NetApp appliances running Data ONTAP support a native auditing framework that is similar to Windows Servers. When configured, this auditing framework generates and saves audit events in Windows.evt file format. The Windows Legacy collection protocol supports collection of events from such NetApp.evt files. You set up these event sources under the netapp_evt event source type.

The NetApp Data ONTAP appliance is configured to generate CIFS Auditing events and save them periodically as.evt files in a format that includes the timestamp in the filename. Refer to the Network Appliance Data ONTAP Event Source Configuration Guide on RSA Link for details. The collection protocol saves the timestamp of the last processed.evt filename to keep track of collection status.

### Net App Specific Parameters

Most of the parameters that you maintain in Add/Edit Source dialog apply to both Windows Legacy and Net App events sources.

The following two parameters are unique to NetApp event sources.

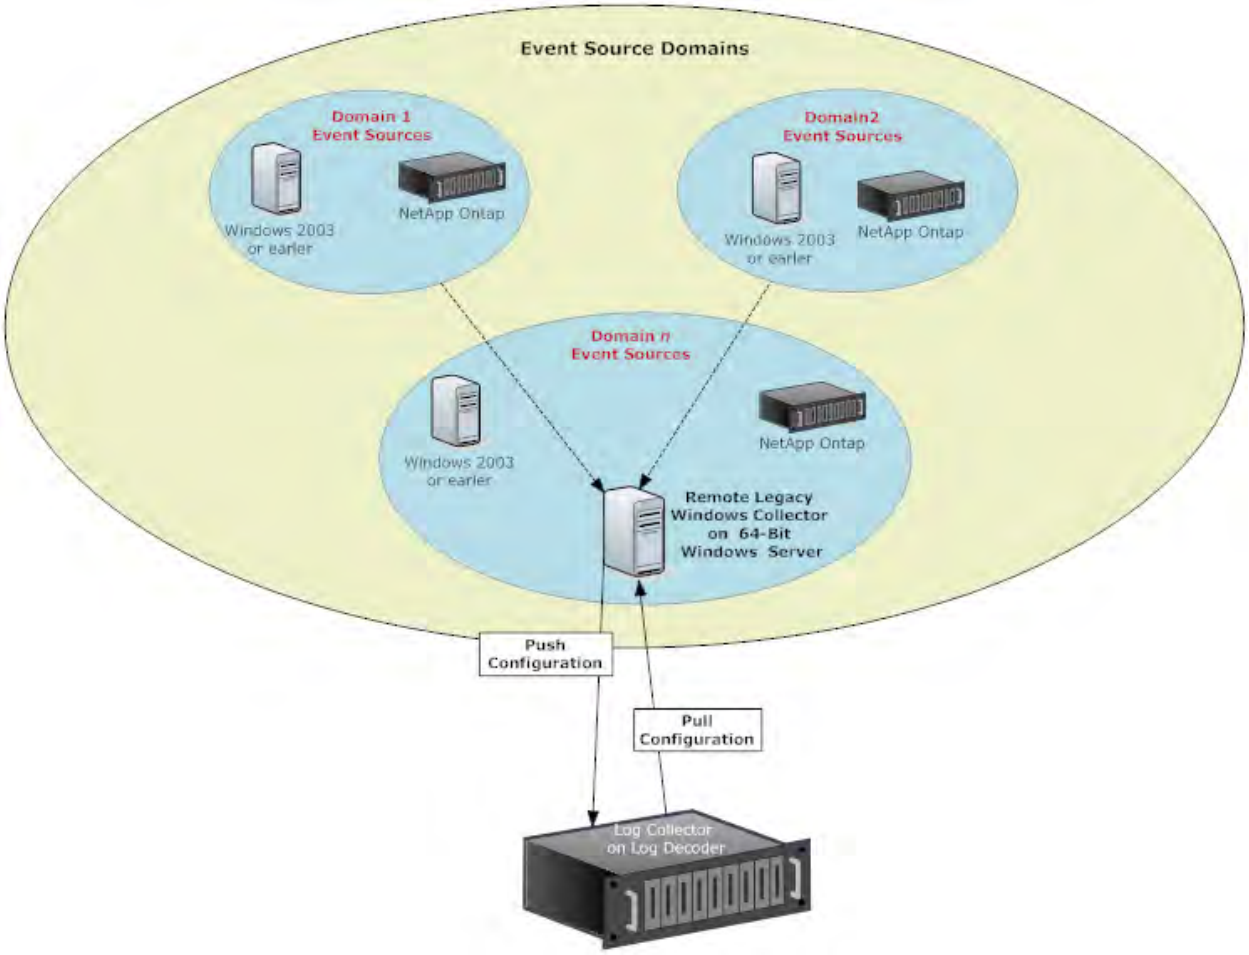
- **Event Directory Path** - The NetApp appliance generates event data and saves it in.evt files in a shareable directory on the NetApp appliance. NetWitness requires you to specify this directory path in the Event Directory Path parameter
- **Event File Prefix** - Similar to the Event Directory Path, NetWitness requires you to specify the prefix (for example, adtlog.) of the event data.evt files so that NetWitness can process this data.

In each polling cycle, NetWitness browses the configured NetApp shared path for the **.evt** files that you identified with the Event Directory Path and Event File Prefix parameters. NetWitness:

- Sorts Files matching the event-file-prefix.YYMMDDhhmmss.evt format in ascending order.
- Uses the timestamp of the last file processed to determine the files that still need processing. If NetWitness finds a partially processed file, it skips the events already processed.

## Deployment Scenario

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier, and NetApp ONTAP appliance, event sources. The Windows Legacy Remote Collector is the SA Legacy Windows Collector installed on physical or virtual Windows 2008 64-bit server in your event source domain.



## Set Up the Windows Legacy Collector

This topic tells you where to find the executable and instructions required to install or upgrade the Windows Legacy collector in your Windows Legacy domain or domains.

You install the NetWitness Windows Legacy collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **NWLegacyWindowsCollector-11.*version-number.exe***. You download the **NWLegacyWindowsCollector-11.*version-number.exe*** from RSA Link. Please refer to the *NetWitness 11.x Windows Legacy Collection Upgrade & Installation Instructions* for the details on how to install or upgrade Windows Legacy collection.

**Note:** The Microsoft Management Console (MMC) should be closed during the installation process.

## Configure Windows Legacy and NetApp Event Sources

This topic tells you how to configure Windows Legacy event sources in NetWitness.

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier event sources, and from NetApp event sources.

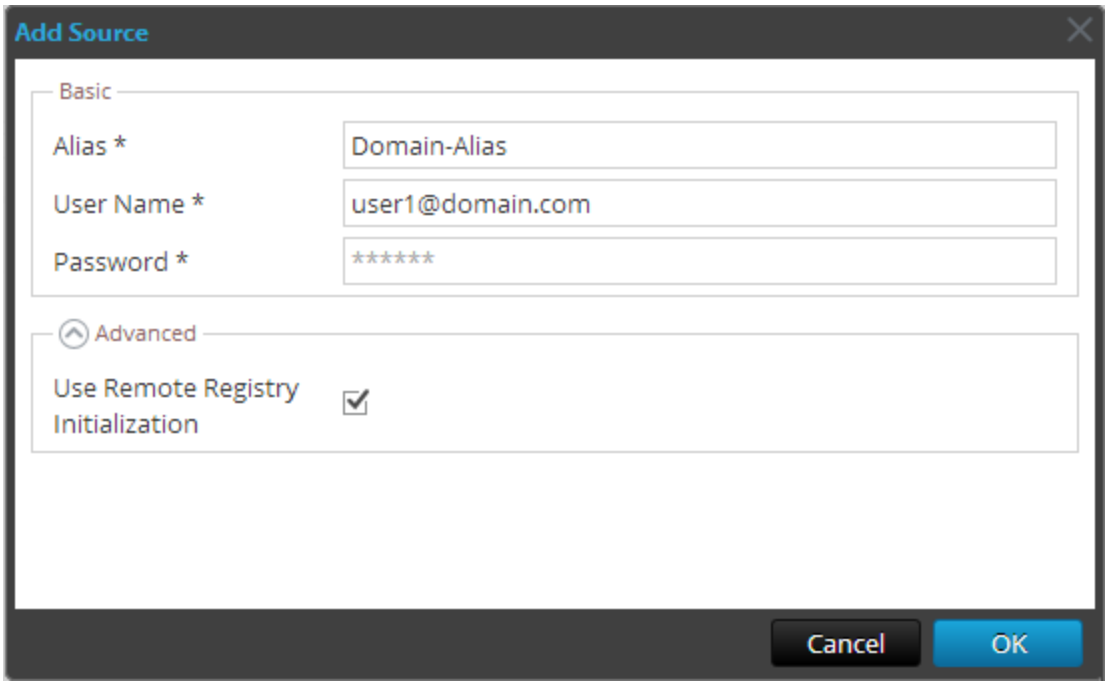
## Prerequisites

Before you configure a Windows Legacy event source, make sure that you have:

1. Installed the NetWitness Windows Legacy Remote Collector on a physical or virtual Windows 2008 64-bit server.
2. Added this Windows Legacy Remote Collector to NetWitness.

## Add a Windows Legacy Event Source

1. Access the Services view by selecting **(Admin) > Services** from the NetWitness menu.
2. In the **Services** grid, select a **Windows Legacy Log Decoder** service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select one of the following options from the drop-down menu.
   - Windows Legacy/Windows.
   - Windows Legacy/NetApp.
6. Configure the alias:
   a. Click in the **Event Categories** panel toolbar.
   The **Add Source** dialog is displayed.
   b. Specify values for the parameters and click **OK**.



**Note:** By default, **Remote Registry Initialization** is selected. For details, see Remote Registry Access below.

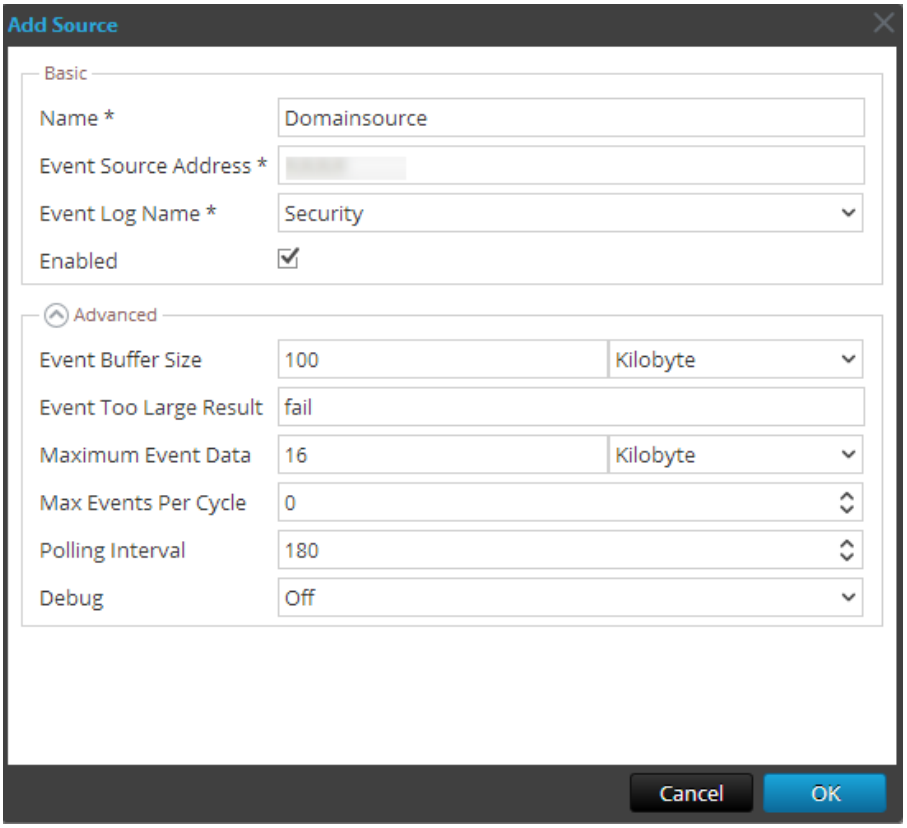
The newly added windows event source type is displayed in the **Event Categories** panel.

7. Add the event source:

   a. Select the new alias in the **Event Categories** panel and click in the **Source** panel toolbar.

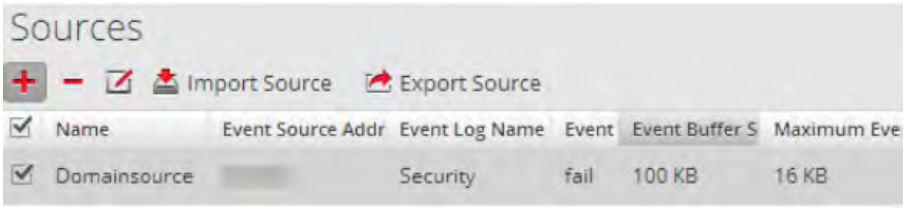
   The **Add Source** dialog is displayed.

   b. Specify values for the event source parameters and click **OK**.



For details, see Windows Legacy Configuration Parameters below.

The newly added Windows event source is displayed in the **Event Categories** panel.



## Remote Registry Access

Windows Legacy Collector performs an initial verification of the event source before collecting data. By default, Windows Legacy Collector uses Windows Management Instrumentation (WMI) method to perform this initial verification. If you enable Remote registry access method, Windows Legacy Collector performs a remote registry query to verify the event source.

## Configure Push or Pull between Log Collector and Windows Legacy Collector

You can configure the Windows Legacy Collector to push event data to a Local Collector, or you can configure a Local Collector to pull event data from the Windows Legacy Collector.

### To configure a Local Collector or the Windows Legacy Collector:

1. Go to **(Admin) > Services**.
2. Select a Local Collector or the Windows Legacy Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Windows Legacy Collector from which the Local Collector pulls events in this tab.
   - If you selected a Windows Legacy Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Windows Legacy Collector pushes events in this tab.

## Windows Legacy Configuration Parameters

The following table describes the basic parameters for a Windows Legacy event source.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Feature | Description |
|---|---|
| Name* | The name of the event source. Valid value is a name in the **[_a-zA-Z] [_a-zA-Z0-9]*** range. You can use a dash "-" as part of the name. |
| Event Source Address* | IP address of the event source. Valid value is an IPv4 address, IPv6 address, or a hostname including a fully qualified domain name. NetWitness defaults to **127.0.0.1**.<br>Log Collector converts the hostname to lower-case letters to prevent duplicate entries. |
| Event Log Name | The name of the event log from which to collect event data (for example, **System**, **Application**, or **Security**). The following are examples of some of these channels:<br>• **System** -applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system.<br>• **Application** -all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application specific channel for it.<br>• **Security** -the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority. |

| Feature | Description |
|---|---|
| Enabled | Select this checkbox to collect from this event source. If you do not check this checkbox, the Log Collector does not collect events from this event source. |
| Event Directory Path | NetApp **.evt or.evtx** files directory path. This must be the UNC path.<br>The NetApp generates event data and saves it in.evt or.evtx files in a shareable directory on the NetApp appliance.<br>• In each polling cycle, Log Collector browses the configured NetApp shared path for the.evt files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :<br>◦ sorts files that match the **event-file-prefix.YYMMDDhhmmss.evt** format in ascending order.<br>◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.<br>• In each polling cycle, Log Collector browses the configured NetApp shared path for the **.evtx** files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :<br>◦ sorts files that match the **event-file-prefix.YYMMDDhhmmssms.evtx** format in ascending order.<br>◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed. |
| Event File Prefix | Prefix of the **.evt** files (for example, **adtlog**.) saved in the **Event Directory Path**. |
| Cancel | Closes the dialog without adding the Windows Legacy event source. |
| OK | Adds the current parameter values as a new event source |

The following table describes the advanced parameters for a Windows Legacy event source.

| Feature | Description |
|---|---|
| Event Buffer Size | Maximum size of the data the Log Collector pulls from the event source for each request.<br>Valid value is a number in **0** to **511** Kilobytes range. You specify this value in **Kilobytes**. |
| Event Too Large Result | Tells Log Collector what to do if an event is too large for the event buffer. |
| Maximum Event Data | Maximum size of event data to include in the output. Valid value is a number in **0** to **511Kilobytes** range. You specify this value in **Kilobytes** or **Megabytes**.<br>• 1 Kilobyte - 100 Megabytes<br>• 0 = do not include event data in the output. |
| Max Events Per Cycle | The maximum number of events per polling cycle (how many events collected per polling cycle). |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |

| Feature | Description |
|---|---|
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables or disables debug logging for the event source. Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode -adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). Limit the number of event sources for which you use Verbose debugging to minimize performance impact. |

## Troubleshoot Windows Legacy and NetApp Collection

This topic highlights possible problems that you may encounter with Windows Legacy Collection (LWC) and suggested solutions to these problems.

**Note:** In general, you receive more robust log messages by disabling SSL.

### Protocol Restart Problems

| Problem | Possible Causes | Solutions |
|---|---|---|
| You restart the Legacy Windows collection protocol, but NetWitness is not receiving events. | The logcollector service is stopped. | Restart the **logcollector** service.<br>1. Log on to the **Windows Legacy Remote Collector**.<br>2. Go to **Start > Administrative Tools > Task Scheduler** and click on **Task Scheduler Library**.<br>3. In the right panel, look for the **restartnwlogcollector** task and make sure that it is running.<br>4. If this is not the case, right-click **restartnwlogcollector** and select **Run**. |

### Installation Problems

If you see any of the following messages in the **MessageBroker.log**, you may have issues.

| | |
|---|---|
| Log Messages | Any message that contains "rabbitmq" |
| Possible Cause | RabbitMQ service may not be running.<br>Port **5671** may not be opened. |
| Solutions | Make sure that the RabbitMQ service is running.<br>Make sure that port **5671** is open. |
| Log Messages | Error: Adding logcollector user account.<br>Error: Adding administrator tag to logcollector account.<br>Error: Adding logcollection vhost.<br>Error: Setting permissions to logcollector account in all vhosts. |
| Possible Cause | **rabbitmq-server** was not running when installer tried to create users and vhosts. |
| Solutions | Make sure that the **RabbitMQ** service is running and run below commands manually.<br>`rabbitmqctl -q add_user logcollector netwitness`<br>`rabbitmqctl -q set_user_tags logcollector administrator`<br>`rabbitmqctl -q add_vhost logcollection`<br>`rabbitmqctl -q set_permissions -p / logcollector ".*" ".*" ".*"`<br>`rabbitmqctl -q set_permissions -p logcollection logcollector ".*" ".*" ".*"` |

## Windows Legacy Federation Script Issues

If you see any of the following messages in the federation script log, you may have issues.

| Problem | Possible Symptoms | Solutions |
|---|---|---|
| Federation script started, but the LWC service went down. | NetWitness log shows connection failure exceptions with Windows Legacy Collector. | This issue is fixed automatically after restarting the Windows Legacy service. |

| Problem | Possible Symptoms | Solutions |
|---|---|---|
| LWC is running, but RabbitMQ service is down or restarting. | Federation log file at Windows Legacy side displays an error message about RabbitMQ service being down.<br>The log file to look at is: **C:\NetWitness\ng\logcollector**<br>The following error message is logged in case RabbitMQ is not running:<br>`"Unable to connect to node logcollector@localhost: nodedown"`<br>The following diagnostics messages are displayed:<br>`attempted to contact: [logcollector@localhost]`<br>`logcollector@localhost: * connected to epmd (port 4369) on localhost * epmd reports: node 'logcollector' not running at all other nodes on localhost: ['rabbitmqctl-4084'] * suggestion: start the node` | Run the **federation.bat** script manually at LWC. To run the **federate.bat** script manually, perform the following steps:<br>1. Go to folder C**:\Program Files\NwLogCollector** where the Windows Legacy instance is installed.<br>2. Locate the file **federate.bat i**n this folder. Select the file and right click.<br>3. Select **Run as Administrator**.<br>4. To monitor the log file, navigate to **C:\NetWitness\ng\logcollector\federate.log** while the **federate.bat** script is being executed.<br>**Note:** Make sure the log file does not show any errors while the script is being executed. |
| RabbitMQ service is down on the NetWitness side. | NetWitness User Interface pages do not work. | Restart RabbitMQ service. |
| Customer receives a Health and Wellness notification, or the following Health and Wellness Alarm is displayed: "Communication failure between Master NetWitness Host and a Remote Host" with LWC Host as the Remote IP. | **Federate.bat** script failed to run successfully. | If the **Federate.bat** script did not run correctly, run it manually as described previously. |

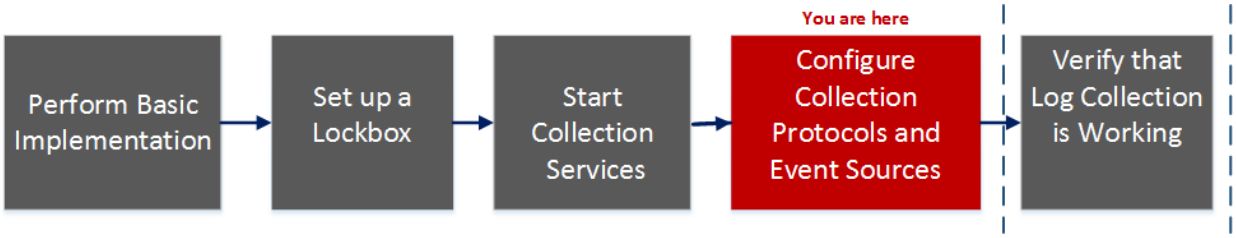
# Reference

## AWS Parameters

This topic provides an overview of the AWS collection configuration parameters for deploying a remote log collection service (VLC) in an Amazon Web Services (AWS) environment.

### Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



### What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

### Related Topics

- Configure AWS (CloudTrail) Event Sources in NetWitness

The following table describes the **Basic** configuration parameter for AWS collection.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Parameter | Description |
|---|---|
| Name * | Name of the event source. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Account Id * | Account Identification code of the S3 Bucket |

| Parameter | Description |
|---|---|
| S3 Bucket Name * | Name of the AWS (CloudTrail) S3 bucket.<br>Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket.<br>Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are:<br>• Bucket names must be at least three and no more than 63 characters long.<br>• Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number.<br>• Bucket names must not be formatted as an IP address (for example, 192.168.5.4).<br>The following examples are **valid** bucket names:<br>• `myawsbucket`<br>• `my.aws.bucket`<br>• `myawsbucket.1`<br>The following examples are **invalid** bucket names:<br>• `.myawsbucket` - Do not start a Bucket Name with a period<br>• `myawsbucket.` - Do not end a Bucket Name with a period<br>• `my..examplebucket` - Only use one period between labels. |
| Access Key * | Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys. |
| Secret Key * | Secret key used to access the S3 bucket. |
| Region * | Region of the S3 bucket. `us-east-1` is the default value. |
| Region Endpoint | Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds. |
| Use Proxy | Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled. |
| Proxy Server | Enter the proxy name you want to connect to access the AWS server. |
| Proxy Port | Enter the port number that connects to the proxy server to access the AWS server. |
| Proxy User | Enter the user name to authenticate with the proxy server. |
| Proxy Password | Enter the password to authenticate with proxy port. |
| Start Date * | Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days. |

| Parameter | Description |
|---|---|
| Log File Prefix | Prefix of the files to be processed.<br>**Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter. |
| Cancel | Closes the dialog without adding the AWS (CloudTrail). |
| OK | Adds the current parameter values as a new AWS (CloudTrail). |

The following table describes the **Advanced** configuration parameter for AWS collection.

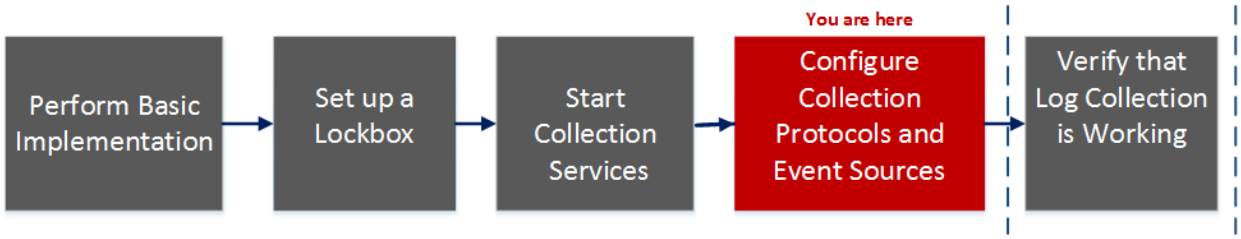
| Parameter | Description |
|---|---|
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables or disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>**On** = enabled<br>• **Verbose** = enabled in verbose mode -adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |
| Command Args | Arguments added to the script. |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is 60.<br>For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy. |
| SSL Enabled | Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.<br>The check box is selected by default. |
| Test Connection | Validates the configuration parameters specified in this dialog are correct. For example, this test validates that:<br>• NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog.<br>• NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely). |

# Azure Parameters

Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## Related Topics

- Configure Azure Event Sources in NetWitness

## Azure Event Source Configuration Parameters

This topic describes the Azure event source configuration parameters.

### Basic Parameters

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Name | Description |
|---|---|
| Name * | Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen. |

| Name | Description |
|---|---|
| Enabled | Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default. |
| Client ID * | The Client ID is found the Azure Application Configure tab. Scroll down until you see it. |
| Client Secret * | When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation.<br>Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later. |
| API Resource Base URL * | Enter `https://management.azure.com/`. Be sure to include the trailing slash (/). |
| Federation Metadata Endpoint * | In your Azure application, click the **View Endpoints** button (near the bottom of the pane).<br>There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here. |
| Subscription ID * | You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left. |
| Tenant Domain * | Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**. |
| Resource Group Names * | In Azure, select Resource groups from the left navigation pane, then select your group. |
| Start Date * | Choose the date from which to start collecting. Default's to the current date. |
| Test Connection | Checks the configuration parameters specified in this dialog to make sure they are correct. |

## Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

| Name | Description |
|---|---|
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |

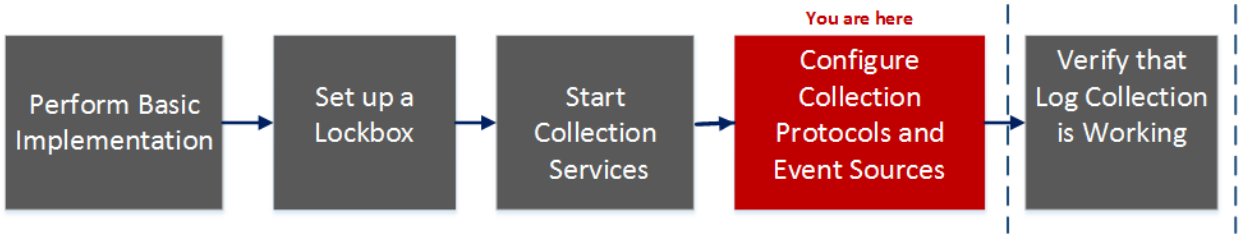
| Name | Description |
|---|---|
| Max Duration Poll | Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit. |
| Max Events Poll | The maximum number of events per polling cycle (how many events collected per polling cycle). |
| Max Idle Time Poll | Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit. |
| Command Args | Optional arguments to be added to the script invocation. |
| Debug | **Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables or disables debug logging for the event source. Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact. |

# Check Point Parameters

The Check Point Collection protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## Related Topics

- Configure Check Point Event Sources in NetWitness

## Check Point Collection Configuration Parameters

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

### Basic Parameters

| Parameter | Description |
|---|---|
| Name* | Name of the event source. |
| Address* | IP Address of the Check Point server. |

| Parameter | Description |
|---|---|
| Server Name* | Name of the Check Point server. |
| Certificate Name | Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab.<br>Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***. |
| Client Distinguished | Enter the Client Distinguished Name from the Check Point server. |
| Client Entity Name | Enter the Client Entity Name from the Check Point server. |
| Server Distinguished | Enter the Server Distinguished Name from the Check Point server. |
| Enabled | Select the check box to enable the event source configuration to start collection. The check box is selected by default. |
| Pull Certificate | Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store. |
| Certificate Server Address | IP Address of the server on which the certificate resides. Defaults to the event source address. |
| Password | Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server. |

## Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

| Parameter | Description |
|---|---|
| Port | Port on the Check Point server that Log Collector connects to. Default value is 18184. |
| Collect Log Type | Type of logs that you want to collect: Valid values are:<br>• **Audit** - collects audit events.<br>• **Security** - collects security events.<br>If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected. |
| Collect Logs From | When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are:<br>• **Now** - Start collecting logs now (at this point in time in the current log file).<br>• **Start of Log** - Collect logs from the beginning of the current log file.<br>If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session. |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |
| Max Duration Poll | The maximum duration of polling cycle (how long the cycle lasts) in seconds. |
| Max Events Poll | The maximum number of events per polling cycle (how many events collected per polling cycle). |
| Max Idle Time Poll | Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value. |
| Forwarder | Enables or disables the Check Point server as a forwarder. By default it is disabled. |

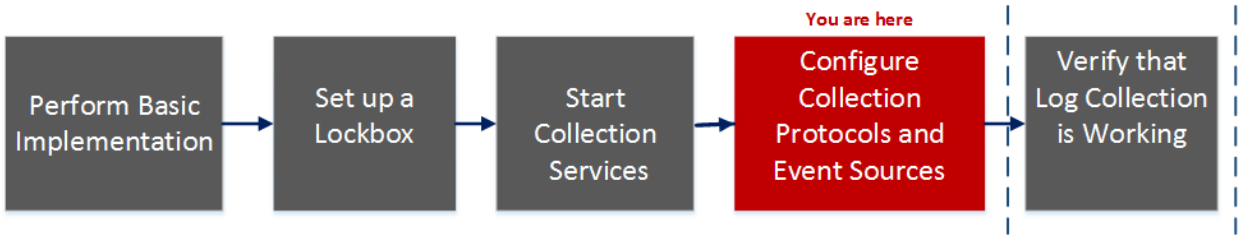
| Parameter | Description |
|---|---|
| Log Type (Name Value Pair) | Logs from the event source in Name Value format. By default it is disabled. |
| Debug | **Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br>Enables and disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br>If you change this value, the change takes effect immediately (no restart required). |

# File Parameters

This topic describes the File Collection configuration parameters.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |

## File Collection Event Source Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Name | Description |
|---|---|

| Name | Description |
|---|---|
| File Directory* | Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression:<br>**[_a-zA-Z][_a-zA-Z0-9]***<br>This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data.<br>After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory. |
| Address* | IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name. |
| File Spec | Regular expression. For example, **^.*$** = process everything. |
| File Encoding | Character encoding used by the syslog senders to this port. Defaults to UTF-8.<br>**Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8.<br>RSA has tested the following values:<br>• EUC-KR<br>• SJIS<br>• GB3212/GBK<br>• ISO_8859-1 (German)<br>• ISO_8859-7 (Greek) |
| Cancel | Closes the dialog without making adding an event source type. |
| OK | Adds the parameters for the event source. |

The following table describes the **Advanced** configuration parameter for File collection.

| Name | Description |
|---|---|
| Ignore Encoding Conversion Errors | Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default.<br>**Caution:** This may cause parsing and transformation errors. |

| Name | Description |
|---|---|
| File Disk Quota | Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing.<br><br>**Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB.<br><br>Valid value is a number in the **0** to **100** range. **10** is the default. |
| Sequential Processing | Sequential processing flag:<br>• Select the check box (default) to process event source files in collection order.<br>• Do not select the checkbox to process event source files in parallel. |
| Save On Error | Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default. |
| Save On Success | Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default. |
| Eventsource SSH Key | SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys.<br><br>**Note:** If File collection is stopped, NetWitness does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key.<br>You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness will not update the **authorized_keys** file until File collection is restarted. |
| Manage Error Files | By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these:<br>• Maximum space allotted to error files in the **Error Files Size** parameter.<br>• Maximum number of error files allowed in **Error Files Count** parameter.<br><br>A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.<br><br>Select the check box to manage error files. The check box is not selected by default. |

| Name | Description |
|---|---|
| Error Files Size | Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness saves error files. The value that you specify is the maximum total size of all the files in the error directory.<br>Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Error Files Count | Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Error Files Reduction % | Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first.<br>Valid value is a number in the **0** to **100** range. **10** is the default. |
| Manage Saved Files | Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these:<br>• Maximum space allotted to saved files in the **Saved Files Size** parameter.<br>• Maximum number of saved files allowed in **Saved Files Count** parameter.<br>A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. |
| Saved Files Size | Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Saved Files Count | Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default.<br>If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service. |
| Saved File Reduction % | Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first.<br>Valid value is a number in the **0** to **100** range. **10** is the default. |

| Name | Description |
| --- | --- |
| Debug | **Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br><br>Enables or disables debug logging for the event source.<br>Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact.<br><br>If you change this value, the change takes effect immediately (no restart required). |

# Log Collection Service System View

A Log Collector is a service that runs on a Log Decoder host (referred to as a Local Collector) or sends events from a Remote Collector to a Local Collector, and is configured and managed in a similar way to a Log Decoder.

To access the Log Collection Service System view, go to (Admin) > Services and select a Log Collector service, then select View > System.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings | Set Up a Lockbox |

## Quick Look

From the Log Collector Service Information Toolbar, you can manage event data using the Collection icon to start event data from a stopped protocol or stop collecting data from a started protocol. From the Host Tasks icon, you can select tasks that you want to run. You can also shutdown your service and reboot your service from the Service Information Toolbar.

# ODBC Event Source Configuration Parameters

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

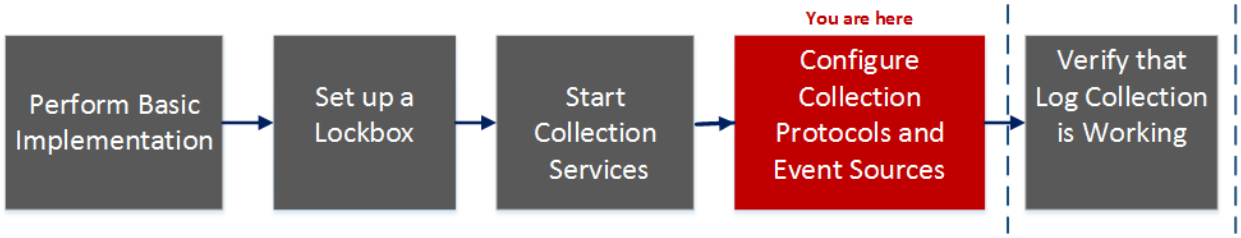
## Access ODBC Configuration Parameters

### To access the ODBC Event Source Configuration Parameters:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/Config** from the drop-down menu.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation. | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

# Data Source Name (DSN) Parameters

Use the Sources panel to review, add, modify, and delete Data Source Name (DSN) parameters.

## Sources Panel

An ODBC DSN tells the Log Collector how to reach an ODBC endpoint. You refer to an ODBC DSN when you configure a data source name with information such as which ODBC driver to use or the host name and port of the ODBC endpoint.

An ODBC DSN is a sequence of name-value pairs. For information about the valid names for a given ODBC data source type, such as Sybase, Microsoft SQL Server, or Oracle, please download the *DataDirect Connect Series for ODBC User's Guide and DataDirect Connect Series for ODBC User's Guide* in the Progress DataDirect Document Library.

## Toolbar

The following table provides descriptions of the toolbar options.

| Option | Description |
|---|---|
| | Opens the Add DSN dialog in which you add an event source for the event source type you selected in the Event Categories panel. |
|  | Deletes the selected event sources. |
| | Opens the Edit DSN dialog in which you modify the configuration parameters for the selected event source.<br>When you select multiple event sources, this option opens the Bulk Edit Source dialog in which you can edit the parameters values for the selected file directories. |
|  | Opens the Bulk Add Option dialog in which you can import DSN parameters in bulk from a comma-separated values (CSV) file. The Bulk Add Option dialog has the following two options:<br>• Import CSV File<br>• Paste CSV Content |
|  | Creates a **.csv** file that contains the parameters for the selected DSNs. |
|  | Validates the configuration parameters for the selected ODBC database. |

# Add or Edit DSN Dialog

In this dialog, you add or modify an event source for the selected event source.

## Basic Parameters

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Name | Description |
|---|---|
| DSN* | The data source name (DSN) that defines the database from which to collect events.<br>Select an existing DSN from the drop-down list. For details, see ODBC DSNs Event Source Configuration Parameters. |
| Username* | User name that the data source name uses to connect to the database. You must specify a user name when you create the event source. |
| Password | Password that the data source name uses to connect to the database.<br>**Caution:** The password is encrypted internally and is displayed in its encrypted form. |
| Enabled | Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default. |
| Address* | For ODBC, this field is not used. The Log Collector uses the address in the **ODBC.ini** file. |

## Advanced Parameters

| Name | Description |
|---|---|
| Max Cell Size | Maximum size in bytes of the data that the Log Collector can pull from one cell in the database. The default value is **2048**. |
| Nil Value | Character string that the Log Collector displays when NIL is returned for a cell in the database. Default value: “” (null). |
| Polling Interval | Interval (amount of time in seconds) between each poll. The default value is **180**.<br>For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy. |
| Max Events Poll | The maximum number of events per polling cycle (how many events collected per polling cycle). |

| Name | Description |
|---|---|
| Debug | **Caution:** Caution: Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector.<br><br>Enables or disables debug logging for the event source. Valid values are:<br>• **Off** = (default) disabled<br>• **On** = enabled<br>• **Verbose** = enabled in verbose mode -adds thread information and source context information to the messages.<br><br>This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact. |
| Initial Tracking Id | Initial identification code that the Log Collector assigns to this event source if collection is not started. If there is no value for this parameter, the Log Collector starts at the end of the table and only pulls rows after the end of the table as they are added. The default value is "" (null).<br>For Example: 2020-11-11 05:05:11<br><br>**Note:** The Initial Tracking ID format varies based on the format of the tracking column used in the data query in the typespec.<br>For Example: If the tracking column value is in epoch, the Initial Tracking ID must be in the epoch format. |
| Filename | For Microsoft SQL Server Event Sources only, the location of the trace files directory (for example, **C:\MyTraceFiles**).<br><br>Refer to the RSA Microsoft SQL Server Event Source Configuration Guide, located on RSA Link. |
| Test Connection | Checks the configuration parameters specified in this dialog to make sure they are correct. |
| Cancel | Closes the dialog without adding or modifying DSN parameters. |
| OK | Adds or modifies the parameters for the DSN. |

# ODBC DSNs Event Source Configuration Parameters

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

## Access ODBC Configuration Parameters

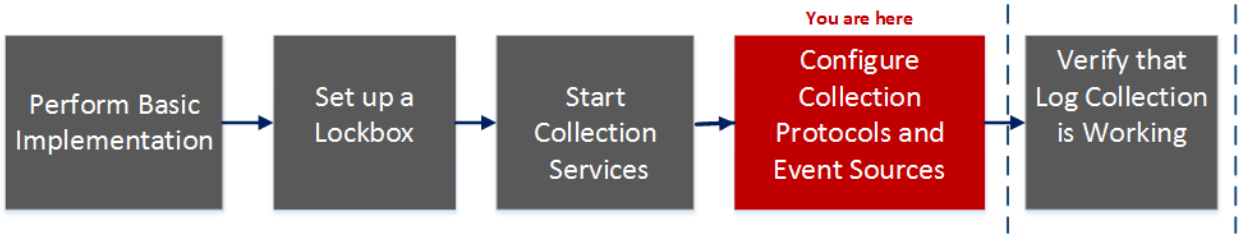
### To access the ODBC Event Source Configuration Parameters:

1. Access the Services view by selecting **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/DSNs** from the drop-down menu.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## ODBC DSN Configuration Parameters

This topic describes the Data Source Names DSNs configuration parameters.

### DSN Panel

In the DSNs panel, you can add, delete, or edit DSNs and the DSN name-value pairs for ODBC Event sources.

| Feature | Description |
|---|---|
| | Displays the Add DSN dialog in which you define a DSN and its parameters. |
|  | Deletes the selected DSNs. |
| | Displays the Edit DSN dialog in which you edit the name-value pairs for the selected DSN. |
|   | Displays the Manage DSN Templates dialog in which you can add or delete DSN name-value pair templates. |
| | Selects DSNs. |
| DSN | Name of the DSN that you added. |
| Parameters | **<name-value for="" p="" pairs="" the=""> </name-value>** |

### Add or Edit DSN Dialog

In this dialog, you add or modify a file directory for the selected event source.

**Note:** Required parameters are marked with an asterisk. All other parameters are optional.

| Feature | Description |
|---|---|
| DSN Template | Select a predefined DSN value name-value pairs template for the DSN. |

| Feature | Description |
|---|---|
| DSN Name* | Add the name of the DSN. You cannot edit a DSN name after you add it.<br>This value must correspond with a DSN entry in the ODBC.ini file. Valid value is a character string that is restricted to the following characters:<br>`[_a-zA-Z][_a-zA-Z0-9]*`<br>This means that the file directory must start with a letter followed by numbers, letters, and underscores (for example, **oracle_executive_compensation**). |
| Parameters | Adds a row in which you can define a parameter name-value pair.<br> Deletes the selected parameter name-value pair.<br> Selects parameter name-value pairs.<br>Name - Enter or modify the parameter name.<br>Value - Enter or modify the value associated with the parameter name. |
| Cancel | Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs. |
| Save | Adds the DSN and its name-value pairs or saves modifications to the name-value pairs. |

## Manage DSN Templates Dialog

In this dialog, you can add or delete DSN name-value pair templates.

| Feature | Description |
|---|---|
| | Template Selection Panel |
| | Opens the Add Template panel in which you can add a DSN name-value pair template. |
|  | Deletes the selected template. |
| | Selects a template for deletion or modification. |
| | Add Template Panel |
| | Adds a value pair row. |
|  | Deletes a value pair row. |
| | Selects a value pair row. |

| Feature | Description |
|---|---|
| Name | Enter the parameter name. |
| Value | Enter the value associated with the parameter name. |
| Cancel | Cancels any changes you made in the dialog. |
| Save | Adds the DSN and its name-value pairs or saves modifications to the name-value pairs. |
| Close | Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs. |

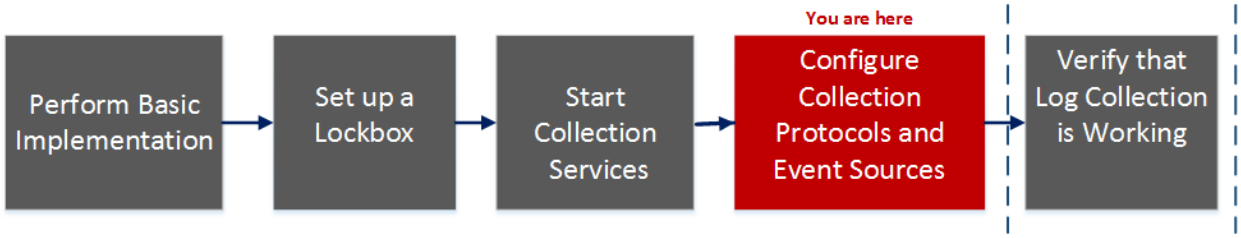
# Remote/Local Collectors Configuration Parameters

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder host, where the events are parsed and stored for subsequent analysis.

This topic introduces features of the Services Config view > Remote Collectors/Local Collectors tab.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I Want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## Related Topics

- Provision Local Collectors and Remote Collectors
- Configure Local and Remote Collectors

## Services Config View

The Services Config view is the view on which you maintain all the Log Collection parameters. The tab in which you maintain the deployment parameters referred to in this guide is the **Remote/Local** Collectors tab:

- If you are configuring a Local Collector , NetWitness displays the **Remote Collectors** tab so that you can configure the Local Collector to pull events from Remote Collectors.
- If you are configuring a Remote Collector , NetWitness displays the **Local Collectors** tab so that you can configure the Remote Collector to push events to a Local Collector .

## Remote Collectors Tab

On a Local Collector, the Remote Collectors panel provides a way to add or delete Remote Collectors from which the Local Collector pulls events.

| Column | Description |
|---|---|
| | Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events. |
|  | Deletes the Remote Collector from the Local Collector Remote Collectors panel. |
| | Displays the **Edit Source** dialog for the selected Remote Collector . |
| | Selects Remote Collectors. |
| Name | Names of the Remote Collectors from which the Local Collector currently pulls events. |
| Address | IP Addresses of the Remote Collectors from which the Local Collector currently pulls events. |
| Collections | Choose which collection protocols that the Remote Collector pushes to a Local Collector.<br>You can select any combination of protocols. If you do not select a protocol, NetWitness selects all protocols. |

## Local Collector Tab

On a Remote Collector , the Local Collector panel provides a way to add or delete the Local Collectors to which you want to the Remote Collector to push events.

Select the **Destination** or **Source** in the **Select Configuration** drop-down menu.

- **Destination** displays the **Add Remote Destination** dialog.
- Source displays the **Add Source** dialog.

The following table describes the Add Source dialog.

| Column | Description |
|---|---|
| | Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events. |
|  | Deletes the Remote Collector from theLocal Collector Remote Collectors panel. |
| | Displays the **Edit Source** dialog for the selected Remote Collector . |
| | Selects Remote Collectors. |

| Column | Description |
|---|---|
| Name | Names of the Remote Collectors from which the Local Collector currently pulls events. |
| Address | IP Addresses of the Remote Collectors from which the Local Collector currently pulls events. |

The following table describes the Local Collectors Panel.

| Column | Description |
|---|---|
| | Displays the **Add Remote Destination** dialog for the Group that you selected. You add destination Local Collectors for this group to which you want the Remote Collector to push events. |
|  | Deletes the destination Log Collector from the group. |
| | Displays the **Edit Remote Destination** dialog for the selected destination Local Collector . |
| | Selects a destination Local Collector . |
| Destination Name | Displays the name of the destination Local Collector . |
| Address | Displays the IP address of the destination Local Collector . |
| Collections | Choose which collection protocols that the Local Collector pulls from a Remote Collector.<br>You can select any combination of protocols. If you do not select a protocol, NetWitness selects all protocols. |

# Log Collection Tabs

This topic describes the tabs available in the Log Collection view.

## Access Log Collection View

### To access the log collection view:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Select any of the available tabs to view or update the corresponding parameters.

## Available Tabs

Use the (Admin) > Services view to maintain Log Collection parameters. It has the following tabs:

- **General**: contains high-level parameters that govern the operation of the Log Collector service and each collection protocol. See Log Collection General Tab for details.
- **Remote Collectors**: use this tab to set up remote collectors. See Configure Local and Remote Collectors for details.
- **Files**: provides an interface for editing Log Collector configuration files.
- **Event Sources**: use this tab to configure collection for your event sources. See Log Collection Event Sources Tab for details.
- **Event Destinations**: Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector. See Log Collection Event Destinations Tab for details.
- **Settings**: contains parameters for Lockbox security setup, and certificate management.
- **Appliance Service Configuration**: contains configuration parameters for the RSA NetWitness Core Appliance service.

Please refer to the **Files** tab and the **Appliance Service Configuration** tab in the *Host and Services Configuration Guide* for information on the configuration parameters on these tabs.

# Log Collection General Tab

This topic introduces features of the service Config view > General tab that relate specifically to Log Collector .

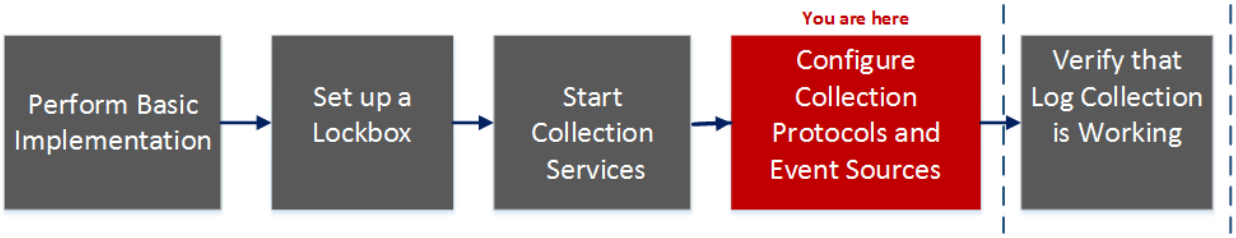
### To access the Log Collection General tab:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Click > **View > Config**.

   The **Service Config** view is displayed with the Log Collector **General** tab open.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation. | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | *Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## Related Topics

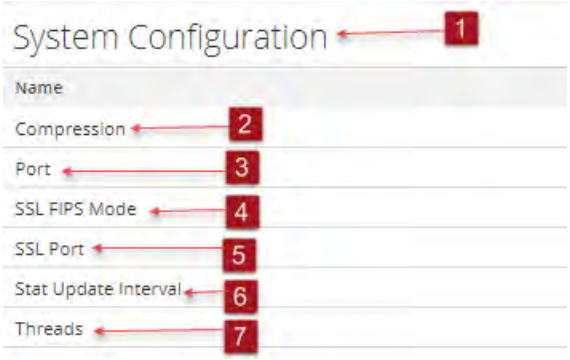
- Configure SDEE Event Sources in NetWitness
- Configure SNMP Event Sources in NetWitness
- Configure Syslog Event Sources
- Configure VMware Event Sources in NetWitness
- Configure Windows Event Sources in NetWitness
- Windows Legacy and NetApp Collection Configuration

## Quick Look

The RSA NetWitness administrator must configure event sources to send logs to the collectors. When event sources are configured they poll event sources, retrieve logs, and send the event data to NetWitness ).

## System Configuration Panel

The System Configuration panel manages service configuration for a NetWitness service. When a service is first added, default values are in effect. You can edit these values to tune performance. Refer to the **General** tab for a description of these parameters.



| | |
|---|---|
| 1 | System Configuration Panel manages service configuration for a NetWitness service. |
| 2 | Compression: The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**.<br>A change in value is effective immediately for all subsequent connections. |
| 3 | Port: The port on which the service listens. The ports are:<br>• 50001 for Log Collectors |

- 50002 for Log Decoders
- 50003 for Brokers
- 50004 for Decoders
- 50005 for Concentrators
- 50007 for other services

4 SSL FIPS Mode: When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.

5 SSL Port: The NetWitness Core SSL port on which the service listens. The ports are:

- 56001 for Log Collectors
- 56002 for Log Decoders
- 56003 for Brokers
- 56004 for Decoders
- 56005 for Concentrators
- 56007 for other services

6 Stat Update Interval: The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**.
A change in value is effective immediately.

7 Threads: The number of threads in the thread pool to handle incoming requests. A setting of 0 lets the system decide. The default value is 15.
A change takes effect on service restart.

## Collector Configuration Panel

The Collector Configuration panel provides a way to enable automatic start of log collection by event source type.

1 Collector Configuration Panel provides a way to enable automatic start of log collection by event source type.

2 Enable All enables the automatic collection for all event types.

**Enable All** = start receiving events and collecting logs for all event types when the Log Collector service starts.

3 Disable all disables the automatic collection for all event types.

**Disable All** = (default) do not receive event data for all event types until you explicitly start collection.

4 Start Collection on Service Startup enables automatic start, per event source type, of log collection when the Log Collector service starts. Valid values are:

- Selected = start collecting logs when the Log Collector service starts.
- Not selected = (default) do not collect event data until you explicitly start collection.

5 **Apply**: Click **Apply** to save the changes to the parameter values.

# Log Collection Event Destinations Tab

Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector :

- Log Decoders
- Identity Feed

## Prerequisites

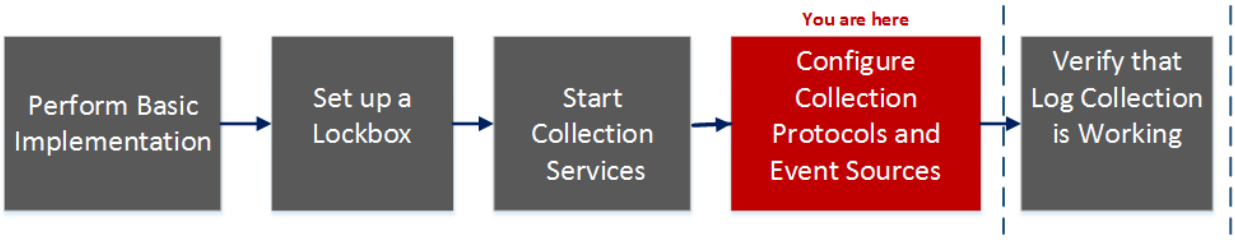
You must implement the following configuration to create an identity feed.

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

**Note:** See the "Create an Identity Feed" topic in the *Live Resource Management Guide* for more information on how to create and investigate on an identity feed.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation. | Basic Implementation |
| Administrator | Set up a to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

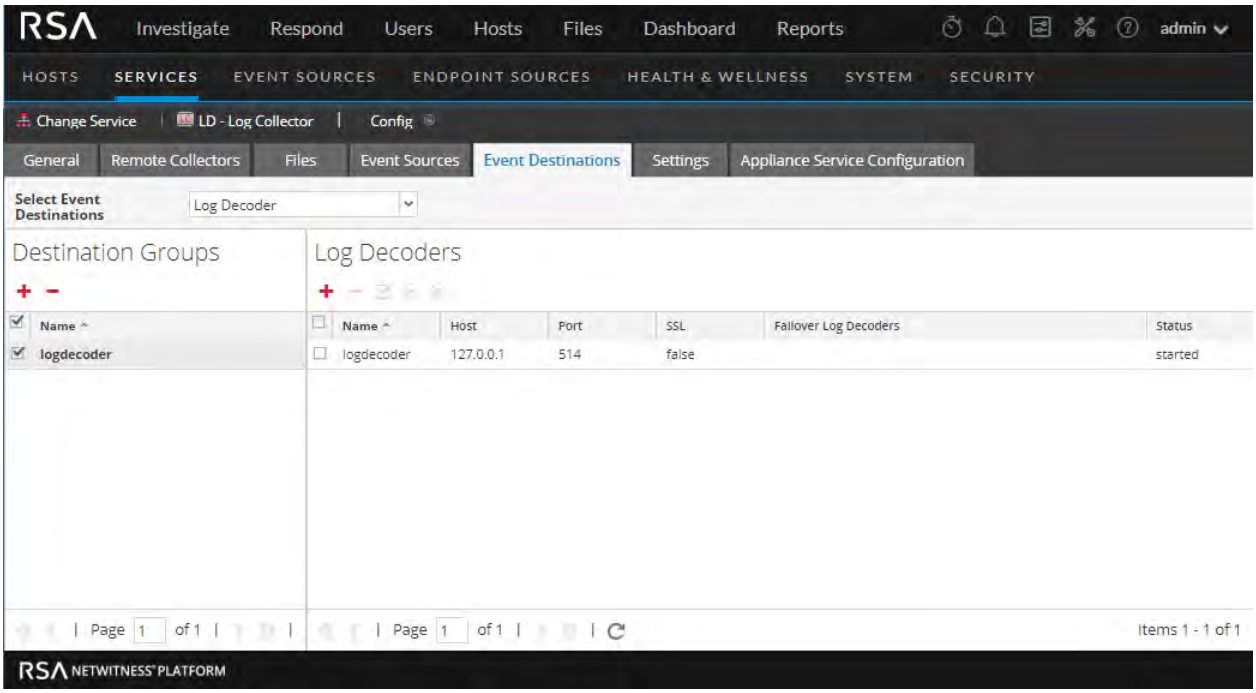
*You can perform this task here.

## Related Topics

- See the **Create an Identity Feed** topic in the *Live Resource Management Guide*.

## Quick Look

The Event Destinations tab of the Log Collection service Config view allows you to configure the destination of event data collected by the Log Collector.



The required permission to access this view is Manage Services.

### To access the Event Destinations tab:

1. Go to **(Admin) > Services** .
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Destinations** tab.
5. In the **Select Event Destinations** drop-down menu:
   - Select **Log Decoder** to configure Log Decoder destinations for event data collected by the Log Collector.

     **Note:** You must select a Log Decoder service from the Add Log Decoder Destination dialog, but the remainder of the configuration is done automatically.

   - Select **Identity Feed** to configure an identity feed destination for event data collected by the Log Collector.

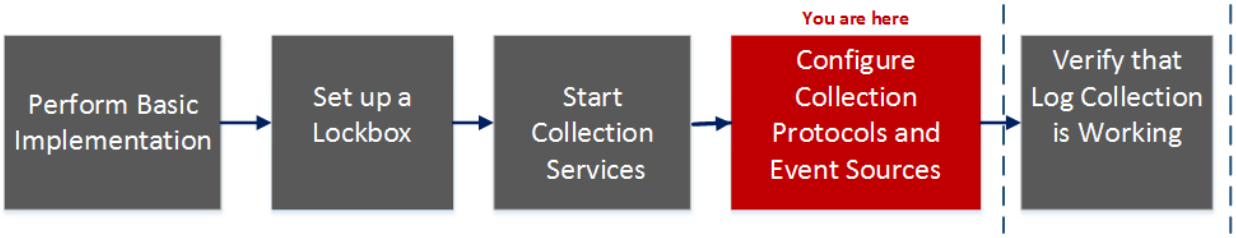
# Log Collection Event Sources Tab

Use the Event Sources tab to configure the AWS (CloudTrail), Check Point, File, ODBC, SDEE, Logstash, SNMP, Syslog, SNMP, VMware, Windows, and Windows Legacy event sources.

To access the Event Sources tab, go to (Admin) > **Services** > select **Log Collection service** > **View** > **Config** > **Event Sources**) .

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation. | Basic Implementation |
| Administrator | Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | *Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

*You can perform this task here.

## Related Topics

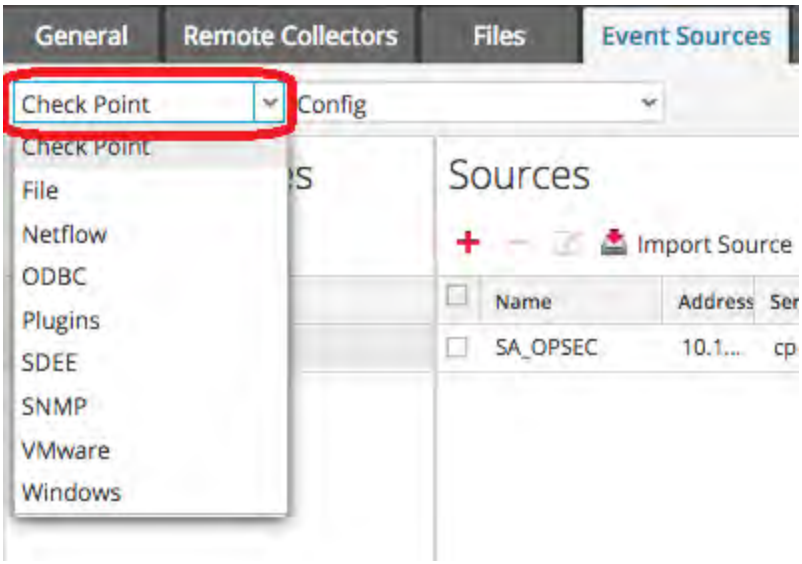
- Configure AWS (CloudTrail) Event Sources in NetWitness
- Configure Check Point Event Sources in NetWitness
- Configure File Event Sources in NetWitness
- Configure ODBC Event Sources in NetWitness
- Configure SDEE Event Sources in NetWitness
- Configure SNMP Event Sources in NetWitness

- Configure Syslog Event Sources
- Configure VMware Event Sources in NetWitness
- Configure Windows Event Sources in NetWitness
- Configure Logstash Event Sources in NetWitness
- Windows Legacy and NetApp Collection Configuration

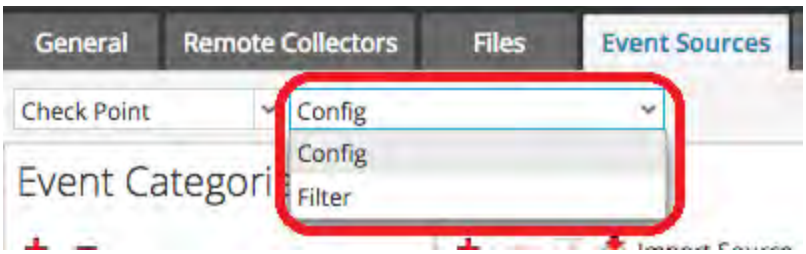
## Quick Look

The Config view has two drop-down menus:

- The left-most menu lists all of the available collection protocols.



- The right-most menu has two choices: **Config** and **Filter**.



The Config view in the Event sources tab has two panels: Event Categories and Sources.

**Note:** For details on the Filter menu item, see Configure Event Filters for a Collector.

### Event Source Types Menu

The Log Collector Event Sources tab has a two-box, drop-down menu in which you select the collection protocol and any supporting parameters for that protocol.

In the left box, you select one of the following protocols: Check Point, File, ODBC, Plugins, SDEE, SNMP, SNMP, VMware, Windows, and Windows Legacy.

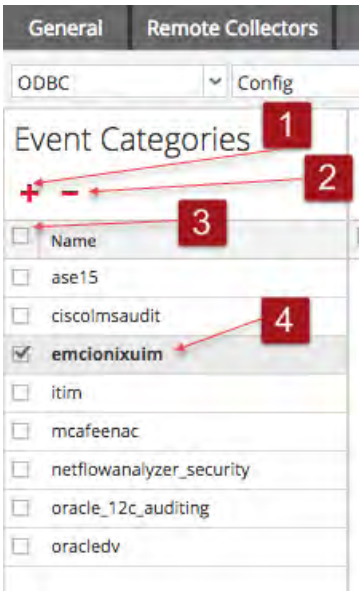
In the right box, you select:

- Config to configure the generic event source parameters for the type you selected in the left drop-down. All generic Config panels have a toolbar with these options:
  - Add, Edit, and Delete
  - Import (also Import Source, Import DSN)
  - Export (also Export Source, Export DSN)
- For ODBC, SNMP, and Windows only:
  - For ODBC, DSNs to configure
  - For SNMP, SNMP v3 User Manager
  - For Windows, Kerberos Realm Configuration

Selecting an option displays a configuration panel where you configure the collection parameters for the event source. The configuration panels are slightly different for different event sources and are described separately.

## Event Categories Panel

Once you select a collection protocol, the Event Categories panel is populated with all of the event sources that you have configured for that collection protocol. For example, the following image shows ODBC event sources that have been configured:



The Event Categories panel provides a way to add or delete event source types.

| | |
|---|---|
| 1 | Displays the Available Event Source Types dialog from which you select the event source type for which you want to define parameters. |
| 2 | Deletes the selected event source types from the Event Categories panel. |

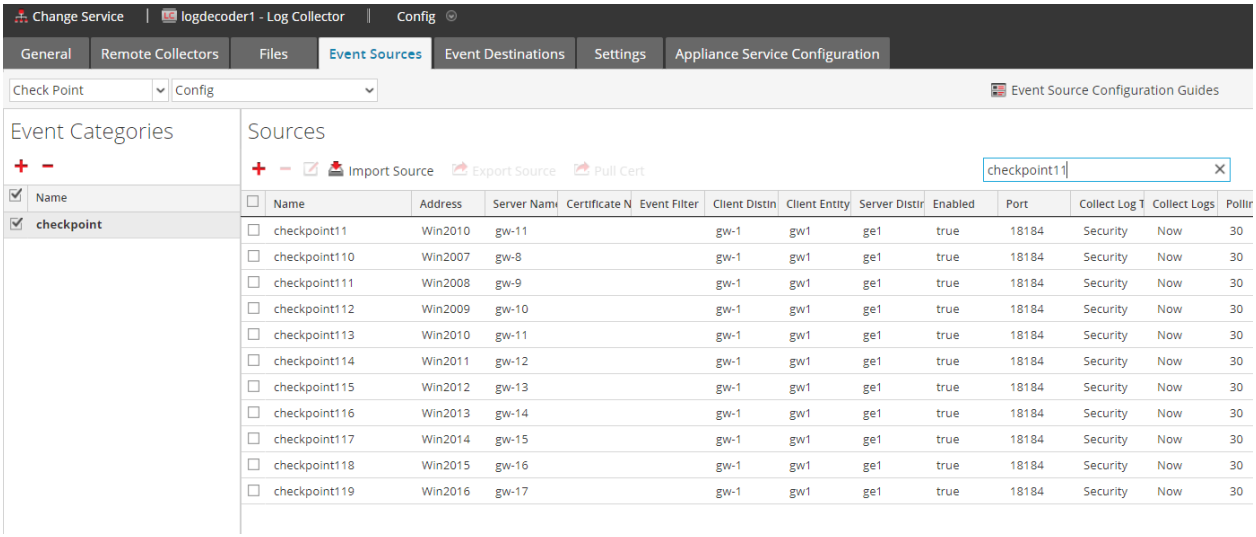
3 Selects event source types.

4 Displays the name of the event source types that you have added.

## Sources Panel

The Sources panel lists the values of the parameters for the selected event source type. For details, see the individual collection protocol topics.

Below is an example of a list of Check Point event sources. Note that the result set has been limited to sources whose names contain the string **checkpoint11**.



# Log Collection Settings Tab

Use the Settings tab to:

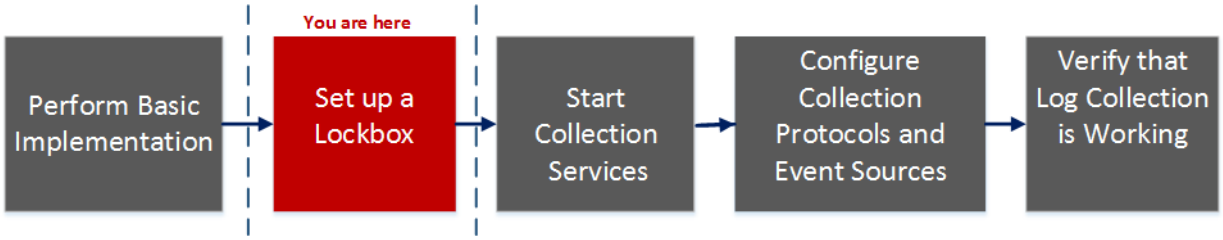
- Set up a lockbox
- Reset Stable System value
- Manage certificates

**Caution:** If the host name on which the Log Collector is installed is changed after installation, the Log Collector will fail to collect events from event sources. You must reset stable system values if the hostname changes.

To access the Log Collection Settings Tab, go to (Admin) > Services. In the Services grid, select a Log Collector Service. Click Actions menu cropped under Actions and select View > Config.

## Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | Perform basic Log Collection implementation. | Basic Implementation |
| Administrator | *Set up a lockbox to maintain lockbox settings. | Set Up a Lockbox |
| Administrator | Start Log Collection services. | Start Collection Services |
| Administrator | Configure Log Collection protocols and event sources. | Configure Collection Protocols and Event Sources |
| Administrator | Verify that Log Collection is working. | Verify That Log Collection Is Working |

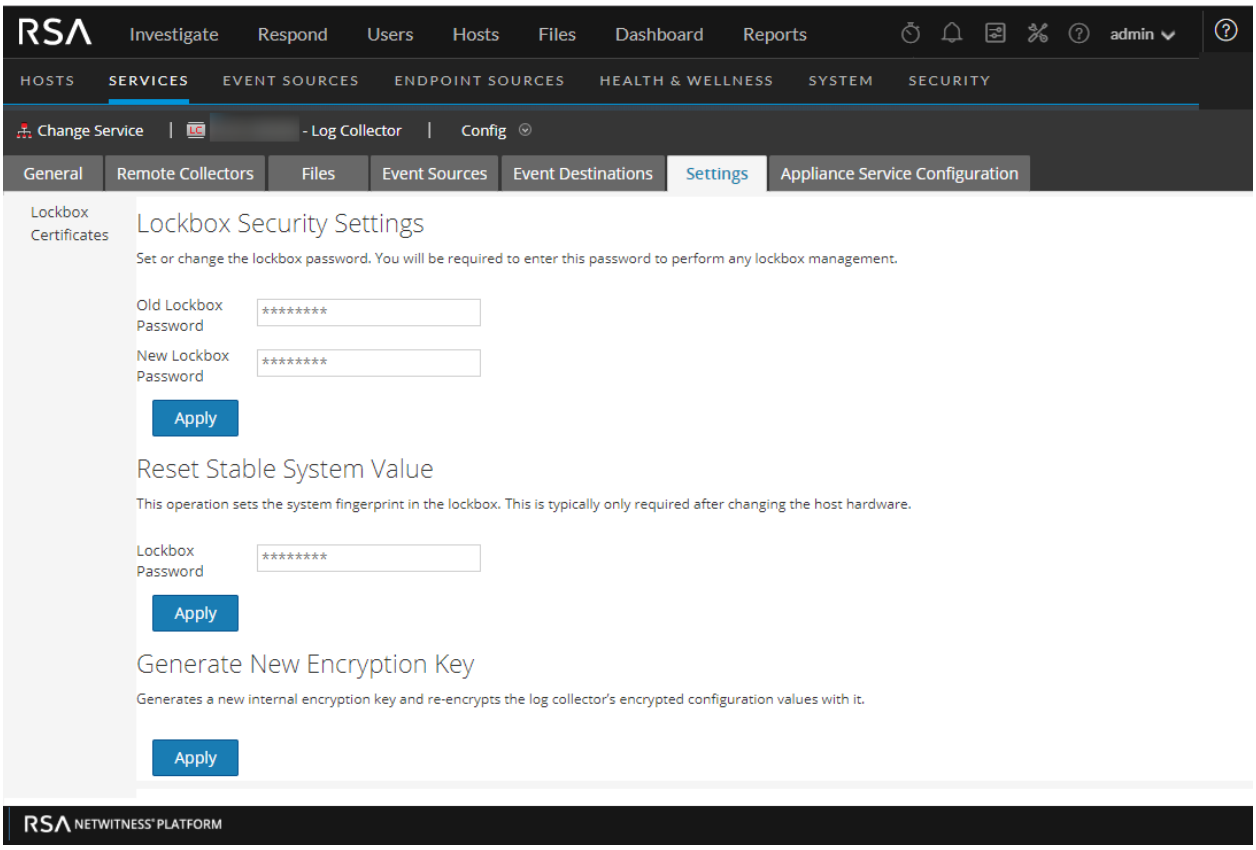
*You can perform this task here.

## Related Topics

- See the "Create an Identity Feed topic" in the *Live Resource Management Guide*.

## Quick Look

This is an example of the Settings tab.



# Troubleshoot Log Collection

This topic describes the format and content of Log Collection Troubleshooting. NetWitness informs you of Log Collector problems or potential problems in the following two ways.

- Log files.
- Health and Wellness Monitoring views.

## Junk Syslog Messages

The remote log collector has been made looser in regards to how it handles syslog messages. This was done to reduce the number of dropped messages due to missing parts of the header, or for other minor formatting errors. However, this might also allow syslog event messages that contain junk to get through the parser. If you see such messages in the system, you can add a syslog collection filter to remove events that are sending these messages.

## Log Files

If you have an issue with a particular event source collection protocol, you can review debug logs to investigate this issue. Each event source has a Debug parameter that you can enable (set parameter to On or Verbose) to capture these logs.

**Caution:** Only enable debugging if you have a problem with this event source and you need to investigate this problem. If you have Debug enabled all the time it will adversely affect the performance of the Log Collector.

## Health and Wellness Monitoring

Health and Wellness monitoring makes you aware of potential hardware and software problems in a timely manner so that you can avoid to outages. RSA recommends that you monitor the Log Collector statistical fields to make sure that the service is operating efficiently and is not at or near the maximum values you have configured. You can monitor the following statistics (Stats) described in the (Admin) > Health & Wellness view.

## Sample Troubleshooting Format

RSA NetWitness returns the following types of error messages in the log files for.

| | |
|---|---|
| Log Messages | `timestamp failure (LogCollection) Message-Broker Statistics:...`<br>`timestamp failure (AMQPClientBaseLogCollection):...`<br>`timestamp failure (MessageBrokerLogReceiver):...` |
| Possible | The Log Collector cannot reach the Message Broker because the Message Broker: |

| | |
|---|---|
| Cause | • has stopped running<br>• has erroneous connection settings |
| Solutions | 1. `<use the="the" systemctl="systemctl" command="command" on="on" console="console" to="to" check="check" status="status" of="of" message="message" broker="broker" shell="shell" console.="console.">returns the following if the message broker is not running:</use>`<br>`prompt$ systemctl status rabbitmq-server`<br>`rabbitmq start/running, process 10916`<br>2. Start the RabbitMQ Message Broker on event-broker node in the Explore view:<br>  |

# Troubleshooting Logstash

| | |
|---|---|
| Issue | Unable to re-configure or edit the custom configuration in Logstash. |
| Possible Cause | While re-configuring the events source configuration, if you update the Event source host's IP and save it, Logstash still connects to the old IP.<br>For example, suppose the Elasticsearch IP is not reachable due to some reason, and you updated the correct IP, but Logstash connects to the old IP (which is not reachable). |
| Solution | You must restart the Logstash service:<br>`systemctl restart logstash` |

| | |
|---|---|
| Issue | NetWitness Export connector UI does not validate user aggregation permissions. |
| Possible Cause | Users without aggregation permission are also allowed to configure NetWitness Export Connector in the UI. |
| Solution | Make sure you configure the NetWitness Export Connector Event source with the right |

| | |
|---|---|
| | aggregation permissions. |

| | |
|---|---|
| Issue | NetWitness Export Connector UI does not validate user credentials. |
| Possible Cause | NetWitness Export Connector UI displays test configuration successful even if you have configured Export Connector without appropriate aggregation permissions. |
| Solution | Make sure you configure the NetWitness Export Connector Event source using the correct credentials. |

| | |
|---|---|
| Issue | Logstash event source test configuration fails with memory allocation an error "There is insufficient memory for JVM". |
| Possible Cause | Sometimes test configuration fails due to insufficient memory available for JVM. |
| Solution | You must change the JVM -xms to a lower value at `/etc/logstash/jvm.options`. Perform the following:<br>1. Go to `/etc/logstash/jvm.options` and change `-Xms8g` to a lower value as per the memory configuration of the appliance.<br>2. Restart the Logstash service using the following command:<br>`service logstash restart` |

| | |
|---|---|
| Issue | Issue with Logstash Performance. |
| Possible Cause | If EPS is more than 25K, you must increase JVM to get better performance. |
| Solution | You must change the JVM -xmx to a higher value at `/etc/logstash/jvm.options`. Perform the following:<br>1. Go to `/etc/logstash/jvm.options` and update JVM to `-Xmx32g`.<br>2. Restart the Logstash service using the following command:<br>`service logstash restart` |

# Log Parser Customization

**Note:** The JSON Mapping information in this guide applies to NetWitness Version 11.5 and later.

You use the Log Parser Rules view (available from the (Configure) view) to customize rules and to map meta for your log parsers.

The *default log parser* parses logs that do not match any installed log parsers. The information contained in such a log is processed against the default log parser's rules, and metadata is then extracted by those rules and is available for Enrichment, Investigation, Reporting, and Alerting. This provides immediate visibility into logs from custom or unsupported sources.

You can also add or extend a log parser. For example, you may need to parse certain fields differently than in the manner provided by the log parser for a particular event source. You can add rules that change the way meta information is extracted from the logs for the event source. And you can then map the extracted information to NetWitness meta keys.

Finally, you can view and test sample log messages and rules for your log parsers, including the default log parser.

To access this tab, go to **(Configure) > Log Parser Rules**. For more details, see Parser Rules Tab.

## Dynamic Rules

The **Dynamic Rules** entry for a log parser displays the following information:

- The default log parser that parses logs that are not associated with a particular log parser
- Native XML-defined device parsers that have been extended with dynamic log parser rules, and
- User-created custom device parsers used to parse unsupported custom event sources

The dynamic parse rules are used to parse arbitrary values triggered by a literal token on the left hand side of the value in unstructured logs. Currently, this is used to parse name-value pairs.

Following are some examples (the token is in bold red):

```
src: 1.2.3.4
src = 1.2.3.4
src=1.2.3.4
Source address is 1.2.3.4
```

## JSON Mapping

This allows you to parse JSON nodes from Logstash as well as Log Collection Plugins by mapping JSON nodes to an appropriate meta on which the value should be saved.

The **JSON Mappings** for a log parser displays the following information:

- Sample JSON Message - This allows you paste the log messages.
- The list of JSON Mappings: these are the names that represent the meta information.
- Details of each mapping: for each mapping, the display name, path, NetWitness meta key, and a text description.

The JSON mapping functionality is for strictly paring structured JSON logs, and mapping values from the log to meta or fine parsing. The parsing is not applied to arbitrary logs; only logs where we know the exact structure of the data.

For example:

```
{ "event": { "source": { "address": "1.2.3.4", "port":8080 } } }
```

NetWitness knows the structure of logs when it knows the event source type, or when you add specific JSON mappings.

# Add or Delete a Log Parser

**Note:** The information in this topic applies to NetWitness Version 11.2 and later.

For version 11.2, RSA has added the ability to add log parsers through the UI. You can also delete log parsers, as long as they have never been deployed to a Decoder. You can create a new log parser definition from scratch, or extend an existing one.

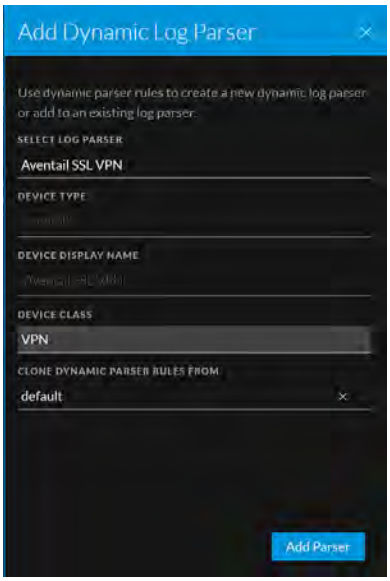
You can add a log parser to extend the functionality for an existing parser. For example, if you have some unknown messages for the Cisco Pix parser, you could add rules to match your unknowns.

**IMPORTANT:** If you are adding a new log parser, for example when onboarding an event source, you must map the event source IP to the new log parser in order for messages to be parsed. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

## Add a Log Parser

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.



3. Fill in details for this dialog box. For details, see Add Dynamic Log Parser Parameters below.
4. Click **Save** to save the new log parser.

   This updates the definition file in the file system. It *does not* deploy the changes.
5. To deploy your changes to all of your Decoders, click **Deploy**.

# Delete a Log Parser

You can use the UI to delete a log parser.

### To delete a log parser:

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser, then click **Delete**.

   Delete Parser dialog box is displayed.
3. Click **Delete Parser** to remove the log parser from the system.

**Note:** If you have encounter any issues when you attempt to delete a parser, see the Troubleshooting section, Delete a Log Parser Manually.

# Add Dynamic Log Parser Parameters

When you are adding a log parser, the following parameters are available.

| Field | Details |
|---|---|
| SELECT LOG PARSER | Select NEW, or choose an existing log parser.<br>By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities.<br>**Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser. |
| DEVICE TYPE | Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers. |
| DEVICE DISPLAY NAME | Enter the display name for the log parser.<br>**Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name. |
| DEVICE CLASS | Select a device class. |
| CLONE DYNAMIC PARSER RULES FROM | Leave blank to start with no rules, or select one of the existing log parsers to clone its rules. |

## Import or Export a Log Parser

To import the log parser:

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** panel, click **Import**.

3. Select a log parser to import.
   The log parser is imported successfully. This will import the selected log parser rules along with the JSON mapping (if any).

To export the log parser:

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. Select the log parser to export.
3. In the **Log Parsers** panel, click **Export**.
   The selected parser is exported successfully in a .json format. This will export the selected log parser rules along with the JSON mapping (if any).

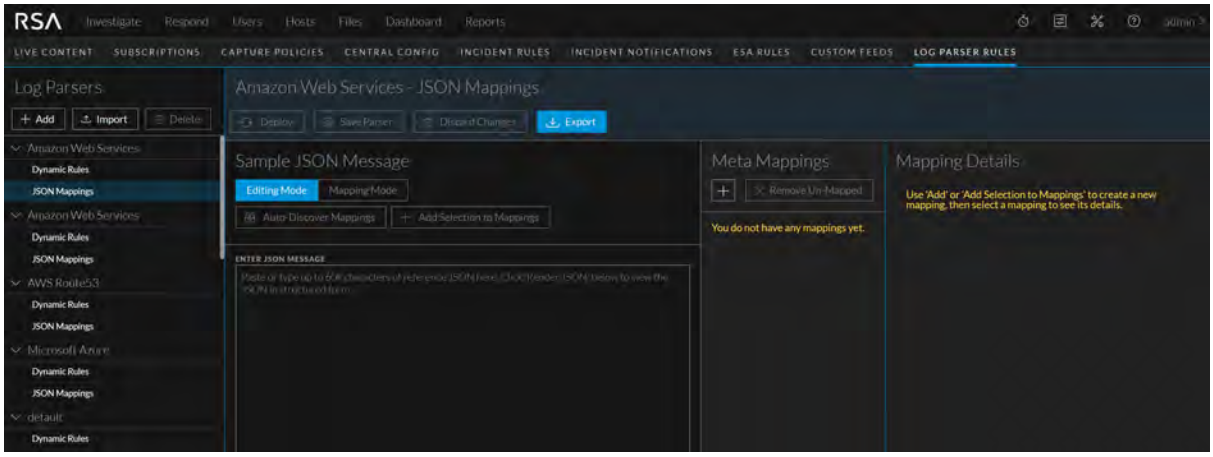
# JSON Mappings

JSON mappings is applicable from version NetWitness Platform 11.5 and Later.

## View JSON Mappings

1. In the NetWitness UI, go to **(Configure) > Log Parser Rules**.
2. From the Log Parsers pane, select a parser, then click JSON Mappings.

   The JSON Mappings and Mapping Details are shown for the parser you selected.



The Mapping Details pane displays the following information.

| Field | Details |
|---|---|
| DISPLAY NAME | This name corresponds to the name displayed in the JSON Mappings panel. |
| PATH | The path to where the values for this portion of the log are stored. |
| DESCRIPTION | Optionally, you can enter a text description for this mapping. |
| META | Select a meta key to which this value from the log is mapped. Select a value from the drop-down menu.<br>Optional if you choose a Value Format. |

| Field | Details |
|---|---|
| VALUE FORMAT | Choose a value format parser onto which to pass this JSON value. You can either select an existing meta or **Custom Regex Type**. If you select custom regex type, you must define the regex and capture to *fine* parse the value in the meta.<br>Optional if you choose a Meta. |
| CUSTOM REGEX TYPE | Select Custom Regex Type from the Value Format drop-down, which allows you to add new custom regex type. |
| REGEX PATTERN | Specify a regex to identify different pieces of data contained within a JSON node value. |
| FIRST CAPTURE | Select a meta key that should be captured first based on the value defined in the Regex pattern. |
| ADD A CAPTURE | New capture field is added. By default, it is loaded with meta keys in the drop-down. You can add maximum of 20 captures and this option will be disabled once it reaches maximum. |

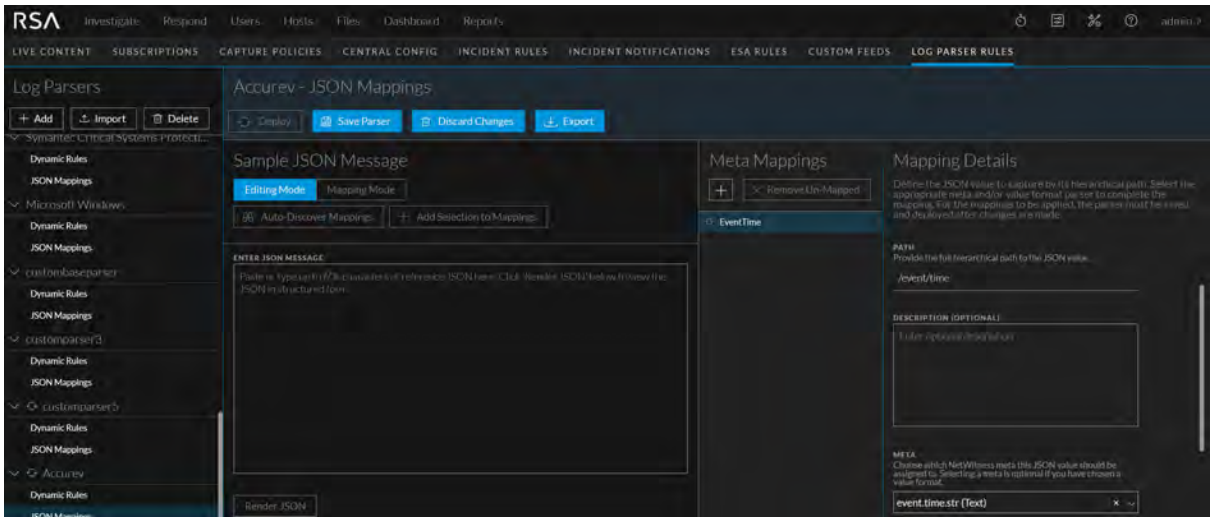
**Note:** You need to select a meta or enter a Value Format, but you do not need to fill in values for both settings.

## Add a JSON Mapping

After you add a parser, as described in Add a Log Parser, you can then add JSON mappings.

1. Follow the procedure to add a parser.
2. Select the **JSON Mappings** entry for the newly-added parser.

   The following screen shows an example where an Accurev is added:



3. Click **Add New** to begin adding a mapping.
4. Enter values for display name, path, meta or value format (or both), and (optionally) a description.
5. Click **Save Parser** to save your new mapping.

# Auto Discover JSON Mappings

Beginning with NetWitness version 11.5.1, you can automatically create the mappings without the need to manually enter the name and path of the mapping.

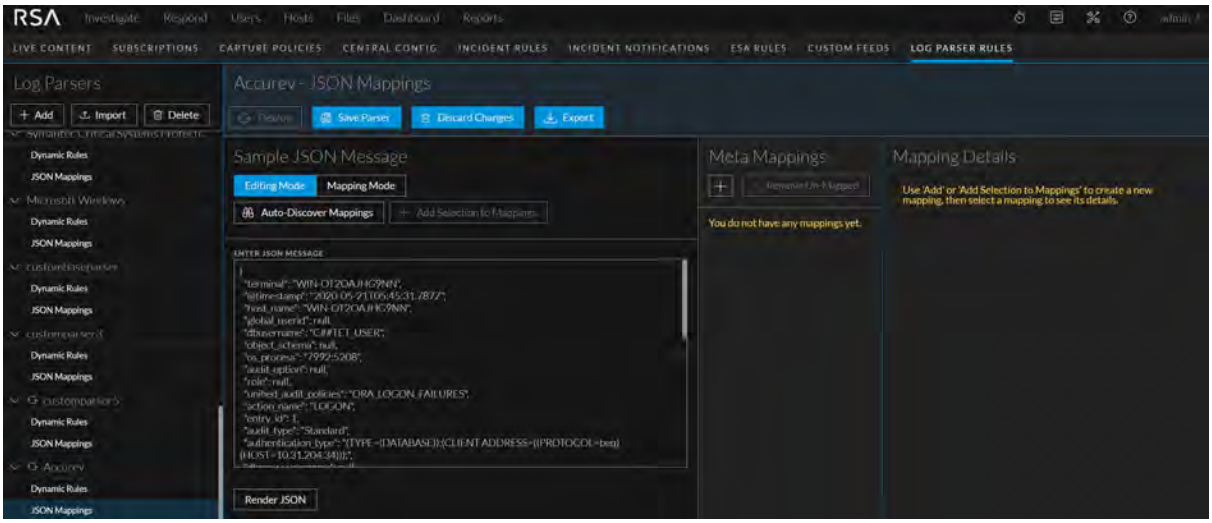
As an example, we are using the following JSON log:

```
{"terminal":"WIN-OT2OAJHG9NN","@timestamp":"2020-05-21T05:45:31.787Z","host_
name":"WIN-OT2OAJHG9NN","global_userid":null,"dbusername":"C##TET_
USER","object_schema":null,"os_process":"7992:5208","audit_
option":null,"role":null,"unified_audit_policies":"ORA_LOGON_
FAILURES","action_name":"LOGON","entry_id":1,"audit_
type":"Standard","authentication_type":"(TYPE=(DATABASE));(CLIENT ADDRESS=
((PROTOCOL=beq)(HOST=10.31.204.34)));","dbproxy_username":null,"external_
userid":null,"@version":"1","new_schema":null,"new_name":null,"statement_
id":1,"proxy_sessionid":0,"os_username":"WIN-
OT2OAJHG9NN\\Administrator","system_privilege":null,"sql_
binds":null,"timestamp":"2020-05-21 10:22:12","client_program_
name":"sqlplus.exe","sessionid":4125005309,"userhost":"WORKGROUP\\WIN-
OT2OAJHG9NN","rman_device_type":null,"object_name":null,"event_timestamp_
utc":"2020-05-20T23:22:12.452Z","system_privilege_used":null,"return_
code":1017,"version":"19.0.0.0.0","instance_name":"orcl","sql_
text":null,"target_user":null,"fga_policy_name":null,"rman_object_
type":null,"dbid":1566661212,"rman_operation":null}
```

### To auto-discover JSON mappings:

1. Select the **JSON Mappings** entry for the appropriate parser.
2. Paste JSON formatted log message in to the **Sample JSON message** text box, and click **Render JSON**.

The screen looks like this:



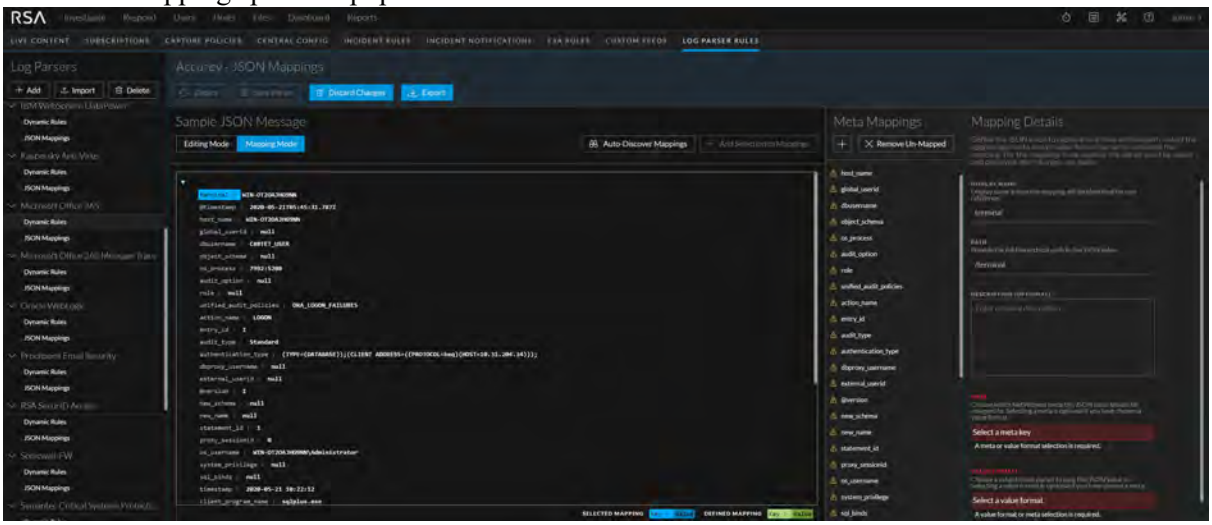
Rendering JSON in Editing Mode allows you to view and edit (if needed) the logs in a pretty format. Additionally, if your text is not valid JSON, the text field is displayed in red.

3. Click **Mapping Mode**, to view the JSON in a collapsable tree format which also highlights the mapping.

**Note:** In **Mapping mode**, you cannot edit the sample Log.

4. Click **Auto-Discover Mappings** to discover the JSON nodes and create mappings.

   The Meta Mappings panel is populated as shown here:



5. After you auto-discover, note that all the mappings are invalid (preceded by this icon: ⚠). You cannot save your changes until all the mappings are valid (mapping is preceded by this icon: 🔄) or removed.

**Note:**
The meta value is highlighted in blue if it matches the selected mapping including the regex (if used).
The meta value is highlighted in green if it matches any other mappings that are not selected.

6. To make a mapping valid, you need to select a **Meta Key** or **Value Format** for all the mappings that you want to parse and save.

**Note:** In the **Value Format** you can either select an existing meta or **Custom Regex Type**.

7. If you want to *fine* parse the value in the meta in the **Value Format** drop-down, select **Custom Regex Type** and enter the regex in the **Regex Pattern** field. For example,`\s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*).`

**Note:** The custom regex will be added to the database, when you **Save Parser**.

8. For a value in the Regex, you can select a meta key and store the capture as below:
   - **First capture**: The first portion of the string, up to the period character is stored to the meta key. For example, `ip.src`
   - To add more capture, click **Add Capture** and select the meta key.
     For more information on Regex, see Regex Values.
9. If there are mappings that you do not want to save, you can select the mapping and click **Delete**. Alternatively, after you complete all of the mappings that you want to keep, you can click **Remove Unmapped** to remove all mappings that you have not yet validated.
10. After you have either completed or removed all of your mappings, click **Save Parser** to save your new mappings. Note that the icon preceding each mapping is removed.

## Deploy JSON Parser

You need to deploy a JSON parser so that logs coming in to any decoder are parsed appropriately and meta is generated and stored correctly.

To deploy a parser, select it from the list and click **Deploy**. The parser, its dynamic rules, and its mappings are sent to all Log Decoders.

**Note:** A JSON parser must have at least one rule or mapping to enable deployment.

# Add or Delete a Log Parser Rule

**Note:** The information in this topic applies to NetWitness Version 11.2 and later.

For version 11.2, RSA has added the ability to create custom rules for log parsers. You can create rules to change how meta values are parsed for a particular log parser. Prior to version 11.2, you could only view the out-of-the-box log parser rules.

## About Log Parser Rules

Parsers are described within their XML files. Each log parser has an XML file that contains rules on how to parse messages for that parser. The out-of-the-box rules are contained within these XML files. For details, see the Log Parser Customization topic in the RSA Link space for RSA Content.

## Custom Log Parser Rules

When you create a new log parser rule, it is saved to another XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

### To create a custom log parser rule:

1. In the NetWitness UI, navigate to (Configure) > **Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser, then **Dynamic Rules**.
3. From the **Rules** pane, click **Add Rule**.

   The Add Rules dialog box is displayed.

   **IMPORTANT:** If you click outside of the Add Rule dialog box before you save your rule, your changes will be lost.

4. Enter a name for the new rule, and click **Add New Rule**.
5. Add at least one meta key and a value to match, in order to create a valid rule.
6. Click **Save** to save your new rule.

   This updates the definition file in the file system. It *does not* deploy the changes.

7. To deploy your changes to all of your Decoders, click **Deploy**.

## Guidelines for Custom Rules

When you are creating a custom rule, keep in mind the following:

- For the list of tokens that match strings from the log file, very short tokens are not useful. For example, a one- or two-character string can match more items than desired.
- Remember to add the delimiter (especially if it is a space) as part of the token. For example "domain=" or "email ".
- When constructing regular expressions, the more complexity you add, the more performance overhead added to the system to compare against the rule.
- To see examples of good tokens and regular expressions, examine the rules that are provided for the default log parser.

# Default Log Parser and Log Parser Rules

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

This tab displays information about pattern matching and rules for the parsers in your system. The features on this tab apply to all log parsers, including the Default Log Parser.

## Default Log Parser

The NetWitness default log parser is used to parse logs coming from the Log Decoder that do not match any of the configured log parsers. This default parser parses these logs by using a default set of rules and tokens.

You can view the default log parser and its details by going to **Admin > Event Sources > Log Parser Rules** and selecting **default** from the Log Parsers panel.

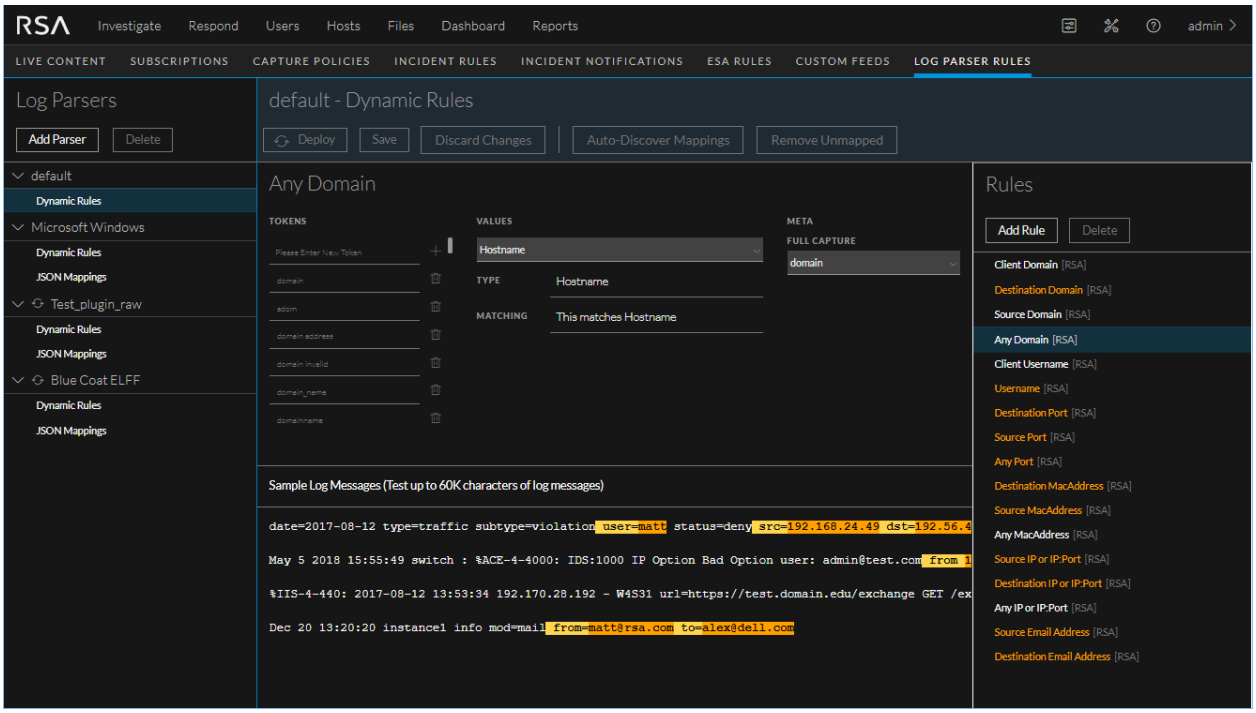
**Note:** If you do not see the default log parser and its rules, you might need to go to Live and deploy the RSA Content to your log decoders. Additionally, you must have at least one Log Decoder at version 11.2 to view the default log parser.

You can view the default log parser and its details, depending on your version:

- For NetWitness version 11.1, go to **Admin > Event Sources > Log Parser Rules**, then select **default** from the Log Parsers panel.
- For NetWitness version 11.2 and later, go to **Configure > Log Parser Rules**, then select **default** from the Log Parsers panel.

**Note:** The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

This is a view of the Log Parser Rules tab, showing the **Default Log Parser** and **Any Domain** rule selected:



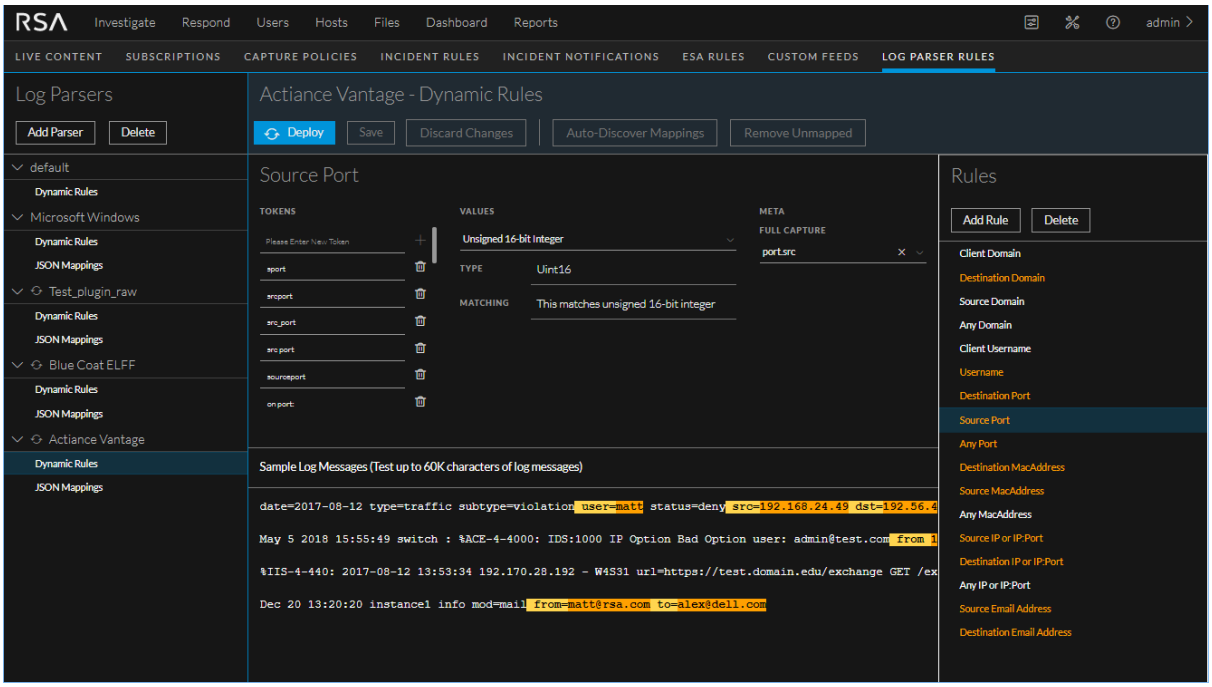
The Parser Rules Tab topic describes the items available for the Log Parsers tab.

