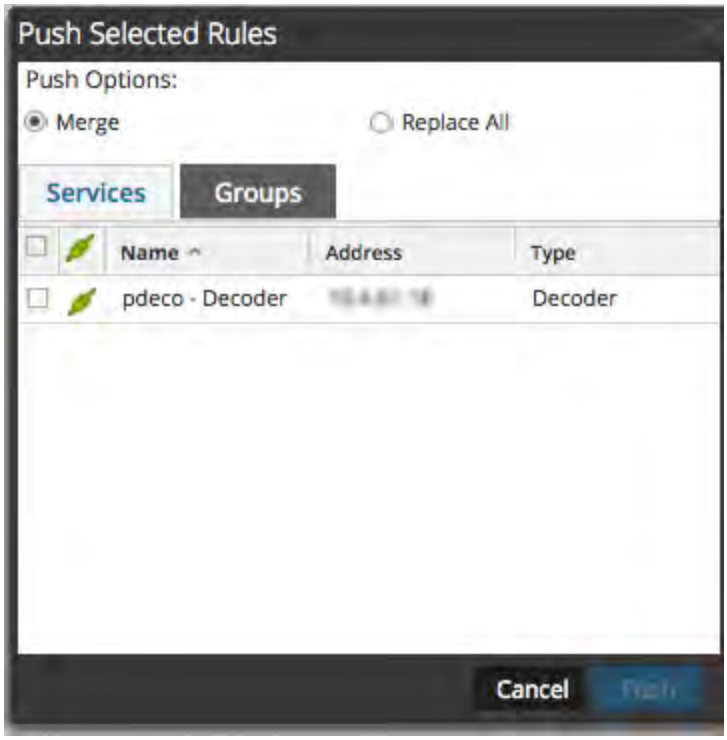
   - Select 
 **> Push > Selection**.

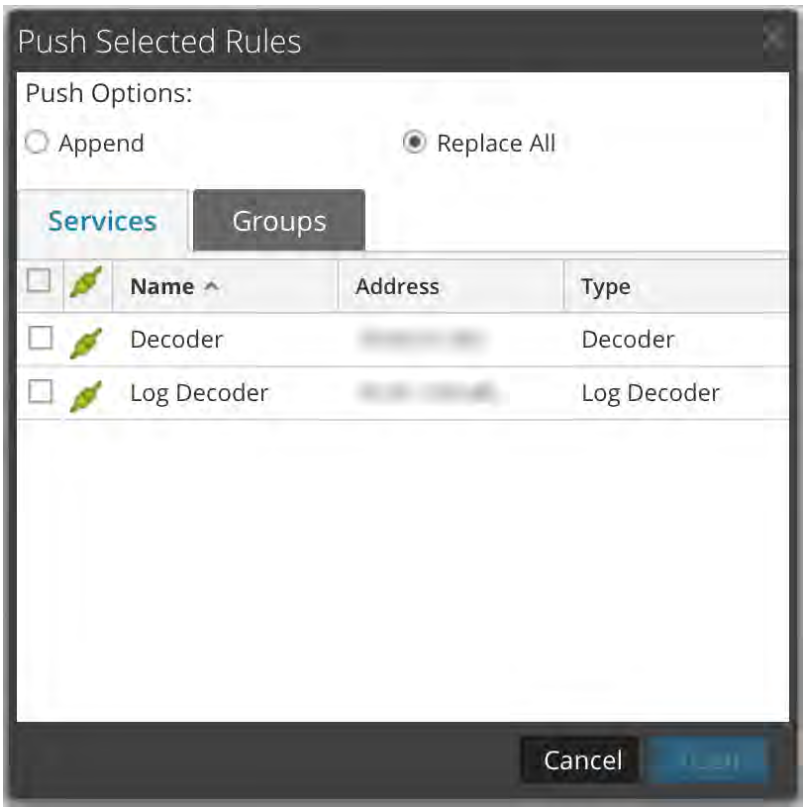
- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.



3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

### To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions > **Push > All**.
   (**Push > All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.



2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

## Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:

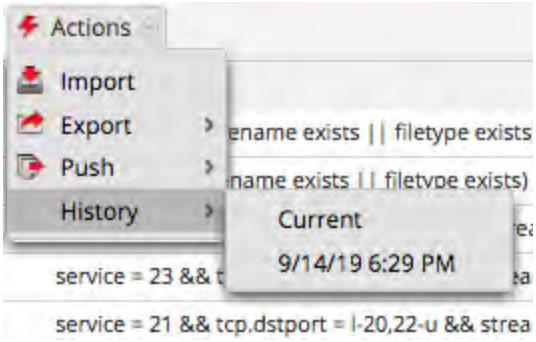
- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

## Restore a Rule Snapshot from History

NetWitness keeps the last ten snapshots of rules applied to a service.

### To restore a rules snapshot from history:

1. Select Actions > **History**.
   A submenu of snapshots is displayed.



2. Select the snapshot time from the submenu.
   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.
3. To apply the rules to the service, click **Apply**.
   The rules are applied to the service.

# Configure Application Rules

Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:

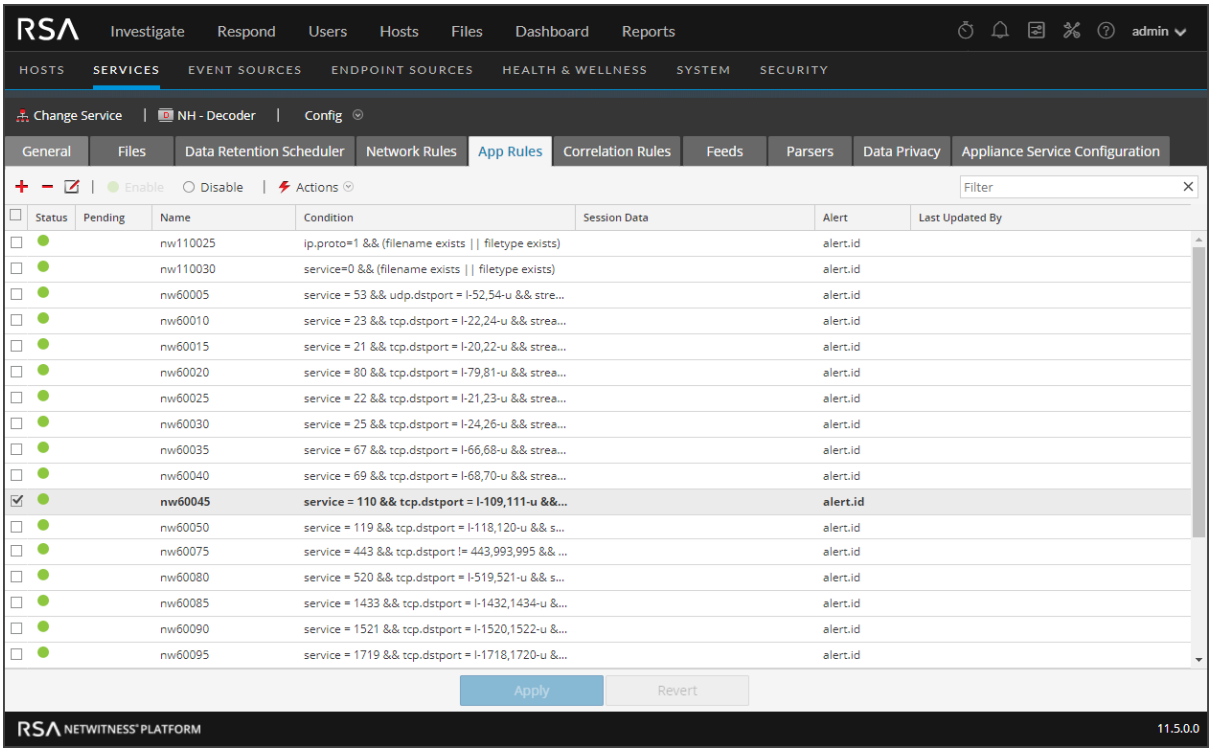
- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate All

To retain email to and from a specific e-mail address, create a rule as follows:

- Rule Name: Retain Email Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Keep

### To add or edit an application rule:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and > **View** > **Config**.
   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.



4. Do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
5. The Rule Editor Dialog is displayed with application rule parameters.

   a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.
   b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.

All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.

d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:

- **Keep**: The packet payload and associated meta are saved when they match the rule.
- **Filter**: The packet is not saved when it matches the rule.
- **Truncate**: Select a truncate option to execute when a packet matches the rule. The example uses the **All** option.
- **Truncate All** to save the packet headers and associated metadata, and do not save the packet payload.
- **Truncate After First <n> Bytes** to save the packet headers and associated metadata, and do not save the packet payload after the specified first <n> bytes, where <n> is a number of bytes.
- **Truncate SSL/TLS Handshake** to truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.

e. In the **Session Options** section, do any of the following:

- **To generate a custom alert** when a session metadata matches the rule, enable the Alert flag and select the name of the alert meta from the **Alert On** drop-down list.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.

6. To save the rule and add it to the grid, click **OK**.

   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.

7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.

8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.

NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

## Monitor Application Rules

The Decoder and Log Decoder keep track of how many times each application rule matches a session. These stats can be viewed by connecting to the Decoder or Log Decoder Explore view and viewing the properties on the `/decoder/config/rules/application` folder. Then, send the command "`statdump`" to that folder. The output of this message is a listing of the number of times each application rule is hit. The listing is ordered in the same order as the contents of the rule definitions in the `/decoder/config/rules/application` folder. For example, on a system with three application rules:

```
0001: hits=6543 loaded=true
0002: hits=9294 loaded=true
0003: hits=43 loaded=true
```

The hit counters for the application rules are reset whenever the parsers are reloaded.

# Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where `port.dst` exists, if there is any combination of ip.src and ip.dst where the count of unique instances of `port.dst > 5` within one minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `port.dst exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(port.dst)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within five minutes, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv4 Potential Brute Force 10
- Rule: `action='login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

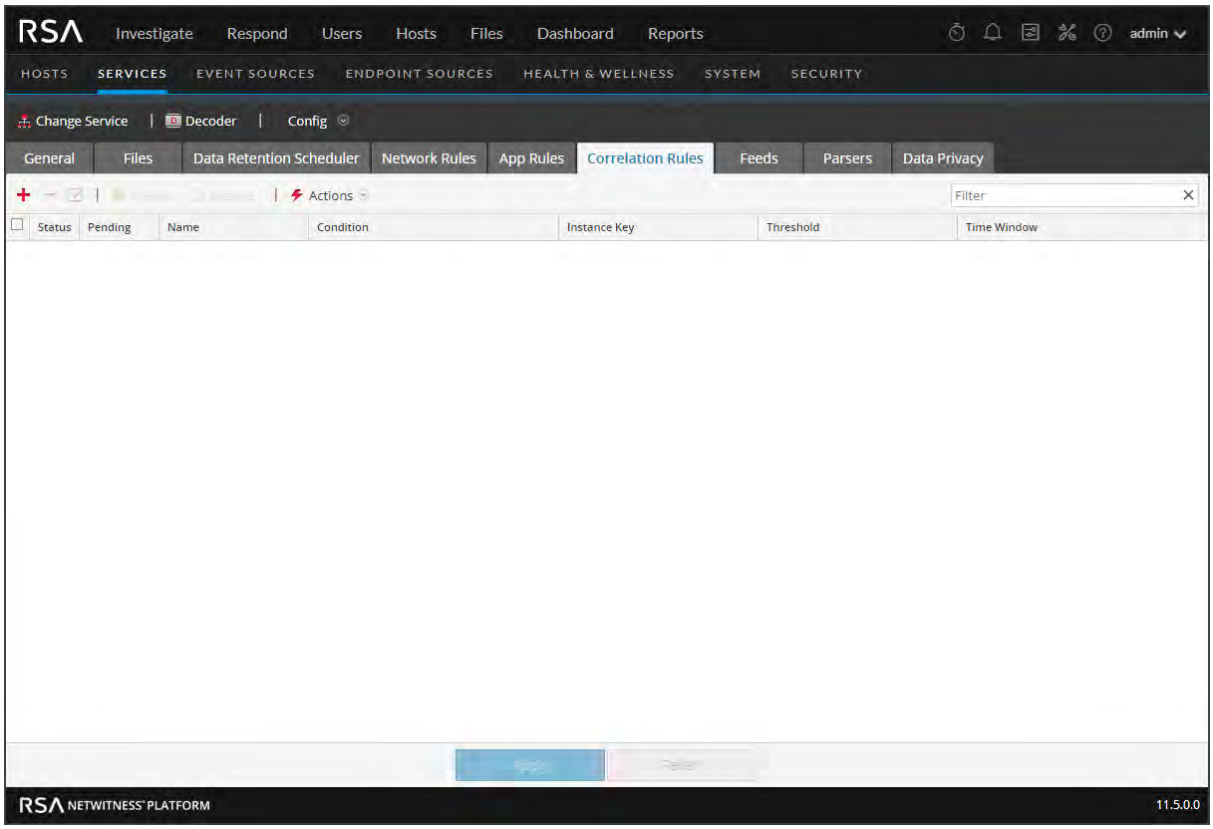
Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `port.dst`. We are counting unique instances of `port.dst` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

**Invalid use case:** In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

### To add or edit a correlation rule

1. Go to (Admin) > **Services**, select a service, and click > **View** > **Config**.
   The Service Config view for the selected service is displayed.

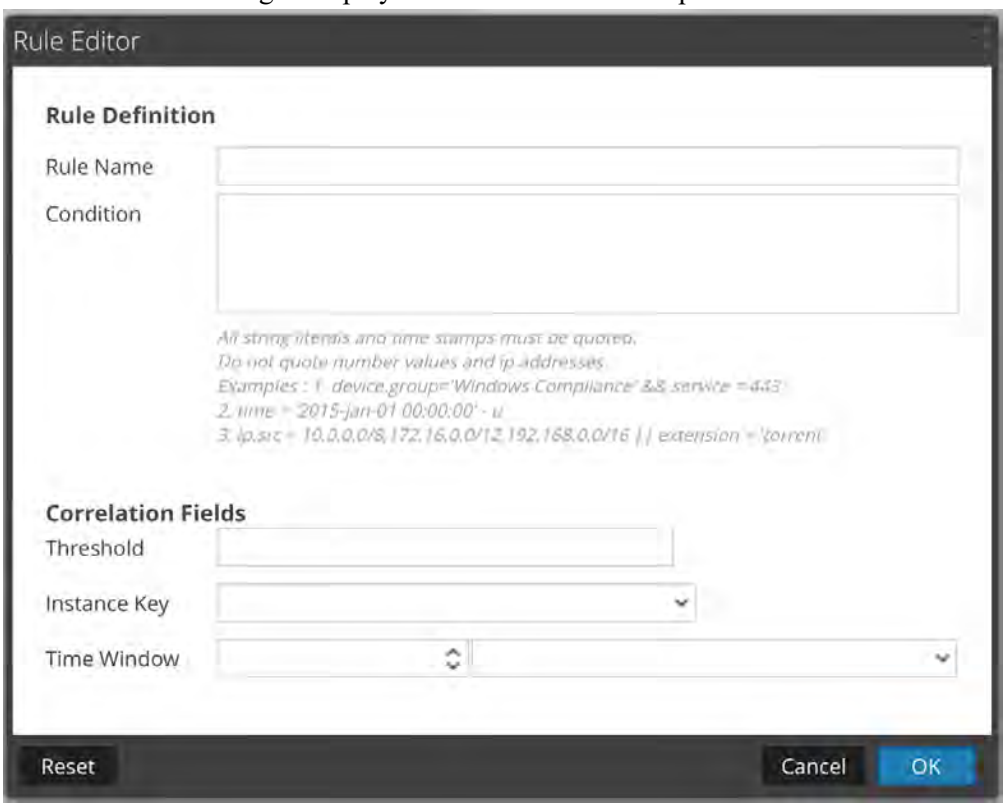
2. Select the **Correlation Rules** tab.



3. In the **Correlation Rules** tab, do one of the following:

   - If adding a new rule, click .

- If editing a rule, select the rule from the rules grid and click .
  The Rule Editor dialog is displayed with correlation rule parameters.



4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses.
   Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - `u_count(associated_key)` = the count of unique values of the specified key
   - `sum(associated_key)` = the values of the specified key
   - `count` = number of sessions (no associated key is specified)
7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).

8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

# Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to Network Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

**Note:** Because network rules are applied on the packet level, you must specify both the source and destination meta keys in the rule condition. This is because the packet flow can occur on both sides at the packet level, while the directions are still not determined. For example, if you want to filter traffic on port 553 and port 55553, the condition should be written as follows:
`port.src=553 || port.dst=553 || port.src=55553 || port.dst=55553`
You must also specify both the source and destination meta keys in the conditions for `ip.src` and `ip.dst`. Specifying only source or destination in the condition will not work as expected.

# Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness supports for use in network rule conditions.

| Meta Key | Description |
|---|---|
| `eth.addr` | Ethernet source or destination address. Commonly known as the MAC address. |
| `eth.dst` | Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value (s). |
| `eth.src` | Same as Ethernet destination except that it focuses on the source address. |
| `eth.type` | Ethernet frame type. |
| `hdlc.type` | Frame type of the HDLC frame. |
| `alias.ip` | IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets. |
| `ip.dst` | Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets. |
| `ip.proto` | IPv4 protocol field. |
| `ip.src` | Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets. |
| `alias.ipv6` | IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation. |

| Meta Key | Description |
|---|---|
| ipv6.dst | Destination IPv6 address in hex format. |
| ip.proto | IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field. |
| ipv6.src | Source IPv6 address in hex format. |
| port.dst | Destination TCP port. |
| tcp.port | TCP source or destination port. |
| port.src | Source TCP port. |
| port.dst | Destination UDP port. |
| udp.port | UDP source or destination port. |
| port.src | Source UDP port. |

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

- Rule Name: Truncate SSL
- Condition: `port.src=443`
- Rule Action: Truncate

To filter subnet traffic, create a rule as follows:

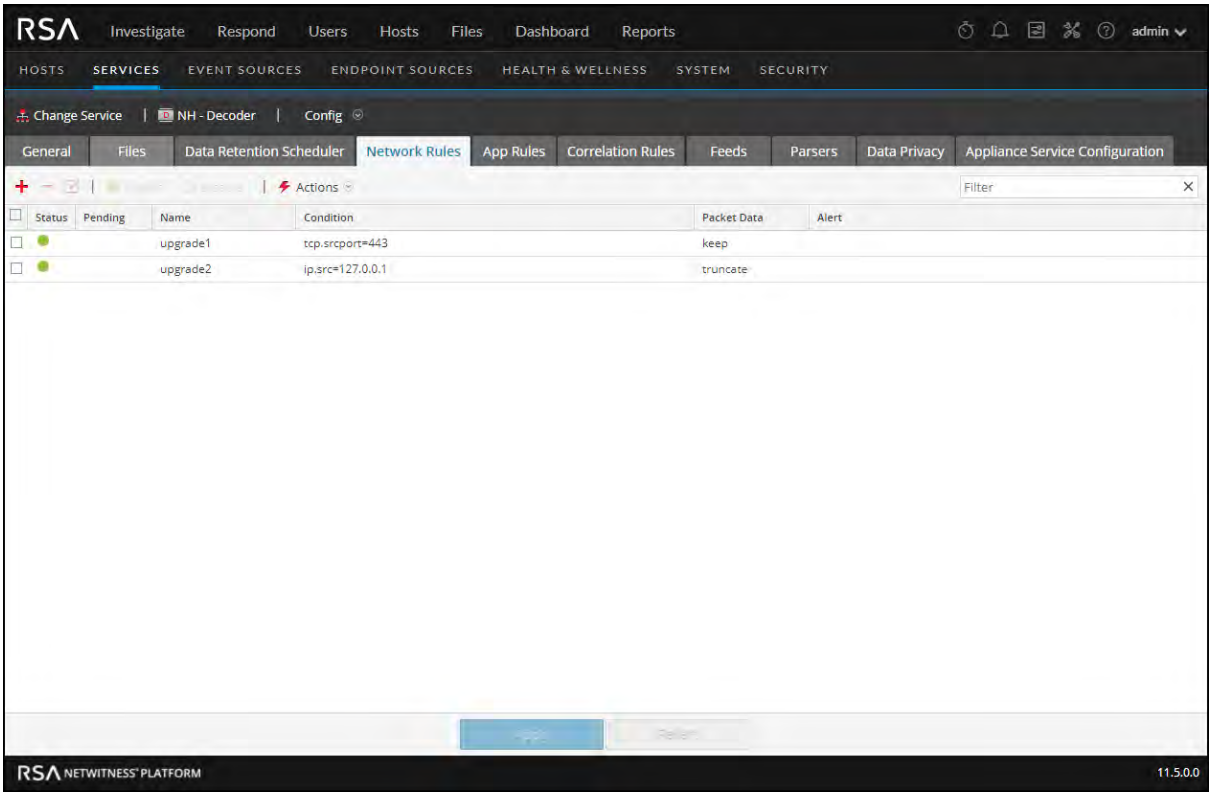
- Rule Name: Subnet Filter
- Condition: `alias.ip=192.168.2.0/24`
- Rule Action: Filter

Meta entities, which provide a way to work with several meta keys at the same time, can be used in application rules, but are not supported in network rules as the metadata available are too limited. For more information on meta entities, see the *Core Database Tuning Guide*.

### To add or edit a network rule:

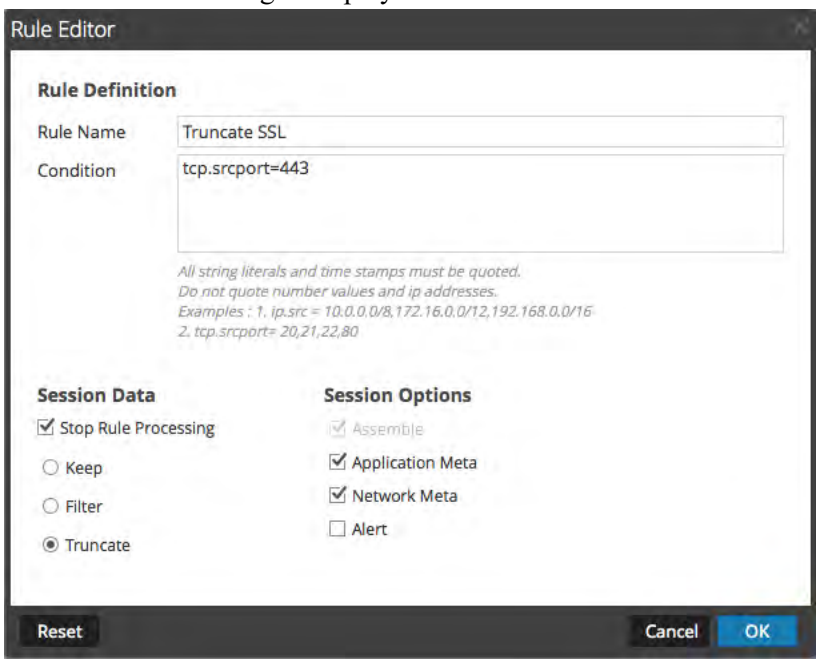
1. Go to (Admin) > **Services**, select a Decoder service, and **> View > Config**.
   The Services Config view for the selected service is displayed.

2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.



3. In the **Network Rules** tab, do one of the following:
   - If adding a new rule, click .

- If editing a rule, select the rule from the rules list and click .
  The Rule Editor dialog is displayed.



4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta values from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SSL from the source port, **`tcp.srcport=443`**.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness supports for use in network rule conditions.
6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated metadata are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.

8. In the **Session Options** section, select all options that apply of these four.
   - **Assemble**: The assembler assembles the packet chain when it matches the rule.
   - **Network Meta:** The packet generates network metadata when it matches the rule.
   - **Application Meta**: The packet generates application metadata when it matches the rule.
   - **Alert**: The packet generates a custom alert when metadata matches the rule.

9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.

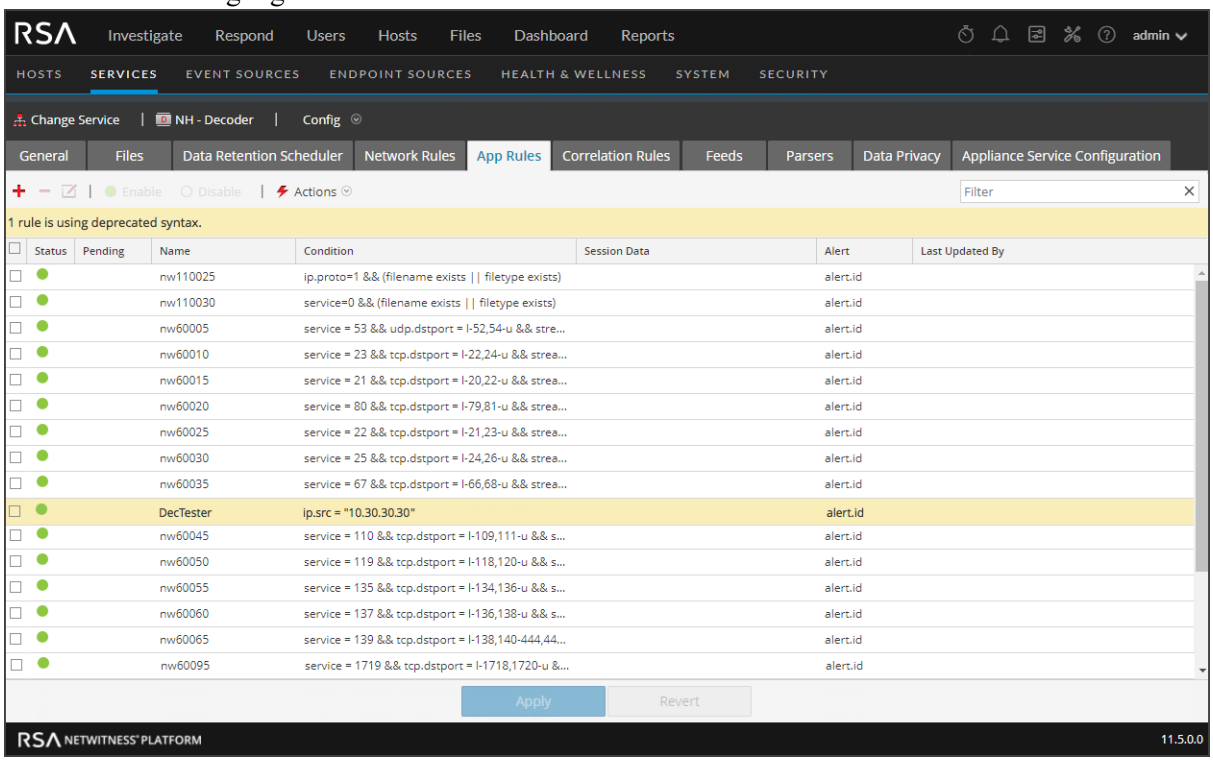
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

# Fix Rules with Invalid Syntax

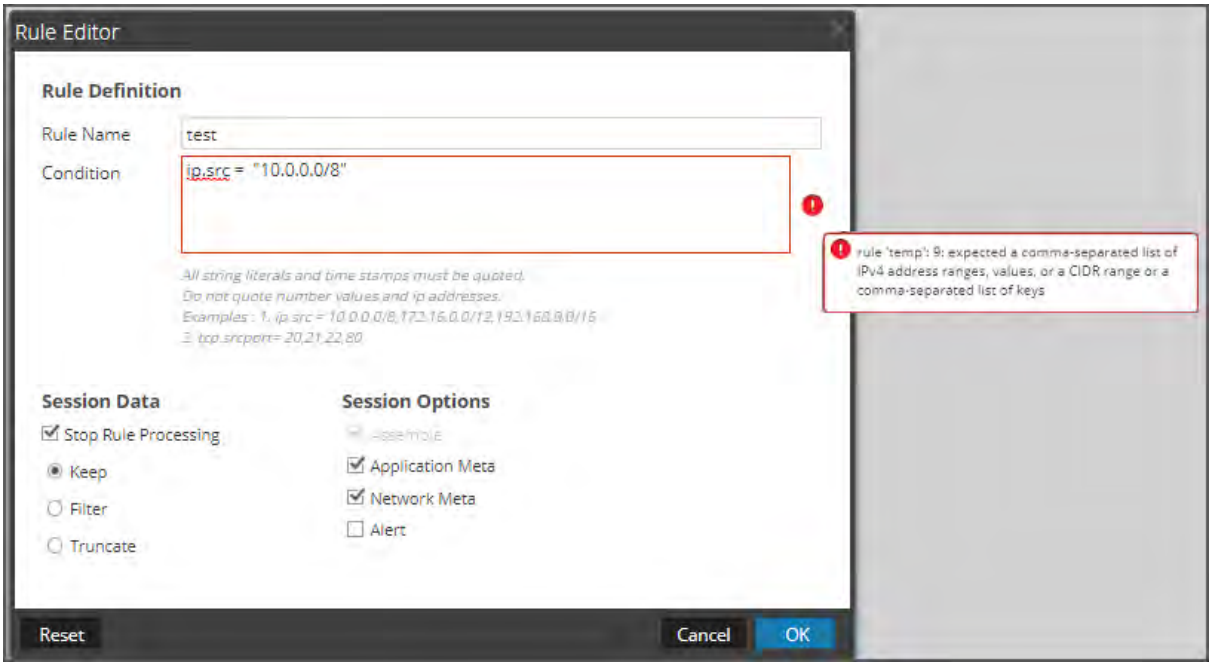
After an update to NetWitness 11.x, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness must follow.

### To correct rules with invalid syntax:

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.



4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule.



5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`

6. Do one of the following:

   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

# Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

## add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all NetWitness APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1 alert=ioc name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian federation\"" name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

## merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string, params`, `binary`, and `params-binary`.

## Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

## Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=ioc
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_
Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command, use the `replace` command.

```
send /decoder/config/rules/application replace --file-
data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-
stream" --data-binary @<pathname> -X POST
"http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

## Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge
1="rule=\"ip.src=192.168.0.1\" name=first keep"
2="rule=\"ip.src=192.168.1.1\" name=second alert=ioc"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D%
22ip.src%3D192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168.1
.1%22%20name%3Dsecond%20alert%3Dioc&3=rule%3D%22ip.src%3D192.168.2.1%22%20name
%3Dthird%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

## Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

**Note:** Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

### Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

```
0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep
0002 : rule="ip.src=192.168.1.1" name=second alert=ioc
0003 : rule="ip.src=192.168.2.1" name=third filter
```

And you want to merge the following four rules:

```
rule="ip.src=192.168.3.1" name=third keep
rule="ip.dst=192.168.4.1" name=NewRule filter order=0
rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
rule="service=80,443" name=web filter order=3
```

Use any method to push your rules and this is what you end up with:

```
0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1
0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2
0003 : rule="service=80,443" name=web filter order=3
0004 : rule="ip.src=192.168.1.1" name=second alert=ioc order=4
0005 : rule="ip.src=192.168.3.1" name=third keep order=5
0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6
```

Are there any surprises here? This is how each rule was processed.

```
1. rule="ip.src=192.168.3.1" name=third keep
```

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

```
2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0
```

This rule is new and had `order=0` in it, which means insert at the very top.

```
3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
```

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

```
4. rule="service=80,443" name=web filter order=3
```

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

## replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a NetWitness Rule File :

```
send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string
```

This is an example of the `replace` command using Numbered Parameters :

```
send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=ioc"
```

## clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

## delete Command

The `delete` command deletes one or more rules on the service.

```
delete atPos <uint32> count <uint32, optional>
```

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

## validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

```
validate rule <string>
```

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

# Configure Parsers and Feeds

Parsers and feeds are responsible for analyzing the packets and logs when captured or imported in Decoders. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

See the following sections for details about configuring parsers and feeds.

- Configure Parsers
- Configure Feeds

## Configure Parsers

NetWitness has a set of native parsers that are defined by the system, and also provides the option to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

There are also several types of custom configurable parsers:

- GeoIP2 – This parser associates IP addresses with geographical locations. For new installations and upgrades, the GeoIP2 parser is enabled by default. For more information on these parsers, see GeoIP2 Parsers.
- Search – This parser is user-configured to generate metadata by scanning for pre-defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- Log – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- Snort® – This parser supports the payload detection capabilities of Snort IDS rules. Snort rules and configuration are added to the `parsers/snort` directory for Investigation and Decoder (see Decoder Snort Detection).

In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

**Note:** To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

In addition, you can download parsers using NetWitness Live Services.

## Upload and Delete Custom Parsers

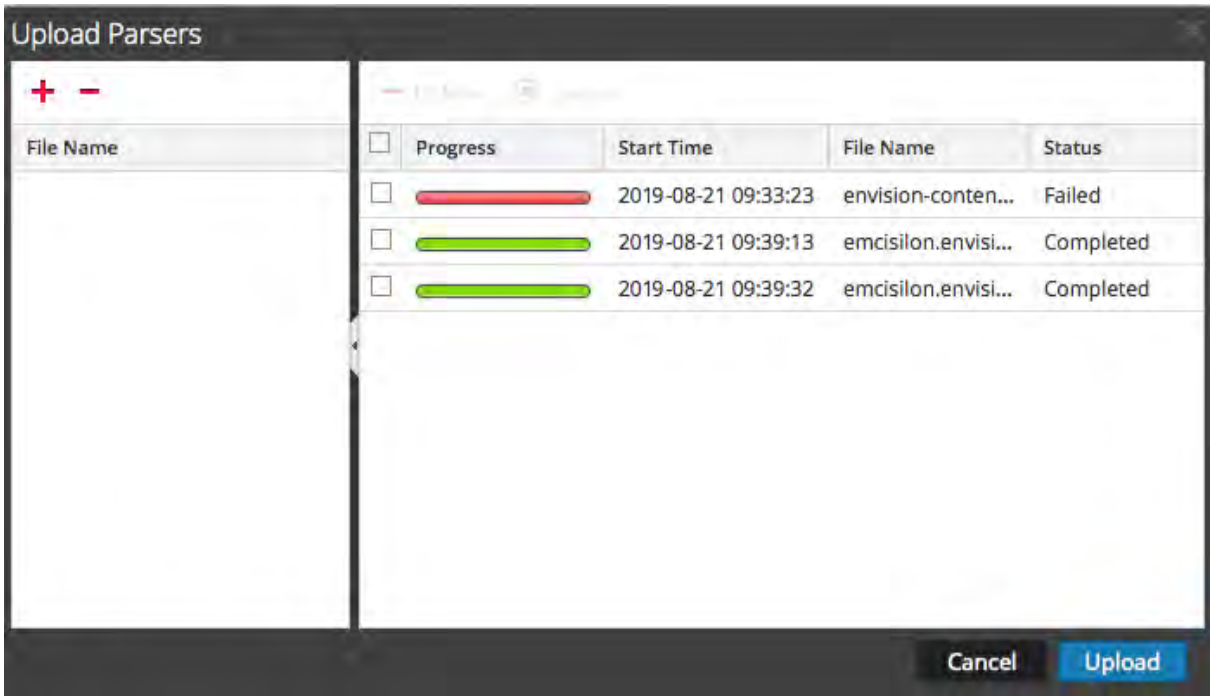
RSA NetWitness has the ability to upload parsers from your local system and delete these parsers.

### Upload Parsers to a Decoder or Log Decoder

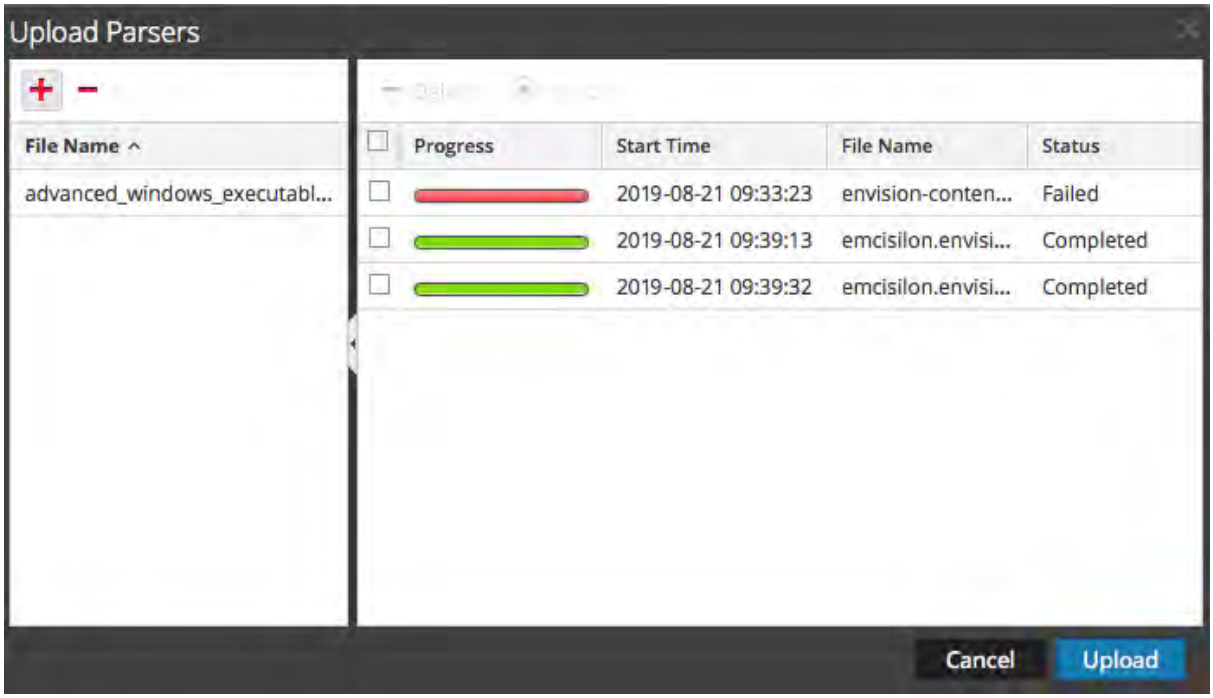
The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

1. Go to (Admin) > **Services**, select a service, and click **> View > Config.**
   The Config view for the selected service is displayed.
2. Click the **Parsers** tab.

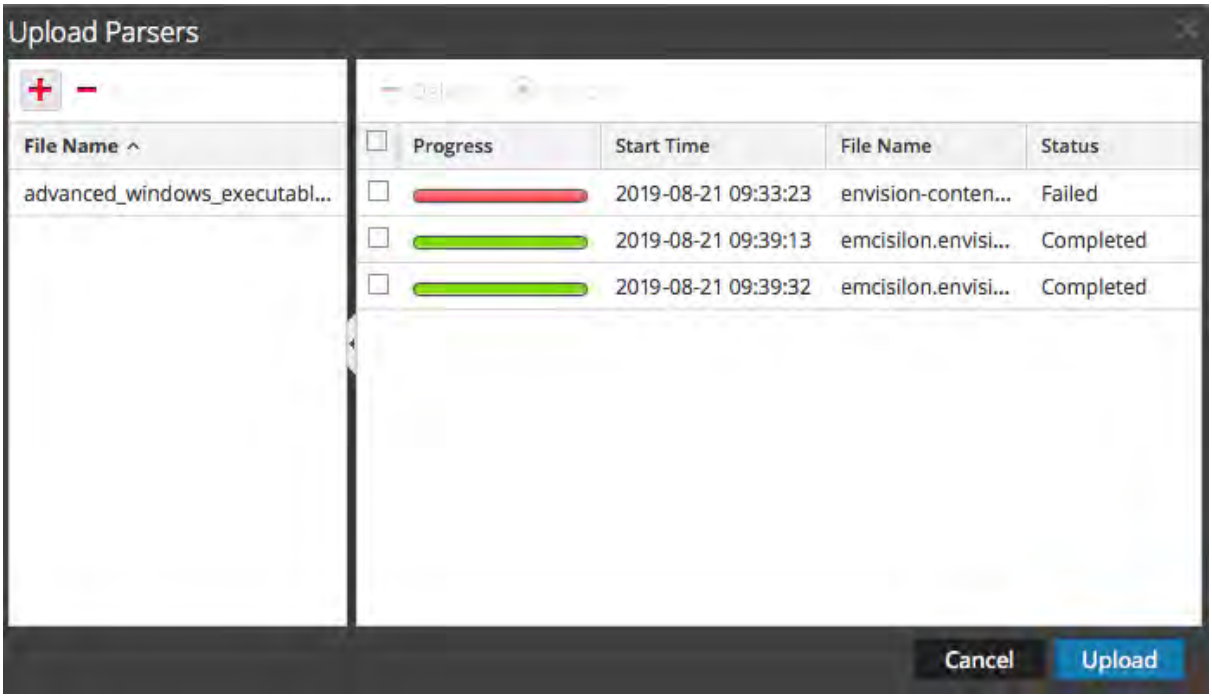
3. Click Upload.
   The Upload Parsers dialog is displayed.



4. Click .
   A file selection dialog is displayed.
5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.
   The dialog closes, and the selected files are displayed in the File list.



6. Click **Upload**.
   The Upload Job grid shows the progress of the upload jobs with each job representing a file being uploaded.



7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

## Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click −.

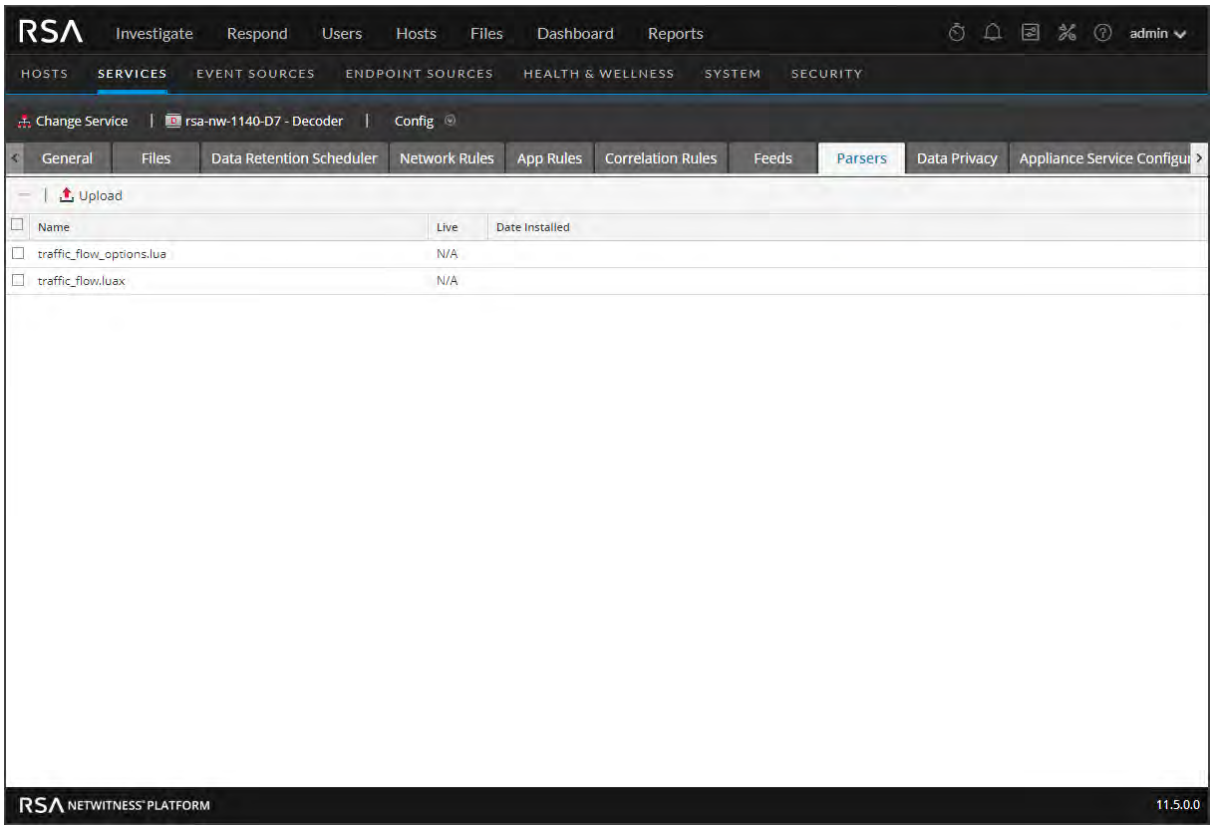
## Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

**Note:** Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to (Admin) > **Services**, select a Decoder, and > **View** > **Config.**
   The Services Config view for the selected service is displayed.
2. Click the **Parsers** tab.



3. In the **Parsers** tab, select one or more parsers to delete.
4. Click −.
   A dialog requests confirmation that you want to delete the parsers.
5. If you want to delete the parsers, click **Yes**.
   The parsers are removed from the Decoder immediately.

## Enable and Configure the Entropy Parser

Beginning with NetWitness 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may be worthy of investigation.

The parser creates meta keys, based on statistics collected by the native NetWitness parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

RSA does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.

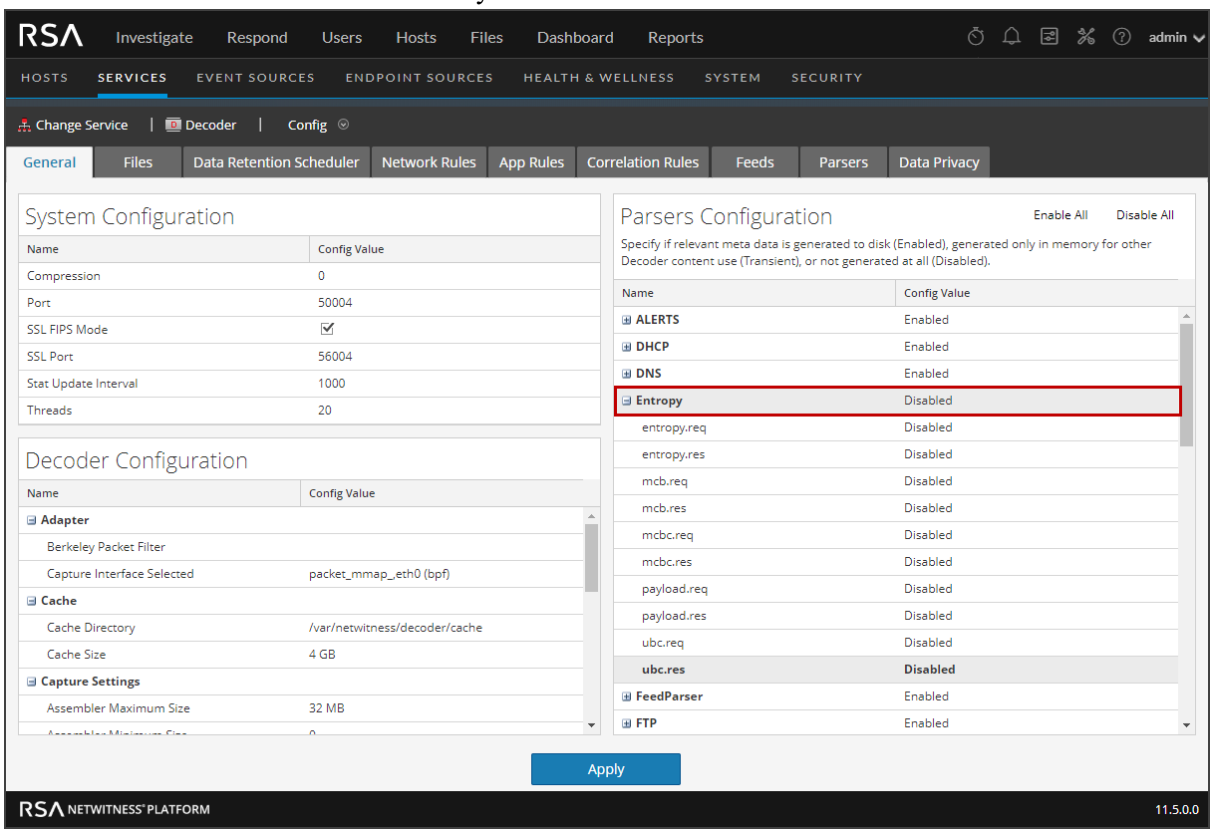
These are the new meta keys generated by the Entropy parser by default:

- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.

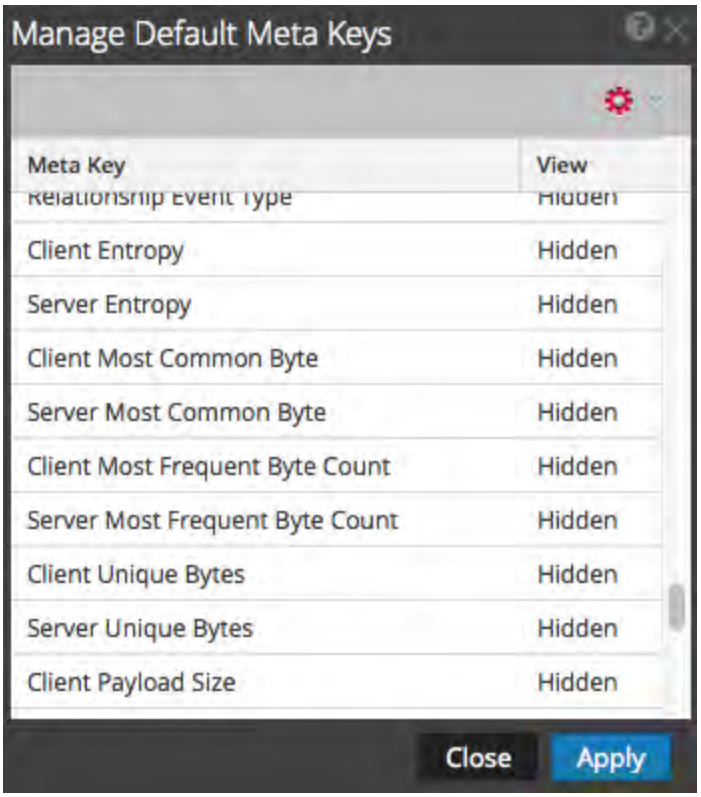
### To enable and configure the Entropy parser on a Decoder:

1. Go to (Admin) > **Services**, select a Decoder service and click **View > Config**.
   The Services Config view for the selected Decoder is displayed.
2. The Entropy parser is disabled by default. Click the drop-down list for **Entropy** in the **Config Value** column, and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list

and select **Disabled** next to the meta key.



3. Click **Apply**.
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.
4. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below in Entropy Parser Configuration in the Concentrator Custom Index File.
5. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.



## Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

```
<!-- This section is commented out because it's only used by the Entropy
parser which is disabled by default. To enable this part of the language, copy
to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note
that depending on how the Entropy parser is configured, the entropy.req and
entropy.res format might be a Float32 instead of a UInt16. So make sure to
change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring
this for interesting sessions based on payload byte analysis of the packets.
By default, to make indexing easier, the normal Float32 value for entropy.req
and entropy.res is multiplied by 10k and stored in a UInt16 (thus giving 4
digits of precision, 0 to 10,000). However, if you define the entropy.* fields
in the Decoder language to be Float32, it will store it as a float with a
range of 0.0 to 1.0. Take care to change the language everywhere if you decide
to keep it as a Float32. We do not recommend indexing as a Float32 because of
the high unique counts due to minute changes in precision. -->

<!--

<key description="Entropy Request (Client)" format="UInt16" level="IndexNone"
name="entropy.req" valueMax="10001"/>

<key description="Entropy Response (Server)" format="UInt16" level="IndexNone"
name="entropy.res" valueMax="10001"/>

-->
```

```
<!-- The most common byte is simply which byte for each side (0 thru 255) was
seen the most -->

<!--

<key description="Most Common Byte Request" format="UInt8" level="IndexNone"
name="mcb.req"/>

<key description="Most Common Byte Response" format="UInt8" level="IndexNone"
name="mcb.res"/>

-->

<!-- The most common byte count is the number of times the most common byte
(above) was seen in the session streams -->

<!--

<key description="Most Common Byte Count Request" format="UInt32"
level="IndexNone" name="mcbc.req" valueMax="500000"/>

<key description="Most Common Byte Count Response" format="UInt32"
level="IndexNone" name="mcbc.res" valueMax="500000"/>

-->

<!-- Unique byte count is the number of unique bytes seen in each stream. 256
would mean all byte values of 0 thru 255 were seen at least once -->

<!--

<key description="Unique Byte Count Request" format="UInt16" level="IndexNone"
name="ubc.req"/>

<key description="Unique Byte Count Response" format="UInt16"
level="IndexNone" name="ubc.res"/>

-->

<!-- The payload size metrics are the payload sizes of each session side at
the time of parsing. However, in order to keep indexing from having high
unique counts (bad for performance), the two payload size metas below are
indexed in buckets. -->

<!--

<key description="Payload Size Request" format="UInt32" level="IndexNone"
bucket="true" name="payload.req" valueMax="500000"/>

<key description="Payload Size Response" format="UInt32" level="IndexNone"
bucket="true" name="payload.res" valueMax="500000"/>

-->
```

## Flex Parsers

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non-internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser. A parser node can have an optional **declaration** node and any number of **match** nodes.

**Topics**

- Arithmetic Functions
- Common Parser Operations
- General Functions
- Logging Functions
- Nodes
- Payload Functions
- Regex
- String Functions

## Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

### Language Definition

The following table provides language definitions.

| Node Name | Attribute Name | Description |
|---|---|---|
| `and` | | Performs bitwise AND between two numbers. |
| | `name` | Variable to AND result into. |
| | `value` | Number to AND into result. |
| `or` | | Performs bitwise OR between two numbers. |
| | `name` | Variable to OR result into. |
| | `value` | Number to OR into result. |
| `increment` | | Performs ADDITION of two numbers. |
| | `name` | Variable containing the initial value AND to receive ADDITION results. |
| | `value` | Number to ADD to initial value. |
| `decrement` | | Performs SUBTRACTION of two numbers. |
| | `name` | Variable containing initial value AND to receive SUBTRACTION results. |
| | `value` | Number to SUBTRACT from initial value. |
| `divide` | | Performs DIVISION of two numbers. |
| | `name` | Variable containing the initial value AND to receive DIVISION results. |
| | `value` | Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser. |
| `modulo` | | Performs MODULO of two numbers. |
| | `name` | Variable containing the initial value AND to receive MODULO results. |
| | `value` | Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser. |
| `multiply` | | Performs MULTIPLICATION of two numbers. |

| Node Name | Attribute Name | Description |
|---|---|---|
| | name | Variable containing the initial value AND to receive MULTIPLICATION results. |
| | value | Number by which to MULTIPLY the initial value. |
| shiftleft | | Performs a binary shift left. |
| | name | Variable containing the initial value AND to receive shift results. |
| | value | Number of bits to shift by. |
| shiftright | | Performs a binary shift right. |
| | name | Variable containing the inital value AND to receive shift results. |
| | value | Number of bits to shift by. |

## Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

### Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

### Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
               <if name="state" equal="1" />
                    <identify />
               </if>
          </match>
     </parser>
```

```
</parsers>
```

### Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

### Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens" service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
```

```
     </parser>
</parsers>
```

### Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001 Microsoft
               Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

## General Functions

This topic defines language for the flex parser general functions.

### General Functions Language Definition

| Node Name | Attribute Name | Description |
|---|---|---|
| apptype | | Gets the currently defined service type for the current session. |
| | name | A number variable to receive the current service type. |
| identify | | Marks the session with the parser's service type if the service type has not already been identified. |
| assign | | Assigns a value to a variable. |
| | name | The unique identifier assigned to the item in the declaration section. |
| | value | Optional. If specified, the action defined in the match is only applied when the declaration matches the given value. |
| getmeta | | Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback. |
| | name | The variable to receive the value of the meta key that generated the callback. |
| gettoken | | Returns the current matched token. |
| | name | A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string. |
| end | | This terminates the execution of the current **match** section. |
| if | | Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type. |
| | name | The unique variable identifier assigned to the item in the **declaration** section. |
| | equal<br>notequal<br>less<br>lessequal<br>greater<br><br>greaterequal<br>and<br>or | The operation value to compare. If true, any sub-actions are executed. |

| Node Name | Attribute Name | Description |
|---|---|---|
| register | | Adds metadata to the session. |
| | name | The unique identifier of a meta variable to be created, as defined in the **declaration** section. |
| | value | The value of the metadata to be created. |
| while | | Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type. |
| | name | The unique variable identifier assigned to the item in the declaration section. |
| | equal<br>notequal<br>less<br>lessequal<br>greater<br>greaterequal<br>and<br>or | Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables. |
| call | | Executes the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared. |
| | value | The name of the match element, or a string variable containing the name of a match element.<br>• If the match element name is specified, the parser will not load if the named matched element doesn't exist.<br>• If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element.<br>• If no **match** element can be found matching the string value, no action is taken. |

## Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

### Language Definition

| Node Name | Attribute Name | Description |
|---|---|---|
| `failure` | | Logs a message to the system log with the log level **Failure.** |
| | `value` | A string to include as the log message. |
| `warning` | | Logs a message to the system log with the log level **Warning.** |
| | `value` | A string to include as the log message. |
| `info` | | Logs a message to the system log with the log level **Info**. |
| | `value` | A string to include as the log message. |
| `debug` | | Logs a message to the system log with the log level **Debug.** |
| | `value` | A string to include as the log message. |

## Nodes

This topic defines language for the flex parser nodes.

### Nodes Language Definition

| Node Name | Attribute Name | Description |
|---|---|---|
| `parsers` | | The root node in each definition file. |
| | `xmins:xsi` | Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance |
| | `xsi:noNamespaceSchemaLocation` | Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd |
| `parser` | | The node that defines a single parser definition. This node must be directly under the `parsers` node. There can be more than one per file. |
| | `name` | The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z]. |
| | `desc` | Provides a friendly description of what the parser does. |
| | `service` | The unique number assigned to the session when identified. |
| `declaration` | | Delineates the definition. Each of these definitions can have an associated `match` entry. |

| Node Name | Attribute Name | Description |
|---|---|---|
| token | | Specifies a definition for identifying a token somewhere in the session protocol. This defines a `match` callback when the specified tokens are encountered in a session payload. The `read` position is set to the byte immediately following the matched token. |
| | name | This is a unique identifier for the declaration. |
| | value | This is the exact token value to be identified. |
| | options | Options specify that the token should start on a new line or at an end of a line (`linestart` or `linestop`). |
| meta-callback | | Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (for example, 80 for HTTP). |
| | name | Name of the match element to be executed when a callback occurs. (String) |
| | key | Name of the meta key that generates callbacks. (String) |
| | format | The data type of the meta key that will generate the meta. |
| | apptype | The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional) |
| number | | Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values. |
| | name | This is a unique identifier for the declaration. |

| Node Name | Attribute Name | Description |
|---|---|---|
| | `scope` (optional) | Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default). |
| `string` | | Defines a numeric variable that can be referenced elsewhere within the parser definition. |
| | `name` | This is a unique identifier for the declaration. |
| | `scope` (optional) | Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default). |
| port | | Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session. |
| | `name` | This is a unique identifier for the declaration. |
| | `value` | This is the port number to identify. |
| `session` | | Defines a `match` callback for session begin/end events. These events only occur if a token for the parser is encountered in the session. |
| | `name` | This is a unique identifier for the declaration. |
| | `value` | Specifies that processing takes place at the beginning of a new session or at the end of a session (`begin` or `end`). |
| `stream` | | Defines a `match` callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream. |
| | `name` | This is a unique identifier for the declaration |

| Node Name | Attribute Name | Description |
|---|---|---|
| | value | Specifies that processing takes place at the beginning or at the end of a stream (begin or end). |
| function | | Defines a match section that can be used as a generic function. No callbacks are associated with this declaration. |
| | name | This is a unique identifier for the declaration. |
| meta | | Defines the type of data that the parser will create. |
| | key | Specifies the key name. The key needs to be 1-16 bytes in size. |
| | format | Specifies the variant type (for example, **Text**, **IPv4**, **UInt32**). Refer to the SDK documentation for a full list. |
| pattern | | Defines a regular expression variable for use by the regex function |
| | name | This is a unique identifier for the declaration. |
| | scope (optional) | Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **global**, **constant**, **stream**, and session (default). |
| | value (optional) | Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **scope attribute** is set to constant. |
| match | | The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element:<br>• General<br>• Arithmetic<br>• String<br>• Payload |

## Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

### Language Definition

| Node Name | Attribute Name | Description |
|---|---|---|
| `find` | | Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute. |
| | `name` | A `number` variable to receive the offset from the `read` position where the match begins. |
| | `value` | A string to find. |
| | `length` (optional) | A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance. |
| `install-decoder` | | To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead. |
| | `type` | The type of decoder to install.<br>Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate. |
| | `offset` | Offset from the current read position to begin decoding. |
| | `length` | The maximum payload length to decode. |
| `isdecoding` | | Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters. |
| `move` | | Moves the `read` position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the `read` position is updated and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute. |

| Node Name | Attribute Name | Description |
|---|---|---|
| | value | The number of bytes to move the read position. |
| | direction (optional) | The direction to move the current read position. Can be forward (default) or **reverse.** |
| packetid | | Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined. |
| | name | A number variable to receive the current packet id. |
| payload-position | | Returns the current read position. This is a zero based index into the stream payload. |
| | name | A number variable to receive the current read position. |
| read | | Reads a specified number of bytes starting at the read position into a variable. If there is sufficient data in the stream, the read position is updated, the data read assigned, and any child elements will then execute. If not found, the read position remains unchanged and any child elements will not execute. |
| | name | The name of a string or number variable to receive stream data. If a number variable is provided, the bytes read are interpreted as a single unsigned numeric value. |
| | length | The number of bytes to read from a stream. |
| | endianess (optional) | The byte ordering to use when reading into a number variable. Can be big (default) or little. The attribute is invalid when reading into a string variable. |

## Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

### Language Definition

| Attribute Name | Description |
|---|---|
| `name` | A `number` variable to receive the offset from the `read` position where the match begins. |
| `value` | A regular expression to find. |
| `length` (optional) | A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance. |
| `found` (optional) | The name of a `string` variable to receive a matched string. |

## String Functions

This topic provides language definitions for the flex parser string functions.

### String Functions Language Definition

| Node Name | Attribute Name | Description |
|---|---|---|
| `append` | | Attaches a number or string to the end of a `string` variable. |
| | `name` | The unique identifier of a string variable to which the specified value is to be attached. |
| | `value` | A number or string to attach. |
| `find` | | Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute. |
| | `name` | A `number` variable to receive the zero-based position, where the provided value string was found in the **in** string. |
| | `value` | A string to find. |
| | `in` | A string to search. |
| | `length` (optional) | A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched. |
| `length` | | Assigns the length of a string to a `number` variable. |
| | `name` | A `number` variable to receive the length of the specified string. |
| | `value` | A string value whose length is to be determined. |
| `regex` | | Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance. |
| | `name` | A number variable to receive the zero-based position, where the provided regular expression matched in the in string. |
| | `value` | A regular expression to be searched for. |
| | `in` | A string to search. |

| Node Name | Attribute Name | Description |
|---|---|---|
| | length (optional) | A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched. |
| | found (optional) | The name of a string variable to receive the matched string. |
| substring | | At least one of the optional attributes from and length must be specified. |
| | name | The unique identifier of a string variable to receive the extracted value. |
| | value | A string value from which to extract a substring. |
| | from (optional) | The zero-based position from which to begin the substring. If not specified, it defaults to zero. |
| | length (optional) | The number of characters to extract. If not specified, it defaults to the remaining length of the string. |
| tolower | | Converts a string to all lowercase letters. |
| | name | The name of a string variable to process. |
| toupper | | Converts a string to all uppercase letters. |
| | name | The name of a string variable to process. |
| urldecode | | Decodes a string containing url-encoded characters. |
| | name | A string variable to receive the decoded string. |
| | value | A url-encoded string to decode. |
| base64decode | | Decodes a base-64 encoded string. |
| | name | A string variable to receive the decoded string. |
| | value | A url-encoded string to decode. |
| uudecode | | Decode a uuencoded string. |
| | name | A string variable to receive the decoded string. |
| | value | A uuencoded string. The header and trailing lines should not be included. |
| quotedprintabledecode | | Decode a Quoted-printable encoded string. |
| | name | A string variable to receive the decoded string. |
| | value | A quoted-printable encoded string. |
| convert-ebcdic | | Convert an EBCDIC string to its ASCII equivalent. |

| Node Name | Attribute Name | Description |
|---|---|---|
| | name | A string variable to receive the decoded string. |
| | value | A url-encoded string to decode. |

## GeoIP2 Parsers

This topic describes the GeoIP2 parser for Decoders. This parser converts IP addresses into geographic locations, such as the country name and city where the IP address is typically found.

**Note:** In version 11.3 and later, the native GeoIP2 parser replaces the GeoIP parser (which has been permanently removed). The GeoIP2 parser provides the same basic functionality as the GeoIP parser as well as many enhancements. For example, it converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4.

Available in NetWitness version 11.2 or later, the GeoIP2 Parser is enabled by default for upgrades and new installations. The GeoIP2 parser provides the latest Maxmind GeoIP package and supports IPv6 addresses as well as IPv4.

To edit the GeoIP2 parser configuration:

1. Go to (Admin) > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. In the Parsers Configuration panel, select **GeoIP2** to view and update configuration options.
4. Define the IP addresses to lookup. The GeoIP2 parser enables the following IP addresses by default: `ip.src`, `ip.dst`, `ipv6.src`, and `ipv6.dst`. You can update options by using `parsers.options` to remove or add new IP addresses. For example, you can edit `parsers.options` and pass a comma-separated list of IP addresses to use as follows:
   `GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst,alias.ip"`
   This adds a new IP address to lookup called `ip.addr`. However, since `alias.ip` does not end in `.src` or `.dst`, the parser will elect to place the GeoIP2 metadata generated in meta keys without a `.src` or `.dst` suffix. So, you would see country, city, and so on, after the `alias.ip` metadata.
5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

**Note:** The list you pass for `alias.ip` replaces the default list. So, if you pass `alias.ip=ip.src`, it generates only GeoIP2 metadata for `ip.src`, and generates no metadata for other IP addresses.

**Note:** `parsers.options` is used for passing options to multiple parsers. So if you add GeoIP2 to it, you should not delete any other options being passed to other parsers (like Entropy).

The following table provides the full list of metadata that the GeoIP2 parser can potentially generate and indicates which metadata is or is not enabled by default:

| Enabled by Default | Not Enabled |
|---|---|
| country, country.src, country.dst | latdec, latdec.src, latdec.dst |
| | longdec, longdec.src, longdec.dst |
| domain, domain.src, domain.dst | isp, isp.src, isp.dst |
| org, org.src, org.dst | city, city.src, city.dst |

You can enable the other metadata using the standard parser configurations.

**Note:** By disabling some metadata by default, the GeoIP2 parser does not work the same as the GeoIP parser (which did not, by default, disable any metadata it generated). If you need any of the disabled metadata, you need to enable them (once only) for each Decoder, after upgrading to 11.2 or later. Keep in mind that the `isp` and `org` meta keys usually produce an equivalent value to `domain`.

## Lua Parsers

There are a number of Lua parsers available from Live. See RSA Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

## HTTP Parsers

The HTTP parser is a native parser that is used for Decoders to parse both requests and responses in HTTP messages. In version 11.4 and later, the HTTP parser provides a decompression option.

The decompression option mimics the decompression option in the Lua HTTP parser and is controlled by the `'decompression'` option for the HTTP parser. Parser options are set in the `/decoder/parsers/config/parsers.options` configuration node. To set an option on the HTTP parser, you append an `HTTP=""` clause to the `parsers.options` field so that HTTP can understand the `'decompression'` option.

For example, you could add `HTTP="decompression=true"` to the parser option list to enable decompression of all HTTP compressed bodies.

You can use the following values in the `'decompression'` field.

| Value | Description | Example Entry in parsers.options |
|---|---|---|
| `true` | Decompress all bodies | `HTTP="decompress=true"` |
| `false` | Do not decompress. This is the default. | `HTTP="decompress=false"` |
| `1` | Decompress `application/*` content | `HTTP="decompress=1"` |
| `2` | Decompress `audio/*` content | `HTTP="decompress=2"` |
| `4` | Decompress `font/*` content | `HTTP="decompress=4"` |
| `8` | Decompress `image/*` content | `HTTP="decompress=8"` |
| `16` | Decompress `message/*` content | `HTTP="decompress=16"` |
| `32` | Decompress `model/*` content | `HTTP="decompress=32"` |
| `64` | Decompress `text/*` content | `HTTP="decompress=64"` |
| `128` | Decompress `video/*` content | `HTTP="decompress=128"` |

The numeric values can be combined by addition to search for multiple types of content. For example, if you want to decompress application and text content, use `1 + 64 = 65`, which becomes `HTTP="decompress=65"`.

### To set the decompression option:

1. Go to (Admin) > **Services** and select a Decoder, and in the actions menu ( ), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP="decompress=<option from table>"`.

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

## Visibility into HTTP/2 Sessions

You can search for metadata items derived from headers in the HTTP/2 stream to gain visibility into HTTP/2 sessions.

### To turn on header parsing for HTTP/2 sessions:

1. Go to **ADMIN** > **Services** and select a Decoder, and in the actions menu ( ), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP2="headers=true"`.
4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

# Decoder Snort Detection

Snort is a free and open-source intrusion prevention system that uses a rule-based language to detect malicious network traffic. The NetWitness Platform Decoder offers compatibility with Snort detection rules, sometimes referred to as Snort signatures. NetWitness supports importing existing Snort rules into the Decoder, extending the known threats that can be detected. There are many sources for Snort rules, as it is an open source solution. In most cases, the behavior of Snort rules in the Decoder is the same as the rules in other network analysis tools. However, the Decoder does not have coverage for all Snort rule options. The topics in this section highlight NetWitness Platform Decoder-specific details of how to set up Snort parsers, how Snort rules are handled, and explain cases where Decoder might differ in behavior from Snort.

## Using Snort Rules in Decoders

The Snort Detection engine is implemented as a built-in native parser in Decoders. The parser's identifier is `Snort`, and can be found in the Decoder Parsers Configuration page along with the other native parsers enabled by default. The Snort parser reads files from the directory `/etc/netwitness/ng/parsers/snort`. All files in this directory are read during the Decoder service restart. Files that end in the extension `.conf` are treated as configuration files. The format for configuration files matches the configuration file format for Snort, although not all configuration directives are supported. Further details are in Configuration Directives . Files that end in the extension `.rules` are treated as Snort rules files. A rules file can contain one or more rules, and the Snort directory can contain more than one rules file. The rule file format is the same as for Snort itself. The Snort rule files can be loaded into the Decoder by any of the following methods:

1. The Decoder service starts.
2. The `reload` message is sent to the `/decoder/parsers` folder. This allows for rules to be reloaded while capture is running.

However, note the following:

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however, there are rule options that are not supported by Decoders which are not fully parsed. For more information, see Snort Parser Capabilities .

**Note:** RSA recommends that the maximum number of Snort rules in use per Decoder is 1,000.

## Initial Decoder Snort Configuration

Follow these steps to set up an initial configuration of Snort on a Decoder.

1. Edit the `snort.conf` file in the `/etc/netwitness/ng/parsers/snort` directory, and configure it according to the instructions in Configuration Directives , which describes the details of the variables inside the configuration file. If the variables `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` are not defined, they default to the value of `any`.
   A sample `snort.conf` file is shown below, but depending on where the Decoder is placed in the network, and which threats need to be captured, you might need to alter the configuration.
   For example, you can be more specific about the internal subnets by defining `ipvar HOME_NET [192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12]`. However, if the Decoder is capturing

traffic on a DMZ, those subnets might not be accurate.
Also, if `HOME_NET` has been defined, and the `EXTERNAL_NET` has also been narrowed down to `ipvar EXTERNAL_NET !$HOME_NET`, then you may miss lateral movement traffic (for example, `192.168/16` to `192.168/16`) within your environment. In general we suggest you align this configuration file with how you configure the `traffic_flow` configuration for the corresponding Traffic Flow Lua parser.

An example `snort.conf` file that is a good starting point:

```
#Configure the network addresses you are protecting
ipvar HOME_NET any
#Configure the network addresses external to your environment
ipvar EXTERNAL_NET any
#Configure any specific network ports
portvar HTTP_PORTS any
```

2. Generate or upload a Snort rules file into the same directory (`/etc/netwitness/ng/parsers/snort`). Read the Snort documentation at https://www.snort.org/#documents for details on how to construct rules. There are many free community-generated Snort rules available as well, that can be uploaded from https://www.snort.org/downloads/#rule-downloads. Several other sites publish Snort signatures as responses to new threats that are found. The basic rule structure and supported sections are mentioned in Rule Sections.

   **Note:** Only the Snort V2.x rules are supported. There are some rule options that are not supported, which are described in Snort Parser Capabilities .

3. Make sure the Snort configuration and rules files do not cause any errors when initialized by the Decoder by running the service restart command on the Decoder.
   The reload will check in the Snort rules without restarting, but does not log any messages about whether there are any issues with the rules or configuration.

   a. In the NetWitness user interface, go to (Admin) > **Services** > **Decoder** > > **View** > **System**.

   b. Select **Shutdown Service** and confirm. (The Decoder will automatically restart.)

   c. Go to > **Services** > **Decoder** > > **View** > **Logs**.

   d. Search for Snort to validate that the rules files loaded.
      The log will indicate if the rules files are loaded completely (`full`), partially (`partial`), or if any rules railed to load (`failed`).
      The following are example log entries, using `mysnort.rules`, with two fully supported rules in the file. If any of the rules are marked partial or failure, examine the rules to determine why the load was not successful.

```
Loaded mysnort.rules, full 2, partial 0, failures 0
Loaded 2 snort rules, 2 small tokens, 0 with pcres, 0 partial, 0
unsupported
```

      When you search for Snort, you can find details on configuration variables and warning messages

if they are not defined. The following is an example log entry for a `snort.conf` file that is not fully populated with the minimal IP and port variables.

```
Undefined snort ip variables (will default to any): EXTERNAL_NET, HOME_
NET
Undefined snort port variables (will default to any): HTTPS_PORTS
```

e. Alternatively, you can perform the service restart and review of the logs from the Decoder console:

```
systemctl restart nwdecoder
tail -f /var/log/messages | grep -i snort
```

4. Import or capture network traffic that is known to trigger the Snort rules to validate they are functioning.
5. Validate that the Snort rules are getting triggered by the network traffic or by sample uploaded PCAPs. The Snort statistics can be used to track which rules have been evaluated, compared to generated metadata. For more information, see Rule Statistics . The default metadata generated by Snort rules are: `sig.id`, `sig.name`, `threat.category`, `threat.source`, and `risk.num`. The mapping of Snort rule information to NetWitness Platform metadata, and how to change it, is described in Snort Parser Output.

## Snort Parser Output

When a Snort rule matches a session, it produces meta items. The meta items generated may change depending on the configuration of the Snort parser. Snort parser meta key usage has been updated with a new option for the Snort parser. The option, `Snort="udm=true"` (set to true by default), uses the Aligned Unified Data Model (UDM) key set. For information about UDM, see https://community.rsa.com/community/products/netwitness/rsa-content/udm. By default, the Aligned UDM key set is used.

**Note:** To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

The following keys are generated in the Aligned Unified Data Mode:

- `sig.id` with the value of the rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `sig.name` with the value of the rule's `msg` field
- `risk.num` with the value of the rule's priority

The following keys are generated in Legacy Key Mode:

- `alert.id` with the value of rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `risk.info`, `risk.suspicious`, or `risk.warning` depending on the priority of the rule. The value of the risk meta is the rule's `msg` field.

If you want to use the legacy key set which contains keys that are consistent with previous releases for Snort parser meta keys, follow these steps.

1. In the NetWitness User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder and then click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In the right panel, in `parser.options`, add `Snort="udm=false"`.

## Rule Statistics

The Snort parser maintains counters to monitor the activity of each rule. These counters can be retrieved using the running `snrtStat` on the Decoder's `/decoder/parsers` node, which can be accessed through the NwConsole utility or the REST interface. The statistics reported for each rule are:

- `evaluations`: This counts the number of times the rule was evaluated. A rule can be evaluated once for each stream in a session. Typically a rule will only match one side of a session, and will be evaluated, at most, once. The `content` strings determine if a rule will be evaluated in a session. A `content` pattern must match somewhere in the session in order for it to be evaluated.
- `hits`: This counts the number of times a rule matched and the corresponding alert meta item was created.

To review the Snort statistics when using the Decoder console:

1. Log in to the console locally or remotely
2. Type the command `NwConsole`
3. Log in to `localhost:50004 <admin> <netwitness>` (change login credentials accordingly)
4. Enter `/decoder/parsers snrtStat`

The output is a JSON structure listing the number of evaluations and hits performed, along with the options evaluated, for each Snort ID.

## Configuration Directives

Decoder supports a limited number of configuration directives.

### Variable Definitions

Decoder supports definitions of variables that hold the value of IP ranges using `ipvar` or Port ranges using `portvar`. For example, Snort rules usually make use of `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` variables. These have to be defined in your configuration file. If they are undefined, they default to the special value `any`.

### ruletype

The definition of additional rule types is supported. However, only rules that have a base rule type of `alert` are supported. Rule type definitions follow the same definition format as Snort configuration.

### Other Configuration Entries

#### *config detection: debug*

Adding this configuration line turns on debug messages that are generated as the rule is being processed. These debug messages are generally emitted only emitted when a rule matches a session by one of the content patterns, but then fails to match other options within the rule. This is useful for debugging complex filters in Snort rules, to determine why they may not be matching as expected.

#### *config nopcre*

Adding this configuration line turns off the PCRE (regular expression) capability.

#### *config classification*

Classification configuration influences how meta is generated when a rule matches a session. Meta output from Snort rule matches is described in Snort Parser Output.

## Snort Parser Capabilities

The general format of a Snort rule is that it contains a rule header and rule options. The rule header consists of the rule action, protocol type, source-destination criteria (IP addresses, ports), and the direction of traffic. The rule options consist of the message (`msg`) which describe what the rule has detected, the references related to the threat or where the rule was generated, the classification of the rule, the unique signature (`rule`) identifier, and a long list of attributes (for example, `flow`, `content`, `pcre`) to define how the traffic is identified. The specific details on which header and rule options are supported are outlined in the remainder of this section.

### Rule Sections

| Section | Description |
|---|---|
| Header | The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met. |
| Actions | The specified action or a rule must be defined (either one of the native Snort actions, or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. The Decoder only uses rules with alert actions. |
| Protocols | The Decoder supports the current Snort protocol keywords (`tcp`, `udp`, `icmp`, `ip`). |
| IP Addresses | The full language for defining IP addresses is supported, including lists, CIDR, and negation. |
| Port Numbers | The full language for defining port numbers is supported, including lists, ranges and negation. |

| Section | Description |
|---|---|
| Direction Operator | The directional operator supports the from-to (‘->’) and bidirectional (‘<>’) values. The to-from (‘<-’) value is invalid and causes the rule to fail to load. |

### Content

The Snort `content` statement makes up the bulk of the Snort pattern detection capability. For best performance, Decoder strives to map `content` patterns to the Token Parser used by most NetWitness parsers. Therefore, the `content` strings are the main mechanism to activate the rule matching engine on a session for a particular rule. If the rule does not have any content patterns, it is effectively unsupported. The Snort parser allows for very short strings patterns in content, but be aware that a rule that contains only very short content may have to be evaluated for every session, which will make the Snort Engine run much more slowly.

The Snort parser supports most forms of `content` statements, including the following modifiers. All modifiers effect the last `content` pattern declared in the rule.

| Option | Description |
|---|---|
| `nocase` | Case-insensitive pattern matching is used. |
| `offset` | This option is applied to the distance of the token from the beginning of the packet. If the number of bytes between the offset point and the start of the token is **less** than this value, it is not a match. |
| `depth` | This option is applied to the distance of the token from the current offset position, or the beginning of the packet if no offset is set. If the number of bytes between the 'offset' point and the beginning of the token is **greater** than this value, it is not a match. |
| `distance` | This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **less** than this value, the token is not a match. |
| `within` | This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **greater** than this value, the token is not a match. |

These content modifiers are supported if the Snort parser is used in conjuction with AppHTTP native parser:

| Option | Description |
|---|---|
| `http_client_body` | The token must appear in the body of an HTTP request. |
| `http_cookie` | The token must appear in an HTTP cookie header. |
| `http_header` | The token must appear any where in in an HTTP request or response header. |

| Option | Description |
|---|---|
| `http_method` | The token must appear in the HTTP method field. The detection engine does not currently restrict the method tokens, such as `GET` or `POST`, to the HTTP method field, so these matches will work even if `AppHTTP` is turned off. |
| `http_uri` | The token must appear in the **normalized** HTTP header. Non-normalized header matches are not supported. |

Further detail on the HTTP related modifiers is described below in HTTP Parsing.

### Flow

The flow directive verifies that the rule is only applied to the client or server stream. It supports the following options.

| Option | Description |
|---|---|
| `to_client` | Limits the rule to only matching on a stream that a Decoder has defined as Server. |
| `from_server` | Synonym for `to_client`. |
| `from_client` | Limits the rule to only matching on a stream that a Decoder has defined as Client. |

### Fast Pattern

The Snort parser uses `content` tagged with `fast_pattern` to indicate tokens that should always be used as tokens in the Decoder's token scanner. Decoder supports the `fast_pattern` and `fast_pattern:only` directives, but it does not support the `fast_pattern:offset,length` directive.

### PCRE

The Snort parser implements `pcre` regex matching using the same libpcre library as other tools. It supports most of the flags documented for the `pcre` tag, with a few minor exceptions as described later in this document.

### HTTP Parsing

The Snort parser relies on the native HTTP parser to notify it when HTTP is being parsed. The HTTP parser feeds information to the Snort engine to let it know which regions of the session should be used to evaluate the `http content` flags. The `pcre` implementation has option flags analogous to the `http content` options, and these are supported as well. If the native HTTP parser is disabled, then these features are also disabled in the Snort parser.

### File Data

The Snort parser supports the `file_data` tag for HTTP response bodies only. This functionality relies on the native HTTP parser being enabled. If the Native HTTP parser has the decompression feature turned on, the Snort parser also uses decompressed responses to implement rule matching inside of `file_data` regions. You can enable the HTTP decompression feature by adding the token `HTTP="decompress=true"` to the configuration field `/decoder/config/parsers.options`.

The Decoder has a Javascript normalization parser that functions similarly to the `normalize_javascript` feature in Snort's HTTP preprocessor. It also affects data presented to Snort rules using `file_data`. To enable the Javascript normalization parser, add the token `JSNormalize="unescape=true"` to the configuration field `/decoder/config/parsers.options`.

The Snort parser emulates the `file_data` behavior in the same way as Snort. Directives that appear after `file_data` are implicitly evaluated whenever a content match is found inside of a `file_data` region. Because of this, `file_data` has side effects on other statements that appear after it in a rule.

### Binary (byte) Directives

The Snort parser supports the `byte_test`, `byte_extract` and `byte_jump` directives.

The detection engine supports most options on these directives:

- The options for extracting the value, such as the offset, the little endian / big endian options, and relative options are supported. The relative flag causes the extraction of the byte value to occur relative to the DOE (Detection Offset End) pointer.
- `byte_jump` and `byte_extract` support the `align` and `multiplier` options to manipulate the extracted value.

The '`byte_extract` directive stores values in variable names that can be used to substitute a number into a few specific locations elsewhere in the rule. These locations are supported:

- The `value` field in a subsequent `byte_test`
- The value of a `within` statement on a subsequent content pattern
- The value of a `distance` statement on a subsequent content declaration.

The `byte_jump` option explicitly moves the DOE (Detection Offset End) pointer for use by subsequent directives, like `byte_test`, content marked with distance or within, or PCRE patterns marked as relative.

There are some less common byte operations that are not supported:

- The byte options do not support the `string` option for converting text into a binary value
- The byte options do not support the `bitmask` option.
- The byte options do not support the `dce` option.

### Default option / fallback

When the Snort parser encounters rule options it does not yet support, it skips those options and assumes they did not prevent the rule from matching. In such cases it relies on the implementation of options it does support, such as the content or pcre statements, to determine if the rule matches. This behavior means that the Snort parser is more likely to fail in the `false-positive` direction rather than the `false-negative` direction when using features that Decoder does not yet support.

### Packet Scanning/Scoping

Depending on how the rule is formed, it may be intended to match content entirely within single packets, or it may be intended to match data that spans multiple packets. The Snort parser attempts to handle both cases. Rule statements that are implicitly packet-scoped may be evaluated for every packet available in a session at parse time, and the Snort parser correctly scopes such rules so they only match if the elements of the rule match in a single packet. Conversely, if the rule uses a feature that implies reassembly and reconstruction, such as `file_data`, the Snort parser will allow the rule to be evaluated for the reconstructed portion of the stream that the rule references. This allows the Snort parser to emulate the various buffers that the Snort product provides.

## Known Limitations for Snort Parser

### Decoder Token Match Limits

The Snort Parser is activated by token scanning in Decoder, and therefore is subject to the same limitations on matches as all Decoder parsers. Configuration items such as `parse.bytes.min`, `parse.bytes.max`, timeouts, and size limits all apply to the Snort parser. The Decoder configuration guide describes these parameters in great detail. The Snort parser is implemented on top of reassembled sessions only so that features that require an assembled session can be supported.

### Flow Bits

Flow bit directives, which start with the keyword `flowbits`, are currently mostly ignored by the Snort detection engine. Statements in rules that test flow bits currently always pass. However, the detection engine will honor flowbit directives that specify `noalert`. Rules marked as `noalert` never generate meta, even if they match.

### DCE Preprocessor

The Snort parser does not currently implement any DCE preprocessors, so any features that rely on the DCE preprocessor are not implemented.

### Thresholds and Filters

The Snort parser implements the `threshold` filters option only. It does not yet implement the `detection_filter` filter.

### Raw Byte Scanning

The Snort parser does not currently allow rules to individually bypass the normalization or decoding using tags like `rawbytes`.

### IPv6

The Snort rule parser does not currently allow rules to utilize IPv6 addresses as part of their header.

**Note:** Only the Snort V2.x rules are supported.

## Performance Considerations

The performance of the Snort parser is dependent entirely on the rules that are being evaluated. Therefore it will vary greatly from one installation to another.

### Content Tokens

Content tokens form the main entry point into the Snort engine. Hence they are the main factor affecting rules performance. The more times that a content string is found in the packet stream, the more work the Snort parser performs, and the more CPU time it uses. Therefore, it's important to use content tokens that are long, unique, and unlikely to appear in random data. Short tokens will spuriously activate the Snort parser, wasting CPU time.

### Negation

Statements like `content` and `pcre` support negation, meaning they only allow the rule to match if a content string is not found or if a regex doesn't match. These are usually detrimental to performance because they still tend to contain strings that will activate rule evaluation, yet will often fail since they are intended to filter out patterns. For example, a negated `pcre` search still has to be evaluated if it is negated, and if it is used to filter out common text. it will produce lots of CPU activity on traffic that does not actually match the Snort rule.

## Search Parser

The Search Parser is a custom parser used to generate metadata by scanning for predefined keywords and regular expressions. The parser searches the payload of a reconstructed session for string matches and can execute a regular expression search. You can configure the parser by editing the **search.ini** file.

**Caution:** The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. There are three basic search methods:

- Keyword: Search a stream for a specific set of words
- Pattern: Search a stream for a regular expression match
- Keyword + Pattern: Search a stream for a regular expression if it contains any of a given set of keywords.

### Search Methods

The Search parser uses three basic search methods:

- Keyword: Search a stream for a specific set of words.
- Pattern: Search a stream for a regular expression match.
- Keyword+Pattern: Search a stream for a regular expression if it contains any of a given set of key words.

### Syntax

```
Maxrecon=<max_size>Maxsearch=<max_ssearch_length>MatchLimit=<max_matches_per_
stream
Search Name
Services=<service_id_list>Keywords=<keyword_list>|Pattern=<expression>Case=0|1
Proximity=<number_of_bytes>Recon=0|1
Raw=0|1
```

### Parameters

Parameters used in this command:

| Parameter | Description |
|---|---|
| `autocheck` | Automatically fixes all problems without prompting |
| `header Only` | Check/display the header of each file |

| Parameter | Description |
|---|---|
| `chatty` | Displays a hex dump of every object in the file (huge amount of data) |
| `dump#-#` | Indicates a zero-based object or range of objects in the file to output in hex to the console |

## Example

Following is an example of the command:

To check all NetWitness database files located in the Collection named Default. If any problems are found, the command will describe the problem and ask if you would like to fix it.

```
dbcheck C:\Documents and Settings\User\My Documents\NetWitness\
Investigations\Default\*.nw*
```

## Wireless LAN Configuration

One of the files available for editing in the Services Config view > Files tab is **wlan-config.xml**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's "Per Packet Information" (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan-config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

## Troubleshooting Parsers

This topic provides guidance for troubleshooting issues related to parsers.

### Lua Parser Errors

Lua parsers occasionally generate errors. If a parser enters a state where it generates multiple errors, these errors can hinder performance. Beginning with 11.4, a new option is available for Lua parsers that instructs the Decoder to automatically disable the parser after a configurable number of errors.

The value is set on the `/decoder/parsers/config/parsers.options` configuration node as shown in the following example:

```
Entropy="log2=true" GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst" error_
parser="errorMax=5" addy_parser="errorMax=10"
```

This configuration node enables you to set options for different parsers. In this example, the Lua parser `error_parser` is configured with a maximum error count of 5, and the `addy_parser` to 10. The `errorMax` setting has a valid range of values from 0 (meaning the feature is disabled) to 65,535, and takes effect when parsers are loaded or reloaded.

#### To disable a Lua parser after a defined number of errors:

1. Go to **ADMIN** > **Services**, select a Decoder and then select > **View** > **Explore**.
2. In the left panel, expand **decoder** > **parsers**, and select **config**.
3. In **parsers.options**, add the following command, where `<any_parser>` is the Lua parser for which you want to limit errors, and `<n>` is the number of errors to which the parser is limited:
   `<any_parser>="errorMax=<n>"`

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

### Results of Automatically Disabling a Parser

When a parser is automatically disabled, a log message is generated (per parser thread) and states that the parser has been disabled, as shown in the following example:

```
(W) 2019-Apr-25 16:25:33 [Parse] Lua parser 'error_parser' has been disabled
because it exceeded the configured error threshold (5)
```

If detailed statistics for parsers are enabled, the text of the last error is populated in the parser's detailed statistics under `/decoder/parsers/definitions/<parser-name>`. Also, a new attribute has been added to the XML returned by the `/decoder/parsers?msg=schema` call. When the parser is in an error state, the attribute `error` is set to `1` and the `enabled` attribute is set to `0`. When the parser is reset, the values are reset to `0` and `1` respectively.

### Resetting the Parser

If a parser is disabled because it has exceeded the error threshold, it can be reset by reloading the parser. This causes the statistics to reset so that if the faulty parser is still in place, it will function again until the error threshold is met.

## Configure Feeds

NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even Active Directory (AD) information such as physical location or logical department.

You can use the Live module in NetWitness to obtain feeds from outside sources. "Live Content in NetWitness" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

## Custom Feed Definition File Structure

The NetWitness Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

Feed filenames in RSA NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness feed to use the updated feed files.

### Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

**Note:** The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
```

```
    </LanguageKeys>

    <Fields>
    <Field index="1" type="index" key="alias.host" />
    <Field index="4" type="value" key="threat.desc" />
    <Field index="2" type="value" key="threat.source" />
    <Field index="3" type="value" key="threat.category" />
    </Fields>
    </FlatFileFeed>

  </FDF>
```

## Define Multiple Values in a Single Field

The information in this section applies to NetWitness version 11.3.1 and later.

Custom feeds support multiple values in a single field. This allows feeds to generate multiple values of the same meta.

For example:

```
<Fields>

     <Field index="1" type="index" key="lc.cid" />

     <Field index="2" type="value" key="user" separator=";" openchar="("
     closechar=")"/>

</Fields>
```

The second field is defined to accept multiple values in the corresponding CSV file. The following is an example of the defined values:

```
clc1,(bob;tom;sam) clc12,susan clc123,doris
```

This definition means that when we see the `lc.id` with a value of `cic1`, three `username` meta values are generated with the values of `bob`, `tom` and `sam`.

The separator in the field definition for a multi-value field **must** be different than the separator for the feed file itself. Escaping the separator character in field values is **not** supported.

## Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (`.xml`) file.

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| (Define Feed Tab) Feed Type | Select:<br>**Default** - to define a feed based on a `.csv` formatted feed data file.<br>**STIX** - to define a feed based on STIX formatted `.xml` file. |
| (Define Feed Tab) Feed Task Type | Select:<br>**Adhoc** - to create an on-demand feed.<br>**Recurring** - to update the `.csv` or `.xml` file persistently and store it in a location accessible by NetWitness, so NetWitness downloads a file at regular intervals and pushes it to the downstream devices. |

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| (Define Feed tab) **Name** | The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed.<br>**Note:** You can use special characters to define the name of the custom feed. |
| (Define Feed tab) **File**/ **Browse** | This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`. |
| (Advanced Options tab) **XML Feed File** | The name of the feed definition file. For example, `dynamic_dns.xml`. |
| (Advanced Options tab) **Separator** | The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file. For example, a comma. |
| (Advanced Options tab) **Comment** | The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`. |
| (Define Columns tab, Define Index) **Type** | The type of lookup value in the index position of the feed data file.<br>**IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42).<br>**IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24).<br>**Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index. |
| (Define Columns tab, Define Index) **CIDR** | Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation. |
| (Define Columns tab, Define Index) **Service Type** | For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of 0 indicates no filtering by service type. |
| (Define Columns tab, Define Index) **Truncate Domain** | For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation. |

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| (Define Columns tab, Define Index) **Callback Keys** | For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the `user` meta key is chosen, the index column of the `.csv` file needs to be populated with users to be matched. |
| (Define Columns tab, Define Index) **Index Column** | Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. |
| (DEFINE VALUES) **Key** | The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute. |

## Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

**Note:** Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

**`.csv file:`**

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

**`.xml file:`**

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
```

```
        </LanguageKeys>
        <Fields>
                <Field index="1" type="index" range="cidr"/>
                <Field index="2" type="value" key="alert" />
        </Fields>
</FlatFileFeed>
</FDF>
```

**Note:** To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with `range="cidr"`. Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

## Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab. One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to Custom Feed Definition File Structure

## Create a Custom Feed

You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv` or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

**Note:** For information about STIX and creating a STIX custom feed, see "Create a STIX Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

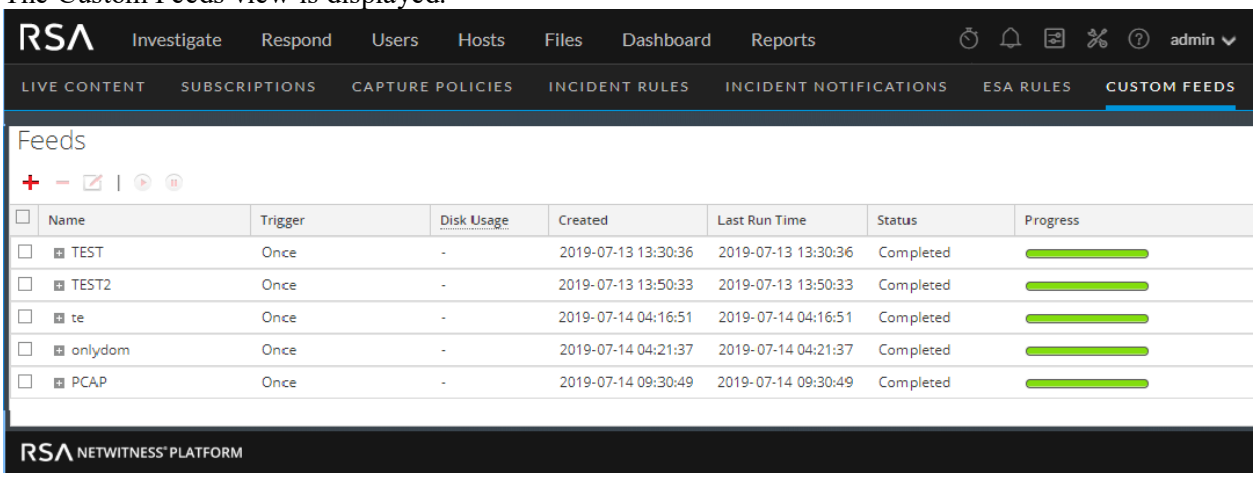
The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

**Note:** When you create a source and destination-based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address. To resolve this issue, create two different feeds using IP addresses and you can use CIDR in these feeds.

### To create a custom feed:

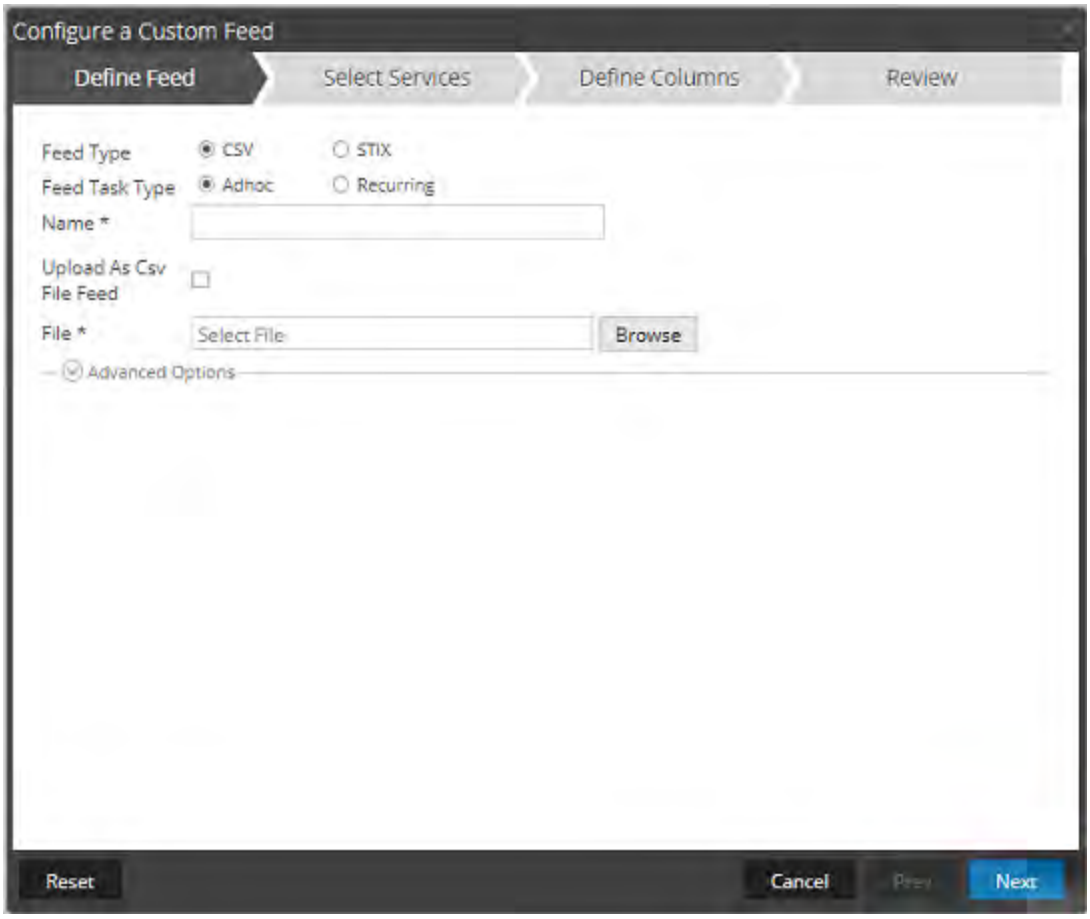
1. Go to **Configure > Custom Feeds.**

   The Custom Feeds view is displayed.



2. In the **Feeds** panel, click + > **Custom Feed** > **Next**.

The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



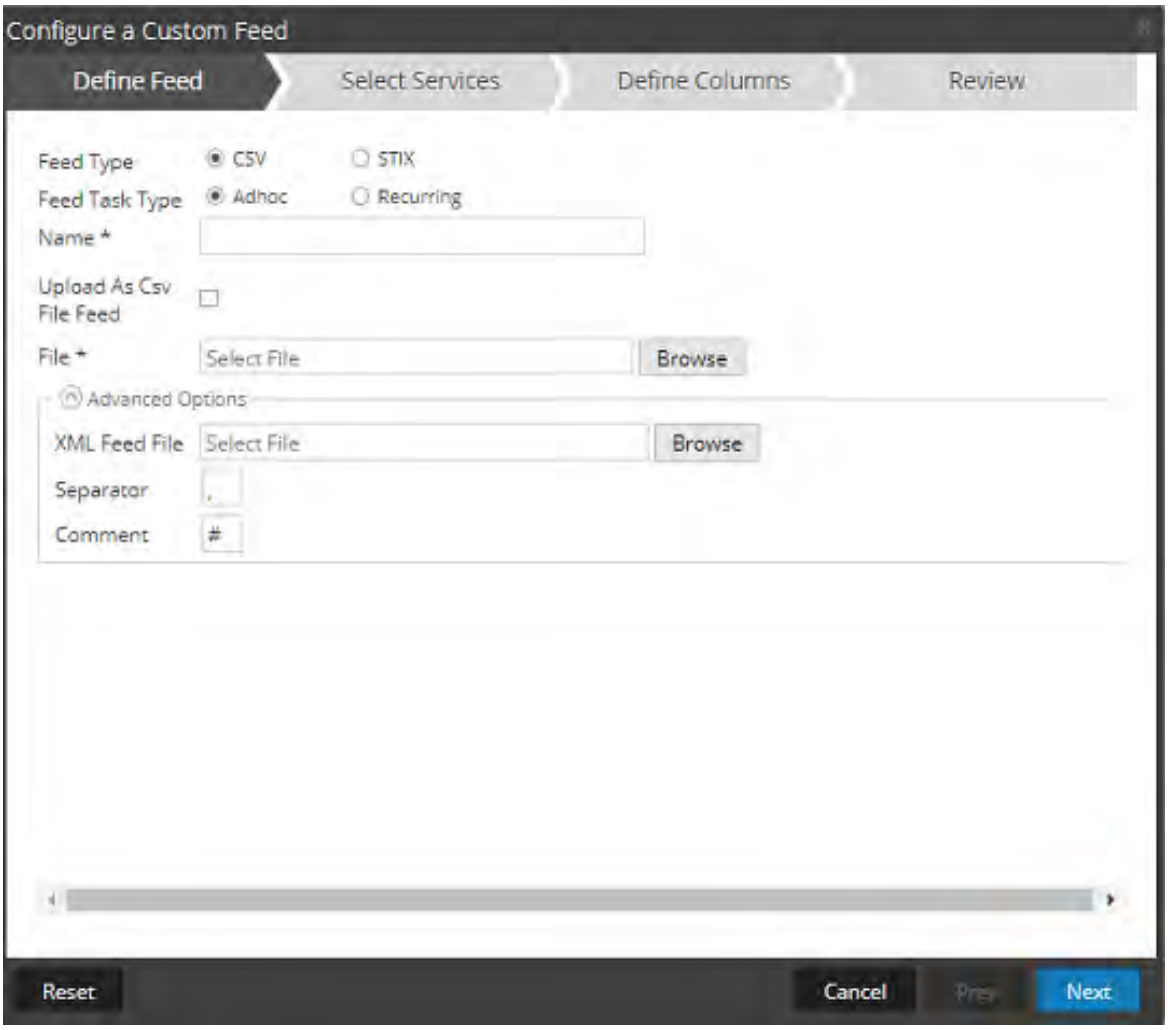
3. Select the Feed Type: **CSV** or **STIX**.
4. To define a feed based on a `.csv` formatted feed data file, select **CSV** (which is the default) in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a CsvFileFeed file, select the **Upload as Csv File Feed** checkbox, type the feed **Name**, select a .csv content file from the local file system, and click **Next**. If you do not select the checkbox, the .csv file will be a FlatFileFeed file.

      **Note:** When you select the Upload as Csv File Feed checkbox, the XML feed options under Advanced are unavailable.

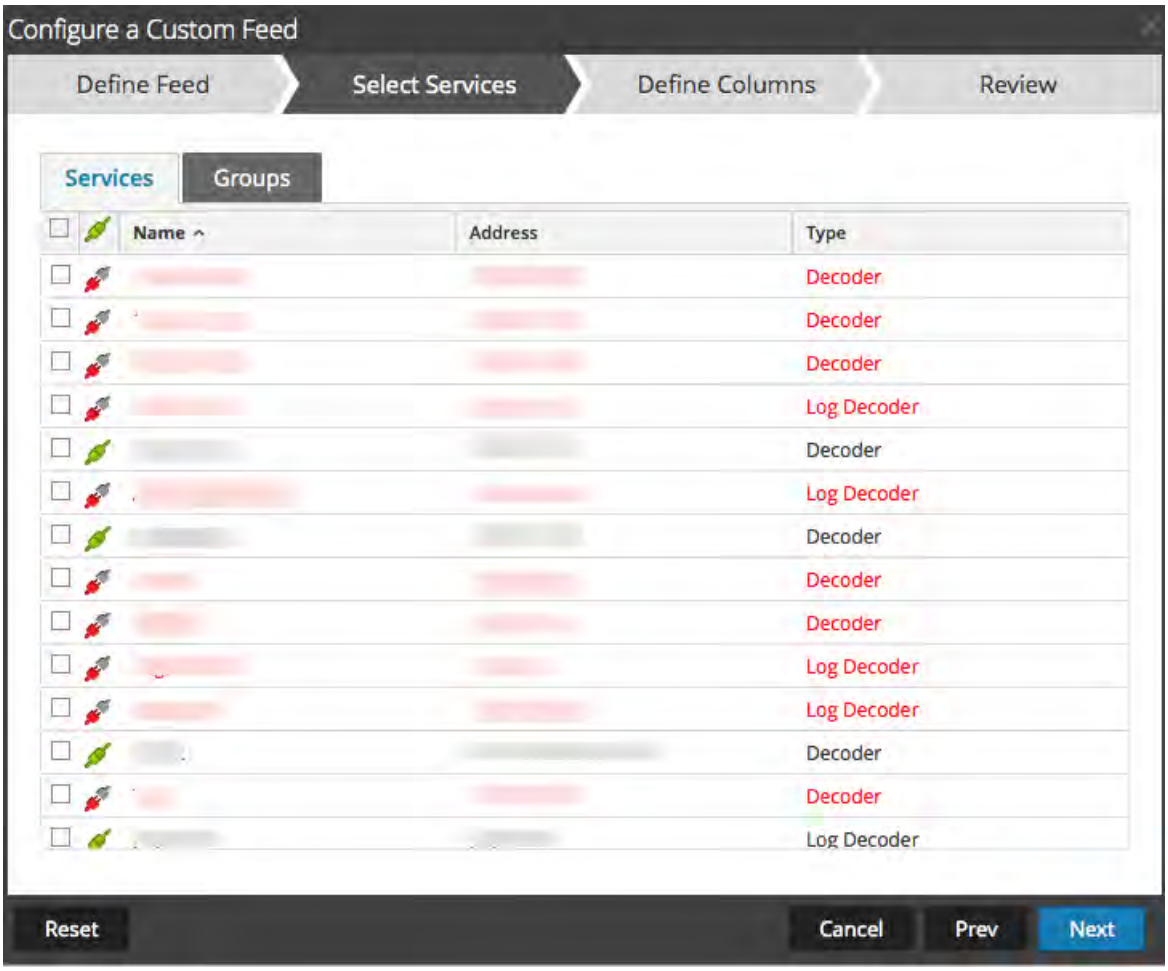
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      **Note:** Ensure that the Upload as Csv File Feed checkbox is deselected.

      The Advanced Options are displayed:



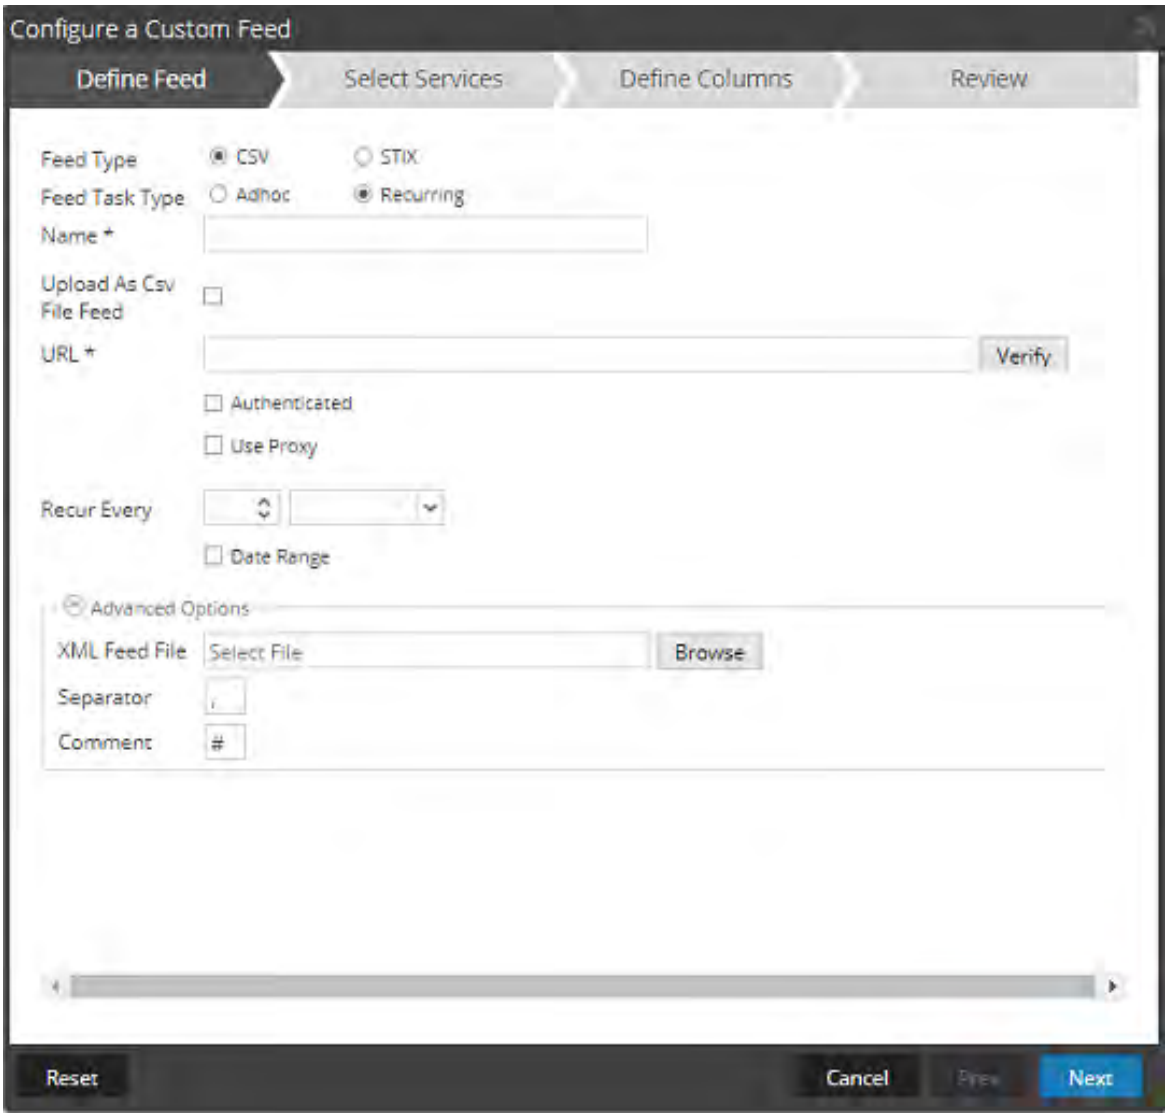
c. Select an XML feed file from the local file system, choose the separator (default is comma), specify the comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range:

   a. In the Define Feed form, select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**. NetWitness verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.
NetWitness provides your user name and password for authentication to the URL.

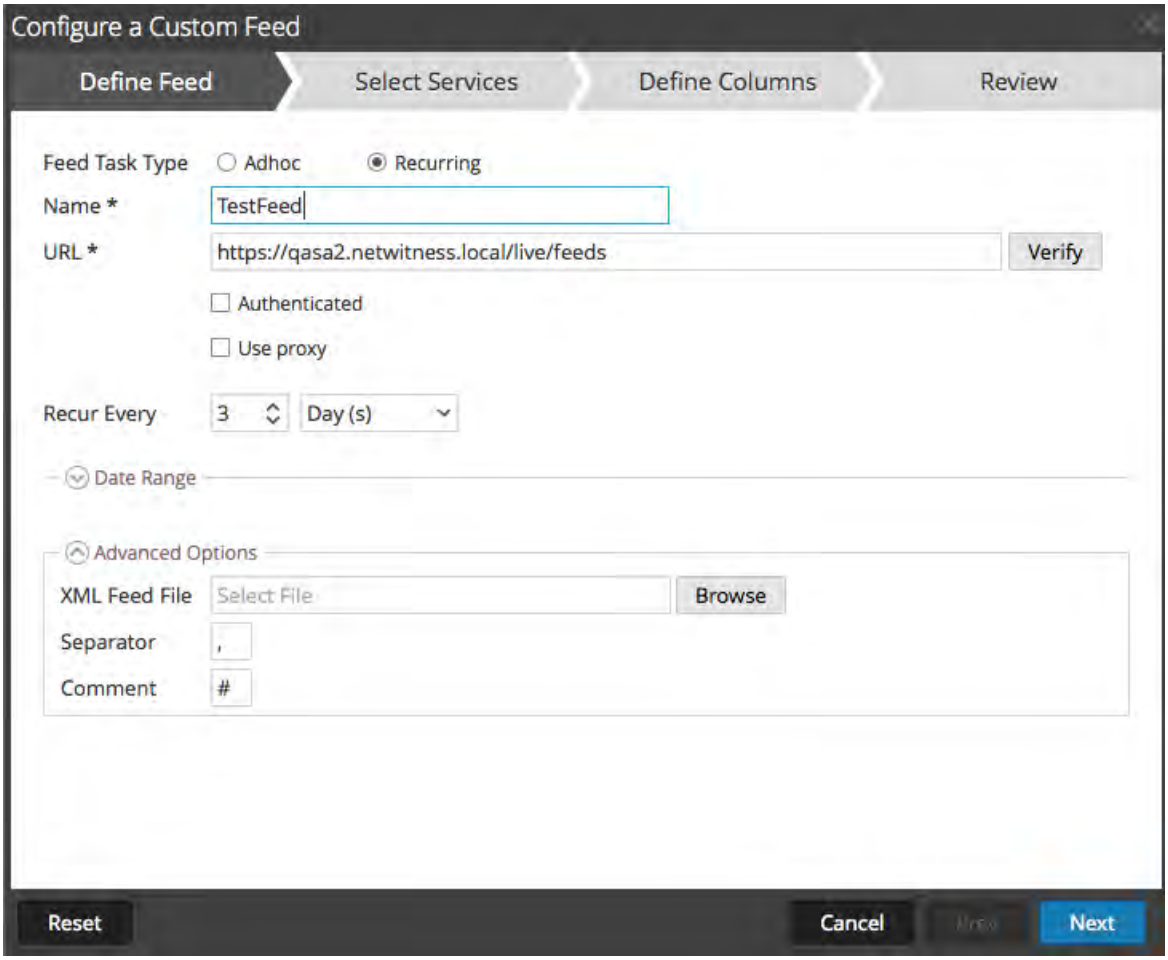
d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not set.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.

- Specify recurrence every week, and select the days of the week.

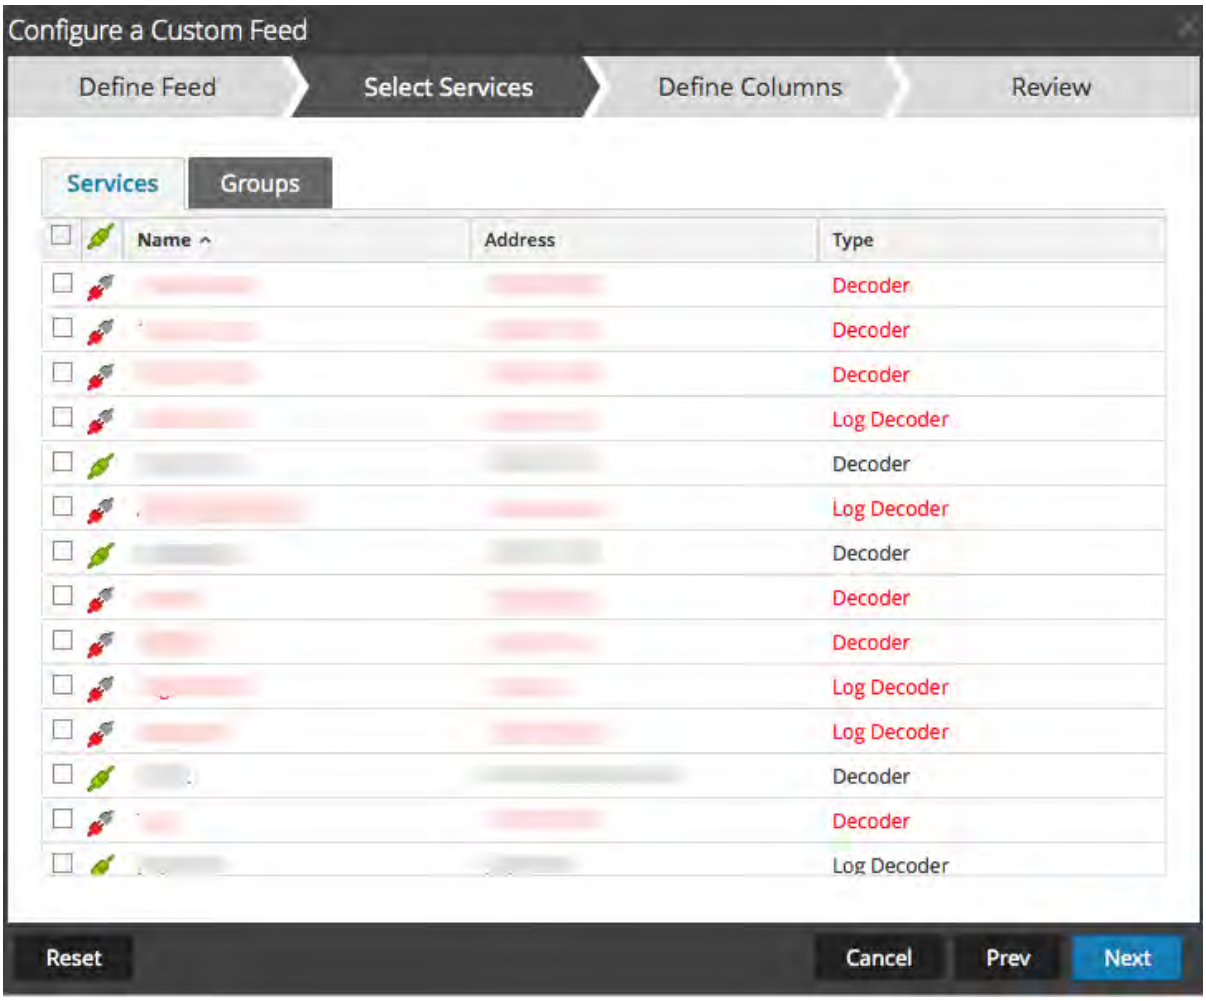
f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



7. (Conditional) If you want to define a feed based on an XML feed file:

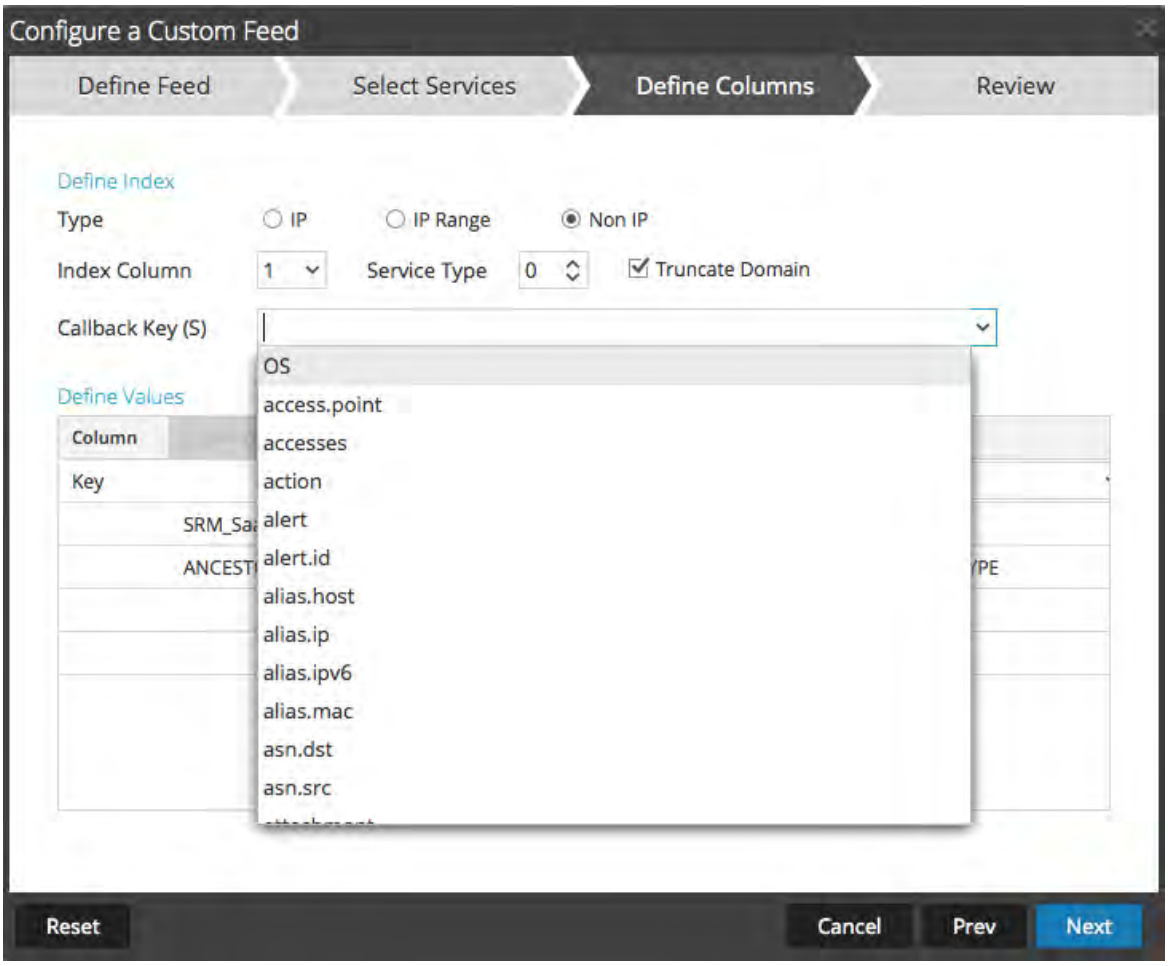
   a. Type the feed **Name**, select **Advanced Options**. The Advanced Options fields are displayed.

   b. Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**. The Select Services form is displayed.

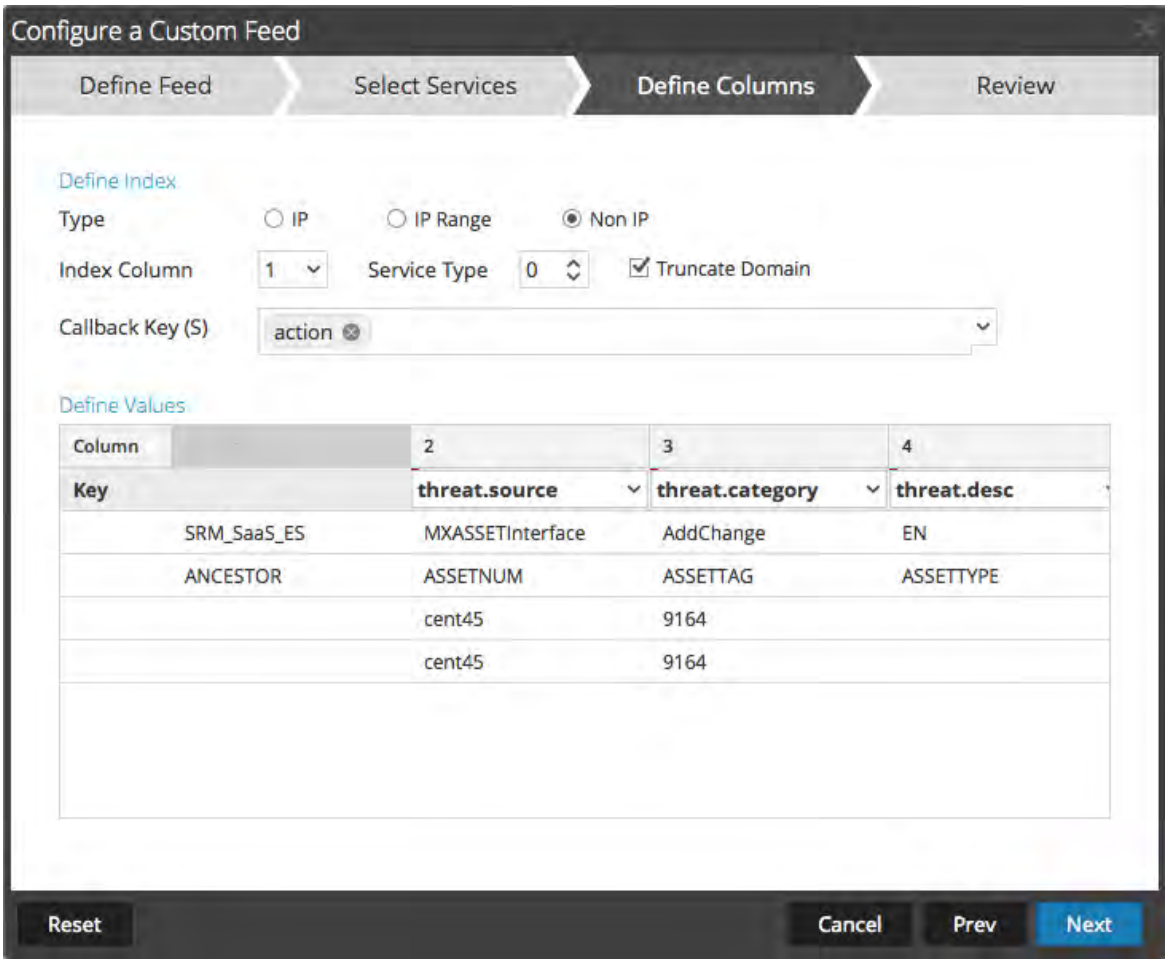


8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns form is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

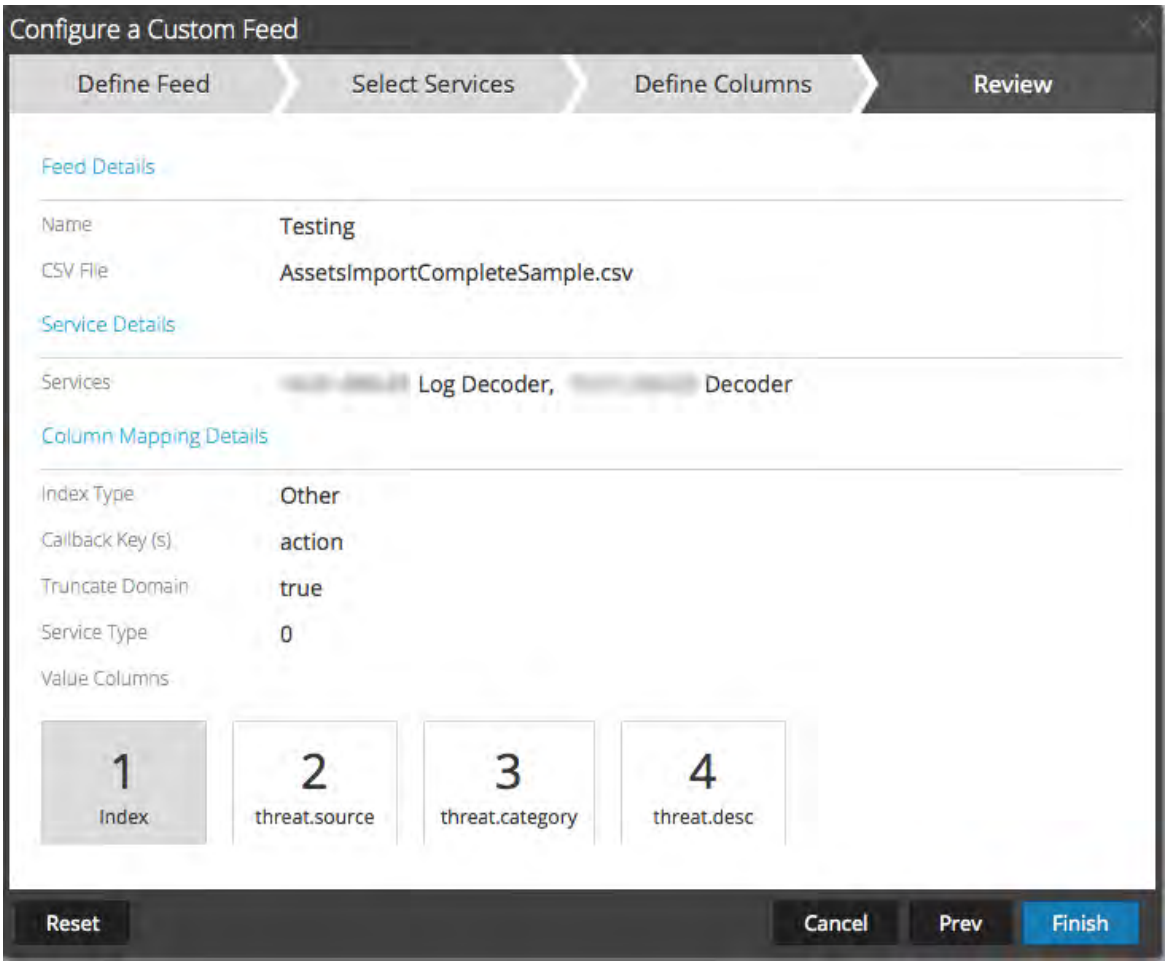


d. Select the language key to apply to the data in each column from the drop-down list. The meta keys displayed in the drop-down list is based on the meta keys available for the service define values. You can also add other meta keys based on advanced expertise.



e. Click **Next**.

The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

## Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness. NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

**Caution:** If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.x, you must re-configure the STIX recurring feed.

In NetWitness, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The property values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

### To create a STIX custom feed:

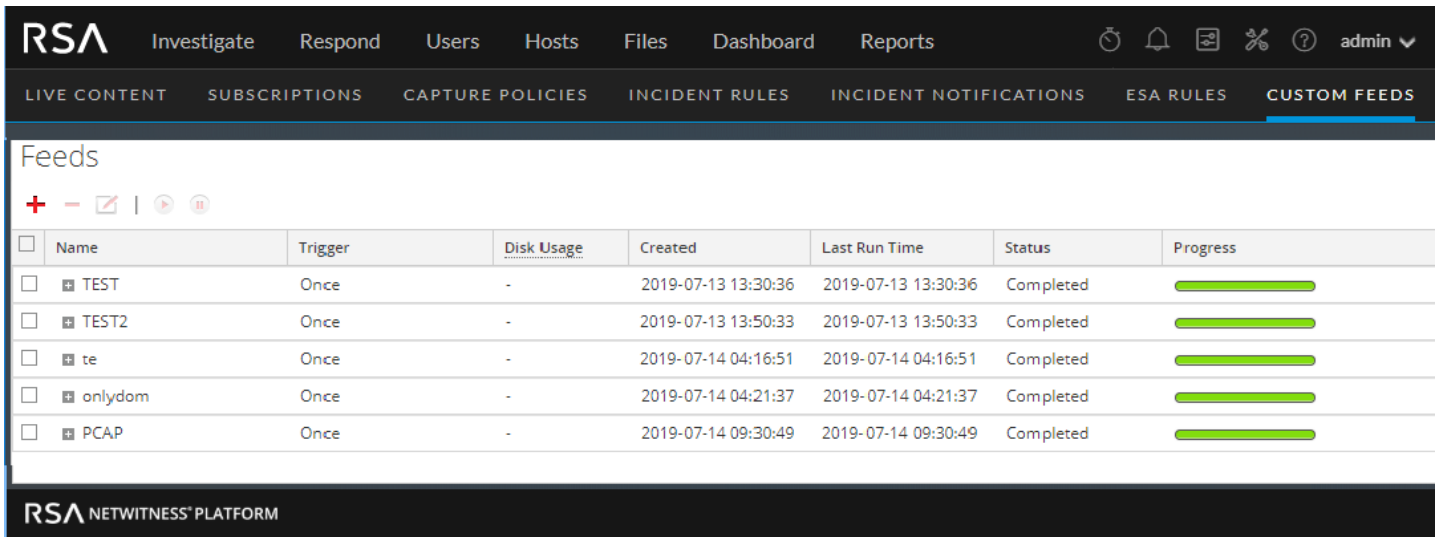
1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide



2. In the toolbar, click +.

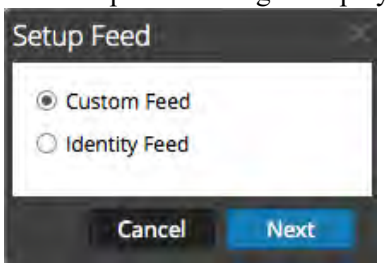
NETWITNESS

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

The Setup Feed dialog is displayed.



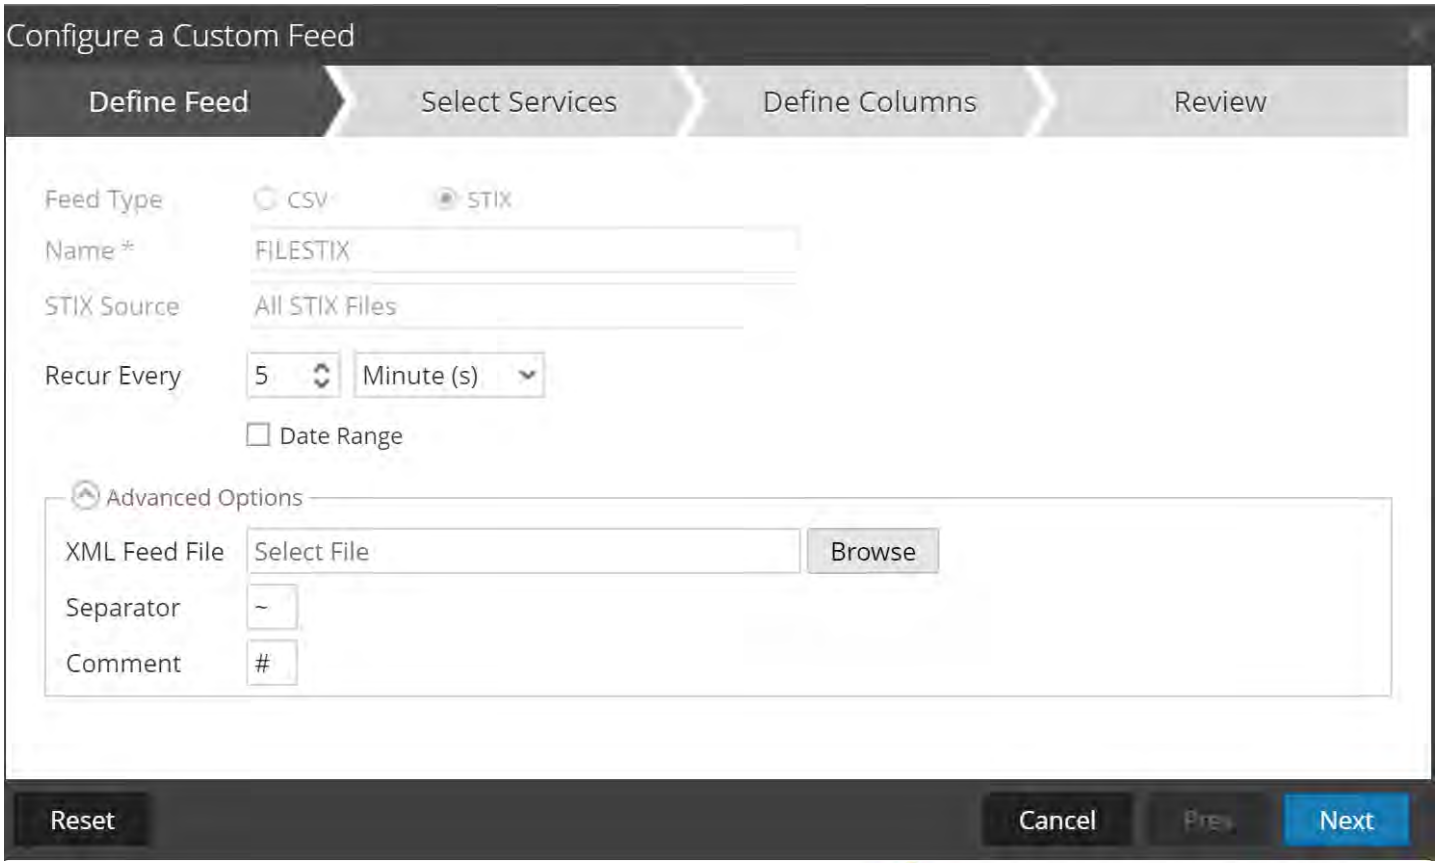
3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide



RSA

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

4. Enter the following details:
   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.
   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.
   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.
   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   **Note:** NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.
5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.
   a. **XML Feed file**: Browse and select an XML feed file from the local file system.
   b. **Separator**: Choose a separator (default is comma).
   c. **Comment**: Specify the comment characters used in the feed data file (default is #).
6. Click **Next**.

NETWITNESS

# RSA® NetWitness

Version 11.7

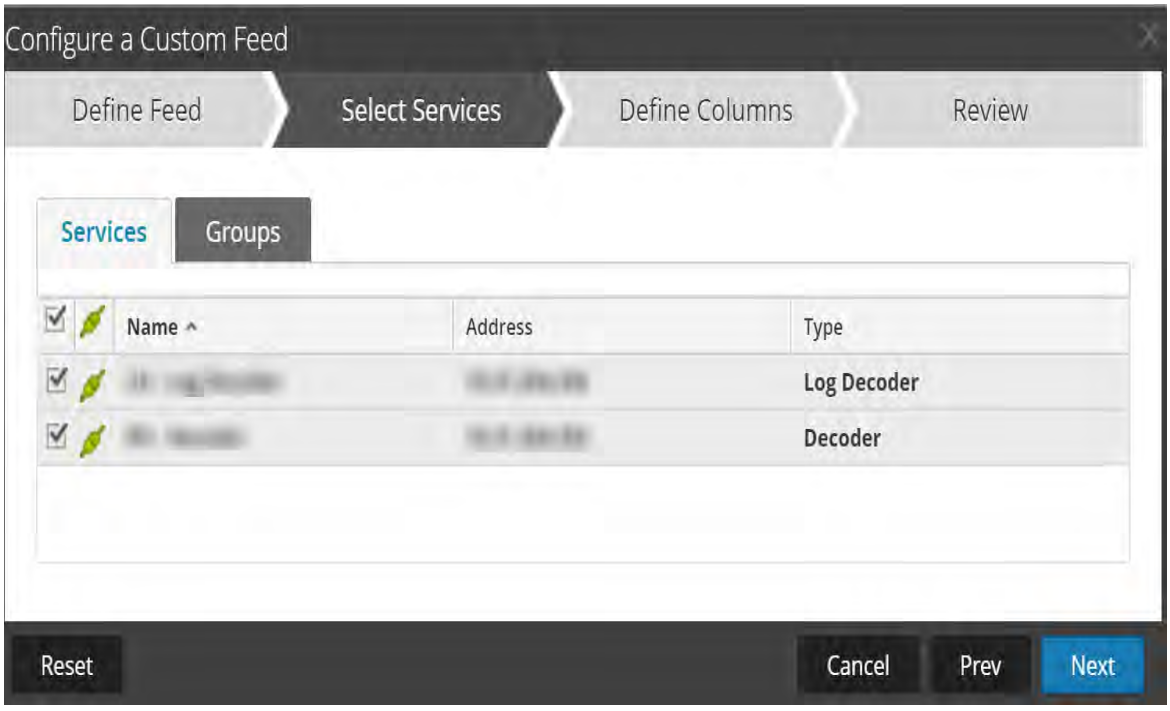
# Decoder Configuration Guide

7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide



NETWITNESS

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

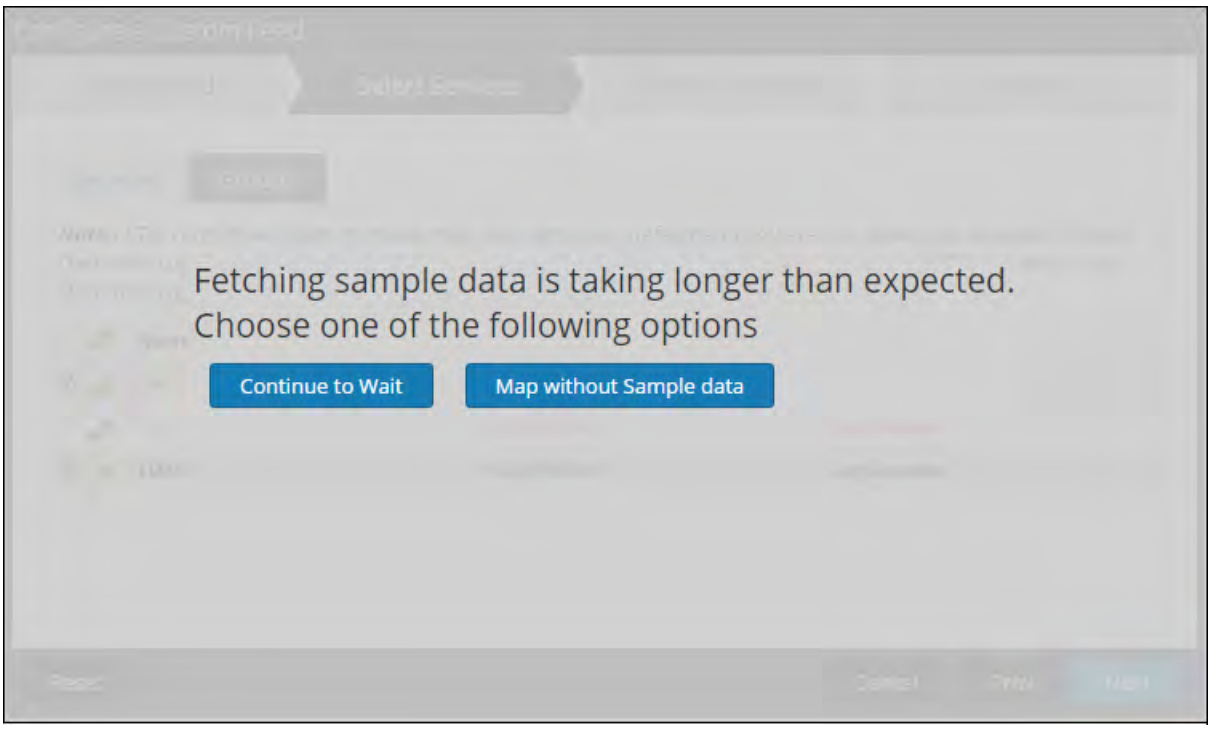
8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide



# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

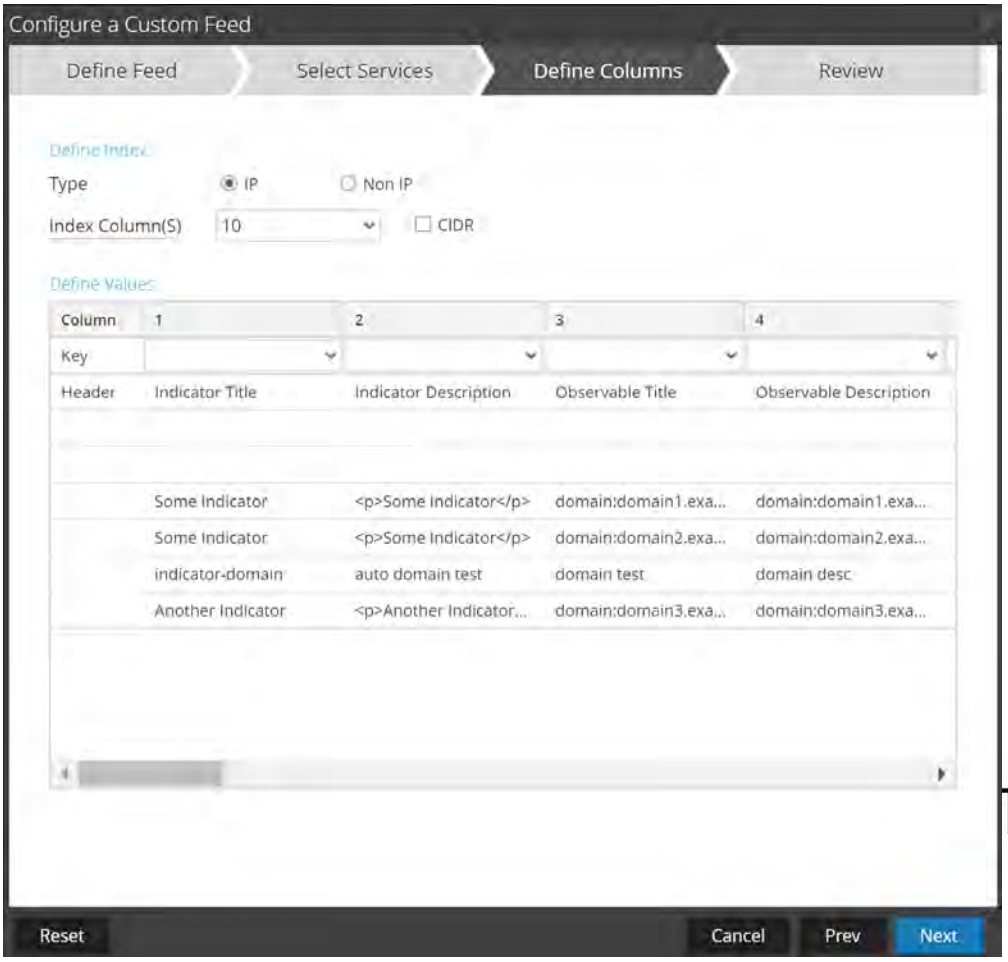
The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide



TWITNESS

RSA

# RSA® NetWitness

Version 11.7

# Decoder Configuration Guide

**Note:**
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.

NETWITNESS

**Note:** Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.

NETWITNESS

## Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

### To create an identity feed:

1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

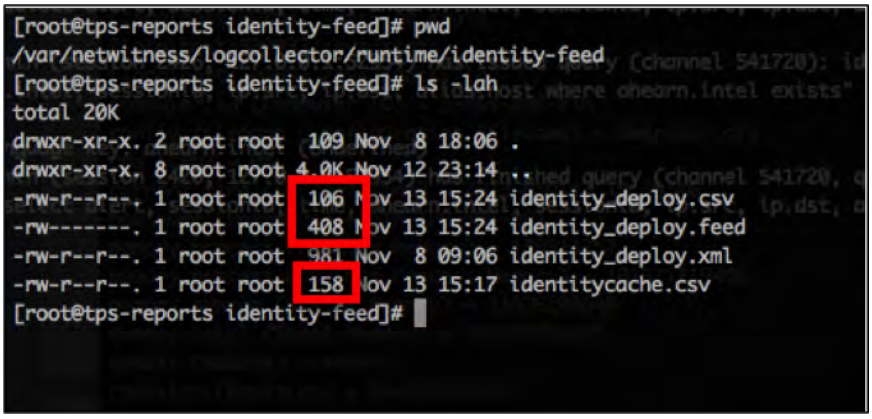
   e. Click and enter a unique name for the feed.

   The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.

a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

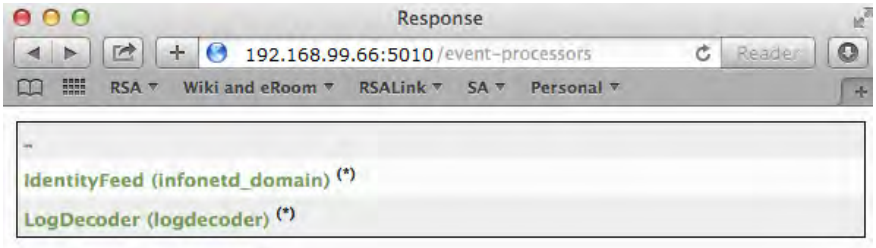
b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.



c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

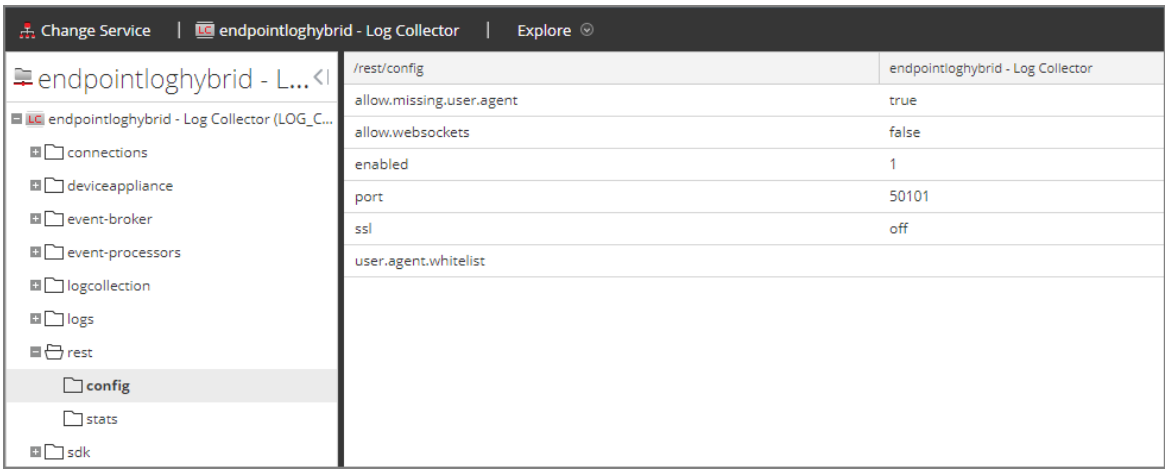


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **(Admin) > Services > *<Log Collector being setup>*** **> View > Explore**.

e. In the left pane, expand **rest > config**.



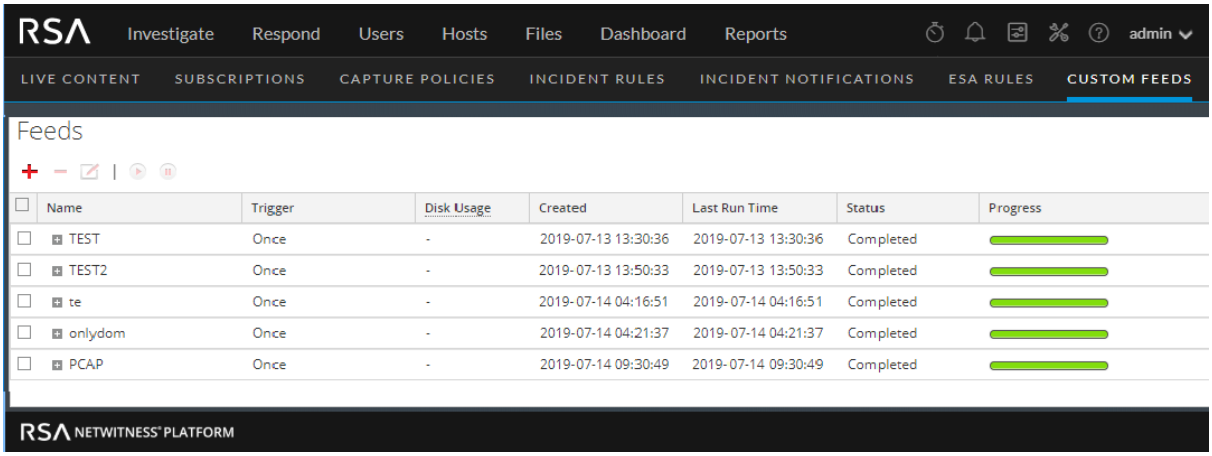
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

**Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

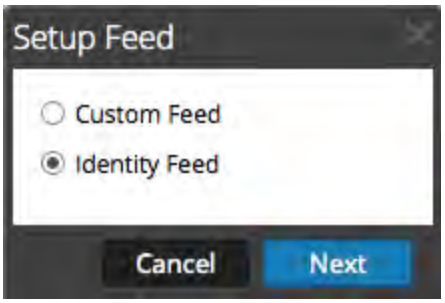
3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.



4. In the toolbar, click .

The Setup Feed dialog is displayed.



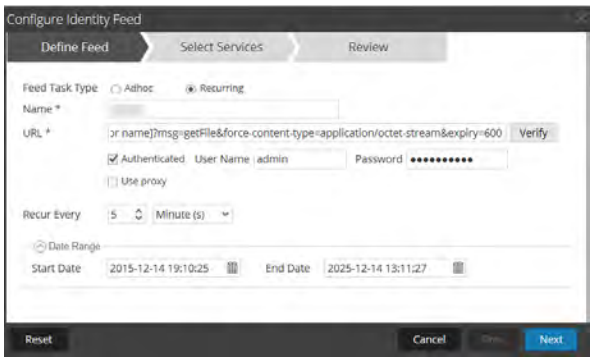
5. Make sure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.



**Note:** RSA NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.)

9. To define the recurrence interval, do one of the following:

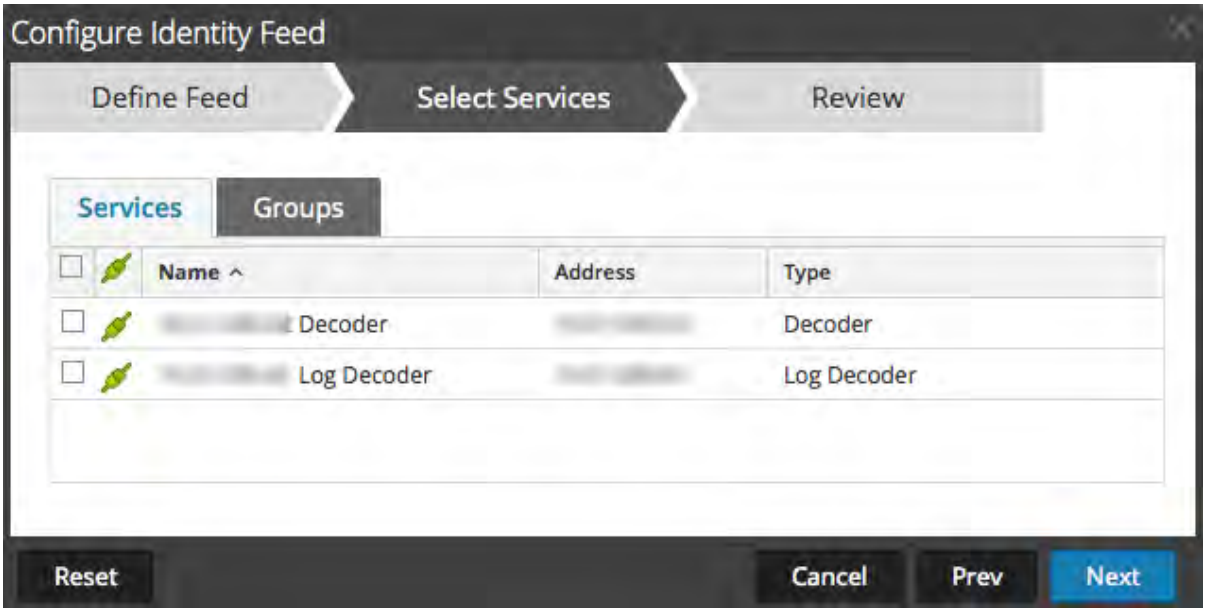
- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

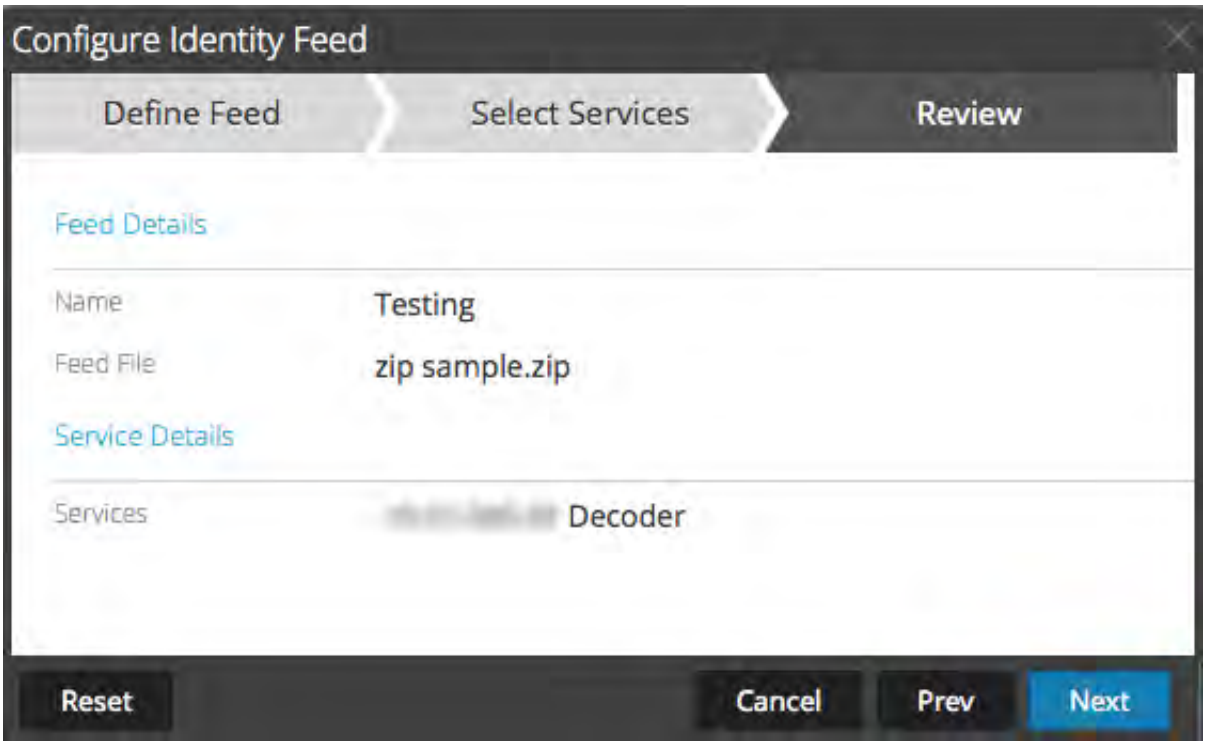
11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

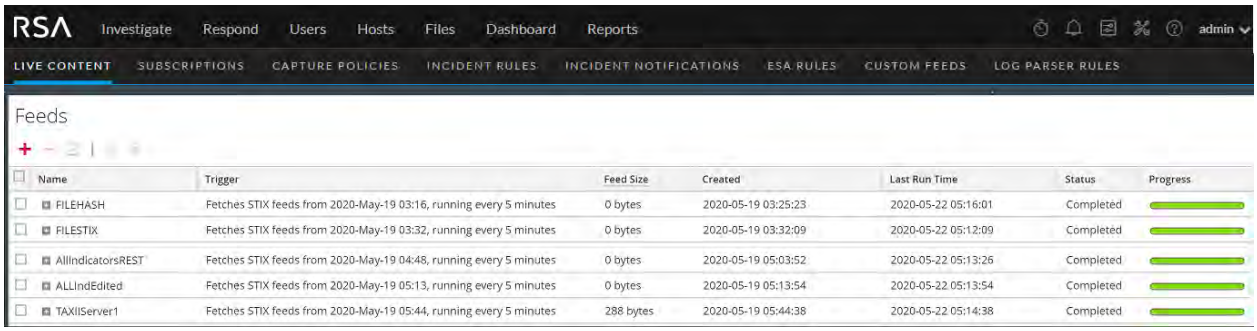
    The Review dialog is displayed.



**Note:** If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



## Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

## Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.

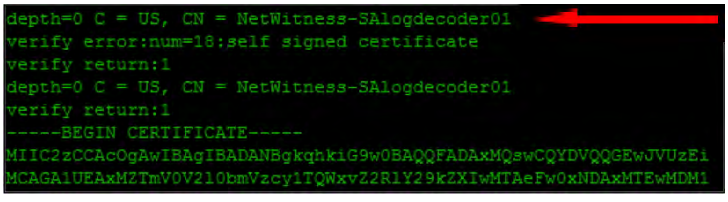
1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

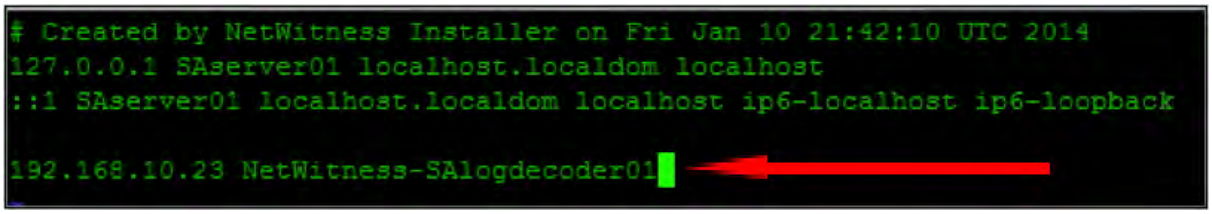
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



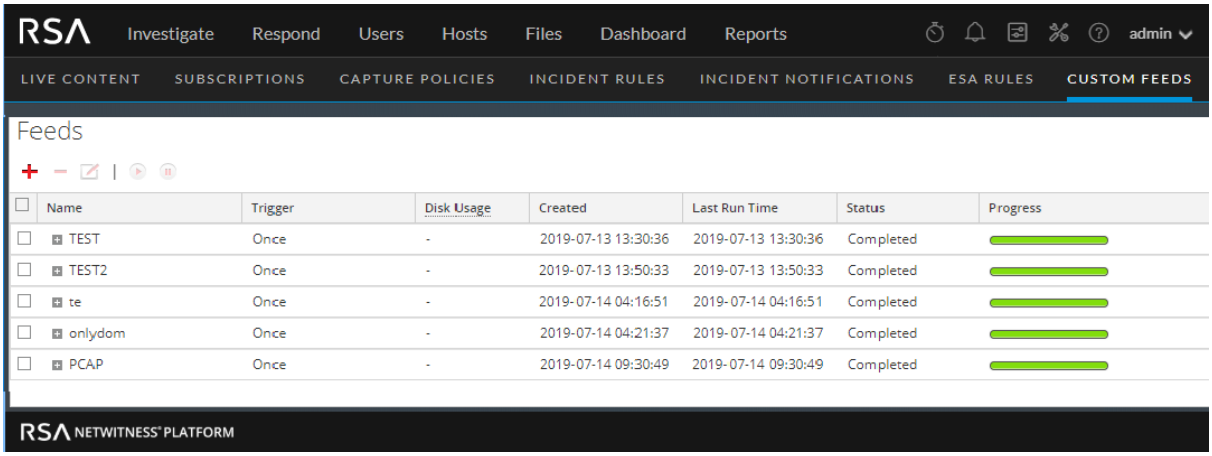
5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

## Edit, Upload, or Remove a Feed

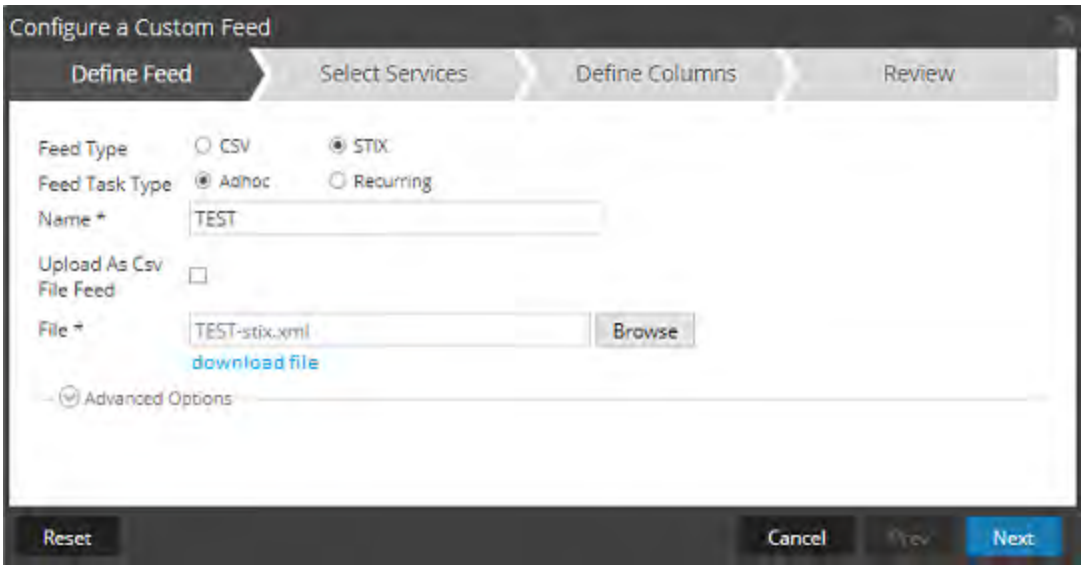
You can upload a feed, edit an existing feed, or remove a feed.

### To edit an existing feed:

1. Go to (Configure) > **Custom Feeds**.
   The Feeds view is displayed.



2. In the toolbar, select a feed and click .
   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:

a. Click **download file**.

   For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

b. Edit and save the file.

c. In the **Define Feed** tab, browse for and open the edited file.

4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous form (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

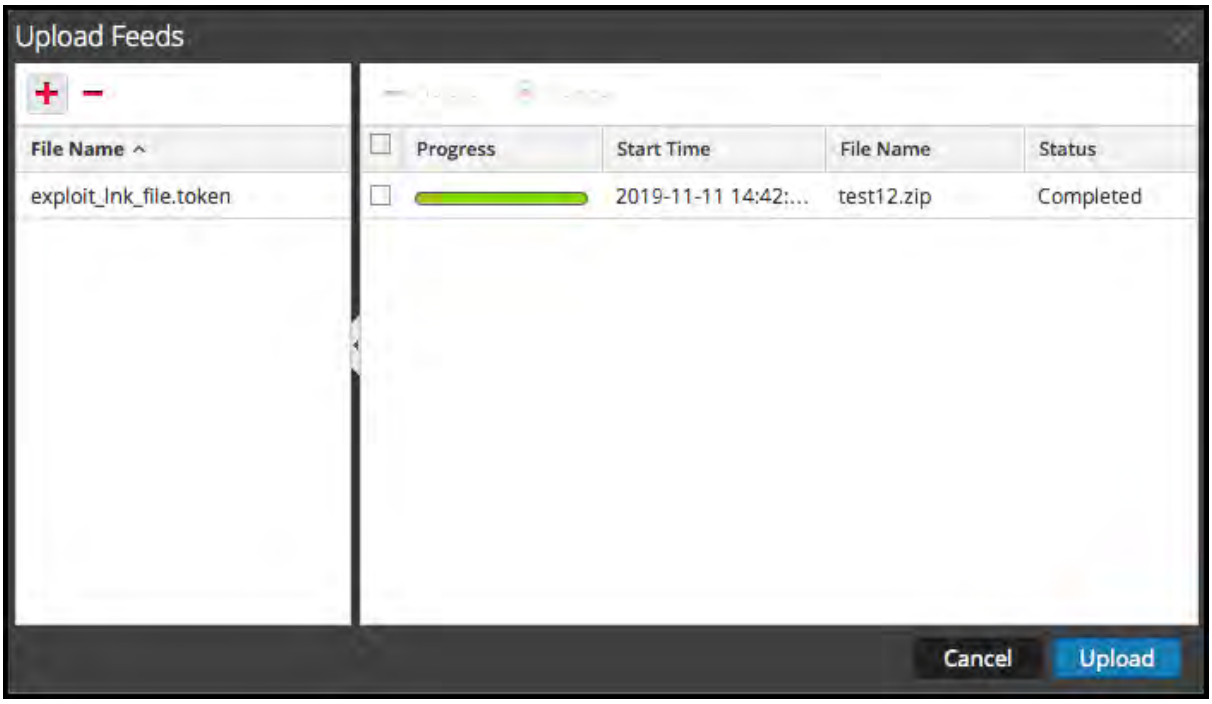
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

### To upload a feed to a Decoder or Log Decoder:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and click **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click .

   The Upload Feeds dialog is displayed.



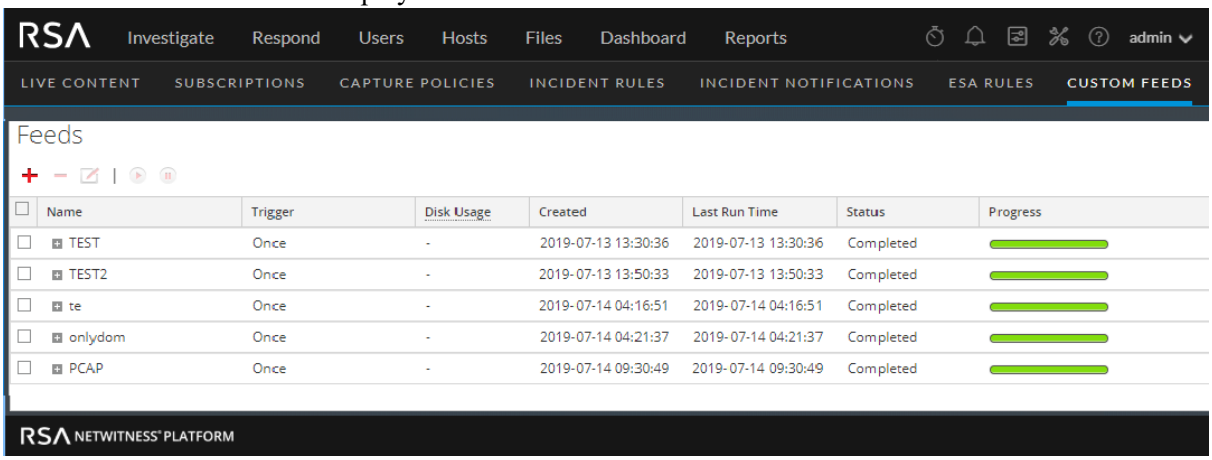
5. In the **File** grid, click + and select a feed file. Supported files are *.feed, *.token, and *.filter.
6. Select the feed file from the **File** list and click **Upload**.

   The Upload Job list is updated to show the progress and status of the uploaded feed.

### To remove a feed:

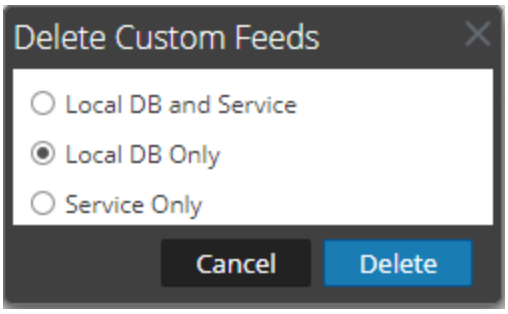
1. Go to (Configure) > **Custom Feeds**.

   The Custom Feeds view is displayed.



2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.



You can select one of the following options to delete the feed:

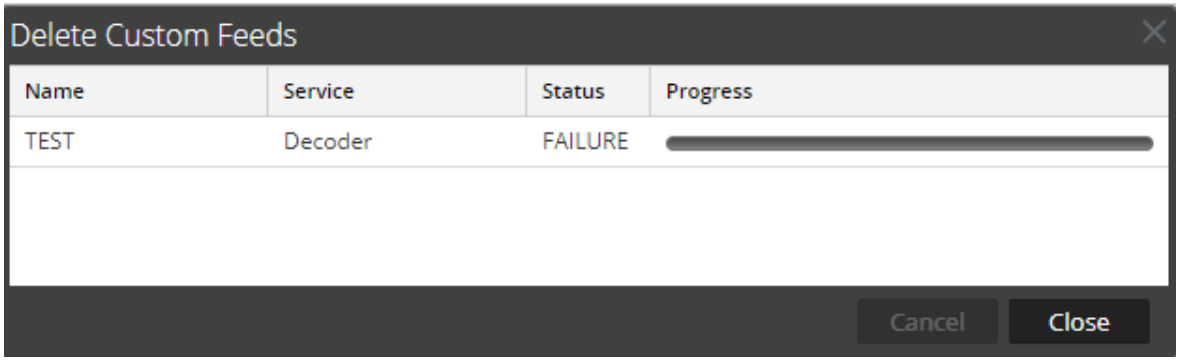
- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer be seen on the NetWitness user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again.

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.



# Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys using a custom feed in the Log Decoder, and highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema. You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data.

Here is an example of creating a custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

**Note:** Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta key in the Decoder.

## Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to (Admin) > **Services** .
2. Select a Log Decoder service and click > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
 name = Name of the key (max is 16 chars)
```

3. Restart the Log Decoder service. In the Services view, click > **Restart**.

**Note:** Following are the NetWitness reserved keywords. Do not use these keywords as custom meta keys as it can cause display error in the NetWitness user interface due to CSS conflicts referencing to the same keywords.

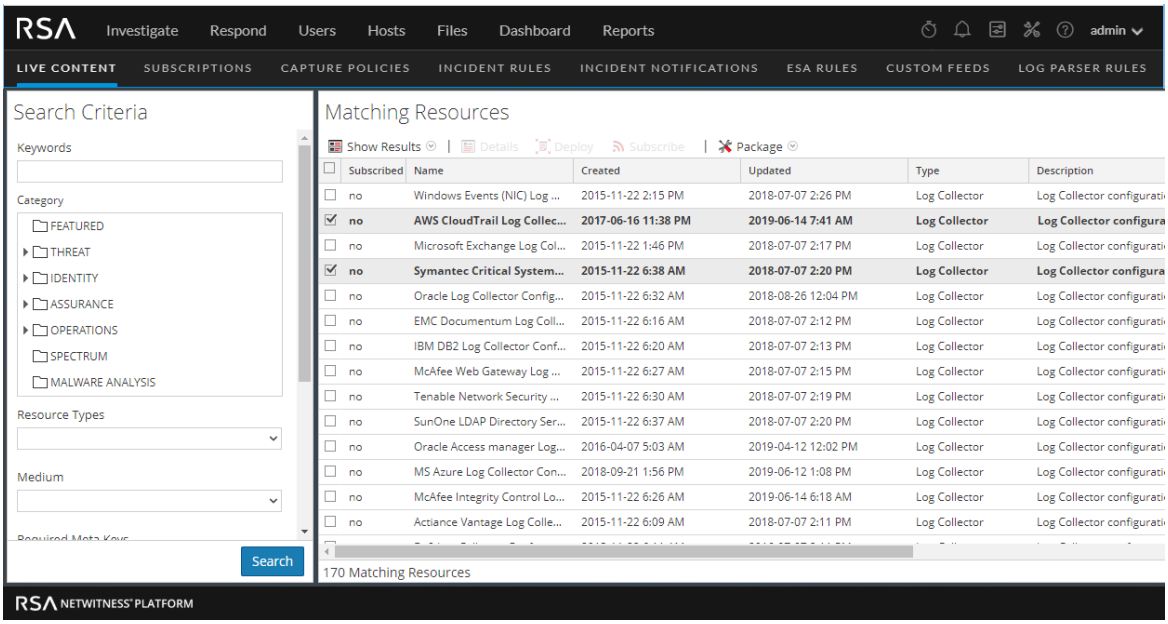
## Deploy a Log Decoder Feed in Live

To deploy the feed in the live environment:

1. Go to (Configure) > **Live Content**
2. Select a group of resources, or a previously created resource package. To select a resource or group of resources:
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).
   b. In the **Matching Resources** panel, select **Show Results > Grid**.

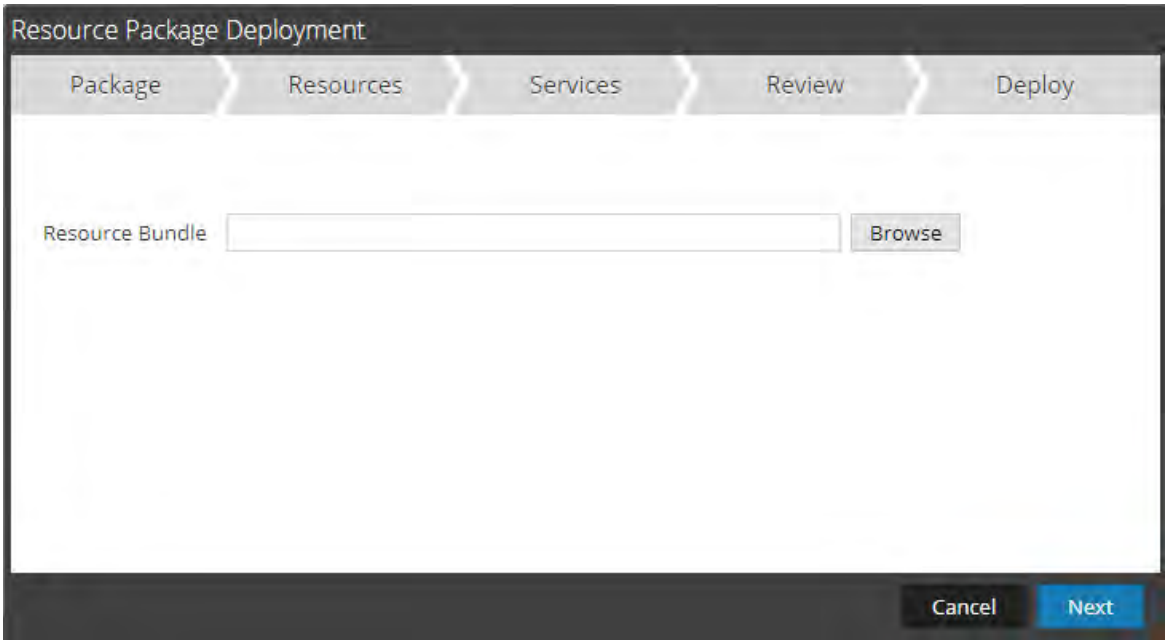
c. Select the checkbox to the left of the resources that you want to deploy.



d. In the Matching Resources toolbar, click Deploy.

3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** :
The Package page of the Resource Package Deployment wizard is displayed.



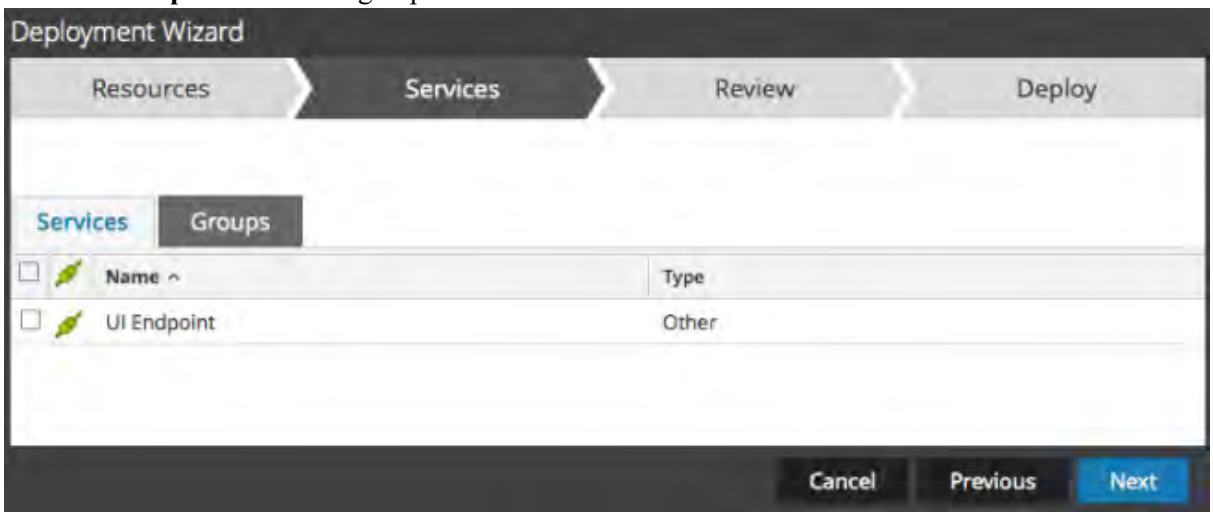
b. Click **Browse** and select a package from your network.

c. Click **Open.**
At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.

3. Click **Next**.
   The **Services** page is displayed. It has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the (Admin) > Services view. The columns are a subset of the columns available in the Services view.

   **Note:** The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.
   Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.
   Use the **Groups** tab to select groups of services.

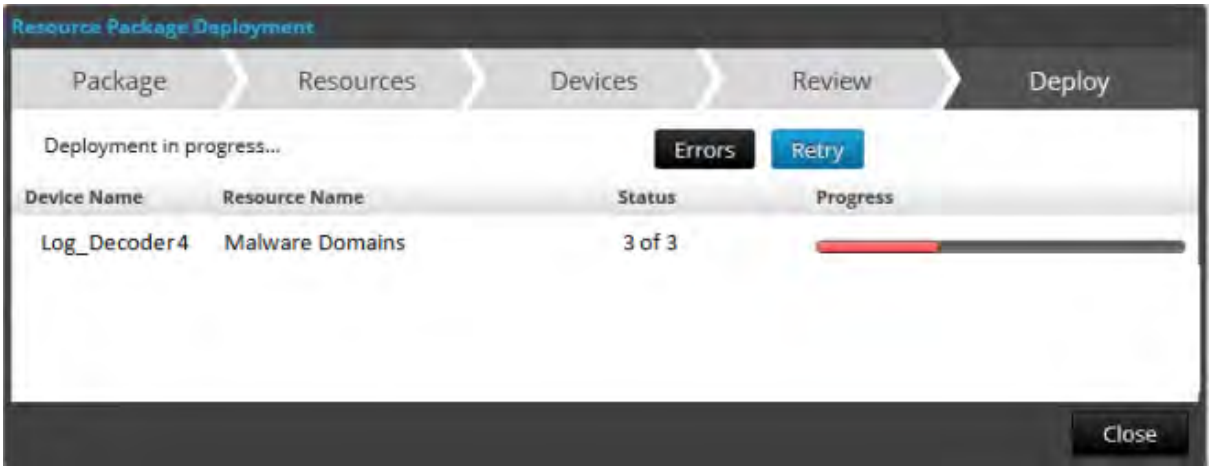


5. Click **Next**.
   The **Review** page is displayed.

   Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

   If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you click to review the errors and retry the deployment.



7. Click **Close**.

> **Note:** The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. Select **alias.host** as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

## Add the Custom Meta Key Entry in the Concentrator Custom Index file

To add the custom meta key entry in the Concentrator custom index file:

1. Go to (Admin) > **Services** > **Concentrator**.
2. Click > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
<Language>
 <?xml version="1.0" encoding="utf-8"?>
 <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
 </Language>
```

4. To restart the Concentrator service, in the Services view, click > **Restart**.

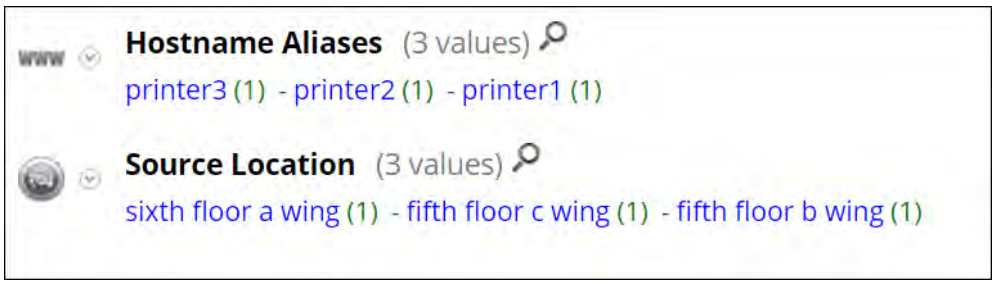
**Note:** In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the Broker. If you have not indexed the meta key in the Concentrator, the Broker does not display the meta key in Investigate.

## Investigate a Custom Meta Key

**Note:** You have to log out and log back in to the NetWitness User Interface in order to view the custom meta key in Investigate.

### To investigate a custom meta key:

1. Go to **Investigate**.
   The Investigate dialog, which provides services, is displayed.
2. Select a Concentrator service, and click **Navigate**.



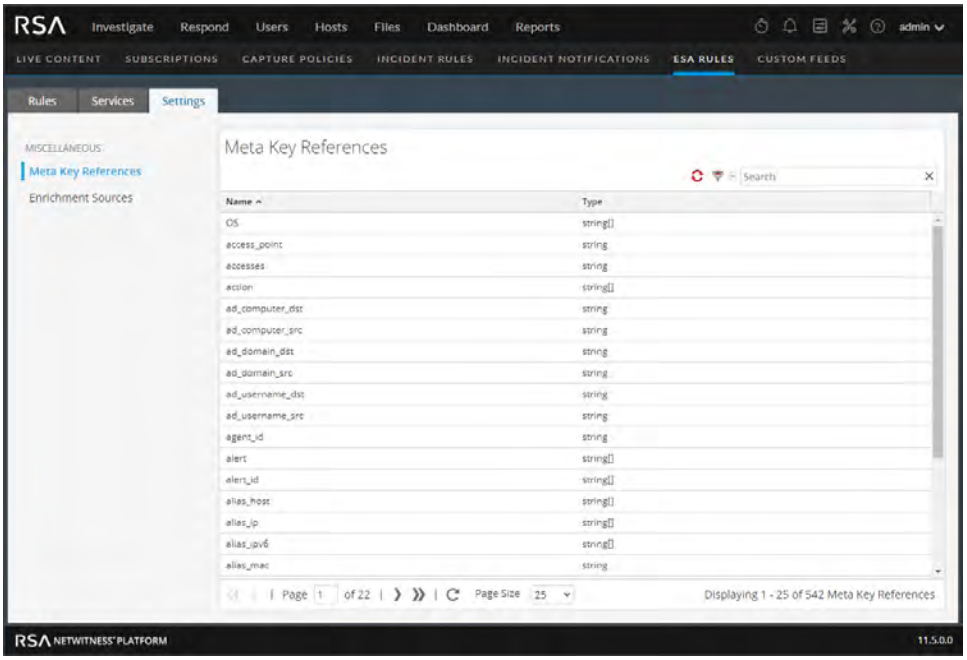
## Additional Procedures

The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine, and ESA configured.

### Verify the Custom Meta Keys on ESA

After you add custom meta keys on the Concentrator, you can verify that your meta keys are updated on ESA.

1. Go to (Configure) > **ESA RULES** > **Settings** tab.



2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).

3. Verify that the custom meta keys appear on ESA. If you do not see the meta keys, you may need to restart the Concentrator.

## Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**
   The Archiver schema is updated with the custom meta key.

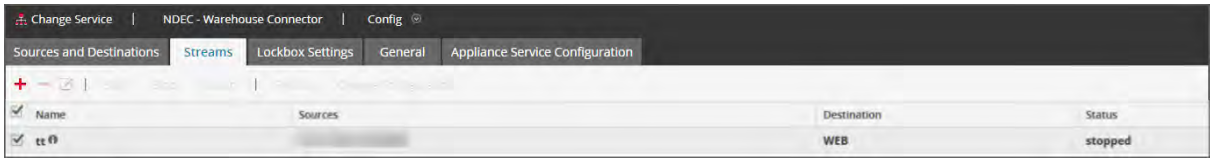
## Update the Schema in Warehouse Connector

If you want to configure the Warehouse Connector with custom metadata and use it in a Warehouse Connector report then you need to update the Warehouse Connector schema in the Reporting Engine.

If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse Connector schema in the Reporting Engine:

1. Go to (Admin) > **Services** > **Warehouse Connector**.
2. Click > **View** > **Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. Select the stream and then click **Reload**.
   The Warehouse Connector pulls the schema from the downstream devices (Log Decoder/Decoder).



For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

## Update the Schema in Reporting Engine

To update the schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Reporting Engine.**
2. Click > **Restart.**

**Note:** Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Monitor** > **Reports** > **Rules**.
2. In the toolbar, click .
3. Select **Warehouse DB**.
4. In the **Build Rule** tab, search for the custom meta from the right panel.
   The custom meta key is displayed.

# Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

**Topics**

- Configure High Speed Packet Capture Capability (Version 11.6 and Later)
- Configure a Log Decoder to Accept Protobuf
- Configure Session Split Timeouts
- Configure Syslog Forwarding to Destination
- Configure Transaction Handling on a Decoder
- Configure Data Export
- Decrypt Incoming Packets
- Edit Decoder System Configuration
- Enable CPU Usage Statistics for Installed Content
- Enable Parser Mappings
- Enable or Disable Lua and Flex Parsing Systems
- Map IP Address to Service Type for Log Parsing
- Map an IP Address to a Time Zone
- Obtain Log Files from a Pre-11.0 Log Decoder
- Upload a Log File to a Log Decoder
- Upload a Packet Capture File

# Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

**IMPORTANT:** Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

RSA NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

**Note:** Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

**Note:** Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

## Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All RSA-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by RSA.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

## Software Prerequisites

RSA NetWitness Platform 11.6 or later.

## Decoder Installation

Perform the following steps to install the Decoder.

## Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

## Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

## Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

## Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
    a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
    b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.

c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.

d. Ensure that you enable the multi-thread assembly while using this mode.

For more information, see Configure the Decoder for NDR Mode.

## Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

## Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

### To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   **`update=1 op=10g`**
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.
7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   **Note:** An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

## Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be

handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

**IMPORTANT:** Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

## Storage Considerations

### Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

### Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

### Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

**Caution:** This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

### Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

### The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.

- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

**Example usage from NwConsole:**

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

**Note:** If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

## Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

## Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.

- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

## Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

### Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

### Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

### Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

### Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

## Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

### To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.

2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   **`update=1 op=ndr`**
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   **Note:** An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

## Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   **IMPORTANT:** Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

## Storage Considerations

### NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

## Parsing and Content Considerations

### Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

## Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of

the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.

- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

## Use Case 1: NDR Mode - Egress, General Purpose

### Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

#### Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

#### Not Tested

All Lua parsers.

#### Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

## Use Case 2: NDR Mode - Egress, Data Exfiltration

#### Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

#### Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

#### Not Tested

All Lua parsers.

#### Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

## Use Case 3: NDR Mode - Lateral Movement

#### Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

### Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

### Not Tested

All Lua parsers.

### Other

The following considerations are recommended while running the Decoder in the NDR mode:

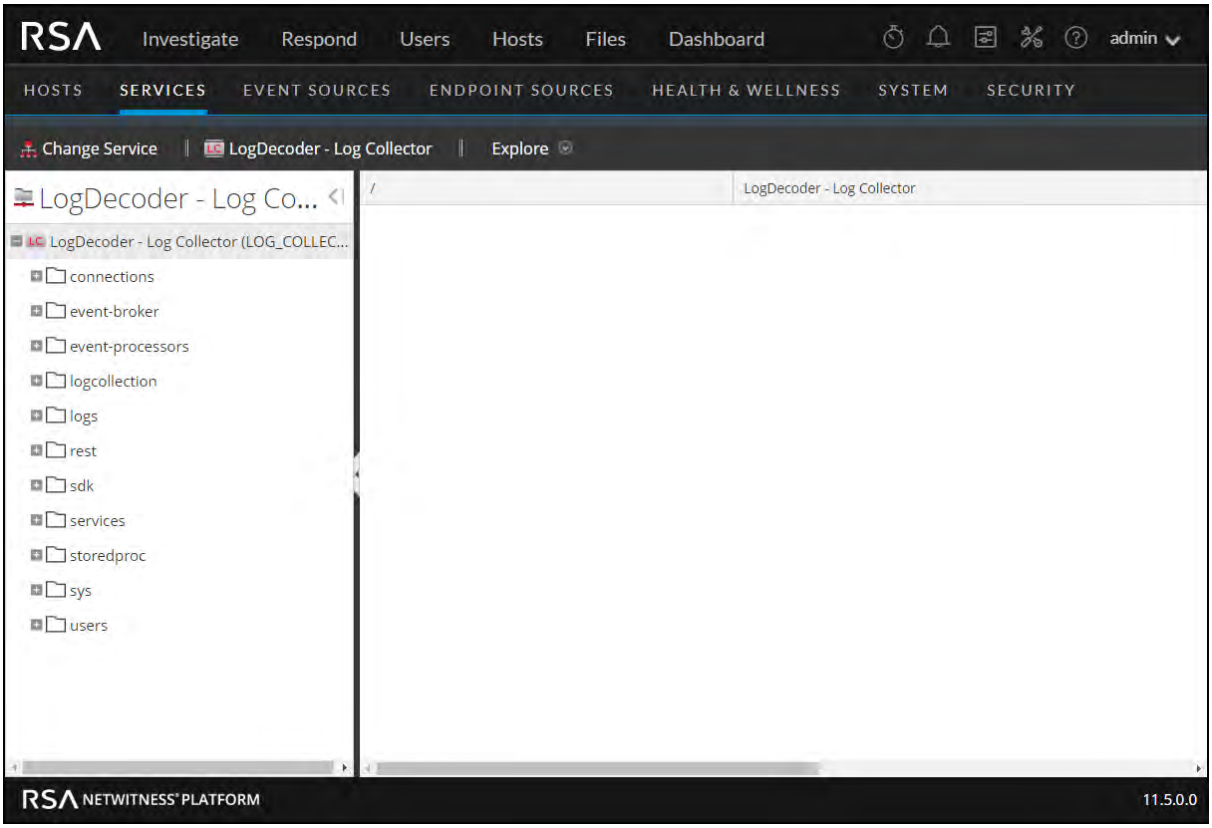
- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

# Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder with a Log Collector service to accept logs in protobuf (Protocol Buffer) format.

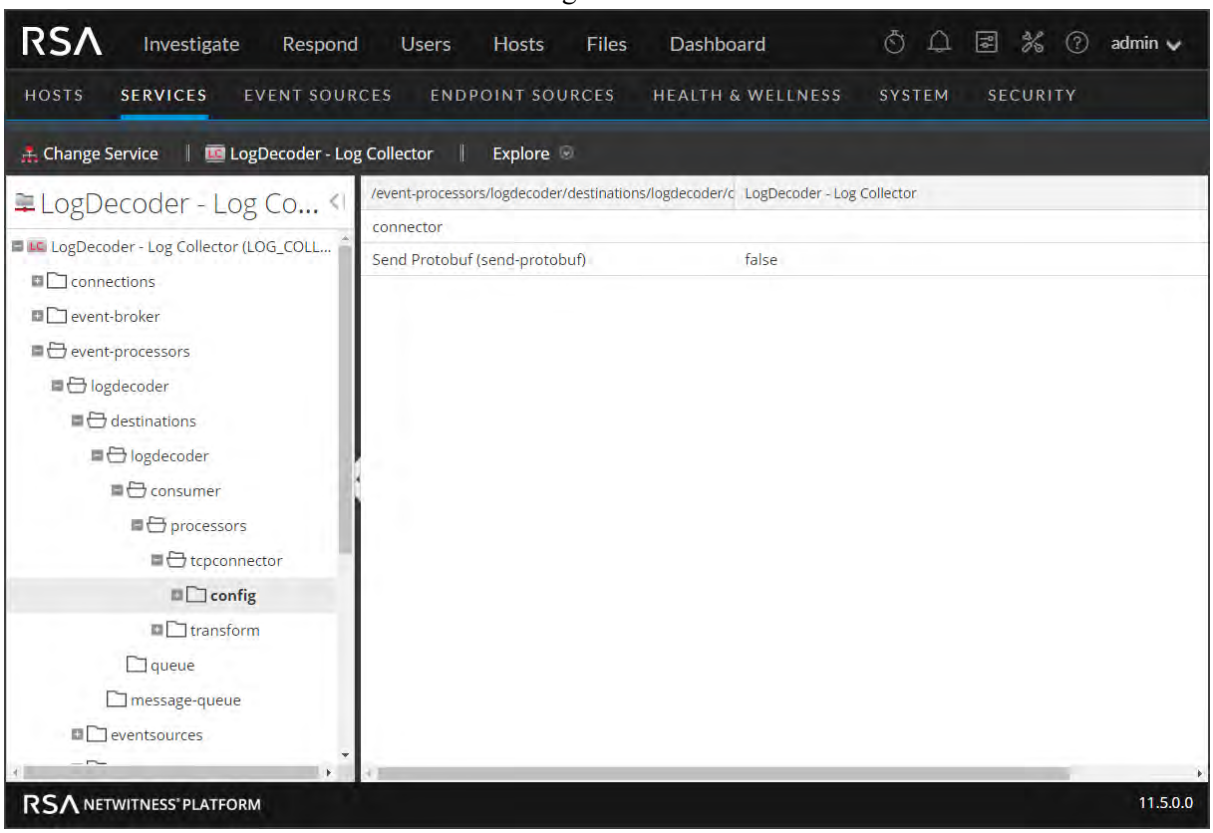
### To import a log file to a Log Decoder:

1. Go to **(Admin) > Services**.
2. Select a Log Decoder with a Log Collector service in the **Service** list, and select **> View > Explore**.
   The Explore view for the Log Decoder -Log Collector is displayed.



3. Navigate to **`event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`**

Your screen should look similar to the following.



4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

# Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.size.max`) or has been inactive for a period of time, the session is split. NetWitness has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

There are two timeout settings in a Network Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.

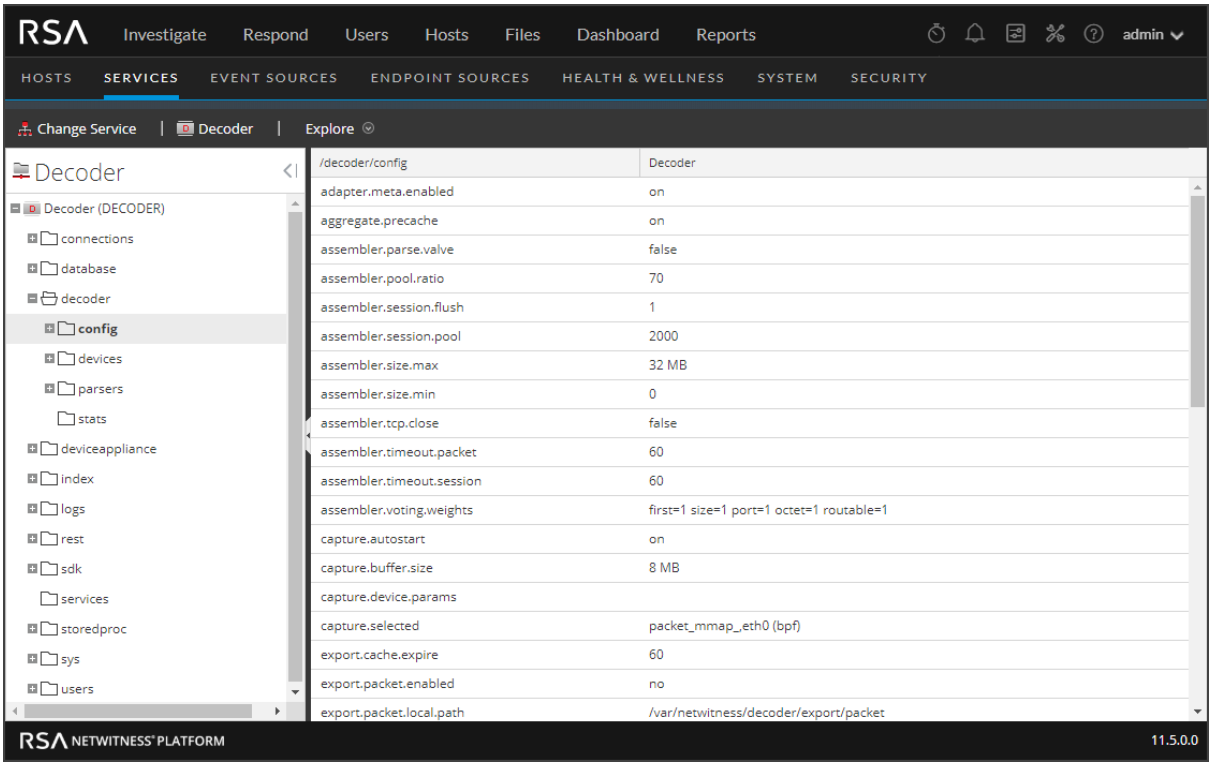
If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.

### To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the (Admin) > **Services** view, select the Decoder service and **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.



3. Click in the **Value** column next to the parameter and set these two parameters :
   **`/decoder/config/assembler.session.flush = 0`**
   **`/decoder/config/assembler.timeout.session = 0`**
4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** >

**stats**.

# Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver.

**Note:** No configuration is necessary to collect Syslog messages on the Log Decoder.

NetWitness forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

**Note:** You must configure Syslog Forwarding using the steps defined in this topic using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness to forward the messages:

   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.

   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.

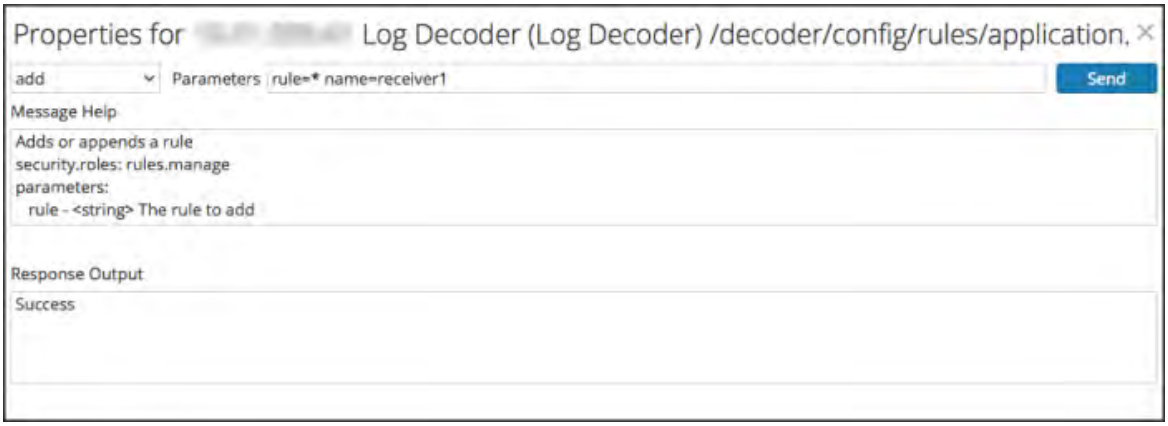
   c. In the **Properties** view, specify the **add** command with the following parameters:

   `rule=<query> name=<name>`

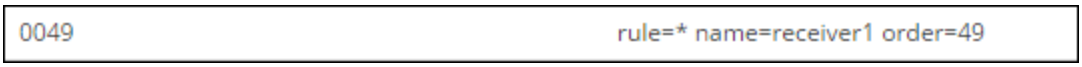
   Example 1: `rule=* name=receiver1`

   Example 2: `rule="device.type='winevent_nic'" name=receiver`)

   d. Click **Send**.



NetWitnesscreates the `name=receiver1 rule=* order=<n>` rule. NetWitness inserts the order number (for example, `order=49`) based on when you set up the rule.



e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

or

```
rule=* name=receiver1 forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the * rule. It creates a transient alert meta with the value "receiver1" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

a. In the **Services** view, select a Log Decoder, and > **View** > **Explore**.

b. Syslog forwarding destinations are defined in the configuration node.

```
/decoder/config/logs.forwarding.destination
```

This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.

```
name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]
```

The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.

The host is an IPv4 address, IPv6 address, or host name.

The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

Example forwarding destination:

```
gears=tls:gears.netwitness.local:6514
```

Example forwarding over tcp to blackout on port 514 with z-connector headers:

```
fwdrule=tcp:blackout.netwitness.local:514:retainsource
```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:

TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`

UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`

TCP Connections: `receiver1=tcp:receiver1.netwitness.local:514`

**Note:**
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

# Configure Transaction Handling on a Decoder

Administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

**Caution:** Use caution when enabling this feature when you are above the standard ingest rate supported by the Network Decoder as it may start to cause backups with aggregation and dropped packets.

## Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `off` (transactions off)
- `meta` (transactions represented as meta items)
- `split` (transactions split sessions)

### Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

## Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

## Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

The following meta items are duplicated into the split session from the session that was parsed:

- `time`
- `medium`
- `eth.src`
- `eth.dst`
- `eth.type`
- `ip.proto`
- `ip.src`
- `ip.dst`
- `ipv6.src`
- `ipv6.dst`
- `ip.proto`
- `port.src`
- `port.dst`
- `tcp.flags`
- `udp.srcport`
- `udp.dstport`
- `service`
- `udp.srcport`
- `udp.srcport`
- `tls.premaster`

# Configure Data Export

This exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object. To enable data export you must configure the export connector through Logstash.

To configure the data export:

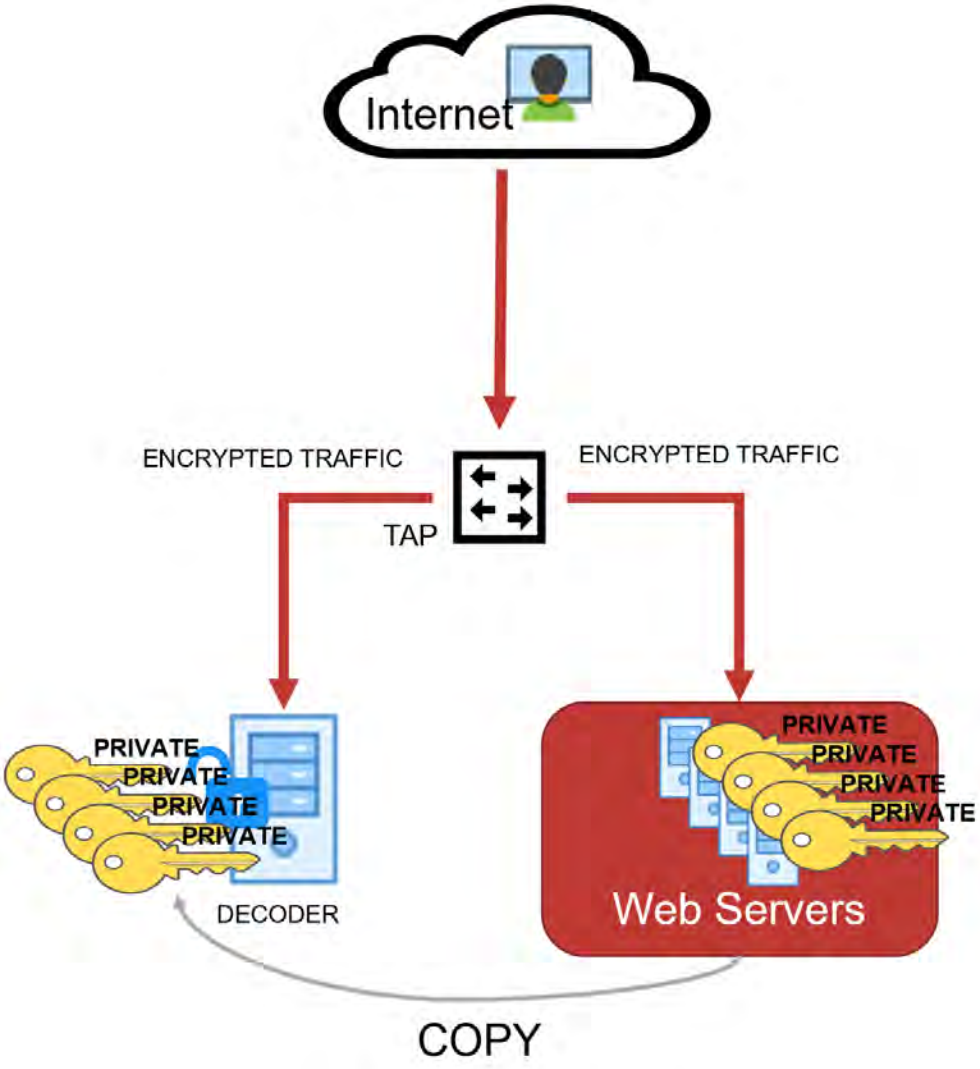
1. Go to **(Admin) > Services** and select a Decoder or Log Decoder.
2. Select **> View > Config**.
3. In the Configuration view, select the **Data Export** tab.
4. In the Data Export list, click the name of the host.

The Event Source tab is displayed with export connector typespec selected.

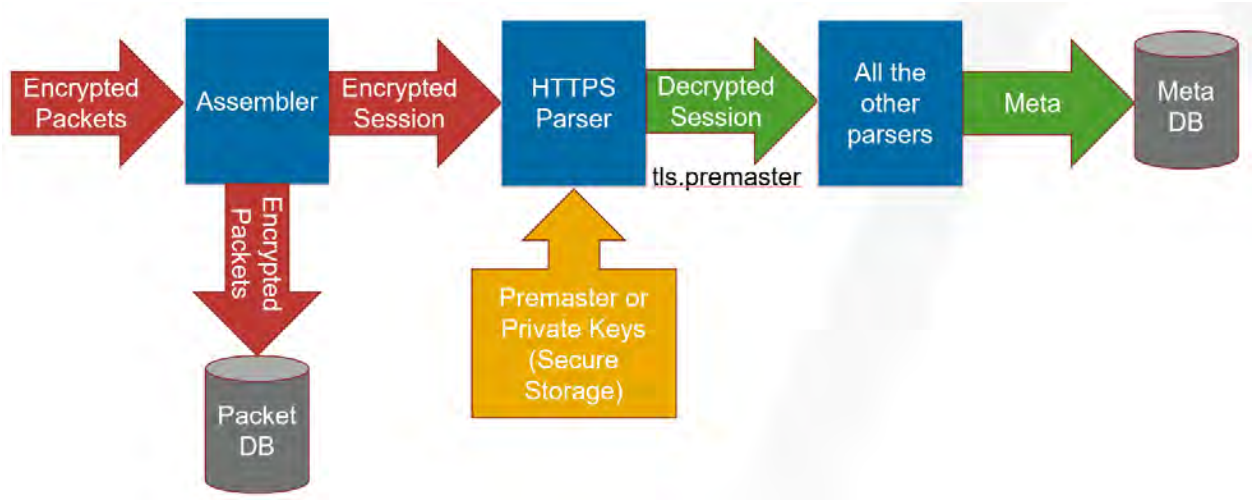
For more information on configuring export connector, see Configure Logstash Event Sources in NetWitness.

# Decrypt Incoming Packets

Administrators can configure a Network Decoder to decrypt incoming network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.2 or earlier and certain cipher suites, which are described in Supported Cipher Suites . The following figure illustrates the supported configuration of a Network Decoder deployed as a passive network device where it captures network traffic for managed servers. The Network Decoder is able to decrypt the traffic by using private keys uploaded to it from the managed servers .



As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system has been able to decrypt them. As the Decoder parses the encrypted traffic, it uses any private keys that have been uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta key, defined as `tls.premaster`, which contains the decryption key for that particular session. Whether the traffic is decrypted or not, the metadata `service` is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number. The following figure shows the basic progression through the NetWitness platform as the packets are being decrypted and the session metadata is generated.



Follow the steps below to configure the Network Decoder to natively decrypt this network traffic.

- Step 1: Validate That The Network Decoder Captures Encrypted Traffic
- Step 2: Obtain Private Keys from Managed Servers
- Step 3: Validate That The Private Key Cipher Suite is Supported
- Step 4: Confirm HTTPS Parser is Enabled on Decoders
- Step 5: Upload the Supported Private Keys to Decoders
- Step 6: Reload HTTPS Parser on Decoders
- Step 7: View Decrypted Sessions

**Note:** Currently, you cannot review the decypted payloads directly in the in the user interface. However, you can review them using the RESTful API interface and the NwConsole. However, the Decoders being able to decrypt traffic enables them to detect and generate potentially malicious communications that would otherwise not be detected.

See Troubleshooting for resolving any issues you might encounter while performing these steps.

## Step 1: Validate That The Network Decoder Captures Encrypted Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```

Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

## Step 2: Obtain Private Keys from Managed Servers

Private keys are the asymmetric keys generated by services that accept TLS traffic. They are normally stored in PEM files. These keys are used during the TLS handshake to encrypt the premaster symmetric key that is used for the rest of the payload encryption.

**Note:** The method to export private keys from web servers (from which to decrypt traffic) varies depending on the product. Refer to the product documentation for instructions for exporting private keys.

### Extracting Certificates for the Decoder SSL Decryption

Extracting the proper key materials from popular servers is required to leverage the Decoder built-in decryption capability. The following are a few examples to extract private keys and certificates from popular servers like Apache, Microsoft IIS, and Exchange.

**Note:** These procedures can also be used as references to extract keys from other servers as well.

#### Extract private key from Apache

The private key file location would be referenced in the main Apache configuration file, which is `httpd.conf` or `apache2.conf`. The config directive `SSLCertificateKeyFile` will specify the path on your server where private keys are stored.

If Apache is using OpenSSL default certificates and keys, then locate private keys (which are usually saved to the folder /usr/local/ssl by default). You can run the command openssl version –a to find OPENSSLDIR where your server is saving the keys.

If the private key is password protected, then it can be extracted using the below command with the password.

```
openssl rsa -in yourcertificate.pem -out serverkey.pem
```

Validate the located private key using the following command.

```
openssl rsa -in serverkey.pem -check -noout
```

#### Extract Private Key and Certificate from Windows Servers

Windows servers provide the interface to extract certificates and private keys in PKCS12 format files (.pfx format). It is recommended to use password protection while exporting private keys.

After exporting keys to the pfx file, you can use the OpenSSL tool to extract private keys as PEM files and upload them to Decoder.

#### *Step 2 (a): Extract PKCS12 file from Internet Information Services (IIS)*

There are multiple ways to extract certificates from IIS and the following are few examples.

#### *Using IIS Manager App*

- Open Internet Information Services Manager App.
- Under IIS > Navigate to Select Certificates > Select Features view > Select the required web or application server certificate.
- Right-click the certificate and select the Export option. In the export wizard, select the file path to save the pfx file (PKCS12 format)
- Example: C:\ServerCerts\servercrt.pfx.
- Enter the password and confirm the password in the export.
- This would create password protected pfx file which contains a private key and associated certificate.

#### *Using Microsoft Management Console (MMC)*

- Open Microsoft Management Console (MMC).
- In the Console Root expand Certificates (Local Computer).
- If the Certificates folder is not available then navigate to File > Add Snap In > Add Certificates.
- Locate your server certificate, it is located in the Web Server or Personal sub-folders.
- Right-click the certificate, identified by the Common Name, select Export, and follow the wizard. Use password to protect the pfx file.
- This would create password protected pfx file which contains a private key and associated certificate.

#### *Step 2 (b): Extract PKCS12 file from Exchange Servers*

Refer the Export a Certificate from an Exchange Server document for information on how to extract the pfx file from the Exchange server.

#### *Step 2 (c): Extract Private Key From a pfx File Using OpenSSL*

OpenSSL tool provides API to export keys in PEM format.

1. Extract private key in PEM format, at the openssl prompt use the password to decrypt the pfx file.
   ```
   openssl pkcs12 -in servercrt.pfx -nocerts -nodes -out serverkey.pem
   ```
2. Validate the private key generated
   ```
   openssl rsa -in serverkey.pem -check -noout
   ```
3. Extract cert in PEM format to validate compatibility with private key
   ```
   openssl pkcs12 -in servercrt.pfx -nokeys -out serverkey.crt
   ```

4. Validate private key and certificate modulus. The modulus should be the same for both the private key and its certificate.

```
openssl rsa -noout -modulus -in serverkey.pem
openssl x509 -noout -modulus -in serverkey.crt
```

### Recommendations

Once private keys are extracted from servers and imported to Decoder, it is recommended to secure or delete the extracted PEM file of the private key (serverkey.pem) generated by the above OpenSSL commands.

## Step 3: Validate That The Private Key Cipher Suite is Supported

As a passive collection device, the Network Decoder can only decrypt ciphers that use the RSA key exchange. The list of supported keys, and whether the keys are FIPS compliant, are listed in Supported Cipher Suites and Unsupported Cipher Suites . If you are expecting to decrypt less-secure channels of communication, you might need to disable FIPS. However, this is a system change to the entire Decoder, not just the parsing of captured traffic, so take caution before disabling FIPS. If you require more-secure cipher suites for the managed server communications, search for "SSL decrypt" in our third party partner integrations section at RSA Ready Community (https://community.rsa.com/community/products/rsa-ready).

**Note:** If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS-compliant.

### Supported Cipher Suites

The following table lists which cipher-suites are supported using private keys.

| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_RSA_WITH_AES_256_GCM_SHA384 | AES256-GCM-SHA384 | [0x9d] | TLSv1.2 | Kx=RSA | Compliant |
| TLS_RSA_WITH_AES_256_CBC_SHA256 | AES256-SHA256 | [0x3d] | TLSv1.2 | Kx=RSA | Compliant |
| TLS_RSA_WITH_AES_256_CBC_SHA | AES256-SHA | [0x35] | SSLv3 | Kx=RSA | Compliant |
| TLS_RSA_WITH_CAMELLIA_256_CBC_SHA | CAMELLIA256-SHA | [0x84] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_WITH_3DES_EDE_CBC_SHA | DES-CBC3-SHA | [0x0a] | SSLv3 | Kx=RSA | Compliant |
| TLS_RSA_WITH_AES_128_GCM_SHA256 | AES128-GCM-SHA256 | [0x9c] | TLSv1.2 | Kx=RSA | Compliant |
| TLS_RSA_WITH_AES_128_CBC_SHA256 | AES128-SHA256 | [0x3c] | TLSv1.2 | Kx=RSA | Compliant |

| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_RSA_WITH_AES_128_CBC_SHA | AES128-SHA | [0x2f] | SSLv3 | Kx=RSA | Compliant |
| TLS_RSA_WITH_SEED_CBC_SHA | SEED-SHA | [0x96] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_WITH_CAMELLIA_128_CBC_SHA | CAMELLIA128-SHA | [0x41] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_WITH_IDEA_CBC_SHA | IDEA-CBC-SHA | [0x07] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_WITH_RC4_128_SHA | RC4-SHA | [0x05] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_WITH_DES_CBC_SHA | DES-CBC-SHA | [0x09] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_RSA_EXPORT_WITH_DES40_CBC_SHA | EXP-DES-CBC-SHA | [0x08] | SSLv3 | Kx=DES | Non-Compliant |

## Unsupported Cipher Suites

The following table lists which cipher-suites are not supported using private keys.

| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 | ECDHE-RSA-AES256-GCM-SHA384 | [0xc030] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 | ECDHE-ECDSA-AES256-GCM-SHA384 | [0xc02c] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 | ECDHE-RSA-AES256-SHA384 | [0xc028] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 | ECDHE-ECDSA-AES256-SHA384 | [0xc024] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA | ECDHE-RSA-AES256-SHA | [0xc014] | SSLv3 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA | ECDHE-ECDSA-AES256-SHA | [0xc00a] | SSLv3 | Kx=ECDH | Compliant |
| TLS_DHE_DSS_WITH_AES_256_GCM_SHA384 | DHE-DSS-AES256-GCM-SHA384 | [0xa3] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_256_GCM_SHA384 | DHE-RSA-AES256-GCM-SHA384 | [0x9f] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_256_CBC_SHA256 | DHE-RSA-AES256-SHA256 | [0x6b] | TLSv1.2 | Kx=DH | Compliant |

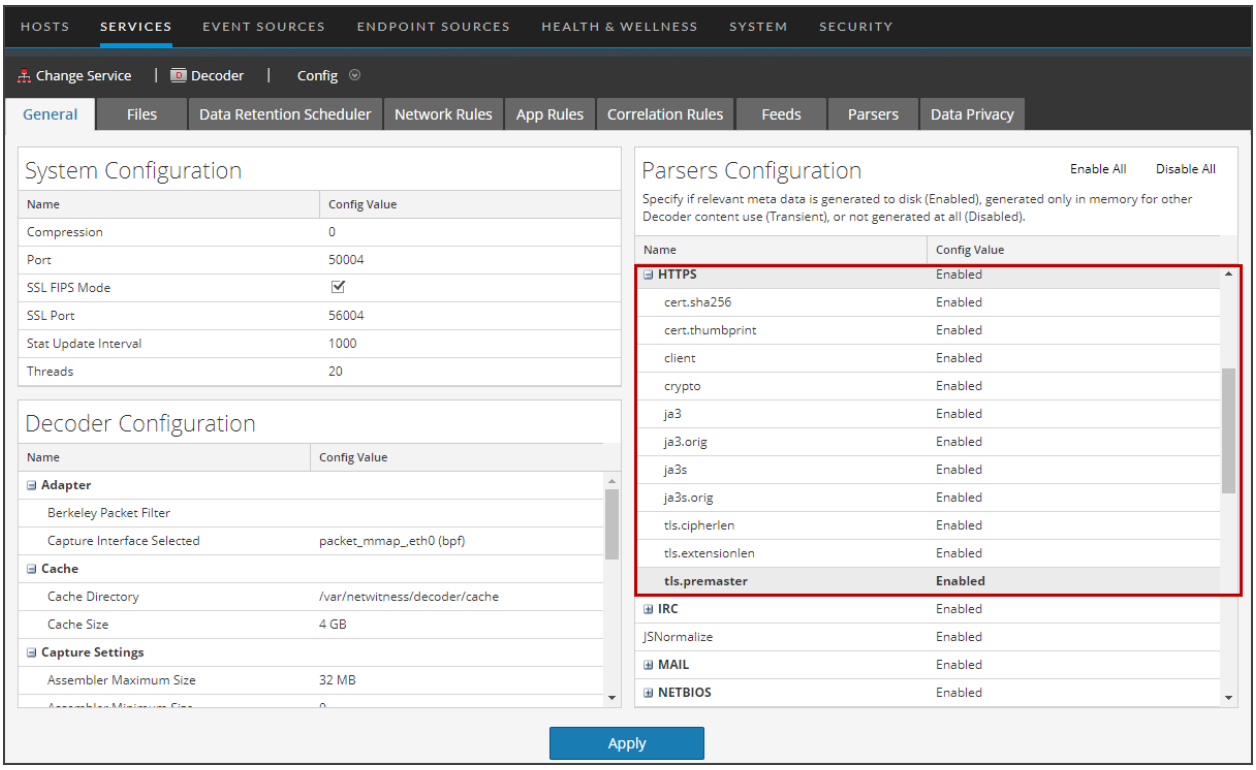
| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_DHE_DSS_WITH_AES_256_CBC_SHA256 | DHE-DSS-AES256-SHA256 | [0x6a] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_256_CBC_SHA | DHE-RSA-AES256-SHA | [0x39] | SSLv3 | Kx=DH | Compliant |
| TLS_DHE_DSS_WITH_AES_256_CBC_SHA | DHE-DSS-AES256-SHA | [0x38] | SSLv3 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA | DHE-RSA-CAMELLIA256-SHA | [0x88] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_DHE_DSS_WITH_CAMELLIA_256_CBC_SHA | DHE-DSS-CAMELLIA256-SHA | [0x87] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384 | ECDH-RSA-AES256-GCM-SHA384 | [0xc032] | SSLv3 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384 | ECDH-ECDSA-AES256-GCM-SHA384 | [0xc02e] | TLSv1.2 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384 | ECDH-RSA-AES256-SHA384 | [0xc02a] | TLSv1.2 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384 | ECDH-ECDSA-AES256-SHA384 | [0xc026] | TLSv1.2 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDH_RSA_WITH_AES_256_CBC_SHA | ECDH-RSA-AES256-SHA | [0xc00f] | SSLv3 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA | ECDH-ECDSA-AES256-SHA | [0xc005] | SSLv3 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA | ECDHE-RSA-DES-CBC3-SHA | [0xc012] | SSLv3 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA | ECDHE-ECDSA-DES-CBC3-SHA | [0xc008] | SSLv3 | Kx=ECDH | Compliant |
| TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA | EDH-RSA-DES-CBC3-SHA | [0x16] | SSLv3 | Kx=DH | Compliant |
| TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA | EDH-DSS-DES-CBC3-SHA | [0x13] | SSLv3 | Kx=DH | Compliant |
| TLS_ECDH_RSA_WITH_3DES_EDE_CBC_SHA | ECDH-RSA-DES-CBC3-SHA | [0xc00d] | SSLv3 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_3DES_EDE_CBC_SHA | ECDH-ECDSA-DES-CBC3-SHA | [0xc003] | SSLv3 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 | ECDHE-RSA-AES128-GCM-SHA256 | [0xc02f] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 | ECDHE-ECDSA-AES128-GCM-SHA256 | [0xc02b] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 | ECDHE-RSA-AES128-SHA256 | [0xc027] | TLSv1.2 | Kx=ECDH | Compliant |

| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 | ECDHE-ECDSA-AES128-SHA256 | [0xc023] | TLSv1.2 | Kx=ECDH | Compliant |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA | ECDHE-RSA-AES128-SHA | [0xc013] | SSLv3 | Kx=ECDH | Compliant |
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA | ECDHE-ECDSA-AES128-SHA | [0xc009] | SSLv3 | Kx=ECDH | Compliant |
| TLS_DHE_DSS_WITH_AES_128_GCM_SHA256 | DHE-DSS-AES128-GCM-SHA256 | [0xa2] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_128_GCM_SHA256 | DHE-RSA-AES128-GCM-SHA256 | [0x9e] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_128_CBC_SHA256 | DHE-RSA-AES128-SHA256 | [0x67] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_DSS_WITH_AES_128_CBC_SHA256 | DHE-DSS-AES128-SHA256 | [0x40] | TLSv1.2 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_AES_128_CBC_SHA | DHE-RSA-AES128-SHA | [0x33] | SSLv3 | Kx=DH | Compliant |
| TLS_DHE_DSS_WITH_AES_128_CBC_SHA | DHE-DSS-AES128-SHA | [0x32] | SSLv3 | Kx=DH | Compliant |
| TLS_DHE_RSA_WITH_SEED_CBC_SHA | DHE-RSA-SEED-SHA | [0x9a] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_DHE_DSS_WITH_SEED_CBC_SHA | DHE-DSS-SEED-SHA | [0x99] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA | DHE-RSA-CAMELLIA128-SHA | [0x45] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_DHE_DSS_WITH_CAMELLIA_128_CBC_SHA | DHE-DSS-CAMELLIA128-SHA | [0x44] | SSLv3 | Kx=DH | Non-Compliant |
| TLS_ECDH_RSA_WITH_AES_128_GCM_SHA256 | ECDH-RSA-AES128-GCM-SHA256 | [0xc031] | TLSv1.2 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_128_GCM_SHA256 | ECDH-ECDSA-AES128-GCM-SHA256 | [0xc02d] | TLSv1.2 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDH_RSA_WITH_AES_128_CBC_SHA256 | ECDH-RSA-AES128-SHA256 | [0xc029] | TLSv1.2 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA256 | ECDH-ECDSA-AES128-SHA256 | [0xc025] | TLSv1.2 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDH_RSA_WITH_AES_128_CBC_SHA | ECDH-RSA-AES128-SHA | [0xc00e] | SSLv3 | Kx=ECDH/RSA | Compliant |
| TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA | ECDH-ECDSA-AES128-SHA | [0xc004] | SSLv3 | Kx=ECDH/ECDSA | Compliant |
| TLS_ECDHE_RSA_WITH_RC4_128_SHA | ECDHE-RSA-RC4-SHA | [0xc011] | SSLv3 | Kx=ECDH | Non-Compliant |

| Cipher Suite Name (RFC) | Name (OpenSSL) | Cipher Suite | TLS Version | KeyExch. | FIPS |
|---|---|---|---|---|---|
| TLS_ECDHE_ECDSA_WITH_RC4_128_SHA | ECDHE-ECDSA-RC4-SHA | [0xc007] | SSLv3 | Kx=ECDH | Non-Compliant |
| TLS_ECDH_RSA_WITH_RC4_128_SHA | ECDH-RSA-RC4-SHA | [0xc00c] | SSLv3 | Kx=ECDH/RSA | Non-Compliant |
| TLS_ECDH_ECDSA_WITH_RC4_128_SHA | ECDH-ECDSA-RC4-SHA | [0xc002] | SSLv3 | Kx=ECDH/ECDSA | Non-Compliant |
| TLS_DHE_RSA_WITH_DES_CBC_SHA | EDH-RSA-DES-CBC-SHA | [0x15] | SSLv3 | Kx=RSA | Non-Compliant |
| TLS_DHE_DSS_WITH_DES_CBC_SHA | EDH-DSS-DES-CBC-SHA | [0x12] | SSLv3 | Kx=DSS | Non-Compliant |
| TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA | EXP-EDH-RSA-DES-CBC-SHA | [0x14] | SSLv3 | Kx=DSS | Non-Compliant |
| TLS_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA | EXP-EDH-DSS-DES-CBC-SHA | [0x11] | SSLv3 | Kx=DSS | Non-Compliant |

## Step 4: Confirm HTTPS Parser is Enabled on Decoders

The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in (Admin) > **Services** > **Decoder** > **Config** > Parsers Configuration panel as shown in the following figure.

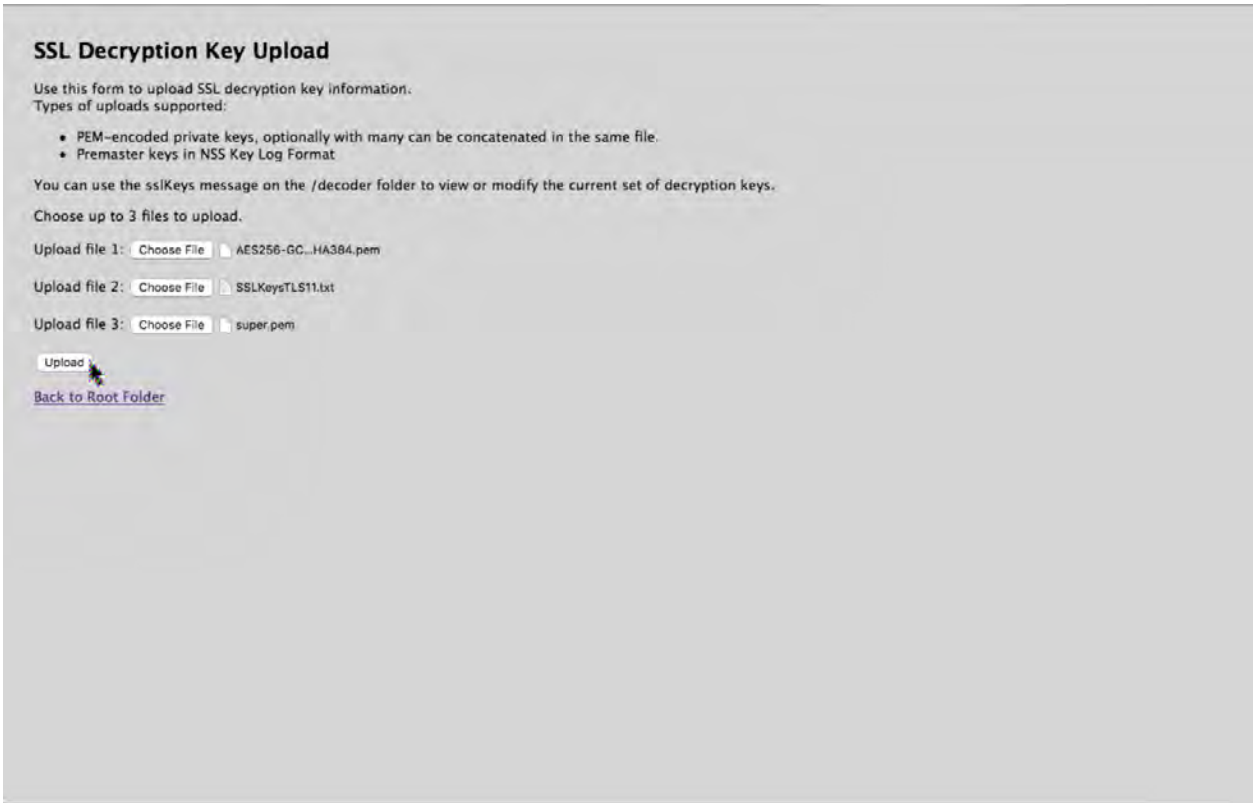


## Step 5: Upload the Supported Private Keys to Decoders

The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for RSA NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for RSA NetWitness Platform*. Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.

The RESTful interface form at the path `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.

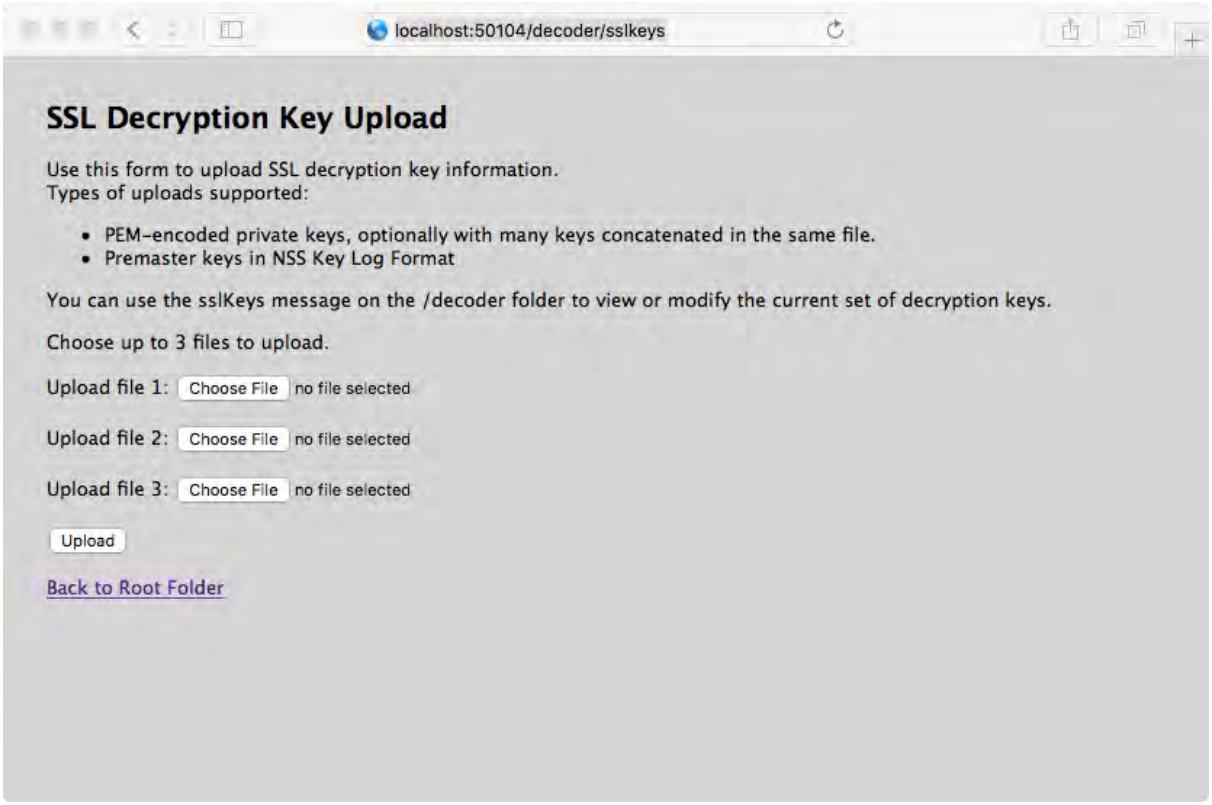


## Upload Multiple Premaster and Private Keys

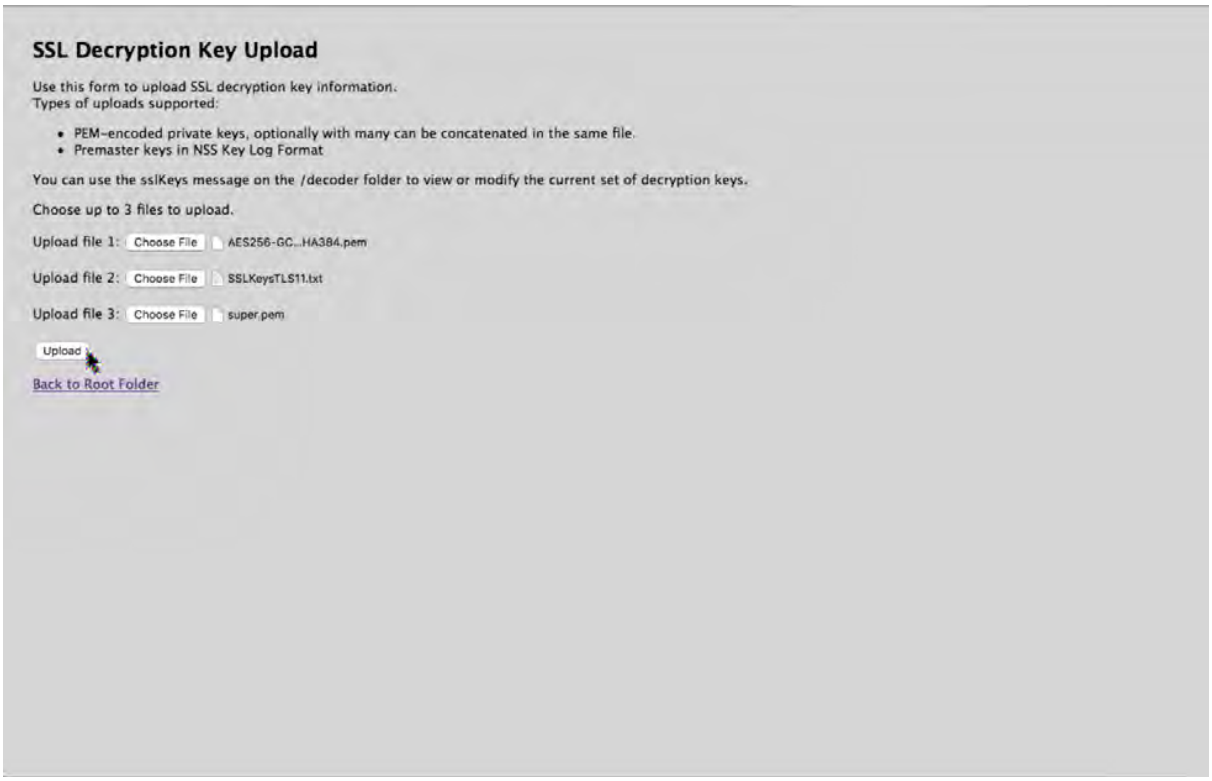
**Note:** As of 11.5, uploading premaster keys is not officially supported yet for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.

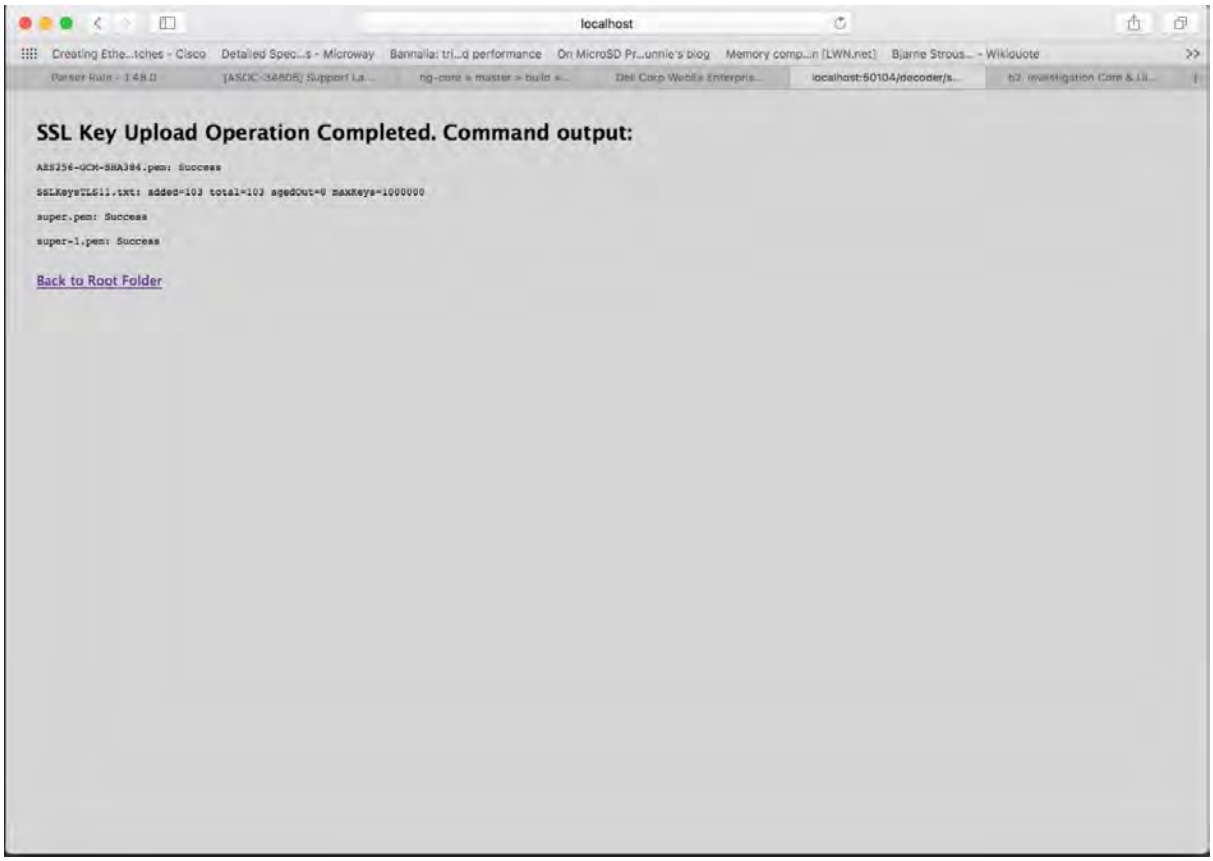


2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on your local file system.
3. (Optional) Repeat for **Upload File 2** and **Upload File 3**.



4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.



## Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

| Parameter | Description |
|---|---|
| `clear` | Removes all premaster keys from memory. Does not delete any PEM files installed on the system. |
| `maxKeys` | Changes the maximum number of premaster keys that are stored in memory. |
| `listPems` | Returns a list of all installed private key PEM files. |
| `deletePem` | Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files. |
| `random` | The random hash used to identify the premaster key. |
| `premaster` | The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first. |

## Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

| Name | Description |
|---|---|
| `added` | The number of premaster keys just added during this command. |
| `total` | The total number of premaster keys loaded in memory. |
| `agedOut` | The total number of premaster keys that were removed during this command; this is not a lifetime stat. |
| `maxKeys` | The current maximum allowed premaster keys |

## Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

## Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called `SSLKEYLOGFILE` and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

## Private Keys or PEM Files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

**Note:** Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```

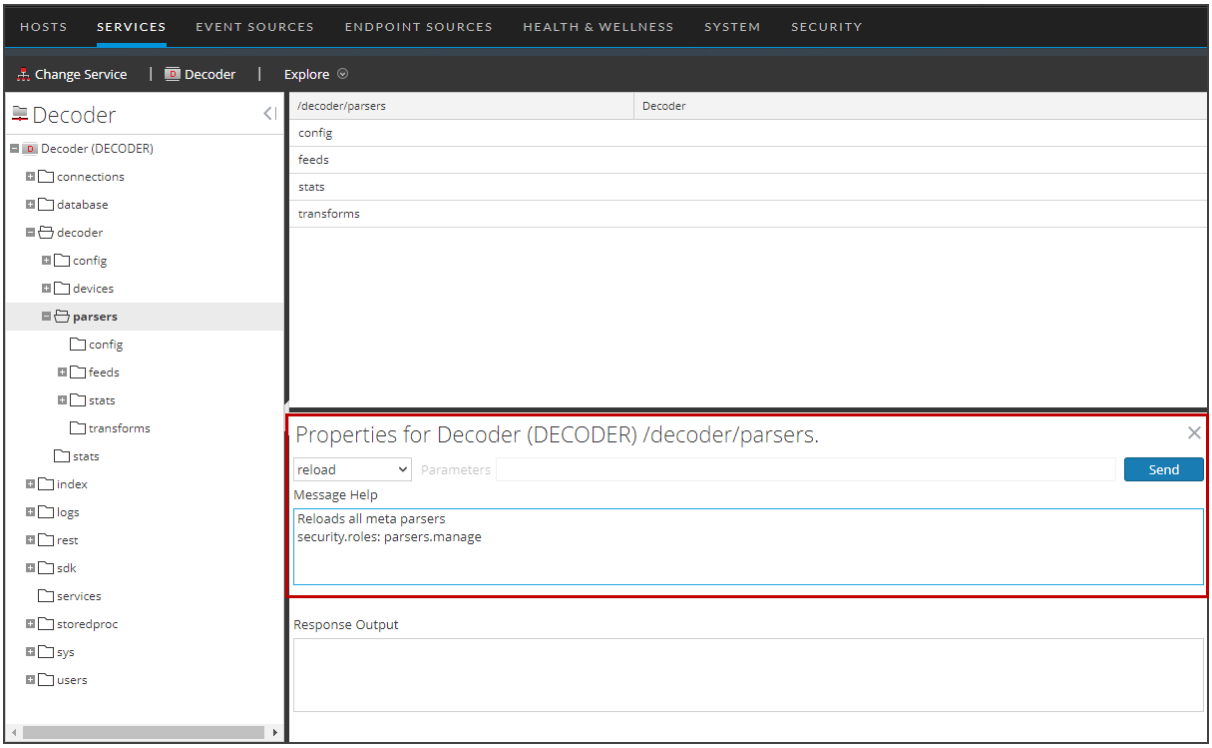
## Step 6: Reload HTTPS Parser on Decoders

After uploading the private keys, you must issue a parser reload command so that the newly-installed key becomes visible to the HTTPS parser. All TLS handshakes that use that private key are now able to be decrypted by the Decoder.

To issue a parser reload command:

1. Go to (Admin) > **Services** and select the Decoder.
2. Click > **View** > **Explore** > **decoder**, right-click **parsers** and select **Properties**.

3. In the Properties for Decoder (DECODER) /decoder/parsers pane, select reload from the drop-down menu and click **Send**.



## Step 7: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, `tls.premaster` metadata is associated with the session that has the premaster key required for decrypting that session. The session will also have crypto metadata denoting the cipher suite, with crypto formated as `tls.premaster`.

### Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

**`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`**

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

**`http://<decoder>:50104/sdk/content&session=<id>&render=text`**

**`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`**

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

Alternatively, you can use the NetWitness Investigator thick client to decrypt and display the network sessions, as it can communicate to a Concentrator or have PCAPs and private keys loaded locally.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the `tls.premaster` metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

## Troubleshooting

If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate that your private key is using an acceptable cipher-suite.
2. Make sure your Network Decoder is capturing the traffic matching the server for which you have the private key. To check, you can upload the private key and PCAP into Wireshark and see if it is able to decrypt it.

## Decryption of Secure SMTP

In version 11.3, NetWitness supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a .csv list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality.

**Note:** The .csv list must include all the destination ports of a session. If a destination port is not in the list, the search for STARTTLS will not be started.

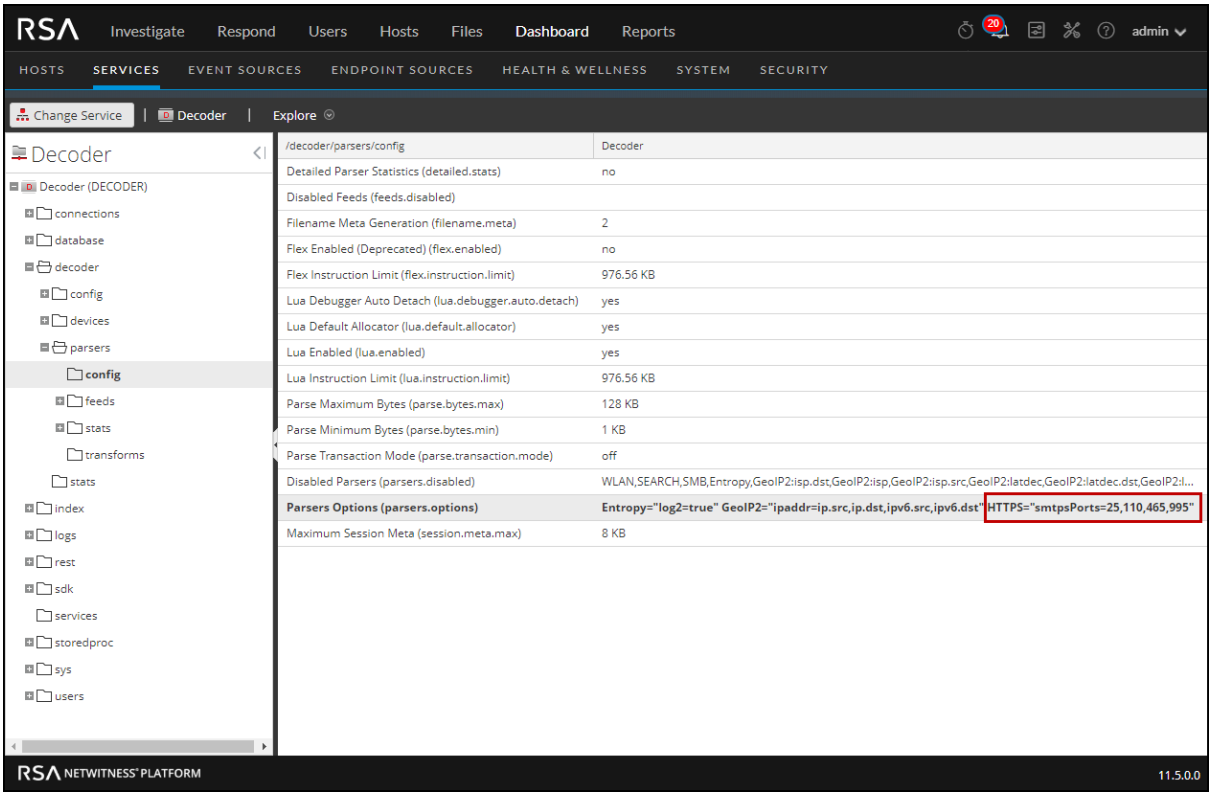
The STARTTLS search is limited to the first 1024 bytes of the session's payload, to prevent performance degradation. If STARTTLS is found, the parser uses the next client packet with payload as the start of a TLS negotiation.

### To add an HTTPS parser option for secure SMTP decryption:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Log Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, enter an HTTPS parser option in the following format that provides a .csv list of the destination ports of the session where the STARTTLS command is searched:

   `HTTPS="smtpsPorts=<port#1,port#2,port#n>"`

The following image shows an example of an HTTPS parser option for secure SMTP decryption.



## Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

**Note:** Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted, a Decoder can process traffic at 3 Gbps .

| Parser Name | Description |
|---|---|
| SYSTEM | Session Details |
| NETWORK | Network Layer |
| ALERTS | Alerts |
| GeoIP | Geographic data based on ip.src and ip.dst |
| GeoIP2 | Geographic data by default based on IPv4 (`ip.src`, `ip.dst`) and IPv6 (`ipv6.src`, `ipv6.dst`) meta keys |
| HTTP | Hyper Text Transport Protocol (HTTP) |
| HTTP_Lua | Hyper Text Transport Protocol (HTTP) Lua |
| FTP | File Transfer Protocol (FTP) |
| TELNET | TELNET Protocol |
| SMTP | Simple Mail Transport Protocol (SMTP) |
| POP3 | Post Office Protocol (POP3) |
| NNTP | Network News Transport Protocol (NNTP) |
| DNS | Domain Name Service (DNS) |
| HTTPS | Secure Socket Layer (SSL) Protocol |
| MAIL | Standard E-Mail Format (RFC822) |
| VCARD | Extracts VCARD fullname and email information |
| PGP | Identifies PGP blocks within network traffic |
| SMIME | Identifies SMIME blocks within network traffic |
| SSH | Secure Shell (SSH) |
| TFTP | Trivial File Transfer Protocol (TFTP) |
| DHCP | Dynamic Host Configuration Protocol (DHCP and BOOTP) |
| NETBIOS | Extracts NETBIOS computer name information. |
| SNMP | Simple Network Management Protocol (SNMP) |
| NFS | Network File System (NFS) protocol |
| RIP | Routing Information Protocol (RIP). |
| TDS | MSSQL and Sybase database protocol (TDS) |

| Parser Name | Description |
|---|---|
| TNS | Oracle database protocol (TNS) |
| IRC | Internet Relay Chat (IRC) protocol |
| RTP | Real Time Protocol (RTP) for audio/video |
| SIP | Session Initiation Protocol (SIP) |
| H323 | H.323 Teleconferencing protocol |
| SCCP | Cisco Skinny Client Control Protocol |
| GTalk | Google Talk (GTalk) |
| VlanGre | Vlan ID and GRE/EtherIP tunnel addresses |
| BITTORRENT | BitTorrent File Sharing Protocol |
| FIX | Financial Information eXchange Protocol |
| GNUTELLA | Gnutella file sharing protocol |
| IMAP | Internet Message Access Protocol |
| MSRPC | Microsoft Remote Procedure Call protocol |
| RDP | Remote Desktop Protocol |
| SHELL | Command Shell Identification |
| TLSv1 | TLSv1 |
| SearchEngines | A parser that extracts search terms |
| FeedParser | External Feed Parser |

## TLS Certificate Hashing

The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists, such as the one from sslbl.abuse.ch.

The TLS Certificate hashing feature is disabled by default. To enable TLS Certificate hashing:

1. Go to **(Admin)** > **Services**, select a Network Decoder service and > **View > Explore.**
2. Select **decoder** > **parsers** > **config**.
3. In the values column next to `parsers.options`, type `HTTPS="cert.sha1=true"`.
   When this option is enabled, the SHA-1 is stored as a text value in the `cert.thumbprint` meta key.

4. The change takes effect on parser reload. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**

The SHA-256 hash of the certificate can be enabled by adding the parser option:

```
HTTPS="cert.sha256=true"
```

to a Network Decoder's `/decoder/parsers/config/parsers.options` configuration.

When this option is enabled, SHA-256 is stored as a text value in the meta keys:

```
cert.sha256
cert.thumbprint
```

## JA3 and JA3S TLS Fingerprints

The Network Decoder can produce the JA3 value of TLS clients and the JA3S value of TLS servers that are observed in a Network session. The values that are produced conform to the values generated by the open source JA3 tools (https://github.com/salesforce/ja3). The JA3 features are disabled by default.

To enable JA3 features:

1. In the NetWitness Platform User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, add `HTTPS="ja3=true ja3s=true"`.
5. In the left panel, right click on **parsers** and select **properties**.
6. In the right panel, in the lower pane, set the value in the first drop down to **Reload**.
7. Click **Send**.

JA3 and JA3S can be enabled independently using these options. When enabled, the JA3 is stored as a text value in the meta key `ja3`. The JA3S is stored as a text value in the meta key `ja3s`.

Additional meta keys are activated using a mechanism similar to the JA3S and JA3S meta items. For example, `ja3.orig` is enabled by adding `ja3.orig=true` to the HTTPS parser options. This is also true for `ja3s.orig`, `tls.extensionlen`, and `tls.cipherlen`.

`ja3.orig`, `tls.extensionlen`, and `tls.cipherlen` are only created if JA3 is enabled.

`ja3s.orig` is only created if JA3S is enabled.

## Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder

In previous versions, ingesting encrypted and decrypted traffic streams of the same session to a Decoder causes packets from both the sessions to mix on the Decoder as reassembly is performed by the same thread. It cause session parsing and content extraction inaccuracies.

In NetWitness 11.6, using multi-adapter capture and multi-thread assembler features, you can configure the Decoder to receive encrypted and decrypted streams on separate adapters. The multi-thread assembler feature allows decoder to assemble packets from its corresponding capture work thread. It keeps the packets from encrypted and decrypted sessions separate during assembly and avoid inaccuracies in session parsing and content extraction.

**To configure the Decoder for the simultaneous ingestion of the encrypted and decrypted traffic streams:**

1. Configure Decoder to capture from multiple adapters simultaneously, see (Optional) Multiple Adapter Packet Capture.
2. Set `/decoder/config/assembler.threading.enabled=on` to enable multi-thread assembler.
3. Restart the Decoder service.

## Community ID

The Network Decoder generates Community ID flow hash values that are compatible with the Community ID specification defined by `https://github.com/corelight/community-id-spec`.

The Community ID is written to a text-formatted meta key named `community`.

The Community ID is generated on sessions containing TCP over IPv4, TCP over IPv6, UDP over IPV4, and UDP over IPV6.

# Edit Decoder System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an RSA Customer Support technician advises you to change them.

System Configuration

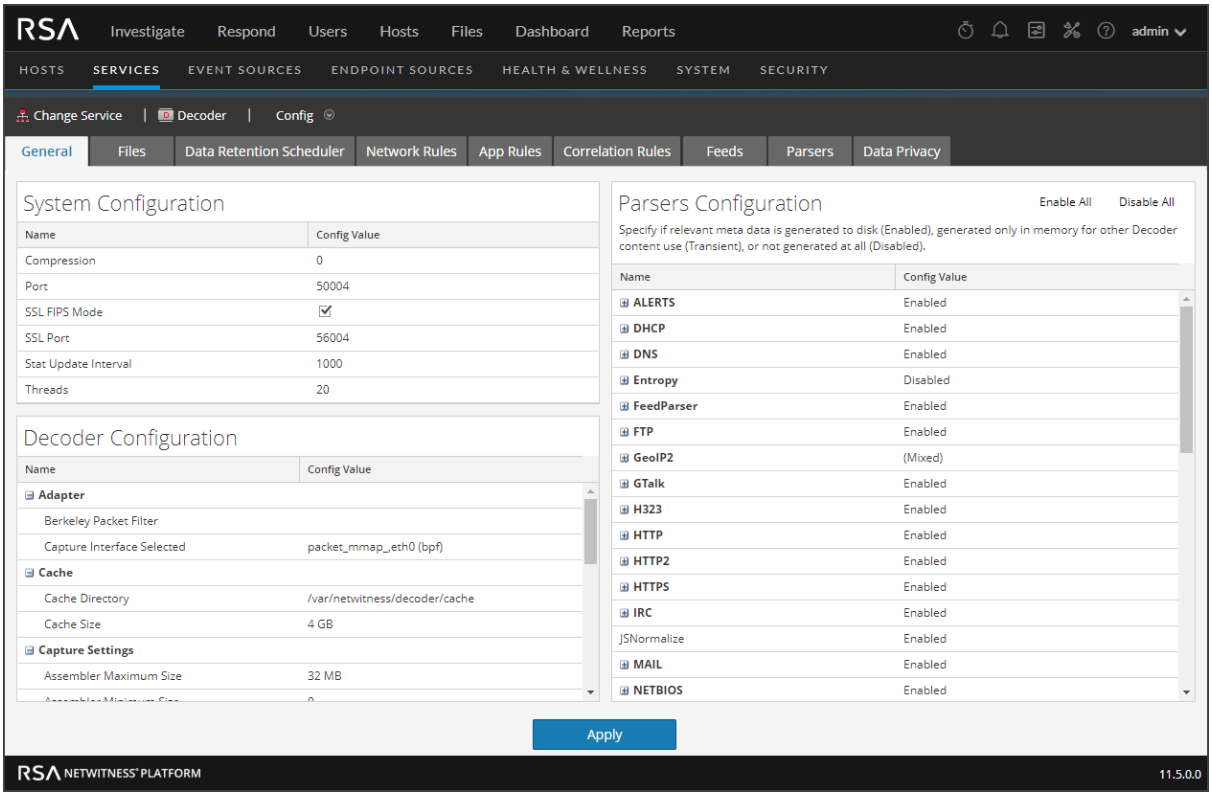
| Name | Config Value |
|---|---|
| Compression | 0 |
| Port | 50004 |
| SSL FIPS Mode | ☐ |
| SSL Port | 56004 |
| Stat Update Interval | 1000 |
| Threads | 20 |

One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

### To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to **(Admin) > Services**.

2. Select a Decoder or Log Decoder service, and select **> View > Config**.
   The Services Config view for the service is displayed with the General tab open.



3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.

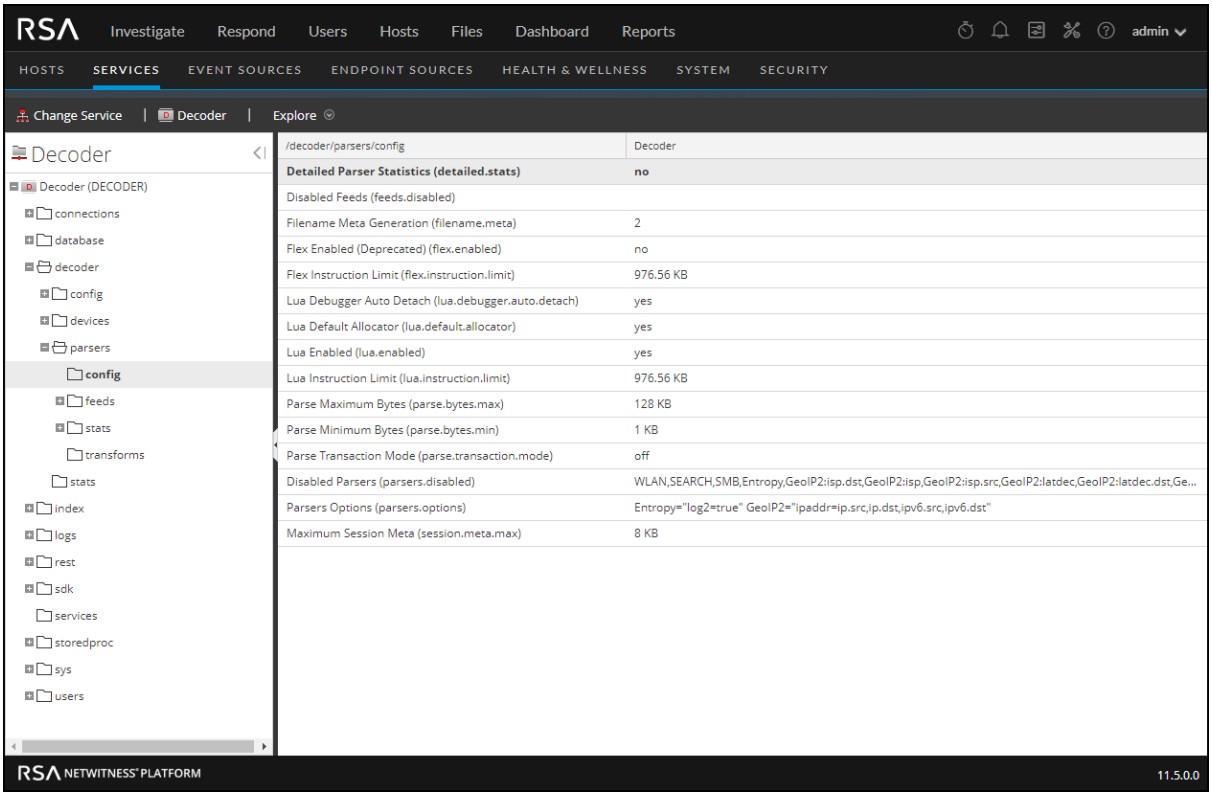
# Enable CPU Usage Statistics for Installed Content

The Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explore view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
   The Explore view for the Decoder is displayed.
3. Open `/decoder/parsers/config/` and in the right pane, select the `detailed.stats` parameter.



4. Change the value to **yes**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explore view, the new statistic is visible.

# Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.

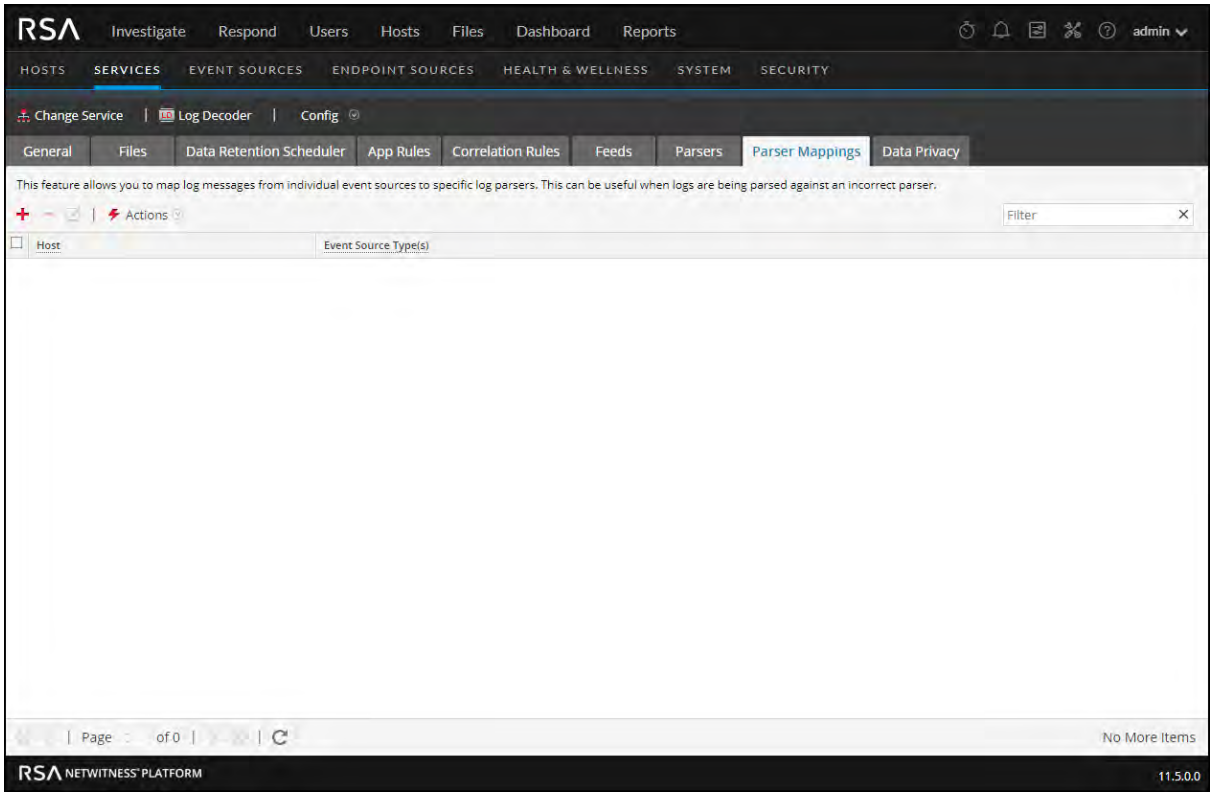
**Note:** You can also enable parser mapping functions by navigating to (Admin) **> Event Sources > Discovery.**

## Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

1. Go to **(Admin) > Services** and select a Log Decoder.
2. Select **> View > Config**.
3. In the Configuration page, select the **Parser Mappings** tab.

The Parser Mappings tab is displayed in the Services Config view.



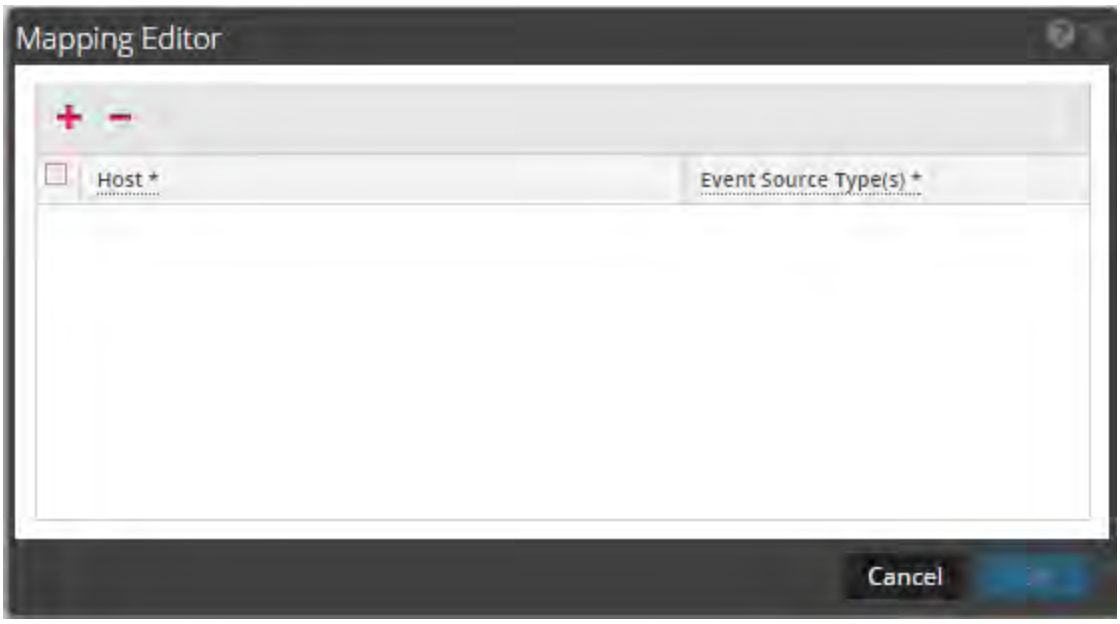
## Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to (Admin) > **Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.

   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click .

   The Mapping Editor is displayed.



5. Any of the following mappings can be defined:
   - **One Host and One Event Source Type**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Sources(**s) field, enter the event source type.

     For example: `apache`
   - **One Host and One or More Event Source Types**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`
   - **One Host, One Log Collector, and One Event Source Type**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache`
   - **One Host, One Log Collector ID, and One or More Event Source Types**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`

**Note:** The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

6. Click **OK**.

   The Parser Mapping is added.

7. To cancel the parser mappings selection, click **Cancel**.

## Read IP to Event Source Type Mappings

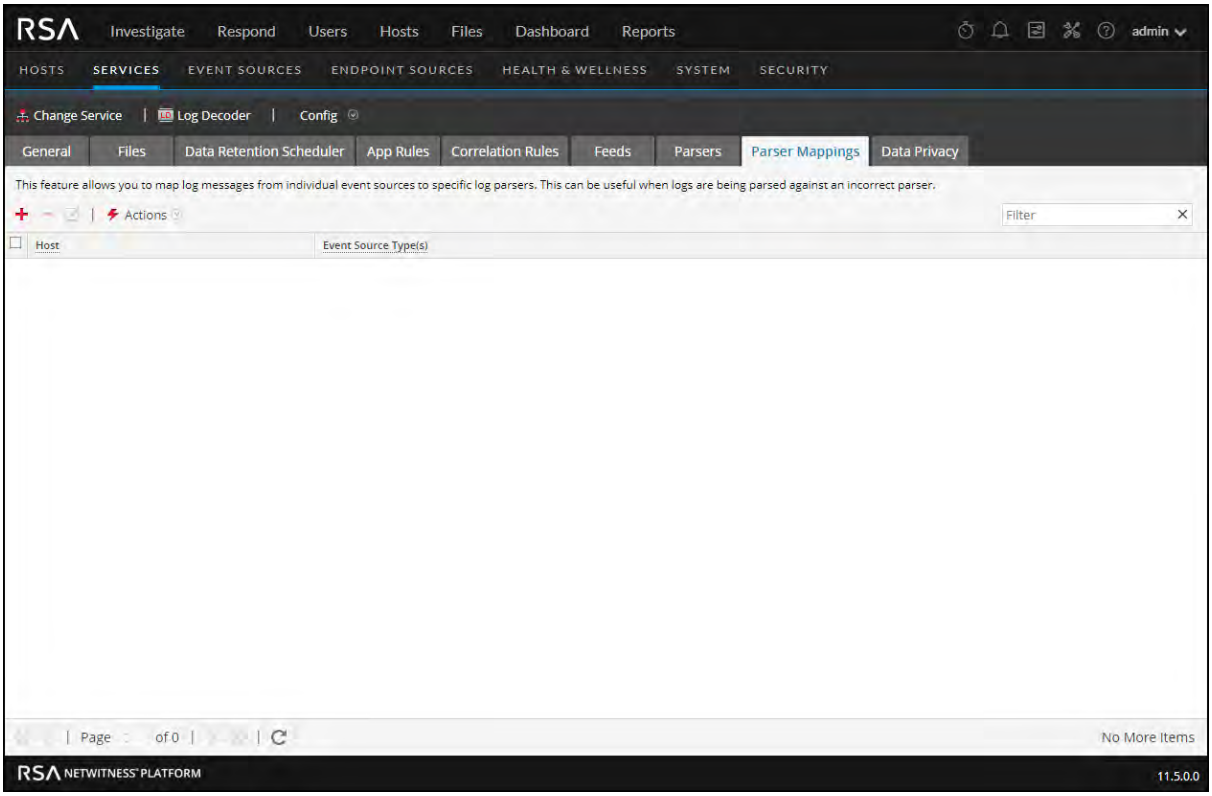
To read an IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Services Config view is displayed.

3. Select the **Parsers Mapping** tab.

   The mappings are displayed.



## Edit IP to Event Source Type Mappings

To edit IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.

   **Note:** You can only edit one mapping at a time.
5. Click .
6. In the **Event Source(s)** field, modify the event source(s).

   **Note:** The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

## Delete IP to Event Source Type Mappings

To delete IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .

   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

## Sort the Hostname or Event Source Type

To sort the hostname or event source type:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.

Event Source Types are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.

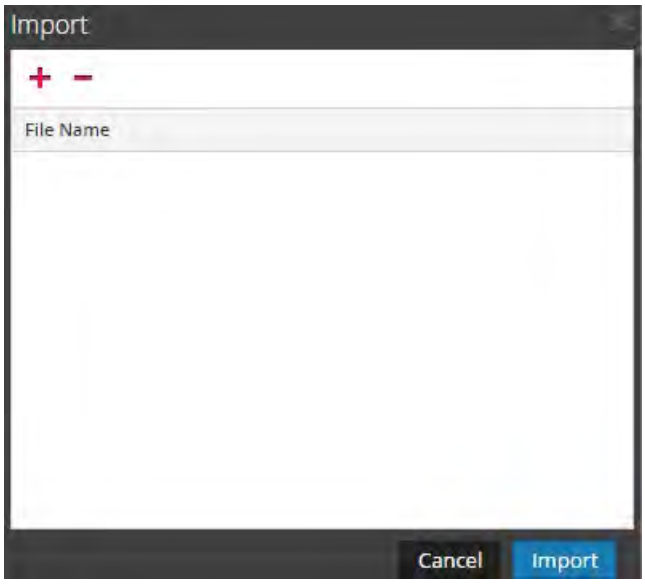
## Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions > Import**.

   The Import dialog is displayed.



5. Click .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

**Note:** You can only import one .csv file at a time.

## Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.

5. Select **Actions > Export > Selection**.

   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

## Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.

The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

# Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.

The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of RSA Customer Care or for troubleshooting purposes.

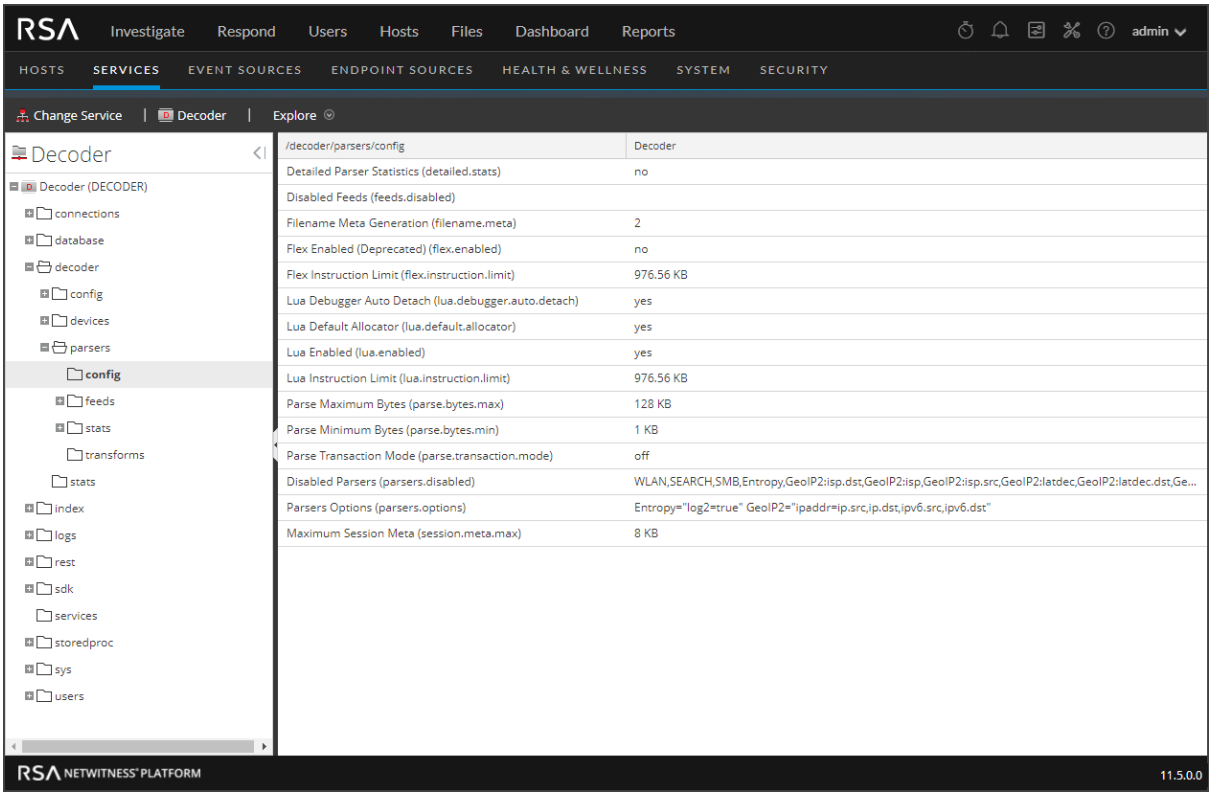
In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

### To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **(Admin) > Services.**
2. Select a Decoder or Log Decoder and **> View > Explore.**
   The Services Explore view for the selected service is displayed.

3. In the Node list, navigate to and select **`/decoder/parsers/config`**.



4. In the values panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.
   - To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
   - To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

# Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

If you map an IP address to its services, the Log Decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.

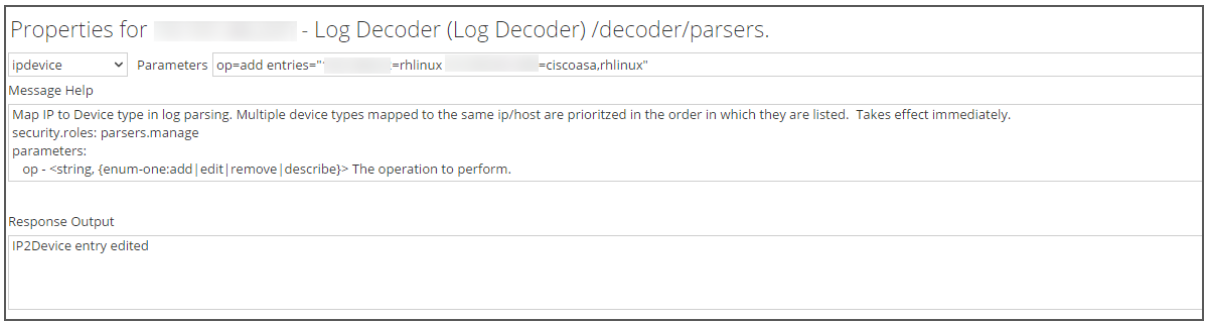
## Map an IP Address to a Service Type

### To map an IP address to a service type, do the following:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters:

   `op=add/remove entries="`***`ipaddress=service`***`"`

   for example, `op=add entries="10.100.201.300=ciscoasa"`
5. Click **Send**.



## IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="`***`address`***`=`***`service type`***`"`

- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.
  `op=remove entries="`***`address`***`"`

- `describe`: This operation returns the values currently in the ipdevice map.

# Map an IP Address to a Time Zone

This topic discusses NetWitness support for Event Time.

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Timestamp consideration for log files:

- Some logs are in UTC format.
- Some logs that are not in UTC include a timezone offset value to adjust the time accordingly.
- For logs that use local time, with no offset provided, you can create a source mapping to manually adjust times for logs from that event source.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: `America/Anguilla`
- POSIX format: `AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45`
- Offset by Minutes format: `= -500`

NetWitness maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

### To map an IP address to a time zone, do the following:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:

   `op=add entries="`***`ipaddress`***`=`***`timezone`***`"`

   for example: `op=add entries="10.10.10.10=Africa/Addis Ababa"`
5. Click **Send**.

## tzinfo Command

You can view the strings that can be used to specify the time zone by using the `tzinfo` command.

### To view the time zone strings, do the following:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.

4. In the **Properties** view, specify the `tzinfo` command with the following parameters:

   `op=tznames`

5. Click **Send**.

The list of time zone strings is returned in the **Response Output** text box.

## iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="address=time zone"`

- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="address"`

- `describe`: This operation returns the values currently in the iptmzone map.

## Examples

The following examples provide instances for mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**

  `op=add entries="10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga"`

- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=remove entries="10.5.245.9"`

- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=add entries="2001:DB8:85A3::8A2E:370:7334=America/Anguilla"`

- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format, enter the following string in the **iptmzone** command and click **Send**.

  ```
  op=add entries="10.168.0.2=America/Anguilla
  2001:DB8:85A3::8A2E:370:7334=0500 nwappliance21=EST5EDT,M3.2.0/2,M11.1.0"
  ```

## Change the Date format

The Log Decoder parsing engine uses the `event.time` meta key to keep track of the time an event occurs for incoming log messages. You can use the `mdformat` for the **iptmzone** command to change the date format. The Log Decoder currently has the ability to change the dates in the logs to have the following format:

```
mdy or dmy (month/day/year or day/month/year)
```

Notes:

- Event time metadata in a parser does not account for `dmy` and `mdy`.
- Currently, there is no functionality to detect this scenario and adjust parsing automatically.

**To change the date format, do the following:**

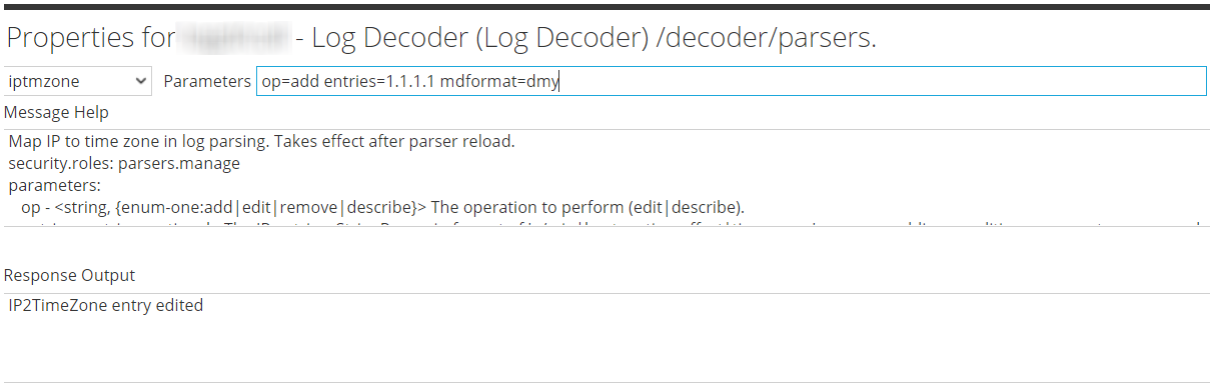
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select; **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, select **iptmzone** from the drop-down list, and specify the command with the following parameters:

   `op=add entries="<ipaddress>" mdformat=[dmy | mdy | none]`

   for example: `op=add entries="1.1.1.1" mdformat=dmy`

   Where:

   - `ipaddress` is the Device IP address, and
   - `mdformat` can be **dmy**, **mdy**, or **none**.

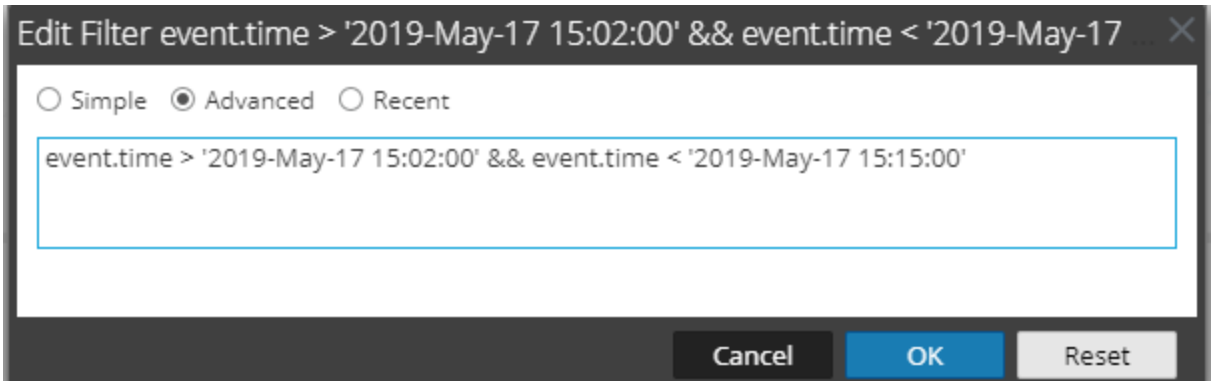


5. Click **Send**.

NetWitness maps the IP address along with the date format in the Log Decoder. Event time meta items are updated according to their respective mappings.

## Event Time Filter Example

If you want to see logs that have an event time between 3:02 PM and 3:15 PM on May 17, 2019, create the following filter:



**Note:** The query builder may tell you "invalid expression," but that is a validation error in the User Interface. The query works because even though this is a text (string) search, the system actually compares the ASCII values. So, for example the expression **A < B** would be true.

Below is a sample of the event meta values returned from the query:

## Missing Year Support

If there is no year associated with a format string, the parser attempts to populate the year heuristically. In most cases, the value is populated based on the current year. The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

The following are the various other scenarios:

1. Latent log during transition to new year.
2. Logs from forward time zones (or skewed clocks) just before new year transition.
3. Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year.

### Latent log during transition to new year

If the day is more than 31 days into the future, the year is decremented.

For example,

The message date is Dec-31. The current date is 2018-Jan-1. The temporary assigned date, 2018-Dec-31, will be more than 31 days into the future.

This will cause the year component to be decremented to 2017, resulting in a reasonable message time.

### Logs from forward time zones (or skewed clocks) just before new year transition

If the day is more than 334 days into the past, the year is incremented.

For example,

The message date is Jan-1. The current date is 2017-Dec-31. The temporary assigned date, 2017-Jan-1, will be more than 334 days into the past.

This will cause the year component to be incremented to 2018, resulting in a reasonable message time.

### Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year

If the day (Feb 29) is invalid (say, the assigned year is NOT a leap year), the relative position to the current time cannot be calculated. To do this, the year is decremented in an attempt get a valid time stamp.

Because the position of the leap day relative to the transition to the new year, along with the expectation that no logs would be received this far into the future, we do not ever make an attempt to increment the year to produce a valid time stamp.

After the year is decremented, the same logic is then followed (refer to statement 1 and 2). If the result is still an invalid day. The parser throws and a valid message time cannot be parsed.

### Limitations

**Note:** Currently, there is no mechanism to assign a year to the import of logs.

As this pertains to leap days, if you find the correct leap year, an inconsistent data would result. For example, if a set of messages is two years old and during a leap year, only a single day would remain which is accurate. Because of the heuristic described above, the remaining set of messages would have time stamps one year too.

For data consistency, usually you cannot find valid leap years beyond 1 month and less than 11 months.

## Examples

The following examples provide instances for logs with year and logs without year:

- If the log is with year, event time is generated as below:

```
%emcavamar: 1704^^2017-04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_
Proxy^^Internal server error^
<MESSAGE
     id1="1:01"
     id2="1"
     eventcategory="1605020000"
     functions="&lt;@msg:*PARMVAL($MSG)&gt;&lt;@event_time:*EVNTTIME
     ($MSG,'%W-%G-%F %H:%U:%O',fld2,fld3)&gt;"
     content="&lt;fld1&gt;^^&lt;fld2&gt;^^&lt;fld3&gt;^^&lt;fld4&gt;^^
     &lt;&lt;event-source NodeID=&quot;&lt;hostname&gt;&quot;
     ProgramName=&quot;&lt;fld8&gt;&quot;/&gt;^^&lt;fld9&gt;^^&lt;cate
     gory&gt;^^&lt;severity&gt;^^&lt;event_
     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

- If the log is without year, event time is still generated, The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

```
%emcavamar: 1704^^04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_

     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

# Obtain Log Files from a Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to (Admin) > **Services** > select a **Log Decoder**, then select > **View** > **Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

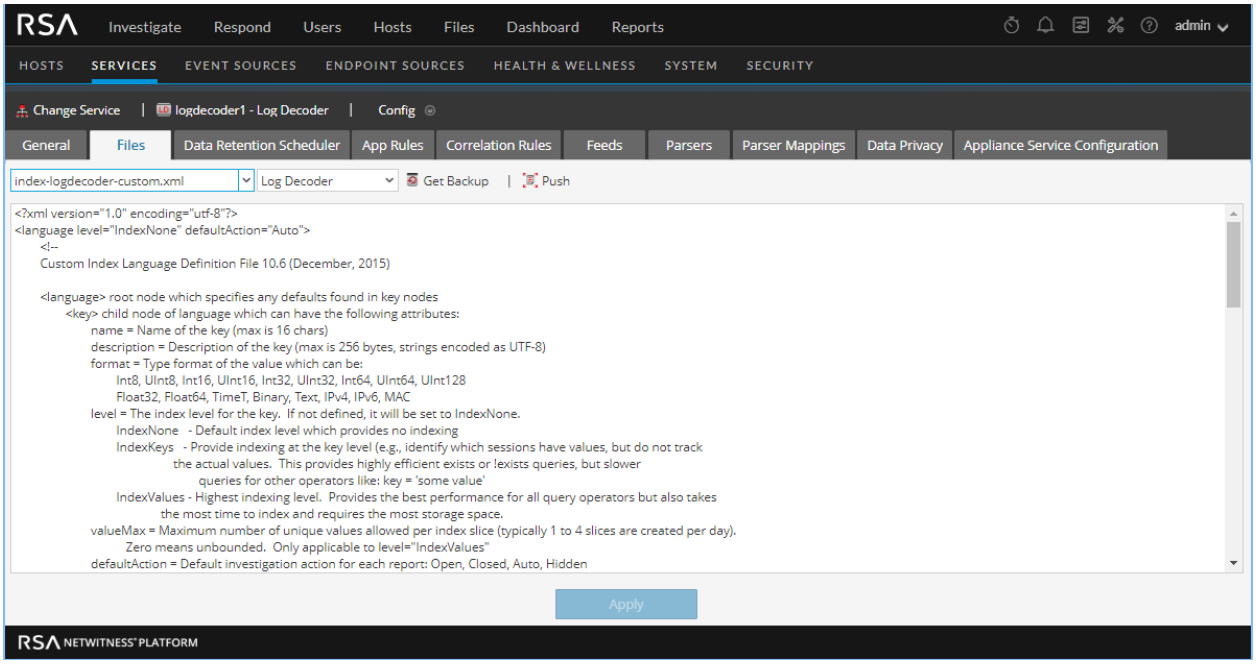
```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4" valueMax="100000"
defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.
5. Restart the Log Decoder service as follows.

   Select Log Decoder service > **Explore** > **decoder** > **Properties** > **reset**. You select **reset** from a drop down menu.

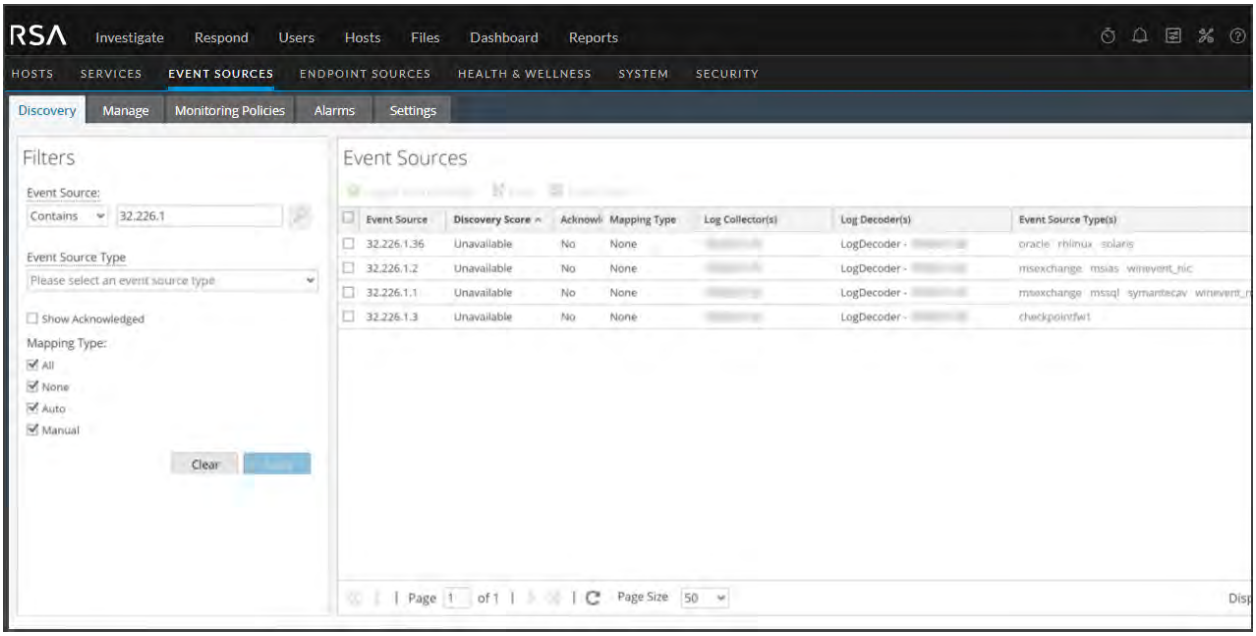
Click **Send** after you select reset.

This is an example of the **index-logdecoder-custom.xml** file.



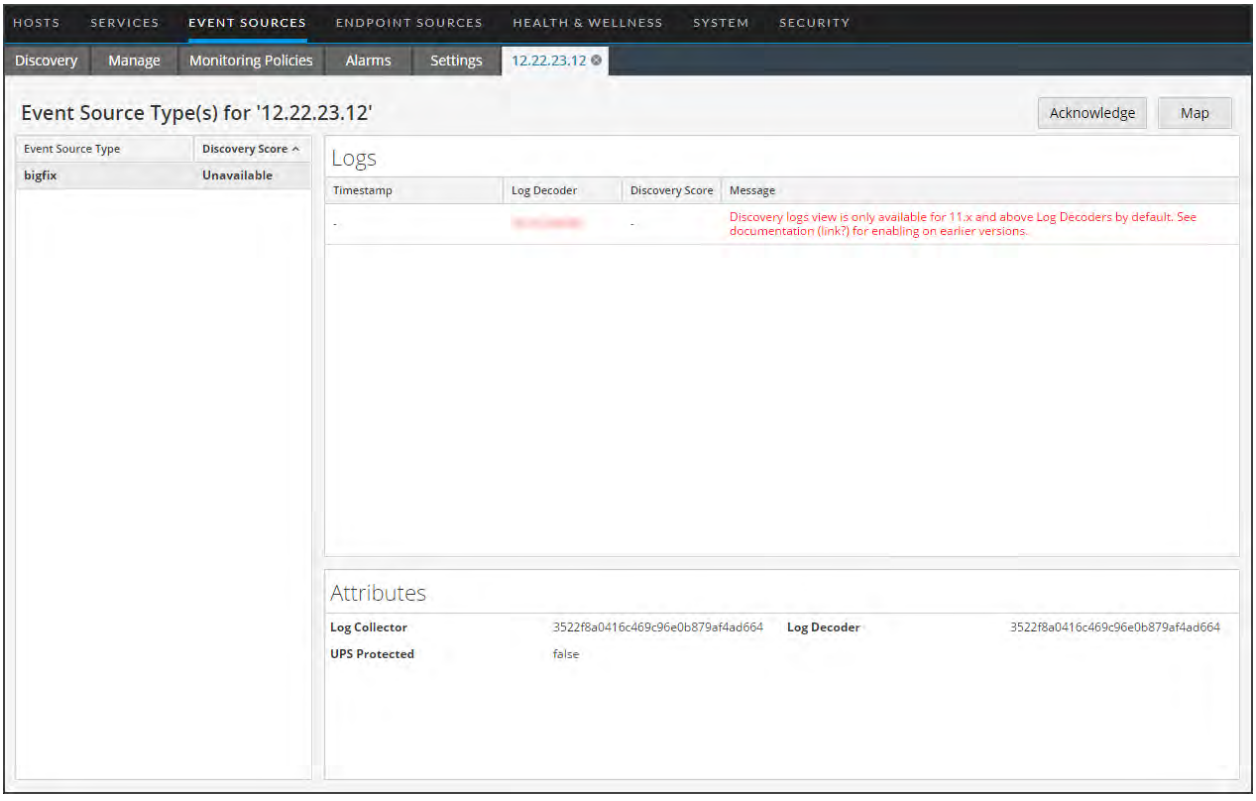
**Note:** Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



**Note:** Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.



# Upload a Log File to a Log Decoder

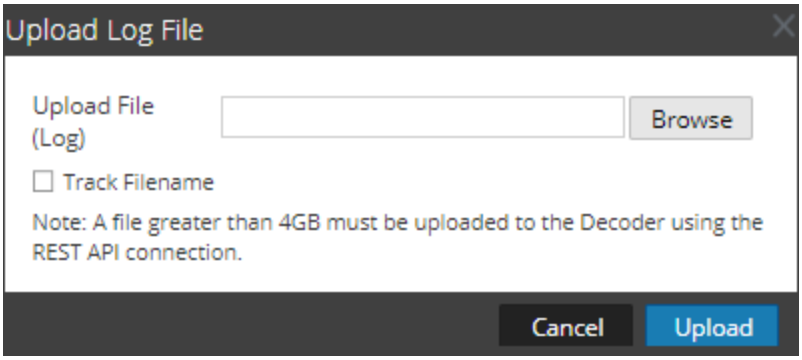
There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring, for example, when the Log Decoder is capturing logs.

### To import a log file to a Log Decoder:

1. Go to **(Admin) Services**.
2. Select a Log Decoder in the **Service** grid, and select **> View > System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.



4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.
7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

# Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

### To select and upload a packet capture file:

1. Go to **(Admin)** > **Services**.

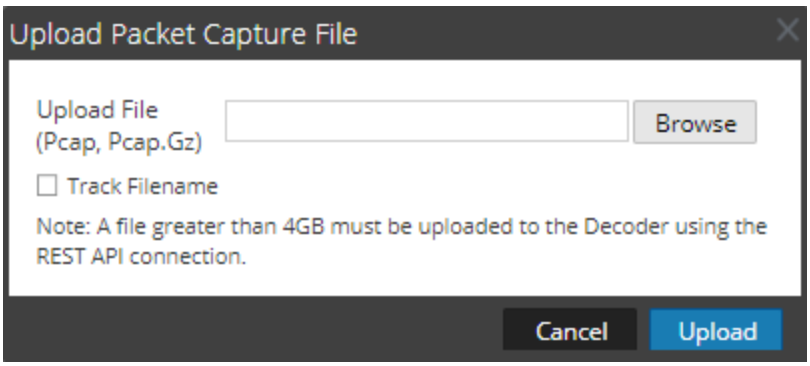
   The Administration Services view is displayed.

2. Select the Decoder name, and **> View > System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.



4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File (pcap, pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

## Simultaneous Import and Capture

You can import or upload PCAPs while the capture is running using RESTful API. Make a note of the following points before you start importing during capture:

- The source file metadata is not created for imported PCAPs when the capture is running. If capture is stopped, the source file metadata is created as in older versions.
- The NWD files can be imported, but not while the capture is running. If you attempt to import an NWD file while the capture is running, the Decoder returns an error. An active import will block starting/stopping of import and capture.
- The file tracking meta is not created during the simultaneous import and capture.

# Decoder and Log Decoder References

This is a collection of references, which provide information about the user interface for Decoders and Log Decoders in NetWitness, with references to the procedures that describe the work you can do in that part of the user interface.

# Services Config View - Capture Policies Tab

In the Capture Policies tab ( (Configure) > **Capture Policies**, administrators can configure selective network data collection policies.

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of Decoder resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. You can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected. The administrator can choose to deploy predefined policies that capture:

- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols is available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

## Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | use predefined selective collection policies* | (Optional) Configure Selective Network Data Collection |
| Administrator | create new policies from predefined ones* | (Optional) Configure Selective Network Data Collection |

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | create custom policies* | (Optional) Configure Selective Network Data Collection |
| Administrator | verify policies | (Optional) Configure Selective Network Data Collection |
| Administrator | unpublish policies* | (Optional) Configure Selective Network Data Collection |
| Administrator | delete policies* | (Optional) Configure Selective Network Data Collection |

*You can complete these tasks here.

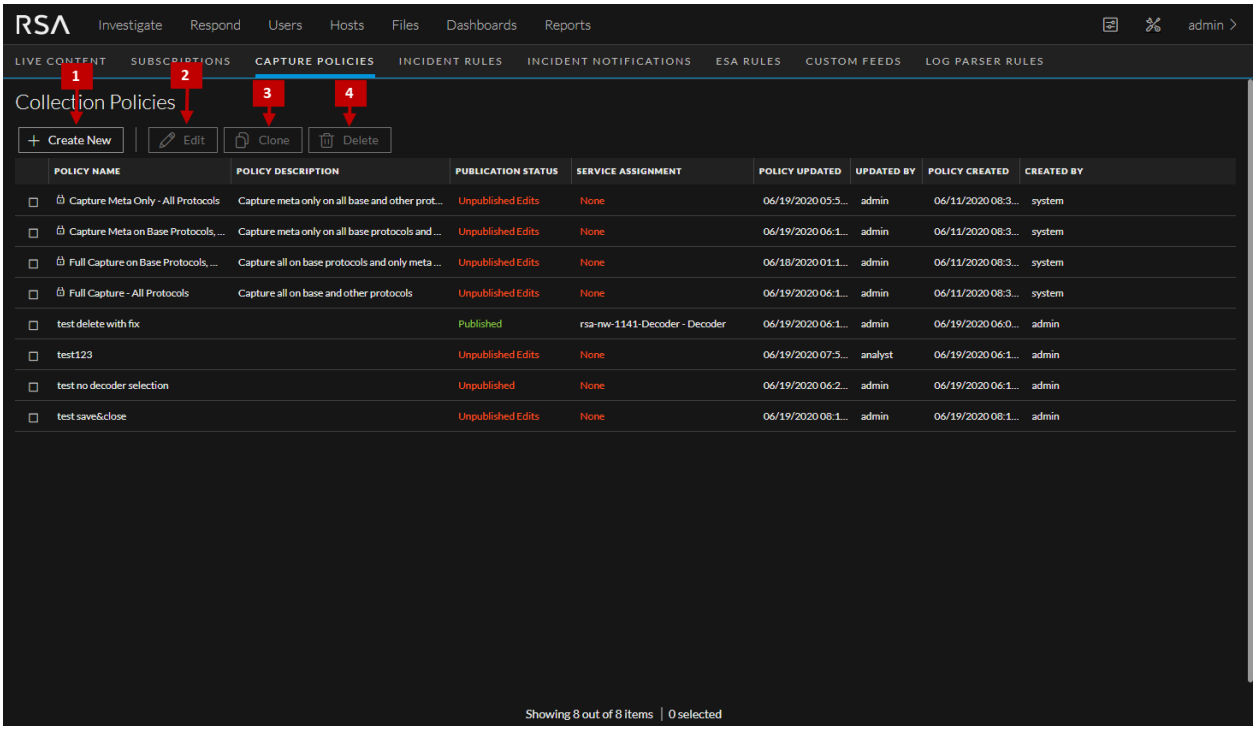
- Services Config View - Edit Capture Policies Wizard

## Quick Look

This is an example of the Capture Policies tab.



1 Create New - Provides a wizard to create a new policy.
2 Edit - Provides a wizard to edit an existing custom policy.
3 Clone - Selects an existing policy (predefined or custom) and copies it to create a new policy.
4 Delete - Removes policies.

The following table describes the contents of the Capture Policies tab.

| Column | Description |
|---|---|
| Policy Name | The name of the policy (not editable for predefined policies). |
| Policy Description | The description of the policy (not editable for predefined policies). |
| Publication Status | • **Unpublished**: policies that have not been deployed to Decoders yet.<br>• **Unpublished Edits**: policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders).<br>• **Published**: policies which have been deployed to Decoders.<br>• **Failed**: policies that failed to execute, for example, if a Decoder is offline or a system is down. For information about how to troubleshoot failed policies, see "Troubleshooting Policy Deployments That Fail" in (Optional) Configure Selective Network Data Collection. |
| Service Assignment | Identity of the Decoder or service on which the policy is run. |
| Policy Updated | Date the policy was edited. |
| Updated By | Role of the person who updated the policy. |
| Policy Created | Date on which the policy was created. |
| Created By | Role of the person who created the policy. |

# Services Config View - Edit Capture Policies Wizard

In the Edit Policies view ( (Configure) > **Capture Policies** > **Edit**, administrators can configure selective network data collection policies. The panels for creating a new policy and editing an existing policy are the same except that in the editing wizard, the definitions of the existing policy are displayed.

You can edit existing policies to customize them for your environment. A base set of protocols are available for alterations, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it.

**Note:** A set of predefined policies are available immediately. The only way you can edit a predefined policy is by assigning Decoders to the policy to collect the targeted data.

## Workflow

The following figure shows the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | create new policies from predefined ones* | (Optional) Configure Selective Network Data Collection |
| Administrator | create custom policies* | (Optional) Configure Selective Network Data Collection |
| Administrator | unpublish policies* | (Optional) Configure Selective Network Data Collection |
| Administrator | delete policies* | (Optional) Configure Selective Network Data Collection |

*You can complete these tasks here.

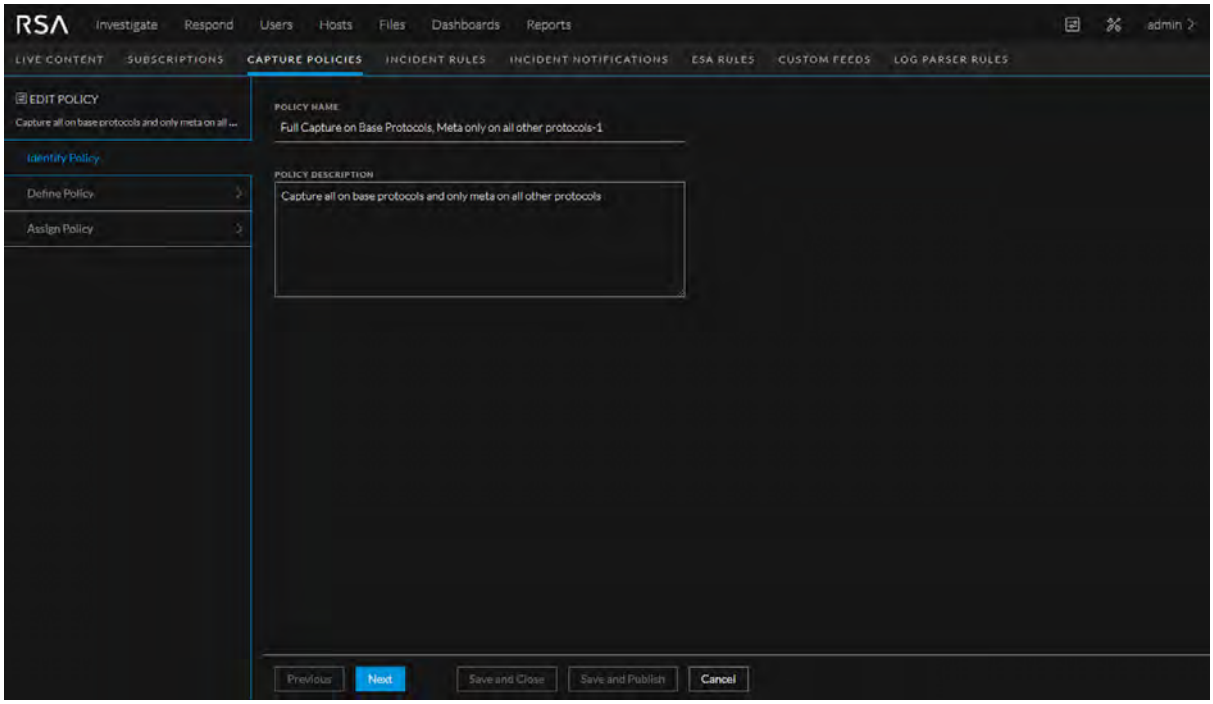
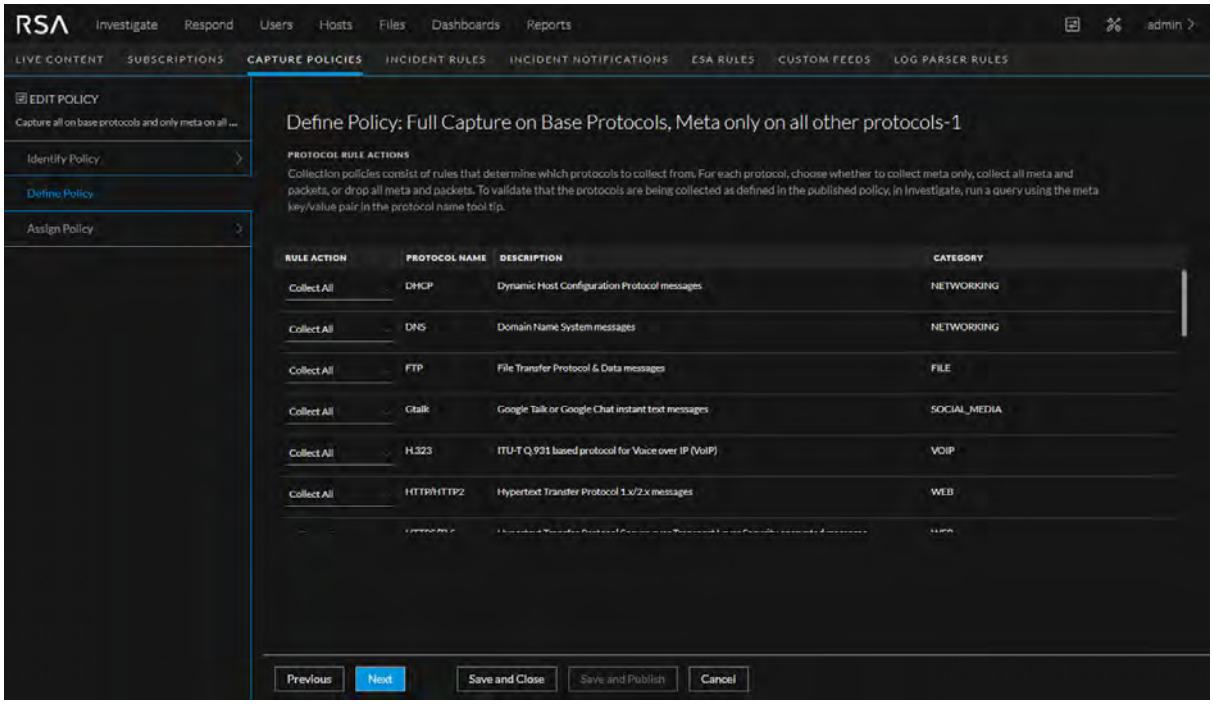
- Services Config View - Capture Policies Tab

## Quick Look

1. To access the Edit Policy wizard, go to (Configure) > **Capture Policies**, select a policy, and click **Edit**.
   The Identify Policy page is displayed, where you can change the name and description of the policy.



2. To view the Define Policy page, click **Next**.



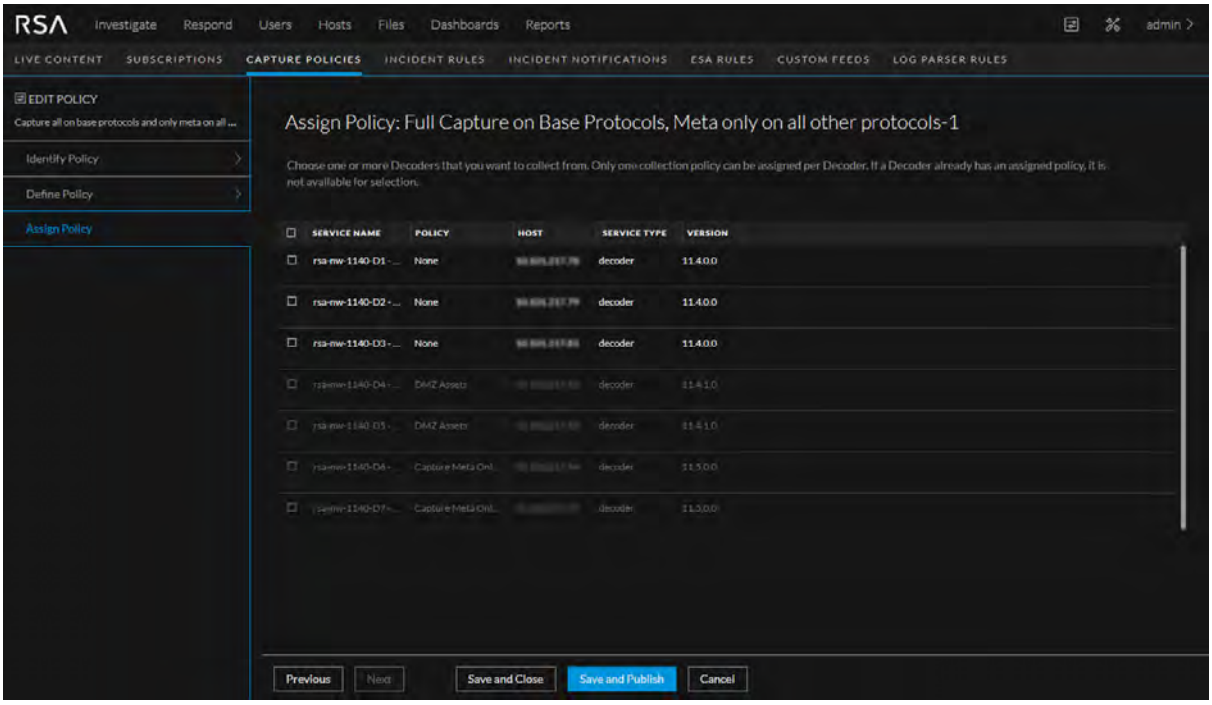
In the Define Policy page, you can define rule actions for the protocols for which you are interested in collecting data. The rule actions are:

- **Collect Meta Only**: Collect metadata
- **Drop All**: Drop metadata and network packets
- **Collect All**: Collect metadata and network packets

You can click **Save and Close** to save your policy without deploying it on Decoders.
The following table describes the actions of the buttons on this page.

| Button | Description |
|---|---|
| **Previous** | Go to the previous page of the wizard |
| **Next** | Keep updates from the current page and go to the next page of the wizard. |
| **Save and Close** | Save the policy definitions without publishing the policy. |
| **Save and Publish** | Save the policy definitions and publish the policy to Decoders to begin data collection. |
| **Cancel** | Cancel the definitions and return to the Capture Policies tab. |

3. Click Next to go to the Assign Policy page.



This is where you assign the policy to Decoders to capture the data. The following table describes the columns in this page.

| Column | Description |
|---|---|
| **Service Name** | The name of a service. For 11.5, Decoder is the only available service. |
| **Policy** | The policy that a Decoder is assigned to. |
| **Host** | The IP address or name of the host system for the Decoder. |
| **Service Type** | The type of service the policy is published to. For 11.5, the service type is **decoder**. |
| **Version** | The version of NetWitness Platform that is installed on the service host. |

# Services Config View - Data Privacy Tab

In the Data Privacy tab ( **(Admin) > Services > Select a Decoder or Log Decoder >** > **Config > Data Privacy tab)**, administrators can configure data privacy parameters for certain Core services. For the Decoder and Log Decoder, you can set the default hash algorithm and salt.

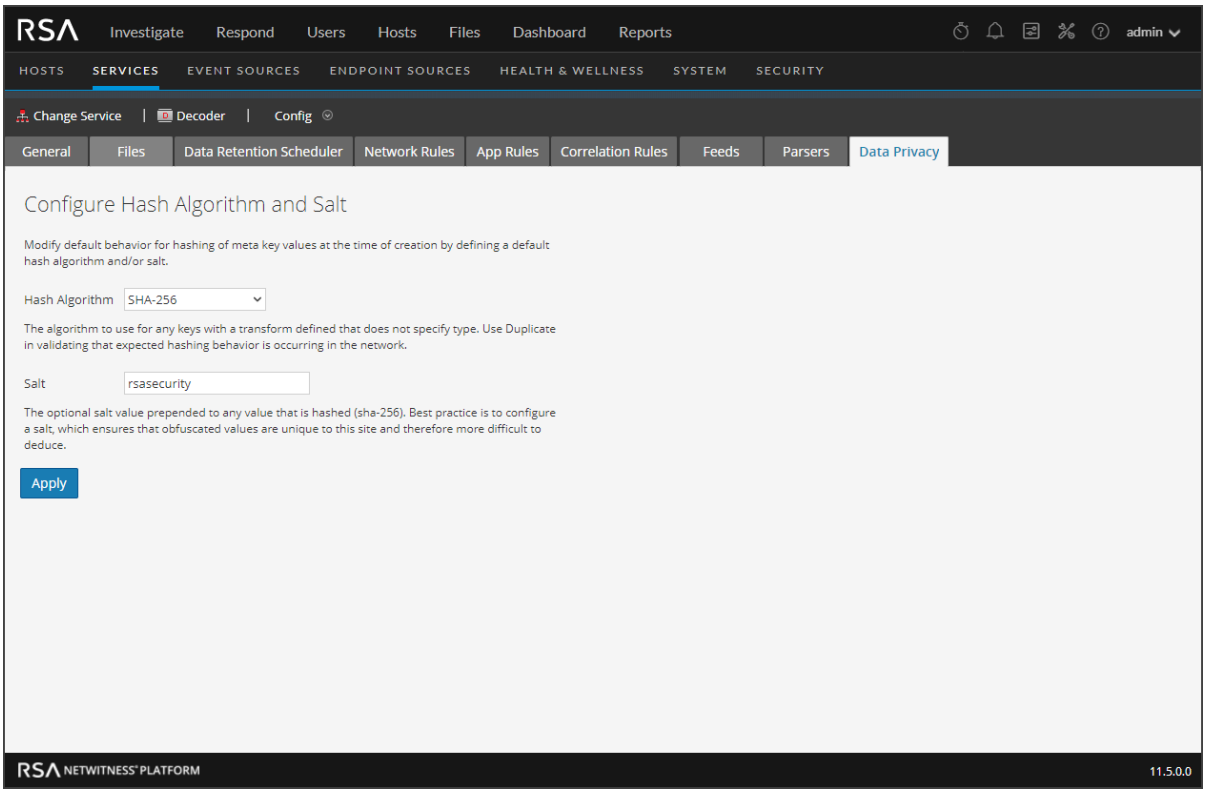
## What do you want to do?

| User Role | I want to ... | Documentation |
|---|---|---|
| Administrator | configure hash algorithm and salt | "Configure the Hash Algorithm and Salt" in the *Data Privacy Management Guide*. (Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.) |

## Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

## Quick Look



The Data Privacy tab has the Configure Hash Algorithm and Salt configuration settings. The following table describes the parameters in this tab.

| Parameter | Description |
|---|---|
| Hash Algorithm | Displays a drop-down list of hash algorithms to use for any keys with a transform that does not specify algorithm type. Possible values are SHA-256 and Duplicate. Duplicate is a special algorithm available for administrators to use when validating that expected hashing behavior is occurring in the network. |
| Salt | Indicates the optional salt value prepended to any value that is hashed. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. Configuring a value ensures that obfuscated values are unique to this site and therefore more difficult to deduce. For more information on this field, see "Configure Data Obfuscation" in the *Data Privacy Management* guide. |
| Apply | Applies any changes. |

# Services Config View - Data Retention Scheduler

In the Data Retention Scheduler tab, you can set the rollover criteria for removing database records from primary storage using an age-based threshold. You can also schedule the timing to check whether the threshold is reached.

To access the Data Retention Scheduler tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Data Retention** tab.

## What do you want to do?

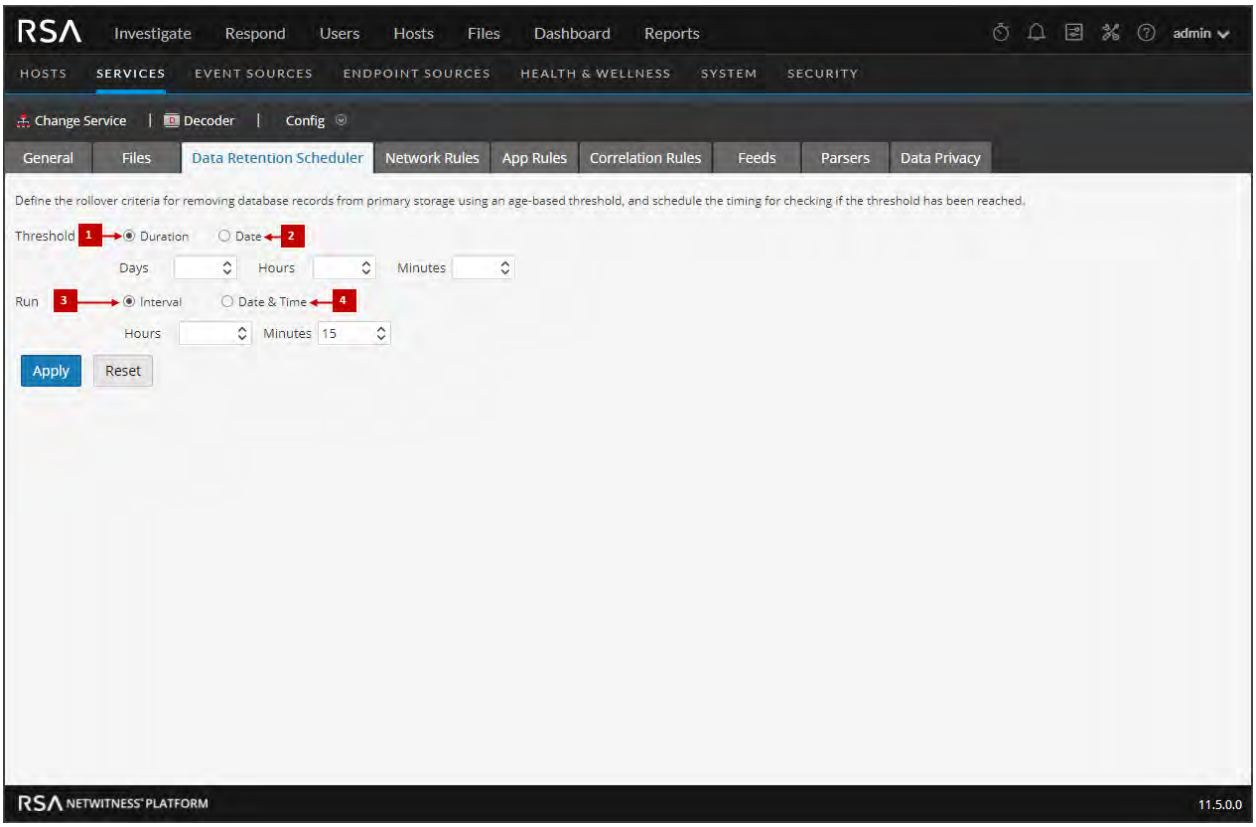
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | Schedule the timing to see if the threshold is reached. | Configure Transaction Handling on a Decoder |

## Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup

## Quick Look

This is an example of the Data Retention Scheduler tab.



| | |
|---|---|
| 1 | **Threshold Duration**: Removes database files older than the selected number of days, minutes, or hours. |
| 2 | **Threshold Date**: Removes database files older than the selected UTC date (YYYY-MM-DD-HH:MM:SS) that are not compatible with minutes, hours, or days parameters. |
| 3 | **Run Interval**: Indicates the number of hours between executions. |
| 4 | **Run Date and Time**: Defines which days of the week to execute the scheduler, as well as time of execution in HH:MM:SS format for the local time of the service. |

# Services Config View - Feeds Tab

Feeds and parsers are Lua programs loaded and compiled when either processing capture files in NetWitness Investigate or capturing data with Decoders. Most commonly, they are used for static meta extraction and service identification.

**Note:** Pre-11.0 versions of NetWitness used FLEXPARSE programs in addition to Lua programs; Flexparsers are deprecated in NetWitness 11.0. Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

NetWitness uses feeds to create metadata based on externally defined meta values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data can identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

Feeds can be added, removed, and updated while a Decoder is running without affecting capture. The Feeds tab ( **(Admin) > Services** > select a Decoder or Log Decoder service and click > **View > Config > Feeds tab**) provides a user interface for managing feeds on Decoders.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | configure feeds | Configure Parsers and Feeds |
| Administrator | enable and disable parsers | Enable and Disable Parsers and Log Parsers |

## Related Topics

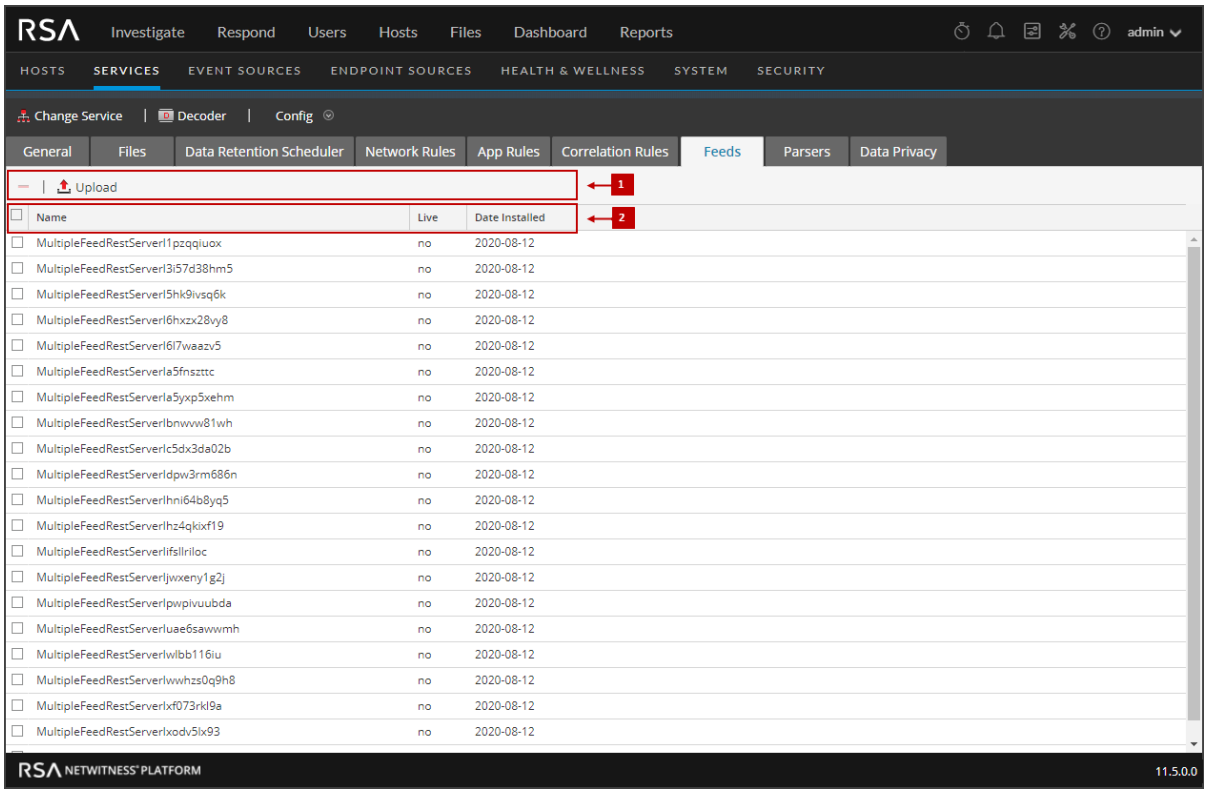
## Quick Look

This is an example of the Feeds tab.



1 Feeds Tab Toolbar - Provides options to work with feeds in the grid
2 Feed List - Lists all feeds that are currently deployed on the Decoder

## Feeds Tab Toolbar

| Feature | Description |
|---|---|
| Upload | Displays the Upload Feeds dialog. |
| − | Deletes the selected feeds. |

## Feeds List

The Feeds list provides a listing of all currently deployed feeds for the Decoder.

| Column | Description |
|---|---|
| **Name** | The name of the feed or the feed file. |

| Column | Description |
|---|---|
| **Live** | Indicates if the feed originated from Live. Possible values are **Yes**, **No**, or **N/A**.<br>• **Yes** = Installed through Live<br>• **No** = Installed through NetWitness<br>• **N/A** = The feed has no attributes file created by NetWitness to track the installation date. The feed may have been installed manually, not through NetWitness or Live Services. Manually installed feeds still function properly. |
| **Date Installed** | The date the feed was pushed to the service. |

# Upload Feeds Dialog

This topic describes the features of the Upload Feeds dialog in the Services Config view > Feeds tab.

The **Upload** option in the Services Config view > Feeds tab displays the Upload Feeds Dialog, in which you can manage the uploading of feeds to a Decoder or Log Decoder.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | prepare a list of feeds for upload | Edit, Upload, or Remove a Feed |
| Administrator | view and delete upload jobs | Edit, Upload, or Remove a Feed |

## Related Topics

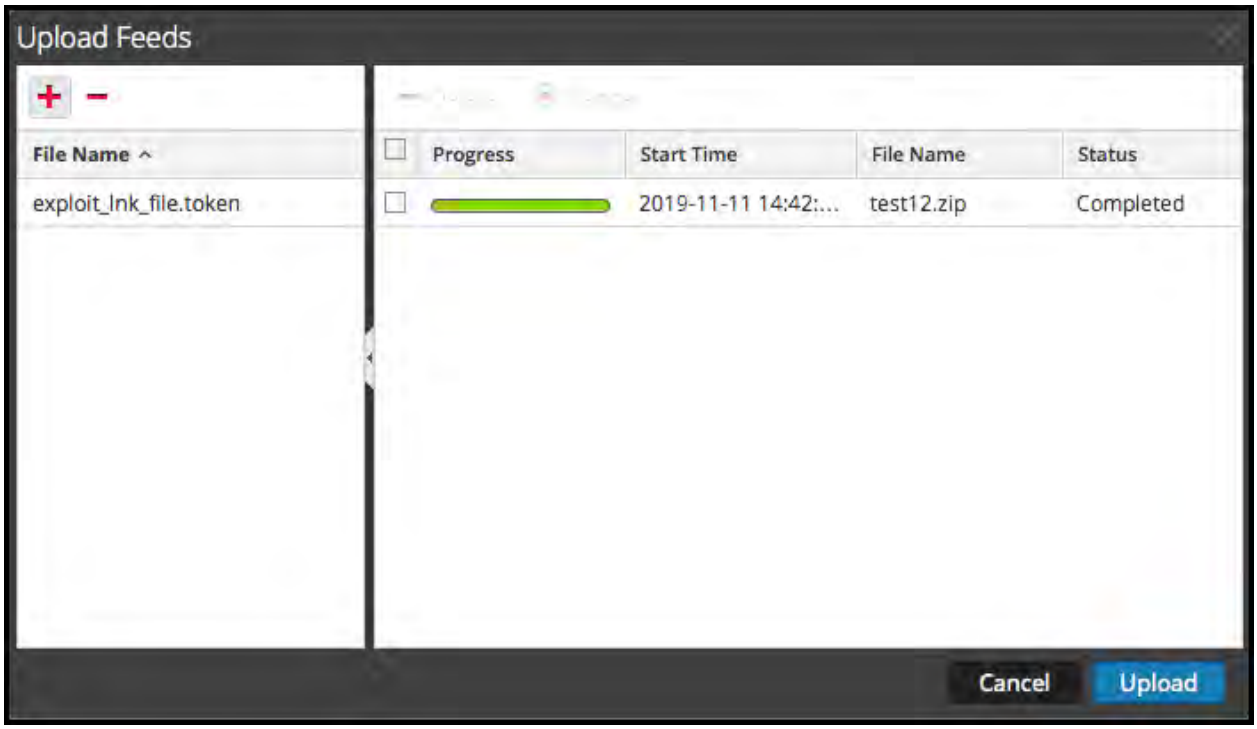
## Quick Look

This is an example of the Upload Feeds dialog.



## File List

The File list is the place to prepare a list of feeds for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking **Upload** starts the upload process.

| Feature | Description |
|---|---|
| | Opens a view of the directory structure where you can select files to add to the File list. |
|  | Deletes the selected files from the File list. |
| **File Name** | Lists the feed files you have added from a file system in preparation for uploading to a Decoder. When you click **Upload**, the files listed here are uploaded. |

## Upload Job List

The Upload Job list provides a view of upload jobs started by clicking **Upload**.

| Feature/Column | Description |
|---|---|
| | Deletes an upload job. |
| **Progress** | Displays progress of an upload job. |
| **Start Time** | Displays the start time of an upload job. |
| **File Name** | Lists filename of the feed being uploaded. |
| **Status** | Displays the status of upload job. |

## Upload Feeds Dialog Buttons

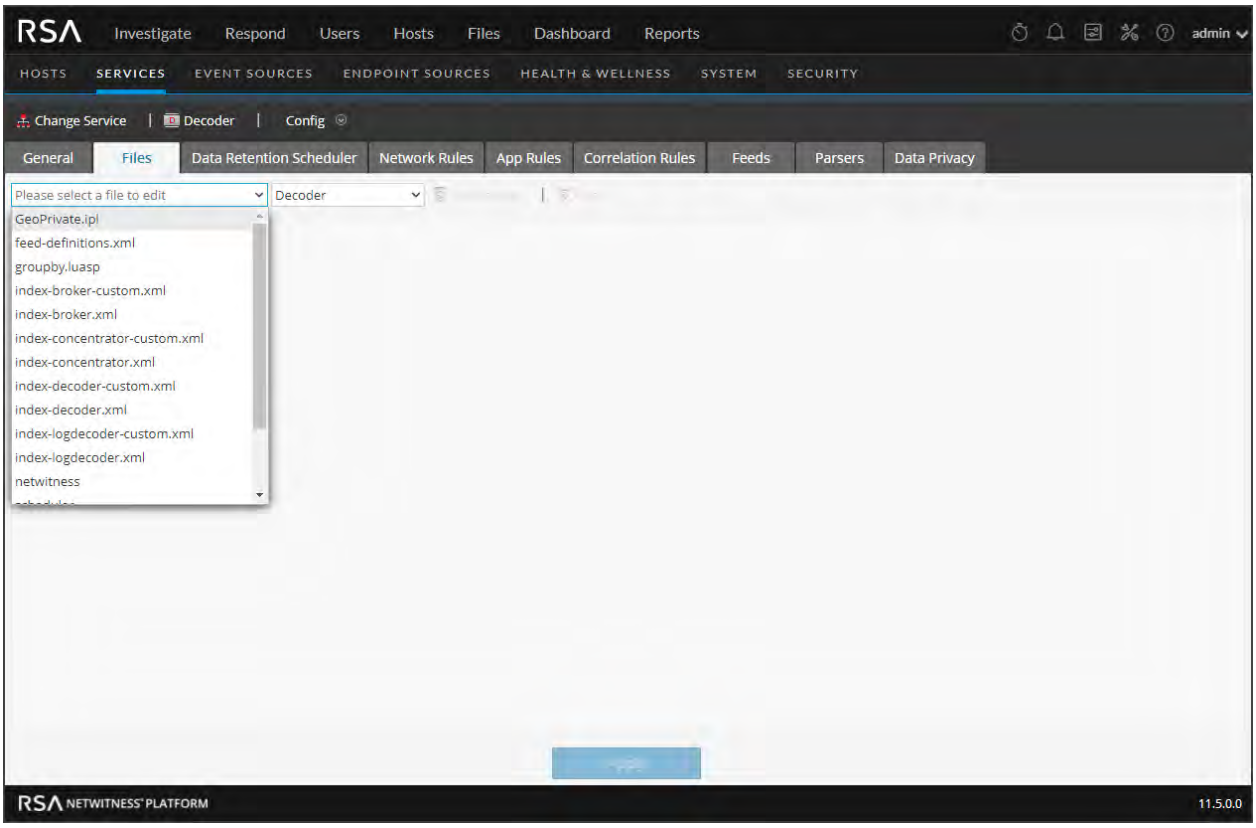
| Feature | Description |
|---|---|
| **Cancel** | Closes the Upload Feed dialog. |
| **Upload** | Starts uploading the feed files listed in the File list. Each feed is listed in a separate row in the Upload job list. |

# Services Config View - Files Tab

The Decoder and Log Decoder configuration files are visible and editable in the (Admin) > Services > Config view > Files tab. "Edit Core Services Configuration Files" in the *Hosts and Services Getting Started Guide* provides general instructions for editing files. (Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.)

Like other Core services, both the Decoder and Log Decoder have an index file, and may also have a crashreporter, netwitness, and scheduler. The Decoder and Log Decoder index files are named **`index-decoder-custom.xml`** and **`index-logdecoder-custom.xml`.**

**Note:** `Table-map.xml` and `table-map-custom.xml` are available only for Log Decoders with log content installed.



## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | obtain log files from pre-11.0 Log Decoder | Obtain Log Files from a Pre-11.0 Log Decoder |

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | edit files and parsers | • Feed Definitions File<br>• Flex Parsers<br>• GeoIP2 Parsers<br>• Lua Parsers<br>• Decoder Snort Detection<br>• Search Parser<br>• Wireless LAN Configuration |

## Related Topics

## Quick Look

| Filename | Description |
|---|---|
| `GeoPrivate.ipl` | This fixed parser takes the IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display. |
| `feed-definitions.xml` | Used to create custom feeds, this is the XML schema used by the Decoder to define a **feed** message when it creates a **.feed** file. |
| `traffic_flow_options.lua` | Used to provide directionality information. Update this file with environment-specific internal and external subnets for the Lua parser to create proper directionality in metadata. The parser is described in RSA Content for RSA NetWitness Platform. |
| `search.ini` | This is the Search Parser configuration file. The Search Parser is a custom parser, used to generate metadata by scanning for pre-defined keywords and regular expressions. |
| `wlan-config.xml` | This is the wireless LAN configuration file (9/9/2009). This file controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. |

# Services Config View - General Tab

The General tab for a Decoder in the Services Config view provides a way to manage basic service configuration, configure data capture, and select the parsers that are applied to the captured data. To access the General tab, go to **Admin > Services >** select a Decoder or Log Decoder and click ⚙ **> View > Config > General tab**.

## Workflow

The following figure depicts common Decoder configuration tasks with the steps you can complete in this view highlighted.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | configure capture settings* | Configure Capture Settings |
| Administrator | manage parsers and log parsers* | Enable and Disable Parsers and Log Parsers |
| Administrator | start and stop data capture | Start and Stop Data Capture |
| Administrator | configure rules | Configure Decoder Rules |

*You can complete these tasks here.

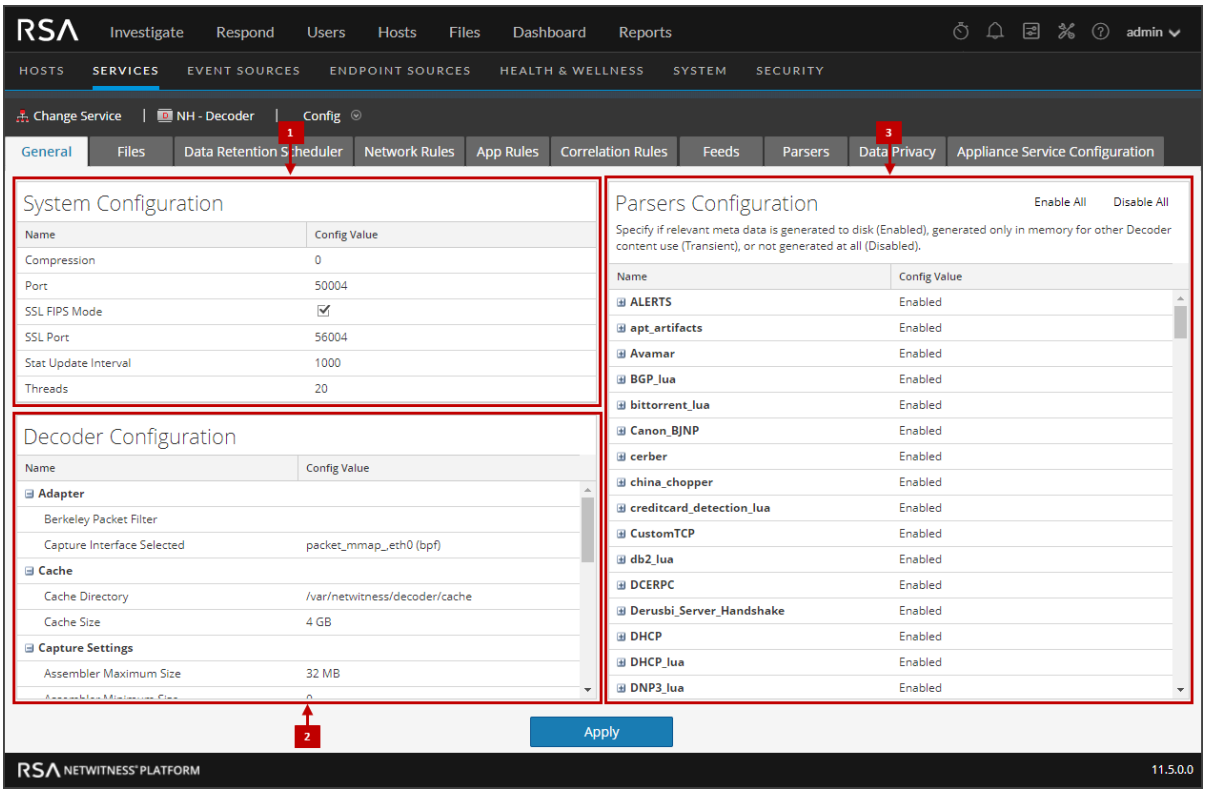
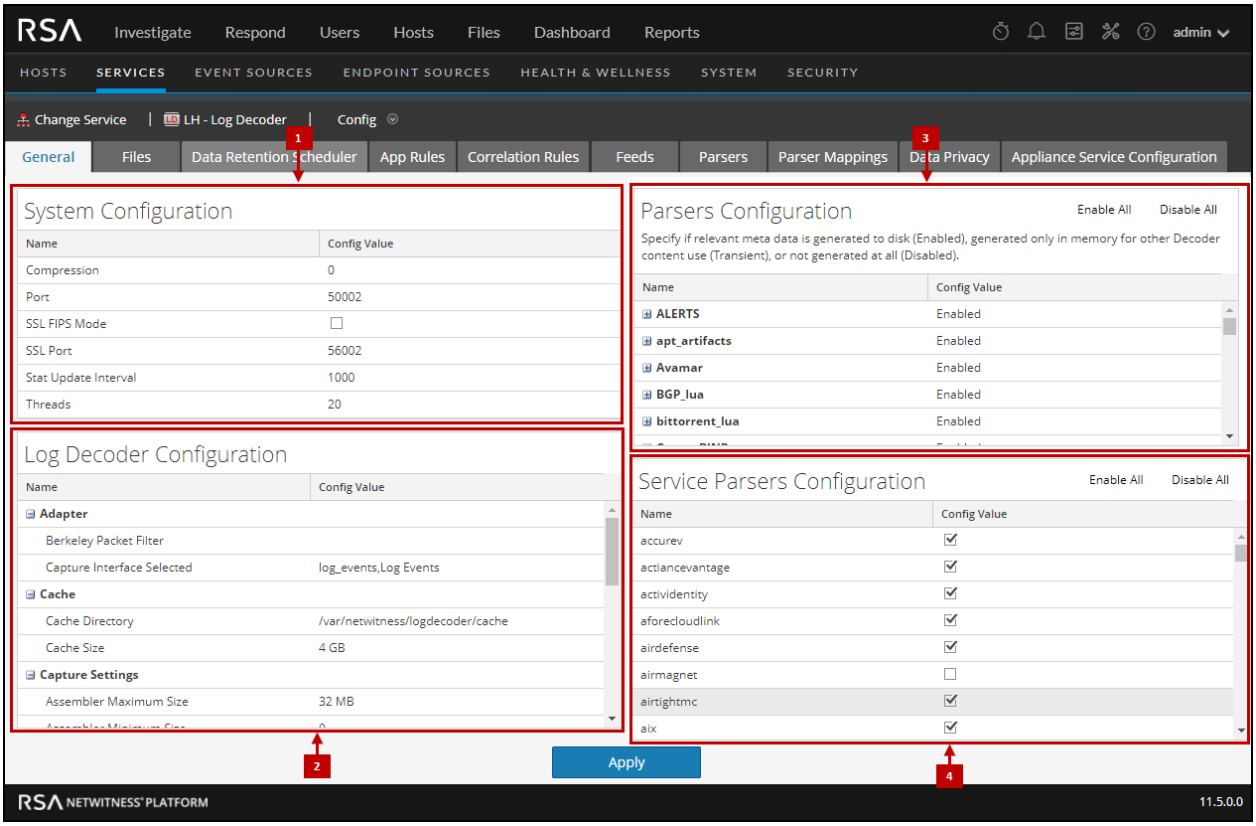
## Quick Look

The first figure is an example of the General tab for a Decoder. The second is the General tab for a Log Decoder.



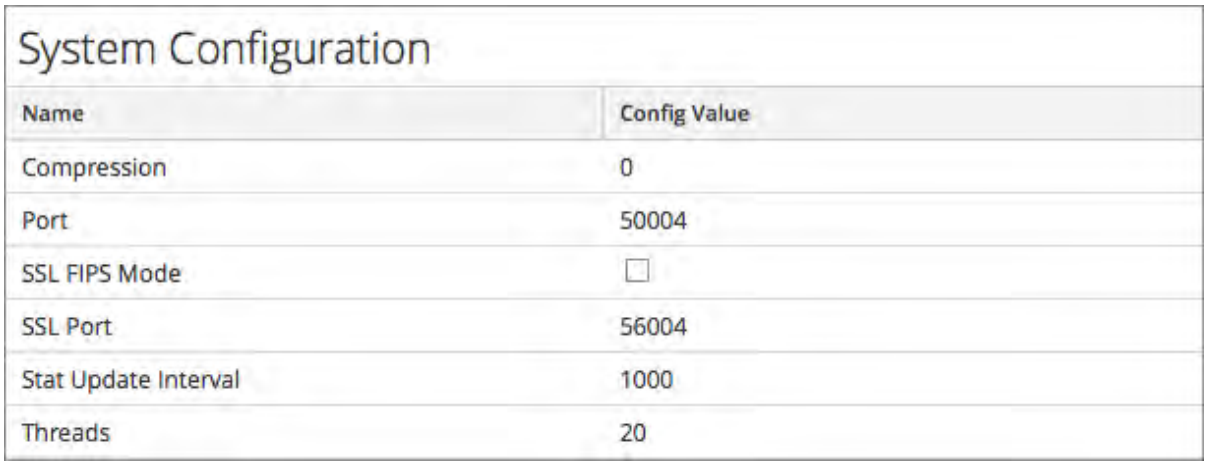


1 System Configuration - Manages service configuration for a Decoder or a Log Decoder.

2 Decoder Configuration or Log Decoder Configuration - Lets you view and edit service configuration parameters for a Decoder or Log Decoder.
3 Parsers Configuration - Lets you select parsers to use on the Decoder or Log Decoder.
4 Service Parsers Configuration (Log Decoders only) - Lets you select service parsers to use on the Log Decoder.

## System Configuration Section

The System Configuration section manages service configuration for a Decoder. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

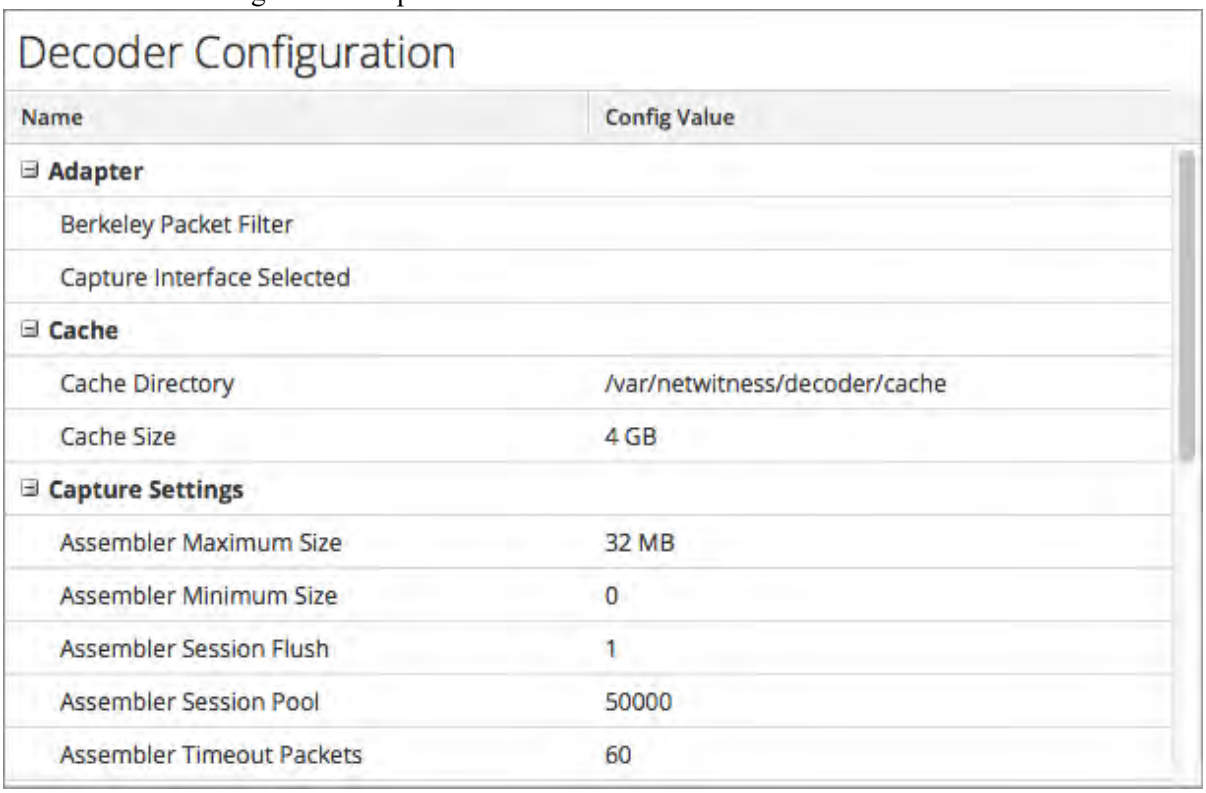


The System Configuration section has these parameters.

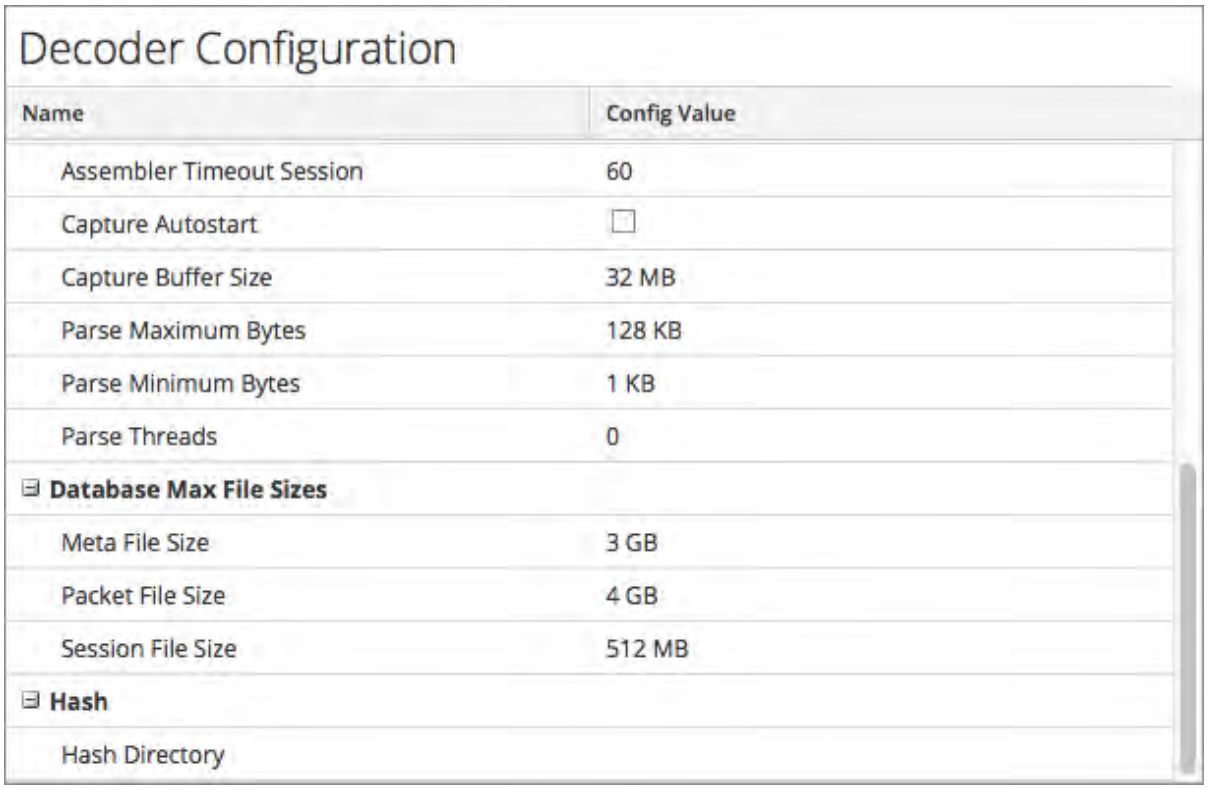
| Parameter | Description |
|---|---|
| **Compression** | The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**.<br>A change in value is effective immediately for all subsequent connections. |
| **Port** | Determines the port used by the service.<br>**Note:** If you change the port number, ensure that you restart the service. |
| **SSL FIPS mode** | If enabled, all the data transferred in the network will be encrypted using SSL. |
| **SSL Port** | Indicates the port used for encrypting using SSL. |
| **Stat Update Interval** | The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**.<br>A change in value is effective immediately. |
| **Threads** | The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide.<br>A change takes effect on service restart. |

## Decoder Configuration Section

The Decoder Configuration section provides a way to view and edit service configuration parameters for a Decoder or Log Decoder. When a service is first added, default values are in effect. You can edit these values to manage traffic capture.



Scrolling to the bottom of the section reveals these additional Decoder Configuration parameters.



## Adapter Section

Adapter parameters configure the network interface for capture as described in Configure Capture Settings.

## Cache Section

Cache parameters configure the cache directory and size for session cache files. The following table describes the cache settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

| Cache Parameter | Description |
|---|---|
| **Cache Directory** | The directory where session cache files are stored. The default value is `/var/netwitness/decoder/cache`. Change takes effect immediately. |
| **Cache Size** | The maximum size, in Megabytes (MB), that all files in the cache directory can attain before the oldest files are deleted. Once the threshold is reached, the cache size is reduced by 10%. The default value is **4 GB**. Change takes effect immediately. |

## Capture Settings Section

The Capture Settings section provides a way to configure operational capture settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

| Capture Settings Parameter | Description |
|---|---|
| **Assembler Maximum Size** | Specifies the maximum size in bytes that a session's packet data size can attain. The default value is **32 MB**. Change takes effect immediately. |
| **Assembler Minimum Size** | Specifies the minimum size in bytes that a session must have in order to generate metadata. A value of **0** means every session has metadata generated. The default value is **0.** Change takes effect immediately. |
| **Assembler Session Flush** | Specifies whether a session is removed from the assembler when the session's last chain is removed from the assembler. The default value is **1**.<br>• **2** = if the first packet of a session times out of assembler, the session is removed from assembler after parsing is complete. Any subsequent packets for this session create a new session in assembler.<br>• **1** = If the last chain of a session times out of assembler, the session is removed from assembler. Any subsequent packets for this session create a new session in assembler.<br>• **0** = If the last chain of a session times out of assembler, the session is left in assembler until it times out. Any subsequent packets for this session are filtered<br>Change takes effect on service restart. |
| **Assembles Session Pool** | Specifies the number of entries in the session pool. The default value is **350000**. Change takes effect on service restart. |
| **Assembler Timeout Packets** | Specifies the number of seconds before a packet or chain is timed out. T default value is **60**. Change takes effect immediately. |
| **Assembler Timeout Session** | Specifies the number of seconds before a session is timed out. Default value is **60**. Change takes effect immediately. |
| **Capture Autostart** | Specifies whether capture begins automatically each time Decoder is started. When checked, the value = yes. When unchecked, the value = no. The default value is **no**. Change takes effect immediately. |
| **Capture Buffer Size** | The capture memory buffer allocation in Megabytes. Default value is **64 MB**. Change takes effect on service restart. |
| **Parse Maximum Bytes** | The maximum number of bytes to scan a stream for additional tokens. When the first token is found, the stream is scanned up to the set number of bytes, but no further. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **128 KB**. Change takes effect immediately. |

| Capture Settings Parameter | Description |
|---|---|
| **Parse Minimum Bytes** | The minimum number of bytes to scan a stream for the first token. If no token is found within the set number of bytes, scanning is terminated. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **1 KB**. Change takes effect immediately. |
| **Parse Threads** | The number of parse threads to use for session parsing. A value of **0** means let the server decide. The default value is **0**. Change takes effect on service restart. |

## Database Max File Sizes Section

The Database Max File Sizes section controls the maximum file size for various databases. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

| File Size Parameter | Description |
|---|---|
| **Meta File Size** | The maximum size of meta database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart. |
| **Packet File Size** | The maximum size of packet database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart. |
| **Session File Size** | The maximum size of session database files in Megabytes. The default value is **100 MB**. Change takes effect on service restart. |

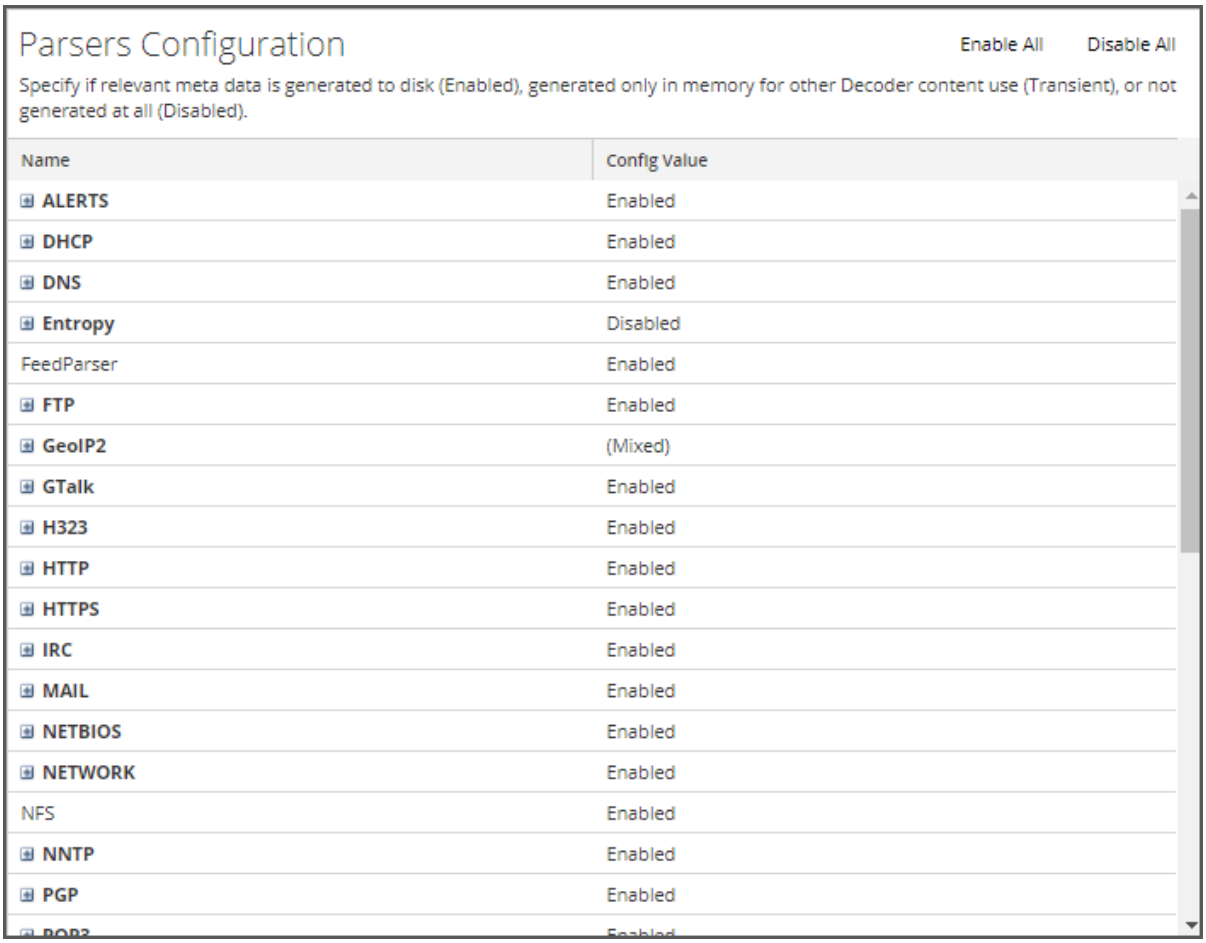
## Hash Section

The Hash section settings control data base file hashing options. There is a small performance penalty when hashing.

| Hash Parameter | Description |
|---|---|
| **Hash Directory** | The server directory where all hash files are written. If empty, each hash file is written to the same directory as the file being hashed. The default value is blank. Change takes effect on service restart. |

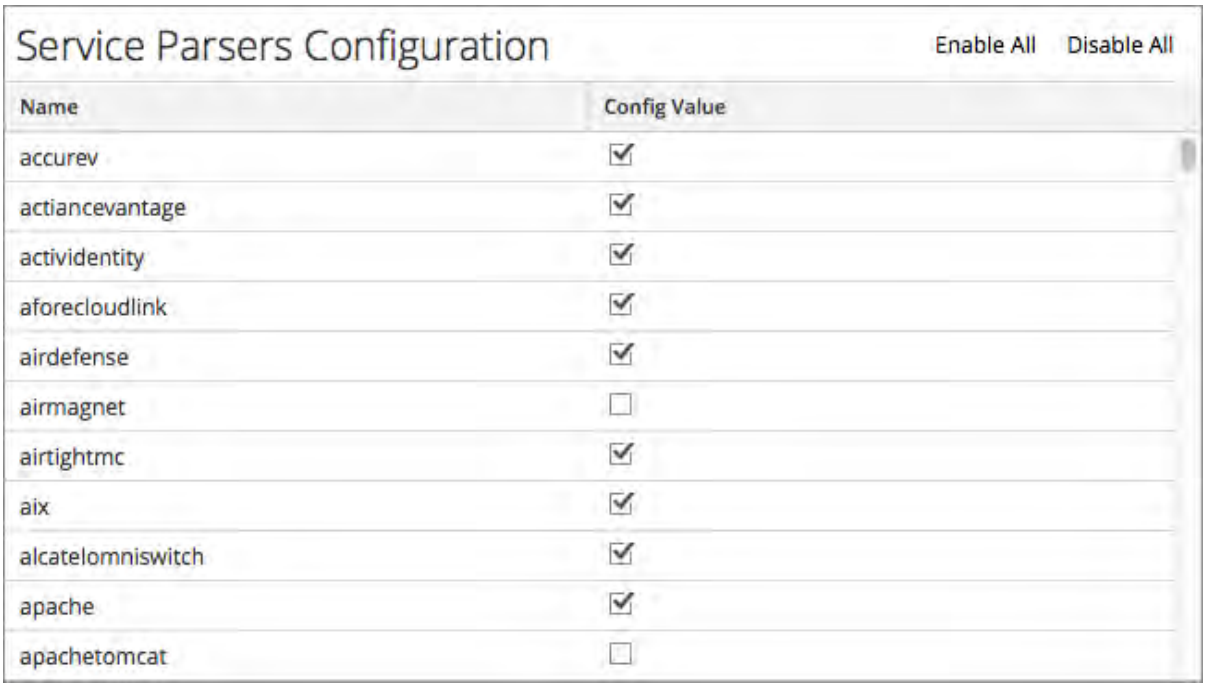
## Parsers Configuration Panel

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. See Enable and Disable Parsers and Log Parsers for detailed information and procedures.



## Service Parsers Configuration Section for Log Decoder

The Service Parsers Configuration section provides a way to select Service parsers to use on the Log Decoder.



Service Parsers Configuration

# Services Config View - Parsers Tab

In the Services Config View > Parsers tab, you can view deployed parsers on a Decoder or Log Decoder, upload parsers, and delete deployed parsers. Parsers can be added and removed while a Decoder or Log Decoder is running without affecting capture.

To access the Parsers tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Parsers** tab.

## What do you want to do?

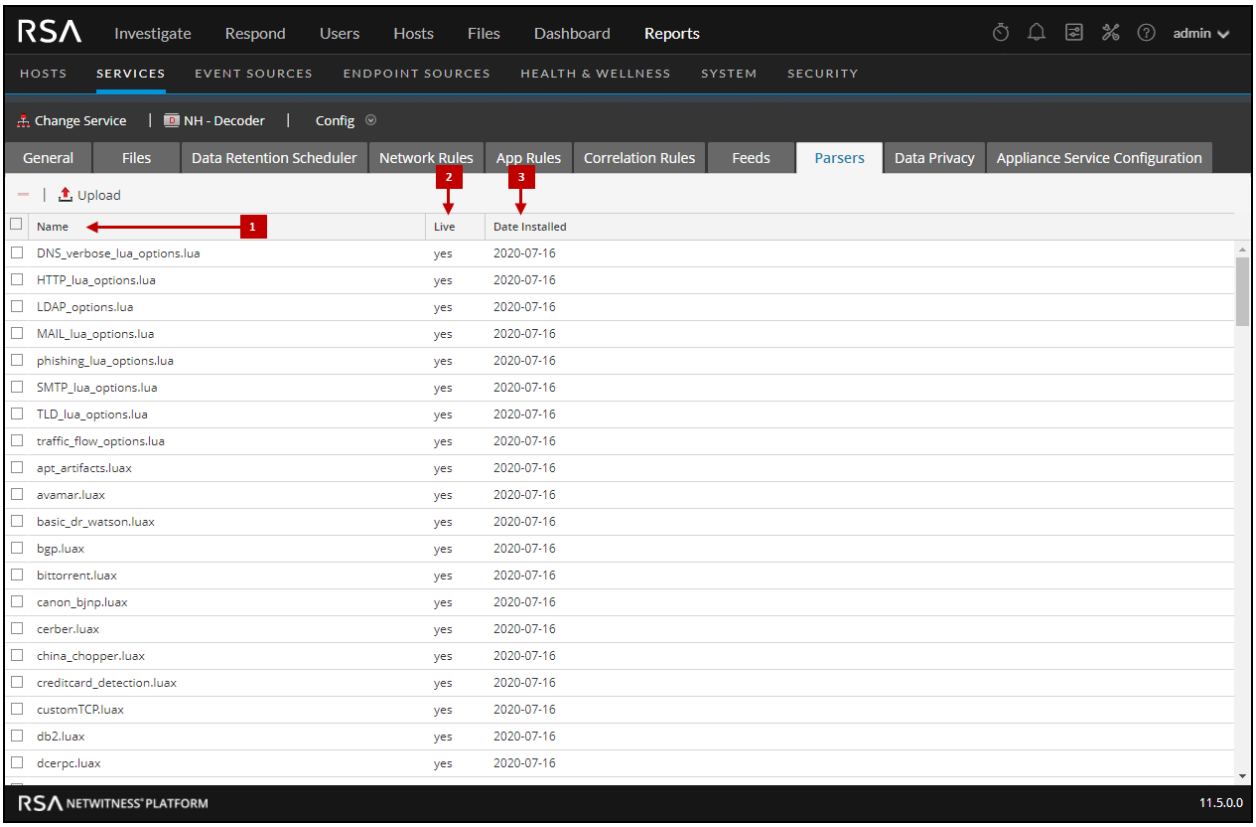
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | View deployed parsers. | Enable and Disable Parsers and Log Parsers |
| Administrator | Upload parsers to a Decoder or Log Decoder. | Enable and Disable Parsers and Log Parsers |

## Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Upload and Delete Custom Parsers

## Quick Look

This is an example of the Parsers tab. The Parsers grid lists all parsers that are currently deployed on the Decoder.



1 **Name**: The name of the parser or the parser file.

2 **Live**: Indicates if the parser originated from Live. Possible values are **Yes**, **No**, or **N/A**.

- **Yes** = Installed through Live Services.
- **No** = Installed through NetWitness.
- **N/A** = The parser has no attributes file created by NetWitness to track the installation date. The parser may have been installed manually, not through NetWitness or Live Services.

3 **Date Installed**: The date the parser was pushed to the service.

## Parsers Tab Toolbar

The Parsers Tab toolbar has options to work with parsers in the grid.

| Feature | Description |
|---|---|
| Upload | Enables you to upload parsers to a Decoder or Log Decoder. |
| − | Requests confirmation that you want to delete the selected parsers. You can select **No** to cancel the deletion, or select **Yes** to delete the selected parsers. |

# Services Config View - Parser Mappings Tab

This topic provides a description of the configurable options for a Log Decoder in the Parser Mappings tab.

In the Parser Mappings Administrators can configure log parser mappings for Log Decoder services. To access the Parser Mappings tab, go to (Admin) > **Services** > select a Log Decoder service and click > **View** > **Config** > **Parser Mappings** tab.

**Note:** You can also configure log parser mappings for Log Decoder services by navigating to **Admin > Services > Event Sources > Discovery**.

This feature is intended to track a subset of event sources that is parsing against the wrong parser.

## What do you want to do?

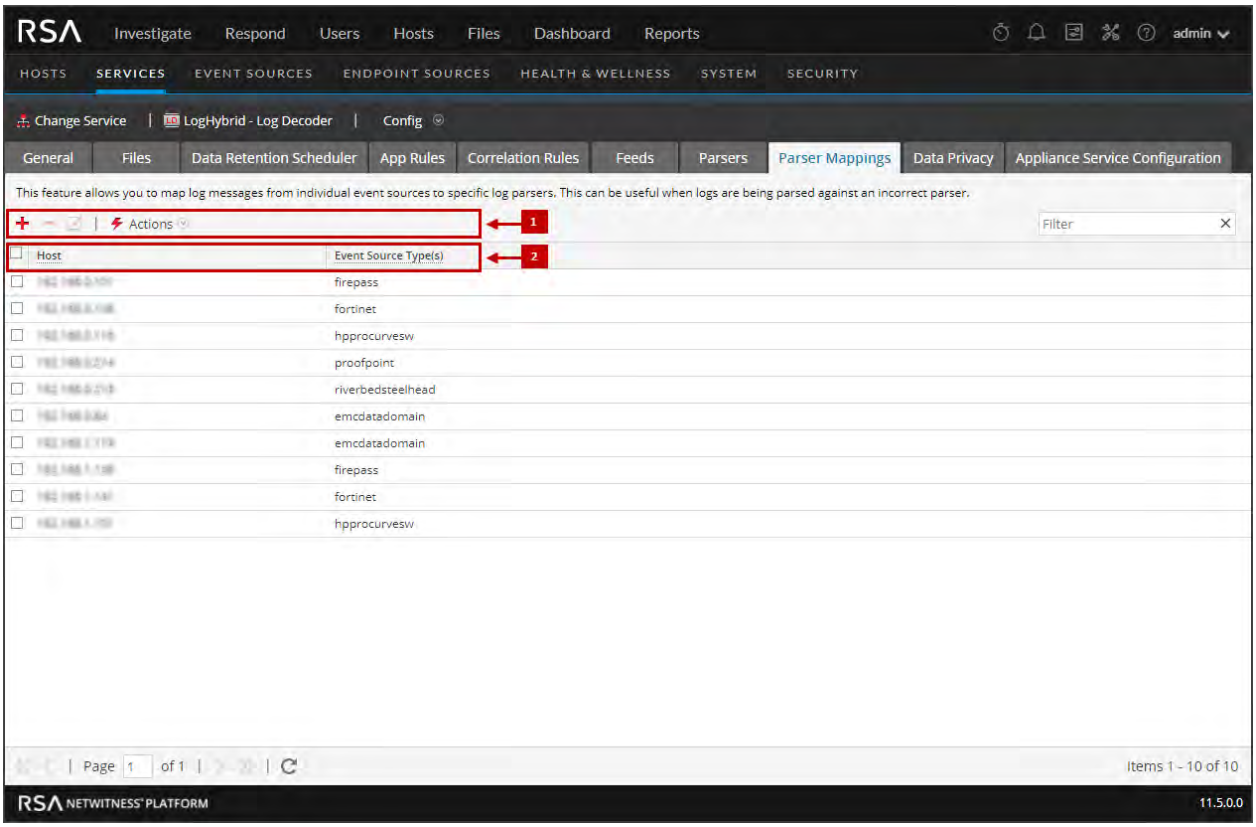
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | Manage IPs for Event Source Mapping. | Enable Parser Mappings |

## Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

## Quick Look

This is an example of the tab.



1 Parser Mappings Toolbar - Provides options to work with parser mappings in the list
2 Parser Mappings List - Lists all parsers that are currently mapped on the Log Decoder

## Parser Mappings Toolbar

The Parser Mappings toolbar has options to work with parser mappings in the grid.

| Feature | Description |
|---|---|
| | Add a parser mapping. |
|  | Delete the selected parser mapping. |
| | Edit a parser mapping. |
| | Refresh the list of parser mappings. |
| | Display the Actions menu.<br>• **Import** - Import a parser mapping to a file.<br>• **Export** - Save a parser mapping to a file. |

## Parser Mappings List

The Parser Mappings list displays all parsers that are currently mapped on the Log Decoder.

| Parameter | Description |
|---|---|
| **Host** | Displays the IP address of the host. |
| **Event Source** | Displays the event sources that are parsing incorrectly. |

## Parser Mappings Editor Dialog

The Parser Mappings Editor dialog allows you to update an IP to event source mapping.

To access the Parser Mappings Editor dialog, in the Services Config view for a Log Decoder, select the Parser Mappings tab.

# Data Export Tab

The Data Export tab (**Admin** > **Services** > select a Decoder or Log Decoder and click > **View** > **Config** > **Data Export** tab) exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object by configuring the export connector through Logstash.

### Prerequisites

Make sure you have log collector service to configure Logstash in the UI.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | Configure Export Connector | Configure Logstash Event Sources in NetWitness |

## Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

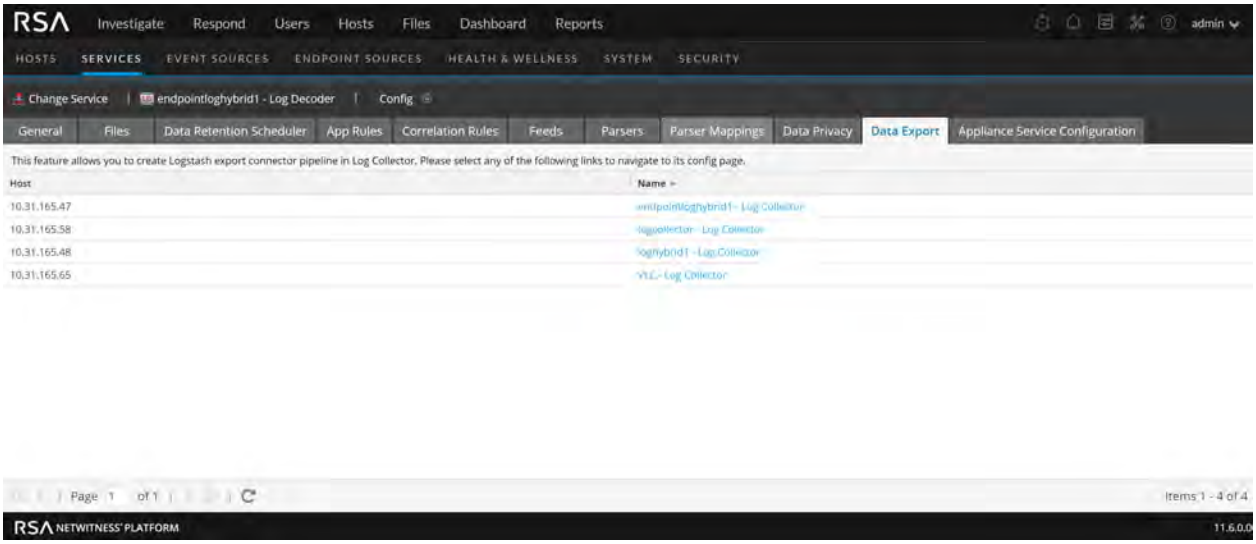
- Services Config View - Rules Tabs

## Quick Look

The following figure shows an Data Export tab.



The data export list displays all the Log Collectors in your deployment.

| Parameter | Description |
| --- | --- |
| Host | Displays the IP address of the host. |
| Name | Displays the name of the Log Collector. |

# Services Config View - Rules Tabs

The Rules tabs in the Services Config view ( **(Admin) > Services >** select a service and click **> View > Config**) enable you to define and manage capture rules. Each type of rule has a list with slightly different columns and different parameters in the Rule Editor dialog. Application and correlation rules apply to both Decoders and Log Decoders. Network rules apply only to Network Decoders.

## Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | configure capture settings | Configure Capture Settings |
| Administrator | manage parsers and log parsers | Enable and Disable Parsers and Log Parsers |
| Administrator | start and stop data capture | Start and Stop Data Capture |
| Administrator | configure rules* | Configure Decoder Rules |
| Administrator | import, export, or push a rule* | Configure Decoder Rules |
| Administrator | enable or disable a rule* | Configure Decoder Rules |
| Administrator | add, edit, or delete a rule* | Configure Decoder Rules |

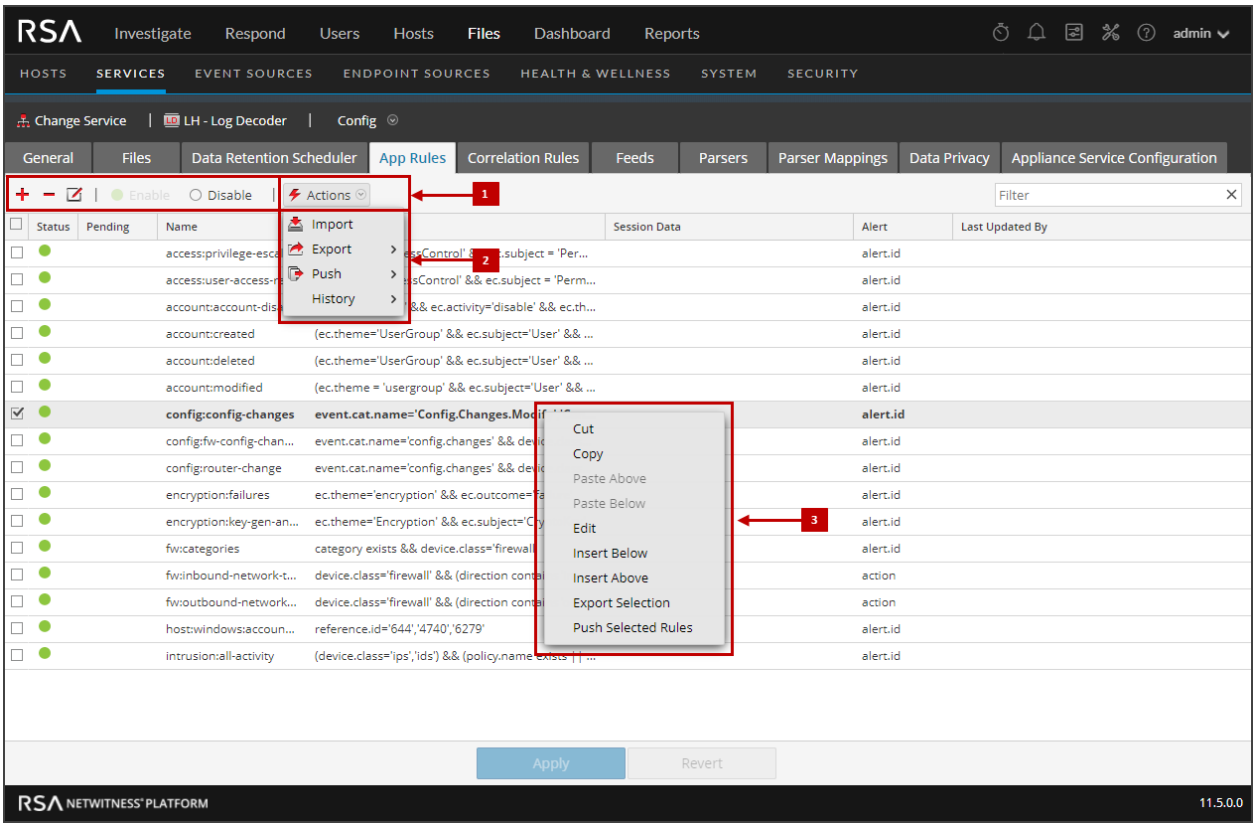
*You can complete these tasks here.

## Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup
- App Rules Tab
- Correlation Rules Tab
- Network Rules Tab

## Quick Look

This is an example of the App Rules tab.



1 Rules Tab Toolbar - Provides options to work with rules in the list
2 Rules Actions Menu - Provide options to manage sets of rules
3 Rules List Context Actions - Displays the Rules List Context Menu

## Rules Tab Toolbar

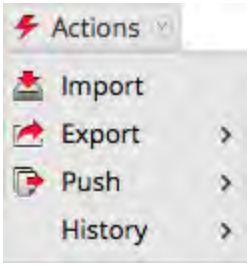
The toolbar is the same for all Config view > Rules tabs.

| Feature | Description |
|---|---|
| Actions | Displays the **Actions** menu. |
| + | Adds a new rule to a service. |
| − | Deletes a rule from a service. |
| | Allows rule modification. |
| Disabl | Disables a rule (without deleting the rule). |
| Enable | Enables (reactivates) a rule. |

| Feature | Description |
|---|---|
| Filter | The input field for a search string. NetWitness filters the rules dynamically as you type a search string. Clicking **x** clears the input field, restoring the unfiltered view. |
| Apply | Saves the changes made to rules and applies the configured rules to a service. Until you apply changes, it is possible to reload the rules as they were before current modifications. |
| Revert | Discards unsaved changes to the list and reverts to the unedited rules. |

## Rules Actions Menu

The Actions menu has options that help to manage sets of rules.



| Option | Description |
|---|---|
| Import | Imports a set of rules into the user interface so that it can be applied to a service. You can edit the rules before applying. |
| Export | Saves selected rules or all rules to an .nwr file on the client machine. |
| Push | Allows rules to be applied to other services (Decoders or Log Decoders) or Decoders belonging to a service group. When pushing, the rules can either be merged (update existing rules and append new ones) or replaced.<br>• **Push > All.** Pushes all rules to other services. All rules on the target services are removed and replaced with all of the rules on the source service.<br>• **Push > Selection.** Pushes selected rules to other services. You have two options:<br>  • **Replace.** Deletes all rules on the target services and replaces them with the selected rules from the source service.<br>  • **Merge.** Merges the selected rules with the existing rules on the target services |
| History | Displays the last ten snapshots of rules applied through NetWitness. You can select and apply (restore) a snapshot to the Decoder at anytime. |

## Rules List Context Actions

Within a rules list, right-clicking a row displays the Rules list context menu.

| Option | Description |
|---|---|
| Cut | Deletes the current rule. |

| Option | Description |
| --- | --- |
| Copy | Copies the current rule. |
| Paste Above | Pastes the copied rule above the current rule. |
| Paste Below | Pastes the copied rule below the current rule. |
| Edit | Edits the current rule. |
| Insert Below | Inserts imported rules below the current rule. |
| Insert Above | Inserts imported rules above the current rule. |
| Export Selection | Exports the selected rules. |
| Push Selected Rules | Pushes the selected rules to other services. |

# App Rules Tab

The App Rules tab (**Admin > Services >** select a Decoder or Log Decoder and click **> View > Config > App Rules tab**) enables you to manage application rules. NetWitness applies application rules at the session level.

## What do you want to do?

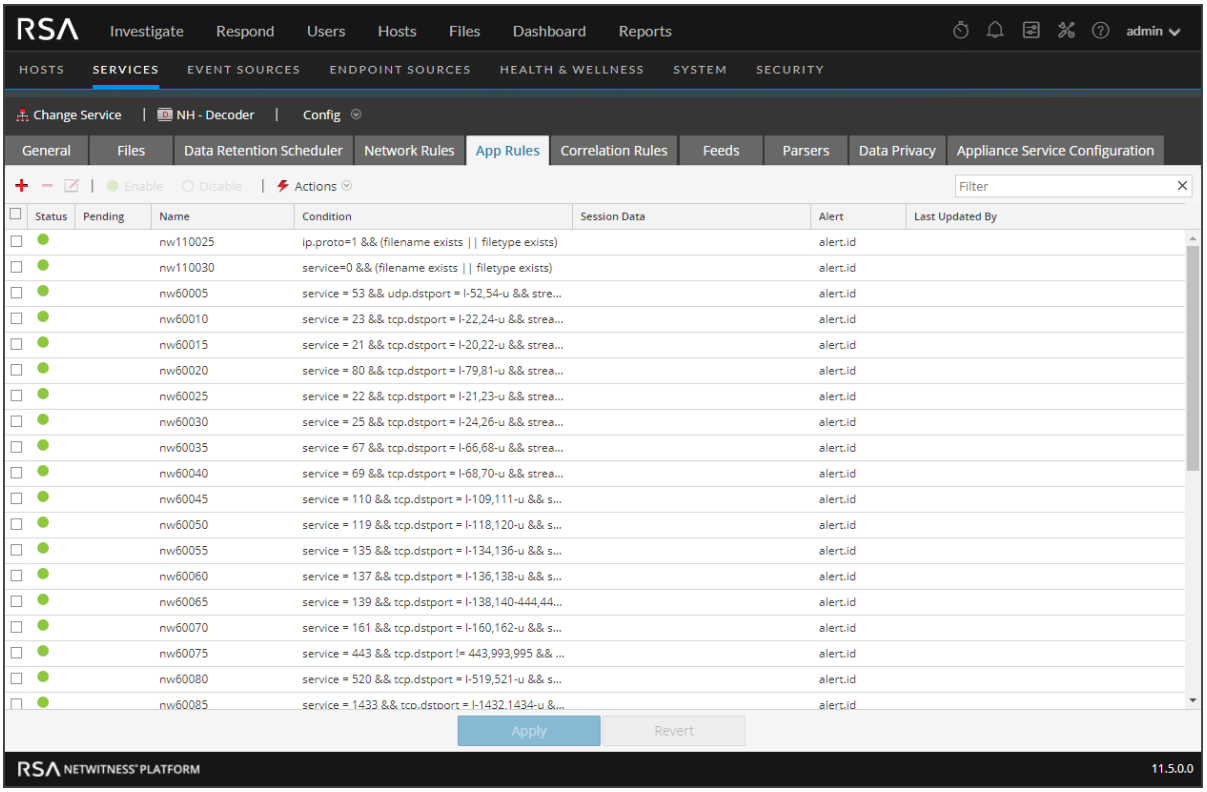
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | add or edit application rules | Configure Application Rules |

## Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Configure Decoder Rules
- Services Config View - Rules Tabs

## Quick Look

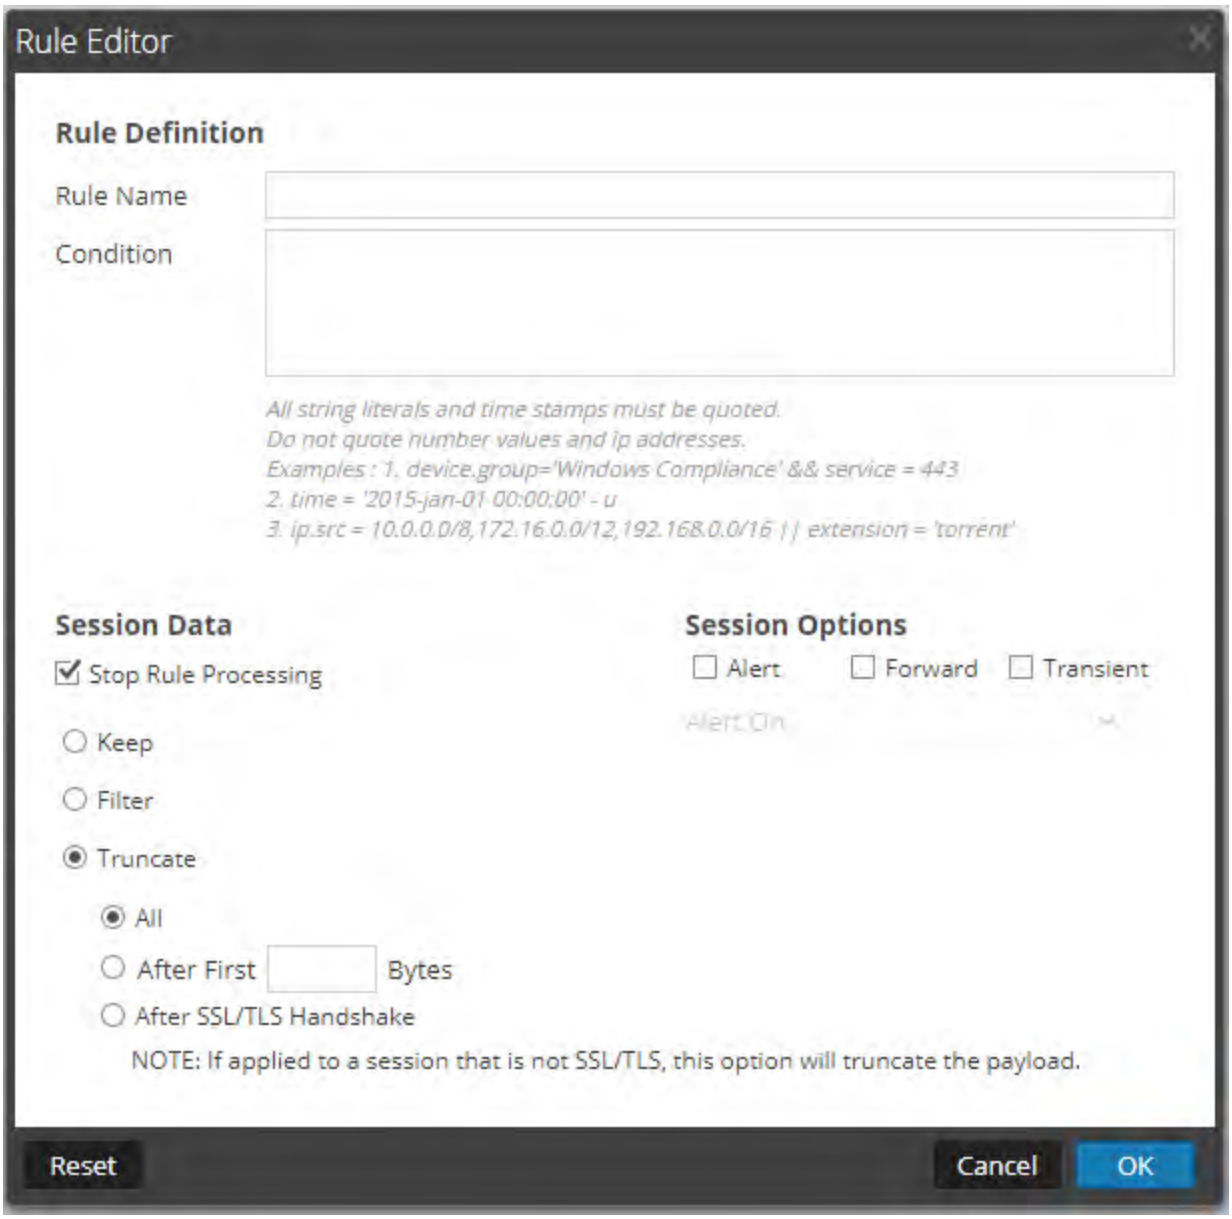
The following figure shows an App Rules tab and the table describes the columns.



| Column | Description |
|---|---|
| **Pending** | This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed. |
| **Name** | This is the rule name, a descriptive identifier for the rule. |
| **Condition** | This is the definition of the condition that triggers an action when matched. |
| **Session Data** | This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**. |
| **Alert** | This column displays the name of the custom alert that the Decoder generates when metadata matches the rule. |
| **Status** | This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled. |

## Rule Editor Dialog

The following figure shows the Rule Editor dialog for an application rule.



The Rule Editor dialog provides the fields and options needed to define an application rule.

| Field | Description |
|---|---|
| **Rule Name** | The descriptive name that identifies the rule. |
| **Condition** | The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings.<br><br>All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. |

The following table describes the Session Data actions and options.

| Action | Description |
|---|---|
| **Stop Rule Processing** | If checked, further rule evaluation ends if the rule is matched, and the session is saved in accordance with the session action. If not checked, rule evaluation continues until all rules are evaluated. |
| **Keep** | The packet payload and associated metadata are saved when they match the rule. |
| **Filter** | The packet is not saved when it matches the rule. |
| **Truncate** | **Truncate All** – truncates all session payload bytes. The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained. This is the default truncation option.<br>**Truncate After First <n> Bytes** – truncates the session payload bytes after the specified first <n> bytes, where <n> is an integer. The packet payload is not saved after <n> bytes when it matches the rule, but packet headers and associated metadata are retained.<br>**Truncate SSL/TLS After Handshake** – truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers. |
| **Alert** and **Alert On** | If **Alert** is checked, the packet generates a custom alert when metadata matches the rule. You can select the name of the alert in the **Alert On** field. |
| **Forward** | Enables the performance of syslog forwarding when the log matches the rule. |
| **Transient** | Prevents the alert metadata that is created from being written to the disk. |

The following table describes Rule Editor dialog actions.

| Action | Description |
|---|---|
| **Reset** | Resets the contents of the dialog to their values before editing; changes are discarded. |
| **Cancel** | Cancels any edits and closes the Rule Editor dialog. |
| **OK** | Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes. |
| **Save** | (Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax. |

# Correlation Rules Tab

The Correlation Rules tab ( **(Admin) >** select a service and click **> View > Config > Correlation Rules tab**) enables you to manage correlation rules. Basic correlation rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | add or edit a correlation rule | Configure Correlation Rules |

## Related Topics

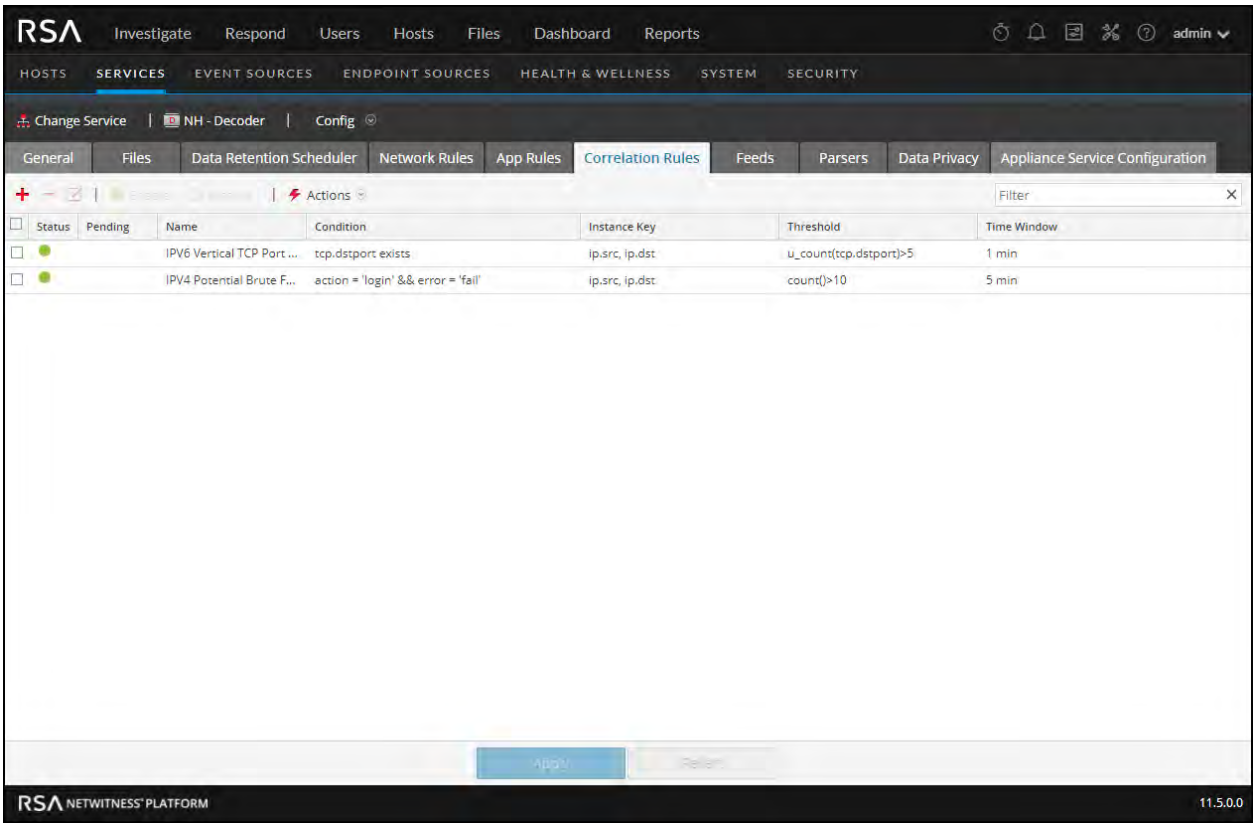
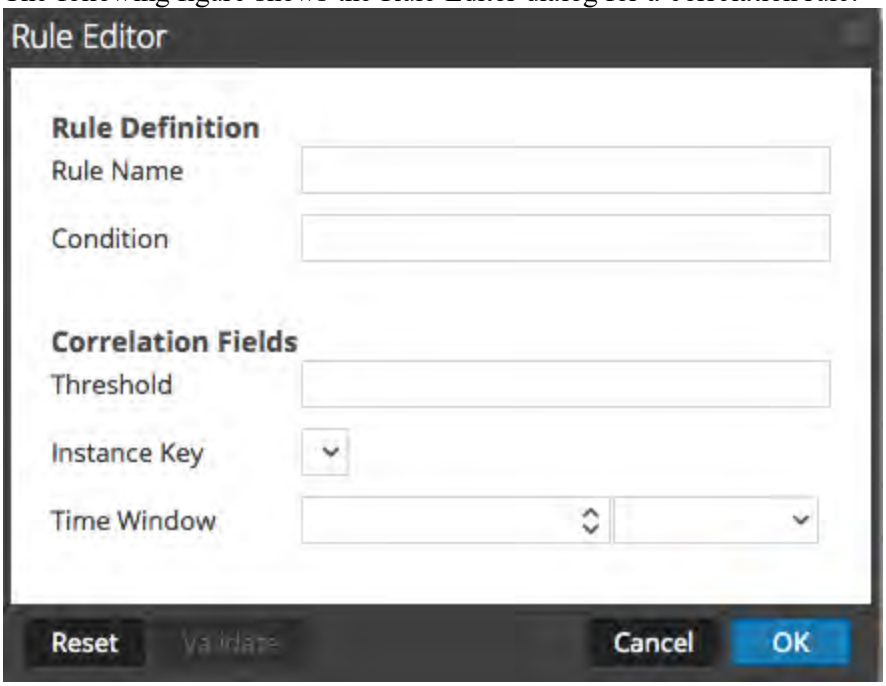
## Quick Look

The following figure shows the Correlation Rules tab.



The following figure shows the Rule Editor dialog for a correlation rule.



The following table describes the Correlation Rules tab columns.

| Column | Description |
|---|---|
| **Pending** | This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed. |
| **Name** | This is the descriptive name for the rule. |
| **Condition** | This is the definition of the condition that triggers an action when matched.<br>In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. |
| **Instance Key** | This is the target indicator to base the event upon. It can be a single primary key, such as ip.src or a compound primary key such as `ip.src,ip.dst`. |
| **Threshold** | This is the minimum number of occurrences required to trigger a correlation session and can include a associated key that identifies the meta type that were are counting to determine if the condition is satisfied. The correlation engine cannot use IPv4 or IPv6 as an associated meta type. Use one of these three arguments:<br>• `u_count(associated_key)` = the count of unique values of the specified key. A key is required.<br>• `sum(associated_key)` = the values of the specified key. a key is required.<br>• `count()` = number of sessions, no associated key used. If included, it is ignored. |
| **Time Window** | This is the duration in hours, minutes, or seconds within which the threshold must be reached to trigger a correlation session. |
| **Status** | This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled. |

The **Rule Editor** dialog provides the fields and options needed to define a network rule. The fields correspond exactly to the grid columns.

| Action | Description |
|---|---|
| **Reset** | Resets the contents of the dialog to their values before editing; changes are discarded. |
| **Cancel** | Cancels any edits and closes the Rule Editor Dialog. |
| **OK** | Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor Dialog closes. |
| **Save** | (Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax. |

# Network Rules Tab

The Network Rules tab ( **(Admin) > Services >** select a Decoder and click **> View > Config > Network Rules tab**) enables you to manage network rules. NetWitness applies network rules at the packet level. Network rules consist of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules apply only to Network Decoders.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | add, edit, or fix network rules | Configure Network Rules |

|---|---|
| **Reset** | Resets the contents of the dialog to their values before editing; changes are discarded. |
| **Cancel** | Cancels any edits and closes the Rule Editor dialog. |
| **OK** | Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes. |
| **Save** | (Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax. |

# Services System View - Decoders

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

To reach the Services System view, go to **(Admin) > Services >** select a Decoder or Log Decoder > > **View** > **System**.

## Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | configure capture settings | Configure Capture Settings |
| Administrator | manage parsers and log parsers | Enable and Disable Parsers and Log Parsers |
| Administrator | start and stop data capture* | Start and Stop Data Capture |
| Administrator | upload packet capture and log files* | Upload a Log File to a Log Decoder<br>Upload a Packet Capture File |
| Administrator | reset log stats, perform host tasks, shutdown the service, shutdown the appliance service, and reboot the host* | *Hosts and Services Getting Started Guide* |
| Administrator | configure rules | Configure Decoder Rules |

*You can complete these tasks here.

# Introduction to Endpoint Agent Installation

**Note:** The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, physical or virtual, where a supported operating system is installed. An Endpoint Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. (Optional) Configuring the Relay Server

**Note:** You must set up the default relay server before generating the Agent packager. Whenever the Relay server configuration is modified, agent policy is updated automatically. For more information on configuring the relay server, see *Endpoint Configuration Guide*.

2. Generating an agent packager
3. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and tracking events from these hosts. It monitors key behaviors related to process, file, registry, console, and network, and forwards them as events to the Endpoint Server over HTTPs.

**Note:** The Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information, see the *NetWitness Endpoint Configuration Guide*.

## Supported Operating Systems

| **Windows** | **Linux** *(The agent software runs on either i386 or x86_64 architecture)* | **macOS** |
|---|---|---|
| Windows 10 (32 and 64-bit) (up to version 21H2) | CentOS 6.x, 7.x, and 8.x | macOS Big Sur (11 ) |
| Windows 8.1 (32 and 64-bit) | Red Hat Enterprise Linux 6.x, 7.x, and 8.x | macOS Catalina (10.15) |
| Windows 8 (32 and 64-bit) | SUSE Linux Enterprise Server 12 SP3, 12 SP4, 12 SP5 and 15 SP1 | macOS Mojave (10.14) |
| Windows 7 (32 and 64-bit) | Ubuntu 16.04 LTS, 18.04 LTS, and 20.04 LTS | macOS High Sierra (10.13) |
| Windows Server 2019<br>Windows Server 2019 Core | | macOS Sierra (10.12) |
| Windows Server 2016 | | OS X El Capitan (10.11) |
| Windows Server 2012 R2 | | OS X Yosemite (10.10) |
| Windows Server 2012 | | OS X Mavericks (10.9) |
| Windows Server 2008 R2 (32 and 64-bit) | | |

## Hardware Requirements

The following are the minimum hardware requirements to run an agent in a host (laptops, workstations, servers, physical or virtual):

- 256 MB RAM
- 300 MB disk space
- Single-core CPU

## Installation Flowchart

The following flowchart illustrates the Endpoint agent installation process:

# Prerequisites

- Install RSA NetWitness. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Install NetWitness Endpoint Log Hybrid. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Deploy ESA Rules from the Endpoint Rule Bundle. For more information, see *ESA Configuration Guide*.
- Configure Endpoint Metadata forwarding. For more information, see *NetWitness Endpoint Configuration Guide*.
- Review the default policies and create groups to manage your agents. For more information, see *NetWitness Endpoint Configuration Guide*.
- Configure your RSA Live account and make sure the File Reputation service is enabled. For more information, see *Live Services Management Guide*.
- To migrate an existing NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.5 and later, see https://community.rsa.com/t5/rsa-netwitness-platform/post-migration-steps-for-importing-configurations-from-rsa/ta-p/129 to import the NetWitnes Endpoint 4.4.0.x configurations (file status, certificate status and blocked hashes).

**Note:** If you are upgrading, make sure that you deploy the latest Endpoint application rules from RSA Live. For more information, see *Live Services Management Guide*.

# Generate an Endpoint Agent Packager

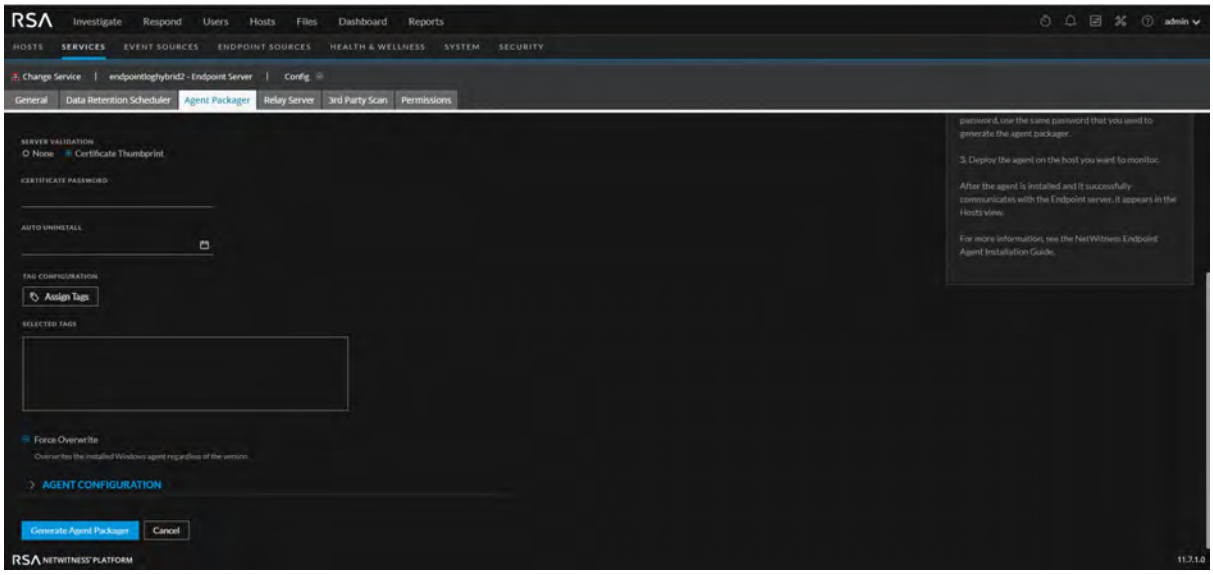
To generate an agent packager to collect endpoint data from hosts:

1. Log in to NetWitness.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Login screen.

2. Click **(Admin) > Services**.

3. Select the **Endpoint Server** service and click **> View > Config > Agent Packager** tab.
   The Agent Packager tab is displayed.



4. Enter the values in the following fields:

| Field | Description |
|---|---|
| Endpoint Server | Displays all the available Endpoint servers in the deployed. |
| Endpoint Server Forwarder (Optional) | The optional Endpoint Server Forwarder allows you to enter an alternative Fully Qualified Domain Name (FQDN) or IP address on which the sever can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server. If specified forwarder is not available, agent will eventually fall back to the packaged address. |
| HTTPS Port | Port number. For example, 443. |
| Server Validation | Determines how the agent validates the Endpoint Server certificate:<br>• None – The agent will not validate the server certificate.<br>• Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate. |
| Certificate Password | Password used to download the packager. The same password is used while generating the agent installer. For example, netwitness. |
| Auto Uninstall | Date and time the agent automatically uninstalls. You can leave it blank if not required. |
| Tag Configuration | When you click **Assign Tags** under Tag Configuration, you can do any of the following:<br>• Create new tags and assign them to the hosts.<br>• Select already existing tags and assign them to the hosts.<br>For more information, see Investigate Hosts.<br>**Note: Tag Configuration** feature is supported from version 11.7.1 or later. |
| Force Overwrite | Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once.<br>If you enable this option, make sure that you provide the same service name and driver service name as the previously installed agent, while creating a new agent.<br>**Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>`<br>After you move an agent from one deployment to another, using Force Overwrite to change the agent incurs an 8-hour delay in communication between the agent and its Endpoint Server on the new deployment. To eliminate the delay, uninstall the agent from the old deployment, and reinstall the agent on the new deployment. |

| Field | Description |
|---|---|
| **Agent Configuration** | |
| **Note:** The following Service and Driver fields are applicable only for Windows. | |
| **Service** | |
| Service Name | Name of the agent service. For example, NWEAgent. |
| Display Name | Display name of the agent service. For example, RSA NWE Agent. |
| Description | Description of the agent service. For example, RSA NetWitness Endpoint. |
| **Driver** | |
| Driver Service Name | Name of the driver service. For example, NWEDriver. |
| Driver Display Name | Display name of the driver service. For example, RSA NWE Driver. |
| Driver Description | Description of the driver service. For example, RSA NetWitness Endpoint Driver. |
| Generate Agent | Generates an agent packager. |

5. Click **Generate Agent**.

   This downloads an agent packager (**AgentPackager.zip**) on the host where you are accessing the NetWitness user interface.

# Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

**Note:** Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file as administrator by right-clicking the file and selecting **Run as administrator**.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - NWE000032.msi (for Windows 32-bit)
   - NWE000064.msi (for Windows 64-bit)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.i686.rpm (for RPM based Linux 32-bit)
   - nwe-agent.x86_64.rpm (for RPM based Linux 64-bit)
   - nwe-agent.i686.deb (for Debian based Linux 32-bit)
   - nwe-agent.x86_64.deb (for Debian based Linux 64-bit)

   **Note:** The MSI files should not be renamed.

# Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

**Note:** By default, the agent is installed in the Insights mode. Depending on the policy assigned, the agent can operate in Insights or Advanced mode. Make sure you review the policy before deploying the agent. For more information, see *NetWitness Endpoint Configuration Guide*.

## Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

### Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  **Note:** Click **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager on the host machine.

- Using Services.msc

  Open `Services.msc` in run and look for the service name that you configured while generating the agent packager on the host machine.

## Deploying Agent (Linux)

To deploy the agent on the hosts you want to monitor:

### RPM based Linux

Run the **nwe-agent.i686.rpm** (for 32-bit) or **nwe-agent.x86_64.rpm** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
rpm -iv <installer file name>.rpm
```

For example, using the default installer file names, you can enter one of the following commands:

`rpm -iv nwe-agent.i686.rpm` (for i386 architecture)

`rpm -iv nwe-agent.x86_64.rpm` (for x86_64 architecture)

**Note:** To upgrade RPM based Linux agents, run **rpm -Uvh nwe-agent.i686.rpm** or **rpm -Uvh nwe-agent.x86_64.rpm**.

### Debian based Linux

Run the **nwe-agent.i686.deb** (for 32-bit) or **nwe-agent.x86_64.deb** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
dpkg -i <installer file name>.deb
```

For example, using the default installer file names, you can enter one of the following commands:

`dpkg -i nwe-agent.i686.deb` (for i386 architecture)

`dpkg -i nwe-agent.x86_64.deb` (for x86_64 architecture)

(Enter the administrator password when prompted.)

**Note:** To upgrade Debian based Linux agents, run **dpkg -i nwe-agent.i686.deb** or **dpkg -i nwe-agent.x86_64.deb**.

## Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  **Note:** Click **Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

# Deploying Agent (Mac)

To deploy the agent, run the **nwe-agent.pkg** file on the hosts you want to monitor.

## Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  **Note:** Click **Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.

- Using Command Line

  Run the following command to get the PID

  ```
  pgrep NWEAgent
  ```

- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/NWEAgent.log | grep NWEAgent | grep Version
  ```

# Uninstall Agents

You can use one of the following methods to uninstall Endpoint agents. Select a method based on your current Endpoint agent version.

- Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)
- Uninstalling Agent Manually

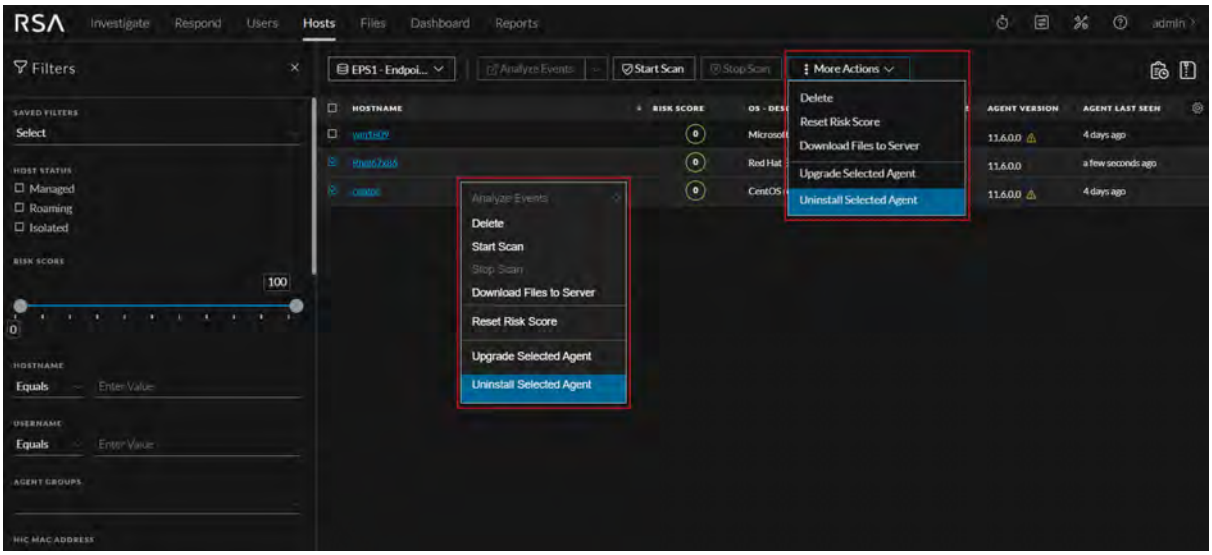
## Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)

**Note:** To uninstall an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

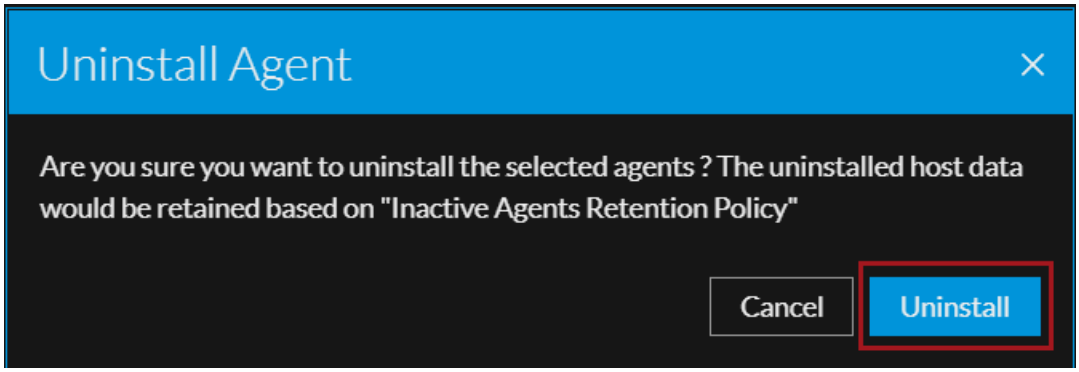
You can uninstall agent using UI by going to **Hosts** and performing one of the following options.

### Uninstall one or more agents from Hosts view

1. Select one or more hosts from which you want to uninstall the agents.
2. Selected **More Actions > Uninstall Selected Agent** from the toolbar.



3. In the **Uninstall Agent** dialog, click **Uninstall.**

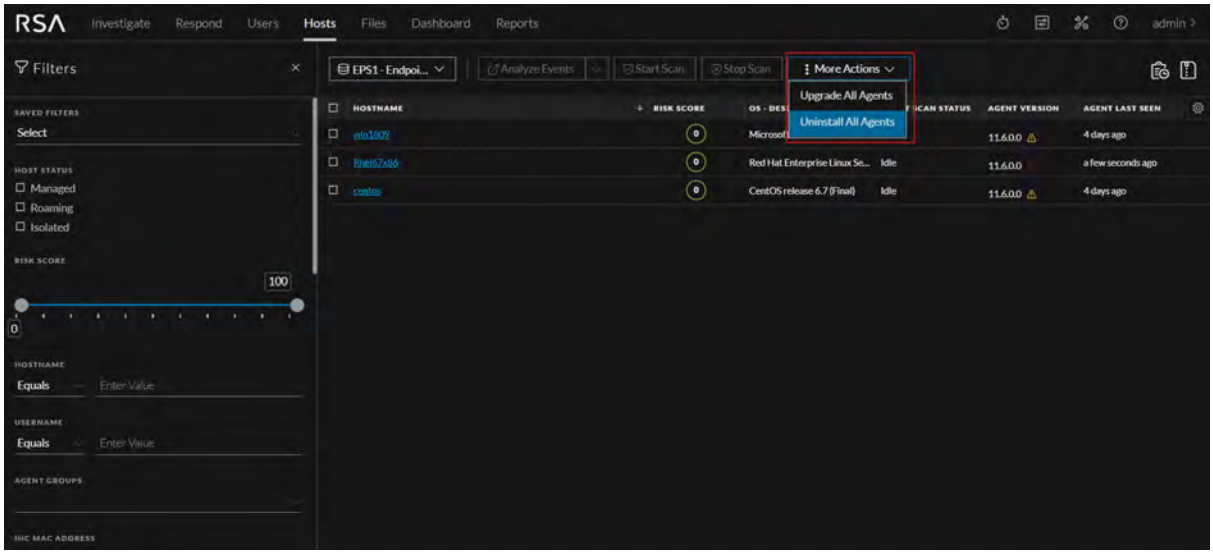


### Uninstall all the agents from Hosts view

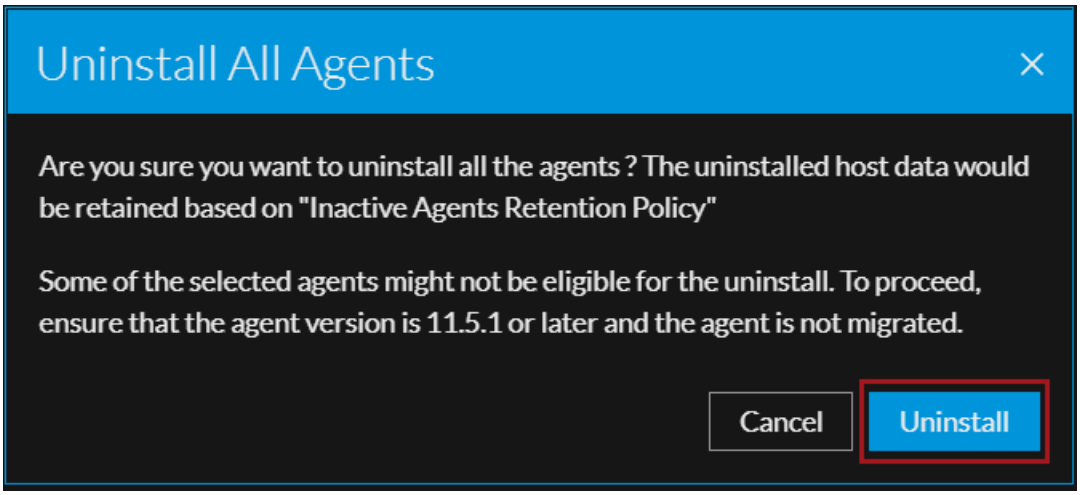
> **Note: Uninstall All Agents** via UI is also supported for Broker service.

1. Select **More Actions > Uninstall All Agents** from the toolbar.

> **Note:** For the uninstall all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. If you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



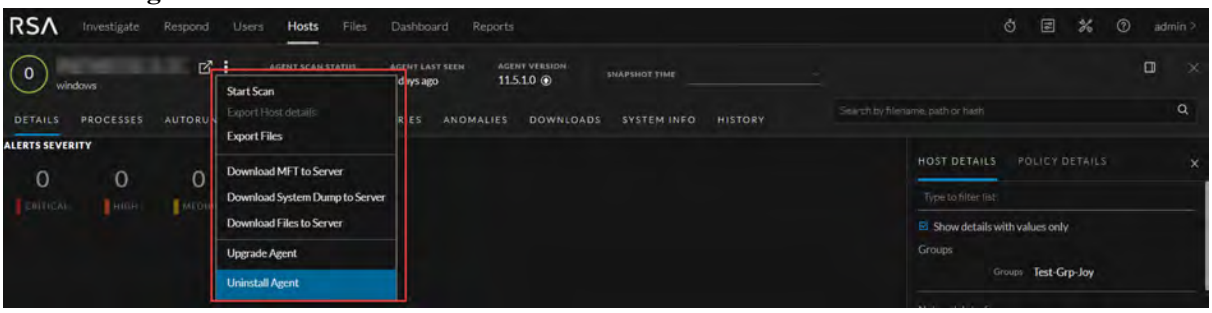
2. In the **Uninstall All Agents** dialog, click **Uninstall.**



**Note: Uninstall All Agents** process will require more time to complete depending upon the number of agents selected based on the filters applied.

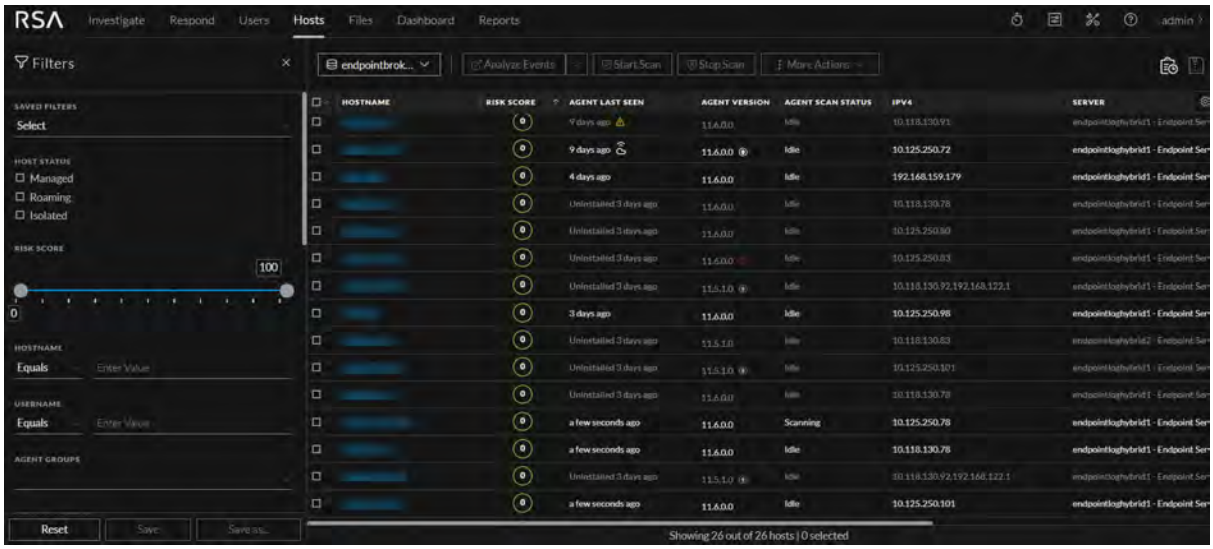
### Uninstall an agent from Host details view

1. Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Uninstall Agent**.



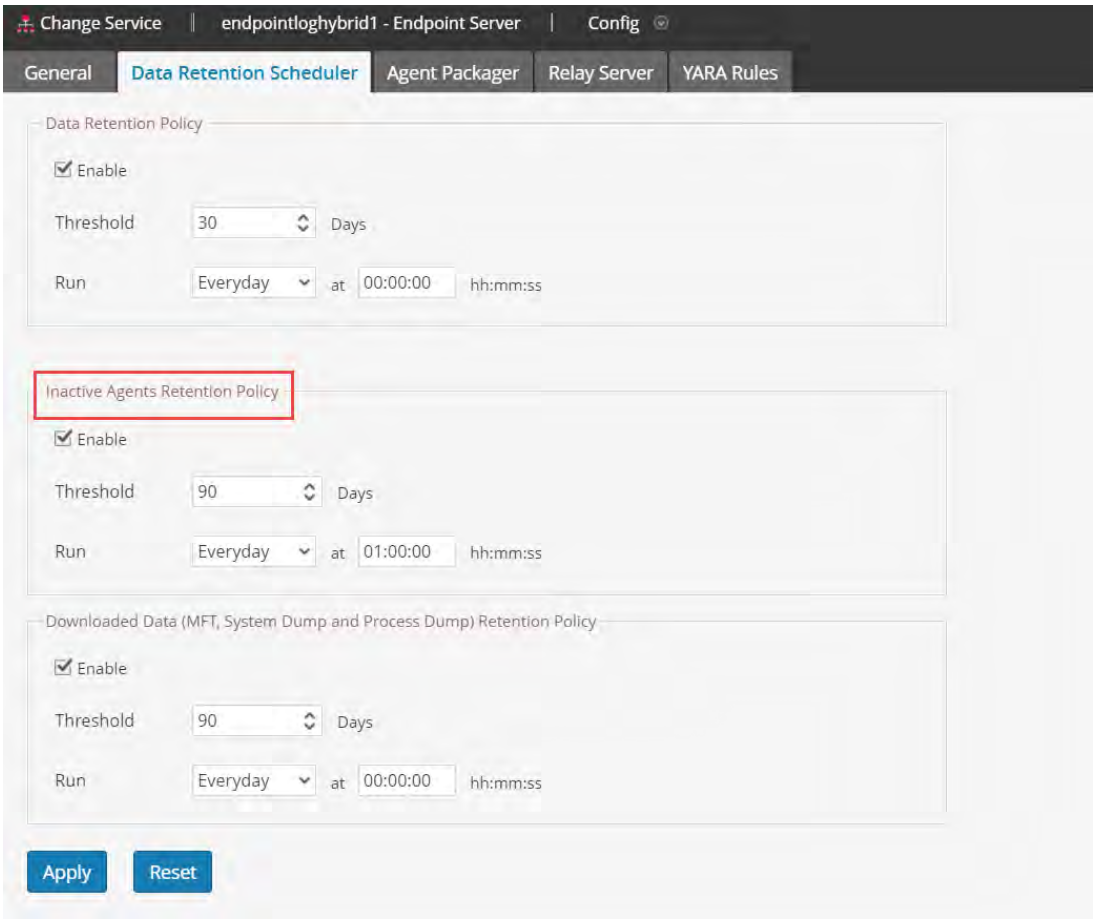
2. In the **Uninstall Agent** dialog, click **Uninstall.**

3. After the agent is uninstalled, **Agent Last Seen** is updated and the host is grayed out in the **Hosts** view.



**Note:** Once an agent is uninstalled, only **Delete** and **Analyze Events** actions can be performed on it.

**IMPORTANT:** If you are uninstalling agent using UI, the uninstalled host data would be retained based on **Inactive Agents Retention Policy.**



# Uninstalling Agent Manually

## Uninstalling Windows Agent

Run the following command as administrator:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

## Uninstalling Linux Agent

For RPM based Linux, run the following command as root:

```
rpm -ev nwe-agent
```

For Debian based Linux, run the following command as root:

```
dpkg -r nwe-agent
```

## Uninstalling Mac Agent

Run the following commands:

1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil --forget com.rsa.pkg.nwe`

# Upgrade Agents

You can use one of the following methods to upgrade Endpoint agents. Select a method based on your current Endpoint agent version. If you have upgraded the endpoint server recently, you must restart it to see **Upgrade Selected Agent** and **Upgrade All Agents** options on the UI.

- Upgrading 11.5.1 or Later Agents Versions Using UI
- Upgrading 11.3.x or Later Agents Versions

## Upgrading 11.5.1 or Later Agents Versions Using UI

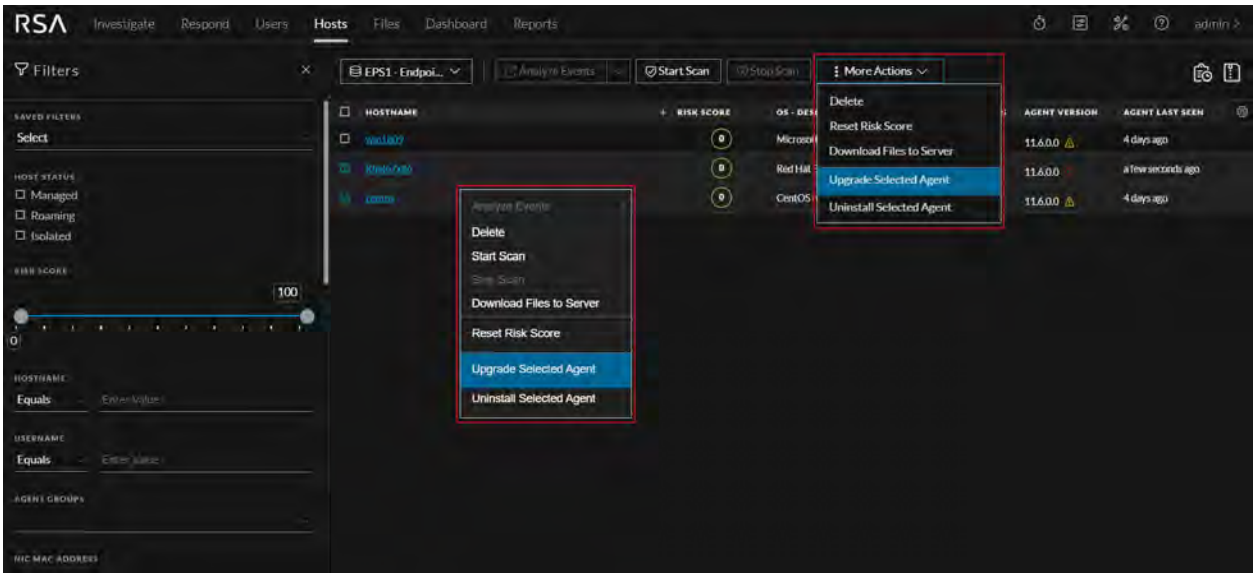
**Note:** To upgrade agent from UI, ensure the service user account has both `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage` permissions. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

From 11.6, you can upgrade the Endpoint agents using the UI. Agent version must be 11.5.1 or later to upgrade using the UI.

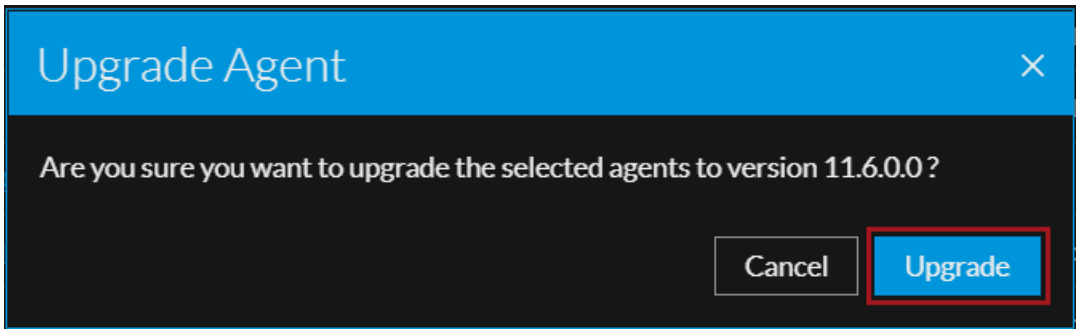
You can upgrade agents using UI by going to **Hosts** and performing one of the following options.

### Upgrade one or more agents from Hosts view

1. Select one or more hosts and select **More Actions > Upgrade Selected Agent**



2. In the **Upgrade Agent** dialog, click **Upgrade**.

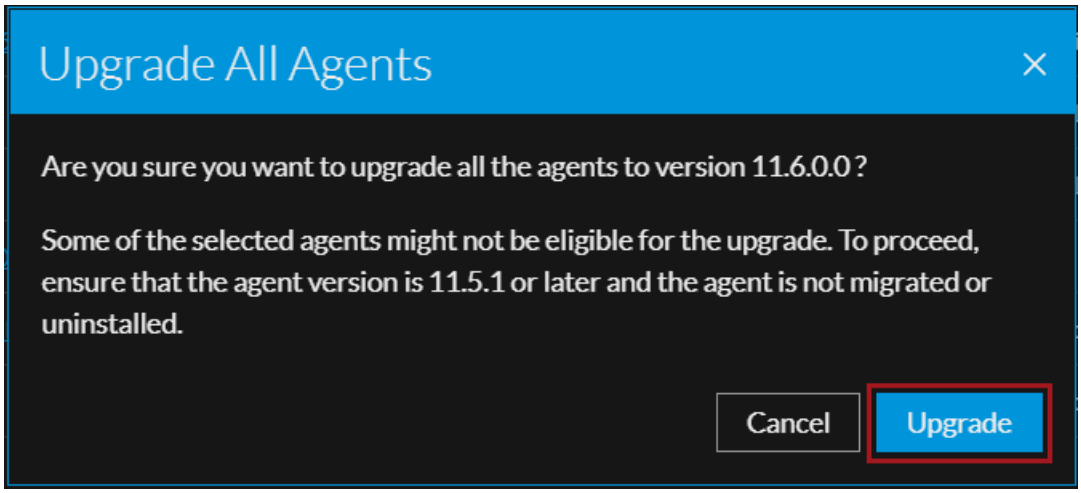


### Upgrade all agents from Hosts view

1. Select **More Actions > Upgrade All Agents** from the toolbar, to perform bulk agent upgrade.

**Note:** For the upgrade all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. When you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.

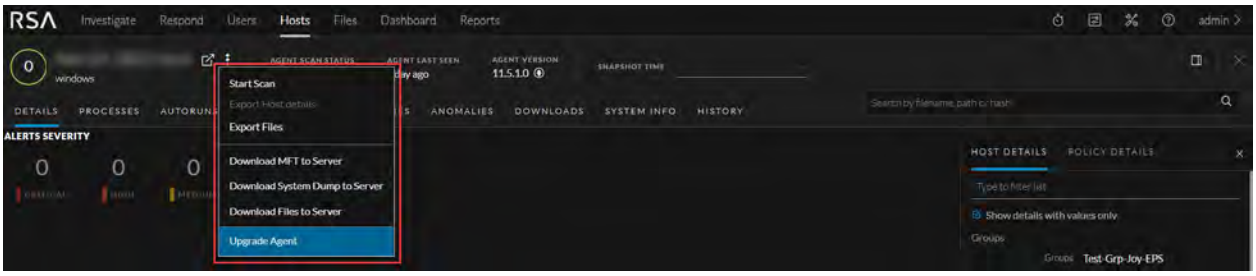
2. In the **Upgrade All Agents** dialog, click **Upgrade**.



**Note: Upgrade All Agents** process will require more time to complete, depending upon the number of agents selected based on the filters applied.

### Upgrade an agent from Hosts details page

Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Upgrade Agent**.



1. In the **Upgrade Agent** dialog, click **Upgrade**.

**Note:** To upgrade an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

The following upgrade status icons are displayed in the **Agent Version** column.

| Icons | Upgrade Status | Description |
|---|---|---|
| | Upgrade Available | An agent upgrade is available. |
| | Agent Upgrade Pending | The agent has not yet received the upgrade command. |
| | In Progress | The agent is being upgraded. |
| | Failed | Agent upgrade failed. View details in the agent history page. |
| No Icon | No Upgrade Available | No upgrade available for the agent. Refer to agent eligibility. |

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands.
     The Agent History view is displayed.
   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands.
       The History view is displayed.

For more information on Agent History, see the "Investigating Hosts" topic in the *NetWitness Endpoint User Guide*.

# Upgrading 11.3.x or Later Agents Versions

You can upgrade the 11.3.x and later versions of Endpoint agent to 11.6 or later.

**Note:** In a multi-server Endpoint deployment, during an agent upgrade, make sure that the correct Endpoint server is mentioned in the respective agent policy. In case the agent uses the default policy, ensure to use the agent packager downloaded from the respective Endpoint server to which it is communicating. Using Agent packager from different Endpoint server for agent upgrade will result in migrating the agents to another Endpoint server.

**Note:** For a subsequent installation or upgrade, use the same service and driver service name.

To upgrade from 11.3.x and later, download the 11.6 agent packager, deploy and verify agents. For more information, see Generate an Endpoint Agent Packager and Deploy and Verify Endpoint Agents.

Upgrade from 4.4.0.9 and 4.4.1.x is supported only for version 11.3. For more information, see *NetWitness Endpoint 4.4.1.x to NetWitness Platform 11.3 Migration Guide*.

To upgrade an agent from 4.4.0.x to 11.6, uninstall the agent and perform a fresh installation.

# Recommendations for Installing Agents in Virtual Desktop Infrastructure (VDI) Environment

Agent ID is generated based on various parameters, such as security identifier (SID) and SMBIOS Universal Unique Identifier (UUID). A SMBIOS UUID is a 128-bit number used to uniquely identify a host.

**Note:** While cloning the VDI image where an agent is already installed, the agent ID automatically changes for Windows and Mac agents if `uuid.action = keep` is not set in the .vmx file. For more information, see Configure a Virtual Machine to change the UUID.
For Linux agents, the agent ID does not change automatically on VDI clone.

When you clone a VDI image:

- If you do not change the agent ID for each VDI clone, make sure that the SMBIOS UUID remains the same.
- If you change the agent ID for each VDI clone, make sure that the SMBIOS UUID is also changed.

To avoid duplication of agent IDs, make sure that the SMBIOS UUID changes on the following VDIs:

- Citrix XenServer
- VMWare Workstation
- VMware vCloud Director

  For more information, see VMware Knowledge Base.
- vCenter hosted ESXi Server

To get the SMBIOS UUID on a Windows virtual host, execute the following command:

```
wmic csproduct get UUID
```

# Troubleshooting

This section provides information about possible issues when using the RSA NetWitness Endpoint.

## Packager Issue

| | |
|---|---|
| Issue | Failed to generate the agent installers. |
| Explanation | Some encryption software may create additional files that fails to generate the agent installers. |
| Resolution | Copy the packager to a machine that does not have antivirus or encryption software and then generate the agent installers. |

| | |
|---|---|
| Issue | Failed to generate agent installers for MAC. |
| Explanation | Agent packager `AgentPackager.exe` fails to generate MAC agent installer (`nwe-agent.pkg`) with the error message "Failed to generate table of content for package" or "Failed to create config file C:\AgentPackager (4)\agents\mac\Plugins\NWEInstallerPlugin.bundle\Contents\Resources\config.cfg". |
| Resolution | Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**. |

| | |
|---|---|
| Issue | Agent packager generates temporary agent installers for MAC. |
| Explanation | Agent packager `AgentPackager.exe` generates MAC agent installer as `nwe-agent_tmp.pkg` instead of `nwe-agent.pkg`. |
| Resolution | Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**. The MAC agent package `nwe-agent.pkg` will be generated as expected |

## Agent Upgrade via UI Issues

| | |
|---|---|
| Issue | Agent upgrade not available. |
| Explanation | 1. The agent version might not be supported for upgrade from UI. Agent version has to be 11.5.1 or later for upgrade via UI.<br>2. Logged in user may not have appropriate permission for upgrade from UI.<br>3. Agent version is up-to date. |
| Resolution | 1. Use the manual upgrade method for upgrading the version. |

| | |
|---|---|
| | 2. Use admin user which have following permissions, endpoint-server.agentupdate.manage and endpoint-server.ca.manage.<br>3. No upgrade required. Agent version is already up-to date and no further upgrade is available. |

| | |
|---|---|
| Issue | Agent upgrade is in Pending state. |
| Explanation | The hosts for which the command is shown in pending could be in offline or inactive state. |
| Resolution | Ensure Hosts/agents are communicating with Endpoint server directly or via Relay server for it to receive the upgrade command from server. Verify "Agent Last seen" time in Host listing page. |

| | |
|---|---|
| Issue | Agent upgrade failed. |
| Explanation | 1. Agent upgrade fail with any of the following reasons:<br>• Service Name or Driver name mismatch<br>• Checksum mismatch<br>• Installer size mismatch<br>2. Agent installer could not be created. |
| Resolution | 1. Retry upgrading the agent. If it continues to fail, use the manual upgrade method.<br>2. Check the permissions for the user initiated the upgrade command. User can be viewed in **Host** > **Agent History** page. User should have following permissions, `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage`. |

| | |
|---|---|
| Issue | Linux agent upgrade fails with an error, sudo not found. |
| Resolution | Make sure that the sudo package is installed on the agent machine. |

## Agent Uninstall via UI Issues

| | |
|---|---|
| Issue | Agent uninstalled failed. |
| Explanation | Agent uninstall fails due to several unknown reasons. |
| Resolution | 1. Retry uninstalling the agent.<br>2. Use the manual uninstall method. For more information, see Uninstalling Agent Manually. |

# NetWitness Endpoint

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.1 and later.

## About NetWitness Endpoint

NetWitness Platform provides an endpoint detection and response solution that continuously monitors the behavior of all endpoints in and outside the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster. During investigation, the analyst can use the visual indication of threat level to assess the risk of endpoints.

As part of this solution, NetWitness Platform introduces **Endpoint Log Hybrid** that:

- Collects and manages endpoint (host) data from Windows, Mac, and Linux hosts.
- Collect log files and Windows logs from Windows hosts.
- Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.

Analysts can:

- Perform instant scans for detailed insights of the host behavior at any point in time.
- Analyze the scope of the attack across hosts and network through integrated metadata.
- Quickly triage and focus their investigation by managing suspect and legitimate files.
- Perform multiple checks of file legitimacy to determine if a file is malicious, including checking file certificates and hashes.
- Blacklist malicious files and then block them across all hosts in the network to prevent future execution of this file on any host.
- Download Master File Table (MFT), system dump, and process dump for forensic investigation.
- Isolate host from the network to safely investigate possible threats within the host.

Endpoint Log Hybrid receives data from the Endpoint Agents. The following services run on the Endpoint Log Hybrid:

- **Endpoint Server**: Manages data received and stores it in a database. It parses the events, generates metadata, and forwards it to the Log Decoder through protobuf.

  **Note:** You may need to install your Endpoint Server on separate hardware from your Log Decoder. If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

  If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

  If that doesn't help, RSA recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

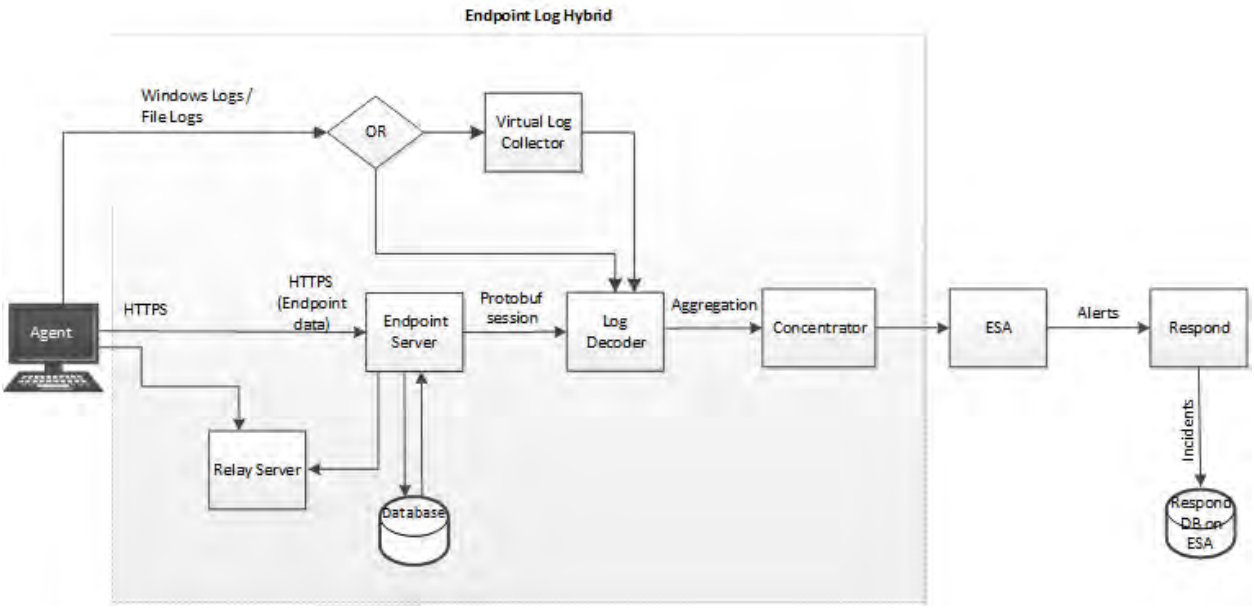
- **Log Decoder**: Captures data from the Endpoint Server and processes the metadata.
- **Concentrator**: Aggregates metadata from the Log Decoder and makes it available for all upstream components like Investigate, Reporting Engine, Respond, and Event Stream Analysis similar to NetWitness Decoder and Concentrator.
- **Log Collector**: Collects logs from all event sources that are supported for the log collection in the NetWitness Platform.

In addition to the above services, the Endpoint Log Hybrid leverages the following services:

- **Event Stream Analysis (ESA)**: Creates alerts from ESA rules for Endpoint data.
- **Endpoint Broker**: Provides a consolidated view of all Endpoint servers in a multiple Endpoint Log Hybrid deployment.

## Endpoint Agent Data Flow

The following figure shows the endpoint data flow from the agent to the NetWitness Platform:



The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all the NetWitness Platform services.

Basic configuration involves:

- Installing agents on hosts
- Deploying the ESA rules from the Endpoint Rule Bundle
- Creating groups and policies
- Configuring Endpoint metadata forwarding and retention policies
- Defining health and wellness policies to monitor Endpoint Server
- Installing and configuring Relay Server

You can configure the required settings in the NetWitness Platform user interface under Administration Services Config view ( **(Admin) > Services > Endpoint Server > Config**).

# Agent Modes

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

In NetWitness Platform 11.3 and later, the Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information on policy configuration, see the *NetWitness Endpoint Configuration Guide*. You can have both Insights and Advanced agents in a single deployment.

There is no license required for the Insights agent. However, you must procure a license for an Advanced agent. For more information on licensing, see the *Licensing Management Guide*.

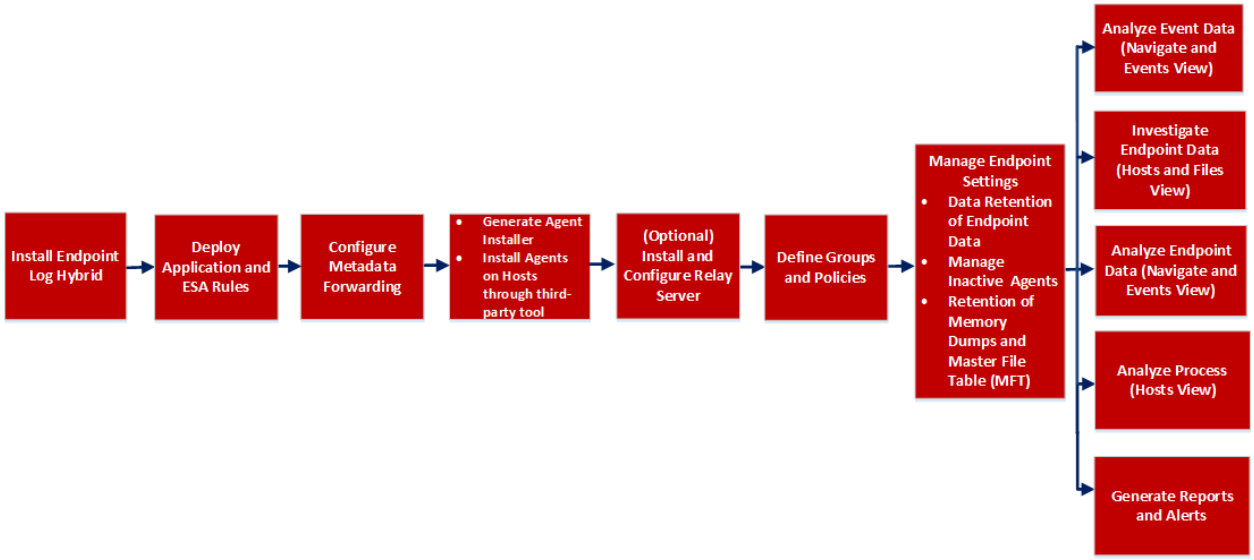
The following table list the features supported for Insights and Advanced agents:

| Feature | Insights Agent | Advanced Agent |
|---|---|---|
| Scan data -<br>Processes, Autroruns, Files, Drivers, Libraries, and System Information | Yes - Windows, Mac, and Linux | Yes - Windows, Mac, and Linux |
| Tracking data -<br>Process, File, Registry, Network, and Console | No | Yes - Windows and Mac<br>Registry and Console events are applicable only for Windows. |
| Expanded network visibility | Yes - Windows | Yes - Windows |
| Anomaly detection -<br>Image Hooks, Kernel Hooks, Registry Discrepancies, and Suspicious Threads | No | Yes - Windows |
| Windows log collection | Yes | Yes |
| File log collection | Yes - Windows | Yes - Windows |
| Threat detection content -<br>ESA, Application Rules | Yes | Yes |
| Analysis of downloaded file | Yes | Yes |
| File status -<br>Whitelist, Blacklist, Graylist, and Neutral | Yes | Yes |
| File remediate (Block) | No | Yes - Windows |
| Process visualization | No | Yes |
| Live connect | Yes | Yes |
| File reputation service<br>(Third-party lookup) | Yes | Yes |

| Feature | Insights Agent | Advanced Agent |
|---|---|---|
| Risk score for hosts | No | Yes |
| MFT, process dump, and system dump download | No | Yes - Windows |
| Automatic file download | Yes | Yes |
| Automatic Memory DLL Download | No | Yes |
| Manual file download | No | Yes |
| Network isolation | No | Yes - Windows |
| Relay server | Yes | Yes |

# Endpoint Log Hybrid Configuration

This topic provides the high-level tasks required to configure the Endpoint Log Hybrid.



| Tasks | Description |
|---|---|
| Install the Endpoint Log Hybrid | See the *Physical Host Installation Guide* and *Virtual Host Setup Guide*. |
| Deploy Application and ESA Rules | See Deploying Endpoint Application Rules and ESA Correlation Rules. |
| Configuring Metadata Forwarding | Similar to logs and packets, you can view Endpoint metadata in the Navigate and Events view. You can also generate reports and alerts for the Endpoint data. By default, the Endpoint Meta option is disabled. The agent must be installed with the Endpoint Meta option enabled to forward metadata. |

| Tasks | Description |
|---|---|
| Install Agents on Hosts | The Endpoint agent installer is generated using the Packager tab under **(Admin) > Services > Config > Endpoint Server** from the NetWitness Platform user interface. The Packager is a zip file that contains executables and configuration files for generating agent installer for Linux, Mac, and Windows operating systems. You can install only one version of the agent on a host. If you have a previous version of an agent installed (for example, 4.4), uninstall this agent to install the 11.7 agent.<br>After the agent is installed, it appears on the **Hosts** view. By default, the Endpoint data is posted for the first time. To collect subsequent Endpoint data, you have to either schedule a scan or perform ad hoc scan. It retrieves data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host.<br>**Note:** If a Windows host has proxy setup enabled and configured, the Endpoint agent communicates to the Endpoint server through proxy. If a host has both Automatic (Auto detect and Setup Script) and Manual proxy settings enabled and configured, the order of precedence is as follows:<br>1. Manual proxy setup<br>2. Automatic proxy setup - Use setup script<br>3. Automatic proxy setup - Automatically detect settings |
| Install and Configure the Relay Server | See (Optional) Installing and Configuring Relay Server. |
| Endpoint Sources | To efficiently manage and update endpoint agent configurations, you can group the agents, and manage their behavior using policies. |
| Enable Reputation Status | Reputation Status is enabled by default in an NetWitness Platform 11.3 and later deployment and displays information about the file. For troubleshooting, see the *Live Services Guide*. |
| Risk Score | Risk Score is calculated and obtained from NetWitness Respond for hosts and files. For more information, see the *NetWitness Respond Configuration Guide*. |
| Configuring Data Retention Policy | Define data retention policies to optimally store and manage the Endpoint data based on the age of the Endpoint data or the storage size.<br>By default, 30 days of agent data is retained. |
| Managing Inactive Agents | By default, agents (including all the collected Endpoint data) that have not communicated with the Endpoint Server for 90 days will be automatically deleted. |
| Configure Retention Policy for Memory Dumps and MFT | Define retention policy to optimally store and manage downloaded system dump, process dump, and MFT. By default, 90 days of data is retained. |

| Tasks | Description |
| --- | --- |
| Investigate Endpoint data | You can investigate the Endpoint data in the **Hosts** and **Files** views. For more information, see the *NetWitness Endpoint User Guide*. |

# Deploying Endpoint Application Rules and ESA Correlation Rules

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

The existing IIOCs from NetWitness Endpoint 4.4.0.x are now available as OOTB Endpoint Application rules tagged as Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File. Application rules for Endpoint are automatically available on installation of NetWitness Platform 11.3 and later.

For Endpoint risk score, every Application rule must have an ESA rule that generates alerts used for the risk score calculation. A set of OOTB ESA rules are available as Endpoint Rule Bundle. You must specify the Endpoint data sources (Concentrators) and deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

If the Application rule key value matches with ESA rule then an alert is triggered which is used to compute the risk score and an incident is raised when risk score exceeds the defined threshold limit.

**Note:** If you are upgrading from an existing Endpoint Log Hybrid to 11.3 or later, you must deploy the Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see the *Live Services Management Guide*.

You can view the application rules that are deployed in **(Admin) >Services > Endpoint Log Hybrid - Log Decoder** > **Config** > **App Rules** and application rules that were triggered in **Investigate** > **Navigate**> **Endpoint Log Hybrid - Concentrator** > **App rules**.

The Endpoint ESA rules generate alerts with the severity; Critical, High, and Medium. You can view the alerts on:

- Risk Details tab - You can view Critical, High and Medium alerts for a host or file on **Hosts** > **Risk Details** or **Files** > **Risk Details**.
- Respond view : You can view only critical and high severity alerts on **NetWitness Respond** > **Alerts**.

## Custom Endpoint Rule for Risk Scoring

If you have custom IIOCs in NetWitness Endpoint 4.4.0.x, you need to create these custom Endpoint rules. Once you have created your custom Application rule, you must create the custom ESA Rule for risk score calculation and update the RiskConfig file in MongoDB.

To create a custom Endpoint rule, perform the following tasks:

1. Add a custom Application Rule
2. Add a custom ESA Rule
3. Add the rule to RiskConfig

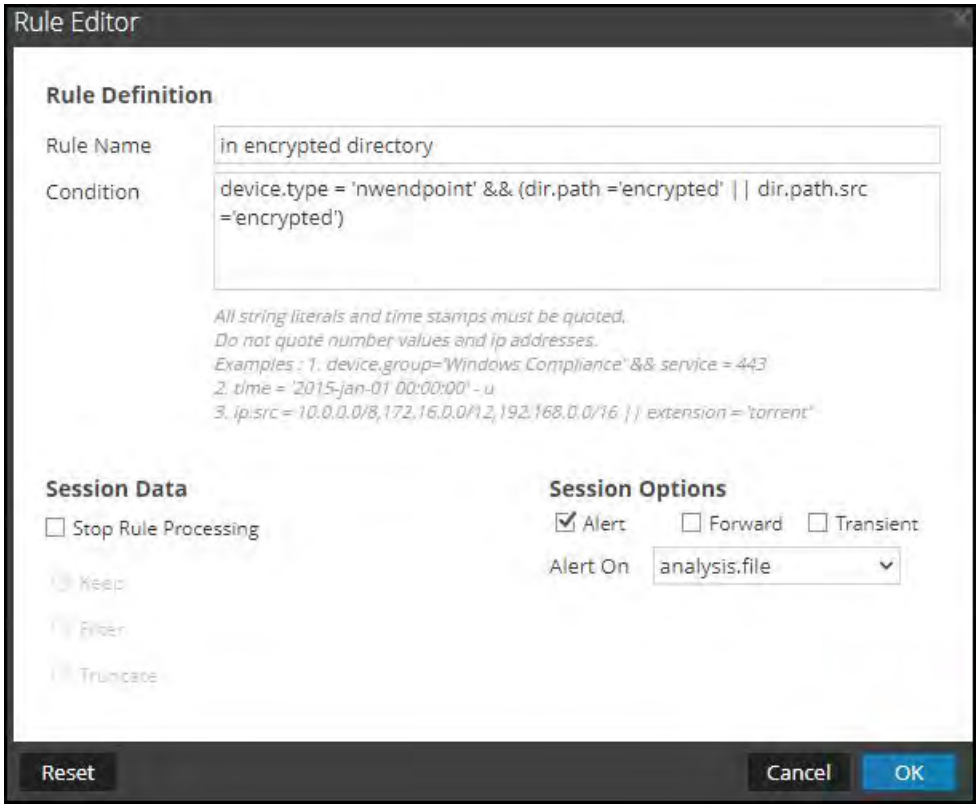
# Add a custom Application Rule

### To add a custom application rule:

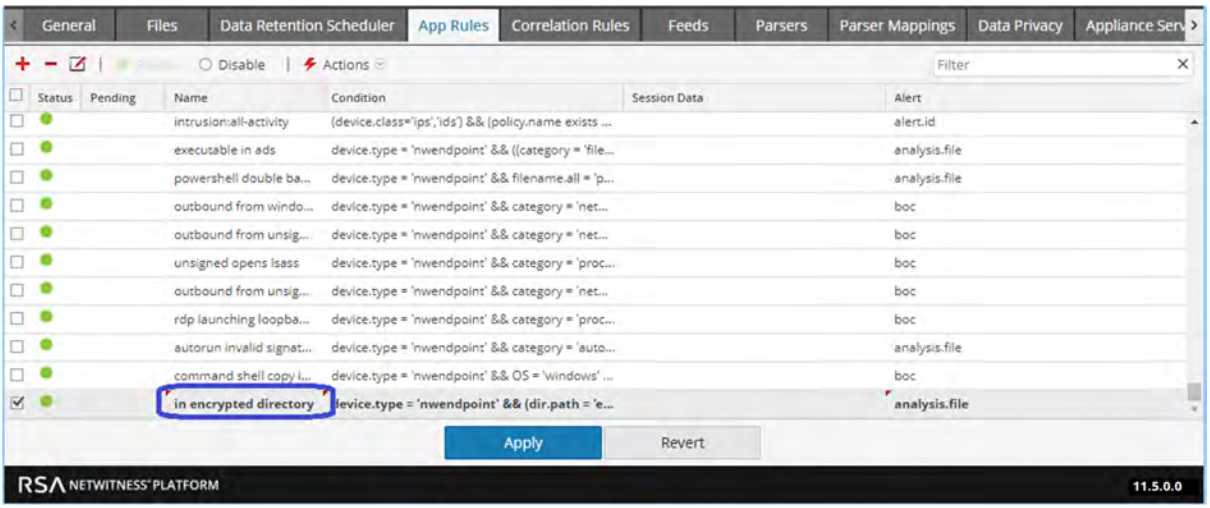
1. Complete steps 1-11 in "Configure Application Rules" topic of *Decoder and Log Decoder Configuration Guide*.

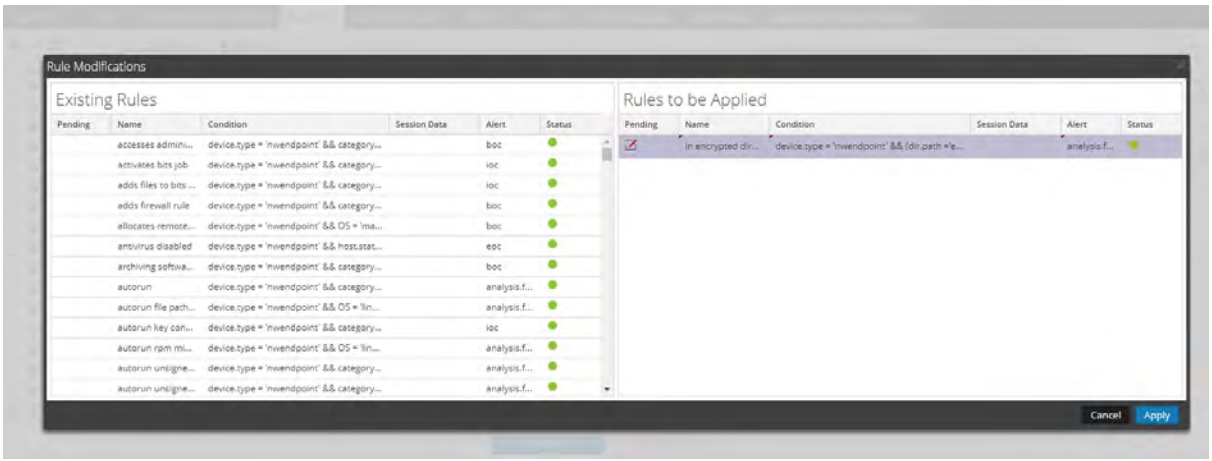
   **Note:** You must be familiar with the metakeys tagged as (Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File) on which an alert will be generated. In the example below, the alert is generated on Analysis.File metakey for In Encrypted Directory rule.

   Following is an example of an Application Rule created for In Encrypted Directory alert.



2. After a custom application rule is added successfully, select the newly created rule (For example, In Encrypted Directory alert) and click **Apply**.





In case of multiple Endpoint servers, you must create this custom Application rule on every Endpoint Hybrid Log Decoder service.

## Add a custom ESA Rule

To add a custom ESA rule, perform the following.

1. SSH to the Admin Server.
2. Create a new JSON file (for example,`in encrypted directory.json`) with the custom ESA rule definition in the below format.

```
{
"id": "In Encrypted Directory","key": "analysis.file",
"value": "in encrypted directory",
"title": "In Encrypted Directory",
"type": "ENDPOINT",
"enabled": true,
```

```
"description": "End Point rule for In Encrypted Directory",
"severity": "MEDIUM"
}
```

The following table describes the fields that define a rule.

| Fields | Description |
|---|---|
| id | The name of the ESA Rule. For example, In Encrypted Directory. |
| key | The metakey on which an alert would be generated.<br>For example, alert is generated on analysis.file metakey for In Encrypted Directory rule. |
| value | Specify the value. The value must exactly match with the App rule name. For example, in encrypted directory. |
| title | The name of the alert. For example, In Encrypted Directory. |
| type | Specify the type of rule. For custom endpoint rule, the type must be ENDPOINT. |
| enabled | The status of the rule. Specify true, if the rule should be considered for risk scoring. |
| description | The description of the rule. |
| severity | The severity of the rule; critical, high or medium. |

3. To enter shell mode of nw-shell, execute the following command:

   ```
   nw-shell
   ```

4. Connect to ESA correlation-server using the following command:

   ```
   connect --service correlation-server
   ```

5. Login to the ESA correlation-server using the following command:

   ```
   login
   ```

   **Note:** You must provide Administrator credentials.

6. Navigate to the API xpath using the following command:

   ```
   cd correlation/keyvalue/settings/set
   ```

7. Run the API using the following command:

   ```
   invoke --file <absolute-path-to-rule-definition-file>
   ```

   **Note:** You must specify the absolute path to the rule definition file. For example, `invoke --file /root/rule.json`

## Add the rule to RiskConfig

After you create the custom Application rule and the ESA rule, you must update the RiskConfig in mongoDB.

### To update the riskconfig file, perform the following:

1. SSH to Admin Server.
2. Create a JavaScript file (For example, `in-encrypteddirectory- rule.js)` with the custom ESA rule definition in the below format.

```
db.risk_rule.insertMany(
[ {
"name" : "In Encrypted Directory",
"enabled" : true,
"handler" : "Default",
"entities" : {

},
"metas" : {
"File" : [
{
"meta" : "checksum_src",
"name" : "filename_src",
"weight" : NumberInt(100)
}
],
"Host" : [
{
"meta" : "agent_id",
"name" : "alias_host",
"weight" : NumberInt(100)
}
]
},
"_class" : "com.rsa.asoc.respond.pipeline.risk.rules.AlertScoringRule"
} ]
)
```

The following table describes the fields that define a rule.

| Field | Description |
|---|---|
| name | The name of the ESA rule. |

| Field | Description |
|---|---|
| enabled | The flag to enable or disable risk scoring. Specify true to enable risk scoring. |
| handler | The value of this should be Default. |
| entities | The value of this should be empty. |
| metas > Files > meta | The metakey for a file for which score should be calculated. |
| metas > Files > name | The name of the metakey of the file identity. |
| metas > Files > weight | By default the weight value is 100. |
| metas > Host > meta | The metakey for a host for which score should be calculated. |
| metas > Host > name > | The name of the metakey of the host identity. |
| metas > Host > weight | By default the weight value is 100. |
| _class | This is used for internal purpose, do not change. |

3. Insert the new rule into the riskconfig file on mongoDB using following command:

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> in-encrypted-directory-rule.js
```

4. Confirm if ESA rule is updated successfully in the riskconfig, using following command

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> --eval "db.risk_rule.find({ "name": /.*In
Encrypted Directory.*/i })"
```

5. Restart the Respond server for the changes to take effect.

```
service rsa-nw-respond-server restart
```

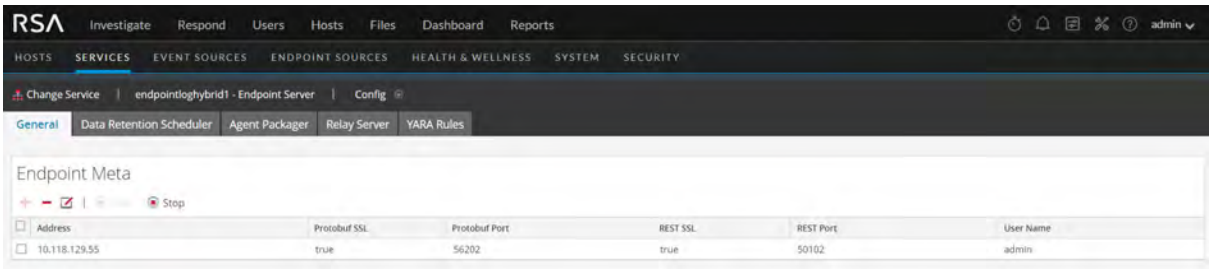
After you create a custom Endpoint rule and update the risk configuration file, whenever an event is generated for the new rule (For example, In Encrypted Directory) an alert will be generated and the risk score is calculated for the host and file.

# Configuring Metadata Forwarding

To view the metadata, you must enable the metadata forwarding while installing the Endpoint Log Hybrid. The Endpoint metadata is displayed in the NetWitness Platform Investigate (**Navigate** and **Events** views) similar to Logs and Packets. For information on metadata mappings, see Endpoint Metadata Mappings.

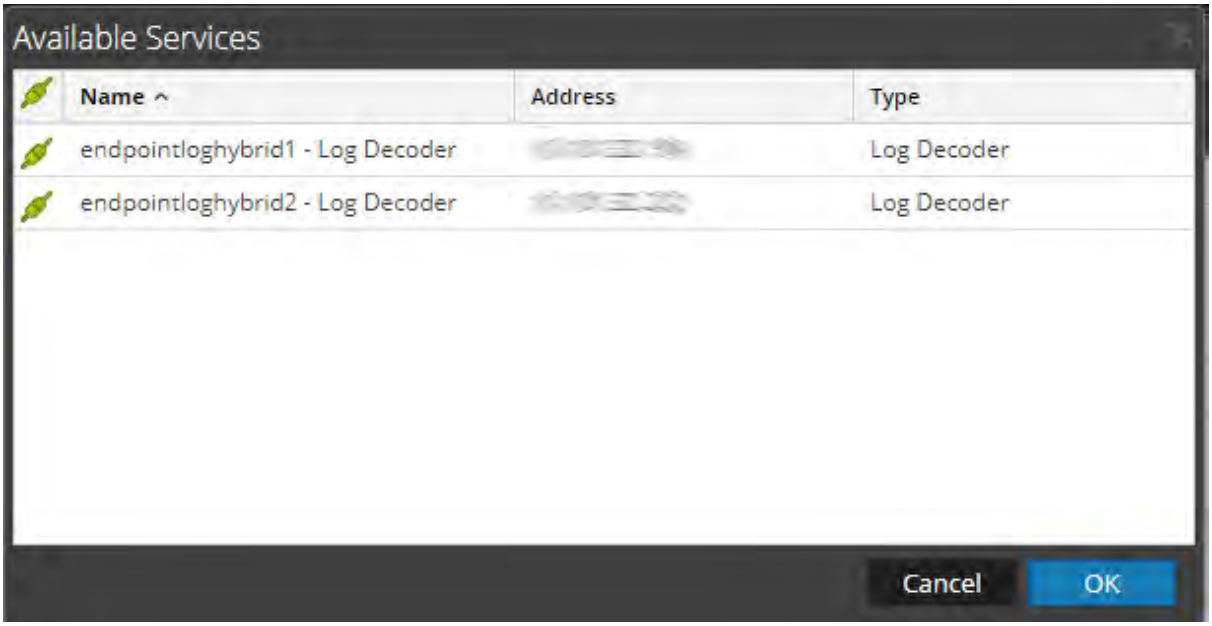
To configure metadata forwarding:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.



5. Click in the toolbar.

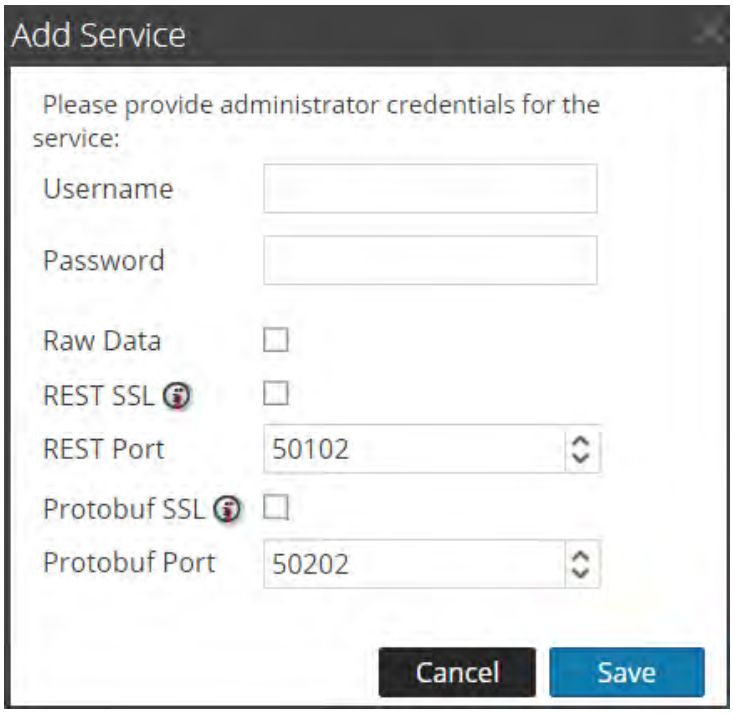
   The Available Services dialog is displayed.



6. Select a Log Decoder service and click **OK**.

   The Add Service dialog is displayed.

**Note:** You can add only one Log Decoder service.



7. Enter the administrator credentials for authentication.
8. (Optional) If you enable Raw Data, a brief summary of the session is forwarded along with the metadata.
9. (Optional) If you have enabled SSL on the REST port in the Log Decoder, select the **REST SSL** option. By default, the REST port for non-SSL is 50102 and SSL is 56102.
10. Select the **Protobuf SSL** option to enable SSL on Protobuf. By default, the Protobuf port is 50202.
11. Click **Save**.

After configuring the metadata forwarding, make sure to:

- Start the capture on the Log Decoder
- Start the aggregation on the Concentrator
- Add the Log Decoder as a service in the **Concentrator**

## Start Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Start
   The Endpoint Server starts forwarding the metadata to the Log Decoder.

# Stop Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Stop.
   The Endpoint Server stops forwarding the metadata to the Log Decoder.

# Remove Metadata Forwarding

**Note:** Make sure you stop the service, before removing the metadata forwarding.

1. In the Endpoint Meta config view, select the service.
2. Click −.
3. Click **Apply**.

# Endpoint Metadata Mappings

You can view the default metadata mappings or modify the metadata mappings for endpoints.

## JSON Schema for Metadata Mappings

All metadata mappings is configured using the JSON schema. The following is a sample JSON schema:

```
{
"metaKeyPairs" : [
     {
     "metaKeyPairsCategory" : "",
     "keyPairs" : [
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          },
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
```

```
            }
        ]
        }
]
}
```

The following APIs are used to view or modify the metadata mappings:

- `get-default` - Returns the default configurations for the endpoint metadata mappings.
- `get-custom` - Returns the custom configurations for the endpoint metadata mappings.
- `set-custom` – Helps customize the endpoint metadata mappings.

## View the Metadata Mappings

To view the endpoint metadata mappings:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following command:
   `connect --host <IP address> --port <number>`

**Note:** The default port is 7050.

4. Run the following commands:

```
cd endpoint/meta
cd get-default
invoke
```

The following screen shows the default metadata mappings:

```
    {
      "endpointJpath" : "users/sessionType",
      "metaName" : "logon_type",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "hostFileEntries/hosts",
      "metaName" : "dhost",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "securityConfigurations",
      "metaName" : "event_state",
      "type" : "text",
      "enabled" : true
    }
  ]
},
{
  "metaKeyPairsCategory" : "MACHINE_IDENTITY",
  "keyPairs" : [
    {
      "endpointJpath" : "_id",
      "metaName" : "agent.id",
      "type" : "text",
      "enabled" : true
    },
```

**To disable a default metadata mapping:**

Enter the same endpointJpath value and set the enabled parameter to `false`.

For example, if the endpointJpath is `Category` and enabled parameter is `true`, enter the same endpointJpath and set the enable parameter to `false`.

```
{
  "metaKeyPairsCategory" : "COMMON",
  "keyPairs" : [
    {
      "endpointJpath" : "Category",
      "metaName" : "category",
      "type" : "text",
      "enabled" : true
    },
```

**Note:** Do not modify the metaKeyPairsCategory in the schema; “COMMON”, “COMMON_MACHINE”, “COMMON_MACHINE_FOR_EVENTS”.

**To change the metadata name or metadata type:**

Enter the same endpointJpath value and specify values for the metaName and type.

**Note:** The metaName must exist in the table-map.xml of the Log Decoder, index-concentrator.xml or index-concentrator-custom.xml file of the Concentrator, for the metaName to appear on the Investigate view.

## Add or Modify Metadata Mappings

To add or modify the metadata mappings, run the `set-custom` API. The metaKeyPairs configuration provided in the JSON file should match the JSON schema of the default configuration received through the `get-default` API.

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following commands:

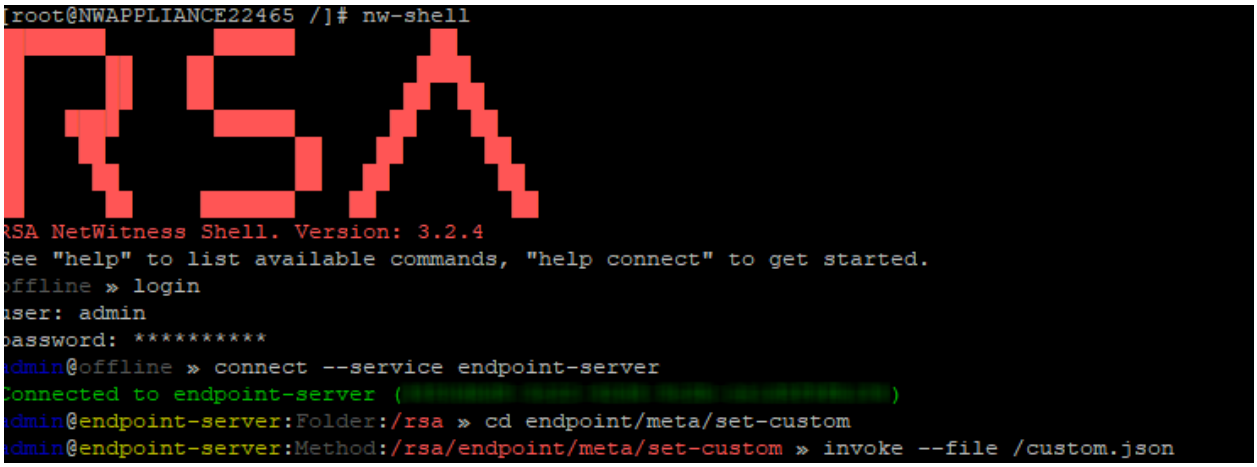
   ```
   connect --service endpoint-server
   ```

   **Note:** The default port number is 7050.

4. Run the following commands:

   ```
   cd endpoint/meta
   cd set-custom
   invoke --file <json file>
   ```

You can add new metaKeys by adding entries to the file that will be uploaded using the `set-custom` API. The following example shows how to add a new metadata mapping:



## View the Custom Metadata Mappings

To view the custom metadata mappings, run the `get-custom` API, and then invoke commands.

**Note:** The `get-custom` API will return values only if the metadata mappings are modified using the `set-custom` API.

# Endpoint Sources

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

The Endpoint agents deployed in your environment may be large in number and geographically distributed. To efficiently manage and update configurations automatically, agents can be organized into smaller subsets called **Groups**.

## Groups

Groups can be created based on Machine OU, IP address (IPv4 and IPv6), host names, operating system type, and operating system description. You can create groups based on your requirements. For example, you can group all agents running on Windows 2016 Server and IP ranging from 10.40.10.1 to 10.40.10.200. For more information on creating groups, see Creating Groups and Policies.

**Note:** All agents that are not part of any group use the default policy settings.

## Policies

To manage the behavior of agents in a group, you can apply a set of rules called **Policies**. The RSA NetWitness Platform supports three types of policies for endpoints: **Agent Endpoint**, **Agent File Logs**, and **Agent Windows Logs** policies. The following default policies are available on installation.

**Note:** RSA recommends that you review these default policies before deploying agents.

- Default Agent Endpoint (EDR) Policy
- Default Windows Log Policy
- Default File Log Policy

You can either assign the default policies to a group, modify the default policy, or create custom policies based on your organizational requirements.

**Note:** You cannot edit the default policy for Windows Logs nor for File Logs.

You can do the following through a policy:

- Define the agent mode - Insights or Advanced
- Configure scan schedule and settings
- Configure automatic file download
- Configure endpoint settings, such as which Endpoint server the agents should communicate, port details, and beacon intervals
- Configure response actions such as blocking
- Configure Windows and File Log collection

For example, you can create a policy to schedule scan and enable blocking. For more information on creating policies, see Create an EDR Policy, Create a File Log Policy, or Create a Windows Log Policy.

# Group Ranking

When a group is created, a rank is associated with every group based on the creation order. If an agent belongs to multiple groups, to handle conflicting configurations, you can reorder the groups to change the ranking, and the policy associated with the highest ranked group takes precedence.

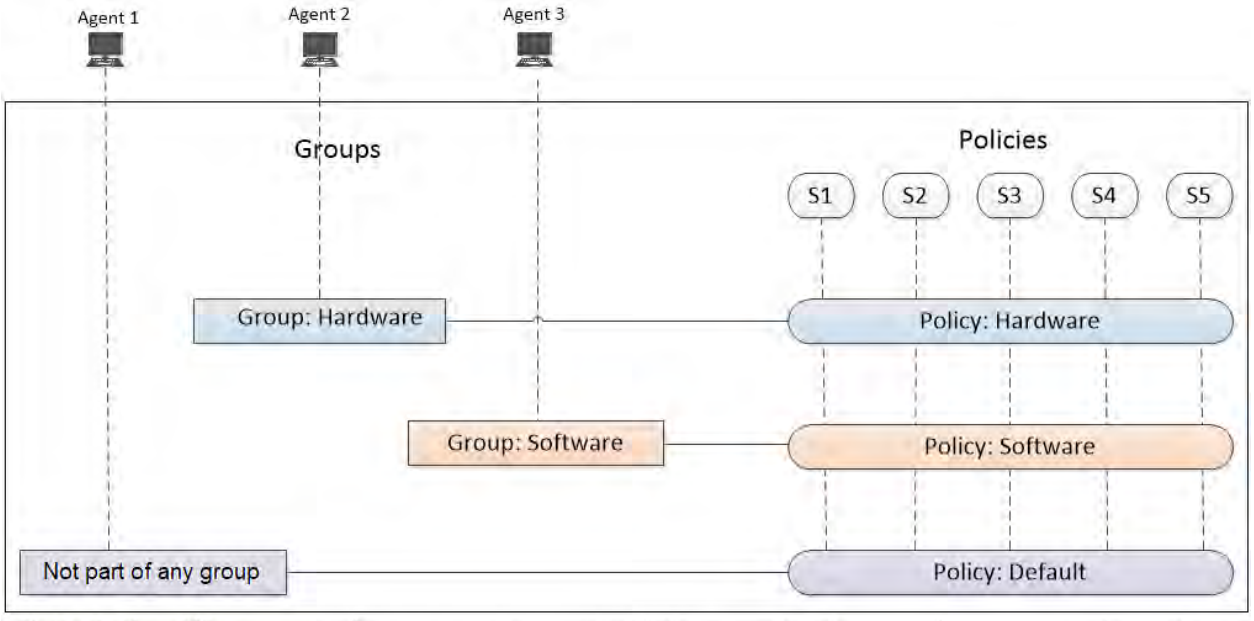
## Example 1

A **Server** group contains 100 hosts with a default Agent Endpoint policy. Amongst these, if 20 hosts require further investigations, analyst can:

1. Create a temporary group with a static list of these 20 hosts.
2. Create or apply any policy to this group that will not impact any other hosts.
3. Edit the ranking for the new group, moving to the top of the Ranking list (making sure it is above the existing Server group).
4. After investigation is done, delete this group. The hosts are revalidated and assigned to the appropriate group based on the ranking.

## Example 2

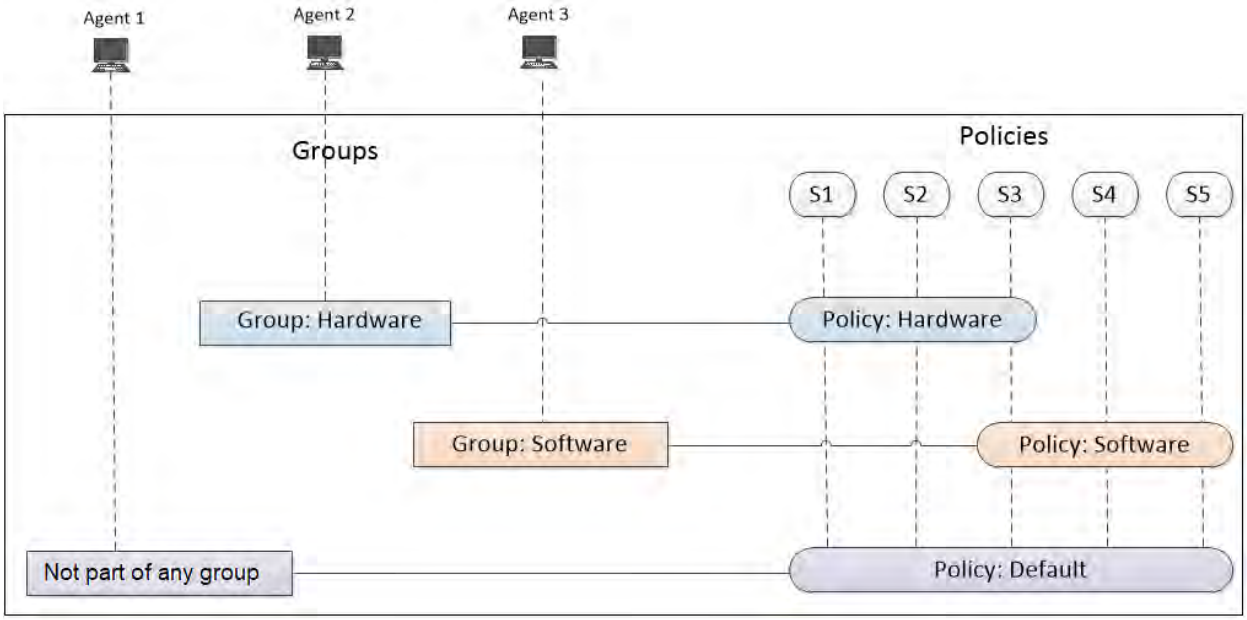
**Case 1:**



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

Each agent is a part of a unique group that is associated with a policy, where each policy has all settings S1, S2, S3, S4, and S5 defined. For example, Agent 2 is a part of the group Hardware, where all settings in the policy Hardware are applicable.

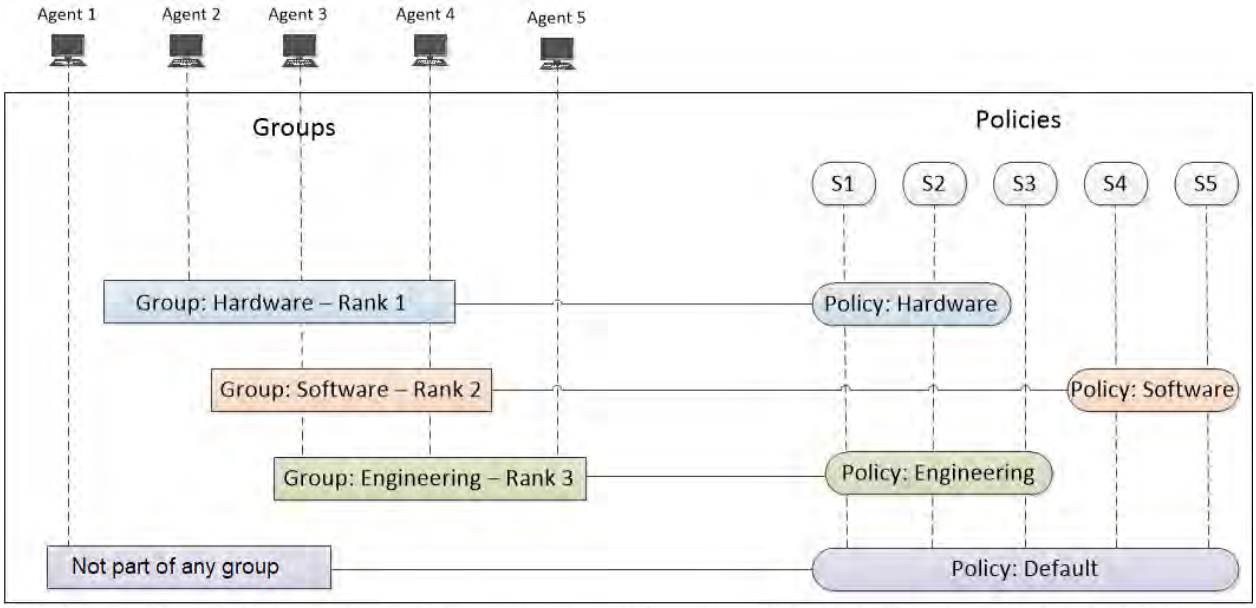
**Case 2:**



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

In the policy Hardware, S4 and S5 settings are not defined, and hence the agent 2 inherits settings S4 and S5 from the default policy.

**Case 3:**



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

- Agent 2 is a part of the highest ranked group Hardware, and with the policy Hardware. The agent 2 inherits settings S3, S4, and S5 from the default policy as they are not defined in the policy Hardware.

- Agent 3 is a part of Hardware, Software, and Engineering groups, and with the policy Software. The agent considers the settings S4 and S5 from the policy Software, and the remaining undefined settings are inherited as follows:
  - S1 and S2 from the policy Hardware, which is associated with the highest ranked group.
  - S3 from the policy Engineering, which is the next ranked group.
- Agent 4 is a part of Hardware, Software, and Engineering groups, and with the policy Engineering.
  - Though settings S1 and S2 are defined in policy Engineering, the agent 4 considers the settings S1 and S2 from the policy Hardware as it is associated with the highest ranked group.
  - S4 and S5 from the policy Software, which is the associated with the next highest ranked group.
  - S3 from the policy Engineering.

The following are some of the key points:

- If an agent is not assigned to any group, default policies are applied.
- A policy can be assigned to multiple groups. However, a group can only have one policy of each type (Agent Endpoint and Agent Windows Logs).
- An agent can belong to multiple groups. The policy is derived based on the ranking of the group as shown in the above example (case 3).
- If all settings are defined in a single policy, and it is the highest ranked policy for an agent, no policy settings from other ranked groups are inherited (case 1).
- If there are any undefined settings in the policy, the settings from the default policy is considered as shown in the example above (case 2 and 3).
- If an agent falls into more than one group, its complete set of policy attributes is determined as follows:
  - It takes all settings from the highest ranked policy that applies.
  - Any settings that are not set in the highest ranked policy are taken from the next highest ranked policy that applies.
  - If there are still unset attributes, they are taken from the default policy.
  - If there are any conflicts, the higher ranked policy wins.

## Example 3

Assume the following:

- Agent A belongs to below two groups, **Production Servers** and **All Windows Hosts**.
- The Production Servers group has the **Schedule scan set and no blocking** policy assigned, and it has the following settings:
  - Schedule Scan : Enabled
  - Effective Date: 2019-03-08

  - Start Time: 09:00
  - Scan Frequency: Every 1 week
  - CPU Maximum: 45 %
  - Virtual Machine Maximum: 20 %
  - Blocking: Disabled
- The All Windows Hosts group has the **EDR for All Windows** policy applied, which has the following settings:
  - Scan Master Boot Record: Disabled
  - Blocking: Enabled
- The **Production Servers** group is ranked higher than the **All Windows Hosts** group for EDR policies. Keep in mind that ranking only applies to policies of the same source type: that is, all EDR policies are ranked, and all Windows Logs policies are ranked separately.

Agent A gets its final policy configuration as per the ranking of the groups (and associated policies) to which it belongs:

- The agent uses the schedule set in the **Schedule scan set and no blocking** policy.
- Scan Master Boot Record is disabled, because that is set in the **EDR for All Windows** policy.
- Blocking is disabled: since there is a conflict, the value in the higher ranked policy is used.
- All other attributes are set based on values in the Default EDR policy.
- Note that if you wanted Blocking to be enabled, you could change the group ranking so that All Windows Hosts is higher than Production Servers: in this case, Production Servers would win the conflict, and Blocking would be enabled for Agent A.

## Default Agent Endpoint (EDR) Policy

When an agent is installed, it operates in an Insights mode until a policy is assigned. The following are the default EDR policy settings:

| Settings | Fields | Default Value |
|---|---|---|
| Scan Schedule | Run Scheduled Scan | Disabled |
| | Effective Date | Current date |
| | Scan Frequency | Every week |
| | Start Time | 09:00 (this is 9 AM) |
| | CPU Maximum | 25% |
| | Virtual Machine Maximum | 10% |

| Settings | Fields | Default Value |
|---|---|---|
| Agent Mode | Monitoring mode | Advanced |
| Scan Settings | Scan Master Boot Record | Disabled |
| | Auto Scan New Systems When Added | Disabled |
| File Download Settings | Automatic File Download | Enabled |
| | Automatic Memory DLL Download | Enabled |
| | Signature | Exclude All Signed |
| | File Size Limit | 1 MB |
| Response Action Settings | Blocking | Disabled |
| | Network Isolation | Disabled |
| Endpoint Server Settings | Endpoint Server | The agent considers the default Endpoint Server that is configured during packager generation. |
| | Server Alias (Optional) | |
| | HTTPS Port | 443 |
| | HTTPS Beacon Interval | 15 Minutes |
| | UDP Port | 444 |
| | UDP Beacon Interval | 30 Seconds |

## Default Windows Log Policy

The following are the default Windows Log policy settings:

| Settings | Fields | Default Value |
|---|---|---|
| Windows Log Settings | Status | Disabled |
| | Protocol | TLS |
| | Send Test Log | Disabled |

## Default File Log Policy

The following are the default File Log policy settings:

| Settings | Fields | Default Value |
|---|---|---|
| File Log Settings | Status | Disabled |
| | Protocol | TLS |
| | Send Test Log | Disabled |

# Creating Groups and Policies

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

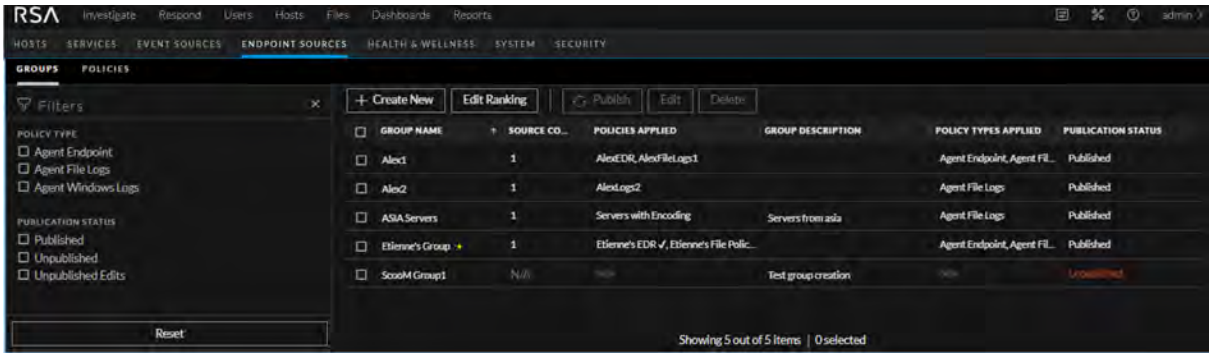
The following sections provide instructions on how to create groups and policies.

- Groups: Create a Group
- Policies:
  - Construct a Policy
  - Create an EDR Policy
  - Create a Windows Log Policy
  - Create a File Log Policy
  - Replace Windows SFTP Agents

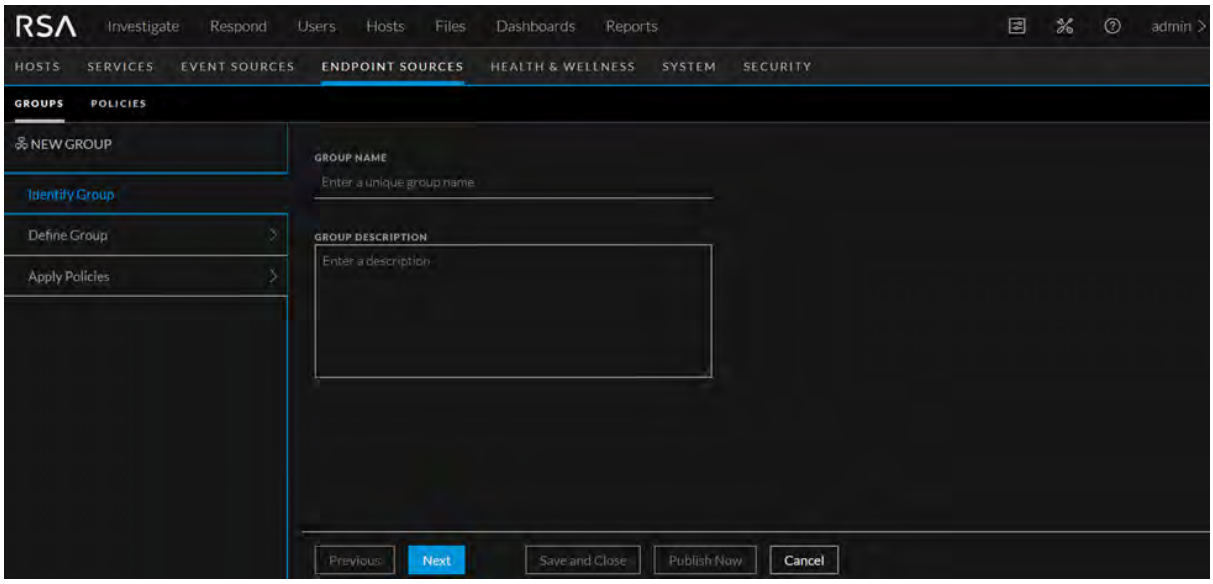
## Create a Group

To create a group:

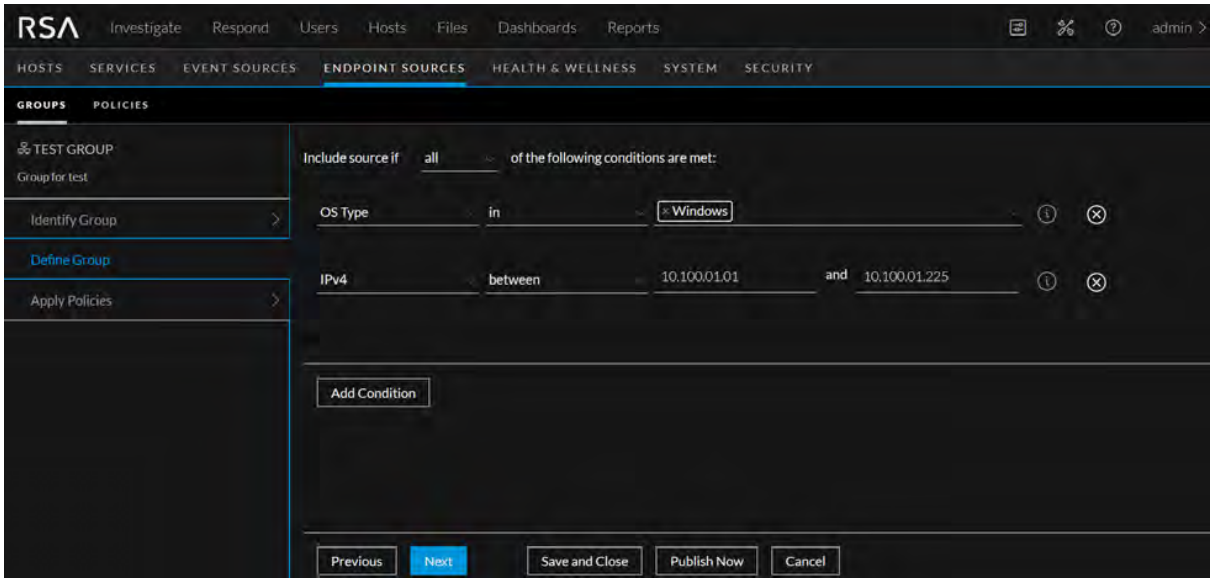
1. Go to **(Admin) > Endpoint Sources** view.
2. In the left panel, select the **Groups** tab.



3. In the toolbar, click **Create New**.
4. In the **New Group** panel, enter a group name and group description, and click **Next**.



5. Specify the logical statements that define the condition for an agent to be included in the group. Each logical statement consists of: parameter, operator, and values to match.



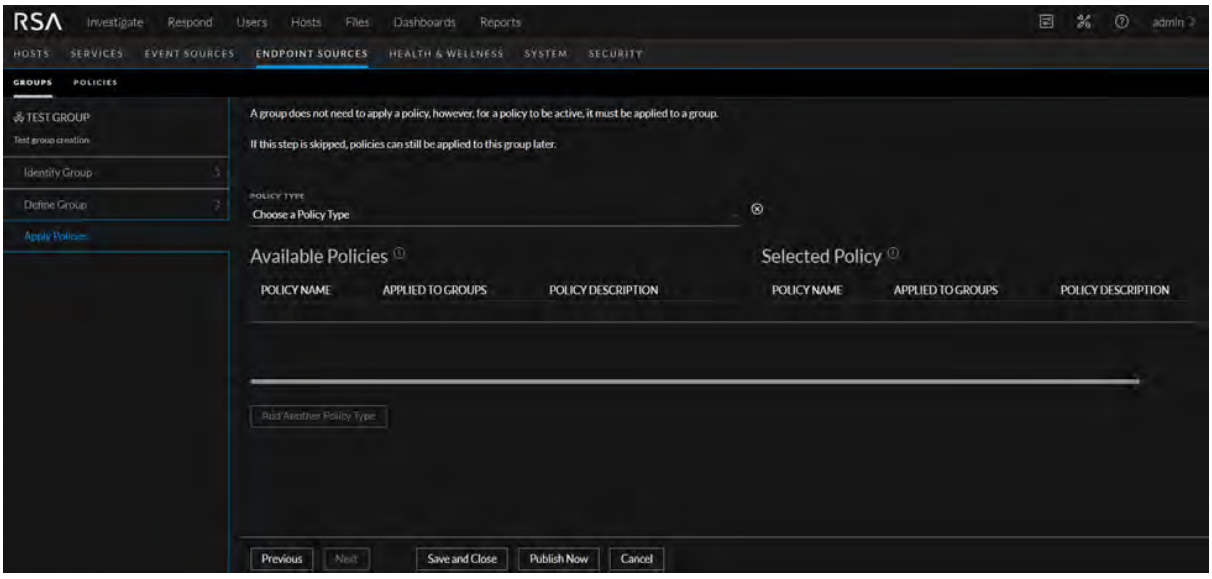
- In the **Include source if ___ of the conditions are met** field, select either **all** or **any**.
- For each logical statement, select the required options:

| Item | Description |
|---|---|
| Parameter | The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU or Tag.<br>• OS Type, OS Description, Host Name: The value you enter should reference hardware or virtual machines that are running endpoint agents.<br>• IPv4 or IPv6: Enter valid IP addresses as either ranges or as a set of IP addresses to include or exclude.<br>• Machine OU: Enter a valid Machine OU(Organizational Unit) name.<br>• Tag: Enter a valid tag that already exists.<br>**Note:** f you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP addresses separated by a space or a comma. |
| Operator | The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**. |
| Value or values to match | The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text.<br>**Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid. |

6. Continue adding conditions until you have completely specified the new group. After you have added all conditions, click **Next** to proceed.
7. (Optional) Click **Apply Policies** and select the source type from the drop-down list.

   Policies with the selected source type are displayed below **Available Policies**.

   Select a policy by clicking ⊕. Skip this step if you want to apply a policy to the group at a later time.



**Note:** You can attach only one policy per source type to a group. That is, you cannot attach more than one Agent Endpoint policy to a single group, nor more than one Agent Windows Logs policy.

For more information on creating policies, see Create an EDR Policy, Create a Windows Log Policy, or Create a File Log Policy.

8. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Groups view. The publication status is displayed as **Unpublished** in the Groups view.

     **Note:** You can select an unpublished group and click **Publish** to publish a group.

   - Click **Publish Now** to publish the group.

## Construct a Policy

When you create a policy, you should keep in mind the way groups and Agents can inherit values from other policies. The simplest way to construct a policy is to set values for all of the available settings for that policy type. If you do this, you can assign the policy to one or more groups, and all of the agents in those groups can receive the settings defined in the policy itself.

However, you do not need to set all possible available settings within a single policy. In the Group Ranking section, there are examples that show where values can come from, based on the ranking order.

**Note:** Remember that a group can have no more than one of each policy type assigned to it: it can be assigned 0 or 1 Agent Endpoint, Agent File Logs, and Agent Windows Logs policies.

If an agent is only a member of one group, that agent's settings are as follows:

- If a value is set in the policy assigned to the group, that value is used.
- If a value is not set in the policy assigned to the group, the value set in the default policy is used.

For agents that are members of multiple groups, it is a bit more complicated. For these agents, the settings are evaluated from highest priority member group (as set on the Edit Rankings page) to the lowest priority member group. If a parameter is set in a higher group, it is not overwritten, event if the same parameter is also set in a lower group. For example, assume an Agent is part of three groups:

- If a value is set in the highest ranked policy, the agent uses that value.
- If a value is not set in the highest ranked policy, but is set in the second-highest-ranked policy, the agent uses the value from the second-highest-ranked policy.
- If a value is not set in either the first- or second-highest ranked policy, but is set in the third-highest-ranked policy, the agent uses the value from the third-highest-ranked policy.
- If a value is set in the highest-ranked policy and either or both of the other policies, the value is taken from the highest-ranked policy.
- If a value is not set in any of the three policies assigned to the agent, the agent uses the value set in the default policy.

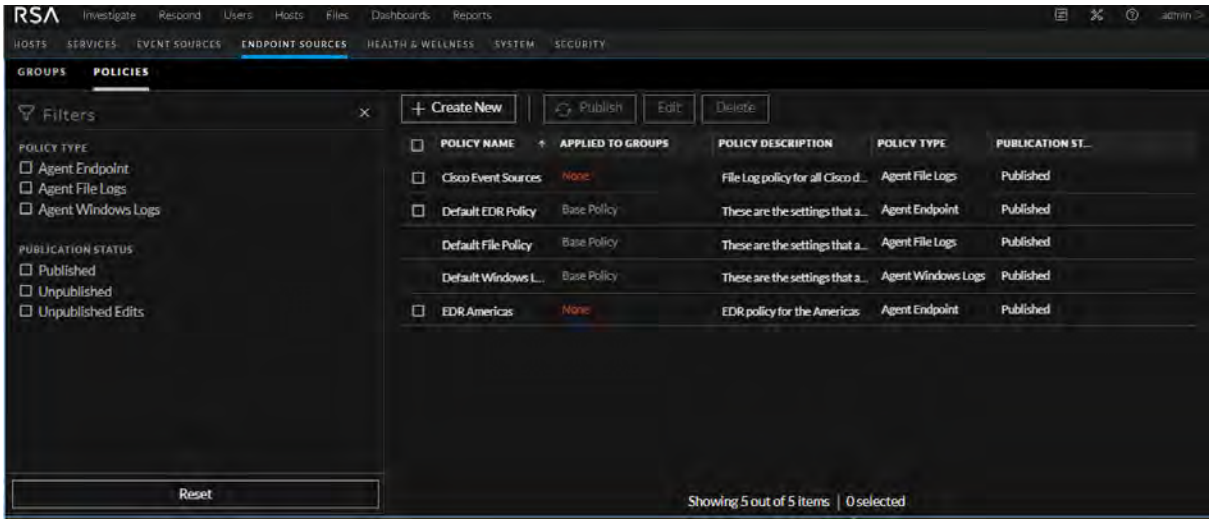
## Create an EDR Policy

While creating a policy, note the following:

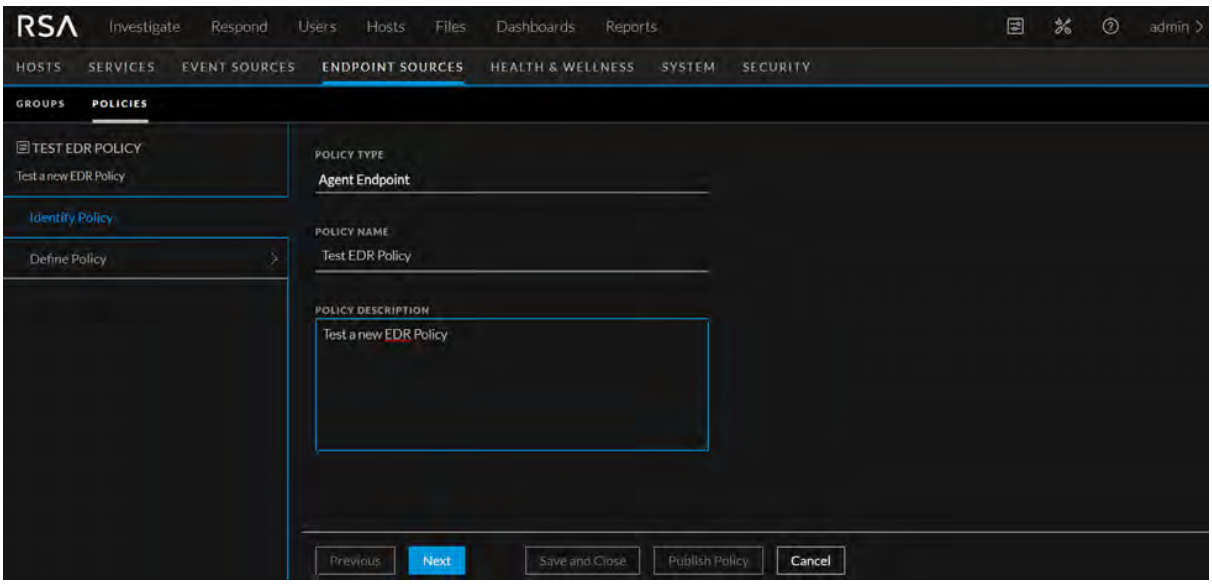
- Whenever you choose a setting, it is added to the **Selected Settings** panel.
- To clear any of your selected settings, click to remove that setting.
- At any point in the wizard, you can choose **Save and Close**, so that you can return to complete the policy at a later time.

### To create an EDR policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.



3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

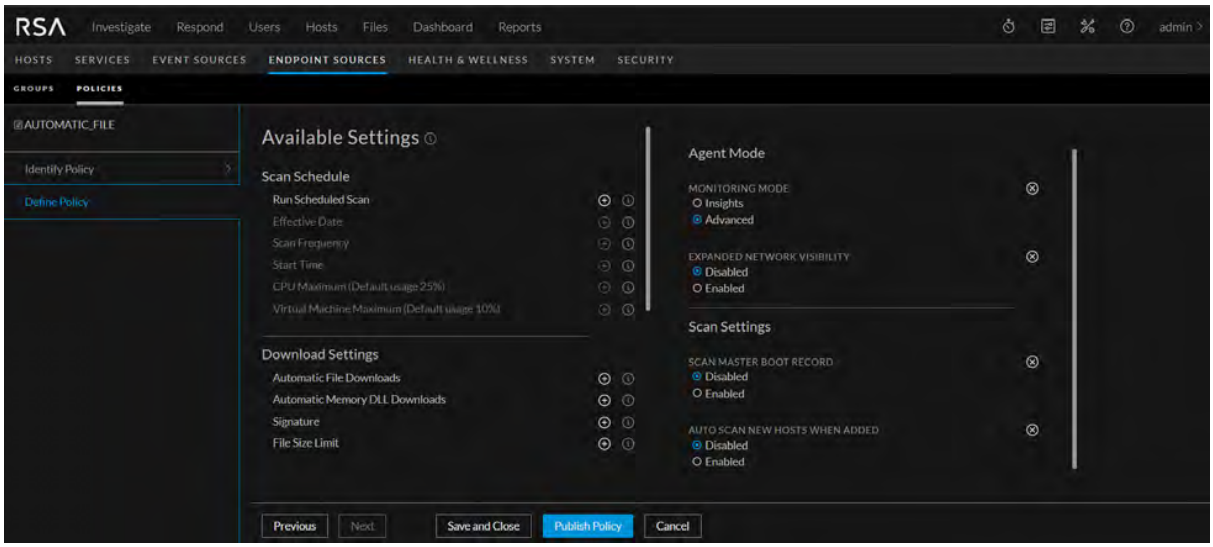


- Select **Agent Endpoint** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click to select a setting from list of **Available Settings**. After you click, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings. For details, see Define Policy Panel for Agent Endpoint Policy.

**Note:** You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- In the Scan Schedule category, enable **Run Scheduled Scan** to configure the scan, and set any of the available parameters based on your needs. For more details, see Define Policy Panel for Agent Endpoint Policy.
- In the **Agent Mode** category, you can set the following:
  - Select the monitoring mode of the agent - Insights or Advanced.
  - Select **Expanded Network Visibility**:

### Prerequisite

**Note:** For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for RSA NetWitness Platform*.

- To enable network tracking and monitoring on Windows hosts in Insights mode.

**Note:** Reports UDP connections for Windows 10 version 1803 in Insights mode.

- To optimize the frequency of agents sending network events for both Insights and Advanced modes.
- The endpoint agents should have the **Expanded Network Visibility** option enabled for enriched network events from NetWitness Platform packet deployment with endpoint data. In the **Events** View > **Hosts** tab, the endpoint data related to the network event selected will be automatically displayed if it exists. For more information, see "Host Information" in the *Investigate User Guide*.

**Note:** For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service is enabled.

- In the Scan Settings category, you can enable either or both of the following actions:
  - Enable **Scan Master Boot Record** to include Master Boot Record (MBR) details in scheduled scans.
  - Enable **Auto Scan New Systems When Added** to automatically queue a scan for any host that does not have any snapshot data
- In the Download Settings category, you can set the following:
  - Enable **Automatic File Downloads** to automatically download files based on the Signature and file size. By default this option is enabled.
  - Enable **Automatic Memory DLL Downloads** to automatically download all the memory DLLs that are detected during a scan. By default this option is enabled.
  - Select the **Signature** type to limit the download of files based on the signature (not available for Linux systems).
  - Specify the **File Size Limit** to limit the download of files based on the file size. The file size limit should be between 1 KB - 10 MB.
- In the Response Action Settings category you can enable or disable the following actions:
  - Enable **Blocking** to prevent the execution of a malicious file on any host.
  - Enable **Network Isolation** to provide an option to isolate a compromised host during investigation.
- In the Endpoint Server Settings, configure your server:
  - Add the Endpoint server that the agent will communicate from the drop-down list.

    **Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
  - (Optional) Enter an alternative hostname or IP address.
  - Enter the HTTPS port used for communication.
  - Specify the HTTPS beacon interval.
  - Enter the UDP port used for communication.
  - Specify the UDP beacon interval.

- **Advanced Setting** - For RSA Support staff only.

  **IMPORTANT:** It is strongly recommended not to use the Advanced Configuration unless advised to do so by RSA.

7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

## Create a Windows Log Policy

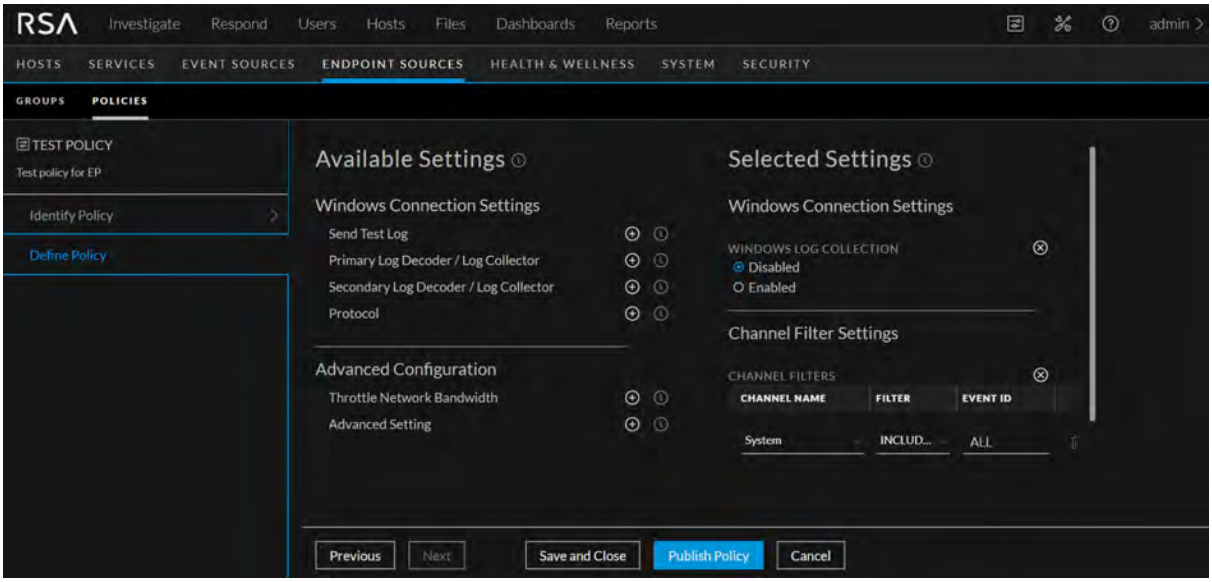
To create a Windows Log policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

   - Select **Agent Windows Logs** as the source type from the drop-down list.
   - Enter the policy name.
   - Enter a description for the policy.
5. Click **Next**.

6. Click to select a setting from list of **Available Settings**. After you click a setting it is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

**Note:** You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- Select **Windows Log Collection** to enable Windows Log collection. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward logs from the drop-down list.

  **Note:** When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TLS.
- Add **Channel Filters** and select the channels from which the logs are collected from the drop-down list. You can add or remove a channel filter and specify individual Event IDs.

- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness Platform. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For RSA Support staff only.

    **IMPORTANT:** It is strongly recommended not to use the Advanced Configuration unless advised to do so by RSA.

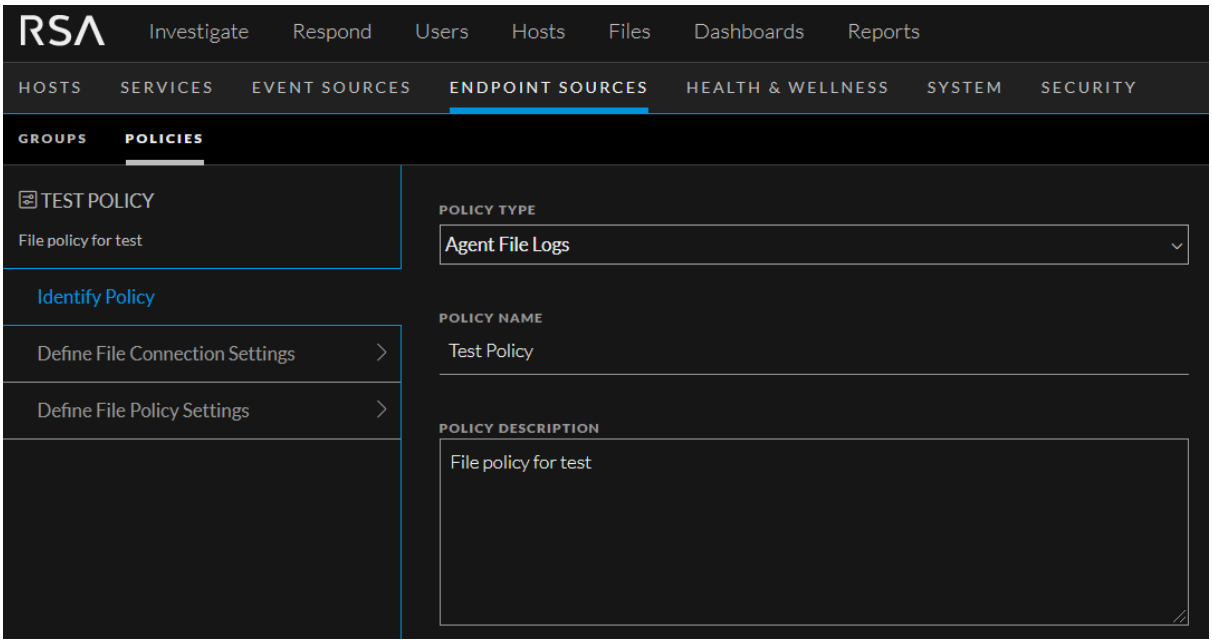
7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

## Create a File Log Policy

**Note:** You cannot create File Log policies while the system is in mixed mode. Until all Endpoint servers are updated to 11.4, the Agent File Logs options on the policy create, assign policy, and edit ranking pages are disabled.

### To create a File Log policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

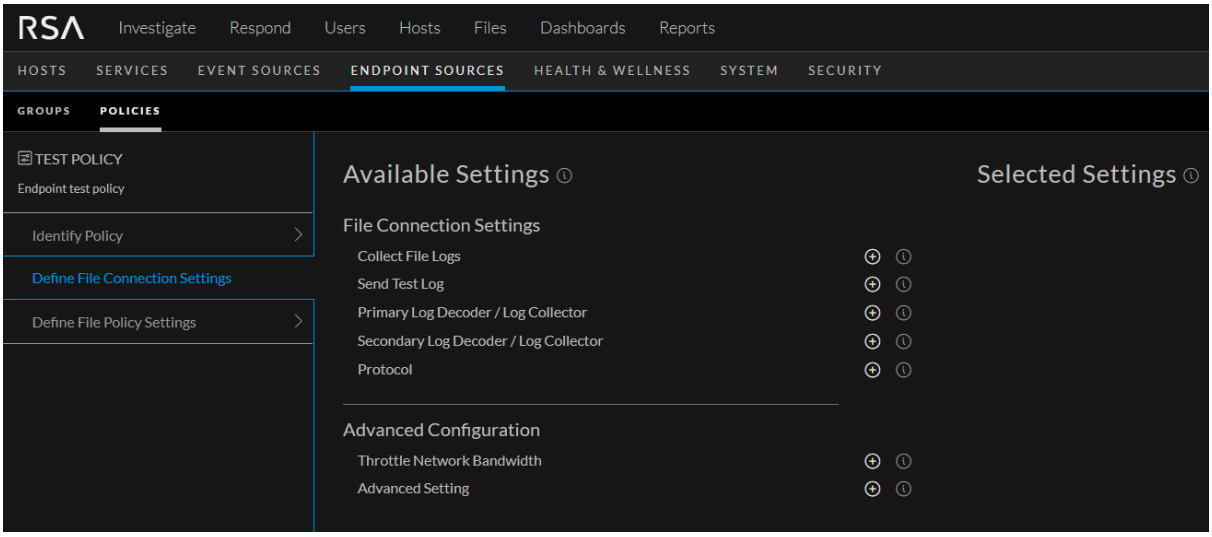


- Select **Agent File Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click to select a setting from list of **Available Settings**. After you click a setting, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

**Note:** You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- Enable **Collect File Logs** to collect file logs on endpoints assigned to this policy. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward file logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward file logs from the drop-down list.

  **Note:** When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

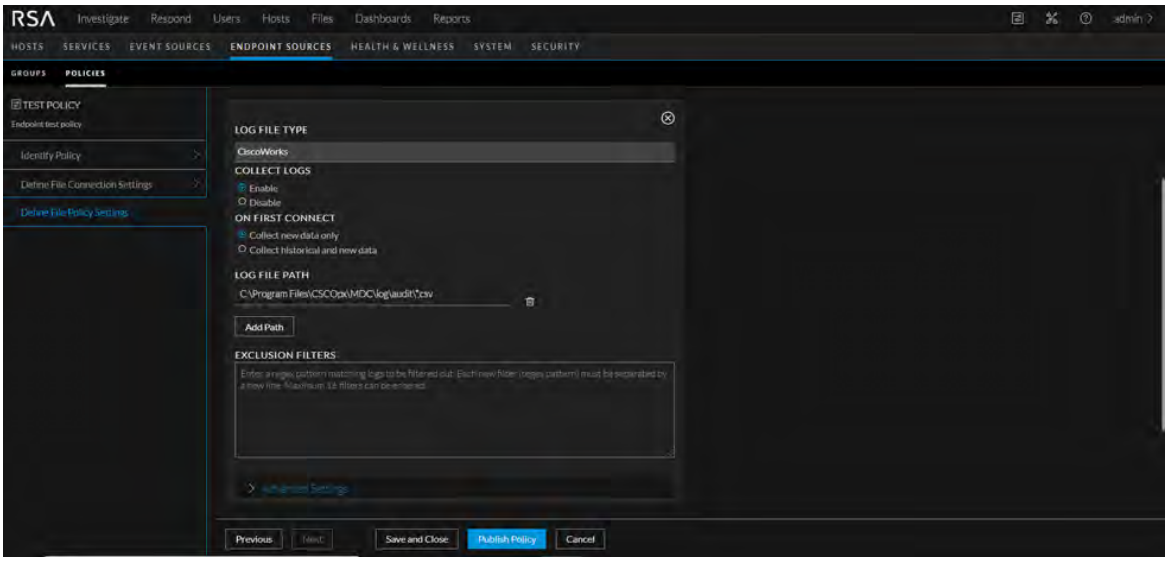
- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.
- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness Platform. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For RSA Support staff only.

    **IMPORTANT:** It is strongly recommended not to use the Advanced Configuration unless advised to do so by RSA.

7. Click **Next**, and add the file type or types for the policy.
   a. Select a log file type from the list, then click **Add Selected File Type** to configure its log collection settings.

   For a list of currently supported event source types, see Endpoint Sources - Policies.

   b. Choose values for the available parameters.



- **Collect Logs**: Select **Enable** or **Disable**.
- **On First Connect**: Choose whether or not to collect older, historical data, or just new data. The default setting is to collect new data only.

  **Note:** New data is data that is collected starting from when you configure log collection for the specified event source.

- (Optional) **Log File Path**: Add a path for where the log files are stored. This is only necessary if the log files are not stored in the standard directory for the selected event source type. To add a path, click **Add Path** and enter a pathname.

  **Note:** This can be a Universal Naming Convention (UNC) pathname. (`\\host-name\share-name\file-path`).

  Click **Add Path** again to add another path. You can add as many paths as you like.

- **Exclusion Filters**: You can enter a newline-separated list of exclusion filters, which specify log files from which RSA should not be collecting data.

  **Note:** The filter needs to be entered as a valid regex string, or the system will not allow you to save it.

- Advanced Settings: note that most users do not need to set these parameters.
  - **Source Alias**: For most installations, this value is not needed. Use this to specify a unique event source name, in the case you have multiple event sources of the same type, for example two IBM WebSphere MQ event sources in the same NetWitness Platform installation.
  - **File Encoding**: Select a type of file encoding. You can choose from a wide variety of encodings. The default value is **UTF-8/ASCII**.

For more details on the available parameters, see Panels for Log File Policy.

c. You can add more file types to the policy. After you have added all your file types, proceed to the next step.

8. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

## Replace Windows SFTP Agents

Note that you might want to replace the SFTP Agent for Windows with the NetWitness Platform Endpoint Agent for collection from file event sources. If so, perform the following procedure:

1. Using the File Collection Policy wizard (as described below), configure file collection for your event sources.
2. Verify that collection is working.
3. On each of your event sources, stop the SFTP service.

# Managing Groups

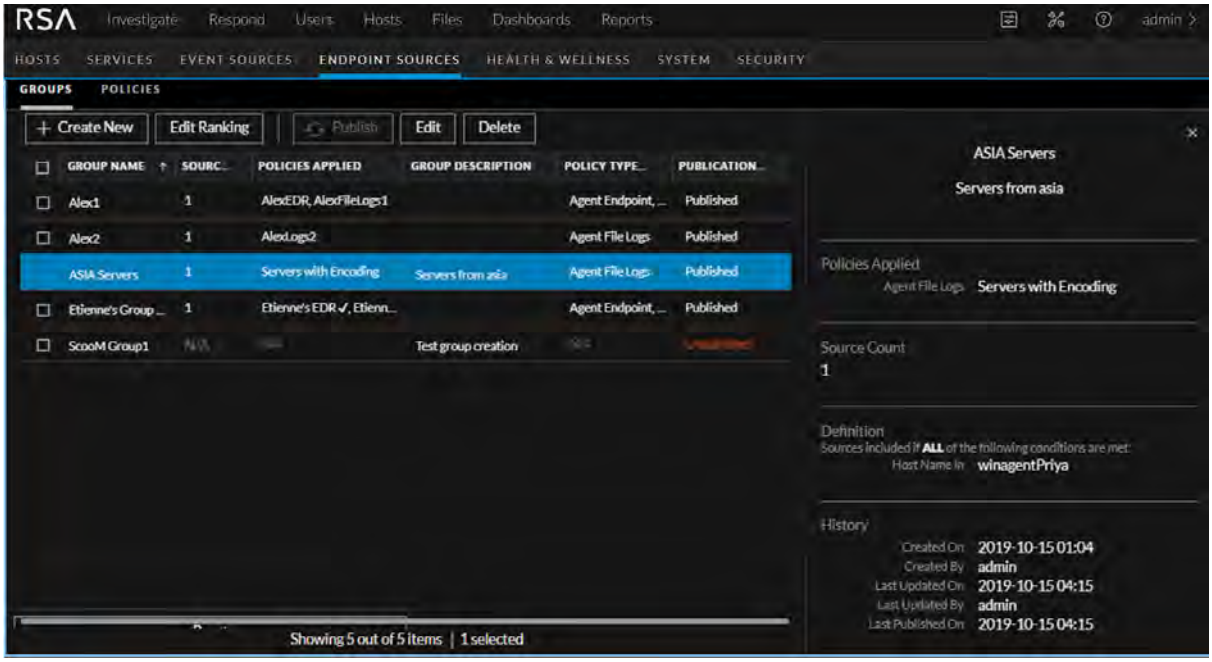
**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

You can view group details, edit group details, filter endpoint groups, delete groups, and edit group ranking. For details on how to create groups, see Create a Group.

## View Group Details

To view properties of the selected group:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Groups** tab. The details, such as group name, source count, policies applied, group descriptions, source type applied, and publication status are displayed. For more details on these columns, see Endpoint Sources - Groups.
3. Click the row to view the properties in the right-panel.



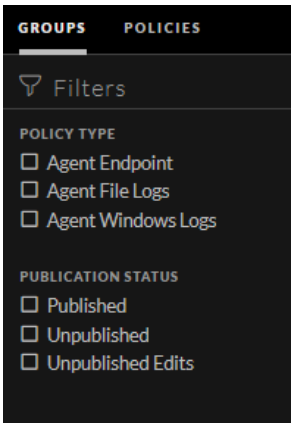
## Filter Endpoint Groups

The Filters Panel allows you to filter the list of displayed groups, based on the one of the following source type:

- Agent Endpoint
- Agent Windows Logs

Additionally, you can sort based on publication status:

- Published - Groups that are published to use.
- Unpublished - Groups that are saved but not published.
- Unpublished Edits - Groups that are previously published and edited later and saved, but not published.



The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filter criteria.

## Edit a Group

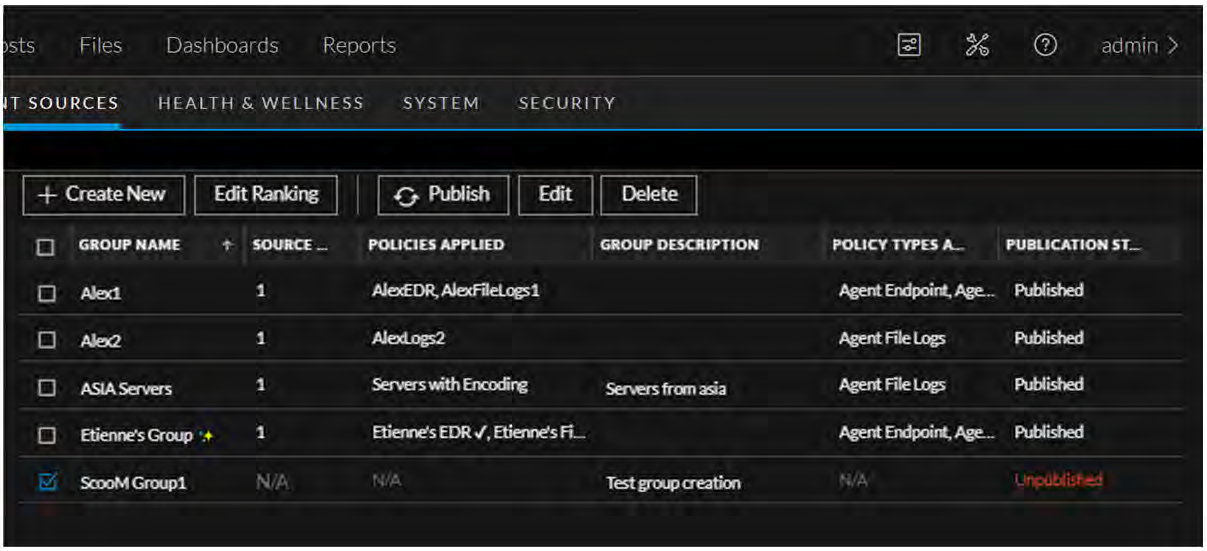
You can edit the properties of the group at any point in time. To edit properties of a group:

1. Go to **(Admin) > Endpoint Sources**.
2. Select a group and click **Edit**.
3. Edit the group details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Groups view. The group will be listed under the **Unpublished Edits** category.
   - Click **Publish Now** to publish the changes.

## Delete a Group

To delete a group:

1. Go to **(Admin) > Endpoint Sources**.
2. The **Groups** tab and available groups are displayed.



3. Select one or more groups and click **Delete**.
4. Click **Delete**. The confirmation message is displayed.
5. In the Delete Groups dialog, click **Delete Group(s)** to permanently delete the selected groups.

# Managing Policies

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

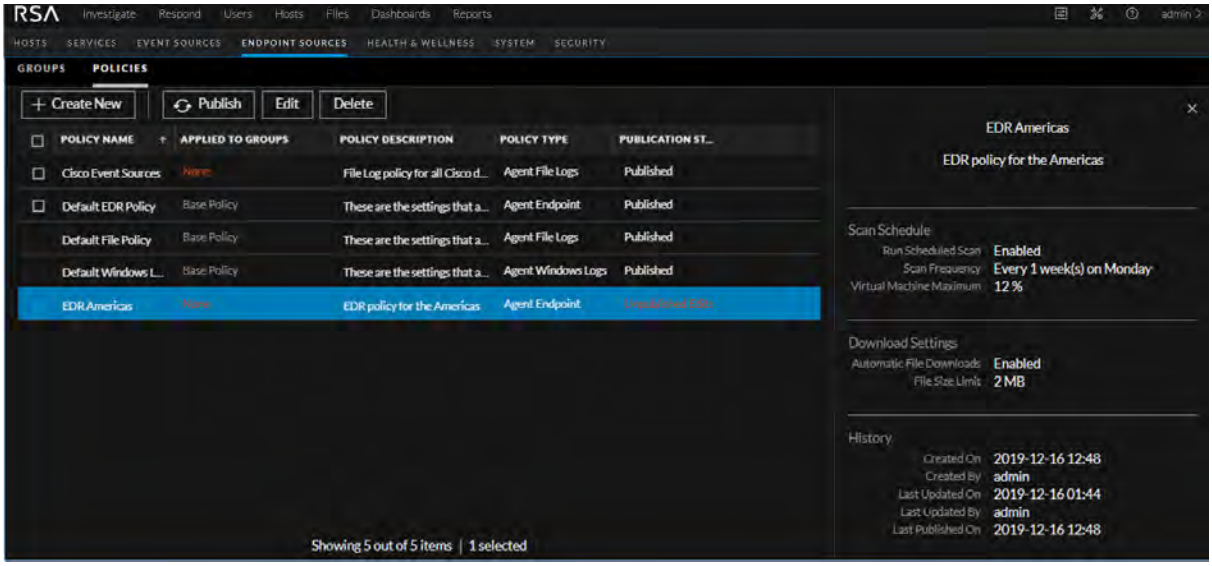
You can view, edit, filter, and delete policies, as detailed in the following sections:

- View Policy Details
- Filter Policies
- Edit a Policy
- Delete a Policy
- Conflict Resolution

## View Policy Details

To view properties of the selected policy:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Policies** tab. The details, such as policy name, applied to groups, policy description, source type, and publication status are displayed. For more details on these columns, see Endpoint Sources - Policies.
3. Click the row to view details about selected policy in right pane.



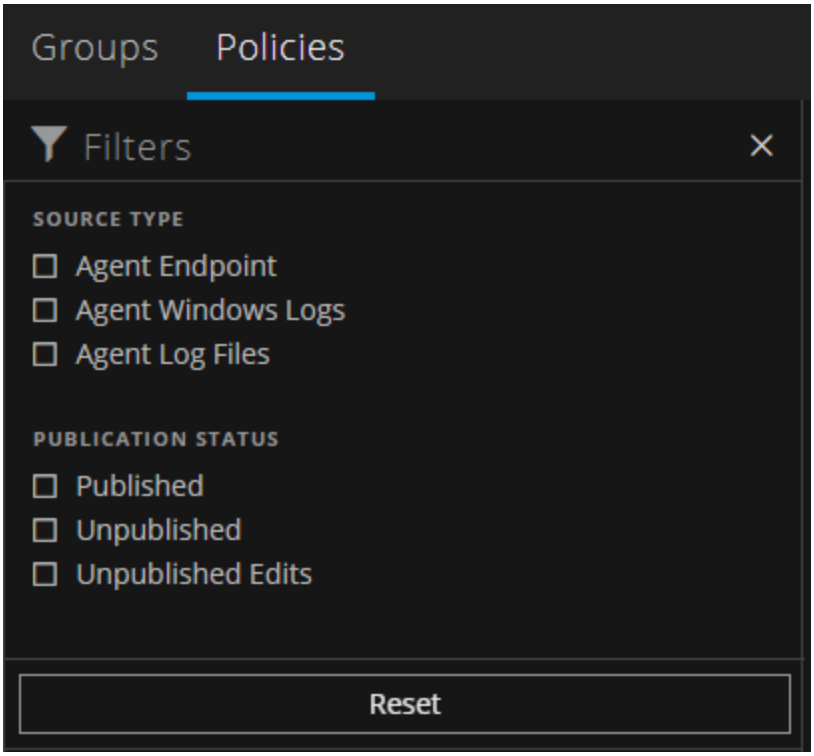
## Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the source type. You can filter on any combination of the following:

- Agent Endpoint
- Agent File Logs
- Agent Windows Logs

Additionally, you can filter based on publication status:

- Published: Policies that are published to use.
- Unpublished: Policies that are saved but not published.
- Unpublished Edits: Policies that are previously published and edited later and saved, but not published.



The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filtering criteria.

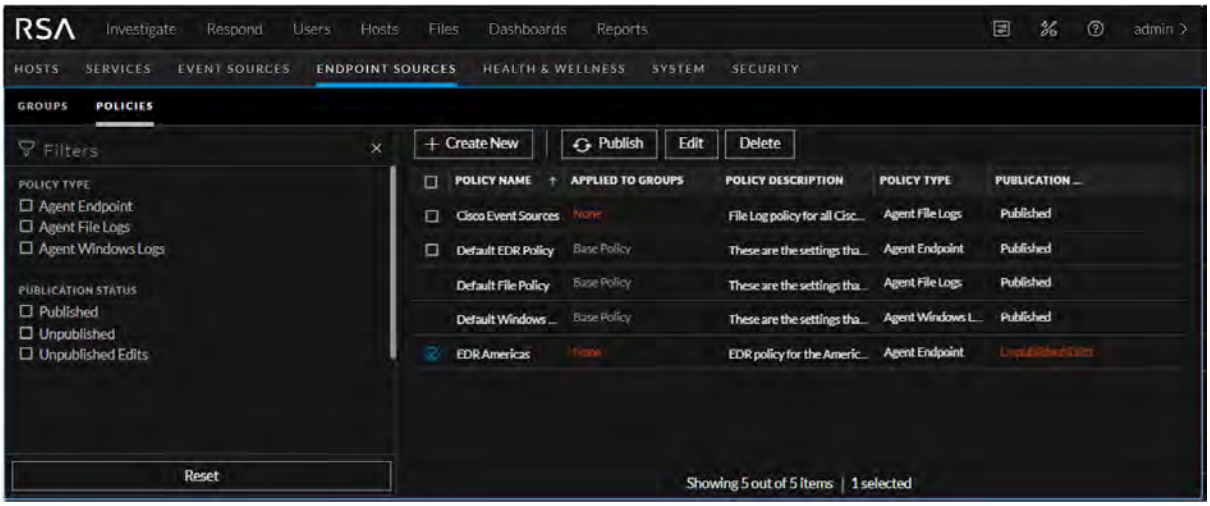
## Edit a Policy

You can edit the settings of the default Agent Endpoint and custom policies. The default Agent Windows Log policy cannot be edited.

**Note:** For the default EDR policy, you cannot edit the source type, policy name, and policy description. However, you can edit the details in the Define Policy panel.

To edit a policy:

1. Go to **(Admin) > Endpoint Sources**, and select the **Policies** tab.
2. Select a policy and click **Edit**.

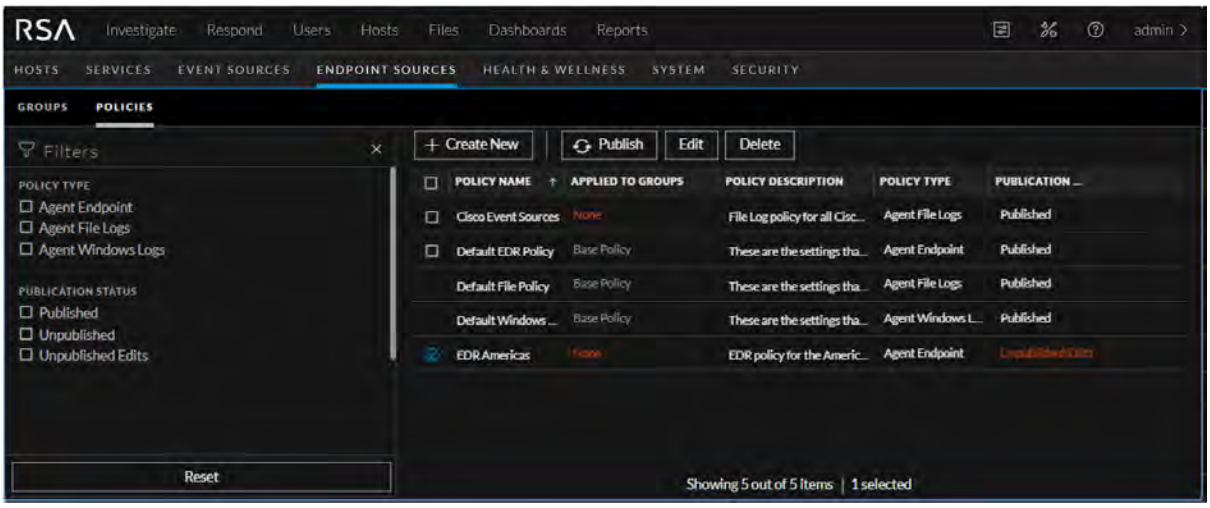


3. Edit the policy details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Policies view. The policy will be listed under the **Unpublished Edits** category.
   - Click **Publish Policy** to publish the changes.

## Delete a Policy

To delete a policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click the **Policy** tab. The available policies are displayed.



3. Select one or more policies and click **Delete**.

   The confirmation message is displayed.

4. In the Delete Policies dialog, click **Delete Policy(ies)** to permanently delete the selected policies.

## Conflict Resolution

An endpoint can be in more than one group, and can thus have more than one Agent Endpoint, Agent File Logs, or Windows Logs policy applied to it. In this case, there may be conflicting settings that could be applied to the endpoint.

For example, an endpoint that is in two Groups could have two, different File Log policies applied to it. In this case, some of the settings could have conflicting values. The value that is actually applied to the endpoint is determined by the highest-ranked policy that contains a value for that setting.

For example, assume there is an endpoint that has 2 Agent File Log policies applied to it:

- LF Policy One: Log File Type is webgateway, and **File Encoding** is set to UTF-8
- LF Policy Two: Log File Type is webgateway, and **File Encoding** is set to Local Encoding

How NetWitness Platform assumes the webgateway logs are encoded is dependent upon which policy is ranked higher:

- If Policy One is ranked higher than Policy Two, NetWitness Platform treats the logs as having UTF-8 encoding.
- If Policy Two is ranked higher than Policy One, NetWitness Platform treats the logs as having Local Encoding.

For an example using EDR policies, see Simulation Examples, which shows how you can preview the settings that would be applied before actually changing any policy rankings.

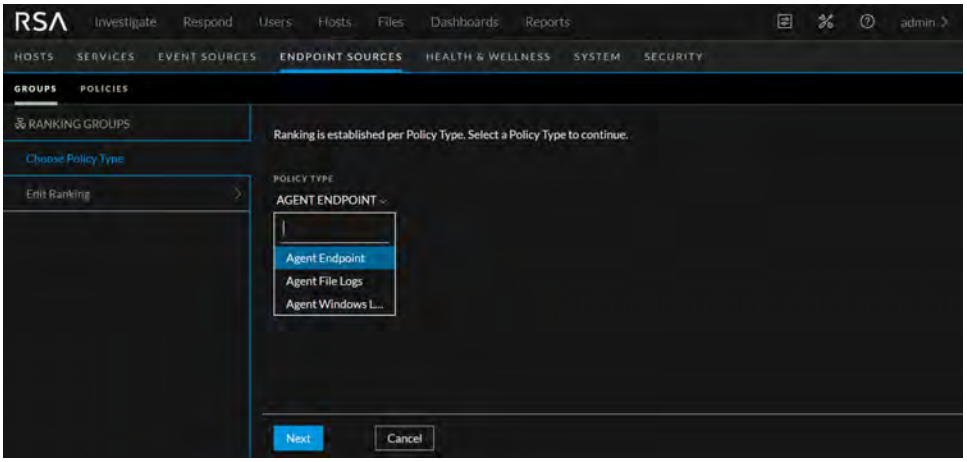
# Change Policy Ordering for Groups

An endpoint agent can be included in multiple groups. And these groups can have different policies applied to them. In this case, you can edit the ordering or ranking of policies, to specify a hierarchy for your policies.

## Edit Ranking

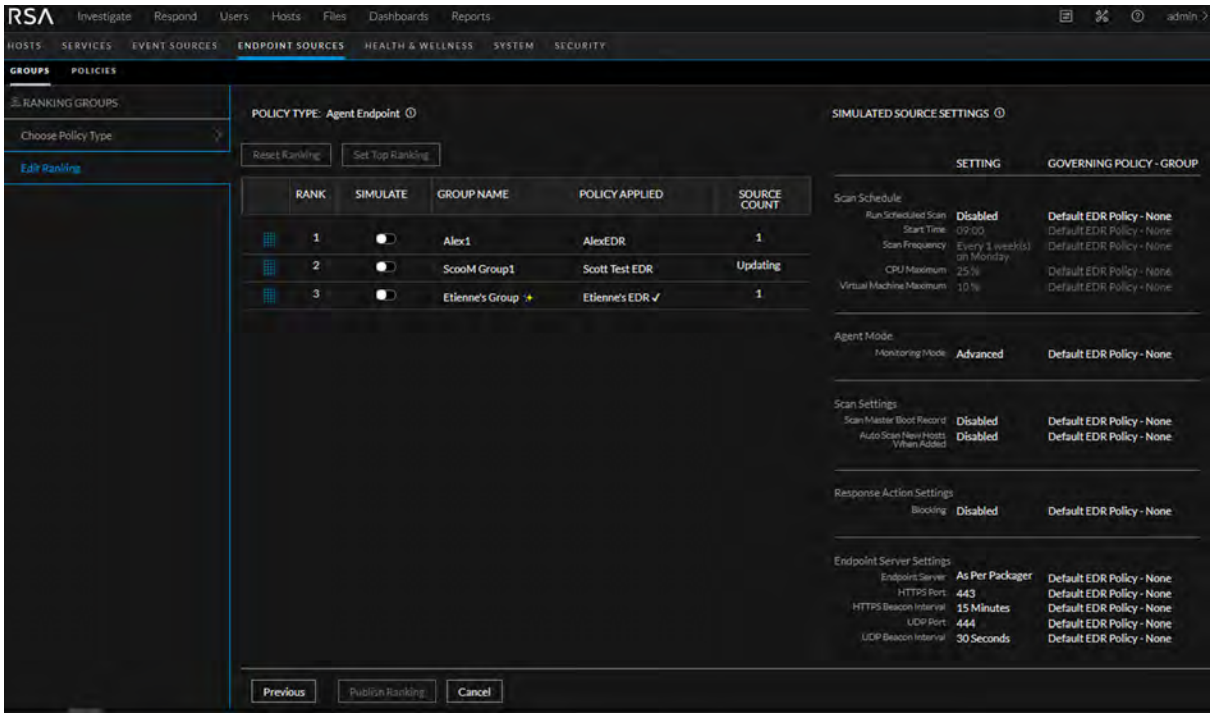
### To edit the ordering or ranking of a group:

1. Go to **(Admin) > Endpoint Sources**.
2. Select the Groups tab and click **Edit Ranking**.
3. Select one of the following source type for the drop-down list:
   - **Agent Endpoint** to rank the groups associated with Agent Endpoint type policies.
   - **Agent Windows Logs** to rank the groups associated with Agent Windows Log type policies
   - **Agent Log Files** to rank the groups associated with agents that are using File Collection.



4. Click **Next**.

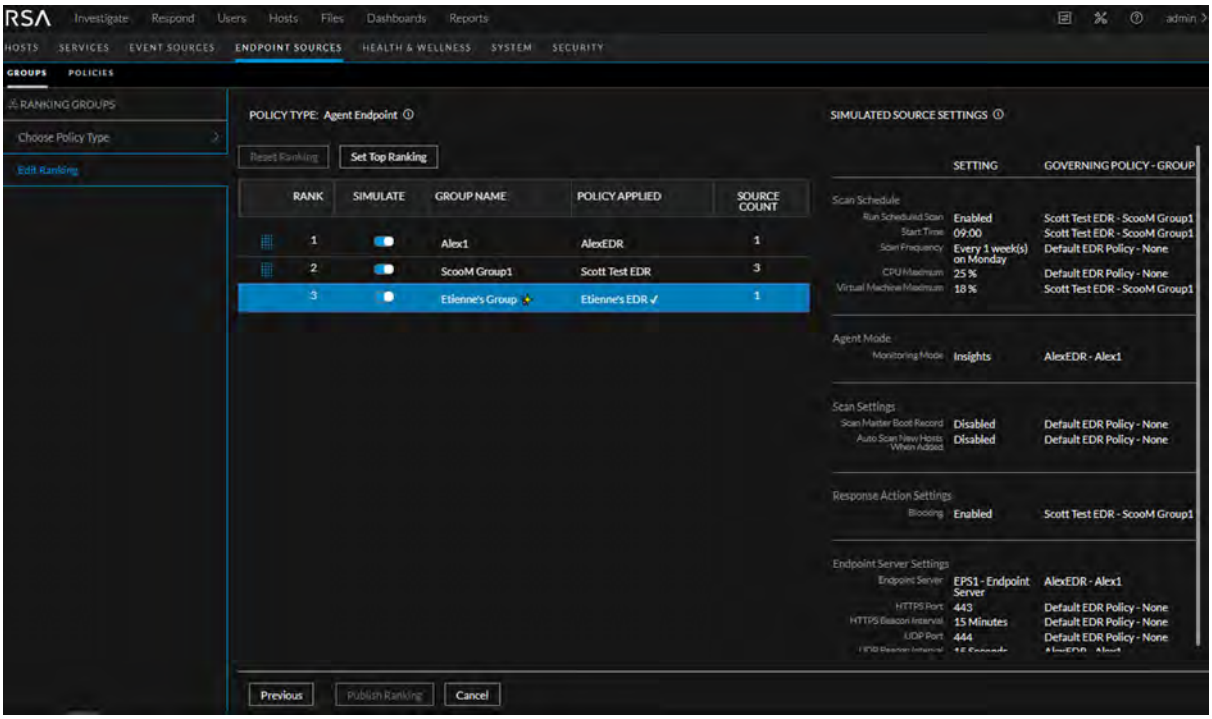
   The Ranking view is displayed:



You can simulate your policy settings and how they affect the endpoints within their groups. This gives you the ability to preview how your changes to the ranking will affect the policy settings applied to each hypothetical agent.

5. You can manipulate the sliders to simulate different options. You can select the slider in the **Simulate** column for each group into which a hypothetical agent would fall, and drag it to the right to simulate turning on that policy.

   This image shows all policies being simulated:



6. Reorder your groups as necessary.
   a. Select anywhere within a group's row.
   b. Drag the group up or down to change the priority. Priority decreases from top to bottom.
   c. Repeat moving groups until they are ordered as you prefer.

   **Note:** To move any group to the top, select the group and click **Set Top Ranking**.

7. As you change the rankings for your groups, you can preview how the policy settings would change based on your new rankings. For example, assume each of the following scenarios:
   - If you have a hypothetical agent that belongs in group 1, simulate only group 1 to see which policies would affect that agent.
   - If you have a hypothetical agent that belongs in group 1 and group 2, simulate both group 1 and group 2 to see how policies would be applied for that agent.
8. After you have specified the optimal ranking order, you can publish the new ranking.

## Simulation Examples

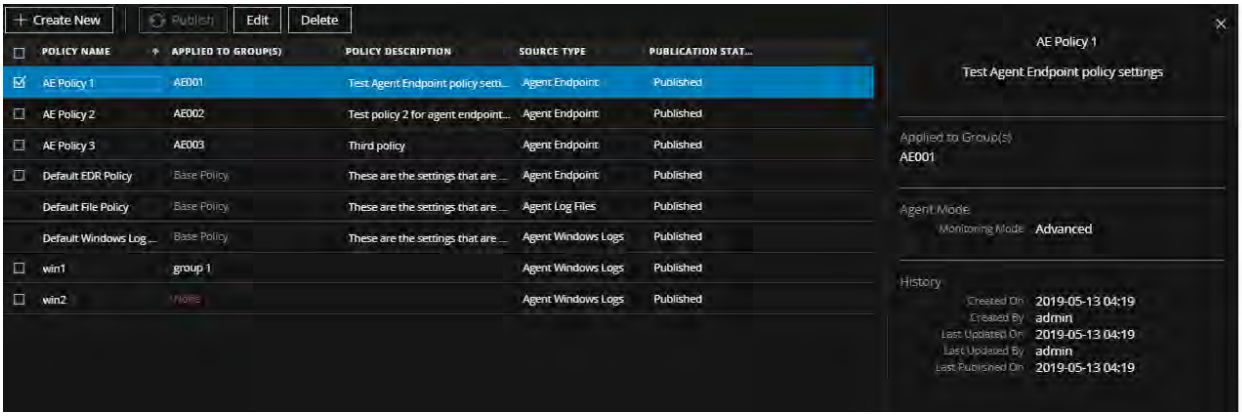
This section contains simulation examples for Agent Endpoint policies and Agent Log policies. Note that Windows policies have the same behavior as Agent Endpoint policies.

## Agent Endpoint Policies Examples

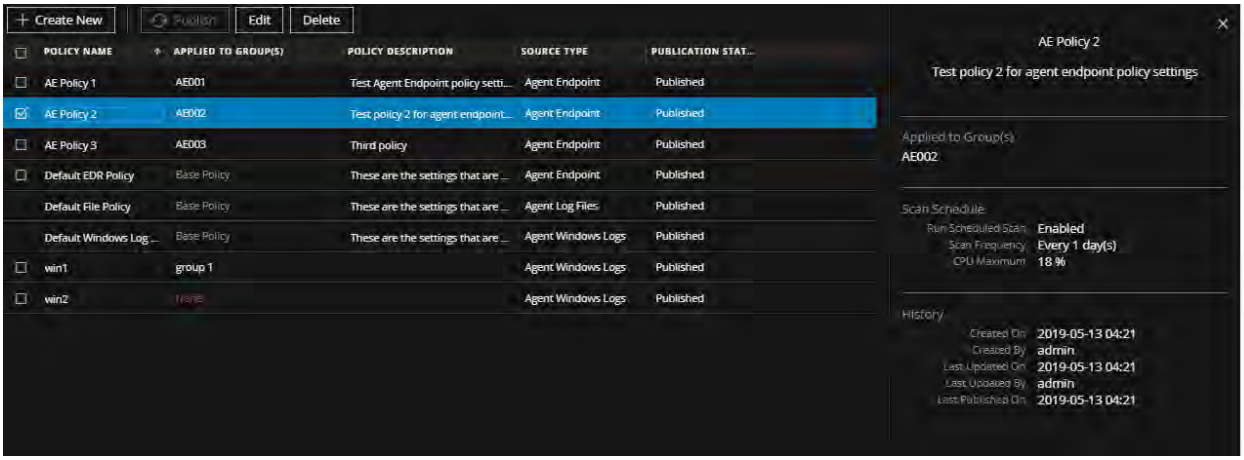
The **Simulated Source Settings** panel shows each individual policy setting, along with the governing policy for each setting.

Examine **AE Policy 1**, **AE Policy 2** and **AE Policy 3** to see which values are set in those policies.

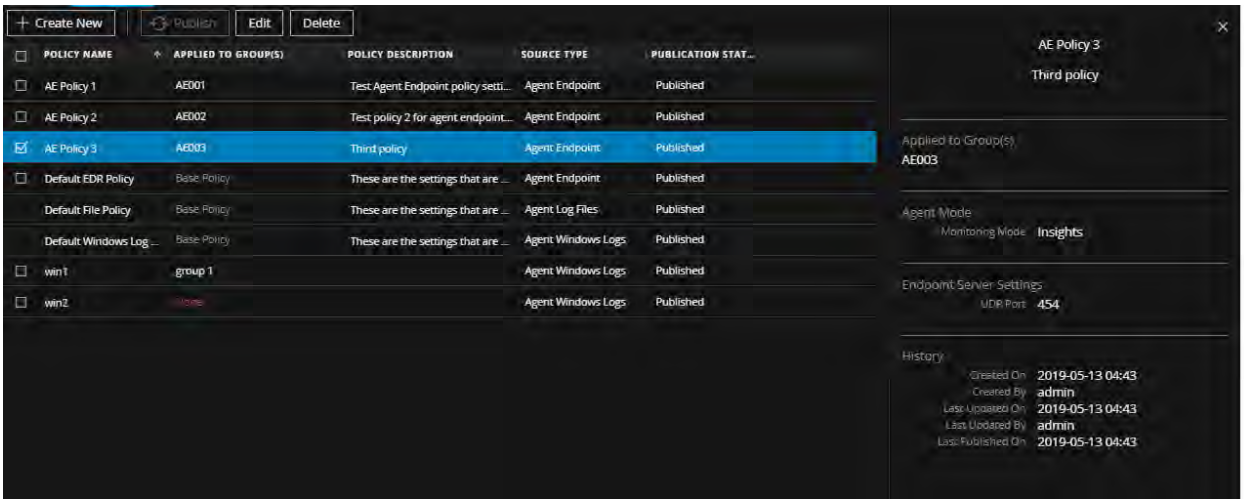
**AE Policy 1** has Agent Mode set:



**AE Policy 2** has a scan schedule set, as well as limiting the CPU maximum to 18%:

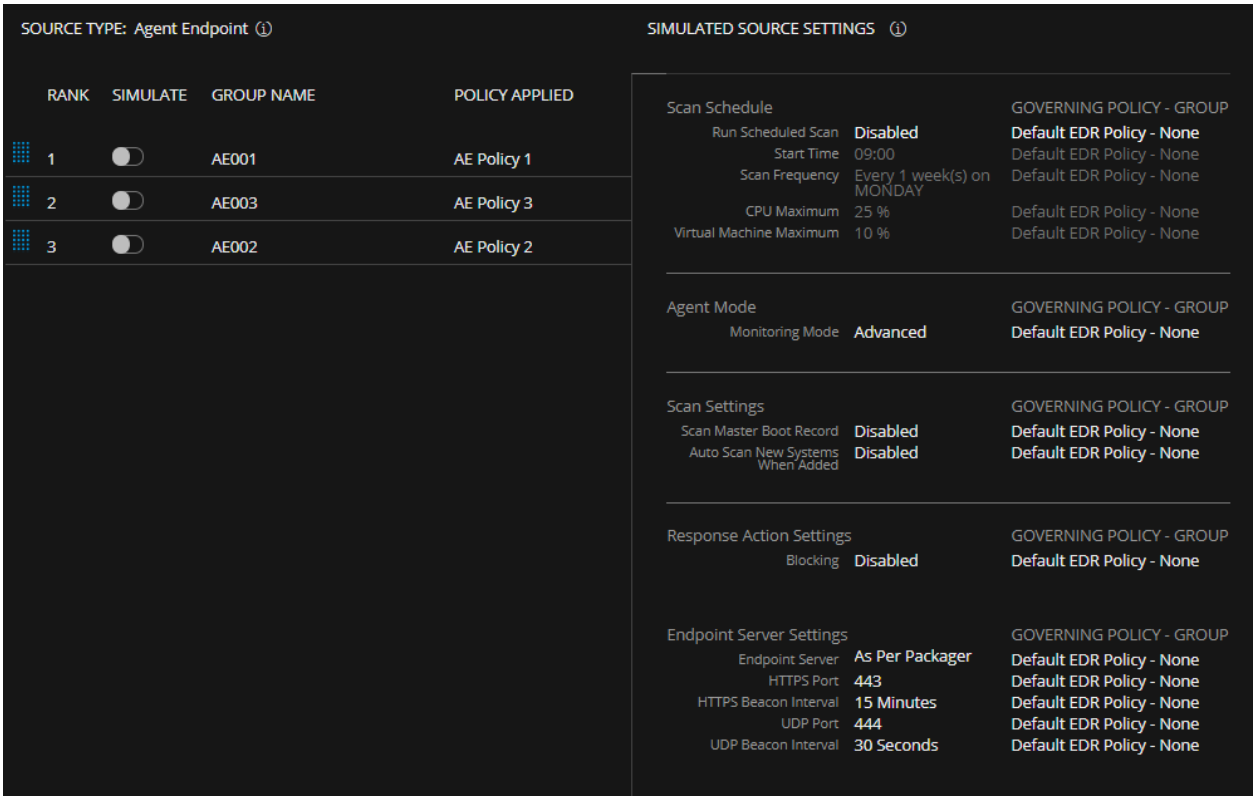


**AE Policy 3** has Agent Mode set (to **Insights**), and sets the UDP Port to **454**:



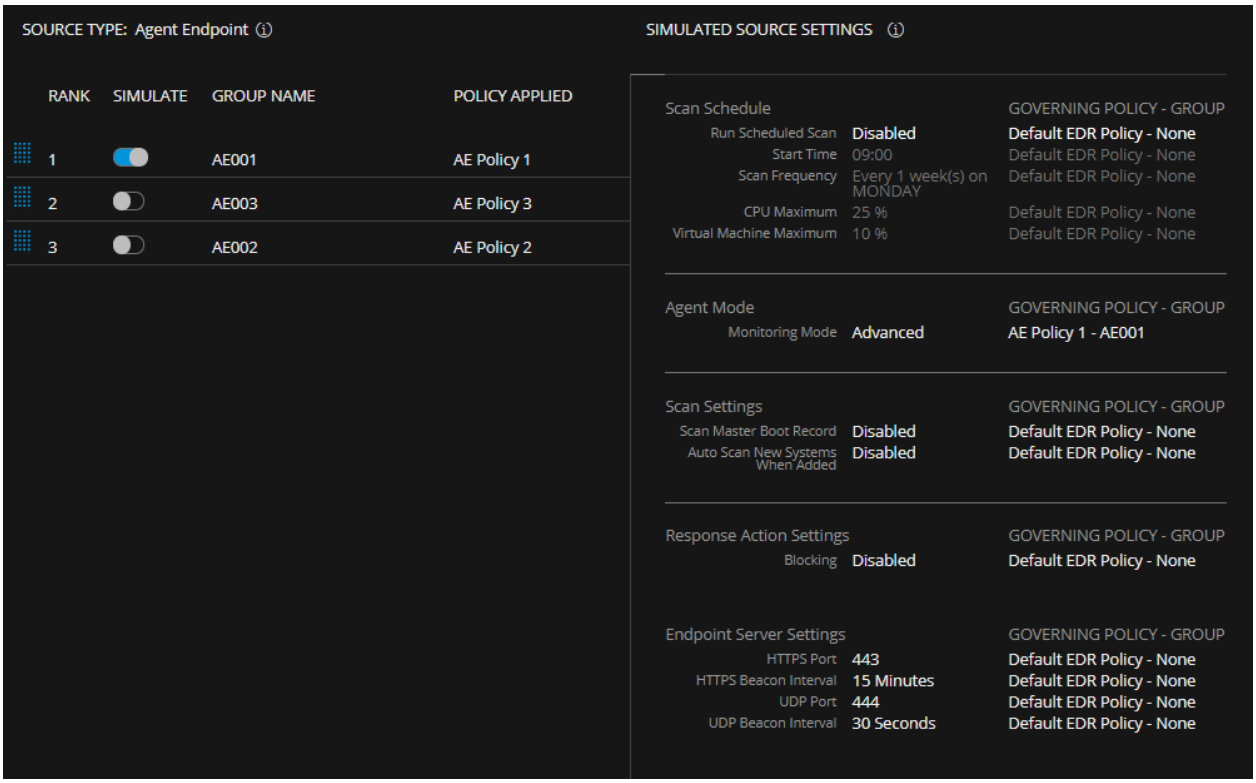
### No Settings Applied

When none of the policies are simulated, you can see that the Default EDR Policy governs all behavior.



### Simulate a Single Policy

When you select the AE001 Group, you can see that the values set in AE Policy 1 govern the behavior Agent Mode, as well as the Default EDR Policy being used for all unset parameters.



### Simulate Multiple Policies

When you select multiple groups and policies, you can see the effects of each policy, based on the current ranking.

You can see that Agent Mode is set to **Insights**: this is because **AE Policy 3** is ranked above **AE Policy 1**, so the higher ranked policy's setting is used. None of the other parameters are set in more than a single policy, so for those, each policy's setting is used. Since **AE Policy 1** only has Agent Mode set—and **AE Policy 3** ranks higher and sets a different value—**AE Policy 1** does not govern any of the EDR settings. And finally, for parameters not set in any of the simulated policies, the Default EDR Policy settings are used.

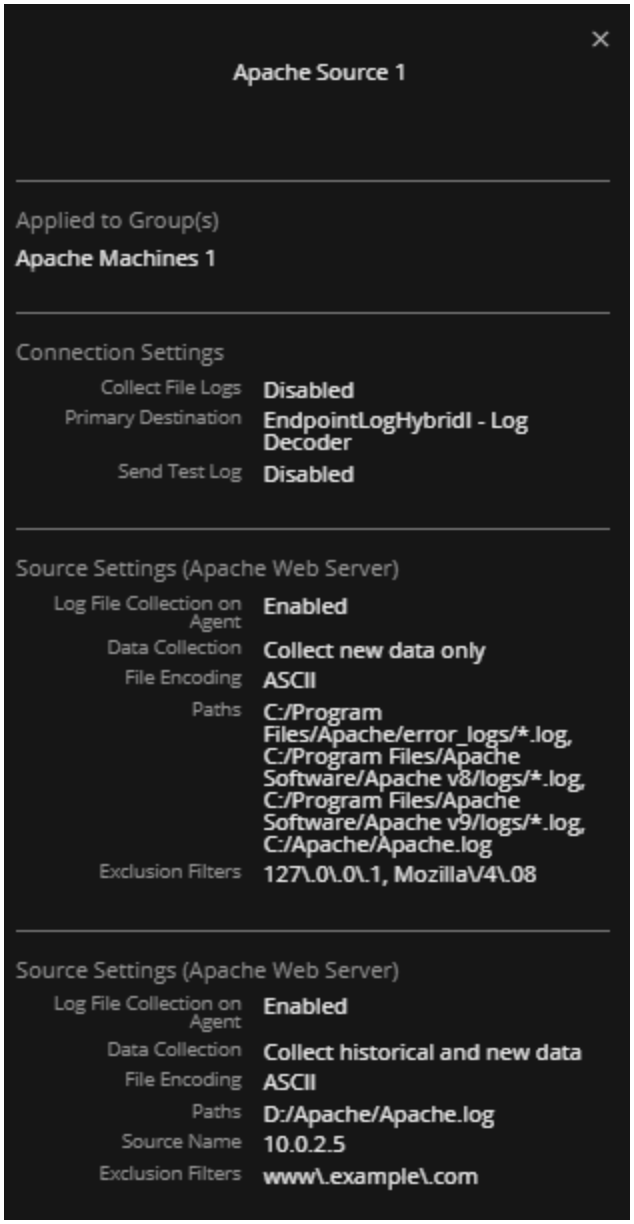
## File Log Policies Simulation Example

The collection of parameter values into a complete policy works a bit differently for File Log policies than for EDR or Windows policies. To determine which values are applied from which policies, note the following:

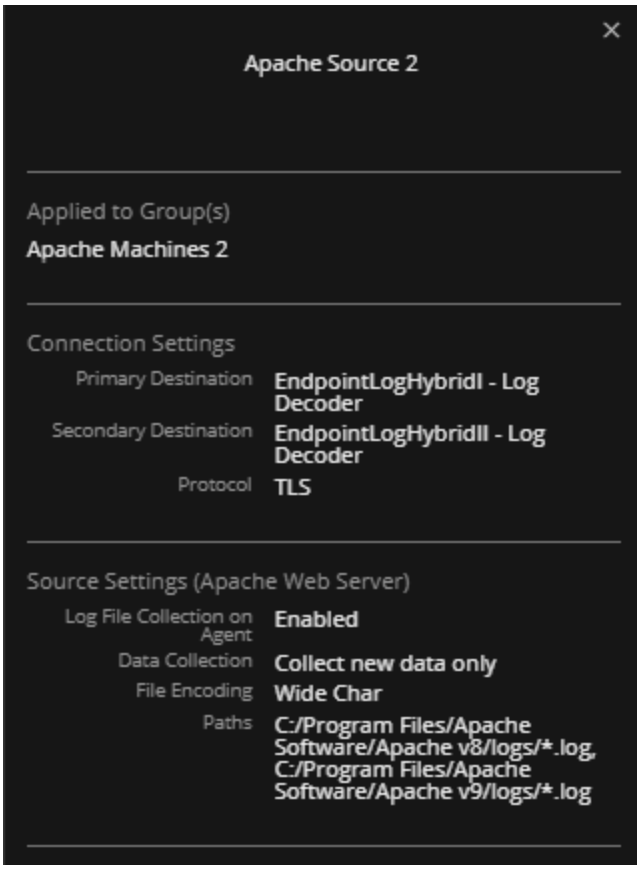
- Each event source type acts as a separate setting. That is, if a policy has values for both Apache and RSA Access Manager, for example, each of those event source types is treated as a separate set of values.
- When an endpoint inherits values, it might not only get values from the highest ranked policy that has a value set. It might, for example, inherit Apache values from one policy, and RSA Access Manager settings from another.
- If you consider a set of File Log policies that all include settings for the same event sources, then they behave the same as EDR and Windows policies.

Consider the following example, where there are three log file policies—two with Apache source types and one with MS SQL event source type.

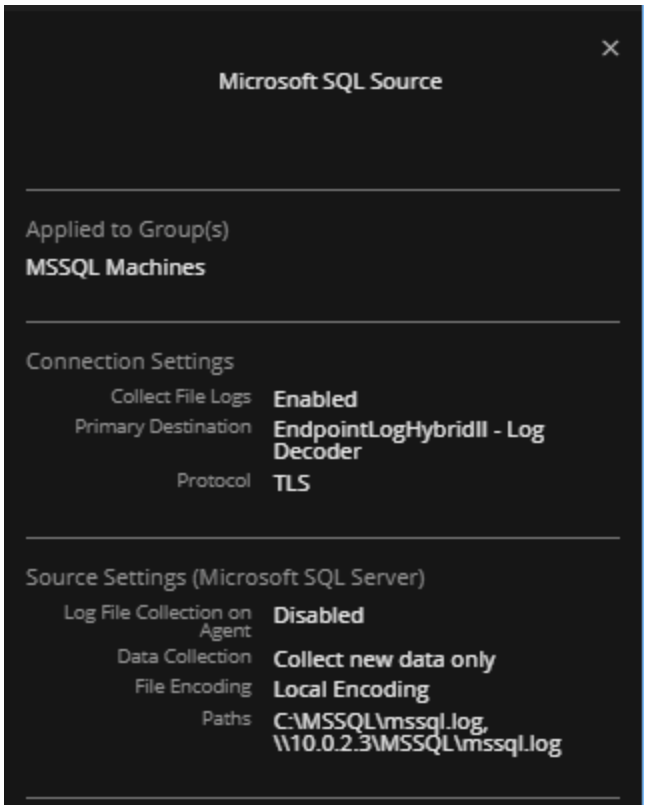
- File policy **Apache Source 1**:



- File policy **Apache Source 2**:

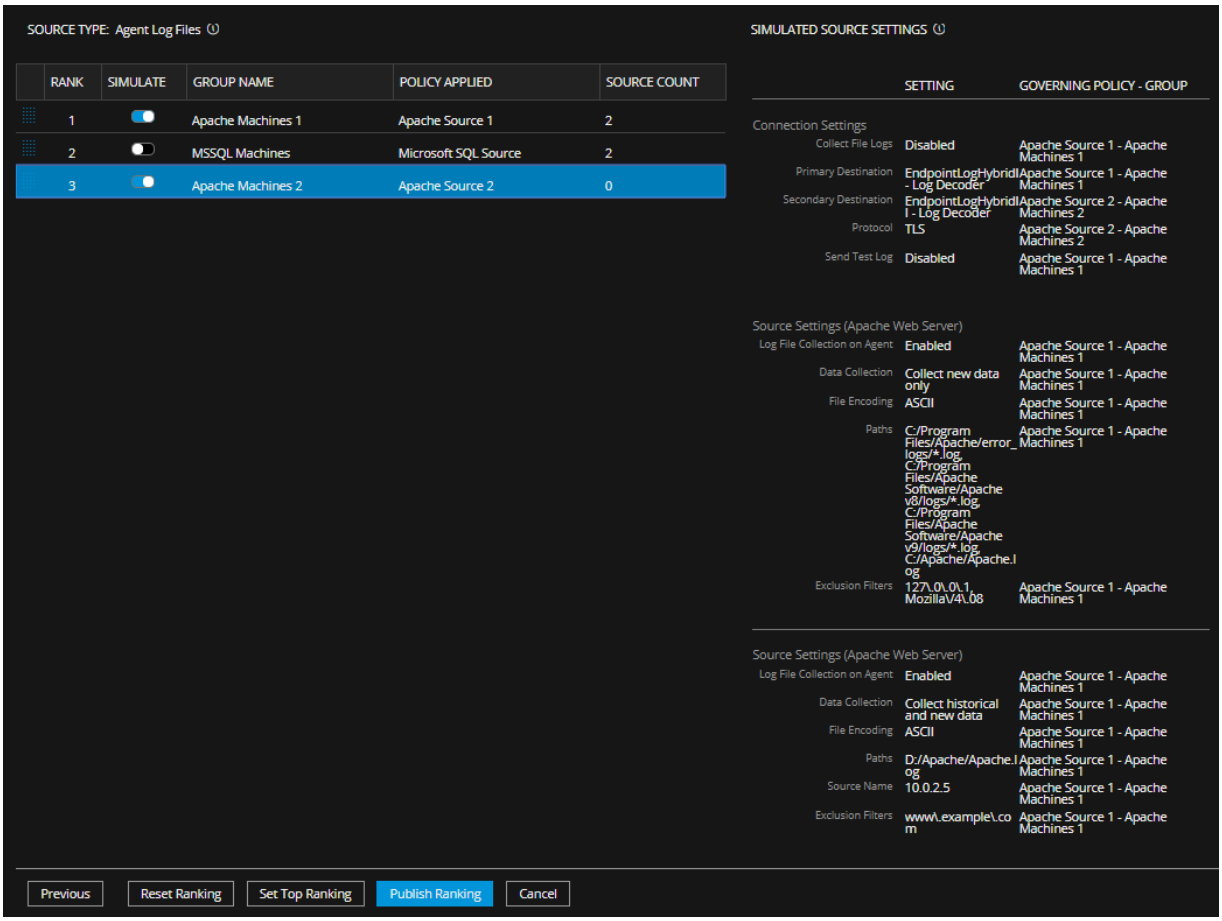


- File policy **Microsoft SQL Source**:



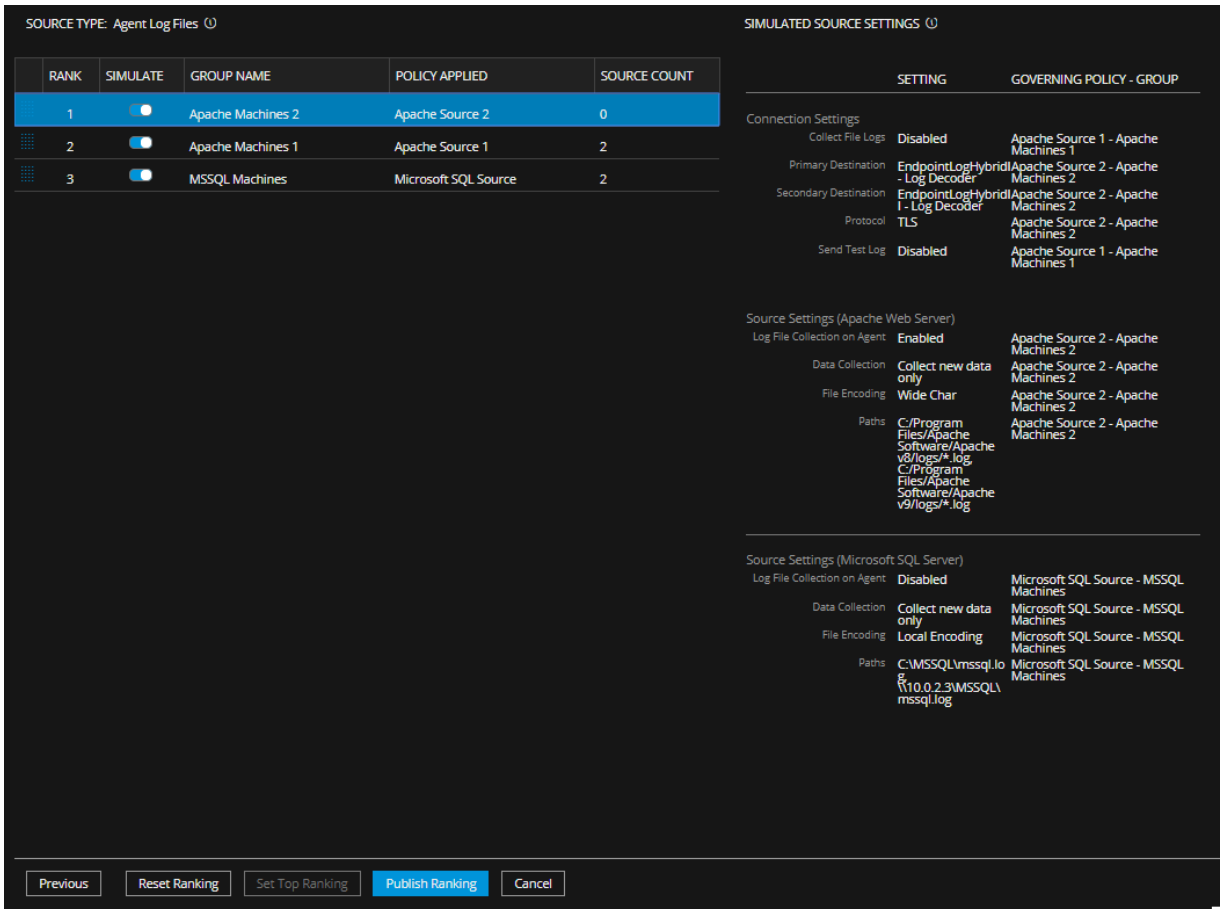
Examine two of the possible ranking orders:

- Simulate policies 1: **Apache Source 1**, 2: **Apache Source 2**. Note that in this case, the MS SQL policy is not simulated.



In this case, all Apache settings for the group are inherited from the **Apache Source 1** policy.

- Move the **Apache Source 2** policy higher than **Apache Source 1** policy, and add the **Microsoft SQL Source** policy. Simulate policies 1: **Apache Source 2**, 2: **Microsoft SQL Source**, 3: **Apache Source 1**.



In this case, all Apache settings for the group are inherited from the **Apache Source 2** policy, and groups also get the MS SQL settings.

So, the Apache settings are inherited from the highest ranked Apache policy **only**, but the source settings as a whole are **combined** to include settings from each event source type.

## The SIMULATE Slider

The slider has two positions:

- On:
- Off:

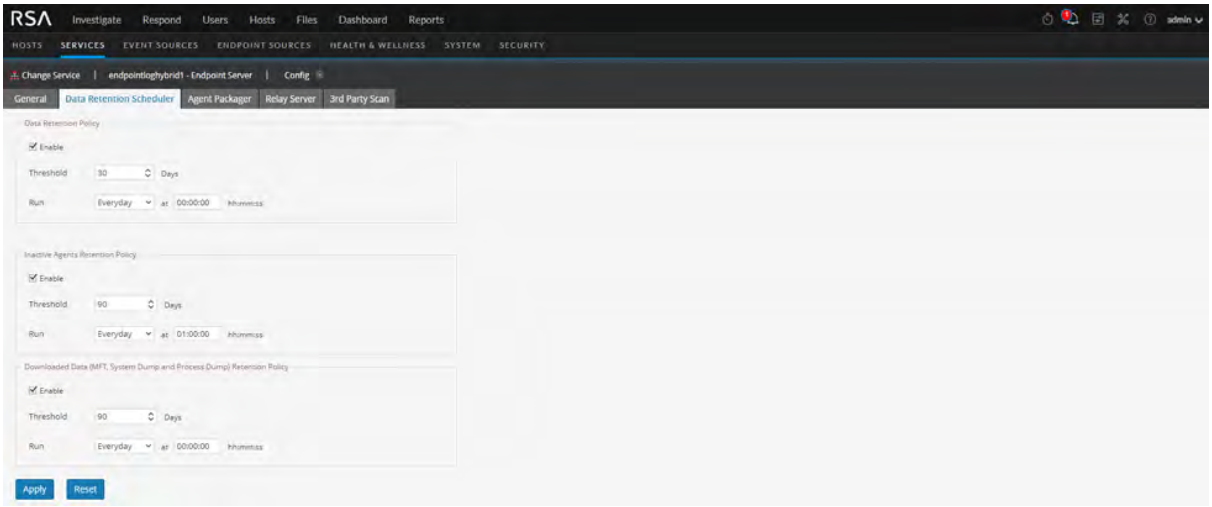
If the simulate slider is ON for a policy, that policy's values are factored into the complete set of governing settings. If the slider is OFF for a policy, the setting for that policy have no effect on the list of the governing settings.

# Configuring Data Retention Policy

An administrator can configure the retention policies to retain the Endpoint data based on the age or the storage size. By default, days and size-based retention policies are enabled.

To change the configuration for age-based retention:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

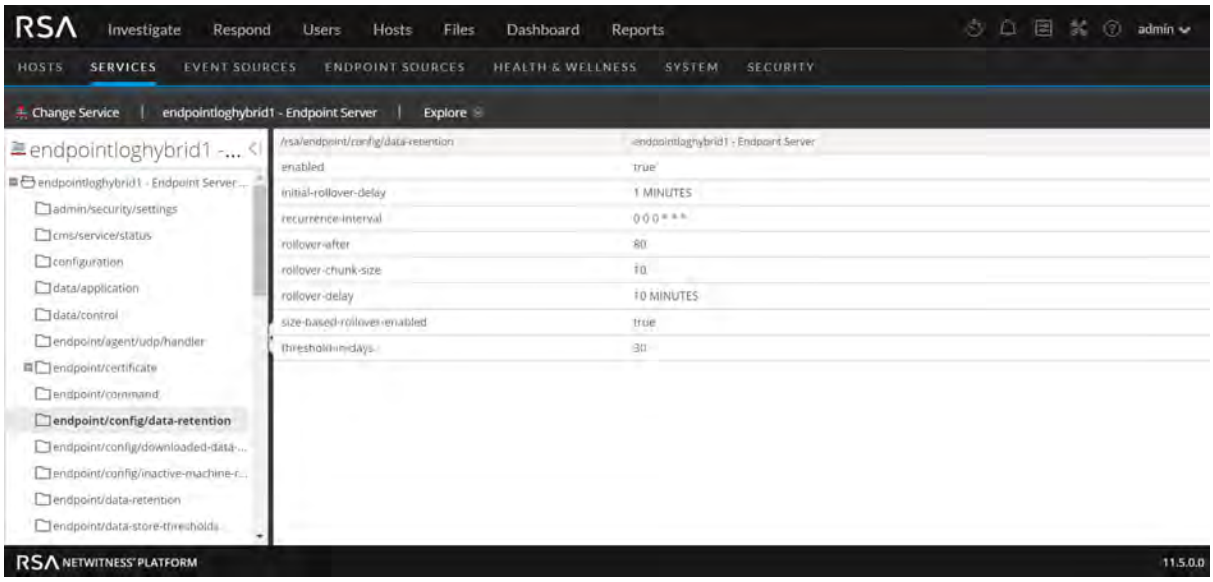


5. In the **Data Retention Policy** panel, by default, the **Threshold** is set to 30 days, and **Run** to Everyday. This means only 30 days of Endpoint data is retained and the older data is deleted from the database.
6. Click **Apply**.

**To change the configuration for size-based retention:**

By default, for the size-based retention, the `rollover-after` value is set to 80 and `rollover-chunk-size` is set to 10. This means that when the storage size exceeds 80 percent of the space allocated for the disk partition, 10 percent of the older Endpoint data is deleted from the database. However, you can change these values as follows:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View > Explore**. The Explore view is displayed:



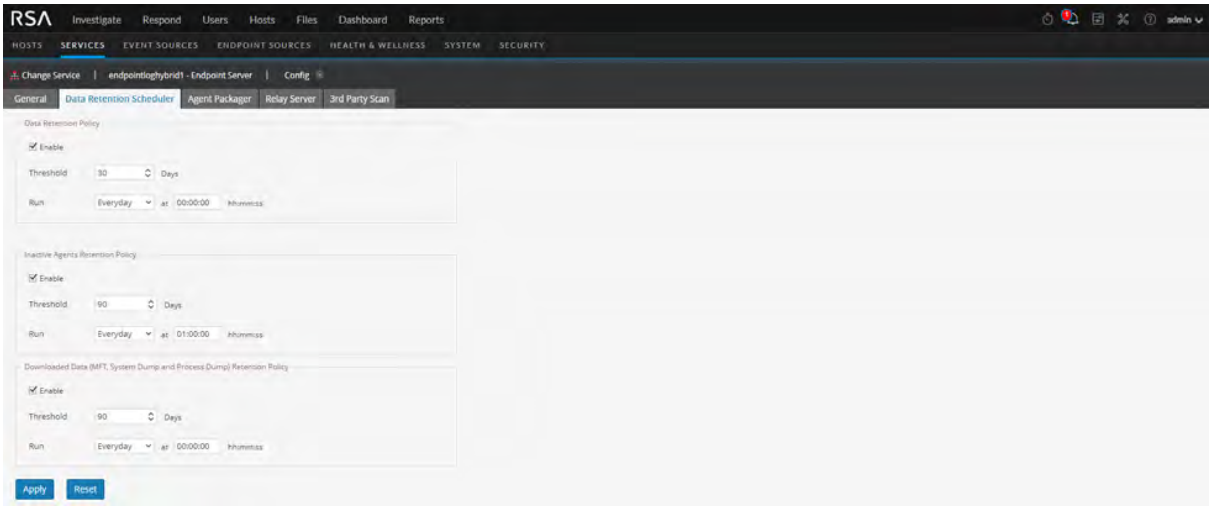
4. In the left panel, select **endpoint/config/data-retention**.
5. Edit the configurations based on your requirements.

# Managing Inactive Agents

An administrator can configure the inactive agent retention policy to delete data of agents that are inactive, from the Endpoint Server. On deletion, the Endpoint Server stops collecting data from these agents. By default, this option is enabled.

To configure the inactive agent retention policy:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.



5. In the **Inactive Agents Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to Everyday. This means that the data of agents that have not communicated with the Endpoint server for 90 days is deleted from the database.
6. Click **Apply**.

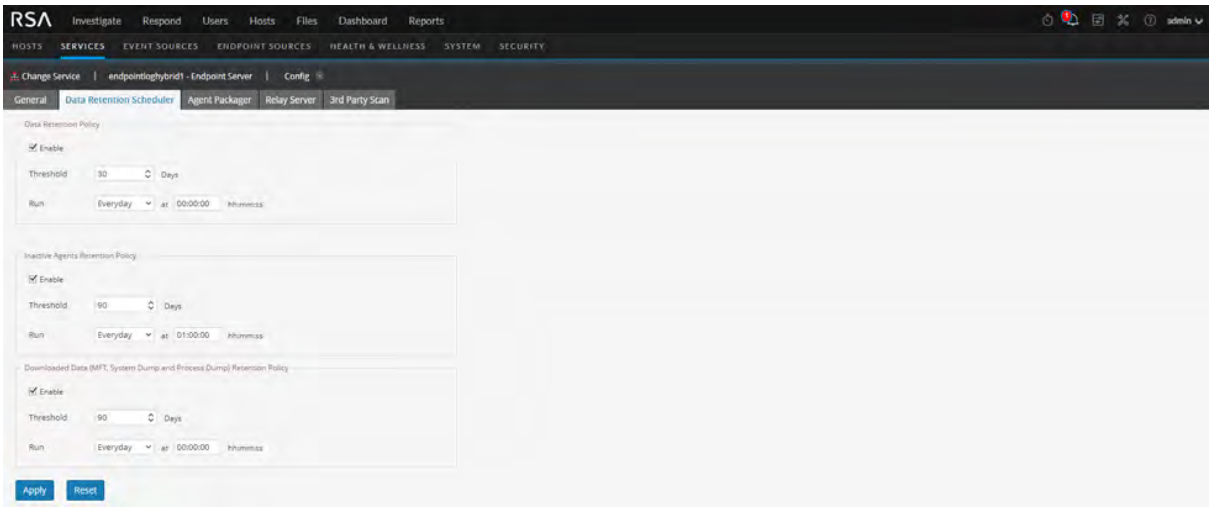
**Note:** The Inactive Agents Retention Policy is not applicable for NetWitness Endpoint 4.4.0.2 or later agents.

# Configure Retention Policy for Memory Dumps and MFT

An administrator can configure the retention policy to delete the downloaded system dump, process dump, and Master File Table (MFT) from the Endpoint server based on the number of days. By default, this option is enabled.

### To configure the retention policy:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.



5. In the **Memory Dumps and MFT Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to every day. This means only 90 days of data is retained and the older data is deleted from the Endpoint server.
6. Click **Apply**.

# (Optional) Installing and Configuring Relay Server

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3.1 and later.

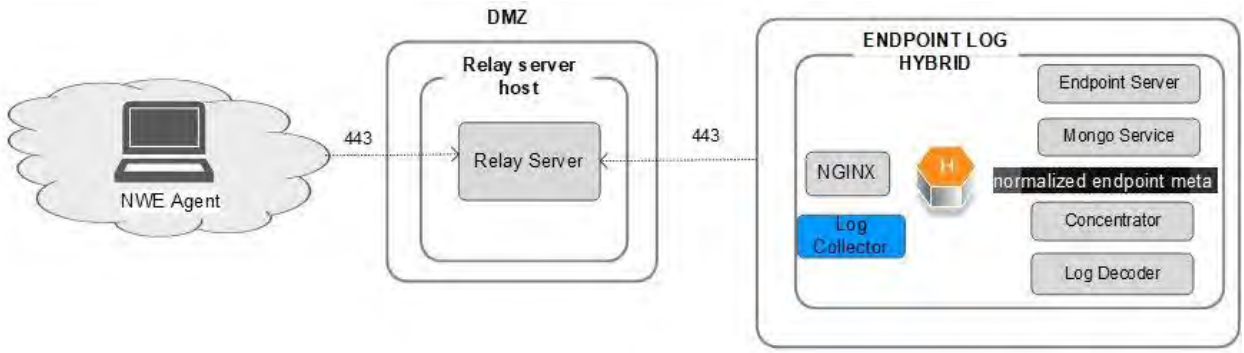
Relay Server (referred to as RAR in RSA Endpoints) extends NetWitness Platform's visibility into endpoints when they are outside the corporate network. The Relay Server deployed in a cloud or DMZ relays the endpoint data between the hosts and the Endpoint Server. The hosts that are outside the corporate network send the endpoint data to the configured Relay Server and the corresponding Endpoint server pulls the data.

**Note:** If you have Windows hosts that are outside the corporate network, the log data is not sent to the Relay Server.

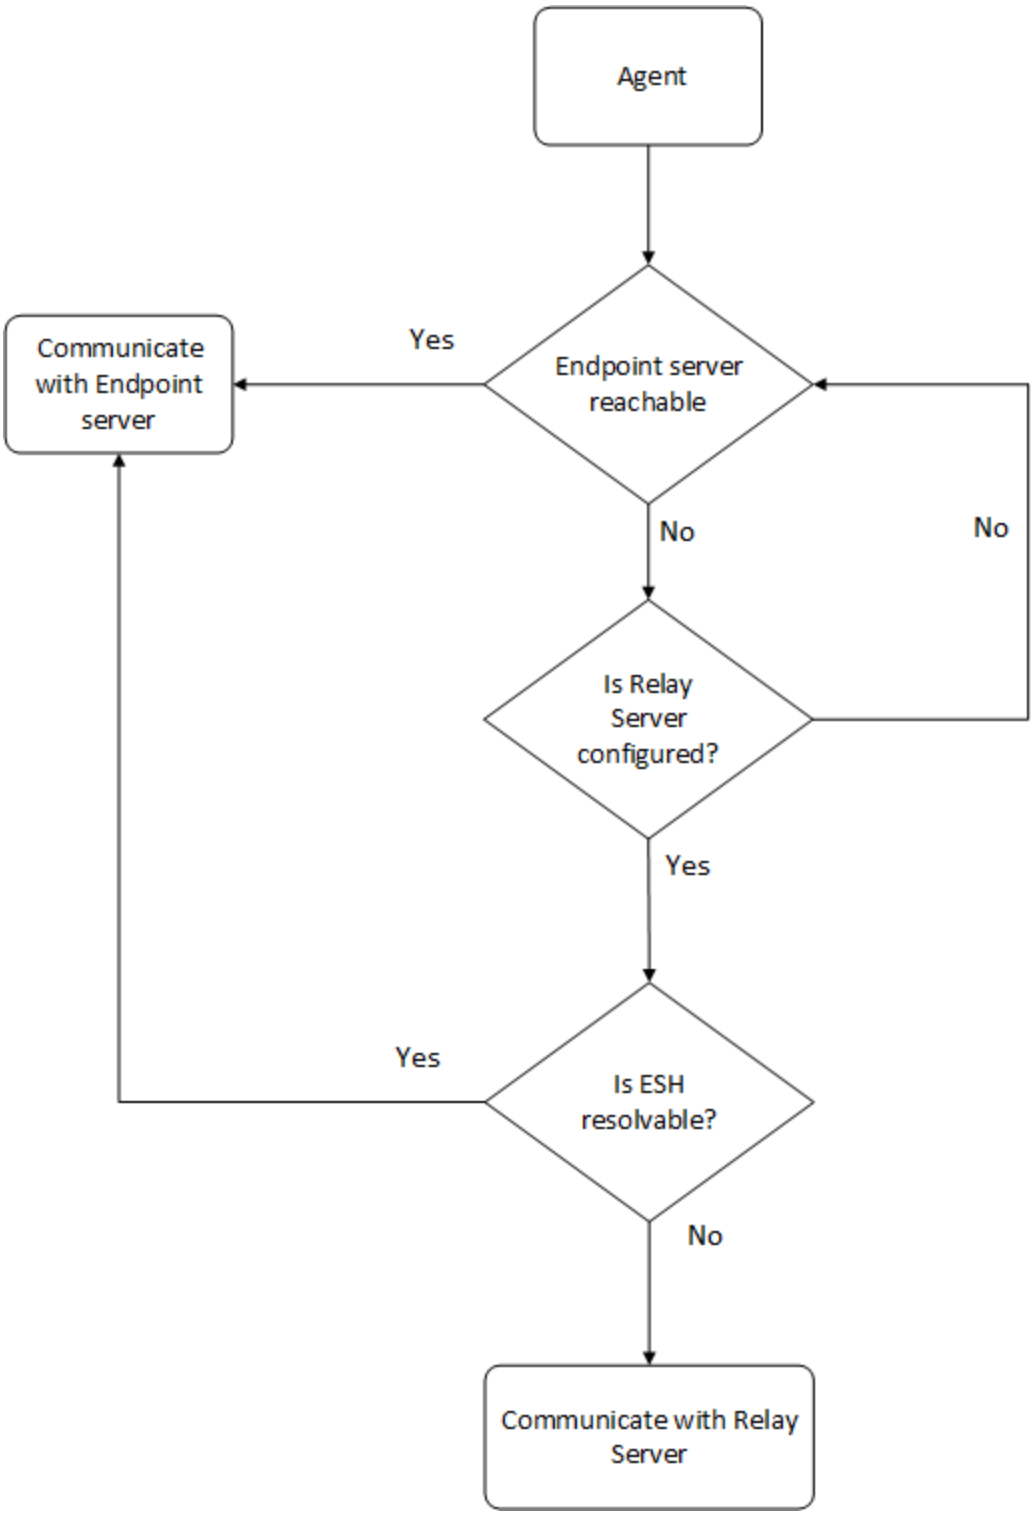
You can configure a Relay Server on the Endpoint Server Config view. Once the Relay Server is configured, the policy for the host is automatically updated and you can view the Relay Server settings on the **Host Details** view > **Policy Details** panel.

You can configure a single Relay Server with one or more Endpoint servers. In this case, the Relay Server ensures that the endpoint data reaches the Endpoint Server configured in the policy.

The following describes the architecture of the Relay Server.



The following flowchart explains how the host switches to the Relay Server.



Agent
Endpoint server reachable
Yes
Communicate with Endpoint server
No
No
Is Relay Server configured?
Yes
Yes
Is ESH resolvable?
No
Communicate with Relay Server

# Installing the Relay Server

The Relay Server installer contains binaries, certificates, configuration files, and the installation script required to install the Relay Server.

**IMPORTANT:**
- The Relay Server version must match with the corresponding NetWitness Endpoint Server version. If you plan to upgrade a Relay Server to a newer version, first upgrade the Endpoint Server, then download the Relay Server installer, and run the installer script.
- Operating System updates and general system hardening on the Relay Server must be managed by the customer according to standard best practices. The Relay server package does not contain OS updates and the operating system will not be updated as part of the standard NetWitness update process.
- Do NOT run the nwsetup-tui script to install the Relay Server. Follow the instructions in this document only as Relay Server is an independent server and not part of NetWitness Platform UI (Admin > Hosts).

## Installation Media

The Relay Server can be installed only on a CentOS 7 or NetWitness Platform 11.4.0.0 base image which is available for download from Download Central (https://download.rsasecurity.com). Also, make sure that the Relay server host is connected to internet to download the required dependencies.
For more information on deploying Relay Server host on a:

- DMZ - see "Step 1a. Deploy the Virtual Host to create VM" in the *Virtual Host Installation Guide*.
- Cloud
  - see "Step 1. Deploy NW Server Host" in the *Azure Installation Guide*.
  - see "AWS Deployment" in the *AWS Installation Guide*.

## Relay Server Host System Requirements

| Agents | RAM | CPU Cores | Disk | Ideal Beacon Interval |
|---|---|---|---|---|
| 20000 | 32 GB | 4 cores | 200GB | 5 min |

### To install the Relay Server:

1. Log in to NetWitness Platform.
2. Click **(Admin) > Services**.
3. Select the **Endpoint Server** service and click > **View** > **Config** > **Relay Server** tab.
4. In the **Download Installer** section, enter the installer password and click **Download** to download the Relay Server installer file (**RelayInstaller.zip**).
5. Copy the Relay Server installer file (**RelayInstaller.zip**) to the Relay Server host.

6. Unzip the **RelayInstaller.zip** file on the Relay Server host. For example:

   ```
   /home/RelayInstaller.zip
   unzip <installer path>
   ```

7. Set up the execution permission using the following command:

   ```
   chmod +x install.sh
   ```

8. Run the installer script using the following command:

   ```
   ./install.sh
   ```

   The **All necessary RPMs will be installed without further** prompts is displayed.

9. Enter **Y** to continue the installation.

   The password prompt is displayed.

10. Enter the password.

    **Note:** Make sure you enter the same password you set while downloading the Relay Server installer.

    **Note:** In case if you are re-installing the Relay Server host. **Do you wish to update the list** prompt is displayed.
    - Enter **Y** to update the Endpoint server IPs.

    **Enter the Endpoint Server IPs** prompt is displayed.

11. Enter all the Endpoint server IPs you plan to configure with the Relay server with comma separated.

If the Relay Server installation is successful, you can check the status of the services:

- Check if the Relay Server is up and running:

  ```
  systemctl status rsa-nw-relay-server
  ```

- Check if Ngnix is running:

  ```
  systemctl status ngnix
  ```

You can also update Endpoint Server IPs without installing the Relay Server.

### To update Endpoint Server IPs without installing the Relay Server:

1. Run the following command:

   ```
   bash /var/netwitness/relay-configure-allowed-hosts.sh
   ```

   The list of all the configured Endpoint server IPs is displayed and **Do you wish to update the list** prompt is displayed.

2. Enter **Y** to update the list of Endpoint server IPs.

   **Enter the Endpoint Server IPs** prompt is displayed.

3. Enter a comma-separated list of all the Endpoint Server IPs to update.

   The list of updated IPs is displayed.

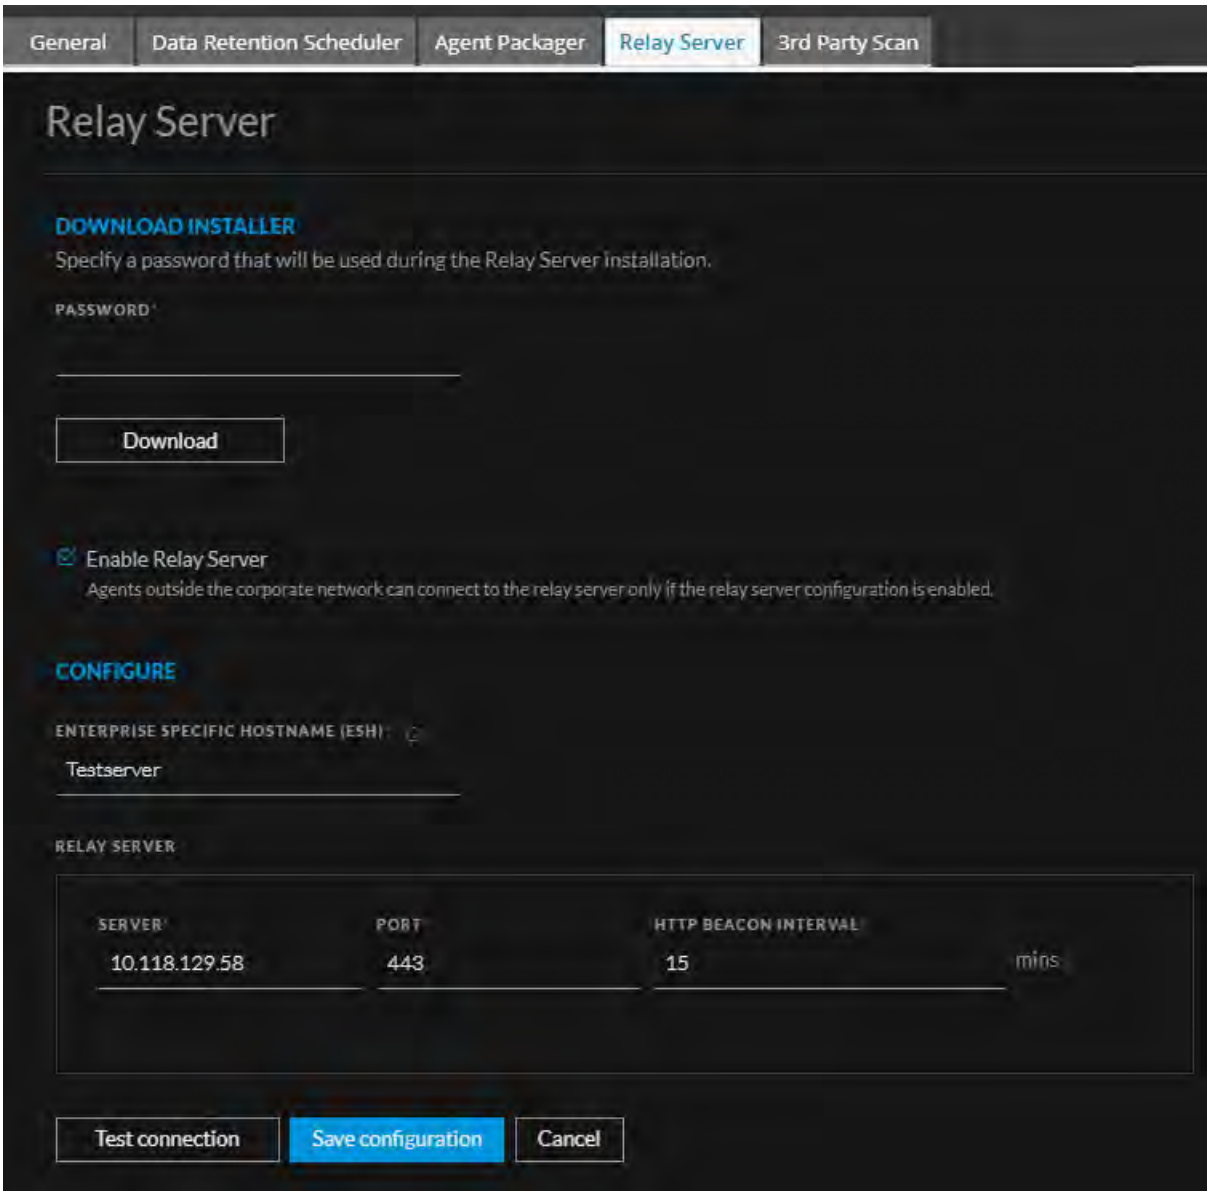
# Configuring the Relay Server

Make sure you have installed the Relay Server.

**Note:** During Relay Server host installation, firewalld is configured to allow incoming connections only on TCP ports 443 and 22.

To configure the Relay Server:

1. Log in to NetWitness Platform.
2. Click **(Admin) > Services**.
3. Select the **Endpoint Server** service and click > **View** > **Config** > **Relay Server** tab.
   The Relay Server tab is displayed.



4. Select the **Enable Relay Server** check box to enable the Relay Server configuration.

**Note:** To disable the Relay Server, clear the **Enable Relay Server** check box.

**Caution:** Before you disable the Relay Server configuration, if the hosts will be always roaming make sure to migrate these hosts to an alternate Endpoint server configured with a different Relay server. Else these hosts will not be able to connect back to the corporate network. When you disable the configuration, the Relay Server settings are removed from the EDR policy.

5. In the **Configure** section:

a. Enter the ESH.

**IMPORTANT:** This should a hostname that can only be resolved on the corporate internal DNS and not on public internet DNS (ex: 1.1.1.1 or 8.8.8.8). It is used to determine if the host running the Endpoint agent client is connected to the internal network (physically on premise or via VPN).

b. Specify the Relay **Server**, **Port** and **HTTP Beacon Interval**.

**IMPORTANT:** The Relay Server needs to be a hostname that can be resolved correctly on both internal DNS (with the internal IP) and public DNS (with the public IP)

6. Click **Test Connection** to check if the Relay Server is reachable.
7. Click **Save Configuration** to save the configuration.

**Note:** Before you modify the Relay Server configuration, perform any one of the following:
- Make sure that the hosts are inside the corporate network so that the policy with the Relay Server configuration is applied.
- If hosts will always be roaming, then migrate these hosts to an alternate Endpoint server configured with a different Relay Server.

**IMPORTANT:** You must change the root password after you deploy the Relay Server host.

# Configure YARA

YARA helps analysts in identifying and classifying malware in a simple and effective manner. By default YARA is disabled, administrators can configure and enable YARA. You are required to provide YARA rule files and specify the path where these rule files are stored. Ensure that the Endpoint server and YARA rules directory are in the same appliance.

**Note:** The YARA rules directory should have the permission as 'netwitness'.

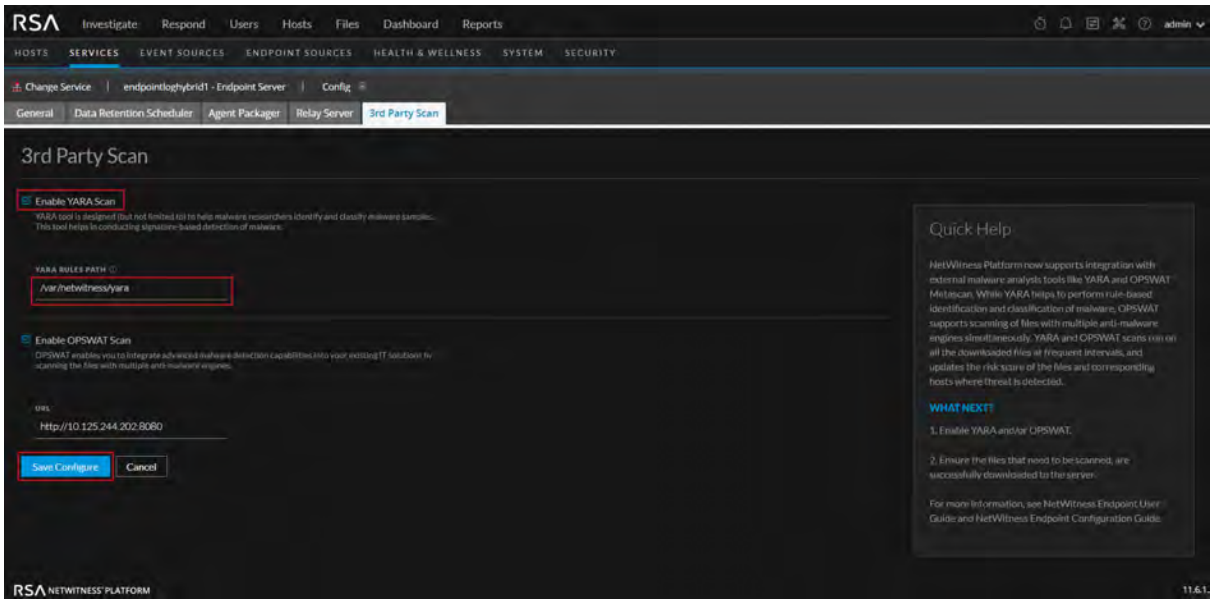
**Note:** For new installations, YARA will be included as part of the orchestration. If you are upgrading to NetWitness Platform 11.6 or later, YARA is included automatically. In case of an upgrade, deploy the following Yara App rules from Live-

- Yara Rule Matched
- Process with Matched Yara Rule

**IMPORTANT:** Ensure that YARA is configured and YARA RULES PATH is same across all the Endpoint servers.

To change the configuration for YARA:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select **View** > **Config**.
4. Click the **3rd Party Scan** tab.



5. Select **Enable YARA Scan.**

6. In **YARA RULES PATH**, specify the directory path where the YARA rule files are stored.

   **Note:** You can add any number of YARA rule files in this directory. Each rule file can have more than one rule. All downloaded files are scanned by all the YARA rule files.

7. Click **Save Configure**.

# Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

You can configure the Endpoint Metadata for the NetWitness Endpoint 4.4.0.2 by integrating the Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder. You can view the Endpoint metadata in the **Investigate > Navigate** and **Events** views. This integration includes the following steps:

- Enable Metadata Forwarding
- Enable Machines to Forward Metadata

## Enable Metadata Forwarding

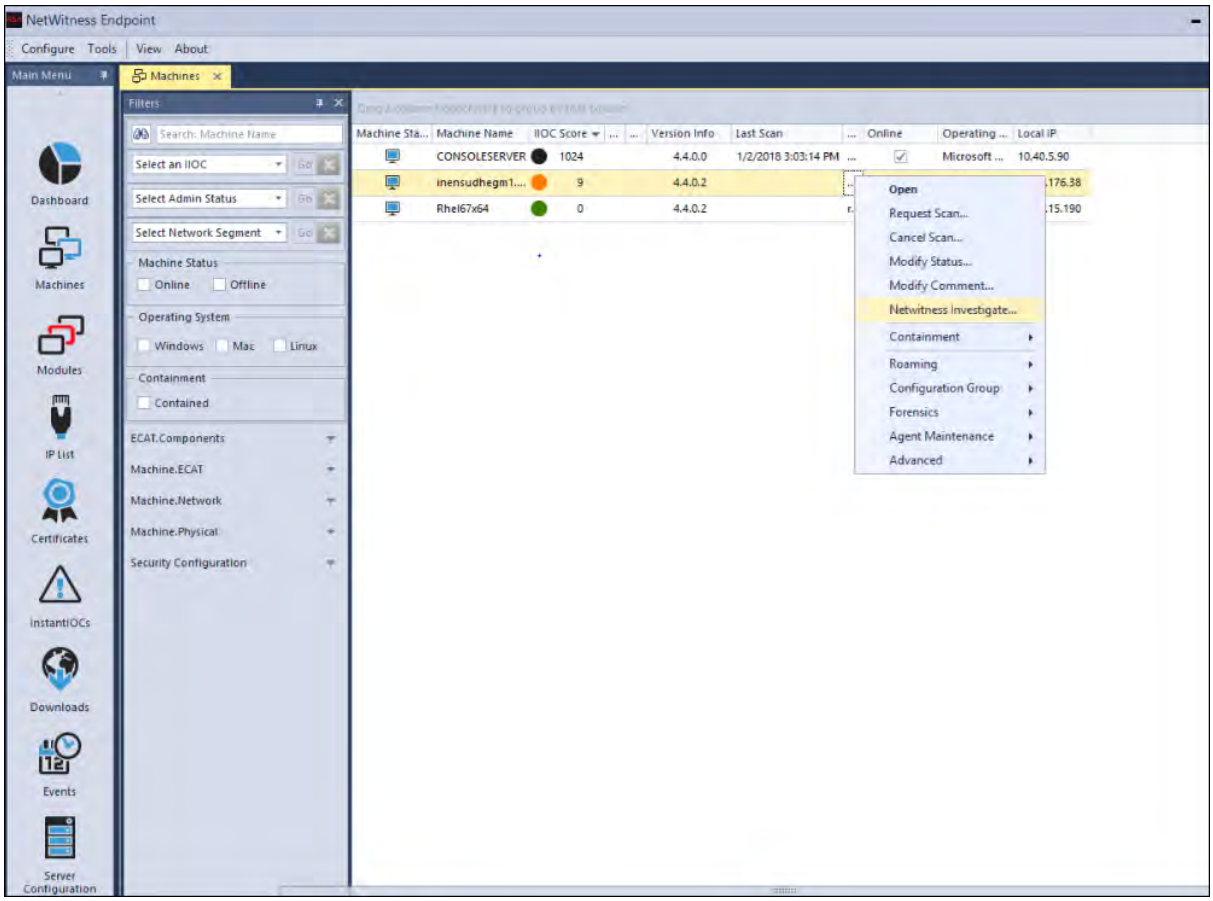
To enable the Metadata Integrator service for the selected NetWitness Endpoint 4.4.0.2 agents, run the following command:

```
ConsoleServer.exe /nw-investigate enable
```

## Enable Machines to Forward Metadata

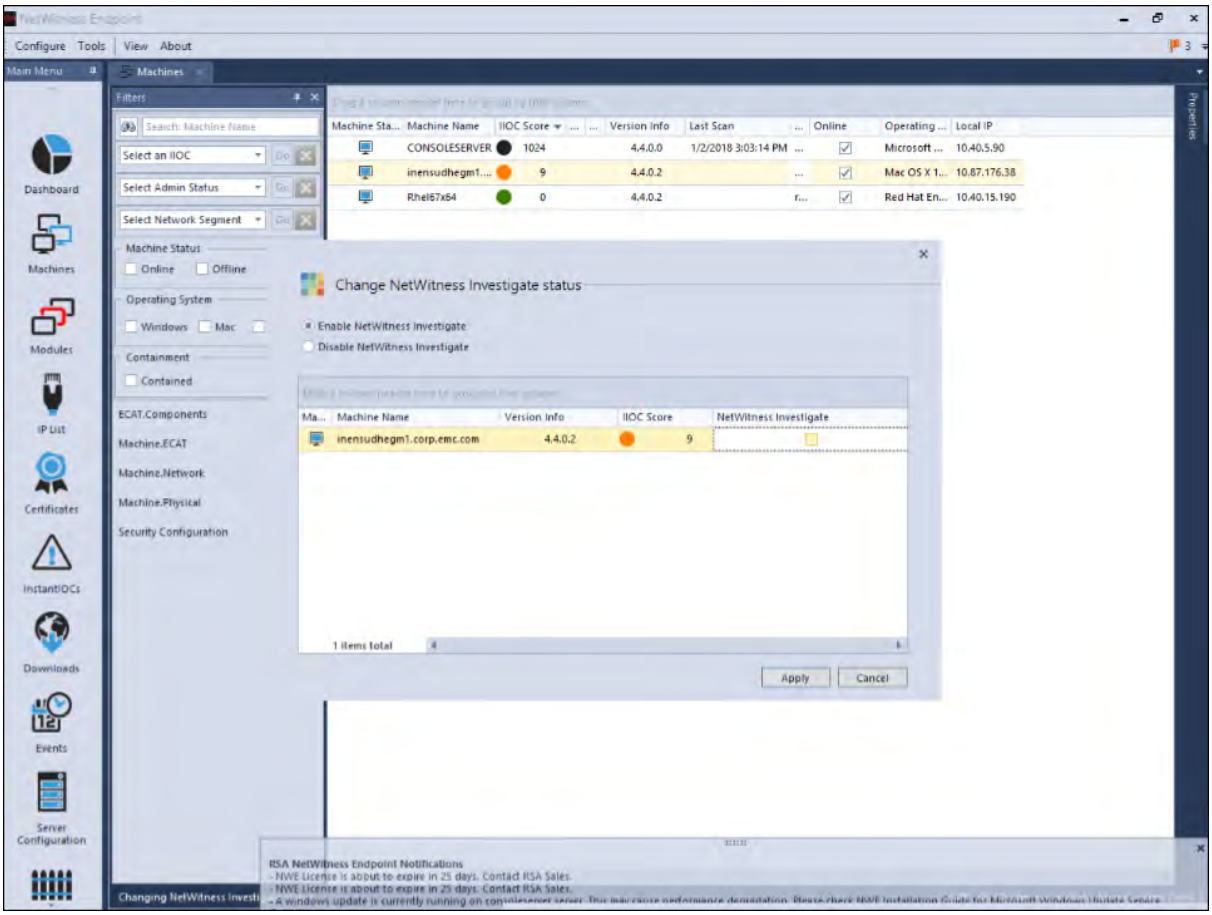
After you enable the Metadata Forwarding using any one of the above options, perform the following to enable the machines to forward metadata to the Log Decoder.

1. Open the NetWitness Endpoint 4.4.0.2 user interface.
2. Click **Machines** from the left panel. The list of available machines are displayed.



3. Select machines for which you want to forward metadata to the NetWitness Endpoint Server.
4. Right-click and select the **NetWitness Investigate** option.

   The Change NetWitness Investigate Status dialog is displayed.



5. Select the **Enable NetWitness Investigate** option.
6. Click **Apply**.
7. To verify if the **Enable NetWitness Investigate** option is enabled, repeat step 4.

# Endpoint References

This section is intended to help you understand the purpose of the Services Config View for the Endpoint Server. For each configuration, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition, it includes workflow and Quick Look sections to highlight important features in the user interface.

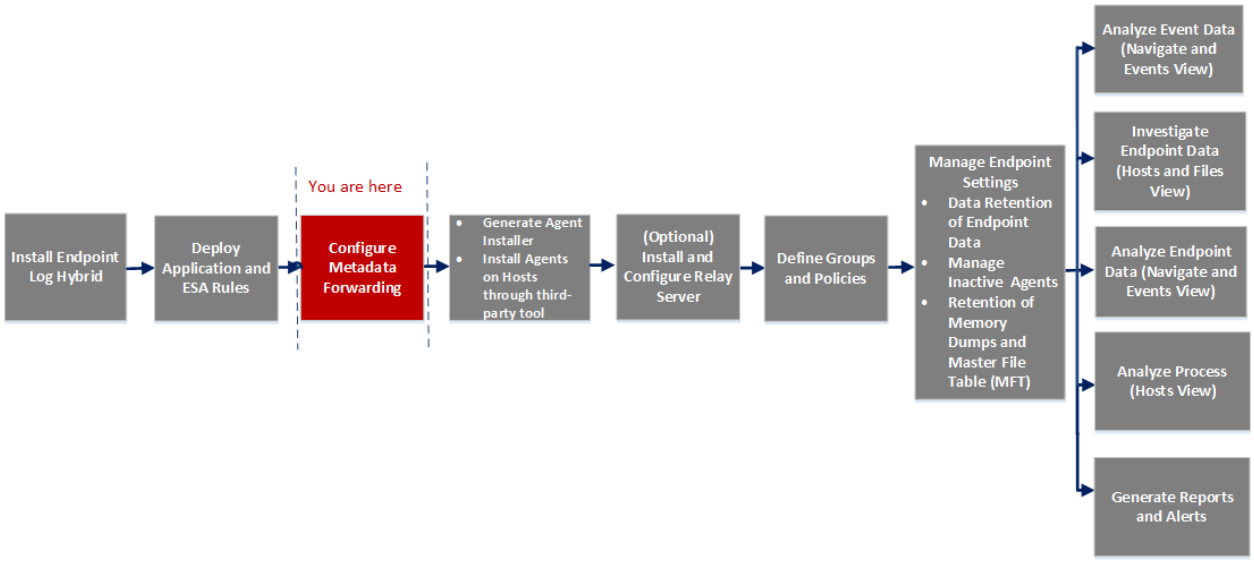
You can view the complete service nodes in tree form in the Services Explore view. For more information, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

# General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

## Workflow



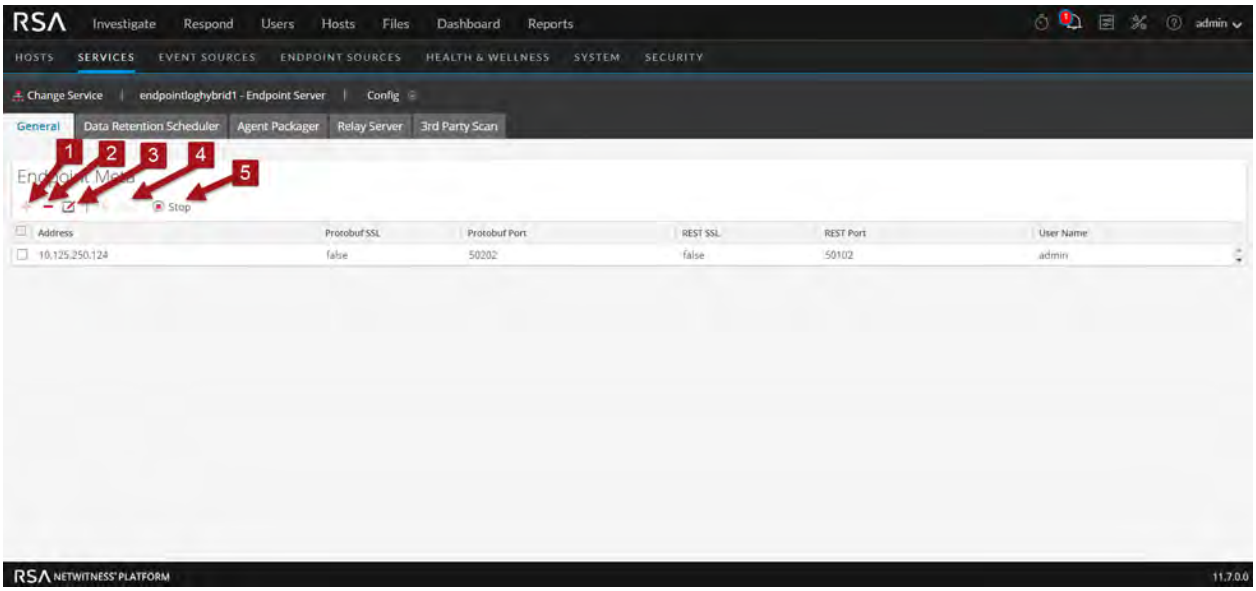
## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents* | Configuring Metadata Forwarding |
| Administrator | Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents* | Integrating NW Endpoint 4.4.0.2 or Later with NW Platform |

*You can perform this task in the current view

## Quick Look

The following figure is an example of the General tab.



1. Click + to view the Available Services dialog.
2. Click − to delete the added service.
3. Click to edit the information for the added service.
4. Click Start to start the Endpoint metadata forwarding.
5. Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

| Field | Description |
|---|---|
| Address | Displays the IP address of the Log Decoder. |
| Protobuf SSL | Indicates if SSL is enabled on Protobuf. By default, this option is disabled. |
| Protobuf Port | Displays the port used for Protobuf. By default, the port is 50202. |
| REST SSL | Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled. |
| REST Port | Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL). |
| User Name | Displays the user name. |
| Raw Data | Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled. |

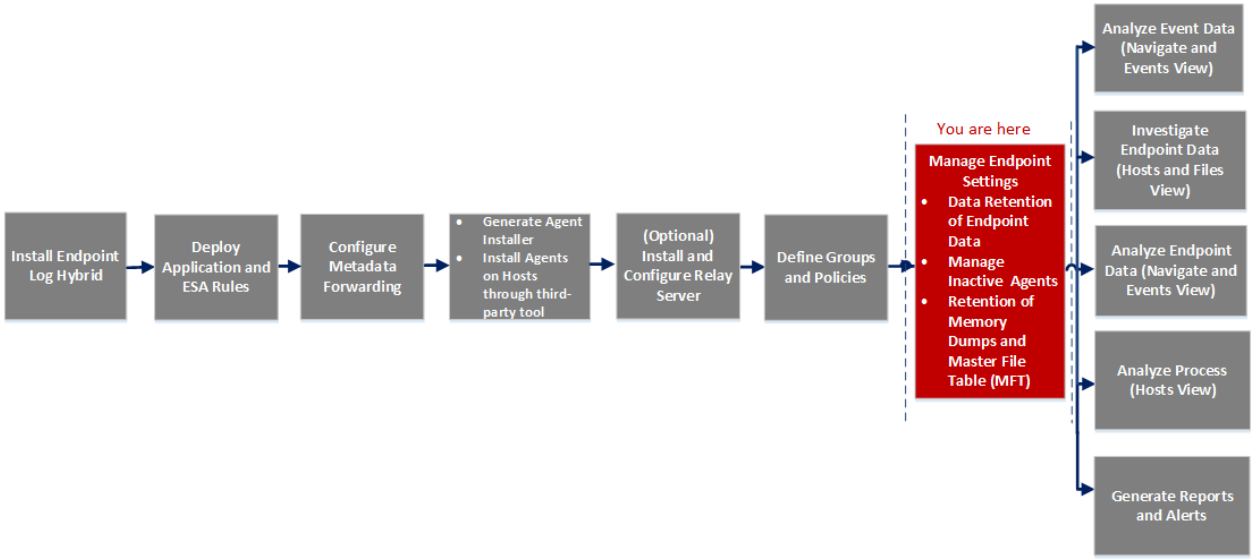
# Data Retention Scheduler Tab

In the **Data Retention Scheduler** tab, you can configure data retention, inactive agents, and memory dump and MFT retention policies for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

Repeat the above steps to configure data retention settings for multiple endpoint servers.

## Workflow



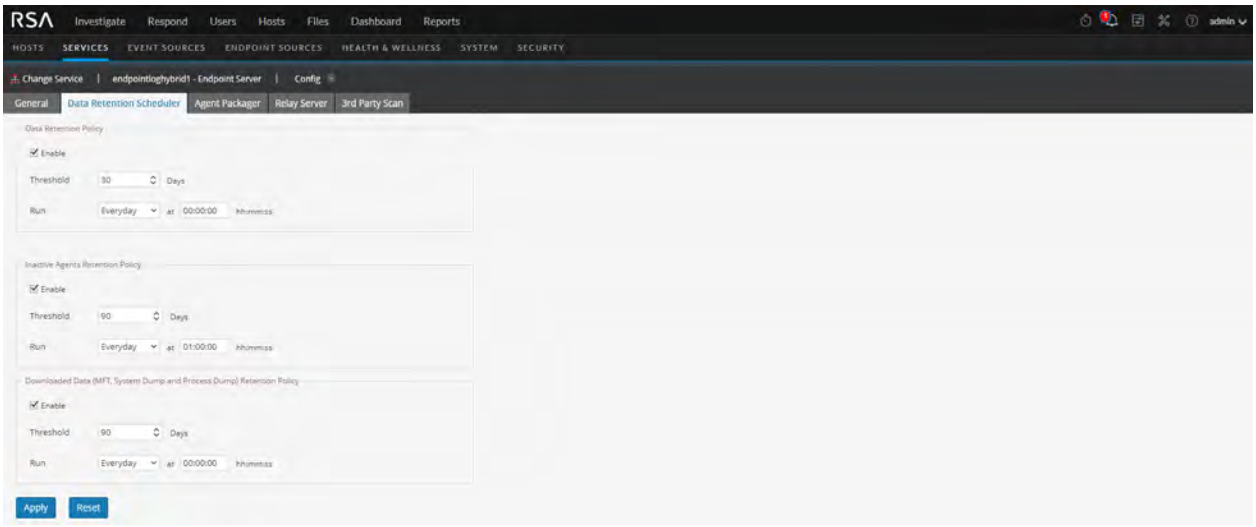
## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Data Retention Policy* | Configuring Data Retention Policy |
| Administrator | Configure Inactive Agents Policy* | Managing Inactive Agents |
| Administrator | Configure Memory Dumps and MFT Policy* | Configure Retention Policy for Memory Dumps and MFT |

*You can perform this task in the current view

## Quick Look

The following figure is an example of the Data Retention Scheduler tab.



## Features

The following table lists the fields for data retention policy.

| Field | Description |
|---|---|
| Enable | Enables the configuration for the data retention policy. By default, this option is enabled. |
| Threshold | Displays the number of days the Endpoint data is retained in the database. By default, the Threshold is set to 30 days. The data older than 30 days is deleted from the database. |
| Run | Displays the schedule for running the data retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job. |
| Apply | Overwrites any previous schedule for the data retention policy and applies the new schedule immediately. |
| Reset | Resets the schedule to the default settings. |

The following table lists the fields for inactive agents retention policy.

| Fields | Description |
|---|---|
| Enable | Enables the configuration for the inactive agents policy. By default, this option is enabled. |
| Threshold | Displays the number of days the inactive agents are retained in the Endpoint Server. By default, the threshold value is 90 days. |

| Fields | Description |
|---|---|
| Run | Displays the schedule for running the inactive agents retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job. |
| Apply | Overwrites any previous schedule for the inactive agents retention policy and applies the new settings immediately. |
| Reset | Resets the schedule to the default settings. |

The following table lists the fields for memory dumps and MFT retention policy.

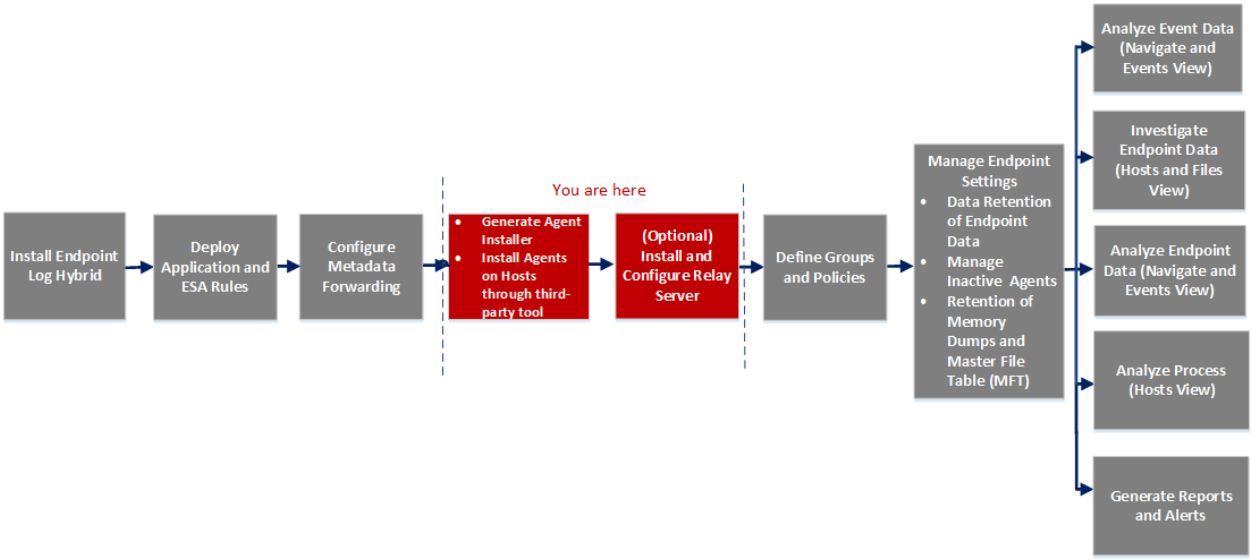
| Fields | Description |
|---|---|
| Enable | Enables the configuration for the memory dumps and MFT policy. By default, this option is enabled. |
| Threshold | Displays the number of days the memory dumps and MFT are retained in the Endpoint Server. By default, the Threshold is set to 90 days. The data older than 90 days is deleted from the Endpoint Server. |
| Run | Displays the schedule for running the retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job. |
| Apply | Overwrites any previous schedule for the retention policy and applies the new schedule immediately. |
| Reset | Resets the schedule to the default settings. |

# Agent Packager Tab

In the **Agent Packager** tab, you can generate an agent packager and agent installer. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Packager** tab.