## Highlight Matching Patterns

You can paste logs into the Log Messages text box, and the system highlights the matching literals and patterns for the rules for the selected event source type. Use this feature to confirm that the parser is behaving as expected.

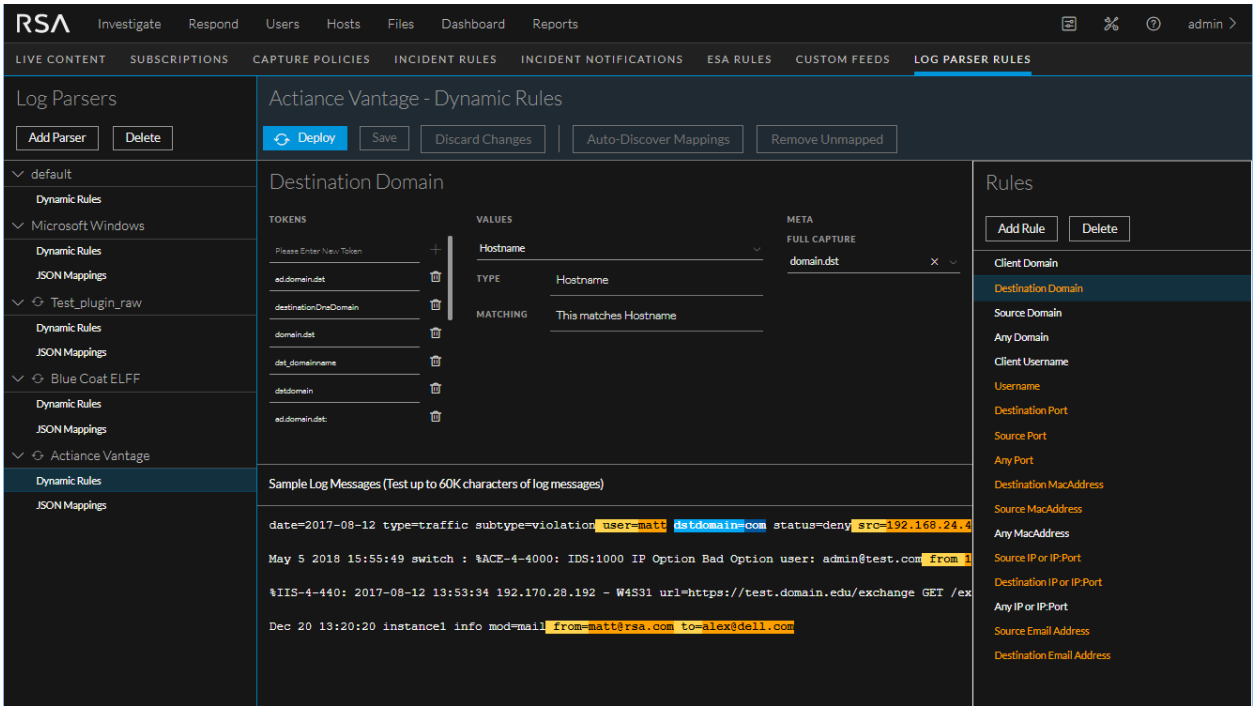
1. In the NetWitness UI, navigate as follows, depending on your version:
   - For NetWitness version 11.1, go to **Admin > Event Sources > Log Parser Rules**.
   - For NetWitness version 11.2 and later, go to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, select the **Dynamic Rules** entry for a log parser.
3. From the **Rules** pane, select a rule.

   For example, this screen shows the **Source Port** rule for the **Actiance Vantage** log parser:



4. Add text or paste in a sample log message.

Strings that match tokens for the selected rule are highlighted in blue. Strings that match other rules for the parser (and the rules themselves) are highlighted in orange.



For example, in the previous screen, note:

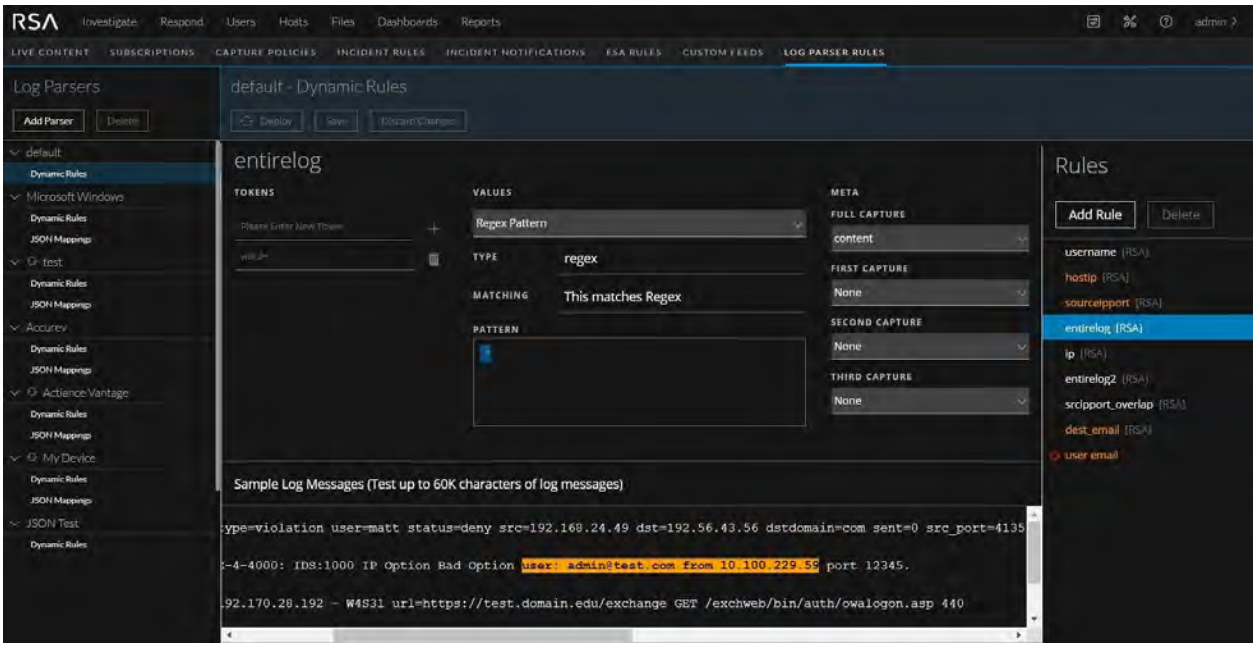
- The destination domain address, matching the **dstdomain** token, is highlighted in blue. The token is in dark blue, and the matching string is highlighted in light blue. This is because the **Destination Domain** is the currently selected Rule.
- The strings highlighted in orange match tokens for rules for **Username**, **Source IP or IP:Port**, **Destination IP or IP:Port**, **Source Port**, **Source Email Address**, and **Destination Email Address**. This is because they are in rules for the default parser that are not currently selected.

## Highlight Overlapping Patterns

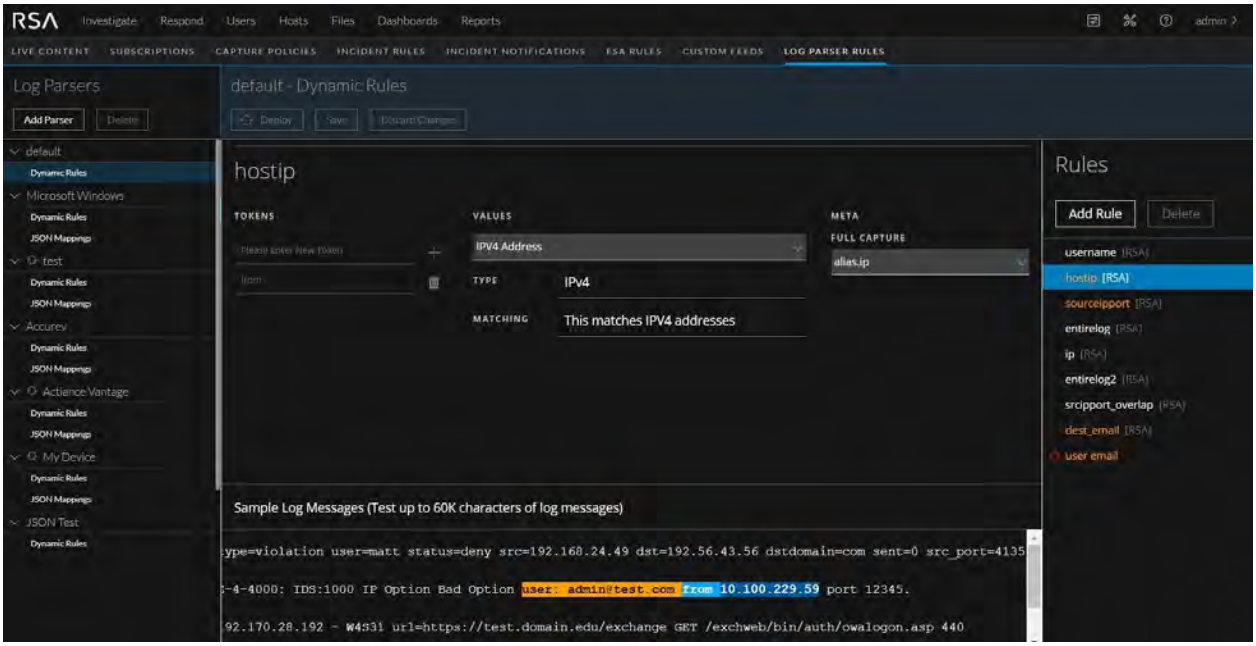
When you have patterns that overlap rules (that is, one pattern matches more than one rule), the behavior is as follows:

- The pattern is displayed in a single color (yellow)
- When you select one of the matching rules, the exactly-matched pattern is displayed in light and dark blue

For example, the pattern `user: admin@test.com from 10.100.229.59` matches several rules.



When you select the **hostip** rule, the highlighting that matches only this rule is shown in dark and light blue.



# Use Cases

This topic describes the procedures you use to either on board a new event source, or to extend the parsing capabilities for an existing log parser.

## Use Case 1: On Board a New Event Source

In this case, a customer has an event source and wants to add it into the NetWitness. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

- If the new rules apply to all parsers, you can add them to the Default parser.
- If not, add them only to the new log parser you are creating.

VI. Save the new rules, and deploy them to all Log Decoders.

VII. Map the IP address for the newly added event source to the newly-created log parser. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

## Use Case 2: Modify an Existing Parser

In this case, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

VI. Save the new rules, and deploy them to all Log Decoders.

For a detailed walk through of some of the steps in these use cases, see Extend an Existing Log Parser Example.

# Extend an Existing Log Parser Example

**Note:** The information in this topic applies to NetWitness Version 11.2 and later.

Parse Rules can be used to parse unknown logs from existing devices. If a log is identified as a particular type (**device.type** is populated), and is not already being parsed (**msg.id** is not populated), then Parse Rules can be added to pull out relevant data from these logs.

If the neither **device.type** nor **msg.id** are populated for the logs from an existing device, then you need to map the device before Parse Rules can be processed against these logs.

**Note:** If a log message is already being parsed (**msg.id** is populated) then Parse Rules will not be processed against that log.

## Task Overview

In this example, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the CONFIGURE > Log Parser Rules view, Add the Log Parser

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules as described in Add Rules and Deploy.

VI. Save the new rules, and deploy them to all Log Decoders.

## Notes

**Note:** All the procedures in the topic use the CONFIGURE > Log Parser Rules view.

In the Log Parser Rules tab, you may see the Refresh icon ( ) next to an item. This indicates that the item has undeployed changes.

## Add the Log Parser

The first step in the process is to add a log parser, based on an existing log parser that you want to customize.

### To add a log parser

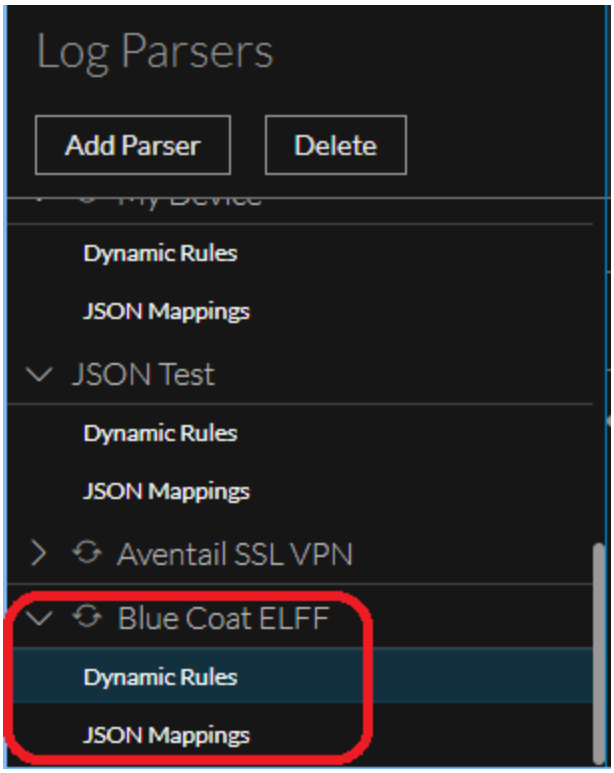
1. In the NetWitness menu, navigate to **(Configure) > Log Parser Rules**.
2. In the Log Parsers panel, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. In the **SELECT LOG PARSER** field, select the existing parser to extend. In this example, we use Blue coat ELFF.

   **Note:** Values for Device Type, Device Display Name, and Device Class are filled in automatically, based on the log parser you selected.

   You can clone the rules from any of your existing parsers, including the **default** parser. For simplicity, in this example we leave this field blank: thus, only the rules we create are added to the new parser.
4. Click **Add Parser** to create the new parser.

The new parser is listed in the Log Parsers panel. Note the symbol next to the new parser—this indicates that your changes have not yet been saved.



## About Custom Rules

When you create a new log parser rule, it is saved to an XML definition file for the parser. These files are known as token files. This is important, because the built-in rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

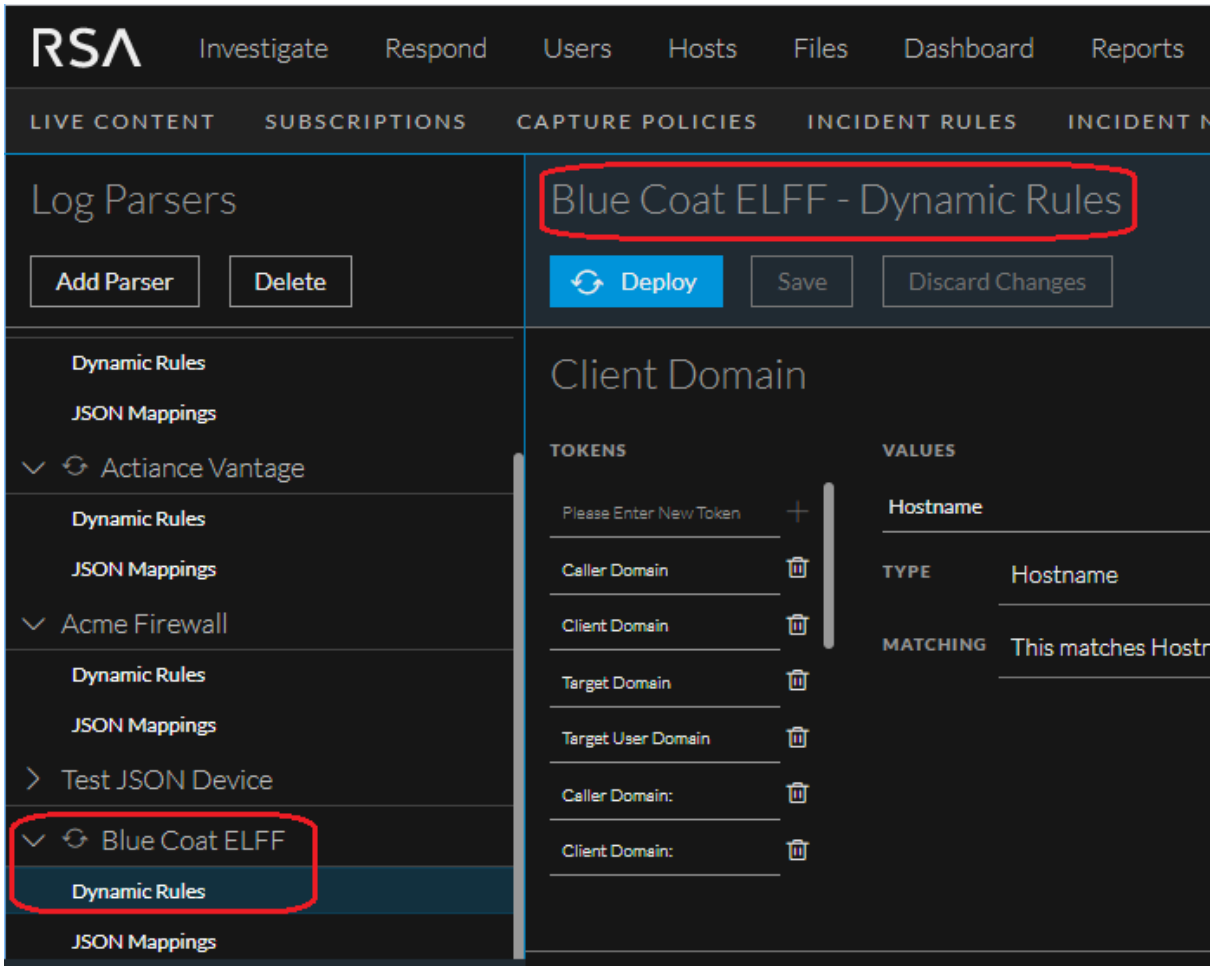
## Add Rules and Deploy

After you have added the parser, the next step is to add one or more rules.

For example, you know that your log messages have some email addresses that follow a "source_mail" string. You could add the following rule to parse these strings:

**IMPORTANT:** If you click on another parser in the **Log Parsers** panel, before you save your rule, your changes are lost.

1. Make sure the Dynamic Rules entry for the Blue Coat ELFF parser is selected.

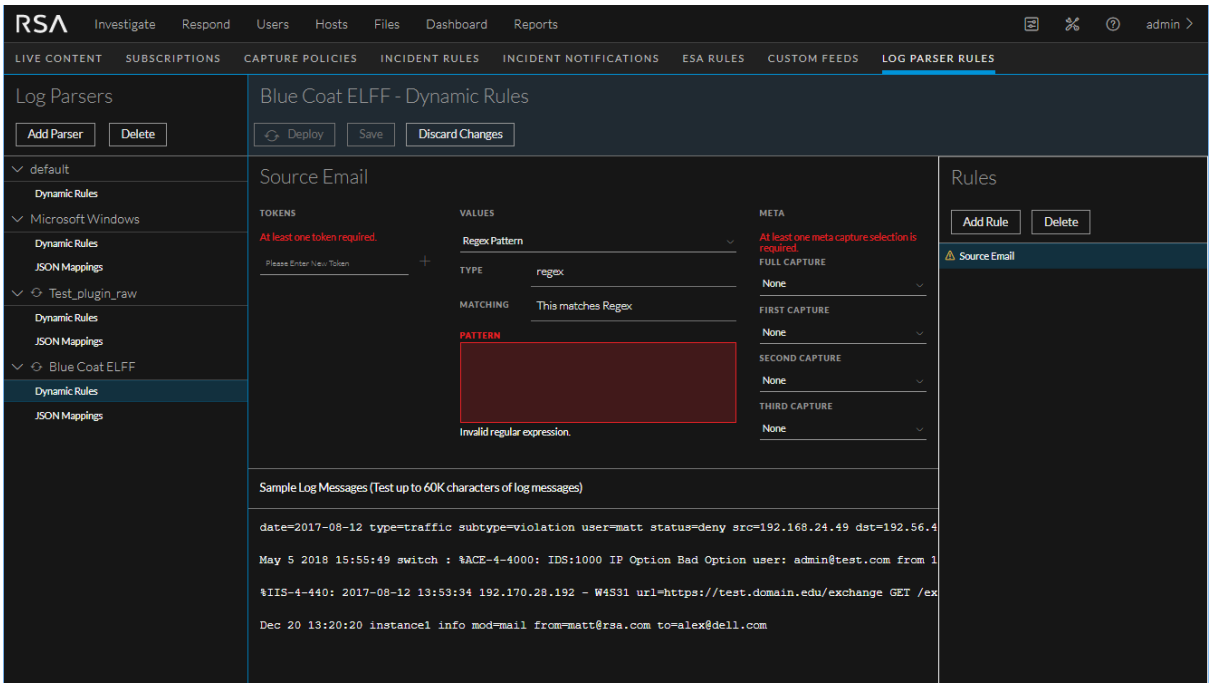


2. In the Rules panel, click **Add Rule**.

   The Add New Rule dialog box is displayed.

3. Enter a name for the rule, and click **Add New Rule**.

   The center panel is updated to reflect that you are working on a new rule.



In the TOKENS section, enter a string for the token that you want to match, then click +.

In this example, we entered **email** .

**Note:** Make sure to include a delimiter for your token. For example, in this case, the token consists of 6 characters: the string "email," and then a space. Some tokens might use a colon, semicolon, or some other character as the delimiter, but it can be easy to forget to add the space character when that is the delimiter.

4. You can enter more tokens, or continue to add values.
5. In the VALUES section, choose the value for the rule. If you choose to match a Regex Pattern, you need to enter the pattern in the PATTERN field. Other values do not require any options.

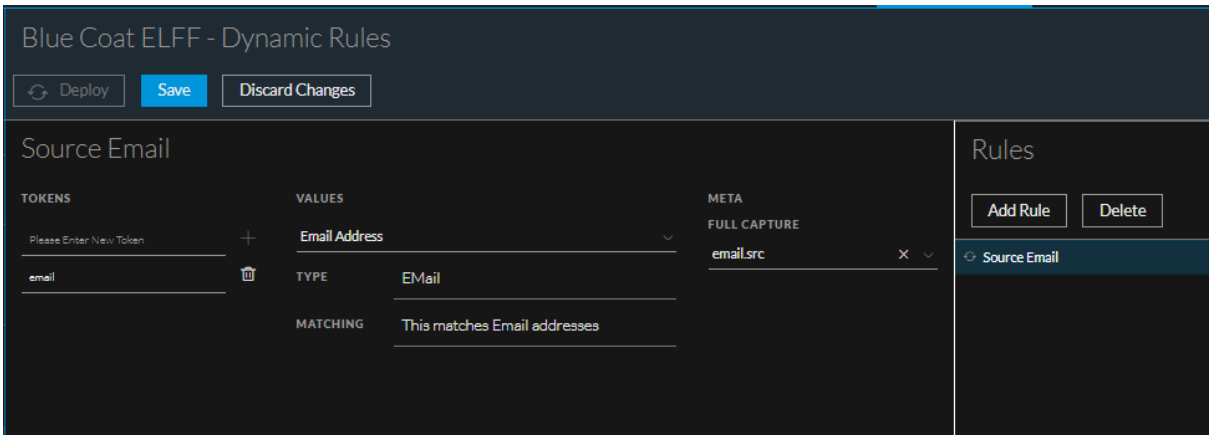
   In this example, we selected **Email Address**.
6. In the META section, click to select a meta key to which the rule stores its information. Some notes:

   - Enter characters to filter the list of available meta keys.
   - For Regex values, you can select "pieces" of the value, and store each piece to its own meta key.

   **Note:** If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.

   In this example, we selected the **email.src** meta key.

   The following image shows an example rule:



7. Click **Save** to save the rule. Repeat this procedure to continue adding rules.
8. After you have added all of your rules, click **Deploy** to deploy the new parser to your Log Decoders. Some notes about deploying rules:
   - You deploy an entire set of rules for a parser. That is, you can continue adding rules for a specific parser until you have all of your rules, and then you can deploy them all at once.
   - After you deploy a custom parser, you can no longer delete it. You can only delete parsers that you have not yet deployed.

**Note:** In this example, we extended an existing log parser. However, if you are creating a new log parser for a new event source, make sure to map the new log parser to the IP address of the event source, as described in "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

## Regex Values

Custom Log Parser Rules can match regular expression patterns. If you select a Regex pattern for your Value, you can capture the entire matched token, or sections of it:

- Full capture: the entire matched string is stored to your selected meta key.
- First capture: the first portion of the string, up to the period character, is stored to the meta key.
- Second capture: the second portion of the string, starting after the first period character, is stored to the meta key.
- Third capture: the third portion of the string, starting after the second period character, is stored to the meta key.

You can choose any or all four of these captures, depending on the token you are matching.

For example, we examine the **Source IP or IP:Port** RSA rule:

- Regex Pattern: \s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*)
- Full capture: none

- First capture: **ip.src**
- Second capture: **port.src**
- Third capture: none
- Assume example string of "src=192.168.24.4:8080", where **src** is one of the tokens defined for this rule:
  - **192.168.24.4** is saved to the **ip.src** meta key.
  - **8080** is saved to the **port.src** meta key.

For more details, see any online reference that describes PERL regular expressions. There are many tutorials available online.

**IMPORTANT:** Be careful when constructing regular expressions in your custom rules. Badly constructed regular expressions could impact your performance.

# Appendix A: Select the Reference Log Decoder

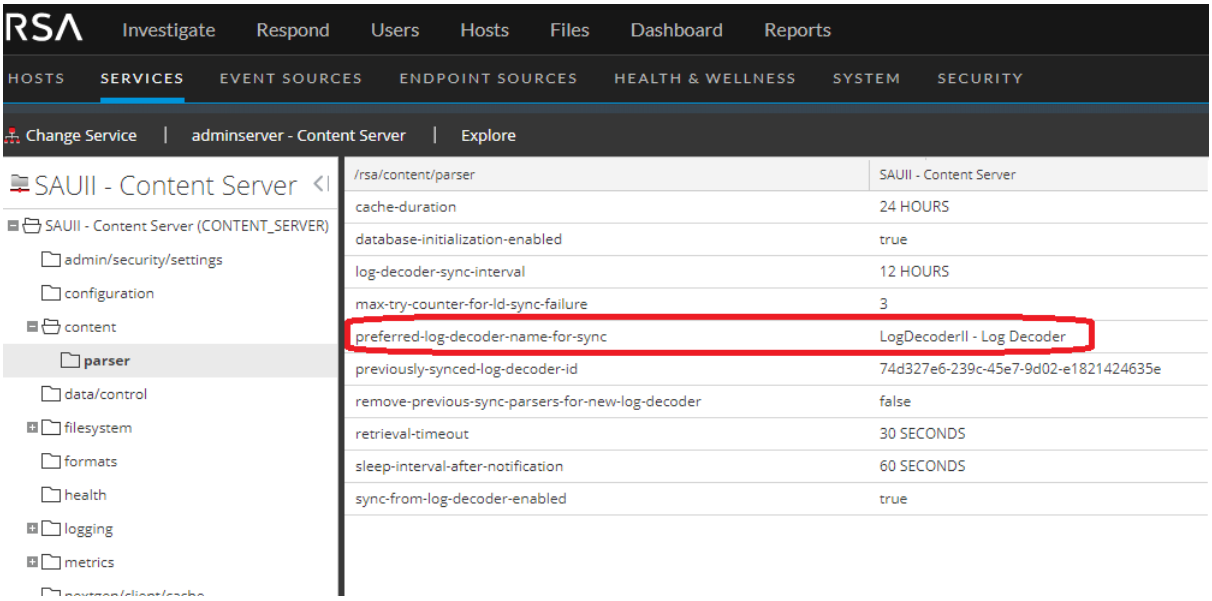
For version 11.2, RSA has added the ability to add log parsers and log parsing rules through the UI, using the Log Parsers view. The Log Parsers tab is populated based on your reference Log Decoder. If you have more than one Log Decoder, you can select which acts as the reference one for populating the tab in the UI. This topic describes the procedure to do so.

**Note:** If you have previously set a reference log decoder, make sure that it is at NetWitness version 11.5 or later to get full functionality.

### To change the reference log decoder:

1. In the NetWitness UI, navigate to **(Admin) > Services**.
2. For the **Content Server**, select **View > Explore**.
3. From the left navigation panel, expand **content > parser**.
4. To set the reference log decoder, enter a value for `preferred-log-decoder-name-for-sync`.

   Enter the name listed in the **Name** column on the **ADMIN > Services** screen for your preferred log decoder.



5. The change takes effect during the next system sync, based on the `log-decoder-sync-interval`. To sync sooner, you can do either of the following:

   - To sync immediately, restart the Content Sever: in the **(Admin) > Services** view, from the **Actions** menu for the Content Server, select **> Restart**.
   - Change the `log-decoder-sync-interval` parameter from its default of 12 hours to your preferred interval. Note that the minimum value for this parameter is **1 HOUR**.

# Appendix B: Move Log Parsers to Production

You may have a development or test environment where you work on new and updated log parsers and log parser rules. In this case, at some point you need to move your new and updated log parsers into your production environment. This topic describes how to do this.

**To move custom log parsers and log parser rules from development to production environment:**

1. On the development system, do the following:
   a. SSH to the NetWitness Server
   b. Export the log parser information by running the following command:

      ```
      mongodump --host localhost --port 27017 --db "content-server" --username
      "deploy_admin" --password "netwitness" --authenticationDatabase admin
      ```

   c. Copy the "dump" folder to your production NetWitness Server.
2. On the production system, do the following:
   a. SSH to the NetWitness Server
   b. Drop the content-server table from Mongo by running below commands in the order listed:

      ```
      mongo --username deploy_admin --password netwitness --
      authenticationDatabase admin
      use content-server
      db.logDeviceParser.drop()
      db.patternFormatType.drop()
      exit
      ```

   c. Run the following restore command:

      ```
      mongorestore --host localhost --port 27017 --db "content-server" --
      username "deploy_admin" --password "netwitness" --authenticationDatabase
      admin PATH_TO_DUMP_FOLDER
      ```

      Make sure to replace *PATH_TO_DUMP_FOLDER* with the actual path to the "dump" folder.
   d. Restart the content-server by running the following command:

      ```
      systemctl restart rsa-nw-content-server
      ```

# Appendix C: Troubleshooting and Limitations

This section describes some common issues that can occur when you customize log parsers and log parser rules.

## Troubleshooting

| | |
|---|---|
| You do not see any log parsing against a newly created parser. | You may have forgotten to map the new parser. To map a parser, go to **(Admin) > Event Sources > Discovery** tab. See the "Discovery Tab" topic in the *Event Source Management Guide* for details. |
| Deployment fails | If you click Deploy to deploy a new or updated log parser, and it fails, you should check the log for your reference log decoder. You access this log in the following location on the NetWitness Server:<br>`/var/log/netwitness/content-server/content-server.log` |

## Delete a Log Parser Manually

If you have any issues when you attempt to remove a Log Parser through the UI, you can manually delete a log parser by using **NwConsole**.

### To delete a log parser that has been deployed:

1. Access the RSA NetWitness Console, using the **NwConsole** command. For details, see "Access NwConsole and Help" in the *NwConsole User Guide*.
2. Run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=filename.xml
   type=device
   ```

   where ***filename*** is the name of the XML file for the log parser. For example, to delete the log parser for Oracle Access Manager, run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=oracleam.xml
   type=device
   ```

Notes about the log parser filename:

- Log parser files are located on the Log Decoder in the following path:

  `/etc/netwitness/ng/envision/etc/devices`

- Each log parser has its own sub-folder. For example, the Cisco ASA parser files are in the following folder:

  `/etc/netwitness/ng/envision/etc/devices/ciscoasa`

- Some log parser file names begin with **v20_**, while others do not—the only way to tell is by examining the `devices` folders. For Cisco ASA, the log parser file name is **v20_ ciscoasamsg.xml**. However, in the previous command, when you specify the filename, do ***not*** use the **v20_** prefix.

# NwLogPlayer

NwLogPlayer is a troubleshooting tool that simulates syslog traffic. `NwLogPlayer.exe` is a command line utility located on the Log Decoder host in `/usr/bin`.

At the command line, type `nwlogplayer.exe -h` to list the available options, as reproduced here:

| Option | Description |
|---|---|
| `--priority arg` | set log priority level |
| `-h [ --help ]` | show this message |
| `-f [ --file ] arg (=stdin)` | input message; defaults to **stdin** |
| `-d [dir ] arg` | input directory |
| `-s [ --server ] arg (=localhost)` | remote server; defaults to **localhost** |
| `-p [ --port ] arg (=514)` | remote port; defaults to **514** |
| `-r [ --raw ] arg (=0)` | Determines raw mode.<br>• 0 = add priority mark (default)<br>• 1= File contents will be copied line by line to the server.<br>• 3 = auto detect<br>• 4 = enVision stream<br>• 5 = binary object |
| `-m [ --memory ] arg` | Speed test mode. Read up to 1 Megabyte of messages from the file content and replays. |
| `--rate arg` | Number of events per second. This argument has no effect if **rate** > eps that the program can achieve in continuous mode. |
| `--maxcnt arg` | maximum number of messages to be sent |
| `-c [ --multiconn ]` | multiple connection |
| `-t [ --time ] arg` | simulate time stamp time; format is `yyyy-m-d-hh:mm:ss` |
| `-v [ --verbose ]` | If **true**, output is verbose |
| `--ip arg` | simulate an IP tag |
| `--ssl` | use SSL to connect |
| `--certdir arg` | OpenSSL certificate authority directory |
| `--clientcert arg` | use this PEM-encoded SSL client certificate |
| `--udp` | send in UDP |

## Limitations

Please note the following limitations when using the Log Parser Rules tab:

- **Log Decoder must be at version 11.2:** For the functionality in the Log Parser Rules tab to work, your installation must have at least one Log Decoder running NetWitness version 11.2 or later.
- **JSON Mapping: Log Decoder must be at version 11.5:** For the JSON Mapping Beta functionality to work, your installation must have at least one Log Decoder running NetWitness version 11.5 or later.
- **Mixed Mode:** If any Log Decoders are at version 11.2 or later, and the NetWitness Server is at version 11.2 or later, the Log Decoders will have parseall rules enabled by default, and thus will begin to parse logs accordingly. However, the 11.2 NetWitness Server does not support Log Decoders with versions less than 11.2, so the Log Parser Rules tab in the UI stays blank.
- **Meta key fields list refresh:** If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta in the Log Parser Rules tab immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.
- **Field Restrictions:** Note the following field restrictions:
  - **Rule name** must be 64 characters or fewer.
  - **Parser Name** must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
  - **Parser Display Name** must be 64 characters or fewer, and cannot match any other parser display name.
  - **Regex Expression** must be 1-255 characters, and a valid regex (closed capture list allowed).
  - **Tags** cannot be duplicates.
- **Deploy only to 11.2 Log Decoders:** The Deploy operation only deploys log parsers to version 11.2 or later Log Decoders.
- **Cannot Remove Deployed Parsers:** Once deployed, you cannot delete a log parser using the UI.
- **See log for errors:** Refer to content-server logs for more details on deploy failure details and log decoder names.

# Parser Rules Tab

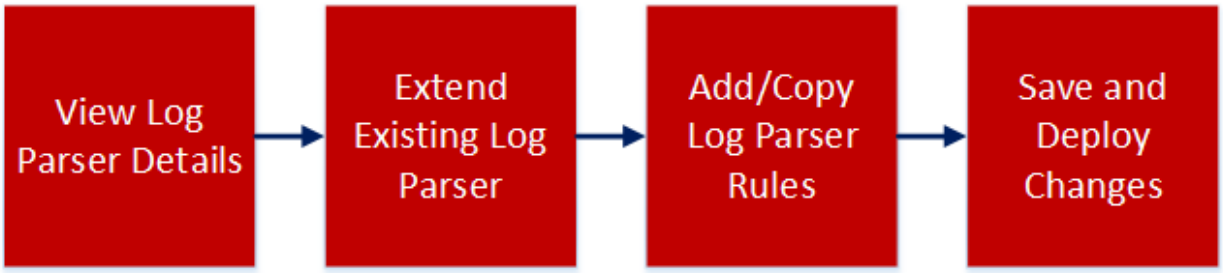
**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

This tab contains details about the rules for the default log parser, as well as any other custom rules and log parsers that have been defined.

To access this tab, go to **(Configure) > Log Parser Rules**.

## Workflow

This workflow shows processes available from the Log Parser Rules view.



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator | *View log parser rules. | Default Log Parser and Log Parser Rules |
| Administrator | *Add, edit or delete a log parser rule (version 11.2 and later) | Add or Delete a Log Parser Rule |
| Administrator | *Add or remove a log parser (version 11.2 and later) | Add or Delete a Log Parser |

*You can perform this task here.

## Related Topics

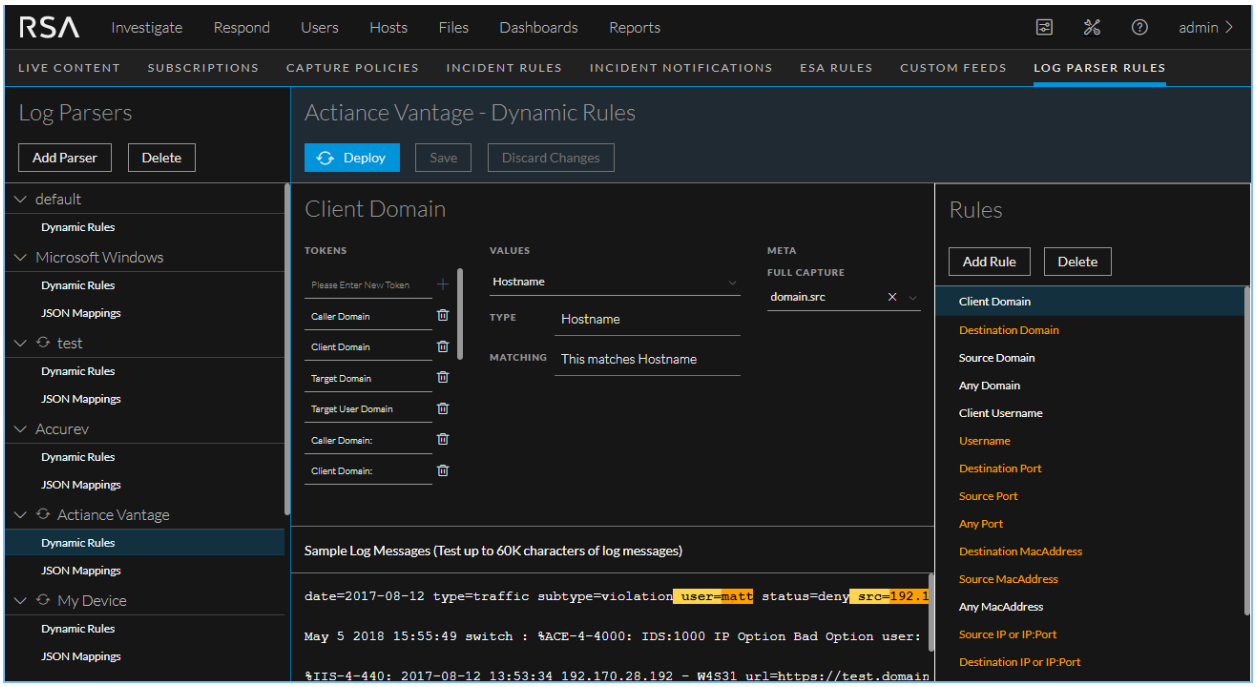
Default Log Parser and Log Parser Rules

## Quick Look

**Note:** The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

The Log Parser Rules tab organizes and displays information about the configured log parsers in your system.

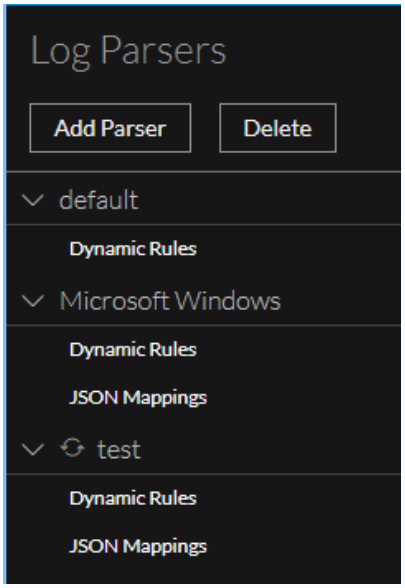
If you select the Dynamic Rules entry for a parser, the screen displays the dynamic rules:



**Note:** The icon indicates that there is some uncompleted or unsaved work. For example, next to a parser name, it means that the parser has not yet been deployed.

If you select JSON Mappings, the screen displays JSON mappings for the parser.

## Log Parsers Panel

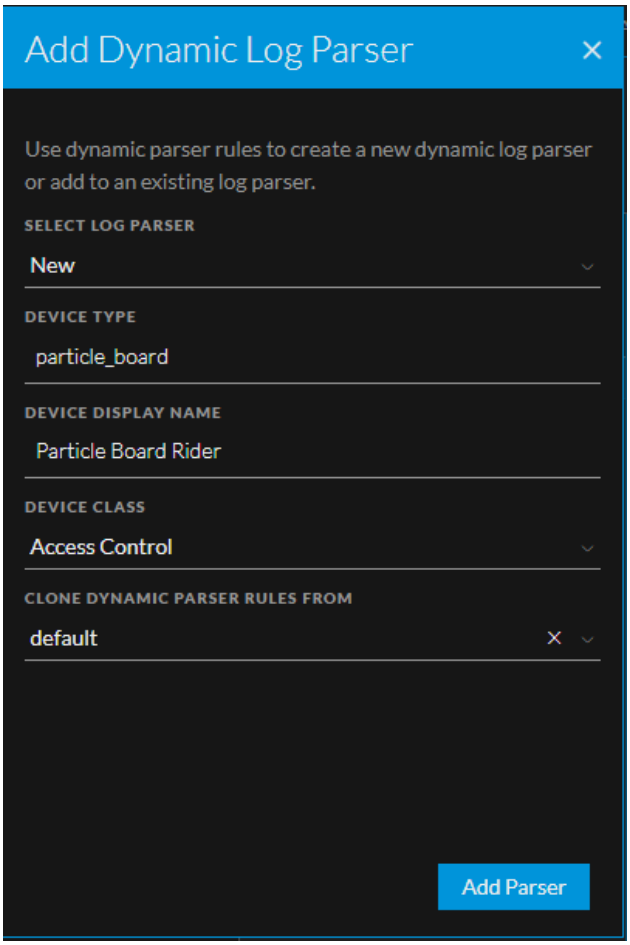


The Log Parsers Panel lists the configured log parsers.

- Until you add rules to existing XML parsers on your reference Log Decoder, (or add a new, custom log parser) only the **default** parser is listed here.
- Select a specific log parser to view its details in the Details and Rules panels.
- Click **Add Parser** to open the Add Dynamic Log Parser dialog box.
- Click **Delete** to delete a log parser.

**IMPORTANT:** Once you deploy a log parser, you can no longer delete it through this interface. The **Delete** button is not available for deployed parsers. To manually delete a log parser, see Add or Delete a Log Parser.

The Add Dynamic Log Parser dialog box allows you to add a custom log parser.



When you are adding a log parser, the following parameters are available.

| Field | Details |
|---|---|
| SELECT LOG PARSER | Select NEW, or choose an existing log parser.<br>By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities.<br>**Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser. |
| DEVICE TYPE | Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers. |
| DEVICE DISPLAY NAME | Enter the display name for the log parser.<br>**Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name. |
| DEVICE CLASS | Select a device class. |
| CLONE DYNAMIC PARSER RULES FROM | Leave blank to start with no rules, or select one of the existing log parsers to clone its rules. |

# Dynamic Rules

If you select the Dynamic Rules entry for a parser, you see the following panes:

- Details
- Rules

## Details Pane

The details pane shows the three pieces for the selected rule:

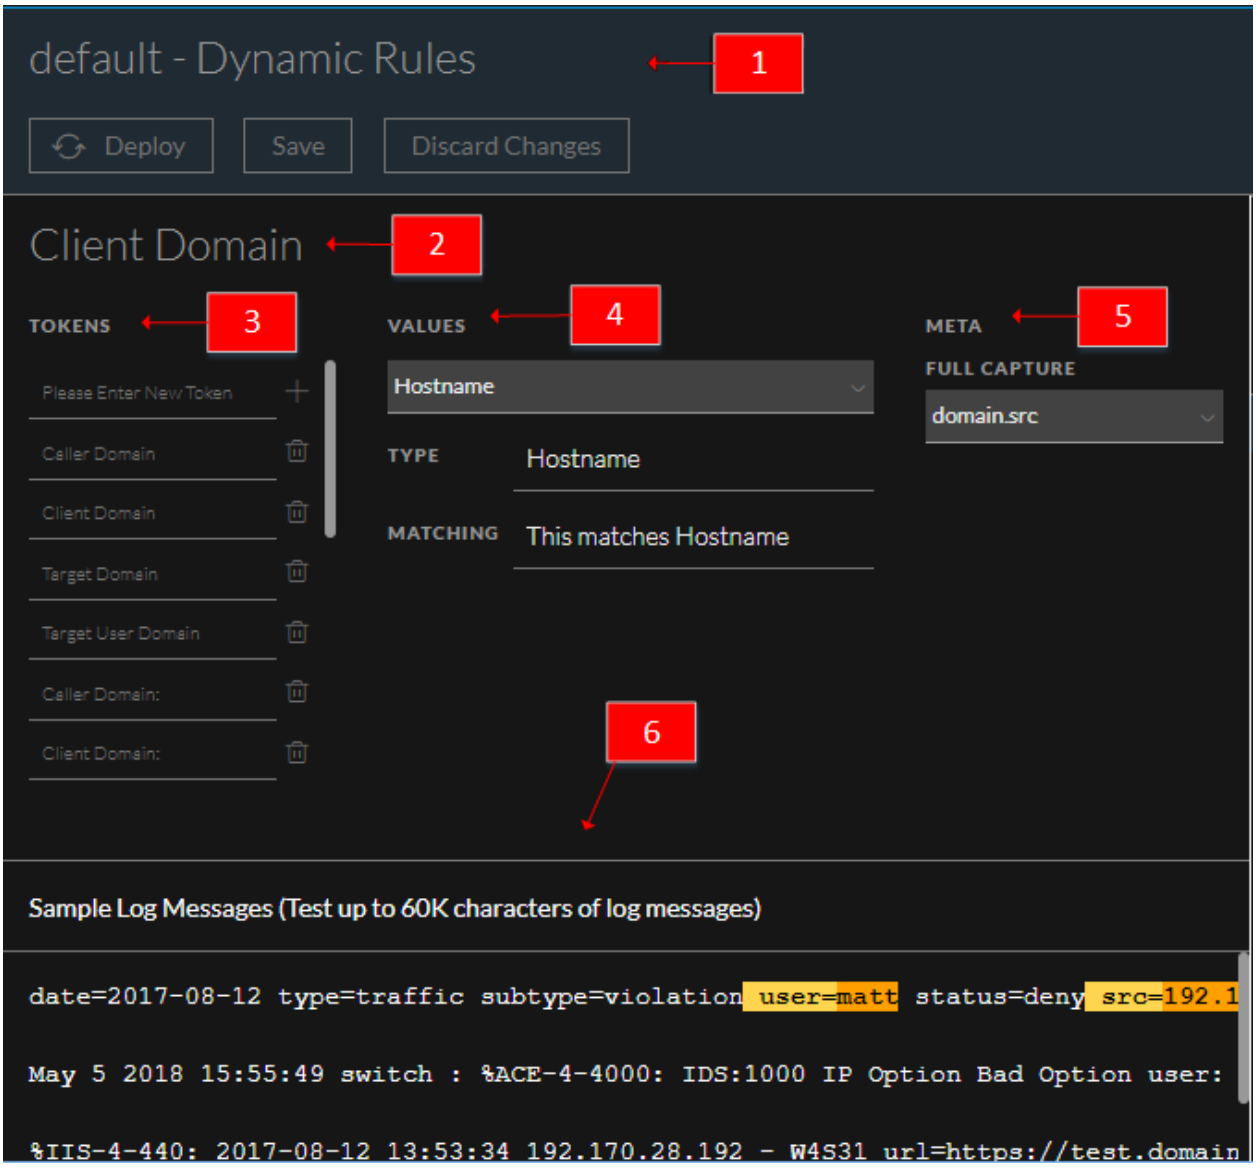
- **Tokens:** one or more tokens to match in the message. For example, the Any Port rule looks for the following strings to match against: **port** , **port:**, **port=**, and others.
- **Values:** the value that follows the token. This is a string that is captured as meta. For example, assume a log contains the following string:

  ```
  port 12345
  ```

  The Any Port rule has a token that matches "port ". When it encounters that string, it assigns the token value, "12345" to a meta key.
- **Meta:** the meta keys to which the value is mapped. For example, the Any Port rule maps the port value to the **port** meta key.

Essentially, a rule says, "when you are parsing a message, if you match one of my tokens, assign the value that follows the token to the meta key that I want it stored as."

The bottom section of the Details panel contains sample log messages, and how they would be parsed for the selected log parser.



| | |
|---|---|
| 1 | Displays the name of the selected log parser, and the buttons for deploying, saving, and discarding changes. This value changes when you select a different parser. |
| 2 | Displays the name of the selected rule. This value changes when you select a different rule for this parser. |
| 3 | Displays the list of tokens defined for the selected rule. |
| 4 | Displays the type and pattern of the value matching for the selected parser. The values here are determined by the type of the selected value. You can also use the Regex option to define a custom regular expression. |
| 5 | Displays the NetWitness meta to which the selected rule maps any matched tokens. The values here are determined by the selected Rule. |
| 6 | Displays a sample log message, and highlights strings that match tokens in the selected log parser. You can edit this field, and add in your own logs to preview how the selected parser will parse your logs.<br>**Note:** The sample section refreshes whenever a rule is changed or updated, as well as when you |

paste in samples from your logs.

For example, consider the following scenario:

- The **default** parser is selected.
- The **Any Domain** rule is selected.
- The Tokens matching list displays all of the tokens that are matched when found in a log message: **Domain**, **Domain Name**, **domain**, **ADMIN_DOMAIN**, and so on.
- The Meta list displays the NetWitness meta to which the value for the token is mapped: **domain**.

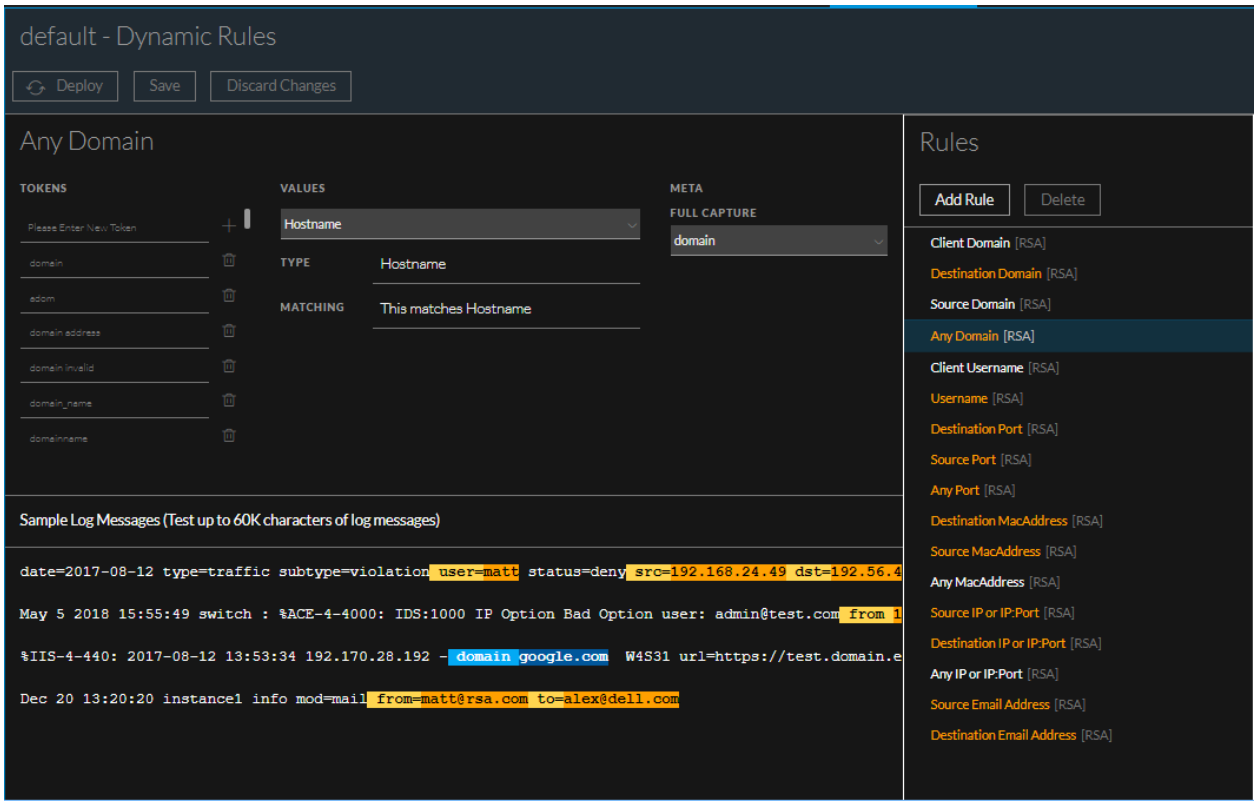
So, let's say the sample log message area has the following text:

```
Below are sample log messages:

May 5 2010 15:55:49 switch : %ACE-4-400000: IDS:1000 IP Option Bad Option
List by user admin@test.com from 10.100.229.59 to 224.0.0.22 on port 12345.

Apr 29 2010 03:15:34 pvg1-ace02: %ACE-3-251008: Health probe failed for
server 218.83.175.75:81, connectivity error: server open timeout (no SYN ACK)
domain google.com with mac 06-00-00-00-00-00.
```

In this case, the Sample Log Message area looks like this:



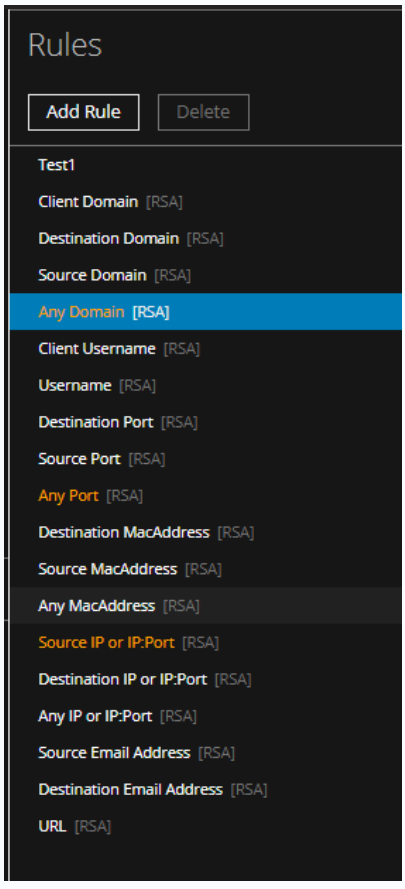
Note that some strings are highlighted, and that there are two "pairs" of highlight colors:

- Dark blue and light blue highlighting is applied to the strings that match the currently selected rule.
  - Dark Blue highlighted strings match a token in the selected rule. In this case, **domain** is the token that is matched for the **Any Domain** rule.
  - Light Blue highlighted strings are the values that correspond to the tokens in dark blue. For example, **google.com** is highlighted in light blue, because it corresponds to the **domain** token.
- Orange and yellow highlighting is applied to the strings that match rules for the current parser that are *not* currently selected.
  - Orange highlighted strings match a token in a rule that is not currently selected.
  - Yellow highlighted strings are the values that correspond to the tokens in orange. For example, the **user** token matches the **Username** rule (which is not currently selected).

In this example, the **domain** meta would be assigned a value of **google.com** for this log message, if it was parsed using the default log parser.

## Rules Pane

The Rules pane displays the list of rules used by the selected log parser. When you select a rule, you change the values that are displayed in both the **Tokens** and **Values** areas of the panel.



Note the highlighted rules:

- The currently selected rule is highlighted in blue.
- Other rules that match tokens in the sample log message area are highlighted in orange.

Other notes for the Rules panel:

- RSA rules (the rules provided out-of-the-box for each log parser) are identified by **[RSA]** following the rule name.

  You can copy these rules when adding a new log parser, and then change them as needed.
- The **Delete** button is only available for custom rules; for RSA rules, it is greyed out.
- Use the **Add Rule** button to add a custom rule.

# JSON Mappings

If you select the JSON Mappings entry for a parser, you see the following panes:

- Sample JSON Message
- Meta Mappings
- Mapping Details

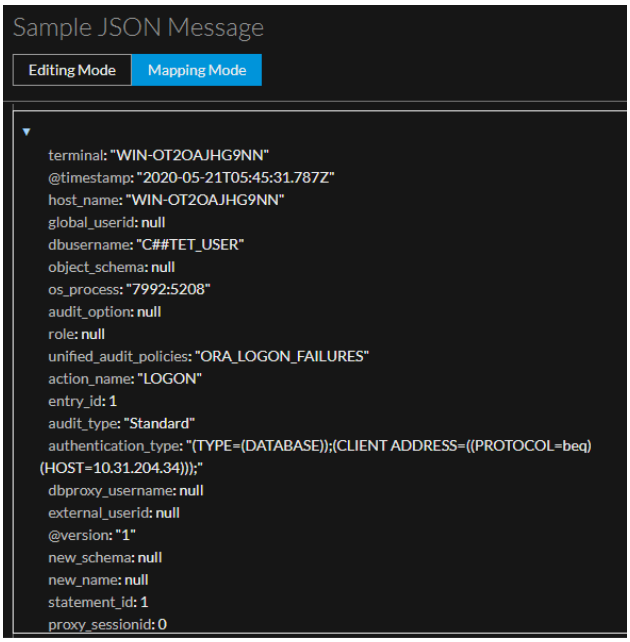
## Sample JSON Message

You can enter or paste sample JSON text. Click the **Render JSON** button to automatically format the text into JSON code. If the text is not valid JSON, you receive a message and the text is not formatted.

The following screen shows the Sample JSON Message area with some JSON that has been pasted in:

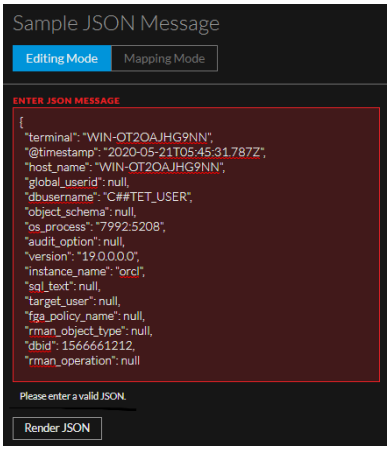
Since this is valid JSON, clicking **Render JSON** produces the following:

Note that you can see the tree mode of the sample JSON if you click **Mapping Mode**:



**Note:** You can edit the sample JSON in Editing mode, but not in Mapping mode. Mapping mode is read only.

On the other hand, if you enter text that is not valid JSON, the screen looks as follows:



## Auto Discover JSON Mappings

Beginning with NetWitness version 11.5.1, you can automatically create the mappings without the need to manually enter the name and path of the mapping. For details, see .Auto Discover JSON Mappings.

When the system auto discovers mappings, the path is filled in automatically, based on the structure of the mappings. For simple name-value pairs, this is straightforward. For example, for this pair, **"host_name": "WIN-OT2OAJHG9NN"** , the path is set to `/host_name`.

However, the rules for nested mappings and arrays are as follows:

- For a nested structure, names are separated with a forward slash (/).

```
{
  "parent": {
    "child": "value"
  }
}
```

The path is set to `/parent/child`.

- Arrays are accessed by omitting the index.

```
{
  "array": [
    "x",
    "y",
    "z"
  ]
}
```

The path is set to `/array/`.

```
{
  "array": [
    {
      "name": "value"
    }
  ]
}
```

The path is set to `/array//name`.

- Variable names are accessed by omitting them from the path.

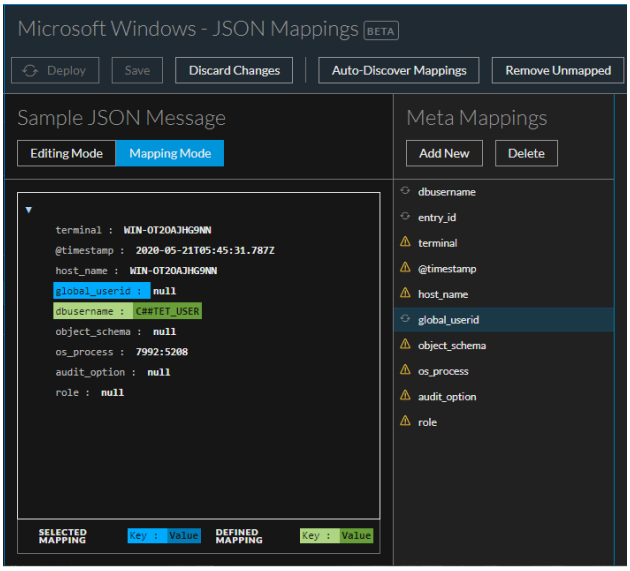
```
{
  "root": {
    "x": {
      "name": "value"
    },
    "y": {
      "name": "value"
    }
  }
}
```

The paths are set to `/root/x/name` and `/root/y/name`.

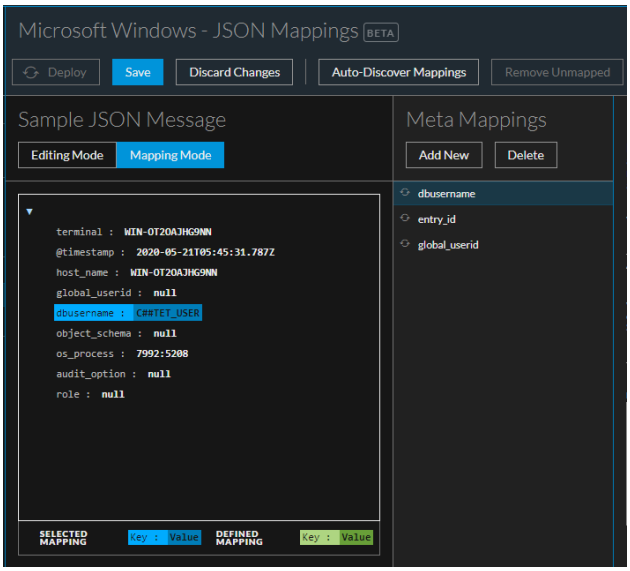
## Remove Unmapped Entries

If there are mappings that you do not want to save, you can remove them. After you validate all of the mappings that you want to keep, you can click **Remove Unmapped** to remove all mappings that you have not yet validated.

For example, assume you have auto-discovered some mappings as shown here:



After you click **Remove Unmapped**, you can see that only mapped entries remain:



**Note:** You cannot save your work until all of the entries have either been mapped or removed from the list.

## Meta Mappings

This panel lists the mappings that exist for this parser. You can add a mapping by using the **Add New** button, or delete an existing mapping by selecting it and clicking **Delete**.

## Mapping Details

The Mapping Details pane displays the following information.

| Field | Details |
|---|---|
| DISPLAY NAME | This name corresponds to the name displayed in the JSON Mappings panel. |
| PATH | The path to where the values for this portion of the log are stored. |
| DESCRIPTION | Optionally, you can enter a text description for this mapping. |
| META | Select a meta key to which this value from the log is mapped. Select a value from the drop-down menu.<br>Optional if you choose a Value Format. |
| VALUE FORMAT | Choose a value format parser onto which to pass this JSON value. You can either select an existing meta or **Custom Regex Type**. If you select custom regex type, you must define the regex and capture to *fine* parse the value in the meta.<br>Optional if you choose a Meta. |
| CUSTOM REGEX TYPE | Select Custom Regex Type from the Value Format drop-down, which allows you to add new custom regex type. |
| REGEX PATTERN | Specify a regex to identify different pieces of data contained within a JSON node value. |
| FIRST CAPTURE | Select a meta key that should be captured first based on the value defined in the Regex pattern. |

| Field | Details |
|---|---|
| ADD A CAPTURE | New capture field is added. By default, it is loaded with meta keys in the drop-down. You can add maximum of 20 captures and this option will be disabled once it reaches maximum. |

**Note:** You need to select a meta or enter a Value Format, but you do not need to fill in values for both settings.

## Disable log Parser Rules

You can disable log parser rules, so that none of them are processed by the Log Decoder. You might have your log parsers working as you like, and do not want any extra processing that you do not need.

You disable them from the reference Log Decoder.

1. Go to **(Admin) > Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.
3. Under **Parsers Configuration**, look at the Config Value for **PARSERULESCAN**.
   If it is **Enabled**, log parser rules are processed. If it is **Disabled**, they are not processed.
4. If the rules are Enabled, click Enabled and select Disabled to disable the log parser rules.
   To save the changes, click **Apply**.

# Overview

This document is intended to provide a general overview of Logstash and NetWitness integration. The intention is to provide enough implementation detail that users can have comfort using and troubleshooting these integrations on their own.

To describe Logstash, here is some introductory text from Logstash reference documentation:

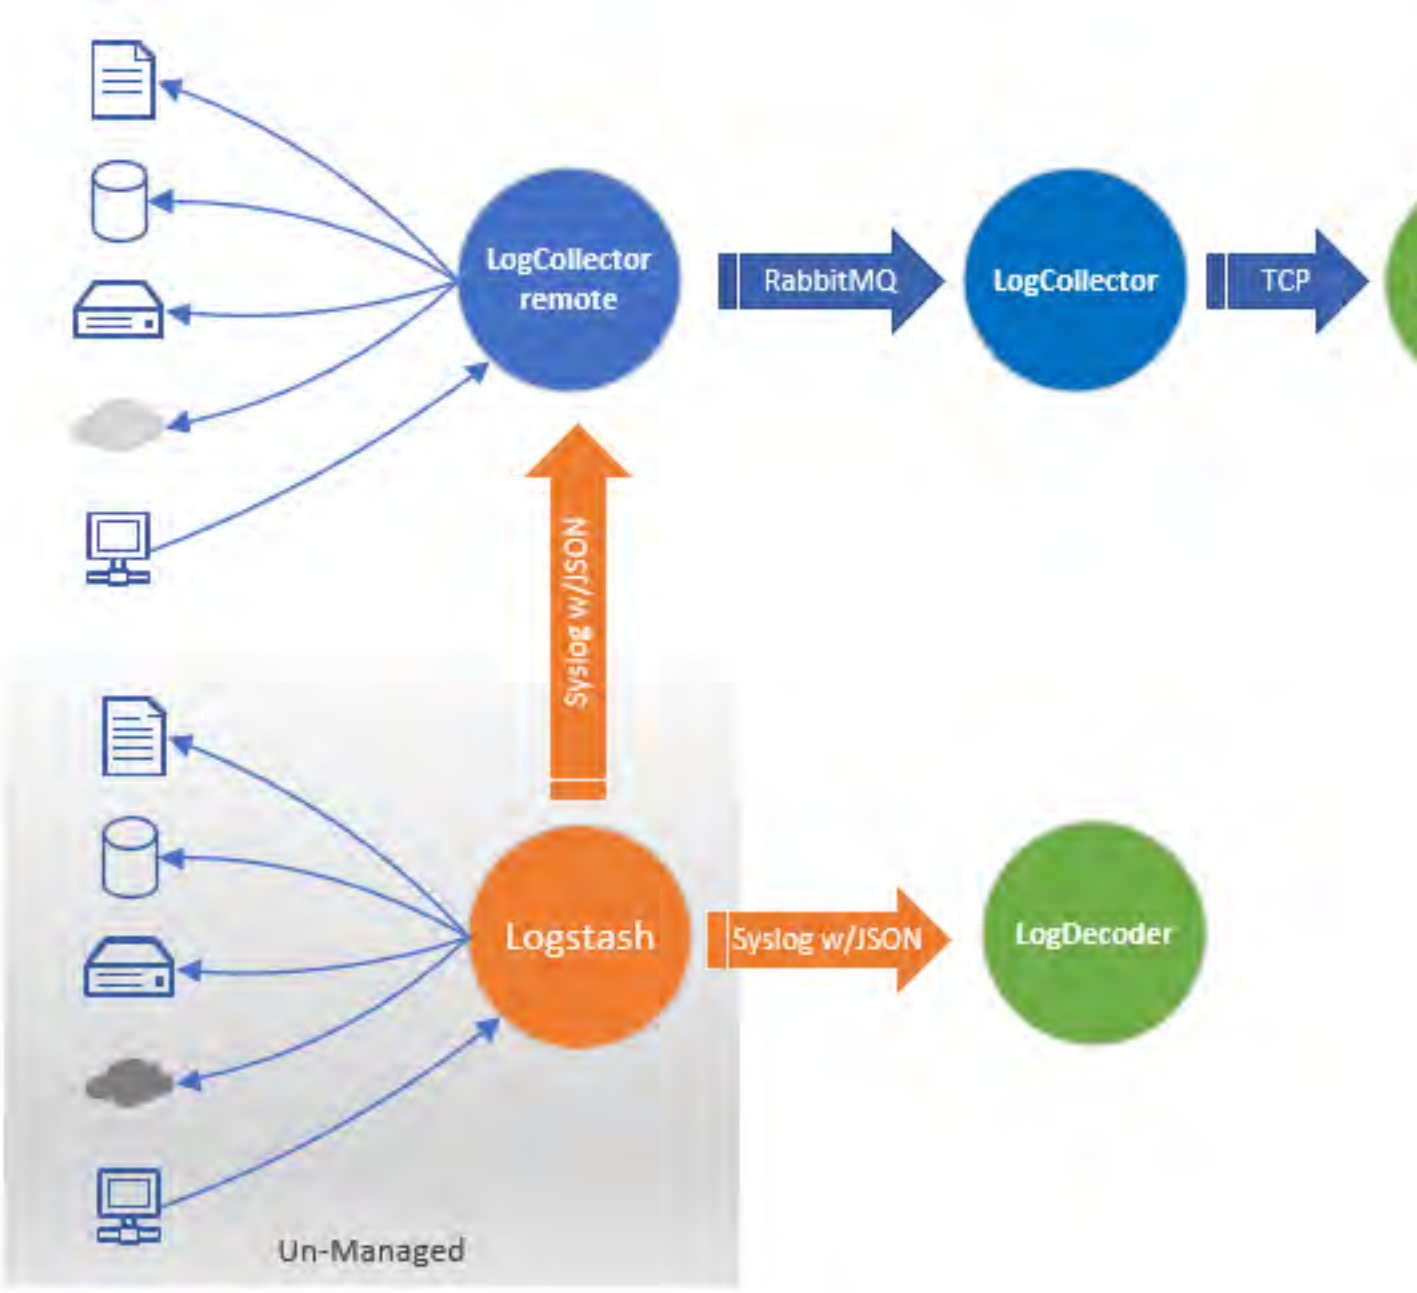
> *Logstash is an open source data collection engine with real-time pipelining capabilities. Logstash can dynamically unify data from disparate sources and normalize the data into destinations of your choice…*

From a NetWitness standpoint, there are two basic use cases:

- For customers that have an event source for which RSA NetWitness does not already provide an integration, or if you want a customized integration that is different from the one provided by RSA.
- For customers that already have an existing Logstash configuration, you can use Logstash to integrate as many of your event sources as you like. Integrating your event sources should be a matter of updating the destination for where you currently send the log information: either adding NetWitness as a destination, or changing your current output destination to NetWitness.

From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see Configure Logstash Event Sources in NetWitness in the *Log Collection Configuration Guide*.

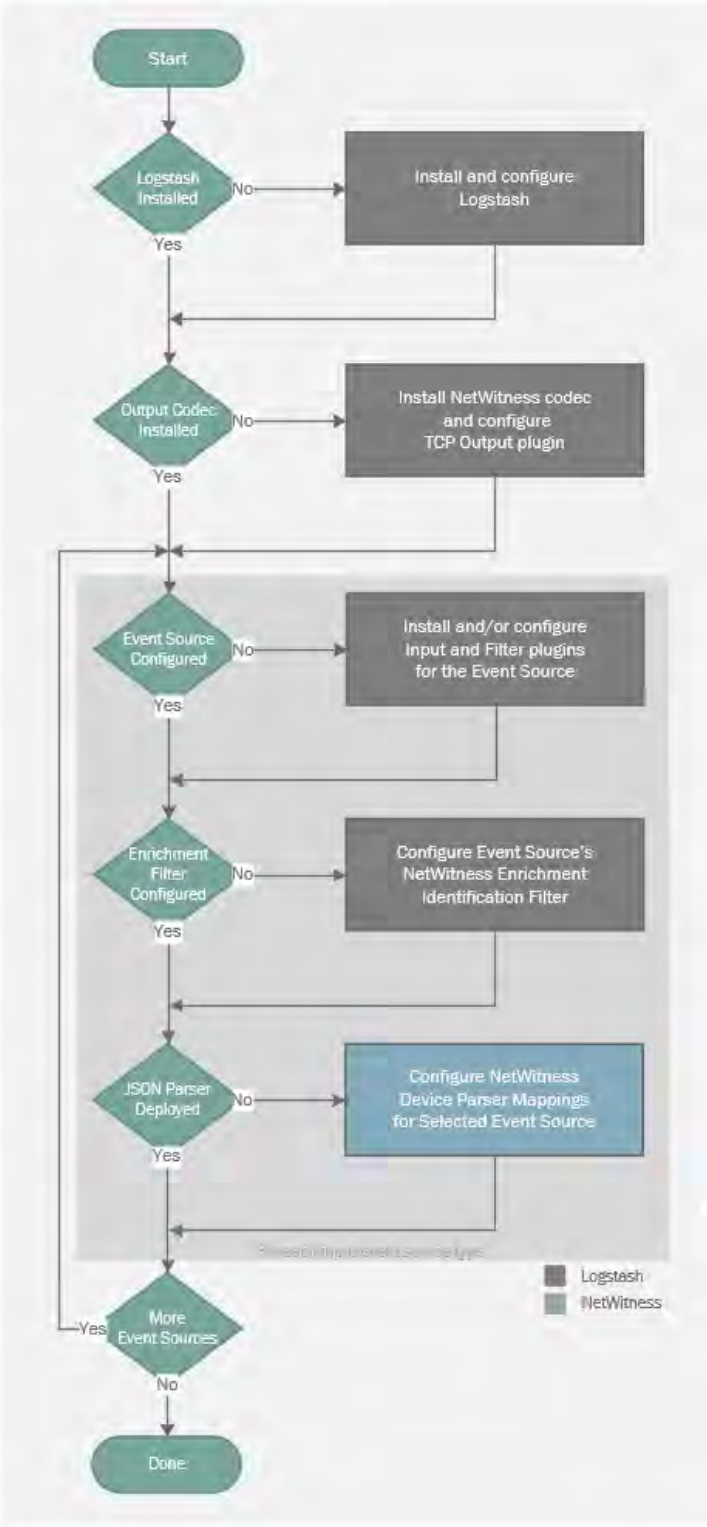
The following diagram displays a view of how Logstash integrates with the NetWitness.



LogCollector
remote
RabbitMQ
LogCollector
TCP
Syslog w/JSON
Logstash
Syslog w/JSON
LogDecoder
Un-Managed

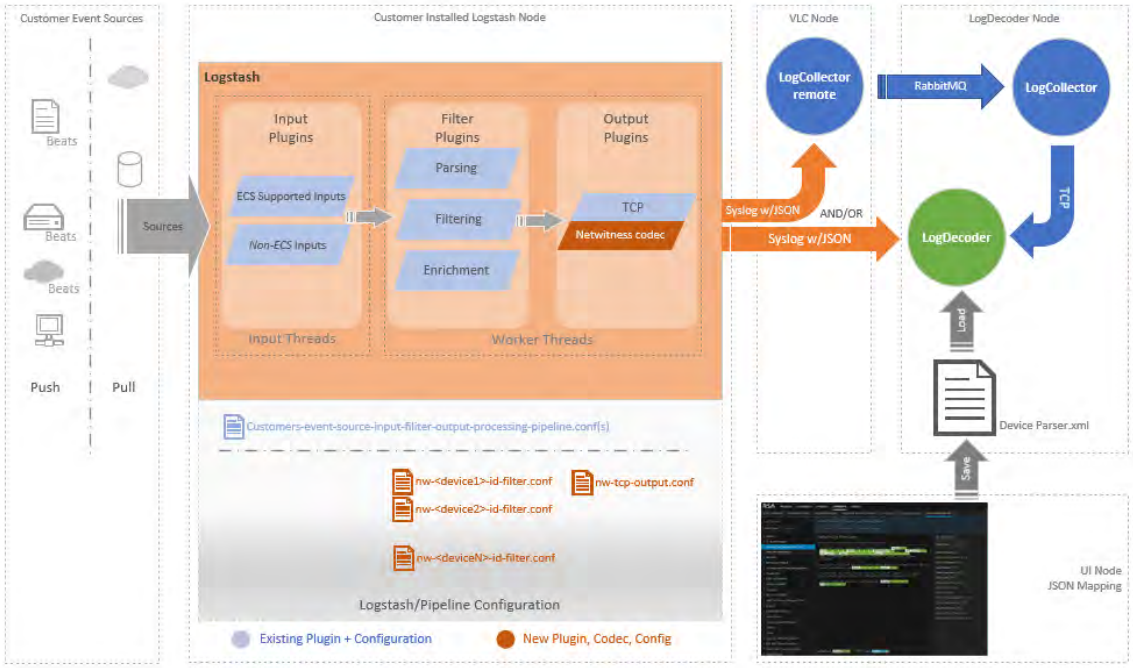
# Configuration Process

The following flowchart describes the steps customers take to integrate Logstash with NetWitness, depending on their prior familiarity with and use of Logstash.



The following sequence describes the data flow from an event until it becomes NetWitness meta in a Log Decoder.

1. An event source generates events.
2. The collection plugin (for example a Beats plugin) collects events from the event source.
3. Logstash processes the data from the events.
4. A NetWitness codec encodes the Logstash-processed data into a format that can be consumed by NetWitness.
5. An output plugin sends the processed event data to the NetWitness.
6. A JSON parser populates meta from the processed event data.



# Install Logstash

Skip this section if you already have Logstash installed and configured.

Please ensure that you follow all the security-related best practices and guidelines outlined in the Logstash documentation to avoid any potential security risks.

You can install either the free, open source version of Logstash (OSS) or the paid version (Elastic).

Information on released versions of Logstash is available at Logstash Reference. Links in the following steps show an example of installing current version of Logstash on Linux.

1. Install the service: Installing Logstash (OSS free version)
2. Based on your OS, after installation do one of the following:
    - Linux: set Logstash to run as a service: Running Logstash
    - Windows: see Running Logstash on Windows
3. Next, enable Logstash to start when the system boots up:
    - For CentOS, see https://www.unix.com/man-page/centos/1/systemctl/
    - For Debian, see https://wiki.debian.org/systemd/documentation

    Those are 2 examples: adjust instructions according to your particular Operating System.

For Generic Troubleshooting Instructions for Logstash, follow this link: Logstash Troubleshooting

If you are using CentOS, note the following:

- Logstash logs are stored in /var/log/logstash/logstash-plain.log
- If you install logstash using rpm install, make sure it installs as logstash user and folders get created with the same user: **not** the root user.

# Install and Configure the NetWitness Codec

To forward Logstash events to the NetWitness in RFC-5424 format, you need to install the NetWitness codec on your system and refer to it in your output plugin configuration.

To install or update the codec:

The following procedure can be performed on either Linux or Windows: instructions that are specific to an OS are noted.

1. Download offline installer from RSA Link in the following location: RSA NetWitness Codec Installer
2. Copy the downloaded NetWitness ZIP archive to the system where Logstash runs.
3. Open a command prompt and change directory to Logstash home:
    - On Linux: cd /usr/share/logstash.
    - On Windows: cd: ***logstash_directory***

      For example: cd: c:\Logstash\
4. Stop the logstash service, if it is running.
    - On Linux, run the following command:

      systemctl stop logstash
    - On Windows, open the Services window (you can search for it or find it from the Start menu), then locate the Logstash service in the list and click **Stop the service**.
5. Run the following command and check to see if **logstash-codec-netwitness** is listed.
    - On Linux:

      bin/logstash-plugin list
    - On Windows:

      .\bin\logstash-plugin list
6. If it is listed, delete it by running the following command:
    - On Linux:

      bin/logstash-plugin remove logstash-codec-netwitness
    - On Windows:

      .\bin\logstash-plugin remove logstash-codec-netwitess
7. To install the latest package, run the following command:

- On Linux:

  bin/logstash-plugin install file:///***<path-to-file>***/logstash-codec-netwitness-offline-**<version>**.zip

- On Windows:

  .\bin\logstash-plugin install file:///***<path-to-file>***/logstash-codec-netwitness-offline-**<version>**.zip

  Make sure to use forward slashes (/) as a separator between Windows subfolders for the path to the logstash installation package.

If the codec is installed correctly, you receive a confirmation message. The following is an example:

Installing file: /usr/share/logstash/logstash-codec-netwitness-offline-1.0.0.zip

Install successful

8. Below are default paths for logstash configurations. All output, filter, and input configuration files are under these folders.

   we would go over those configuration files in later sections.

   - For Linux: /etc/logstash/conf.d/
   - For Windows: ***logstash_directory***/config/

   For details on output files, see "Configure Logstash Output Plugins" on page 13. For details on input and filter plugins, see "Logstash Input and Filter plugins" on page 19.

9. Start the logstash service:

   - On Linux, run the following command:

     systemctl start logstash

   - On Windows, open the Services window (you can search for it or find it from the Start menu), then locate the Logstash service in the list and click **Start the service**.

# Configure Logstash Output Plugins

## Logstash TCP Output

In order to send the events from Logstash to NetWitness, we use the TCP output plugin: https://www.elastic.co/guide/en/logstash/current/plugins-outputs-tcp.html

The TCP output is configured with the NetWitness codec, which formats the outgoing events to be consumable by a NetWitness Log Decoder or Virtual Log Collector (VLC).

The following is an example of a properly configured output block using TCP & the NetWitness codec:

Output Block

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 514
    codec => netwitness
  }
}
```

## Logstash TLS Output

The output block can be further configured to allow for TLS communication between Logstash and NetWitness. An example of a properly configured output block using TLS and the NetWitness codec:

TLS Output Block

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 6514
    ssl_enable => true
    codec => netwitness
  }
}
```

## TLS with Log Decoder (or Virtual Log Collector) Verification

TLS can also be set up to verify the Log Decoder or Virtual Log Collector (VLC) to which it will be communicating. To do this, the Root and Intermediate CA certificates need to be obtained and stored in a truststore for Logstash.

1. On the Log Decoder (or VLC) to which you will be sending events, run the following command:

   cat /etc/pki/nw/ca/nwca-cert.pem /etc/pki/nw/ca/ssca-cert.pem > nw-truststore.pem
2. Copy the nw-truststore.pem file to the Logstash machine and store it in a known location.
3. Create a certificate for the Logstash machine using a self-signed CA or your own CA.
4. Store the cert and private key files in a location of your choosing.

   You need to specify the locations of these files in your TLS output block.

The following code snippet shows an example of a properly configured output block using TLS and the NetWitness codec

Output Block with Verification

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 6514
    ssl_enable => true
    ssl_verify => true
    ssl_cacert => "/path/to/certs/nw-truststore.pem"
    ssl_key => "/path/to/certs/privkey.pem"
    ssl_cert => "/path/to/certs/cert.pem"
    codec => netwitness
  }
}
```

# Configure the Event Source

If you have logstash already install and configured to collect events from desired event-sources you can skip this section.

As a starting point, view the list of input plugins here: Input Plugins. This is not meant to be an exhaustive list, just as a starting point to view some of the available input plugins.

The remainder of this section describes some examples.

## Collect Apache File Logs

Typically, Apache logs are written to files on the disk, so to collect events from file you could use the **Filebeat** plugin.

To install and configure Filebeat, see the following websites:

1. Install the Filebeat service on Linux. Refer to the following link: Filebeat Installation
2. Configure Filebeat to collect from specific logs. Refer to the following link: Filebeat Configuration
3. Configure Filebeat to send the output to Logstash. Refer to the following link: Filebeat Logstash Output

## Collect CentOS Audit Logs

To collect audit events from an operating system (for example CentOS), you could use the **Auditbeat** plugin.

To install and configure Auditbeat, see the following websites:

1. Install the Auditbeat service on Linux. Refer to the following link: Auditbeat Installation
2. Configure Auditbeat to collect from specific logs. Refer to the following link: Auditbeat Configuration
3. Configure Auditbeat to send the output to Logstash. Refer to the following link: Auditbeat Logstash Output

## Configure Parameters for Filebeat or Auditbeat

For Filebeat or Auditbeat plugin, make sure to configure input and output parameters. Modify /etc/filebeats/filebeat.yml as shown below.

To enable file collection, modify the **Filebeat inputs** section as shown in the following image:

```
#========================== Filebeat inputs =============================

filebeat.inputs:

# Each - is an input. Most options can be set at the input level, so
# you can use different inputs for various configurations.
# Below are the input specific configurations.

- type: log

  # Change to true to enable this input configuration.
  enabled: true

  # Paths that should be crawled and fetched. Glob based paths.
  paths:
    - /var/log/*.log
    #- c:\programdata\elasticsearch\logs\*
```

Modify the Outputs as follows:

- Comment out settings in the **Elasticsearch Output** section
- Uncomment **Logstash output** settings and provide logstash IP and Port.

Below is an example of the sections after changes are made:

```
#================================== Outputs ===================================

# Configure what output to use when sending the data collected by the beat.

#-------------------------- Elasticsearch output ------------------------------
#output.elasticsearch:
  # Array of hosts to connect to.
  # hosts: ["localhost:9200"]

  # Optional protocol and basic auth credentials.
  #protocol: "https"
  #username: "elastic"
  #password: "changeme"

#----------------------------- Logstash output --------------------------------
output.logstash:
  # The Logstash hosts
  hosts: ["localhost:5044"]

  # Optional SSL. By default is off.
  # List of root certificates for HTTPS server verifications
  #ssl.certificate_authorities: ["/etc/pki/root/ca.pem"]

  # Certificate for SSL client authentication
  #ssl.certificate: "/etc/pki/client/cert.pem"

  # Client Certificate Key
  #ssl.key: "/etc/pki/client/cert.key"
```

# Configure Logstash Filters to Add NetWitness Meta

In order for an event to be processed in the Log Decoder as a specific data type, you need to add some meta key information to the event in Logstash.

- [@metadata][nw_type] — NetWitness device parser content name
- [@metadata][nw_msgid] — NetWitness message pattern to parse message
- [@metadata][nw_source_host] — Originating event source's IP or host value

The value for nw_type *must* match the device parser name. It should be composed of lowercase characters, numbers, or underscore and be less than 29 characters in length.

Optionally, you can add the following meta key:

[@metadata][nw_collection_host] — Collection system identifier (**lc.cid**)

By default, the NetWitness codec sends the complete JSON event as payload to the NetWitness Log Decoder. If the NetWitness nw_type device parser type has a custom payload format and failover payload format, the NetWitness codec plugin must be configured to use them. Please see the "Configure the Event Source" on page 15 section for more details.

The following code snippet contains an example of adding the required meta:

Code to Populate NetWitness Meta

```
filter {
  if ![@metadata][nw_type] {
    if [agent][type] == "filebeat" {
      mutate {
        add_field => {
          "[@metadata][nw_type]" => "linux"
          "[@metadata][nw_msgid]" => "LOGSTASH001"
          "[@metadata][nw_source_host]" => "%{[host][hostname]}"
        }
      }
    }
  }
}
```

# Advanced NetWitness Configuration

## Grok Filter Plugin

You can use Grok to parse incoming logs and extract valuable meta information. For details, see Grok filter plugin: match. The meta extracted using grok is part of the full event package sent to NetWitness, where it can be mapped to NetWitness meta.

Resources:

- List of Grok patterns: https://github.com/logstash-plugins/logstash-patterns-core/tree/master/patterns
- Grok debugger: https://grokdebug.herokuapp.com/

## Logstash Input and Filter plugins

See the following URLs:

- Input Plugins
- Filter Plugins

You can use the beats input plugin for Logstash to receive events from beats sources, including Filebeat & Auditbeat: Beats Input Plugin

You can use the drop filter plugin for Logstash to filter out unwanted logs being passed through Logstash: Drop Filter Plugin

## Filter out unwanted logs

You can also filter out unwanted logs using the drop-event processor for Filebeat & Auditbeat.

- Examples for Filebeat:

  Filebeat Reference: Filtering and Enhancing Data

  Filebeat Reference: Drop Events

- Examples for Auditbeat:

  Auditbeat Reference: Filter and Enhance the Exported Data

  Auditbeat Reference: Drop Events

## Configure heartbeat plugin to send test logs to NetWitness

The **Heartbeat** plugin can be used to send a test message to verify connectivity between logstash and NetWitness. For details, see the Heartbeat Plugin configuration guide: Heartbeat Input Plugin.

Example of Heartbeat Plugin

```
...

heartbeat {
  id => "sample_plugin"
  #interval => 60
  count => 3
  message => "sequence"
  add_field => {
  "[@metadata][nw_type]" => "logstash_testlog"
  "msg" => "This is test log from some eventsource"
}

...
```

# Configure logstash to persist events in case of failure (Recommended)

By default, Logstash uses in-memory queues to buffer events. The size of these in-memory queues is not configurable. If there is a machine failure, or if the service is forcibly stopped, the contents of these queues are lost. To protect against data loss in these situations, Logstash supports persistent queues that are stored on disk and thus can survive failures. For details, see Logstash Persistent Queues.

# NetWitness Codec Advanced Configuration

By default, the NetWitness codec sends the complete JSON event as payload to the NetWitness Log Decoder. If the NetWitness nw_type device parser type has a custom payload format, you must configure the NetWitness codec plugin to recognize this custom format.

The payload_format and payload_format_failover mappings use nw_type as the key. The payload_format mapping is searched first for the device type (nw_type). If the device type is not set, or no format is specified for nw_type, or the system fails to make all configured variable substitutions, the complete JSON output is used as the payload. If the primary format from the payload_format mapping fails, the payload_format_failover mapping is tried. If that also fails, the complete JSON output is used as the payload. You can use The format can use Logstash event field syntax for this custom configuration.

The following code snippet shows example of adding meta with custom payload formats.

Add meta with custom payload formats

```
output {
   if [@metadata][nw_type] { # Only targeted NetWitness items
   tcp {
```

```
        id => "netwitness-tcp-output-conf-output"
        host => "127.0.0.1"
        port => 514
        ssl_enable => false
        codec => netwitness {
           # Payload format mapping by nw_type.
           # If nw_type is absent or formatting fails,
           # JSON event is used as the payload
           payload_format => {
              "apache" => "%APACHE-4-%{verb}: %{message}"
           }
           # Failover format, if above format fails
           # If nw_type is absent or formatting fails,
           # JSON event is used as the payload
           payload_format_failover => {
              "apache" => "%APACHE-4: %{message}"  # When verb is missing
              }
           }
        }
     }
  }
```

# Troubleshoot Installation Issues

If you encounter any issues during installation of Logstash, see Logstash Installation and Setup.

# Configure NetWitness to Collect Events

You need to start capture on the Log Decoder to which your are sending your Logstash data.

To start or restart network capture on a Log Decoder:

1. Log in to **NetWitness** and click the **ADMIN** icon > **Services**.
   The Services view is displayed.
2. Select a **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click

.

   If the toolbar is displaying the Stop Capture (

) icon, then capture has already been started.

By default, Log Decoders support events that are up to 32 KB in size. If your events are getting truncated on the Log Decoder, use the following procedure to change the event size:

1. Change LogDecoder REST config at **http://*LogDecoder_IP*:50102/-decoder/config**, where ***LogDecoder_IP*** is the IP address of your Log Decoder.
2. Set pool.packet.page.size to 64 KB.
3. Restart the Log Decoder: this is required after you change the pool.packet.page value.

If you are collecting events larger than 64 KB in size, follow instructions above in the "Filter out unwanted logs" on page 19 section. You can drop unwanted logs or fields for a specific event source, to reduce the size of the incoming data.

# Linux Event Source Example

This section shows sample input, filters and output configuration to collect system and audit events from CentOS.

## Input Plugin

An input plugin enables a specific source of events to be read by Logstash. The following code represents an example input plugin.

input-beats.conf

```
# Below input block collects events using beats plugins (e.g filebeats, auditbeats)
# Skip this block if it's already defined in another pipeline.
input {
    beats {
        port => 5044
    }
}
```

Make sure that port 5044 is open on the Logstash machine. As an example, if Logstash is on a CentOS system, run the following commands to open port 5044:

firewall-cmd --add-port=5044/tcp
firewall-cmd --add-port=5044/tcp --permanent
firewall-cmd --reload

## Output Plugin

An output plugin sends event data to a particular destination. Outputs are the final stage in the event pipeline.

output-netwitness-tcp.conf

```
# Below is tcp output plugin with netwitness codec to tranform events in syslog and send
it to LogDecoder
# Only one of these configurations can be within the same pipeline.
output {
  #if [@metadata][nw_type] { # Only targeted Netwitness items
    tcp {
      id => "netwitness-tcp-output-conf-output"
      host => "10.10.100.100"  ## LogDecoder IP
      port => 514
      ssl_enable => false
      #ssl_verify => true
      #ssl_cacert => "/path/to/certs/nw-truststore.pem"
      #ssl_key => "/path/to/certs/privkey.pem"
      #ssl_cert => "/path/to/certs/cert.pem"
```

```
      codec => netwitness {
        # Payload format mapping by nw_type.
        # If nw_type is absent or formatting fails, JSON event is used as the payload
        payload_format => {
          "apache" => "%APACHE-4-%{verb}: %{message}"
        }
        # Failover format, if above format fails
        # If nw_type is absent or formatting fails, JSON event is used as the payload
        payload_format_failover => {
          "apache" => "%APACHE-4: %{message}"  # When verb is missing
        }
      }
    }
  #}
}
```

# Filter Plugin

A filter plugin performs intermediary processing on an event. Below is a filter plugin configuration for system events collected from linux using the Filebeat plugin.

linux-system.conf

```
# Filters are often applied conditionally depending on the characteristics of the events.
# Requires these additional configurations within the same pipeline:
#   input-beats.conf
#   output-netwitness-tcp.conf

filter {
if ![@metadata][nw_type] {
  if [ecs][version] and [host][hostname] and [agent][type] == "filebeat" {
    if [event][module] == "system" {
      mutate {
        add_field => {
          "[@metadata][nw_type]" => "linux"
          "[@metadata][nw_msgid]" => "LOGSTASH001"
          "[@metadata][nw_source_host]" => "%{[host][hostname]}"
        }
      }
    }
  }
 }
}
```

Below is filter plugin configuration for audit events collected from linux using the Auditbeat plugin.

linux-audit.conf

```
filter {
    if ![@metadata][nw_type] { # Update Once
```

```
      if [ecs][version] and [host][hostname] and [agent][type] == "auditbeat" {
        if [event][module] == "audit" {
          mutate {
            add_field => {
              "[@metadata][nw_type]" => "linux"
              "[@metadata][nw_msgid]" => "LOGSTASH002"
              "[@metadata][nw_source_host]" => "%{[host][hostname]}"
            }
          }
        }
      }
    }
  }
```

# Create a Pipeline

It is recommended to have one pipeline for each input type. For example, all beats collection should be in the same pipeline. To run collection as separate pipeline, create a directory and add above input, filters, and output configuration files to it.

Example Pipeline for Beats

```
/etc/logstash/pipeline1/
/etc/logstash/pipeline1/input-beats.conf
/etc/logstash/pipeline1/output-netwitness-tcp.conf
/etc/logstash/pipeline1/linux-system.conf
/etc/logstash/pipeline1/linux-audit.conf
```

Modify /etc/logstash/pipeline.yml and add the following entries:

Add to pipeline.yml

```
- pipeline.id: my-sample-pipeline-1
  path.config: "/etc/logstash/pipeline1/*.conf"
```

# Build Custom JSON Parser

This section is intended for advanced programmers who want to build their own JSON parser. It describes how to build a Logstash parser for a sample device. We use the Linux device as an example throughout.

This chapter is optional: you do not need to build a custom JSON parser from scratch to input logs from Logstash to NetWitness.

Major sections in this document:

- Configure a filter by defining several required pieces of metadata.
- Examine a sample log message from the Linux device
- Walk through creating the parser, based on the sample log message
- View the parsed meta from the sample log message, as it appears on the Log Decoder

## Sample JSON Log Received on Log Decoder

Let's examine a sample log and discuss its contents.

<13>1 - Centos7 linux - LOGSTASH001 [lc@36807 lc.ctime="1585886465037" lc.-cid="Centos7" lc.ctype="logstash"] {"message": "msg='op=PAM:accounting grant-ors=pam_access,pam_unix,pam_localuser acct=root exe=/usr/sbin/crond hostname=? addr=? terminal=cron res=success'", "user":{ "email":"john.deaux@test.com", "user-name":"CORP\\deauxj" }, "host": { "name": "Centos7", "hostname": "Centos7", "con-tainerized": false, "architecture": "x86_64", "id": "d1059ac783b24eb7bbde70a41fa572c9", "os": { "name": "CentOS Linux", "kernel": "3.10.0-1062.el7.x86_64", "version": "7 (Core)", "codename": "Core", "platform": "centos", "family": "redhat" } }, "@timestamp": "2020-04-03T04:01:05.037Z", "files": [ "test1.log", "test2.log", "test3.log" ],"machine_details" : { "1" : { "hostname" : "USXXLinux" }, "2" : { "hostname" : "USXXWindows" }}}

The first portion of the log is the RFC-5424 header:

<13>1 - **Centos7 linux** - **LOGSTASH001** [lc@36807 lc.ctime="1585886465037" lc.-cid="Centos7" lc.ctype="logstash"]

This header contains the information that we used in setting our fields above:

- **nw_source_host**: Centos7 (Hostname)
- **nw_type**: linux (Device Type)
- **nw_msgid**:  LOGSTASH001 (Message ID)

The remainder of the log is the JSON Payload.

JSON Payload

```
{
```

```
    "message": "msg='op=PAM:accounting grantors=pam_access,pam_unix,pam_localuser acct-
t=root exe=/usr/sbin/crond hostname=? addr=? terminal=cron res=success'",

    "user": {
        "email": "john.deaux@test.com",
        "username": "CORP\\deauxj"
    },

    "host": {
        "name": "Centos7",
        "hostname": "Centos7",
        "containerized": false,
        "architecture": "x86_64",
        "id": "d1059ac783b24eb7bbde70a41fa572c9",
        "os": {
            "name": "CentOS Linux",
            "kernel": "3.10.0-1062.el7.x86_64",
            "version": "7 (Core)",
            "codename": "Core",
            "platform": "centos",
            "family": "redhat"
        }
    },

    "@timestamp": "2020-04-03T04:01:05.037Z",

    "files": [
        "test1.log",
        "test2.log",
        "test3.log"
    ],

    "machine_details": {
        "1": { "hostname": "USXXLinux"},
        "2": { "hostname": "USXXWindows"}
    }

}
```

# Create the JSON Parser for a Linux Device

Now that we have the sample log from the Linux device, we can construct a filter plugin for this device.

## Initial Parser to Match Message ID and Device Type

The parser name should match the device type. We call this initial parser v20_linuxmsg.xml, which matches the message ID from the event. We set content to a variable, logstash_json_payload, which represents the JSON payload. We will parse the payload later in the process.

Message ID and Device Type Parsing

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<DEVICEMESSAGES
    name="linux"
    displayname="Linux"
    group="Unix">
    <VERSION device="2.0"/>

    <MESSAGE
        id1="LOGSTASH001"
        id2="LOGSTASH001"
        content="&lt;logstash_json_payload&gt;" />

    <!-- Additional logic to parse JSON payload -->

</DEVICEMESSAGES>
```

## Map Payload Contents to Datatypes

We create datatypes to map each element from the payload to meta that can be saved to the NetWitness database.