## Workflow



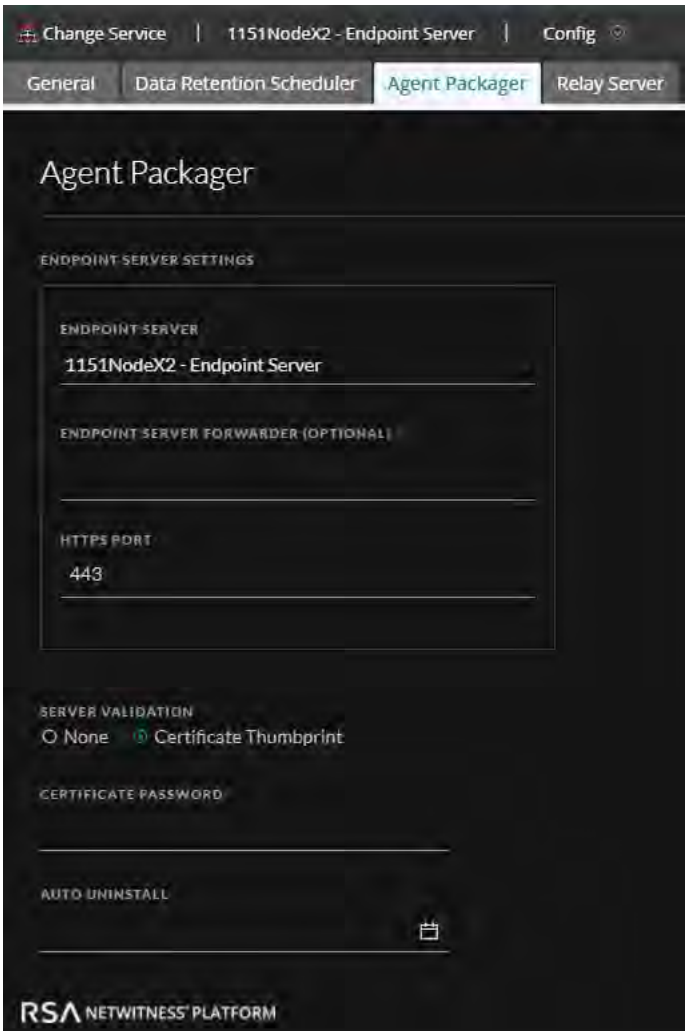
## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Generate an Agent Packager for Endpoint Data Collection* | *NetWitness Endpoint Agent Installation Guide* |
| Administrator | Generate an Agent Installer* | |
| Administrator | Install and Configure Relay Server* | *NetWitness Endpoint Configuration Guide* |

*You can perform this task in the current view

## Quick Look

The following figure is an example of the Agent Packager tab.



Change Service | 1151NodeX2 - Endpoint Server | Config

# Relay Server Tab

In the **Relay Server** tab, you can download and configure Relay Server . To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Relay Server** tab.

## Workflow

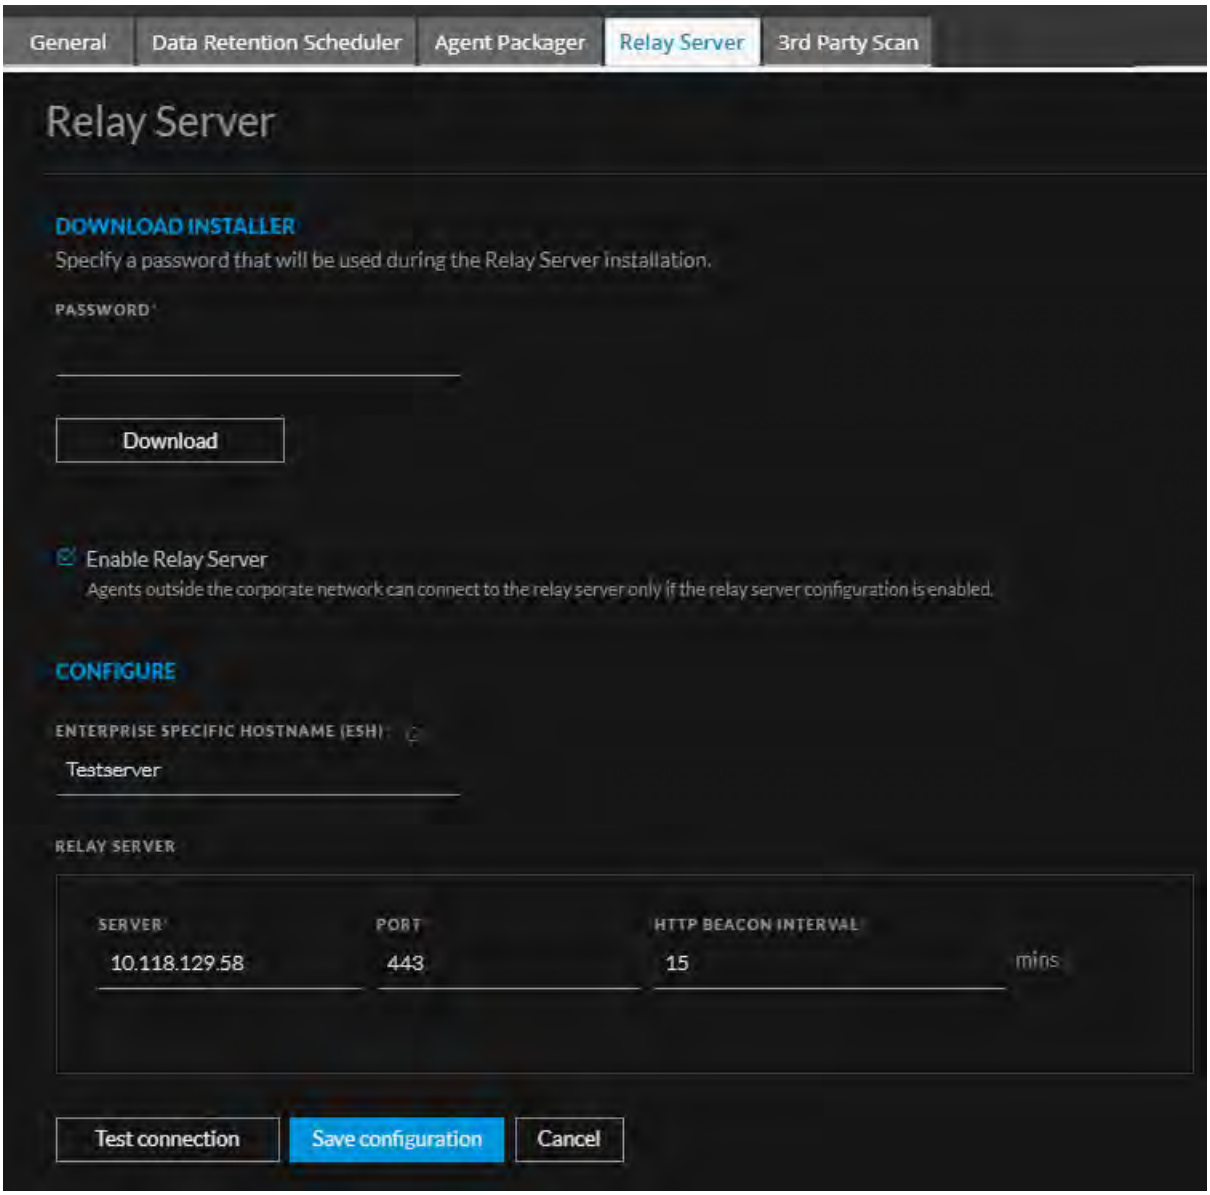
## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Install Relay Server* | (Optional) Installing and Configuring Relay Server |
| Administrator | Configure Relay Server* | (Optional) Installing and Configuring Relay Server |

* You can perform this task in the current view.

## Quick Look

The following figure is an example of the Relay Server tab.



## Features

The following table lists the fields for Relay Server tab.

| Field | Description |
|---|---|
| **Download Installer** | |
| Password | Enter the relay server installation password. For example, netwitness. Password must be minimum of 3 characters and can contain alphanumeric and special characters.<br>**Note:** You must provide the same password when prompted during Relay Server installation. |

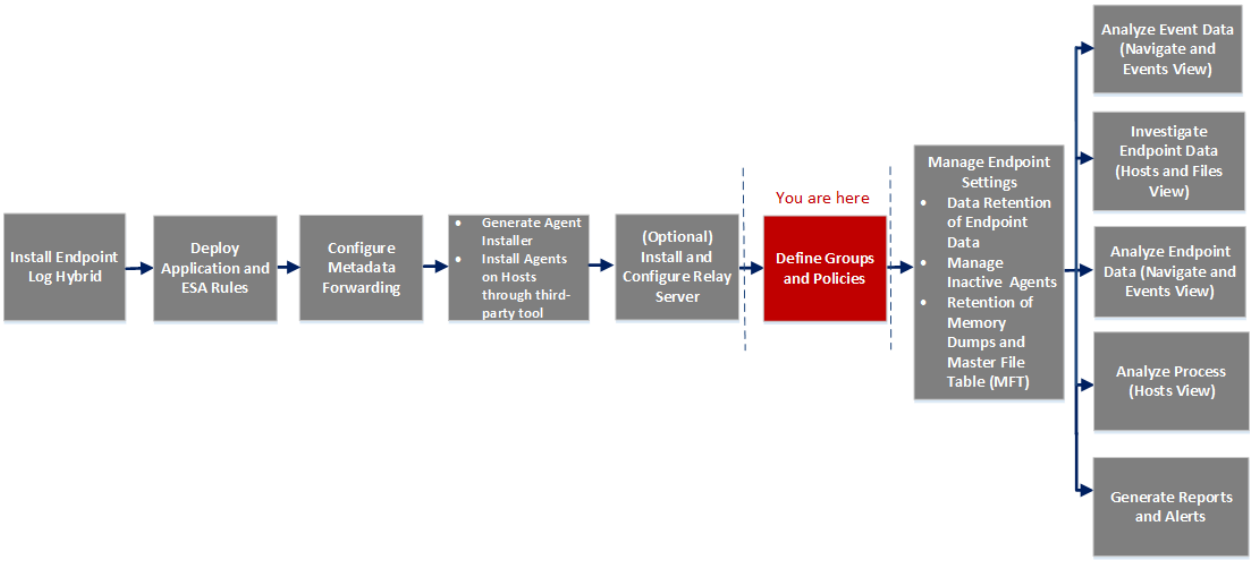
| Field | Description |
|---|---|
| Download | Click to download the Relay Server installer. |
| Enterprise Specific Hostname (ESH) | Enter the hostname which can be resolved only within the corporate network. |
| Enable Relay Server | Check Enable Relay Server for Agents outside the corporate network to connect to the configured relay server. By default, this option is disabled. |
| **Configure** | |
| Server | Hostname or IP of the Relay Server. |
| Port | Port number. For example, 443. |
| HTTP Beacon Interval | Enter the Interval value ranges from 60 – 1440 minutes. |
| Test Connection | Click test connection to check if the relay server is reachable by the agents. |
| Save Configuration | Saves the relay server configuration. |
| Cancel | Cancel the unsaved changes. |

# Endpoint Sources - Groups

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Administrator | create new groups* | Create a Group |
| Administrator | edit groups* | Edit a Group |
| Administrator | edit ranking* | Managing Groups |
| Administrator | delete groups* | Delete a Group |
| Administrator | view default policies | Default Agent Endpoint (EDR) Policy |
| Administrator | create an EDR policy | Create an EDR Policy |
| Administrator | create a Windows Log policy | Create a Windows Log Policy |
| Administrator | edit policies | Edit a Policy |
| Administrator | delete policies | Delete a Policy |

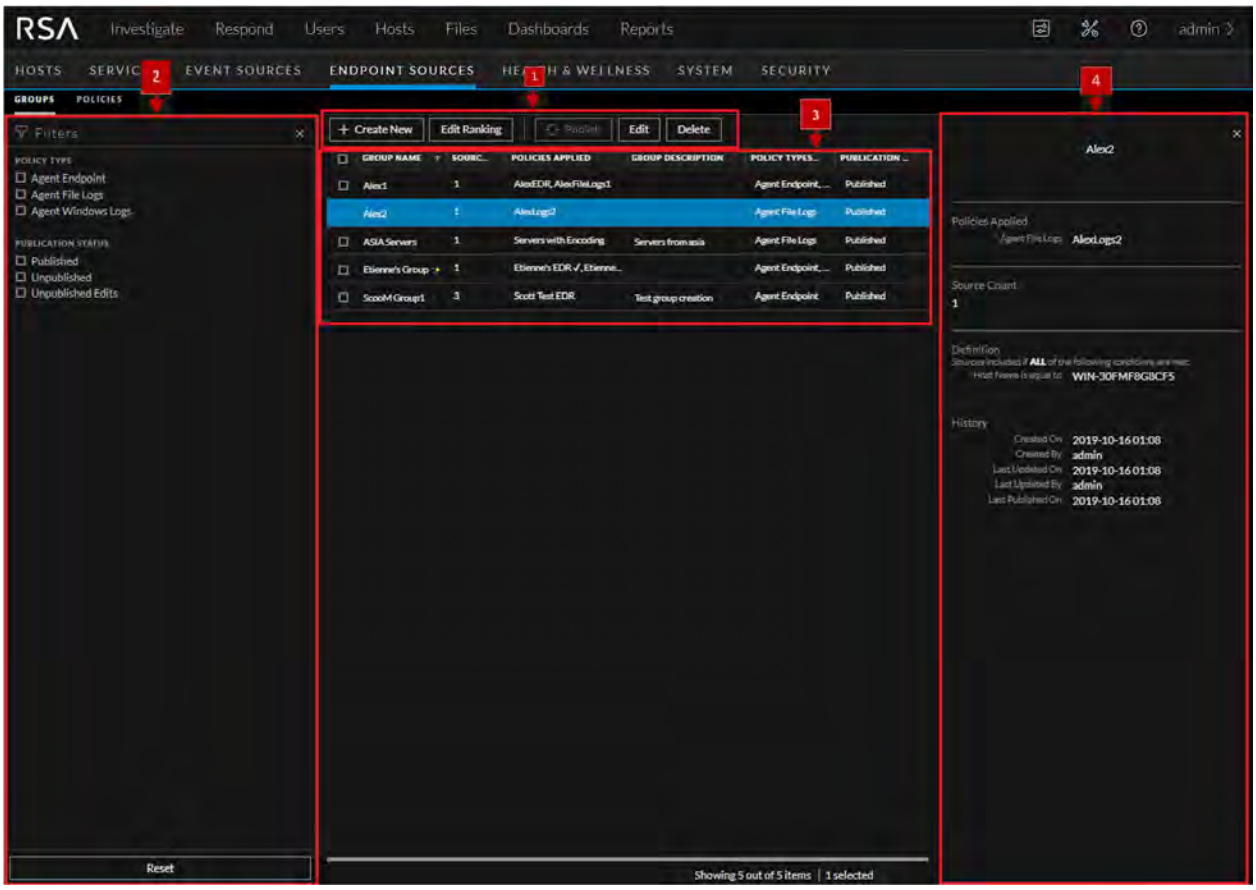
*You can perform this task in the current view.

## Related Topics

- Endpoint Sources
- Managing Policies

## Quick Look

Below is an example of the Groups tab:



| | |
|---|---|
| 1 | **Toolbar**<br>• **Create New**: Lets you create a new group. For more information, see Create a Group<br>• **Edit Ranking**: Lets you edit the ranking of groups. For more information, see Managing Groups<br>• **Publish**: Publishes the selected group or groups.<br>• **Edit**: Lets you edit the details of an existing group. For more information, see Edit a Group.<br>• **Delete**: Deletes the selected group or groups permanently. For more information, see Delete a Group. |

2 **Filter Pane**

- **Filters**: You can filter groups based on Policy Type and Publication Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see Filter Endpoint Groups.

3 **Groups List Pane**

- **Group name**: Name of the group.
- **Source Count**: Number of hosts that are currently members of the group.
- **Policies applied**: Lists the policies applied to this group.
- **Group description**: Description of the group.
- **Policy Types Applied:** Type of policies applied to the group: Agent Endpoint, Agent File Logs, Agent Windows Logs, or any combination of these.
- **Publication Status**: Status of the group - Published or Unpublished.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

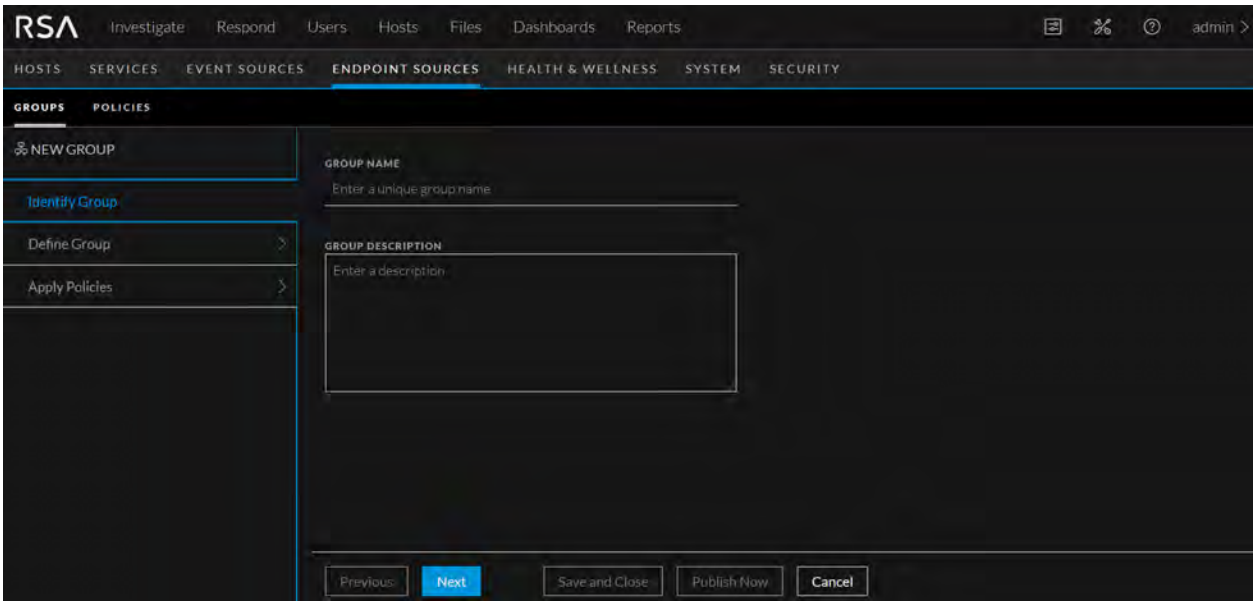
4 **Group Details Pane**

Displays the properties of the selected group.

**Note:** Click the row to view the Properties panel for a group.

## Create Group

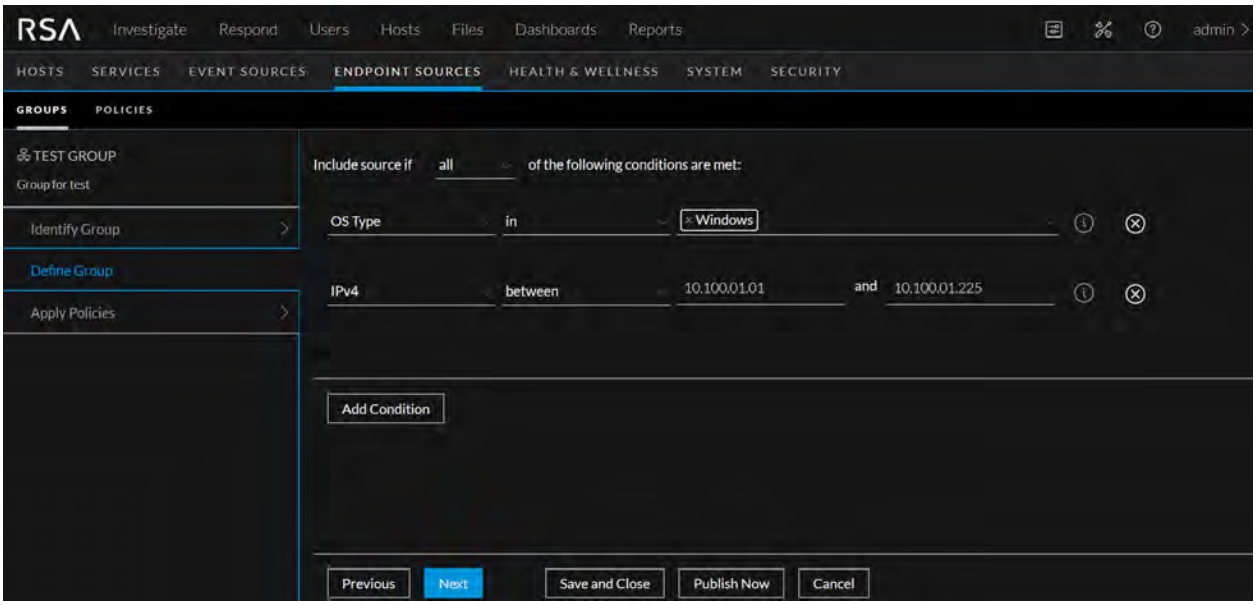
Below is an example of the Create Group dialog. The table describes the information and options in the Create Group dialog.



| Field | Description |
|---|---|
| Group Name | Name of the group. The name should be unique. |
| Group Description | Description of the group and should not exceed 8000 characters. |

## Define Group

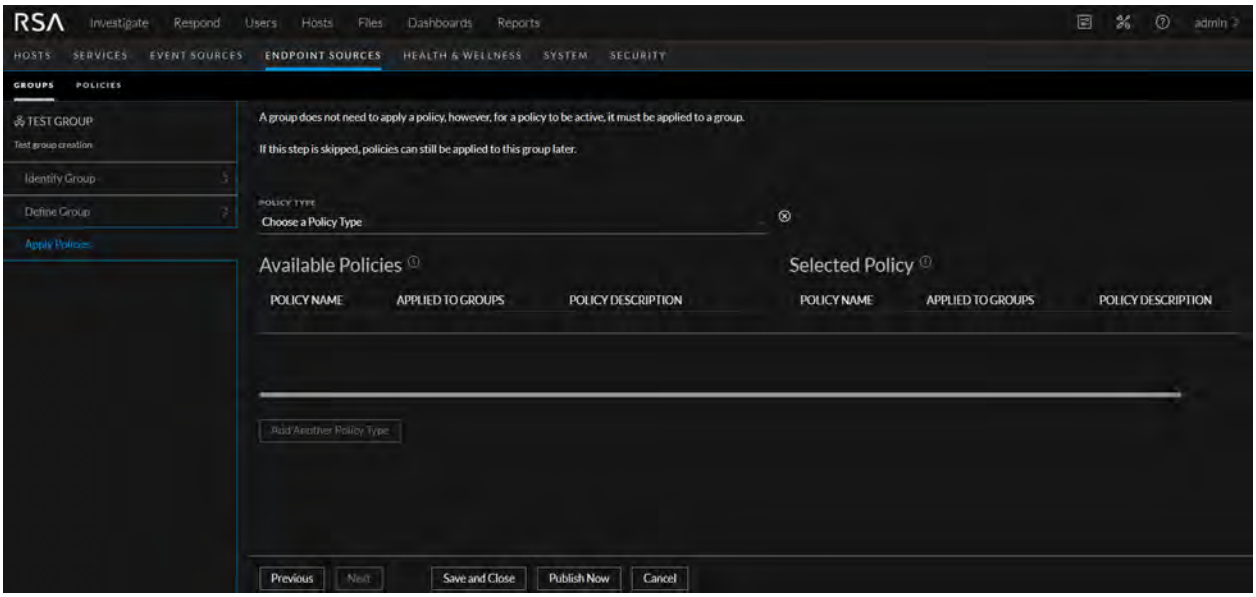
Below is an example of Define Group panel. The table describes the information and options in the Define Group panel:



| Field | Description |
|---|---|
| Include source if ...of the conditions are met | Defines the conditions for an agent to be included in the group. Available options are all or any. |
| Parameter | The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6 or Machine OU.<br>• OS Type - Type of operating system. Available options are: Windows, Linux, and MacOS.<br>• OS Description - Description of the operating system. The description should not exceed 256 characters. Available operators are: is equal to, contains, start with, and ends with. For example, Microsoft Windows 10 Enterprise.<br>• Host name - Name of the host. The host name can contain only alphanumeric characters. Available operators are: is equal to, contains, start with, ends with, and in. For example, DESKTOP-QQPDNG3.<br>• IPv4 and IPv6 - IP address. Available operators are: between, in, not in, and between. For example, 10.40.15.220.<br>• Machine OU - Name of the Machine OU. Available operators are: is equal to, contains. For example, OU=Win10, OU=Contractors, DC=corp, DC=com<br>**Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma. |
| Operator | The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**. |
| Value or values to match | The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text.<br>**Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid. |
| Add condition | Lets you add another condition. |

## Apply Policies

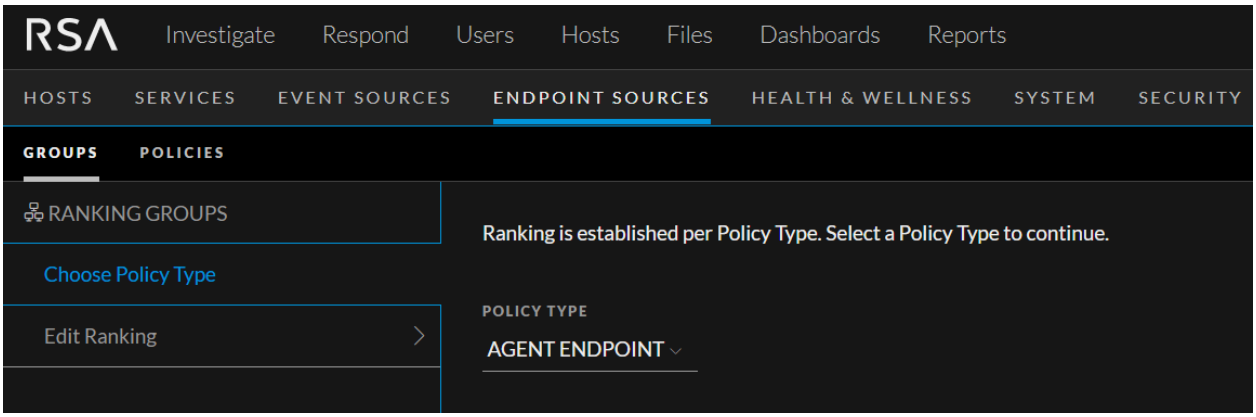
Below is an example of Apply Policies panel. The table describes the information and options in the Apply Policies panel:



| Field | Description |
|---|---|
| Source Type | Defines the source type for the group. Available options are Agent Endpoint and Agent Windows Logs. |
| Available Policies | List the available policies associated with the source type. |
| Selected Policies | List the policies selected. |
| Add Another Source Type | Lets you add another source type. |
| Save and Close | Saves the settings and closes the Create Group dialog. |
| Publish Now | Publishes the created group. |

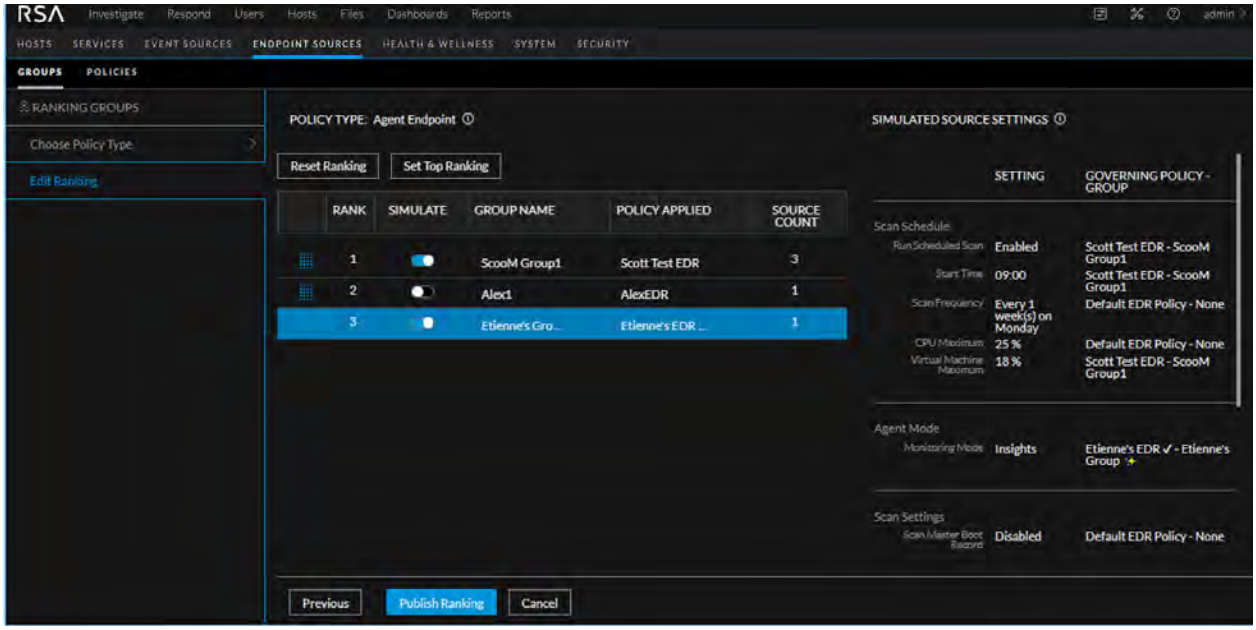
## Ranking Groups

Below is an example of the Ranking Groups dialog. The table describes the information and options in the Ranking Groups dialog.



| Field | Description |
|---|---|
| Source Type | Establishes ranking for the source type. Available options are Agent Endpoint and Agent Windows Logs. |

Below is an example of the Edit Ranking panel.



From this panel, you can do the following:

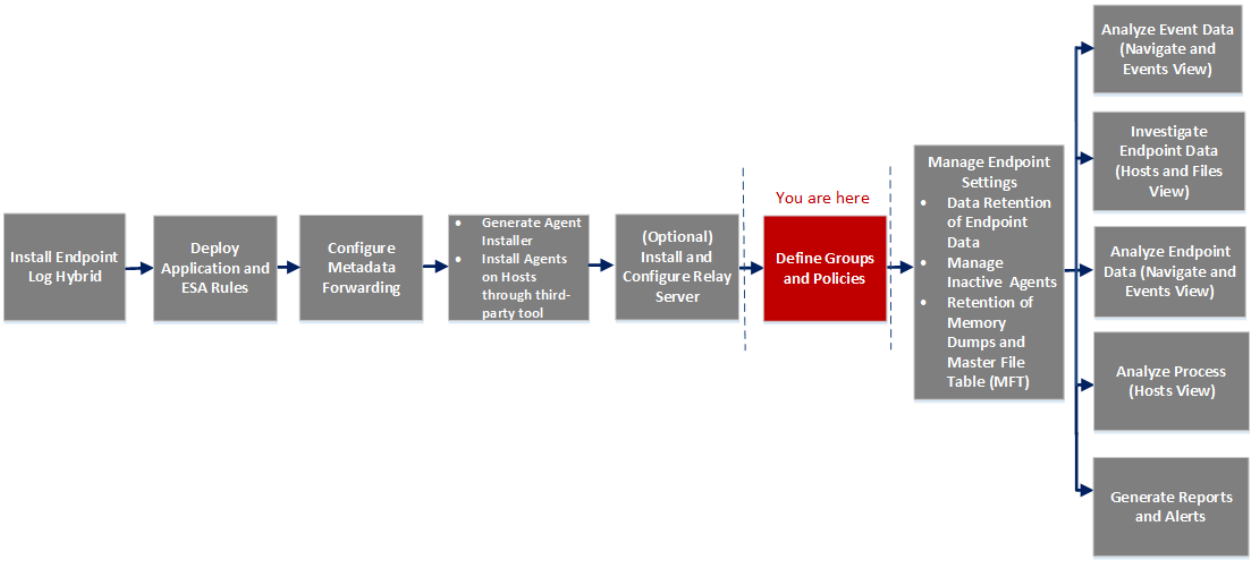
- Drag the group up or down to change the priority. Priority decreases from top to bottom.
- Turn the Simulate slider on or off, to simulate your policy settings and how they affect the endpoints within their groups. For more details, see Simulation Examples.
- Use the available buttons to perform actions:
  - **Reset Ranking**: Resets the ranking to the original order.
  - **Set Top Ranking**: Moves the selected group to the top.
  - **Previous**: Navigates to the Choose Source Type panel.
  - **Publish Ranking**: Lets you edit the details of an existing group. For more information, see Edit a Group.
  - **Cancel**: Discards the changes and returns to the Groups tab.

# Endpoint Sources - Policies

**Note:** The information in this topic applies to RSA NetWitness Platform Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Administrator | create new groups | Create a Group |
| Administrator | edit groups | Edit a Group |
| Administrator | edit ranking | Managing Groups |

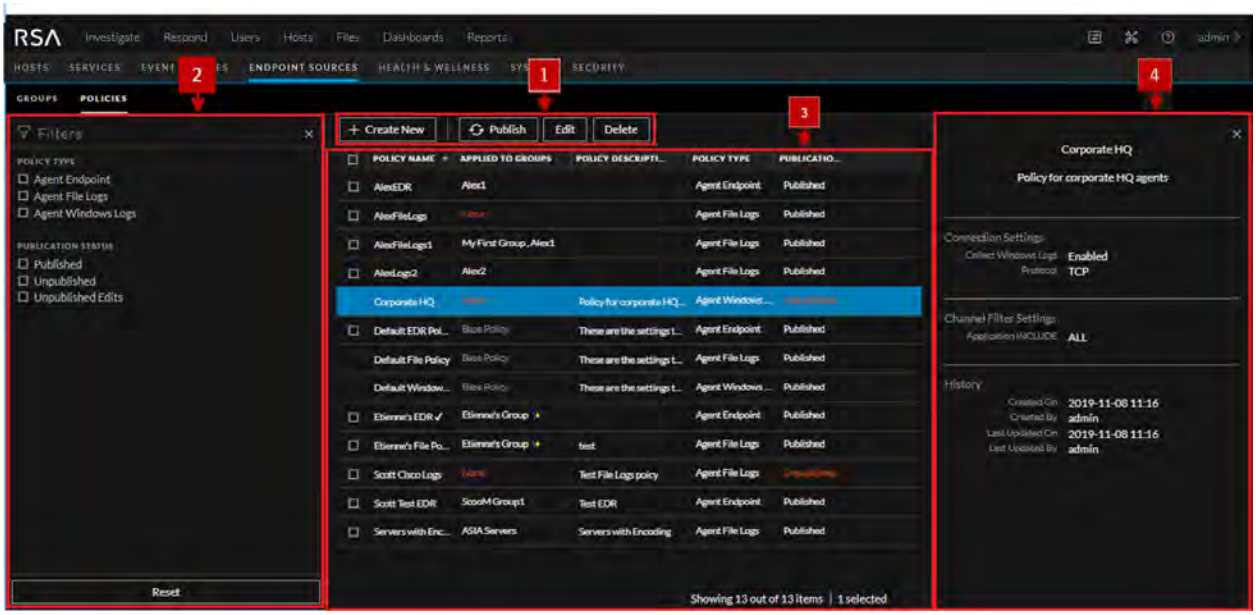
## Related Topics

- Endpoint Sources
- Managing Groups

## Quick Look

Below is an example of the Policies tab:



1 **Toolbar**

- **Create New**: Lets you create a new policy. For more information, see Managing Policies.
- **Publish**: Publishes the selected policy.
- **Edit**: Lets you edit the details of an existing policy. For more information, see Edit a Policy.
- **Delete**: Deletes the selected policies permanently. For more information, see Delete a Policy.

2 **Filter Panel**

- **Filters**: You can filter policies based on Policy Type and Publication Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see Filter Policies.

3 **Policies List Panel**

**Policy View.** Displays the policy details:

- **Policy name**: Name of the policy.
- **Applied to groups**: Lists the group to which this policy is applied.
- **Policy description**: Displays the first portion of the description.
- **Policy type**: Displays the policy type: Agent Endpoint, Agent File Logs, or Agent Windows Logs.
- **Publication Status**: Status of the policy: Published or Unpublished.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

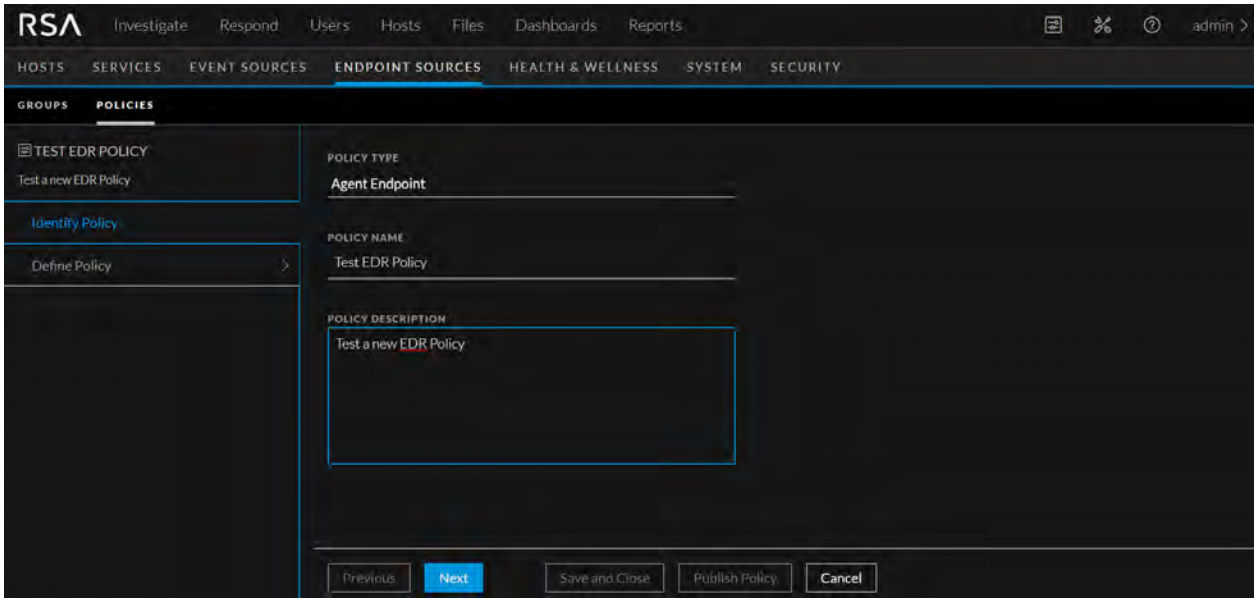
4 **Policy Details Panel**

Displays the properties of the selected policy.

**Note:** To view the Properties panel for a policy, click the Policy Name.

## Create Policy

Below is an example of the Create Policy dialog. The table describes the information and options in the Create Policy dialog.



| Field | Description |
|---|---|
| Policy Type | Displays the type for the policy. Available options are Agent Endpoint, Agent File Logs, and Agent Windows Logs. |

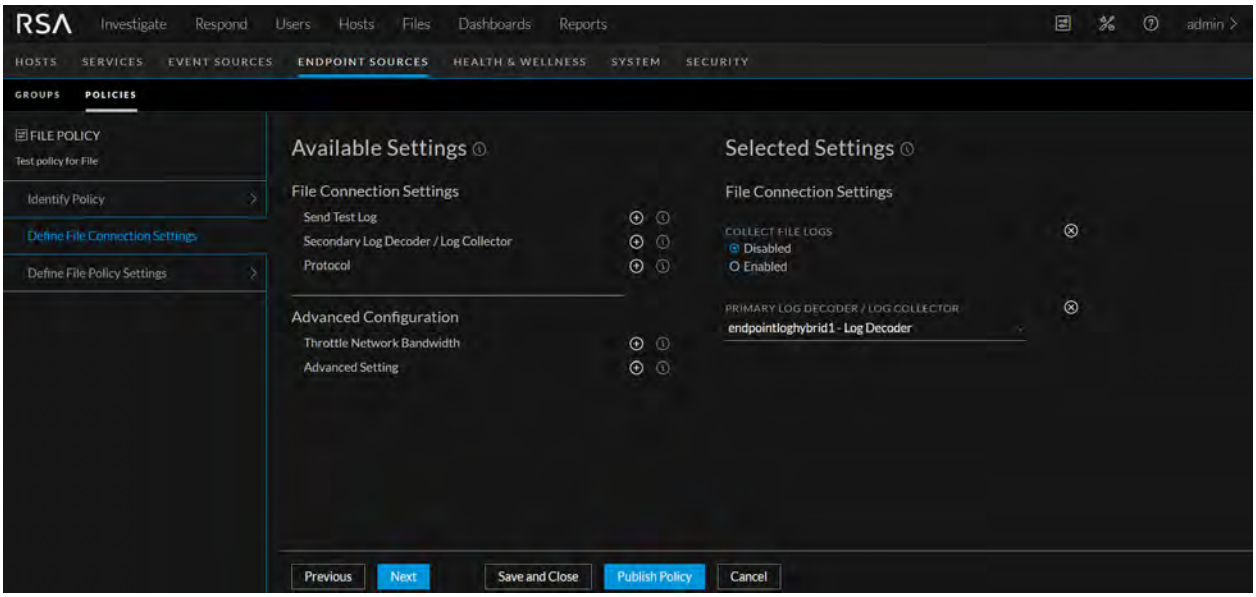
| Field | Description |
|---|---|
| Policy Name | Name of the policy. The name should be unique. |
| Policy Description | Description of the policy. Description should not exceed 8000 characters. |

## Panels for Log File Policy

There are two panels for defining the parameters for an Agent Log File Policy: **Define Connection Settings** and **Define File Policy Settings**.

### Define Connection Settings

Below is an example of Define Connection Settings panel. The table describes the information and available options.

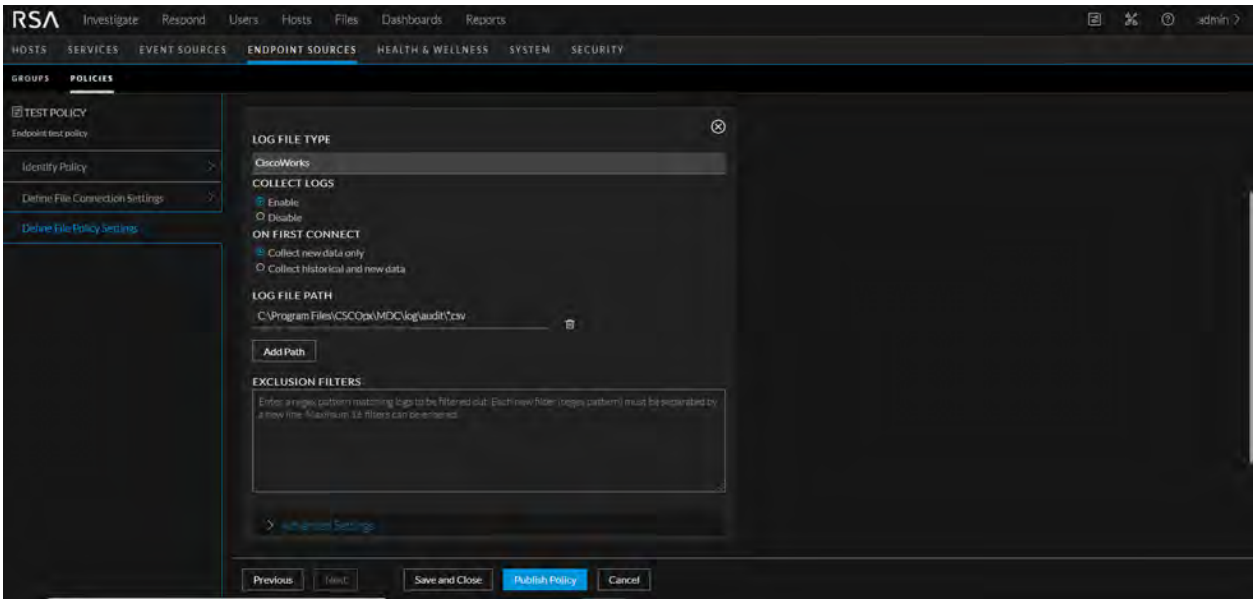


| Field | Description |
|---|---|
| Collect File Logs | If enabled, the log file collection capability of the agent is activated. Logs are collected and forwarded to the RSA NetWitness Platform as they are generated. If disabled, no defined event source logs are collected.<br>**Note:** This option must be enabled for any file event sources to be collected. |
| Send Test Log | If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled. |

| Field | Description |
|---|---|
| Primary Log Decoder / Log Collector | The primary Log Decoder or Log Collector to which the collected file logs will be forwarded. |
| Secondary Log Decoder / Log Collector | If the primary Log Decoder or Log Collector is not reachable, collected file logs are forwarded to the secondary Log Decoder or Log Collector.<br>**Note:** The NetWitness Platform cannot detect failures when UDP protocol is used. |
| Protocol | Select the transport protocol that is used to forward the collected file logs to the NetWitness Platform servers. The following options are available:<br>• SSL: Recommended, but also the most resource-intensive option.<br>• TCP: Sends the logs in clear text over a reliable TCP connection. May be acceptable within a corporate network.<br>• UDP: Sends the log in clear text over a non-guaranteed UDP connection. This is the least resource intensive option.<br>**Note:** Resource intensity is dependent upon the Log Decoder, since there is only a single connection per agent. |
| **Advanced Configuration** | |
| Throttle Network Bandwidth | Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness Platform. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.If not set, Agent does not do any network throttling.If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.<br>  |

| Field | Description |
|---|---|
| Advanced Setting | **Caution:** It is strongly recommended not to use this setting unless advised to do so by RSA. |

## Define File Policy Settings



| Field | Description |
|---|---|
| Log File Type | From the drop-down menu, select the type of event source to be monitored.<br>The list of available event source is based on all the event source types defined on your RSA NetWitness Platform. You can add event source types using the Live Services module. For details, see "Find and Deploy Live Resources" in the *Live Services Management Guide*. |
| Collect Logs | If enabled, log files for this file type instance are collected and forwarded to the NetWitness Platform. File collection must be enabled on each source applying this policy for these specific logs to be collected. |
| On First Connect | Determines whether the NetWitness Agent collects all logs or only newly created logs located in the specified paths upon initial collection. In both cases, new logs are collected.<br>**Note:** Historical logs cannot be collected after an agent has begun collecting logs. |

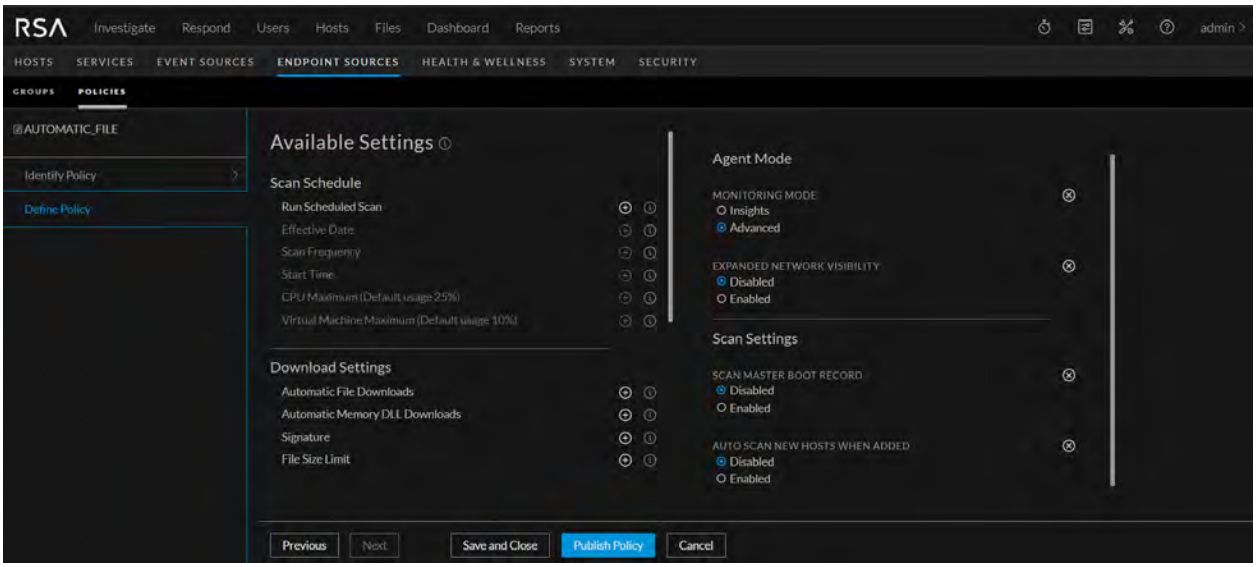
| Field | Description |
|---|---|
| Log File Path | One or more paths to be used by the agent to locate the log files. Represents the location of the log files to be read.<br><br>**Note:** The Path value cannot end at a directory—the final portion of the path must represent a file name or set of files (using wildcard characters). You can use wildcards for both files and directories.<br><br>Each source is limited to entry of 16 paths. This setting must include a path and a file spec. For example: `C:\Program Files\apache-tomcat-*\logs\*.log`. In this case, the file spec is all files with a ".log" extension in the specified path.<br><br>If you cannot use wildcards to specify multiple files, you can add additional paths to accommodate the differences in path locations on a specific endpoint agent. This might be due to installation locations or version information. Only the paths with valid locations and files on the specific endpoint agent are used, and the others are ignored.<br><br>For many event source types, there is a default path. If so, you only need to enter a path if the log files are not stored in the standard directory for that event source type.<br><br>**Note:** This can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). For more details about UNC paths, see Endpoint Sources - Policies below. |
| Exclusion Filters | An optional list of regex patterns which can be used to filter out any logs that match the patterns. Each separate filter should be entered on a new line. Each source is limited to 16 exclusion filters.<br><br>**Note:** Each filter needs to be entered as a valid regex string, or the system does not allow you to save it. |
| **Advanced Settings** | |

| Field | Description |
|---|---|
| Source Alias | Optionally, enter a hostname, IPv4 or IPv6 address to identify individual sources. This is recommended when there are two or more sources of the same type on the same server: For example, a server that runs two instances of Apache web server.<br><br>**Note:** This value only rarely needs to be entered. One example is if you have more than one Web Server, and they are running different Apache servers.<br><br>Note the following:<br>• If you enter a value for this parameter, the event source is applicable to a single Endpoint server.<br>• This optional address or hostname is included in the meta for any logs originating from this source. This can be used by analysts to assist in identifying the source.<br>• Set a value for this parameter if two sources of the same event source type are configured in the same policy.<br>• This setting is not commonly needed: it is only useful if the policy is only applied to a single endpoint. |
| File Encoding | Specifies the type of character encoding of the log files. If **Local Encoding** is selected, the NetWitness Agent uses the default encoding of the Windows machine upon which it is running.<br><br>This setting must match the encoding of the log files, or they will not be processed correctly.<br><br>**Note:** UTF-8/ASCII is recommended (and the default). UTF-8 is a super-set of ASCII<br><br>Note that all logs are re-encoded to UTF-8 before being sent to the NetWitness Platform. |

For a list of the currently supported types, see Currently Supported File Log Event Source Types.

## Define Policy Panel for Agent Endpoint Policy

Below is an example of Define policy panel. The table describes the information and options for Agent Endpoint policy:



| Settings | Description |
|---|---|
| | **Scan Schedule** |
| Run Scheduled Scan | Run a scheduled scan if you want to receive regular snapshots from a host. Scan snapshots provide detailed information about processes and files loaded on the memory. By default, this option is disabled.<br>You can also run a manual scan from the **Hosts** view.<br>**Note:** The following scan schedule options are available only when the scan schedule is enabled.<br>The values entered are specific to the agent time zone. |
| Effective Date | Date when the policy takes effect. If you do not want this policy to take effect as soon as it is applied to a group and published, set an effective date that is in the future. By default, this is set to the current date. |
| Scan Frequency | Determines how often the scheduled scan runs on a host. By default, this is set to every week. Every network is different and the frequency should balance the needs of the analysts for current data, availability to review the data, and how systems deal with the load of the generated data.<br>Select Days or Weeks:<br>• Days: Select the number of days of the scan frequency. You can set a schedule to scan every n days, where n is 1, 2, 3, 4, 5, 6, 10, 15, or 20. For example, to scan every third day, select 3.<br>• Weeks: Select after how many weeks the policy scan should be initiated and on which day of the week the policy scan should initiate. For example, to scan every other Wednesday, choose 2 and W. |
| Start Time | Time when the scheduled scan starts to run on a host. By default, this is set to 9:00. This is the local host time, meaning that scans across a global network will not run all at once. Note that the time is in 24 hour format. To set a time of 7:30 PM, select 19:30. |

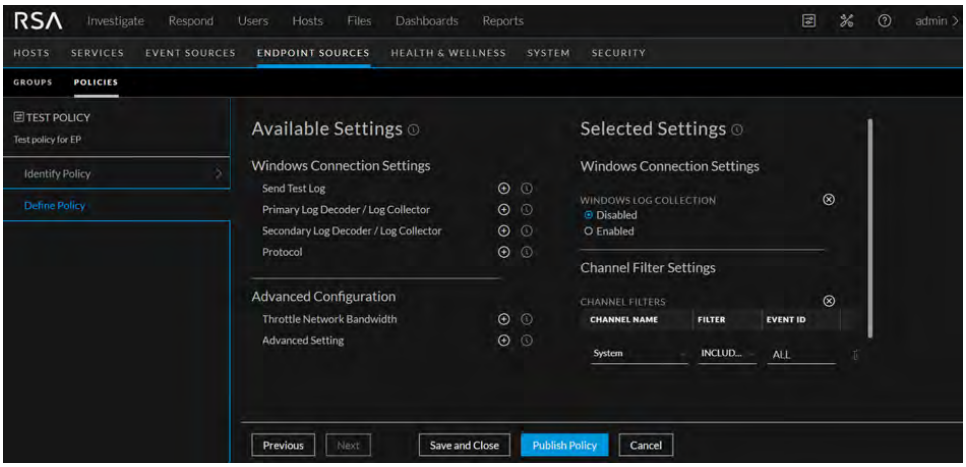
| Settings | Description |
|---|---|
| CPU Maximum | Amount of CPU the agent can use to run scheduled scans on physical hosts. By default, the value is set at 25%. Increasing the CPU maximum increases the speed of scan snapshot retrieval.<br>Drag the slider to specify the maximum CPU usage by the created policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Note that the higher the percentage, the less CPU is available for other tasks on the host. |
| Virtual Machine Maximum | Amount of CPU the agent can use to run scheduled scans on virtual machines. By default, the value is set at 10%. Increasing the virtual machine maximum value increases the speed of scan snapshot retrieval.<br>Drag the slider to specify the maximum Virtual Machine usage by the policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Keep in mind that the higher the percentage, the less CPU is available for other tasks running on the virtual machine. |
| **Agent Mode** | |
| Monitoring mode | Allows you to specify whether an agent should operate in Insights (free) or Advanced mode (license). By default, it is set to Advanced. |
| (Version 11.5 and Later) Expanded Network Visibility | Enables network tracking and monitoring on Windows hosts in Insights mode.<br>**Note:** For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service should be enabled.<br>It also optimizes the frequency of agents sending network events for network packet correlation for both Insights and Advanced modes. By default, this option is disabled. |
| **Scan Settings** | |
| Scan Master Boot Record | Includes Master Boot Record (MBR) details in scheduled scans. By default, this option is disabled. This can help to identify when an operating system boot sequence is compromised. However, not all modifications to the MBR are malicious, as they could be made to provide encryption or enforce licensing of certain legitimate software. |
| Auto Scan New Systems When Added | Automatically scans when a new host is added. By default, this option is disabled. If this option is disabled, no snapshot data is displayed in the **Hosts** view until a manual or scheduled scan is run on these hosts. Existing hosts will not be affected.<br>**Note:** Enabling this option on a new deployment when this policy is applied to a large number of hosts may result in a large number of simultaneous scans that cause performance degradation. |
| **Download Settings** | |
| Automatic File Download | Automatically download the files to the NetWitness Endpoint Server based on the file size and signature. If a file is present on multiple hosts or multiple Endpoint Servers, only one instance of the file is downloaded. By default this option is enabled. |

| Settings | Description |
|---|---|
| Automatic Memory DLL Downloads | From version 11.6.1 and higher, all memory DLLs that are detected during a scan, will be automatically downloaded regardless of the file size. This option is enabled by default. |
| Signature | Limits the download of files based on the signature. The options are :<br>• Exclude All Signed - Downloads all the unsigned files to the NetWitness Endpoint Server and exclude all the signed files.<br>• Exclude only Microsoft and Apple signed - Downloads all the unsigned files and exclude the files signed by Microsoft and Apple.<br>• Include All- Downloads all the signed and unsigned files.<br>**Note:** . In case of Linux, **Exclude all signed** and Exclude **Microsoft and Apple** signed options will download the files that are not part of any installed RPMs or files which are part of RPM but the hashes does not match with RPM. |
| File Size Limit | Limits the download of files based on the file size. The File size should be between 1 KB and 10 MB. By default, file size lesser than or equal to 1 MB are downloaded automatically. |
| **Response Action Settings** | |
| Blocking | Allows an analyst to prevent the execution of a malicious file on any host running an Advanced mode agent. By default, this option is disabled. File blocking will not be enforced if it is disabled by policy, which might be desirable to ensure that there are no performance side effects on systems where CPU or IO performance is critical.<br>**Note:** Blocking is only supported on Windows agent (in Advanced mode) with NetWitness Platform version 11.3 and later. |
| Network Isolation | Allows an analyst to block hosts that are compromised from connecting to the network. This controls the spread of an attack and help analyze the malware behavior after the network isolation. All attempted network connections are monitored and reported to the Endpoint Server. By default, this option is disabled.<br>**Note:** Network isolation is only supported on Windows agent (in Advanced mode) with NetWitness Platform version 11.4 and later. |
| **Endpoint Server Setting** | |
| Endpoint Server | Displays all available Endpoint servers in the deployed.<br>**Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation. |
| Server Alias (Optional) | The optional server alias allows you to enter an alternative hostname or IP address on which the server can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server. |

| Settings | Description |
|---|---|
| HTTPS Port | Port number used for HTTPS communication. By default, the port is set to 443.<br>If you want to change this port, make sure that it matches the server configuration. If you enter the wrong port, the agents can no longer communicate with the Endpoint server and the system will be non-functional. |
| HTTPS Beacon Interval | Determines how often an agent can communicate with the Endpoint server over HTTPS. By default, the value is set to 15 minutes. The default method of beaconing is UDP. Beaconing is used as a method of keep-alive to know if a host is online and to allow hosts to respond faster than the fallback HTTPS beacon time. |
| UDP Port | Port number used for UDP communication. By default, the port is set to 444.<br>If you want to change this port, make sure that it matches the server configuration. Entering the wrong port results in loss of functionality and effects performance. |
| UDP Beacon Interval | Determines how often an agent can communicate with the Endpoint server over UDP. By default, the value is set to 30 seconds. |

## Define Policy Panel for Windows Logs Policy

The table describes the information and options for Agent Windows Logs policy:



| Settings | Description |
|---|---|
| Windows Log Collection | If enabled, logs from the Windows hosts are collected and forwarded to the NetWitness Platform. By default, this option is disabled. |
| Send Test Log | If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled. |

| Settings | Description |
|---|---|
| Primary Log Decoder / Log collector | Primary NetWitness Platform Log Decoder or Log Collector to which the collected Windows logs are forwarded. |
| (Optional) Secondary Log Decoder / Log collector | If the primary Log Decoder or Log Collector is not reachable, the collected Windows logs are forwarded to the secondary Log Decoder or Log Collector.<br>**Note:** NetWitness Platform cannot detect failures when UDP protocol is used. |
| Protocol | Select whether TLS, TCP, or UDP transport protocol is used to forward the collected Windows logs to the NetWitness Platform servers. By default, the protocol is TCP. |
| Channel Filters | Configure which Windows Log events to collect by selecting a channel, filter condition, and the relevant event IDs. You can either select common channels, such as Security or System from the drop-down list, or create custom channels by entering the channel name. By default, all events are collected from a selected channel.<br>To collect a subset of events from that channel replace 'ALL' with the relevant Event IDs. Select **INCLUDE** if only events with the listed Event IDs should be collected or select **EXCLUDE** to collect all events except for these events. |
| **Advanced Configuration** | |
| Throttle Network Bandwidth | Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness Platform. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.<br>• If not set, Agent does not do any network throttling.<br>• If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.<br>  |

| Settings | Description |
| --- | --- |
| Advanced Setting | **Caution:** It is strongly recommended not to use this setting unless advised to do so by RSA. |

# Troubleshooting

This section provides information about possible issues when using RSA NetWitness Endpoint.

## Agent Communication Issues

| | |
|---|---|
| Issue | Agent **Last Seen Time** column is not updated in the UI. |
| Explanation | The issue could be due to any one of the following:<br>• Agent is inactive<br>• Agent data is not processed if the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy** due to which all the agent data including agent last seen time is not updated. |
| Resolution | See the resolution for these statistics in the Health and Wellness Issues section. |

| | |
|---|---|
| Issue | Agent is unable to communicate with the Endpoint Server. |
| Explanation | This could be due to one of the following reasons:<br>• Agent is inactive.<br>• Endpoint Server settings is incorrect in the agent packager or policy configuration, or not available for communication.<br>• Endpoint Server or Nginx Server is not running .<br>• Firewall or IP table rules are blocking the connection between the host and Endpoint Server. |
| Resolution | • Check if the Endpoint Server and Nginx Server are reachable.<br>• If the Endpoint Server settings are incorrect, uninstall the agent, download the agent packager, and reinstall the agent.<br>• Update firewall or IP table rules, if required. |

| | |
|---|---|
| Issue | Agent takes a long time to scan. |
| Explanation | Sometimes, the NetWitness Endpoint scan takes a long time to complete. This is because of the CPU usage by other antivirus programs (such as Windows Defender, McAfee, Norton, and so on) that may be installed on the agent machines. |
| Resolution | It is recommended to whitelist the `<service.exe>` (name provided in the packager, by default, the service name is `NWEAgent.exe`) file in the antivirus suite. |

| | |
|---|---|
| Issue | You want to change the responsiveness of the Agent. |

| | |
|---|---|
| Explanation | Depending on your installation, you can adjust Beaconing intervals to change how responsive your agents are. |
| Resolution | If resources are not a concern, you can lower the HTTPS Beacon Interval and UDP Beacon Intervals. If resources are a concern and responsiveness of the agent is not, you can increase these intervals. |

| | |
|---|---|
| Issue | Agent is unable to generate network tracking events in Insights mode. |
| Explanation | Verify that Windows Management Instrumentation (WMI) service is running. |
| Resolution | • Run `Services.msc` and look for Windows Management Instrumentation (WMI) service.<br>• Go to properties and change the **Startup type** to Automatic. |

# Packager Issues

| | |
|---|---|
| Message | `Failed to load the client certificate.` |
| Issue | Incorrect certificate password. |
| Explanation | While generating the agent installer, the certificate password does not match with the one provided while downloading the agent packager from the UI. |
| Resolution | Specify the correct certificate password. |

# Health and Wellness Issues

## Endpoint Issues

| | |
|---|---|
| Behavior | The health check of the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy**. |
| Issue | Endpoint Server service or required resources are not available or not in a usable state. This could be due to one of the following reasons:<br>• Unable to forward Endpoint meta data to the Log Decoder.<br>• Endpoint Log Hybrid disk usage reaches the specified limit.<br>• Mongo DB is down or excessive read and write errors during processing. |
| Resolution | • For Log Decoder issue, see Log Decoder Issues section.<br>• For disk usage and Mongo DB issues, see Disk Usage and Mongo Issues section. |

## Disk Usage and Mongo Issues

| | |
|---|---|
| Behavior | The health check of the **Data.Application.Connection-Health Application**, **Data Store Disk Usage** or **Data Persistence** for Endpoint Server shows Unhealthy. |
| Issue | • **Data.Application.Connection-Health Application** or **Data Persistence** shows Unhealthy, if Mongo service is down or fails due to authentication.<br>• **Data Store Disk Usage** shows **Unhealthy**, if Endpoint Server Mongo storage size has exceeded the threshold. By default, the server automatically delete the old data when it reaches 80% of the disk space. |
| Resolution | • For **Data.Application.Connection-Health Application** or **Data Persistence** issue, you must check the Endpoint server logs (`/var/log/netwitness/endpoint-server/endpoint-server.log`) and Mongo logs (`/var/log/mongodb/mongod.log`), and:<br>◦ If the issue is due to authentication, you must reissue the certificate. For more information, see "Service Certificate Reissue" section in the *System Maintenance Guide*.<br>◦ If the issue is due to Mongo service is down, you must restart the Mongo.<br>• For **Data Store Disk Usage** issue, you must increase the storage or configure data retention settings to clear the old data. For more information, see Configuring Data Retention Policy. |

## Log Decoder Issues

| | |
|---|---|
| Behavior | Endpoint metadata is not available in the **Investigate > Navigate** or **Events** view. |
| Issue | The health check of the **Log Decoder Buffer** and **Meta Forward** shows **Unhealthy** in the Health and Wellness. |
| Explanation | The issue could be due to any of the following reasons:<br>• Log Decoder capture is not started.<br>• Concentrator aggregation is not started.<br>• Log Decoder connection issue.<br>• Log Decoder buffer usage is beyond the specified limit. |
| Resolution | Make sure that:<br>• Capture is enabled on the Log Decoder.<br>• Aggregation is enabled on the Concentrator.<br>• Meta forwarding is configured properly. |

| | |
|---|---|
| | **Note:** Make sure **Capture Autostart** is enabled in the Service Config view for Log Decoder and **Aggregate Autostart** is enabled in the Service Config view for Concentrator. |

# File Log Policy Issues

## Invalid Policy or Bad Connection Issues

| | |
|---|---|
| Issue | Policies can be invalid for a variety of reasons. Some examples:<br>• No sources found if the policy is enabled.<br>• Invalid or missing typespec file<br>• No destination is reachable for a file log policy event source type<br>Additionally, if capture is stopped on the destination Log Decoder, Endpoint Agents will send an error to the Endpoint Server saying that they failed to connect.<br>Also, if there is a lot of data to be processed for Agents collecting File data (when File Policy is enabled) , there is a possibility that Log Decoder buffer becomes full. If this happens, the Log Decoder cannot process any requests from the Agents communicating via EPS. |
| Explanation | The system is dynamic in nature, which means its state can change: event sources can lose their connection, typespec files can be altered or deleted, and other changes can occur that can invalidate a previously valid policy. |
| Resolution | To help identify the specific issue, check the log file on the Endpoint Server that reports the error:<br>`/var/log/netwitness/endpoint-server/endpoint-server.audit.log`<br>Relevant errors will be listed as **FileLogError** in the log file.<br>If you experience this issue, you can do the following:<br>1. Try to identify and target higher-value data, thus limiting the total amount of data being processed.<br>2. Enable throttling in the File policy to smooth out the peaks in usage.<br>3. If you really do need to process more data on a regular basis, consider server-side hardware upgrades. |

## Reset File Collection Bookmarks

| | |
|---|---|
| Issue | If the system is not configured correctly, NetWitness Platform might collect logs and not be able to parse them. Or, files might get sent, but for some reason, not make it to the Log Decoder (for example if communication is via UDP and there is a network connectivity issue). |

| | |
|---|---|
| | In these and other cases, you can reprocess these "missing" log files. |
| Explanation | For whatever reason, you may need to reprocess logs from the beginning of the file. |
| Resolution | Reset bookmarks for an event source type using the procedure described here: Reset File Collection Bookmarks. |

### Missing Log Collectors and Event Sources in the User Interface

| | |
|---|---|
| Issue | Some log collectors or event sources seem to be missing from the list of available items. |
| Explanation | The Filter drop-down menus (types, log collectors, and log decoders) only show values that are in the event sources database, rather than all possible values. For example, if you have a log collector that has not yet collected any logs, then it is missing from the list. |
| Resolution | Collect logs from a specific log collector and event source, and then they should appear as items in the appropriate menu. |

## Relay Server Issues

### Test Connection Issues

| | |
|---|---|
| Issue | Relay Server test connection failed. |
| Resolution | 1. Check if the hostname or IP and port of the Relay Server are correct.<br>2. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:<br>a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:<br>`nc -zvw3 <relayhost> <relayport>`<br>If the Relay Server is not reachable contact your Administrator.<br>b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:<br>`rpm -qa \| grep <Endpoint Server Revision ID>`<br>c. Make sure if the Relay Server is installed and running.<br>• Verify the Relay Server installation logs using the following command:<br>`/var/log/relay-install.log`<br>• Verify the status of Relay Server using the following command:<br>`systemctl status rsa-nw-relay-server` |

| | |
|---|---|
| Issue | Test fails when installing relay server in cloud, using CentOS 7 configuration |
| Resolution | 1. Check if you have entered the suggested port numbers.<br>2. If you have entered any other port number than the suggested one<br>3. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:<br>a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:<br>`nc -zvw3 <relayhost> <relayport>`<br>If the Relay Server is not reachable contact your Administrator.<br>b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:<br>`rpm -qa \| grep <Endpoint Server Revision ID>`<br>c. Make sure if the Relay Server is installed and running.<br>• Verify the Relay Server installation logs using the following command: `/var/log/relay-install.log`<br>• Verify the status of Relay Server using the following command: `systemctl status rsa-nw-relay-server` |

| | |
|---|---|
| Issue | Relay Server installer generation fails with an error message ‘Unable to download the installer. Retry after sometime’. |
| Explanation | Dependencies of the Relay Server are not resolved or downloaded completely. |
| Resolution | You must retry the download after 5-10 minutes. If the download still fails even after all dependencies are downloaded in the Endpoint Server, contact the RSA Customer Support.<br>**Note:** You can check ‘Finished downloading all Relay Server dependencies’ message in the Endpoint Server logs at `/var/log/netwitness/endpoint-server/endpoint-server.log`, to see if the dependencies are downloaded. If the download fails due to yum related issues, then you must clean yum repo using the command `yum clean all` and restart the Endpoint Server. |

## Installation Issues

| | |
|---|---|
| Issue | Relay Server installation fails due to missing or corrupted dependencies. |
| Resolution | Re-download the installer dependencies, perform the following: |

| | |
|---|---|
| | 1. Go to **(Admin) > Endpoint Server** service > select > **View** > **Explore**.<br>2. In the Endpoint server configuration, make sure **endpoint.relay.installer.download-on-restart** boolean is set to true (by default it is true).<br>3. Restart the Endpoint server using the following command:<br>`systemctl restart rsa-nw-endpoint-server`<br>Fresh dependencies will be downloaded to the local directory in the Endpoint Server. This may take few minutes.<br>4. Download the Relay Installer.<br>5. Run the Relay Server Installation Script.<br>For more information, see (Optional) Installing and Configuring Relay Server. |

# YARA Issues

| | |
|---|---|
| Issue | Failure in saving YARA configuration. |
| Explanation | The rule-folder path is under some Linux user home-directory such as /root or /home/user1. |
| Resolution | Choose other paths such as /var or /tmp etc. or change the owner of the directory to 'netwitness' user. |

# OPSWAT Issues

## Files can not be scheduled for scan

| | |
|---|---|
| Issue | Some files cannot be scheduled for the scan. See Endpoint Configuration Guide > Troubleshooting |
| Explanation | The issue could be due to any one of the following:<br>1. One of the endpoint servers is either down or not responsive.<br>2. OPSWAT is not configured in one or more of the endpoint servers. |
| Resolution | 1. Ensure all the endpoint servers are up and running.<br>2. Ensure OPSWAT is configured in all the endpoint servers. |

## OPSWAT not configured on all endpoint servers

| | |
|---|---|
| Issue | OPSWAT is not configured on appropriate Endpoint servers. |
| Explanation | The issue could be due to any one of the following:<br>1. OPSWAT is not configured in any of the endpoint servers. |

| | |
|---|---|
| Resolution | 2. One or more endpoint servers are down. |
| | 1. Ensure OPSWAT is configured in all the endpoint servers.<br>2. Ensure all the endpoint servers are functioning. |
| | |

## OPSWAT scan results not getting updated

| | |
|---|---|
| Issue | OPSWAT scan is scheduled successfully, but no results are getting updated. |
| Explanation | The issue could be due to any one of the following:<br>1. Either you have selected unsupported file extensions, or some files are larger than the configured file size limit.<br>2. OPSWAT server is either down or not responsive. |
| Resolution | 1. Ensure only the files with supported extensions are selected, and file size has not exceeded the configured maximum file size.<br>2. Contact OPSWAT support for additional information. |

# Appendices

## Reset File Collection Bookmarks

In cases where issues have caused logs to be lost, or not correctly sent to the Log Decoder, you can resend messages in log files by resetting the bookmarks for those log files.

**Note:** For security reasons, RSA does not allow resetting bookmarks from the agents. Rather, you must do so from an Endpoint Server.

The following procedure describes how to reset bookmarks for file collection logs.

**Note:** Currently, you can reset bookmarks for all sources or just one specific source, by providing a list in a JSON file.

### Construct a JSON File to Identify Agents and Event Source Types for Reset

First, you need to construct a JSON file using the following structure:

```
{

     "agentIds": [],
     "sourceType" : ""

}
```

where:

- `agentIds`: a list of the IDs for one or more Endpoint Agents: these are the individual agents on which the source log files reside.
- `sourceType`: this is a list of the file event source type or types for which you want the log file bookmarks to be reset.

For details on finding agent IDs and source types, see How to Find Agent IDs and Source Types below.

For example, the following source code snippet could be used to delete bookmarks for **all** sources on 3 agents:

```
{

     "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
        88AD4B2C-192B-B50E-A125-C05B801301AA"
        "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
     "sourceType": "ALL"

}
```

Similarly, the following source code snippet could be used to delete bookmarks for **apache** sources on 3 agents:

```
{
```

```
    "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
       88AD4B2C-192B-B50E-A125-C05B801301AA"
       "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
    "sourceType": "apache"

}
```

## Reset Bookmarks

Perform the following steps to reset the bookmarks that you specified in a JSON-formatted file:

1. SSH to the NetWitness Platform Admin Server.
2. Run `nw-shell` command. for details about using the NetWitness shell, see the *Shell User Guide*, available in RSA Link.
3. After nw-shell starts, connect to an Endpoint Server service, using the following command:

   `connect --service endpoint-server.`*`serviceID`*

   where *serviceID* is identifier for the Endpoint Server that hosts the agents you are changing. See How to Find Endpoint Service IDs for details on how to retrieve the service ID.
4. Change to the directory where the reset command resides:

   `cd endpoint/command/reset-bookmark`
5. Login with an administrator account.
   a. Type the login command:

      `login`

   b. Enter the user name for your admin account.

   c. Enter the password for your admin account.
6. Run the reset command: you need to provide the JSON path and filename that you created earlier.

   `invoke --file <path and filename for JSON>`

   For example:

   `invoke --file /tmp/test.json`

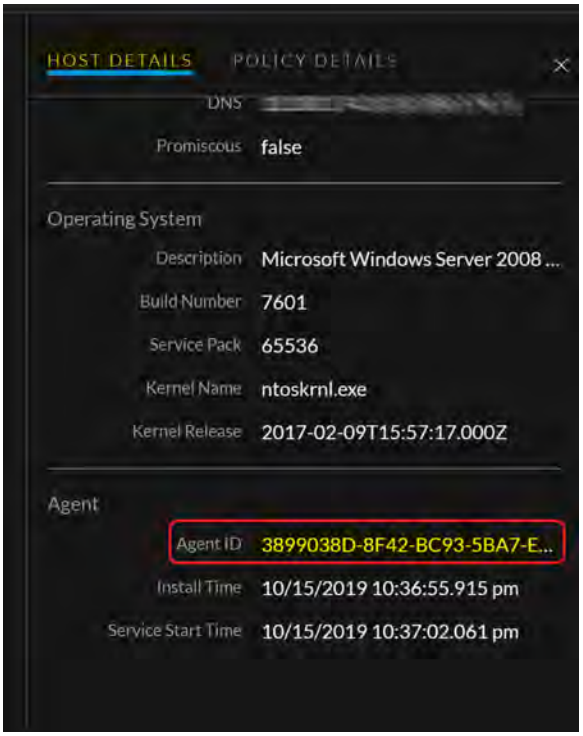
The bookmarks for each log file identified in your JSON file are reset. The following image shows an example NetWitness Platform Shell session:

```
[root@SA ~]# nw-shell
RSA Netwitness Shell. Version: 5.15.0-SNAPSHOT

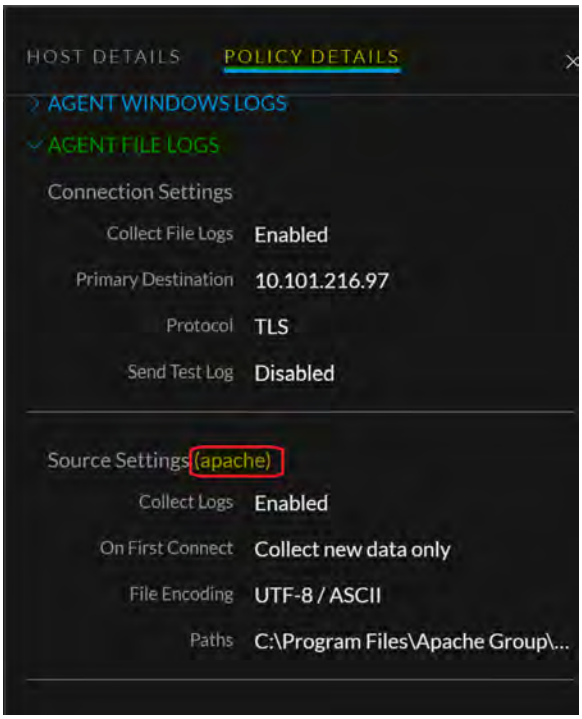
offline » connect --service endpoint-server.38909c2f-7a9b-415a-b567-f49a19cf250e
INFO: Connected to endpoint-server (38909c2f-7a9b-415a-b567-f49a19cf250e)
endpoint-server:Folder:/rsa » cd endpoint/command/reset-bookmark
endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » login
user: admin
password: **********
admin@endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » invoke --file /tmp/test.json
```

## How to Find Agent IDs and Source Types

To find the Agent IDs for agents, go to **Hosts** > ***<select an Agent>***, then click the **Host Details** panel, and scroll down to the **Agent** section, where the Agent ID is shown:



To find the source types, go to **Hosts** > ***<select an Agent>***, then click the **Policy Details** panel, expand Agent File Logs, view the Source Settings for the source type name to use:



## How to Find Endpoint Service IDs

You can retrieve the service ID for an Endpoint Server by using SSH to connect to it.

### To retrieve the service ID for an Endpoint Server:

1. SSH to the NetWitness Platform Endpoint Server for which you need to retrieve the ID. The IP address is available under **(Admin) > Hosts**. The IP address for each host is listed in the **Host** column of the table.
2. View the file that contains the ID by running the following command:

   ```
   cat /etc/netwitness/endpoint-server/service-id
   ```

   It returns the Endpoint Server ID, for example:

   ```
   38909c2f-7a9b-415a-b567-f49a19cf250e
   ```

# Currently Supported File Log Event Source Types

The following event source types are currently supported:

| | | |
|---|---|---|
| Apache Tomcat | Apache Web Server | CA Siteminder |
| CiscoWorks | CiscoWorks | Citrix XenMobile Device Manager |
| Courion Password Courier | EMC NetWorker | EMC Symmetrix |
| GlobalSCAPE EFT Server | IBM TAM WebSEAL | IBM WebSphere |
| IBM WebSphere MQ | JBoss Application Server | Kaspersky Anti-Virus |
| McAfee Endpoint | Microsoft DHCP | Microsoft Exchange |
| Microsoft Exchange 2007 | Microsoft Exchange 2010 | Microsoft Exchange 2013 |
| Microsoft Exchange 2016 | Microsoft Exchange SMTP | Microsoft Forefront Threat Management Gateway |
| Microsoft IAS (TVM) | Microsoft ISA | Microsoft ISA 2006 |
| Microsoft ISA PF | Microsoft SQL Server | MSIAS |
| Oracle Access Management | Oracle iPlanet Web Server | Oracle WebLogic |
| Oracle WebLogic Audit Recorder | Perforce | Perforce AL |
| Perforce P4D | Rapid7 NeXpose | RIM Blackberry Enterprise Server |
| RSA Access Manager | RSA ACE Server | RSA ACE Server |
| RSA ACE Server AM | RSA ACE Server AMX | RSA Adaptive Auth (Hosted) |
| RSA Certificate Manager | RSA Federated Identity Manager | SAP ERP Central Component |
| Steel-Belted Radius Accounting | Steel-Belted Radius Authentication | SunOne LDAP Directory Server |
| Trend Micro IMSS | Trend Micro IWSS | Trend Micro IWSS Audit |
| VMware View | Windows DNS Debug Logs | |

# Specify UNC (Universal Naming Convention) Paths

During configuration of a Log File Policy, you can specify the log file path. You can set one or more paths to be used by the agent to locate the log files. The path can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). This topic describes how to specify a UNC path.

## Secure the UNC Path Location

When you use a UNC path to collect log data on a remote system, make sure that you secure the UNC path location. One solution that works with minimal risk in a Windows domain environment is to do the following:

1. Create a share on the directory on the computer where the log data exists in isolation.
2. Name the share to something like **LOGDATA$** for example. (Shares can be hidden from curious browsers by adding a "$" to the end of the share name).
3. Remove all the default share permissions except local admin so it can be changed.
4. Add a share permission for the agent computer system. This allows any user on the agent system to access the shared location. On the agent system collecting the remote log data, nothing else should be required to properly collect the log data from the UNC path.

**Note:** You may not be able to view the UNC directory contents from file explorer. Seek advice from your IT or security group for additional guidence to setting up and securing a UNC directory share.

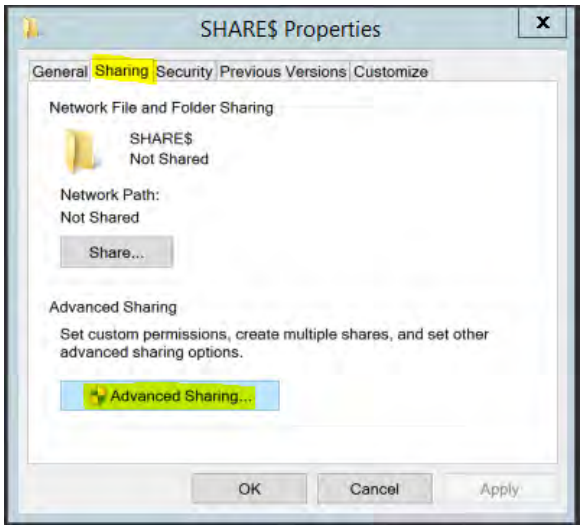
The following procedures describe how to:

- Share a folder between machines in a domain, and
- Share a folder between machines in a Workgroup

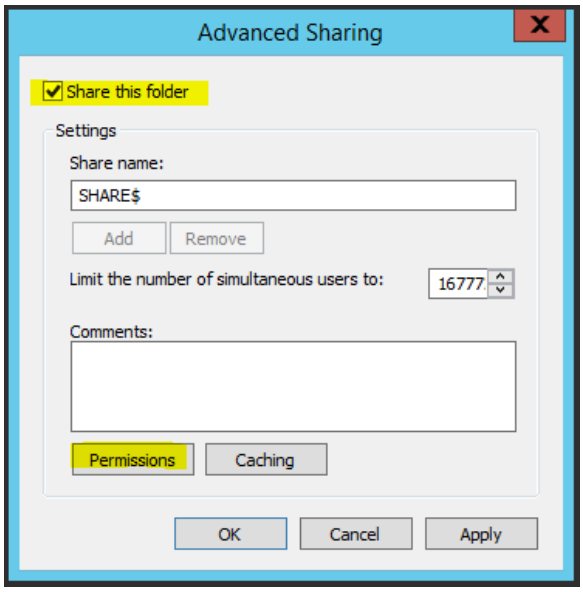
## Share a folder between machines in a domain

This procedure describes how to share a folder between Windows machines that are both in the same domain.

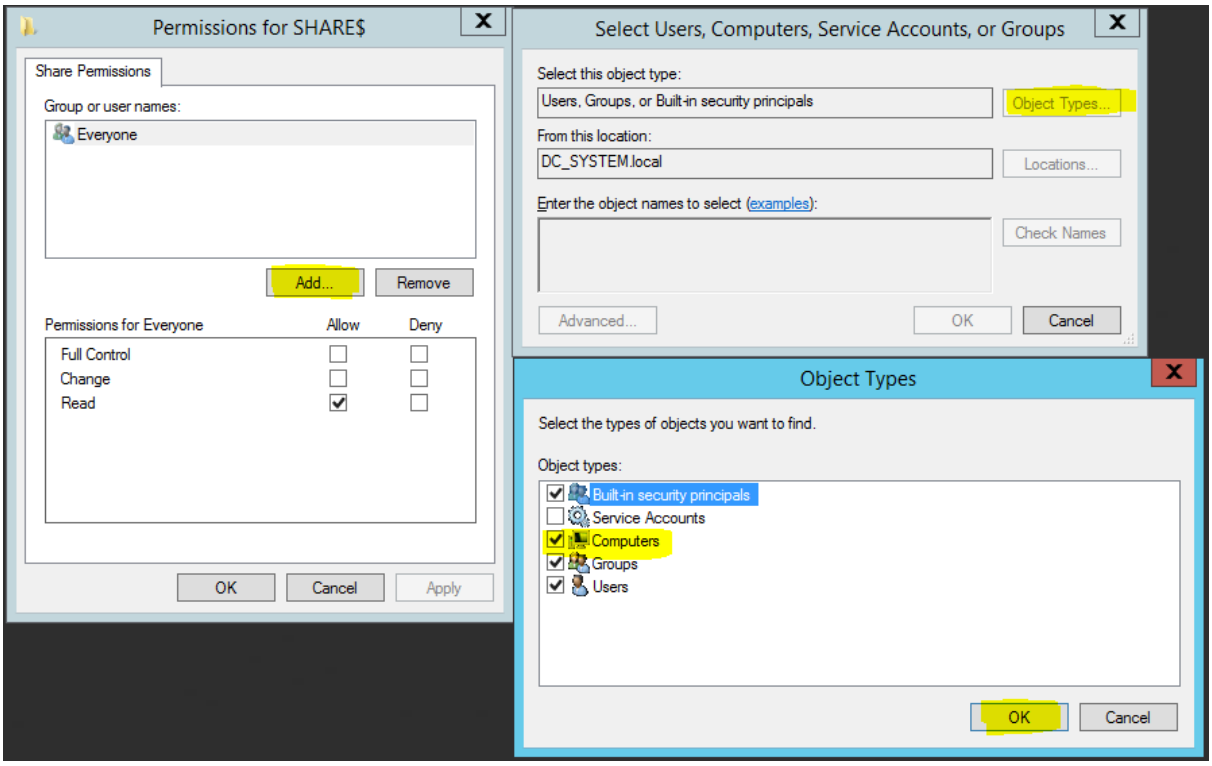
1. Log on to a Domain member machine that contains the logs folder you want to collect using an agent.
2. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.



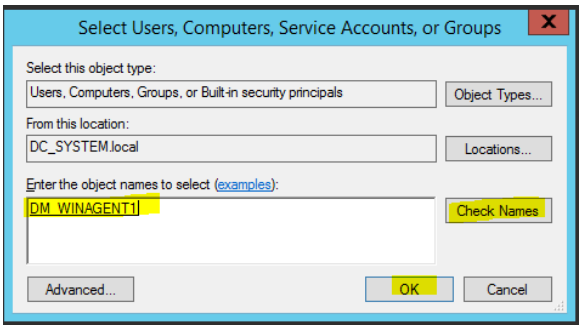
3. Click Advanced Sharing, select Share this folder, and then click Permissions.



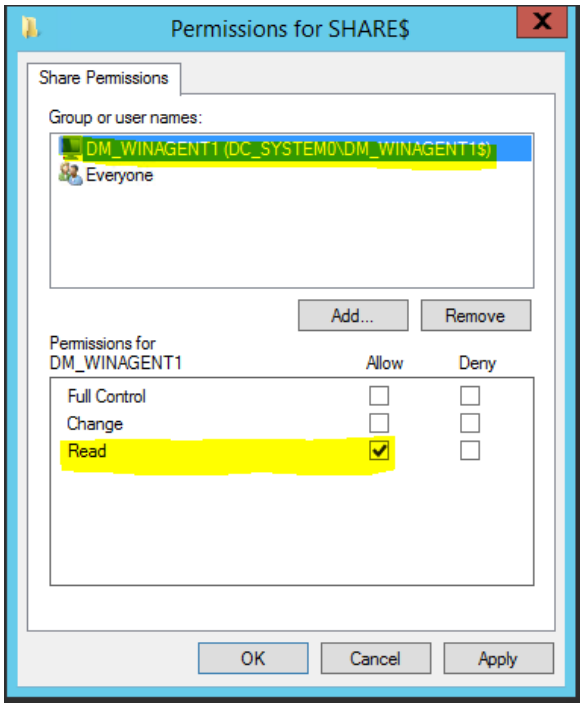
4. Click **Add**, and then on the next window click **Object Types**, check **Computers**, hit **OK**.



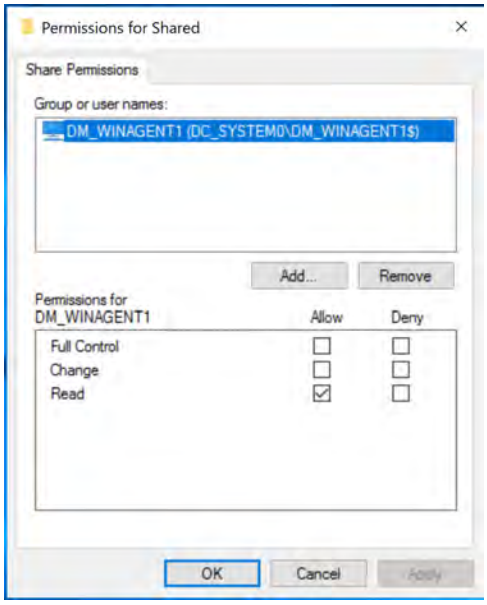
5. Search for the Agent computer name as shown below and click **OK**.



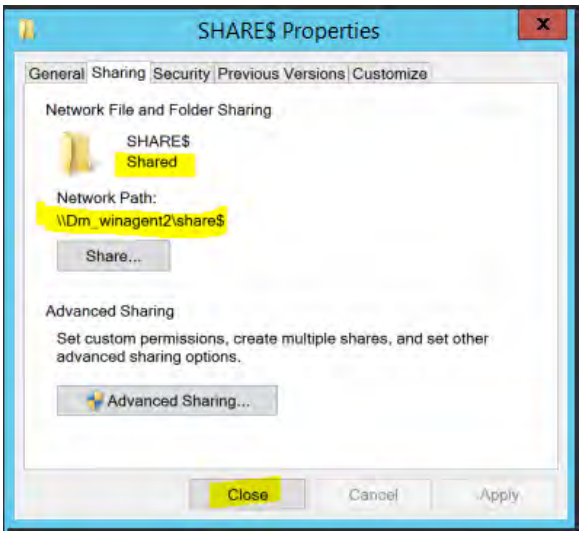
6. In the Permissions screen, provide **Read** permission to the agent, click **Apply**, and then click **OK**.



7. Remove **Everyone** from the Share Permissions list.



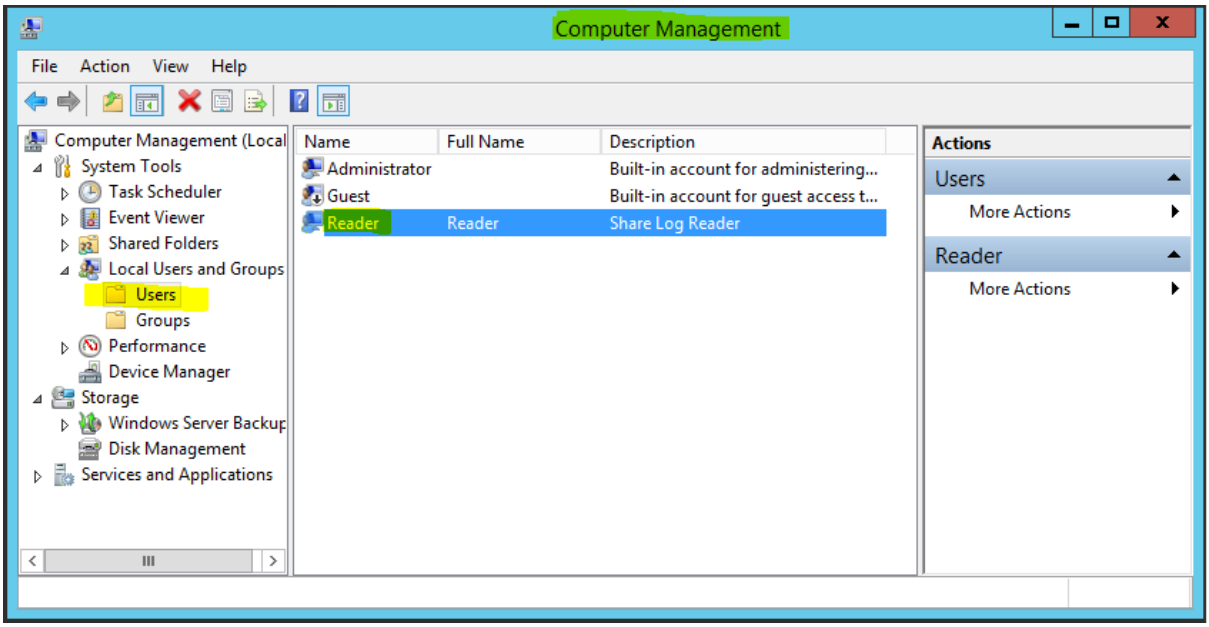
8. Verify that now the **SHARE$** folder status is correct, and note the network path so that you can enter it later, when you configure the policy that will use this shared folder.



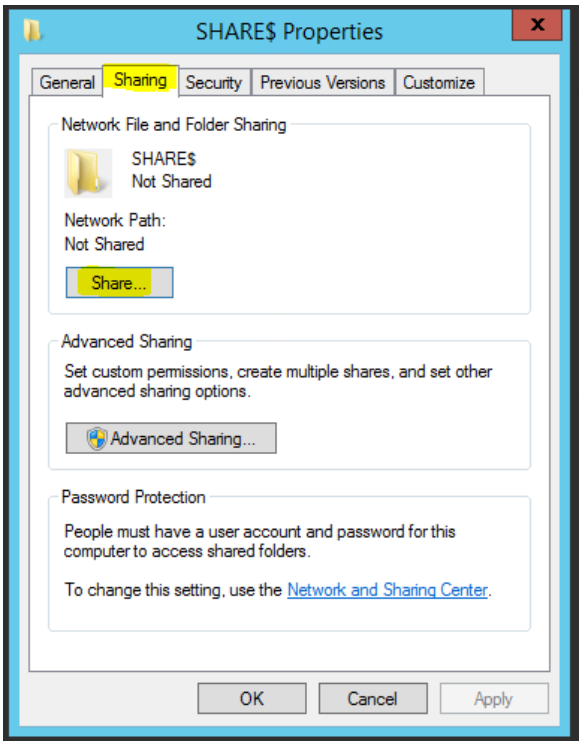
## Share a folder between machines in a Workgroup

This procedure describes how to share a folder between Windows machines that are both in the same Workgroup.

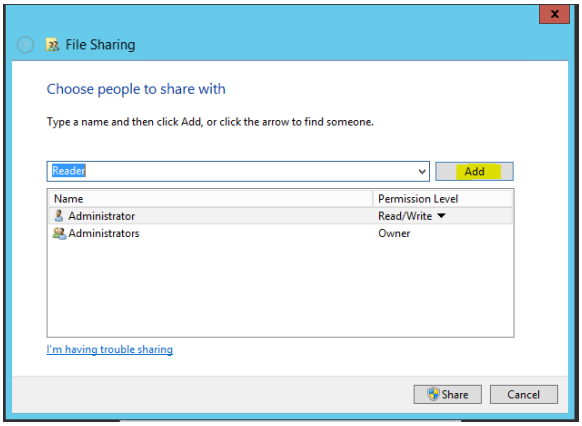
1. Log on to a workgroup machine that contains the logs folder you want to collect using an agent.
2. Create a non-admin user for log collection: **Reader** in this example.



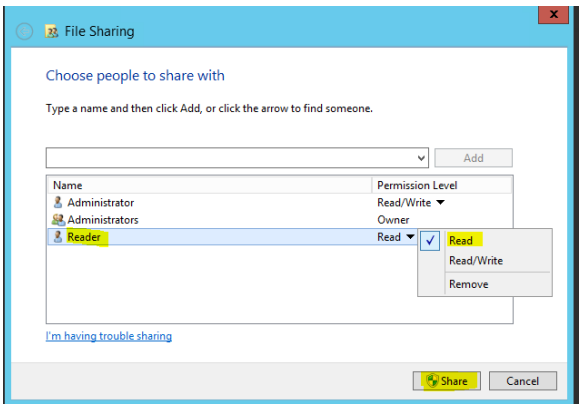
3. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.
4. Click the **Sharing** tab, then click **Share**.



5. Choose the newly-created user and click **Add**.



6. Select the **Read** permission and click **Share**.



7. Log onto the Agent to add credentials, so that the system can read logs from the shared folder.
   a. Download the `psexec` tool from the Microsoft web site.
   b. Run the following command:

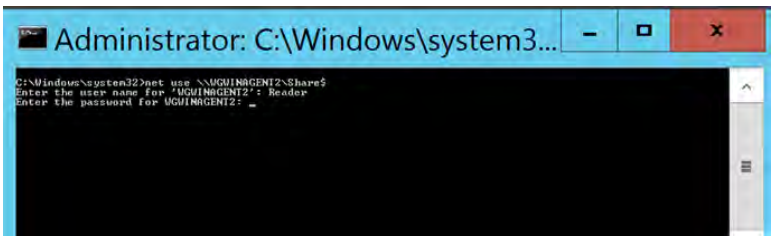
      ```
      psexec -i -s cmd.exe
      ```

      A new command window opens, running as **system**.
   c. In the command window, run the following command to cache credentials for the newly-created user to access logs on shared folder from a workgroup machine:

      ```
      net use \\hostname of machine with logs\Share$
      ```

      For example:

      ```
      net use \\WGWINAGENT2\Share$
      ```
   d. Provide the username and password for the non-admin user created earlier (in step 2).



This command adds credentials to read logs from the shared folder on the workgroup machine.

# What is NetWitness Endpoint?

RSA NetWitness Endpoint is an endpoint detection and response tool that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster.

## About this Guide

This guide provides end-to-end instructions to configure NetWitness Endpoint and to use Endpoint features.

## RSA NetWitness Platform Documentation in NetWitness Community Portal

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the a.

Use these links to view the NetWitness Platform 11.x documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: NetWitness Platform 11.7 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

## Getting Started

The following tasks can be performed in any sequence.

# Introduction

NetWitness Investigate provides data analysis capabilities in NetWitness, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

**Note:** In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

## Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

| Operating System | Scan Categories | Tracking Categories |
|---|---|---|
| Windows | file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, and suspicious threads | • Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.<br>• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.<br>• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`, `Modifies Startup Folder Location`, `Modifies Winlogon Registry Settings`, `Registers Time Provider Dll`, `Registers Port Monitor Dll`, `Registers Netsh helper Dll`,<br>• System event - Reports IP change and boot events.<br>• Network event - TCP/UDP and incoming/outgoing.<br>  • Reports outbound and inbound network connections on all supported Windows platforms.<br>  • Reports IPv4 and IPv6 connections.<br>• Console event (for Windows 8 and later) - User input that is entered into a console application, such as `cmd.exe`, `powershell.exe`, is captured and reported with the context `console.local`.<br>  Commands executed by `cmd.exe`, `powershell.exe` as a result of inter-process communication through anonymous pipes are captured and reported with the context `console.remote`.<br>  For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`. |
| Linux | file, autrorun, loaded library, systemd, process, cron, initd, and machine | - |

| Operating System | Scan Categories | Tracking Categories |
|---|---|---|
| Mac | file, daemon, process, task, dylib, autorun, and machine | • Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.<br>• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.<br>• Network event - TCP/UDP and incoming/outgoing.<br>  • Reports outbound and inbound network connections on all supported Mac operating system.<br>  • Reports IPv4 and IPv6 connections. |

For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

## Risk Score

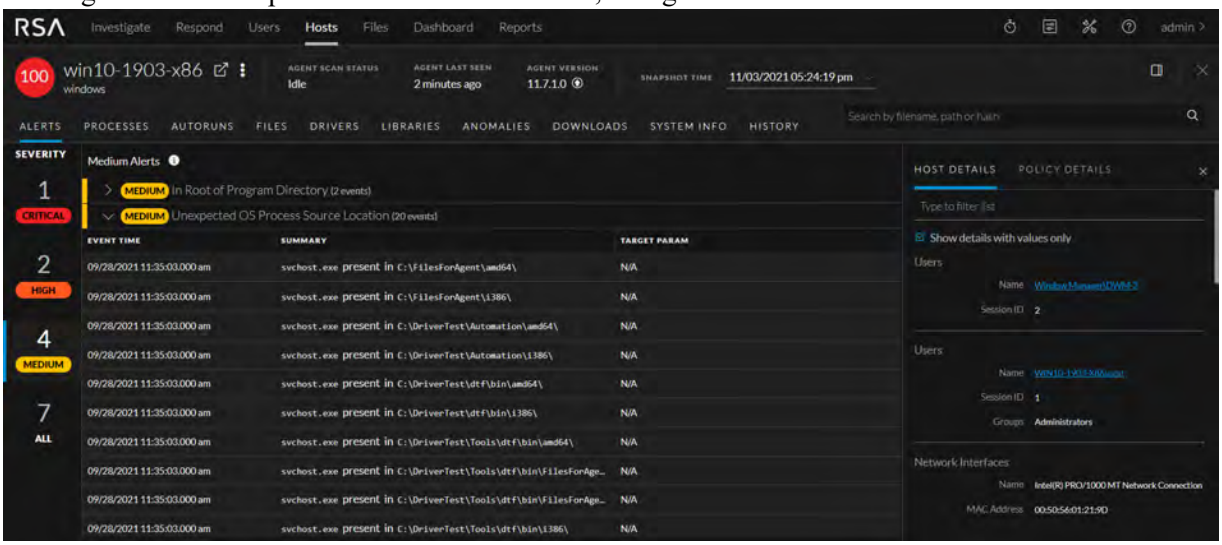
Analysts can use the risk score to begin an investigation on hosts and files. RSA uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

**Note:** If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.

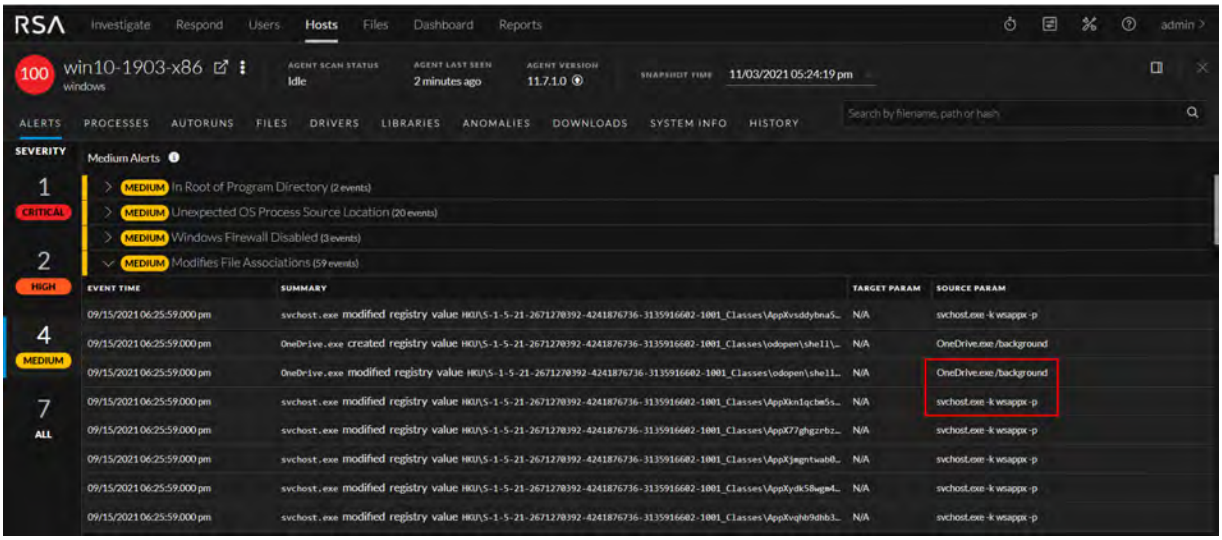
The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

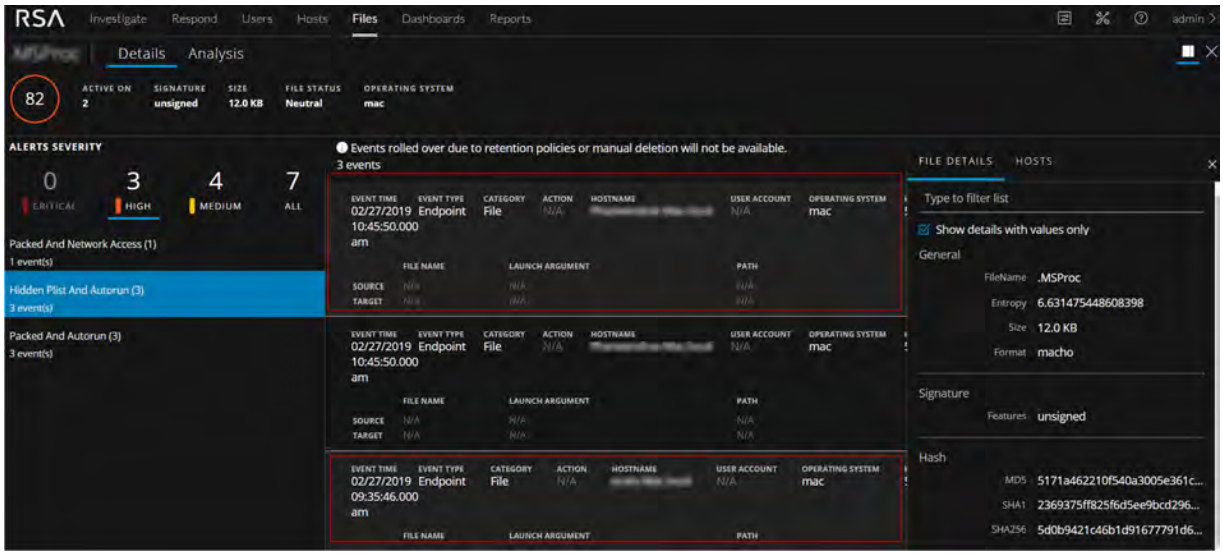
This figure is an example of a host with 1 Critical, 2 High and 4 Medium distinct alerts.



All the distinct alert shown in the above example can be for the same file or different files. For example, Modifies File Associations alert is triggered for files, such as `svchost.exe` and `OneDrive.exe`.



This figure is an example of files with distinct alerts. Each file can have a multiple distinct alerts. The files can have a same alert name being triggered by two different hosts as shown below.



The risk score is reset when you perform any of the following actions:

- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Besides the above factors, the risk score is reset when a file no longer matches Yara rules in the subsequent scans

**Note:** When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

**Note:** For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.

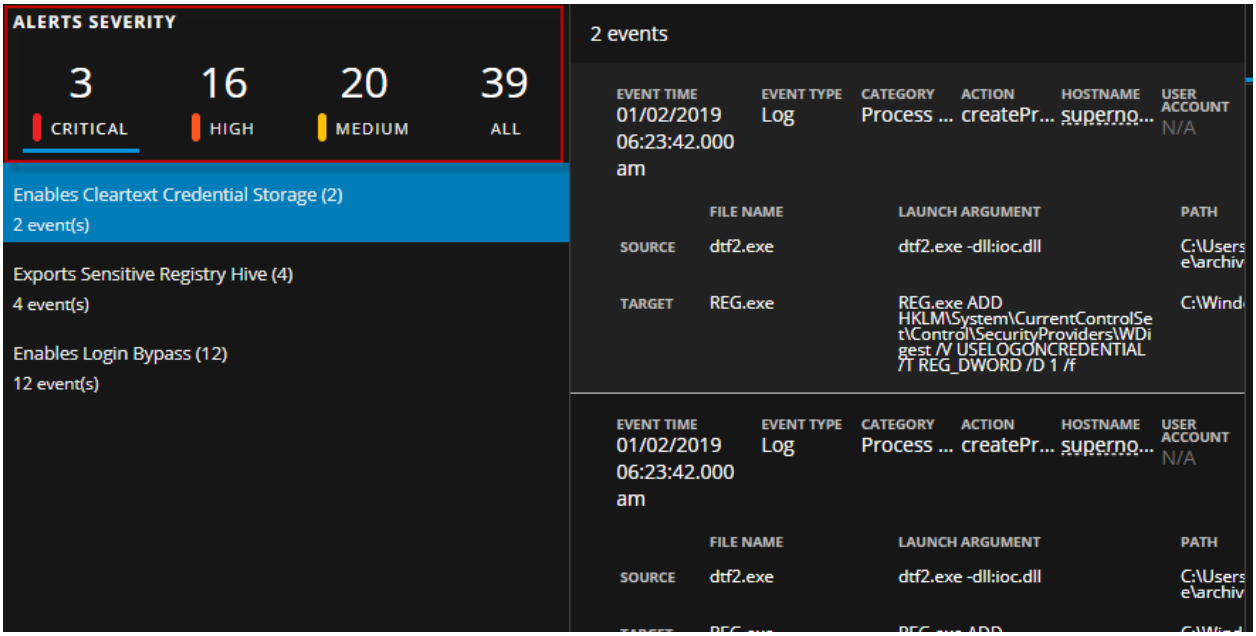
**Note:** For the accurate risk score calculation, the default multi-valued meta keys are required on the ESA Correlation service. For more information, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" section in the *ESA Configuration Guide*.

## Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

| Severity | Color | Risk Score Range |
|---|---|---|
| Critical | Red | 100 |
| High | Orange | 70-99 |
| Medium | Yellow | 31-69 |
| Low | Green | 0-30 |

The following is an example of alerts contributing to the risk score:



In the above example, there are three distinct critical alerts. For each alert type, associated events are displayed. You can see that the "Enables Cleartext Credential Storage" alert was triggered twice. The details of the two events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

## Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

**Global Risk Score** - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

**Local Risk Score** - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

## Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

# File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

| Reputation | Description |
|---|---|
| Malicious | File hash is labeled as malicious. |
| Suspicious | File hash is suspected to be malicious. |
| Unknown | File hash is not known. |
| Known | File hash information is known to the file reputation service and does not have any previous bad record. |
| Known Good | File hash information is known good, such as files signed by Microsoft or RSA. |
| Invalid | File hash format is invalid. |

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide*.

**Note:** The File Reputation service supports maximum of 10 million files for a reputation of file hash.

# File Status

To help analysts triage and focus on their investigation, NetWitness provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.
- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

For more information, see Changing File Status or Remediate.

## Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB. For more information, see Changing File Status or Remediate.

## Network Isolation

If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. By isolating the host, you can control the spread of an attack and analyze the malware behavior. When a host is isolated, only connection to the following IP addresses are allowed:

- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, and 255.255.255.255.
- Other IP addresses that you include in the exclusion list.

In the isolated state, all events are reported to the Endpoint Server retaining full visibility into activities on the host. You can continue investigation by requesting scans, downloading MFT, files, and so on. The following metadata is added to the network events:

- network.isolated - indicates that the host is isolated.
- network.connectallowed - indicates that the network connection is allowed as the IP address is included in the exclusion list.
- network.connectblocked - indicates that the network connection is blocked.

**Note:** If the agent is enabled for log or file collection, make sure that you add the Log Decoder IP addresses in the exclusion list while you isolate the host.

For more information, see Isolating Hosts from Network.

# Focusing on Endpoint Analysis

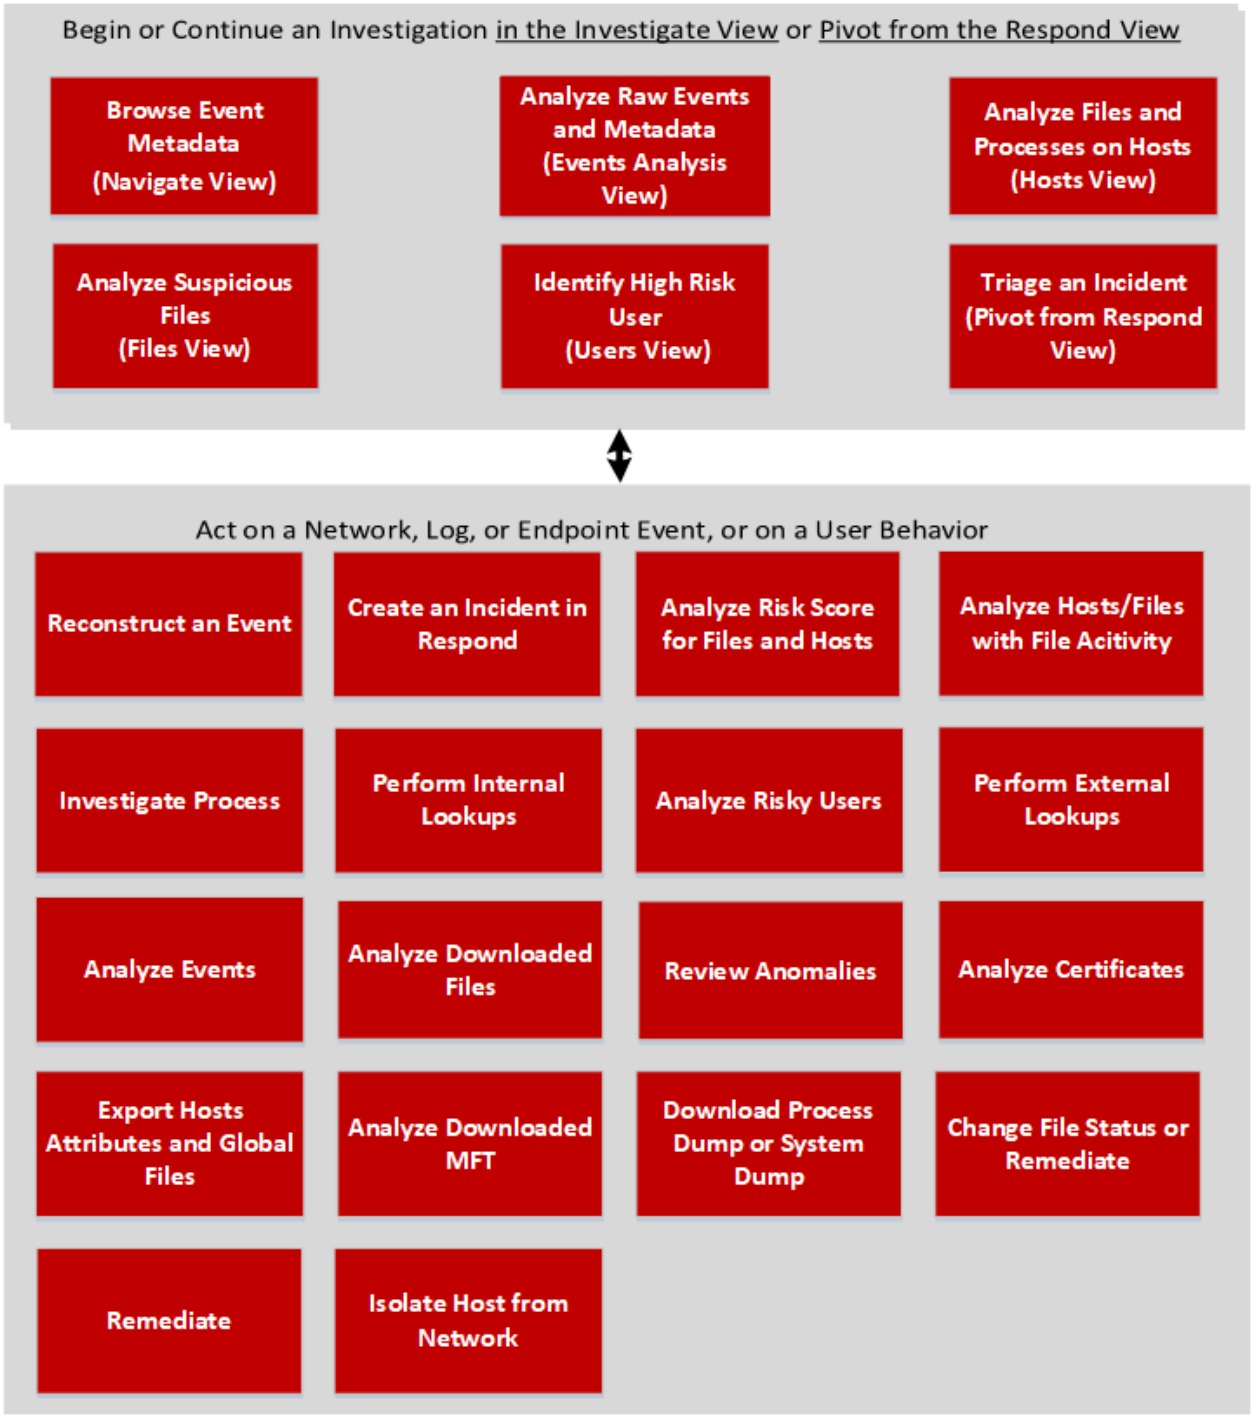
This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**Files**). (See Investigating Files.)

**Note:** To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.



Begin or Continue an Investigation in the Investigate View or Pivot from the Respond View
Browse Event Metadata (Navigate View)
Analyze Raw Events and Metadata (Events Analysis View)
Analyze Files and Processes on Hosts (Hosts View)
Analyze Suspicious Files (Files View)
Identify High Risk User (Users View)
Triage an Incident (Pivot from Respond View)
Act on a Network, Log, or Endpoint Event, or on a User Behavior
Reconstruct an Event
Create an Incident in Respond
Analyze Risk Score for Files and Hosts

Export Hosts Attributes and Global Files
Analyze Downloaded MFT
Download Process Dump or System Dump
Change File Status or Remediate
Remediate
Isolate Host from Network

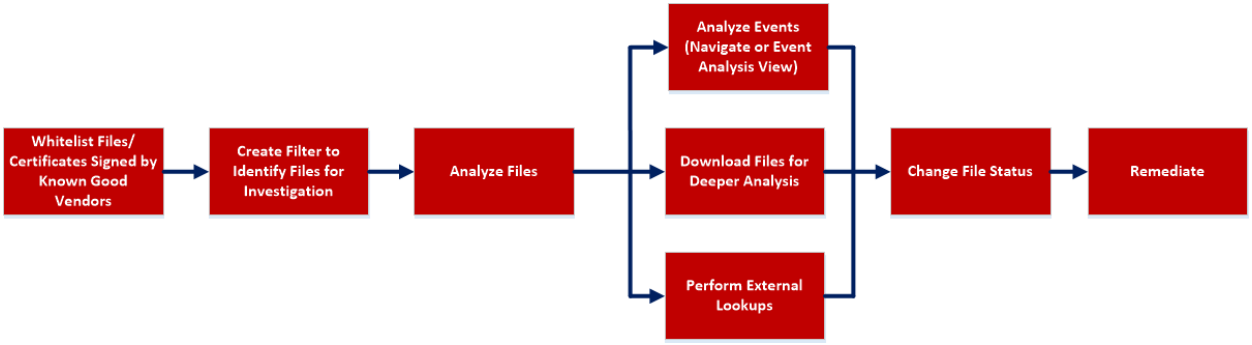
# Investigating Files

**Note:** The information in this topic applies to NetWitness Version 11.3 and later.

The Files view provides a holistic view of all files in your deployment. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

## Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:



- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  **Note:** Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may require further investigation. You can also sort or filter using On Hosts column to narrow down the search during investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.

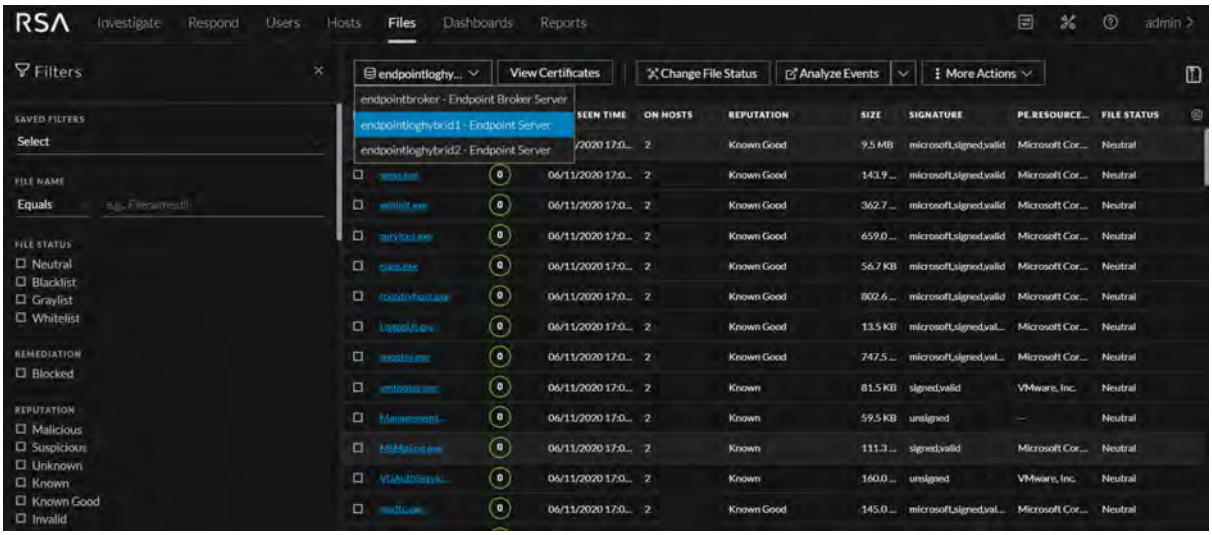
f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Events view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Investigate files using a rule-based detection technique. YARA helps to identify threats effectively using easy-to-create malware descriptions called YARA rules. For more information, see Analyze Files Using YARA.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

## View Files

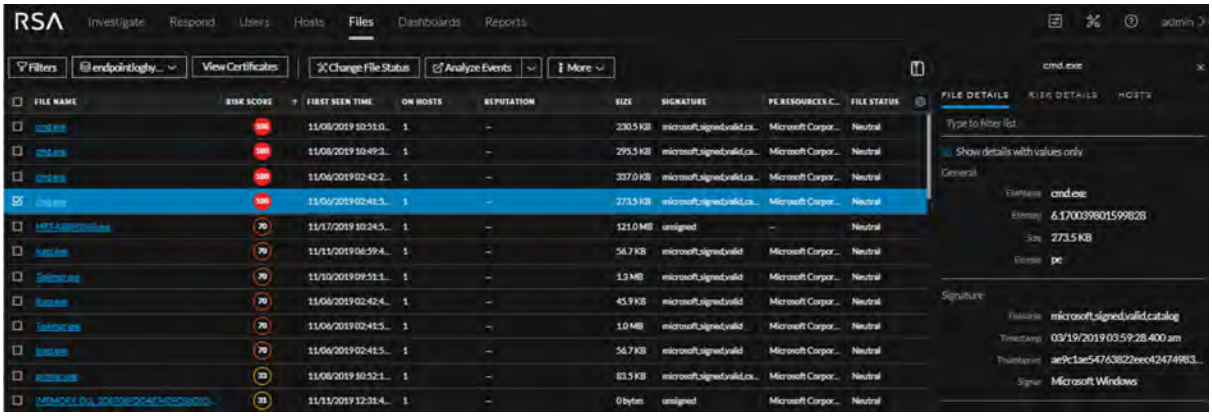
You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **Files**.
2. Select one of the following:



- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

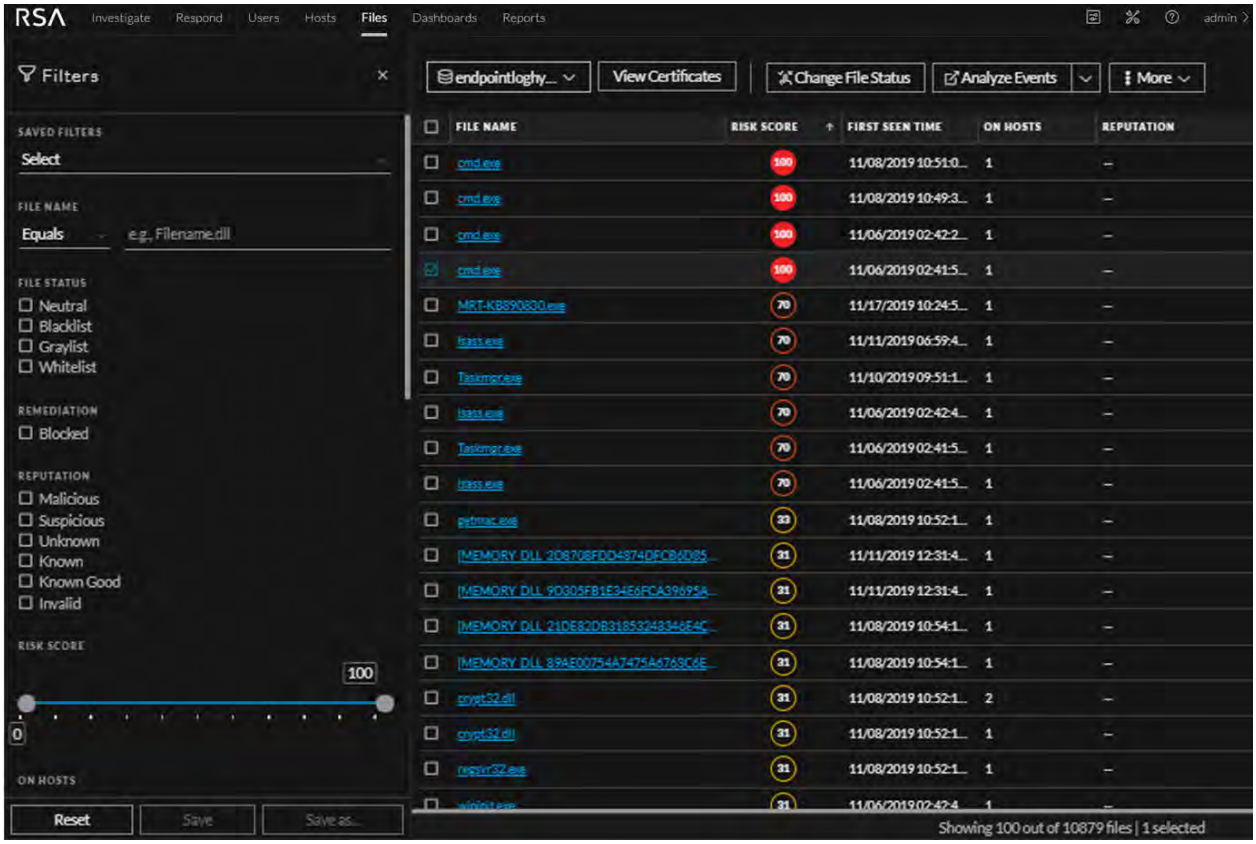


- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

## Filter Files

You can narrow down the investigation by filtering files using file name, on hosts, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), downloaded status, and YARA rules.

**Note:** While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, File Status, On Host, and Reputation Status.



Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

**Note:** Special characters are not allowed in the filter name except underscore ( _ ) and hyphen (-) while saving the filter.

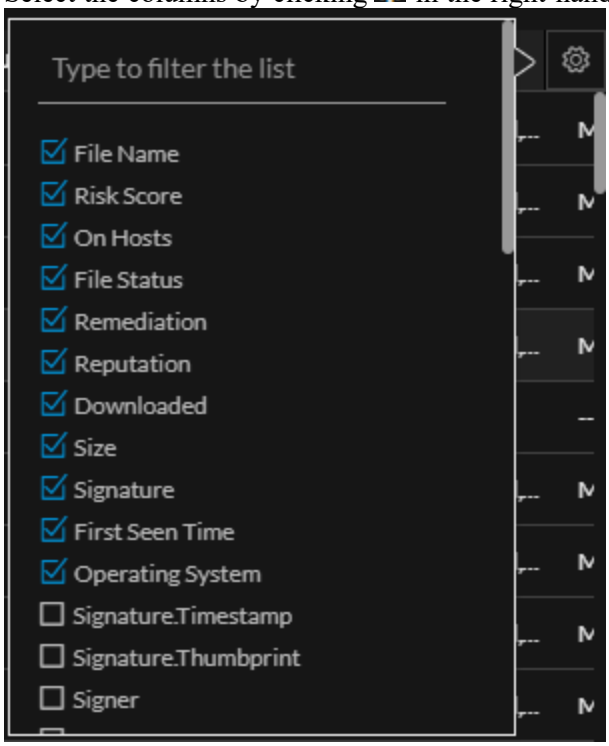
For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

**Note:** For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

## Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner.



3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

## Analyze Files Using the Risk Score

To analyze files using the risk score:

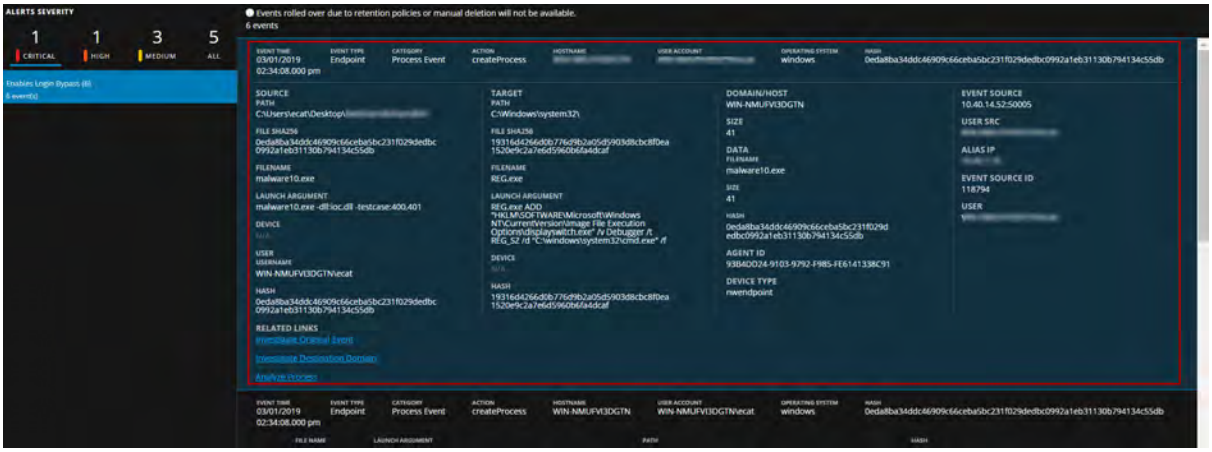
1. Go to **Files**.

   The Files view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the hostname to investigate the host.

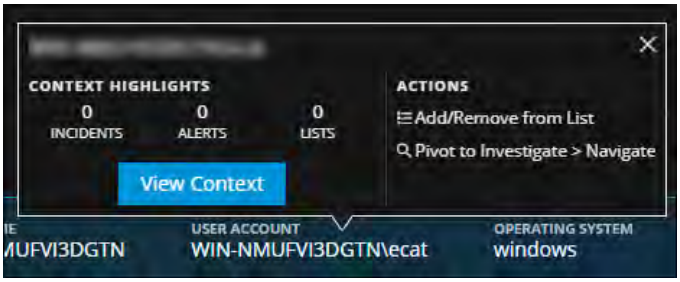
     The Details tab is displayed.
4. In the **Alert Severity** panel, click the alert severity, such as **Critical**, **High**, **Medium**, or **All**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

**Note:** Only the latest 1000 events are displayed.

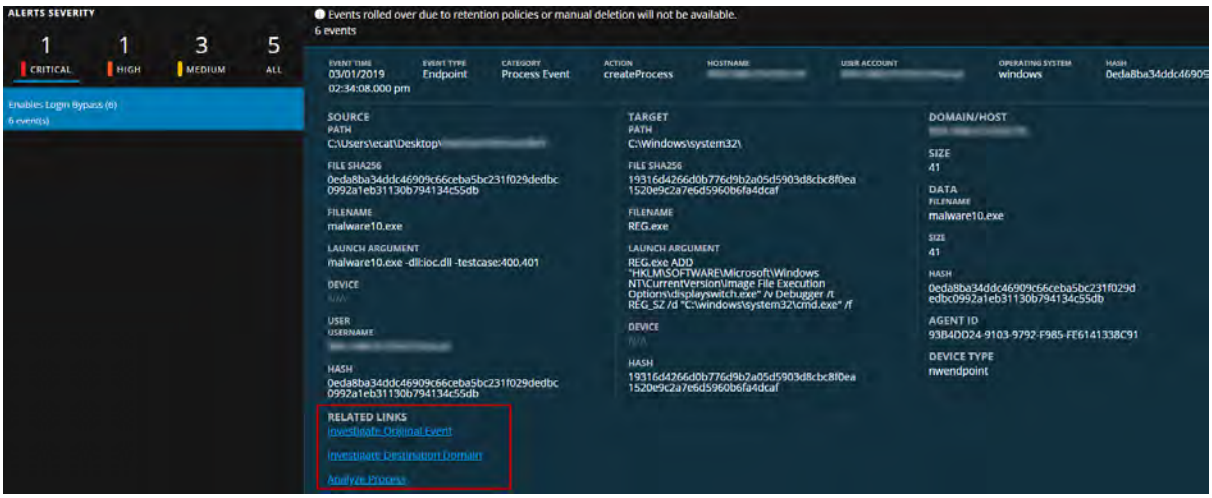
6. To view all the metadata associated with a specific event, click the event header. The information such as source path, target path, filename, and others is displayed.



7. Hover over one of the meta values for IP, Hostname, Mac, File name, File hash, User, and Domain to view additional information about the specific metadata. A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.



8. To investigate the original event and destination domain of the event, do any of the following:



- To reconstruct an event in a readable form that matches the original, click the **Investigate Original Event** link highlighted in blue. For more information on event reconstruction, see the *NetWitness Investigate User Guide*.
- For details about the elements associated with an event, click the **Investigate Destination Domain** link highlighted in blue. For more information on Contextual Information for an Event, see the *NetWitness Investigate User Guide*.

  **Note:** Investigate Destination Domain link is not displayed if there is no domain.dst event.
- To view a list of processes captured on the hosts and investigate a particular process, click the **Analyze Process** link highlighted in blue. For more information on process analysis, see Investigating a Process.

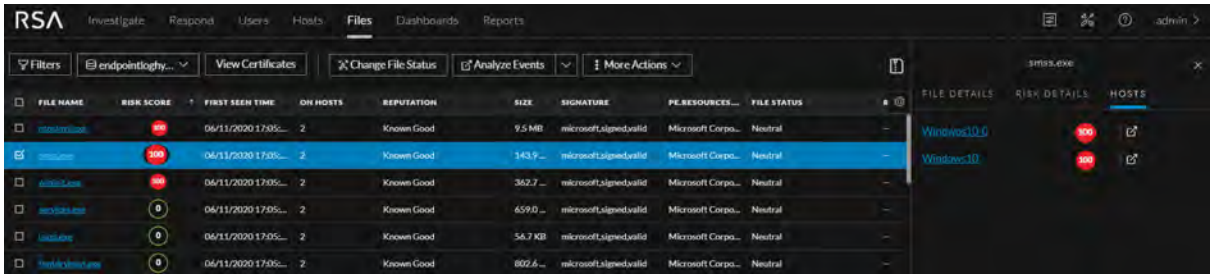
  **Note:** Analyze Process link is not displayed if there is no createprocess event.

## Analyze Hosts with File Activity

To view the list of hosts on which a file exist, do the following:

**Note:** By default, the system detects the best data source for the On Hosts aggregation. To change the data source, in the Explore view, modify the investigate service ID under `endpoint/investigate`.

1. In the **Files** tab, click the row for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts along with the risk score are displayed.



3. Click the host name to open the host details.
4. Click to analyze events on the host in the Events view. For more information, see Analyzing Events.

## Analyze Files Using YARA

YARA helps analysts with rule-based detection capabilities in identifying and classifying malware. You can easily create malware descriptions using YARA rules. Administrators must enable and configure YARA on the Endpoint server. To learn more about enabling and configuring YARA, refer to RSA NetWitness Endpoint Configuration Guide.

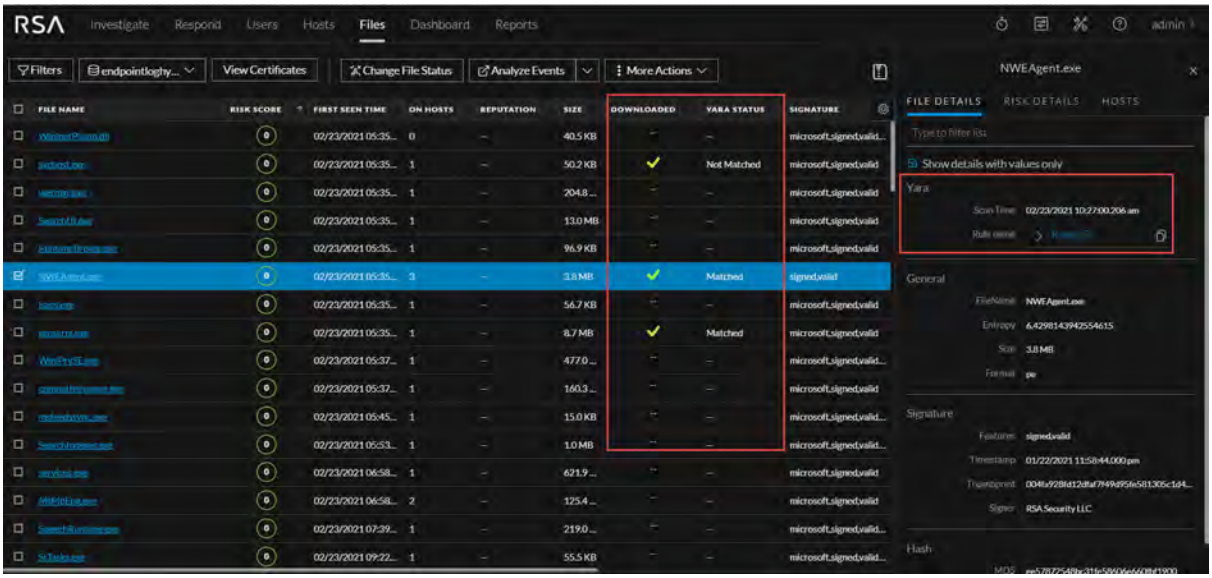
Files must be downloaded to the Endpoint server and YARA scans the downloaded files automatically. The scan results are displayed under **YARA STATUS** on the **Files** tab.

To analyze the scanned files,

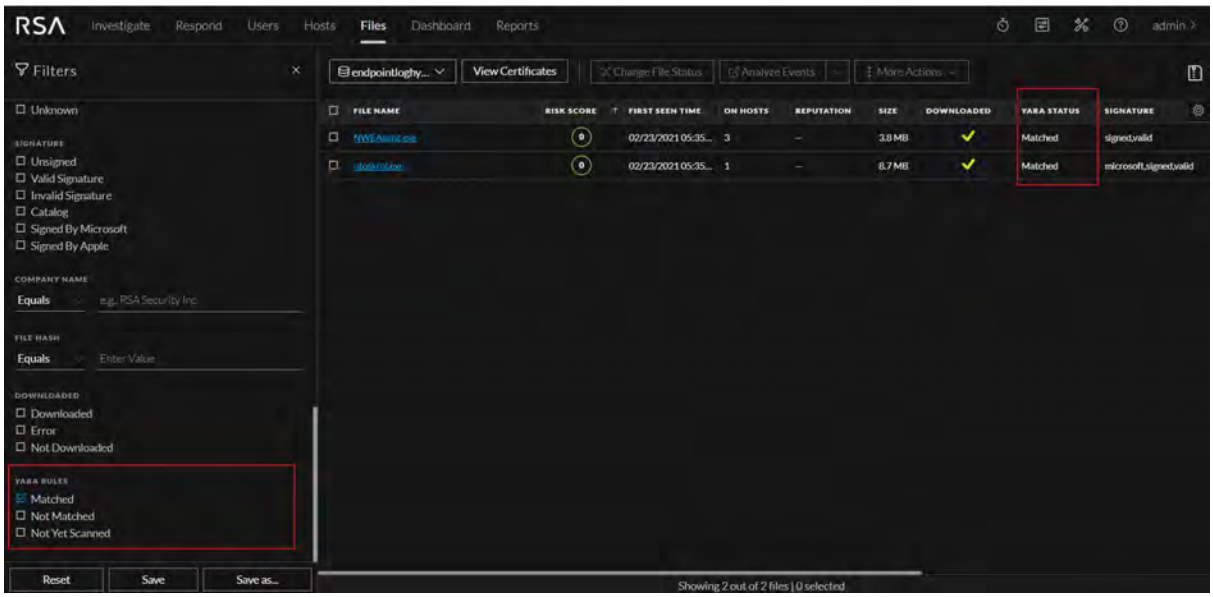
1. Go to **Files**.
2. Select the Endpoint server from the server drop-down , to view files.
3. Select a file that is downloaded to the Endpoint server and do any of the following:
   - Click a row to view the YARA scan details associated with the file in the **File Details** panel.
   - If any file matches one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.
   - **YARA STATUS** field displays the status of the YARA scan. Following are the available statuses and their definitions
     - **Matched** - The file matches with one or more YARA rules
     - **Not Matched** - The file does not match with any of the YARA rules
     - **Not Yet Scanned** - There is no scan performed for this file. Files will be scanned automatically once they have been downloaded. After the scan YARA status will be updated to either Matched or Not Matched

   **Note:** When a file matches with a YARA rule, high severity alerts are triggered and, the file's risk score is updated. In the subsequent scans, If the same file doesn't match with a YARA rule, the risk score will be reset.

   **Note:** If a downloaded file has an error, it will not be scanned by YARA and, the **Downloaded** column will display the file download status as **Error**.



4. On the **Filters** pane, scroll to the **YARA RULES** section. This section provides options to filter the files based on YARA scan status:
   - Select **Matched** to view the files that match YARA rules.
   - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the **YARA RULES** section.

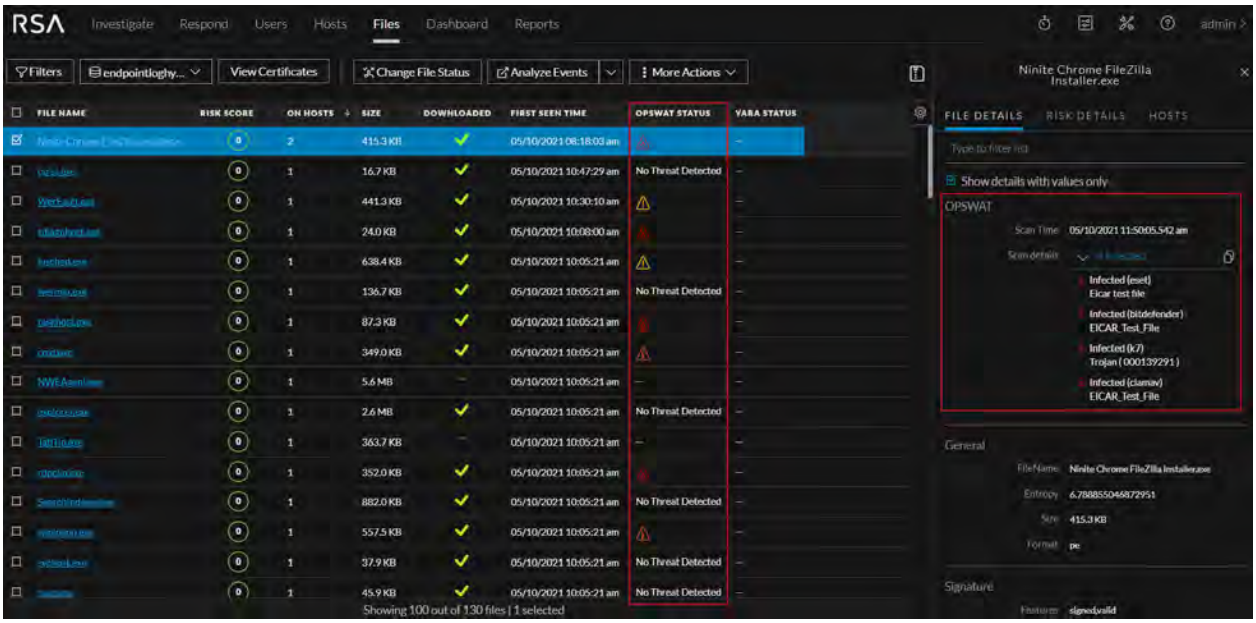


For more information on investigating with YARA, see *NetWitness Investigate User Guide.*

## Analyze Files Using OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. Administrators need to enable and configure OPSWAT on the Endpoint server. To learn more about enabling and configuring OPSWAT, see *NetWitness Endpoint Configuration Guide*.

All downloaded files (executable) will automatically be sent to OPSWAT server for scanning once OPSWAT is enabled and configured on the endpoint servers.



## Scan files with OPSWAT

Downloaded files are automatically sent to the OPSWAT server for scanning. However, you can also initiate the scan manually using options under the**More Actions** menu. Executable files with the following file extensions, ***pe***, ***script***, ***macro***, and ***elf*** are supported by this feature. The maximum file size limit is set to 10MB by default. You can increase or decrease it if required.

## Automatic scan:

The endpoint server will automatically send all (executable) downloaded files to the OPSWAT server. The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab.

## Manual Scan:

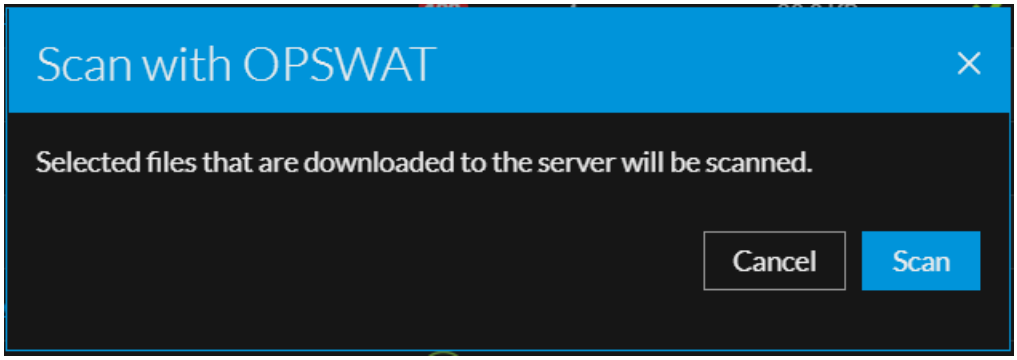
You can also manually initiate an OPSWAT scan using the options under the**More Actions** menu on the **Files** tab.

The **More Actions** menu provides the following options:

## Manual Scan - Scan selected files

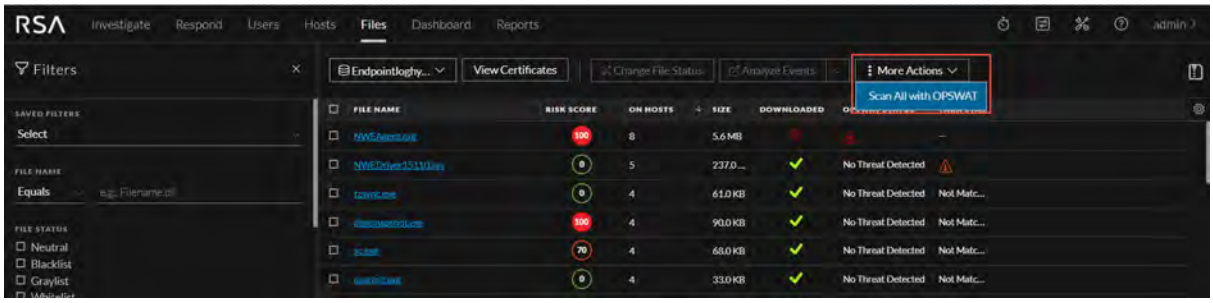
1. Select the files that need to be sent to the OPSWAT server for scanning.
2. Select **More Actions > Scan with OPSWAT**.

3. Click **Scan** on the confirmation pop-up.

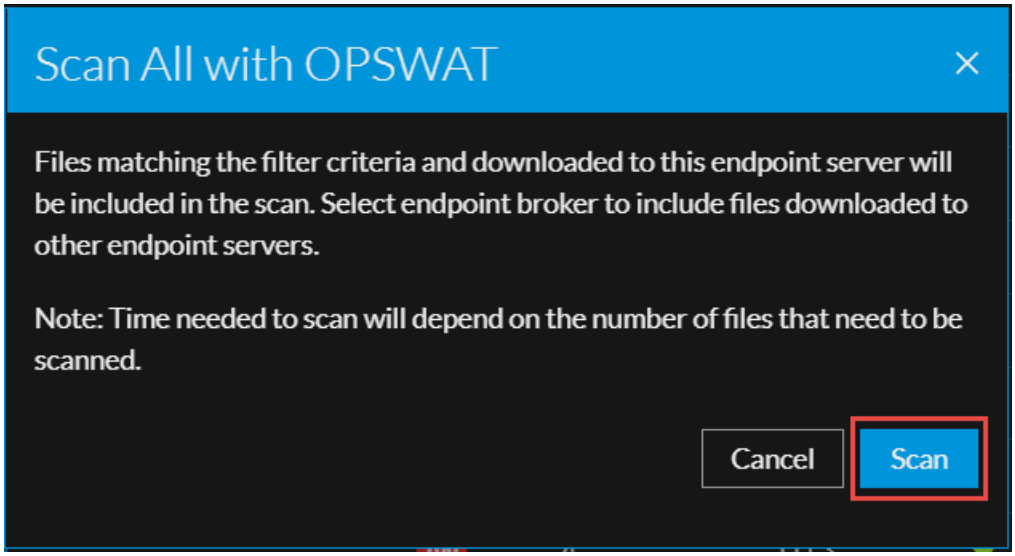


## Manual Scan - Scan all files

1. Select **More Actions > Scan All with OPSWAT**.



2. Click **Scan** on the confirmation pop-up.



## View OPSWAT Scan Results

The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab as follows:

- File is infected

- Suspicious file

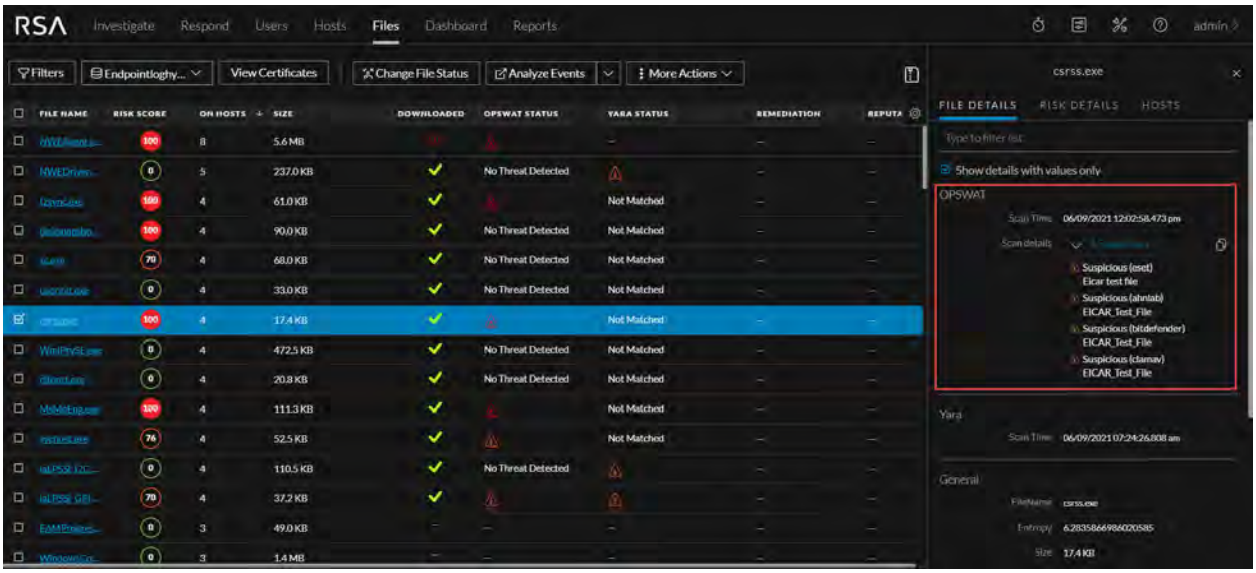
- Scan failed; see troubleshooting section for more information.

- The file is clean as of the last scanned time.

- Not yet scanned.

Click on a file to view scan results under the**FILE DETAILS** panel.

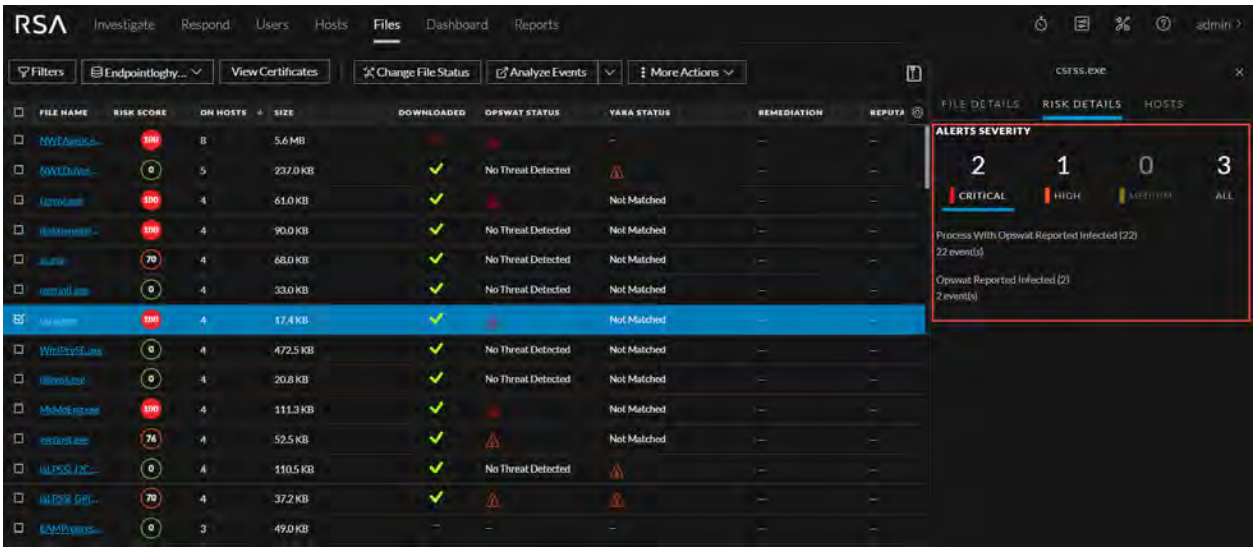
- **Scan Time**: States the last scanned time.
- **Scan details**: States whether a file is infected or suspicious or no threat detected, names of anti-malware engines that identified the threat.



## Alerts and Impact on Risk scores

**Alerts**: Critical alerts will be triggered when OPSWAT finds a file as infected, and High severity alerts when a file is found suspicious.

**Risk score**: If a file is found infected or suspicious by OPSWAT, the risk score of that file and the corresponding host will be increased.



# Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Files**.
2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.
3. Select one or more files, and right-click or in the **More Actions** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

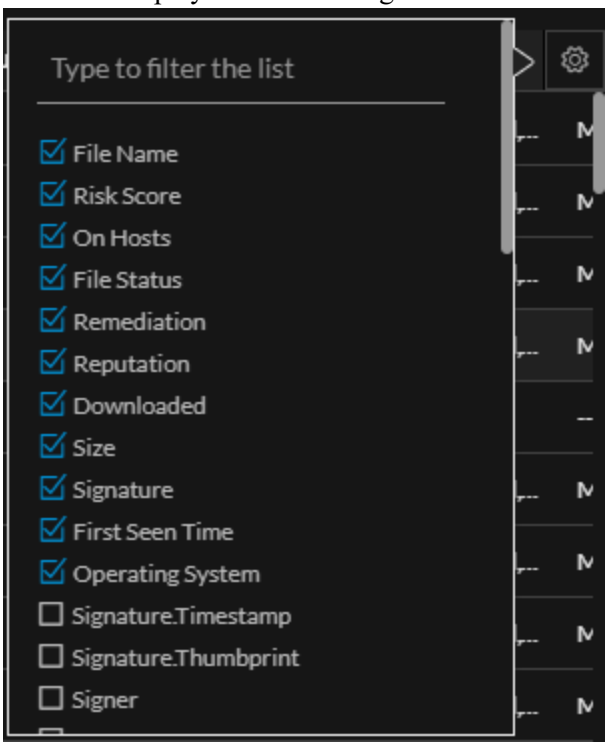
b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.

**Note:** To open files in multiple tabs, make sure you enable the pops-up in the browser.

## Set Files Preference

By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:



3. Sort the data on the required column.

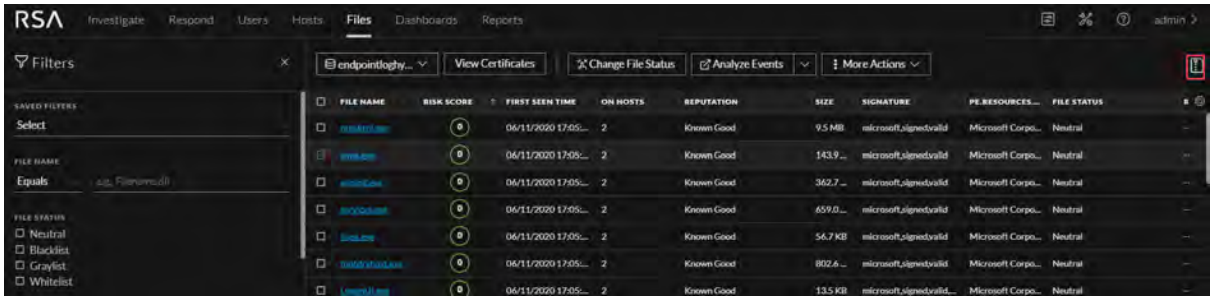
**Note:** The selections you make here become your default view every time you log in to the Files view.

## Export Global Files

To extract the list of global files to a comma-separated values (csv) file:

**Note:** While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.
4. Click to export the files to a csv file.



You can either save or open the CSV file.

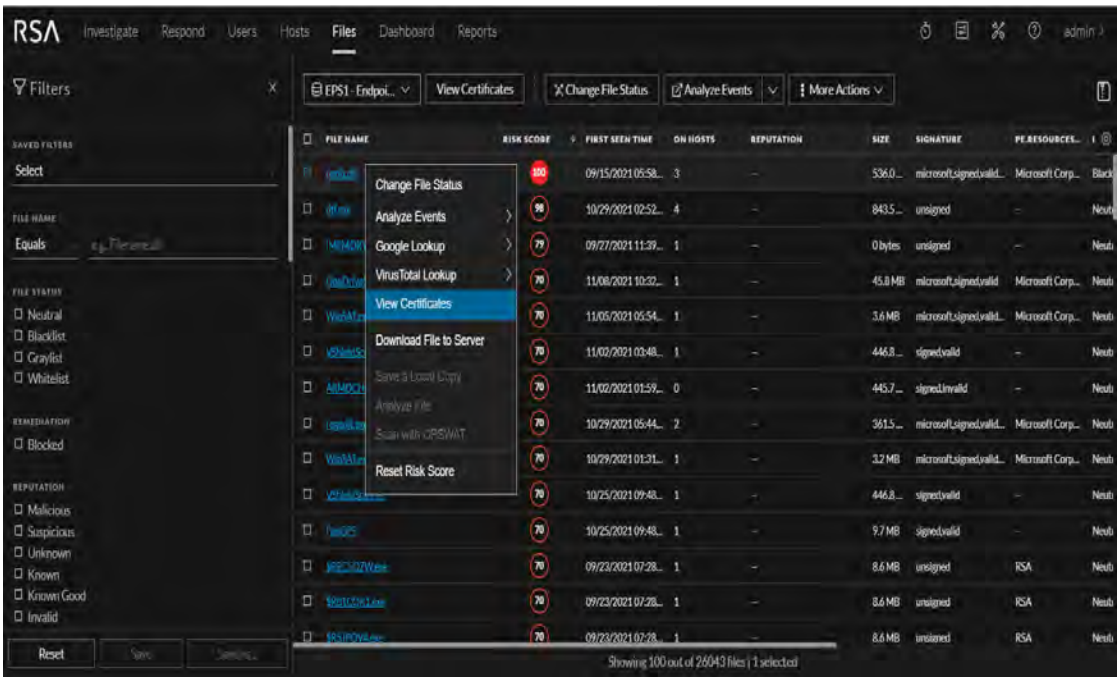
## Analyze Certificates

**Note:** The information in this topic applies to NetWitness Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:



- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.

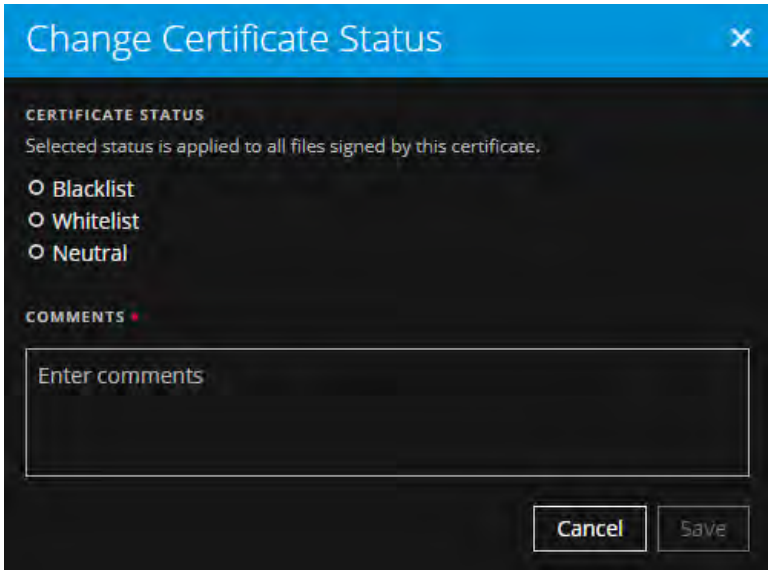
## Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.



2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

   **Note:** If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

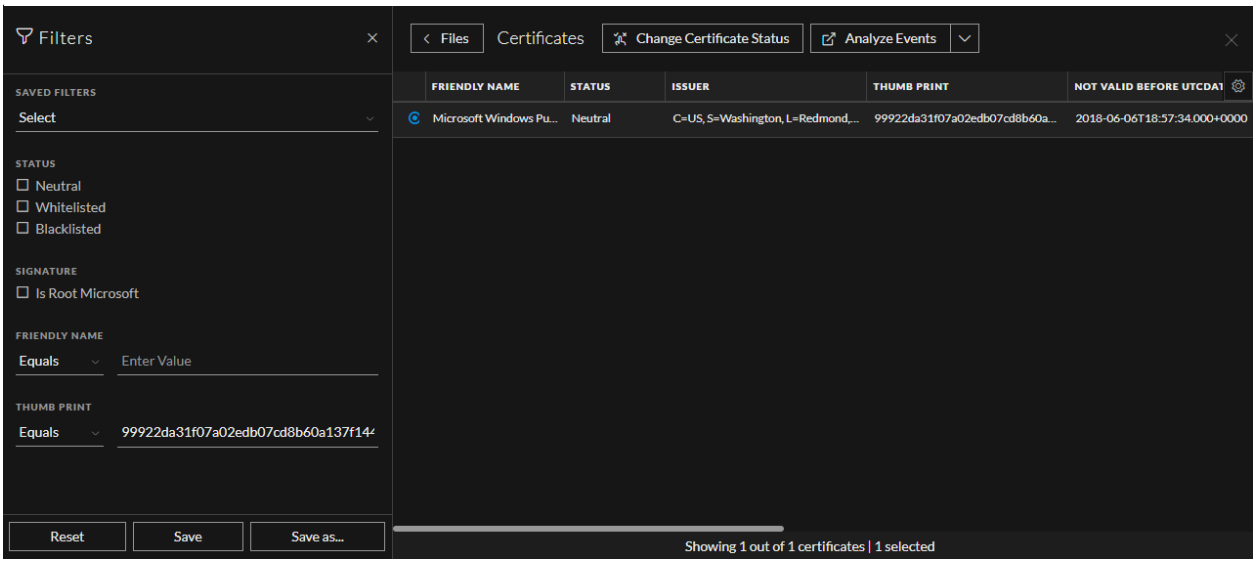
3. Add a comment and click **Save**.

4. Click **< Files** to go to the Files view.

**Note:** In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

## Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.



Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

**Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

## Resetting Risk Score of Files

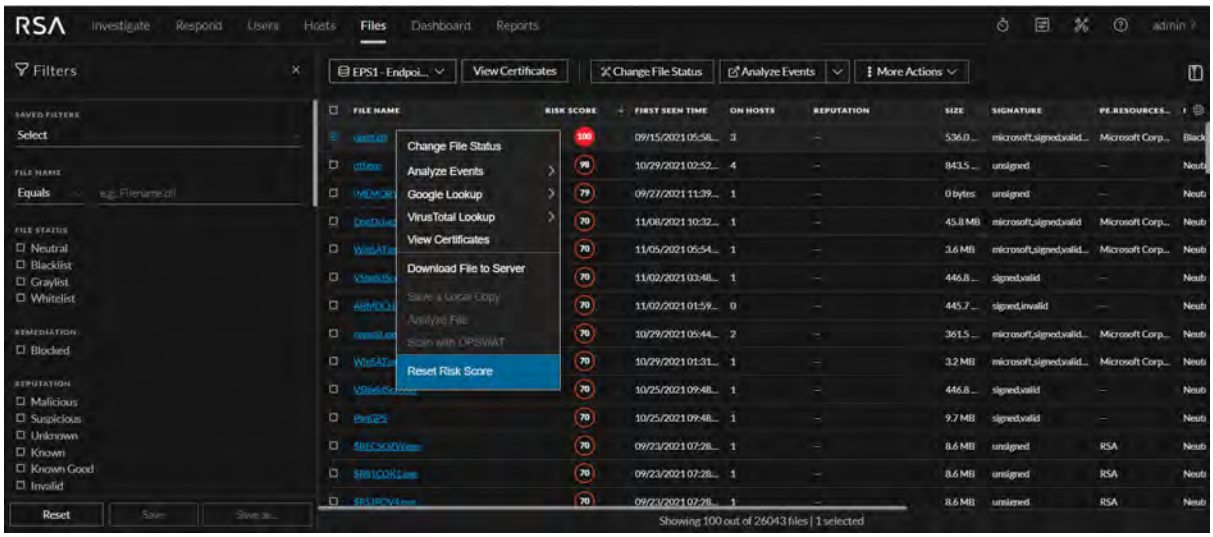
You can reset the risk score for a file in these situations:

- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

### To reset the risk score of a file:

1. Go to **Files**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more files and do one of the following:



- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

**Note:** You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.

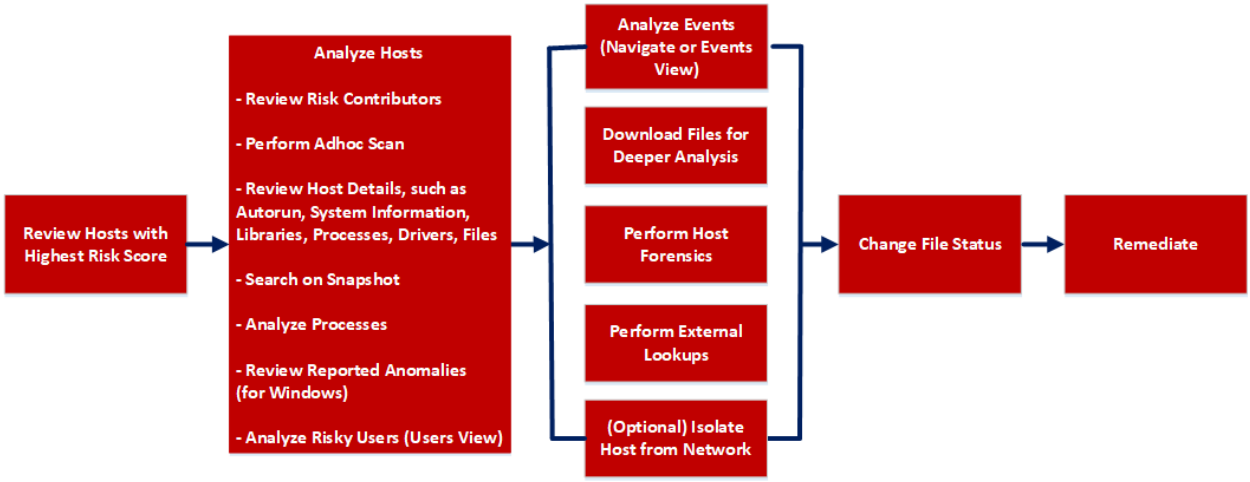
# Investigating Hosts

**Note:** The information in this topic applies to NetWitness Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

## Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:



- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Events view. For more information, see Analyzing Events.
- Review hosts for rare files in the **On Hosts** column. If a file is present on 100 hosts, it can be legitimate. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Filter to exclude hosts on host status, risk score, hostname, and so on. For more information, see Filter Hosts.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.

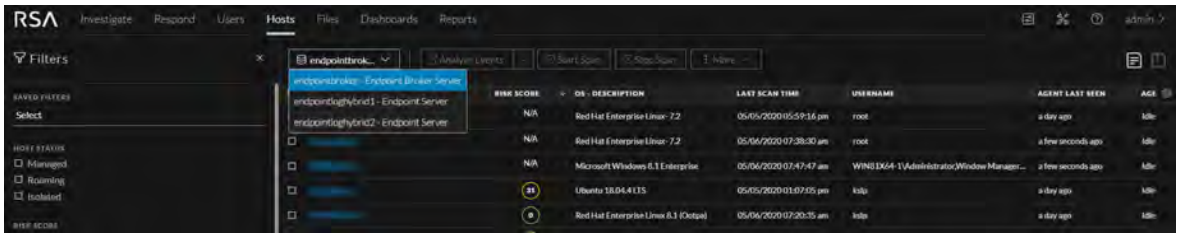
- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Download MFT, process, or system dump to the server for forensic investigation. For more information, see Performing Host Forensics.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.
- (Optional) If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. For more information, see Isolating Hosts from Network.

## View Hosts

You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **Hosts**.
2. Select from the following:

- **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.
- **Endpoint Server** to view hosts on a specific Endpoint server.



3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

# Manage Hosts Using Tags

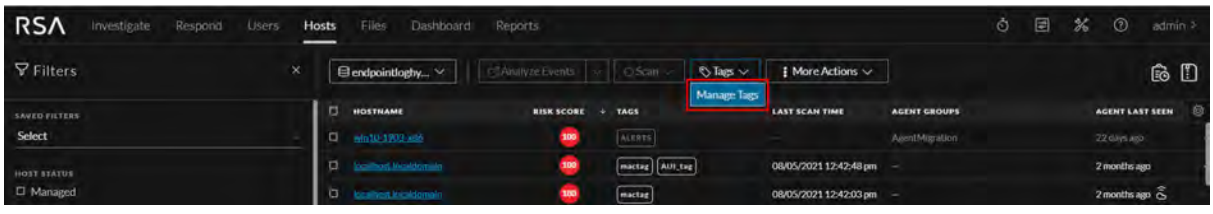
From version 11.7 and later, NetWitness Platform allows you to create Tags to manage the hosts effectively. Tags are custom texts that you can create and assign to hosts for identifying them. A tag can contain alphabets, numbers and special characters(Except \ **' , [ ] "** and **space**). You can use these tags to create host groups. You can also filter hosts by tags using the filters pane on the Hosts screen.

## Manage Tags

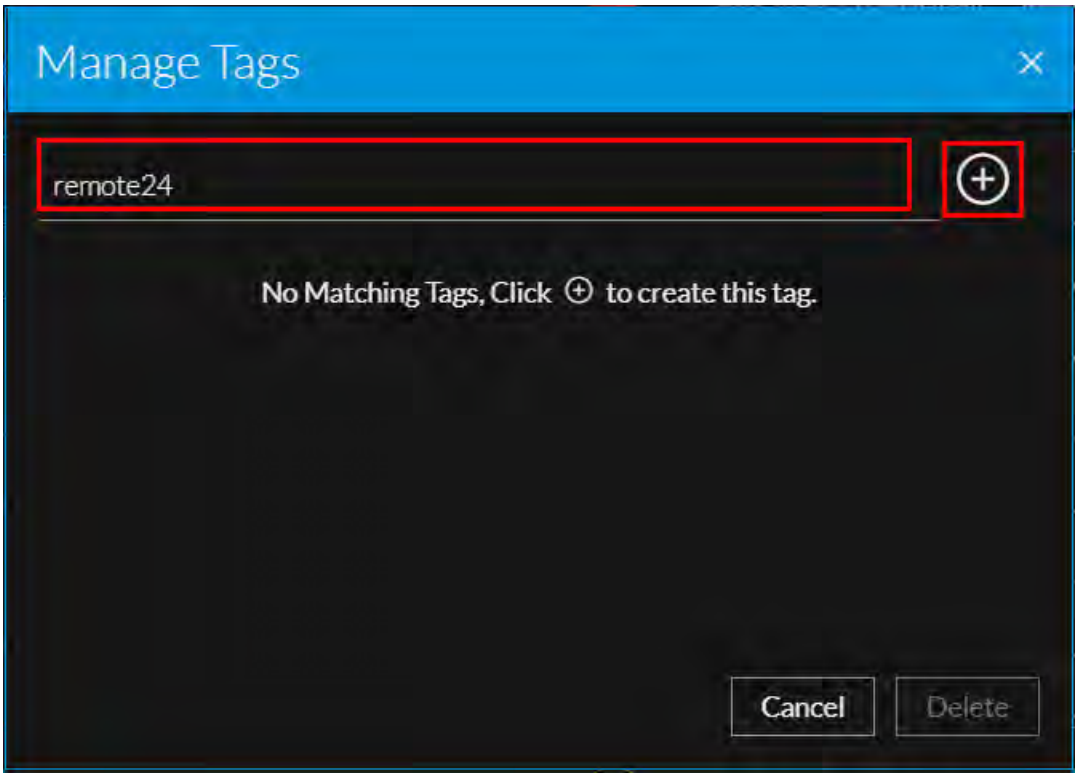
The Manage Tags option allows you to create and delete tags without selecting any hosts.

### To Create Tags:

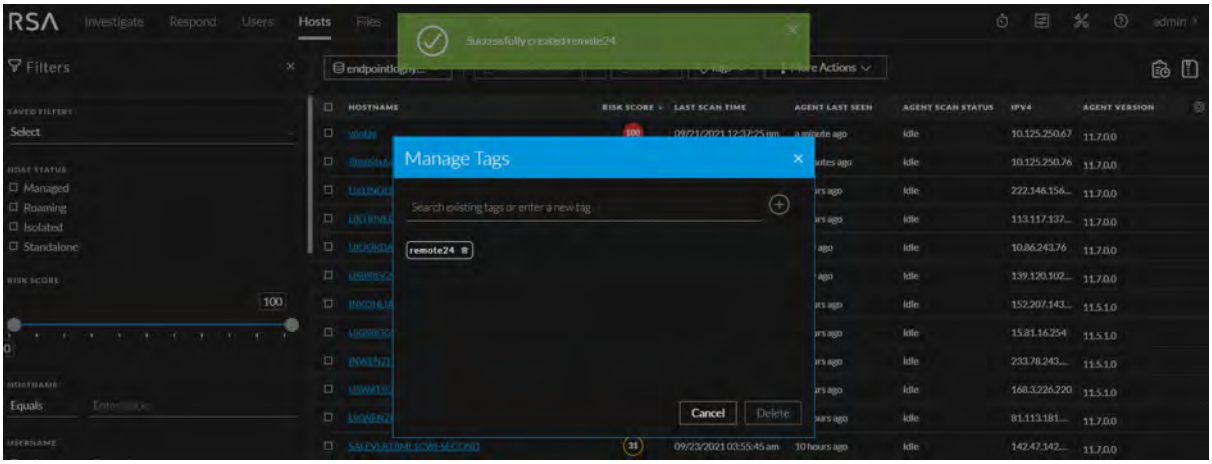
1. Click **Tags > Manage Tags** on the Hosts tab.



2. Enter a valid tag in the text field on the **Manage Tags** pop-up and click .



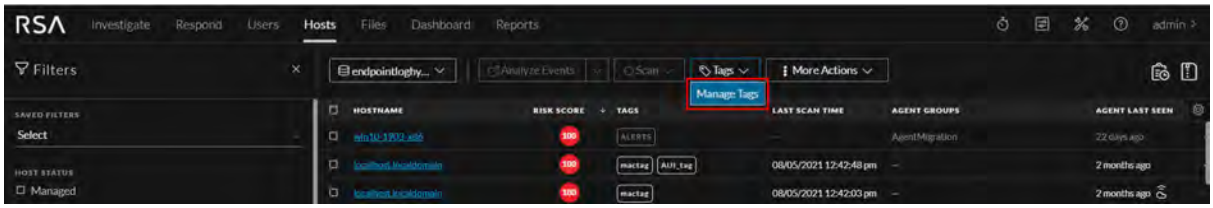
- The tag is created, and a success message will appear.



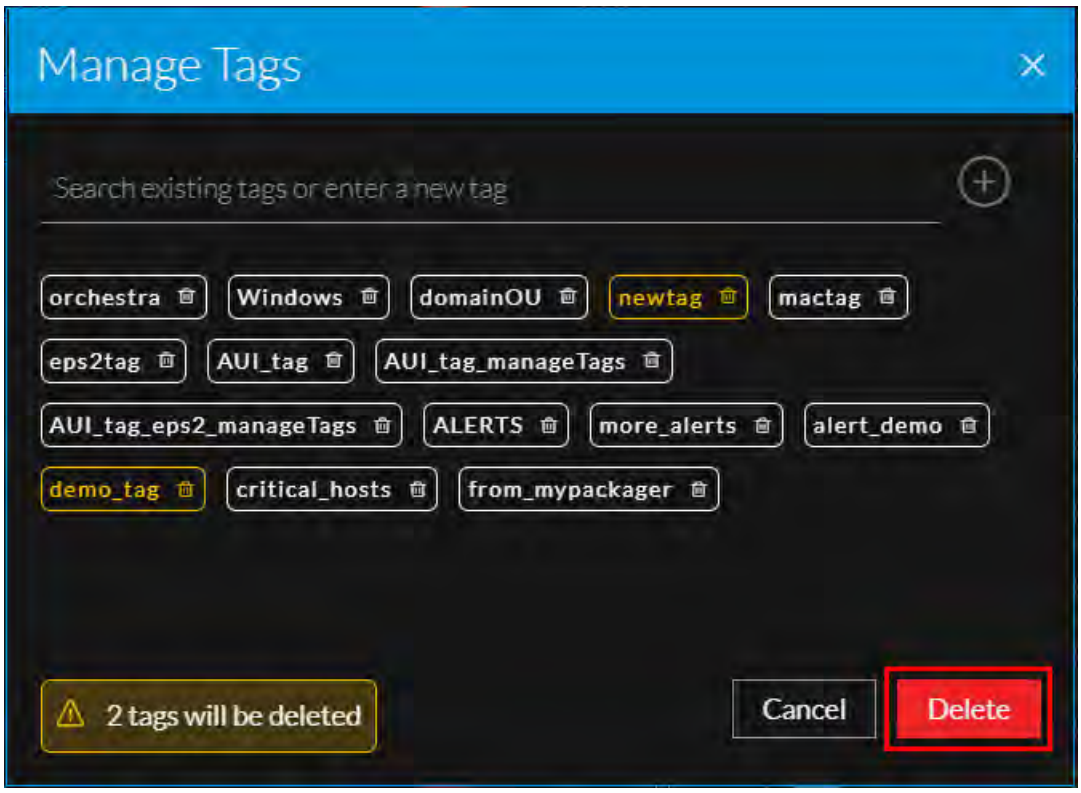
3. Repeat step 2 to create more tags.

## To Delete Tags:

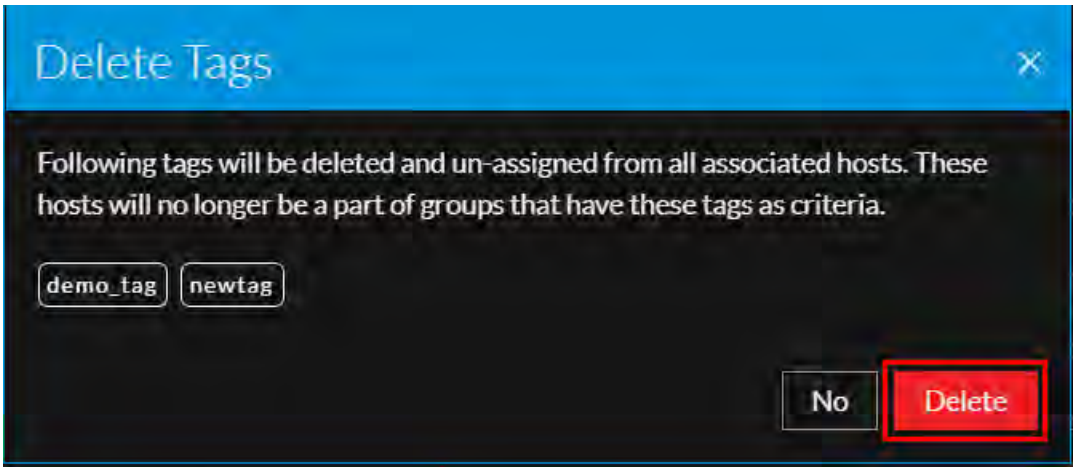
1. Click **Tags > Manage Tags** on the Hosts tab.



2. Select the tags that you want to delete and click **Delete** on the **Manage Tags** pop-up.



3. Click **Delete** on the **Delete Tags** confirmation pop-up.



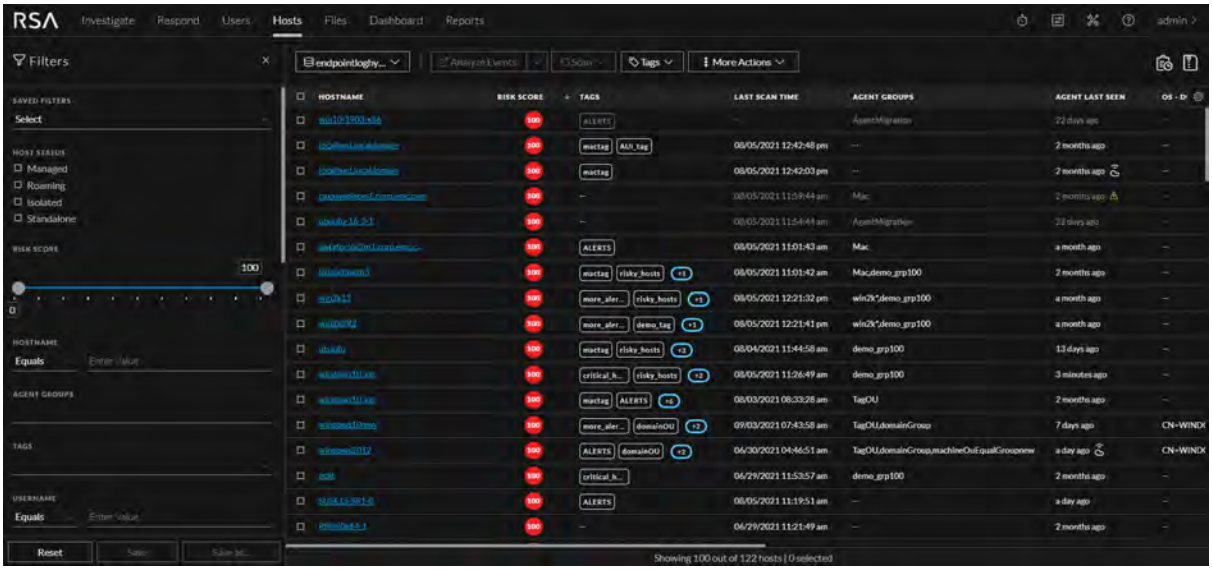
**Note:** The tags you deleted will also be unassigned from all associated hosts. If the associated hosts are a part of groups created using these tags as one of the criteria, then the hosts will no longer be a part of those groups. Refer What happens next after unassigning or deleting tags from hosts? for more information.

## Assign tags

1. Select one or more hosts on the Hosts tab.
2. Select **Tags > Assign Tags** from the menu.

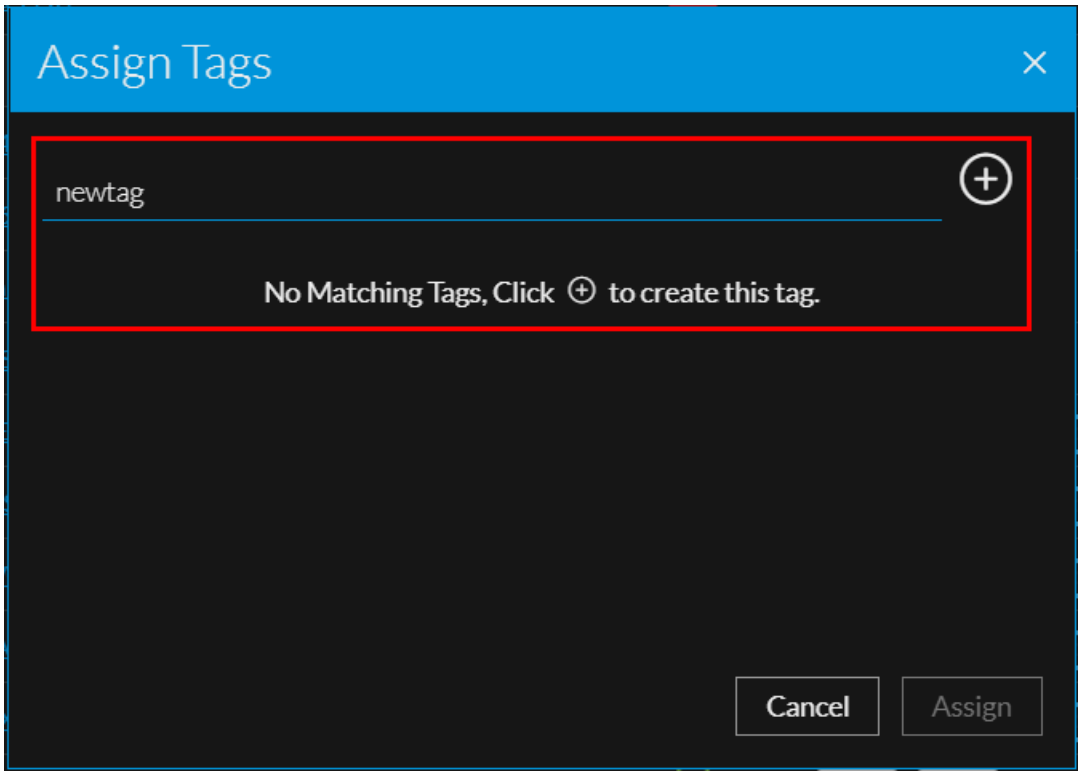
   (or)

   - Select a host, right click and select **Assign Tags**.



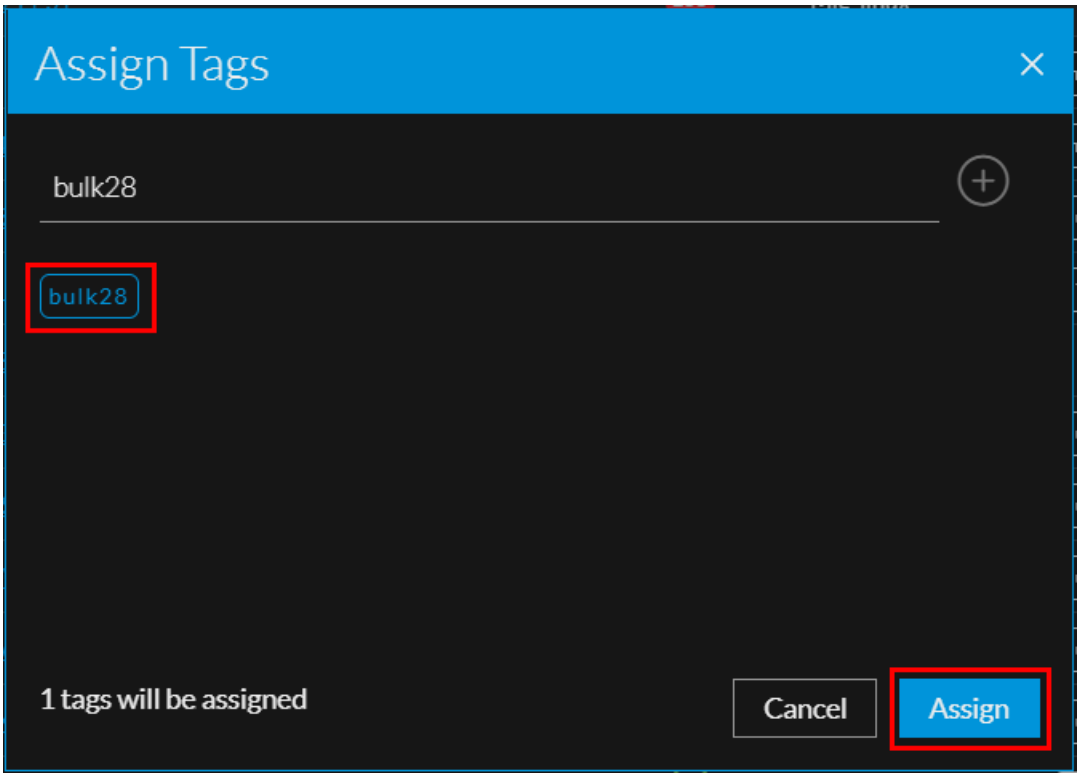
3. The Assign Tags pop-up will appear and shows all the existing tags. You can either

- Enter a valid tag and click to create it. The newly created tag is selected by default.

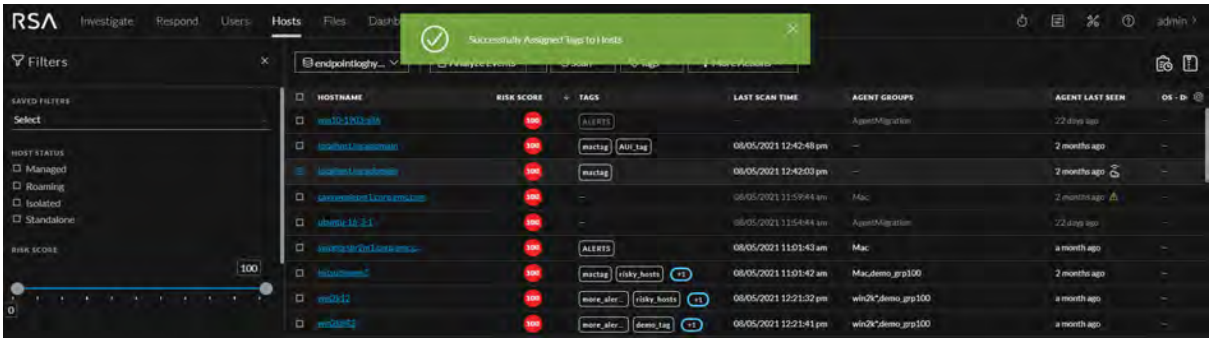


(Or)

- Search for an existing tag using the text field and select it if required.



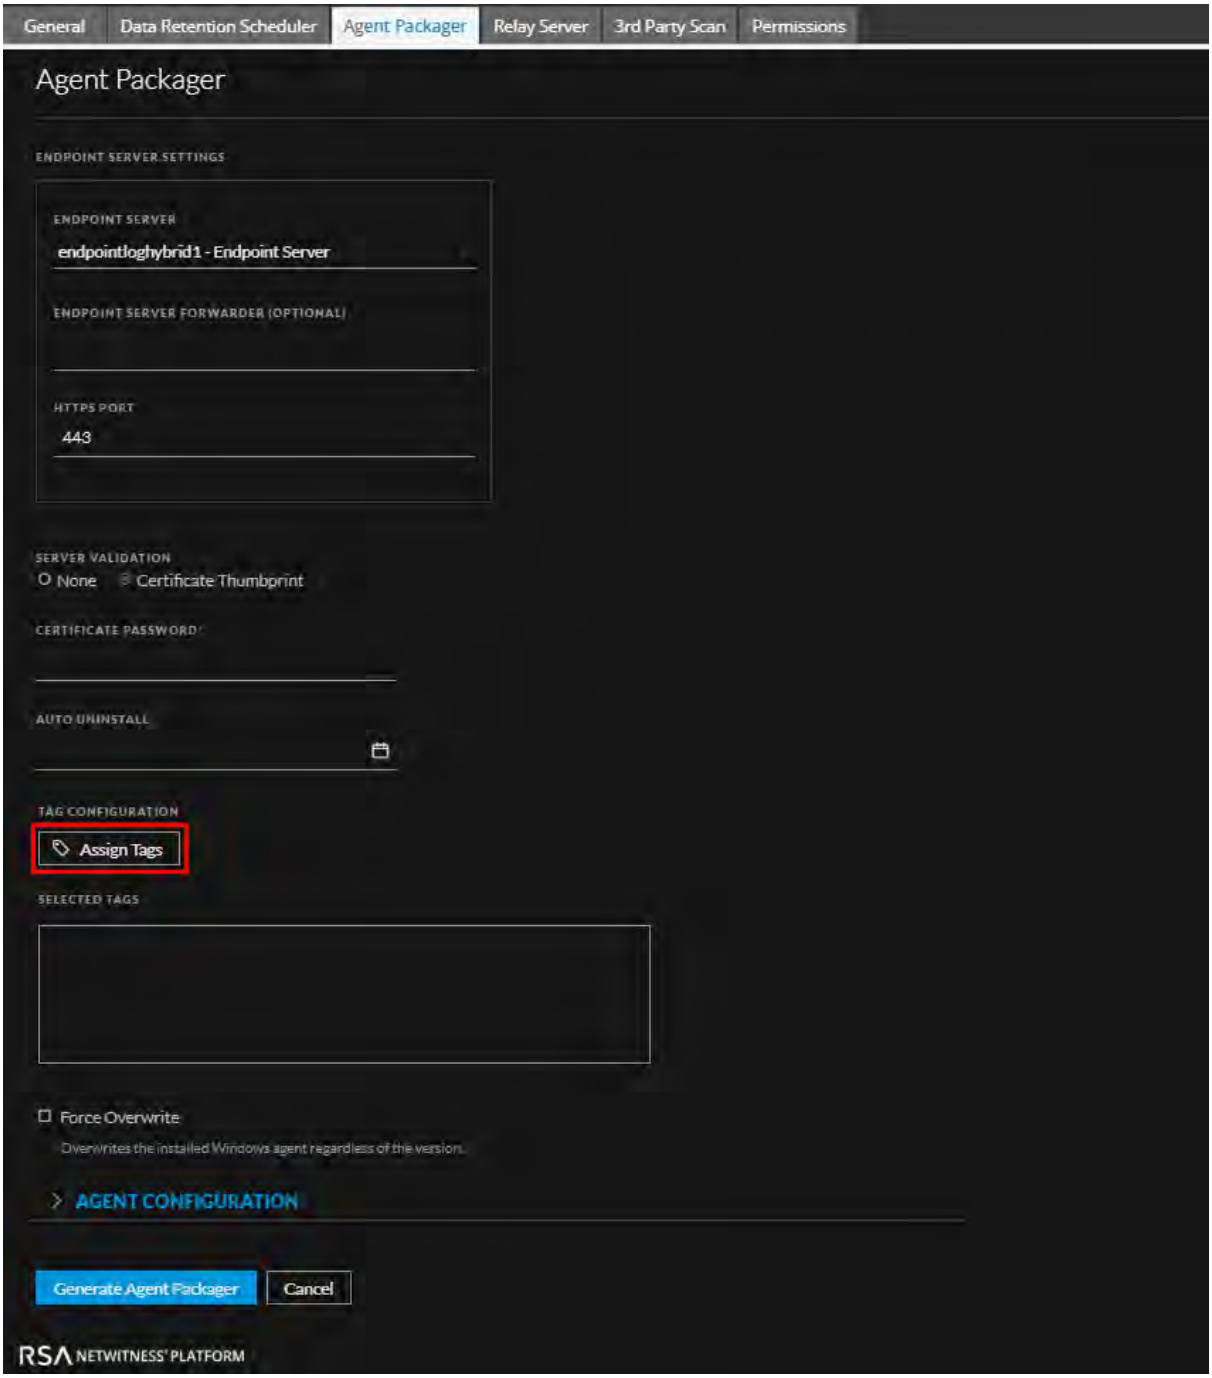
4. Click **Assign**. These tags will be assigned to the selected hosts.



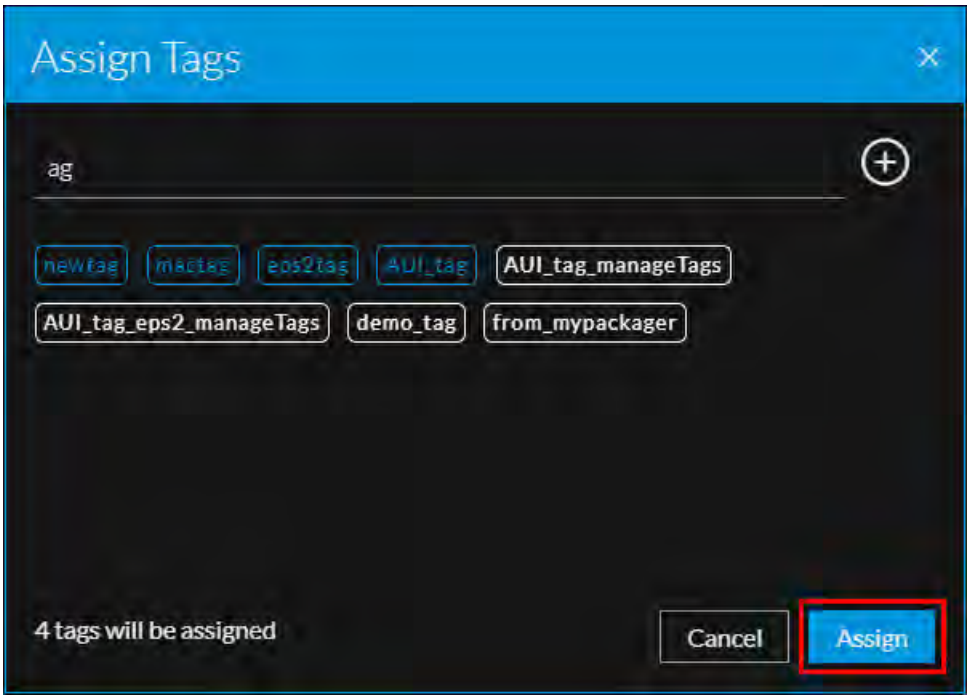
## Create and Assign Tags When Generating the Agent Packager

You can add tags to the hosts while installing the Endpoint agents. When generating the agent packager on the Agent Packager tab, you can either create new tags or select already existing tags. These tags will automatically be assigned to the host in which the agent will be installed.

1. Click **Assign Tags** under **TAG CONFIGURATION** on the Agent Packager tab.



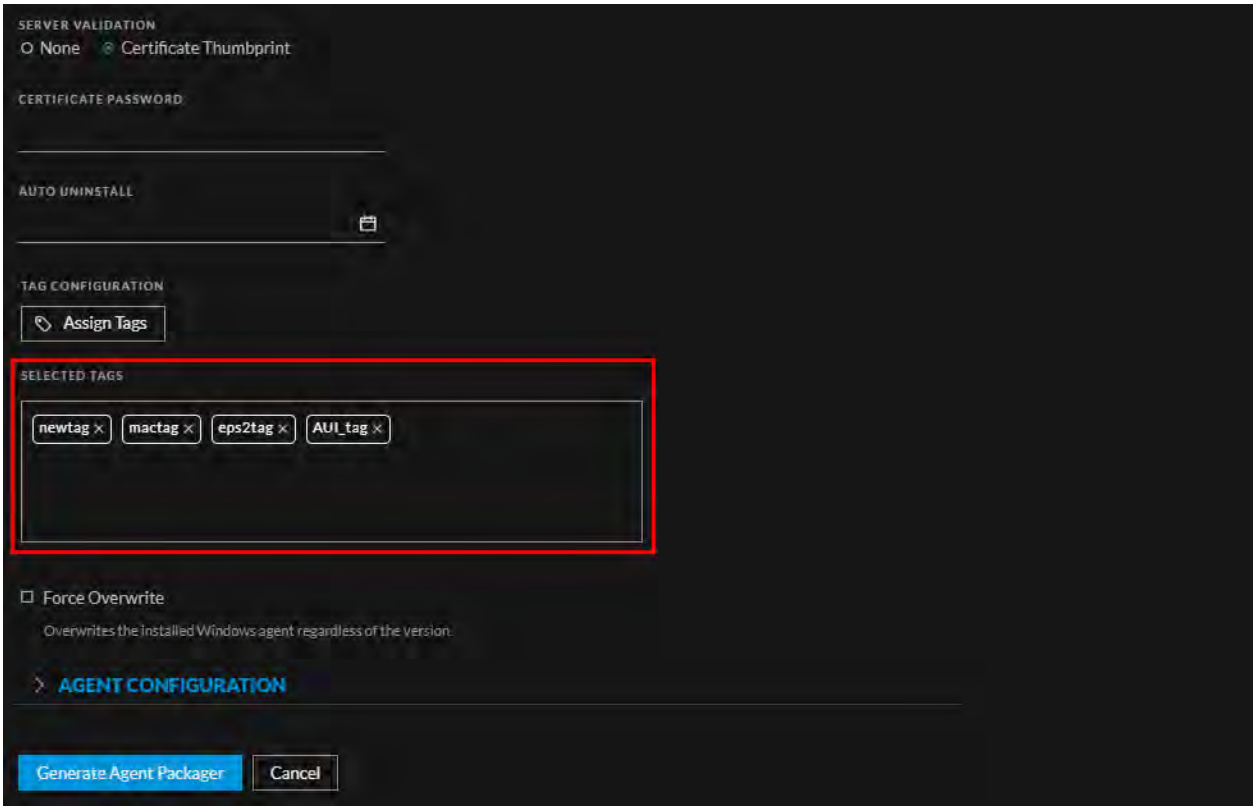
2. On the **Assign Tags** pop-up,
   - Search for an existing tag using the text field and click **Assign**.



(or)

- Enter a new tag in the text field and click to add it to the selection. Click **Assign**.

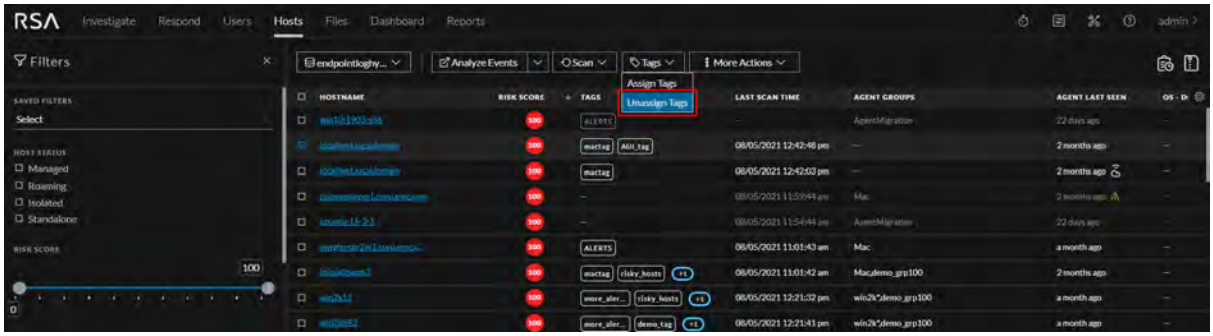
3. Assigned tags will appear under **SELECTED TAGS**.



**Note:** In 11.7.1 and later versions, the tags added while generating the Agent Packager are applicable only to the newly installed agents and not to the manually upgraded agents.

## Unassign tags

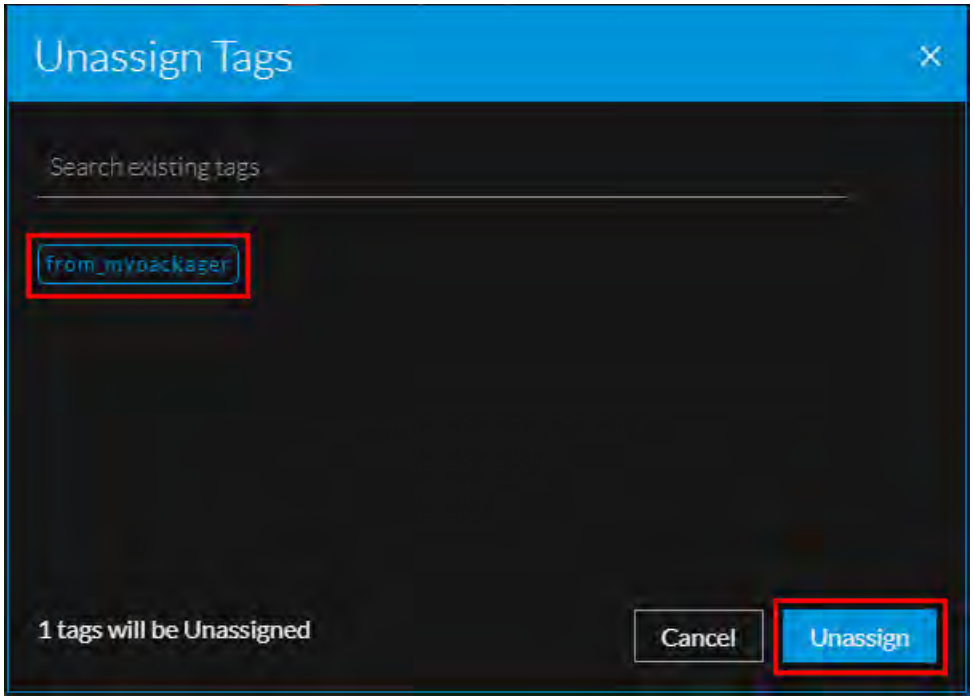
1. Select one or more hosts on the Hosts tab.
2. Select **Tags > Unassign Tags** from the menu.



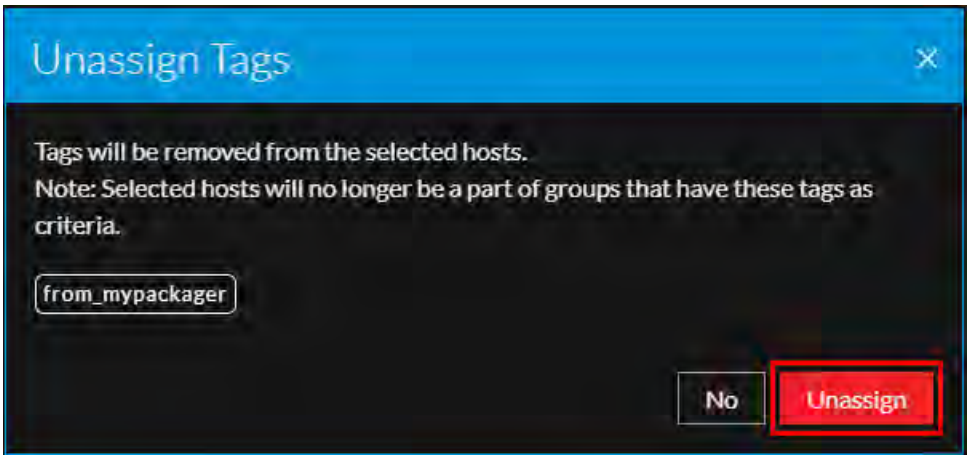
(or)

- Right click on a host and select **Unassign** Tags. The **Unassign Tags** pop-up will appear and shows all the tag assigned to the selected hosts.

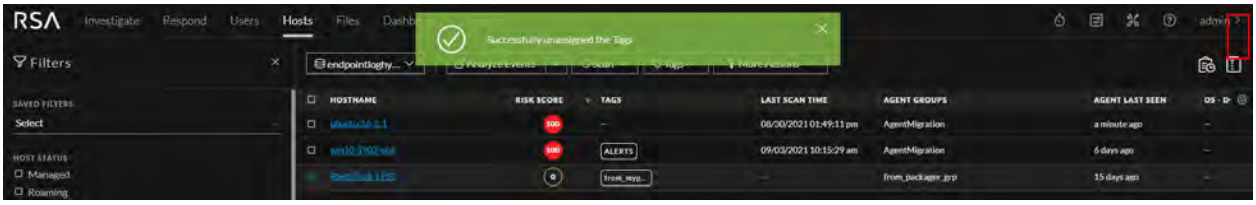
3. Search for the tags you want to unassign, select them and click **Unassign**.



4. Click **Unassign** on the confirmation pop-up.



5. These tags will be Unassigned from the selected hosts.



### What happens next after unassigning or deleting tags from hosts?

Unassigning/deleting tags from hosts will immediately initiate group & policy evaluation. For example, if a host is a part of the group created using only the unassigned/deleted tag as criteria, the host will no longer be a part of that group. Refer to the following scenarios to understand more.

**Example Scenario 1:** Assume you create a group with a couple of tags as grouping criteria, all the hosts with these tags assigned will be a part of the group. And, if you delete these two tags(or unassigning from the hosts), the hosts may no longer be a part of this group.

**Example Scenario 2:** Assume you create a group with a couple of tags and IP addresses as grouping criteria; all the hosts assigned with these tags and IP addresses will be a part of the group. And, if you delete(or unassigning from the hosts) the tags alone, the hosts may still be a part of this group as they are still grouped using the IP addresses.

## View Agent History

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

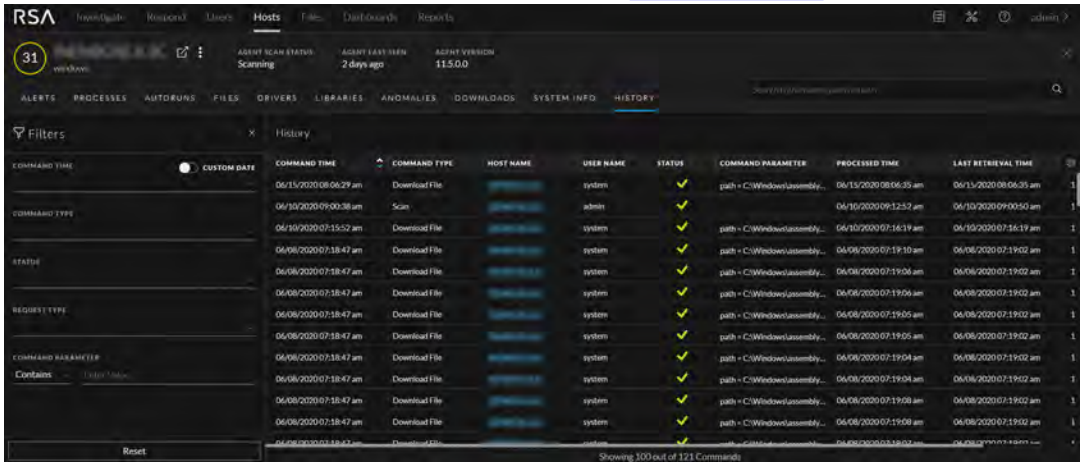
To view the commands:

1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands, for more information see Filter Hosts.

     The Agent History view is displayed. For more details, see Analyze History.

   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands, for more information see Filter Host Details.
       The History view is displayed. For more details, see Analyze History.

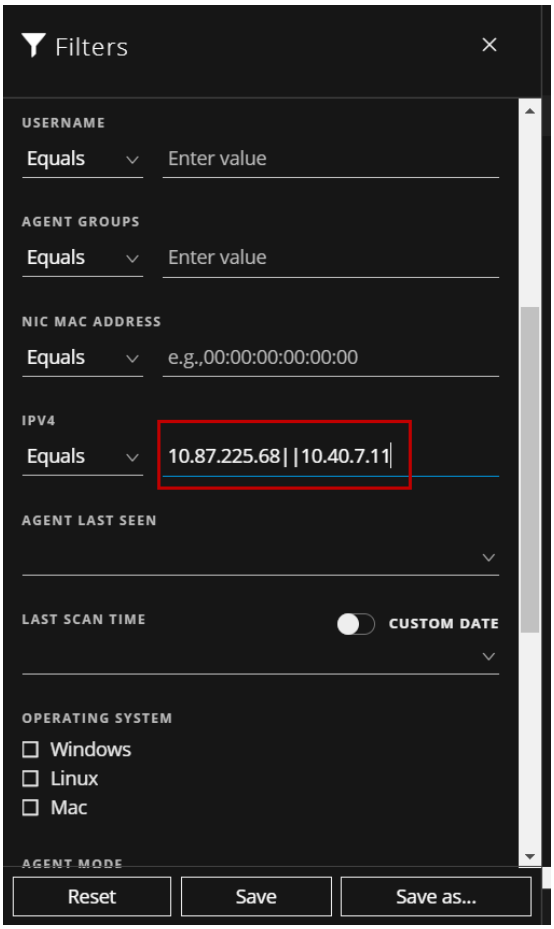
## Filter Hosts

You can filter hosts on agent version, agent ID, agent mode, agent upgrade, agent last seen, last scan time, operating system, hostname, username, Mac address, risk score, IPV4, driver error code, security configurations, agent groups, and host status - managed, roaming, and isolated.

In the **Host** view > click , to filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

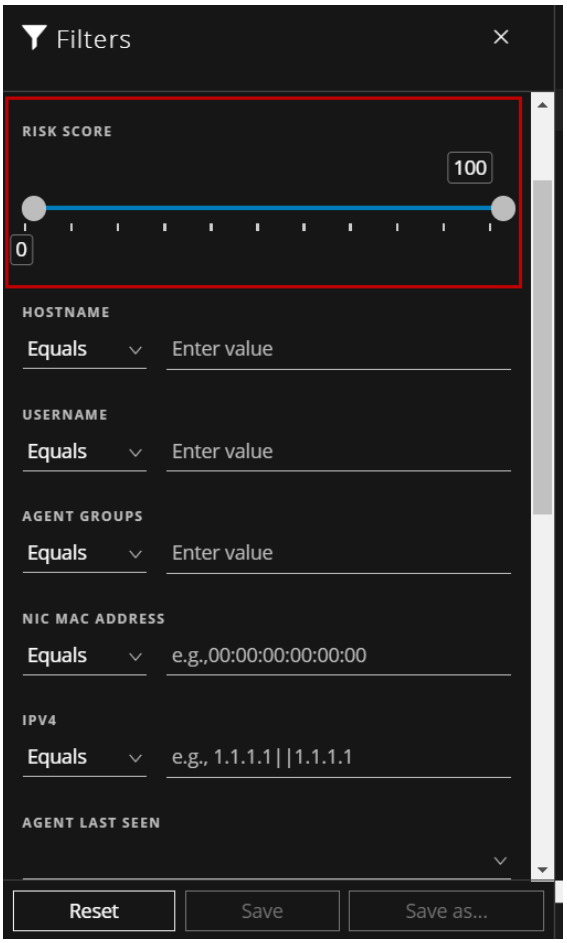
**Note:** While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.

To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator. For example, using `Equals` operator for multiple IPV4 values with a separator `||`.



To filter on the agent last seen or last scan time, select the option from the drop-down list. If you select 3 Hours ago for the Last Scan Time, the result displays hosts that were last scanned 3 hours ago or earlier.

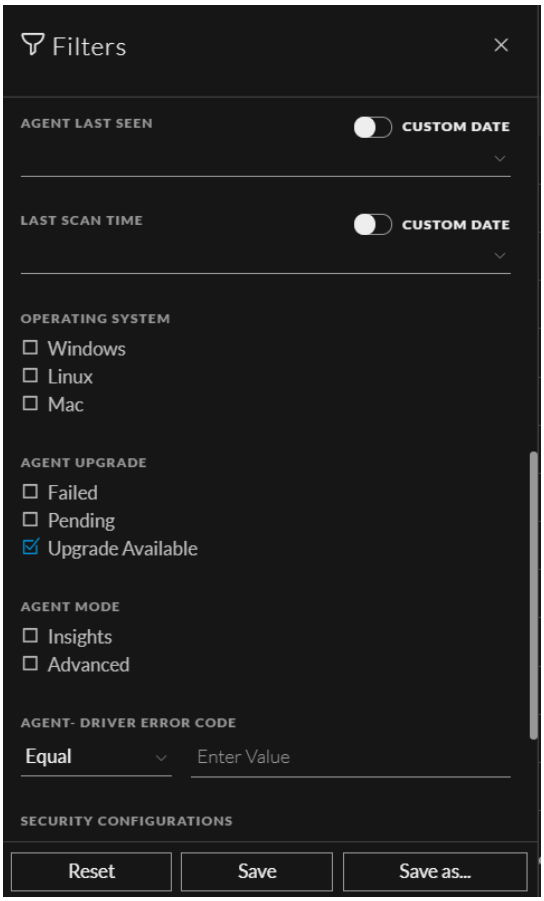
To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



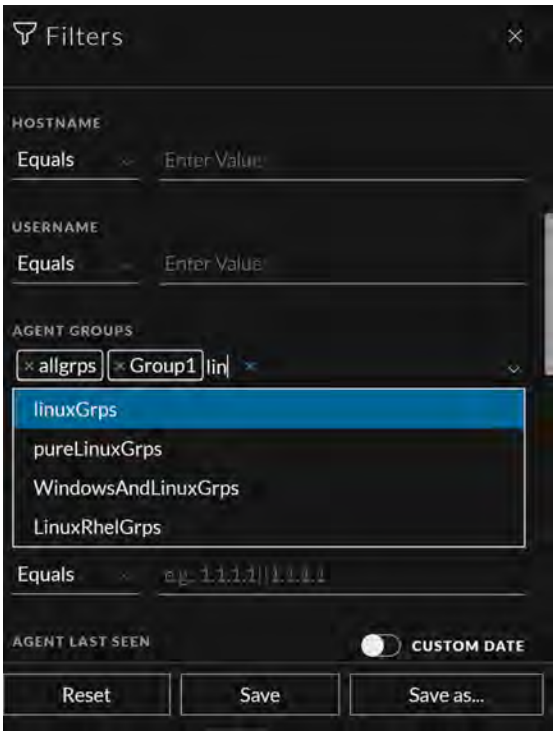
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

**Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

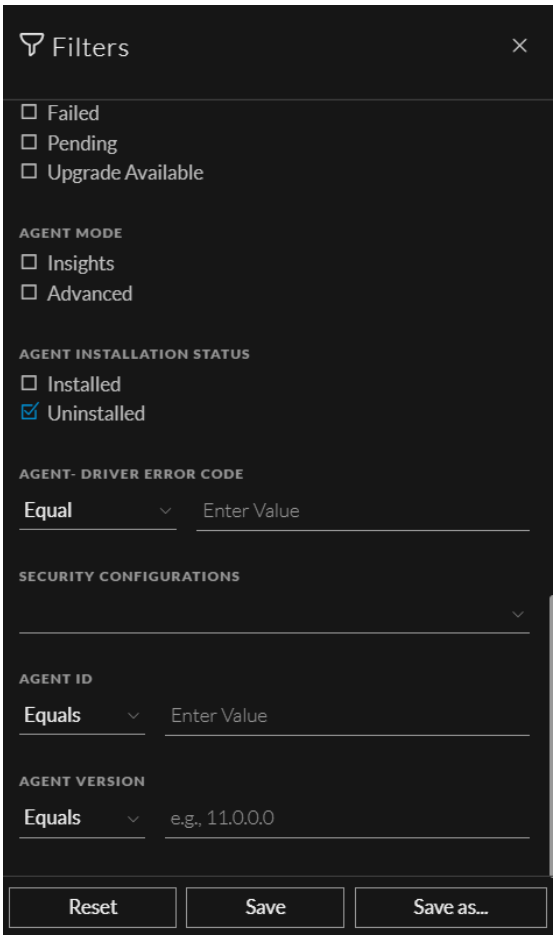
To filter the agents based on the upgrade status, select one of the upgrade statuses. For example, select the **Upgrade Available** checkbox to get the list of agents available for an upgrade.



To filter the agents based on single or multiple agent groups, select a group from the drop-down list. You can also search the name of the groups from this list.



To filter the agents based on the installation status, select one of the installation statuses. For example, select the **Uninstalled** checkbox to get the list of agents for which the uninstall is initiated or successfully completed.

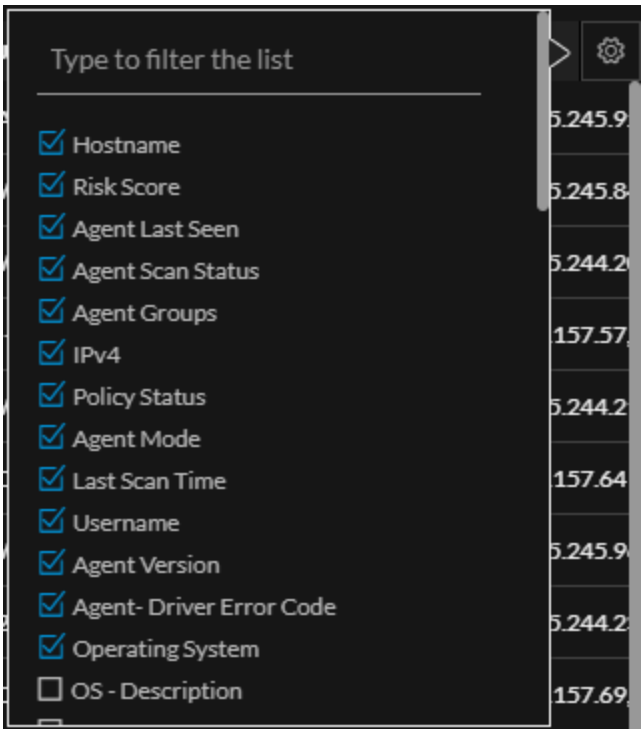


You can also filter the commands on command type, status, host name, request type, command parameter and command time (In which you can filter by custom date range), by clicking .

## Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner.



3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

## Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

You can either choose to perform a quick scan or a full system scan.

**Quick scan** - Scans all executable files that are loaded in memory. Both Insights and Advanced agents support quick scan.

**Full System Scan** - Scans all fixed drives or the system drive You can perform a full system scan only on advanced agents that are in version 11.6 or later. Native executables are included in the full system scan, by default

When hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

### To perform a Quick Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time, and do one of the following:

- Click **Scan > Start Scan** from the menu (Or)
- Right-click and select **Start Scan** from the context menu

3. Click **Start Scan** on the pop-up. Quick scan is initiated for executable modules loaded in memory.

The following are the scan statuses:

| Status | Description |
|---|---|
| Idle | No scan is in progress. |
| Scanning | Scan is in progress. |
| Pending | Scan request is sent to the server, and the agent will receive the request the next time it communicates with the server. |
| Cancel | Stop request is sent to the server, and the agent will receive the request the next time it communicates with the server. |

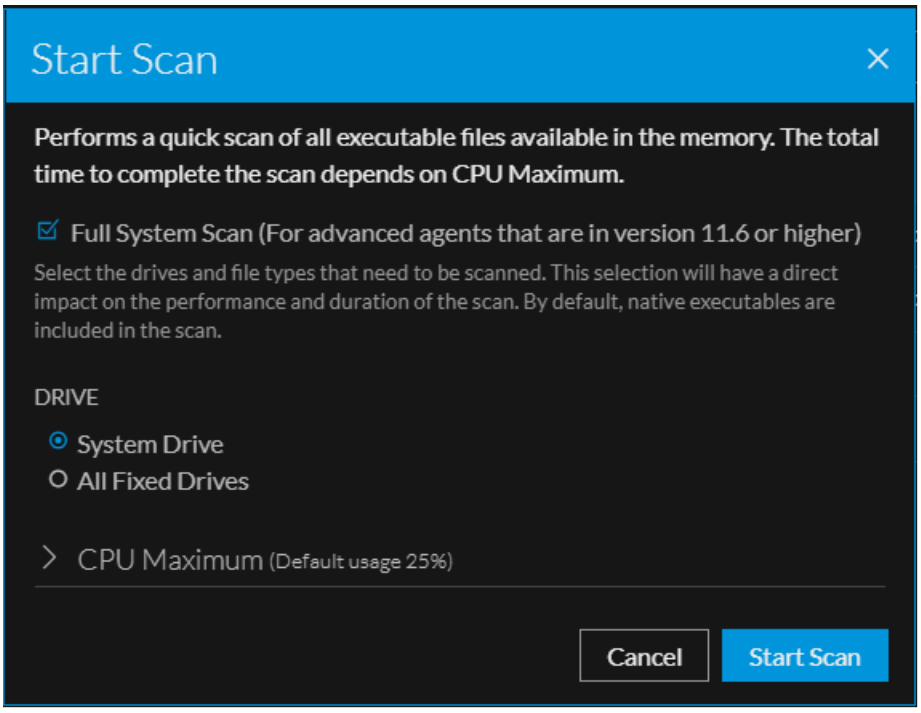
**Note:** By default, the scan utilizes 25% of the CPU. You can click CPU Maximum and select a value from 5% to 100%. Increasing the CPU Maximum limit reduces the scan time but could lead to more CPU usage.

### To perform a Full System Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:
   - Click **Scan > Start Scan** from the menu bar (Or)
   - Right-click and select **Start Scan** from the context menu

1. From the **Start Scan** pop-up, select **Full System Scan (Only on advanced agents that are 11.6 or higher.)**

2. Select **System Drive**(Default selection) or **All Fixed Drives**
3. Click **Start Scan** on the pop-up.



**Note:** An Endpoint server supports up to 10k Full System Scans in a rollover period.

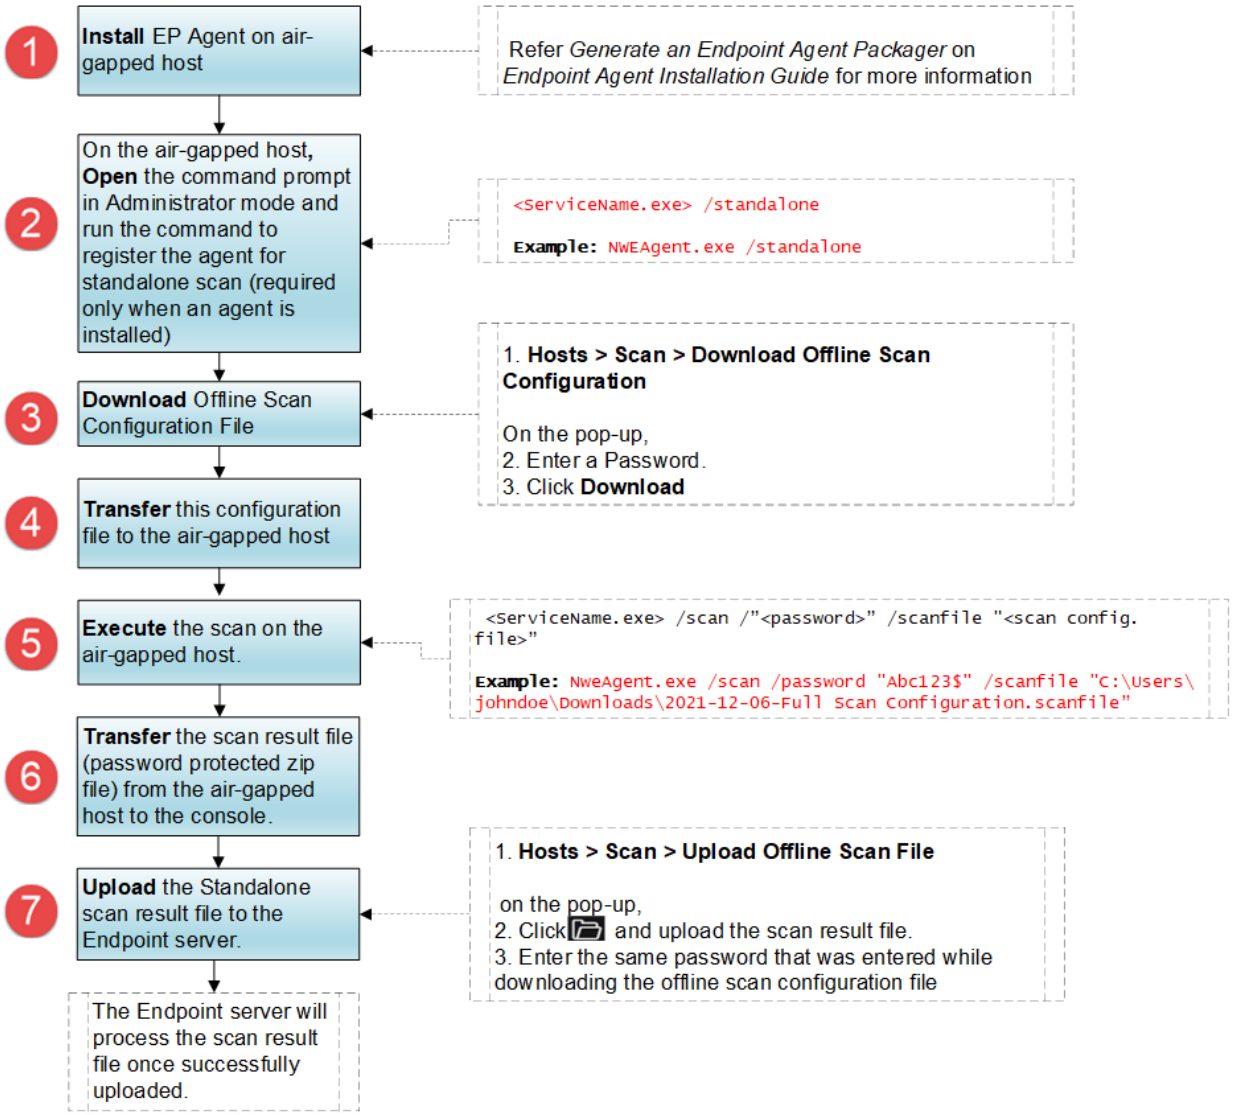
## Standalone Scan on Air-gapped Windows Hosts

The Standalone scan feature allows administrators to run scans on the air-gapped Windows hosts that are disconnected from the network. Administrators can download the scan command once from UI and execute it on multiple hosts. For the best utilization of resources, we recommend running standalone scan every two weeks. Policies do not apply on air-gapped hosts, and features such as downloading MFT to the server, upgrading agents through UI, downloading a file to the server are not available for standalone agents.

The scan process involves two files:

- **Offline Scan Configuration** - Contains the configuration information needed to run the scan.
- **Scan Results File** – This contains the results of the Scan, which you can upload using the **Scan > Upload Offline Scan File** option on the **Hosts** view. This file will be imported and processed by NetWitness.

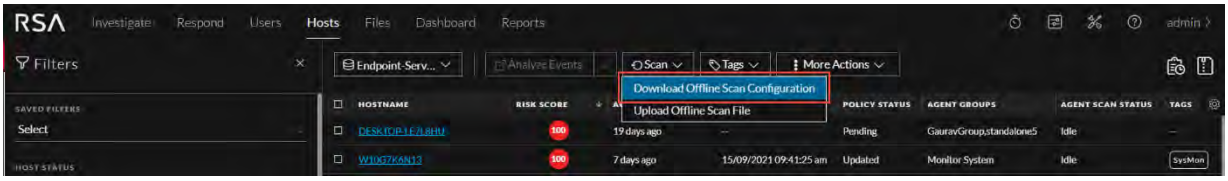
## Standalone scan workflow:



**Note:** Both Download Offline Scan Configuration and Upload Offline Scan File options are available only on the Endpoint server view. These options can't be accessed from Broker view.

## Generate the scan configuration file

1. Click **Scan > Download Offline Scan Configuration** on the Hosts screen.

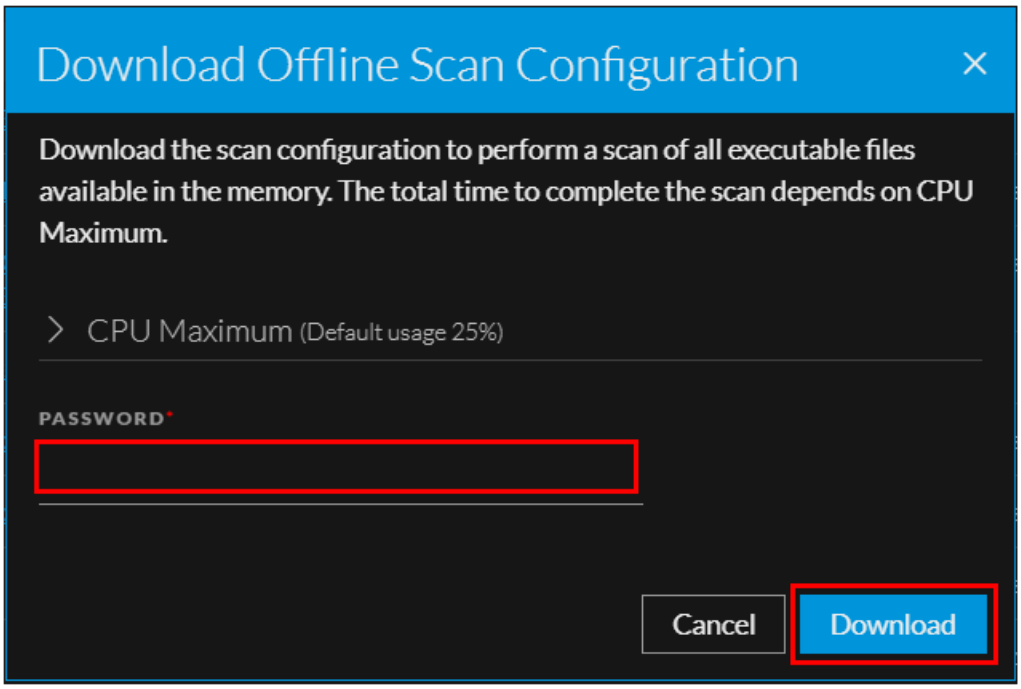


On the Download Offline Scan Configuration pop-up,

2. (Optional) **Select CPU Maximum**.

3. Enter a Password. (not more than 31 characters long)

4. Click **Download**.



5. Transfer the Offline Scan Configuration file to the air-gapped host.

## Install Endpoint Agent and Register for Standalone Scan

1. Install the Endpoint Agent on the air-gapped host. Refer to *Endpoint Agent Installation Guide* for more information.
2. Register the agent for standalone scan (required only when an agent is installed)
   - Open command prompt in administrator mode and execute the following command:

     `ServiceName.exe /standalone`

     Example: `NweAgent.exe /standalone`

## Start a Standalone scan

1. Open the command prompt in Administrator mode, on the air-gapped host.

2. Execute the scan using the following command(syntax):

```
ServiceName.exe /scan /password ”<password>” /scanfile "<scan config. file>”
```

Example: `NweAgent.exe /scan /password "Abc123$" /scanfile "C:\Users\johndoe\Downloads\2021-12-06-Full Scan Configuration.scanfile"`

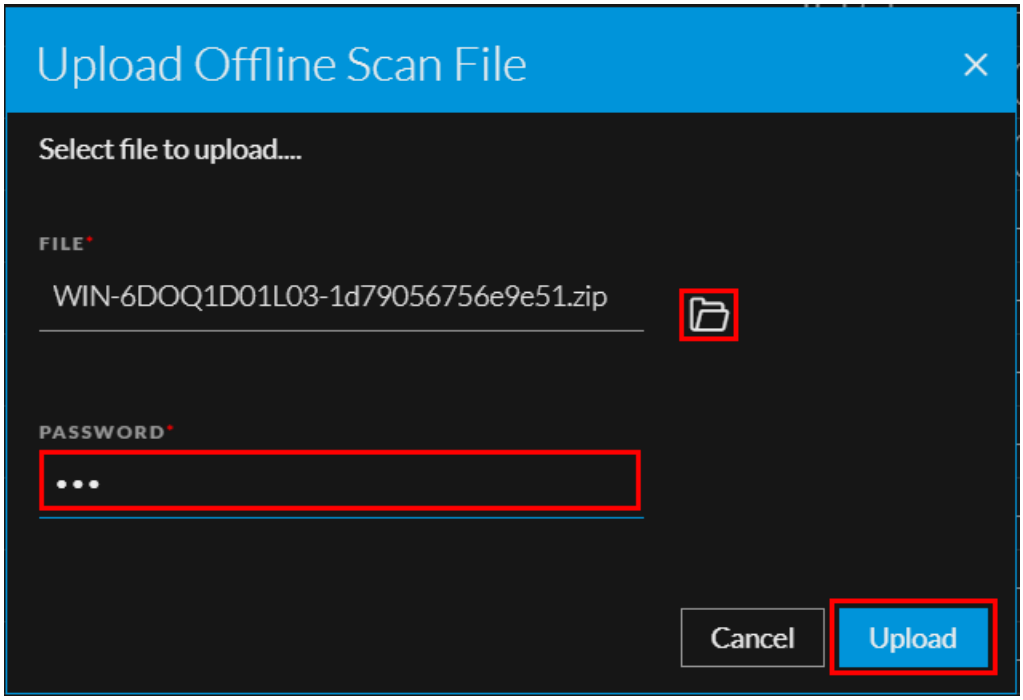
- `<password>` is the password entered while generating the Offline Scan Configuration File.

- `<scan config file>` is name of the scan configuration file with full path.

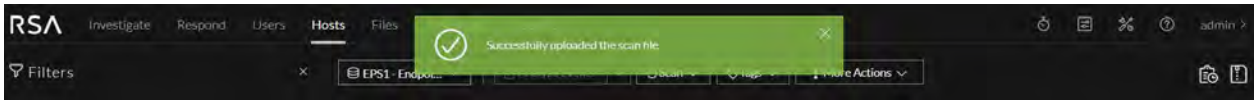
3. Wait until the scan is completed.
4. Transfer the scan result file(password protected .zip file) back to the machine to upload to the UI.

## Upload the Standalone scan result file

1. Click **Scan > Upload Offline Scan File** on the Hosts screen.



2. Click and upload the scan result file.
3. Enter the same password that was entered while downloading the offline scan configuration file.
4. The Endpoint server will process the scan result file once successfully uploaded.



**Note:** Standalone agents can only be upgraded manually using the Endpoint agent packager. Refer to *Generate an Endpoint Agent Packager* on *Endpoint Agent Installation Guide* for more information.

# Analyze Hosts Using the Risk Score

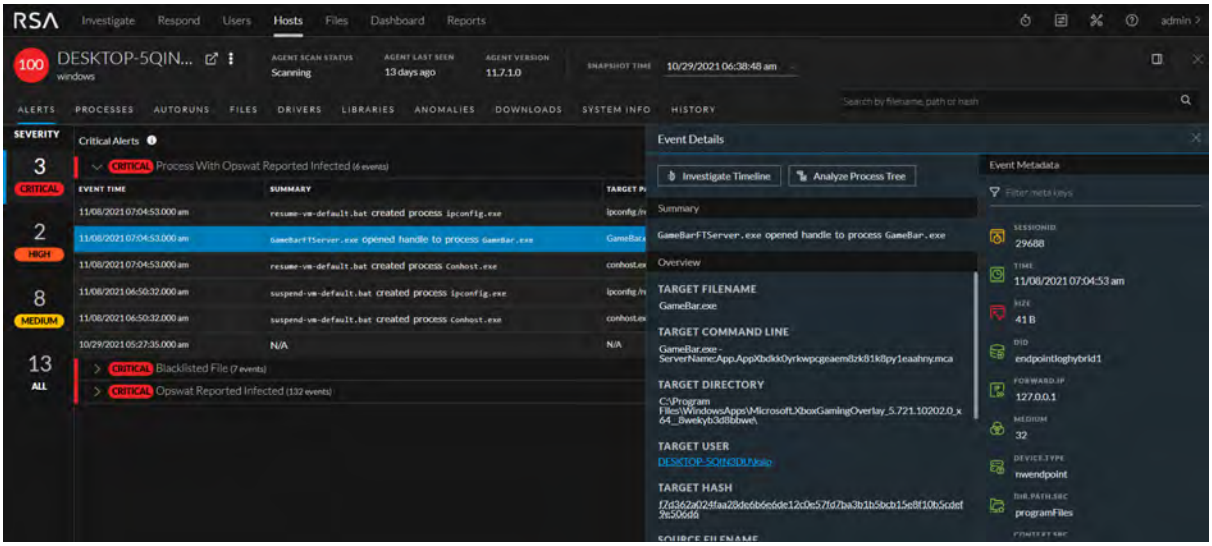
You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

To analyze the hosts using the risk score:

1. Go to **Hosts**.

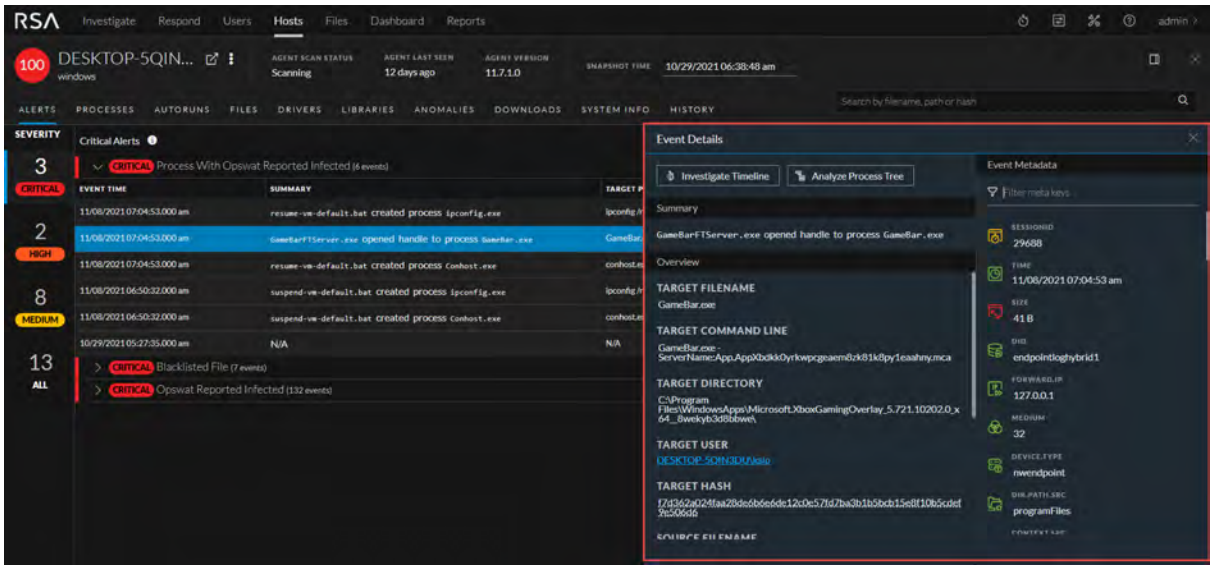
   The Hosts view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.
3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.
4. In the **Alerts** panel, click the alert severity such as **Critical**, **High**, **Medium**, or **All**.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

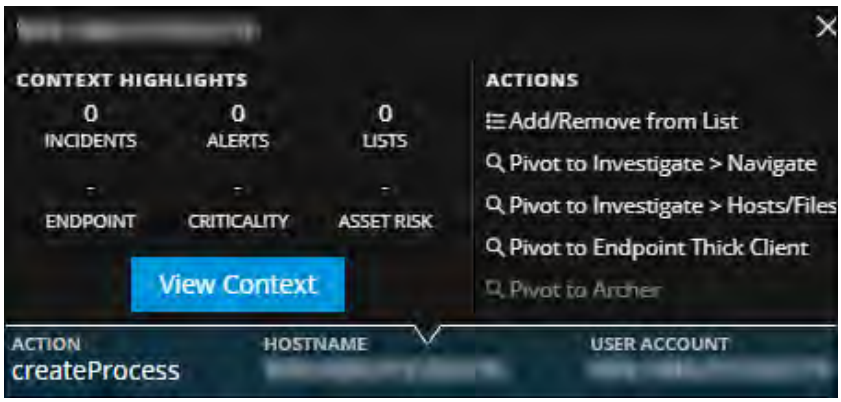


**Note:** Only the latest 1000 events are displayed.

6. To view all the metadata associated with a specific event, click on an event. The information such as summary, target path, filename, and others is displayed on the **Event Details** panel.



7. Event Metadata such as IP, Hostname, Mac, Filename, File hash, User, and Domain is displayed on the Event Details panel. Scroll down to view all related information. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.



8. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click the **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To view a list of processes captured on the hosts and investigate a particular process, click the **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

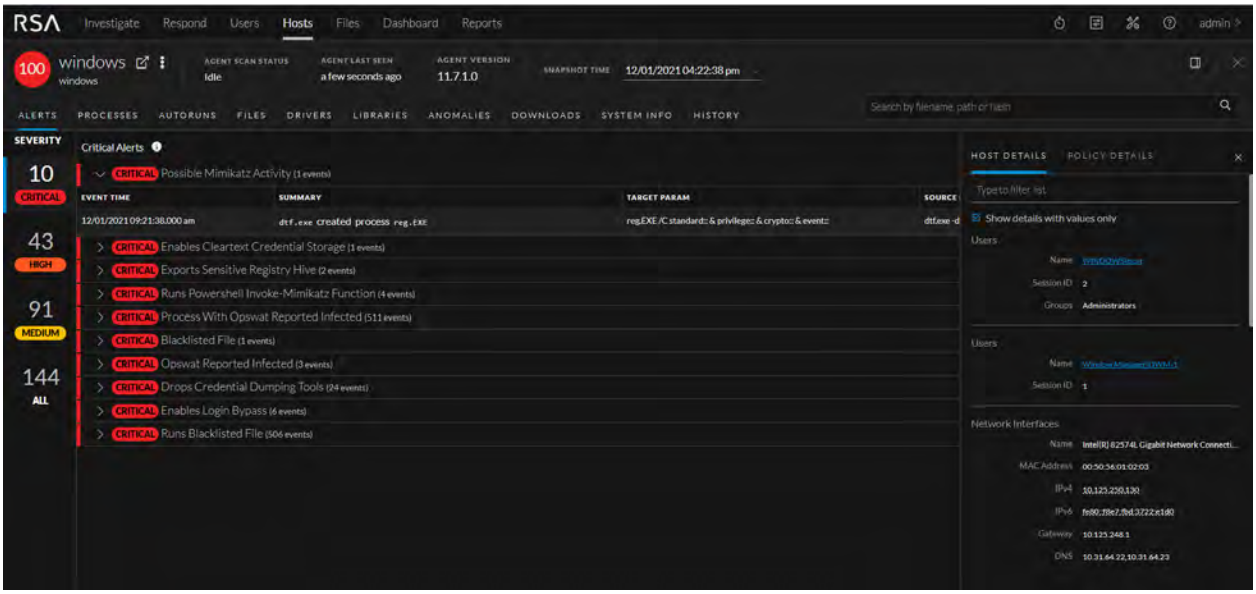
## Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information, such as Network interface, operating system, hardware and others.

- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.



## Filter Host Details

In the Processes, Autoruns, Files, Drivers, Libraries, and Anomalies tabs, you can filter the processes or files on file status, reputation, file or process name, signature, and risk score. Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

In the **Host** view > **Files** tab, you can filter the files available on host, and files deleted from host. The result of files deleted from host depends on the data retention policy configured in the **Endpoint Config** view > **Data Retention Scheduler** tab. By default, data retention policy is configured for 30 days, this means only 30 days of deleted files are stored in the Endpoint server. These filter options are disabled if **All Files Available on Host** toggle is disabled.

In the **Host** view > **History** tab, you can filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters).The filter is added to the **Saved Filters** panel on the left. To delete a filter, hover over the filter name and click 🗑.

**Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

## Search Files on Host

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.

**Note:** To search for a SHA-256 checksum, provide the entire hash string in the search box.

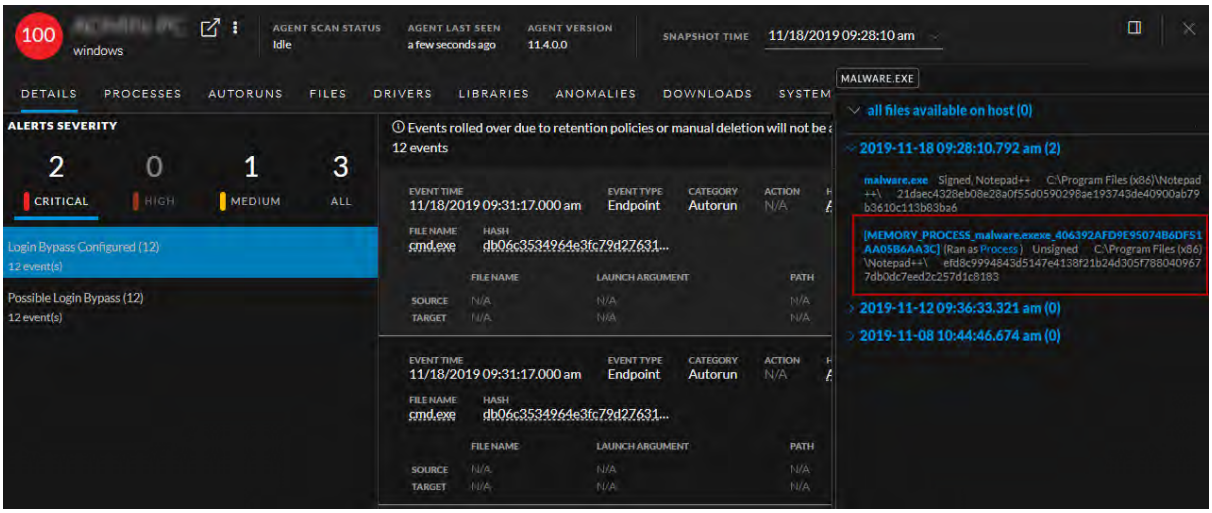
The result displays the matching files present on the host in **All Files Available on Host** category and in the respective **snapshot** category with the details, such as file name, signature information,and checksum. In addition, the **snapshot** category displays the system interaction, for example, ran as process, library, autorun, service, task, or driver. To view more details, click the **filename** or **system interaction** link.

Example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Details** tab, enter the file path `C:\Users` in the search box.

   The search displays a maximum of 100 results of the executables in this folder. In this example, there are some unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

   This file is run as a Process.
4. To view details of this file, click **Process** in the result.

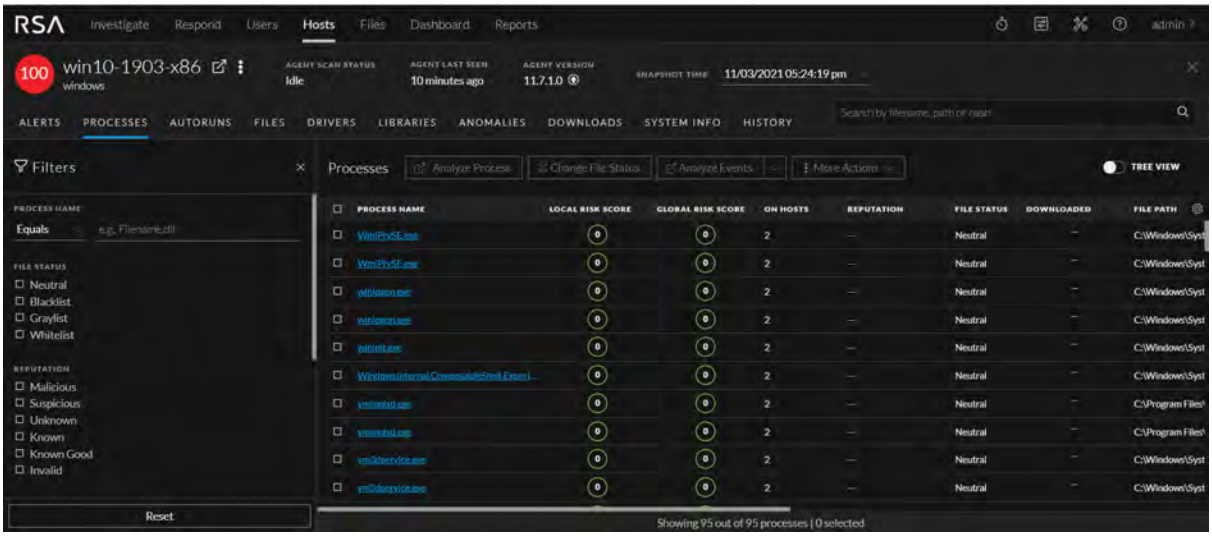


This opens the Process tab where you can view the process details.

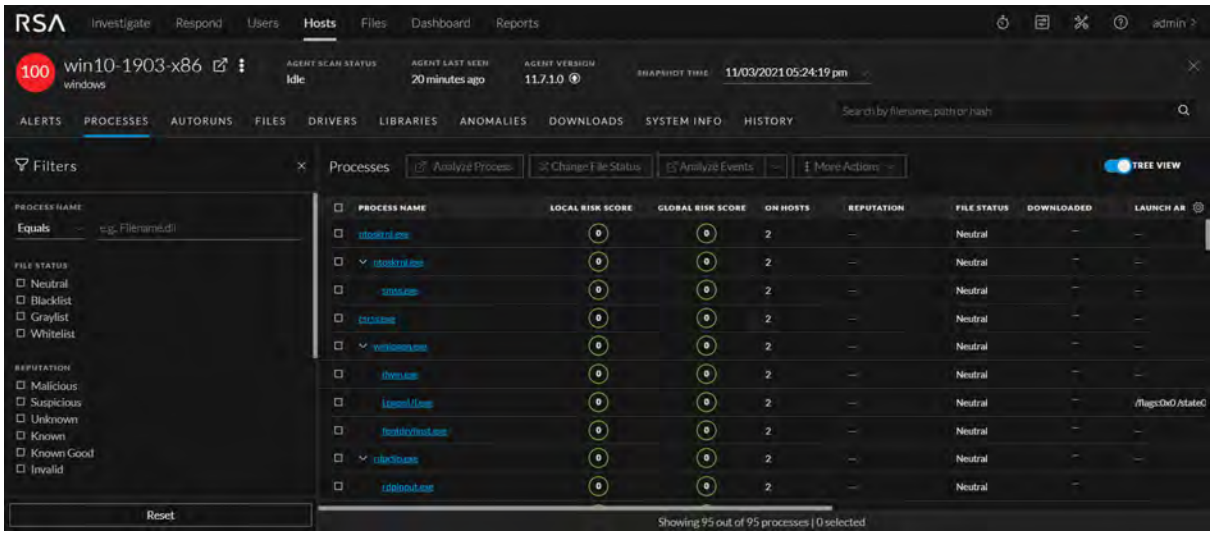
## Analyze Processes

To analyze the process:

1. In the **Hosts** details, select the **Processes** tab.

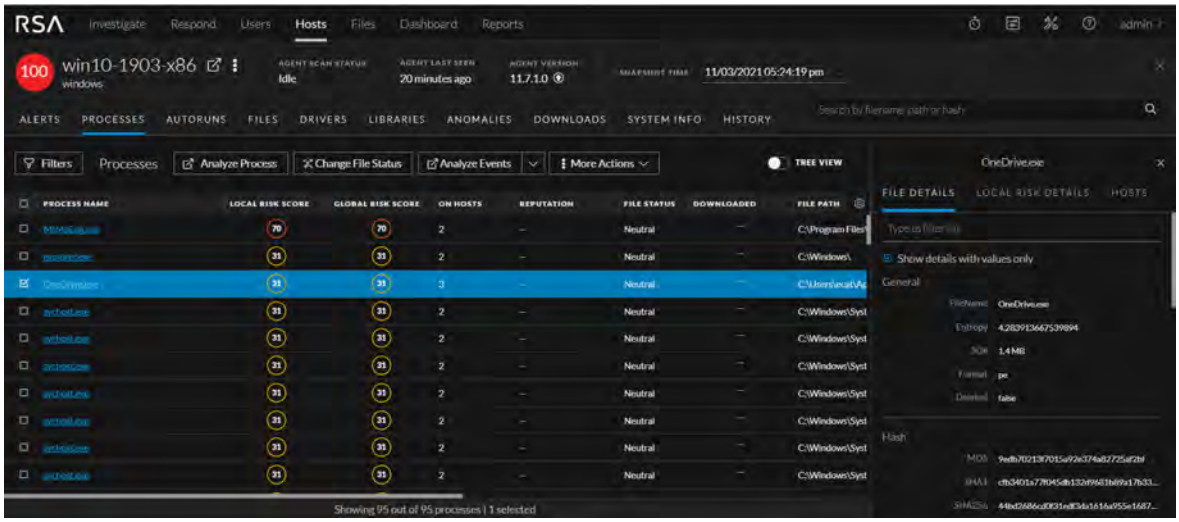


To view the process tree, click the toggle switch. The following is an example of the tree view:

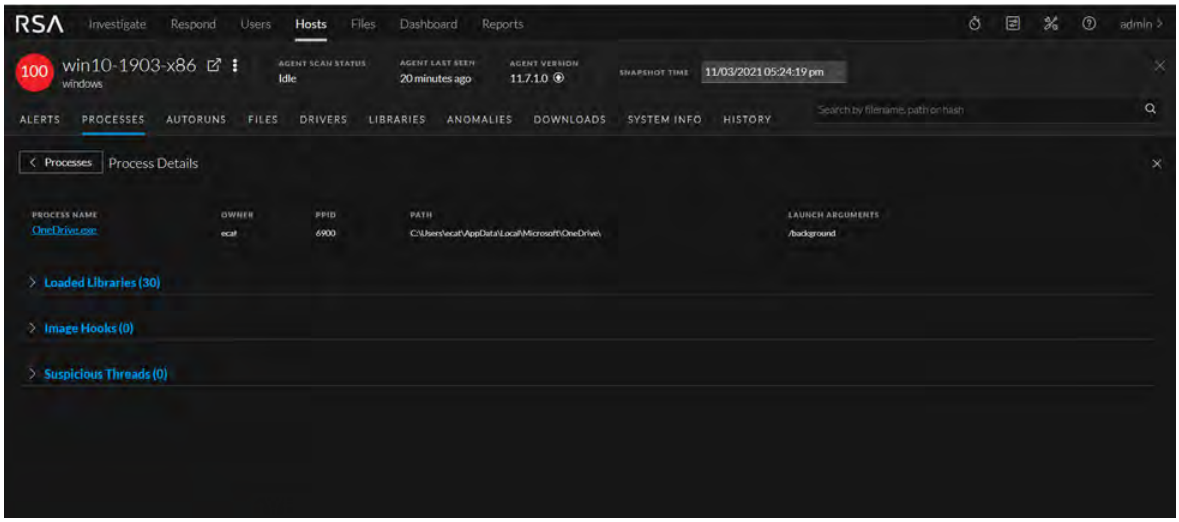


2. In the **Processes** Tab, do one of the following:

   - Click a row to view the properties of a process in the right panel.



- Click the process name to view the process details of a specific process.



When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

## Analyze Autoruns

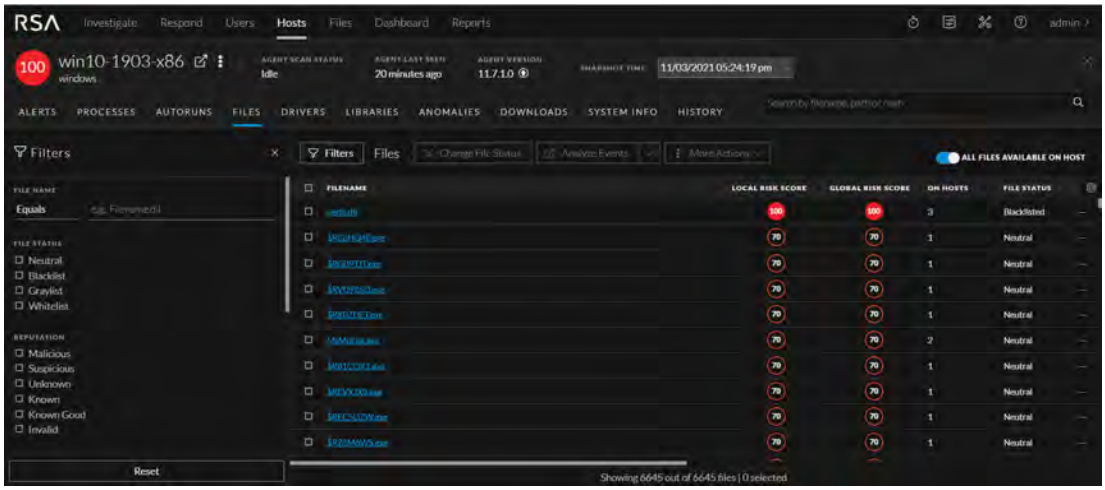
In the Hosts details, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.

For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

## Analyze Files

To analyze the files, you can do either one of the following based on your requirement.

- In the **Hosts** view, select the **Files** tab.
  You can view the list of all files (reported as part of scan and tracking) on the host including the deleted files.



- To view the files reported as part of scan snapshot, you must disable **All Files Available On Host** toggle and select the scan time form the **Snapshot** drop-down list.

Example for analyze files, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

## Analyze Libraries

In the Hosts details, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

## Analyze Drivers

In the Hosts details, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

## Analyze Anomalies

**Note:** This tab is available only for advanced agent.

In the Hosts details, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.

- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

**Note:** Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

## Analyze System Information

In the Hosts details, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

## Analyze History

In the Host details, select the **History** tab. This tab lists the commands along with the respective status and additional details.

When you review the history, look for the command status and retrieval count to check if the agent retrieved the commands.

Below are some examples:

- A file download command is issued, but the file is deleted on the host. In this case status of the command is failed as the file is not downloaded.
- The retrieval count increases, but the command is not processed. This happens when an analyst requests a large number of files (For example, MFT, system dump, or process dump), and the connection breaks when the agent uploads these files.
- If the agent command is not retrieved, the agent is either offline or busy processing other commands (For example, uploading a system dump). In this case, the status of the command shows pending.

To view more details, click the **Hostname** link highlighted in blue. The Hosts details view is displayed. In the case of MFT, download file, system dump, and process dump command types, **Downloads** tab is displayed with details such as file name, type, status, size, downloaded time and SHA256 of the file, when you click on the **Hostname** link.

## Export Host Details or Files to JSON File

**Note:** Export Host details option is disabled if there is no snapshot time.

To export host details or files to JSON file:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. Click (**More**) beside the hostname and do any of the following:
   - To export the scan data categories for the host, select **Export Host Details**. This exports files such as:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.
     - fileContext.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported during the host scan.
     - machinedetails.json - This file consists of the machine details, including hardware, operating system, interfaces, and so on, along with the agent details like version, policy details.

   **Note:** If Endpoint Broker is selected and a host is communicated with multiple Endpoint servers, during the host details export, all files and details of the host are exported from the Endpoint server where the selected snapshot is stored.

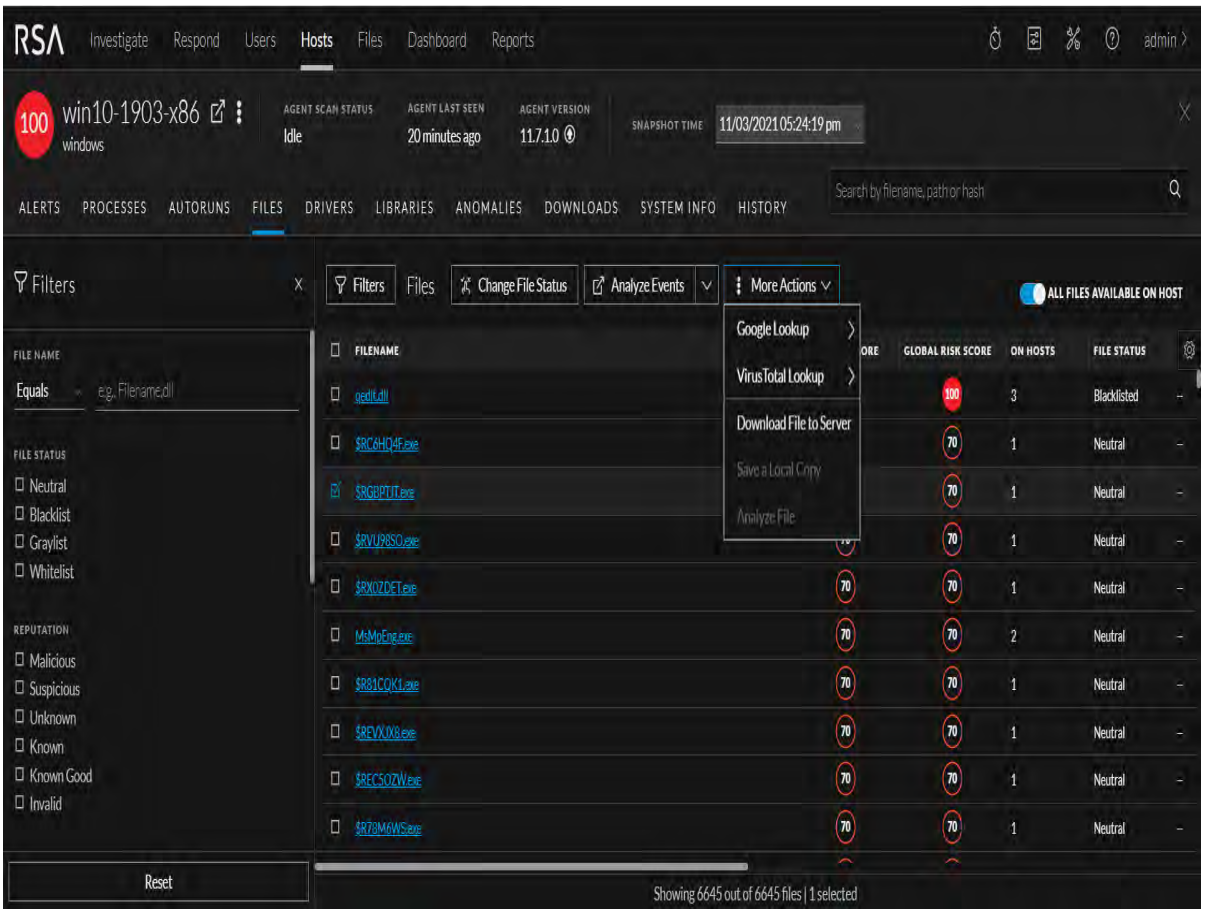
   **Note:** allfiles.json file is exported irrespective of the selected snapshot.

   - To export all the files available on the host, select **Export Files**. This exports:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.

## Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Hosts** > **Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More Actions** drop-down list in the toolbar, do the following:



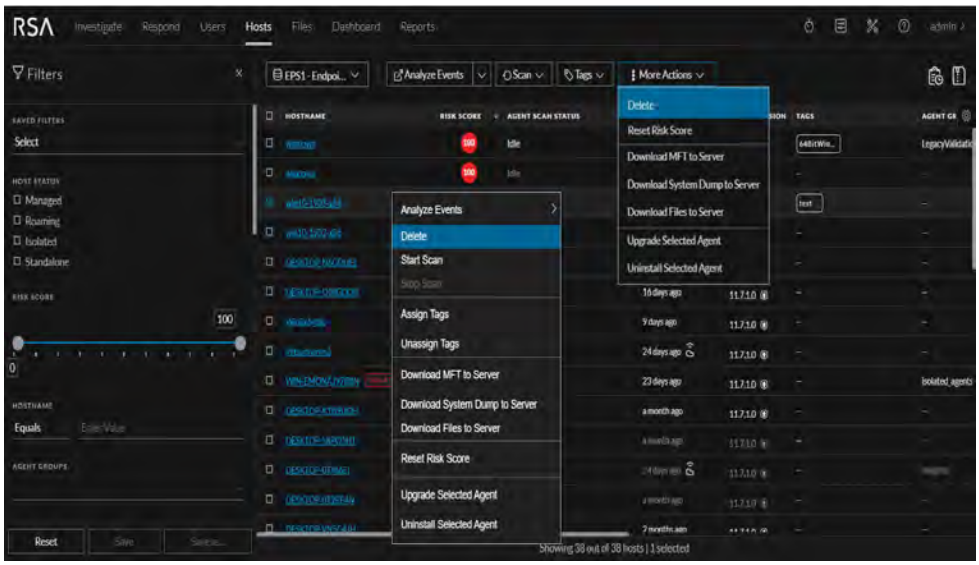
- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

**Note:** To open files in multiple tabs, make sure you enable the pops-up in the browser.

## Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

1. Go to **Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:



- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

**Note:** If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

## Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3 or later, if you want to delete the hosts with older versions:

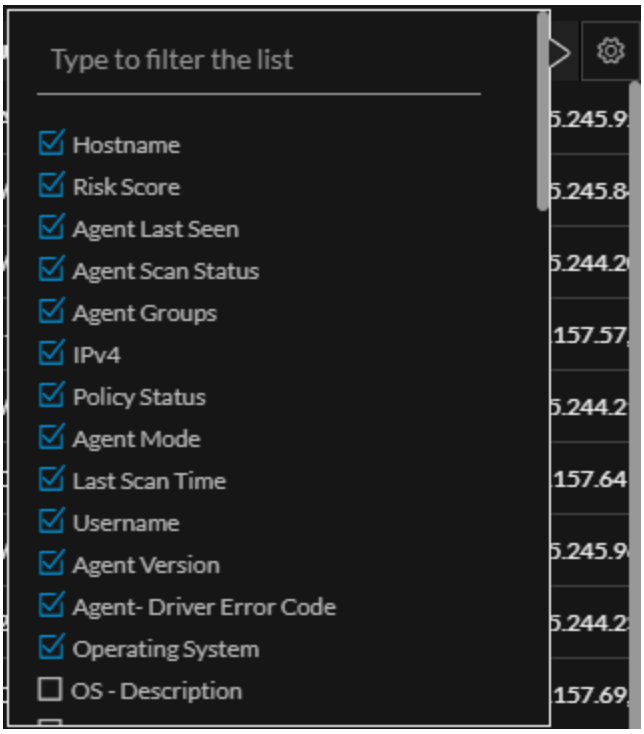
1. Go to **Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

   If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

## Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:



3. Scroll down or enter the keyword to search for the column in the displayed list.
4. Sort the data on the required column.

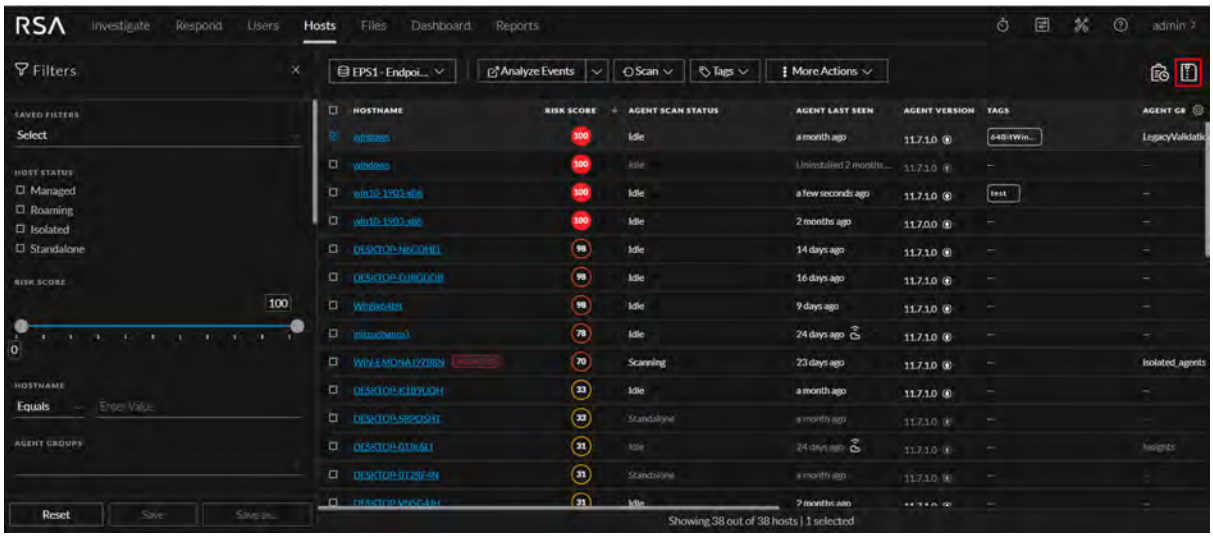
> **Note:** The selections you make here become your default view every time you log in to the Hosts view.

## Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **Hosts**.
2. Filter the hosts by selecting the required filter options.
3. Add columns by clicking in the right-hand corner.

4. Click to export the host attributes to a csv file.



You can either save or open the csv file.

## Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. On all the tabs within the Hosts view, the message Host is migrated to <Server-name> is displayed. You view the host details by clicking the <Server-name>. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

**Note:** Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.

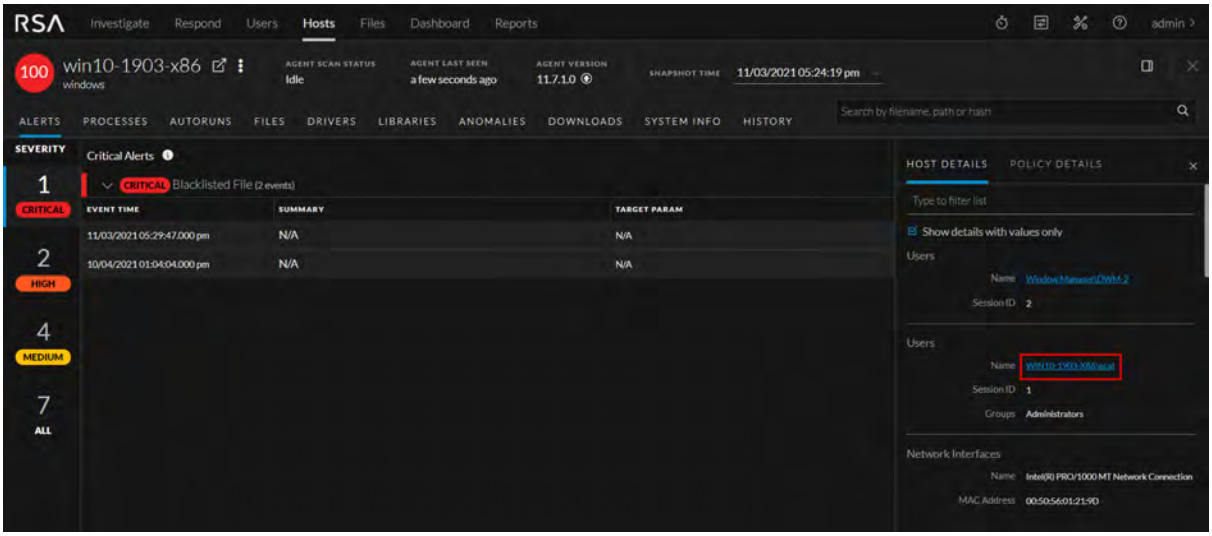
**Note:** To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

## Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the Users category, click the name.

This opens the Entities tab for investigation in a new tab.



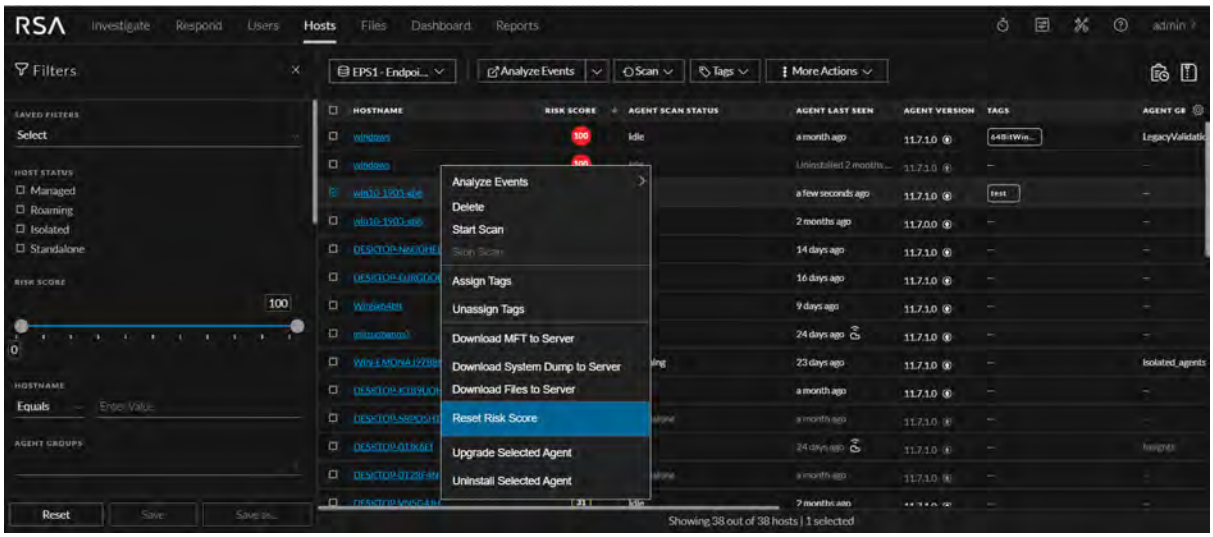
## Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

### To reset the risk score of a host:

1. Go to **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

**Note:** You can select a maximum of 100 hosts to reset the score.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

# Investigating a Process

**Note:** The information in this topic applies to NetWitness Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, risk score, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

## Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:
  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.

  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

## Analyze a Process

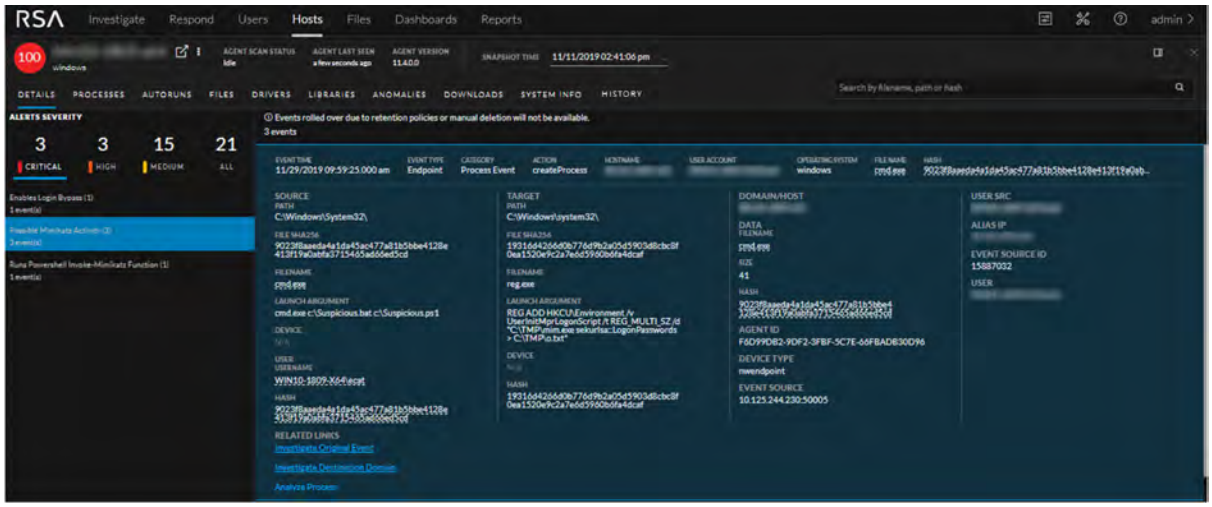
**Note:** Linux is not supported for analyzing a process.

To analyze the process:

1. Go to **Hosts** and click on a host.
2. Click on an event associated with an alert on the Host Details view. The **Event Details** panel appears.
3. To analyze process activities of a file, do one of the following:
   - In the **Event Details** panel, click **Analyze Process Tree**.
   - Select the **Processes** tab and do one of the following:

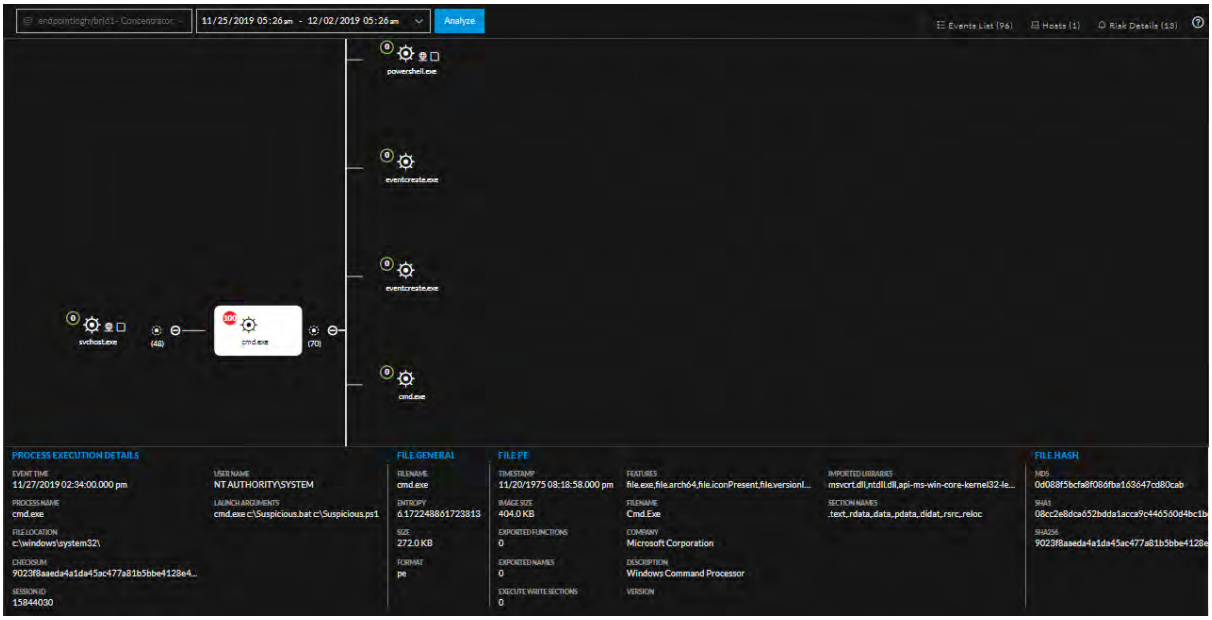
- Right-click a process and select **Analyze Process** from the context menu.
- Click **Analyze Process** in the toolbar.

In the following example, the file `dtf.exe` has created proces `reg.exe`.



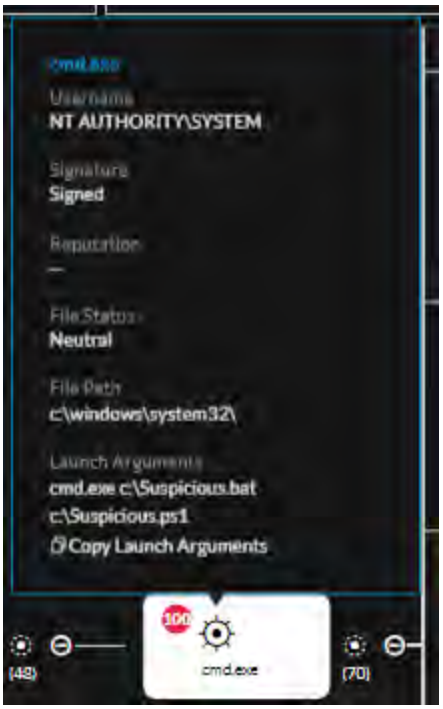
Clicking **Analyze Process** displays the process visualization. For each node, the process name, risk score, and type of activity the selected process has performed (network, file, or registry) are displayed. Optionally, you can change the time range to view data.

You can view the properties, such as process execution details, file properties of the selected process in the bottom of the view.



**Note:** No result is displayed in the process visualization view if there is no data for last seven days or if there is no `createprocess` event.

4. On the right side of the process visualization view:
   - Click **Events List** to view the associated events. You can also filter events based on the events category. For more information on filtering, see Analyze Events for a Process.
   - Click **Hosts** to view the hosts on which this file is present and the associated risk score. For more information, Analyze Hosts with File Activity.
   - Click **Risk Details** to view the list of distinct alerts, such as Critical, High, Medium and All. For more information, see Analyze Hosts Using the Risk Score.
5. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

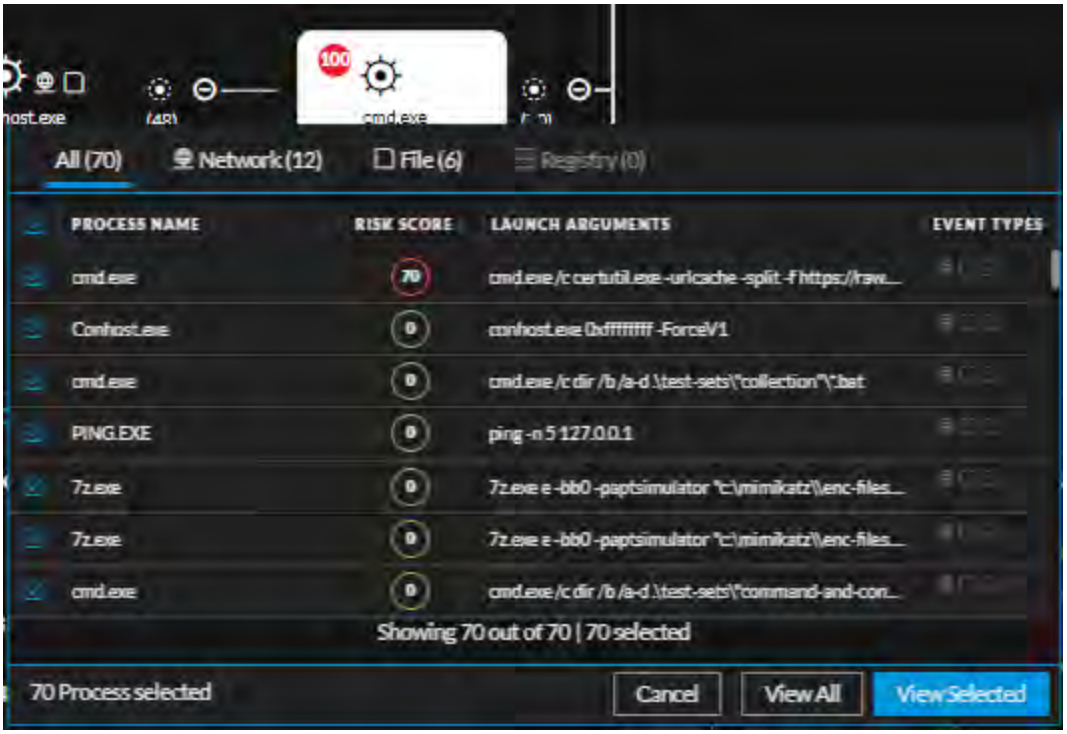


6. Click to view the child processes. The Process selection dialog is displayed with the child processes associated with the process based on the risk score. You can filter the result on the event type by clicking icons on the top panel. When no matching event types are available, these filter options are disabled.

   Depending on the type of event, the icons are highlights in the Event Types column.

   a. Click **View All** to view all child processes or select the required processes and click **View selected**. The associated events and properties are displayed in the right panel.

b. Click to change the process selection and click to collapse the view.

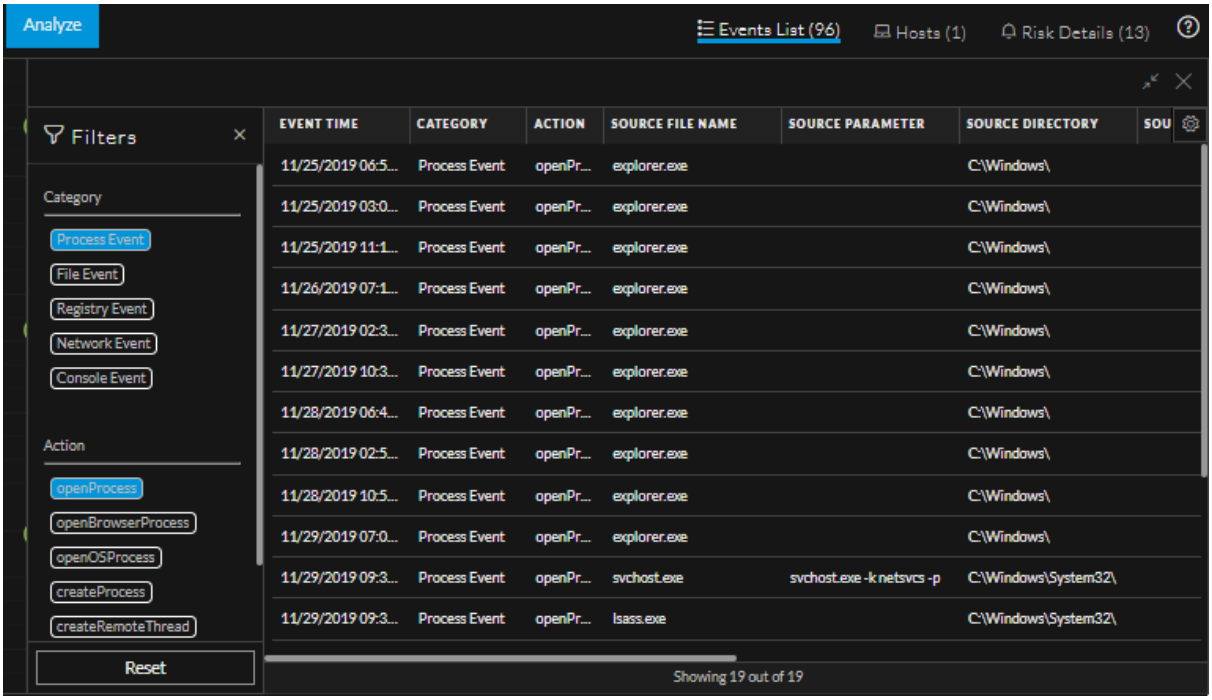


## Analyze Events for a Process

To analyze events for the selected process:

1. Perform steps 1 to 3 in Analyze a Process.
2. In the process visualization, click the **Events** tab.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

For example, to view only process events, select the **Process Event** category, and filter on action.



The result displays the sequence of activities involving this process for the selected filters.

**Note:** For the console events, the context for local and remote are available only if the data is sent from 11.4 or later agents.

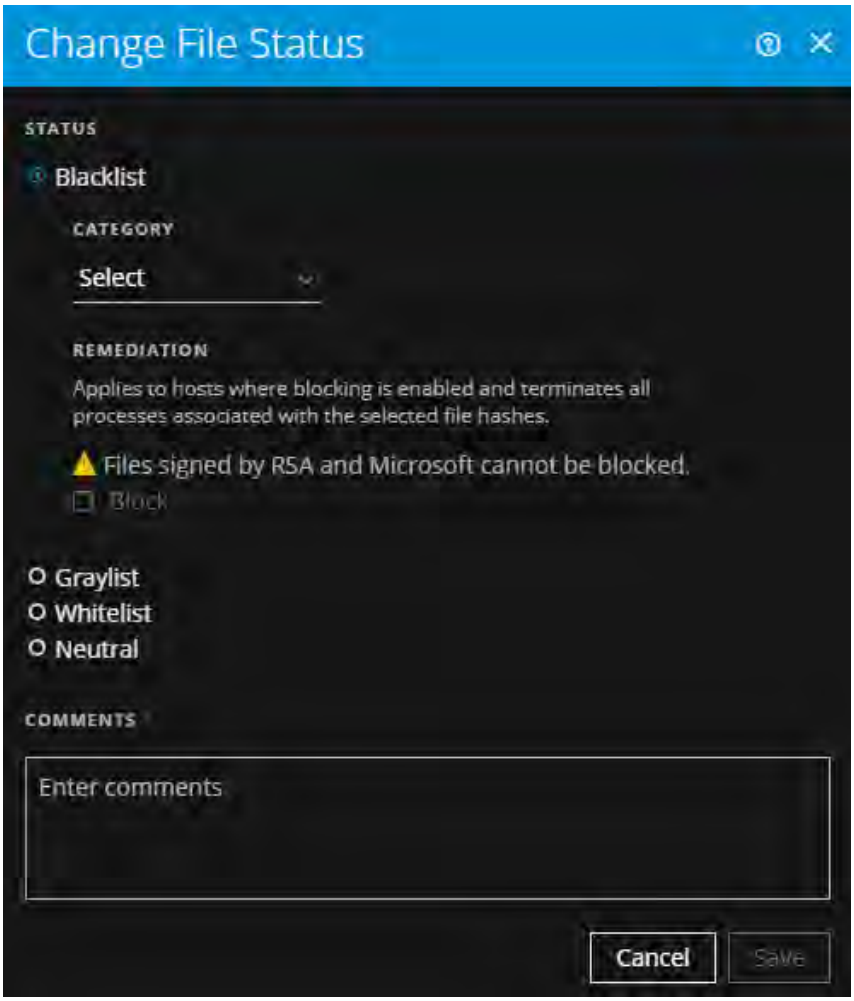
# Changing File Status or Remediate

**Note:** By default, the blocking option is disabled in the policy. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **Hosts** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.



**Note:** You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

**Caution:** Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

**Note:** Blocking is supported only for Windows hosts.
You cannot block the following:
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.
To delete a blocked file, users can log in to the host and execute the delete command using the elevated command prompt.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

## Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```

4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

# Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually or automatically download the file to the server.

**Note:** Saving or analyzing downloaded file works the same way irrespective of whether the file is downloaded manually or automatically.

**Note:** Downloaded files are stored in the Endpoint Server which may fill up the disk space. To utilize the storage efficiently without impacting the health of Endpoint Server, RSA recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<files>/`. If you want to change the location, make sure that you have **endpoint-server.configuration.manage** permissions and do the following:
1. In the Explore view, go to **endpoint/download**,
2. In the base-path, provide the location of the directory.

**Caution:** By default, the status **File Download Disk Usage** stats in the **Health and Wellness** view shows unhealthy if the disk usage reaches 60% and the file download stops automatically when the disk usage is 70%. You can customize the warning or fatal thresholds in the **> Services > Endpoint Server > view > Explore > rsa.endpoint.file-download-disk-thresholds.warning-percent** and **rsa.endpoint.file-download-disk-thresholds.fatal-percent** parameters respectively.

For the downloaded file, you can:

- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

## Download Files to Server

Downloading file to server is not supported for memory DLL and floating code.

**Note:** Downloading files may take significant time. Additional requests to the agent during download are queued and processed when the download is complete.

## Automatic File Download

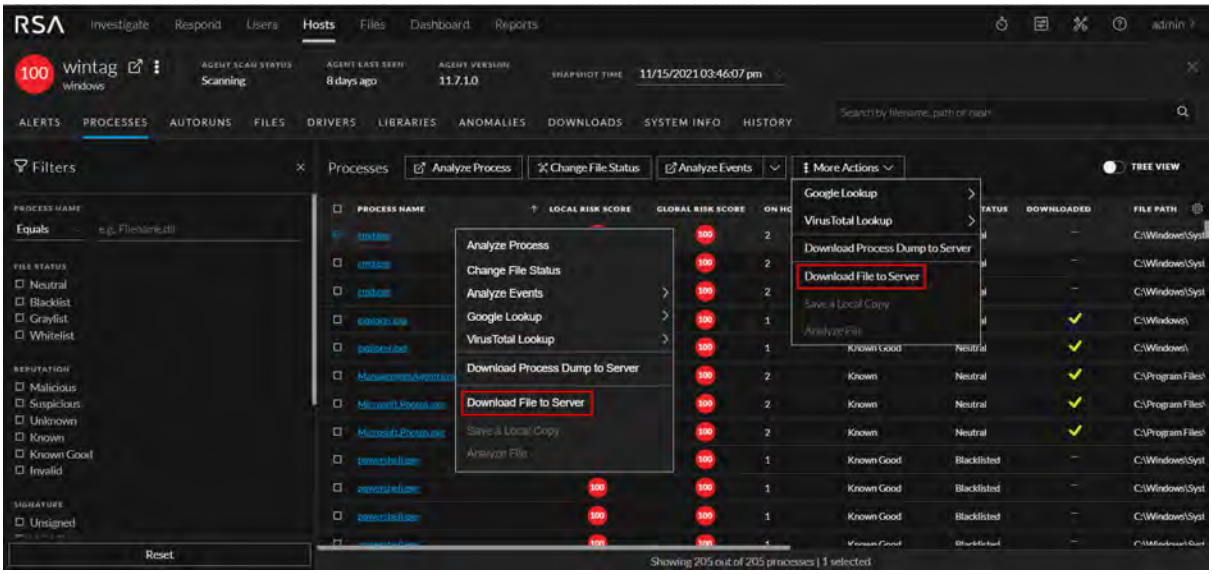
By default, the files that are unsigned and size lesser than or equal to 1 MB are downloaded automatically to the NetWitness Endpoint server. And, only single copy of each file is downloaded automatically. You can limit the volume of files to be downloaded in the **> Endpoint Sources > Policies** tab, so the files matching certain criteria are only downloaded automatically. For more information on automatic file download settings, see "Create an EDR Policy" section in the *RSA NetWitness Endpoint Configuration Guide*.

The status of the download is displayed in the **Files** tab > **Downloaded** column.

## Manual File Download

To manually download files to the server from the Hosts view:

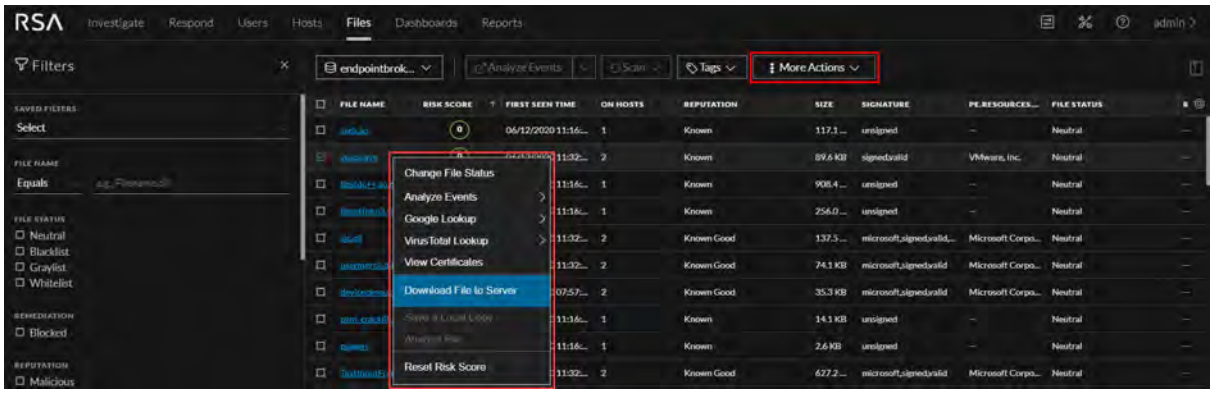
1. Go to **Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:



- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

To download files to the server from the Files view:

1. Go to **Files**.
2. Select the file and do one of the following:



- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

## Save Downloaded Files

You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.

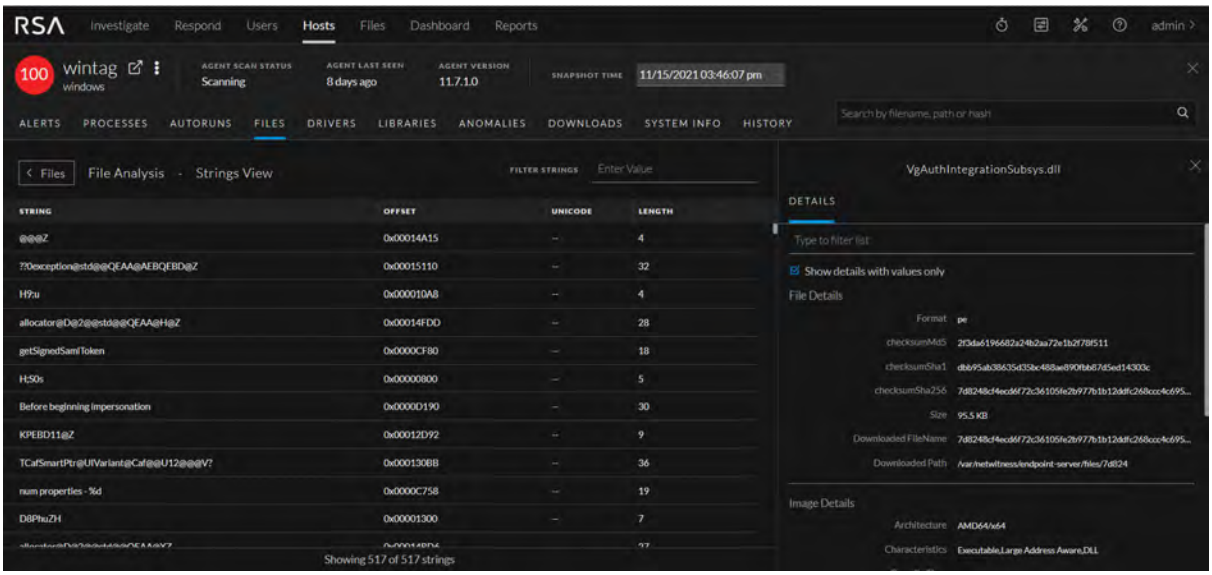
To save a file:

1. Go to **Hosts** or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

## Analyze Downloaded Files

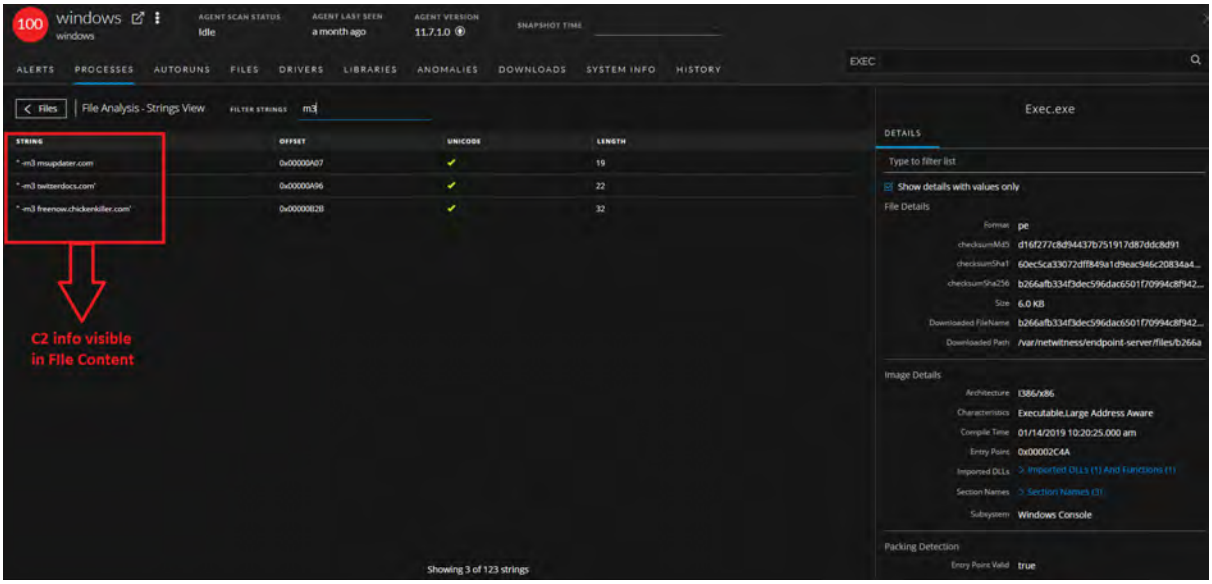
You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.



3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.



If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.

# Performing Host Forensics

**Note:** The information in this topic applies to NetWitness Version 11.4 and later.

You can perform the following forensic investigation on a host:

- Master File Table (MFT)
- System Dump
- Process Dump

**Note:** This is applicable only for Windows agent (in Advanced mode) with NetWitness Platform version 11.4. Downloading system dump files may take significant time. Additional requests to the agent during system dump download are queued and processed when the download is complete. MFT, system dump, and process dump downloads are not supported for agents communicating through Relay server.

**Note:** MFT, system dump, and process dump are stored in the Endpoint Server which may fill up the disk space. For large deployments, to utilize the storage efficiently without impacting the health of Endpoint Server, RSA recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<file type>/`, where `<file type>` is MFT, system dump, or process dump. If you want to change the location, make sure that you have endpoint-server.configuration.manage permissions and do the following:
1. In the Explore view, go to **endpoint/download**.
2. In the base-path, provide the location of the directory.

## Download Master File Table

Master File Table contains metadata of every file on the host. It keeps track of information, such as filename, size, timestamps, permissions, and location of the file on the host. It consists of two sets of timestamps - Standard Information ($SI) and File Name ($FN). Each set has the following timestamps - creation, access, update, and modification.

Time stomping is a technique that modifies the timestamps for a file (creation, access, update, and modification time) to mimic files that are in the same folder, making it difficult to identify suspicious files on a host. To perform forensic investigation of a suspicious file, you can download and analyze the MFT, and focus on files that are time stomped. For more information, see Analyze Downloaded MFT.

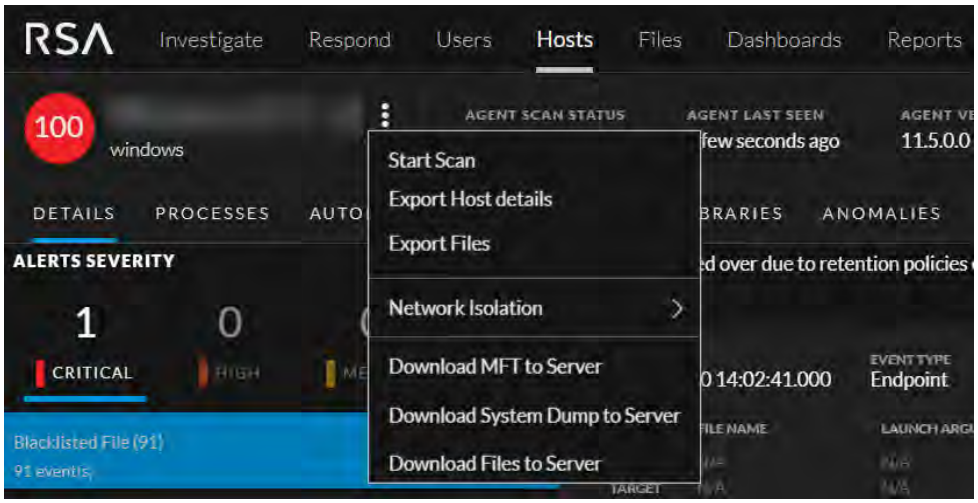
During MFT analysis, you can also search for suspicious filenames, and also files that were created before or after a known malicious event. You can also download files from the MFT viewer for further analysis.

### Download MFT to Server

To download MFT to the server from the Hosts view:

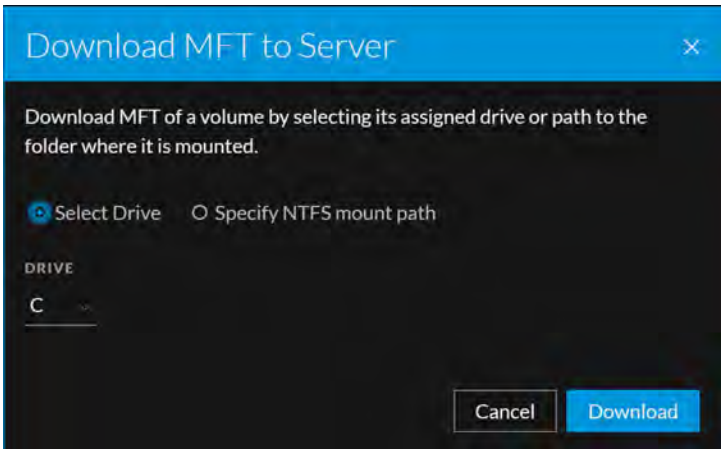
1. Go to **Hosts** and do one the following:
   - Select a host and select **Download MFT to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download MFT to Server**.

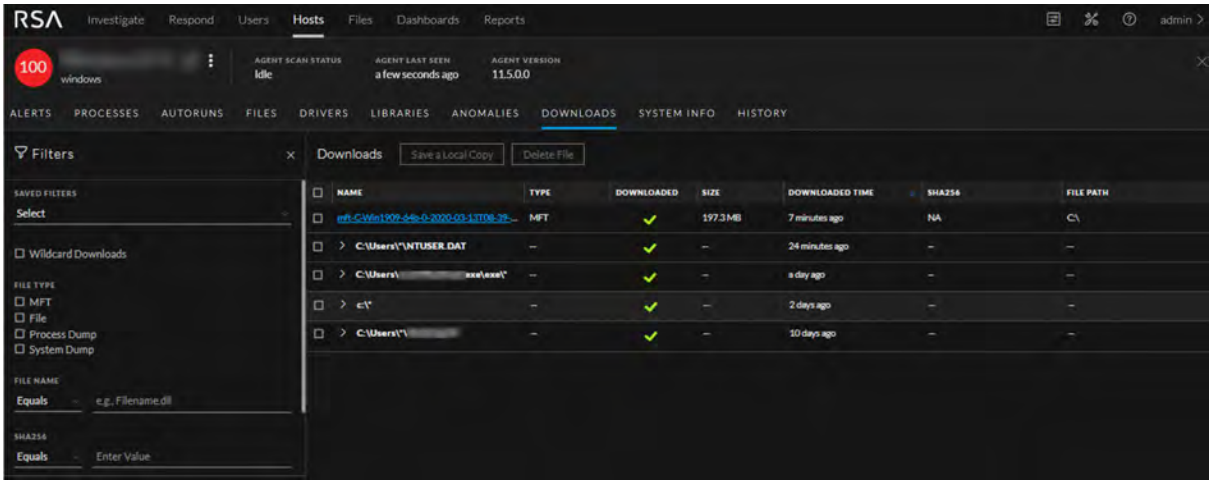


2. In the **Download MFT to Server** dialog, select one of the following:
   - Choose **Select Drive** to download MFT on assigned drive.
     You can select the drive from the **Drive** drop-down list. By default the selected drive is C.
   - Alternatively, you can choose **Specify NTFS mount path** to download MFT on the path to the folder where it is mounted

   Click **Download**.



3. View details of the downloaded MFT in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.



# Analyze Downloaded MFT

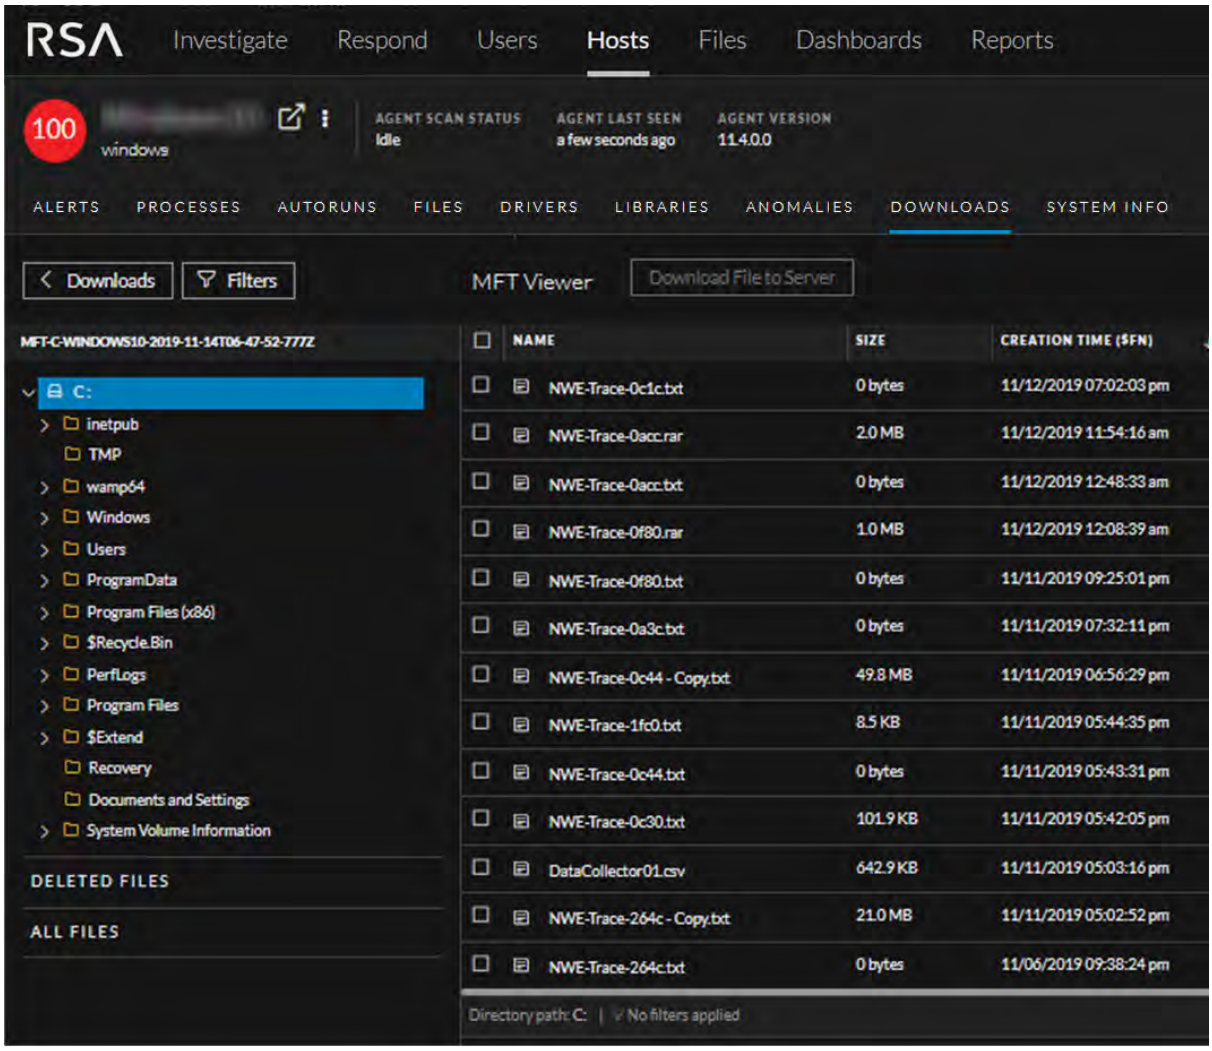
You can use the MFT viewer to begin analysis where you can search for files based on file name, time stamps, and identify files that are timestomped.

## View MFT

To view the content of the downloaded MFT:

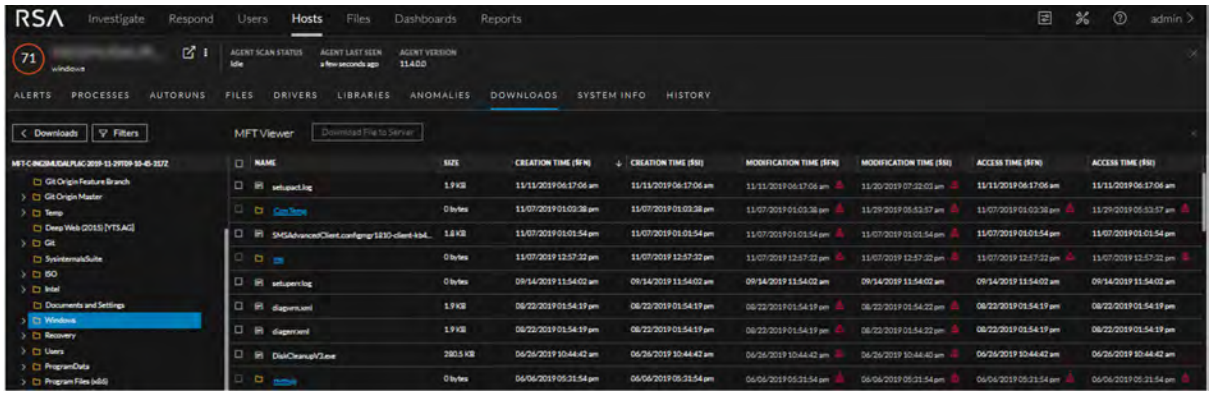
1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Click the file name. The MFT viewer is displayed.

   All available files are displayed in a tree view similar to the Windows Explorer in the All Files folder. The Deleted Files folder contains a sequential list of all deleted files.



4. Click ▶ to view the folder structure. Click the row to view the folder content.

   The details of the MFT is displayed in the table. By default, the table is sorted on the creation time ($FN). If the $SI and $FN timestamps are different, the columns are highlighted in red (⚠) indicating that it is time stomped.

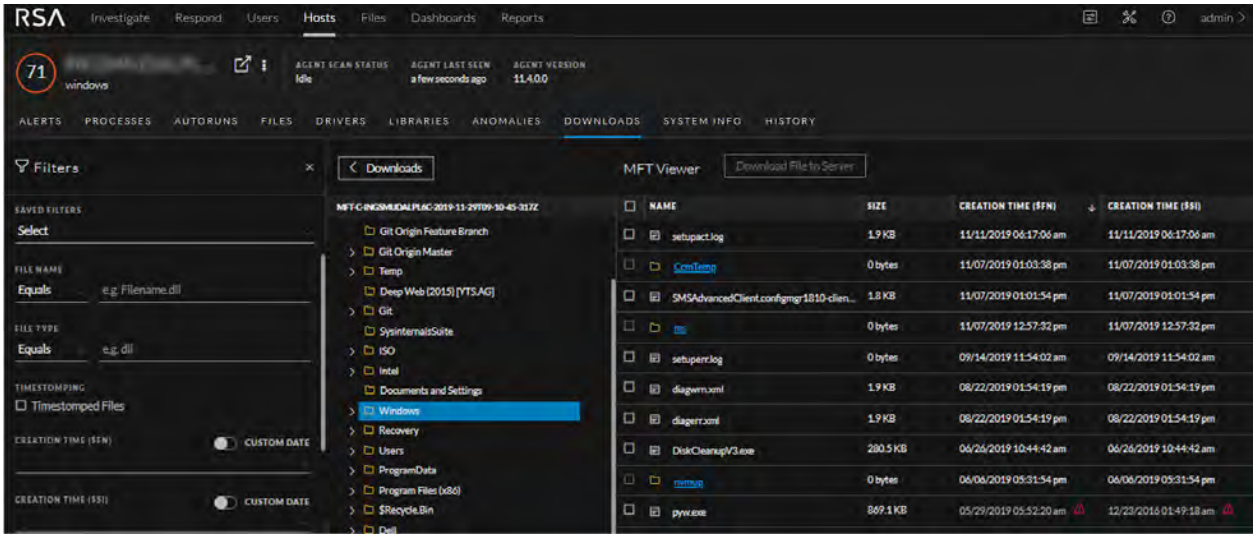


5. Select one or more files and click **Download File to Server** on the toolbar to download files to the server.

> **Note:** Downloading a folder is not supported and hence the option is grayed out for folders.

### Filter MFT

You can filter files on file name, creation time ($FN), creation time ($SI), access time ($FN), access time ($SI), update time ($FN), update time ($SI), modified time ($FN), and modified time ($SI).



Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

> **Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

To filter, save, and delete MFT, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

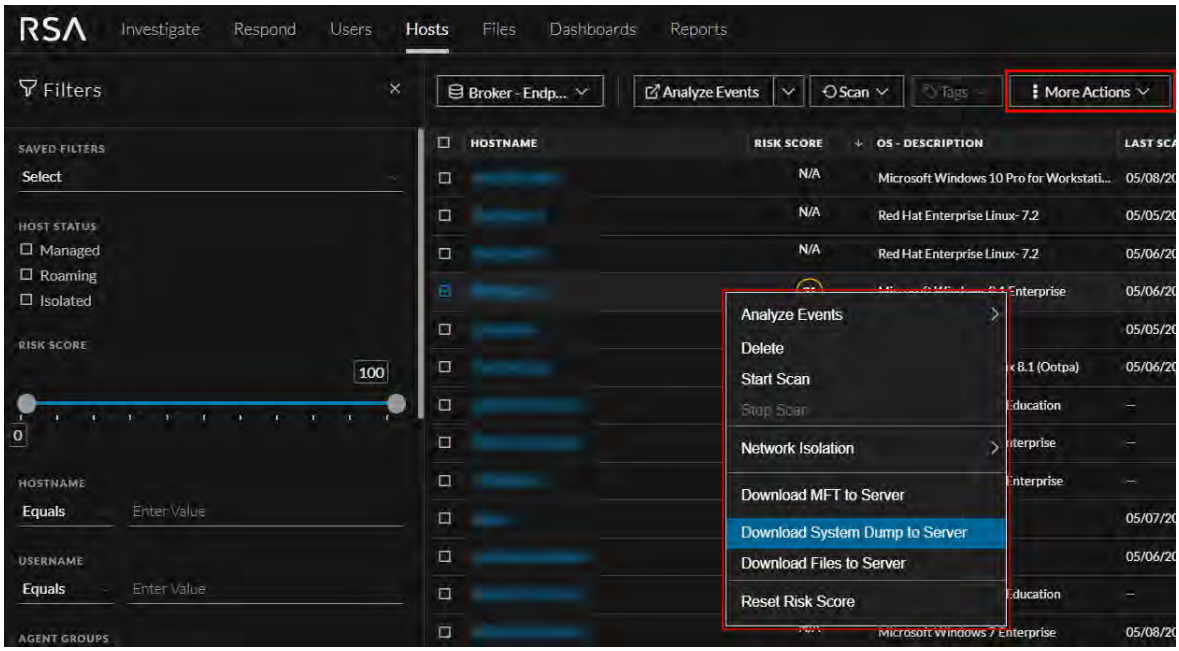
## System and Process Memory Dump

To perform forensic investigation during an incident response, you can request a memory dump of a host or a process running on the host. You can analyze these dumps using third-party tools, such as Volatility, Rekall.

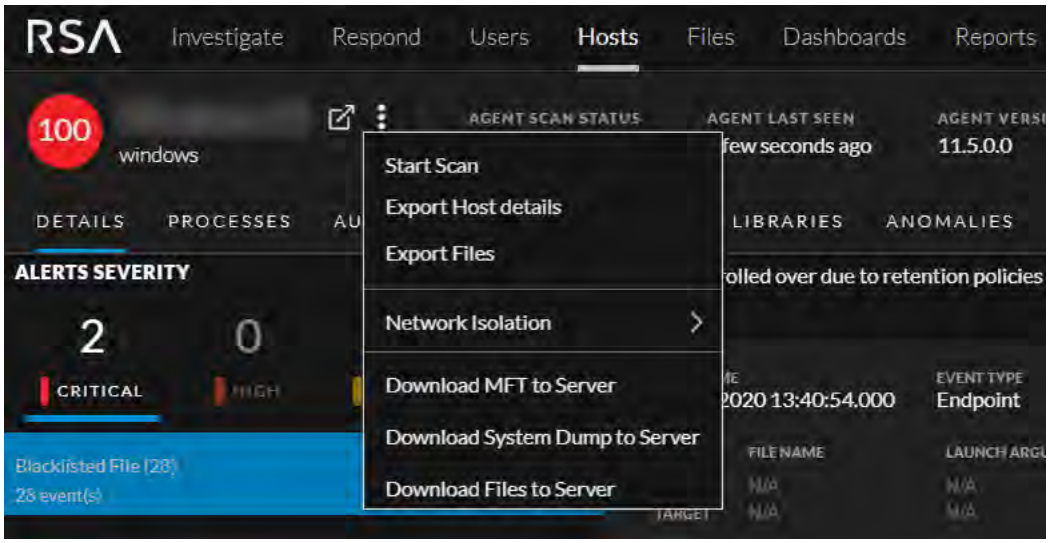
### Download System Dump to Server

To download system dump to the server from the Hosts view:

1. Go to **Hosts** and do one the following:
   - Select a host and select **Download System Dump to Server** from the right-click context menu, or from the **More** drop-down list in the toolbar.



- Select the hostname to open the host details and select **Download System Dump to Server** from the **More** option besides the hostname.



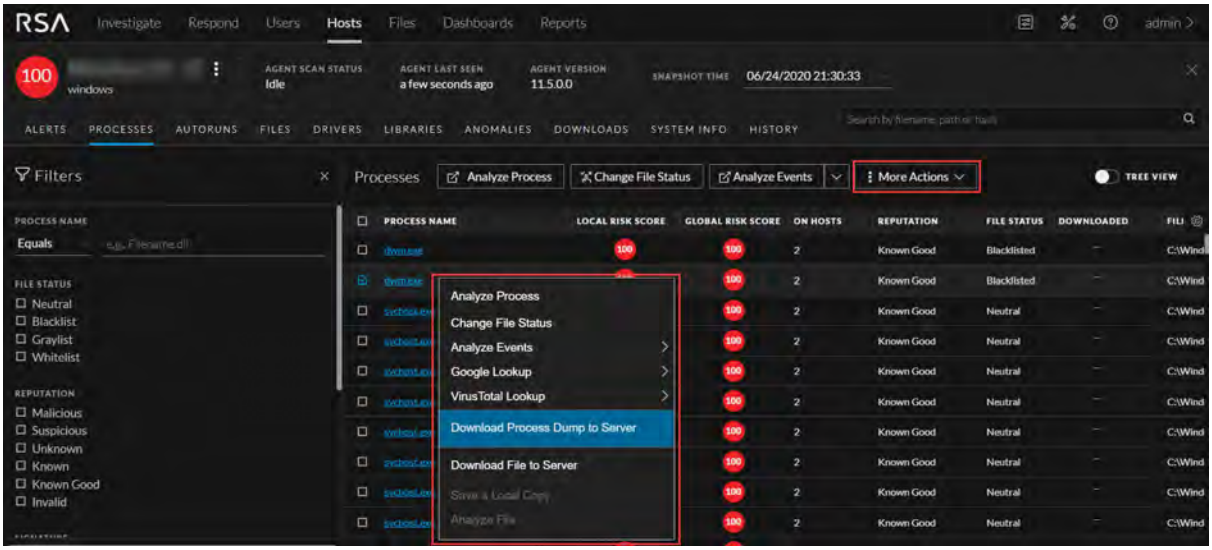
2. View the details of the downloaded system dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

## Download Process Dump to Server

To download process dump to the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details.

3. In the Processes, Libraries, or Anomalies tab, select **Download Process Dump to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.



4. View the details of the download process dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

To filter, save, and delete system dump or process dump, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

The following are some errors you might encounter during system and process dump download:

| Issue | Explanation |
|---|---|
| Parameter is incorrect. | The process for which the dump is requested might be running with a different process ID. |
| Element not found | The process for which the dump is requested is no longer active. |
| java.io.IOException:Unable to unwrap data, invalid status [CLOSED] | Connection to the agent is interrupted. |
| java.net.SocketTimeoutException | The network is slow or the system is down. |
| One or more arguments are not correct | Agent might be in the Insight mode or driver is not running. |

## Download Files Using Full Path or Wildcard

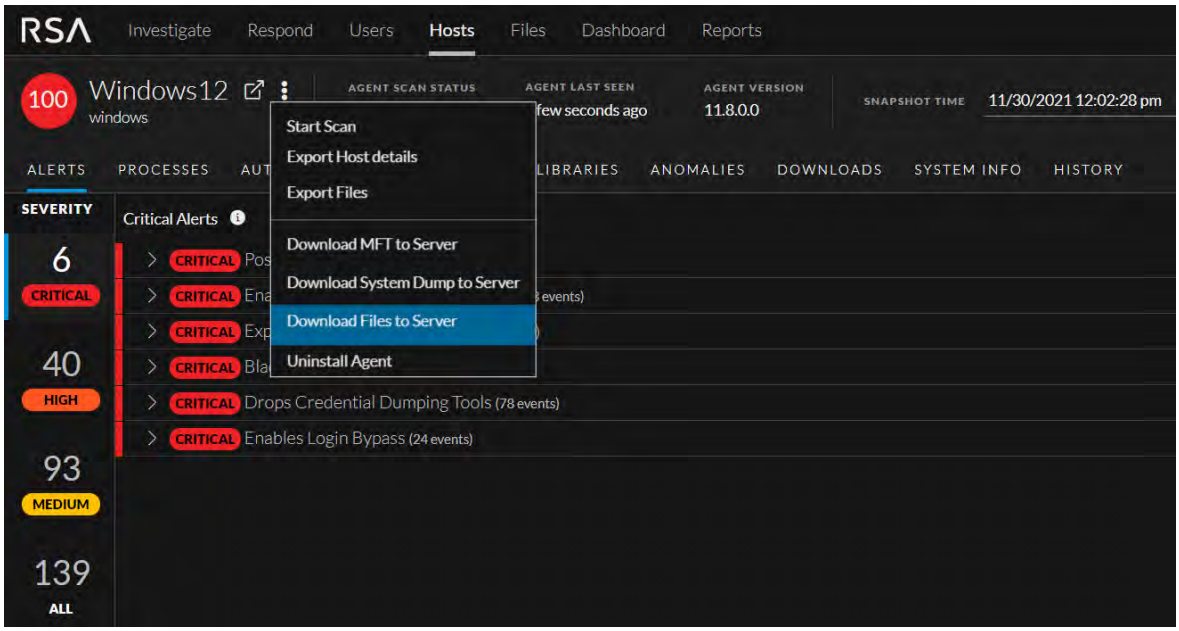
You can manually download files that help in investigations by either providing full path of the file or using wildcard.

**Note:** This is applicable only for agents in Advanced mode with NetWitness Platform version 11.5 and later.

To download files to the server:

1. Go to **Hosts** and do one of the following:
   - Select one or more hosts from the same operating system, and select **Download Files to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar. You can download files from only top 100 selected hosts at a time.

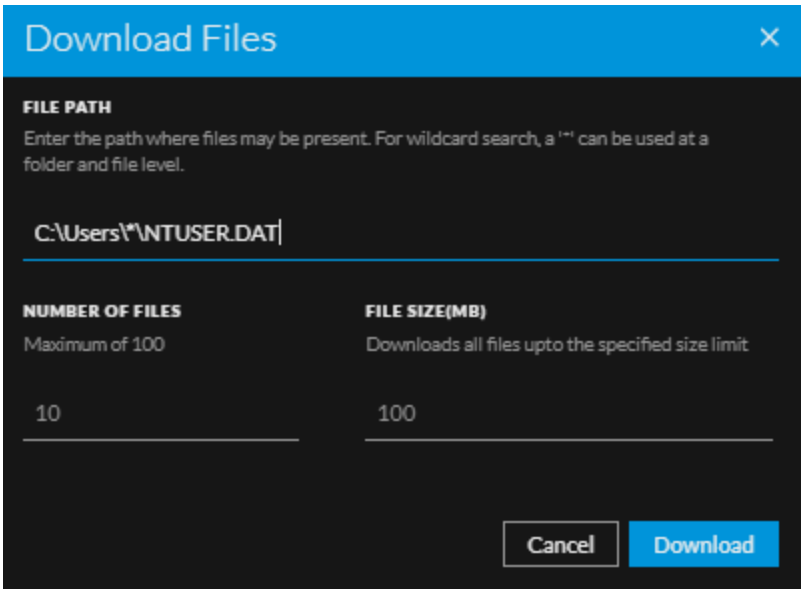
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download Files to Server**.



2. In the **Download Files to Server** dialog, enter the full path where the files may be present or search using wildcard. For wild card search, you can use a maximum of two `*`, one at a folder level and the other at a file level.

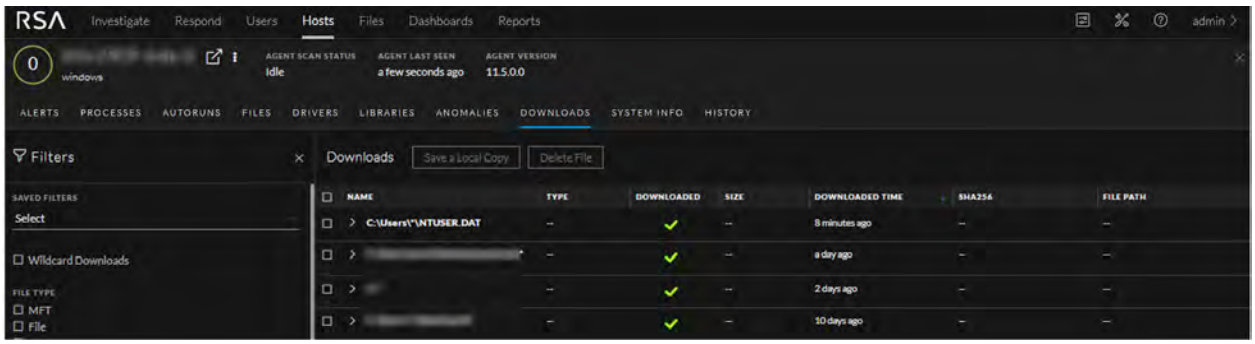
   For example, to retrieve the registry hive, you can enter the full path, `C:\Windows\System32\config\SYSTEM`.

   If you want to retrieve user settings and configuration preferences for all users, download all files using the wildcard `C:\Users\*\NTUSER.DAT`.



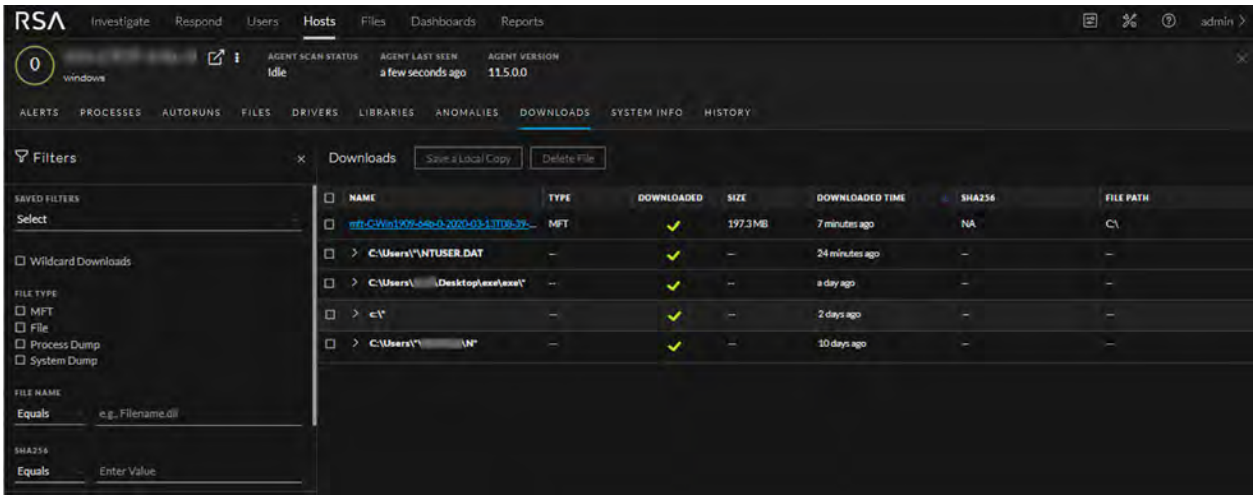
3. For wildcard search, enter the number of files to download and size of the file. By default, the number of files is set to 10 and file size is set to 100 MB. For example, if the maximum number of files is set to 10 and file size is set to 10 MB, first 10 files within 10 MB are downloaded.
4. Click **Download**.

All files downloaded as a part of wildcard search are grouped together based on the search criteria. For example, all files downloaded using `C:\Users\*\NTUSER.DAT` are grouped, and you can click ❯ to expand and view all files under this group. You can sort the groups on the downloaded time and view the status of the download in the **Downloaded** column.



## Filter Downloaded Files

You can filter the downloaded files on wildcard downloads, file type, file name, SHA256 (for files), and downloaded time. In the Downloaded Time field, you can also filter by custom date.



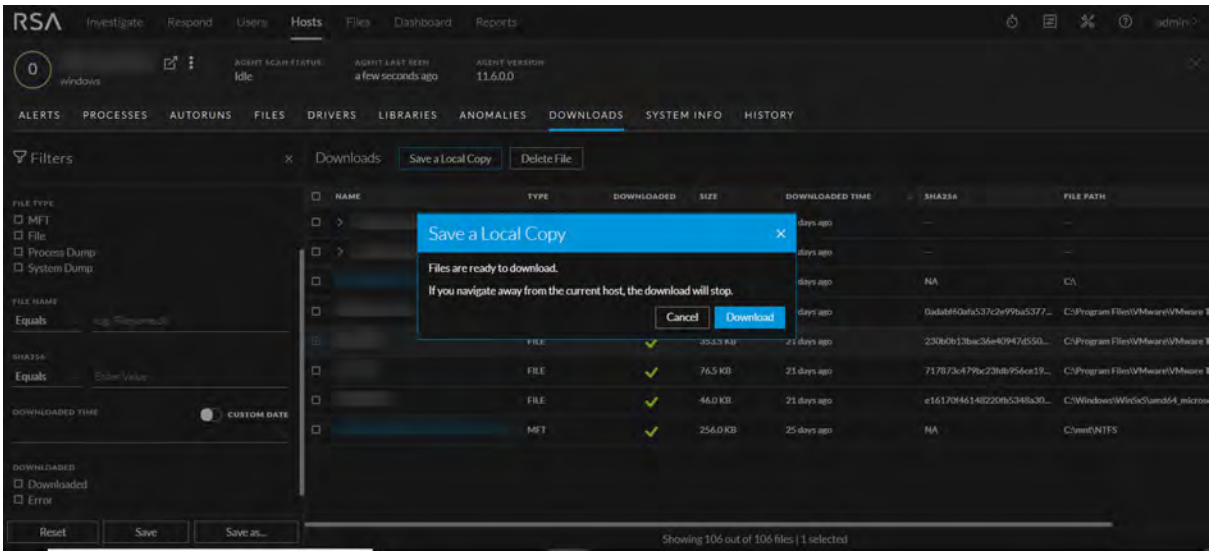
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

**Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

## Save Downloaded File

You can retrieve the downloaded file and save it to your local file system for further analysis. To save the file:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click the file you want to save and select **Save a Local Copy** from the context menu or from the toolbar.



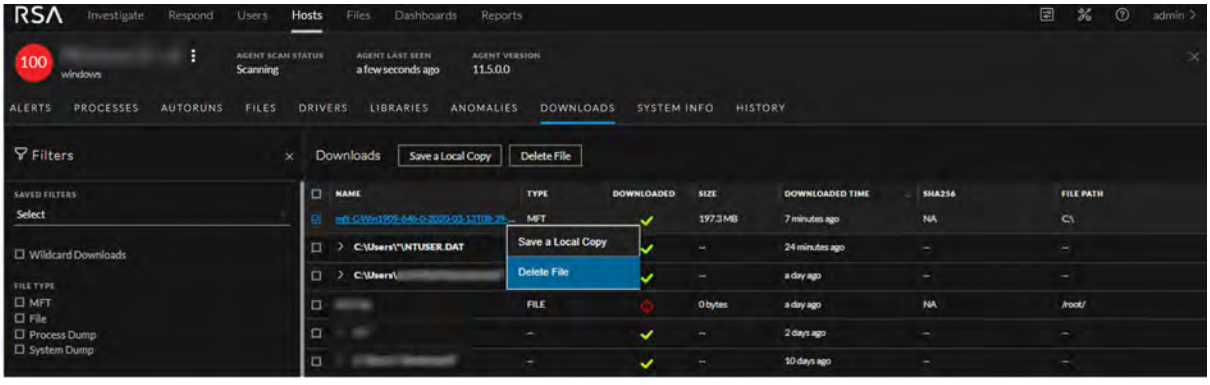
4. In the **Save a Local Copy** dialog, click **Download**.

**Note:** For wildcard downloads, select a file from the group that are downloaded successfully to save a local copy. You cannot save multiple files in the group at a time or save files with errors.

## Delete Downloaded Files

If you want to delete the downloaded file from the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click one or more files you want to delete, and select **Delete File** from the context menu or from the toolbar.



**Note:** For wildcard downloads, you can select the group to delete all files that are downloaded.

# Analyzing Events

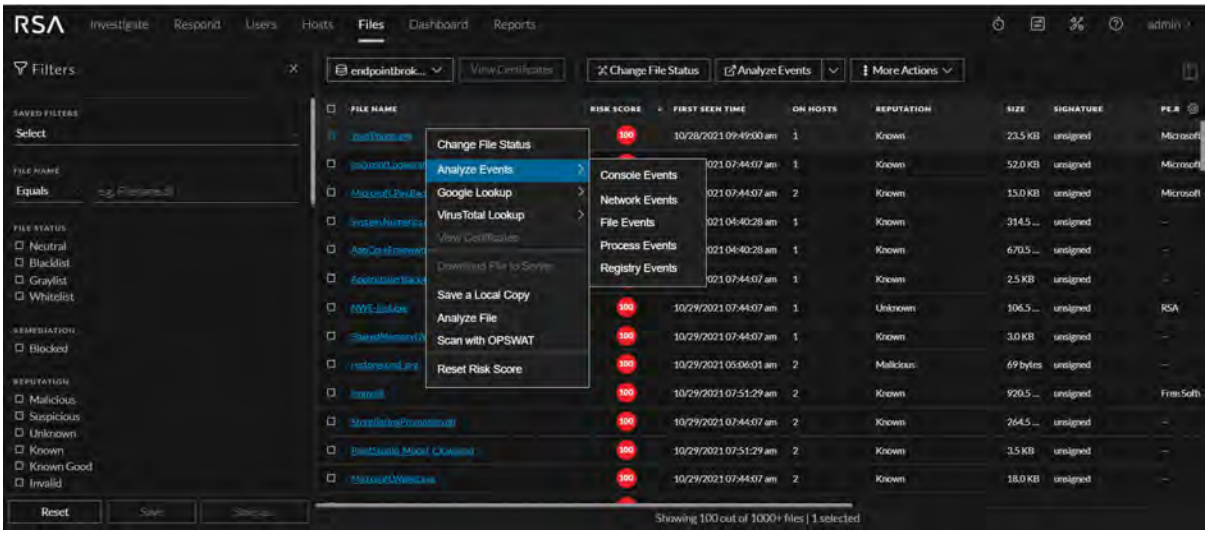
If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

**Note:** By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

## Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.



This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

**Note:** If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.

## Analyze Events from Hosts View

To investigate a particular host, IP address (IPV4), or username:

1. Go to **Hosts**.
2. Do one of the following:

- Right-click a host, select **Analyze Events** from the right-click context menu or in the toolbar, and select a specific event type (such as network events, file events) that you want to view.
- Select the hostname to open the host details. Right-click a file or in the toolbar, select **Analyze Events**, and select a specific event type that you want to view.

  The following figure is an example of the Autoruns tab.

  This opens the Navigate view with data related to the file.

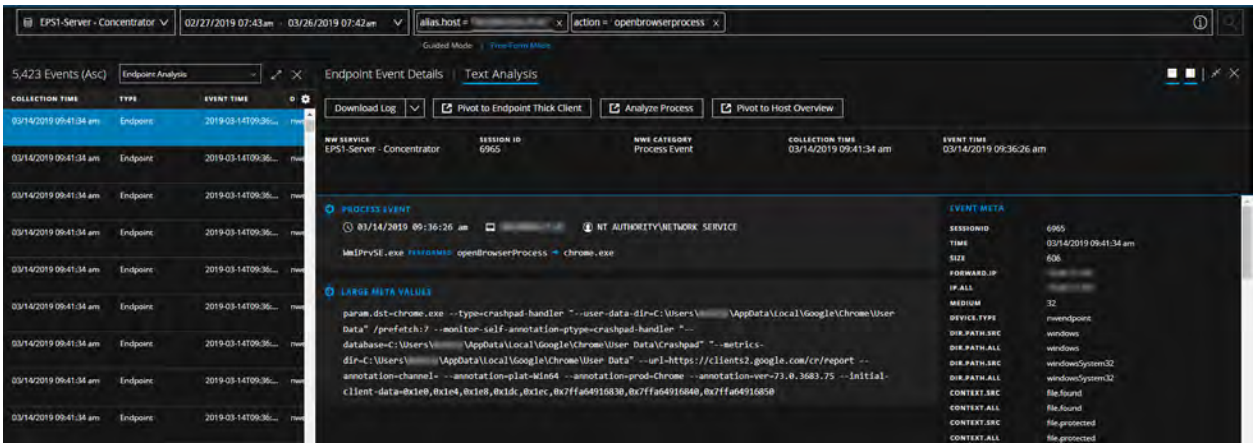
For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

## Text Analysis for an Endpoint Event

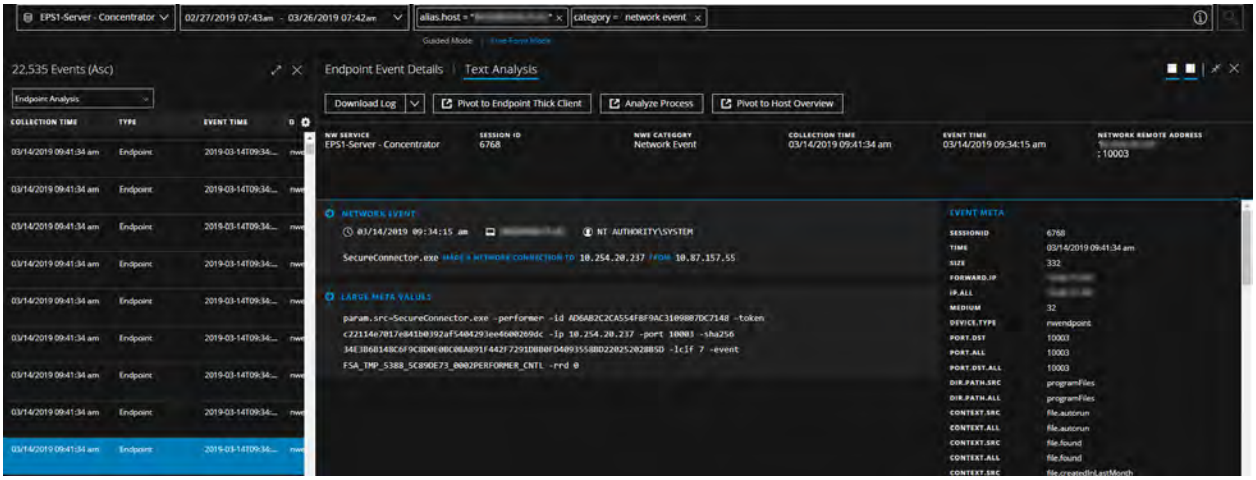
You can view all Endpoint events in their original text format in the Events view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event. (Version 11.5 and Later) The event header includes host name, process, and user name details in addition to other event details if the selected Endpoint event contains these metadata.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.



Below is an example of the Network event:



For more information on Events view, see the *NetWitness Investigate User Guide*.

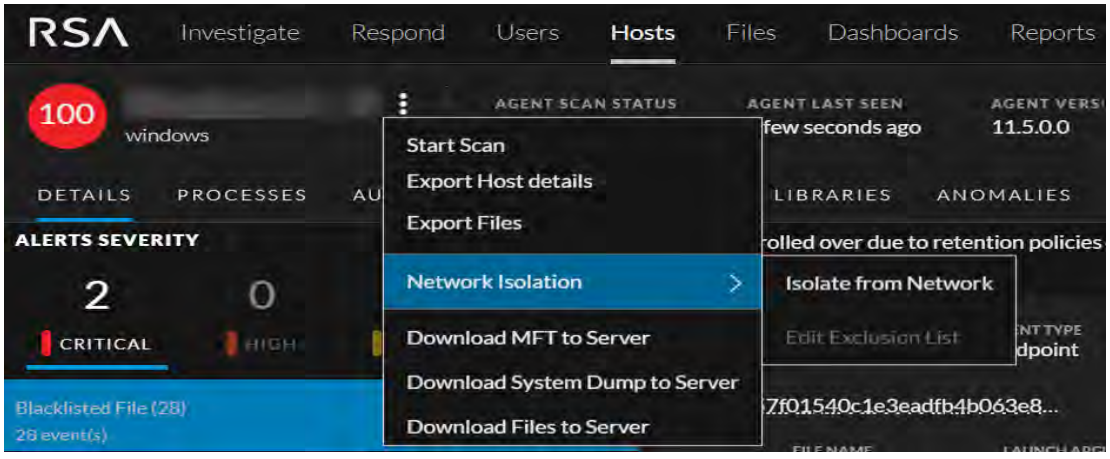
# Isolating Hosts from Network

**Note:** By default, the network isolation option is disabled in the policy, and you cannot view options mentioned in this section. To enable network isolation, in the policy configuration, select **Enabled** in the **Network Isolation** option under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

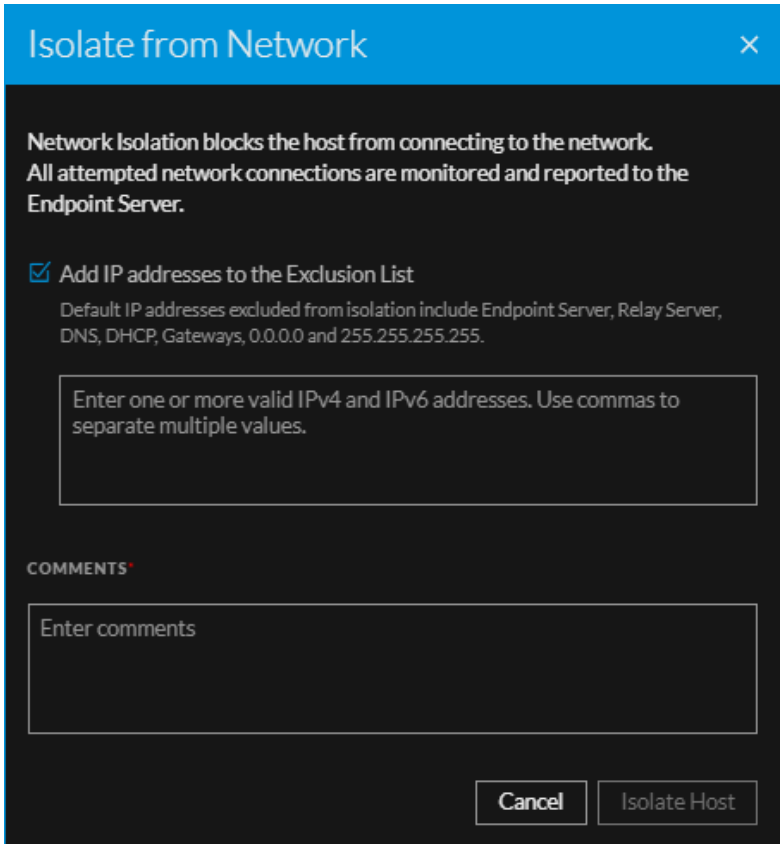
To isolate a host from the network:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Isolate from Network** from the right-click context menu, or from the **More** drop-down list in the toolbar.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Isolate from Network**.



2. In the Isolate from Network dialog, by default, a set of IP addresses are excluded from isolation. For more information, see Network Isolation. To add IP addresses to the list, select the **Add your IPs to Exclusion List** checkbox. You can enter up to 100 IP addresses separated by comma.

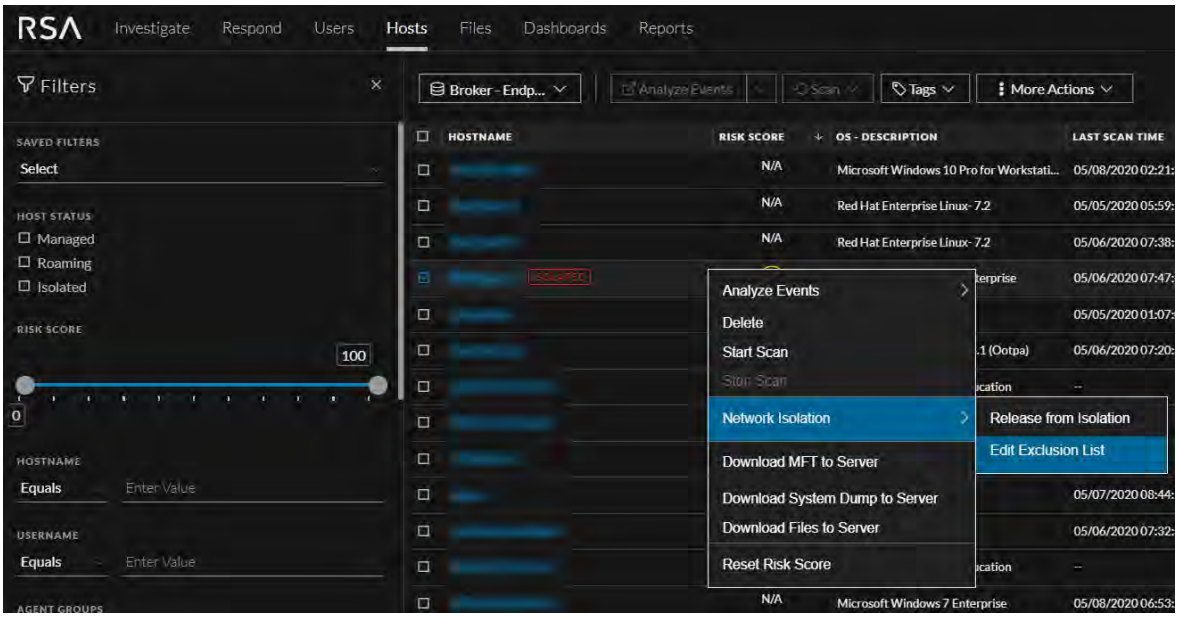


3. Enter comments.
4. Click **Isolate Host**.

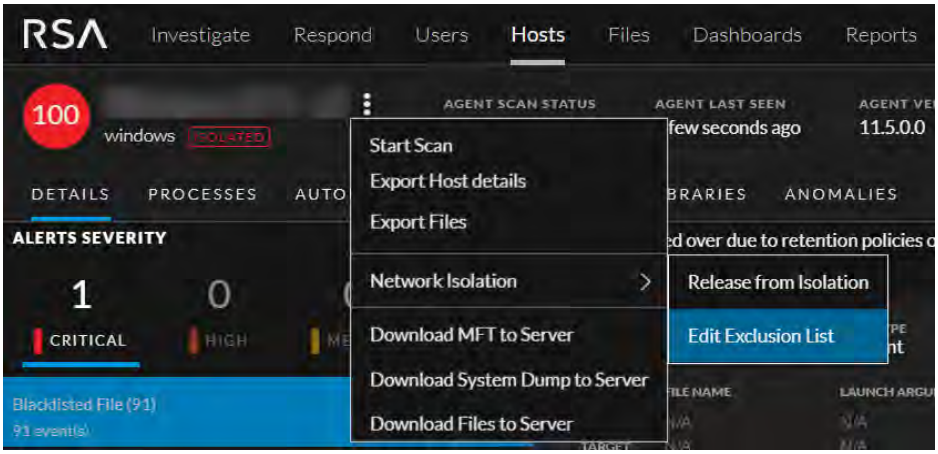
## Edit Exclusion List

To edit the exclusion list:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Edit Exclusion List** from the right-click context menu, or from the **More** drop-down list in the toolbar.



- Select the hostname to open the host details, click (**More**) beside the hostname, and select **Network Isolation > Edit Exclusion List**.

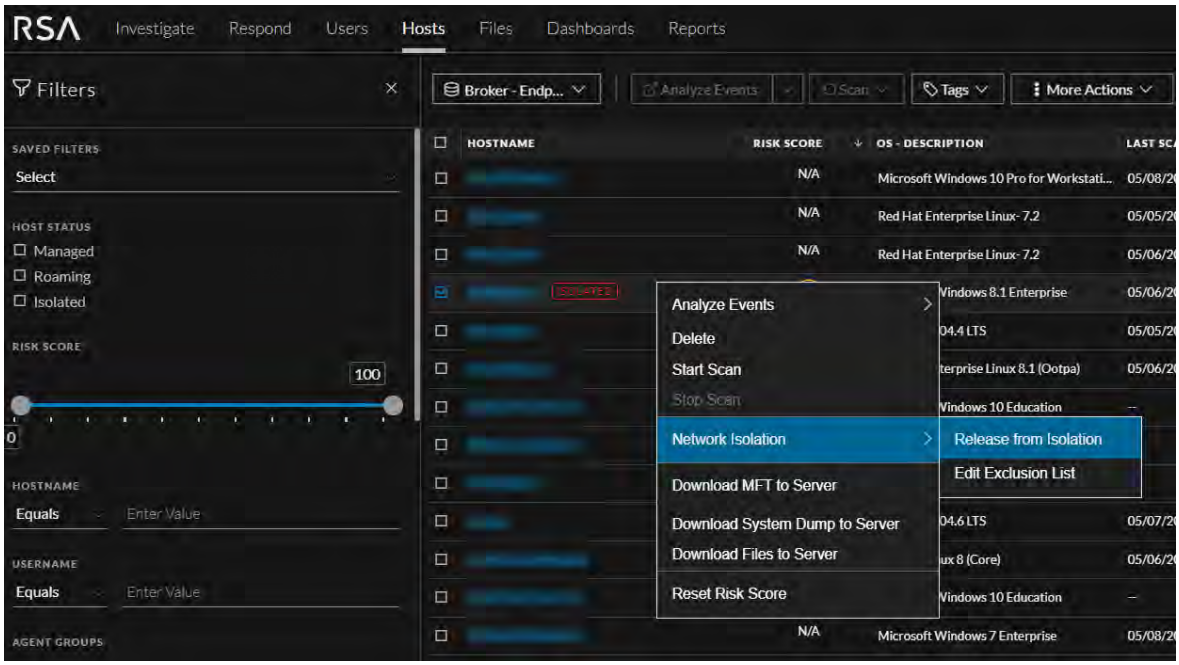


2. Add or modify the IP addresses in the list.
3. Enter comments and click **Save**.

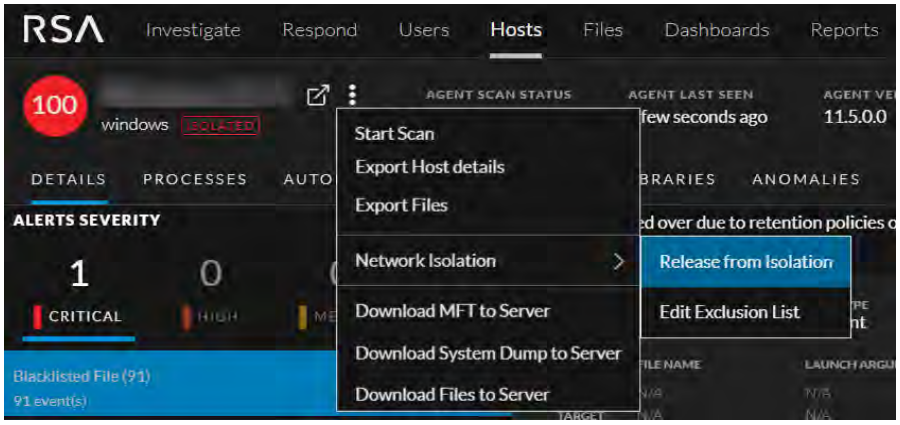
## Release Isolated Hosts

Releasing the isolated host restores the network connection and removes IP addresses added to the Exclusion list. To release the host from isolation:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Release from Isolation** from the right-click context menu, or from the **More** drop-down list in the toolbar.



- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Release from Isolation**.



2. Enter comments and click **Release Host**.

# NetWitness Endpoint with Third-Party Antivirus Products

If you want the NetWitness Endpoint agent to coexist with any of the security products, make sure to whitelist the agent. For more information, see the respective third-party product documentation.

# Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

## General Issues

| | |
|---|---|
| Issue | Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying. |
| Solution | The Endpoint Broker aggregates data from all Endpoint Servers, which responds within 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following:<br>1. Go to **(Admin) > Endpoint Broker** service.<br>2. Click > **View** > **Explore**.<br>3. Click **endpoint/broker** node.<br>4. In the **query-timeout** field increase the value, for example, 30 seconds. |

| | |
|---|---|
| Issue | The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues:<br>• UDP<br>• HTTPS<br>• Firewall |
| Solution | • To verify the UDP or HTTPS connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:<br>1. Go to System32 folder using the following command:<br>`cd C:\Windows\System32`<br>2. Execute the following command:<br>`<Agent Service name>.exe /testnet`<br>For example, `NWEAgent.exe /testnet`<br>• If the issue is with the firewall, check the incoming and outgoing firewall rules. |

| | |
|---|---|
| Issue | The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues:<br>• UDP<br>• TCP<br>• TLS |

| | |
|---|---|
| Solution | • Firewall |
| | • To verify the UDP, TCP, and TLS connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:<br>1. Go to System32 folder using the following command:<br>`cd C:\Windows\System32`<br>2. Execute the following command:<br>`<Agent Service name>.exe /testlognet`<br>For example, `NWEAgent.exe /testlognet`<br>• If the issue is with the firewall, check the incoming and outgoing firewall rules. |

## Multi-server Issue

| | |
|---|---|
| Issue | Agent is not communicating with the Endpoint Server after migration. |
| Solution | Check the Nginx logs of the Endpoint Server to which the agent has migrated, and if the agent is communicating with error code 403, that means the certificate of the first Endpoint Server and second Endpoint Server are different. This is because during the installation of second Endpoint Server, the certificate of first Endpoint Server is not copied to the second Endpoint Server.<br>Reinstall the second Endpoint Server by copying the certificate of first Endpoint Server, and reinstall the agent. For more information, see the *Physical Host Installation Guide*. |

## Hosts View Issues

| | |
|---|---|
| Message | `An error has occurred. The Endpoint Server may be offline or inaccessible.` |
| Issue | When attempting to access the Hosts or Files view, the view opens with the message. |
| Explanation | Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under **(Admin) > Services** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server. |

| | |
|---|---|
| Issue | Hosts view shows 'No Results Found.' error in the following scenario:<br>• Host A belongs to Endpoint server A and does not exist in Endpoint server B.<br>• Endpoint server B is selected in Hosts view.<br>• In a new window/tab, open the Host details page (of Host A)<br>• Navigate to Hosts view using **[*Host Name*] > Actions > Pivot to Investigate** |

| | |
|---|---|
| | **> Hosts/Files**<br>`Endpoint server B is selected by default, and the page shows 'No results found.' error.` |
| Explanation | This is expected behavior. The Endpoint server that is selected first is considered to be current /active throughout the session. |
| Workaround | Ensure the correct Endpoint server is selected, and `Pivot to Investigate > Hosts/Files` will behave normally. |

| | |
|---|---|
| Issue | For MFT download:<br>1. The request fails with file not found error for drives/mount paths created on the machine after agent is installed.<br>2. Incorrect MFT is downloaded for the provided NTFS mount path. |
| Solution | Make sure that the agent version is 11.6 or later. |

## Files View Issues

| | |
|---|---|
| Issue | Unable to analyze events from **Hosts** and **Files** view. |
| Explanation | Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue:<br>**Note:** To get the investigate-service-id:<br>1) Go to **(Admin) > Services > Concentrator** service.<br>2) Click > **View** > **Explore** tab.<br>3) Expand the **sys/stats** node list.<br>4) In the UUID filed, copy the value.<br>1. Go to **(Admin) > Services > Endpoint Server** service.<br>2. Click > **View** > **Explore** tab.<br>3. In the **endpoint/investigate** field, specify the **investigate-service-id**. |

## Policy Issue

| | |
|---|---|
| Issue | Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required. |
| Explanation | **Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied. |

| | |
|---|---|
| | **Permission Required** - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*. |

| | |
|---|---|
| Issue | Policy Status shows error. |
| Explanation | Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details. |

## Driver Issue

| | |
|---|---|
| Issue | While loading the driver on the host, an error is encountered. |
| Explanation | Check the driver error code in the **Agent-Driver Error Code** column under **Hosts** view. Contact your system administrator with the error code. |

## File Reputation Service Issue

| | |
|---|---|
| Issue | When you configure RSA Live for the first time and the File Reputation service is not connected. |
| Solution | You must manually enable the File Reputation service. To enable the File Reputation service:<br>1. Go to **(Admin) > System > Live Services**.<br>2. In the **Additional Live Services** section, select the enable File Reputation check box.<br>3. Click **Apply**. |

## Risk Scoring for Hosts or Files Issue

| | |
|---|---|
| Issue | NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files. |
| Solution | Check the backlog of alerts for risk scoring.<br>1. SSH to the ESA Primary appliance.<br>2. Execute the following command:<br>`mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or":[{state:"STAGED"},{state :"WORKING"}]}).count()' --quiet`<br>The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts. |

| | |
|---|---|
| | 3. To disable risk scoring:<br>a. Go to **(Admin) > Services > Respond** service.<br>b. Click > **View** > **Explore**.<br>c. Expand the **respond/scheduled/jobs** node list.<br>d. In the **risk-scoring-enabled** field, set the value to **false**.<br>4. To disable Endpoint ESA alerts:<br>a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium.<br>i. Go to **(Configure) > ESA Rules**.<br>The Configure view is displayed with the Rules tab open.<br>ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete.<br>A confirmation dialog is displayed.<br>iii. Click **Yes**.<br>b. To disable only Medium severity NetWitness Endpoint ESA alerts:<br>i. Go to **(Admin) > ESA Correlation** service (on which Endpoint deployment is added).<br>ii. Click > **View** > **Explore**.<br>iii. Expand the **correction/alert** node list.<br>iv. In the **transient-enabled** field, set the value to **false**. |

## Endpoint Broker/Server Issue

| | |
|---|---|
| Issue | User have access to one Endpoint server and unable to access the other. |
| Explanation | Reach out to the administrator and check if you have access to that endpoint servers. Request for access if required. |

| | |
|---|---|
| Issue | In the Endpoint Server Broker view, the user can scan hosts that belong to a particular Endpoint server but cannot scan hosts that belong to another Endpoint server. |
| Explanation | User may not have access to that endpoint server. Check with the Administrator to see if the user has access. |

# NetWitness Endpoint Reference Materials

This section is intended to help you understand the purpose and application of NetWitness **Investigate** > **Hosts** view and **Files** view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - Downloads Tab
- Hosts View - System Information Tab
- Hosts View - Agent History Tab

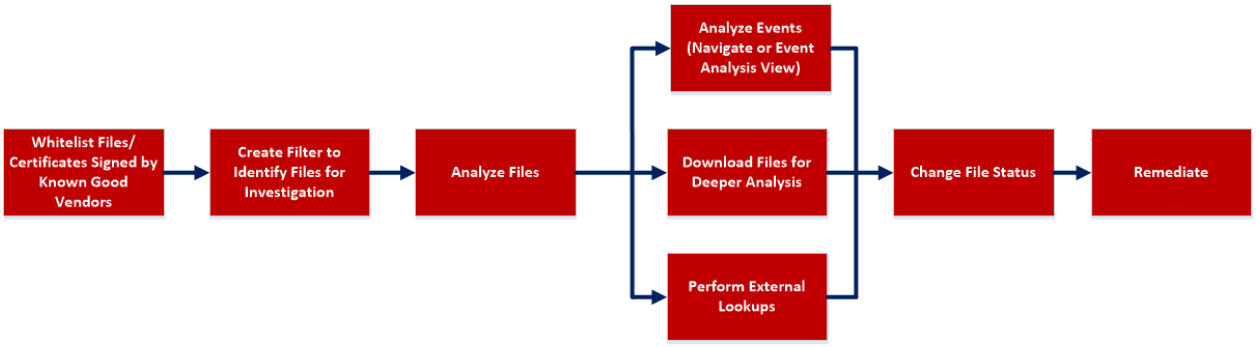
# Files View

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Files view provides a holistic view of all files in your deployment. To access this view, go to **Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | whitelist files and certificates signed by known good vendors* | Analyze Certificates |
| Threat Hunter | create filter to identify files for investigation* | Filter Files |
| Threat Hunter | analyze files* | Investigating Files |
| Threat Hunter | analyze events* | Analyzing Events |
| Threat Hunter | download files for deeper analysis* | Analyzing Downloaded Files |
| Threat Hunter | perform external lookups* | Launch an External Lookup for a File |
| Threat Hunter | change file status or remediate* | Changing File Status or Remediate |

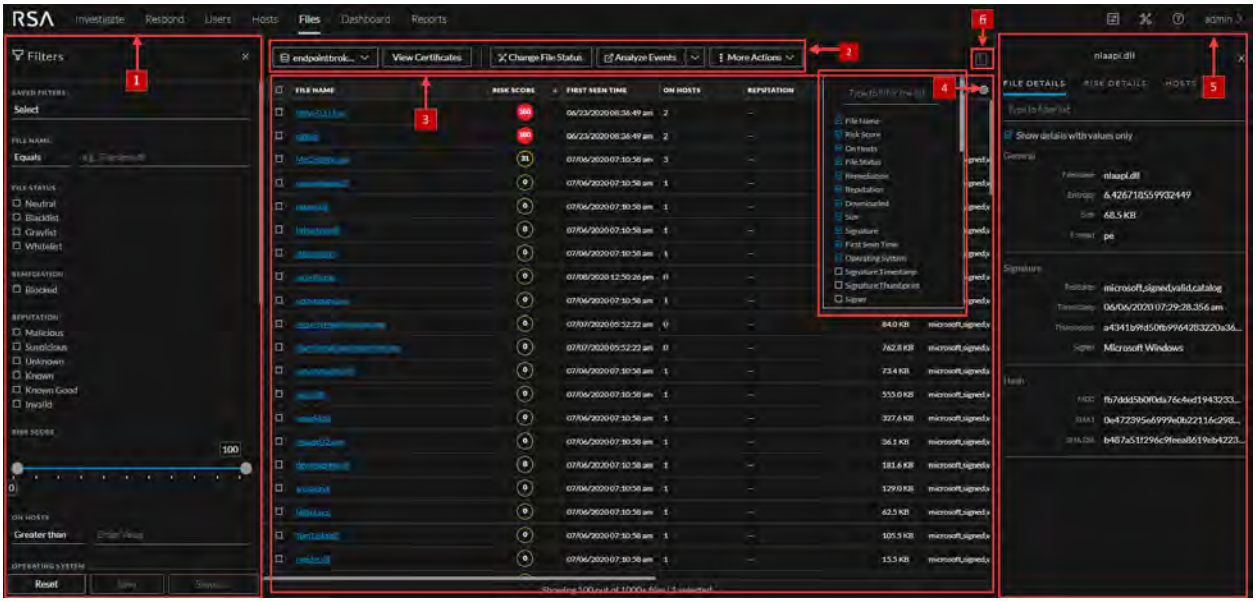
*You can perform this task in the current view

## Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts
- Analyzing Downloaded Files
- Analyzing Events
- Analyze Certificates
- Changing File Status or Remediate

## Quick Look

Below is an example of the Files view:

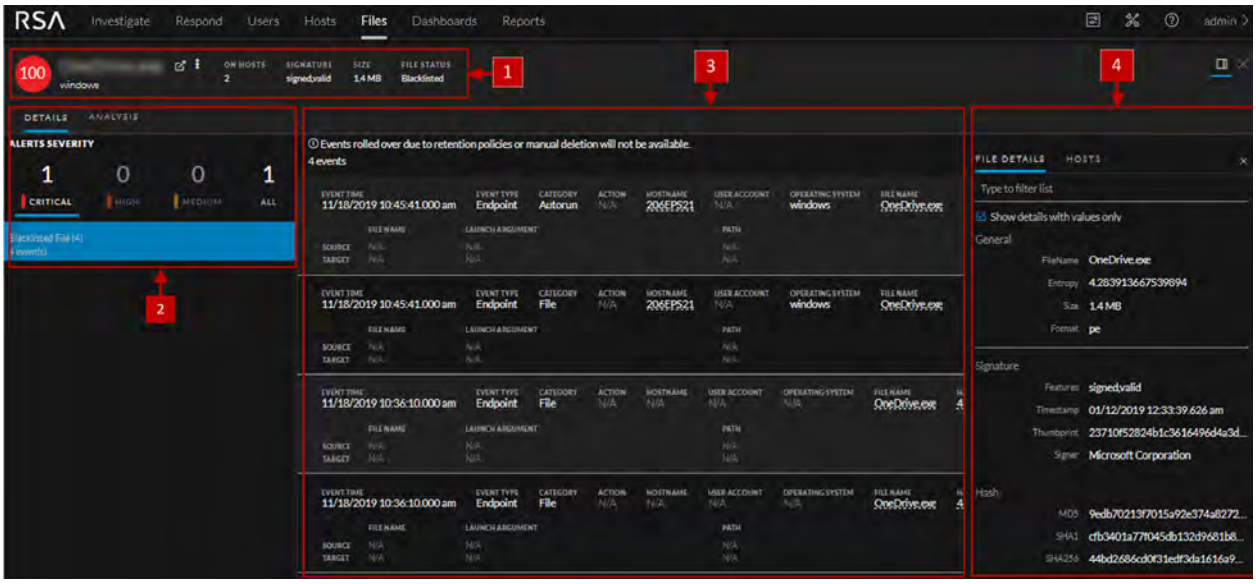


1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

| | |
|---|---|
| 2 | **Actions in the toolbar:**<br>**Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts.<br>**View Certificates** - Provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates.<br>**Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate.<br>**Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.<br>**More Actions** - Provides options to:<br>• Perform external lookups.<br>• Download files to server, save a local copy, and analyze files for deeper analysis.<br>• Reset risk score.<br>**Note:** You can perform the above actions from the right-click context menu. |
| 3 | **Sort Columns.** Lets you sort on column titles. |
| 4 | **Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference. |
| 5 | **Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs:<br>**File Details** - Displays the file information.<br>**Risk details** - Displays the distinct alerts associated with the risk score.<br>**Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. For more information, see Analyze Hosts with File Activity. |
| 6 | **Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files. |

## File Details View

To access this view, go to **Files**, and select a file. Below is an example of the File Details view:



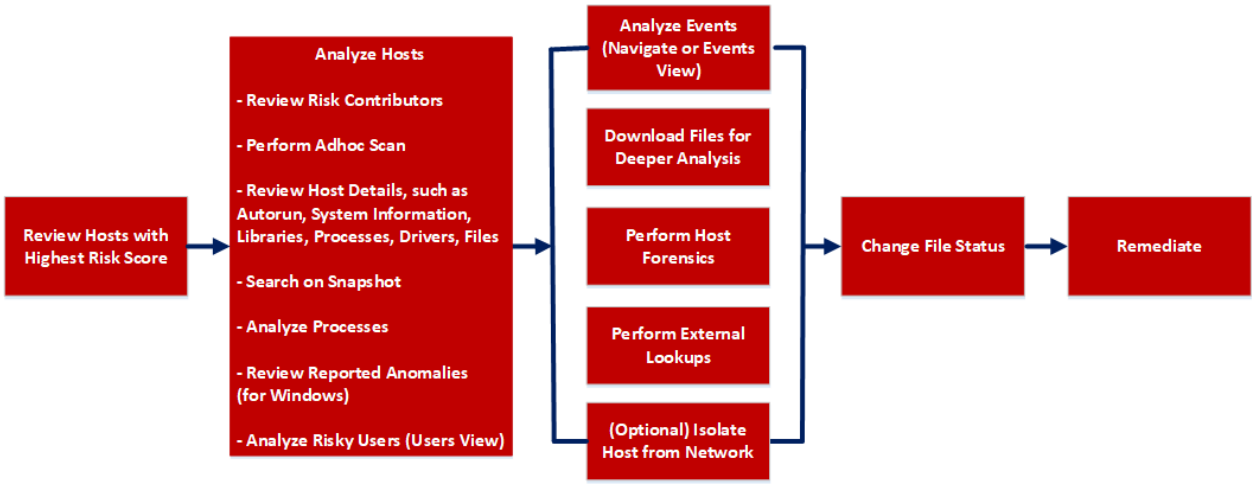
| | |
|---|---|
| 1 | **Agent and Scan Details**. You can view the following agent and scan details of the selected host:<br>**Host name** - Name of the host. For example, `WIN-ABC`.<br>**Risk score** - Risk score of the host.<br>**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).<br>**Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.<br>**More** - Provides options to perform external lookups.<br>**On Hosts** - Indicates the number of hosts on which a file exist.<br>**Signature** - Provides signatory information.<br>**Size** - Size of the file.<br>**File Status** - Status of the file. For example, `Neutral`. |
| 2 | **Details** tab - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.<br>**Analysis** tab - Provides detailed information about a downloaded file. For more information, see Analyzing Downloaded Files. |
| 3 | Displays events for an alert and metadata associated with a specific event. |
| 4 | **Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs:<br>**File Details** - Displays the file information.<br>**Hosts** - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity. |

# Hosts View

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **Hosts**. By default, hosts are sorted based on the risk score.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | review hosts with highest risk score* | Analyze Hosts Using the Risk Score |
| Threat Hunter | analyze hosts* | Investigating Hosts |
| Threat Hunter | perform adhoc scan* | Scan Hosts |
| Threat Hunter | review host details* | Analyze Host Details |
| Threat Hunter | search on snapshot* | Search Files on Host |
| Threat Hunter | analyze processes* | Investigating a Process |
| Threat Hunter | review reported anomalies* | Analyze Anomalies |

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | analyze risky users* | Analyzing Risky Users |
| Threat Hunter | analyze events* | Analyzing Events |
| Threat Hunter | download files for deeper analysis* | Analyzing Downloaded Files |
| Threat Hunter | perform external lookups* | Launch an External Lookup for a File |
| Threat Hunter | change file status or remediate* | Changing File Status or Remediate |
| Threat Hunter | filter files* | Filter Host Details |
| Threat Hunter | isolate host from network* | Isolating Hosts from Network |
| Threat Hunter | download MFT*, system dump*, or process dump | Performing Host Forensics |

*You can perform this task in the current view.

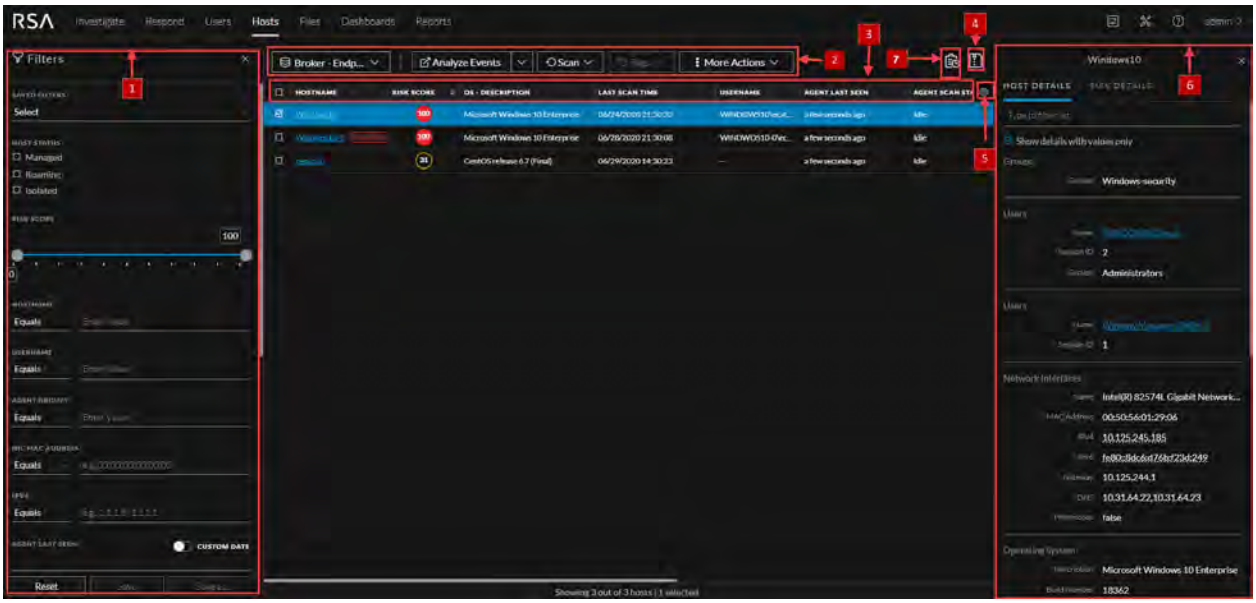
## Quick Look

Below is an example of the Hosts view:



1 **Filter Hosts**.You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

**Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts.

**Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

**Start Scan** - Starts a scan for the selected hosts.

**Stop Scan** - Stops a scan for the selected hosts.

**More Actions** - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Isolation host from the network. For more information, see Isolating Hosts from Network.

**Note:** You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on column titles.

4 **Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.

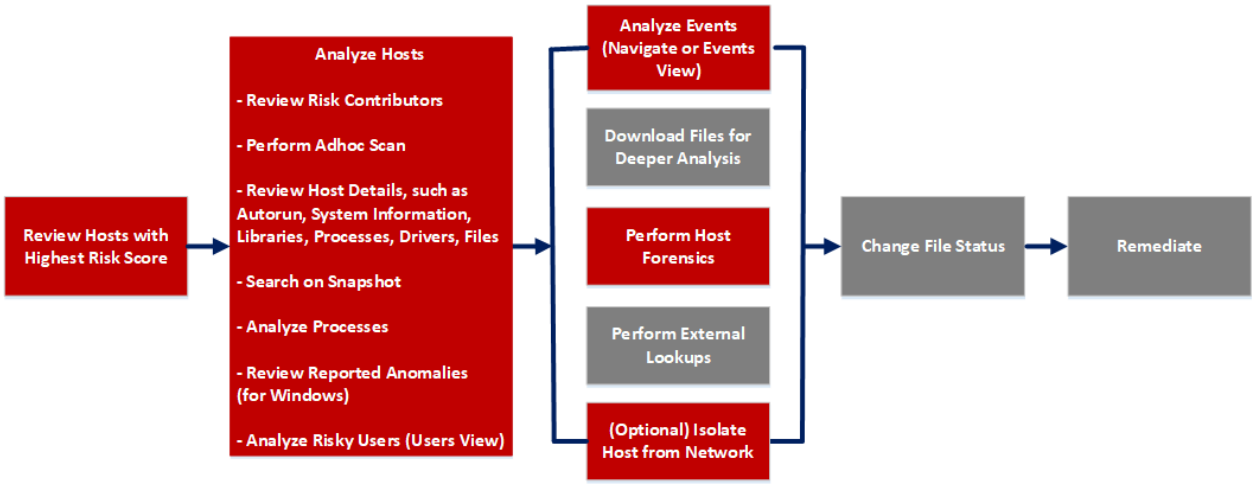
| | |
|---|---|
| 5 | **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference. |
| 6 | **Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs:<br>**Host details** - Displays the host information such as Network Interfaces, operating system, hardware and others.<br>**Risk details** - Displays the distinct alerts associated with the risk score. |
| 7 | **View Agent History** - Displays the list of commands issued to the agent. For more information, see View Agent History. |

# Hosts View - Details Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **Hosts** view, and select a host.

## Workflow



## What do you want to do?

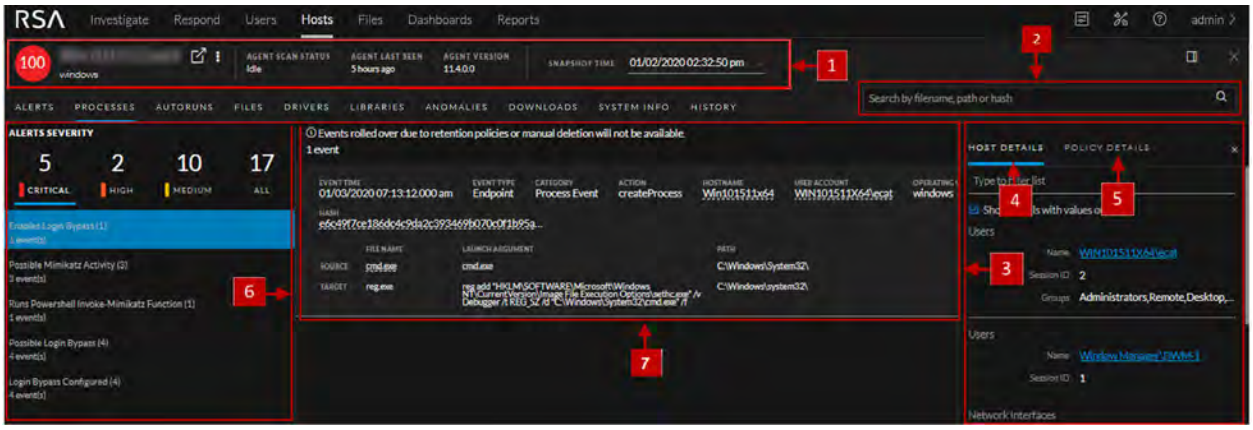
- Performing Host Forensics
- Isolating Hosts from Network

## Quick Look

Below is an example of the Details tab:



1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

**Host name** - Name of the host. For example, `WIN-ABC`.

**Risk score** - Risk score of the host.

**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).

**Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

**Agent Last Seen** - Time when the agent last communicated with the Endpoint server.

**Agent Version** - Version of the agent. For example, `11.3.0.0`.

**Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

**More** - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

**Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.

2 Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.

3 **Show/Hide Right Panel** - Displays host and policy details panel.

4 **Host Details Panel** - Displays all properties of the selected host. It is grouped as follows:

**Groups** - Groups on which the host is added on.

**User** - Information related to the user.

**Network Interfaces** - Network adapter information, such as Mac Address, Gateway.

**Operating System** - Operating system version and build information.

**Agent** - Agent-related information, such as agent ID, driver error code, install time, and agent mode.

**Hardware** - Information related to the architecture.

**Locale** - Time zone and language that is local to the host.

5 **Policy Details Panel** - Displays the following:

- Policy Status -
  - Updated - Host has the latest policy.
  - Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
  - Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
  - Error - Problem applying the latest policy along with the error description.
- Blocked Hashes Status -
  - Updated - Host has the latest blocked hashes.
  - Pending - Hashes are blocked but the latest hashes are not updated on the host. When the host communicates with the Endpoint server next time, the latest hashes are applied if there are no errors.
- Evaluated Time - Time when the Endpoint server evaluated the policy.
- Relay Server. Displays the Relay Server details.
  - Server - Host name or IP address of the Relay Server.
  - Port - Port number.
  - HTTP Beacon Interval - HTTP beacon interval value in minutes.
- Complete resolved policy settings. For more information, see "Managing Policies" in the *NetWitness Endpoint Configuration Guide*.

**Note:** The values that are not set in the policy are not displayed.

6 **Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.

7 Displays events for an alert and metadata associated with a specific event. For more information, see Analyze Hosts Using the Risk Score.

# Hosts View - Process Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

## Workflow

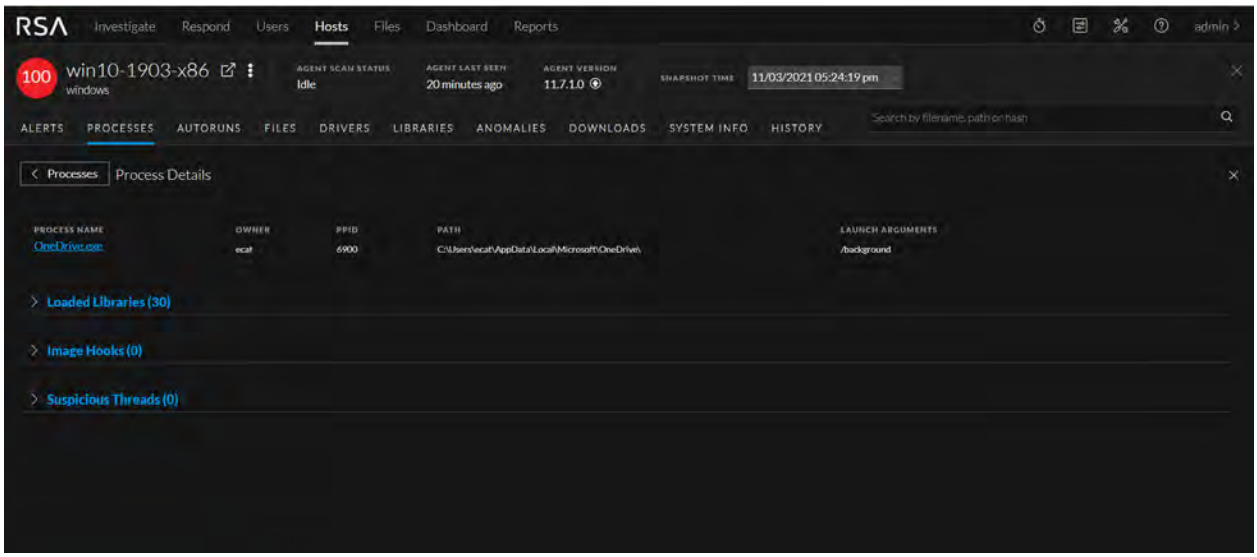
| 6 | **Show/Hide Right Panel** - Displays the following properties of a process in the right panel:<br>• **File Details** - Displays all properties of the selected process. It is grouped as follows:<br>**General** - General information about the file, such as file name, entropy, size, and format.<br>**Signature** - Provides signatory information.<br>**Hash** - Hash type of the file (MD5, SHA1, and SHA256).<br>**Time** - Time when the file was created, modified, or accessed.<br>**Location** - Location of the file.<br>**Process** - Details of the process, such as image size and PID.<br>**Image** - Image details loaded by the process.<br>• **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All.<br>• **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. |
| 7 | **Filter Files**. You can filter processes by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details. |
| 8 | **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference. |

## Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:



| Field | Description |
|---|---|
| Process Name | Name of the process. For example, `server.exe`. |
| PID | ID of the process. For example, `492`. |
| Path | Path of the file associated with the process on the disk. For example, `C:\Windows\System32`. |
| Launch Arguments | Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`. |

- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

# Hosts View - Autoruns Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

## Workflow

- Download process dump to server.
- Download files to server, save a local copy, and analyze files for deeper analysis.

**Note:** You can perform some of the above actions from the right-click context menu.

3 **Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.

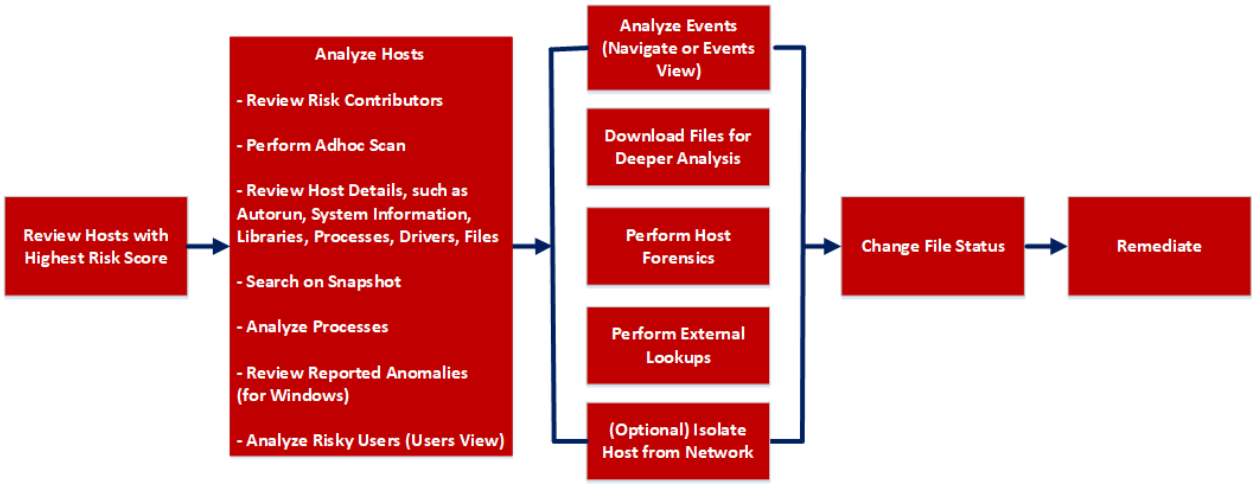
| | |
|---|---|
| 4 | **Details Panel** - Displays the following tabs:<br>• **Autoruns** - Files that are executed at start-up.<br>• **Services** - Files that are running as a service for the selected host.<br>• **Tasks/Cron jobs** - Files that are configured to run as scheduled tasks along with the trigger. |
| 5 | **Show/Hide Right Panel** - Displays the following properties in the right panel:<br>• **File Details** - Displays all properties of the selected process. It is grouped as follows:<br>**General** - General information about the file, such as file name, entropy, size, and format.<br>**Signature** - Provides signatory information.<br>**Hash** - Hash type of the file (MD5, SHA1, and SHA256).<br>**Time** - Time when the file was created, modified, or accessed.<br>**Location** - Location of the file.<br>**Autoruns/Services/Tasks** - Details related to autrouns, services, or tasks.<br>• **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All.<br>• **Hosts** -Displays the top 100 hosts based on the risk score on which the file is present. |
| 6 | Clicking a filename lets you navigate to the Files view for further analysis. |
| 7 | **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details. |
| 8 | **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference. |

# Hosts View - Files Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Files tab displays all files on the host including the files deleted within last 30 days. To access this tab, select a host from the **Hosts** view and click the **Files** tab. By default, it displays 100 files. To display more files, click **Load More** at the bottom of the page.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | review hosts with highest risk score* | Analyze Hosts Using the Risk Score |
| Threat Hunter | analyze hosts* | Investigating Hosts |
| Threat Hunter | perform adhoc scan* | Scan Hosts |
| Threat Hunter | review host details | Analyze Host Details |
| Threat Hunter | search files on host* | Search Files on Host |
| Threat Hunter | analyze processes | Investigating a Process |
| Threat Hunter | review reported anomalies | Analyze Anomalies |

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | analyze risky users | Analyzing Risky Users |
| Threat Hunter | analyze events* | Analyzing Events |
| Threat Hunter | download files for deeper analysis* | Analyzing Downloaded Files |
| Threat Hunter | perform external lookups* | Launch an External Lookup for a File |
| Threat Hunter | change file status or remediate* | Changing File Status or Remediate |
| Threat Hunter | filter files* | Filter Host Details |
| Threat Hunter | isolate host from network* | Isolating Hosts from Network |
| Threat Hunter | download MFT*, system dump, or process dump* | Performing Host Forensics |

*You can perform this task in the current view.

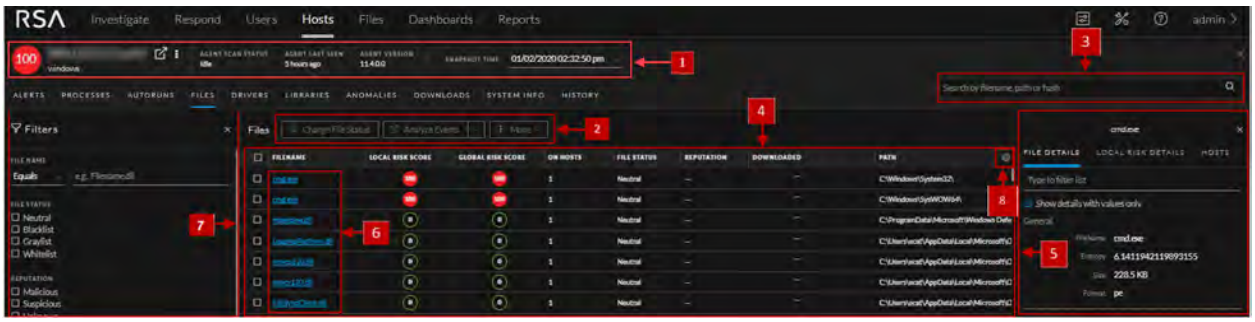
## Quick Look

Below is an example of the Files tab:



| | |
|---|---|
| 1 | **Agent and Scan Details**. You can view the following agent and scan details of the selected host:<br>**Host name** - Name of the host. For example, `WIN-ABC`.<br>**Risk score** - Risk score of the host.<br>**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).<br>**Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.<br>**Agent Last Seen** - Time when the agent last communicated with the Endpoint server.<br>**Agent Version** - Version of the agent. For example, `11.3.0.0`.<br>**More** - Provides options to:<br>• Start a scan for the selected hosts. For more information, see Scan Hosts.<br>• Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.<br>• Isolation host from the network. For more information, see Isolating Hosts from Network.<br>• Download MFT to the server. For more information, see Performing Host Forensics.<br>• Download System Dump to the server. For more information, see System and Process Memory Dump.<br>**Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu. |
| 2 | **Actions in the toolbar:**<br>**Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate.<br>**Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.<br>**More Actions** - Provides options to:<br>• Perform external lookups.<br>• Download files to server, save a local copy, and analyze files for deeper analysis.<br>**Note:** You can perform some of the above actions from the right-click context menu. |
| 3 | Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host. |
| 4 | **All Files Available on Host** - Lists all files (reported as part of scan and tracking) on the host. By default, **All Files Available on Host** toggle is enabled for Windows and Mac. |
| 5 | **Details Panel** - Displays information, such as filename, local risk score, global risk score, on hosts, reputation status, file status, package details and others. |

| | |
|---|---|
| 6 | **Show/Hide Right Panel** - Displays the following properties in the right panel:<br>• File Details - Displays all properties of the selected process. It is grouped as follows:<br>**General** - General information about the file, such as file name, entropy, size, and format.<br>**Signature** - Provides signatory information.<br>**Hash** - Hash type of the file (MD5, SHA1, and SHA256).<br>**Time** - Time when the file was created, modified, or accessed.<br>**Location** - Location of the file.<br>• Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All.<br>• Hosts - Displays the top 100 hosts based on the risk score on which the file is present. |
| 7 | Clicking a filename lets you navigate to the Files view for further analysis. |
| 8 | **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters.<br>**Note:** In the **Deleted** column, a trash icon appears next to the deleted file. The **Deleted** column is not displayed if you disable **All Files Available On Host**.<br>For more information, see Filter Host Details. |
| 9 | **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference. |

# Hosts View - Drivers Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The Drivers tab lists the drivers running on the hosts at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Drivers** tab.

## Image Hooks

Image hooks found in executable image are displayed in the following columns.

| Columns | Description |
|---|---|
| Type | Type of the hook . Possible values are - inline, iat, eat, or exception Handler. |
| Local Risk Score | Risk score of suspicious or malicious activities performed by the file on a specific host. |
| Global Risk Score | Aggregated score of all suspicious and malicious activities performed by the file across all hosts. |
| Reputation | Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid. |
| Signature | Provides signatory information. |
| Downloaded | Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error. |
| Hooked Process | Process in which hooks are placed. |
| Hooked Filename | Name of the file that was modified by the hook. |
| Hooked Symbol | Symbol in which the hook is performed. |

## Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

| Category | Description |
|---|---|
| Type | Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt. |
| Driver name | Name of the driver which placed the hooks. |
| Local Risk Score | Risk score of suspicious or malicious activities performed by the file on a specific host. |
| Global Risk Score | Aggregated score of all suspicious and malicious activities performed by the file across all hosts. |

| Category | Description |
|---|---|
| Reputation | Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid. |
| Signature | Provides signatory information. |
| Downloaded | Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error. |
| Object Function | Name of the object function hooked into. |
| Hooked File Name | Name of the file that was modified by the hook. |

## Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

| Category | Description |
|---|---|
| Start Address | Start Address - Start address of the thread. |
| DLL Name | Name of the DLL. |
| Local Risk Score | Risk score of suspicious or malicious activities performed by the file on a specific host. |
| Global Risk Score | Aggregated score of all suspicious and malicious activities performed by the file across all hosts. |
| Reputation | Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid. |
| Process | File name and PID of the process in which thread is running. |
| Downloaded | Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error. |
| Signature | Provides signatory information. |
| Thread ID | ID of the running thread. |
| Thread Environment Block | Address of the thread environment block. |

## Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.

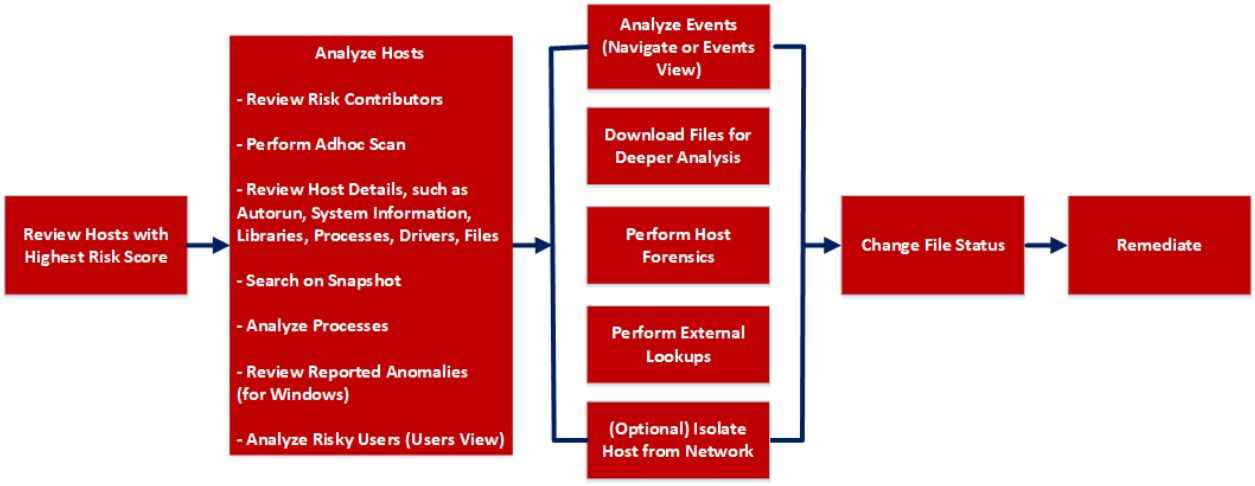
| Category | Description |
|---|---|
| Hive | Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`. |
| Reason | Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch. |
| Registry Path | Registry path that is affected. The value is separated by a @ character. |
| Raw Type | Value type found in the low-level parsing. |
| Raw Data | Value data extracted from the low-level parsing. |
| API Type | Value type from the Win32 registry API. |
| API Data | Value data from the Win32 registry API. |

# Hosts View - Downloads Tab

**Note:** The information in this topic applies to NetWitness Version 11.4 and later.

The Downloads tab provides information about all downloads (MFT, files, system dump, and process dump) performed on the host. To access this tab, select a host from the **Hosts** view and click the **Downloads** tab.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | review hosts with highest risk score | Analyze Hosts Using the Risk Score |
| Threat Hunter | analyze hosts | Investigating Hosts |
| Threat Hunter | perform adhoc scan | Scan Hosts |
| Threat Hunter | review host details | Analyze Host Details |
| Threat Hunter | search on snapshot | Search Files on Host |
| Threat Hunter | analyze processes | Investigating a Process |
| Threat Hunter | review reported anomalies | Analyze Anomalies |
| Threat Hunter | analyze risky users | Analyzing Risky Users |
| Threat Hunter | analyze events | Analyzing Events |
| Threat Hunter | download files for deeper analysis | Analyzing Downloaded Files |
| Threat Hunter | perform external lookups | Launch an External Lookup for a File |
| Threat Hunter | change file status or remediate | Changing File Status or Remediate |
| Threat Hunter | isolate host from network* | Isolating Hosts from Network |
| Threat Hunter | download MFT, download files, system dump, or process dump* | Performing Host Forensics |

*You can perform this task in the current view.

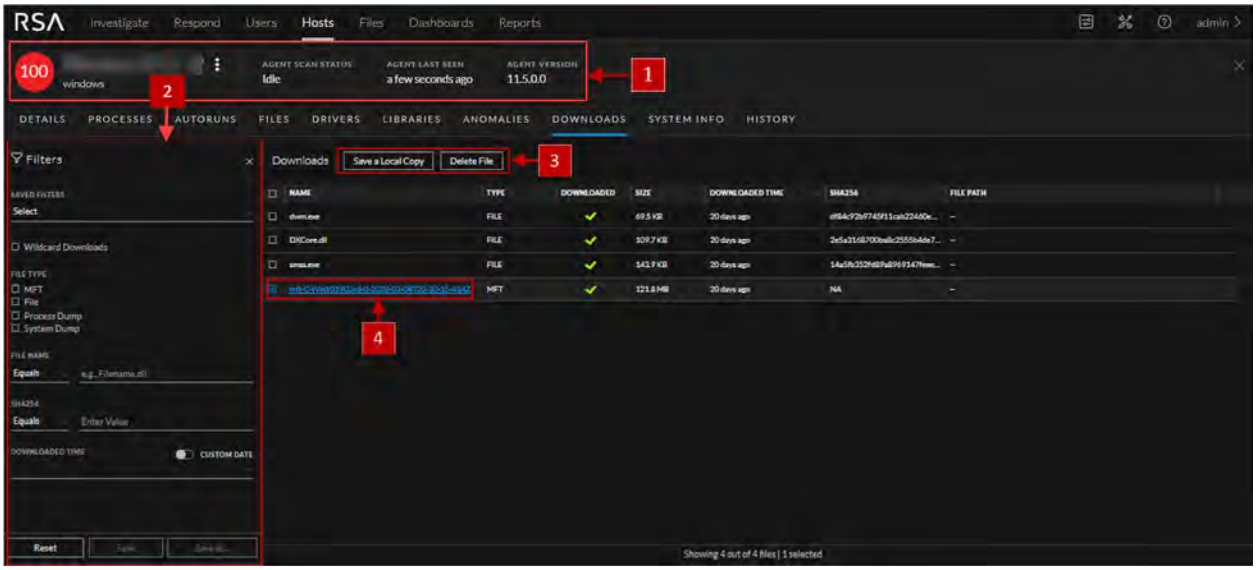
## Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts

- Performing Host Forensics
- Isolating Hosts from Network

## Quick Look

Below is an example of the Downloads tab:



1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

**Host name** - Name of the host. For example, `WIN-ABC`.

**Risk score** - Risk score of the host.

**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).

**Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

**Agent Last Seen** - Time when the agent last communicated with the Endpoint server.

**Agent Version** - Version of the agent. For example, `11.3.0.0`.

**More** - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download files to the server. For more information, see Download Files Using Full Path or Wildcard.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

2 **Filter Files**. You can filter downloaded files by selecting the options in the Filters panel and create filters. For more information, see Performing Host Forensics.

3 **Actions in the toolbar:**
**Save a Local Copy** - Lets you retrieve the downloaded MFT and save it to your local file system for further analysis.

**Delete File** - Deletes the downloaded MFT from the server.

For more information, see Performing Host Forensics.

4 **View MFT Details**. Click the filename to view the MFT details. For more information, see MFT Viewer.

The table displays the following information:

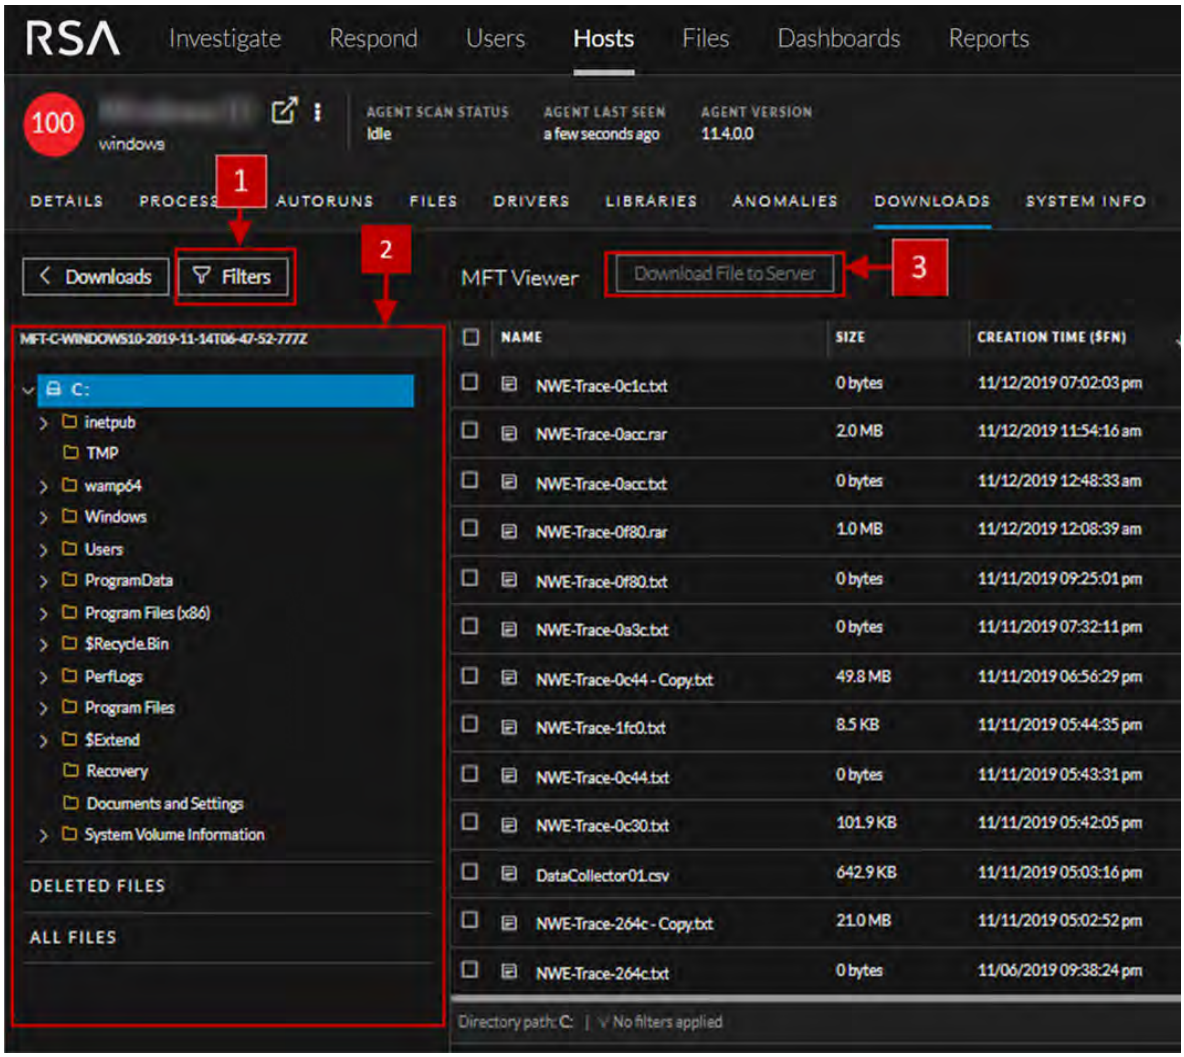
| Column | Description |
|---|---|
| File Name | Name of the file that is downloaded. For example, `VGAuthService.exe`. |
| Type | Type of file downloaded - MFT, file, memory dump. |

| Column | Description |
|---|---|
| Downloaded | Status of the download:<br> - Download successful<br> - Processing the downloaded file<br> - Errors including download failed<br> - Errors downloading one or more files in the group. |
| Size | Size of the downloaded file. |
| Downloaded Time | Time when the MFT was downloaded. |
| SHA256 | SHA256 of the file.<br>**Note:** This is applicable only for files. |

## MFT Viewer

You can analyze the downloaded MFT using the MFT Viewer. For more information, see Analyze Downloaded MFT.

Below is an example of the MFT Viewer:



1. **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter MFT.
2. **Folder Details**. Lets you view the content of the MFT.
3. **Download File to Server**. Downloads files to the server.

The table displays the following information:

| Column | Description |
|---|---|
| Name | Name of the file. For example, `dtf.exe`. |
| Size | Size of the file. |
| Creation Time ($FN) | File Name ($FN) creation time. |
| Creation Time ($SI) | Standard Information ($SI) creation time. |

| Column | Description |
|---|---|
| Modification time ($FN) | $FN modified time. |
| Modification time ($SI) | $SI modified time. |
| Access time ($FN) | $FN access time. |
| Access time ($SI) | $SI access time. |
| Update time ($FN) | $FN updated time. |
| Update time ($SI) | $SI updated time. |
| Full Path | Path of the file. |
| Allocated Size | File size on the disk. |
| Archive | Indicates if a file is archived. |
| Compressed | Indicates if a file is compressed. |
| Encrypted | Indicates if a file is encrypted. |
| Hidden | Indicates if a file is hidden. |
| Directory | Indicates if it is a directory. |
| Extension | Type of the file. For example, exe, pdf, txt. |

# Hosts View - System Information Tab

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

The System Information tab lists the agent system information. To access this tab, select a host from the **Hosts** view and click the **System Information** tab.

## Workflow

| | |
|---|---|
| 1 | **Agent and Scan Details**. You can view the following agent and scan details of the selected host:<br>**Host name** - Name of the host. For example, `WIN-ABC`.<br>**Risk score** - Risk score of the host.<br>**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).<br>**Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.<br>**Agent Last Seen** - Time when the agent last communicated with the Endpoint server.<br>**Agent Version** - Version of the agent. For example, `11.3.0.0`.<br>**More** - Provides options to:<br>• Start a scan for the selected hosts. For more information, see Scan Hosts.<br>• Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.<br>• Isolation host from the network. For more information, see Isolating Hosts from Network.<br>• Download MFT to the server. For more information, see Performing Host Forensics.<br>• Download System Dump to the server. For more information, see System and Process Memory Dump.<br>**Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu. |
| 2 | **Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host. |
| 3 | **System Information Panel** - See System Information Panel. |

## System Information Panel

The System Information panel displays the following tabs:

| Tabs | Description |
|---|---|
| Host File Entries | All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4` |
| Network Shares | Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`. |
| Security Products | Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`. |

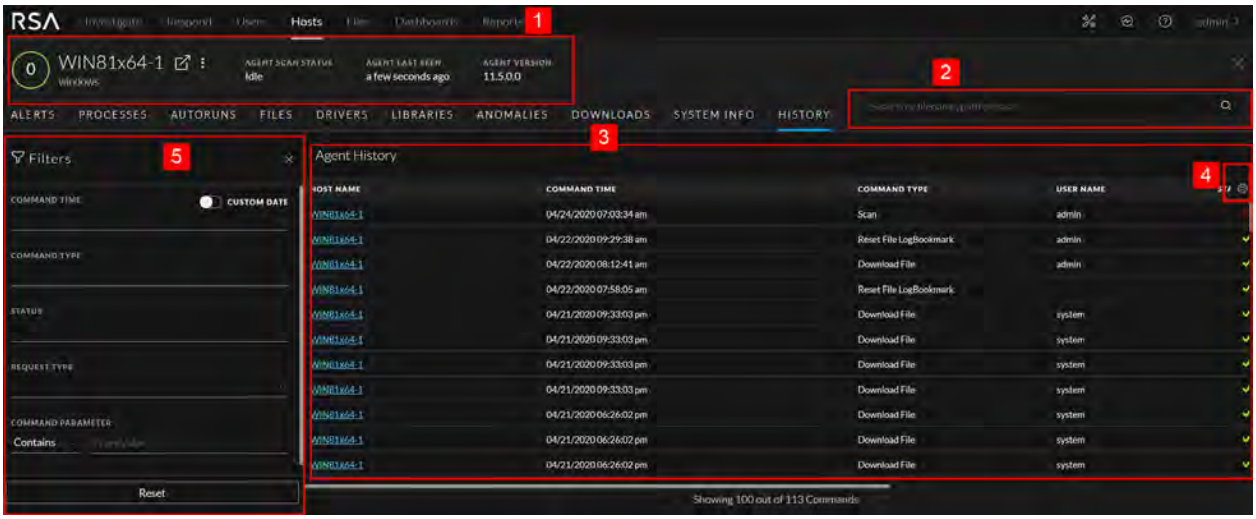
| Tabs | Description |
| --- | --- |
| Windows Patches | List of patches applied by Windows update (for Windows only). For example, `KB2959936`. |
| Security Configuration | Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac. |

# Hosts View - Agent History Tab

The Agent History tab lists the commands along with the respective status and additional details.

## Quick Look

Below is an example of the Agent History tab:



1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

**Host name** - Name of the host. For example, `WIN-ABC`.

**Risk score** - Risk score of the host.

**Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac).

**Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

**Agent Last Seen** - Time when the agent last communicated with the Endpoint server.

**Agent Version** - Version of the agent. For example, `11.3.0.0`.

**More** - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

2 **Search files on host**. Lets you search the files on the host (file name, file path, and SHA-256 checksum).

3 **Details Panel**- Displays information, such as:

- **Command Time** - Command issued time.
- **Command Type** - Type of the command (Identity, scan, stop scan, download file, MFT, process dump, system dump, start isolation, update isolation exclusion list, stop isolation, reset file logbookmark, and download multiple files, agent upgrade, and uninstall agent) issued.
- **User Name** - User who issued the command. For example, Analyst, System.
- **Status** - Status (success, pending, expired, failed, or cancelled) of the command issued.

**Note:** If the command's status is expired, it means that the agent is unable to process the command even after five retries.

- **Command Parameter** - Parameters associated with the command. For example, Command parameter for command type Download File is `path = C:\Windows\System32\ | filename = cmd.exe | hash = 6f88fb88ffb0f1d5465c2826e5b4f523598b1b8378377c8378ffebc171bad18b`

**Note:** Command types such as identity, scan, stop scan, stop isolation, system dump do not contain any associated command parameters.

- **Processed Time** - Time at which the command is completed, pending, expired, failed, or cancelled.
- **Last Retrieval time** - Last time when the command is issued to the agent.
- **Total Retrieval** - The number of times the command is issued to the agent.

**Note:** After you upgrade to NetWitness version 11.5, the commands executed in the previous versions are displayed automatically. The fields such as last retrieval time, total retrieval, and user do not contain any values. For system generated commands, the user field value shows as system.

4 **Filter Files**. You can filter commands by selecting the options in the Filters panel. For more information, see Filter Host Details.

5 **Settings Menu.** You can set History view preferences by selecting columns from the Settings menu.

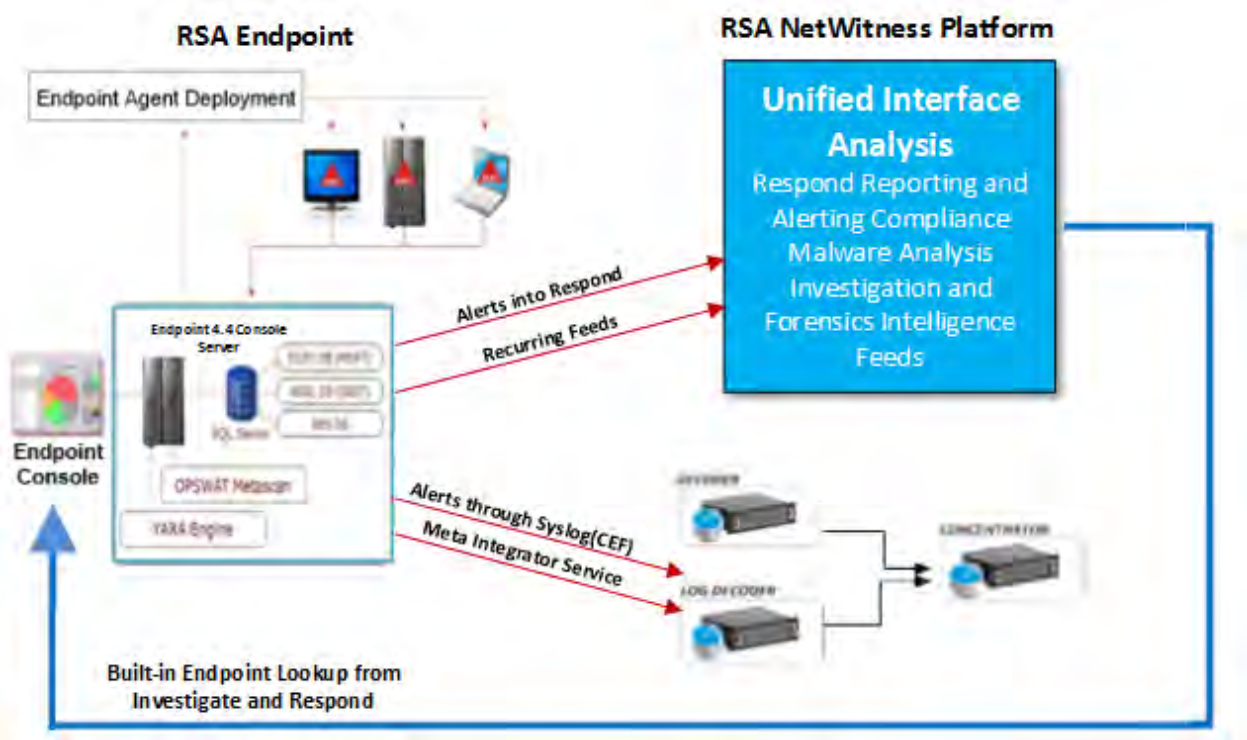
# RSA NetWitness Endpoint Integration

RSA customers who are using RSA NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness 11.x in several different ways.

**Note:** In Version 11.2 and later, the following components are rebranded:
- RSA NetWitness Suite to RSA NetWitness Platform
- Packet Decoder to Network Decoder

## Integration Options



## Integration Methods

The following are the RSA NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 or later directly to a Log Decoder

**Endpoint alerts into NetWitness Respond**. This integration provides the capability for forwarding Endpoint alerts to Respond.

**Contextual data from Endpoint through a NetWitness Live recurring feed**. This integration can enrich the session displayed in NetWitness Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.

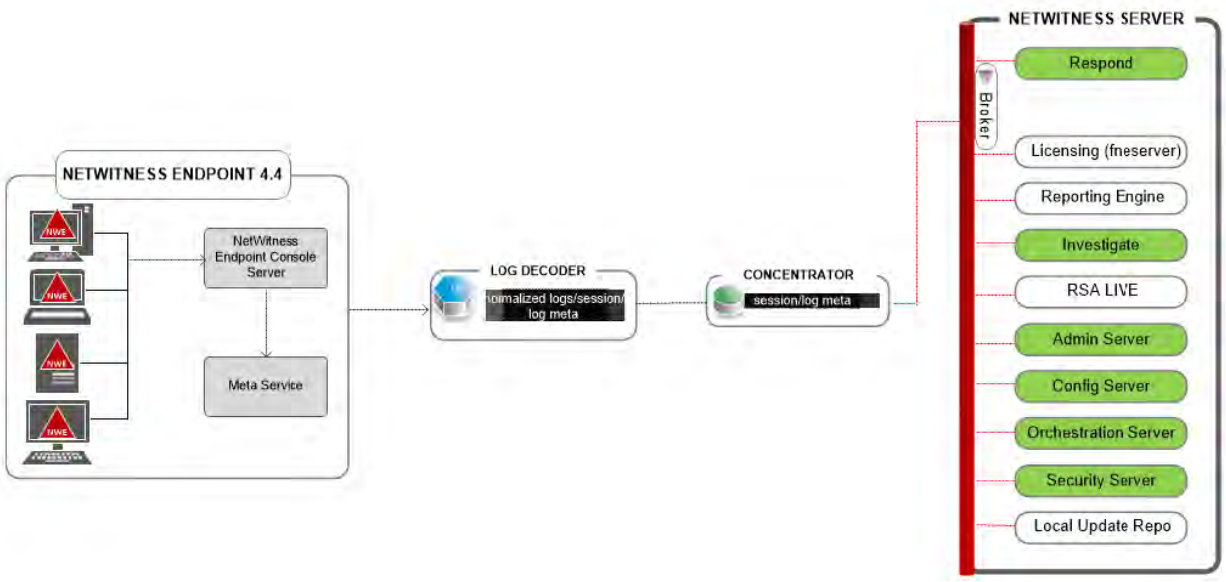
**NetWitness Endpoint alerts through Syslog (CEF) into NetWitness Log Decoders**. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness ecosystem.

(For Version 11.1 and later) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets.

**Note:** For information on NetWitness Endpoint 4.4.0.x integration with NetWitness, see *NetWitness Endpoint Configuration Guide*.

## NetWitness Endpoint Metadata Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.



## Built-in NetWitness Endpoint Lookup

With the RSA NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness, the built-in NetWitness Endpoint Lookup from NetWitness Investigation and NetWitness Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

**Note:** The exception occurs if you customize NetWitness by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the **(Admin)** > System view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

## NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. RSA NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. RSA NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.

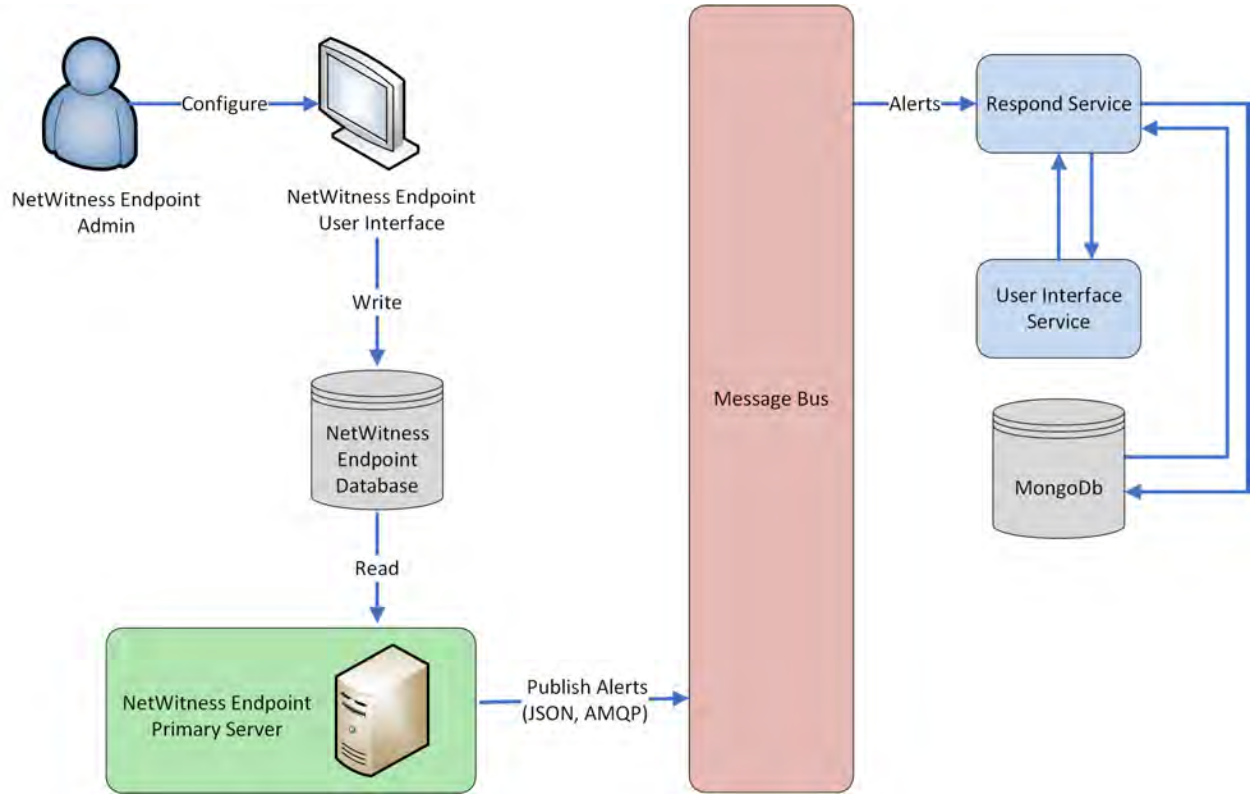
Each of these alert types can be sent to NetWitness.

# Configure NetWitness Endpoint Alerts to Respond

This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness and displayed in the **Respond > Alerts** view.

**Note:** RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "RSA NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness and its display in the **Respond > Alerts** view.



## Prerequisites

Ensure that you have the following:

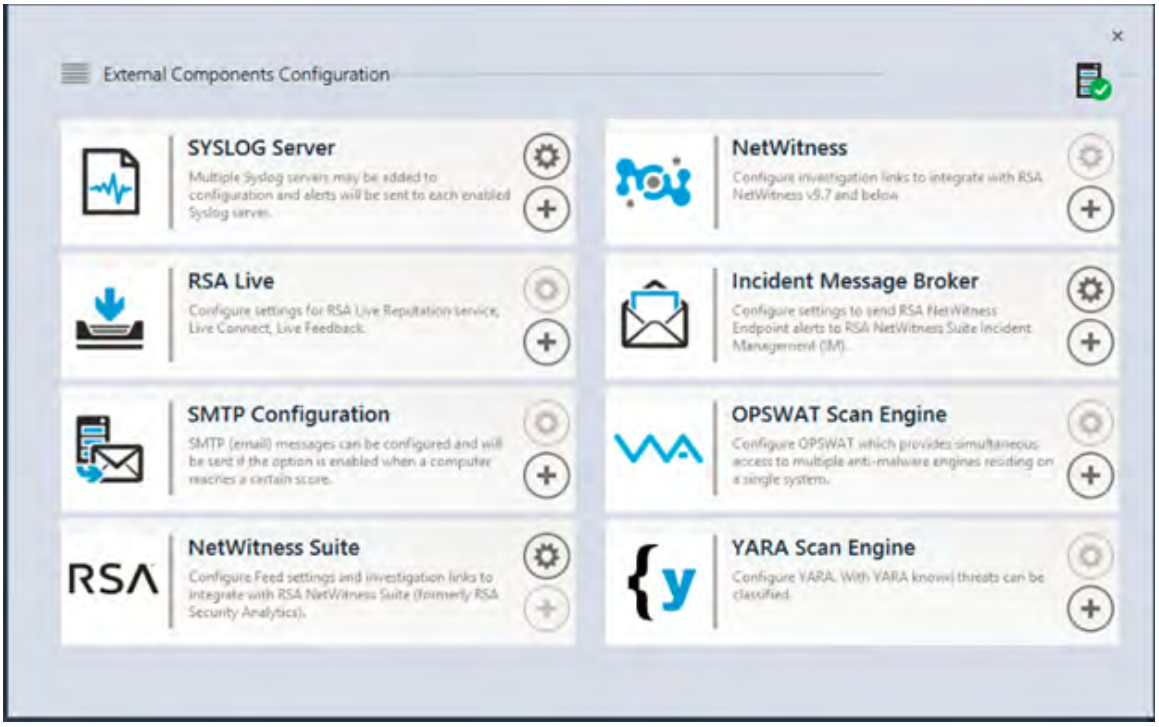
- The Respond service is installed and running on NetWitness.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

# Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

### To configure NetWitness Endpoint to send alerts to Respond to the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **(Configure) > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.



2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

**Note:** In NetWitness 11.0 and 11.1, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      c:\client.cer
      ```

      Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

      ```
      PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
      "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
      "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
      TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
      Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
      DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
      Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
      (5); Export-Certificate –Cert (Get-ChildItem –Path
      Cert:\LocalMachine\My\ -DnsName ecat) –FilePath C:\Client.cer
      ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:

   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

## Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

| Known Issues | Solutions |
| --- | --- |
| Orchestration fails on admin node. | You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service. |

# Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure RSA NetWitness Endpoint data in RSA NetWitness to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness ecosystem.

Administrators can configure NetWitness to consume system scan contextual data from NetWitness Endpoint through a NetWitness Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

**Note:** Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

**Caution:** In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness ingest devices (Decoder and Log Decoder).

## Prerequisites

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 RSA Decoder and Concentrator connected to the NetWitness Server in the network.

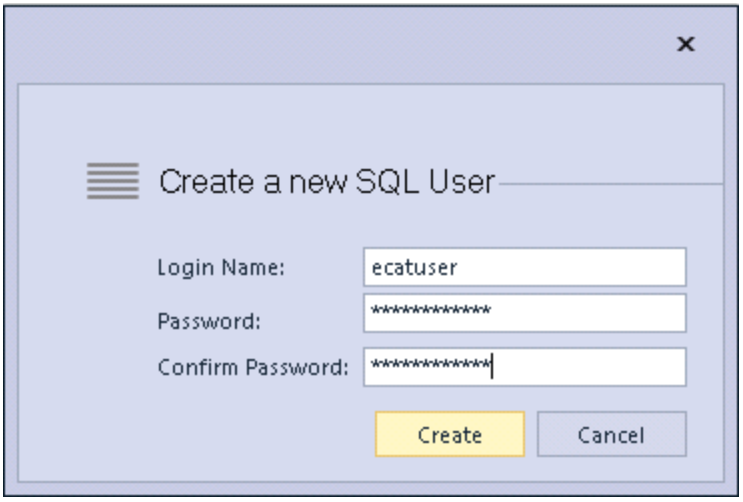
**To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:**

1. Enable the NetWitness Endpoint Feed for NetWitness in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness trust store.
3. Configure the NetWitness Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Live.

# Enable the NetWitness Endpoint Feed for NetWitness

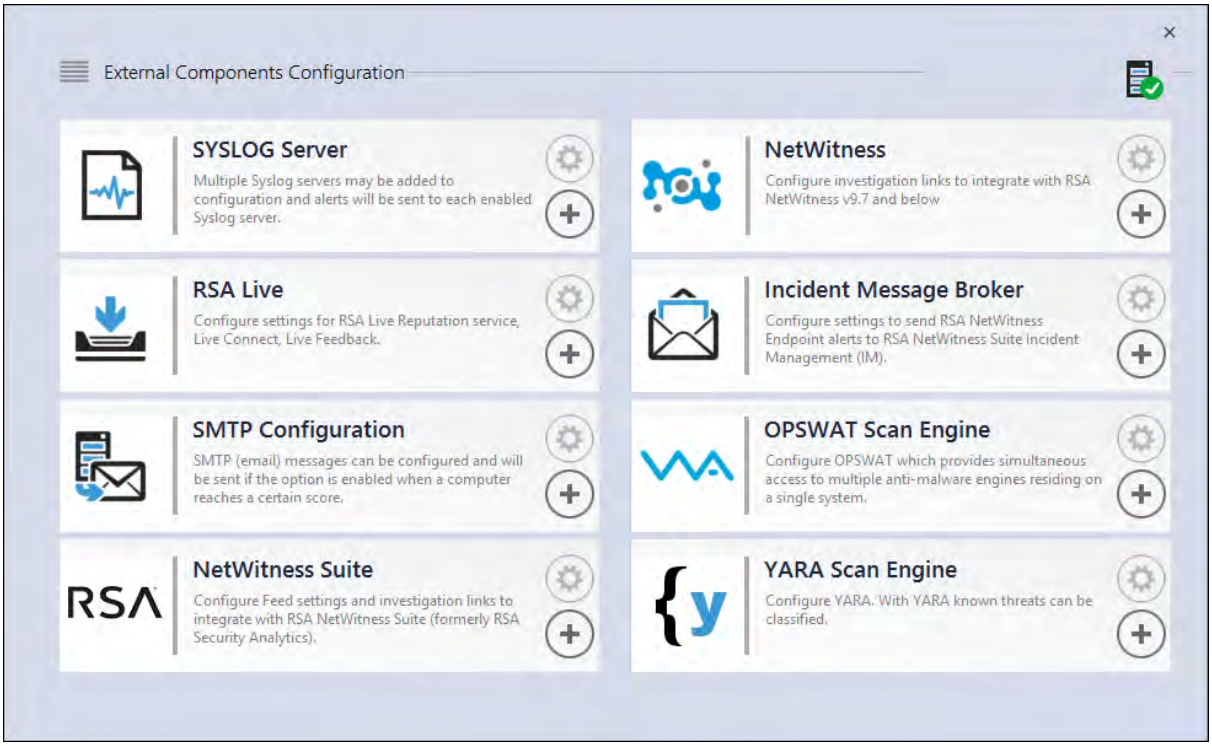
1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select **(Configure) > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

The Create a new SQL User dialog is displayed.

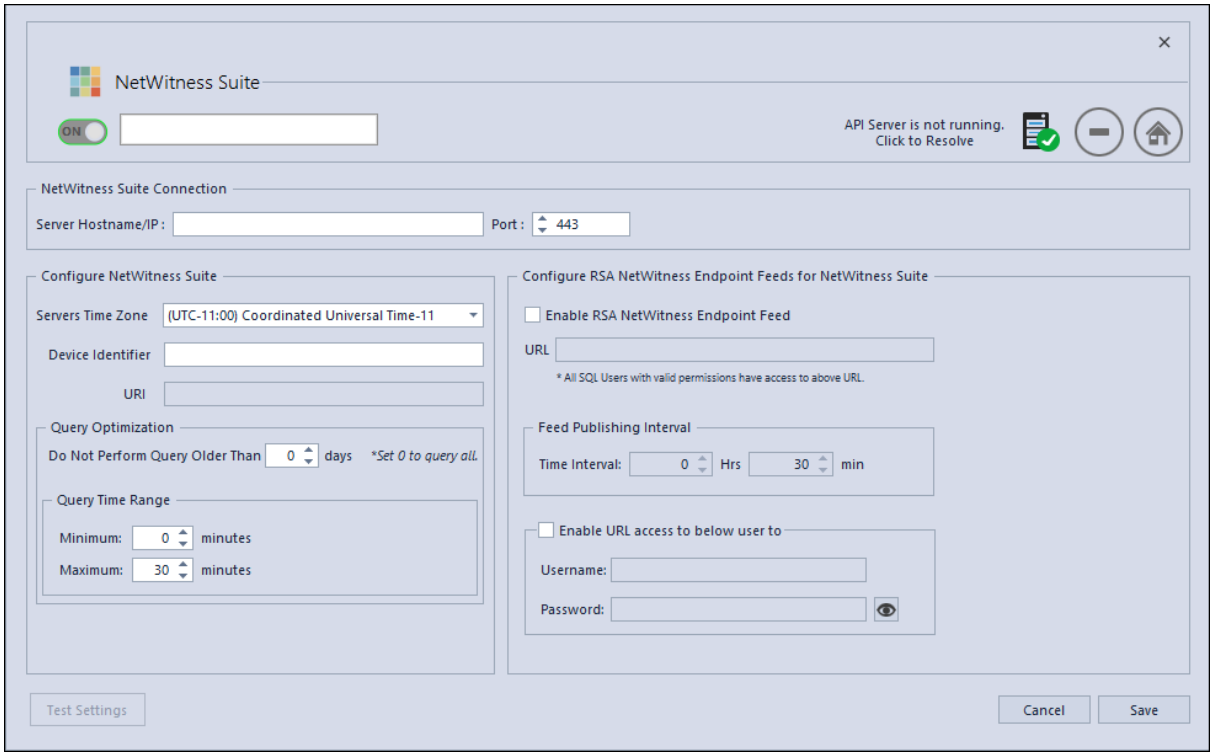


c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.



3. In NetWitness, click +.
   The NetWitness dialog is displayed.



4. In the **NetWitness** panel, in **On**, enter the name to identify the NetWitness component.
5. In the **NetWitness Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness concentrator device ID.

   **Note:** You can find the Device Identifier in NetWitness when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness, so that a query does not overload the NetWitness Server.
9. In the **Configure RSA NetWitness Endpoint Feeds for NetWitness** panel, perform the following:
   a. Select **Enable RSA NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

## Export the NetWitness Endpoint SSL Certificate

**Note:** This procedure works only for NetWitness 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness, refer to the applicable version of this guide.

### To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`NweCA.cer`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA.cer`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     **`scp NweCA.cer root@<sa-machine>:.`**
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     **`scp EcatCA.cer root@<sa-machine>:.`**
6. To import the NetWitness Endpoint Endpoint CA certificate into the NetWitness Trusted store, navigate to java directory. Enter the following commands:
   - For NetWitness Endpoint fresh installation:
     ```
     keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore /etc/pki/java/cacerts -storepass changeit
     ```
   - For NetWitness Endpoint upgraded from previous version:
     ```
     keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore /etc/pki/java/cacerts -storepass changeit
     ```

   When prompted for certificate update confirmation, enter **Yes**.
7. Create a file `jetty.user` in the `/etc/default` directory and add the following text.
   ```
   JAVA_OPTIONS="${JAVA_OPTIONS} -Djdk.security.allowNonCaAnchor=true"
   ```
8. On the NetWitness host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit**`/etc/hosts.user`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:
     ```
     <ip-address-ecat-cs> NweServerCertificate
     ```
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts.user`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:
     ```
     <ip-address-ecat-cs> ecatserverexported
     ```
9. SSH to ADMIN Server and run the following command.
   ```
   nw-manage --refresh-host --host-all
   ```
10. To restart NetWitness, enter the following command:
    service jetty restart

## Configure the NetWitness Concentrator Service

1. Log on to NetWitness and go to **(Admin) > Services**.
2. Select a **Concentrator** from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in

the feed definition, where:
**description** is the name of the meta key you want to display in NetWitness Investigation.
**level** is "IndexValues"
**name** matches the column name of the CSV file that NetWitness uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

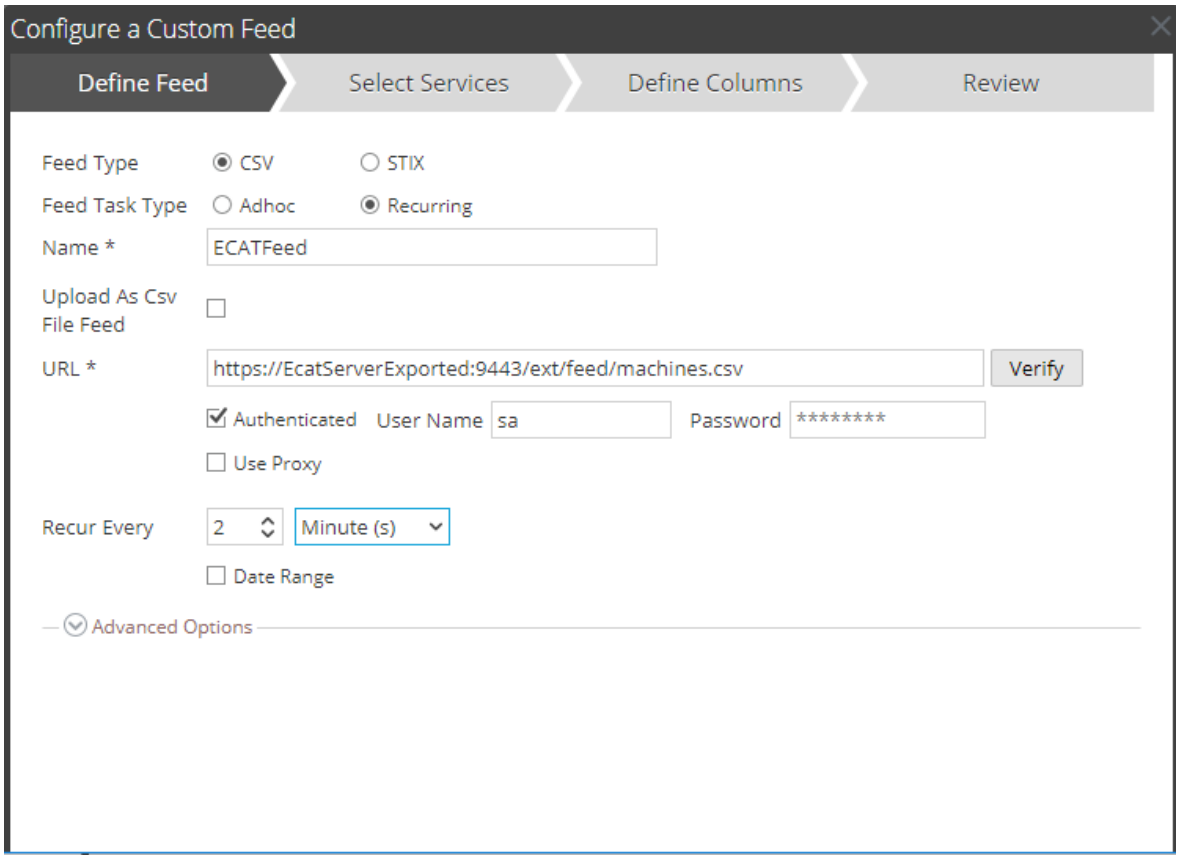
## Configure the Recurring Custom Feed Task in NetWitness

1. Log on to NetWitness and go to **(Configure) > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.
   e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:
      - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`**.
      - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`**.

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

g. Click **Verify** to check if NetWitness can reach the web resource.

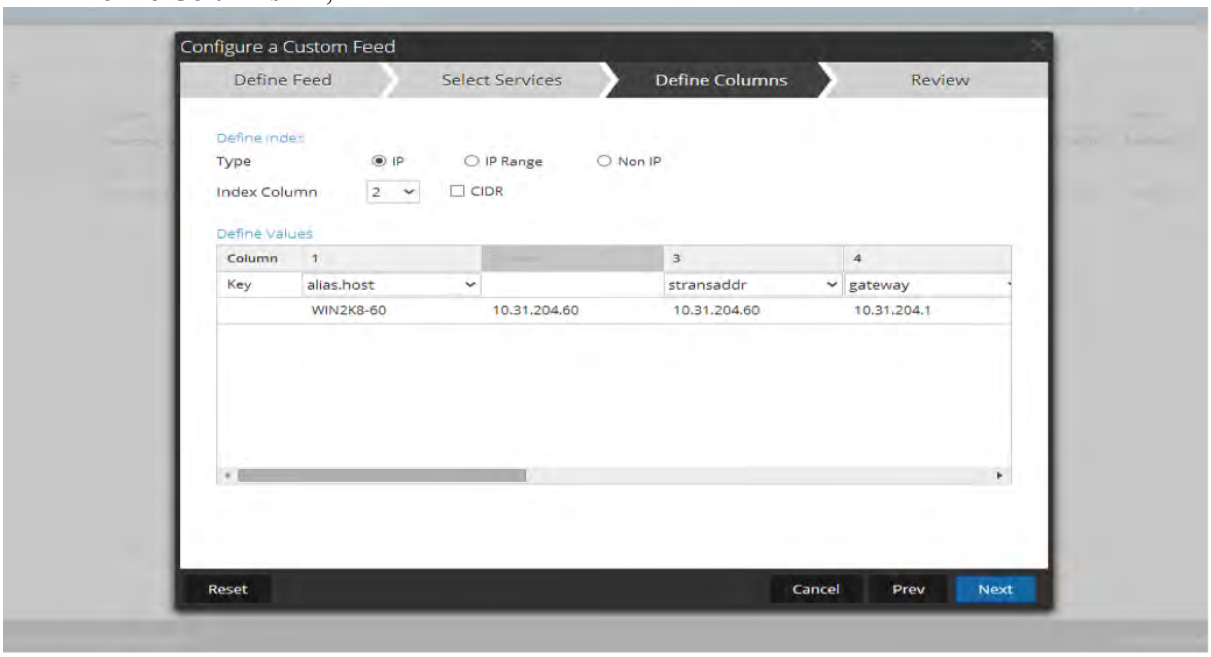
.



h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.

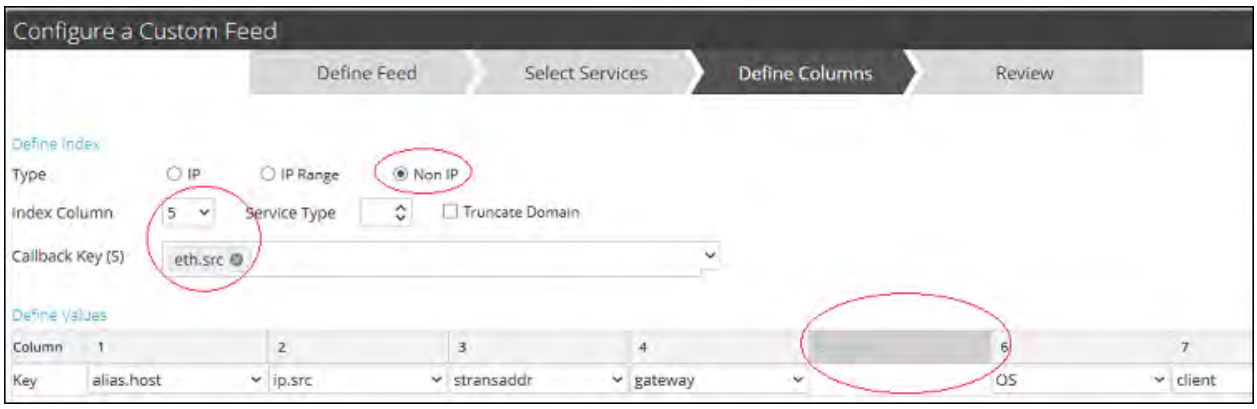


The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

| Column | Name | Description | Column Name in NetWitness (Meta Key Name) |
|---|---|---|---|
| 1 | MachineName | Host name of the Windows agent | alias.host |
| 2 | LocalIp | IPv4 address | IP type (indexed column) |
| 3 | RemoteIp | Far end IP as seen by the router | stransaddr |
| 4 | GatewayIp | IP of the gateway | gateway |
| 5 | MacAddress | MAC address | eth.src |
| 6 | OperatingSystem | Operating system used by the Windows Agent | OS |
| 7 | AgentID | Agent ID of the host (unique ID assigned to the agent) | client |
| 8 | ConnectionUTCTime | Last time when the agent connected to NetWitness Endpoint server | ecat.ctime |
| 9 | Source Domain | Domain | domain.src |
| 10 | ScanUTC time | Last time when the agent was scanned | ecat.stime |

| Column | Name | Description | Column Name in NetWitness (Meta Key Name) |
|---|---|---|---|
| 11 | UserName | Username of the client machine | username |
| 12 | Machine Score | Score of the agent indicating the suspicious level | risk.num |

**Note:** In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.



## Result

When viewing feed data in NetWitness, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

# Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of RSA NetWitness Endpoint data in RSA NetWitness to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine.

For NetWitness networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness reporting on NetWitness Endpoint events, and NetWitness alerting of NetWitness Endpoint events.

## Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later RSA Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

## Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

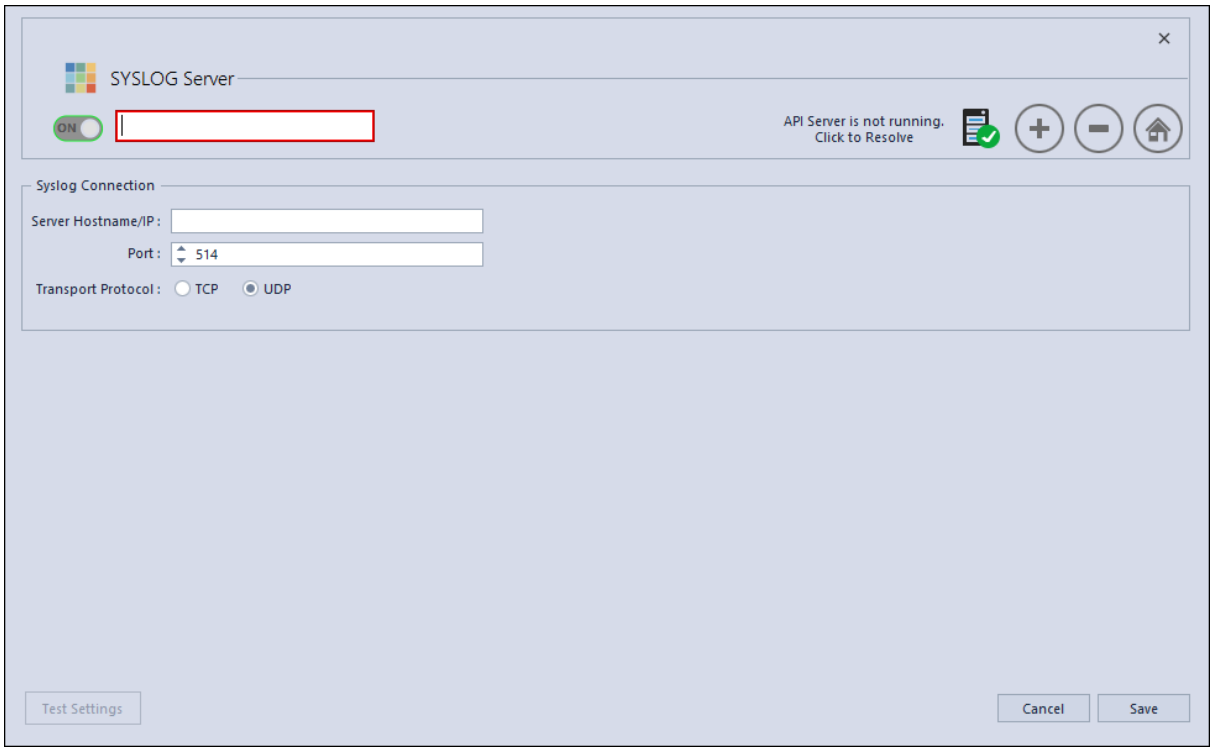
**Note:** Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness.

# Configure NetWitness Endpoint to Send Syslog Output to NetWitness

### To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:

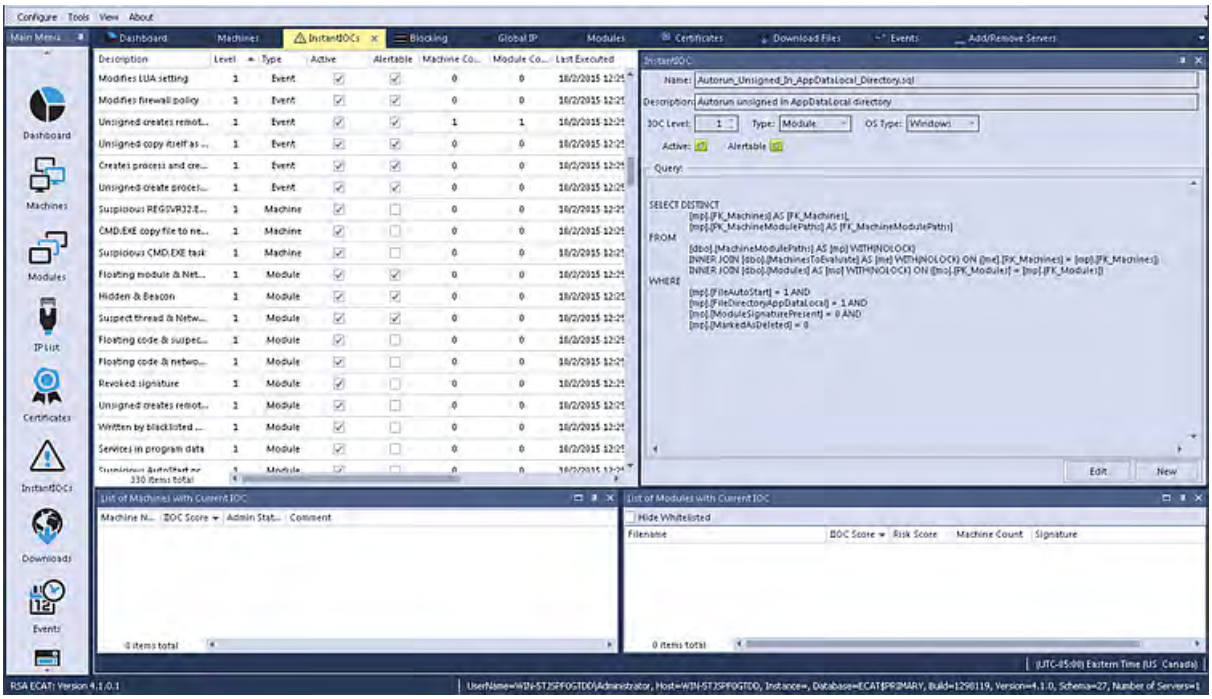
1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click .
   The SYSLOG Server dialog is displayed.



4. In the **NetWitness** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   **Server Hostname/IP** = The hostname DNS or IP address of the RSA Log Decoder
   **Port** = 514
   **Transport Protocol** = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.



When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

## Edit the Table Mapping in table-map-custom.xml

In the default RSA table-map.xml provided by RSA, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

| NetWitness Endpoint Fields | NetWitness Mapping | Transient in NetWitness |
|---|---|---|
| agentid | client | No |
| CEF Header Hostname Field | alias.host | No |
| CEF Header Product Version | version | No |
| CEF Header Product Name | Product | Yes |
| CEF Header Severity | severity | Yes |
| CEF Header Signature ID | event.type | No |

| NetWitness Endpoint Fields | NetWitness Mapping | Transient in NetWitness |
|---|---|---|
| CEF Header Signature Name | event.desc | No |
| destinationDnsDomain | ddomain | Yes |
| deviceDnsDomain | domain | Yes |
| dhost | host.dst | No |
| dst | ip.dst | No |
| end | endtime | Yes |
| fileHash | checksum | No |
| fname | filename | No |
| fsize | filename.size | No |
| gatewayip | gateway | Yes |
| instantIOCLevel | threat.desc | No |
| instantIOCName | threat.category | No |
| machineOU | dn | No |
| machineScore | risk.num | No |
| md5sum | checksum | No |
| os | OS | No |
| port | ip.dstport | No |
| protocol | protocol | Yes |
| Raw Message | msg | Yes |
| remoteip | stransaddr | Yes |
| rt | alias.host | No |
| sha256sum | checksum | No |
| shost | host.src | No |
| smac | eth.src | No |
| src | ip.src | No |
| start | starttime | No |
| suser | user.dst | No |
| timezone | timezone | No |
| totalreceived | rbytes | Yes |

| NetWitness Endpoint Fields | NetWitness Mapping | Transient in NetWitness |
|---|---|---|
| totalsent | bytes.src | No |
| useragent | user.agent | No |
| userOU | org | Yes |

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness you need to add them to `table-map-custom.xml`, and set the flags to `None`.

| NetWitness Endpoint Fields | NetWitness Mapping | Transient in NetWitness |
|---|---|---|
| moduleScore | cs.modulescore | Yes |
| moduleSignature | cs.modulesign | Yes |
| Target module | cs.targetmodule | Yes |
| YARA result | cs.yararesult | Yes |
| Source module | cs.sourcemodule | Yes |
| OPSWATResult | cs.opswatresult | Yes |
| ReputationResult | cs.represult | Yes |

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

**Note:** Restart the Log Decoder or reload the log parsers for the changes to take effect.

## Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness and go to **(Admin) > Services**.
    1. Select a **Concentrator** from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.

3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.
5. To add the Concentrator as a data source in the Reporting Engine, in the **(Admin) > Services** view, select the **Reporting Engine** and Select **View> Config > Sources.**
   NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

## Example

**Note:** The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
**description** is the name of the meta key you want to display in NetWitness Investigation.
**level** is "IndexValues"
**name** is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>
 <key description="Severity" format="Text" level="IndexValues" name="severity"

valueMax="250000" defaultAction="Open"/>
 <key description="Strans Address" format="Text" level="IndexValues" name="stransaddr"
valueMax="250000" defaultAction="Open"/>
 </language>
```

## Result

Analysts can:

- Create NetWitness alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

# Getting Started with ESA

This topic covers quick start topics for NetWitness Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

**Note:** The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**IMPORTANT:** The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

## How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

## Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

## An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

## Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

| Rule Type | Description |
|---|---|
| Simple Filter Rule | This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts.<br><br>For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port. |
| Event Window Rule | This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert.<br><br>The memory consumption of such rules is highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user has five failed login attempts within a ten minute time frame. |

| Rule Type | Description |
|---|---|
| Followed By Rule | This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs:<br>• If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence.<br>• If the event belongs to an existing event thread, it is added to that sequence.<br>In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account. |

**Note:** ESA sends alerts to NetWitness Respond for processing and the alerts are eventually stored in a database. If your rule creates too many alerts, it can slow down another part of the system.

When writing and deploying rules, you should be aware that rule memory usage and alert generation consume system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

## Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events**. The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Validate your ESA rules within the Rule Builder or Advanced EPL Rule Builder before you deploy them**. To prevent errors in your rules and confirm that they generate the expected alerts, you can test the rule logic with JSON data within the rule builders. This capability is available in NetWitness Platform version 11.5 and later. For more information, see Validate an ESA Rule and Validate an Advanced EPL Rule .
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded.
- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.

- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Add Memory Thresholds to ESA rules that use memory**. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the rule goes over the allotted memory threshold, it gets disabled individually and an error is displayed for that rule on the **(Configure) > ESA Rules > Services** tab. This capability is available in NetWitness Platform version 11.5 and later.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

For more best practice information for writing ESA rules, see ESA Rule Writing Best Practices.

## Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**.  RSA Live rules have parameters that need to be modified.  If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Working with Trial Rules.

## Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and

effective detection of events.

- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory usage for your ESA in the Health and Wellness tab. For more information, see "View Detailed Statistics in Health and Wellness" in Troubleshoot ESA.

## Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Working with Trial Rules.
- **Set up thresholds in Health & Wellness to alert you if memory usage is too high**. There are metrics in NetWitness Health & Wellness that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see View Memory Metrics for Rules.
- **Monitor memory metrics for each rule in Health & Wellness**. For each rule, you can view the estimated memory usage in Health & Wellness. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see View Memory Metrics for Rules.

# Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

## Troubleshoot ESA Correlation Services

| Problem | Possible Causes | Solutions |
|---|---|---|
| On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline.<br><br>In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable." | Several | When an ESA Correlation service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline.<br><br>Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA Correlation service machine may be down.<br><br>To bring up ESA Services:<br><br>Go to **(Admin) > Services**, select your ESA service, and then select **> Start**.<br><br>If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline.<br><br>In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable. | Configuration issues | If your system has been recently upgraded, you may have made a configuration error.<br><br>Go to **(Admin) > Services**, select your ESA service and then select **> Edit**. In the Edit Service dialog, click **Test Connection**. If the connection fails, you likely have a configuration error. Attempt to fix your configuration error and try again. |
| Suddenly, an ESA Correlation service is completely unresponsive and appears to have crashed. The ESA Correlation Log file shows a Too Many Open Files error. | Connectivity issues | The most likely cause for this error is a connectivity issue between the ESA Correlation service and a data source used in an ESA rule deployment, such as a Concentrator or Decoder.<br><br>1. Restart the ESA Correlation service.<br>2. Go to **(Admin) > Services**, select your ESA service and then select **> Restart**.<br>3. Check the connectivity from ESA to the data source. Look for connection errors in the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.<br><br>For example:<br>`Error: com.rsa.netwitness.streams. RecordStreamException: admin@<ip address>:56005:: com.rsa.netwitness.streams.RecordStreamException: connect::com.rsa.asoc.transport.nw.session. NextgenException: Failed to connect to <ip address>:56005`<br><br>If there are network connectivity issues, fix the issues and then restart the ESA Correlation service again to see if it fixes the problem.<br><br>If you have a data source with intermittent connectivity, you should remove it from the ESA rule deployment. |

## Troubleshoot RSA Live Rules for ESA

| Problem | Possible Causes | Solutions |
|---|---|---|
| I imported a group of rules from RSA Live, and now my ESA service is crashing. Why? | You may not have configured the parameters for the RSA Live rule to tune it for your environment. | Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment.<br>To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules. |
| I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled. | Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run. | You can verify that a rule was disabled by going to **(Configure) > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.<br>If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.<br>Then, search for a message similar to the following:<br>`"Property named '<meta_name>' is not valid in any stream"`<br>For example, you might see:<br>`Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`<br>If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*. |

## Troubleshoot ESA Rules

| Problem | Possible Causes | Solutions |
|---|---|---|
| I have an ESA rule that is not getting deployed and is not creating alerts. | A meta key that the rule uses is a string array type, but it shows as a string type on ESA. | Check to see if any string array meta keys that the rule uses are configured as string array types on ESA. Go to **(Configure) > ESA Rules > Settings** tab (Meta Key References).<br>• If it shows `string[]`, it is configured as a string array type on ESA. This is fine.<br>• If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA.<br><br>In the ESA Correlation service Explore view, go to `correlation/stream`. Add string array meta keys to the **multi-valued** list to allow them to be used as an array in ESA rules. Go back to the Meta Key References and click the refresh icon ().<br>Verify that the meta keys with a string array type show a value of `.string[]`. For additional details, see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *ESA Configuration Guide*. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| I created a rule, and I checked the syntax. The rule looked fine. When I went to deploy the rule, I got an error. Why? | You may not have the correct meta to deploy the rule. | Check the Meta Key References. You may not have the correct meta to deploy the rule. Check the ESA Correlation service log files to see which meta keys are missing: `/var/log/netwitness/correlation-server/correlation-server.log`<br><br>In NetWitness version 11.3.0.2 and later, you can check the ESA rule status in the ESA rule deployment (Go to **(Configure) > ESA Rules > Rules** tab. In the options panel on the left, select a deployment and look in the **ESA Rules** section). If a disabled rule has an error message, it shows in the Status field. Hover over the rule to view the error message tooltip.<br><br>  <br><br>In the above example, the error message shows: "Failed to resolve event type: Event type or class named "Host_Whitelist" was not found." In this case, a Context Hub list called "Host_Whitelist" that is used by the rule is not available. For more information on context hub lists, see the *Context Hub Configuration Guide*.<br><br>For more information, see the ESA Rules Section section of the Deployment Panel reference. |
| I set up notifications for a rule, but we are not receiving them. The `correlation-server.log` file does not show any errors. Why? | Correlation-server successfully sent the notification messages to integration-server, but when integration-server tried to send the notifications to their destination, it failed. | When troubleshooting notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). For an example, see Integration-Server SMTP Notification Error Example.<br><br>**Note:** For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| I created a rule with an enrichment, added an SMTP notification, and deployed my rule. We are not receiving SMTP notifications. Why? | You do not have a template that met the criteria to parse the events. | Check the ESA Correlation service log files to see if the SMTP notification failed: `/var/log/netwitness/correlation-server/correlation-server.log`. For more details on the notification error, check the Integration-Server log file on the NetWitness Server (also known as Node 0, Admin server, or NWServer): `/var/log/netwitness/integration-server/integration-server.log`.<br><br>If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. See SMTP Notification Error Example below for a notification error example.<br><br>For information on creating a custom ESA template, see "Define a Template for ESA Alert Notifications" in the *System Configuration Guide*.<br><br>Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents. |
| I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why? | You may have connectivity issues. | Check the Offered Rate statistic on the **(Configure) > ESA Rules > Services** tab. Select the ESA service and then look at the statistics on the tab for the Deployment.<br><br>If the Offered Rate is zero, then the ESA service is not receiving data from Concentrators. Check the ESA Correlation log files for connectivity issues: `/var/log/netwitness/correlation-server/correlation-server.log`.<br><br>If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in **(Configure) > ESA Rules > Settings** tab (Meta Key References). |

| Problem | Possible Causes | Solutions |
|---|---|---|
| I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why? | There may be a problem with the rule. | **If a specific rule is not firing**, go to **(Configure) > ESA Rules > Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button).<br><br>You can also check Events Matched field. Go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column.<br><br>If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity. |
| After a recent upgrade, I am not seeing alerts and I am seeing disabled rules. | There may be a problem with the ESA rule deployment. | Deploy the ESA rule deployments again. ESA Rule Deployment Steps provides more information on deploying rules using the ESA Correlation service.<br><br>If this does not resolve the issue, check the ESA Correlation log files for more information: `/var/log/netwitness/correlation-server/correlation-server.log`. |
| After an update or upgrade to 11.3.0.2 or later, if I try to make an adjustment to some rules, I get an error when trying to save them. | The Ignore Case option may be selected for a meta key that does not contain alphabetic values, such as IP address. | In NetWitness Platform 11.3.0.2 and later, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text values. Adding Ignore Case on meta keys which do not contain alphabetic values causes additional processing to occur for no added benefit.<br><br>In the ESA Rule Builder - Build a Statement dialog, check to see if you have any meta keys that do not contain alphabetic characters, for example, ip_src and ip_dst. If you do, clear the **Ignore Case** checkbox for those meta keys and try to save the rule again. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| After an upgrade to 11.3.0.2 or later, I see a warning message in the ESA Correlation service log file showing a difference between the multi-valued and default-multi-valued parameter meta key values. Why? | You do not have the required meta keys on ESA Correlation that the Endpoint, UEBA, and Live content rules need to work. | If you want to use the latest Endpoint, UEBA, and Live content rules, add the necessary meta keys to the `multi-valued` and `single-valued` parameter fields. For detailed information and instructions, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.<br>For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys. |
| Meta keys marked as sensitive for data privacy are still included in notifications and alerts for some rules. | In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work. | The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view.<br>1. Add the ESA generated `event_source_id` meta key to the `index-concentrator-custom.xml` file.<br>2. Add the `event_source_id` meta key to the SELECT statement within any ESA rule that does not select every piece of metadata from the session.<br>3. After the Concentrator changes take effect, redeploy the ESA rule deployment that contains the ESA rule.<br>To do this, see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id.<br>For NetWitness 11.4 and later, to resolve the data privacy issue, see How to Remove Sensitive Meta Keys Globally from All Alerts. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| The **Pivot to Investigate > Navigate** link does not work in a context tooltip accessed from Respond. | In ESA rules that do not select every piece of meta from the session (that is, using `select *`), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work. | For NetWitness 11.3 and later (including 11.4), see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id. |
| I added a data source filter to the data sources in my ESA rule deployment. It was working fine and then all of a sudden, I stopped receiving alerts. | If there are any adjustments to an application rule on the Decoders that are mapped to the data sources used in your data source filter, the filter does not work for that rule since the application rule used in the filter no longer exists. | The optional data source filter is available in NetWitness 11.5 and later.<br>If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed. |

| Problem | Possible Causes | Solutions |
|---|---|---|
| I added a data source filter to the data sources in my ESA rule deployment and I see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. | You are filtering out a large portion of the traffic and less sessions match the aggregation criteria. | In the Explore view node list for an ESA Correlation service, select **correlation > stream**. Decrease the `max-sessions` parameter from 10,000 to a lower session count and restart the ESA Correlation service. For step-by-step instructions, see Adjust Maximum Sessions for the Data Source Filter. |
| I created a rule using a Context Hub list and it was working properly, but suddenly, the rule stopped firing and ESA is not processing any rules. | If a Context Hub list that is used by ESA Correlation is renamed or deleted, ESA will not be able to access the list and may halt processing for all rules. | Do not rename or delete a Context Hub list that is used in a deployed ESA rule. ESA Correlation will also not be able to access a Context Hub list if you delete it and then add it again with the same name while the rule is deployed.<br>If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules. |

### SMTP Notification Error Example

The following SMTP notification error example is an excerpt from a `correlation-server.log` file, which shows an error message for sending notifications with unsupported templates. In this example, there is a rule that is configured with the GeoIP enrichment, which has a hash table as one of its fields (the GeoIPLookup meta). Because the default SMTP template is only designed to deal with metas that are either singular values or arrays that contain only singular values, such as `"ip.src":"1.1.1.1"` and `"action":["fw:inbound-network-traffic"]`, sending the email notification fails due to the array containing a hash table.

```
FTL stack trace ("~" means nesting-related):

- Failed at: ${value!""} [in template "smtp.ftl" in macro "value_of" at line
1, column 152]

- Reached through: @value_of metadata[key] [in template "smtp.ftl" at line 85,
column 141]

----

...

For "${...}" content: Expected a string or something automatically convertible
to string (number, date or boolean), or "template output" , but this has
evaluated to an extended_hash (LinkedHashMap wrapped into
f.t.DefaultMapAdapter):

==> value!"" [in template "smtp.ftl" at line 1, column 154]
```

### Integration-Server SMTP Notification Error Example

The following SMTP notification error example is an excerpt from an `integration-server.log` file, which shows a failure when the Integration-server attempts to send an email notification to the email notification server. In this case, you should check the email notification server configuration in the Global Notifications settings ( **(Admin) > System > Global Notifications > Servers** tab).

```
2019-10-09 18:53:42,015 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
Notification|SMTP dispatch failed (Reason: Sending the email to the following
server failed : email.server.com:25)

2019-10-09 18:53:42,100 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
SystemOperation|Failed to forward ResolvedNotification
{server=5c45c867e4b03b89a49b78ba, destination=5c45c854e4b03b89a49b78b9,

java.lang.IllegalArgumentException: org.apache.commons.mail.EmailException:
Sending the email to the following server failed : email.server.com:25
```

## Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" procedure in the *ESA Configuration Guide* should fix the issue.

### Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,

suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

### Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

## Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id

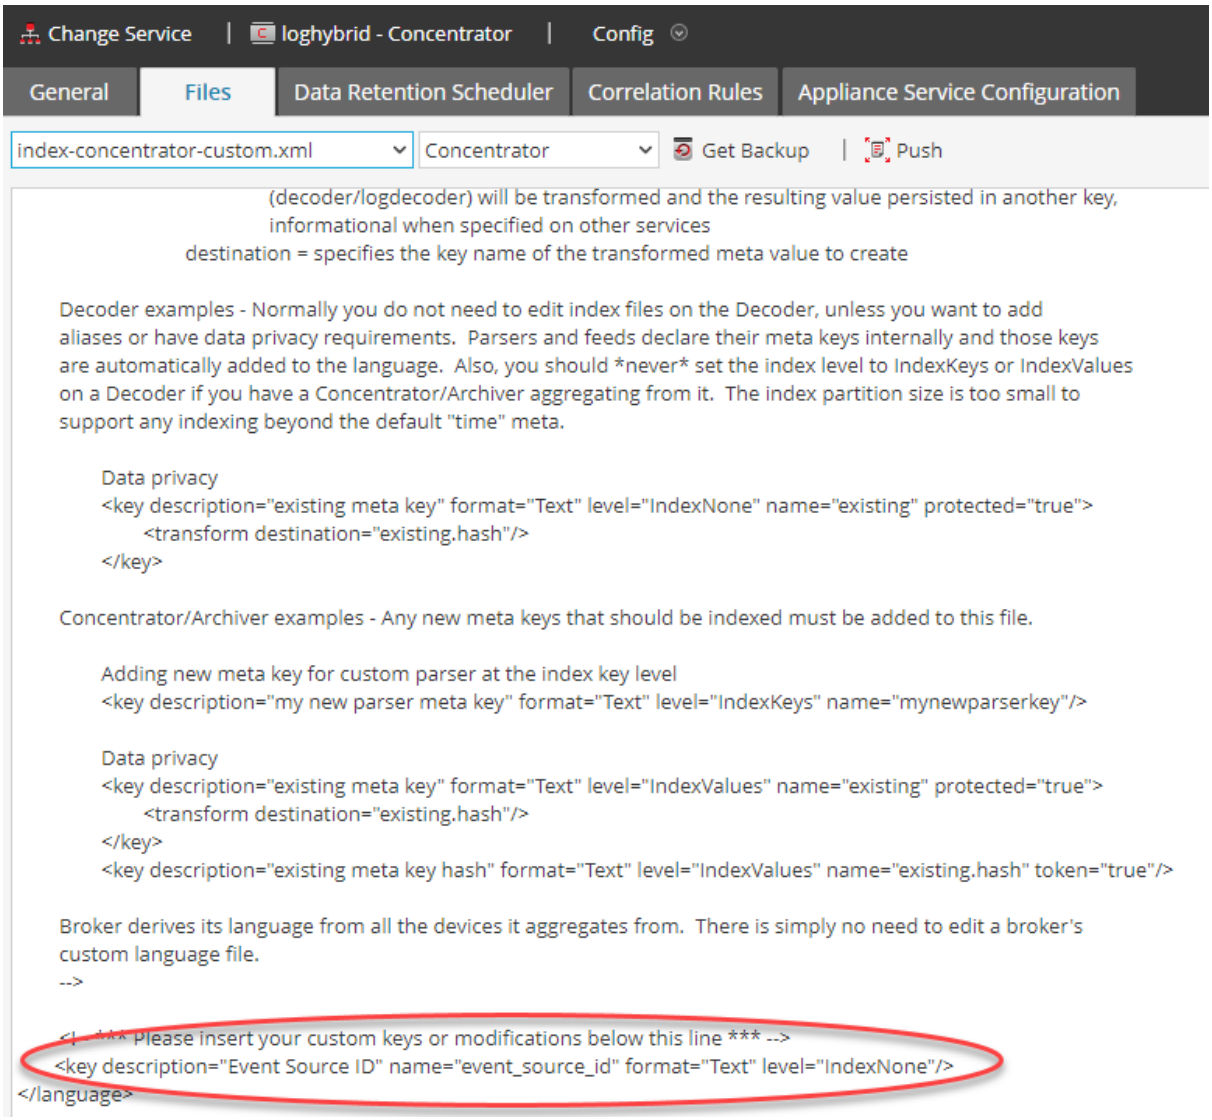
In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.

The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy, instead, see How to Remove Sensitive Meta Keys Globally from All Alerts. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view.

**Note:** Do not use any Esper keyword as custom meta keys since this causes an error while creating an ESA Rule. For Esper keywords, see Reserved keywords.

1. Update the **`index-concentrator-custom.xml`** file to include the ESA generated **`event_source_id`** meta key. If you do not add the meta key, ESA cannot recognize it and the rule will fail to deploy.
   The following figure shows the file configured for the custom meta key "**`Event Source ID`**" with index settings of "**`IndexNone`**" with a format of "**`Text`**".

   <key description="Event Source ID" name="event_source_id" format="Text" level="IndexNone"/>



To save and deploy the new setting on the NetWitness host, select the **Apply** button. To force the change, restart the Concentrator service or you can wait until the next polling interval for the change to be recognized.

The XML file can also be deployed to other NetWitness hosts by clicking the **Push** button and selecting the destination NetWitness host. Only deploy the XML file to a NetWitness host that runs that service (that is, other Concentrators).

2. Update any ESA rule that selects only certain meta from the session to include the ESA generated **`event_source_id`** meta key. Add the **`event_source_id`** meta key to the **`SELECT`** statement. See the following example rule.

Example Rule with event_source_id

```
@RSAAlert
SELECT user_dst, reference_id, hostname, event_source_id FROM
Event(
```

```
device_class='Windows Hosts',
reference_id IN ('4624' , '4625'),
user_dst IS NOT NULL,
user_dst NOT LIKE '%$',
user_dst NOT IN ('ANONYMOUS LOGON','SYSTEM')
)
.win:time_batch(10 Minutes)
GROUP BY user_dst
HAVING COUNT(distinct hostname) >= 15;
```

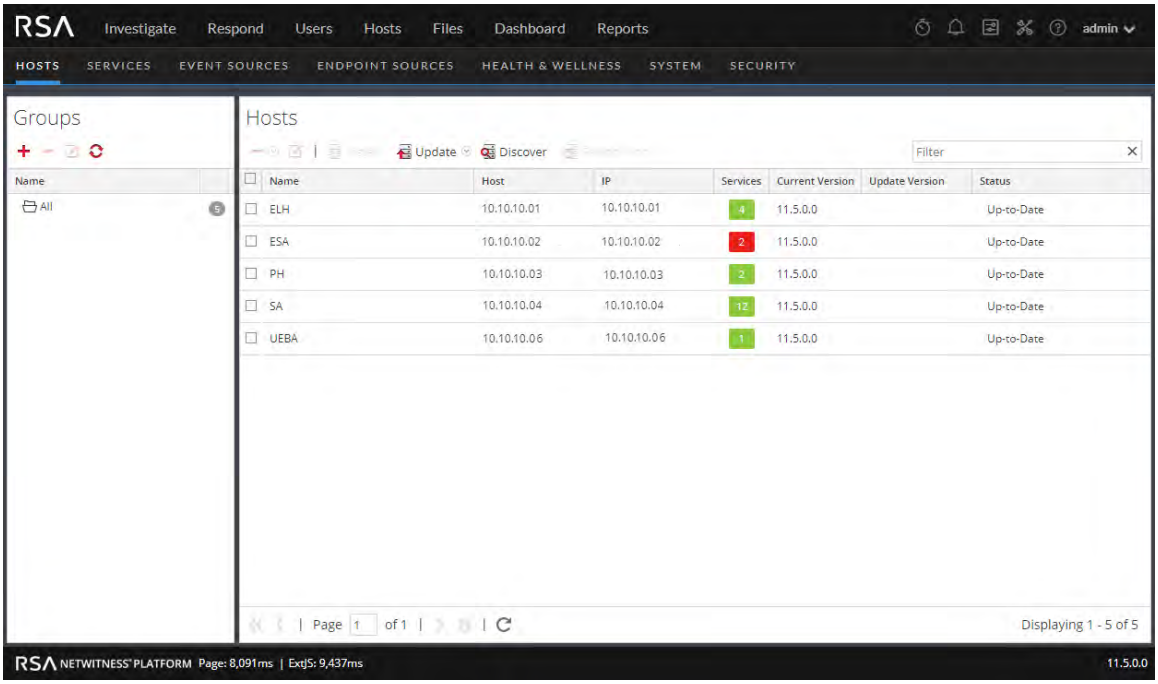
3. After the Concentrator changes takes effect, redeploy the ESA rule deployment that contains the ESA rule.

For additional information, see How ESA Handles Sensitive Data. For information on the stragegy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

## Steps to Troubleshoot Memory Issues with an ESA Service Offline

### Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to **(Admin) > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and you may see an error message.

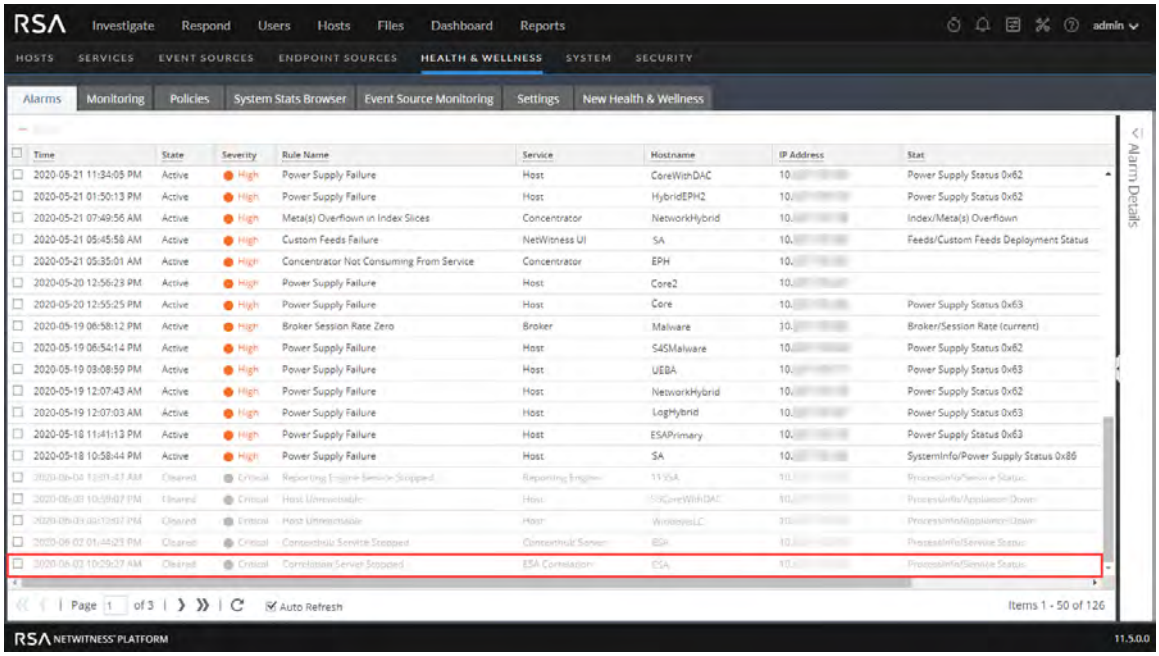


If your host is down, contact your NetWitness Administrator to restart it. Otherwise, go to Step 2.

## Step 2: View Detailed Statistics in Health & Wellness

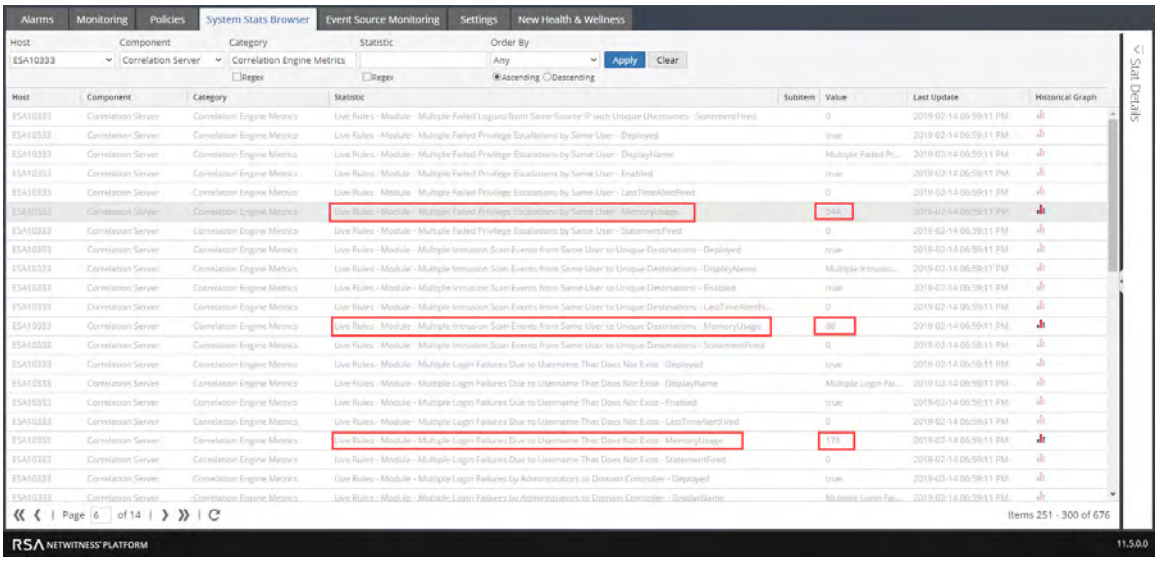
If your ESA service is down, you can go to Health & Wellness and view the **last known metrics** to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail. In NetWitness 11.5 and later, see also View Health Statistics and Trends for ESA Correlation in New Health & Wellness.

1. Go to **(Admin) > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms for ESA Correlation:
   - Correlation Server in Critical State
   - Correlation Server in Unhealthy State
   - Correlation Server Stopped



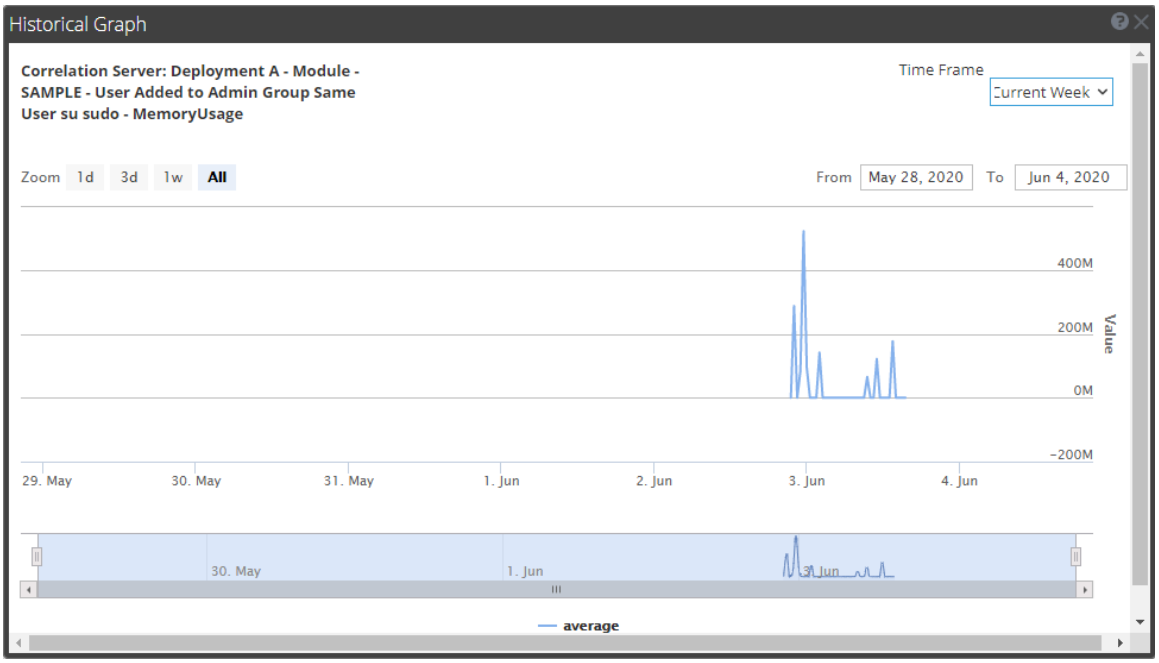
2. Go to **(Admin) > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following and click **Apply**:

| Host | Component | Category |
|---|---|---|
| <your host> | Correlation Server | Correlation Engine Metrics |

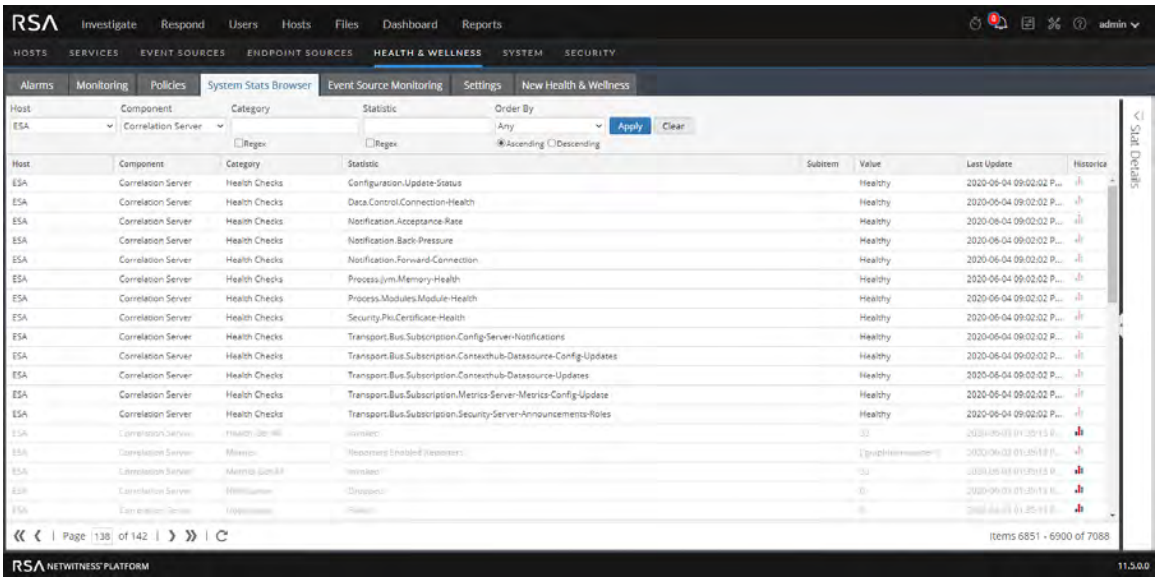


The name of the rule is in the **Statistic** column and the memory usage in bytes is in the **Value** column.

3. Click to view a historical view of memory usage for the rule in the **Historical Graph** column.



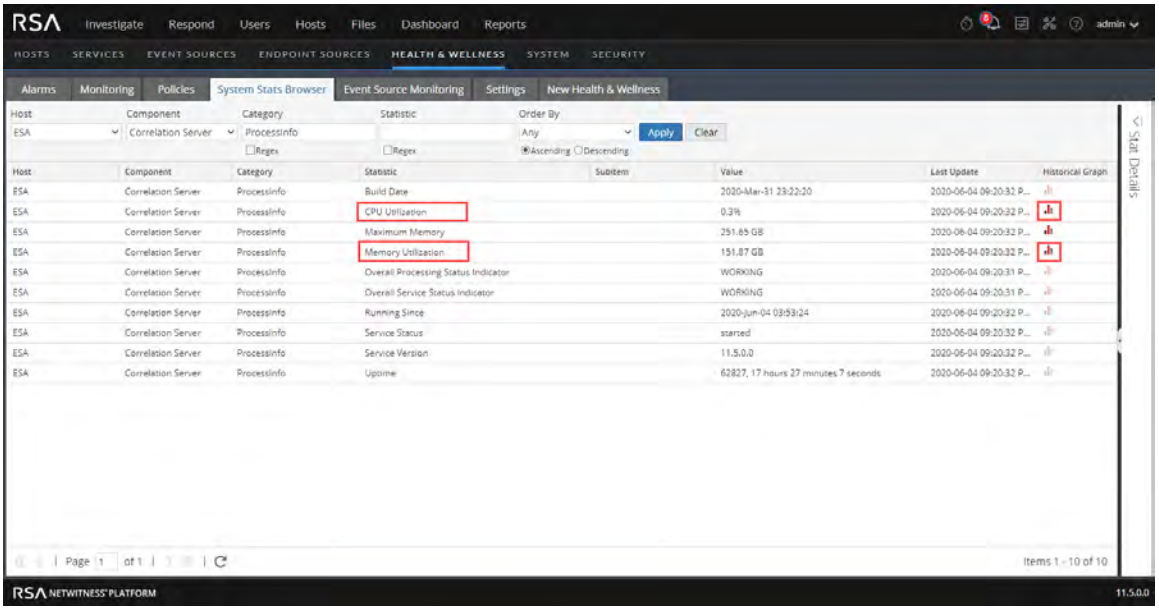
4. In the **System Stats Browser**, you can also see details of your ESA Correlation service performance.



Select your host, and use the following filters to view the following statistics:

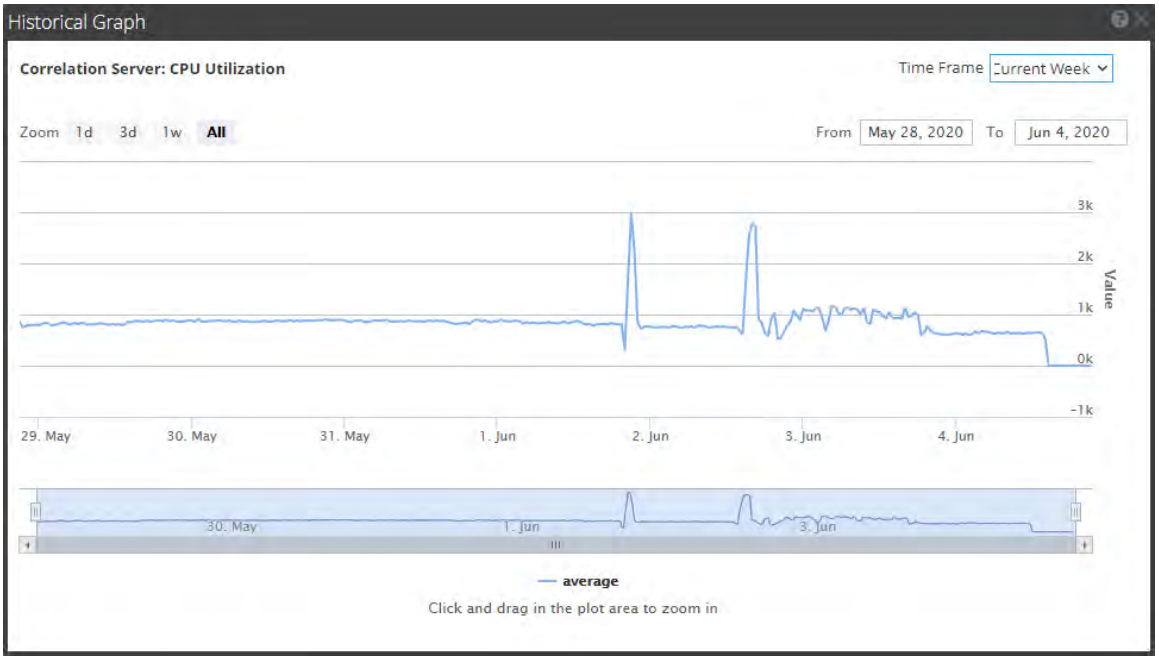
| Host | Component | Category | Statistic | Example |
|---|---|---|---|---|
| <your host> | Host | SystemInfo | CPU Utilization | 49.74% |
| <your host> | Host | SystemInfo | Memory Utilization | 72.87% |
| <your host> | Host | SystemInfo | Used Memory | 183.14 GB |
| <your host> | Host | SystemInfo | Total Memory | 251.65 GB |
| <your host> | Host | SystemInfo | Uptime | 289546, 3 days 8 hours 25 minutes 46 seconds |
| <your host> | Correlation Server | Process jvm | Memory Total Max | 163 GB |
| <your host> | Correlation Server | Process jvm | Memory Total Used | 13.50 GB |
| <your host> | Correlation Server | ProcessInfo | CPU Utilization | 0.3% |
| <your host> | Correlation Server | ProcessInfo | Maximum Memory | 251.65 GB |
| <your host> | Correlation Server | ProcessInfo | Memory Utilization | 151.87 GB |

The following figure shows the location of the ESA Correlation service CPU and Memory Utilization statistics.



5. Click to view a historical view of CPU and memory utilization.

   The following figure shows the historical graph of **CPU utilization**.



The following figure shows the historical graph of **Memory Utilization**.

If you are having a problem with memory or CPU utilization, continue to step 3.

## Step 3: Bring up your ESA Services

1. Go to **(Admin) > Services**, select your ESA service, and then select **> Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

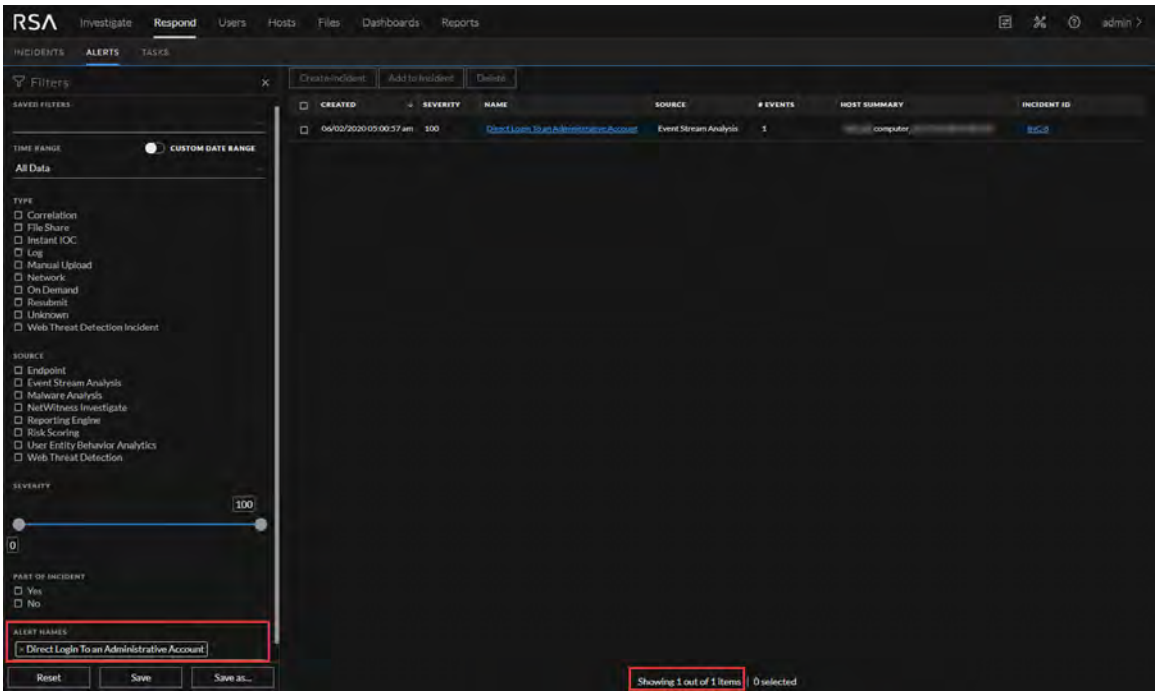
If you are able to start your ESA service without a shutdown, continue to step 4.

## Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

## View Alert Summaries

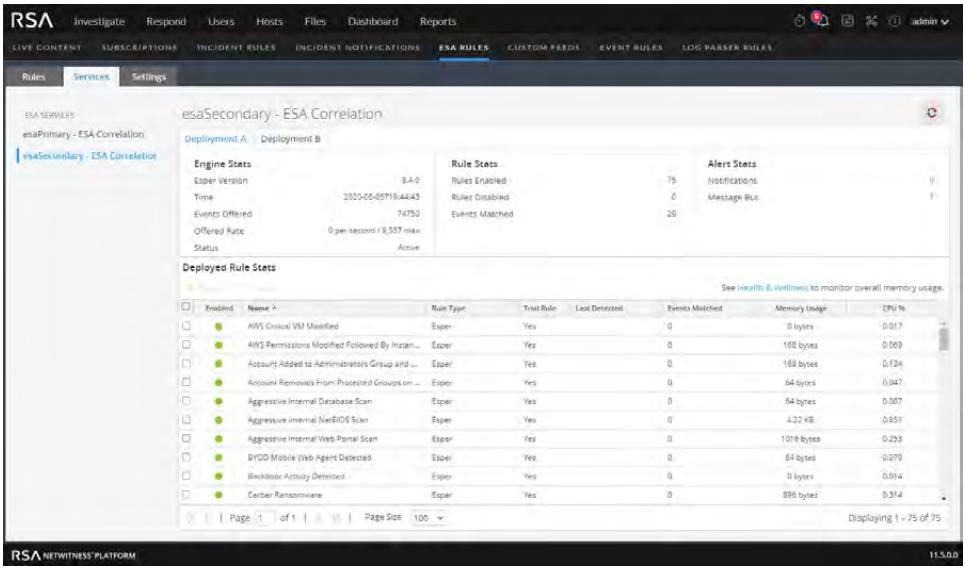
Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **Respond > Alerts**. In the **Filters** panel on the left, in the **Alert Names** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.



To clear your filter, click **Reset**.

## View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. This is a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column for the deployment. If a high number of events were matched for a given rule, you can investigate the rule further to see if you can make it more efficient.



## Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

### Disable Rules

1. To disable rules, go to **(Configure) > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

### Edit Rules

1. To repair the rules, go to **(Configure) > ESA Rules > Rules tab > Rule Library**.
2. For each rule that you repair, do the following:
   a. Select the rule to edit and then select **> Edit**.
   b. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
   c. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Working with Trial Rules.

### Deploy Rules

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the options panel on the left, select the deployment that contains the rule.
3. In the Deployment view, the rule that you changed shows a status of Updated. Click **Deploy Now**. The rule status changes to Deployed.

### Verify that the Rules are Enabled

After you deploy the ESA rules, they should automatically show as enabled. If not, you can enable the rules.

1. Go to **(Configure) > ESA Rules > Services** tab, and select the ESA service in the options panel.
2. On the deployment tab for the deployment that contains the rules, in the Deployed Rule Stats section, look at the status of the rules in the Enable column. Enabled rules show a green circle. If the rules show a white circle, you can enable the rules.
3. To enable rules, select the rules you want to enable and select **Enable** above the table.

### (Optional) Check the ESA Correlation Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

## ESA Rule Troubleshooting with Nw-Shell

**Note:** This procedure applies to NetWitness Platform 11.3 and later versions.

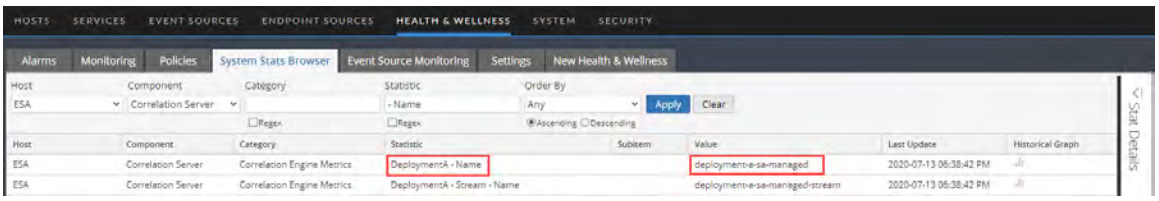
The ESA Correlation service replaces the Event Stream Analysis service in NetWitness version 11.3 and later. As a result of this change, some settings are no longer available in the user interface. In addition to the standard troubleshooting methods available, you can use the **nw-shell** utility to perform advanced troubleshooting of the ESA Correlation service and rules. For detailed information on the nw-shell utility, see the *RSA NetWitness Shell User Guide*.

- Find Your Engine Name for Nw-Shell
- Connect to an ESA Correlation Server
- View the Contents of a Named Window
- See the Method Input and Output

### Find Your Engine Name for Nw-Shell

Follow these steps to find your engine name using your ESA rule deployment name. Your engine name is required for ESA Nw-Shell troubleshooting. Locate the names of each deployment that you plan to troubleshoot.

1. In the NetWitness UI, go to **(Admin) > Health & Wellness > System Stats Browser**.
2. In the System Stats Browser, use the following filters and then click **Apply**.
   a. **Host**: Select your ESA host.
   b. **Component**: Select **Correlation Server**.
   c. **Statistic**: Type **- Name** (put a space between the dash and name).
3. In the **Statistic** column, locate your deployment followed by **- Name**. The name in the **Value** field is `YOUR ENGINE NAME`.



In the above example, the deployment name is DeploymentA and the engine name is `deployment-a-sa-managed`.

## Connect to an ESA Correlation Server

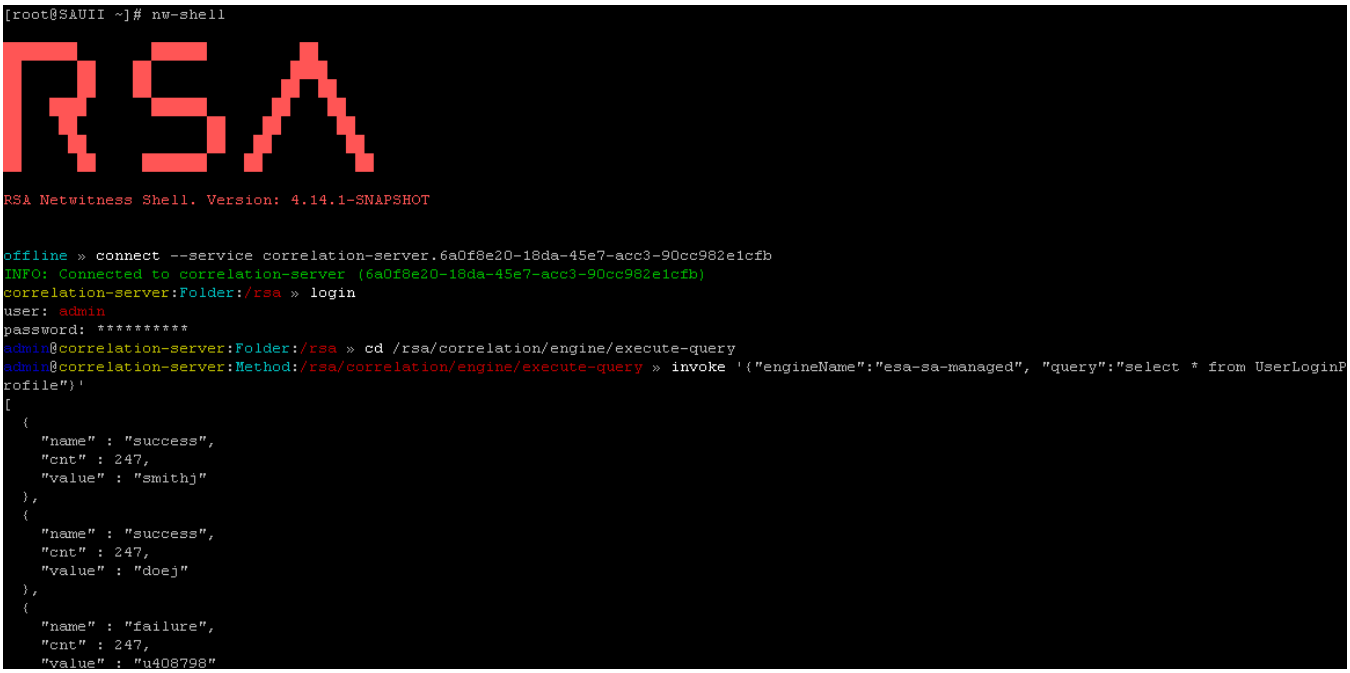
1. Log in to nw-shell:
   a. Connect via SSH to the NW server (head unit).
   b. After logging in and getting the command prompt, type `nw-shell`.
2. Connect to ESA:
   a. Go to your ESA physical host and type the command:
   `cat /etc/netwitness/correlation-server/service-id`
   b. Go back to the NW server and nw-shell and connect to the correlation server:
   `connect --service correlation-server.ID`
3. Log in to ESA with the admin user credentials.
   a. Type `login`.
   b. Enter the username and password of the admin user.

## View the Contents of a Named Window

Use the execute-query method to view the contents of a named window.

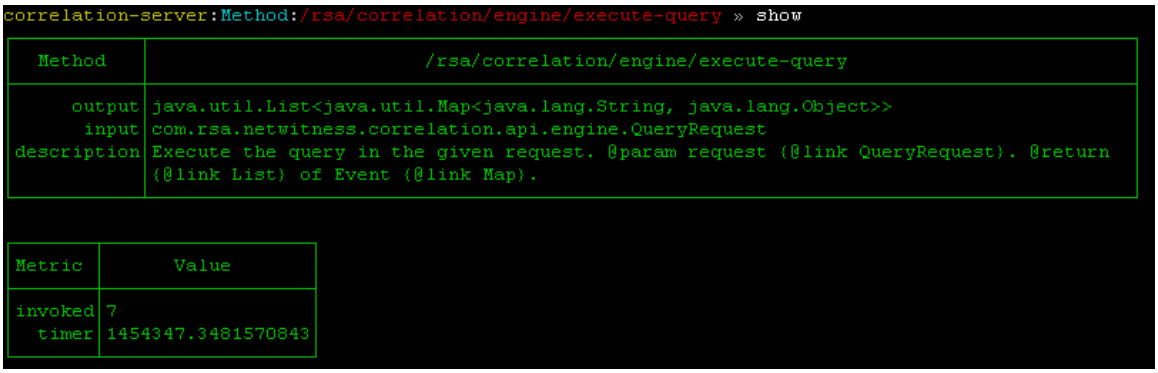
1. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/engine/execute-query`
2. Type `invoke '{"engineName":"<YOUR ENGINE NAME>", "query":"<YOUR QUERY>"}`
   - Where `<YOUR ENGINE NAME>` = the engine name that you located in Find Your Engine Name for Nw-Shell.
   - Where `<YOUR QUERY>` = the select statement into the named window.

Example: `invoke '{"engineName":"esa-sa-managed", "query":"select * from UserLoginProfile"}'`



## See the Method Input and Output

Type `show` at the command line to see the input and output expected. All method invocation must be prefaced by `invoke`.



## Obtain Correlation Server Metrics for ESA Rule Deployment Troubleshooting Using Nw-Shell

**Note:** This procedure is available in NetWitness Platform version 11.4.1 and later.

You can use Nw-Shell to view ESA Correlation Server metrics for each of your ESA rule deployments. These metrics show the number of sessions behind for the deployment data sources as well as the memory usage for the rules in the deployment.

1. Find the engine name to use for Nw-Shell. See Find Your Engine Name for Nw-Shell.
2. Connect to an ESA Correlation Server. See Connect to an ESA Correlation Server.
3. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/service/stats/get-condensed-metrics`
4. Type `invoke '<YOUR ENGINE NAME>'`
   Where `<YOUR ENGINE NAME>` is the engine name that you located in Find Your Engine Name for Nw-Shell.

Here is an example of the metrics output that you can obtain for your ESA rule deployment:

```
{
  "engineName" : "esa",
  "eventsOffered" : 1650,
  "maxEventsRate" : 2.337019271237945,
  "eventsRate" : {
    "count" : 1650,
    "oneSecRate" : 0.02129597415982235,
    "meanRate" : 0.05795554387594279,
    "oneMinuteRate" : 0.15485195471608212,
    "fiveMinuteRate" : 0.12419048320215775,
    "fifteenMinuteRate" : 0.11923922260543295
  },

      "statementFired" : 0,
      "alertsFired" : 0
    }
  ]
}
```

# View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for an ESA Correlation service and its associated ESA rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing ESA to slow down or stop. To see approximately how much memory a rule is using, you can view estimated memory usage for each rule in the Health & Wellness System Stats browser (you need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you need to complete the following steps to use memory metrics to troubleshoot memory usage for rules:

1. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see ESA Permissions.
2. View the memory statistics in Health & Wellness.
3. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
4. Use the memory metrics data to modify rules to be more efficient, if necessary.

**Note:** You can also view memory metrics for ESA rules in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

## Prerequisites

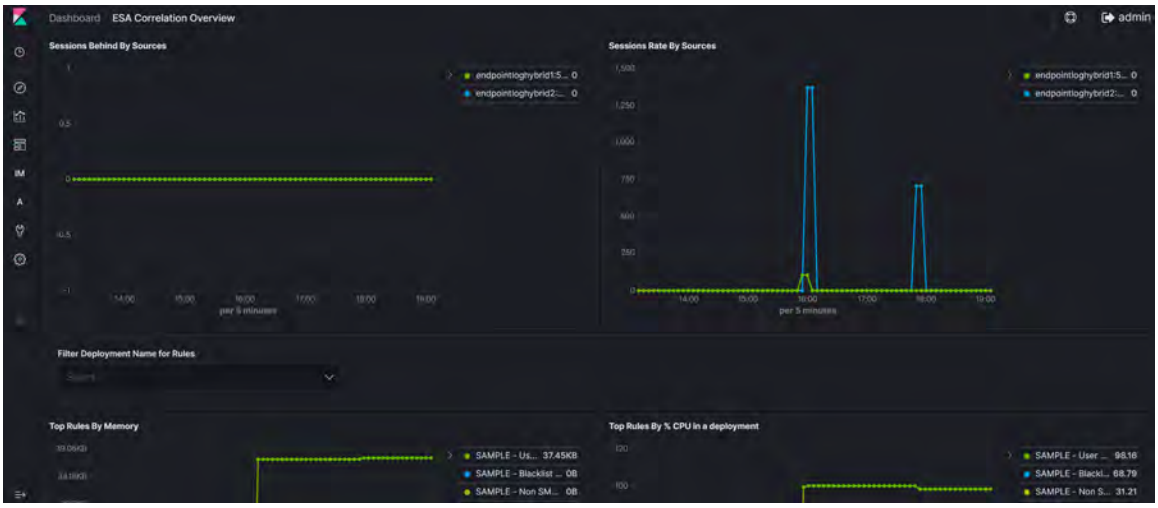
The following are requirements for using memory metrics:

- You must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

**Note:** Memory Metrics is always on for the ESA Correlation service; you do not have to enable it.

## View Health Statistics and Trends for ESA Correlation in New Health & Wellness

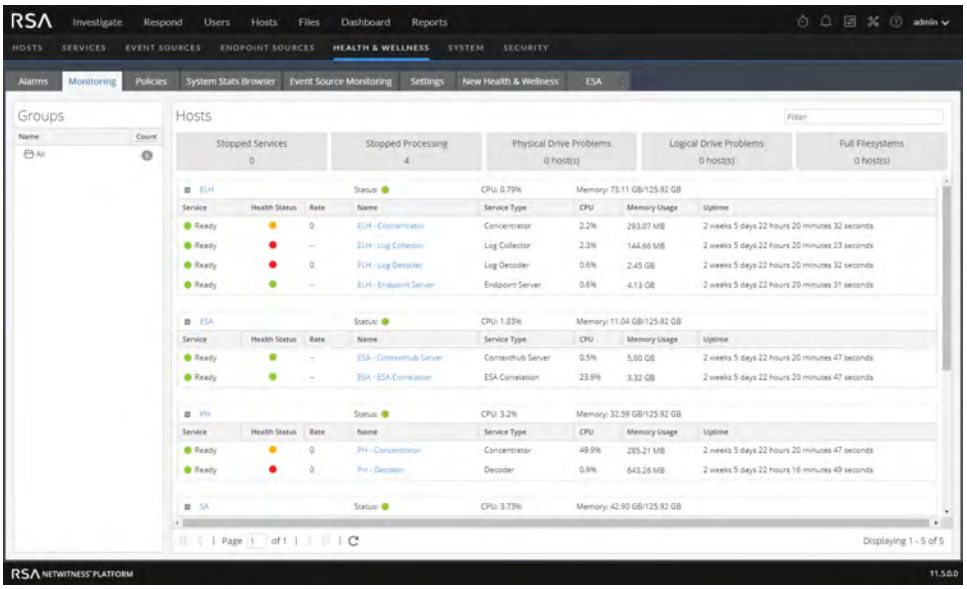
In NetWitness version 11.5 and later, New Health & Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.



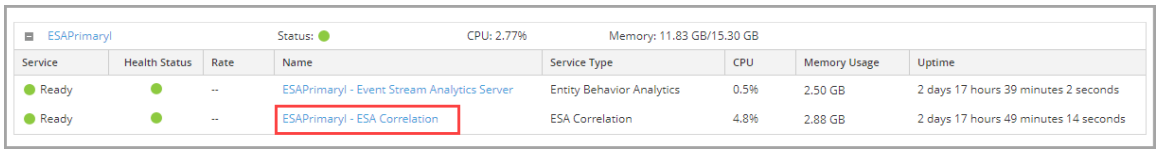
For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the *System Maintenance Guide*.

## View Memory Metrics for an ESA Correlation Service in Health & Wellness

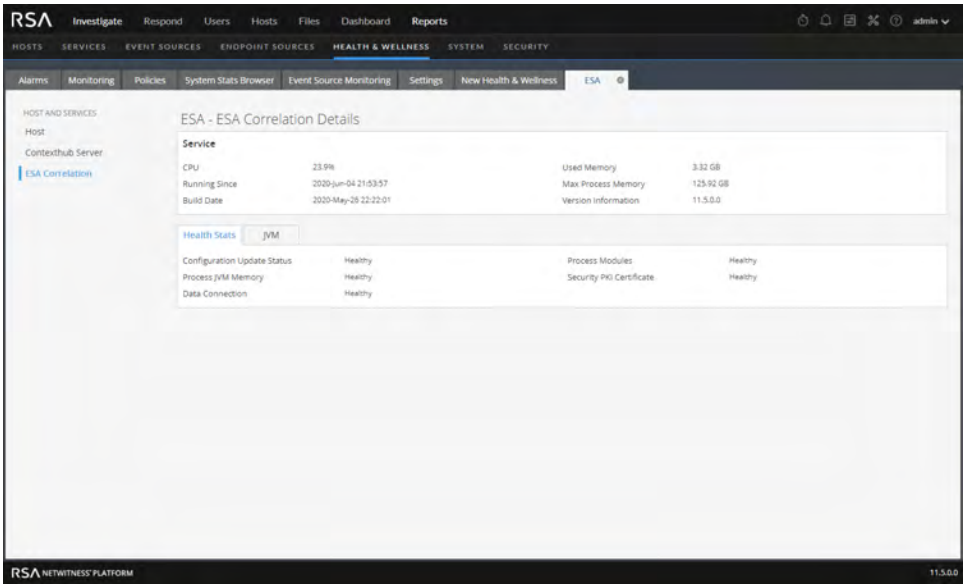
1. Go to **(Admin) > Health & Wellness > Monitoring** tab.



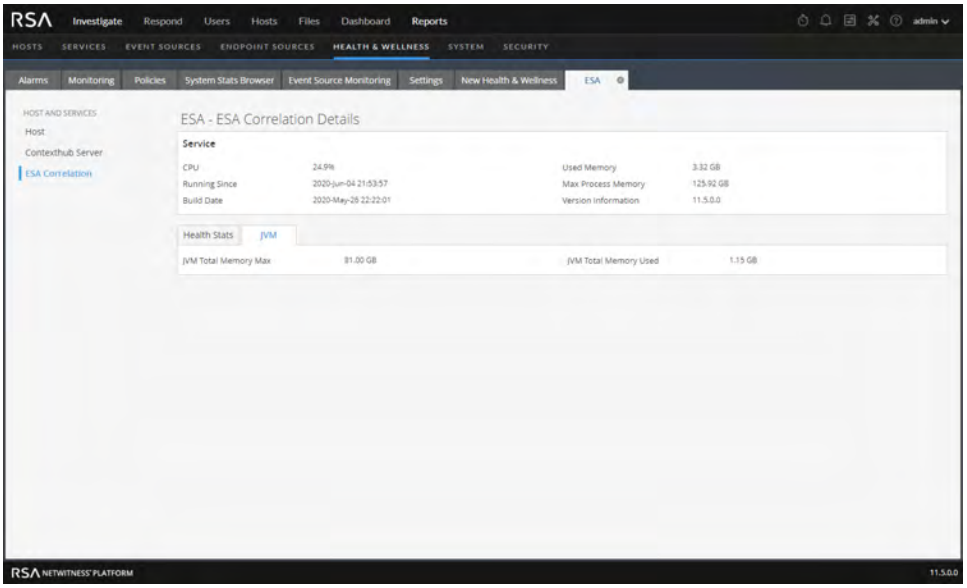
2. Locate your host and click the link in the **Name** field for your ESA Correlation service, for example, ESA- ESA Correlation.



3. On the tab for your ESA host, click the **Health Stats** tab.
   You can view the health status of the ESA Correlation service.



4. Click the **JVM** tab.
   You can view the JVM total memory used by the selected ESA Correlation service.

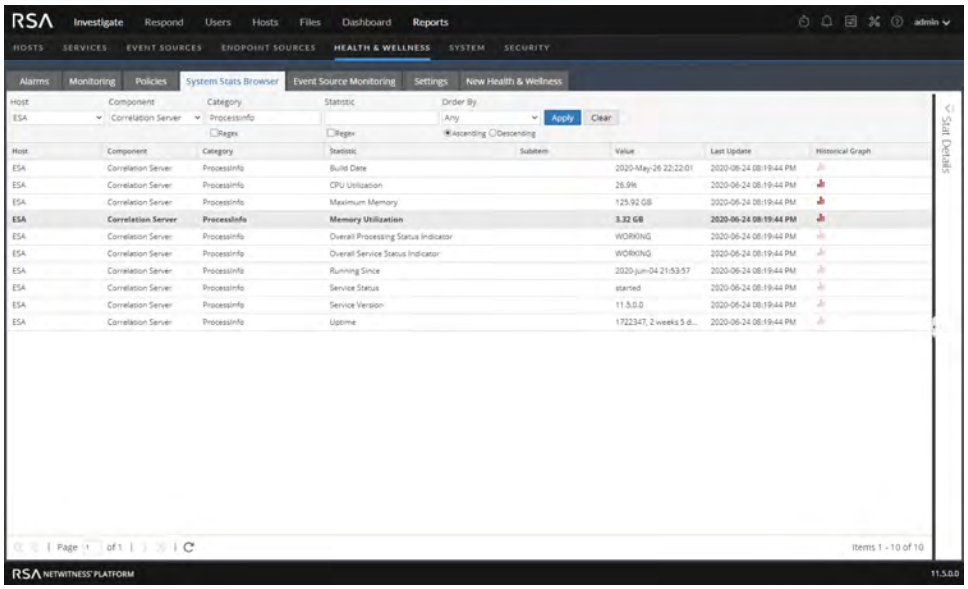


**Note:** You can also view memory metrics for the ESA Correlation service in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

## View Memory Metrics for an ESA Correlation Service and its ESA Rules

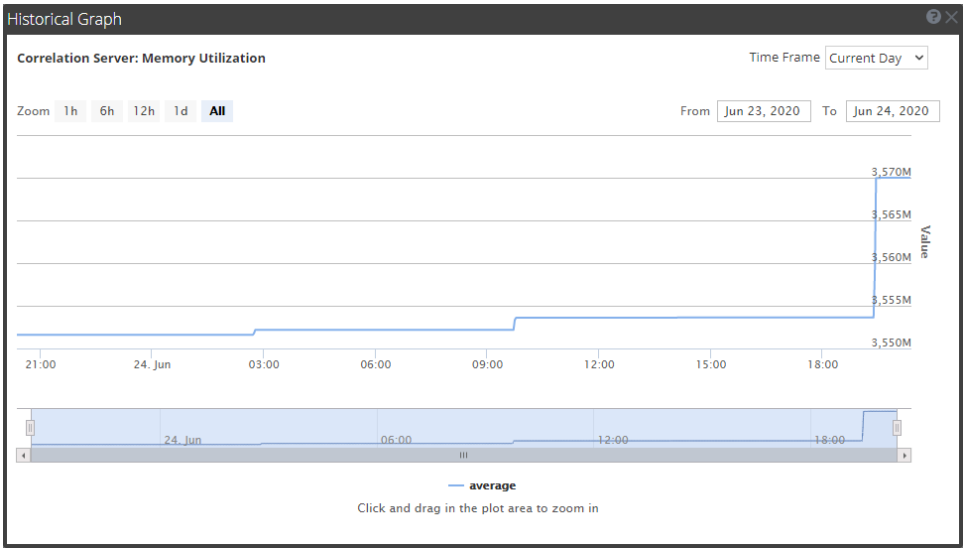
1. Go to **(Admin) > Health & Wellness > System Stats Browser**.
2. To view memory metrics for an ESA Correlation service, in the **Host** field, select your ESA host. Select **Correlation Server** for **Component**, enter **ProcessInfo** for **Category**, and then click **Apply**.

| Host | Component | Category |
|---|---|---|
| <your host> | Correlation Server | ProcessInfo |



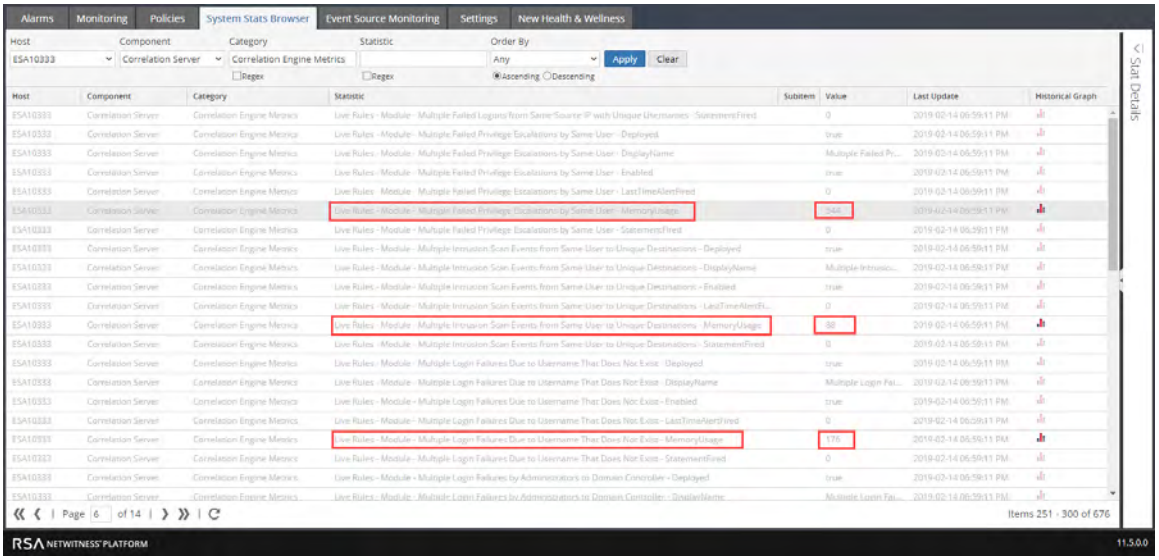
The **Memory Utilization** statistic shows the total memory in use by the ESA Correlation service.

3. To view the historical memory usage for the ESA Correlation service, click the **Historical Graph** icon.



4. To view the memory metrics for individual rules, in the **Category** field, enter **Correlation Engine Metrics** and click **Apply**.

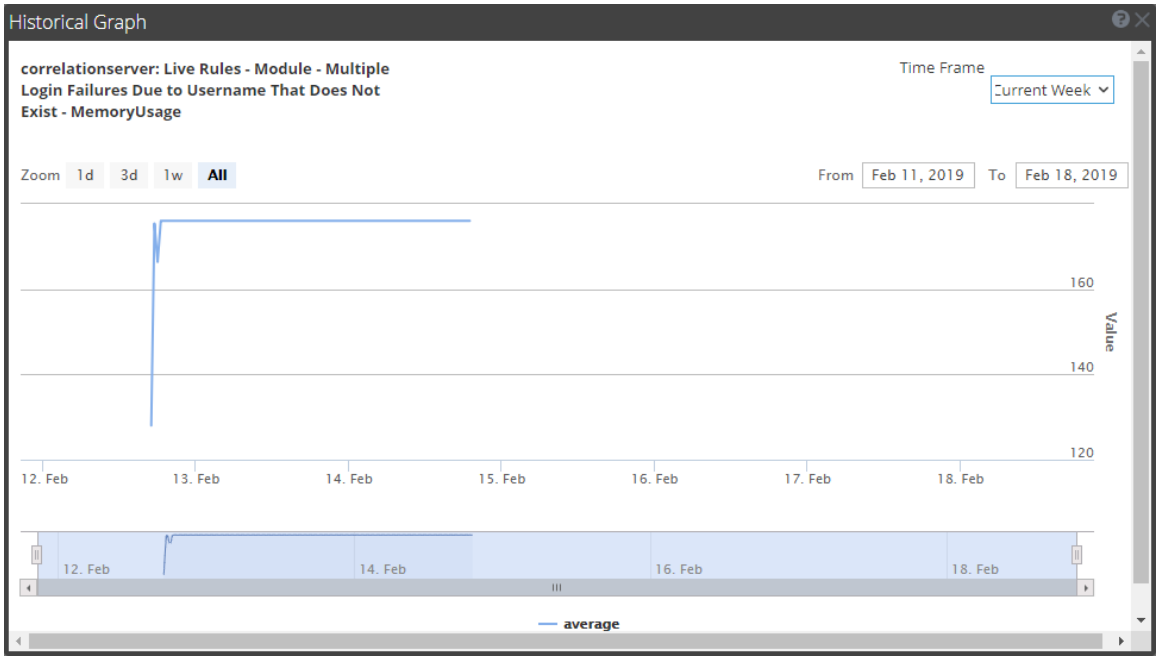
| Host | Component | Category |
|---|---|---|
| <your host> | Correlation Server | Correlation Engine Metrics |



The name of the rule is in the **Statistic** column appended with **MemoryUsage** and the memory usage in bytes is in the **Value** column.

**Note:** The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 2/10/19 at 12 p.m., but Health & Wellness polls at 2/10/19 at 12:10 p.m., the **Last Update** field will display a timestamp of 2/10/19 12:10 p.m.

5. Click to view a historical view of memory usage for the rule in the **Historical Graph** column.



**Note:** You can also view memory metrics for ESA rules in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

# How ESA Handles Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA does not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule
- How to remove sensitive meta keys from global alerts

## How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

## Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

## Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.

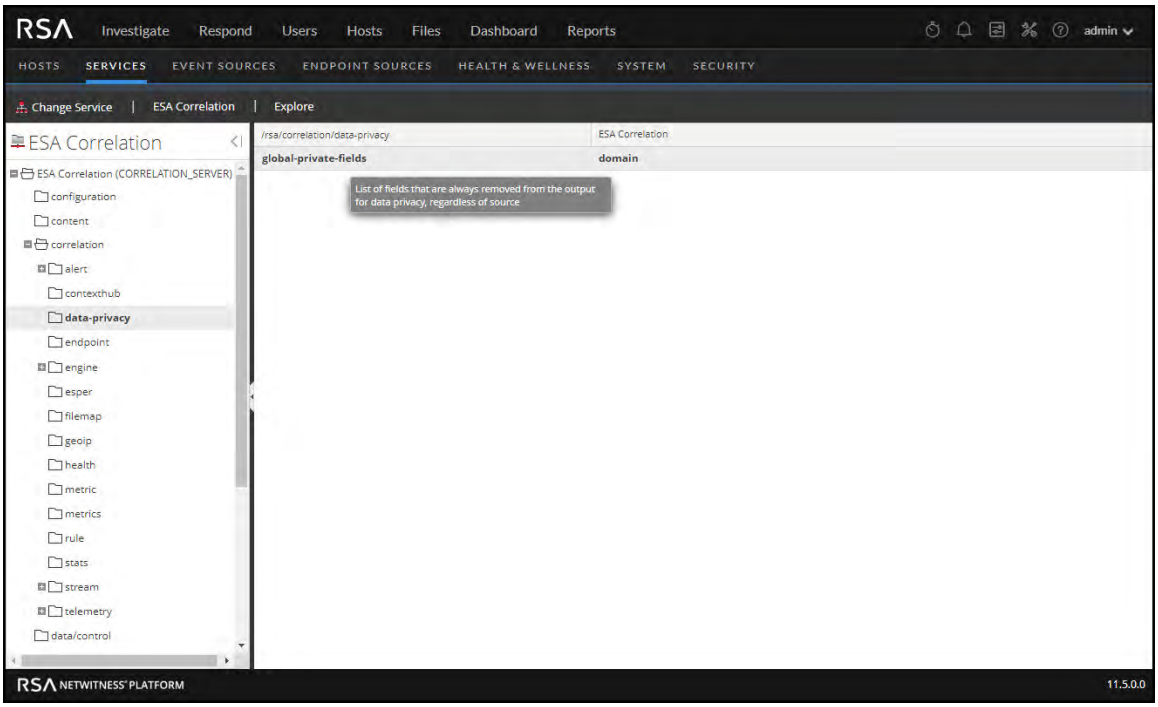
Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

## How to Remove Sensitive Meta Keys Globally from All Alerts

**Note:** This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

1. Go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.



The changes are effective immediately.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

# ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

| Rule Type | Description | When to Use |
|---|---|---|
| RSA Live ESA | RSA Live has a catalog of ESA rules that you can download and modify to run in your network. | Download RSA Live ESA rules to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements. |
| Rule Builder | In the rule builder, you define rule criteria in an easy-to-use interface. | Use the rule builder to create your first rules. You choose many of the rule conditions from lists. |
| Advanced EPL | With the Event Processing Language (EPL), you define rule criteria by writing a query. | Use advanced EPL rules to define rule criteria in the EPL syntax. |
| Endpoint Rule Bundle | An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. The rules in this bundle only apply to NetWitness Endpoint. | If you have NetWitness Endpoint, you can configure risk scoring to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. |

## Sample Rules

Sample Rule Builder rules come with NetWitness and appear in the Rule Library. Use sample rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.

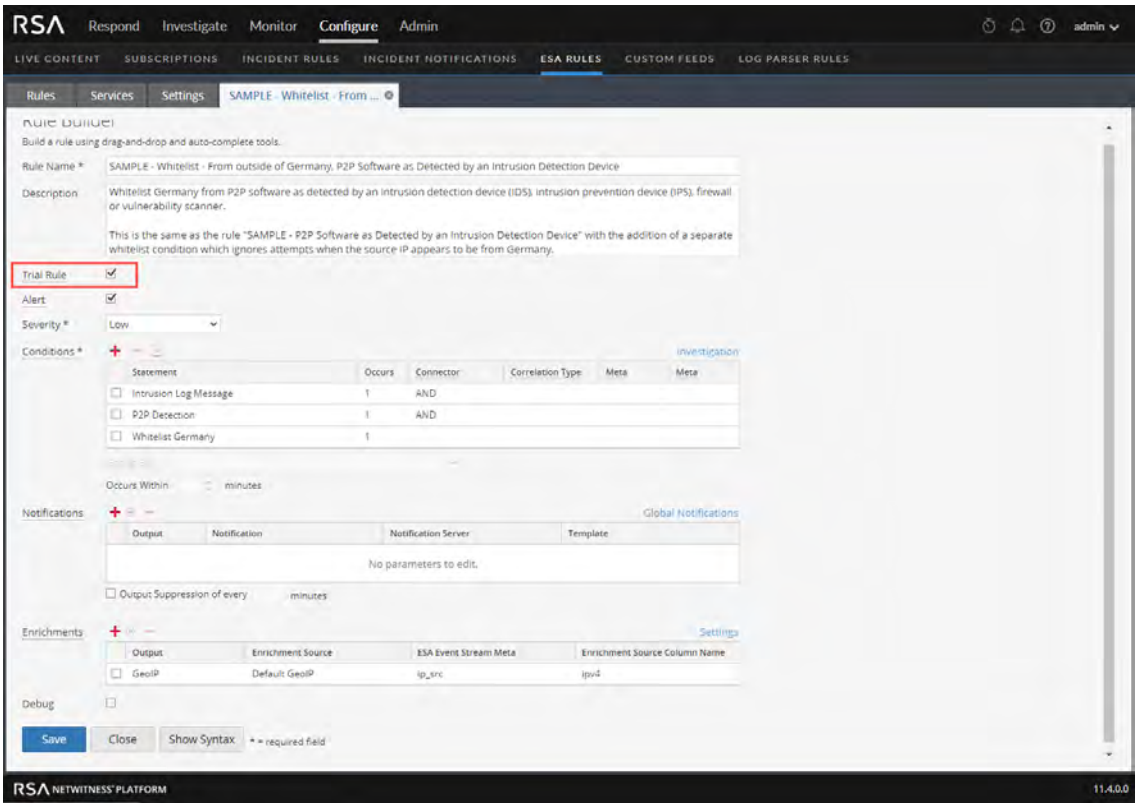
## Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. These rules appear in the Rule Library with the sample rules. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

# Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold set by the administrator. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

The following figure shows the Trial Rule setting in the Rule Builder.



# ESA Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness role. User access is restricted based on roles and permissions assigned to roles.

- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library
- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.

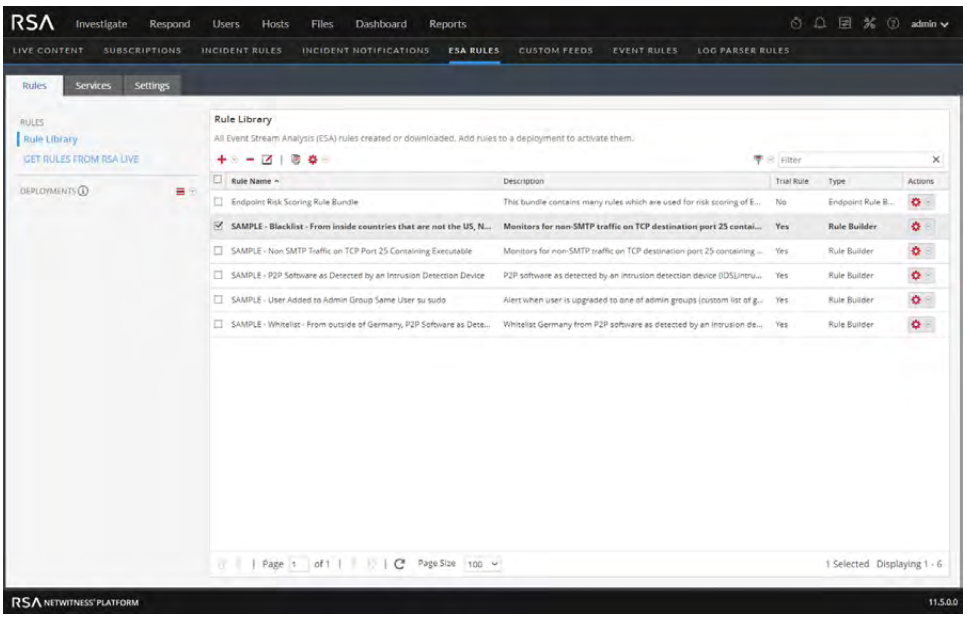
| Permission | Administrators | Operators | Analysts | SOC Mgrs | MAs | DPOs |
|---|---|---|---|---|---|---|
| Access Alerting Module | Yes | Yes | Yes | Yes | | Yes |
| View Rules | Yes | Yes | | Yes | | Yes |
| View Alerts | Yes | | Yes | Yes | | Yes |
| Manage Rules | Yes | Yes | | Yes | | Yes |

For more information on roles and permissions, see the *System Security and User Management Guide*.

## Practice with Sample Rules

NetWitness comes with sample rules so analysts can become familiar with how rules look before they create their own rules. Use the sample rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Sample rules are installed in the Rule Library, which contains every rule you download or create. The following figure shows sample rules in the Rule Library.



These are the available sample rules:

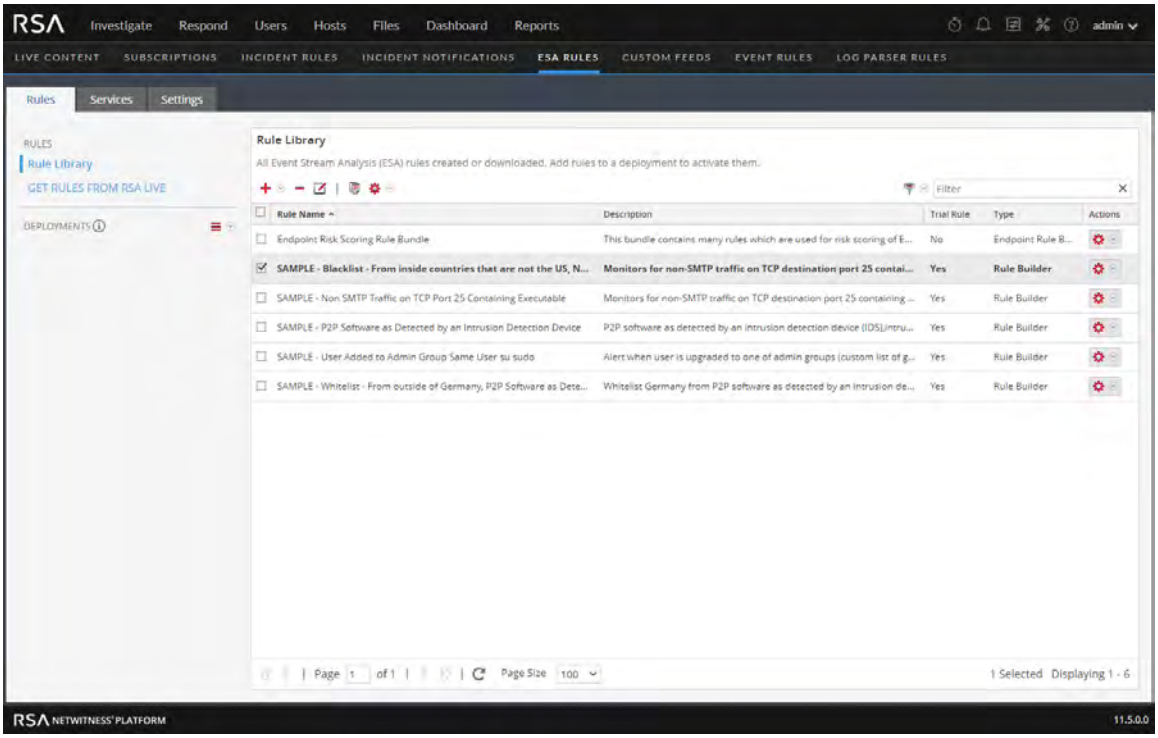
- SAMPLE - Blacklist - From inside countries that are not the US, Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - P2P Software as Detected by an Intrusion Detection Device
- SAMPLE - User Added to Admin Group Same User su Sudo
- SAMPLE - Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness from the rules you download and create.

## Rule Library

The Rule Library shows the following information for a rule:

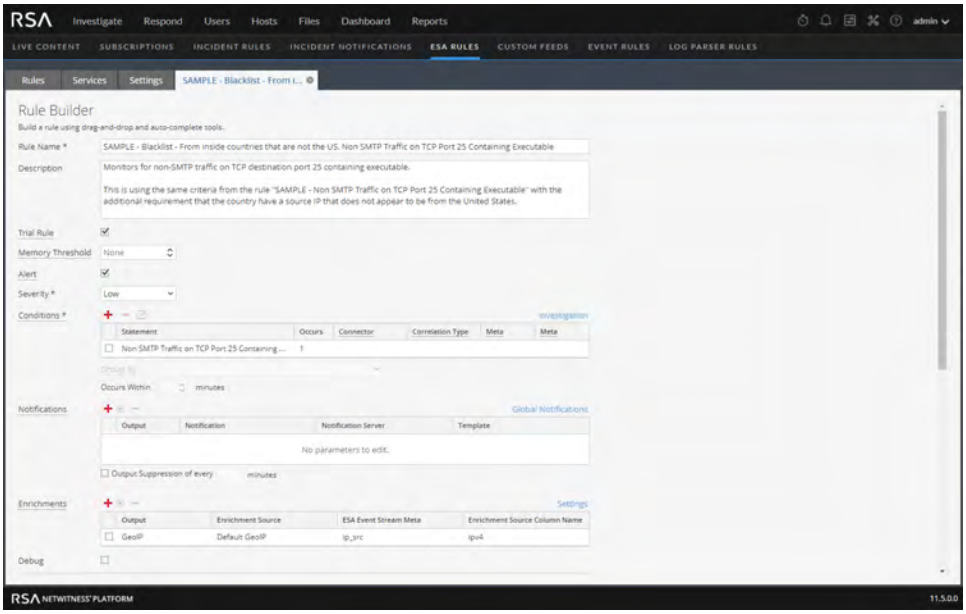
- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, downloaded from RSA Live, or Endpoint Rule Bundle.



## Practice with Sample Rules

1. Go to **(Configure) > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library**, double-click a sample rule or select a sample rule and click .
   The rule is opened in Rule Builder.



3. To practice with a sample rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy sample rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with sample rules, you will be able to download, create, and deploy your own rules.

# Working with Trial Rules

The ESA Correlation service is capable of processing large volumes of disparate event data from Concentrators. However, when working with ESA Correlation rules, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that rules do not use excessive memory, you can enable them as trial rules. You should disable the trial rule setting only after testing the new rule in your environment during times of both normal and peak network traffic.

You can set a global threshold of the percentage of memory that trial rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically. To configure the memory threshold, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules that you import are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to deploy the rule with an added safeguard.

**Note:** Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

## Deploy Rules as Trial Rules

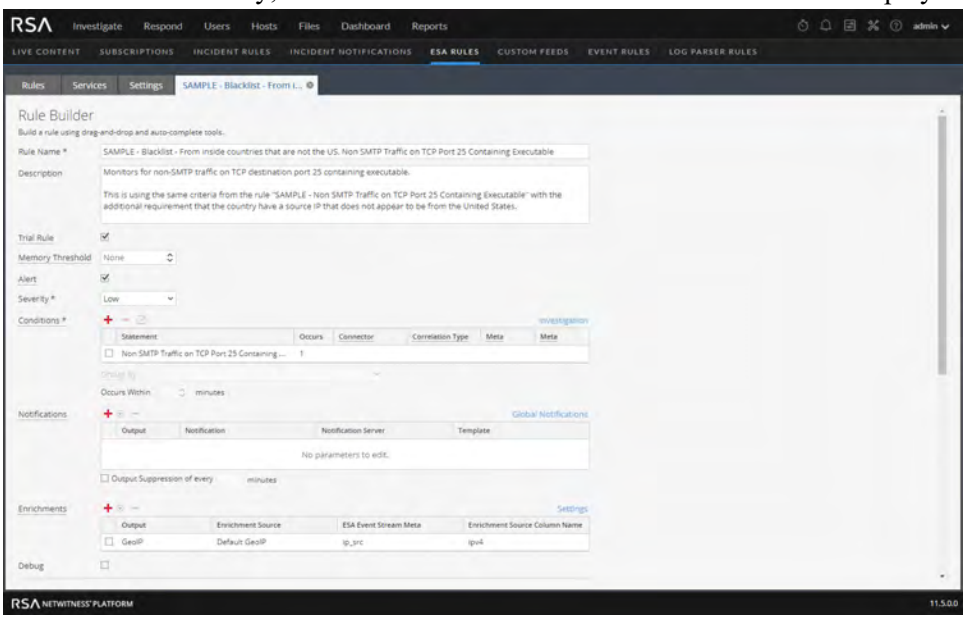
This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

In NetWitness 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment.

For example, if you change the status of a trial rule to disabled ( (Configure) > ESA Rules > Services tab) and redeploy the ESA rule deployment ( (Configure) > ESA Rules > Rules tab), the trial rule remains disabled.

1. Go to **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.



3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.
   - The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   - The configuration parameter, `fatal-percentage`, has a default value of 90.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

**Note:** If a trial rule is disabled, you will need to go to the **(Configure) > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

# Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Download Configurable RSA Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

# Download Configurable RSA Live ESA Rules

This topic explains how to download configurable rules from the NetWitness Live Content Management System so you can customize them to meet your needs.

RSA Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If RSA Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "RSA ESA Rules" at the following link:
https://community.netwitness.com/t5/netwitness-platform-threat/rules/ta-p/677884

This is an example of how each RSA Live ESA rule is described on RSA Live:

| Rule Name | Description |
|---|---|
| Logins across Multiple Servers | Detects logins from the same user across 3 or more separate servers within 5 minutes.<br><br>The time window and number of unique destinations are configurable. |

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

**Note:** When a rule description includes a configurable parameter, the default setting for the parameter is used. In the example rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

## Prerequisites

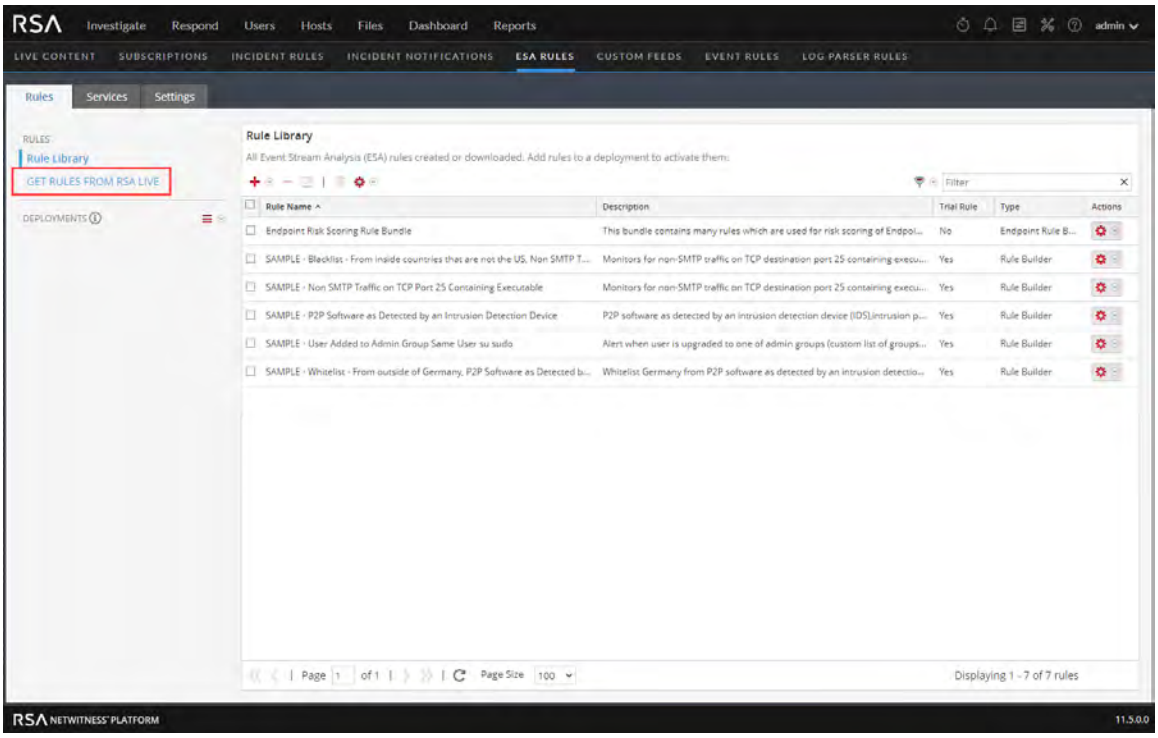
These are the prerequisites for downloading configurable RSA Live ESA rules;

- Have permission to manage rules
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness. See the *Live Services Management Guide* for details.
- Update your meta keys. See "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

## Download RSA Live ESA Rules

**Caution:** Before you deploy the latest Live ESA rules, update your meta keys. See "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

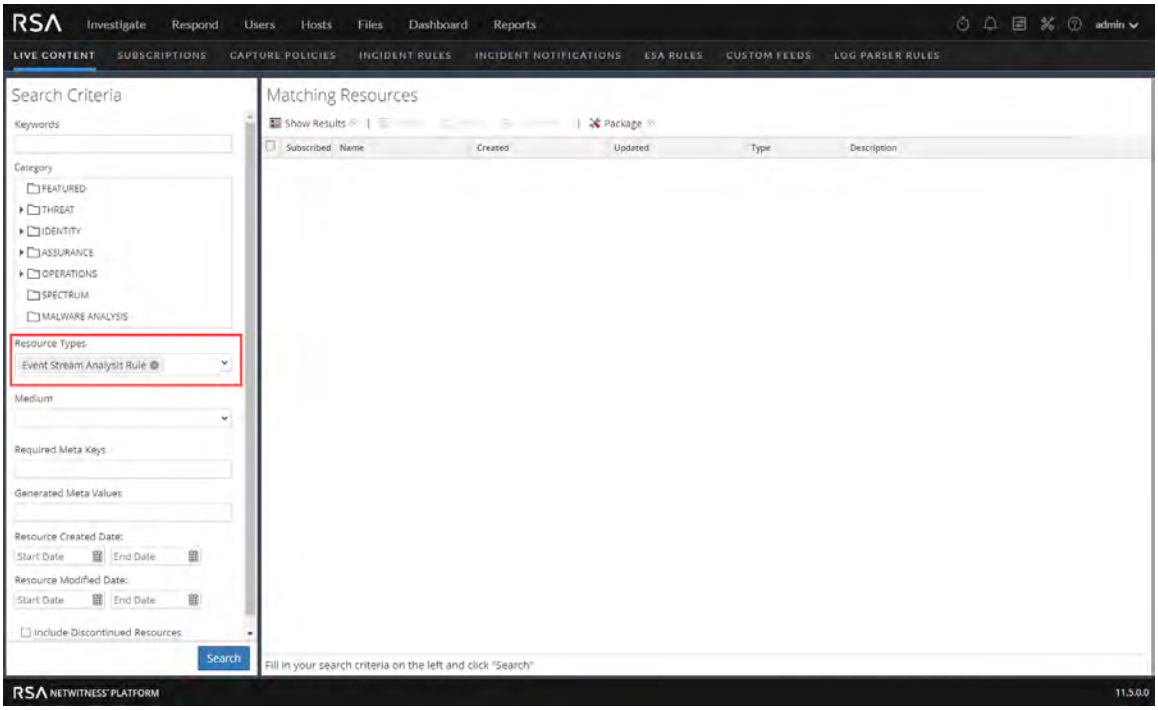
1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed.



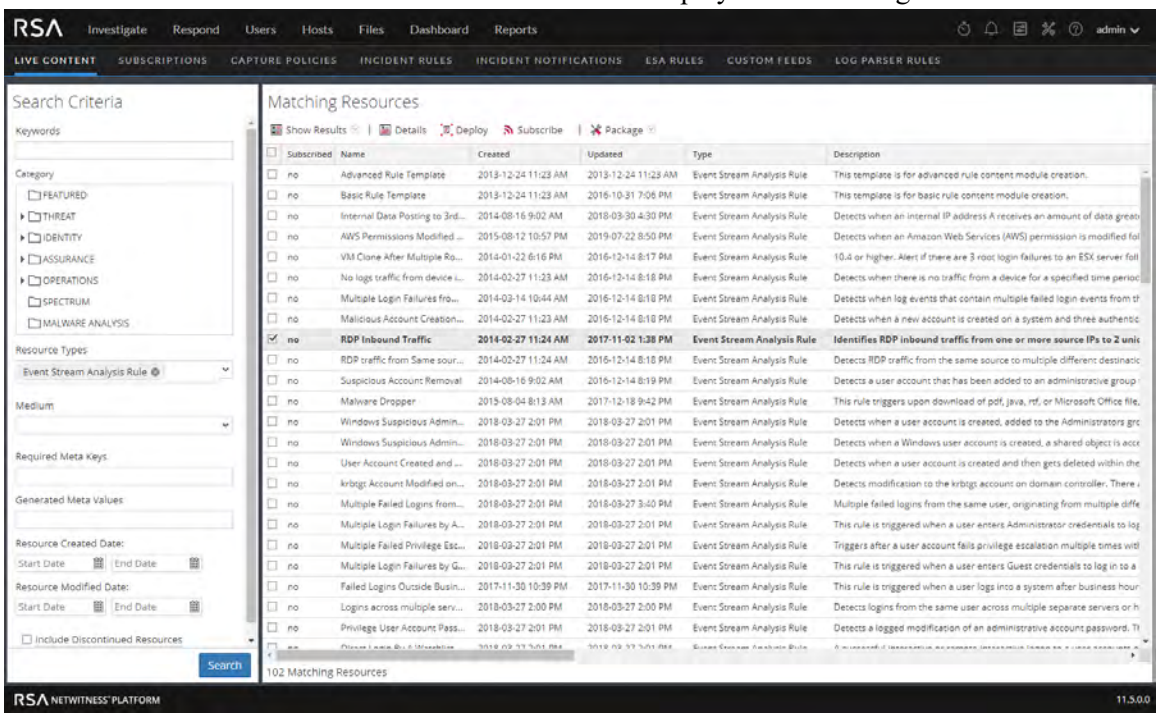
2. In the options panel, click **Get Rules from RSA Live**.

   The Live Content Search view is displayed. (Alternatively, you can go to **(Configure) > Live Content**.)

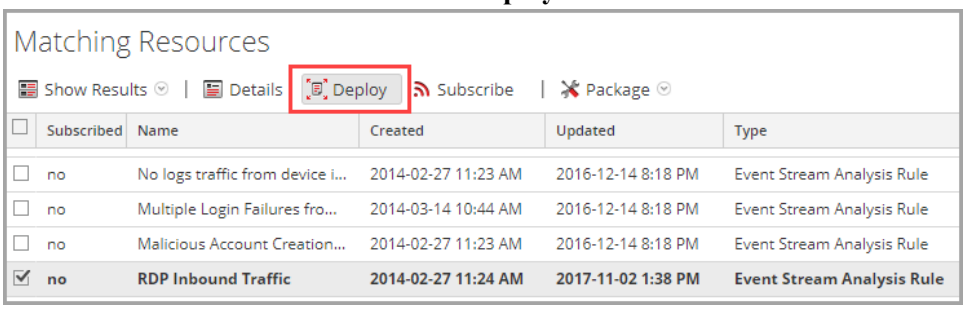
3. In **Search Criteria**, for **Resource Types** select **Event Stream Analysis Rule**.



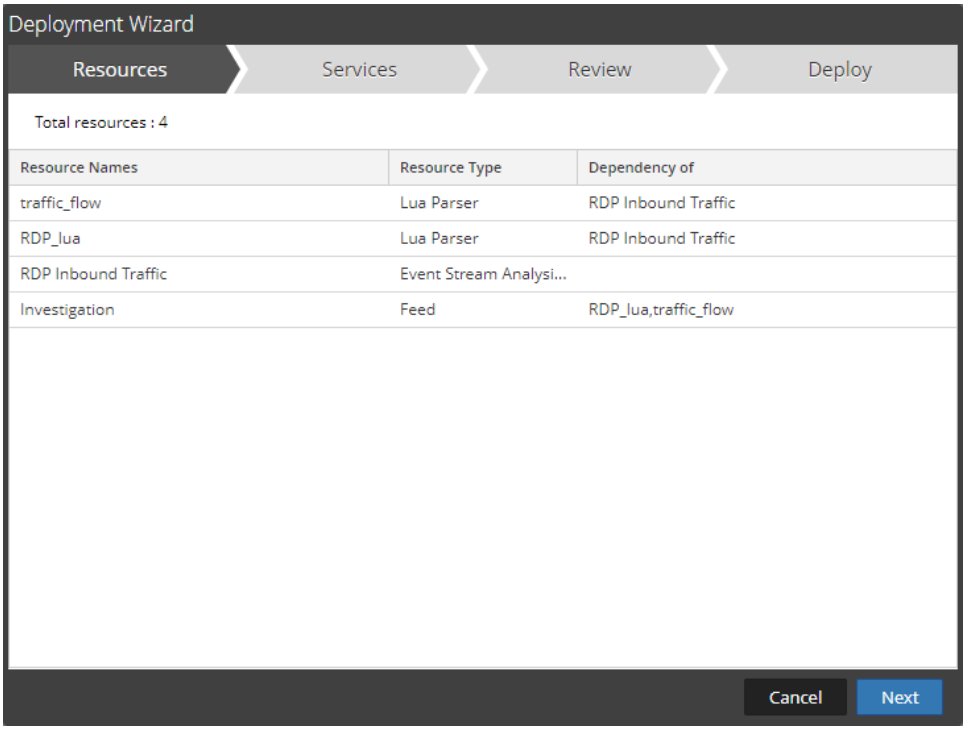
4. Specify any of the following criteria to find a rule to configure for your environment. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "RSA ESA Rules" at the following link: https://community.netwitness.com/t5/netwitness-platform-threat/rules/ta-p/677884
   For a detailed description of the search criteria, see "The Live Search View" in the *Live Services Management Guide*.
   - Keywords
   - Category
   - Resource Types (Event Stream Analysis Rule)
   - Medium (Log, Log and Packet, or Packet)
   - Required Meta Keys
   - Generated Meta Values
   - Resource Created Date
   - Resource Modified Date
   - Include Discontinued Resources
5. Click **Search**. Rules that match the search criteria are displayed in Matching Resources.



6. Select each rule to download and click **Deploy**.



The Deployment Wizard is displayed.



7. Follow the steps in the wizard. If you need more information, see "Deploy Resources in Live" in the *Live Services Management Guide*.

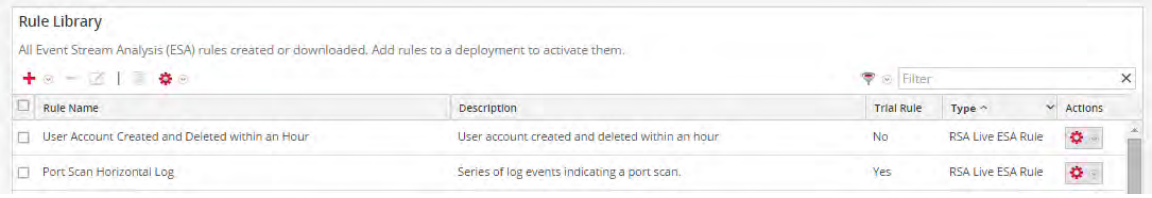
When you finish the steps in the wizard, the selected rules are displayed in the Rule Library.

## Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule

- Type
- Actions



The type is RSA Live ESA Rule.

## Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

## Configure Parameters for an RSA Live ESA Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, double-click an RSA Live ESA Rule or select the rule and click . The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. RSA recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Alert (This option applies to 11.3 and later.) Select Alert to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
   - Severity
   - Notifications
   - Enrichments
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

5. Click **Save**.

# Add a Rule Builder Rule

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

There are two methods to design a rule in ESA:

- **Rule Builder** is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- **Advanced EPL** allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you should use Rule Builder. These topics explain the Rule Builder.

## Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.

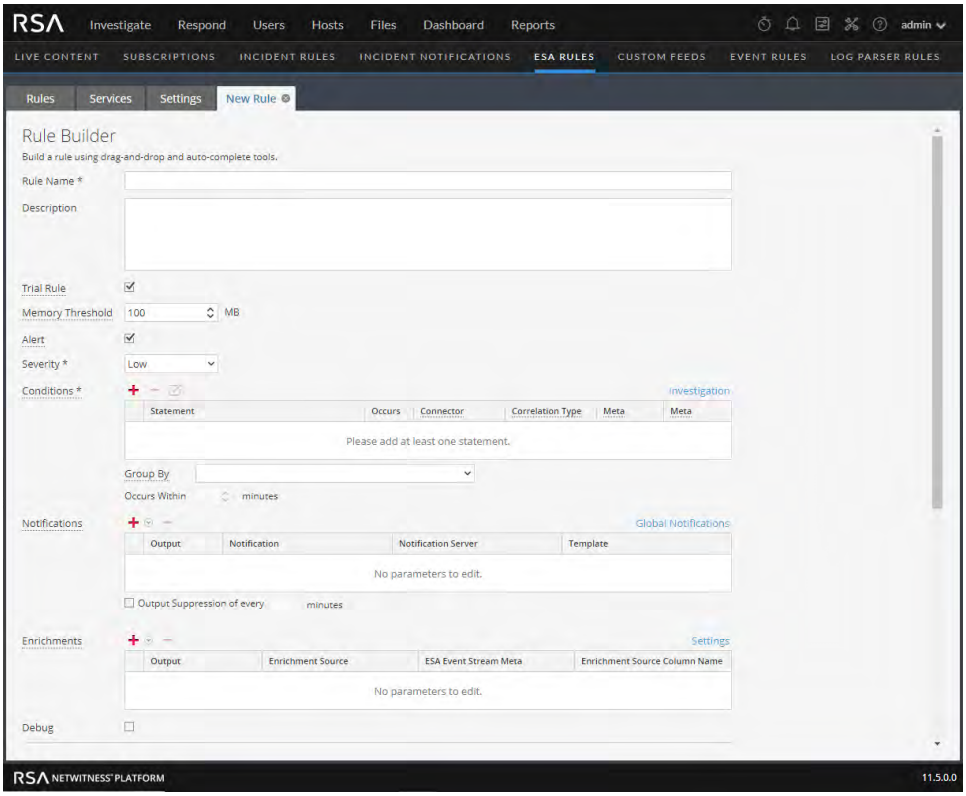
### Prerequisites

You must have permission to manage rules. See ESA Permissions.

### Name and Describe a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.

2. In the **Rule Library**, select **> Rule Builder**.
   The New Rule tab is displayed.



3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.
6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
8. For **Severity**, classify the rule as Low, Medium, High or Critical.

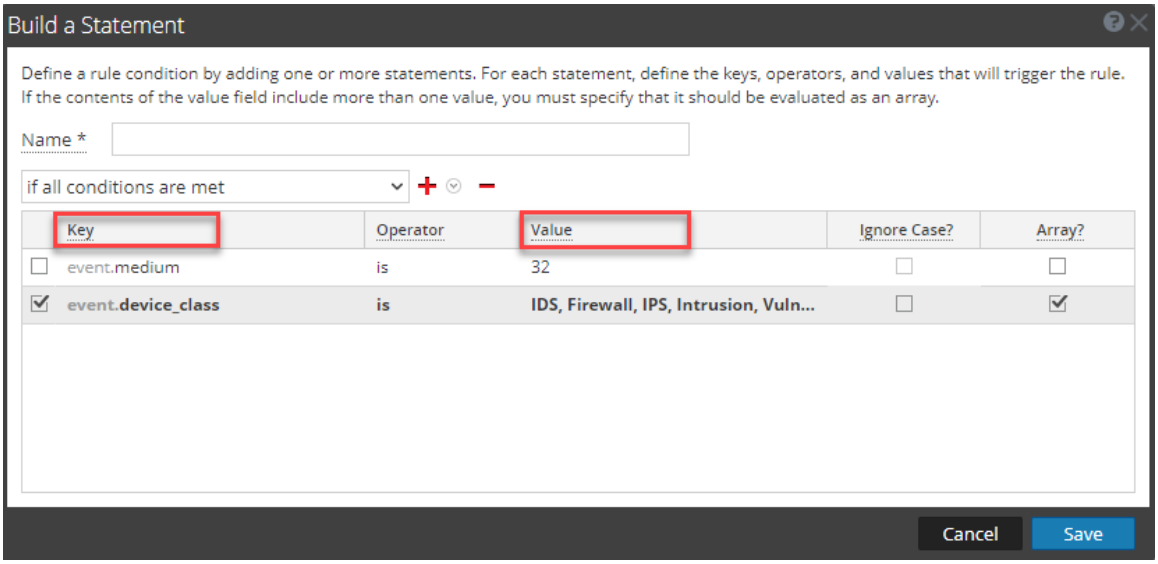
# Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

## Example

The following graphic shows an example of a Rule Builder statement.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.



## Prerequisites

To build a rule statement, you must know the meta key and the meta value.

For a complete list of meta keys, go to **(Configure) > ESA Rules > Settings > Meta Key References**.

Meta entities are not currently supported, such as:

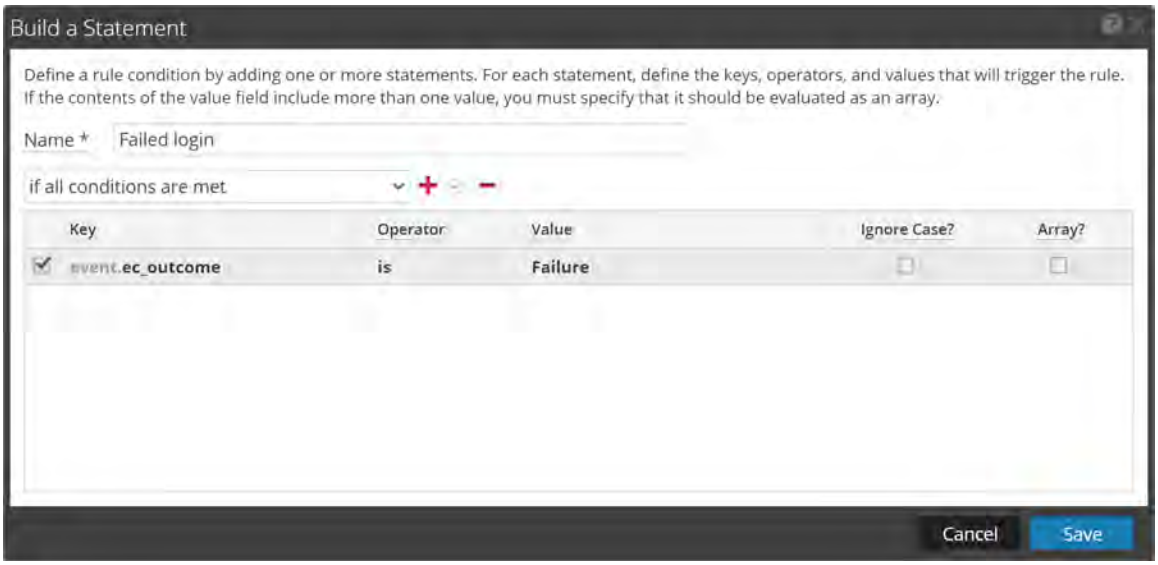
```
fullname.all
eth.all
ip.all
ipv6.all
port.src.all
port.dst.all
dir.path.all
org.all
geoip.all
port.all
```

```
domain.all
email.all
filename.all
directory.all
checksum.all
param.all
context.all
attack.all
analysis.all
compromise.all
inv.all
outcome.all
ec.all
user.all
host.all
client.all
```

**Caution:** If you add meta entities to your rule, they cannot get data from the data sources, so they do not trigger alerts.

## Build a Rule Statement

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library**, click **> Rule Builder** or edit an existing Rule Builder rule.
   The Rule Builder view is displayed.
3. In the **Conditions** section, click .
   The Build Statement dialog is displayed.



4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The operator that you use depends on the metadata type.
   The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), is one of (For array type meta), is not one of (For array type meta), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN." (For best rule performance, only use the **Ignore Case** option when necessary.)
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.
   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.
7. To use another meta key in the statement, click , select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click and select **Add Whitelist Condition**.

9. To add a blacklist, click and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

## To Add a Whitelist

You use a whitelist to ensure that specified entities are excluded from triggering the rule. Whitelists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

**Note:** An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.

## To Add a Blacklist

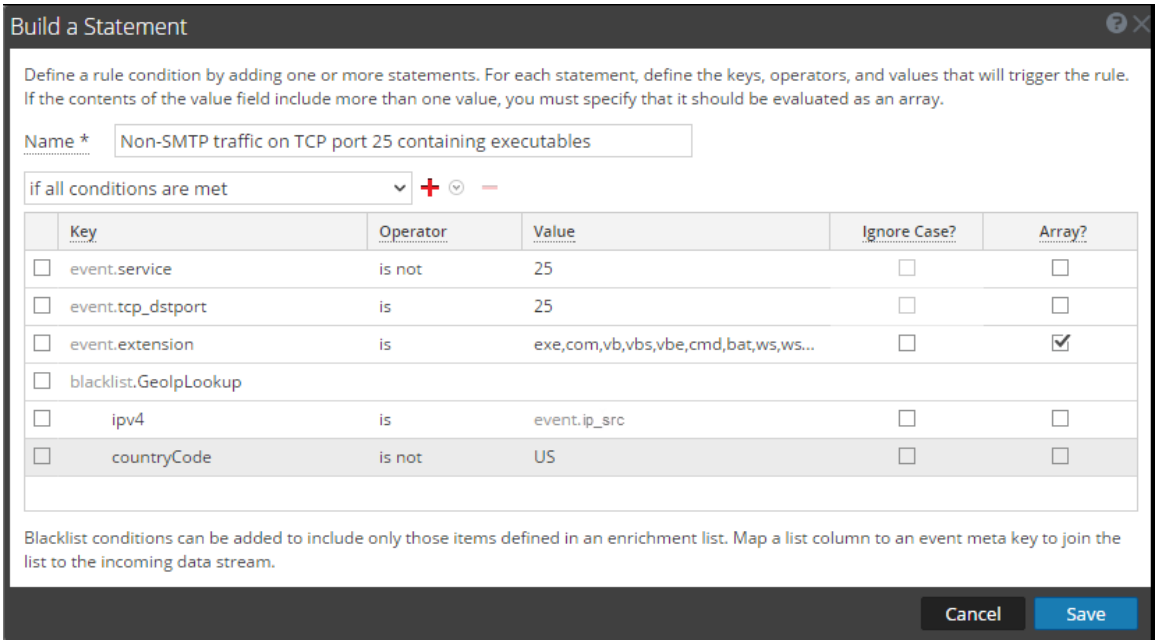
You use a blacklist to ensure that specified entities trigger the rule. Blacklists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a blacklist.
3. For the subcondition:
   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

## Example: Blacklist

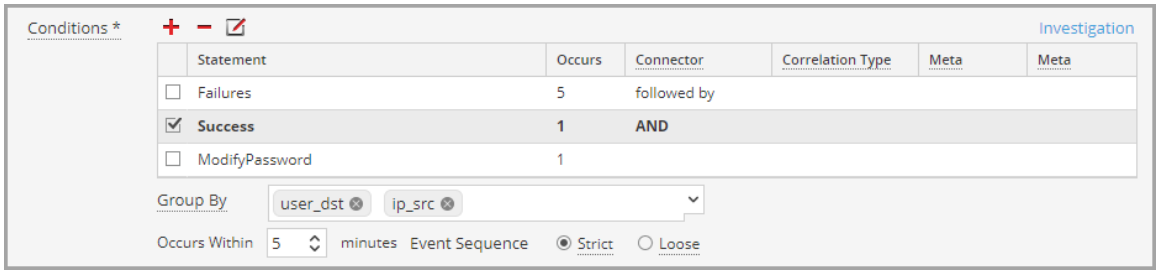
The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.



| Statement | Description |
|---|---|
| service is not 25 | The traffic is not SMTP traffic. |
| tcp_dstport is 25 | The traffic is running on TCP port 25. |
| extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh | The file extension is an executable. |
| GeoIpLookup | The blacklist is based on a GeoIPLookup source. |
| ipv4 is ip_src | The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. |
| countryCode is not US | When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field. |

## Example: Strict Pattern Matching and Using the *Is Not Null* Operator

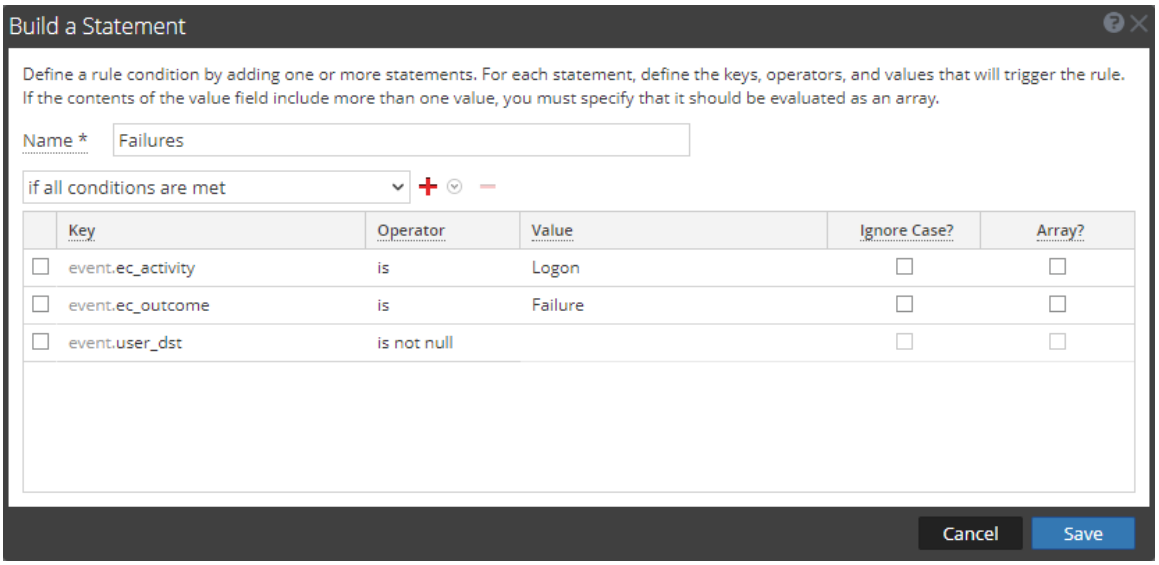
The following example uses the ability to exclude null values and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:



| Rule Condition | Description |
|---|---|
| Failures | This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success). |
| Success | This condition searches for one successful login. |
| ModifyPassword | This condition searches for an instance where the password is modified. |
| GroupBy: user_dst, ip_src | The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and ip_src. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by ip_src ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results. |
| Occurs within 5 minutes | The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger. |
| Event Sequence: Strict | The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specified with no intervening events.<br>Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect. |

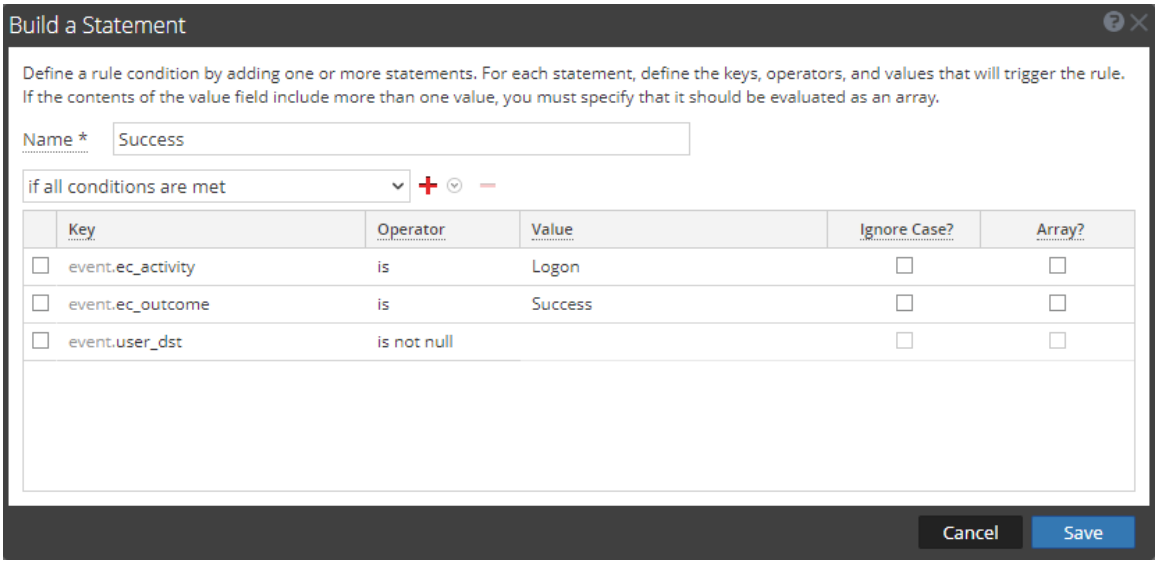
**Note:** Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:



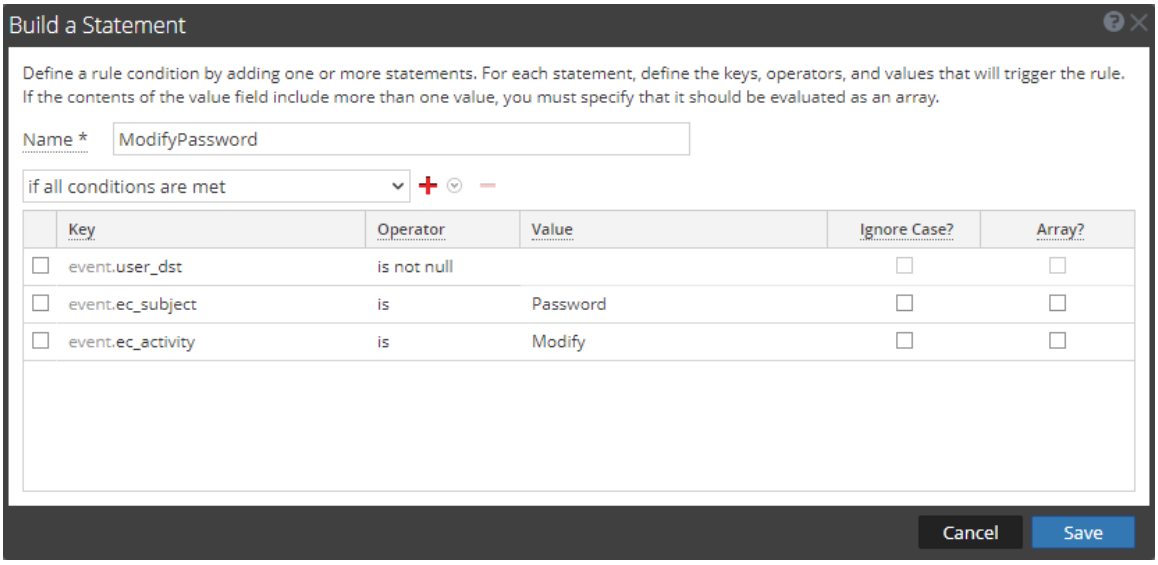
| Rule Statement | Description |
|---|---|
| ec-activity is Logon | Identifies activity that attempts to log on to a system.<br>The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. For best rule performance, only use the **Ignore Case** option when necessary. |
| ec_outcome is Failure | Identifies activity outcome logged as "failure." |
| user_dst is not null | Ensures that the condition is only true if user_dst is populated.<br>The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator. |

The following statement makes up the Success condition:



| Rule Statement | Description |
|---|---|
| ec_activity is Logon | Identifies logon activity. |
| ec_outcome is Success | Identifies a logon that is successful. |
| user_dst is not null | Ensures that user destination account field must be populated for the condition to be true. |

The following statement makes up the ModifyPassword condition:



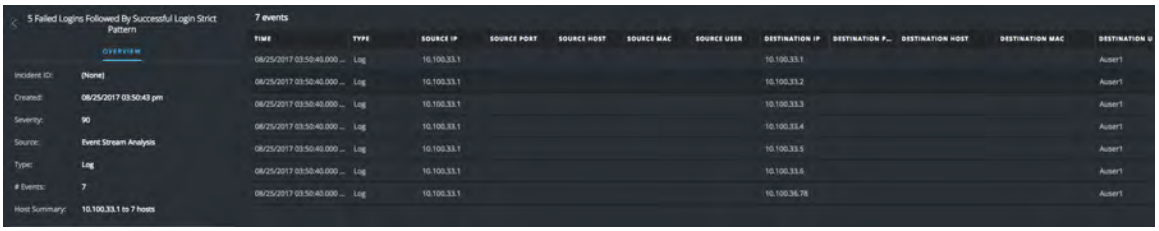
| Rule Statement | Description |
|---|---|
| user_dst is not null | Ensures the user destination account field must be populated for the condition to be true. |
| ec_subject is Password | Identifies a subject of Password. |
| ec_activity is Modify | Identifies activity where the password was modified. |

## Example Results

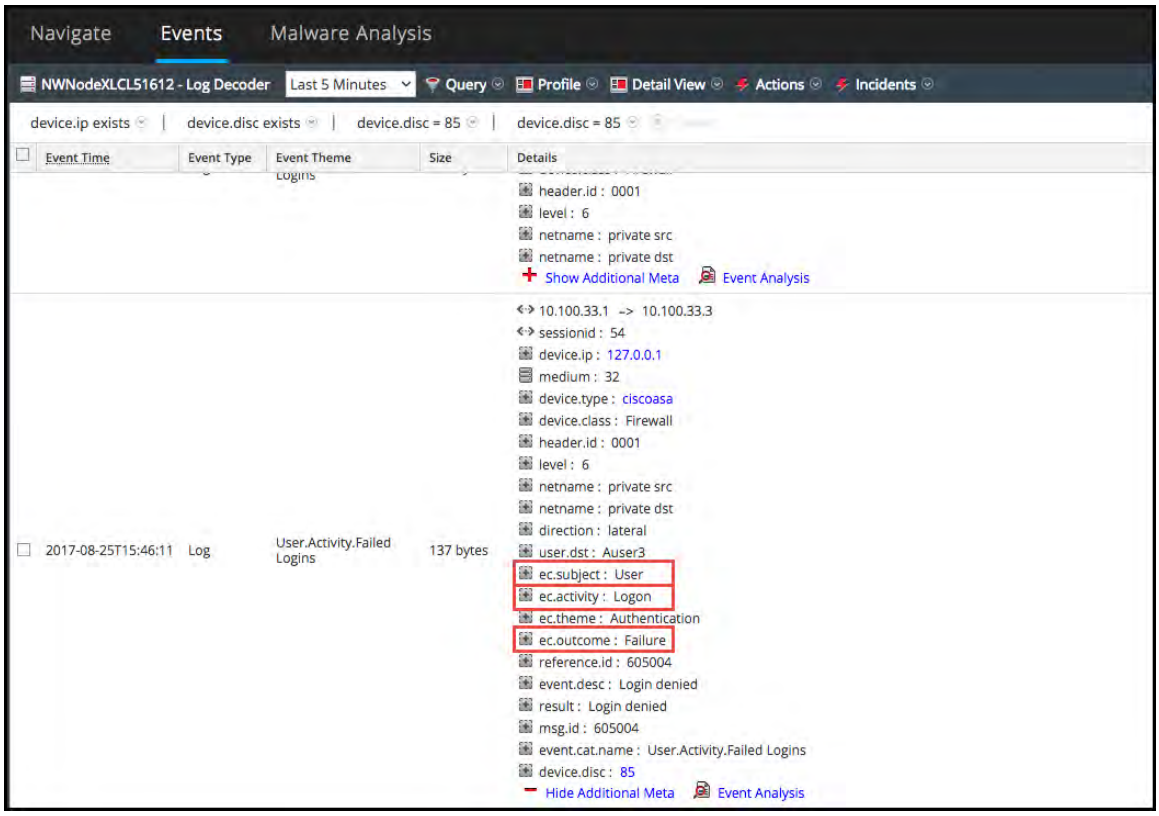
When the alert fires for the above example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.

The following figure shows the alert in the Respond Alerts List view.

The next figure shows the events in the alert in the Respond Alert Details view.



Drilling down into the Investigation view by clicking on the source for one of the events, you can see the case for each of the string values.

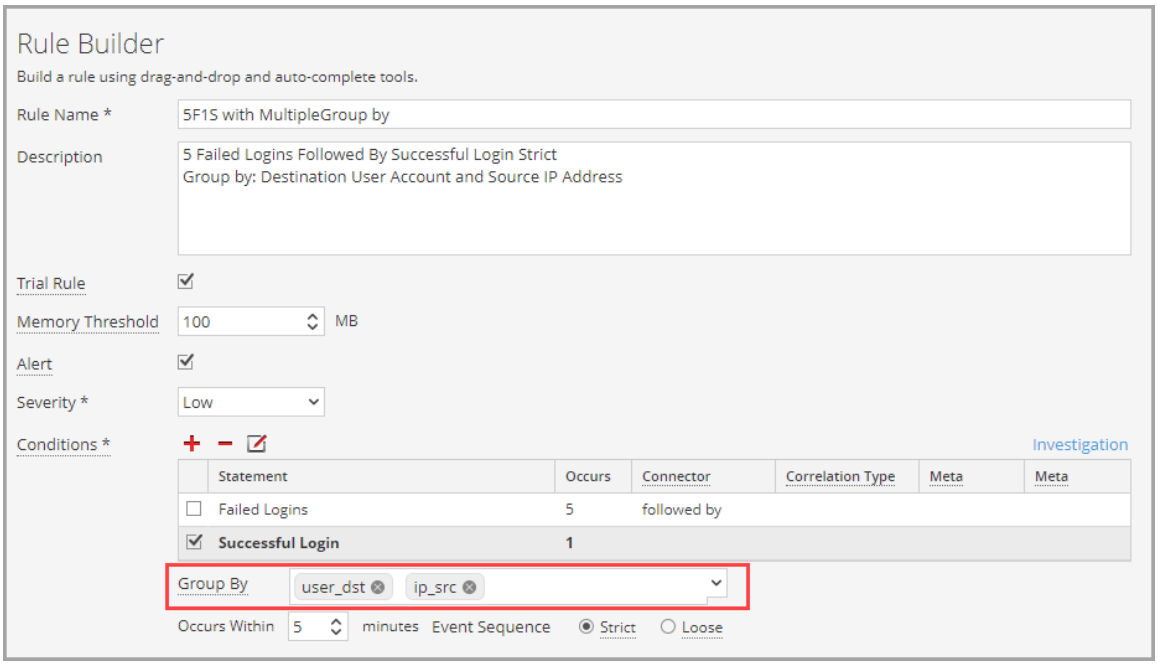


## Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

The following example shows a rule grouped by user_dst and ip_src.

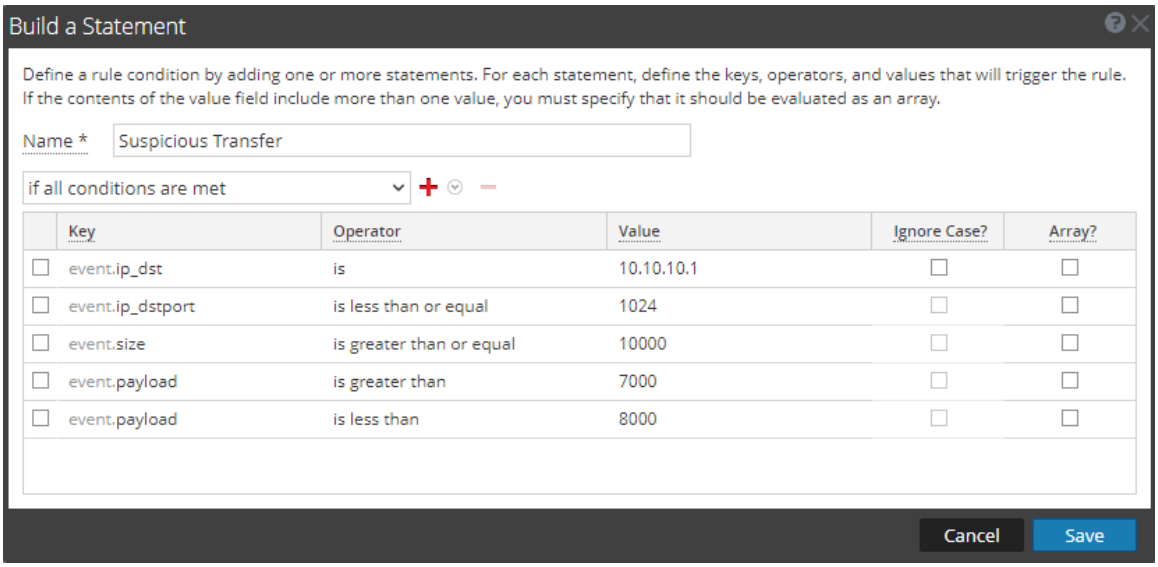


| Rule Condition | Description |
|---|---|
| Failed Logins | Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login). |
| Successful Login | Identifies one successful login. |
| Group By: user_dst and ip_src | Groups the rule results by user_dst (user destination account) and ip_src (IP address of the machine that the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result. |
| Occurs within 5 minutes with a strict pattern match | The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger. |

## Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



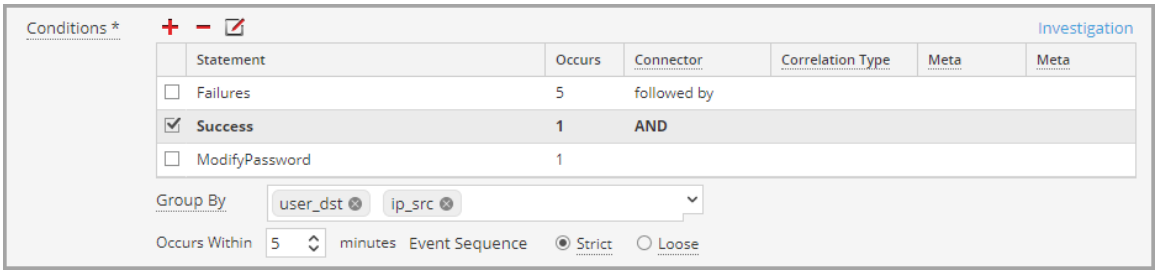
| Rule Statement | Description |
|---|---|
| ip_dst is 10.10.10.1 | The destination port is 10.10.10.1. |
| ip_dstport is greater than or equal to 1024 | The destination port is in a commonly used port range, 1024 or greater. |
| size is greater than or equal to 10000 | The size of the transfer is 10000 or greater, which is a suspiciously large transfer. |
| payload is greater than 7000 | The payload is between 7000 and 8000, which is a suspiciously large payload. |
| payload is less than 8000 | The payload is between 7000 and 8000, which is a suspiciously large payload. |

# Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

## Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.



This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (ip_src) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

## Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by

- AND
- OR

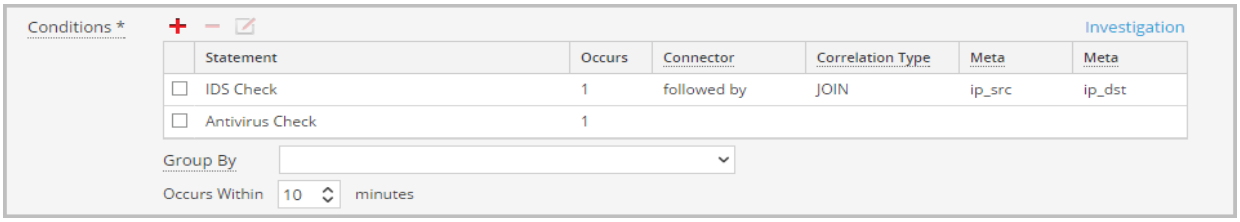
4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between.

   For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events.
   For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log in to an account multiple times. To do this, you might group by user_dst and ip_src.

## Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.



This is the criteria for the rule:

A. An IDS alert occurs.

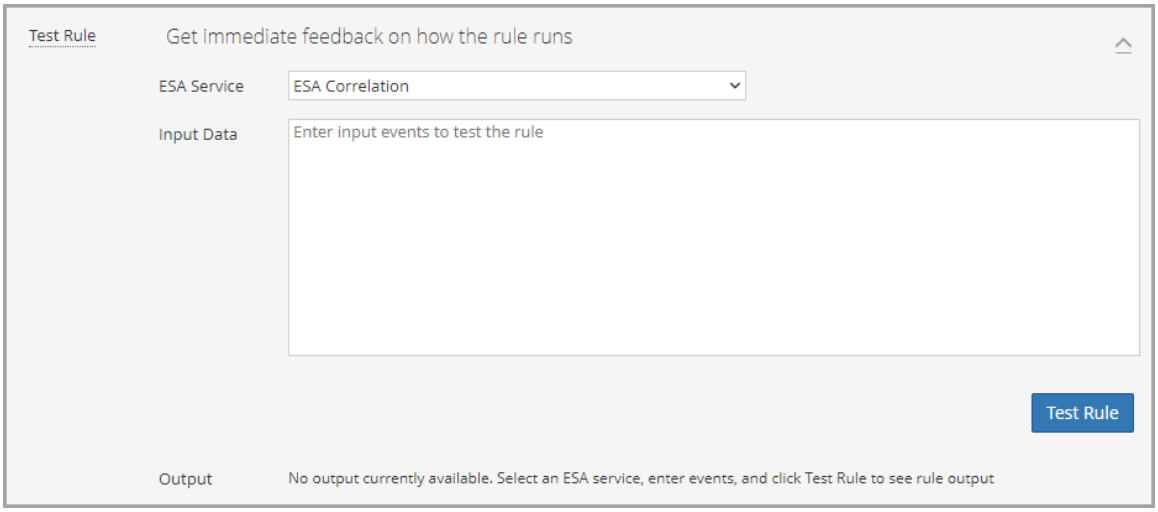
B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

## Validate an ESA Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.
2. Scroll down to the **Test Rule** section.



3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   **To download the events from the Investigate > Navigate view:**

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.

   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.

c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].

d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

**To download the events from the Investigate > Events view:**

a. In the main menu, go to **Investigate > Events** in a new tab.

b. In the Events view, enter a query for the ESA rule test.

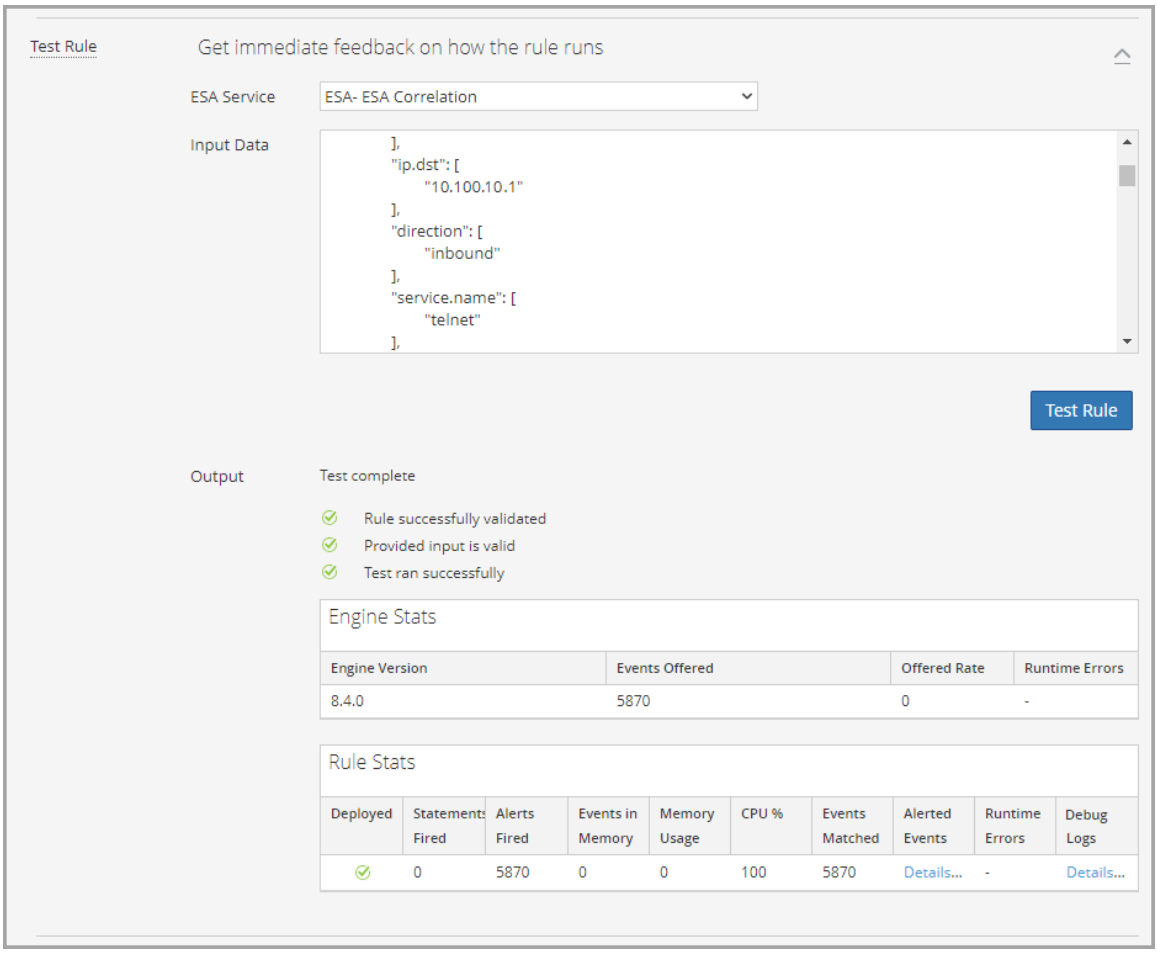
c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.



The following table describes the test rule output **Engine Stats**.

| Field | Description |
|---|---|
| Engine Version | Esper version running on the ESA service |
| Events Offered | Number of events processed by the ESA service since the last service start |
| Offered Rate | The rate that the ESA service processes current events / The maximum rate that the ESA service processed events |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment. |

The following table describes the test rule output **Rule Stats**.

| Field | Description |
|---|---|
| Deployed | A green checkmark indicates that the rule is deployed on the selected ESA service. |

| Field | Description |
|---|---|
| Statements Fired | The number of statements that fired the alerts |
| Alerts Fired | The number of alerts generated from the test data |
| Events in Memory | The number of events placed in memory by the rule |
| Memory Usage | The total amount of memory used by the rule |
| CPU % | The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. |
| Events Matched | The number of events that matched the rule |
| Alerted Events | If applicable, this field can contain a link to events that caused an alert. |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the rule. |
| Debug Logs | This field contains a link to Esper debug (audit) logs. |

# Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

## Edit, Duplicate or Delete a Rule

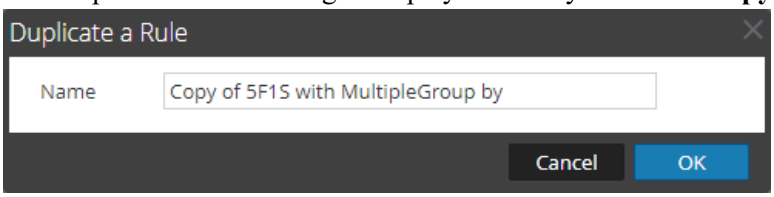
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

### Edit a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

### Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.

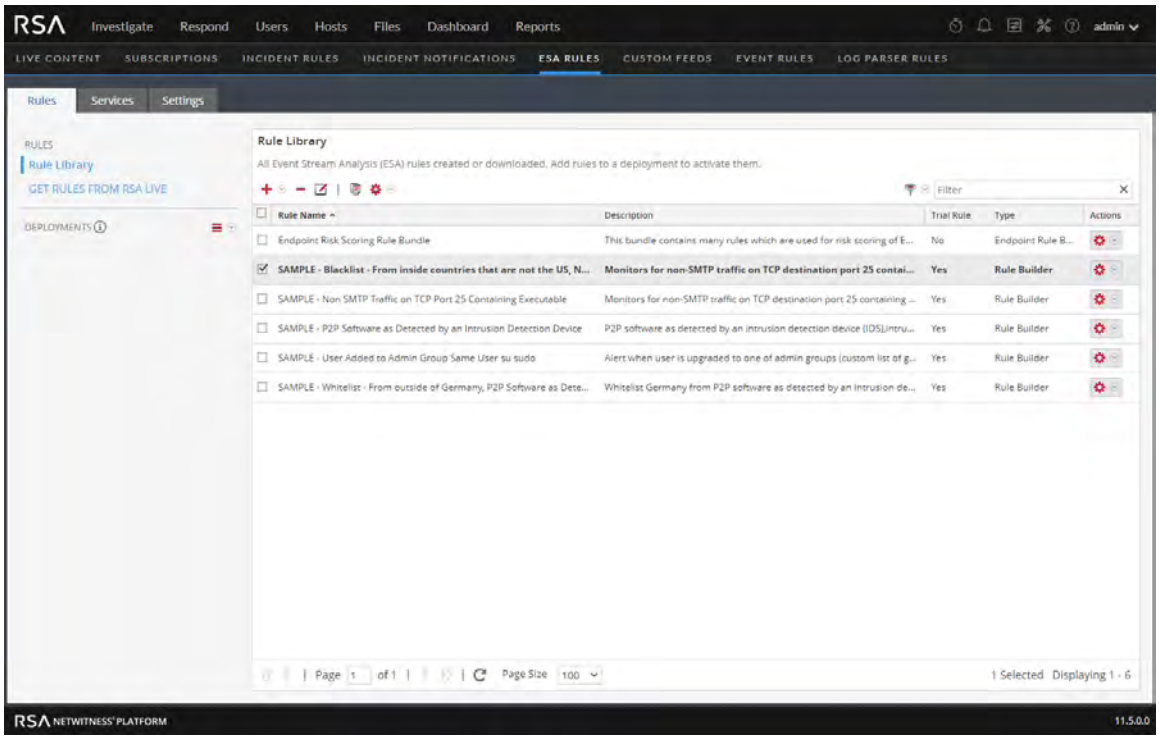


3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

### Delete a Rule

1. Go to **(Configure) > ESA Rules > Rules**.
   The Rules tab is displayed.



2. In the Rule Library, select one or more rules and click .

   A warning dialog is displayed.

3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

# Filter or Search for Rules

This topic shows analysts how to specify the type of rules that display in the Rule Library.

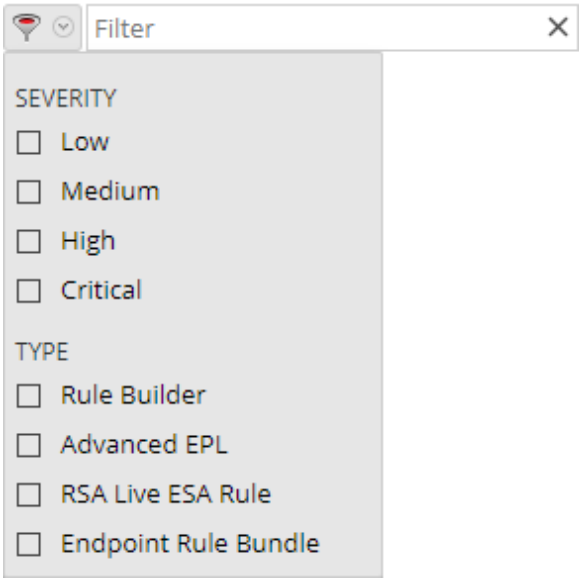
## Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

## Filter Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.

2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.



The selected rule types appear in the list.

## Search for Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

# Import or Export Rules

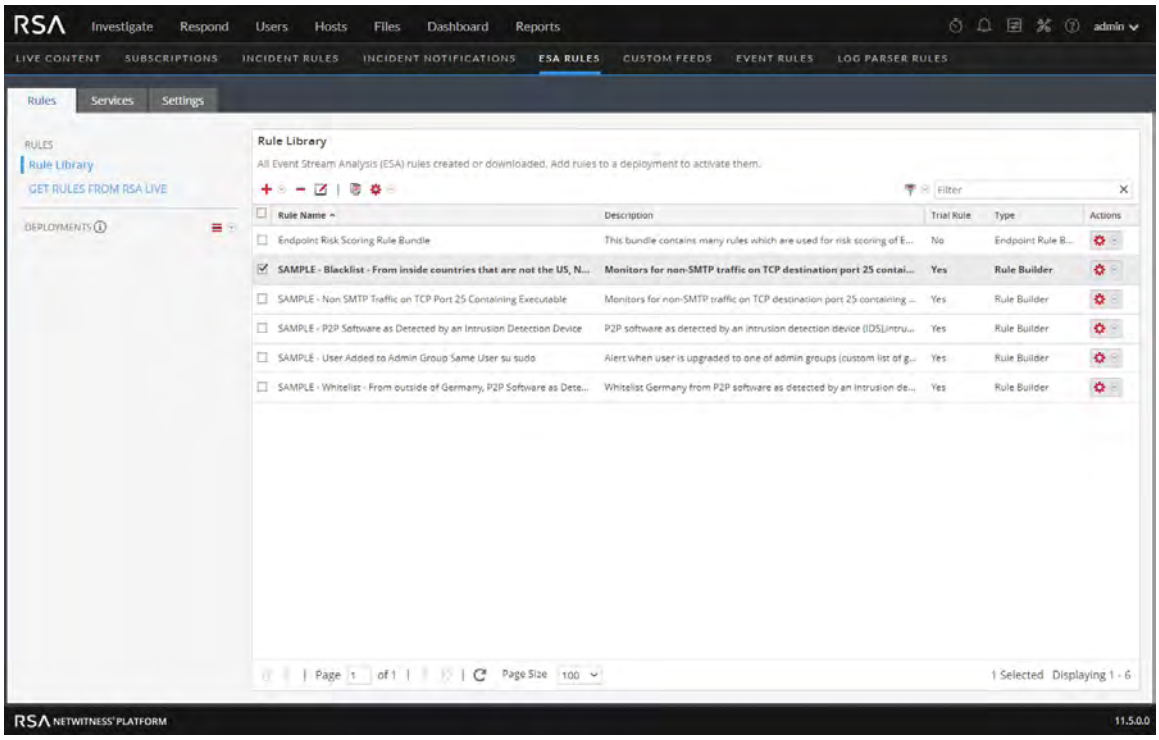
The topic provides instructions to import ESA rules from a NetWitness instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

## Import ESA Rules

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.



2. In the **Rules Library** toolbar, select **> Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

## Export ESA Rules

1. Select an ESA rule or multiple rules and select **> Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

**Note:** The binary file cannot be edited.

# Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

To configure a notification, you configure these components:

- **Notification Server**: The notification server is the source of the notifications. After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- **Notifications**: These are the outputs (destinations) of the notifications, which can be email, script, and Syslog. When you design a rule, you can specify the notification for an alert.
- **Templates**: The message format of an alert notification is defined in a template.

If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. For more information, see Troubleshoot ESA Rules. For information on creating a custom template, see see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *System Configuration Guide*.

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide.*

## Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog

- Script

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

## Email Notifications

ESA Correlation can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

## Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide.*
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

## Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.
- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

# Add Notification Method to a Rule

This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

## Prerequisites

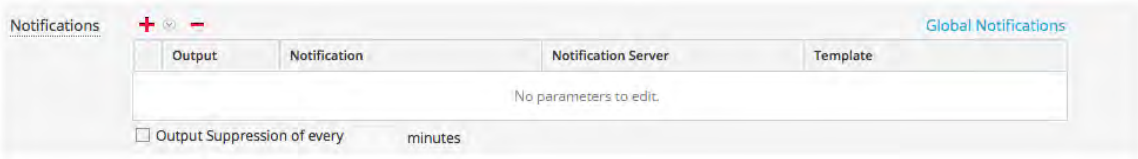
- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:

  Go to **(Admin) > System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide*.

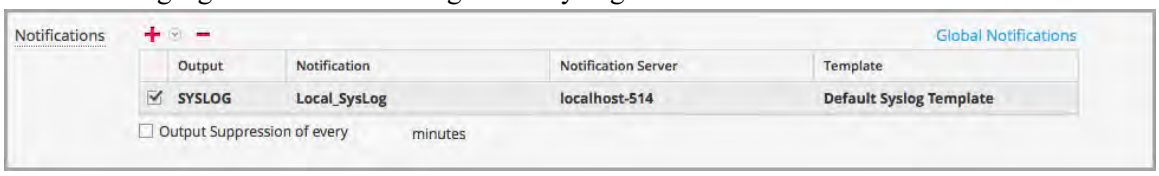
## Add a Notification Method to a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, click to add a new rule or select an existing rule and click . Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed. The Notifications section is the same for both tabs.



3. Click and select the **Output** for the alert:
   - Email
   - SNMP (This option is not supported in NetWitness 11.3 and later.)
   - Syslog
   - Script

4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.

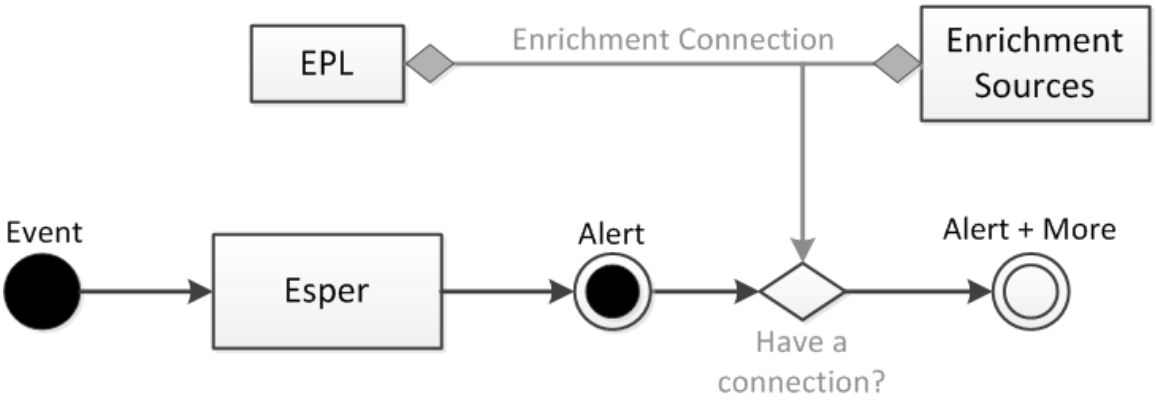


7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

# Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.



Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- MaxMindGeoIP Database

**Note:** The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

## Example Rule with Enrichments

The following example rule illustrates how ESA enrichments can enhance alerts.

```
@RSAAlert @Name("simple") SELECT * FROM Event(ec_theme='Login Failure')
```

This rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

| sessionid | ec_ theme | username | ip_src | ip_dst | host_dst |
|---|---|---|---|---|---|
| 1 | Login Success | dshrute | 23.xx.23x.16 | | |
| 2 | Login Failure | jhalpert | 23.xx.23x.16 | 31.1x.x9.1x8 | www.facebook.com |

An alert without an enrichment with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
         {
             "username": "jhalpert",
             "host_dst": "www.facebook.com",
             "ip_dst": "31.1x.x9.1x8",
             "sessionid": 2,
             "ec_theme": "Login Failure",
             "esa_time": 1406148964130,
             "ip_src": "23.xx.23x.16"
         }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same deployment, with the same event stream, can generate the alert shown below.