The entire payload is assigned to the **FileBeatsEvent** datatype.

```
<VARTYPE name="logstash_json_payload" dataType="FileBeatsEvent"/>
```

The timestamp is parsed an assigned to the **InternetTime** datatype.

```
<DataType name="InternetTime"dateTime="%W-%M-%DT%H:%T:%S.%V%E" />
```

## Parse the Message String

Using the parser above, we parse (using the FineParse type defined above) the message string from the log file.

"message": "msg='**op**=PAM:accounting grantors=pam_access,pam_unix,pam_localuser **acct**=\"root\"
**exe**=\"/usr/sbin/crond\" hostname=? addr=? terminal=cron **res**=success'",

The following code extracts the values from the string and saves them to meta keys:

- **op** is saved to **operation.id**
- **acct** is saved to **service.account**
- **res** is saved to **result**
- **exe** is saved to **process.src**

Note that he **search** flag is set to **true** to parse key/value pars regardless of their order in the string.

Extract Values: save to Meta

```
<DataType name="TagValParse" regex="(?: |^)(?:exe=(\S+)|acct=(\S+)|res=(\S+)|op=(\S+))"
```

```
search="true">
    <Capture index="1" meta="process.src" />
    <Capture index="2" meta="service.account" />
    <Capture index="3" meta="result" />
    <Capture index="4" meta="operation.id" />
</DataType>
```

The following code:

- Assigns the whole key as **message** and maps it to the **FineParse** type.
- The **FineParse** type is then mapped to **TagValParse** type.

```
<DataType name="FineParse" regex="msg='(.*)'">
    <Capture index="1" type="TagValParse" />
</DataType>

<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
    <Capture key="/message" type="FineParse" meta="message"/>
    <Capture key="/user/email" meta="email"    />
    <Capture key="/user/username" type="DomainUser"/>
    <Capture key="/files/" meta="sourcefile" />
    <Capture key="/machine_details//hostname"   meta="host.dst"/>
</DataType>
```

Give the previous string and the code above, the output on the Log Decoder is as follows:

**message**: msg='op=PAM:accounting grantors=pam_access,pam_unix,pam_localuser acct=root exe=/usr/sbin/crond
  hostname=? addr=? terminal=cron res=success'
**service.account**: root
**process.src**: /usr/sbin/crond
**result**: success
**operation.id**: PAM:accounting

## Parse an Array in JSON

In our sample JSON log file from earlier, one section contained an array object:

```
"files": [
  "test1.log",
  "test2.log",
  "test3.log"
]
```

To fetch all the values of an array, you need to define a capture key enclosed in forward slashes to fetch all values, for example **/files/**.

```
<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/files/" meta="sourcefile" />
```

```
  </DataType>
```

Using the code above on the sample array, the following would be the output on the Log Decoder:

**sourcefile**: test1.log
**sourcefile**: test2.log
**sourcefile**: test3.log

## Parse a Nested JSON Object

Let's look at an example nested object from our sample log file from earlier:

```
"host": {
  "name": "Centos7",
  "hostname": "Centos7",
  "containerized": false,
  "architecture": "x86_64",
  "id": "d1059ac783b24eb7bbde70a41fa572c9",
  "os": {
    "name": "CentOS Linux",
    "kernel": "3.10.0-1062.el7.x86_64",
    "version": "7 (Core)",
    "codename": "Core",
    "platform": "centos",
    "family": "redhat"
  }
}
```

To fetch nested values, you need to build a path that contains the keys from each nested level. For example, to fetch the OS name from our example, you use the following code:

```
  <DataType name="ElasticCommonSchemaSubset">
     <Capture key="/host/os/name"> meta="OS" />
  </DataType>
```

Using the code above on the sample nested object, the following would be the output on the Log Decoder:

**OS**: CentOS Linux

## Capture Data That Has Varying Parent Key

When capturing structured data types like JSON, instead of a numbered capture index, you can provide a field name path that uses the key attribute. For example, assume we want to capture the **hostname** from **machine_details** and ignore the indexed key:

```
"machine_details": {
  "1": { "hostname": "USXXLinux"},
  "2": { "hostname": "USXXWindows"}
}
```

To fetch the required values, which have a varying parent key name, we leave the parent key empty in the path:

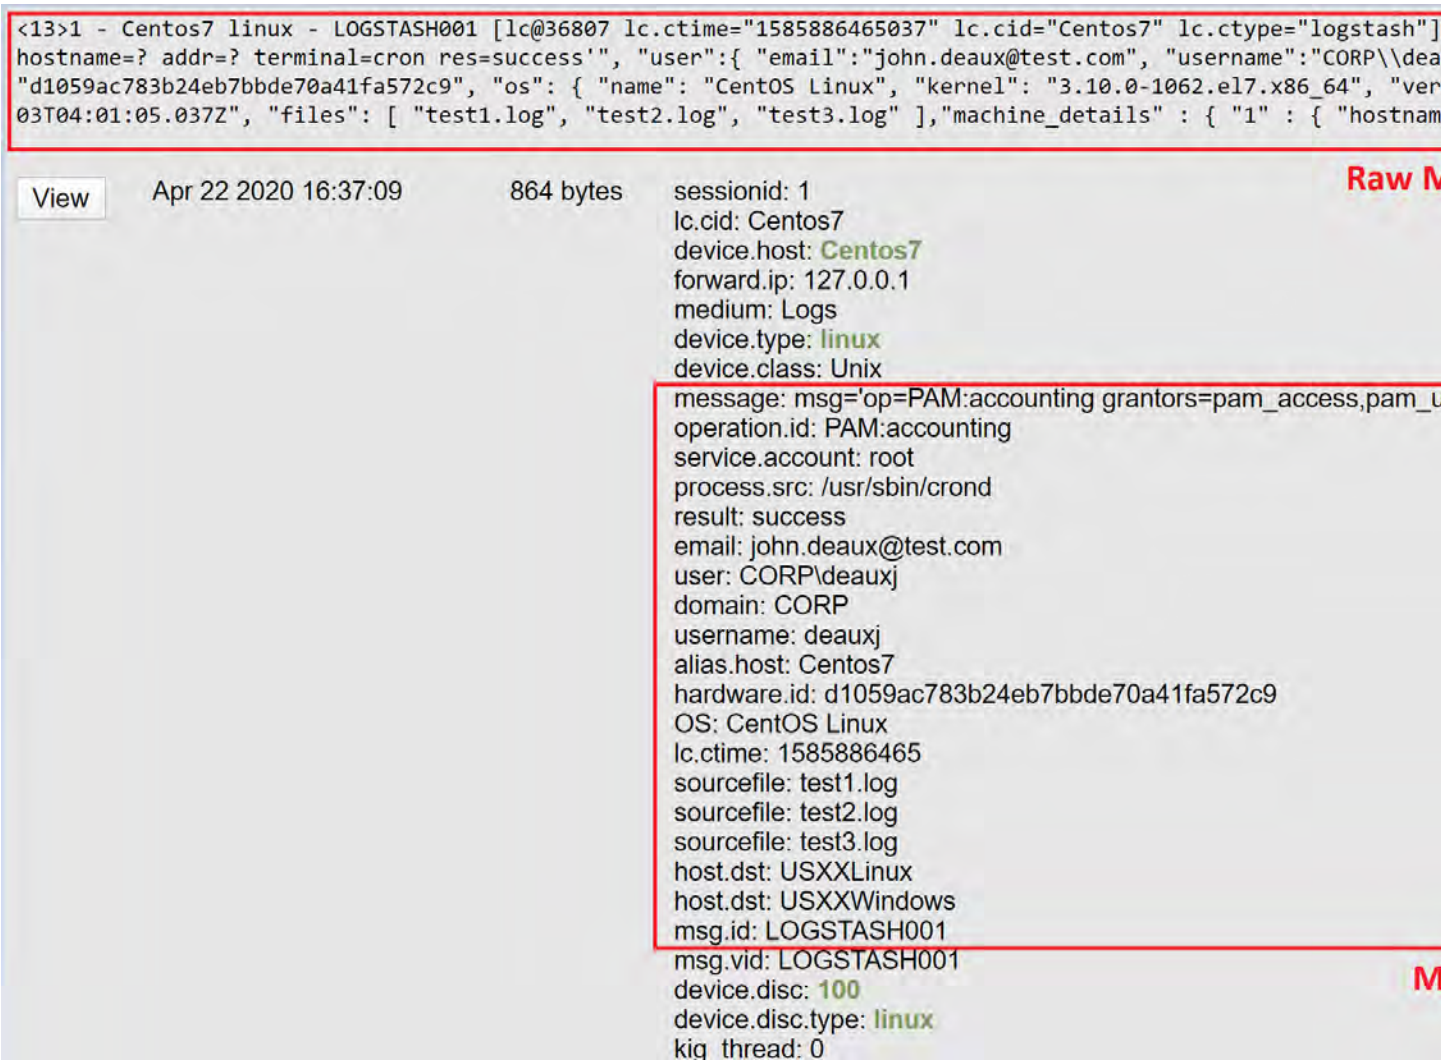
```
<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/machine_details//hostname">  meta="host.dst" />
</DataType>
```

Using the code above on the sample, the following would be the output on the Log Decoder:

**host.dst**: USXXLinux
**host.dst**: USXXWindows

## The Parsed Example Event on the Log Decoder

Assuming the sample log message from the beginning of this document, and using the parser that we have built, the image below details the event as it would appear on the Log Decoder.



The following representation of the sample log has meta values highlighted.

<13>1 - Centos7 linux - **LOGSTASH001** [lc@36807 **lc.ctime="1585886465037"** lc.-cid="Centos7" lc.ctype="logstash"] {**"message":** "msg='**op=PAM:accounting** grantors=pam_access,pam_unix,pam_localuser **acct=root exe=/usr/sbin/crond** hostname=? addr=? terminal=cron **res=success**'", "user":{ **"email":"-john.deaux@test.com"**, **"username":"CORP\\deauxj"** }, "host": { "name": "Centos7", **"hostname": "Centos7"**, "containerized": false, "architecture": "x86_64", **"id": "d1059ac783b24eb7bbde70a41fa572c9"**, "os": { **"name": "CentOS Linux"**, "kernel": "3.10.0-1062.el7.x86_64", "version": "7 (Core)", "codename": "Core", "platform": "centos", "family": "redhat" } }, "@timestamp": "2020-04-03T04:01:05.037Z", "files": [ **"test1.log", "test2.log", "test3.log"** ],"machine_details" : { "1" : { **"hostname" : "USXXLinux"** }, "2" : { **"hostname" : "USXXWindows"** }} }

## Example Parser Listing

The following code represents the complete parser, including the components we built earlier in this document.

Example Parser Listing

```
<?xml version="1.0" encoding="ISO-8859-1"?>

<DEVICEMESSAGES
   name="linux"
   displayname="Linux"
   group="Unix">
   <VERSION device="2.0" />

<MESSAGE
      id1="LOGSTASH001"
      id2="LOGSTASH001"
      content="&lt;logstash_json_payload&gt;" />

<VARTYPE name="logstash_json_payload" dataType=FileBeatsEvent"/>

<DataType name="InternetTime" dateTime="%W-%M-%DT%H:%T:%S.%V%E" />

<DataType name="CollectionTime" type="InternetTime" meta="lc.ctime"/>

<DataType name="ElasticCommonSchemaSubset" format="JSON">
   <Capture key="/@timestamp">     type="CollectionTime" />
   <Capture key="/host/hostname">  meta="alias.host" />
   <Capture key="/host/id">        meta="hardware.id" />
   <Capture key="/host/os/name">   meta="OS" />
</DataType>

<DataType name="DomainUser" regex="(?:(\w+)\\)?(\w+)">
   <Capture index="0" meta="user" />
   <Capture index="1" meta="domain" />
   <Capture index="2" meta="username" />
</DataType>

<DataType name="TagValParse" regex="(?: |^)(?:exe=(\S+)|acct=(\S+)|res=(\S+)|op=(\S+))"
search="true">
   <Capture index="1" meta="process.src" />
   <Capture index="2" meta="service.account" />
   <Capture index="3" meta="result" />
   <Capture index="4" meta="operation.id" />
</DataType>

<DataType name="FineParse" regex="msg='(.*)'">
   <Capture index="1" type="TagValParse" />
</DataType>

<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/message" type="FineParse" meta="message"/>
   <Capture key="/user/email" meta="email" />
   <Capture key="/user/username" type="DomainUser"/>
   <Capture key="/files/" meta="sourcefile" />
   <Capture key="/machine_details//hostname" meta="host.dst" />
```

```
</DataType>

</DEVICEMESSAGES>
```

# Deploy JSON parser

After you have built or changed a JSON parser, you need to upload it to the NetWitness Log Decoder.

1. SSH to the Log Decoder system.
2. Copy the custom parser file to the following folder:

   /etc/netwitness/ng/envision/etc/devices/***eventsource***

   where ***eventsource*** is the name of the event source. You may need to create the folder if it doesn't already exist.

   For example, we need to create **linux** folder under /etc/net-witness/ng/envision/etc/devices directory and copy the **v20_linuxmsg.xml** parser file to /etc/netwitness/ng/envision/etc/devices/linux directory.
3. To get the new parser loaded into memory, you need to reload the parsers on the Log Decoder.

## Reload Parsers from REST

From a browser, run the REST reload command by entering the following URL:

http://***<logdecoder_ip>***:50102/decoder/parsers?msg=reload

For example, if your Log Decoder IP address is **10.10.100.101**, use the following string:

http://10.10.100.101:50102/decoder/parsers?msg=reload

If the call is successful, you should see a REST response, "The parsers have been reloaded."

## Reload Parsers from NetWitness UI

You can also reload your parsers from the UI as follows.

1. In the NetWitness UI, navigate to (Admin) **> Services**.

   The Services view is displayed.
2. Select the Log Decoder to which your want to reload the parsers, and click **View > Explore**.
3. In the left pane, navigate to **decoder > parsers**.
4. Right-click **parsers** and select **Properties**.
5. From the drop-down menu in the Properties panel, select **reload**.

# How Malware Analysis Works

NetWitness Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

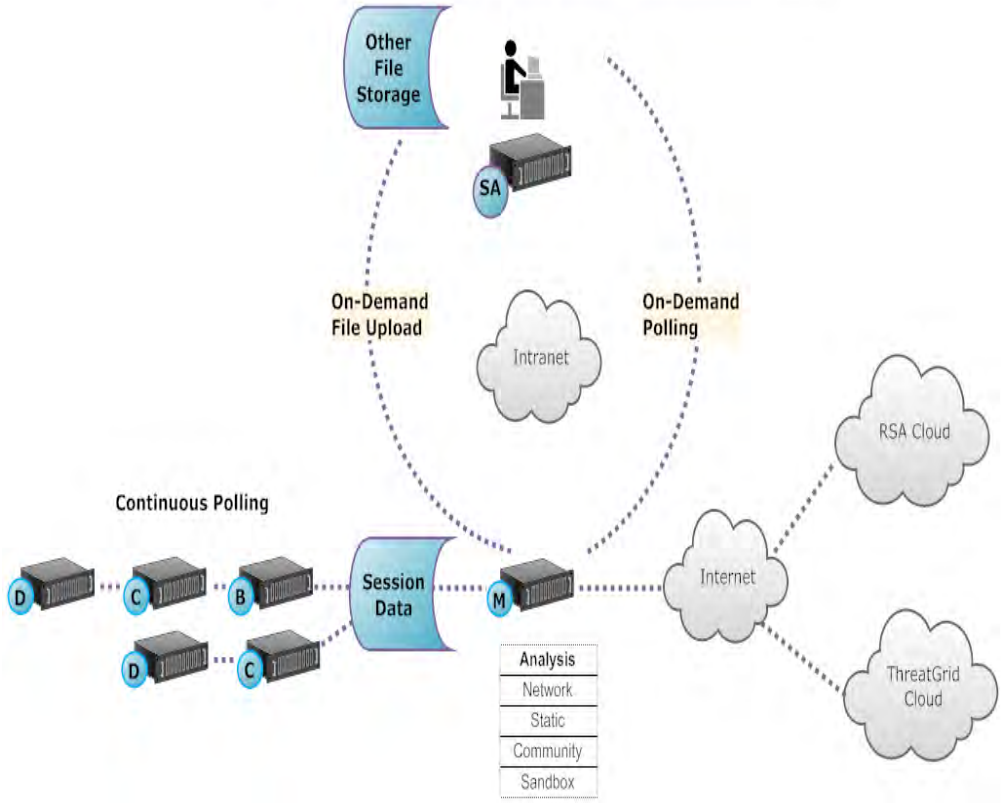
In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows Indicators of Compromise (IOC) authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for NetWitness Respond.

## Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

| Daily Quota (Number of Files) | Free | Standard | Enterprise |
|---|---|---|---|
| Malware Analysis | 100 | unlimited | unlimited |
| ThreatGrid Analysis | 5 | 1000 | 5000 |



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

# Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGRID Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

## NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness customers have a free subscription, with a free trial key for ThreatGRID analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGRID Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 5000 per day.

# Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

## Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

# Scoring Modules

RSA NetWitness Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between -100 and 100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

## Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

## Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

## Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

## Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

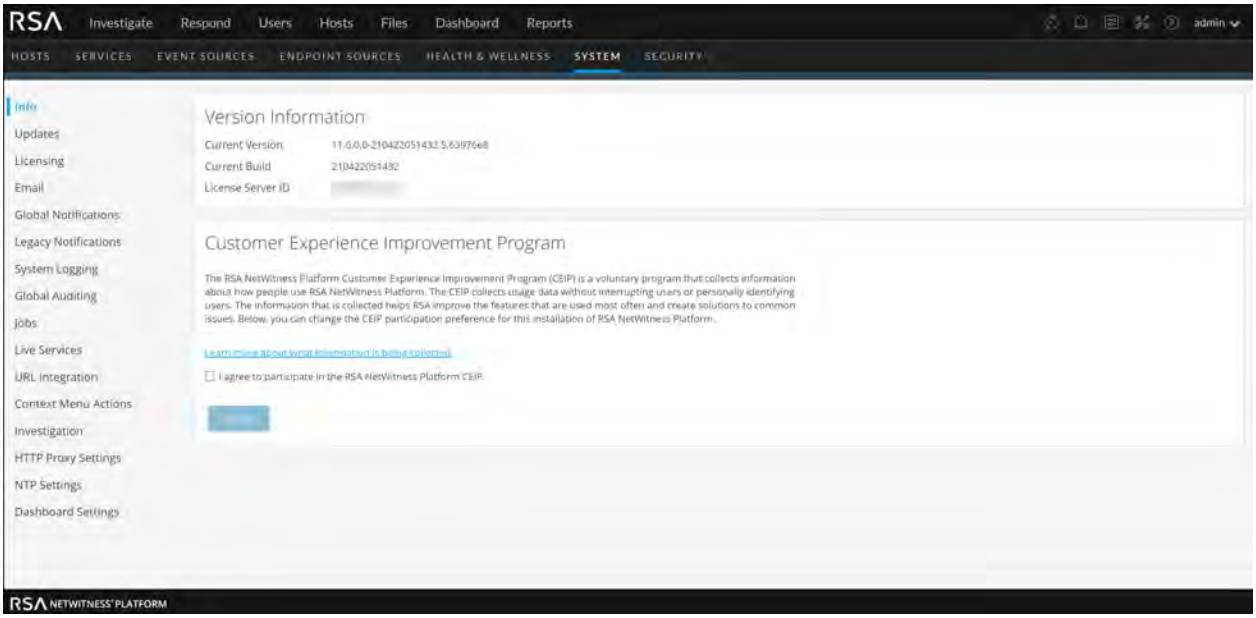
# Roles and Permissions for Analysts

This topic identifies the user roles and permissions required for a user to conduct malware analysis in NetWitness. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

## Required Roles and Permissions

RSA NetWitness manages security by providing access to views and functions using both system permissions and permissions on individual services.

On the system level, the user needs to be assigned a system role, in the (Admin) > System view, that provides access to specific views and functions.



The default `Malware_Analysts` role in NetWitness11.7 is assigned all of the permissions listed below. If necessary, an Administrator can create a custom role with some combination of the following permissions:

- Access Investigation Module (required)
- Investigation - Navigate Events
- Investigation - Navigate Values
- Access Incident Module
- View and Manage Incidents
- View Malware Events (to view events)
- File Download (to download files from the Malware Analysis service)
- Initiate Malware Scan (to initiate a one-time service scan or one-time file upload)

- Dashlet permissions for convenience: Dashlet - Investigate Top Values Dashlet, Dashlet - Investigate Service List Dashlet, Dashlet - Investigate Jobs Dashlet, Dashlet - Investage Shortcuts Dashlet.

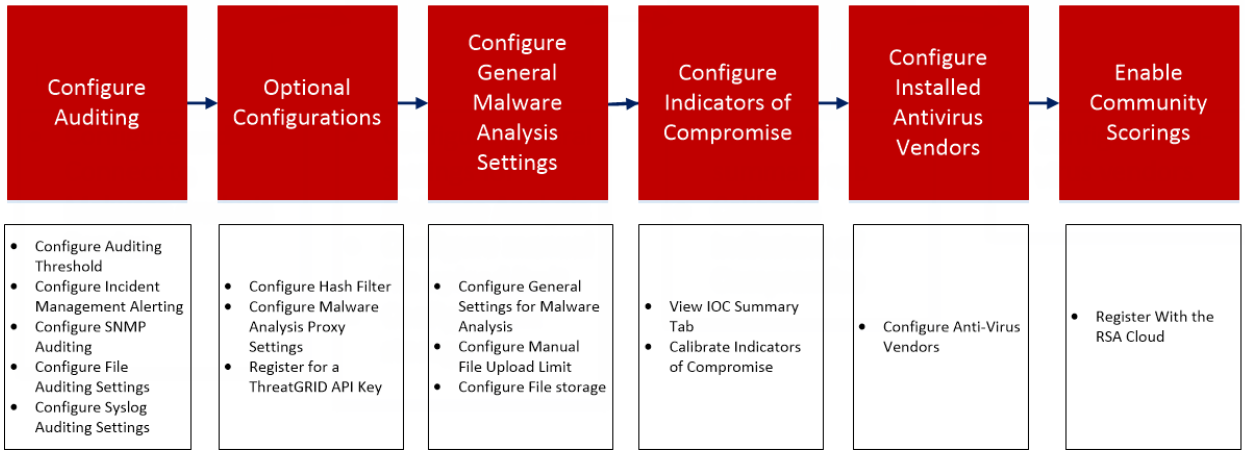
A use case for creating a custom role would be a Junior Malware Analyst role, with limited permissions that do not include the File Download permission.

On specific services, a malware analyst needs to be a member of the **Analysts** group, or to a group that has the two default permissions assigned to the Analyst group: **sdk.meta** and **sdk.content**. Users who have these permissions can use specific applications, run queries, and view content for purpose of analysis on the service.

# Basic Setup

Malware Analysis can operate as a service on a Decoder or as a service on a dedicated appliance. This guide includes instructions for setting up the operating environment and then configuring the Malware Analysis service. After this configuration is complete, analysts can conduct malware analysis.

These are the configuration steps for Malware Analysis, and also for editing the configuration. Perform the steps in the section in the sequence they are given.



## Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure Malware Analysis that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

| Step | High-Level Task |
|---|---|
| Step 1 - (Optional) Configure Dedicated Appliance | (Optional) Configure Dedicated Appliance<br>This topic describes the procedures for configuring the environment to connect to the Malware Analysis service. |
| Step 2 - Configure General Malware Analysis Settings | Configure General Malware Analysis Settings<br>• Enable continuous polling.<br>• Configure manual file upload limit.<br>• Configure the file storage repository and database.<br>• Calibrate the Static, Network, Community, and Sandbox scoring modules. |

| Step | High-Level Task |
|---|---|
| Step 3 - Configure Indicators of Compromise | Configure Indicators of Compromise<br>Calibrate Indicators of Compromise that are applied for each scoring module (Static, Network, Community, Sandbox) and for YARA-based IOCs. |
| Step 4 - Configure Installed Antivirus Vendors | Configure Installed Antivirus Vendors |
| Step 5 - Enable Community Scoring | Enable Community Analysis<br>Register with the RSA cloud and test connections to enable Community scoring. |
| Step 6 - Configure Auditing on Malware Analysis Host | (Optional) Configure Auditing on Malware Analysis Host<br>Configure auditing thresholds and enable Syslog, SNMP, and file auditing. |
| Step 7 - Configure Hash Filter | (Optional) Configure Hash Filter<br>Configure hash filtering to fine tune Malware Analysis event analysis based on known good or bad file hashes. |
| Step 8 - Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings<br>(Optional) Configure Malware Analysis to communicate with the RSA Cloud through a web proxy instead of directly. |
| Step 9 - Register for a ThreatGRID API key | (Optional) Register for a ThreatGRID API Key |

## (Optional) Configure Dedicated Appliance

You can configure the NetWitness operating environment to connect to a NetWitness Malware Analysis service.

Malware Analysis operates as a service on a dedicated Malware Analysis appliance. If your site is using a dedicated appliance, do one of the following:

- If your site is adding a new dedicated NetWitness Malware Analysis appliance, install the physical appliance in your network and configure the operating environment.
- If your site is upgrading a dedicated Spectrum appliance to a dedicated NetWitness Malware Analysis appliance, re-image the Spectrum appliance as a Malware Analysis appliance.

Malware Analysis is dependent on the Core infrastructure to operate. The following steps are necessary before Malware Analysis can successfully analyze data.

1. Configure the onboard Broker on the Malware Analysis appliance to connect another Broker or Concentrator in the existing Core infrastructure.

   **Note:** If no Core infrastructure exists, only manually uploaded files can be analyzed.

2. Use NetWitness Live to find all Live resources with the `malware analysis` tag and deploy these resources to each Decoder service that will be capturing traffic for Malware Analysis to analyze. NetWitness uses this proprietary set of parsers and feeds to find events that are likely to be malware.
3. Configure communications ports. Malware Analysis requires a number of different communications ports to be open, including TCP/443 for HTTPS. These are described below in Network Connections.
4. Configure the NextGen source to which Malware Analysis will connect. This is the Broker or the Concentrator.
   Malware Analysis is now ready to begin analyzing network traffic.

## Network Connections

The inbound and outbound network connections must be configured for the Malware Analysis appliance to properly communicate with services, RSA sources for software updates, and other critical information.

Your network firewall must be configured to allow the Malware Analysis access to the internet. Proxy servers may be used to facilitate these connections, if necessary.

### Inbound Connections

TCP/22 - Secure Shell access to the Malware Analysis server to review log files and troubleshoot. Access can be limited to IP addresses that will be managing Malware Analysis.

- TCP/443 - HTTPS web-based connection to access the Malware Analysis user interface.
- TCP/50008 - JMX port for performance troubleshooting, using an application such as JVisualVM. This is optional and access can be limited to IP addresses that will be managing Malware Analysis.

### Outbound Connections

- TCP/443 - HTTPS connections to SSL-based web servers. Some features include Malware Analysis sending files or documents to servers for analysis, which require a secure connection. Use of a web proxy server is supported.
- (TCP/443 - SSL connection from Malware Analysis to the RSA Cloud. Use of a SOCKS proxy server is supported. Customer infrastructure changes may be required to ensure that 443 is open to cloud.netwitness.com.)
- TCP/50103 - REST API port used to communicate with a Broker. (NetWitness 10.3.x and earlier)
- TCP/50105 - REST API port used to communicate with a Concentrator. (NetWitness 10.3.x and earlier)
- TCP/50003 TCP/56003 - Ports used to communicate with a Broker. (NetWitness 10.4 and later)
- TCP/50005 TCP/56005 - Ports used to communicate with a Concentrator. (NetWitness 10.4 and later)

- ICMP - JMS connection from NetWitness to the Malware Analysis service to verify if the hostname and ip address entered is valid for a successful test connection.

# Configure General Malware Analysis Settings

You can configure several basic settings required to enable and calibrate the consumption of sessions, manual file upload, and the different scoring modules that Malware Analysis uses to analyze data.

You can also set up file sharing with the data repository. Malware Analysis has three modes of consuming sessions and files. Any combination of the three choices may be used to initiate analysis in Malware Analysis. The choices are:

- **Continuous Polling of the Core service:** You can enable and configure continuous polling of the Core service. When enabled and configured, Malware Analysis continuously polls the Core service for sessions tagged for analysis. By default, continuous polling is disabled. You can enable Denial of Service (DOS) attack prevention for use during continuous polling. You can test the connection to the Malware Analysis service that is being continuously polled using an option in the Integration tab.

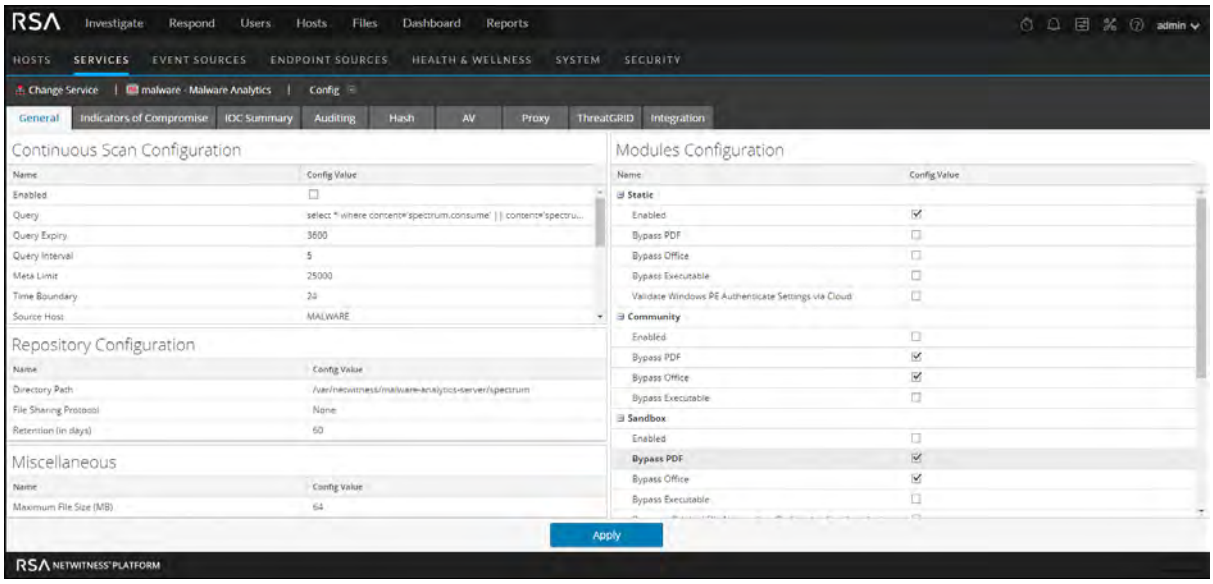
  **Note:** When adding a Core service as a service for continuous polling on 10.3.5 and earlier Malware Analysis, use the REST port; for example, add a Concentrator to 10.3.5 Malware Analysis with REST port (50105) instead of the native NexGen port (50005).

- **On-Demand Analysis of the Core service:** You can analyze sessions based on Investigations initiated directly in NetWitness. This method allows manually controlled consumption of Core sessions and allows tighter control over how files in those sessions are processed (for example, send to sandbox for processing). Document types can bypass the default restrictions and be sent to community or sandbox processing regardless of the configured setting.
- **Manual File Upload:** You can manually upload one or more files for analysis by navigating to a visible folder on your computer and selecting files to be uploaded. The maximum size for the uploaded files is configurable.

## View the Basic Settings

To view the basic settings:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a Malware Analysis service and click **> View > Config**.
   The Service Config for the service is displayed with the **General** tab open.



## Configure Continuous Polling

Malware Analysis is rate limited so that 1,000 files per day may be submitted to ThreatGRID's Cloud for sandbox processing. To optimize your use of the sandbox, Malware Analysis configuration allows you to choose which of several methods of consumption Malware Analysis uses; you can enable or disable continuous polling.

An important consideration when configuring continuous polling is the Denial of Service (DOS) Prevention parameters. By default this feature is disabled because you need to carefully consider the settings for your environment before enabling the feature.

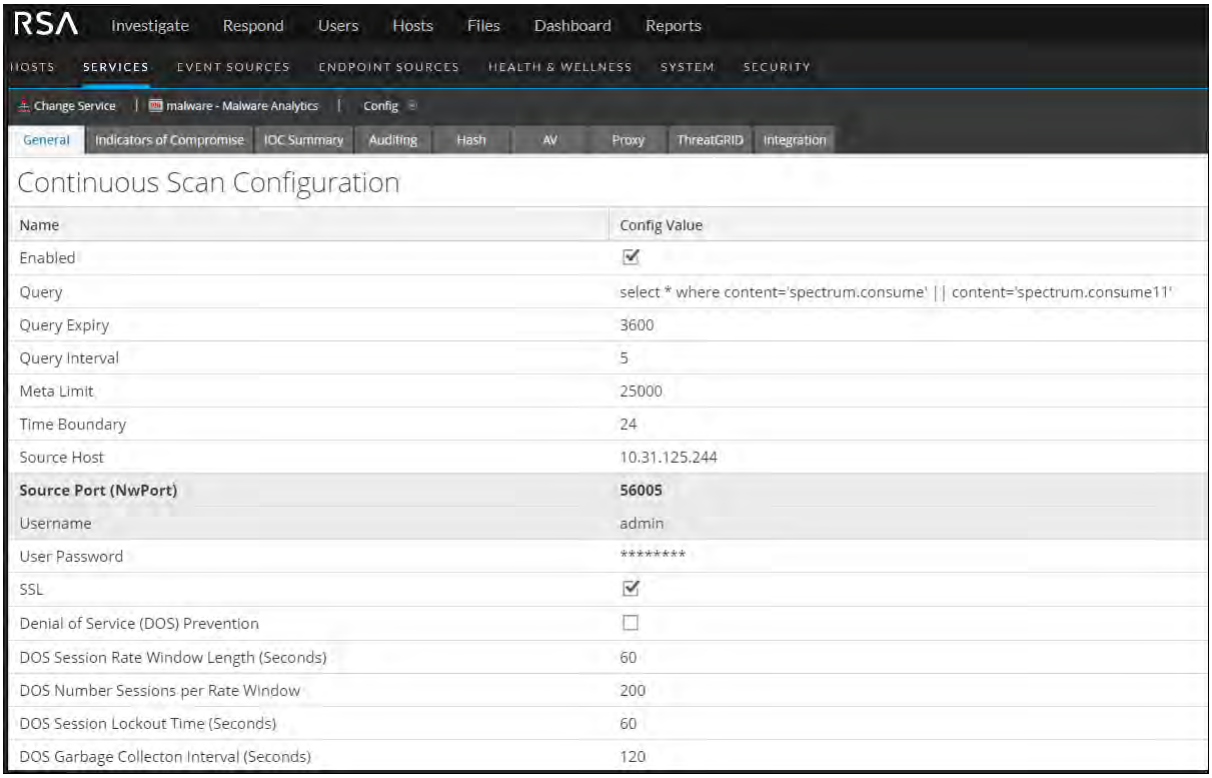
When DOS Prevention is disabled, Malware Analysis analyzes the queued sessions in first-in first-out order. A DOS attack may rapidly fill the queue so that Malware Analysis is busy handling those sessions, while a malware attack is occurring in a later session. The later session with the actual attack may not reach the beginning of the queue and undergo analysis until after the attack has begun.

When DOS Prevention is enabled, Malware Analysis treats too many sessions from a single IP address as a DOS attack. If an IP address exceeds the Number of Sessions per Rate Window, Malware Analysis begins to disregard sessions from that address until the Session Lockout time is reached. Then Malware Analysis resumes analysis of the sessions from that IP address. The disregarded sessions from the IP address are not analyzed at all, so a malware attack may slip through during the Session Lockout period.

Using the DOS Garbage Collection Interval setting, Malware Analysis clears in-memory storage of an IP source after a specified number of seconds. IP addresses with little activity during this interval are cleared from memory. If an IP address is active at intervals that exceed the DOS Garbage Collection Interval, Malware Analysis may not identify it as a DOS attack.

To configure Malware Analysis for continuous polling, in the Continuous Scan Configuration section:

1. In the **General** tab, under **Continuous Scan Configuration** you can configure continuous polling.



2. To enable continuous polling, click **Enabled**.
3. (Optional) If you want to change the default values for querying, enter new values for the **Query Expiry**, **Query Interval**, **Meta Limit**, and **Time Boundary**.
4. To configure the Malware Analysis appliance that Malware Analysis queries to retrieve data for analysis, specify the **Source Host** and **Source Port (NwPort)**.
5. (Optional) If you want to change the default logon credentials for the Malware Analysis appliance, specify the **Username** and **User Password**.
6. If you want to use SSL for communication between the Malware Analysis appliance and the Core service, enable **SSL**.
7. (Optional) If you want to configure Denial of Service (DOS) prevention:
   a. Enable the **Denial of Service (DOS) Prevention** parameter.
   b. Set up the DOS prevention session limitations:
      - Specify the number of seconds of the time window during which Malware Analysis counts sessions for a single IP address (**DOS Session Rate Window Length**). The window is called a Rate Window and a counter is set when the first session is received from that IP source. The default value is 60 seconds.
      - Specify the number of sessions allowed per Rate Window in the **DOS Number Session per Rate Window**. The default value is 200 sessions. When the number of sessions is reached within the Rate Window; Malware Analysis begins disregarding sessions from the IP address

and the disregarded sessions from that IP are not analyzed at all. Malware Analysis continues to disregard sessions until the lockout time is reached.

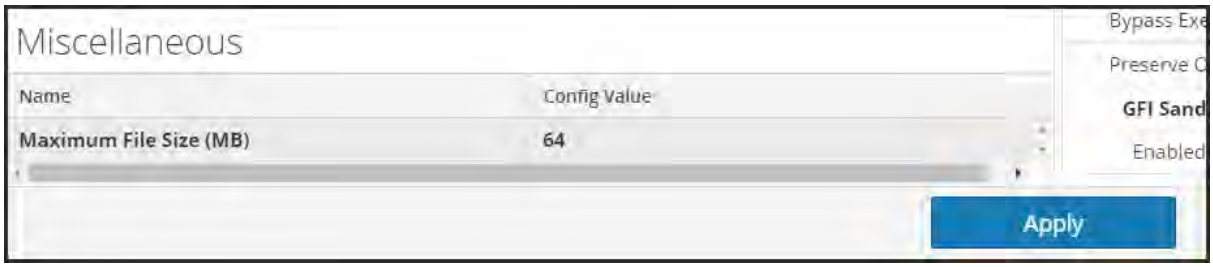
- Specify the length of lockout time (during which sessions from the IP address are disregarded and not analyzed) in the **DOS Session Lockout Time (Seconds)**. The default value is 60 seconds. When the lockout duration has elapsed, Malware Analysis resumes analysis of sessions from that IP address.
- Specify the interval of inactivity for an IP address before NetWitness removes the in-memory object for the IP source in **DOS Garbage Collection Interval (Seconds)**. The default value is 120 seconds.

8. Click **Apply** to apply the changes.
   The applied changes become immediately effective as Malware Analysis receives new packets.
9. Test the connection of the Malware Analysis service to the Core service selected in the **Integration** tab by clicking the **Test Connection** button in the **Continuous Scan Connection Test** section.

## Configure Manual File Upload Settings

To configure the maximum file size for manual file upload:

1. In the Miscellaneous section, type the maximum file size in Megabytes allowed for files uploaded manually for Malware Analysis scanning.



2. Click **Apply**.
   The changes become immediately effective.

## Configure the Data Repository

Malware Analysis can store a finite number of files on the appliance. The data repository configuration has a file system retention period of 60 days. This setting determines how long files are retained in the Malware Analysis appliance. When old files are deleted, they cannot be recovered. Every day, Malware Analysis deletes files that exceed the file system retention period to ensure that there is no wasted disk space.

The File System Retention Period is the only setting that governs when files are deleted. Files are not deleted based on the amount of disk space being used. If the setting needs to be changed, the administrator must configure the retention period based on the anticipated space usage during the number of retention days specified.

The visible data repository parameters in the NetWitness user interface are:

- The location of the repository is **/var/lib/netwitness/malware-analytics-server/spectrum**. Do not edit this value.
- The file sharing protocol, which allows access through one of the File Sharing Protocols to copy files from the Malware Analysis service.
- The file retention period in number of days.

To configure file sharing, in the Repository Configuration section:

1. Click on the File Sharing Protocol and select **FTP** or **SAMBA** or **None**.
2. Select the number of days that files are maintained in the repository before deletion.
3. Click **Apply.**

The changes become immediately effective.

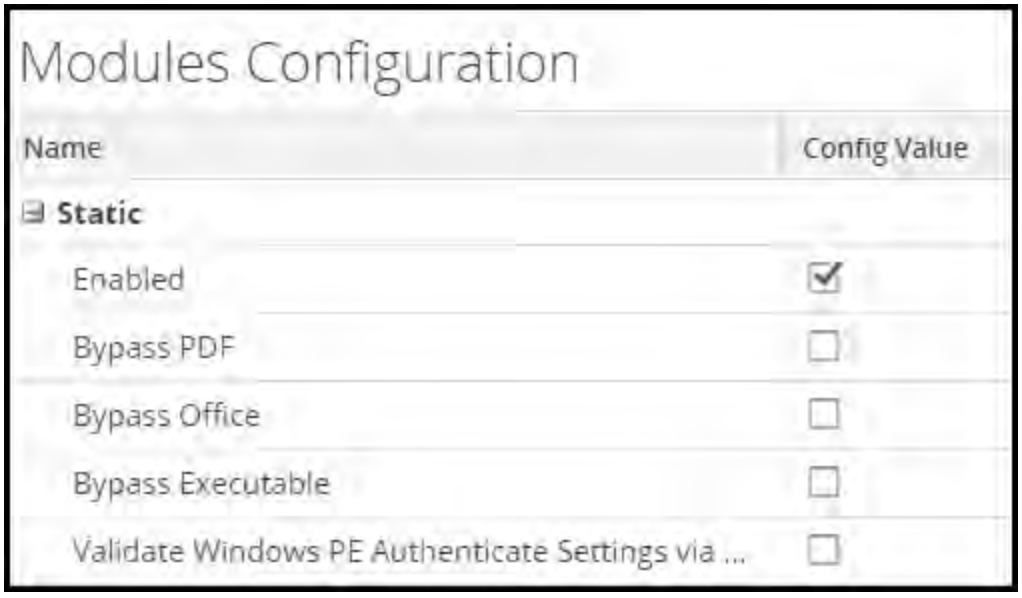
## Calibrate Scoring Modules

The Modules Configuration section helps configure the following components of Malware Analysis to:

- Completely disable any or all of three scoring modules (Static, Community, and Sandbox). Before disabling or enabling any scoring module, ensure that you understand what each scoring module detects.
- Malware Analysis tags sessions containing Microsoft Office, Windows PE, and PDF files for consumption by the Malware Analysis service. You can configure Malware Analysis to ignore Windows PE, Microsoft Office, and PDF documents entirely. If this is the case, a better option is to adjust your Core settings to ignore these files so they are not tagged for Malware Analysis consumption.

A sample application for using scoring module calibration is this: when setting up rule groups or analyzing system performance, you can test various scenarios in which PDF documents are not analyzed, but Microsoft Office and Windows PE documents are. You can test the scenario in each of the three scoring modules. If you see a measurable improvement in system performance, you can apply this knowledge on a broader scale.

## Configure Static Analysis Scoring



To configure Static analysis scoring, in the **Modules Configuration** section:

1. By default the Static module is enabled. To enable or disable Static analysis entirely, click the **Enabled** checkbox.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the checkboxes **Bypass PDF**, **Bypass Office**, and **Bypass Executable**.
3. To configure your preference for Authenticode validation of digitally signed Windows PE files, click the **Validate Windows PE Authenticate Settings via Cloud** checkbox. If you want to prevent Windows PE files that are digitally signed from being transmitted to the RSA Cloud for validation, remove the check.
   When disabled, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and MS Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.
4. Click **Apply.**The changes become immediately effective as Malware Analysis receives new packets.

## Configure Community Analysis Scoring

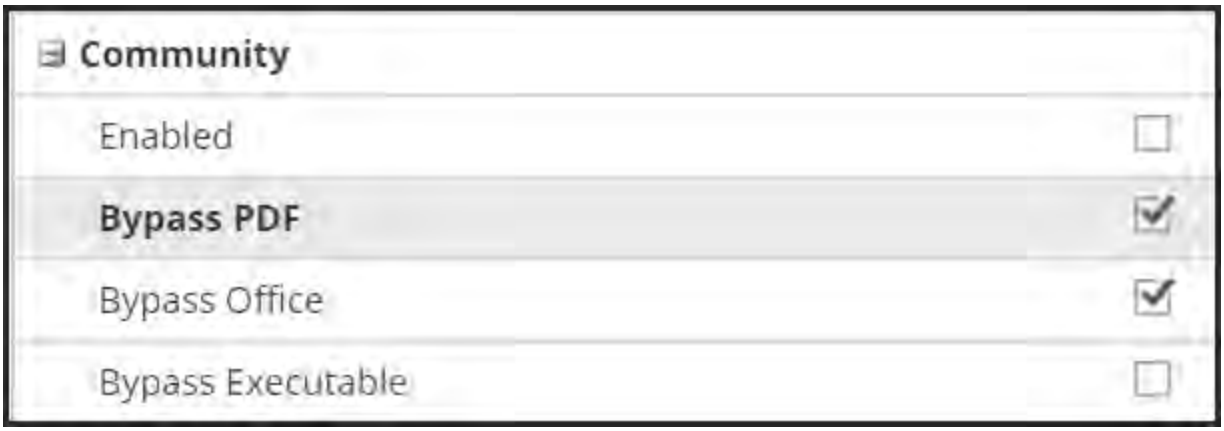
Once the Community module is enabled, the security community analyzes all documents not prevented from processing. This is achieved by sending network session and file attributes to the RSA Cloud for processing. The RSA Cloud then may make external connection to security community partners as needed to process the information.

The file content is never sent to the community for analysis. Instead, the MD5/SHA-1 hash of the file is sent for Anti-Virus detection and Blacklisting. Similarly, session Meta is harvested and analyzed as part of this process. Meta elements such as URL and Domain Name are examined and transmitted to the RSA Cloud to identify known bad URLs/Domains.

You can enable Community analysis and limit which document types are processed. There is no risk for the file content (except for a hash) being sent outside of your network.

**Note:** To gain access to the RSA Cloud where processing occurs, you must register your Malware Analysis service with RSA customer service. There are two methods: register the service using the options in the Integration tab or contact RSA Customer Care.

To configure Community analysis scoring, in the Modules Configuration section:



1. To enable or disable Community analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select the specific checkboxes - **bypasspdf**, **bypass office, bypass executable.**
3. Click **Apply** to save the changes and put them into effect immediately as Malware Analysis receives new packets.

## Configure Sandbox Analysis Scoring

By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set to the most restrictive settings to force the user to specify whether or not potentially sensitive information is sent outside of the network for processing. If a document type is not prevented from being processed, the entire file (not just the hash) is sent to the destination sandbox server.

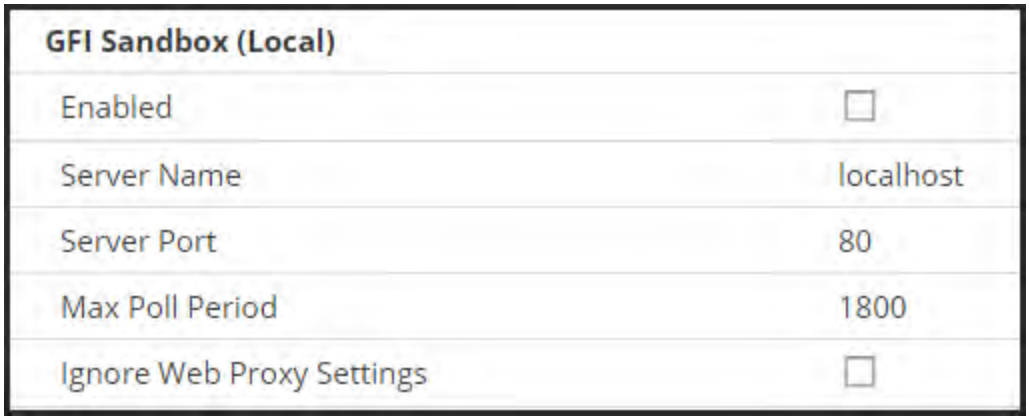
In addition, you can choose to preserve the original file name when performing sandbox analysis.

**Note:** If you do not specify the **Preserve Original File Name when Performing sandbox Analysis** parameter, NetWitness hashes the files.

When you enable the sandbox module, you must specify whether or not the sandbox processing is performed using a local GFI sandbox, a local ThreatGRID sandbox, or a cloud version of the ThreatGRID sandbox. The cloud version of the ThreatGRID sandbox is provided directly by ThreatGRID and requires an activation key to be obtained from ThreatGRID and configured in the ThreatGRID tab.

## GFI Sandbox Settings

To use a locally installed GFI sandbox, you must enable GFI and supply the Server Name and Server Port of the GFI sandbox Server. The Max Poll Period and Polling Interval determine how long to wait for a submitted sample to finish processing and how often to check the status (in seconds). The Ignore Web Proxy Settings option allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.



## ThreatGRID Sandbox Settings

**Note:** Before enabling ThreatGRID scoring, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate. Use NetWitness to register for a ThreatGRID API key, then you can enable and configure a locally installed ThreatGRID sandbox or the ThreatGRID Cloud sandbox. Refer to the following detailed task: Register for a ThreatGRID API Key.

The Ignore Web Proxy Settings allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

To configure sandbox scoring, in the Modules Configuration section:

1. To enable or disable sandbox analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the three checkboxes **Bypass PDF**, **Bypass Office, Bypass Executable.**
3. Configure the active sandbox vendor. You have three options:
   a. To use a locally installed instance of the GFI sandbox, provide the Server Name and Server Port of the GFI sandbox Server, the Max Poll Period and Polling Interval, and optionally, select the **Ignore Web Proxy** checkbox.
   b. To use a locally installed instance of ThreatGRID, enable ThreatGRID scoring, provide the ThreatGRID Service Key and optionally, select the **Ignore Web Proxy** checkbox.
   c. To use the ThreatGRID Cloud, you must first register for a ThreatGRID API key. Then enable ThreatGRID scoring, provide the ThreatGRID Service Key, enter the URL for the ThreatGRID server (https://panacea.threatgrid.com), and optionally, select the **Ignore Web Proxy** checkbox.
4. Click **Apply**.
   The changes become immediately effective.

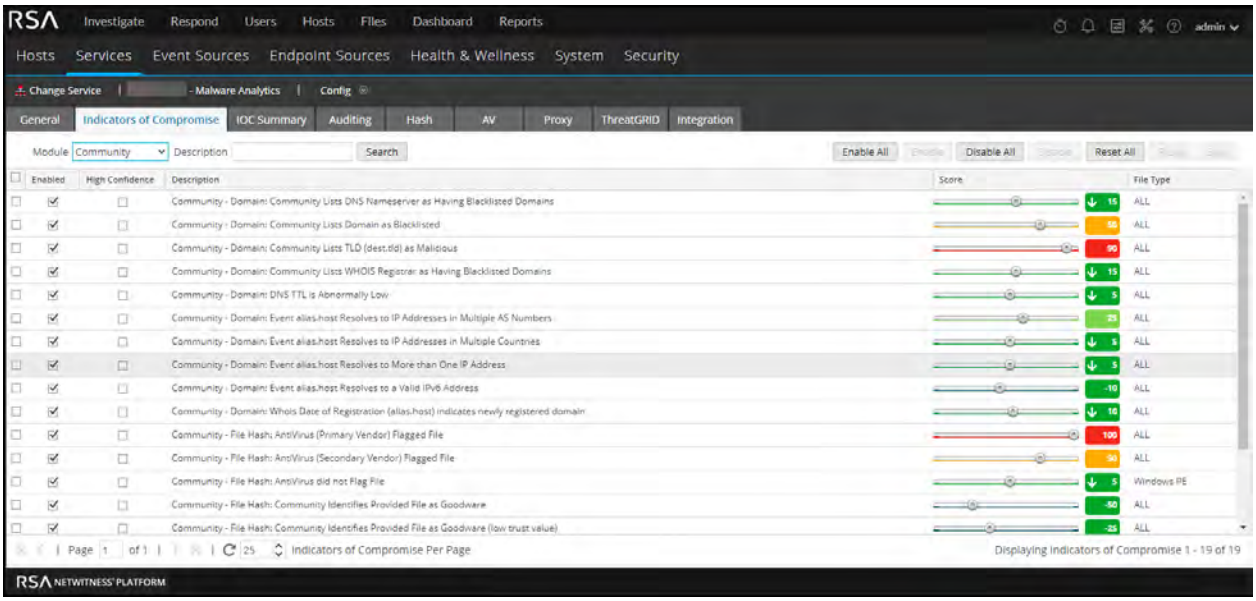
## Configure Indicators of Compromise

The Indicators of Compromise (IOC) for the Malware Analysis scoring modules are configured since, each Malware Analysis scoring module -- Network, Static, Community, Sandbox, and YARA -- has a default set of Indicators of Compromise (IOCs) that it uses to evaluate the file and session data in order to assess the likelihood of malware being present.

Each IOC is assigned a numeric score weighting between -100 (good) and 100 (bad). When an IOC triggers, the numeric score weighting is factored into the total score for the session or file being analyzed. The individual score weightings for all matched IOCs are aggregated to produce the resulting score for each session or file. The aggregated score is adjusted to ensure that it does not exceed the valid score range (-100 through 100).

**Note:** The score weighting assigned to an IOC is not always the explicit score value that is aggregated (it is not a simple addition of score weights for each IOC that triggers). Instead, the IOC's score is a weighting or indicator of importance that is factored into calculating an overall score.

The Indicators of Compromise (IOC) configuration settings for Malware Analysis are in the Service Config view > Indicators of Compromise tab. Below is an example of the tab.



Using the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC as an example, the IOC's score weighting could be set to 100. However, Malware Analysis dilutes this value based on the percentage of primary AV vendors that agree if the sample is malicious. The closer to 100% of the vendors who agree that the sample is malicious, the closer to the full 100 points are used in aggregating a score. As the percentage drops closer to 0%, the proportion of the full 100 points used in the aggregated score drops.

IOCs use logic implemented natively in Malware Analysis. You cannot adjust the logic. Instead, you can only adjust the IOC to increase or decrease its impact on scoring, to indicate a confidence setting, or to turn the IOC on or off. The typical scenario is to adjust a limited set of IOC score weighting values downward for IOCs that are inflating the final score and causing false positive analysis results. An extreme version of tuning would be to disable the IOCs entirely if they consistently contribute to false positive results. Additionally, the flexibility exists to allow you to disable all IOCs and to choose a select few to leave enabled. For example, all IOCs can be disabled with the exception of a select few IOCs that detect AntiVirus matches. Using Malware Analysis in this extremely limited configuration, you can reduce results in Malware Analysis such that only known A/V matches generate results.

You can configure this functionality in several ways:

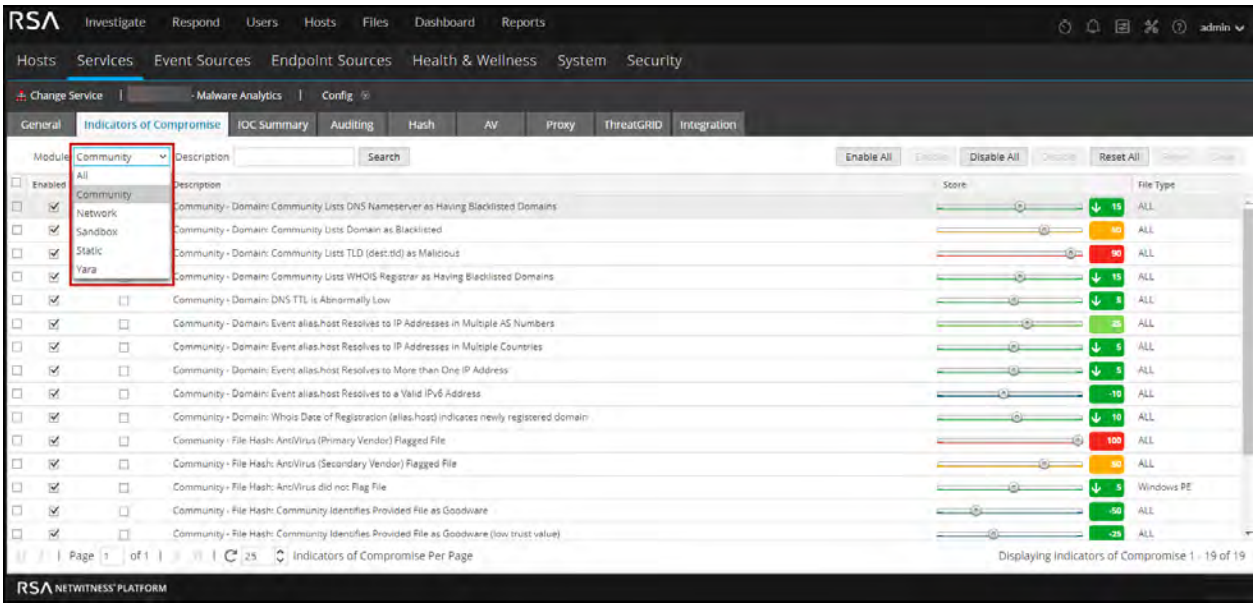
- Disable IOCs so that they are not evaluated as part of the scoring module to which they are assigned.
- Adjust the score weight for an IOC such that its impact on the aggregated score is increased or decreased.
- Mark IOCs that you expect to be strong indicators of malware and display a high-confidence (HC) flag on sessions that triggered these IOCs in the Malware Analysis results.
- Customize score and confidence settings uniquely to the file type being analyzed. Each IOC is pre-assigned a file type to which it is applied. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**. The IOC with the most applicable file type is used during file-based analysis. For example, if a PDF is analyzed, an IOC with a file type set to **PDF** will be chosen rather than the same IOC with a file type set to **ALL.** If no file-type specific match is found, the IOC with a file type set to **ALL** is selected.
- Search for rules to display in the grid based on a match to the rule description.

## Filter Displayed IOCs by Module

You can filter the displayed IOCs by scoring module: one of the four built-in modules or YARA. YARA-based IOCs are interleaved with the native IOCs with each category. Although the YARA IOCs are not identified as such in the other views, you can select YARA from the Module selection list to see a list of YARA rules.

To view the IOCs for one or the four scoring modules or for YARA:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service.
3. In the row, select **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select **All**, **NextGen**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.



## Filter Displayed Modules to Show Only Modified Modules

The **Indicators of Compromise** tab visually identifies IOCs that are locally modified. When an IOC has been modified, for example, the score weight has been changed, and the name is displayed in red and includes a modification indicator appended to the IOC name. The modification indicator is ++ and can be used as a filtering mechanism when searching for IOCs.
To limit the display to locally modified IOCs:

1. In the **Description** field, enter ++.
2. Click **Search**.
   The view is filtered to show only modified IOCs.

## Enable and Disable IOCs for a Scoring Module

When an IOC is disabled, it no longer impacts the aggregate score for the scoring module to which it belongs. If the IOC has multiple instances (differentiated only by file type), disabling a more file-type specific IOC results in use of the more file-type agnostic version of the IOC in scoring.
For example, if the same IOC exists as file type **ALL** and file type **Windows PE**, disabling the **Windows PE** instance of the IOC causes the **ALL** version to be used in scoring. In order to disable the IOC entirely for **Windows PE**, while leaving the IOC enabled for other file types, set the score weighting of the **Windows PE** instance of the IOC to a value of zero as described below. This leaves the IOC enabled for Windows PE files (although it has a zero weighting and is suppressed from being displayed in analysis results), while not affecting the other file types. The remaining file types will continue to use the **ALL** instance of the IOC.

To enable or disable an IOC so that it no longer factors into a scoring module:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and in the row select > **View > Config**.
3. Click the **Indicators of Compromise** tab.
4. In the **Module** selection list, select a scoring module: **All**, **Community**, **Network**, **Sandbox**, **Static**, or **YARA**.
   The configured rules and settings for the module are displayed.
5. Do one of the following:
   a. Click the **Enabled** checkbox in the column next to a rule that you want to enable.
   b. Select one or more rules, and click **Enable** or **Disable** in the toolbar.
   c. To toggle between Enabled and Disabled for all rules displayed on the page, click the **Enabled** checkbox in the column title.
   d. To enable or disable all rules for the scoring module, click **Enable All** or **Disable All** in the toolbar.
6. To save the changes to the page, click **Save** in the toolbar.

> **Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

## Adjust the Score Weight for an IOC

Adjusting the score weight for an IOC increases or decreases the IOC's overall impact on the aggregate score for the module in which it is configured. To raise or lower the overall impact of the IOC, reduce the current value to a new setting.

- Values ranging from -100 to -1 indicate that the session or file being analyzed is not likely to be malware (-100 being the least likelihood).
- Values ranging from 1 to 100 indicate a likelihood that the file or session being analyzed is malware (100 being the highest likelihood).
- Setting the value to zero leaves the IOC enabled, but causes the IOC to no longer impact the aggregate score and suppresses the IOC from being displayed in analysis results. Setting the value to zero is a method of disabling a file-type specific instance of an IOC while leaving the original file-type agnostic instance of the rule intact for scoring of the remaining file types.

To adjust the score weight:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service.
3. In the row, select **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select a scoring module: **All**, **Network**, **Static**, **Community**, **Sandbox** or **YARA**.
   The configured rules and settings for the module are displayed.
6. Do one of the following:
   a. Drag the score slider left or right to decrease or increase the score weight.
   b. Click directly on the displayed score weight and enter a new score weight.
7. To save the changes to the page, click **Save** in the toolbar.

**Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

## Set the High Confidence Flag for an IOC

The High Confidence setting is used as a method of flagging specific IOCs as high confidence indicators that malware is present. As an example, the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC has a low probability of being a false positive, combined with a high probability of being an accurate measurement of malware being present. By flagging this IOC (and others) as High Confidence, you can use a filter in the Malware Analysis results to limit display to only those sessions that include one or more high confidence rules. By doing so, the display is limited to a smaller subset of results whose accuracy is accorded a higher degree of confidence. Displaying results not limited to high confidence IOCs still allows you to review results that are more grey in nature. This provides for results that are less prone to false negative results. Choosing to filter or to not filter results based on confidence level has a valid use case in the NetWitness workflow.
To set the High Confidence flag:

1. In the **Indicators of Compromise** tab, select a scoring module from the **Module** selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. Click the **High Confidence** checkbox in the column next to a rule that you want to flag or unflag as highly likely to indicate the presence of malware in a session when matched.
3. To save the changes to the page, click **Save** in the toolbar.

**Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

## Reset IOCs to Default Settings

1. In the **Indicators of Compromise** tab, select a scoring module from the Module selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. If you want to reset all rules on the current page to their default settings, click **Reset** in the toolbar.
3. If you want to reset all rules for the selected scoring module to default settings, click **Reset All** in the

toolbar.

4. To save changes to the page, click **Save** in the toolbar.

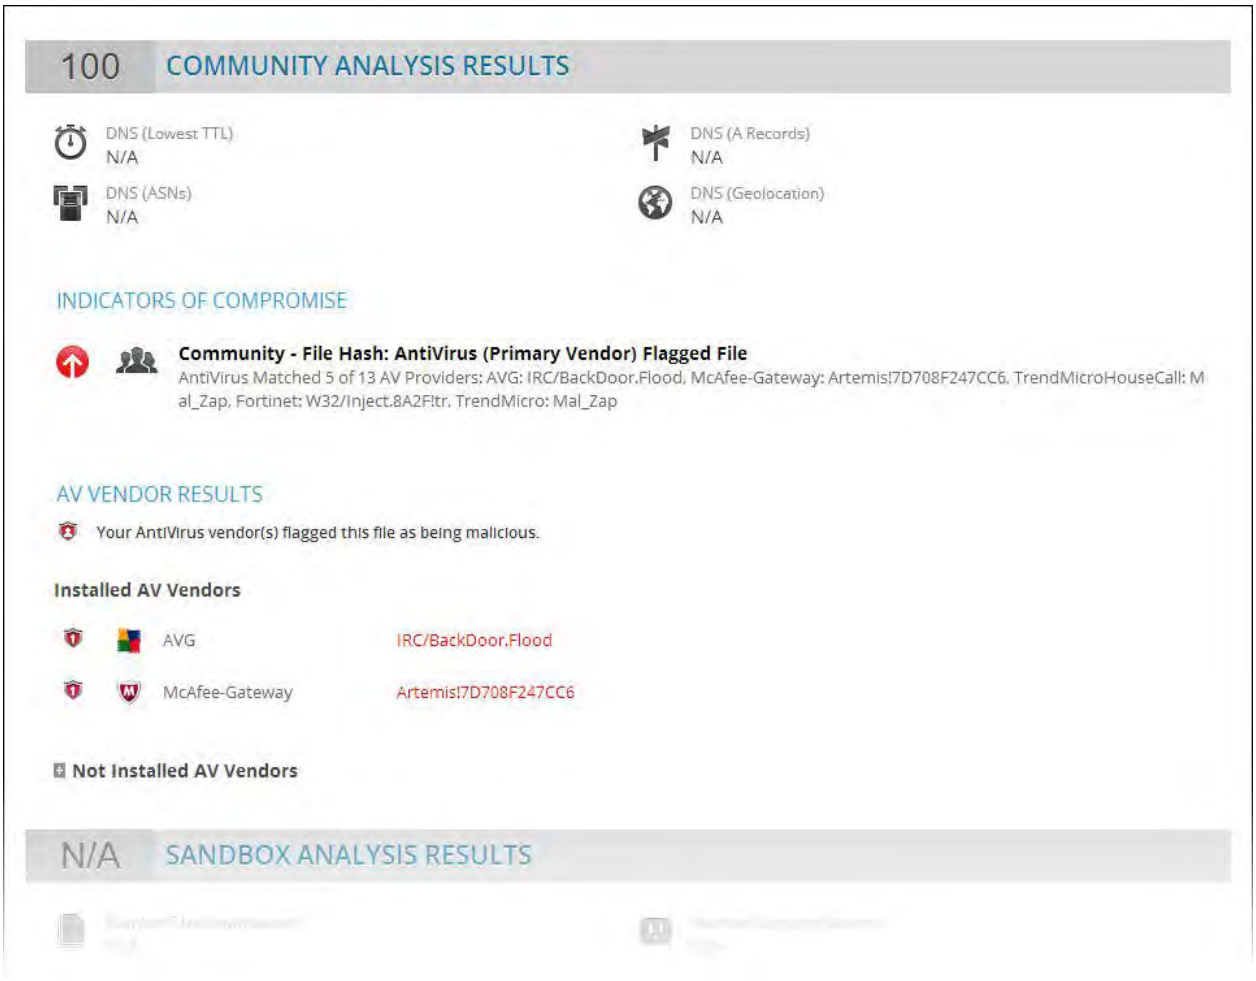
## Configure Installed Antivirus Vendors

You can compare file analysis results from your installed antivirus (AV) vendors versus community results from the Malware Analysis knowledge base. While a file is being analyzed by community analysis, Malware Analysis checks an antivirus knowledge base to determine if the sample is already known to be malicious. If the file is known to be malicious, NetWitness flags the file to indicate whether a primary antivirus vendor or a secondary antivirus vendor identified the sample. NetWitness classifies vendors as primary and secondary to indicate the level of reputation the vendors have in the industry, and Indicators of Compromise factor the reputation into scoring. For example, detection made solely by secondary antivirus vendors may score less than detection by primary vendors.

**Note:** When choosing AV vendor software to install on your network, it is highly recommended that you include at least one from NetWitness Primary Vendors list. For more information, please see the Supported Antivirus Vendors.

You can identify the antivirus vendors installed on your network to NetWitness. NetWitness compares the antivirus results during community analysis against the results from the installed vendors selected in the AV tab. If a match is detected, the file being analyzed is flagged to indicate that your locally installed primary or secondary antivirus software detected the sample.

The example below shows the community analysis results for a file that had a score of 100. Under **Indicators of Compromise**, you can see that the file was flagged by the listed AV vendors in the Community. Under **AV Vendor Results**, NetWitness indicates whether the AV vendors installed in your environment flagged the file as malicious. If your installed AV vendors detected the virus, the name of the malware is displayed. If your installed AV vendors did not detected the virus, **--Not detected--** is displayed next the AV vendor name. Under **Not Installed Vendors**, you can click + to expand the section and see if other vendors not installed on your system detected the virus.



## Identify Installed AV Software

To identify Antivirus software installed on your network:

1. Go to **(Admin) > Services.**
2. Select a Malware Analysis service, and in the row select **> View > Config**.
3. In the **Service Config View**, select the **AV** tab.
4. Select the checkbox next to each antivirus vendor (primary and other) whose software is installed on your network.
5. To save the changes, click **Apply**.
   The Community Analysis results will indicate whether your software flagged an event.
6. (Optional) If you want to reset the list of installed AV software to the default value (none), click **Reset**.
   All selections are removed.
7. To save changes, click **Apply**.

# Enable Community Analysis

An Administrator can enable community analysis. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. To enable Community analysis, you must register with the RSA cloud and test connection to the cloud, then to test the connection between the RSA cloud and the service you have configured for continuous scanning.

A complete description of analysis methods is provided in How Malware Analysis Works.

1. Go to **(Admin) > Services.**
2. Select a Malware Analysis service, and in the row select **> View > Config**.
3. In the **Service Config View**, select the **Integration** tab.
4. Scroll down to **RSA Cloud Connection Test and Registration**.

   NetWitness tests communications with the site at `https://cloud.netwitness.com`. If your company uses a proxy for outbound traffic, please check your Proxy settings. A valid connection is required in order to register with the RSA Community Service.
5. Enter your company name and contact email. Click **Register**.

   If all required fields are complete, your registration is completed. The label on the button used to register changes to Update.
6. To verify that the Malware Analysis Service can connect to the Core service selected for continuous scanning, click **Test Connection**.

   NetWitness initiates a check based on the Source Host, Source Port, Username, and User Password specified in the General tab. When the test executes successfully, analysts are able to see Community Scoring in Malware Analysis.

# (Optional) Configure Auditing on Malware Analysis Host

This topic introduces the configurable features of the Malware Analysis auditing log and the procedures for configuring the features. Malware Analysis is capable of generating auditing alerts based on configured score module thresholds. Once the analysis score for a file in an analysis session meets or exceeds the configured threshold(s), an auditing alert is generated. Thresholding allows sessions and files that score high enough to be likely malware candidates to automatically generate an alert.

Alerts can be configured to be formatted as SNMP, Syslog or File entries. Supporting various audit formats provides a method for external systems to ingest auditing events based on their capability of parsing the supported formats.

In addition to auditing analysis sessions, the following events will trigger an audit alert:

- User login successes and failures
- Changes to system configuration settings

- Server restart
- Server version upgrade and install

The Auditing configuration settings for Malware Analysis are in the Service Config view > Auditing tab.

## Configure the Auditing Threshold

The sole purpose of the thresholds is to specify the criteria that must be reached prior to an alert being generated for an analyzed session/file. If auditing is enabled, each scored file/session is examined to determine if the score in each score module meets or exceeds the configured auditing threshold. If so, an alert is generated using the configured audit alert format (e.g., SNMP, Syslog or File). For example, by configuring SNMP and setting the Community Threshold to 90, all sessions/files that score 90 or higher in the Community Score module generate an SNMP trap. If all of the thresholds are set to 90, then an alert is not generated unless a session or file scores 90 or higher in the Network, Static, Community and sandbox score modules.

To configure the auditing threshold:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, click the **Auditing** tab.
4. In the **Auditing Thresholds** section:
   a. Set the threshold for the **Community**, **Static**, **Network**, and **Sandbox** by doing one of the following for each scoring module:
      - In the slider, click and drag the handle in either direction.
      - In the value field, type a number between 0 and 100, inclusive.
   b. (Optional for 10.3 SP2) Select one or more triggers to record a message and deliver it through all enabled auditing methods.
   c. Click **Apply**.
      - The threshold setting becomes effective immediately for all enabled auditing methods: SNMP, File, and Syslog.
      - The recorded messages are sent through all enabled auditing methods: SNMP, File, and Syslog.

## Configure Incident Management Alerting

When enabled, Malware Analysis alerts feed into the NetWitness Respond workflow.

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.

4. In the **Respond Alerting** section, select the **Enabled** checkbox and click **Apply**.
   Alerting becomes effective immediately.

## Configure SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host. In addition to the score and event ID, the alert includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure SNMP auditing:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **SNMP Auditing** section, click the checkbox to enable SNMP auditing.
5. Configure the SNMP server name and port.
6. Configure the SNMP version and trap OID for sending traps.
7. Configure the Malware Analysis community, and retry and timeout parameters when sending traps.
8. Click **Apply**.
   The SNMP auditing settings become effective immediately.

## Configure File Auditing Settings

When file auditing is enabled, the audit log file is kept in the Malware Analysis Home Directory. The default location for this log file is:

`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`.

As each log reaches the maximum file size, it is archived and a new log is created. The size of these audit logs and their number are both configurable.

**Caution:** Avoid setting the max file size and archive file count too high, because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

To configure the file auditing settings:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **File Auditing** section, click the checkbox to enable file auditing.
5. (Optional) Set the Archive File Count and Max File Size.
6. Click **Apply**.
   The file auditing settings become effective immediately.

## Configure Syslog Auditing Settings

When enabled, Syslog provides auditing through the use of the RFC 5424 syslog protocol. Regulations, such as SOX, PCI DSS, HIPAA, and many others are requiring organizations to implement comprehensive security measures, which often include collecting and analyzing logs from many different sources. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

In addition to the score and event ID, the syslog includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure the syslog auditing settings:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Syslog Auditing** section, click the checkbox to enable syslog auditing.
5. Configure the host where the target syslog process is running and the port on the host where the syslog process is listening.
6. Configure the facility, encoding, format, max length, and timestamp for outgoing syslog messages.

   **Note:** (Optional) Configure Identity String to prepend to syslog alerts.
   For CEF format, please refer to Create Custom Alert in CEF Format for additional considerations.

7. Click **Apply**.

   The syslog auditing settings become effective immediately.

# (Optional) Configure Hash Filter

This topic introduces hash filters as a method of marking files in Malware Analysis that are known to be good or known to be bad. Hash filtering allows you to maintain a list of known good or known bad file hashes. In the Hash tab, you can fine tune Malware Analysis event analysis based on file hashes. When a file hash is marked as Good, Malware Analysis does not analyze the file the next time it is seen. When a file hash is marked as Bad, Malware Analysis automatically raises the file's community score by a large number of points. Malware Analysis still analyzes the file, just in case new information becomes available.

**Note:** If an event contains a single file and that file's hash is marked as Good, Malware Analysis filters the entire event and you do not see it in Malware Analysis results.

To add hash filters to the hash list, you can use either of these manual methods:

1. Context menu add in the Event Detail view: Right-click on a file, and a context menu allows marking of the hash for the selected file as Good (Normal) or Bad (Malicious).
2. Hash tab toolbar: Click **Add** in the Hash tab to add a file hash, file size, and optionally, mark the hash as trusted.

There is also an automated method to add hash filters to Malware Analysis by importing a hash list in bulk from the watched folder. Hashes imported through the watched folder do not appear in the hash list. With bulk importing and the watched directory (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis server set up, copy a hash list into the watched folder to be automatically imported into the system. Hashes imported using the bulk import method overwrite hashes that were previously imported through the watched folder.

## View the Hash List

To view the Hash List:

1. Go to **(Admin) > Services**.
2. In the Services view, select a Malware Analysis service, and select **> View > Config**.
3. Select the **Hash** tab.

   The hash list is displayed in the Hash tab. Only file hashes that have been added using one of the methods are displayed.

## Add a File Hash to the Hash Filter

To add a file hash to the hash filter:

1. In the **Hash** tab, in the toolbar, click **Add**.

   The Add Hash dialog is displayed.
2. If the hash is trusted, select **Trusted**.
3. Enter the MD5 hash and the file size in bytes.
4. Click **Save**.

   The file hash is added to the hashes and used to perform hash filtering in Malware Analysis.

## Mark a Hash as Trusted or Untrusted

To mark a file hash as trusted or untrusted:

1. In the **Hash** tab, to toggle between trusted and untrusted, click in the **Trusted** column for the hash.
2. In the toolbar, click **Save Edit**.

## Delete a Hash from the Hash Filter

To delete a hash from the hash filter:

1. In the **Hash** tab, select one or more hashes that you want to remove from the hash filter.
2. In the toolbar, click **Delete**.

   A dialog requests confirmation and offers an opportunity to cancel.
3. To confirm the deletion, click **Yes**.

The file hash is deleted from the grid and no longer used to perform hash filtering in Malware Analysis.

## Search for a File Hash

In the Hash tab, you can search for a file hash that is displayed in the grid. In the MD5 field, type the file hash for which you are searching, and click **Search**. The list of files that contain the hash is displayed in the grid.

## Import a Hash List Using the Watched Folder

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted as described below into a folder (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis appliance, and it is automatically imported into the local hash database. This is the only way to import file hashes into. An additional use case is to allow a system administrator to expose the watched directory to some process that would push a file to this directory. This is a bulk import method designed to handle a high volume of hash imports.

This is a csv-formatted file with no spaces between the data in each row. The assumption with the data in the hash list is that there are no duplicates. Duplicates are ignored during processing. If duplicate hashes are encountered, the log file will display the following message to indicate the number of duplicate hashes contained in the file:

2013-08-09 09:46:00,674 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processing - /var/lib/rsa>malware/hashWatch/test.csv
2013-08-09 09:47:56,619 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.services.file.hash.HashServiceImpl - Skipped 21 Duplicate Hashes Already on File
2013-08-09 09:48:06,638 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed - /var/lib/rsa>malware/hashWatch/test.csv

Below is an example of a hash list in the default file format.

```
[BeginFileExample]
392126E756571EBF112CB1C1cdEDF926,98865,True
0E53C14A3E48D94FF596A2824307B492,2226,True
176308F27DD52890F013A3FD80F92E51,42748,False
9B3702B0E788C6D62996392FE3C9786A,32768,False
937ADE76A75712B7FF339403B4FCB5A6,4821,False
B47139415F735A98069ACE824A114399,1723,False
E6CAF205E602CFA9A65663DB1A087874,704,False
680CA0BCE1FC7BC4136ADF4E210869C5,2075,False
[EndFileExample]
```

A NetWitness configuration file (**/var/netwitness/malware-analytics-server/spectrum/conf/hashFileWatchConfig.xml**) specifies the format and options in the hash list import process. Below is a listing of the configuration file.

```
<config>
 <enabled>true</enabled>
 <distributedCacheEnabled>true</distributedCacheEnabled>
 <watchDirectory>//var/lib/rsamalware/hashWatch</watchDirectory>

<processedDirectory>/
var/lib/rsamalware/hashWatch/processed</processedDirectory>

<erroredDirectory>/
var/lib/rsamalware/hashWatch/error</erroredDirectory>
 <md5Col>0</md5Col>
 <fileSizeCol>-1</fileSizeCol>
 <isTrustedCol>1</isTrustedCol>
 <isTrust>false</isTrust>
 <ignoreFirstLine>false</ignoreFirstLine>
 <frequencyInMinutes>1</frequencyInMinutes>
 <isGzipCompressed>false</isGzipCompressed>
 </config>
```

| Line | Description |
|---|---|
| <md5Col>0</md5Col> | The location of the md5 hash in each entry. The default value is position **0**, or the first position. |
| <fileSizeCol>1</fileSizeCol> | The location of the hash size in each entry. The default value is position **1**, or the second position. If the hash size is not included in the csv file, the value must be **-1**. |
| <isTrustedCol>2</isTrustedCol> | The location of the Trusted Column in each entry. The default value is position **2**. If the Trusted parameter is not included in the csv file, the value must be **-1**. |
| <isTrust>false</isTrust> | The default assumption for **Trusted** in each entry is **false**. |
| <ignoreFirstLine>false</ignoreFirstLine> | The presence or absence of a header in the hash. The default value is **false**. If the hash has a header, the value must be set to **true**. |
| <frequencyInMinutes>1</frequencyInMinutes> | The interval between checks by NetWitness in the watched directory. The default value is **1** minute. |
| <isGzipCompressed>false</isGzipCompressed> | The hash is compressed using Gzip. The default value is **false**. If the hash is Gzip compressed, the value must be set to **true** here. |

When the hash list has been imported, the system log has entries similar to this:

```
2013-04-11 03:22:00,597 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 2013-04-11 03:22:00,600 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed
- /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

If there is a problem loading the file, the system log has entries similar to this:

```
2013-04-11 03:17:00,597 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 ... Verbose log
 2013-04-11 03:17:00,632 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Error
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **/var/netwitness/malware-analytics-sever/spectrum/hashWatch** directory.
   Malware Analysis automatically watches this folder and processes files placed there.
   Malware Analysis adds every hash found in the hash lists to the hash filter.
   If there are processing errors, they are logged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/error**
   Processed files are cataloged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/processed**
   Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

# (Optional) Configure Malware Analysis Proxy Settings

This topic describes the configuration of a web proxy for communicating with the RSA Cloud service and local ThreatGRID or GFI service. The settings in the Service Configuration view > Proxy tab set up communication by web proxy, which Malware Analysis can use to communicate with RSA Cloud for community analysis and sandbox analysis. Once the proxy is configured:

- Malware Analysis communicates via web proxy with the RSA Cloud for community analysis.
- Malware Analysis communicates via web proxy with the configured ThreatGRID or GFI sandbox service. Using a web proxy may negatively affect performance. ThreatGRID and GFI configuration sections in the General tab have an option to ignore the web proxy and communicate directly with the sandbox to improve performance.

## Configure the Web Proxy

To configure the web proxy for Malware Analysis:

1. Go to **(Admin) > Services** view.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Proxy** tab.
4. To enable the proxy, select the **Enabled** checkbox.
5. (Optional) To automatically detect proxy settings for the NetWitness Server, select the checkbox.
   The proxy host and proxy port fields are autofilled.

6. If you want to use a different proxy, enter the **Proxy Host** and **Proxy Port**.
7. Enter the username and password used to log on to the proxy host.
8. (Optional) Select **SSL**, if the proxy host communicates over SSL.
9. Click **Apply**.
10. Restart the Malware service.

**Note:** Malware Analysis does not support NTML web proxy authentication.

# (Optional) Register for a ThreatGRID API Key

This topic provides the procedure for obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.

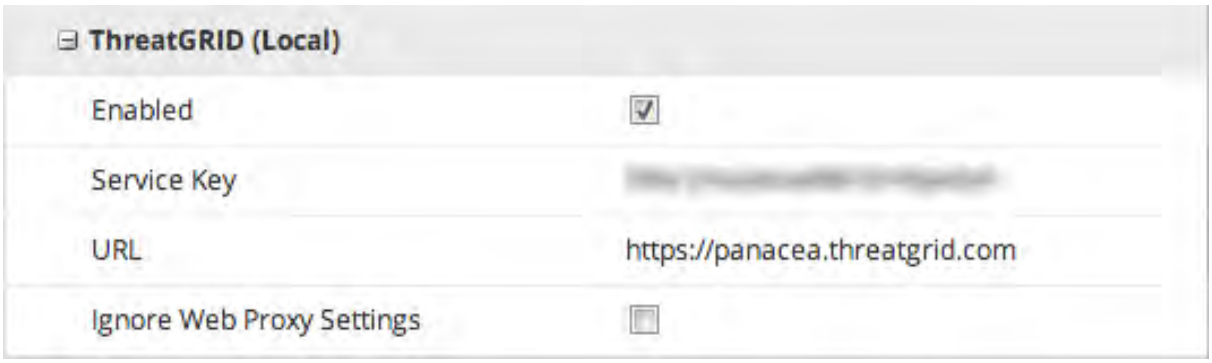
If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

When you fill in your user information and click **Register**, a key is displayed in this tab, and automatically added to the ThreatGRID configuration in the **General** tab. In a few minutes, you will receive an email from ThreatGRID containing a link to their page where you can log on. After you agree to the license terms on the ThreatGRID page, you can submit files for analysis, and ThreatGRID will recognize files that Malware Analysis submits for sandbox analysis.

### To obtain a Trial ThreatGRID API key:

1. Go to **(Admin) > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **ThreatGRID** tab.
4. Enter your full name, job title, organization name, and email address.
5. In the User Id and Password field, create a user ID and password for logging on to ThreatGRID.
6. Click **Register**.

   Your registration is sent to ThreatGRID and an API key is displayed below the Register button. The key is automatically filled in the **General** tab.
7. Select the **General** tab to confirm that the ThreatGRID configuration now includes the API key.



8. When you receive an email from ThreatGRID with a link where you can log on, log on and accept the terms of the agreement.

   Your trial of ThreatGRID begins and Malware Analysis can send five files per day to the ThreatGRID Cloud for sandbox analysis.

# Additional Procedures for Configuring Malware Analysis

This topic provides procedures that an Administrator may perform to accomplish an objective that is not part of basic Malware Analysis setup. After Malware Analysis is configured, administrators may want to fine-tune the service and implement advanced customization; an example of this is implementing custom YARA content.

- Create Custom Alert in CEF Format
- Enable Custom YARA Content

## Create Custom Alert in CEF Format

This topic provides instructions for creating custom alerts in Common Event Format (CEF) to send to a service that ingests events as CEF. This is an advanced configuration task, which requires sufficient knowledge to manually edit the configuration file: `/var/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`. Before editing the file, you must stop the Malware Analysis service in the operating system. The CEF Alert becomes active when you restart the Malware Analysis service.

### The CEF Template

To send events to a service ingesting events as CEF, NetWitness runs them through a configuration file that serves as a CEF template before feeding the events to a correlation technology. You can tune the configuration file, which specifies the sequence and mapping of syslog fields in each alert.

The following example syslog message shows the CEF fields in the extensions section of the alert (following the last '|' in the alert). Each field can be configured to indicate the sequence (described in the Example section below). Fields can be excluded entirely from the alert via a configuration setting.

```
CEF:0|NetWitness|Spectrum|10.3.0.7995.1.0|Suspicious Event|Detected
suspicious network event ID 4 session ID n/a|2|static=100.0 nextgen=25.0
community=100.0 sandbox=25.0 file.name=myFile.exe file.size=1234556
file.md5.hash=DEADBEEFBABECAFEDEADBEEFBABECAFE
event.source=spectrum://admin@0:0:0:0:0:0:0:1:64563 event.type=MANUAL_
UPLOAD event.id=0 country.dst.code=-- country.dst=Unavailable
ip.src=0:0:0:0:0:0:0:1 ip.dst=0:0:0:0:0:0:0:1 event.uuid=f7a6155a-31de-
4fa6-ba16-41fb9a8e5f26 ...
```

### Understand a Syslog Auditing File Entry

The description of the file structure is based on the following sample.

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125

CEF: 0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious
 network event ID 857 session ID 73|2|

static=100.0 network=29.0 community=8.0 sandbox=N/R

file.name=-CVE-00_DOC_2010-05-13_attachment.doc file.size=0
file.md5.hash=20a29259c0e5958afb2f50c4177bb307
```

```
com.netwitness.event.internal.id=73
com.netwitness.event.internal.uuid=37d2bad7-06bc-4b34-88e1-df43d9710204

```

## First Line

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125
```

| Log Information | Description |
|---|---|
| Feb 6 10:02:28 | The timestamp for the entry. |
| 10.10.10.125 | The source IP address for the event. |
| SpectrumServer125 | The source hostname for the event. |

## Audit Common Event Format (CEF) Header

```
0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious network
event ID 857 session ID 73|2|
```

The audit CEF header is a pipe-separated listing of the following fields:

| Log Information | Description |
|---|---|
| 0 | The ArcSight Common Event Format (CEF) version used for the audit syslog. |
| NetWitness | The service that created the syslog message. |
| Spectrum | Malware Analysis is the logger for the event. |
| 1.2.1.130 | Malware Analysis version. |
| event ID 857 | Unique network event id for this event. |
| session ID 73 | Core unique session id for the session that included this event. |

| Log Information | Description |
|---|---|
| 2 | Severity, an integer between 1 and 6 indicates the level of severity for the message.<br>• 1 = INFORMATION_LEVEL<br>• 2 = WARNING_LEVEL<br>• 3 = ERROR_LEVEL<br>• 4 = SUCCESS_LEVEL<br>• 5 = FAILURE_LEVEL<br>• 6 = AUDIT_FAILURE_LEVEL |

## Audit CEF Extension

```
static=100.0 network=29.0 community=8.0 sandbox=N/R
file.name=-CVE-00_DOC_2010-05-13_attachment.doc  file.size=0
file.md5.hash=20a29259c0e5958afb2f50c4177bb307
com.netwitness.event.internal.id=73
com.netwitness.event.internal.uuid=37d2bad7-06bc-4b34-88e1-df43d9710204
alias.ip=10.25.50.149 client=Wget/1.11.4 Red Hat modified payload=108872

```

## Analysis Scores

The first entry in the audit CEF extension provides the four Malware Analysis scores for the event: Static, Network, Community, and Sandbox.

| Log Information | Sample Value |
|---|---|
| static | 100.0 |
| network | 29.0 |
| community | 8.0<br>A score of 0.0 can be a community score for the event or can indicate that no community services were enabled. |

| Log Information | Sample Value |
|---|---|
| sandbox | N/R<br>N/R means not run. This indicates that the GFI sandbox was not enabled. |

## File Information

The next three entries provide file information: file name, size, and hash.

| Log Information | Sample Value |
|---|---|
| file.name | -CVE-00_DOC_2010-05-13_attachment.doc |
| file.size | 0 |
| file.md5.hash | 20a29259c0e5958afb2f50c4177bb307 |

## Event Meta Data Retrieved by NextGen

The record continues with the Core meta data for the event. The meta data in the message depends on the event. The amount of data in the message is truncated to the maximum length in bytes configured in the Syslog Settings. The default value is 1024.

| Log Information | Sample Value |
|---|---|
| com.netwitness.event.internal.id | 73 |
| com.netwitness.event.internal.uuid | 37d2bad7-06bc-4b34-88e1-df43d9710204 |
| alias.ip | 10.25.50.149 |
| client | Wget/1.11.4 Red Hat modified |
| payload | 108872 |
| packets | 136 |
| country.dst | Private |
| time | Fri Jan 27 10:09:25 EST 2012 |
| threat.source | netwitness |
| tcp.srcport | 43580 |
| action | get |
| com.netwitness.event.internal.source | http://QASpectrum2:50104/sdk |
| filetype | rtf |

| Log Information | Sample Value |
|---|---|
| alias.host | qa-fc12-149 |
| eth.src | 00:25:90:18:76:E2 |
| ip.proto | 6 |
| tcp.flags | 27 |
| ip.src | 10.25.50.61 |
| tcp.dstport | 80 |
| threat.category | spectrum |
| eth.dst | 00:0C:29:F8:50:2D |
| lifetime | 0 |
| alert.id | nw32535 |
| sessionid | 73 |
| medium | 1 |
| size | 117864 |
| content | spectrum.consume11 |
| extension | doc |
| directory | /files/MALWAREMALWARE/OfficeDocs/DOC/ |
| eth.type | 2048 |
| ip.dst | 10.25.50.149 |
| service | 80 |
| filename | -CVE-00_DOC_2010-05-13_attachment.doc |
| server | Apache/2.2.13 (Fedora) |
| streams | 2 |
| referer | http://qa-fc12-149/files/MALWAREMALWARE/OfficeDocs/DOC/ |
| risk.info | http client server version mismatch |

## Edit the Configuration File

1. Stop the Malware Analysis service.
2. Edit the configuration file as described in the Example.

3. Start the Malware Analysis service.

   The Malware Analysis service begins processing alerts through the configuration file and sending CEF alerts to designated services.

## Example

The configuration file can be used to dictate which fields appear in the resulting alert as well as the label associated with each field and the order in which the data fields appear. The configuration file is composed of one or more XML `MalwareCefExtension` blocks as shown in the example below. The ordering of these blocks in the configuration file implies the order of the data fields in the CEF alert.

In the example below, the CEF alert would include two data fields, `ip.src` followed by `ip.dst`. The `customKey` is used to indicate the labeling of the data field in the alert. This allows the user to choose a custom label in order to force the alerting format to better match the expectations of the alert consumer. In other words, the format can be tuned to prevent unwanted changes to an existing alert parser. Lastly, the `isDisplay` setting determines if the field is included in the alert output. This allows the user to turn off data fields without having to physically delete the `MalwareCefExtension` block from the configuration.

```
 <config>
 <malwareExtensionList>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.src</customKey>
   <malwareKey>ip.src</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.dst</customKey>
   <malwareKey>ip.dst</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
 </malwareExtensionList>
</config>
```

At the end of the configuration file are three additional settings that can be used to further tune the alert format. They are as follows:

| Setting | Description |
|---|---|
| includesUnknownMeta | This true or false setting indicates if unknown data elements are included in the resulting alert. Any NextGen session meta can be considered for inclusion into a CEF alert.<br>Because additional session meta can be introduced via authoring new NextGen parsers, meta that is not contained in the default configuration may be encountered. You can set includesUnknownMeta to true to include the unknown meta in the alert and label it using the NextGen meta key name. To force a custom key for the unknown meta, you must edit this file and add a new MalwareCefExtension to the dictionary.<br>To omit unknown meta from the alert, set includesUnknownMeta to false. |
| displayNulls | This true or false setting indicates if values that are set to null are included in the alert. If displayNulls is set to false, the null value fields are omitted even if their MalwareCefExtension isDisplay property is turned on. This allows dynamic formatting of alerts to exclude null fields. |
| valueIfNull | This true or false setting allows you to specify a string placeholder (n/a by default) to be used as the value for any null valued fields. If displayNulls is set to true, then null valued fields are included in the alerts. Their value is set to the value specified in valueIfNull. |

The following represents the default CEF configuration file. The default configuration file includes all default NextGen session meta.

## Enable Custom YARA Content

This topic provides instructions for enabling custom YARA content on the NetWitness host on which the Malware Analysis service is installed. In addition to the built-in Indicators of Compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed appliances.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the appliance to consume. This section provides instructions for the Administrator who configures appliances to enable the creation of custom YARA content.

## Prerequisites

This is an advanced configuration task, which requires sufficient privilege and knowledge to set up a GNU Compiler Collection (GCC) and C++ Python development library to build YARA. In addition, you must be thoroughly familiar with the standard YARA documentation. The following components are required:

- The Perl-Compatible Regular Expression (PCRE) library: pcre-8.33.tar.bz2
- The yara 1.7 (rev:167) stand-alone YARA command line: yara-1.7.tar
- The YARA extension for Python: yara-python-1.7.tar.gz
- YARA rules documentation: YARA User's Manual 1.6.pdf

The components are available for download here: https://code.google.com/p/yara-project/downloads/list

**Note:** As of writing, YARA 2.0 is available but not supported for Malware Analysis 10.5.

## Install Libraries and Applications Required to Build YARA on a CentOs-Based Appliance

As a prerequisite to building YARA on a host that is running CentOS, you must install `make`, the GNU Compiler Collection, and C++ Python Development Library on the appliance. To install the applications and libraries required to build YARA:

1. To ensure the standard YUM repo and no other repo files are in the /etc/yum.repos.d folder, enter the following command:
   **`ls -al /etc/yum.repos.d`**
   The results should be similar to the following:
   ```
   -rw-r-r-. 1 root root 1926 Jun 26  2012 CentOS-Base.repo
   -rw-r-r-. 1 root root  637 Jun 26  2012 CentOS-Debuginfo.repo
   -rw-r-r-. 1 root root  626 Jun 26  2012 CentOS-Media.repo
   -rw-r-r-. 1 root root 2593 Jun 26  2012 CentOS-Vault.repo
   ```
2. To install `make` on the appliance, enter the following commands:
   a. **`yum search make`**
      The following message is returned: `make.x86_64 : A GNU tool which simplifies the build process for user`
   b. **`yum install make.x86_64`**
3. To install and test GCC on the host, enter the following commands:
   a. **`yum search gcc`**
      The following messages are displayed:
      ```
      gcc-c+.x86_64 : C+ support for GCC
       gcc.x86_64 : Various compilers (C, C++, Objective-C, Java, ...)
      ```
   b. Enter the following commands:
      **`yum install gcc.x86_64`**
      **`yum install gcc-c++.x86_64`**

c. To test the gcc commands, enter the following commands:

```
gcc -v
cc -v
```

4. To install the C++ Python development library on the appliance, enter the following commands:

a. **yum search python dev**
The following message is returned:
`python-devel.x86_64 : The libraries and header files needed for Python development`

b. **yum install python-devel.x86_64**

## Set Up YARA

To create a GCC and C++ Python development library in which you can build YARA on the NetWitness host that is running Malware Analysis:

1. Do one of the following:

a. If the host on which you are installing is running Mac OS, install xCode for Mac OS.

b. If the host on which you are installing is running CentOS, install make, GCC and C++ Python development library using the YUM command line.

2. To Install the PCRE library on the host, open a terminal window and enter the following commands:

```
tar -xvf pcre-8.33.tar.bz2
cd pcre-8.33
./configure
make
sudo make install
```

3. To install the stand-alone YARA command line, enter the following commands:

```
tar -xvf yara-1.7.tar
cd yara-1.7
./configure
make
sudo make install
```

4. To test the stand-alone YARA command line:

a. Enter the following command:

```
yara
```

b. If the command succeeds, continue with Step 7. If the command fails and returns the `yara: error while loading shared libraries: libpcre.so.1: cannot open shared object file: No such file or directory` error, enter the following command to check the `/etc/ld.so.conf` file or `LD_LIBRARY_PATH` environment variable.

```
ldconfig -v
```

5. To install the YARA extension for Python, enter the following commands:

```
tar -xvf yara-python-1.7.tar.gz
cd yara-python-1.7
```

```
python setup.py build
sudo python setup.py install
```

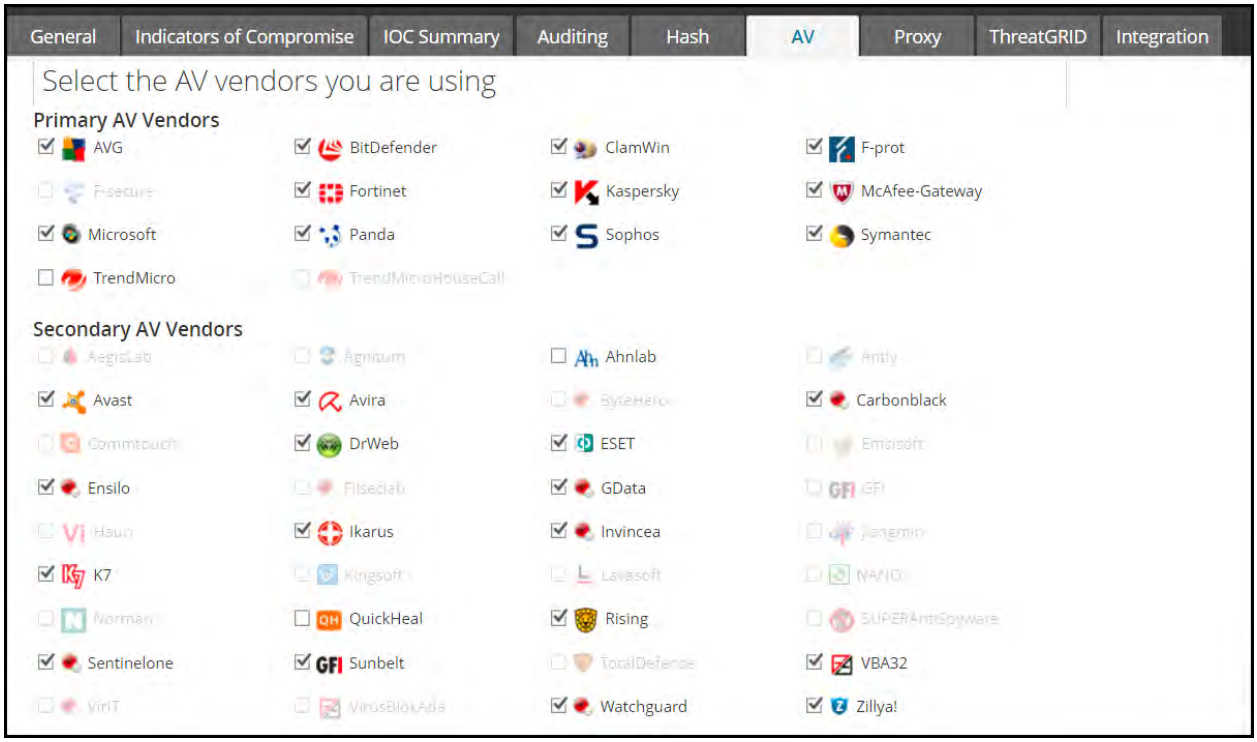
6. To test the YARA extension:
   a. Enter the following command: **python**
   b. At the Python prompt (>>>), enter the following commands:

```
import yara
exit()
```

When this configuration is complete, analysts  can create custom YARA IOCs for consumption on a Malware Analysis host as described in "Implement Custom YARA Content" in the *Malware Analysis User Guide*

# Supported Antivirus Vendors

This section provides detailed information about the NetWitness supported antivirus (AV) vendors.