```
{"events": [
     {
         "username": "jhalpert",
         "host_dst": "www.facebook.com",
         "GeoIpLookup": [
         {
             "city": "Cambridge",
             "longitude": -71,
             "countryCode": "US",
             "areaCode": 617,
             "metroCode": 506,
             "region": "MA",
             "dmaCode": 506,
             "ipv4Obj": "/23.xx.23x.16",
             "countryName": "United States",
             "postalCode": "02142",
             "ipv4": "23.xx.23x.16",
             "latitude": 42,
             "organization": "Verizon Business"
         }
     ],
     "orgchart": [
         {
             "supervisor": "mscott",
             "name": "James Halpert",
             "extension": 3692,
             "location": "Scranton",
```

```
            "department": "Sales",
            "id": "jhalpert"
        }
    ],
    "ip_dst": "31.1x.x9.1x8",
    "sessionid": 2,
    "LoginRegister": [
        {
            "username": "dshrute",
            "ip_src": "23.xx.23x.16"
        }
    ],
    "ec_theme": "Login Failure",
    "esa_time": 1406155218912,
    "ip_src": "23.xx.23x.16"
    }
]}
```

The system pulls contextual data to make the alert more meaningful.

To include the name of the supervisor and the name of the user with the last successful login in the ESA notification, this example includes the following template expressions: `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee in the alert and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

# Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- Context Hub List (Preferred)
- In-Memory Table (Ad hoc only)
- GeoIP

**Note:** Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness. You can only use the In-Memory Table with ESA. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources.

**Note:** The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

# Configure a Context Hub List as an Enrichment Source

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

## Prerequisites

Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *RSA NetWitness Context Hub Configuration Guide*.

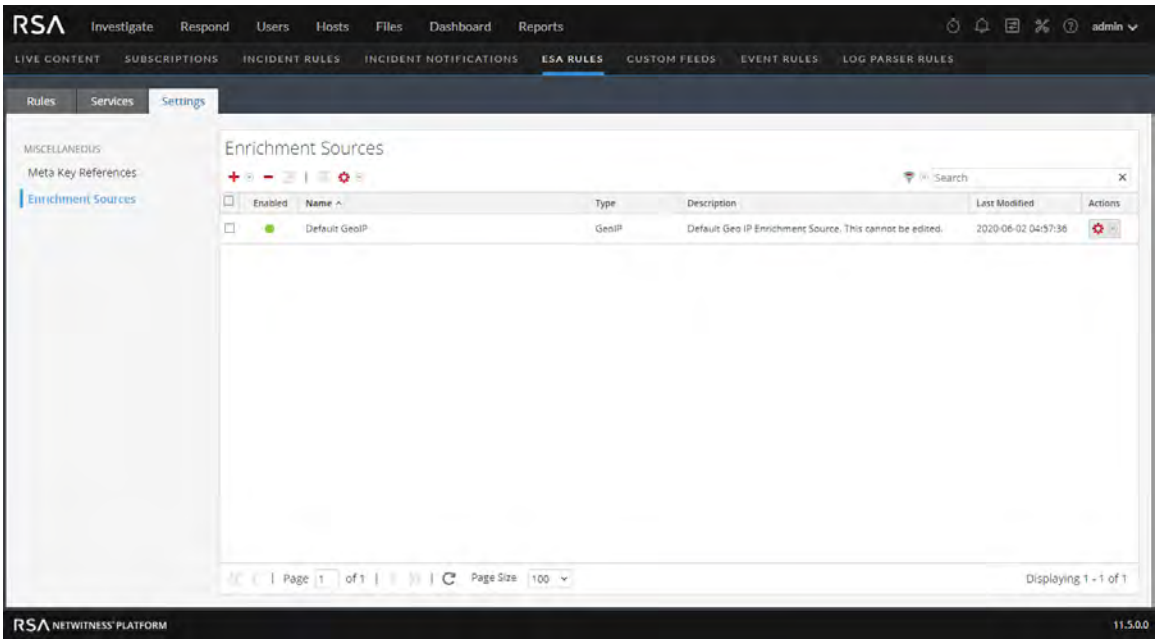
**Caution:** When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

**IMPORTANT:** If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

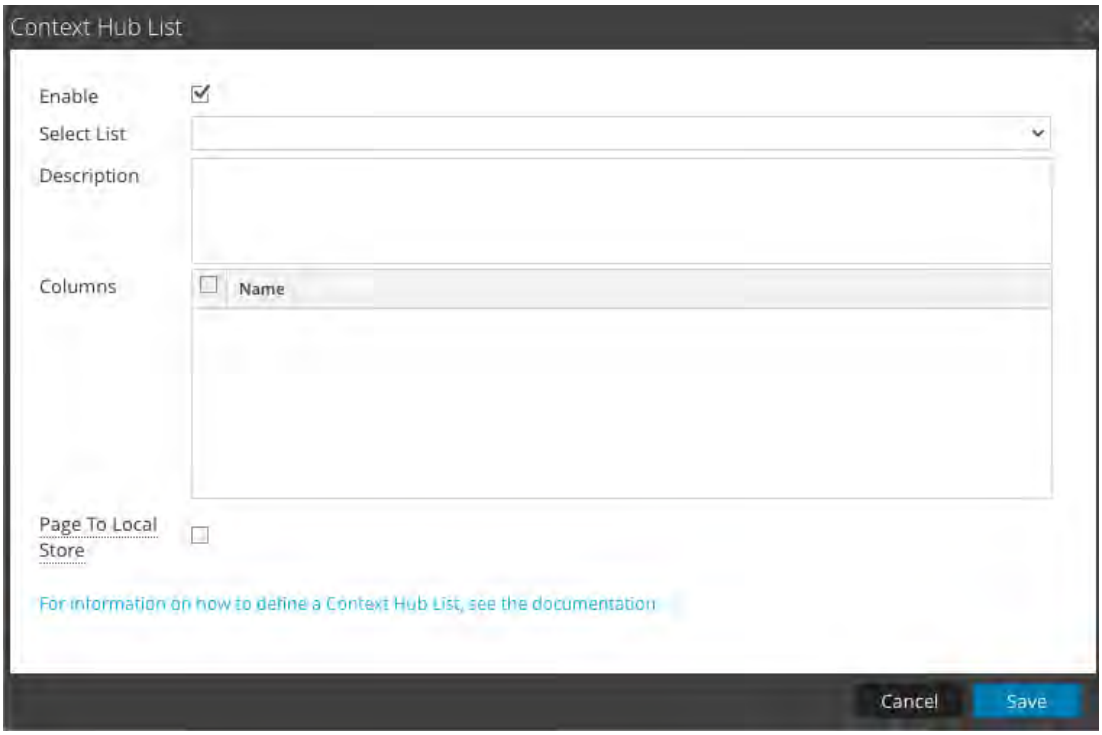
## Configure a Context Hub List as an Enrichment Source

1. Go to **(Configure) > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



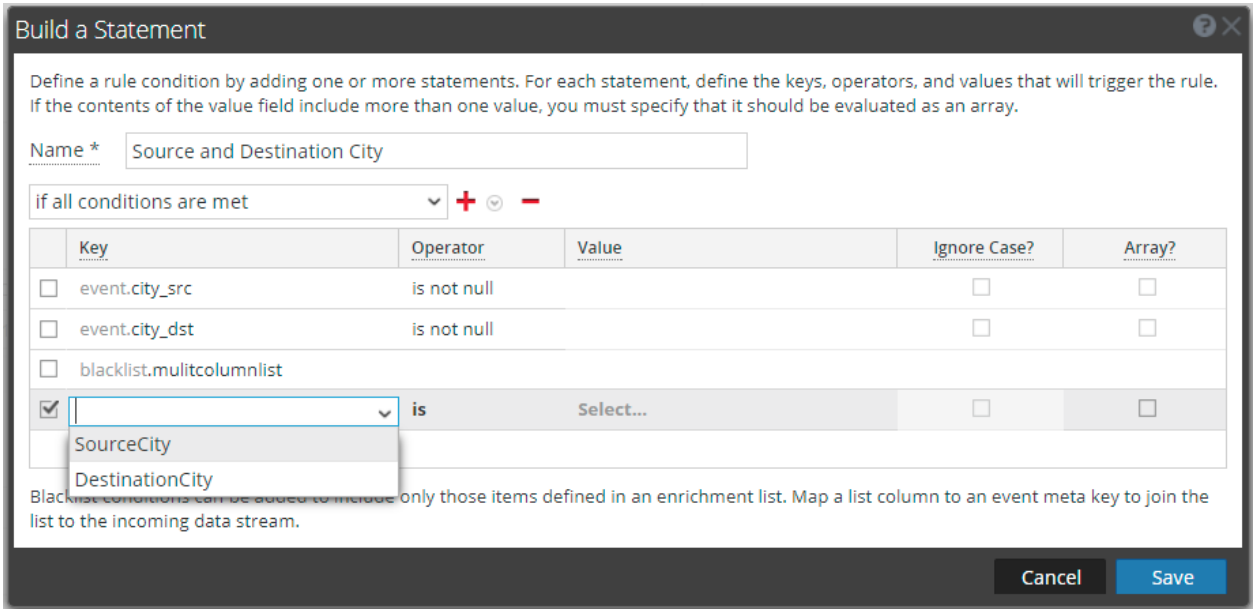
3. From the drop-down menu, select **Context Hub**.



4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.
6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.

7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.
8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.



For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

# Configure an In-Memory Table as an Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.

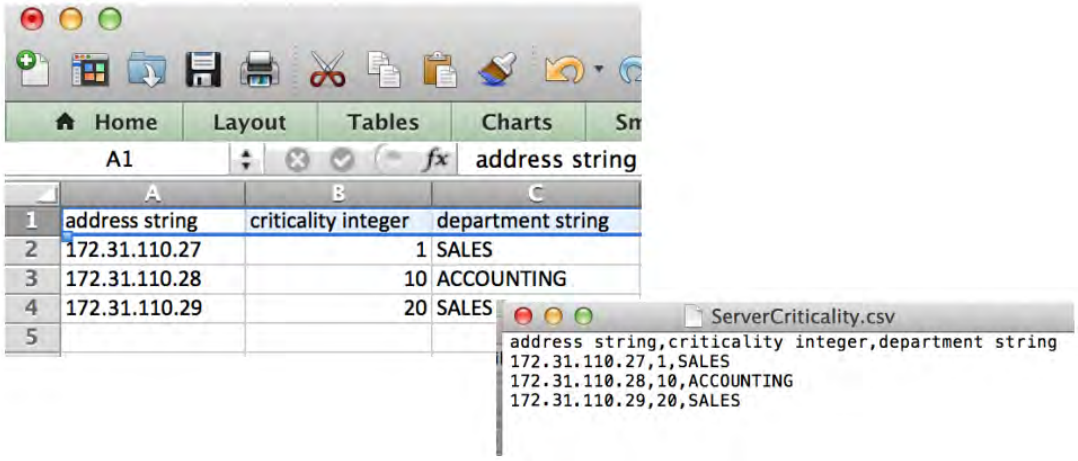
For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

**Note:** It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

## Prerequisites

- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

The following shows a valid .CSV file represented as a .CSV and as a table.

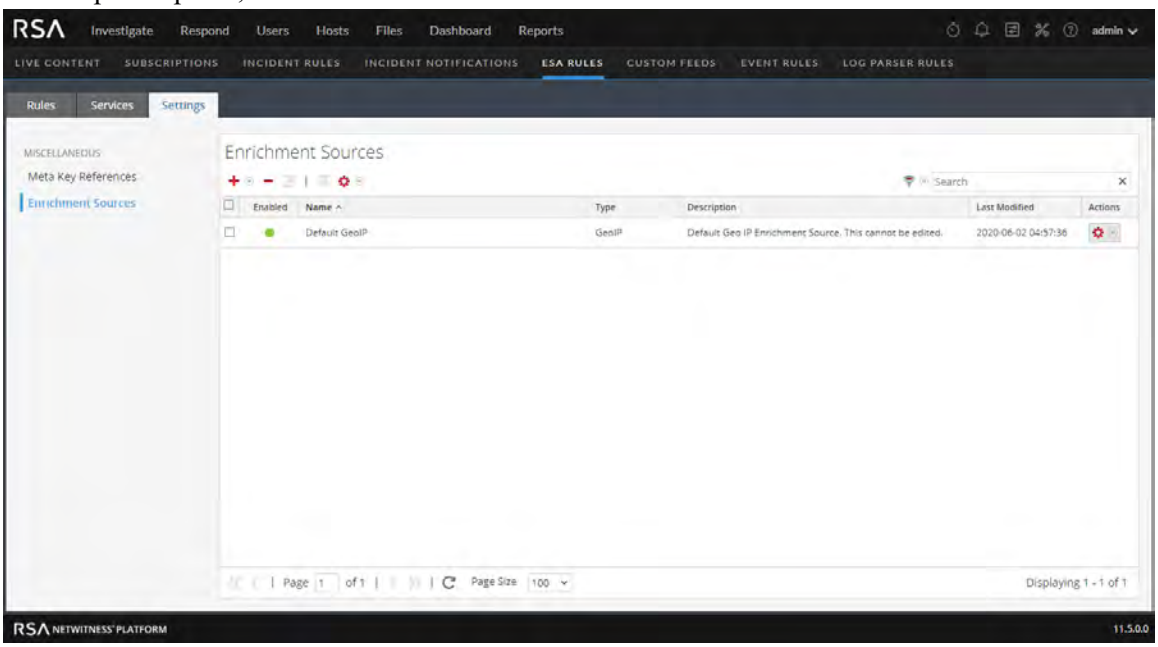


## Configure an Ad hoc In-Memory Table

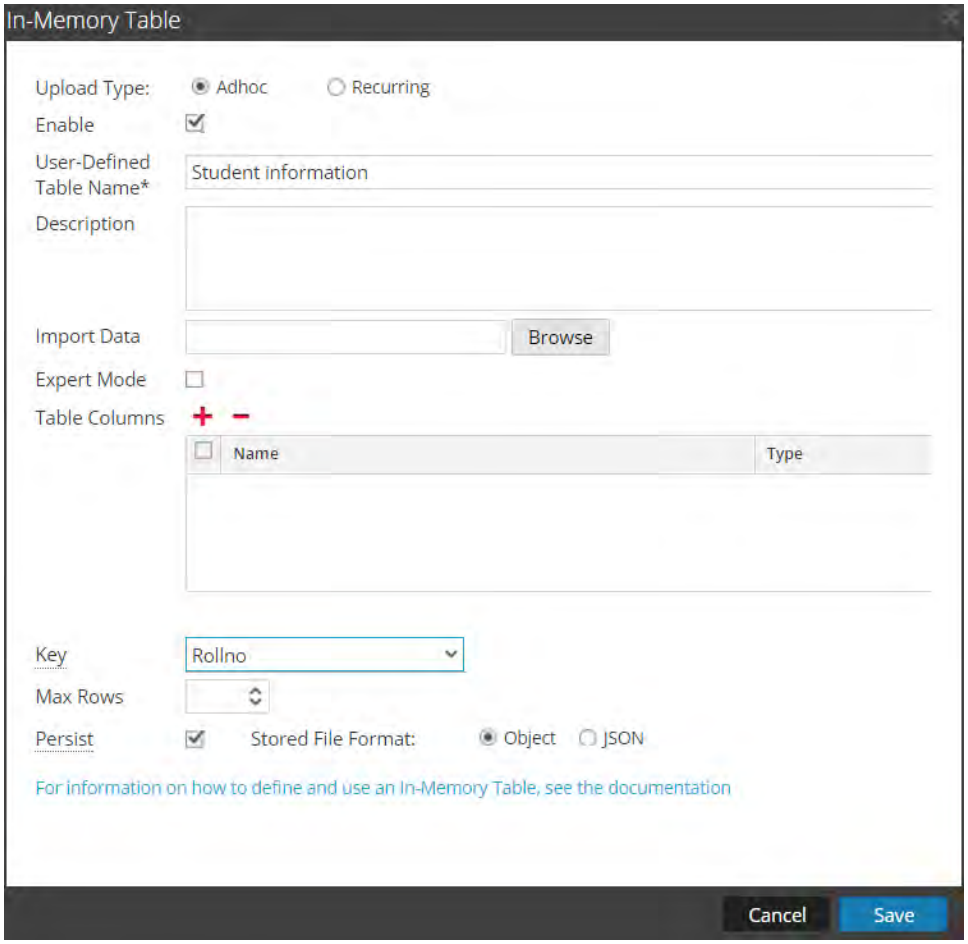
**Note:** It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.



4. In the **Enrichment Sources** section, click > **In-Memory Table**.



5. Describe the in-memory table:
   a. Select **Ad hoc**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   **Note:** Do not use any Esper keyword as **User-Defined Table Name** since this causes an error while using this enrichment in the ESA Rule. For Esper keywords, see Reserved keywords.

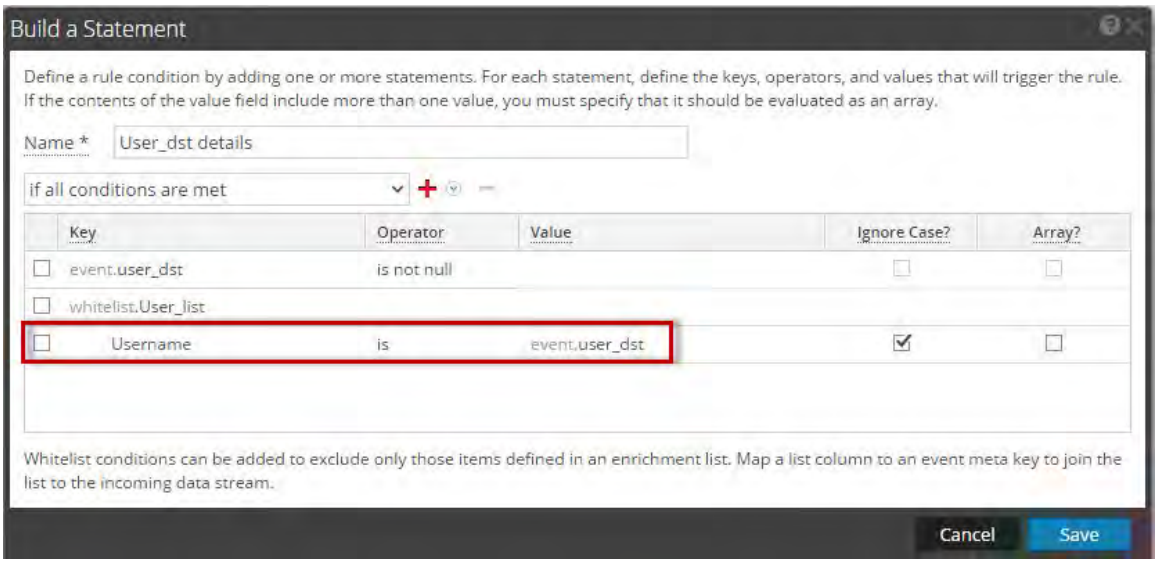
   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
   When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

**Note:** If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
    By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to a rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:



Next, the alert is enriched with the User_list in-memory table:

Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

## Add a Recurring In-Memory Table

Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

It is preferable to use Context Hub List enrichment sources for ESA rules instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness Platform. You can only use the In-Memory Table with ESA.

**Note:** Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

# Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

**Note:** This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure a Context Hub List as an Enrichment Source.

### To add an enrichment to a rule:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - GeoIP

   **Note:** If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This adds an @Audit('stream') annotation to the rule. This is useful when debugging the Esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

# Deploy Rules to Run on ESA

This section explains how an ESA Rule Deployment works and how to set up a deployment to run a group of ESA rules. Administrator, SOC Manager, or Data Privacy Officer role permissions are required for all procedures in this section.

To create an ESA rule deployment, you need to perform the steps described in ESA Rule Deployment Steps.

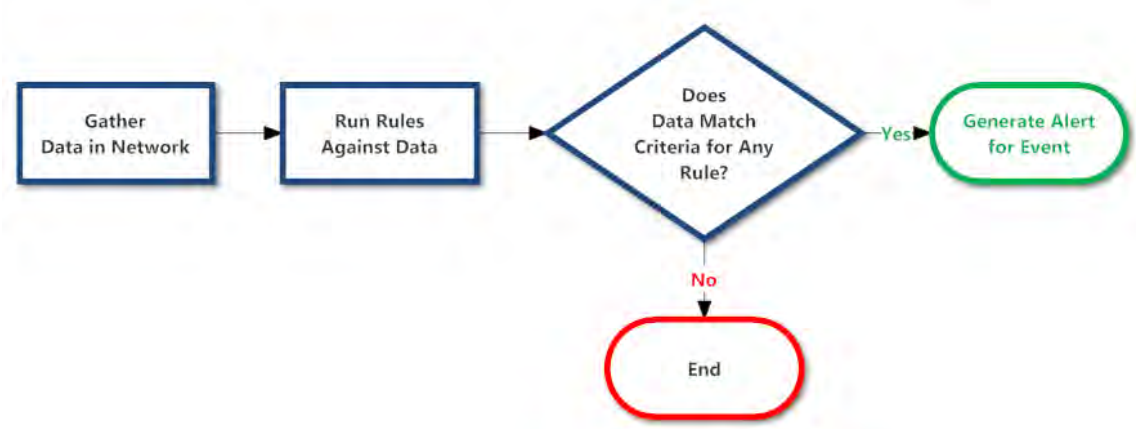
## How an ESA Rule Deployment Works

An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:



In addition, you may want to perform other steps on your deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to the deployment. For descriptions of these procedures, Additional ESA Rule Deployment Procedures.

# ESA Rule Deployment Steps

This topic explains how to add an ESA rule deployment, which includes an ESA service with its associated data sources and a set of ESA rules. You can add an ESA rule deployment to organize and manage ESA services and rules. Think of the deployment as a container for these components:

- An ESA service
- One or more data sources (This is available in version 11.3 and later.)
- A set of ESA rules

For example, if you add a Spam Activity deployment it could include an ESA London service, Concentrators with the appropriate data, and a set of ESA rules to detect suspicious email activity.

**Note:** An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments.
In NetWitness version 11.2 and earlier, the ESA service is the Event Stream Analysis service. In version 11.3 and later, it is the ESA Correlation service.

To add an ESA rule deployment, you need to complete the following procedures:

- Step 1. Add an ESA Rule Deployment
- Step 2. Add an ESA Service
- Step 3. Add Data Sources
  - (Optional) Add a Data Source Filter
- Step 4. Add and Deploy Rules

## Step 1. Add an ESA Rule Deployment

### Prerequisites

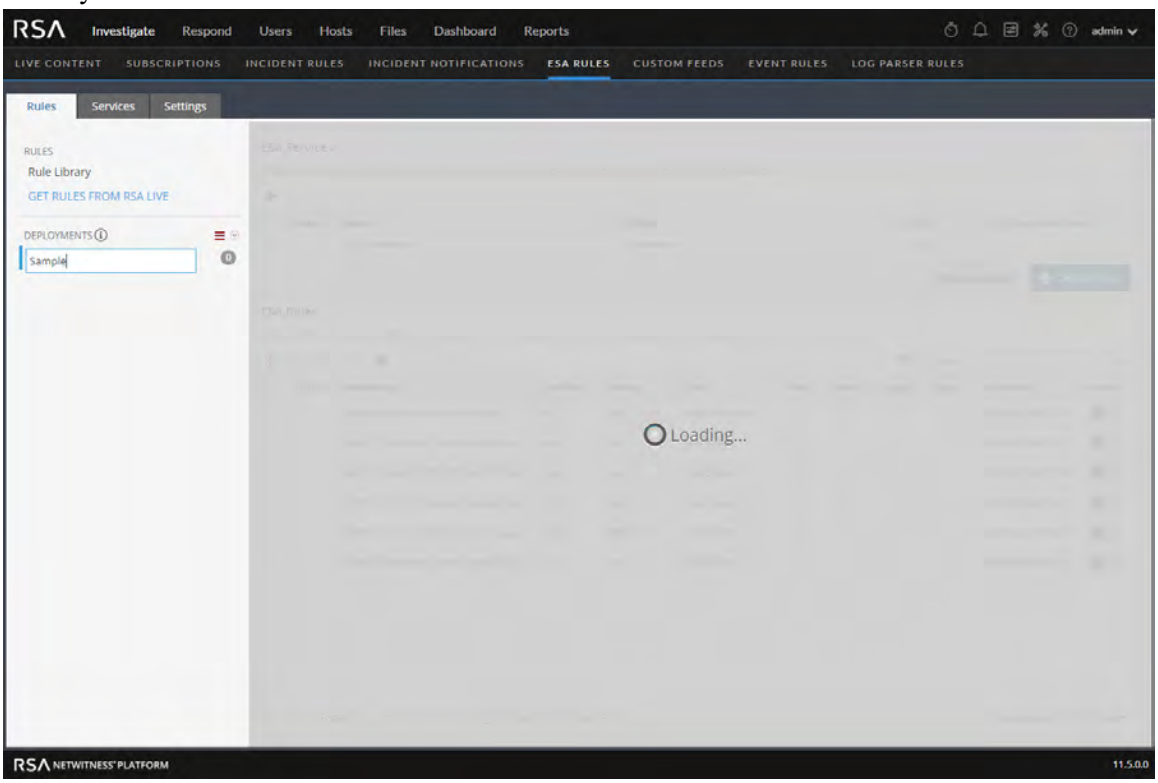
The following are required to add an ESA rule deployment:

- The ESA service must be configured on the host.
- Rules must be in the Rule Library. See Add Rules to the Rule Library.

#### To add an ESA rule deployment:

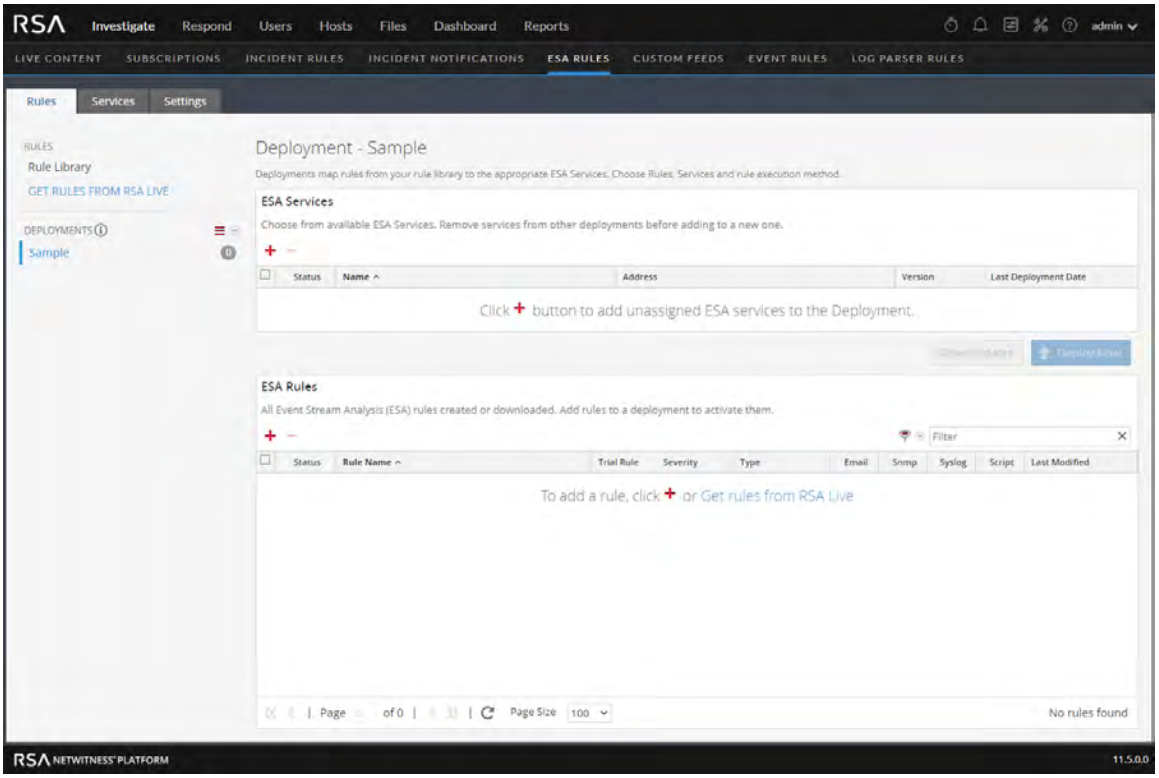
1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel on the left, next to Deployments, select **> Add** and type a **name** for the deployment. The naming convention is up to you. For example, it could indicate the purpose or

identify an owner.



In NetWitness 11.3 and later, the deployment names that you choose appear on the deployment tabs in the **(Configure) > ESA Rules > Services** tab.

3. Press **Enter**.
   The deployment is added. The Deployment view is displayed on the right.



## Step 2. Add an ESA Service

The ESA service in an ESA rule deployment gathers data in your network and runs ESA rules against the data. The goal is to capture events that match rule criteria, then generate an alert for the captured event.

An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments. For example, ESA London could be in these deployments simultaneously:

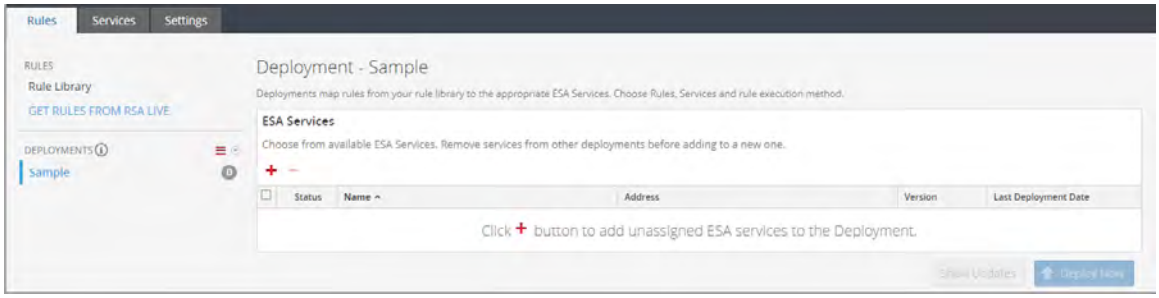
- Deployment EUR, which includes one set of rules
- Deployment CORP, which includes another set of rules.

Changes made to an ESA rule deployment do not take effect until you click Deploy Now. For example, Deployment EUR could include the ESA London service and a set of 25 rules. If you replace the ESA London service with the ESA Paris service, the next time you deploy Deployment EUR, the 25 rules will be removed from ESA London and added to ESA Paris.

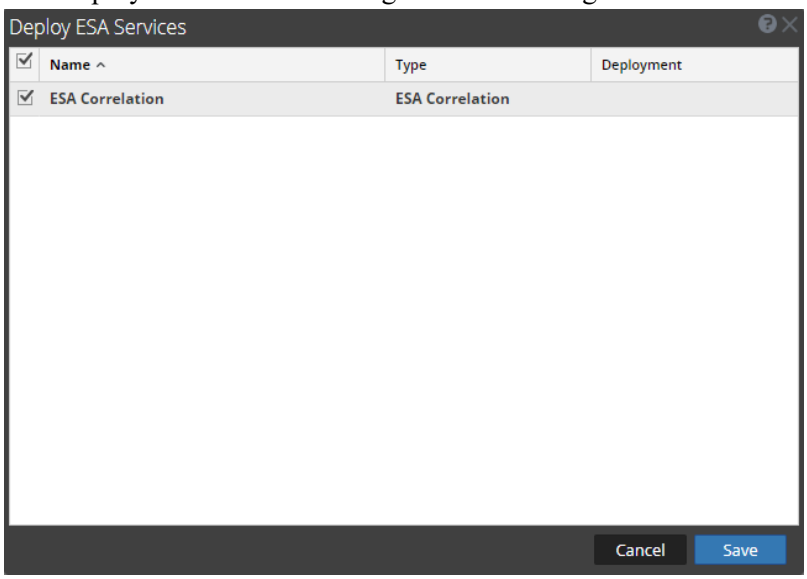
Deleting an ESA rule deployment immediately removes the rules from the ESA service. If an ESA service is not part of any deployment, the ESA service does not have any rules.

### To add an ESA service:

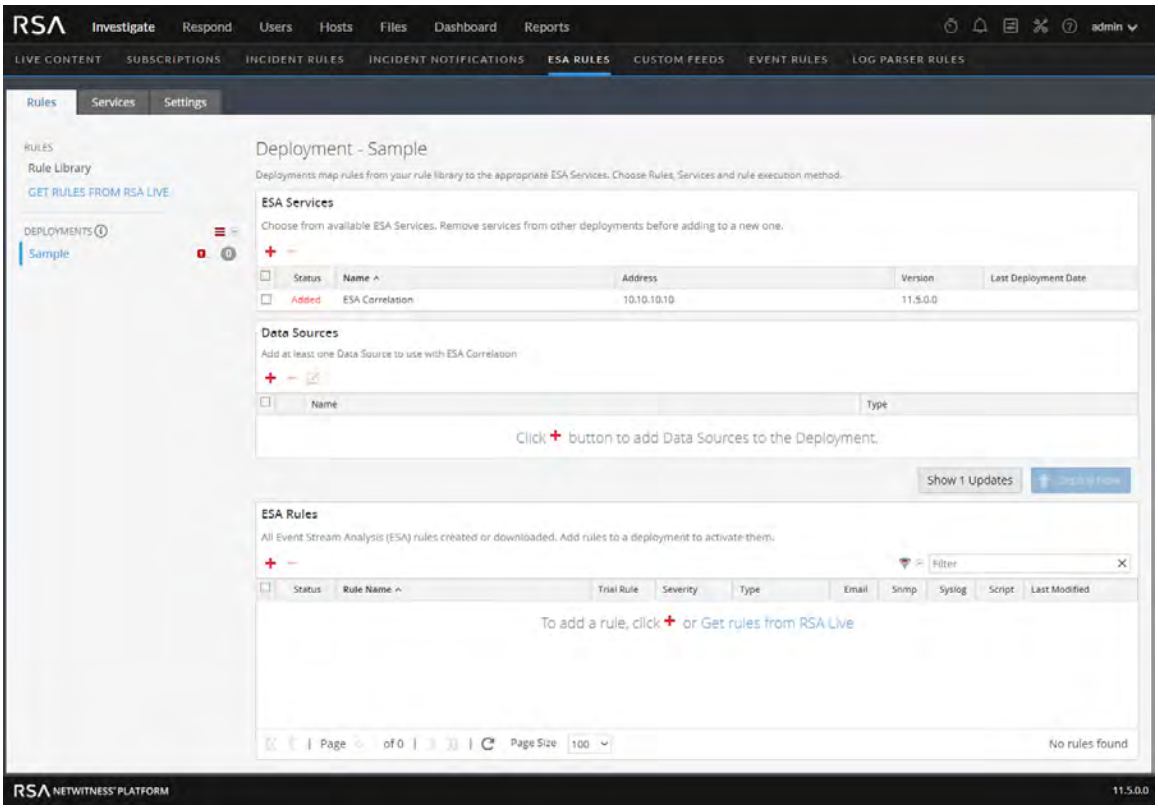
1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the options panel, select a deployment:



3. In the **Deployment** view, click + in **ESA Services**.
   The Deploy ESA Services dialog lists each configured ESA.



4. Select an ESA service and click **Save**.
   The Deployment view is displayed. The ESA service is listed in the **ESA Services** section, with the status **Added**.

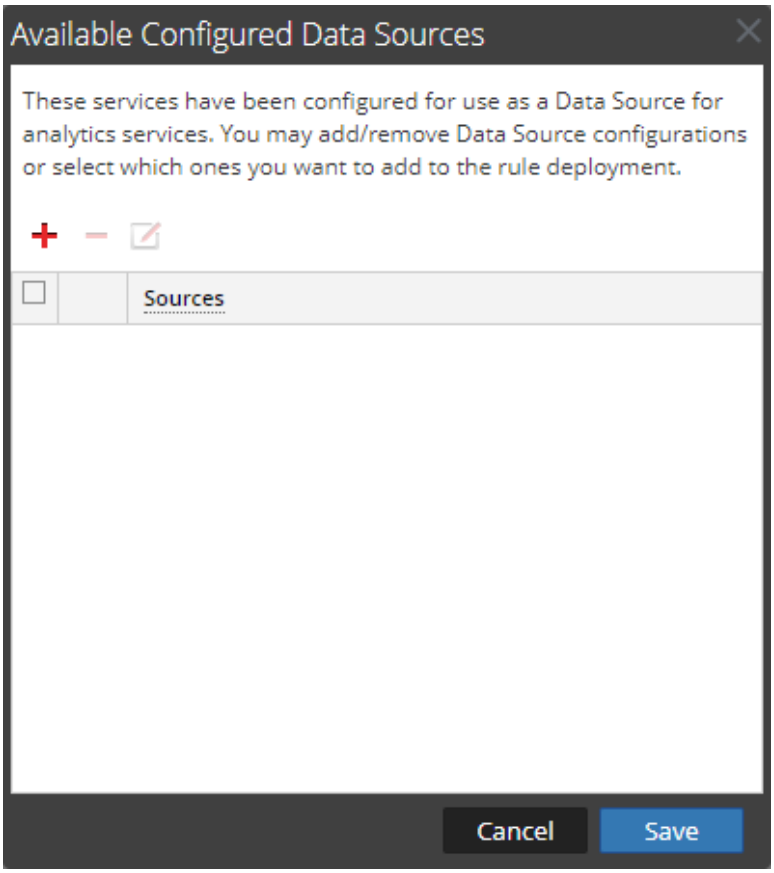


## Step 3. Add Data Sources

**Note:** This option is available in version 11.3 and later.

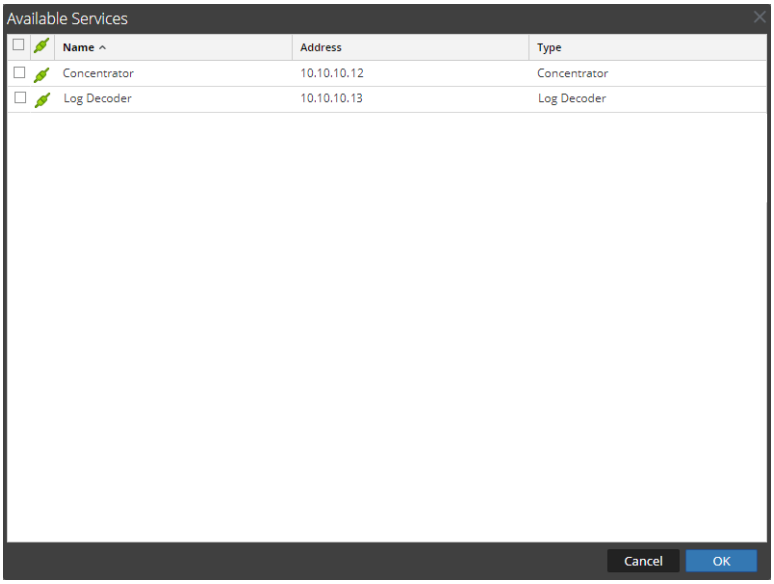
You can select one or more data sources, such as Concentrators, to use for your selected ESA Service. This enables you to specify different data sources for each deployment. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment.

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the options panel, select a deployment.
3. Configure one or more data sources for your deployment. Do the following for each data source:
   a. In the **Deployment** view **Data Sources** section, click + .
   The **Available Configured Data Sources** dialog lists the services that have been configured for use as a data source.



b. To add a data source configuration, click + .

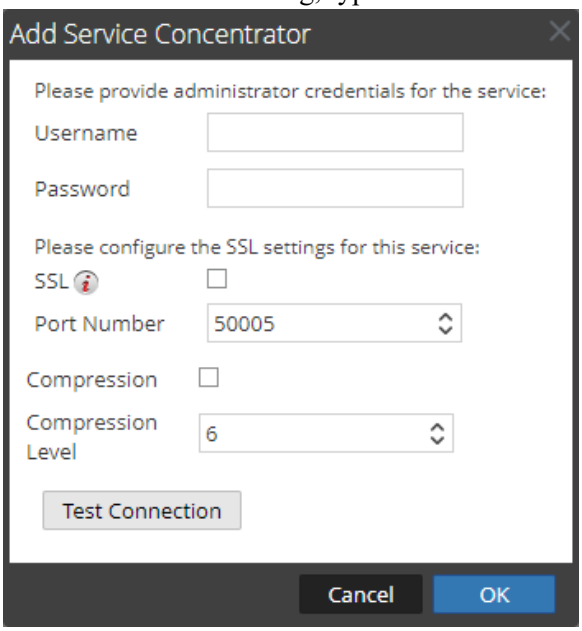
The **Available Services** dialog lists the available data sources from the (Admin) > Services view, such as Concentrators.



**Note:** You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

c. In the **Available Services** dialog, select a data source, such as a Concentrator, and click **OK**.

d. In the **Add Service** dialog, type the Administrator username and password for the data source.



e. To enable the SSL or Compression options, select the corresponding checkboxes.

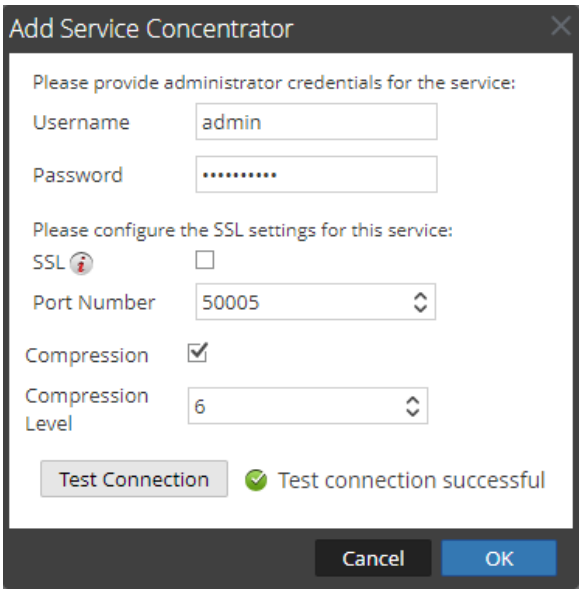
f. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

- Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
- Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
- Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

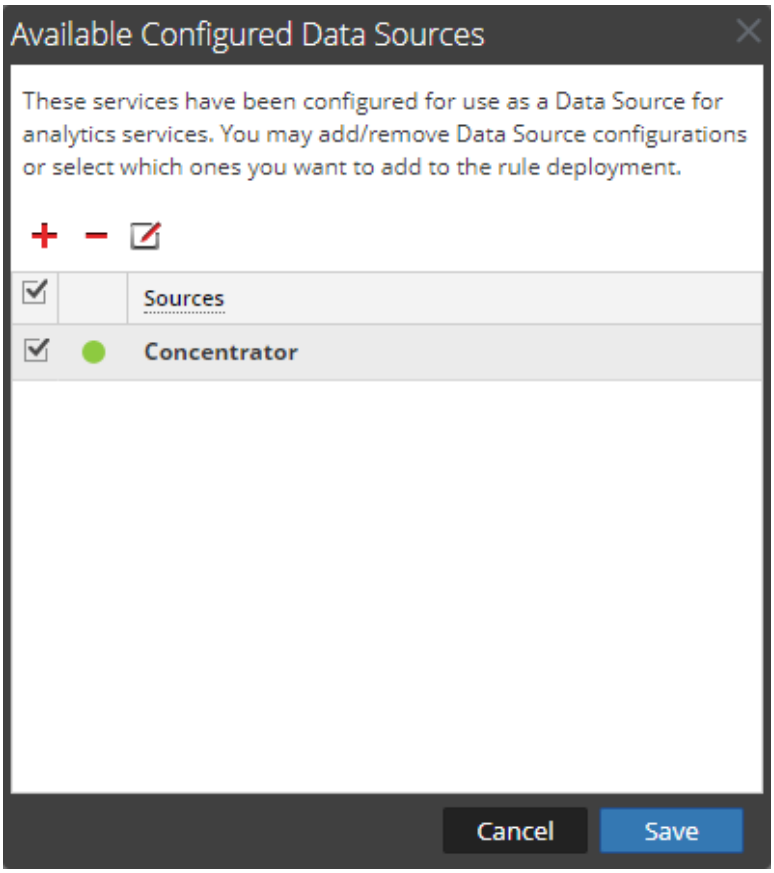
**Note:** If you make any ESA service, data source, or ESA rule changes to an ESA rule deployment, you need to redeploy the deployment. For example, if you change the configuration of a data source in an ESA rule deployment, you must redeploy all the ESA rule deployments that contain that data source.
When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules.

g. Click **Test Connection** to make sure that it can communicate with the ESA service.



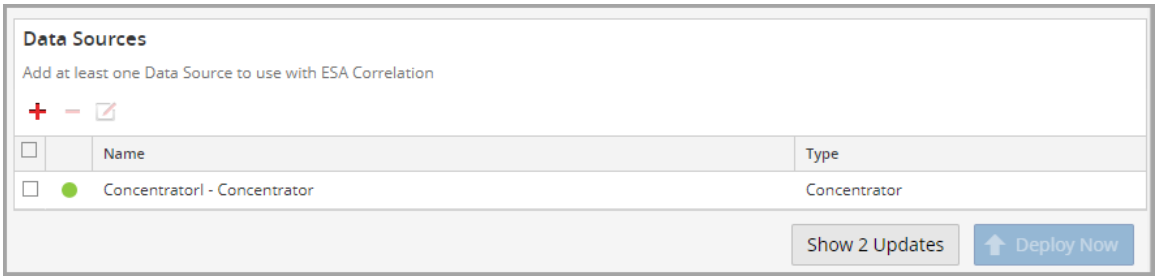
h. Click **OK**.
After you configure your data sources and they appear in the **Available Configured Data Sources** dialog, you can use them for your deployment.

4. In the **Available Configured Data Sources** dialog, select at least one data source to use for the deployment.



A solid colored green circle indicates a running service and a white circle indicates a stopped service.

5. Click **Save**.
   In the Deployment view **Data Sources** section, the selected data sources are added to the deployment. The **Deploy Now** button activates after an ESA service, a data source, and rules are added to an ESA rule deployment.



6. (Optional) If you have a medium to large NetWitness Platform deployment and you have high throughputs, you can create a filter to forward only the data relevant to this deployment to ESA. Before deploying the ESA rule deployment, add the data source filter. See (Optional) Add a Data Source Filter.

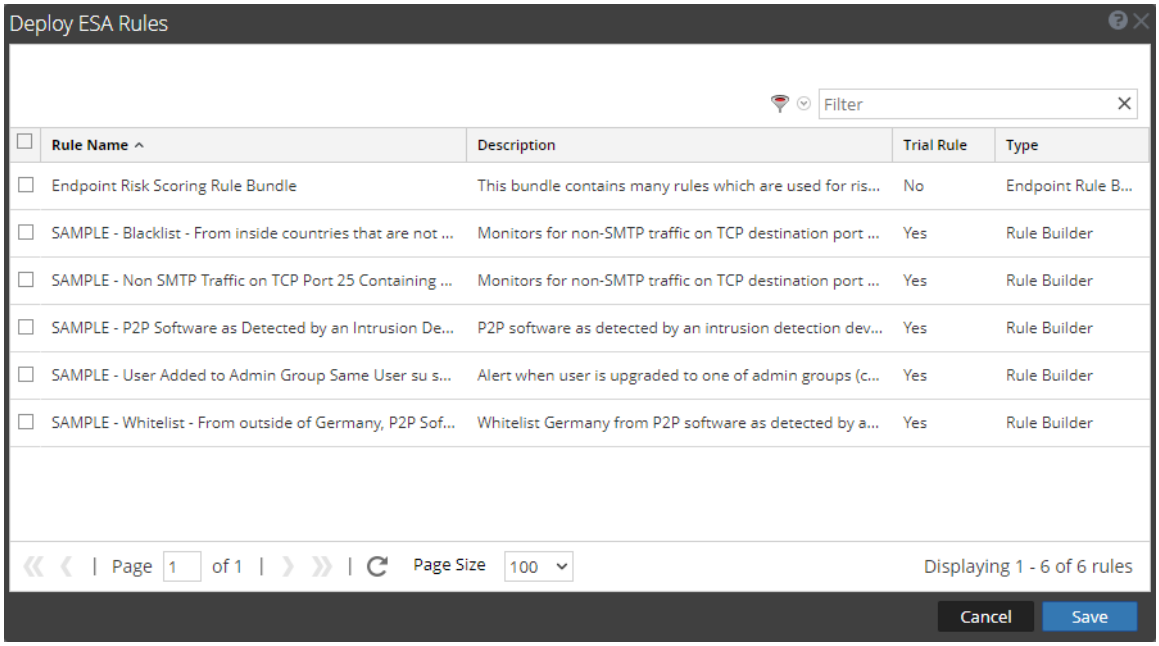
# Step 4. Add and Deploy Rules

This topic explains how to add ESA rules to an ESA rule deployment and then deploy the rules on ESA. Each ESA rule has unique criteria. The ESA rules in an ESA rule deployment determine which events ESA captures, which in turn determine the alerts you receive.

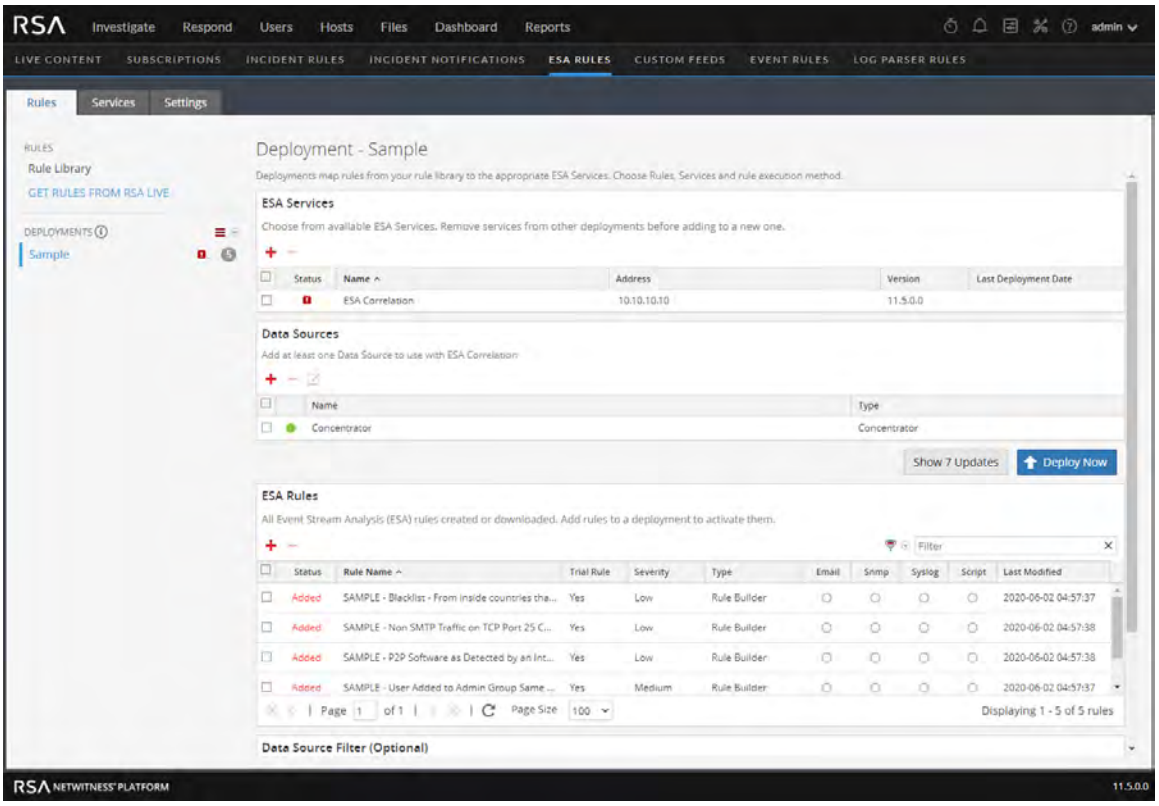
For example, Deployment A includes ESA Paris and, among others, a rule to detect file transfer using a non-standard port. When ESA Paris detects a file transfer that matches the rule criteria, it captures the event and generates an alert for it. If you remove this rule from Deployment A, ESA will no longer generate an alert for such an occurrence.

### To add and deploy rules:

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the options panel, select a deployment.
3. In the **Deployment** view, click in **ESA Rules**.
   The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library:

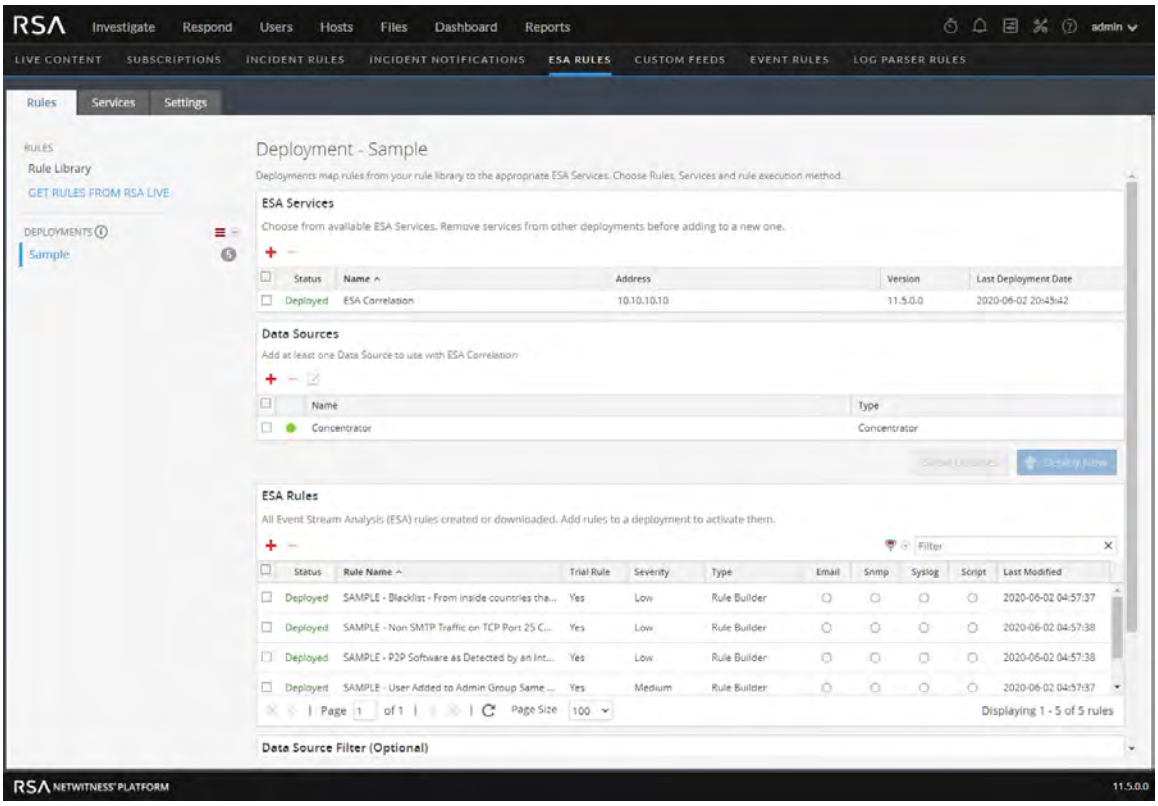


4. Select rules and click **Save**.
   The Deployment view is displayed and the **Deploy Now** button is enabled.



5. The rules are listed in the ESA Rules section.
   - In the Status column, **Added** is next to each new rule.
   - In the Deployments section, indicates there are updates to the deployment.
   - The total number of rules in the deployment is on the right.

6. Click **Deploy Now**.
   The ESA Correlation service runs the rule set. After ESA correlation completes the processing of each rule in the deployment, the status changes to **Deployed**.



## (Optional) Add a Data Source Filter

**Note:** This option is available in NetWitness Platform version 11.5 and later.

To improve performance, you can add an optional data source filter to your ESA rule deployment so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources. There are two options that you can use to create the filter:

- The **Simple** data source filter option enables you to select the application rules to be included in the filter query. The application rules that you select must be enabled on the Decoders that feed the data sources in your ESA rule deployment. ESA Correlation uses the filtered event data to process the ESA rules. This is the procedure described here.
- The **Advanced** data source filter option enables you to add a data source query directly. The individual application rule queries must be separated by an “or” condition. For more information on creating and writing Decoder rules, see "Configure Application Rules" in the *Decoder and Log Decoder Configuration Guide*.

**Caution:** The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

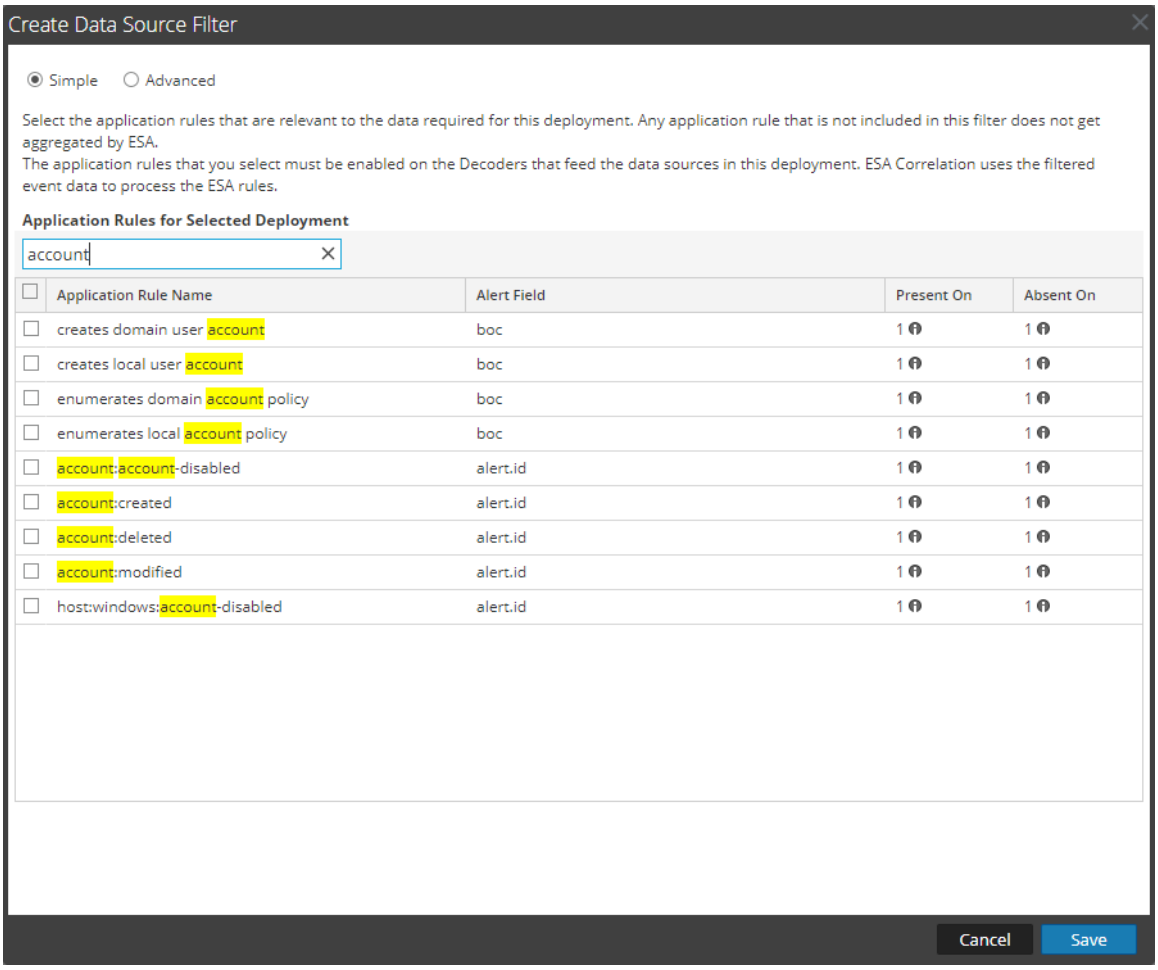
Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

**IMPORTANT:** If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

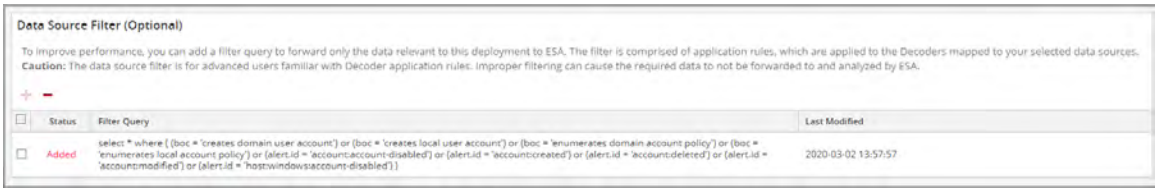
### To add a Simple data source filter:

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the options panel, select a deployment.
3. In the **Deployment** view **Data Source Filter (Optional)** section, click .

   The **Create Data Source Filter** dialog lists the application rules that are available to filter the events in the data sources in your ESA rule deployment.
4. Select the application rules that you want to use to filter the data sources in your deployment and click **Save**. The **Alert Field** shows the meta key used in the alert. **Present On** shows the number of Decoders mapped to the data sources that have the rule. **Absent On** shows the number of mapped Decoders that do not have the rule. If present, hover over the icon to view the names of the Decoders. You can use the filter to help locate the rules. For example, you can type "account" to search for application rules that contain that word.



The application rules that you select appear in a Filter Query with the status of Added.



5. When you are ready to deploy your ESA rule deployment, click **Deploy Now**.
   The ESA Correlation service runs the rule set. After ESA Correlation completes the processing of each rule in the deployment, the status changes to **Deployed**. The data source filter status changes to **Deployed** when the filter is actively streaming only the relevant data as defined in the filter query.

   **Troubleshooting Information**: When filtering out a large portion of the traffic, you may see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. Decrease the `max-sessions` parameter from 10,000 to a lower session count. See Adjust Maximum Sessions for the Data Source Filter.

## Deploy the Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Additional ESA Rule Deployment Procedures

In addition to deploying an ESA service and rules, you may want to perform other steps on your ESA rule deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to an ESA rule deployment.

**Note:** You cannot edit or duplicate an Endpoint Risk Scoring Rules Bundle.

In NetWitness version 11.3 and later, you can add or remove a data source from a deployment. In NetWitness 11.3.0.2 and later, you can edit a data source in an ESA rule deployment. This enables you to change the data source password, SSL, port, and compression settings.

- Replace an ESA Service in an ESA Rule Deployment
- Edit a Data Source in an ESA Rule Deployment (This option is available in NetWitness version 11.3.0.2 and later.)
- Add or Remove a Data Source (This option is available in version 11.3 and later.)
- (Optional) Add or Remove a Data Source Filter (This option is available in version 11.5 and later)
- Edit or Delete a Rule in a Deployment
- Stop Deployment
- Edit the ESA Rule Deployment Name or Delete a Deployment
- Show Updates to an ESA Rule Deployment
- Fast Deployment and Full Deployment of ESA Rules

Each of the following procedures starts in the Rules tab [ **(Configure) > ESA Rules > Rules** tab].

Anytime you make changes to an ESA rule deployment, you must redeploy it for the changes to take effect. To redeploy the deployment, click the **Deploy Now** button for that deployment.

## Replace an ESA Service in an ESA Rule Deployment

An ESA rule deployment can have only one ESA service, but you can replace it at any time with another ESA service. You can use the same ESA service in multiple deployments.

### Remove an ESA Service from an ESA Rule Deployment

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Services** section, select a service and click in the toolbar.
   A confirmation dialog is displayed.

4. Click **Yes**.
   The service is removed from the deployment.
5. After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

### Add an ESA Service to an ESA Rule Deployment

1. To add an ESA Service to an ESA rule deployment, see Step 2. Add an ESA Service. For the ESA Correlation service in NetWitness Respond 11.3 and later, you must add at least one data source to the service. See Step 3. Add Data Sources.
2. After you finish making changes to the ESA rule deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the ESA rule deployment is redeployed.

## Edit a Data Source in an ESA Rule Deployment

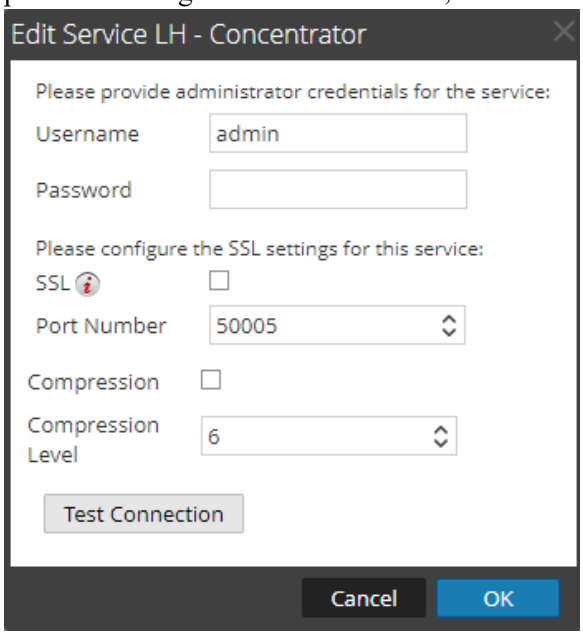
**Note:** This procedure applies to NetWitness Platform 11.3.0.2 and later versions.

You can change the configuration of a data source in an ESA rule deployment. You can change the data source password, SSL, port, and compression settings. When a data source password changes, it is important to change the password on the data source so that ESA can continue to communicate with the data source.

**Note:** If you make any ESA service, data source, or ESA rule changes to an ESA rule deployment, you need to redeploy the deployment. For example, if you change the configuration of a data source in an ESA rule deployment, you must redeploy all the ESA rule deployments that contain that data source.

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **Data Sources** section, select a data source and click  in the toolbar.

4. In the **Edit Service** dialog, type the Administrator username and password for the data source. If the password changed on the data source, enter the new password here.

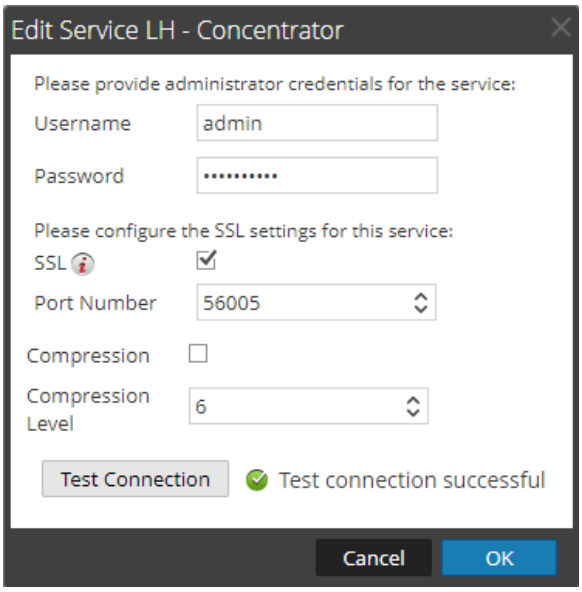


5. To enable the SSL or Compression options, select the corresponding checkboxes.
6. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:
   - Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
   - Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
   - Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

   Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

   **Note:** When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules.

7. Click **Test Connection** to make sure that it can communicate with the ESA service.



8. Click **OK**.
9. After you finish making changes to the deployment, click **Deploy Now** to redeploy the ESA rule deployment. The changes take effect on ESA after the deployment is redeployed. You can view the update information in the Updates to the Deployments dialog. See Show Updates to an ESA Rule Deployment.

## Add or Remove a Data Source

**Note:** This option is available in NetWitness version 11.3 and later.

### Remove a Data Source from an ESA Rule Deployment

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **Data Sources** section, select the data source and click in the toolbar.
   The data source is removed from the deployment.
4. After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

### Add a Data Source to an ESA Rule Deployment

1. To add a data source, see Step 3. Add Data Sources.
2. After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

## (Optional) Add or Remove a Data Source Filter

To improve performance, you can add an optional data source filter to your ESA rule deployment so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

You cannot edit a data source filter. To modify a data source filter, you must remove the filter, add a new filter, and then redeploy the ESA rule deployment.

**Note:** This option is available in NetWitness version 11.5 and later.

**Caution:** The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

**IMPORTANT:** If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

### Remove a Data Source Filter from an ESA Rule Deployment

If you plan to replace your data source filter with an adjusted filter, you may want to copy the filter query in the data source filter before you remove it and compare it with the new query.

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **Data Source Filter (Optional)** section, select the filter and click  in the toolbar.
   The filter is removed from the deployment.
4. After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

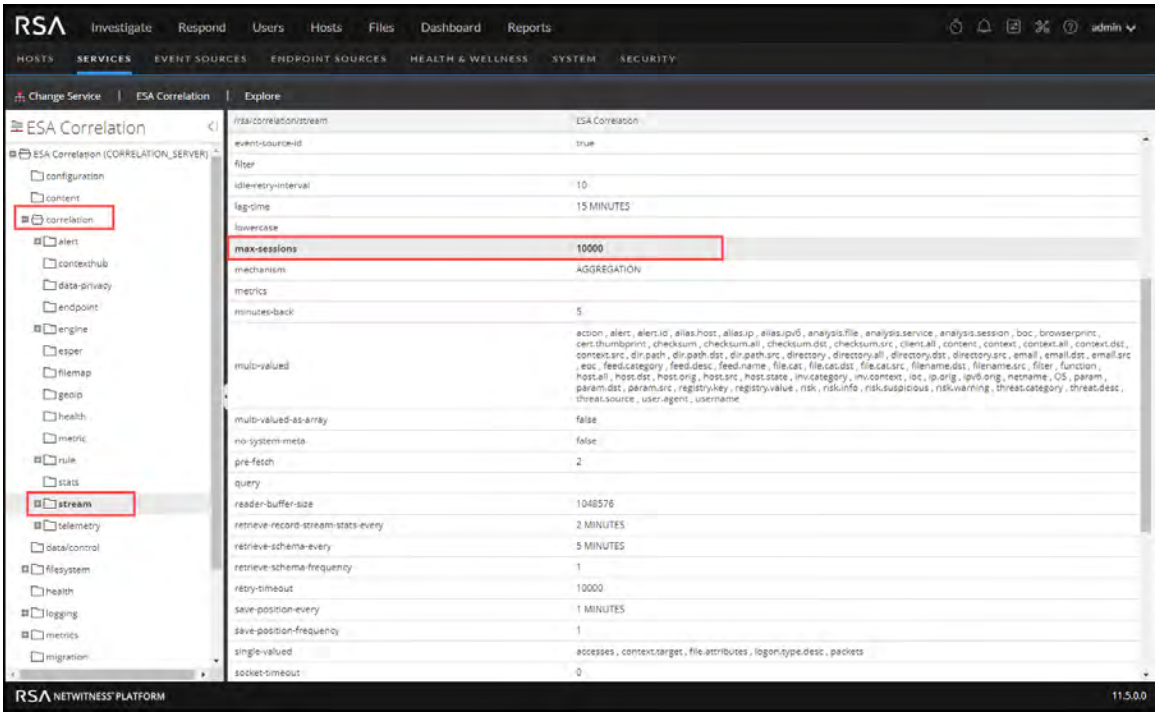
### Add a Data Source Filter to an ESA Rule Deployment

1. To add a simple data source filter, see (Optional) Add a Data Source Filter. If necessary, you can use the advanced filter instead of the simple filter to add a data source query directly. The individual application rule queries must be separated by an "or" condition. For more information on creating and writing Decoder rules, see "Configure Application Rules" in the *Decoder and Log Decoder Configuration Guide*.
2. After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

### Adjust Maximum Sessions for the Data Source Filter

When filtering out a large portion of the traffic, you may see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. (You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`). Lower the `max-sessions` parameter until you no longer see the error in the log. The more you filter out the traffic, the lower you should set the `max-sessions` parameter.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.



2. In `max-sessions`, lower the value until you no longer see the error in the ESA Correlation log file. The default value is **10000**.
3. Restart the ESA Correlation service. Go to **(Admin) > Services**, select the ESA Correlation service, and then select **> Restart**.

## Edit or Delete a Rule in a Deployment

In an ESA rule deployment, you can edit and delete rules to customize the deployment.

### Edit a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, double-click a rule to open it in a new tab.

4. Modify the rule, then click **Save**.
   The rule is saved.
5. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the deployment is redeployed.

### Delete a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, select a rule and click  in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The rule is deleted.
5. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the deployment is redeployed.

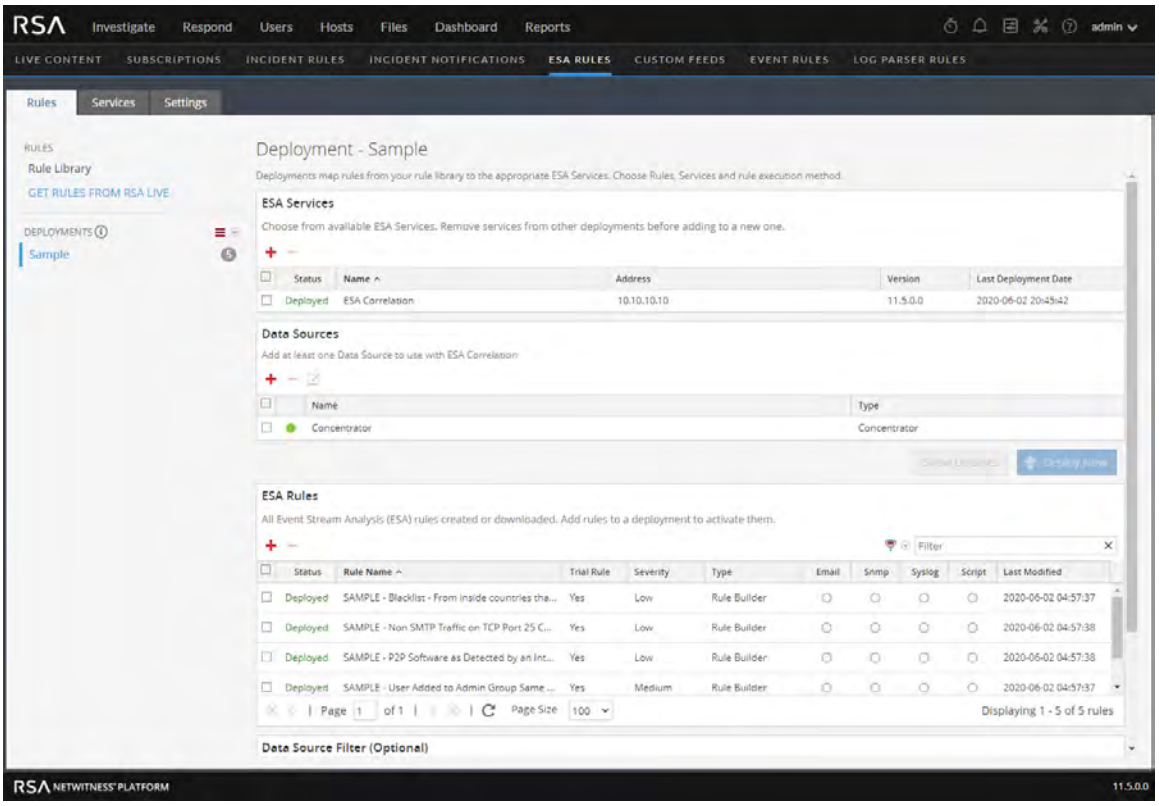
## Stop Deployment

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, select a rule and click  in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The rule is to stopped.
5. Click **Stop Deployment** to stop the deployment.

## Edit the ESA Rule Deployment Name or Delete a Deployment

#### To access the deployments:

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. In the options panel, under **Deployments**, select a deployment.
   The Deployment view is displayed.



## Edit the ESA Rule Deployment Name

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select **> Edit**.

   The deployment name is made available for editing.

3. Enter the new deployment name.

4. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the ESA rule deployment is redeployed. In NetWitness 11.3 and later, the deployment names that you choose appear on the deployment tabs in the **(Configure) > ESA Rules > Services** tab.

## Delete an ESA Rule Deployment

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select **> Delete**.

   A confirmation dialog is displayed.

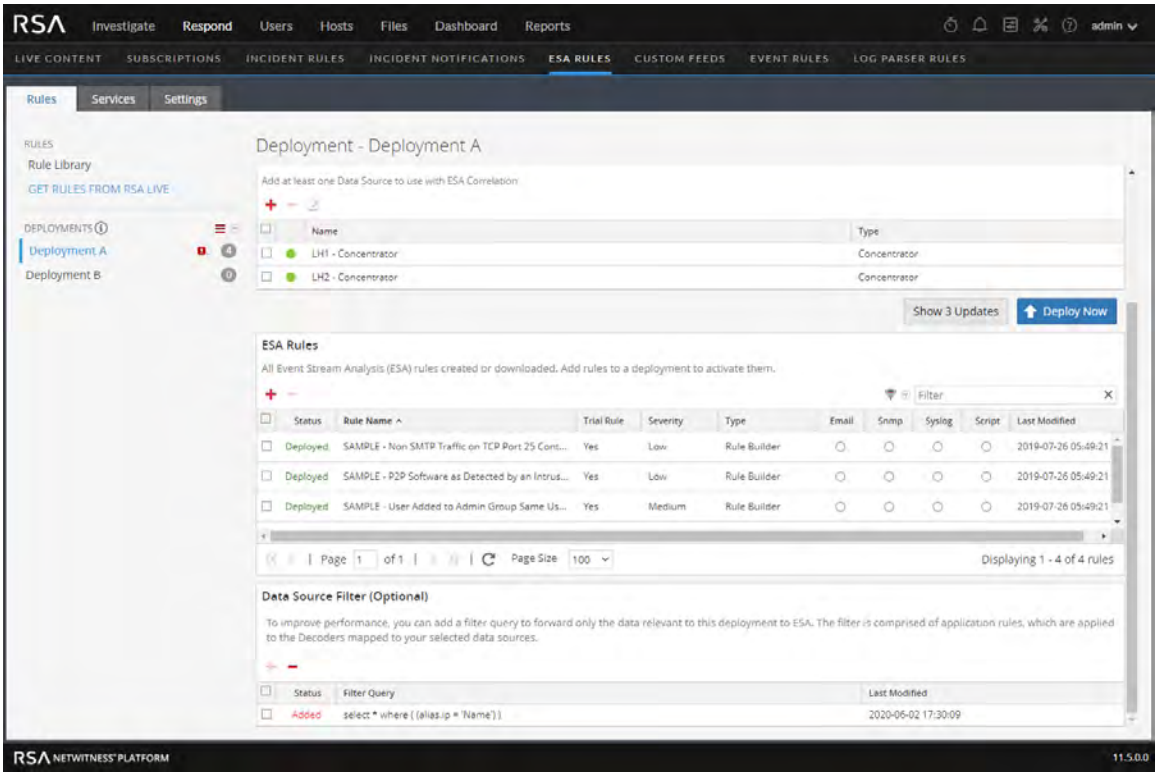
3. Click **Yes**.

   The deployment is deleted.

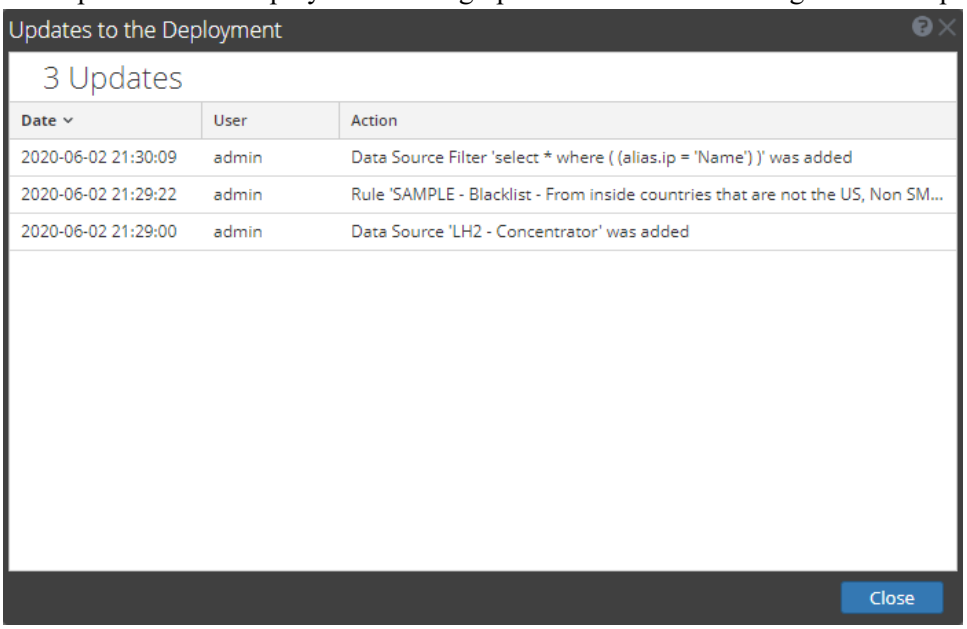
## Show Updates to an ESA Rule Deployment

You can view changes to an ESA rule deployment, such as adding or removing rules. When there is a change to a deployment, the update icon ( ) appears next to the name of the deployment in the Rules tab options panel.

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, under **Deployments** click **Show Updates** on the far right.



The Updates to the Deployments dialog opens and shows the changes to the deployment.



3. Click **Close**.

## Fast Deployment and Full Deployment of ESA Rules

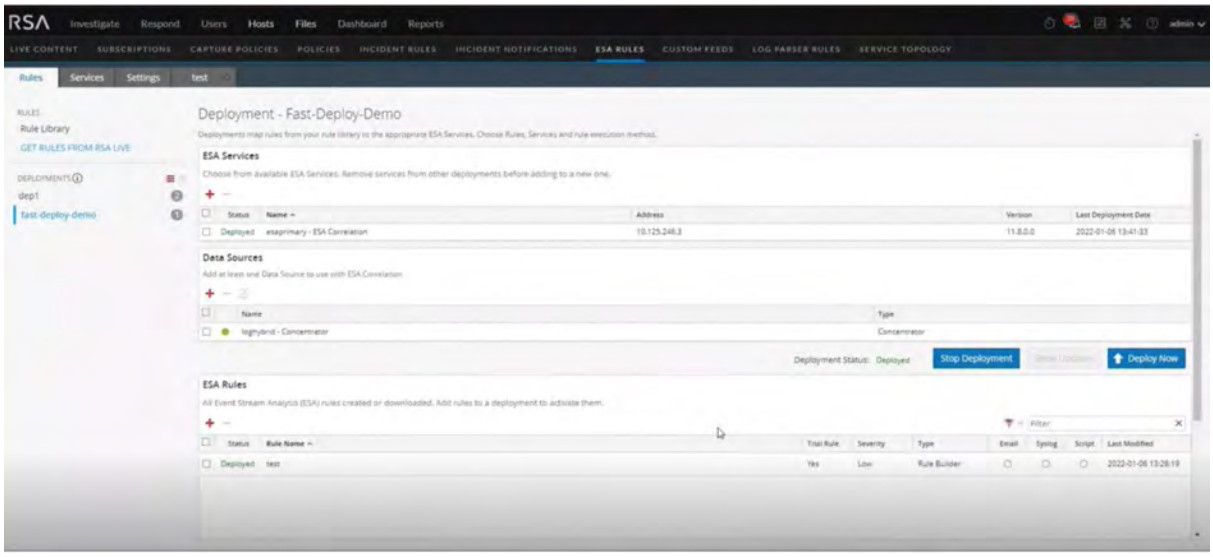
Only changes to an ESA rule is eligible for a fast deployment. This means if an ESA rule has been added, modified or deleted only then you can perform a fast deployment. In case, along with rules, if anything else has been changed such as a data source has been added, then the Fast Deployment option will not be displayed as it will not be eligible. The Fast Deployment option can be used to quickly load the latest rule that runs entirely on the Esper Engine hence reducing the need to redeploy the engine again in a shorter time where all the related settings of the selected deployment are deleted and the deployment is recreated from scratch.

The Full Re-Deploy can be used if:

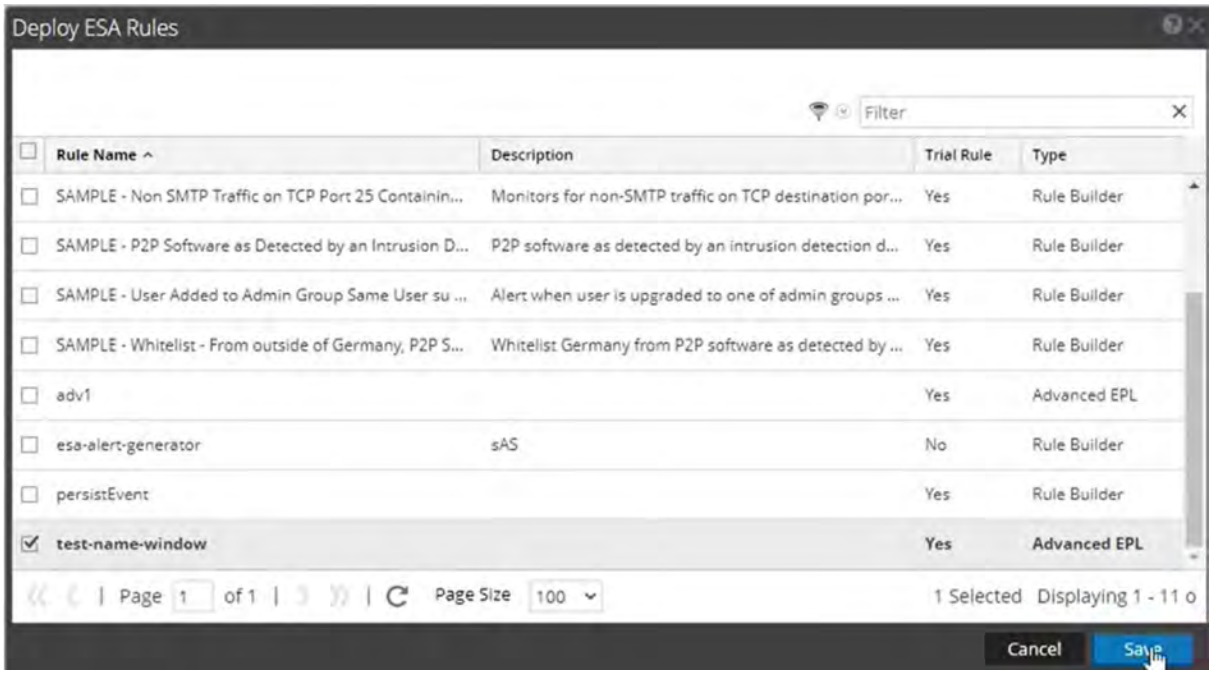
- The previously deployed rules failed, and the analyst wants to redeploy the same rules again.
- There are other changes made to the ESA Services, the Data Sources along with the ESA Rules.
- If the analyst wants to tear down the entire engine and recreate it.

To perform Fast Deployment:

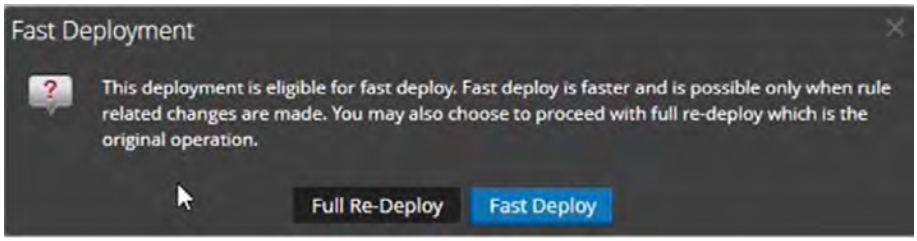
1. Go to (**Configure**) > **ESA Rules**.
   The Rules tab is displayed.



2. Under ESA Rules, click to deploy a new rule.
3. Select a rule you want to deploy from the list and click **Save**.



4. Click **Deploy Now**.
   A confirmation message is displayed.



5. Click **Fast Deploy** to begin the deployment of the new ESA Rule.

**Note:** The Fast Deploy button will be displayed only if the ESA rule has been added, deleted or updated, not if you have made updated to the ESA Services or Data Sources.

# View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts

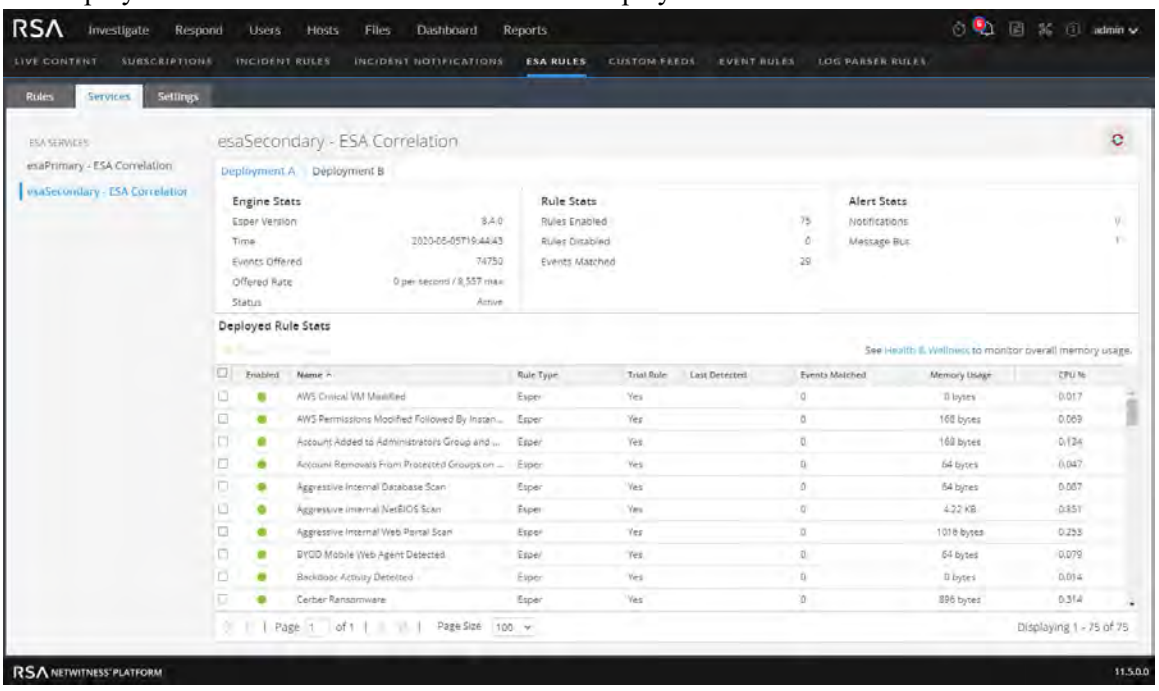
## View Stats for an ESA Service

This topic describes how to view the deployment statistics (stats) for an ESA Correlation service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot an ESA rule deployment.

**Caution:** When you modify and re-deploy an ESA rule deployment, all of the stats are removed from that deployment. The generated alerts are not removed from NetWitness Respond.

### View ESA Stats

1. Go to **(Configure) > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.



3. (This option applies to NetWitness version 11.3 and later.) In the Deployment view under the ESA Correlation service name, select the tab of the deployment you would like to view. For example, select the Deployment A tab to view the stats for deployment A. Select the Deployment B tab to view the status for deployment B.
4. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.
   - **Engine Stats**
   - **Rule Stats**
   - **Alert Stats**
5. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - The type of rule
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
   - The amount of memory used by the rule
   - The percentage of the deployment CPU used by the rule (available in NetWitness version 11.5 and later)
6. To monitor overall memory usage and health of your ESA Correlation service, click **Health & Wellness**.

## Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

## Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

1. Click in the upper right corner to refresh the information.
2. View the updated information.

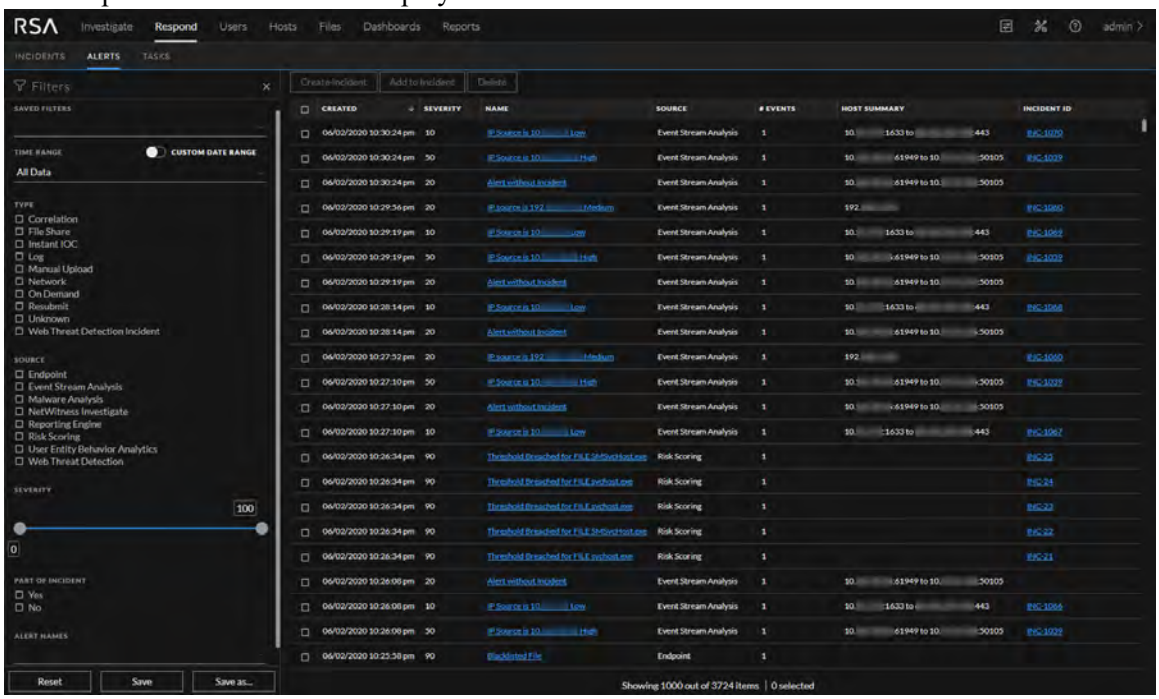
# View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range from the following sources:

1. Detect AI
2. Endpoint
3. Event Stream Analysis
4. Malware Analysis
5. NetWitness Investigate
6. Reporting Engine
7. Risk Scoring
8. User Entity Behavior Analysis
9. Web Threat Detection

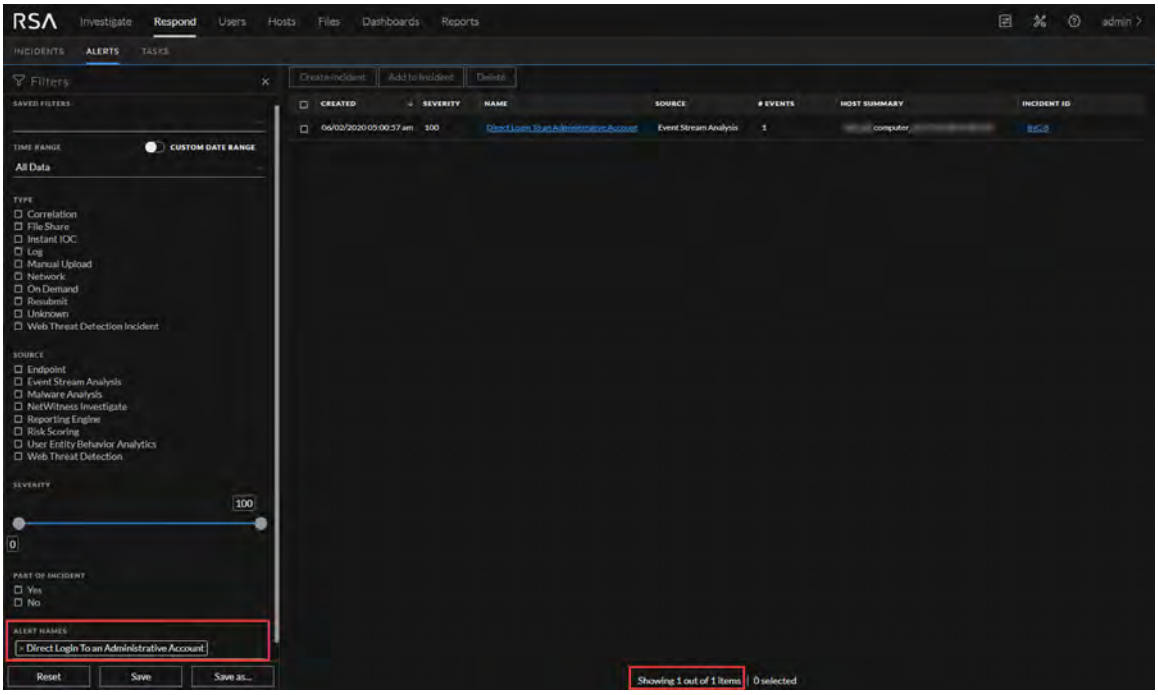
Perform the following steps to use the functionalities provided in the Respond view.

1. Go to **Respond > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness alerts.



2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the Alert Names section, you can select an alert for an ESA rule, such as

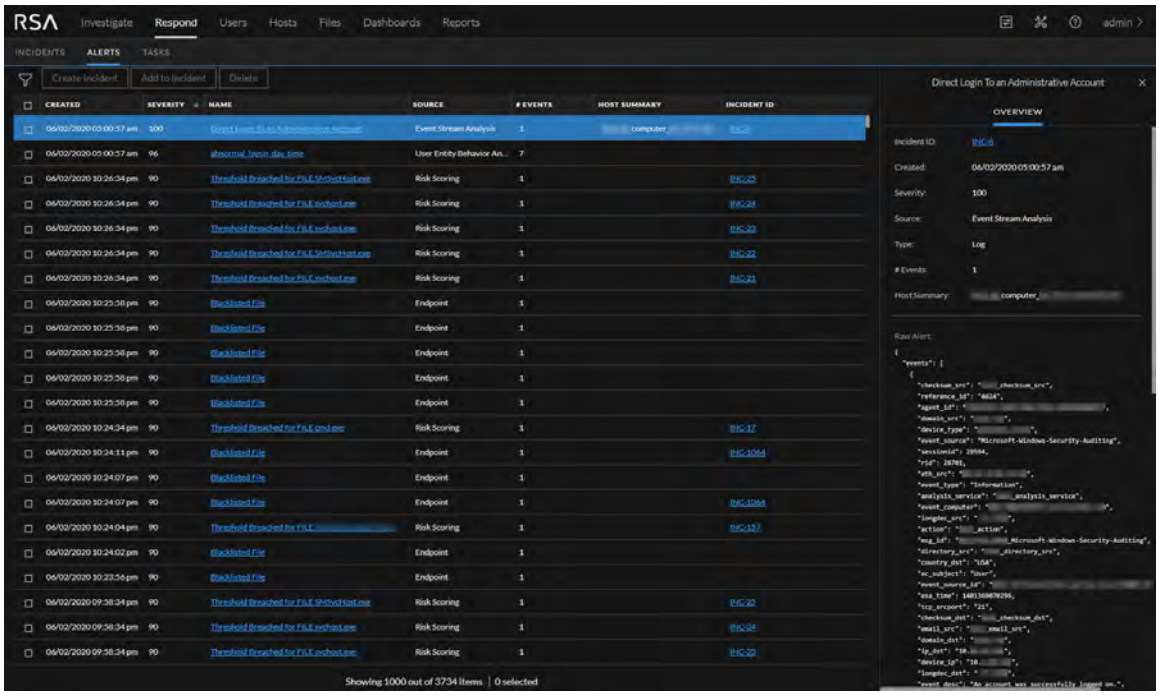
Direct Login to an Administrative Account, and leave the Time Frame set to Last Hour.
The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.



The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.



For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

# Add an Advanced EPL Rule

This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

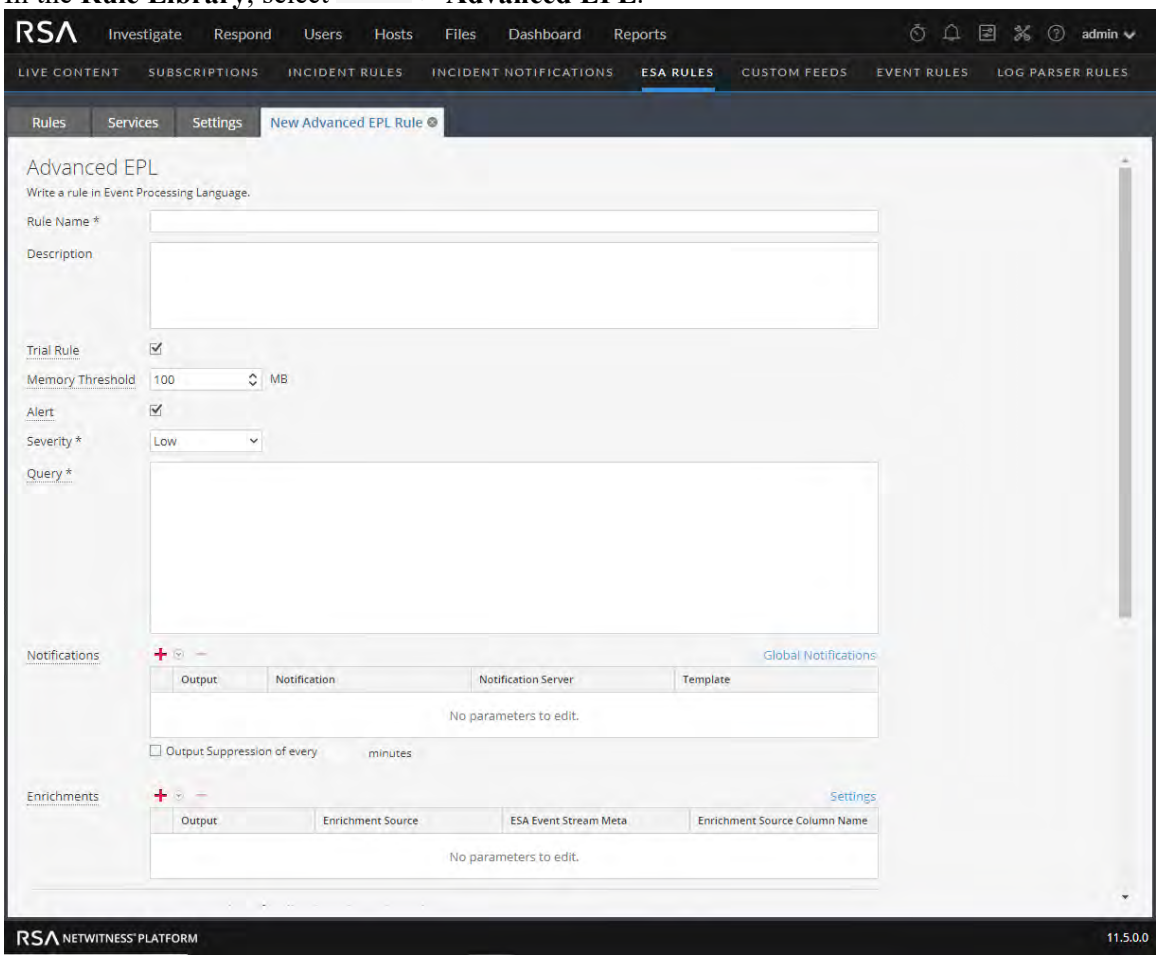
## Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

# Add an Advanced EPL Rule

1. Go to (Configure) > **ESA Rules**.
2. In the **Rule Library**, select > **Advanced EPL**.



3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library
5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.
6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) >

ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.

7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
8. For **Severity**, classify the rule as Low, Medium, High or Critical.
9. To define rule criteria, write a **Query** in EPL.

**Note:** For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

Supported meta entities:

| S. No | Supported Meta Entities | Description |
|---|---|---|
| 1 | fullname_all | |
| 2 | eth_all | |
| 3 | ip_all | Combines all the IPv4 meta keys. |
| 4 | ipv6_all | Combines all the IPv6 meta keys. |
| 5 | port_src_all | |
| 6 | port_dst_all | |
| 7 | dir_path_all | |
| 8 | org_all | |
| 9 | geoip_all | |
| 10 | port_all | |
| 11 | domain_all | |
| 12 | email_all | |
| 13 | filename_all | |
| 14 | directory_all | |
| 15 | checksum_all | |
| 16 | param_all | |
| 17 | context_all | |
| 18 | attack_all | |
| 19 | analysis_all | |

| | | |
|---|---|---|
| 20 | compromise_all | |
| 21 | inv_all | |
| 22 | outcome_all | |
| 23 | ec_all | |
| 24 | user_all | |
| 25 | host_all | |
| 26 | client_all | |

10. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

    `@Name("RIG {ip_src} {alias_host} {ec_activity}")`

    where,

    - RIG is the static part of the statement name
    - {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

    **Note:** If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

    If a rule should generate an alert, include this ESA annotation in the syntax:

    `@RSAAlert`

    For more information on ESA Annotations, see ESA Annotations.

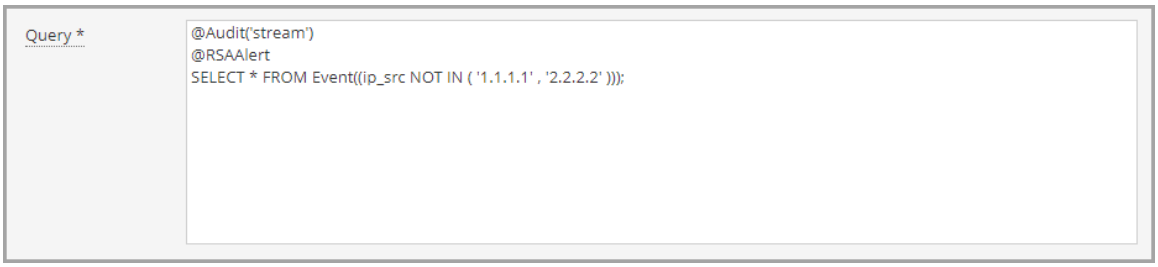
## Validate an Advanced EPL Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

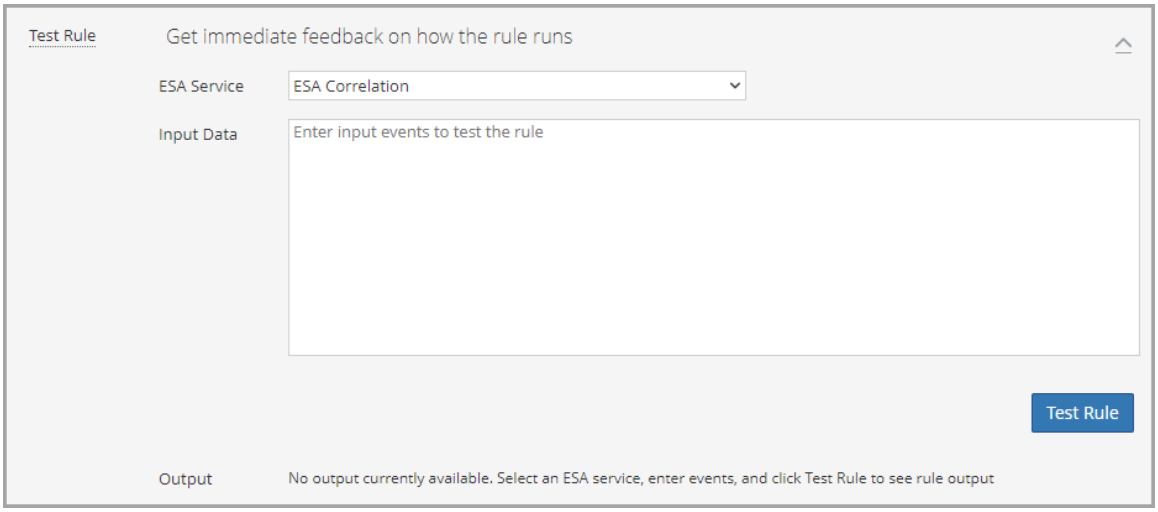
If you want to view all of the debug information, include an `@Audit('stream')` annotation to your rule query and view the Debug Log in the test output. To enable auditing you require to add `@Audit` to the rule and set the logging level for the Esper audit package to INFO. This can be done by creating `correlation-server.yml` file under `/etc/netwitness/correlation-server` with this content and restarting the correlation-server service with systemctl restart rsa-nw-correlation-server:

```
logging:
   level:
     com.espertech.esper.audit: INFO
```

The following basic example query contains the `@Audit('stream')` annotation and queries for events that do not have a source IP of 1.1.1.1 or 2.2.2.2.



1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.
2. Scroll down to the **Test Rule** section.



3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   **To download the events from the Investigate > Navigate view:**

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.

   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.

   c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].

   d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

   e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

**To download the events from the Investigate > Events view:**

a. In the main menu, go to **Investigate > Events** in a new tab.

b. In the Events view, enter a query for the ESA rule test.

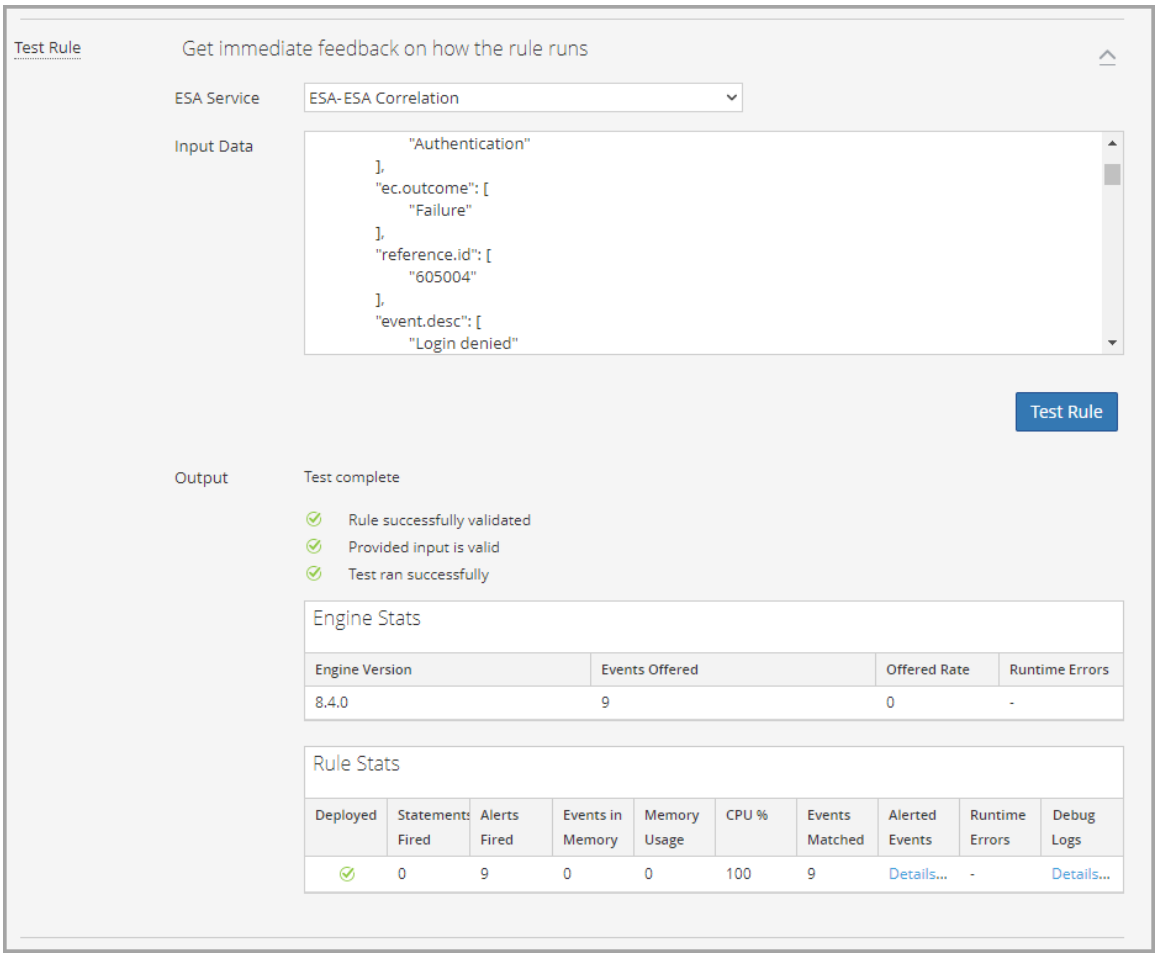
c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.



**Note:** If you are testing any Rule that has meta key defined as type 'short', the Test Rule will not generate alert for the event.

The following table describes the test rule output **Engine Stats**.

| Field | Description |
|---|---|
| Engine Version | Esper version running on the ESA service |
| Events Offered | Number of events processed by the ESA service since the last service start |
| Offered Rate | The rate that the ESA service processes current events / The maximum rate that the ESA service processed events |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment. |

The following table describes the test rule output **Rule Stats**.

| Field | Description |
|---|---|
| Deployed | A green checkmark indicates that the rule is deployed on the selected ESA service. |
| Statements Fired | The number of statements that fired the alerts |
| Alerts Fired | The number of alerts generated from the test data |
| Events in Memory | The number of events placed in memory by the rule |
| Memory Usage | The total amount of memory used by the rule |
| CPU % | The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. |
| Events Matched | The number of events that matched the rule |
| Alerted Events | If applicable, this field can contain a link to events that caused an alert. |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the rule. |
| Debug Logs | This field contains a link to Esper debug (audit) logs. |

# Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Advanced ESA rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can make a strict pattern match for better performance.

Strict Pattern Match Example

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
     (medium IN ( 1 ) AND
     filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' , 'windows
executable' ))
     ).win:time(5 Minutes)
MATCH_RECOGNIZE (
     MEASURES E1 as e1_data , E2 as e2_data
     PATTERN (E1 E2)
     DEFINE
          E1 as (E1.filetype IN ('pdf')),
          E2 as (E2.filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' ,
'windows executable' ))
```

```
);
```

**Caution:** Care should be taken to only add the case-insensitive *toLowerCase()* function on meta keys as needed. The *toLowerCase()* function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function.

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

**Note:** In NetWitness version 11.5, ESA Correlation supports Esper version 8.4.0. In version 11.4, ESA Correlation supports Esper version 8.2.0 and in version 11.3, ESA Correlation supports Esper version 7.1.0.

# ESA Annotations

This topic describes annotations that NetWitness provides to use in advanced EPL rules.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

## @RSAContext Annotation (11.5 and later)

The @RSAContext annotation can be used in advanced rules to dynamically add or remove data from a Context Hub list after the rule fires. For example, you can create a rule that automatically adds an IP address to a blacklist and removes it from a whitelist.

You can update a single-column or a multi-column Context Hub list. The @RSAContext annotation also performs error handling when the Context Hub list cannot be reached.

### Prerequisites

Before deploying a rule using the @RSAContext annotation, the list must exist in Context Hub. For information on creating a Context Hub list, see the *Context Hub Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**IMPORTANT:** If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

### Single-Column Context Hub Lists

The @RSAContext annotation uses the following format for a single column Context Hub list:

```
@RSAContext (list="<single_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"LIST=<meta_key>"})
```

The @RSA Context parameters for a **single-column** Context Hub List are described in the following table.

| Parameter | Description |
|---|---|
| `list` | Where `<single_column_list>` is the name of the single-column Context Hub list (whitelist or blacklist). |
| `action` | You can add an entry to or remove an entry from the list:<br>• `DELETE_ENTRY` - Removes an entry from the list.<br>• `ADD_ENTRY` - Adds an entry to the list.<br>You can only have one action per `@RSAContext` entry. |

| Parameter | Description |
|---|---|
| onError | Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options:<br>• STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists.<br>Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing.<br>• IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed.<br>Select this option if continuing rule processing is more important than updating the Context Hub list. |
| fields | Maps a meta key value to the column in the Context Hub list. Single-column lists always show LIST= in capital letters. |

The first example deletes a source IP address from an IP whitelist. However, if the list is not available, the source IP address is not removed from the list and processing is continued.

```
@RSAContext (list="ip_whitelist", action=DELETE_ENTRY, onError = IGNORE_ERROR_
AND_CONTINUE, fields={"LIST=ip_src"})
```

The second example adds a source IP address to an IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="ip_blacklist", action=ADD_ENTRY, onError = STOP_ALL_RULE_
PROCESSING_AND_WAIT, fields={"LIST=ip_src"})
```

## Multi-Column Context Hub Lists

The @RSAContext annotation uses the following format for a multi-column Context Hub list:

```
@RSAContext (list="<multi_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"<column1>=<meta_key1 or constant value1>",<column2>=<meta_key2 or
constant value2>",<column n>=<meta_key n or constant value n>",})
```

The @RSA Context parameters for a **multi-column** Context Hub List are described in the following table.

| Parameter | Description |
|---|---|
| list | Where <multi_column_list> is the name of the multi-column Context Hub list. |
| action | You can add an entry to or remove an entry from the list:<br>• DELETE_ENTRY - Removes an entry from the list.<br>• ADD_ENTRY - Adds an entry to the list.<br>You can only have one action per @RSAContext entry. |
| onError | Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options:<br>• STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists.<br>Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing.<br>• IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed.<br>Select this option if continuing rule processing is more important than updating the Context Hub list. |
| fields | Maps a meta key values or constant values to the columns in the Context Hub list. Multi-column lists show the names of each column in the fields parameter.* |

The first example deletes a user and the associated source and destination IP addresses from a multi-column IP whitelist. However, if the list is not available, the specified fields are not removed from the list and processing is continued.

```
@RSAContext (list="MultColumn_whitelist", action=DELETE_ENTRY, onError =
IGNORE_ERROR_AND_CONTINUE, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

The second example adds a user and the associated source and destination IP addresses to a multi-column IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="MultColumn_blacklist", action=ADD_ENTRY, onError = STOP_
ALL_RULE_PROCESSING_AND_WAIT, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

### Automatic Context Hub List Updates

When using the @RSAContext annotation in your rules, string array meta keys (shown as `string[]` in the Meta Key References on the ESA Rules > Settings tab) are inserted and removed as separate lines in the Context Hub list. This enables lookups in the Investigate and Respond views.

#### Single Column Context Hub List Update Example

A single column Context Hub list has one column with the string array meta key `alias_host`. If the rule using that list fires and `alias_host` has three values (Google, Yahoo, and Dell), ESA Correlation adds three rows to the Context Hub list:

Google
Yahoo
Dell

#### Multi-Column Context Hub List Update Example

A multi-column Context Hub list has three columns. If the rule using that list fires and the meta keys have the following values:

- `username` (string array) with values Aimee and Chris
- `ip_dst` (string) with value 10.10.10.10
- `alias_host` (string array) with values Dell, Google, and Yahoo

ESA Correlation adds six rows to the Context Hub list:

Aimee, 10.10.10.10, Dell
Aimee, 10.10.10.10, Google
Aimee, 10.10.10.10, Yahoo
Chris, 10.10.10.10, Dell
Chris, 10.10.10.10, Google
Chris, 10.10.10.10, Yahoo

## @RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

| Event number | Message ID | username | src_IP | Time |
|---|---|---|---|---|
| 1 | login_fail | alice | 1.2.3.4 | 10:00 |
| 2 | login_fail | alice | 1.2.3.4 | 10:01 |
| 3 | login_fail | alice | 6.7.8.9 | 10:01 |
| 4 | login_fail | bob | 1.2.3.4 | 10:01 |
| 5 | login_fail | alice | 1.2.3.4 | 10:03 |

For the above statement, five alert notifications are generated.

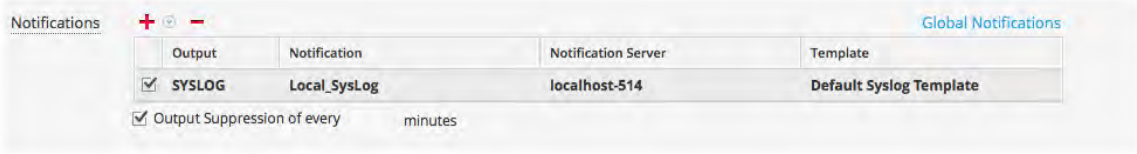
However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

### To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.



2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

## @RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is undeployed and redeployed. The systems take a snapshot just before the ESA rule deployment is undeployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the deployment is redeployed. This ensures that the contents of the window are not lost if the deployment state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

**Note:** All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a deployment (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

**Caution:** (This caution applies only to NetWitness Platform versions 11.3.x, 11.4.x, and 11.5.0.0.) To avoid data being overwritten, if you have a rule with a named window, do not disable and re-enable it. Instead, undeploy and redeploy the ESA rule deployment that contains the rule.

## @UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

## @Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

**Note:** You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

## @Audit Annotation

Add the `@Audit('stream')` annotation to your ESA rules to print alerts to the ESA logs for troubleshooting. This is useful when debugging the Esper rules. The @Audit('stream') annotation provides debug information for the next statement in the rule. For example:

```
@Audit('stream')
@RSAAlert
SELECT * FROM Event((ip_src NOT IN ( '1.1.1.1' , '2.2.2.2' )));
```

In the above example, `@RSAAlert` is only necessary if the statement needs to send an alert to the Respond view.

In NetWitness Platform 11.5 and later, you can test rules in the rule builders. If you add the `@Audit ('stream')` annotation to an advanced EPL rule, you can view the Debug Log in the test output. For more information, see Validate an Advanced EPL Rule .

# Example Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

## Example #1:

Create a user account and delete the same user account in 300s. User information is stored in user_src meta.

## EPL #1:

| | |
|---|---|
| Rule Name | CreateAndDelete Useraccount1 |
| Rule Description | Create a user account followed by an action to delete the same user account in 300 seconds. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * FROM Event(ec_subject='User'`<br>`  AND ec_outcome='Success'`<br>`  AND user_src is NOT NULL`<br>`  AND ec_activity IN ('Create', 'Delete')`<br>`  ).win:time(300 seconds)`<br>`match_recognize (partition by user_src`<br>`   measures C as c, D as d`<br>`   pattern (C D)`<br>`  define`<br>`   C as C.ec_activity='Create' ,`<br>`   D as D.ec_activity='Delete');` |
| Note | • Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete')<br>• Partition by creates buckets. In this case, Esper creates buckets per value of user_src. And hence value of user_src is common between both events.<br>• Define the pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression.<br>• Most efficient use case.<br>• The ‘loose’ pattern match of (C+ D) will result in decreased performance. Unless you need to include all C events within the generated alert, keep the strict pattern match of (C D). See the Esper documentation for more details. |

## EPL #2:

| | |
|---|---|
| Rule Name | CreateAndDeleteUseraccount2 |
| Rule Description | Create a user account followed by an action to delete the same user account in 300 seconds. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`<br>`->`<br>`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_src)`<br>`) )where timer:within(300 Sec) ];` |
| Note | • Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts.<br>• A thread is created for every User creation.<br>• There is no way to control threads. It is important to have time bounds and preferably small intervals.<br>• If you do not need every first event to start a new thread and match with the subsequent second event, then add suppression syntax of @SuppressOverlappingMatches after the pattern keyword. See the Esper documentation for more details. |

## Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

## EPL #3:

| | |
|---|---|
| Rule Name | CreateUserLoginandDeleteUser |
| Rule Description | Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * FROM Event(ec_subject='User'`<br>`and ec_activity in ('Create','Logon','Delete')`<br>`and ec_theme in ('UserGroup', 'Authentication')`<br>`and ec_outcome='Success'`<br>`).win:time(300 seconds)`<br>`match_recognize (measures C as c, L as l, D as d`<br>`pattern (C L D)`<br>`define`<br>`C as C.ec_activity = 'Create',` |

| | |
|---|---|
| | L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src,<br>D as D.ec_activity = 'Delete' AND D.user_src = C.user_src<br>); |
| Note | • Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between.<br>• Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3).<br>• Pattern can also be used. You might get more alerts than expected. (EPL #4). |

## EPL #4: Using NamedWindows and match recognize

| | |
|---|---|
| Rule Name | CreateUserLoginandDeleteUser |
| Rule Description | Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account. |
| Rule Code | @Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long);<br>@Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event( ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null );<br>@Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity<br>as ecactivity, sessionid from Event( ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null );<br>@Name('Pattern')<br>@RSAAlert(oneInSeconds=0, identifiers={"user"})<br>select * from FilteredEvents<br>match_recognize (<br>partition by user<br>measures C as c, L as l, D as d<br>pattern (C L+D)<br>define C as C.ecactivity= 'Create',<br>L as L.ecactivity= 'Logon',<br>D as D.ecactivity='Delete'<br>); |

## EPL #5: Using Every @RSAAlert(identifiers={"user_src"})

| | |
|---|---|
| Rule Name | CreateUserLoginandDeleteUser |

| | |
|---|---|
| Rule Description | Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account. |
| Rule Code | `SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern [every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event(ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];` |

## Example #3:

Excessive login failures from same sourceIP.

## EPL #6: @RSAAlert(identifiers={"ip_src"})

| | |
|---|---|
| Rule Name | ExcessLoginFailure |
| Rule Description | The same user tried logging in from the same Source IP and faced login failures. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`<br>`AND ec_outcome = 'Failure').win:time_batch(300 seconds) GROUP BY`<br>`ip_src HAVING COUNT(*) = 10;` |
| Note | • Uses time _batch: Looks at events in batches(tumbling window). Every event matching the filter criteria will be kept for the specified time window.<br>• "GROUP BY" clause aggregates events within the data window by ip_src and HAVING clause instructs a count of 10 events with the same ip_src must occur within the time window.<br>• One of the issues with tumbling windows is that events occurring towards the end of the batch might not lead to an alert.<br><br>In the below sequence of events at t=301 even though 10 login failures occurred for the same login in the last 300 secs, there will be no alert because the batch of events was dropped at t=300. |

| Time t | Login Failures for Specific Users | Alert | Time Batch |
|---|---|---|---|
| 0 | 0 | 0 | 1 |
| 295 | 6 | 0 | 1 |
| 299 | 3 | 0 | 1 |
| 301 | 1 | 0 | 2 |
| 420 | 6 | 0 | 2 |
| 550 | 3 | 0 | 2 |
| 600 | 0 | 0 | 3 |

| | |
|---|---|
| | 720 6 0 3<br>850 3 0 3<br>900 1 1 3 ends and 4 begins<br>• Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows.<br>• Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, Esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10.<br>• Time and count can be modified as needed. |

## EPL #7: @RSAAlert(identifiers={"ip_src"})

| | |
|---|---|
| Rule Name | ExcessLoginFailure |
| Rule Description | The same user tried logging in from the same Source IP and faced login failures. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`<br>`AND ec_outcome = 'Failure').win:time(300 seconds) GROUP BY ip_src HAVING COUNT(*) = 10;` |
| Note | • This is a sliding window and hence after an alert is fired for a set of events they can be used for another alert as well until time has passed.<br>• If 10 events were involved in causing the alert only the last event will appear.<br>• Events are not removed from the time window. You could use output rate limiting. See the Esper documentation for more details. |

## Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

## EPL #8: using time_batch

| | |
|---|---|
| Rule Name | MultiplefailedLogins |
| Rule Description | There are multiple failed logins for the following cases:<br>- From multiple users from same source to same destination.<br>- Single user from multiple sources to the same destination. |
| Rule Code | `@RSAAlert(oneInSeconds=0)`<br>`SELECT * FROM Event (`<br>`ec_activity='Logon'`<br>`AND ec_outcome='Failure'` |

| | |
|---|---|
| | AND ip_src IS NOT NULL<br>AND ip_dst IS NOT NULL<br>AND user_dst IS NOT NULL<br>)<br>.win:time_batch(300 seconds)<br>group by ip_src,ip_dst<br>having count(distinct user_dst) >= 5; |
| Note | • ip.dst and ip.src are common across all events.<br>• user_dst is unique for all events.<br>• Alert is fired when there are at least 5 different users try to login from same ip.src and ip.dst combination. |

## Example #5:

No Log traffic from a device in a given timeframe.

## EPL #9: using timer:interval

| | |
|---|---|
| Rule Name | NoLogTraffic |
| Rule Description | There is no log traffic observed from a device in a given time frame. |
| Rule Code | SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))]; |
| Note | • Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert.<br>• List of device ip address or device hostnames as input. Only these systems will be tracked.<br>• Time input is required. Alert is fired when time interval between events exceeds input time. |

## Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

## EPL #10: using timer and Lockout

| | |
|---|---|
| Rule Name | FailedloginswoLockout |
| Rule | There are multiple failed logins that are not followed by Lockout event by the same |

| | |
|---|---|
| Description | user. |
| Rule Code | SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)<br>AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))<br>where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout')) ]; |
| Note | • Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user.<br>• The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain.<br>• In current query, every distinct will suppress new thread for combination of user and device for 1 millisec.<br>• Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs |

## Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

## EPL #11: @RSAAlert(oneInSeconds=0)

| | |
|---|---|
| Rule Name | MatchLikeRegex |
| Rule Description | There are custom functions to perform LIKE and REGEX comparisons of array meta keys. |
| Rule Code | SELECT * FROM pattern[<br>e1=Event(matchLike(alias_host, "10.0.0.%")) AND<br>e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))<br>where timer:within(5 Minutes)]; |

**Note:**
1. "**.**" in meta keys should be replaced with ("_").
2. All patterns should be time bound.
3. Use appropriate tags in front of statements, for example:

```
@RSAPersist:
@RSAAlert:
```

# Configure an In-Memory Table Using an EPL Query

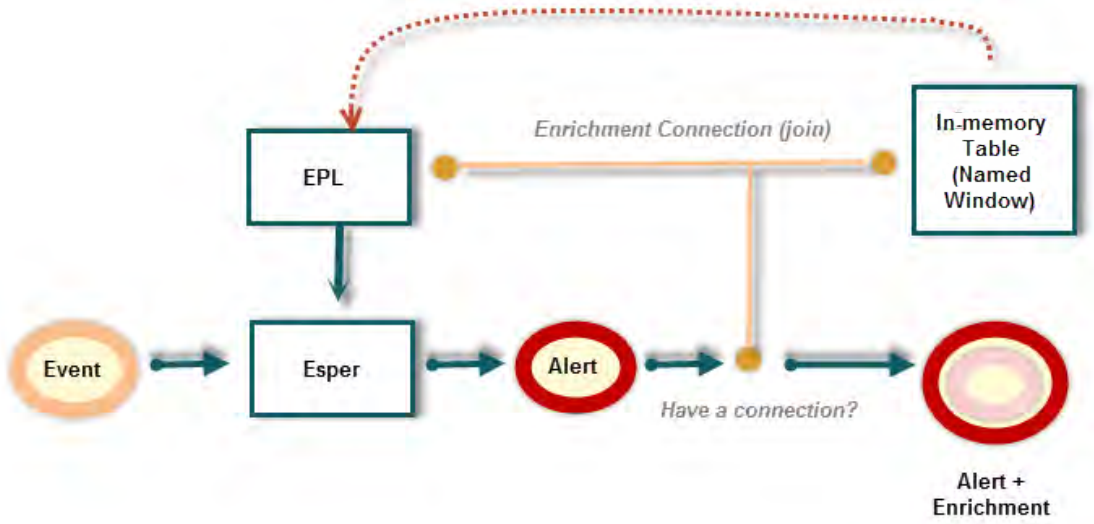
**Note:** It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

When you use an In-Memory Table configuration in expert mode, you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting states from the event stream.

## Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



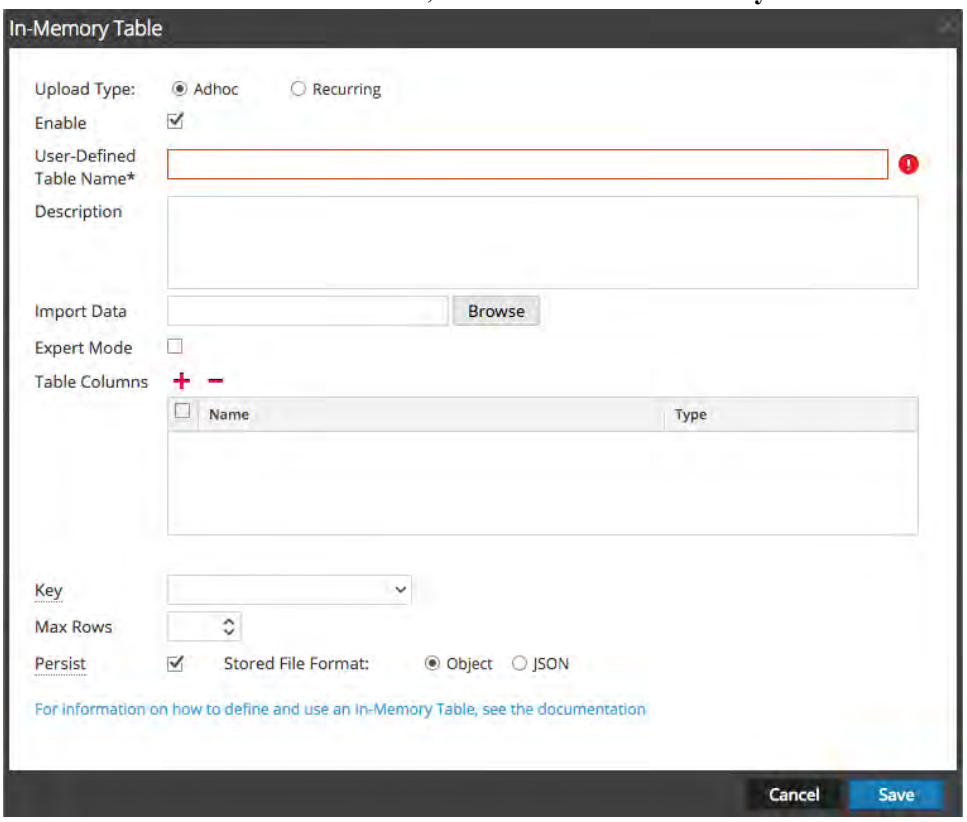
## Prerequisites

- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

## Procedure

**Note:** It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click > **In-Memory Table**.



5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.

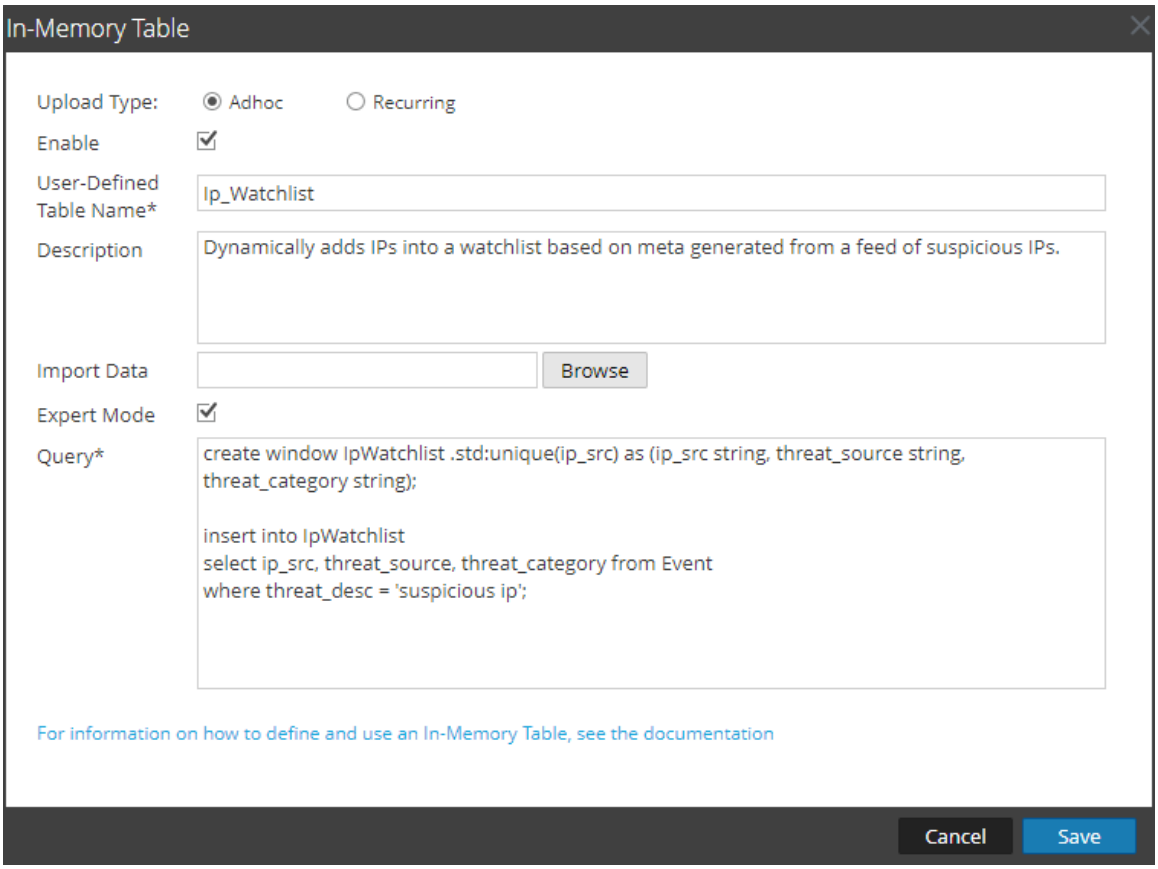
## Example

For example, you want to know when an IPS or IDS is giving five or more inbound events with an event identified with malicious code. Additionally, you would like to know when the source IP of those events has been identified as suspicious by other sources. This information helps to more quickly triage the event and determine whether the alert is a true positive.

## Step 1: Create the Enrichment

In this example, this enrichment is a watchlist of IPs that have been identified as suspicious by third party sources or by internal staff. The meta of `threat_desc equal to 'suspicious ip'` is generated when a match to a feed occurs. This meta can be matched and output based on a log, packet, or endpoint event.

The enrichment should look like the following:

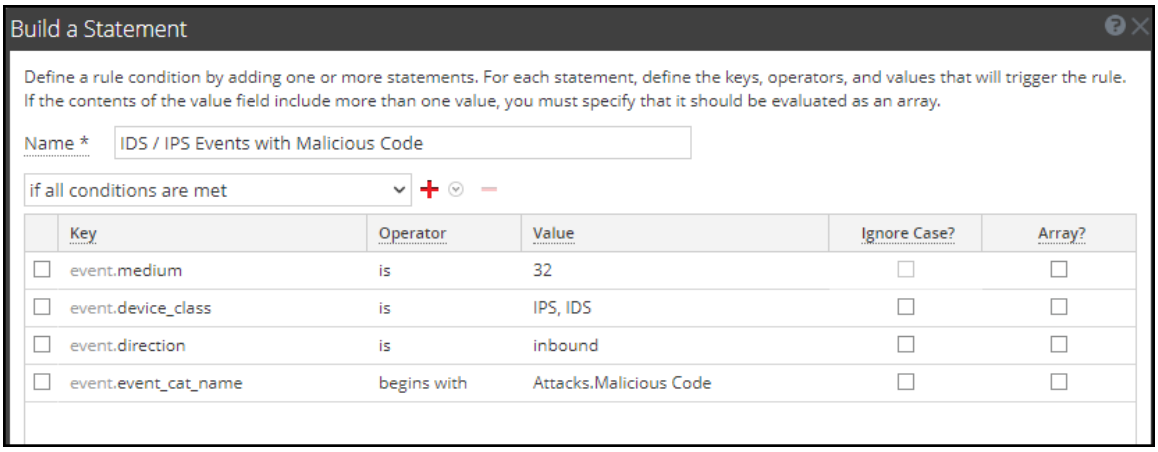


| Parameters | Description |
|---|---|
| Upload Type | Adhoc |
| IP_Watchlist | IP_Watchlist |
| Description | Dynamically populated whitelist based on a feed of IPs that are considered suspicious. |
| Expert Mode | Selected |
| Query | `create window IpWatchlist .std:unique(ip_src) as (ip_src string, threat_source string, threat_category string);`<br>`insert into IpWatchlist`<br>`select ip_src, threat_source, threat_category from Event`<br>`where threat_desc = 'suspicious ip';` |

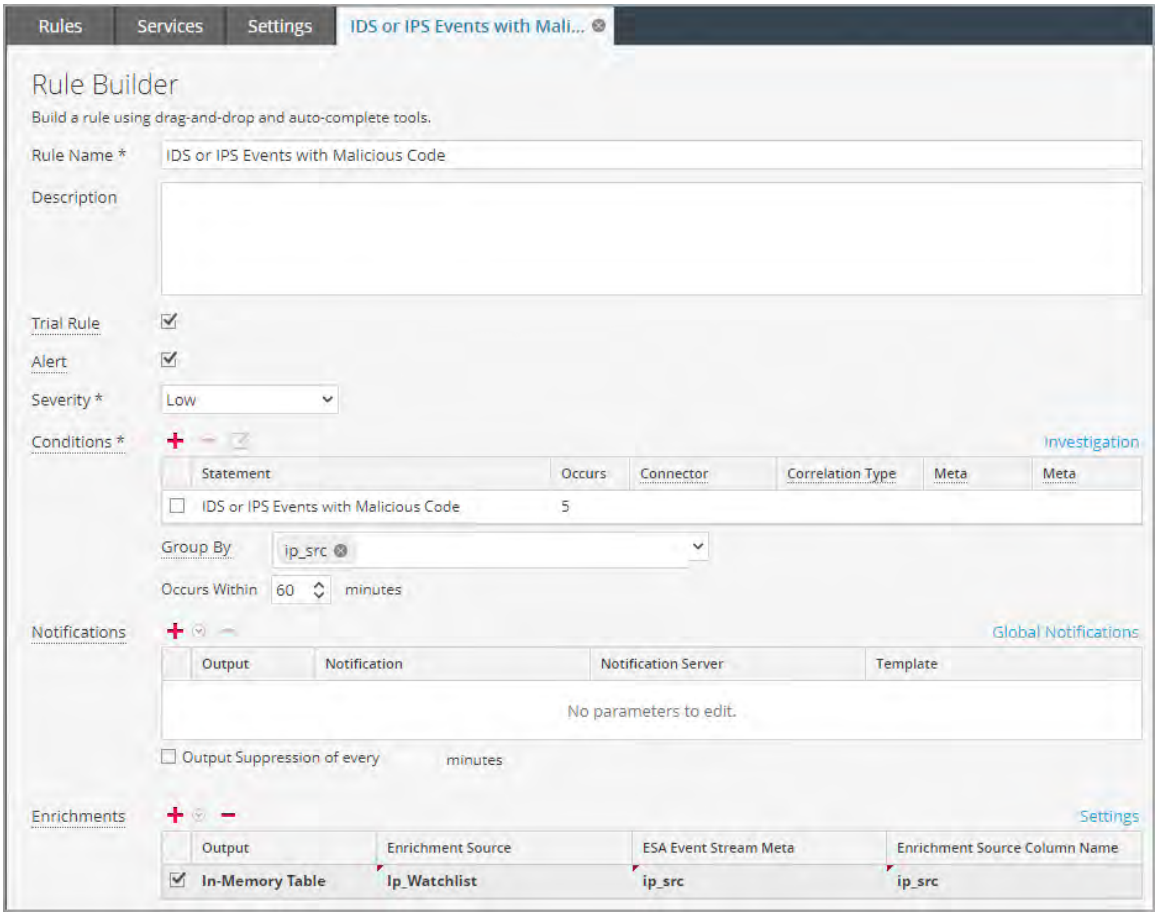
# Step 2: Create Your Rule

First, you need to create your ESA Correlation rule. This example rule looks for inbound IPS or IDS log events with the `event_cat_name` beginning with `Attacks.Malicious Code`. If five or more events for the same `ip_src` occur within 60 minutes, then an alert will be triggered. If an `ip_src` from the Enrichment equals the `ip_src` from the alert, then that alert will be enriched with additional meta. In this case, the analyst would see the values for `threat_source` and `threat_category` in the raw alert. `Threat_category` would indicate the type of malware and `threat_source` would indicate the entity that has reported the ip as suspicious. The analyst could use this information to do additional research or escalate to the next tier for creation of a possible incident.

## Rule Statement



## Rule Logic with Enrichment Added



# ESA Alert References

In Event Stream Analysis (ESA), you configure and deploy ESA rules to get alerted about potential network threats.

These topics explain the user interface for ESA Correlation rules.

- Rules Tab
- Rules Tab Options Panel
- Rule Library Panel
- Rule Builder Tab
- Build a Statement Dialog
- Advanced EPL Rule Tab
- Rule Syntax Dialog

# Rules Tab

The Rules tab enables you to configure ESA rules and deployments.

## What do you want to do?

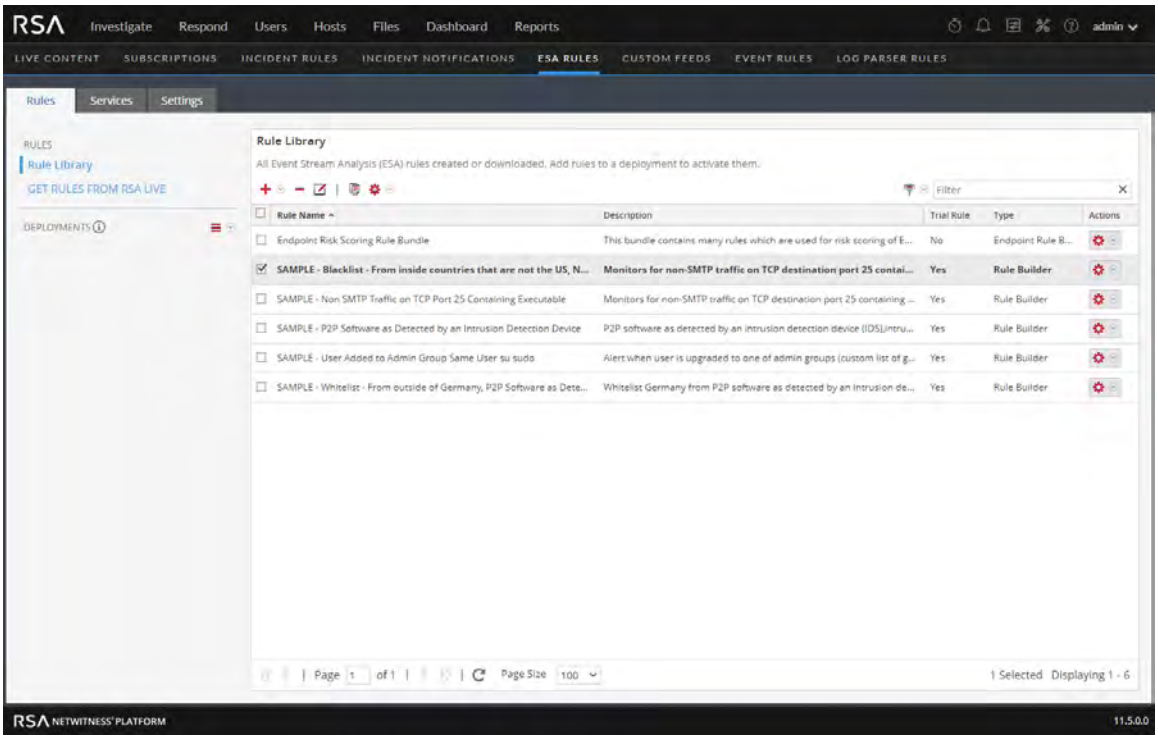
| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | View types of rules. | ESA Rule Types |
| Content Expert | Deploy Trial Rules. | Working with Trial Rules |
| Content Expert | Create a rule. | Add Rules to the Rule Library |
| Content Expert | Deploy a rule. | Deploy Rules to Run on ESA |

## Related Topics

- Getting Started with ESA

## Quick Look

The Rules tab is displayed when you go to **(Configure) > ESA Rules**.
The following figure shows the Rules tab.



The Rules tab is divided into three sections:

- Rules Tab Options Panel
- Rule Library Panel
- Deployment Panel

# Rules Tab Options Panel

In the **Rules** tab options panel to the left, you can view ESA rules in the Rule Library and create ESA rule deployments.

## What do you want to do?

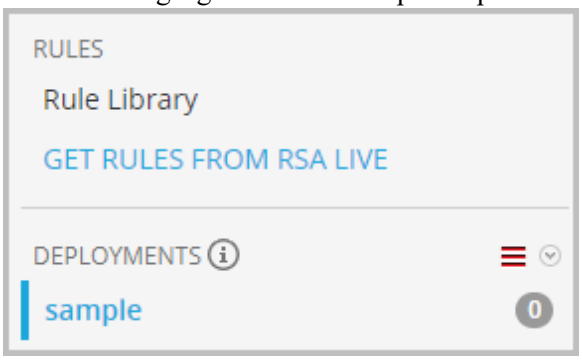
| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | View an ESA rule. | Add Rules to the Rule Library |
| Content Expert | Create an ESA rule deployment. | ESA Rule Deployment Steps |

## Related Topics

- Working with Rules

## Quick Look

The following figure shows the options panel in the **Rules** tab.



There are two sections in the options panel: Rules and Deployments.

## Rules Section

The Rules section contains two options. **Rule Library** is selected by default, and when it's selected, the Rule Library view is displayed within the tab. **Get Rules From RSA Live** navigates to the Live Search view, where you can search for rules.

## Deployments Section

The Deployments section lists ESA rule deployments and indicates whether there are updates to the deployments. From this section, deployments can be added, deleted, edited, and refreshed. Selecting a deployment from the list displays the Deployment panel within the tab. The following table describes the features of this section.

| Feature | Description |
| --- | --- |
| | Displays a drop-down menu from which you can choose to add, edit, or delete an ESA rule deployment. You can also refresh the list of deployments to see if there are any new updates to the list. |
| | Indicates whether there are any updates to the deployment. |
| | Indicates the number of rules in the deployment. |

# Rule Library Panel

The Rule Library panel allows you to manage rules.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Add an ESA rule. | Add a Rule Builder Rule |
| Content Expert | Edit, duplicate, or delete an ESA rule. | Edit, Duplicate or Delete a Rule |
| Content Expert | Import or export ESA rules. | Import or Export Rules |
| Content Expert | Filter the ESA rules list. | Filter or Search for Rules |

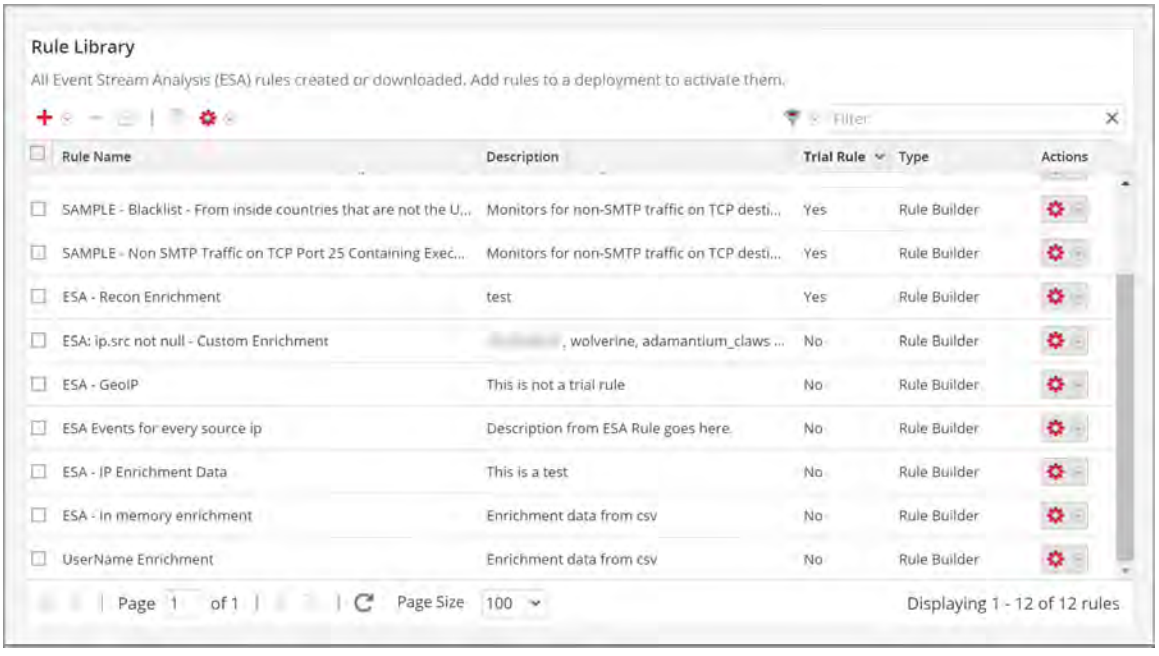
## Related Topics

- Add an Advanced EPL Rule

## Quick Look

To access this view, go to **(Configure) > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.



The Rule Library panel includes the following components:

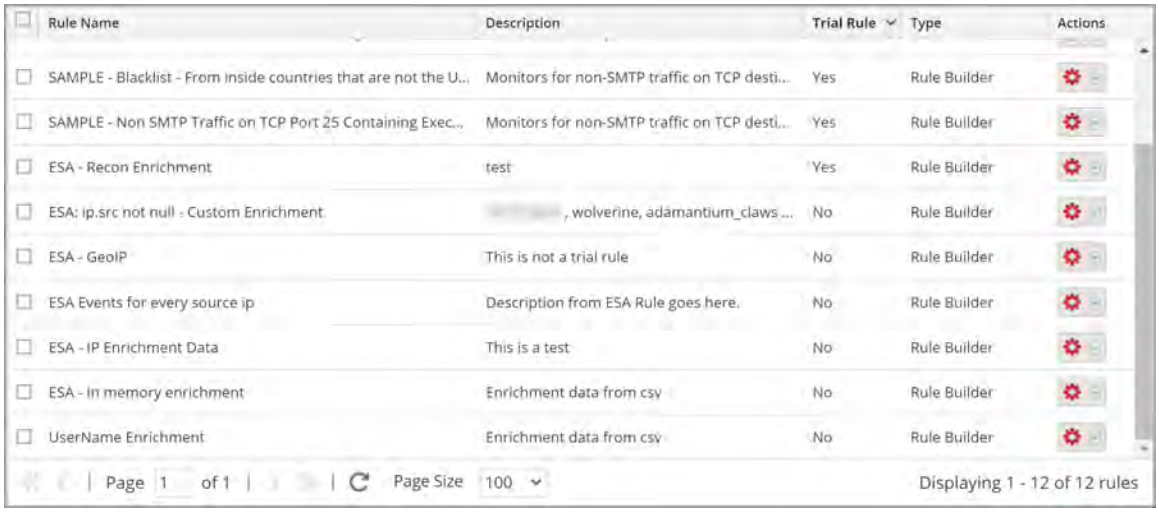
- Rule Library toolbar
- Rule Library list

## Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

## Rule Library List

The following figure shows the Rule Library list.

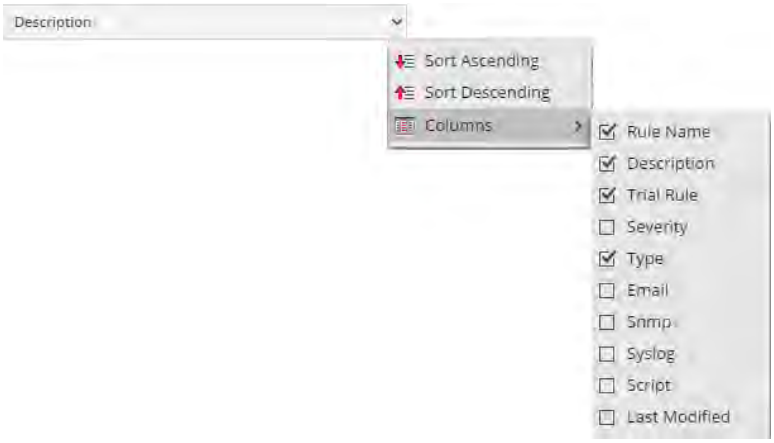


The Rule Library list shows all of the ESA rules. The following table lists the columns in the Rule Library list and their description.

| Column | Description |
|---|---|
| Rule Name | Purpose of the ESA rule. |
| Description | Summary of what the ESA rule detects. |
| Trial Rule | Deployment mode to see if the rule runs efficiently. |
| Type | The type of rule. For more information, see ESA Rule Types. |
| Actions ( ) | Menu to delete, edit, duplicate, or export the selected rule. |
| Severity | Threat level of alert triggered by the rule. |
| Email | Indicates whether an alert notification for the rule is sent by email. This column is not visible by default. |

| Column | Description |
|---|---|
| SNMP | Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default. (ESA SNMP notifications are not supported in NetWitness version 11.3 and later.) |
| Syslog | Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default. |
| Script | Indicates whether an alert notification for the rule executes a script. This column is not visible by default. |
| Last Modified | The date and time when the ESA rule was last modified. This column is not visible by default. |

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.



# Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Define a Rule Builder rule. | Add a Rule Builder RuleStep 1. Name and Describe the Rule |
| Content Expert | Define rule criteria. | Step 2. Build a Rule Statement |
| Content Expert | Add conditions to the rule. | Step 3. Add Conditions to a Rule Statement |
| Content Expert | Test the ESA rule logic. | Validate an ESA Rule |

## Related Topics

- Add an Advanced EPL Rule

## Quick Look

To access the Rule Builder tab:

1. Go to **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the **Rule Library** toolbar, select **> Rule Builder**.
   The Rule Builder tab is displayed.

The following figure shows the Rule Builder tab.

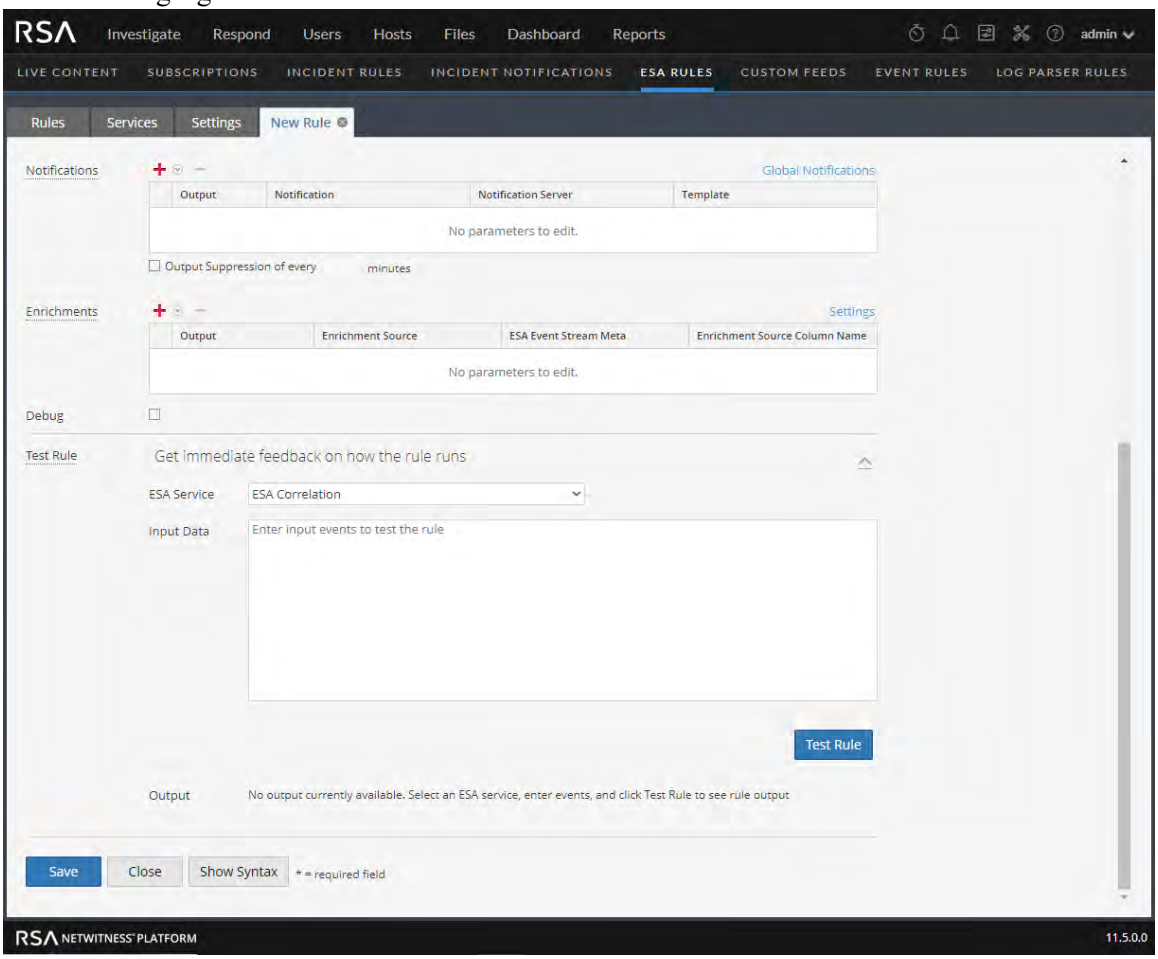
The following figure shows the Rule Builder tab scrolled down with the Test Rule section in view.



The following table lists the parameters in the Rule Builder tab.

| Field | Description |
|---|---|
| Rule Name | Purpose of the ESA rule. |
| Description | Summary of what the ESA rule detects. |
| Trial Rule | Deployment mode to see if the rule runs efficiently. |
| Memory Threshold | (This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab.<br>New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set. |

| Field | Description |
|---|---|
| Alert | (This option applies to version 11.3 and later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond.<br>To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*. |
| Severity | Threat level of alert triggered by the rule. |

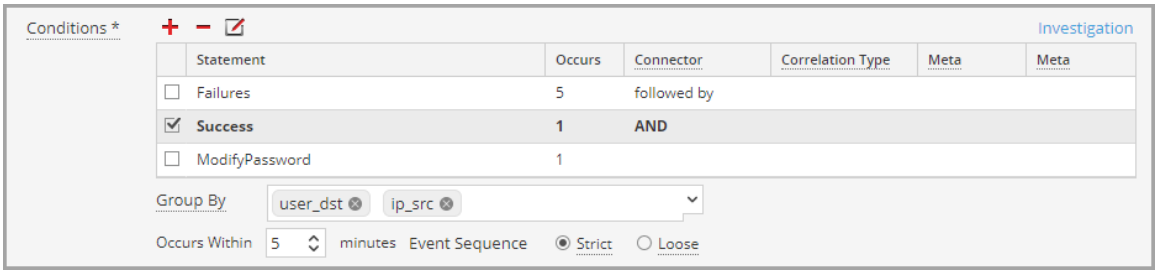
The Rule Builder includes the following components:

- Conditions Section
- Notifications Section
- Enrichments Section
- Debug Option
- Test Rule Section

## Conditions Section

In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.



The following table lists the parameters of the Conditions section.

| Parameter | Description |
|---|---|
| + | Add a statement. |
| − | Remove selected statement. |
| | Edit selected statement. |
| Statement | Logical group of conditions for one operation. |
| Occurs | Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count. |

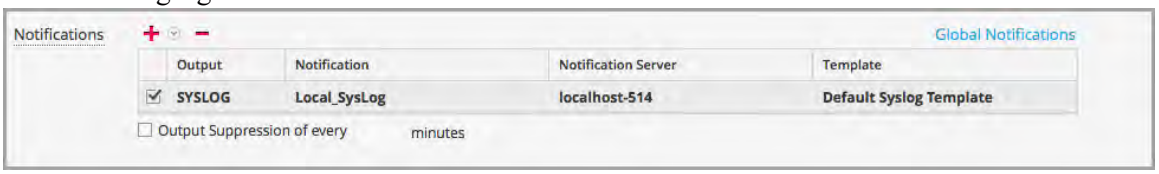
| Parameter | Description |
|---|---|
| Connector | Options to specify relationship among the statements:<br>• followed by<br>• not followed by<br>• AND<br>• OR<br>The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence. |
| Correlation Type | **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. |
| Meta | Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above). |
| Meta | Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources. |
| occurs within minutes | Time window within which the conditions must occur. |
| Event Sequence | Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between.<br>For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins. |
| Group By | Select the meta key by which to group results from the dropdown list.<br>For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John.<br>You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src. |

## Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



| Parameter | Description |
|---|---|
| + | To add an alert notification type. |
| − | To delete the selected alert notification. |
| Output | Alert notification type. Options are:<br>• Email<br>• SNMP (This option is not supported in NetWitness version 11.3 and later.)<br>• Syslog<br>• Script |
| Notification | Name of previously configured output, such as an email distribution list. |
| Notification Server | Name of server that sends the output. |
| Template | Name of template for the alert notification. |
| Output Suppression of every | Option to specify alert frequency. |
| Minutes | Alert frequency in minutes. |

## Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

| Parameter | Description |
|---|---|
| | To add an enrichment. |
|  | To delete the selected enrichment. |
| Output | Enrichment source type. Options are:<br>• In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)<br>• GeoIP |
| Enrichment Source | Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table. |
| ESA Event Stream Meta | ESA meta key whose value will be used as one operand of join condition. |
| Enrichment Source Column Name | Enrichment source column name whose value will be used as the other operand of the join condition.<br>For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected. |

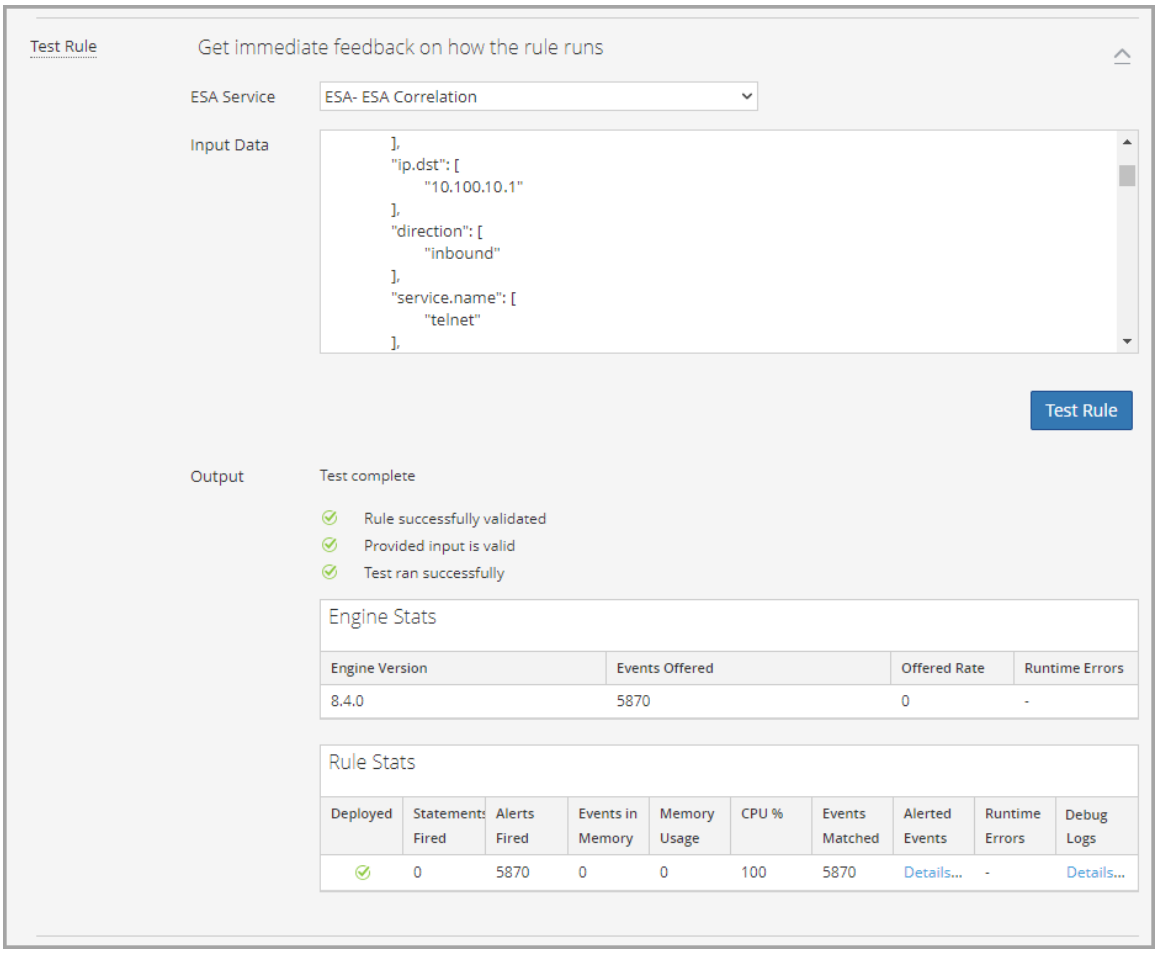
## Debug Option

Select the Debug option to print alerts to the ESA logs for troubleshooting. This adds an @Audit ('stream') annotation to the rule. This is useful when debugging the Esper rules.

## Test Rule Section

**Note:** The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.



| Field | Description |
|---|---|
| ESA Service | Select the ESA Correlation service to process the rule. |
| Input Data | Enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. |
| Output Data | After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications. |

The following table describes the test rule output **Engine Stats**.

| Field | Description |
|---|---|
| Engine Version | Esper version running on the ESA service |

| Field | Description |
|---|---|
| Events Offered | Number of events processed by the ESA service since the last service start |
| Offered Rate | The rate that the ESA service processes current events / The maximum rate that the ESA service processed events |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment. |

The following table describes the test rule output **Rule Stats**.

| Field | Description |
|---|---|
| Deployed | A green checkmark indicates that the rule is deployed on the selected ESA service. |
| Statements Fired | The number of statements that fired the alerts |
| Alerts Fired | The number of alerts generated from the test data |
| Events in Memory | The number of events placed in memory by the rule |
| Memory Usage | The total amount of memory used by the rule |
| CPU % | The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. |
| Events Matched | The number of events that matched the rule |
| Alerted Events | If applicable, this field can contain a link to events that caused an alert. |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the rule. |
| Debug Logs | This field contains a link to Esper debug (audit) logs. |

## Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

# Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Configure a rule statement. | Step 2. Build a Rule Statement |
| Content Expert | Add conditions to the rule. | Step 3. Add Conditions to a Rule Statement |

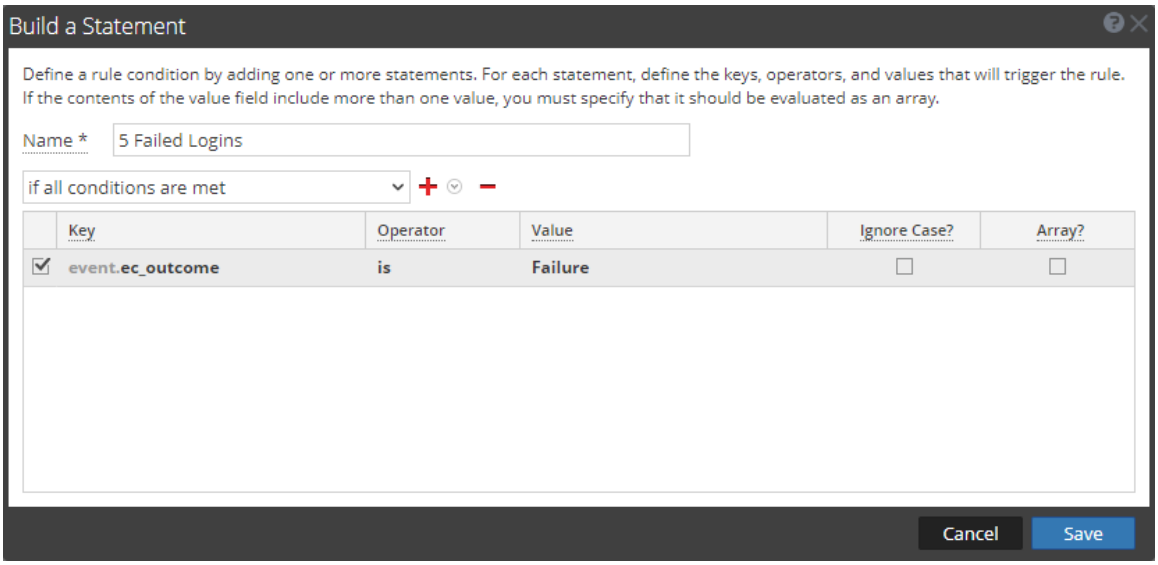
## Related Topics

- Add a Rule Builder Rule

## Quick Look

To access the Build a Statement dialog:

1. Go to **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.
2. In the **Rule Library** toolbar, select **> Rule Builder**.
   A New Rule tab is displayed..
3. In the **Conditions** section, click .
   The Build a Statement dialog is displayed.



The following table describes the parameters in the Build a Statement dialog.

| Parameter | Description |
|---|---|
| Name | Purpose of the statement. |
| Select | Conditions the rule requires. There are two options:<br>• If all conditions are met<br>• If any of these conditions are met |
| Key | Key for ESA to check in the rule statement. |

| Parameter | Description |
|---|---|
| Operator | Relationship between the meta key and value for the key:<br>• is<br>• is not<br>• is not null<br>• is greater than (>)<br>• is greater than or equal to (>=)<br>• is less than (<)<br>• is less than or equal to (<=)<br>• is one of (For array type meta)<br>• is not one of (For array type meta)<br>• contains<br>• not contains<br>• begins with<br>• ends with |
| Value | Value for ESA to look for in the key. |
| Ignore Case? | This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN." |
| Array? | Choice to indicate if contents of Value field represent one value or multiple values:<br>• Select the box to indicate multiple values.<br>• Clear the box to indicate one value. |
| | Add a statement. You can add a meta condition, whitelist condition, or blacklist condition. |
|  | Delete selected statement. |
| Save | Add statement to the Conditions section of the Rule Builder tab. |

The following table shows the operators you can use in the Rule Builder:

| Operator | Required Value | Usage | Example | Meaning |
|---|---|---|---|---|
| is | Singular string value | The meta key is equal to the *value* field. | ***user_dst*** is John Doe. | ***user_dst*** is equal to the string *"John Doe"*. |

| Operator | Required Value | Usage | Example | Meaning |
|---|---|---|---|---|
| is | Array string value | The meta key is equal to one of the elements of the *value* field. | ***user_dst*** is John, Doe, Smith. | ***user_dst*** is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.). |
| is not | Singular string value | The meta key is not equal to the *value* field. | ***size*** is not 200. | ***size*** is not equal to the number 200 (size is a numeric value). |
| is not | Array string value | The meta key is not equal to any of the elements of the *value* field. | ***size*** is not 200, 300, 400. | ***size*** is equal neither to *200* nor to *300* nor to *400*. |
| is not null | N/A (looks for any value) | The meta key value is not null. | ***user_dst*** is not null. | ***user_dst*** is a meta that contains a value. |
| is greater than (>) | Number | The numeric value of the meta key is greater than the number in the *value* field. | ***payload*** is greater than 7000. | ***payload*** is a numeric value that is greater than 7000. |
| is greater than or equal to (>=) | Number | The numeric value of the meta key is greater than or equal to the number in the *value* field. | ***payload*** is greater than or equal to 7000. | ***payload*** is a numeric value that is greater than or equal to 7000. |
| is less than (<) | Number | The numeric value of the meta key is less than the number in the *value* field. | ***ip_dstport*** is less than 1024. | ***ip_dstport*** is a numeric value that is less than the numeric value 1024. |
| is less than or equal to (<=) | Number | The numeric value of the meta key is less than or equal to the number in the *value* field. | ***ip_dstport*** is less than or equal to 1024. | ***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024. |
| is one of | Array string value | The meta key is one of the array string values in the *value* field. | ***alias_host*** is one of Facebook, UTube, Instagram. | ***alias_host*** is one of the array string values *Facebook, UTube, Instagram*. |
| is not one of | Array string value | The meta key is not one of the array string values in the *value* field. | ***alias_host*** is not one of Facebook, UTube, Instagram. | ***alias_host*** is not one of the array string values *Facebook, UTube, Instagram*. |

| Operator | Required Value | Usage | Example | Meaning |
|---|---|---|---|---|
| contains | String | The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key). | ***ec_outcome*** contains failure. | ***ec_outcome*** is a string that contains the substring *"failure"*. |
| not contains | String | The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key). | ***ec_outcome*** not contains failure. | ***ec_outcome*** is a string that does not contain the substring*"failure"*. |
| begins with | String | The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key). | ***ip_dst*** begins with 127.0. | ***ip_dst*** is a string that starts with *"127.0"*. |
| ends with | String | The *value* field is the end of the meta key (This operator is only available for a string-valued meta key). | ***user_dst*** ends with son. | ***user_dst*** is a string that ends in*"son"*. |

**Note:** Terms in ***bold italics*** are Meta that may not exist in all customer environments.

# Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Define an Advanced EPL rule. | Add an Advanced EPL Rule |
| Content Expert | Test the Advanced EPL rule logic. | Validate an Advanced EPL Rule |
| Content Expert | See examples of an Advanced EPL Rule. | Example Advanced EPL Rules |
| Content Expert | See best practices for writing Advanced EPL Rules. | ESA Rule Writing Best Practices |

## Related Topics

- Add a Rule Builder Rule

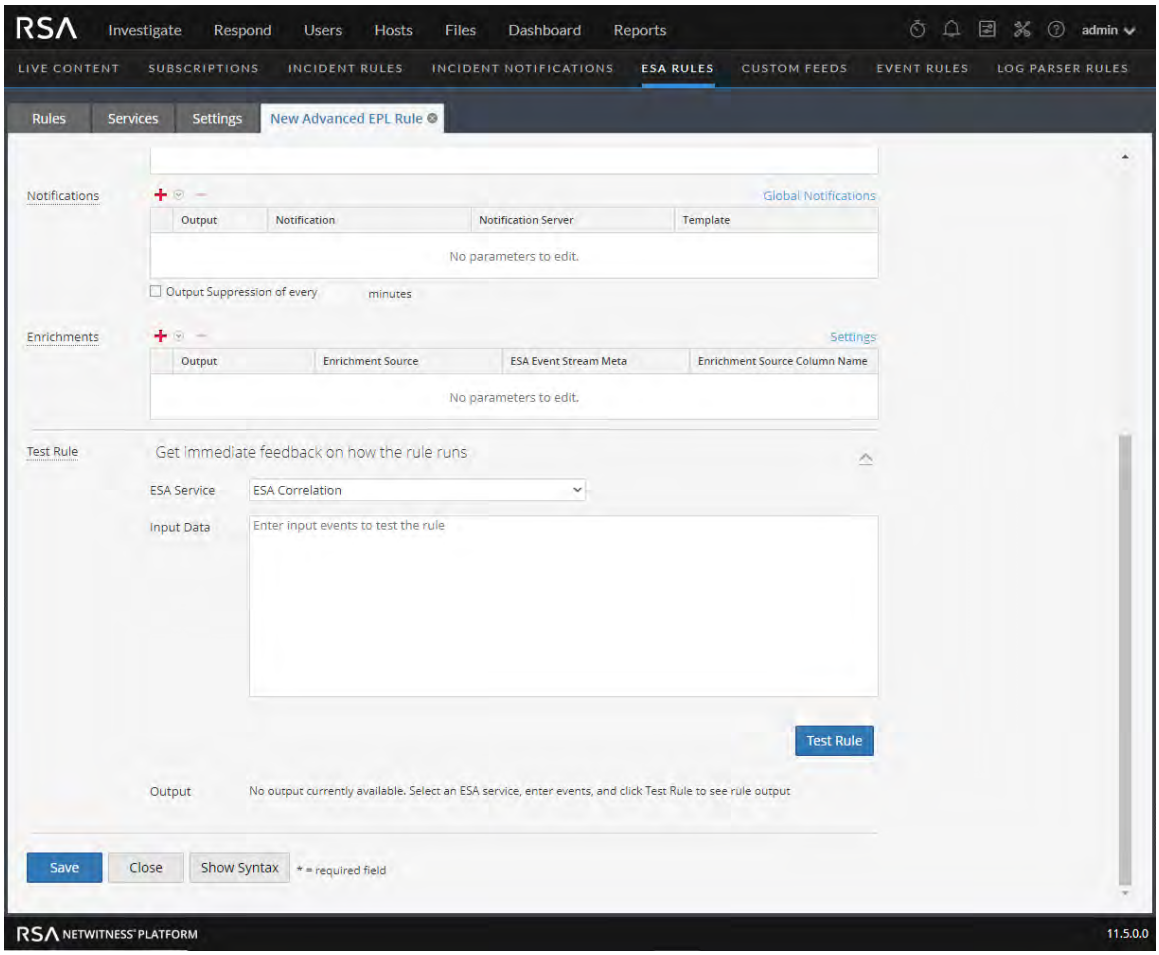
The following figure shows the Advanced EPL Rule tab scrolled down with the Test Rule section in view.



The following table lists the parameters in the Advanced EPL Rule tab.

| Parameters | Description |
|---|---|
| Rule Name | Purpose of the ESA rule. |
| Description | Summary of what the ESA rule detects. |
| Trial Rule | Deployment mode to see if the rule runs efficiently. |
| Memory Threshold | (This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab.<br>New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set. |

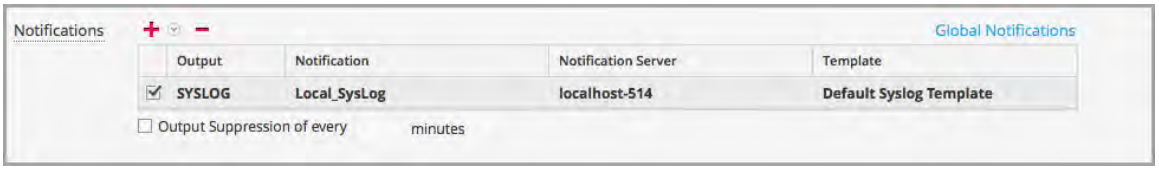
| Parameters | Description |
|---|---|
| Alert | (This option applies to version 11.3 and Later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond.<br>To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*. |
| Severity | Threat level of alert triggered by the rule. |
| Query | EPL query that defines rule criteria. |

## Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



| Parameter | Description |
|---|---|
| + | To add an alert notification type. |
| − | To delete the selected alert notification type. |
| Output | Alert notification type. Options are:<br>• Email<br>• SNMP (This option is not supported in NetWitness version 11.3 and later.)<br>• Syslog<br>• Script |
| Notification | Name of previously configured output, such as an email distribution list. |
| Notification Server | Name of server that sends the output. |
| Template | Name of template for the alert notification. |
| Output Suppression of every | Option to specify alert frequency. |
| Minutes | Alert frequency in minutes. |

## Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

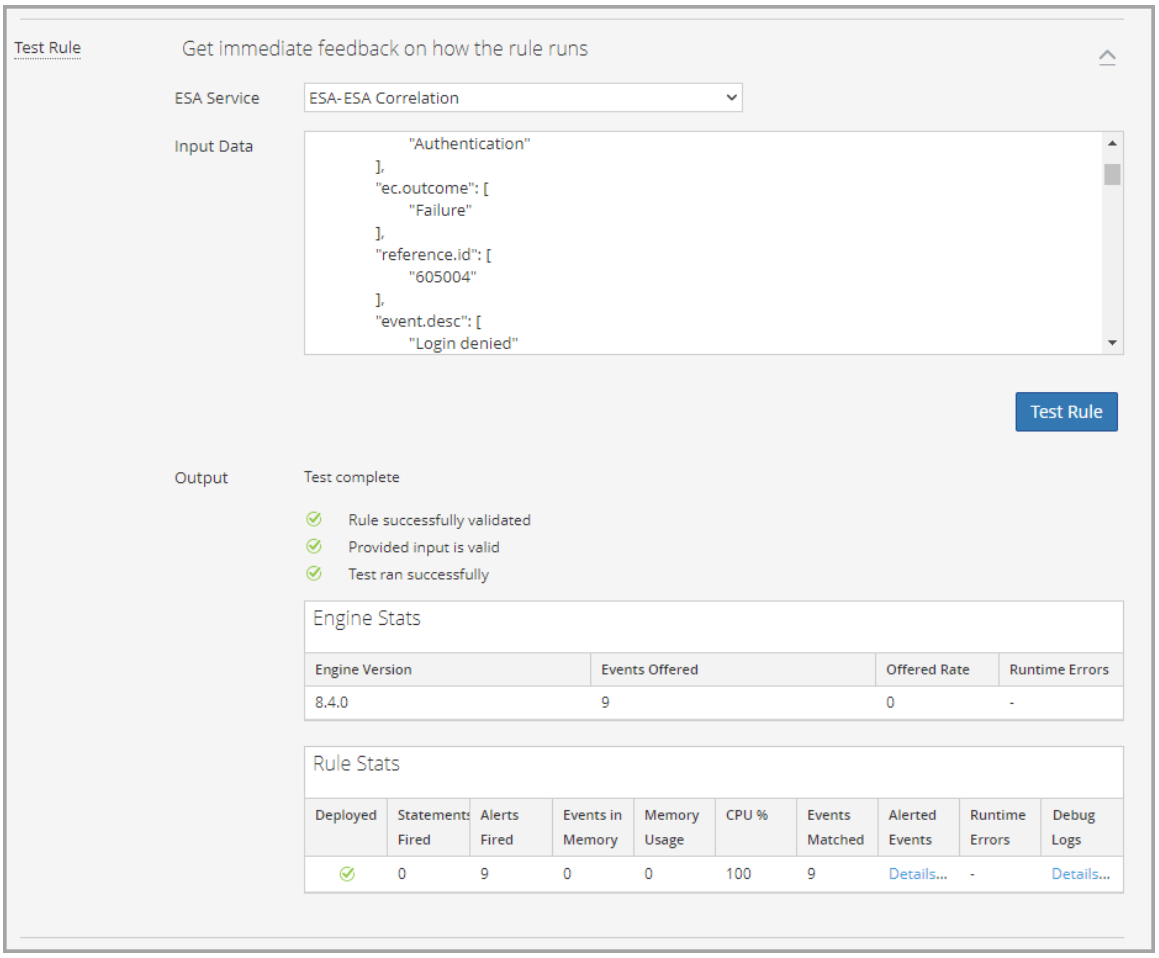
For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.

| Parameter | Description |
|---|---|
| + | To add an enrichment. |
| − | To delete the selected enrichment. |
| Output | Enrichment source type. Options are:<br>• In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)<br>• GeoIP |
| Enrichment Source | Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table. |
| ESA Event Stream Meta | ESA meta key whose value will be used as one operand of join condition. |
| Enrichment Source Column Name | Enrichment source column name whose value will be used as the other operand of the join condition. |

## Test Rule Section

**Note:** The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.



| Field | Description |
|---|---|
| ESA Service | Select the ESA Correlation service to process the rule. |
| Input Data | Enter the input events to test the rule. You can download the events from the Investigate view in JSON format, copy the events, and paste them in this field. |
| Output Data | After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications. If you want to view all of the debug information for the test, include an `@Audit('stream')` annotation to your rule query. |

The following table describes the test rule output **Engine Stats**.

| Field | Description |
|---|---|
| Engine Version | Esper version running on the ESA service |

| Field | Description |
|---|---|
| Events Offered | Number of events processed by the ESA service since the last service start |
| Offered Rate | The rate that the ESA service processes current events / The maximum rate that the ESA service processed events |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment. |

The following table describes the test rule output **Rule Stats**.

| Field | Description |
|---|---|
| Deployed | A green checkmark indicates that the rule is deployed on the selected ESA service. |
| Statements Fired | The number of statements that fired the alerts |
| Alerts Fired | The number of alerts generated from the test data |
| Events in Memory | The number of events placed in memory by the rule |
| Memory Usage | The total amount of memory used by the rule |
| CPU % | The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. |
| Events Matched | The number of events that matched the rule |
| Alerted Events | If applicable, this field can contain a link to events that caused an alert. |
| Runtime Errors | If applicable, this field can contain a link to runtime error messages related to the rule. |
| Debug Logs | This field contains a link to Esper debug (audit) logs. |

## Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

# Rule Syntax Dialog

This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

## Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select **> Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.

The following table describes the Rule Syntax dialog parameters.

| Parameters | Description |
|---|---|
| **Rule is valid** or **Validation error in rule** | Indicates whether the rule syntax is valid or needs to be changed. |
| Rule Name | Displays the name of the rule. |
| Text | Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid. |

# Deployment Panel

ESA rule deployments map rules from your rule library to the appropriate ESA Services and data sources. The Deployment panel ( (Configure) > ESA Rules > Rules tab) enables you to create and configure ESA rule deployments that specify:

- ESA Services
- Data Sources (This is available in NetWitness version 11.3 and later.)
- ESA Rules

When you are ready to start aggregating data and generating alerts from an ESA rule deployment, you deploy the ESA rule deployment to activate it.

**Note:** An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments.
In NetWitness Platform version 11.2 and earlier, the ESA service is the Event Stream Analysis service. In version 11.3 and later, it is the ESA Correlation service.

## What do you want to do?

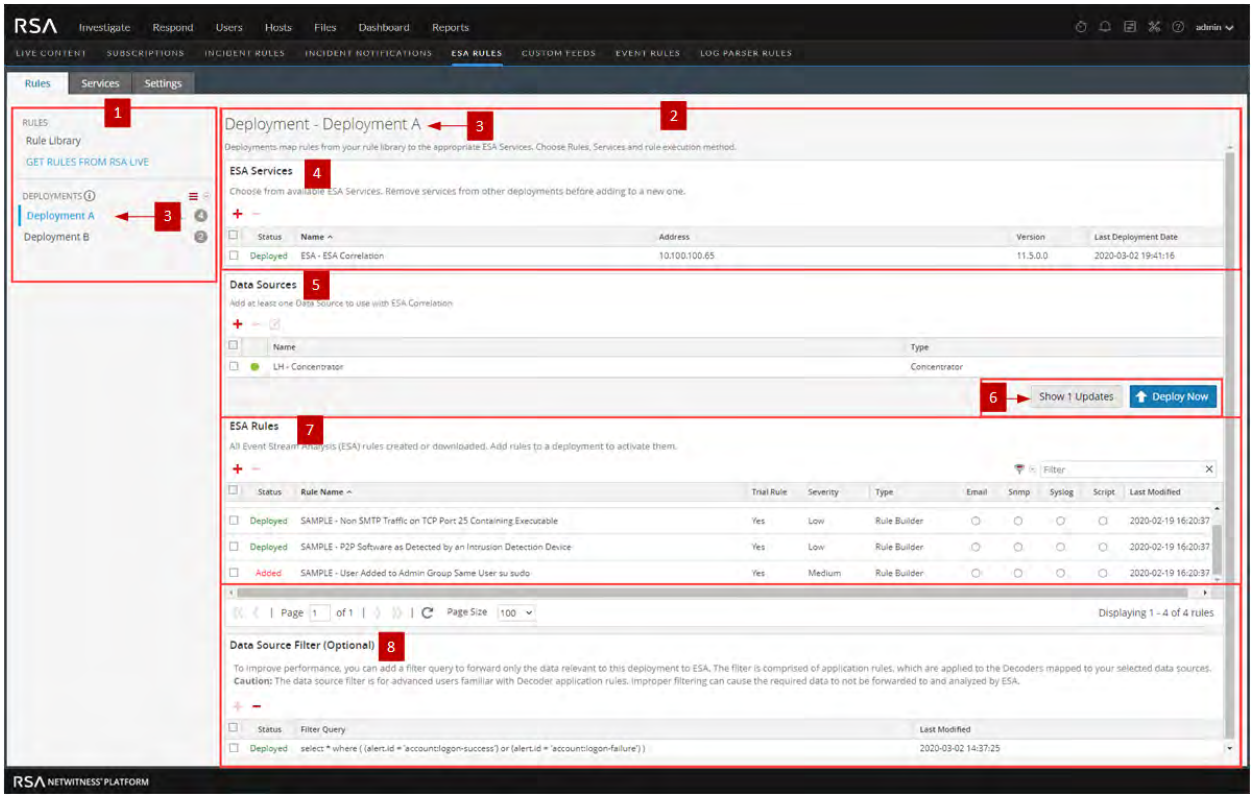
| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Add an ESA rule deployment. | ESA Rule Deployment Steps |
| Content Expert | Manage deployments. | Additional ESA Rule Deployment Procedures |

## Related Topics

- View Stats for an ESA Service

## Quick Look

The following figure shows the Deployment panel.



| | |
|---|---|
| 1 | Shows the options panel. Click the deployment in the options panel to view the deployment in the Deployment panel on the right. |
| 2 | Shows the Deployment panel. |
| 3 | Shows the ESA rule deployment name. |
| 4 | The ESA Services section shows the ESA Correlation service that processes the ESA rules and creates alerts. |
| 5 | The Data Sources section shows the data sources, such as Concentrators, that provide the data for the deployment. |
| 6 | The deployment options enable you to view the changes to the deployment (Show Updates) and deploy the ESA rule deployment on ESA (Deploy Now). The (Configure) > ESA Rules > Services tab shows the status of the deployment after it is deployed. |
| 7 | The ESA Rules section shows the rules that are used to trigger alerts in the deployment. |
| 8 | The Data Source Filter (Optional) section enables you to add a filter query to forward only the data relevant to this deployment to ESA. The data source filter is for advanced users familiar with Decoder application rules. |

## ESA Services Section

In the ESA Services section, you can manage each ESA service in the deployment.

The following table describes the actions you can perform in the ESA Services section.

| Task | Description |
|---|---|
| + | Adds an ESA service to the deployment. |
| − | Removes the selected ESA service from the deployment. |

The following table describes the columns in the ESA Services section.

| Title | Description |
|---|---|
| Status | Indicates if the deployment status is **Added**, **Deployed**, **Updated**, or **Failed**. |
| Name | Name of the ESA service. |
| Address | IP address of the host where the ESA service is installed. |
| Version | Version of the ESA service. |
| Last Deployment Date | The date and time when the ESA service was last deployed. |

## Data Sources Section

**Note:** This option is available in NetWitness Platform version 11.3 and later.

In the Data Sources section, you can select one or more data sources, such as Concentrators, to use for your selected ESA Service.

The following table describes the actions you can perform in the Data Sources section.

| Task | Description |
|---|---|
| + | Adds a data source for the selected ESA service to the deployment. |
| − | Removes a data source for the selected ESA service from the deployment. |
| | (This option is available in NetWitness Platform version 11.3.0.2 and later.) Enables you to change the configuration of a data source in an ESA rule deployment. You can change the data source password, SSL, port, and compression settings. When a data source password changes, it is important to change the password on the data source so that ESA can continue to communicate with the data source.<br>**Note:** If you make any ESA service, data source, or ESA rule changes to an ESA rule deployment, you need to redeploy the deployment. For example, if you change the configuration of a data source in an ESA rule deployment, you must redeploy all the ESA rule deployments that contain that data source.<br>When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules. |

The following table describes the columns in the Data Sources section.

| Title | Description |
|---|---|
| (Status) | Shows the status of the data source. A solid colored green circle indicates a running service and a white circle indicates a stopped service. |
| Name | Shows the name of the data sources used by the selected ESA service. You can specify the data sources separately for each ESA rule deployment. |
| Type | Shows the type of the data sources. Data sources can be Concentrators or Decoders. It is important that you choose data sources that have the appropriate data for the rules in the deployment. For example, if you have NetWitness Endpoint and you want to deploy the Endpoint Risk Scoring Rules Bundle, you must choose endpoint data sources. |

**Note:** You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

## Position Tracking Information

The ESA Correlation service continuously streams data from the data sources like decoders (log and network), and concentrators. ESA retrieves events from the data sources, and applies rules to generate alerts to detect malicious activities. When you deploy a data source, ESA starts processing information from the latest available session, by default. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the time/date when the events were processed.

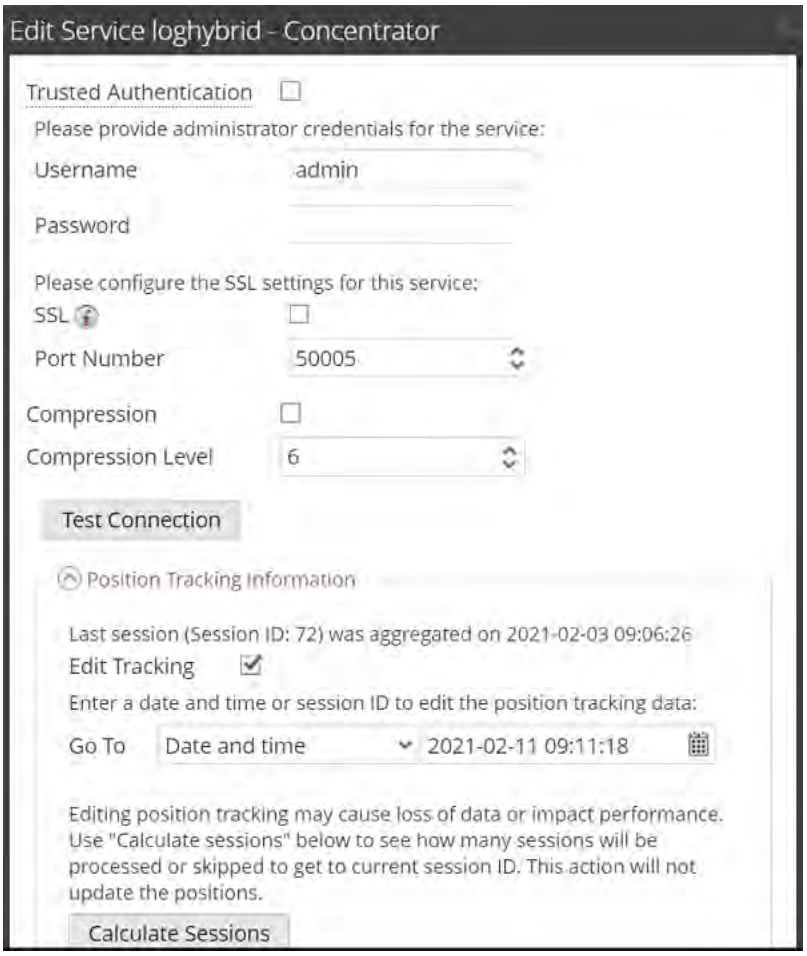
Edit Position Tracking Information enables you to:

- Visualize the number of sessions that a particular ESA data source has already analyzed, review the number of sessions ESA would process after you edit the position tracking, and plan your work.
- Edit the tracking position information based on:
  - Date and Time (Collection Time)
  - Session ID
- Edit position tracking for multiple data sources before you deploy them.
- Calculate the number of sessions that the ESA Correlation Service is scheduled to process for a particular data source to either process, reprocess, or skip sessions with respect to the current position of the data source.

**Note:** The Edit Position tracking feature with the `Date and Time` option works based on the profile time settings in the Netwitness UI. This time-zone based time from the UI is converted to UTC, and is sent to the core, to retrieve the corresponding session ID for that time stamp.
Example: If the UI follows IST, the UI converts it to UTC and sends it to the core. The session ID is fetched for the specific UTC time stamp, and set to position tracking at deployment.

### Editing Position Tracking Information

The following figure shows the Edit Position Tracking window.



To edit position tracking information:

1. Select the specific data source from the **Data Source** menu.

2. Click .

The **Edit Service** window is displayed.

3. Select the **Trusted Authentication** check-box, or enter your administrative credentials (username and password).

4. In the **Position Tracking Information** menu, click the **Edit Tracking** check-box to select it.
a. If you want to edit the position tracking information based on date and time stamp:
In the **Go To** text field, select **Date and Time** and enter the date and time.
The ESA Correlation service starts processing the events from the date and time that you entered.

b. If you want to edit the position tracking information, based on the session ID:
In the **Go To** text field, select **Session ID** and enter the session ID.
The ESA Correlation service starts processing the events from the session ID that you entered.

5. Click **Calculate Sessions** to calculate the number of sessions that will be processed with respect to the existing position of the data source, if any.

6. Click **OK**.

7. Click **Deploy Now**.
The tracking position information will be deployed to the ESA Correlation service, only when the deployment is successfully completed.

**Note:** After you deploy, in the **Data Sources** menu, click on , to view the edit tracking information. The default time-out associated with this information is 1 minute.

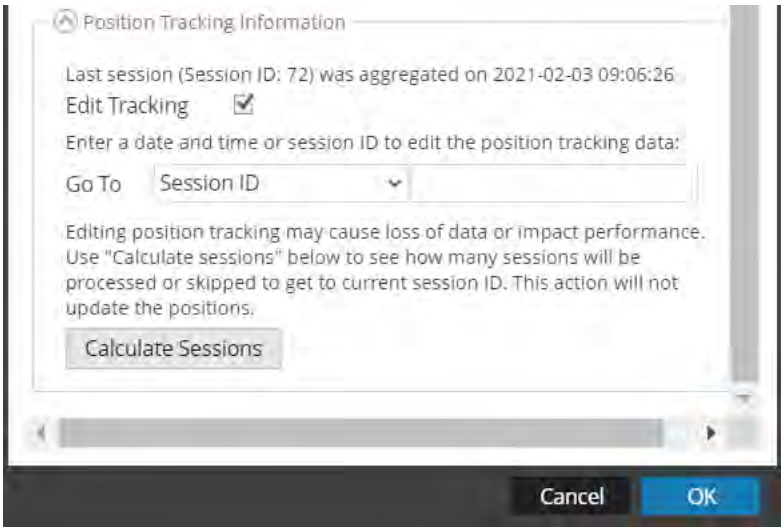
## Use Case Scenario

This section provides information about how you can use position tracking information in a real world scenario.

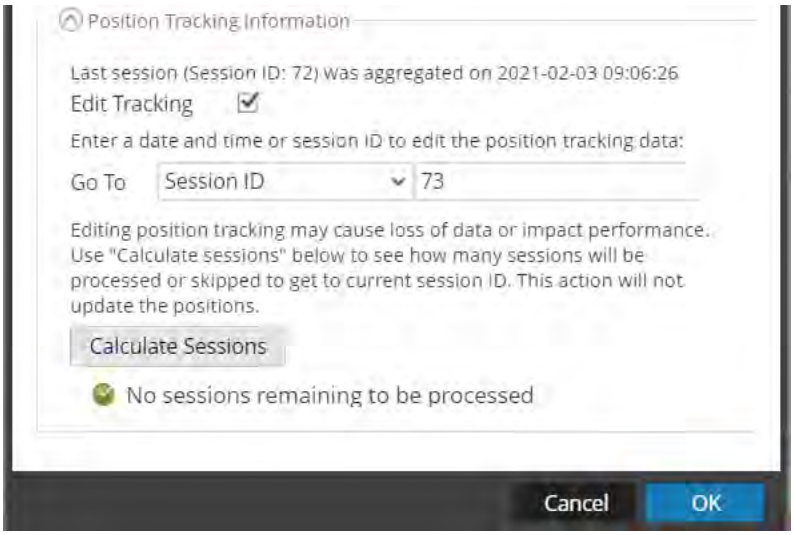
If you have deployed a data source with a total of 72 sessions that ESA has already processed, and if you want to start processing the events from the beginning, or go back with respect to the time or sessions ID.

1. Click **Edit Tracking**.
2. Enter 1 in the **Session ID** text box.
3. Click **Calculate Sessions**.
All the 72 sessions will be reprocessed.

The following image shows the use case scenario.



4. Enter a future Session ID.
The **No sessions remaining to be processed** message is displayed.



**Note:** Editing the tracking information is optional. If you add a new data source to an existing ESA deployment, and you do not edit the tracking information, ESA follows the default behavior to process events.

## Importing Position Tracking Information

You can migrate the settings of position tracking for one or more data sources at the same time from an existing deployment, using the import function.

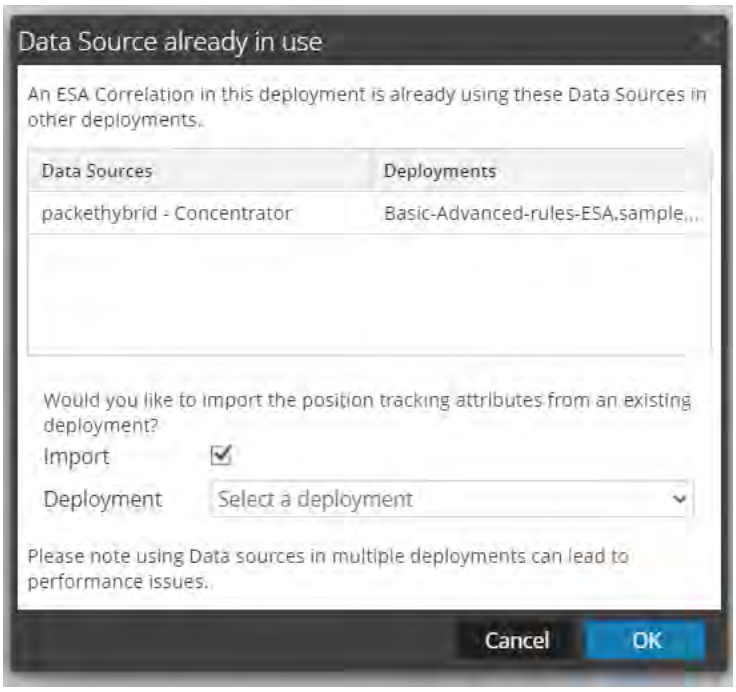
To import position tracking information from an existing deployment:

1. Go to **Configure** > **ESA Rules** > **Deployment** tab.
2. Create a new deployment. See ESA Rule Deployment Steps
3. Add ESA Services. See Step 2. Add an ESA Service

The Data Sources panel will be enabled.

4. Add Data Sources. See Step 3. Add Data Sources
5. In the Data Sources tab, click + to add a configured data source.
The Available Configured Data Sources window appears.
6. Select the Data Sources and click **Save**.The Data Sources window displays the data sources that are already in use by the other deployments.

The following figure shows the Import functionality.



7. Select the **Import** check-box.

8. In the **Deployment** dropdown box, select the deployment from which you want to import the position tracking attributes from an existing deployment. The dropdown menu lists all of the deployments with which data sources are shared. Review the list of data sources in the **Data Sources** menu, and click **OK**.

9. Add an ESA Rule. See Step 4. Add and Deploy Rules

10. In the Data Sources tab, click **Deploy Now**.
The deployment retrieves the position tracking information from the selected pre-existing deployment, and applies it to the new deployment.

**Note:** Ensure that you do not delete the deployment from where you imported the position tracking information, before you perform **Deploy Now** on the newly created or edited deployment. The import position tracking information function is disabled by default. Sharing data sources between multiple deployments can lead to performance issues.

## Deployment Options

There are two deployment options below the Data Sources section. These options apply to the entire ESA rule deployment.

The following table describes these deployment options.

| Task | Description |
|---|---|
| Show Updates | Enables you to view a history of updates to the deployment. |
| Deploy Now | Activates the ESA rule deployment. The selected ESA service starts aggregating data and generating alerts using the specified ESA rules in the deployment. You need to add ESA Rules to the deployment before deploying the ESA rule deployment. |

## ESA Rules Section

In the ESA Rules section, you manage rules in the deployment. This section lists all rules that are currently in the deployment.

The following table describes the actions you can perform in the ESA Rules section.

| Task | Description |
|---|---|
| + | Opens the Deploy ESA Rules dialog, where you can select a rule. |
| − | Removes the selected ESA rules from the deployment. |
| | Filters the list of rules. |
| Filter | Enables you to search for a rule. |

The following table describes the columns in the ESA Rules section.

| Title | Description |
|---|---|
| Status | Indicates the rule status:<br>• **Deployed** - the rule is deployed.<br>• **Updated** - the rule has been updated since the last deployment.<br>• **Added** - the rule has been added since the last deployment.<br>• **Disabled** - the rule is disabled due to an error in the rule or an error during the deployment of the rule.<br><br>In NetWitness Platform version 11.3.0.2 and later, if a disabled rule has an error message, it shows ! in the Status field. Hover over the rule to view the error message tooltip.<br>  |
| Rule Name | Describes the purpose of the ESA rule. |
| Trial Rule | Indicates whether the rule is Deployment mode to see if the rule runs efficiently. |
| Severity | Shows the threat level of alert triggered by the rule. |
| Type | Shows the type of the ESA rule. For more information, see ESA Rule Types. |

| Title | Description |
|---|---|
| Email, SNMP, Syslog, Script | Indicates which notification types are used for alerts generated by the rules. (ESA SNMP notifications are not supported in NetWitness version 11.3 and later.) |
| Last Modified | Shows the date and time when the ESA rule was last modified. |

## Data Source Filter (Optional) Section

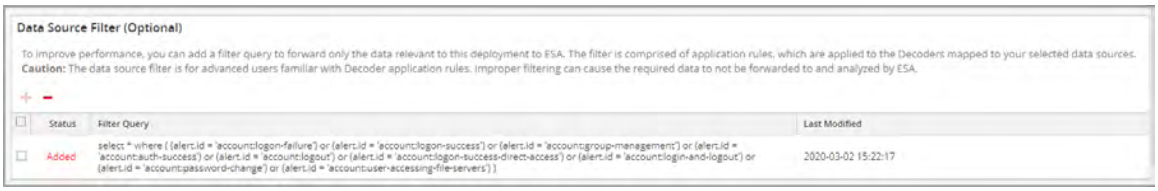
**Note:** This option is available in NetWitness version 11.5 and later.

The data source filter is optional. If you have a medium to large NetWitness Platform deployment and you have high throughputs, you can add a filter query to forward only the data relevant to this deployment to ESA. This helps to filter out certain types of traffic that does not add value to the analysis of the data in the ESA rule deployment.

**Caution:** The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

**IMPORTANT:** If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.



The following table describes the columns in the Data Source Filter (Optional) section.

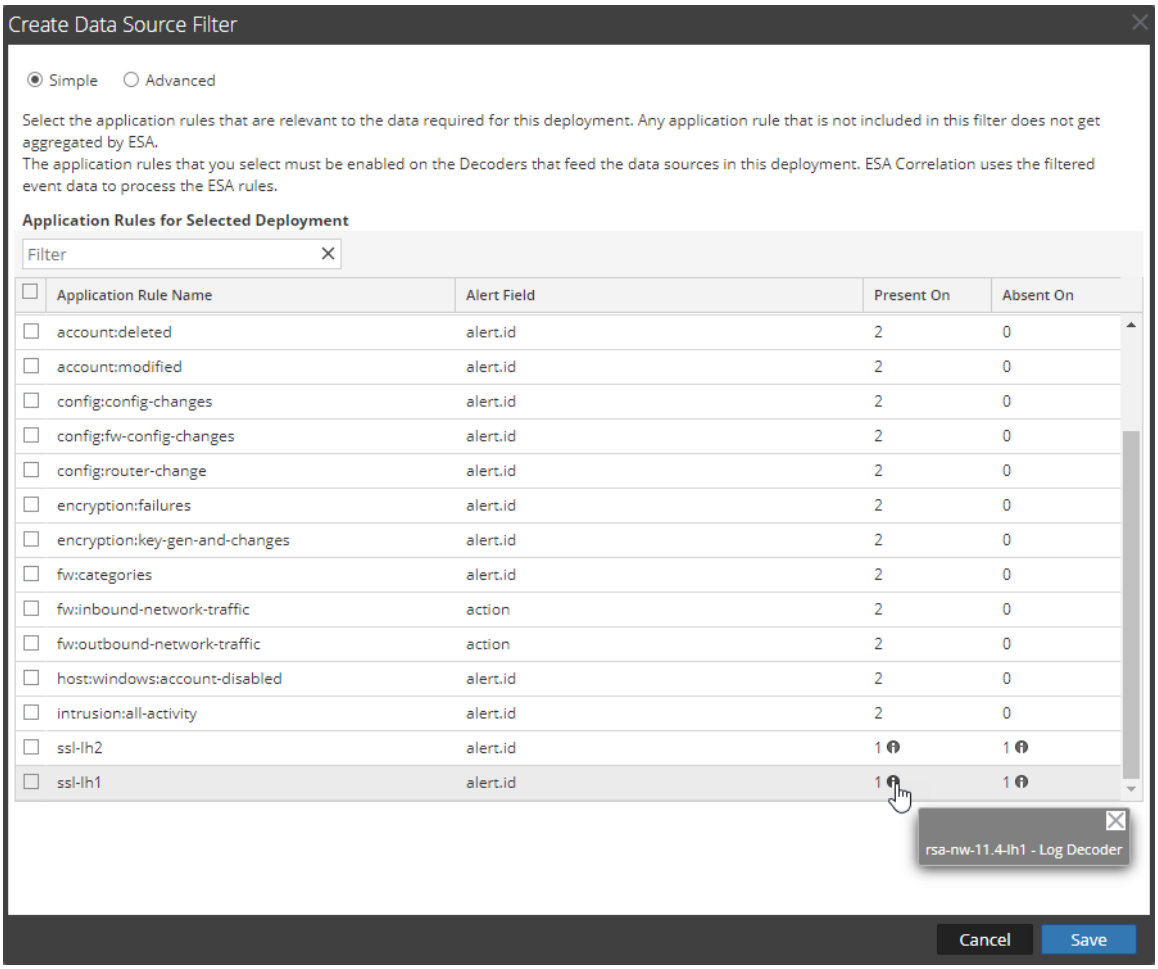
| Title | Description |
|---|---|
| ☐ | Enables you to select and remove a data source filter. |
| Status | Indicates the data source filter status:<br>• **Added** - the filter is added to the deployment, but it is not yet deployed.<br>• **Deployed** - the filter is actively streaming only the relevant data as defined in the filter query. |

| Title | Description |
|---|---|
| Filter Query | Shows the query that contains the application rules. Each application rule query is separated by an "or" condition. You can use either the simple or advanced option to create the data source filter. You can only have one data source filter per deployment for your selected data sources. |
| Last Modified | Shows the date that the filter was added to the ESA rule deployment. |

## Create Data Source Filter Dialog - Simple

When you create the data source filter, you select application rules to be included in the filter query. The application rules that you select must be enabled on the Decoders that feed the data sources in this deployment. ESA Correlation uses the filtered event data to process the ESA rules.

**Caution:** The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.



The following table describes the columns in the Create Data Source Filter dialog.

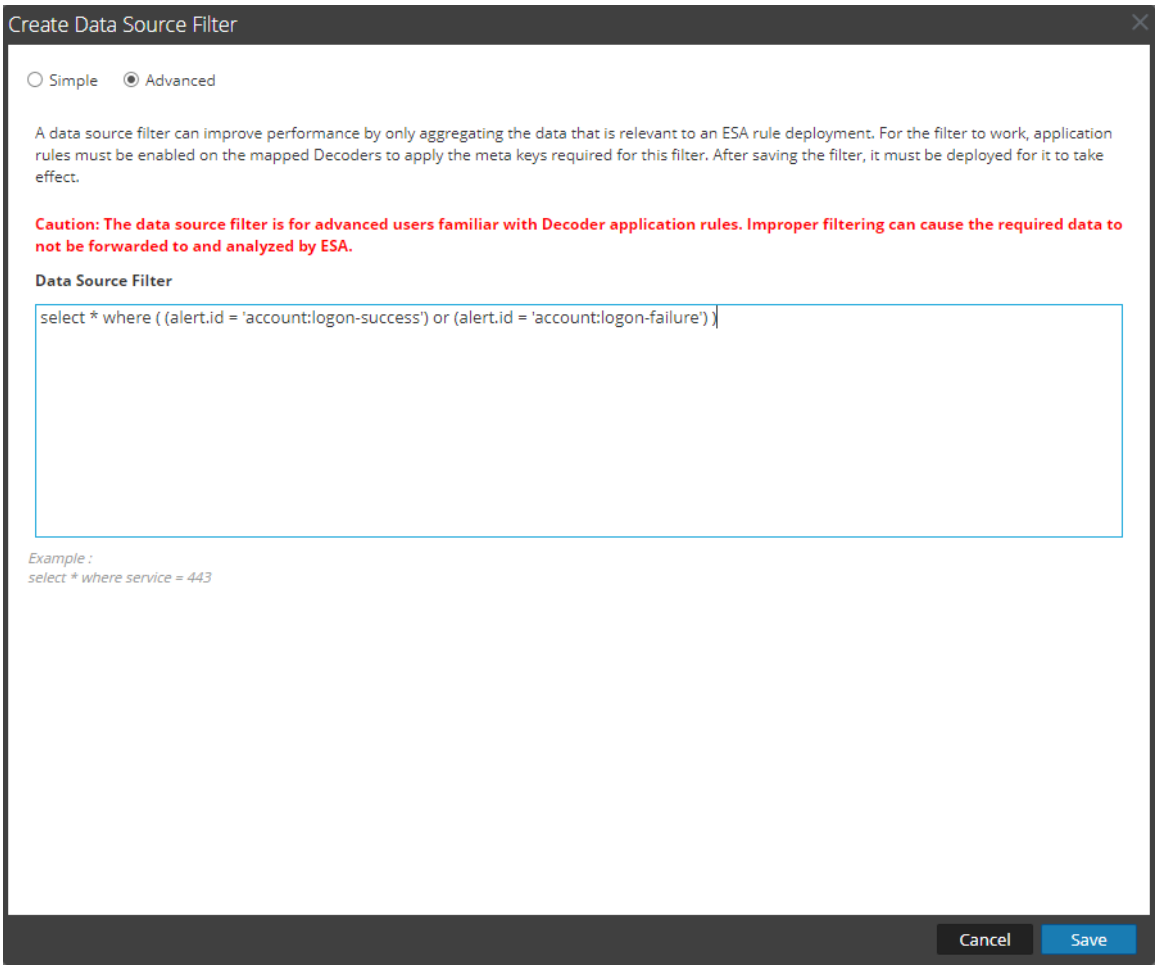
| Title | Description |
|---|---|
| Filter | Enables you to search for a rule. For example, you can type "account" to search for application rules that contain that word. |
| Application Rule Name | Shows the names of the application rules on the Decoders mapped to the data sources in this deployment. |
| Alert Field | Shows the meta key used in the alert. |
| Present On | Shows the number of Decoders mapped to the data sources in this deployment that *have* the listed application rule. If the rule is not present on all of the Decoders, you can hover over the icon to view the names of the Decoders that contain the rule. |
| Absent On | Shows the number of Decoders mapped to the data sources in this deployment that *do not have* the listed application rule. If a rule is not present on all of the Decoders, you can hover over the icon to view the names of the Decoders that do not contain the rule. |

For more information, see "Configure Application Rules" in the *Decoder and Log Decoder Configuration Guide*.

## Create Data Source Filter - Advanced

If necessary, you can use the advanced filter instead of the simple filter to add your data source filter query directly. The individual application rule queries must be separated by an "or" condition. For more information on creating and writing Decoder rules, see "Configure Application Rules" in the *Decoder and Log Decoder Configuration Guide*.

**Caution:** The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.



Create Data Source Filter
Simple
Advanced
A data source filter can improve performance by only aggregating the data that is relevant to an ESA rule deployment. For the filter to work, application rules must be enabled on the mapped Decoders to apply the meta keys required for this filter. After saving the filter, it must be deployed for it to take effect.
Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.
Data Source Filter
select * where ( (alert.id = 'account:logon-success') or (alert.id = 'account:logon-failure') )
Example :
select * where service = 443
Cancel
Save

# Deploy ESA Services Dialog

The Deploy ESA Services dialog displays all ESA services available to be added to an ESA rule deployment.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Configure an ESA rule deployment. | ESA Rule Deployment Steps |
| Content Expert | Add a service. | ESA Rule Deployment Steps |
| Content Expert | Add data sources. (This is available in 11.3 and later.) | ESA Rule Deployment Steps |
| Content Expert | Add and deploy rules. | ESA Rule Deployment Steps |

## Related Topics

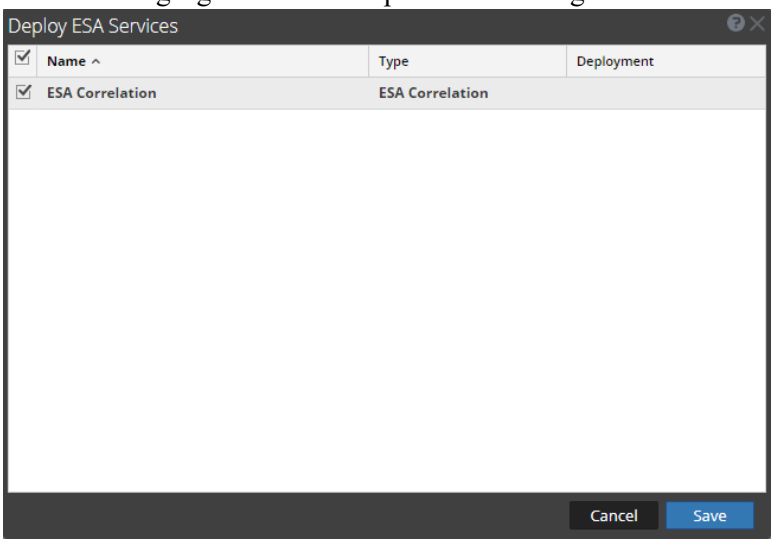
- Additional ESA Rule Deployment Procedures
- View Stats for an ESA Service

## Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a deployment.
3. In the **ESA Services** panel, click .
   The Deploy ESA Services dialog is displayed.

The following figure is an example of this dialog.



The following table describes the parameters of the Deploy ESA Services dialog.

| Parameters | Description |
|---|---|
| Name | Displays the name of configured ESA services. |
| Deployment | Displays the ESA rule deployments to which the service has already been added. |

# Deploy ESA Rules Dialog

The Deploy ESA Rules dialog enables you to filter and select rules to deploy to an ESA service.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Configure an ESA rule deployment. | Step 1. Add an ESA Rule Deployment |
| Content Expert | Deploy a rule | Step 4. Add and Deploy Rules |

## Related Topics

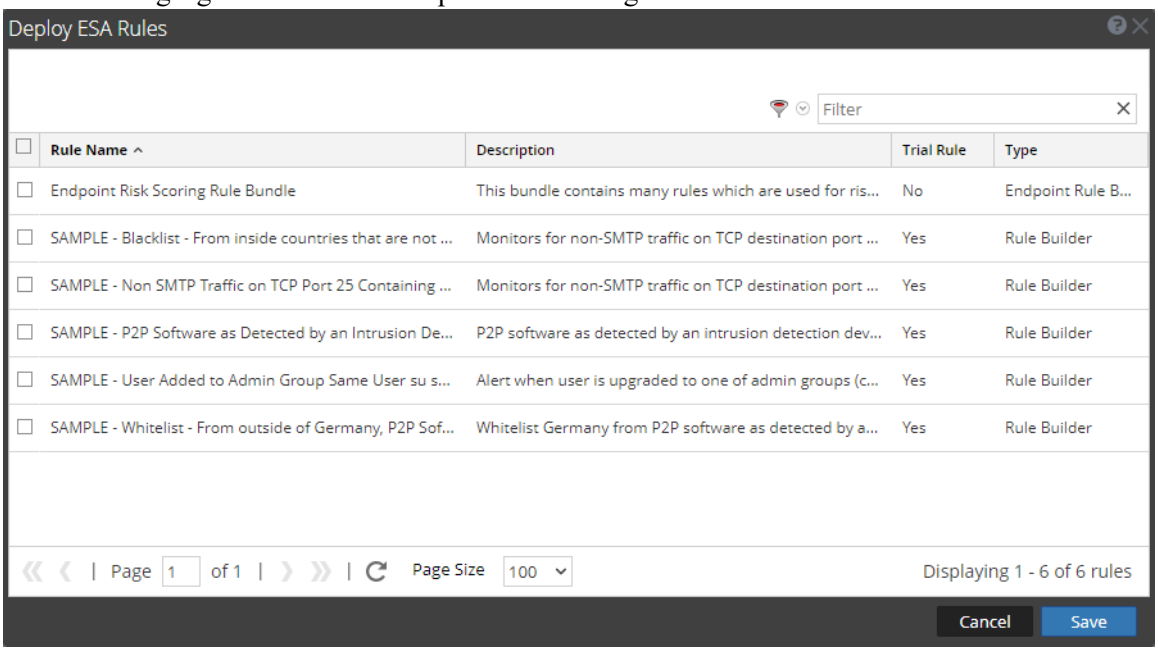
- Additional ESA Rule Deployment Procedures

## Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a new deployment by clicking **> Add**.
3. If you add a new deployment, type the name of the deployment in the box in the options panel.
4. In the **ESA Rules** panel, click .
   The Deploy ESA Rules dialog is displayed.

The following figure shows an example of this dialog.



The following table describes the parameters of the Deploy ESA Rules dialog.

| Parameters | Description |
|---|---|
| | Filters the list of rules based on severity and type. The text box beside this icon filters based on rule name. |
| Rule Name | Displays the name of the rule. |
| Description | Describes the rule. |
| Trial Rule | Indicates whether or not the rule is a trial rule. |
| Type | Indicates the type of rule: RSA Live ESA, Advanced EPL, or Rule Builder. |

# Updates to the Deployment Dialog

The Updates to the Deployment dialog displays changes made to the deployment, such as adding a rule or service. Deployment updates are indicated by the update icon ( ) next to the name of the deployment in the Rules tab options panel.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Deploy rules to run on ESA. | ESA Rule Deployment Steps |
| Content Expert | Edit or delete an ESA rule deployment. | Edit the ESA Rule Deployment Name or Delete a Deployment |
| Content Expert | View deployment updates. | Show Updates to an ESA Rule Deployment |

## Related Topics

- Replace an ESA Service in an ESA Rule Deployment

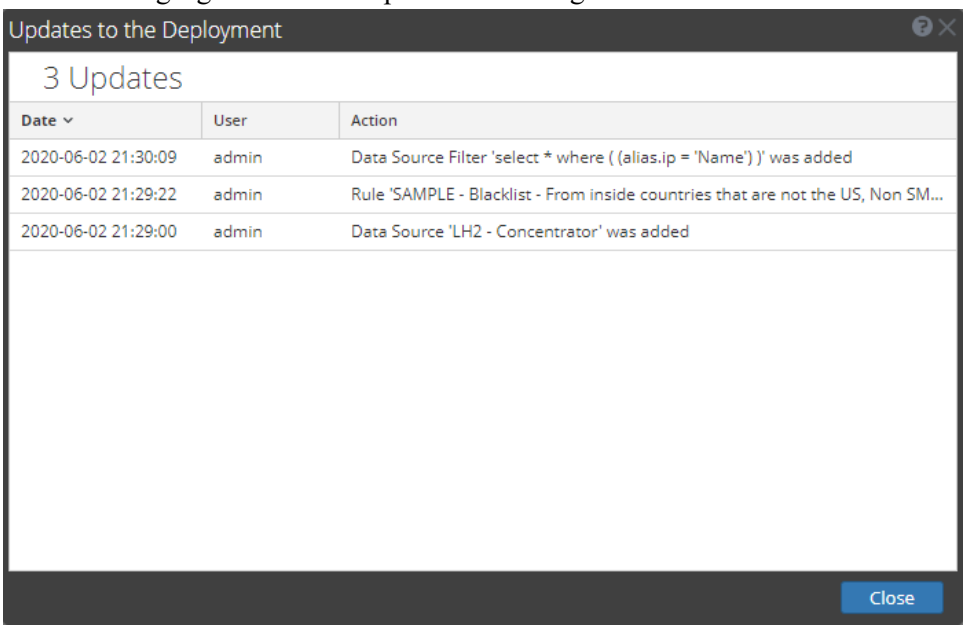
- Edit or Delete a Rule in a Deployment

## Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployments** section, select or add a deployment.
3. In the **Deployment** panel, click **Show Updates**.
   The Updates to the Deployment dialog is displayed.

The following figure is an example of this dialog.



The Updates to the Deployment dialog displays the number of updates at the top of the dialog. The following table describes the parameters of this dialog.

| Parameters | Description |
|---|---|
| Date | Displays the day and time of the update. |
| User | Displays the user who made the update. |
| Action | Describes the update. |

# Services Tab

This topic provides an overview of the **(Configure) > ESA Rules > Services** tab. The Services tab shows the status of the deployments on each ESA service.

## What do you want to do?

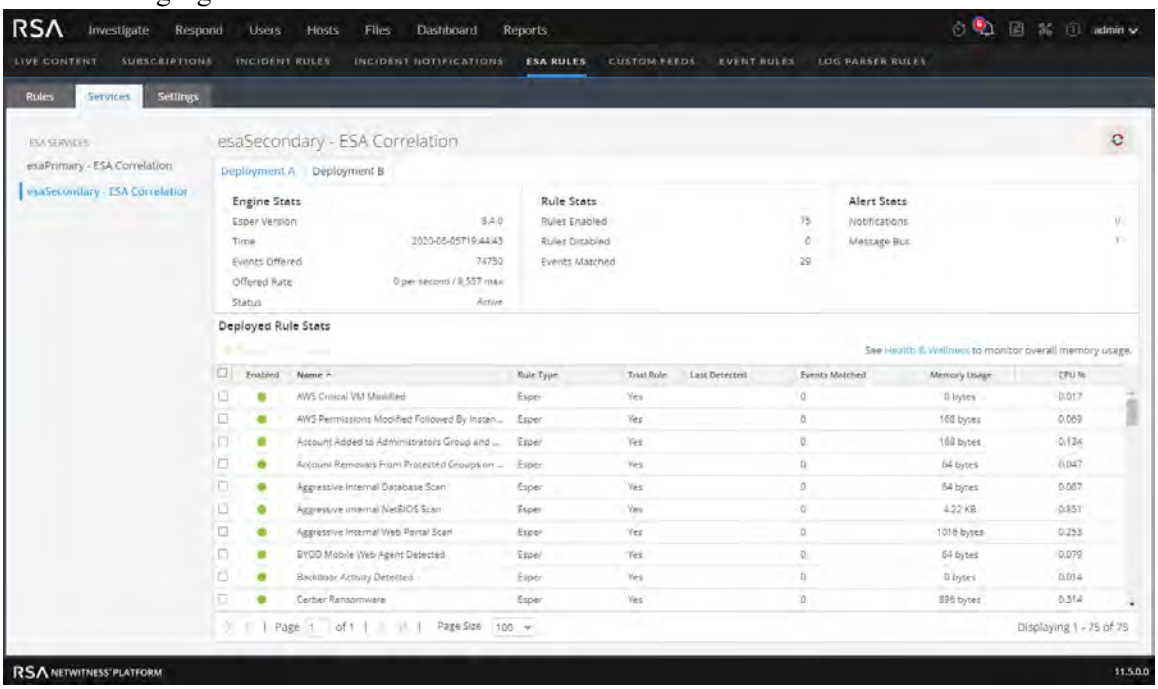
| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Troubleshoot Services Tab. | Troubleshoot ESA |
| Content Expert | View deployment Stats for an ESA Service. | View Stats for an ESA Service |

## Related Topics

- View a Summary of Alerts

## Quick Look

The following figure shows the Services tab:



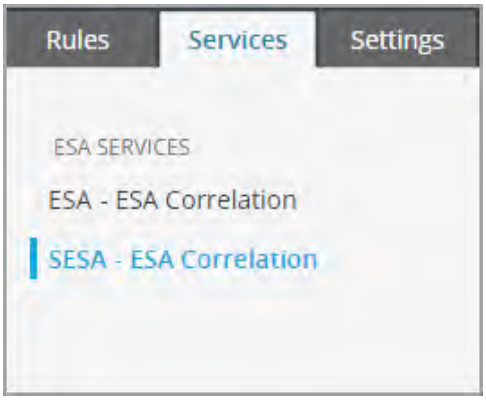
(This option is available in NetWitness version 11.3 and later.) If an ESA Correlation service has multiple deployments, under the service name, you will see a tab for each deployment. In the above example, there are two deployment tabs, Deployment A and Deployment B. Each tab displays information specific to that deployment.

The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

## ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness.



## General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.

The following table lists and describes the parameters in each section.

| Sections | Parameter | Description |
|---|---|---|
| Engine Stats | Esper Version | Esper version running on the ESA service |
| | Time | Time when the last event was sent to Esper Engine |
| | Events Offered | Number of events processed by the ESA service since the last service start |
| | Offered Rate | The rate that the ESA service processes current events / The maximum rate that the ESA service processed events. |
| | Status | Shows the status of the deployment. A status of **Active** means that the deployment is active. A status of **Inactive** means that there was probably an error starting the deployment. Check the error log file for more information: `/var/log/netwitness/correlation-server/correlation-server.log`. |
| Rule Stats | Rules Enabled | Number of rules enabled |
| | Rules Disabled | Number of rules disabled |
| | Events Matched | Total number of events matched to all rules on the ESA service |
| Alert Stats | Notifications | The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.) |
| | Message Bus | The total number of alerts sent to Respond for the deployment |

## Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.

The table lists the various parameters in the view and their description.

| Parameters | Description |
|---|---|
| Enable | Enables a rule that was disabled. |
| Disable | Disables a rule that was enabled. |
| Health & Wellness link | Enables you to monitor overall memory usage and health of your ESA Correlation service. |
| Enabled | Indicates whether the rule is enabled or disabled.<br>A green circle icon indicates that the rule is enabled.<br>A white circle icon indicates that the rule is disabled.<br>If a disabled rule has an error message, it shows in the Enabled field. Hover over the icon to view the error message tooltip. The following example shows that the rule was disabled because it exceeded the configured memory threshold for that rule.<br>  |
| Name | Name of the ESA rule. |
| Rule Type | (This field applies to version 11.3 and later.) **Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules. |
| Trial Rule | Indicates if the rule is running in trial rule mode. |
| Last Detected | The last time alert was triggered for the rule. |
| Events Matched | The total number of events that matched the rule. |
| Memory Usage | The total amount of memory used by the rule.<br>**Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage. |
| CPU % | The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. (This field is available in version 11.5 and later.)<br>**Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage. |

# Settings Tab

This topic describes the components of the **(Configure) > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- MetaKey Referances
- Viewing the List of Meta Entities
- Enabling Meta Entity in the ESA Correlation Server
- Building Rules with Custom Meta Entities
- Configure a data enrichment source

## What do you want to do?

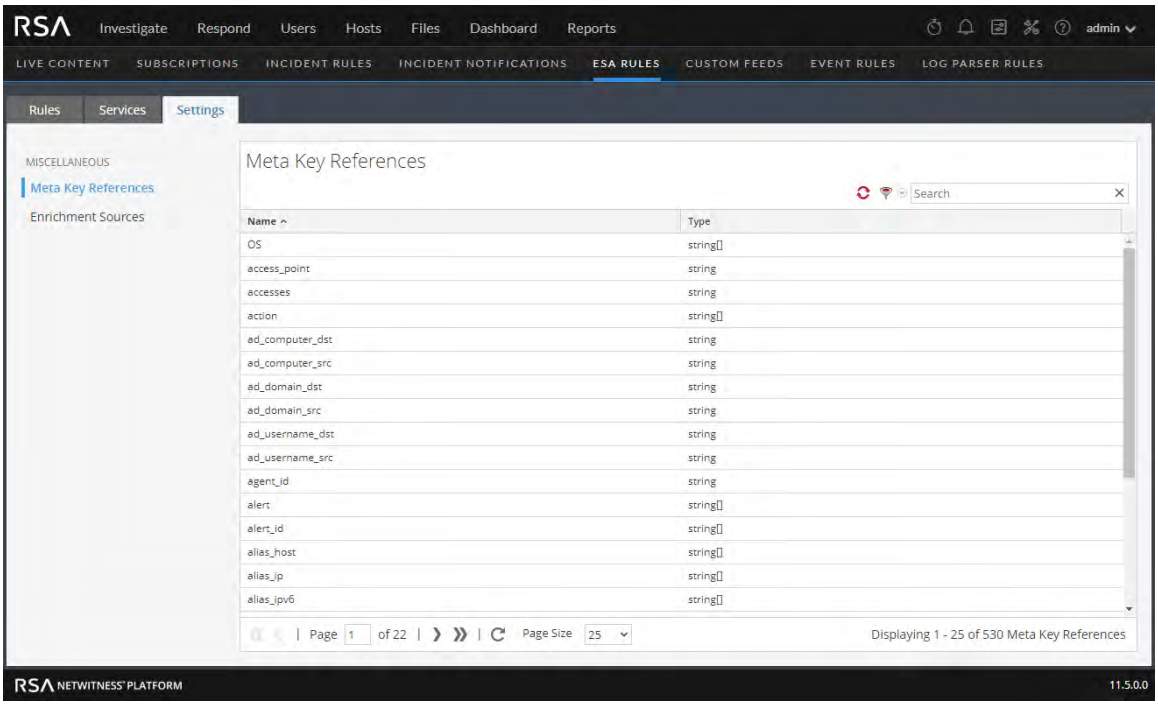
| Role | I want to ... | Show me how |
|---|---|---|
| Content Expert | Configure an in-memory table as an enrichment source. (Recurring In-Memory Tables are no longer supported in version 11.3 and later.) | Configure an In-Memory Table as an Enrichment Source |
| Content Expert | Configure a Context Hub list as an enrichment source. | Configure a Context Hub List as an Enrichment Source |

## Related Topics

- Add a Data Enrichment Source
- Rule Builder Tab.

## Quick Look

The following figure shows the Meta Key References section in the Settings tab.



## Meta Key References

The Meta Key References section lists each Meta key used by the ESA Correlation server and the type of value the key requires.

Meta key entities are configured to be a part of Event Schema. After you upgrade from RSA NetWitness® Platform 11.5, or previous releases to RSA NetWitness® Platform 11.6, you can enable the string [] meta keys entities. You can create rules and configure alerts based on the meta key entities that you select. You can also add meta entities to create rules. The meta entities retrieves data from the data sources to trigger alerts.

**Note:** Only the meta keys comprising of string [] are supported.

## Viewing the List of Meta Entities

Perform the following steps to view the list of meta entities that are available in the system:

1. Click to **Configure** > **ESA RULES** > **Settings** > **Meta Key References.**

The Meta Key References page displays all the meta keys that are enabled.

2. Enter the name of the meta key in the Search text box to view specific meta entities.

## Enabling Meta Entity in the ESA Correlation Server

After an upgrade to NetWitness 11.6 or later, you need to enable the meta entities in the ESA Correlation server to create rules and configure alerts based on the meta key entities.

To enable meta entities in the ESA Correlation server:

1. Click (Admin) **Admin** > **Services**.
2. In the Services view, select the ESA Correlation service.
3. Click the settings icon and go to **View** > **Explore**.

The ESA Correlation Configuration page lists all the services.

4. Click **enable-meta-entity** and set it to **true**.

**Note:** By default, **enable-meta-entity** is set to **false**. Ensure that you enable only the specific meta entitiy using which you want to build a rule. Enabling multiple meta entities affects the system performance.

5. Add custom meta entities by appending or editing the meta-entities field values under explore view.

In the Explore view node list for the ESA Correlation service, select **Correlation** > **Stream**.All the stream settings are listed. You can add custom meta entities to the list as per the requirement. Once you enable custom meta entities, you can view them under Meta Key References. Once you enable the custom meta key entities, the rules will start evaluating the meta key entities and start to evaluate and trigger alerts as per the configured conditions. For more information, see Viewing the List of Meta Entities

The following meta entities are listed in the ESA Correlation Configuration page:

- checksum.all
- compromise.all
- domain.all
- host.all
- ip.all
- outcome.all
- user.all

## Meta Entity Usage Example

*ip_all*, and *host_all* are some of the examples of meta entities.

For example, the *ip_all* meta entity can be used to check for any malicious IPs. It combines all the IPv4 meta keys (*ip_src*,*alias_ip*, *ip_dst*, and *forward_ip*) and creates a string array to retrieve information and trigger alerts.

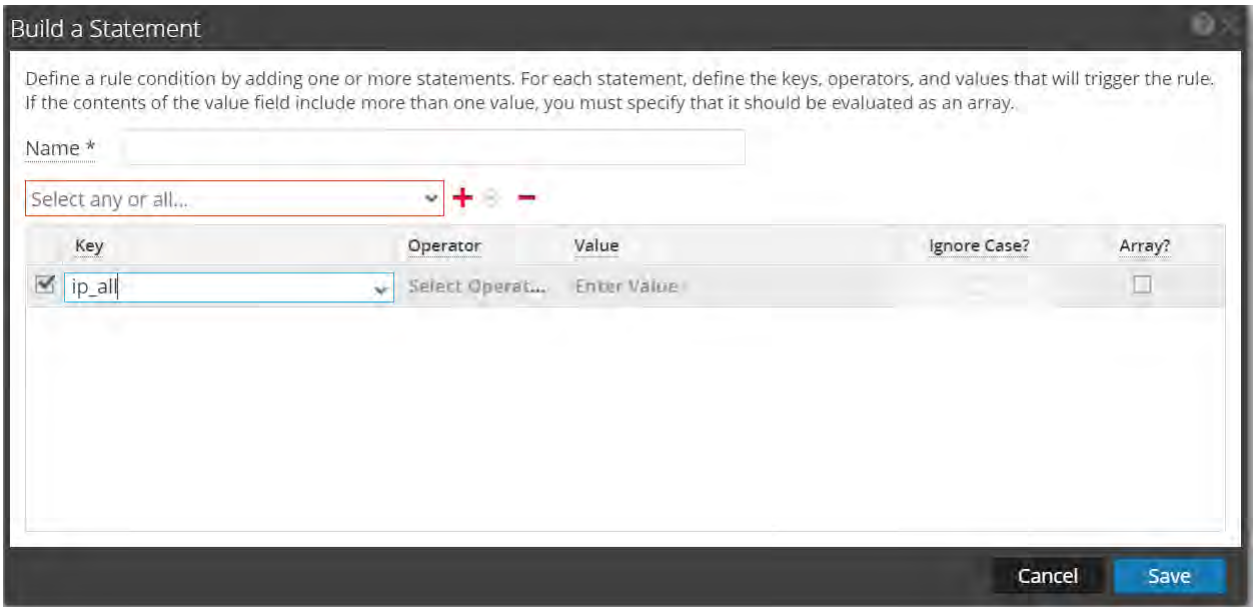
**Note:** You can add and enable custom meta entities (string arrays) to the list.

## Building Rules with Custom Meta Entities

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

The following graphic shows an example of a Rule Builder statement using meta entities.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.



### Prerequisites

To build a rule statement, you must know the meta key and the meta value. For a complete list of meta keys, go to **Configure** > **ESA Rules** > **Settings** > **Meta Key References**.For more information about building rules with meta entities, see Rule Builder Tab.

## Enrichment Sources

In the Enrichment Sources section, you can use the following external data sources:

- GeoIP
- In-Memory Table (Add hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)
- Context Hub

The following figure shows the Enrichment Sources section in the Settings tab.

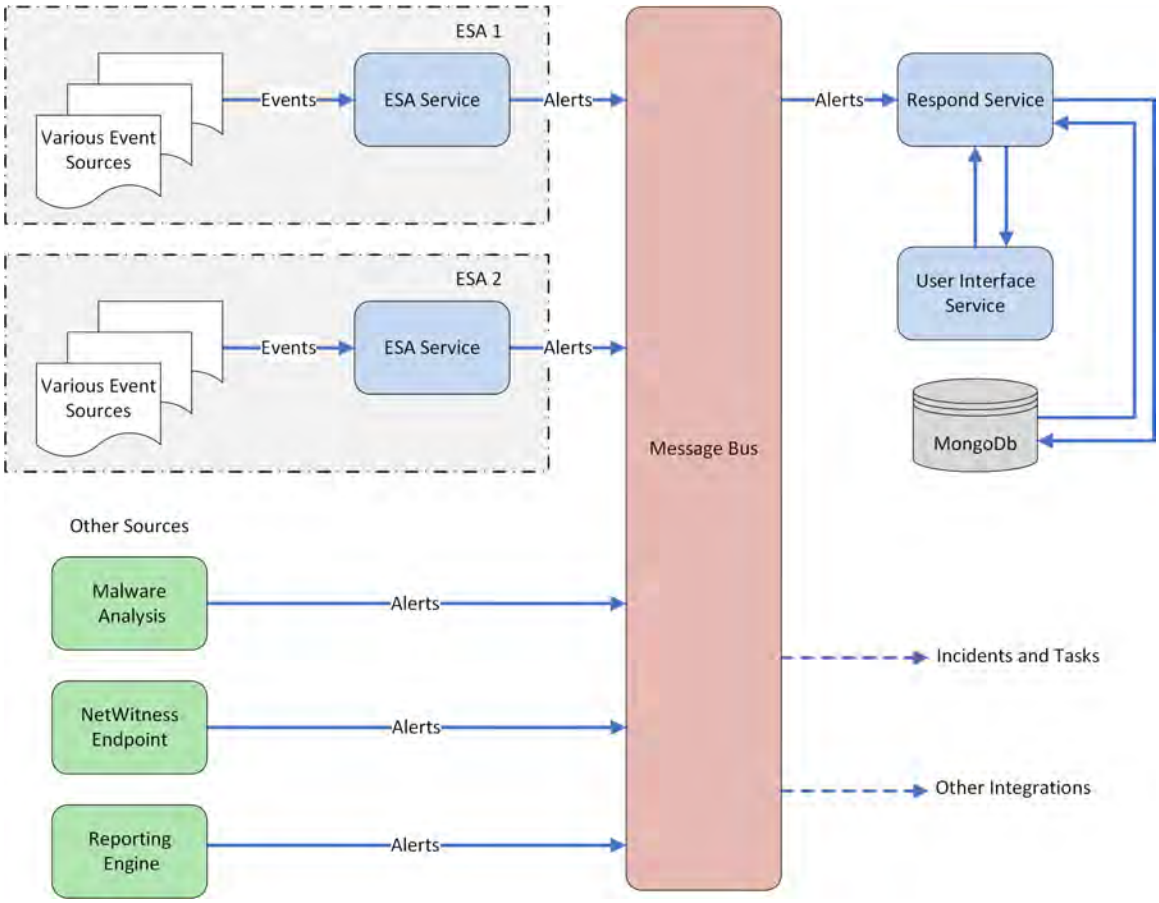
# Event Stream Analysis Overview

NetWitness Event Stream Analysis (ESA) provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators.

ESA's advanced Event Processing Language allows you to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps perform powerful incident detection and alerting.

The following diagram shows the high-level data workflow:



In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

**Note:** The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**IMPORTANT:** Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

## Upgrade Considerations for ESA Analytics

The Event Stream Analytics Server (ESA Analytics) service is not supported or available in NetWitness version 11.5 and later. The Whois Lookup Configuration and ESA Analytics Mapping panels are no longer in the user interface [ (Admin) > System].

**Note: Event Stream Analysis (ESA) is not end of life. ESA Correlation rules and the ESA Correlation service are supported.** ESA Analytics, which is used for Automated Threat Detection, is different from ESA Correlation Rules and is EOL. In its place, you can use ESA Correlation as is offers more functional capabilities and better performance.

# Configure ESA Correlation Rules

This topic provides high-level tasks to configure RSA NetWitness Event Stream Analysis (ESA) Correlation Rules using the ESA Correlation service.

**IMPORTANT:** Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

## Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

**Caution:** The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

**IMPORTANT:** If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see “(Optional) Add a Data Source Filter” in ESA Rule Deployment Steps.

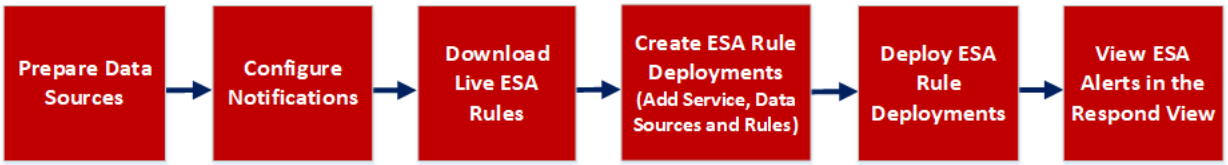
## Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see Deploy Endpoint Risk Scoring Rules on ESA. To configure NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# ESA Correlation Rules Configuration Workflow

The following diagram shows the high-level workflow for configuring ESA Correlation Rules with the ESA Correlation service.



*ESA Rule Deployments* are groups of ESA Rules processed by an ESA service to create alerts. In NetWitness 11.3 and later, the ESA Correlation service processes the ESA rules and creates alerts.

Before you can configure ESA Correlation Rules, install and configure the data sources (Concentrators) to use for the ESA rules. For example, you may have a Concentrator with HTTP packet data and another with Windows Log data. Next, configure the global notification methods that content experts can use for the ESA rules. For example, they may want to send an email notification when a rule creates an alert.

The NetWitness Live Content Management System (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. RSA Live contains an extensive library of ESA rules to detect threats that you can use to save time. Download the rules for the events that you want to detect in your network to the ESA Rule Library and adjust them as needed for your network environment.

After you prepare your data sources and download Live ESA rules, you can create one or more ESA rule deployments. An ESA rule deployment contains an ESA service, one or more data sources, and a set of ESA rules. For example, you can create an ESA rule deployment that contains an ESA Correlation service, a Concentrator with HTTP packet data, and a set of ESA rules for HTTP packet data. When you are ready to have the ESA service run the rule set, you deploy the ESA rule deployment, which places the rules on ESA.

After you deploy an ESA rule deployment, verify that you can view the ESA alerts in the Respond view (Respond > Alerts).

# Prerequisites

Make sure that you:

- Install the ESA Correlation service in your network environment.
- Install and configure one or more Concentrators in your network environment.
- Download or ensure that you have access to the Alerting with Correlation Rules User Guide for version 11.3 or later. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Procedure

The following table shows the high level tasks required to configure ESA Correlation Rules.

| Tasks | Reference |
|---|---|
| 1. Prepare data sources, such as Concentrators, to use for your ESA Correlation Rules. | Refer to Broker and Concentrator Configuration Guide. |
| 2. Configure notifications for the ESA Correlation service. | Refer to Notification Methods. |
| 3. Download Event Stream Analysis rules using Live. Configure the Live ESA Rule parameters for your environment. | Refer to Download Configurable RSA Live Rules. |
| 4. Create ESA rule deployments*: Choose ESA Rules and the appropriate ESA service to use in the ESA rule deployment. For NetWitness 11.3 and later, you must also choose the data sources to use for these rules. | Refer to ESA Rule Deployment Steps. |
| 5. Deploy ESA rule deployments.* | Refer to ESA Rule Deployment Steps. |
| 6. View ESA alerts in the Respond view. | Refer to the NetWitness Respond User Guide. |

*ESA rule deployments are groups of ESA Rules that are processed by an ESA service, such as the ESA Correlation service in NetWitness version 11.3 and later.

For additional optional advanced ESA Correlation Rules configuration procedures, see Additional ESA Correlation Rules Procedures.

For more information on alerting with ESA Correlation rules best practices, creating rules, working with trial rules, adding data enrichment sources, viewing statistics for an ESA service, and troubleshooting, see the Alerting with ESA Correlation Rules User Guide.

# ESA Correlation Health and Wellness Monitoring

In NetWitness version 11.5 and later, New Health and Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the System Maintenance Guide.

# Upgrade Considerations for ESA Hosts

Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later.

**IMPORTANT:** The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

# Trial Rule Status Changes

In NetWitness Platform 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment. For example, if you change the status of a trial rule to disabled [ (Configure) > ESA Rules > Services tab] and redeploy the ESA rule deployment [ (Configure) > ESA Rules > Rules tab], the trial rule remains disabled. Previously, ESA trial rules could change status after an upgrade or when they were redeployed.

## Upgrade Considerations for ESA Rule Deployments (from 11.2.x and Earlier only)

**Caution:** After upgrading to NetWitness version 11.3 or later, due to the ESA Correlation service data source changes, there are necessary data changes to migrated ESA rule deployments.

After the upgrade to version 11.3 or later, migrated ESA rule deployments change as follows:

1. If an ESA rule deployment contains two services before 11.3, the deployment splits into two deployments. You can only have one ESA Correlation service in an ESA rule deployment in version 11.3 or later.
2. If an ESA service has multiple ESA rule deployments before 11.3, they combine into one deployment in version 11.3 or later. You can still access your old deployments. For a detailed example, see ESA Rule Deployments Upgrade Example (from 11.2.x and Earlier only).

To support Endpoint and UEBA content as well as changes to ESA rules from Live, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service. Some single-value meta keys are also required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

## Upgrade Considerations for ESA Rule Deployments (from 11.3.x)

**Caution:** Before upgrading from NetWitness 11.3.x to 11.4 or later, it is important to delete ESA rule deployments that do not contain an ESA Correlation service. The remaining ESA rule deployments should have been deployed at least once with the ESA Correlation service.

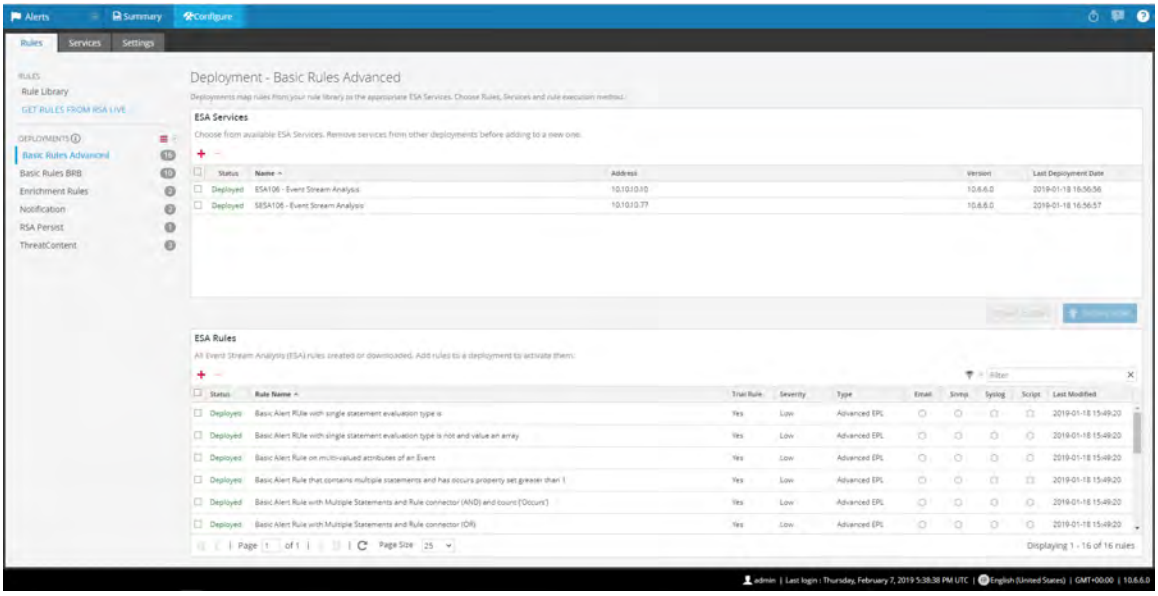
# ESA Rule Deployments Upgrade Example (from 11.2.x and Earlier only)

**Note:** This example applies only to upgrades from NetWitness version 11.2.x and earlier to 11.3.x or 11.4.x.

to NetWitness 10.6.6 ESA rule deployments before and after an upgrade to version 11.3 or later. In this example, before the upgrade there are six 10.6.6 ESA rule deployments. Four deployments have both ESA primary and ESA secondary Event Stream Analysis services. One deployment has only the ESA primary service and another one has only the ESA secondary service. Each 10.6.6 ESA rule deployment before the upgrade has a set of rules as shown in the following table:

| 10.6.6 ESA Rule Deployment (Before Upgrade) | # of Rules | ESA Primary | ESA Secondary |
|---|---|---|---|
| Basic Rules Advanced | 16 | x | x |
| Basic Rules BRB | 10 | x | x |
| Enrichment Rules | 2 | x | x |
| Notification | 2 | | x |
| RSA Persist | 1 | x | |
| Threat Content | 3 | x | x |
| **Total # of Rules** | | **32** | **33** |

The following figure shows the 10.6.6 ESA rule deployments before the upgrade.



In this example, after the upgrade to 11.3, there are only two functional ESA rule deployments; one has the ESA primary (ESAP) ESA Correlation service and the other has the ESA secondary (ESAS) ESA Correlation service. The ESAP - ESA Correlation service deployment contains 32 rules, which is the total of all of the rules in the 10.6.6 deployments that contained the ESA primary service (16 + 10 + 2 + 1 + 3). The ESA secondary ESA Correlation service contains 33 rules, which is the total of all the rules in the 10.6.6 deployments that contained the ESAS Service (16 + 10 + 2 + 2 + 3). Since the RSA Persist deployment only contained one ESA primary service in 10.6.6, that rule was added to the ESAP 11.3 deployment. Since the Notification 10.6.6 deployment contained one ESA secondary service, the rule was added to the 11.3 ESAS deployment.

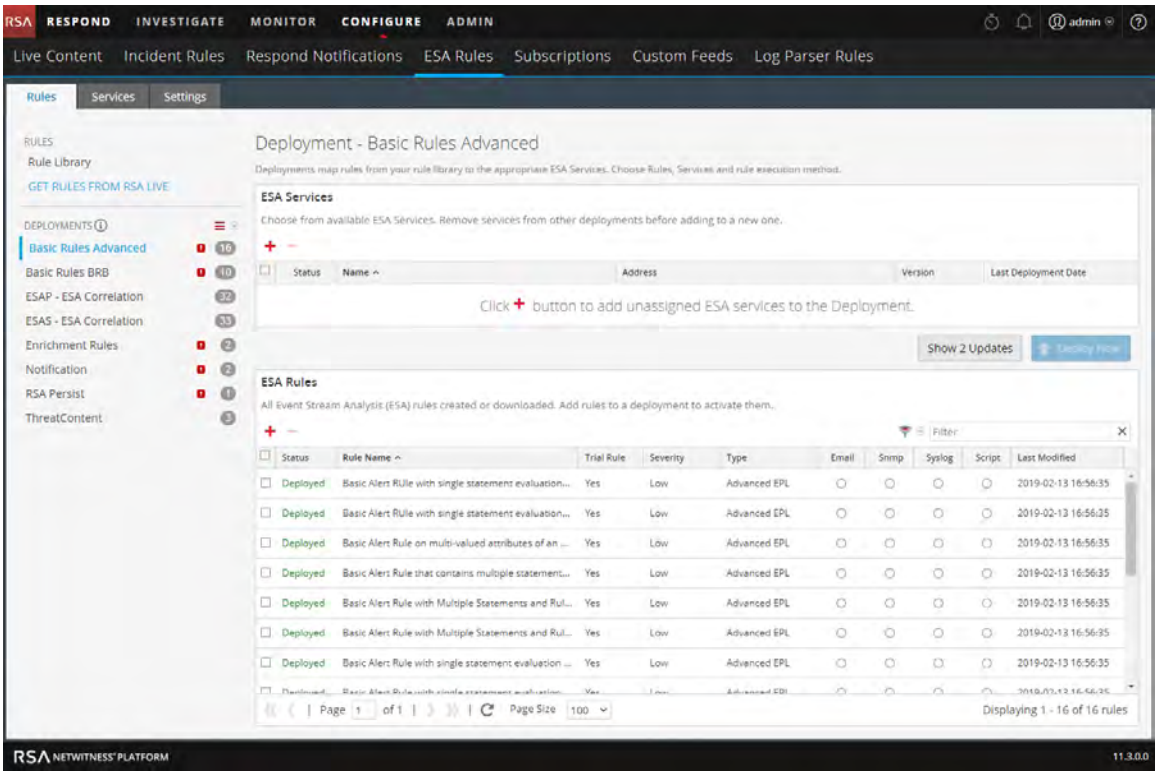
The following table shows the 11.3 ESA rule deployments after upgrade, the number of rules in each deployment, and which deployments have the ESA primary and ESA secondary ESA Correlation services.

| 11.3 ESA Rule Deployment (After Upgrade) | # of Rules | ESA Primary | ESA Secondary |
|---|---|---|---|
| Basic Rules Advanced | 16 | | |
| Basic Rules BRB | 10 | | |
| **ESAP - ESA Correlation** | **32** | **x** | |
| **ESAS - ESA Correlation** | **33** | | **x** |
| Enrichment Rules | 2 | | |
| Notification | 2 | | |
| RSA Persist | 1 | | |
| Threat Content | 3 | - | - |
| **Total # of Rules** | | **32** | **33** |

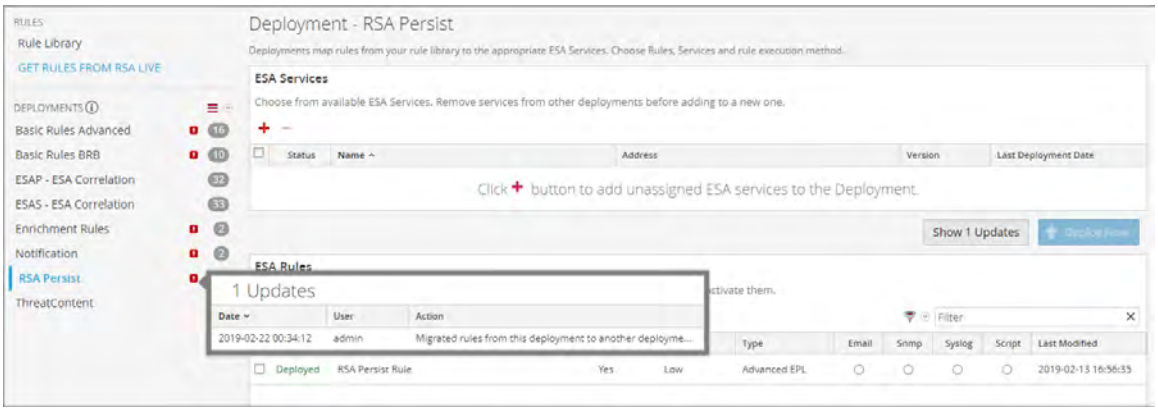
In this example, all of the 10.6.6 ESA rule deployments were moved to 11.3, but they have no services after the upgrade. The only functional 11.3 ESA rule deployments are ESAP and ESAS. The 10.6.6 ESA rule deployments are preserved in case you want to use them.

**Caution:** Before upgrading from NetWitness 11.3.x to 11.4, it is important to delete ESA rule deployments that do not contain an ESA Correlation service. The remaining ESA rule deployments should have been deployed at least once with the ESA Correlation service.

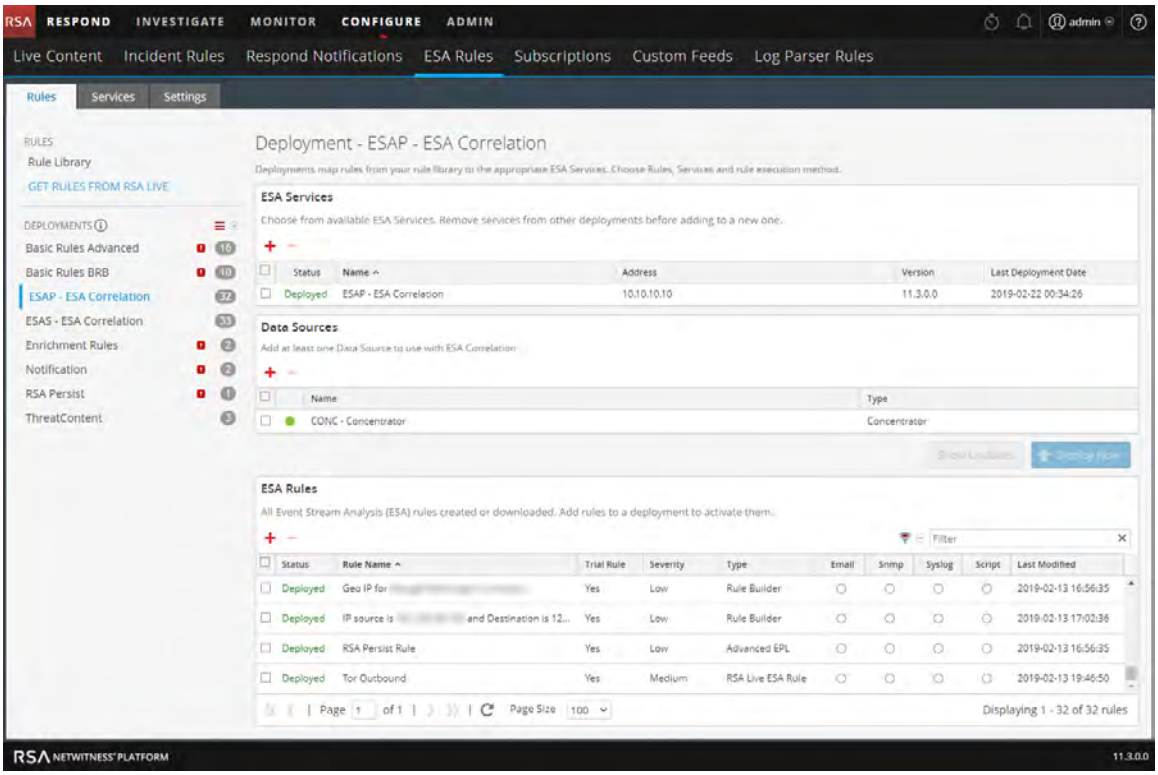
The following figure shows the 11.3 ESA rule deployments after the upgrade. Notice that the Basic Rules Advanced deployment from 10.6.6 does not have any ESA services, but it still contains the original 16 rules.



The 10.6.6 ESA rule deployments show update messages detailing the changes as shown in the following figure.



The following figure shows the ESA primary rule deployment after the upgrade (ESAP - ESA Correlation). Notice that the ESAP - ESA Correlation deployment has only the ESA primary ESA Correlation service.



In NetWitness 11.3 and later, you can only have one ESA Correlation service per deployment, but an ESA Correlation service can be in more than one ESA rule deployment.

# Additional ESA Correlation Rules Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of ESA Correlation Rules.

Use this section when you are looking for instructions to perform a specific task after the initial setup of ESA.

- Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys
- Configure Advanced Settings for an ESA Correlation Service
  - Enable or Disable Sending ESA Rule Alerts to the Respond View
  - Enable ESA Correlation Service Debugging for All Rules
  - Configure Maximum Events per Alert for All Rules
  - Adjust Maximum Sessions for the ESA Data Source Filter
  - Configure Meta Keys as Arrays in ESA Correlation Rule Values
  - Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy
- Configure Character Case for Advanced ESA Rules
- Deploy Endpoint Risk Scoring Rules on ESA
- Change Memory Threshold for ESA Rules
- Start, Stop, or Restart ESA Service
- View Audit Logs and Verify ESA Component Versions

## Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys

**Note:** This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions.

To support Endpoint, UEBA, and RSA Live content, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service for 11.3 and later. Additional string meta keys are required within the ESA Correlation service for 11.3.0.2 and later.

If the meta keys used for your ESA rules are different from the required default multi-value meta keys, your ESA rules continue to work, but you should update your ESA rules to use the required meta keys as soon as possible to ensure that your rules continue to deploy properly.

**Note:** On a new installation of ESA on 11.3.0.2 and later, no ESA rule adjustments are necessary.

The ESA Correlation service has the following multi-valued (string array) and single-valued (string) parameters:

- **multi-valued** - Shows the string array meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later, it shows the existing string array meta keys before the upgrade. (This parameter is equivalent to the Event Stream Analysis service ArrayFieldNames parameter in NetWitness Platform versions 11.2 and earlier.)
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string array meta keys for the latest version.
- **single-valued** - Shows the string meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later from versions prior to 11.3, this parameter value is empty.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string meta keys for the latest version.
- **default-multi-valued** - Shows the required string array meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.
- **default-single-valued** - Shows the required string meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.

**Note:** If you have the same value in the `single-valued` and `multi-valued` parameter fields, the `single-valued` meta key value takes precedence over the `multi-valued` meta key value.

To use the latest Endpoint, UEBA, and Live content rules, you must update the **multi-valued** parameter on the ESA Correlation service to include all of the meta keys in the **default-multi-valued** field. You must also update the **single-valued** parameter field to include all of the meta keys in the **default-single-valued** field. To do this, follow the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure.

**Caution:** Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

**Note:** If you are using multiple ESA Correlation services, the `multi-valued` and `single-valued` parameters should be the same on each ESA Correlation service.

In NetWitness Platform 11.3.0.2 and later, ESA automatically adjusts the operator in the rule statement when there is a change from string to string array, but you still may need to make manual adjustments to adjust for the string array changes.

To change the string type meta keys to string array type meta keys manually, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```

If you used any meta keys in the ESA rule notification templates from the Required String Array or String Meta Keys list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.

**Note:** Advanced EPL rules may get disabled and are not automatically updated so they must be fixed manually.

For additional troubleshooting information, see “Troubleshoot ESA” in the *Alerting with ESA Correlation Rules User Guide*.

## Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules

To use the latest Endpoint, UEBA, and Live content rules, you must update the **multi-valued** parameter field on the ESA Correlation service to include all of the meta keys in the **default-multi-valued** field. You must also update the **single-valued** parameter field to include all of the meta keys in the **default-single-valued** field.

**Caution:** Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

**Note:** If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing this procedure should fix the issue. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.

1. After an upgrade to 11.3.0.2 or later, go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.

3. Compare the **multi-valued** parameter meta keys with the required **default-multi-valued** meta keys. Copy and paste the missing string array meta keys from the **default-multi-valued** parameter to the **multi-valued** parameter. (You may want to copy only a couple meta keys at one time to reduce the number of reported errors).
4. Copy and paste the string meta keys from the **default-single-valued** parameter to the **single-valued** parameter.
5. If you have multiple ESA Correlation services, make the same meta key changes on each ESA Correlation service.
6. Apply the changes on the ESA Correlation services:
   a. Go to **(Configure) > ESA Rules** and click the **Settings** tab.
   b. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).
7. If you are using any of the **default-multi-valued** or **default-single-valued** meta keys in your ESA Advanced rules, update the rule syntax. See also Adjust Custom ESA Rule Builder and ESA Advanced Rules.
8. If you used any meta keys in the ESA rule notification templates from the **default-multi-valued** parameter list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.
9. Deploy your ESA rule deployments.
10. Check your rules for error messages in the ESA Rules section of the ESA rule Deployment or check the ESA Correlation error logs for errors.
    - (This option is available in NetWitness verson 11.3.0.2 and later.) To access the error messages in the ESA rule deployment, go to **(Configure) > ESA Rules > Rules** tab, select a deployment in the options panel on the left, and go to the **ESA Rules** section. If the ESA rule status shows "Disabled" or shows the icon in the Status column, you need to determine the issue to fix the rule. If a disabled rule has an error message, it shows in the Status field. You can hover over the rule to view the error message tooltip without going to the error log.
    - To access the ESA Correlation service logs, you can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

## Adjust Custom ESA Rule Builder and ESA Advanced Rules

Update your ESA Rule Builder and ESA Advanced rules to work with the string and string array meta keys listed in the `default-multi-valued` and `default-single valued` parameter fields for the ESA Correlation service. You can add additional meta keys to the `multi-valued` and `single-valued` parameters.

For example, if you use ec.outcome as a single-valued meta key in your ESA rule as shown below:

```
@RSAAlert
SELECT * FROM Event((ec_outcome IN ( 'Success' )))
.win:time_length_batch(2 Minutes, 2)
```

```
HAVING COUNT(*) >= 2;
```

If you add ec.outcome to the **multi-valued** parameter field, you need to update your rule as shown below:

```
@RSAAlert
SELECT * FROM Event(( 'Success' = ANY( ec_outcome ) ))
.win:time_length_batch(2 Minutes, 2)
HAVING COUNT(*) >= 2;
```

For more information, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

## Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure should fix the issue.

### Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,
checksum_src, client_all, content, context, context_all, context_dst,
context_src, dir_path, dir_path_dst, dir_path_src, directory,
directory_all, directory_dst, directory_src, email_dst, email_src,
feed_category, feed_desc, feed_name, file_cat, file_cat_dst, file_cat_
src, filename_dst, filename_src, filter, function, host_all, host_dst,
host_orig, host_src, host_state, ip_orig, ipv6_orig, OS, param, param_
dst, param_src, registry_key, registry_value, risk, risk_info, risk_
suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

### Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

## Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

**Note:** If you are upgrading from version below 11.4.x.x, make sure that meta keys on new ESA hosts are updated to match upgraded ESA Hosts in the Same NetWitness Platform Network.

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.6, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to **(Admin) > Services**, and in the Services view, select the ESA Correlation service and then select **> View > Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to **(Configure) > ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ().
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

# Configure Advanced Settings for an ESA Correlation Service

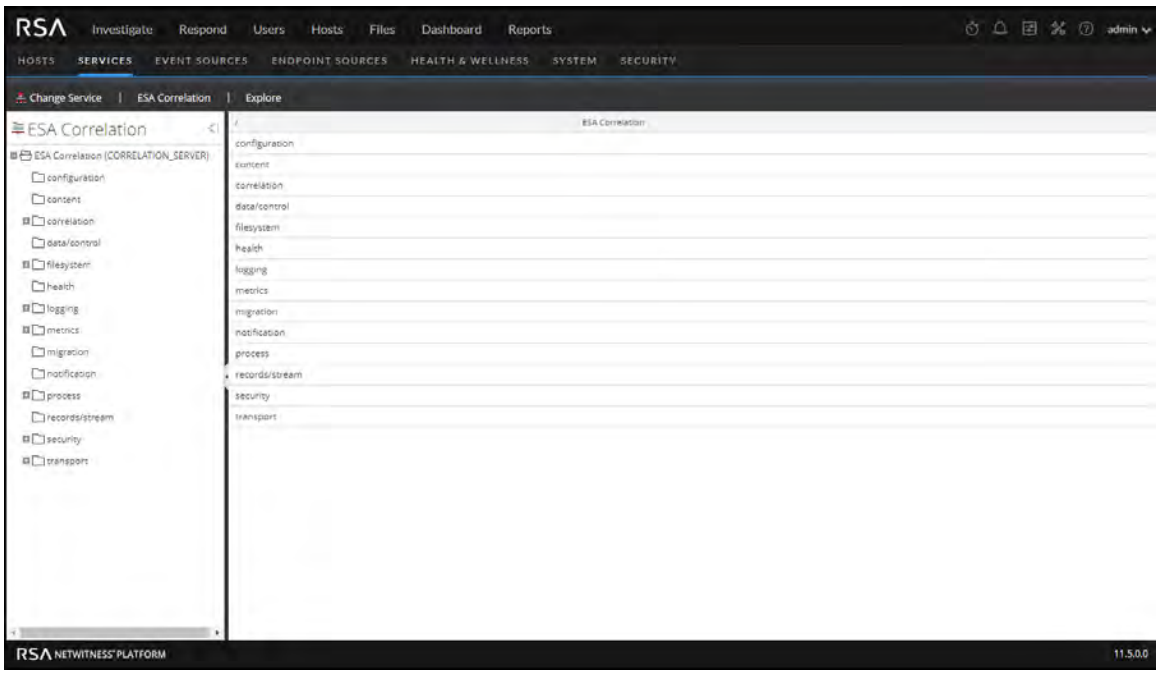
These procedures are optional and they apply only to ESA Correlation Rules.

In the Explore view for an ESA Correlation service, you can manage sending ESA rule alerts to the Respond view, turn on debugging for all rules, configure the events to preserve for rules with multiple events, and configure meta keys as string array values on ESA.

- Enable or Disable Sending ESA Rule Alerts to the Respond View
- Enable ESA Correlation Service Debugging for All Rules
- Configure Maximum Events per Alert for All Rules
- Adjust Maximum Sessions for the ESA Data Source Filter
- Configure Meta Keys as Arrays in ESA Correlation Rule Values
- Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

## Access Advanced Settings for an ESA Correlation Service

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. In Services view, select an ESA Correlation service and then select **> View > Explore**.
   The Explore view is displayed.



## Enable or Disable Sending ESA Rule Alerts to the Respond View

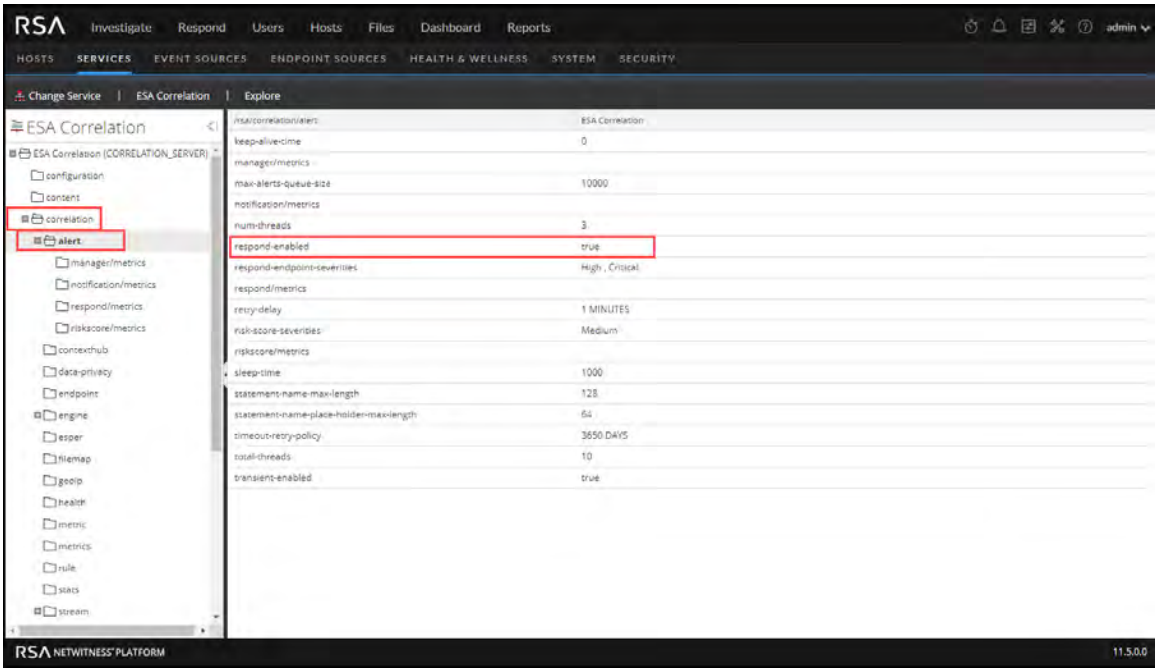
ESA gathers data, runs ESA Correlation rules against the data, captures events that meet rule criteria, and creates alerts for those captured events. You can view those alerts in the Respond view.

Before an ESA Correlation rule alert can go to the Respond view, both of the following settings must be enabled:

1. For all rules, the ESA Correlation service must have the `respond-enabled` parameter set to **true**. (The default is true.)
2. For an individual rule, the ESA Correlation rule must have the **Alert** option selected in the rule builder for that rule.

### To enable or disable alert forwarding to the Respond view for ALL ESA Correlation rules:

1. In the Explore view node list for an ESA Correlation service, select **correlation > alert**.



2. To allow all ESA Correlation Rule alerts to go to the Respond view, set `respond-enabled` to **true**. Alerts for ESA rules that have the **Alert** option selected are visible in the Respond view.
3. To stop all ESA Correlation Rule alerts from going to the Respond view, set `respond-enabled` to **false**.
   ESA Correlation Rules do not go to the Respond view, even if you select the **Alert** option in the rule.
   The changes take effect immediately.

**Note:** The `respond-enabled` parameter is equivalent to the **Forward Alerts On Message Bus** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

### To send or not send alerts to the Respond view for a single ESA Correlation rule:

Content experts managing the ESA Correlation rules can decide whether to send alerts to the Respond view for each rule.

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.

   - To turn on Respond alerts for a rule, select the **Alert** checkbox.
   - To turn off Respond alerts for a rule, clear the **Alert** checkbox.

3. Click **Save**.

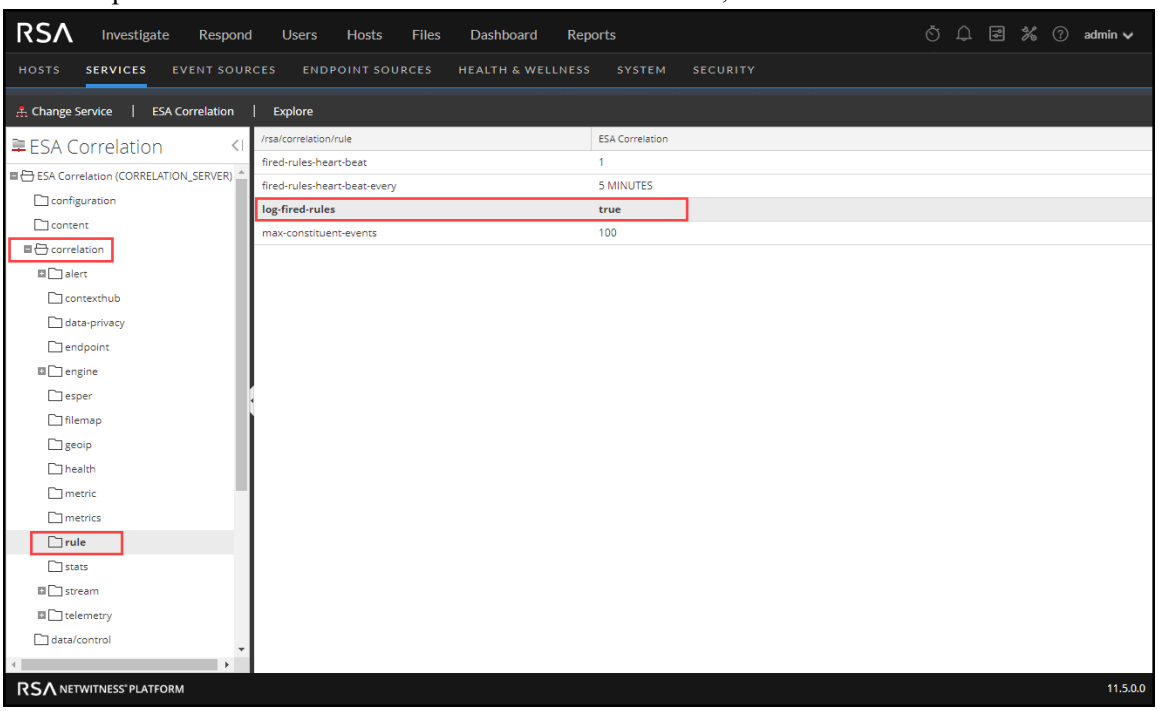
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

## Enable ESA Correlation Service Debugging for All Rules

You can turn on debugging for all ESA rules to see if rules are creating (firing) alerts and data is being processed properly by the ESA Correlation service. This can also be helpful when writing or fixing global notification templates, such as syslog or email. You can see the actual content of an alert before sending the notification.

When you disable ESA Correlation service debugging for all rules, you can still turn on debugging for an individual rule at any time.

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.

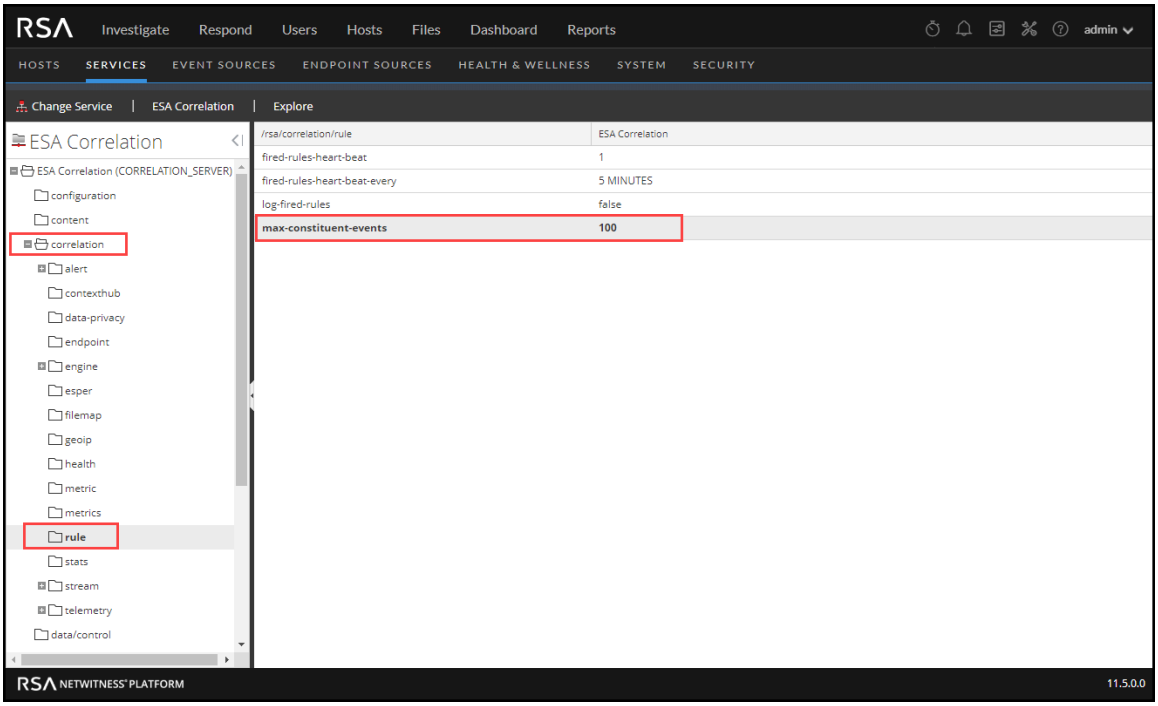


2. Set `log-fired-rules` to **true** to print alerts to the /var/log/netwitness/correlation-server/correlation-server.log for troubleshooting. This is the same as the Debug option in the rule builders for individual ESA rules except that this option enables debugging for all rules.
3. When you are ready to turn off debugging for all ESA rules, set `log-fired-rules` to **false**. The changes take effect immediately.

**Note:** The `log-fired-rules` parameter is equivalent to the **Debug Rules?** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

## Configure Maximum Events per Alert for All Rules

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.



2. For rules that contain multiple events, in `max-constituent-events`, enter how many of the associated events to preserve. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is **100**.
   The changes take effect immediately.

**Note:** The `max-constituent-events` parameter is equivalent to the **Max Constituent Events** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

## Adjust Maximum Sessions for the ESA Data Source Filter

**Note:** This procedure applies only to NetWitness Platform version 11.5 and later.

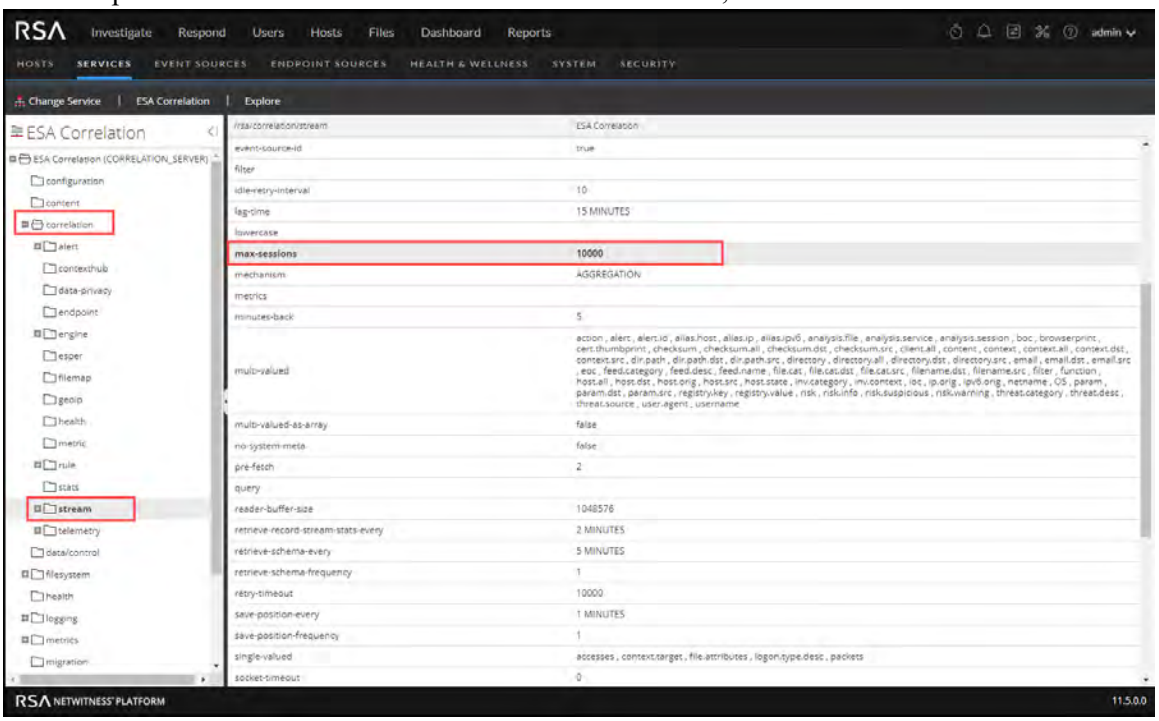
In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

**Caution:** The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

When filtering out a large portion of the traffic, you may see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. (You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`). Lower the `max-sessions` parameter until you no longer see the error in the log. The more you filter out the traffic, the lower you should set the `max-sessions` parameter.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.



2. In `max-sessions`, lower the value until you no longer see the error in the ESA Correlation log file. The default value is **10000**.

3. Restart the ESA Correlation service. Go to **(Admin) > Services**, select the ESA Correlation service, and then select **> Restart**.

**IMPORTANT:** If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see "(Optional) Add a Data Source Filter" in the *Alerting with ESA Correlation Rules User Guide*.

# Configure Meta Keys as Arrays in ESA Correlation Rule Values

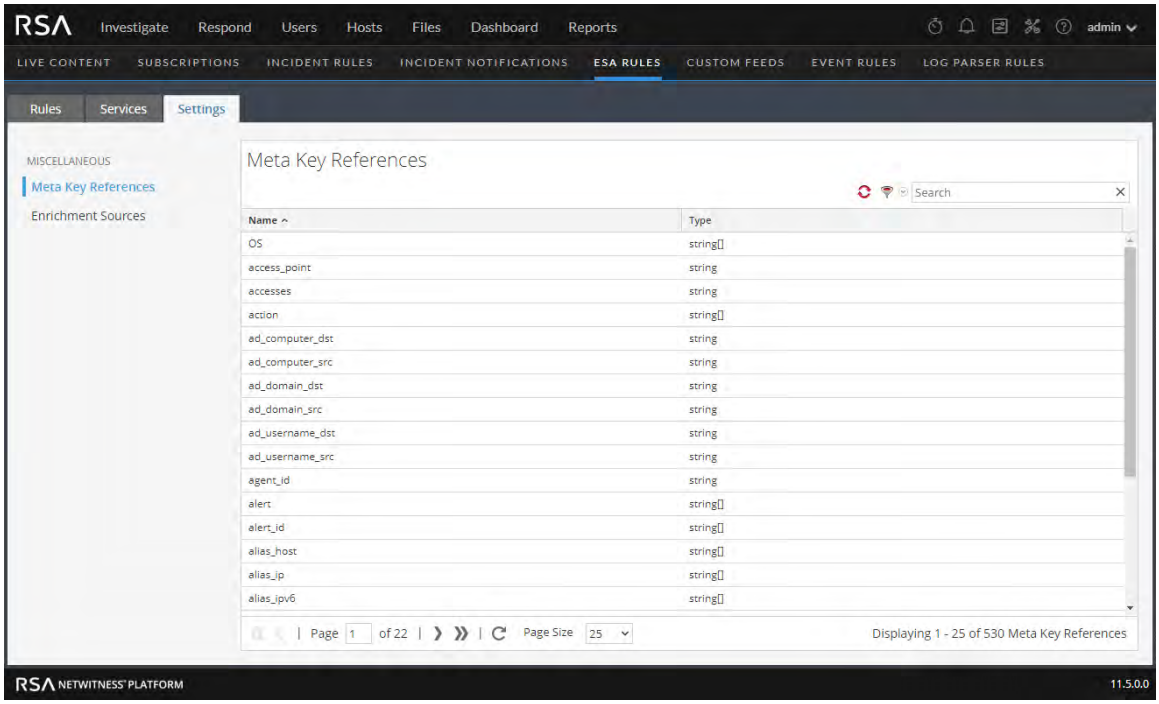
A common reason for an ESA rule to generate an error during deployment is because a meta key in the rule is a string array type, but it shows as a string type on ESA. To prevent or fix this issue, do the following:

- Determine if a Meta Key is a String Array Type on ESA
- Add the String Array Type Meta Key to ESA
- Verify that the String Array Type Meta Key is Configured Correctly on ESA

**Caution:** Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

## Determine if a Meta Key is a String Array Type on ESA

1. Go to **(Configure) > ESA Rules** and click the **Settings** tab.



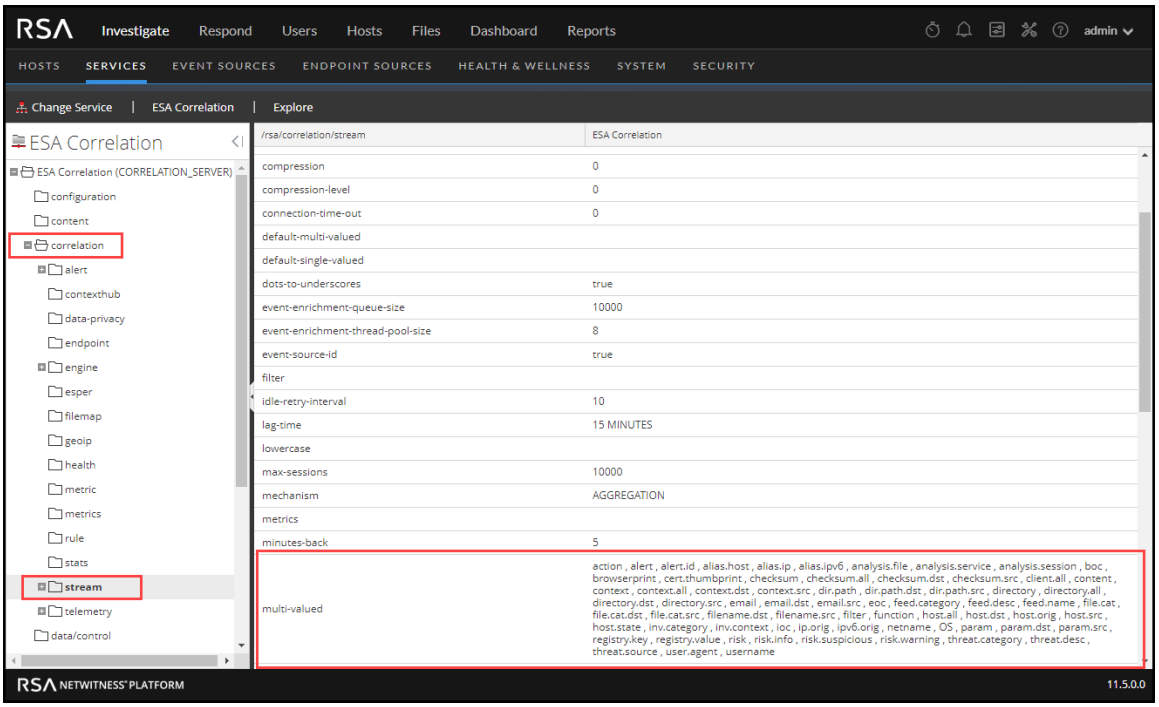
2. In the Meta Key References, for each meta key that is a string array type, locate the meta key in the Name field and then check the value.
   - If it shows `string[]`, it is configured as a string array type on ESA. This is fine.
   - If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. Go to Add the String Array Type Meta Key to ESA.

**Caution:** Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

## Add the String Array Type Meta Key to ESA

**Caution:** Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. If you add a meta key to the `multi-valued` parameter field that you use in other ESA rules, ensure that those rules are using the string array syntax.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.
2. Add string array meta keys to the **`multi-valued`** list to allow them to be used as an array in ESA rules.



3. Verify the configuration on ESA. Go to Verify that the String Array Type Meta Key is Configured Correctly on ESA.

**Note:** The `multi-valued` parameter is equivalent to the `arrayFieldNames` parameter in the Event Stream Analysis service in NetWitness version 11.2 and earlier.

## Verify that the String Array Type Meta Key is Configured Correctly on ESA

1. Go back to **(Configure) > ESA Rules** and click the **Settings** tab.
2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).
3. Verify that the meta keys with a string array type show a value of `string[]`.

## Required String Array Meta Keys on the ESA Correlation Service

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```

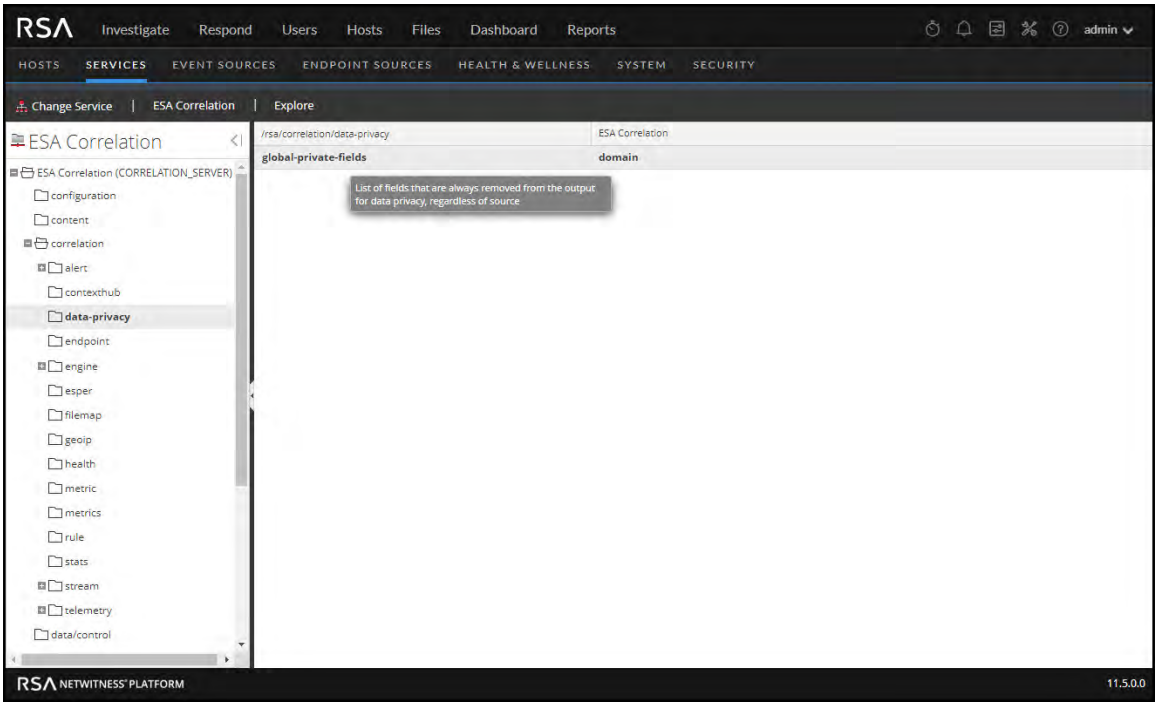
**Note:** Check the `default-multi-valued` and `default-single-valued` parameters on your ESA Correlation service for the latest required fields. For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

## Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

**Note:** This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

1. Go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.



The changes are effective immediately.

For more information, see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules Configuration Guide*. For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

# Configure Character Case for Advanced ESA Rules

**Note:** This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions, however, it is not supported in version 11.3.1.0.

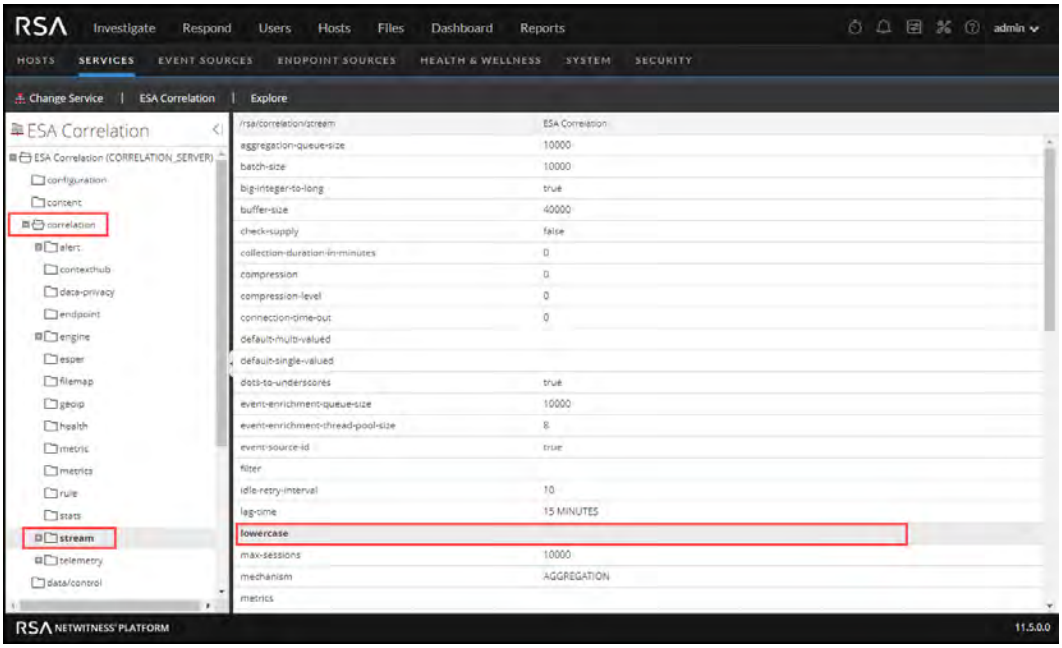
Advanced Event Processing Language (EPL) rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta keys may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can use the `toLowerCase`() function. However, care should be taken to only add the case-insensitive `toLowerCase()` function on string and string array meta keys as needed. The `toLowerCase()` function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function. For more information, see "Event Process Language (EPL)" in the *Alerting with ESA Correlation Rules User Guide*.

You can optimize your rule performance by identifying the meta keys used most often in your environment. Instead of using the `toLowerCase()` function with the original meta key, replace the meta key throughout the rule with `<meta.key>_lower`. You can also use the special case-insensitive meta keys in your Rule Builder rules.
For example, you can configure ESA Correlation to use `filename_lower` (which is case insensitive) instead of using the original `filename` meta key. In your rule, replace `filename` with `filename_lower`.

### To configure special case-insensitive meta keys to use in your ESA rules:

1. Go to **(Configure) > ESA Rules > Rules** tab. In your ESA rule deployments, identify any ESA rules using the `toLowerCase()` function more than ten times for a particular string or string array meta key. Keep track of these ESA rules and meta keys.
2. Go to **(Admin) > Services**, select an ESA Correlation service, and then select **> View > Explore**.

3. In the Explore view node list, select **correlation > stream**.
   Notice that there is a **`lowercase`** parameter with empty values.



4. Update the **`lowercase`** parameter with the string or string array meta keys identified in step 1 using a comma separated list, for example: `protocol,alias.host,action,alert`

> **Note:** String and string array are the only data types supported for the ESA Correlation service **`lowercase`** parameter.
>
> Use NWDB format (decimal), NOT Esper format (underscore). Do not press **Enter** to commit or it will put in a return. Instead, click another parameter.

5. After you add all of the meta keys, validate the meta keys on ESA.

   a. Go to **(Configure) > ESA Rules > Settings tab > Meta Key References** and click the Meta Re-Sync (Refresh) icon ( ).

   b. Search for **`_lower`** or **`<meta key>_lower`**, for example: `protocol_lower`.

   - The meta keys with a string array type should show a value of `string[]`.
   - The meta keys with a string type should show a value of `string` (without the brackets).

6. Update all of your ESA rules that use `.toLowerCase` meta keys and replace them with `<meta key>_lower` (Example: filename_lower IN ('svchost.exe'))
7. Deploy the ESA rule deployment again.

> **Note:** If you remove a meta key from the `lowercase` parameter list and re-sync the meta key references, you also need to update the rules that use the corresponding lowercase meta key (`<meta.key>_lower`).

# Deploy Endpoint Risk Scoring Rules on ESA

**Note:** The Information in this topic applies to NetWitness 11.3 and later.

Endpoint Risk Scoring Rules only apply to NetWitness Endpoint.

The ESA Correlation service processes and deploys endpoint risk scoring rules. These rules generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on Risk Scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. An *Endpoint Risk Scoring Rules Bundle* comes with NetWitness along with the sample ESA rules. The Endpoint Risk Scoring Bundle contains approximately 400 rules. You add this rule bundle to an ESA Rule Deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) during ESA Rule Deployment.

For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. For more information about ESA rule deployments, see "Deploy Rules to Run on ESA" in the *Alerting with ESA Correlation Rules User Guide*.

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Important Considerations when Deploying the Endpoint Risk Scoring Rules Bundle

- If you add the Endpoint Risk Scoring Bundle to an ESA rule deployment, the deployment should have data sources with endpoint data.
- An ESA rule deployment can have only one ESA Correlation service. You can, however, use the same ESA Correlation service in multiple deployments.
- If you have two ESA Correlation services with the same endpoint data sources, deploy the Endpoint Risk Scoring Rules Bundle on only one of them.

## Deploy the Endpoint Risk Scoring Rules Bundle on ESA

**Caution:** Before you deploy the Endpoint risk scoring rules, update your meta keys. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

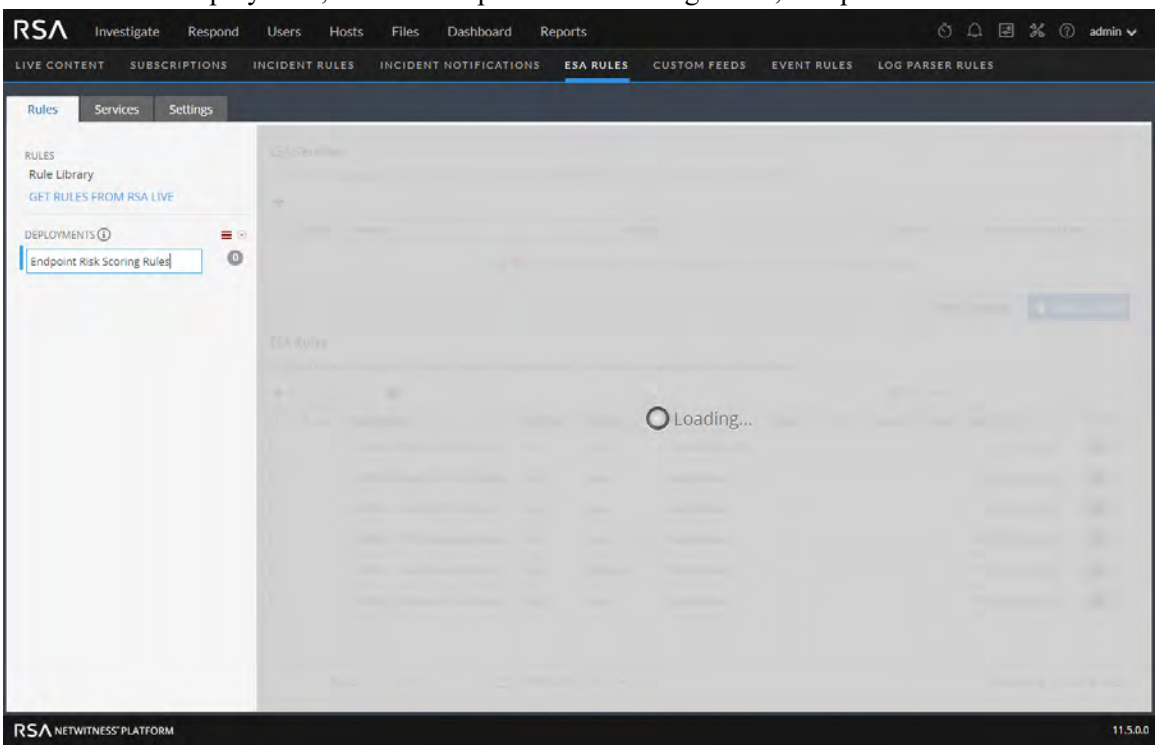
When you deploy the Endpoint Risk Scoring Rules Bundle in an ESA rule deployment, the ESA Correlation service gathers endpoint data in your network and runs endpoint risk scoring rules against the data. The goal is to capture events that match rule criteria, then generate alerts for the captured events.

The following procedure shows how to create an ESA rule deployment with the Endpoint Risk Scoring Rules Bundle and deploy it. If you already have an ESA rule deployment with endpoint data sources, you can add the Endpoint Risk Scoring Rules Bundle to the existing deployment.

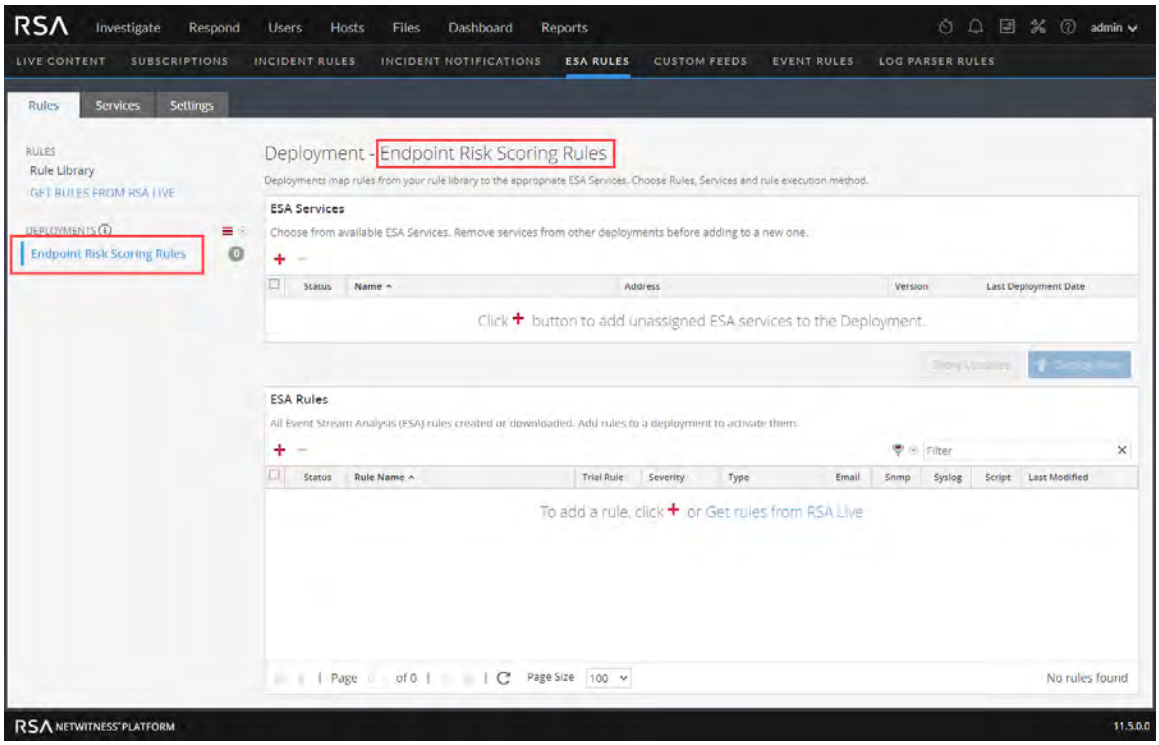
### To create and deploy an ESA rule deployment with the Endpoint Risk Scoring Bundle:

1. Go to **(Configure) > ESA Rules > Rules tab**.

2. In the options panel on the left, next to Deployments, select **> Add** to add a deployment, type a name for the deployment, such as Endpoint Risk Scoring Rules, and press **Enter**.



The deployment is added and the Deployment view is displayed on the right.



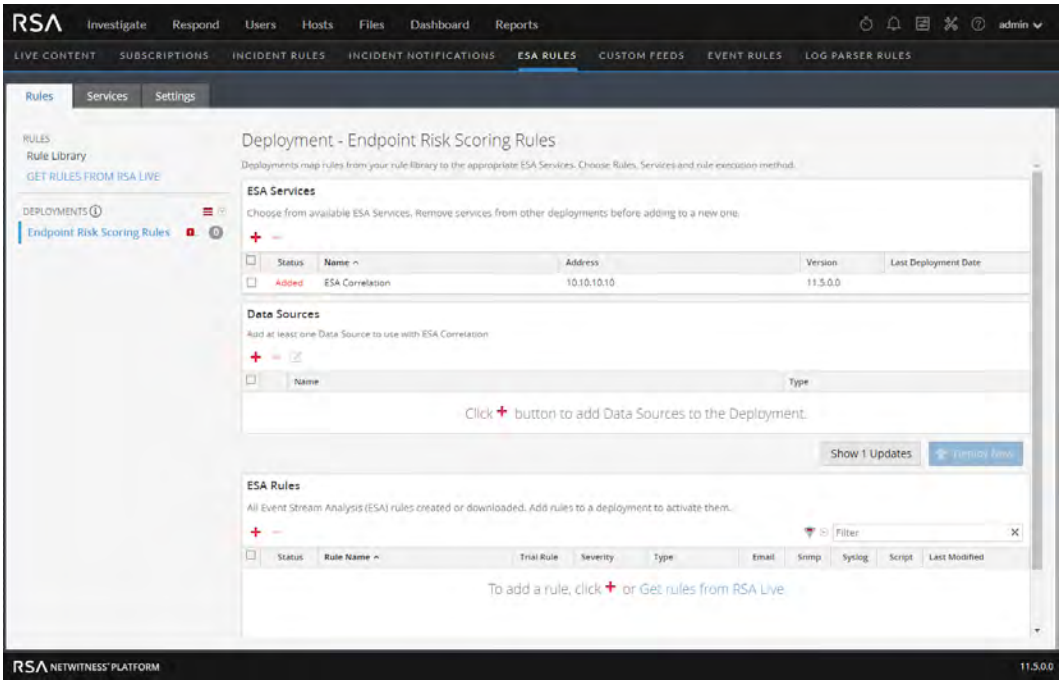
The deployment name that you choose also appears on a deployment tab in the **(Configure) > ESA Rules > Services** tab, where you can view deployment details and statistics.

3. Add an ESA Correlation service:

   a. In the **Deployment** view **ESA Services** section, click **+**.
   The Deploy ESA Services dialog lists each configured ESA Correlation service.

   b. Select an ESA Correlation service and click **Save**.
   The Deployment view is displayed. The ESA Correlation service is listed in the **ESA Services**

section with an **Added** status.

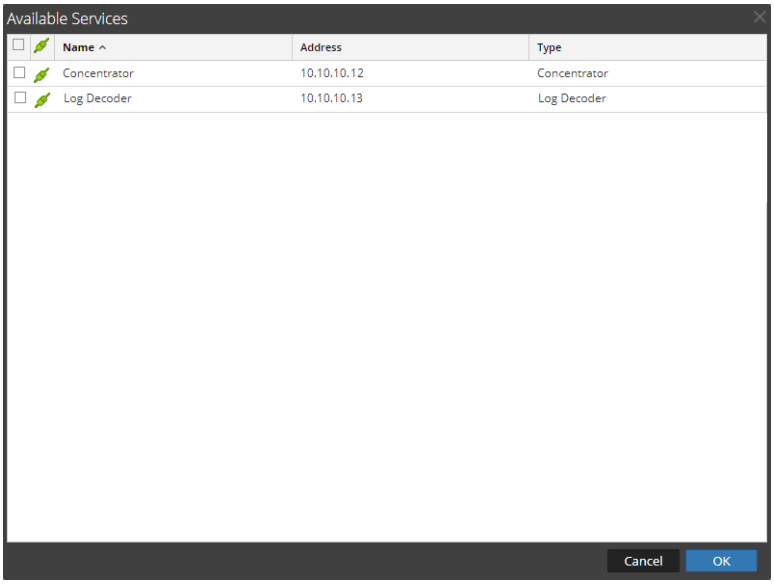


4. Add one or more data sources with endpoint data:

   a. In the **Deployment** view **Data Sources** section, click + .
   The **Available Configured Data Sources** dialog lists the services that have been configured for use as a data source.

   b. To add a data source configuration, click + .
   The **Available Services** dialog lists the available data sources from the

(Admin) > Services view.

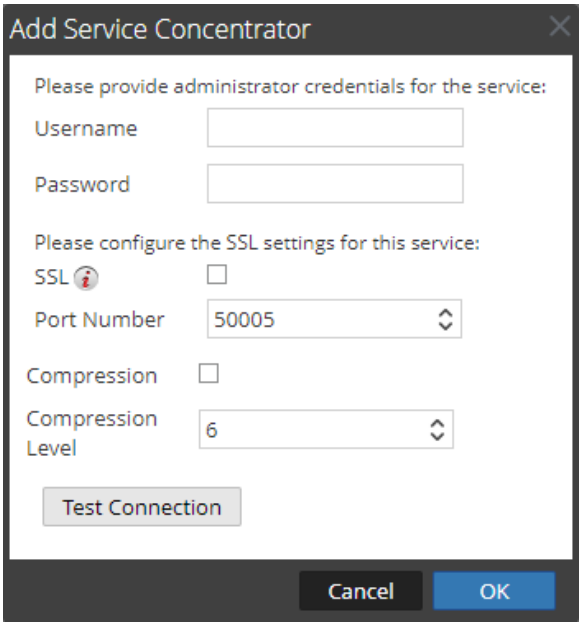


If an endpoint data source (service) that you are looking for is not in the list, see the *Hosts and Services Getting Started Guide* for instructions on how to install a service on a host.

**Note:** You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

c. In the **Available Services** dialog, select an endpoint data source, such as a Concentrator, and click **OK**.

d. In the **Add Service** dialog, type the Administrator username and password for the endpoint data source.



e. To enable the SSL or Compression options, select the corresponding checkboxes.

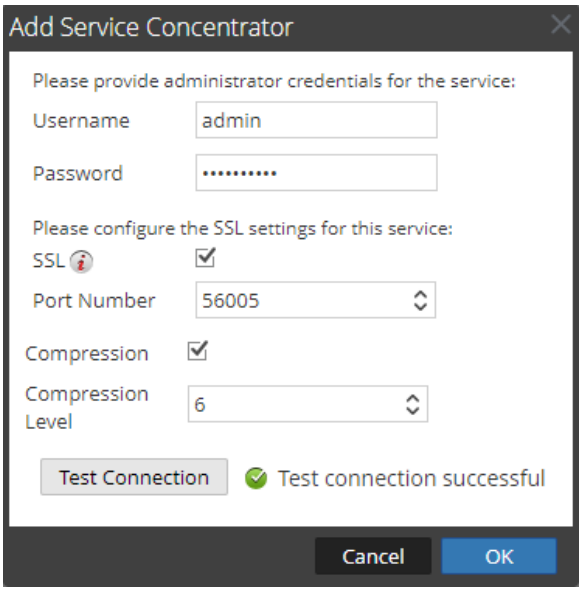
f. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

- Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
- Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
- Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

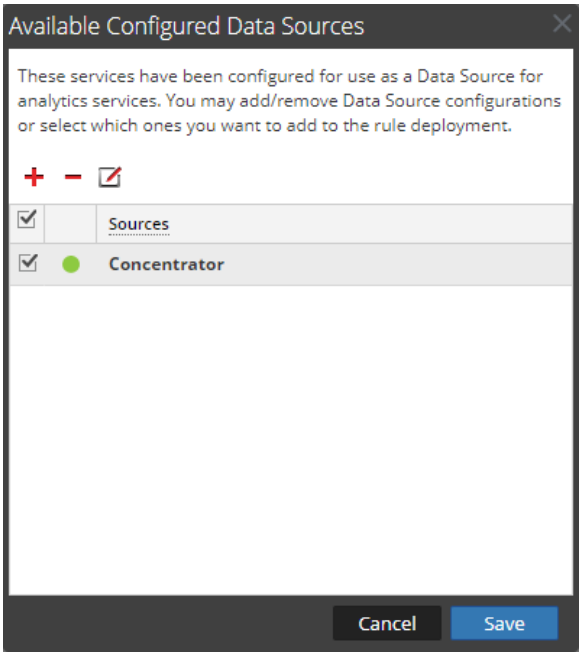
**Note:** If you make any ESA service, data source, or ESA rule changes to an ESA rule deployment, you need to redeploy the deployment. For example, if you change the configuration of a data source in an ESA rule deployment, you must redeploy all the ESA rule deployments that contain that data source.

g. Click **Test Connection** to make sure that it can communicate with the ESA Correlation service.



h. Click **OK**.
After you configure your endpoint data sources and they appear in the **Available Configured Data Sources** dialog, you can use them for your deployment.

i. In the **Available Configured Data Sources** dialog, select at least one endpoint data source to use for the deployment.



A solid colored green circle indicates a running service and a white circle indicates a stopped service.

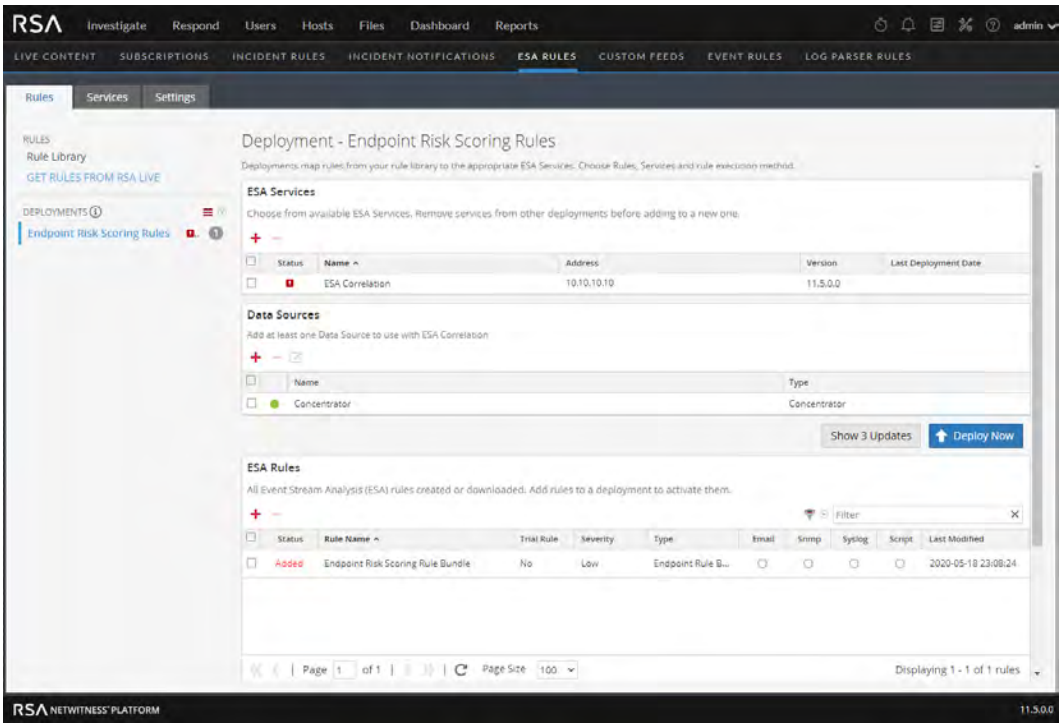
j. Click **Save**.
In the Deployment view **Data Sources** section, the selected data sources are added to the

deployment. The **Deploy Now** button activates after a service, data source, and rules are added to an ESA rule deployment.

5. Add the Endpoint Risk Scoring Rules Bundle:

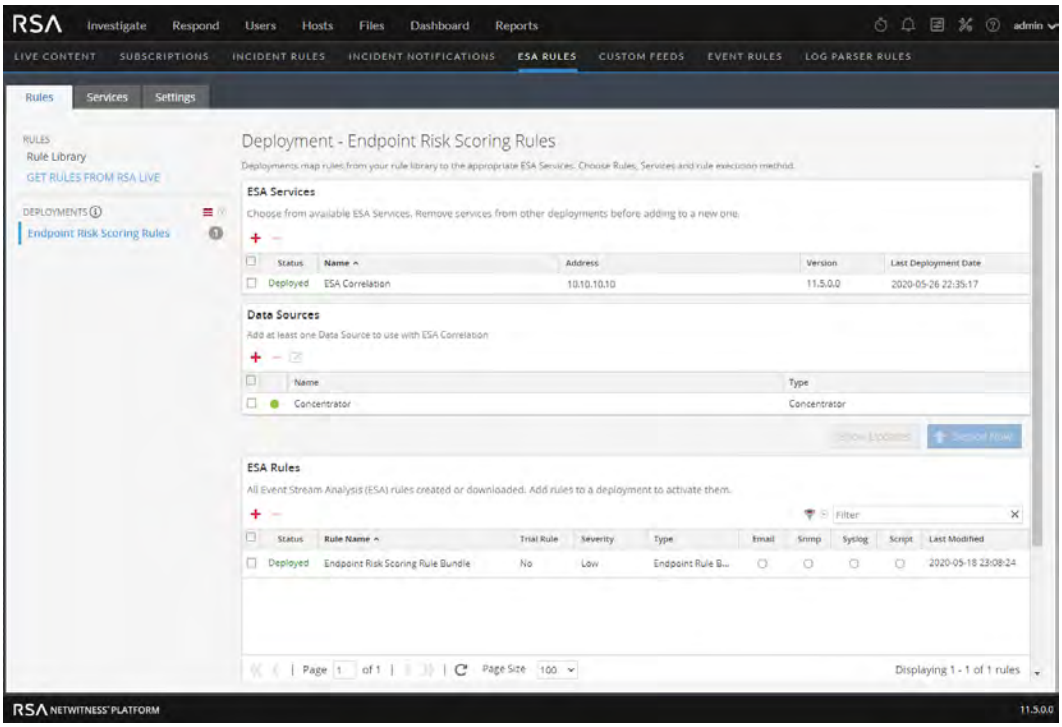
   a. In the **Deployment** view ESA Rules section, click .
   The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library.

   b. Select the Endpoint Risk Scoring Rule Bundle and click **Save**.
   The Deployment view is displayed and the **Deploy Now** button is enabled.



The Endpoint Risk Scoring Rules Bundle is listed in the **ESA Services** section with an **Added** status.

6. Click **Deploy Now**.
   The ESA Correlation service runs the rules in the Endpoint Risk Scoring Rules Bundle. The status of the bundle changes to **Deployed**.



You can now view information and statistics on the **(Configure) > ESA Rules > Services** tab. See View the Status of the Endpoint Risk Scoring Rules Deployment.

## Change the Endpoint Risk Scoring Rule Bundle in a Deployment

You cannot edit or duplicate the Endpoint Risk Scoring Rules Bundle. After the bundle is deployed, you can enable and disable individual rules within the bundle. See Disable or Enable Individual Endpoint Risk Scoring Rules.

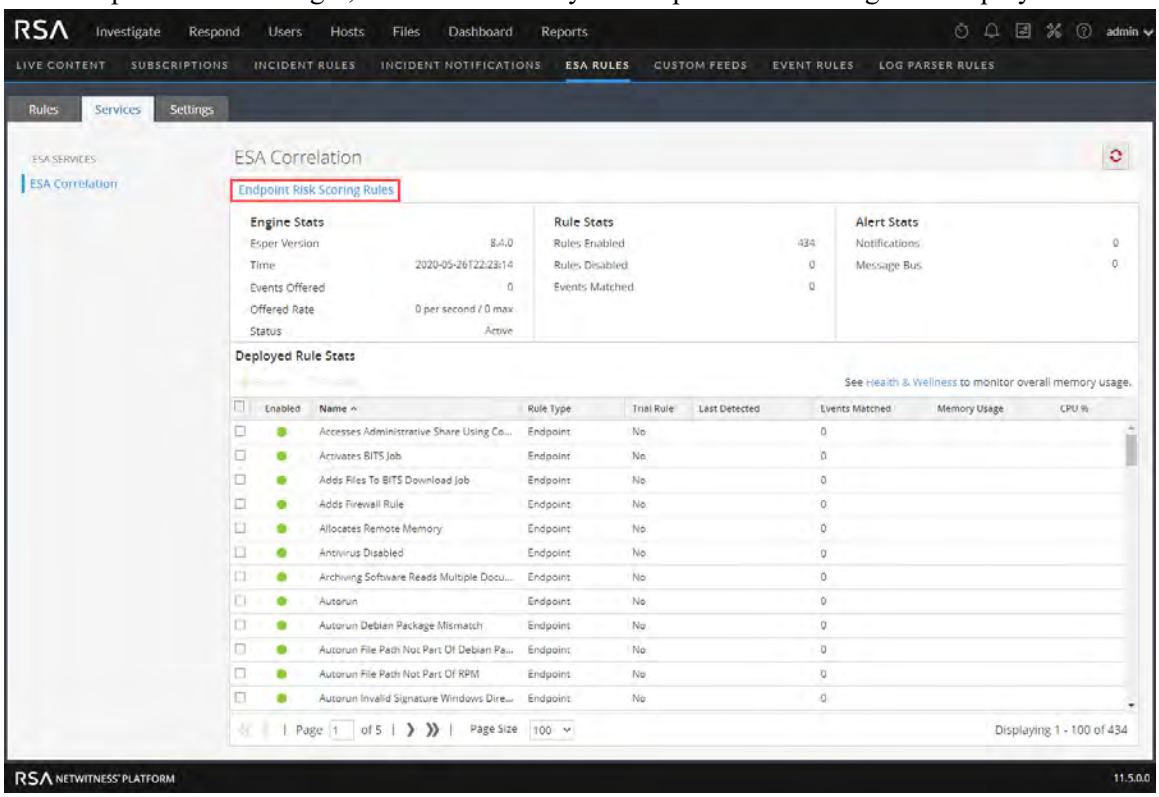
When you make changes to the ESA Rule Deployment containing the Endpoint Risk Scoring Rules Bundle, such as changing the endpoint data sources or changing compression levels, you must redeploy it for the changes to take effect. To redeploy, click the **Deploy Now** button for that deployment.

**Caution:** Deleting an ESA Rule Deployment with an Endpoint Risk Scoring Rule Bundle stops the Risk Scoring alerts that are used in risk scoring calculations to identify suspicious files and hosts.

For more information about changing ESA rule deployments, see "Additional ESA Rule Deployment Procedures" in the *Alerting with ESA Correlation Rules User Guide*.

## View the Status of the Endpoint Risk Scoring Rules Deployment

1. Go to the ESA Rules Services tab ( **(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.



3. In the **Engine Stats**, **Rules Stats** and **Alert Status** sections, look at the statistics related to the deployment, such as Rules Enabled, Rules Disabled, and Events Matched, which show the total numbers for the deployment.
4. In the **Deployed Rules Stats** section, look at the following details for each Endpoint Risk Scoring Rule:
   - **Enable**: Indicates the enabled status. A green circle icon ● indicates that the rule is enabled. A white circle icon ○ indicates that the rule is disabled.
   - **Name**: Shows the name of the rule.
   - **Rule Type**: Endpoint indicates a rule from the Endpoint Risk Scoring Bundle and Esper indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
   - **Last Detected**: Shows the last time an alert was triggered for the rule.
   - **Events Matched**: Shows the total number of events that matched the rule.

## Disable or Enable Individual Endpoint Risk Scoring Rules

1. Go to the ESA Rules Services tab ( **(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.
3. In the **Deployed Rules Stats** section, do one of the following:
   - To enable rules, select the rules that you want to enable in the rules list and click the **Enable** button above the list.

   The selected rules are enabled and a message shows that the rules enabled successfully.

   - To disable rules, select the rules that you want to disable in the rules list and click the **Disable** button above the list.

   The selected rules are disabled and a message shows that the rules disabled successfully.

# Change Memory Threshold for ESA Rules

The following procedures pertain to setting memory thresholds for ESA rules to prevent them from using excessive memory.

## Change Memory Threshold for All Trial Rules

This procedure is optional and applies only to ESA Correlation Rules.

Administrators can increase or decrease the memory threshold for trial rules. Threshold refers to the ESA memory usage, which includes ESA base memory, trial rules, and non-trial rules. When the threshold is exceeded, all deployed trial rules on an ESA service are disabled.

You use trial rules to see if a rule runs efficiently and does not use excessive memory, which can impact performance or force the service to shut down.

By default, the memory threshold is 90, which is the percentage of Java Virtual Memory (JVM).

- The memory threshold is per ESA, not per rule.
- When the memory threshold is exceeded, all trial rules running on the ESA are automatically disabled.
- The ESA configuration has the following parameters for trial rules:
  - `fatal-percentage`: If memory rises above this percentage, ESA disables trial rules. For example, if fatal-percentage is set to 90, when memory rises above 90 percent, ESA disables trial rules.
  - `check-every`: This parameter determines how often ESA checks the fatal-percentage to disable trial rules.

For more information, see "Work with Trial Rules" in the *Alerting with ESA Correlation Rules User Guide*.

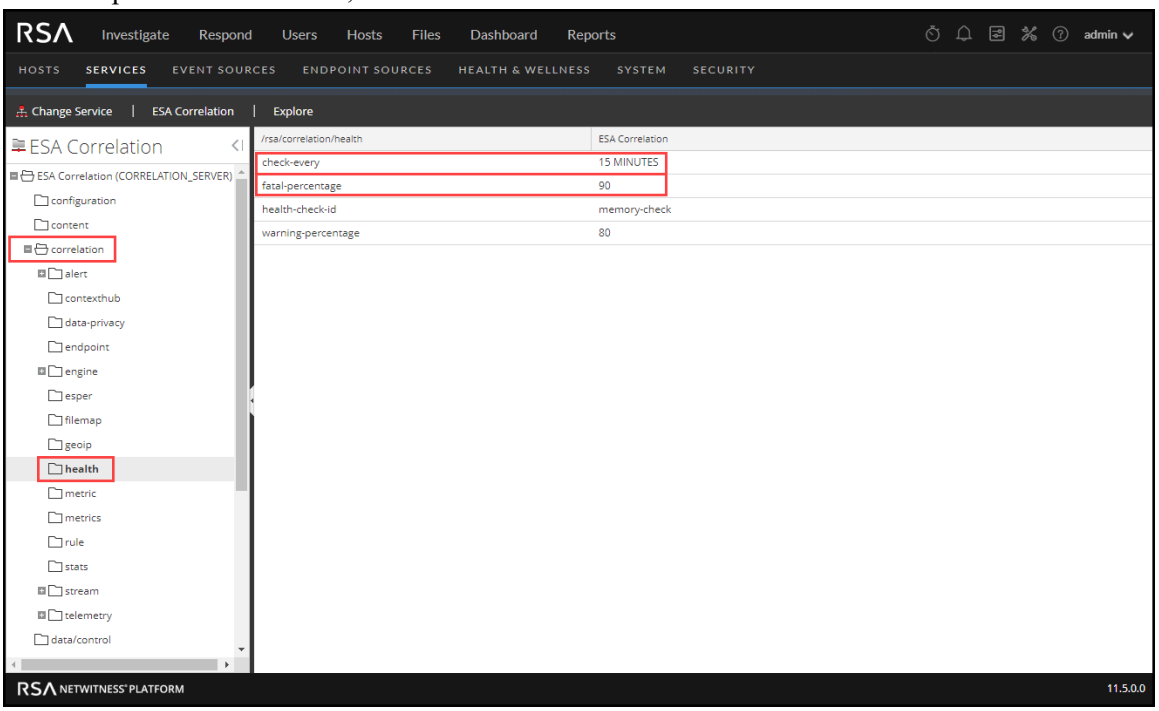
### Prerequisites

A role with administrative privileges must be assigned to you.

**To change memory threshold for trial rules:**

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> View > Explore**.

4. In the Explore view node list, select **correlation > health**.



5. In the right panel, in `fatal-percentage`, type a percentage of JVM that trial rules on the ESA cannot exceed.
   The new memory threshold takes effect immediately.
6. If necessary, you can also adjust the `check-every` parameter, which determines how often ESA checks the fatal-percentage to disable trial rules. By default, ESA checks the fatal-percentage every 15 minutes.