The following are the new AV vendors supported in NetWitness version 11.4.0.1 or later.

- Panda
- Gdata
- Avast
- Carbonblack
- Dr.Web
- enSilo
- Invincea
- Rising
- SentinelOne
- Sunbelt
- VBA32
- Watchguard

The following AV vendors are not supported in NetWitness version 11.4.0.1 or later.

**Note:** AV vendors that are not supported by NetWitness Platform are disabled in the user interface.

- F-secure
- TrendMicroHouseCall
- AegisLab
- Agnitum
- Antiy
- ByteHero
- Commtouch
- Emsisoft
- Filseclab
- GFI
- Hauri
- Jiangmin
- Kingsoft
- Lavasoft
- NANO
- Norman
- nProtect
- SUPERAntiSpyware
- TotalDefense
- VirIT
- VirusBlokAda
- Zillya
- Zoner

# Malware Analysis References

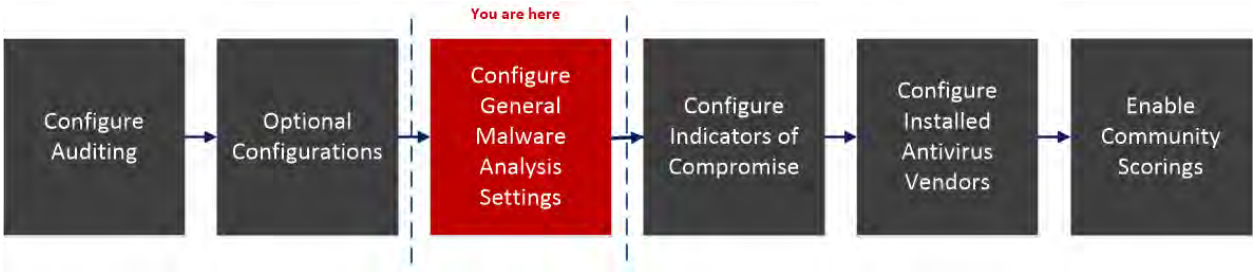
- Services Config View - Indicators of Compromise Tab
- Services Config View - IOC Summary Tab
- Services Config View - Auditing Tab
- Services Config View - Hash Tab
- Services Config View - AV Tab
- Service Config View - Proxy Tab
- Services Config View - ThreatGRID Tab
- Services Config View - Integration Tab

# Services Config View - General Tab

This topic introduces the configuration settings in the Service Config view > General tab for Malware Analysis, which has parameters specific to the Malware Analysis service. In this tab, you can configure:

- The processing parameters for Core services that are capturing data.
- The repository for captured data.
- The static, community, and sandbox scoring categories used to analyze the data.

## Workflow



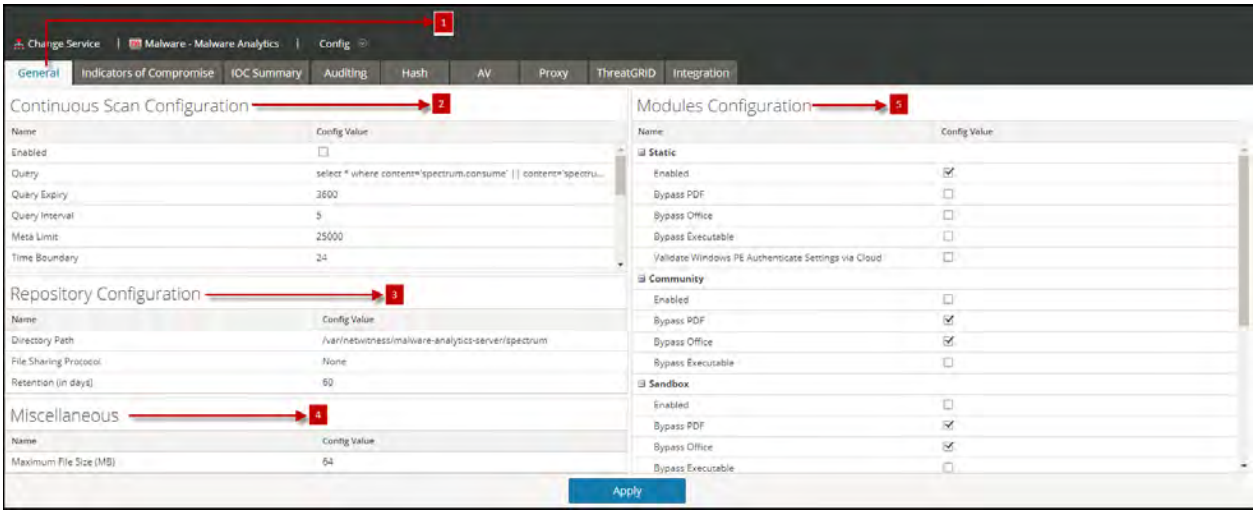
## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings* | Configure General Malware Analysis Settings |
| Administrator | Configure Indicators of Compromise | Configure Indicators of Compromise |
| Administrator | Configure Auditing on Malware Analysis Host | (Optional) Configure Auditing on Malware Analysis Host |
| Administrator | Configure Hash Filter | (Optional) Configure Hash Filter |
| Administrator | Configure Installed Anti virus Vendor | Configure Installed Antivirus Vendors |
| Administrator | Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings |
| Administrator | Register a TreadGRID API Key | (Optional) Register for a ThreatGRID API Key |
| Administrator | Enable Community Analysis | Enable Community Analysis |

*You can perform this task in the current view

## Quick Look

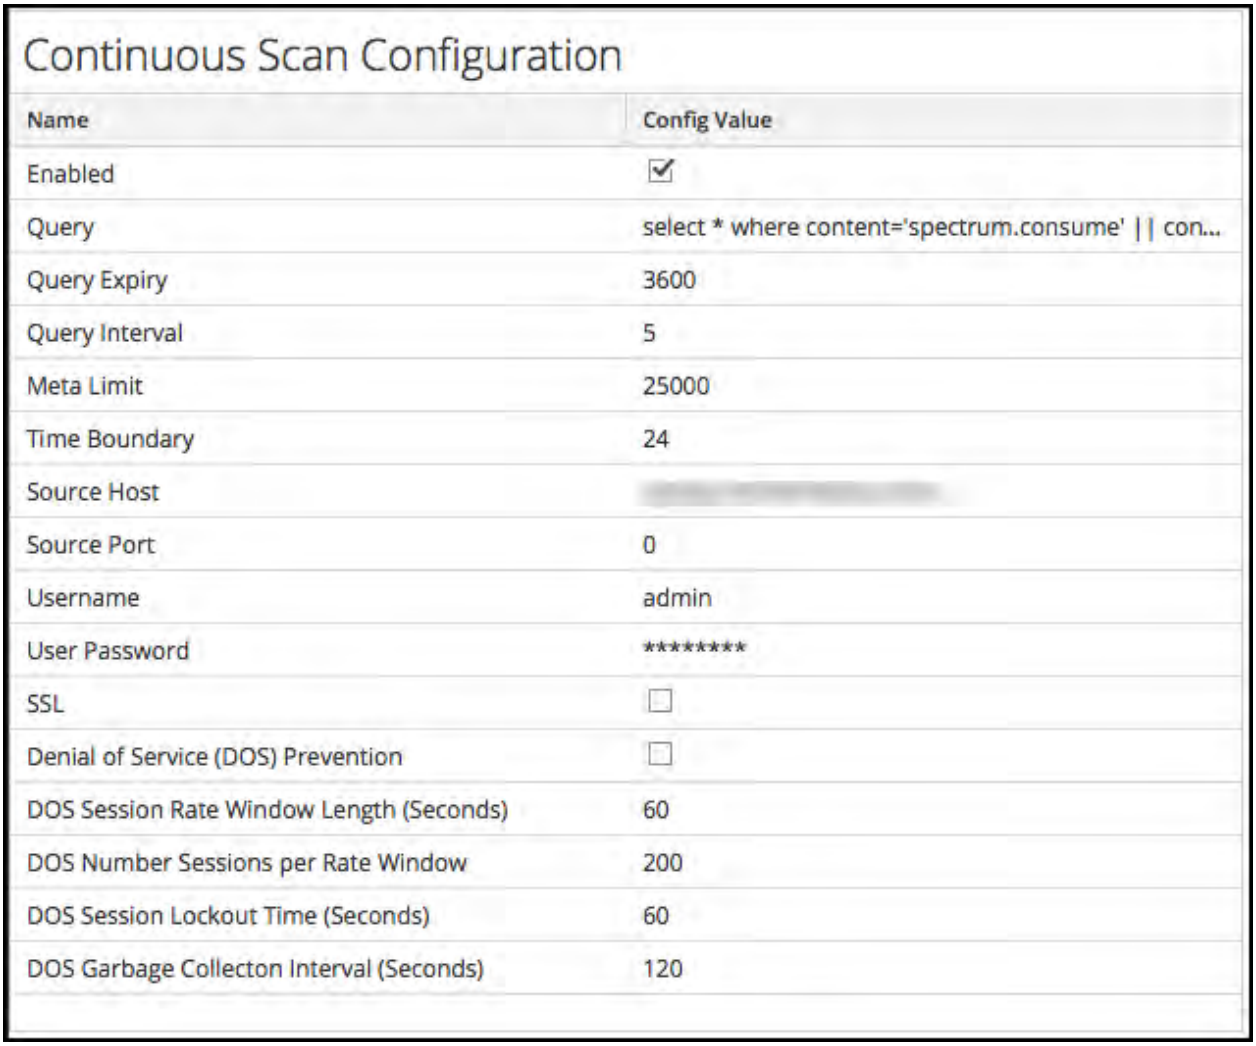
This is an example of the General tab.



1. Displays the General Tab.
2. Allows you to Configure Continuous Scan.
3. Allows you to Configure Repository.
4. Displays Miscellaneous Settings.
5. Allows you to Configure Modules.

This tab has four sections: Continuous Scan Configuration, Repository Configuration, Miscellaneous, and Modules Configuration.

## Continuous Scan Configuration Section



This table describes the features of the Continuous Scan Configuration section.

| Parameter | Description |
|---|---|
| **Enabled** | Completely disable or enable continuous polling of the Core service. By default this is not selected (**disabled**). |
| **Query** | While the Decoder is analyzing network traffic, it creates a meta field called content with a value of **spectrum.consume** in sessions that are likely to contain malware. By default, Malware Analysis only performs analysis on events that have this particular meta value. By changing this query, Malware Analysis can be configured to analyze different types of events.<br>Making this query too broad may force Malware Analysis to analyze too many events, causing it to fall behind or perform poorly.<br>The default query is **select * where content='spectrum.consume'** |

| Parameter | Description |
|---|---|
| **Query Expiry** | When Malware Analysis queries the Core service for meta, it gets a result back within a few seconds. If there is a problem, such as a network connectivity issue, Malware Analysis abandons the query after this configured amount of time.<br>The default value is **3600 seconds**. |
| **Query Interval** | How often, in minutes, to query for new session meta and files. |
| **Meta Limit** | Each time Malware Analysis queries the Core service, it pulls an amount of meta, up to this meta limit. Using this setting, in conjunction with the query interval, you can tune the performance of Malware Analysis in the Core infrastructure.<br>The default value is **25000**. |
| **Time Boundary** | Malware Analysis analyzes sessions that occurred after the Time Boundary. This setting is most important when installing a new Malware Analysis appliance, because it determines how far back in time to begin analysis. Setting the boundary too many hours in the past may cause Malware Analysis to analyze too many past events, causing a large delay before you see any traffic happening in real time.<br>The default value is **24 hours**. |
| **Source Host** | Hostname of the Malware Analysis appliance.<br>This is the IP address, or the hostname, of the service that Malware Analysis queries to retrieve its data for analysis. Do not use localhost as the source host.<br>Depending on the model of the appliance and the configuration of the NetWitness infrastructure, this source host can vary.<br>**Note:** When you change the host name or the host IP address, ensure that you re add the Source Host in the Malware Service config page, and restart the service to take the source host field changes into effect. |
| **Source Port** | Malware Analysis communicates with the NetWitness infrastructure using the REST service listening on this port. This port number is specific to the type of the Core service that is being used as the Source host. This corresponds to the outbound connections for your Core service. |
| **Username** | Username. The default value is **admin**.<br>Malware Analysis must authenticate to the Source host each time it queries for data. In most cases, the account used by Malware Analysis is the same account used to access the Core service through NetWitness. However, it is recommended to create a new account on the Core service dedicated to Malware Analysis. |
| **User Password** | User password. The default value is **netwitness**. |
| **SSL** | Use SSL when communicating with Core. If Malware Analysis is using an SSL connection to communicate with a Core service, check this option.<br>The default value is unchecked. |

| Parameter | Description |
|---|---|
| **Denial of Service (DOS) Prevention** | The Denial of Service Prevention feature provides safeguards against malware that intentionally generates high volumes of network connections between two endpoints containing Windows PE content. Generating a high volume of connections artificially inflates the amount of traffic that security services monitoring the network must consume and analyze resulting in a denial of service. This feature helps identify these sessions so that you can have the analysis processing disregard them.<br>The default value is unchecked. |
| **DOS Session Rate Window Length (Seconds)** | Malware Analysis uses this parameter with the **DOS Number Sessions per Rate Window** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from a single IP address.<br>To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic from the IP address is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**.<br>The default value is: **60** seconds. |
| **DOS Number Sessions per Rate Window** | Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from the IP address.<br>To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP source during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**.<br>The default value is: **200** sessions |
| **DOS Session Lockout Time (Seconds)** | Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Number Sessions per Rate Window** parameters to identify a Denial of Service Attack and determine how long to disregard such an attack.<br>To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**.<br>The default value is: **60** seconds |

| Parameter | Description |
|---|---|
| **DOS Garbage Collection Interval (Seconds)** | Performs garbage collection on the internal memory structure used to track Denial of Service attempts.<br>If memory usage is abnormally high, you can decrease this setting to free unused memory more often. If CPU usage is abnormally high, you can increase this setting to eliminate processing overhead (at the expense of memory usage).<br>The default value is: **120** seconds |

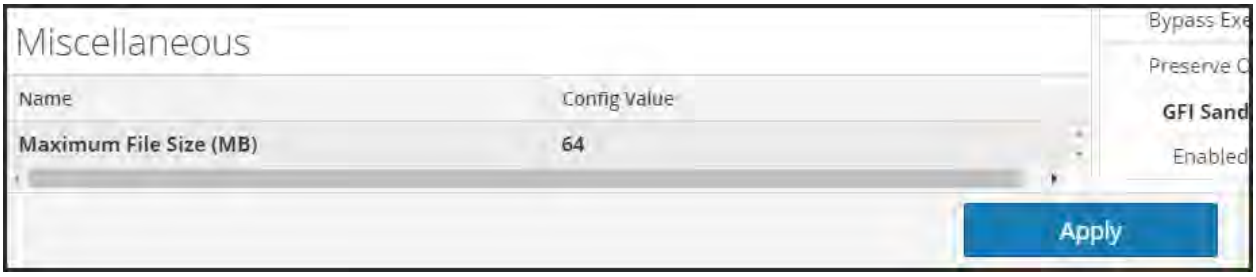
## Repository Configuration Section

Malware Analysis stores all of the files that are analyzed for future use. These files can be downloaded through the user interface or accessed via one of the file sharing protocols.

This table describes the features of the Repository Configuration section.

| Parameter | Description |
|---|---|
| **Directory Path** | All files are stored in the following directory on the Malware Analysis appliance: **/var/lib/netwitness/spectrum** |
| **File Sharing Protocol** | Possible values for the file sharing protocol are FTP, SAMBA, and None. You can enable FTP access and SAMBA file sharing to allow a user access to the stored files on the Malware Analysis from a remote location. No credentials are required to access these files. The port required for FTP access is TCP/21. The default file sharing protocol is **None**. |
| **Retention (in days)** | Malware Analysis maintains files stored in the repository for a specified number of days. You can set the number of days that files are retained before being deleted. The default value is **60** days. |

## Miscellaneous Configuration Section (10.3 SP2 and Later)



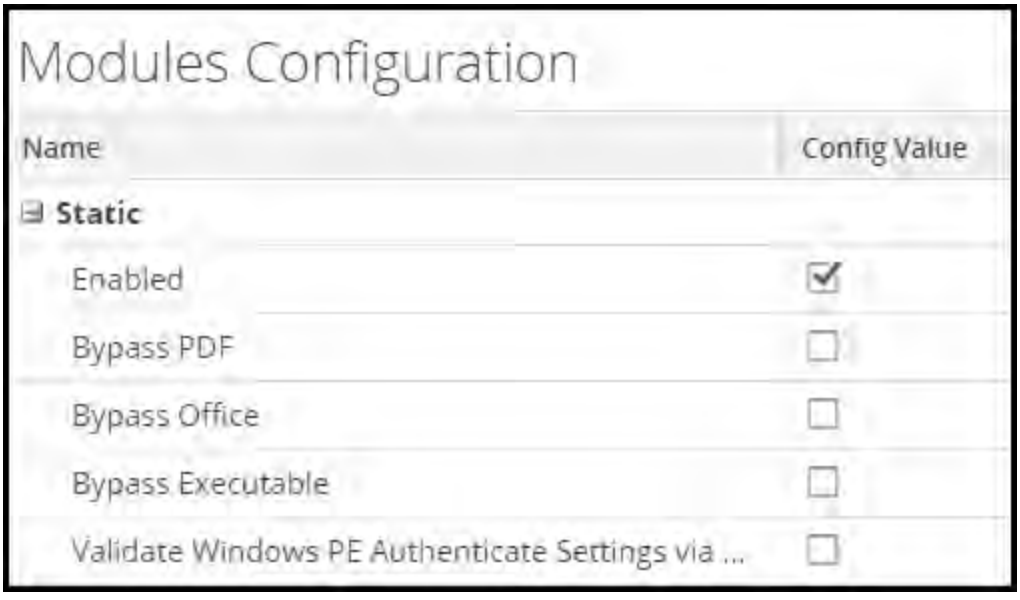
This table describes the features of the Miscellaneous Configuration section.

| Parameter | Description |
|---|---|
| **Maximum File Size** | Limits the size of each file that you can scan for manually. This parameter applies to the feature described in "Upload Files for Malware Scanning" in the Investigation and Malware Analysis Configuration Guide. The default value is **64 MB**.<br>If the file size limit is exceeded, prevents you from scanning the file. |

## Modules Configuration Section

The Modules Configuration section allows configuration of the static, community, and sandbox scoring categories.

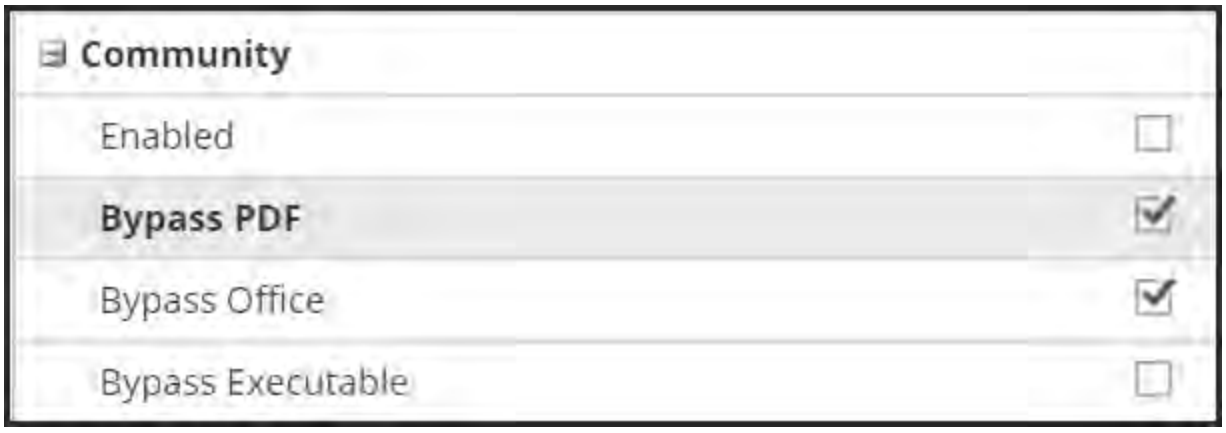
### Static Analysis Configuration



The static module is the only scoring category that is enabled by default. This table describes the parameters for configuring static analysis.

| Feature | Description |
|---|---|
| **Enabled** | Completely disable or enable static analysis. By default this is selected (**enabled**). |
| **Bypass PDF** | Disable analysis of PDF documents. By default this is not selected; all PDF files undergo static analysis. |
| **Bypass Office** | Disable analysis of Office documents. By default this is not selected; all MS Office files undergo static analysis. |
| **Bypass Executable** | Disable analysis of Windows PE documents. By default this is not selected; all Windows PE files undergo static analysis. |
| **Validate Windows PE Authenticate Settings via Cloud** | Specify whether or not Windows PE files are sent to the RSA-Netwitness Cloud for Authenticode validation. The default value is selected.<br>• When selected, any Windows PE file that is digitally signed is transmitted over the network (in its entirety) to the RSA-Netwitness Cloud for validation. If the intent is to prevent Windows PE files from leaving the customer network, you should disable this option.<br>• When not selected, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and M/S Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis. |

## Community Analysis Configuration



By default, the community module is disabled and the options are selected to prevent PDFs and MS Office documents from being processed. The intent is to default the settings to the most restrictive choices so that no sensitive documents leave the network unless the user chooses. This table describes the parameters for configuring Community analysis.

| Feature | Description |
|---|---|
| **Enabled** | Completely disable or enable community analysis. By default this is not selected (**disabled**).<br>**Note:** Before you enable community, you must log in to live account. For more information about live account, see Live Services Management Guide. |
| **Bypass PDF** | Disable analysis of PDF documents. By default this is selected; PDF files are not processed. |
| **Bypass Office** | Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed. |
| **Bypass Executable** | Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed |

## Sandbox Analysis Configuration

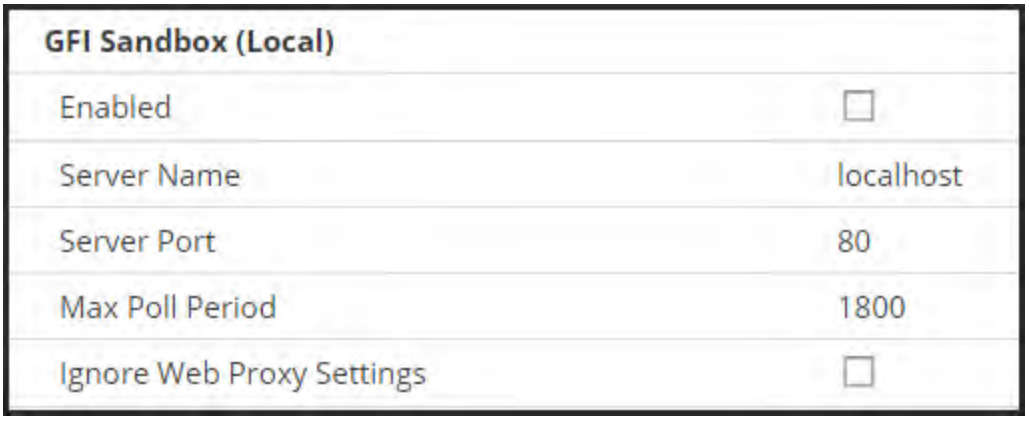
By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set the most restrictive settings to force the user to specifically choose whether or not potentially sensitive information is sent outside of the network for processing. If the document type is not prevented from being processed, the file is sent to the destination sandbox server in its entirety (not limited to a hash of the file contents).

This table describes the parameters for configuring Sandbox analysis.

| Feature | Description |
|---|---|
| **Enabled** | Completely disable or enable sandbox analysis. By default this is not selected **(disabled)**. |
| **Bypass PDF** | Disable analysis of PDF documents. By default this is selected; PDF files are not processed. When not selected, all PDF files are submitted in their entirety to the Sandbox for analysis. |

| Feature | Description |
|---|---|
| **Bypass Office** | Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed. When not selected, all MS Office files are submitted in their entirety to the Sandbox for analysis. |
| **Bypass Executable** | Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed. When not selected, all Windows PE documents are submitted in their entirety to the Sandbox for analysis. |
| **Preserve Original File Name when Performing Sandbox Analysis** | In 10.3 SP2 and later, enable the ability to hash for filenames when they are sent to a local sandbox. By default this is not selected.<br>**Note:** If you do not select this parameter, NetWitness hashes the files. |

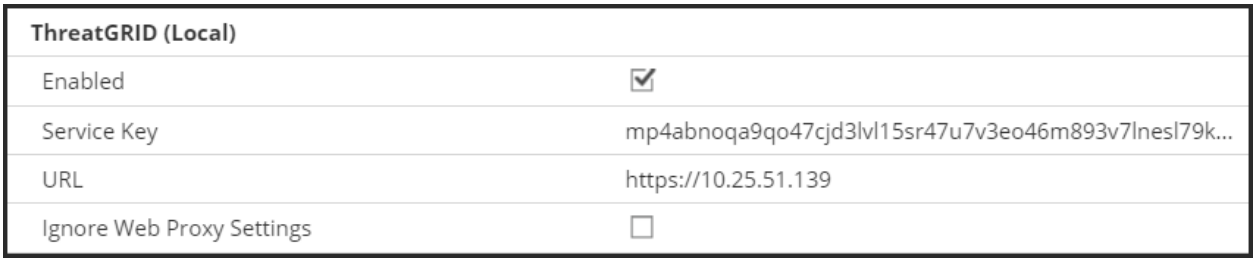
## GFI Sandbox Settings



In the GFI Sandbox section, you can enable sandbox processing by GFI and configure the locally installed GFI sandbox. The table describes the parameters for configuring the GFI sandbox.

| Feature | Description |
|---|---|
| **Enabled** | When enabled, sandbox processing is performed by a local copy of GFI. The default value is **disabled**. If you enable GFI, you need to configure the remaining parameters. |
| **Server Name** | The GFI Sandbox server name. No default value. |
| **Server Port** | The GFI Sandbox server port. Default value is **80**. |
| **Max Poll Period** | Determines how long to wait for a submitted sample to finish processing. Default value is **600 seconds**. |
| **Ignore Web Proxy Settings** | Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no web proxy has been configured in Malware Analysis, the setting is ignored. |

## ThreatGRID Sandbox Settings



In the ThreatGRID Sandbox section, you can enable sandbox processing by ThreatGRID and choose whether to use the locally installed ThreatGRID or the ThreatGRID Cloud for sandbox analysis.

- If you have a local copy of ThreatGRID, configure sandbox processing to use the local copy.
- If no local instance of ThreatGRID has been purchased and installed, configure the ThreatGRID Cloud.

The table describes the parameters for configuring the ThreatGRID sandbox.

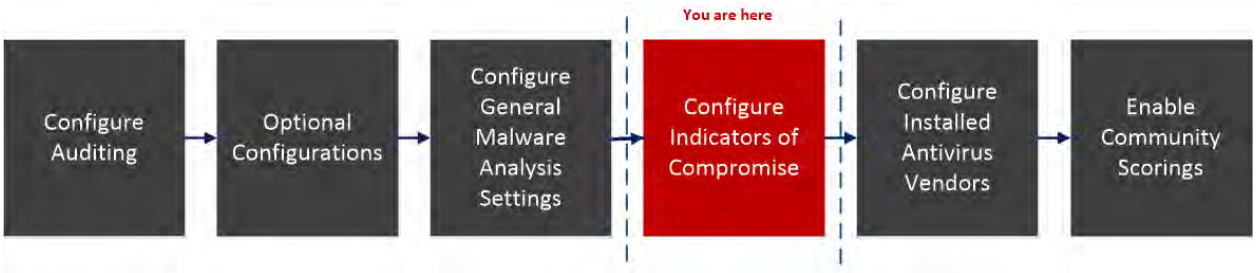
**Note:** Before enabling this service, you must configure a ThreatGRID-supplied Service Key. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate.

| Feature | Description |
|---|---|
| Enabled | When enabled, sandbox processing is performed by ThreatGRID, either a local copy or the ThreatGRID Cloud. The default value is **disabled**. |
| Service Key | Before enabling the sandbox module, a ThreatGRID-supplied Service Key must be configured. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate. |
| URL | The URL for the ThreatGRID server to be used (if you are not using a locally installed ThreatGRID). The ThreatGRID Cloud is reachable via https://panacea.threatgrid.com |
| Ignore Web Proxy Settings | Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored. |

# Services Config View - Indicators of Compromise Tab

This topic introduces the features and functions available in the Service Config view > Indicators of Compromise tab, which applies to the Malware Analysis service. This tab provides a way to configure the way each of the four scoring modules uses the available rules to score data.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings | Configure General Malware Analysis Settings |
| Administrator | Configure Indicators of Compromise* | Configure Indicators of Compromise |
| Administrator | Configure Auditing on Malware Analysis Host | (Optional) Configure Auditing on Malware Analysis Host |
| Administrator | Configure Hash Filter | (Optional) Configure Hash Filter |
| Administrator | Configure Installed Anti virus Vendor | Configure Installed Antivirus Vendors |
| Administrator | Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings |
| Administrator | Register a TreadGRID API Key | (Optional) Register for a ThreatGRID API Key |
| Administrator | Enable Community Analysis | Enable Community Analysis |

*You can perform this task in the current view

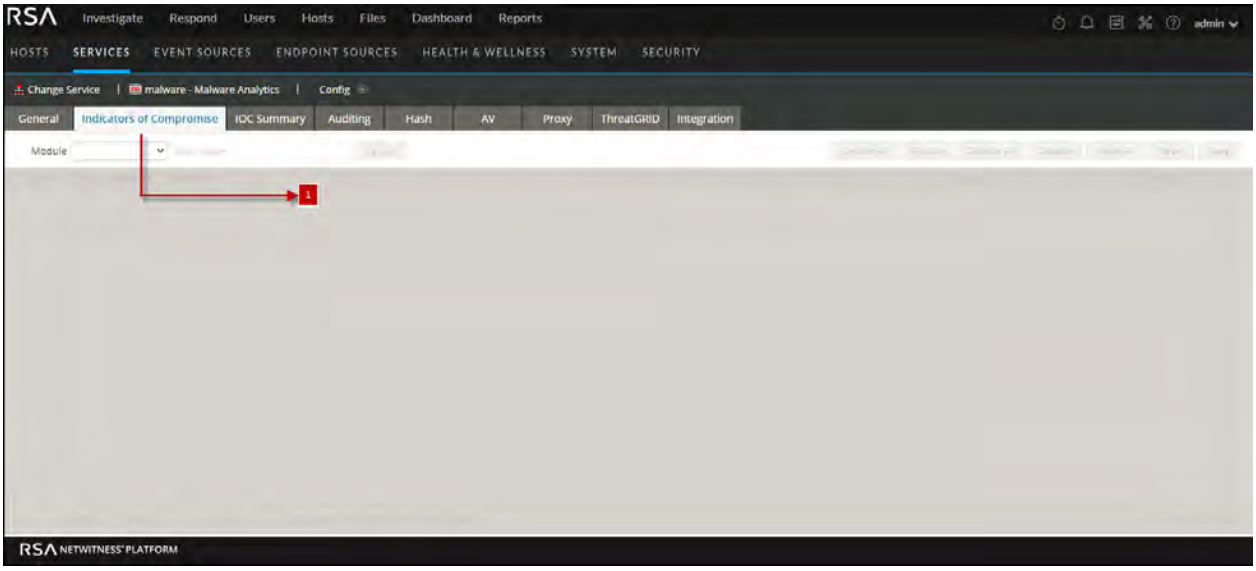
## Quick Look

This is an example of the Indicators of Compromise tab.



1 Displays the Indicators of Compromise Tab.

## Features

The Indicators of Compromise tab consists of a toolbar and page-able grid.

This table describes the features of the grid.

| Feature | Description |
|---|---|
| Module selection list | Selects the scoring module for which you want to view the Indicators of Compromise: All, Network, Static, Community, Sandbox, or Yara. |
| Search field | Type text for which you are searching in the Description field. |
| Search option | Filters the grid to display only Descriptions that match the Description search term. |
| Enable All option | Click to enable all rules for the scoring module, as opposed to enabling all rules on the page using the checkbox. |
| Enable option | Click to enable selected rules. |
| Disable All option | Click to disable all rules for the scoring module, as opposed to disabling all rules on the page using the checkbox. |
| Disable option | Click to disable selected rules. |

| Feature | Description |
|---|---|
| Reset All option | Click to reset all rows on the page to their default values. |
| Reset option | Click to reset selected rows to their default values. |
| Save option | Click to save changes you made on this page. If you leave the page without saving, the changes are lost. The description of each row with unsaved changes has a red corner. |

This table describes the features of the toolbar.

| Column | Description |
|---|---|
| Selection checkbox | Checkboxes for selecting individual rows or all rows on the page. |
| Enabled checkbox | If the indicator of compromise is enabled, Malware Analysis uses the rule for scoring session data. |
| High Confidence checkbox | If checked, Malware Analysis treats the rule as one very likely to indicate the presence of malware, and an event that triggers that rule is marked in the results grid. |
| Description | Describes the Indicator of Compromise. |
| Score | Specifies the score that you want to factor in to the total score for any event that triggers the rule. The default score is displayed and you can raise or lower the score by dragging the slider or typing a number in the score box. |
| File Type | Displays the file types to which the rule applies. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**. |

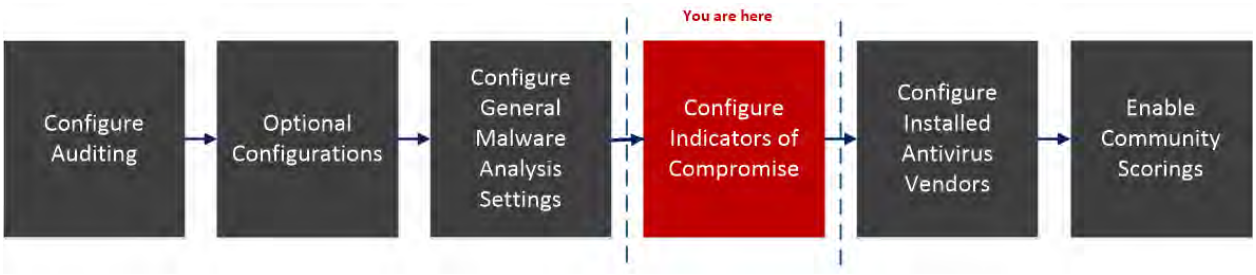
# Services Config View - IOC Summary Tab

This topic introduces the features and functions available in the Service Config view > IOC Summary tab. This tab provides a way to view summary information for any IOC. A grid for each scoring module lists the configured IOCs along with statistics associated with that IOC of a specific range of time. The statistics include:

- The number of events for a network session or the number of files for a static, community, or sandbox event that were flagged with the IOC.
- The current score configured for the IOC in the Indicators of Compromise tab.
- The scores returned by each of the scoring modules.

When you select an event, you can show the Malware Events view or Malware Files view for the IOC. You can also open the selected IOC in the Indicators of Compromise tab to edit the Current Score.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings | Configure General Malware Analysis Settings |
| Administrator | Configure Indicators of Compromise* | Configure Indicators of Compromise |
| Administrator | Configure Auditing on Malware Analysis Host | (Optional) Configure Auditing on Malware Analysis Host |
| Administrator | Configure Hash Filter | (Optional) Configure Hash Filter |
| Administrator | Configure Installed Anti virus Vendor | Configure Installed Antivirus Vendors |
| Administrator | Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings |

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Register a TreadGRID API Key | (Optional) Register for a ThreatGRID API Key |
| Administrator | Enable Community Analysis | Enable Community Analysis |

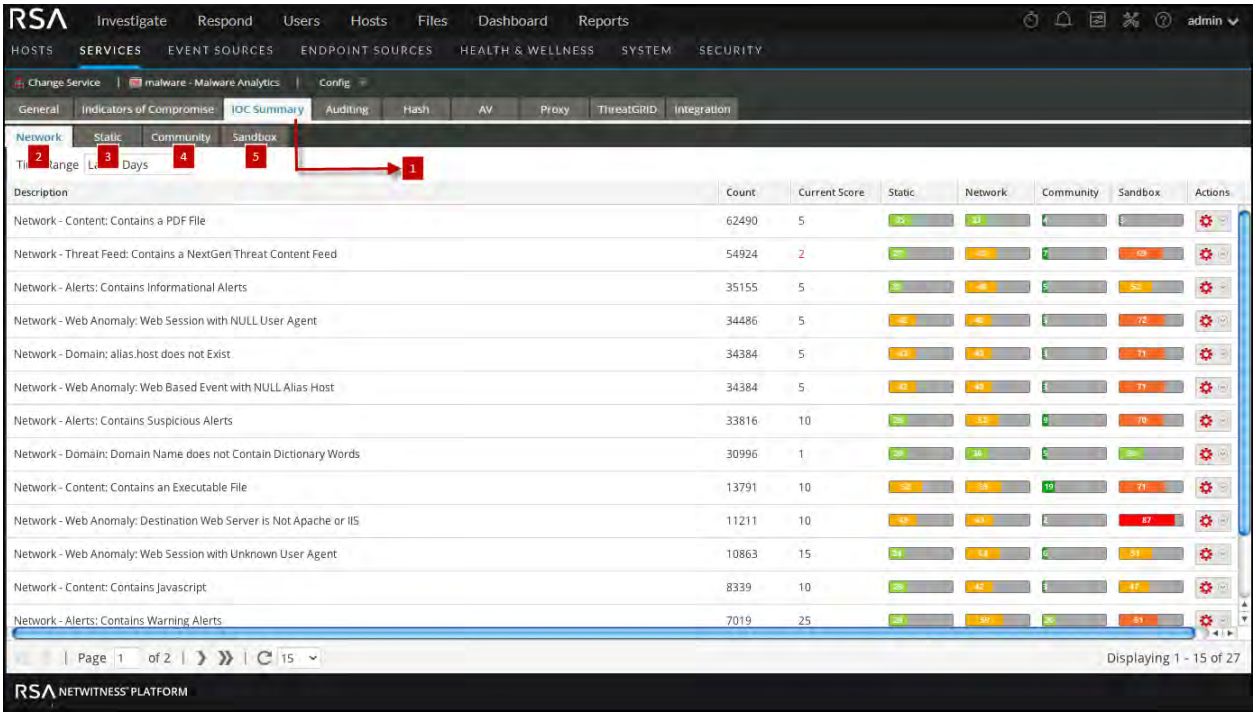
*You can perform this task in the current view

## Related Topic

Basic Setup

## Quick Look

This is an example of the IOC Summary tab for the Network scoring module.



1 Displays the IOC Summary Tab.
2 Displays the Network View.
3 Displays the Static View.
4 Displays the Community View.
5 Displays the Sandbox View.

## Features

The IOC Summary consists of four tabs, one for each scoring module: Network, Static, Community, and Sandbox. Each tab has the same form and same information with a toolbar and page-able grid.

This table describes the features of each tab.

| Feature | Description |
|---|---|
| Time Range | Selects the time range for the IOC Summary. Possible values are: Last 5 Minutes, Last 15 Minutes, Last 30 Minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom. |
| Description column | Lists the descriptions for the IOCs. |
| Count column | Lists the number of occurrences of the IOCs. In the Network tab, the count is the number of events in which the IOC was found. In the other tabs, the count is the number of files in which the IOC was found. |
| Current Score column | Lists the current score for the IOCs as configured in the Indicators of Compromise tab. |
| Static, Network, Community, and Sandbox columns | List the scores that each of the scoring modules gave the IOCs. |
| Actions drop-down | The Actions drop-down menu has two options:<br>• Show Events/Files: opens the IOC in the Investigation Events view or Files view. This view can also be opened by double-clicking on the IOC.<br>• Edit: opens the IOC in the Indicators of Compromise tab to edit the Current Score. |

# Services Config View - Auditing Tab

This topic introduces the features and functions of the Auditing tab in the Services Config view for Malware Analysis. The Auditing tab in the Services Config view for Malware Analysis provides a way to configure the auditing feature. Malware Analysis has an automated auditing system capable of sending alerts (syslog, snmp, audit log file entries) as Malware Analysis exceeds configured score value thresholds for each scoring module (Network, Static, Community, Sandbox). Malware Analysis can automatically feed any external system capable of ingesting the supported audit formats. One alert is generated for each file in an analyzed session that meets or exceeds the configure threshold.

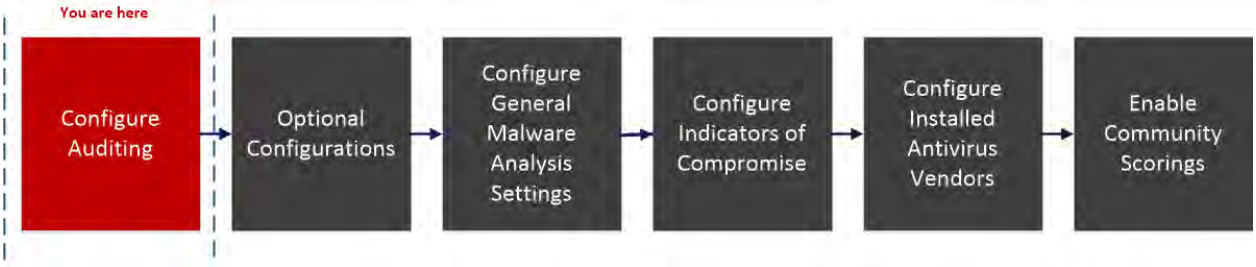
The audit log is a log file maintained on the Malware Analysis appliance for every significant event or action. Audit logs are rolled out and archived over time as they become large so an audit history is maintained. The size of these audit logs and their number are both configurable.

Some examples of events that are logged are:

- User login successes and failures
- Changes to system configuration settings
- Server restart
- Server version upgrade and install
- Suspicious events that exceed the Audit Thresholds

Malware Analysis can send audit events as an SNMP trap to a configured SNMP trap host, and consolidate logs in syslog format. Refer to the following task topic for detailed procedures: (Optional) Configure Auditing on Malware Analysis Host.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings | Configure General Malware Analysis Settings |
| Administrator | Configure Indicators of Compromise | Configure Indicators of Compromise |
| Administrator | Configure Auditing on Malware Analysis Host* | (Optional) Configure Auditing on Malware Analysis Host |

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure Hash Filter | (Optional) Configure Hash Filter |
| Administrator | Configure Installed Anti virus Vendor | Configure Installed Antivirus Vendors |
| Administrator | Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings |
| Administrator | Register a TreadGRID API Key | (Optional) Register for a ThreatGRID API Key |
| Administrator | Enable Community Analysis | Enable Community Analysis |

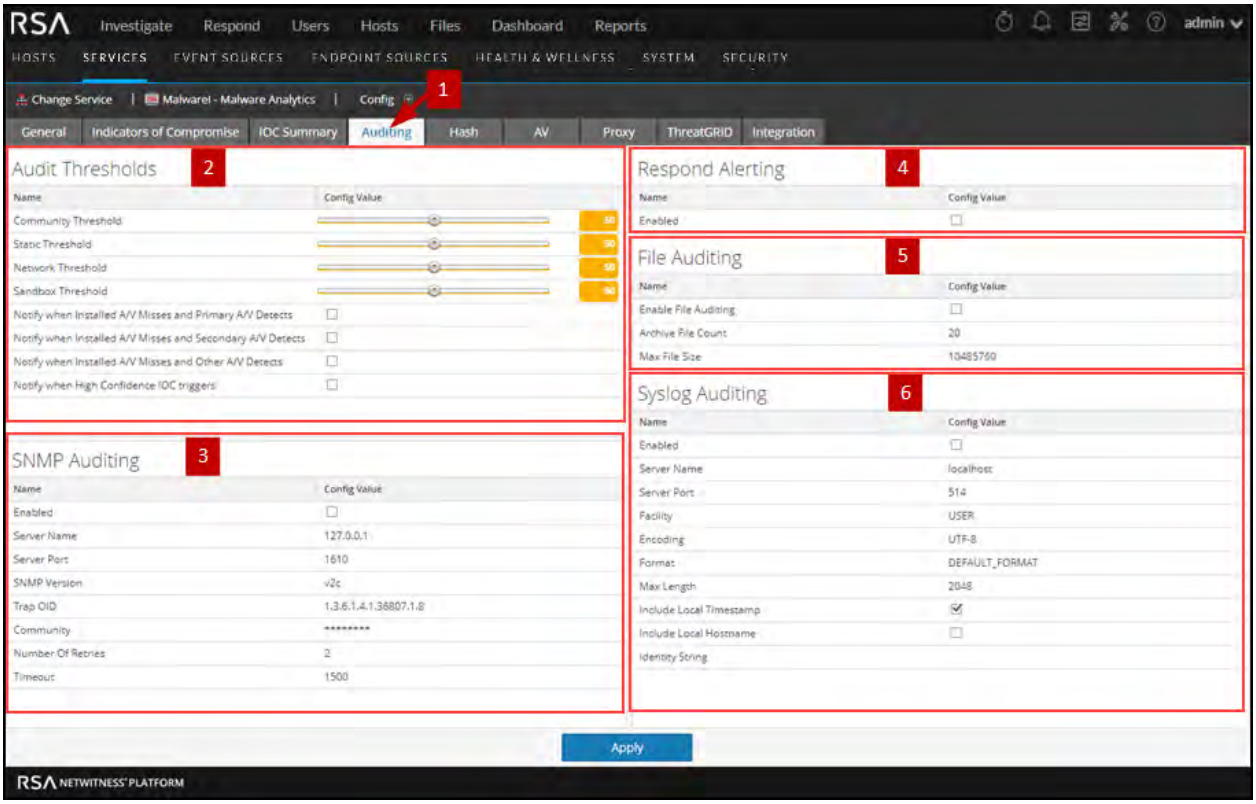
*You can perform this task in the current view

## Related Topics

Basic Setup

## Quick Look

This is an example of the Auditing tab.



1 Displays the Auditing Tab.
2 Displays the Audit Thresholds section.

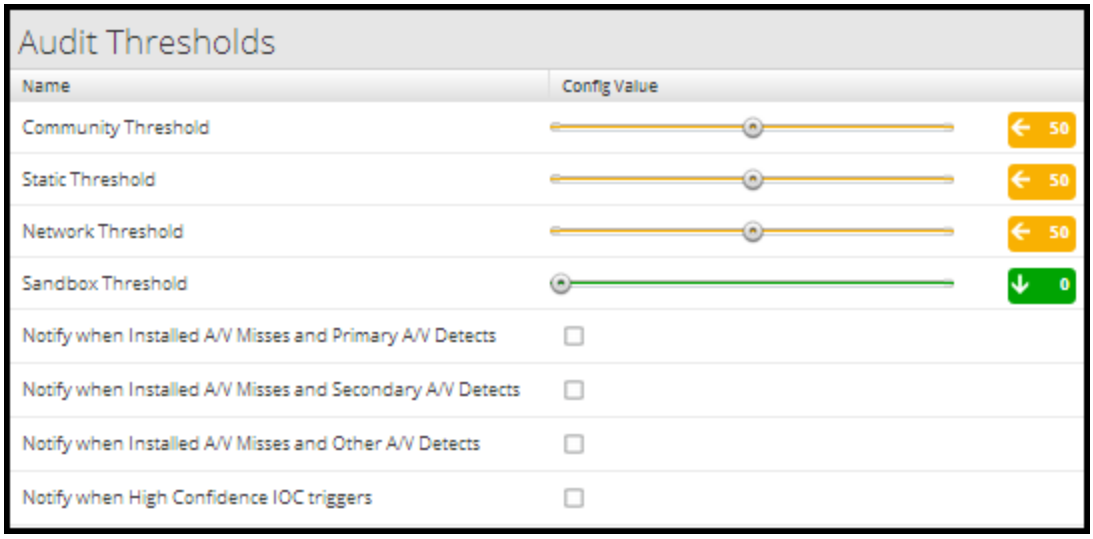
3 Displays the SNMP Auditing section.
4 Displays the Respond Alerting section.
5 Displays the File Auditing section.
6 Displays the Syslog Auditing section.

## Features

The Auditing tab includes five sections and an Apply button used to save changes made in this tab and put them into effect.

- Auditing Thresholds
- SNMP Auditing
- Respond Alerting
- File Auditing
- Syslog Auditing

## Audit Thresholds



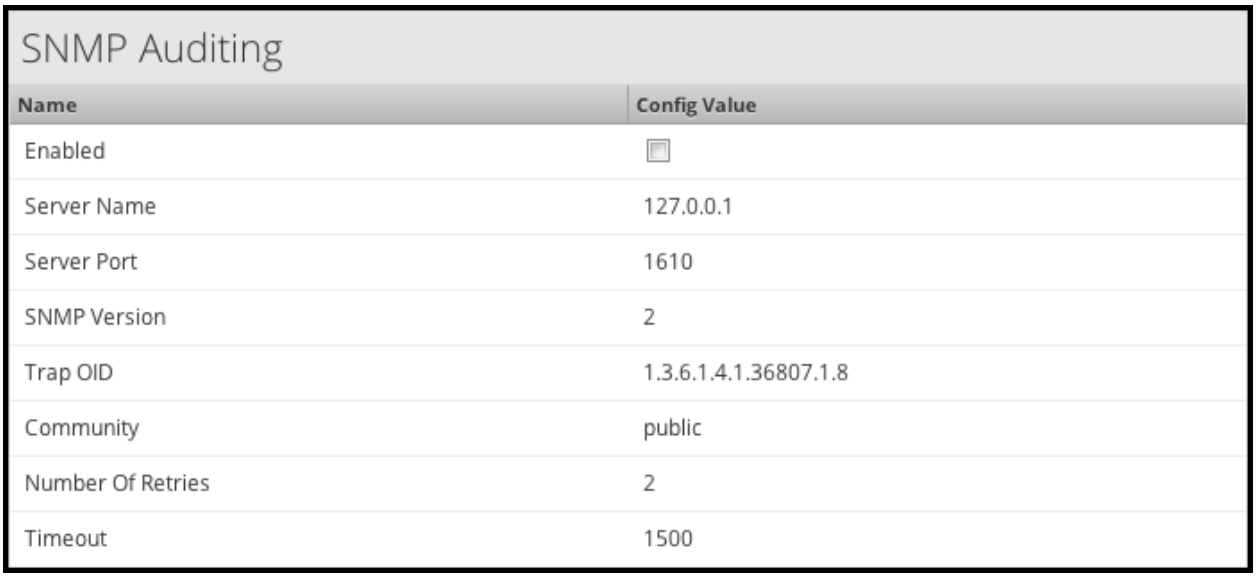
This table describes the features in the Audit Thresholds section.

| Name | Config Value |
|---|---|
| **Community**, **Static**, **Network**, and **Sandbox Thresholds** | Malware Analysis scoring module thresholds for recording event information in a log file. Malware Analysis records the event information in a log file if the event scored high enough to satisfy all of the auditing thresholds. Each scoring category that completed analysis (for example, not all sessions invoke sandbox analysis) is compared against the configured audit threshold for that category. Any one of the category must exceed the threshold in order for an audit event to be triggered.<br>An integer between 0 and 100 is a valid value. Setting these thresholds too low may cause a very large volume of audit events and notifications. |

| Name | Config Value |
|---|---|
| **Notify when Installed A/V Misses and Primary A/V Detects** | Records a message in a log file when installed antivirus software misses a virus and the primary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked. |
| **Notify when Installed A/V Misses and Secondary A/V Detects** | Records a message in a log file when installed antivirus software misses a virus and the secondary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked. |
| **Notify when Installed A/V Misses and Other A/V Detects** | Records a message in a log file when installed antivirus software misses a virus and the other antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog.<br>The default value is unchecked. |
| **Notify when High Confidence IOC triggers** | Records a message in a log file when a high confidence IOC (Indicators of Compromise) triggers. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog.<br>The default value is unchecked. |

## SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host.

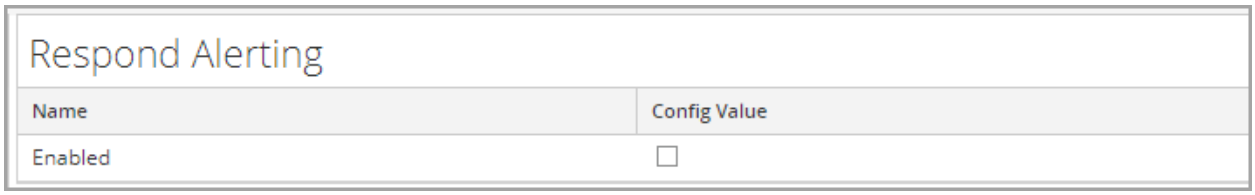


This table describes the features in the SNMP Auditing section.

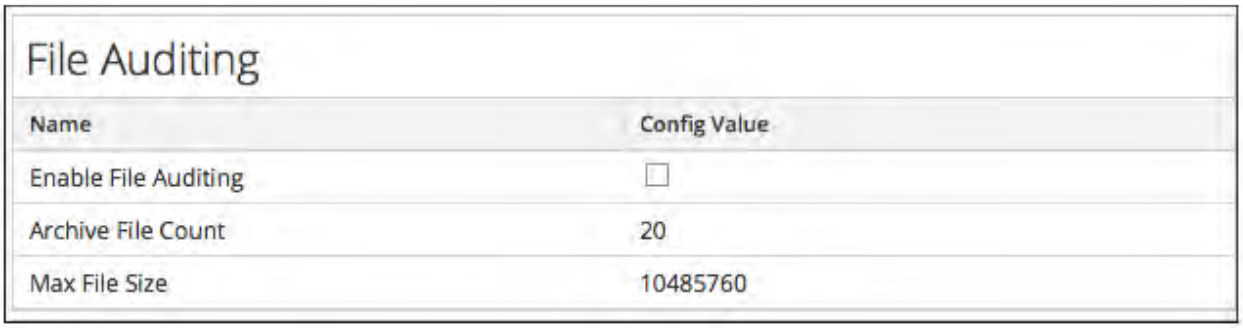
| Name | Config Value |
|---|---|
| **Enabled** | Click to enable or disable SNMP auditing. |
| **Server Name** | The host where the target SNMP server is running. |
| **Server Port** | The port used where the SNMP trap receiver is listening. |
| **SNMP Version** | The version of the SNMP protocol to use when sending traps. |
| **Trap OID** | The object ID to use to identify the type of trap to send. |
| **Community** | The SNMP group to which Malware Analysis belongs. |
| **Number Of Retries** | The number of retries for sending a trap. |
| **Timeout** | The timeout period to wait for acknowledgment. |

## Respond Alerting

The Respond Alerting section enables NetWitness Respond to receive alerts from Malware Analysis. Select Enabled to forward alerts to the Respond view.



## File Auditing

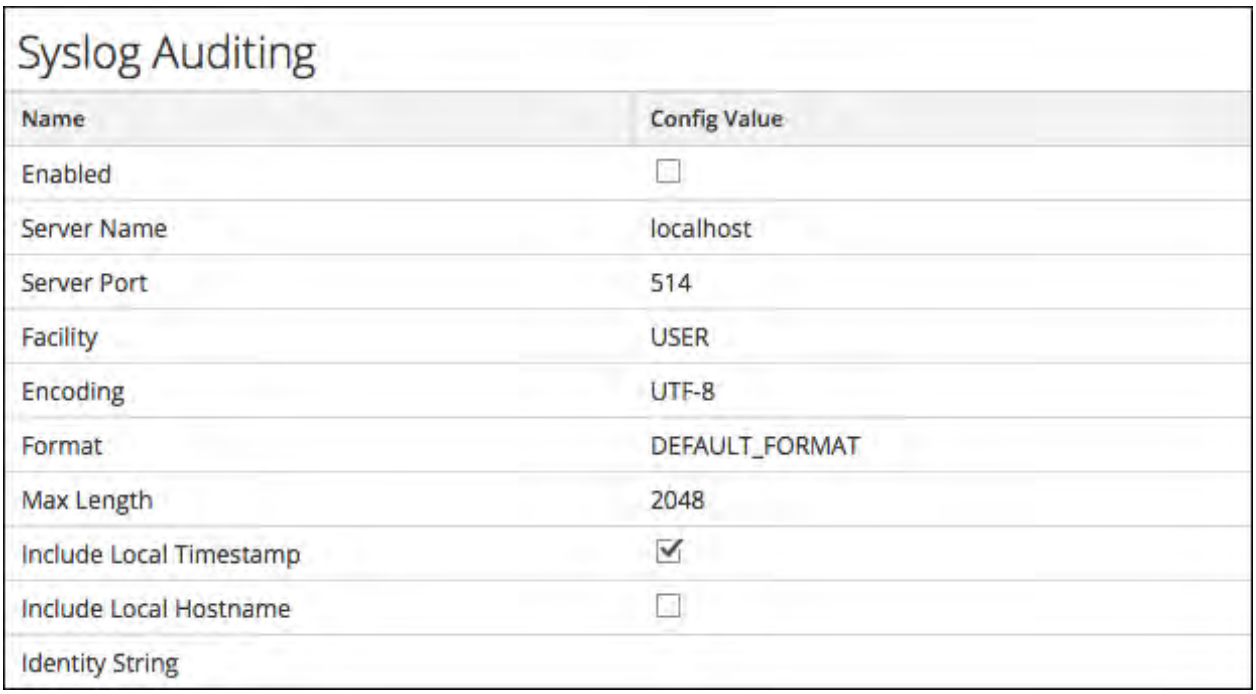


This table describes the features in the File Auditing section. Avoid setting the max file size and archive file count too high because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

| Name | Config Value |
|---|---|
| **Enable File Auditing** | Click to enable or disable file auditing. |

| Name | Config Value |
|---|---|
| **Archive File Count** | Malware Analysis keeps only as many log files as defined by this setting. When the maximum number is reached, the oldest log files are deleted and cannot be recovered. The default value is 20. Valid value: Integer between 1 and 50, inclusive. |
| **Max File Size** | The maximum file size for a single auditing log before it is archived. The default value is 10485760 bytes. |

## Syslog Auditing



This table describes the features in the Audit Thresholds section.

| Feature | Description |
|---|---|
| **Enabled** | Click to enable or disable syslog auditing. |
| **Server Name** | This is the host where the target syslog process is running. |
| **Server Port** | This is the port where the target syslog process is listening. |
| **Facility** | This is the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, and LOCAL1 through LOCAL7. |
| **Encoding** | This is the encoding to use for text in syslog messages; for example, UTF-8. |
| **Format** | This is the desired message format. Possible values are: Default, PCI DSS, or SEC. |

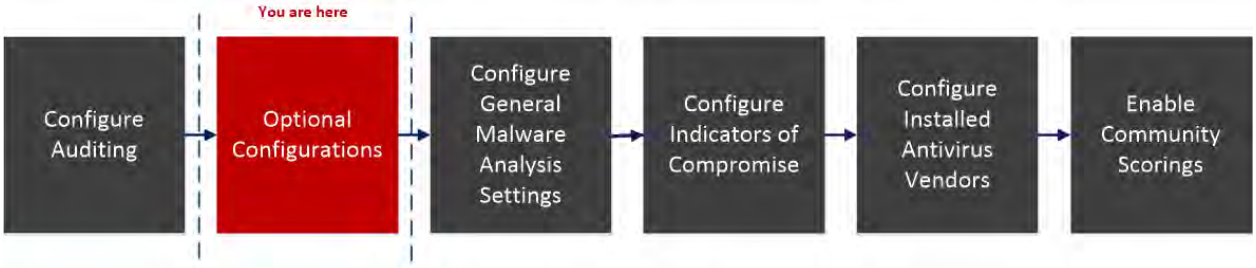
| Feature | Description |
|---|---|
| **Max Length** | This is the maximum length in bytes that any syslog message can be. Default is 1024. Messages that exceed the maximum length are truncated. |
| **Include Local Timestamp** | Check this box to include the local timestamp in messages. |
| **Include Local Hostname** | Check this box to include the local hostname. |
| **Identity String** | This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that will submit the messages to a syslog auditing. |

# Services Config View - Hash Tab

This topic introduces the features and functions available in the Service Config view > Hash tab for Malware Analysis.

In this tab, you can manage hash filtering in Malware Analysis. The hash grid is initially empty; the grid lists filters that have been added to Malware Analysis. In this view, you can add a hash filter, delete a hash filter, mark a hash filter as trusted or untrusted, and save changes.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings | Configure General Malware Analysis Settings |
| Administrator | Configure Indicators of Compromise | Configure Indicators of Compromise |
| Administrator | Configure Auditing on Malware Analysis Host | (Optional) Configure Auditing on Malware Analysis Host |
| Administrator | Configure Hash Filter* | (Optional) Configure Hash Filter |
| Administrator | Configure Installed Anti virus Vendor | Configure Installed Antivirus Vendors |
| Administrator | Configure Malware Analysis Proxy Settings | (Optional) Configure Malware Analysis Proxy Settings |
| Administrator | Register a TreadGRID API Key | (Optional) Register for a ThreatGRID API Key |
| Administrator | Enable Community Analysis | Enable Community Analysis |

*You can perform this task in the current view

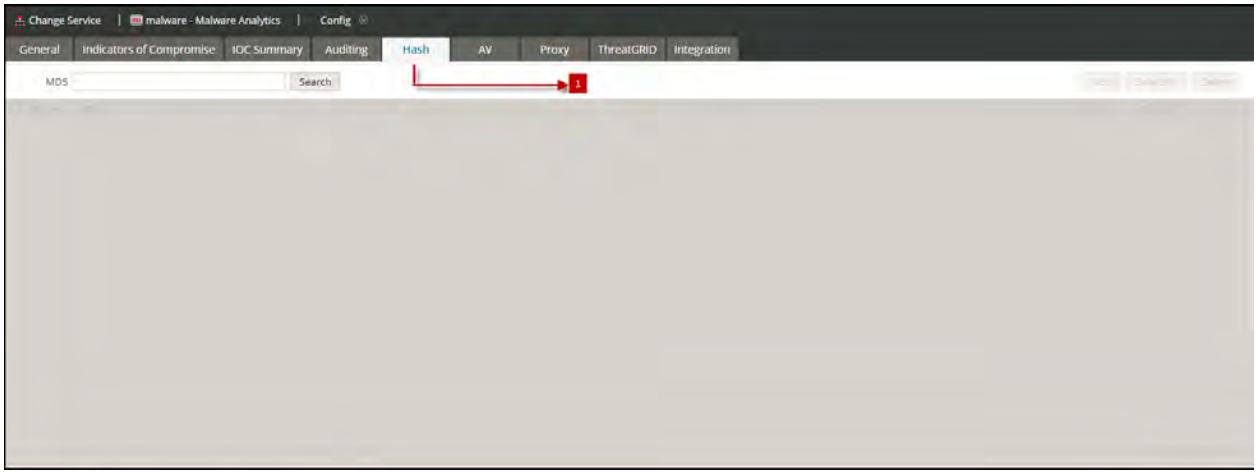
## Quick Look

This is an example of the Hash tab.



1 Displays the Hash Tab.

This is an example of the Add Hash dialog.

### Features

The **Hash** tab consists of a toolbar and a pageable hash grid.

This table describes the Hash tab toolbar.

| Feature | Description |
|---|---|
| **MD5 Search** | Enter an MD5 hash for which you want to search the results in the grid. The search function is case-insensitive. |
| **Add** | Displays the Add Hash dialog in which you can add a new hash to the hash grid, specify whether the hash is trusted or not, and provide the hash file size. |
| **Save Edit** | Saves any additions or edits to hashes in the grid. |
| **Delete** | Deletes selected hashes from the grid. |

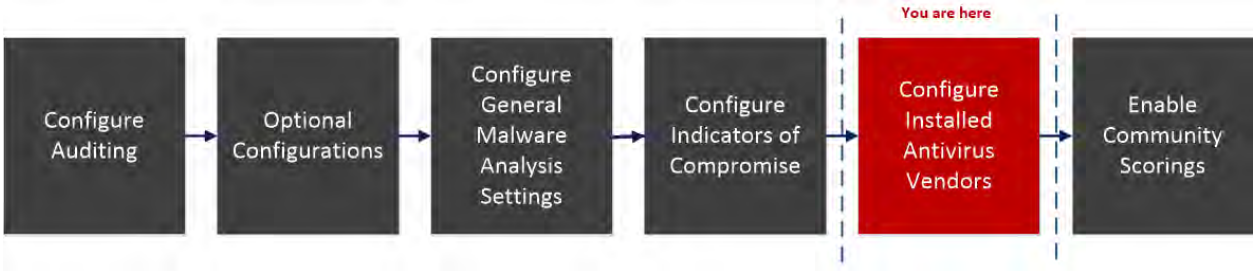
This table describes the Hash grid columns.

| Feature | Description |
| --- | --- |
| **Select Checkbox** | Click to select a row. Click in the column header to select a header. |
| **Trusted** | Marks a hash as trusted or untrusted. |
| **MD5** | Identifies the MD5 hash. |
| **File Size** | Identifies the hash file size in kilobytes. |

# Services Config View - AV Tab

This topic introduces the features and functions of the AV tab in the Service Config view for a Malware Analysis service. The AV tab provides a way to identify the anti-virus software vendors whose software is in use on your network. NetWitness can include the results from these vendors in the detailed results view of an event that has been analyzed using Malware Analysis.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |
|---|---|---|
| Administrator | Configure General Malware Analysis Settings | Configure General Malware Analysis Settings |

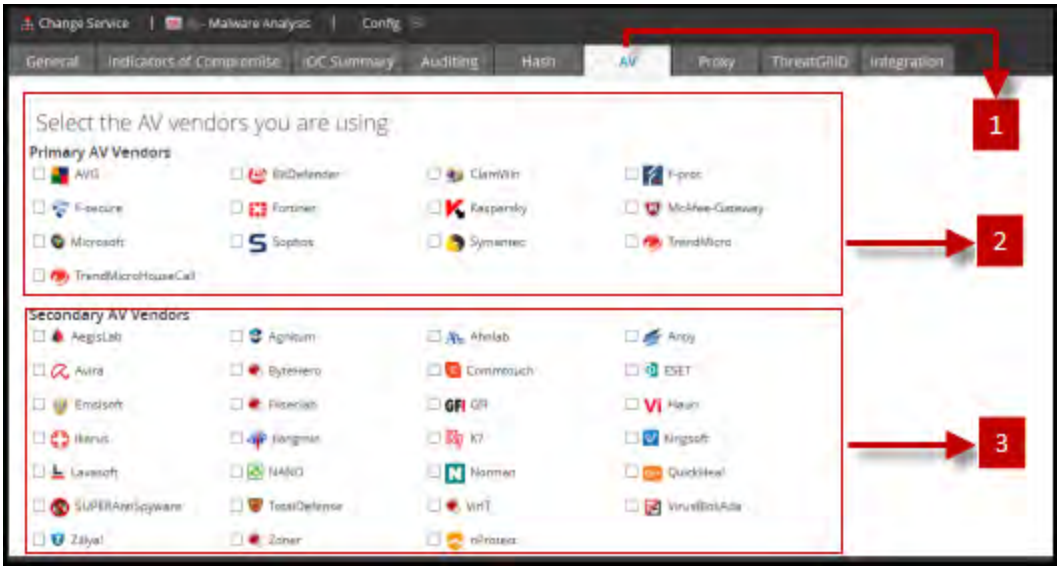
Configure Installed Antivirus Vendors

## Quick Look

This is an example of the AV tab.



1 Displays the Av Tab.
2 Allows you to select the AV vendor that you are using.
3 Displays the Secondary AV vendors.

## Features

The AV tab lists anti-virus vendors whose software may be installed in your network. There are two categories for vendors: Primary, which are the most trusted, and Secondary, which are less known. Each vendor name has a checkbox and an icon. Checking a vendor name indicates that you have installed the selected AV software from that vendor in your environment.

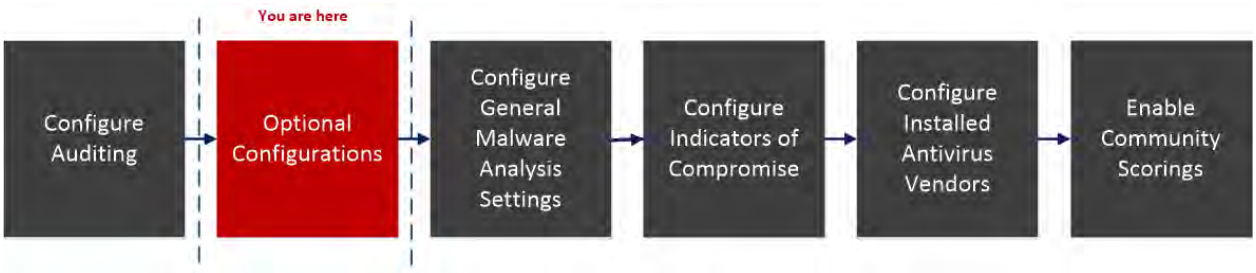
This table describes the options in the AV tab.

| Feature | Description |
|---|---|
| Vendor Checkbox | Choose one or more Anti Virus vendors from the supplied list to indicate which products have been installed in the local organization. |
| Apply | Saves changes made in the AV tab. |
| Reset | Resets the AV list to the default state, which has no vendors selected. |

# Service Config View - Proxy Tab

This topic introduces the parameters configured in the Proxy tab in the Service Config view for a Malware Analysis service. This tab configures Malware Analysis communication via web proxy with the RSA Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity. If you are using a local sandbox service, communications via web proxy are unnecessary and may slow performance. When configuring the sandbox module in the **General** tab, you can choose to bypass the configured web proxy.

## Workflow



## What do you want to do?

| Role | I Want to... | Show me how |

| Automatically detect web proxy settings | Select the checkbox to use settings configured in the System settings. |
| Proxy host | Enter the hostname for the proxy host. |
| Proxy port | Enter the port used for communication on the proxy host |
| Users | Enter the username used to log on to the proxy host. |
| User Password | Enter the user password used to log on to the proxy host. |
| SSL | (Optional) Select the checkbox to enable communication using SSL. |
| Apply button | Click the **Apply** button to submit chosen settings. |

# Services Config View - ThreatGRID Tab

This topic introduces the parameters required to obtain a trial ThreatGRID API key in the Malware Analysis **ThreatGRID** tab, which provides a method of obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the Sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.

If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

Basic Setup

## Quick Look

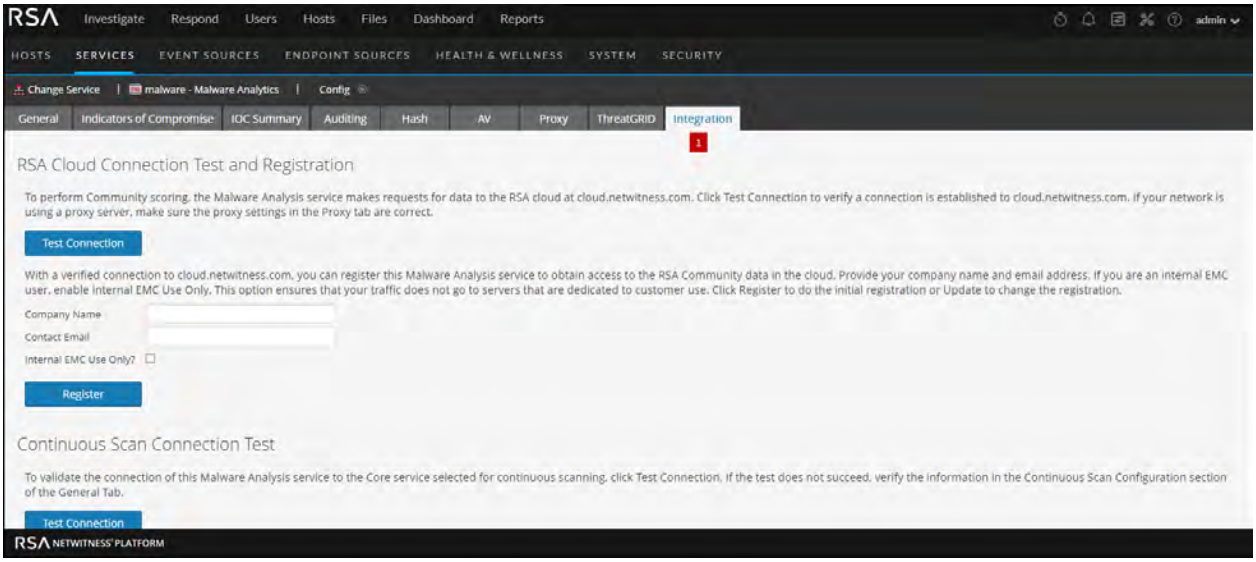
The following figure is an example of the Integration tab.



1 Displays the Integration Tab.

## Features

This tab has two sections: RSA Cloud Connection Test and Registration and Continuous Scan Connection Test. The following table describes the features.

| Feature | Description |
|---|---|
| **RSA Cloud Connection Test and Registration button** | Clicking this button tests for an active connection to cloud.netwitness.com. NetWitness tests communications with the site and checks Proxy settings. A valid connection is required in order to register with the RSA Community Service. |
| **Company Name** | This is the name of your company. This is a required field. |
| **Contact Email** | This is the contact email. This is a required field. |
| **Internal EMC Use Only Check box** | This is an optional field. EMC customers, salespersons, or demo users should check this option to ensure that their requests do not use bandwidth on the production server. When the box is checked the following warning is displayed:<br>`Checking this box may cause a less robust performance because the production server isn't being used.` |
| **Register button** | Clicking the Register button completes registration if all required fields are filled in. The Register button becomes the Update button after registration is complete. |
| **Update button** | The Update button is displayed after registration is complete. |

| Feature | Description |
| --- | --- |
| **Continuous Scan Connection Test button** | Clicking this button initiates a check to verify that the Malware Analysis service can connect to the Core service selected for continuous scanning (the Source Host, Source Port, Username, and User Password as specified in the General tab). |

# Malware Analysis Functions

NetWitness Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

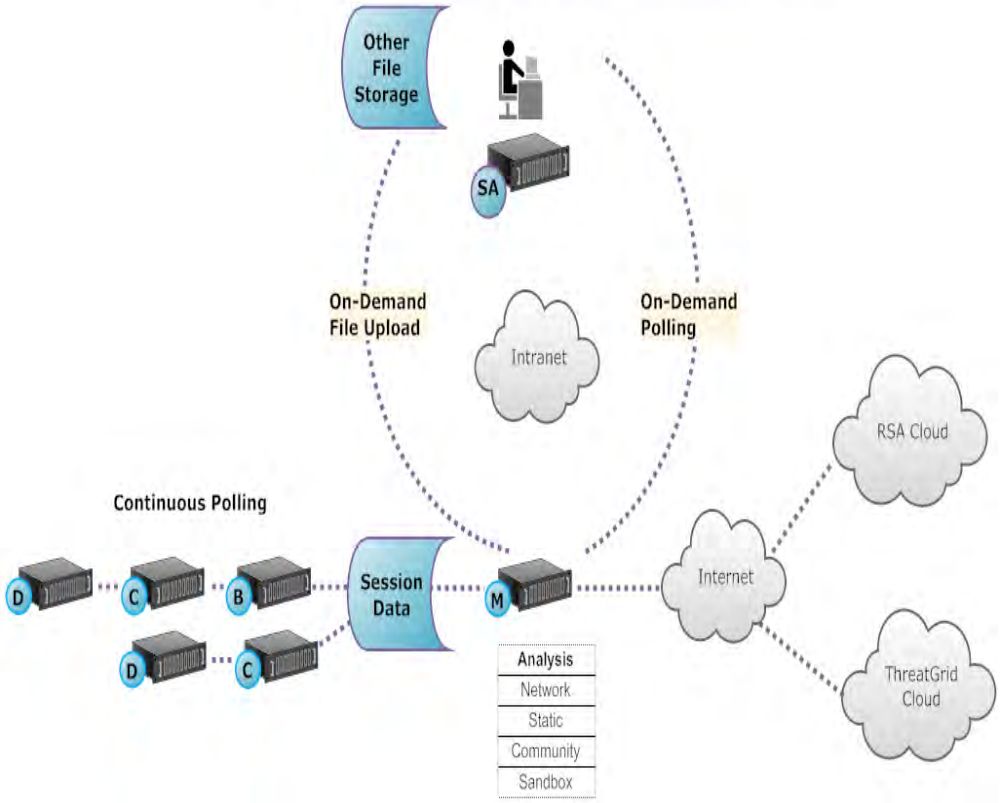
In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

## Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

| Daily Quota (Number of Files) | Free | Standard | Enterprise |
|---|---|---|---|
| Malware Analysis | 100 | unlimited | unlimited |
| ThreatGrid Analysis | 5 | 1000 | 5000 |



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

## Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

## NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness customers have a free subscription, with a free key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

## Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

## Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an on-board Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

# Malware Scoring Modules

RSA NetWitness Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

## Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

## Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

## Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

## Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

# Conducting Malware Analysis

Analysts can use the RSA NetWitness Malware Analysis service to detect malware in selected data and files.

Analysts who conduct analysis using NetWitness Malware Analysis need to have the appropriate system roles and permissions set up for their user accounts.

The following procedures provide instructions for using Malware Analysis:

- Begin a Malware Analysis Investigation
- Upload Files for Malware Analysis Scanning
- Implement Custom YARA Content
- Configure the Malware Analysis Summary of Events View
- Filter Dashlet Data in the Summary of Events View
- Examine Scan Files and Events in List Form
- View Detailed Malware Analysis of an Event

# Begin a Malware Analysis Investigation

You can investigate data that has been scanned, flagged, and rated by Malware Analysis as containing Indicators of Compromise. This includes all types of Malware Analysis scans: continuous mode polling, on-demand polling, and on-demand uploaded files. Continuous mode polling must be enabled when the administrator configures basic settings for the Malware Analysis service.

NetWitness provides several methods of launching a Malware Analysis investigation.

## Fastest: Instant Launch from Malware Analysis Dashlets

The fastest way to begin a Malware Analysis investigation is an Instant launch from the NetWitness Dashboard using one of the Malware Analysis dashlets that lists events or files that are likely to contain malware. The dashlets are described as part of the RSA NetWitness Content in Dashlets. From one of these dashlets, you can go directly to the Analysis Results for a specific event that has been listed as worthy of investigation:

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

## On-Demand Polling from a Meta Value in the Navigate View

You can initiate on-demand polling from within an investigation by right-clicking a meta value in the Navigate view, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis (see "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*).

## Investigate a Specific RSA Service

You can also begin a Malware Analysis investigation of a service in the Investigate > Malware Analysis view. For Malware Analysis investigation on a service basis, a service must be specified in the Investigate > Malware Analysis view.

1. Investigate opens the Malware Analysis view with the user-specified default service selected.
2. If no default service is currently specified, a dialog allows you to select the Malware Analysis service to investigate.
3. When a service has been selected in the Malware Analysis view, the Summary of Events for the selected service and continuous scan data for the service is displayed.

This topic provides instructions for all methods of launching a Malware Analysis investigation.

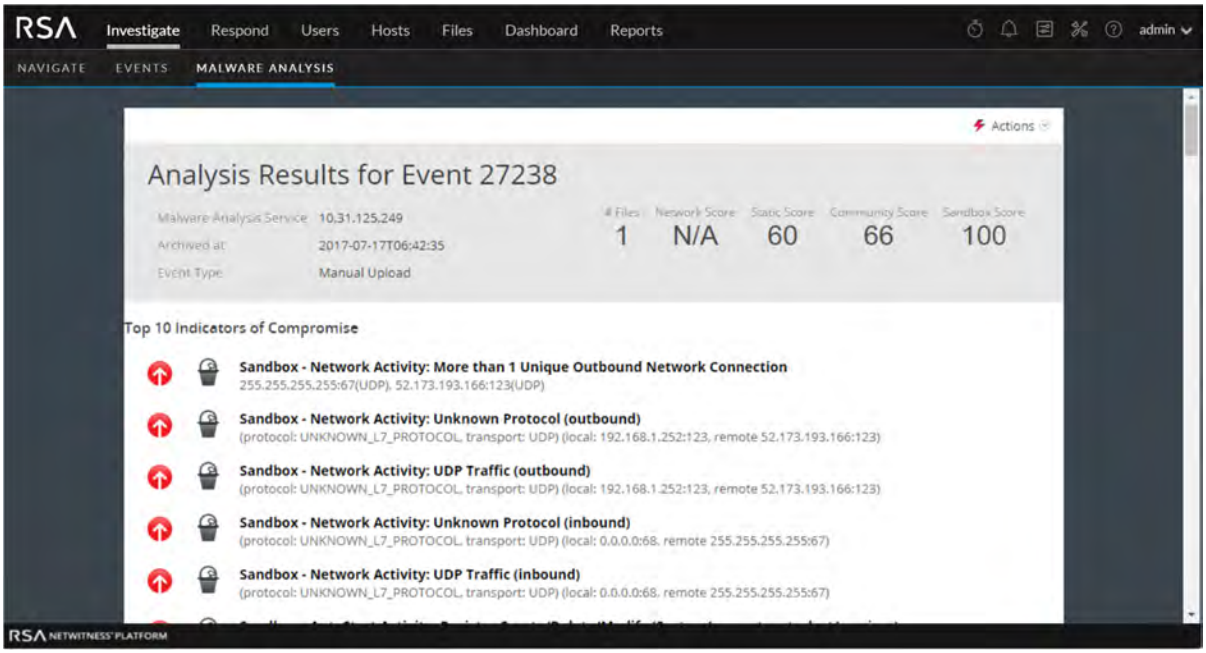
# Launch a Malware Investigation from a Malware Analysis Dashlet

A prerequisite for this procedure is that one of the following dashlets must be visible in the NetWitness dashboard or in the Malware Analysis view, and must be populated with listed events or files. If you do not see the dashlets, add them and configure the dashlets.

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

To launch a Malware Analysis investigation from a dashlet:

1. Log in to NetWitness and look for one of the above dashlets in the Monitor view or in the Malware Analysis view
2. In the dashlet, double-click an event or file for deeper analysis. A detailed analysis of the event in the Events List or the event with which the file in the File List is associated is displayed in the Malware Analysis view.



To learn more about configuring the Malware Analysis dashlets in the Monitor dashboard, see "Dashlets" in the *NetWitness Platform Getting Started Guide*.

To learn about the ways you can configure and filter information in dashlets in the Malware Analysis view, refer to Filter Dashlet Data in the Summary of Events View.

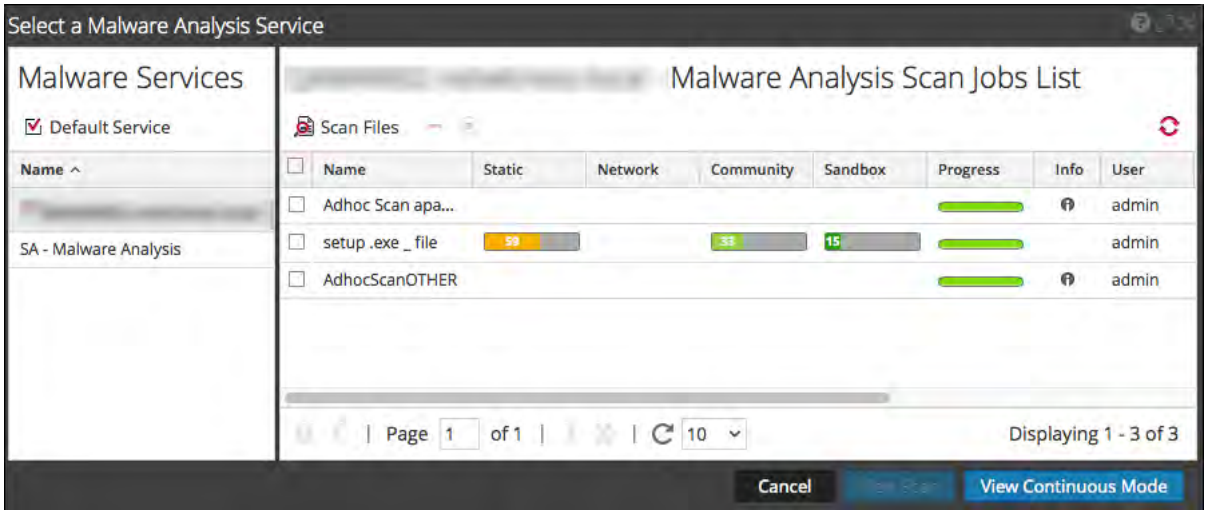
To learn about the actions you can perform in the Analysis Results, refer to View Detailed Malware Analysis of an Event.

## Begin a Malware Analysis Investigation (No Default Service)

To begin an investigation with no default service specified:

1. Select **Investigate > Malware Analysis**.

   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel and available scan jobs in the right panel. This scan jobs panel contains the same columns as the Malware Scan Jobs dashlet in the Unified dashboard. In addition, it has a toolbar and View options, which are described in Select a Malware Analysis Service Dialog.



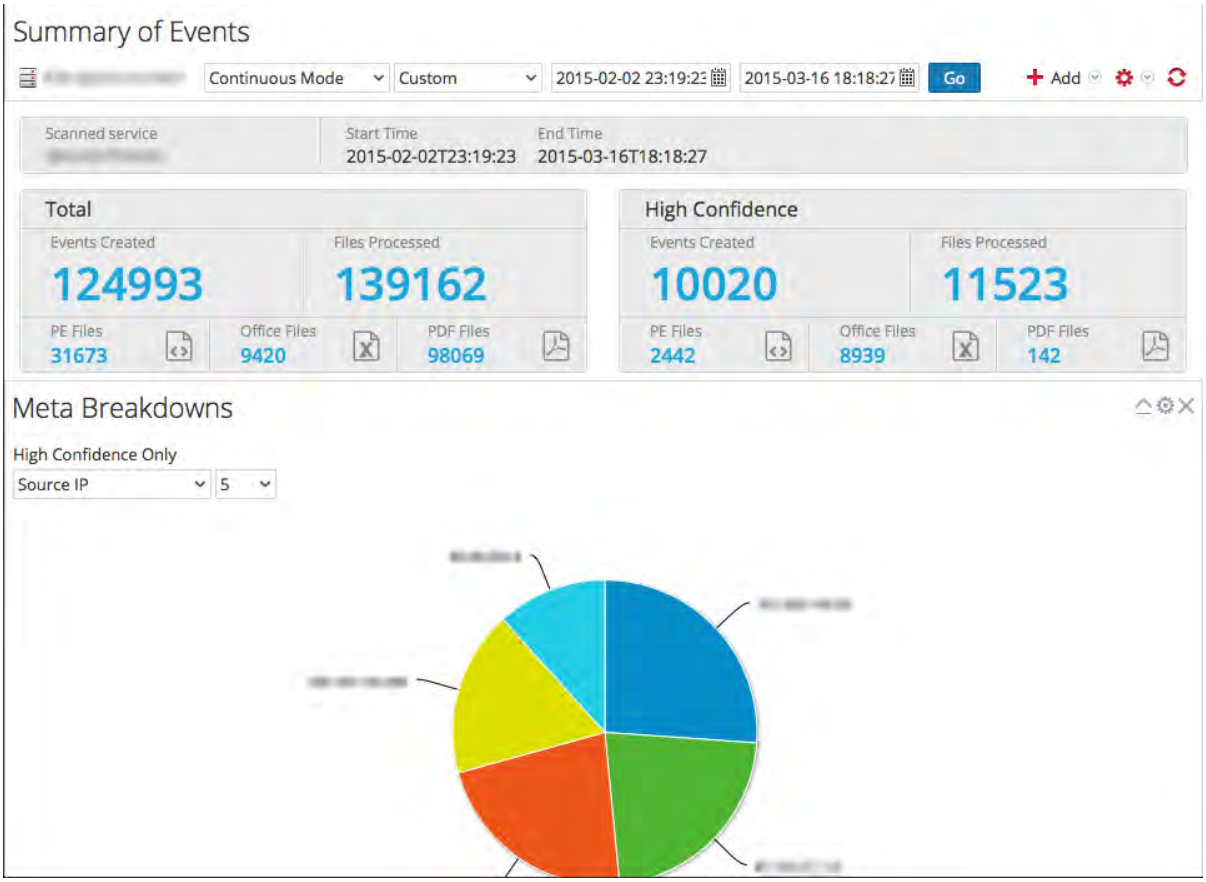
2. In the list of Malware Analysis hosts, select a host and a list of scan jobs is displayed in the right panel. These jobs are created when you scan an event or a file (see Upload Files for Malware Analysis Scanning and "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*.
3. To begin analyzing a scan, do one of the following:

   a. Select a scan and click **View Scan**.

   b. Click **View Continuous Mode**.

      The Summary of Events for the selected scan is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the

Summary of Events View.



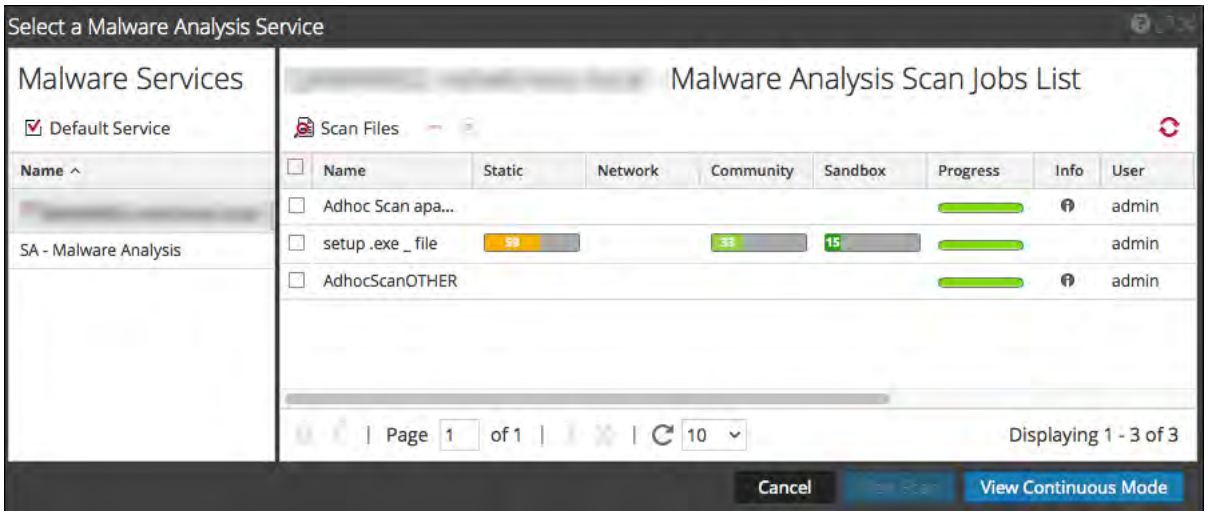
## Set or Clear the Default Service

You can set the default service and clear the default service in the Select a Malware Analysis Service dialog.

To set a default service:

1. Click the service name in the Summary of Events toolbar.

   The Select a Malware Analysis Service dialog is displayed.



2. Select a service on the list of available Malware services, and click Default Service.

   The service becomes the default, (indicated by ☑ in front of the host name).

3. To clear the default service, select the default service in the grid, and click Default Service.

   No default service is set.

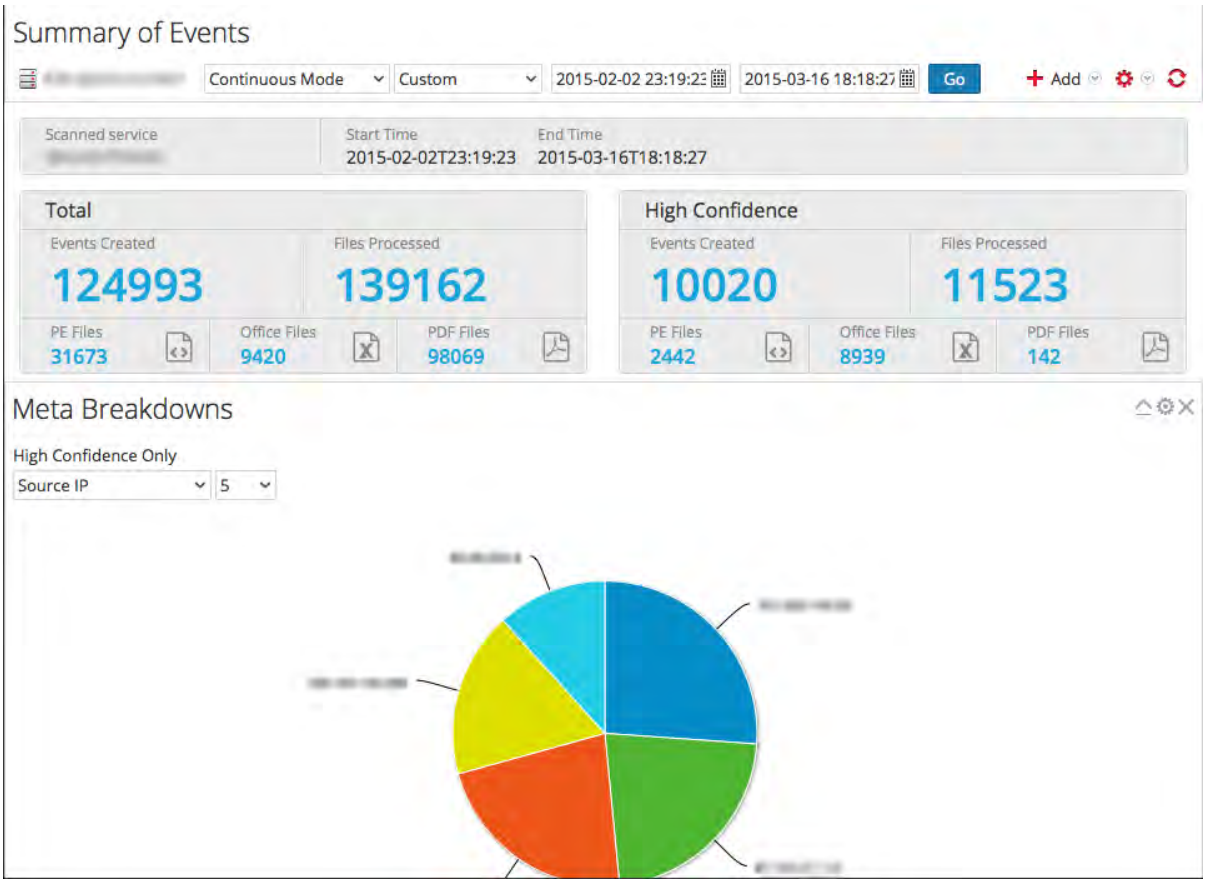
## Upload and Scan Files

A Malware Analyst with permission to `Initiate Malware Analysis Scan` can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog (see Upload Files for Malware Analysis Scanning. An administrator can upload packet capture files to a Decoder for Malware Analysis in the Services System view as described in "Upload Packet Capture File" in the *Decoder and Log Decoder Configuration Guide*.

## Begin an Investigation (Default Service Specified)

To begin an investigation with a default service specified, select **Investigate > Malware Analysis**.

The Summary of Events for a continuous scan of the selected service is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.



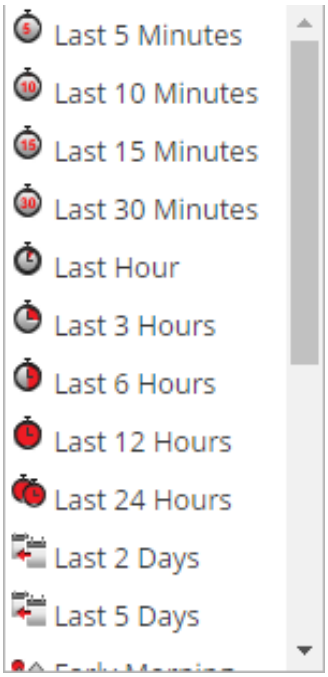
## Apply Time Parameters Filter for Results

You can apply a Threshold filter to refresh the results of the chosen dashlets.

1. To select a different time range, select either **Continuous Mode** or a different scan from the toolbar.

   The Malware Summary of Events for the selected scan is displayed.

2. To select a new time range for the scan, click in the range selection list in the toolbar. Ranges available are: Last 5 minutes, Last 10 minutes, Last 15 minutes, Last 30 minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.



The results are updated immediately.

3. To refresh a continuous mode scan with new data, click .

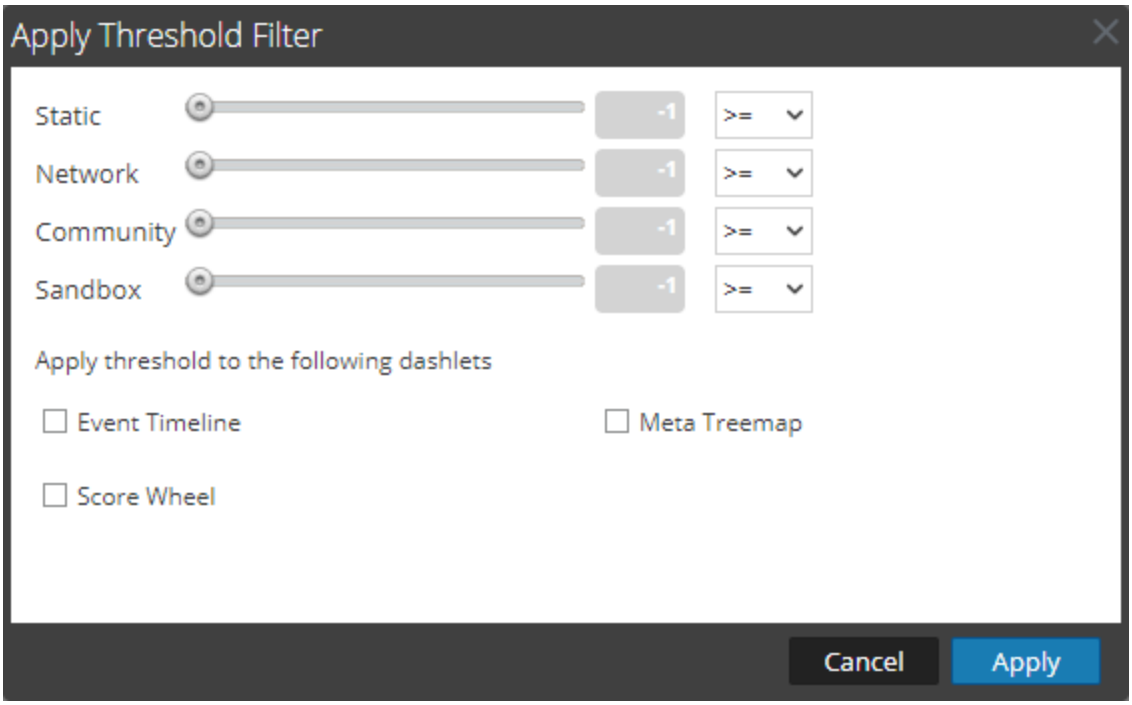
## Apply a Threshold Filter to Continuous Mode Results

You can apply a new threshold filter to an instance of the Malware with High Confidence IOCs and High Scores dashlet, the Meta Treemap dashlet, the Score Wheel dashlet, and the Event Timeline dashlet.

To customize the scoring applied to the scan, in the toolbar, do the following:

1. Select > **Apply Threshold Filter**.

   The Apply Threshold Filter dialog is displayed.



2. If you want to limit the number of events displayed to events that were given a score above a certain number, do the following:
   a. Drag the slider in the Static, Network, Community, and Sandbox slider bars.
   b. To select the dashlets in which the thresholds apply, select the appropriate checkboxes.
   c. Click **Apply**.

## Delete or Resubmit an On-Demand Scan with New Bypass Settings

You can delete an on-demand scan or resubmit an on-demand scan with different bypass settings than those specified in the Service Configuration view for a Malware Analysis service.

To delete a scan while viewing an on-demand scan, do the following:

1. Select **Actions > Delete Scan**.

   A dialog asks for confirmation that you want to delete the scan.