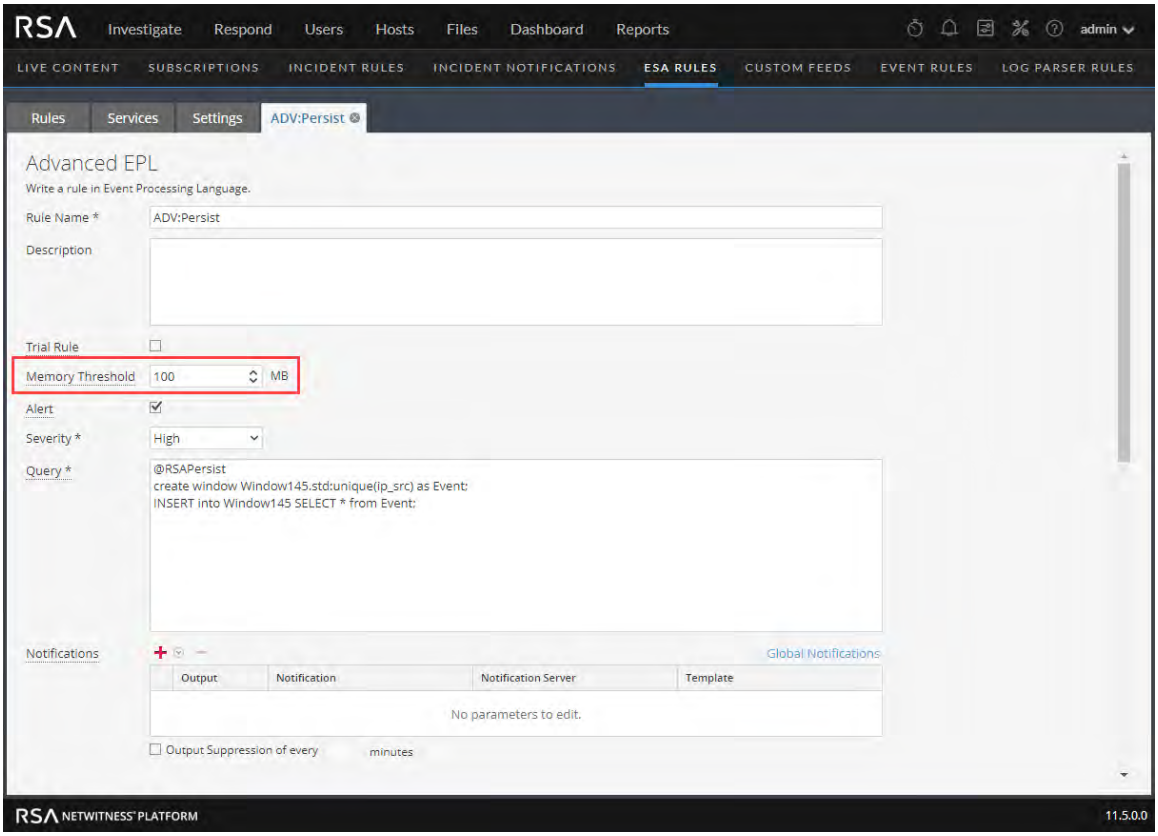
## Change Memory Threshold for Individual Trial Rules and Non-Trial Rules

**Note:** This option is available in NetWitness Platform version 11.5 and later.

In addition to setting a memory threshold for all trial rules, you can set a memory threshold individually for both trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set. You should configure a memory threshold for rules that use memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab.

1. Go to **(Configure) > ESA Rules >Rules** tab.
2. In the **Rule Library**, select the rule you want to configure and click .
   The rule details are displayed.

3. In the **Memory Threshold** field, add the maximum memory usage allowed for this rule in MB. **100 MB** is the default for new rules.



4. Click **Save**.
5. When you are finished changing the memory thresholds for individual rules in an ESA rule deployment, redeploy the deployment.
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

# Start, Stop, or Restart ESA Service

This topic provides instructions to start, stop, or restart the ESA Correlation service from the NetWitness user interface and from the command line. These procedures apply to ESA Correlation Rules.

## Start the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Start**.

## Stop the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Stop**.

## Restart the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Restart**.

## Start the ESA Service from the Command Line

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl start rsa-nw-correlation-server
   ```

## Stop the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl stop rsa-nw-correlation-server
   ```

## Restart the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   `systemctl restart rsa-nw-correlation-server`

# View Audit Logs and Verify ESA Component Versions

This topic provides details about audit logging and instructions to verify the versions of the ESA components installed. These procedures apply to ESA Correlation Rules.

## View Audit Logs for Rules

Audit logging allows you to view details about rules that are created and changed in NetWitness. There are local audit logs in each of the services in NetWitness. When Global Audit Logging is configured, NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system.

For details on how to access your local audit logs, see "Local Audit Log Locations" in the *System Configuration Guide*. To set up Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

The following Syslog global audit log examples show create, update, remove rule, and delete deployment actions for the ESA Correlation service (correlation-server).

### Create Action

success=true, identity=admin, parameters={Arguments=[madhavi-sa-managed]}}
```

Each log contains the following parameters:

- **Time stamp**: Time the rule was modified. Example: `09-17-2018 08:54:21`
- **System Info**: Information about the system where the action was performed, such as IP address. Example: `10.0.0.0`
- **deviceVersion**: Version of your ESA service. Example: `11.3.0.0`
- **deviceService**: Example: `correlation-server`
- **action**: Examples: `create`, `update`, `remove`
- **Parameters**: Placeholder for the following keys:
  - **Epl Module Identifier (moduleIds)**: unique identifier for the rules. Example: `5b9fce314a5b1f5951babc2a, 5b9fce314a5b1f5951babc2b`
  - **enabled**: Shows if the rule is enabled or not. Example: `enabled=true`
  - **respondEnabled**: Shows if alerts from this rule can go to the Respond view. Example: `respondEnabled=true`
  - **trial**: Displays if the rule is configured as a trial rule or not. Example: `trial=false`
  - **EplStatements**: Displays the rule syntax. Example:

    ```
    eplStatements=[module GHmoduleId15;@Name('GHmoduleName15') @Description
    ('GHmoduleDesc15') @RSAAlert(oneInSeconds=0, identifiers=

    {"user_dst"}

    ) SELECT * FROM Event(ec_outcome in ('Success', 'Failure') AND ec_
    activity='Logon').win:time(5 min) match_recognize (measures F as f_array,
    S as s pattern (F F F F F+ S+) define F as F.ec_outcome= 'Failure', S as
    S.ec_outcome= 'Success');]
    ```

  - **identity**: Example: `admin`

## ESA Audit Logs on NW Server (11.5 and Later)

In NetWitness Platform 11.5 and later, in addition to the audit logs available on ESA Correlation-server, new audit logs on the NW Server (SA_SERVER) show when users add, modify, filter, delete, export, and import ESA rules in the Rule Library. The NW Server audit logs also show when users add, modify, and deploy ESA rule deployments. Modifications to an ESA rule deployment include adding, deleting, or updating a rule in a deployment as well as adding a data source or an ESA Correlation service to a deployment.

## Verify ESA Correlation Version

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   rpm -qa | grep rsa-nw-correlation-server
   ```
   The ESA Correlation server version is displayed.

# References - Previous ESA Versions

This section is a collection of references, which describe the user interface for ESA Configuration in previous versions of NetWitness.

**Note:** ESA Analytics is not supported in NetWitness 11.5 and later versions.

See the following topics for details:

- Services Config View Data Sources Tab (11.2 and Earlier)
- Services Config View Advanced Tab (11.2 and Earlier)
- ESA Analytics Mappings (11.1.x to 11.4.x)
- Module Settings (11.1.x to 11.4.x)
- Whois Lookup Service Configuration (11.1.x to 11.4.x)

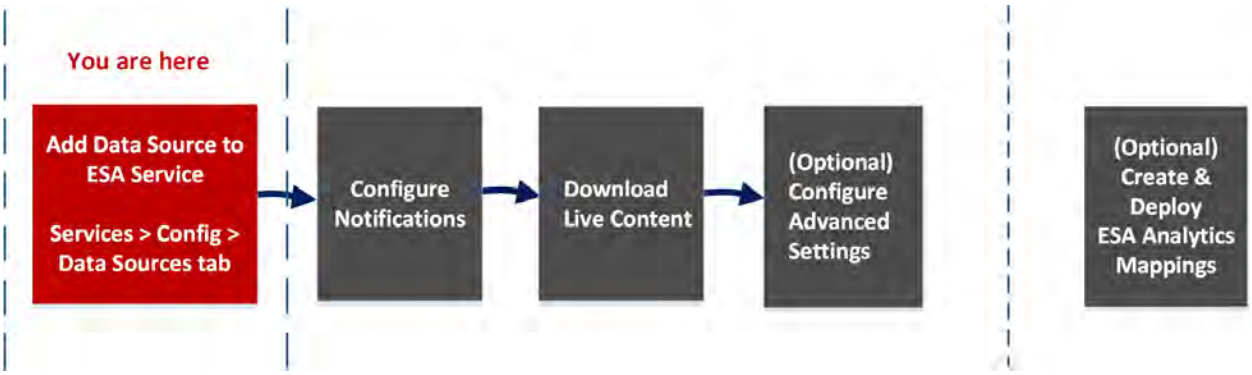
# Services Config View Data Sources Tab (11.2 and Earlier)

**Note:** The information in this topic applies ONLY to NetWitness version 11.2 and earlier.
For version 11.3 and later, see Data Source Configuration Changes.
ESA Analytics is not supported in NetWitness Platform 11.5 and later versions.

The **Services Config view > Data Sources** tab of an ESA service enables you to configure the sources that ESA uses to analyze data. An ESA service ingests data from Concentrators to detect incidents and alert analysts to potential threats.

## Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring data sources is located in the process.



In NetWitness 11.2 and earlier, ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service*
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Add a Concentrator as a data source to the Event Stream Analysis Service * | See "Configure ESA Correlation Rules" and "Step 1. Add a Data Source to an ESA Service" in the *ESA Configuration Guide for version 11.2*. |
| Administrator | Configure Notifications | See "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*. |
| Administrator | Download Live Content | See "Download Configurable RSA Live Rules" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*. |
| Administrator | Configure Advanced Settings | See "Step 2. Configure Advanced Settings for an ESA Service" in the *ESA Configuration Guide for version 11.2*. |

*You can complete these tasks here (that is in the Services Config view Data Sources tab).

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

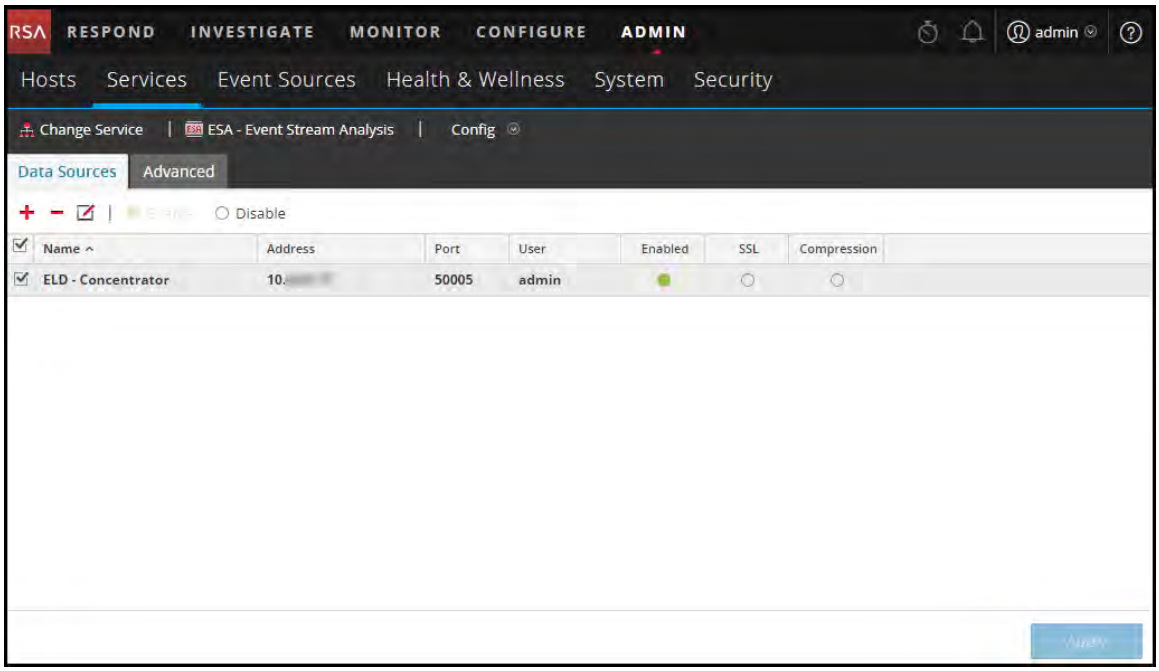
## Related Topics

- See "Add or Update a Host" in the *Host and Services Getting Started Guide*.

## Quick Look

To access the Data Sources tab, go to **Admin** > **Services** > (Select an ESA service) > > **View** > **Config**.

The following figure shows the Services Config view Data Sources tab for an ESA service.



## Toolbar

The following table describes the options in the toolbar.

| Option | Description |
|---|---|
| + | Adds a new data source to the ESA service. |
| − | Deletes a data source from the ESA service. |
| | Edits a data source. You must have the username and password credentials for the service in order to make changes. |
| Enable | Enables the selected data source. |
| Disable | Disables the selected data source. |

## Data Sources

The Data Sources list shows all of the data sources added to the ESA service. The following table describes the columns the Data Sources list.

| Column | Description |
|---|---|
| Name | The name of the data source service. |
| Address | The address of the data source service. |
| Port | The port used by the data source. |

| Column | Description |
| --- | --- |
| User | The user connected with the data source. |
| Enabled | Indicates if the data source is enabled. |
| SSL | Indicates if SSL communication is enabled. |
| Compression | Indicates if compression is enabled. |

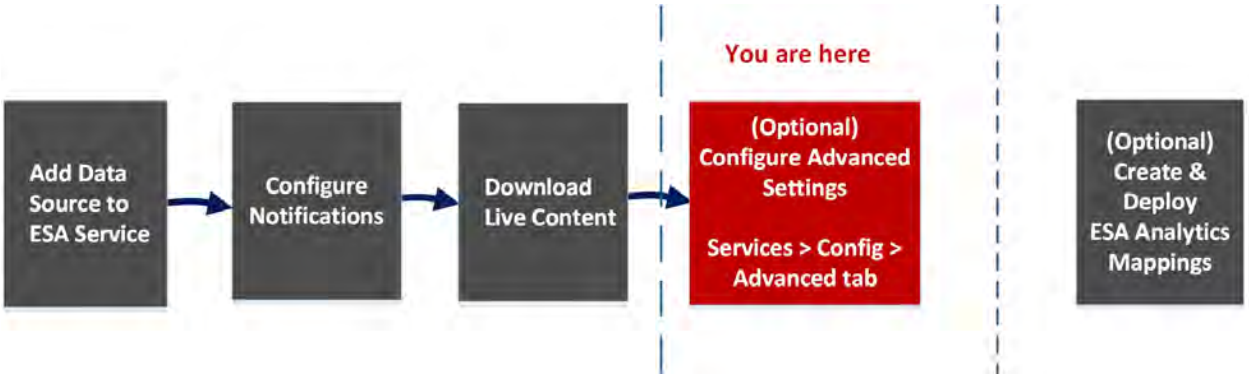
# Services Config View Advanced Tab (11.2 and Earlier)

**Note:** The information in this topic applies ONLY to NetWitness version 11.2 and earlier.
For version 11.3 and later, see Configure Advanced Settings for an ESA Correlation Service.
ESA Analytics is not supported in NetWitness Platform 11.5 and later versions.

The **Services Config view > Advanced** tab of an ESA service enables you to configure advanced settings. In the Advanced view, you can configure advanced settings to improve performance, to preserve events for rules with multiple events, to buffer events in memory, and to set the number of events to be stored on the ESA.

## Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring advanced settings is located in the process.



In NetWitness 11.2 and earlier, ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings*

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Add a Concentrator as a data source to the Event Stream Analysis Service | See "Configure ESA Correlation Rules" and "Step 1. Add a Data Source to an ESA Service" in the *ESA Configuration Guide for version 11.2*. |
| Administrator | Configure Notifications | See "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*. |
| Administrator | Download Live Content | See "Download Configurable RSA Live Rules" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*. |
| Administrator | Configure Advanced Settings * | See "Step 2. Configure Advanced Settings for an ESA Service" in the *ESA Configuration Guide for version 11.2*. |

*You can complete these tasks here (that is in the Services Config view Advanced tab).

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Related Topics

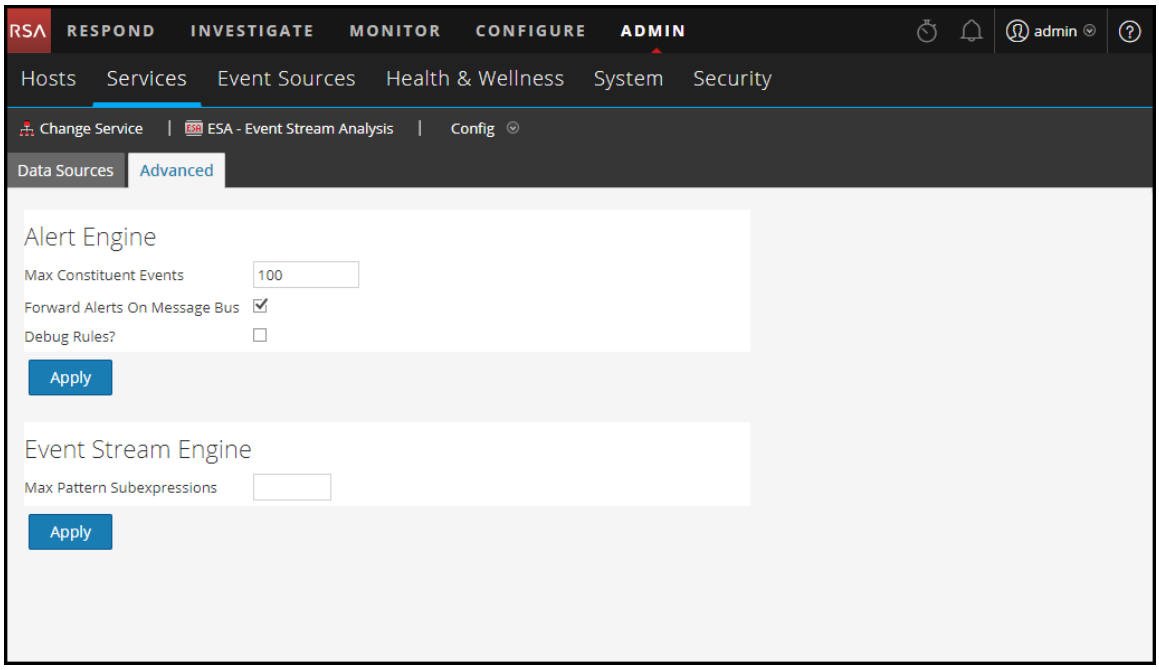
## Quick Look

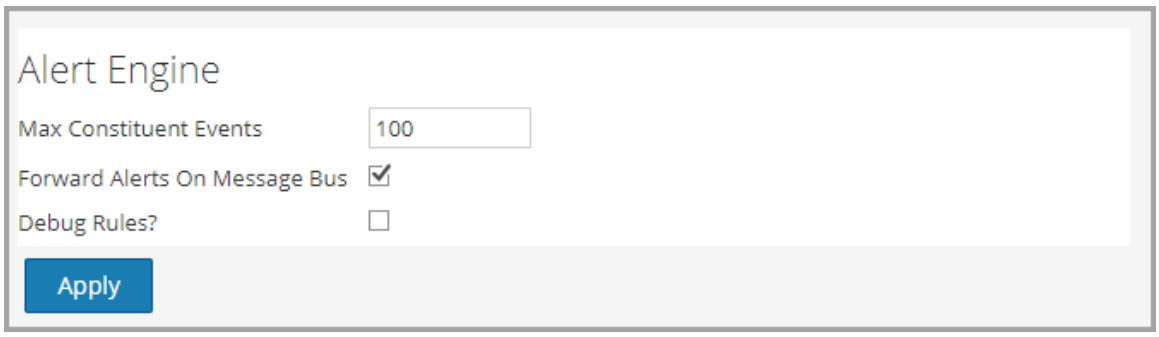
To access the Advanced tab, go to **Admin > Services >** (Select an ESA service) > **> View > Config**.

The following figure shows the Services Config view Advanced tab for an ESA service.



## Alert Engine Settings

In the Alert Engine section, you specify values to preserve events for rules that choose multiple events. The following figure shows the Alert Engine section.



The following table lists the parameters in the Alert Engine section and their descriptions.

| Parameter | Description |
|---|---|
| Max Constituent Events | For rules that contain multiple events, this configuration value determines how many of the associated events are preserved. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is 100. |
| Forward Alerts On Message Bus | To forward ESA alerts for NetWitness Respond, you must select this option. The ESA alerts generated will be sent to the Message Bus and subsequently to Respond. This option is selected by default. You may want to ensure that the Respond Server service is running. |
| Debug Rules? | Selecting enables debugging rules. |

## Event Stream Engine Settings

In the Event Stream Engine section, you specify details to improve performance. The following figure shows the Event Stream Engine section.

The following table lists the parameter in the Event Stream Engine section and its description.

| Parameter | Description |
|---|---|
| Max Pattern Subexpressions | Certain rules require ESPER to maintain subexpressions in memory before deciding to fire them or not. These subexpressions consume memory and if left unchecked may cause the service to go down with memory exhaustion. This parameter is a safety measure that keeps such memory hogging rules under check. If a rule exceeds the specified number of subexpressions, its processing is delayed. The default value is 0, which means this setting is disabled. You must set a value if there are service stability issues. |

# Whois Lookup Service Configuration (11.1.x to 11.4.x)

**Note:** The information in this topic applies ONLY to RSA NetWitness® Platform versions 11.1.x to 11.4.x.
The Whois Lookup Service and ESA Analytics are not supported in NetWitness Platform 11.5 and later versions.

In the Whois Lookup Configuration panel (Admin > System > Whois), you configure a connection to the Whois Lookup service for your preconfigured ESA Analytics modules used in RSA Automated Threat Detection. The Whois Service enables you to get accurate data about domains that you connect to. In order to ensure effective scoring, it is important that you configure the Whois service settings.

You must have an RSA Live account to use this service.

If you configured a Live account in the Live Services panel (Admin > System > Live Services), the Whois Lookup Service is automatically configured for you. You just need to check the connection of the Whois Lookup service.

**Note:** If you do not have an RSA Live account, you can create one at the RSA Live Registration Portal: https://cms.netwitness.com/registration/ The *Live Services Management Guide* provides additional information.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure the Whois Lookup service. | See "Configure the Whois Lookup Service" in the *ESA Configuration Guide for RSA NetWitness Platform 11.4*. |
| Administrator | Check the connection of the Whois Lookup service. | See "Configure the Whois Lookup Service" in the *ESA Configuration Guide for RSA NetWitness Platform 11.4*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

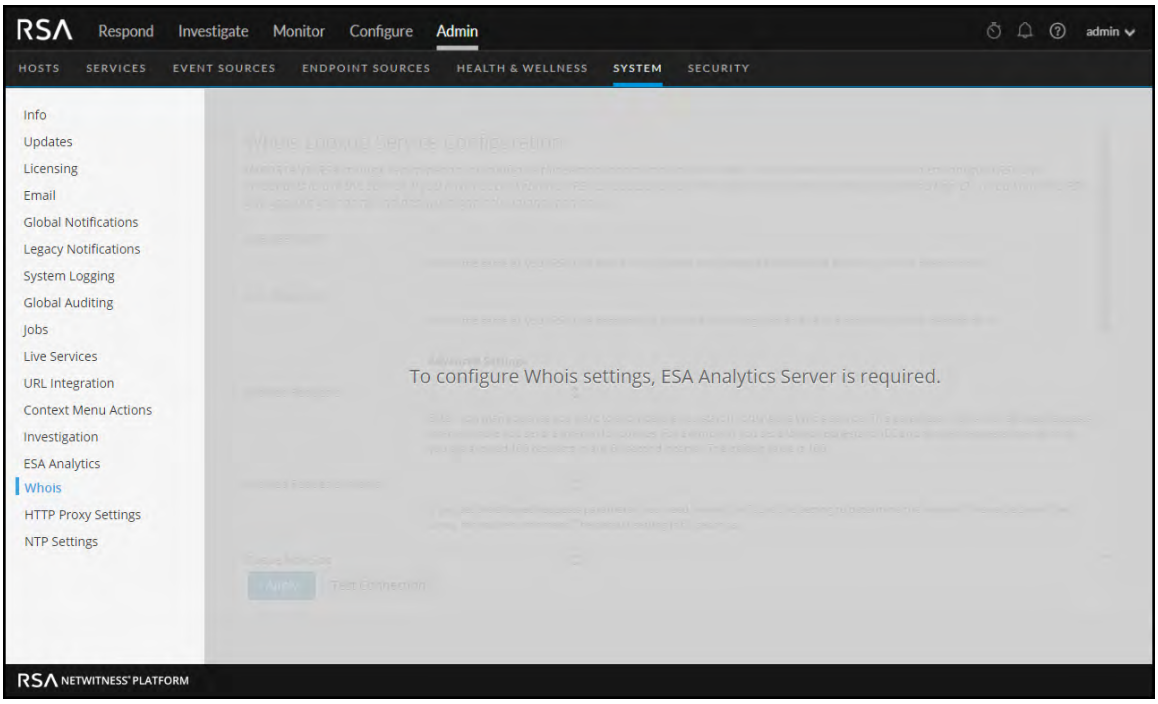
## Related Topics

- See "ESA Analytics Mappings" in the *ESA Configuration Guide for RSA NetWitness Platform 11.4*.

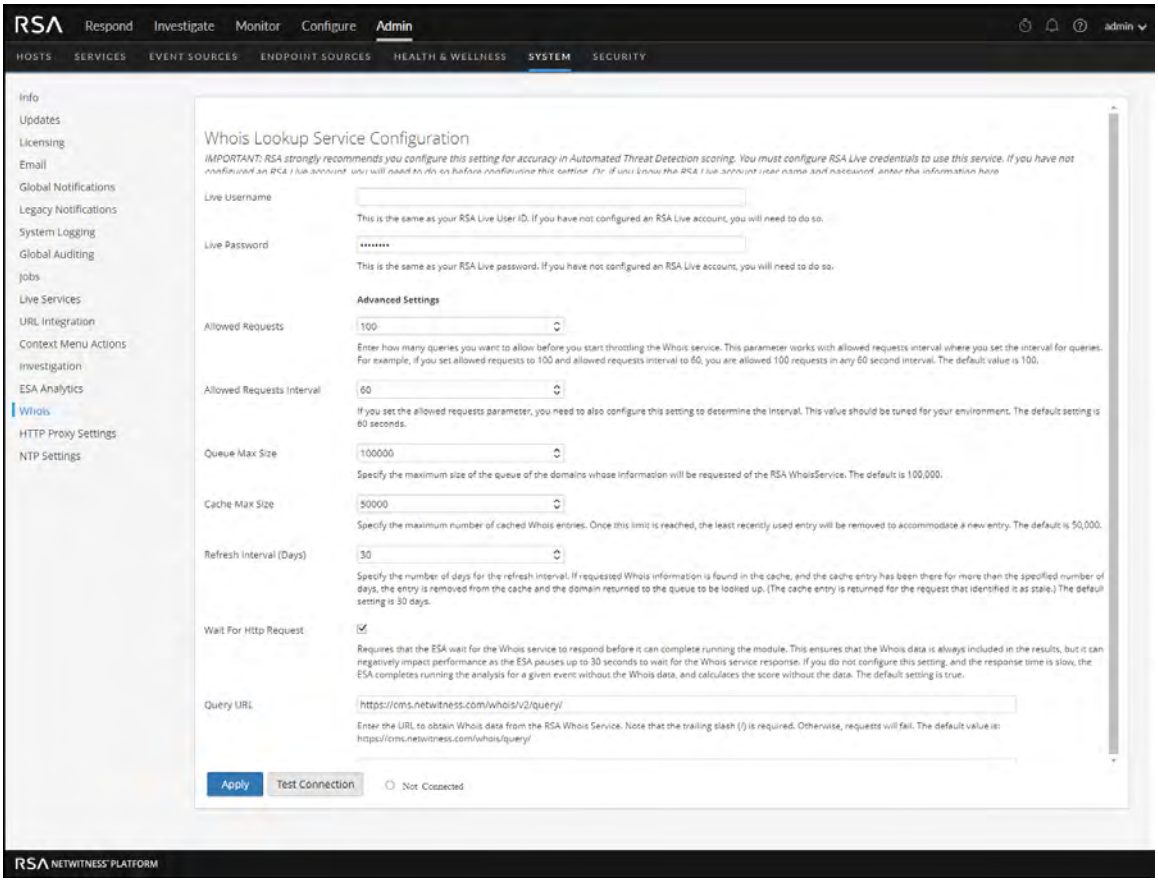
## Quick Look

To access the Whois Lookup Service Configuration, go to Admin > System and in the options panel, select Whois.

The ESA Analytics Server service must be available (shows a green circle) in the Admin > Services view. If you do not have an ESA Analytics Server service available, you will see the following panel.



If you have an ESA Analytics Server service available, you will see the following panel.



The following table describes the listed Whois Lookup Service configuration settings.

| Parameter | Description |
|---|---|
| Live Username | **Required only if you did not already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live User ID. If you have not configured an RSA Live account, you will need to do so.<br>The default value is "whois." |
| Live Password | **Required only if you did already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live password. If you have not configured an RSA Live account, you will need to do so.<br>The default value is null. |
| Allowed Requests | (Optional) Enter how many queries you want to allow before you start throttling the Whois service. This parameter works with **Allowed Requests Interval** (in seconds), where you set the interval for queries. For example, if you set **Allowed Requests** to 100 and **Allowed Requests Interval** to 60, you are allowed 100 requests in any 60 second interval.<br>The default value is 100. |
| Allowed Requests Interval | (Optional) If you set the **Allowed Requests** parameter, you need to also configure this setting to determine the interval. This value should be tuned for your environment.<br>The default setting is 60 seconds. |
| Queue Max Size | (Optional) Specify the maximum size of the queue of the domains whose information will be requested of the RSA WhoisService.<br>The default is 100,000. |
| Cache Max Size | (Optional) Specify the maximum number of cached Whois entries. Once this limit is reached, the least recently used entry will be removed to accommodate a new entry.<br>The default is 50,000. |
| Refresh Interval (Days) | (Optional) Specify the number of days for the refresh interval. If requested Whois information is found in the cache, and the cache entry has been there for more than the specified number of days, the entry is removed from the cache and the domain returned to the queue to be looked up. (The cache entry is returned for the request that identified it as stale.)<br>The default setting is 30 days. |

| Parameter | Description |
|---|---|
| Wait For HTTP Request | (Optional) Requires that the ESA wait for the Whois service to respond before it can complete running the module. This ensures that the Whois data is always included in the results, but it can negatively impact performance as the ESA pauses up to 30 seconds to wait for the Whois service response.<br>If you do not configure this setting, and the response time is slow, the ESA completes running the analysis for a given event without the Whois data, and calculates the score without the data.<br>The default setting is true. |
| Query URL | (Optional) Enter the URL to obtain Whois data from the RSA Whois service. The trailing slash ('/') is required. Otherwise, requests will fail.<br>The default value is:<br>`https://cms.netwitness.com/whois/v2/query/` |
| Authentication URL | (Optional) Enter the URL to obtain authentication tokens from the RSA Whois service. The default value is:<br>`https://cms.netwitness.com/authlive/authenticate/WHOIS` |

# ESA Analytics Mappings (11.1.x to 11.4.x)

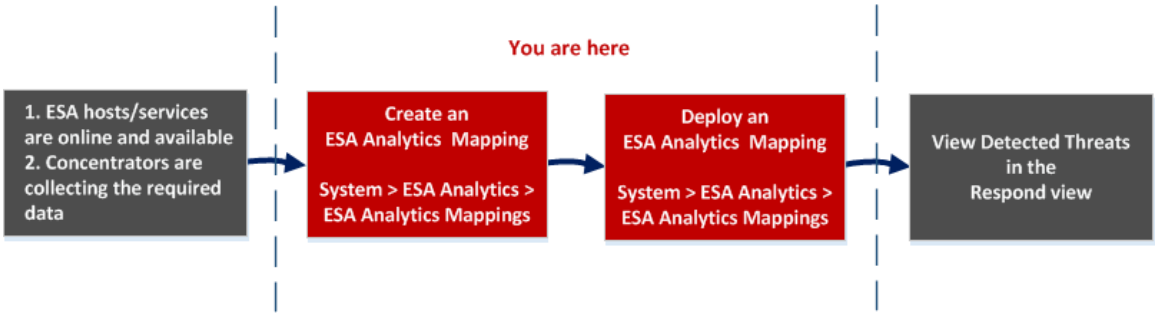
**Note:** The information in this topic applies ONLY to NetWitness versions 11.1.x to 11.4.x. ESA Analytics is not supported in NetWitness 11.5 and later versions.

In the ESA Analytics Mappings panel (Admin > System > ESA Analytics), you define how the RSA Automated Threat Detection functionality should automatically detect advanced threats. You can analyze the data that resides on one or more Concentrators by selecting a preconfigured ESA Analytics module.

To better utilize your network resources and reduce unnecessary data flow, you can map multiple data sources, such as Concentrators, to available ESA Analytics services in order to process data more efficiently and take advantage of additional capacity.

## Workflow

This workflow shows the process for creating and enabling an ESA Analytics mapping to start automatically detecting advanced threats.



Before you create an ESA Analytics mapping, ensure that the ESA hosts and services that you want to use for your mappings are online and available. All of the services need to be in sync with a consistent time source. Also ensure that the Concentrators are collecting the required data. When you create an ESA Analytics mapping, you select an ESA Analytics module to map, such as Suspicious Domains. Then you select the data sources, such as Concentrators, to use for that module along with an ESA Analytics service to process the data. When you are ready to start aggregating data, you deploy the mapping. Analysts can view detected threats for that module in the Respond view.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Verify that the ESA hosts and services are online and available. | Admin > Hosts and Admin > Services<br>See *Hosts and Services Getting Started Guide*. |
| Administrator | Ensure that the Concentrators are collecting the required data. | See *Broker and Concentrator Configuration Guide* |

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Create ESA Analytics mappings.* | See "Mapping ESA Data Sources to Analytics Modules" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*. |
| Administrator | Deploy ESA Analytics mappings.* | See "Mapping ESA Data Sources to Analytics Modules" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*. |
| Administrator, Analyst | View detected threats. | See *NetWitness Respond User Guide*. |

*You can complete these tasks here (that is in the ESA Analytics Mappings panel).

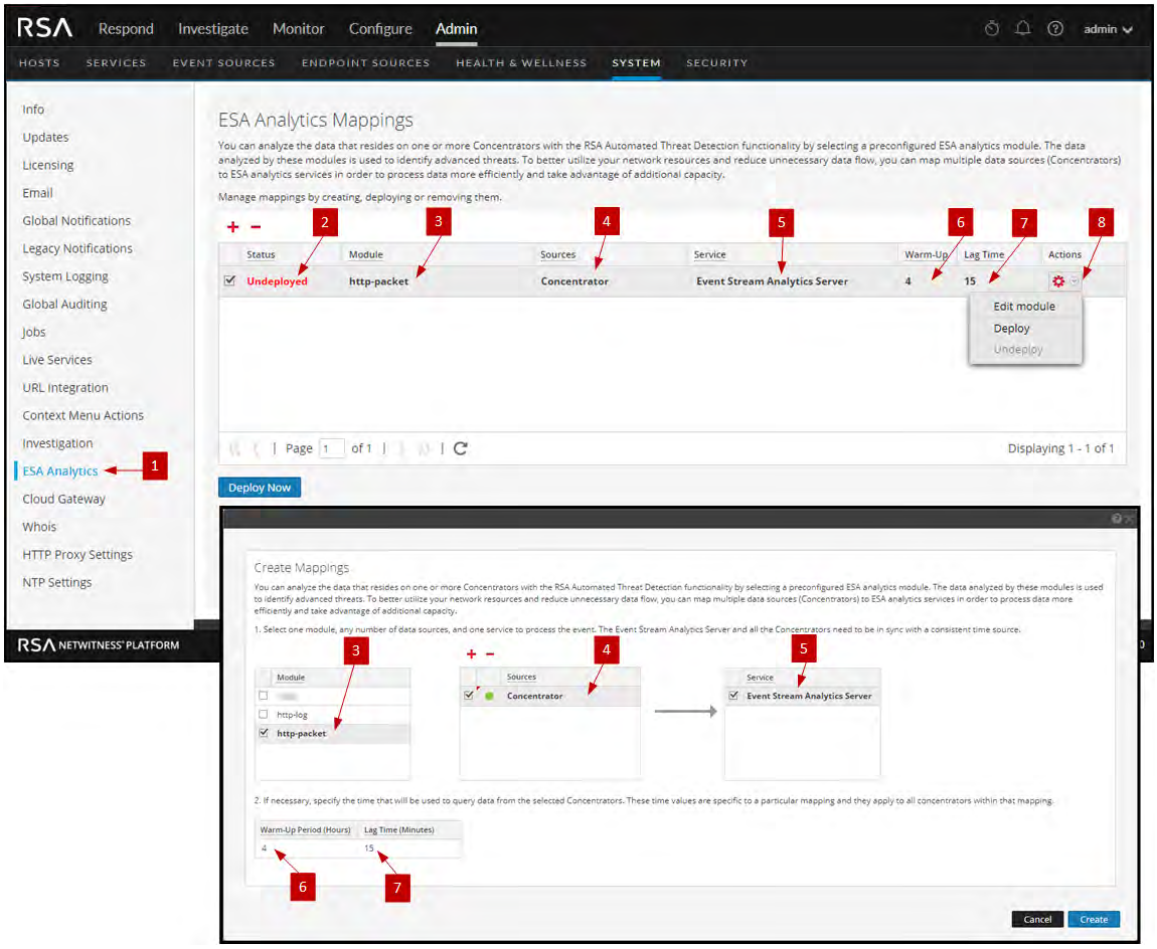
Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Related Topics

- "Configure ESA Analytics" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- "Update a Mapping" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- "Undeploy a Mapping" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- "Delete a Mapping" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- "Change the Warm-up Period and Lag Time" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- Module Settings (11.1.x to 11.4.x)

## Quick Look

The following example illustrates an ESA Analytics mapping. The configuration defines the data sources for the selected module and the ESA Analytics service that will process the events from those data sources.



| | |
|---|---|
| 1 | Displays the ESA Analytics Mappings panel. |
| 2 | Shows the status of the ESA Analytics mapping. |
| 3 | The name of the module that is mapped. |
| 4 | Data sources, such as Concentrators, assigned to the mapping. |
| 5 | ESA Analytics service that processes the data for the mapping. |
| 6 | Warm-up period configuration (in hours) on the data sources for the mapping. |
| 7 | Lag configuration (in minutes) on the data sources for the mapping. |
| 8 | Actions for changing module settings, deploying module mappings, and undeploying module mappings. |

## Toolbar

The following table describes the toolbar actions.

| Icon / Button | Description |
|---|---|
| | Opens the Create Mappings dialog where you can create an ESA Analytics mapping. Create a separate mapping for each module. After creating and reviewing the mappings, you deploy them. |
|  | Deletes an ESA Analytics Mapping.<br>• You can delete a mapping with a status of Undeployed at any time. Since a mapping in the Undeployed state is not deployed and is not running, it does not affect data aggregation.<br>• Deleting a deployed mapping clears the configuration on the ESA server, reverts the deployment for that mapping, and stops pulling data from the data source for that module. You should undeploy a mapping with a status of Deployed before deleting it. |
| Deploy Now | After you create your mappings, you need to deploy them in order to start aggregating data for the modules. You can select one or more mappings with a status of Undeployed to deploy. |

**Note:** If you want to make changes to a deployed mapping, such as adding or removing Concentrators or changing the service, you must undeploy and delete the existing mapping and then create and deploy a new mapping for that module.

## ESA Analytics Mappings

The following table describes the listed ESA Analytics mappings.

| Title | Description |
|---|---|
| | To select an individual mapping, select the checkbox next to the mapping. |
| Status | Shows the status of the mapping. There are two statuses:<br>**Undeployed** - An undeployed mapping maps an ESA Analytics module to sources and an ESA Analytics service. It does not start aggregating data for the module until you deploy the mapping.<br>**Deployed** - A deployed mapping is deployed and running. In a deployed mapping, the selected ESA Analytics service uses query-based aggregation to collect the appropriate filtered events for the selected module from the Concentrators. |

| Title | Description |
| --- | --- |
| Module | Indicates the selected ESA Analytics module. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. The module resides within the ESA Analytics service. |
| Sources | Sources are the data sources, such as Concentrators, from which ESA will aggregate the data for the specified module. |
| Service | Indicates the ESA Analytics service that will process the data for the specified module. The selected service needs to be in sync with a consistent time source. |
| Warm-Up Period (Hours) | Specifies a warm-up duration (in hours). A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts.<br>RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed.<br>For more information about Warm-up Period and Lag time, see Module Settings (11.1.x to 11.4.x). |

| Title | Description |
| --- | --- |
| Lag Time (Minutes) | Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay.<br><br>The Lag parameter gives the Concentrator a chance to finish aggregating all of the data.<br><br>After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module.<br><br>For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on.<br><br>**Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data.<br><br>**Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation.<br><br>For more information about Warm-up Period and Lag time, see Module Settings (11.1.x to 11.4.x). |
| | Enables you to select additional actions for the selected module mapping:<br><br>• **Edit Module** - Enables you to configure the warm-up period and lag time for the selected module mapping.<br>• **Deploy** - Deploys the selected module mapping. The specified ESA Analytics service starts pulling data from the data sources for that module.<br>• **Undeploy** - Undeploys the selected module mapping. The specified ESA Analytics service stops pulling data from the data sources for that module.<br><br>**Caution:** Undeploying a mapping with a status of Deployed will affect data aggregation for that module. |

# Module Settings (11.1.x to 11.4.x)

**Note:** The information in this topic applies ONLY to NetWitness versions 11.1.x to 11.4.x. ESA Analytics is not supported in NetWitness 11.5 and later versions.

After you create or deploy a module mapping in the ESA Analytics Mappings panel (Admin > System > ESA Analytics), you have the option to change some module configurations for that mapping.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Change the warm-up period for an undeployed module mapping. | "Change the Warm-up Period and Lag Time" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4* |
| Administrator | Change the warm-up period for a module mapping during the warm-up period. | "Change the Warm-up Period and Lag Time" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4* |
| Administrator | Change the warm-up period for a module mapping after the warm-up period is complete. | "Change the Warm-up Period and Lag Time" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4* |

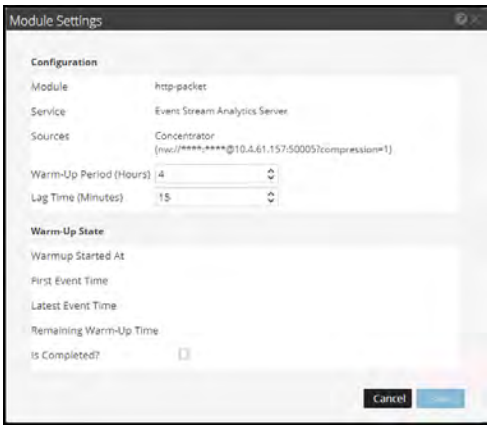
Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Related Topics

- "Mapping ESA Data Sources to Analytics Modules" in the *ESA Configuation Guide for RSA NetWitness Platform 11.4*
- ESA Analytics Mappings (11.1.x to 11.4.x)

## Quick Look

To access the module settings, in the ESA Analytics Mappings panel, select the mapping that you want to change and in the **Actions** column, select **> Edit Module**. The Module Settings dialog has a Configurations section and a Warm-Up State section.



## Configurations

The Configurations section enables you to change the Warm-Up Period and Lag Time configurations.

The following table describes the settings available for an ESA Analytics module mapping.

| Field | Description |
|---|---|
| Module | Shows the name of the mapped module. |
| Service | Shows the ESA Analytics service that processes the data for the mapping. |
| Sources | Shows the mapped data sources and the URLs used to communicate with ESA. |

| Field | Description |
|---|---|
| Warm-Up Period (Hours) | Specifies a warm-up duration in hours. A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts.<br><br>RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed.<br><br>You can update the Warm-Up Period of a deployed module mapping depending on whether or not the warm-up period is complete:<br>• **During the warm up period** - You can add hours to the warm-up period or subtract any remaining warm-up time.<br>• **The warm-up period is complete** - You can add hours to the warm-up period by adding the difference between the current time and the First Event Time to the hours that you want to add.<br>For example, a warm-up period of 10 hours is complete and the First Event Time shows 12:00:00. The current (system) time is 16:00:00 (4 hours later) and you want to add 5 more hours to the warm-up time. To do this, you need to add 9 hours (4+5=9) to the warm-up period of 10, so you would set the new warm-up period to 19 hours.<br>You cannot decrease the warm-up period if it is complete, unless you delete the mapping and create a new one.<br><br>The Warm-up Period value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different warm-up times, the Concentrator uses separate Warm-up Period values for each module mapping. |

| Field | Description |
|---|---|
| Lag Time (Minutes) | Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay.<br><br>The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. When you specify a Lag time, the first time the module deploys, data aggregation starts at **Current (System) Time - Lag Time - Warm-Up Time**. For example, if the current time is 2:00 PM, Lag time is 30 minutes, and Warm-up time is 4 hours, when the module deploys for the first time, data collection starts at 9:30 AM (2:00 PM - .5 hour - 4 hours).<br><br>After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module.<br><br>For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on.<br><br>**Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data.<br><br>The Lag time value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different Lag times, the Concentrator uses separate Lag values for each module mapping.<br><br>**Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation.<br><br>To determine the correct Lag Time, add together the following to get an environmental lag time:<br><br>1. **Log or Packet Latency** - This is the time it takes for the Log Decoder to receive the logs or the (Packet) Decoder to receive packets. For example, the Log Decoder may get logs every 20 minutes. In this case, you would want to set Lag time to at least 20 minutes, preferably 25 minutes, so that you do not miss events.<br><br>2. **Aggregation Latency** - This is the time it takes to get the data from the Log Decoder to the Concentrator.<br><br>3. **Other Buffer** - Add in any additional time delay specific to your |

| Field | Description |
| --- | --- |
| | environment. |

## Warm-Up State

The Warm-Up State section provides information about the warm-up state, which you can use to determine the appropriate adjustments to the warm-up period.

| Field | Description |
| --- | --- |
| Warmup Started At | The time when the first event was processed by the ESA Analytics module from the data source. |
| First Event Time | The time that the first event occurred. The warm-up time is based on this time. |
| Latest Event Time | The time that the latest event occurred. |
| Remaining Warm-Up Time | The number of hours remaining in the warm-up period. |
| Is Completed? | Indicates whether the warm-up period is complete. If it is true, the warm-up period is complete. If it is false, the module is still warming up and you can view the number of hours remaining in the Remaining Warm Up Time field. |

# NetWitness Event Sources

Event sources are network sources that send information about events to the NetWitness. They can be physical devices, such as laptops, network switches or firewall, and virtual or cloud-based applications, such as VMware. For example:

- An Apache HTTP Server
- Amazon Web Services CloudTrail
- A Barracuda Web Application Firewall
- A connection to Dropbox
- An Oracle Database
- A VMware vCenter Server

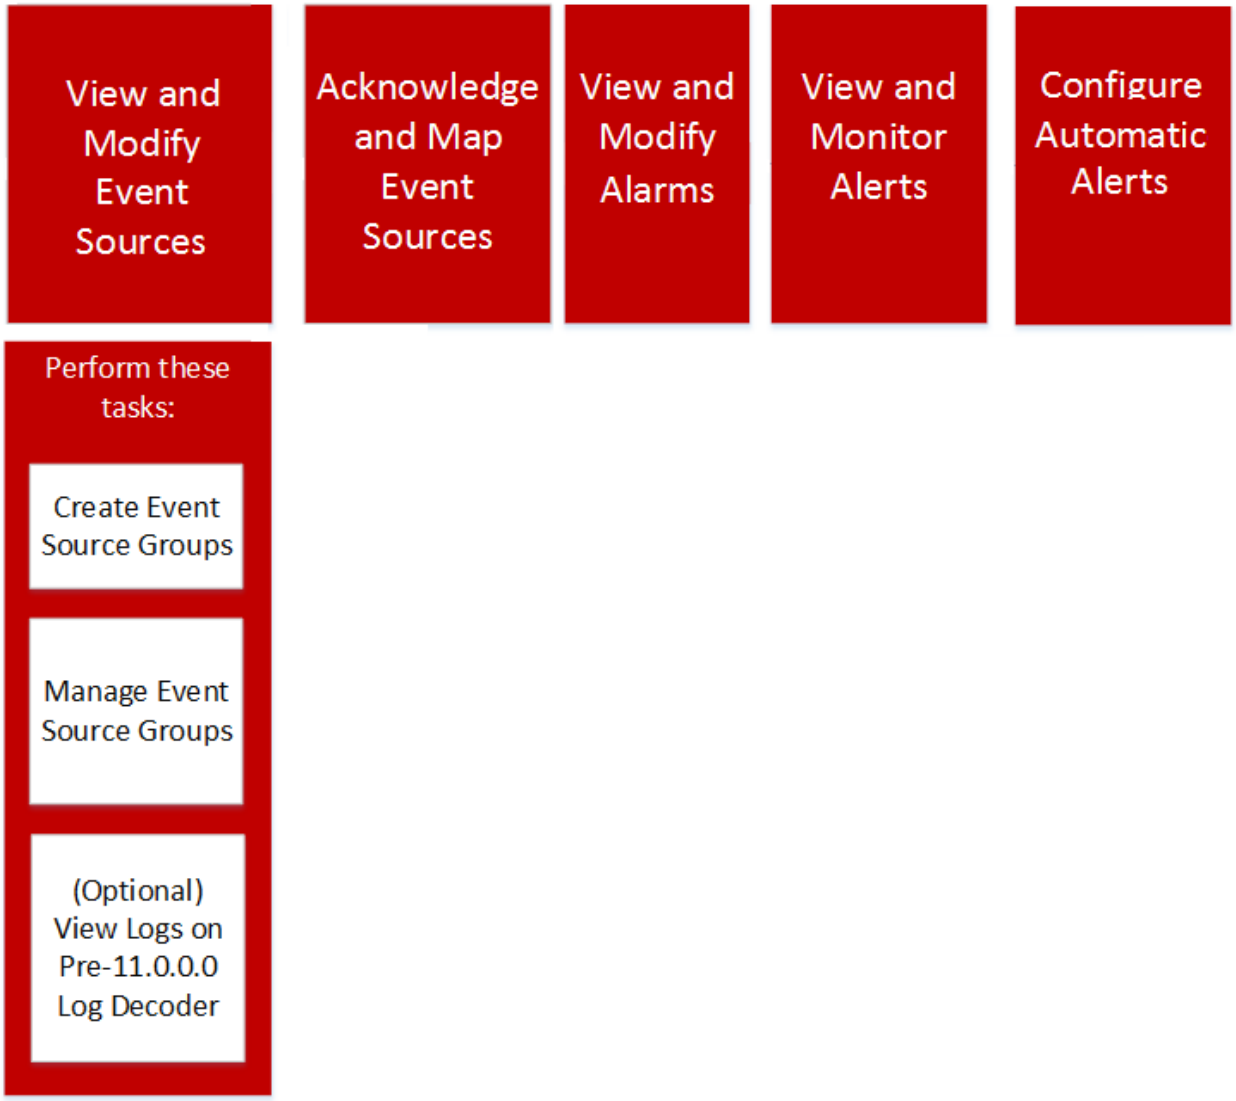
You first configure all of your event sources so that they can communicate with the NetWitness. RSA provides configuration guides for many common event sources, using a variety of collection methods (such as Syslog or file collection). After you have your event sources configured, use the information in this guide to manage them going forward.

# Event Source Management

The Event Sources module in NetWitness provides an easy way to manage event sources and configure alerting policies for your event sources.

## Workflow

This workflow shows the overall process for managing event sources, and configure monitoring for them. It also shows where configuring alarms and alerts settings are located in the process.



## Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

## Automatic Mapping

Introduced in NetWitness version 11.1, the system maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. The User Interface (UI) indicates that an address has been auto-mapped in the Discovery workflow.

## Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to **(Admin) > Event Sources**.
2. Click any of the following:
   - The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
   - The **Manage** tab. Use this tab to add, edit, and delete event source groups and view details for your existing event source groups.
   - The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.

- The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
- The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.

**Note:** When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

## How Alarms and Notifications Work

The Event Source module in NetWitness displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: The system sends an alert whenever an event source exceeds the thresholds in the policy for the associated groups.
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:

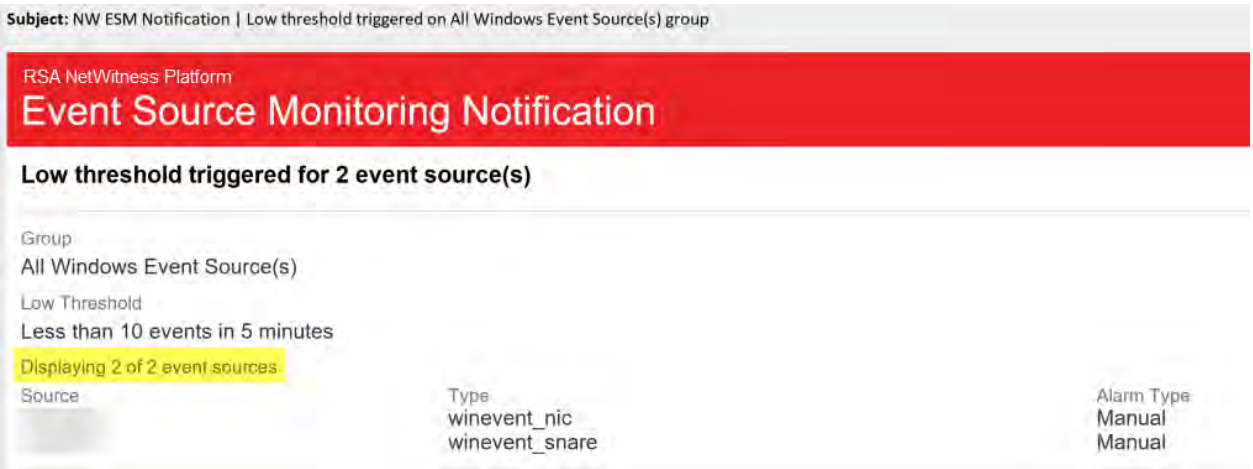
- To receive manual notifications (through email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:
  - Baseline alerting must be on. This is turned on by default.
  - You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
  - The event source that triggers the alarm must be in a group that has a policy enabled.
- If you have automatic alerting turned on, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list the event source that double alarmed twice; one listing indicating it was an automatic alarm.

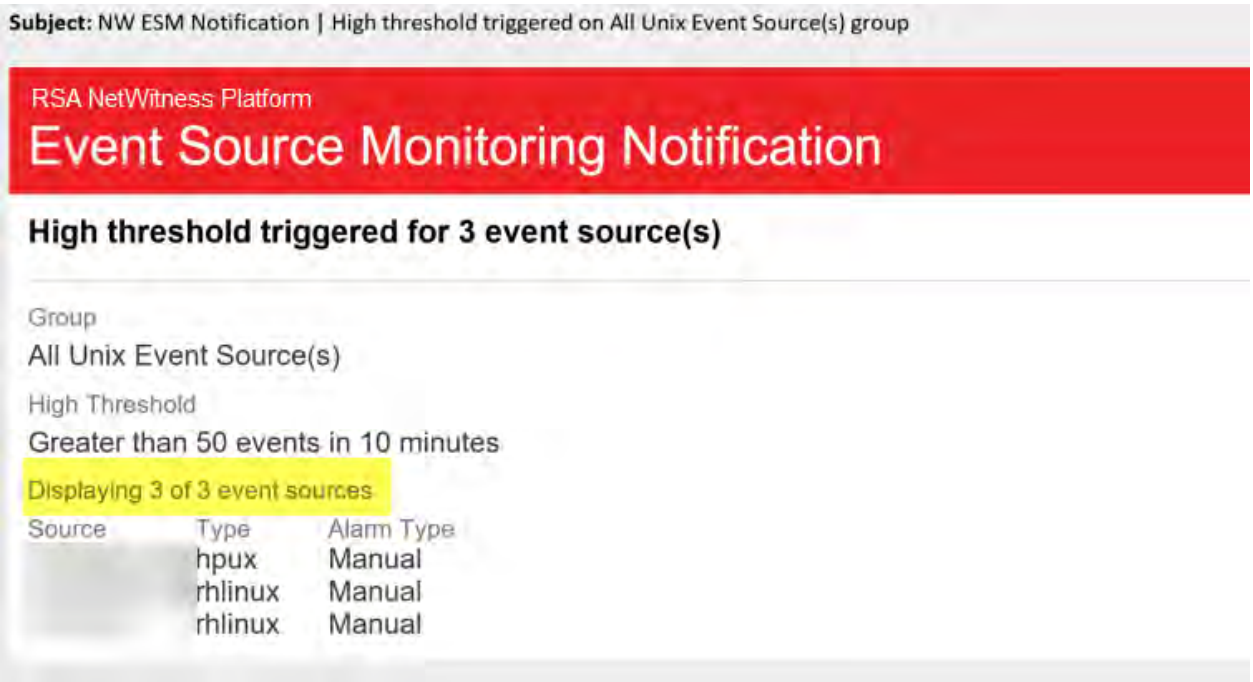
## Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.

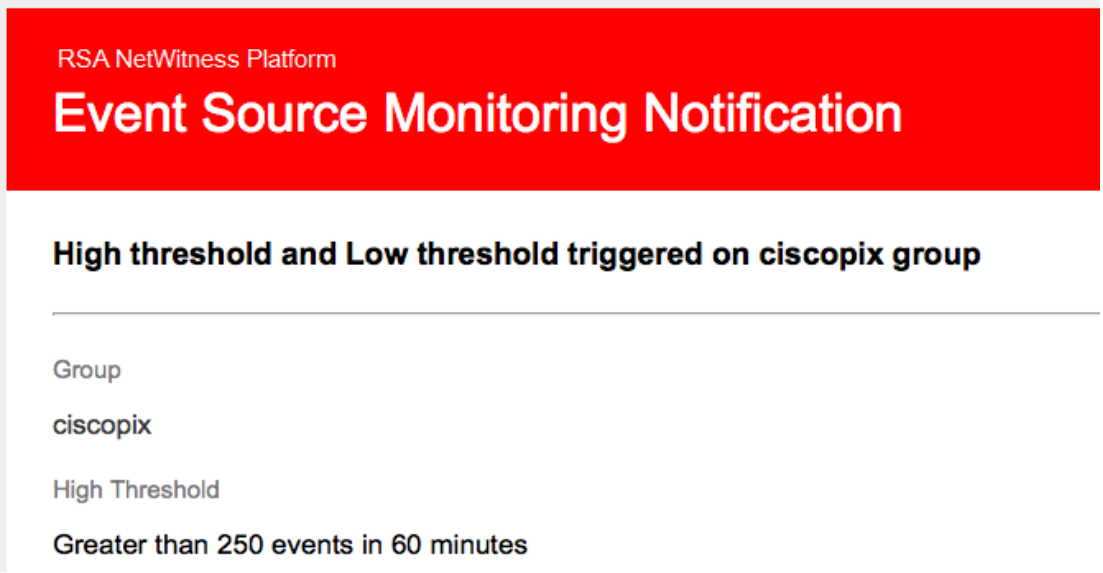
The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.





## High and Low Thresholds Both Triggered

Occasionally, both the high and low alarms are triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:



In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

# Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

**Note:** Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.

- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

# Common Scenarios for Monitoring Policies

Typically, organizations monitor their event sources in "buckets" based on how critical the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

**Note:** If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)

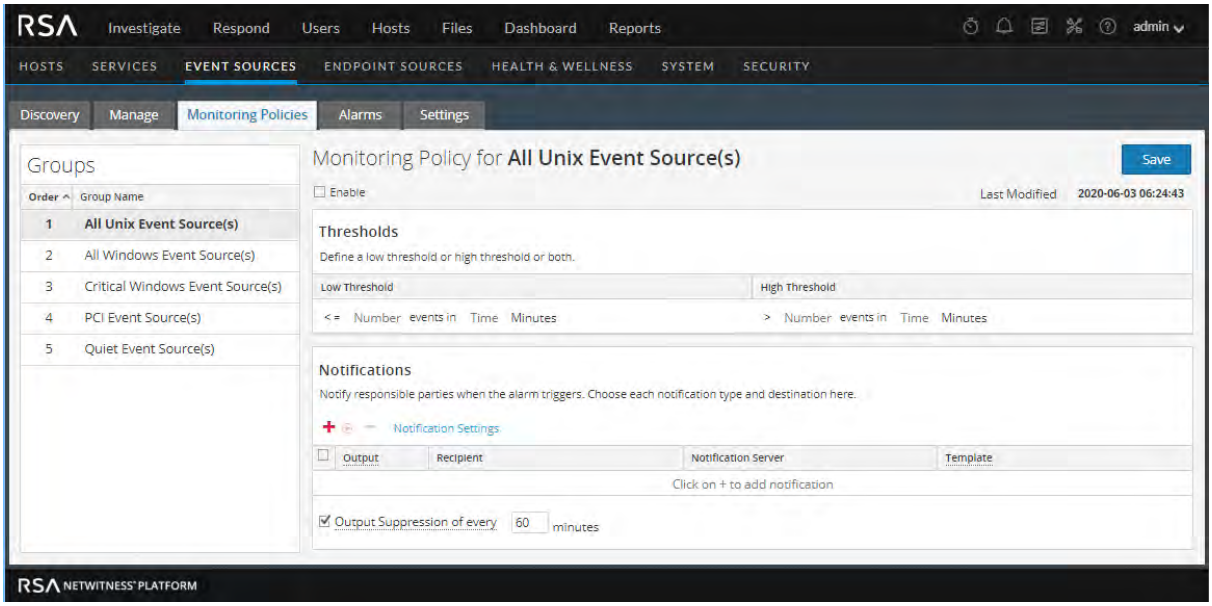
## Ordering the Groups

**Note:** To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices
3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any

thresholds—you can use automatic alerting to generate alarms for the event sources in this group.



In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

# Managing Event Source Groups

## Definitions

When dealing with event source groups in NetWitness, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

## Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

**Note:** When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

## Default Groups

RSA NetWitness has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

**Note:** You cannot edit or delete the **All** event source group.

## Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

RSA NetWitness provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:

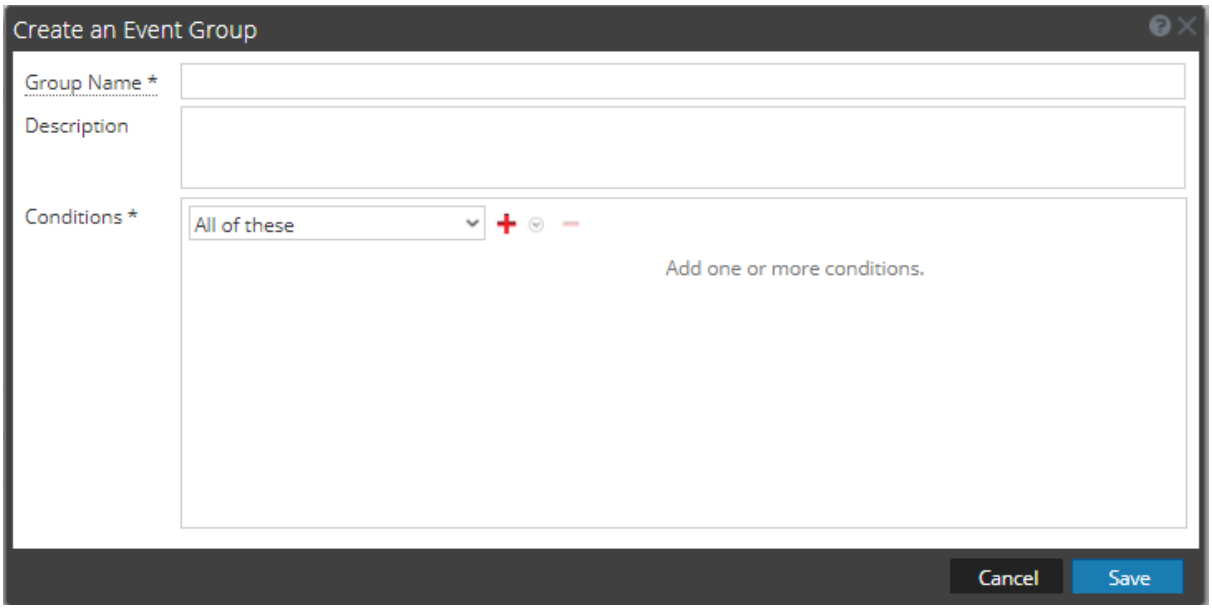
- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

### Procedure

To create an Event Source group:

1. Go to **(Admin) > Event Sources**.
2. In the **Manage** panel, click .

   The Create an Event Group dialog is displayed.



3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

   The new group is listed in the **Manage** panel.

## Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

### Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.

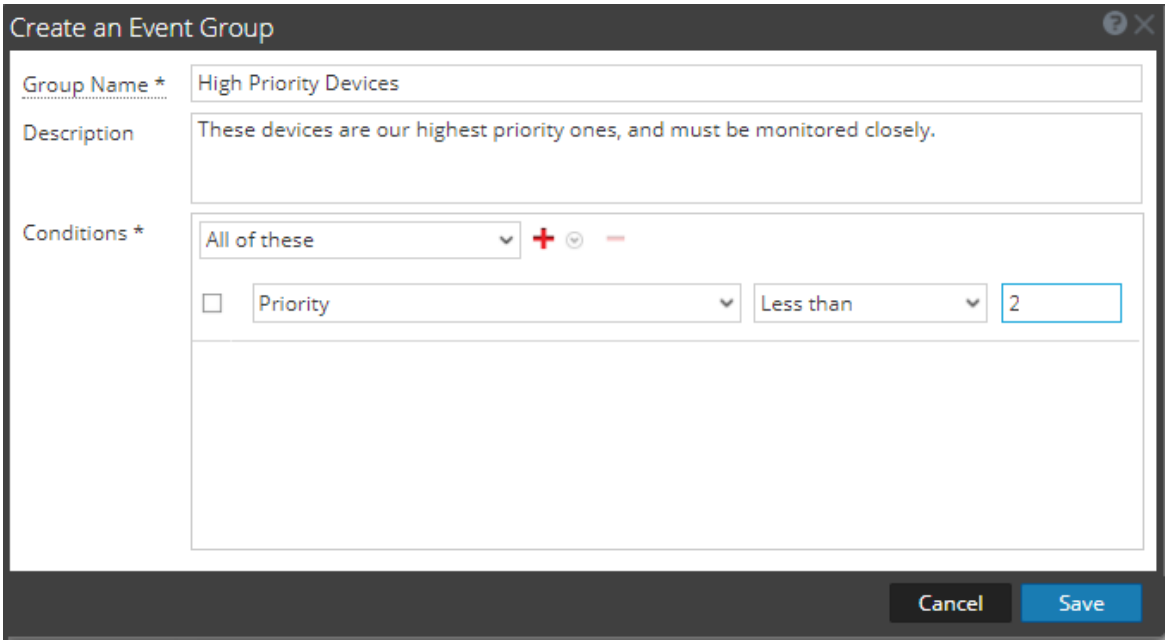
1. Go to **(Admin) > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.
4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.

a. Select an Attribute: **Priority**.

b. Select an Operator: **Less than**.

c. Enter a value: **2**.

The following figure displays the updated Edit Event Group dialog.



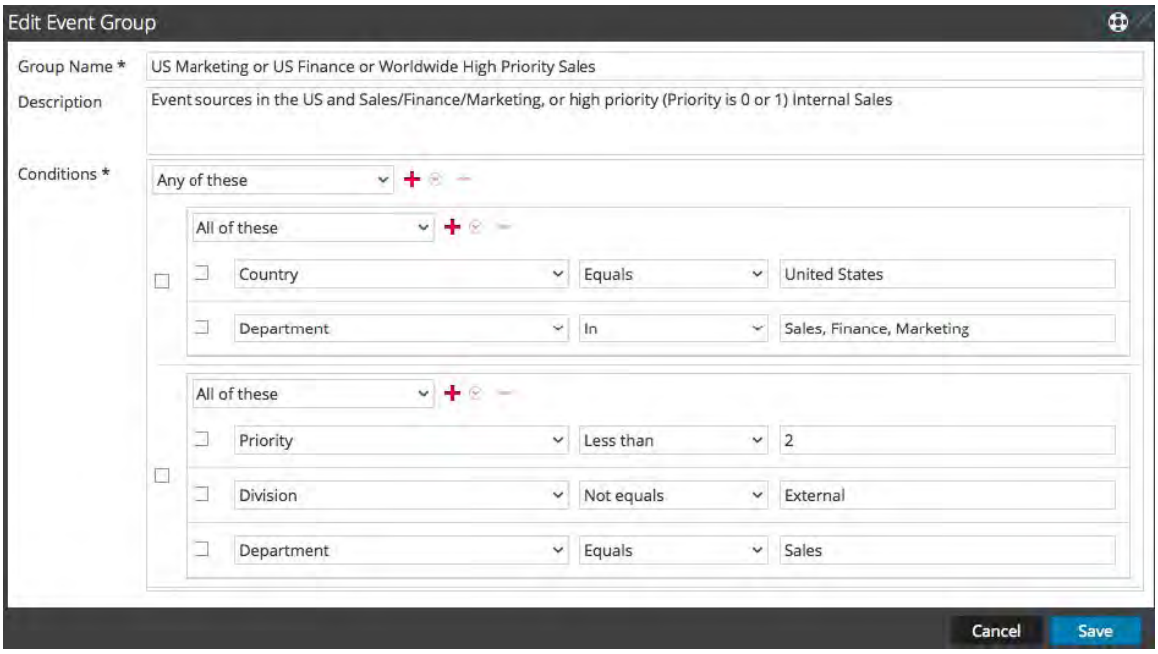
7. Click **Save**.

## Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.



# Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

## Parameters

The following table describes the fields on the Create/Edit an Event Group form.

| Field | Description |
|---|---|
| **Group Name** | This field is required, and appears throughout the NetWitness UI as the identifier for the group. |
| **Description** | An optional description to help describe the purpose or details for the group. |
| **Tools** | The following items are available on the toolbar:<br>• **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group.<br>• **Remove (−)**: removes the selected rule or group of rules from the list.<br>When you add a new group, that has the effect of creating nested levels of conditions. |
| **Conditions** | Described below, in the **Rule Criteria** table. |
| **Cancel / Save** | **Cancel** and **Save** options are available in the form. |

## Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

| Rule Constructor | Details |
|---|---|
| **Grouping** | You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules:<br>• **All of these**: logically equivalent to AND<br>• **Any of these**: logically equivalent to OR<br>• **None of these**: logically equivalent to NOT<br><br>If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected. |
| **Attribute** | This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on. |

| Rule Constructor | Details |
|---|---|
| **Operator** | Choose from the following options:<br>• **Equals**: matches the provided value<br>• **Not equals**: returns event sources whose specified attribute not equal to the provided value<br>• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:<br>`Where IP in 10.25.50.146, 10.25.50.248`<br>This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.<br>• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.<br>• **Like**: matches items that begin with the provided string. For example:<br>`Where Event Source Type Like Apache`<br>This condition returns event sources whose Event Source Type begins with `Apache`.<br>• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.<br>• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.<br>• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value. |
| **Value** | Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format. |

## Acknowledging and Mapping Event Sources

In NetWitness version 11.1, RSA introduced Automatic Mapping. The system automatically maps incoming events to a type based on previous logs received from that address, reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

## Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

### To acknowledge event sources:

1. Go to **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click **Toggle Acknowledge**.

Note the following:

- After Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.
- The **Toggle Acknowledge** button behaves as follows:
  - If the Acknowledged state for all of the selected event sources is the same, all values are toggled. That is, if you select only event sources with **Yes** in Acknowledged column, the value changes to **No** for all of them. Similarly if they all have **No** in the Acknowledged column, the value changes to **Yes** for all selected event sources.
  - If you select a multiple event sources, and the value for some is **Yes** and for other it is **No**, when you click **Toggle Acknowledge**, all of the values are set to **Yes** for the selected event sources.

**Note:** Acknowledged Event Sources are not displayed by default.

## Manually Map Event Source Types

When discovered event source types are not completely accurate, you can manually map the parsers to obtain additional information.

### To map one or more event sources:

1. Go to **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click

.

   The Manage Parser Mappings dialog box is displayed.

**Note:** For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

4. Add or remove parser mappings, and change the priority order, based on the needs of your organization. For more details, see Manage Parser Mappings .

**Note:** Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

### Viewing Logs from Pre-11.0 Log Decoder

NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available. For more details, see Viewing Logs from Pre-11.0 Log Decoder.

## Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness.

Similarly, you may need to change some of the conditions that are used to populate the group.

**Note:** You cannot edit the event source group name. After you create a group, that name exists as long as the group itself exists.

### Edit an Event Source Group

1. Go to **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   The Edit Event Group dialog is displayed.
4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

### Delete an Event Source Group

Note the following:

- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.
- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click  .

   A confirmation dialog is displayed.
4. Click **Yes** to delete the group.

## Removing Idle Event Sources

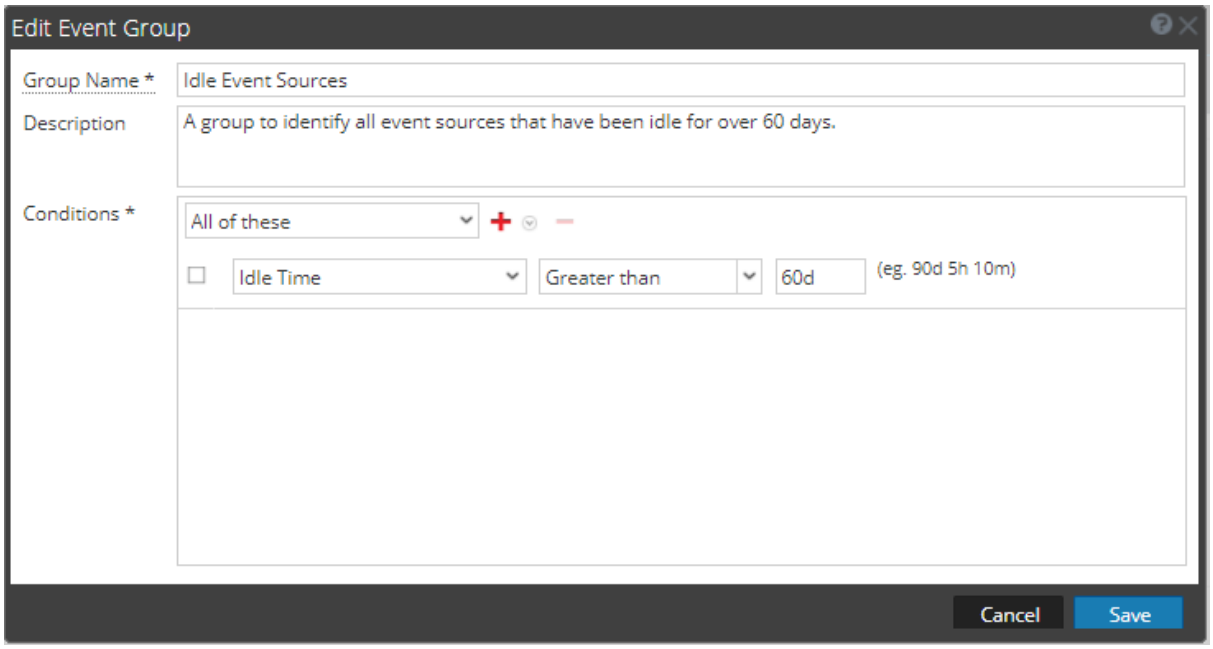
Periodically, you may want to update your set of event sources, and remove ones that are no longer being used. You can use the **Idle Time** parameter to do this.

**Note:** The information in this topic applies to NetWitness Version 11.2 and later.

### To remove idle event sources:

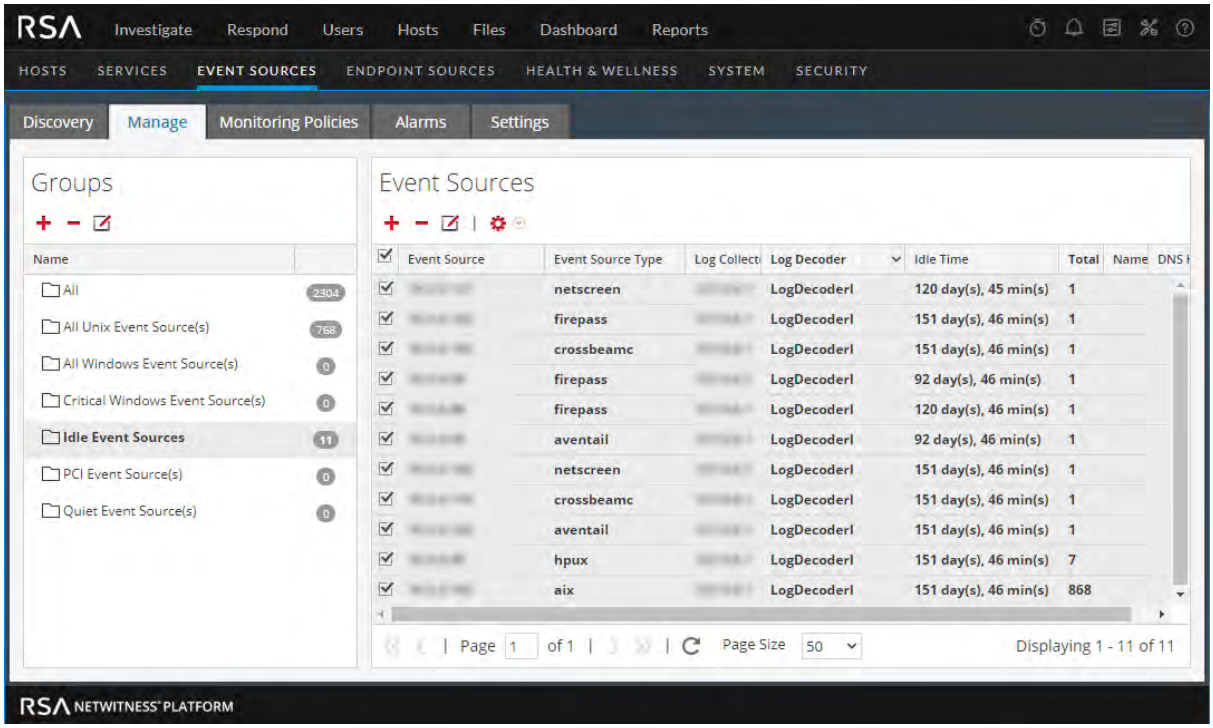
1. Go to **(Admin) > Event Sources**.
2. In the **Manage** panel, click .

   The Create an Event Group dialog is displayed.
3. Fill in the name and description as you like, and add a condition that uses the **Idle Time** parameter, as shown here:



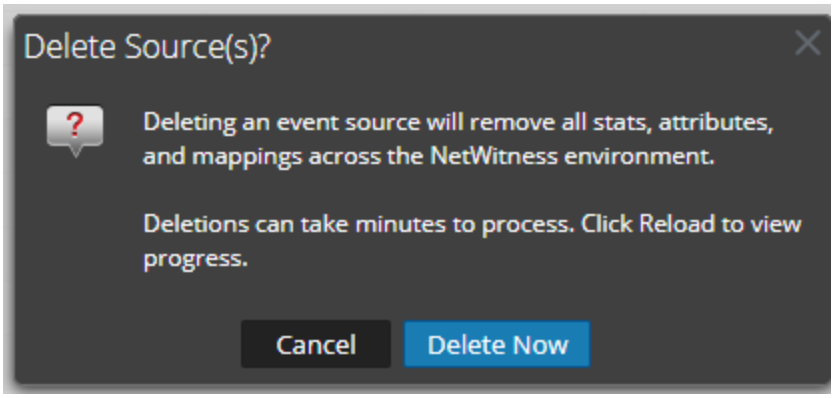
In this example, we have set the condition to identify event sources that have been idle for at least 60 days.

4. Save the new group, then select it in the Groups panel.
5. Select some or all event sources in the group. The following screen shows all event sources from this group selected.



6. In the Event Sources panel, click − to delete the selected, idle event sources.

A confirmation message appears:



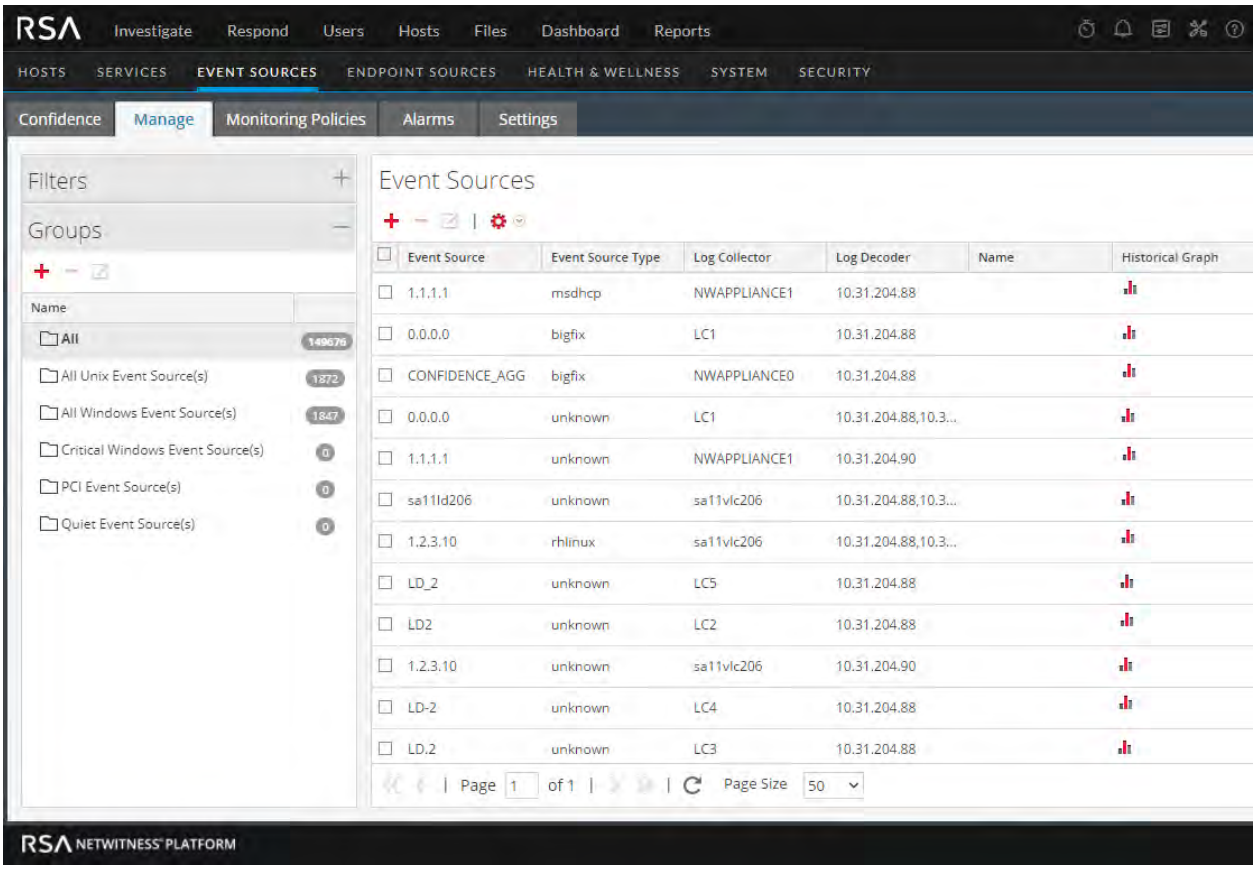
7. Click Delete Now to confirm your intention to delete the selected event sources.

If, in the future, an event source that has been removed sends logs, a new event source will be created.

## Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:



Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

## Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. After you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, RSA NetWitness uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

## Create an Event Source

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

**Note:** The Discovery Score is listed as **Unavailable** for manually-added event sources. The score remains as **Unavailable** until the event source begins sending information to the NetWitness

## Update Attributes for an Event Source

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
5. Enter or change the values for any attributes, except for certain attributes that cannot be altered after you have entered them.
6. Click **Save**

# Bulk Editing Event Source Attributes

You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

**Note:** You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

**Note:** Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.

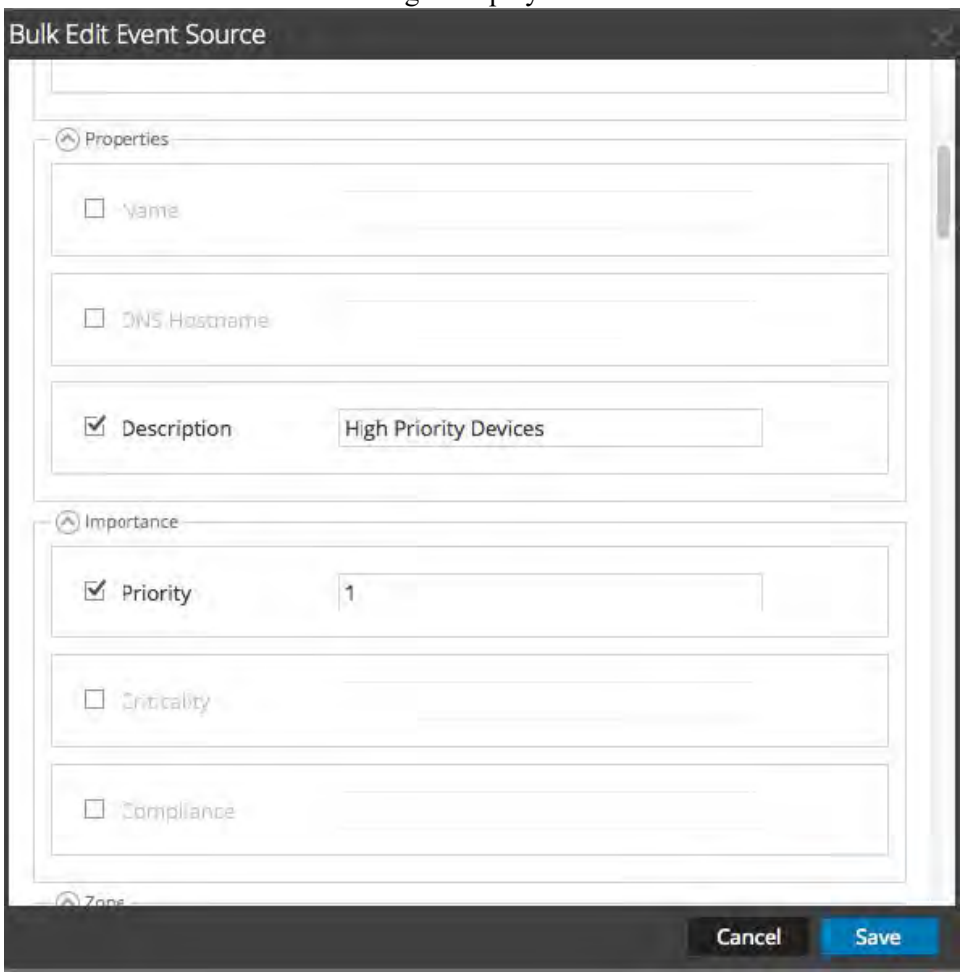
To bulk edit attributes for Event Sources:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

**Note:** To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.

5. Select the **Edit** icon from the menu bar.

   The Bulk Edit Event Source dialog is displayed.



6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

## Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

**Note:** The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness), the original value in NetWitness will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

RSA NetWitness treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness, the attributes for that event source are ignored. That is, NetWitness does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness (that is, it is **not** cleared).

**Note:** There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.

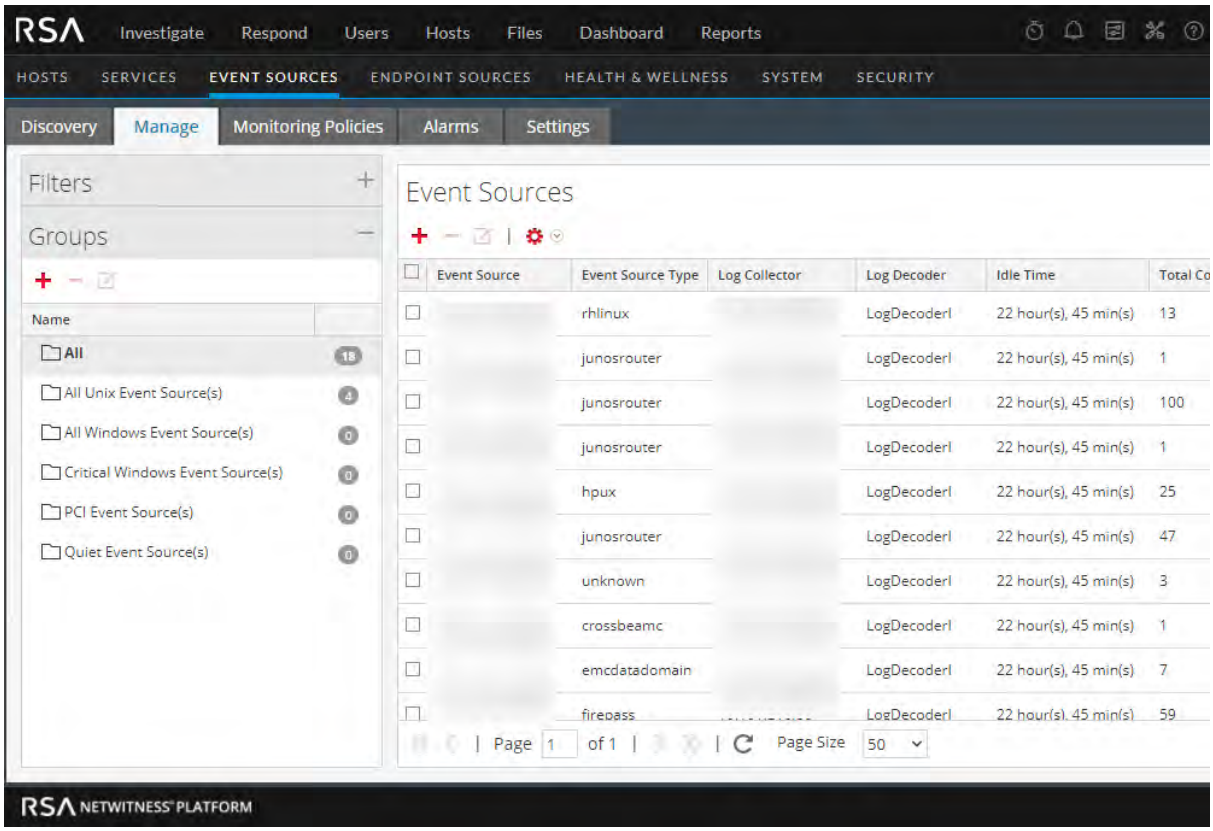
The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

## Import Event Source Attributes

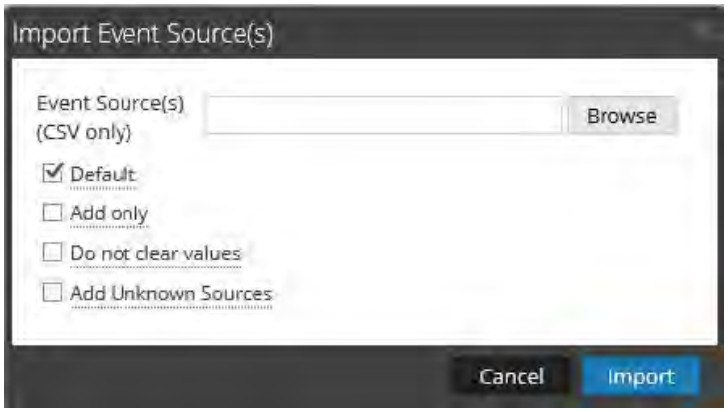
To import Event Source attributes from a file:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. From the Import/Export menu in the toolbar ( ), select **Import** ( Import ).
   The Import Event Sources dialog is displayed.



4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness is blank. Thus, no existing values will be overwritten.

- **Do not clear values**: Does not clear attribute values in NetWitness for items in the import file that are blank.
- **Add Unknown Sources**: Adds new event sources based on items in the import file.

**Note:** You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

### Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

## Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

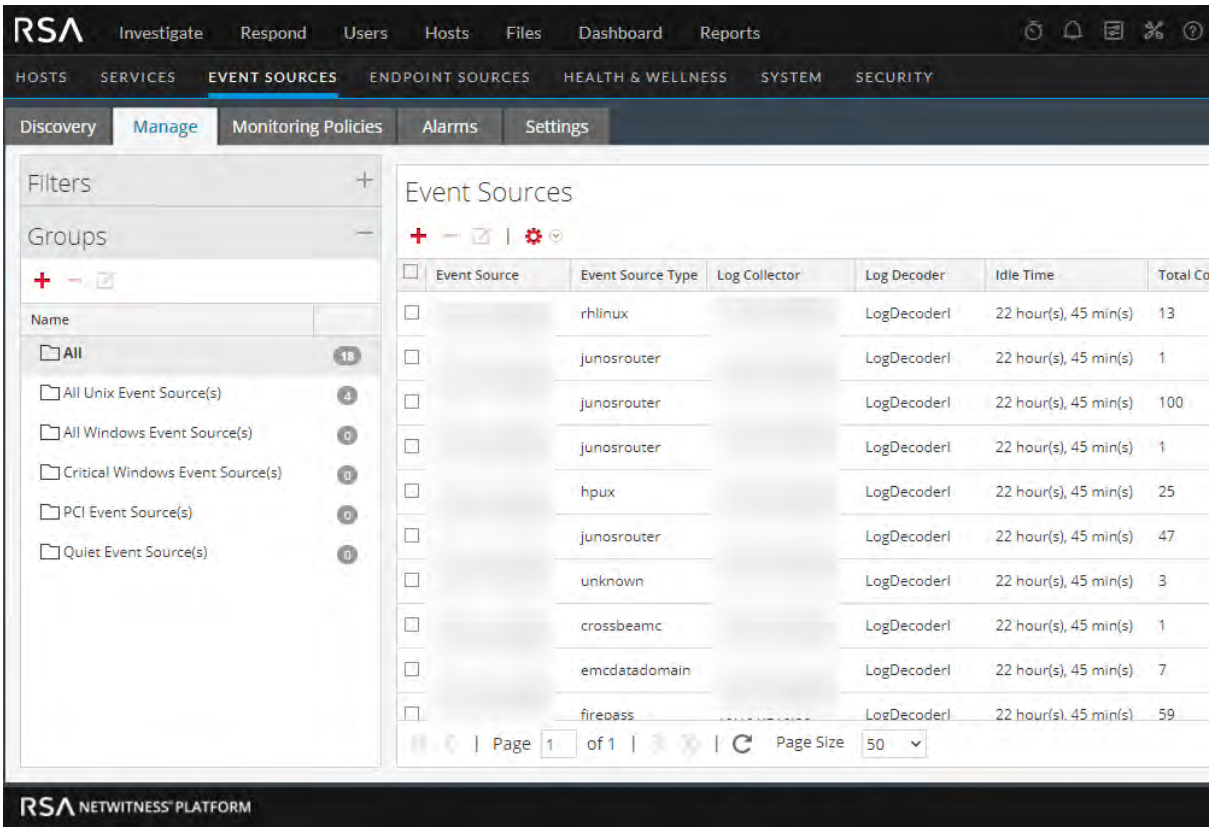
Note the following:

- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

To export your Event Sources:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (  ), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.

6. Enter a file name and click **Export**.

The event source attributes are saved to the file name you specified, in a CSV format.

## Sorting Event Sources

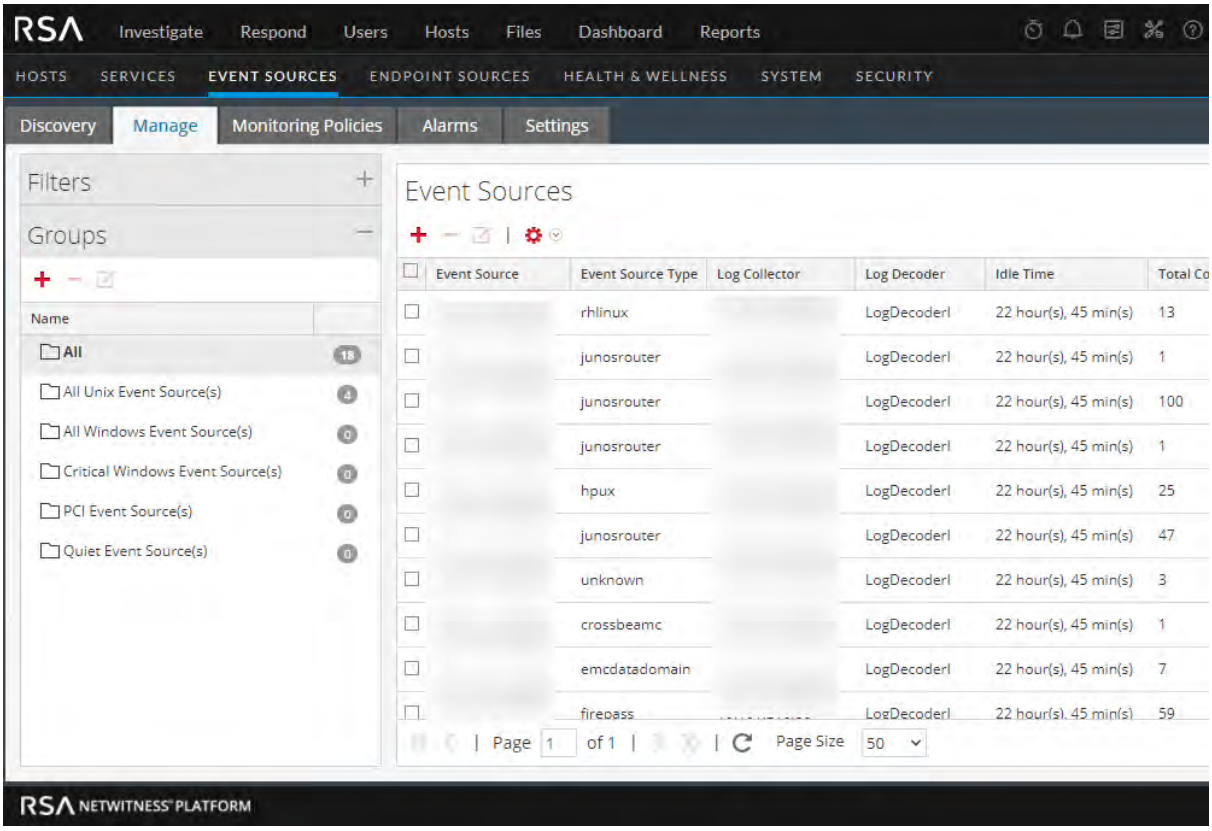
The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

**Note:** The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)

To sort your event sources:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. To sort a column, click + in the column header.

   The Sort Options drop-down menu is displayed.
4. Select the sort order that you want.

# Monitoring Policies

Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

**Note:** In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.

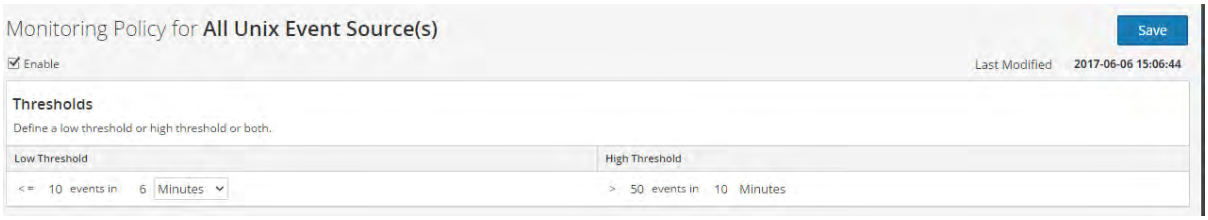
## Configuring Event Source Group Alerts

Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

### Create an Alert Policy for an Event Source Group

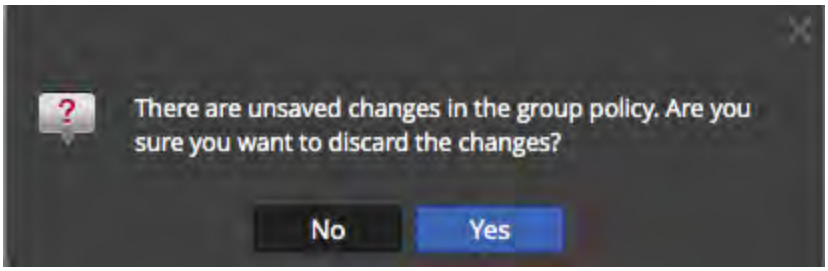
1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.



5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

**Note:** If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:

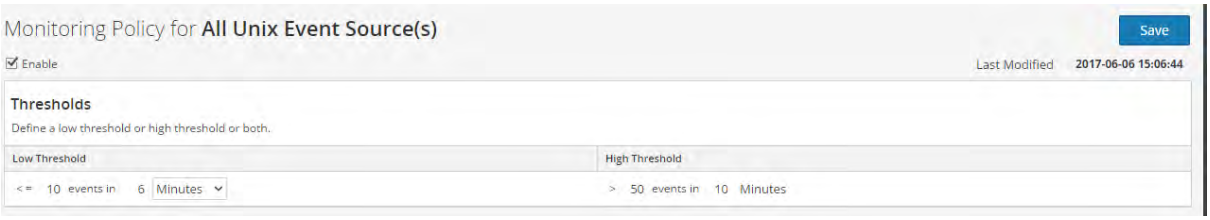


## Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.

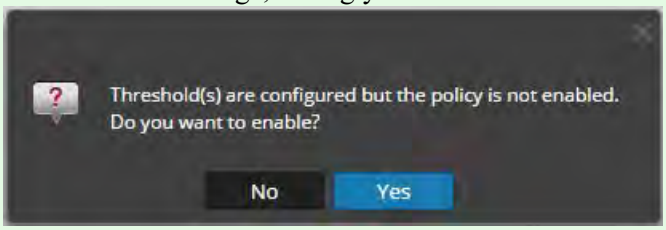
If you configure longer policy duration for low threshold policy, it may result in increased memory (SMS Heap) usage. In order to avoid increased memory usage (For more information, see 'Troubleshooting Health & Wellness' in the *System Maintenance Guide*), make sure you optimize the policy filter to match the required Event Sources and also RSA recommends having a policy duration of < 3 days if 30 low threshold policies match 20K Event Sources. If there are < 10 low threshold policies, you can have < 7 days policy duration with each policy matching unique Event Sources.

1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.



4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.
5. Select **Enable** to enable alarms when thresholds are not met.

**Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd



For example, suppose you enter 10 and 30 for the values for the low threshold: `10 events in 30 minutes`, and 20 and 30 for the values for the high threshold: `20 events in 30 minutes`. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

After you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

# Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

**Note:** After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

## Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

## Add Notifications for an event source group

To add notifications for an event source group:

1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

   **Note:** You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click , and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

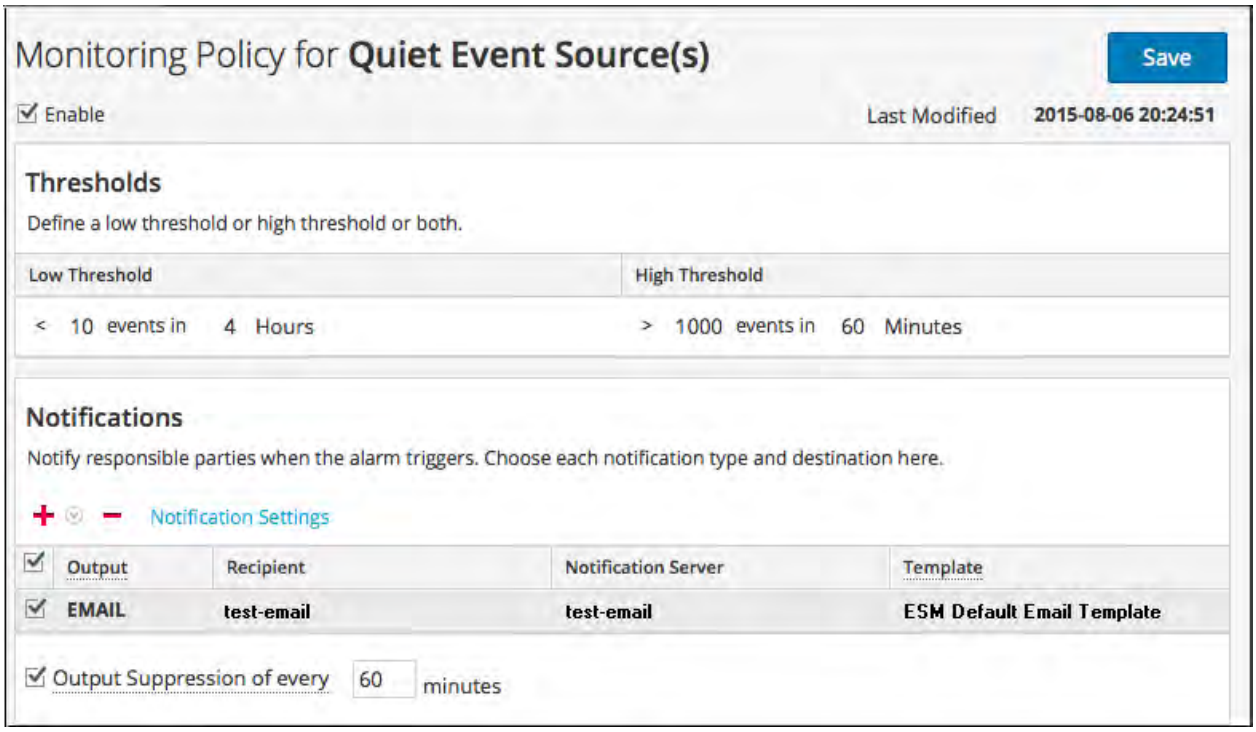
   **Note:** Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

   **Note:** If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.



# Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

**Note:** Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

## Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

## Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for

this event source group, even if thresholds are not met or exceeded.

5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

# Configuring Automatic Alerting

**Note:** Automatic alerting, and it settings, are currently in Beta testing.

## Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

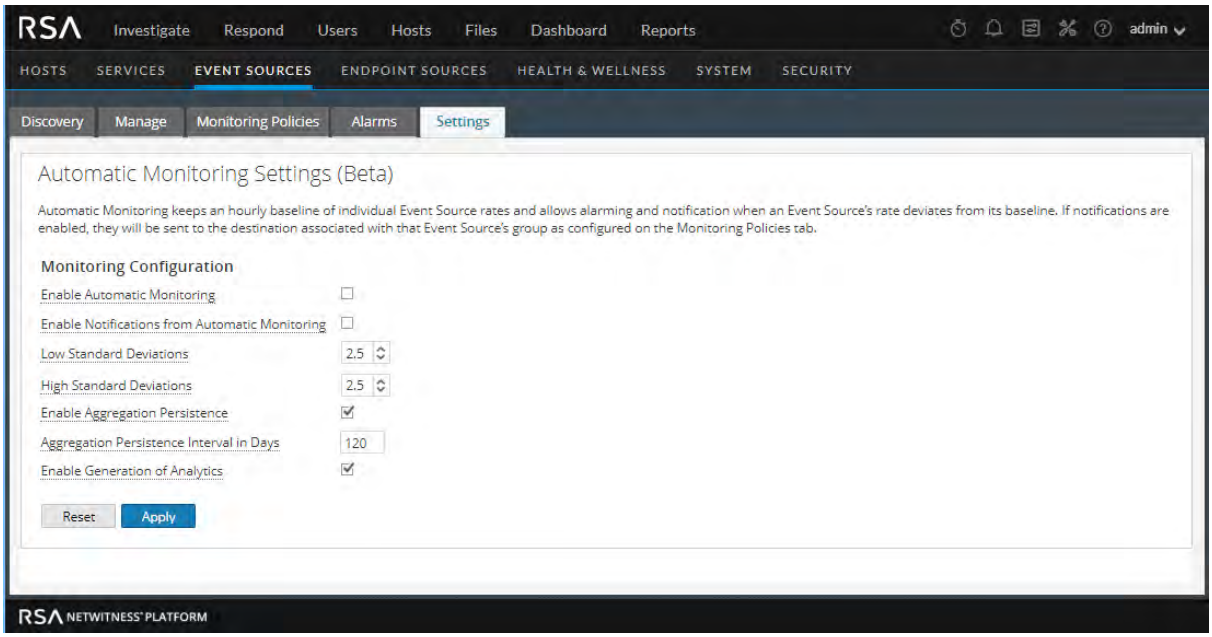
- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

## Configure Automatic Alerting

To configure automatic alerting:

1. Go to **(Admin) > Event Sources**.
2. Select the **Settings** tab.

   The Settings tab is displayed.



3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.5** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.5** (95% confidence).

   **Note:** You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation.
6. Click **Save** to close the dialog and save your settings.

# Viewing Event Source Alarms

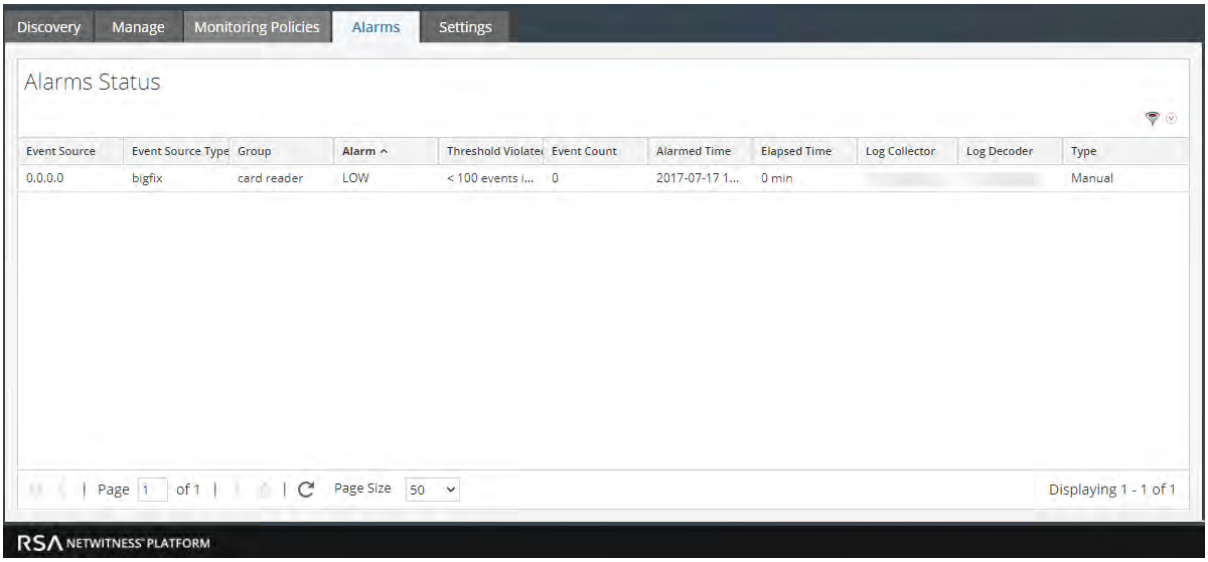
This topic describes how to view alarms for your event source groups. After you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

## Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to **(Admin) > Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the icon.

   This is an example when you mouse over the Alarm column.



5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

**Note:** You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

## Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area:

Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

# Event Source Management References

The following topics contain reference information for Event Source Management:

- Discovery Tab
- Manage Tab
- Manage Event Source Tab
- Event Sources View
- Create/Edit Group Form
- Details View
- Historical Graph for System Stats
- Manage Parser Mappings
- Alarms Tab
- Monitoring Policies Tab
- Settings Tab

## Discovery Tab

To access the Discovery tab, go to NetWitness (Admin) > **Event Sources**. The Discovery tab is displayed.

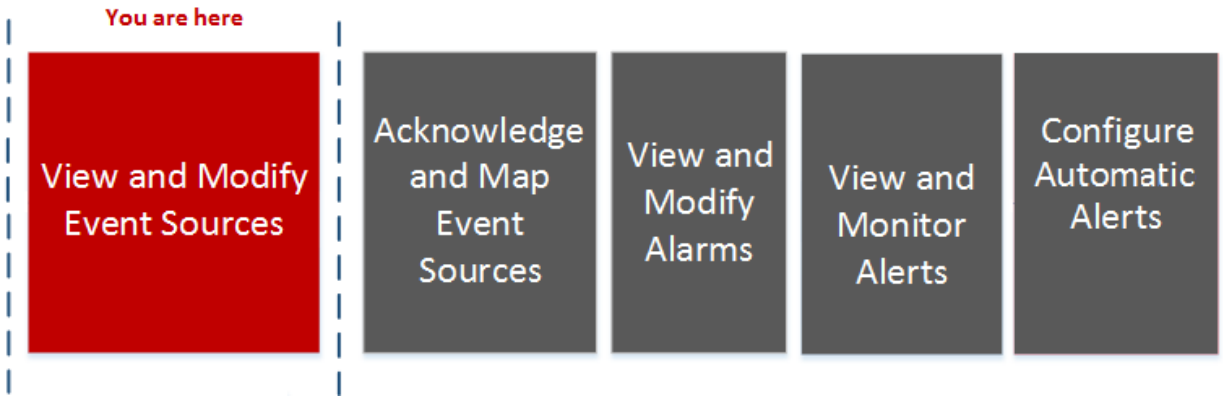
The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

**Note:** The following features apply to NetWitness version 11.1 and later:
- Acknowledging multiple event sources
- Filtering by event source type
- (for 11.2 and later) Mapping filter options include None, Auto, and Manual
- Mapping multiple event sources
- Searching for event sources on the Event Source Discovery page

NetWitness, version 11.2 and later, automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. A value of **Auto** in the **Mapping Type** column indicates that an address has been auto-mapped.

### Workflow

This workflow shows the overall process for configuring event sources.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Acknowledge and map event sources.* | Acknowledging and Mapping Event Sources |
| Administrator | Add and configure parser mappings for a Log Decoder.* | Manage Parser Mappings |
| Administrator | View event source alarms. | Viewing Event Source Alarms |

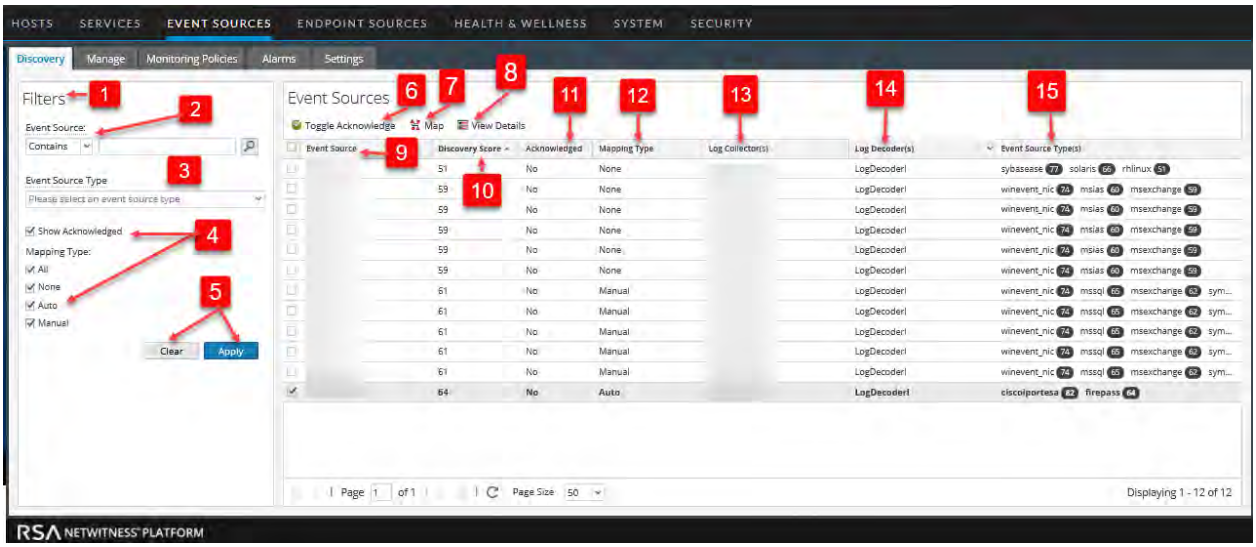
Manage Parser Mappings

Details View

## Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.



1 Displays the Filters and Event Sources panels with the Discovery tab open.

2 Displays the Event Source Filter field with a drop-down menu that offers the following options:

- Enter the full or partial address (IP, IPv6 or Hostname) of the source(s) you want to review. You can also enter multiple entries that are separated by commas.
  For example, **10.10.10.10,10.10.10.11,host1.company.com**
- **Exact:** Returns sources that completely match the search term.
  For example, **10.10.10.10** only returns **10.10.10.10**, not **10.10.10.101**.
- **Starts With:** Returns sources that start with the search term.
  For example,**10.10.10.** returns the whole **10.10.10.x subnet**.
- **Contains:** Returns sources that start with the search term.
  For example, **exch** returns all terms such as **us-exch-1.company.com**, or **lab21** returns all **hostx.lab21.company.com** terms.
- **Ends With:** Returns sources that end with the search term.
  For example, **lab21.company.com** returns all hosts.

**Note:** When specifying the search string, you can use **. - :** (period, dash, colon).

3 The Event Source Type drop-down menu filters for addresses containing all of the selected event source types.

4
- Select the **Show Acknowledged** checkbox to display acknowledged Event Sources.
- Mapping filter options can include just one of the mapping types listed in the Filter Panel, or multiple Mapping Types can be selected.

**Note:** If no mapping filter options are selected, the default is to display **All**, **None**, **Manual**, and **Auto** mapping types.

5
- The **Apply** button uses all criteria that is set in all filters.
- The **Clear** button clears all filters from the panel.

6 Toggles the event sources between acknowledged and not acknowledged states.

7 Maps the selected event sources.
8 View Details button to view details of the selected Event Source.
9 Displays the  addresses of the selected Event Sources.
10 Displays the discovery scores of the selected Event Sources.
11 Displays whether or not the selected Event Sources have been acknowledged.
12 Displays the selected Event Source Mapping type as Auto, Manual, or None. Any changes to the mapping are only displayed here.
13 Displays the host names of the Log Collectors where the Event Sources are located.
14 Displays the host names of the Log Decoders where the Event sources are located.
15 Displays the discovered Event Source Types and their associated discovery scores.

## Toolbar and Features

The Discovery tab contains the following features:

| Field | Description |
|---|---|
| **Tools**<br>Toggle Acknowledge<br>Map | The following items are available on the toolbar:<br>• **Toggle Acknowledge**: Toggles the acknowledged state for the selected Event Source between **Yes** and **No**.<br>• **Map**: Opens the Manage Parser Mappings dialog box, where you can map an event source to the correct log parser.<br>• **View Details**: Provides details on the selected Event Source, as well as logs that have been received for this event source. For example:<br>  |
| **Event Source** | The IP, IPv6, or Hostname of the Event Source. |
| **Discovery Score** | Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident). |
| **Acknowledged** | Selections are either **Yes** (you have acknowledged the Event Source) or<br>**No** (you have not acknowledged the Event Source). |

| Field | Description |
|---|---|
| **Mapping Type** | Selections are **Manual** (you mapped the Event Source), **Auto** (the system automatically mapped the Event Source), or **None** (you have not mapped the Event Source).<br>Auto mapping is content aware. When a log message is parsed to a high confidence header or message that has been tagged, an auto mapping will be set for that address and type. This auto-mapping is valid for 24 hours and will be renewed every time a log message matches a tagged header of a message.<br>Log messages are first parsed against auto-mapped parsers, and only fall back to discovery if there is no match amongst the mapped parsers. Log messages that fall back to discovery can match the tagged headers or messages from other event sources: this results in multiple types being mapped.<br>For example, an address could eventually be mapped to Windows, MS SQL, and Apache, and these parsers are evaluated first. If an event source is decommissioned, and its IP re-purposed, the 24-hour timer ages out the mappings for the decommissioned types.<br>**Note:** This features applies to RSA NetWitness version 11.2 and later. |
| **Log Collector(s)** | Log Collectors that have received logs from this Event Source address. |
| **Log Decoder(s)** | Log Decoders that have received logs from this Event Source address. |
| **Event Source Type(s)** | The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type. |

**Note:** Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

| Field | Description |
|---|---|
| **Sort Ascending** | Sort the column by discovery score in ascending order. |
| **Sort Descending** | Sort the column by discovery score in descending order. |
| **Columns** | Used to hide or show one or more columns. |

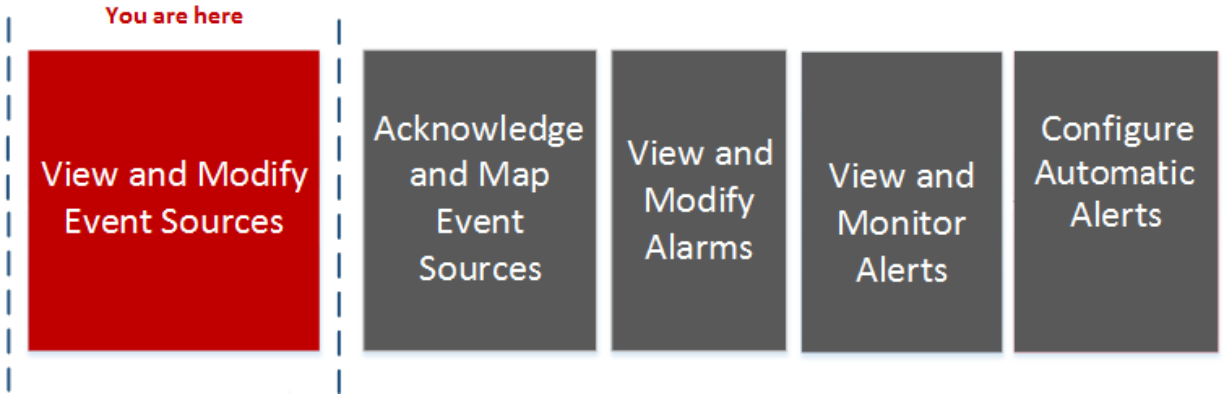
# Manage Tab

The Manage tab organizes event sources into groups, and displays attributes for each event source.

To access this tab, go to (Admin) > **Event Sources** > **Manage**.

## Workflow

This workflow shows the overall process for configuring event sources.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | *View and modify event sources. | Managing Event Source Groups |
| Administrator | Acknowledge and map event sources. | Acknowledging and Mapping Event Sources |
| Administrator | Add and configure parser mappings for a Log Decoder | Manage Parser Mappings |
| Administrator | View event source alarms. | Viewing Event Source Alarms |
| Administrator | Troubleshoot event source management. | ESM Troubleshooting & Appendix |

*You can perform this task here.

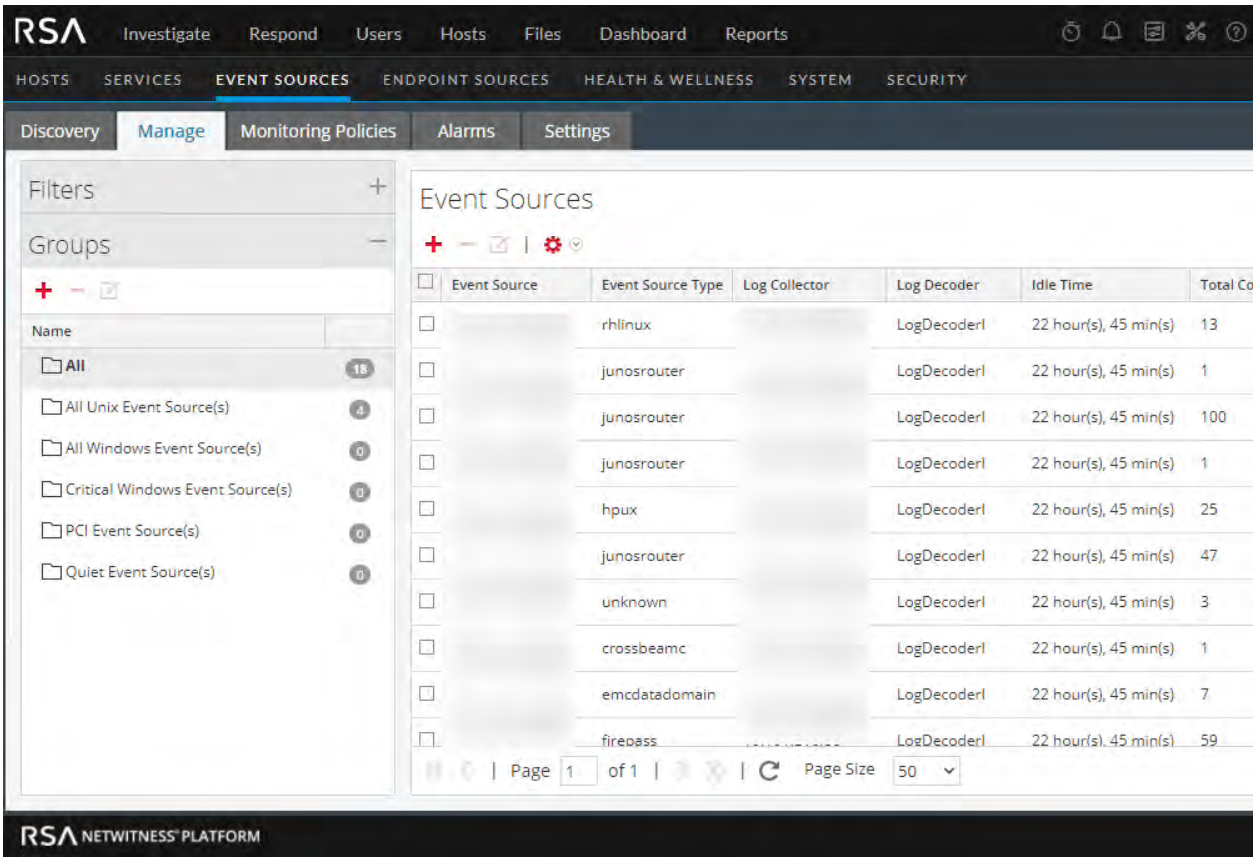
## Related Topics

Creating Event Source Groups

Creating an Event Source and Editing Attributes

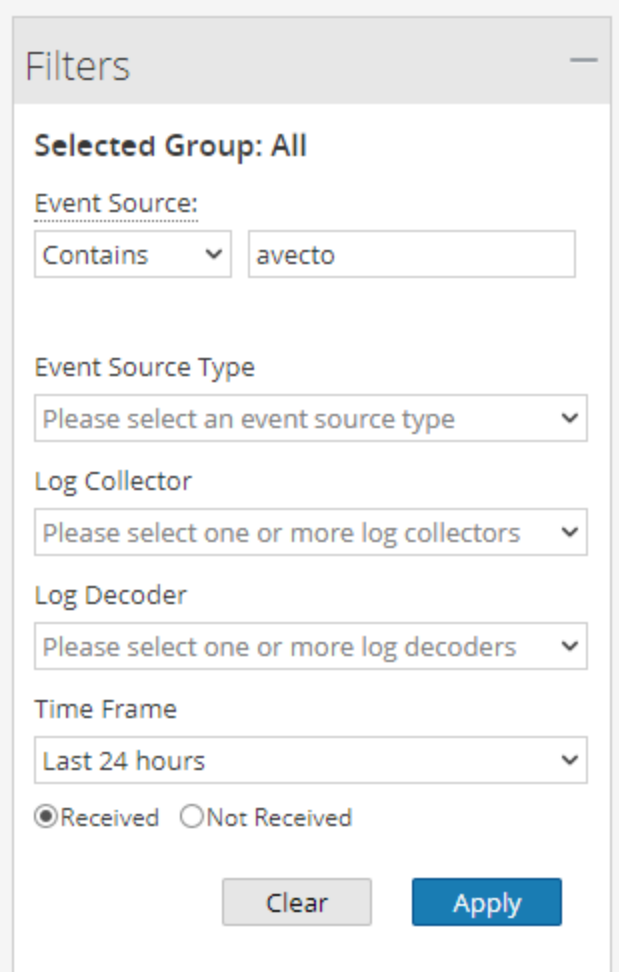
## Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.



## Filter Panel

The Filter Panel provides options for filtering the set of event sources shown in the grid view. This is an example of the Filter Panel:



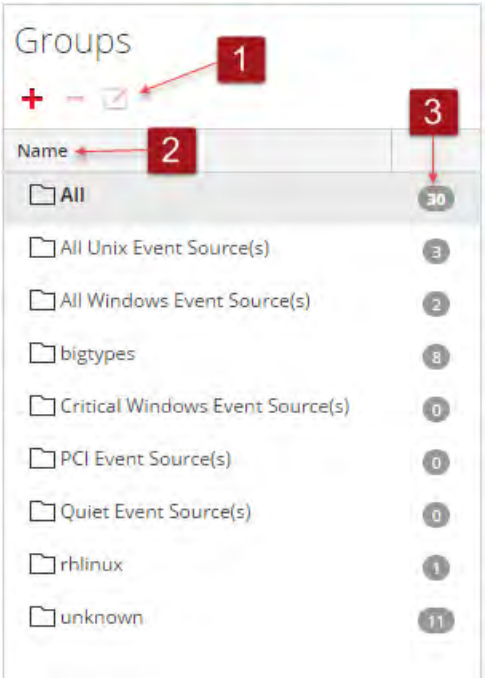
This panel provides the following options:

- You can filter on the event source name, using **Contains**, **Exact**, **Starts With**, or **Ends With**. Select one of these choices, then enter the corresponding string to match against.
- Select one or more Event Source Types to filter based on this value.
- To view event sources that send data to a particular Log Collector, select a Log Collector from the drop-down list.
- To view event sources that send data a particular Log Decoder, select a Log Decoder from the drop-down list.
- Select the time frame for when the events were collected. You can choose a value from 5 minutes to the previous 90 days, or all data that has been collected.
- Use the **Received** and **Not Received** radio buttons to filter the query results to contain only event sources that logs have been received from within the selected time, or query results to contain only event sources that logs have not been received from within the selected time.

After you complete the set of filters, click **Apply** to view the query results in the Event Sources grid.

## Groups Panel

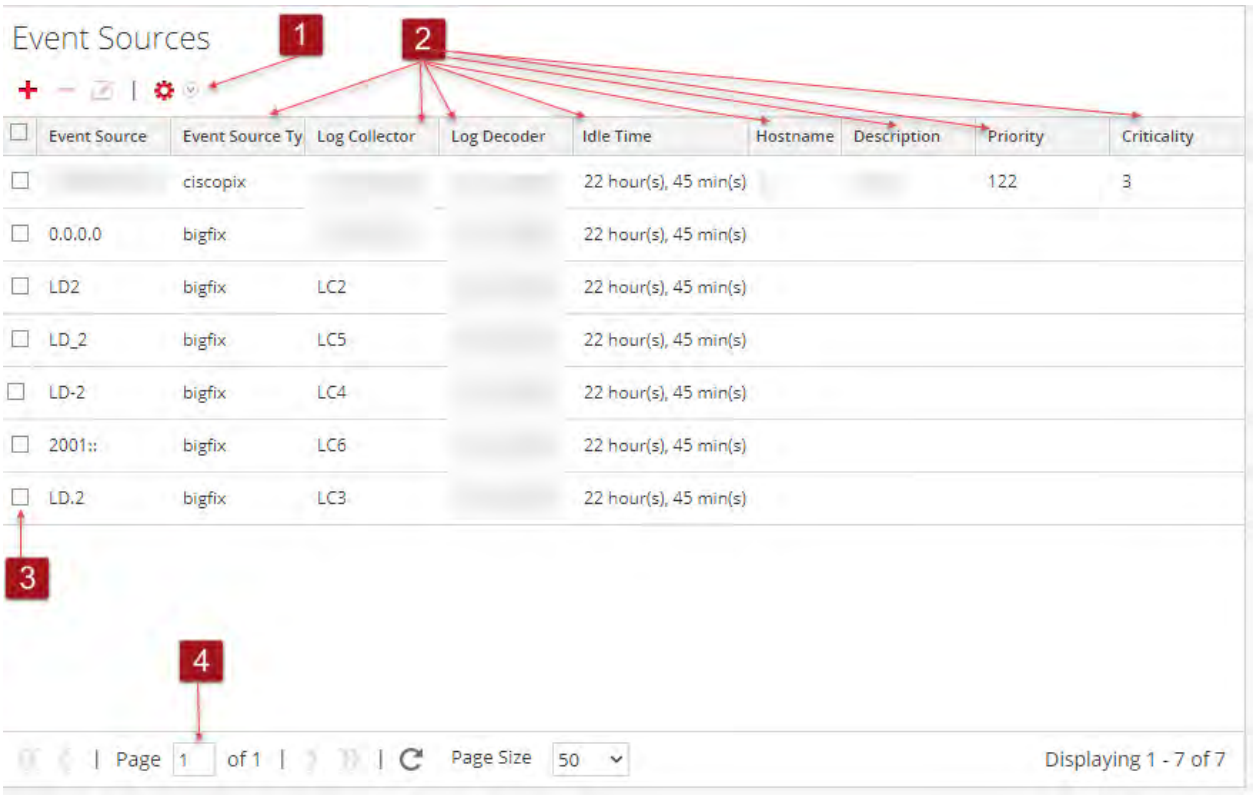
The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.



| | |
|---|---|
| 1 | Displays the standard NetWitness icons for adding, removing, or editing groups. |
| 2 | Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group.<br>For example, if you create a group that consists of Windows event sources for the Sales organization, you could name the group **Windows Sales Sources**.<br>**Note:** The event source group name is not editable. After you create a group, that name exists as long as the group itself. |
| 3 | The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group.<br>**Note:** The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count. |

## Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.



| | |
|---|---|
| 1 | The toolbar contains the following tools:<br>• **Add**: manually add an event source<br>• **Remove**: remove an event source<br>• **Edit**: Update attributes for an existing event source<br>• **Import / Export** menu: Displays a menu with the following options:<br>  • **Import**: Import event sources from a  Content Management Database (CMDB), spreadsheet, or other tool.<br>  • **Export**: Export selected event sources and their attributes in CSV format.<br>  • **Export Group**: Export the entire group that is currently selected. |
| 2 | Columnar display of attributes. You can choose which attributes to display. |
| 3 | Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing. |

| | |
|---|---|
| 4 | Navigation Tools:<br>At the bottom of the screen, there are items that help in navigating your group:<br>• **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group.<br>• **<<**, **<**, **>** and **>>**: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page.<br>• **Page Size**: use this selector to choose your page size.<br>• **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group. |

## Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

# Historical Graph for System Stats

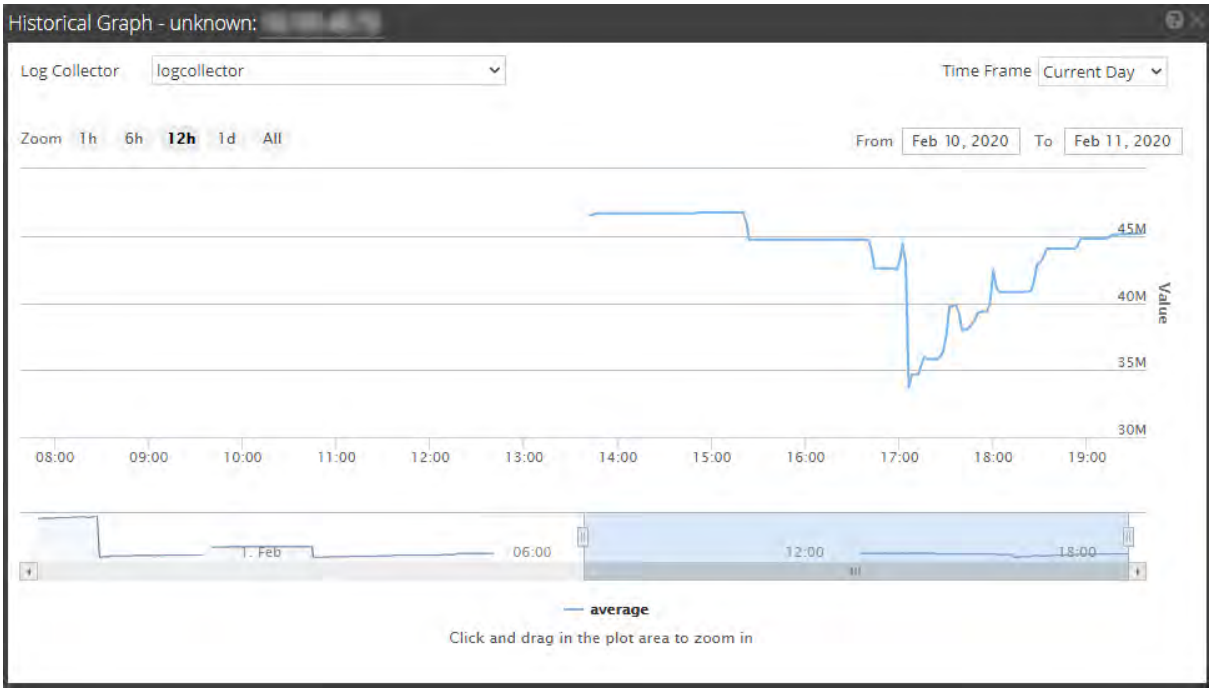
**Note:** The information in this topic applies to NetWitness Version 11.4.1 and later.

Historical system statistics are available for each event source.

### To access the Historical Graph for the System Stats:

1. Go to **(Admin) > Event Sources**.
   The Event Sources view is displayed.
2. Click the **Manage** tab.
   The Event Sources Manage tab is displayed.
3. In the **Historical Graph** column, select the view chart icon ( ) for any listed event source.
   The Historical graph for the selected event source is displayed. The figure displays event source

activity.



## Parameters

You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.

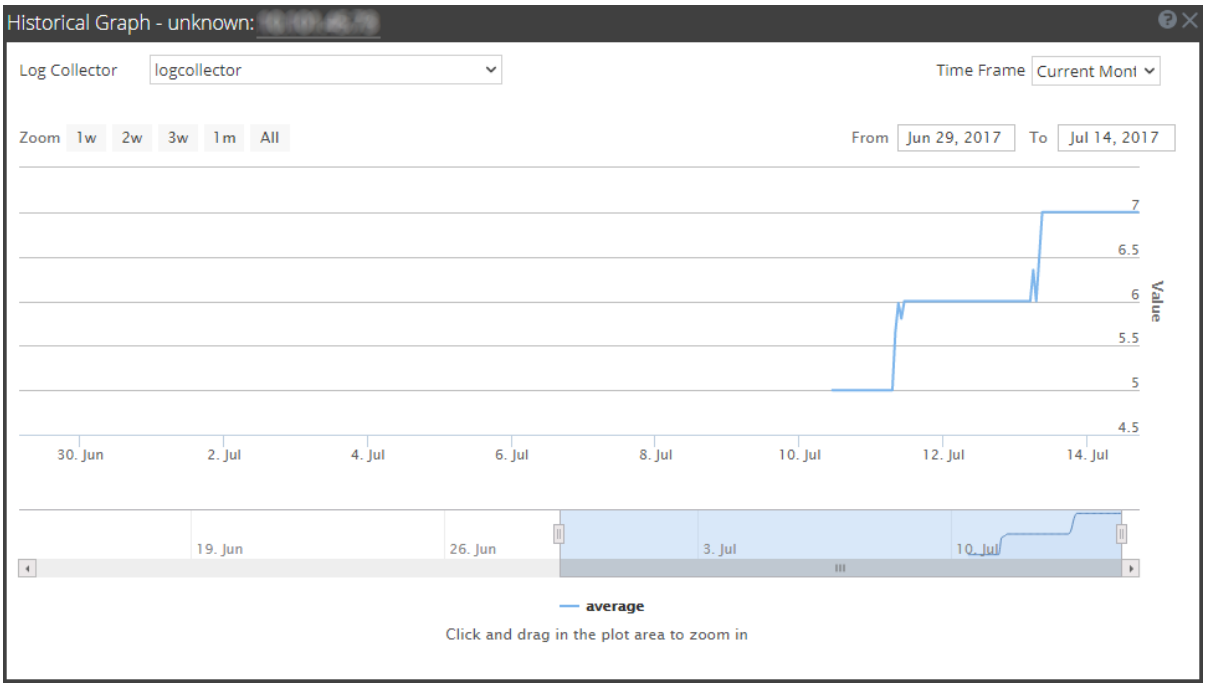
| Parameter | Description |
|---|---|
| Log Collector | Select the Log Collector for which you want to view historical data. In some cases, the historical data for an event source may be spread across multiple Log Collectors. |
| Time Frame | Select the time frame for which you want to view the historical data.<br>The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**. |
| From <date><br>To <date> | Select the date range for which you want to view the historical data. |

You can zoom in for a detailed view of the data in the Historical graph.

## Examples of Zooming In

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6 hour frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6 hour window.

Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.



You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.

# Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.

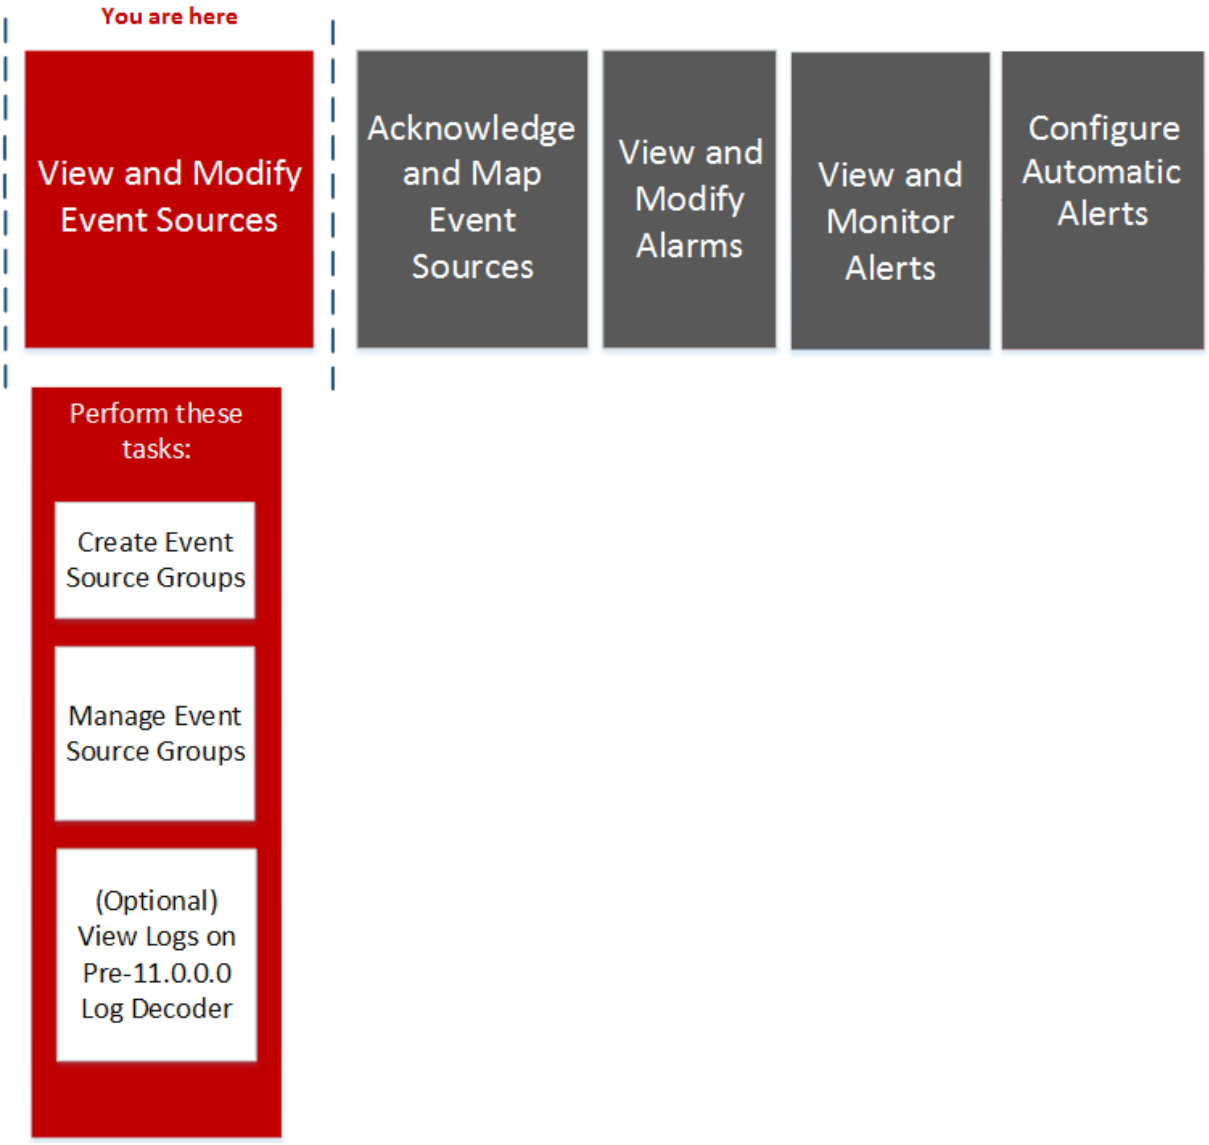
- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

## Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Create an event source group that contains all the high priority event sources. | Creating Event Source Groups |
| Administrator | Edit event source attributes. | Creating an Event Source and Editing Attributes |

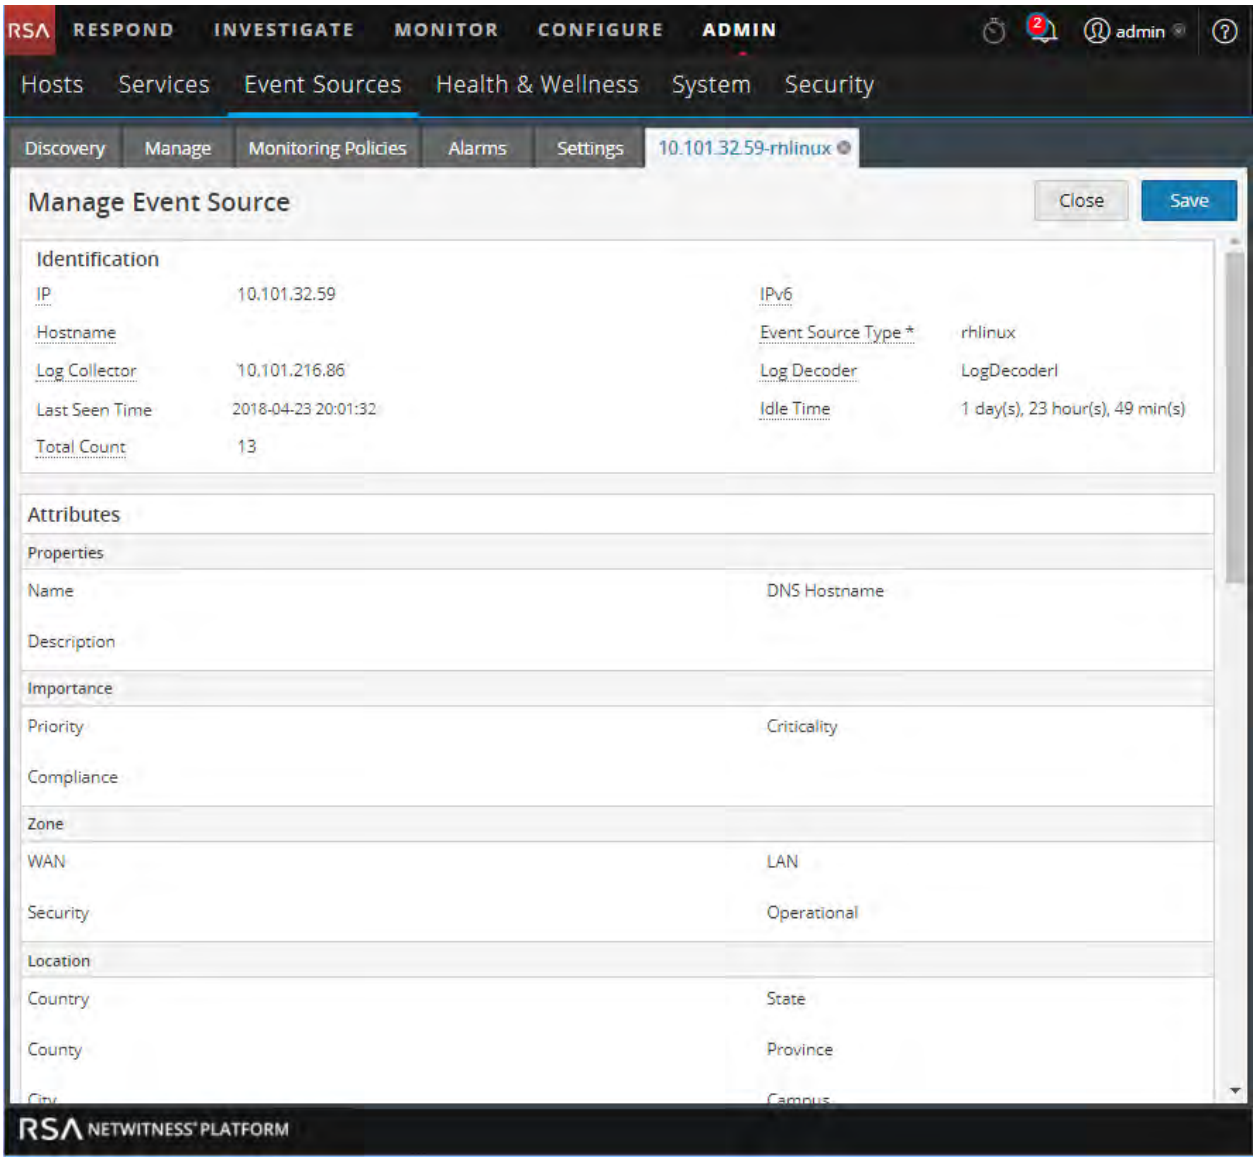
## Related Topics

Creating Event Source Groups

Creating an Event Source and Editing Attributes

## Quick Look

This is an example of the Event Source tab:



This table describes event source attribute categories.

| Attribute Section | Description |
|---|---|
| Identification | These attributes are the main attributes that collectively identify an event source.<br>You can only change these attributes when you are specifying the details for a new event source.<br>For an existing event source, the attributes in this section are auto-populated, and cannot be changed while on this screen.<br>Attributes available for a new event source:<br>• IP<br>• IPv6<br>• Hostname<br>• Event Source Type<br>• Log Collector<br>• Log Decoder<br>The following attributes are displayed when viewing the details for an existing event source:<br>• Last Seen Time: this is the last time there was communication between NetWitness and the event source<br>• Idle Time: this is the amount of time elapsed since the **Last Seen Time**. This time can be useful if you want to filter event sources that have been inactive for a certain duration.<br>• Total Count: total count of all event sources for this **Event Source Type**. |
| Properties | These attributes provide the name and description.<br>• Name<br>• DNS Hostname<br>• Description |
| Importance | These attributes can be used for grouping by priority.<br>• Priority<br>• Criticality<br>• Compliance |

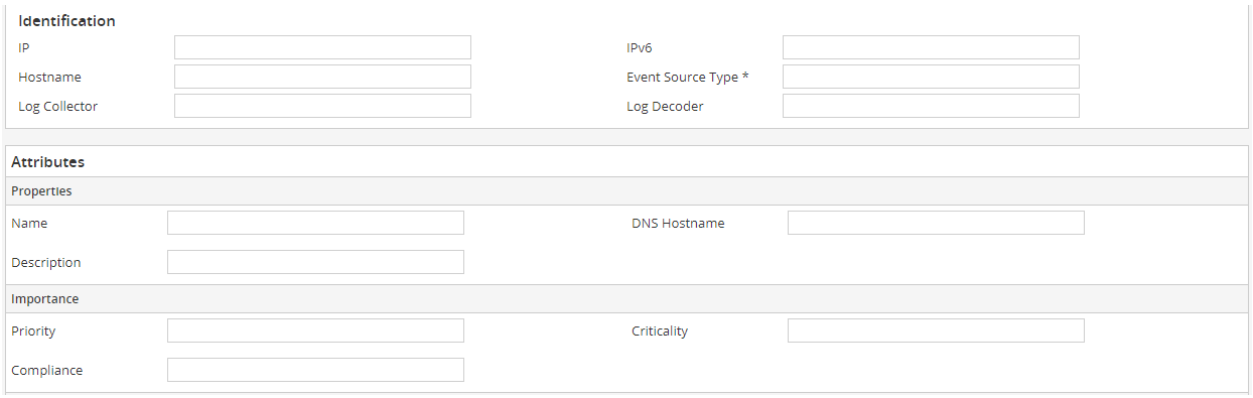
| Attribute Section | Description |
|---|---|
| Zone | These attributes can be used for grouping by zone.<br>• WAN (Wide Area Network)<br>• LAN (Local Area Network)<br>• Security<br>• Operational |
| Location | These attributes can be used to group by the physical or geographical location.<br>• Country<br>• State<br>• County<br>• Province<br>• City<br>• Campus<br>• Postal Code<br>• Building<br>• Floor<br>• Room |
| Organization | These attributes can be used to group by organization, and also to provide contact information.<br>• Company<br>• Division<br>• Business Unit<br>• Department<br>• Group<br>• Contact<br>• Contact Phone<br>• Contact Email |
| Owner | These attributes specify those responsible for the event source.<br>• Manager<br>• Primary Administrator<br>• Backup Administrator |

| Attribute Section | Description |
|---|---|
| Physical | These attributes specify the physical properties for the event source.<br>• Vendor<br>• Serial Number<br>• Asset Tag<br>• Voltage<br>• UPS Protected<br>• Rack Height<br>• Depth<br>• BTU Output<br>• Color |
| Function | These attributes can be used to group by function.<br>• Primary Role<br>• Sub Role 1<br>• Sub Role 2 |
| System Information | These attributes specify system information.<br>• Domain Name<br>• System Name<br>• Identifier<br>• System Description |
| Custom | This section provides eight custom attributes, for any other attributes that your organization might need. |

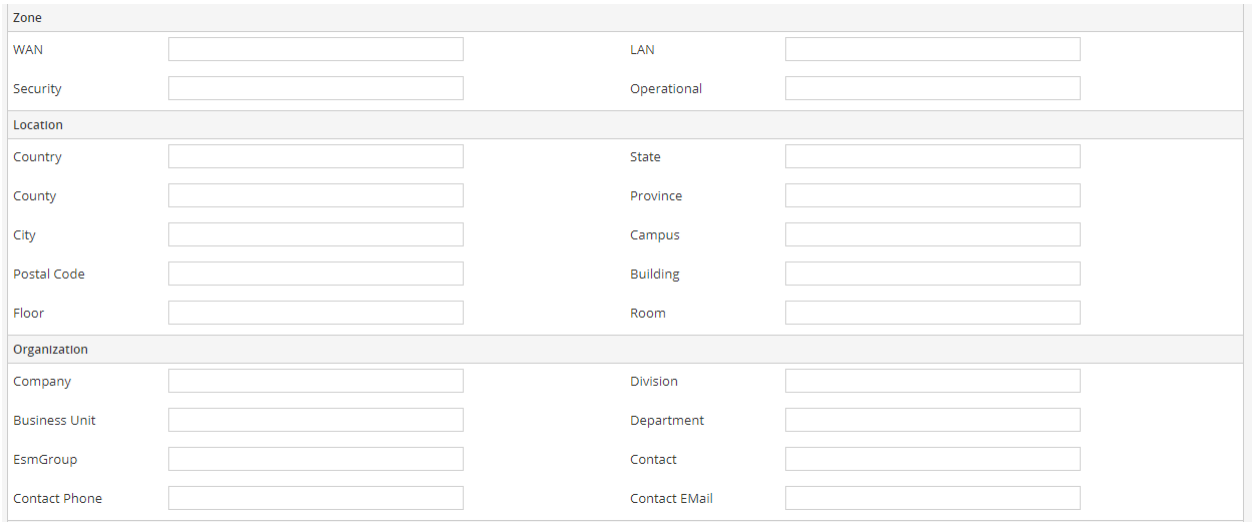
## Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.



This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



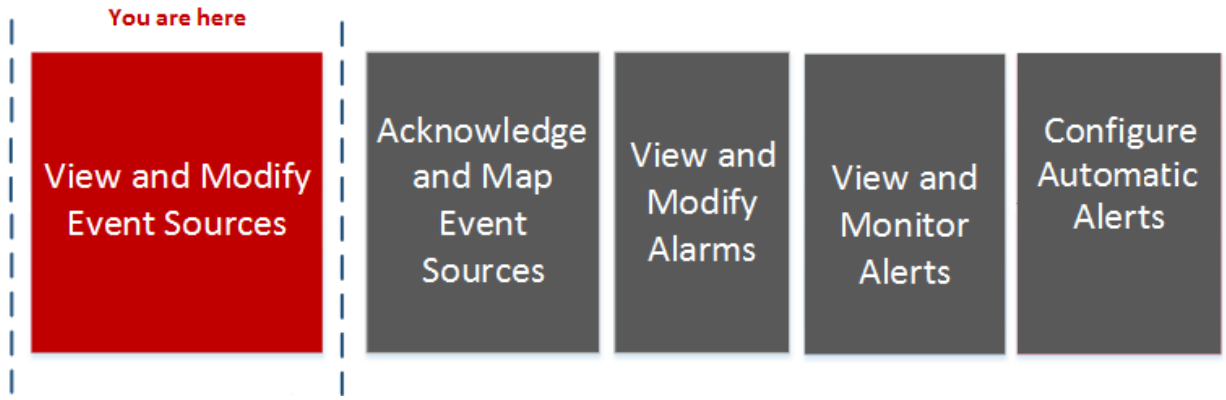
# Event Sources View

The Event Source Attributes panel has the following tabs.

To access this panel, go to **(Admin) > Event Sources**.

## Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Create an event source group. | Creating Event Source Groups |
| Administrator | Edit or delete an event source group. | Editing or Deleting Event Source Groups |
| Administrator | Edit event source attributes. | Creating an Event Source and Editing Attributes |

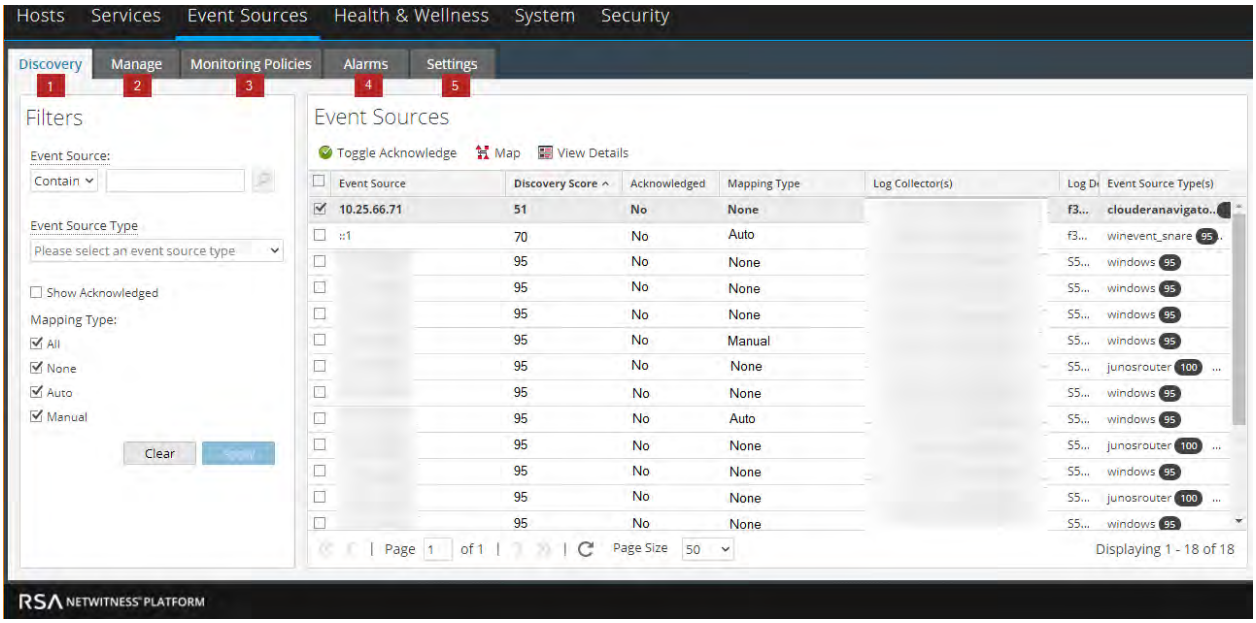
Creating Event Source Groups

Editing or Deleting Event Source Groups

Creating an Event Source and Editing Attributes

## Quick Look

The Event Sources view presents the details for Event Sources that are discovered, acknowledged, or mapped by NetWitness.



1 [Discovery Tab]

Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately.

2 [Manage Tab]

Use this tab to create, edit, and delete Event Source Groups. It presents a customizable, searchable view of all of your event sources and groups.

3 [Monitoring Policies Tab]

Use this tab to manage alert configuration for event sources.

4 [Alarms Tab]

Use this tab to see the details of the alarms that have been generated.

5 [Settings Tab]

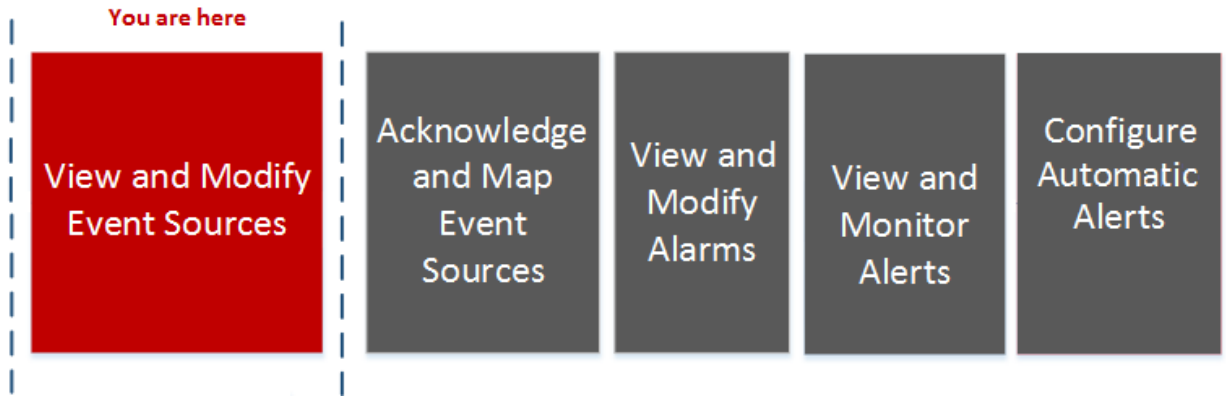
Use this tab to view or change the behavior for automatic (baseline) alerts.

# Create/Edit Group Form

This Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

## Workflow

This workflow shows the overall process for configuring event sources.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|

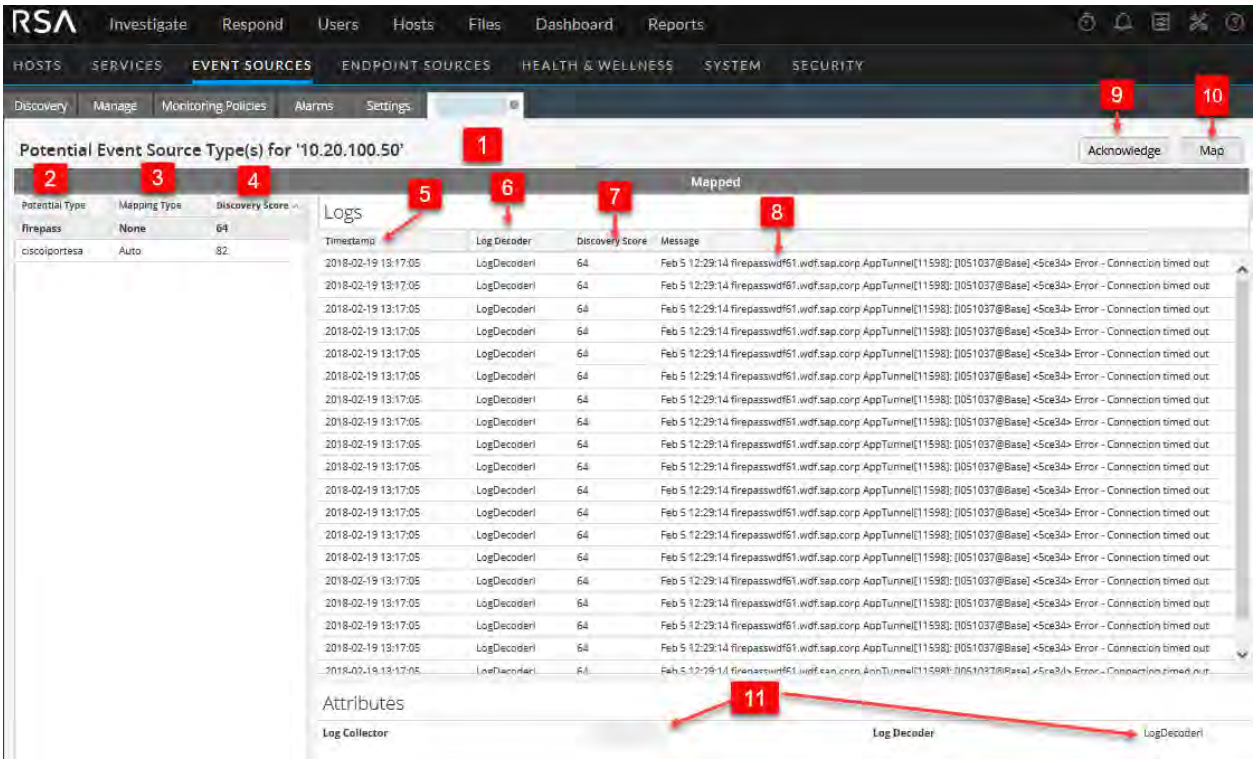
Viewing Logs from Pre-11.0 Log Decoder

## Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

**Note:** Device logs are only available for 11.0.0.0 and above Log Decoders.



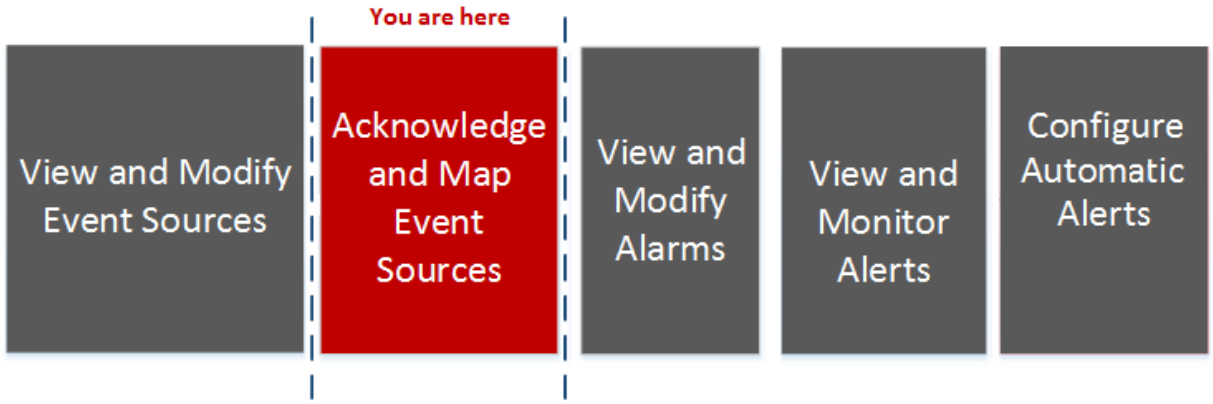
| | |
|---|---|
| 1 | Displays the address of the selected Event Source. |
| 2 | Displays the potential type of the selected Event Source. |
| 3 | Displays the selected Event Source Mapping Type as Auto-Mapped, Manually Mapped, or None. Any changes to the Event Source Mapping are only displayed here. |
| 4 | Displays the discovery score for the selected Event Source type from least confident (0) to most confident (100). |
| 5 | Displays timestamps for the last few logs that have been parsed to the selected Event Source Type. |
| 6 | Displays the address of the Log Decoder that is parsing event sources. |
| 7 | Displays the discovery score of the corresponding log. |
| 8 | Displays logs for the selected Event Source type. |
| 9 | Allows you to acknowledge that all the discovered Event Source types are correct. |
| 10 | Allows you to set the appropriate parsers for selected Event Source addresses. |
| 11 | Displays the Event Source Management attributes for the selected Event Source Type. |

# Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

## Workflow

This workflow shows the overall process for configuring event sources.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | View and modify event sources. | Managing Event Source Groups |
| Administrator | Acknowledge and map events sources. | Acknowledging and Mapping Event Sources |
| Administrator | *Add and configure parser mappings for a Log Decoder | Manually Map Event Source Types |
| Administrator | View event source alarms. | Viewing Event Source Alarms |

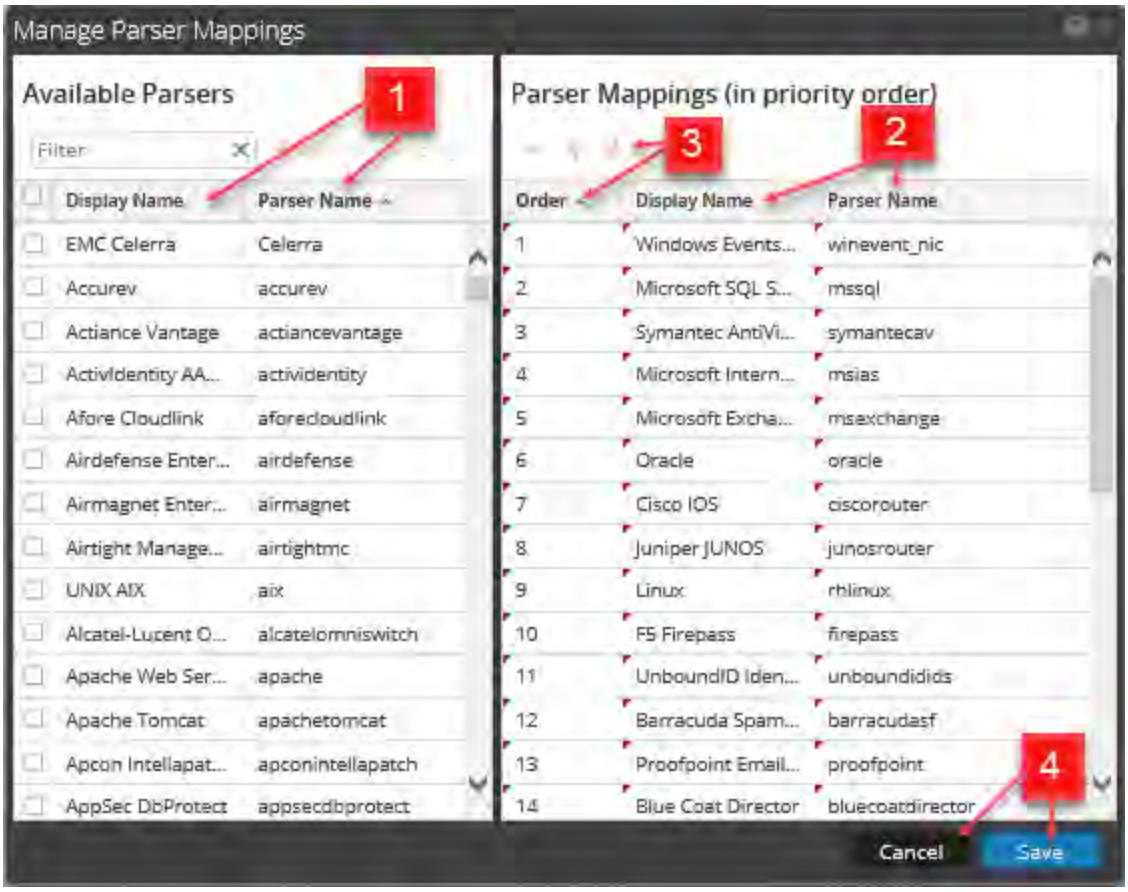
*You can perform this task here.

## Related Topics

Viewing Logs from Pre-11.0 Log Decoder

## Quick Look



**Note:** For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

| | |
|---|---|
| 1 | Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered.<br>To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel.<br>You need to select parsers before the **Add toMapping** button is enabled.<br>Add the selected parser by clicking the **Add to Mapping** button in the right panel.<br>You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key. |
| 2 | Displays the names of the selected parsers that you want to map. |
| 3 | Displays the order of the selected parser mappings.<br>You can delete parser mappings by selecting the minus sign ( − ).<br>Press the **Ctrl** key to select multiple mappings to perform group operations on them. |

4 Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner on the **Details** tab is updated to reflect the status. If mapped, the text displayed is **Mapped**.
Click **Cancel** to return to the **Details** tab.

## Best Practices

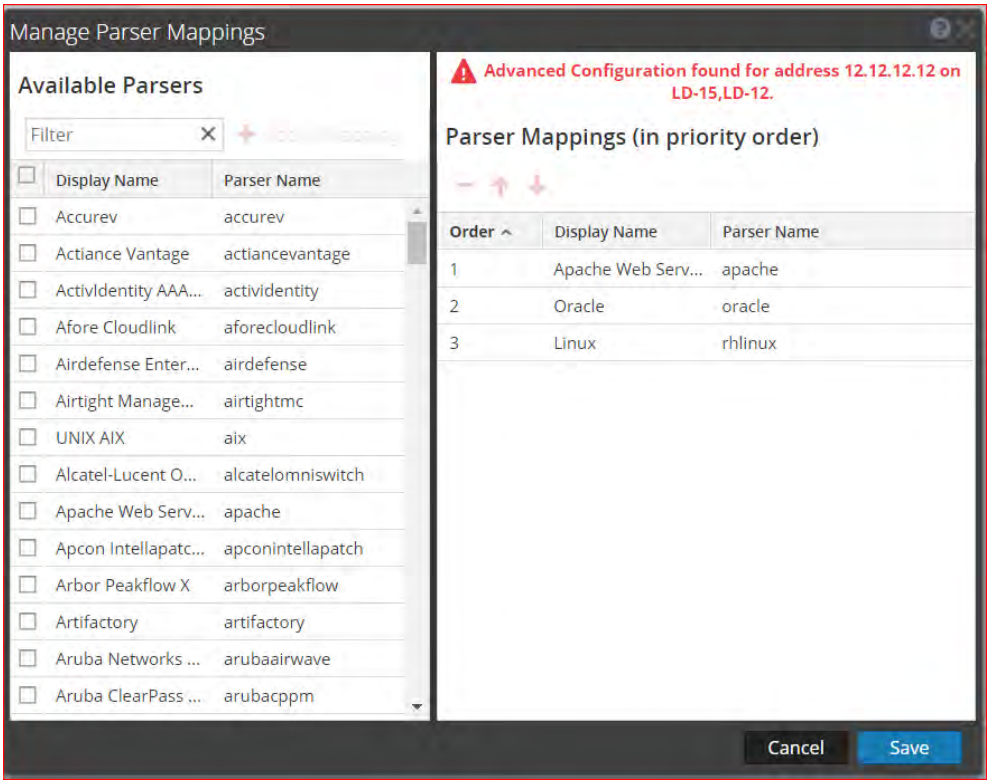
When mapping multiple device types from the same event source, assign the highest priority to the strictest log parser. Conversely, a log parser with generic headers should be lowest in priority. The CEF log parser is an example of a strict log parser.

## Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

**Note:** If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.



# Alarms Tab

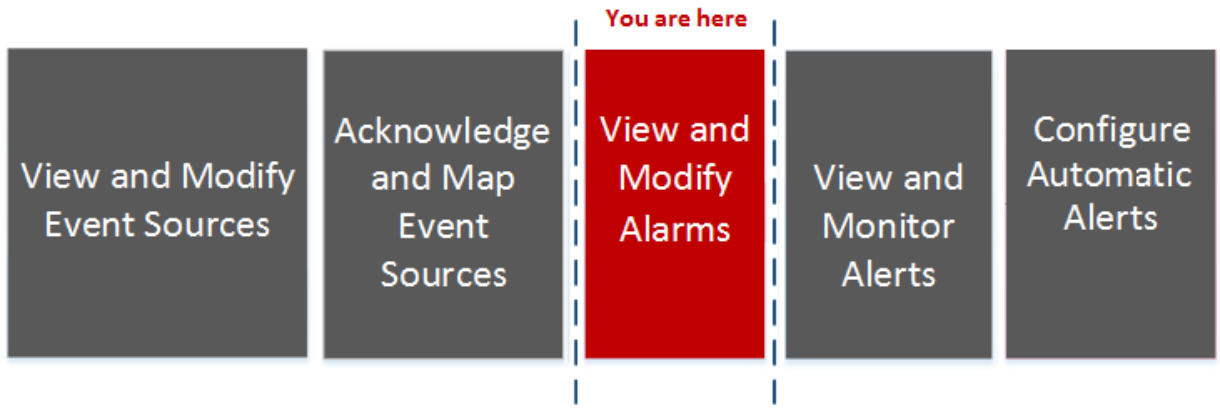
From the Alarms tab you can view details of the alarms that have been generated.

The Alarms tab has one panel that displays Alarm status.

To access this tab, go to (Admin) > **Event Sources** > **Alarms**.

## Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | View and modify event sources. | Managing Event Source Groups |
| Administrator | Acknowledge and map events sources. | Acknowledging and Mapping Event Sources |
| Administrator | Add and configure parser mappings for a Log Decoder | Manage Parser Mappings |
| Administrator | *View event source alarms. | Viewing Event Source Alarms |

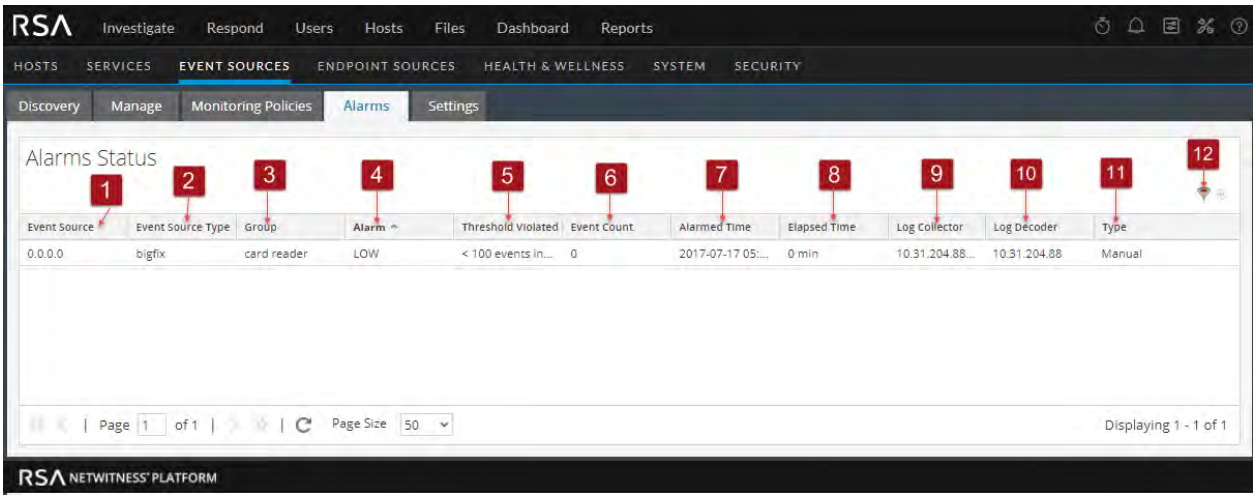
*You can perform this task here.

## Related Topics

Configuring Automatic Alerting

## Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. After the event source returns to a normal state, the corresponding alarm disappears from the list.



| | |
|---|---|
| 1 | Displays the IP, IPv6, or Hostname of the event source that is alarmed. |
| 2 | Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux). |
| 3 | Displays the event source group that contains the event source for which the alarm has been triggered. |
| 4 | Displays the type of threshold that was triggered: **High** or **Low** |
| 5 | Displays the conditions of the threshold that was triggered. For example:<br>`5,000,000 events in 5 minutes` |
| 6 | Displays the number of events in the threshold time period causing the alarm. |
| 7 | Displays the initial time the event source went into an alarmed state.<br>**Note:** When you first access this view, the data is sorted by this column (most recent alarm first). |
| 8 | Displays the elapsed time since the event source entered an alarmed state. |
| 9 | Displays the Log Collector last collecting from this event source. |
| 10 | Displays the Log Decoder last receiving from this event source. |
| 11 | Displays the alarm type. Alarm type is either **Manual** or **Automatic**:<br>• **Manual**: these are alarms that violate the configured threshold policy.<br>• **Automatic**: these are alarms that deviate from the baseline for the alarmed event source. |
| 12 | Select the **Filter** icon to display the **Filter** menu:<br>  <br><br>Select either **Automatic** or **Manual**:<br>• If you select **Automatic**, only the alerts that are based on baselines are displayed. |

- If you select **Manual**, only the alarms for which you have set thresholds are displayed.

**Note:** You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.

# Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to (Admin) > **Event Sources** > **Monitoring Policies**.

## Workflow

This workflow shows the overall process for configuring event sources.

## Related Topics

Setting Up Notifications

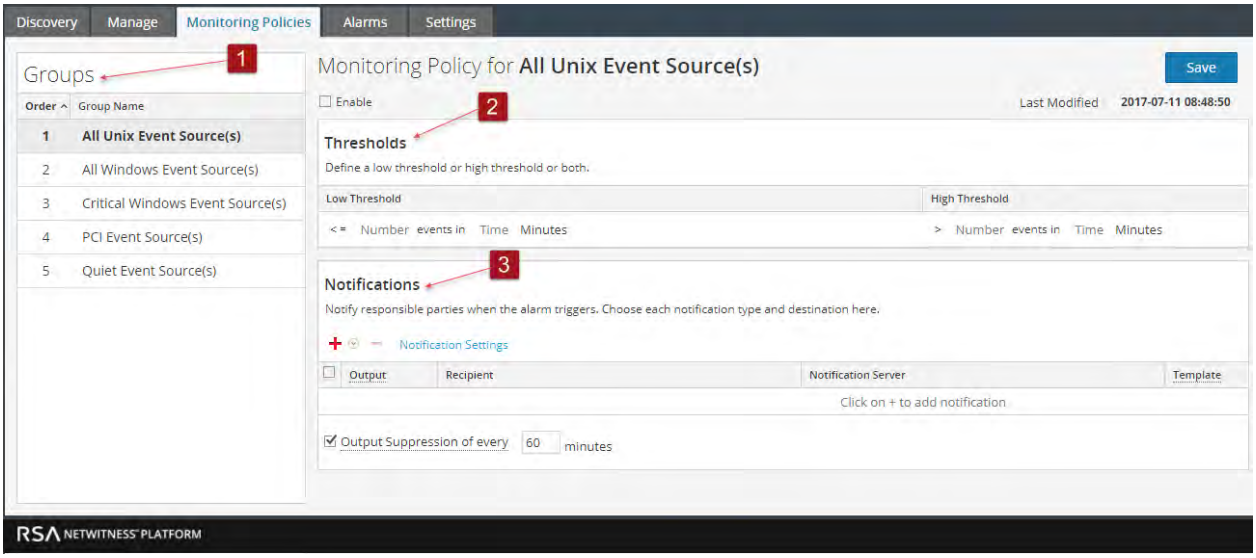
Disabling Notifications

## Quick Look

The **Monitoring Policies** tab consists of three panels:

- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.



1 Displays the Groups panel.
2 Displays the Thresholds panel.
3 Displays the Notifications panel.

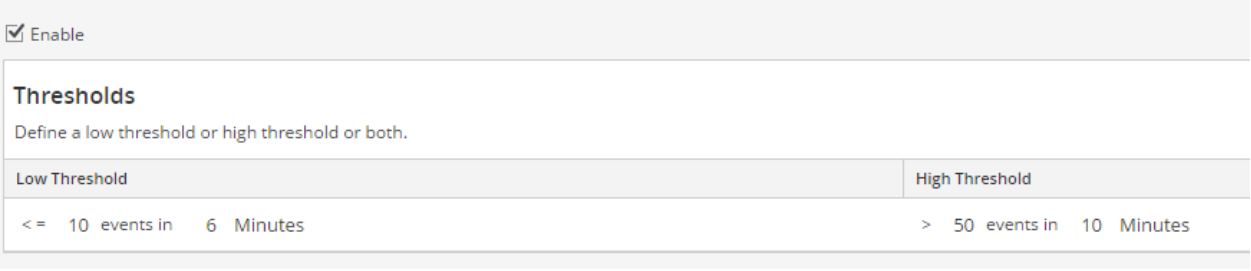
## Event Groups Panel

The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

## Thresholds Panel

This is an example of the Thresholds panel for an event source group.

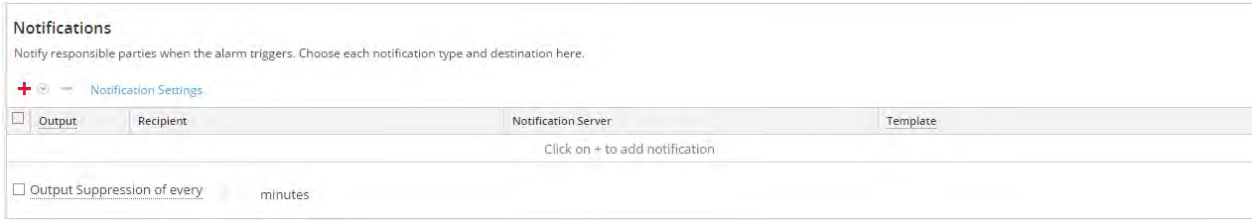


The Thresholds Panel contains the following features.

| Feature | Description |
|---|---|
| Enable | The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring.<br><br>**Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy.<br><br>If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications.<br><br>See below for more details on the look of notifications. |
| Low number of events<br><br>Low number of minutes or hours | This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent. |
| High number of events<br><br>High number of minutes or hours | Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent. |
| Last Modified date and time | This field indicates the last time and date that the thresholds were changed. |
| Save | Saves the changes you have made to the thresholds. |

## Notifications Panel

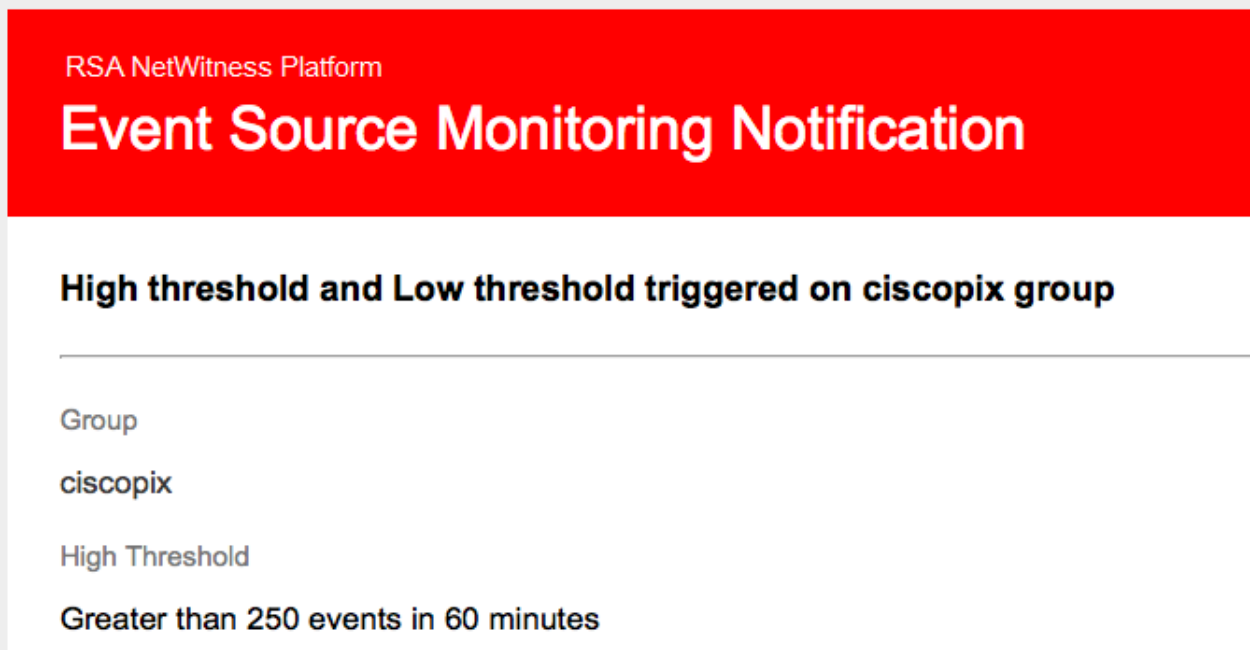
This is an example of the Notifications panel for an event source group.



The following table describes the fields on the Notifications panel

| Field | Description |
|---|---|
| Tools<br>+ - | The following items are available on the toolbar:<br>• **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification<br>• **Remove (-)**: removes the selected row from the list. |
| Notification Settings | Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness. |
| Type | Displays the type of the notification that you have chosen. The available options are as follows:<br>• Email<br>• SNMP<br>• Syslog |
| Notification | See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details. |
| Notification Server | See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details |
| Template | For Event Source Management, RSA provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization:<br>• **Email template**: sends notifications to the specified email addresses.<br>• **SNMP template**: sends notifications to the specified SNMP server<br>• **Syslog** template: sends notifications to the specified Syslog server.<br>See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details. |
| Output Suppression | Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time. |

The following are sample notifications, based on the supplied Templates.



- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```
11-11-2015 11:57:33 Local7.Debug 127.0.0.1 community=public,
enterprise=1.3.6.1.4.1.36807.1.20.1, uptime=104313, agent_
ip=10.251.37.92, version=Ver2, 1.3.6.1.4.1.36807.1.20.1="NetWitness

## Related Topics

Automatic Alerting

Disabling Notifications

## Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

# About Automatic Alerting

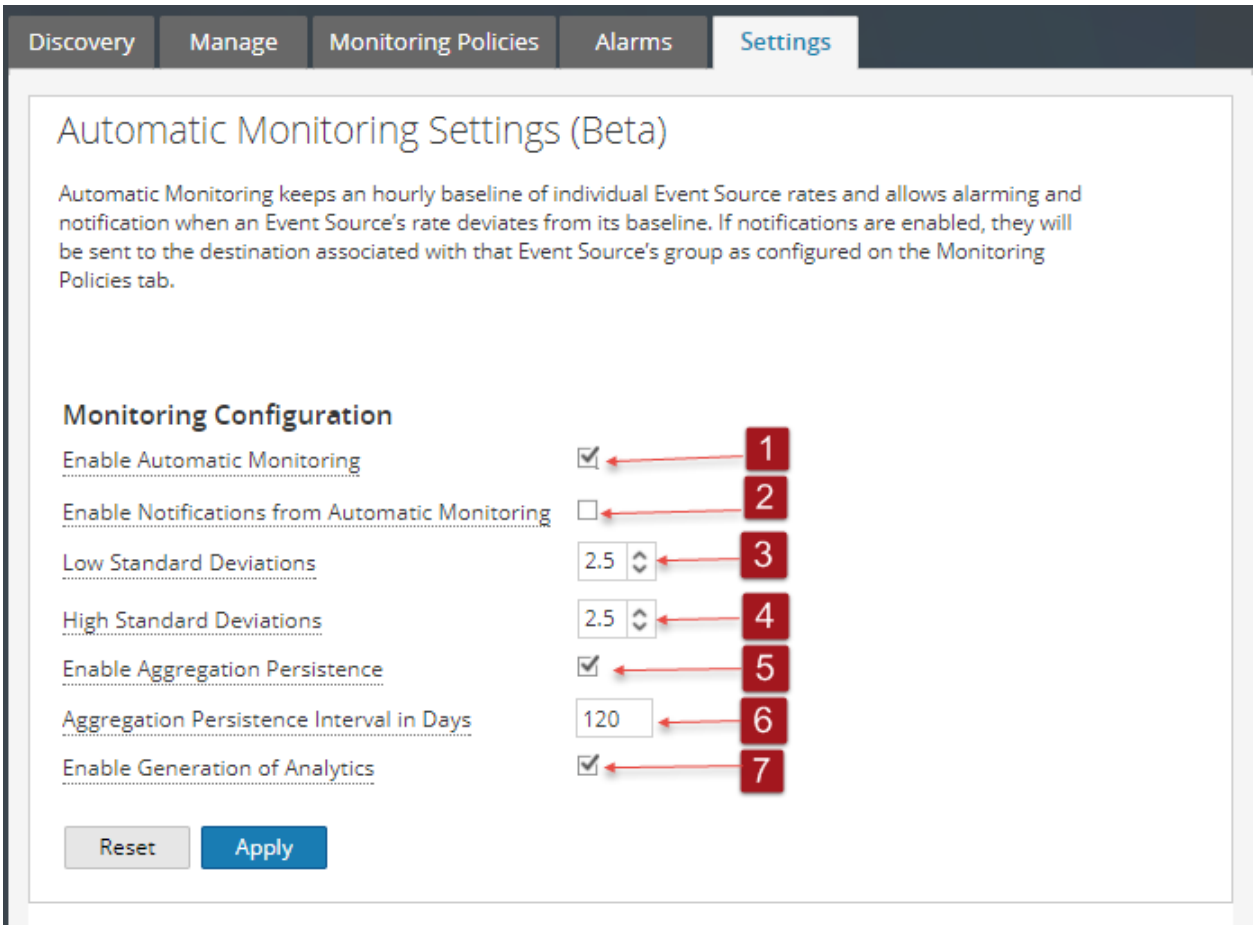
You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

**Note:** Automatic alerting, and it settings, are currently in Beta testing.



| | |
|---|---|
| 1 | Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on) |
| 2 | Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered) |
| 3 | The standard deviations below which to receive alerts. Default is **2.5** (95% confidence) |
| 4 | The standard deviations above which to receive alerts. Default is **2.5** (95% confidence) |
| 5 | When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source.<br>• **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source.<br>• **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source |
| 6 | Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source |
| 7 | When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**.<br>The data retained includes baseline value over time and the alerting history for each event source. |

Note, however, the event source address and type is anonymized, so only your event rate information is revealed.

Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

8 The **Reset** option discards any unsaved changes for all settings on the page.

9 Click **Apply** to save any changes you made to the values on the page.

## Features

The Settings tab contains the following features.

| Feature | Description |
|---|---|
| **Enable Automatic Monitoring** | Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on) |
| **Enable Notifications From Automatic Monitoring** | Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered) |
| **Low Standard Deviations** | The standard deviations below which to receive alerts. Default is **2.5** (95% confidence) |
| **High Standard Deviations** | The standard deviations above which to receive alerts. Default is **2.5** (95% confidence) |
| **Enable Aggregation Persistence** | When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source.<br>• Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source.<br>• Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source |
| **Aggregation Persistence Interval in Days** | Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source |

| Feature | Description |
|---|---|
| **Enable Generation of Analytics** | When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**.<br>The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed.<br>Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality |
| **Reset** | This option discards any unsaved changes for all settings on the page. |
| **Apply** | Click **Apply** to save any changes you made to the values on the page. |

# ESM Troubleshooting & Appendix

Troubleshooting Topics:

- Alarms and Notifications Issues
- Duplicate Log Messages
- Troubleshooting Feeds
- Import File Issues
- Negative Policy Numbering

Appendix: Viewing Logs from Pre-11.0 Log Decoder

## Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

### Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

#### Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Settings** tab ( (Admin) > Event Sources > Settings), and is selected by default. However, at some point someone may have cleared this option.

#### Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

### Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs.

Much of the preliminary configuration for Notifications is done from **(Admin) > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

### Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to (Admin) **> Event Sources > Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

### Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

# Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

## Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely because it
exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

## Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.
   b. Click **decoder(*)** to view the properties for the decoder.
   c. In the Properties drop-down menu, select **reset**, then click **Send**.
4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.
5. Start the collectd service:
   ```
   service collectd start
   ```

# Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

## Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

## How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness.

After the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

After the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

**Note:** If the event source type attribute changes when the feed is updated, NetWitness adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

## Feed File

The format of the feed file is as follows:

`DeviceAddress, Forwarder, DeviceType, GroupName`

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

## Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

### 10.5 Log Decoders

Are your NetWitness Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

### Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

### Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

`http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain`

This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4 count=338
lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-Feb-04
22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304 source=5.6.7.8
count=1301 lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-
Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

## Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

## SMS Log File

Check the SMS log file in the following location to view informational and error messages:
`/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed:
Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have
al-least on group with at least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip
archive "/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not
be opened
Unable to push the ESM Feed: <reason>
```

## Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

**ESMReader**

1. On Log Decoders add **debug "true"** flag in in **/etc/collectd.d/logdecoder-esm.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

   ```
   tail –f /var/log/messages | grep collectd
   ```

   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

   ```
   Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
   error getting ESM data for field "groups" from logstat device=checkpointfw1
   forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
   NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting
   ESM data for field "forwarder" from logstat device=apachetomcat
   source=10.31.204.240. Reason: <reason>
   ```

**ESMAggregator**

1. On NetWitness, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

   ```
   # ESMAggregator module collectd.conf configuration file
   #
   # Copyright (c) 2014 RSA The Security Divsion of EMC
   #
   <Plugin generic_cpp>
   PluginModulePath "/usr/lib64/collectd"
   <Module "ESMAggregator">
           verbose 1
           interval "60"
           cache_save_interval "600"
           persistence_dir "/var/lib/netwitness/collectd"
   </Module>
   </Plugin>
   ```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run “tail –f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[1]

Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[3]
logdecoders = 767354a8-5e84-4317-bc6a-52e4f4d8bfff
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[4]
utcLastUpdate = 1425174470
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: Dispatching
RRD stat NWAPPLIANCE15788/esma_rrd-cacheflowelff/esm_counter-3.3.3.3 with a
value of 1752 for NWAPPLIANCE15788/cacheflowelff/esm_counter-3.3.3.3
aggregated from 1 log
```

## Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

### To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

# Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

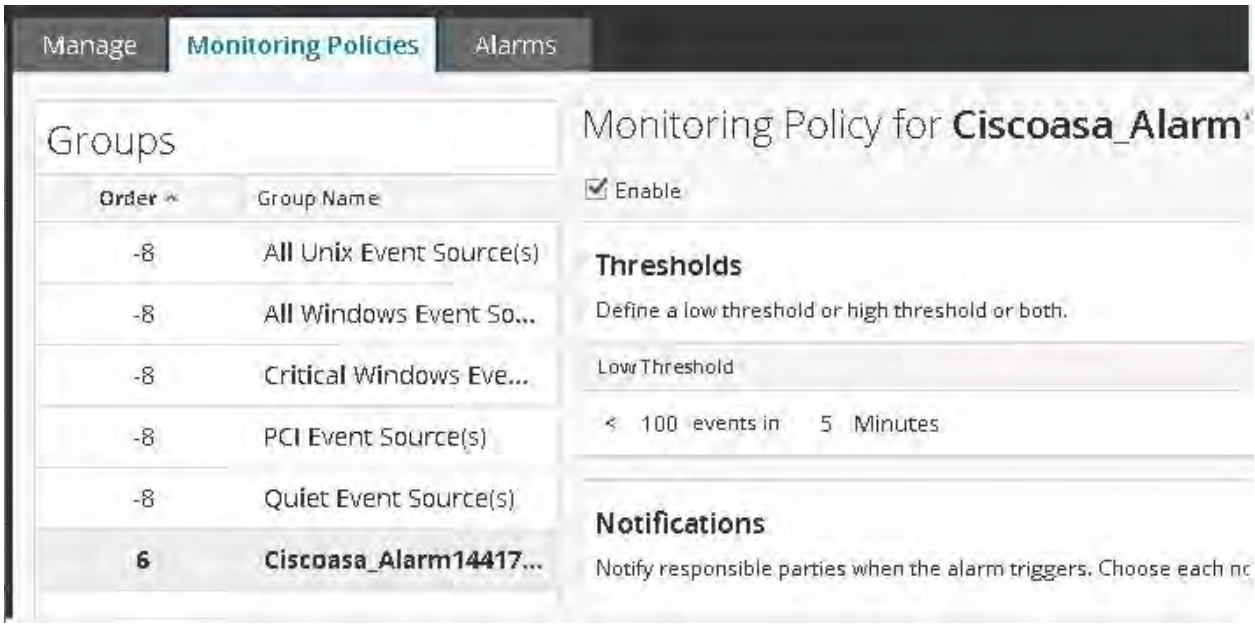
- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

# Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

## Details

The following screen shows an example of the situation where the numbers of group policies become negative.



If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

## Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`

   b. Click **decoder(*)** to view the properties for the decoder.

   c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

# Viewing Logs from Pre-11.0 Log Decoder

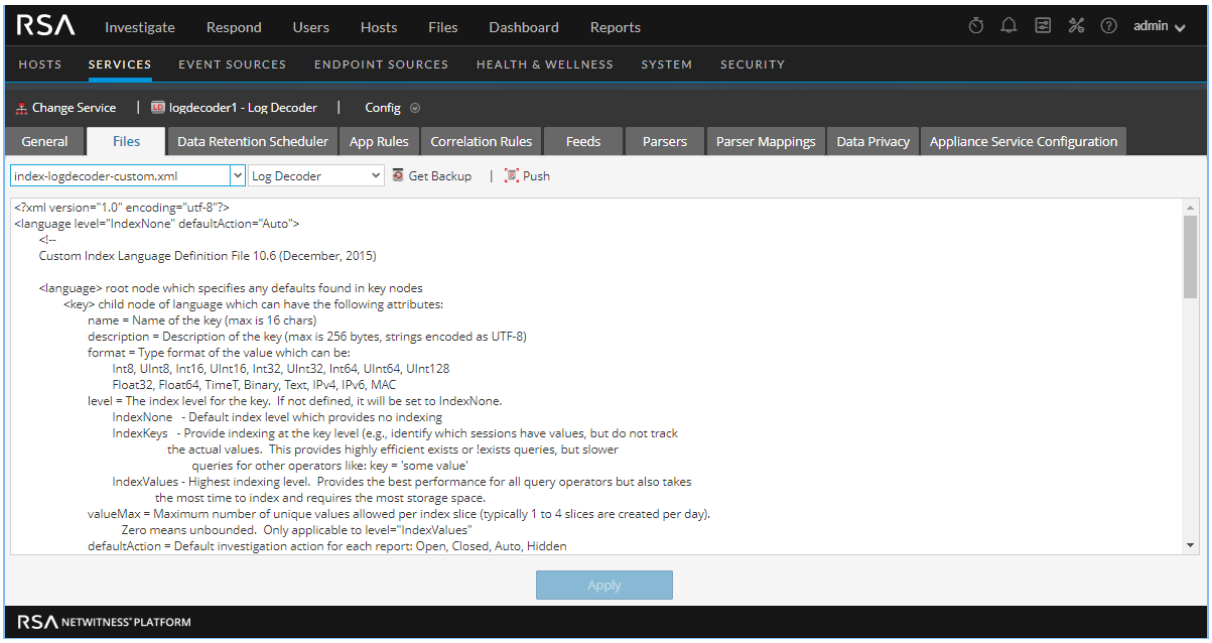
NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to **(Admin) > Services >** select a Log Decoder, then select **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

   ```
   <key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device Host" level="IndexValues" name="device.host" format="Text"
   valueMax="100000" defaultAction="Open"/>
   ```

4. Click **Apply**.



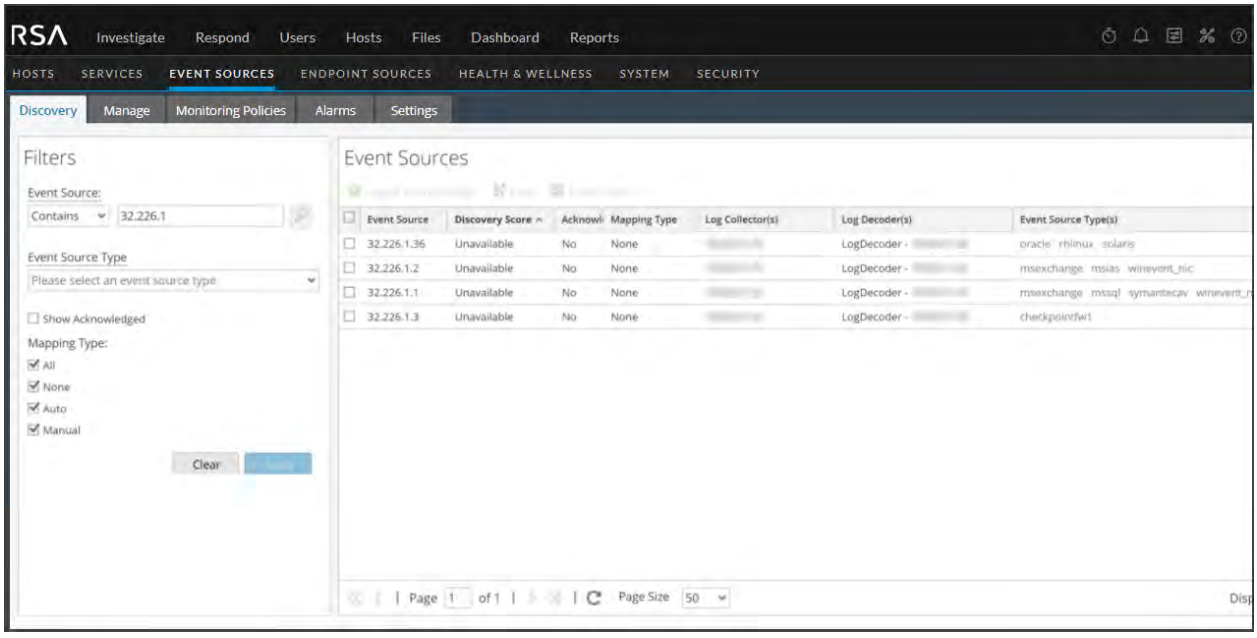
5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.

**Note:** Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



**Note:** Device logs are only available for 11.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0 Log Decoder.

# Google Cloud Platform Installation Overview

**Note:** Google Cloud Platform is supported from version 11.4 and later.

Google Cloud Platform (GCP) instances have the same functionality as the NetWitness hardware and virtual hosts. RSA recommends that you perform the following tasks when you set up your GCP environment.

Before you can deploy NetWitness in GCP, you need to:

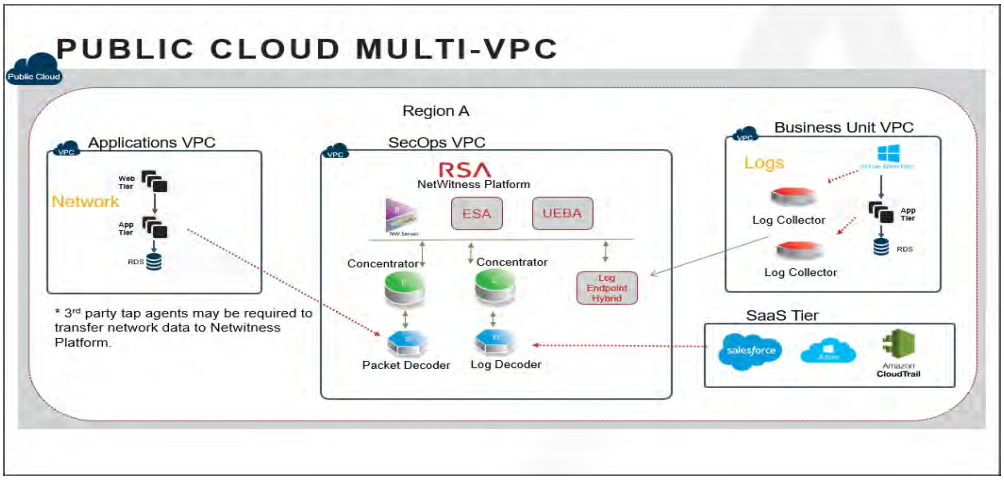
- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for RSA NetWitness® Platform 11.x.
- Make sure that you have a NetWitness Throughput license.

# GCP Deployment Scenarios

The following diagrams illustrate some common GCP deployment scenarios.

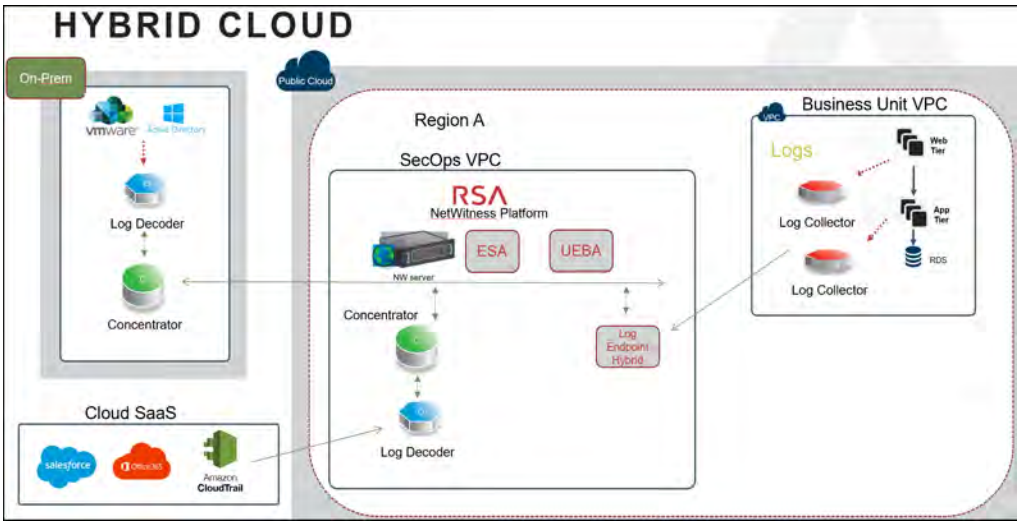
## NetWitness Full Stack VPC Visibility

This diagram shows all NetWitness components (full stack) deployed in GCP.



## Hybrid Deployment

This diagram shows the Log Decoder and Concentrator deployed in GCP with all other NetWitness components deployed on premises.



# GCP Deployment

This topic contains the rules and high-level tasks you must follow to deploy NetWitness components in the GCP.

## Checklist

| Step | Description |
|---|---|
| 1 | Prerequisites |
| 2 | Find NetWitness Platform GCP Images |
| 3 | Establish gcloud Environment |
| 4 | Create an Instance using Google Cloud SDK Shell |
| 5 | Installation Tasks |
| 6 | Configure Hosts (Instances) in NetWitness Platform |

## Prerequisites

You need the following items before you begin the integration process:

- Access to GCP console.
- Google Cloud SDK Toolkit installed.
- Network routability (and proper GCP firewall rules) for the instances to transfer data to the NetWitness.

## Find NetWitness Platform GCP Images

There are two types of NetWitness GCP images. The following description guides you on which image is appropriate for your deployment.

- **Lite Image**: rsa-nw-11-7-0-0-17934-lite
  If you have an active NW Server or NetWitness software repository, use the Lite image. This image has a small footprint and does not contain the NetWitness software packages. When you set up NetWitness using the Lite image, it will require the IP address of the NW Server or NetWitness software repository. This image is available publicly, and you can deploy it without needing to contact RSA Support.
- **Full Image**: rsa-nw-11-7-0-0-17934-full
  For fresh or new deployments, where an NW Server is deployed for the first time, use the Full image. This image contains the entire NetWitness software library and other files required to complete the

installation.
To get access to the Full image, open an NetWitness Customer Support case (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to get granted the proper image permissions.

**Note:** For more information on GCP image deployment, see the blog post Running RSA NetWitness in Google Cloud.

## Establish gcloud Environment

1. Download and install the Google Cloud SDK Toolkit (https://cloud.google.com/sdk).
2. Run the following gcloud commands to log in and set the proper project:

```
gcloud auth login
gcloud config set project <project name>
```

## Create an Instance using Google Cloud SDK Shell

1. Determine what machine type is appropriate for selection. For more information, see GCP Instance Configuration Recommendations.
2. Using the image names listed under Find NetWitness Platform GCP Images, create a GCP Instance by running the command:

```
gcloud compute instances create <instance name> --image <netwitness image name> --image-project <rsa project> --machine-type <machine type> --zone <gcp zone> --network <gcp project network> --subnet <gcp project subnet> --no-address
```

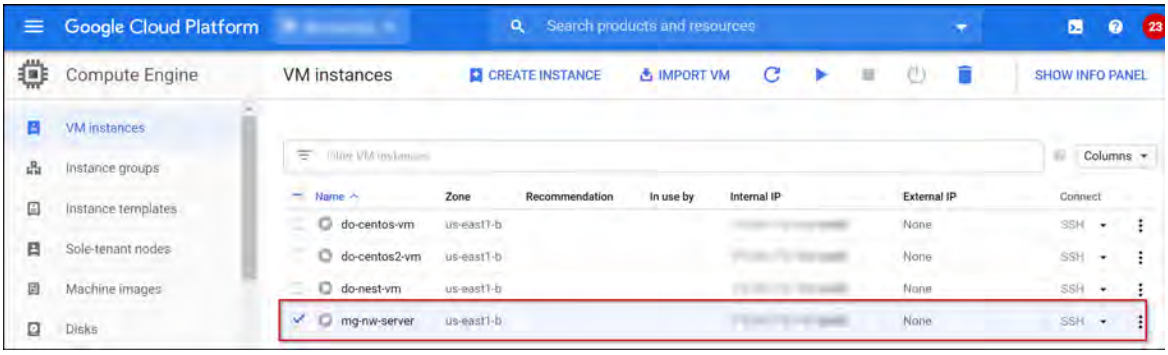
For example:

```
gcloud compute instances create nw-server --image rsa-nw-11-7-0-0-17934-full --image-project gcp-nw-prod-images --machine-type n1-standard-8 --zone us-west1-c --network rsa-network --subnet rsa-subnet --no-address
```

**Note:**
- The network and subnet values may vary based on the setup.
- The simple example is shown above, but there are many other options available. For more information, see the Quickstart: Creating a New Instance Using the Command Line section in the GCP documentation.

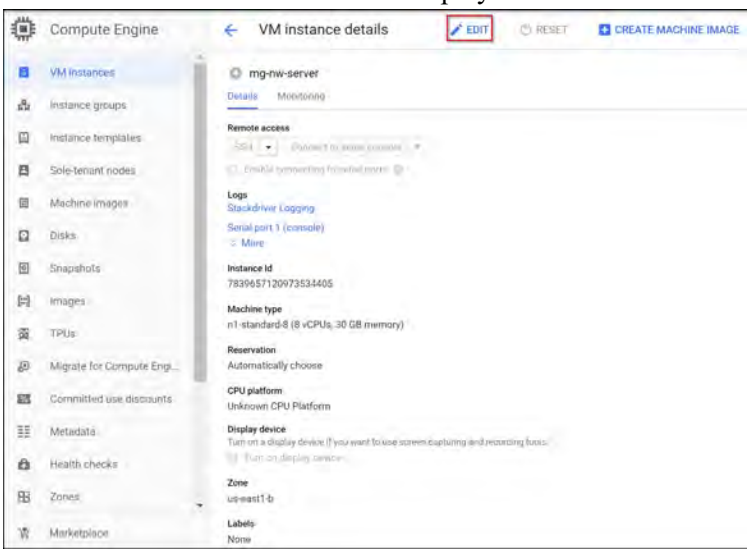
3. To modify the machine type, region, zone, or other configurations:
   a. Go to **Google Cloud Platform > Compute Engine > VM Instance** view to find the VM Instance.

b. Select the instance and click STOP.



c. Click the Instance name (**mg-nw-server**).

d. Click EDIT to modify the settings according to your preference and click **Save**.
The **VM instance details** view is displayed.



e. SSH to the newly-created instance using the default NetWitness credentials.

## Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the Network Architecture and Ports topic in the *Deployment Guide for RSA NetWitness Platform.*

**Caution:** Do not proceed with the installation until the ports on your firewall are configured.

## Tasks - Install 11.7.0.0 on the NetWitness Server (NW Server) Host and Component Hosts

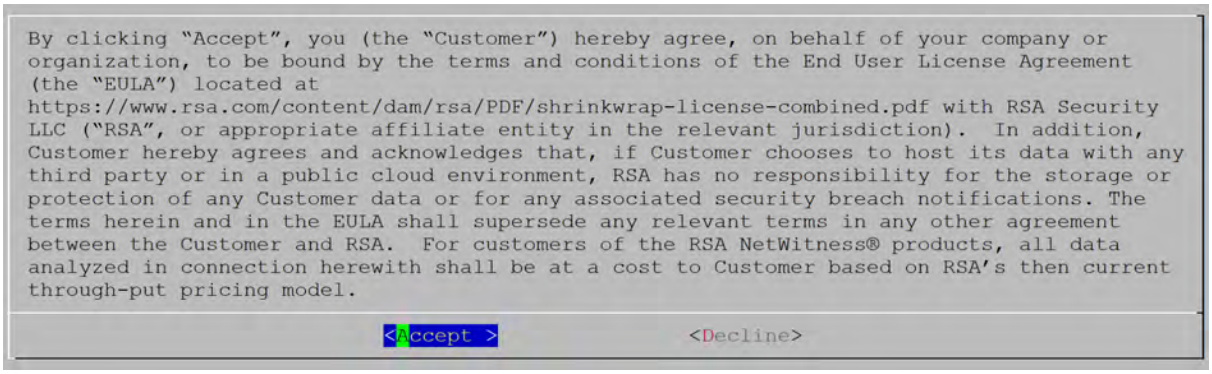
Complete the following steps to install 11.7 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

**Caution:** If you want to install the Endpoint Relay Server, do not run the nwsetup-tui script. Follow the instructions in (Optional) Installing and Configuring Relay Server in the *NetWitness Endpoint Configuration Guide for RSA NetWitness Platform Guide*.

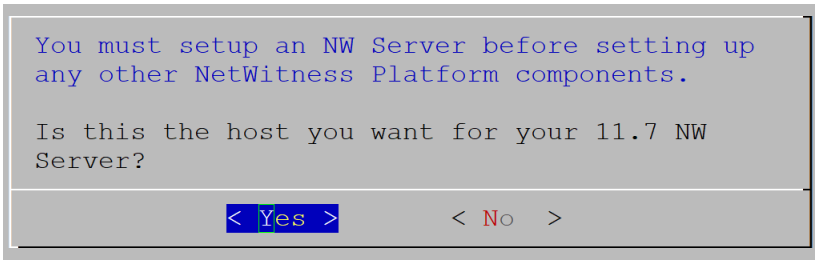
1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host. This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   **Note:** Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 11.7" in the "Post Installation Tasks" section in this guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 10 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.



3. Tab to **Yes** and press **Enter** to install NW Server.
   Tab to **No** and press **Enter** to install Component Hosts.

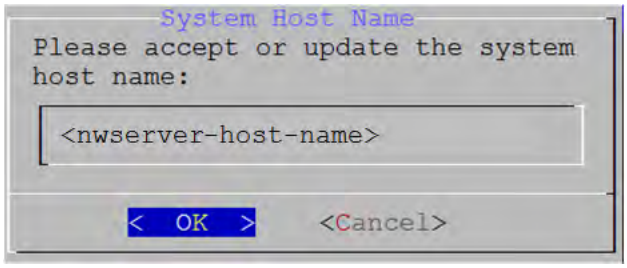
   **Caution:** If you choose the wrong host for the NW Server and complete the setup, you must restart the setup program (step 2) and complete all the subsequent steps to correct this error.

4. The **Install** or **Recover** prompt is displayed.
   **NetWitness Server Host prompt**

   **Component Hosts prompt**

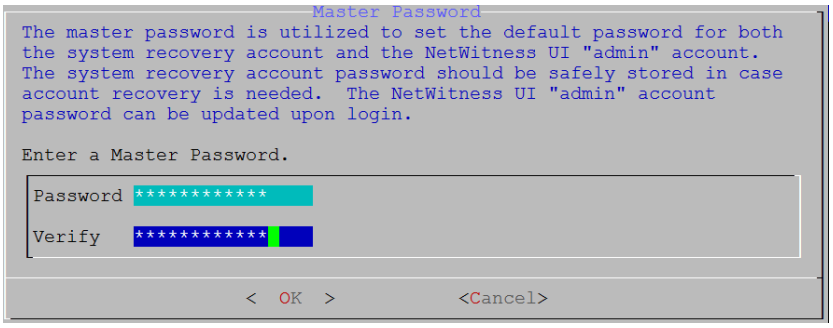
   Press **Enter**. By default, the **Install (Fresh Install)** option is selected.

5. The **System Host Name** prompt is displayed.



Press **Enter** if you want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. The **Master Password prompt** is displayed.



Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

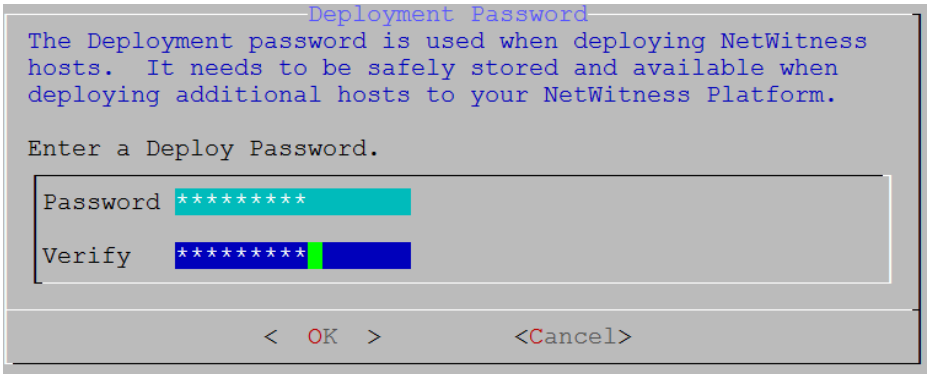
The following list of characters are supported for Master Password and Deployment Password:

- Symbols : ! @ # % ^ + ,
- Numbers :0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.

**Caution:** This step 6 is applicable only for NW Server Host.

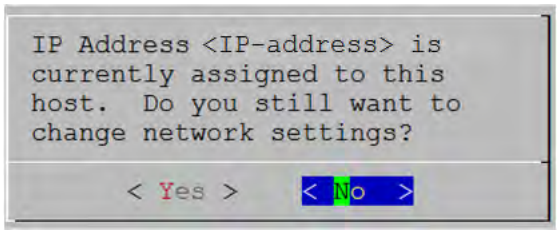
7. The **Deployment Password** prompt is displayed.



Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

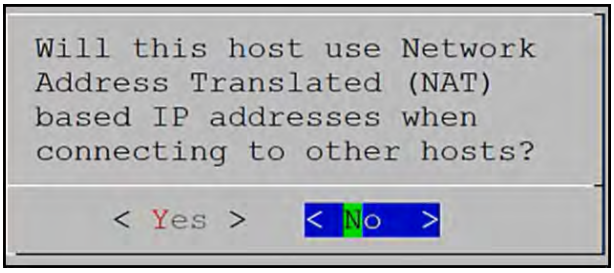
**Caution:** This step 7 is applicable for both NW Server and Component Hosts.

8. The setup program finds a valid IP address for this host and the following prompt is displayed.



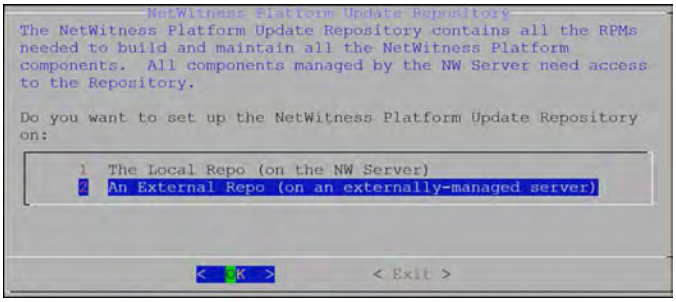
Tab to **No** and press **Enter**, if you want to use this IP and avoid changing your network settings.

9. The Use Network Address Translation (NAT) prompt is displayed.



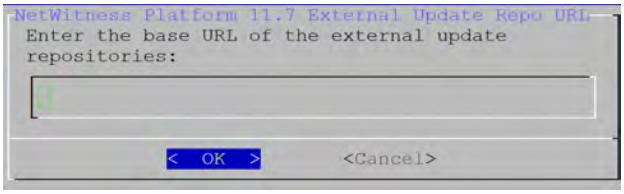
- For the NW Server, tab to **No** and press **Enter**.
- For Component Hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

10. The **NetWitness Platform Update Repository** prompt is displayed.



- For NW Server Host: Select **2 An External Repo (on an externally-managed server)**. Tab to **OK** and press **Enter**.
- For Component Hosts: Select **1 The Local Repo (on the NW Server)**. Tab to **OK** and press **Enter**.

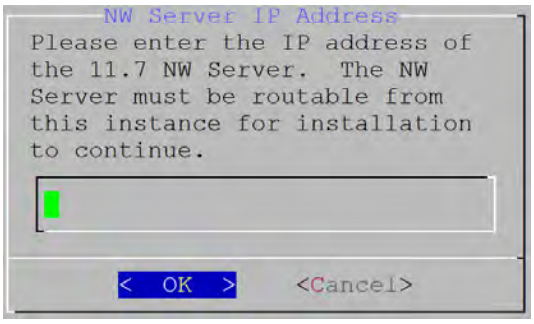
11. The **NetWitness Platform 11.7 External Update Repo URL** prompt is displayed.



Enter the base URL of the NetWitness Platform external repo, tab to **OK** and press **Enter**.

**Caution:** This step 11 is applicable only for NW Server Host.

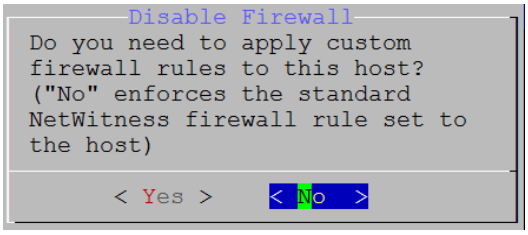
12. The **NW Server IP Address** prompt is displayed.



Enter the IP address of 11.7 NW Server host, tab to **OK** and press **Enter**.

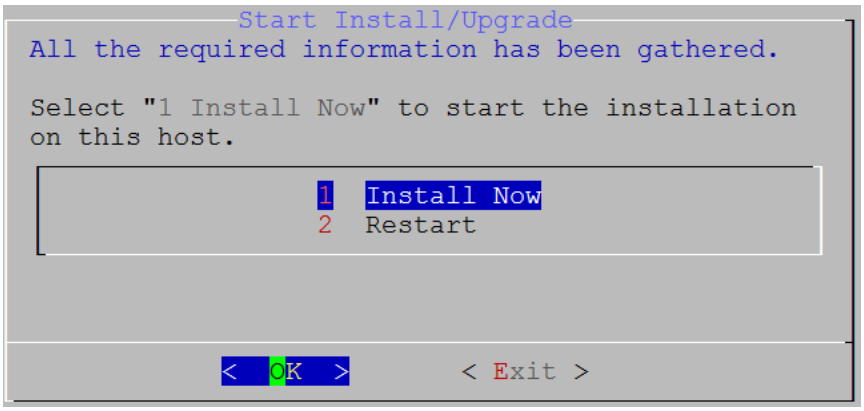
**Caution:** This step 12 is applicable only for Component Hosts.

13. The **Disable Firewall** prompt is displayed.



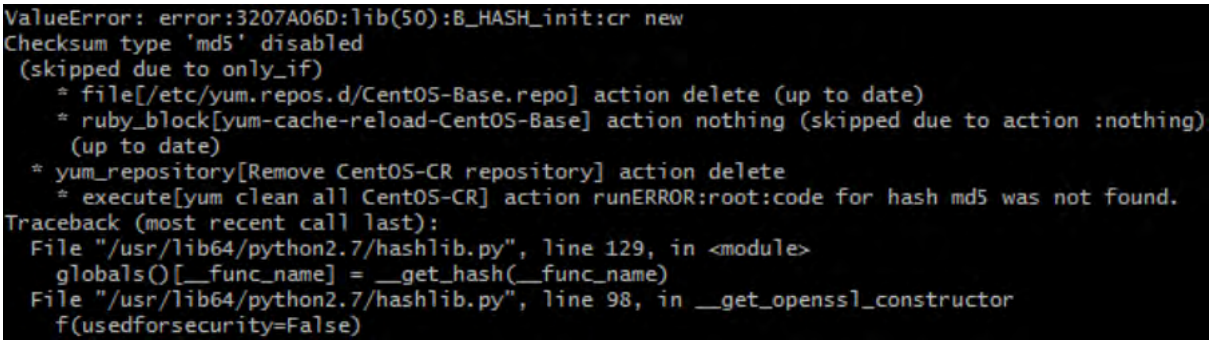
Tab to **No** and press **Enter**.

14. Press **Enter** to install 11.7 on the NW Server.
The **Start Install/Upgrade** prompt is displayed.



15. When **Installation complete** is displayed, you have installed the 11.7 NW Server on this host.

**Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



**Note:** If you want to perform a silent installation using CLI, see the Silent Installation Using CLI topic in the *Physical Host Installation Guide*.

## Storage Configurations

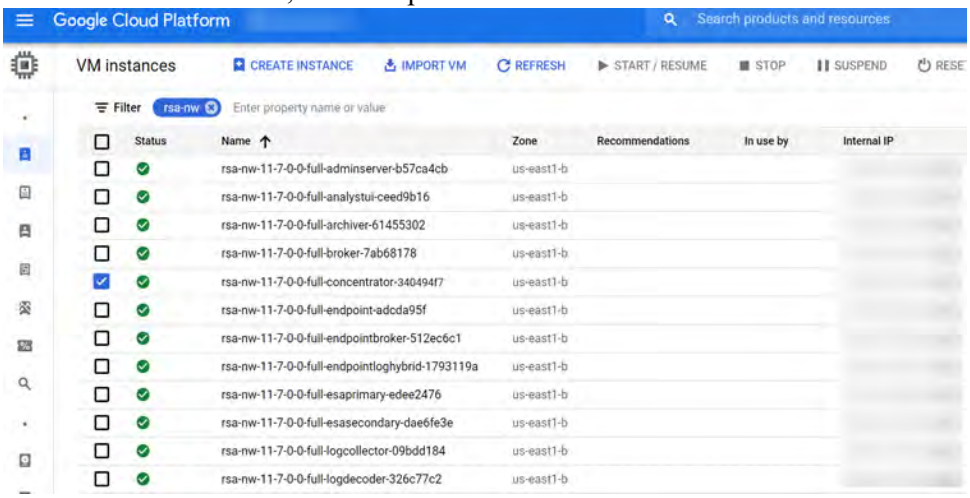
For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

## Create a Disk

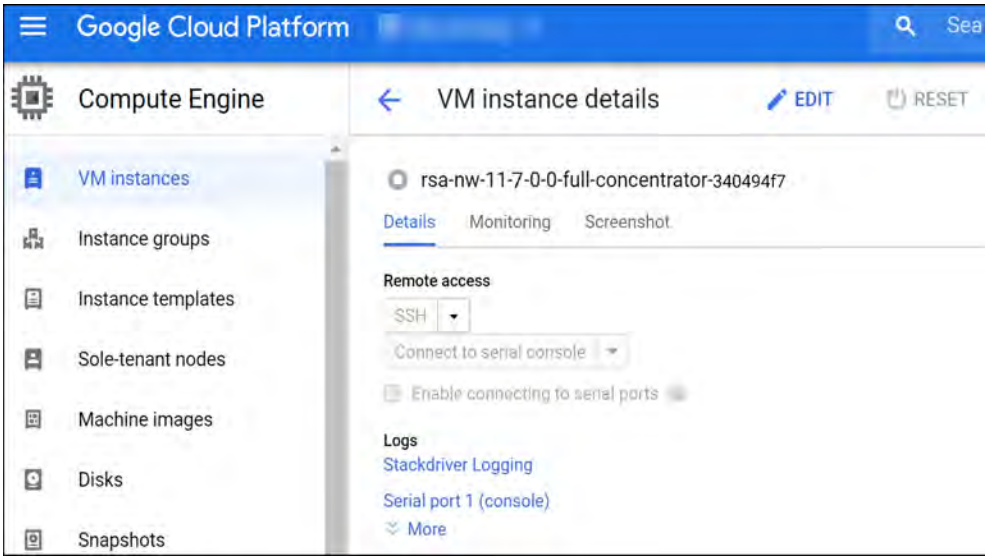
To understand which volumes are required to support the instance, see the Storage Requirements topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

**To create a disk**:

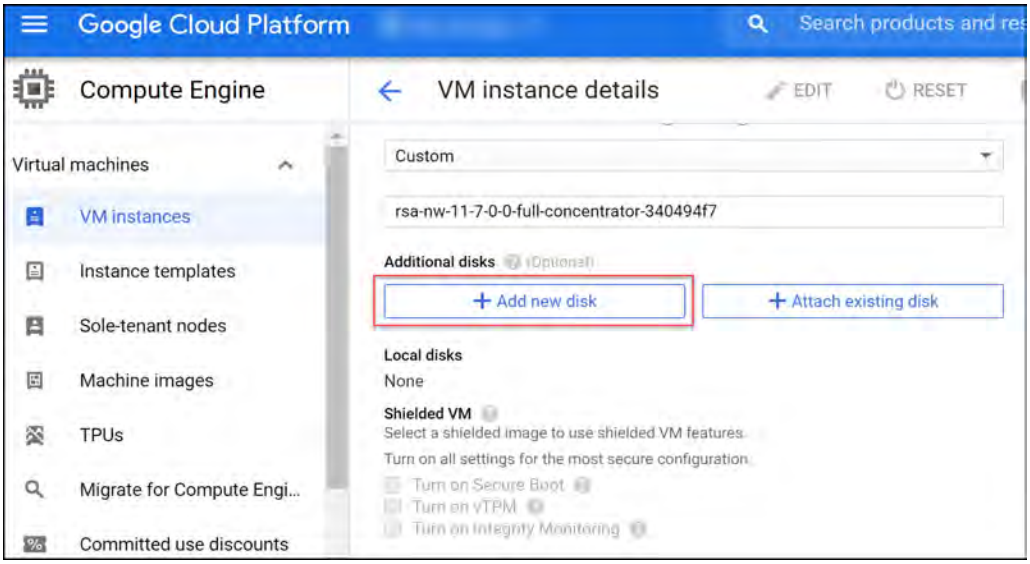
1. Go to **Google Cloud Platform > Compute Engine > VM Instance** to identify the VM instance.
2. Click the instance name, for example **rsa-nw-11-7-0-0-full-concentrator-340494f7**.



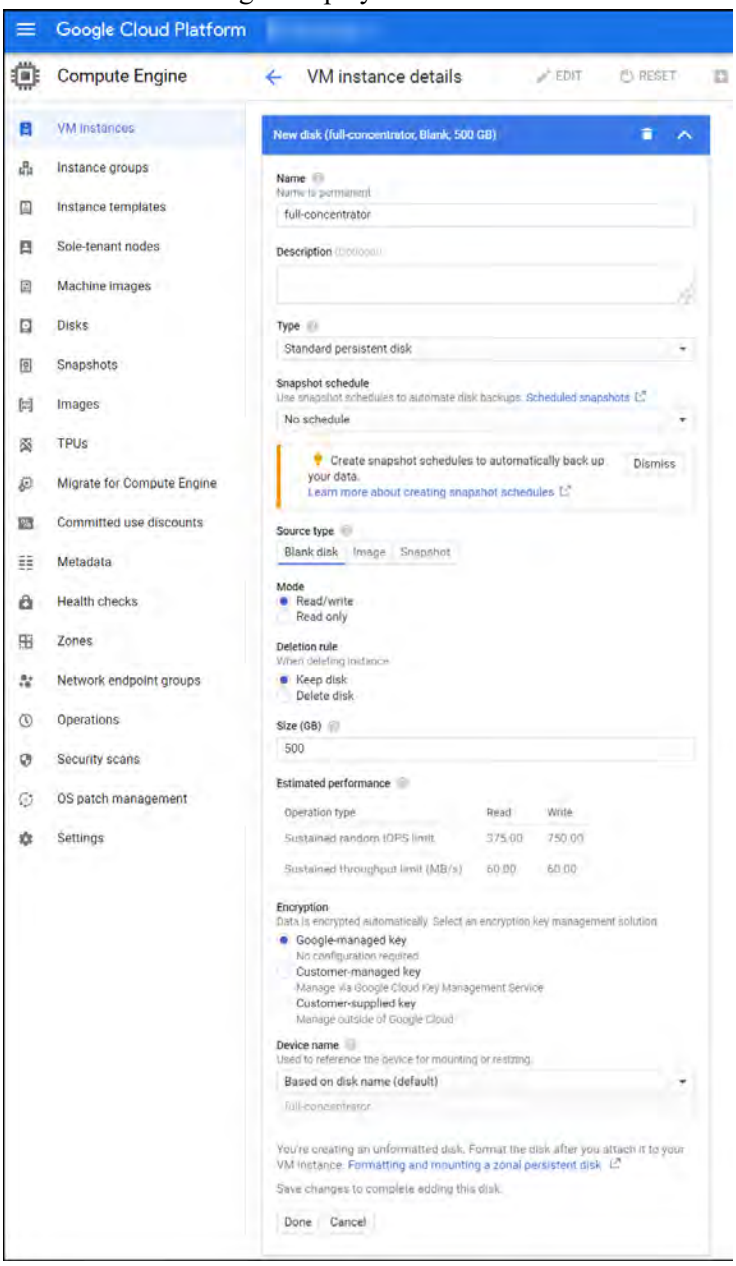
3. Click EDIT to make the required changes.
The **VM instance details** view is displayed.



4. Under **Additional disks** (Optional), click + Add new disk to add a new disk.



5. The **New disk** dialog is displayed.



Enter values in the following fields:

a. **Name**: Enter a unique name.

b. (Optional) **Description** : Enter the required additional information.

c. **Type**: Select **Standard persistent disk** from the drop-down menu.

d. **Snapshot schedule**: By default, **No schedule** option is selected.

e. Under **Source type > Blank disk**.
   - **Mode**: By default, **Read/write** option is selected.
   - **Deletion rule**: By default, **Keep disk** option is selected.

f. **Size (GB)**: Enter the required size.

g. Under **Encryption**: By default, **Google-managed key** is selected.

h. **Device name**: By default, **Based on disk name (default)** is selected.

i. Click **Done**.

6. Click **Save**.

**Note:** To add another disk to the instance type, repeat steps 1 to 6.

## Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness Host and Services Getting Started Guide. This guide also describes the procedures for applying updates and preparing for version upgrades.

# GCP Instance Configuration Recommendations

**Note:** These recommendations can be used as a baseline for 11.7.0.0 and adjusted as needed.

Instance compute, and memory utilization will vary depending on content applied, ingestion rates, and the number of running queries.

This topic contains the minimum GCP instance configuration settings recommended for the NetWitness virtual stack components.

- Compute Engine Instance:
  - Minimum instance type - **n2-standard-32** is the minimum instance type required for any NetWitness component image so that it can function.
  - Machine type adjustments - You must adjust machine types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Endpoint Hybrid stream includes an Endpoint Server, Concentrator, and Log Decoder.
    - Respond receives alerts from the Reporting Engine, and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Persistent Disk (Storage)

  For performance recommendations, recommended storage allocation per NetWitness host, and input/output operations per second, see the "Storage Requirements" topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

  The following table displays the specification recommendations for NetWitness GCP instances.

## Virtual Log Decoder (VLC)

| Compute Engine Instance | | | |
|---|---|---|---|
| **EPS** | **Machine Type** | **Virtual CPU's** | **Memory** |
| 5,000 | n2-standard-4 | 4 | 16 GB |
| 10,000 | n2-standard-4 | 4 | 16 GB |
| 15,000 | n2-standard-8 | 8 | 32 GB |

## Archiver

| Compute Engine Instance | | | |
|---|---|---|---|
| EPS | Machine Type | Virtual CPU's | Memory |
| 5,000 | n2-standard-4 | 4 | 16 GB |
| 10,000 | n2-standard-8 | 8 | 32 GB |
| 15,000 | n2-standard-16 | 16 | 64 GB |

## Broker

| Compute Engine Instance | | | |
|---|---|---|---|
| EPS | Machine Type | Virtual CPU's | Memory |
| 5,000 | n2-standard-4 | 4 | 16 GB |
| 10,000 | n2-standard-4 | 4 | 16 GB |
| 15,000 | n2-standard-4 | 4 | 16 GB |

## Log Concentrator

| Compute Engine Instance | | | |
|---|---|---|---|
| EPS | Machine Type | Virtual CPU's | Memory |
| 5,000 | n2-standard-8 | 8 | 32 GB |
| 10,000 | n2-standard-8 | 8 | 32 GB |
| 15,000 | n2-standard-16 | 16 | 64 GB |

## Event Stream Analysis (ESA)

| Compute Engine Instance | | | |
|---|---|---|---|
| EPS | Machine Type | Virtual CPU's | Memory |
| 9,000 | n2-standard-8 | 8 | 32 GB |
| 18,000 | n2-standard-16 | 16 | 64 GB |
| 30,000 | n2-standard-32 | 32 | 128 GB |

## Log Decoder

| Compute Engine Instance | | | |
|---|---|---|---|
| EPS | Machine Type | Virtual CPU's | Memory |
| 5,000 | n2-standard-8 | 8 | 32 GB |
| 10,000 | n2-standard-16 | 16 | 64 GB |
| 15,000 | n2-standard-32 | 32 | 128 GB |

## NetWitness Endpoint Hybrid

| Compute Engine Instance | | | |
|---|---|---|---|
| Agents | Machine Type | Virtual CPU's | Memory |
| 15,000 agents | n2-standard-48 | 48 | 192 GB |

## New Health and Wellness

| Compute Engine Instance | | |
|---|---|---|
| Machine Type | Virtual CPU's | Memory |
| n2-standard-4 | 4 | 16 GB |

## NetWitness Server and Co-Located Components

| Compute Engine Instance | | |
|---|---|---|
| **Machine Type** | **Virtual CPU's** | **Memory** |
| n2-standard-16 | 16 | 64 GB |

## Analyst UI

| Compute Engine Instance | | |
|---|---|---|
| **Machine Type** | **Virtual CPU's** | **Memory** |
| n2-standard-8 | 8 | 32 GB |

## UEBA

| Compute Engine Instance | | |
|---|---|---|
| **Machine Type** | **Virtual CPU's** | **Memory** |
| n2-standard-16 | 16 | 64 GB |

# RSA NetWitness

Version 11.7

# Hosts and Services Getting Started Guide

## Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

## Trademarks

RSA Conference Logo, RSA, and other trademarks, are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

## License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

## Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

# Hosts and Services Basics

This guide gives administrators the standard procedures for adding and configuring hosts and services in NetWitness. After introducing you to the basic purpose of hosts and services and how they function within the NetWitness network, this guide covers:

- Tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## What Is a Host?

A host is the machine on which a service runs and can be a physical or virtual machine. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

## What Is a Category?

A category assigns a service or services to a host when you install a host from the Hosts view. You choose a host **Category** in the **Install Services** dialog which is displayed when you select a host in the Hosts view and click 
. The following table lists each category and the services it installs. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

| Category | Services Installed |
|---|---|
| Analyst UI | Investigate Server, Broker, NetWitness UI, Reporting Engine, Respond Server |
| Archiver | Workbench and Archiver |
| Broker | Broker |
| Concentrator | Concentrator |
| Endpoint | Endpoint Server |
| Endpoint Broker | Endpoint Broker Server |
| Endpoint Log Hybrid | Log Collector, Log Decoder, Endpoint Server, and Concentrator |
| ESA Primary | Contexthub Server and ESA Correlation |
| ESA Secondary | ESA Correlation |

| Category | Services Installed |
|---|---|
| Log Collector | Log Collector |
| Log Decoder | Log Collector and Log Decoder |
| Log Hybrid | Log Collector, Log Decoder, and Concentrator |
| Log Hybrid - Retention | Log Collector and Log Decoder (deployed on RSA Series 6 Hybrid hardware with Log Hybrid-Retention Optimization) |
| Malware Analysis | Malware Analysis and Broker |
| Network Decoder | Decoder (Packets) |
| Network Hybrid | Concentrator and Network Decoder |
| New Health and Wellness | Metrics Server |
| UEBA | UEBA |
| Warehouse Connector | Warehouse Connector |

## What Is a Service?

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

You must configure the following Core services first:

- Network Decoder
- Concentrator
- Broker
- Log Decoder

All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides* section of the NetWitness documentation page on NetWitness Community at https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

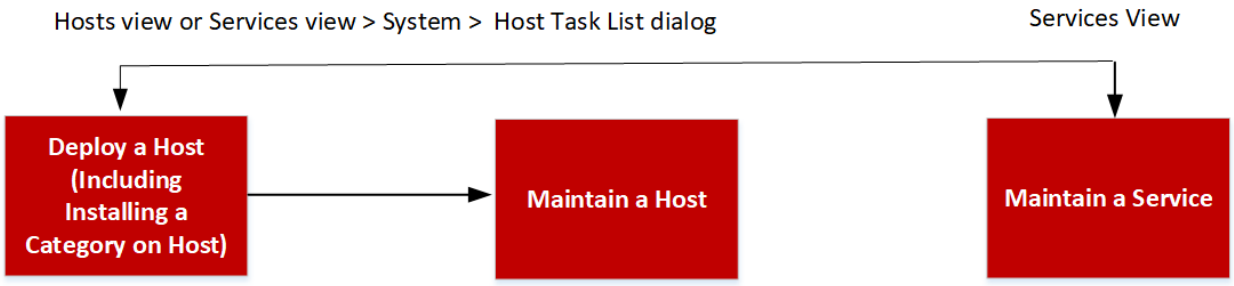
You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data. For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.



## Setting Up a Host

You use the Hosts view to add a host to NetWitness. See Step 1. Deploy a Host for detailed instructions.

## Maintaining Hosts

You use the main Hosts view ( **(Admin) > Hosts**) to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Host Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Maintenance Procedures for detailed instructions.

After initial implementation of NetWitness, the major task you perform from the Hosts view is updating your NetWitness deployment to a new version.

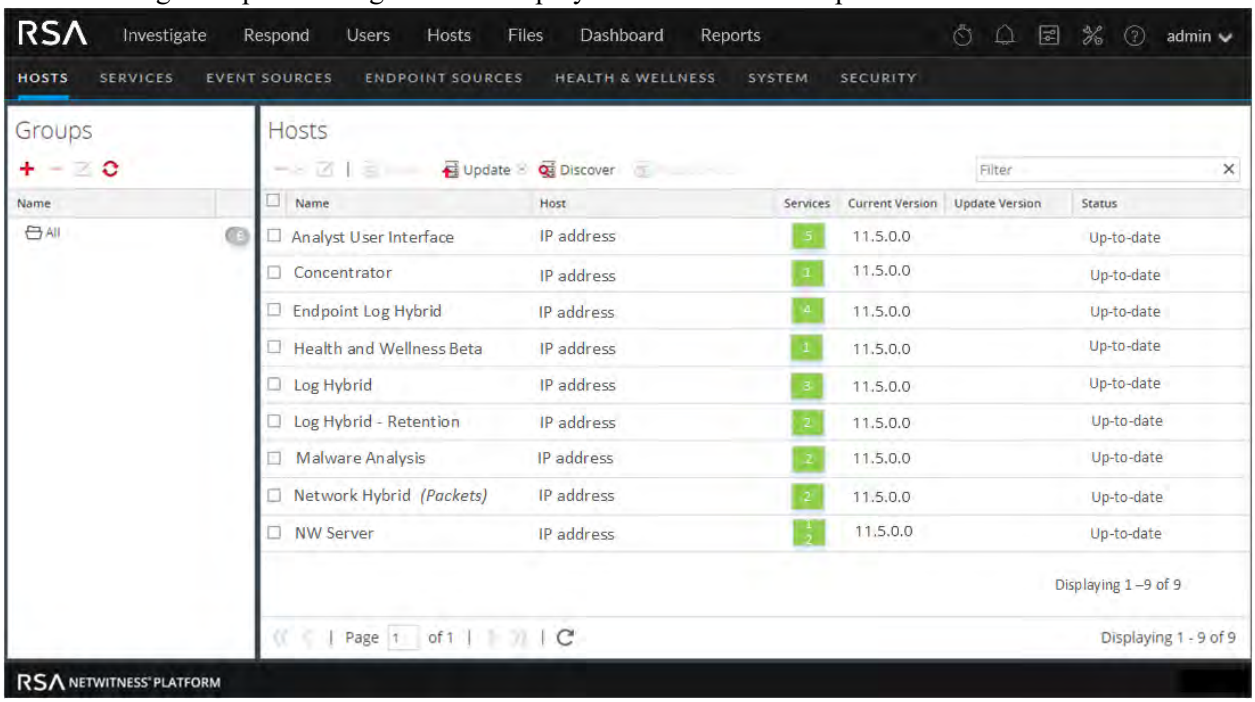
### Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Hosts and Services Maintenance Procedures. You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you apply the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

NetWitness supports multiple versions in your deployment. For more information, see Running in Mixed Mode. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

The following example is a single version deployment with all hosts updated to 11.5.0.0.



## Maintaining Services

You use the Services view ( **(Admin) > Services**) to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

## Services Implemented with the NetWitness Server

The services in the following list are implemented when you deploy the NW Server to support:

- The expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- Content, Investigate, Respond, and Source functionality.

**Caution:** You do not need to configure these services to deploy NetWitness. RSA recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

| Service | Purpose |
|---|---|
| Admin | The Administration (Admin) Server is the back-end service for administrative tasks in the NetWitness User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The Admin server requires the Config server and the Security server to be online to perform its role. |
| Config | The Configuration (Config) Server stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The Config server facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties. |
| Content | The Content server manages the RSA provided and user-created parser rules. For more information on parser management, search for "parsers" in NetWitness Community. |
| Integration | The Integration Server manages interactions with external systems. The service handles the following outbound or inbound channels.<br>• REST API Gateway - gateway to external REST clients that assigns calls to the NetWitness Application Programming Interface (API).<br>• Notifications Dispatcher - centralized dispatcher for all outbound notifications originating in the NetWitness deployment. |
| Investigate | The Investigate server supports Investigate and Malware Analysis functionality. For more information see the *NetWitness Investigate User Guide*. |
| Orchestration | The Orchestration server provisions, installs, and configures all services in your NetWitness deployment. |
| Respond | The Respond server supports Respond functionality. For more information see the *NetWitness Respond Configuration Guide*. |

| Service | Purpose |
|---|---|
| Security | The NetWitness Security Server (**Security server**) manages the security infrastructure of a NetWitness deployment. It handles the following security-related concerns.<br>• Users and the authentication accounts<br>• Role Based Access Control (RBAC)<br>• Deployment PKI infrastructure<br>A NetWitness deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness must maintain the user state, which is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out-of-the-box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers.<br>The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment-wide authorization. |
| Source | The Source server is reserved for future use and will provide a centralized location to configure sources (for example, Endpoints and Log Sources). |

# Running in Mixed Mode

Mixed mode occurs when some services are updated to the latest version and some are still on older versions. This happens when you update the hosts in your deployment to the latest version in phases (or stagger the update).

## Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- May not have all the features operational until you update your entire deployment.
- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

## Examples of Staggered Updates

In the following examples, all the hosts are on 11.4.0.0 and you want to stagger the host updates to version 11.4.1.0.

## Example 1. Multiple Network Decoders and Concentrators, Alternative 1

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Archiver host, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host, and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

RSA recommends that you update the Sessions 2 and 3 hosts in the order listed.

**Session 1: Update Essential Hosts**

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

**Session 2: Update Other Hosts**

1. Update the two Network Decoder hosts.
2. Update the two Concentrator hosts and the Archiver host.

**Session 3: Update Other Hosts**

1. Update all other hosts.

## Example 2. Multiple Network Decoders and Concentrators, Alternative 2

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

RSA recommends that you update the Sessions 2 and 3 hosts in the order listed.

**Session 1: Update Essential Hosts**

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

**Session 2: Update Other Hosts**

1. Update one Network Decoder host and one Concentrator host.

**Note:** It does not matter which of the Network Decoder hosts or which of the Concentrator hosts you update first.

Time elapses during which NetWitness processes a significant amount of data.

**Session 3: Update Other Hosts**

1. Update the second Network Decoder host and the second Concentrator host.
2. Update all Log Decoder hosts before you update Virtual Log Collectors.
3. Update all other hosts.

### Example 3. Multiple Regions

In this example, the 11.4.0.0 deployment includes one NW Server host, one Event Stream Analysis host, one Endpoint Log Hybrid host, one Malware Analysis host. Additionally, there are two sites, each with two Network Decoders, two Concentrators, and one Broker, for a total of four Network Decoder hosts, four Concentrator hosts, and two Broker hosts.

**Session 1: Update Essential Hosts and Site 1**

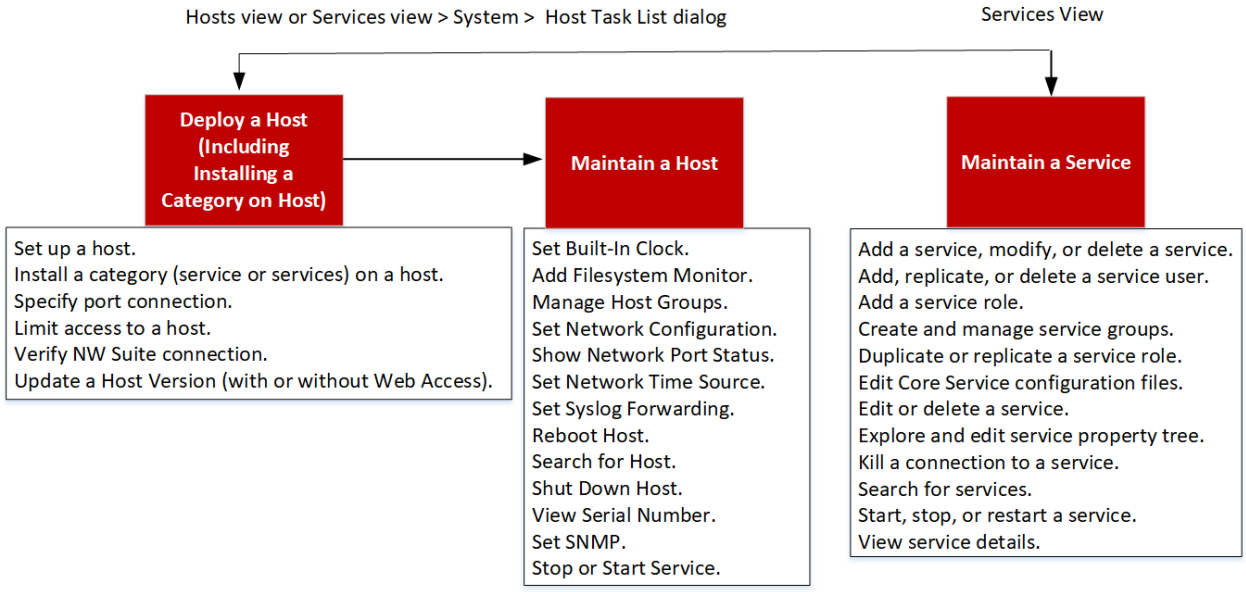
1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update one Broker host, two Network Decoder hosts, and two Concentrator hosts.

**Session 2: Update Other Hosts and Site 2**

1. Update the second Broker host.
2. Update the two remaining Network Decoder hosts.
3. Update the two remaining Concentrator hosts.
4. Update all the other hosts.

# Hosts and Services Set Up Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment. This topic contains information about basic procedures. For additional procedures, see Hosts and Services Maintenance Procedures.



| High-Level Task | Description |
|---|---|
| Set Up a Host | Complete the following tasks in the order shown to set up a host.<br>Step 1. Deploy a Host<br>Step 2. Install a Service on a Host<br>Step 3. Review SSL Ports for Trusted Connections<br>Step 4. Manage Access to a Service |

## Step 1. Deploy a Host

**Caution:** If you include "." in a host name, the host name must also include a valid domain name.

1. Deploy a host.

   You can deploy a physical host (RSA Appliance), virtual host on-prem, a virtual in AWS, a virtual host in Azure, or a virtual host on Google Cloud Platform. See the following guides for instructions on how to deploy hosts.

   - *Physical Host Installation Guide*
   - *Virtual Host Installation Guide*
   - *AWS Installation Guide*

- *Azure Installation Guide*
- *GCP Installation Guide*

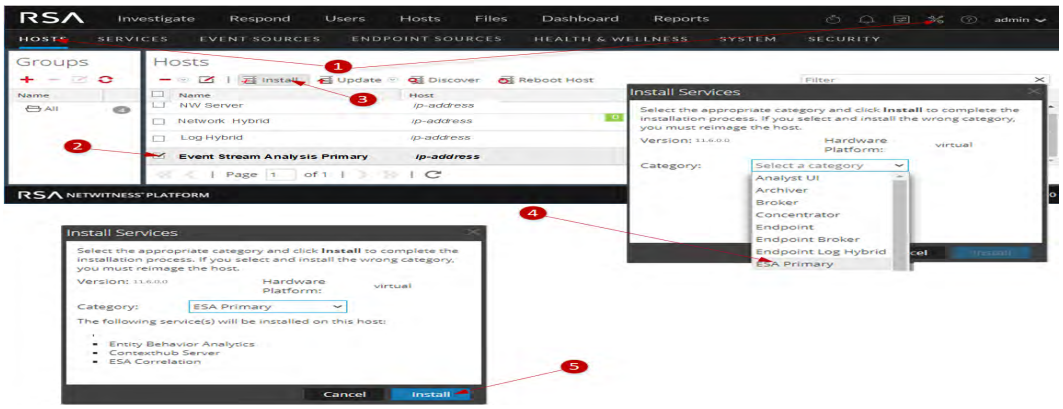
2. Go to **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the hosts that you deployed.
3. Select the hosts that you want to enable.
   The Enable menu option becomes active.
4. Click **Enable**.

5. Select the host you enabled.
   The host is displayed in the Hosts view. At this point, you can install a service on the host.

## Step 2. Install a Service on a Host

Perform the following steps to install a service on a host.

1. In NetWitness, go to **(Admin) > Hosts**.
   The Hosts view is displayed.
2. Select the host on which you want to install the service (for example, **Event Stream Analysis**).
3. Click  in the toolbar.
   The Install Services dialog is displayed.
4. Select a service from the **Category** drop-down list (for example, **ESA Primary**).
5. Click in the Install Services dialog.



6. A pop-up listing all the services already installed on this host is displayed. If there are no services installed, this pop-up will not be displayed.
7. Click **Yes** to install the new service.

# Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

## Encrypted SSL Ports

By default, trusted connections are established with two settings:

- SSL is enabled.
- Core service is connected to an encrypted SSL port.

Each NetWitness Core service has two ports:

- Unencrypted non-SSL port
  Example: Archiver 50008
- Encrypted SSL port
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in **(Admin) > Services** no longer require credentials to be defined for every NetWitness Core service. Instead, users who have been authenticated by the server can access the service without entering another password.

## Test a Trusted Connection

**Prerequisites**

1. The administrator must assign a role to the user.
   For more information, see "Add a User and Assign a Role" in the *System Security and User Management Guide*.
2. The user must:
   - Log in to NetWitness for the server to authenticate the user.
   - Have access to the service.

**Procedure**

1. In NetWitness, go to **(Admin) > Services**.
   The Services view is displayed.

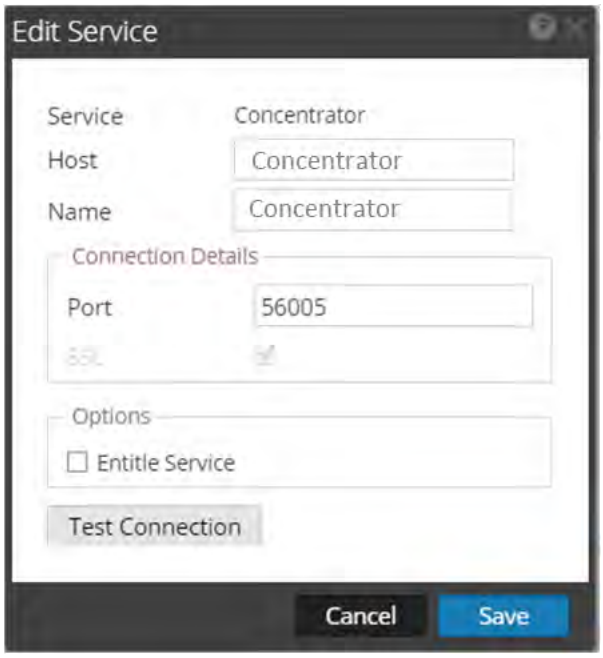
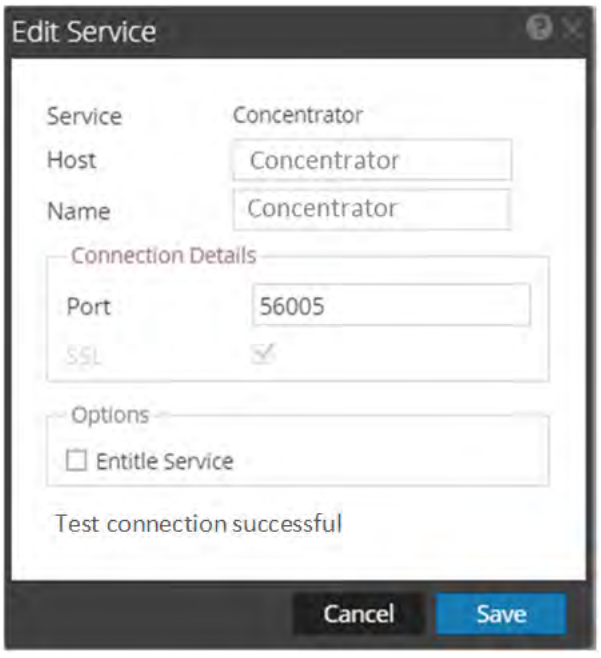
2. Select the checkbox of the service (for example, a Concentrator) to test and click .
   The **Edit Service** dialog is displayed.



**Note:** The Options box will only display if the selected service is not licensed. A licensed service is denoted by a in the Services view.

3. Remove the username to test the connection without credentials.
4. Click **Test Connection**.

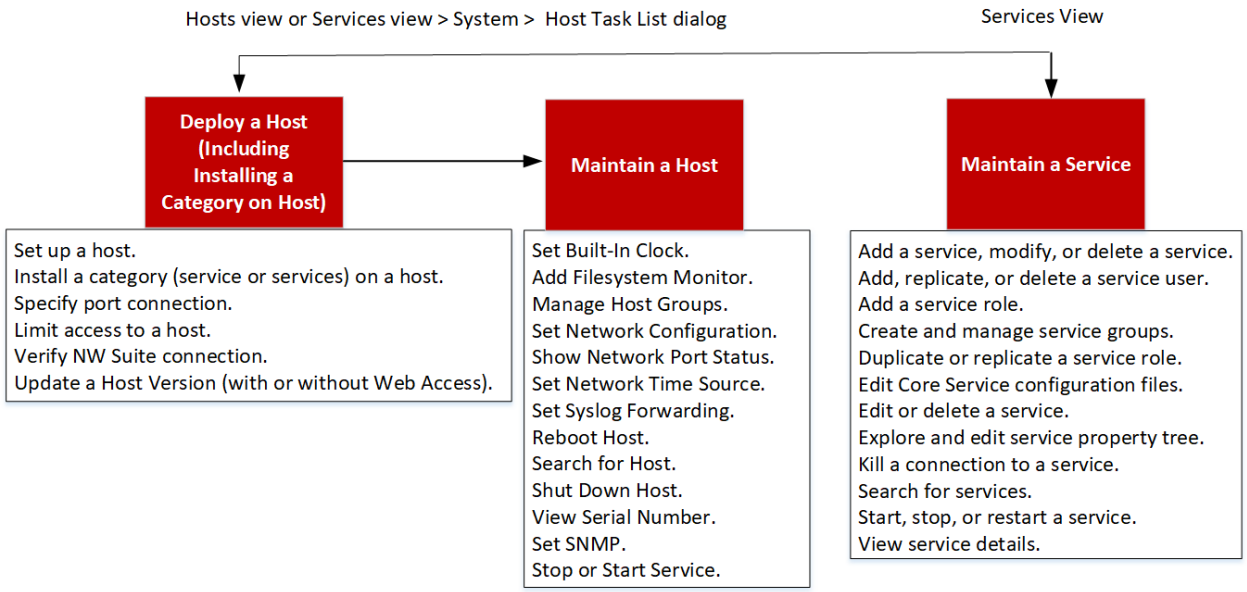


The message `Test connection successful` confirms the trusted connection is established. The previously authenticated user can access the service without typing a username and password on the service.

5. Click **Save**.

# Hosts and Services Maintenance Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment.



| High-Level Task | Description |
|---|---|
| Maintain a Host - Basics | The following maintenance tasks are shown in alphabetical order.<br>• Apply Version Upgrades to a Host<br>• Create and Manage Host Groups<br>• Search for Hosts<br>• Set Network Time Source<br>• Show Network Port Status<br>• Show Serial Number<br>• Shut Down Host<br>• Stop and Start a Service on a Host |

| High-Level Task | Description |
|---|---|
| Maintain a Host from the Host Task List Dialog | You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core hosts.<br>• Execute a Task From the Host Task List<br>• Add and Delete a Filesystem Monitor<br>• Reboot a Host<br>• Set Host Built-In Clock<br>• Set Network Time Source<br>• Set SNMP<br>• Set Syslog Forwarding<br>• Show Network Port Status<br>• Show Serial Number<br>• Shut Down Host<br>• Stop and Start a Service on a Host |
| Maintain a Service | The following procedures describe how to maintain services.<br>• Add, Replicate, or Delete a Service User<br>• Add a User Role to a Service<br>• Change a Service User Password<br>• Create and Manage Service Groups<br>• Duplicate or Replicate a Service Role<br>• Edit Core Service Configuration Files<br>• Edit or Delete a Service<br>• Explore and Edit Service Property Tree<br>• Terminate a Connection to a Service<br>• Search for Services<br>• Start, Stop, or Restart a Service<br>• View Topology Details<br>• Services System View<br>• Centralized Service Configuration via Policy |

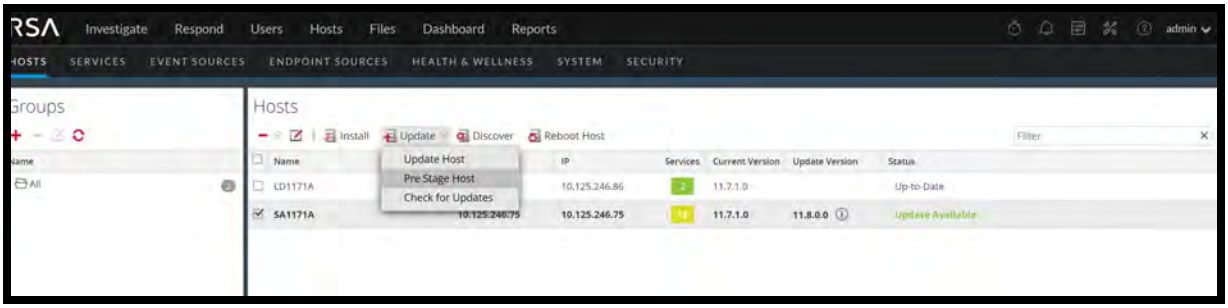
# Apply Version Upgrades to a Host

Upgrade guides are available for all supported versions of NetWitness. Refer to the upgrade guide for the latest version in the *Install and Upgrade* section of the NetWitness documentation page on RSA Link.

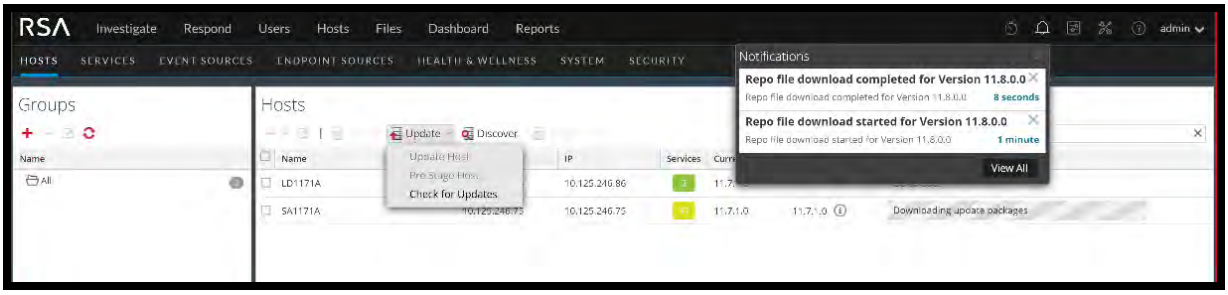
## Pre-Stage Host

**Note:** The **Pre Stage Host** option is enabled for upgrade on the Admin Server. This option will be available after you upgrade to 11.7.1 and can be used to upgrade to versions later than 11.7.1.

1. Go to > Hosts.
2. Click **Update** > **Check for Updates**.
   All possible update versions will displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.
   A confirmation message for downloading the files is displayed.

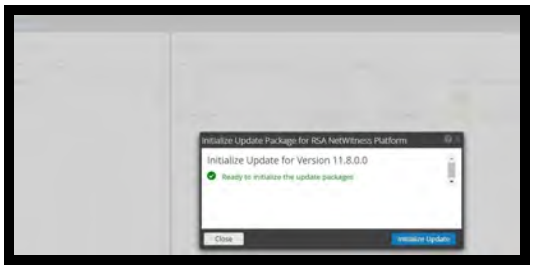


4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.
   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.



**Note:** The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.
7. Click on **Initialize Update**.
   The initialization of the package will take some time as the files are large and will need to be unzipped.



**IMPORTANT:** Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.
9. After the initialization is completed successfully, click **Update** > **Update Host.**
   After the host is updated, you will be prompted to reboot the host.

10. Set up the host and reboot the host.

# Create and Manage Host Groups

The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

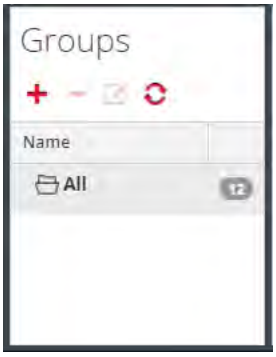
Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:

- Group different categories to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

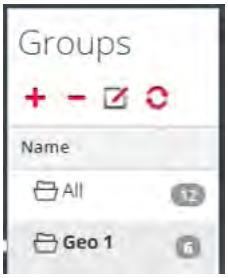
## Create a Group

1. Select **(Admin) > Hosts**.
   The Hosts view is displayed.

2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, `Geo 1`) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of hosts in that group.



## Change the Name of a Group

1. In the Hosts view **Groups** panel, double-click the group name, or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

## Add a Host to a Group

In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel. The host is added to the group.

## View the Hosts in a Group

To view the hosts in a group, click the group in the **Groups** panel.
The Hosts panel lists the hosts in that group.

## Remove a Host from a Group

1. In the Hosts view **Groups** panel, select the group that contains the host that you want to remove.
   The hosts in that group appear in the Hosts panel.

2. In the **Hosts** panel, select one or more hosts that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected hosts are removed from the group, but are not removed from the NetWitness user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The `All` group contains the hosts that were removed from the group.
   In the following example, the host group called `Geo 1` does not contain any hosts, because all the hosts in that group are removed.

## Delete a Group

1. In the Hosts view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness user interface. The `All` group contains the hosts from the deleted group.

# Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

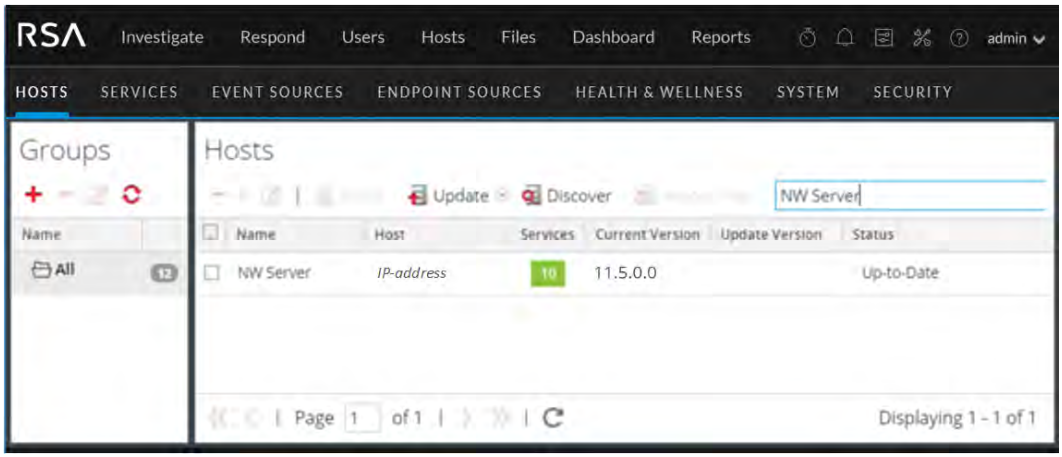
## Search for a Host

1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel toolbar, type a host **Name** or **Hostname** in the **Filter** field.

   The Hosts panel lists the hosts that match the names entered in the Filter field.

## Find the Host that Runs a Service

1. Select **(Admin) > Services**.
2. In the **Services** view, select a service. The associated host is listed in the Host column for that service.
3. To administer the host in the Hosts view, click the link in the **Host** column for that service. The host associated with the selected service is displayed in the Hosts view.

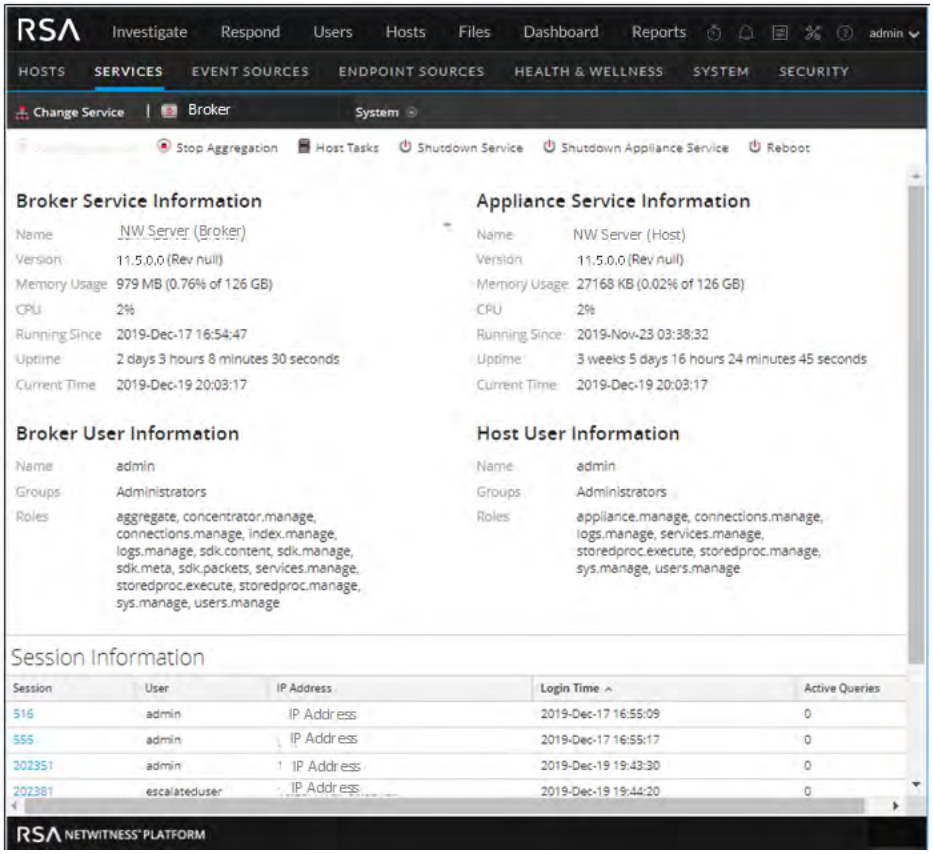


# Execute a Task From the Host Task List

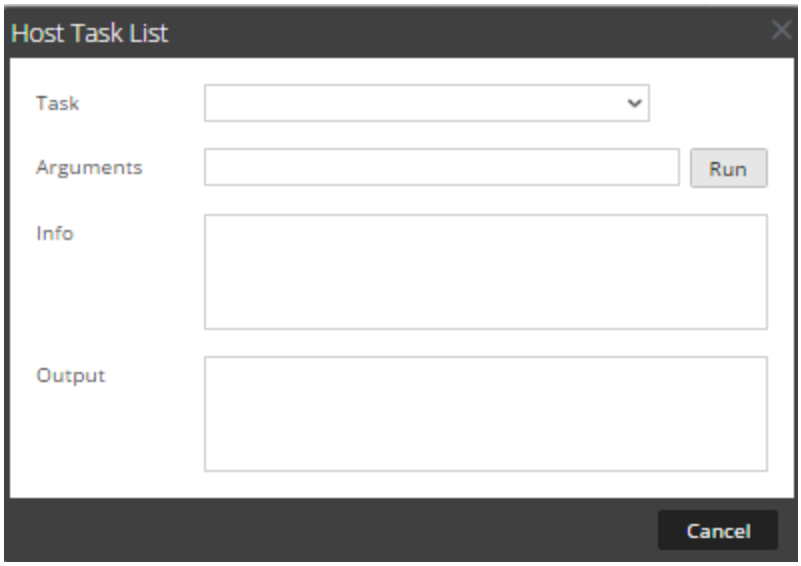
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click > **View** > **System**.

   **Note:** The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.

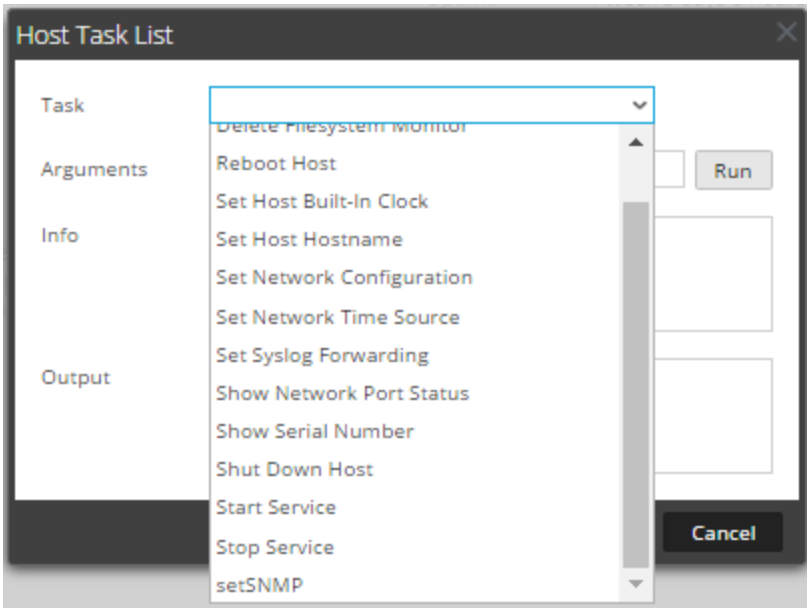
   The System view for the service is displayed below.



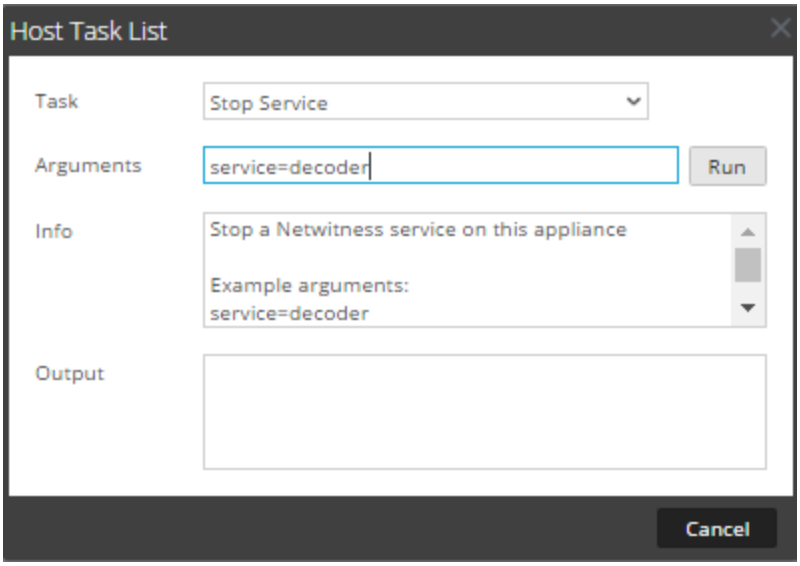
3. In the **Services System** view toolbar, click Host Tasks.



4. In the **Host Task List** dialog, click in the **Task** field to display a drop-down list of tasks that run on a host.



5. Select a task (for example, click **Stop Service**).
The task is displayed in the Task field. Task description, example arguments, security roles, and parameters are displayed in the Info area.



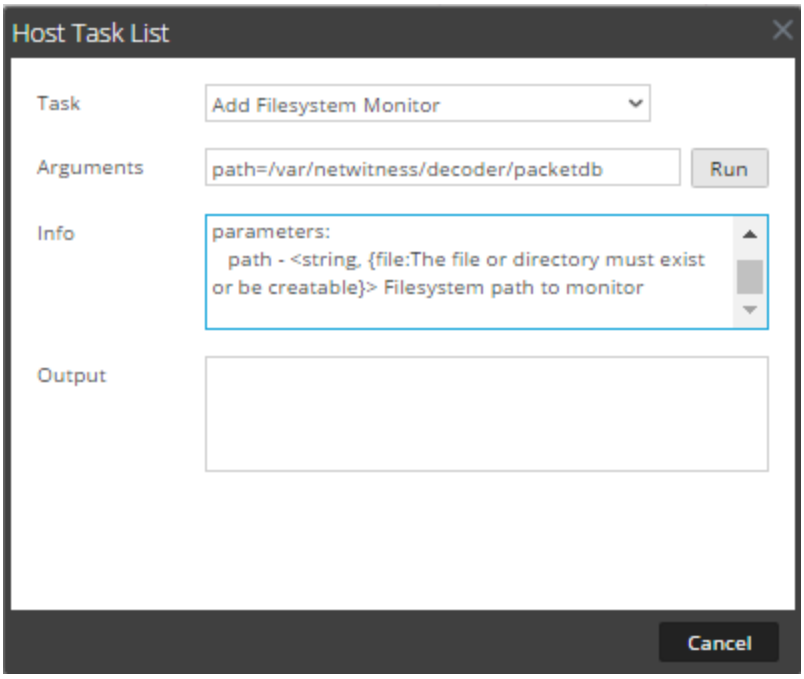
6. Type arguments if necessary and click **Run**.
The command executes and the result is displayed in the Output section.

# Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. NetWitness Platform adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

## Configure the Filesystem Monitor

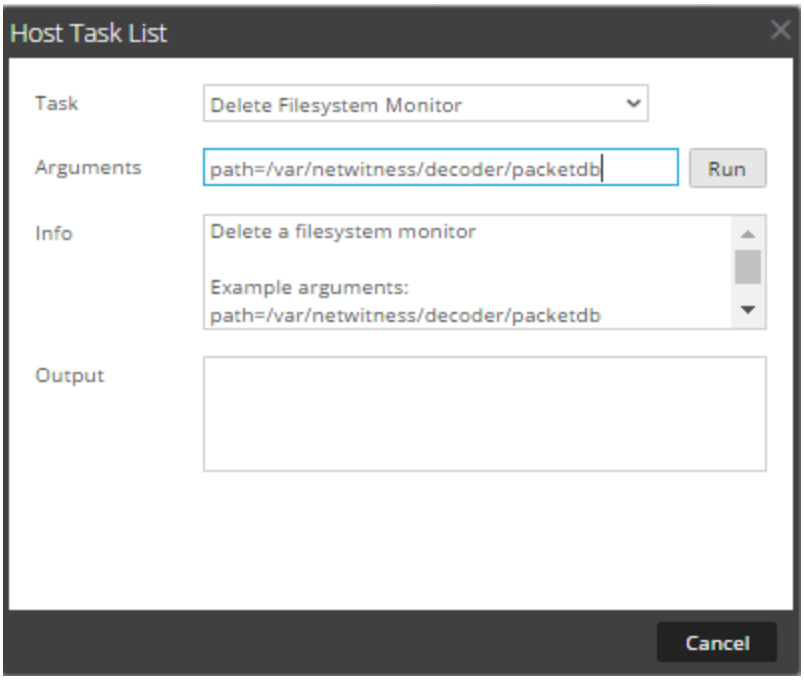
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the file system to monitor, type the path in the **Arguments** field. For example:
   **`path=/var/netwitness/decoder/packetdb`**



6. Click **Run**.
   The result is displayed in the Output area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

## Delete a Filesystem Monitor

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example:
   **`path=/var/netwitness/decoder/packetdb`**



6. Click **Run**.
   The result is displayed in the Output area. The service stops monitoring the file system.

# Reboot a Host

Under certain conditions, you must reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

NetWitness Platform also offers other options for shutting down a host:

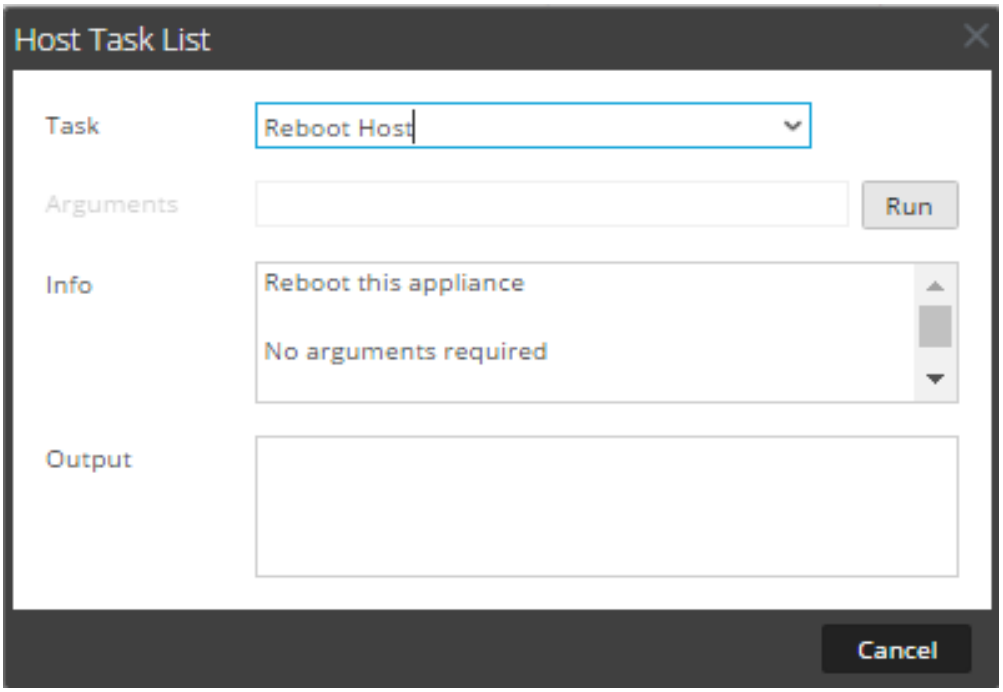
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the Shut Down and Restart a Host from the Hosts View procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

## Shut Down and Restart a Host from the Hosts View

1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel, select a host.
3. Select Reboot Host from the toolbar.

## Shut Down and Restart a Host from the Host Task List

1. Select **(Admin) > Services**.
2. In the **Services** panel, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



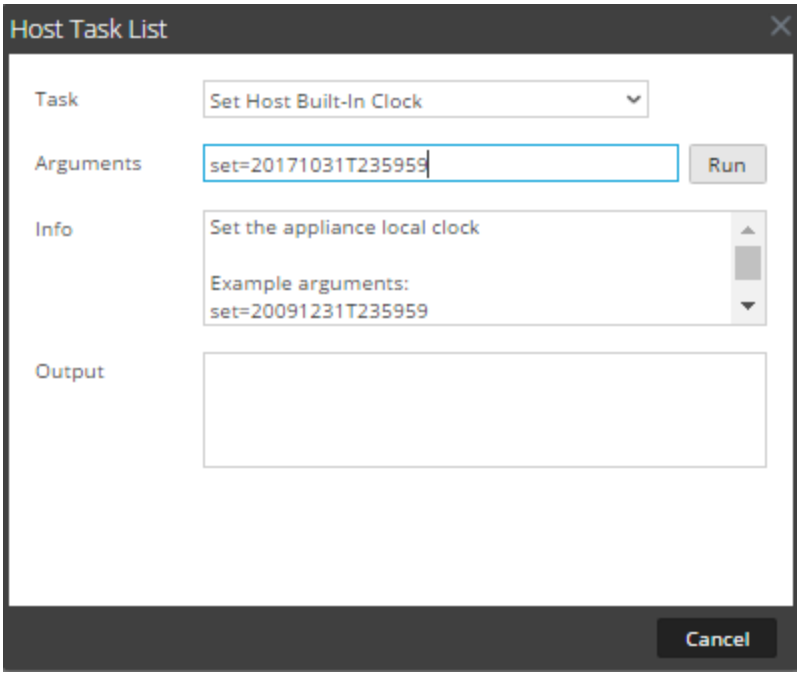
5. Click **Run**.
   The host is rebooted and the result is displayed in the Output area.

# Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

## Set the Time on the Local Clock

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Host Built-In Clock**.
   Help for the task is displayed in the Info area.
5. Enter the date and time arguments in the **Arguments** field.
   For example, to specify October 31, 2017 at 11:59:59 PM, type:
   **`set=20171031T235959`**



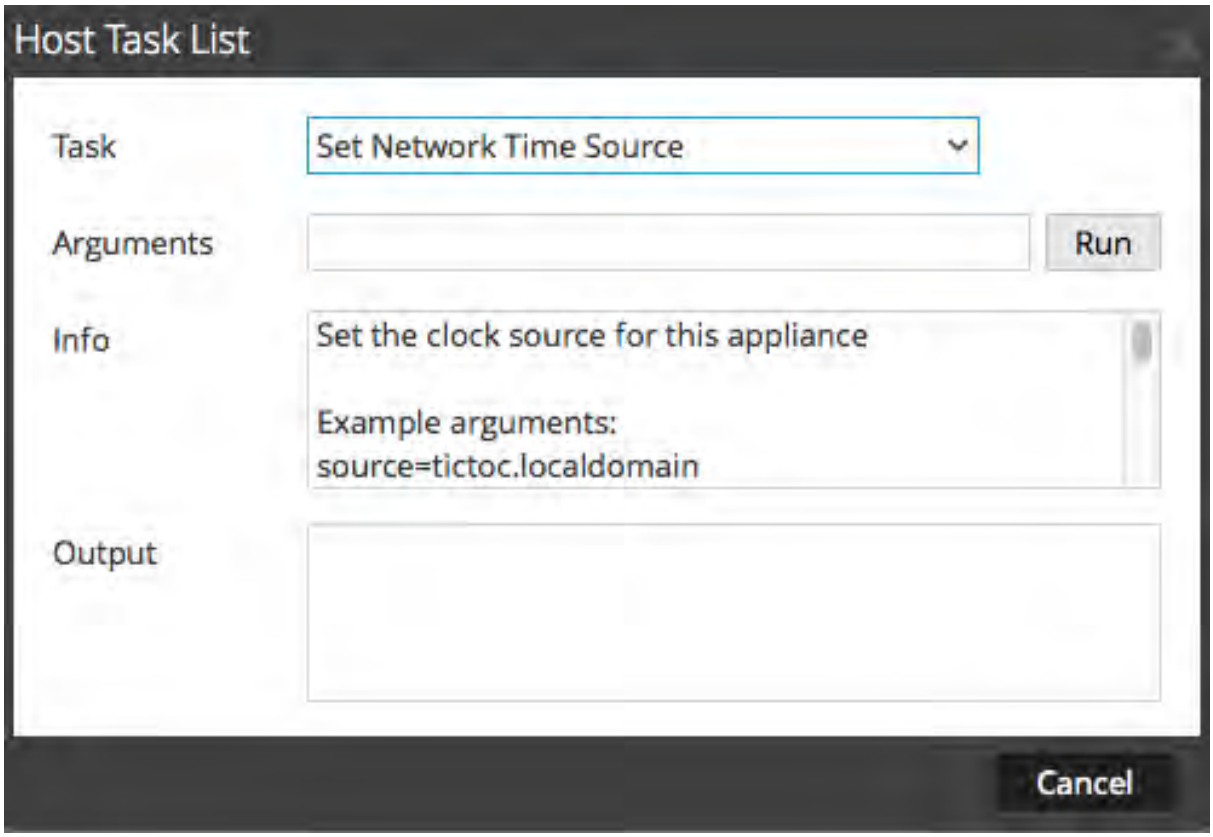
6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the Output area.

# Set Network Time Source

When setting the clock source for a host, set the hostname or address of an Network Time Protocol (NTP) server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

## Specify the Network Clock Source

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Network Time Source**.



5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: `source=tictoc.localdomain`
   - If you want to use the host clock as a clock source, type: `source=local`
6. Click **Run**.
   The clock source is set and a message is displayed in the Output area.

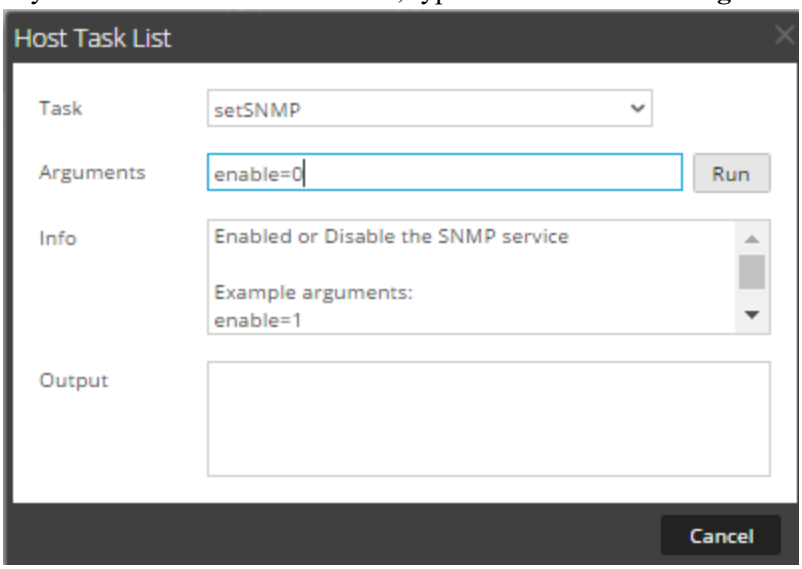
**Note:** If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

# Set SNMP

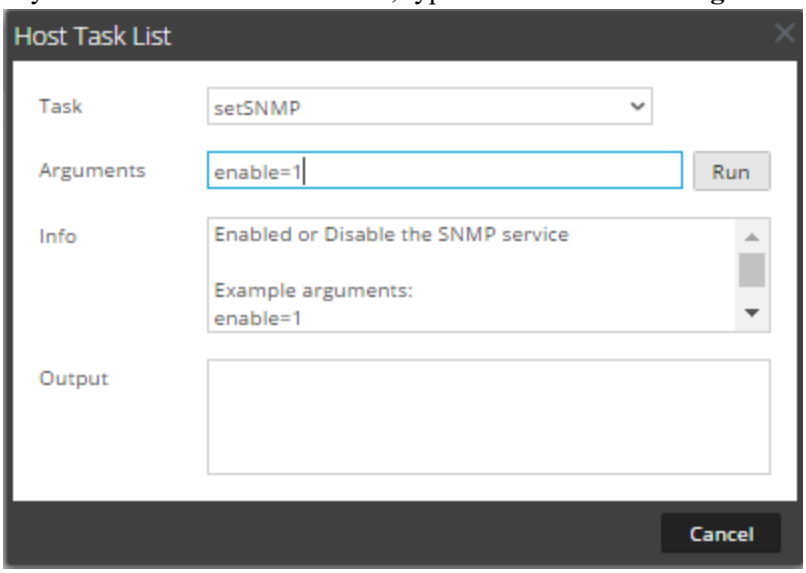
The Set SNMP task in the Host Task List enables or disables the SNMP service on a host. For a host to receive SNMP notifications, enable the SNMP service. If you are not using SNMP for NetWitness notifications, it is not necessary to enable the service.

## Toggle SNMP Service on the Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **setSNMP**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **`enable=0`** in the **Arguments** field.



- If you want to enable the service, type **`enable=1`** in the **Arguments** field.



6. Click **Run**.
   The result is displayed in the Output area.

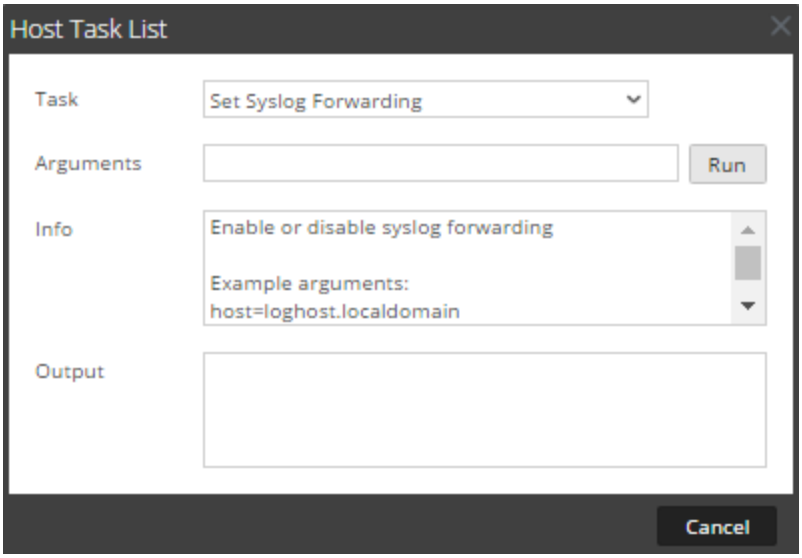
# Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

## Set Up and Start Syslog Forwarding

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.



5. In the **Arguments** field, do any one of the following.

   - To enable syslog forwarding, specify any one of the following formats:
     **`host=<loghost>.<localdomain>`** (for example, `host=syslogserver.local`).

     **`host=<loghost>.<localdomain>:<port>`** (for example, `host=syslogserver.local:514`).

     **`host=<IP>`** (for example, `host=10.31.244.244`).

     **`host=<IP>:<port>`** (for example, `host=10.31.244.244:514`).

     The following table lists the parameters used to enable syslog forwarding.

| Parameter | Description |
|---|---|
| `loghost` | The host name of the remote syslog server. |
| `localdomain` | The domain of the remote syslog server. |
| `port` | IP address of the remote syslog server. |
| `IP` | The port number on which the remote syslog server receives a syslog messages. |

   - To disable syslog forwarding, type **`host=disable`**.

6. Click **Run**.
   The result is displayed in the Output area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.

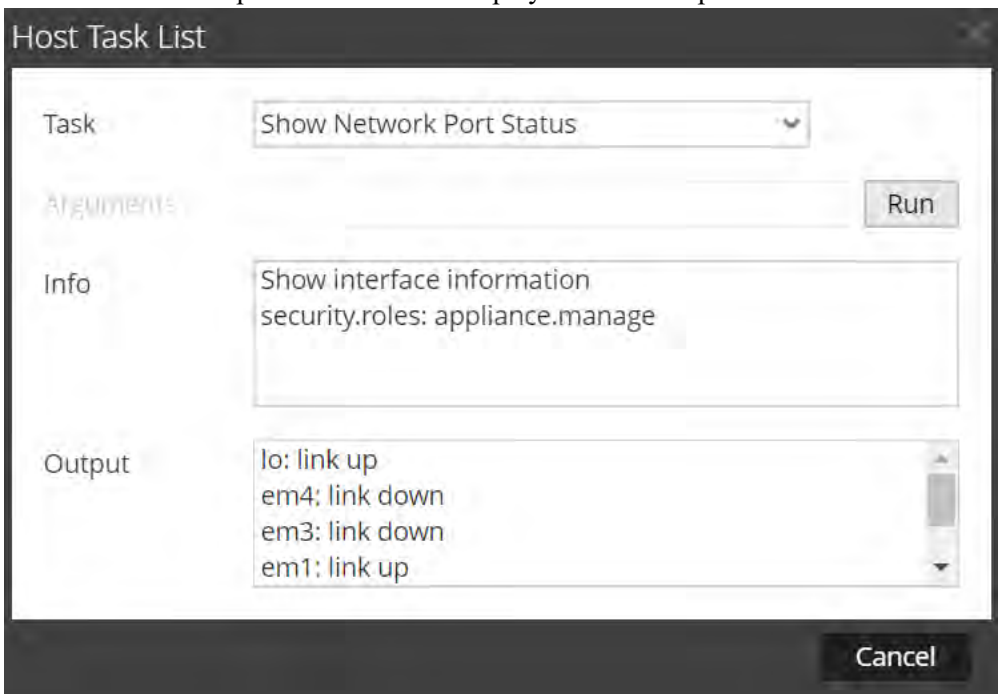
**Note:** You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness services configured for syslog forwarding.

# Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

## Display the Network Port Status

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View> System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.
5. No arguments are required for this task. Click **Run**.
   The status for each port on the host is displayed in the Output area.

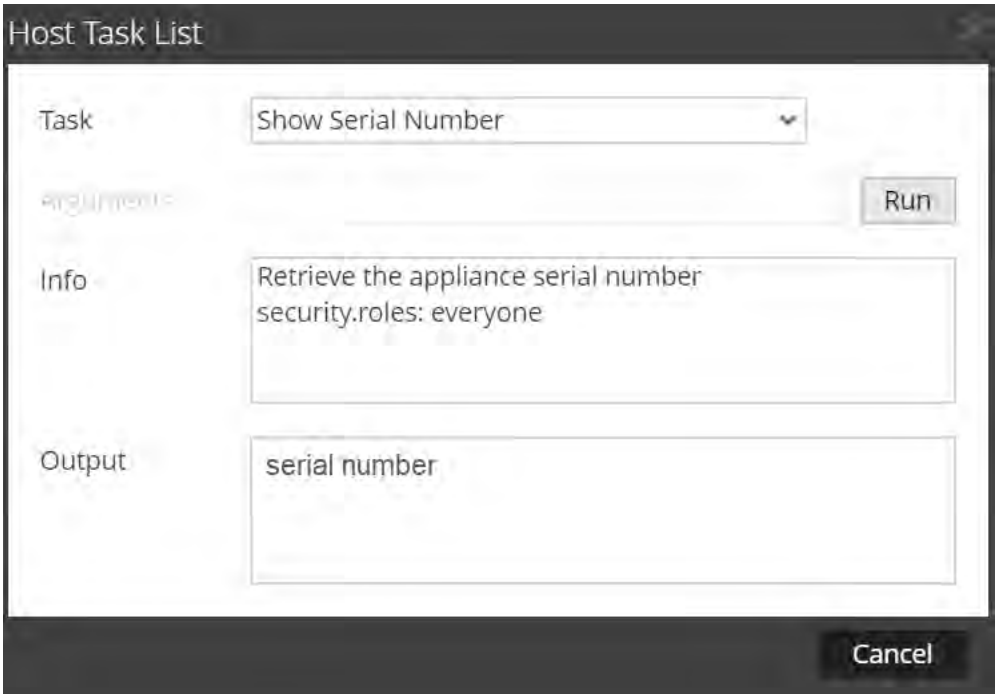


# Show Serial Number

The Show Serial Number task in the Host Task List displays the serial number of a host.

## Show the Serial Number

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the Output area.



# Shut Down Host

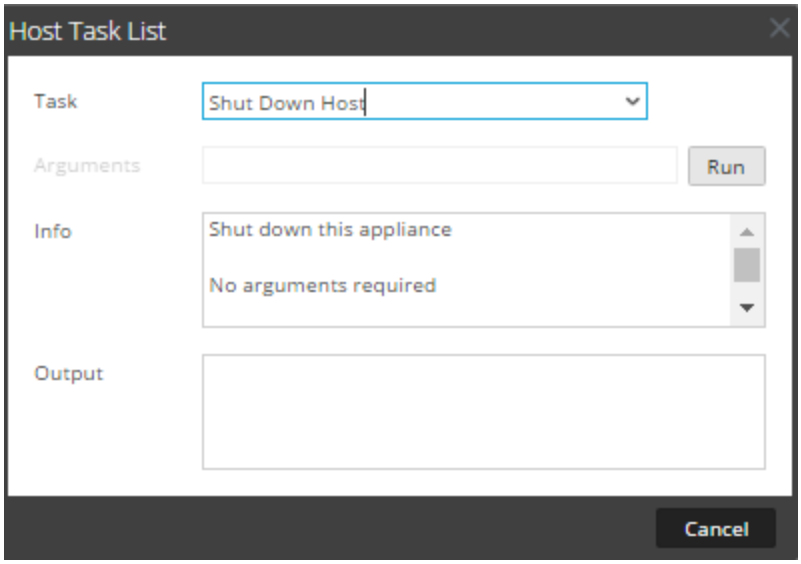
Under certain circumstances (for example, a hardware upgrade or an extended power outage that exceeds backup power capacity), it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically. Use the power switch to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

See Reboot a Host for how to start and stop a host without shutting down the host.

## Shut Down the Host

1. In the **Host Task List**, select **Shut Down Host**.



2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

# Stop and Start a Service on a Host

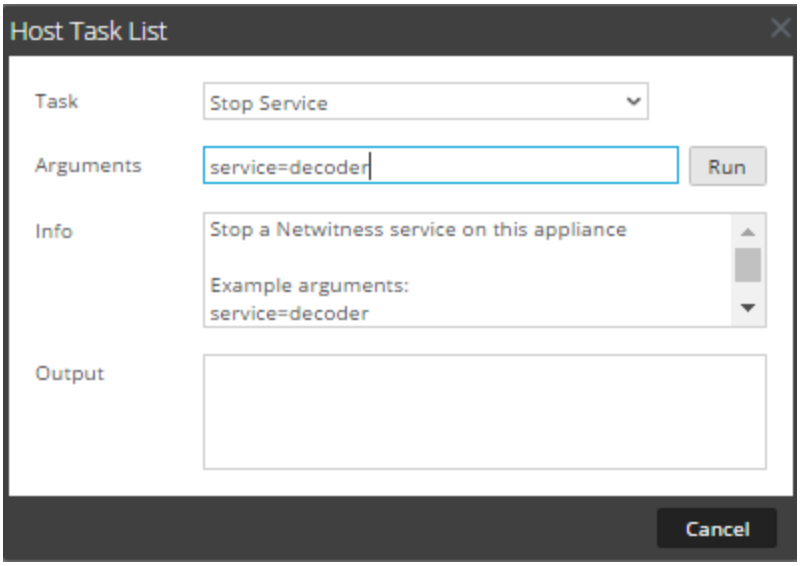
The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

## Stop a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Stop Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.

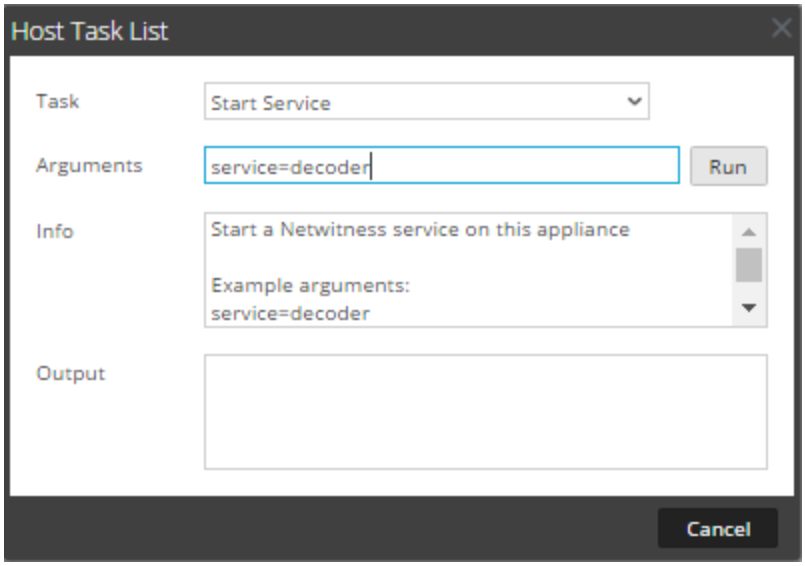


6. To execute the task, click **Run**.
   The service stops and the status is displayed in the Output area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

## Start a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Start Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.



6. To execute the task, click **Run**.
   The service starts and the status is displayed on the Output area.

## Add, Replicate, or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

**Note:** This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the "Set Up a User" in *System Security and User Management Guide*.

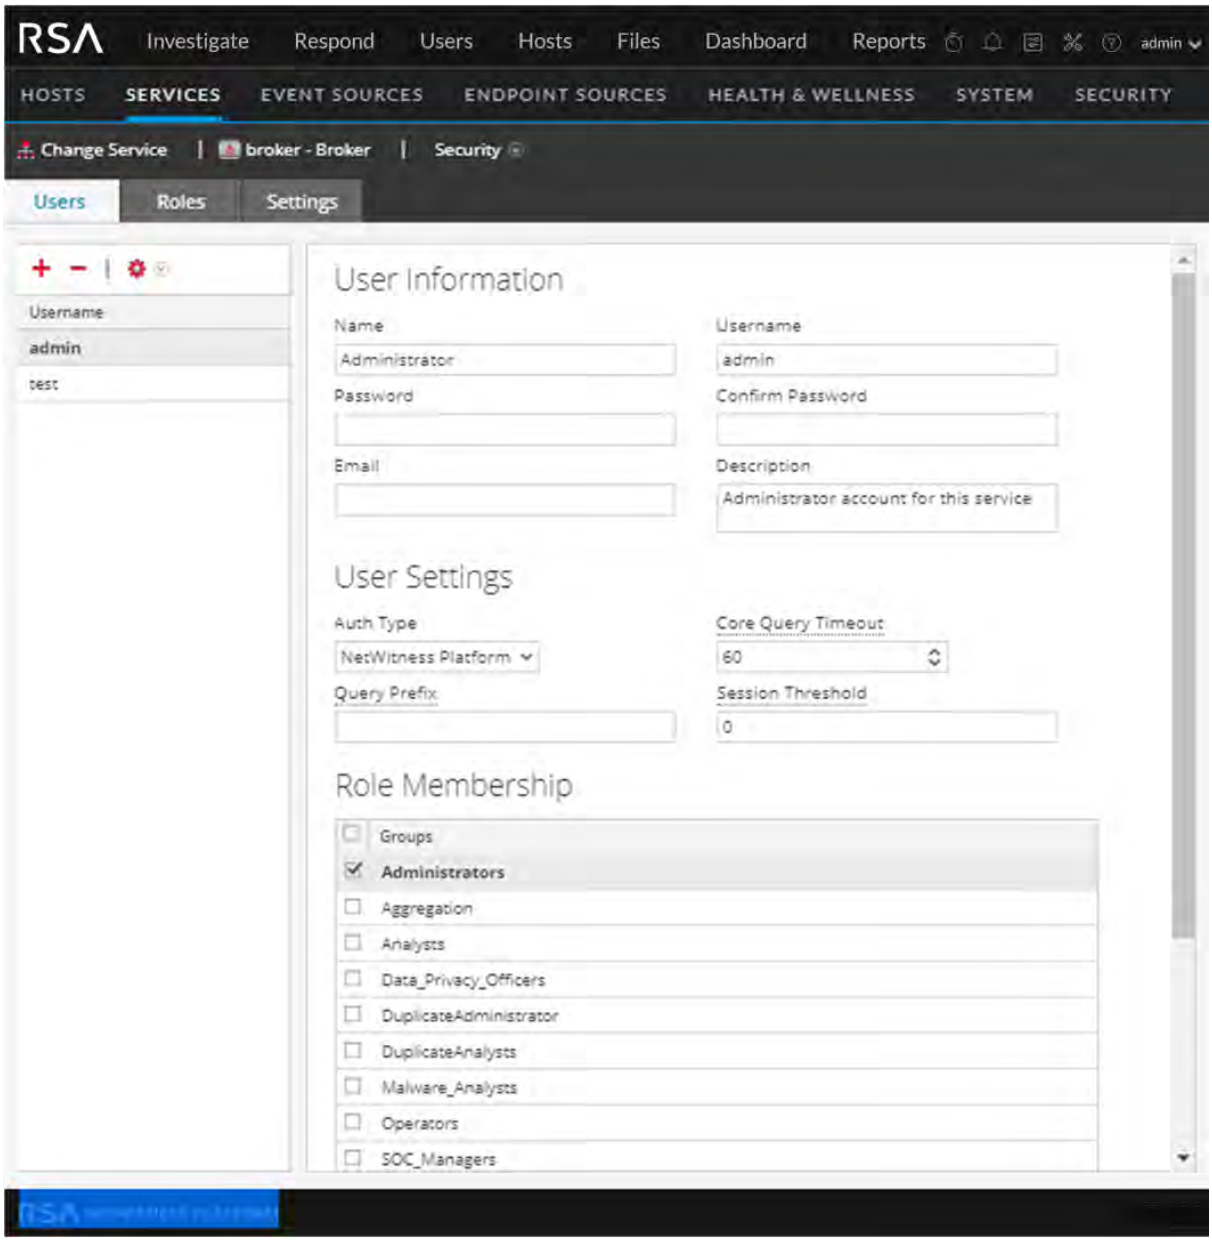
For each service user, you can:

- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives
- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

### To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.



### Add a Service User

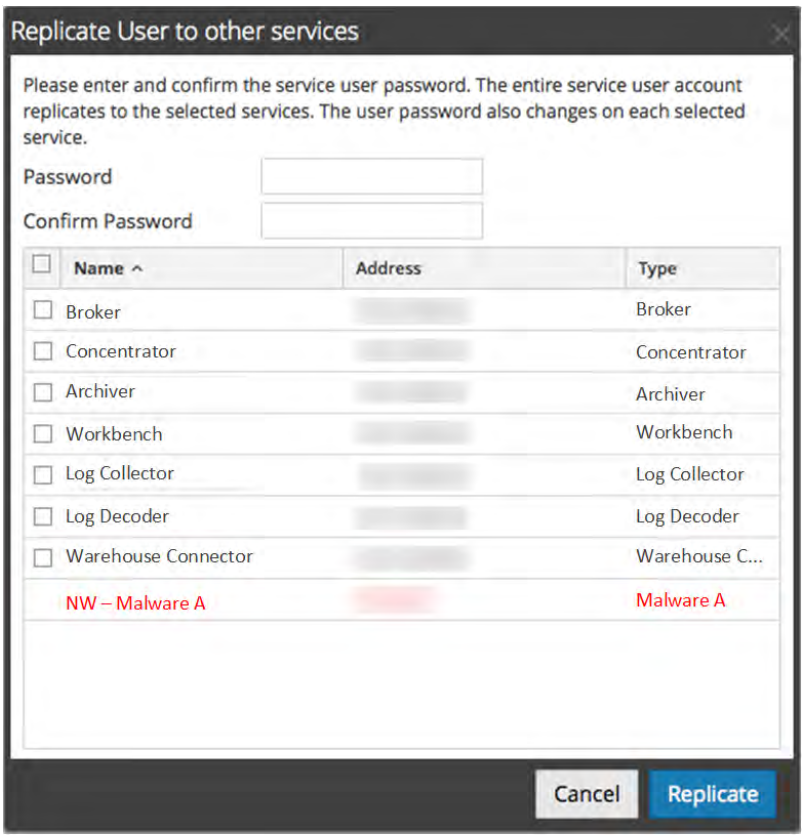
1. On the **Users** tab, click .
2. Type the user name to access the service, then press **Enter**.
   The User Information section displays the user name and the rest of the fields are available for editing.

3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:
   - **Name** for logging on to NetWitness
   - **Email** address
   - **Description** of the user
5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness authenticates the user, select **NetWitness**.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select **External**.
   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness 10.5 and later service versions and does not appear for 10.4 and earlier versions.
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.
7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

**Replicate a User to Other Services**

**Note:** The **admin** user cannot be replicated to other services.

1. In the Users tab, select a user and click **> Replicate**.
   The Replicate Users to Other Services dialog is displayed.