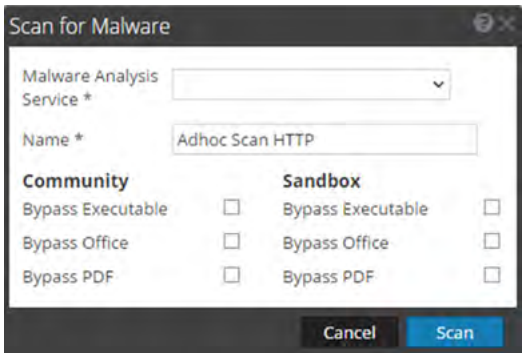
2. Click **Yes**.

   The selected scan is deleted.

To apply different bypass settings to the current scan:

1. Select **Actions > Resubmit Scan**.

   The Scan for Malware dialog is displayed.



2. Select the bypass settings that you want to use on the new scan, and click **Scan**.

   Malware Analysis resets cache and resubmits the file for a new scan, and the scan jobs are added to the jobs queue.

3. When the job is complete, scroll to the left and select **View**.

   The Malware Summary of Events for the selected scan is displayed.

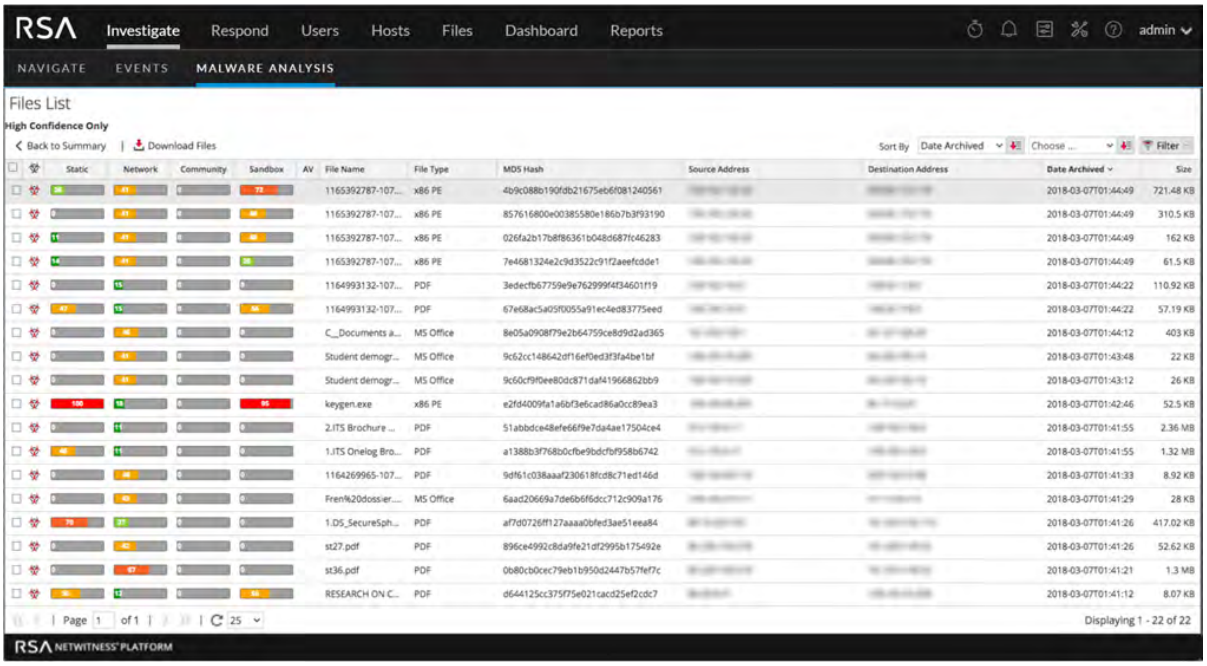
## View the Files List

You can view a list of files for an event from the Malware Analysis Summary of Events and from each of the Visualization charts: Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel.

To view the Files List, do one of the following:

- In the Summary of Events, click on the number of files in the **Total** row or the **High Confidence** row under **Files Processed**, **PE Files**, **Office Files**, or **PDF Files**. The Files List is displayed.
- In any visualization dashlet, click the number next to the **Files** field in the top right corner of the dashlet.

The Files List for the selected drill point is displayed.



From the Files List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files as described in Examine Scan Files and Events in List Form.

To return to the Summary of Events, click **Back to Summary**.

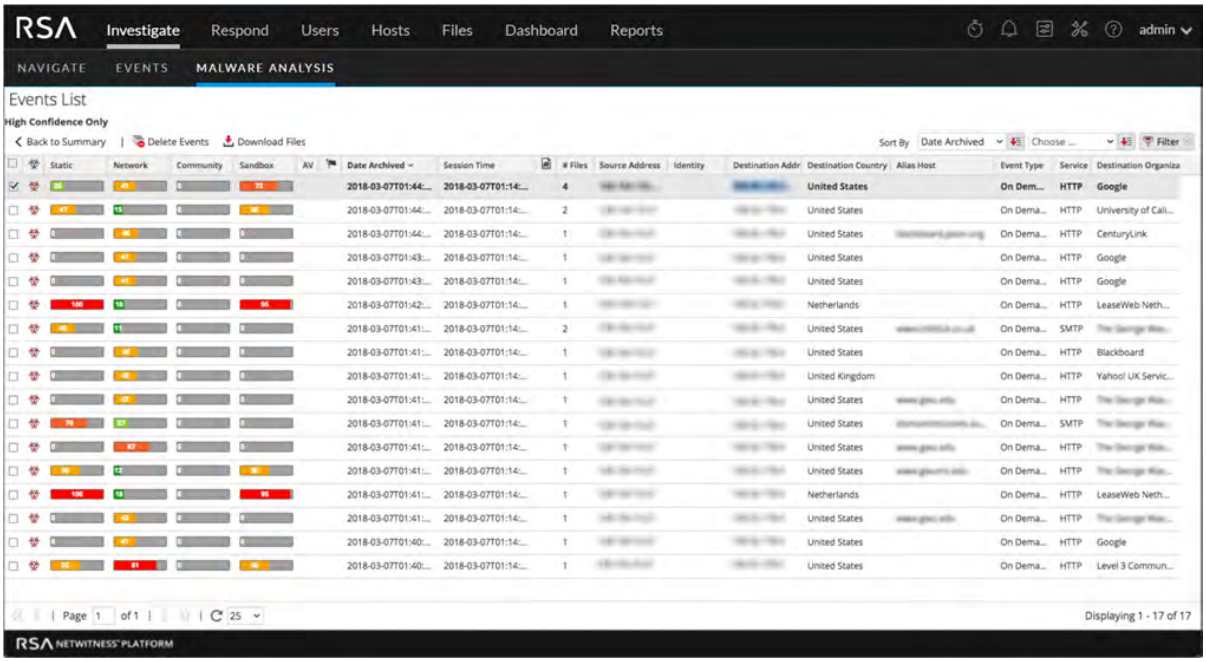
## View the Events List

From the Malware Analysis Summary of Events and from each of the visualization charts (Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel), you can select events to view in the Events grid.

To view the Events List, do one of the following:

- In the Summary of Events, click the number of Events Created in the **Total** row or the **High Confidence** row. The Events List is displayed.
- In any visualization dashlet, click the number next to the Events field in the top right corner of the dashlet.

The Events List for the selected time is displayed.



# Implement Custom YARA Content

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed hosts.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume.

As malware and the threat landscape evolve, it is important to review and examine existing custom rules. Updates are often necessary to incorporate new detection methods. RSA also updates YARA rules in Live from time to time. To receive updates, you can subscribe to the RSA Blog and RSA Live at http://blogs.rsa.com/feed.

This document provides information to help customers implement custom YARA rules in Malware Analysis.

## Prerequisites

The host on which you are adding custom rules must be configured to support authoring of YARA rules as described in "Enable Custom YARA Content" in the *Malware Analysis Configuration Guide*.

## YARA Version and Resources

RSA Malware Analysis is packaged with YARA version 1.7 (rev:167). To find out the exact version, you can run `yara -v` on the Malware Analysis host as shown in this example:

```
[root@TESTHOST yara] # yara -v
 yara 1.7 (rev:167)
```

## Meta Keys in YARA Rules

Malware Analysis is compliant with other sources of YARA rules, and it also consumes additional meta keys that are specific to Malware Analysis. Each YARA rule is equivalent to an Indicator of Compromise (IOC) within Malware Analysis. The example below illustrates the meta definitions in a rule:

```
meta:
 iocName = "FW.ecodedGenericCLSID"
        fileType = "WINDOWS_PE"
        score = 25
        ceiling = 100
        highConfidence = false
```

| Meta Key | Description |
|---|---|
| iocName | (Required) This is the name that MA uses as the rule name. It is specific to Malware Analysis and is required to add the rule to the IOC list. |

| Meta Key | Description |
|---|---|
| fileType | Specifies the files type. Possible values are: WINDOWS_PE, MS_OFFICE, and PDF. If not specified, the default value is WINDOWS_PE. |
| score | This value that is added to the static score if the YARA rule is triggered. If not specified, the default value is 10. |
| ceiling | This is the maximum amount that is added to the static scores when a rule is triggered multiple times in one session. For example, if each time a rule is triggered, 20 points are added to the static, and you do not want more that 40 points added when the rule is triggered more than two times, you can specify a ceiling of 40. If not specified, the default value is 100. |
| highConfidence | This sets the High Confidence flag, which is set on IOCs when there are high confidence indicators that malware is present. If not specified, the default file value is false. |

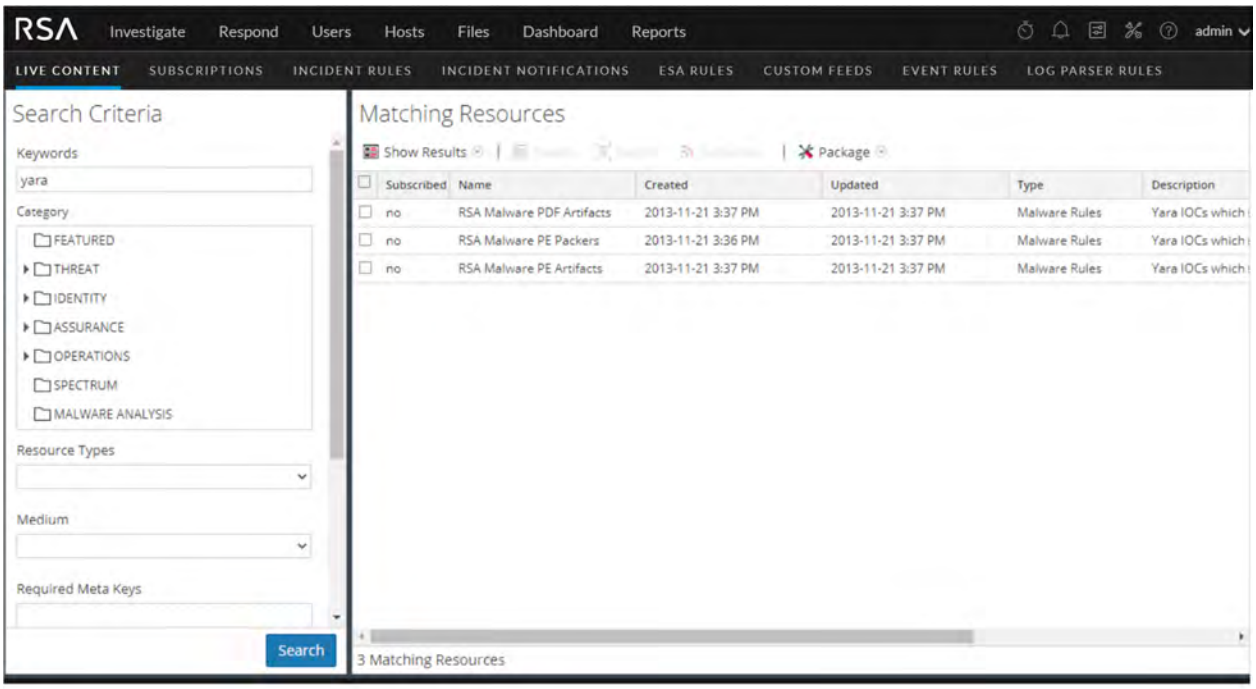
**Note:** Refer to the following URL for YARA resources: https://code.google.com/p/yara-project/downloads/list. NetWitness uses YARA 1.7, not YARA 2.0.

## YARA Content

RSA Live contains 3 sets of Yara rules:

- PE Packers
- PDF Artifacts
- PE Artifacts

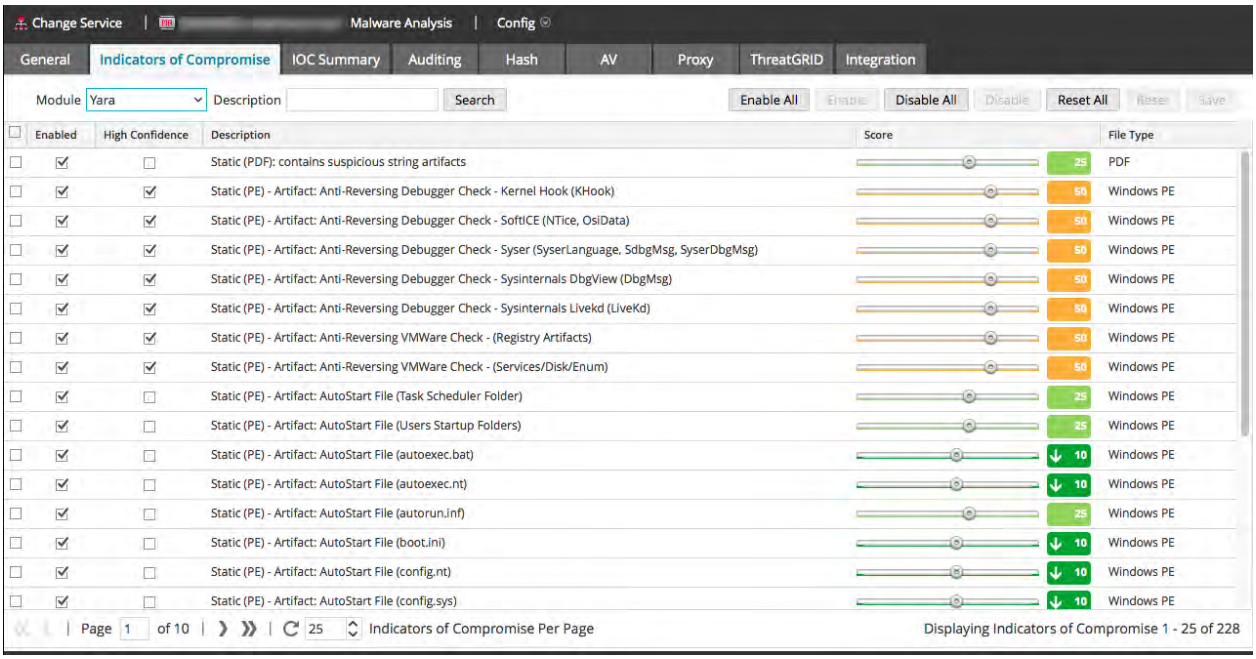
The following figure illustrates YARA content available as YARA rules in NetWitness Live.



On the Malware Analysis host, the YARA rules reside in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`, as shown in the example below.

```
[root@TESTHOST yara]# pwd
 /var/lib/netwitness/malware-analytics-server/spectrum/yara
 [root@TESTHOST yara]# ls *.yara
 rsa_mw_pdf_artifacts.yara rsa_mw_pe_artifacts.yara rsa_mw_pe_packers.yara
```

The individual rules are listed as IOCs in the Malware Analysis Service Config view > Indicators of Compromise tab. To view them, use the Yara module as the filter. You can adjust the configuration of an individual in the same way that you configure other IOCs.



## Add Custom YARA Rules

To introduce custom YARA rules from other sources:

1. To ensure that the YARA rules follows the correct format and syntax, use the YARA command to compile the YARA rule as shown in the following example. If the rule compiles with no errors, this indicates that the YARA rule has the correct syntax.

   ```
   [root@TESTHOST yara]# yara rsa_mw_pe_packers.yara dummy.txt
   [root@TESTHOST yara]#
   ```

2. Ensure that custom rules do not duplicate existing YARA rules from RSA or other sources. All YARA rules are in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`

3. Ensure that the meta keys that RSA supports are included to organize the YARA rules as part of the configurable IOCs, and name the file with the yara extension (<filename>.yara). For better organization, make sure that the `iocName` meta is included in the meta section as shown in the following example.

   Example:

   ```
   rule HEX_EXAMPLE
    {
        meta:
            author = "RSA"
            info = "HEX Detection"
           iocName = "Hex Example"
        strings:
            $hex1 = { E2 34 A1 C8 23 FB }
            $wide_string = "Ausov" wide ascii
        condition:
   ```

```
        $hex1 or $wide_string
}
```

4. When ready, place the custom YARA file in the folder that the Malware Analysis service watches:
   `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
   The file is consumed within one minute.
   Once consumed, NetWitness moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Services Config view > Indicators of Compromise tab.

**Note:** If you fail in adding the custom YARA rule, after step 4, do the following:
1. Check the custom YARA file is in `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch/error`.
2. Check the logs `/var/lib/netwitness/malware-analytics-server/spectrum/logs/spectrum.log`.

# Examine Scan Files and Events in List Form

When viewing the Summary of Events in a Malware Analysis scan, you can click a file count or an event count to view the Files List or the Events List for the scan (see Begin a Malware Analysis Investigation). In the Files List and Events List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files. When you find an event or file of interest in the Events List or Files List, you can view many details about the event in the Event Details view.

For each event in the Events List, NetWitness provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The Influenced by customized rule flag.
- The date the event was archived.
- The session time.
- The MD5 hash filter.
- The number of files in the event.
- The source IP address of the event.
- The Identity.
- The destination IP address.
- The destination country.
- The name of the alias host.
- The event type, for example, Network.
- The service used by the event.
- The destination organization

For each file in the Files List, NetWitness provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The filename.
- The file type.
- The MD5 hash filter.
- The source IP address of the event that contained the file.

- The destination IP address.
- The date the event that contained the file was archived.
- The file size.

## Sort the Files List or Events List

You can sort the Files List and Events List by column name in ascending and descending order. You can choose one or two columns.

To sort the list:

1. In the first **Sort By** drop-down list, choose a column name and sort direction: for descending order or for ascending order.
2. (Optional) In the second **Sort By** drop-down list, choose a column name, and sort direction, for descending order or for ascending order.
   The column titles reflect the selected sort order.

## Filter the List by Filename or MD5 File Hash

You can filter the Files List and Events List by filename or file hash. With this feature, you can specify a limited subset of the original data based on the search criteria.

**Note:** When you perform a search, you search the scan that you are currently displaying, not all scans.

1. Click    
   .
   The Filter dialog is displayed.
2. Enter a value in **File Name** or **MD5 Hash** and click **Filter**. The File Name and Hash field are not case sensitive. Wild card or regular expressions are not supported. The filter is based on exact matches. You can drag across a filename or hash to select from the Files list or Events list, then copy and paste it in the dialog.
3. Click **Filter**.
   Malware Analysis filters the list to display only files or events with the selected hash
4. To revert to the unfiltered list, click    
   . When the Filter dialog is displayed, click **Reset**.

### Download Files from the Files List

NetWitness lets you select and download files from the Files List or the Events List.

**Caution:** Use caution when downloading files from Malware Analysis; some files may contain harmful code. File Download is a specific permission that can be configured, refer to "Define Roles and Permissions for Malware Analysts" in the *Malware Analysis Configuration Guide* for more details.

To download files from the Files List or Events List:

1. In the **Files List** or **Events List**, select the checkbox next to one or more rows.
2. In the toolbar, select 
.
   The Malware File Download dialog is displayed.
3. Do one of the following:
   a. If you decide not to download the file, click **Cancel**.
   b. If you want to download the file, select click the **Download** button.
      The file or files selected are downloaded in a zip archive with the name `Malware_Files.zip`.

## Delete Events from the Scan

In the Events List, you select one or more events and delete them from the scan. This is useful for removing events that are not of interest.

To remove an event from the scan being viewed:

1. In the **Events List**, select one or more events.
2. In the toolbar, click

.
   NetWitness asks for confirmation that you want to delete the events.
3. In the confirmation dialog, click **Yes**.
   The selected events are deleted.

## Return to the Summary of Events

To leave the Files List or Events List and return to the Summary of Events, click **Back to Summary**.

## Open the Detailed Analysis for an Event

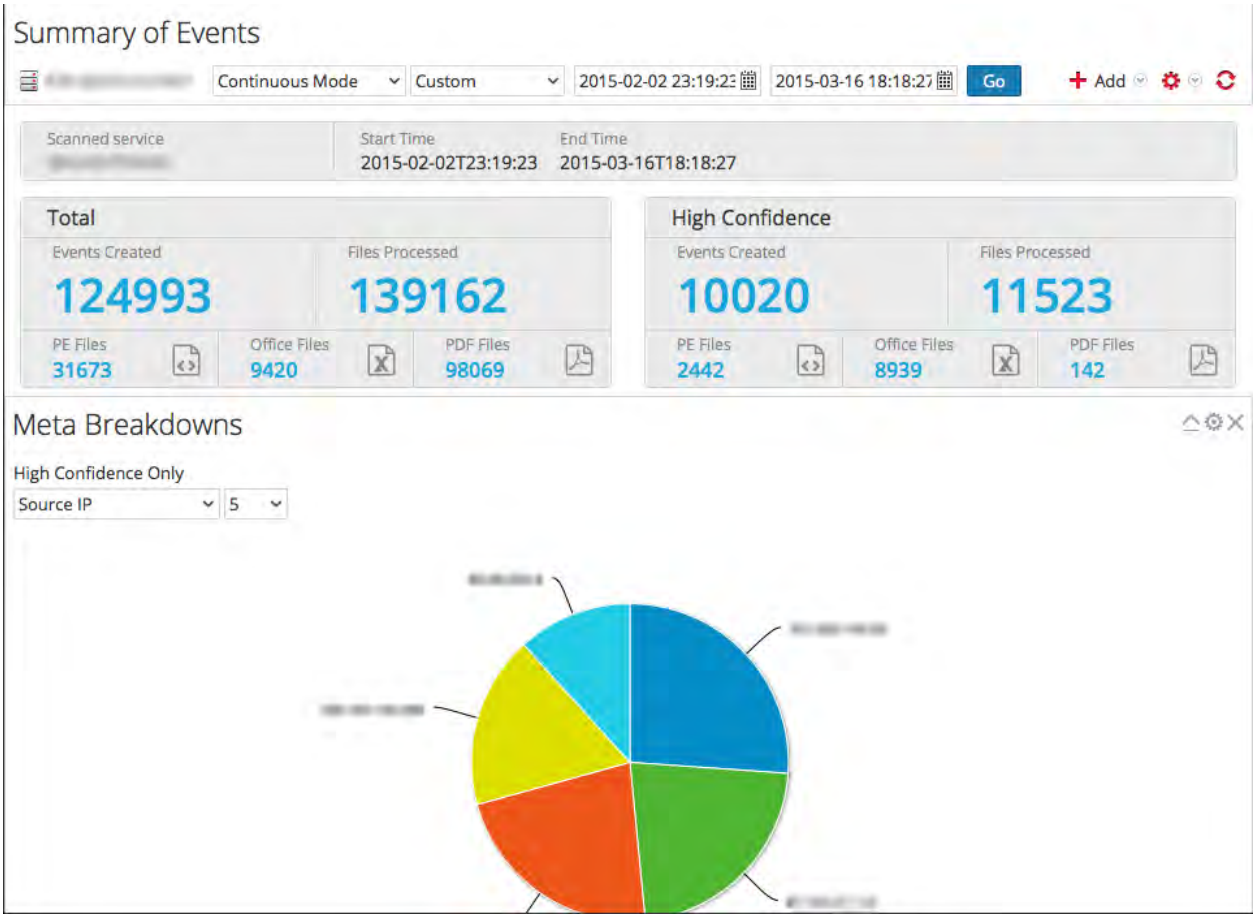
While you examine events or files in the Files List or Events List, you can double-click any event or file to open a detailed analysis of the event in the Events List or the event with which the file in the Files List is associated (see View Detailed Malware Analysis of an Event).

# Configure the Malware Analysis Summary of Events View

The Summary of Events provides a summary of the scan being investigated, and below the summary are configurable dashlets such as visualization charts and listings. By default, the Summary of Events for a scan opens with the default dashlets displayed. You can customize the view by adding, modifying, and deleting default dashlets. The configured customization of dashlets persists through different scan investigations, and you can restore default dashlets at any time. The default dashlets are:

- Summary of Events (Fixed)
- Event Timeline
- Top Listing of Highly Suspicious Malware
- Meta Treemap
- Score Wheel
- Meta Breakdowns

The following figure is an example of the default Summary of Events.



The rest of this topic provides instructions for managing and configuring dashlets.

## Add a Dashlet

You can add multiple copies of dashlets in the Malware Analysis Summary of Events. To add a dashlet:

1. In the toolbar, select **Add**.
   The drop-down list of dashlets is displayed. There are four visualization options: Score Wheel, Meta Treemap, Meta Breakdowns, and Event Timeline. The other three dashlets are the same dashlets available in the NetWitness dashboard: Malware with high Confidence IOCs and High Scores, Top Listing of Highly Suspicious Malware, Top Listing of Possible Zero Day Malware. Details for these common dashlets are provided in "Dashlets" in NetWitness Content.
2. Select a dashlet.
   The new dashlet is added as the last dashlet below the existing dashlets.
3. If the dashlet is a duplicate of an existing dashlet, change the name of the new dashlet so that it is unique.

## Modify or Delete a Dashlet Using Toolbar Options

Each dashlet has a toolbar that offers options for modifying the dashlet. The visualization charts have the same configuration settings, while some of the other dashlets have different additional settings.

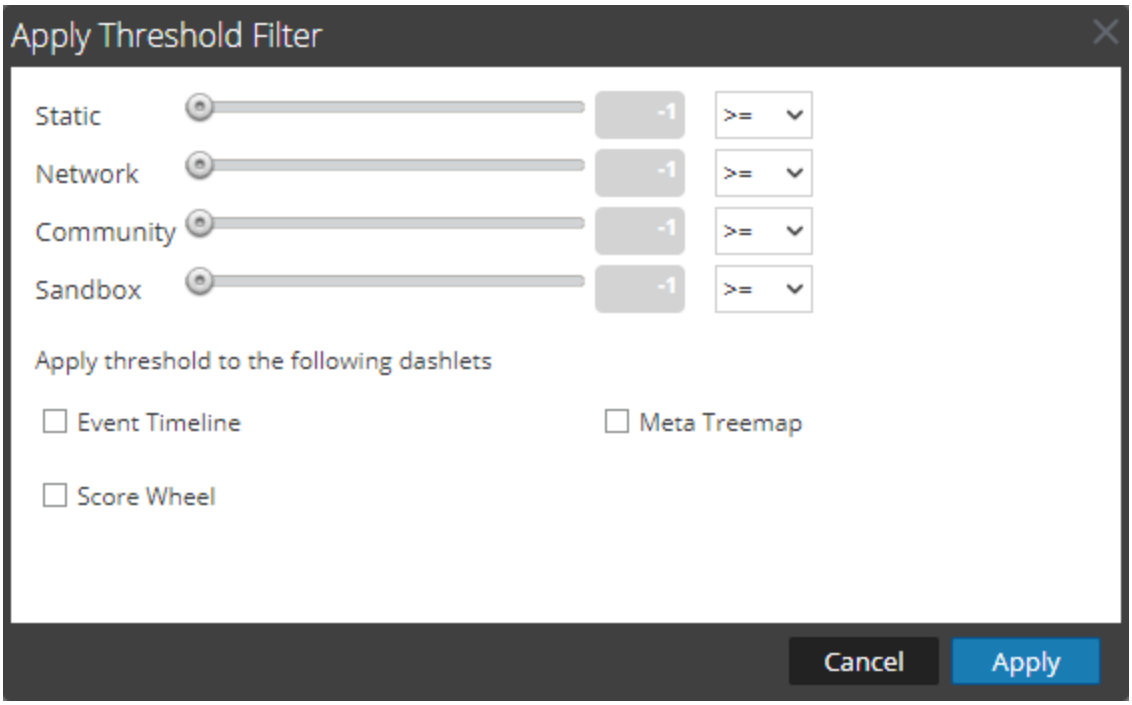
To use the toolbar options:

- To close a dashlet so that only the title bar is displayed, click .
- To open a dashlet that is closed, click .
- To display the configurable settings for a dashlet, click .
  The settings dialog for the dashlet is displayed.
- To delete a dashlet, click .

## Apply Threshold Filter to Multiple Dashlets

Within dashlets, you can set a threshold to show only events equal to, above, or below a certain score in the four categories (Static, Network, Community, and Sandbox). This procedure sets the thresholds by dashlet type for these dashlets: Event Timeline, Score Wheel, and Meta Treemap. You can also set the threshold for individual dashlets.

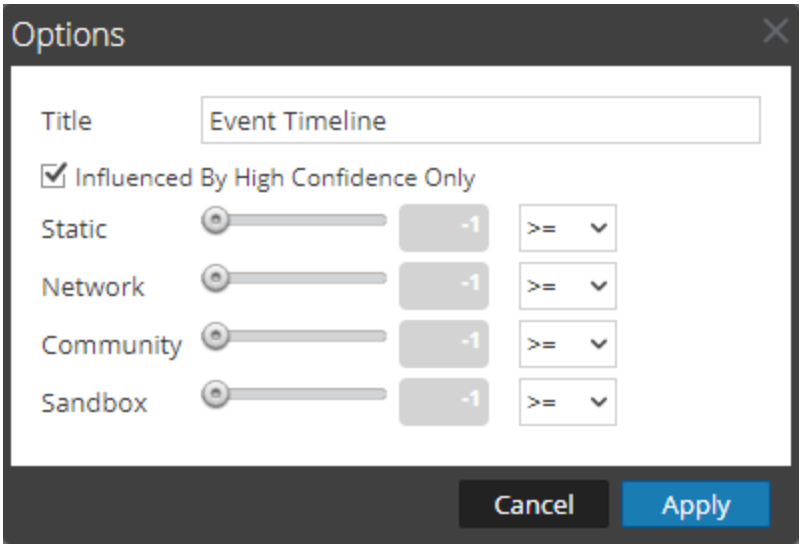
1. In the toolbar, select > **Apply Threshold Filter**.
   The Apply Threshold Filter dialog is displayed.



2. Select one or more dashlet types: Event Timeline, Score Wheel, and Meta Treemap.
3. Drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
4. Click **Apply**.
   The threshold filters are applied to the selected dashlet types in the Summary of Events.

## Set Title and Category Options for a Dashlet

1. To display the configurable settings for a dashlet, click ⚙.
   The Options dialog for the dashlet is displayed.

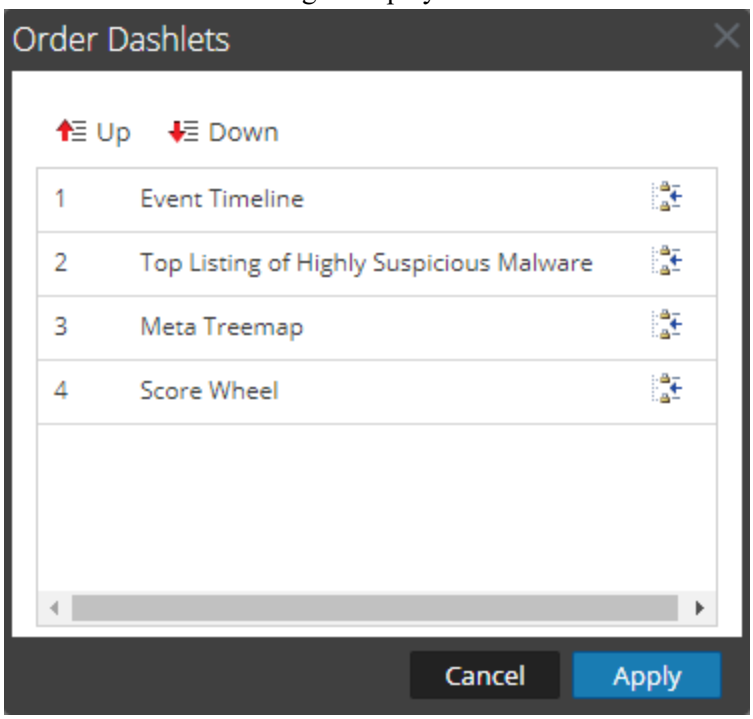


2. Type a new title for the dashlet in the **Title** field.
3. If you want to see only events that are influenced by a High Confidence tag, which means there is high confidence that the event contains harmful code, check the **Influenced By High Confidence Only** option.
4. If you want to see only events that were given a score above a certain score in the four categories (Static, Network, Community, and Sandbox), drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
5. Click **Apply**.
   The title and filters are applied to the dashlet.

## Order Dashlets

To change the order of dashlets as they appear beneath the Summary of Events:

1. In the toolbar, select > **Order Dashlets**.
   The Order Dashlets dialog is displayed.



2. Select a dashlet that you want to move up or down, and click Up or Down.
3. When you are satisfied with the order, click **Apply**.
   The dialog closes and the order of dashlets below the Summary of Events is changed to match your choices.

## Restore Default Dashlets

After you have added, modified, and arranged dashlets, you can revert to the default settings for dashlet display. To restore the default dashlets:

1. In the toolbar, select > **Restore Default Configuration**.
   A dialog requests confirmation that you want to restore the configuration.
2. Do one of the following:
   a. If you decide to keep the dashlet arrangement you have configured, click **No**.
   b. If you are sure that you want to restore the defaults, click **Yes**,
      The dashlet display reverts to the default display.

# Filter Dashlet Data in the Summary of Events View

The Summary of Events provides a summary of the scan being investigated with selectable dashlets. The Summary of Events is fixed, but Analysts can configure each dashlet to filter out information and drill into the data.

The rest of this topic provides instructions for managing and configuring dashlets.

## Configure the Score Wheel Dashlet

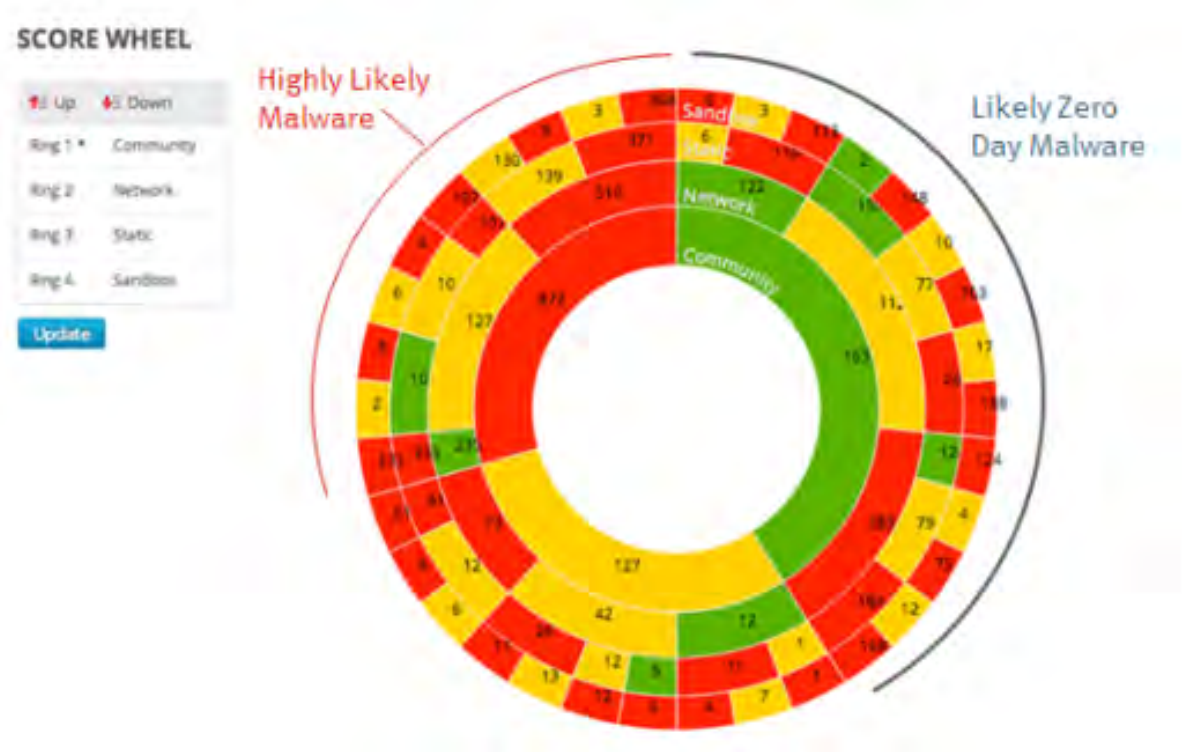
The Score Wheel is a high-level visualization of analyzed sessions that scored high, medium, or low in each of the scoring categories: Static, Network, Community, and Sandbox. The Score Wheel is a quick way to drill into sessions to review them. Each ring represents a different scoring category so that you can visually compare results by category.

You can change the order of the rings to highlight indicators of compromise that were flagged in one category but not in another category. Comparing the same results in a different sequence of the rings provides visibility into additional vulnerabilities in a session, and you can drill into sessions of interest. The following examples show two possible use cases.

## Zero-Day Candidates Example

This example shows how to drill into sessions that the Community did not flag as malicious, but all other scoring categories did. The resulting list of sessions highlights zero-day candidates.

1. Configure the Score Wheel rings in the following sequence:
   **Community** (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice in the outermost (Sandbox) ring that aligns with a green slice on the innermost ring (Community): green (innermost) -> **Static**: red -> **Network**: red -> **Sandbox**: red (outermost).



## Malicious Sessions Example

This example shows how to drill into sessions in which all scoring categories identify the resulting list of sessions as malicious, indicating Malware Analysis has the most confidence that they are malware.

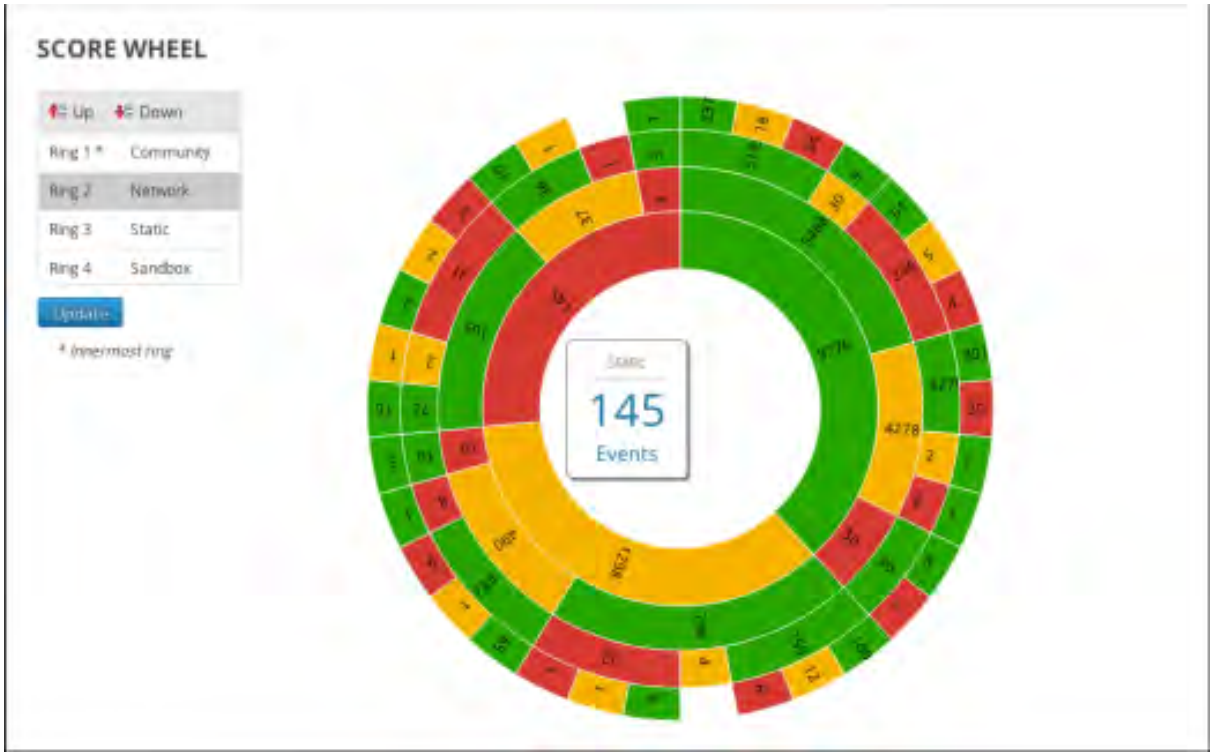
1. Configure the Score Wheel rings in the following sequence:
   **Community** (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice of the outermost (Sandbox) ring that aligns within a red slice on the innermost ring (Community): red (innermost) -> Static: red -> Network: red -> Sandbox: red (outermost).

## Arrange the Ring Sequence by Scoring Module

In the Score Wheel, you can arrange the sequence of the rings by scoring module. Initially, the sequence of rings from inside to outside is Static, Network, Community, and Sandbox.

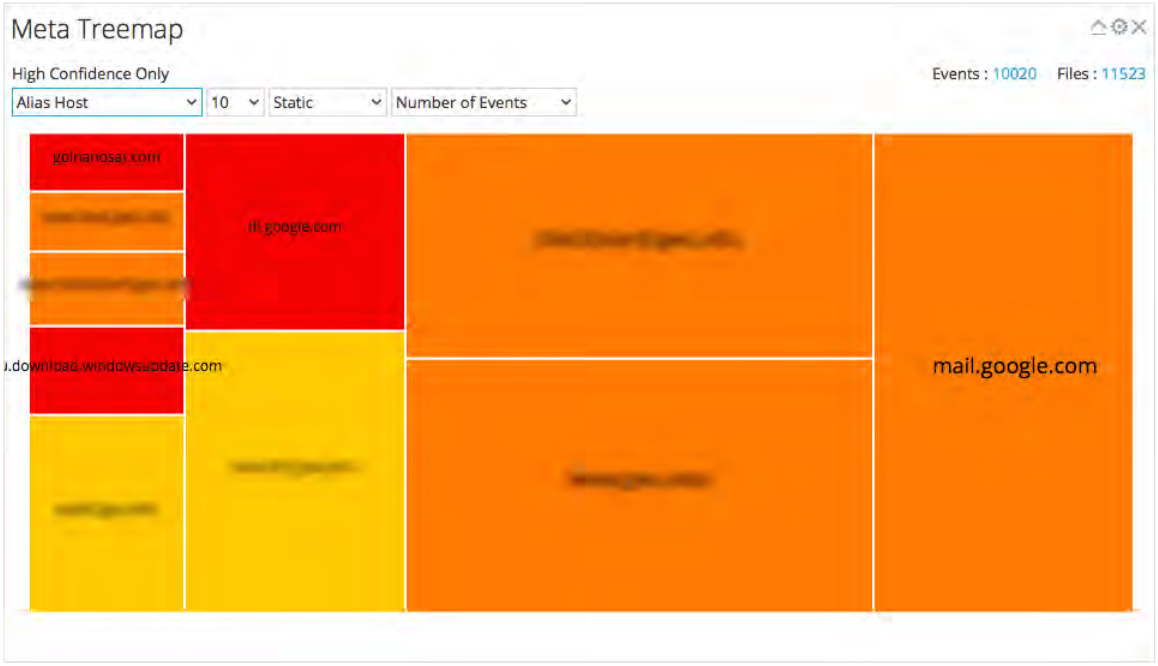
To change the ring sequence:

1. Do one of the following:
   a. Click and drag each scoring module up or down.
   b. Select each scoring module and use the Up and Down buttons to move it.
2. When the ring sequence is the way you want it, click the **Update** button.
   The Score Wheel is refreshed with the new sequence.



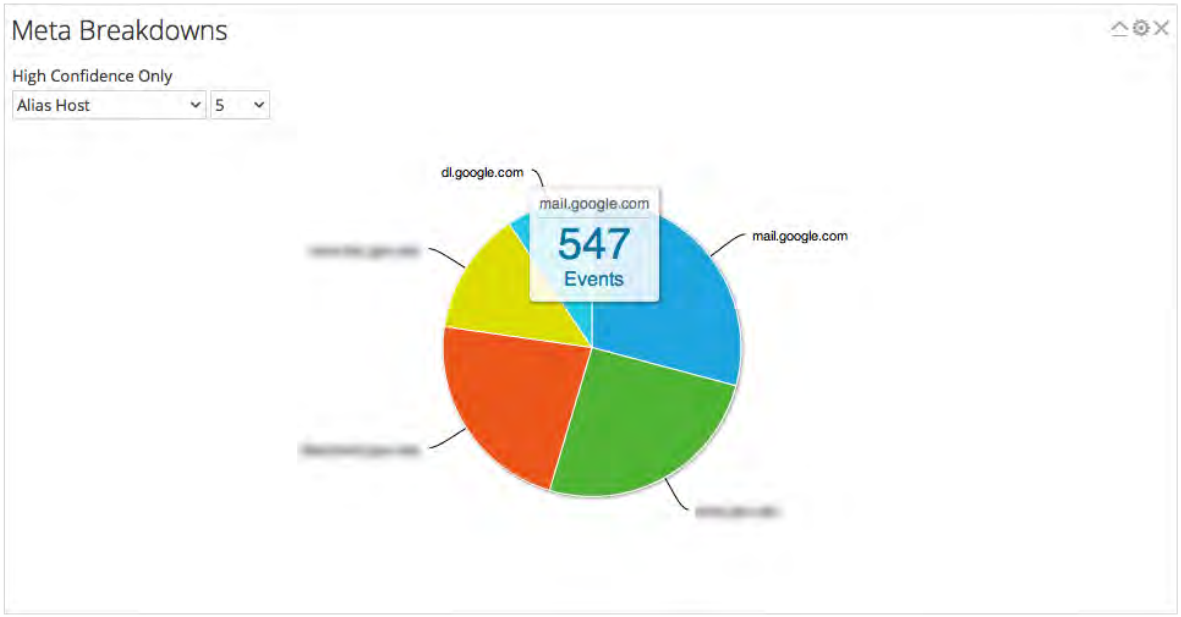
## Configure the Meta Treemap Dashlet

In the Meta Treemap chart, you can visualize and filter meta breakdowns by meta type, count, and analysis type. Use the three selection lists to set the filter, and the Meta Treemap chart is refreshed immediately.



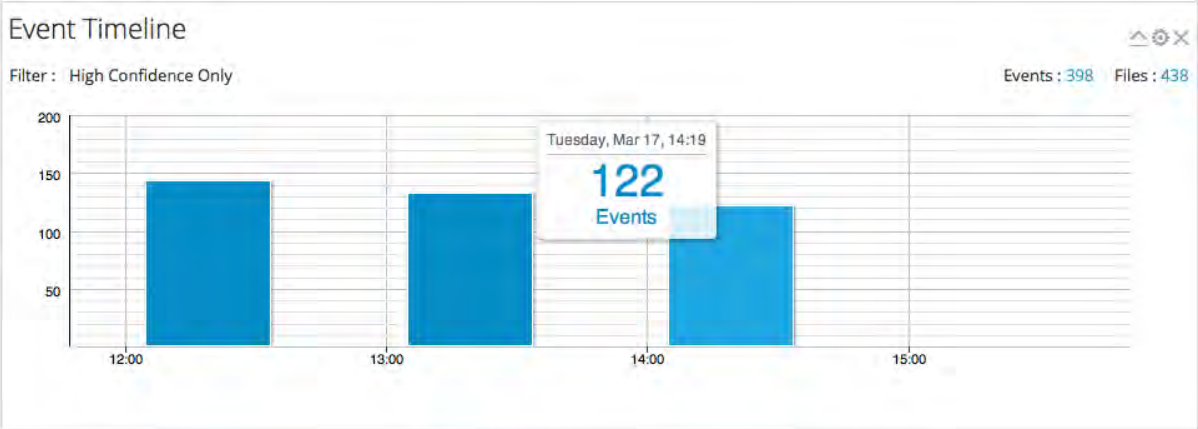
## Configure the Meta Breakdowns Dashlet

The Meta Breakdowns dashlet is a visualization of values for a specific meta key in a pie chart. In the Meta Breakdowns chart, you can filter meta breakdowns by meta type and count. Use the two selection lists to set the filter, and the Meta Breakdowns chart is refreshed immediately.



## Configure the Events Timeline Dashlet

The Events Timeline dashlet is a visualization of the events along a timeline. No additional filters are available for the Event Timeline.

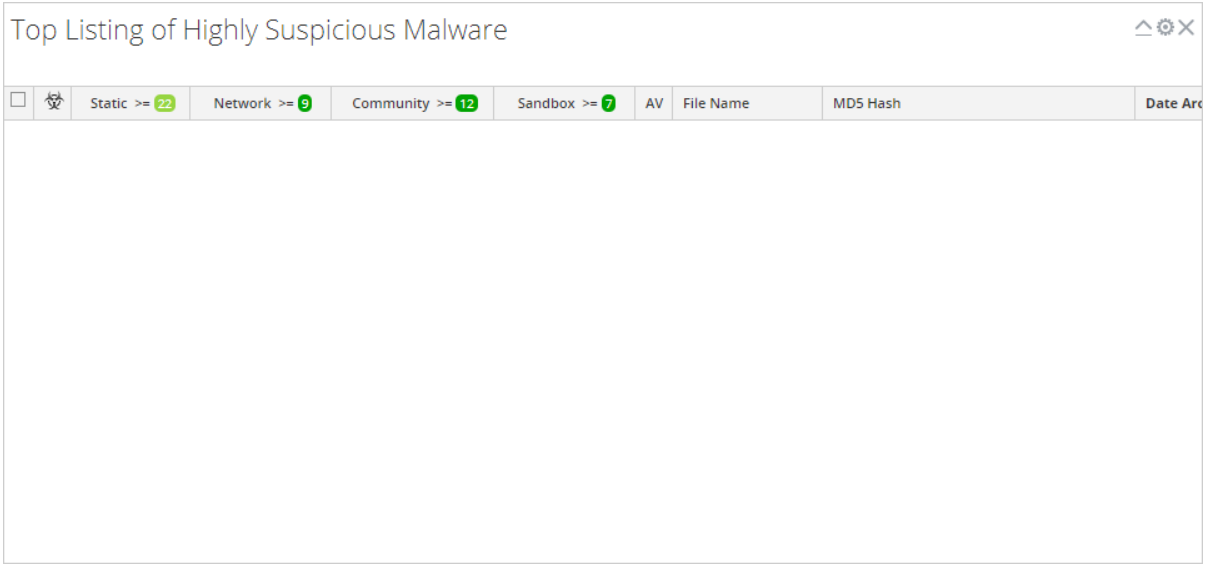


### Open All Events in the Events List

From within the Event Timeline, you can open the entire list of events in the Events List. To do so, click View Events. This option is not the same as clicking the count next to Events, which is the same for all visualization charts and opens the current drill point in the Events List.

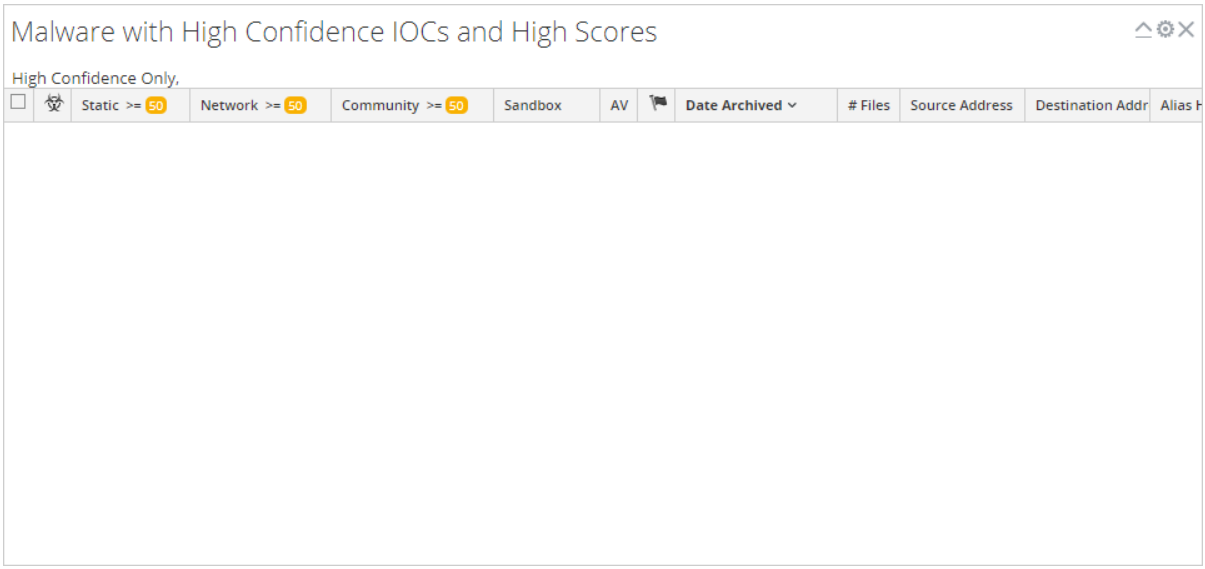
## Configure the Top Listing of Highly Suspicious Malware Dashlet

The Top Listing of Highly Suspicious Malware Dashlet presents the Top 10 most suspicious events in the Events List or the Files List. This dashlet is also available in the Monitor dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



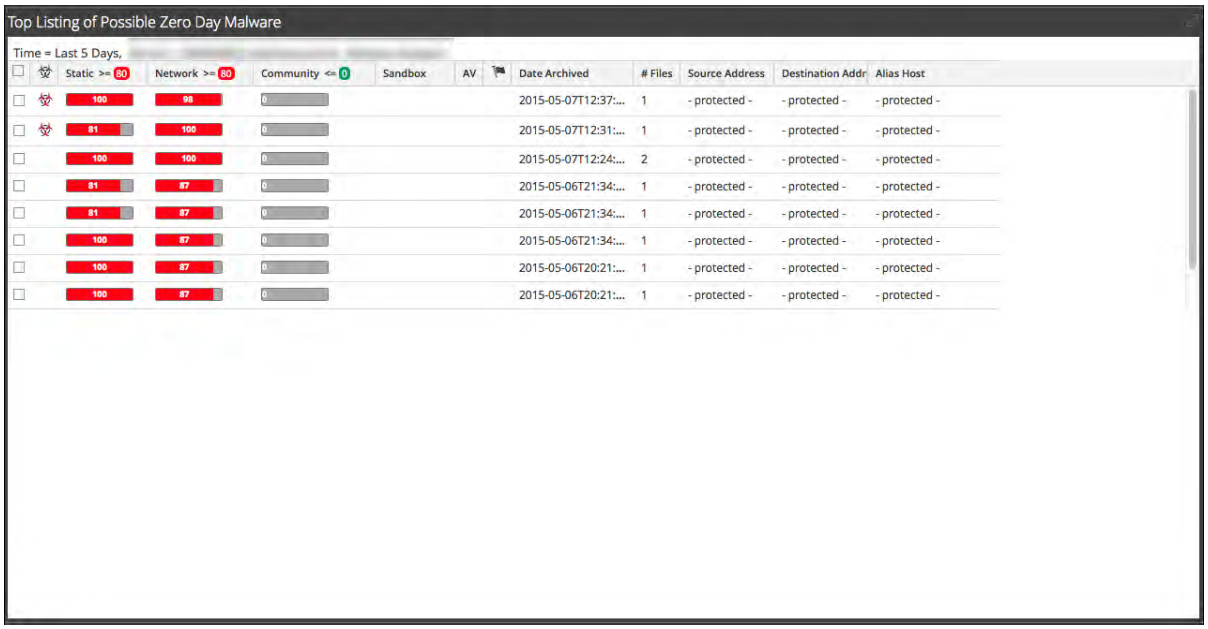
## Configure the Malware with High Confidence IOCs and High Scores Dashlet

The Malware with High Confidence IOCs and High Scores dashlet presents Indicators of Compromise that have both high scores and high confidence that the events are likely to contain malware. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



## Configure the Top Listing of Possible Zero Day Malware Dashlet

The Top Listing of Possible Zero Day Malware dashlet presents potential zero day events in the Events List or the Files List. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



Top Listing of Possible Zero Day Malware
Time = Last 5 Days,
Static >= 80
Network >= 80
Community <= 0
Sandbox
AV
Date Archived

# Upload Files for Malware Analysis Scanning

There are two methods for analysts to upload files for Malware Analysis scanning.

A Malware Analyst with permission to Initiate Malware Analysis Scan can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog.

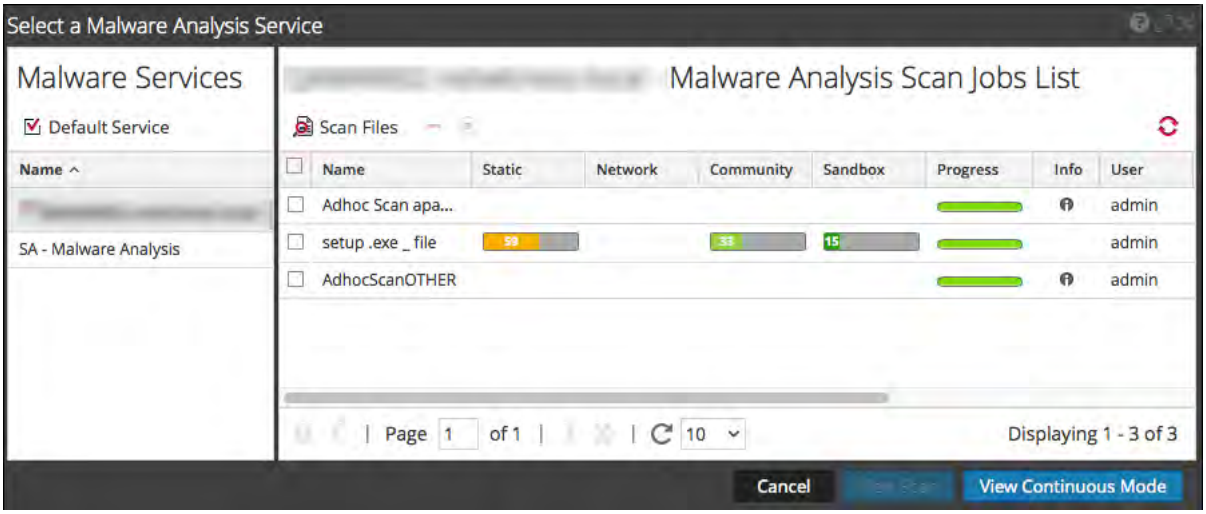
It is also possible to upload a file for scanning using a watched file share.

## Upload Files Manually

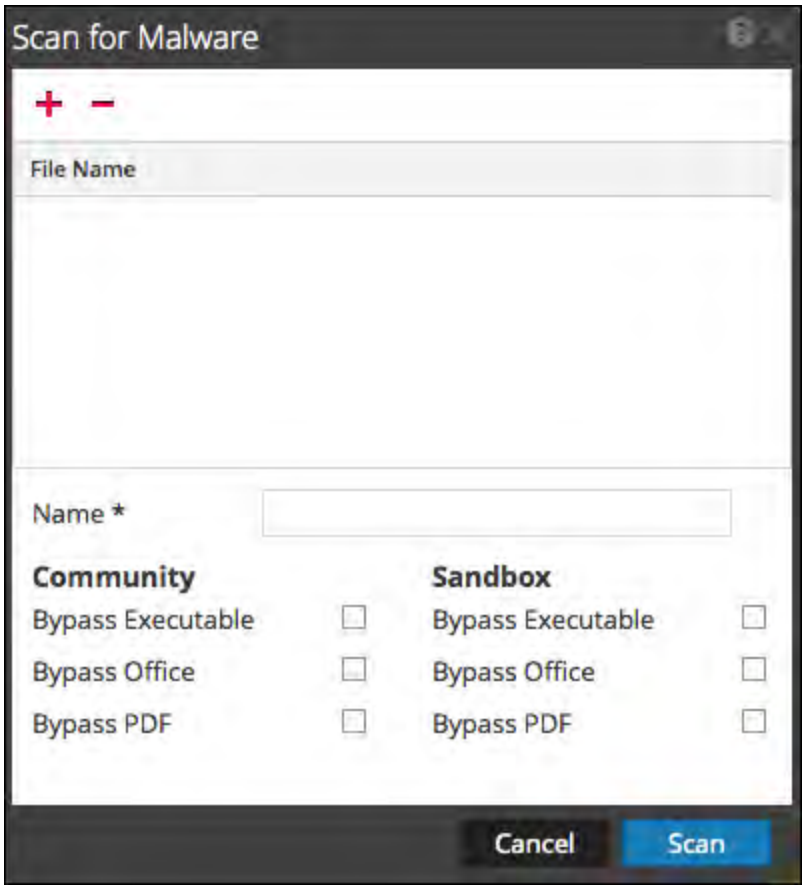
This topic provides instructions for initiating on-demand scanning of an uploaded file. When you upload a file for scanning, NetWitness starts the upload job and adds it to the jobs queue. When the job is complete, you can view the scan in Malware Analysis.

To upload a file to scan:

1. Go to **Investigate > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel.



2. Click **View Scan**.
   The Scan for Malware dialog is displayed.



3. Click +
   A view of the files system is displayed so that you can choose files to upload.
4. Select one or more files from the list and click **Open**.
   The file names are added. Malware Analysis escapes the filename characters before processing a file. The maximum number of filename characters after escaping is 200. If the filename is greater than 200 characters, Malware Analysis truncates the filename characters and displays the truncated filename in the NetWitness user interface.
5. Continue adding and deleting files until you have a list of the files that you want to upload.
6. Name the scan and select the types of files to bypass. This is useful for a zip archive that contains different types of files, and overrides the default bypass settings.
7. Click **Scan**.
   The scan job is submitted and NetWitness displays a confirmation message for successful submission. The scan request is added to the Scan Jobs List dashlet. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
8. The job is added to the Scan Jobs List in the Select a Malware Analysis Service dialog and in the Unified dashboard Scan Jobs List dashlet.
9. To view the scan when complete, double-click the scan.
   The Malware Summary of Events for the selected scan is displayed.

# Upload Files from a Watched Folder

To upload files from a watched folder, you can drop files into a watched file share for Malware Analysis. Analysts can share YARA rules, hash files, and infected zip archives with Malware Analysis.

Malware Analysis watches a file share and automatically consumes files placed in specific folders in the file share. This feature is useful for:

- Bulk import of hash files from `/var/lib/rsamalware/spectrum/hashWatch`.
- Addition of custom-YARA rules to the Indicators of Compromise (IOC) list on the host from `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`.
- Creation of on-demand scan jobs from a zip archive of infected zip files from `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Analysts need to prepare the files for consumption in accordance with requirements, the file extension must be correct, and the file must be copied to the correct watched folder in the file share.

## Import a Hash List

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted into a folder (`/var/lib/rsamalware/spectrum/hashWatch`) on the Malware Analysis host, and it is automatically imported into the local hash database. This is described in "Configure Hash Filter" in the *Malware Analysis Configuration Guide.*

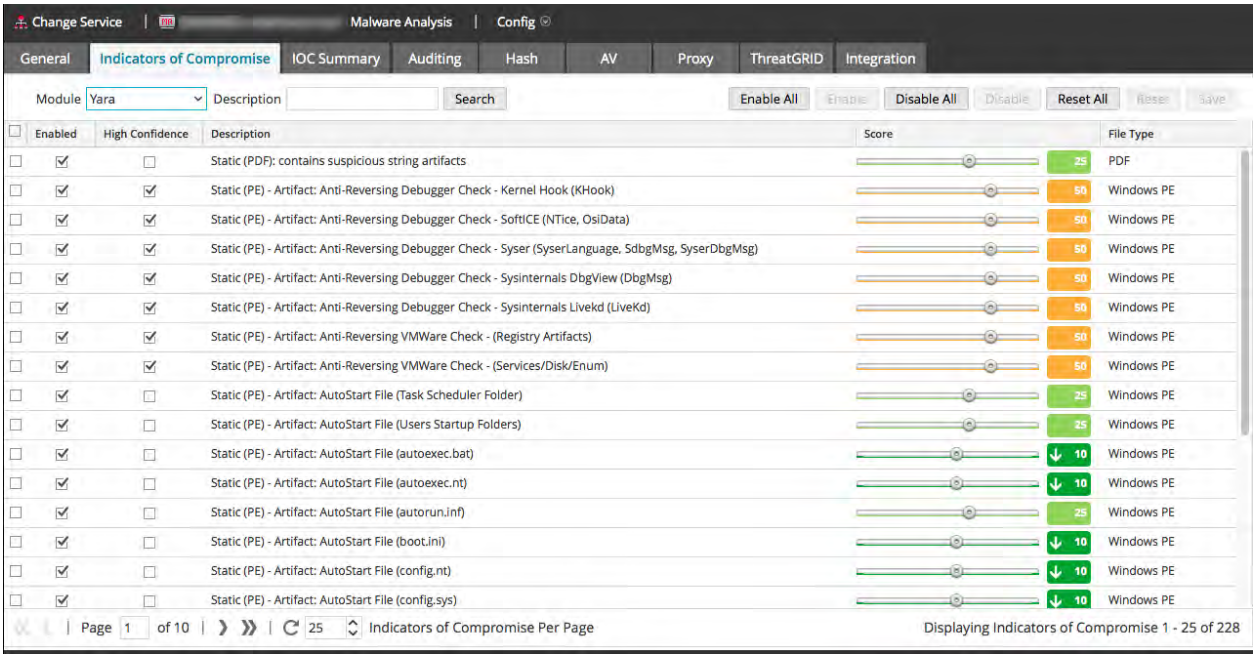
To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **`/var/lib/rsamalware/spectrum/hashWatch`** directory.
   NetWitness Malware Analysis automatically watches this folder and processes files placed there.
   a. Malware Analysis adds every hash found in the hash lists to the hash filter.
   b. If there are processing errors, they are logged in: `/var/lib/rsamalware/spectrum/hashWatch/error`
   c. Processed files are cataloged here: `/var/lib/rsamalware/spectrum/hashWatch/processed`
   d. Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

## Import YARA rules to the IOC List

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume. Implement Custom YARA Content provides complete information on the prerequisites for using custom YARA content and authoring rules.

When the rules are ready, place the custom YARA files in the folder that the Malware Analysis service watches:
`/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
The file is consumed within one minute.
Once consumed, NetWitness moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Service Config view > Indicators of Compromise tab.



## Import Files into the Scan Jobs List

When you obtain samples from perimeter security solutions and would like to perform further analysis on the files, you can zip the files and password protect the archive with `infected`, then add to the watched folder for consumption by Malware Analysis. This zipped archive is ready to be placed in the watched folder: `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

**Note:** The maximum size of the archive is 100 MB.

To analyze infected, password-protected zip files, Malware Analysis consumes archives place in a watched folder and creates an on-demand job that is added to the Scan Jobs List.

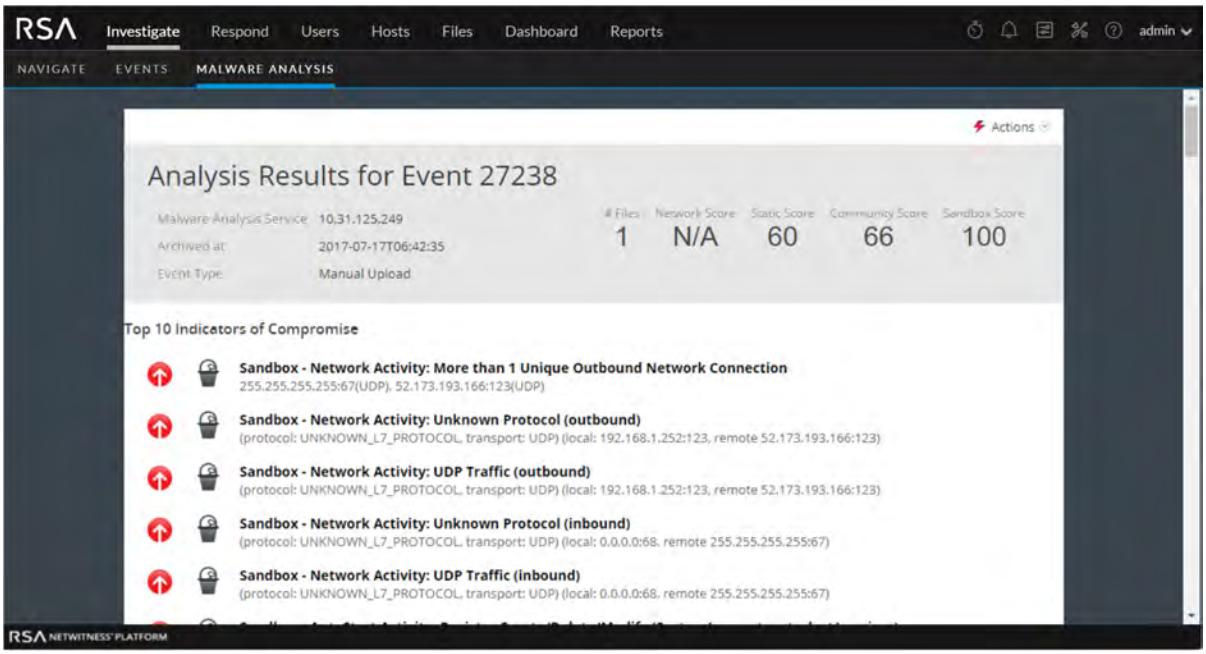
1. While logged on as administrator, place the files to be processed in a zip file with password `infected` at `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`
   In a minute or two Malware Analysis consumes the archive and creates an on-demand job in the Scan Jobs List. The scan job name is the name of the file, the user is **file share**, and the Event Type is 1. The archive is moved to `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`
2. After the job is added to the Scan Job List, run a script or cronjob to clean up the zip file in `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`.

# View Detailed Malware Analysis of an Event

When viewing the list of individual events in a Malware Analysis scan in the Malware Analysis Events grid, you can double-click an event to view the detailed analysis results for the event.

## View Malware Analysis Details for an Event

1. Start an investigation in the **Malware Analysis** view.
   The Malware Summary of Events is displayed, and includes four charts, including the Event Timeline.
2. Do one of the following:
   a. To view all events in the Event Timeline, click the **View Events** button.
   b. Double-click data in the **Meta Breakdown**, **Meta Treemap Chart**, or **Score Wheel**.
      The Events List is displayed.
3. Double-click an event.
   The Analysis Results for the event are displayed.

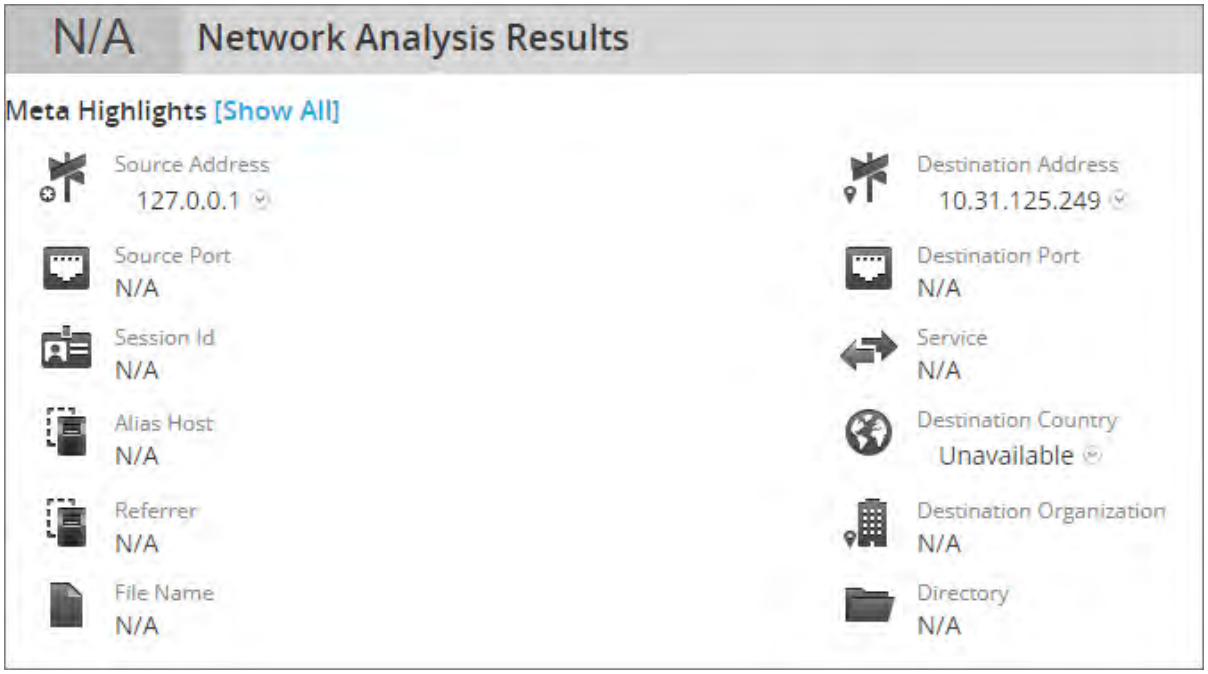


4. (Optional) If you want to delete an event, select **Actions > Delete Event**.
5. If you want to view a reconstruction of the network session, select **Actions > View Network Session**.
   The session opens in the Navigate view > Event Reconstruction.

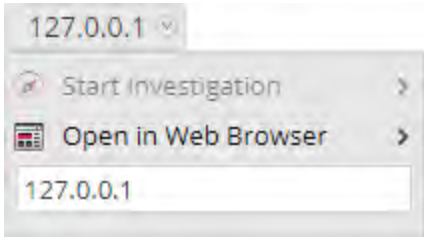
## Pivot Network Analysis Results

You can pivot the Network Analysis Results in several ways:

1. Scroll down to the Network Analysis Results.



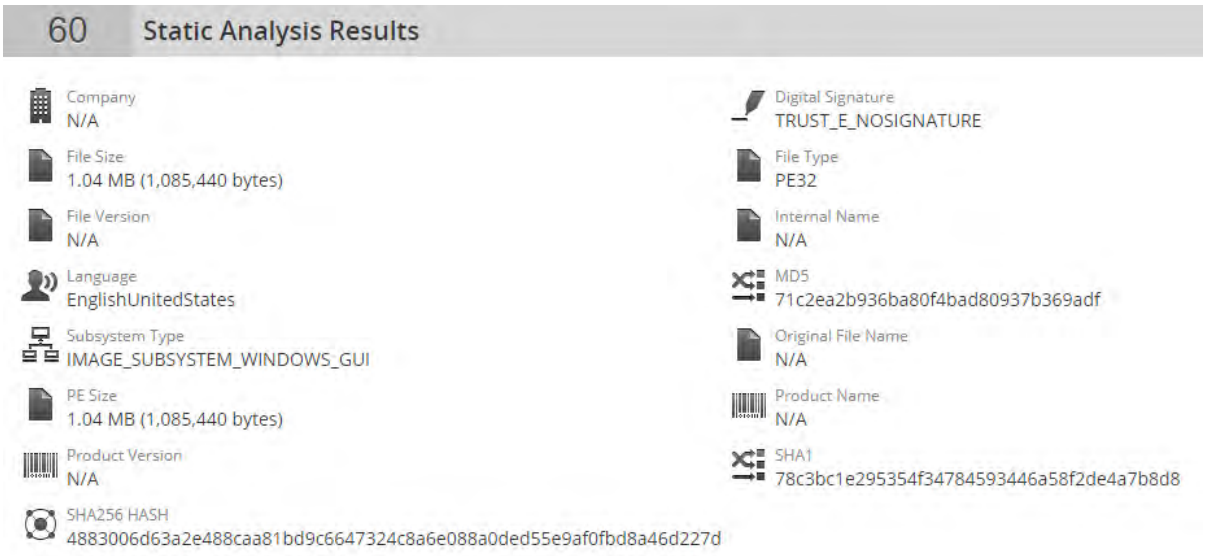
2. Hover over a meta value and left-click.
   The context menu is displayed.



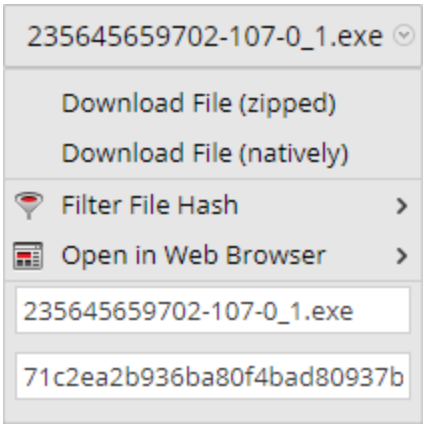
3. To view the selected meta value in the **Navigate** view, select **Start Investigation** and a time option.
4. To view the selected meta value in a browser, select **Open in Web Browser > Open in Google**.

## Use File Actions in the Static Analysis Results

1. Scroll down to the Static Analysis Results.



2. If you want to download a file, select the file name and either **Download File (zipped)** or **Download File (natively)** in the drop-down menu. It is safer to download a file in zipped format.



3. If you want to mark the file as safe or unsafe in the hash list, select **Filter File Hash** and **Mark hash as good** or **Mark hash as bad**.

## View Community Analysis Results Details

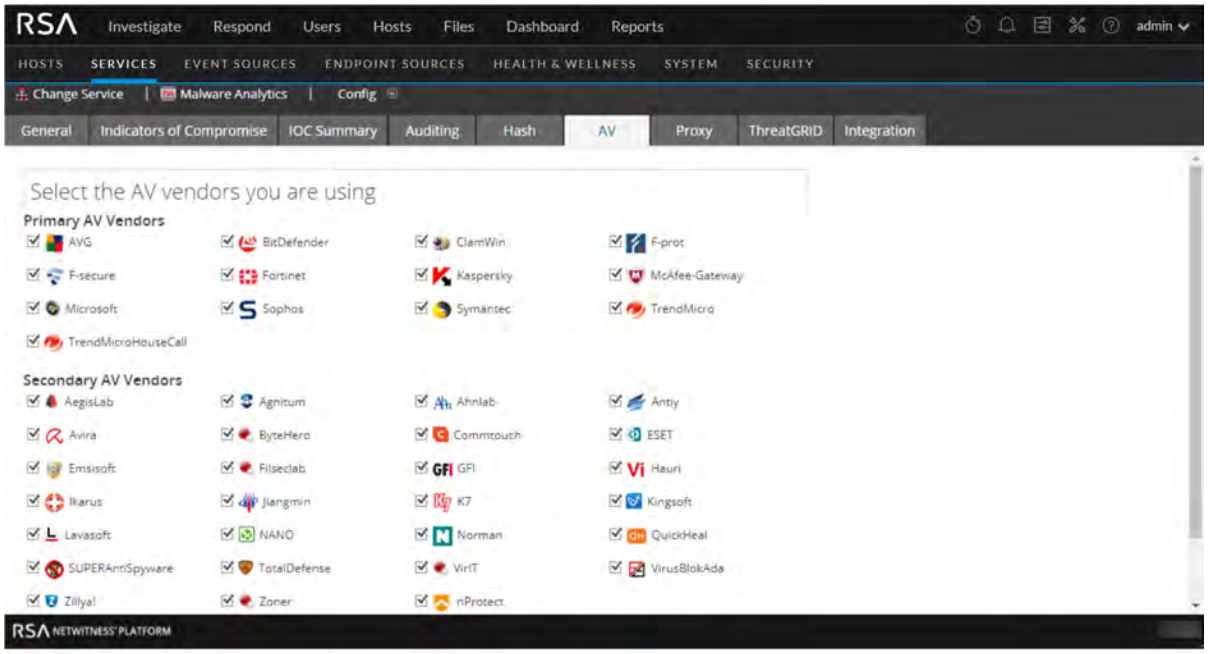
The Community Analysis Results summarizes results from the community, identifying Indicators of Compromise that were flagged as a risk or identified as good.

In addition, this view lists the results from Installed AV Vendors and Not Installed AV Vendors. You can compare results of the installed AV vendors that were configured for the current Malware Analysis service versus Community results. You can also see results from a list of AV vendors that are not configured as installed for the current Malware Analysis service.

Each row of AV vendor results includes the shield icon to show whether the IOC was discovered by a Primary ( ) or Secondary AV ( ) vendor in the community, the name of the Installed or Not Installed vendor, and the name of malware or risk detected by the community and AV vendor. If the AV vendor did not detect a risk, **-- Not detected --** is displayed instead of the name of the risk.

The Not Installed AV Vendors section is expandable to view all entries, but is collapsed by default to minimize the need to scroll. Clicking the + expands the list.

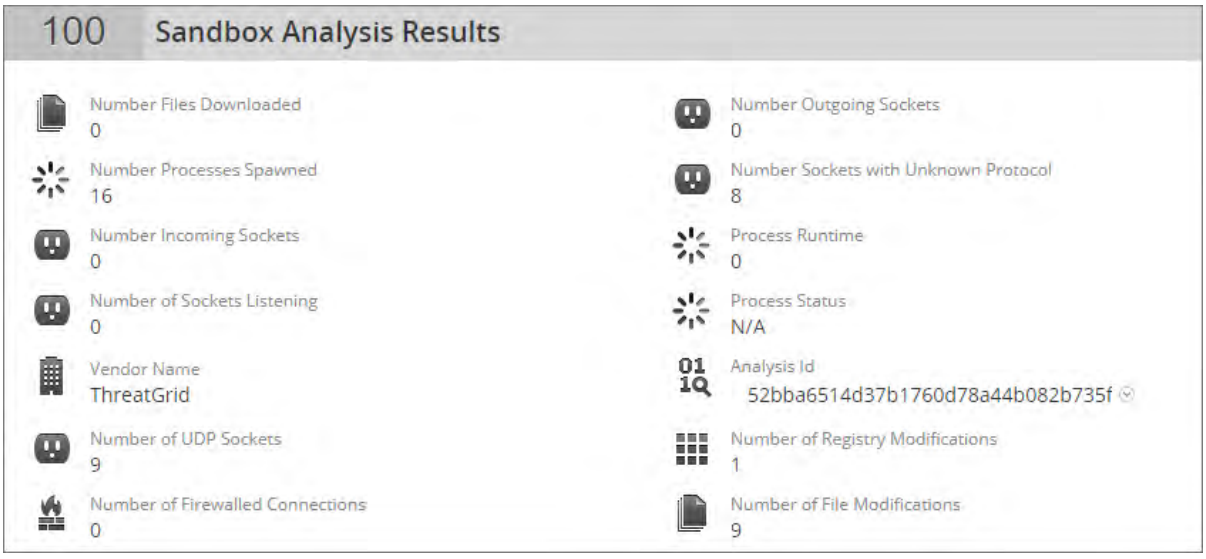
If no installed AV vendors have been configured for the current Malware Analysis service, the following message is displayed: No AV vendors were marked as installed. Please go to the Malware Analysis Service configuration page to identify installed AV vendors.



## View Sandbox Analysis Results in the ThreatGRID User Interface

If you have registered with ThreatGRID, you can view the Sandbox results directly in ThreatGRID.

1. Scroll down to the Sandbox Analysis Results.



2. Click the **Analysis ID** and select **Open In ThreatGRID**.
   The analysis report in ThreatGRID is displayed.

# Malware Analysis Reference Materials

This section provides is intended to help you understand the purpose and application of Malware Analysis views in NetWitness Investigate. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

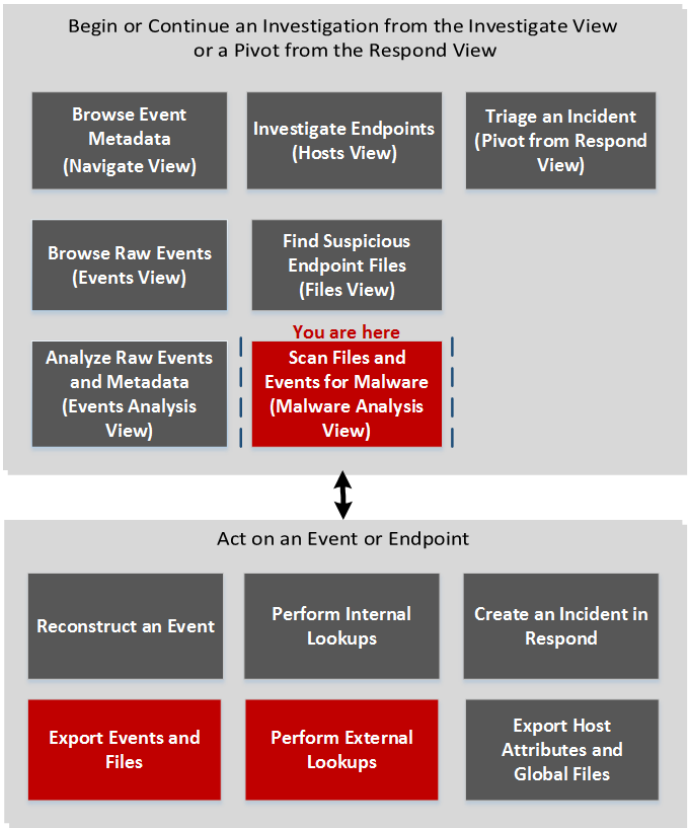
- Malware Analysis View
- Malware Analysis Events List and Files List
- Scan For Malware Dialog
- Select a Malware Analysis Service Dialog

# Malware Analysis View

In NetWitness Investigate, the Malware Analysis view provides the user interface for conducting a malware analysis. The Malware Analysis view is in the form of a customizable dashboard, in which default dashlets in the initial view are based on the user role (Administration or Analyst) and user customizations. Initially, the Summary of Events dashlet is displayed in the Malware Analysis view. Additional dashlets present different visualizations of the events being viewed, and each representation is configurable to further refine your view as you search for Indicators of Compromise. The Malware Analysis dashlets available in the Dashboard are also available in the Malware view.

To access this view, select **Investigate > Malware Analysis**. If a default service has not been selected, the Select a Malware Analysis Service dialog is displayed. Select a service, then click **View Continuous Mode**.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |

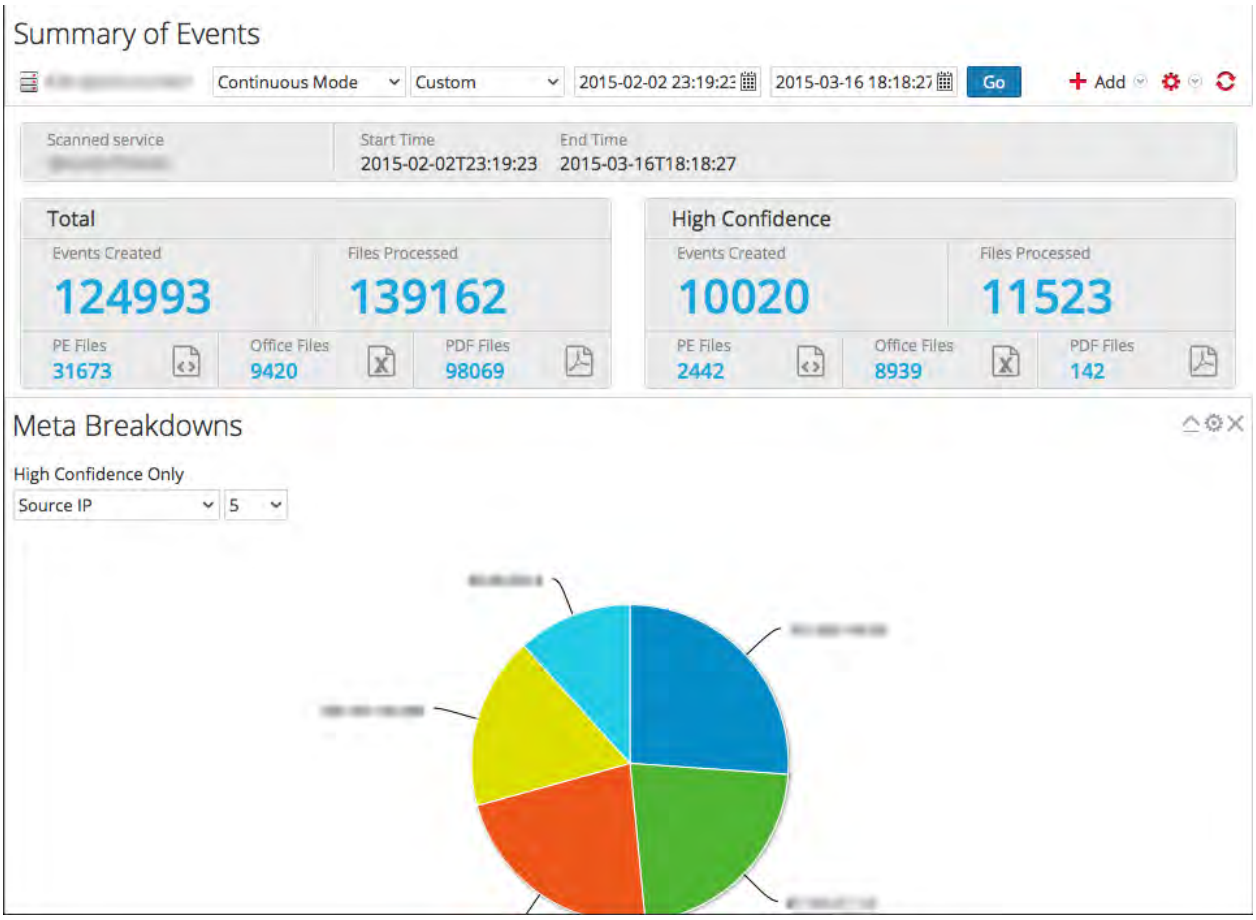
## Quick Look

Below is an example of the Malware Analysis view.



The Malware Analysis view consists of the Summary of Events panel and four dashlets unique to this view. Each of the unique dashlets have identical Options dialogs. The Malware Analysis dashlets in the MONITOR view are also available, and are described in the Dashlets topic in the NetWitness Content space.

## Summary of Events Panel

In the Summary of Events panel, you can select the service, the scan mode, and the time range. In addition, you can select a data point and view the events associated with the event.

The following table describes all features in the Summary of Events panel.

| Feature | Description |
|---|---|
| | Selects a service to display. |
| Scan Mode | Displays a drop-down list of available scan modes. |
| Time Range | Displays a drop-down list of time ranges to view events. |
| Start Date | When Time Range is set to custom, offers a calendar from which to choose the start date of the time range. |

| Feature | Description |
|---|---|
| End Date | When Time Range is set to custom, offers a calendar from which to choose the end date of the time range. |
| | Displays a drop-down list of dashlets you can add to the view. |
| | Displays a drop-down list of actions you can perform in this view:<br>• Restore Default Configuration<br>• Order Dashlets<br>• Apply Threshold Filter |
| | Refreshes the Malware Analysis view. |

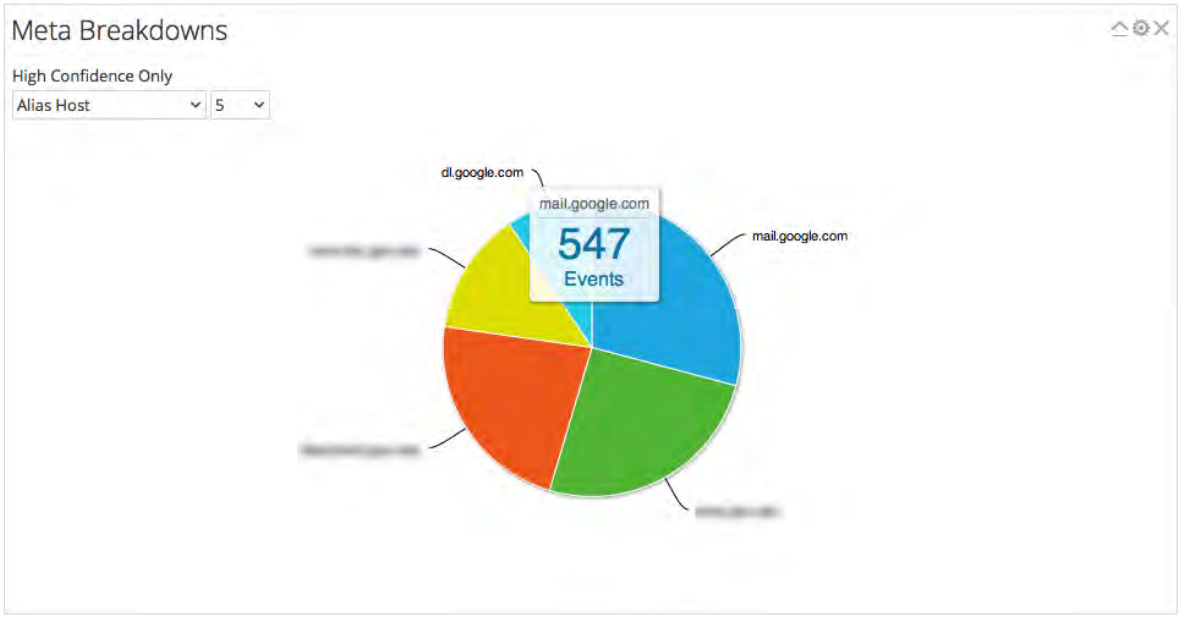
## Options Dialog

In the Options dialog, you can customize the results displayed in the dashlet. This dialog can be accessed by clicking the icon in the top right corner of each dashlet. The following table describes the features of the Options dialog.

| Feature | Description |
|---|---|
| Title | Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed. |
| Influenced By High Confidence Only | Indicates whether the data shown is restricted to events flagged as high confidence. |
| Static, Network, Community, Sandbox | Allows you to filter results based on the scores in the scoring modules. |
| Cancel | Closes the dialog without saving any changes. |
| Apply | Applies changes to the dashlet immediately and closes the dialog. |

## Meta Breakdowns

Meta Breakdowns presents events in the form of a pie chart, with each slice representing a meta value for the specified meta key. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta value having the most events. Hovering over an event displays the count.

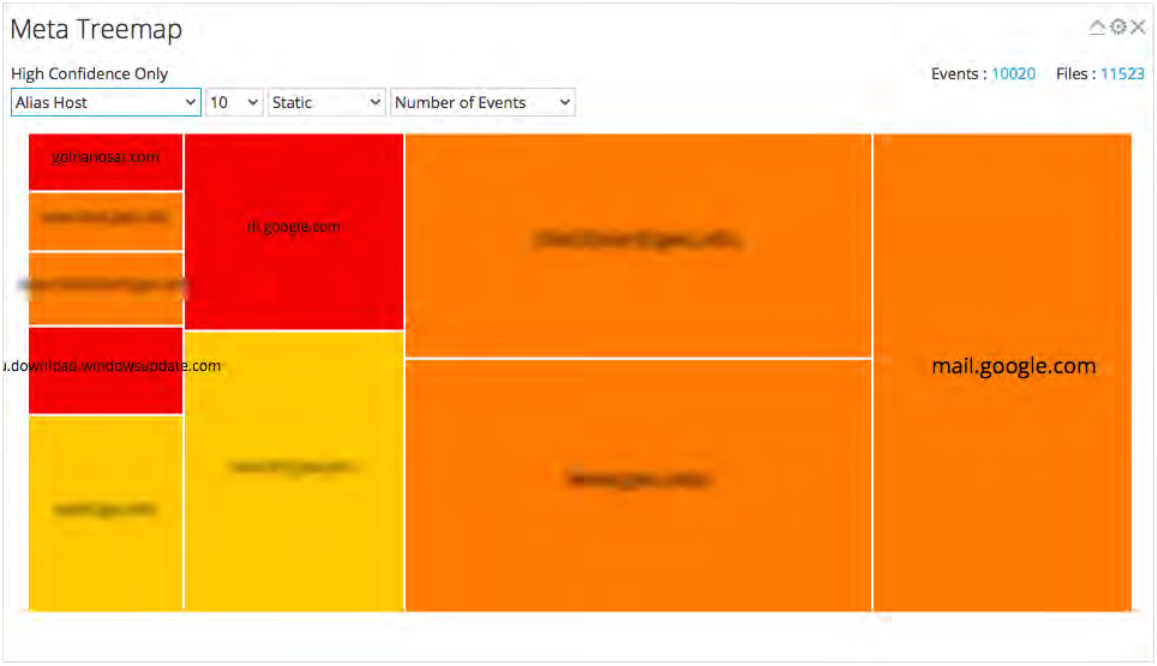


The following table describes the options in the Meta Breakdowns dashlet.

| Feature | Description |
|---|---|
| High Confidence Only | Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed. |
| Meta Key | Drop-down list of available meta keys. |
| Count | Drop-down list specifying how many of the top results are displayed. |

## Meta Treemap

Meta Treemap presents events in the form of a heat map. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta values having the most events. In addition, you can select the module that detected the meta value in the events: static, network community, or sandbox.



The following table describes the options in the Meta Treemap dashlet.

| Feature | Description |
|---|---|
| High Confidence Only | Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed. |
| Meta Key | Drop-down list of available meta keys to select as a filter. |
| Count | Drop-down list specifying how many of the top results are displayed. |
| Module | Drop-down list specifying which module results will be pulled from. |
| Value | Drop-down list specifying what information will be displayed when the mouse is hovering over a result (for example, Average Score). |

## Score Wheel

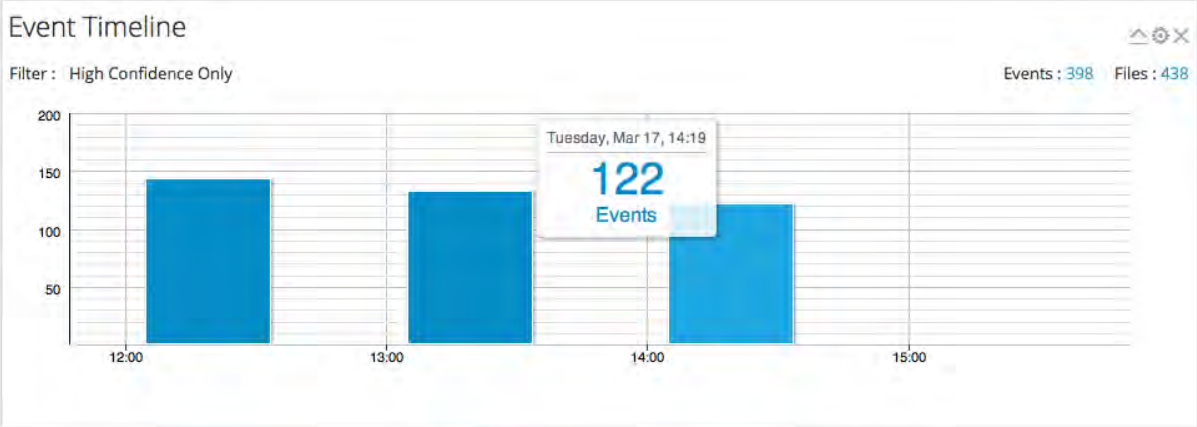
The Score Wheel offers a view of events as concentric rings with colors representing scores for events based on Indicators of Compromise and the scoring module. You can arrange the position of the rings using the Up and Down arrows to obtain a view that highlights events that were detected by one scoring module (red) and not detected by other scoring modules.

The following table describes the features of the Score Wheel dashlet.

| Feature | Description |
|---|---|
| High Confidence Only | Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed. |
| Module Order grid | Displays the order of the rings in Score Wheel, Ring 1 being the innermost ring and Ring 4 being the outermost ring. You can click the **Up** and **Down** buttons to reorder the modules, then click **Update** to apply the changes. |

## Event Timeline

The Event Timeline offers a view of events organized by the time of occurrence in a bar graph. Clicking and dragging to select a time range within the chart zooms in on the selected time.