2. Enter and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

**Delete a Service User**

1. On the **Users** tab, select the **Username** and click −.
   NetWitness requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

## Add a User Role to a Service

There are pre-configured roles in NetWitness that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured user roles and their permissions.

| Role | Permission |
|---|---|
| Administrators | Full system access |
| Operators | Access to configurations but not to metadata and session content |
| Analysts | Access to metadata and session content but not to configurations |

| Role | Permission |
|---|---|
| SOC_Managers | Same access as Analysts and additional permissions to handle incidents |
| Malware_ Analysts | Access to malware events and to metadata and session content |
| Data_Privacy_ Officers | Access to metadata and session content and configuration options that manage obfuscation and viewing of sensitive data within the system (see *Data Privacy Management Guide*). |

You must add a service role when you have added a:

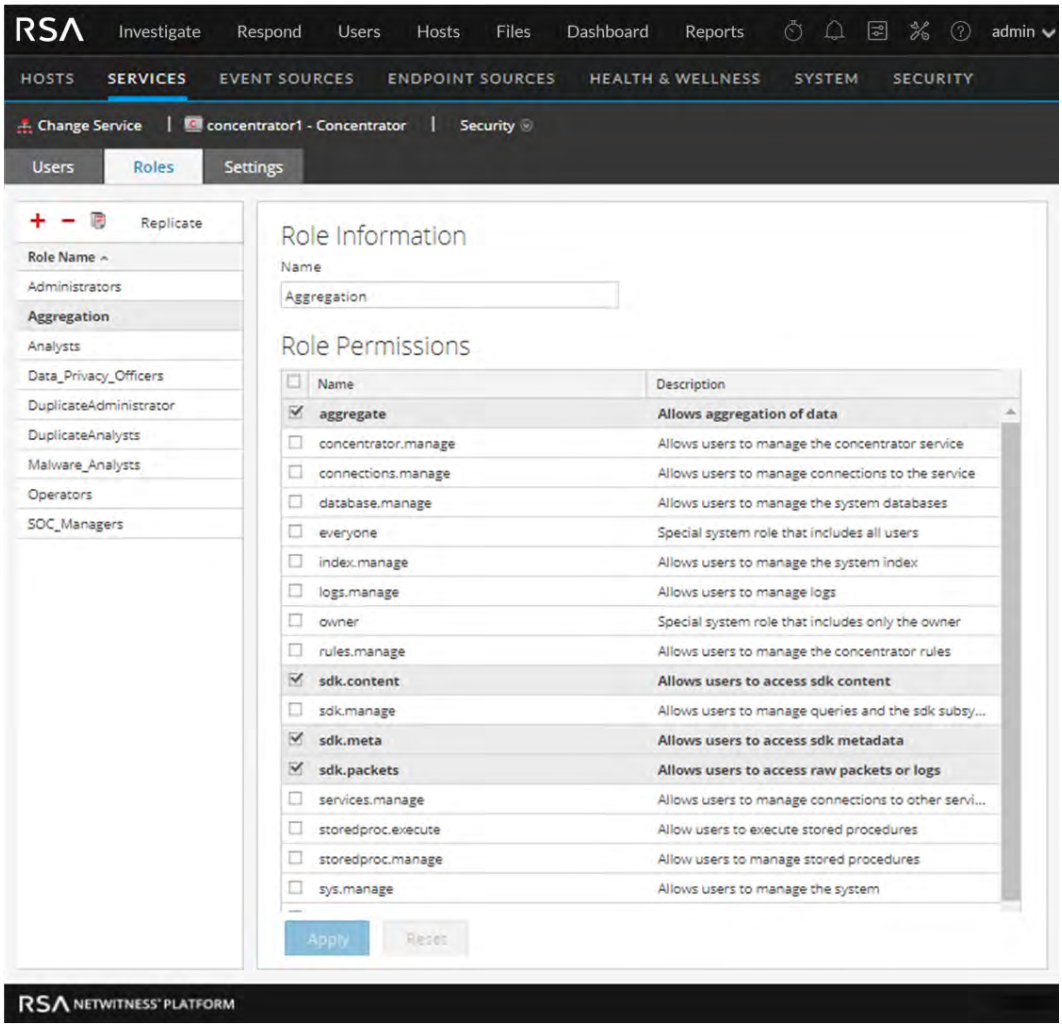
- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

There is also a pre-configured **Aggregation** service role. Services Security View - Aggregation Role and Services Security View - Service User Roles and Permissions provide additional information.

### To add a service user role and assign permissions to it:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click +.
   The Services Security view is displayed and five pre-configured roles are already listed.



4. Click +, type the **Role Name** and press **Enter**.
   The Role Name is displayed above a list of **Role Permissions**.
5. Select each permission the role will have on the service.
6. Click **Apply**.

You can add service users to the role in the **Users** tab.

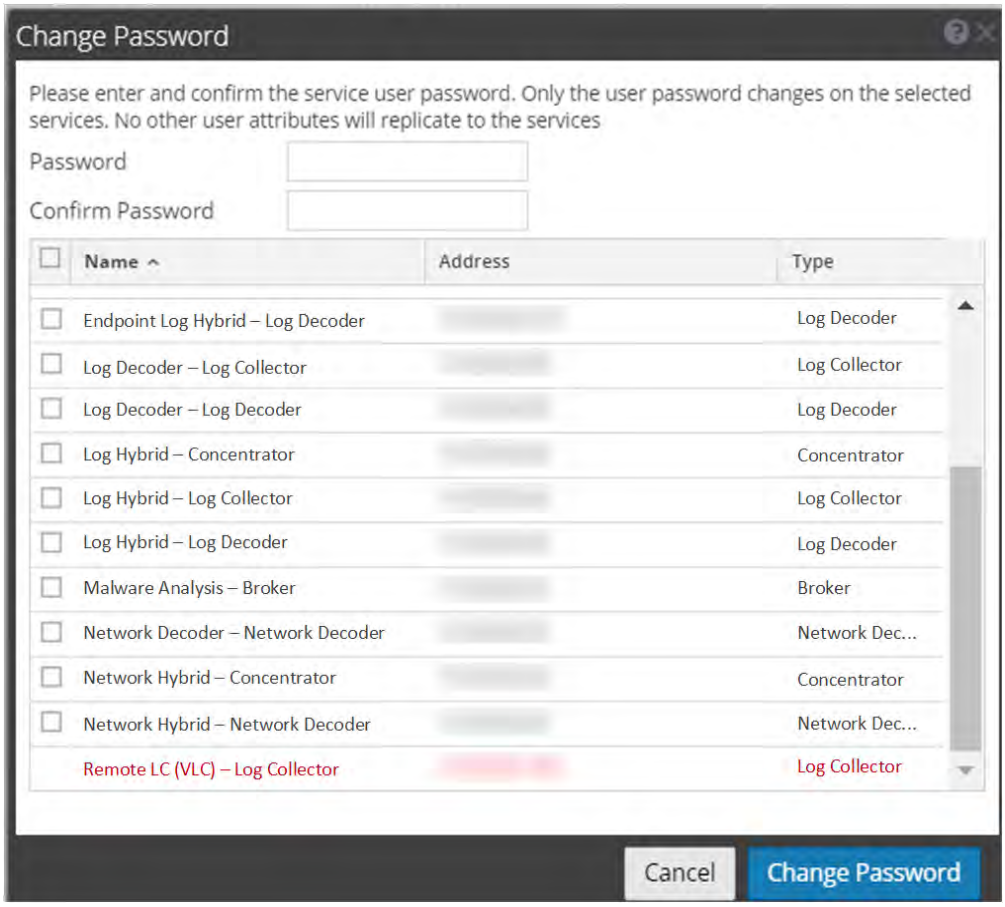
## Change a Service User Password

This procedure allows administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

**Note:** The Change Password option does not apply to external users.

### To change the password of a service user:

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, then click **> View > Security**.
   The Security view for the selected services is displayed.
3. In the **Users** tab, select a user and select **Change Password** from .
   The **Change Password** dialog is displayed.



4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

**IMPORTANT:** If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source. For details, see "Configure the Data Sources" topic in the *Reporting Engine Configuration Guide for RSA NetWitness Platform 11.x Guide*.

# Create and Manage Service Groups

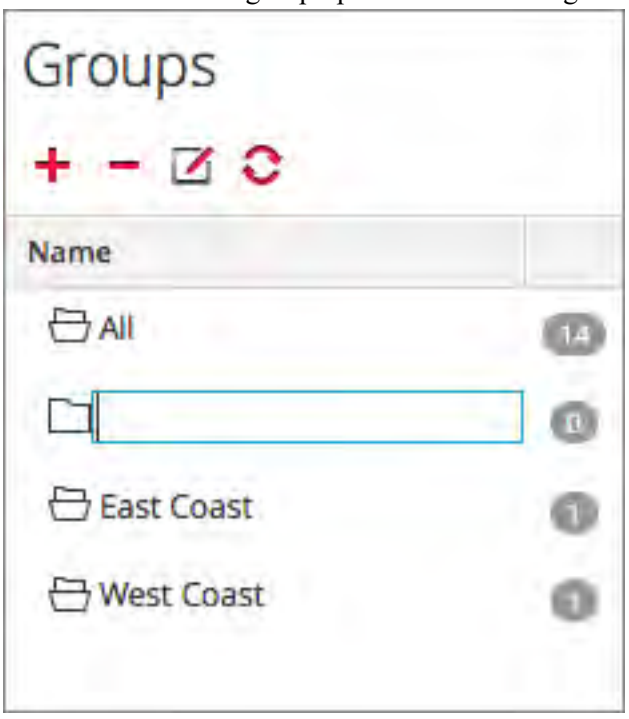
The Admin Services view provides options to create and manage groups of services. The Services list toolbar includes options to create, edit, and delete service groups. Once groups are created, you can drag individual services from the Services panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.

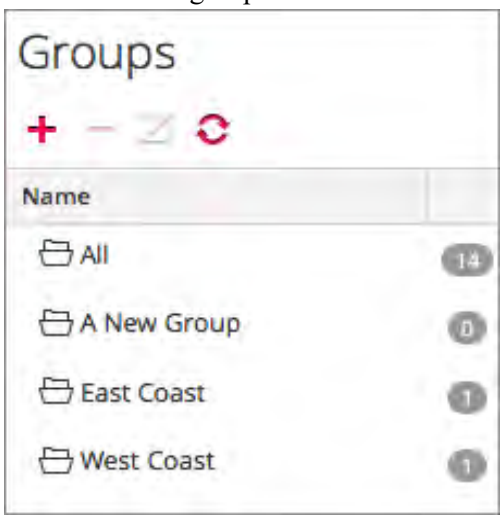
## Create a Group

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **`A New Group`**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of

services in that group.



## Change the Name of a Group

1. In the Services view **Groups** panel, double-click the group name or select the group and click . The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

## Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel.
The service is added to the group.

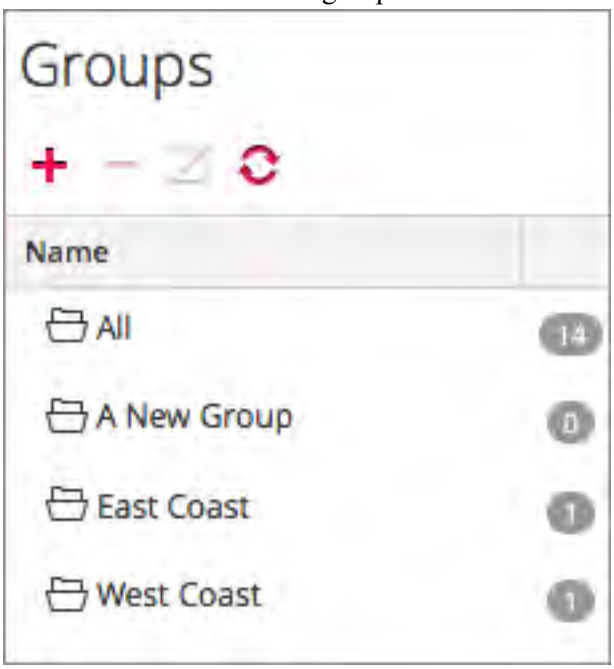
## View the Services in a Group

To view the services in a group, click the group in the **Groups** panel.

The Services panel lists the services in that group.

## Remove a Service from a Group

1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness user interface. The number of services in the group, which is listed near the group name, decreases by the number of services removed from the group. The **All** group contains the services that are removed from the group.
   In the following example, the service group called **A New Group** does not contain any services, because the service in that group is removed.



## Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness user interface. The **All** group contains the services from the deleted group.

# Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as `JuniorAnalysts` and modify the permissions.

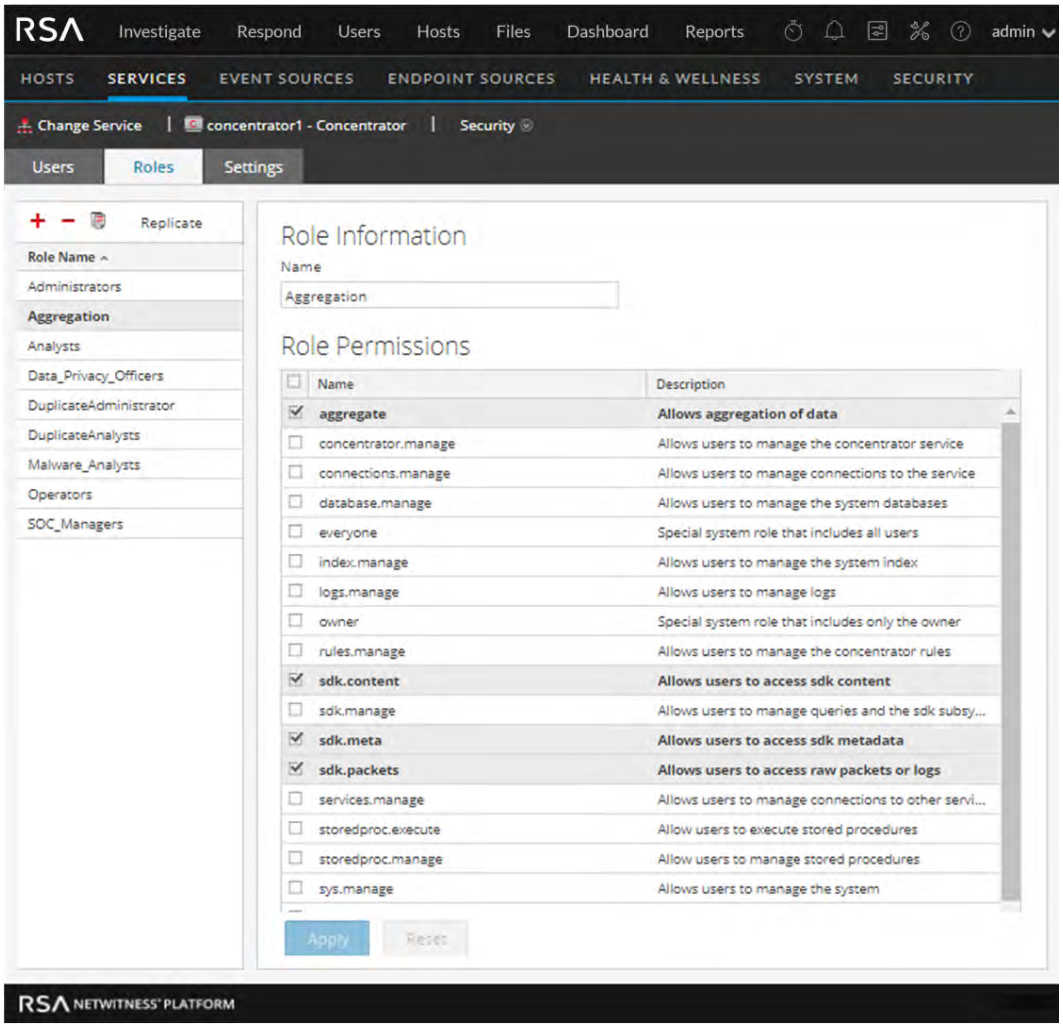
The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the `JuniorAnalysts` role that exists on a Broker to a Concentrator and Log Decoder.

### To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

## Duplicate a Service Role

1. In the **Roles** tab, select the role you want to duplicate.



2. Click **> Duplicate Role.**
3. Type a new name and click **Apply**.

4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

### Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the role.
3. Click **Replicate**.

## Edit Core Service Configuration Files

The service configuration files for Network Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services are editable as text files. In the Services Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness system is currently using.
- Retrieve and restore the latest backup of the file you are editing.
- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all Core services are the:

- The NetWitness file (`netwitness`). This is preconfigured and does not require editing.
- The service index file (`index-<service>`). This is preconfigured and may require editing.
  See Edit a Service Index File for more information.
- The scheduler file (`scheduler`). The scheduler service is optional and requires editing.
  See Configure the Task Scheduler for more information.
- The crash reporter file (`crashreporter`). The crash reporter service is optional and requires editing.
  See Enable the Crash Reporter Service for more information.
- The feed definitions file (`feed-definitions`). This file is optional and may require editing.
  See "Feed Definitions File" in the *Decoder Configuration Guide* for more information.

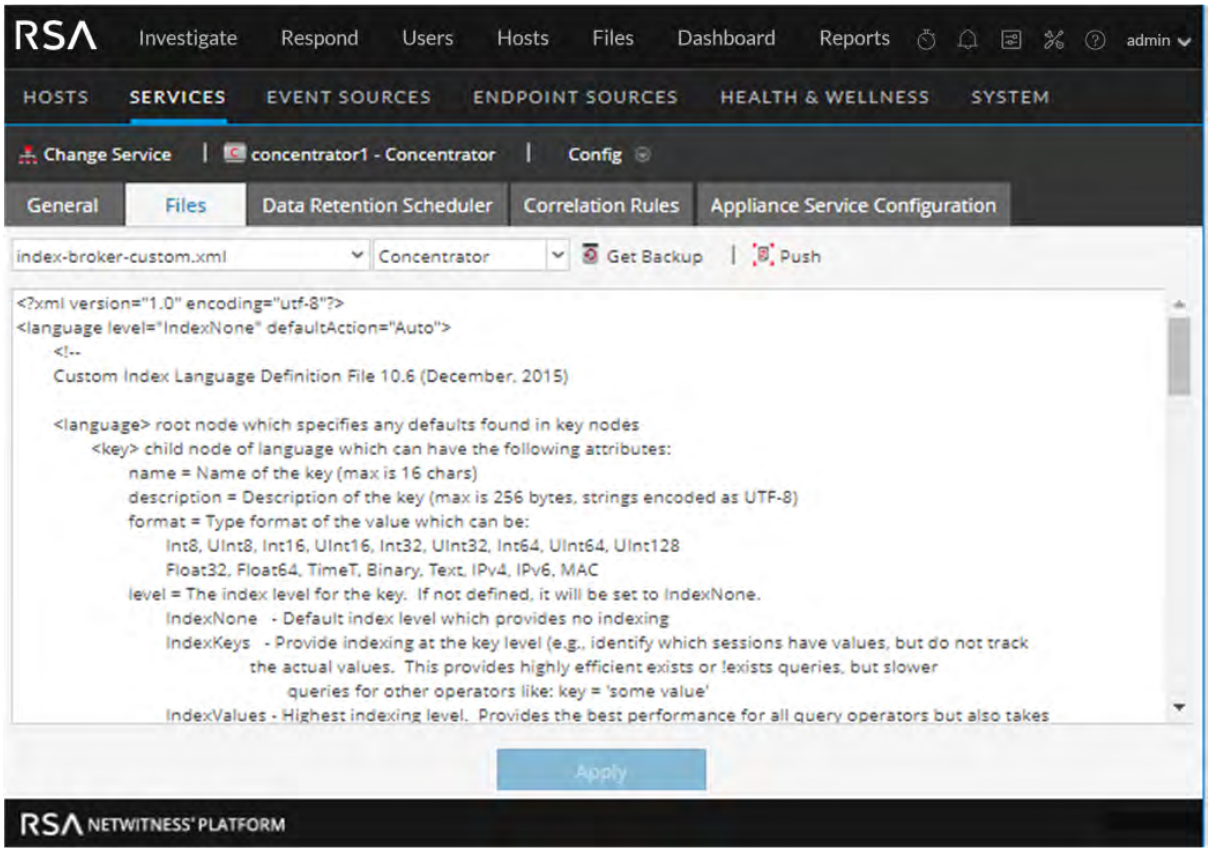
In addition, the Network Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter. There is also the table mapping file provided by RSA, `table-map.xml`, which is an important part of the Log Decoder.

**Note:** The default values in these configuration files are good for the most common situations, however some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

# Edit a Service Configuration File

### To edit a file:

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services list, select a service.
3. Select **> View > Config**.
   The Service Config view is displayed with the General tab open.
4. Click the **Files** tab.
   cThe selected service, such as Concentrator, appears in the drop-down list on the right.
5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.
6. Choose a file from the **Please Select A File To Edit** drop-down list.
   The file content is displayed in edit mode.



7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

## Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available.

**To revert to a backup of a configuration file:**

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click

.
   The backup file opens in the text editor.
3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

## Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click

.
   The Select Services dialog is displayed.
3. Select each service to push the configuration file on it. Each service must be the same type as the one you selected in the Services view.

   **Caution:** If you decide not to push the configuration file, click **Cancel**.
4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

## Edit a Service Index File

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each core service. Accessing the index file through the Service Config view in NetWitness opens the file in a text editor, where you can edit the file.

**Note:** Only administrators with a thorough and comprehensive understanding of Core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all Core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of RSA Support to bring the system back into a working state.

These are the index files:

- index-broker.xml, and index-brokereustom.xml
- index-concentrator.xml, and index-concentrator-custom.xml
- index-decoder.xml, and index-decodereustom.xml
- index-logdecoder.xml, and index-logdecodereustom.xml
- index-archiver.xml, and index-archiver-custom.xml
- index-workbench.xml, and index-workbench-custom.xml

### Index and Custom Index Files

All customer-specific index changes are made in index-<service>-custom.xml. This file overrides any settings in index-<service>.xml, which is solely controlled by RSA.

The custom index file, index-<service>-custom.xml**,** allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in index-<service>-custom.xml replace the definitions found in index-<service>.xml.
- Keys that are added to index-<service>eustom.xml and not found in index-<service>.xml are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management Guide*.
- To adjust the NetWitness Core database query performance as described in the *NetWitness Core Database Tuning Guide*.

**Caution:** Never set the index level to IndexKeys or IndexValues on a Network Decoder if you have a Concentrator or Archiver aggregating from the Network Decoder. The index partition size is too small to support any indexing beyond the default time meta key.

## Configure the Task Scheduler

### Scheduler File

You can edit the scheduler file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

### Scheduler Task Syntax

A task line in the scheduler file consists of the following syntax, where <Value> has no spaces:

<ParamName>=<Value>

If `<Value>` has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter `time` or one of the interval parameters (`seconds`, `minutes` or `hours`) is required.
- Escape special characters with a `\` (backslash).

## Task Line Parameters

The following task line parameters are accepted by the scheduler.

| Syntax | Description |
|---|---|
| **daysOfWeek**: <string, optional, {enum-any:sun\|mon\|tue\|wed\|thu\|fri\|sat\|all}> | The days of week to execute a task. The default value is all. |
| **deleteOnFinish**: <bool, optional> | Delete the task when it has successfully finished. |
| **hours**: <uint32, optional, {range:1 to 8760}> | The number of hours between executions. |
| **logOutput**: <string, optional> | Output the response to log using the specified module name. |
| **minutes**: <uint32, optional, {range:1 to 525948}> | The number of minutes between executions. |
| **msg**: <string> | The message to send the node. |
| **params**: <string, optional> | The parameters for the message. |
| **pathname**: <string> | The path of the node that receives the message. |
| **seconds**: <uint32, optional, {range:1 to 31556926}> | The number of seconds between executions. |
| **time**: <string> | The time of execution in HH::MM:SS format (local time of this server). |
| **timesToRun**: <uint32, optional> | How many times to run because service start, **0** = unlimited (default). |

## Messages

The following are the message strings to use in the Task Scheduler `msg` parameter.

| Message | Description |
|---|---|
| **addInter** | Add a task to run at a defined interval. For example, this message runs the `/index save` command every 6 hours:<br>`addInter hours=6 pathname=/index msg=save` |
| **addMil** | Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the `/index save` command at 1 AM every business day:<br>`addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri` |
| **delSched** | Deletes an existing scheduled task. The `id` parameter of the task must be retrieved from the print message. |
| **print** | Prints all scheduled tasks. |
| **replace** | Assign all scheduled tasks in one message, deleting any existing tasks. |
| **save** | Save node. |

### Sample Task Line

The following example task line in the `scheduler` file downloads the feeds package file (`feeds.zip`) to the selected Network Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget file\=http://feedshost/nwlive/feeds.zip"
```

## Enable the Crash Reporter Service

The Crash Reporter is an optional service for NetWitness services. When activated for any of the Core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to RSA for analysis. The results are forwarded to RSA Support for any further action.

The information package sent to RSA does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any Core product.

## The `crashreporter.cfg` File

One of the files available for editing in the Service Config view > Files tab is `crashreporter.cfg`, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Network Decoders, Concentrators, Brokers, and hosts.

This table lists the settings for the `crashreporter.cfg` file.

| Setting | Description |
|---|---|
| `applicationlist=decoder, concentrator, host` | Define the list of products to monitor. |
| `sitedir=/var/crashreporter` | Location of the site directory for the report. |
| `webdir=/usr/share/crashreporter/Web` | Location of the web directory. |
| `devdir=/var/crashreporter/Dev` | Location of the development directory. |
| `datadir=/var/crashreporter/data` | Location of the directory storing data files. |
| `perldir=/usr/share/crashreporter/perl` | Location of the Perl files. |
| `bindir=/usr/share/crashreporter/bin` | Location of the binary executables. |
| `libdir=/usr/share/crashreporter/lib` | Location of the binary libraries. |
| `cfgdir=/etc/crashreporter` | Location of the configuration files. |
| `logdir=/var/log/crashreporter` | Location of the log files. |
| `scriptdir=/usr/share/crashreporter/scripts` | Location of the directory containing scripts. |
| `workdir=/var/crashreporter/work` | Location of the process work directory. |
| `sqldir=/var/crashreporter/sql` | Location where created SQL files are placed. |
| `reportdir=/var/crashreporter/reports` | Location where temporary reports are created. |
| `packagedir=/var/crashreporter/packages` | Location of the created package files. |
| `gdbconfig=/etc/crashreporter/crashreporter.gdb` | Location of the `gdb` configuration file. |

| Setting | Description |
|---|---|
| `corewaittime=30` | Define the number of seconds to wait after finding a core to determine if the core is still being written. |
| `cyclewaittime=10` | Define the number of minutes to wait between search cycles |
| `deletecores=1` | Specify if the Core files should be deleted after report.<br>0 = No<br>1 = Yes<br>**Note:** Until the Core file is deleted, it is reported each time crashreporter is restarted. |
| `deletereportdir=1` | Specify if the report directory should be deleted after the report. Useful to view ore reports on box.<br>0 = No<br>1 = Yes<br>**Note:** If not deleted, the directory will be included in each subsequent package. |
| `debug=1` | Specify whether debugging messages are turned on or off in the `crashreporter` logging output.<br>0 = No<br>1 = Yes |
| `posturl=https://www.netwitnesslive.com/crash...ter/submit.php` | Define the webserver post URL. |
| `postpackages=0` | Specify if the packages should be posted to the webserver.<br>0 = No<br>1 = Yes |
| `deletepackages=1` | Specify if packages should be deleted after they are posted to webserver.<br>0 = No<br>1 = Yes |

## Configure the Crash Reporter Service

### To configure the Crash Reporter service:

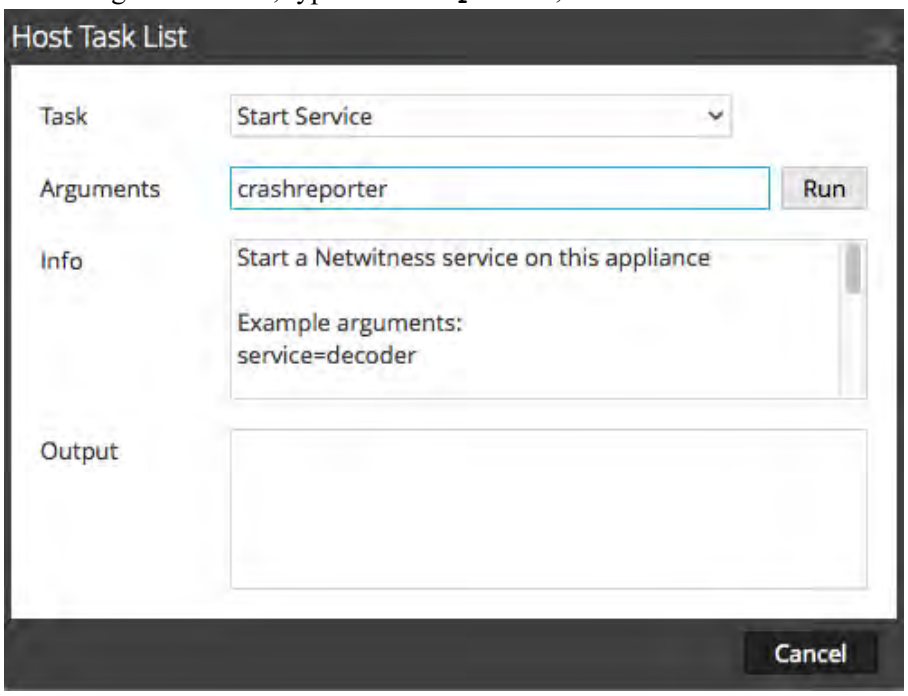
1. Select **(Admin) > Services**.
2. Select a service and click **> View > Config**.
3. Select the **Files** tab.
4. Edit `crashreporter.cfg`.
5. Click **Save**.
6. To display the Service System view, select **Config > System**.
7. To restart the service, click .
   The service shuts down and restarts.

## Start and Stop the Crash Reporter Service

### To start the Crash Reporter Service:

1. Select **(Admin) > Services**.
2. Select a service and click **> View > System**.
3. In the toolbar, click .
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.

5. In the Arguments field, type **`crashreporter`**, then click **Run**.



The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

## Maintain the Table Map Files

The table mapping file provided by RSA, `table-map.xml`, is a very important part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the `metadb`.

**Note:** Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live Services, which RSA updates as required. If you make changes to the `table-map.xml` file, they can be overwritten during a content or service upgrade.

The table map and custom table map files have two purposes:

- To translate the variables used in the Log Parsers to NetWitness meta key names
- To tell the system which keys to move onto the Concentrator.

For example, look at the out-of-the-box Palo Alto log parser, and examine one of its meta keys: `stransaddr`. This key represents the source translated address. If we look in the `table-map.xml`file we can see that this variable is listed as `Transient`:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="Transient"
format="Text" />
```

Because this variable is listed as, `Transient`, it never moved to the Concentrator. In fact, if you look at all the metadata that we parse from that log in the Concentrator, it is not listed as an available key.

Assume we change the value in the `table-map-custom.xml`file to the following:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="None"
format="Text" />
```

In this case, the key-value pair would get copied to the Concentrator, and from there you can choose whether or not to index it.

In the`table-map.xml`file, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the `table-map.xml` file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.
- If a key does not exist in the `table-map.xml`file, add an entry to the `table-map-custom.xml`file in the Log Decoder.

**IMPORTANT:** Do not update the **`table-map.xml`** file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`**file.

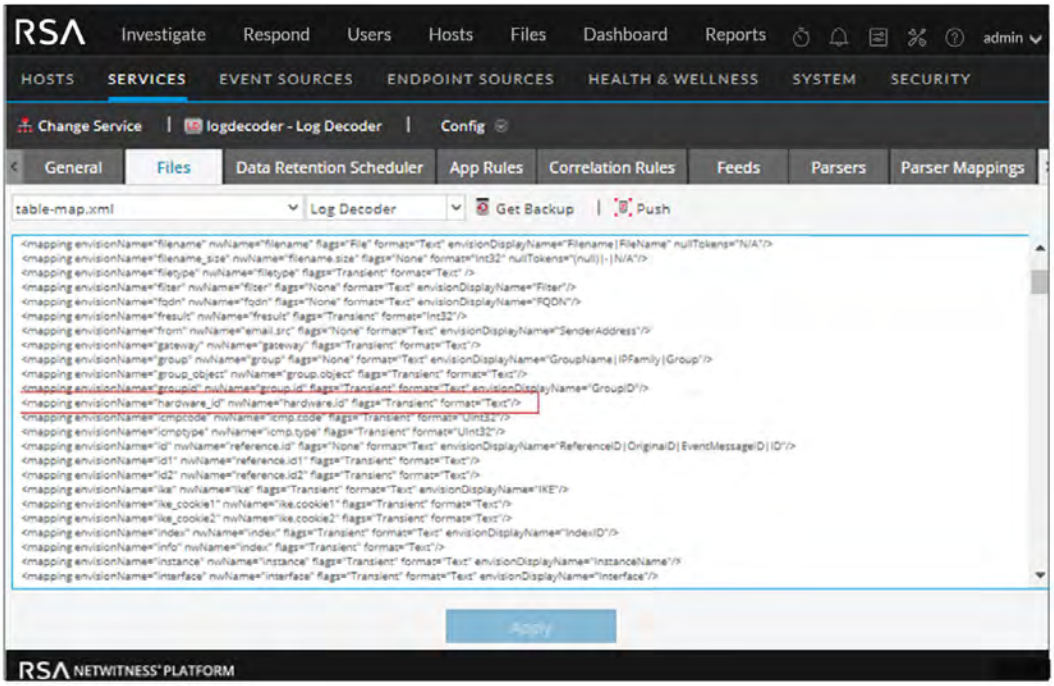
## Prerequisites

If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

### To verify and update the table mapping file:

1. Go to **(Admin) > Services**.
2. In the Services list, select a Log Decoder and click **> View > Config**.

3. Click the **Files** tab and select the **table-map.xml** file.



4. Verify that the `flags` keywords are set correctly to either `Transient` or `None`.
5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the `flags` keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the `flags` keyword shows as `Transient`:
   `<mapping envisionName="hardware_id" nwName="hardware.id"`
   **`flags="Transient"`**`/>`
   To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml` file:
   `<mapping envisionName="hardware_id" nwName="hardware.id"` **`flags="None"`**`/>`
6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

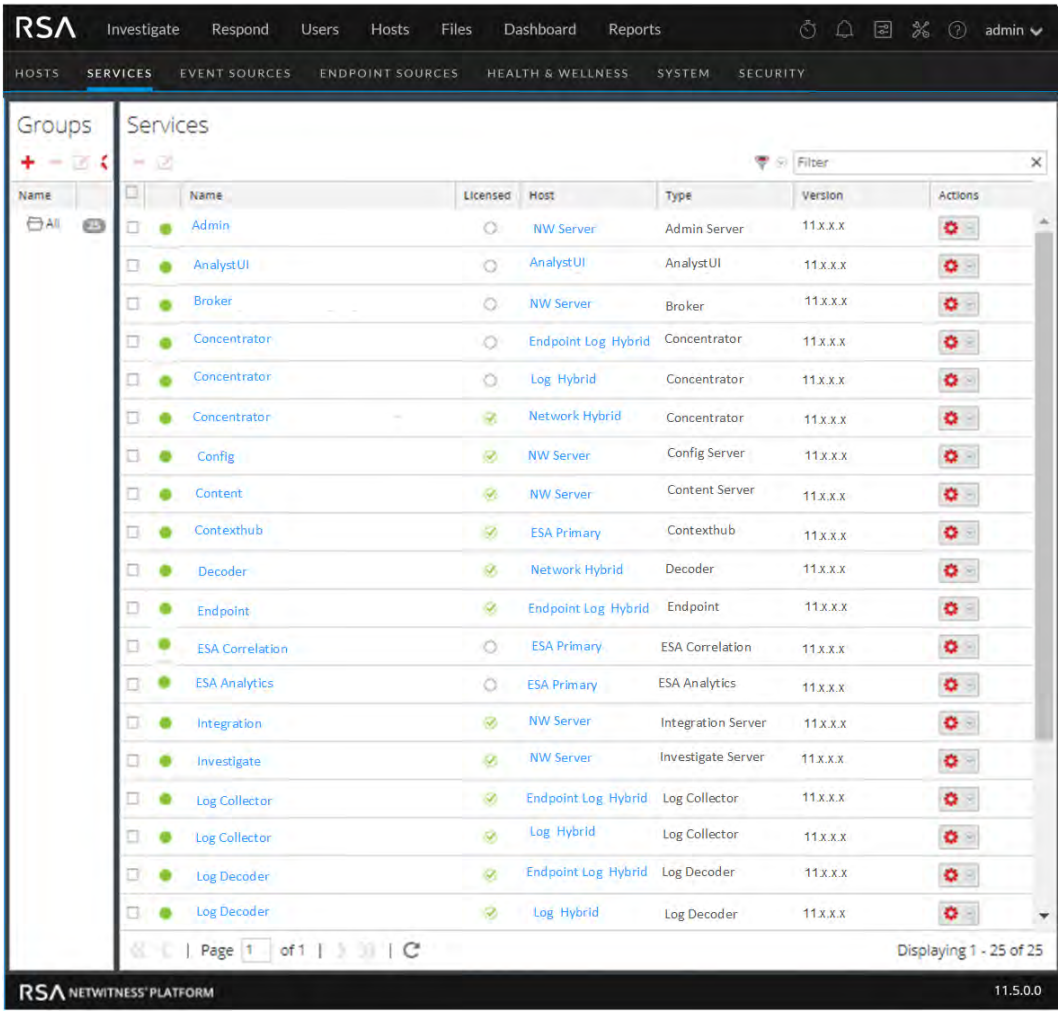
**Caution:** Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` because it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out-of-the-box. Use the `table-map-custom.xml` file for different use cases.

## Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or deleting a service that you no longer need.

Each of the following procedures starts in the Services view.

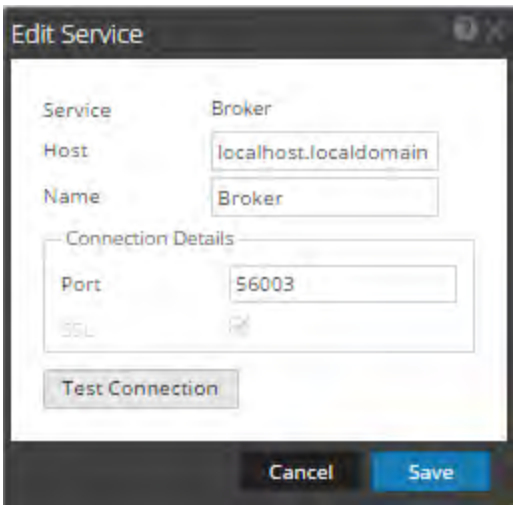
To navigate to the Services view, in NetWitness, go to **(Admin) > Services**.



## Edit a Service

1. In the Services view, select a service and either click or > **Edit**.

   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.



2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each Core service has two ports, SSL and non-SSL.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
     If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. Click **Save**.

## Delete a Service

1. In the Services view, select one or more services and either click − or > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to the NetWitness modules.

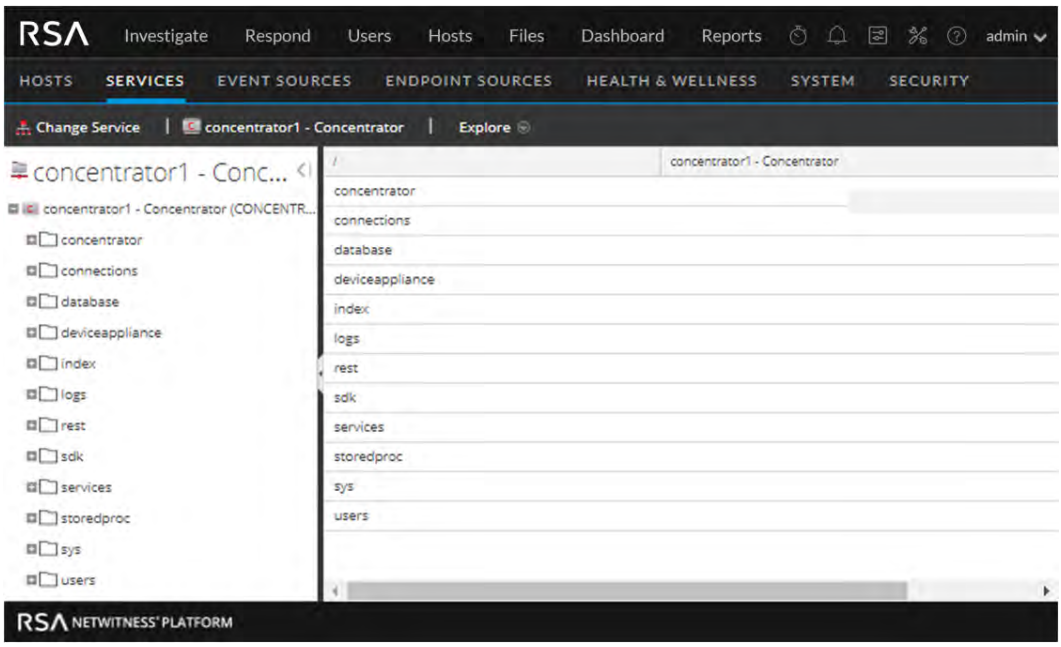
# Explore and Edit Service Property Tree

You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

### To navigate to the Explore view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then select **> View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the right.



## Display or Edit a Service Property

### To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

### To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

## Send a Message to a Node

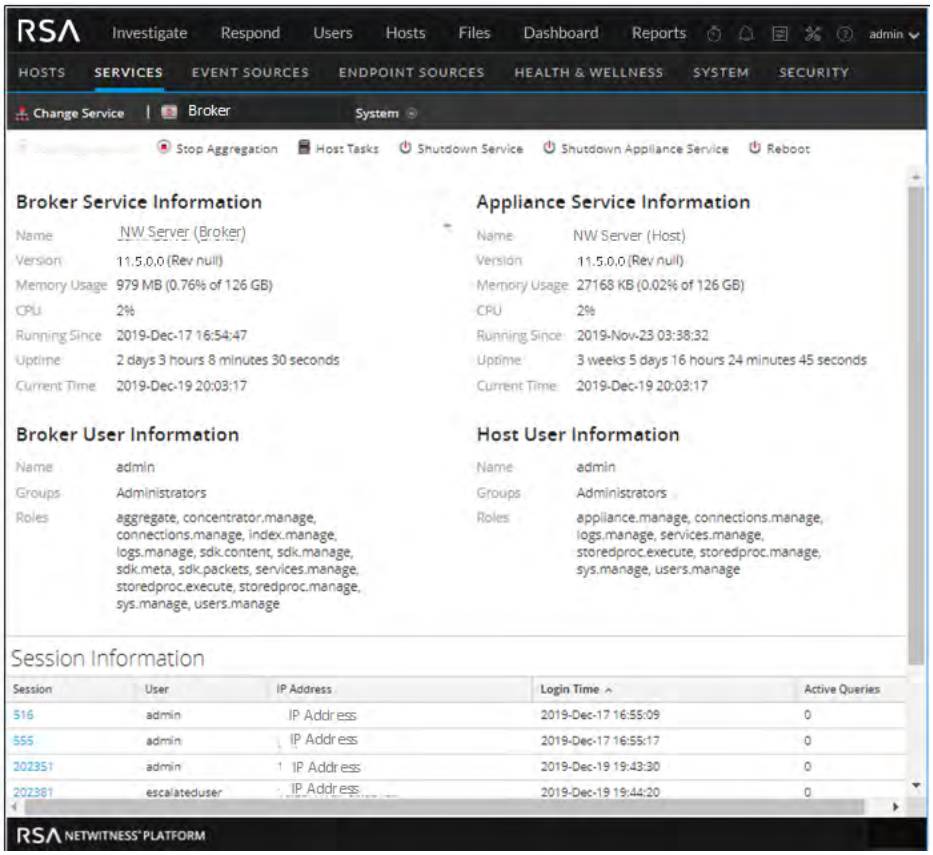
1. In the Properties dialog, select a message type from the drop-down list. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the Response Output field.

# Terminate a Connection to a Service

You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can terminate the session and the active queries in a session.

## Terminate a Session on a Service

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, and select **> View > System**.
   The Services System view is displayed.

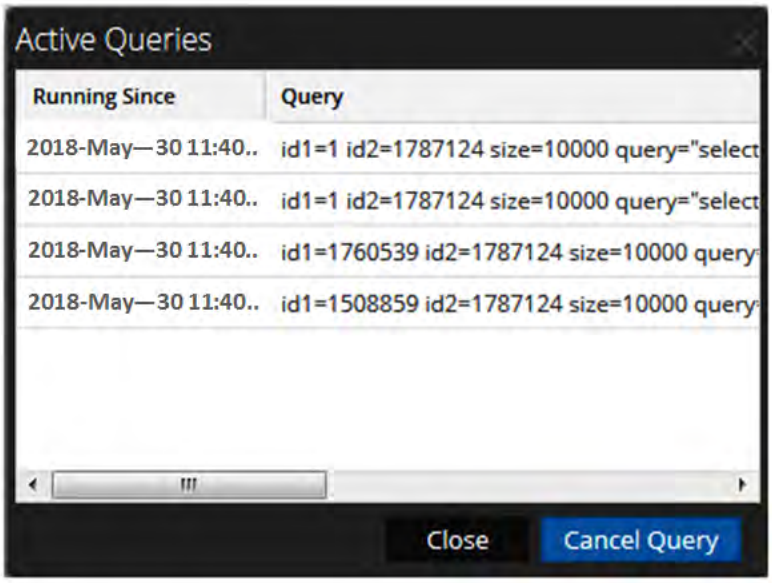


3. In the **Session Information** list at the bottom, click a session number from the Session column.
   The confirmation dialog is displayed.
4. Click **Yes**.

## Terminate an Active Query in a Session

1. Scroll down to the **Sessions** list.
2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.

   The Active Queries dialog is displayed.



3. Select a query and click **Cancel Query**.

   The query stops and the Active Queries column is updated.

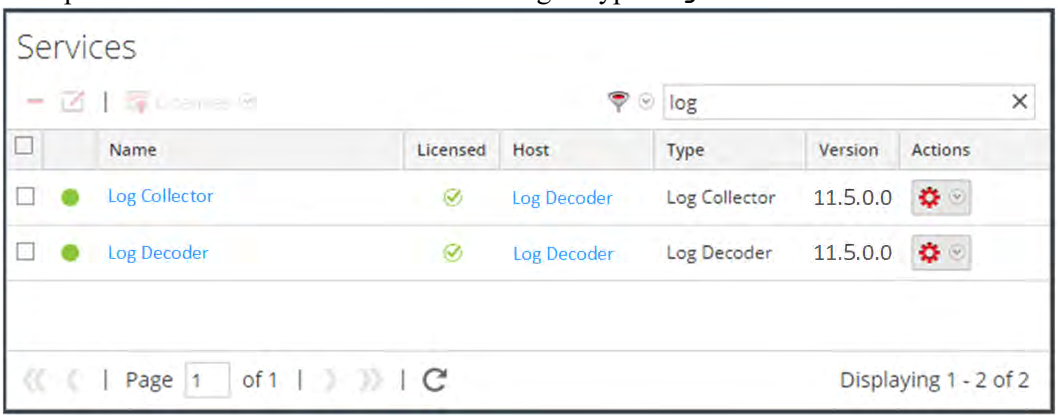
# Search for Services

You can search for services from the list of services in the Services view. The Services view enables you to quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

## Search for a Service

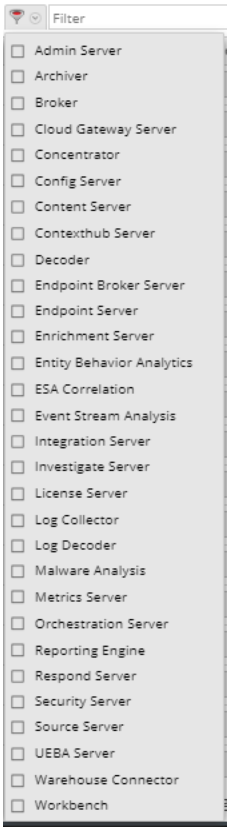
1. In NetWitness, go to **(Admin) > Services**.
2. In the **Services** list toolbar, type a service **Name**, **Host**, or service **Type** in the **Filter** field.

The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.

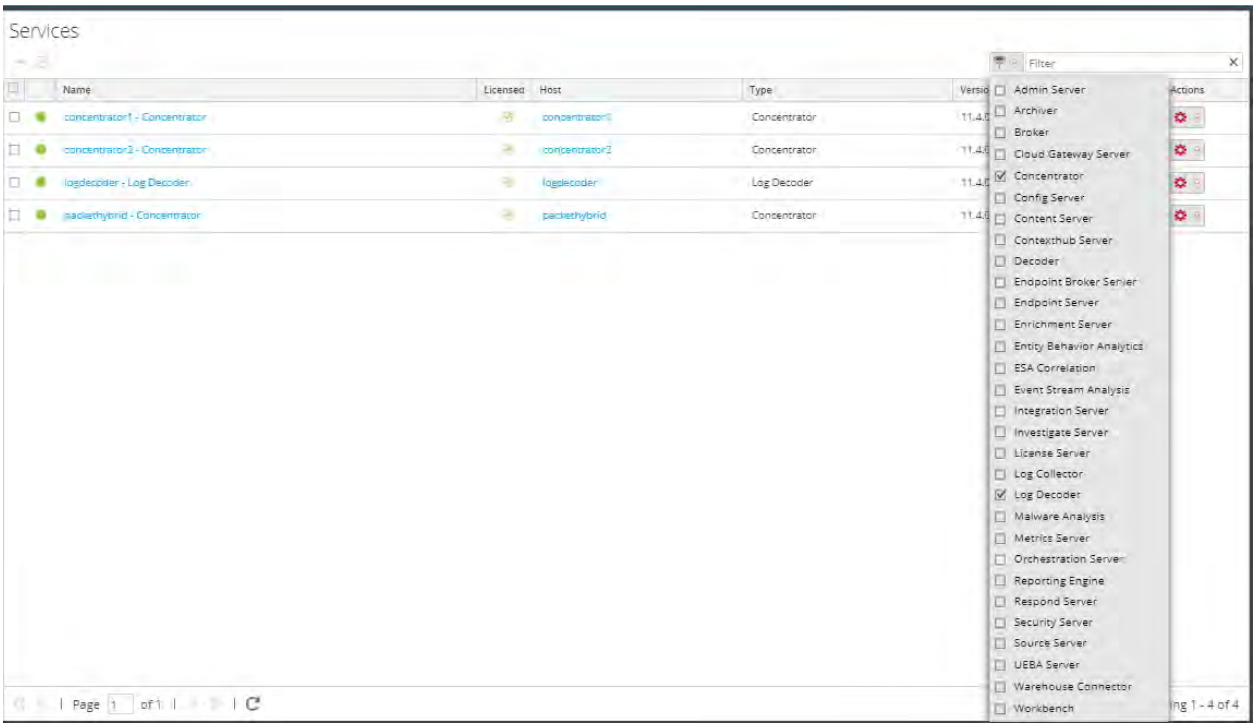


## Filter Services by Type

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services view, click and select the service types that you want to appear in the Services view.



The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.



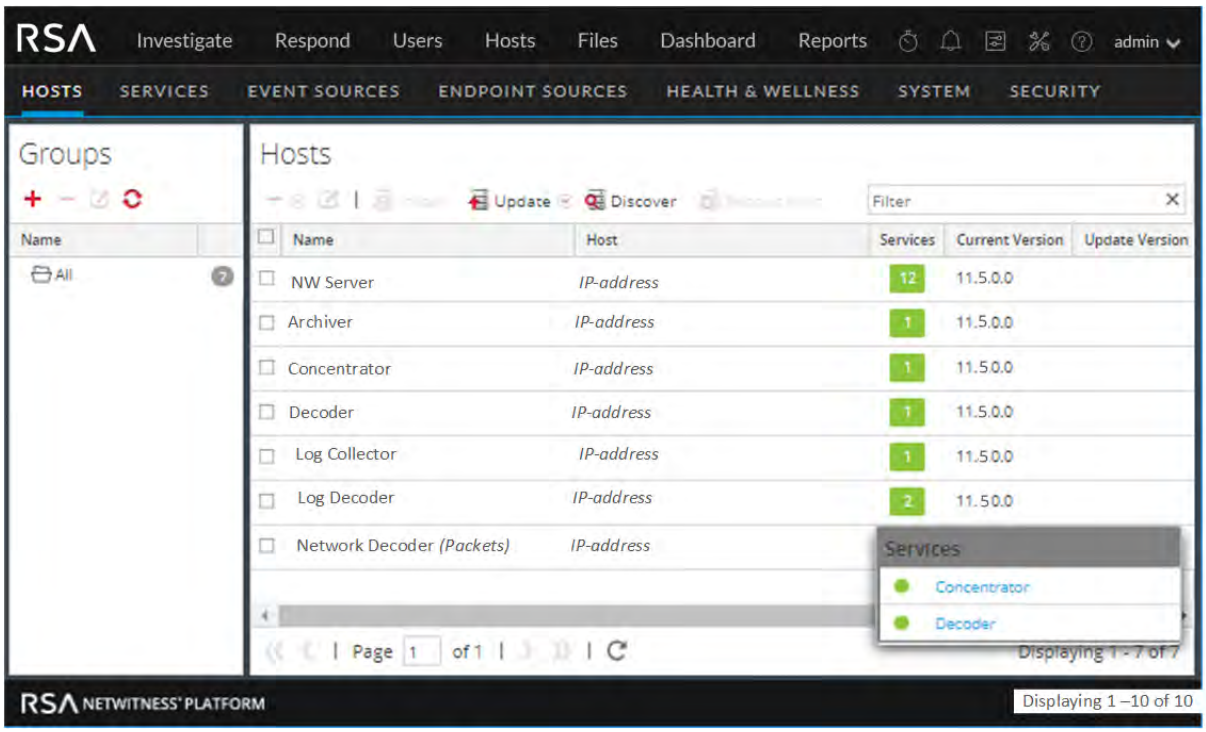
## Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness, go to **(Admin) > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.

   A list of the services on the selected host is displayed.

   In the following example, a list of two services on the selected host are listed after clicking the box containing the number 2.



3. You can click the service links to view the services in the Services view.

# Start, Stop, or Restart a Service

These procedures apply to Core services only.

Each of the following procedures starts in the Services view. In NetWitness, go to **(Admin) > Services**.

## Start a Service

1. Select a service and click > **Start**.

## Stop a Service

When you stop a service, all of its processes stop and active users are disconnected from it.

### To stop a service:

1. Select a service and click > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

## Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness displays a message.

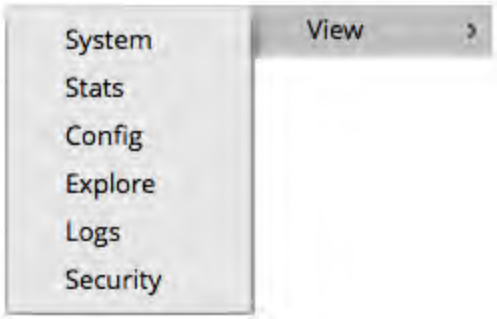
**To restart a service:**

1. Select a service and click > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

# View Service Details

You can view and edit information about services using options in the View menu for a service.



## Purpose of Each Service View

Each view displays a functional piece of a service and is described in detail in its own section:

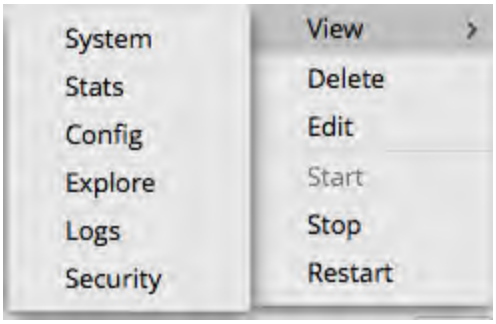
- Services System View shows a summary of service, appliance service, service user, host user, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

# Access a Service View

### To access a view for a service:

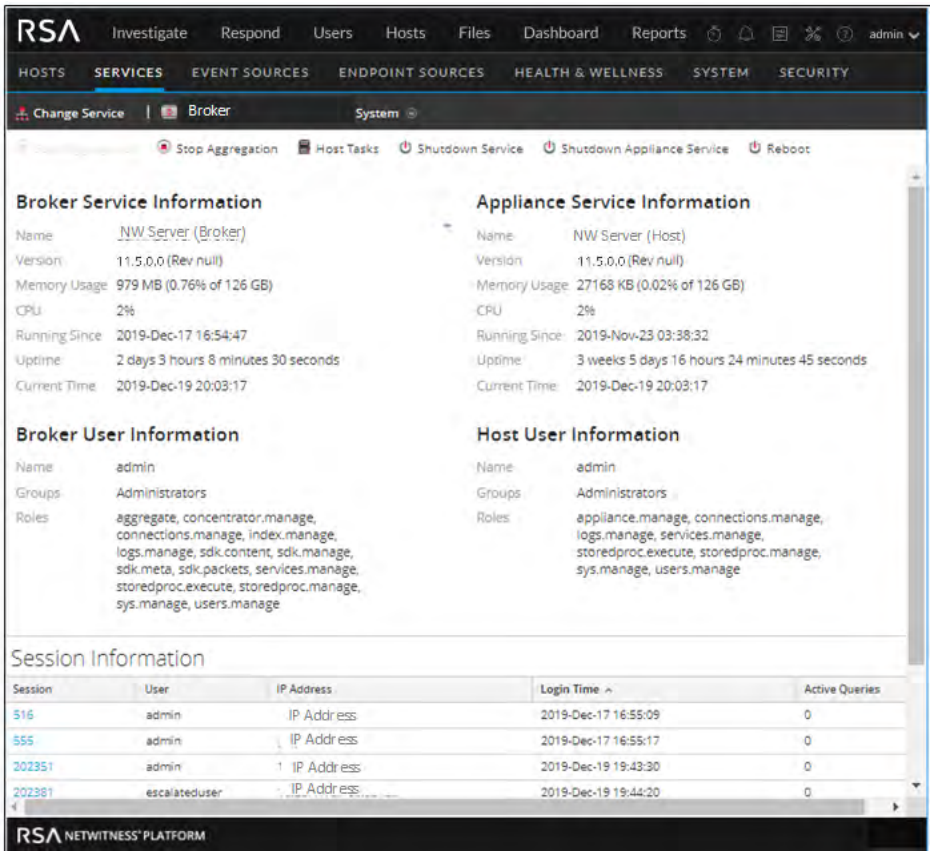
1. In NetWitness, go to **(Admin) > Services**.
2. Select a service and click **> View**.

   The View menu is displayed.

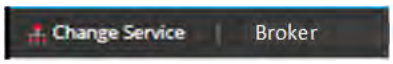


3. From the options on the left, select a view.

   Below is an example of the Services System view for a Broker.



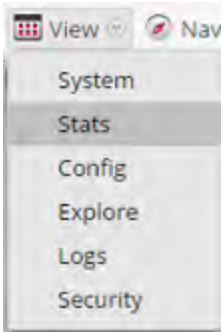
4. Use the toolbar to navigate:



a. Click **Change Service** to select another service.
   The Administrate Service dialog is displayed.

b. Select the checkbox to the left of the service that you want.

c. Select the view that you want for the service you selected in the View drop-down list.



The new view (for example, Stats) is displayed for the service you selected.

## View Topology Details

**Note:** This feature is supported in 11.7 and later.

**Note:** To view the **Service Topology Tab**, you must ensure this feature is enabled under **Admin Server** > **Explorer** > **Feature**> **service-topology-feature**.

Administrators and analysts can view all the NetWitness core services in a hierarchical layout depicting the collection and aggregation of the services in your deployment. This visualization displays the topology for Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, ESA and Log Collector and provides insights on which:

- Broker aggregates from the Concentrators.
- Concentrator aggregates from the Log Decoders.
- Log Decoder receives data from the Log Collectors.
- Log Collector sending data to other Log Collectors and vice-versa and the direction of the data flow.

**Note:** Services such as Reporting Engine, Malware Analysis, UEBA, Endpoint Server, Cloud Link Service, and Warehouse connector are not supported.

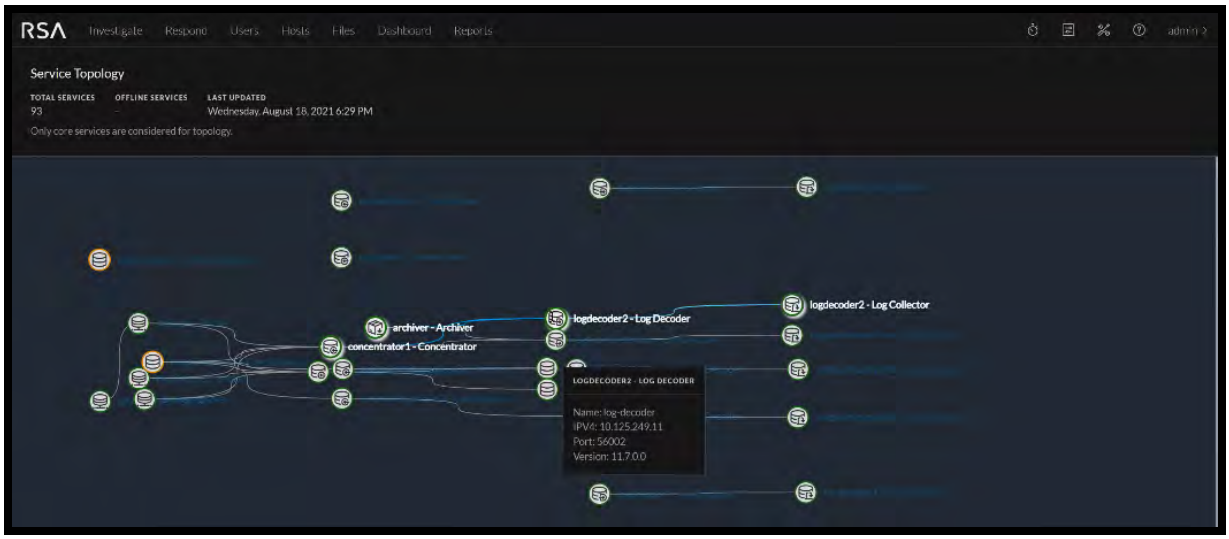
The topology is automatically refreshed once in 3 hours. You can click on any node to view the details.

To view the Topology:

1. Click > **Service Topology.**
2. Do one of the following:

- Scroll horizontally to view the complete topology.
- Click **Search** and enter the service name to locate a specific service. The specific service will be highlighted in blue color in the hierarchical layout.

3. Click on the node to view the details.
   For more information, see Services Topology View topic.



# Centralized Service Configuration via Policy

**Note:** The information in this section applies to NetWitness Platform Version 11.7 and Later.

Centralized Service Configuration allows you to manage the configuration of services in your environment efficiently. The Decoder, Concentrator, and Log Decoder deployed in your environment may be large in number and geographically distributed. Managing common configurations across the services can be time consuming. With Centralized Service Configuration, you can centrally create a policy of common configuration settings and apply the policy to a set of groups.

**Groups**

A group is a set of services based on the service type Decoder, Concentrator, and Log Decoder. You can create a group and assign policy to it based on your requirement. For example, group all the 10G Decoder services or group services within a geographical area. For more information on creating groups, see Creating Groups and Policies.

**Policies**

A Policy is a set of service configurations that you can apply to a set of groups. This allows you to efficiently manage the service settings. Once you create a customized policy, you can assign it to a group.

## Benefits of Centralized Service Configuration

- Apply customized settings in one step to any number of services

- Centrally restart all services within a group (when needed) to apply changes
- Indicates when an action is required, such as service restart, failed publication, or Out of Compliance services
- Clone policy to quickly create similar policies with minor changes
- Quickly revert changes to a policy in case of issues
- Groups of the same service type can be created based on similar hardware profiles or other criteria
- Add configuration items to policies in order to customize settings. Any settings which are not in the policy will be left as default
- (For version 11.7.1 and Later) Reconfigure 10G Network Decoders from the Policy UI. Administrators can quickly create 10G policies for each Decoder group based on the hardware profile
- (For version 11.7.1 and Later) Clone policy from an existing service, to save policy transition time for existing users

# Creating Groups and Policies

## Create a Group

You can create a group with one or more services and assign one policy to it. Atleast one service is required to publish a group.

To create a group:

1. Go to (**CONFIGURE**) > **Policies**.
2. In the left panel, click **Groups**.
3. In the tool bar, click

.
4. In the New Group panel, do the following:
   - Enter the name of the group.
   - Enter a description for the group.
   - Select the type of service for the group.
5. Click **Next**.
6. In the Define Group, click to assign services to the group.

**Note:** A service is disabled if it is assigned to another group.

7. Click **Next**.
8. In the Assign Policies, click to assign one policy to a group. Make sure that the policy and group is of same service type.
9. Do any one of the following:

- Click **Save and Publish** to save and publish the policy.

  The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:

  - To publish and restart the services immediately, click **Publish & Restart**.
  - To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
  - To cancel the restart dialog, click **Cancel**.

  The settings that do not require restart will be applied immediately.
- Click **Save and Close** to save the settings.

## Create a Policy

You can create a policy and assign it to one or more groups.

To create a policy:

1. Go to **(CONFIGURE)** > **Policies**.
2. Click **Policies**.
   The available policies are displayed.
3. Click

to add a new policy.
4. In the New Policy panel, do the following:
   - Select the policy type from the drop-down list.
   - Enter a unique policy name.
   - Enter a description for the policy.
   - Select the service type for the policy from the drop-down list.
   - (For version 11.7.1 and Later) Select the service from which you want to clone the settings.
5. Click **Next**.
6. Do any one of the following:
   - Customize the settings for the policy based on your requirement, for example, in the Database setting, click and change the Policy value to sha256 or change the byte range to 10 MB.

     **Note:** (For version 11.7.1 and Later) If you have preferred to clone from existing service, the setting values are populated automatically from the selected service on customize settings section. You can also add or modify the settings based on your requirement.
   - (For version 11.7.1 and Later) To configure 10g Settings:
     - Click **10g Settings**.

- Select the Decoder service to fetch the settings.
- Click **Done**.

7. In the Group List, click to assign groups to the policy. The policy and group should be of same service type.

**Note:** A group is disabled if another policy of the same type is already assigned to this group.

8. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:
     - To publish and restart the services immediately, click **Publish & Restart Now**.
     - To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
     - To cancel the restart dialog, click **Cancel**.

     The settings that do not require restart will be applied immediately.
   - Click **Save and Close** to save and return to the Policies view.

# Managing Groups and Policies

## View a Group

To view properties of the selected group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Click a row to view details about the selected group in the right panel.

## Delete a group

You can delete one or more groups. Once a group is deleted, the services and policies in the group will no longer displays the deleted group details.

To delete a group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select one or more groups and click **Delete**.

The confirmation message is displayed.

## Edit a Group

You can edit the properties of the group at any point in time. The service type cannot be edited. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description the status remains published (if it is already published).

To edit a group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select a group and click **Edit**.

**Note:** You cannot edit the service type.

4. Make the required changes in the group.
5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Groups view.

## Filter Groups

The Filters Panel allows you to filter the list of displayed groups, based on the service type:

- Decoder
- Log Decoder
- Concentrator

Additionally, you can filter based on publication status or service status:

- **Published**: Groups that are published.
- **Unpublished**: Groups that are saved but not published.
- **Failed**: Groups that are failed to publish.
- **N/A**: Groups for which publication status is not applicable.
- **Service Require Restart**: The services associated with the group that require restart.

The Filters panel can be hidden or displayed:

- To display if hidden, click in the toolbar.
- To hide, click at the top-right of the panel.

## Delete a Policy

To delete a policy:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select one or more policies and in the **More Actions** drop-down list in the tool bar, click **Delete**.

The delete dialog is displayed.

**Note:** The services associated with this policy still require a restart if the restart is pending.

4. Click **Delete** to permanently delete the selected policies.

The deletion will take effect immediately.

## Revert a Policy

You can revert a policy to the previously published version for a maximum of 5 times. Once a policy is reverted you cannot get back to the newer version and you must publish a policy.

**Note:** The revert is disabled if there is no previously published version.

To revert a policy:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy and in the **More Actions** drop-down list in the tool bar, click **Revert**.
   All changes made to policy will be discarded and reverted to the previously published version. You must publish the policy once it is reverted.

**Note:** If there are any missing settings in the previously published version, then a default value is set for those settings.

## Clone a Policy

You can clone only one policy at a time. Once cloned, all the settings from the old policy is copied to the new policy.

To clone a policy:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

The policy is cloned successfully.

## Edit a Policy

You can edit the settings of the policies. The service type and policy type cannot be edited. Once the policy is edited the changes in the policy is reflected upon saving the policy. The updated settings are applied to the service if published.

After saving and before publishing the publication status of the changed policy is set to Unpublished if any settings is changed.

To edit a policy:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy and click **Edit**.
4. Make the required changes in policy.

**Note:** You cannot edit service type and policy type.

5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Policies view.

## View a Policy

To view a policy:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Click a row to view details about the selected policy in the right panel.

## Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Published**: Policies that are published.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

The Filters panel can be hidden or displayed:

- To display if hidden, click in the toolbar.
- To hide, click at the top-right of the panel.

# Hosts and Services Views References

This topic is a reference for features in the NetWitness Admin user interface.

The Admin module pulls NetWitness Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

**Topics**

- Hosts View
- Services View
- Services Config View
- Services Explore View
- Services Logs View
- Services Security View
- Services Stats View
- Services System View

# Hosts View

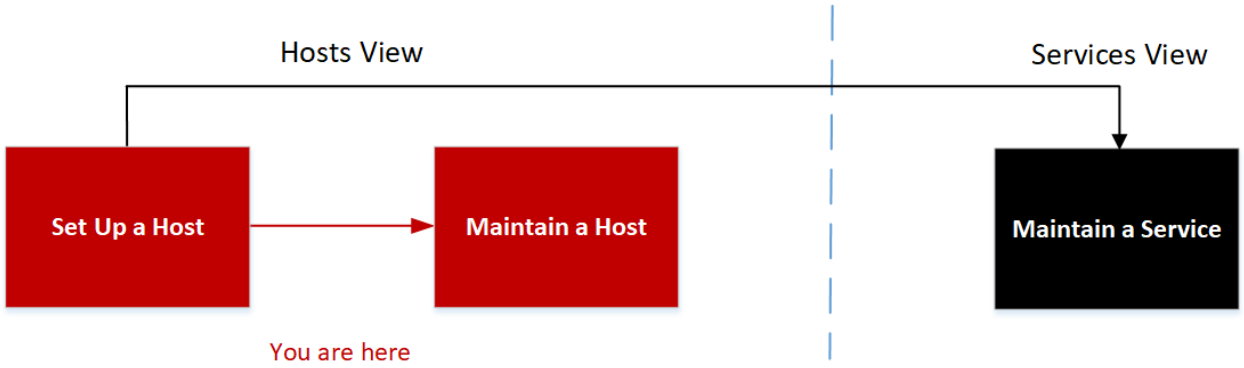
You set up and maintain the physical or virtual machine on which NetWitness services run in the Hosts view.

**IMPORTANT:** For help with resolving errors you receive during version installation and update, see Troubleshooting Version Installations and Updates .

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the Core services first. You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

## Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness versions. Setting up a host is the first task in this workflow.The hosts with Core services are set up out-of-the-box. After that, you can set up additional hosts to enhance your NetWitness deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.



## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host.* | Setting Up a Host |
| Administrator | maintain a host.* | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | apply version updates to a host.* | Apply Version Upgrades to a Host |

* You can perform these tasks in the current view.

## Related Topics:

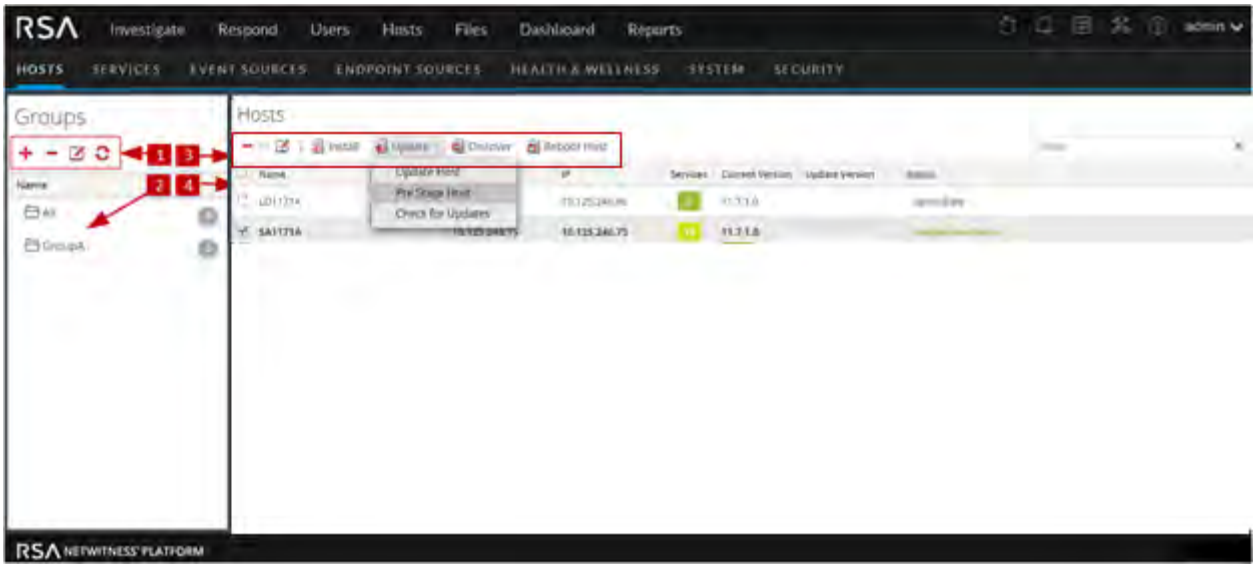
## Quick Look

This is an example of the Hosts view.



1 Groups Panel Toolbar - Provides options to work with host groups in the list.
2 Groups Panel - Lists all host groups currently in your deployment.
3 Hosts List Toolbar - Provides options to work with the Hosts list.
4 Hosts List - Lists all hosts currently in your deployment.

### Groups Panel Toolbar

| Feature | Description |
|---|---|
| + | Displays a new row in the Groups panel in which you enter the name of a new group. |
| − | Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion. |
| | Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately. |
| | Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately. |

## Groups Panel

The Groups panel provides a logical way to organize hosts, such as by function, geography, or project. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list. You can drag a host from the Hosts list to add it to a group. A host may belong to more than one group.

**Note:** In NetWitness Live, groups can subscribe to resources while individual hosts cannot.

| Column Title | Description |
|---|---|
| **Name** | The host groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group. |

## Hosts List Toolbar

The Hosts list toolbar contains the tools that you use to maintain the hosts in your NetWitness deployment.

| Feature | Description |
|---|---|
| | This drop-down list displays two options.<br>• **Remove Host**: Deletes the selected host from both the host group and the Hosts list altogether. All related services will be removed as well.<br>• **Remove From Group**: Removes the selected host from the host group. The Host will still be available in the Hosts list.<br>Changes take effect immediately. |
| | Opens the Edit Host dialog in which you edit a host or service identification and basic communication settings. See Step 1. Deploy a Host for more information. |
|   | Opens the Install Services dialog from which you can install a service on a deployed host. See Step 2. Install a Service on a Host for more information. |

| Feature | Description |
|---|---|
|  | This drop-down list displays three options.<br>• **Update Host**: Updates the selected hosts with the version you select in the Update Version column.<br>• **Pre-Stage Host:** Pre-stage the upgrade repository by downloading the required packages without affecting the system.<br>• **Check for Updates**: Checks the Local Update Repo for the latest updates available from RSA.<br>Changes take effect immediately. See Apply Version Upgrades to a Host for more information. |
| | Most of the time, the Discovery function completes automatically and you do not need to click .<br>For a fresh installation, click Discover to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness automatically discovers services running on the host and you do not need to click Discover. |
| | Restarts the host immediately. |
| | Entering a Name or Host here filters the list. This field allows you to quickly find a particular host. |

## Hosts List

| Column | Description |
|---|---|
| ☐ | Select the host by clicking the corresponding checkbox in this column. To select all of the hosts, select the checkbox in the header. |
| **Name** | Displays the name of the host that was given when the host was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order. |
| **Host** | Displays the IP address of each host. |
| **Services** | Displays the number of services added to the host. |
| **Current Version** | Displays the version that the host is currently on. |
| **Update Version** | Displays a drop-down list of versions that the user can upgrade to. See Apply Version Upgrades to a Host for more information. |

| Column | Description |
| --- | --- |
| **Status** | Displays whether or not the host is upgraded to the most current version. If the host is on the most current version, then the Status displays "Up-to-Date". |

# Services View

You set up and maintain the NetWitness services in the Services view. In the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector.
- Use shortcuts to get to administration tasks.
- Add, edit, and remove services.
- Sort services by name and host.
- Filter services by type, name, and host.
- Start, stop, and restart services.

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first.

| Services | Notes |
|---|---|
| **NW Server** | |
| Admin<br>Config<br>Content<br>Integration<br>Investigate<br>License<br>Orchestration<br>Reporting Engine<br>Respond<br>Security | Implemented with the NW Server<br>Implemented with the NW Server<br>Implemented with the NW Server<br>Implemented with the NW Server<br>Implemented with the NW Server<br>Implemented with the NW Server<br>Implemented with the NW Server<br><br>Implemented with the NW Server<br>Implemented with the NW Server |

| Log Collector<br>Log Decoder | <br>Core Service |
| **Malware Analysis** | |
| Malware Analysis<br>Broker | <br>Core Service |
| **Network Decoder** | |

| Services | Notes |
|---|---|
| Decoder (Packets) | Core Service |
| **Network Hybrid** | |
| Concentrator<br>Network Decoder | Core Service<br>Core Service |
| **New Health and Wellness** | |
| Metrics Server | |
| **UEBA** | |
| UEBA | |
| **Warehouse Connector** | |
| Warehouse Connector | Command line installation |

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data. For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Workflow

This workflow shows the procedures you complete to set up and maintain a service. Adding a service to a host is the first task in this workflow. The hosts with Core services are set up out-of-the-box. After that, you can set up additional services on hosts to enhance your NetWitness deployment.

## What do you want to do?

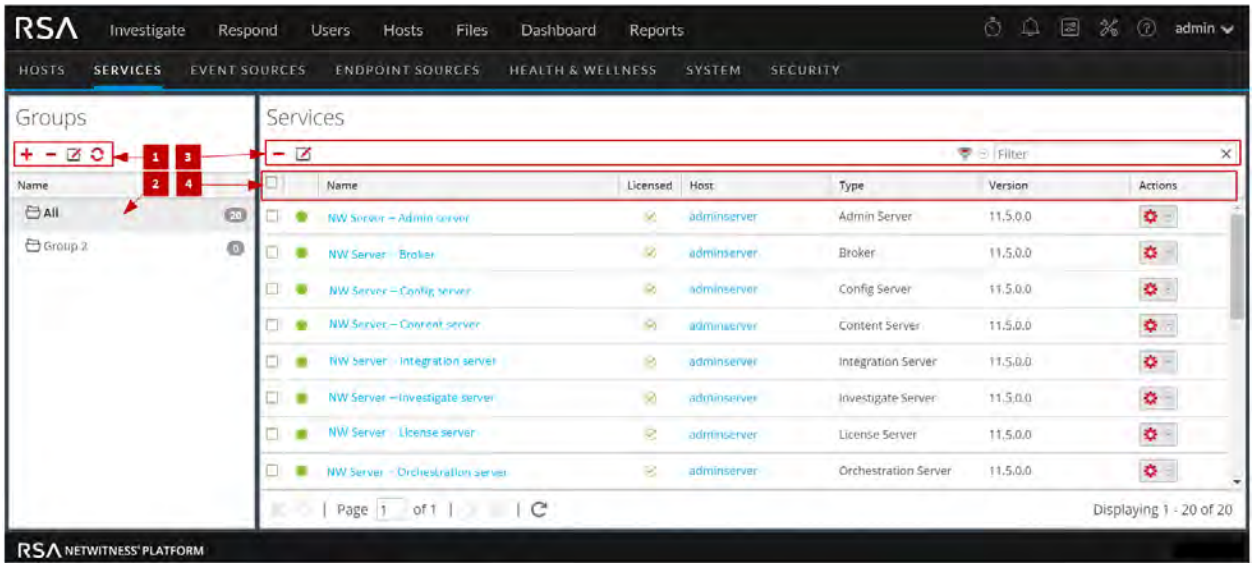
## Quick Look

This is an example of the Services view.



1 Groups Panel Toolbar - Provides options to work with service groups in the list.
2 Groups Panel - Lists all service groups currently in your deployment.
3 Services List Toolbar - Provides options to work with the Services list.
4 Services List - Lists all services currently in your deployment.

## Groups Panel Toolbar

| Feature | Description |
|---|---|
| + | Displays a new row in the Groups panel in which you enter the name of a new group. |
| − | Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion. |
| | Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately. |
| | Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately. |

## Groups Panel

The Groups panel provides a logical way to manage groups of services, such as by function, geography, or project. After you create a group, you can drag individual services from the Services panel into the group. A service may belong to more than one group.

| Column Title | Description |
|---|---|
| **Name** | The service groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group. |

## Services List Toolbar

This topic introduces the options in Services list toolbar to add, remove, edit, and get a license for services. You can also filter the services listed in the Services list.

To access the Admin Services view, in NetWitness, go to **(Admin) > Services.** The Services list toolbar is at the top of the Services list in the Services view.

| Feature | Description |
|---|---|
| + | Adds a service for your deployment of NetWitness to manage. See Step 2. Install a Service on a Host. |
| − | Deletes a service from your deployment of NetWitness. See Edit or Delete a Service. |
| | Edits service identification and basic communication settings. |
| Filter | Filters the services listed in Services view.<br>In the Filter drop-down list, you can filter the services by one or more selected service types. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down list and the Filter field at the same time to filter the services listed in the Services view. |

## Services List

| Column | Description |
|---|---|
| ☐ | Select the service by clicking the corresponding checkbox in this column. To select all of the services, select the checkbox in the header. |
| **Online/Offline Indicator** | Displays ● if the service is online.<br>Displays ● if the service is offline. |
| **Name** | Displays the name of the service that was given when the service was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order. |
| **Licensed** | Displays ✓ if the service is licensed.<br>Displays ● if the service is not licensed. If one or more services are not licensed, a red banner will appear at the top of the screen that will prompt you to fix this.<br>One or more services are not licensed. For more information, see License Details |
| **Host** | Displays the host name that the service belongs to. |
| **Type** | Displays the service type. |
| **Version** | Displays the version that the service is currently on. |

| Column | Description |
| --- | --- |
| **Actions** | Use drop-down list to:<br>• Navigate to the different service views (System, Stats, Config, Explore, Logs, Security) See View Topology Details for more information.<br>• Delete, edit, start, stop, and restart a service. See Start, Stop, or Restart a Service for more information. |

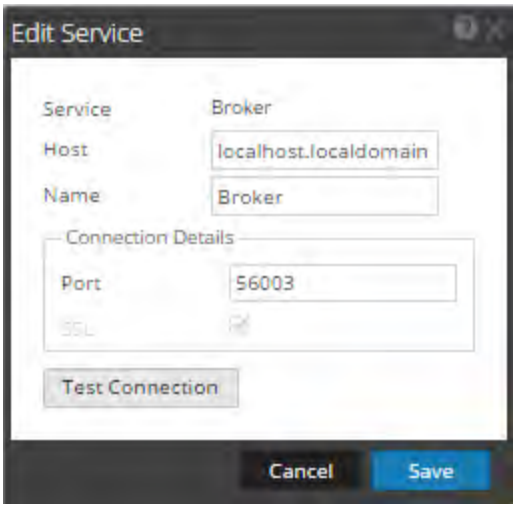
## Quick Look



The following list describes the features of the Add Service or Edit Service dialogs.

| Field or Option | Description |
|---|---|
| **Service** | Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Network Decoder, Event Stream Analysis, Incident Management, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench. |
| **Host** | Specifies the host on which the service resides. |
| **Name** | Specifies the name used to identify the service, for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well. |
| **Port** | Specifies the port used to communicate with this service. The default port, based on the selected service type in the **Service** field, is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information about ports, see "Network Architecture and Ports" in the *Deployment Guide*. |
| **SSL** | Indicates that NetWitness uses SSL for communications with this service. |
| **Username** | Specifies the username used to log in to this service. The default username is `admin`. |
| **Password** | Specifies the password used to log in to this service. The default password is `netwitness`. |
| **Test Connection** | Tests the connection of a service that you are adding. |
| **Cancel** | Closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited. |

| Field or Option | Description |
| --- | --- |
| **Save** | Adds a new service or saves changes to existing service. |

# Services Config View

The Services Config view is one of the views available from the **(Admin) > Services >** . It provides a user interface for configuring all aspects of a Core service or NetWitness service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers) or service (for example, Reporting Engine, IPDB Extractor, Log Collector, and Warehouse Connector).

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | configure an Archiver service. | See *Archiver Configuration Guide*. |
| Administrator | configure a Broker service. | See *Broker and Concentrator Configuration Guide*. |
| Administrator | configure a Concentrator service. | See *Broker and Concentrator Configuration Guide*. |
| Administrator | configure a Context Hub service. | See *Context Hub Configuration Guide*. |
| Administrator | configure an Endpoint Broker service. | See *Endpoint Configuration Guide*. |

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | configure an Endpoint Log Hybrid service. | See *Endpoint Configuration Guide*. |
| Administrator | configure an ESA Primary service. | See *ESA Configuration Guide*. |
| Administrator | configure an ESA Secondary service. | See *ESA Configuration Guide*. |
| Administrator | configure a Log Collector service. | See *Log Collection Configuration Guide*. |
| Administrator | configure a Log Decoder service. | See *Decoder Configuration Guide* |
| Administrator | configure a Malware Analysis service. | See *Malware Analysis User Guide*. |
| Administrator | configure a Network Decoder service. | See *Decoder Configuration Guide*. |
| Administrator | configure a Reporting Engine service. | See *Reporting Engine Configuration Guide*. |
| Administrator | configure a Respond service. | See *NetWitness Respond Configuration Guide*. |
| Administrator | configure a UEBA service. | See *NetWitness UEBA User Guide*. |
| Administrator | configure a Warehouse Connector service. | See *Warehouse Connector Configuration Guide*. |
| Administrator | configure a Workbench service. | See *Workbench Configuration Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

- Services Config View - Data Retention Scheduler Tab
- Services Config View - Files Tab

# Services Config View - Appliance Service Configuration Tab

The Appliance Service Configuration tab appears in the Services Config view for the Archiver, Broker, Concentrator, IPDB Extractor, Network Decoder, Log Collector, and Log Decoder services.

This topic lists and describes the available configuration parameters for the NetWitness Core Appliance service. The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service.* | Maintaining Services |
| Administrator | view or modify appliance service parameters.* | See "Services Config View - Appliance Service Configuration Tab" in the *Hosts and Services Getting Started Guide for Version 10.x*and prior. |

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | specify how long to retain database records. | See "Configure Data Retention" in the *Data Privacy Management Guide*.<br>For information about the Data Retention tab for Archiver, see "Data Retention Tab - Archiver" in the *Archiver Configuration Guide*. |
| Administrator | edit `.xml` and `.lua` files. | Edit Core Service Configuration Files |

* You can perform these tasks in the current view.

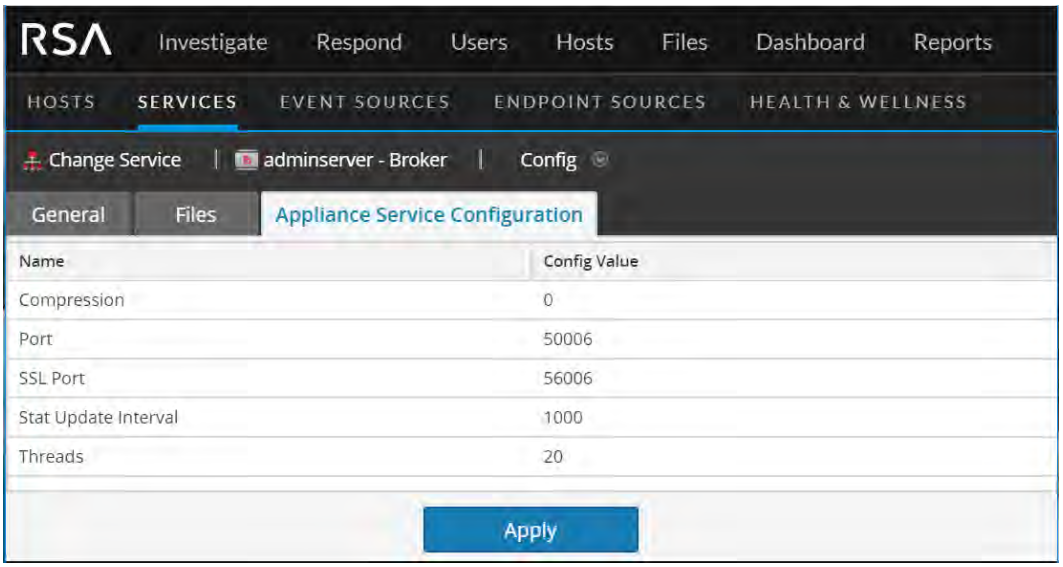
## Quick Look

This is an example of the Appliance Service Configuration tab for a Broker.



The following list describes the configuration values for this tab.

| Name | Description of Configuration Value | When Changes Take Effect |
|---|---|---|
| Compression | Compresses a message when it reaches the positive number (in bytes) that you specify. | The next time you connect to this service. |
| Port | Unencrypted listening port.<br>**0** indicates that the port is disabled. | Upon restart of the service. |
| SSL FIPS Mode | One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). For detailed instructions, see "Activate or Deactivate FIPS" in the *System Maintenance Guide*. | Upon restart of the service. |
| SSL Port | SSL (Secure Sockets Layer) listening port.<br>**0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral. | Upon restart of the service. |
| Stat Update Interval | How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness. | Immediately. |
| Threads | Threads in thread pool required to used to handle requests. The `Threads` parameter works with the `Polling Interval` parameter for event and log threads. | Immediately. |

## Services Config View - Data Retention Scheduler Tab

The Data Retention Scheduler tab appears in the Services Config view for the Network Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Network Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

**Note:** If additional customization is necessary, use the Scheduler under the Files tab in the Services Config view. For example, if you have storage available to save the RAW data versus the metadata, use `Capacity` as the threshold and to set different thresholds per database (metadata versus packet).

## Workflow

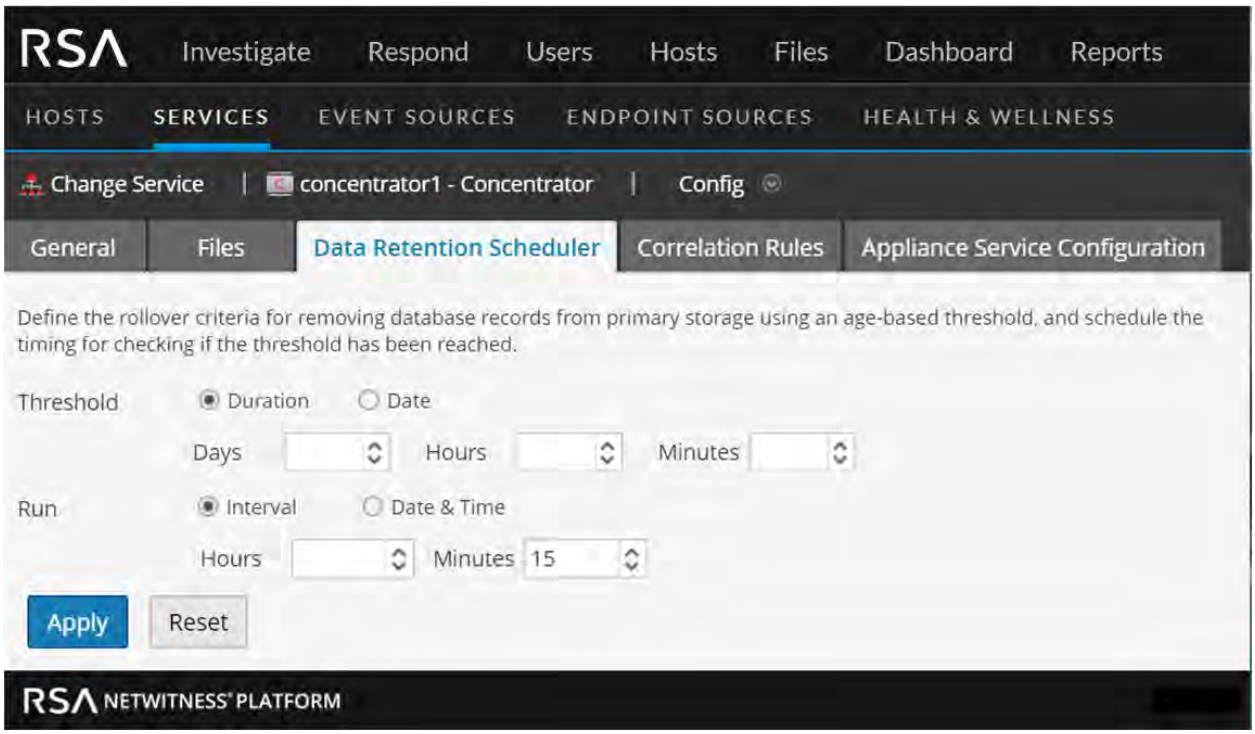
## Quick Look

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.



The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

| Parameter | Description |
|---|---|
| **Threshold** | The threshold is based on the age of the data, the amount of time the data was stored or the date on which the data was stored. The date is from the database file, not from the actual session time.<br>• **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.<br>• **Date**: The removal of data based on the date of the timestamp.<br>Specifies the monthly date and time in the and fields. |
| **Run** | The schedule for running the job that checks rollover criteria.<br>• **Interval**: Schedule the database check to occur at a regular interval. Specifies the hours and minutes between the scheduled checks.<br>• **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are `Everyday`, `Weekdays`, `Weekends`, and `Custom`, where `Custom` allows you to select one or more specific days of the week. |

| Parameter | Description |
|---|---|
| **Apply** | Overwrites any previous schedule for this service and applies the new settings immediately.<br>**Caution:** After you apply these settings, when the threshold is met the system deletes the old data from the database and you can no longer access it. |
| **Reset** | Resets the schedule to the last applied state. |

## Services Config View - Files Tab

The Files tab appears in the Services Config view for Archivers, Brokers, Concentrators, Log Decoders, and Network Decoders.

In the Files tab, you can edit service configuration files as text files. The files you can edit vary depending upon the type of service you are configuring. The following files are common to all Core services.

- The NetWitness file (`netwitness`)
- The service index file (`index-<service>`)
- The scheduler file (`scheduler`)
- The crash reporter file (`crashreporter`)
- The feed definitions file (`feed-definitions`)

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

**Note:** The default values in the configuration files cover most common situations. You may need to edit configuration parameters and values for optional services, such as the crash reporter or scheduler. Do not change these values in the Files tab unless you understand networks and the factors that affect the way services collect and parse data.

More detail on the service configuration parameters is available in the Service Configuration Settings.

## Workflow

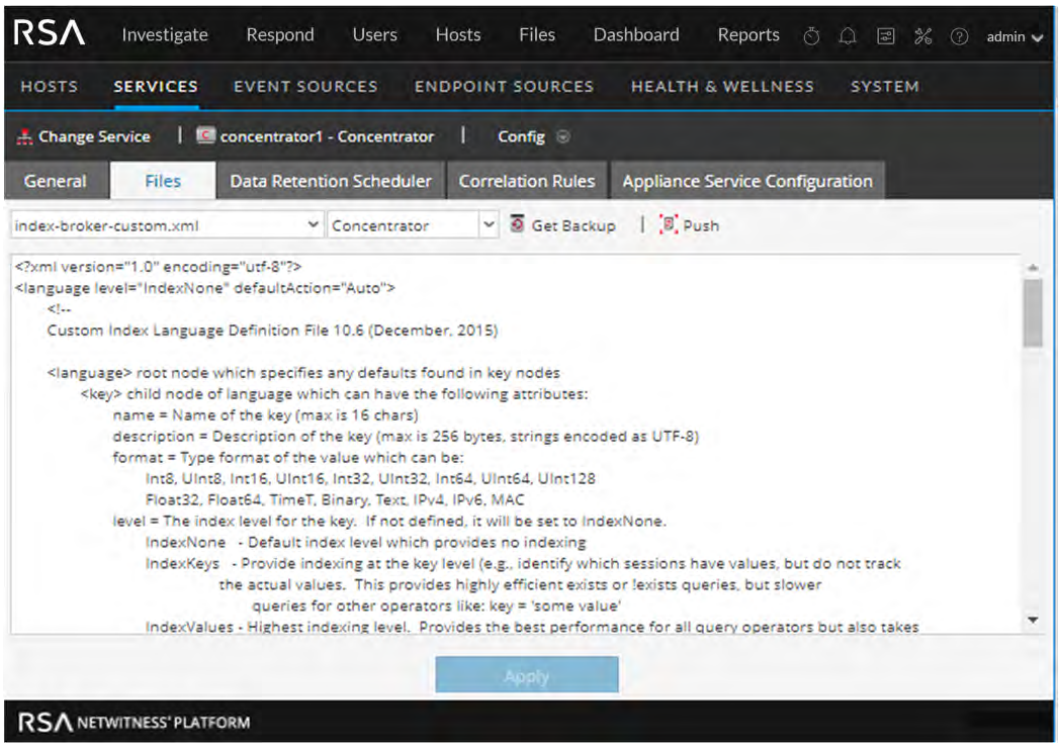
## Quick Look

This is an example of the Files tab.



## Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

| Feature | Description |
|---|---|
| **File** drop-down list | Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use. |
| **Service** / **Host** drop-down list | Displays the service type and host. You can open a file from either the service or the host for editing. |
| Get Backup | Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**. |
| Push | Displays a dialog in which you can select services of the same type and push the currently viewed file to the services. |
| **Apply** | Overwrites the current file and creates a backup file. |

# Services Explore View

You can use the NetWitness Services Explore view ( **(Admin) > Services**, **> View > Explore**) to display and edit both host and service configurations.

The Services Explore view offers advanced access and control of all NetWitness hosts and services. All services expose their functionality through a treelike series of nodes, similar to the Windows Explorer view of a Windows file system. Here you can:

- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore view can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node.

**Caution:** A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | view and edit host and service configurations.* | Explore and Edit Service Property Tree |

* You can perform these tasks in the current view.

## Related Topics

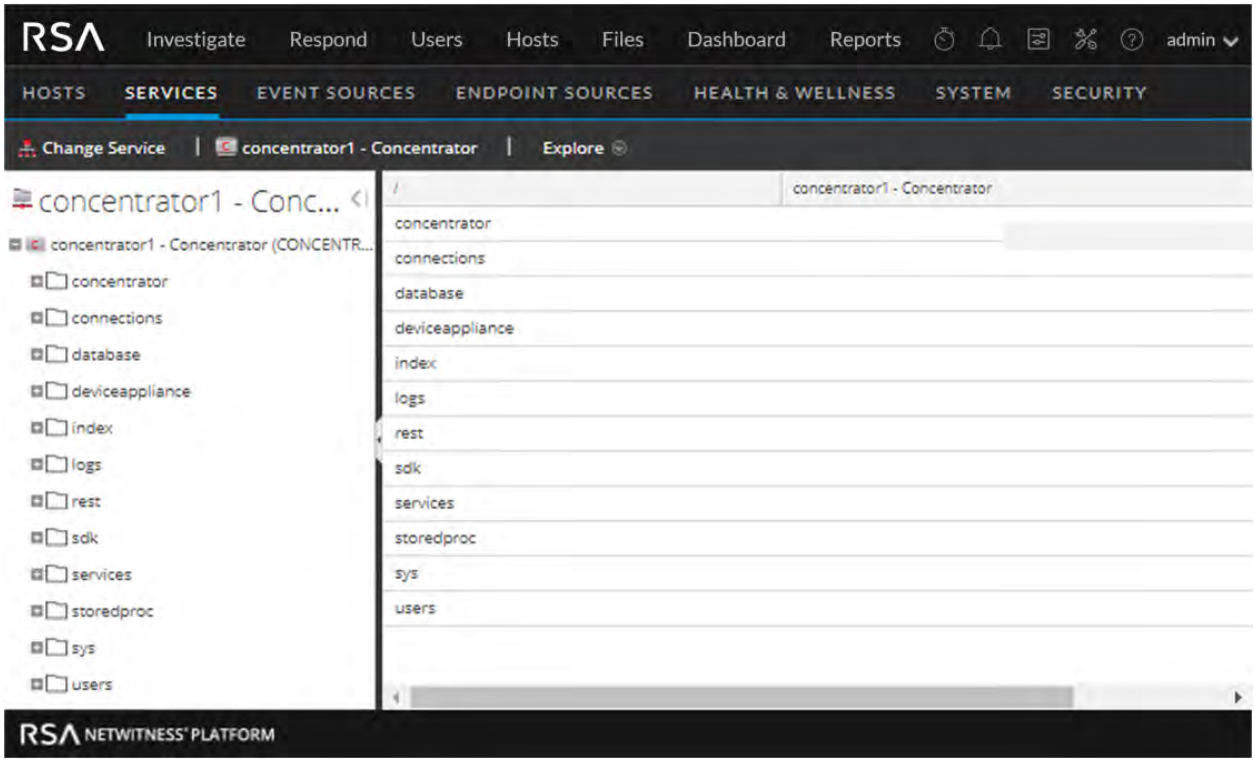
## Quick Look



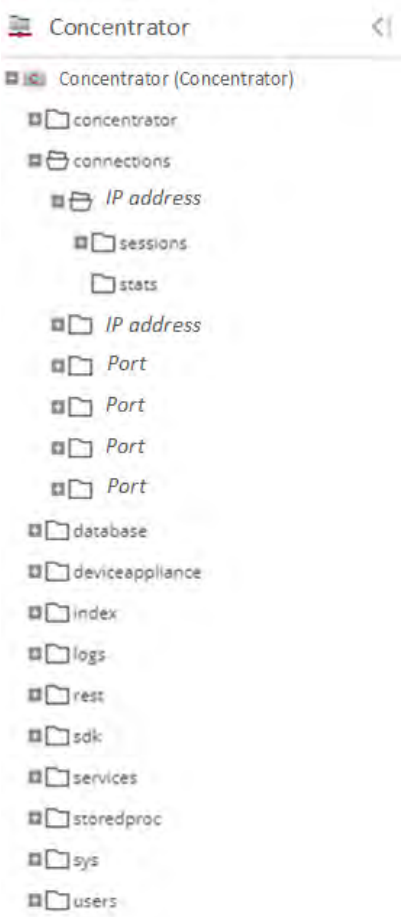
The Services Explore View has two main panels:

- The Node list
- The Monitor panel

You can right-click on a file to access the Properties for the file. See Services Explore View - Properties Dialog for more information.

### The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.



Each root folder is named based on the functionality it exposes. For instance, the `/connections` folder shows all connected IP addresses. Underneath each IP address or port in the list are two folders, `sessions` and `stats`.

- The `sessions` folder displays all authenticated user sessions originating from the IP/Port.
- The `stats` folder displays values, such as the number of messages sent or received, bytes sent or received, and other values set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the Monitor panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and Monitor panel.

## The Monitor Panel

The Monitor panel displays properties and values for a selected node (such as `index`) and a child folder (such as `config`). There are two ways to edit values:

- Click the value and type a new value
- Send a `set` message in the Properties dialog

| /index/config | Concentrator |
|---|---|
| index.dir | /var/netwitness/concentrator/index=2.89 TB |
| index.dir.cold | |
| index.dir.warm | |
| index.slices.open | 42 |
| page.compression | huffhybrid |
| reindex.enable | true |
| save.session.count | auto |

- View Topology Details

# Services Explore View - Properties Dialog

You can use the Services Explore view > Properties dialog to perform the following tasks.

- Send messages to a system node
- Retrieve values for a property for multiple services
- Set values for a property for multiple services

Right-click any file in the Node list or Monitor panel to display the Properties context menu.

When you select `Properties` from the Node list or Monitor panel context menu, the Properties dialog opens below the Monitor panel. All nodes have support help that contains the following information.

- A description of the node
- The list of supported messages with a corresponding description
- Security roles needed to access the messages

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness dashboard or view.

## Workflow

## What do you want to do?

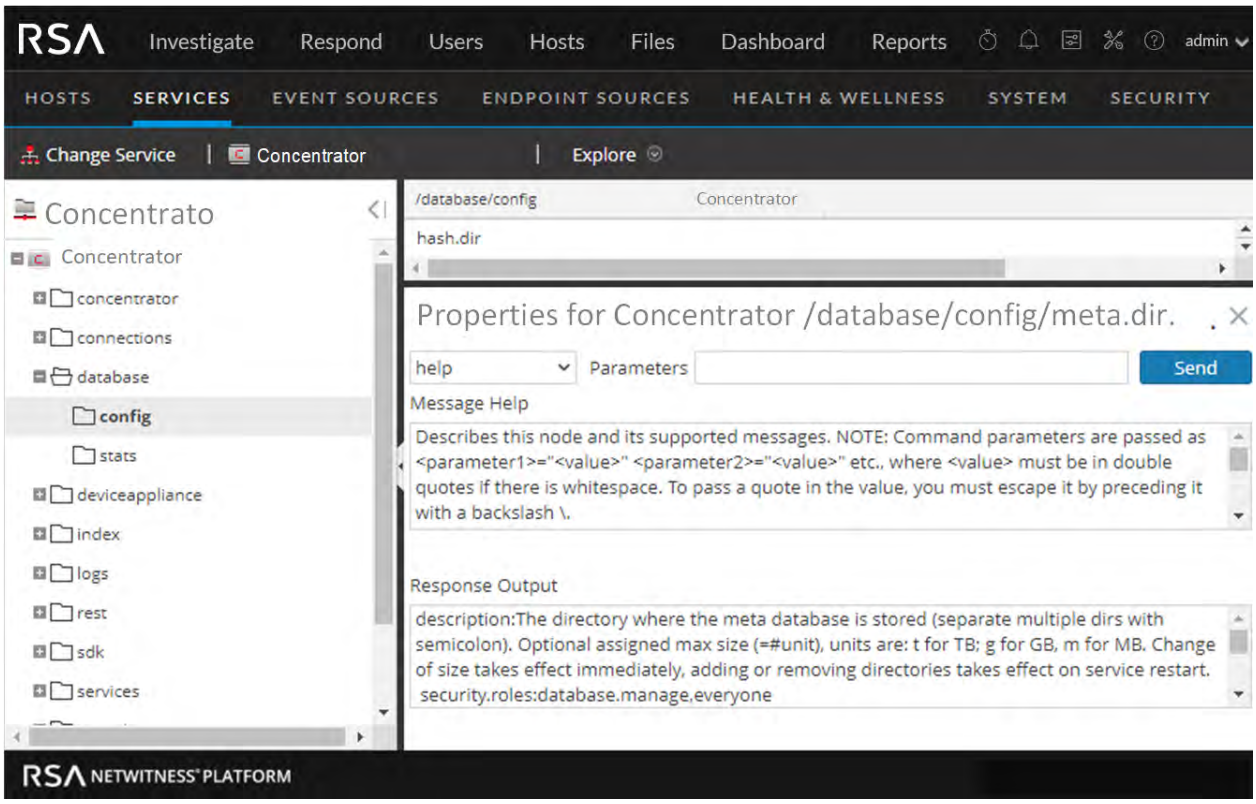
* You can perform these tasks in the current view.

## Related Topics

- Services Explore View

The following example shows the Properties dialog with information in Message Help displayed.



The Properties dialog has the following features.

| Feature | Description |
|---|---|
| **Message** drop-down list | Lists all available messages for the current node. Select a message from this drop-down list to send to the node. |
| **Parameters** input field | Type the message parameters in this field. |
| Send | Sends the message to the selected node. |
| **Message Help** | Displays help text for the current message. |
| **Response Output** | Displays the response to a message or output from a message. |

# Services Logs View

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging panel ( **(Admin) > System tab > System Logging**) with two exceptions:

- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

For a complete description of NetWitness logging features in the System Logging panel, see "Monitor Health and Wellness of NetWitness Platform" in the *System Maintenance Guide*.

## Workflow

| **Historical tab** | This is a searchable view of the service log. For more information, see "System Logging - Historical Tab" in the *System Maintenance Guide*. |

## Services Security View

In NetWitness, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness, a user must belong to a role that has permissions on that service. For NetWitness version 10.4 or later Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

**Note:** Only the default admin user in NetWitness is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the Admin Services view. For every other user, you must configure access to each particular service through NetWitness.

### Workflow

### What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |

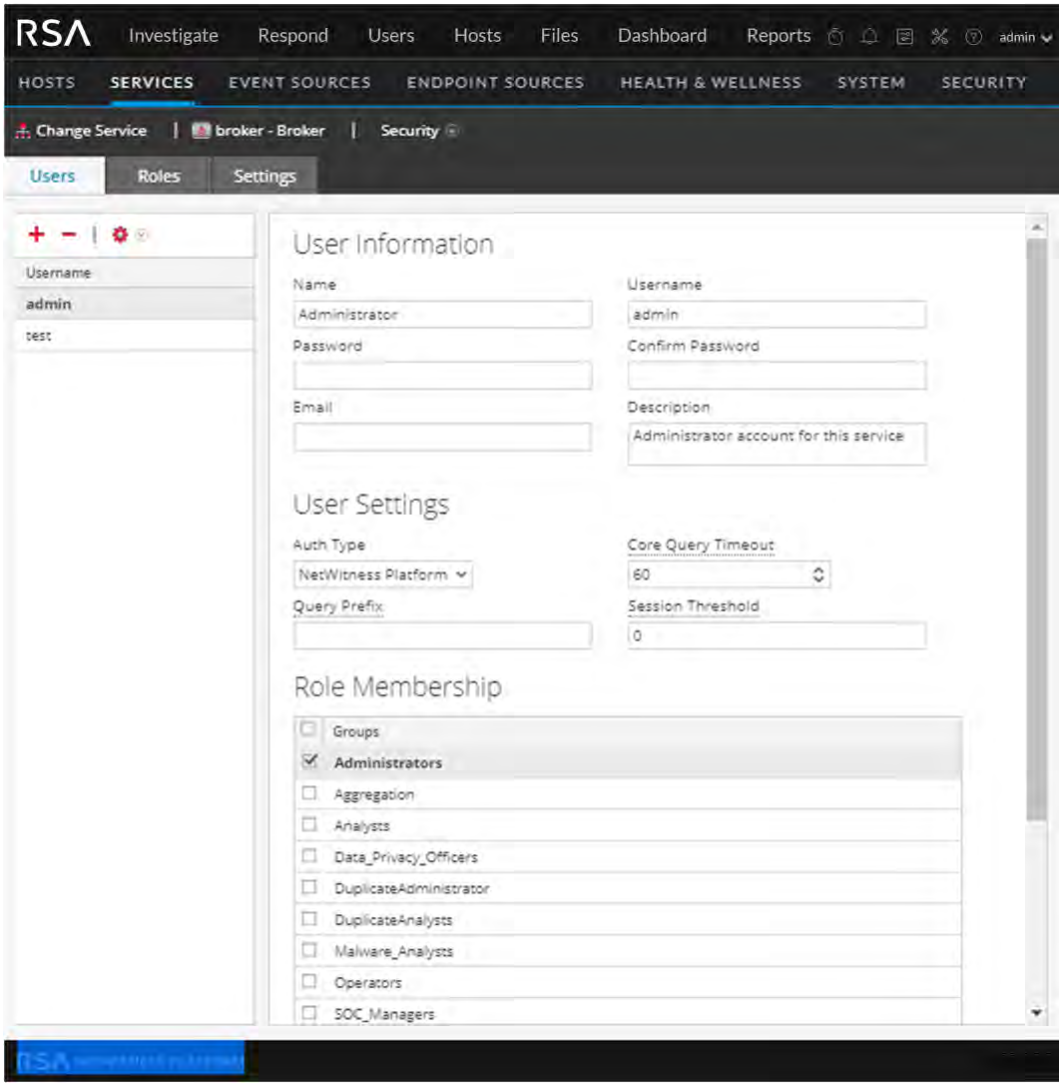
## Quick Look



The Services Security view has three tabs: Users, Roles, and Settings.

### Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.
- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.

## Topics

- Services Security View - Users Tab
- Services Security View - Roles Tab

# Services Security View - Users Tab

In the Services Security view Users tab, you can configure the following for a service:

- Add user accounts.
- Change service user passwords.
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

**Note:** For version 10.4 or later NetWitness Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

## Workflow

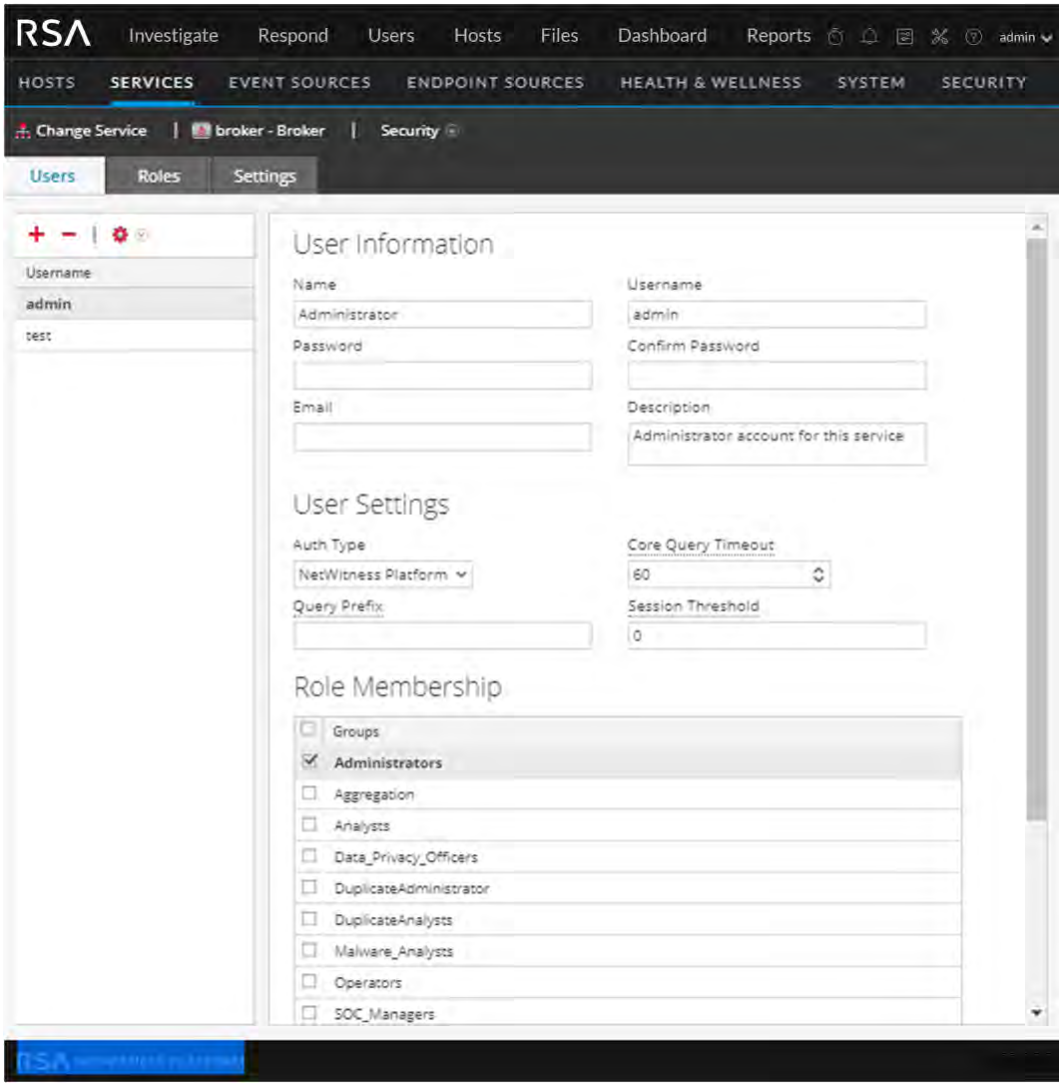
## Quick Look



The Users tab has a User List panel on the left. Selecting a username from the panel makes the User Definition panel on the right available.

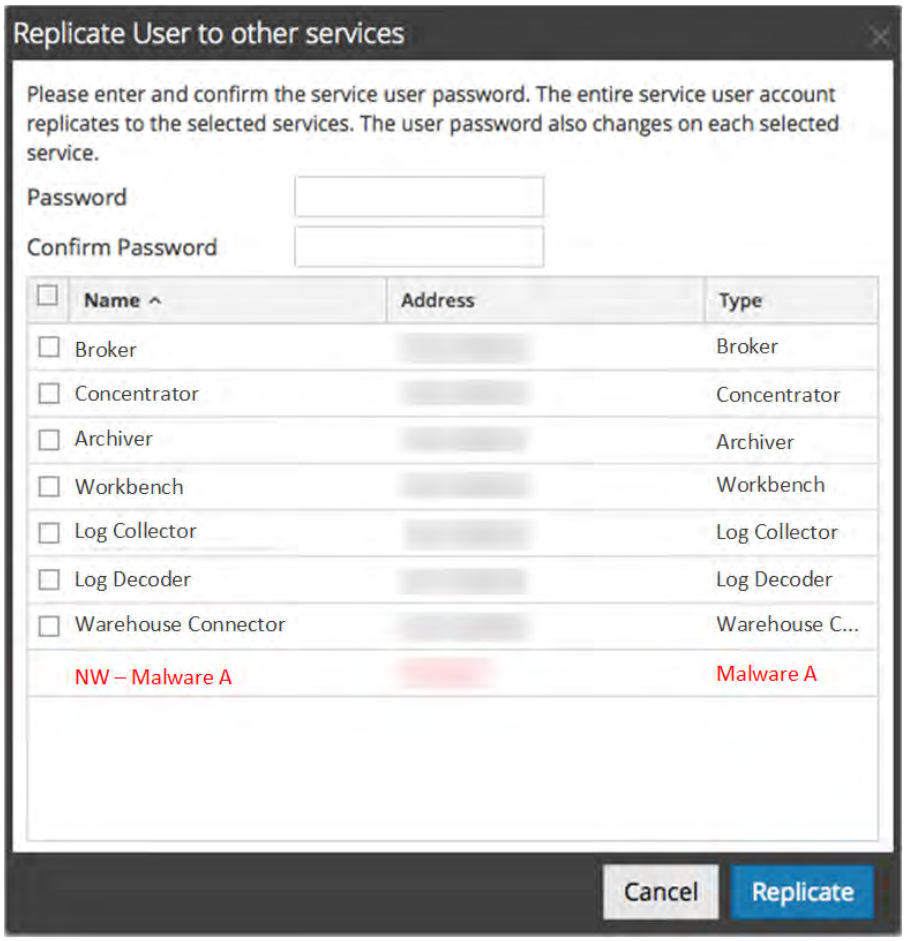
## User List Panel

The User List panel has the following features.

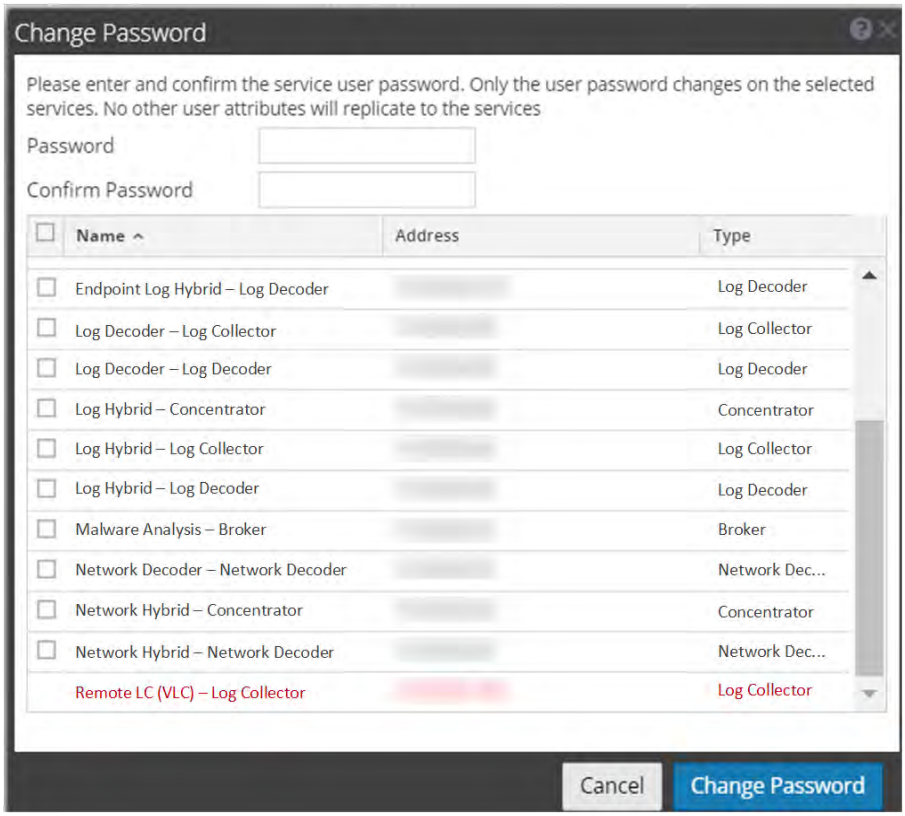
| Feature | Description |
|---|---|
| + | Adds a new user to the current service. |
| − | Deletes the selected users from the service. |

| Feature | Description |
|---|---|
| | Performs one of the following actions on the selected service user account:<br>• **Replicate:** Replicates the entire service user account to selected services.<br>• **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account. |
| **Username** | The usernames for all user accounts that access the service. The username must be one used to log on to NetWitness. |

The following figure shows the "Replicate User to other services" dialog.



The following figure shows the **Change Password** dialog.



## User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Admin Services Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons at the bottom of the panel:

- The **Apply** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

### User Information

The User Information section has the following features.

| Field | Description |
|---|---|
| **Name** | The name of the user. |
| **Username** | The username that this user enters to log in to the service. This is the NetWitness username generated when the administrator added the user and the associated credentials in the Admin Services Security view. |

| Field | Description |
|---|---|
| **Password** (and **Confirm Password**) | The password that the user enters to log on to the service. This is the NetWitness password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness account password and the service password must match in order to allow the user to connect to the service through NetWitness. |
| **Email** | (Optional) The user's email address. |
| **Description** | (Optional) A general description field to describe this user. |

## User Settings

The User Settings section has the following features.

| Field | Description |
|---|---|
| **Auth Type** | The authentication scheme for this user. The product line supports internal and external authentication.<br>• **NetWitness Platform** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Admin Services Security view to create the user and their associated credentials.<br>• **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see "Configure PAM Login Capability" in the *System Security and User Management Guide*. |
| **Core Query Timeout** | **Note:** This field was previously known as "SA Core Query Timeout" and does not appear for 10.4 and earlier service versions. NetWitness version 10.4 and earlier services use "Query Level" instead.<br>Specifies the maximum number of minutes a user can run a query on the service. If this value is set to **0**, the query timeout is not enforced for the user on the service. |
| **Query Prefix** | (Optional) Restricts query results seen by the user by appending the query syntax to every query. For example, adding the query prefix `email != 'ceo@company.com'` prevents those email results from showing up in the sessions. |
| **Session Threshold** | (Optional) Controls the behavior of the application when scanning meta values to determine session counts. If any meta value has a session count that is above the set threshold, the determination of the true session count stops when the threshold is reached.<br>If a threshold is set for a session, the Navigate view (INVESTIGATE > Navigate) shows that the threshold was reached and the percentage of query time used to reach the threshold. |

## Role Membership

The Role Membership section shows a list of all roles. The checkbox next to a role is selected for the roles that a user is a member of for the selected service.

# Services Security View - Roles Tab

The Services Security view Roles tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Add a User Role to a Service.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |

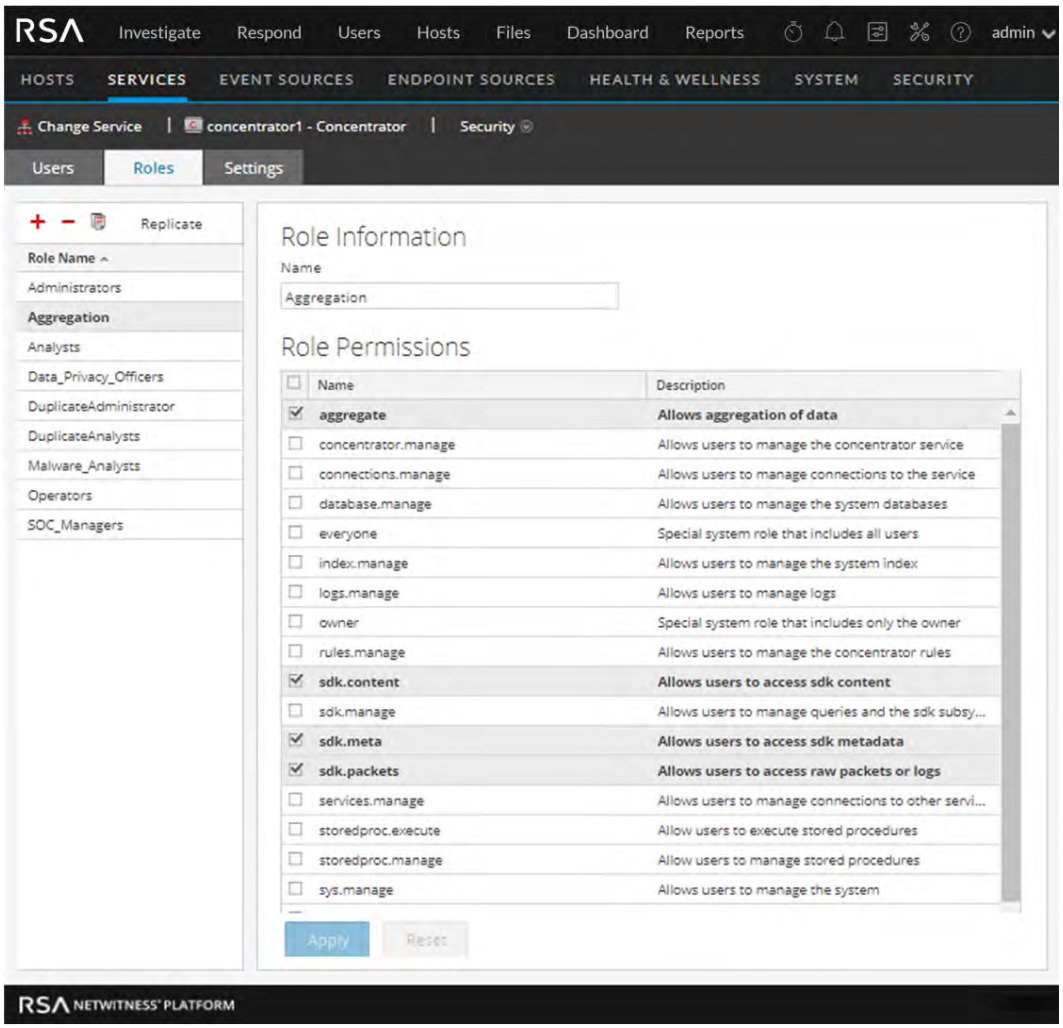
- Services View

## Quick Look



The Roles tab has a **Role Name** panel on the left. Selecting a role name shows the **Role Information** panel for the selected role on the right.

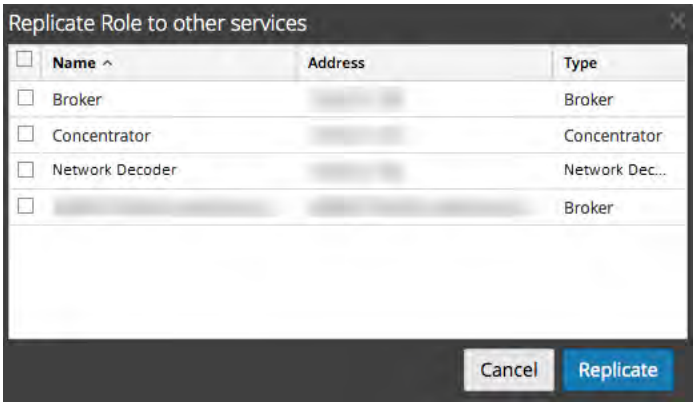
## Role Name Panel

The **Role Name** panel has the following features.

| Feature | Description |
|---|---|
| + | Adds a new group to the current service. |
| − | Deletes the selected group from the current service. |

| Feature | Description |
|---|---|
| | Copies a role and its assigned permissions to a new role. The name of the new role must be unique. For example, you can copy the `Analysts` role and create another role with a new name, such as `Analyst_Managers`. |
| **Replicate** | Pushes a role and its assigned permissions to other services. After you select a role and click **Replicate**, the Replicate Role to other services dialog is displayed. In the dialog, you can select the services where you want to replicate the role. |

The following figure shows the Replicate Role to other services dialog.



## Role Information and Permissions Panel

The Role Information and Permissions panel defines role permissions.

There are two buttons:

- The **Apply** button saves the changes made in the Role Permissions panel and they become effective immediately.
- If you have not saved changes in the Role Permissions panel, the **Reset** button resets all fields and settings to their values before editing.

### Services Security View - Service User Roles and Permissions

The Services Security view Roles tab enables you to create service user roles and assign permissions. You can also use the pre-configured service user roles included with NetWitness to assign user permissions.

## Related Topics

- Services Security View - Aggregation Role
- Services Security View - Roles Tab

## Service User Roles

NetWitness has the following pre-configured service user roles.

| Role | Assigned Permissions | Personnel/Account |
|---|---|---|
| Administrators | All permissions | NetWitness System Administrator |
| Aggregation | `aggregate`<br>`sdk.content`<br>`sdk.meta`<br>`sdk.packets` | You can use this role to create an Aggregation account.<br>This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness version 10.5 and later services. |
| Analysts, Malware_ Analysts, and SOC_ Managers | `sdk.meta`<br>`sdk.content`<br>`sdk.packets`<br>`storedproc.execute` | Users can use specific applications, run queries and view content for purposes of analysis. |
| Data_Privacy_ Officers | `sys.manage`<br>`users.manage`<br>`sdk.meta`<br>`sdk.content`<br>`sdk.packets`<br>`sdk.manage`<br>`logs.manage`<br>`database.manage`<br>`index.manage`<br>`dpo.manage` | Data Privacy Officer<br>Data Privacy Officers have the `dpo.manage` permission on Network Decoders and Log Decoders. |
| Operators | `sys.manage`<br>`services.manage`<br>`connections.manage`<br>`users.manage`<br>`logs.manage`<br>`parsers.manage`<br>`rules.manage`<br>`database.manage`<br>`index.manage`<br>`sdk.manage`<br>`decoder.manage`<br>`archiver.manage`<br>`concentrator.manage`<br>`storedproc.manage` | Operators are responsible for the daily operation of the services. |

## Service User Permissions

There are many permissions that you can assign a service role in NetWitness. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

| Permission | Definition |
|---|---|
| sys.manage | Allows the user to edit the service configuration settings. |
| services.manage | Allows the user to manage connections to other services. |
| connections.manage | Allows the user to manage connections to the service. |
| users.manage | Allows the user to create individual users and user roles and specify user permissions. |
| aggregate | Allows the user to perform aggregation of data. |
| sdk.meta | Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query. |
| sdk.content | Allows the user to access raw packets and logs from any client application (Investigations and Reporting). |
| sdk.packets | Allows users to access raw packets and logs from any client application. |
| appliance.manage | Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service. |
| decoder. manage | Allows the user to edit the configuration settings for the Network Decoder service. |
| concentrator.manage | Allows the user to edit the configuration settings for the Concentrator/Broker service. |
| logs.manage | Allows the user to view the service logs and edit the logging configuration settings for the specified service. |
| parsers.manage | Allows the user to manage all attributes under the parsers node. |
| rules.manage | Allows the user to add and delete all rules. |
| database.manage | Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases. |
| index.manage | Allows the user to manage all index-related attributes. |
| sdk.manage | Allows the user to view and set all SDK configuration items. |
| storedproc.execute | Allows the user to execute a Lua stored procedure. |
| storedproc.manage | Allows the user to manage Lua stored procedures. |
| archiver.manage | Allows the user to modify the Archiver configuration. |

| Permission | Definition |
|---|---|
| dpo.manage | Allows the user to manage the transform configuration and the applicable keys. |

## Services Security View - Aggregation Role

This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

## Related Topics

- Services Security View - Service User Roles and Permissions
- Services Security View - Roles Tab

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

- aggregate
- sdk.meta
- sdk.packets
- sdk.content

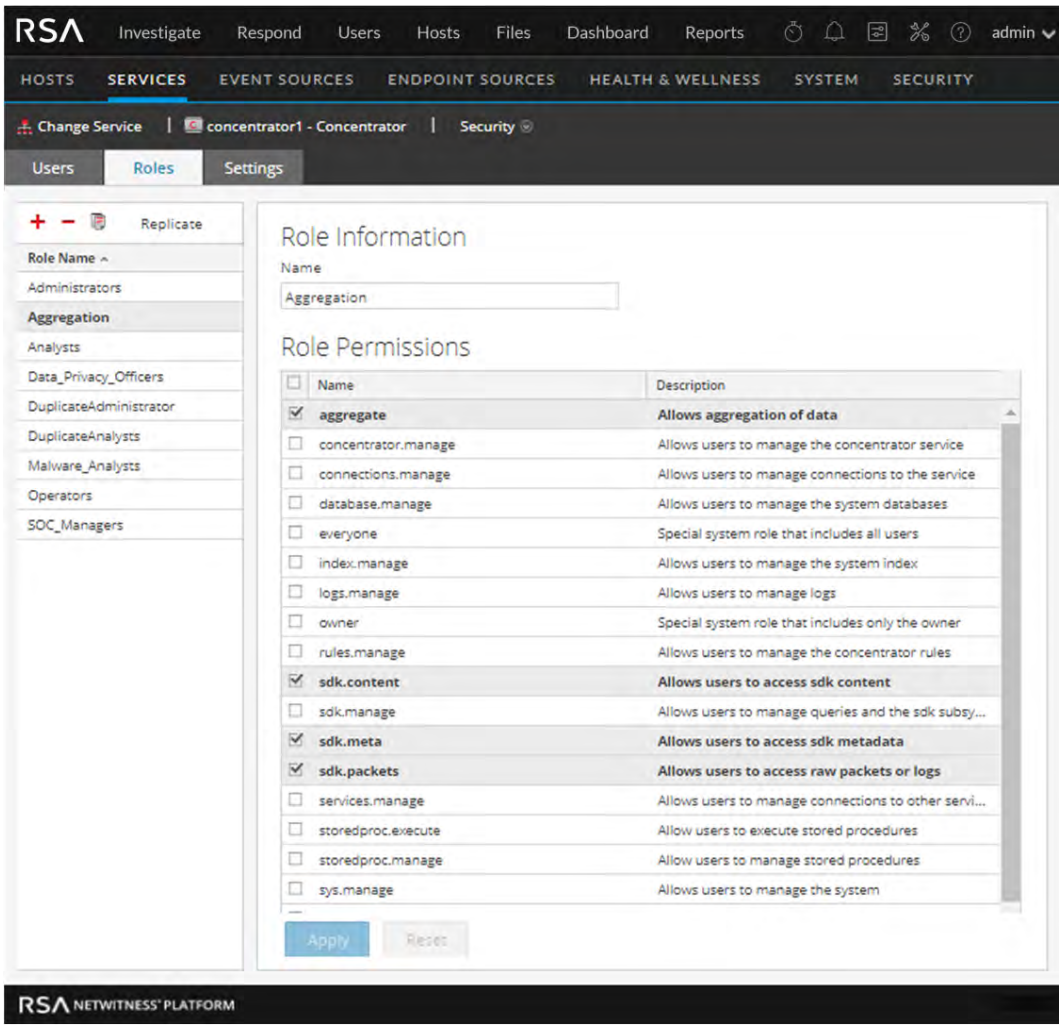
The Aggregation role is available only on NetWitness version 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Network Decoders, Concentrators, Archivers, and Brokers. The aggregate permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the **(Admin) > Services** (select a service) > > **View** > **Security** > **Roles** tab.

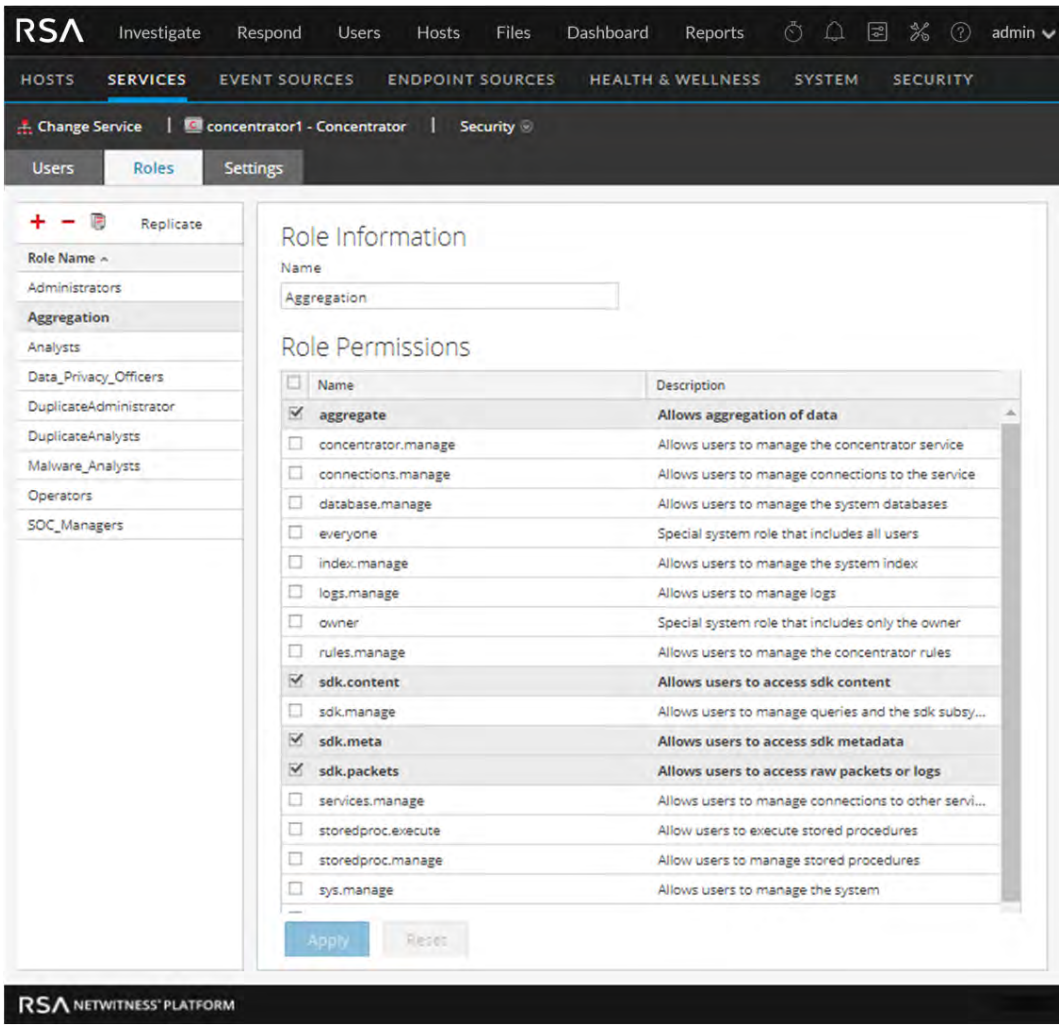
Procedures related to roles are described in Hosts and Services Maintenance Procedures. Services Security View - Service User Roles and Permissions provides detailed information on the pre-configured roles.

The following figure shows the permissions in the Aggregation role.



## Services Security View - Settings Tab

In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Network Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.



This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the metadata and content to privileged users. See the *Data Privacy Management Guide* for more information.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Network Decoders, and Log Decoders.* | See the *System Security and User Management Guide* for more information. |

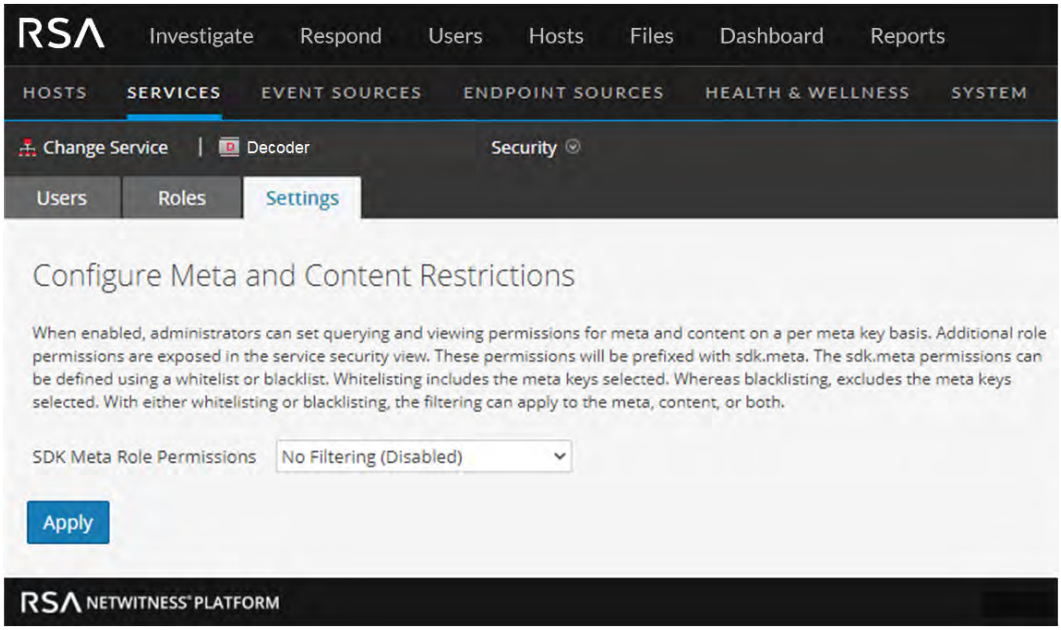
## Quick Look



The Settings tab includes two features.

| Feature | Description |
|---|---|
| **SDK Meta Role Permissions** field | Provides option for disabling or configuring meta key and content restrictions. The filtering options are described. |

| Feature | Description |
|---|---|
| **Apply** button | Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles. |

## SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

**Note:** There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

| `system.roles` Node Value | Settings Tab Option | Description |
|---|---|---|
| 0 | No Filtering (Disabled) | System roles that define permissions on a per meta key basis are disabled. |
| 1 | Whitelist metadata and content | Metadata and content for the specified SDK meta roles are white listed, or visible to users assigned the system role. |
| 2 | Whitelist only metadata | Metadata for the specified SDK meta roles is white listed, or visible to users assigned the system role. |
| 3 | Whitelist only content | Content for the specified SDK meta roles is white listed, or visible to users assigned the system role. |
| 4 | Blacklist metadata and content | Metadata and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role. |
| 5 | Blacklist only metadata | Metadata for the specified SDK meta roles is black listed, or not visible to users assigned the system role. |
| 6 | Blacklist only content | Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role. |

# Services Stats View

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | monitor the status and operations of a service.* | See the *System Maintenance Guide*. |
| Administrator | chart statistical information for a service over a user-specified period of time.* | See the *System Maintenance Guide*. |

* You can perform these tasks in the current view.

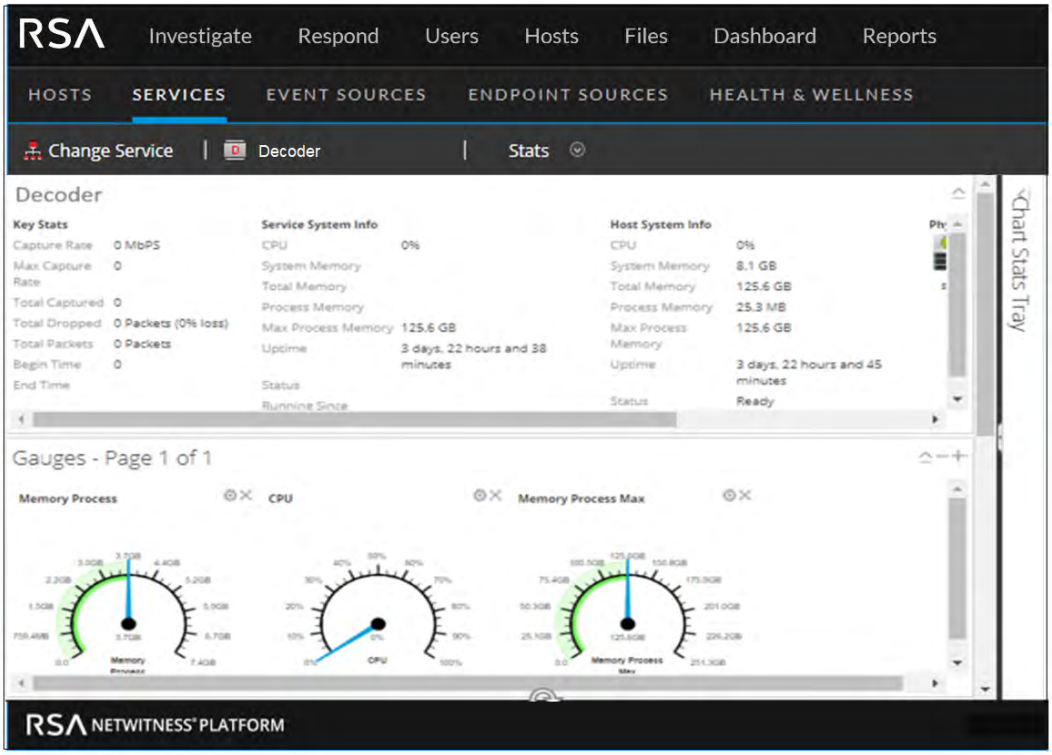
## Quick Look

The following figure shows an example of the Services Stats view for a Network Decoder.



Although different statistics are available for different types of services, certain sections are common to the Services Stats view for any Core service:

- Summary Stats
- Gauges
- Timeline Charts
- Historical Timeline Charts
- Chart Stats Tray

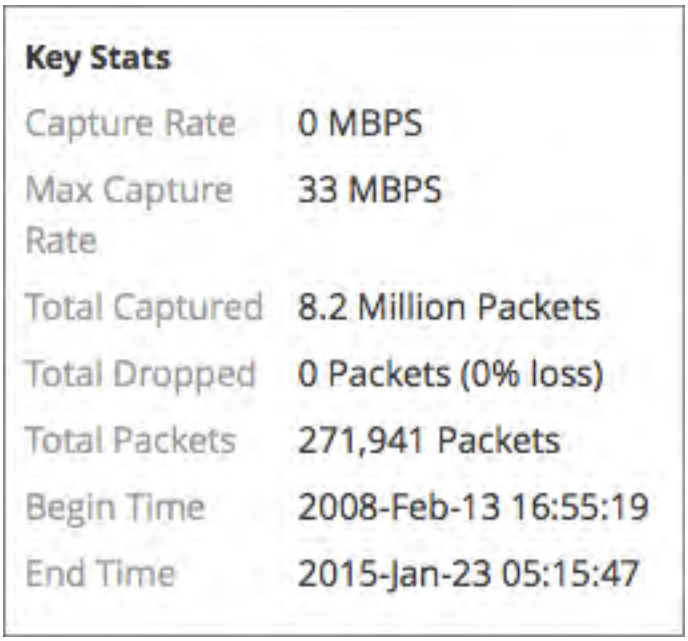
## Summary Stats Section

The Summary Stats section is at the top of the default view and has no editable fields. There are five panels in the Summary Stats section: Key Stats, Service System Info, Host System Info, Logical Drives, and Physical Drives. The **Key Stats** panel displays different statistics for different types of services. The remaining four panels in the Summary Stats section are the same for all types of services.

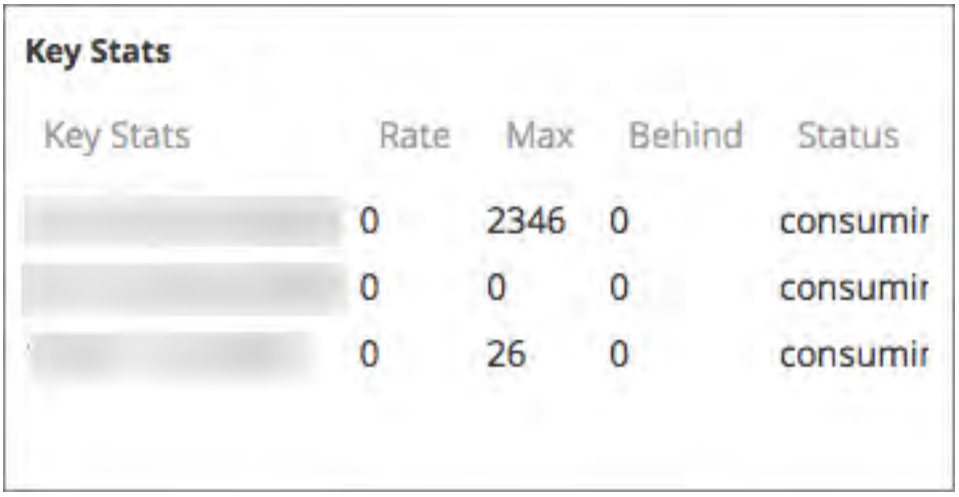
### Key Stats

The Key Stats panel displays different statistics for different types of services.

- For a **Network Decoder** or **Log Decoder**, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and end time.

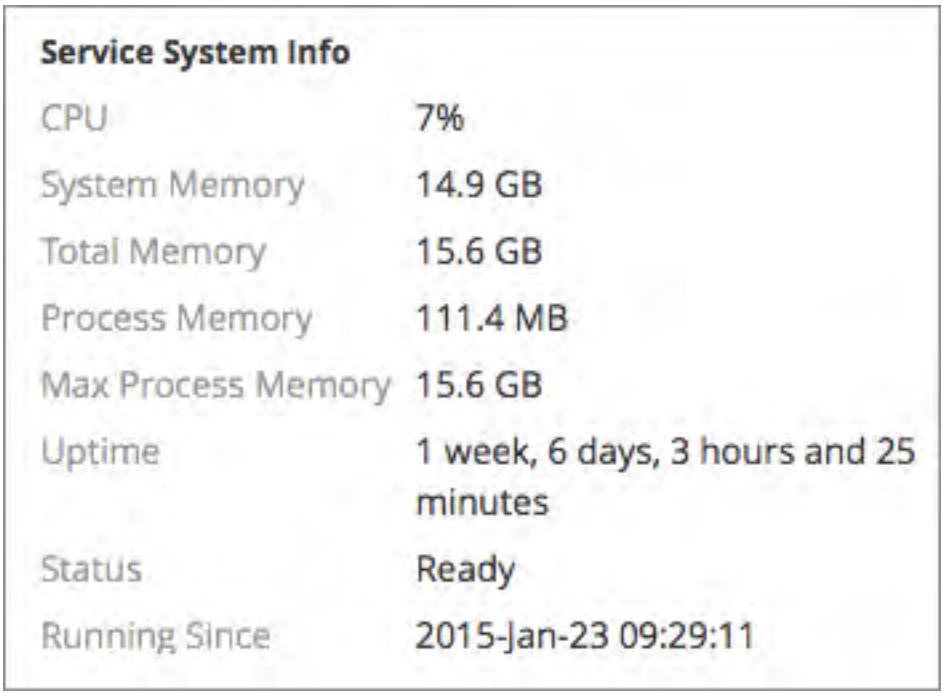


- A **Broker** or **Concentrator** aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a list. The columns in the list provide the service name, the capture rate, the maximum capture rate, the number of sessions behind (that need to be aggregated), and the service status.



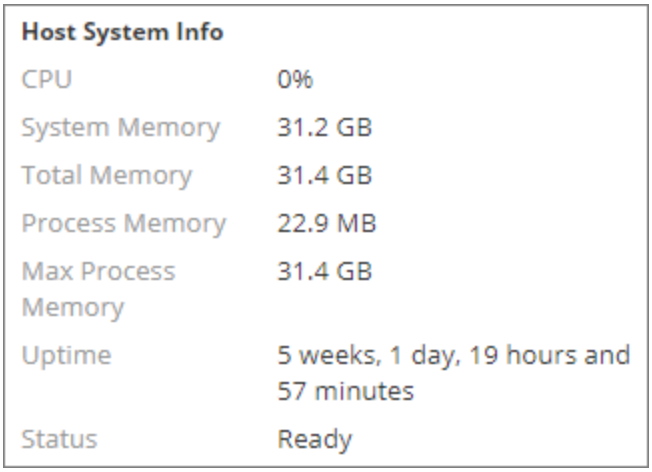
## Service System Info

The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



## Host System Info

The Host System Info panel includes the percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum process), host uptime, status, running since time, and the current time.



## Logical Drives and Physical Drives

The Logical Drives panel and Physical Drives panel are shown with an icon for the drive name and state. Drive types are used in the names and the drive status options are listed below.

## Drive Types and Status

| Drive Type | Description | Comments | Status Options |
|---|---|---|---|
| `sd` | SCSI block device | Directly connected SAS, SATA MegaRAID volumes. | Green: OK<br>Red: FAIL |
| `ld` | MegaRAID Logical Volume | Defined in BIOS or with MegaCLI tool. | Green: OK<br>Yellow: DEGRADED/BUILDING<br>Red: FAIL |
| `pd` | MegaRAID Physical Disks | Not directly exposed to Linux. | Green: OK<br>Red: FAIL |
| `md` | Linux software RAID Volume | | Green: OK<br>Yellow: DEGRADED/BUILDING<br>Red: FAIL |

## Gauges

The Gauges section in the Services Stats view presents statistics in the form of analog gauges. See Services Stats View - Gauges for details on configuring gauges.

## Timeline Charts

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Services Stats View - Timeline Charts for details on configuring timelines.

## Historical Timeline Charts

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services. Only the display name, begin date, and end date. See Services Stats View - Timeline Charts for details on configuring timelines.

**Note:** Historical timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

## Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Services Stats View - Chart Stats Tray for a detailed description.

## Topics

# Services Stats View - Chart Stats Tray

In the Services Stats view, the Chart Stats Tray provides a way to customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | customize the monitored statistics for individual services.* | See the *System Maintenance Guide*. |

* You can perform these tasks in the current view.

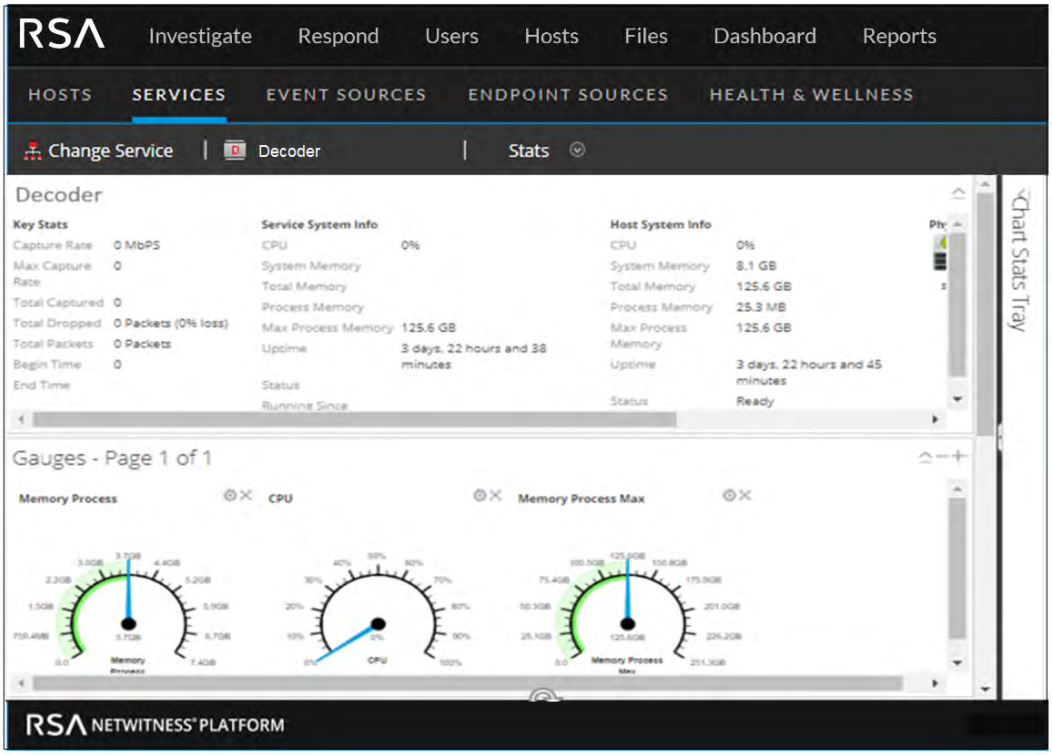
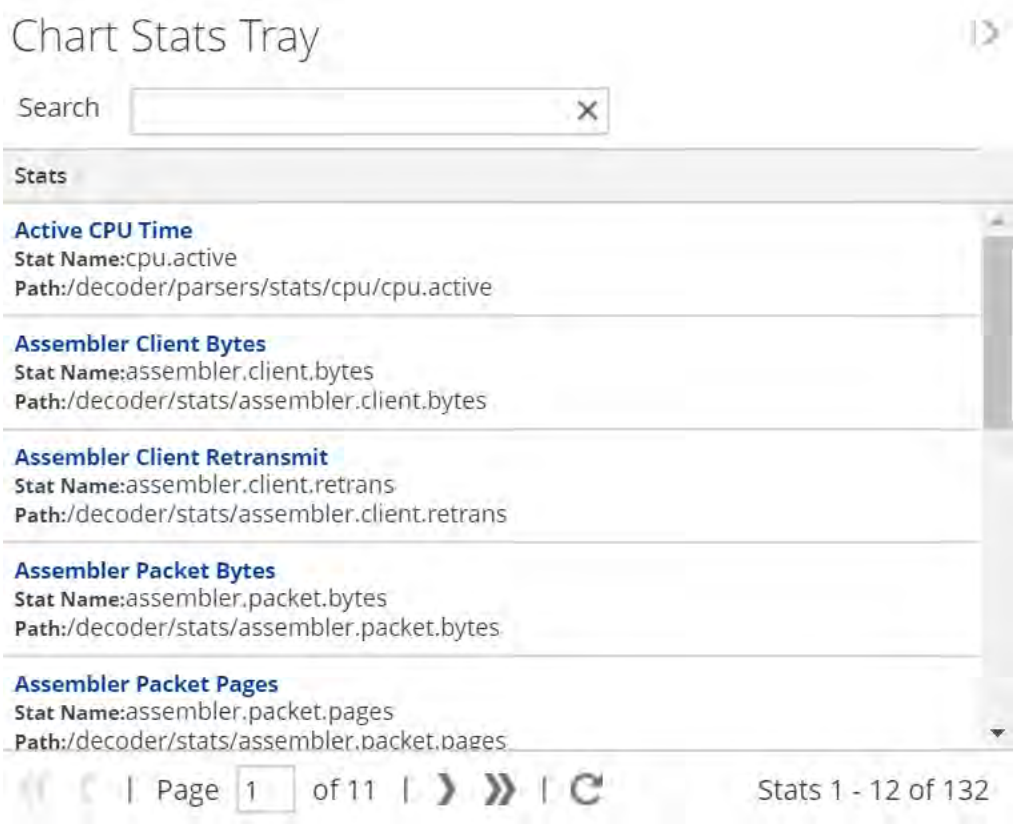
## Quick Look

The following example shows the Services Stats view for a Network Decoder. The Chart Stats Tray is collapsed.



To view the Chart Stats Tray, click on the to expand the Chart Stats Tray.



The Chart Stats Tray has different statistics for different types of services. In the example above, 132 statistics are available for the Network Decoder. The following table describes features of the Chart Stats Tray.

| Feature | Description |
|---|---|
| | Click to expand the panel horizontally. |
| | Click to collapse the panel horizontally. |
| | Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted. |
| | Click to go to the first page. |
| | Click to go to the previous page. |
| | Type a page number in the Page field. |
| | Click to go to the next page. |
| | Click to go to the last page. |

| Feature | Description |
|---|---|
| | Click to refresh the view. |
| Stats 1 - 12 of 132 | Displays the range of statistics being displayed. The total number statistics varies by service type. |

## Services Stats View - Gauges

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

### Workflow

### What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | view statistics in the form of an analog gauge.* | See the *System Maintenance Guide*. |

* You can perform these tasks in the current view.

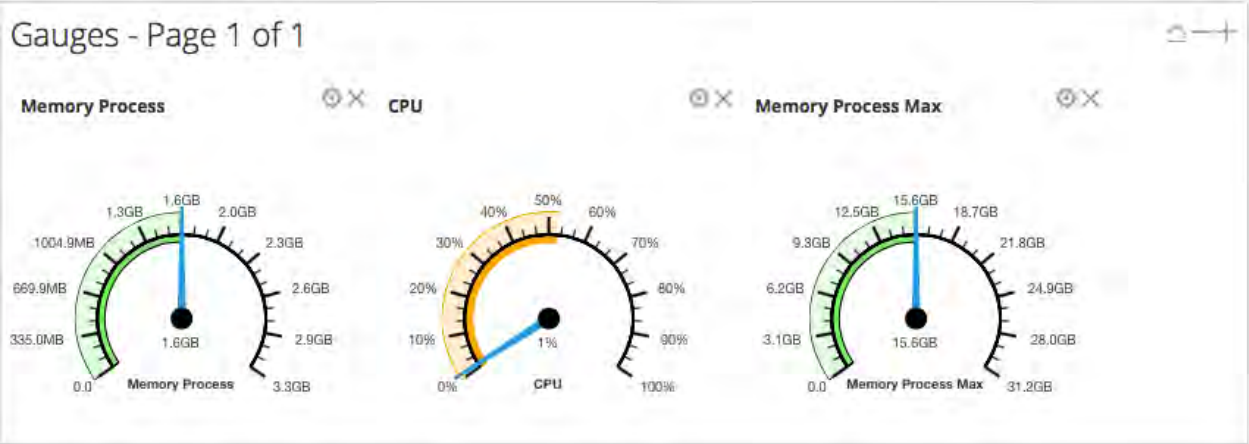
## Quick Look

The following figure shows the default gauges in the Services Stats view for a Log Decoder.



The default gauges show these statistics:

- Process memory use
- CPU use
- Maximum process memory use

The controls in the Gauges title bar and in each gauge are the standard dashlet controls. Dashlets are the parts that make up a dashboard.

- In the Gauges title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

## Services Stats View - Timeline Charts

The Services Stats view Timeline Charts sections display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section or Historical Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

## Workflow

## What do you want to do?

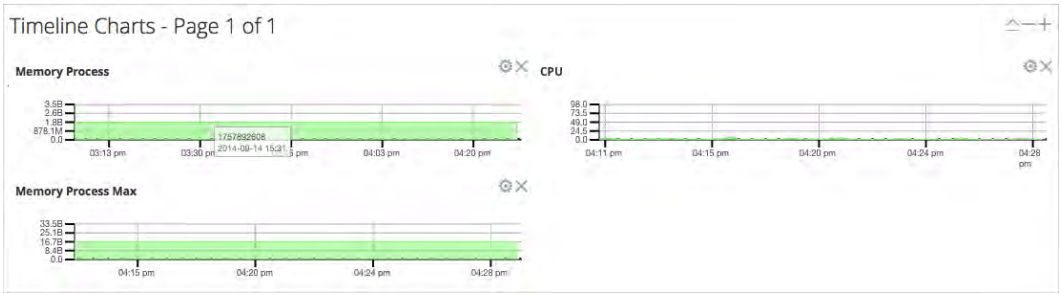
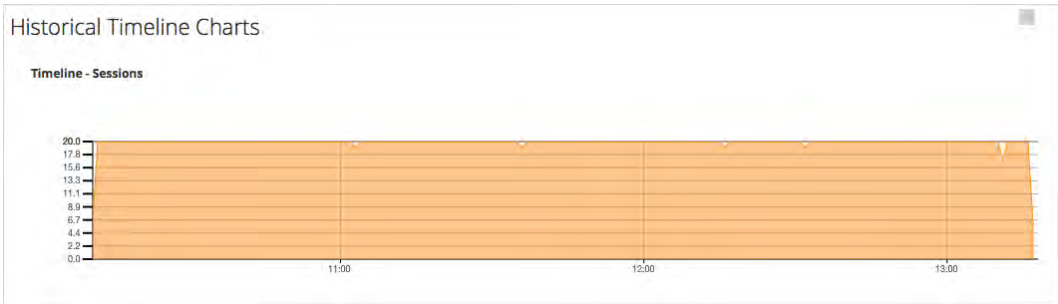
## Quick Look

The following figure is an example of a current timeline showing the value and timestamp of a data point.



The following figure is an example of a historical timeline chart.



The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets
- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls. The Historical Timeline Charts title bar and timelines have the same controls.

- In the Timeline Charts title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

# Services System View

This topic introduces features in the Services System view using Decoders (Network Decoder and Log Decoder) as an example. See the appropriate configuration guides for other services (for example, the *NetWitness Broker and Concentrator Configuration Guide*) for details on their respective **(Admin) > Services > System** views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Network Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted. For more information on Decoders, see the *Decoder Configuration Guide*.

## Workflow

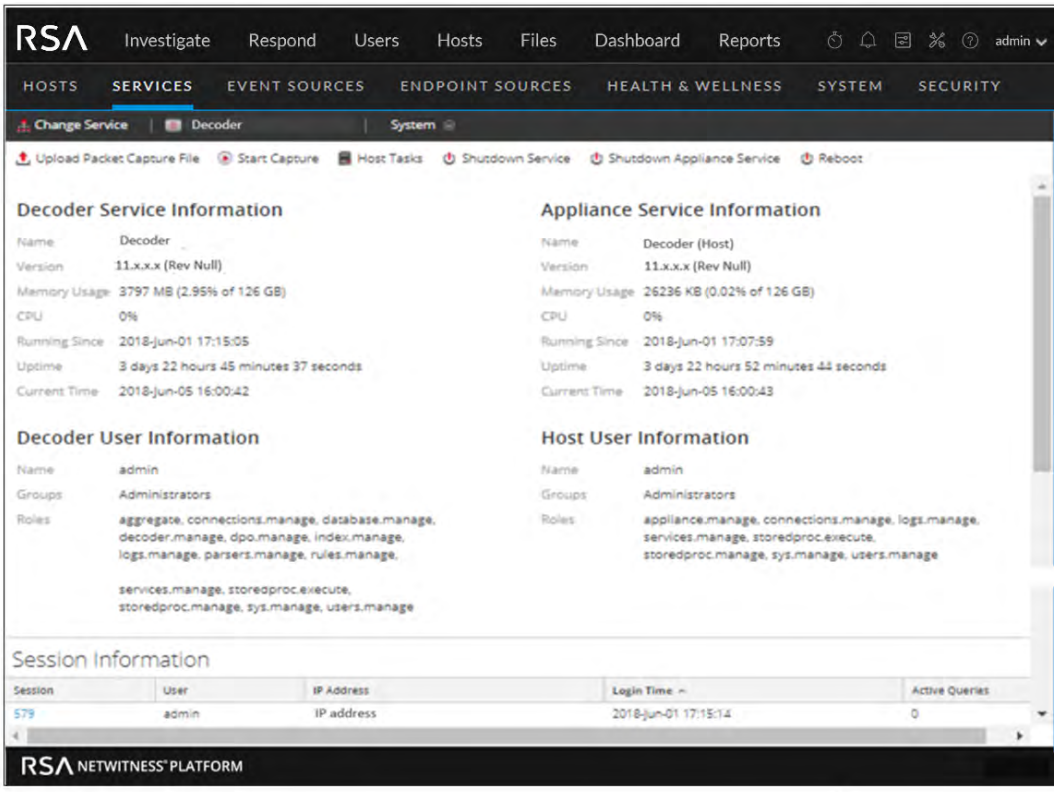
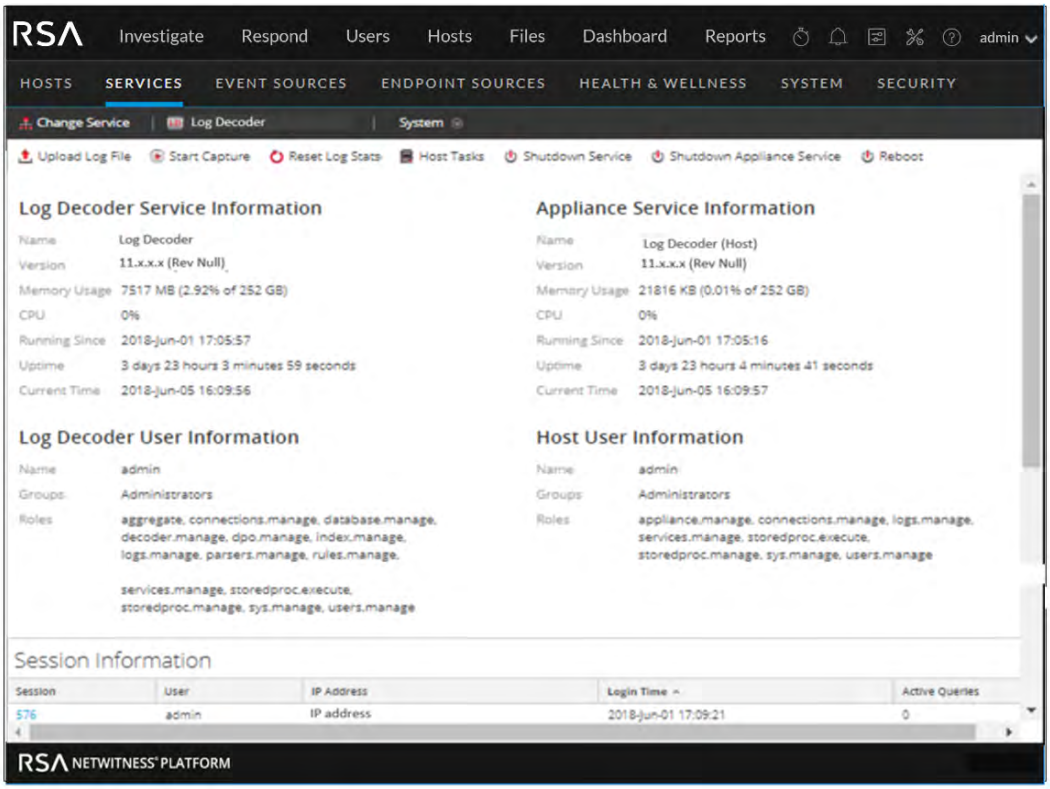
## Quick Look

The following figure shows an example of the Services System view for a Network Decoder.



The following figure shows the Services System view for a Log Decoder.



## Services Info Toolbar

The following toolbars show the options specific to Log Decoders (top) and Network Decoders (bottom).

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Network Decoder (packet capture file) and the Log Decoder (log file).

| Action | Description |
|---|---|
| **Upload Packet Capture File** | Displays a dialog that provides a way to select a packet capture (`.pcap`) file for upload to the selected Network Decoder. For more information, see "Upload Packet Capture File" in the *Decoder Configuration Guide*.<br>**Note:** This option does not apply to Log Decoders. |
| **Upload Log File** | Displays a dialog that provides a way to select a log (`.log`) file for upload to the selected Log Decoder. For more information, see "Upload Log File to a Log Decoder" in the *Decoder Configuration Guide*. |
| **Start/Stop Capture** | Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable. |

# Services Topology View

This topic introduces the services topology, a hierarchical view of the NetWitness core services depicting the collection and aggregation in your deployment.

This visualization displays the topology for the Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, ESA and Log Collector. You can view the services that are online and details of each node.

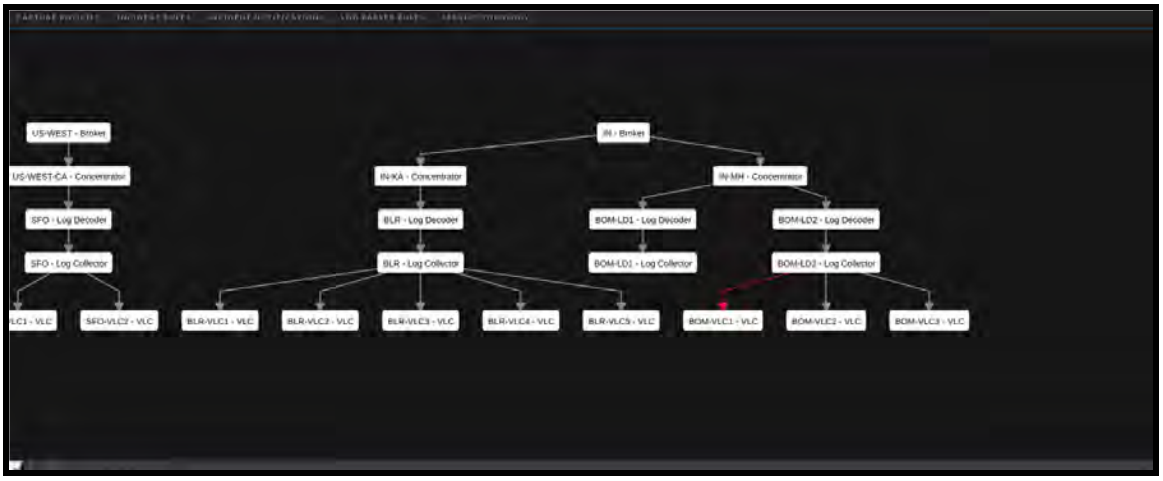
## Workflow

## What do you want to do?

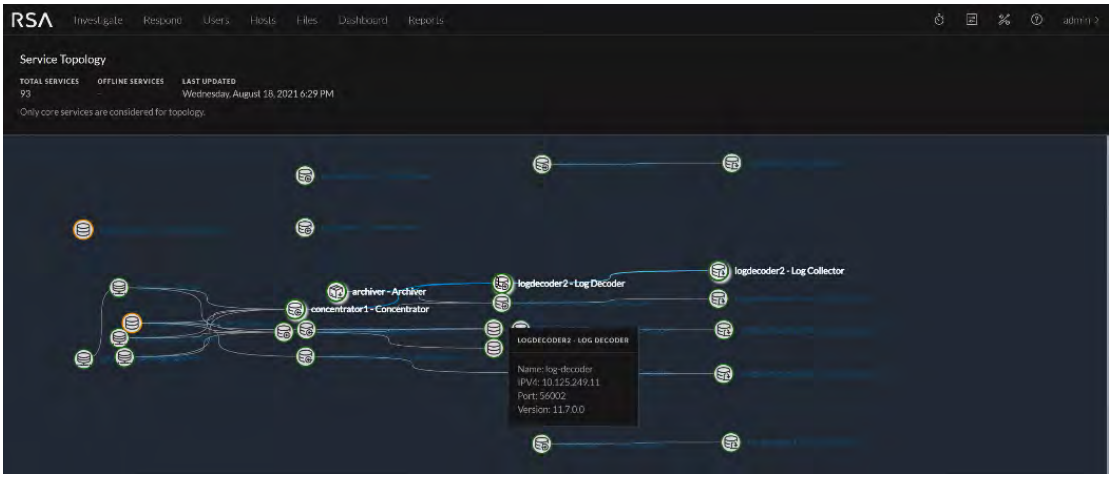
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | maintain a service. | Maintaining Services |

## Quick Look

The following figure shows an example of how each service is aggregating data in a hierarchy along with which services are online or offline.



The following figure shows the details of a node. When you hover over any of the services, additional details such as name, IP version, Port number and Version number are displayed.



| Action | Description |
|---|---|
| **Node** | Displays a dialog that provides name, IP version, Port number and Version number. |
| **Search** | Enter the service name to locate a specific service. |

# Services System View - Host Task List Dialog

In the RSA NetWitness Services System view, you can use the Host Tasks option to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core services.

## Workflow

## What do you want to do?

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | manage host-related tasks and host communications with the network.* | Hosts and Services Maintenance Procedures |

* You can perform these tasks in the current view.

## Related Topics

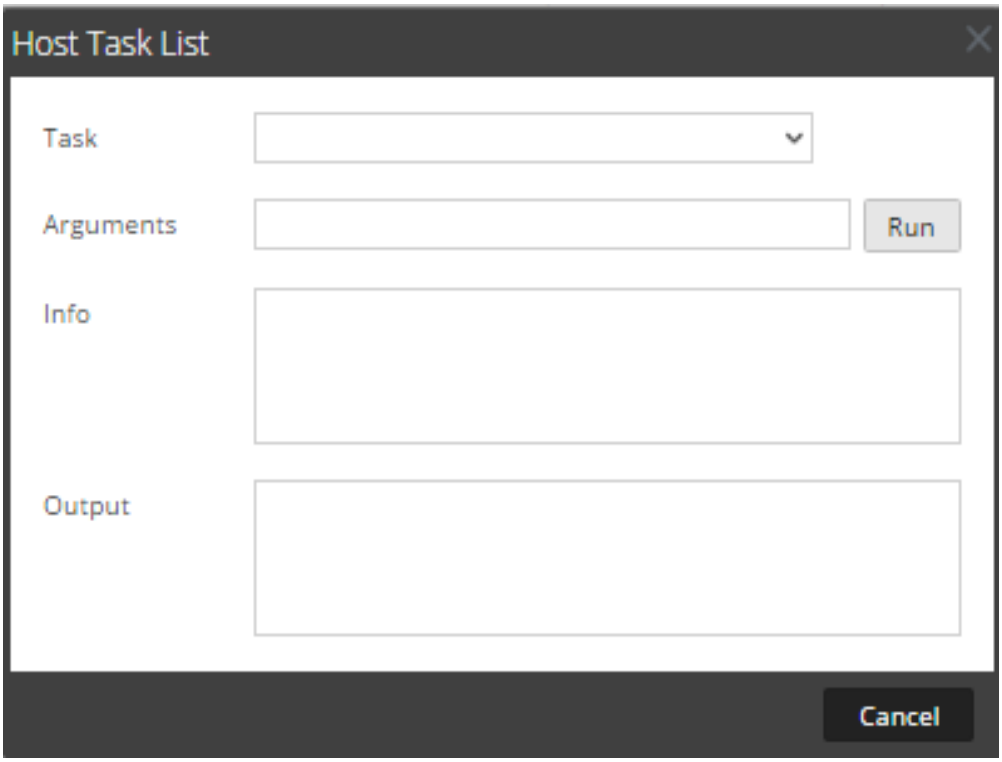
## Quick Look



The table below describes the Host Task List dialog features.

| Field | Description |
|---|---|
| **Task** | An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed. |
| **Arguments** | An entry field in which you enter the arguments, if any, for the message. |
| **Run** | Executes the task and arguments in the entry fields. |
| **Info** | Information about the message purpose and syntax. |
| **Output** | The output or result of an executed task. |
| **Cancel** | Closes the Host Task list dialog. |

## Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

| Task | Description |
|---|---|
| **Add Filesystem Monitor** | Starts monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor. |

| Task | Description |
|---|---|
| **Delete Filesystem Monitor** | Stops monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor. |
| **Reboot Host** | Shuts down and restarts the host. See Reboot a Host. |
| **Set Host Built-in Clock** | Sets the local host clock. See Set Host Built-In Clock. |
| **Set Host Hostname** | This method of changing the hostname is deprecated in NetWitness 10.6. To edit a hostname, see Edit or Delete a Service. |
| **Set Network Time Source** | Sets the clock source for this host. See Set Network Time Source. |
| **Set Syslog Forwarding** | Enables or disables syslog forwarding from a remote server to the selected service. See Set Syslog Forwarding. |
| **Show Network Port Status** | Shows the network interface information for a host. See Show Network Port Status. |
| **Show Serial Number** | Gets the host serial number. See Show Serial Number. |
| **Shut Down Host** | Shuts down the physical host and the host remains off. See Shut Down Host. |
| **Start Service** | Starts a service on this host. See Stop and Start a Service on a Host. |
| **Stop Service** | Stops a service on this host. See Stop and Start a Service on a Host. |
| **setSNMP** | Enables or disables the SNMP service on a host. See Set SNMP. |

# Service Configuration Settings

This topic introduces the available service configuration settings for RSA NetWitness Core services.

NetWitness Core services include Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers. The service configuration parameters listed below constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness user interface while other parameters are viewable or configurable only on the Services Explore view.

## Aggregation Configuration Parameters

This table lists and describes the available configuration parameters that are common to services that perform aggregation, such as Concentrators and Archivers.

| Configuration Path | /concentrator/config or /archiver/config |
|---|---|
| aggregate.autostart | Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately. |
| aggregate.buffer.size | Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart. |
| aggregate.crc | If enabled, all aggregation streams will be CRC validated. Change takes effect immediately. |
| aggregate.hours | Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately. |
| aggregate.interval | Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately. |
| aggregate.meta.page.factor | Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart. |
| aggregate.meta.perpage | Lists the allocated number of meta stored on one page of data. Change takes effect on service restart. |
| aggregate.precache | Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately. |
| aggregate.sessions.max | Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart. |
| aggregate.sessions.perpage | Lists the number of sessions stored on one page of data. Change takes effect on service restart. |

| Configuration Path | /concentrator/config or /archiver/config |
|---|---|
| aggregate.time.window | Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately. |
| consume.mode | Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart. |
| export.enabled | Allows export of session data, if enabled. Change takes effect on service restart. |
| export.expire.minutes | Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately. |
| export.format | Determines the file format used during data export. Change takes effect on service restart. |
| export.local.path | Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart. |
| export.meta.fields | Determines which meta fields are exported. Comma-separated list of fields.<br>* means all fields.<br>* and field list means all fields except the listed fields.<br>Just the field list means only those fields are included.<br>Change takes effect immediately. |
| export.remote.path | Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart. |
| export.rollup | Determines the rollup interval for export files. Change takes effect on service restart. |
| export.session.max | Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| export.size.max | Displays the maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| export.usage.max | Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately. |
| heartbeat.error | Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately. |
| heartbeat.interval | Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately. |

| Configuration Path | /concentrator/config or /archiver/config |
|---|---|
| heartbeat.next.attempt | Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately. |
| heartbeat.no.response | Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately. |

## Appliance Service Configuration Parameters

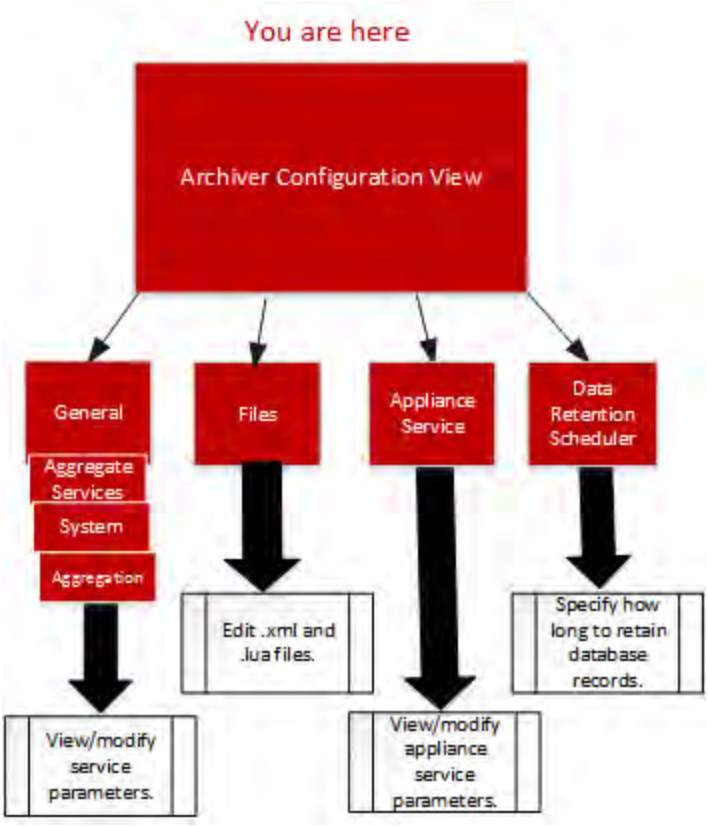
The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware. The list describes the Appliance Configuration parameters.

| Appliance Parameter Field | Description |
|---|---|
| **Logs** | /logs/config refer to Core Service Logging Configuration Parameters |
| **REST** | /rest/config refer to REST Interface Configuration Parameters |
| **Services** | /services/<service name>/config refer to Core Service-to-Service Configuration Parameters |
| **System** | /sys/config refer to Core Service System Configuration Parameters |

## Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Archivers.

## Workflow



| Role | I want to ... |
|---|---|
| Administrator | Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *RSA NetWitness Archiver Configuration Guide* for instructions. |
| Administrator | Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *RSA NetWitness Deployment Guide* for instructions. |

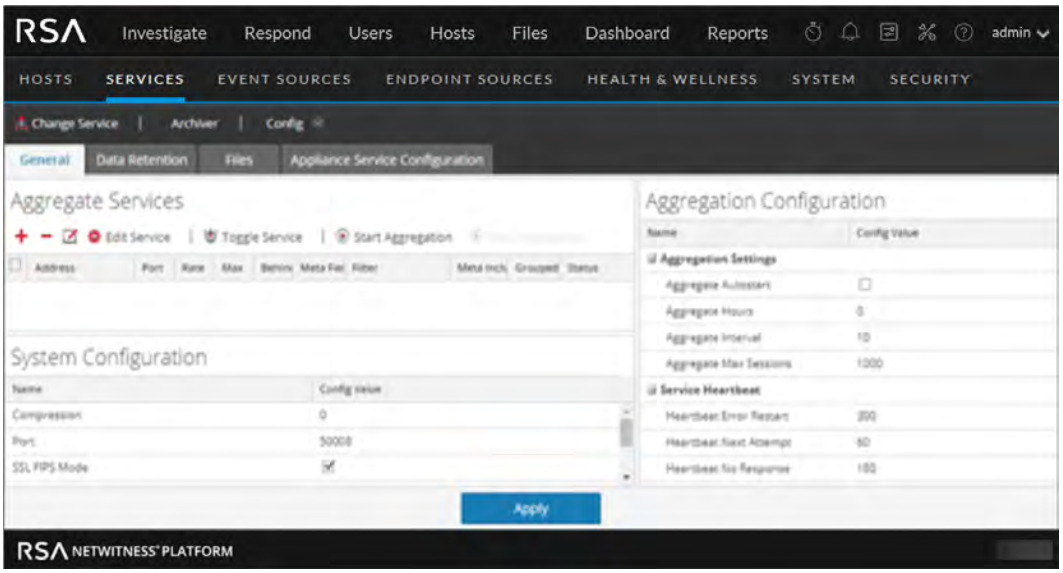
## Quick Look

To access the Services Config view:

1. In **NetWitness**, select **(Admin) > Services**.
   The Admin Services view is displayed.

2. Select an Archiver service and select **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.



## Broker Service Configuration Parameters

The following list describes the Broker configuration parameters.

| Broker Parameter Field | Description |
|---|---|
| **Broker** | `/broker/config` refer to Aggregation Configuration Parameters |
| `aggregate.interval.behind` | Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately. |
| **Database** | `/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide*. |
| **Index** | `/index/config` |
| `index.dir` | The directory where the broker device mapping files are stored. Change takes effect on service restart. |
| `language.filename` | The index language specification (XML) that is loaded on startup. Change requires service restart. |
| **Logs** | `/logs/config` refer to Core Service Logging Configuration Parameters |
| **REST** | `/rest/config` refer to REST Interface Configuration Parameters |
| **SDK** | `/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes |

| Broker Parameter Field | Description |
|---|---|
| **Services** | `/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters |
| **System** | `/sys/config` refer to Core Service System Configuration Parameters |

## Concentrator Service Configuration Parameters

The following list describes the Concentrator configuration parameters.

| Concentrator Parameter Field | Description |
|---|---|
| **Concentrator** | `/concentrator/config` refer to Aggregation Configuration Parameters |
| **Database** | `/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*. |
| **Index** | `/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*. |
| **Logs** | `/logs/config` refer to Core Service Logging Configuration Parameters |
| **REST** | `/rest/config` refer to REST Interface Configuration Parameters |
| **SDK** | `/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes |
| **Services** | `/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters |
| **System** | `/sys/config` refer to Core Service System Configuration Parameters |

## Core Service Logging Configuration Parameters

The following table describes the logging configuration parameters for all NetWitness Core services. Logging configuration is the same for all Core services.

| Logs Configuration Folder | /logs/config |
|---|---|
| `log.dir` | Displays the directory where the log database is stored. Optional assigned max size (=#) is in MBs. Change takes effect on service restart. |

| Logs Configuration Folder | /logs/config |
|---|---|
| log.levels | Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: <Module>= [debug\|info\|audit\|warning\|failure\|all\|none]. Change takes effect immediately. |
| log.snmp.agent | Sets a remote SNMP Trap Receiving agent. |
| snmp.trap.version | Sets the SNMP version (2c or 3) to be used for gets and traps. |
| snmpv3.engine.boots | Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user. |
| snmpv3.engine.id | Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service. |
| snmpv3.trap.auth.local.key | Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually. |
| snmpv3.trap.auth.protocol | Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA). |
| snmpv3.trap.priv.local.key | Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x. |
| snmpv3.trap.priv.protocol | Displays the SNMPv3 Trap Privacy Protocol (none or AES). |
| snmpv3.trap.security.level | Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv, or authPriv. |
| snmpv3.trap.security.name | Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication. |
| syslog.size.max | Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately. |

## Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a Network Decoder, the connection parameters are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the `/services` folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Network Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following list describes the Service Configuration parameters:

| Services | /services/host:port/config |
|---|---|
| allow.nonssl.to.ssl | Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if `false`, non-secure to secure connections will be denied. Change takes effect immediately. |
| compression | Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression. |
| crc.checksum | Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation. |
| ssl | Displays a config node that enables or disables SSL encryption on the connection. |

## Core Service System Configuration Parameters

The following list describes the System configuration parameters that are common to all NetWitness Core services.

| System Configuration Folder | /sys/config |
|---|---|
| compression | Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections. |
| crc.checksum | Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections. |
| drives | Displays drives to monitor for usage stats. Change takes effect on service restart. |

| System Configuration Folder | /sys/config |
|---|---|
| port | Displays the port this service will listen on. Change takes effect on service restart. |
| scheduler | Displays the folder for scheduled tasks. |
| service.name.override | Displays an optional service name used by upstream services for aggregation in lieu of hostname. |
| ssl | Encrypts all traffic using SSL, if enabled. Change takes effect on service restart. |
| stat.compression | Compresses stats as they are written to the database, if enabled. Change takes effect on service restart. |
| stat.dir | Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart. |
| stat.exclude | Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted:<br>? match any single character<br>* match zero or more characters to delimiter /<br>** match zero or more characters including delimiter.<br>Change takes effect immediately. |
| stat.interval | Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately. |
| threads | Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately. |

## Decoder Configuration Parameters

The following list describes the configuration parameters that are identical on both Network Decoder and Log Decoder services.

| Configuration Path | <service>/config |
|---|---|
| aggregate.buffer.size | Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart. |
| aggregate.precache | Determines if the decoder will pre-cache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately. |

| Configuration Path | <service>/config |
|---|---|
| assembler.pool.ratio | Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart. |
| assembler.session.flush | Flushes sessions either when they are complete, or when they are parsed. Change takes effect on service restart. |
| assembler.session.pool | Lists the number of entries in the session pool. Change takes effect on service restart. |
| assembler.size.max | Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately. |
| assembler.size.min | Lists the minimum size that a session must be before persisting. Change takes effect immediately. |
| assembler.timeout.packet | Lists the number of seconds before packets are timed out. Change takes effect immediately. |
| assembler.timeout.session | Lists the number of seconds before sessions are timed out. Change takes effect immediately. |
| assembler.voting.weights | Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately. |
| capture.autostart | Determines if capture begins automatically when the service starts. Change takes effect on service restart. |
| capture.buffer.size | Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart. |
| capture.device.params | Displays capture service specific parameters. Change takes effect on service restart.<br>The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored.<br>On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters.<br>• use-envision-time: If this is set to 1, the time metadata for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta.<br>• port: This parameter can be set to a numeric value to override the default syslog port listener, 514. |
| capture.selected | Displays current capture service and interface. Change takes effect immediately. |

| Configuration Path | <service>/config |
|---|---|
| export.expire.minutes | Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately. |
| export.packet.enabled | Allows export of packet data, if enabled. Change takes effect on service restart. |
| export.packet.local.path | Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart. |
| export.packet.max | Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| export.packet.remote.path | Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart. |
| export.packet.size.max | Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| export.rollup | Determines the rollup interval for export files. Change takes effect on service restart. |
| export.session.enabled | Allows export of session data, if enabled. Change takes effect on service restart. |
| export.session.format | Determines the file format used during session export. Change takes effect on service restart. |
| export.session.local.path | Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart. |
| export.session.max | Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| export.session.meta.fields | Determines which meta fields are exported. Comma-separated list of fields.<br>* means all fields.<br>* plus field list means all fields BUT listed fields.<br>Just field list means only those fields are included.<br>Change takes effect immediately. |
| export.session.remote.path | Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart. |
| export.session.size.max | Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |

| Configuration Path | <service>/config |
|---|---|
| export.usage.max | Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately. |
| parse.threads | Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart. |
| pool.packet.page.size | Displays the size of a packet page (default is KB). Change takes effect on service restart. |
| pool.packet.pages | Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart. |
| pool.session.page.size | Displays the size of a session page (default is KB). Change takes effect on service restart. |
| pool.session.pages | Lists the number of session pages decoder will allocate and use. Change takes effect on service restart. |

## Network Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Network Decoders.

| Decoder Parameter Field | Description |
|---|---|
| **Decoder** | /decoder/config refer to Decoder Configuration Parameters. |
| **Database** | /database/config refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*. |
| **Index** | /index/config refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*. |
| **Logs** | /logs/config refer to Core Service Logging Configuration Parameters. |
| **REST** | /rest/config refer to REST Interface Configuration Parameters. |
| **SDK** | /sdk/config refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes. |
| **System** | /sys/config refer to Core Service System Configuration Parameters. |

## Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for Log Decoder configuration settings.

| Log Decoder Setting Field | Description |
|---|---|
| **Database** | `/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*. |
| **Decoder** | `/decoder/config` refer to Decoder Configuration Parameters. |
| **Index** | `/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide.* |
| **Logs** | `/logs/config` refer to Core Service Logging Configuration Parameters. |
| **REST** | `/rest/config` refer to REST Interface Configuration Parameters. |
| **SDK** | `/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes. |
| **System** | `/sys/config` refer to Core Service System Configuration Parameters. |

## Log Tokenizer Configuration Settings

The Log Decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

| Parser Name | Description | Configuration Parameters |
|---|---|---|
| Log Tokens | Scans for runs of consecutive characters to produce 'word' meta items. | `token.device.types`, `token.char.classes`, `token.max.length`, `token.min.length`, `token.unicode` |
| IPSCAN | Scans for text that appears to be an IPv4 address to produce `ip.addr` meta items. | `token.device.types` |
| IPV6SCAN | Scans for text that appears to be an IPv6 address to produce `ipv6` meta items. | `token.device.types` |
| URLSCAN | Scans for text that appears to be a URL to produce `alias.host`, `filename`, `username`, and `password` meta items. | `token.device.types` |

| Parser Name | Description | Configuration Parameters |
|---|---|---|
| DOMAINSCAN | Scans for text that appears to be a domain name to produce `alias.host`, `tld`, `cctld`, and `sld` meta items. | `token.device.types` |
| EMAILSCAN | Scans for text that appears to be an email address to produce `email` and `username` meta items. | `token.device.types` |
| SYSLOGTIMESTAMPSCAN | Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create `event.time` meta items. | `token.device.types` |
| INTERNETTIMESTAMPSCAN | Scans for text that appears to be RFC 3339-format timestamps to create `event.time` meta items. | `token.device.types` |

## Log Tokenizer Configuration Parameters.

| Log Decoder Parser Setting Field | Description |
|---|---|
| `token.device.types` | The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information.<br>If this field is empty, then log tokenization is disabled. |
| `token.char.classes` | This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`.<br>• `alpha`: Tokens may contain alphabetic characters<br>• `digit`: Tokens may contain numbers<br>• `space`: Tokens may contain spaces and tabs<br>• `punct`: Tokens may contain punctuation marks |
| `token.max.length` | This field puts a limit on the length of the tokens. The default value is **5** characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metadata.<br>Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index. |

| Log Decoder Parser Setting Field | Description |
|---|---|
| token.min.length | This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, **3**. |
| token.unicode | This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting.<br>When this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed.<br>When this is set to false, each log is treated as ASCII characters and only ASCII character classification is done.<br>Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled. |

## REST Interface Configuration Parameters

The following list describes the available configuration parameters for the REST interface built in to all NetWitness Core Services.

| REST Configuration Path | /rest/config |
|---|---|
| cache.dir | Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart. |
| cache.size | Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart. |
| enabled | Switches to enable or disable REST services, **1** is on, **0** is off. Change takes effect on service restart. |
| port | Displays the port the REST service will listen on. Change takes effect on service restart. |
| ssl | Encrypts all REST traffic using SSL, if enabled. The default system means use setting from /sys/config/ssl. Change takes effect on service restart. |

## NetWitness Platform Core Service system.roles Modes

All NetWitness Platform Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node `/sdk/config/system.roles` sets querying and viewing permissions for metadata and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Platform user interface (see "Data Privacy Tab" in the *Data Privacy Management Guide* for details). When the value is edited, change takes effect immediately.

Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated metadata, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered
- 5 - blacklist meta filtered
- 6 - blacklist content filtered

# Centralized Service Configuration via Policy Settings

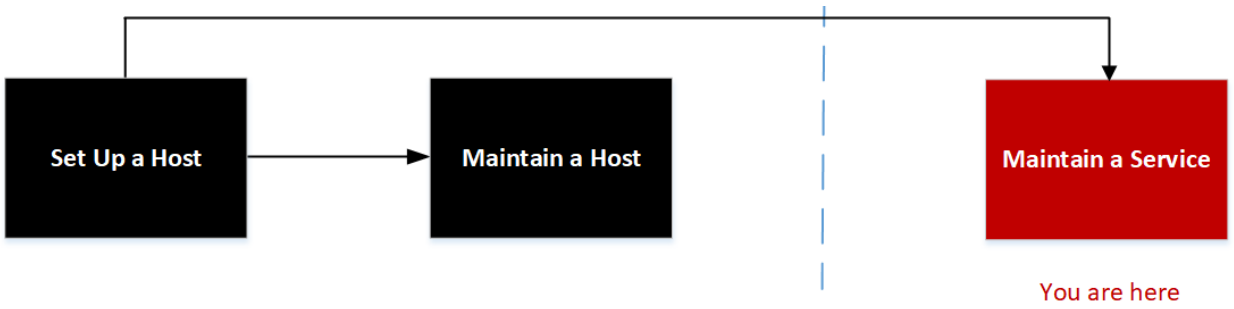
This topic introduces the available centralized service configuration settings for Concentrators, Decoders and Log Decoders services.

## Centralized Service Configuration – Groups Tab

**Note:** The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

### Workflow



### What do you want to do?

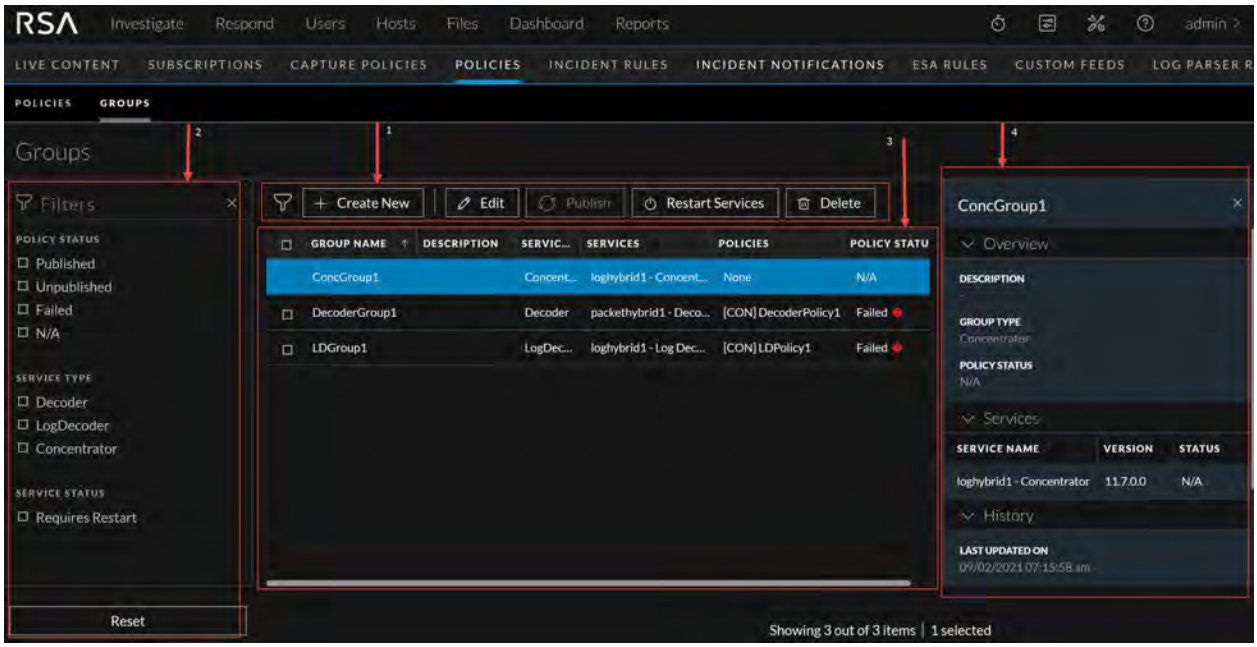
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |
| Administrator | Centrally Create and Maintain Service Groups.* | Hosts and Services Maintenance Procedures |

* You can perform these tasks in the current view.

### Related Topics:

- Hosts and Services Set Up Procedures
- Hosts and Services Maintenance Procedures

## Quick Look



Below is an example of the **Groups** tab:

The following table describes the Groups tab.

| | |
|---|---|
| 1 | **Toolbar**<br>• **Create New**- Lets you create a new group. For more information, see "Create a Group" in the Centralized Service Configuration via Policy.<br>• **Edit** – Lets you edit the group. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.<br>• **Publish** – Publishes selected groups.<br>• **Restart Services** – Restarts the service associated with the selected group. This option is disable if:<br>◦ There are no services in the group.<br>◦ No service restart is required.<br>• **Delete**- Deletes the selected groups. |

2 **Filter Pane**

- **Filters**: You can filter groups based on Policy Type and Policy Status, Service Type and Service Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Groups" in the Centralized Service Configuration via Policy.

3 **Group List Pane**

- **Group Name** – Name of the group.
- **Description** – Description of the group.
- **Service Type** – Displays the service type to which the group is applied.
- **Services** – Displays the service to the which the group is applied.
- **Policies** – Displays the policy to which the group is applied.
- **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

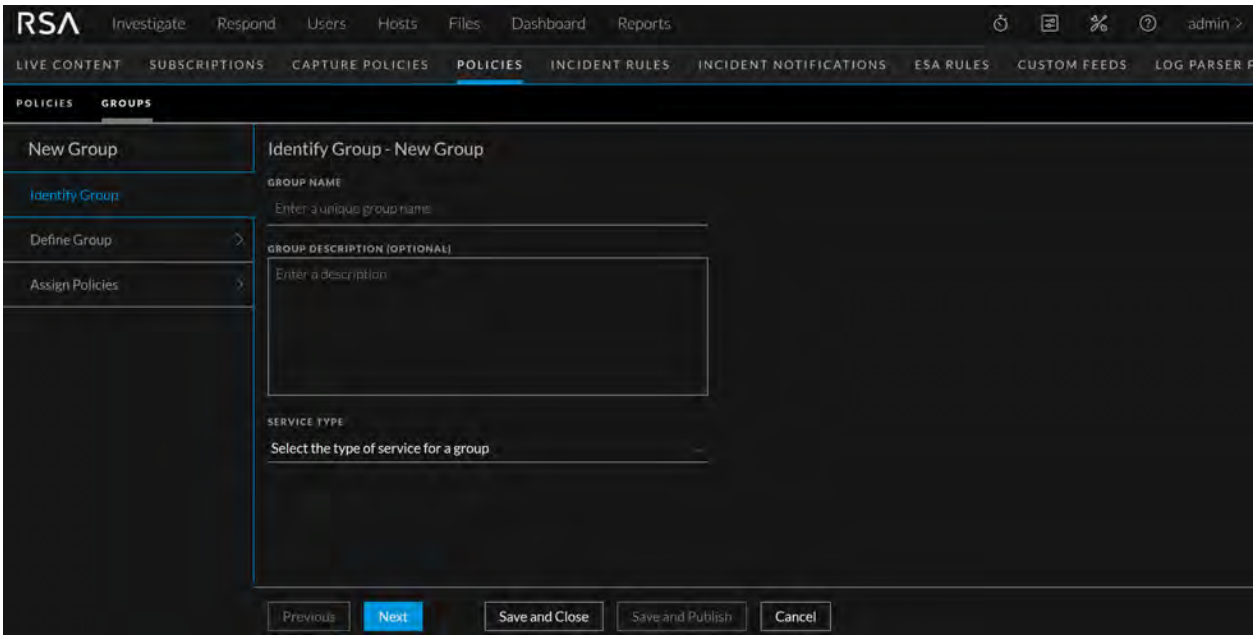
4 **Groups Details Panel**

Displays the properties of the selected group.

**Note:** Click the row to view the Properties panel for a group.

## Create Group Dialog

Below is an example of the Create Group dialog.

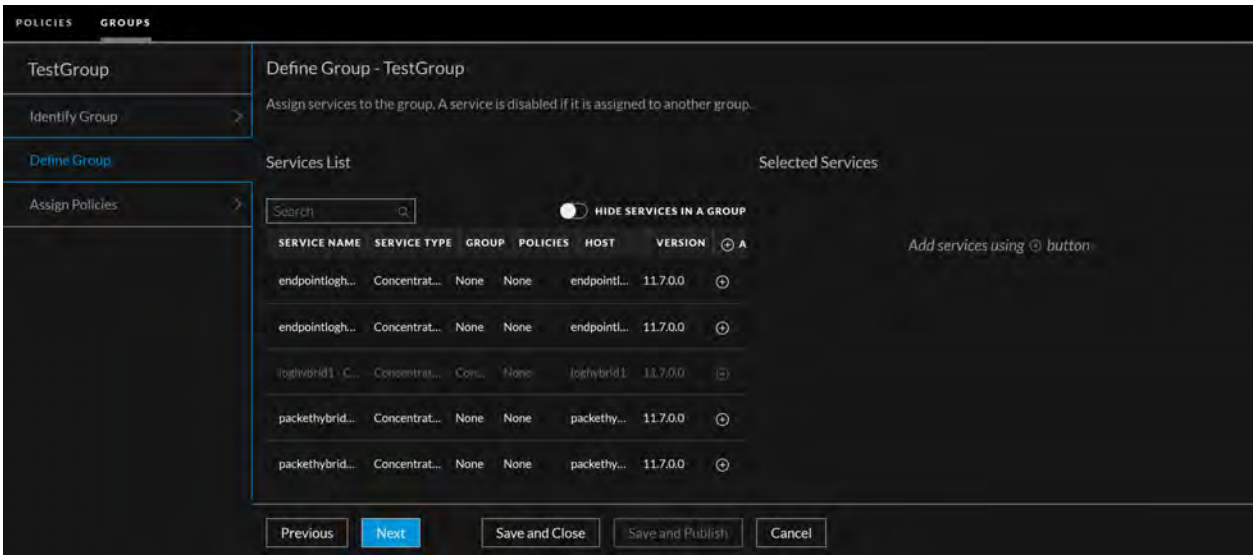


The table describes the information and options in the Create Group dialog.

| Field | Description |
|---|---|
| Group Name | Name of the group. The name should be unique. |
| Group Description (Optional) | Description of the group. Description should not exceed 8000 characters. |
| Service Type | Select the type of service for a group. Available options are Log Decoder, Decoder, and Concentrator. |
| Save and Close | Saves the settings and closes the Create Group dialog. |

## Define Group Dialog

Below is an example of the define group dialog.



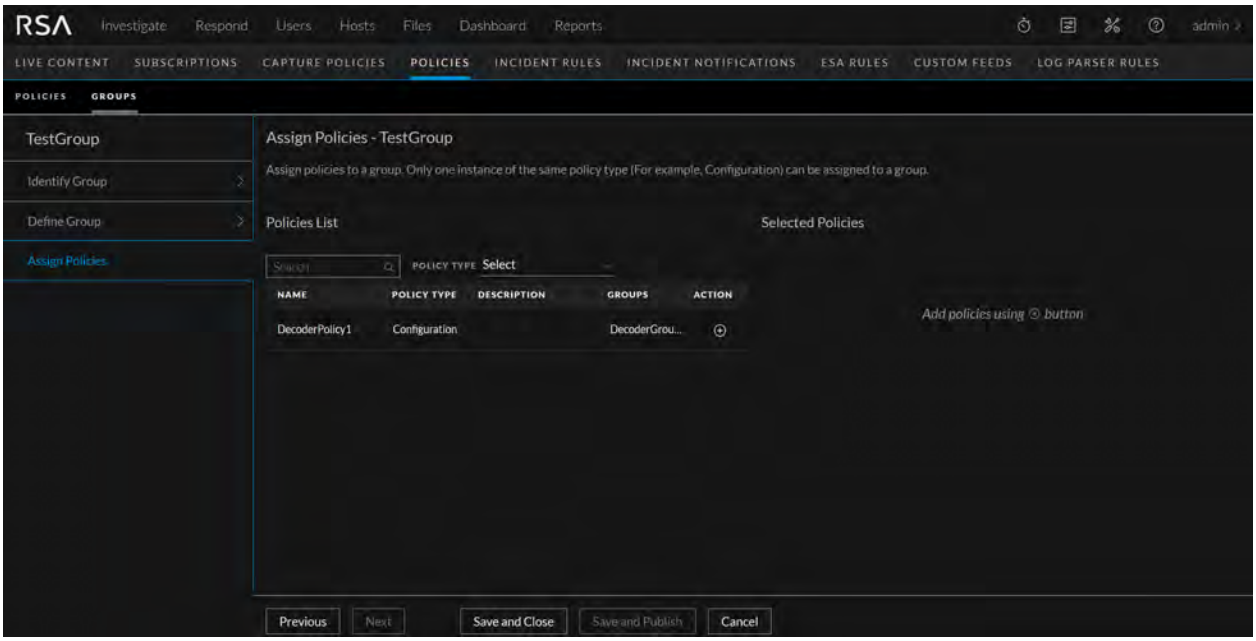
The table describes the information and options in the Define Group dialog.

| Field | Description |
|---|---|
| Service List | Displays the list of services associated with the selected service type.<br>The following describes services list:<br>• **Service name** – Name of the service.<br>• **Service type** – Displays the service type of the service.<br>• **Group** – Name of the group.<br>• **Policies** – Displays the policies associated with the service.<br>• **Host** – Host name of the service.<br>• **Version** – Service version.<br>• **All** – Lets you to add services to the group. You can either click to add all services or click to add specific service. |

| Field | Description |
|---|---|
| Hide Services in a Group | Displays the services that is not assigned to any group. By default, this option is disabled. |
| Selected Services | Displays the list of selected services for the group. |
| Save and Close | Saves the setting and closes the Define Group dialog. |
| Save and Publish | Saves and publishes the created group.<br>**Note:** This option is disabled if you have not:<br>- Assigned services<br>- Assigned policies |

## Assign Policy Dailog

Below is an example of Assign Policy dialog.



The following table describes assign policy dialog:

| Field | Description |
|---|---|
| Policies List | Displays the list of policies associated with the group. The following describes policies list:<br>• **Name** – Name of the policy.<br>• **Policy Type** – Displays the policy type.<br>• **Description** – Description of the policy.<br>• **Groups** – Groups associated with the policy.<br>• **Action** - Click to add policies to the group. |
| Policy Type | Select the policy type from the drop-down list. |
| Selected Policies | Displays the list of selected policies for the group. |
| Save and Close | Saves the settings and closes the Create Group dialog. |

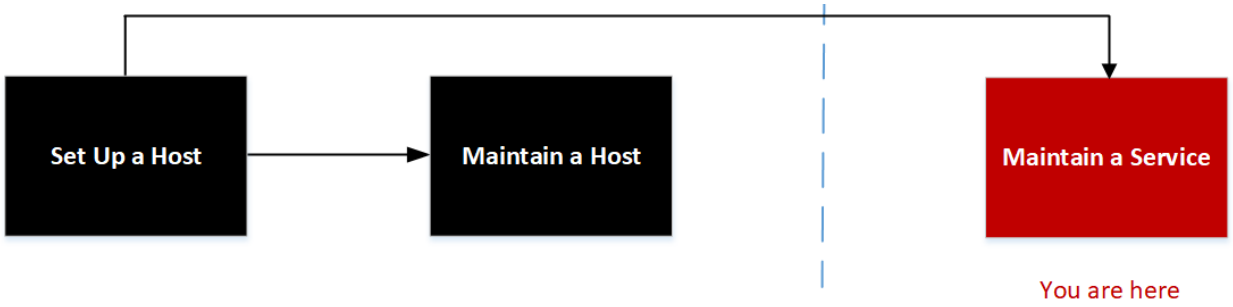
| Field | Description |
|---|---|
| Save and Publish | Saves and publishes the created group.<br>**Note:** This option is disabled if you have not:<br>- Assigned services.<br>- Assigned policies. |

## Centralized Service Configuration – Policies Tab

**Note:** The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

### Workflow



### Related Topics:

- Hosts and Services Set Up Procedures
- Hosts and Services Maintenance Procedures

### What do you want to do?

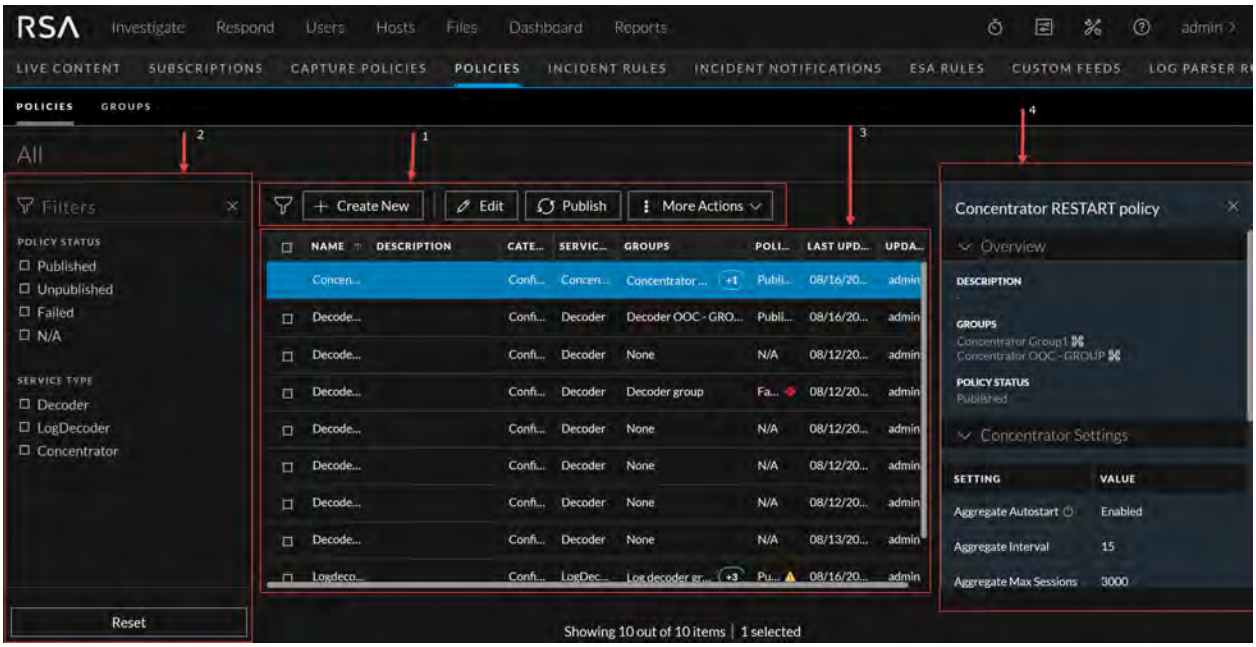
| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | set up a host. | Setting Up a Host |
| Administrator | maintain a host. | Maintaining Hosts |
| Administrator | maintain a service. | Maintaining Services |

| User Role | I want to... | Documentation |
|---|---|---|
| Administrator | Centrally Create and Maintain Service Policy.* | Hosts and Services Maintenance Procedures |

* You can perform these tasks in the current view.

## Quick Look

Below is an example of the **Policies** tab:



1 **Toolbar**

- **Create New**- Lets you create a new policy. For more information, see "Create a Policy" in the Centralized Service Configuration via Policy.
- **Edit** – Lets you edit the policy. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.
- **Publish** – Publishes the selected policy or policies.
- **More Actions**
  - **Assign to Group** -Lets you assign policy to a group.
  - **Clone** – Lets you clone a policy.
  - **Revert** – Lets you revert to previous policy settings. By default, the revert value is set to 5. You can customize the revert value in Explorer view.
  - **Delete** - Deletes the selected policy or policies permanently.

2 **Filter Pane**

- **Filters**: You can filter policies based on Policy Type and Policy Status and Service Type.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Policies" in the Centralized Service Configuration via Policy.

3 **Policy List Pane**
**Name – Name of the policy.**

• **Description** – Description of the policy.

• **Category** – Type of policies applied.

• **Service Type** – Displays the service type to which the policy is applied.

• **Groups** - Lists the group to which this policy is applied.

• **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

• **Last Updated** – Displays the time when the policy is updated.

• **Updated By** – The user who updated the policy.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

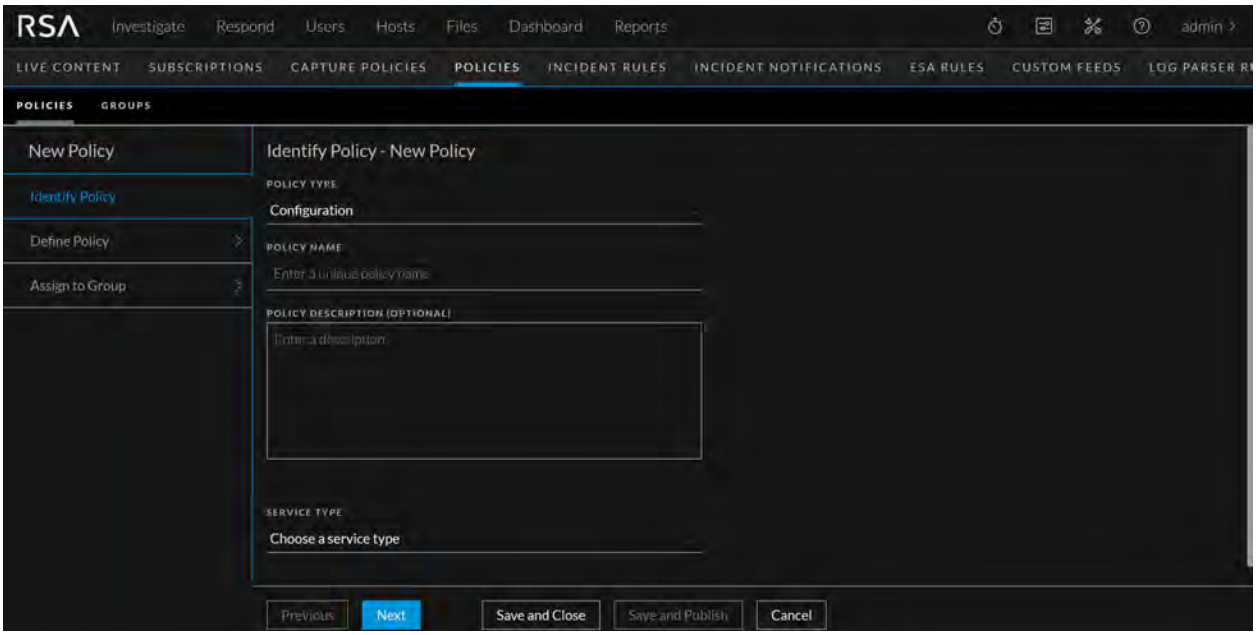
4 **Policy Details Pane**

Displays the properties of the selected policy.

**Note:** Click the row to view the Properties panel for a policy.

## Create Policy

Below is an example of the Create Policy dialog.

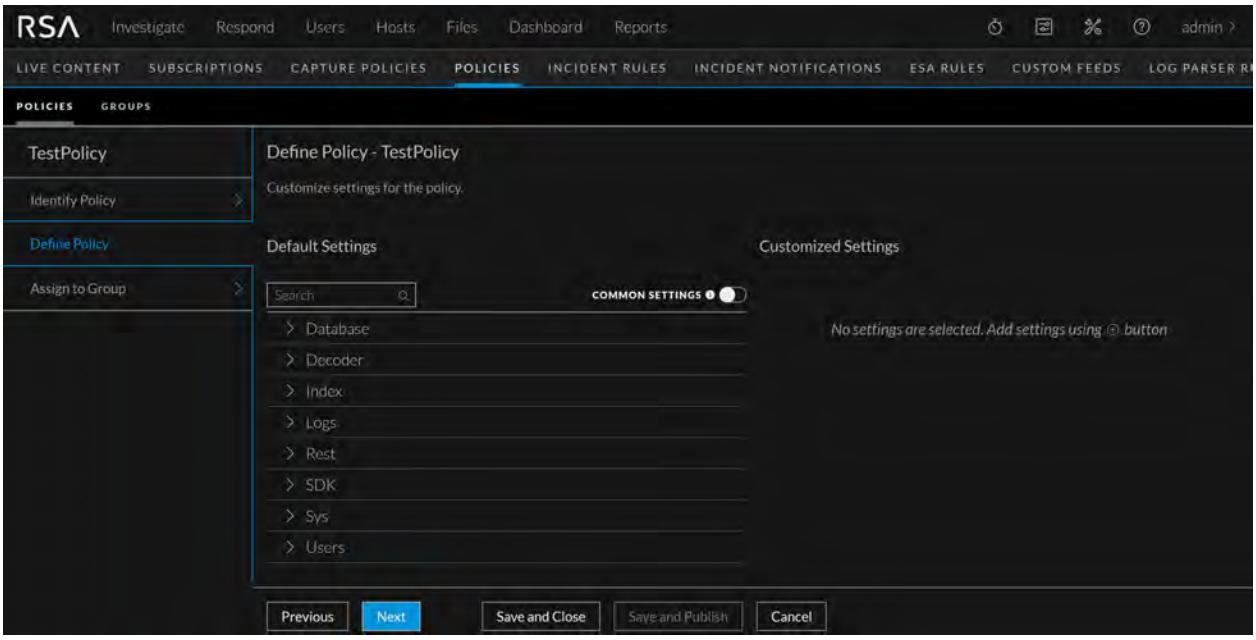


The table describes the information and options in the Create Policy dialog.

| Field | Description |
|---|---|
| Policy Type | Displays the policy type. |
| Policy Name | Name of the policy. The name should be unique. |
| Policy Description (Optional) | Description of the policy. Description should not exceed 8000 characters. |
| Service Type | Displays the type of the service. Available options are Log Decoder, Decoder, and Concentrator. |

| Field | Description |
|---|---|
| (For version 11.7.1 and Later) Clone from Existing Service (Optional) | Displays the list of services based on the service type to clone those settings. |
| Save and Close | Saves the settings and closes the Create Policy dialog. |

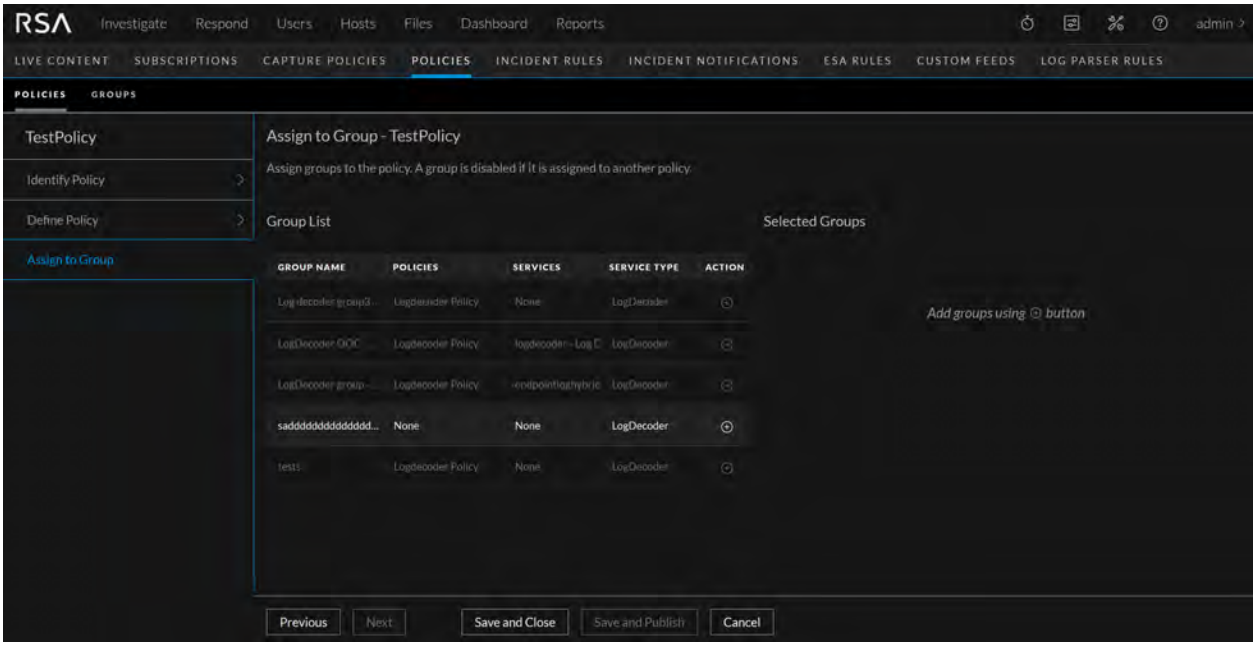
## Define Policy Settings



| Field | Description |
|---|---|
| Default Settings | Displays the settings of the service based on the category, for example, Database, Decoder and so on.<br><br>Click  to expand the setting category.<br><br>  <br><br>The following describes Default settings:<br>• **Setting**- Name of the setting.<br>• **Value**- The settings value.<br>• **Description**- Description of the setting.<br>• **All** – Lets you to select the settings for customization. You can either click to customize all the settings value or click on a specific setting |
| Common Settings | Displays the common settings of the service. By default, it is disabled. |
| (For version 11.7.1 and Later) 10g Settings | Fetches the 10g settings. |

| Field | Description |
|---|---|
| Customized Settings | Lists the selected settings for customization.<br>Click ⊕ to add the setting.<br>  <br>Update the value based on your requirement.<br>  |

## Assign to Group



| Field | Description |
|---|---|
| Group List | Displays the list of group associated with the policy. A group is disabled if it is already assigned to another policy.<br>• Group Name<br>• Policies<br>• Services<br>• Service Type<br>• Action |
| Selected Group | Lists the selected groups. Click to add groups. |
| Save and Close | Saves the settings and closes the Assign to Group dialog. |
| Save and Publish | Saves and publishes the created policy.<br>**Note:** This option is disabled if:<br>- Policy settings are not customized.<br>- Policy is not assigned to groups. |

# Troubleshooting Version Installations and Updates

This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support.

Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Installation Failed Error
- Host Update Failed Error
- Missing Update Packages Error
- OpenSSL 1.1.x Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade

Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.

- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis

# deploy_admin User Password Has Expired Error

| | |
|---|---|
| **Error Message** |  |
| **Cause** | The `deploy_admin` user password has expired. |
| **Solution** | Reset your `deploy_admin` password password.<br>1. On the NW Server host only, run the following command.<br>`nw-manage --update-deploy-admin-pw`<br>`Please enter the new deploy_admin account password: <new-deploy-admin-password>`<br>`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`<br>2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.<br>3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt. |

# Downloading Error

| | |
|---|---|
| **Error Message** |  |
| **Problem** | When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete. |
| **Cause** | Version download files can be large and take a long time to download. If there are communication issues during the download it will fail. |
| **Solution** | 1. Try to update again.<br>2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform 11.6*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.<br>3. If you are still not able to update, contact Customer Support. |

# Error Deploying Version <version-number> Missing Update Packages

| | |
|---|---|
| **Error Message** |  |
| **Problem** | Error deploying version <version-number> is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted. |
| **Solution** | 1. Click **Close** to close the dialog.<br>2. Remove the version folder from staging folder.<br>3. Make sure that the salt-master service is running.<br>4. Recopy the update package zip file to the staging folder.<br>5. In the Hosts view toolbar, select Check for Updates again.<br>  <br>6. Click **Initialize Update**.<br>7. Click **Update** > **Update Hosts** from the toolbar.<br>8. Click **Begin Update** from the **Update Available** dialog.<br>After the host is updated, it prompts you to reboot the host.<br>9. Click **Reboot** from the toolbar. |

# Upgrade Failed Error

| | |
|---|---|
| **Error Message** | While updating/installing a device to version 11.2 or above, the following error can occur and be found in /var/log/netwitness/config-management/chef-solo.log:<br> |

| | |
|---|---|
| **Cause** | The reason can be because the target host is unable to communicate to the Admin Server on port 53 as it is attempting to use the dnsmasq service on the Admin Server to resolve, in this case, 889e5752-6ae3-4286-a944-c182 33f4ccbc. This is the salt minion id of the admin server. You can see this by running "cat /etc/salt/minion" on the Admin Server to compare. Example output:<br>`[root@S5-NWAdmin ~]# cat /etc/salt/minion`<br>`master: localhost`<br>`hash_type: sha256`<br>`log_level: info`<br>`id: 889e5752-6ae3-4286-a944-c18233f4ccbc` |
| **Solution** | If possible, configure any firewalls between the target host and the Admin Server host to be able to communicate on port 53. If this is not possible, the workaround is to include the minion id in the /etc/host file on the component hosts and starting in the 11.4 release, modify the chef recipe not to overwrite this workaround. |
| **Workaround** | Refer to Install/Upgrade fails in RSA NetWitness Platform because Resolv::ResolvError: no address for a particular host KB Article. |

| | |
|---|---|
| **Error Message** | Received an error in the error log similar to the following when trying to update to version 11.6 :<br>`FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt` |
| **Cause** | Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes. |
| **Solution** | To resolve the issue, follow the below steps.<br>1. SSH to Admin Server.<br>2. Locate the component descriptor file by running the following command.<br>`cd /etc/netwitness/component-descriptor/`<br>3. Open the component descriptor file by running the following command.<br>`vi nw-component-descriptor. json`<br>4. Search for “packages” section for the component you have custom build/rpm. For example, below shown is the package details for “concentrator” host that has custom build/rpm.<br>`“concentrator”: {`<br>`“cookbook_name”: “rsa-concentrator”,`<br>`“service_names”: [“rsa-nw-concentrator”],`<br>`“family”: “launch”,`<br>`“default_port”: xxxx, “description”: “Concentrator”,`<br>`“packages”:[{ “name”: “rsa-nw-concentrator”,`<br>`“version” : “11.6.0.0-2003001075220.5.cecf24b.e.17.centos”`<br>`},`<br>5. Delete the complete version details including (,) character in the packages section. For |

| | |
|---|---|
| | example, it should look like as shown below after you delete the version details.<br>`"packages": [{`<br>`"name": "rsa-nw-concentrator"`<br>`},`<br>**Note:** You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.<br>6. Run the upgrade process again. |

## External Repo Update Error

| | |
|---|---|
| **Error Message** | Received an error similar to the following error when trying to update to a new version from the :<br>`.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""` |
| **Cause** | There is an error the path you specified. |
| **Solution** | Make sure that:<br>• the URL does exist on the NW Server host.<br>• you used the correct path and remove any spaces from it. |

## Host Installation Failed Error

| | |
|---|---|
| **Error Message** |  |
| **Problem** | When you select a host and click **Install** the install service process fails. |
| **Solution** | 1. Try to install the service again.<br>Often this is all you need to do.<br>2. If you still cannot install the service:<br>a. Monitor the following logs on NW Server as it progresses (for example, submit the `tail -f` command string from the command line'):<br>`/var/netwitness/uax/logs/sa.log`<br>`/var/log/netwitness/orchestration-server/orchestration-server.log` |

| | |
|---|---|
| | `/var/log/netwitness/deployment-upgrade/chef-solo.log`<br>`/var/log/netwitness/config-management/chef-solo.log`<br>`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`<br>The error appears in one or more of these logs.<br>b. Try to resolve the issue and reinstall the service.<br>• Cause 1 - Entered the wrong `deploy_admin` password in the nwsetup-tui.<br>Solution - Reset your `deploy_admin` password password.<br>1. On the NW Server host and all other hosts on 11.x, run the following command.<br>`/opt/rsa/saTools/bin/set-deploy-admin-password`<br>2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.<br>• Cause 2 -The `deploy_admin` password has expired.<br>Solution - Reset your `deploy_admin` password password.<br>1. On the NW Server host and all other hosts on 11.x, run the following command.<br>`/opt/rsa/saTools/bin/set-deploy-admin-password`<br>2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.<br>3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support. |

## Host Update Failed Error

| | |
|---|---|
| **Error Message** |  |
| **Problem** | When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails. |
| **Solution** | 1. Try to apply the version update to the host again.<br>Often this is all you need to do.<br>2. If you still cannot apply the new version update: |

a. Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
`/var/netwitness/uax/logs/sa.log`
`/var/log/netwitness/orchestration-server/orchestration-server.log`
`/var/log/netwitness/deployment-upgrade/chef-solo.log`
`/var/log/netwitness/config-management/chef-solo.log`
`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
The error appears in one or more of these logs.

b. Try to resolve the issue and reapply the version update.

- Cause 1 - `deploy_admin` password has expired.
  Solution - Reset your `deploy_admin` password .
  Complete the following steps to resolve Cause 1.

  1. In the NetWitness Suite menu, select **(Admin) > Security > Users** tab.
  2. Select the `deploy_admin` and click **Reset Password**.
  3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
     a. Reset `deploy_admin` to use a new password.
     b. On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
     `/opt/rsa/saTools/bin/set-deploy-admin-password`

- Cause 2 -The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts.
  Complete the following step to resolve Cause 2.

  - On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
  `/opt/rsa/saTools/bin/set-deploy-admin-password`

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

## Missing Update Packages Error

| Error Message | **Initialize Update for Version xx.x.x.x**<br>Missing the following update package(s)<br>Download Packages from RSA Link |
|---|---|

| | |
|---|---|
| **Problem** | Missing the following update package(s) is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder. |
| **Solution** | 1. Click Download Packages from RSA Link in the **Initialize Update Package for RSA NetWitness Platform** dialog.<br>The RSA Link page that contains the update files for the selected version is displayed.<br>2. Select the missing packages from the staging folder.<br>The **Initialize Update Package for RSA NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages. |

## OpenSSL 1.1.x

| | |
|---|---|
| **Error Message** | The following example illustrates an ssh error that can occur when the ssh client is run from a host with OpenSSL 1.1.x installed:<br>`$ ssh root@10.1.2.3`<br>**`ssh_dispatch_run_fatal: Connection to 10.1.2.3 port 22: message authentication code incorrect`** |
| **Problem** | Advanced users who want to ssh to a NetWitness Platform host from a client that is using OpenSSL 1.1.x encounter this error because of incompatibility between CENTOS 7.x and OpenSSL 1.1.x. For example:<br>`$ rpm -q openssl`<br>`openssl-1.1.1-8.el8.x86_64` |
| **Solution** | Specify the compatible cipher list on the command line. For example:<br>`$ ssh -oCiphers=aes128-ctr,aes192-ctr,aes256-ctr root@10.1.2.3`<br>`I've read & consent to terms in IS user agreement.`<br>`root@10.1.2.3's password:`<br>`Last login: Mon Oct 21 19:03:23 2019` |

## Patch Update to Non-NW Server Error

| | |
|---|---|
| **Error Message** | The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error:<br>**`API\|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`** |
| **Problem** | After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 , the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error. |
| **Solution** | You have two options: |

| | |
|---|---|
| | • Update the non-NW Server host to 11.6.0.0, or<br>• Do not update the non-NW Server host (keep it at its current version) |

## Reboot Host After Update from Command Line Error

| | |
|---|---|
| **Error Message** | You receive a message in the User Interface to reboot the host after you update and reboot the host offline.<br> |
| **Cause** | You cannot use CLI to reboot the host. You must use the User Interface. |
| **Solution** | Reboot the host in the Host View in the User Interface. |

## Reporting Engine Restarts After Upgrade

| | |
|---|---|
| **Problem** | In some cases, after you upgrade to 11.6 from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success. |
| **Cause** | The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted. |
| **Solution** | To resolve the issue, do the following:<br>1. Check which database files are corrupted:<br>Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks:<br>• If the live charts db file is corrupted, the following logs are displayed:<br>Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:<br>org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]<br>at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)<br>at org.h2.message.DbException.get(DbException.java:168)<br>org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database!<br>• If the alert status db file is corrupted, the following logs are displayed: |

Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading
record: null. Possible solution: use the recovery tool
[90030-196]
```

2. To resolve the live charts database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   **Note:** Some live charts data may be lost on performing the above steps.

   To resolve the alert status or report status database file corruption, perform the following steps:

   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.
   c. Restart the Reporting Engine service.

   For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to RSA NetWitness Platform 11.4.

| | |
|---|---|
| **Problem** | After you upgrade to version 11.6, the Reporting Engine service does not restart. |
| **Cause** | The Reporting Engine service may not start due to any of the following reasons.<br>- workspace.xml not updated.<br>- Time is not converted properly in livechart h2 database.<br>- JCR (Jackrabbit repository) is corrupted with primary key violation. |
| **Solution** | To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service is installed. |

| | |
|---|---|
| | **Note:** You can find the Reporting Engine Migration Recovery tool in the below location.<br>`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`<br>1. SSH to Admin Server.<br>2. Untar the RE (Reporting Engine) tool, run the following command.<br>`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`<br>3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.<br>`mkdir <NAME OF THE DIRECTORY>`<br>`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`<br>4. Run the script, run the following command.<br>`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`<br>For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**. |

## Log Collector Service (`nwlogcollector`)

Log Collector installation logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

| | |
|---|---|
| **Error Message** | `<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.` |
| **Cause** | The Log Collector Lockbox failed to open after the update. |
| **Solution** | Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. |

| | |
|---|---|
| **Error Message** | `<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found` |
| **Cause** | The Log Collector Lockbox is not configured after the update. |
| **Solution** | If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. |

| | |
|---|---|
| **Error Message** | `<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.` |
| **Cause** | You need to reset the stable value threshold field for the Log Collector Lockbox. |
| **Solution** | Log in to NetWitness and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. |

| | |
|---|---|
| **Error Message** | Decoder tries to start capture events but fails.<br>`Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.` |
| **Solution** | To resolve the issue, do the following steps,<br>1. SSH to the Decoder host.<br>2. Run the following commands.<br>`yum reinstall pfring*`<br>`systemctl restart nwdecoder` |

## NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

| | |
|---|---|
| **Problem** | After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup;<br>or,<br>The following message seen in the `sa.log`.<br>`Syslog Configuration migration failed. Restart jetty service to fix this issue` |
| **Cause** | NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0. |
| **Solution** | 1. SSH to the NW Server.<br>2. Submit the following command.<br>`orchestration-cli-client --update-admin-node` |

## Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

| | |
|---|---|
| **Problem** | 1. Tried to upgrade a non-NW Server host and it failed.<br>2. Retried the upgrade for this host and it failed again.<br><br>You will see the following message in the `orchestration-server.log`.<br>`"'file' _virtual_ returned False: cannot import name HASHES""` |
| **Cause** | Salt minion may have been upgraded and never restarted on failed non-NW Server host |
| **Solution** | 1. SSH to the non-NW Server host that failed to upgrade.<br>2. Submit the following commands.<br>`systemctl unmask salt-minion`<br>`systemctl restart salt-minion`<br>3. Retry the upgrade of the non-NW Server host. |

## Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

| | |
|---|---|
| **Error Message** | `<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]` |
| **Cause** | Update of the Reporting Engine failed because you do not have enough disk space. |
| **Solution** | Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. |

## Event Stream Analysis

| | |
|---|---|
| **Problem** | After upgrading to version 11.6, the ESA correlation server does not aggregate events from the configured data sources. |
| **Error Message** | `Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)` |
| **Solution** | To resolve the issue, do the following steps.<br>In the NetWitness user interface, |

1. Go to **(Configure) > ESA Rules**.
   **ESA Rules** panel is displayed with **Rules** tab open.
2. In the Rules tab options panel, under Deployments, select a deployment.
3. In the **Data Sources** section, select the data source and click in the toolbar.
4. In the **Edit Service** dialog, type the password for that data source.
5. Click the **Test Connection** button to make sure that it can communicate with the ESA service and then click **OK**.

**Note:** Do the above procedure for all the configured data sources.

6. After you finish making changes to the deployment, click **Deploy Now** to redeploy the ESA rule deployment.

# What Is NetWitness® Investigate?

NetWitness audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata. NetWitness Investigate provides the data analysis capabilities in NetWitness, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

## About This Guide

This guide provides end-to-end guidelines for all members of the SOC team to configure NetWitness Investigate and to investigate log and network events. End-to-end guidelines for investigating endpoints and user entity behavior using NetWitness Investigate are provided in separate documents:

- *NetWitness Endpoint Quick Start Guide*
- *NetWitness UEBA Quick Start Guide*

## RSA NetWitness Platform 11.7 Documentation in NetWitness Community

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the a.

Use these links to view the RSA NetWitness Platform 11.x documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: RSA NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: RSA NetWitness Platform 11.7 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

## Getting Started

The following tasks can be performed in any sequence and are for the entire SOC team.

| Description | References |
|---|---|
| | |
| View information about product updates, improvements, and known issues | *Release Notes for RSA NetWitness Platform 11.7* |
| Understand how NetWitness Investigate works | "How NetWitness Investigate Works" in the *NetWitness Investigate User Guide* |

## Setup, Installation, or Upgrade

No special setup, installation, or upgrade tasks are required for Investigate; it is part of NetWitness Platform for Logs and Network. However, setup is required for several components with which NetWitness Investigate works if you plan to do this type of analysis. These tasks are for the Administrator, and the SOC Manager may want to understand the setup.

| Description | References |
|---|---|
| | |
| Install and set up the Malware Analysis (standalone or service) | Malware Analysis Configuration Guide |
| Install and set up NetWitness Endpoint (standalone or service) | NetWitness Endpoint Quick Start Guide |
| Install and set up NetWitness UEBA (standalone or service) | NetWitness UEBA Quick Start Guide |

## System-Level Configuration

Administrators configure system-level preferences for NetWitness Investigate.The following tasks are for the administrator, and the tasks can be performed in any sequence. SOC Managers should understand the possible configuration options.

| Description | References |
|---|---|
| | |
| Configure role-based access control (RBAC) for analysts who will be using Investigate. These components have permissions related to investigate: investigate (Navigate view and Legacy Events view), investigate-server (Events view), Malware (Malware Analysis view), Endpoint-broker-server, and Endpoint-server. | "Role Permissions" in the System Security and User Management Guide |
| Configure Investigate to limit content available for different user roles (preQueries). | "Verify Query and Session Attributes per Role" in the System Security and User Management Guide |
| Configure default settings and limits for NetWitness Investigate on a system level. | "Configure Investigation Settings" in the System Configuration Guide |

## User Preference Configuration

The following tasks are for Threat Hunters, Content Experts, and Incident Responders, and SOC Managers. The tasks can be performed in any sequence.

| Description | References |
|---|---|
| | |
| Configure Navigate view and Events view preferences. | "Configure the Navigate and Legacy Events View" in the *NetWitness Investigate User Guide* |
| Configure Event Analysis view preferences. | "Configure the Events View" in the *NetWitness Investigate User Guide* |
| Configure the Malware Analysis view preferences. | "Configure Malware Analysis" in the *Malware Analysis User Guide* |

## Investigation

Different types of investigation may be handled by analysts with different skill levels and goals.

- Incident Responders (T1 Analysts) typically pivot to Investigate from NetWitness Respond to find detailed information about an incident so that they can respond to and remediate incidents.
- Threat Hunters (T2/T3 Analysts) typically peruse events, metadata, and raw content so that they can recommend issues for remediation and remediate issues.
- Content Experts (Threat Intelligence) typically peruse events, metadata, raw content, user and host data, and UEBA data so that they can investigate new threat intelligence, evaluate and create new feeds, and create correlation rules to flag indicators of compromise.
- SOC Managers need to understand the use cases.

| Description | References |
|---|---|
|  | |
| Learn about practical use cases | "Sample Use Cases for NetWitness Investigate" in the *NetWitness Investigate User Guide* |
| Investigate metadata and raw events in logs and network traffic | "Beginning an Investigation" in the *NetWitness Investigate User Guide* |
| Investigate possible malware | Malware Analysis User Guide |
| Investigate endpoints | NetWitness Endpoint User Guide |
| Perform user and entity behavior analysis | NetWitness UEBA User Guide |

## Maintenance

The administrator can perform the following tasks in any sequence.

| Description | References |
|---|---|
|  | |
| Maintain the list of queries and analyze the query patterns of other users of the NetWitness Platform system. | "Maintaining Queries Using URL Integration" in the System Maintenance Guide |

| Description | References |
| --- | --- |
| Fine tune system-level configuration settings to improve performance or limit access to data. | "Verify Query and Session Attributes per Role" in the System Security and User Management Guide<br>"Configure Investigation Settings" in the System Configuration Guide |

# RSA NetWitness

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

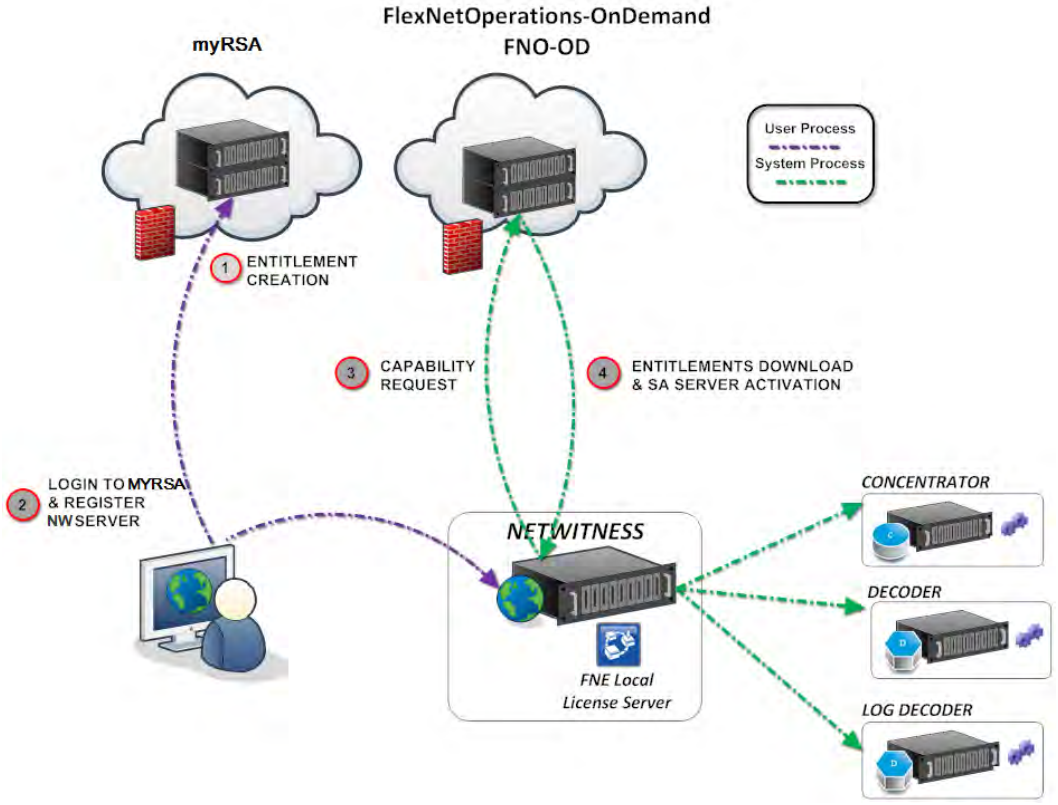
# Entitlement Capability Implementation

This topic describes how licensing of appliances and services is implemented in NetWitness. The entitlement capability leverages myRSA (https://my.rsa.com/) as the mechanism for entitlement delivery.



| Key | Description |
|---|---|
| 1 | **Entitlements Created and Available to Customer.**<br>After a customer order is processed, the entitlements (licenses) become available in myRSA. The entitlements are tied to an individual account. |
| 2 | **Register NetWitness Server on myRSA and Map Entitlements to the Local License Server (LLS).**<br>• Customers log on to myRSA and view the entitlements to which they have access within their account.<br>• Customers map entitlements to their Local License Server using the License Server ID (displayed in the NetWitness (Admin) **> System > Info** panel). The License Server ID is used only for mapping entitlements to a Local License Server and does not pertain to appliance activation. |

| Key | Description |
|---|---|
| 3 | **Synchronize the Server and Download Mapped Entitlements.**<br>There are two methods for customers to synchronize with FlexNet Operations-On Demand (FNO-OD) and download the mapped entitlements to their LLS.<br>• **Sites with Internet connectivity.** If the LLS has Internet connectivity, the LLS attempts to synchronize with FNO-OD every 24 hours over HTTP (TCP-80). Customers with Internet connectivity can also perform on-demand synchronization, using the **Refresh** option in the (Admin) **> System > Licensing** panel on the NetWitness Server. For more information, see Register the Server (Online Registration).<br><br>After the synchronization, endpoint entitlements that were mapped to the Local License Server on the NetWitness Platform appliance are synchronized on hourly basis by port 443.<br>• **Sites in closed environments.** Customers can synchronize the mapped entitlements by downloading a capability request and importing it on the NetWitness Server. For more information, see Register the Server (Offline Capability Request).<br><br>After the synchronization, entitlements that were mapped to the Local License Server on the NetWitness appliance are synchronized, but the entitlements have not been used in any way. For example, if you have purchased 10 Decoders and 10 Concentrators, 10 of 10 Decoder entitlements and 10 of 10 Concentrator entitlements would be available on the NetWitness Server. |

**Note:** FNO-OD is the license server in the cloud on myRSA. The URL is rsasecurity.subscribenet.com. The customer's firewall must allow communications between this URL on port 80 (whatever it resolves to when using lookup or whois) and the NetWitness IP address.

# NetWitness Platform Licensing Overview

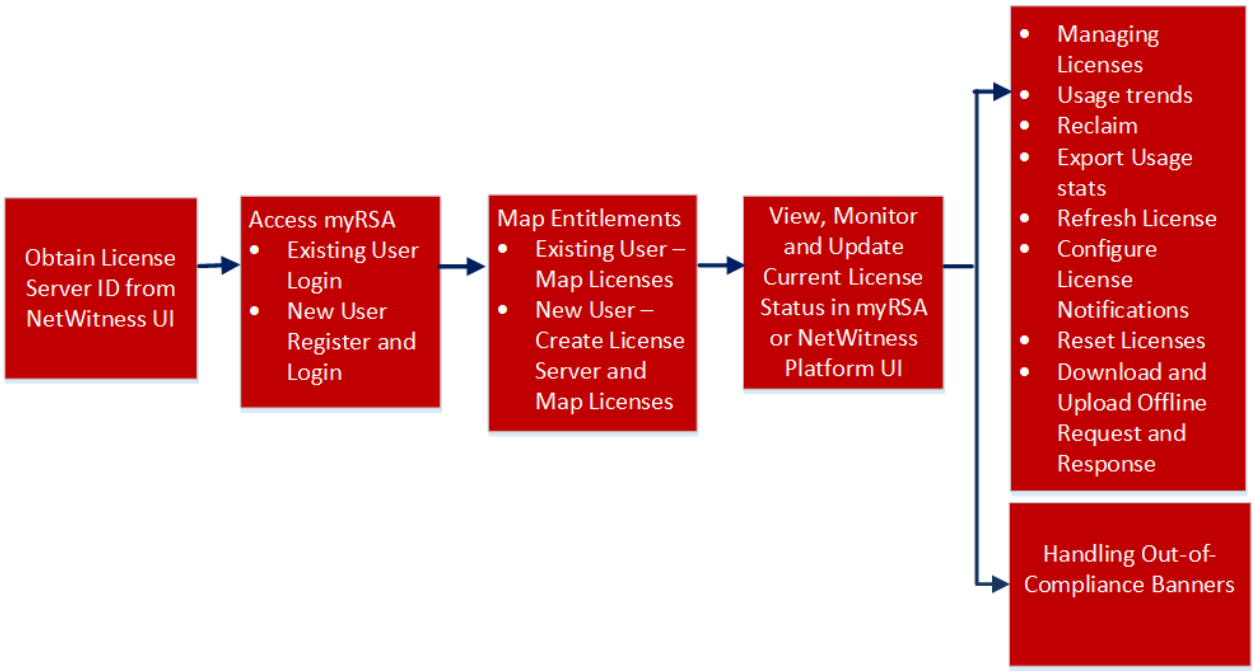
After you have purchased the licenses and have received all the relevant email communications, perform the steps required to map entitlements in NetWitness. You must perform each step in the proper sequence.

This document is divided into three parts:

- How to obtain license information from myRSA and view in the NetWitness Platform UI
- Understanding License Types and its functionality
- Troubleshooting or maintenance information

## Workflow

The following workflow illustrates the end-to-end licensing process after you have the NetWitness product installed .



| Configuration Step | Description |
|---|---|
| Obtain License Server ID from NetWitness Platform User Interface | Before you begin the licensing process, you must ensure that you obtain the License Server ID displayed on the NetWitness User Interface. |
| Access myRSA | Your myRSA Welcome e-mail message contains system log in instructions to myRSA. Instructions for downloading your product licenses can be found in this document, as well as the myRSA website. |

| Configuration Step | Description |
| --- | --- |
| Register the Server (Online Registration) | Your NetWitness Server must be registered to myRSA and entitlements must be mapped. There are two methods of synchronizing NetWitness with myRSA: online and offline. |

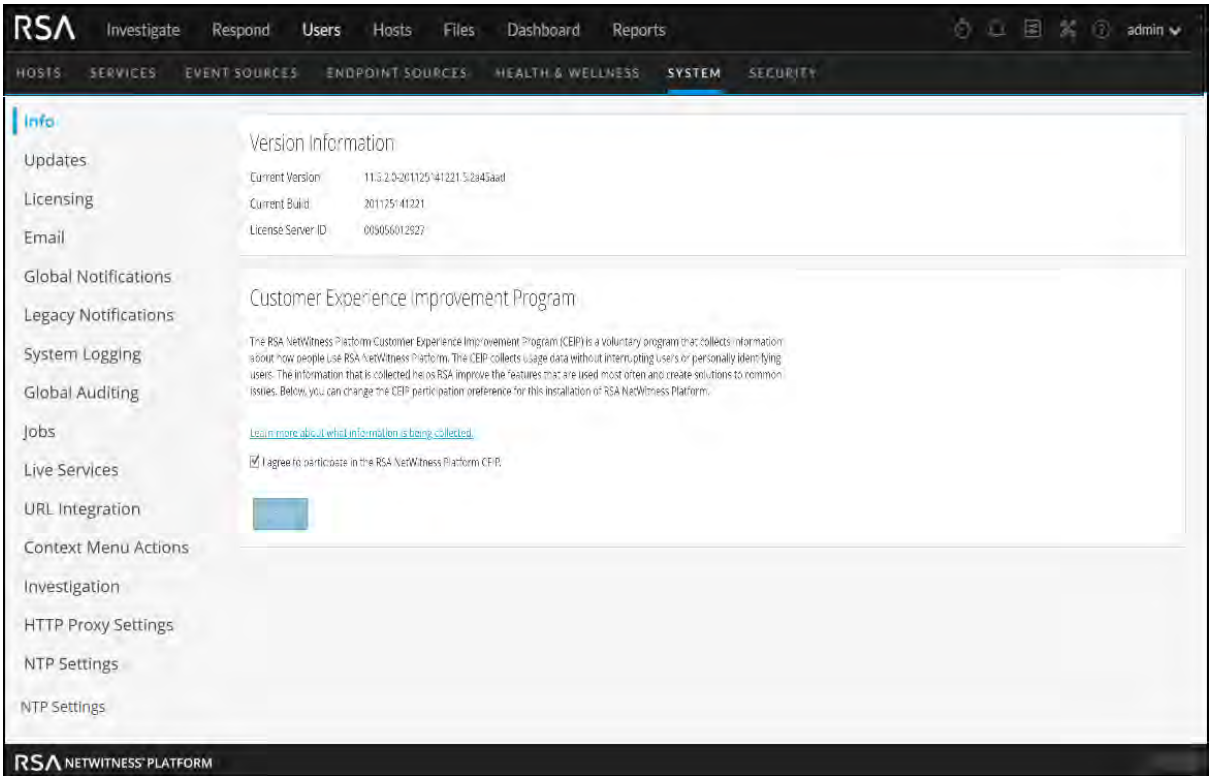
# Obtain License Server ID from NetWitness Platform User Interface

Before you begin the licensing process, you must make sure that you obtain the License Server ID displayed in the NetWitness User Interface which is generated on the successful installation of the product.

### To obtain the license service ID:

1. Log in to the NetWitness user interface.
2. Go to **(Admin) > System**.

   The Admin System view opens to display the Version Information in the **Info** panel.



3. Under **Version Information**, locate the **License Server ID** and make a note.
   Log in to **myRSA** and enter the License Server ID to view your entitled license information. For more information, see Access myRSA.

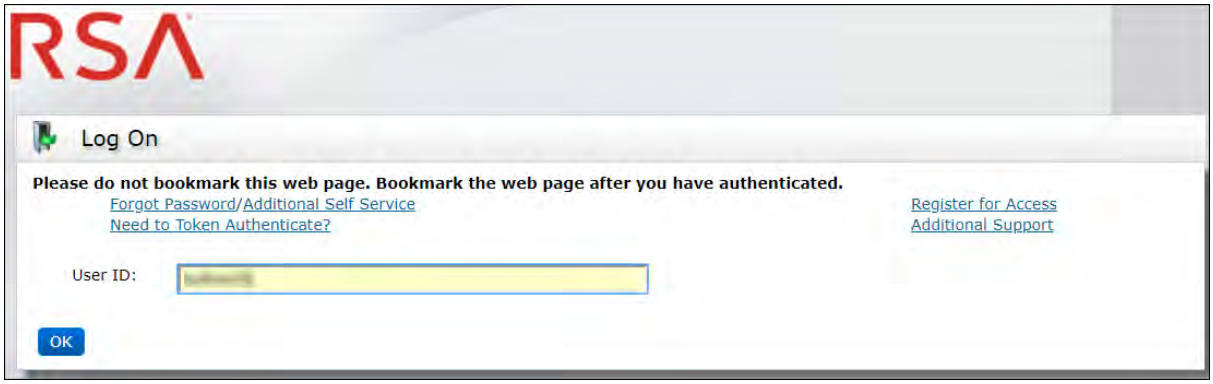
# Access myRSA

You will receive an order confirmation e-mail. Refer to your myRSA email for login information. If you are a new myRSA user, you also receive an e-mail containing instructions on how to create a new account. Your myRSA Welcome e-mail message contains system log in instructions to myRSA. This document provide you instructions on how to map your product licenses on the myRSA website.

1. The new users instruction e-mail contains a **Click Here** link. This link opens an Enrollment Portal, where the -Based Authentication (RBA) method must be configured for the account.
2. After the RBA method is enabled, a Confirmation e-mail message containing the User ID (which is your e-mail address), along with a temporary password is sent. After the first login, you are prompted to change the password. Once the password is changed, you are logged into myRSA.

**Note:** If you have a pre-existing account for the RSA Link or RSA Online websites, you receive only one e-mail on how to use your existing login credentials. You must log into myRSA with your existing User ID, password, and RSA method.

3. When you navigate to https://my.rsa.com/, the **RSA Secure Logon** screen is displayed.



4. Enter your User ID and click **OK**, which displays the **Password** field. When you enter the password, you are logged into myRSA.

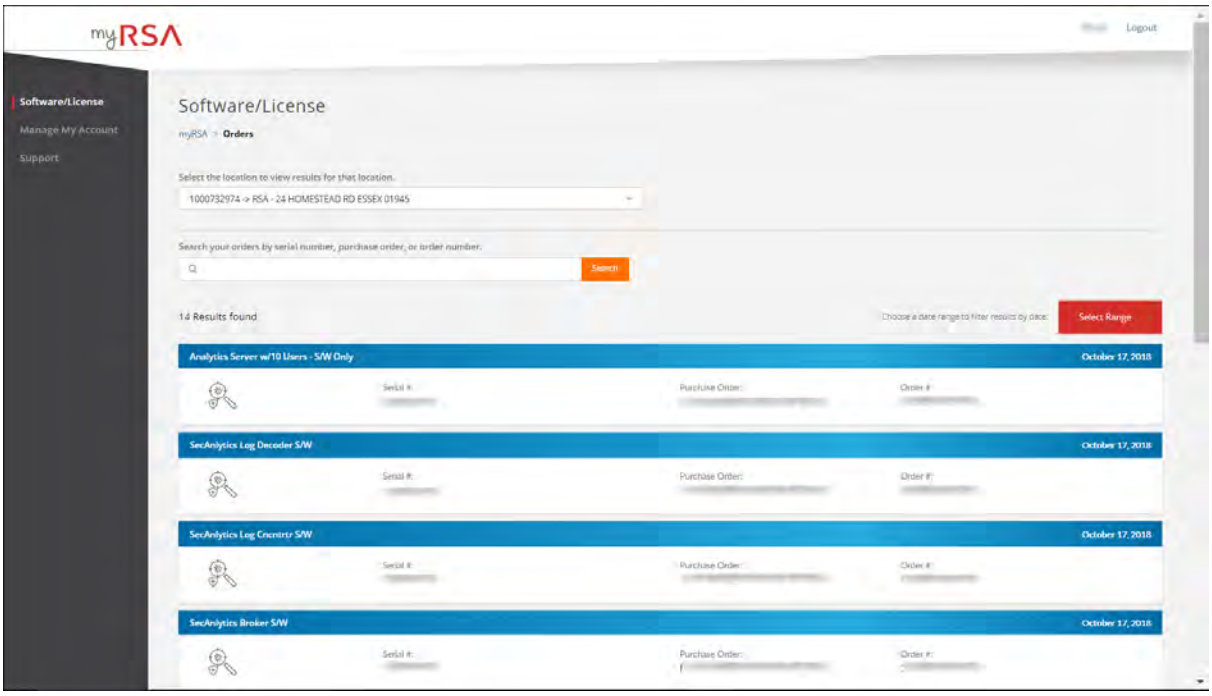
   Your contact e-mail address is used to authenticate your User ID. If the Customer Authentication process is successful, the myRSA Software/License page displays a list of all the following products available which are associated to your site location:

   - RSA Products
   - Serial Numbers
   - Purchase Orders
   - Sales Orders

   **Note:** You may be prompted to verify your identity through your RBA method, if multiple log in failures occur in a row, or if you have not logged into myRSA within the past several months.

5. In the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

   The **Order Detail** screen is displayed.



# License for NetWitness Endpoint 4.4.0.x Agents

If you are an existing NetWitness Endpoint 4.4.0.x customer, who also has NetWitness Server, Log Hybrid and an ESA box, you receive licenses for NetWitness Endpoint 4.4 and 11.6 agents. You receive the following RSA Order Fulfillment Confirmation email which contains the license details for NetWitness Endpoint 4.4.0.x and NetWitness 11.6.

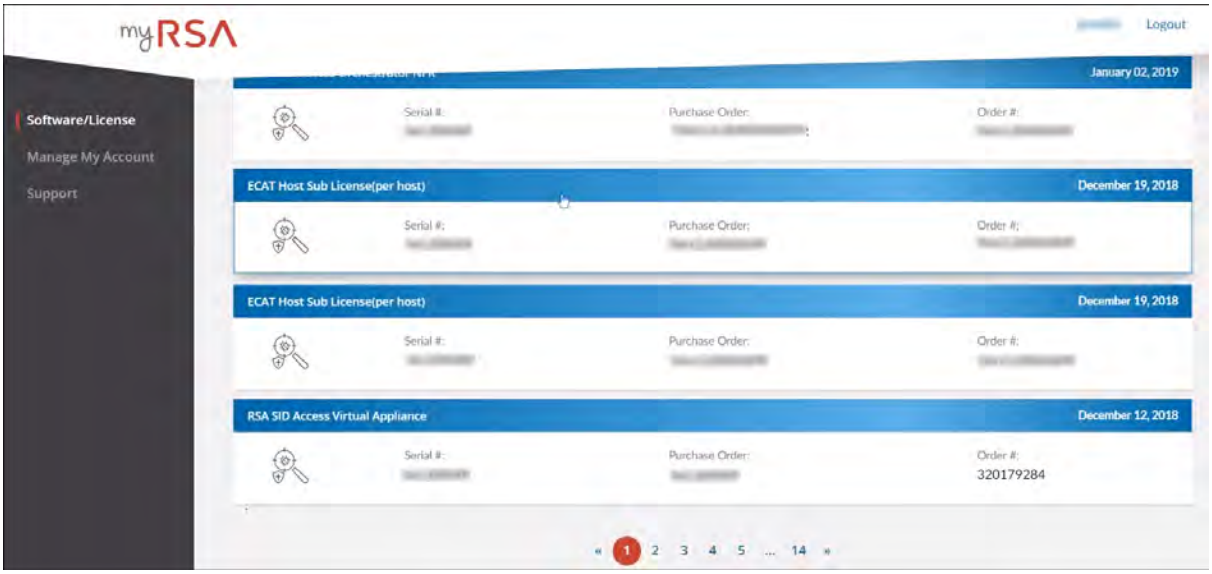
**Note:** If you are a new NetWitness 11.6 customer, the RSA Order Fulfillment Confirmation email contains the license details for the current 11.6 version only.

| Part Number | Part Description | Quantity | Fulfillment Date |
|---|---|---|---|
| **ECAT-SUB-T4** | Tier4 RNWE Subsc p/Host 1001-2500 1Mo | 1 | February 7, 2019 |
| # of License Months - 3<br>Billing Plan Type - Annual in advance<br>License Duration - Term<br>Sales Type - Upgrade<br>Number of Hosts - 500 | | | |
| Serial/License Number: [redacted] | | | |
| **RSA-0015012** | ECAT Host Sub License(per host) | 1 | February 7, 2019 |
| # of License Months - 3<br>Billing Plan Type - Annual in advance<br>License Duration - Term<br>Sales Type - Upgrade<br>Number of Hosts - 500 | | | |
| Serial/License Number: [redacted] | | | |

In the above screenshot, the part number with **RSA-0015012** indicates that it is aNetWitness Endpoint 4.4 license and the part number with **ECAT-SUB-T4** indicates that it is a NetWitness 11.6 license. You will get NetWitness 11.6 license and if you have NetWitness Endpoint 4.4 license, myRSA will upgrade the number of host for both licenses.

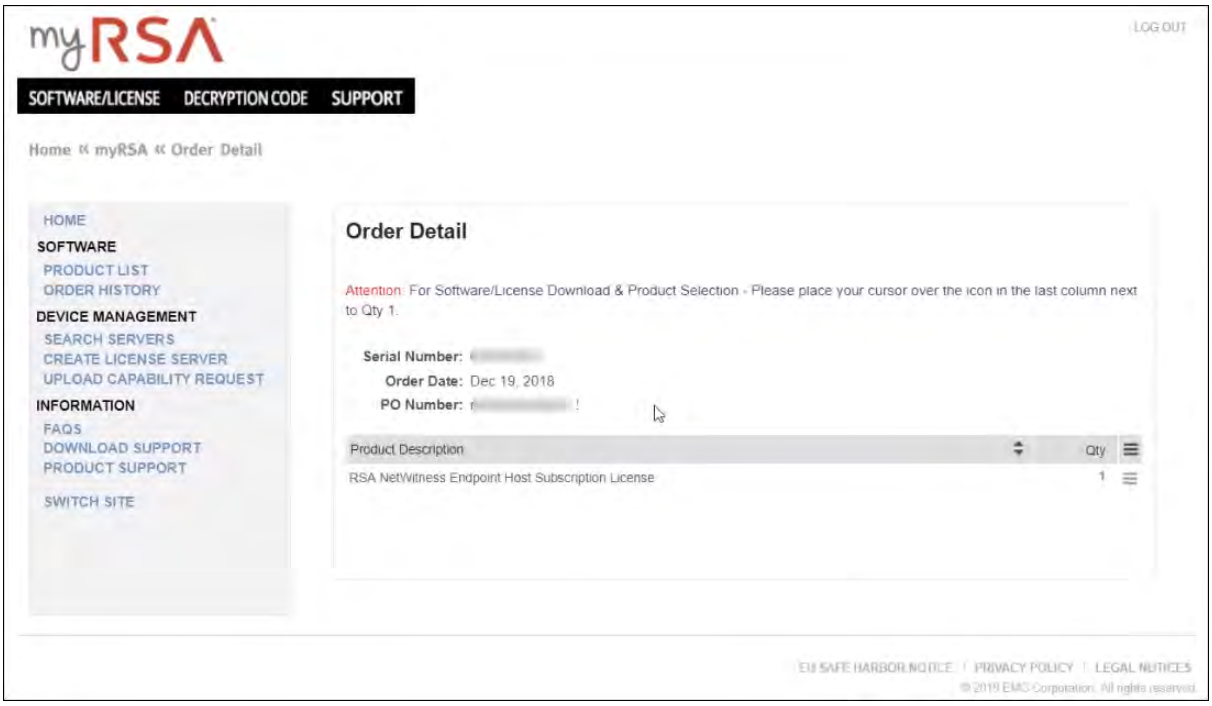
### To download an Endpoint (ECAT) 4.4.x license, perform the following steps:

1. After you log in to myRSA, an ECAT Subscription Licenses option is displayed.



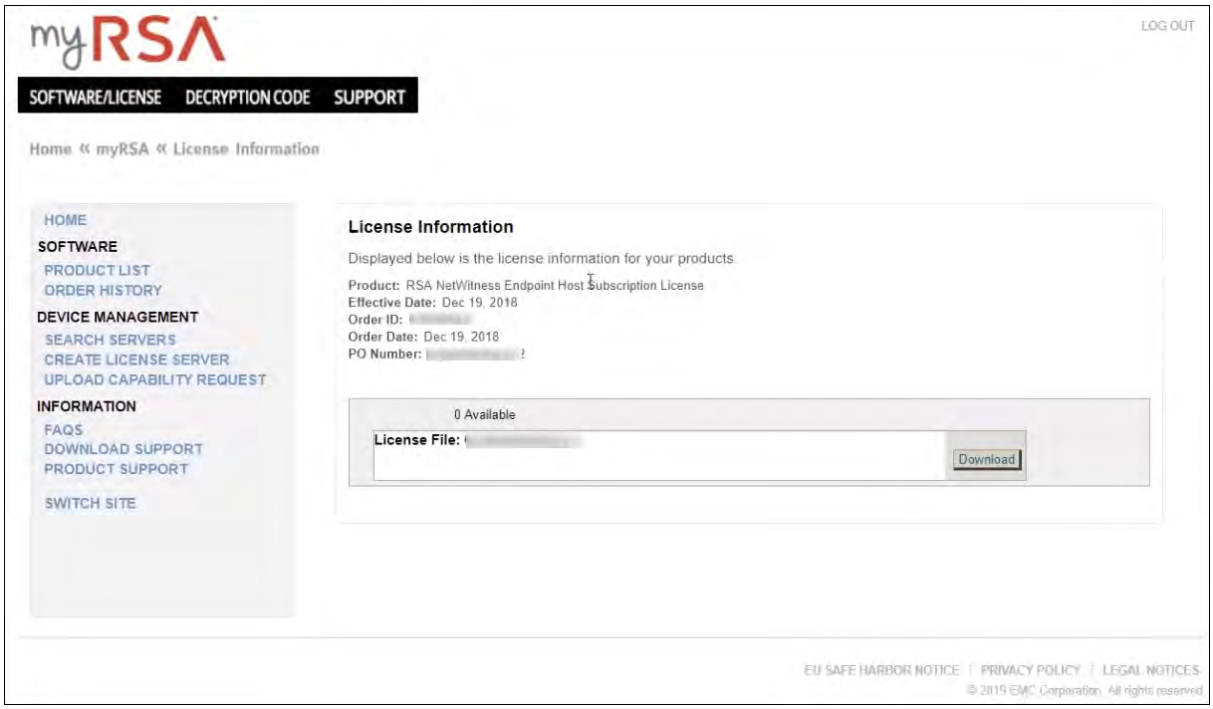
2. Click on ECAT Host Sub License (per host).

   The Order Detail page is displayed.



3. Click on **Product Description**.

   The License information page is displayed.



4. Click **Download** to download NetWitness Endpoint 4.4.0.x license.

If you have an existing NetWitness Endpoint 4.4.0.x and do not have RSA NetWitness Platform, then you must register to the license server. For more information. see Register the Server (Online Registration).

If you have an existing NetWitness Endpoint 4.4.0.x customer, and also NetWitness, then you can use the same license in NetWitness.

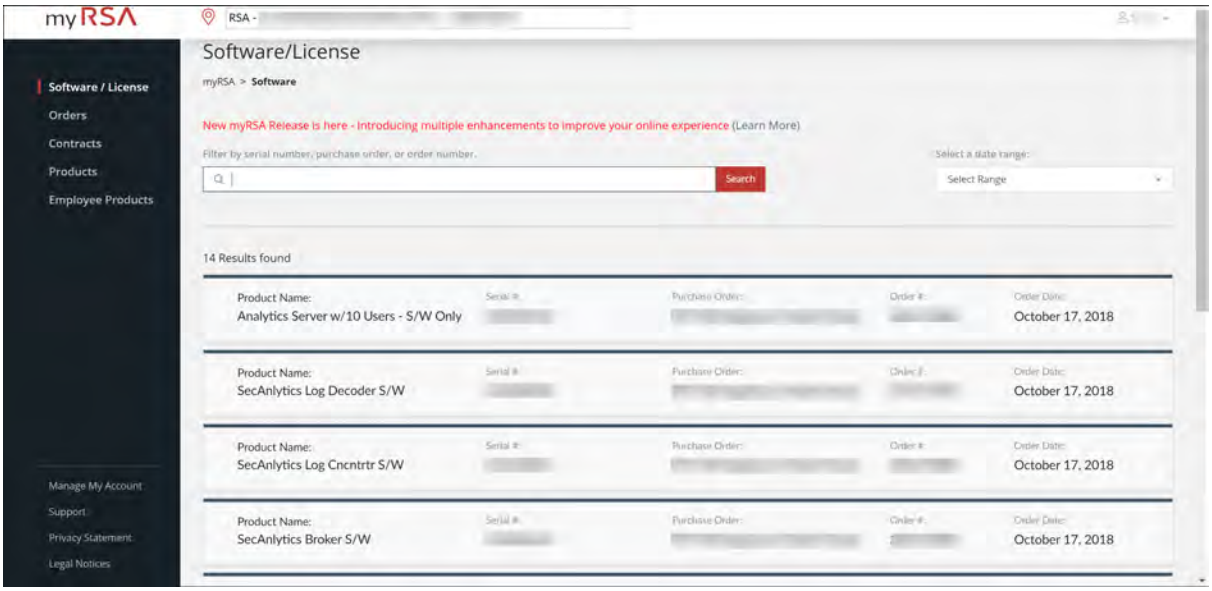
If you are new to NetWitness 11.6 , and have NetWitness Endpoint, then you can view the license only for the current version in NetWitness.

# Register the Server (Online Registration)

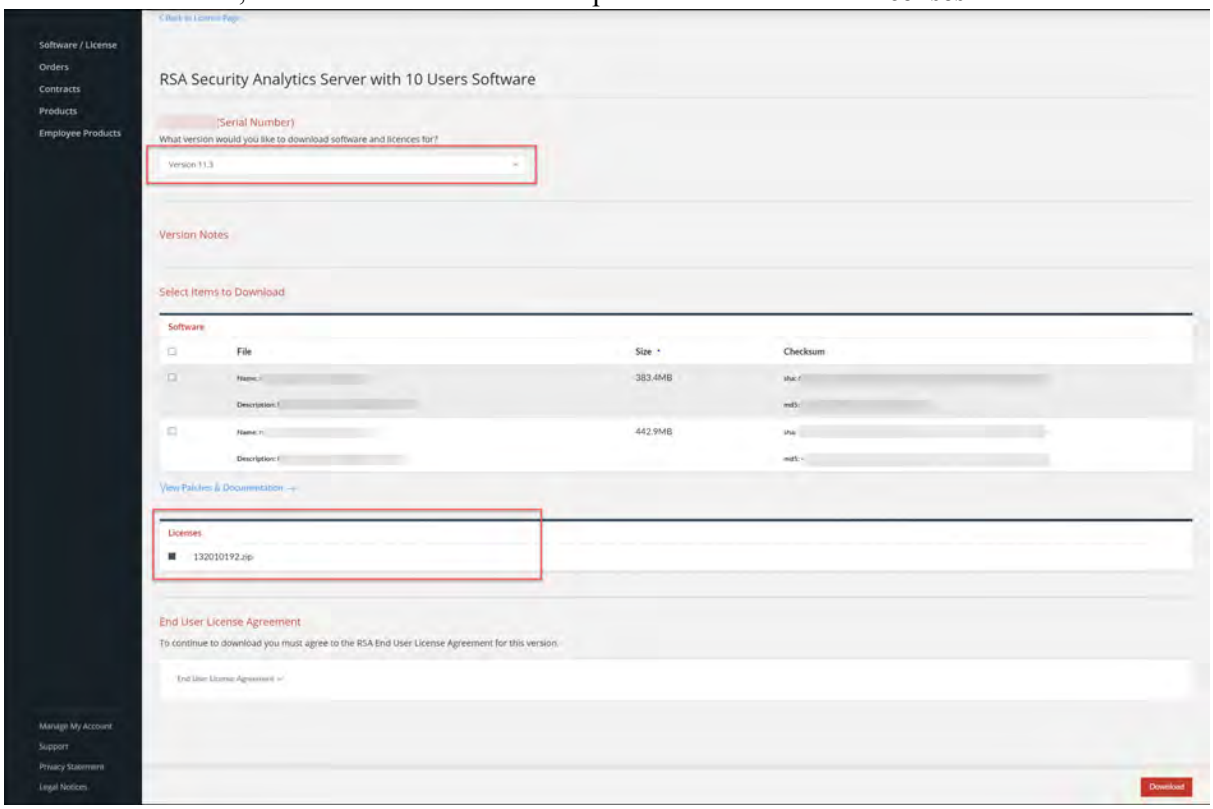
In the NetWitness entitlement process, you need to register the NetWitness Server and map the entitlements to the Local License Server (LLS). There are two methods of synchronizing NetWitness with myRSA: online and offline.

**Note:** By default NetWitness is configured to synchronize with myRSA at regular intervals hence manual synchronization is not required.

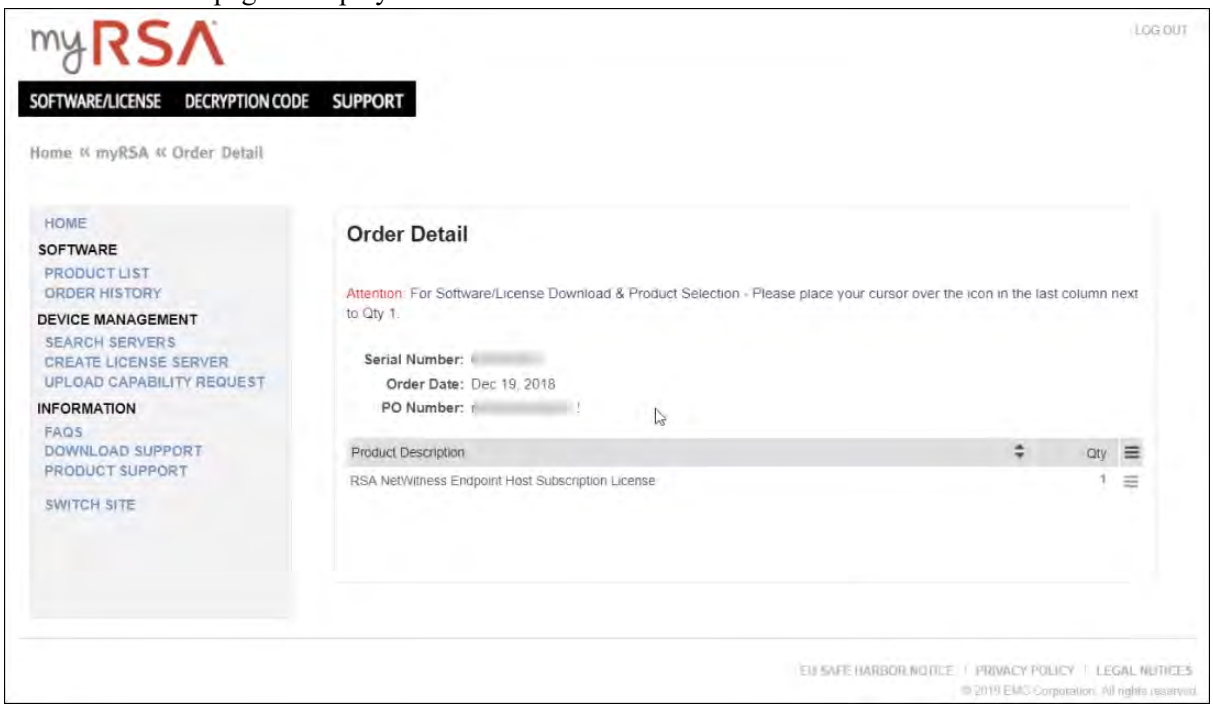
1. On the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.



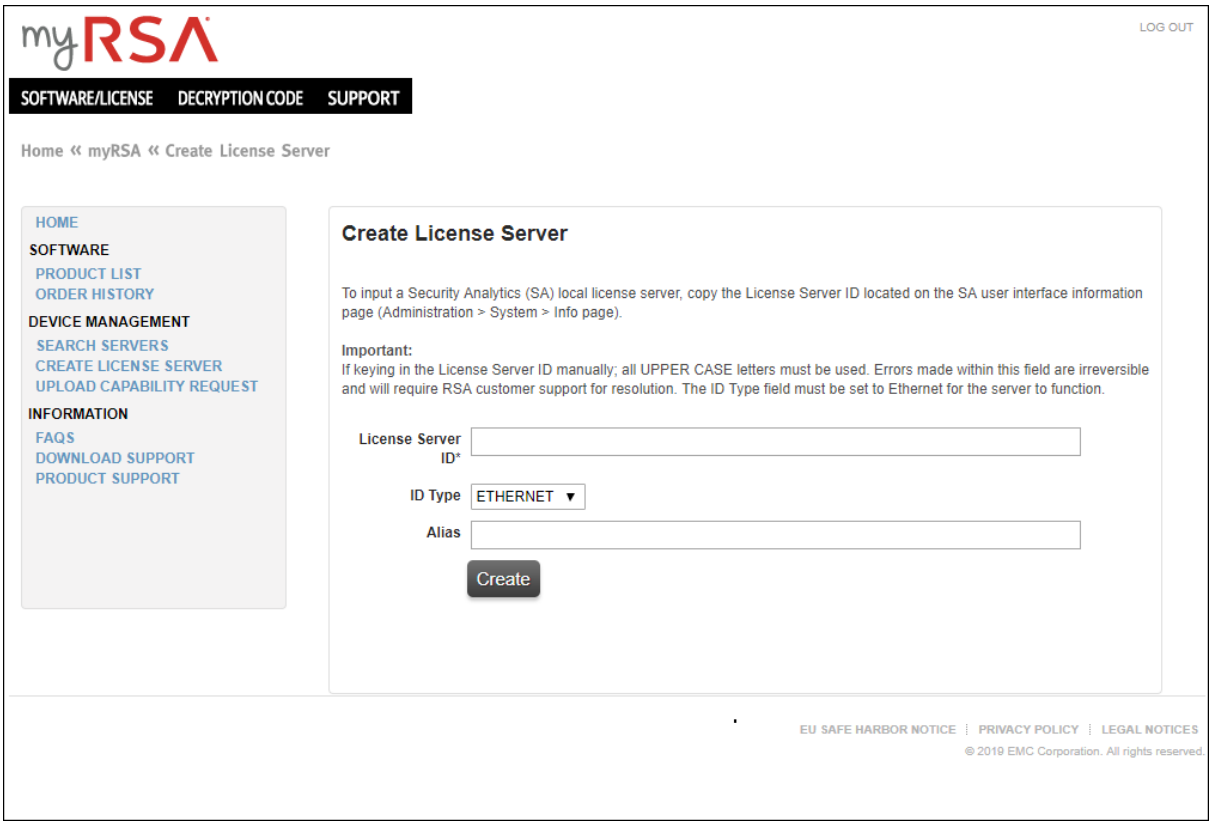
2. Click on a line item, select a version from the drop-down and select the **Licenses** checkbox.



3. Click **Download**.
The Order Detail page is displayed.

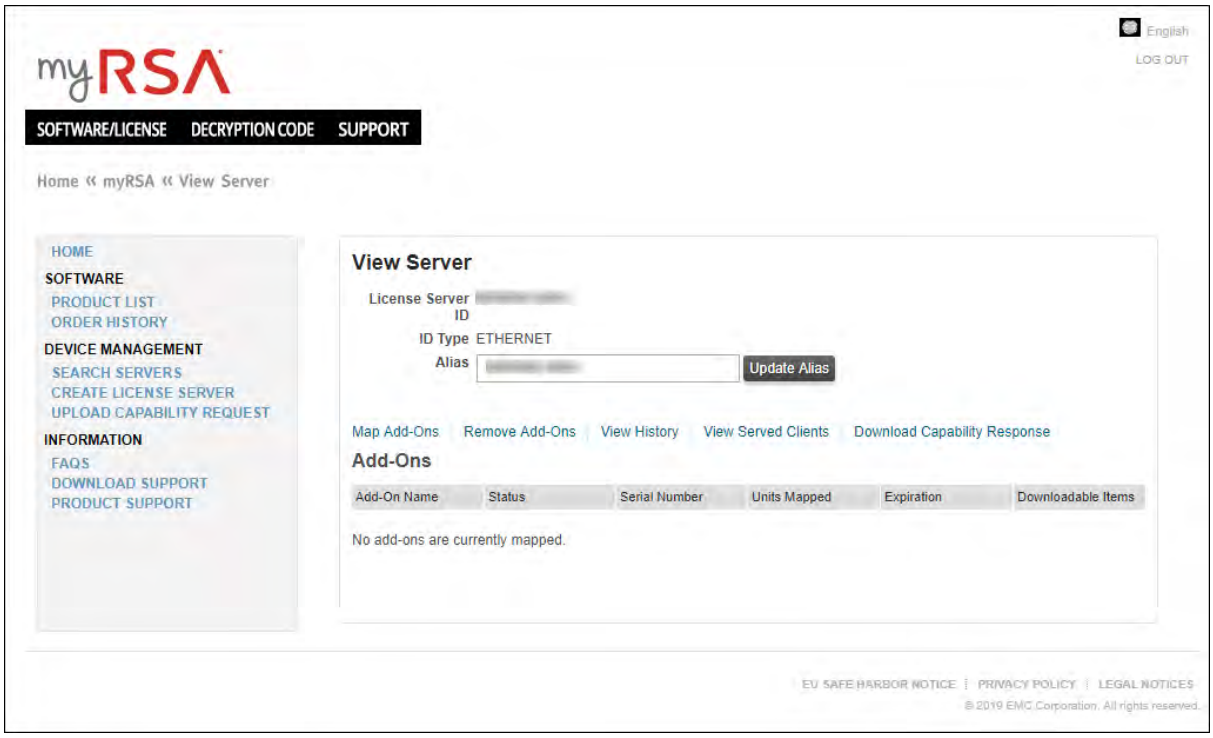


4. Click **Create License Server**.



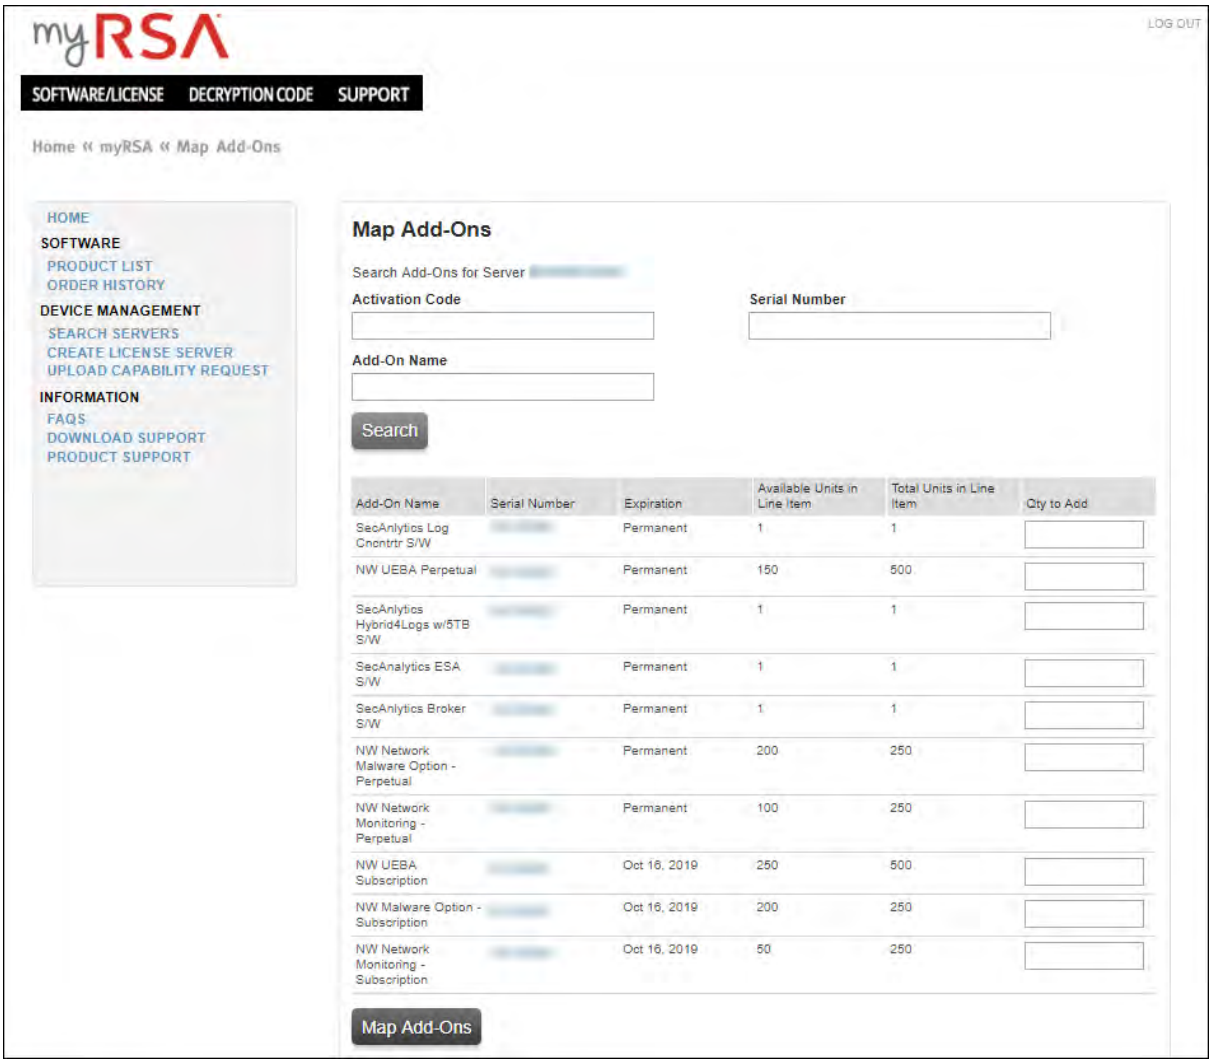
5. Complete the following fields:
   - Copy or enter (in uppercase letters) the License Server ID in the License Server ID field.
   - In the **ID Type** drop-down, select **ETHERNET** (the default value).
   - In the **Type** drop-down, select **Ethernet** (the default value).
   - (Optional) In the **Alias** field, type an alias to your Appliance ID.
6. Click **Create**.

   The View Server page is displayed.



7. Click Map Add-Ons.

   The Map Add-Ons page is displayed.



8. After you have registered the license server and viewed the license details, you must map the entitlements. For more information, see Map Entitlements .

**Note:** By default NetWitness host is configured to synchronize with myRSA at regular intervals and also a designated nameserver (DNS). No action is required.

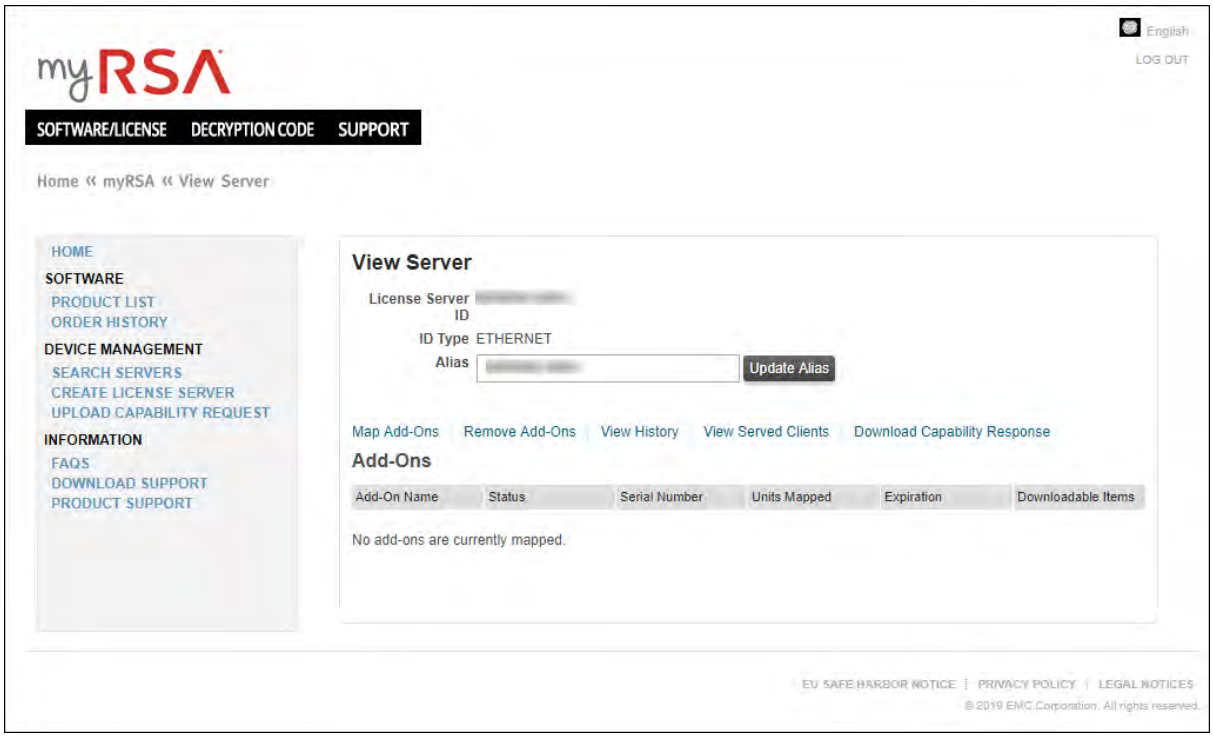
**Note:** In a multiple NetWitness deployment where the services are connected to both primary and secondary NetWitness hosts and the services are licensed only with the primary NetWitness, a license expiry message is shown for the same services on the secondary NetWitness. You can ignore the message and continue using the product.

# Map Entitlements

Mapping entitlements involves choosing the quantity of available entitlements to pull to the NetWitness Server during synchronization.

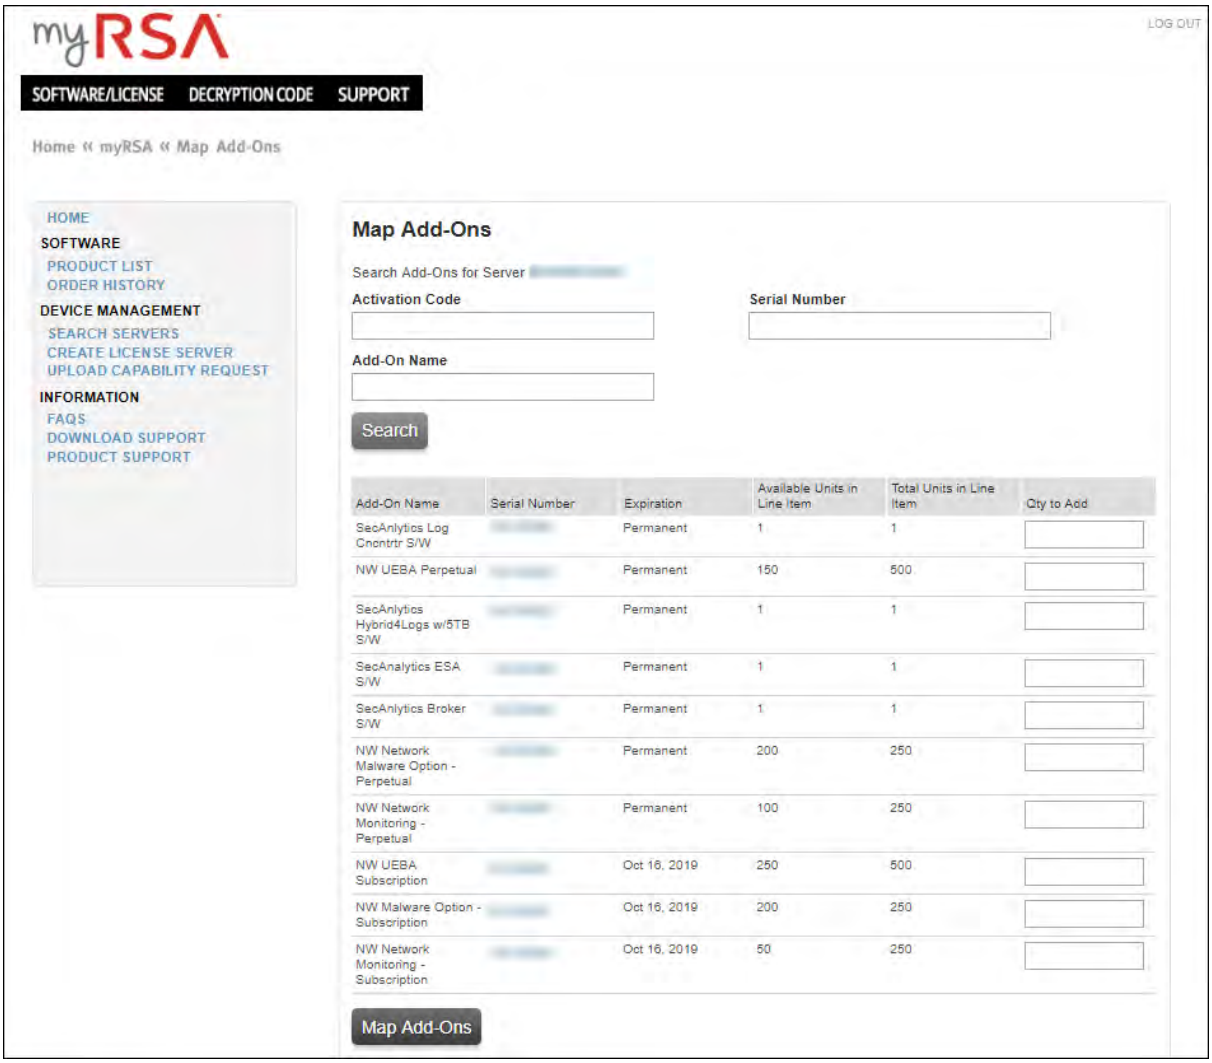
To map appliance entitlements to the server:

1. Log in to myRSA.
2. Click on the **SEARCH SERVERS** and then click on the License Server ID to view the entitled Server Details.



3. Click **Map Add-Onss**.

   The Map Add-Ons page is displayed.



The Add-On table lists all entitlements that are available for your account. The table has a row for each NetWitness product entitlement, with the following information:

- **Add-On Name**: The name of the entitlement; for example, SMC Concentrator or SMC Decoder.
- **Serial Number**: The serial number associated with a product.
- **Expiration**: For licenses that are not permanent, the expiration information is displayed. The value in this field is a specific date (for example, Oct 6, 2019) or a time range (for example, 90 days). If the value is a time range, the expiration period begins when the add-on is mapped to a server.
- **Available Units in Line Item**: The quantity of entitlements currently available for that license. This quantity is the difference between the Total Units and the entitlements that have been mapped to a NetWitness Server for licensing.
- **Total Units in Line Item**: The total quantity of entitlements tied to a specific license.
- **Quantity to Add**: The number of entitlements for a specific license.

4. To designate the quantity of entitlements to map to the NetWitness Server from a license, type a quantity in the **Units to Configure** column.
5. Click **Map Add-Ons**.

   The View Server page displays a message indicating that the entitlements were successfully mapped to the NetWitness Server.

   Entitlements are now dedicated and set aside from an accounts pool. The message **Waiting to add to appliance** is displayed in the **Status** for each entitlement. The entitlements are not yet synchronized with the server.
6. (Optional) If you want to add more entitlements, use the **Map Add-Ons** option.
7. (Optional) If you want to remove entitlements, use the **Remove Add-Ons** option.

Now you can synchronize and pull down the mapped entitlements to the NetWitness Server

## View Current Licenses

After you have completed the license process, you can view the current licensing status in the NetWitness UI.

Each NetWitness Server is a license server providing capabilities to entitle services connected to it. To make entitlements available for licensing services, the entitlements must be mapped to the Local License Server (LLS) on the NetWitness Server.

**Note:** If licensing a hybrid system, which has a Concentrator and Decoder on the same appliance, each component must be licensed separately.

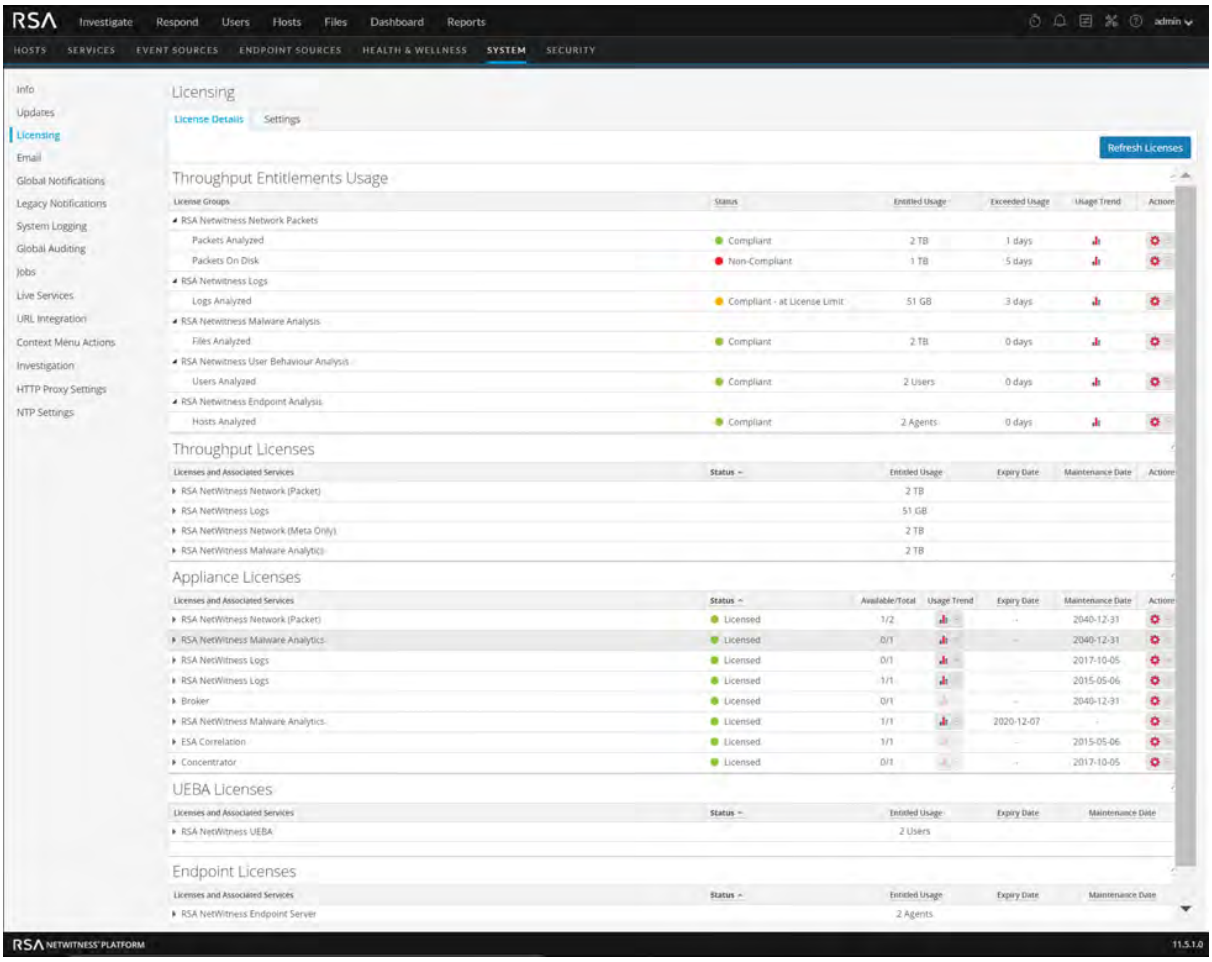
## View and Manage Licenses

In NetWitness, you can view and manage available licenses.

To view the licenses that are available on this instance of NetWitness:

1. Go to **(Admin) > System.**
2. In the options panel, select **Licensing**.

   The **License Details** tab is displayed.



Each license is listed in the grid by license type. Information includes the status of the license indicated using color-coded circles and the related information.

# Register the Server (Offline Capability Request)

NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS. This topic provides instructions for offline synchronization of the Local License Server (LLS) with the online repository. For more information on the functional description of the LLS, see Entitlement Capability Implementation.

If you are unable to register the NetWitness Server online, you can download an offline capability request in NetWitness and upload that binary request to the myRSA Portal. If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA.

## Prerequisites

Before implementing the NetWitness Platform entitlements capability offline, ensure the following

- The NetWitness Server is registered to myRSA (https://my.rsa.com/) and entitlements are mapped. Internet access is not required for offline synchronization.
- An Offline Capability Request has been downloaded from the NetWitness UI to be uploaded to myRSA.
- An Offline Response has been uploaded to NetWitness that was received from myRSA within 24 hours.

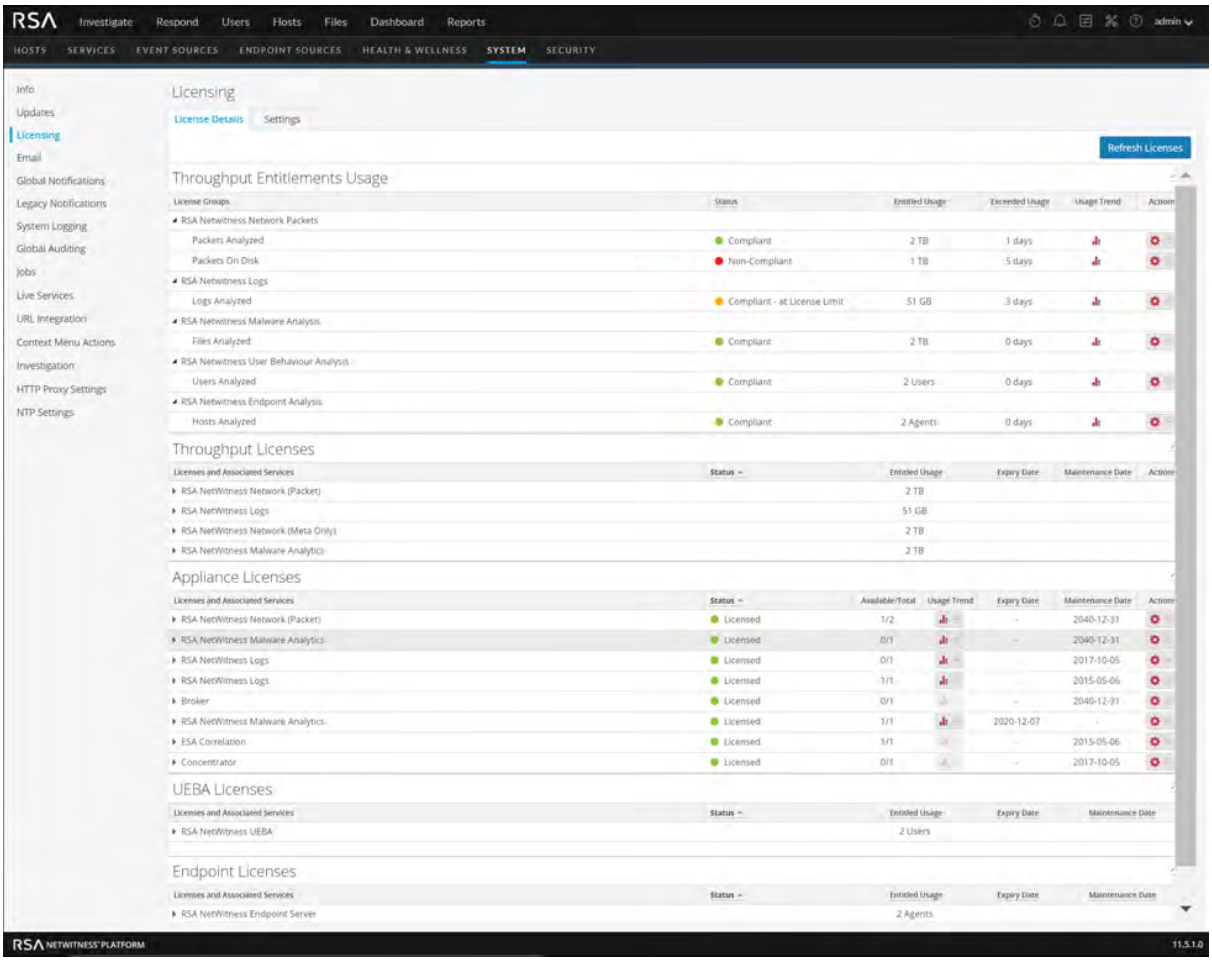
Here is a workflow that describes how to use the offline capability to acquire the licenses from myRSA and view them.

## Download an Offline Request for Submission to myRSA

**To register the server using an offline capability request:**

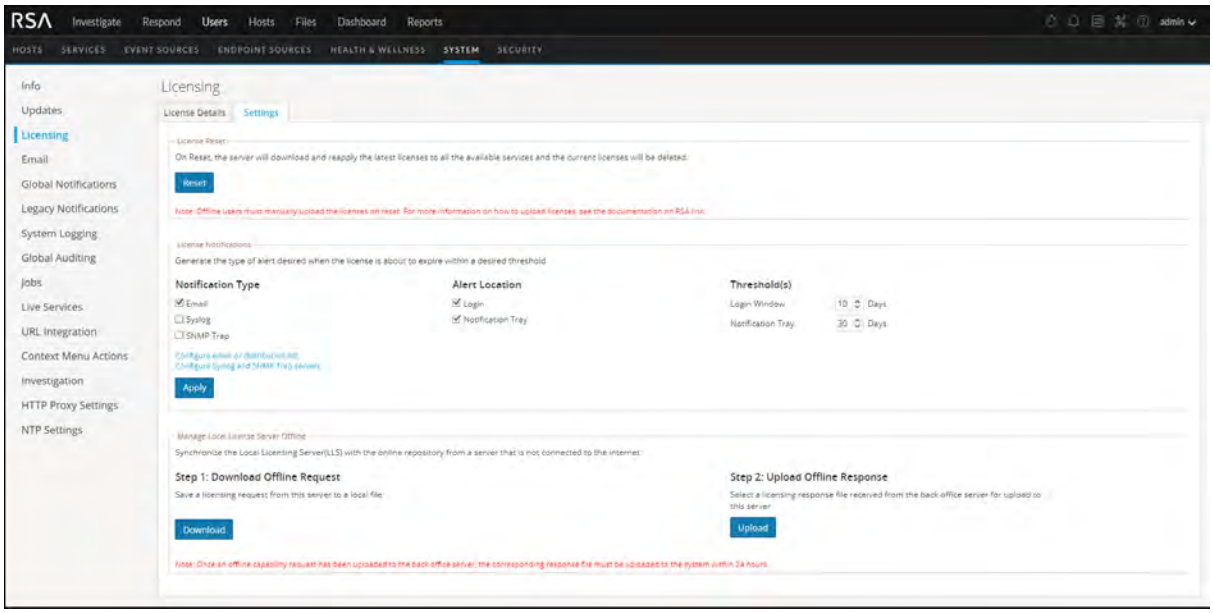
1. Go to **(Admin) > System**.
2. Click **Licensing**.

   The License Details page is displayed.



3. Select the **Settings** tab.

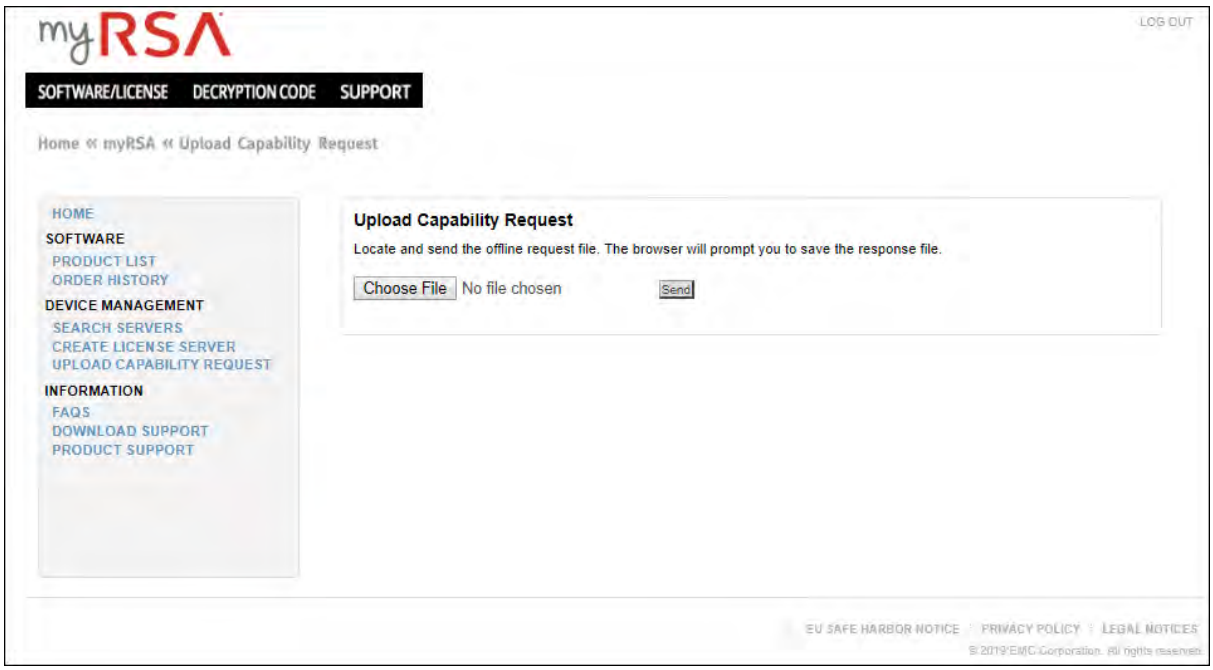
   The Settings page is displayed.



4. In the **Step 1. Download Offline Request** panel, click **Download**.
   A file called **OfflineCapabilityRequest.bin** is downloaded to the local system.
5. Login to the myRSA Portal at https://my.rsa.com/ with your user credentials.
6. Click on a service which needs to be licensed.

   Under **Device Management**, click **Upload Capability Request**.

   The **Upload Capability Request** dialog is displayed.



7. Click **Choose File** and browse the local file system to find the file downloaded from the NetWitness Server. Select **OfflineCapabilityRequest.bin**.

The filename is displayed next to the **Choose File** button.

8. Click **Send**.
   The license data in a .bin file format is downloaded. The .bin file contains the data you entered as well as information about any entitlements that have been added to the NetWitness Server. If the server has just been added, there are no entries under **Add-Ons**. The server is registered and you can now map entitlements as described in the following sections.
9. After you download the .bin file from myRSA, login to NetWitness UI to upload the .bin file on the Settings page. For more information, see Upload an Offline Capability Response to NetWitness Platform.

## Upload an Offline Capability Response to NetWitness Platform

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA. To upload an offline capability response (**response.bin**) file saved to the local file system from myRSA:

1. Follow the steps 1 to 3 mentioned in the Download a Capability Request for Submission to myRSA procedure.
2. Login to the NetWitness user interface.
3. Go to **(Admin) > System** > **Licensing** > **Settings** tab.
4. In the **Upload Offline Response** section, click **Upload Response**.
   A dialog to upload the file is displayed.

5. Browse and select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.
   The entitlements are uploaded to NetWitness and the licenses added to the grid in the **Licensing Details** tab. They are available for licensing appliances.
   After you have uploaded the entitlements, you can verify the synchronization by performing any one of the following:
   - To view results in NetWitness, go to **(Admin) > System**>**Licensing** > **Licensing Details** tab. The individual product entitlements that have been pulled down to NetWitness are displayed in the **Available/Total** column.
   - Within the myRSA interface, you can see the status for entitlements changed to **In Sync**.

## Refresh Licenses

When a new license is added, to map the view with the new license, click **Refresh Licenses.**

Refreshing your licenses performs the following behind-the-scenes tasks:

- Restarts the LLS server to ensure the latest licenses are pulled down from the central Flexera server.
- Associates any unlicensed service with a valid license (if available).
- Replaces expired or Out-of-the-Box license with valid licenses (if available).

# License Types

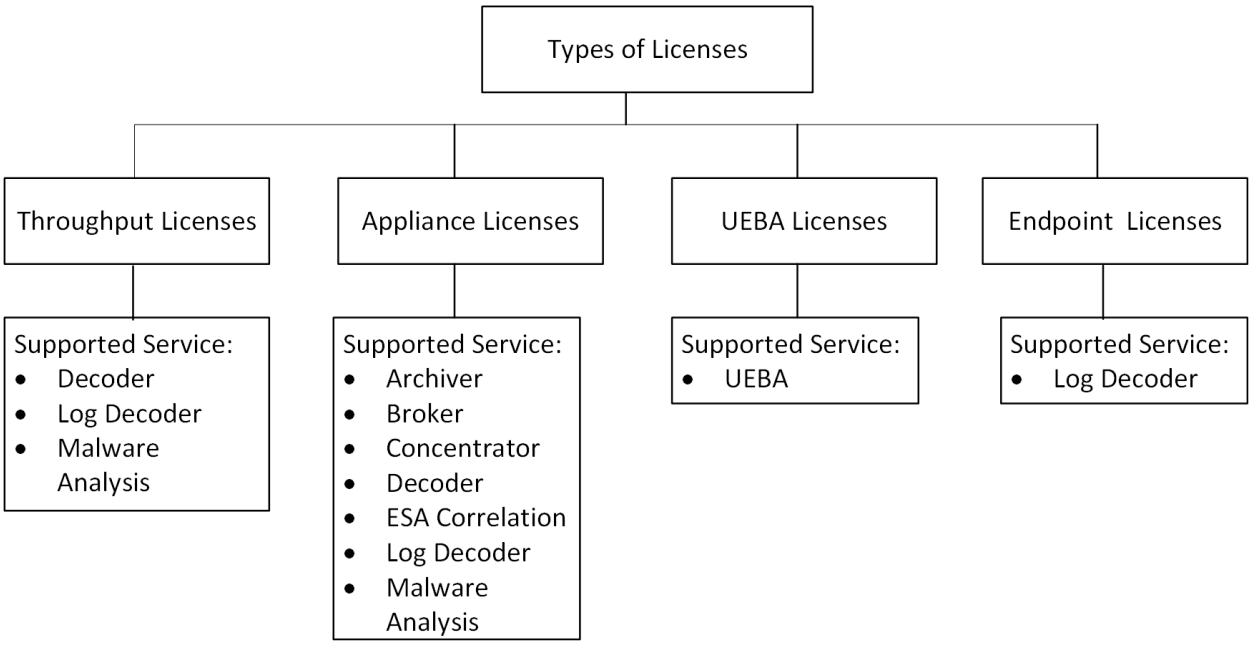
After you have installed the NetWitness software and the required services, you need to acquire the relevant licenses for the each of the services or a group of services based on your requirements. NetWitnessentitlement uses a trust-based licensing model. Appliances continue to function as usual even when the license is out-of-compliance.

## Choosing a License Type

The type of license you choose is based on your network requirements. The following types of licenses are available in RSA NetWitness:

- Throughput License
- Appliance License
- UEBA (User and Entity Behavior Analytics)
- Endpoint License

Here is a chart, followed by a description of each license type available for the NetWitness Platform products and services.



# Throughput Licenses

Throughput license are based on the amount of data used per day for logs (SIEM), or network (packets) or malware.

The throughput per day is measured in Gigabytes per day for logs, and in Terabytes per day for packets. The total amount of throughput is selected based on the total amount of throughput per day that is being licensed across your entire enterprise deployment of NetWitness Platform. This license is measured as follows:

| Service | Unit of Measurement | Increments | License Duration |
|---|---|---|---|
| Network Decoder | Terabytes (TB) per day | 1 TB | Subscription or perpetual |
| Log Decoder | Gigabytes (GB) per day | 50 GB | Subscription or perpetual |
| Malware | Terabytes (TB) per day of Files Analyzed by Malware Analysis | 1 TB | Subscription or perpetual |

**Note:** In version 11.5 and later, NetWitness Platform introduced Network Meta-Only license in addition to the Network Full Packet license.

**Network Full Packet License** captures, analyzes, and stores packet payloads and metadata and allows users to retain the packet payload for analysis or for session reconstruction. Network Full Packet License measures the bytes analyzed and the bytes written to the disk for Network Packets.

**Network Meta-Only License** captures and analyzes packet payloads and discards the packet payload data after analysis. Using this license, NetWitness Platform can be deployed in an environment where full packet capture is not required. This helps to optimally manage the storage space, and easily detect threats without the need to retain the full payload of the sessions. Network Meta-Only License measures the bytes analyzed for Network Packets and can be used with or without the Network Full Packet License.

When customers have both - Network Meta-Only License and Network Full Packet Licenses, the entitlement is aggregated and measured against the bytes analyzed for Network Packets. However, the entitlement for bytes written to disk for Network Packets will continue to be measured against the Network Full Packet Licenses. The following table is an example of how the license is used and analyzed.

| Available Licenses | Network Full Packet License | Network Meta-Only License | Network Packet Bytes Analyzed | Network Packet Bytes Written to Disk |
|---|---|---|---|---|
| 10TB of Network Full Packet | 10TB | 0TB | 10TB | 10TB |
| 10TB of Network Meta-Only | 0TB | 10TB | 10TB | 0TB |
| 10TB of Network Full Packet<br>5TB of Network Meta-Only | 10TB | 5TB | 15TB | 10TB |
| 5TB of Network Full Packet<br>10TB of Network Meta-Only | 5TB | 10TB | 15TB | 5TB |

For more information on the status of your license, usage and out of compliance licenses, see About Out-of-Compliance Banners.

## Appliance Licenses

NetWitness Platform supports the Appliance license, which is applicable to all hosts that require a license. Other services do not require a license. Appliance licenses are measured as follows:

- Services are licensed automatically if you have a valid appliance based license for a specific service to be licensed.
- Appliance licenses can be purchased as a perpetual license that does not expire and will have a maintenance contract. If you purchase a subscription license, then it will expire if you do not renew the contract.

## User and Entity Behavior Analytics Licenses

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is based on the number active of users.

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). UEBA monitors the number of active users from the previous day and sends it to the licensing server. The entitlement is measured for logs and endpoint events for the number of active users and is checked against a user id. If a threshold is identified in a calendar month an appropriate banner is displayed. For more information on banners, see About Out-of-Compliance Banners.

## Endpoint Licenses

Endpoint license are entitled based on the number of active agents deployed.

There are two types of agents:

- **Advanced Agents**: The license for these agents is based on the number of advanced agents in your deployment. A 90-days trail license period is provided. After the 90-days trial period, a zero MB and zero Agent license is applied to the Log Decoder service and Endpoint service in the NetWitness Endpoint Log Hybrid. Once an Endpoint license is applied any Archivers, Brokers, Concentrators, and ESA are automatically licensed as a result. An usage exceeded banner is displayed when the license goes out-of-compliance in the following scenarios:

  a. If the number of active agents exceeds the number of licensed agents

  b. If the Endpoint Subscription is about to expire in near future or has already expired.

  For example, if you have purchased a license for 50,000 agents and if the number of agents exceeds more than 50,000, the banner is displayed.

  Or, if you have purchased a license for 50k agents but have mapped the entitlements for only 10k agents on myRSA, an out-of-compliance banner is displayed when your usage exceeds these 10k active agents.

- **Insights Agents** - There is no license required for these agents if they are used to collect only endpoint data.
- **Log Collection with Endpoint Agents** - All Endpoint agents (Advanced or Insights) can forward Windows Log data only to a licensed Log Decoder (or Hybrid). Windows Logs sent to a licensed Log Decoder (or Hybrid) will count against either the applied Throughput or Appliance license. Logs may be retained in the NetWitness Endpoint Log Hybrid as long as a Log (SIEM) Throughput license with available capacity is available. In either case, a license for Logs is required, irrespective of the Insights or Advanced agent.

## NetWitness Endpoint **4.4.0.x License**

If you have a **NetWitness Endpoint** 4.4.0.x license, you can use the same amount of license on NetWitness 11.6. For example, if you have purchased a 50,000 license for NetWitness Endpoint 4.4.0.x, you will get a 50,000 license on NetWitness Endpoint 4.4.0.x as well as on NetWitness 11.6. For more information on how to get a license for **NetWitness Endpoint 4.4.0.x**, see License for NetWitness Endpoint 4.4.0.x Agents.

# Out-of-the-Box Trial License

RSA NetWitness Platform comes with an OOTB 90-days trial license.

For Endpoint metered license, you will be provided with 0MB Log Decoder license. The 0MB license from the Log Decoder will be utilized after the 90-days trial period is complete. If you are still within the 90-days trial period and if you have an Endpoint Metered license, then the Log Decoder uses the remaining trial license. The Log Decoder will apply the 0MB license only after the trial license completed.

# Configure License Support For Multiple NetWitness Servers

If you have multiple NetWitness servers deployed in your environment, and require license support, you must configure multiple Mac addresses.

**To configure online:**

1. Log in to the NetWitness Server console.
2. Navigate to /opt/netwitness/flexnetls.
3. Edit the local-configuration.yaml file and add the mac address of the back up or secondary host.
   For example, `backup-hostid: 685B3596A5F3` or `backup-hostid: "685B3596A5F3:785B3596A5F3"`.
4. Restart `systemctl restart flexnetls-RSALM`.
5. Obtain the instance details from `wget http://localhost:3333/api/1.0/instances` and set the `"failOverRole"` to `MAIN` to verify the failover.
   For example, `"failOverRole" : "MAIN"`.

**To configure offline:**

1. Perform the step 1 to step 6 from the online procedure .
2. Download the capability request from NetWitness UI.
3. Upload the request to FNO (myRSA).
4. Upload the response from FNO (myRSA) to the NetWitness UI.

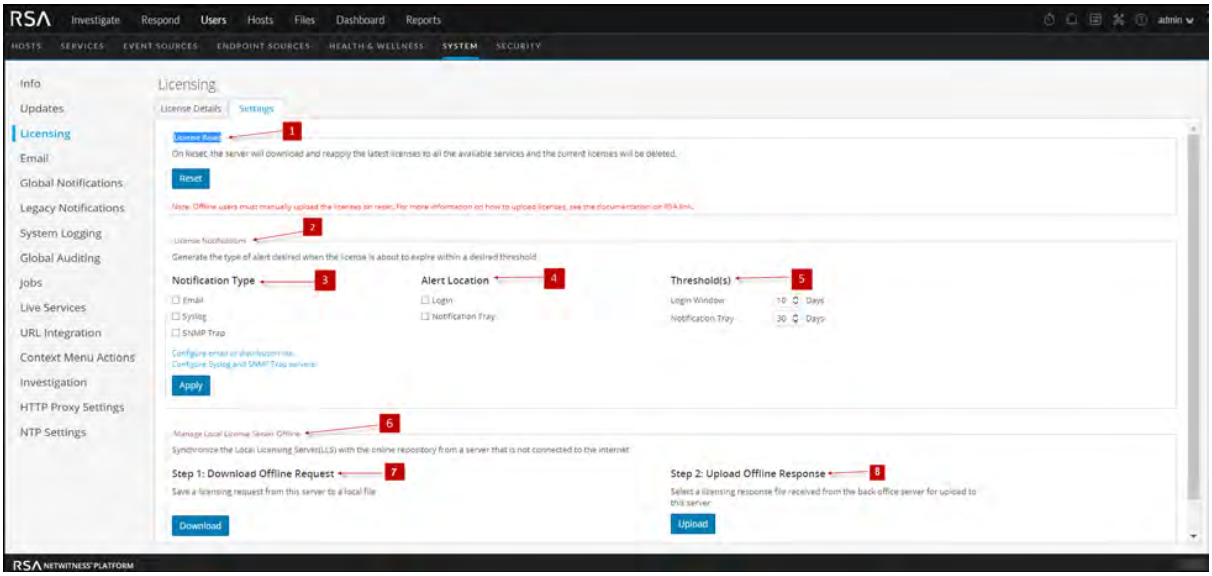
# Configure License Notifications

This topic provides instructions for configuring notification settings for the Local License Server (LLS). If you wish to receive alerts about the approaching license expiration date, you can configure NetWitness to send notifications. You can receive notification by email, syslog and SNMP. You can also view the notification during system log on and in the Notification Tray. You can also specify the number of days before expiration as a threshold for notification.

**Note:** In the Analyst UI, the license notifications will not be displayed in the notification tray or login window when the license goes out of compliance or when the license expires. This is displayed only on the Admin UI.

### To configure the notification:

1. Go to **(Admin) > System**.
2. Select **Licensing**.
3. Select the **Settings** tab.



4. Select each of the methods for NetWitness to use when sending a notification about the license status.
   a. To receive a notification at log on, select **Login** and specify the number of days before the license expires that you want to receive notification in the **Login Window Threshold** field.
   b. To receive a notification in the Notifications tray, select **Notification Tray** and specify the number of days before the license expires that you want to receive notification in the **Notification Tray Threshold** field.
   c. To receive an Email notification to a configured distribution list, select **Email** and select **Configure email or distribution list**. The Email panel is displayed in a separate tab, and you can

configure notifications in the Email Server Settings section. Refer to the *System Configuration Guide* for further details.

d. To receive syslog notifications, select **Syslog** and click **Configure Syslog and SNMP Trap servers**. The System Auditing panel opens in another tab and you can configure the system settings.

e. To receive notifications through SNMP Trap, select **SNMP Trap** and select **Configure Syslog and SNMP Trap servers.** The System Auditing panel opens in another tab and you can configure the SNMP auditing settings.

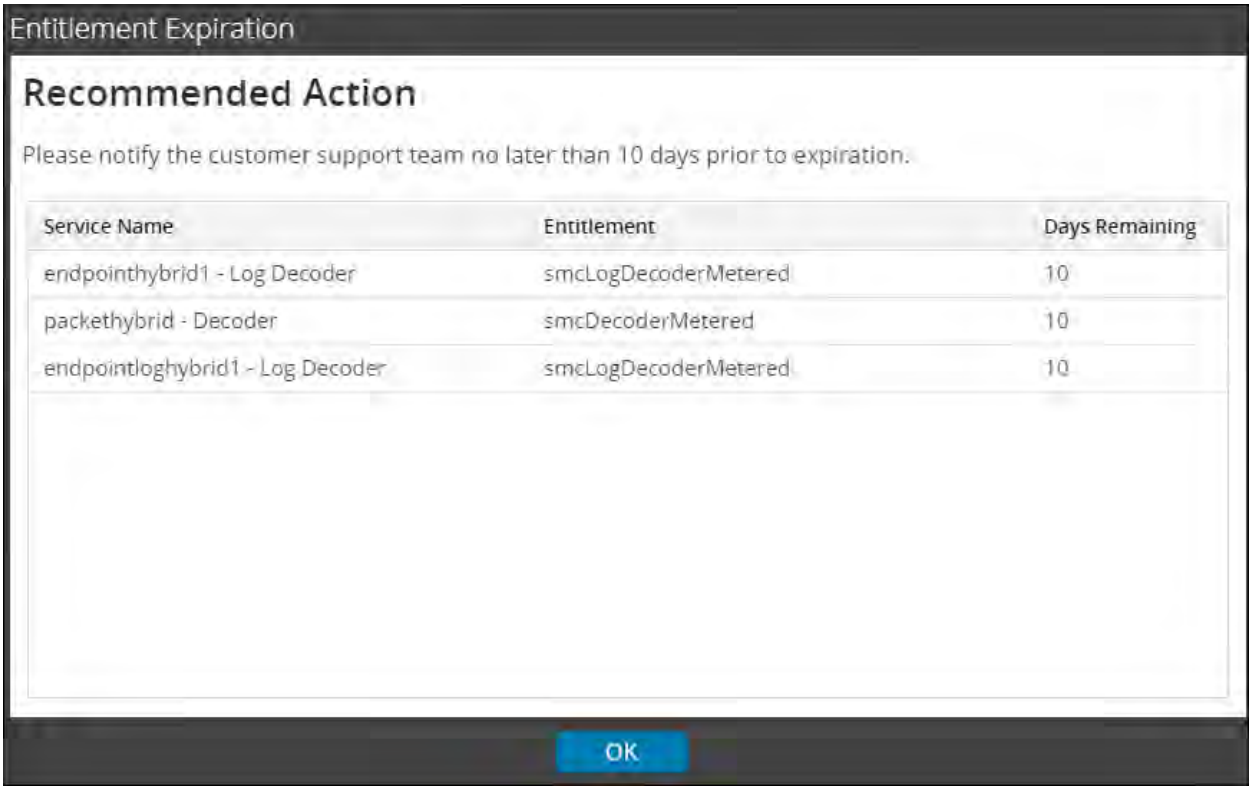
5. Click **Apply Notifications**.
   The settings are saved and go into effect immediately.

# About Out-of-Compliance Banners

Banners let you know the status of your license and usage compliance.

**Note:** To help customers transition seamlessly to Throughput license for their network (packet) usage, NetWitness Platform provides a 45 days grace period. So, on upgrading to 11.6, you will not see the Out-of-Compliance notification or banner for 45 days from the day of upgrade for any network license usage. If you upgrade from 11.5.1 or later to 11.6, the available balance of the unused grace period will be applicable after the upgrade. For example
• If the grace period of 20 of the 45 days is used post upgrade to 11.5.1 or later then customers upgrading to 11.6 will get the remaining 25 days of the grace period.
• If the grace period of 45 days is used post upgrade to 11.5.1 or later the customers upgrading to 11.6 will not have any grace period left.

When a license for a specific service is about to expire, an **Entitlement Expiration** message is displayed with the list of services about to expire.



After you log on, either a red or yellow banner may be displayed, based on the license issue:

- A red banner is displayed if your license has expired, or exceeded the allotted usage, or if the license has internal errors.

**Note:** A red banner cannot be dismissed and the license issue must be resolved.

- A yellow banner is displayed if the license is approaching expiration or the license is nearing the allotted usage. The banner can be dismissed by clicking the **Reject** button.

Here is an example of how the license usage is calculated and a way that you can resolve the license issues:

- Contracted daily usage can be exceeded three times in a calendar month. The fourth spike puts the system in an out-of-compliance state and from that day the grace period begins. If you are able to keep your usage within compliance for seven consecutive days until the end of calendar month, the Out-of-Compliance Red banner disappears.
- For example, if the fourth spike occurs on November 23, 2019 then the grace period will continue till the end of the next month which is December 31, 2019. During this period if the usage is within compliance for any seven consecutive days then license reverts to its compliant state. There will be no license breach and the Out-of-Compliance Red banner disappears. However, if there are regular spikes and no fair usage is shown for seven consecutive days, then the license will get into the Breach state and the Out-of-Compliance Red banner will continue to be displayed.
- The breach period starts immediately after Grace Period ends. However, if your deployment is in a breach state, you can bring the state back to normal by keeping the usage in a compliant state for seven consecutive days.

**Note:** Even when the Red banner is displayed, there is no loss of functionality, all NetWitness appliances continue to work with full functionality. All other functionality is included in the license (ESA, storage, and so on).

# Troubleshoot Licensing

This topic provides information about possible issues that NetWitness users may encounter when setting up licensing in NetWitness. You can look up explanations of issues and their solutions. NetWitness notifies users of issues using the popup notifications and the system log as described in the "Troubleshoot NetWitness" topic in the *System Maintenance Guide*.

## Out-of-Compliance Banners

| Problem | Possible Causes | Solutions |
|---|---|---|
| Yellow and Red Out-of-Compliance Banners | • A service is not licensed.<br>• A license has expired, or is due to expire within the next two weeks.<br>• Usage exceeds entitled limit.<br>• Usage is approaching entitled limit. | • Contact Customer Support to buy or renew your license.<br>• Reduce usage<br>or<br>• Adjust contracted usage amount |

## Common Log and Configuration Files

When troubleshooting licensing, the following files contain information that may help to diagnose the problem. Specific conditions for searching the files are described in the troubleshooting tables.

On the NetWitness Server, run `wget` for the following files after you ssh onto the NetWitness Server:

- `http://localhost:3333/api/1.0/features`
- `http://localhost:3333/api/1.0/instances`
- `http://localhost:3333//api/1.0/hostids`
- `http://localhost:3333/api/1.0/capability_request`

## NetWitness Server Problems

This table lists possible problems with the NetWitness Server errors that can affect entitlements.

| Problem | Possible Causes | Solutions |
|---|---|---|
| Some features have been mapped in the central Flexera server, but the NetWitness Server does not display them. | Ensure that the NetWitness Server is connected to the Internet. | To resolve the error execute a License Refresh as follows:<br>1. GSo to **(Admin) > Services > Licensing.**<br>2. In the License Details tab, click **Refresh Licenses**.<br>**Note:** If the NetWitness Server is not connected to the Internet, try to synchronize offline. For more information, see Register the Server (Offline Capability Request) |
| NetWitness Platform Licensing page not showing any license information although there are services available. | Ensure that you have the required entitlements pulled down from the Central Flexera server. | To resolve the error execute a License Refresh as follows:<br>1. Go to **(Admin) > Services > Licensing**.<br>2. In the License Details tab, click **Refresh Licenses**. |

## Wrong License Mapping Issue

| Problem | Possible Causes | Solution |
|---|---|---|
| Decoder license not available due to core appliances being removed from the NetWitness Server without releasing the license. Several core appliance licenses were not available for use. | Various possible causes. | Reset the license on NetWitness Server. |

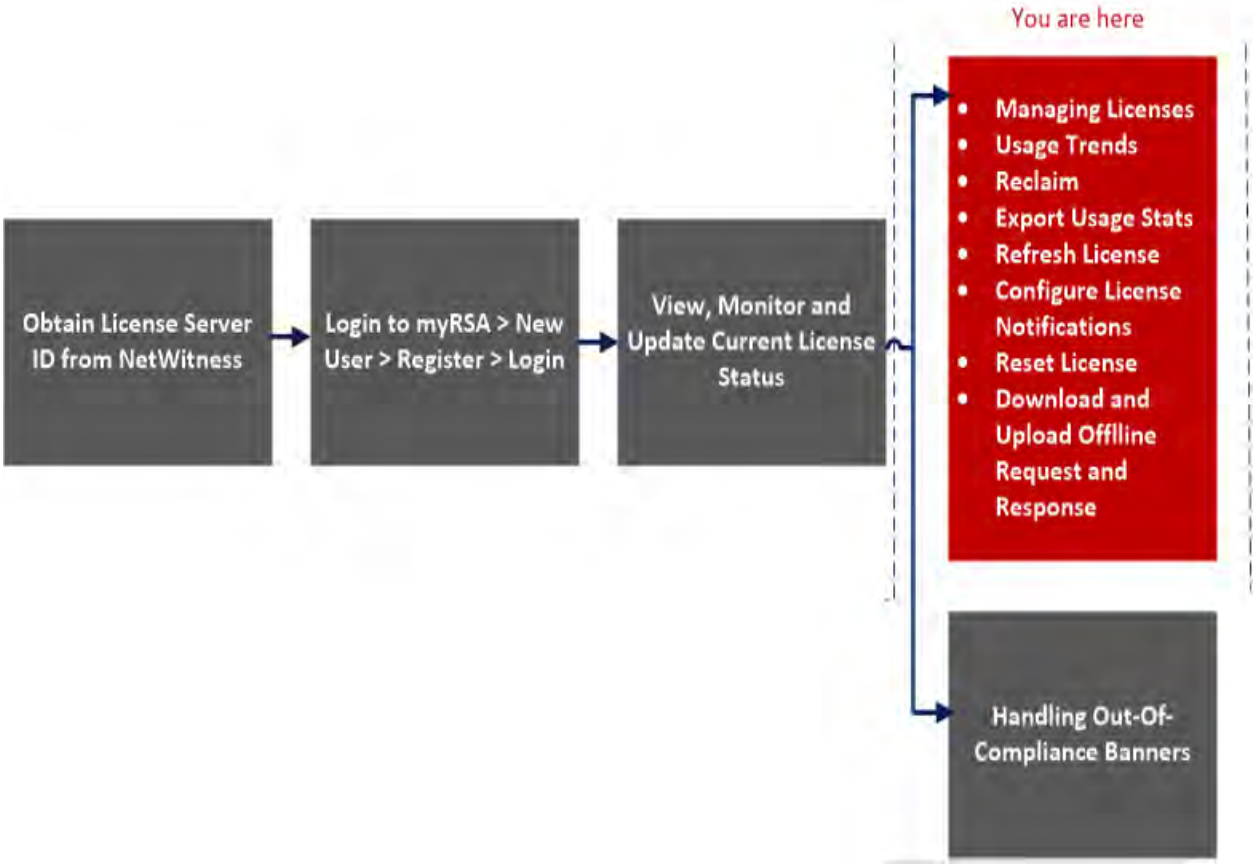
| Problem | Possible Causes | Solution |
|---|---|---|
| Archiver DACs are not mapped to the license server with all other appliances' licenses. | Various possible causes. | 1. Enter **1** in Quantity field to add for each license.<br>2. Select **Map Add-ons** at the bottom of the screen.<br>3. Click **Download Capability Request** and upload license to the Offline Capability Request in the User Interface under the **License** tab. |
| Two new appliances were installed: one Log Hybrid and one Log Archiver. Able to license the Log Hybrid, but the following error occurred when attempting to license the Archiver:<br>"There is an issue with registering your product, please contact RSA Customer Support."<br>Also, one of the Concentrators showed as a Trial license, and a separate Log Decoder showed as a Trial license when they should be licensed. | The new entitlements are not mapped to the license server. | Map add-ons to myRSA and upload the `.bin` file into the NetWitness User Interface. |

# License Details

This topic introduces the features of the System Licensing panel. NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS.

## Workflow

This workflow shows the end-to-end licensing process.



## What do you want to do?

| Role | I want to... | Show me how... |

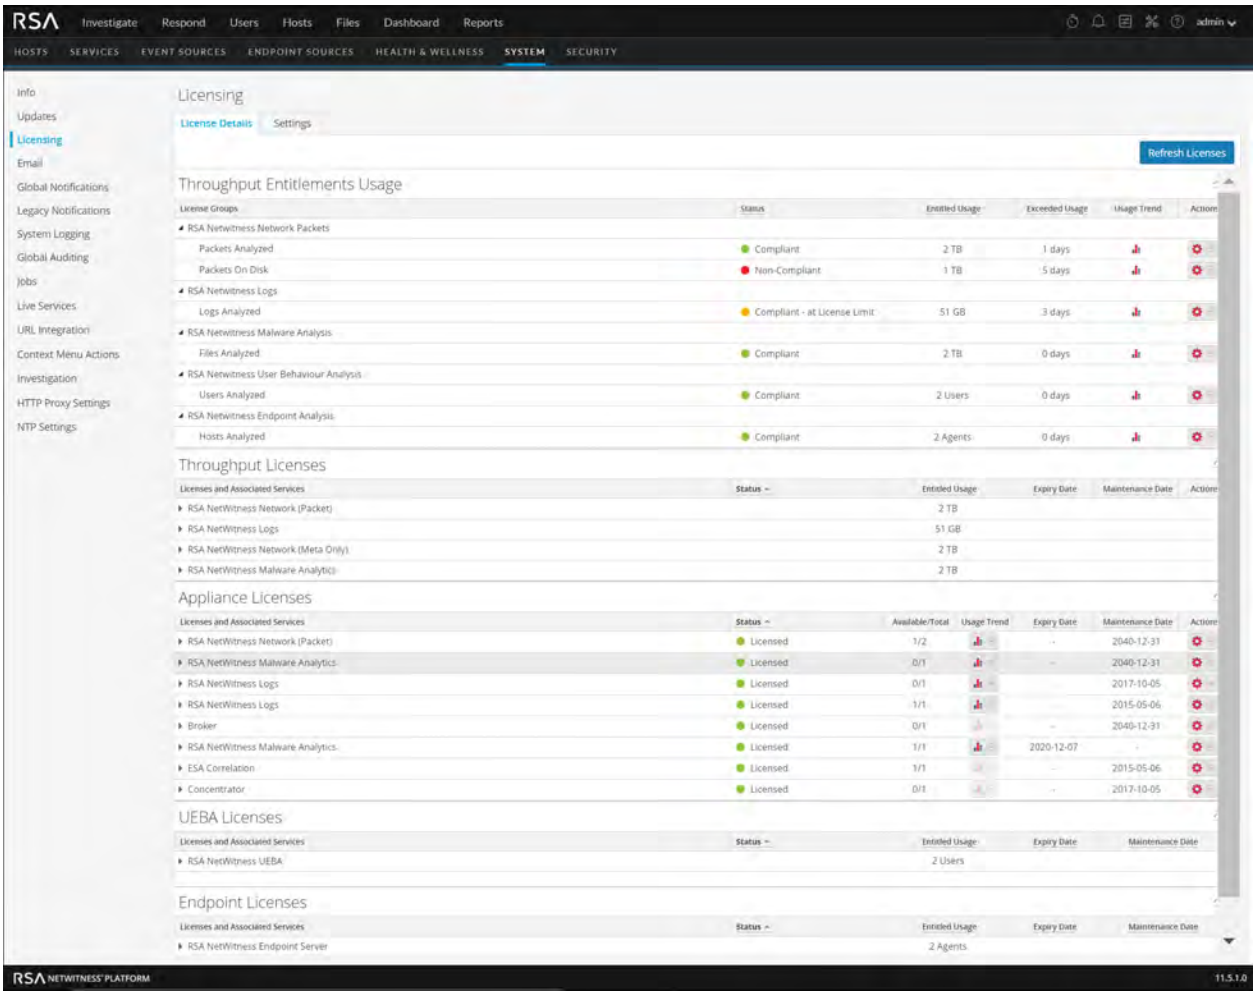
## Related Topics

- Settings
- View and Export Usage Stats

**Note:** On initial start up, the usage shown in the Licensing page displays zero usage for the initial one hour.

### Quick Look



The following table describes the features of the License Details tab.

1 **Refresh Licenses**:Refreshes and maps the new licenses.

2 Displays the following details of the Throughput license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the entitled usage for aggregate as well as individual services .
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services.
- **Expiry Date** - Displays the expiry date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Reassigns an extensively used Throughput license to another unused Throughput license. This is applicable only for Throughput and Appliance license.

3 Displays the following details of the Appliance license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Available/Total** - Displays the number of available license and the total number of licenses.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Move the license from Appliance to Throughput license.
  - **Reclaim**: This option gets activated when any appliance service is down. When you click **Reclaim** the license becomes available in the pool of the specific license service. This is applicable only for Appliance license.

4 Displays the following details of UEBA license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near

Usage Limit, and Within Usage limit.

- **Entitled Usage** - Displays the number of entitled users.
- **Actual Usage** - Displays the daily active users.
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**

5 Displays the following details of Endpoint license or licenses.

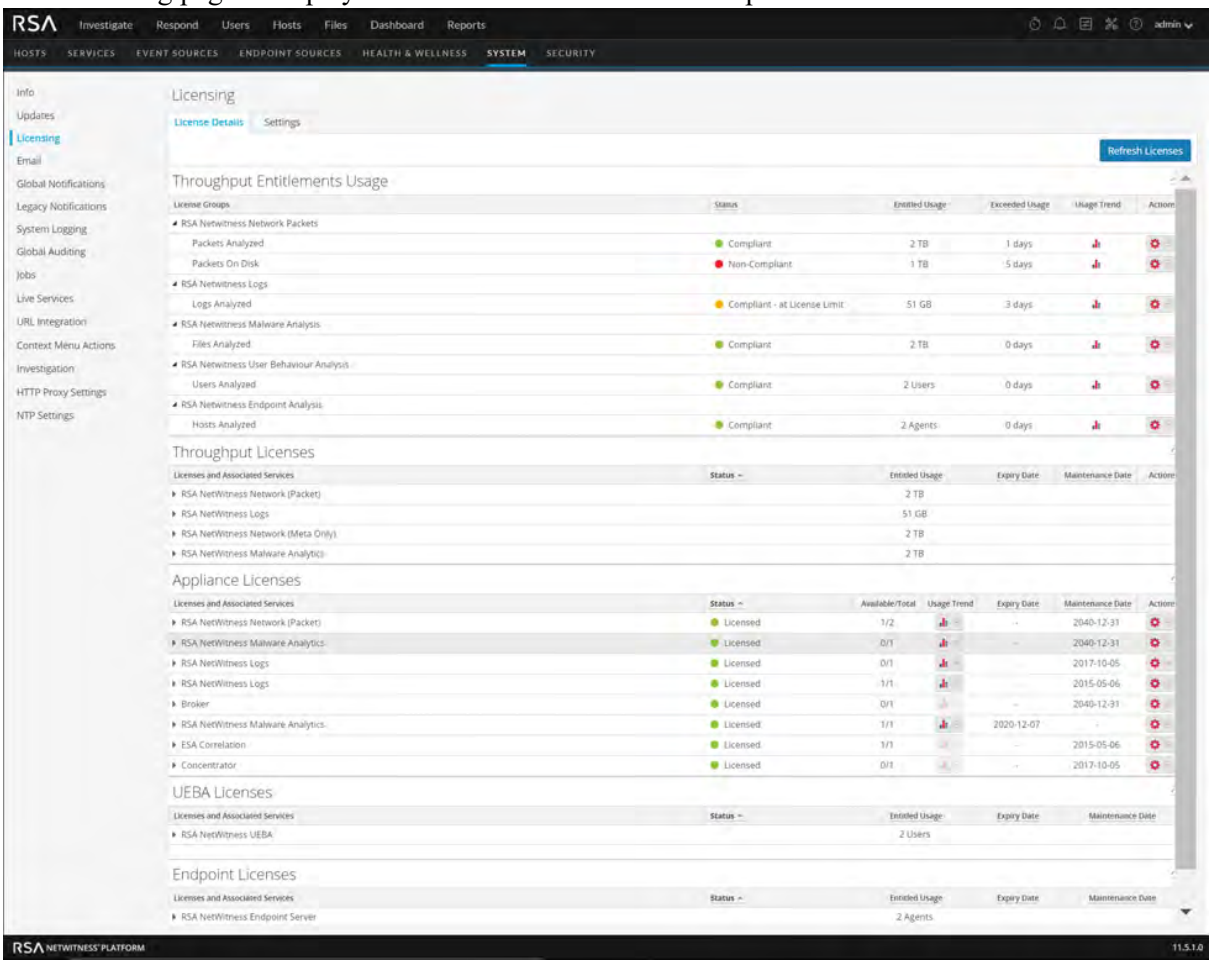
- **License and Associated Service** - Displays the license and the services assigned to it. For example, Endpoint Hybrid or Endpoint Log Hybrid.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the users of the entitled agents .
- **Actual Usage** - Displays the number of daily active agents .
- **Exceeded Usage** - Displays the number of days on which the actual number of agents exceeded the entitled threshold.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time.
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**

## Usage Trends

You can view the usage trend for aggregate licenses as well as individual licenses. The data is displayed for each day. When you click the usage trend icon, it opens a new window and displays the usage data as a chart. The user can use this data to analyze the license usage in the deployment.

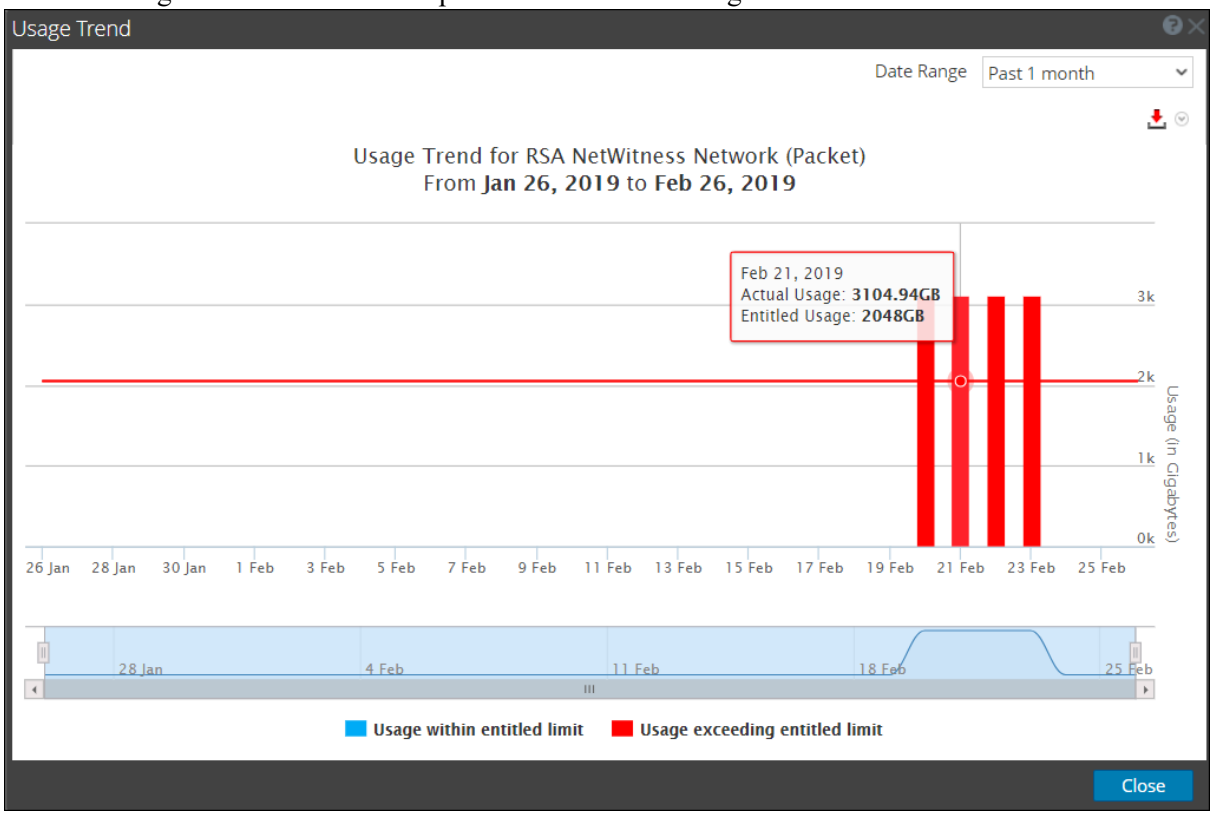
To access this view:

1. Go (Admin) > **System** and select **Licensing**.
   The Licensing page is displayed with the License Details tab opens.

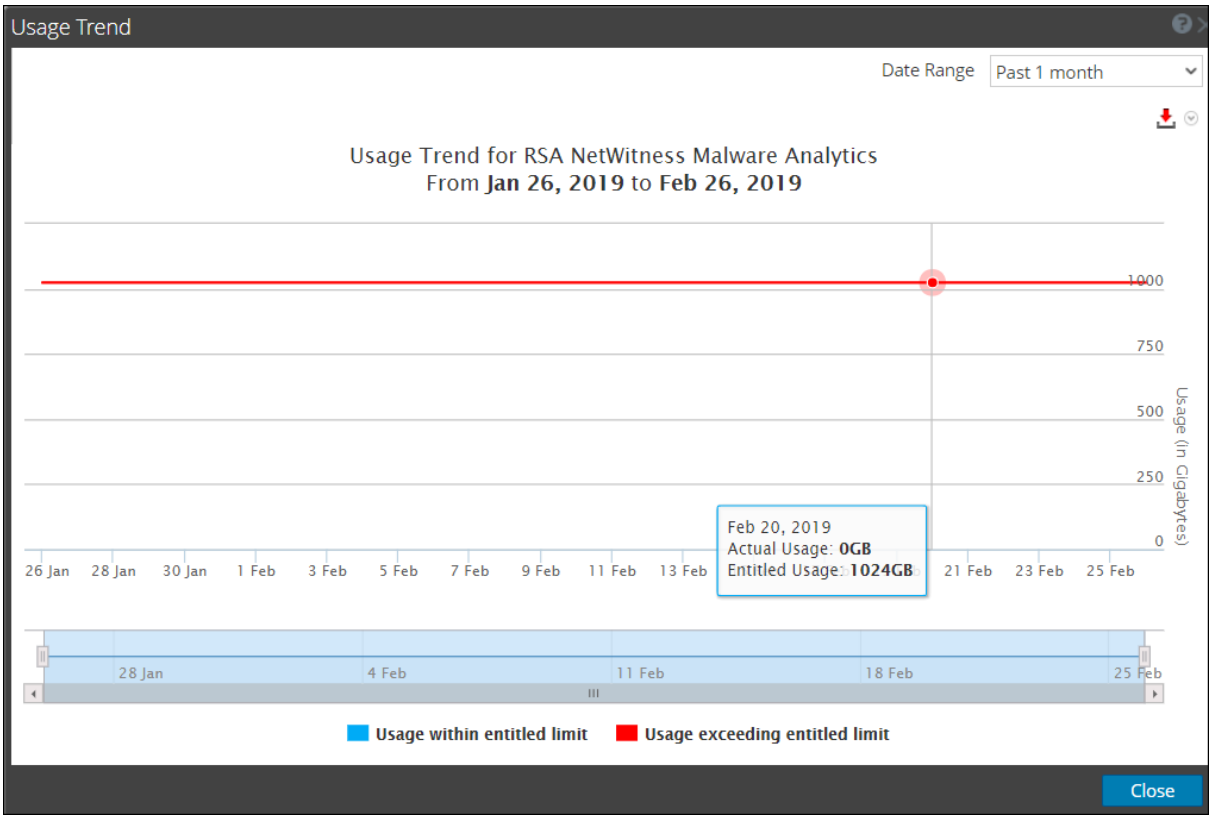


2. Select a service or license and click the icon under the Usage Trend column.
   The Usage Trend window is displayed.

The following screenshot is an example of the Exceeded Usage Trend.



The following screenshot is an example of Within Limits Exceeded Usage Trend.



Usage Trend
Date Range
Past 1 month

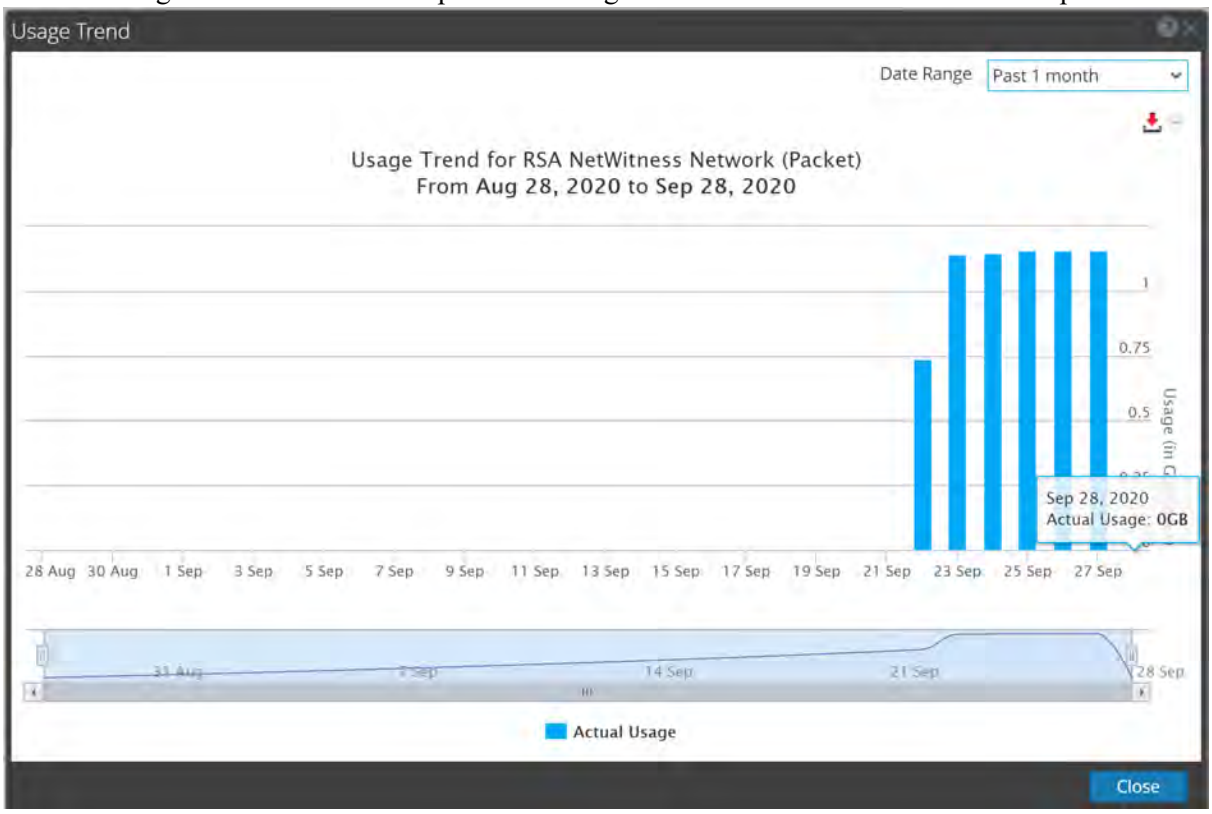
Usage within entitled limit
Usage exceeding entitled limit
Close

The following screenshot is an example of the Usage Trend chart for a license with multiple services.



The threshold limit is indicated as a horizontal red-dotted line across the chart. When actual data usage exceeds the entitled daily usage, those days are indicated by red colored bars.
The chart can be generated to collect data for 1 month, 3 months, 6 months, 12 months or custom date range.

These charts can be exported in CSV, and PDF formats by clicking the icon.

**Note:** The maximum range for which trend can be viewed is 12 months. The pan-zoom bar at the bottom of the chart can be used to narrow the chart to a smaller time range for better visibility in that range.

If the entitled limit exceeds the usage limit then an appropriate out-of-compliance banner is displayed. For more information, see About Out-of-Compliance Banners.

# Reassign Service Licenses

You can move service between licenses only if a similar service license is available.

You can move the services between the following licenses.

- Throughput License to Throughput License
- Throughput License to Appliance License
- Appliance License to Throughput License
- Appliance License to Appliance License

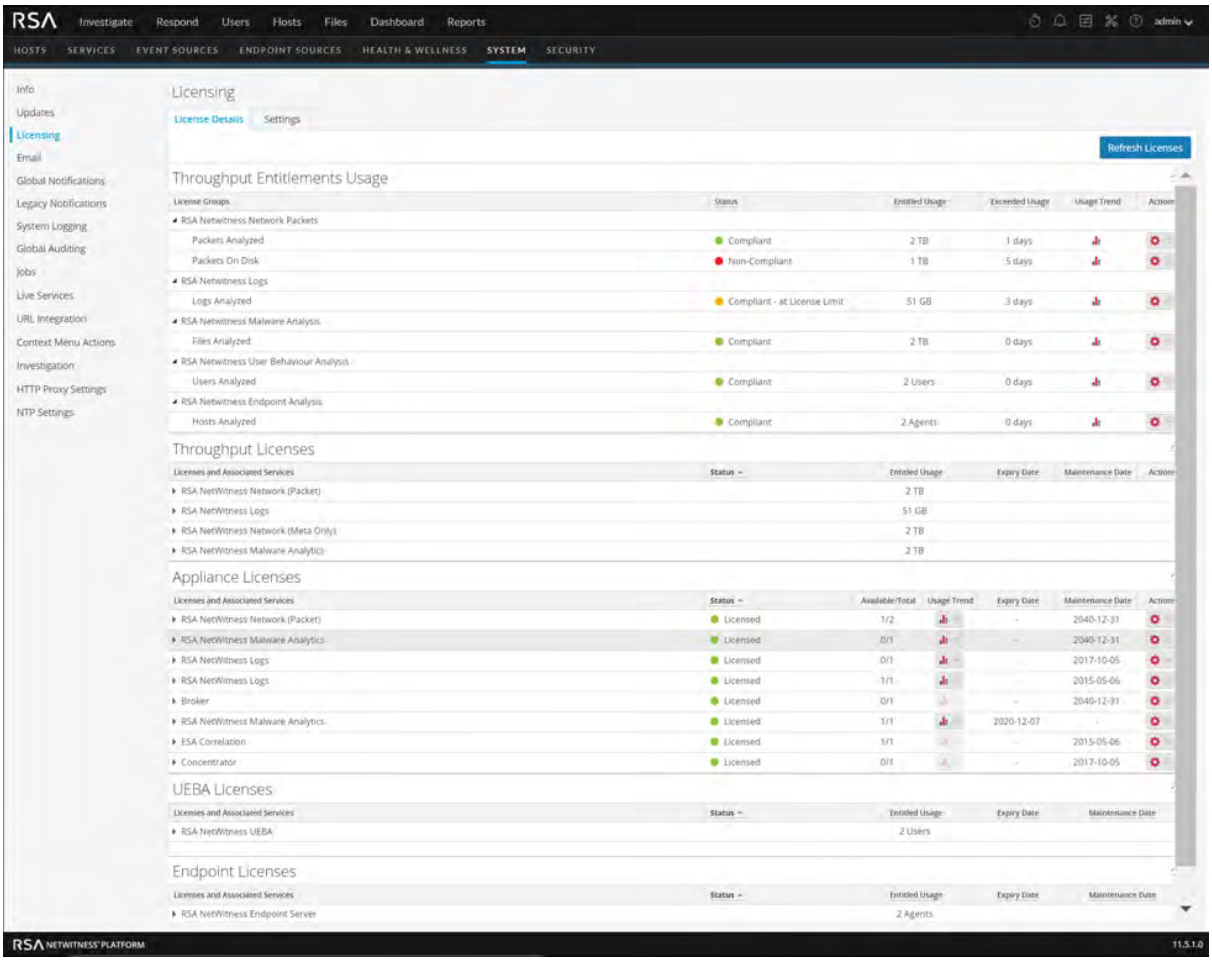
**Note:** If you want to change the licenses by moving between throughput and appliance, you can do this by selecting the license under the actions of each license. Trail licenses cannot be moved.

You can move the licenses for following reasons:

1. If the subscription based license has expired
2. If there are any unused available license for any service
3. If you want to reduce the usage of the service

To access this view:

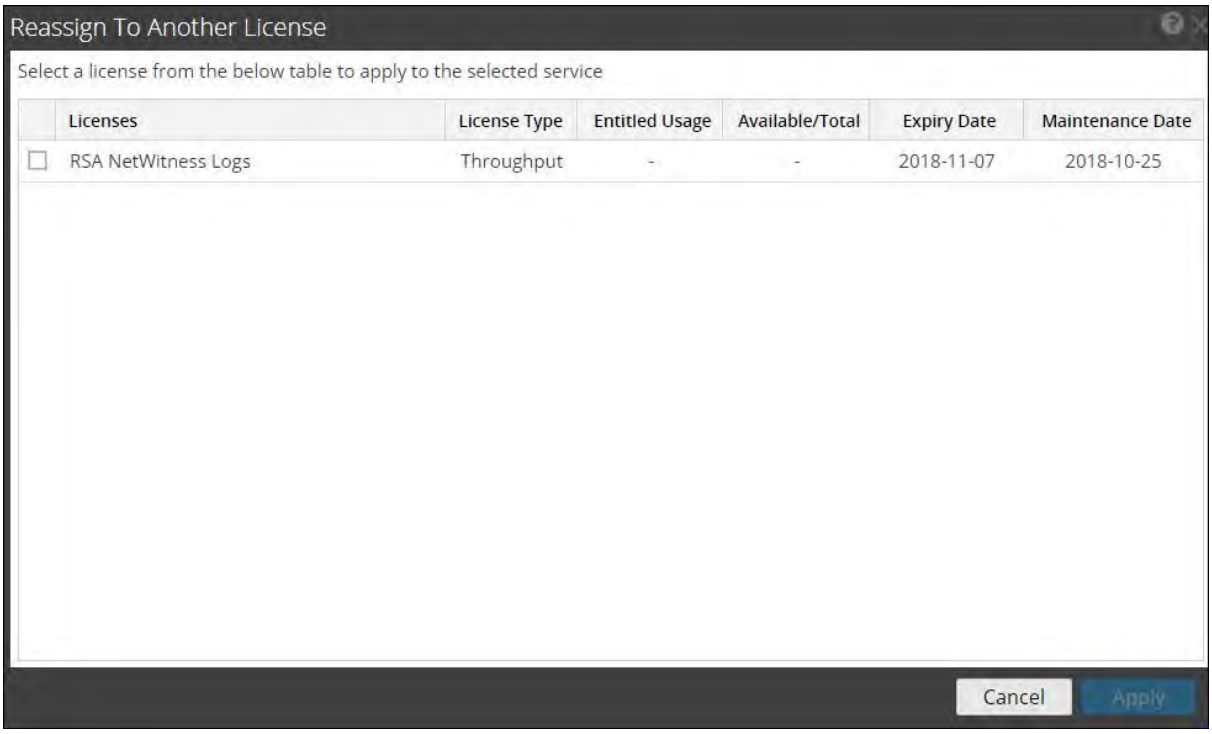
1. Go **(Admin) > System** and select **Licensing**.
   The License Details tab is displayed.



2. Select a service of which you want to move the license.

3. Click , and select the **Reassign to Another License** option.

   The Reassign To Another License dialog is displayed with a list of the available licenses that can be moved.



4. Select a license to be applied for the selected service.
5. Click **Apply**.

**Note:** The above procedure can be used to move both Throughput Licenses and Appliance Licenses. However, the UEBA and Endpoint licenses cannot be moved.

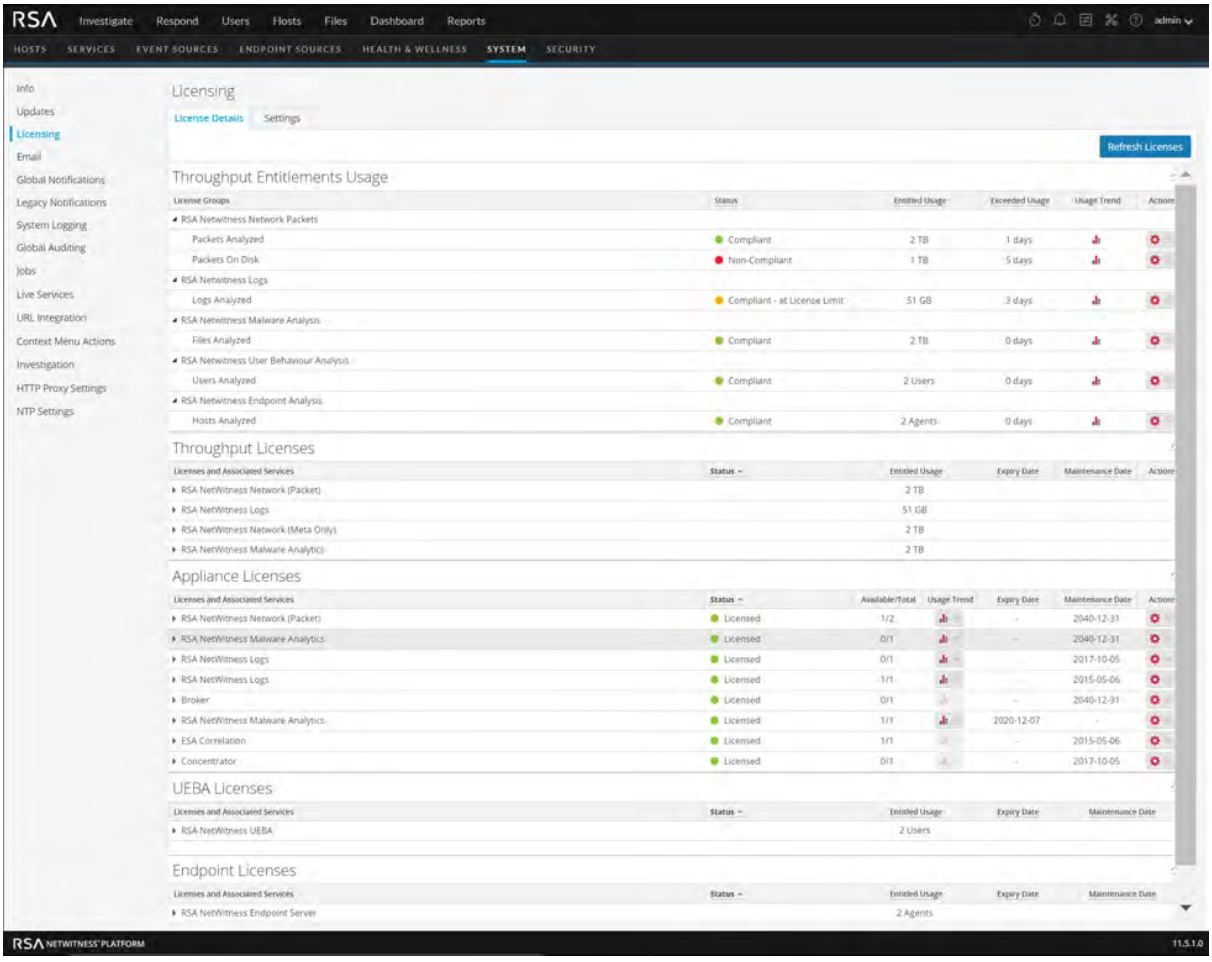
# View and Export Usage Stats

NetWitness provides the ability for Administrators to view usage statistics of device types that are eligible for a Throughput , Appliance Licenses such as Log Decoder, Decoder, Malware, UEBA, and Endpoint Server licenses. An hourly usage statistics is captured for all supported services connected to the NetWitness Server and are made available in CSV, and PDF formats. Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

### To access Export Usage Stats:

1. Go **(Admin) > System** and select **Licensing**.

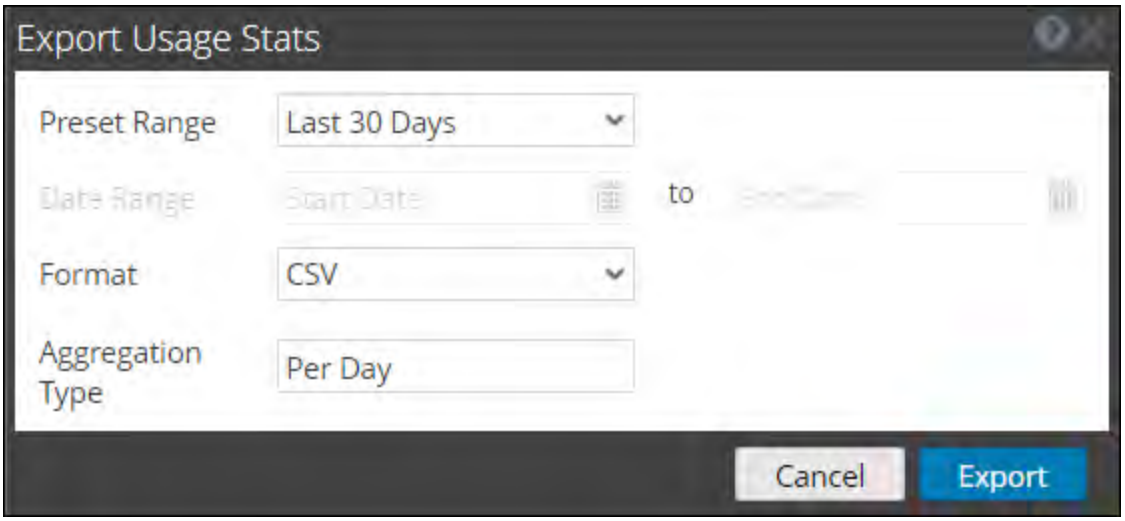
   The License Details tab is displayed.



2. Select a service for which you want to export usage stats.

3. Click , and select the **Export Usage Stats** option.

   The **Export Usage Stats** dialog is displayed.



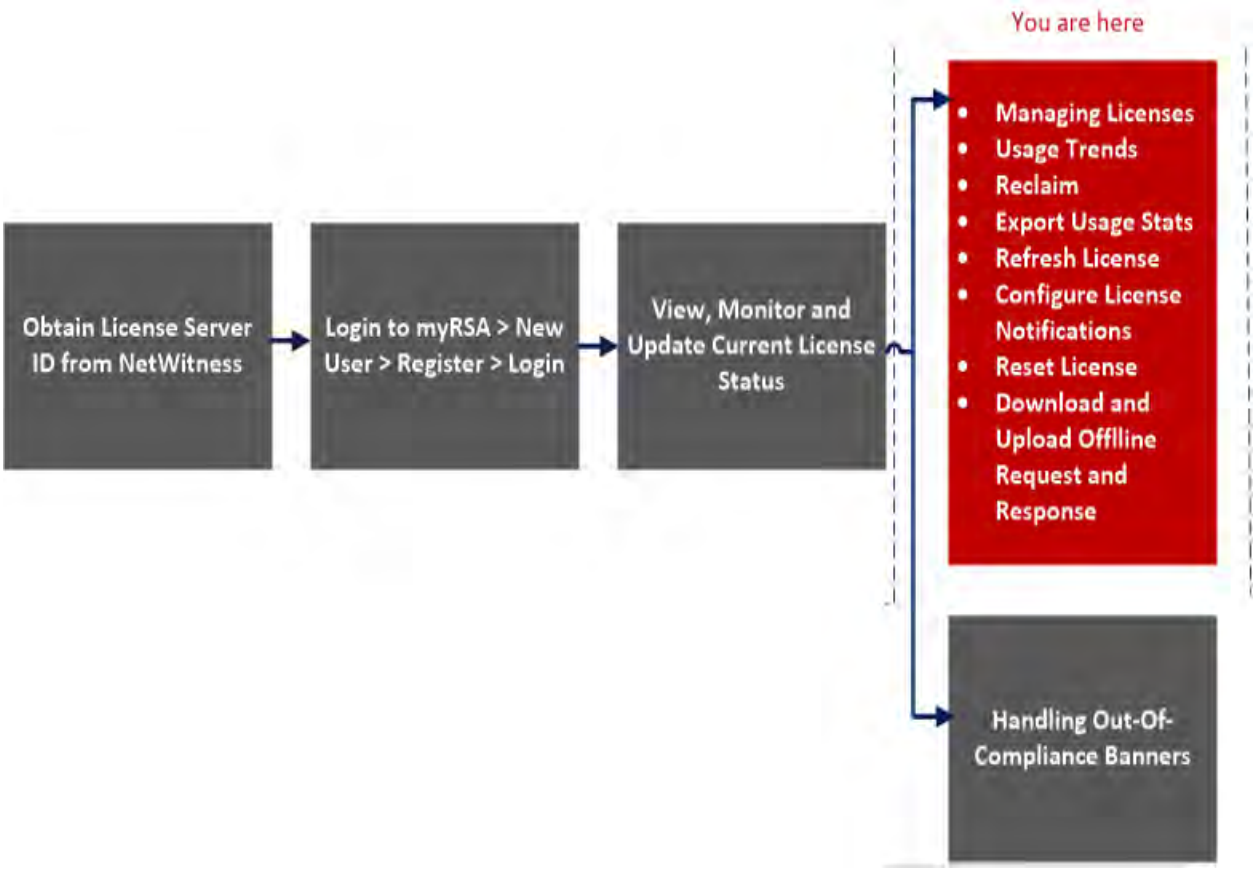
4. Select a **Preset Range**, **Date Range** (in case of custom range ), **Format** and **Aggregation Type** to generate the report.
5. Click **Export** to export the report or click **Cancel** to return to the **License Details** tab.

# Settings

This topic describes the notification settings for the NetWitness in the **Licensing panel** > **Settings** tab.

## Workflow

This workflow illustrates the end-to-end licensing process.



## What do you want to do?

| Role | I want to... | Show me how... |
|---|---|---|
| Administrator | Register NetWitness Server | Obtain License Server ID from NetWitness Platform User Interface |
| Administrator | Synchronize NetWitness Server | Register the Server (Online Registration) |
| Administrator | Install product licenses from DLC. | Access myRSA |
| Administrator | Monitor and update current licenses. | View Current Licenses |
| Administrator | *Configure licensing notifications. | Configure License Notifications |

| Role | I want to... | Show me how... |

*You can perform this task here.

## Related Topics

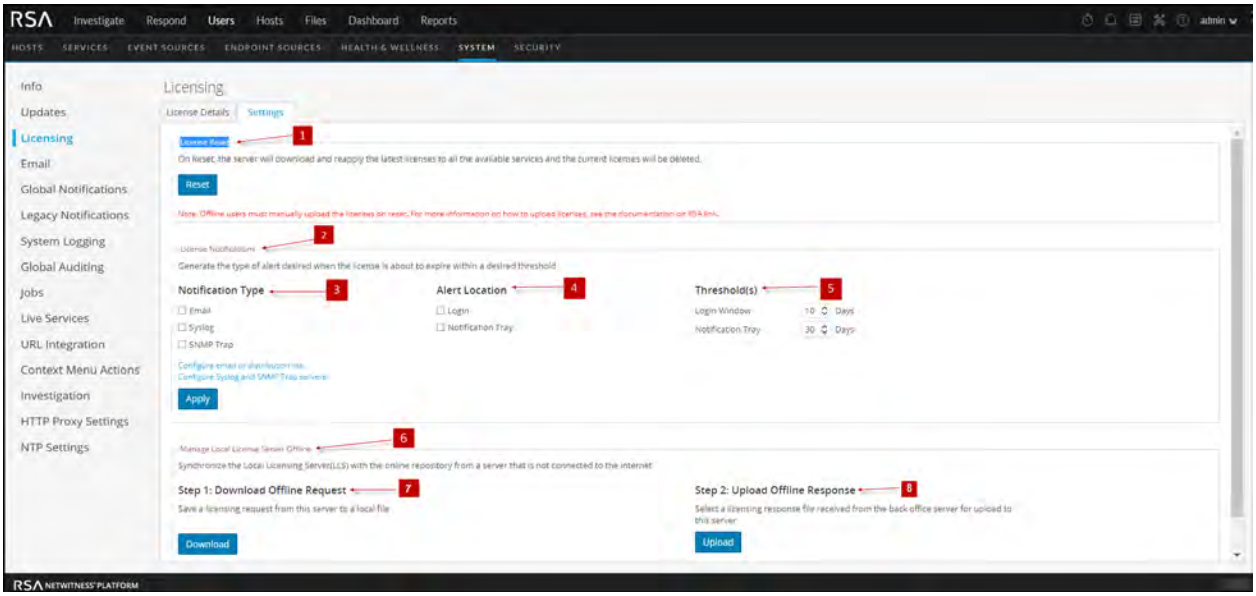
Obtain License Server ID from NetWitness Platform User Interface

Configure License Notifications

## Quick Look

From the **Settings** tab you can:

- Configure licensing notifications.
- Download an Offline Capability Request in NetWitness for submission to DLC.
- Within 24 hours, upload to NetWitness an Offline Response that was received from DLC.



The following table describes the **Settings** tab features.

| | |
|---|---|
| 1 | Displays the **License Reset** panel which applies the default license settings. |
| 2 | Displays the **Licensing Notifications** panel. |
| 3 | Displays the **Notification Type**. There are three types of notifications:<br>• **Email:** Checkbox to receive a notification of approaching license expiration in an email message. The email is sent to the configured email or distribution list.<br>• **Syslog:** Checkbox to receive a notification of approaching license expiration in an syslog message. The syslog is generated in accordance with the settings in the Syslog Auditing Settings.<br>• **SNMP Trap:** Checkbox to receive a notification of approaching license expiration in an SNMP trap. The trap is generated in accordance with the settings in the SNMP Auditing |

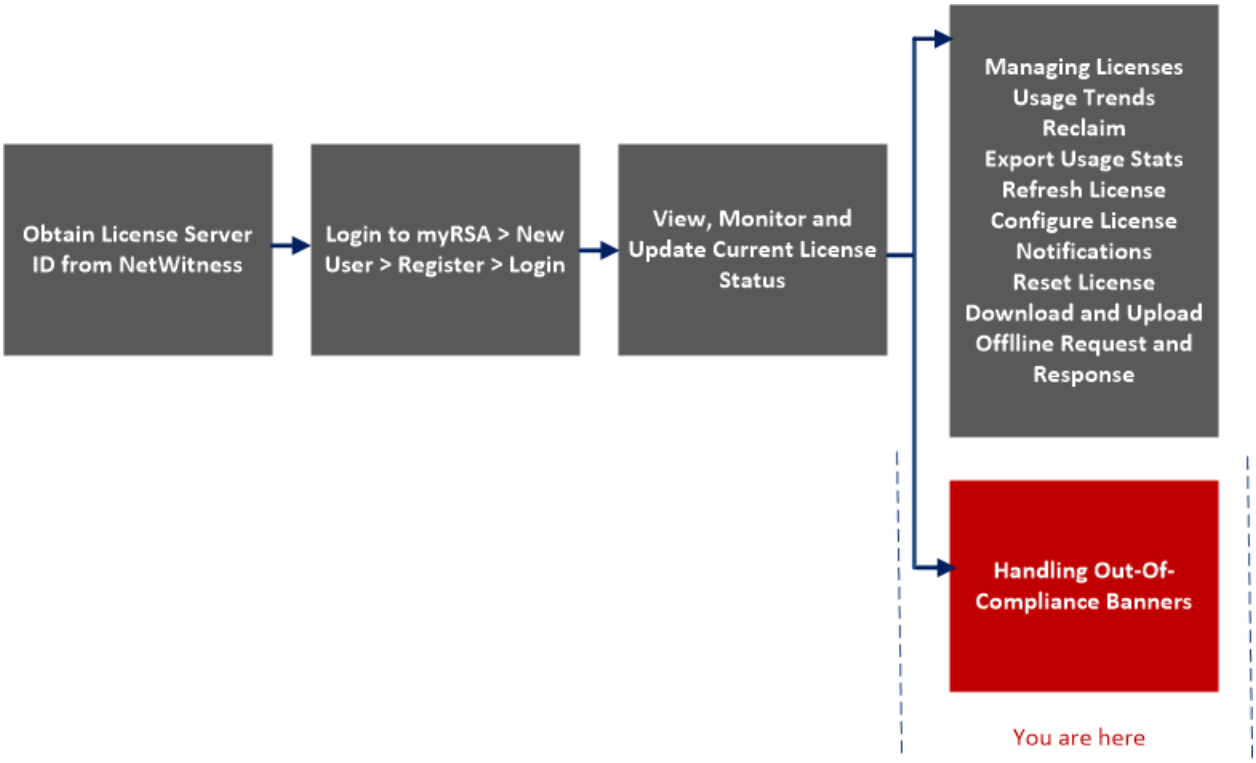
| | |
|---|---|
| | Settings. |
| 4 | Displays the type of **Alert Notification**.<br>• **Login:** Select this checkbox to receive a notification of your approaching license expiration when you log on to NetWitness. The **Login Window Threshold** field specifies the number of days before the license expires to display the notification at log on.<br>• **Notification Tray:** Select this checkbox to receive a notification of approaching license expiration in the Notifications tray. |
| 5 | Displays the **Threshold** field, which specifies the number of days before the license expires to send a notification to the Notifications tray. |
| 6 | Displays the **Manage Local License Server Offline** panel. |
| 7 | Displays the **Download Offline Request** button. This button enables you to download a request from the NetWitness Platform LLS into a local file for processing by a back-office server. The downloaded bin file should be uploaded to DLC to generate the offline response. |
| 8 | Displays the **Upload Offline Request** button. This button enables you to browse for an offline response that you received from the back-office server, and uploads the selected response to NetWitness. The file must be uploaded within 24 hours after receiving the file. |

# Out-of-Compliance Reference

This topic describes the workflow when your license is out of compliance.

## Workflow

This workflow illustrates the end-to-end licensing process.



## What do you want to do?

| Role | I want to... | Show me how... |
|---|---|---|
| Administrator | Register NetWitness Server | Obtain License Server ID from NetWitness Platform User Interface |
| Administrator | Synchronize NetWitness Server | Register the Server (Online Registration) |
| Administrator | Install product licenses from DLC. | Access myRSA |
| Administrator | Monitor and update current licenses. | View Current Licenses |
| Administrator | Configure licensing notifications. | Configure License Notifications |
| Administrator | *View Out-of-Compliance banners. | About Out-of-Compliance Banners |

*You can perform this task here.

**Note:** When throughput devices are under trial period, warning messages will not be displayed unless usage is observed on the corresponding device.

## Out-of-Compliance State

The following sample banner is displayed when a license expires:

If your license has internal errors, the following banner is displayed:

In addition to a red banner being displayed during system log on, an Out of Compliance Acknowledgment dialog is also displayed. Click **Accept** to continue using your NetWitness product.

Licenses may become out-of-compliance due to reasons provided in the following table:

| Red Banner Message | Possible Causes | Solutions |
|---|---|---|
| One or more services is not licensed. | Trial license period has expired.<br>There are pre-11.0.0.0 services in the deployment that are not licensed. | Contact RSA Sales team to procure a NetWitness license.<br>Upgrade the services to NetWitness version 11.0.0.0 or later. |
| One or more licenses is expired. | Log ingestion usage has been observed after the date of renewal. The license is not valid anymore for the corresponding usage. | Contact RSA Sales team to renew or resolve the license. |
| You have exceeded license usage limits. | If the allotted daily usage is exceeded on four or more occasions, the Grace Period begins. The Grace Period begins on the day of the fourth occurrence and ends at the end of the following calendar month. Seven continuous days of standard usage will end the Grace Period. If the daily allotted usage is still being exceeded at the end of the Grace Period, the 30-day Breach Period begins. Seven continuous days of standard usage will end the Breach Period. | Contact RSA Sales to extend or increase your allotted usage by purchasing a NetWitness license. |

| Red Banner Message | Possible Causes | Solutions |
|---|---|---|
| Your Trial license has internal errors. | An internal licensing issue was reported during your Out-of-the-Box Trial period. | Contact RSA Technical Support to resolve this issue. |

**Note:** If a license has not been installed within 90 days, you must contact RSA Sales to purchase a NetWitness license.

## License Approaching Out-of-Compliance

When your license is approaching expiration, or it is nearing its allotted usage, a yellow banner with a brief description is displayed. A yellow banner is displayed 14 days before your license is due to expire. You will also see a yellow banner if you are approaching your allotted license usage. You can get rid of the yellow banner by clicking the **Dismiss** button.

The following sample banner is displayed in the NetWitness screen if your license is approaching its allotted usage:

The following table explains the messages that are displayed when you see a yellow banner.

| Yellow Banner Message | Possible Causes | Solutions |
|---|---|---|
| You are nearing license usage limits. | One or more Throughput licenses has exceeded your allotted usage for three times during the current calendar month. The fourth time that you exceed your allotted usage during the current month will push the deployment into an Out-of-Compliance state. | Contact RSA Sales if your allotted usage spikes four times within a calendar month. |
| One or more licenses is expiring. | One or more licenses is due to expire within 14 days.<br>Or<br>Log ingestion usage has been observed. The license is not valid anymore for the corresponding usage. | Contact RSA Sales to purchase a new license. |

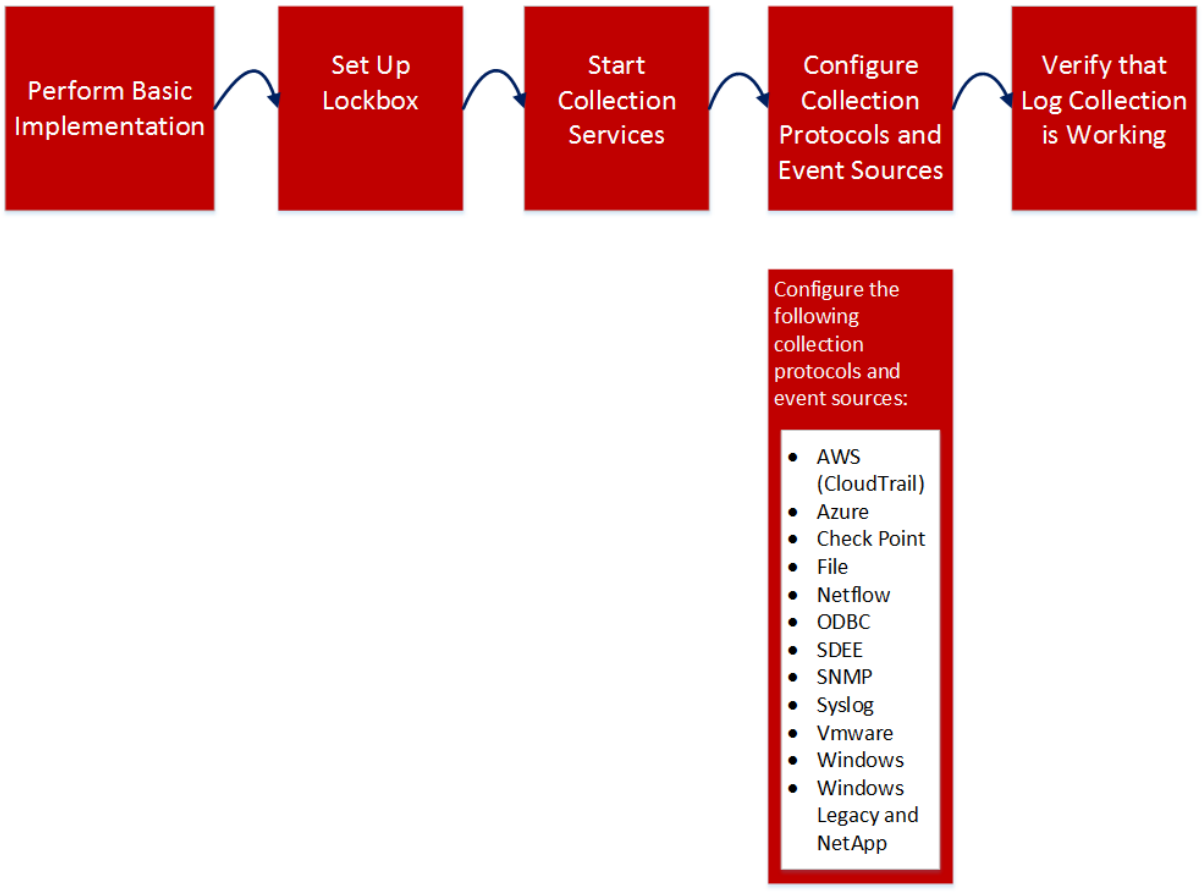
# About Log Collection

This guide describes the high-level steps and subtasks for setting up and configuring log collection for event sources that include:

- What Log Collection does, how it works from a high level, and provides high-level deployment diagrams.
- How to start collecting events.
- Where to find instructions to set up more complex deployments.
- How to start any collection protocol.
- Which tools to use to troubleshoot Log Collection issues and lists global troubleshooting instructions.
- How to fine tune and customize Log Collection in your environment.
- How to configure individual collection protocols. Instructions are in the individual Log Collection sections.

## Workflow

This workflow depicts the basic tasks needed to start collecting events through Log Collectors.



## High-Level Procedures

At a high level, these are the procedures you must follow for log collection:

I. Add local and remote collectors to RSA NetWitness.

Set up a Log Collector locally on a Log Decoder (that is a Local Collector). You can also set up Log Collectors in as many remote locations (that is Remote Collectors) as you need for your enterprise. For details, see Basic Implementation.

II. Download the latest content from RSA Live. You must perform this task periodically, as the content provided on RSA Live is updated regularly.

Log Collection content is marked as one of the following resource types:

- **RSA Log Collector** - content enabling the collection of event source types.
- **RSA Log Device** - the latest supported event source parsers.

You can also subscribe to content on Live. For details, see the *Live Services Management Guide*.

III. Configure Settings: set up the lockbox and Certificates.

For details, see Set Up a Lockbox and Configure Certificates.

IV. Configure Event Sources.

You configure all the event sources on your network to send their log information to RSA NetWitness. Whenever you add new event sources, you need to perform this procedure as well. All event source configuration guides are found in the RSA Supported Event Sources space in RSA Link.

V. Start and stop services for configured protocols. Occasionally, you may be required to stop and restart services, based on new event sources that you add to RSA NetWitness.

VI. Verify that Log Collection is working.

Whenever you set up a new event source or add a new collection protocol, you should verify that the correct logs are being sent to RSA NetWitness.

# Log Collection Architecture

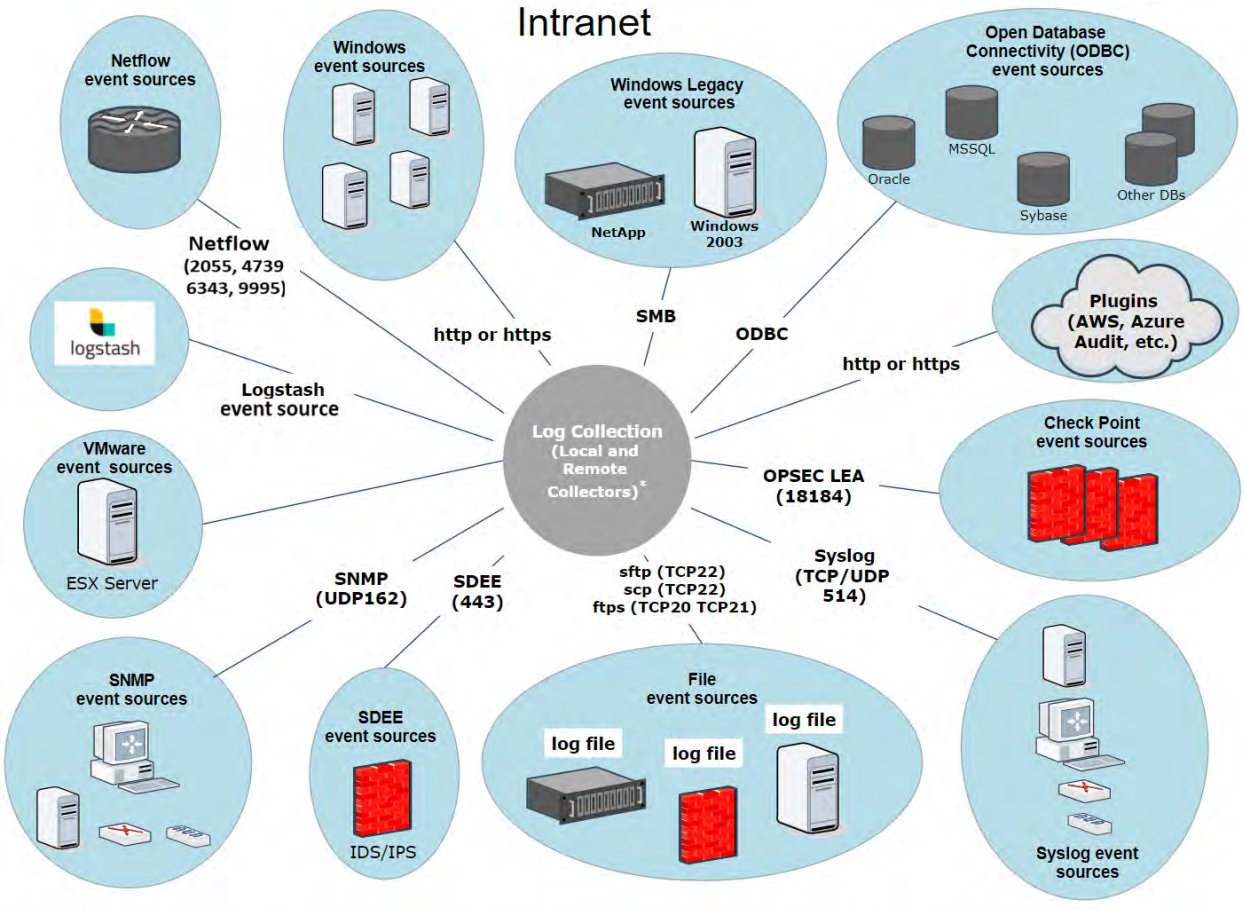
This topic describes how NetWitness performs log collection.

## How to Deploy Log Collection

You can deploy Log Collection according to needs and preferences of your enterprise. This includes deploying Log Collection across multiple locations and collecting data from varying sets of event sources. You do this by setting up a Local Collector with one or many Remote Collectors.

## Components of Log Collection

The following figure shows all the components involved in event collection through the NetWitness Log Collector.



*In Log Collection, Remote Collectors send events to the Local Collector and the Local Collector sends events to the Log Decoder.

## Local and Remote Collectors

In this scenario, log collection from various protocols like Windows, ODBC, and so on, is performed through both the Remote Collector and Log Collector service. If the log collection is done by the Local Collector, it is forwarded to the Log Decoder service, just like the local deployment scenario. If the log collection is done by a Remote Collector, there are two methods in which these are transferred to the Local Collector:

- **Pull Configuration** - From a Local Collector, you select the Remote Collectors from which you want to pull events.
- **Push Configuration** - From a Remote Collector, you select the Local Collector to which you want to push events.

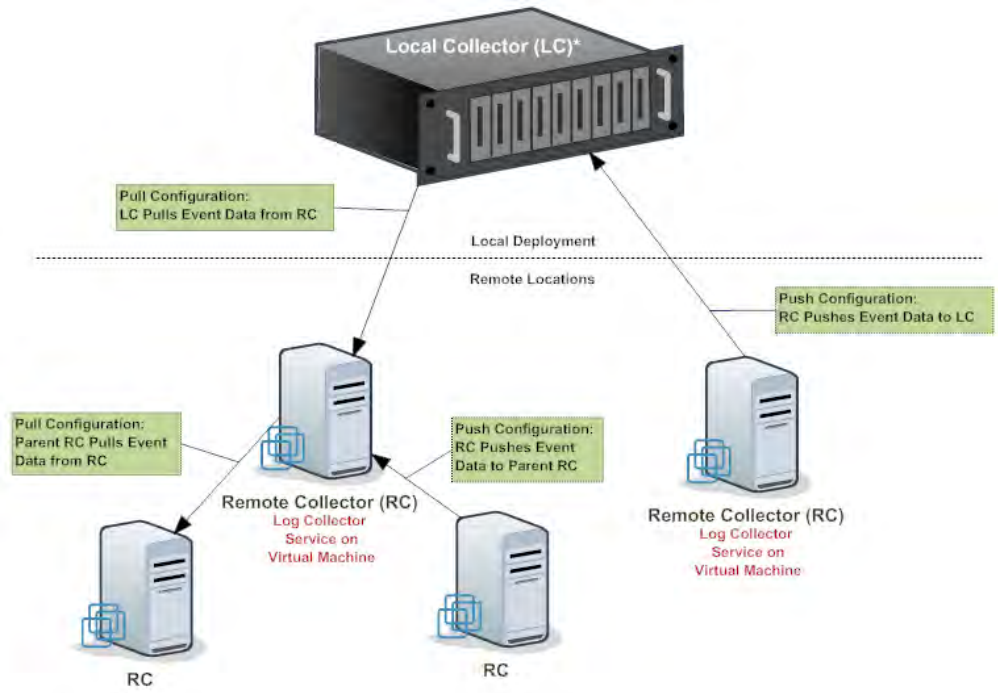
**Note:** Typically, the Push configuration is used. Pull is available if you have a DMZ in your environment. Less secure network segments are not allowed to make connections to more secure network segments. With Pull, the Log Collector (or Virtual Log Collector) in the secure network initiates the connection to the VLC in the less secure network, and the logs are then transferred without breaking the connection rules.

You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

Additionally, you can set up a chain of Remote Collectors for which you can configure:

- One or more Remote Collectors to push event data to a Remote Collector.
- A Remote Collector to pull event data from one or more Remote Collectors.

The following figure illustrates how the Local and Remote Collectors interact to collect events from all of your locations.



* The Local Collector (LC) is the Log Collector service on the Log Decoder appliance.

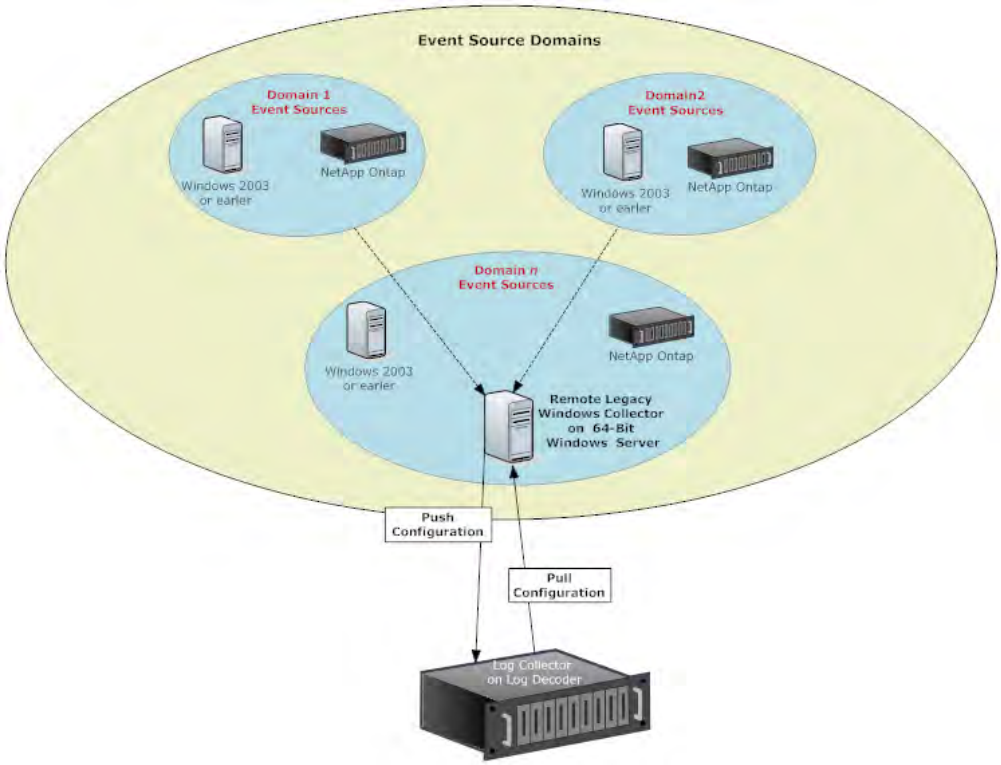
## Windows Legacy Remote Collector

The NetWitness Windows Legacy Collector is a Microsoft Windows based remote log collector (RC) which can be installed on a Windows domain.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

The following figure illustrates the deployment required to collect events from Windows Legacy event sources.



Event Source Domains

# Basic Implementation

This topic tells how to perform the initial setup of Local Collectors and Remote Collectors.

## Prerequisites

Verify that the Log Decoder is set up and:

- is capturing data.
- has the current content loaded.
- is properly licensed.

## Roles of Local and Remote Collectors

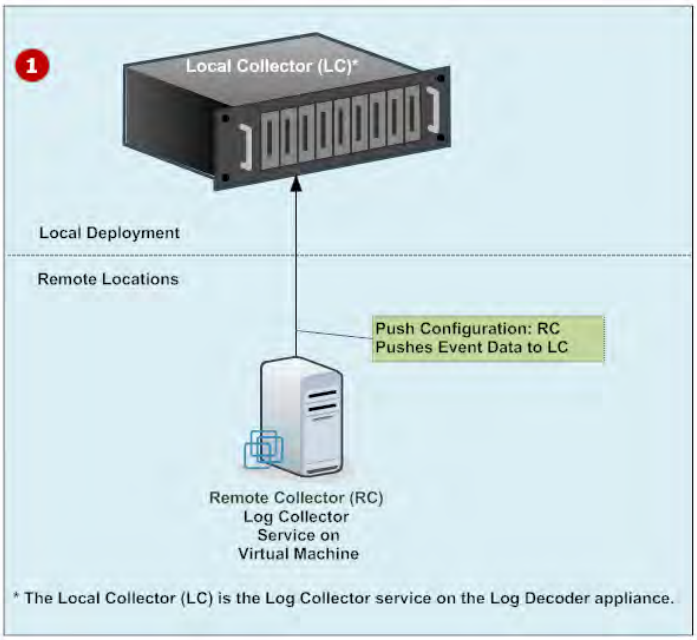
A Local Collector (LC) is a Log Collector service running on a Log Decoder host. In a local deployment scenario, the Log Collector service is deployed on a Log Decoder host, with the Log Decoder service. Log collection from various protocols like Windows, ODBC, and so on, is performed through the Log Collector service, and events are forwarded to the Log Decoder service. The Local Collector sends all collected event data to the Log Decoder service.

You must have at least one Local Collector to collect non-Syslog events.

A Remote Collector (RC), also referred to as a Virtual Log Collector (VLC), is a Log Collector service running on a stand-alone Virtual Machine. Remote Collectors are optional and they must send the events they collect to a Local Collector. Remote Collector deployment is ideal when you have to collect logs from remote locations. Remote Collectors compress and encrypt the logs before sending them to a Local Collector.

## Deploying and Configuring Log Collection

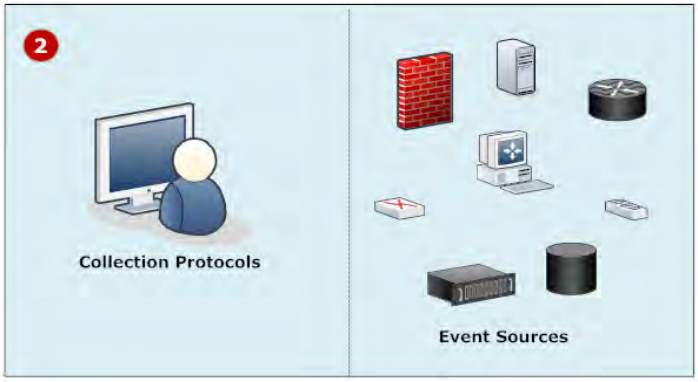
The following diagram illustrates the basic tasks you must complete to deploy and configure Log Collection. To deploy Log Collection, you need to set up a Local Collector. You can also deploy one or more Remote Collectors. After you deploy Log Collection, you need to configure the events sources in NetWitness and on the events sources themselves. The following diagram shows the Local Collector with one Remote Collector that pushes events to the Local Collector.



1 Set up Local and Remote Collectors.

The Local Collector is the Log Collector service running on the Log Decoder host.

A Remote Collector is the Log Collector service running on a virtual machine or Windows server in a remote location.



2 Configure event sources:

- Configure collection protocols
- Configure each event source to communicate with the NetWitness Log Collector.

For details on these procedures, see Configure Collection Protocols and Event Sources.

# Adding Local Collector and Remote Collector to NetWitness

### To add a Local Collector and Remote Collector to NetWitness:

1. Go to **(Admin) > Services**.
2. Click and select **Log Collector** from the menu.
   The **Add Service** dialog box is displayed.
3. Define the details of the **Log Collection** service.
4. Select **Test Connection** to ensure that your Local or Remote Collector is added.

# Configuring Log Collection

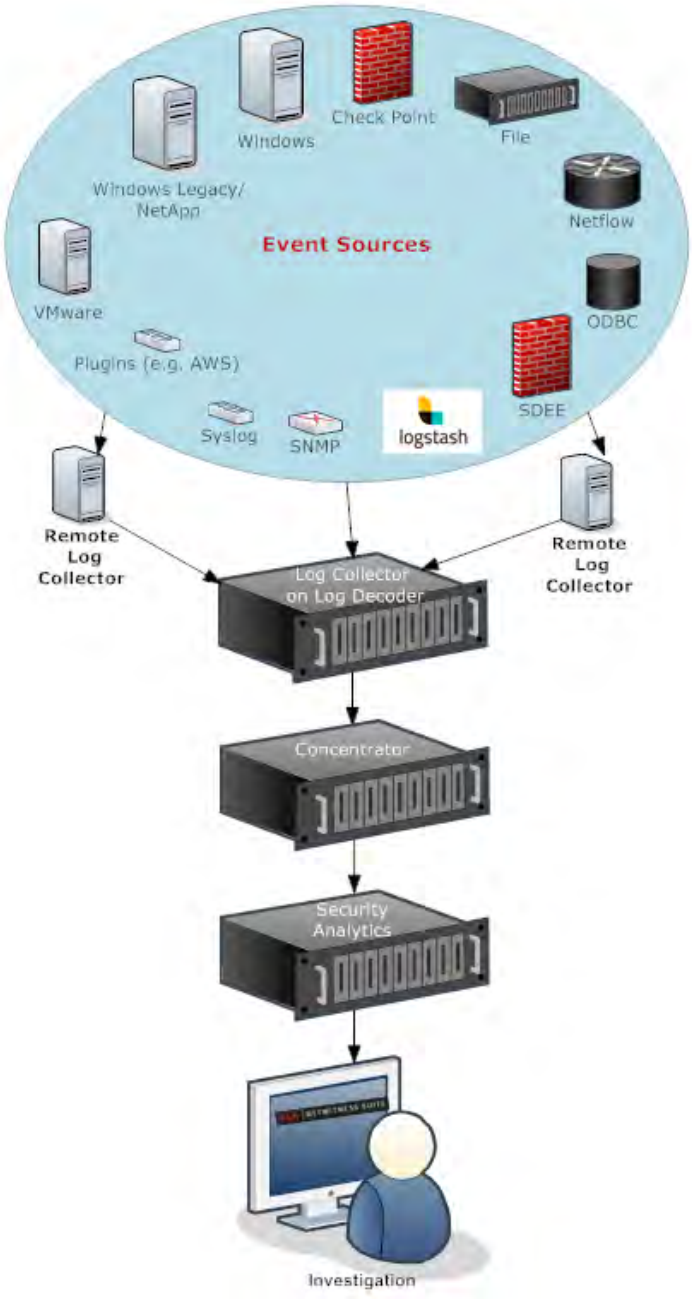
You choose the Log Collector—that is a Local Collector (LC) or Remote Collector (RC)—for which you want to define parameters in the Services view. The following figure shows how to navigate to the Services view, select a Log Collector service, and display the configuration parameter interface for that service.

### To configure log collection:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Click **View > Config** to display the Log Collection configuration parameter tabs.
4. Define global Log Collection parameters in the **General** tab.
5. The UI presents tabs, depending on whether the current service is Local or Remote.
   - For a Local Collector, NetWitness displays the **Remote Collectors** tab. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - For a Remote Collector, NetWitness displays the **Local Collectors**. Select the Local Collectors to which the Remote Collector pushes events in this tab.
6. Edit configuration files as text files in the **Files** tab.
7. Define collection protocol parameters in the **Event Sources** tab.
8. Define the lockbox, encryption keys, and certificates in the **Settings** tab.
9. Define Appliance Service parameters in the **Appliance Service Configuration** tab.

# Data Flow Diagram

You use the log data collected by the Log Collector service to monitor the health of your enterprise and to conduct investigations. The following figure shows you how data flows through NetWitness Log Collection to Investigation.



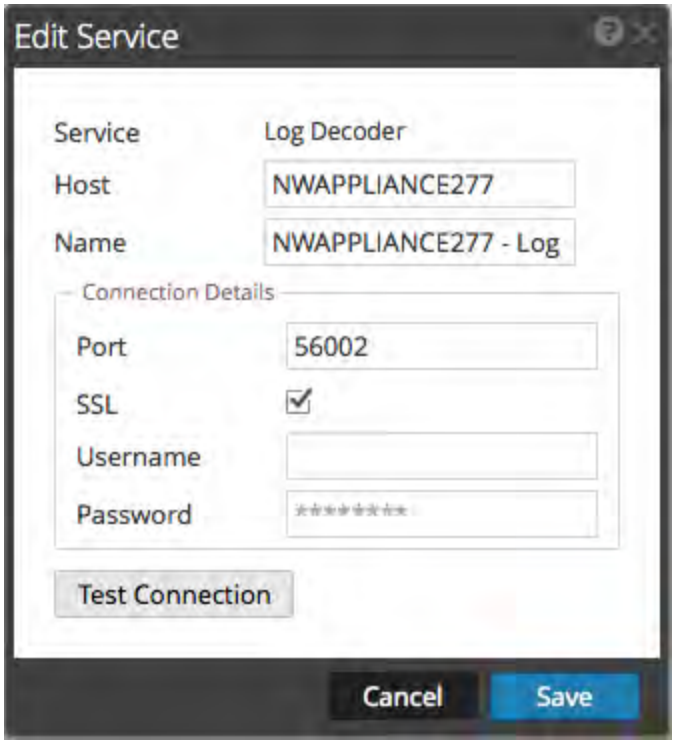
# Provision Local Collectors and Remote Collectors

The NetWitness server verifies if an appliance has a Log Decoder service. If there is a Log Decoder service, it becomes a Local Collector. If a Log Decoder service is missing, it becomes a Remote Collector. A local Log Collector has an Event Destination and by default goes to the Local Log Decoder service. A Remote Collector does not have an Event Destination. The NetWitness Server identifies a Legacy Windows Collector as a Remote Collector.

### To edit a Local Collector or Remote Collector:

1. Go to **(Admin) > Services**.
2. Select a Log Collector service.
3. In the **Services** view, select in the toolbar.

   The **Edit Service** dialog is displayed.



4. In the **Edit Service** dialog, provide the following information.

| Field | Description |
|---|---|
| Service | Select Log Collector as the service type. |
| Host | Select a Log Decoder host. |
| Name | Type name you want to assign to the service. |

| Field | Description |
|---|---|
| Port | Default port is 50001 for clear text and 56001 for SSL encrypted. |
| SSL | Select **SSL** if you want NetWitness to communicate with the host using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. |
| (Optional) Username | Type the username of the Local Collector. |
| (Optional) Password | Type the password of the Local Collector. |

5. Click **Test Connection** to determine if NetWitness connects to the service.
6. When the result is successful, click **Save**.

   If the test is unsuccessful, edit the service information and retry.

## Configure Local and Remote Collectors

This topic describes how to configure Local and Remote Collectors.

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder service, where the events are parsed and stored for subsequent analysis.

You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

This topic describes how to:

- **Configure Local Collector to Pull Events from Remote Collector**

  If you want a Local Collector to pull events from Remote Collector, you set this up in the Remote Collectors tab of the Local Collector's Configuration view.

- **Configure Remote Collector to Push Events to Local Collectors**

  If you want a Remote Collector to push events to a Local Collector, you set this up in the Local Collector tab of the Remote Collector's Configuration view. In the Push configuration, you can also:

  - **Configure Failover Local Collector for Remote Collector**

    You set up a destination made up of local collectors. When the primary Local Collector is unreachable, the Remote Collector attempts to connect to each Local Collector in this destination until it makes a successful connection.

  - **Configure Replication**

    You set up multiple destination groups so that NetWitness replicates the event data in each group. If the connection to one of the destination groups fails, you can recover the required data because it is replicated in the other destination group.

  - **Configure Log Routing for Specific Protocols**

    You set up multiple destinations in a destination group to direct event data to specific locations according to protocol type.

- **Configure Chain of Remote Collectors**

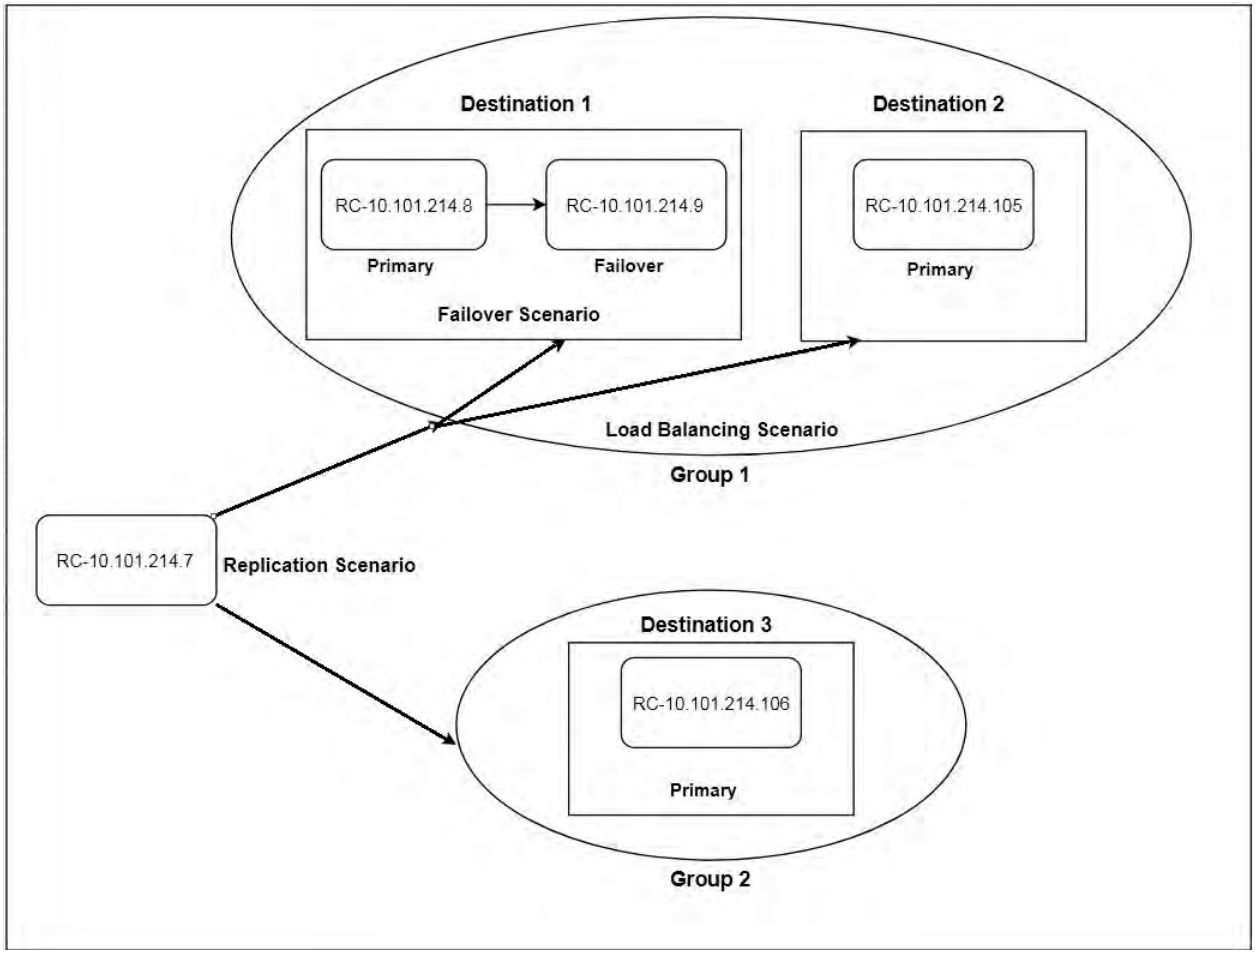
  You can set up a chain of Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from a chain of Remote Collectors.

  - You can configure one or more Remote Collectors to push event data to a Remote Collector.
  - You can configure a Remote Collector to pull event data from one or more Remote Collectors.

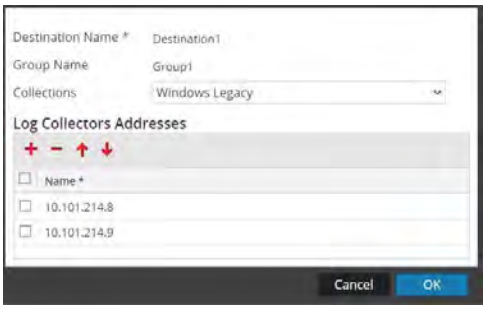
## Failover, Replication and Load Balancing

This section describes failover, replication, and load balancing work in how RSA NetWitness.

The following figure illustrates a Remote Collector configured for load balancing, failover and replication.

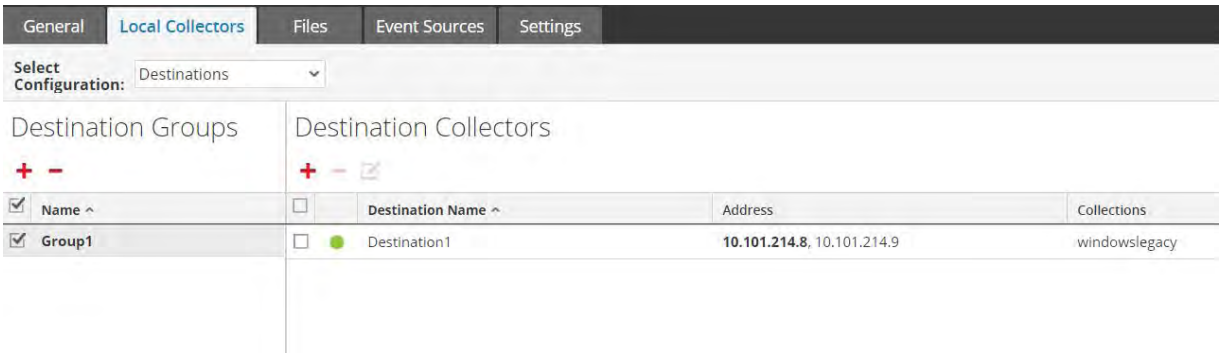


- **Failover** is achieved by setting up multiple collectors in the same Destination. Destination 1 has a primary Collector, and second, failover Collector. This is done in NetWitness by adding multiple Log Collectors to the same Destination.

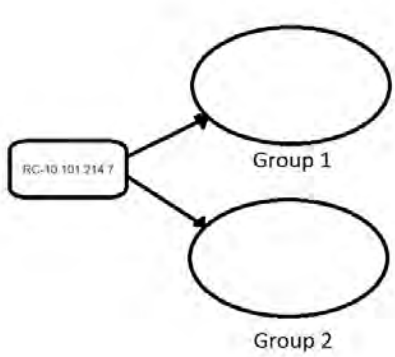


Since 10.101.214.8 is listed first, that becomes the primary collector, and 10.101.214.9 becomes the failover. To make 10.101.214.9 the primary, use the up arrow to change the order.

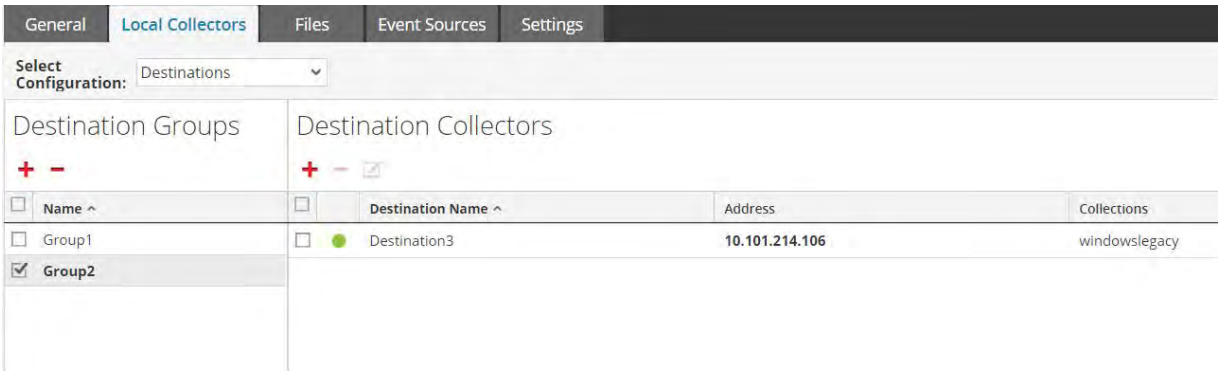
Below, you can see the two collectors both listed for Destination 1. The primary (10.101.214.8) is in bold.



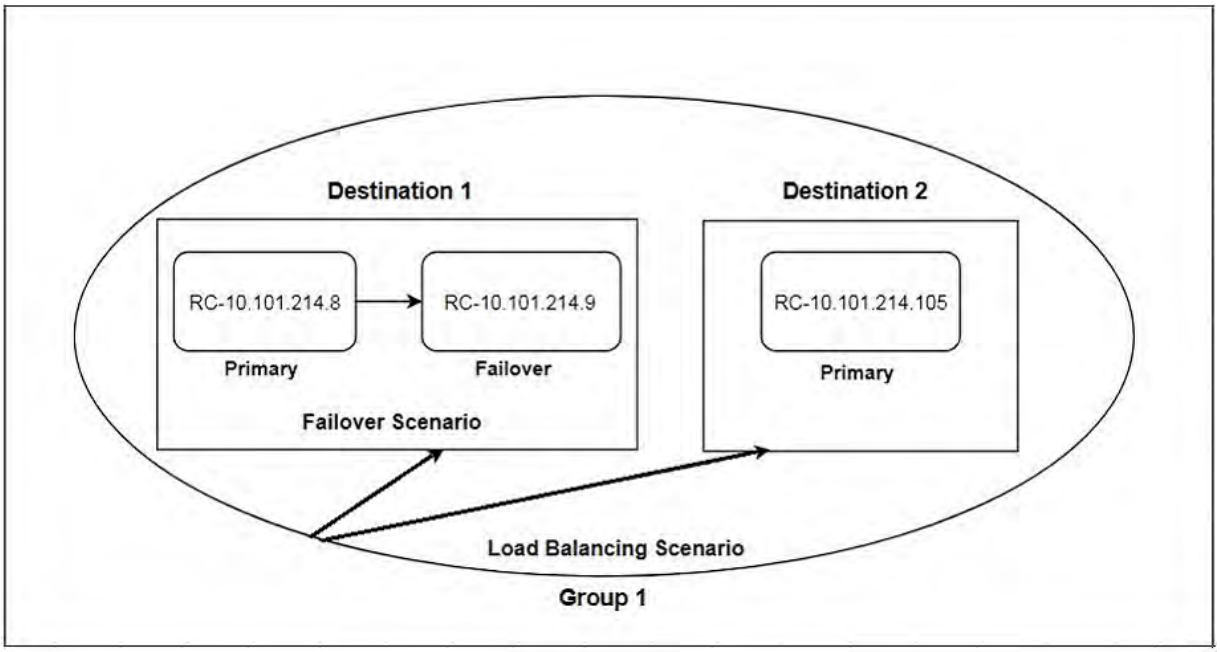
- **Replication** is accomplished by having multiple Destination Groups: each group receive the entire set of message data.



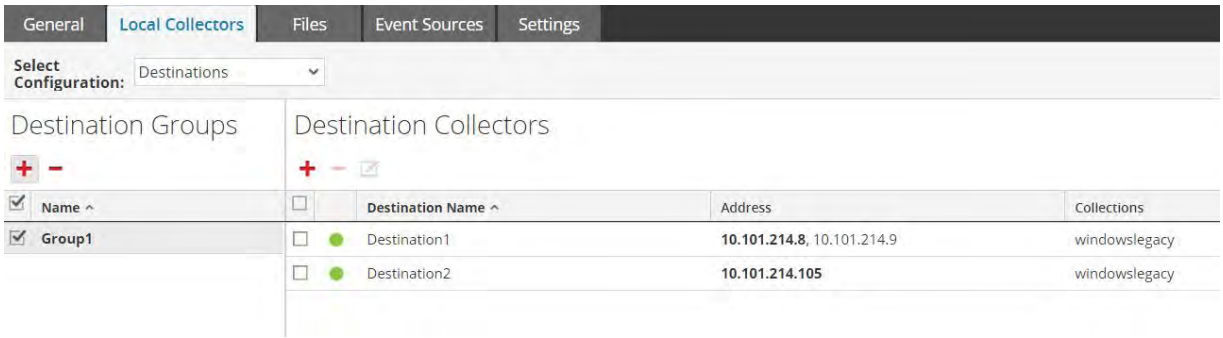
In the following screen, you can see that message data is sent to the collectors in Group 1 *and* Group 2.



- **Load balancing** is achieved by setting up multiple Destinations within a Group.



In the following screen, you can see that Group 1 has two destinations, Destination 1 and Destination 2. The message data is divided up equally among the Destinations in the group.



With two Destinations, each destination receives half the message data. With three Destinations, each would receive 1/3 of the total message data. Keep adding Destinations to further reduce the load on the collectors in each destination.

**Note:** You can also set up log routing so that event data for specific protocols is sent to specific destinations.

## Configure a Local Collector or Remote Collector

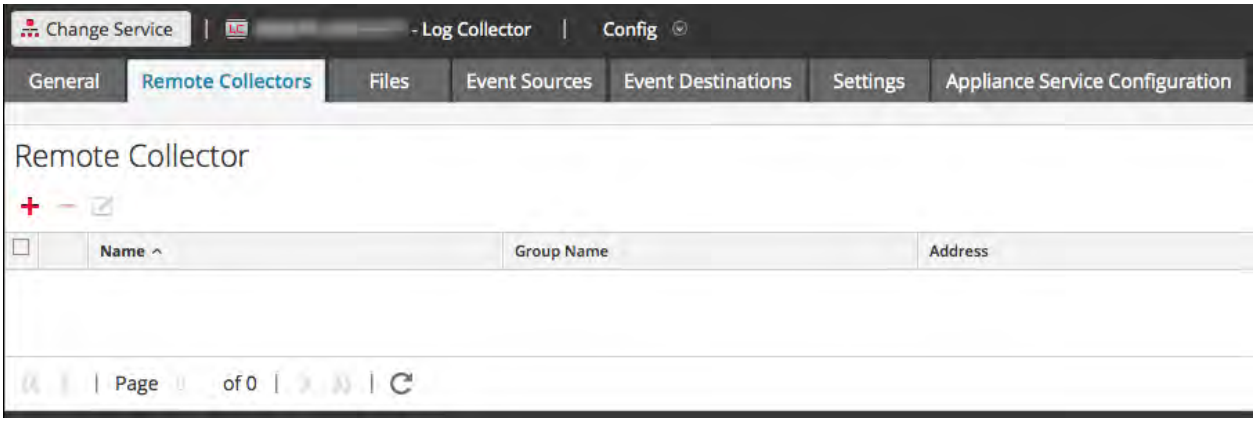
You choose the Log Collector, that is a Local Collector (LC) or Remote Collector (RC), for which you want to define deployment parameters in the Services view. The following procedure shows you how to navigate to the Services view, select a Local or Remote Collector, and display the deployment parameter interface for that service.

### To configure a Local Collector or Remote Collector:

1. Go to **(Admin) > Services**.
2. Select a Local or Remote Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - If you selected a Remote Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Remote Collector pushes events in this tab.

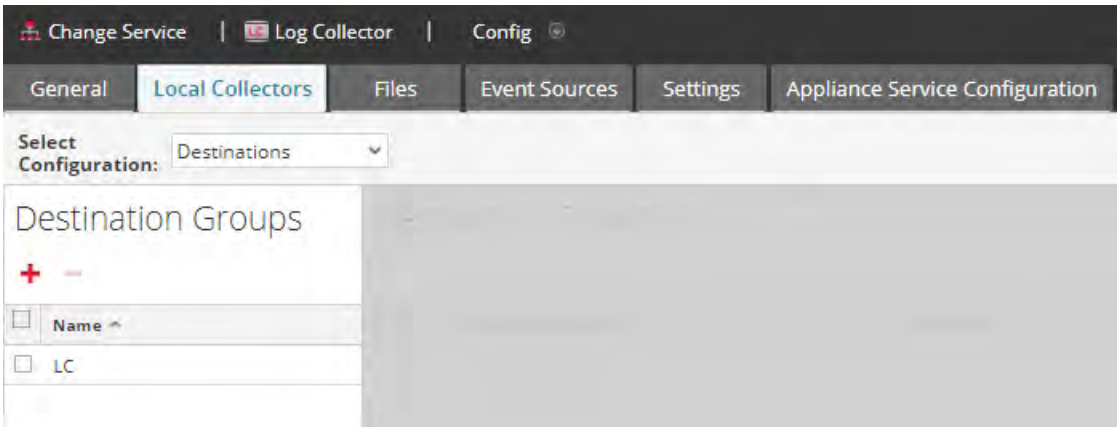
## Remote Collectors Tab

The following figure depicts the **Remote Collectors** tab for a Local Collector that is configured to pull events from a Remote Collector. NetWitness displays this tab when you have selected a Local Collector in (Admin) > Services.

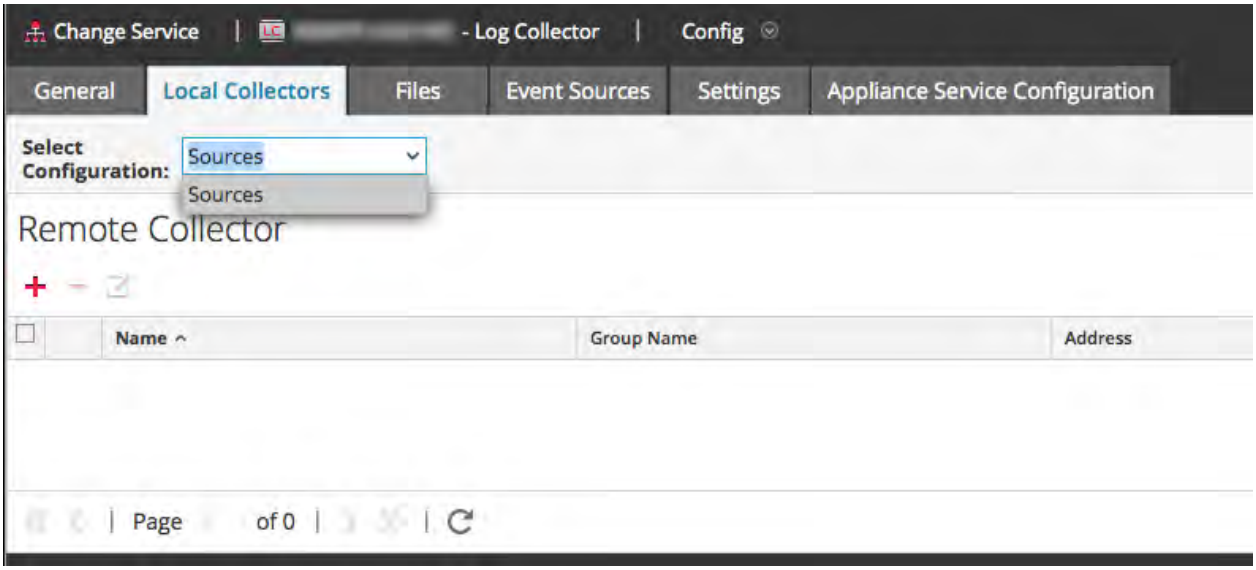


## Local Collectors Tab for a Remote Collector

The following figure depicts a **Local Collectors** tab for a Remote Collector that is configured to push events to a Local Collector or another Remote Collector.



The following figure depicts the Local Collectors tab for a Remote Collector that is configured to pull events from a Remote Collector. NetWitness displays this tab when you have selected a Remote Collector in (Admin) > Services.



## Parameters

Remote/Local Collectors Configuration Parameters

# Configure Failover Local Collector

This topic tells you how to set up a Failover Local or Remote Collector.

## Set up a Failover Local Collector

You can set up a Failover Local Collector that NetWitness will fail over to if your primary Local Collector stops operating for any reason.

1. Go to **(Admin) > Services**.
2. In **Services**, select a Remote Collector service.
3. Click **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, select .

   The Add Remote Destination dialog displays.
6. Set up a Destination Group and select a primary Local Collector (for example, **LC-PRIMARY**).
7. Select the Group (for example, **Primary_Standby_LCs**) in the Destination Groups panel and click .

   The Group you selected is displayed in the Local Collectors panel.
8. Add the Failover Local Collector (for example, **LC-STANDBY**).

   The following examples show the newly added primary and failover Local Collectors showing the primary Local Collector as **Active** and the Failover Local Collector as **Standby**. The active Local Collector is highlighted (for example, **LC-PRIMARY**).
9. (Optional) Add, delete, and change the order of Local Collectors to each Remote Destination.

   a. Click to add a Log Collector as a failover Remote Destination.

   b. When connecting to a Remote Destination, the Remote Collector will attempt to connect to each Local Collector in this list in order, until it makes a successful connection.

   c. Select a Local Collector and use the up ( ) and down ( ) arrow buttons to change the order of connection.

   d. Select one or more Local Collectors and click  to remove them from the list.

   The selected Local Collectors are added to the Log Collector section. When the Remote Collector starts collecting data, it pushes data to these Log Collectors.

## Set up a Failover Remote Collector

You can set up a Failover Remote Collector that NetWitness will fail over to if your primary Remote Collector stops operating for any reason.

### To set up a failover remote collector:

1. Go to **(Admin) > Services**.
2. In **Services**, select a Remote Collector service.
3. Click **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.

4. Select the **Local Collectors** tab.
5. Select **Sources** in **Select Configuration** drop-down menu.
6. Click + to display in **Add Source** dialog.
7. Define the failover Remote Collector and click **OK**.

## Parameters

Remote/Local Collectors Configuration Parameters

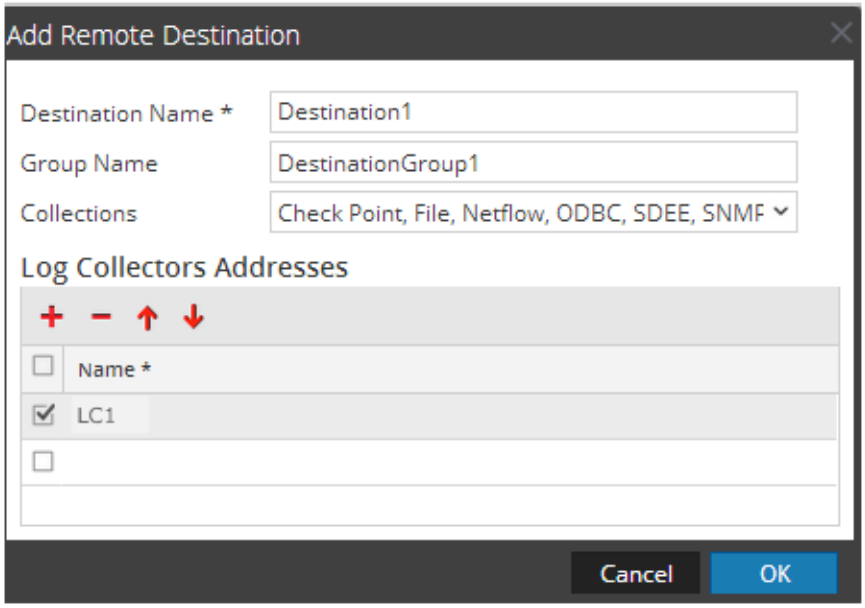
# Configure Replication

This topic tells you how to replicate event data sent by a Remote Collector.

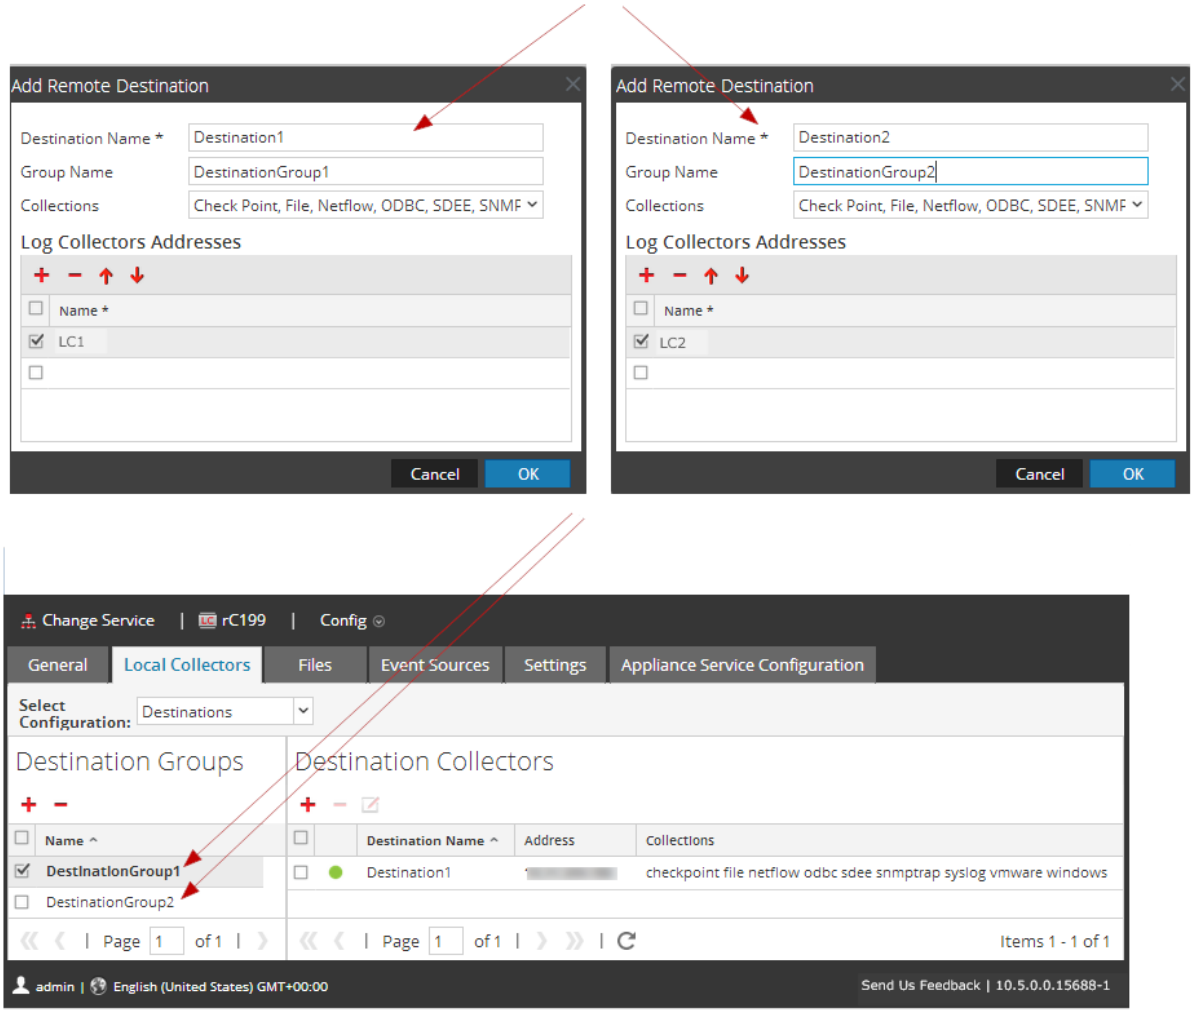
You can specify multiple Destination Groups so that the event data is replicated to each group.

### To replicate event data to multiple Local Collectors:

1. Go to **(Admin) > Services.**
2. Select a Remote Log Collection service.
3. Under Actions, select **> View > Config**.
   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, click +.
   The **Add Remote Destination** dialog is displayed.



6. Set up a separate Destination for each Local Collector and designate the protocols for which you want to push event messages to that Local Collector. The following examples shows the addition of two Destination Local Collectors (**Destination1** and **Destination2**) for the **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols:



a. Type the **Destination Name**.

b. Type the **Group Name**. If you do not type a Group Name, the Destination Name is taken as the Group Name.

c. Select the collection protocols in the drop-down list.

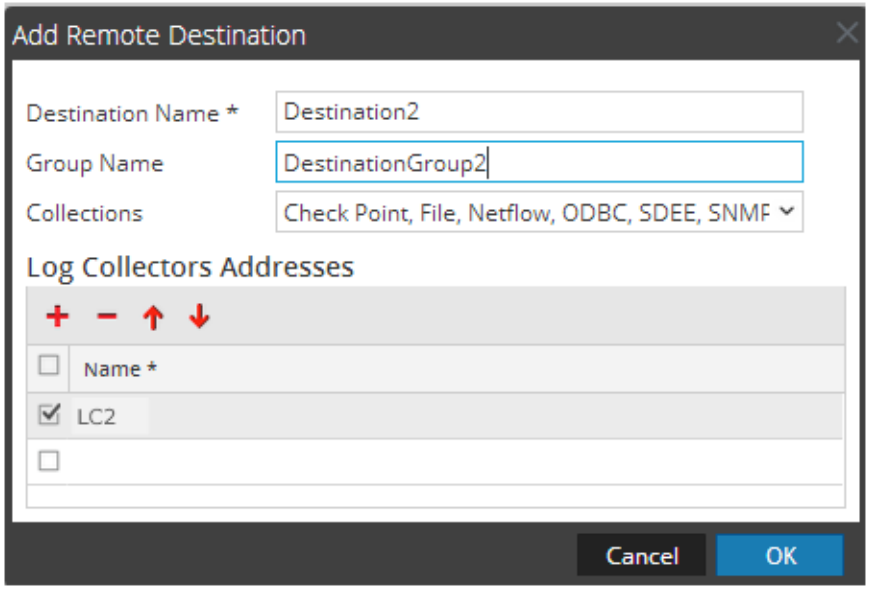
d. Select a Local Collector (for example, **LC1**).

e. Click **OK**.

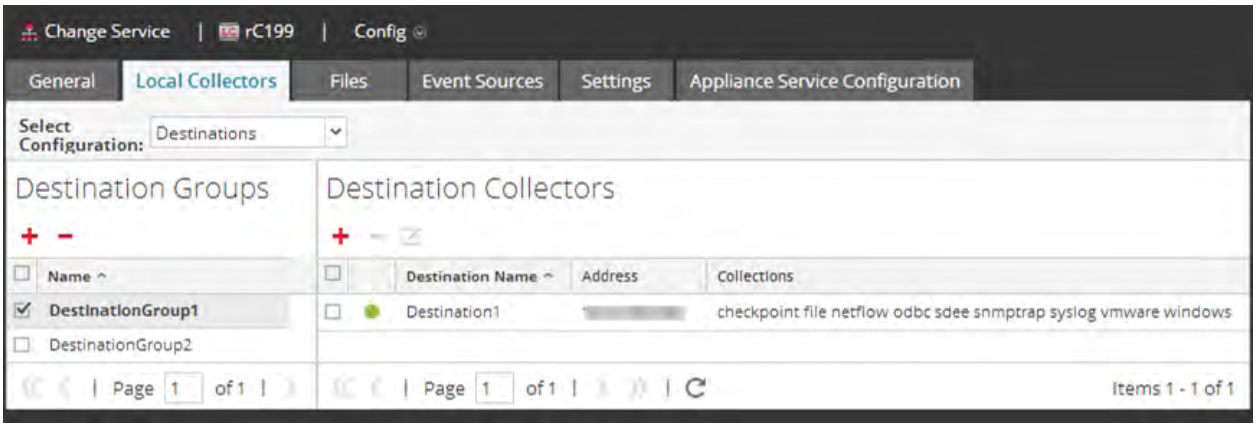
f. Select the new group (for example, **DestinationGroup2**) group in the **Destination Groups** panel and click + in the **Local Collector** panel.

g. In the **Local Collector** panel, click + and complete the **Add Remote Destination** dialog as

illustrated in the following figure.



The **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols are sent to two Local Collectors (**LC1** and **LC2**). Both Local Collectors are active and collecting event data.



## Configure Chain of Remote Collectors

This topic describes how to chain Remote Collectors (also referred to as VLCs).

You can set up a chain of Remote Collectors to push event data to a Remote Collector, or you can configure a Remote Collector to pull event data from a chain of Remote Collectors.

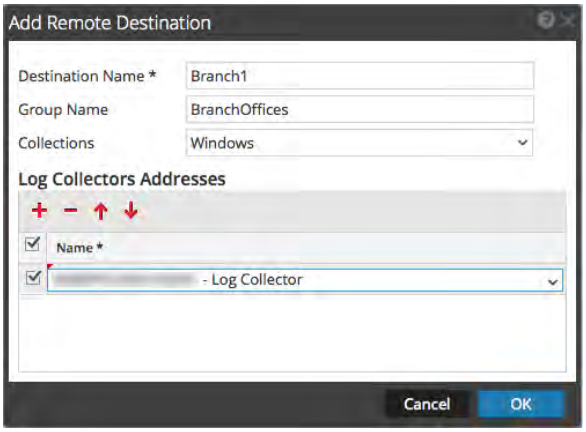
- **Remote Collectors to push data.** Push data from a Remote Collector to other Remote Collectors or Local Collectors.
- **Remote Collector to pull data.** Use a Remote Collector to pull data from one or more Remote Collectors.

## Configure Remote Collector to Push Event Data to Remote Collector

1. Go to **(Admin) > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Log Collector Service Config** view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Destinations** in the **Select Configurations** drop-down menu.
6. In the **Destination Groups** panel section, select .

   The **Add Remote Destination** dialog is displayed.
7. Set up a **Destination Group**:
   a. Enter a **Destination Name**.
   b. (Optional) **Enter a Group Name**. If you leave Group Name blank, NetWitness sets it to the value that you specified in Destination Name.
   c. Select one or more collection protocols in the **Collections** drop-down list.
   d. Under **Log Collectors Addresses**, click to select a Remote Collector.



**Note:** If you do not select a collection protocol, the Remote Collector pushes all collection protocols to the Remote Collectors.

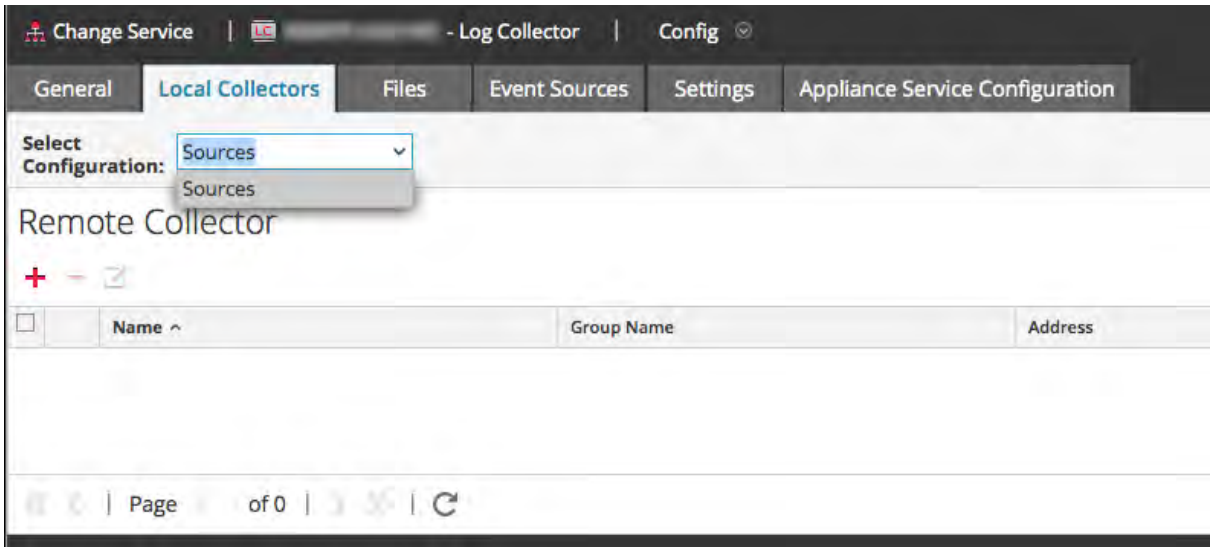
## Configure Remote Collector to Pull Event Data from a Remote Collector

1. Go to **(Admin) > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select

> **View** > **Config** to display the Log Collection configuration parameter tabs.

The **Service Config** view is displayed with the **Log Collector General** tab open.

4. Select the **Local Collectors** tab.
5. Select **Sources** in the **Select Configurations** drop-down menu.



6. In the **Remote Collectors** panel, select +.

   The **Add Source** dialog is displayed.

7. In the **Add Source** dialog:

   a. Select one or more collection protocols.

      If you do not select a collection protocol, the Remote Collector pulls all collection protocols from the Remote Collector.

   b. Click **OK**.

      The Remote Collector is added to the Remote Collector section. When the Log Collector starts collecting data, it pulls event data from this Remote Collector.

## Throttle Remote Collector to Local Collector Bandwidth

To improve performance, you can throttle the bandwidth to control the rate that the Remote Collector sends event data to Local Collector or between Message Brokers. To do this, you configure the Linux kernel's filtering and IPTable functionality.

This works for both push and pull Remote Collector configurations. The **set-shovel-transfer-limit.sh** shell script located on the **/opt/netwitness/bin** automates the configuration of the kernel filter and iptables related to this port.

This topic describes how to throttle Remote Collector to Local Collector bandwidth using the **set-shovel-transfer-limit.sh** shell script. It contains the following sections:

- The **set-shovel-transfer-limit.sh** shell script command line help.

  **Note:** The filter value that you need to set depends on the rate at which remote log collector is sending events to the Local Collector.

- An example that sets the Filter to 4096 kilobits per second.

## Command Line Help for Set Shovel Transfer Limit Script

Issue the `-h` command to display help for `set-shovel-transfer-limit.sh` shell script.

```
cd /opt/netwitness/bin
./set-shovel-transfer-limit.sh
```

Usage:

```
set-shovel-transfer-limit.sh -s|-c|-d|[-i interface] [-r rate]
```

where:

- -c = clear existing
- -d = display filter
- -s = set new values
- -i = interface is the name of the network interface. Default value is **eth0**
- -r = rate is the bandwidth rate. Default value is **256kbps**

Bandwidths and rates can be specified in:

- **nolimit**: disables throttling
- **kbit**: Kilobits per second
- **mbit**: Megabits per second
- **kbps**: Kilobytes per second
- **mbps**: Megabytes per second
- **bps**: Bytes per second

## Set the Filter to 4096 Kilobits per Second

This example sets the Filter to 4096 kilobits per second.

```
[root@<hostname> bin]#./set-shovel-transfer-limit.sh -s -r 4096kbit

RATE=4096kbit
 PORTNUMBER=5671
 DEVICE_INTERACE=eth0

iptables: No chain/target/match by that name.

# Set Up a Lockbox

## What Is a Lockbox

A lockbox is an encrypted file that you use to store confidential information about an application. The NetWitness Lockbox stores an encryption key for the Log Collector.

The encryption key is used to encrypt all event source passwords and the event broker password.

When you create the Lockbox, you need to define a password for the Lockbox.

The Log Collector operates the Lockbox in a mode during data collection that does not require you to specify the password (the Log Collector uses the host system fingerprint instead).

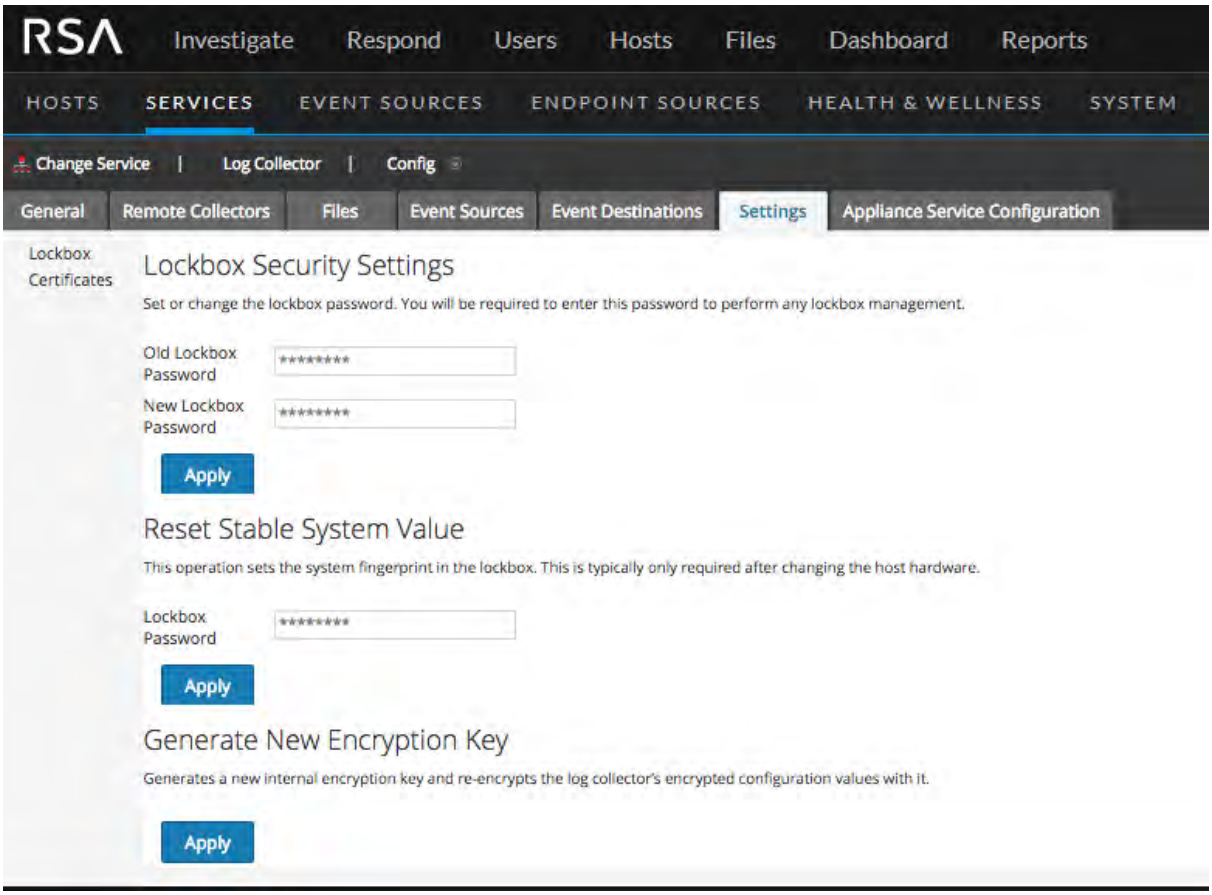
These are the lockbox security settings.

| Feature | Description |
|---|---|
| Old Lockbox Password | When you set up a Lockbox for the first time, this field is blank. NetWitness populates this field after you enter a New Lockbox Password and click Apply. |
| New Lockbox Password | Initial or new lockbox password. To maximize lockbox security, specify a password that is eight or more characters in length with at least one numeric character, uppercase character, and non-alphanumeric character such as # or ! |
| Apply | Click **Apply** to save the changes to the lockbox password. |

## Set Up a Lockbox

To set up a lockbox you need to set a password, as follows:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Settings** tab.



5. In the options panel, select **Lockbox** to configure Lockbox settings.
6. Under **Lockbox Security Settings**, enter a password in the **New Lockbox Password** field and click **Apply**.

# Start Collection Services

If a collection service stops, you may need to start it again. You can also enable the automatic start of collection services.

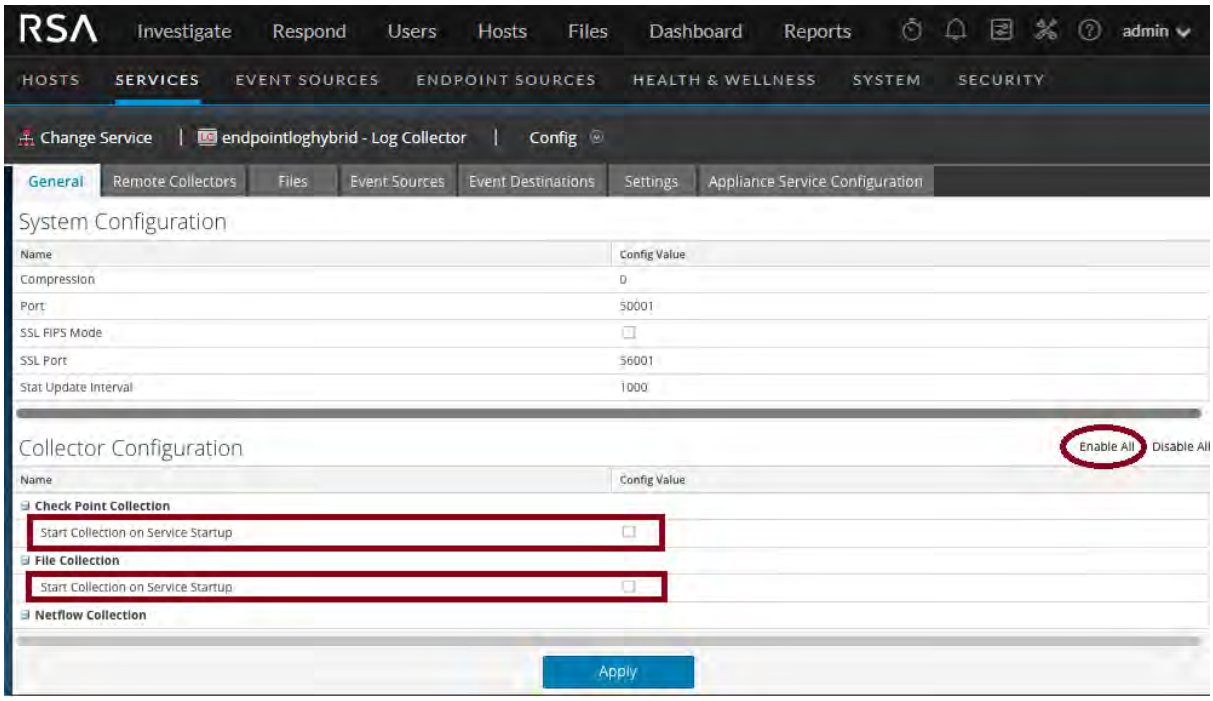
## Start a Collection Service

1. Go to (Admin) > **Services**.
2. Select a Log Collector service and click under **Actions**.
3. Click **View** > **System**.
4. Click **Collection** > ***service*** (for example **File**) and click **Start**.

## Enable Automatic Start of Collection Services

1. Go to (Admin) > **Services**.
2. Select a Log Collector service and click under **Actions**.
3. Click **View** > **Config**.

   The General tab is displayed.
4. In the Collector Configuration panel, select **Start Collection on Service Startup** for the individual collection services that you want to start automatically. Alternatively, select **Enable All** to automatically start all collection services.



5. Click **Apply** for your changes to take effect.

# Verify That Log Collection Is Working

This topic tells you how to verify that you have set up Log Collection correctly.

The following methods verify that Log Collection is working.

- Verify that there is event activity the Event Source Monitoring tab of the **Administration > Health & Wellness** view.
- Verify that there are parsers in the **device.type** field in the **Details** column in the **Investigation > Events** view for the collection protocol you configured.

Please refer to the topics for each Collection Protocol for steps on how to verify that the protocol is set up correctly.

# Configure Certificates

You manage certificates by creating trust stores on the Log Collector. The Log Collector refers to these trust stores to determine whether or not the event sources are trusted.

**Note:** You can configure custom certificates for one or more event sources: for details, see (Optional) Configure Custom Certificates on Log Collectors.

## Add a Certificate

### To add a certificate:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View > Config**.
4. Click the **Settings** tab.
5. In the options panel, select **Certificates**.
6. Click in the **Certificates** tool bar.
   The **Add Cert** dialog is displayed.
7. Click **Browse** and select a certificate (***.PEM**) from your network.
8. Specify a password (if required).
9. Click **Save**.

## Certificates Panel

The following table describe the buttons and columns available in the Certificates panel.

| Field | Description |
|---|---|
| | Opens the Add Cert dialog in which you can add a certificate and password. |

| Field | Description |
|---|---|
|  | Deletes the selected certificates. |
| | Selects certificates. |
| Trust Store Name | Displays the name of the trust store. |
| Certificate Distinguished Name | For Check Point event source only, displays the distinguished name for the certificate. |
| Certificate Password Name | For Check Point event source only, displays the password name for the certificate. |

## Add Cert Dialog

The following table describes the parameters available in the **Add Cert** dialog.

| Field | Description |
|---|---|
| Trust Store Name | Enter a trust store name. |
| File | Click Browse to select a certificate (*.PEM file) file from your network |
| Password | Specify the password for this certificate. |
| Close | Closes the dialog without adding a certificate. |
| Save | Adds the certificate. |

# (Optional) Configure Custom Certificates on Log Collectors

You can configure custom certificates for the syslog listener on Log Collectors. This enables you to put your own trusted certificate in place on the syslog listener for specific event sources, while all other functionality uses the pre-installed certificates.

### To configure custom certificates for an event source:

1. Upload the custom certificate and key files onto the Log Collector or Virtual Log Collector, and save them into a folder. You need to add this path information in step 4 below.
2. Go to **(Admin) > Services**, select a Log Collector service and **> View > Config**.
3. Select the **Event Sources** tab, then choose **Syslog** from the drop-down menu.
4. Add (or select) a **syslog-tcp** event source type.
5. In the **Sources** pane, add (or edit) a source.

   The Add Source dialog box is displayed.
6. In the Add Source dialog box, click the Advanced section toggle.

   The Advanced parameters are displayed.
7. For the **Certificate Directory Path**, enter the pathname for the folder that contains the certificate files.

   The Log Collector SSL syslog connections will use the `logcollector_cert.pem` and `logcollector_key.pem` files in the folder specified.
8. Press **OK** to save all parameters that you added or changed.
9. Restart syslog collection for the changes to take effect.

**Note:** More than one event source can use the same certificates: for each event source that shares the certificate, specify the same **Certificate Directory Path**. However, the specified path cannot contain more than one certificate (that is, one cert and one key file). To use a different custom certificate, you must specify a different **Certificate Directory Path**.

# Log Collection Basics

## How Log Collection Works

The Log Collector service collects logs from event sources throughout the IT environment in an organization and forwards the logs to other NetWitness components. The logs and the descriptive content are stored as meta data for use in investigations and reports.

Event sources are the assets on the network, such as servers, switches, routers, storage arrays, operating systems, and firewalls. In most cases, your Information Technology (IT) team configures event sources to send their logs to the Log Collector service and the NetWitness administrator configures the Log Collector service to poll event sources and retrieve their logs. As a result, the Log Collector receives all logs in their original form.

## Collection Protocols

RSA NetWitness can collect logs from a wide variety of event sources. When you are configuring log collection for a specific event source, you need to know, first and foremost, the protocol that is used to collect the logs.

| Collection Protocol | Description |
|---|---|
| Check Point | Collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs. For details, see Configure Check Point Event Sources in NetWitness. |
| File | Collects events from log files. Event sources generate log files that are transferred using a secure file transfer method to the Log Collector service.<br>For details, see Configure File Event Sources in NetWitness.<br>**Note:** In NetWitness 11.4 and later, you can perform File Log collection for many event sources using Endpoint Agents, thus simplifying the collection process. For details, see the *RSA NetWitness Endpoint Configuration Guide*. For a list of which event sources are supported, see the section "Currently Supported File Log Event Source Types." |
| Netflow | Accepts events from Netflow v5 and Netflow v9. For details, see Configure Netflow Event Sources in NetWitness. |
| ODBC | Collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface. For details, see Configure ODBC Event Sources in NetWitness. |

| Collection Protocol | Description |
|---|---|
| Plugins | The Plugins collection is a generic collection framework for collecting events using external scripts written in other languages. RSA currently provides collection for Amazon Web Services (AWS) CloudTrail and Microsoft Azure.<br>• **AWS**: Collects events from Amazon Web Services (AWS) CloudTrail. Specifically CloudTrail records AWS API calls for an account. For details, see Configure AWS (CloudTrail) Event Sources in NetWitness<br>• **Azure**: Collects events from Microsoft Azure. For details, see Configure Azure Event Sources in NetWitness.<br>Customers can use this framework to develop their own collection protocols. |
| SDEE | Collects Intrusion Detection System (IDS) and Intrusion Prevention Service (IPS) messages.<br>For details, see Configure SDEE Event Sources in NetWitness. |
| SNMP Trap | Accepts SNMP traps. For details, see Configure SNMP Event Sources in NetWitness. |
| Syslog | Accepts messages from event sources that issue syslog messages. For details, see Configure Syslog Event Sources.<br>**Note:** You do not configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors. |
| VMware | Collects events from a VMware virtual infrastructure. For details, see Configure VMware Event Sources in NetWitness. |
| Windows | Collects events from Windows machines that support the Microsoft Windows model. Windows 6.0 is an event logging and tracing framework included in the operating system beginning with Microsoft Windows Vista and Windows Server 2008. For details, see Configure Windows Event Sources in NetWitness. |
| Logstash | Utilize Logstash as a collection method, leveraging the various number of plugins supported by Logstash, such as:<br>• Custom - This send the events from Logstash to NetWitness Platform.<br>• Filebeat- This collects events from file.<br>• Auditbeat - This collects audit events from an operating system (for example CentOS).<br>• Export connector - This exports events from Decoder or Log Decoder to third party system.<br>By default, Logstash version 7.10.0 is installed with all standard Logstash plugins (Beats, Export connector and so on) when Log collector is installed.<br>For more information see, Configure Logstash Event Sources in NetWitness. |

| Collection Protocol | Description |
|---|---|
| Windows Legacy | Collects events from:<br>• Older Windows versions such as Windows 2000 and Window 2003 and collects from Windows event sources that are already configured for enVision collection without having to reconfigure them.<br>• NetApp ONTAP appliance event source so that you can now collect and parse NetApp evt files.<br>• For more information, see.Windows Legacy and NetApp Collection Configuration.<br>**Note:** You install the NetWitness Windows Legacy Collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **SALegacyWindowsCollector-*version-number.exe***. |

# Log Collection Basic Procedure for all Protocols

The basic procedure is the same for all of the supported Collection Protocols.

### To configure collection for an event source:

1. **Set up your Event Source for collection.** Each supported event source has a configuration document available in the RSA Supported Event Sources space on RSA Link
   a. Navigate to the RSA Supported Event Sources space on RSA Link.
   b. Find the Instructions for your Event Source.
      The Overview page lists all of the currently supported Event Sources, as well as information about the collection method, device class, and supported versions.
   c. Download the configuration instructions for your event source, and follow them.
2. **Configure collection on RSA NetWitness.** The event source configuration guide contains these instructions. However, this guide also provides these instructions, based on the collection method used by your event source. See Collection Protocols for details.
3. **Start the Service for your Collection Method.** Normally, you only need to do this for the first event source that uses this collection method. For example, the first time you configure an event source that uses File Collection, you may need to start the File Service in NetWitness.
4. **Verify that Collection is working for your Event Source.**

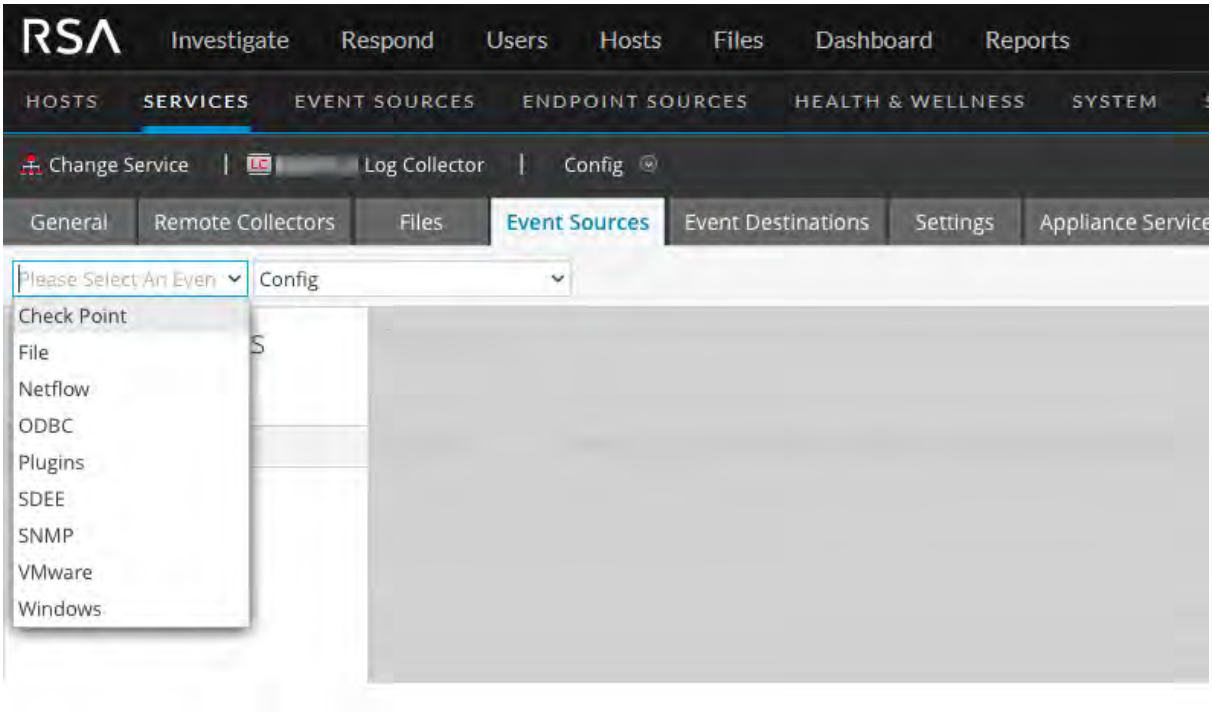
The remainder of this topic discusses steps 2, 3, and 4 in more detail.

## Configure Collection in RSA NetWitness

The process to configure event sources is dependent upon the collection method they use. Note, however, that they are very similar. The following procedure is generic: more details for individual collection methods are available in topics that cover the details for each specific collection method.

### Basic procedure to configure an event source in RSA NetWitness:

1. Go to **(Admin)** > **Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Log Collector Event Sources** tab, select your collection method from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The Available Event Source Types dialog box is displayed.
7. Select an event source type and click **OK**.
   The newly added event source type is displayed in the Event Categories panel.
8. Select the new type in the **Event Categories** panel and click in the Sources toolbar.
   The **Add Source** dialog is displayed.
9. Enter values for the available parameters.

Refer to the Parameters section of the specific collection method that you are configuring.

10. Click **OK**.

## Start the Service for your Collection Method

### To start the service for your collection method:

1. Go to **(Admin) > Services**.
2. Select a **Log Collector** and select **> View > System**.
3. Click **Collection > *protocol* > Start**

   where ***protocol*** is the protocol that you wish to start, for example **Netflow**.

## Verify that Collection is working for your Event Source

You can verify that a collection method is working from the **(Admin) > Health & Wellness > Event Source Monitoring** tab.

### To verify that collection is working for an event source:

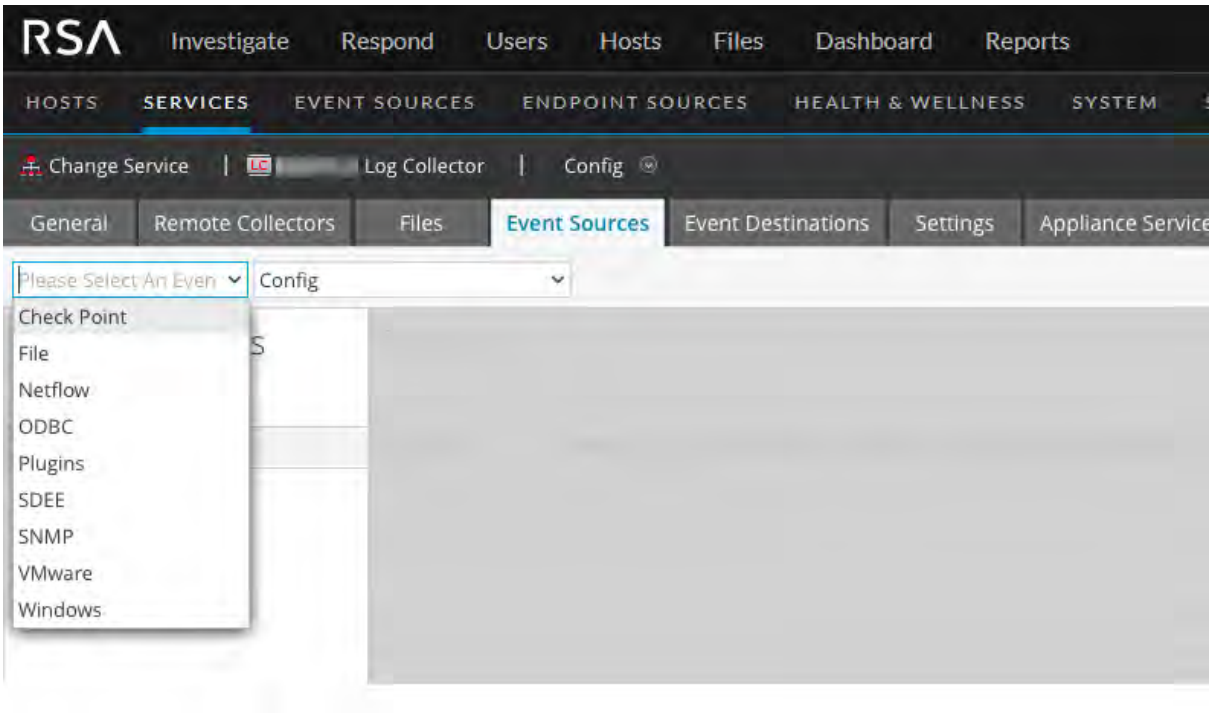
1. Go to **(Admin) > Health & Wellness**
2. Click the **Event Source Monitoring** tab.
3. In the grid, find the **Log Decoder**, **Event Source**, and **Event Source Type**.
4. Look for activity in the **Count** column for an event source to verify that collection is accepting events.

# Search for Specific Event Sources

In some cases, your Log Collector may contain a lot of pre-configured event sources for a specific collection protocol (for example File). If so, you can quickly search for one or more event sources based on address (IP/hostname) or name.

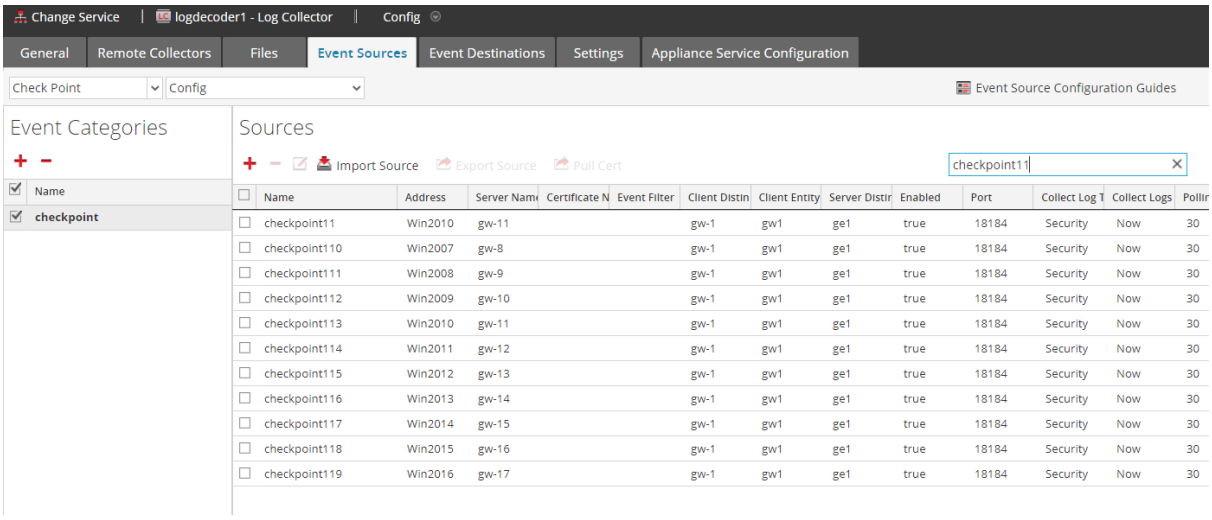
### To search for one or more specific event sources:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection protocol/**Config** from the drop-down menu.



6. From the **Filter by Name / Address** text field, enter an IP address or hostname and click **Enter**.

   Event sources that match the information entered into the search box are returned. For example, the image below shows a list of Check Point event sources whose names match the string **checkpoint11**.



## Configure Event Filters for a Collector

This topics tells you how to create and maintain Event filters across all collection protocols.

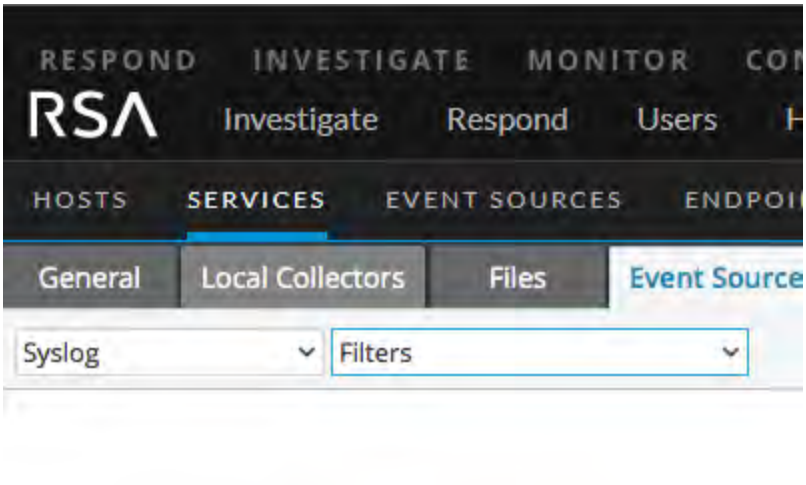
**Note:** Prior to 11.3, you could not configure Syslog Collection for Local Log Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

## Configure an Event Filter

To configure an event filter for an event source:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Syslog** selected.

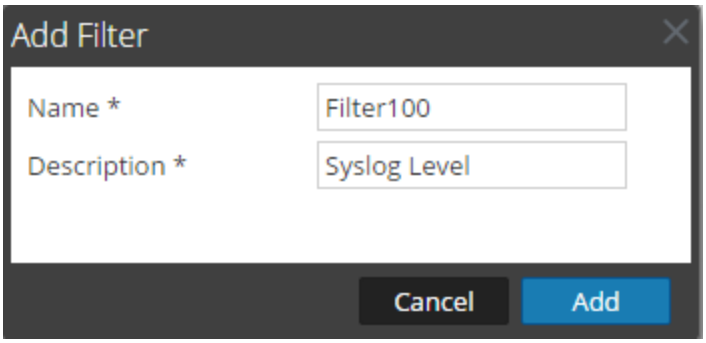


**Note:** Syslog configuration is only available on Remote Collectors prior to 11.3: if you are working with a Local Collector service, **Syslog** is not available from the drop-down menu for Log Collectors on version 11.0, 11.1, or 11.2.

   The **Filters** view displays the filters that are configured for the selected collection method, if any.

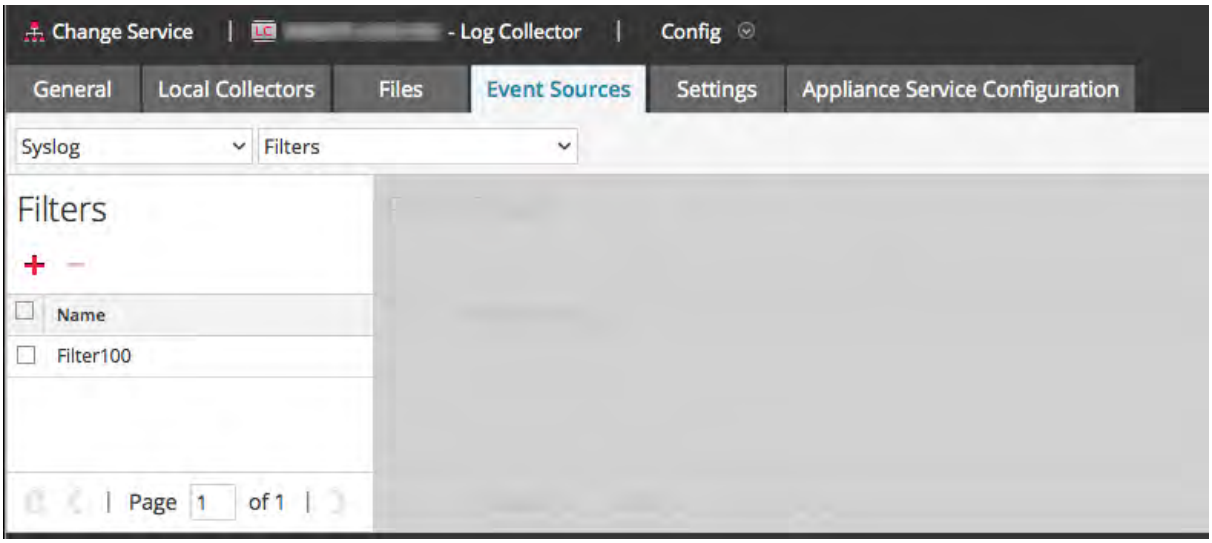
6. In the **Filters** panel toolbar, click .

   The **Add Filter** dialog displays.



7. Enter a name and description for the new filter and click **Add**.

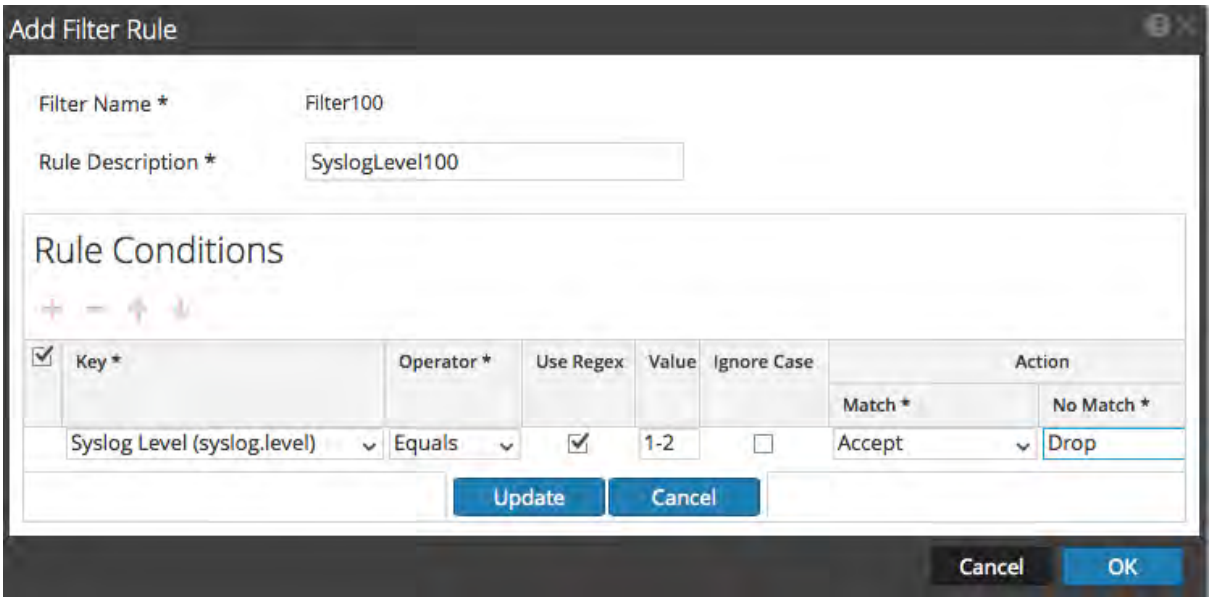
   The new filter displays in the **Filter** panel.



8. Select the new filter in the **Filters** panel and click + in the **Filter Rules** panel toolbar.

   The **Add Filter Rule** dialog is displayed.

9. Click + under **Rule Conditions**.
10. Add the parameters for this rule and click **Update > OK**.



NetWitness updates the filter with the rule that you defined.

**Note:** Rules are processed in order from top down until an Action type aborts the processing, or the final rule is checked. Default behavior is to accept the rule if no matches are found.

The following tables describe the parameters for adding a filter rule.

## Event Filter Rule "Key" Parameter

The values for the Key field depend on the Collection method to which the filter applies.

| Collection Method | Values for the *Key* Field |
|---|---|
| Checkpoint, File, Netflow, Plugin, SDEE SNMP and VMware | • All Data Fields<br>• Event Source Type<br>• Event Source Name<br>• Source IP<br>• Raw Event |
| ODBC | • All Data Fields<br>• Event Source Type<br>• Event Source Name<br>• Source IP<br>• Message ID<br>• Message Level |
| Syslog | • All Data Fields<br>• Event Source Type<br>• Event Source Name<br>• Source IP<br>• Syslog level<br>• Raw Event |
| Windows | • All Data Fields<br>• Event Source Type<br>• Event Source Name<br>• Source IP<br>• Event ID<br>• Provider<br>• Channel<br>• Computer<br>• UserName<br>• DomainName |

| Collection Method | Values for the *Key* Field |
|---|---|
| Windows Legacy | • All Data Fields<br>• Event Source Type<br>• Event Source Name<br>• Source IP<br>• Event ID |

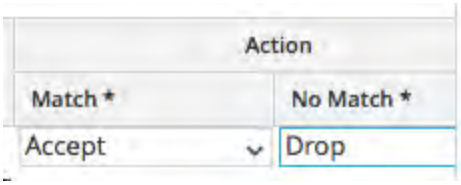
## Other Event Filter Rule Parameters

The following table describes all the other available fields for creating an event filter rule.

| Field | Description |
|---|---|
| Operator | Valid values are:<br>• Contains<br>• Equal |
| Use Regex | Optional. You can select this if you want to use Regex. |
| Value | Value depends on the key value you selected.<br>For example if you choose **Syslog level** for Key, the value will be a number that denotes the syslog level. |
| Ignore case | Optional. Select this to ignore the case sensitivity. |
| Action | Choose actions for message data that matches a condition, or that does not match a condition. See below for more details. |

## Actions

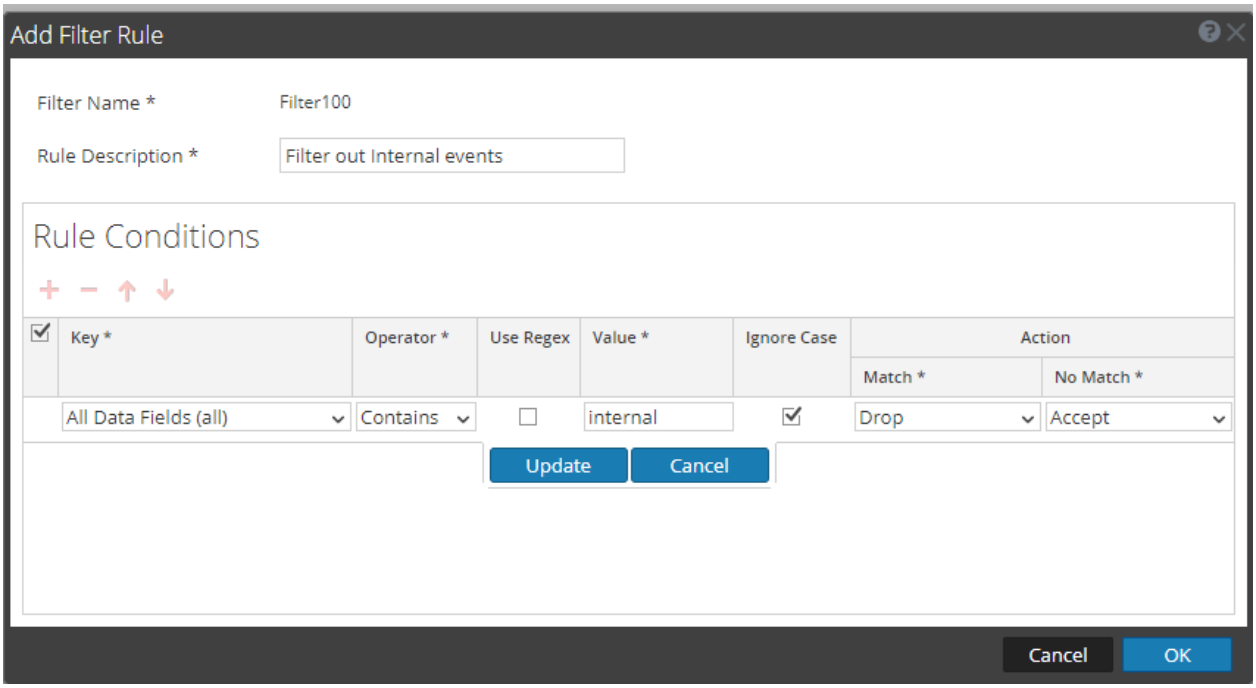
You can choose a 'match' and 'no-match' action for each rule condition. This screenshot shows a condition that uses the **Accept** action on matches, and **Drop** action on events that do not match the condition.



The available actions are as follows:

- **Accept**: the filtered event is included in event logs, and no further rule processing is done for the event: the event will display in the NetWitness user interface during Investigation.
- **Drop**: the filtered event will not be included in event logs, and no further rule processing is done for the event: the event will not display during Investigation.
- **Next condition**: the filtered event moves on to the next rule condition in the rule. If there are no more rule conditions in the current rule, it moves on to the next rule.
- **Next rule**: the filtered event moves on to the next rule. If there are no more rules in the filter, the filter event is included in event logs, and no further rule processing is done for the event (same as **Accept**).

For example, consider the following condition:



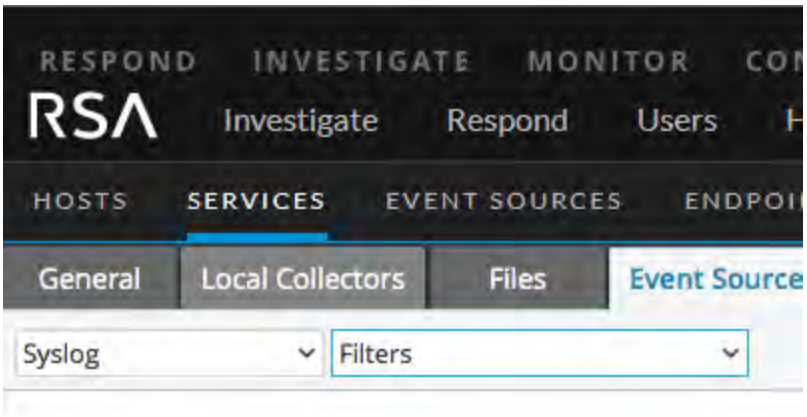
In this condition, if the event log contains the string "internal," the event is not included in the event meta, nor is it displayed during Investigation. If the string is not found, the event is included and is displayed during Investigation.

## Modify Filter Rules

### To modify existing filter rules:

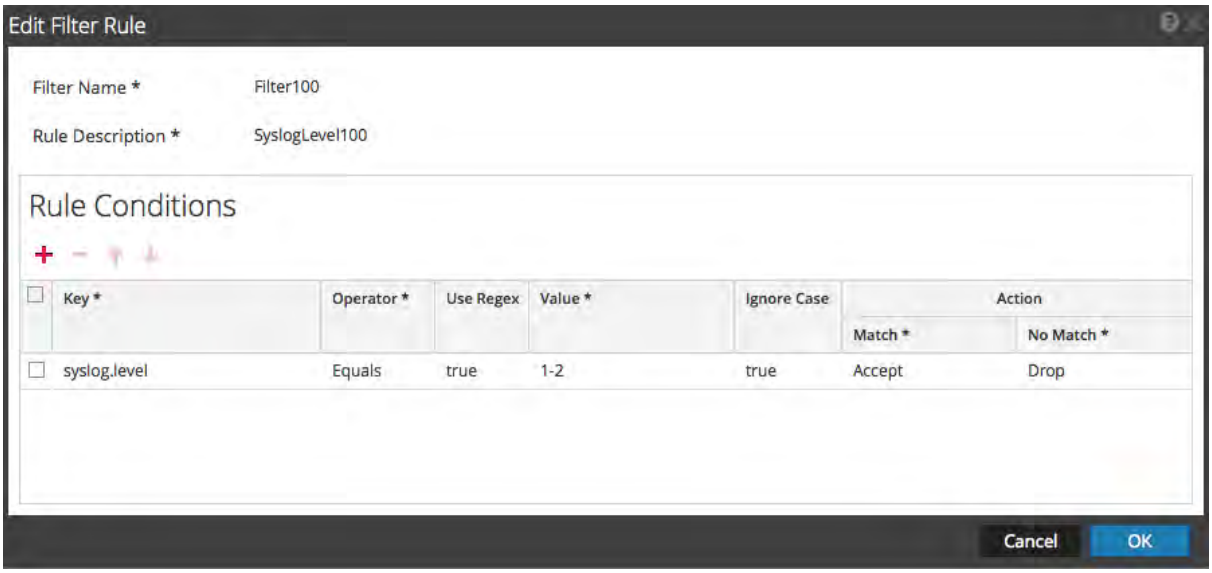
1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Check Point** selected.

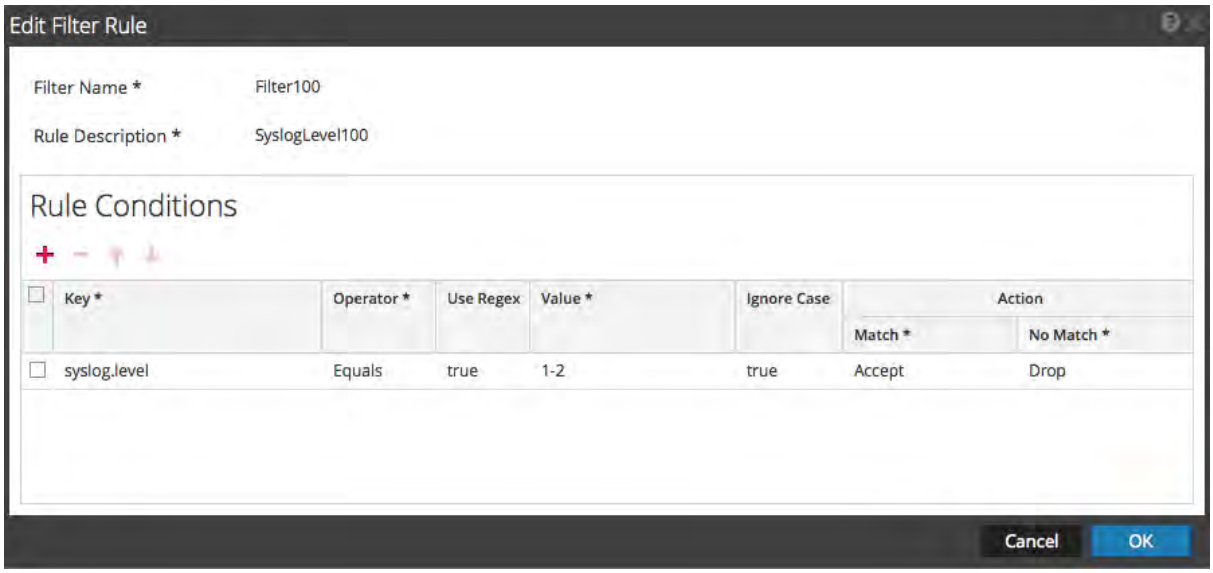


The **Filters** view displays the filters that are configured for the selected collection method, if any.

6. In the **Filter Rules** list, select a rule and click .
   The **Edit Filter Rule** dialog is displayed.



7. Select the rule condition that you want to modify.



8. Modify the condition parameters that require changes and click **Update > OK**.

NetWitness applies the condition parameter changes to the selected filter rule.

# Import, Export, Edit, and Test Event Sources in Bulk

This topic describes how to import, export, edit, and test event sources in bulk.

You can use the bulk export option to export the event source details of your current set up and store it. This data can be imported in bulk when you face a problem with your current set up and require the event source data you had.

You can use the bulk edit feature when you have multiple event sources that need a specific modification. You can select all the sources and apply the edit option across them at a time and avoid applying the change one by one.

## Import Event Sources in Bulk

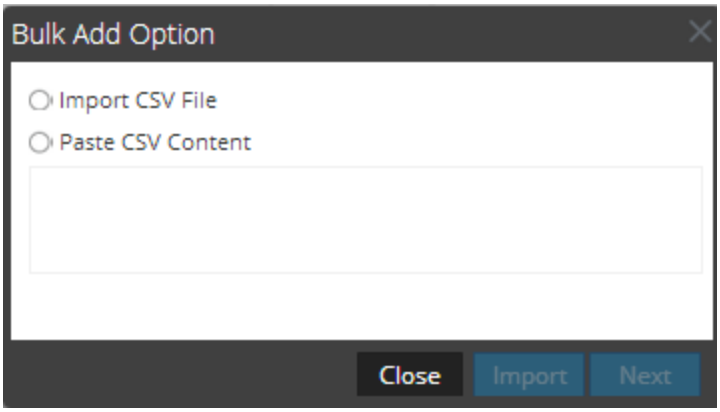
**Warning:** When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

### To import multiple event sources at once:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. Select **Check Point**, **File**, **Netflow**, **Logstash**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Import function.).
6. In the **Sources** panel toolbar, click **Import Source**.

   The **Bulk Add Option** dialog is displayed.



7. Select either **Import CSV File** or **Paste CSV Content**. If you select:
   - Import CSV File:
     a. Click **Next**.

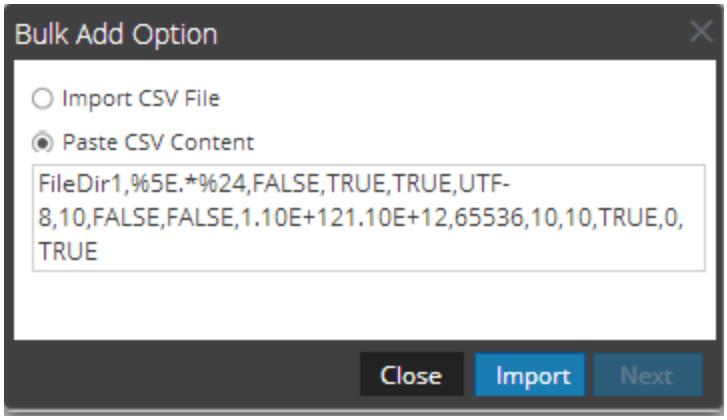
        The **Import dialog** is displayed.

     b. Click **Add** and select a **.csv** file from your network.

     c. Click **Import**.

        The event sources are added to the **Event Source** list.
   - Paste CSV Content

a. Copy the contents of the **.csv** file and paste them into the dialog.



b. Click **Import**.

The event sources are added to **Event Source List**.

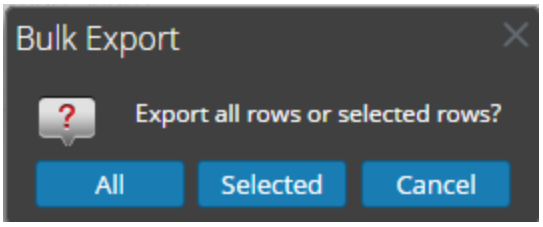
## Export Event Sources in Bulk

**Warning:** When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

### To export event source information:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **Logstash**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Export function.).
6. In the **Sources** panel, select one or multiple event sources and click **Export Source**.

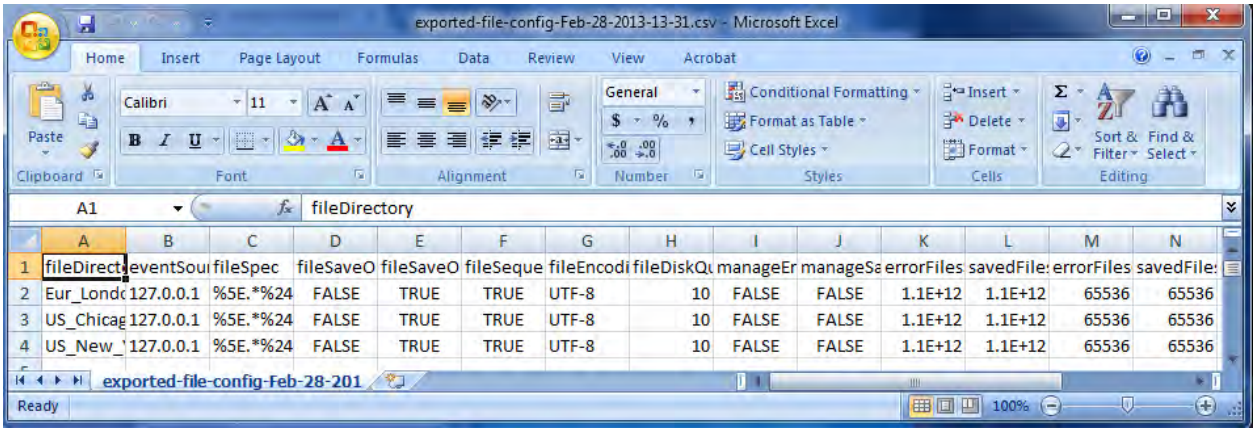
   The **Bulk Export** dialog is displayed.



7. Based on your selection:

- **All**: NetWitness exports all event sources to a time-stamped CSV file.
- **Selected**: NetWitness exports the event source or sources you selected to a time-stamped CSV file.
- **Cancel**: NetWitness cancels the export.

The following is an example of a time-stamped CSV file that gets created with the event sources that you selected from the list.

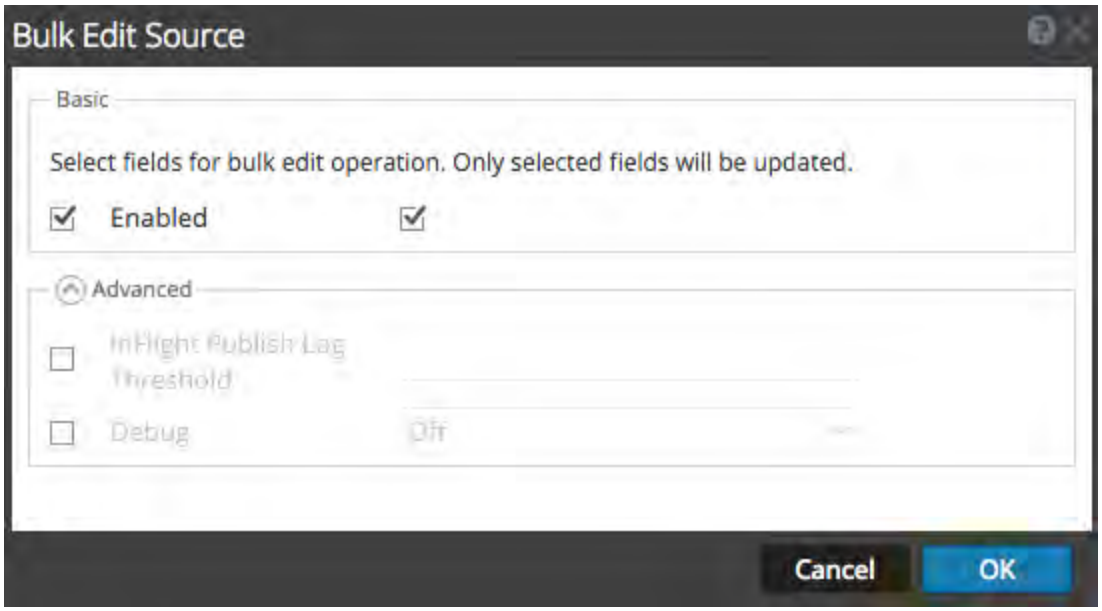


## Edit Event Sources in Bulk

### To edit multiple event sources at once:

1. On the **Log Collector Event Sources** tab, select **Check Point**, **File**, **Netflow**, **Logstash, ODBC**, **Plugins**, **SDEE**, **Syslog**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Edit function.).
2. In the **Sources** panel, select multiple event sources and click .

   The appropriate **Bulk Edit** dialog for the selected event source is displayed. The following figure is an example of **Bulk Edit Source** dialog for File event source parameters.



3. Select the checkbox to the left of the fields that you want to modify (for example, **Debug**).
4. Modify the selected parameters (for example, change Debug from **Off** to **On**).
5. Click **OK**.

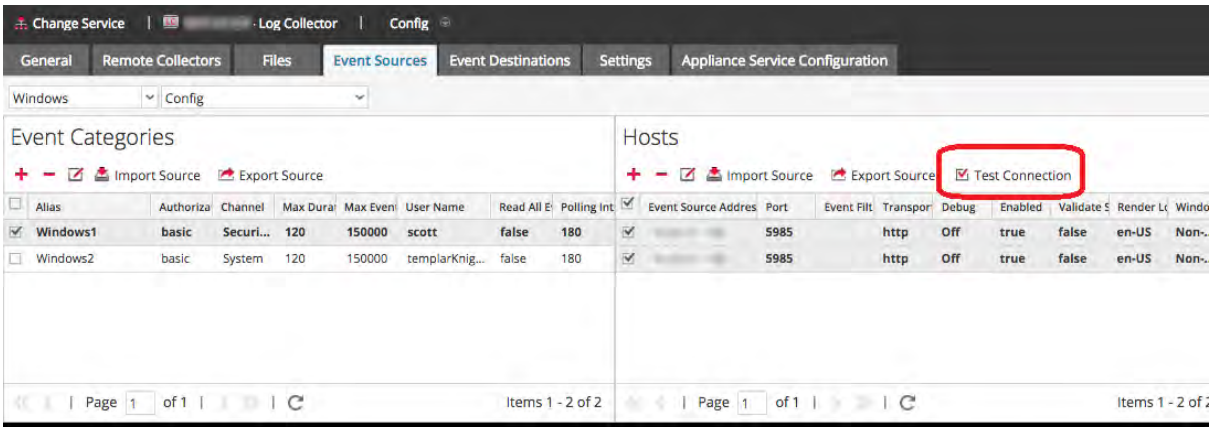
   NetWitness applies the same parameter value change to all of the selected event sources

## Test Event Source Connections in Bulk

### To test multiple event source connections at once:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Select the **Event Sources** tab, select **Plugins**, **ODBC**, **Logstash** or **Windows** (the other protocols do not have a bulk test connection function).
5. Select one or more:
   - sources from the **Sources** panel for **Plugins** or **ODBC**
   - hosts from **Hosts** panel for **Windows**

   The **Test Connection** button is enabled.



6. Click Test Connection .

   The **Bulk Test Connections** dialog is displayed showing the current status of the test for each source. The status can be waiting, testing, passed or failed.

   If you choose to close the testing before it is completed, the testing stops and the **Bulk Test Connections** dialog closes.

After the testing is complete, the results are displayed in the **Bulk Test Connections** dialog.

## See Also

You can use the **Event Sources** module ( (Admin) > **Event Sources**) to create groups of event sources, typically imported from a CMDB, and to monitor event sources based on those groups. For details, see the following topics in the *Event Source Management Guide*:

- Import Event Sources
- Export Event Sources
- Bulk Edit Event Source Attributes

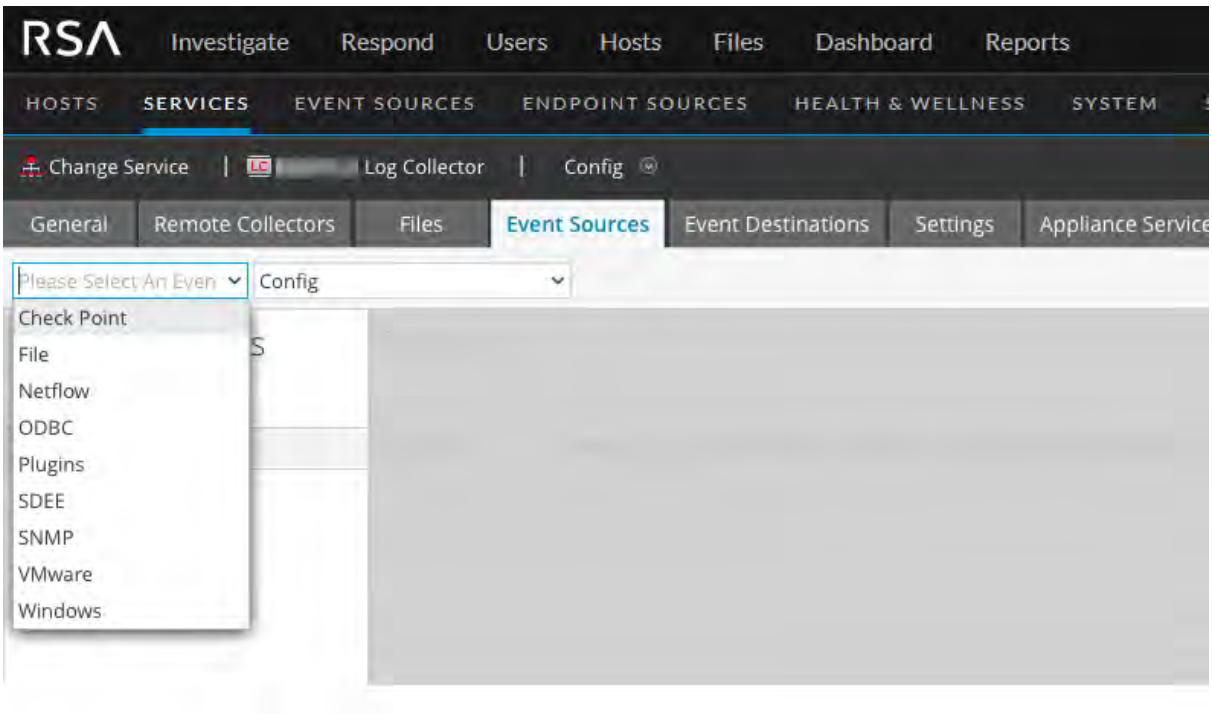
# Configure Collection Protocols and Event Sources

This topic tells you how to configure collection protocols and the event sources using those protocols.

You configure the Log Collector to collect event data from your event sources in the Event Sources tab of the Log Collection parameter view.

### To configure a collection protocol:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select a collection protocol (for example, **File**) and select **Config**.
6. Click + and select an event source.
7. Select the newly added category and click +.
8. Specify the parameters for the event source. For details, see the individual collection protocol topics.

The following guides provide detailed instructions on how to configure the collection protocols and their associated event sources in NetWitness. Each guide includes an index to configuration instructions for the event sources supported for that collection protocol.

To configure individual collection protocols, see the following topics:

- Configure AWS (CloudTrail) Event Sources in NetWitness
- Configure Azure Event Sources in NetWitness
- Configure Check Point Event Sources in NetWitness
- Configure File Event Sources in NetWitness
- Configure Netflow Event Sources in NetWitness
- Configure ODBC Event Sources in NetWitness
  - Configure Data Source Names (DSNs)
  - Create Custom Typespec for ODBC Collection
  - ODBC Event Source Configuration Parameters
  - ODBC DSNs Event Source Configuration Parameters
- Configure SDEE Event Sources in NetWitness
- Configure SNMP Event Sources in NetWitness
- Configure Syslog Event Sources
- Configure VMware Event Sources in NetWitness
- Configure Windows Event Sources in NetWitness
- Windows Legacy and NetApp Collection Configuration
  - Set Up the Windows Legacy Collector
  - Configure Windows Legacy and NetApp Event Sources
  - Troubleshoot Windows Legacy and NetApp Collection
- Configure Logstash Event Sources in NetWitness

# Configure AWS (CloudTrail) Event Sources in NetWitness

This topic tells you how to configure the AWS collection protocol, which collects events from Amazon Web Services (AWS) CloudTrail.

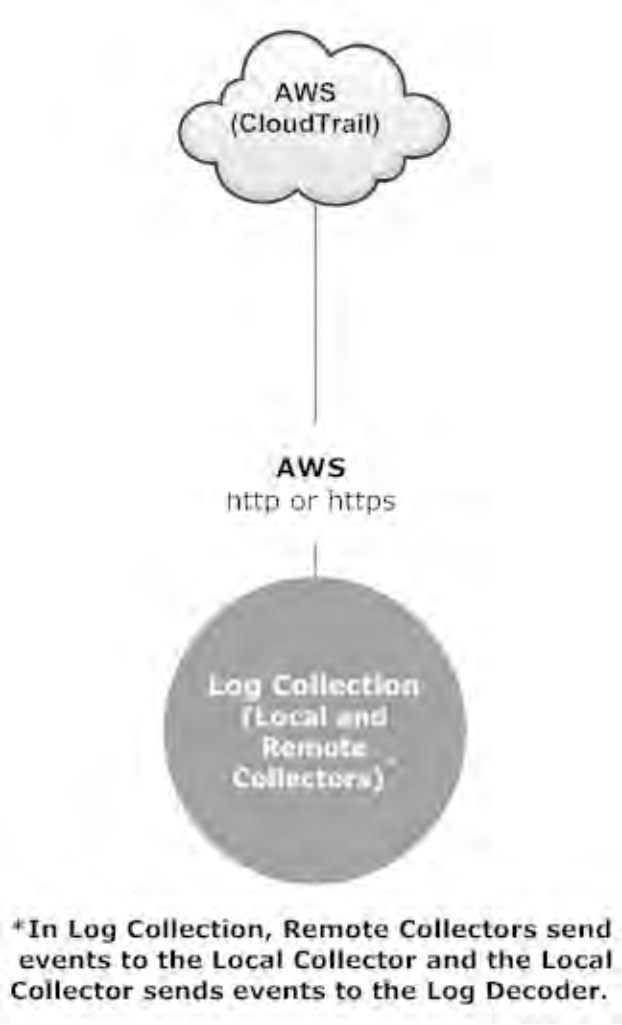
**Note:** The AWS plugin is meant only for collecting from AWS CloudTrail logs, and not for collecting from arbitrary logs in S3 buckets (under arbitrary directories). The AWS CloudTrail logs are sent in JSON format, as detailed in the AWS documentation here: http://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-event-reference.html.

## How AWS Collection Works

The Log Collector service collects events from Amazon Web Services (AWS) CloudTrail. CloudTrail records AWS API calls for an account. The events contain the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service. The AWS API call history provided by CloudTrail events enables security analysis, resource change tracking, and compliance auditing. CloudTrail uses Amazon S3 for log file storage and delivery. NetWitness copies the log files from the cloud (S3 bucket), and sends the events contained in the files to the Log Collector.

## Deployment Scenario

The following figure illustrates how you deploy the AWS Collection Protocol in NetWitness.

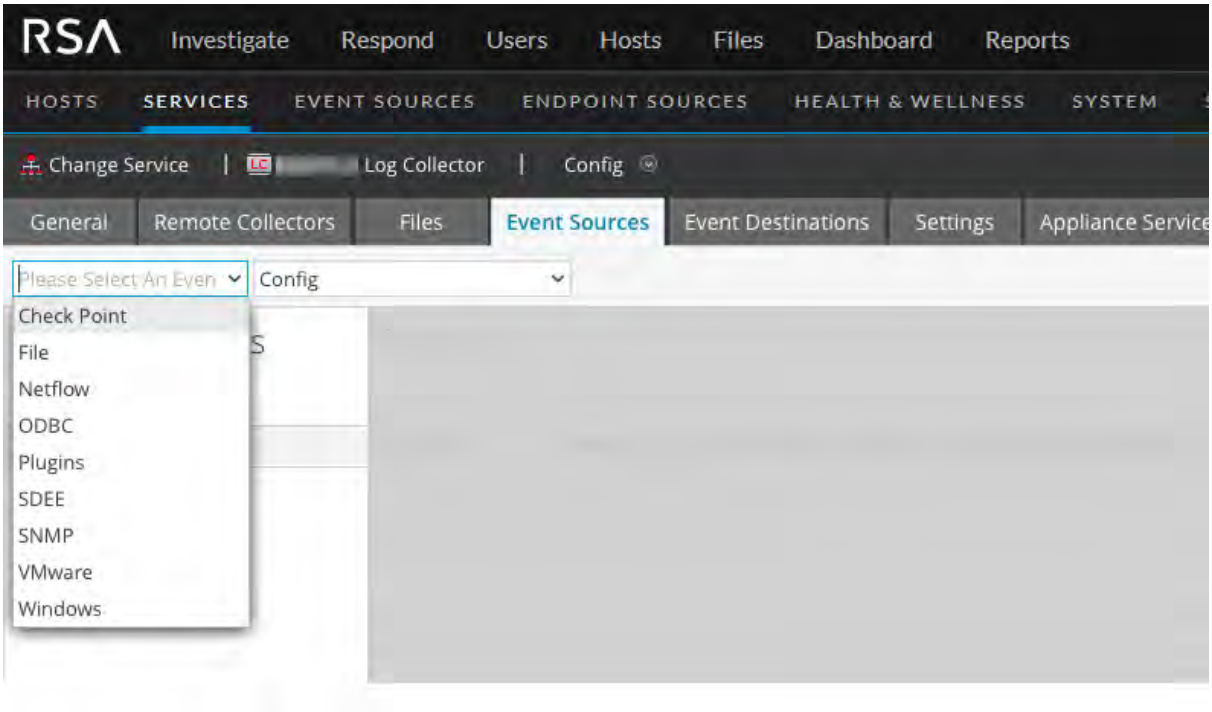


## Configuration

### To configure an AWS (CloudTrail) Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .

   The **Available Event Source Types** dialog is displayed.
7. Select **cloudtrail**) and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see AWS Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

## AWS Parameters

The following table describes the **Basic** configuration parameter for AWS collection.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Parameter | Description |
|---|---|
| Name * | Name of the event source. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Account Id * | Account Identification code of the S3 Bucket |
| S3 Bucket Name * | Name of the AWS (CloudTrail) S3 bucket.<br>Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket.<br>Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are:<br>• Bucket names must be at least three and no more than 63 characters long.<br>• Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number.<br>• Bucket names must not be formatted as an IP address (for example, 192.168.5.4).<br>The following examples are **valid** bucket names:<br>• `myawsbucket`<br>• `my.aws.bucket`<br>• `myawsbucket.1`<br>The following examples are **invalid** bucket names:<br>• `.myawsbucket` - Do not start a Bucket Name with a period<br>• `myawsbucket.` - Do not end a Bucket Name with a period<br>• `my..examplebucket` - Only use one period between labels. |
| Access Key * | Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys. |
| Secret Key * | Secret key used to access the S3 bucket. |
| Region * | Region of the S3 bucket. `us-east-1` is the default value. |
| Region Endpoint | Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds. |
| Use Proxy | Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled. |
| Proxy Server | Enter the proxy name you want to connect to access the AWS server. |
| Proxy Port | Enter the port number that connects to the proxy server to access the AWS server. |
| Proxy User | Enter the user name to authenticate with the proxy server. |

| Parameter | Description |
|---|---|
| Proxy Password | Enter the password to authenticate with proxy port. |
| Start Date * | Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days. |
| Log File Prefix | Prefix of the files to be processed.<br>**Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter. |
| Cancel | Closes the dialog without adding the AWS (CloudTrail). |
| OK | Adds the current parameter values as a new AWS (CloudTrail). |

The following table describes the **Advanced** configuration parameter for AWS collection.

| Parameter | Description |
|---|---|
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables or disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>**On** = enabled<br>• **Verbose** = enabled in verbose mode -adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |
| Command Args | Arguments added to the script. |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is 60.<br>For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy. |
| SSL Enabled | Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.<br>The check box is selected by default. |
| Test Connection | Validates the configuration parameters specified in this dialog are correct. For example, this test validates that:<br>• NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog.<br>• NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely). |

# Configure Azure Event Sources in NetWitness

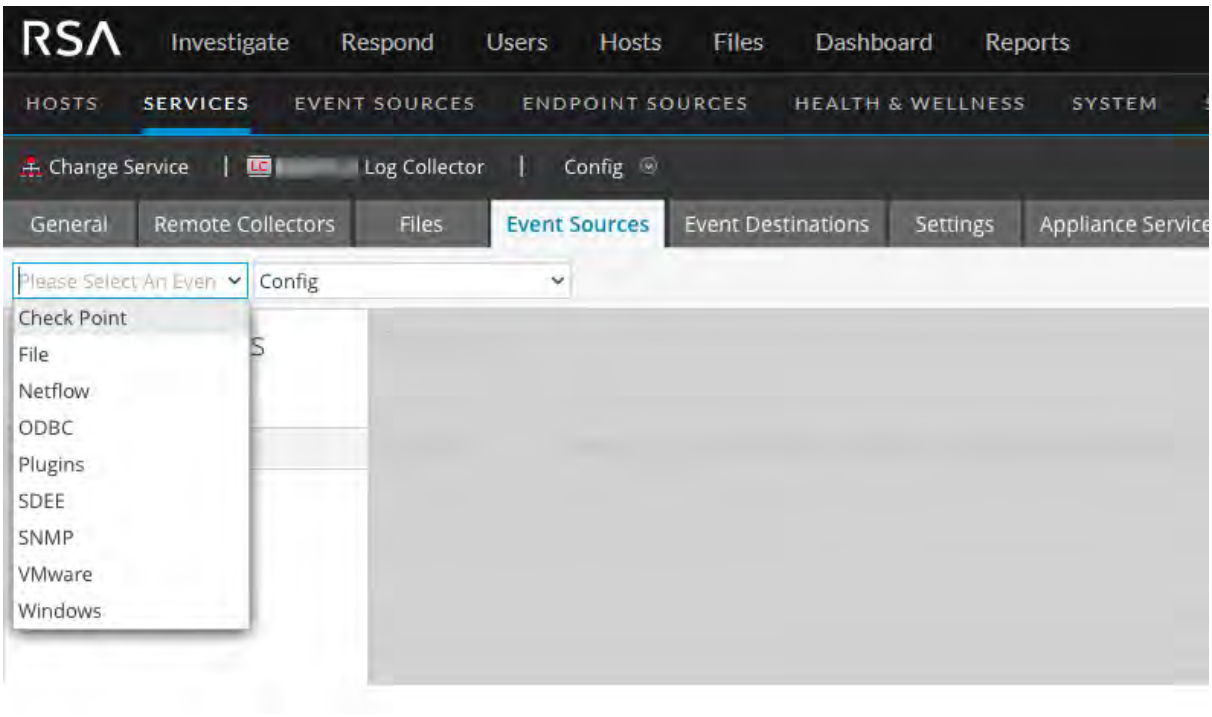
This topic tells you how to configure the Azure collection protocol. Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

## Configuration in NetWitness

For complete details about configuring Azure as an event source, see the Azure Event Source Configuration Guide, available on RSA Link.

### To configure an Azure Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select **azureaudit**) and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

   The **Add Source** dialog is displayed.

9. Define parameter values. For details, see Azure Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.

11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

## Azure Parameters

This section describes the Azure event source configuration parameters.

### Basic Parameters

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Name | Description |
|---|---|
| Name * | Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen. |
| Enabled | Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default. |
| Client ID * | The Client ID is found the Azure Application Configure tab. Scroll down until you see it. |
| Client Secret * | When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation.<br>Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later. |
| API Resource Base URL * | Enter `https://management.azure.com/`. Be sure to include the trailing slash (/). |
| Federation Metadata Endpoint * | In your Azure application, click the **View Endpoints** button (near the bottom of the pane).<br>There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here. |
| Subscription ID * | You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left. |

| Name | Description |
|---|---|
| Tenant Domain * | Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**. |
| Resource Group Names * | In Azure, select Resource groups from the left navigation pane, then select your group. |
| Start Date * | Choose the date from which to start collecting. Default's to the current date. |
| Test Connection | Checks the configuration parameters specified in this dialog to make sure they are correct. |

## Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

| Name | Description |
|---|---|
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |
| Max Duration Poll | Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit. |
| Max Events Poll | The maximum number of events per polling cycle (how many events collected per polling cycle). |
| Max Idle Time Poll | Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit. |
| Command Args | Optional arguments to be added to the script invocation. |

| Name | Description |
| --- | --- |
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br><br>Enables or disables debug logging for the event source. Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact. |

# Configure Check Point Event Sources in NetWitness

This topic tells you how to configure the Check Point collection protocol, which collects events from Check Point event sources.

This protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

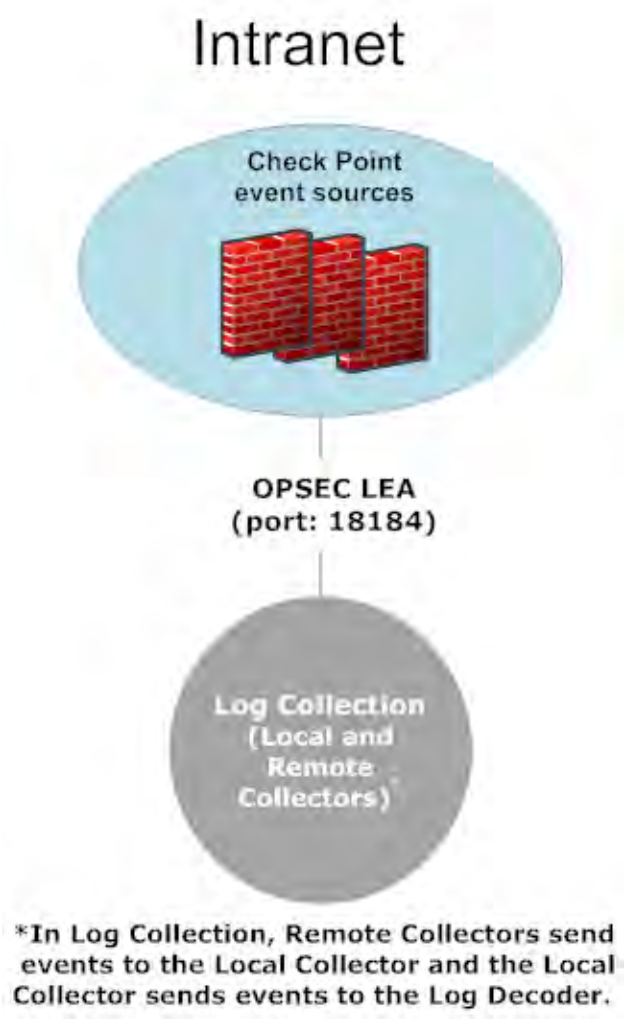
## How Check Point Collection Works

The Log Collector service collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

**Note:** OPSEC LEA (Log Export API) supports extraction of logs from Check Point event sources configured with a SHA-256 or SHA-1 certificate.

## Deployment Scenario

The following figure illustrates how you deploy the Check Point Collection Protocol in NetWitness.

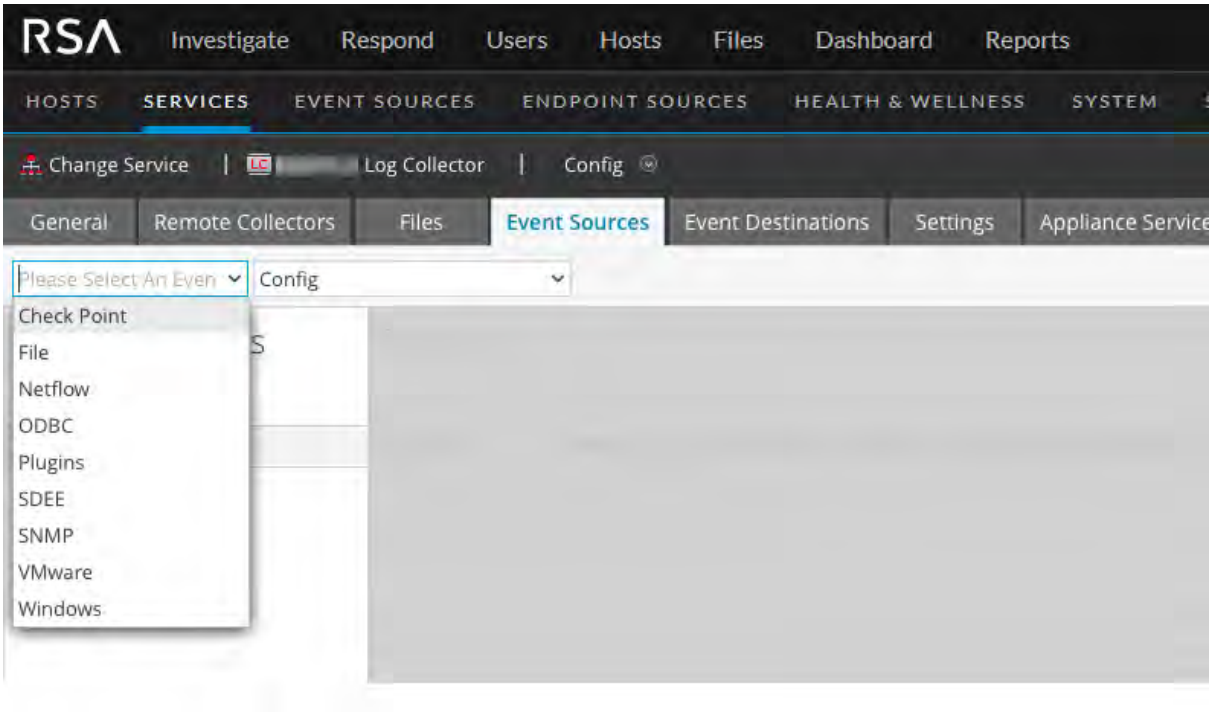


## Configuration in NetWitness

### To configure a Check Point Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Check Point/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .

   The **Available Event Source Types** dialog is displayed.
7. Select a check point event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see Check Point Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

## Check Point Parameters

This section describes the Check Point event source configuration parameters.

## Basic Parameters

| Parameter | Description |
|---|---|
| Name* | Name of the event source. |
| Address* | IP Address of the Check Point server. |
| Server Name* | Name of the Check Point server. |
| Certificate Name | Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab.<br>Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***. |
| Client Distinguished | Enter the Client Distinguished Name from the Check Point server. |
| Client Entity Name | Enter the Client Entity Name from the Check Point server. |
| Server Distinguished | Enter the Server Distinguished Name from the Check Point server. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Pull Certificate | Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store. |
| Certificate Server Address | IP Address of the server on which the certificate resides. Defaults to the event source address. |
| Password | Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server. |

## Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

| Parameter | Description |
|---|---|
| Port | Port on the Check Point server that Log Collector connects to. Default value is 18184. |
| Collect Log Type | Type of logs that you want to collect: Valid values are:<br>• **Audit** - collects audit events.<br>• **Security** - collects security events.<br>If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected. |
| Collect Logs From | When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are:<br>• **Now** - Start collecting logs now (at this point in time in the current log file).<br>• **Start of Log** - Collect logs from the beginning of the current log file.<br>If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session. |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |
| Max Duration Poll | The maximum duration of polling cycle (how long the cycle lasts) in seconds. |

| Parameter | Description |
|---|---|
| Max Events Poll | The maximum number of events per polling cycle (how many events collected per polling cycle). |
| Max Idle Time Poll | Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value. |
| Forwarder | Enables or disables the Check Point server as a forwarder. By default it is disabled. |
| Log Type (Name Value Pair) | Logs from the event source in Name Value format. By default it is disabled. |
| Debug | **Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables and disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |

## Verify Check Point Collection is Working

The following procedure illustrates how you can verify that Check Point collection is working from the **Administration > Health & Wellness > Event Source Monitoring** tab.

### To verify Check Point collection from the Event Source Monitoring tab:

1. Access the **Manage** tab from the **(Admin) > Event Sources** view.
2. Find a checkpoint event source in the **Event Sources** column.
3. Look for activity in the **Total Count** column to verify that Check Point collection is accepting events.

### To verify Check Point collection from the Investigation > Events view:

The following procedure illustrates how you can verify that Check Point collection is working from the **Investigation > Events** view.

1. Access the **Investigation > Events** view.
2. Select the Log Decoder (for example, **LD1**) collecting Check Point events in the **Investigate a Device** dialog.
3. Look for a Check Point event source parser (for example, **checkpointfw1**) in the **device.type** field in the **Details** column to verify that Check Point collection is accepting events.

**Note:** If the logs from the VSX Checkpoint firewall server are collected by the Log Collector checkpoint service, to translate the VSX IP in the logs to **ip.orig** meta, you must add the VSX hostname and the VSX IP address to the `/etc/hosts` file in the Log Collector.

# Configure File Event Sources in NetWitness

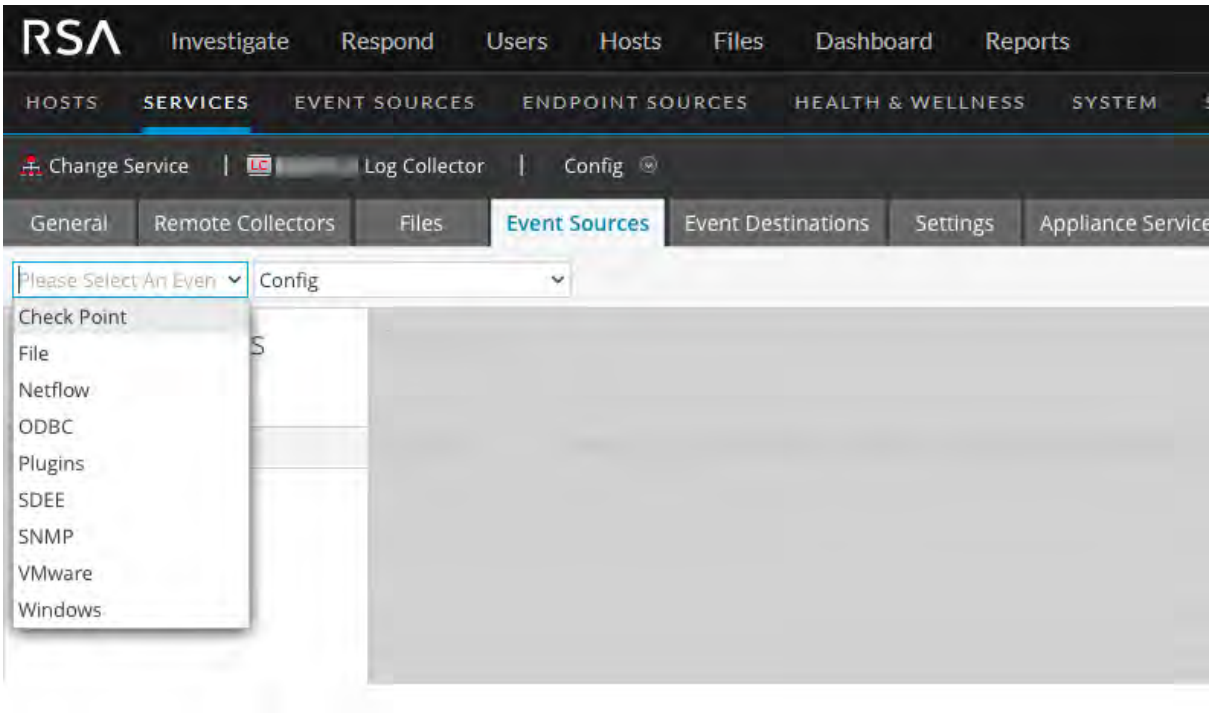
This topic tells you how to configure the File collection protocol:

**Note:** In NetWitness 11.4 and later, you can perform File Log collection for many event sources using Endpoint Agents, thus simplifying the collection process. For details, see the *RSA NetWitness Endpoint Configuration Guide*. For a list of which event sources are supported, see the section "Currently Supported File Log Event Source Types."

## Configure a File Event Source

### To configure a File Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **File/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select a file event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.
   The **Add Source** dialog is displayed.
9. Add a **File Directory** name and modify any other parameters that require changes. For details, see File Collection Parameters below.
10. To get the public key and enter it into the dialog box, do the following:
    a. Select and copy the public key from the Event Source by running: `cat ~/.ssh/id_rsa.pub`
    b. Paste the public key in the **Eventsource SSH Key** field.
11. Click **OK**.

You need to restart file collection for your changes to take effect.

## Stop and Restart File Collection

After you add a new event source that uses file collection, you must stop and restart the NetWitness File Collection service. This is necessary to add the key to the new event source.

## File Collection Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Name | Description |
|---|---|
| File Directory* | Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression:<br>**[_a-zA-Z][_a-zA-Z0-9]***<br>This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data.<br>After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory. |
| Address* | IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name. |
| File Spec | Regular expression. For example, **^.*$** = process everything. |
| File Encoding | Character encoding used by the syslog senders to this port. Defaults to UTF-8.<br>**Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8.<br>RSA has tested the following values:<br>• EUC-KR<br>• SJIS<br>• GB3212/GBK<br>• ISO_8859-1 (German)<br>• ISO_8859-7 (Greek) |
| Cancel | Closes the dialog without making adding an event source type. |
| OK | Adds the parameters for the event source. |

The following table describes the **Advanced** configuration parameter for File collection.

| Name | Description |
|---|---|
| Ignore Encoding Conversion Errors | Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default.<br>**Caution:** This may cause parsing and transformation errors. |

| Name | Description |
|---|---|
| File Disk Quota | Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing.<br><br>**Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB.<br><br>Valid value is a number in the **0** to **100** range. **10** is the default. |
| Sequential Processing | Sequential processing flag:<br>• Select the check box (default) to process event source files in collection order.<br>• Do not select the checkbox to process event source files in parallel. |
| Save On Error | Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default. |
| Save On Success | Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default. |
| Eventsource SSH Key | SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys.<br><br>**Note:** If File collection is stopped, NetWitness does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key.<br>You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness will not update the **authorized_keys** file until File collection is restarted. |
| Manage Error Files | By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these:<br>• Maximum space allotted to error files in the **Error Files Size** parameter.<br>• Maximum number of error files allowed in **Error Files Count** parameter.<br><br>A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.<br><br>Select the check box to manage error files. The check box is not selected by default. |

| Name | Description |
|---|---|
| Error Files Size | Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness saves error files. The value that you specify is the maximum total size of all the files in the error directory.<br>Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Error Files Count | Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Error Files Reduction % | Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first.<br>Valid value is a number in the **0** to **100** range. **10** is the default. |
| Manage Saved Files | Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these:<br>• Maximum space allotted to saved files in the **Saved Files Size** parameter.<br>• Maximum number of saved files allowed in **Saved Files Count** parameter.<br>A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. |
| Saved Files Size | Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Saved Files Count | Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Saved File Reduction % | Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first.<br>Valid value is a number in the **0** to **100** range. **10** is the default. |

| Name | Description |
|---|---|
| Debug | **Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br><br>Enables or disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |

# Configure Logstash Event Sources in NetWitness

You can configure the Logstash collection protocol.

**Note:** Make sure you start Syslog collection to send logs from Logstash to destination host.

**IMPORTANT:**
- Do not change logstash.yml file as it breaks the functionality.
- Do not change sincedb_path input configuration. If you change the sincedb_path, the back up and restore functionality breaks.

### To configure a Logstash Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select **Logstash/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .

   The **Available Event Source Types** dialog is displayed: currently, **Custom** is the only available entry.
7. Select **Custom** and click **OK**.

The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.
   The **Add Source** dialog is displayed.
9. Fill in the fields, based on the Logstash event source you are adding. General details about the available parameters are described below in Logstash Collection Parameters.
10. Click **OK**.

**Note:** Once you configure the Logstash you must restart syslog collection for the changes to take effect.

## Logstash Collection Parameters

The following tables provides descriptions of the Logstash Collection source parameters.

**Note:** Items that are followed by an asterisk (*) are required.

## Basic Parameters

## Custom Event Source

The following table lists the custom event source parameters.

| Name | Description |
|---|---|
| Name * | Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen. |
| Enabled | Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default. |
| Description | Enter a text description for the event source. |
| Input Configuration * | An input plugin enables a specific source of events to be read by Logstash. The following code represents an example input plugin. Paste in the text for your input plugin. |
| Filter Configuration * | A filter plugin performs intermediary processing on an event. Paste in any filter details for your Logstash event source. |
| Event Destination * | NetWitness consumes Syslog from Log Collectors and Log Decoders: specify the specific Log Collector or Log Decoder to which you want to send the information. |
| Test Connection | Checks the configuration parameters specified in this dialog to make sure they are correct. |

## Beats Event Source

The following table lists the beats event source parameters.

| Name | Description |
|---|---|
| Name * | Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Description | Enter a text description for the event source. |
| Port Number* | Enter the port number (for example, 5044) that you configured for your event sources. |
| Linux-Audit | Select the checkbox to enable processing for Linux audit. |
| Linux-System | Select the checkbox to enable processing for Linux system. |
| Ngnix | Select the checkbox to enable processing for Nginx. |
| Event Destination* | Select the NetWitness Log Collector or Log Decoder to which event needs to be send from the drop-down list. |
| Test Configuration | Checks the configuration parameters specified in this dialog to make sure they are correct. |

## Export Connector Event Source

The following table lists the custom export connector event source parameters.

| Name | Description |
|---|---|
| Name * | Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Description | Enter a text description for the event source. |
| Host* | Select the hostname of the Decoder or Log Decoder for data aggregation from the drop-down list. |
| Username* | Username used to access the Decoder or Log Decoder for data aggregation. |

| Name | Description |
|---|---|
| Authentication | **Note:** If you upgrade from NetWitness Platform 11.6.0.0 to 11.6.1.0, automatic key is generated and stored in the key store management for the password set in Logstash pipeline configuration. You can view the key instead of password in the **Authentication** field.<br>Select the authentication type used for data aggregation. By default, **SSL** field is enabled, if you select **trusted authentication**.<br>**Note:** For trusted authentication, make sure you add the PEM file at `/etc/pki/nw/node/node-cert.pem` to the source Decoders REST APIs (`/sys/trustpeer` and `/sys/caupload`). |
| SSL | Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. By default, SSL option is enabled, if you select **trusted authentication** type in the **Authentication** field. |
| Decoder Type* | Decoder Type is a read only field and it is auto populated when you select the Host. |
| Output Configuration* | Logstash pipeline output configuration that send the input events. |
| Test Configuration | Checks the configuration parameters specified in this dialog to make sure they are correct. |

## Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

| Name | Description |
|---|---|
| **Debug** | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br><br>**Caution:** Enables or disables debug logging for the event source. Valid values are:<br><br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact. |
| **Beats SSL**<br>(This option is applicable only for beats typespec) | Select this checkbox to communicate using beats SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This check box is not selected by default.<br><br>**Note:** Ensure that you copy the server SSL certificate and the key (generated in your system) to `/etc/logstash/pki` on Log Collector, which is used during SSL connection. `/etc/logstash/pki` is a path in the Log Collector node. |
| **Certificate**<br>(This option is applicable only for beats typespec) | Select the name of a server SSL certificate located at `/etc/logstash/pki`. |
| **Key**<br>(This option is applicable only for beats typespec) | Select the name of a server SSL key located at `/etc/logstash/pki`. |
| **SSL Enabled** | • For custom typespec - Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This check box is selected by default.<br>• For beats typespec - Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This check box is selected by default.<br>• For export connector typespec - Select the check box for Logstash to communicate with Packet Decoder and Log Decoder in SSL and Non-SSL mode. This check box is not selected by default. |

| Name | Description |
| --- | --- |
| **Export Logs**<br>(This option is applicable only for export_ connector typespec) | Select the check box to export logs from Log Decoders. |
| **Starting Session**<br>(This option is not applicable for export_ connector typespec) | Specify the session id from which you want to start the aggregation from instead of the default. |
| **Include Metas**<br>(This option is not applicable for export_ connector typespec) | Specify the list of metas separated by comma that you want to aggregate. The default metas such as time, did, sessionid are collected in addition to the metas you added for aggregation. |
| **Exclude Metas**<br>(This option is not applicable for export_ connector typespec) | Specify the list of metas separated by comma that you want to exclude from aggregration. |
| **Query**<br>(This option is not applicable for export_ connector typespec) | Specify the query so the data matching the query is only aggregated. For example, select * where user.dst = 'john'. |
| **Enable Metrics Collection**<br>(This option is applicable only for export_ connector typespec) | Enables metrics collection in Elastic.<br>**IMPORTANT:** If you enable the metrics collection, you must provide the Elastic host, username, and password. |

| Name | Description |
|---|---|
| **Elastic Host** (This option is applicable only for export_ connector typespec) | Specify the Elastic host to forward metrics. |
| **Elastic Port** (This option is applicable only for export_ connector typespec) | Port number through which metrics are forwarded. |
| **Elastic Username** (This option is applicable only for export_ connector typespec) | Specify the name of the Elastic search. |
| **Elastic Password** (This option is applicable only for export_ connector typespec) | **Note:** If you upgrade from NetWitness Platform 11.6.0.0 to 11.6.1.0, automatic key is generated and stored in the key store management for the password set in Logstash pipeline configuration. You can view the key instead of password in the **Elastic Password** field.<br>Specify the Elastic search password. |
| **Minutes Back** (This option is applicable only for export_ connector typespec) | Starts collecting data from last xx minutes.<br>For example, if the value is set to 30 minutes, Log Collector starts collecting the logs and metas starting from last 30 minutes. |
| **Persistent Queue** (This option is applicable only for export_ connector typespec | Persistent queue stores the message queue on disk to avoid data loss. By default, this option is not enabled. |

| Name | Description |
|---|---|
| **Additional Custom Configuration** | Use this text box for any additional configuration, in case you have multiple inputs or another set of outputs to send somewhere in addition to a NetWitness Log Collector or Log Decoder. For example, you can configure the data to be sent to Elasticsearch. In this case each event that is sent to Netwitness Platform will also be send to Elasticsearch. |
| **Required Plugins** | Specify the required plugins in a comma separated list.<br>**Note:** Backup and restore is not supported for custom plugins.<br>**Note:** If the test connection failed due to required plugin is not installed, you must install the required plugin, for more information, see Install or Manage Logstash Plugin. |
| **Pipeline Workers** | Number of pipeline worker threads allocated for logstash pipeline. |
| **Ports**<br>(This option is not applicable for export_ connector typespec) | Enter a port number (for example, 5000 or UDP:5000, TCP:5000) , and ensure the Enabled box is checked. This allows the plugins to collect logs over the network (For example, UDP, TCP).<br>**IMPORTANT:** If you are configuring beats event source, make sure you provide beats event source port (For example, 5044) in the advance configuration even if you have updated the port in the basic parameters. |
| **Exclude Metas**<br>(This option is not applicable for export_ connector typespec) | Specify the list of metas separated by comma that you want to exclude from aggregration. |
| **Query**<br>(This option is not applicable for export_ connector typespec) | Specify the query so the data matching the query is only aggregated. For example, select * where user.dst = 'john'. |

**Note:** You can monitor the health and throughput for Logstash pipeline using Logstash Input Plugin Overview dashboard. For more information, see "New Health and Wellness Dashboards" topic in the *System Maintenance Guide*.

## View logstash collection in the Investigation > Events view

### To view logstash collection in the Events view

1. Go to the **Investigation** > **Events view**.
2. Select a Log Decoder service
   (for example, LD1) which collects logstash events, from the drop-down list.
3. Select the time range.
4. Click .
5. Look for events with a device.type value that matches the one defined in the Logstash pipeline.

   **Note:** Though some meta are parsed by default, a custom parser or Log Parser Rules are required for full parsing.

## Install or Manage Logstash Plugin

By default, Logstash related plugins are installed when Logstash is installed. In addition, you can add or customize the plugins based on your requirement.

## List All Lostash Plugins

You can list all the Logstash plugins available on your environment using the following command:

```
/usr/share/logstash/bin/logstash-plugin list --verbose
```

## Install New Logstash Plugin

You can install new plugin using the following command:

```
/usr/share/logstash/bin/logstash-plugin install <plugin-name>
```

For example, see the following command:

```
/usr/share/logstash/bin/logstash-plugin install logstash-input-github
```

## Manage Logstash Plugin

You can manage the existing plugins using the following commands:

- To update all Logstash plugins:

  ```
  /usr/share/logstash/bin/logstash-plugin update
  ```

- To update specific Logstash plugin:

  ```
  /usr/share/logstash/bin/logstash-plugin update <plugin-name>
  ```

## Configure Keystore Management

Keystore management allows you to securely store secret values (key and password). These keys are used as a placeholder for authentication credentials within a Logstash pipeline configuration.

To configure keystore management:

1. Go to (**ADMIN**) > **Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select **Logstash > Keystore management** from the drop-down menu.
6. Click .
7. In the **key** field, enter the name of the key.
8. In the **password** field, enter the password.
9. Click **Save**.

# Configure Netflow Event Sources in NetWitness

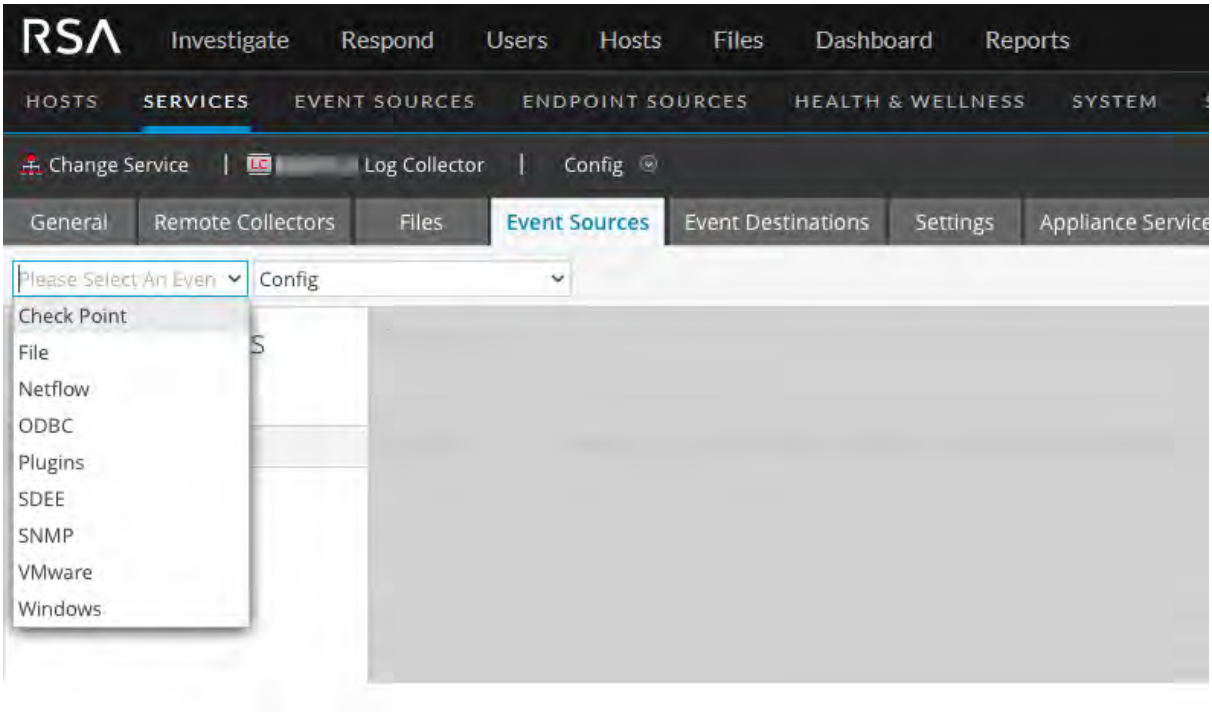
This topic tells you how to configure the Netflow collection protocol.

## Configure a Netflow Event Source

### To configure a Netflow Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Netflow/Config** from the drop-down menu.

6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.

7. Select the **netflow** event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

The **Add Source** dialog is displayed.

9. Enter a port number in the **Port** field, and ensure the Enabled box is checked.

   **Note:** NetWitness opens the 2055, 4739, 6343, and 9995 ports on the firewall by default. You can open other ports for Netflow if required.

   For details of other parameters, see Netflow Collection Parameters below.

10. Click **OK**.

The new event source is displayed in the list.

## Netflow Collection Parameters

The following table provide descriptions of the basic Netflow Collection parameters.

| Name | Description |
|---|---|
| Port | Specify the port number configured for the Netflow event source.<br>NetWitness opens the 2055, 4739, 6343, and 9995 ports for Netflow by default. You can open other ports for Netflow if required. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Cancel | Closes the dialog without making adding an event source type. |
| OK | Adds the parameters for the event source. |

The following table provide descriptions of the advanced Netflow Collection parameters.

| Name | Description |
|---|---|
| InFlight Publish Log Threshold | Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the netflow event messages currently flowing from the event source to NetWitness .<br>Valid values are:<br>• **0 (default)** - disables the log message.<br>• **100-100000000** - generates a log message when this Log Collector has processed the specified number of netflow events. For example, if you set this value to 100, NetWitness generates a log message when 100 netflow events of the specific netflow version (v5 or v9) have been processed. |

| Name | Description |
| --- | --- |
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector .<br><br>Enables or disables debug logging for the event source.<br><br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |

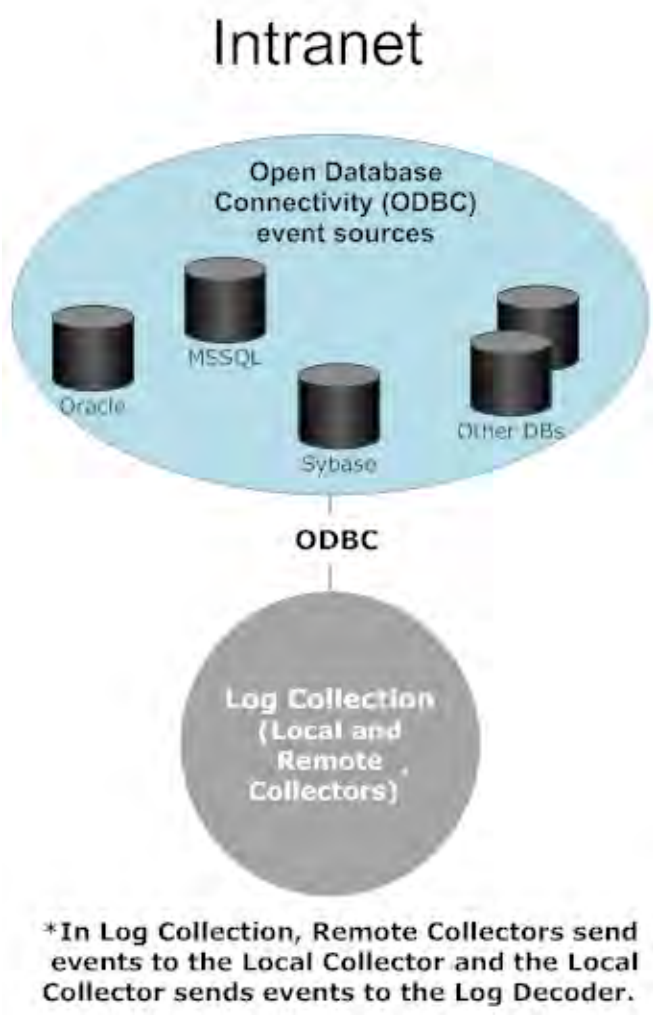
# ODBC

## Configure ODBC Event Sources in NetWitness

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

### Deployment Scenario

The following figure illustrates how you deploy the ODBC Collection Protocol in NetWitness.



## Configure an ODBC Event Source

To configure an ODBC event source, you need to configure an event source type, and also choose a DSN template.

### Configure a DSN

The following procedure describes how to add a DSN from an existing DSN template. For other procedures related to DSNs, see Configure Data Source Names (DSNs).

#### Configure a DSN (Data Source Name):

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.

5. The DSNs panel is displayed with the existing DSNs, if any.
6. Click to open the **Add DSN** dialog.
7. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.) If required, click

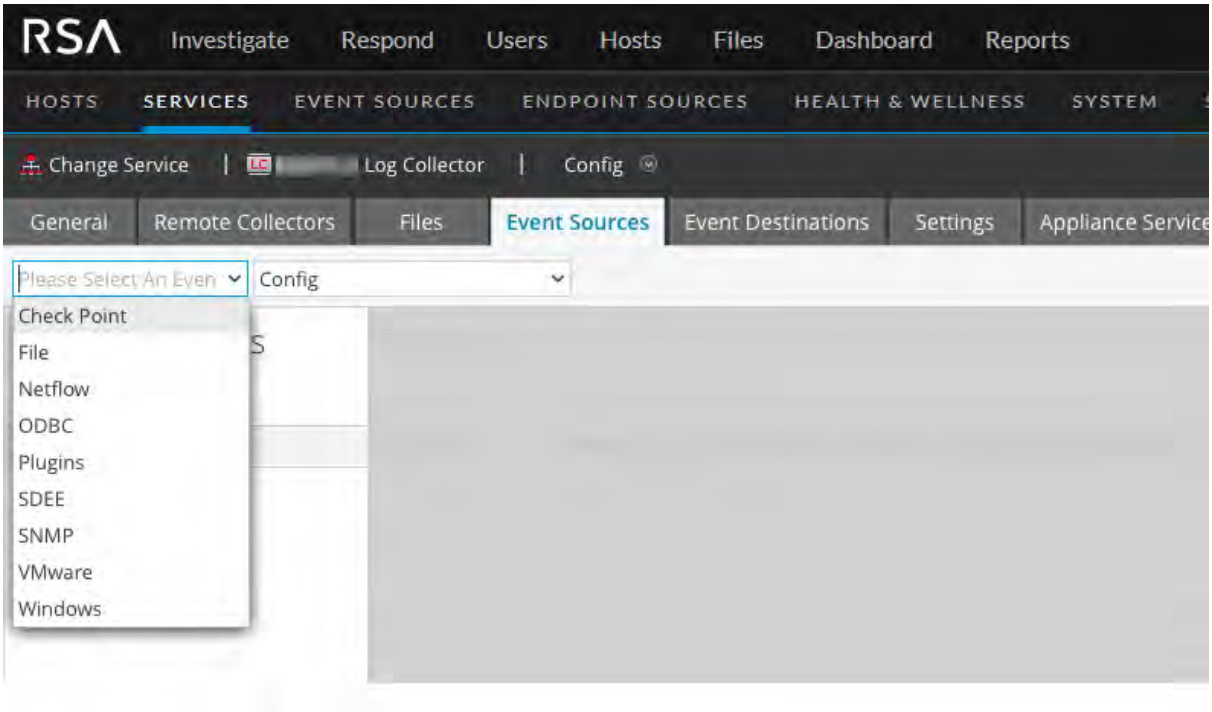
to add or delete DSN templates.
8. Fill in the parameters and click **Save**.

## Add an Event Source Type

For details on parameters used in the following procedure, see ODBC Event Source Configuration Parameters.

### To configure an ODBC Event Source Type:

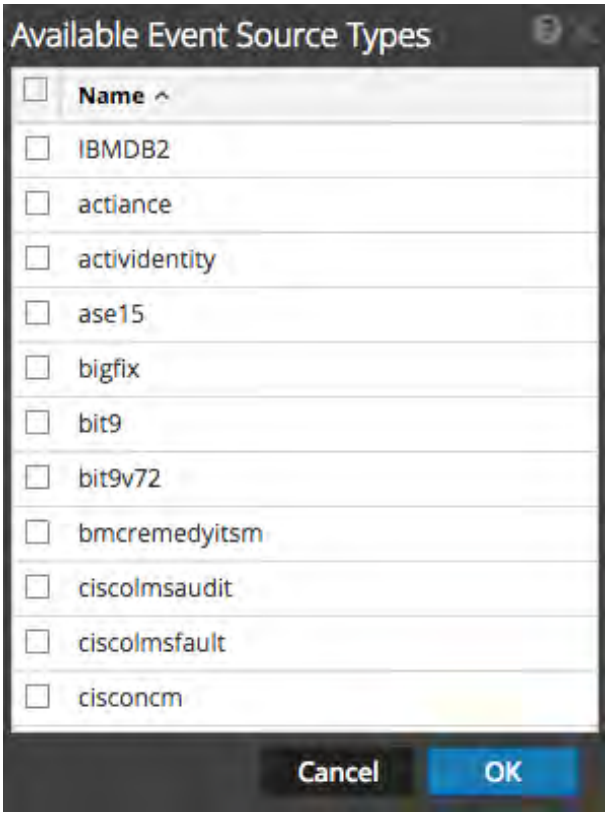
1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **ODBC/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click

.

The **Available Event Source Types** dialog is displayed.

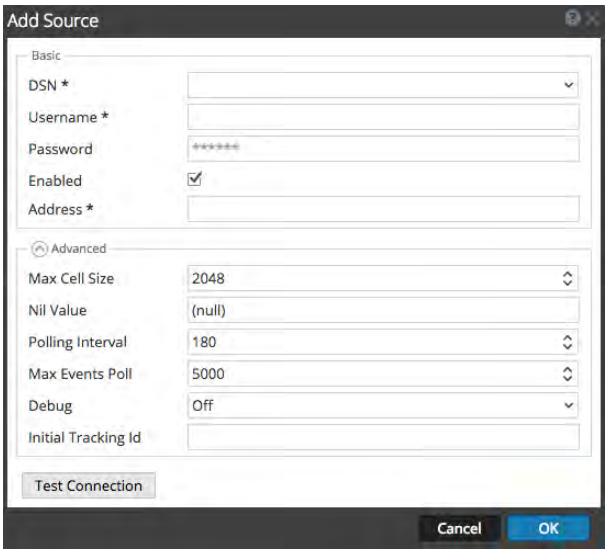


7. Select an event source category (for example **mssql** and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

   The **Add Source** dialog is displayed.



9. Select a DSN from the drop down list, specify or modify the other parameters as required, and click **OK**.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the DSN information and retry.

    **Note:** Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness server displays an error message.
11. If the test is successful, click **OK**.

The newly defined DSN is displayed in the **Sources** panel.

## Configure Data Source Names (DSNs)

This topic tells you how to create and maintain DSNs for ODBC Collection.

### Context

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

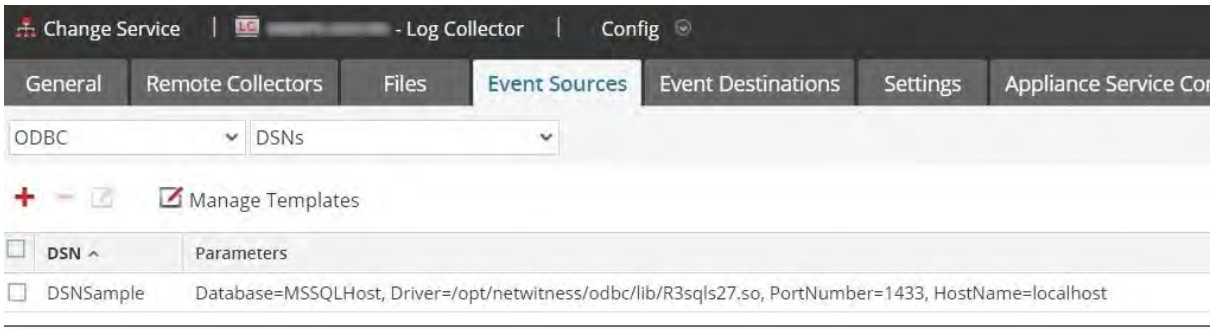
### Navigate to the DSN Panel

To add or edit DSNs or DSN templates, first navigate to the appropriate screen.

#### To navigate to the DSN templates panel:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View > Config**.

4. In the **Log Collector Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.
   The **DSNs** panel is displayed with the DSNs that are added, if any.



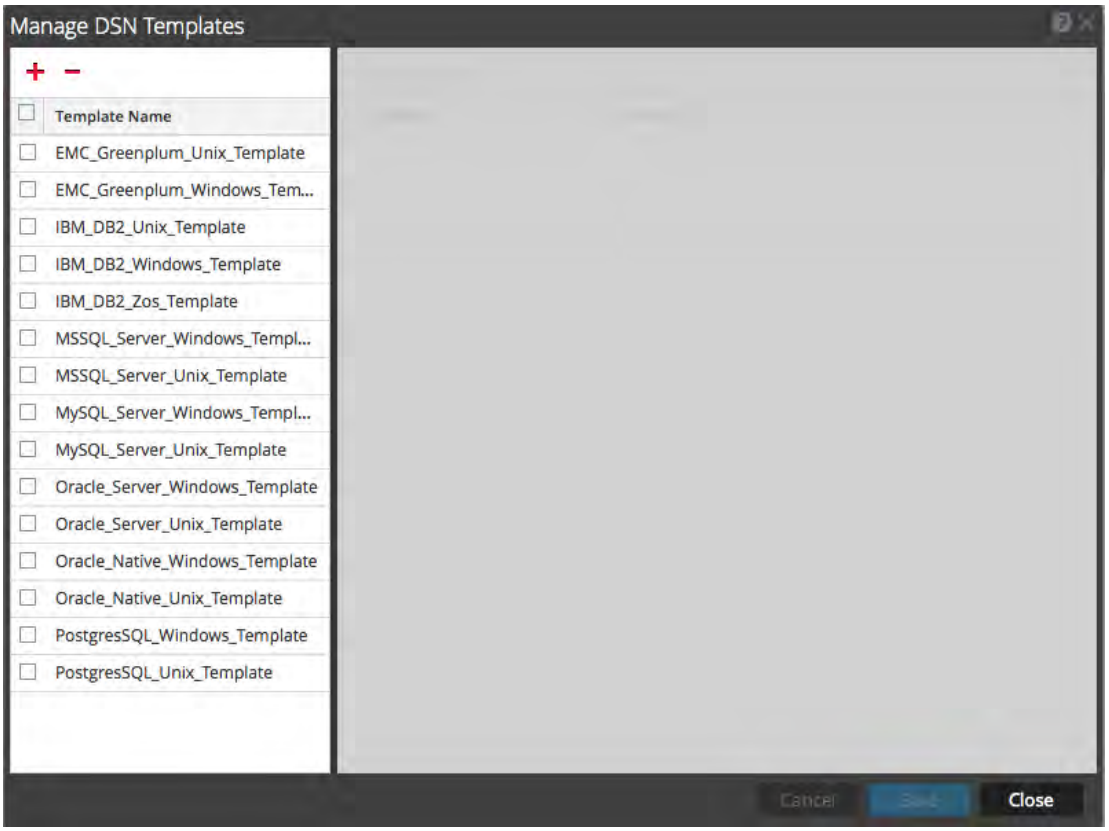
From this screen, you can perform the following actions:

- Add a new DSN template
- Add a DSN from an existing template
- Add a DSN by editing an existing DSN template
- Remove a DSN or DSN template

## Add a New DSN Template

If none of the predefined DSN templates fit your needs, use this procedure to add a DSN template.

1. From the DSNs panel, click Manage Templates.
   The **Manage DSN Templates** dialog is displayed.

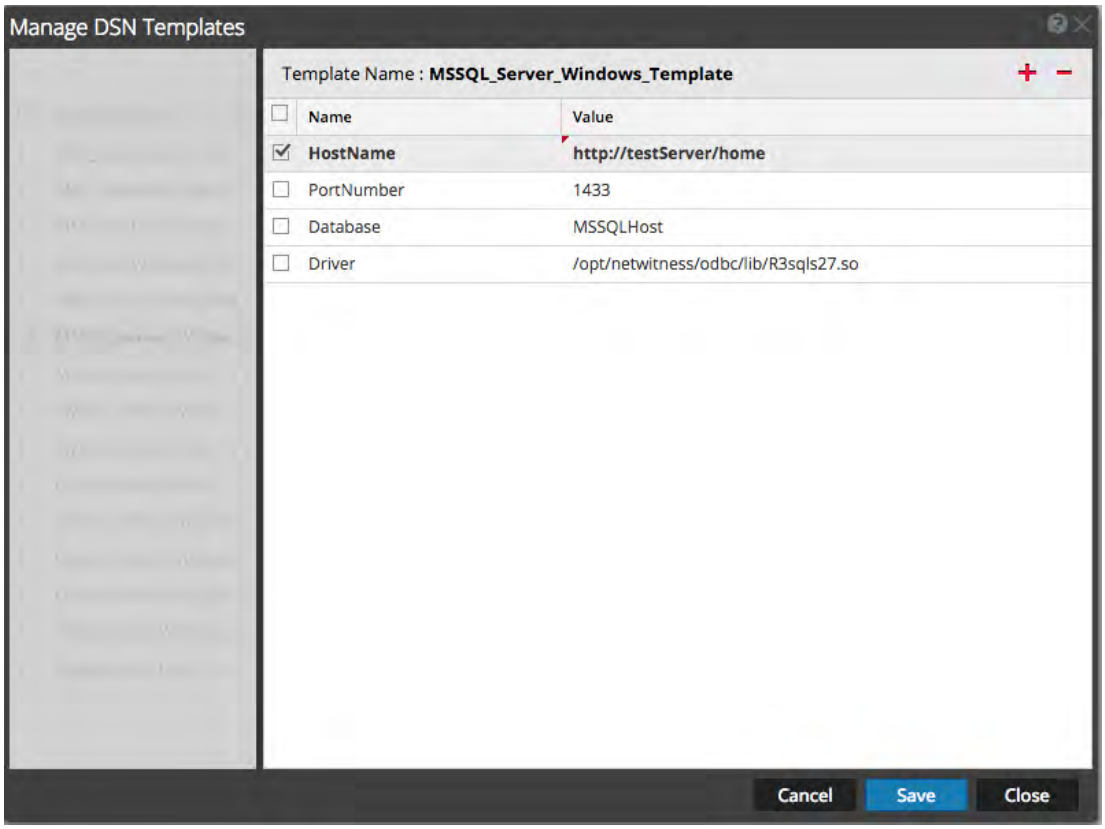


**Note:** RSA provides default templates on the left side panel that you can use while adding a new DSN.

2. Click .

   The right panel is activated.

3. Specify a template name and click on the right panel to add parameters.
4. Specify the parameters. Click **Save**.



The new DSN template is added in the **Manage DSN Templates** list.

## Add a DSN from an existing template

You can select an existing template, and fill in the parameters for your needs.

1. From the DSNs panel, click to open the Add DSN dialog box.
   The **Add DSN** dialog is displayed with existing DSNs, if any
2. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
3. Fill in the parameters and click **Save**.

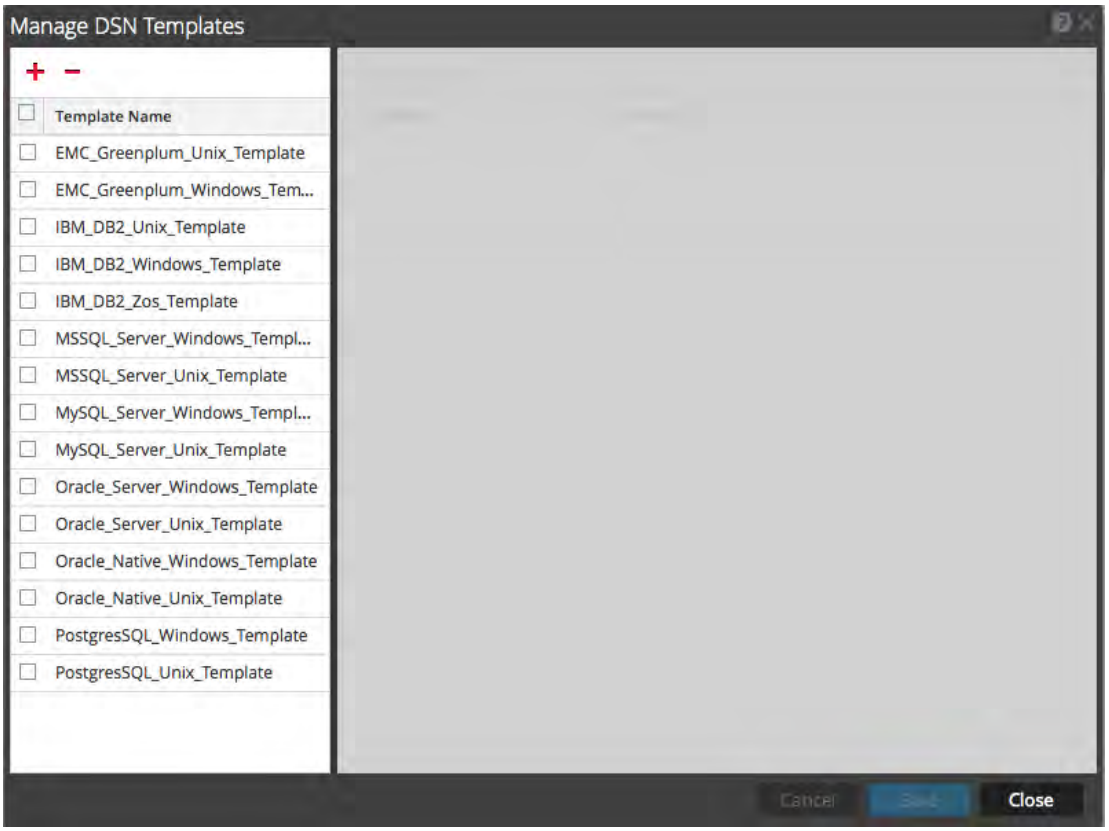
Your DSN is added to the list of DSNs.

## Add a New DSN by editing an existing DSN template

You can add a DSN by updating an existing DSN template to fit your needs.

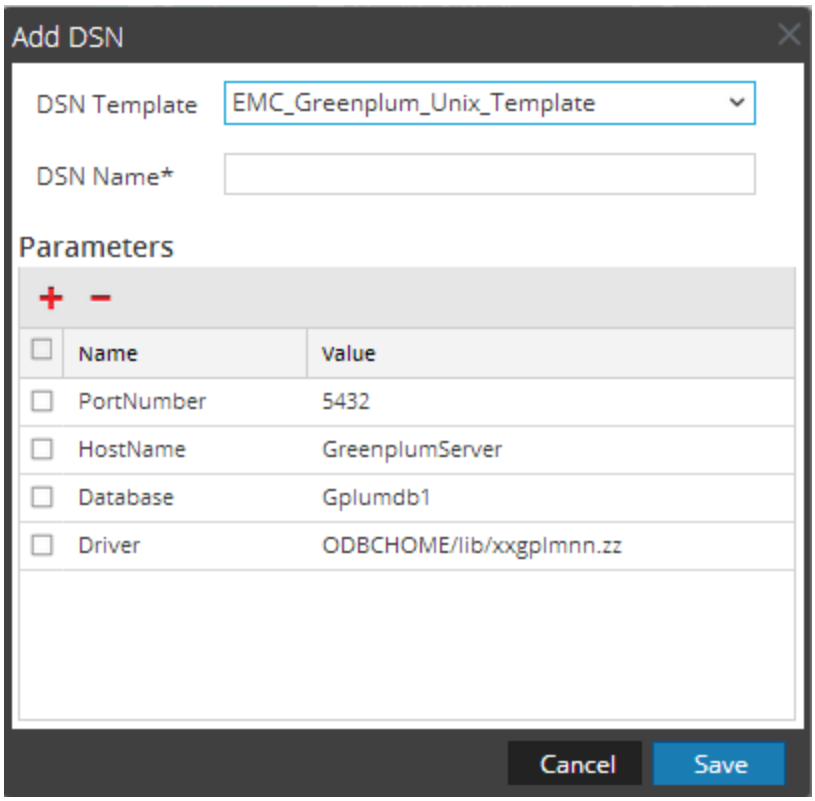
1. From the DSNs panel, click

   .
   The **Manage DSN Templates** dialog is displayed.



2. Select the existing template that you want to modify.

   The right panel is activated, and the default parameters for the selected template are displayed.



3. Specify a name in the **DSN Name** field.
4. Add, delete or edit the default parameters.
5. Once you have the set of required parameters, click **Save**, then **Close**.
6. Choose the DSN Template that you updated from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
7. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

## Remove a DSN or DSN template

If you no longer use a DSN or a DSN template, you can remove it from the system.

### To remove an existing DSN:

1. From the DSNs panel, select an existing DSN.
2. Click —.

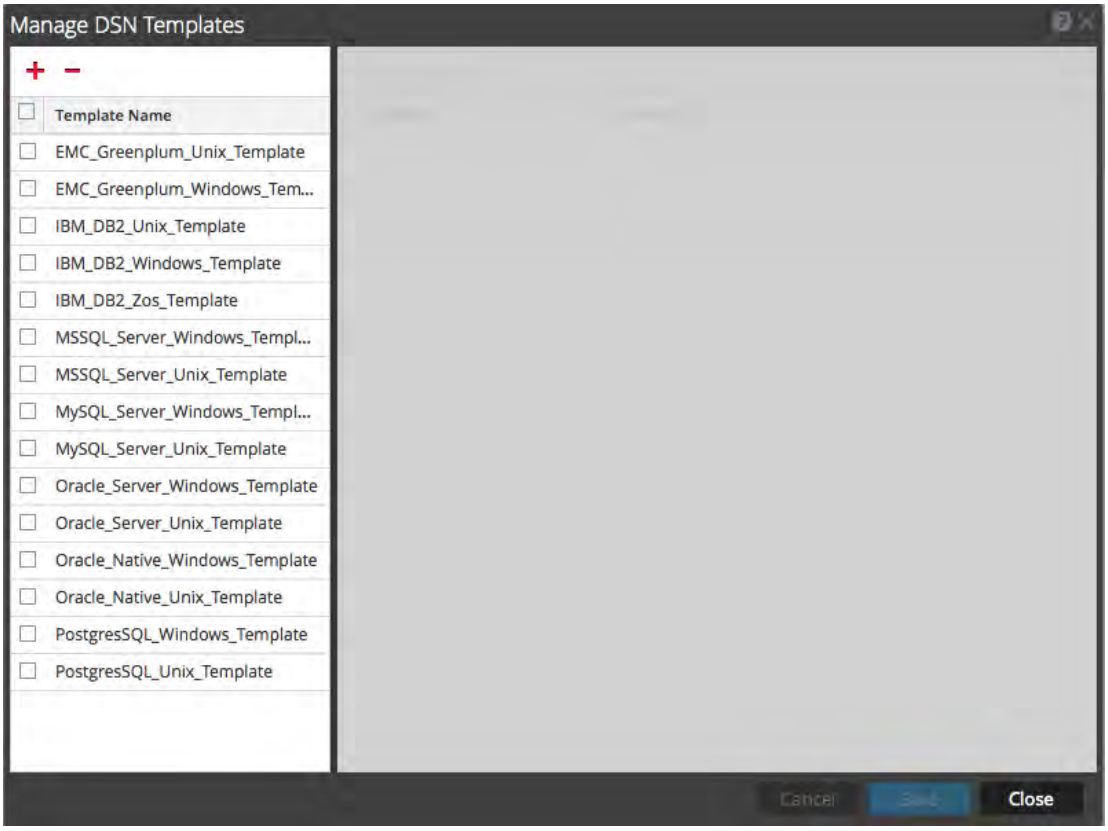
   A Warning message appears, asking whether you are sure you want to delete the DSN.
3. To delete the DSN, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN is removed from the system.

### To remove an existing DSN Template:

1. From the DSNs panel, click Manage Templates.

   The **Manage DSN Templates** dialog is displayed.



2. From the DSNs panel, select an existing DSN Template.
3. Click —.

   A Confirmation message appears, asking whether you are sure you want to delete the DSN Template.

4. To delete the DSN Template, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN Template is removed from the system.

## Configure device.ip meta for ODBC Data Source

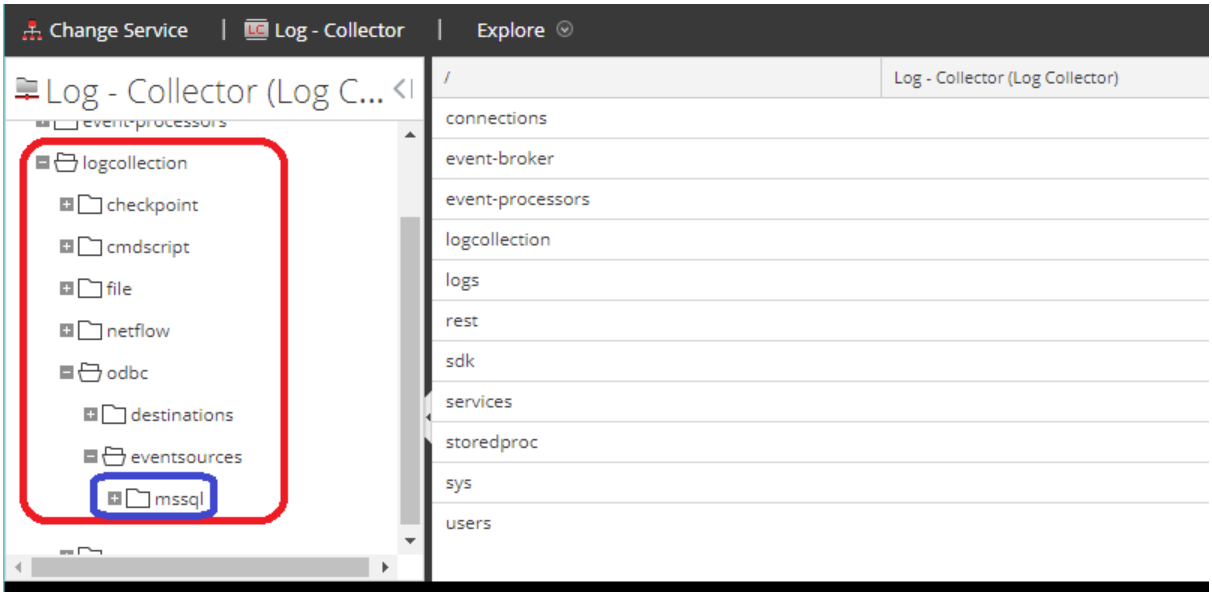
For any ODBC event source, you can choose to have the ODBC collector populate the **device.ip** meta value with either the event source IP address or the actual source IP on which logs are being collected.

### To view or set this parameter:

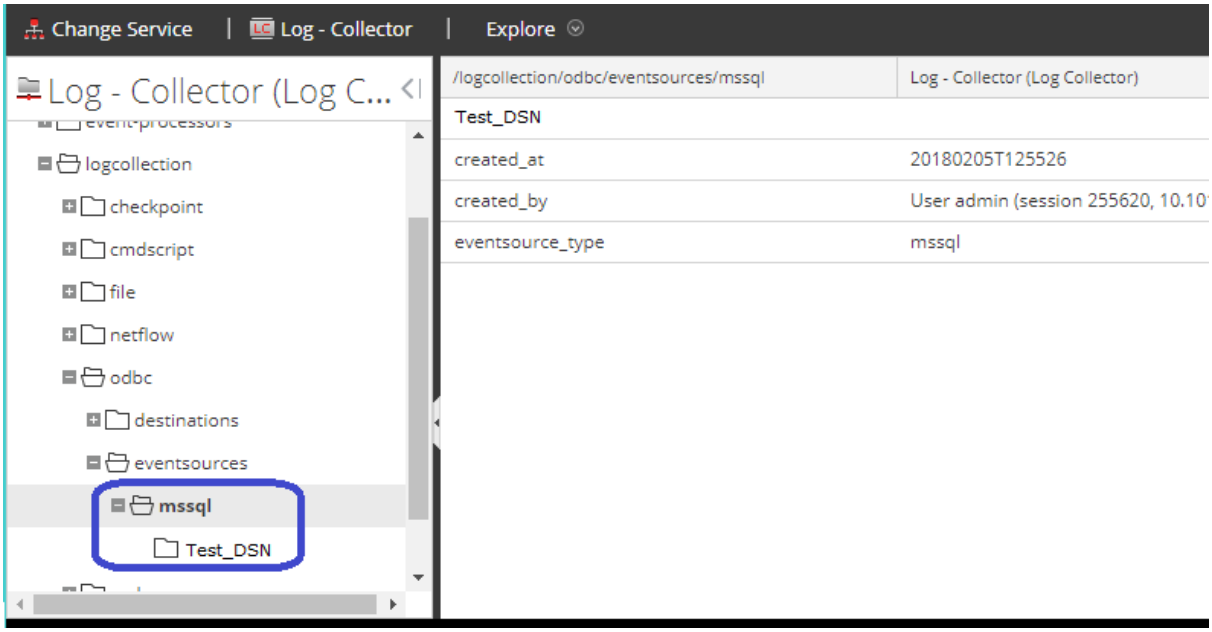
1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View > Explore**.

4. Navigate to **logcollection > odbc > eventsources**.

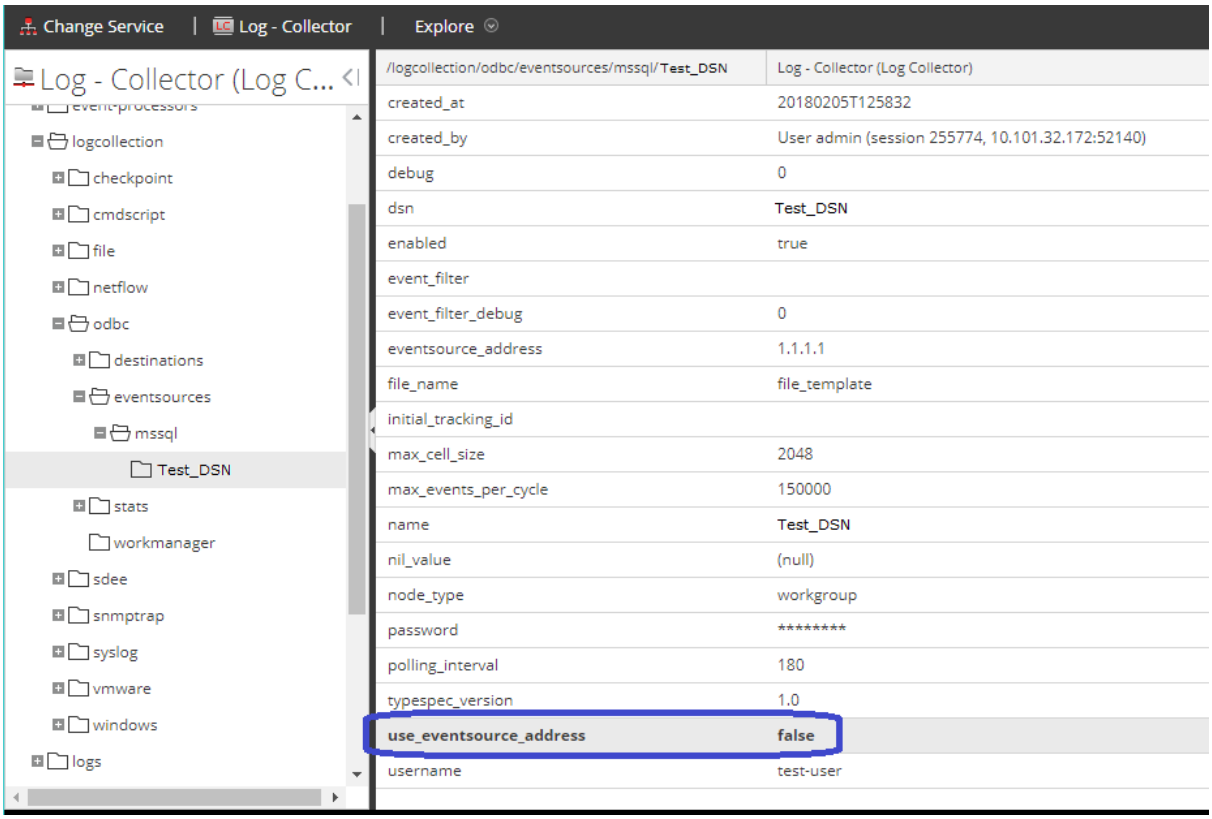
   There are entries for each ODBC event source that you have configured in NetWitness. For example, for this installation, the only ODBC event source currently configured is MS SQL:



5. Click + next to an event source to expand it and see its DSN entry.



6. Click the DSN entry (in this example **Test_DSN**) to show the parameters.
7. The **use_eventsource_address** parameter is listed.



- **False**: actual source IP address is used. This is the default value.
- **True**: event source IP address is used.

8. Click on the value (in this case **False**), and type in the new value.

> **Note:** If you type anything other than **true** or **false** (case does not matter), you receive an error saying that the value you entered cannot be set.

Any changes you make take effect immediately.

## Create Custom Typespec for ODBC Collection

RSA NetWitness uses type specification (typespec) files for ODBC and file collection. These files act on raw log files, and are used for two main purposes:

- Define where in the log file data resides. For instance, some log files contain header information that is not considered data to be parsed.
- Replace certain types of characters that the log parser cannot parse correctly. For instance, the tab character can sometimes cause problems.

This topic tells you how to create a custom typespec for the Log Collector. The topic includes:

- Create Custom typespec procedure
- ODBC Collection typespec syntax

- Sample ODBC Collection typespec files

## Create Custom Typespec

### To create a custom typespec file:

1. Open an SFTP client (for example, WinSCP) and connect to a Log Collector or remote Log Collector.
2. Navigate to `/etc/netwitness/ng/logcollection/content/collection/odbc`, and copy an existing file, for example **bit9.xml**.
3. Modify the file according to your requirements. See ODBC Collection Typespec Syntax for details.
4. Rename and save the file to the same directory.
5. Restart the Log Collector.

**Note:** You will not be able to see new Event Source type in NetWitness until you restart the Log Collector.

## ODBC Collection Typespec Syntax

The following table describes the typespec parameters.

| Parameter | Description |
|---|---|
| name | The display name of your ODBC event source (for example, **activeidentity**). NetWitness displays this name in the **Sources** panel of the **View > Config > Events Sources** tab.<br>Valid value is an alphanumeric string. You cannot use - (dashes), _(underscores), or spaces. The name must be unique across all typespec files in the folder. |
| type | Event source type: **odbc**. Do not modify this line. |
| prettyName | User-defined name for the event source. You can use the same value as name (for example, apache) or use a more descriptive name. |
| version | Version of this typespec file. Default value is 1.0. |
| author | Person who created the typespec file. Replace author-name with your name. |
| description | Formal description of the event source. Replace formal-description with your description of the event source. |
| | **<device> Section** |
| parser | This optional parameter contains the name of the log parser. This value forces the Log Decoder to use the specified log parser when parsing logs from this event source.<br>**Note:** Please leave the field blank when unsure of the log parser to be used. |
| name | Name your ODBC event source (for example, **ActivIdentity ActivCard AAA Server**). |
| maxVersion | The version number of the event source (for example, **6.4.1**). |
| description | Description of the event source. |
| | **<collection> Section** |

| Parameter | Description |
|---|---|
| odbc | The syntax under <odbc> is used for event collection and processing. You can provide multiple queries for the same event source type by adding <query> tags. |
| query | This section contains the details of the query used to collect information from the event source. |
| tag | The prefix tag you want to add to events during transformation (for example **ActivIdentity**). |
| outputDelimiter | Specify the delimiter to use to separate fields. Specify any of the following values:<br>• \|\| (piping)<br>• ^ (caret)<br>• , (comma)<br>• : (colon)<br>• **0x20** (to represent a space) |
| interval | Specify the number of seconds between events. Default value is **60**. |
| dataQuery | Specify the query to fetch data from the ODBC eventsource database for SQL-syntax. For example:<br>`SELECT acceptedrejected, servername, serveripa, sdate, millisecond, suid, groupname, ipa, reason, info1, info2, threadid FROM A_AHLOG WHERE sdate > '%TRACKING%' ORDER BY sdate` |
| maxTrackingQuery | The query used on the initial pull of events to identify the starting point within the data set to begin pulling logs from. After the initial pull, this query is no longer used, unless the **maxTracking** value has been reset or altered. For example:<br>`SELECT MAX(Event_Id) from ExEvents` |
| trackingColumn | The tracking column value used when the ODBC collector pulls a new set of events. |

## Sample ODBC Collection Typespec Files

The following sample is the typespec file for the IBM ISS SiteProtector event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>siteprotector4_x</name>
   <type>odbc</type>
   <prettyName>SITEPROTECTOR4_X</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Collects events from SiteProtector</description>

   <device>
      <name>Internet Security Systems, Inc. RealSecure SiteProtector v 2.0</name>
      <maxVersion>2.0</maxVersion>
```

```
      <description></description>
      <parser>iss</parser>
   </device>

   <configuration>
   </configuration>

   <collection>
      <odbc>
         <query>
            <tag></tag>
            <outputDelimiter></outputDelimiter>
            <interval></interval>
            <dataQuery></dataQuery>
            <maxTrackingQuery></maxTrackingQuery>
            <trackingColumn></trackingColumn>
            <levelColumn></levelColumn>
            <eventIdColumn></eventIdColumn>
            <addressColumn></addressColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

The following sample is the typespec file for the Bit9 Security Platform event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>bit9</name>
   <type>odbc</type>
   <prettyName>BIT9</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Bit9 Events</description>

   <device>
      <name>Bit9</name>
      <parser>bit9</parser>
   </device>

   <configuration>
   </configuration>
```

```
   <collection>
      <odbc>
         <query>
            <tag>BIT9</tag>
            <outputDelimiter>||</outputDelimiter>
            <interval>10</interval>
            <dataQuery>
            SELECT
            Timestamp,
            Event_Id,
            Computer_Id,
            File_Catalog_Id,
            Root_File_Catalog_Id,
            Priority,
            Type,
            Subtype,
            IP_Address,
            User_Name,
            Process,
            Description
            FROM
            ExEvents
            WHERE
            Event_Id > '%TRACKING%'
            </dataQuery>
            <trackingColumn>Event_Id</trackingColumn>
            <maxTrackingQuery>SELECT MAX(Event_Id) from ExEvents</maxTrackingQuery>
            <eventIdColumn></eventIdColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

## Troubleshoot ODBC Collection

You can troubleshoot problems and monitor ODBC collection by reviewing the ODBC collector log informational, warning, and error messages to during execution of collection.

Each ODBC log messages includes the:

- Timestamp
- Category: `debug`, `info`, `warning`, or `failure`
- collection method = `OdbcCollection`
- ODBC event source type (GOTS-name) = Generic ODBC Type Specification name that you configured for the event source.
- collection function completed or attempted (for example, `[processing]`)
- ODBC event source name (DSN-name) = Data Source Name that you configured for the event source.
- description (for example, how many events the Log Collector collected)
- tracking ID = the Log Collector position in the target database table.

The following example illustrates the message you would receive upon successful collection of an ODBC event:

```
2014-July-25 17:21:25 info (OdbcCollection) : [event-source] [processing]
[event-source] Published 100 ODBC events: last tracking id: 2014-July-25
13:22:00.280
```

The following example illustrates a message you may receive upon unsuccessful collection of an ODBC event:

| | |
|---|---|
| **Log Message** | `timestamp failure (OdbcCollection: [event-source] [processing] [event-source-type] Failed during doWork: Unable to prepare statement: state: S0002; error-code:208; description: [RSA] [ODBC-driver][event-source-type]Invalid object name 'object-name'.` |
| **Possible Cause** | ODBC collection failed while accessing the ODBC Driver or the target database. |
| **Solutions** | Validate the DSN value pairs for the events source. |

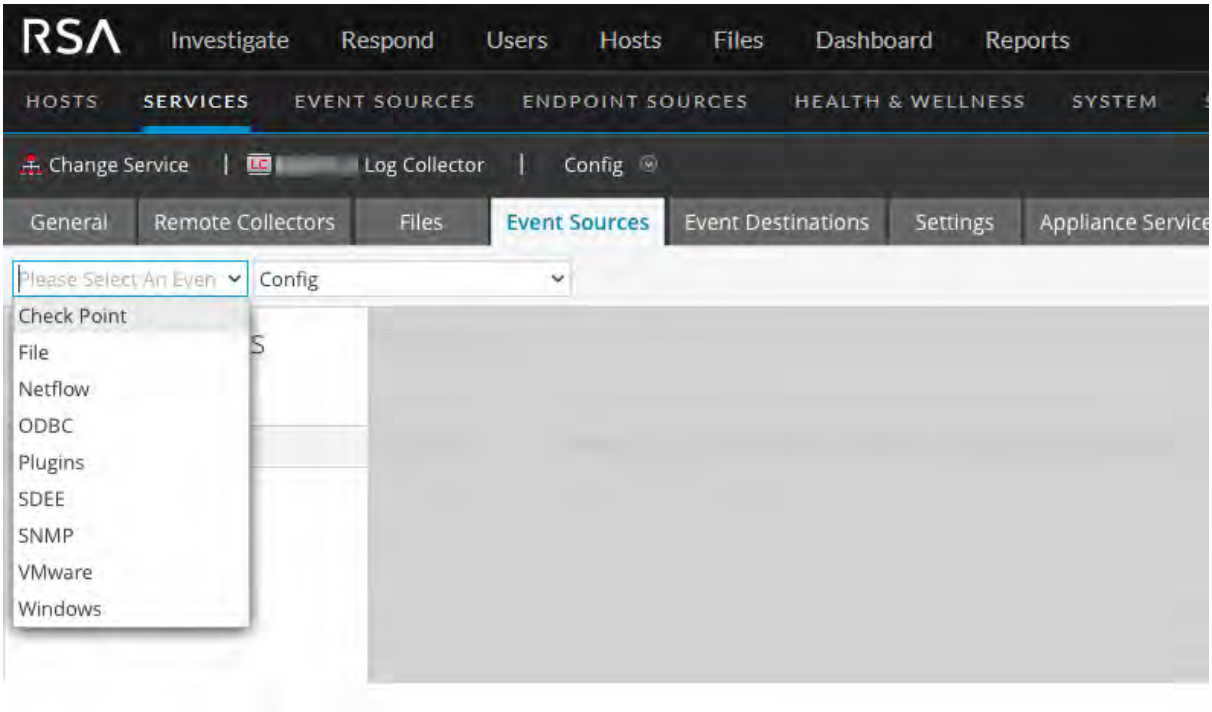
# Configure SDEE Event Sources in NetWitness

This topic tells you how to configure the SDEE collection protocol.

### To add an SDEE Event Source:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SDEE/Config** from the drop-down menu.

   The Event Categories panel displays the SDEE event sources that are configured, if any.

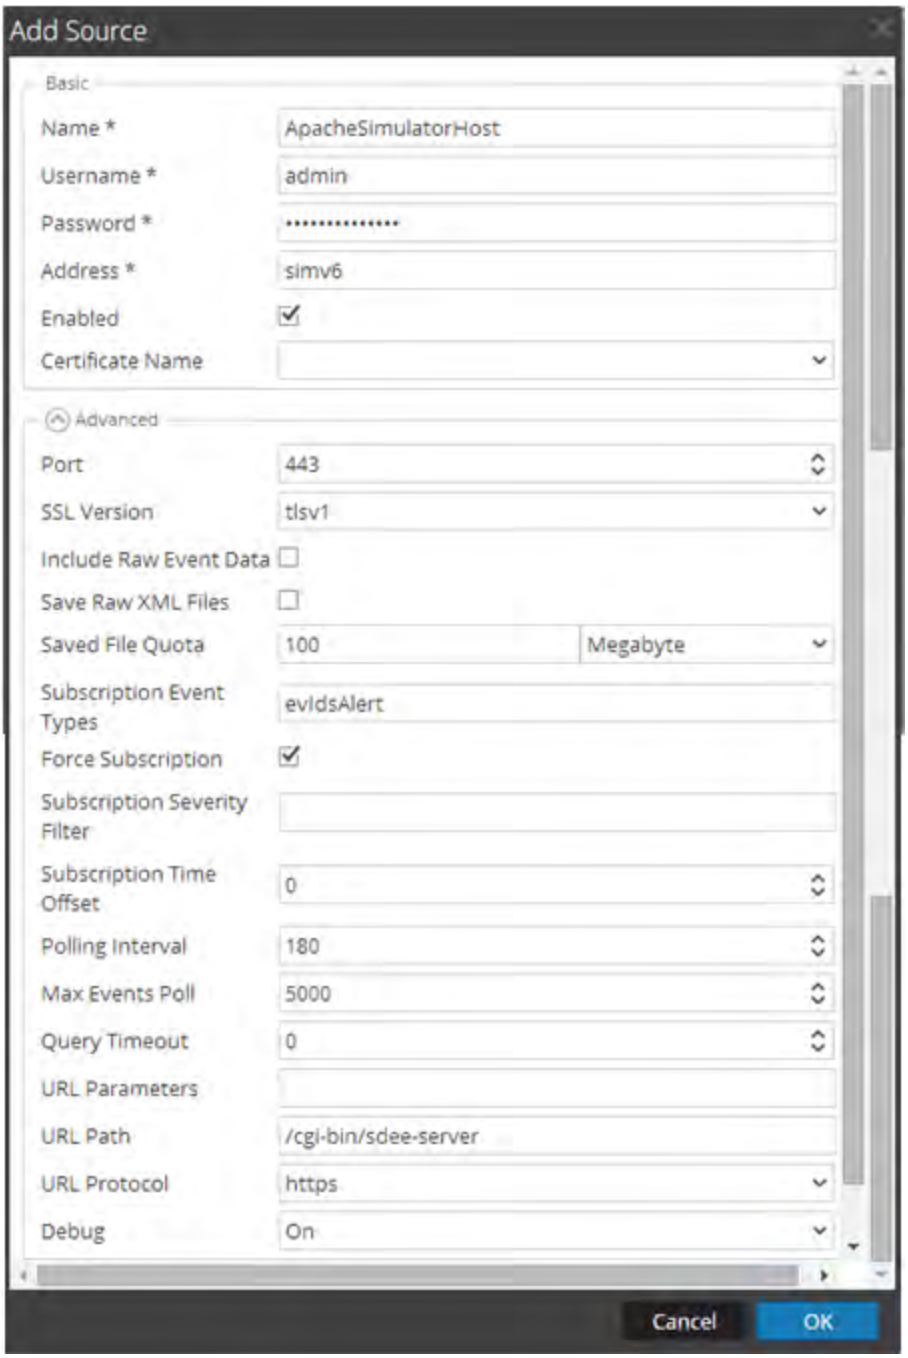
6. In the **Event Categories** panel toolbar, click .

   The **Available Event Source Types** dialog is displayed.

7. Select an event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the Event Categories panel and click in the Sources panel toolbar. The Add Source dialog is displayed.



9. Add a Name, Username, Address, and Password, and modify any other parameters that require changes, and click **OK**.

# Configure SNMP Event Sources in NetWitness

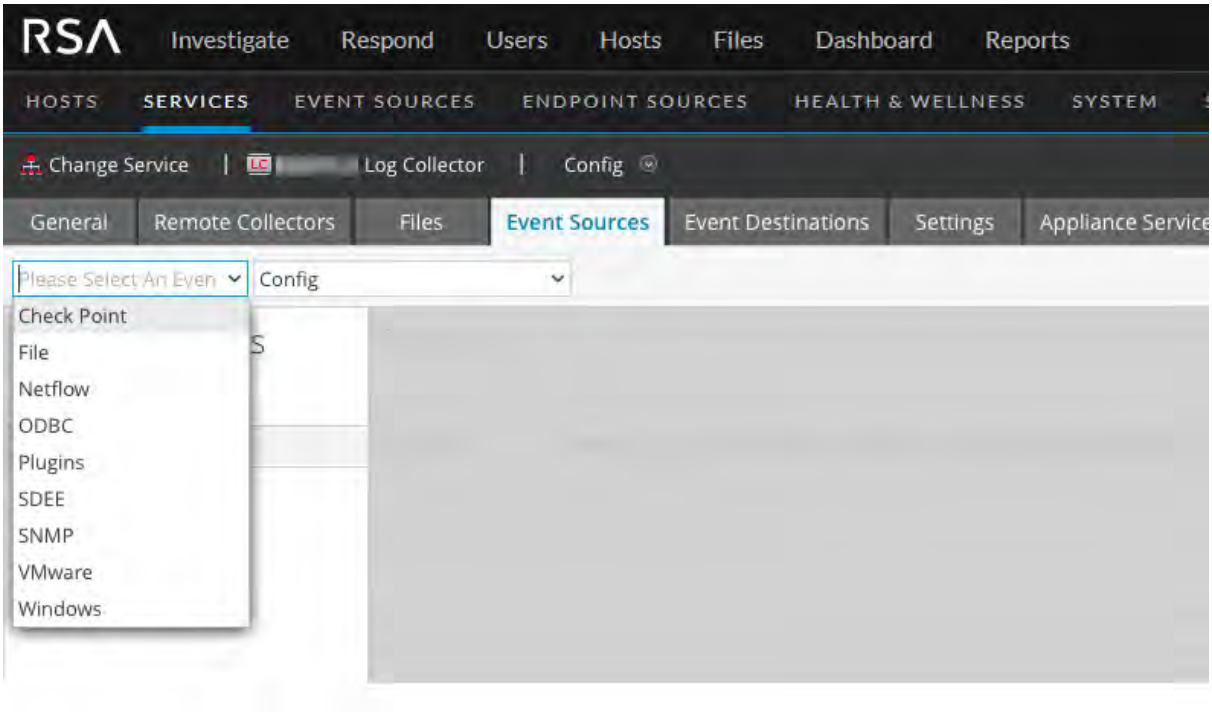
This topic tells you how to configure the SNMP collection protocol.

## Configure the SNMP Trap Event Source

### To add the SNMP Event Source:

**Note:** If you have previously added the **snmptrap** type, you cannot add it again. You can edit it, or manage users.

1. Go to **(Admin)** > **Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SNMP/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select the **snmptrap** event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select **snmptrap** in the Event Categories panel.
9. Select **snmptrap** in the Sources panel and then click the Edit icon, , to edit the parameters.
10. Update any of the parameters that you need to change and click **OK**.

## (Optional) Configure SNMP Users

If you are using SNMPv3, follow this procedure to update and maintain the SNMP v3 users.

### To configure SNMPv3 Users:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **SNMP/SNMP v3 User Manager** from the drop-down menu.

   The SNMPv3 User panel is displayed with the existing users, if any.
5. Click to open the **Add SNMP User** dialog.
6. Fill in the dialog with the necessary parameters. The available parameters are described below.

## SNMP User Parameters

The following table describes the parameters that you need to enter when you create an SNMPv3 user.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Parameter | Description |
|---|---|
| Username * | User name (or more accurately in SNMP terminology, security name). NetWitness uses this parameter and the **Engine ID** parameter to create a user entry in the SNMP engine of the collection service.<br>The **Username** and **Engine ID** combination must be unique (for example, **logcollector**). |
| Engine ID | (Optional) Engine ID of the event source. For all event sources sending SNMP v3 traps to this collection service, you must add the username and engine id of the sending event source.<br>For all event sources sending SNMPv3 informs, you must add just the username with a blank engine id. |

| Parameter | Description |
|---|---|
| Authentication Type | (Optional) Authentication protocol. Valid values are as follows:<br>• **None** (default) - only security level of **noAuthNoPriv** can be used for traps sent to this service<br>• **SHA** - Secure Hash Algorithm<br>• **MD5 - Message Digest Algorithm**<br>**IMPORTANT:** DO NOT USE: do not select MD5, as it conflicts with the Log Collector running in FIPS mode. |
| Authentication Passphrase | Optional if you do not have the **Authentication Type** set. Authentication passphrase. |
| Privacy Type | (Optional) Privacy protocol. You can only set this parameter if Authentication Type parameter is set. Valid values are as follows:<br>• **None** (default)<br>• **AES** - Advanced Encryption Standard<br>• **DES - Data Encryption Standard**<br>**IMPORTANT:** DO NOT USE: do not select DES, as it conflicts with the Log Collector running in FIPS mode. |
| Privacy Passphrase | Optional if you do not have the **Privacy Type** set. Privacy passphrase. |
| Close | Closes the dialog without adding the SNMPv3 user or saving modifications to the parameters. |
| Save | Adds the SNMPv3 user parameters or saves modifications to the parameters. |

# Configure Syslog Event Sources

This topic tells you how to configure Syslog event sources for the Log Collector.

**Note:** Prior to NetWitness 11.3, you did not configure Syslog Collection for Local Log Collectors: syslog collection was only configurable for Remote Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

## Configure a Syslog Event Source

For Remote or Virtual Log Collectors, syslog listeners for UDP on port 514, TCP on port 514 and SSL on port 6514 are created by default. You should not change the SSL settings on the TCP and SSL listeners. If you need SSL certificate verification, create a new event source type to listen on a different port.

**Note:** For local Log Collectors, you cannot create syslog listeners on ports 514 and 6514: these ports are used by the Log Decoder service.

### To configure the Log Collector for Syslog collection:

1. Go to **(Admin) > Services**.
2. In the Services grid, select a Log Collector, and from the Actions menu, choose **> View > Config**.
3. Select the **Event Sources** tab.
4. Select **Syslog/Config** from the drop-down menu.

   The Event Categories panel displays the Syslog event sources that are configured, if any.

   **Note:** For RSA NetWitness, some Syslog event sources are available by default. In this case, you can proceed to step 6.

5. In the Event Categories panel toolbar, click .

   The Available Event Source Types dialog is displayed.
6. Select either **syslog-tcp** or **syslog-udp**. You can set up either or both, depending on the needs of your organization.
7. Select the new type in the Event Categories panel and click in the Sources panel toolbar.

   The Add Source dialog is displayed.
8. Enter the port number, and select **Enabled**. Optionally, configure any of the Advanced parameters as necessary.

   Click **OK** to accept your changes and close the dialog box.

Once you configure one or both syslog types, the Log Decoder or Log Collector collects those types of messages from all available event sources. So, you can continue to add Syslog event sources to your system without needing to do any further configuration in RSA NetWitness.

## Character Encodings

For each protocol (TCP, UDP), you need to instantiate a separate syslog listener for each character encoding.

For example, assume that you have legacy event sources sending syslog in UDP and TCP with EUC-KR and EUC-JP encodings. You would need to configure four listeners for the Log Collector, and configure the syslog event sources to send to separate ports as follows:

- UDP ***<port1>*** for EUC-KR
- UDP ***<port2>*** for EUC-JP
- TCP ***<port3>*** for EUC-KR
- TCP ***<port4>*** for EUC-JP

Alternatively, you could use separate Remote/Virtual Log Collectors, each using the default port 514.

## Syslog Parameters

The following tables describe the available basic and advanced parameters for Syslog configuration.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

### Basic Parameters

| Name | Description |
|---|---|
| Port* | Enter the port number that you configured for your event sources. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| SSL Receiver | **Note:** This parameter applies to NetWitness version 11.1 and newer. It is available only for the **syslog-tcp** Event Category.<br>If you select the check box, the event source accepts SSL/TLS connections only. Also, if you change this setting, you must stop and restart Syslog collection for the change to become effective. |
| Encoding | Character encoding used by the syslog senders to this port. Defaults to UTF-8.<br>**Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8.<br>RSA has tested the following values:<br>• EUC-KR<br>• SJIS<br>• GB3212/GBK<br>• ISO_8859-1 (German)<br>• ISO_8859-7 (Greek) |

## Advanced Parameters

| Name | Description |
|---|---|
| Inflight Publish Log Threshold | Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the syslog event messages currently flowing from the event source to NetWitness.<br>Valid values are:<br>• **0** (default) - disables the log message<br>• **100-100000000** - generates log message when the syslog event messages currently flowing from the event source to NetWitness are within the 100 to 100000000 byte range. |
| Maximum Receivers | Maximum number of receiver resources used to process collected syslog events. The default value is **2**. |
| Event Filter | Select a filter.<br>Refer to Configure Event Filters for a Collector for instructions on how to define filters. |
| Debug | **Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables or disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |

| Name | Description |
|---|---|
| SSL Verify Mode | **Note:** This parameter applies to NetWitness version 11.1 and newer. It is available only for the **syslog-tcp** Event Category.<br>This setting is relevant only if the **SSL Receiver** setting is selected. If you change the SSL Verify Mode, you must stop and restart Syslog collection for the change to become effective.<br>Available options:<br>• **verify-none**: (default) The server does not verify the client's certificate, if any. A client can connect without presenting a certificate.<br>• **verify-peer**: The server verifies the client's certificate, if any. A client can connect without presenting a certificate.<br>**Note:** If verification fails, a warning is logged but the messages will still be accepted.<br>• **verify-peer-fail-if-no-cert**: The client must present a certificate and the server will verify it.<br>**Note:** If you use this mode, the client's CA certificate ***must*** be uploaded to the Log Collector's truststore using the REST API at `http://LC-ip-address:50101/sys/caupload` |
| Certificate Directory Path | You can configure custom certificates for the syslog listener on Log Collectors. For details, see (Optional) Configure Custom Certificates on Log Collectors. |

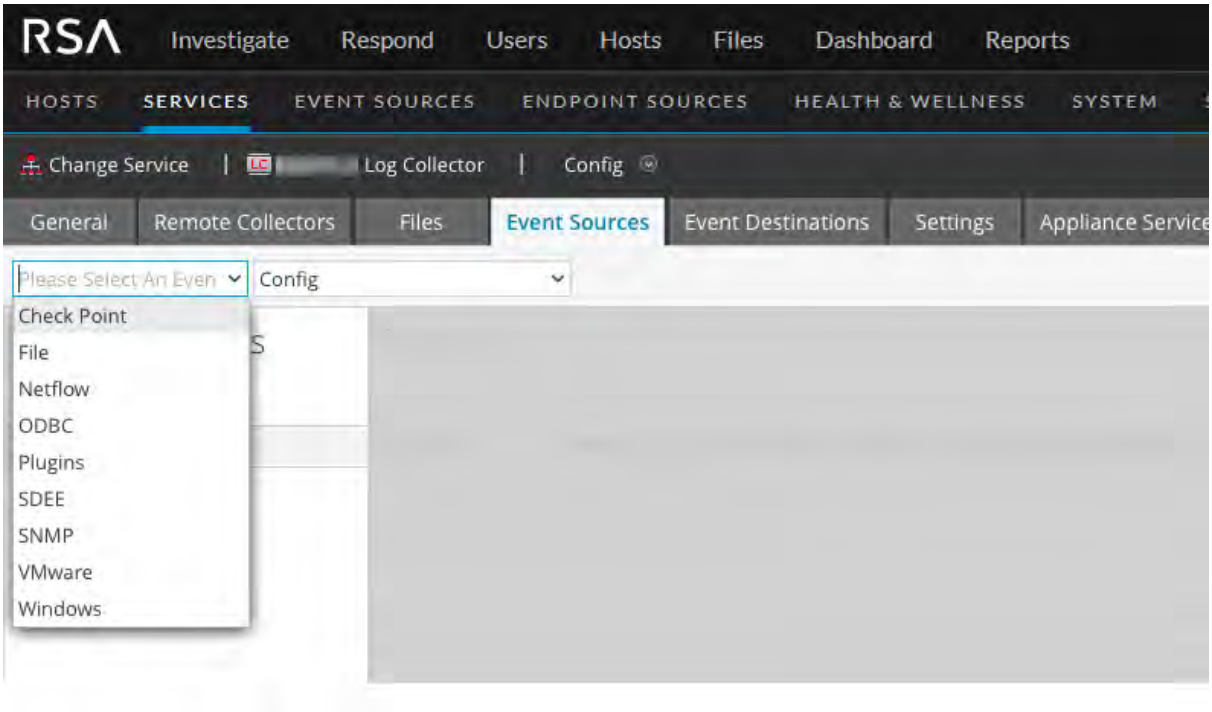
# Configure VMware Event Sources in NetWitness

This topic tells you how to configure the VMware collection protocol.

### To add a VMware Event Source:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

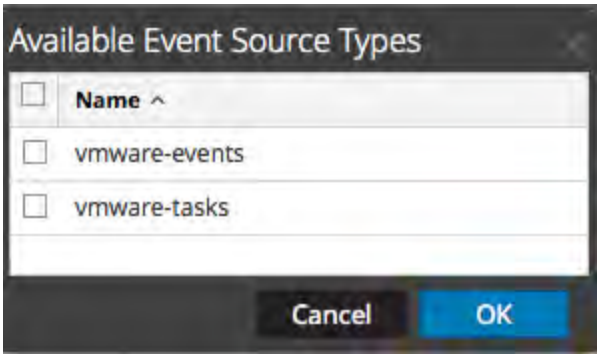
4. Click the **Event Sources** tab.



5. In the Log Collector **Event Sources** tab, select **VMware/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

6. Click + to open the **Available Event Source Types** dialog.



7. Select **vmware-events** or **vmware-tasks** from the Available Event Source Types dialog and click **OK**.

   The VMware available event source types are as follows:

   - **vmware-events:** Setup vmware-events to collect events from vCenter Servers and ESX/ESXi servers.
   - **vmware-tasks:** (Optional) Setup vmware-tasks to collect tasks from vCenter Servers.

8. Select the new type in the Event Categories panel, and click + in the Sources toolbar.

9. Add a Name, Username and Password, and modify any other parameters that require changes.

   **Caution:** If you need to enter the domain name as part of the Username, you must use a double-backslash as a separator. For example, if the domain|username is corp\smithj, you must specify **corp\\smithj**.

10. Click **OK** to save your changes.

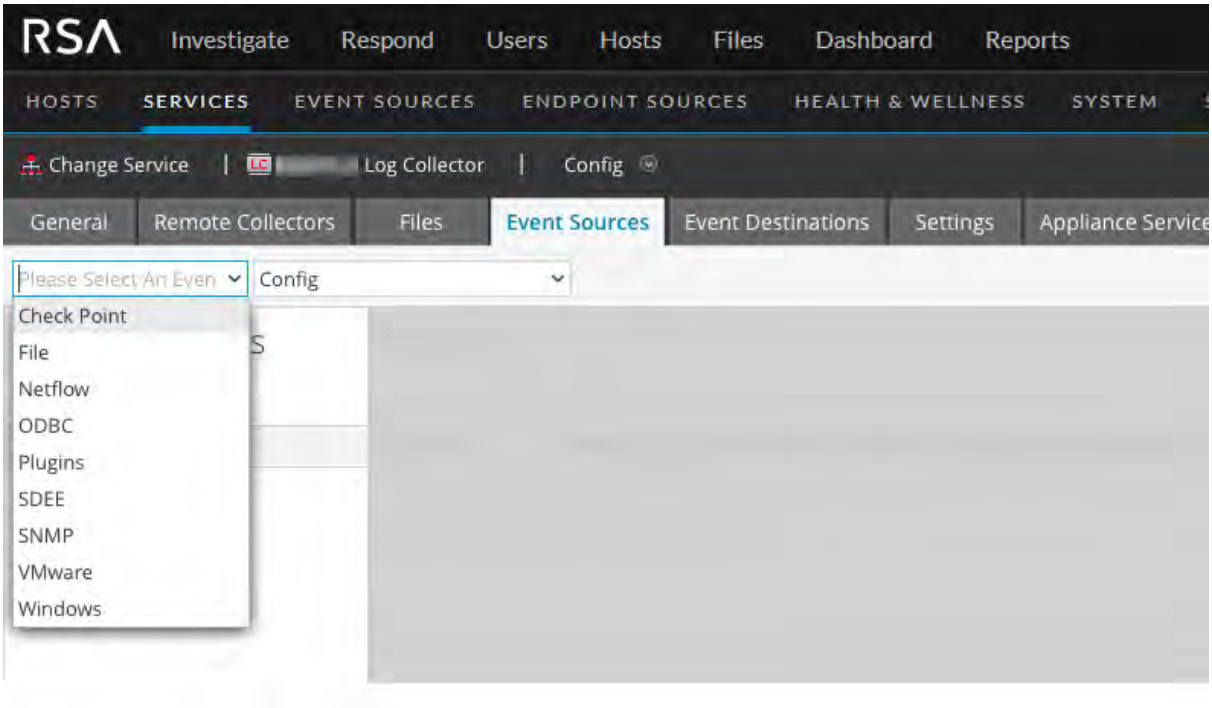
# Configure Windows Event Sources in NetWitness

This topic tells you how to configure the Windows collection protocol.

In RSA NetWitness, you need to configure the Kerberos Realm, and then add the Windows Event Source type.

### To configure the Kerberos Realm for Windows collection:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select **Windows/Kerberos Realm** from the drop-down menu.
6. In the Kerberos Realm Configuration panel toolbar, click + to add a new realm.

The Add Kerberos Domain dialog is displayed.

7. Fill in the parameters, using the guidelines below.

| Parameter | Details |
|---|---|
| Kerberos Realm Name | Enter the realm name, in all caps. For example, DSNETWORKING.COM. Note that the Mappings parameter is automatically filled with variations on the realm name. |
| KDC Host Name | Enter the name of the Domain Controller. ***Do not*** use a fully qualified name here: just the host name for the DC.<br>**Note:** Make sure that the log collector is configured as a DNS client for the corporate DNS server. Otherwise, the Log Collector will not know how to find the Kerberos Realm. |
| Admin Server | (Optional) The name of the Kerberos Administration Server in FQDN format. |
| Mappings | This parameter is automatically filled after you enter the realm name. |

8. Click **Save** to add the Kerberos domain.

### To add a Windows Event Source:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the Log Collector **Event Sources** tab, select **Windows/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

Next, continue from the current screen to add a Windows Event Category and type.

### To configure the Windows Event Type:

1. Select **Windows/Config** from the drop-down menu.
2. In the Event Categories panel toolbar, click to add a source.

   The Add Source dialog is displayed.
3. Fill in the parameters, using the guidelines below.

| Parameter | Details |
|---|---|
| Alias | The windows domain, referred to as Alias, is the configuration parameter that the Log Collector uses to group event sources. These event source type groups (for example, **domain2**, **domain3**, and **domain4**) categorize the event sources you have configured. |

| Parameter | Details |
|---|---|
| Authorization Method | The authentication method. Valid values are:<br>• **Basic** (default)<br>• **Negotiate** - Negotiates authentication between Kerberos and NTLM (Microsoft Windows NT LAN Manager). For security reasons, NetWitness supports Kerberos exclusively. Select this method. |
| Channel | For most event sources that use Windows collection, you want to collect from the **Security**, **System**, and **Application** channels.<br>This is a comma-separated list of channels from which NetWitness collects events. The default value for this parameter is:<br>`System, Application, Security`<br>You can use parentheses to include and exclude event IDs. The exclude filter must have a ^ between the channel name and the event ID. You must separate event IDs with a \|.<br>For example, **Application^(211\|300), System(1010\|1012)** excludes the 211 and 300 Application events and includes the 1010 and 1012 System events.<br>A channel is a named stream of events that transports them from an event publisher to an event log file. There are many predefined Windows channels. The following are examples of some of these channels:<br>• **System** -applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system.<br>• **Application** -all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application-specific channel for it.<br>• **Security** -the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority. |
| User Name | Enter the account name for the Windows user account that you set up earlier for communicating with NetWitness. Note that you need to enter the full account name, which includes the domain. For example, `rsalog@DSNETWORKING.COM`.<br>**Note:** For negotiate authentication, this must be the Kerberos principal name in the name@kerberos_ domain format. For example, **logcollector@LAB30.LOCAL**. |
| Password | Enter the correct password for the user account for the event source. The password is encrypted internally and is displayed in its encrypted form. |
| Read All Events | Select this box to read all historical event data from a channel.<br>• **Unchecked** (default) -Log Collector does not collect from all historical event data for a specified channel.<br>• **Checked** -Log Collector collects from all historical event data from a specified channel. |
| Max Events Per Cycle | (Optional). RSA recommends that you set this value to 0, which collects everything. |
| Polling Interval | (Optional). For most users, a value of **60** should work well. |

| Parameter | Details |
|---|---|
| Render Events | Select this box to request rendered events from the event source.<br>• **Checked** (default) -Log Collector requests rendered events from the event source.<br>• **Unchecked** -Log Collector does not request rendered events from the event source. |

4. Click **OK** to add the source.

   The newly added Windows event source is displayed in the Event Categories panel.

5. Select the new event source in the Event Categories panel.

   The **Hosts** panel is activated.

6. Click in the Hosts panel toolbar.

7. Fill in the parameters, using the guidelines below.

| Parameter | Details |
|---|---|
| Event Source Address | Enter the IP address for the Windows host. |
| Port | Accept the default value, **5985**. |
| Transport Mode | Enter **http**. |
| Enabled | Ensure the box is checked. |

8. Click **Test Connection**.

   **Note:** You should be able to successfully test the connection, even if the Windows service is not running.

For more information on any of the previous steps, see the following Help topics in the NetWitness User Guide:

- Configure Windows Collection
- Microsoft WinRM Configuration Guide
- Test and Troubleshoot Microsoft WinRM Guide

# Windows Legacy and NetApp Collection Configuration

This **Windows Legacy** protocol collects events from Windows Legacy (Windows 2003 or earlier event sources) and CIFS Auditing events from NetApp ONTAP event sources.

You must deploy Log Collection, that is set up a Local Collector and Windows Legacy Remote Collector, before you can configure the Windows Legacy collection protocol.

## How Legacy Windows and NetApp Collection Works

You use the Windows Legacy collection protocol to configure NetWitnessto collection events from:

- Legacy Microsoft Windows event sources (Window 2003 and earlier event sources)
- NetApp event sources

### Window 2003 and Earlier Event Sources

Legacy Windows event sources are older Windows versions (such as Windows 2000 and Window 2003). The Windows Legacy collection protocol collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. You set up these event sources under the windows event source type.

### NetApp Event Sources