The following table describes the features of the Event Timeline dashlet.

| Feature | Description |
|---|---|
| High Confidence Only | Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed. |
| View Events | Displays the Investigate > Events view. |

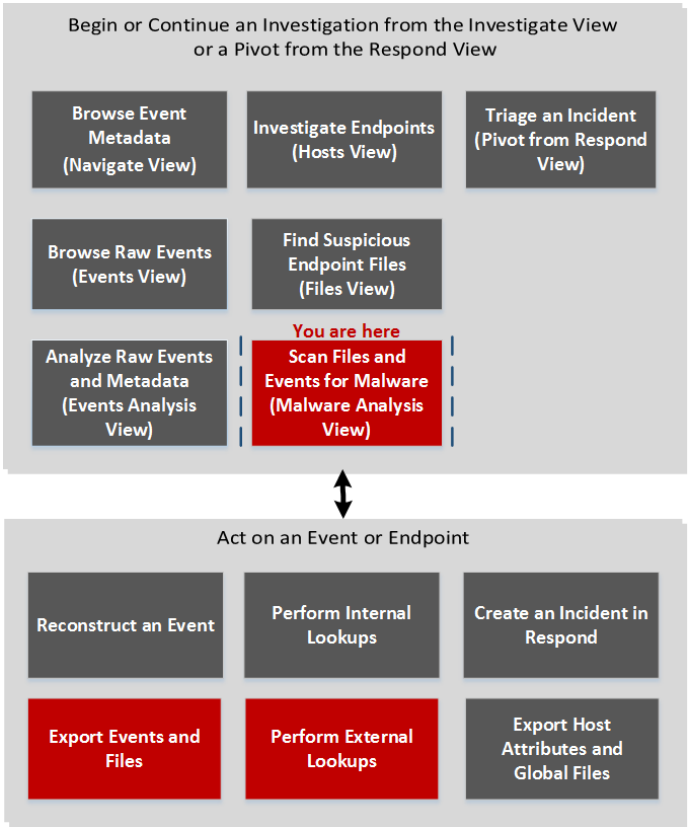
# Malware Analysis Events List and Files List

The Malware Analysis Events List and Files List provide a detailed view of events or files. You can double-click on an event or file in either of the lists to display the Analysis Results view in a new browser tab.

To access this view, go to **Investigate > Malware Analysis** > **Select a Malware Analysis Service** dialog. Select a service from the left panel, then select a job from the right panel, and click **View Scan**. In the Summary of Events view do one of the following:

- In either the **Total** panel or the **High Confidence** panel, click the number in the **Events Created** section.
- If you want to view the Files List, click the number in the **Files Processed** section.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | browse event metadata | *NetWitness Investigate User Guide* |

| User Role | I want to ... | Show me how |
|---|---|---|

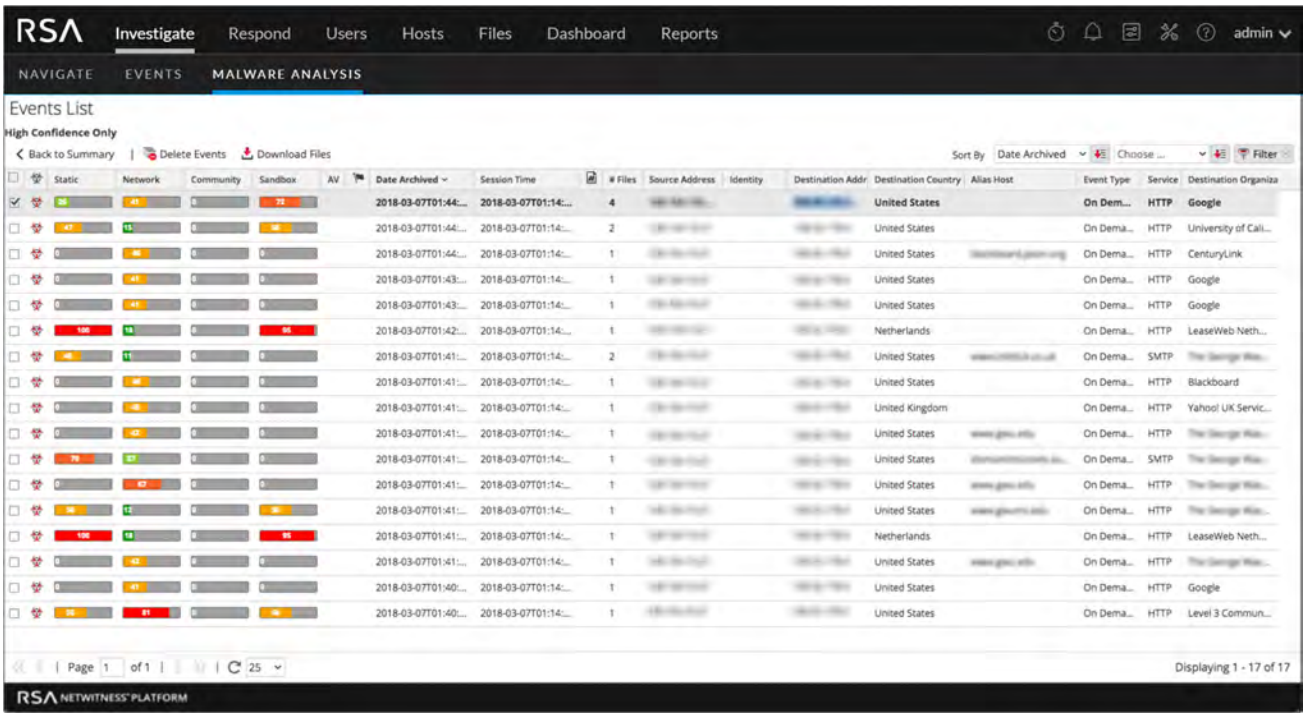
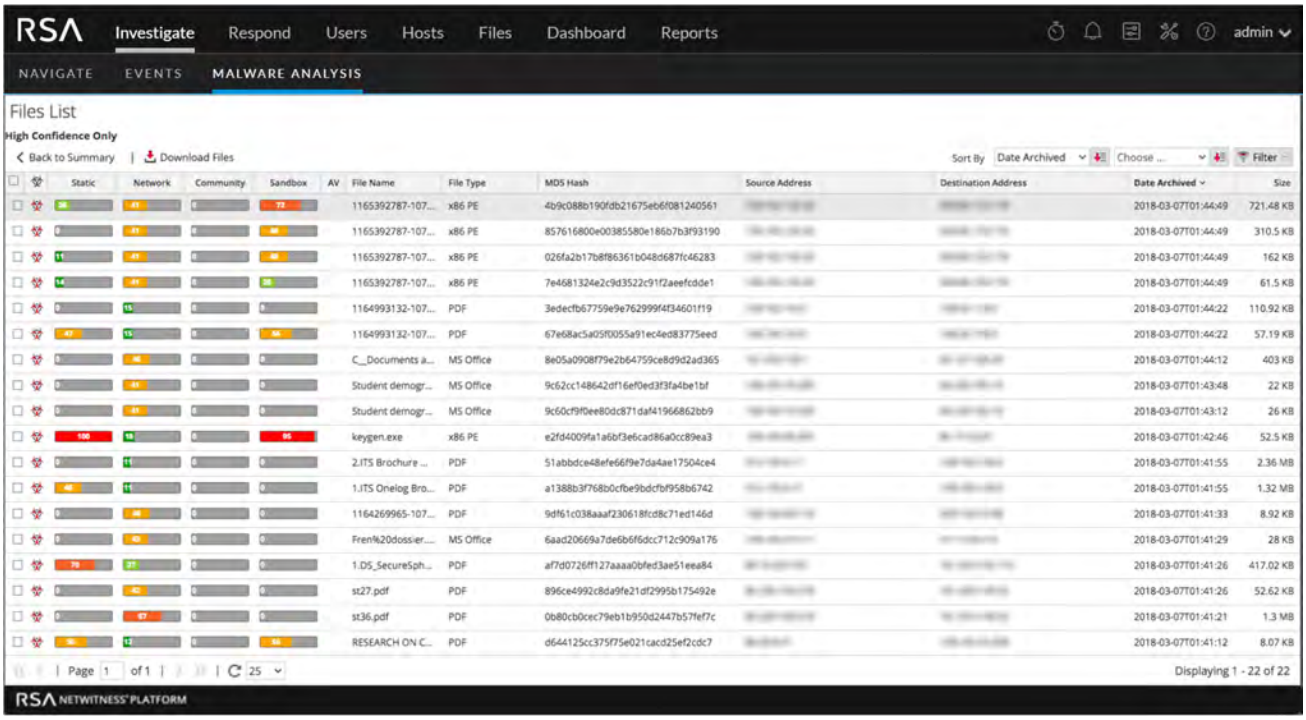
## Quick Look

This is an example of the Events List view.



This is an example of the Files List view.



These are the features in the Events List toolbar, and the Files List toolbar is the same, except it has no option to delete events.

| Feature | Description |
|---|---|
| Back to Summary | Returns to the Summary of Events view. |
| Delete Events | Removes the selected events from the current events list. |
| Download Files | Displays the Malware File Download dialog, which allows you to download available files. |
| Choose ... | Displays a drop-down menu from which you can decide how to sort the list. These are the options for sorting:<br>• High Confidence<br>• Static<br>• Network<br>• Community<br>• Sandbox<br>• AV<br>• File Name<br>• File Type<br>• Hash<br>• Date Archived<br>• Size<br>The button directly to the right of this drop-down indicates whether the list will be sorted by ascending or descending values. |
| Choose ... | Displays a drop-down menu from which you can select a secondary sorting order. This menu includes an option forNetWitness**None**, so selecting a secondary sorting order is not necessary. |
| Filter | Displays a drop-down window in which you can filter the list by filename or MD5 Hash. |

These are the features in the Events List.

| Feature | Description |
|---|---|
| | Indicates whether the event is influenced by the high confidence flag. |
| Static, Network, Community, Sandbox | Displays the scores for each scoring module. |
| AV | Indicates whether the AV flagged this event as suspicious. |

| Feature | Description |
|---|---|
| | Indicates whether the event is influenced by a customized rule. |
| Date Archived | Displays the date and time the event was archived. |
| Session Time | Displays the time of the event's session. |
| | Indicates whether the hash value is marked as trusted. |
| # Files | Displays the number of files included in the event. |
| Source Address | Displays the address of the event source. |
| Identity | Displays the identity of the event source. |
| Destination Address | Displays the address of the event destination. |
| Destination Country | Displays the country of the event destination. |
| Alias Host | Displays the hostname of the alias. |
| Event Type | Displays the type of event. For example, Manual Upload. |
| Service | Displays the service on which the event occurred. |
| Destination Organization | Displays the organization of the destination. |

These are the features in the Files List grid.

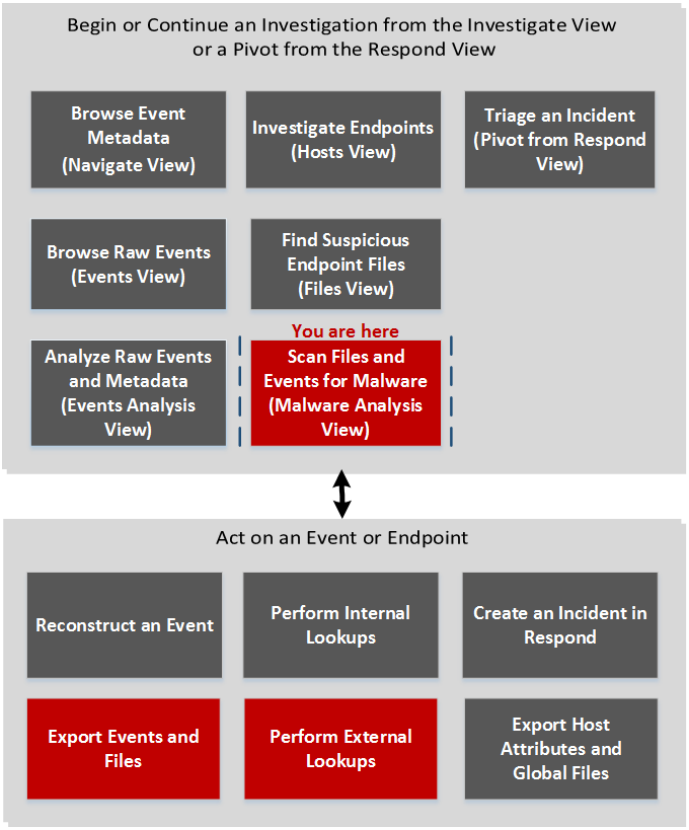
| Feature | Description |
|---|---|
| | Indicates whether the event is influenced by high confidence flag. |
| Static, Network, Community, Sandbox | Displays the scores for each scoring module. |
| AV | Indicates whether the AV flagged this event as suspicious. |
| File Name | Displays the name of the file. |
| File Type | Displays the type of the file (for example, PDF or x86 PE) |
| MD5 Hash | Displays the MD5 hash. |
| Source Address | Displays the address of the file source. |
| Destination Address | Displays the address of the file destination. |
| Date Archived | Displays the date and time the file was archived. |
| Size | Indicates the size of the file. |

# Scan For Malware Dialog

In the Scan for Malware dialog, Malware Analysis analysts can upload files to investigate in Malware Analysis.

To access this dialog go to the **Malware Analysis** view. In the **Select a Malware Analysis Service** dialog, select a service in the left panel, then click Scan Files in the right panel.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | browse event metadata | *NetWitness Investigate User Guide* |
| Threat Hunter | browse raw events | *NetWitness Investigate User Guide* |

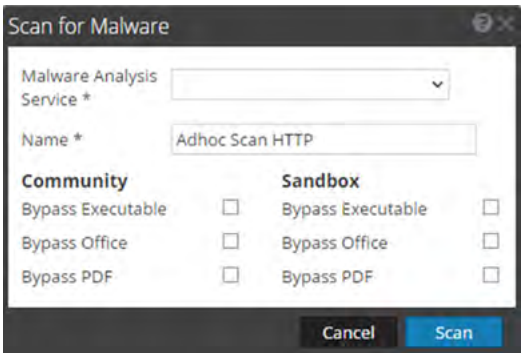
- "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*

## Quick Look

The figure below illustrates the Scan for Malware dialog, and The following table describes the features available in the dialog.



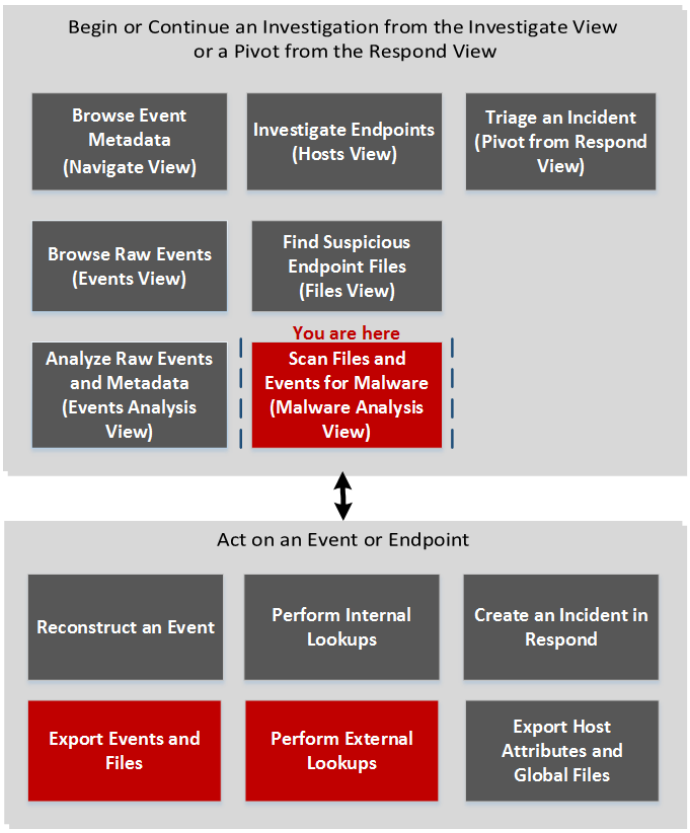
| Feature | Description |
|---|---|
| + | Uploads a file from your computer. |
| − | Deletes a file from the list. |
| File Name | Displays the names of the files added to the list. |
| Name | Allows you to name the scan job. |

| Feature | Description |
|---|---|
| Community | Displays options for Community to bypass or ignore certain types of files:<br>• Bypass Executable<br>• Bypass Office<br>• Bypass PDF |
| Sandbox | Displays options for Sandbox to bypass or ignore certain types of files:<br>• Bypass Executable<br>• Bypass Office<br>• Bypass PDF |
| Cancel | Closes the dialog without performing any actions. |
| Scan | Scans the uploaded files. |

# Select a Malware Analysis Service Dialog

The Select a Malware Analysis Service dialog is accessible in the Malware Analysis view. In this dialog, Malware Analysis analysts can select a service to investigate, choose a scan on that service to investigate, upload a file to scan, and begin a continuous scan of the service.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | browse event metadata | *NetWitness Investigate User Guide* |
| Threat Hunter | browse raw events | *NetWitness Investigate User Guide* |
| Threat Hunter | analyze raw events and metadata | *NetWitness Investigate User Guide* |
| Threat Hunter | investigate endpoints (Version 11.1) | *NetWitness Endpoint User Guide* |

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | find suspicious endpoint files (Version 11.1) | *NetWitness Endpoint User Guide* |
| Threat Hunter | scan files and events for malware* | Conducting Malware Analysis |
| Incident Responder | triage an incident in Investigate | *NetWitness Respond User Guide* |

*You can perform this task in the current view.

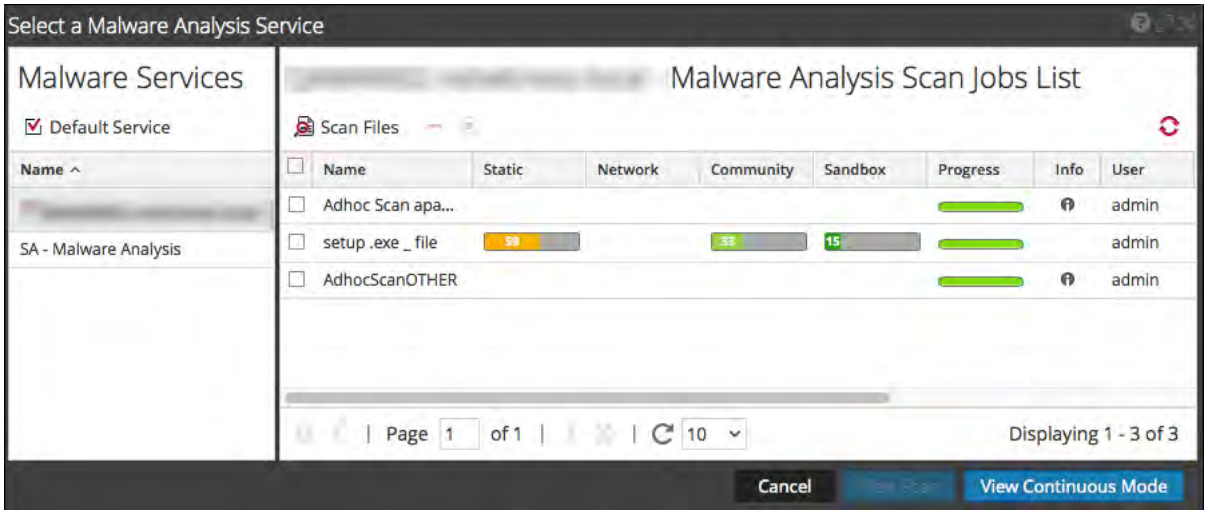
## Quick Look



The Select a Malware Analysis Service dialog has a Malware Services panel on the left and a Scan Jobs List on the right. The Scan Jobs List panel has a toolbar, list, and buttons to view scans.

The Malware Services panel is a list of services available for malware analysis. In this panel, you can select the service to investigate and you set a default service using the Default Service icon. When you select a service, the available scan jobs for that service are listed in the Scan Jobs list.

These are the features in the Scan Jobs List toolbar.

| Feature | Description |
|---|---|
| Scan Files | Displays the Scan for Malware dialog, in which you can upload a file to the service for scanning. |

| Feature | Description |
|---|---|
| Delete scan job ( ) | Deletes one or more selected scan jobs, NetWitness displays a confirmation dialog before deleting scan jobs. |
| Cancel scan job ( ) | Pauses or continues one or more scan jobs. |
| Refresh ( ) | Refreshes the list of scan jobs. |

These are the columns in the Scan Jobs list. This list is also available in the Malware Scan Jobs dashlet.

| Feature | Description |
|---|---|
| Name | Displays the name of the job. |
| Static, Network, Community, Sandbox | Filters the results based on the scores for each scoring module. |
| Progress | Displays the current progress made on the job.<br>• Green: The job is finished.<br>• Black: The job is in progress.<br>• Red: An error occurred. |
| Info | Provides additional information. Displays the query for the job. If the job is not complete, it also displays more detailed description of the status. |
| User | Displays the name of the user who created the job. |
| Events | Counts the number of events for the job. |
| Dropped | Counts the number of files or events in the job that were dropped because the scores are below their configured threshold. |
| Event Type | Displays the type of job: Manual Upload, On Demand, or Resubmit. |
| Scheduled | Displays the date and time when the job was executed. |

These are the available actions in the dialog.

| Feature | Description |
|---|---|
| Cancel button | Cancels the selected scan job. |
| View Scan button | Displays the Summary of Events for the selected scan with the default dashlets displayed. |
| View Continuous Mode button | Displays the Summary of Events for the selected scan with the default dashlets displayed. |

# Overview

The NetWitness Platform API can be accessed using the same host and port as the NetWitness user interface.

## Current Version

By default, all requests to the REST API will automatically use the latest version of the API available. To provide API stability, clients can specify the API version to use by adding the `NetWitness-Version` HTTP header:

```
NetWitness-Version: 1.0
```

## Schema

All data is sent and received as JSON. Any resources containing fields without values will have those fields included with `null` as the value instead of being omitted.

Any fields containing timestamps or dates will be in ISO 8601 format:

```
YYYY-MM-DDTHH:MM:SS.SSSZ
```

## HTTP Usage

The RSA NetWitness API tries to adhere as closely as possible to standard HTTP and REST conventions in its use of HTTP verbs and status codes.

### HTTP Verbs

| Verb | Usage |
|---|---|
| `GET` | Used to retrieve a resource. |
| `POST` | Used to create a new resource. |
| `PATCH` | Used to update an existing resource, including partial updates. Only fields that are modified should be included in the request. |
| `PUT` | Used to replace an existing resource. |
| `DELETE` | Used to delete an existing resource. |

### HTTP Status Codes

| Status code | Usage |
|---|---|
| `200 OK` | The request completed successfully. |

| | |
|---|---|
| `201 Created` | A new resource has been created successfully. The resource's URI is available from the response's `Location` header. |
| `204 No Content` | An update to an existing resource has been applied successfully. |
| `400 Bad Request` | The request was malformed. The response body will include an error providing further information. See Error Response. |
| `401 Unauthorized` | Similar to `403 Forbidden`, but specifically for use when authentication is required and has failed or has not yet been provided. See Authentication and Authorization. |
| `403 Forbidden` | The request was valid, but the server is refusing the action. The user might not have the necessary permissions for a resource. |
| `404 Not Found` | The requested resource does not exist. |
| `500 Internal Server Error` | An unexpected error has occurred. The response body will include a message providing further information. |

# Case Sensitive

All URLs, request parameters and JSON fields are case sensitive.

# Error Response

A common JSON structure is always returned for errors:

| Path | Type | Description |
|---|---|---|
| `status` | `Number` | The HTTP status code returned. |
| `timestamp` | `String` | The timestamp of the request. |
| `errors[]` | `Array` | An array of errors for the given request. |
| `errors[].message` | `String` | A user-friendly error message explaining what went wrong. |
| `errors[].field` | `String` | The field or parameter containing the error. |

```
{
  "status" : 400,
  "timestamp" : "2021-10-26T16:45:32.980363Z",
  "errors" : [ {
    "message" : "Invalid range"
  }, {
    "message" : "Value must be less than or equal to \"10\"",
    "field" : "start"
  } ]
}
```

# Pagination

A common JSON structure is always used for paginated results:

| Path | Type | Description |
|---|---|---|
| `items` | `Array` | An array containing the requested resources. |
| `pageNumber` | `Number` | The requested page number. |
| `pageSize` | `Number` | The requested number of items to return in a single page. |
| `totalPages` | `Number` | The total number of pages available. |
| `totalItems` | `Number` | The total number of items available. |
| `hasNext` | `Boolean` | Indicates if there is a page containing results after this page. |
| `hasPrevious` | `Boolean` | Indicates if there is a page containing results before this page. |

```
{
  "items" : [ ],
  "pageNumber" : 0,
  "pageSize" : 10,
  "totalPages" : 3,
  "totalItems" : 25,
  "hasNext" : true,
  "hasPrevious" : false
}
```

# Authentication and Authorization

All requests must include the `NetWitness-Token` HTTP header containing a valid JSON Web Token (JWT):

```
NetWitness-Token:
eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE1MTEyNDczODYyNjMsImlzcyI6InNlY3VyaXR5L
XNlcnZlci0zODA1NTA0OS0xZWMyLTQ0MDAtOTUwYS0zZTVkMmJiYTljMjIiLCJpYXQiOjE1MTEyMTEzODYyNjM
sImF1dGhvcml0aWVzIjpbIkFkbWluaXN0cmF0b3JzIl0sInVzZXJfbmFtZSI6ImFkbWluIn0.StBjg9ruIX4Fr
yfCX8qvrSBGZHF8DN3qHZM0Ei9-
thFndm1q_DLP_cnh8Fpm43fdKcs1ErcVRTqhaYvVULYmsF9ShUaSThpLts6zbJVEKlq3ldUGWWCY9bfVGRH3n5
KmWzITPi7xZ-
Rf_Kp2Sj8ecVAip3qDwha7TxYrReXefCnUj0UxgaaXjeZIFjwxFmK6NPZ7TAK9OcvcVhozaR8V92g1kUVP8_54
x7iZ2jL4JvDPaScWBjBTvVEffHNbX9_iLNoRmKqvDELSla6E_trkSREogCt6pZh709Qh70uoC3BsKwNQKbHNEO
U1tRPFaUFfRH7bCdp8v3Aeh3PTaKEuQA
```

The JSON Web Token is defined in RFC-7519. Tokens can be obtained using the methods outlined below.

In the remainder of this document, the token will be truncated to just `eyJ...AT` for brevity.

# Obtaining a Token

A JSON Web Token can be obtained using the methods below.

## Using a Username and Password

Users can retrieve an access token using their username and password credentials. Since the API gateway is secured using TLS, all credentials will be encrypted in transit.

```
POST /rest/api/auth/userpass
```

### Request Parameters

| Parameter | Description |
|---|---|
| `username` | The username of the account to authenticate. |
| `password` | The password of the account. |

### Response Fields

| Path | Type | Description |
|---|---|---|
| `id` | `String` | The account identifier. |
| `roles` | `Array` | The roles assigned to the user. |

| Path | Type | Description |
| --- | --- | --- |
| accessToken | String | A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519. |
| refreshToken | String | A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials. |

#### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/userpass' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d 'username=ian&password=changeMe'
```

#### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:44:32 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 106
```

```
{
  "id" : "ian",
  "roles" : [ "Analyst" ],
  "accessToken" : "eyJ...AT",
  "refreshToken" : "eyJ...AT"
}
```

## Using a Refresh Token

Users can also retrieve an access token using a refresh token.

```
POST /rest/api/auth/token
```

#### Request Parameters

| Parameter | Description |
| --- | --- |
| token | A refresh token. |

### Response Fields

| Path | Type | Description |
| --- | --- | --- |
| id | String | The account identifier. |
| roles | Array | The roles assigned to the user. |
| accessToken | String | A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519. |
| refreshToken | String | A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/token' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d
'token=eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE2Mzc4NTg2NzI0NTcsImlzcyI6InNlY3

3NpbAZ6BCfENx5VE0i-It3ZpfvrbQ6fBNtqDdfwmAH1PJuzOXhMKTjg0QECG2POqZRBO1iwxJ9Rg'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:44:32 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 106
```

```
{
  "id" : "ian",
  "roles" : [ "Analyst" ],
  "accessToken" : "eyJ...AT",
  "refreshToken" : "eyJ...AT"
}
```

# Authorization

In order to make requests through the NetWitness Platform API, users must belong to roles that have the `integration-server.api.access` permission, as well as any underlying permissions required to fulfill the request.

# Incidents

An Incident is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An Incident, available in the Respond Interface, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored via the nodal graph. Incidents allow users to ensure they understand the full scope of an attack or event in their NW system and then take action.

## Attributes

The incident resource is comprised of the following attributes:

| Path | Type | Description |
|---|---|---|
| `id` | `String` | The unique identifier of the incident. |
| `title` | `String` | The title of the incident. |
| `summary` | `String` | The summary of the incident. |
| `priority` | `String` | The incident priority. See the valid values. |
| `riskScore` | `Number` | The incident risk score is calculated based on the associated alert's risk score. Risk score ranges from 0 (no risk) to 100 (highest risk). |
| `status` | `String` | The current status. See the valid values. |
| `alertCount` | `Number` | The number of alerts associated with an incident. |
| `averageAlertRiskScore` | `Number` | The average risk score of the alerts associated with the incident. Risk score ranges from 0 (no risk) to 100 (highest risk). |
| `sealed` | `Boolean` | Indicates if additional alerts can be associated with an incident. A `sealed` incident cannot be associated with additional alerts. |
| `totalRemediationTaskCount` | `Number` | The number of total remediation tasks for an incident. |
| `openRemediationTaskCount` | `Number` | The number of open remediation tasks for an incident. |
| `created` | `String` | The timestamp of when the incident is created. |
| `lastUpdated` | `String` | The timestamp of when the incident was last updated. |
| `lastUpdatedBy` | `String` | The NetWitness user identifier of the user who last updated the incident. |
| `assignee` | `String` | The NetWitness user identifier of the user currently working on the incident. |
| `sources` | `Array` | Unique set of sources for all of the alerts in an incident. |

| Path | Type | Description |
|---|---|---|
| `ruleId` | `String` | The unique identifier of the rule that created the incident. |
| `firstAlertTime` | `String` | The timestamp of the earliest occurring Alert in this incident. |
| `categories` | `Array` | The list of categories this incident is categorized under. |
| `categories[].id` | `String` | The unique category identifier. |
| `categories[].parent` | `String` | The parent name of the category. |
| `categories[].name` | `String` | The friendly name of the category. |
| `journalEntries` | `Array` | Set of notes about the incident investigation, also known as the JournalEntry. |
| `journalEntries[].id` | `String` | The unique journal entry identifier. |
| `journalEntries[].author` | `String` | The author of this entry. |
| `journalEntries[].notes` | `String` | Notes and observations about the incident. |
| `journalEntries[].created` | `String` | The timestamp of the journal entry created date. |
| `journalEntries[].lastUpdated` | `String` | The timestamp of the journal entry last updated date. |
| `journalEntries[].milestone` | `String` | Incident milestone classifier. See the valid values. |
| `createdBy` | `String` | The NetWitness user id or name of the rule that created the incident. |
| `deletedAlertCount` | `Number` | The number of alerts that are deleted from the incident. |
| `eventCount` | `Number` | The number of events associated with incident. |
| `alertMeta` | `String` | An object containing unique set of meta values, by type, across all alerts associated with this incident. |
| `alertMeta.SourceIp` | `Array` | Unique source IP addresses. |
| `alertMeta.DestinationIp` | `Array` | Unique destination IP addresses. |

## Incident Priority

The `priority` field can contain these values:

| Value | Description |
|---|---|
| `Low` | Low Priority |
| `Medium` | Medium Priority |
| `High` | High Priority |
| `Critical` | Critical |

### Incident Status

The `status` field can contain these values:

| Value | Description |
| --- | --- |
| `New` | New incident. |
| `Assigned` | Incident is assigned to a user. |
| `InProgress` | Incident response is in progress. |
| `RemediationRequested` | Remediation tasks have been requested. |
| `RemediationComplete` | Remediation tasks are complete. |
| `Closed` | Incident is closed. |
| `ClosedFalsePositive` | Incident is closed as it was created due to false positive. |

### Milestone

Each journal entry can contain a `milestone` consisting of these values:

| Value | Description |
| --- | --- |
| `Reconnaissance` | Intruder is in the initial phase of the attack where targets and vulnerabilities are identified. |
| `Delivery` | Intruder transmitted malware to the target. |
| `Exploitation` | Malware code triggers, which takes action on target network to exploit vulnerability. |
| `Installation` | Malware weapon installs access point usable by intruder. |
| `CommandAndControl` | Malware enables intruder to have persistent access to target network. |
| `ActionOnObjective` | Intruder takes action to achieve their goals, such as data exfiltration, data destruction, or encryption for ransom. |
| `Containment` | Incident is contained. |
| `Eradication` | Necessary actions taken to eliminate components of incident and restore the system status. |
| `Closure` | Incident is addressed. |

## Requests

### Get a Single Incident

A single incident can be retrieved using an incident's unique identifier.

```
GET /rest/api/incidents/{id}
```

### Path Parameters

| Parameter | Description |
| --- | --- |
| `id` | The unique identifier of the incident. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:46:46 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1329
```

```
{
  "id" : "INC-100",
  "title" : "Suspected C&C with suspicious-domain.com",
  "summary" : "Security Analytics detected communications with suspicious-domain.com
that may be command and control malware.",
  "priority" : "Critical",

    "DestinationIp" : [ "11.11.11.111", "11.22.33.444" ]
  }
}
```

### Get Incidents by Date Range

Incidents can be retrieved by the date and time they were created.

```
GET /rest/api/incidents
```

The requested date range can be unbounded, by only supplying either the `since` or `until` parameter, or bounded, by providing both parameters.

#### Request Parameters

| Parameter | Description |
|---|---|
| `pageNumber` | The requested page number. |
| `pageSize` | The maximum number of items to return in a single page. |
| `since` | A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and after this timestamp. |
| `until` | A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and before this timestamp. |

All results will be returned using the paginated response payload sorted by the `created` date, in descending order.

#### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents?since=2018-01-
01T04%3A00%3A00.000Z&until=2018-01-01T05%3A00%3A00.000Z&pageSize=100&pageNumber=0' -i
-X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

#### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8

## Update an Incident

Currently an incident's `status` and `assignee` can be modified using the incidents endpoint.

```
PATCH /rest/api/incidents/{id}
```

The `assignee` field must include the unique identifier for a valid NetWitness user. The list of users can be found in the security section of the administration user interface.

### Request Fields

| Path | Type | Description |
|---|---|---|
| `status` | `String` | The current status. See the valid values. |
| `assignee` | `String` | The NetWitness user identifier of the user currently working on the incident. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X PATCH \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"status":"InProgress"}'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:46:46 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1330
```

```
{
  "id" : "INC-100",

## Remove an Incident

A single incident can be removed using the incident's unique identifier.

```
DELETE /rest/api/incidents/{id}
```

#### Path Parameters

| Parameter | Description |
| --- | --- |
| id | The unique identifier of the incident. |

#### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

#### Sample Response

```
HTTP/1.1 204 No Content
Date: Tue, 26 Oct 2021 16:46:47 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

## Add a Journal Entry

A journal entry, or note, can be added to an existing incident.

```
POST /rest/api/incidents/{id}/journal
```

#### Path Parameters

| Parameter | Description |
| --- | --- |
| id | The unique identifier of the incident. |

#### Request Fields

| Path | Type | Description |
| --- | --- | --- |
| author | String | The NetWitness user id of the user creating the journal entry. |
| notes | String | Notes and observations about the incident. |
| milestone | String | The incident milestone classifier. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100/journal' -i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"author":"duke","notes":"This incident is
contained.","milestone":"Containment"}'
```

### Sample Response

```
HTTP/1.1 201 Created
Location: https://api.netwitness.local/rest/api/incidents/INC-100
Date: Tue, 26 Oct 2021 16:46:47 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

## Get an Incident's Alerts

All the alerts that are associated with an incident can be retrieved using the incident's unique identifier.

```
GET /rest/api/incidents/{id}/alerts
```

### Path Parameters

| Parameter | Description |
|---|---|
| id | The unique identifier of the incident. |

### Request Parameters

| Parameter | Description |
|---|---|
| pageNumber | The requested page number. |
| pageSize | The maximum number of items to return in a single page. |

### Response Fields

| Path | Type | Description |
|---|---|---|
| items | Array | An array containing the requested resources. |
| pageNumber | Number | The requested page number. |

| Path | Type | Description |
| --- | --- | --- |
| pageSize | Number | The requested number of items to return in a single page. |
| totalPages | Number | The total number of pages available. |
| totalItems | Number | The total number of items available. |
| hasNext | Boolean | Indicates if there is a page containing results after this page. |
| hasPrevious | Boolean | Indicates if there is a page containing results before this page. |
| items[].id | String | The unique alert identifier. |
| items[].title | String | The title or name of the rule that created the alert. |
| items[].detail | String | The details of the alert. This can be the module name or meta that the module included. |
| items[].created | String | The timestamp of the alert created date. |
| items[].source | String | The source of this alert. For example, "Event Stream Analysis", "Malware Analysis", etc. |
| items[].riskScore | Number | The risk score of this alert, usually in the range 0 - 100. |
| items[].type | String | The type of alert, "Network", "Log", etc. |
| items[].events | Array | The events that make up this alert. |
| items[].events[].source | Object | The source of the event. |
| items[].events[].source.device | Object | The device contains the endpoint network information. |
| items[].events[].source.device.ipAddress | String | The IP address. |
| items[].events[].source.device.port | Number | The port. |
| items[].events[].source.device.macAddress | String | The ethernet MAC address. |
| items[].events[].source.device.dnsHostname | String | The DNS resolved hostname. |
| items[].events[].source.device.dnsDomain | String | The top-level domain from the DNS resolved hostname. |
| items[].events[].source.user | Object | The user contains the endpoint user information. |
| items[].events[].source.user.username | String | The unique username. |
| items[].events[].source.user.emailAddress | String | An email address. |
| items[].events[].source.user.adUsername | String | An Active Directory (AD) username. |
| items[].events[].source.user.adDomain | String | An Active Directory (AD) domain. |

| Path | Type | Description |
|---|---|---|
| items[].events[].destination | Object | The destination of the event. |
| items[].events[].destination.device | Object | The device contains the endpoint network information. |
| items[].events[].destination.device.ipAddress | String | The IP address. |
| items[].events[].destination.device.port | Number | The port. |
| items[].events[].destination.device.macAddress | String | The ethernet MAC address. |
| items[].events[].destination.device.dnsHostname | String | The DNS resolved hostname. |
| items[].events[].destination.device.dnsDomain | String | The top-level domain from the DNS resolved hostname. |
| items[].events[].destination.user | Object | The user contains the endpoint user information. |
| items[].events[].destination.user.username | String | The unique username. |
| items[].events[].destination.user.emailAddress | String | An email address. |
| items[].events[].destination.user.adUsername | String | An Active Directory (AD) username. |
| items[].events[].destination.user.adDomain | String | An Active Directory (AD) domain. |
| items[].events[].domain | String | The top-level domain or Windows domain. |
| items[].events[].eventSource | String | The source of the event. This may be a fully-qualified hostname with a port, or simple name. |
| items[].events[].eventSourceId | String | The unique identifier of the event on the source. For Network and Log events, this is the Nextgen Session ID. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-
100/alerts?pageSize=10&pageNumber=0' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

### Sample Response

```
HTTP/1.1 200 OK

# Services Information

## Get Service IDs of all Services

The following API lists all services with their service IDs.

The response resource is comprised of the following attributes:

| Path | Type | Description |
|---|---|---|
| `[]` | `Array` | Array of service information. |
| `[].id` | `String` | Unique identifier of each service installed in the RSA NetWitness suite. |
| `[].name` | `String` | Name of the service. For example, endpoint-server. |
| `[].displayName` | `String` | Display name of the service. |
| `[].host` | `String` | Host details of the service. |
| `[].version` | `String` | Version of the service. |

A list of all services can be retrieved using the following API:

```
GET /rest/api/services
```

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/services' -i -X GET \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:04 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 542
```

```
[ {
  "id" : "7527bcdb-4078-4888-8c08-5724baad435d",

  "host" : "endpoint-server",
  "version" : "11.4.0.0"
} ]
```

# Endpoint APIs

Endpoint Log Hybrid collects and manages endpoint data from hosts. Using the APIs, analyst can:

- View list of host names with agent IDs from one or more Endpoint Servers.
- Retrieve host data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host.
- Filter hosts on indexed values and sort columns.
- Get list of snapshots and snapshot details for a host.
- Start or stop a scan.
- Get list of files from a specific Endpoint Server.
- Get alerts for a host or file.
- Download file/files to the server.
- Download system and process dump.
- Isolate host from the network.

Note: All endpoint APIs require a service ID to connect to the specific Endpoint Server.

## Get Hosts

The Get Hosts API lists all hosts' information from a particular Endpoint Server. It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual host information.

| Path | Type | Description |
|---|---|---|
| `items` | `Array` | An array containing the requested resources. |
| `pageNumber` | `Number` | The requested page number. |
| `pageSize` | `Number` | The requested number of items to return in a single page. |
| `totalPages` | `Number` | The total number of pages available. |
| `totalItems` | `Number` | The total number of items available. |
| `hasNext` | `Boolean` | Indicates if there is a page containing results after this page. |
| `hasPrevious` | `Boolean` | Indicates if there is a page containing results before this page. |
| `items[].agentId` | `String` | Agent ID of the host. |
| `items[].hostName` | `String` | Name of the host. |
| `items[].riskScore` | `Number` | Risk score of the host. |
| `items[].networkInterfaces` | `Array` | List of network interfaces with details, such as IP address and MAC address. |

| Path | Type | Description |
| --- | --- | --- |
| items[].networkInterfaces[].name | String | Name of the network interface. |
| items[].networkInterfaces[].macAddress | String | MAC Address of the network interface. |
| items[].networkInterfaces[].ipv4 | Array | List of IPV4 in the network interface. |
| items[].networkInterfaces[].ipv6 | Array | List of IPV6 in the network interface. |
| items[].networkInterfaces[].networkIdv6 | Array | List of network IDV6 in the network interface. |
| items[].networkInterfaces[].gateway | Array | List of gateway in the network interface. |
| items[].networkInterfaces[].dns | Array | List of DNS in the network interface. |
| items[].networkInterfaces[].promiscuous | String | Specifies if the network interface is in the promiscuous mode. |
| items[].lastSeenTime | String | Agent last seen time. |

```
GET /rest/api/hosts?serviceId=<service-id>&&pageNumber=0&pageSize=100
```

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/hosts?serviceId=617b872b-9663-4f72-9bdc-
c80422230df7&pageNumber=0&pageSize=1' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

## Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:05 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 691
```

```
{
  "items" : [ {
    "agentId" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",

  "pageSize" : 1,
  "totalPages" : 2,
  "totalItems" : 2,
  "hasNext" : true,
  "hasPrevious" : false
}
```

# Get Hosts with Filter

The following fields are supported for filtering and sorting on Get Hosts API - 'agentId', 'hostName', 'riskScore' and 'networkInterfaces.ipv4'.

Filter and sort are specified as a part of the request body.

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/hosts?serviceId=617b872b-9663-4f72-9bdc-c80422230df7&pageNumber=0&pageSize=1' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d
'{"criteria":{"criteriaList":[{"criteriaList":[],"expressionList":[{"propertyName":"hostName","restrictionType":"LIKE","propertyValues":[{"value":"WIN-854PACLCQ07-VC","relative":false}]}],"predicateType":"AND"},{"criteriaList":[],"expressionList":[{"propertyName":"riskScore","restrictionType":"BETWEEN","propertyValues":[{"value":0,"relative":false},{"value":100,"relative":false}]}],"predicateType":"OR"}],"expressionList":[],"predicateType":"AND"},"sort":{"keys":["riskScore"],"descending":true}}'
```

### HTTP request

```
GET /rest/api/hosts?serviceId=617b872b-9663-4f72-9bdc-
c80422230df7&pageNumber=0&pageSize=1 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 498

{"criteria":{"criteriaList":[{"criteriaList":[],"expressionList":[{"propertyName":"hos
tName","restrictionType":"LIKE","propertyValues":[{"value":"WIN-854PACLCQ07-
VC","relative":false}]}],"predicateType":"AND"},{"criteriaList":[],"expressionList":[{
"propertyName":"riskScore","restrictionType":"BETWEEN","propertyValues":[{"value":0,"r
elative":false},{"value":100,"relative":false}]}],"predicateType":"OR"}],"expressionLi
st":[],"predicateType":"AND"},"sort":{"keys":["riskScore"],"descending":true}}
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:05 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 692
```

```
{
  "items" : [ {
    "agentId" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",
    "hostName" : "WIN-854PACLCQ07-VC",
    "riskScore" : 0,
    "networkInterfaces" : [ {
      "name" : "Intel(R) 82574L Gigabit Network Connection",
      "macAddress" : "00:50:56:01:1B:31",
      "ipv4" : [ "10.40.15.202" ],
      "ipv6" : [ "fe80::651d:c035:a19b:ea03%13" ],
      "networkIdv6" : [ "fe80::%13" ],
      "gateway" : [ "10.40.12.1" ],
      "dns" : [ "10.31.64.22", "10.31.64.23" ],
      "promiscuous" : false
    } ],
    "lastSeenTime" : "2019-01-28T09:25:02.484Z"
  } ],
  "pageNumber" : 0,
  "pageSize" : 1,
  "totalPages" : 1,
  "totalItems" : 1,
  "hasNext" : false,
  "hasPrevious" : false
}
```

The following is an example for filter criteria in the request body:

```
{
  "criteria": {
    "criteriaList": [
      {
        "expressionList": [{ "propertyName": "agentId", "restrictionType":
"EQUAL","propertyValues": [{"value": "2F53FC2C-A737-B34B-6813-12E48379C15D"}]}]
      }
    ]
  }
}
```

The following are the supported 'restrictionType'

- Operators that require no value: IS_NULL, IS_NOT_NULL.
- Operators that require one value: LIKE, NOT_LIKE, EQUAL, NOT_EQUAL, LESS_THAN,LESS_THAN_OR_EQUAL_TO, GREATER_THAN, GREATER_THAN_OR_EQUAL_TO.
- Operators that require two value: BETWEEN, NOT_BETWEEN.
- Operators that uses multiple value: IN, NOT_IN.

The following are the supported 'predicateType' - AND, OR, NOT.

# Get List of Snapshots for Host

This API provides a list of snapshots, which are IDs to fetch the snapshot details of the host.

```
GET /rest/api/host/<Host-Agent-Id>/snapshots?serviceId=<service-id>
```

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/snapshots?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:06 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 30
```

```
[ "2017-12-22T14:34:05.985Z" ]
```

# Get Snapshot Details for the Host

This API provides snapshot details of the given host for the provided snapshot time.

### Response Fields

| Path | Type | Description |
|---|---|---|
| [] | Array | Array of scan snapshot for the agent. |
| [].machineOsType | String | Type of operating system (Windows, Mac, Linux). |
| [].hostName | String | Name of the host. |
| [].agentId | String | Agent ID of the host. |
| [].agentVersion | String | Version of the agent. |
| [].scanStartTime | String | Start time of the scan snapshot. |
| [].directory | String | Directory of the file. |
| [].fileName | String | Name of the file. |

| Path | Type | Description |
| --- | --- | --- |
| [].owner.username | String | User name of the owner of the file. |
| [].owner.groupname | String | Group name of the owner of the file. |
| [].owner.uid | String | UID of the user name. |
| [].owner.gid | String | GID of the user name. |
| [].timeCreated | String | Time when file was created. |
| [].timeModified | String | Time when file was modified. |
| [].timeAccessed | String | Time when file was last accessed. |
| [].attributes | Array | List of file attributes. |
| [].accessMode | Number | Access mode of the file. |
| [].sameDirectoryFileCounts.nonExe | Number | Number of non-exe files in the same directory of the file. |
| [].sameDirectoryFileCounts.exe | Number | Number of exe files in the same directory of the file. |
| [].sameDirectoryFileCounts.subFolder | Number | Number of sub-folders in the same directory of the file. |
| [].sameDirectoryFileCounts.exeSameCompany | Number | Number of executables with the same company name in the same directory of the file. |
| [].sameDirectoryFileCounts.hiddenFiles | Number | Count of hidden files in the same directory of the file. |
| [].fileContext | Array | List of file context. |
| [].directoryContext | Array | List of directory context. |
| [].autorunContext | Array | List of autorun context. |
| [].networkContext | Array | List of network context. |
| [].kernelModeContext | Array | List of kernel mode context. |
| [].userModeContext | Array | List of user mode context. |
| [].processContext | Array | List of process context. |
| [].rpm.packageName | String | RPM package name to which the file belongs. |
| [].rpm.category | String | Category to which the rpm package belongs. |
| [].windows.processes[].eprocess | String | Identifier of the process. |
| [].windows.processes[].sessionId | Number | Session ID of the process. |
| [].windows.processes[].parentPath | String | Directory of the parent process. |
| [].windows.processes[].imageSize | Number | Size of the process image. |
| [].windows.processes[].integrityLevel | Number | Integrity level of the process. |
| [].windows.processes[].context | Array | List of process context. |
| [].windows.processes[].pid | Number | ID of the process. |
| [].windows.processes[].parentPid | Number | ID of the parent process. |

| Path | Type | Description |
| --- | --- | --- |
| [].windows.processes[].imageBase | Number | Base address of the process. |
| [].windows.processes[].createUtcTime | String | Creation time of the process. |
| [].windows.processes[].owner | String | Name of the user. |
| [].windows.processes[].launchArguments | String | Launch arguments of the process. |
| [].windows.processes[].threadCount | Number | Number of threads running in the process. |
| [].windows.dlls[].createTime | String | Creation time of the process. |
| [].windows.dlls[].eprocess | String | Identity of the process. |
| [].windows.dlls[].imageSize | Number | Size of the DLL image in memory. |
| [].windows.threads[].processName | String | Name of the process. |
| [].windows.threads[].processTime | String | Creation time of the process. |
| [].windows.threads[].eprocess | String | Identifier of the process. |
| [].windows.threads[].pid | Number | PID of the process. |
| [].windows.threads[].ethread | String | Identifier of the thread. |
| [].windows.threads[].tid | Number | ID of the thread. |
| [].windows.threads[].teb | String | Address of thread environment block. |
| [].windows.threads[].startAddress | String | Start address of the thread in memory. |
| [].windows.threads[].state | Array | Thread state. |
| [].windows.threads[].behaviorKey | String | Floating behavior resolution of the thread. |
| [].windows.drivers[].windows.imageBase | Number | Base address of the driver image. |
| [].windows.drivers[].windows.imageSize | Number | Size of the driver image. |
| [].windows.services[].windows.serviceName | String | Service name as identified by the system. |
| [].windows.services[].displayName | String | Display name for the service. |
| [].windows.services[].description | String | Description of the service. |
| [].windows.services[].account | String | Name of the user the service executes as. |
| [].windows.services[].launchArguments | String | Launch arguments of the service. |
| [].windows.services[].windows.serviceMain | String | Service’s main. |
| [].windows.services[].hostingPid | Number | Service’s hosting process ID. |

| Path | Type | Description |
| --- | --- | --- |
| [].windows.services[].state | String | Current state of the service. |
| [].windows.services[].win32ErrorCode | Number | Last Windows 32 error code from registry. |
| [].windows.services[].context | Array | List of service context. |
| [].windows.tasks[].name | String | Name of the task. |
| [].windows.tasks[].executeUser | String | Name of the user the task executes as. |
| [].windows.tasks[].creatorUser | String | Name of the user who created the task. |
| [].windows.tasks[].launchArguments | String | Launch arguments of the task. |
| [].windows.tasks[].status | Array | Status of the task. |
| [].windows.tasks[].lastRunTime | String | Time when the task was last run. |
| [].windows.tasks[].nextRunTime | String | Next scheduled time of the task. |
| [].windows.tasks[].triggerString | String | Textual trigger string of the task. |
| [].windows.autoruns[].type | String | Type of the autorun. |
| [].windows.autoruns[].registryPath | String | Registry path where autorun is located. |
| [].windows.autoruns[].launchArguments | String | Launch argument of the autorun. |
| [].windows.imageHooks[].process.pid | String | PID of the process in which hook was detected. |
| [].windows.imageHooks[].process.fileName | String | Filename of the process in which hook was detected. |
| [].windows.imageHooks[].process.createUtcTime | String | Creation time of the process in which hook was detected. |
| [].windows.imageHooks[].hookLocation.section | String | Name of the image section that was modified by the hook. |
| [].windows.imageHooks[].hookLocation.sectionBase | String | Base of the image section that was modified by the hook. |
| [].windows.imageHooks[].hookLocation.symbol | String | Closest symbol name to the memory location that was modified. |
| [].windows.imageHooks[].hookLocation.symbolOffset | Number | Closest symbol +/- offset to the hook location when relevant. |
| [].windows.imageHooks[].inlinePatch.originalBytes | String | Hexadecimal bytes which were replaced. |
| [].windows.imageHooks[].inlinePatch.originalAsm | Array | Array of decoded ASM instructions that were replaced. |
| [].windows.imageHooks[].inlinePatch.currentBytes | String | Hexadecimal bytes which have overwritten the original code. |
| [].windows.imageHooks[].inlinePatch.currentAsm | Array | Array of decoded ASM instructions that have overwritten the original code. |

| Path | Type | Description |
| --- | --- | --- |
| [].windows.kernelHooks[].hookLocation.objectName | String | Name of the object that was hooked in kernel. |
| [].windows.kernelHooks[].hookLocation.objectFunction | String | Name of the object function that was hooked in kernel. |
| [].mac.processes[].priority | Number | Priority of the process. |
| [].mac.processes[].flags | Number | Process flags. |
| [].mac.processes[].nice | Number | Nice value of process. |
| [].mac.processes[].openFilesCount | Number | Number of open files by process at scan time. |
| [].mac.processes[].context | Array | Process context. |
| [].mac.processes[].pid | Number | ID of the process. |
| [].mac.processes[].parentPid | Number | ID of the parent process. |
| [].mac.processes[].imageBase | Number | Base address of the process. |
| [].mac.processes[].createUtcTime | String | Creation time of the process. |
| [].mac.processes[].owner | String | Name of the user. |
| [].mac.processes[].launchArguments | String | Launch arguments of the process. |
| [].mac.processes[].threadCount | Number | Number of threads running in the process. |
| [].mac.dylibs[].pid | Number | Process ID in dylib which is loaded. |
| [].mac.dylibs[].processName | String | Name of the process. |
| [].mac.dylibs[].imageBase | String | Base address of image in the process. |
| [].mac.drivers[].preLinked | Boolean | True if Kext bundle is prelinked. |
| [].mac.drivers[].numberOfReferences. | Number | Number of references. |
| [].mac.drivers[].dependencies | Array | List of kexts(name) the driver is linked against. |
| [].mac.drivers[].imageBase | String | Base address of the driver image. |
| [].mac.drivers[].imageSize | String | Size of the driver image. |
| [].mac.daemons[].name | String | Label of the daemon. |
| [].mac.daemons[].sessionName | String | Name of the session in which daemon runs. |
| [].mac.daemons[].user | String | Name of the user under which the daemon runs. |
| [].mac.daemons[].pid | Number | ID of the process. |
| [].mac.daemons[].onDemand | Boolean | True if daemon is configured to run on demand. |
| [].mac.daemons[].lastExitCode | Number | Last exit code. |
| [].mac.daemons[].timeout | Number | Time out value. |
| [].mac.daemons[].daemons.launchArguments | String | Launch argument of the daemon. |
| [].mac.daemons[].daemons.configFile | String | Full path of the configuration file used to configure this daemon. |

| Path | Type | Description |
| --- | --- | --- |
| [].mac.tasks[].name | String | Name of the task. |
| [].mac.tasks[].cronJob | Boolean | True if the task is cron job, else launchd. |
| [].mac.tasks[].launchArguments | String | Launch argument of the task. |
| [].mac.tasks[].user | String | Name of the user under which this task will run. |
| [].mac.tasks[].triggerString | String | Trigger string of the task. |
| [].mac.tasks[].configFile | String | Full path of the configuration file used to configure this task. |
| [].mac.autoruns[].type | String | Type of autorun. |
| [].mac.autoruns[].user | String | Name of the user under which the autorun is run. |
| [].mac.autoruns[].name | String | Label of the autorun. |
| [].mac.autoruns[].detail | String | Details of the autorun. |
| [].linux.processes[].priority | Number | Priority of the process. |
| [].linux.processes[].uid | Number | UID of the user. |
| [].linux.processes[].environment | String | Environment variables. |
| [].linux.processes[].nice | Number | Nice value of the process. |
| [].linux.processes[].securityContext | String | Security context. |
| [].linux.processes[].pid | Number | ID of the process. |
| [].linux.processes[].parentPid | Number | ID of the parent process. |
| [].linux.processes[].imageBase | Number | Base address of the process. |
| [].linux.processes[].createUtcTime | String | Time of creation of the process. |
| [].linux.processes[].owner | String | Name of the user. |
| [].linux.processes[].launchArguments | String | Launch arguments of the process. |
| [].linux.processes[].threadCount | Number | Number of threads running in the process. |
| [].linux.loadedLibraries[].pid | String | Process ID in which library is loaded. |
| [].linux.loadedLibraries[].processName | String | Name of the process. |
| [].linux.loadedLibraries[].imageBase | String | Base address of image in the process. |
| [].linux.drivers[].numberOfInstances | Number | Number of instances loaded in memory. |
| [].linux.drivers[].loadState | String | Load state of the driver. |
| [].linux.drivers[].dependencies | Array | Dependent driver names. |
| [].linux.drivers[].author | String | Name of the author of driver. |
| [].linux.drivers[].description | String | Description of the driver. |

| Path | Type | Description |
| --- | --- | --- |
| [].linux.drivers[].sourceVersion | String | Source version of the driver. |
| [].linux.drivers[].versionMagic | String | Version magic of the driver. |
| [].linux.initds[].initdHashSha256 | String | Hash of the init-d script file. |
| [].linux.initds[].initdPaths | String | Path of the init-d script file. |
| [].linux.initds[].pid | Number | ID of the process. |
| [].linux.initds[].description | String | Description of the init-d. |
| [].linux.initds[].status | String | Status of the init-d. |
| [].linux.initds[].runLevels | Array | List of run levels in which the init-d is enabled. |
| [].linux.systemds[].systemdHashSha256 | String | Hash value of the systemd script file. |
| [].linux.systemds[].systemdPaths | String | Path value of the systemd script file. |
| [].linux.systemds[].name | String | Name of the systemd. |
| [].linux.systemds[].description | String | Description of the systemd. |
| [].linux.systemds[].state | String | State of the systemd. |
| [].linux.systemds[].launchArguments | String | Launch argument of the systemd. |
| [].linux.systemds[].pid | Number | ID of the process. |
| [].linux.systemds[].triggeredBy | Array | Triggered by list of the systemd. |
| [].linux.systemds[].triggerStrings | Array | Trigger strings of the systemd. |
| [].linux.autoruns[].type | String | Type of autorun. |
| [].linux.autoruns[].label | String | Label of the autorun. |
| [].linux.autoruns[].comments | String | Comments of the autorun. |
| [].linux.crons[].user | String | User account under which cron job was created. |
| [].linux.crons[].triggerString | String | Trigger string that would launch the cron job. |
| [].linux.crons[].launchArguments | String | Launch arguments of the cron job. |
| firstFileName | String | First name of the file sent by the agent. |
| reputationStatus | String | Reputation status of the file. |
| globalRiskScore | String | Global risk score. |
| firstSeenTime | String | Time when the file was first seen by the Endpoint Server. |
| machineOsType | String | Type of operating system (Windows, Mac, Linux). |
| signature | Object | Signatory information of the file. |
| signature.timeStamp | String | Timestamp of the signature. |
| signature.thumbprint | String | Thumbprint of the certificate. |
| signature.context | Array | Context information of the certificate. |
| signature.signer | String | Signer information of the certificate. |

| Path | Type | Description |
|---|---|---|
| size | String | Size of the file. |
| checksumMd5 | String | MD5 of the file. |
| checksumSha1 | String | SHA1 of the file. |
| checksumSha256 | String | SHA256 of the file. |
| pe | Object | PE information of the file. This is applicable for Windows files. |
| pe.timeStamp | String | Timestamp of the PE File. |
| pe.imageSize | String | Image size of the PE file. |
| pe.numberOfExportedFunctions | String | Number of exported function in the PE file. |
| pe.numberOfNamesExported | String | Number of names exported in the PE file. |
| pe.numberOfExecuteWriteSections | String | Number of execute write sections in the PE file. |
| pe.context | Array | Context information of the PE file. |
| pe.resources | Object | Resources of the PE file. |
| pe.resources.originalFileName | String | Original filename as per PE information. |
| pe.resources.company | String | Company name as per PE information. |
| pe.resources.description | String | Description of the file as per PE information. |
| pe.resources.version | String | Version of the file as per PE information. |
| pe.sectionNames | Array | List of section names in the PE file. |
| pe.importedLibraries | Array | List of imported libraries in the PE file. |
| elf | Object | ELF information of the file. This is applicable for Linux files. |
| elf.classType | String | Class type of the ELF file. |
| elf.data | String | Data of ELF file. |
| elf.entryPoint | String | Entry point for the ELF file. |
| elf.context | Array | Context information of ELF file. |
| elf.type | String | Type of ELF file. |
| elf.sectionNames | Array | List of section names in ELF file. |
| elf.importedLibraries | Array | List of imported libraries in ELF file. |
| macho | Object | Macho information of the file. This is applicable for Mac files. |
| macho.uuid | String | UUID of the Macho file. |
| macho.identifier | String | Identifier of the Macho file. |
| macho.minOsxVersion | String | Minimum OSx version for the Macho file. |
| macho.context | Array | Context information of the Macho file. |
| macho.flags | String | Flags of Macho file. |
| macho.numberOfLoadCommands | String | Number of load commands for the Macho file. |
| macho.version | String | Version of the Macho file. |

| Path | Type | Description |
| --- | --- | --- |
| macho.sectionNames | Array | Section names in the Macho file. |
| macho.importedLibraries | Array | Imported libraries list in the Macho file. |
| entropy | String | Entropy of the file. |
| format | String | Format of the file. |
| fileStatus | String | Status of the file as assigned by the analyst. (Whitelist, Blacklist, Neutral, and Graylist). |
| remediationAction | String | Remediation action as assigned by the analyst. For example, Blocked. |
| [].localRiskScore | Number | File's score based on alerts triggered in the given agent. |

To filter the snapshot details based on the category, the following fields can be provided as path parameter - PROCESSES, LOADED_LIBRARIES, SERVICES, AUTORUNS, TASKS, DRIVERS, THREADS, IMAGE_HOOKS, and KERNEL_HOOKS.

```
GET /rest/api/host/<Host-Agent-Id>/snapshots/2019-06-
17T04:24:14.608Z?serviceId=<service-id>&categories=PROCESSES
```

# Get Files

This API lists all related information of files from a specific Endpoint Server. These information are specific to the unique file and does not include any host information.

It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual file information.

| Path | Type | Description |
| --- | --- | --- |
| items | Array | An array containing the requested resources. |
| pageNumber | Number | The requested page number. |
| pageSize | Number | The requested number of items to return in a single page. |
| totalPages | Number | The total number of pages available. |
| totalItems | Number | The total number of items available. |
| hasNext | Boolean | Indicates if there is a page containing results after this page. |
| hasPrevious | Boolean | Indicates if there is a page containing results before this page. |
| items[].firstFileName | String | First name of the file sent by the agent. |
| items[].reputationStatus | String | Reputation status of the file. |
| items[].globalRiskScore | String | Global risk score. |
| items[].firstSeenTime | String | Time when the file was first seen by the Endpoint Server. |
| items[].machineOsType | String | Type of operating system (Windows, Mac, Linux). |
| items[].signature | Object | Signatory information of the file. |
| items[].signature.timeStamp | String | Timestamp of the signature. |
| items[].signature.thumbprint | String | Thumbprint of the certificate. |
| items[].signature.context | Array | Context information of the certificate. |
| items[].signature.signer | String | Signer information of the certificate. |
| items[].size | String | Size of the file. |
| items[].checksumMd5 | String | MD5 of the file. |
| items[].checksumSha1 | String | SHA1 of the file. |
| items[].checksumSha256 | String | SHA256 of the file. |
| items[].pe | Object | PE information of the file. This is applicable for Windows files. |
| items[].pe.timeStamp | String | Timestamp of the PE File. |
| items[].pe.imageSize | String | Image size of the PE file. |
| items[].pe.numberOfExportedFunctions | String | Number of exported function in the PE file. |
| items[].pe.numberOfNamesExported | String | Number of names exported in the PE file. |
| items[].pe.numberOfExecuteWriteSections | String | Number of execute write sections in the PE file. |
| items[].pe.context | Array | Context information of the PE file. |
| items[].pe.resources | Object | Resources of the PE file. |
| items[].pe.resources.originalFileName | String | Original filename as per PE information. |

| Path | Type | Description |
|---|---|---|
| items[].pe.resources.company | String | Company name as per PE information. |
| items[].pe.resources.description | String | Description of the file as per PE information. |
| items[].pe.resources.version | String | Version of the file as per PE information. |
| items[].pe.sectionNames | Array | List of section names in the PE file. |
| items[].pe.importedLibraries | Array | List of imported libraries in the PE file. |
| items[].elf | Object | ELF information of the file. This is applicable for Linux files. |
| items[].elf.classType | String | Class type of the ELF file. |
| items[].elf.data | String | Data of ELF file. |
| items[].elf.entryPoint | String | Entry point for the ELF file. |
| items[].elf.context | Array | Context information of ELF file. |
| items[].elf.type | String | Type of ELF file. |
| items[].elf.sectionNames | Array | List of section names in ELF file. |
| items[].elf.importedLibraries | Array | List of imported libraries in ELF file. |
| items[].macho | Object | Macho information of the file. This is applicable for Mac files. |
| items[].macho.uuid | String | UUID of the Macho file. |
| items[].macho.identifier | String | Identifier of the Macho file. |
| items[].macho.minOsxVersion | String | Minimum OSx version for the Macho file. |
| items[].macho.context | Array | Context information of the Macho file. |
| items[].macho.flags | String | Flags of Macho file. |
| items[].macho.numberOfLoadCommands | String | Number of load commands for the Macho file. |
| items[].macho.version | String | Version of the Macho file. |
| items[].macho.sectionNames | Array | Section names in the Macho file. |
| items[].macho.importedLibraries | Array | Imported libraries list in the Macho file. |
| items[].entropy | String | Entropy of the file. |
| items[].format | String | Format of the file. |
| items[].fileStatus | String | Status of the file as assigned by the analyst. (Whitelist, Blacklist, Neutral, and Graylist). |
| items[].remediationAction | String | Remediation action as assigned by the analyst. For example, Blocked. |

Note: The following is a sample response with all fields populated. However, the response for pe, macho, and elf is generated based the operating system type. The fields without values will display as null.

```
GET /rest/api/files?serviceId=<service-id>&&pageNumber=0&pageSize=90
```

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files?serviceId=617b872b-9663-4f72-9bdc-
c80422230df7&pageNumber=0&pageSize=1' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

### Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60

# Request Scan

This API starts a scan for the host with the specified agent ID.

```
POST /rest/api/host/{agentId}/scan?serviceId=<service-id>&scanType=<scanType>
```

### Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

### Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |
| scanType | Type of scan command. |
| cpuMax | You can use cpuMax to specify the amount of CPU the agent can use to run the scan. You can choose a value from 5 to 100. If you do not specify a value, the agent uses the default 25% CPU for the scan |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/scan?serviceId=617b872b-9663-4f72-9bdc-
c80422230df7&scanType=QUICK_SCAN&cpuMax=67' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

# Request Scan with given CPU Usage

This API starts a scan for the host with the specified agent ID and given CPU usage.

```
POST /rest/api/host/{agentId}/scan?serviceId=<service-
id>&scanType=<scanType>&cpuMax=<cpuMax>
```

### Path Parameters

Snippet path-parameters not found for operation::endpoint-api-specification/request-scan-for-a-host-with-cpuMax/

### Request Parameters

Snippet request-parameters not found for operation::endpoint-api-specification/request-scan-for-a-host-with-cpuMax/

### Sample Request

Snippet curl-request not found for operation::endpoint-api-specification/request-scan-for-a-host-with-cpuMax/

### Sample Response

Snippet http-response not found for operation::endpoint-api-specification/request-scan-for-a-host-with-cpuMax/

- cpuMax: Minimum value allowed is 5 and Maximum value allowed is 100.

# Request Stop Scan

This API stops a scan for the host with the specified agent ID.

```
DELETE /rest/api/host/{agentId}/scan?serviceId=<service-id>&scanType=<scanType>
```

### Path Parameters

| Parameter | Description |
|---|---|
| `agentId` | Unique identifier of the host. |

### Request Parameters

| Parameter | Description |
|---|---|
| `serviceId` | Service ID of the Endpoint Server to be connected. |
| `scanType` | Type of scan command. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/scan?serviceId=617b872b-9663-4f72-9bdc-c80422230df7&scanType=CANCEL_SCAN'
-i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

# Get Alerts for a Host

This API gets all alerts triggered for a given host. Alerts are categorized as 'Critical', 'High', 'Medium' and 'Low'. The response provides category level count of alerts triggered along with list of alerts.

| Path | Type | Description |
|---|---|---|
| id | String | ID of the entity for which score needs to be queried. Agent ID in case of host and checksum in case of files. |
| distinctAlertCount | Object | Count of distinct Alert/category for the entity. |
| distinctAlertCount.critical | String | Number of critical alerts. |
| distinctAlertCount.high | String | Number of high alerts. |
| distinctAlertCount.medium | String | Number of medium alerts. |
| distinctAlertCount.low | String | Number of low alerts. |
| categorizedAlerts | String | Count of alert and events for a file/host, categorized by severity. |

```
GET /rest/api/host/{agentId}/alerts?serviceId=<service-id>
```

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/alerts?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

## Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 831
```

```
{
  "id" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",
  "distinctAlertCount" : {
    "critical" : 0,
    "high" : 4,
    "medium" : 2,
    "low" : 0
  },
  "categorizedAlerts" : {
    "All" : {
      "Possibly Renamed net.exe Detected" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Powershell Injects Remote Process" : {
        "alertCount" : 3,
        "eventCount" : 3
      },
      "Unexpected taskhostw.exe Parent" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Unexpected runtimebroker.exe Parent" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Performs Scripted File Transfer" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Unexpected Svchost.Exe Parent" : {
        "alertCount" : 1,
        "eventCount" : 1
      }
    }
  }
}
```

To filter alerts based on the category, add the alertCategory path parameter.

```
GET /rest/api/host/{agentId}/alerts?serviceId=<service-id>&alertCategory=Medium
```

# Get Alerts for a File

This API gets all alerts triggered for a given file. Alerts are categorized as 'Critical', 'High', 'Medium' and 'Low'. The response provides category level count of alerts triggered along with list of alerts. Only checksum supported are `sha256` and `md5`.

| Path | Type | Description |
| --- | --- | --- |
| id | String | ID of the entity for which score needs to be queried. Agent ID in case of host and checksum in case of files. |
| distinctAlertCount | Object | Count of distinct Alert/category for the entity. |
| distinctAlertCount.critical | String | Number of critical alerts. |
| distinctAlertCount.high | String | Number of high alerts. |
| distinctAlertCount.medium | String | Number of medium alerts. |
| distinctAlertCount.low | String | Number of low alerts. |
| categorizedAlerts | String | Count of alert and events for a file/host, categorized by severity. |

```
GET /rest/api/file/{checksum}/alerts?serviceId=<service-id>
```

## Sample Request

```
$ curl
'https://api.netwitness.local/rest/api/file/d1c79a36593f0d5f7d07502b963d97acc851dc0291
f4556ce8f110a58a48fda4/alerts?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X
GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

## Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 545
```

```
{
  "id" : "d1c79a36593f0d5f7d07502b963d97acc851dc0291f4556ce8f110a58a48fda4",
  "distinctAlertCount" : {
    "critical" : 0,
    "high" : 2,
    "medium" : 1,
    "low" : 0
  },
  "categorizedAlerts" : {
    "All" : {
      "Possibly Renamed net.exe Detected" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Powershell Injects Remote Process" : {
        "alertCount" : 3,
        "eventCount" : 3

        "eventCount" : 1
      }
    }
  }
}
```

To filter alerts based on the category, add the alertCategory path parameter.

```
GET /rest/api/file/{checksum}/alerts?serviceId=<service-id>&alertCategory=Medium
```

# Request File Download to Server

This API initiates the file download to the Endpoint Server. The following are the fields in the request body:

- path: Full path where the files may be present.

```
POST /rest/api/host/{agentId}/download/download-file?serviceId=<service-id>
```

### Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

### Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/download-file?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d '{"path":"C:\\Users\\sample\\test.exe"}'
```

### HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/download/download-
file?serviceId=617b872b-9663-4f72-9bdc-c80422230df7 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 38

{"path":"C:\\Users\\sample\\test.exe"}
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

# Request Multiple File Downloads to Server

This API initiates the multiple file downloads to the Endpoint Server matching the wildcard path. The following are the fields in the request body:

- path: Path where the files may be present using wildcard.
- countFiles: Maximum number of files returned by the host matching the wildcard path (default 10).

- maxFileSize: Maximum size of each file (in MB) (default 100 MB).

```
POST /rest/api/host/{agentId}/download/download-files?serviceId=<service-id>
```

### Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

### Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/download-files?serviceId=617b872b-9663-4f72-9bdc-c80422230df7'
-i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d '{"path":"C:\\Users\\sample\\*","countFiles":3,"maxFileSize":150}'
```

### HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/download/download-
files?serviceId=617b872b-9663-4f72-9bdc-c80422230df7 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 64

{"path":"C:\\Users\\sample\\*","countFiles":3,"maxFileSize":150}
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

# Request MFT Download

This API initiates the MFT download to the Endpoint Server.

```
POST /rest/api/host/{agentId}/download/mft?serviceId=<service-id>&path=<path>
```

## Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

## Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |
| path | Drive or NTFS Mount path for which MFT is requested |

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/mft?serviceId=617b872b-9663-4f72-9bdc-c80422230df7&path=E%3A%5C'
-i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

## Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:08 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

Request parameter "path" can be any valid windows drive or windows path. Below are the valid sample values

- C:\
- d:\

- E:\mountPath\NTFSmount
- f:\mount path\NTFS Mount

Note: MFT Download is not supported in Relay Mode

# Request System Dump Download

This API initiates the download of the system dump to the Endpoint Server.

```
POST /rest/api/host/{agentId}/download/system-dump?serviceId=<service-id>
```

## Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

## Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/system-dump?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

## Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Note: System Dump Download is not supported in Relay Mode

# Request Process Dump Download

This API initiates the download of the process dump to the Endpoint Server.

Process information are specified as a part of the request body.

```
POST /rest/api/host/{agentId}/download/process-dump?serviceId=<service-id>
```

### Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/process-dump?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d
'{"processId":5744,"eprocess":"0xFFFFE10DC62C6440","fileName":"spoolsvX.bat","path":"E
\\Windows\\ReportServer\\PolicyDefinitions","hash":"687685b7531648c39fbb24fa81312b7fd2
e3ece1bf1347b386f8725783767e5c","processCreateUtcTime":1635266589271}'
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

# Request Network Isolation

This API isolates the host with the specified agent ID from the network.

```
POST /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

### Path Parameters

| Parameter | Description |
| --- | --- |
| agentId | Unique identifier of the host. |

### Request Parameters

| Parameter | Description |
| --- | --- |
| serviceId | Service ID of the Endpoint Server to be connected. |

### Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d
'{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"10.125.0.1","v4":true}],"comment":
"Found malicious"}'
```

### HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/isolation?serviceId=617b872b-
9663-4f72-9bdc-c80422230df7 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 103

{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"10.125.0.1","v4":true}],"comment":"
Found malicious"}
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

# Update Network Isolation Exclusion List

This API updates the network isolation exclusion list for the host with the specified agent ID.

```
PATCH /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

## Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

## Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X PATCH \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d
'{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"1.2.3.4","v4":true},{"ip":"10.125.
0.1","v4":true}],"comment":"Updating IP exclusions for network isolation"}'
```

## HTTP request

```
PATCH /rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=617b872b-9663-4f72-9bdc-c80422230df7 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 159

{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"1.2.3.4","v4":true},{"ip":"10.125.0
.1","v4":true}],"comment":"Updating IP exclusions for network isolation"}
```

## Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

# Release from Network Isolation

This API restores the network connection and removes IP addresses added to the exclusion list for the host with the specified agent ID.

```
DELETE /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

## Path Parameters

| Parameter | Description |
|---|---|
| agentId | Unique identifier of the host. |

## Request Parameters

| Parameter | Description |
|---|---|
| serviceId | Service ID of the Endpoint Server to be connected. |

## Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=617b872b-9663-4f72-9bdc-c80422230df7' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json; charset=UTF-8' \
    -d '{"allowDnsOnlyBySystem":false,"exclusions":null,"comment":"Release from
isolation"}'
```

## HTTP request

```
DELETE /rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=617b872b-9663-4f72-9bdc-c80422230df7 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json; charset=UTF-8
Host: api.netwitness.local
Content-Length: 83

{"allowDnsOnlyBySystem":false,"exclusions":null,"comment":"Release from isolation"}
```

## Sample Response

```
HTTP/1.1 200 OK
Date: Tue, 26 Oct 2021 16:43:09 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```

# Access NwConsole and Help

RSA NetWitness Console, also known as NwConsole, is a multi-platform terminal application that provides powerful tools and command line access to Core services, such as Decoder, Log Decoder, Concentrator, Broker, and Archiver. While most users complete their tasks and investigations through the NetWitness user interface, some advanced users, such as administrators and developers, require direct access to the services without going through the user interface. NwConsole enables you to enter commands from the command line or run multiple commands from a file.

This topic describes how to access NwConsole and view the internal help within NwConsole.

Extensive help information is available within the NetWitness console, also known as NwConsole. You can access this help from the NetWitness command line.

## Prerequisites

All NetWitness appliances have the NwConsole application installed. You can also install it on Windows, Mac, and CentOS to connect and interact with a Core service.

NwConsole is available from the command line on a NetWitness appliance. If you are accessing a Core appliance remotely, you need to have the RSA NetWitness Console application installed on a Windows, Mac, or CentOS machine. To obtain the NetWitness Console application installer, contact RSA Customer Care.

## Access NwConsole

To run NwConsole from the command line on a NetWitness appliance or on a terminal emulator, at the <$> prompt, type `NwConsole` (Linux) or `nwconsole` (Windows). The actual command is `NwConsole`, but Windows is not case sensitive. RSA NetWitness Console is displayed as shown in the following example.

```
Last login: Thu Sep 24 14:00:42 on console
usxx<username>m1:~ <username>$ NwConsole
RSA NetWitness Platform Console 11.2.0.0.6105
Copyright 2001-2020, RSA Security Inc. All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual
pages.
>
```

## View Help

NwConsole provides help on individual commands as well as help on specific topics.

**Caution:** To get the latest information, view the command and help topics within NwConsole.

## View a List of Commands

To view a list of available commands and their descriptions, at the (>) prompt, type `help`. The following example shows a list of available commands.

```
> help
Local commands:
    avro2nwd      - Convert AVRO files to NWD files
    avrodump      - Display schema and contents of AVRO file (for debugging)
    blockspeed    - Tests various write block sizes to determine best setting
    compileflex   - Compile all flex parsers in a directory
    createflex    - Create a flex parser that matches tokens read from a file
    dbcheck       - Perform a database integrity check over one or more
                    session, meta, packet, log or stat db files
    diskspeed     - Measures the speed of the disk(s) mounted at a specified
                    directory
    echo          - Echos the passed in text to the terminal
    encryptparser - Encrypt all parsers in a directory
    feed          - Create and work with feed files
    fmanip        - Manipulate a file with XOR and check for embedded PEs
    hash          - Creates or verifies hashes of database files
    help          - Provides help information for recognized console commands
    history       - Displays, erases or executes a command in the command
                    history
    httpAggStats  - Tests HTTP aggregation and reports statistics as it
                    continues
    log           - Perform operations on a log database
    logParse      - Parse line delimited logs on stdin and post results to
                    stdout
    logfake       - Create a fake log pcap file
    lua           - Execute a lua script
    makec3        - Generate C3 Test Data
    makepcap      - Convert packet database files to pcap or log files
    man           - Displays a list of topics or opens a specific manual page
                    on a topic
    metaspeed     - Tests read performance over an existing meta db
    netbytes      - Display statistics on network interface utilization
    nwdstrip      - Convert full NWD file into just session and meta file
    pause         - Wait for user input when running a script file
    reindex       - reindex a collection
```

```
    sdk             - Execute SDK commands based on the C SDK library, type "sdk
                      help" for more information
    sleep           - Sleeps for the specified milliseconds
    timeout         - Globally change the timeout for waiting for a response from
                      a service
    tlogin          - Open a trusted SSL connection to an existing service
    topQuery        - Returns the top N longest running queries from the audit
                      log (either a file or from the log API)
    vslice          - Validate index slices

Remote commands (executed on the connected service, see "login"):
    login           - Connect to a remote service.  Once connected, type help to
                      see commands available for remote execution.

For detailed help, type "help <command>"
>
```

## View Detailed Help on a Command

To view detailed information about a command, type `help <command>`. The following example shows help for the `logParse` command after typing `help logParse`.

```
For detailed help, type "help <command>"
> help logParse
Usage: logParse {in=<pathname>} {indir=<pathname>} [out=<pathname>]
                [content=<c2|c3>] [device=<device,[device...]>]
                [path=<log-parsers-config-path>] [metaonly] [srcaddr=<src
                address>] [srcaddrfile=<filename,IP Address>]
Parse line delimited logs on stdin and post results to stdout

    in          - The input source file. "in=stdin" means interactive typing of
                  log.
    indir       - The input source files parent directory
    out         - The output file or output file parent directory if input is
                  set by indir. If not specified, use stdout as output.
    content     - Content version, either c2 or c3. Default is c2.
    device      - Comma delimited device list specifying devices that is
                  enabled. Default enable all devices.
    path        - The logparsers configuration path. Default will find
                  configuration file like logdecoder.
    metaonly    - The output will only contains parsed meta, otherwise will
```

```
                print log message after metas.
    srcaddr     - The source address of the all the logs
    srcaddrfile - The source address for logs in one input file, in the format
                filename,ipaddress
>
```

## View a List of Help Topics

To view a list of help topics, type `man`. The following example shows a list of help topics.

```
> man
List of topics:

    Introduction
    Connecting to a Service
    Monitoring Stats
    Feeds
    Converting Packet DB Files to PCAP
    Packets
    Verifying Database Hashes
    SDK Content
    SDK Content Examples
    Troubleshooting

Type "man <topic>" for help on a specific topic, partial matches are acceptable
>
```

## View a Specific Help Topic

To view help about a specific topic, type `man <topic>`. The following example shows the Packets help topic after typing `man Packets`.

```
Type "man <topic>" for help on a specific topic, partial matches are acceptable
> man Packets
                                    Packets
                                    =======

The *packets* command can be used to generate a pcap or log file based on a
list of Session IDs, a time period or a where clause.  The command is quite
flexible and can be used on any running service that has access to the raw
data from a downstream component.  Before running the command, you must first
```

```
*login* to a service and then change directory to the appropriate sdk node,
(e.g., "cd /sdk").  Unlike the *makepcap* command, which only works on the
local file system, this command is meant to be used on a remote service.

    login ...
    cd /sdk
    packets where="service=80 && time='2018-03-01 15:00:00'-'2018-03-01
    15:10:00'" pathname="/tmp/march-1.pcap"
Write 10 minutes of HTTP only packets from March 1st, to the file
/tmp/march-1.pcap.  All times are in UTC.

    packets time1="2018-04-01 12:30:00" time2="2018-04-01 12:35:00"
    pathname=/media/sdd1/packets.pcap.gz
Write all packets between the two times to a gzip compressed file at
/media/sdd1/packets.pcap.gz

    packets time1="2018-04-01 12:30:00" time2="2018-04-01 12:35:00"
    pathname=/media/sdd1/mylogs.log
Write all logs between the two times to a plaintext file at
/media/sdd1/mylogs.log.  Any pathname ending with .log indicates that the
format of the output file should be plaintext line-delimited logs.
>
```

**Caution:** To get the latest information, view the command and help topics within NwConsole.

## Quit NwConsole

To exit the NwConsole application, type `quit` at the command line.

# Basic Command Line Parameters and Editing

NwConsole is like a Swiss army knife; it contains many tools buried underneath its command line interface. NwConsole is multi-platform. Executables are available for CentOS (which ships on appliances), Windows, and Mac. NwConsole is included on all hosts.

## Basic Command Line Parameters

Here are some basic command line parameters:

- `-f` To run a set of commands from a file, use the `-f` attribute as shown here:
  `NwConsole -f /tmp/<somefile.script>`
- `-e` You can use the `-e` attribute (which is similar to the -f attribute) to run a set of commands from a file and allow environment variable substitution within the file using `$ENV_VAR` syntax, as shown here:
  `NwConsole -e /tmp/<somefile.script>`
  Use `\$` to escape a dollar sign and `\\` to escape a backslash.
- `-c` To pass in a list of commands from the command line, use the `-c` attribute as shown here:

  `NwConsole -c <command1> -c <command2> -c <command3>`

  This is not recommended except for very simple scripts. The Bash interpreter can jumble quoted strings if you do not escape properly. If you have non-obvious errors passing through the command line, switch to reading from a file to see if that fixes the issues.
- `-i` Normally, the NwConsole exits after running commands passed by a file or command line. If you want to keep the interactive prompt open after the commands are executed, include `-i` in the command line.
- `-q` To suppress command information messages and only see command output, use `-q` for Quiet mode. This makes it easy to pipe command output (`stdout`) to other commands.

  You can also run NwConsole and type the commands in the console window.

When you use the `-c` option, you can use additional quotes and escape quotes to include embedded spaces for the `where` clause. For example:

```
where="\"tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'\""
```

The following example shows how to use the `-c` option for pcap extraction.

```
[root@nwadmin1 ~]# NwConsole -c login 127.0.0.1:56003:ssl <user> <passowrd> -
c cd sdk -c packets
where="\"tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'\""
pathname="/var/netwitness/ny_sdwan_tcp_443_20200930.pcap"
RSA NetWitness NextGen Console 11.3.1.0
```

```
Copyright 2001-2020, RSA Security Inc. All Rights Reserved.

>login ...
Successfully logged in to 127.0.0.1:56003 as session 168886
>cd sdk
[127.0.0.1:56003] /sdk
>packets where="tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'"
pathname=/var/netwitness/ny_sdwan_tcp_443_20200930.pcap
Writing packets to /var/netwitness/ny_sdwan_tcp_443_20200930.pcap (100%)
```

## Line Editing

You can use the keys in the following table when editing a command.

| Key | Descripton |
|---|---|
| Ctrl-U | Clears the current line |
| Ctrl-W | Deletes the word that the cursor is on |
| Ctrl-A | Moves the cursor to the beginning of the line |
| Ctrl-E | Moves the cursor to the end of the line |
| Ctrl-F | Moves the cursor forward to the next word |
| Ctrl-B | Moves the cursor backwards to the previous word |
| Up arrow | Displays the previously executed command |
| Down arrow | Displays the command executed after the current command (only valid if the up arrow has been pressed) |
| Left arrow | Moves the cursor to the previous character |
| Right arrow | Moves the cursor to the next character |
| Tab | Provides context sensitive completion of most commands and their parameters. The Tab key is very helpful for editing.<br>For example, to view the *Connecting to a Service* help topic, at the command line, you can type `man con` and then press the `Tab` key. NwConsole completes the command for you: `man Connecting to a Service`<br>Press **Enter** to run the command and view the topic. |
| `history` | Displays a numbered list of previous commands |
| `history execute=#` | Executes a previous command, which is also equivalent to typing `!#`<br>For example, `!1` executes the previous command. |
| `history clear` | Clears all command history |
| `history erase=#` | Erases a specific command from the history buffer. History is automatically stored from one session to the next. |

# Connecting to a Service

To connect and interact with a NetWitness Core service (Decoder, Concentrator, Broker, Archiver, and so on), you must first issue the `login` command. You must have an account on that service. You can type `help login` at any time for more information. Here is the syntax of the `login` command:

`login <hostname>:<port>[:ssl] <username> [password]`

For example: `login 10.10.1.15:56005:ssl someuser`

If you do not include the password, the NwConsole prompts you.

If you have set up proper trust between NwConsole and the endpoint, you can use the `tlogin` command and avoid having to enter a password. Setting up trust is beyond the scope of this documentation, but it involves adding NwConsole's SSL cert to the endpoint with the `send /sys peerCert op=add --file-data=<pathname of cert>` command. You must first use a normal login with the proper permissions before you can add a peer cert for subsequent trusted logins.

Once connected, you can interact with the endpoint service through a virtual file system. Instead of files, what you are looking at are the nodes of that service. Some nodes are folders and have child nodes, forming a hierarchical structure. Each node serves a purpose and all of them support a subset of commands like `info` and `help`. The `help` message returns information about the commands that each node supports. When you first log on, you are on the root node, which is the path `/`, just like a Linux or Mac system. To see a list of nodes under `/`, type the `ls` command.

All services have nodes like `sys` and `logs`. To interact with the **/logs** API, you can first send the `help` command to the **/logs** node. To do this, you must use the `send` message, which has this syntax:

```
Usage: send {node pathname} {message name} [name=value [name=value]]
            [--file-data=<pathname>] [--string-data=<text>] [--binary-data=<text>]
            [--file-format={binary,params,params-list,string,params-binary}]
            [--output-pathname=<pathname>] [--output-append-pathname=<pathname>]
            [--output-format={text,json,xml,html}]
Sends a command to a remote pathname.  For remote help, use "send <pathname>help" for
details.
    pathname                - The node pathname to retrieve information on
    message                 - The command (message) to send
    parameters              - Zero or more name=value parameters for the command
    --file-data             - Loads data from a file and send as either a BINARY
                              message or as a PARAMS_BINARY message if other
                              parameters exist. Providing the --file-format parameter
will
                              override automatic detection.
   --file format            - Treat file input as the provided format
  --string-data            - Sends text as a STRING message type
   --binary-data            - Send text as either a BINARY message type or as a
                              PARAMS_BINARY message type if other parameters
                              exist
    --output-pathname       - Writes the response output to the given pathname,
```

```
                              overwriting any existing file
  --output-append-pathname - Writes the response output to the given pathname,
                              will append output to an existing file
  --output-format          - Writes the response in one of the given formats,
                              the default is text
```

Parameters are formatted in `<name>=<value>` pairs, with whitespace between each pair. If a `<value>` has whitespace, you should place each value in double quotes. If the value itself should have double quotes, you can escape them by preceding with a backslash. For example: `send /sdk query query="select * where time=\"12-31-2019 14:30:00\"-u" size=100`

You must also escape backslashes; a double backslash is treated as a single backslash. It is also possible to pass special characters by giving their hex value using `\x##`. For example, `\x0a` would pass a line feed in the parameter value.

To send a `help` message, you would send this:

```
send /logs help
```

And your response would look something like this:

```
description: A container node for other node types
  security.roles: everyone,logs.manage
  message.list: The list of supported messages for this node
  ls:  [depth:<uint32>] [options:<string>] [exclude:<string>]
  mon:  [depth:<uint32>] [options:<uint32>]
  pull:  [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
  info:
  help:  [msg:<string>] [op:<string>] [format:<string>]
  count:
  stopMon:
  download:  [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-time>]
    op:<string> [logTypes:<string>] [match:<string>] [regex:<string>]
    [timeFormat:<string>] [batchSize:<uint32>]
  timeRoll:  [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>] [days:<uint32>]
    [date:<string>]
```

To get more information about a specific message or command, you can specify the `msg=<message name>` on the help command as a parameter. For example, look at the `pull` message help:

```
send /logs help msg=pull
```

```
 pull: Downloads N log entries
  security.roles: logs.manage
  parameters:
  id1 - <uint64, optional> The first log id number to retrieve, this is
     mutually exclusive with id2
  id2 - <uint64, optional> The last log id number that will be sent, defaults to
```

```
       most recent log message when id1 or id2 is not sent
    count - <uint32, optional, {range:1 to 10000}> The number of logs to pull
    timeFormat - <string, optional, {enum-one:posix|simple}> The time format used in
each
       log message, default is posix time (seconds since 1970)
```

The built-in message help says that this command grabs the last N log entries if you omit ID1 and ID2. To look at the last 10 log entries:

```
send /logs pull count=10 timeFormat=simple
```

Almost all of the commands on the service follow this simple format. The only commands that do not are the ones that require more complicated handshaking, like importing a PCAP to a Decoder. To import a PCAP, use the NwConsole `import` command, which takes care of the complicated communication channel handshaking.

Some parameters are specific to NwConsole's `send` command and are not actually sent to the service. You can use these parameters to change the output format of the response, write the response to a file, or read a file from the local machine and send it to the service. The local parameters to NwConsole's `send` command all start with two dashes --.

- `--output-format` — This parameter changes the normal output of the command from plain text to one of these types: JSON, XML, or HTML. The format `values` is a text output that only writes values (query output, stat/config values, and so on) without any other decorations.
- `--output-pathname` — Instead of writing the output to the terminal, the output is written to the specified pathname (truncates any existing file).
- `--output-append-pathname` — This is the same as `--output-pathname` except that it appends the output to an existing file (or creates the file if it does not exist).
- `--file-data` — Reads in a file and uses it as the command payload. This is useful for commands like `/sys fileEdit`. The following example shows how you can send an updated **index-concentrator-custom.xml** file using NwConsole:

  ```
  send /sys fileEdit op=put filename=index-concentrator-
  custom.xml --file-data="/Users/user/Documents/index-
  concentrator-custom.xml"
  ```

- `--file-format` — When reading an input file with `--file-data`, this parameter forces NwConsole to interpret the file as a specific type of input. The allowed enumerations are: `binary`, `params`, `params-list`, `string` and `params-binary`. As an example, to send a file of application rules (`*.nwr`) to a Decoder, you can use this command:

  ```
  send /decoder/config/rules/application replace --file-
  data=/path/rules.nwr --file-format=params-list
  ```

- `--string-data` — Sends the command payload as a string instead of a list of parameters.
- `--binary-data` — Sends the command payload as binary instead of a list of parameters.

Example Streaming Query to JSON file (could be a large result set):

```
send /sdk query size=0 query="select * where service=80 && time='2018-
03-05 13:00:00'-'2018-03-05 13:59:59'" --output-format=json --output-
pathname=/tmp/query.json
```

One thing to note about the `send` command is the fact that, by default, there is a timeout of 30 seconds waiting for a response. Some commands (like the query above) may take longer to receive results. To avoid a premature client-side timeout, you can use the `timeout [secs]` command to increase the wait. For instance, `timeout 600` would wait 10 minutes for a response before timing out. Once enacted, it takes effect for all subsequent commands.

To navigate around the virtual node hierarchy of the service, you can use the `cd` command like you would on any command shell. This covers the basics of connecting and interacting with a service. Once you are connected, the `help` command lists all the commands that you can use to interact with the endpoint. These commands do not display when you are not connected to an endpoint.

# Monitoring Stats

You can use NwConsole to watch statistics (stats) change on a service in real time. However, be warned that this can result in a LOT of output. If you are not careful and monitor too many nodes, the screen scrolls by too quickly to be useful.

As a simple example, if you log on to a Decoder, you can monitor the capture rate in real time. To do this, issue these commands after connecting to a Decoder:

```
cd /decoder/stats
```

```
mon capture.rate
```

That is all you need to do!  Now, any time the capture rate changes, it outputs into the console window.

You can add another monitor:

```
mon capture.avg.size
```

Now it watches those two stats and outputs those values when they change. You may have noticed that as you tried to type the second command, the output from the original monitor was messing up your display. This is the problem with monitoring stats. It is not really meant for doing more than just watching the stats after the first command is entered.

However, you can stop the monitoring by typing `delmons` and pressing **Enter**. Just ignore the output while you type and it returns you to a proper command prompt. If you want to monitor many stats at once, you can give the path of the parent stat folder and it monitors all of the stats underneath it. For example, typing `mon /decoder/stats` or `mon .` (they are equivalent) monitors everything. Be prepared for a lot of output! Remember to enter `delmons` if it is scrolling too fast.

# Useful Commands

The following NwConsole commands are useful when interacting with NetWitness Core services:

- **feed**: Enables you to create and work with feed files.
- **makepcap**: Converts Packet database (DB) files to PCAP.
- **packets**: Retrieves packets or logs from the logged in service.
- **hash**: Creates or verifies hashes of database files.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

## Feeds

The `feed` command provides several utilities for creating and examining feed files. A feed file contains the definition and data of a single feed in a format that has been precompiled for efficient loading by a Decoder or Log Decoder. For a complete reference on feed definitions, see the "Feed Definitions File" topic in the *Decoder Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

### create

```
feed create <definitionfile> [-x <password>]
```

The `feed create` command generates feed files for each feed defined in a feed definition file. A definition file is an XML document that contains one or more definitions. Each feed definition specifies a data file and the structure of that data file. The resulting feed files will be created in the same directory as the definition file with the same name as the data file, but with the extension changed to **.feed** (for example, **datafile.csv** results in **datafile.feed**). Any existing files with the target name will be overwritten without a prompt.

```
$ ls
 example-definition.xml    example-data.csv
 $ NwConsole
 RSA NetWitness Console 11.3.0.0.0
 Copyright 2001-2020, RSA Security Inc.  All Rights Reserved.

 Type "help" for a list of commands or "man" for a list of manual pages.
 > feed create example-definition.xml
 Creating feed Example Feed...
 done.  2 entries, 0 invalid records
 All feeds complete.
 > quit
 $ ls
 example-definition.xml    example-data.feed    example-data.csv
 $
```

Optionally, feed files can be obfuscated using the option `-x` followed by a password of at least 16 characters (no spaces). This will be applied to all feeds defined in the definition file. In addition to the feed file, a token file will be generated for each feed file. The token file must be deployed with the corresponding feed file.

```
feed create example-definition.xml -x 0123456789abcdef
```

### stats

```
feed stats <feedfile>
```

The `feed stats` command provides summary information for an existing, un-obfuscated feed file. Specifying an obfuscated feed file will result in an error.

```
> feed stats example.feed
 Example Feed stats:
 version  : 0
 keys count  : 1
 values count: 2
 record count: 2
 meta key  : ip.src/ip.dst
 language keys:
    alert    Text
```

### dump

```
feed dump <feedfile> <outfile>
```

The `feed dump` command generates a normalized, key-value pair listing of an un-obfuscated feed file. You can use the resulting file to validate a feed file or assist in determining which records were considered invalid when the feed was created. Specifying an obfuscated feed file will result in an error. If `outfile` exists, the command will abort without overwriting the existing file.

```
feed dump example.feed example-dump.txt
```

## Converting Packet DB Files to PCAP

You can use the `makepcap` command to quickly convert any Packet DB file to a generic PCAP file, preserving the capture time order. This command offers many options (see `help makepcap`), but is easy to use. All it really needs is the Packet DB directory (with the `source=<pathname>` parameter) to get started.

**Note:** You must stop the Decoder or Archiver service before running this command. If you want to generate a PCAP while the service is running, see the `packets` command.

- `makepcap source=/var/lib/netwitness/decoder/packetdb`
  This command converts every Packet DB file into a corresponding PCAP file in the same directory. If the disk is almost full, see the next command.

- `makepcap source=/var/lib/netwitness/decoder/packetdb dest=/media/usb/sde1`
  This command writes all of the output PCAPs to the directory at **/media/usb/sde1**.

- `makepcap source=/var/lib/netwitness/decoder/packetdb dest=/media/usb/sde1 filenum=4-6`
  This command only converts the files numbered 4 through 6 and skips all other files. In other words, it converts the Packet DB files: **packet-000000004.nwpdb**, **packet-000000005.nwpdb**, and **packet-000000006.nwpdb**.

- `makepcap source=/var/lib/netwitness/decoder/packetdb time1="2020-03-01 14:00:00" time2="2020-03-02 07:30:00" fileType=pcapng`
  This command only extracts packets with a timestamp between March 1st, 2020 at 2 PM and March 2nd, 2020 before or on 7:30 AM. It writes the file as `pcapng` in the same directory as the source. All timestamps are UTC.

## Packets

You can use the `packets` command to generate a PCAP or log file based on a list of Session IDs, a time period, or a `where` clause. This command is very flexible, and you can use it on any running service that has access to the raw data from a downstream component. Before running the command, you must first `login` to a service and then change directory to the appropriate SDK node (for example, `cd /sdk`). Unlike the `makepcap` command, which only works on the local file system, you use this command for a remote service.

```
login ...
cd /sdk
packets where="service=80 && time='2020-03-01 15:00:00'-'2020-03-01 15:10:00'"
pathname="/tmp/march-1.pcap"
```

This command writes 10 minutes of HTTP-only packets from March 1st to the file **/tmp/march-1.pcap**. All times are in UTC.

- `packets time1="2020-04-01 12:30:00" time2="2020-04-01 12:35:00" pathname=/media/sdd1/packets.pcap.gz`
  This command writes all packets between the two times to a GZIP compressed file at **/media/sdd1/packets.pcap.gz**.

- `packets time1="2020-04-01 12:30:00" time2="2020-04-01 12:35:00" pathname=/media/sdd1/mylogs.log`
  This command writes all logs between the two times to a plaintext file at **/media/sdd1/mylogs.log**. Any pathname ending with **.log** indicates that the format of the output file should be plaintext line-delimited logs.

## Verifying Database Hashes

By default, Archiver writes an XML file for every DB file that is written. This XML file ends with the extension **.hash** and contains a hash of the file along with other pertinent information. You can use the `hash` command to verify that the DB file has not been tampered with by reading the hash stored in the XML file and then rehashing the DB file to verify that the hash is valid. The command does accept wildcards, so something like `/var/netwitness/archiver/database0/default/packetdb/*.hash` will verify all hashes in that directory. You can also use the `--output-pathname` and `--output-format` parameters to write out the verification in json, xml or text formats for scripting purposes. If the DB files are not found in the location that the XML file says it should be in, then the command will attempt to find the DB files in the current directory or the directory where the hash file is found.

```
hash op=verify
hashfile=/var/lib/netwitness/archiver/database0/alldata/packetdb/packe
t-000004880.nwpdb.hash
```

This command verifies that the Packet DB file **packet-000004880.nwpdb** still matches the hash in the XML file **packet-000004880.nwpdb.hash**. For proper security, the hash file should be stored somewhere else to prevent the XML file from being tampered with (such as write-once only media), but the hash command itself is not affected by where it is stored.

# SDK Content Command

One of the powerful commands in NwConsole is `sdk content`. It contains numerous options to do just about anything, at least as far as extracting content from the NetWitness Core stack. You can use it to create PCAP files, log files, or extract files out of network sessions (for example, to grab all of the pictures from email sessions). It can append files, have a maximum size assigned before creating a new file, and automatically clean up files when the directory grows too large. It can run queries in the background to find new sessions. It breaks queries into manageable groups and performs those operations automatically. When the group is exhausted, it does a requery to get a new set of data for further operations. The list of options for the SDK content command is very extensive.

Because the command has so many options, this document provides examples of commands for different use cases.

Before you can run `sdk content`, there are a few commands (like logging into a service) that you need to run first. Here are some examples:

- First connect to a service:
  `sdk open nw://admin:netwitness@10.10.25.50:50005`
- If you need to connect over SSL, use the nws protocol:
  `sdk open nws://admin:netwitness@10.10.25.50:56005`
- Keep in mind that you are passing a URL and must URL encode it properly. If the password is `p@ssword`, the URL looks like this:
  `sdk open nw://admin:p%40ssword@10.10.25.50:50005`
  This also applies to username.
- Once you log in, you can set an output directory for the commands: `sdk output <some pathname>`
- For command line help, type: `sdk content`

Before you try the example commands, it is important to understand the `sessions` parameter. This parameter is very important and controls how much or how little data you want to grab (the `where` clause is also important). The sessions parameter is either a single session ID or a range of session IDs. All NetWitness Core services work with session IDs, which start at 1 and increase by 1 for every new session added to the service (network or log session). Session IDs are 64-bit integers, so they can get quite large.

For example, to keep it simple, assume we have a Log Decoder that has ingested and parsed 1000 logs. On the service, you now have 1000 sessions with session IDs from 1 to 1000 (session ID 0 is never valid). If you want to operate over all 1000 sessions, you pass `sessions=1-1000`. If you only want to operate over the last 100 sessions, you pass `sessions=901-1000`. Once the command finishes processing session 1000, it exits back to the console prompt.

Many times, however, we do not care about specific session ranges. We just want to run a query over all of them and process the sessions that match a query. Here are some shortcuts that simplify this:

- The letter `l` (lowercase L) means lower bound or the lowest session ID.
- The letter `u` means the highest session ID. In fact, it actually means the highest session ID for future sessions as well. In other words, if you pass `sessions=l-u`, this special range means operate over all the current sessions in the system, but also do not quit processing, and as new sessions enter the system, process those, too. The command pauses and waits for new sessions once it reaches the last session on the service. To summarize, the command never exits and goes into continuous processing mode. It runs for days, months, or years, unless it is killed.
- If you do not want the command to run forever, you can pass `now` for the upper limit. This determines the last session ID on the service at the time the command starts and processes all sessions until it reaches that session ID. Once it reaches that session ID, the command exits, regardless of how many sessions may have been added to the service since the command started. So, for the example Log Decoder, `sessions=200-now` starts processing at session 200 and goes all the way to session 1000 and quits. Even if another 1000 logs were added to the Log Decoder after the command started, it still exits after processing session 1000.
- The parameter `sessions=now-u` means start at the very last session and continue processing all new sessions that come in. It does not process any existing sessions (except the last one), only new sessions.
- If you want to run this continually and have it remember the last session it processed between invocations, use the `sessionPersist={pathname}` parameter. The pathname should be a valid filename where the command will write the last successful session id. Upon restart, it will read the last session id and pick up where it left off.

For example commands and what they do, type `man sdk content examples` or see SDK Content Command Examples.

# SDK Content Command Examples

The first NwConsole SDK content command example below is simple and shows all of the commands that you need to enter. After that, the examples show only the `sdk content` commands. The first example creates a log file and grabs the first 1000 logs out of a Concentrator aggregating from a Log Decoder:

- ```
  sdk open nw://admin:netwitness@myconcentrator.local:50005
  sdk output /tmp
  sdk content sessions=1-1000 render=logs append=mylogs.log
  fileExt=.log
  ```
  This script outputs 1000 logs (assuming sessions 1 through 1000 exist on the service) to the file **/tmp/mylogs.log**. The logs are in a plain text format. The parameter `fileExt=.log` is necessary to indicate to the command that we want to output a log file.

- ```
  sdk content sessions=1-1000 render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  ```
  This command grabs the same 1000 logs as above, but it parses the log header and extracts the log timestamp, forwarder, and other information, and puts them in a CSV formatted file.
  Example CSV: `1422401778,10.250.142.64,10.25.50.66,hop04b-LC1,%MSISA-4:81.136.243.248...`
  The timestamp is in Epoch time. The `includeHeaders` and `separator` parameters can only be used on NetWitness installs 10.4.0.2 and later.

- ```
  sdk content sessions=1-now render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  where="risk.info='nw35120'"
  ```
  This command writes a log file across the current session range, but only logs that match `risk.info='nw35120'`. Keep in mind that when you add a `where` clause, it performs a query in the background to gather the session IDs for export. The query should be run on a service with the proper fields indexed (which is typically a Broker or Concentrator). In this case, since you are querying the field `risk.info`, double-check the service where you run the command to make sure it is indexed at the value level (`IndexValues`, see **index-concentrator.xml** for examples). By default, most Decoders only have time indexed. If you use any field but time in the `where` clause, you need to move the query from the Decoder to a Concentrator, Broker, or Archiver with the proper index levels for the query. You can find more information on indexing and writing queries in the *NetWitness Core Database Tuning Guide*.

- ```
  sdk content sessions=1-now render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  where="threat.category exists && time='2020-01-05 15:00:00'-'2020-01-05 16:00:00'"
  ```
  This command is the same as above, but it only searches for matching logs between 3 PM and 4 PM (UTC) on Jan 5, 2020 that have a meta key `threat.category`. Again, because this query has a field other than time in the `where` clause (`threat.category`), it should be run on a service with

`threat.category` indexed at least at the `IndexKeys` level (the operators `exists` and `!exists` only require an index at the key level, although values work fine, too).

- `sdk content sessions=1-now render=logs append=mylogs fileExt=.log where="event.source begins 'microsoft'" maxFileSize=1gb`
  This command creates multiple log files, each one no larger than 1 GB in size. It prepends the filenames with **mylogs** and appends them with the date-time of the first packet/log timestamp in the file. Some example filenames: **mylogs-1-2020-Jan-28T11_08_14.log**, **mylogs-2-2020-Jan-28T11_40_08.log** and **mylogs-3-2020-Jan-28T12_05_47.log**. On versions older than 10.5, the T separator between date and time is a space.

- `sdk content sessions=1-now render=pcap append=mypackets where="service=80,21 && time='2020-01-28 10:00:00'-'2020-01-28 15:00:00'" splitMinutes=5 fileExt=.pcap`
  This command grabs all the packets between the five-hour time period for service types 80 and 21 and writes a PCAP file. Every five minutes, it starts a new PCAP file.

- `sdk content time1="2020-01-28 14:00:00" time2="2020-01-28 14:15:00" render=pcap append=mydecoder fileExt=.pcap maxFileSize=512mb sessions=1-now`
  **Pay attention to this command**. Why? It works for both packets and logs and is *extremely fast*. The downside is that you get everything between the two time ranges and you cannot use a `where` clause. Again, it starts streaming everything back almost immediately and does not require a query to run first on the backend. Because everything is read using sequential I/O, it can completely saturate the network link between the server and client. It starts creating files prepended with **mydecoder** and splits to a new file once it reaches 512 MBs in size.

- `sdk tailLogs`
  or (the equivalent command):
  `sdk content render=pcap console=true sessions=now-u`
  This is a fun little command. It actually uses `sdk content` behind the scenes. The purpose of this command is to view all incoming logs on a Log Decoder. As logs come into the Log Decoder (you can also run it on a Broker or Concentrator), they are output on the console screen. It is a great way to see if the Log Decoder is capturing and what exactly is coming into the Log Decoder. This command runs in continuous mode. Do not use it if the Log Decoder is capturing at a high ingest rate (this command cannot keep up with it). However, it is helpful for verification or troubleshooting purposes.

- `sdk tailLogs where="device.id='ciscoasa'" pathname=/mydir/anotherdir/mylogs`
  This command is the same as above, except it only outputs logs that match the `where` clause and instead of outputting to the console, it writes them to a set of log files under `/mydir/anotherdir` that do not grow larger than 1 GB. Obviously, you can accomplish this with the `sdk content` command as well, but this command requires a little less typing if you like the default behavior.

- `sdk content sessions=now-u render=pcap where="service=80" append=web-traffic fileExt=.pcap maxFileSize=2gb maxDirSize=100gb`
  This command starts writing PCAPs of all web traffic from the most recent session and all new incoming sessions that match `service=80`. It writes out PCAPs no larger than 2 GBs and if all the PCAPs in the directory grow larger than 100 GBs, it deletes the oldest PCAPs until the directory is 10% smaller than the maximum size. Keep in mind that the directory size checking is not exact and it only checks every 15 minutes by default. You can adjust the number of minutes between checks by passing `cacheMinutes` as a parameter, but this only works with versions 10.5 and later.

- `sdk content sessions=79000-79999 render=nwd append=content-%1%.nwd metaFormatFilename=did`
  This is a basic backup command. It grabs 1000 sessions and outputs the full content (sessions, meta, packets, or logs) to the NWD (NetWitness Data Format) format. NWD is a special format that can be re-imported to a Packet or Log Decoder without reparsing. So essentially, the original parsed session imports without changes. The timestamp does not change as well, so if it was originally parsed six months ago, the timestamp upon import will be retained as six months ago.

  **Note:** Do not expect great performance with this command, especially with packets. Gathering the packets for a session involves a lot of random I/O and can drastically slow down the export. Logs do not suffer as much from this problem (only one log per session), but behind the scenes, this command uses the /sdk content API, which is not a performance-minded streaming API like /sdk packets.

  The `metaFormatFilename` parameter is very helpful in this command. If this command is run on a Concentrator with more than one service, the NWD filenames will be created with the `did` meta for each session (the `%1%` in the append parameter is substituted with the value of `did`). Each filename will indicate exactly which Decoder the data came from.

- `sdk content session=1-u where="service=80,139,25,110" render=files cacheMinutes=10 dir=/tmp/content-files maxDirSize=200mb`
  This is another fun little command. It works very similar to our old Visualize product if you pair the output directory with something like Windows Explorer in Icon mode. It extracts files from all web, email, and SMB traffic. This includes all kinds of files, such as images, zip files, videos, PDFs, office documents, text files, executables, and audio files. If it extracts malware, your virus scanner will flag it. Nothing will be executed by the command, so it does not infect the machine (unless you try to execute it yourself). However, it can be useful because if you do find malware, the filename indicates the session ID where it was extracted. You can then query that session ID and see which host the malware possibly infected and take action. You can filter what gets extracted with the parameters `includeFileTypes` or `excludeFileTypes` (see the command help). For example, adding `excludeFileTypes=".exe;.dmg;.msi"` prevents executables and installers from being extracted. This command just runs nonstop extracting files from all existing and any new sessions. After the directory gets littered with more than 200 MBs of files, it automatically starts cleaning up the files every 10 minutes.

  **Note:** This command only makes sense for packet sessions, not logs.

- `sdk content session=1-now render=files where="time='2015-01-27 12:00:00'-'2015-01-27 13:00:00' && (service=25,110,80)" subdirFileTypes="audio=.wav;.mp3;.aac; video=.wmv;.flv;.mp4;.mpg;.swf; documents=.doc;.xls;.pdf;.txt;.htm;.html images=.png;.gif;.jpg;.jpeg;.bmp;.tif;.tiff archive=.zip;.rar; other=*" renameFileTypes=".download|.octet-stream|.program|.exe;.jpeg|.jpg" maxDirSize=500mb`
  This command extracts files from HTTP and email sessions from a one-hour period and then groups the extracted files into directories specified by the `subdirFileTypes` parameter. For example, any extracted audio file with the extension `.wav`, `.mp3`, or `.aac` will be placed into the subdirectory `audio`, which will be created under the specified output directory. The same goes for all the other groups specified in that parameter. Some files will also be automatically renamed based on their file extension, which is handled by `renameFileTypes`. Any file with an extension `.download`, `.octet-stream` or `.program` will be renamed to `.exe`. Files with the extension `.jpeg` will be renamed `.jpg`. Once the top-level directory exceeds 500 MBs, the oldest files are cleaned. This command stops at the last session at the time the command started.

- `sdk content session=1-u render=111 where="filename exists" maxDirSize=20mb fileHash=md5,sha1,sha256 linkMeta=sessionid,time,did,service_uuid deviceType=filehash logDecoder="<hostname>:<port>[:ssl]" sessionPersist=/tmp/last-session.txt`
  If you want to extract file hashes from network protocols like HTTP, SMB, POP3 and SMTP, this is the command you want to use. Not only will it give you the file hash, but it will send an event to a Log Decoder with this information, which will be processed into a session for querying. For example, use `sdk open` to talk to a Broker or Concentrator that is aggregating from one or more Network Decoders. Set the `where` clause to find sessions of interest that have embedded files in the protocols we support for file extraction (use Live to install Malware Analysis content for example). Next, set up a Log Decoder to receive the file hash information. This information will go into the meta keys `checksum`, `checksum.algo`, `filename`, `filename.size` and `link`. The meta key link is used to indicate the session (with the file that has been hashed) on the device used by `sdk open`. When hashes of interest are discovered on the Log Decoder, the link meta can be used to find the original packet session that contains the file. The parameters `fileHash`, `linkMeta` and `deviceType` can be used to customize how the log is generated that is sent to the Log Decoder. The ports for sending Syslog to a Log Decoder are usually 514 or 6514 (for SSL). You may need to add a `table-map-custom.xml` file on the Log Decoder to properly save the meta keys sent in the file hash log. For the `linkMeta` parameter, `service_uuid` is a special meta key that inserts the UUID of the service the session ID belongs to. This can be used to link back to the original session from the Log Decoder. `sessionPersist` is used to write out our session IDs to pick up where we left off from the last run.

- `sdk search session=l-now where="service=80,25,110" search="keyword='party' sp ci"`
  This command searches all packets and logs (the `sp` parameter) for the keyword `party`. If party is

found anywhere in the packets or logs, it outputs the session ID along with the text it found and the surrounding text for context. The `where` clause indicates that it only searches web and email traffic. The `ci` parameter means that it is a case-insensitive search. You can substitute `regex` for `keyword` and it performs a regex search.

- `sdk search session=1-now search="keyword='checkpoint' sp ci" render=log append=checkpoint-logs.log fileExt=.log`
  This is an interesting command example. It searches all logs (or it could be packets) for the keyword `checkpoint` and if that keyword is seen, it extracts the log to a file **checkpoint-logs.log**. There are all kinds of possibilities with this command. Essentially, when a hit is detected, it hands off the session to the content call. So any parameters you pass to `sdk search` that it does not recognize are just passed along to the content call. This allows the full capabilities of the `sdk content` call, but they only work on those sessions with content search hits.

# Commands Used for Troubleshooting

NwConsole provides the following commands that are helpful when troubleshooting NetWitness:

- **whatIsWrong**: Provides a snapshot of a service's configuration, stats, and failure and warning logs for a specified period of time in the past.
- **dbcheck**: Performs consistency checking of database files.
- **topQuery**: Helps pinpoint queries that are taking an excessively long time to run.
- **netbytes**: Troubleshoots the network connections on the current host.
- **netspeed**: Troubleshoots the connection between the host computer running NwConsole and the remote computer connected to it using the `login` command.

The following sections, as well as the NwConsole help and topic information (man) pages, provide additional information.

## whatIsWrong

When a service is not working correctly, the reason is usually somewhere in the logs that the service has written. You can use the `whatIsWrong` console command to obtain a snapshot of a service's configuration, stats, and failure and warning logs (with surrounding context logs) for a specified past period of time, which defaults to the previous seven days. You can save the results of running `whatIsWrong` into a specified plain-text file. The output of this command can be a useful starting point to help determine what is currently wrong with a service.

To use the `whatIsWrong` console command, log on to the service to troubleshoot using the `login` command, and run the `whatIsWrong` command.

**Note:** Use `help whatIsWrong` to see all of the available parameters, including the number of days or hours to look back for events, the pathname to store results, whether or not to append or overwrite the results file, and the delimiter to use for log fields. You can also limit the number of most recent logs used to find context, and you can specify how many context logs per warning or failure log to retrieve.

Whenever you receive a request for logs for a Core service, you should run the `whatIsWrong` command first and use the results collected as a starting point.

## dbcheck

The `dbcheck` command is used to perform consistency checking of database files (session, meta, packets, logs, stats, and so on). This might be necessary when a service cannot start because of errors in the consistency of the database files. Normally a service would automatically recover and correct any consistency issues on startup, but there are times when this does not occur. When a service starts (like Decoder), it typically does not read or open most database files in order to start quickly. It assumes most files are in a consistent state and only does a cursory check of the most recently written files. If there are problems, `dbcheck` can perform those consistency checks, but ONLY if the service is not running.

**Caution:** Do not attempt to run this command while a service is running.

For example, you can check a single file:

```
dbcheck /var/lib/netwitness/decoder/packetdb/packet-000000001.nwpdb
```

You can also use wildcards to check multiple files:

```
dbcheck /var/lib/netwitness/decoder/metadb/meta-00000002*.nwmdb
```

## topQuery

The `topQuery` command can help pinpoint queries that are taking an excessively long time to run. This command parses the audit logs of a service and returns the top N longest running queries for the specified time period.

The easiest way to run it is to log on to the service (usually a Broker or Concentrator) and type `topQuery`. The default behavior is to return the top 100 longest running queries for the last seven days.

Type `help topQuery` for the list of parameters. Here are some additional examples with explanations:

- `topQuery hours=12 top=10`
  This command returns the top 10 queries for the last 12 hours.

- `topQuery time1="2020-03-01 00:00:00" time2="2020-03-14 00:00:00"`
  This command returns the top 100 queries between March 1, 2020 and March 14, 2020. Times are in UTC, not local.

- `topQuery input=/var/log/messages output=/tmp/top20.txt top=20 user=sauser1`
  Instead of connecting to a service, it parses the Syslog audit messages for the top 20 queries in the last seven days, but only for queries executed by user sauser1. It writes the top 20 queries to **/tmp/top20.txt** instead of the console screen. The parameter user is a regex, so you can specify multiple usernames by writing something like `user="(sauser1|sauser2)"`.

## netbytes

The `netbytes` command is very useful for troubleshooting the network connections on the current host. It displays continuous send and receive statistics for all network interfaces. Once executed, you must press **Ctrl-C** to exit this command, which also exits NwConsole.

## netspeed

The `netspeed` command is used to troubleshoot the connection between the host computer running NwConsole and the remote computer connected to it through the `login` command. You must supply the amount of bytes to transfer and it will time the speed of the connection. The netspeed command is very useful for troubleshooting aggregation performance issues that might be network related.

```
login somedecoder:50004 admin ...
netspeed transfer=4g
```

To troubleshoot the connection between a Concentrator and a Decoder, SSH into the Concentrator, run NwConsole, and then log on to the Decoder and run `netspeed`. The output from the command gives you an indication of the maximum network throughput. If it is much less than the standard 1 Gbps interface, it could indicate a network issue.

# RSA Archer Integration

Administrators can integrate RSA NetWitness Platform with RSA Archer Cyber Incident & Breach Response to send alerts and incidents from NetWitness Platform to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

**Note:** When you upgrade from Security Analytics 10.6.5 to NetWitness Platform 11.x, the RSA Archer Cyber Incident & Breach Response integration is no valid, and must be re-configured.

The following table list the NetWitness Platform 11.x integration options with RSA Archer Cyber Incident & Breach Response Version 1.3.1.2.

| RSA Archer Cyber Incident & Breach ResponseVersion | NetWitness Platform 11.x Integration | Reference |
|---|---|---|
| 1.3.1.2 | ESA Correlation | See "Configure ESA Correlation for Integration with RSA Archer Cyber Incident & Breach Response" section. |
| 1.3.1.2 | Reporting Engine (RE) | See "Configure Reporting Engine for Integration with RSA Archer Cyber Incident & Breach Response" section. |
| 1.3.1.2 | Respond | See "Configure Respond for Integration with RSA Archer Cyber Incident & Breach Response 1.3.1.2" section. |
| 1.3.1.2 | Archer Feeds | See "RSA Archer Feeds" section. |

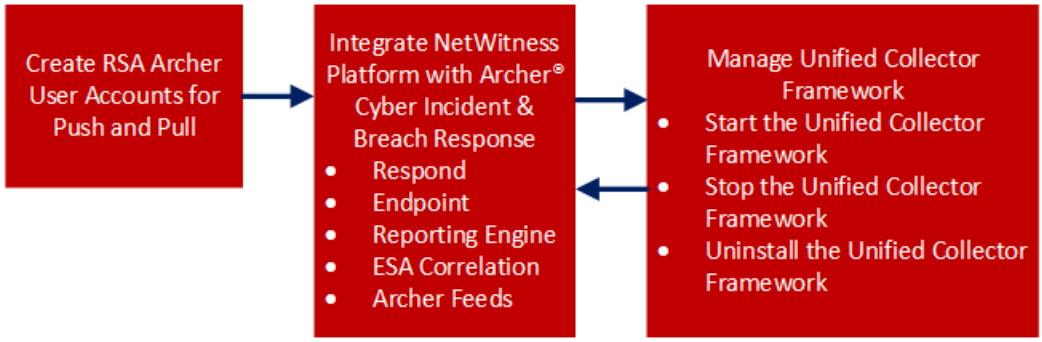
# Configure NetWitness to Work With Archer

The RSA Archer Cyber Incident & Breach Response solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on RSA Archer Cyber Incident & Breach Response capabilities, see RSA Archer documentation on the RSA Archer Community or on the RSA Archer Exchange Community.

This version of RSA Archer determines how NetWitness Platform will be integrated. For supported Archer platforms, see the *SecOps Installation Guide*.

RSA Archer Cyber Incident & Breach Response1.3.1.2 integrates with NetWitness Platform using the RSA UCF (Unified Collector Framework), which comprises of NetWitness Respond integration service and RSA Archer Cyber Incident & Breach Response Watchdog service.

This figure represents the flow of NetWitness Platform 11.x integration with RSA Archer Cyber Incident & Breach Response 1.3.1.2.



## Create RSA Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the RSA Archer GRC Platform.

You require two RSA Archer user accounts to avoid conflicts while sending and receiving data from RSA NetWitness Platform.

To create a user account for push and pull:

1. On the RSA Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the Unified Collector Framework (UCF) uses this account to push data into RSA Archer GRC. For example, UCF User, Push.

   **Note:** When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from RSA Archer GRC. For example, UCF User, Pull.

3. (Optional) Enter a user name for the new user account.

   **Note:** If you do not specify a user name, the RSA Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** panel, in the **Email** field, enter an email address to associate with the new user account.
5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

   **Note:** The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

   **Note:** Make a note of the user name and password for the new user account that you created. You need to enter these credentials when you set up the UCF to communicate with the RSA Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

   **Note:** If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account, and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** panel, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select **SOC: Solution Administrator and EM: Read Only**.
   d. Click **OK**.
10. Click **Apply** and click **Save**.
11. If the machine language and regional settings of your RSA Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the **Locale** field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your RSA Archer GRC Platform, open **Internet Information Services (IIS) Manager**.
    c. Expand your RSA Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.
    d. Restart your RSA Archer GRC site.
12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from RSA Archer GRC.

# Integrate NetWitness Platform With RSA Archer Cyber Incident & Breach Response

You have to configure the system integration settings to manage incident workflow in RSA Archer Cyber Incident & Breach Response.

For information on how to configure system integration settings, see the "Manage Incidents in RSA Archer Cyber Incident & Breach Response" in the *NetWitness Respond Configuration Guide*.

# RSA Unified Collector Framework

RSA NetWitness Platform integrates with RSA Archer Cyber Incident & Breach Response 1.3.1.2 using the RSA UCF. The RSA UCF integrates with all supported SIEM tools and the RSA Archer Cyber Incident & Breach Response solution. After you configure the system integration settings, all incidents are managed in RSA Archer Cyber Incident & Breach Response instead of NetWitness Respond. Incidents created before the integration will not be managed in RSA Archer Cyber Incident & Breach Response.

**Note:**
• You must configure the same option in both RSA NetWitness Platform and the Unified Collector Framework.
• Integration of the RSA NetWitness Respond module with Reporting Engine or ESA Correlation can result in duplicate events, alerts, and incidents created in RSA Archer Cyber Incident & Breach Response.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Platform Reporting Engine, HP ArcSight, and NetWitness Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness Platform servers connected to the same UCF.

## Prerequisites

- Install the RSA Archer Cyber Incident & Breach Response package on Archer. See RSA Archer documentation RSA Archer Community or on the Content Tab at https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.
- Install RSA Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure you have NetWitness Platform 11.1 as it is compatible with RSA Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure that Respond is configured in RSA NetWitness Platform.

The RSA UCF allows you to integrate your RSA Archer Cyber Incident & Breach Response system with the following:

- NetWitness Respond
- NetWitness Platform Reporting Engine

- NetWitness Platform ESA Correlation.
- Archer Feeds

# Configure Respond for Integration with RSA Archer Cyber Incident & Breach Response

## Step 1: Select the Mode for NetWitness Respond

1. Go to **(Admin) > Services**, select the **Respond Server** service, and select > **View** > **Explore**.
2. Navigate to `respond/integration/export`.
3. Set the `archer-sec-ops-integration-enabled` field to **true**.
4. Restart the Respond service by running the following command:
   `systemctl restart rsa-nw-respond-server`

## Step 2: Configure NetWitness Respond to Forward Alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in the SecOps Middleware box.
2. Copy both `keystore.crt.pem` and `rootcastore.crt.pem` from the certs folder (to the import folder of NetWitess server):
   `cp rootcastore.crt.pem /etc/pki/nw/trust/import`

   `cp keystore.crt.pem /etc/pki/nw/trust/import`

   **Note:** Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.
3. SSH to NW-server box
   a. Run the update-admin-node command:
      `orchestration-cli-client --update-admin-node`
   b. Restart the RabbitMQ service:

      `systemctl restart rabbitmq-server`
   c. Restart the SMS service:

      `systemctl restart rsa-sms.service`

      **Note:** This step is mandatory to avoid receiving the "message bus down" error message which indicates that the EventSourceMessagePublisher has failed to reconnect to RabbitMQ on restart. This can cause some features such as deleting event sources to function improperly.
   d. Create user archer and set permissions for the virtual host '`/rsa/system`'
      `rabbitmqctl add_user archer archer`

      `rabbitmqctl clear_password archer`

      `rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"`

### Step 3: Forward Alerts to the NetWitness Respond

- To forward NetWitness Platform ESA Correlation alerts to the NetWitness Respond:
  a. Go to **(Admin) > Services > ESA** service.
  b. Select an **ESA Correlation** service and select **> View > Explore**.
  c. Navigate to the Correlation option in the left panel and select the Alert option.
  d. Edit the respond-enabled option to TRUE.
  e. Restart the Correlation server.
- To forward NetWitness Platform Reporting Engine alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Reporting Engine** service.
  b. Select the **Reporting Engine** service, and then select **> View > Config**.
  c. Click the **General** tab.
  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.
- To forward NetWitness Platform Malware Analysis alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Malware Analysis** service
  b. Select the **Malware Analysis** service, and select > **View** > **Config**.
  c. Click the **Auditing** tab.
  d. In the **Respond Alerting** panel, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

### Step 4: Forward Endpoint Alerts to the NetWitness Respond

You can forward Endpoint alerts to the RSA Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus, see "Configure NetWitness Endpoint Alerts via Message Bus" in the *NetWitness Endpoint Integration Guide*.

### Step 5: Aggregate Alerts into Incidents

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond View" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Go to **(Configure) > Incident Rules**.
2. To enable the rules provided out-of- the-box:

a. Double-click the rule.

b. Select **Enabled**.

c. Click **Save**.

d. Repeat steps a-c for each rule.

3. To add a new rule:

a. Click **Create Rule**.

b. Select **Enabled**.

c. Enter the values in the following fields:

- Rule Name
- Action
- Match Conditions
- Grouping Options
- Incident Options
- Priority
- Notifications

4. Click **Save**.

## Configure Endpoints in RSA Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your RSA NetWitness Platform and RSA Archer GRC systems.

**Note:** Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

### Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

**Note:**
• If Non SecOps mode is selected, incidents are managed in NetWitness Respond instead of RSA Archer Cyber Incident & Breach Response.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Make sure the certificate subject name for your RSA Archer GRC server matches the hostname.

### Procedure

1. On the UCF system, open the Connection Manager, as follows:
   a. Open a command prompt.
   b. Change directories to `<install_dir>\SA IM integration service\data-collector`.
   c. Enter `runConnectionManager.bat`.
2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to RSA Archer Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      **Note:** Enable SSL to add the RSA Archer endpoints.

   b. For the endpoint name, enter **push**.
   c. Enter the URL of your RSA Archer GRC system.
   d. Enter the instance name of your RSA Archer GRC system.
   e. Enter the user name of the user account you created to push data into your RSA Archer GRC system.
   f. Enter the password for the user account you created to push data into your RSA Archer GRC system, and confirm the password.
   g. When prompted if this account is used for pulling data, enter **False**.
4. Add an endpoint for pulling data from RSA Archer Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      **Note:** SSL must be enabled to add the RSA Archer endpoints.

   b. For the endpoint name, enter **pull**.
   c. Enter the URL of your RSA Archer GRC system.
   d. Enter the instance name of your RSA Archer GRC system.
   e. Enter the user name of the user account you created to pull data from your RSA Archer GRC system.
   f. Enter the password for the user account you created to pull data from your RSA Archer system, and confirm the password.
   g. When prompted if this account is used for pulling data, enter **True**.
5. Add an endpoint for RSA NetWitness Platform:
   - For Respond
     a. Enter the number for NetWitness Platform IM.
     b. Enter a name for the endpoint.

c. Enter the SA Host IP address.

d. For SA Messaging Port, enter **5671**.

e. Enter the target queue for remediation tasks. Selecting All processes both the RSA Archer Integration (GRC) and IT Helpdesk (Operations).

f. When prompted to automatically add certificates to the SA trust store, enter **No**.
The certificates are added manually in previous steps.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select Manage incident workflow exclusively in RSA Archer Cyber Incident & Breach Response from the drop-down.

**Note:** Make sure you select the second option as the first option is not supported in NetWitness Platform 11.x release.

- For Reporting Engine and ESA Correlation

a. To use third-party integrations, add the Syslog Server Endpoint, as follows:

i. Enter the number for Syslog Server Endpoint.

ii. Enter the following:

- User defined name
- SSL Configured TCP port number

  **Note:** Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.

- TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

  **Note:** Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.

- UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

  **Note:** Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

By default, the Syslog server runs in the above three modes, unless it is disabled by entering **0**.

b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

## Configure Reporting Engine for Integration with RSA Archer Cyber Incident & Breach Response

To configure Syslog Output Action for the Reporting Engine:

1. Go to **(Admin) > Services**.
2. Select the **Reporting Engine** service, and click **View** > **Config**.
3. Click the **Output Actions** tab.
4. In the **NetWitness Platform Configuration** panel, in the **Host Name** field, enter the host name or IP address of the Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:
   a. In the **Server Name** field, enter the host name of the UCF.
   b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.
   c. In the **Protocol** field, select the transport protocol.

   **Note:** Configure SSL if you select Secure TCP.
6. Click **Save**.

To configure NetWitness Platform Reporting Engine SSL for Secure Syslog Server:

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness Platform server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-0.b14.el7_4.x86_64/jre/lib/security`.
2. Run the following command:

   ```
   keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
   ```

   **Note:** Do not copy and paste the above command. Type the command to avoid errors.
3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Go to **(Admin) > Services**.
   - Select **> View > Explore** of the **Reporting Engine** service .
   - Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
   - Expand **SSLContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.
4. Restart the Reporting Engine service by running the following command:
   `service rsasoc_re restart`

To configure rules in NetWitness Platform:

1. Go to **Reports > Manage**.
   The Manage tab is displayed.
2. In the **Rules > Groups** panel, click ✚.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click ✚.
   1. In the **Rule Type** field, select **NetWitness Platform DB**.
5. Enter a name for the rule.
6. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

   **Note:** Add the Syslog configuration with the Syslog name set above.

7. Click **Save**.

**Note:** To see the same number of alerts in the Reporting Engine and RSA Archer GRC, make sure that you have selected **Once** for execute in both the Syslog and Record tabs.

To add Alert Templates for the Reporting Engine in NetWitness Platform:

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Go to **Reports > Manage > Alerts**.
2. Select the **Template** tab and click ✚.

**Note:** After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

3. In the **Name** field, enter a name for the alert template.
4. In the **Message** field, enter the alert message.
5. Click **Create**.
6. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Platform:

In RSA NetWitness Platform Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Go to **Reports > Manage > Alerts**.
2. Click ✚, select **Enable**, then Select the rule you created.
3. Select **Push to Decoders**.

   **Note:** If you do not enter a value in this field, the link in the RSA Archer Security Alerts application to RSA NetWitness Platform does not work.

4. From the Data Sources list, select your data source.
5. In the **Notification** section, select **Syslog**.
6. Click + and complete the Syslog configuration fields.
7. In the **Body Template** field, select the template that you want to use for this Syslog alert.
8. Click **Save**.

## Configure ESA Correlation for Integration with RSA Archer Cyber Incident & Breach Response

To configure ESA Correlation Syslog Notification Settings in NetWitness Platform:

1. Go to **(Admin) > System > Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an ESA Correlation Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

   **Field Description:**

   - Name - Specify the custom name.
   - Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
   - Port - Specify the port number on which you want the UCF to listen.
   - Facility - Specify the Syslog facility.
   - Protocol - Select the protocol.
7. Click **Save**.

To configure NetWitness Platform ESA Correlation SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Copy the `keystore.cert.pem` from UCF machine to NetWitness server.
2. Run the following command:

   ```
   security-cli-client --add-trusts --service integration-server --superuser-id admin --superuser-pwd netwitness --chain-file <path to keystore.cert.pem file>
   ```
3. Restart the integration server by running the following command:

   ```
   service rsa-nw-integration-server restart
   ```

To Add ESA Correlation Alert Templates

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates\SecOps_SA_ESA_templates.txt`

1. Select **(Admin) > System > Global Notifications**.
2. Click the **Templates** tab and click +.
3. In the **Template Type** field, select ESA Correlation.
4. In the **Name** field, enter the name for the template.
5. 6. (Optional) In the **Description** field, enter a brief description for the template.
6. 7. In the **Template** field, enter the alert message.
7. 8. Click **Save**.
8. 9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create ESA Correlation Rules

1. Click **(Configure) > ESA Rules**.
2. In the **Rule Library**, click +.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** panel:
   a. Click + to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for the statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all the statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and click **Close**.
11. In the Deployments section, click .
12. Click + and enter a deployment name.
13. Click + for ESA Correlation services section.

14. Select the ESA Correlation Service.
15. In the Data Source section, click + and select a data source.
16. Click **Save**.
17. In the **ESA Correlation Rules** section, click + to select the ESA Correlation Rule that you created.
18. Click **Save**.
19. Click **Deploy Now**.

## RSA Archer Feeds

By default, only the IP address and Criticality Rating fields in the RSA Archer Devices application are fed into RSA NetWitness Platform by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://community.emc.com/community/connect/grc_ecosystem/rsa archer or https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.

**Note:** If you want to feed Business Unit and Facility information from your RSA Archer GRC Platform into Live, you must also add keys for these fields in the index-concentrator-custom.xml file.

### Update the Concentrator and Decoder Services

The SA IM Integration Service in RSA Archer Cyber Incident & Breach Response manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of RSA NetWitness Platform retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on the captured network traffic and the feed definition. To enable the Concentrator to detect a new metadata created by the Decoders, make sure to edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml` files.

1. Select **(Admin) > Services**.
2. Select the **Concentrator** and select > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select the `index-concentrator-custom.xml` file. Do one of the following:
   - If content already exists in the file, add a key for the new metadata element:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     **Note:** Do not copy and paste above command . Type the command to avoid errors.
   - If the file is blank, add the following content:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key description="Criticality" format="Text" level="IndexValues"
name="criticality" defaultAction="Open"/>
</language>
```

5. Click **Apply**.
6. To add multiple devices:
   a. Click **Push**.
   b. Select the devices to which you want to push this file.
   c. Click **OK**.
7. Repeat steps 1 to 6 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.
8. Restart the Concentrator and Decoder services by running the following commands:
   ```
   service nwdecoder restart
   service nwconcentrator restart
   ```

## Add the RSA Archer Enterprise Management Endpoint in UCF

1. In the UCF connection manager, select the mode:
   a. Enter the number for Mode Selection.
   b. Select one of the following options:
      - Manage incident workflow in RSA NetWitness Platform.
      - Manage incident workflow exclusively in RSA Archer Cyber Incident & Breach Response.
2. Add the RSA Archer Enterprise Management Endpoint:
   a. Enter the number for Enterprise Management.
   b. Enter the values in the fields as described in the table below.

| Field | Description |
|---|---|
| Endpoint Name | Optional endpoint name. |
| Web Server Port | Defaults to 9090. You can configure this to host the web server url by providing the URL with the port number as in the NetWitness Platform live feed: http://hostname:port/archer/sa/feed. |
| Criticality | Criticality of the assets to be pulled from RSA Archer GRC.<br>If **false**, pull assets with any criticality.<br>If **true**, pull assets with only high criticality.<br>To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH. |

| Field | Description |
|---|---|
| Feed Directory | Directory where the assets CSV file from RSA Archer GRC are saved.<br>**Note:** The directory path provided must exist. |
| Web Server Username | Username for authenticating to the EM web server. |
| Web Server Password | Password for authenticating to the EM web server. |
| SSL Mode | Defaults to No.<br>If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed`<br>If you have not updated the host file, see "Update the RSA NetWitness Platform Host File" section.<br>**Note:** NetWitness Platform currently does not support Archer recurring feeds in SSL mode. |

## Update the RSA NetWitness Platform Host File

1. Edit the host file on the NetWitness Platform server at the following location: `vi /etc/hosts`.
2. Enter the following for the UCF host IP address:

   `<ucf-host-ip> <ucf-host-name>`
3. Restart NetWitness Platform server by running the following command:

   `service jetty restart`
4. While configuring the NetWitness Platform live feed, enter the host name for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   `http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.`
5. Verify that the connection works.

## Create a Recurring Feed Task

For RSA NetWitness Platform to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

**Note:** For RSA Archer Cyber Incident & Breach Response 1.2: For RSA NetWitness Platform to download feed files from the UCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to RSA Archer Cyber Incident & Breach Response 1.3, with a few exceptions. See documentation on the RSA Archer Exchange Community for details.

1. Select **(Configure) > Custom Feeds**.
2. In the **Feeds** view, Click ✚.

3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

   where, *`http :ucf_hostname_or_ip:port`* is the address of the NetWitness Respond Integration Service system. For example: `http://<ucf-host-name>` .
7. Select **Authenticated**.
8. In the **User Name** and **Password** fields, enter the credentials of the user account you created in the Add the RSA Archer Enterprise Management Endpoint in UCF procedure.
9. Define the recurrence interval for the feed.
10. In the **Date Range** panel, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, amke sure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details and click **Finish**.

# Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the RSA UCF for RSA Archer Cyber Incident & Breach Response 11.3.1.2 Integration.

## Start the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select **RSA Unified Collector Framework**.
3. Click **Start**.

## Stop the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the RSA Archer Cyber Incident & Breach Response WatchDog Service.

   **Note:** If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service.

3. Select **RSA Unified Collector Framework**.
4. Click **Stop**.

**Note:** If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

## Uninstall the RSA Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

# Troubleshoot RSA Archer Integration

This section provides resolutions to common problems that you may encounter while configuring RSA Archer Cyber Incident & Breach Response 1.3.1.2 with NetWitness Respond.

| Problem | Solutions |
|---|---|
| **After adding the endpoint for NetWitness Respond, the Certificate Authority truststore fails to set.**<br>**Resolution** | 1. Make sure that the SSH credentials for the NetWitness Platform host are valid.<br>2. If the credentials are correct, but the error still occurs, manually copy certificates. |
| **Remediation Tasks being pushed to the operations queue through the UCF are not appearing in RSA Archer Cyber Incident & Breach Response as Findings.** | 1. Open the Connection Manager using the command prompt:<br>• `Change directories to <install_dir>\SA IM integration service\data-collector.`<br>• `Type: runConnectionManager.bat`<br>2. Enter **2** to edit endpoint.<br>3. Enter **3** to NetWitness Platform Respond.<br>4. Make sure the Target Queue is set to **All** or **Operations**. |
| In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between RSA NetWitness Platform and RSA Unified Collector Framework. | 1. Verify that the SSL certificates are valid.<br>**Note:** NetWitness Respond certificates are valid for two years.<br>2. If your certificates are expired, regenerate and copy the expired certificates.<br>**To regenerate and copy the certificates:**<br>1. In the Command Prompt, go to `<install_dir>\SA IM integration service\data-collector`. |

| Problem | Solutions |
| --- | --- |
| NetWitness Platform unable to forward incidents to UCF. | 2. Enter `runConnectionManager.bat`<br>3. Enter the number for Regenerate NetWitness Platform RespondIntegration Service Certificate.<br>4. In the NetWitness Platform Respond endpoint, in Connection Manager, enter the number for Edit Endpoint.<br>5. Enter **Yes** to copy the certificates automatically to the NetWitness Platform trust store.<br>**Note:** If certificates fail to copy, manually copy the certificates. |
| | 1. In the collector config (C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\CONFIG\collector-config), change the following:<br>im.virtualhost=/rsa/im/integration<br>to<br>im.virtualhost=/rsa/system<br>2. Restart UCF. For more information on restarting UCF, see Start the RSA Unified Collector Framework.<br>3. In the data collector (C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\data-collector), double click on the following file to run it.<br>runConnectionmanager.bat |

# Archiver Overview

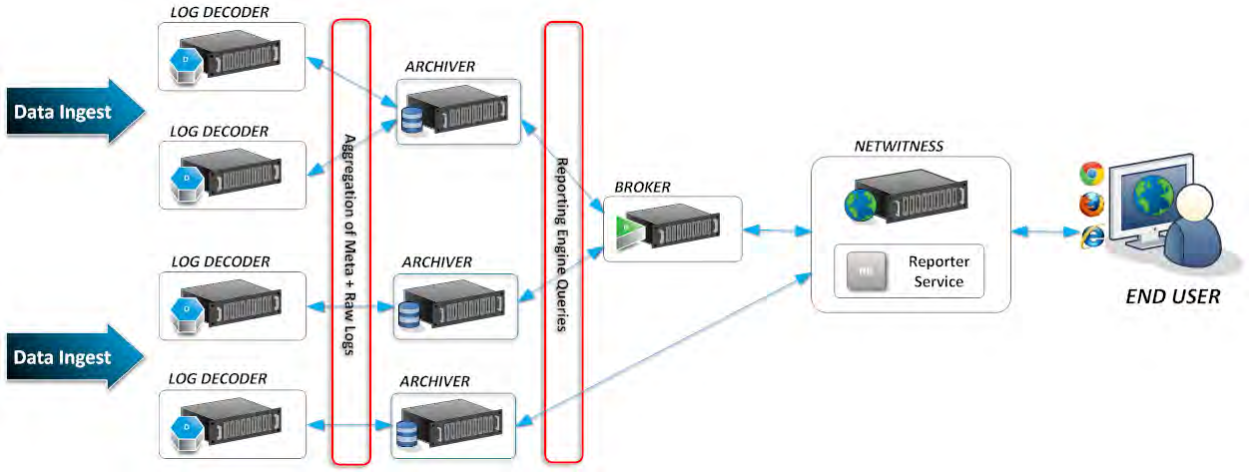
This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

**Note:** Raw packet and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness network that implements the Archiver.



# Configuring an Archiver

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

**Note:** Raw packet and packet meta are not stored in the Archiver.

## Prerequisites

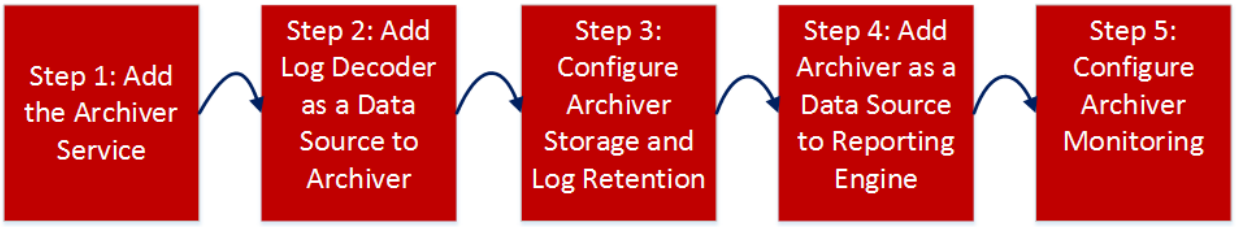
Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder version 11.2 in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

## Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

| Configuration Step | Description |
|---|---|
| Edit the Archiver Service | Provides information on how to add an Archiver service to the Archiver host and apply a license to it. |
| Add Log Decoder as a Data Source to Archiver | Provides instructions on how to add a Log Decoder to an Archiver. |
| Configure Archiver Storage and Log Retention | Provides instructions on how to configure storage and log retention on an Archiver. |

| Configuration Step | Description |
| --- | --- |
| Add Archiver as a Data Source to Reporting Engine | Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver. |
| Configure Archiver Monitoring | Provides instructions on how to configure the alert mechanism related to Archiver storage. |

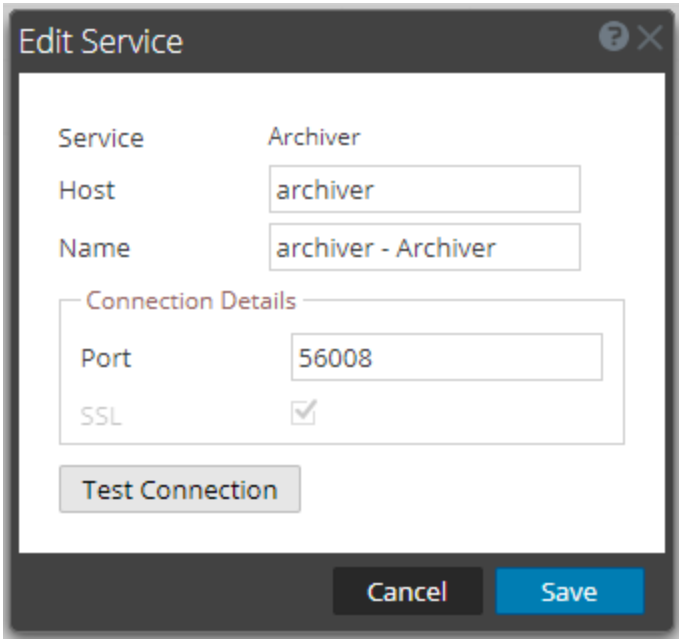
# Edit the Archiver Service

To add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See "Step 1: Add or Update Host" topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

Perform the following steps to edit the Archiver service:

1. Go to **(Admin) > Services**.
   The Services panel is displayed.

2. Select an Archiver service and click in the **Services** panel toolbar.
   The Edit Service dialog is displayed.



3. Provide the following details.

| Field | Description |
|---|---|
| Host | Select a host from the drop-down menu. |
| Name | Type a name for the service. |
| Port | Default port is 50008. |
| SSL | Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.<br>**Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel. |

| Field | Description |
|---|---|
| Username | (Optional) Type the username for the service. |
| Password | (Optional) Type the password for the service. |
| Entitle Service | Select if you want to apply the entitlements currently configured to this service. For more information, see "Entitlement Capability Implementation" topic in the *Licensing Guide*. |

4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The edited service is now displayed in the services panel.

   **Note:** If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

   Refer to the "Synchronize NetWitness Server**"** topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.

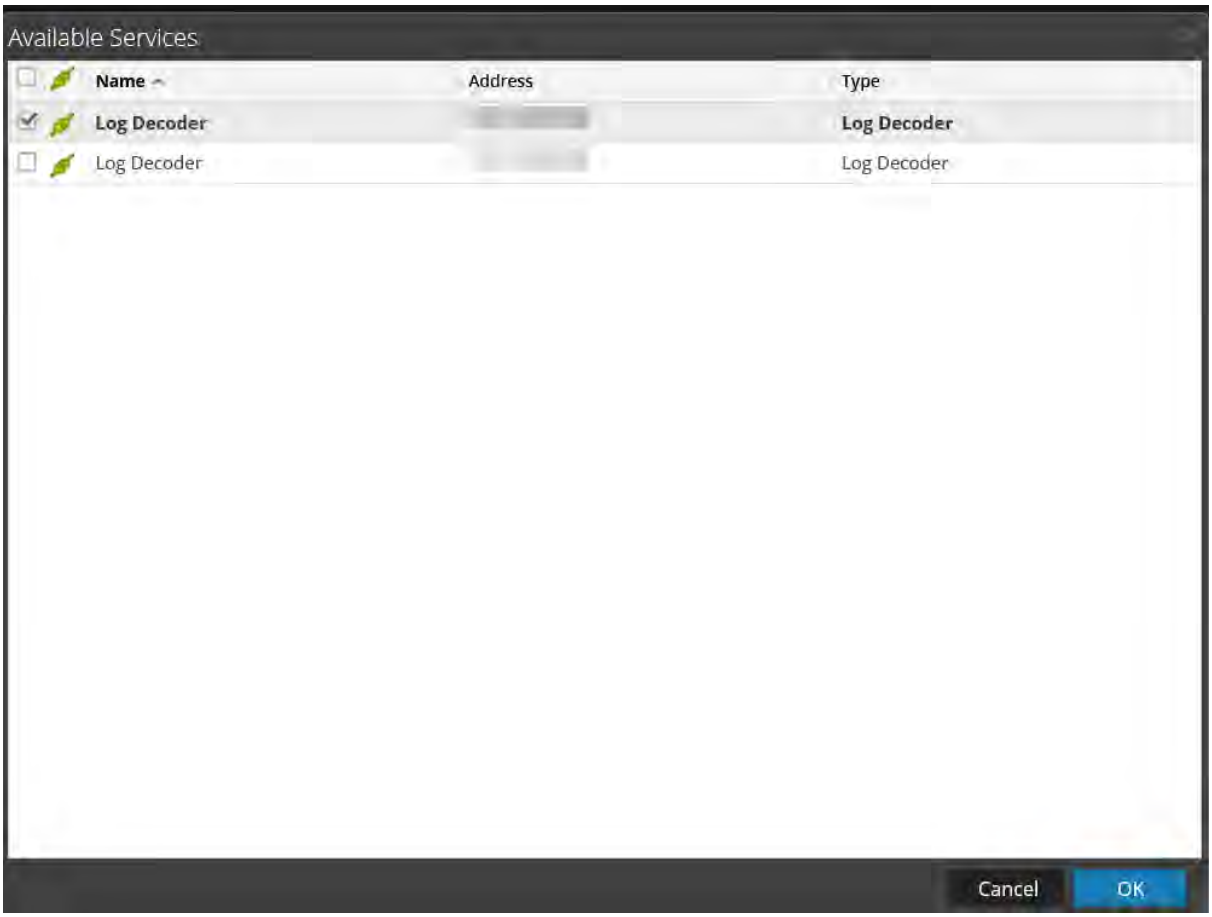
# Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness and make sure the Archiver service shows as active and licensed.

## Add Log Decoder as a Data Source to Archiver

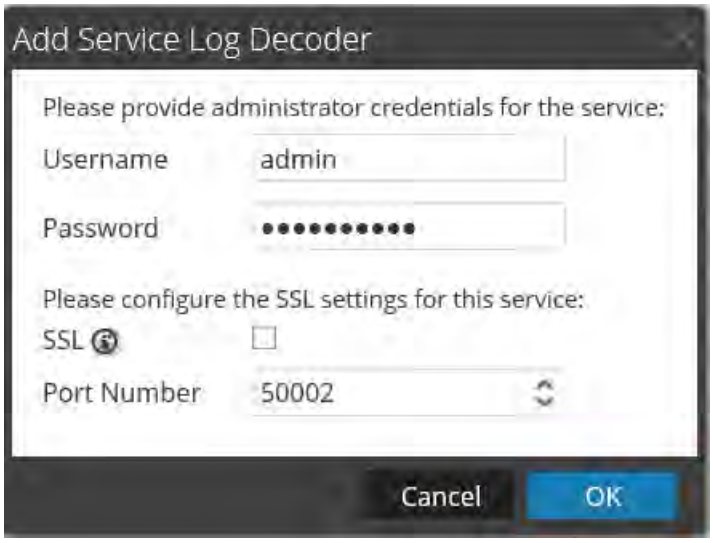
### To add a Log Decoder as a data source to an Archiver:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **General** tab, in the **Aggregate Services** panel, click .
   The Available Services dialog is displayed.



4. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.

5. If the Log Decoder is using the trust model, an Add Service dialog is displayed.



6. Type the username and password for the Log Decoder, and configure the SSL settings.
7. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

## Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

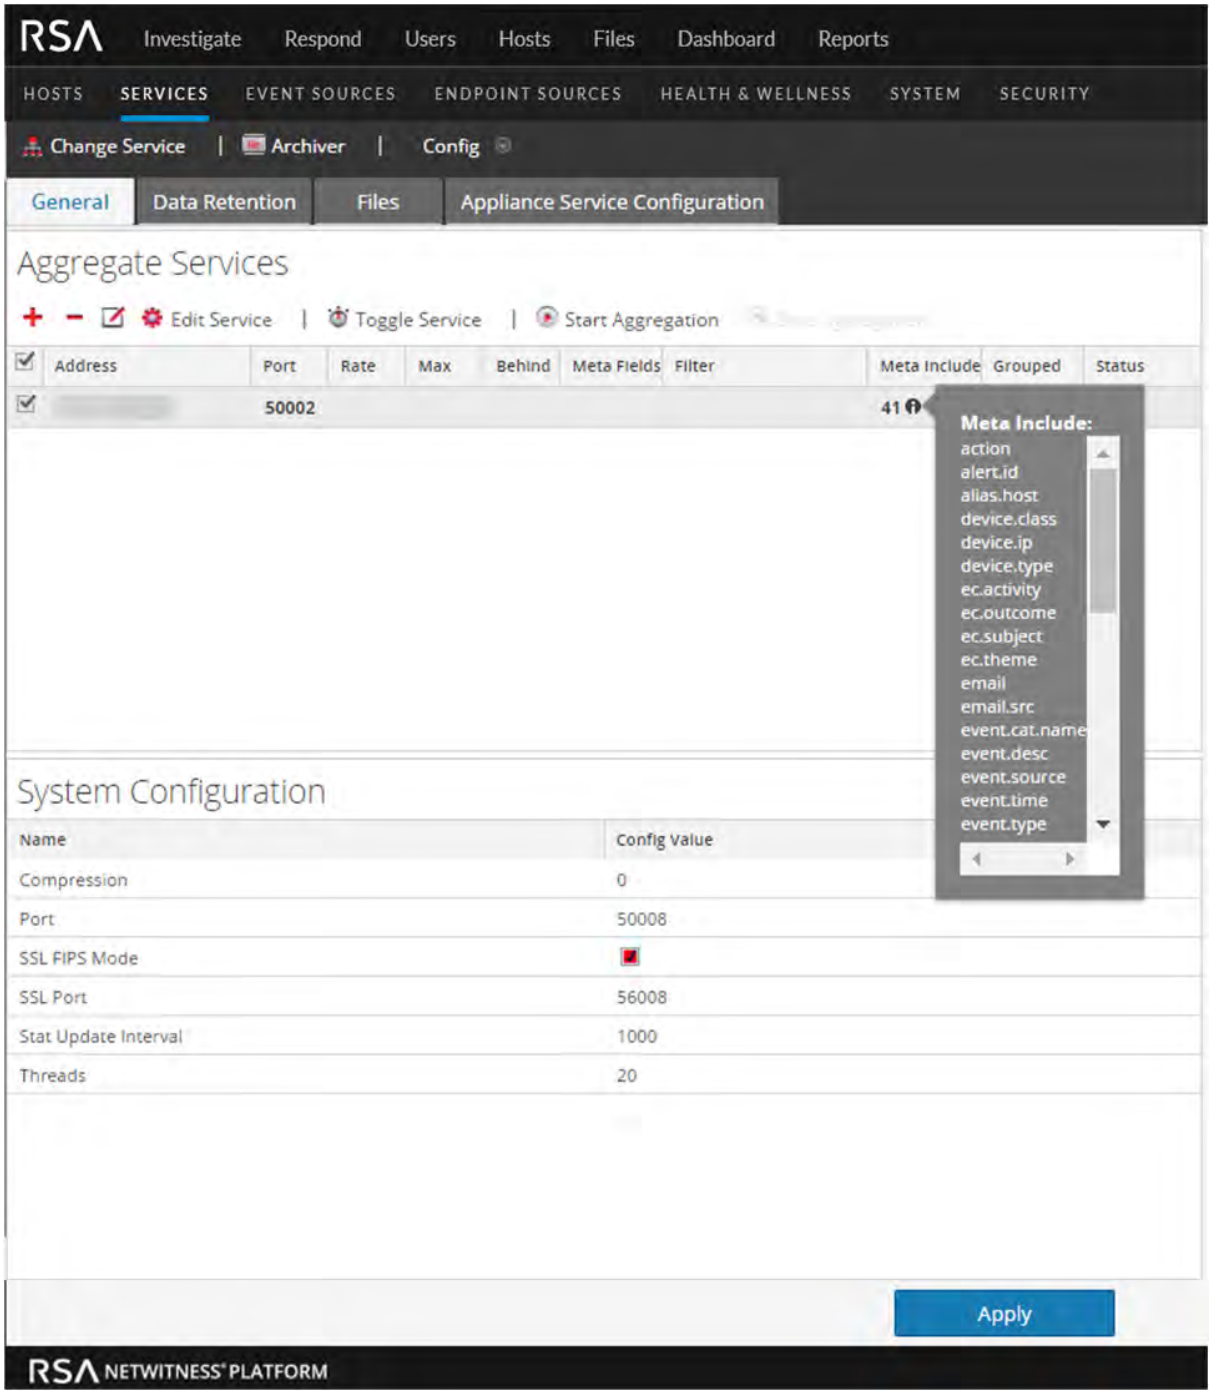
See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

## (Optional) Configure Meta Filters for Aggregation

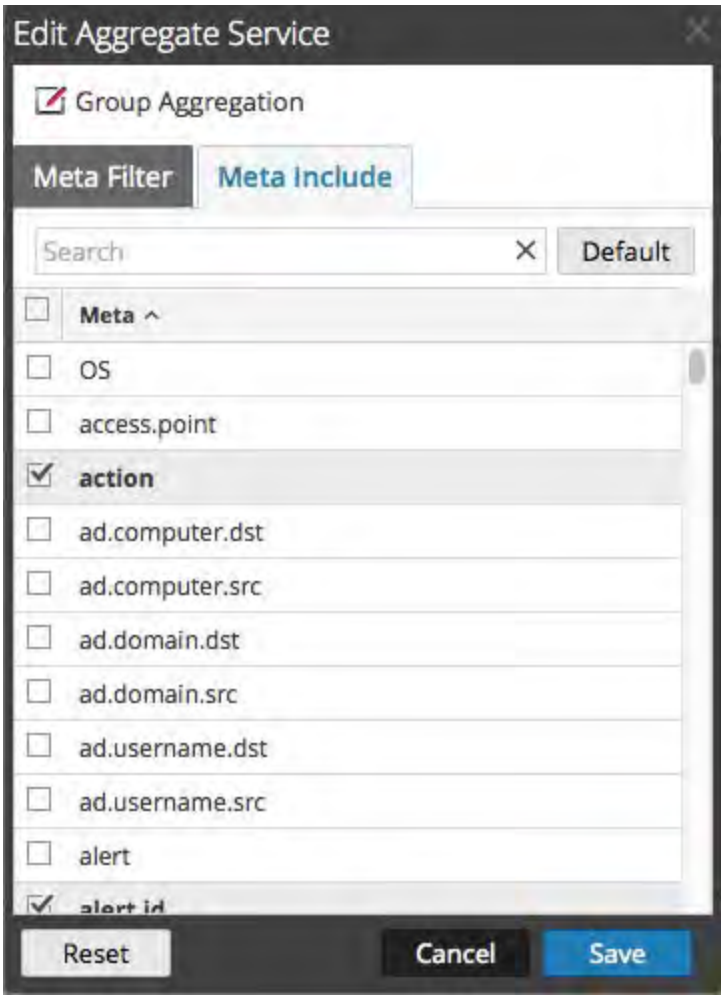
Follow this procedure to view and add additional meta items to the Archiver.

**Caution:** Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click ⓘ in the **Meta Include** field.



2. To add additional meta items, select the Log Decoder service and click .



3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

## (Optional) Add Index Entries for Archiver Reporting

**Caution:** Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)
- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

For information on customizing this list, see "Index Customization" in the *Core Database Tuning Guide*.

# Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.

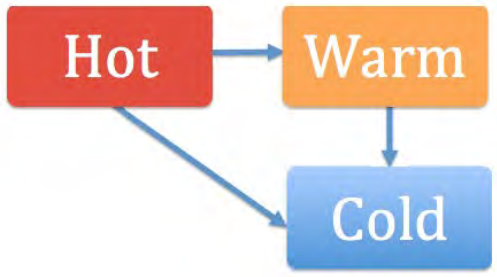
To do this, you must first define the total physical storage space for your collections. NetWitness enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage



When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

## Procedure

Perform the following tasks in the order shown to configure storage and log retention.

| Task | Reference |
|---|---|
| 1. Configure total hot, warm, and cold storage. | Refer to Configure Hot, Warm, and Cold Storage. |
| 2. Configure log retention storage collections. | Refer to Configure Log Storage Collections. |
| 3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules. | Refer to Define Retention Rules. |

# Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness does not manage cold storage.

## Prerequisites

Ensure that you have:

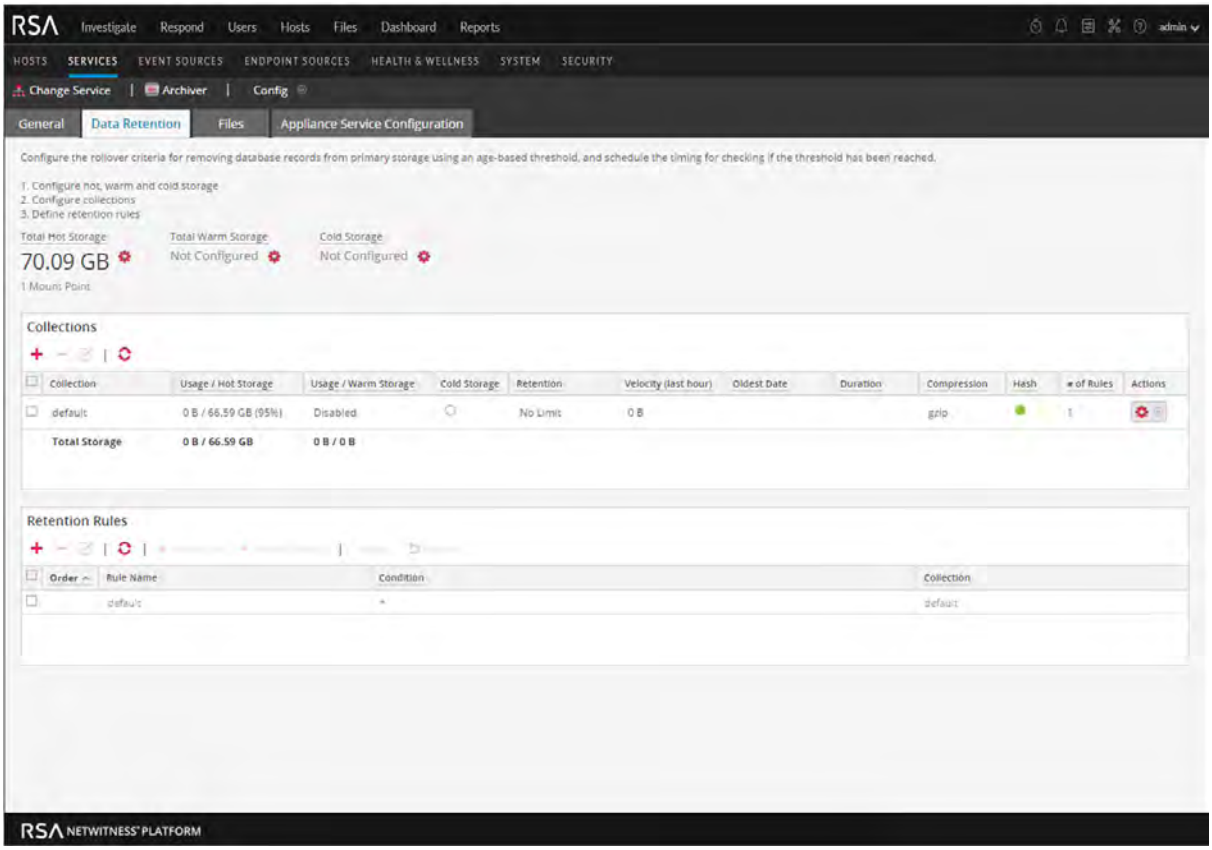
1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

## Procedures

### Configure Total Hot Storage for an Archiver

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

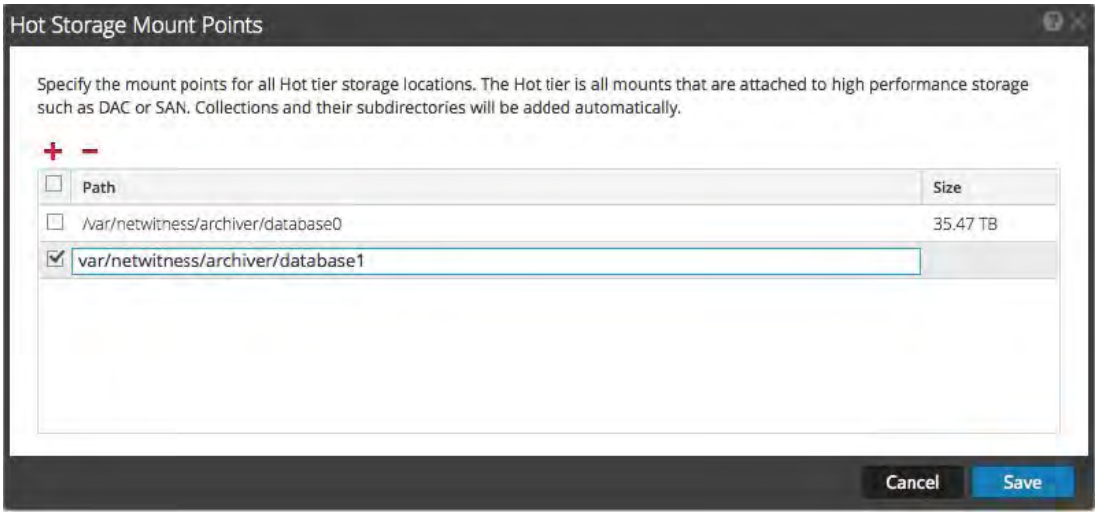
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Total Hot Storage** section, click to configure total hot storage.



4. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

   To add a mount point, click + and type the path to the mount point.



5. Verify that your mount point paths are correct and click **Save**.

NetWitnesswill automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:

```
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index
```

For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:

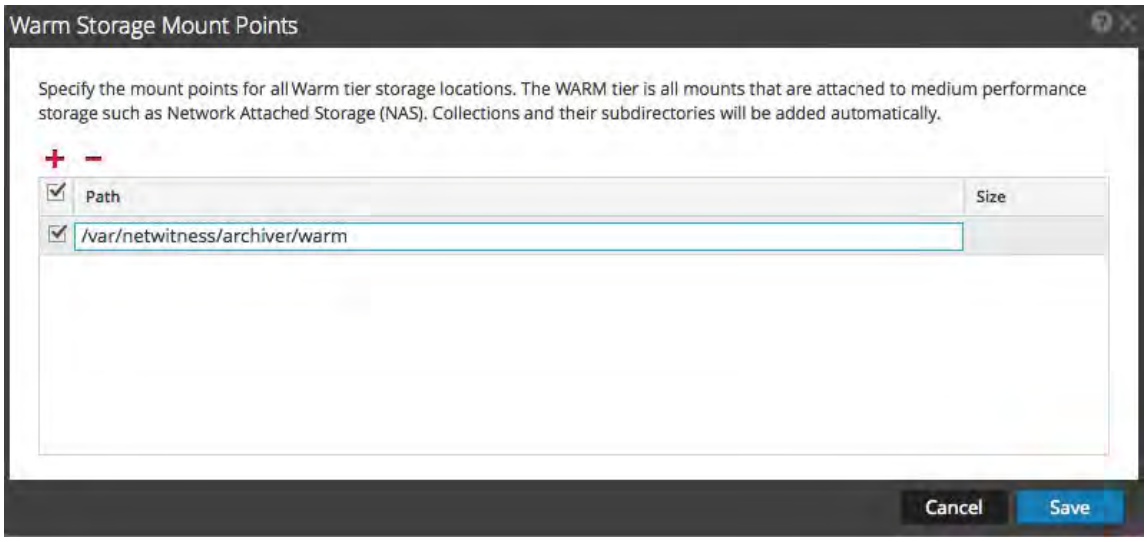
```
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index
```

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

**Caution:** After data has been saved to a mount point, it cannot be removed from the user interface.

## Configure Total Warm Storage for an Archiver

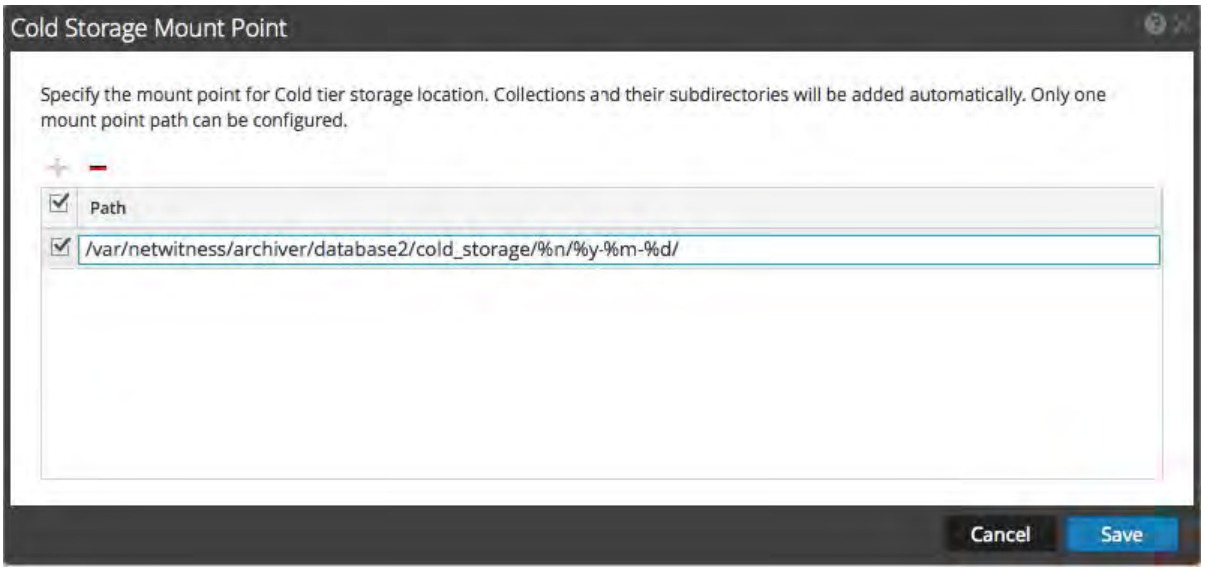
(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).



## Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.



The following format specifiers are allowed in the path:

| Format Specifier | Description |
|---|---|
| %n | collection name (required) |
| %y | year the data moved to cold storage |
| %m | month |
| %d | day |
| %h | hour |
| %##r | block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2. |

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

`/sa-cold-storage/%n/%y-%m-%d/`

NetWitness creates a directory each day with the following format:

**/sa-cold-storage/compliance/2015-11-20/**

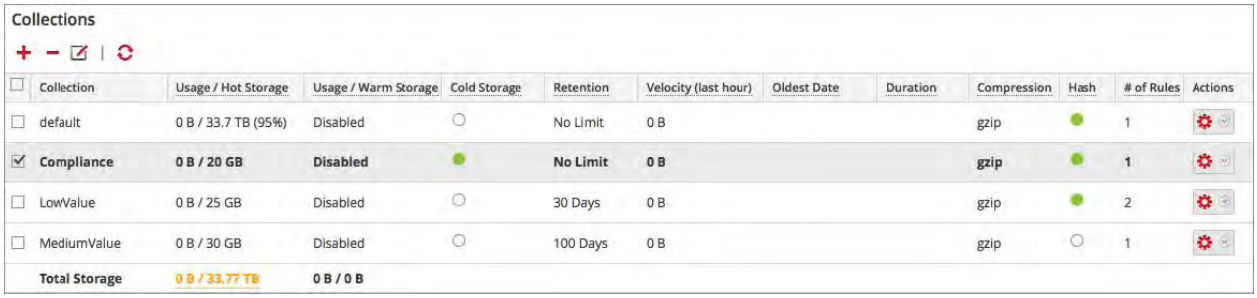
## Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.

| Feature | Description |
|---|---|
| + | Adds a mount point. |
| − | Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections. |
| ☐ | Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage. |
| Mount Point | Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC.<br>Do not add collections or subdirectories to the mount points. NetWitness will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:<br>`<storageLocation>/<CollectionName>/metadb`<br>`<storageLocation>/<CollectionName>/packetdb`<br>`<storageLocation>/<CollectionName>/sessiondb`<br>`<storageLocation>/<CollectionName>/index`<br>For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:<br>`/var/netwitness/archiver/<CollectionName>/metadb`<br>`/var/netwitness/archiver/<CollectionName>/packetdb`<br>`/var/netwitness/archiver/<CollectionName>/sessiondb`<br>`/var/netwitness/archiver/<CollectionName>/index`<br>For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections. |
| Storage Size | Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference. |

## Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



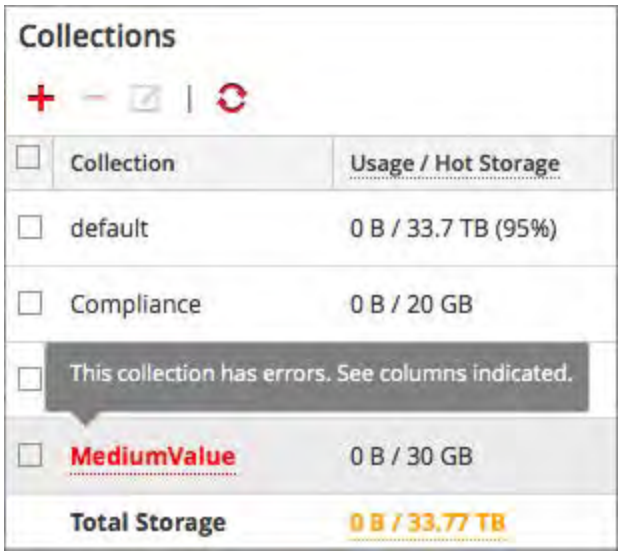
## Collections Features

The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

| Feature | Description |
|---|---|
| | Opens the Collections dialog, in which you can add a storage collection. |
|  | Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain. |
| | Opens the Collections dialog, in which you can edit the selected collection. |
| | Refreshes collection information. |
| | Selects a collection. For example, you can select a collection for editing or removal. |
| Collection | Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used.<br>If a collection has errors, the collection name and the columns with errors appear in red text. |
| Usage / Hot Storage | Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold). |
| Usage / Warm Storage | Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage. |
| Cold Storage | Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled. |
| Retention | Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days.<br>For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. |
| Velocity (last hour) | Shows the number of logs captured over the last hour. |
| Oldest Date | Shows the date and time of the last log capture. |
| Duration | Shows how may days ago that the last log was captured. For example: 20 days. |
| Compression | Shows the compression type used for the meta and raw data in the collection. |
| Hash | Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data. |

| Feature | Description |
|---|---|
| # of Rules | Shows the number of rules applied to the collection.<br>Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection.<br>**Caution:** If a collection does not have a rule, no logs will ever go into that collection. |
| Actions | Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> **> Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules. |
| **Total Storage** | Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column. |

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.



Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

## Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

| Feature | Description |
|---|---|
| | Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection. |
| | Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule. |
| | Opens the Rule Definition dialog, in which you can edit the selected retention rule. |
| | Refreshes retention rule information. |
| Move Up | Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.<br>You can also use drag and drop to reorder retention rules. |
| Move Down | Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. |
| Apply | Saves the rule order change. |
| Revert | Reverts the rule order change. |
| | Selects or shows a selected retention rule. |
| Order | Shows the order of a rule in the overall list of retention rules. |
| Rule Name | Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs. |
| Condition | Shows the conditions for the rule. These conditions specify the type of logs to include in the collection.<br>Define Retention Rules presents the guidelines for all queries and rule conditions in Core services. |
| Collection | Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days) |

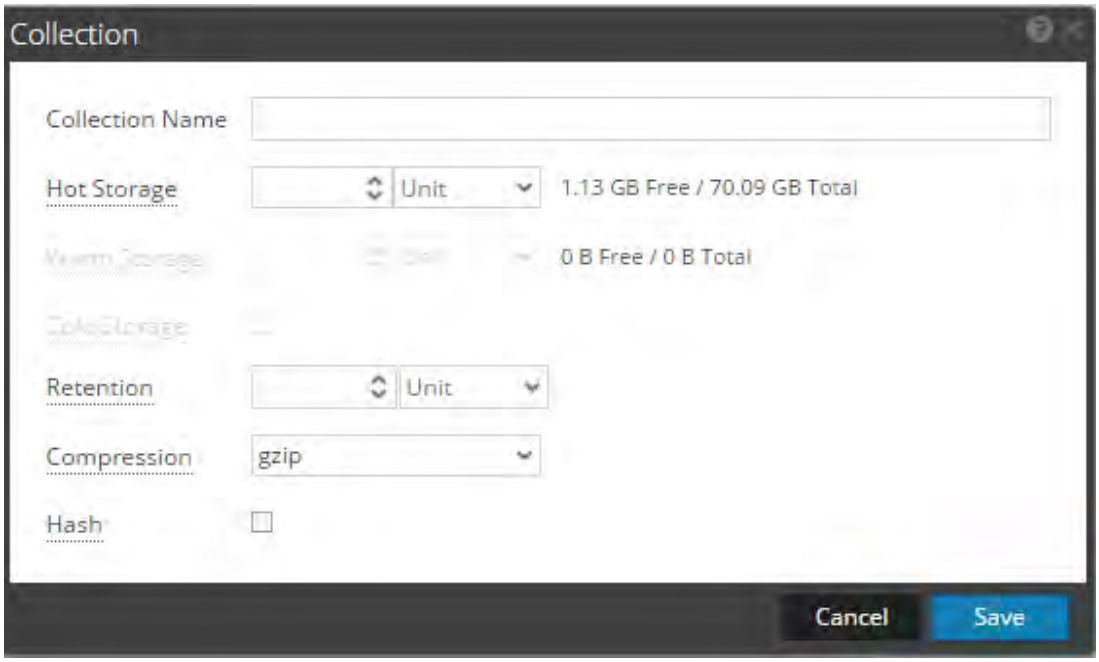
## Collection Dialog

On the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

### To access the Collection dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Collections** section, click to add or edit the rule.
   The Collection dialog is displayed.



The following table describes the fields in the Collection dialog.

| Field | Description |
|---|---|
| Collection Name | Specify a name for your collection, such as Compliance, MediumValue, or LowValue. |

| Field | Description |
|---|---|
| Hot Storage | Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field.<br>When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold). |
| Warm Storage | (Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field.<br>When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage. |
| Cold Storage | (Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed. |
| Retention | (Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage.<br>For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. |
| Compression | Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP. |
| Hash | Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data. |

**Note:** When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

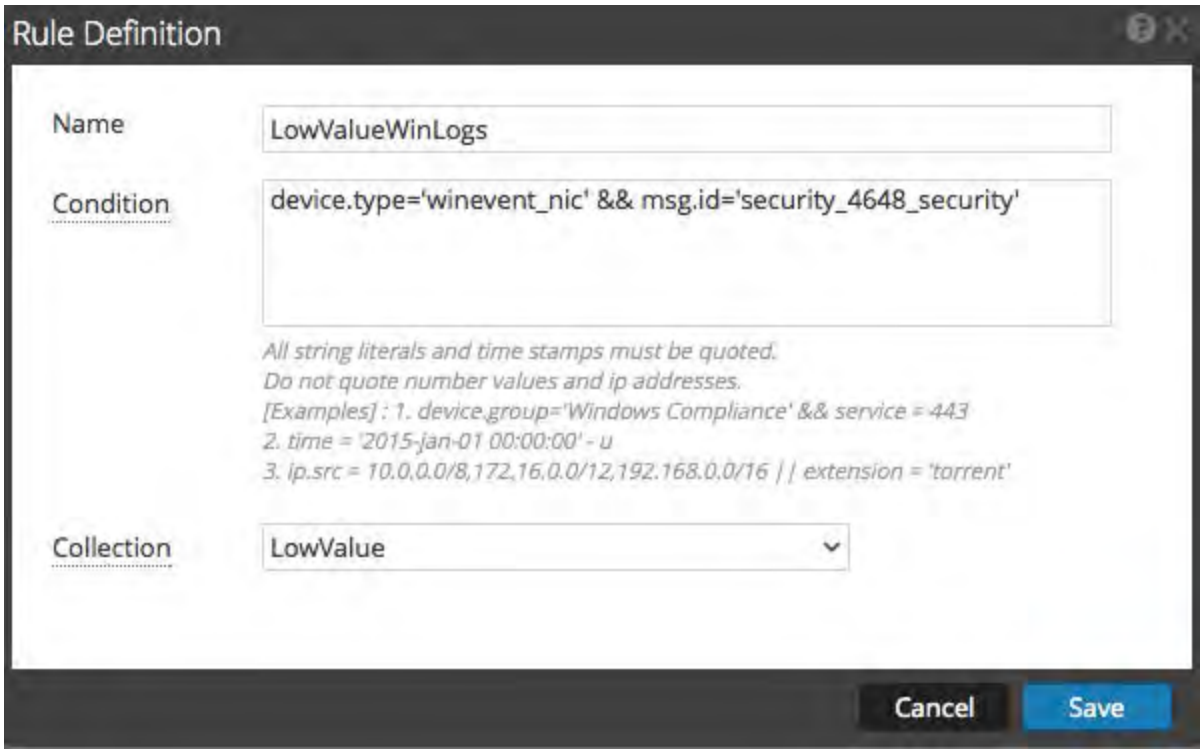
## Rule Definition Dialog

In the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Retention Rule** section, click or .
   The Rule Definition dialog is displayed.



The following table describes fields in the Rule Definition dialog.

| Field | Description |
|---|---|
| Name | Specify a unique name for your retention rule. For example: ComplianceDevices |
| Condition | Specify the conditions for the type of logs that you want to include in the collection.<br>All sting literals and time stamps must be quoted. Do not quote number values and IP addresses.<br>For example:<br>`device.group='PCI Devices' \|\| device.group='HIPPA Devices'` |
| Collection | Select the collection on which you want to apply this rule. For example: Compliance |

# Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

## Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.

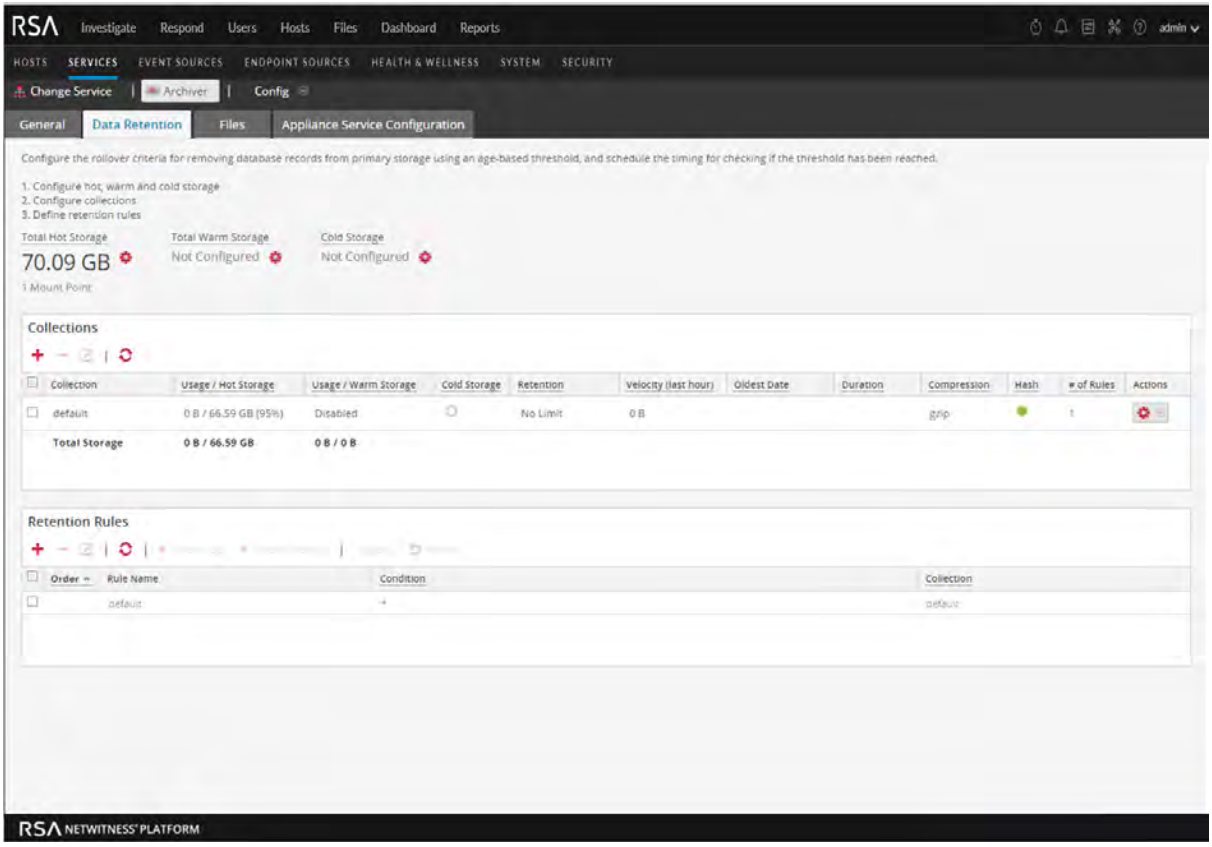
## Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:

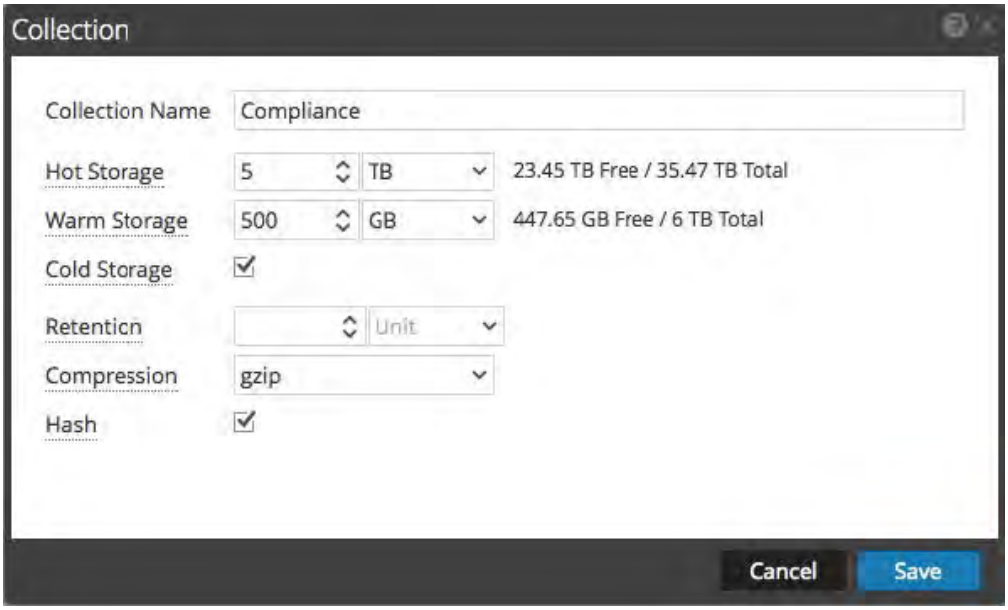
1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Collections** section, click to add a collection.

   (If you decide to make changes to an existing collection, you can select the collection and click to change the settings.)



The **Collection** dialog is displayed.



4. Configure the collection as described in the following table.

| Field | Description |
|---|---|
| Collection Name | Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue. |
| Hot Storage | Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field. |
| Warm Storage | (Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field. |
| Cold Storage | (Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage. |
| Retention | (Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage.<br>For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. |
| Compression | Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data.<br>The default compression is GZIP. |
| Hash | Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data. |

5. Click **Save**.

   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.
   If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

**Note:** When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

# Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver ( (Admin) > Services Config view).

**Caution:** Rule order is very important. It determines the priority for evaluating the log data for storage retention.

## Prerequisites

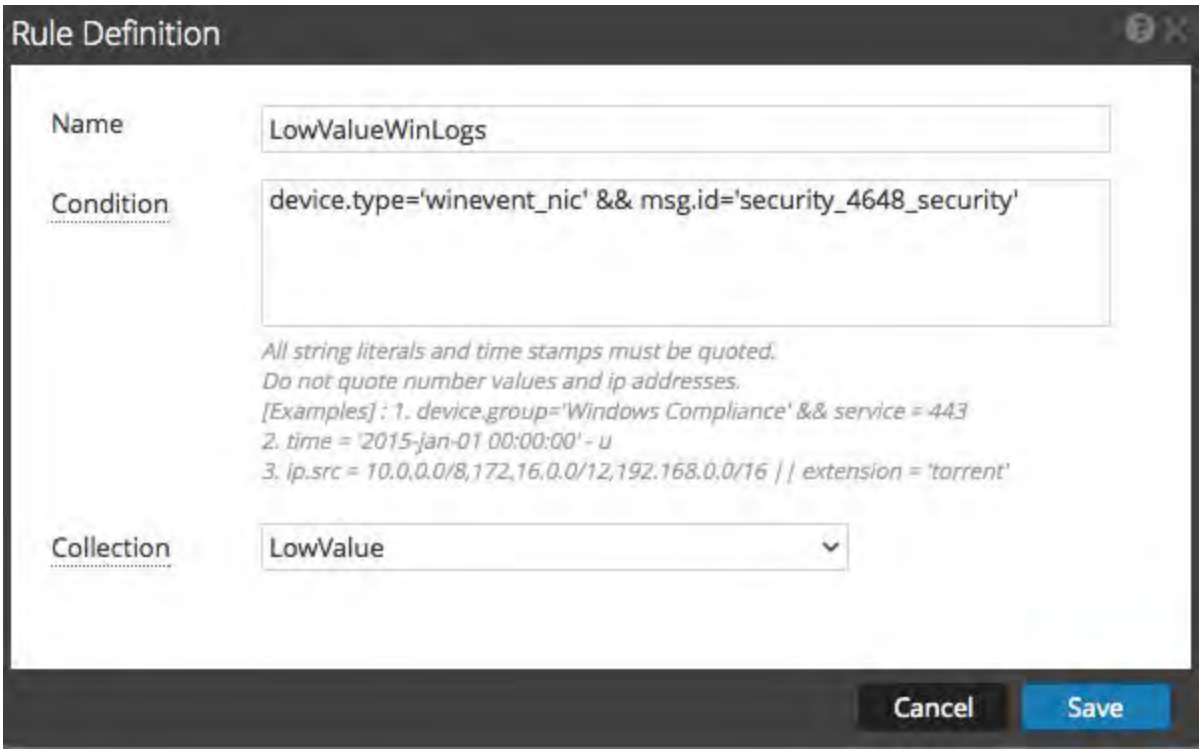
Before you configure your retention rules:

- Configure total hot, warm, and cold storage
- Configure log storage collections

## Procedures

### Define a Retention Rule for a Collection

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Retention Rules** section, click .
   The **Rule Definition** dialog is displayed.

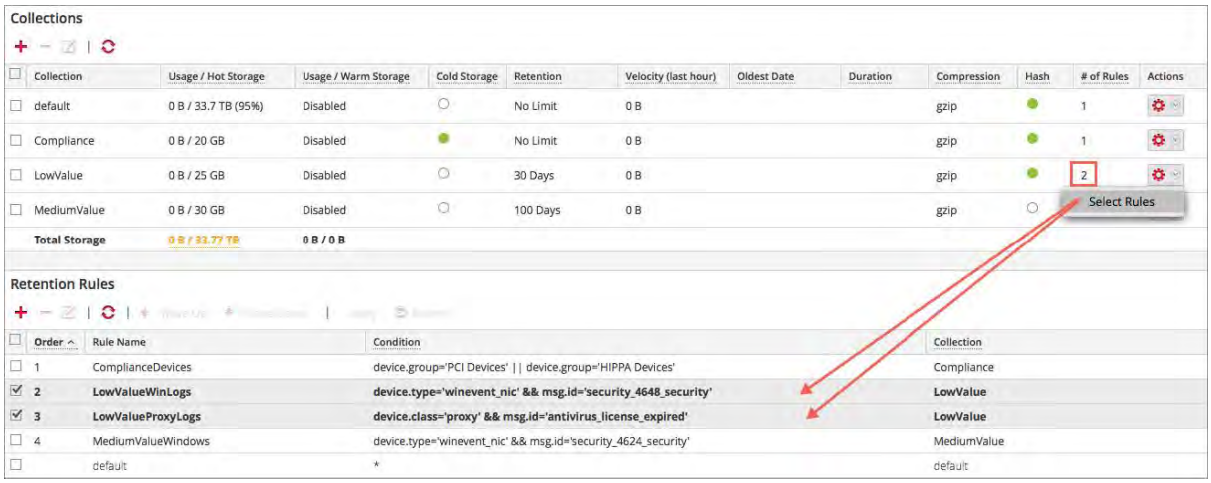


4. Configure the fields in the Rule Definition dialog as described in the following table:

| Field | Description |
|---|---|
| Rule Name | Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs |
| Condition | Specify the conditions for the type of logs that you want to include in the collection.<br>All string literals and time stamps must be quoted. Do not quote number values and IP addresses.<br>For example:<br>`device.type='winevent_nic' && msg.id='security_4648_security'` |
| Collection | Select the collection on which you want to apply this rule. For example: LowValue. |

5. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click **> Select Rules** in the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.



## Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rules** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.

2. Click **Apply** to save the order of the retention rules.

**Caution:** Rule order is very important. It determines the priority for evaluating the log data for storage retention.

# Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

## Prerequisites

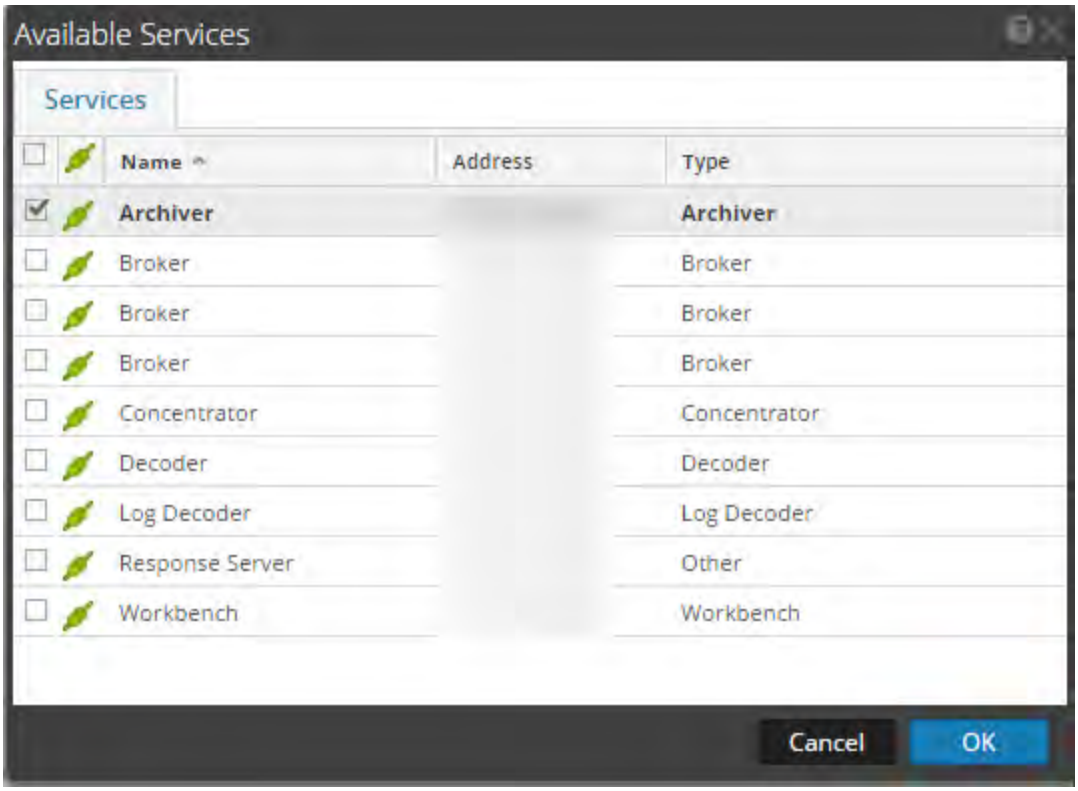
Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

## Procedure

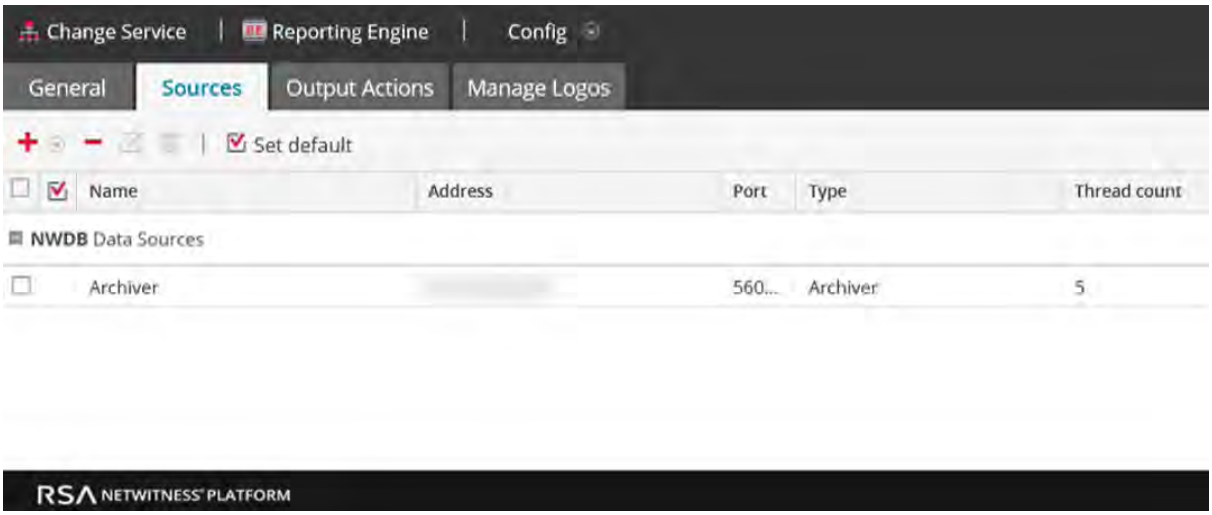
To associate an Archiver data source with Reporting Engine:

1. Go to **(Admin) > Services**, click , and select **Reporting Engine**.
2. In the **Actions** column, select **View > Config**.
   The Services Config view of Reporting Engine is displayed with General tab open.
3. Select the **Sources** tab.
4. Click and select **Available Services**.
   The Available Services dialog is displayed.



5. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**. The Service Information dialog is displayed.
6. Type the username and password for the Archiver.
7. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.

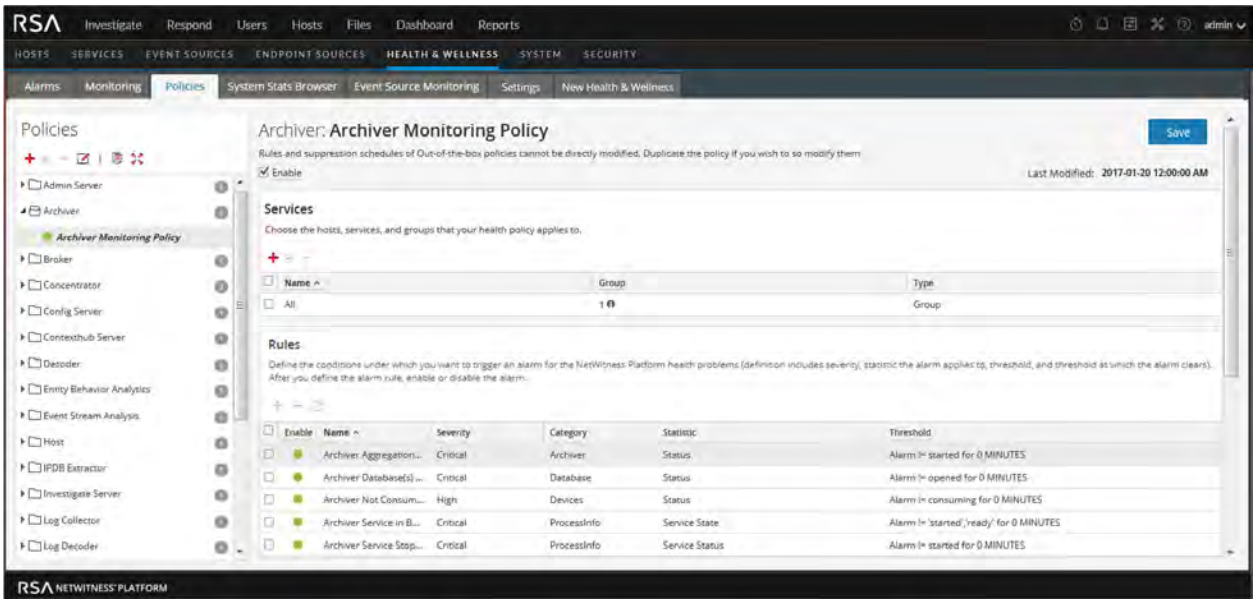


You can now create reports on the data collected by Archiver.

# Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.



For detailed information, see "Manage Policies" in the *System Maintenance Guide.*

# Additional Archiver Configuration

This topic is a collection of individual procedures, which an administrator may perform at any time and they are not required to complete the initial setup of the Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of an Archiver.

# Configuring Data Backup and Restore

This topic provides information on the data backup and restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

**Note:** For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

| Action | Description |
|---|---|
| 1. Restore your data to a location accessible by the Archiver. | Refer to Create Collection |
| 2. Create a collection in Archiver that uses that location. | Refer to "Manage Collections" topic in the *Workbench Configuration Guide*. |
| 3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service. | Refer to Add Archiver as a Data Source to Reporting Engine |

## Add Archiver Service

The NetWitness Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

### Prerequisites

Make sure you have added an Archiver host and applied a license to it.

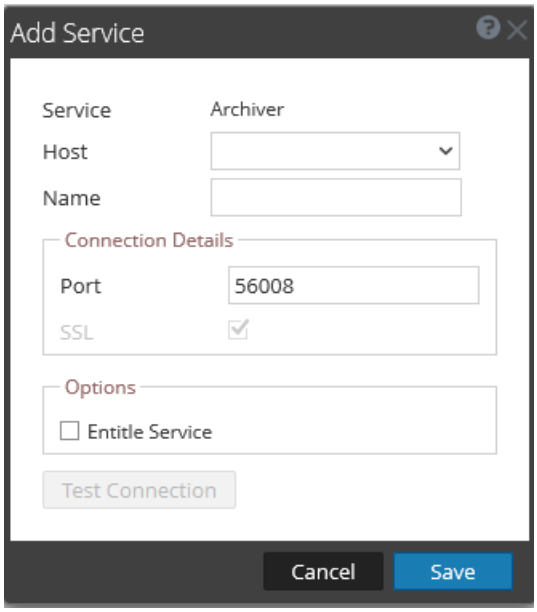
### Procedure

**Note:** This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** panel, select **+>Archiver**.

   The Add Service dialog is displayed, as shown below.



3. Provide the following details.

| Field | Description |
|---|---|
| Host | Select an Archiver host from the drop-down menu. |
| Name | Type a name for the service. |
| Port | Default port is 50007. |
| SSL | Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.<br>**Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel. |
| Username | (Optional) Type the username for the service. |
| Password | (Optional) Type the password for the service. |

4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the Services panel.

**Note:** If the test is unsuccessful, edit the service information and retry.

## Create Collection

You can create a collection on an Archiver service using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

### Prerequisites

Ensure that you have the following:

- Archiver service installed on an Archiver host.
- The Archiverservice has enough space to hold the collection.
- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

### Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.

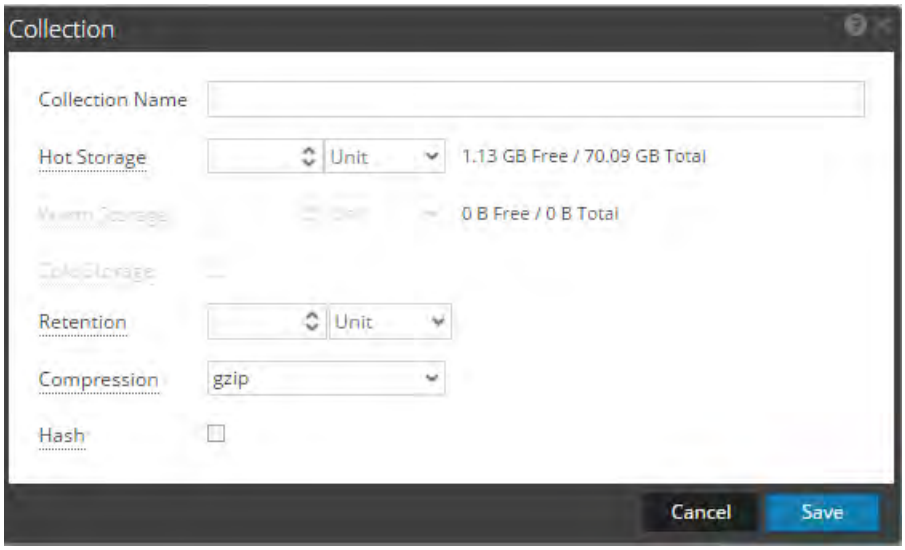
**Note:** The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retentions** tab and click in the **Collections** panel to add a collection.

   The **Collection** dialog is displayed.



4. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.
5. Click **Save** to restore the collection.

   Note the following:
   - Target is the location where the collection is created.
   - If the source path provided to create the restoration collection does not exist, the following error message is displayed:

     *"The source path does not exist '/xxx/xxx/'."*

If there is insufficient storage to restore your collection, the following error is displayed:

*"Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."*

6. The Schedule Job dialog is displayed with the following message:

   *"Restoring data into a new collection. Check the jobs page for progress."*

7. Click **Jobs** icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

**Note:** When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

## Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

### Prerequisites

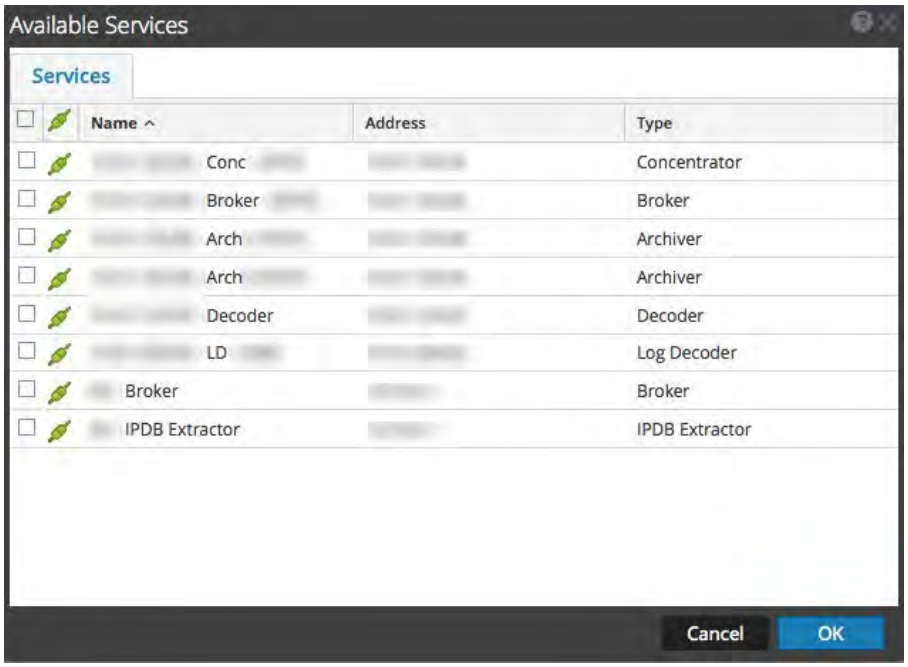
Ensure that you have:

- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

### Procedure

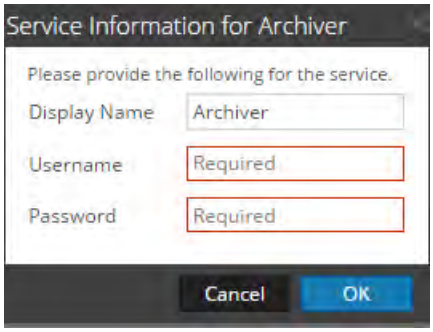
Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Go to **(Admin) > Services**, click , and select **Reporting Engine** service.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Sources** tab.
4. Click and select **Available Services**.
   The Available Services dialog is displayed.



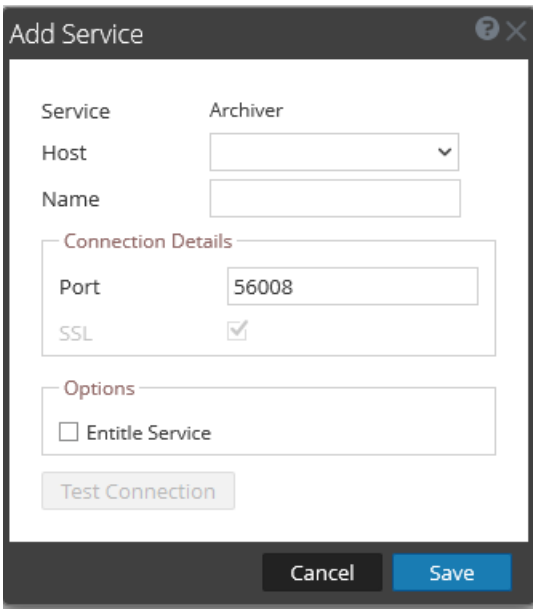
5. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.



6. Type the username and password for admin credentials for the service.
7. Click **OK**.

   The Add Service dialog is displayed.



8. Select a host from the drop-down list and click **Save**.

   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

**Note:** This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

## Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to **(Admin) > Services**.
2. Select an **Archiver** from the **Services** panel and select **> View > Explore**.

   The Explorer view for the Archiver is displayed

3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for the selected query.

## Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

**Note:** You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

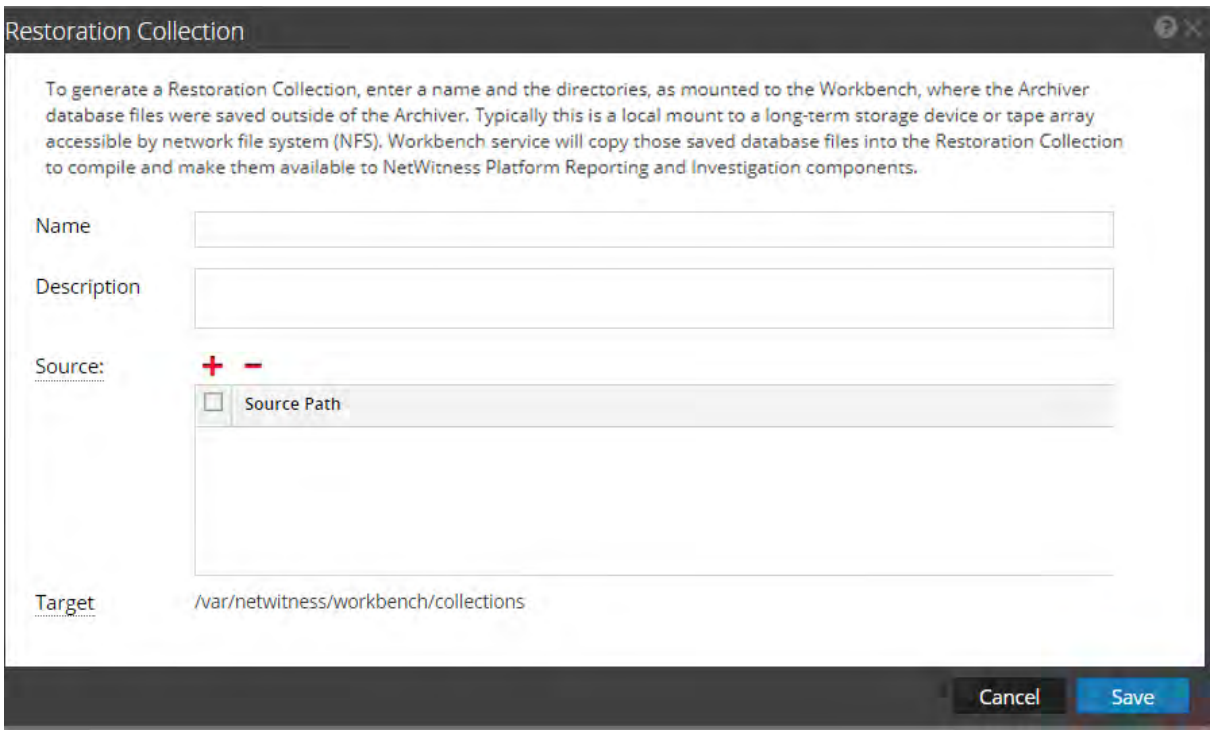
To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, then select **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.

   The Collections panel is displayed.
4. Click in the toolbar.

   The Restoration Collection dialog is displayed.



5. Provide the following information:
   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   **Note: Target** is the location where the collection is created.

6. Click **Save** to restore the collection.

   **Note:** If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon in the NetWitness toolbar to expand the list of restoration collection jobs with their current status.

**Note:** Restoring a collection that is larger than 550 GB may take several hours to process.

## Delete a Collection

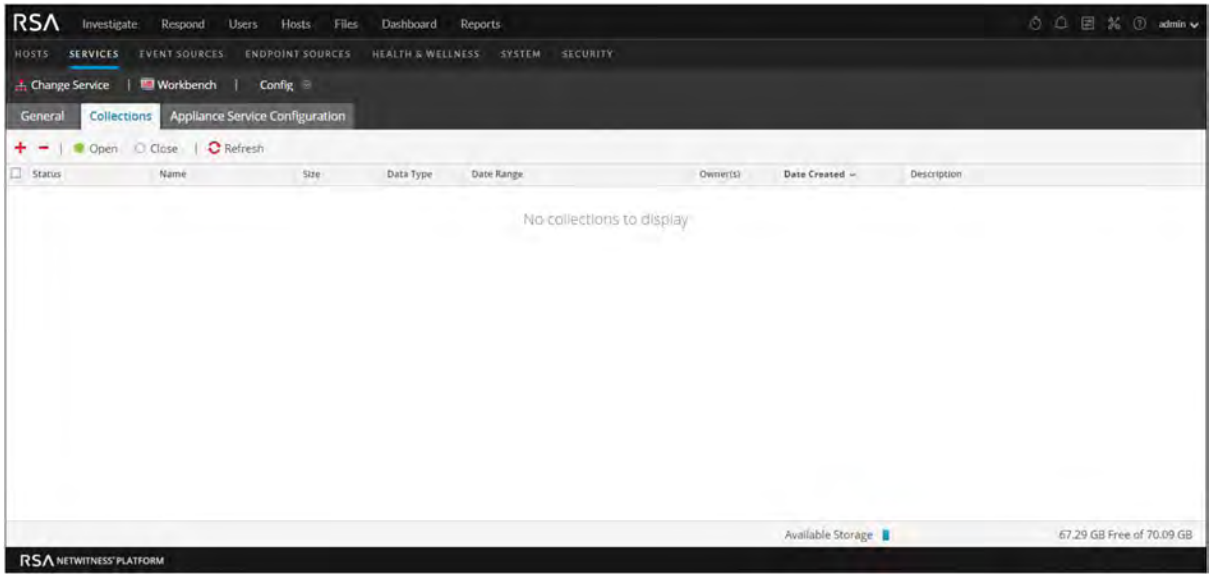
Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, and click **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections panel is displayed.



4. In the Collections panel, select the collection that you want to delete.
5. Click − from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

## Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

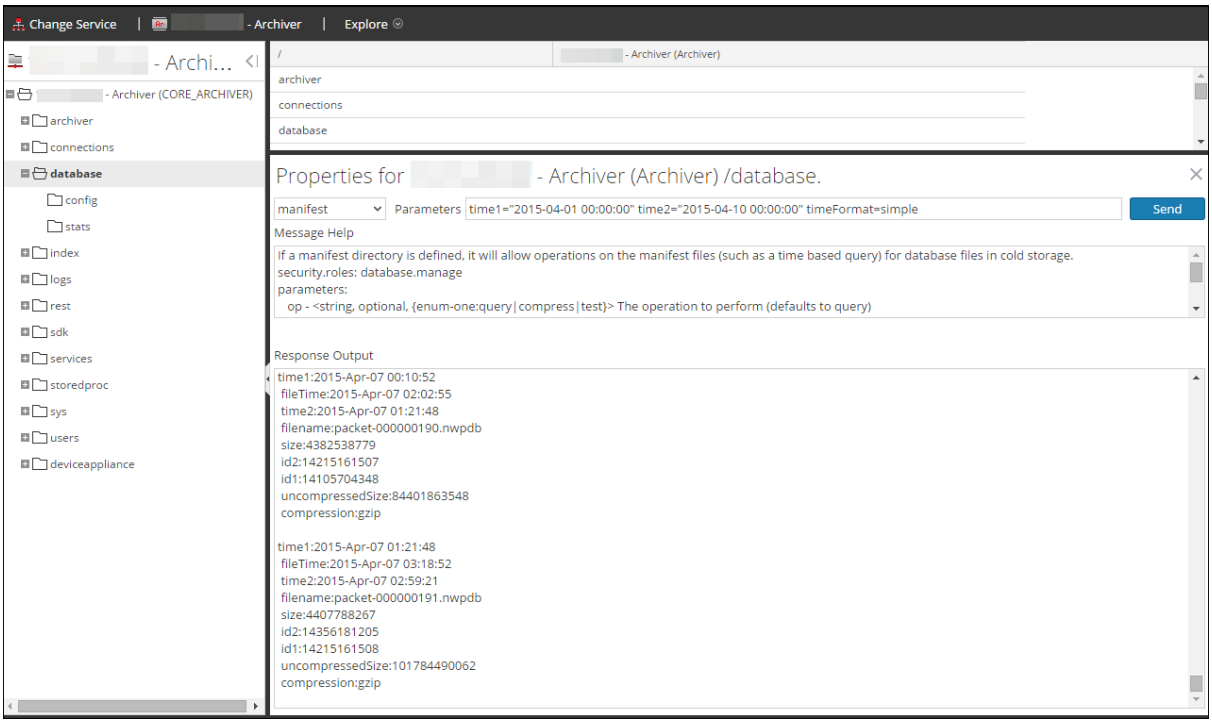
1. Go to **(Admin) > Services**, select the **Archiver**, and click **> View > Explore**.

   The Explorer view for Archiver is displayed.
2. Right-click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
3. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   **Example Search:**

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
   ```



4. Go to **(Admin) > Services**, select an **Archiver**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open
5. Select the **Collections** tab.
6. Create a restoration collection with the source path pointing to files listed in the manifest command output.
7. Save the collection.
   After successfully creating a collection, you can use this collection for reporting and investigation purposes.

## Investigate a Collection

To perform an investigation on an Archiver collection:

1. Go to **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

**Note:** For detailed information about using Investigate, see the *Investigate User Guide.*.

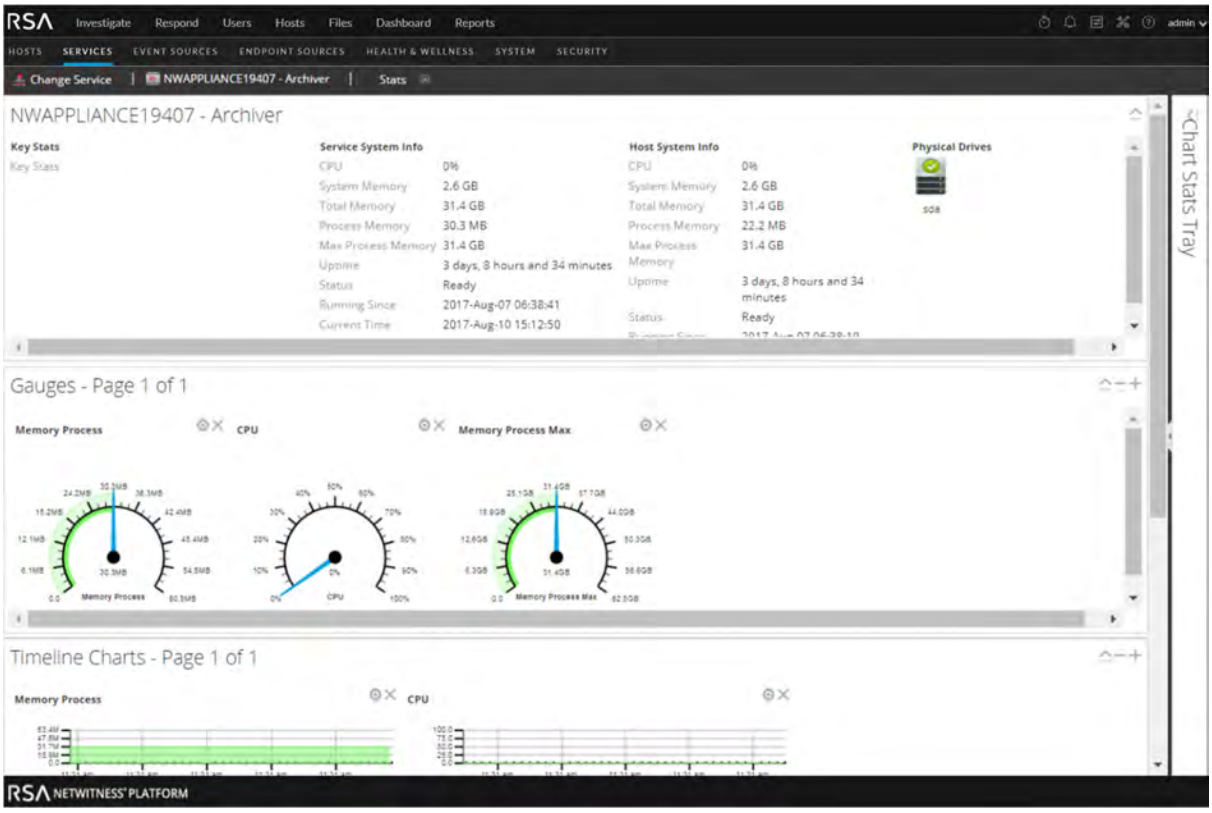
## View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select an **Archiver**, then select **View > Stats**

   The Services Stats view is displayed.



**Note:** For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

## View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Archiver**, then select **> View > Logs**

   The Services Logs panel is displayed.

**Note:** For information about viewing and configuring audit logs, see "Configure Global Audit Logging" topic in the *System Configuration Guide.*

## Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

### Prerequisites

Ensure that you have:

- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

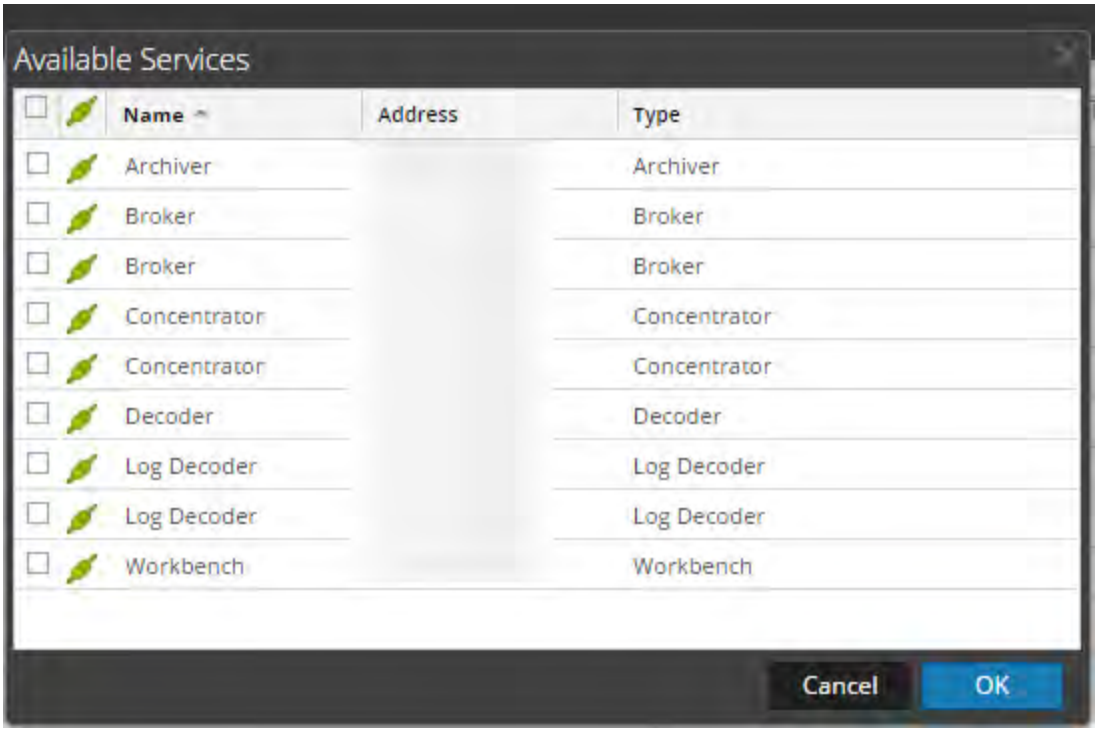
### Procedure

To add an Archiver service as a data source on the Broker:

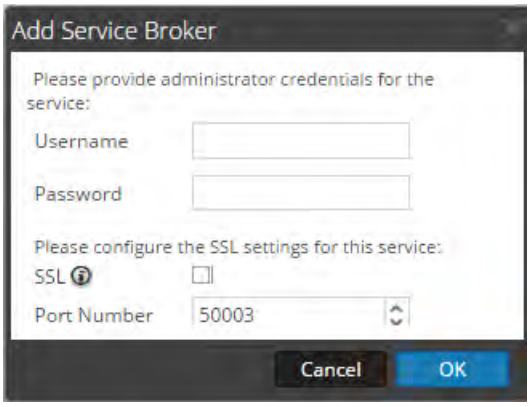
1. Go to **(Admin) > Services** and select a **Broker** service.
2. In the **Actions** column, select **> View > Config**.

   The Config view is displayed with the General tab open.
3. In the **Aggregate Services** section, click .

The Available Services dialog is displayed.

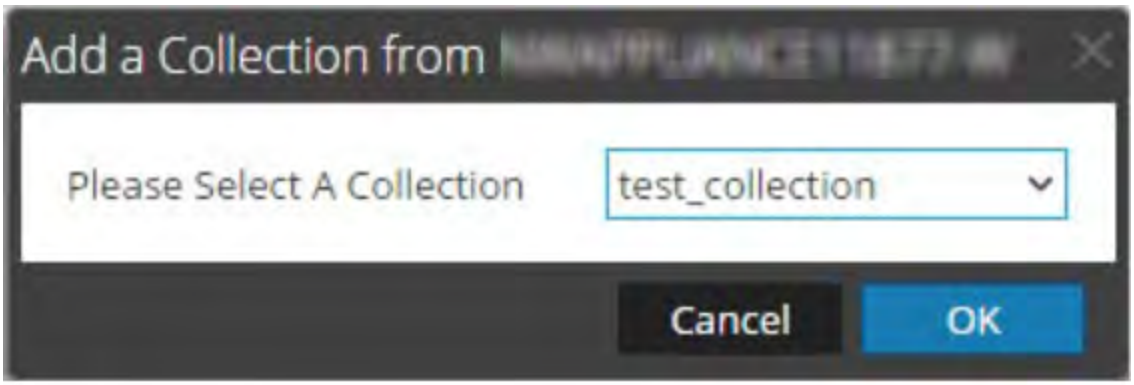


6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.



8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.



10. Select a collection from the drop-down list and click **OK**.

    The Archiver service is now added as a data source to the Broker.

**Note:** This procedure has to be performed for each collection.

# Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

The following table lists the criteria that you can use to retrieve the hash files from the database.

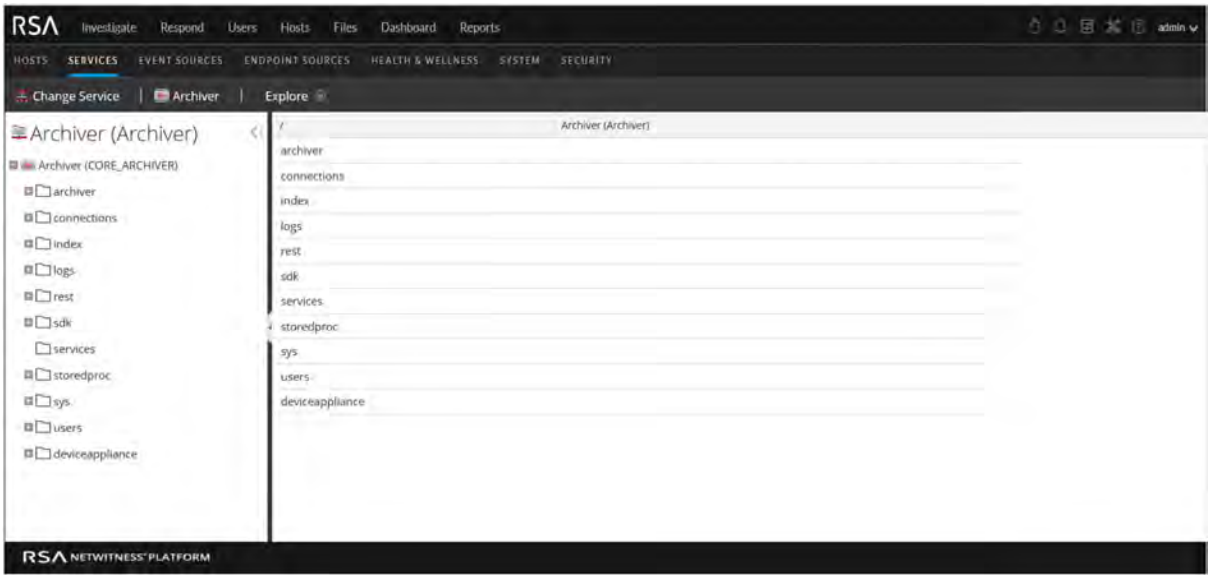
| Criteria | Description |
|---|---|
| sessions | You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information.<br>**For example:**<br>sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100.<br>sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000 |
| beginDate | You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS. |
| endDate | You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS<br>**For example:**<br>beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days. |
| directories | By default, the hash information files are stored with the database files they were created for.<br>You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter.<br>You can define the location as a filter and retrieve the hash information files for the configured location.<br>**For example:**<br>directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash |

## Procedure

To retrieve hash information of the database files:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, select **View > Explore**.

   The Explore view of the Archiver service is displayed.



3. In the node tree, right-click on **archiver** and select **Properties**.

   The Properties dialog is displayed.

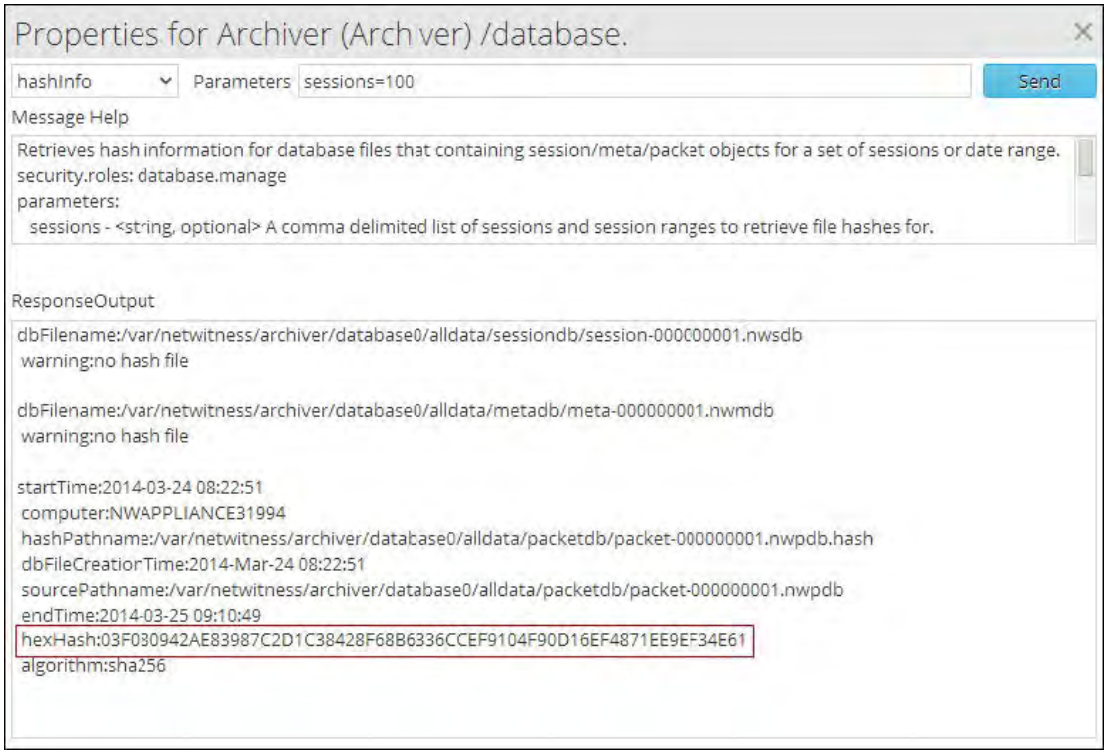
4. In the drop-down menu, select **hashInfo**.
5. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
6. Click **Send**.

   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

## Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

Output

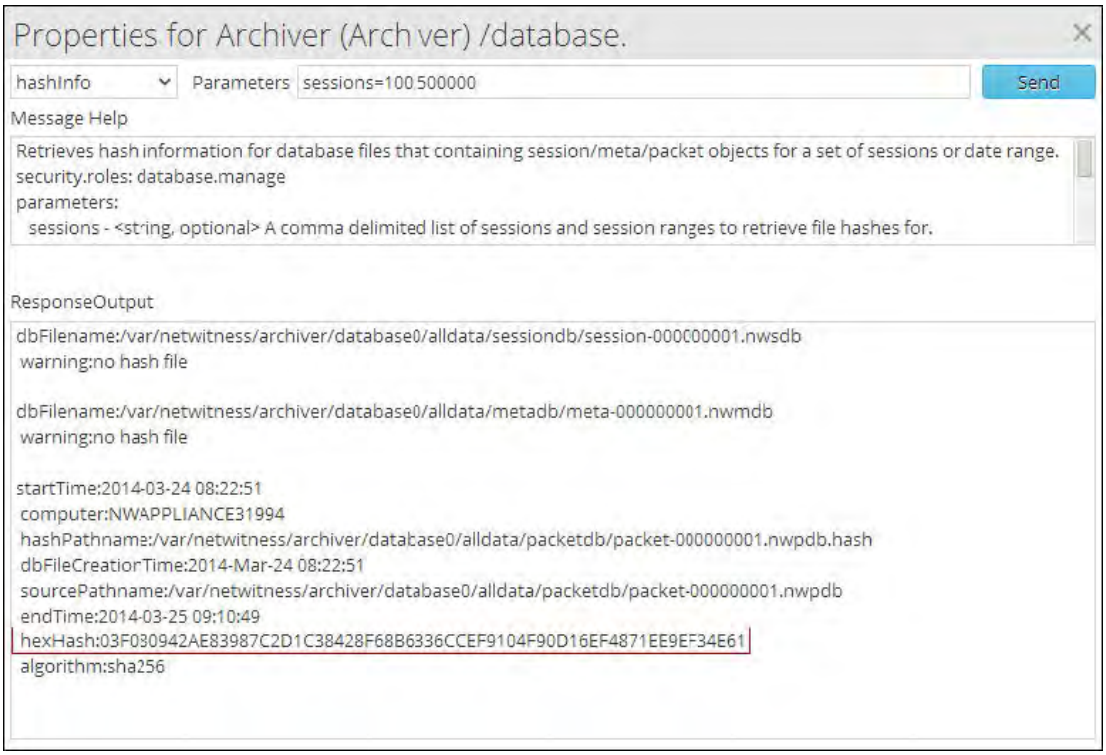


The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000

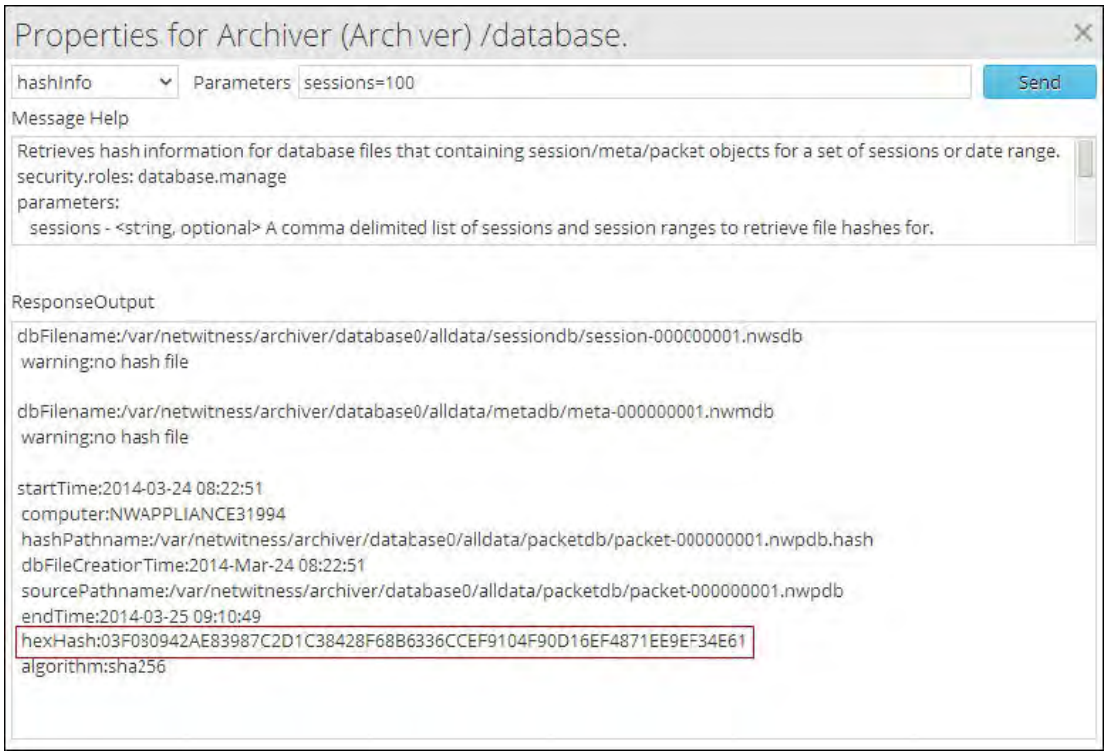
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

# Archiver Collection Dialog

On the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

## Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

## What do you want to do?

| Role | I want to... | Show me how... |
|---|---|---|
| Administrator | Add an Archiver service | Edit the Archiver Service |
| Administrator | Add a Log Decoderas a source to the Archiver | Add Log Decoder as a Data Source to Archiver |
| Administrator | *Configure Archiver Storage and Log Retention | Configure Archiver Storage and Log Retention |

## Related Topics

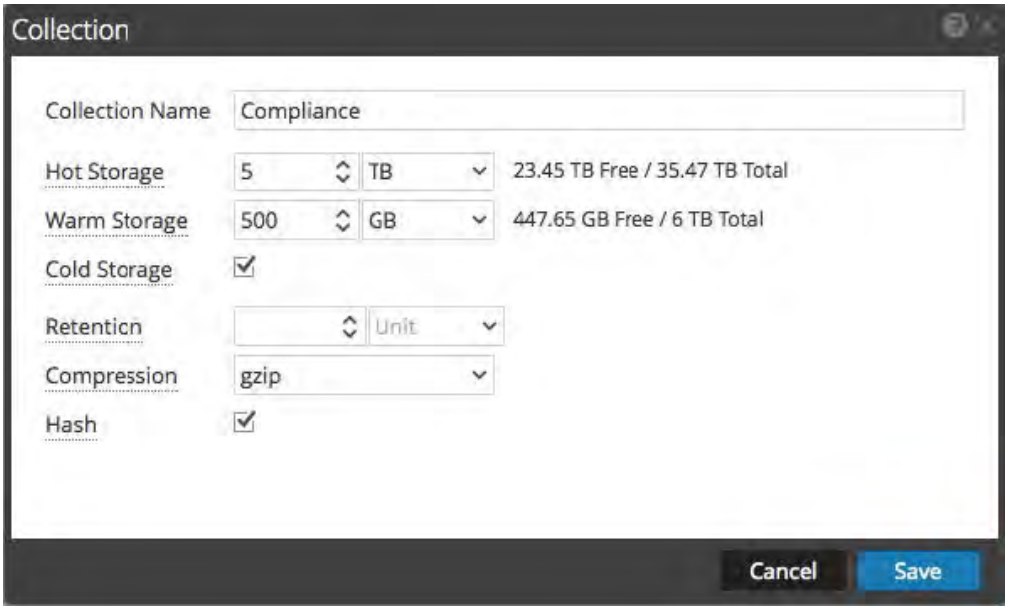
Configuring an Archiver

## Quick Look

To access the Collection dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.

3. Click the **Data Retention tab**.
4. In the Collections section, click .
   The Collection dialog is displayed.



**Note:** When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

| Field | Description |
|---|---|
| Collection Name | Specify a name for your collection, such as Compliance, MediumValue, or LowValue. |
| Hot Storage | Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold). |
| Warm Storage | (Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage. |
| Cold Storage | (Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed. |

| Field | Description |
| --- | --- |
| Retention | (Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. |
| Compression | Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP. |
| Hash | Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. |

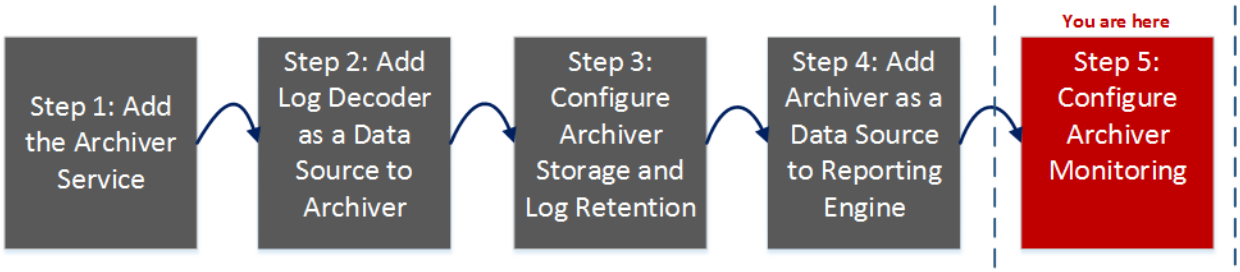
# Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to **(Admin) > Services**, select an **Archiver** service, then select **View > Config**.

## Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

**Note:** Archiver can aggregate from Log Decoder and Archiver (Archiver-Archiver aggregation). Archiver can be aggregated by Archiver and Broker. A Broker can aggregate from either set of concentrators or set of Archivers

## What do you want to do?

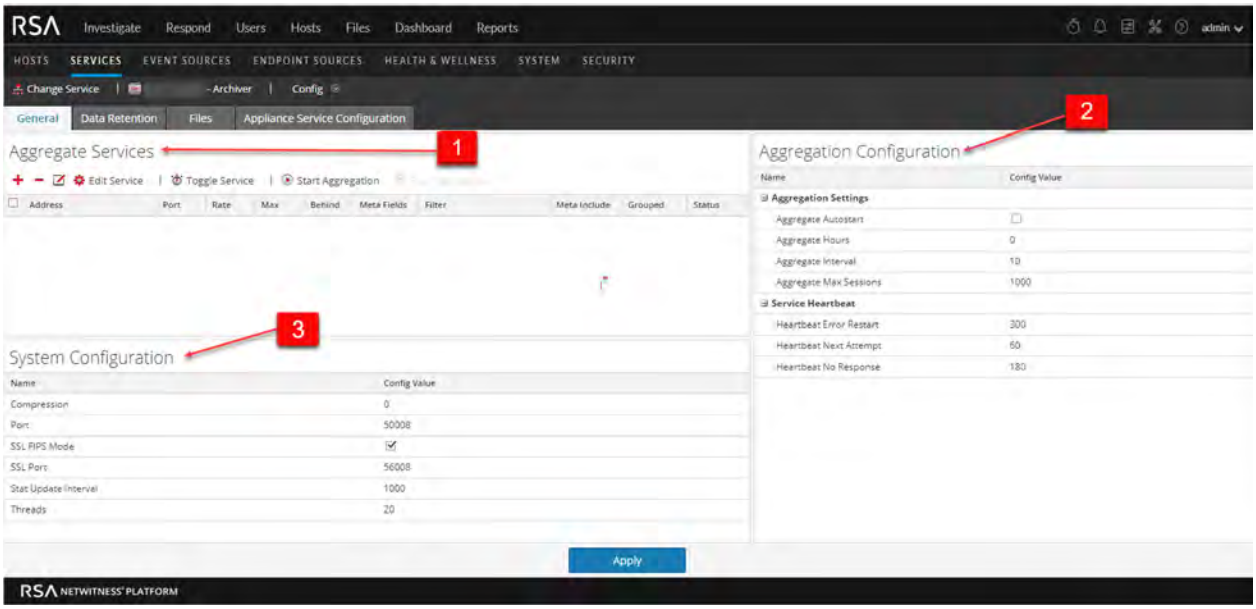
## Related Topics

Configure Log Storage Collections

## Quick Look

This is an example of the General tab.



These are the three major sections in the General tab for Archivers:

| | |
|---|---|
| 1 | Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. |
| 2 | System Configuration section manages service configuration for a service. |
| 3 | Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. |

## Aggregate Services Section

This is an example of the Aggregate Services section for a Concentrator. The Aggregate Services section toolbar offers these options.

| Option | Description |
|---|---|
| | Opens a dialog in which you can add a Archiver or a Log Decoder. |
|  | Removes the selected aggregate service. |
| | Opens a dialog to edit **Meta Fields** and **Filter** values. |
|   | When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service. |
| | When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures. |
|   | Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation. |

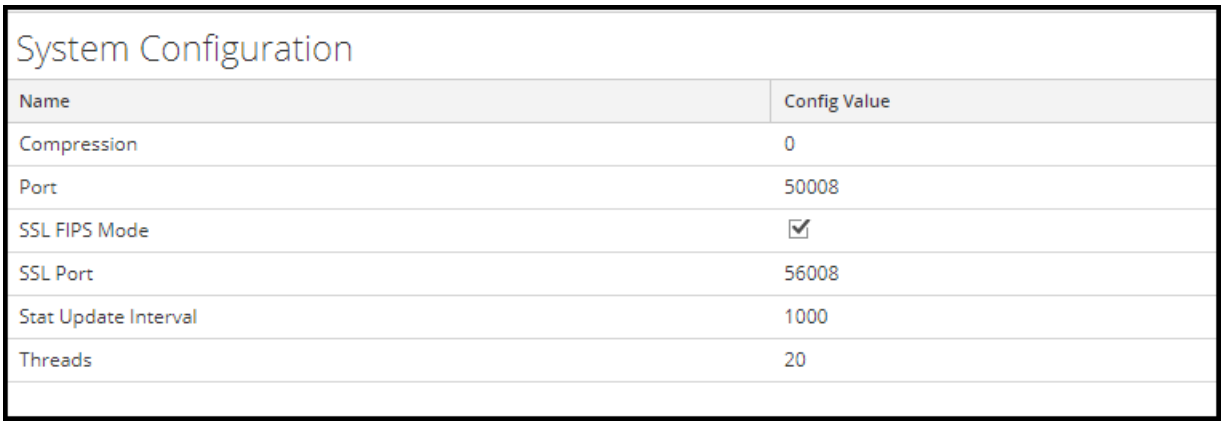
The Aggregate Services section list has these columns.

| Column | Description |
|---|---|
| **Address** | Lists the address of the service. |
| **Port** | Lists the port on which the service listens. The default ports are:<br>• 50001 for Log Collectors<br>• 50002 for Log Decoders<br>• 50003 for Brokers<br>• 50004 for Decoders<br>• 50005 for Concentrators<br>• 50007 for other services |
| **Rate** | Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**. |
| **Max** | Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture. |
| **Behind** | Lists the number of sessions on the service that need to be aggregated. |

| Column | Description |
|---|---|
| **Collection** | For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section. |
| **Meta Fields** | For Concentrators only, lists the types of metadata being consumed by the aggregate service. |
| **Filter** | For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service. |
| **Meta Include** | For Concentrators only, lists the number of types of meta included in the aggregate service. |
| **Grouped** | Whether or not the aggregate service is part of a group. |
| **Status** | Lists the current status of the service:<br>• online = available to provide data for consumption by the Broker or Concentrator<br>• offline = not available to provide data for consumption by the Broker or Concentrator<br>• consuming = providing data for consumption by the Broker or Concentrator |

## System Configuration Section

When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

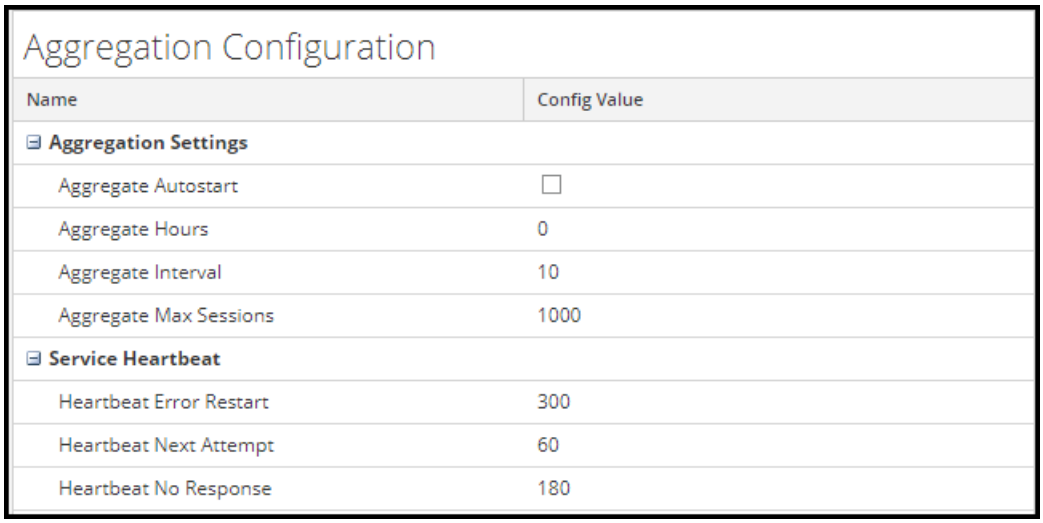
| Parameter | Description |
|---|---|
| **Compression** | The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**.<br>A change in value is effective immediately for all subsequent connections. |

| Parameter | Description |
|---|---|
| **Port** | The port on which the service listens. The default ports are:<br>• 50001 for Log Collectors<br>• 50002 for Log Decoders<br>• 50003 for Brokers<br>• 50004 for Decoders<br>• 50005 for Concentrators<br>• 50007 for other services |
| **SSL FIPS Mode** | When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**. |
| **SSL Port** | Indicates the SSL port. |
| **Stat Update Interval** | The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**.<br>A change in value is effective immediately. |
| **Threads** | The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**.<br>Changes takes effect on service restart. |

## Aggregation Configuration Section

The Aggregation Configuration Section provides configuration settings for aggregation. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

**Caution:** Do not edit any of these settings without guidance from Customer Support.



# Archiver Service Configuration

This topic lists and describes the available configuration settings for RSA NetWitness Archivers.

## Workflow

## Related Topics

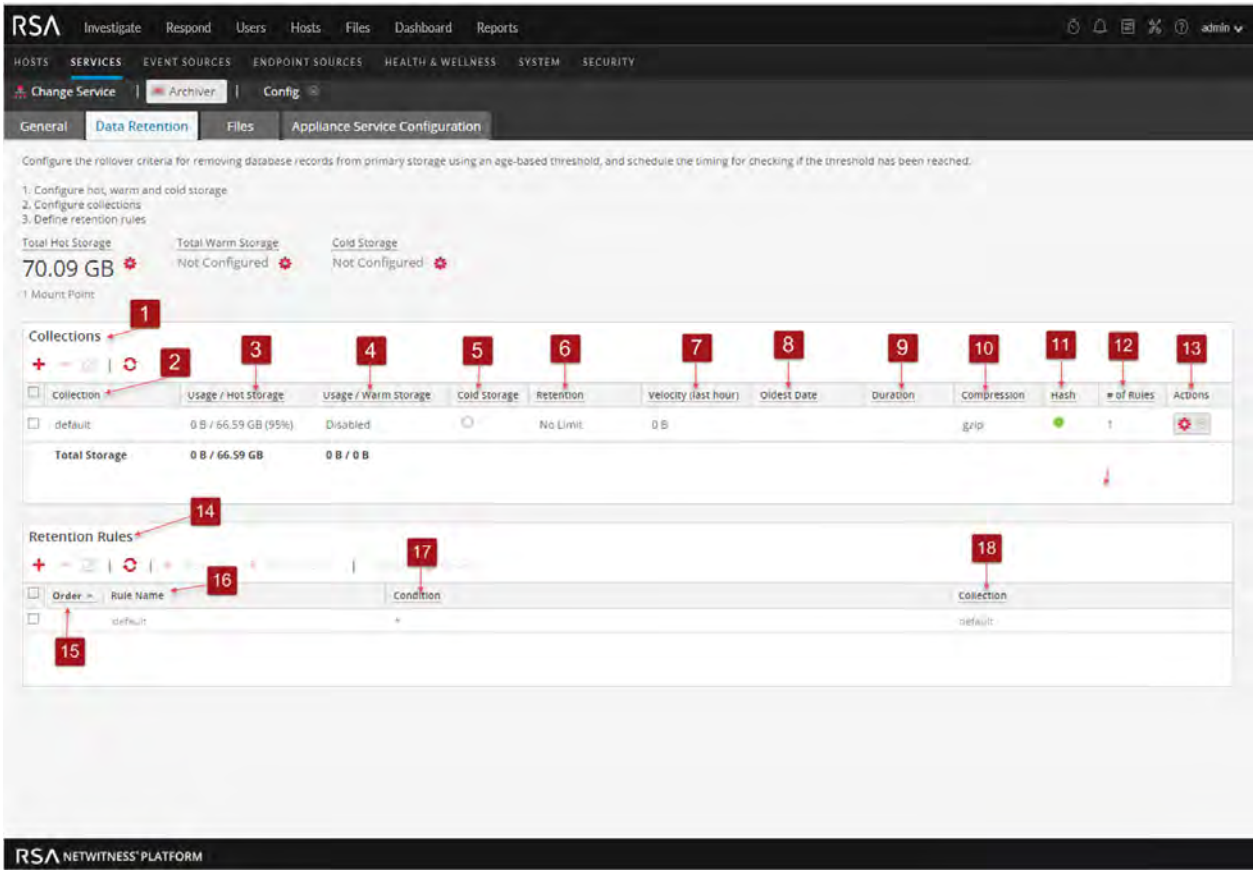
Configuring an Archiver

Configure Hot, Warm, and Cold Storage

## Quick Look

As an administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.



| | |
|---|---|
| 1 | Displays the Collections panel with the Data Retention tab open. |
| 2 | Allows you to sort the collections in ascending or descending order. |
| 3 | Displays the allocated hot storage space for the collection, as well as the approximate current usage. |
| 4 | Displays the allocated warm storage space for the collection, as well as the approximate current usage. |
| 5 | Displays whether the collection uses cold storage for long-term backup. |
| 6 | Displays the time range used to determine when data is moved to cold storage or discarded. |
| 7 | Displays the amount of data written to the collection during the past hour. |
| 8 | Displays the date of the oldest data stored in the collection. |
| 9 | Displays the approximate age of the oldest data stored in the collection. |
| 10 | Displays the compression type used in collection storage. |
| 11 | Displays whether or not hashes are used when storing data in the collection. |
| 12 | Displays the number of retention rules that use this collection for storing data. |
| 13 | Displays the Actions drop-down menu. |
| 14 | Displays the Retention Rules panel. |
| 15 | Displays the order in which Retention Rules are evaluated in the execution chain. |
| 16 | Displays the name of the Retention Rule. |
| 17 | Data that satisfies this condition is stored in the corresponding collection. |
| 18 | Displays the collection used to store the data that satisfies this particular rule condition. |

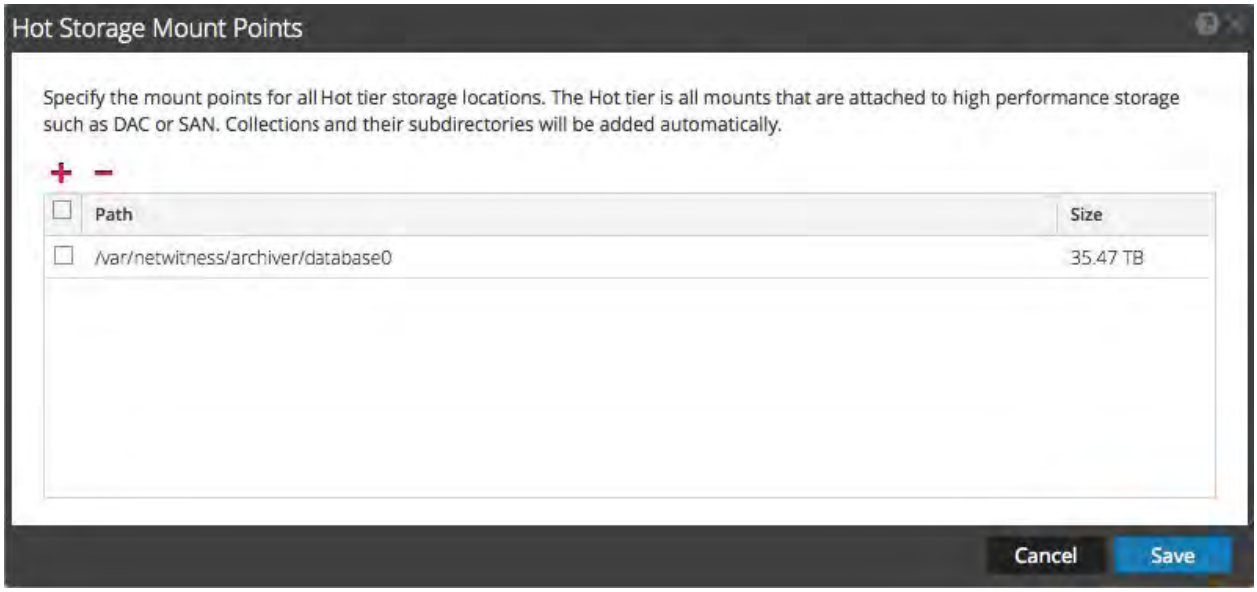
## Total Hot, Warm, and Cold Storage

The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

### Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the icon near the respective section.

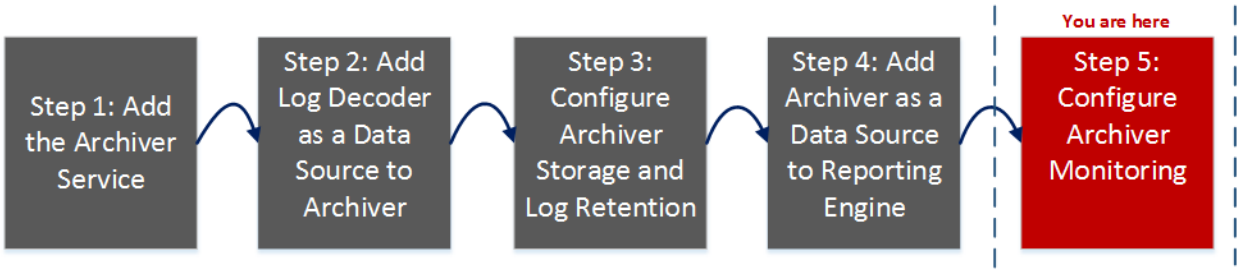


# Services Config View - Archiver

The Services Config view ( (Admin) > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

## Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



## What do you want to do?

| Role | I want to... | Show me how... |
|---|---|---|
| Administrator | Add the Archiver service. | Edit the Archiver Service |
| Administrator | Add a Log Decoder as a Data Source to an Archiver. | Add Log Decoder as a Data Source to Archiver |

| Administrator | *Add a Log Decoder as an aggregate service. | Click in the Aggregate Services section. |
| Administrator | *Remove the selected aggregate service. | Click in the Aggregate Services section. |

| Role | I want to... | Show me how... |
|---|---|---|
| Administrator | *Edit Meta Fields and Filter values of the aggregate service. | Click in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service. |
| Administrator | *Communicate with the Archiver. | Click in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver. |
| Administrator | *Toggle the state of a service between offline and online. | Click  in the Aggregate Services section. |
| Administrator | *Aggregate data using the rules defined for the service. | Click  in the Aggregate Services section.<br>Note that it is necessary to start aggregate service after aggregation has been stopped. |
| Administrator | *Stop aggregation on the Archiver. | Click  in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures. |

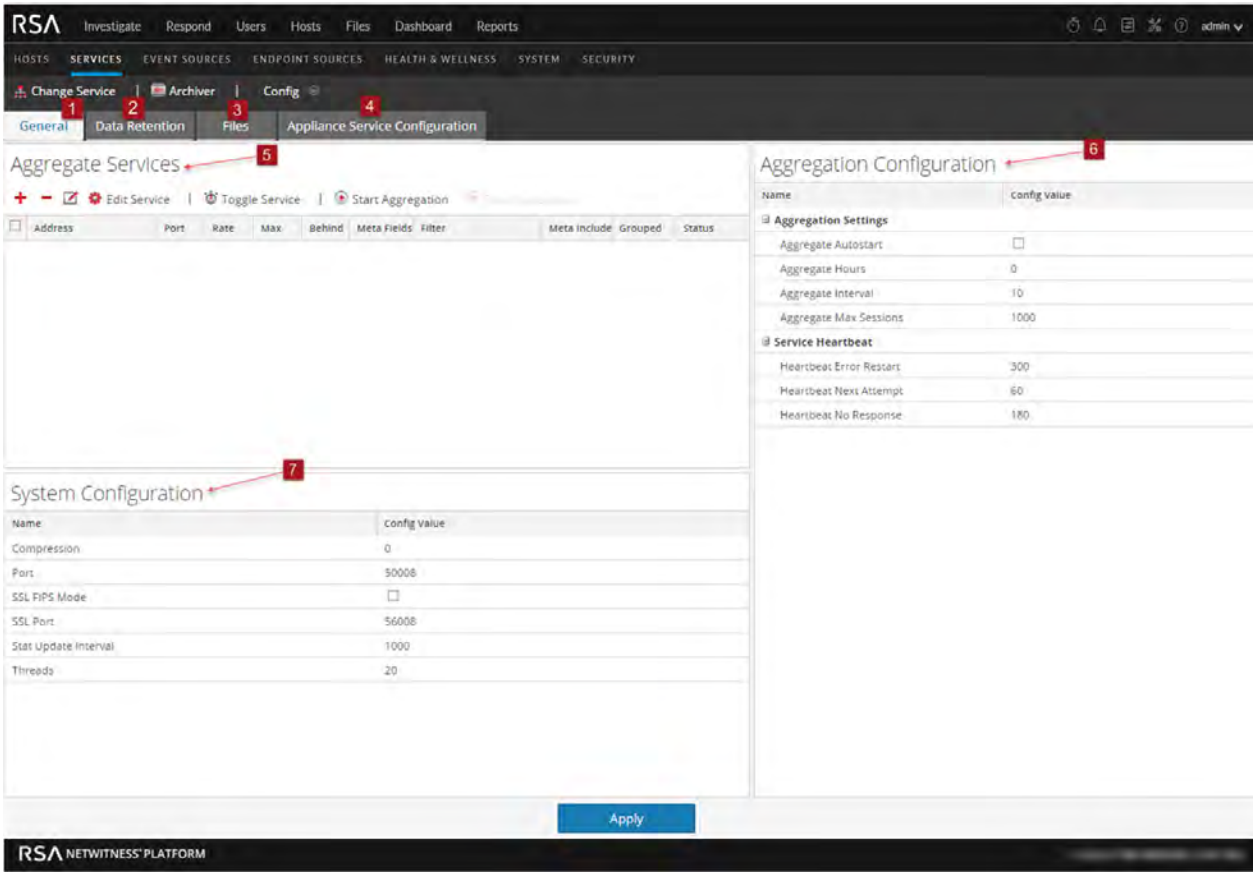
*You can perform this task in the current view.

## Related Topics

Configure Log Storage Collections

## Quick Look

The Services Config view has four tabs and three panels.



| | |
|---|---|
| 1 | General tab provides a way to manage basic Archiver service configuration. |
| 2 | Data Retention tab provides a way to view and edit collections and retention rules. |
| 3 | Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files |
| 4 | Appliance Service Configuration tab provides a way to configure an Archiver service. |
| 5 | Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. |
| 6 | Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process. |
| 7 | System Configuration panel provides a way to manage service configuration for an Archiver service. |

## General

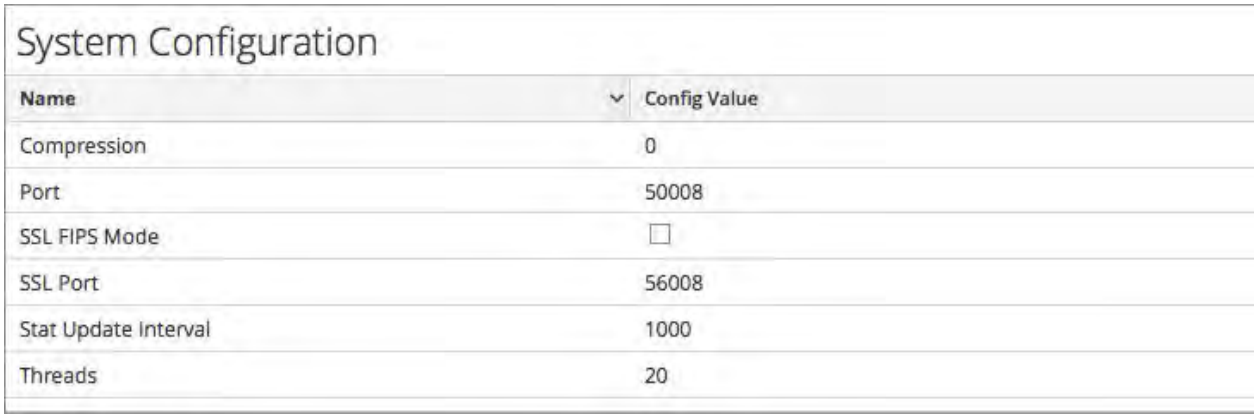
The General tab contains the following sections:

- Aggregate Services
- System Configuration
- Aggregation Configuration

## Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

## System Configuration

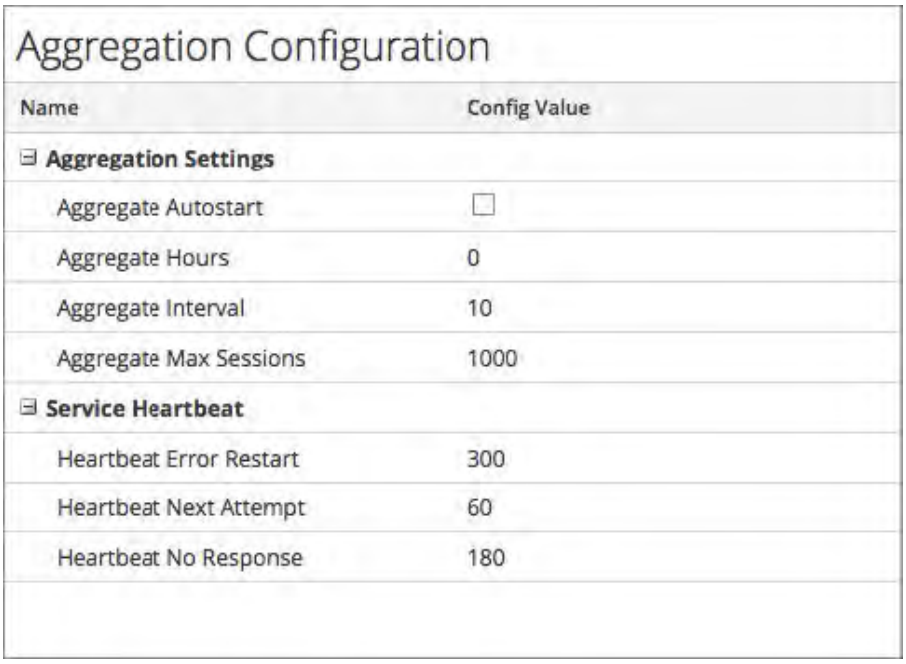


When you add an Archiver service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

| Task | Description |
|---|---|
| Compression | Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed. |
| Port | Determines the port used by the service.<br>**Note:** If you change the port number, ensure that you restart the service. |
| SSL FIPS mode | If enabled, all the data transferred in the network will be encrypted using SSL. |
| SSL Port | Indicates the port used for encrypting using SSL. |

| Task | Description |
|---|---|
| Stat Update Interval | Determines how often (in milliseconds) statistic nodes are updated in the system. |
| Threads | Determines the number of threads in the thread pool to handle incoming requests. |

### Aggregation Configuration



The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

## Aggregation Settings

The Aggregations Settings section has the following parameters.

| Parameter | Description |
|---|---|
| Aggregate Autostart | If enabled, data aggregation will automatically restart after a service restart. |
| Aggregate Hours | Determines the maximum number of hours a service is allowed to start aggregation. |
| Aggregate Interval | Determines the minimum number of milliseconds before another round of aggregation is requested. |

| Parameter | Description |
|---|---|
| Aggregate Max Sessions | Determines the number of sessions to aggregate on each round. |

## Service Heartbeat

The Service Heartbeat section has the following parameters.

| Parameters | Description |
|---|---|
| Heartbeat Error Restart | Determines the number of seconds to wait after a service error before attempting a service reconnect. |
| Heartbeat Next Attempt | Determines the number of seconds to wait before attempting a service reconnect. |
| Heartbeat No Response | Determines the number of seconds to wait before taking unresponsive service to offline. |

## Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see "Files Tab" in the *Host and Services Getting Started Guide*.

# AWS Installation Overview

Before you can deploy NetWitness in the Amazon Web Services (AWS) you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see the Storage Guide for RSA NetWitness® Platform 11.x.
- Make sure that you have a NetWitness Throughput license.

When you are ready to begin deployment, you can purchase any of the following Third-Party solutions for packet capture in AWS. If you engage one of these third-parties, they will assign an account representative and a professional services engineer to you who will work closely with RSA Support.

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP

# AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Azure, virtual, and hardware hosts. RSA recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow the best practices to use the system and the dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that the compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build a Concentrator directory for the index database on the Provisioned IOPS SSD.

# AWS Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

## Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *RSA NetWitness Host and Services Getting Started Guide*.

## NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

# Prerequisites

You need the following items before you begin the installation process:

- Ixia account (https://login.ixiacom.com/)
- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Decoder.

# AWS Deployment

This topic contains the rules and high-level tasks you must follow to deploy NetWitness components in the AWS.

## Rules

You must adhere to the following rules when deploying NetWitness in AWS.

- If you reboot the Network Decoder instance, the tunnel is not retained. Create the tunnel on Network Decoder again and restart the Decoder service.
- It is recommended to use private IP addresses when you provision AWS NetWitness instances.

**Note:** If you assign a public IP to the NW Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

## Checklist

| Step | Description | √ |
|---|---|---|
| 1 | Establish AWS Environment | |
| 2 | Find NetWitness Platform AMIs | |
| 3 | Launch an Instance and Configure a Host | |
| 4 | Configure Hosts (Instances) in NetWitness Platform | |
| 5 | Configure Packet Capture | |

## Establish AWS Environment

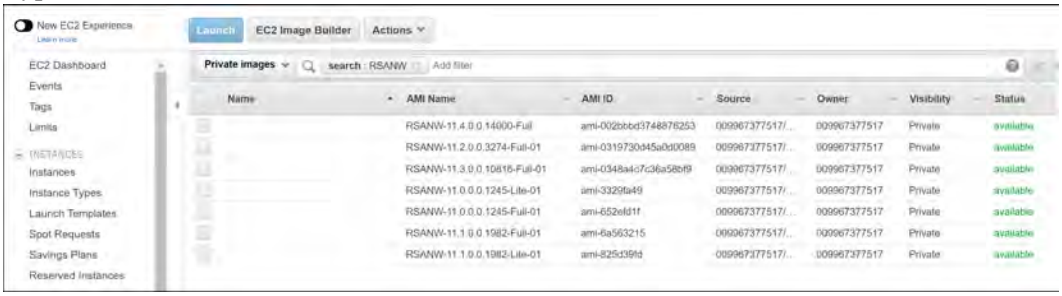
1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.

# Find NetWitness Platform AMIs

You can search for NW- AMI files within the Public/Shared/Community repository, using the keyword "RSANW".

**Note:** For more information, see AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose AMIs.
3. In the first filter, choose Public images.
4. Type "RSANW" in the search field to find the NetWitness AMIs.



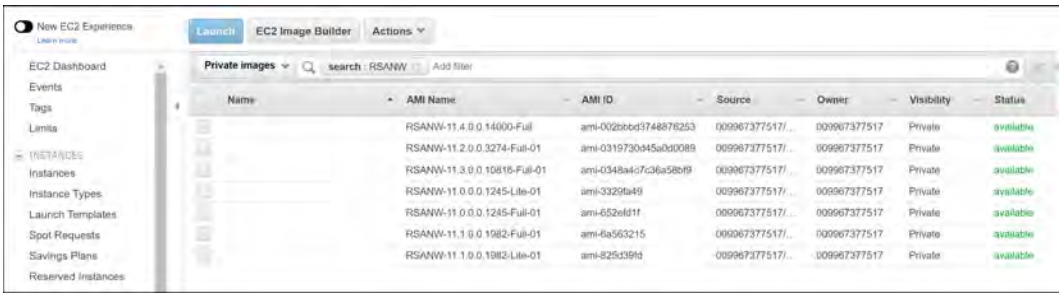
**Note:** Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to obtain access to the **RSA-11.7.0.0-AMI-17934-FULL-SIGNED**.

5. Go to Launch an Instance and Configure a Host.

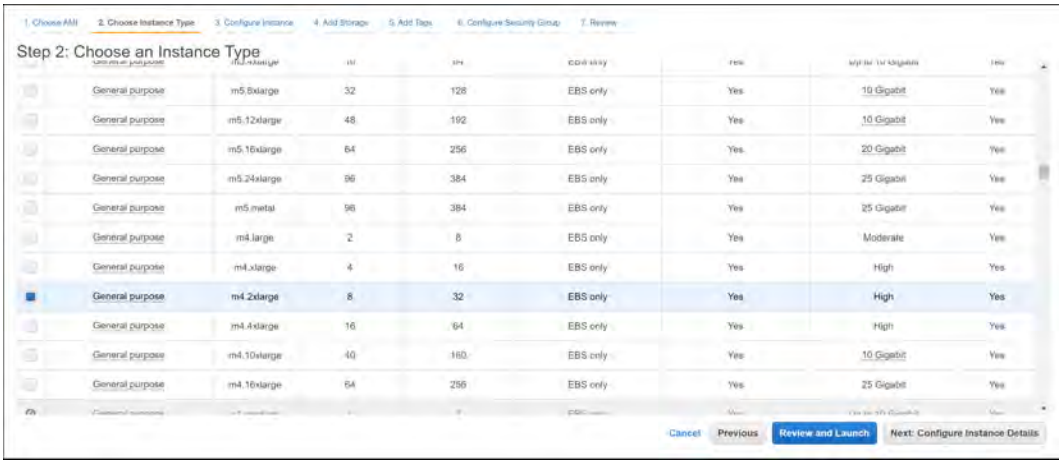
# Launch an Instance and Configure a Host

**Note:** Fore more information, see AWS "Launching an Instance" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launching-instance.html).

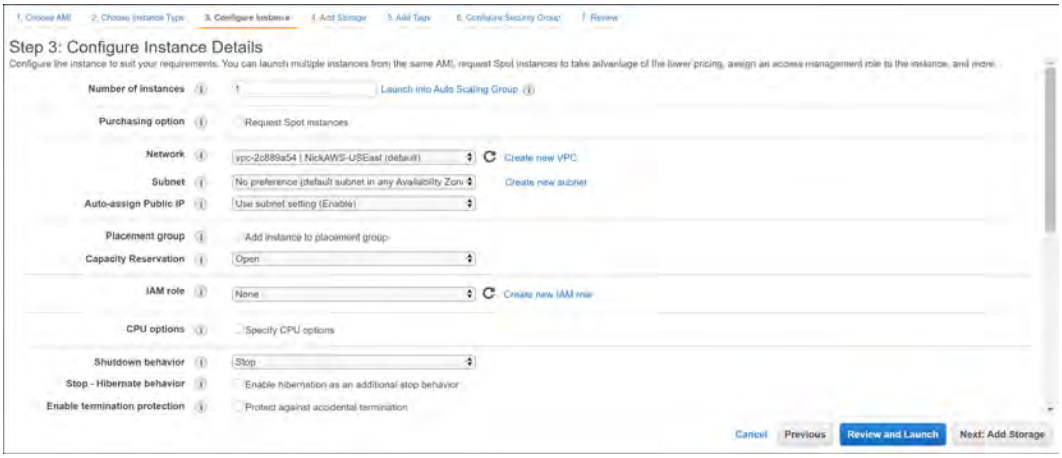
1. Select an instance from the grid (for example, **RSA-NW-Concentrator-11.7.0.0-01**) and click **Launch**.



2. Choose the RAM and CPUs by selecting the instance type.
   For more information, see Storage Guide for RSA NetWitness® Platform 11.x for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type selected with **8** CPUs and **32** GB of RAM.

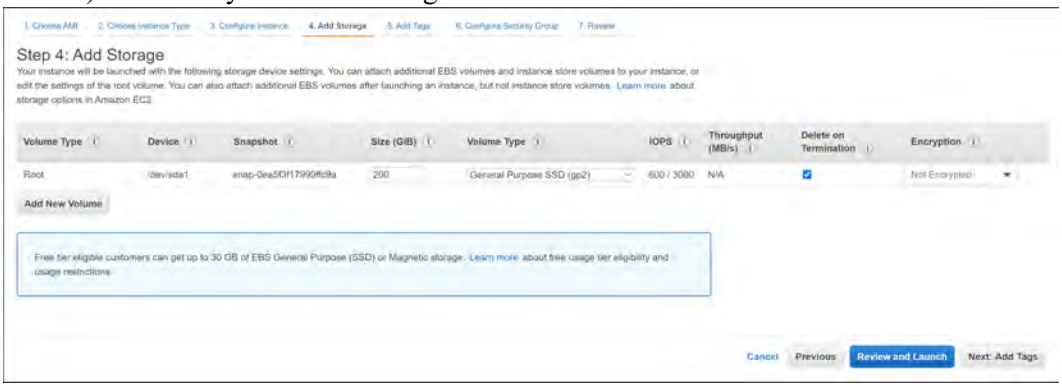


3. Click **Next: Configure Instance Details** at the bottom right of the **Step 2: Choose an Instance Type** page.
   The **Step 3. Configure Instance Details** page is displayed.
   For NetWitness, the subnet and VPC are defaulted to the values.



4. Click **Next: Add Storage** at the bottom right of the **Step 3: Configure Instance Details** page.
   The **Step 4. Add Storage** page is displayed.

For more information, see the Storage Guide for RSA NetWitness® Platform 11.x for guidelines on how to configure storage based on based on the requirements of the NetWitness component (that is, service) for which you are launching an instance.

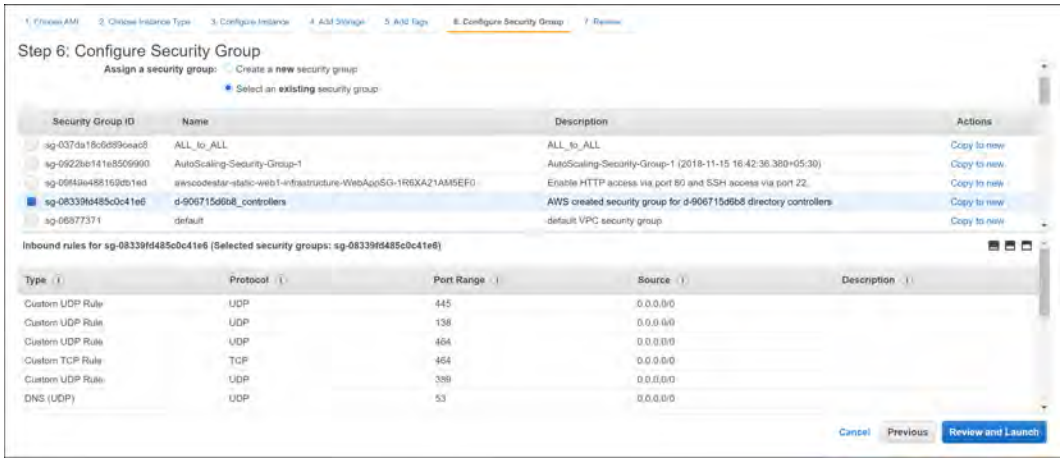


5. Click **Next: Add Tags** at the bottom right of the **Step 4: Add Storage** page.
   The **Step 5. Add Tags** page is displayed. Enter the name of your Instance.
6. Click **Next: Configure Security Group** at the bottom right of the **Step 5: Add Tags** page.
   The **Step 6. Configure Security Group** page is displayed.
   a. Select the "Create a **new** security group" radio button.
   b. Create a rule that opens all the firewall ports for the NetWitness component.
      You must configure the security group correctly to configure the instance (host) from the NetWitness User Interface and SSH to it.

      **Note:** Fore more information. see the "Network Architecture and Ports" documentation on RSA Link (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness components..

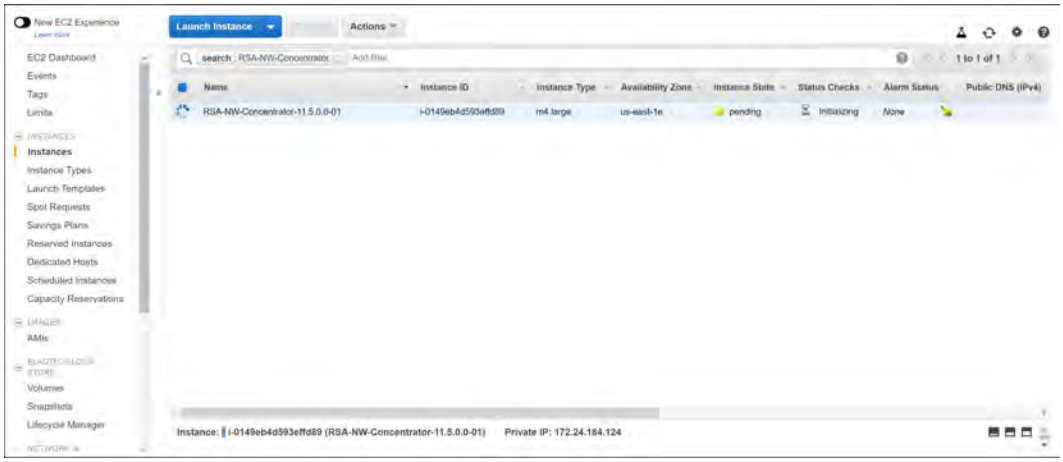
   **Note:** After you configure a Security Group, you can change it at any time.
7. Click **Review and Launch** at the bottom right of the **Step 6: Configure Security Group** page.
   The **Step 7. Review Instance Launch** page is displayed.
8. Click **Launch** at the bottom right of the **Step 7. Review Instance Launch** page.
   The **Select an existing key pair or create a new key pair** dialog is displayed.
9. Choose **Proceed without key pair**.

10. Click **Launch Instance**.
    AWS displays the following information as it builds the Instance.

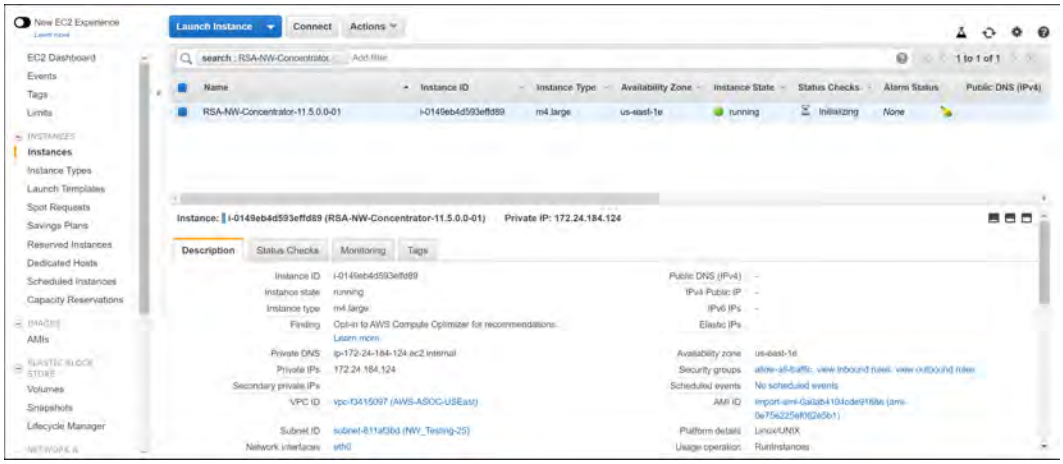


11. Click **View Instances**.

12. Select **Instances** from the left navigation panel to review all instances that AWS is initializing (for example, the **NW-Concentrator**) .



The IP Address for the new **RSA-NW-Concentrator-11.7.0.0-01** host is ***sample-ip-address***.



13. SSH to the newly-created instance using the default NetWitness credentials.

14. Go to Configure Hosts (Instances) in NetWitness Platform .

# Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

# Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform Guide*.

**Caution:** Do not proceed with the installation until the ports on your firewall are configured.

## Task 1 - Install 11.7.0.0 on the NW Server Host and Component Hosts

Complete the following steps to install 11.7 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

**Note:** You can perform this task for RSANW-11.7.0.0.17934-Full instance.

**Caution:** If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

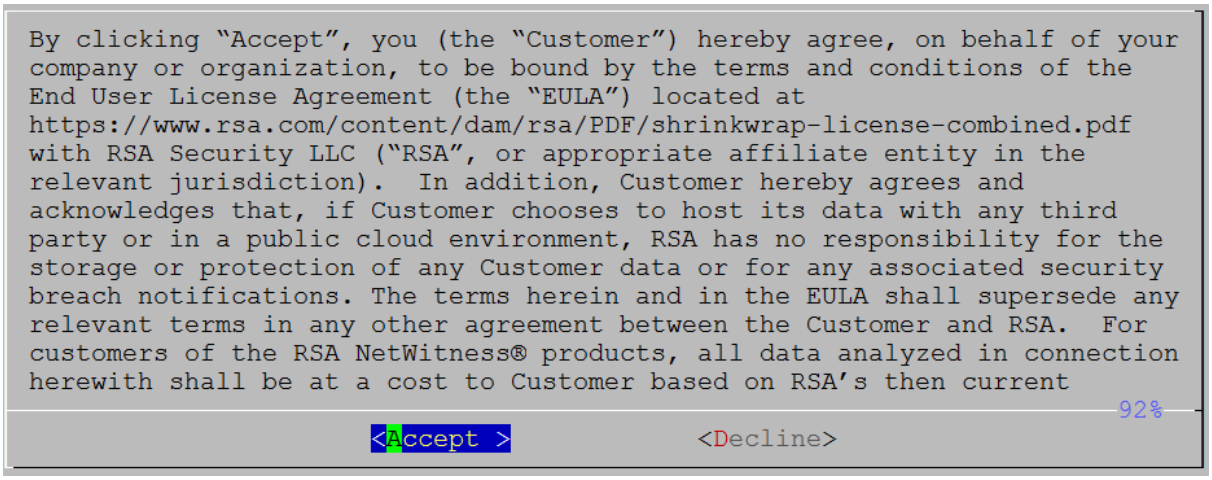
**IMPORTANT:** In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

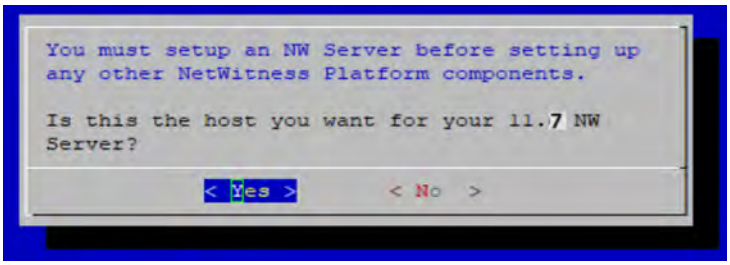
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   **Note:** Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the

host.
3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.

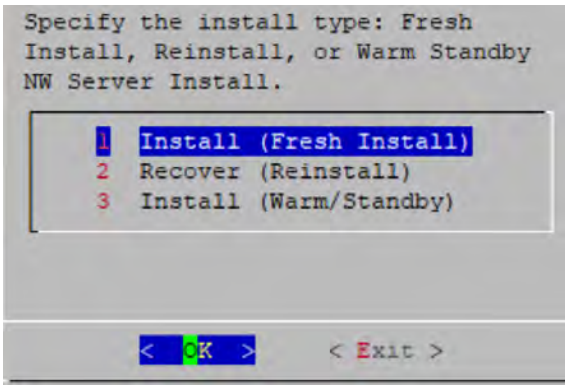


3. Tab to **Yes** and press **Enter** to install 11.7 on the NW Server.
   Tab to **No** and press **Enter** to install 11.7 on other component hosts.

   **Caution:** If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

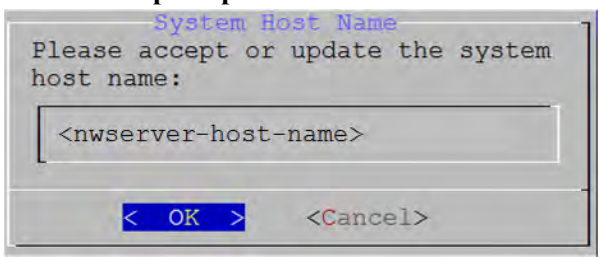
4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 11.7 Disaster Recovery.).

**NW Server Host prompt**:



**Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)**

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   **NW Server prompt**:

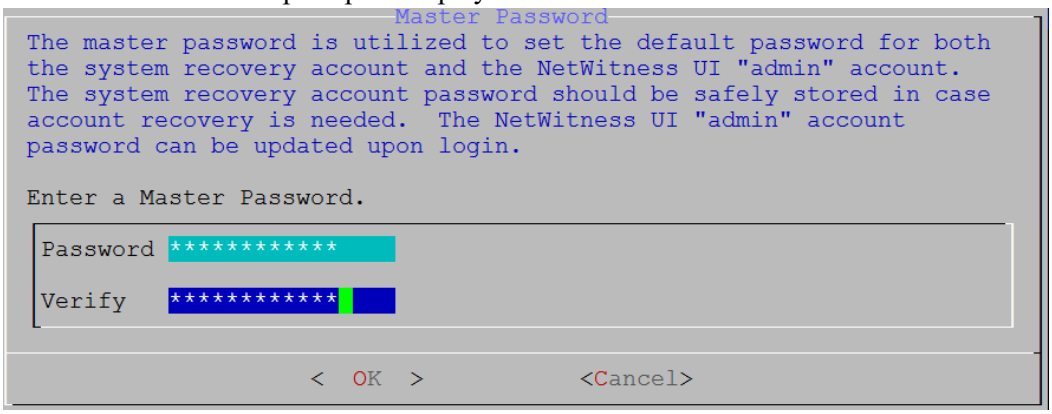


**Other Component Hosts prompt says <non-nwserver-host-name>**

> **Caution:** If you include "." in a host name, the host name must also include a valid domain name.

Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.



The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

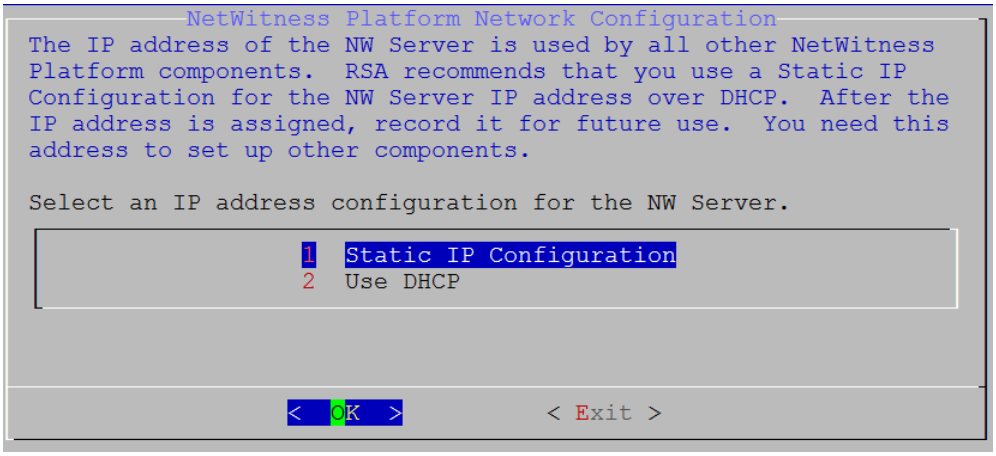
   - If you are using an SSH connection, the following warning is displayed.

     **Note:** If you connect directly from the host console, the following warning is not displayed.

     Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

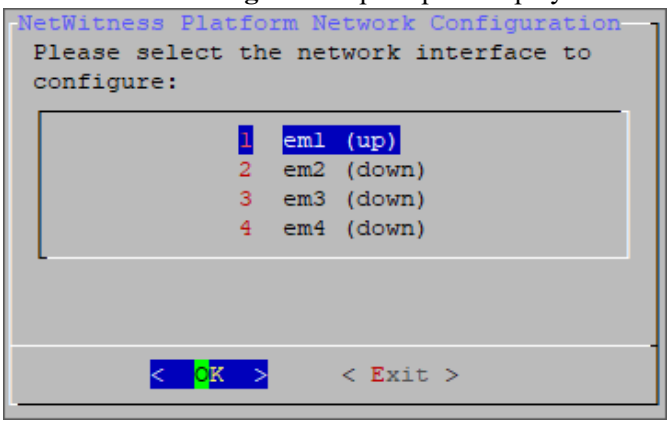
**Caution:** Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.



Tab to **OK** and press **Enter** to use **Static IP**.

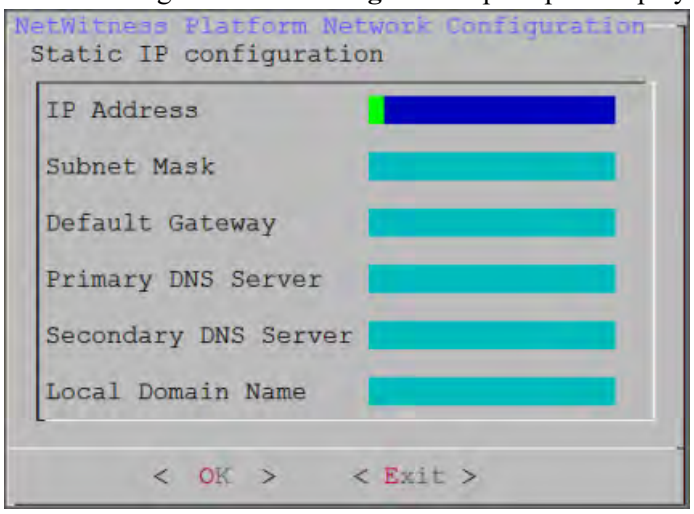
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

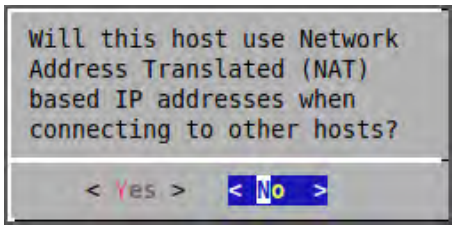
The following **Static IP Configuration** prompt is displayed.



10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

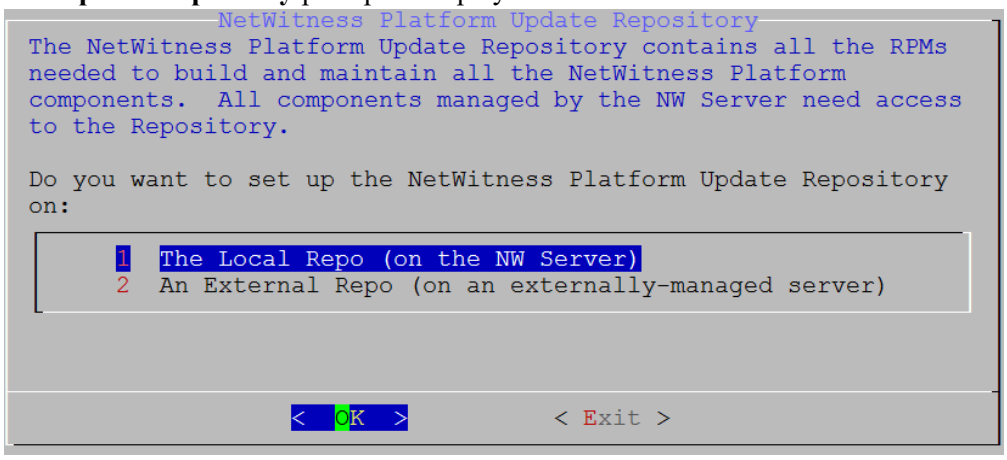
**Caution:** If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.



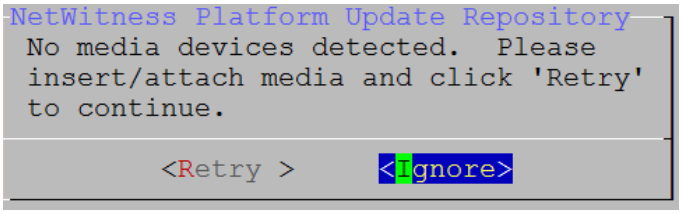
**For the NW Server**, tab to **No** and press **Enter**.
**For component hosts**, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

12. The **Update Repository** prompt is displayed.

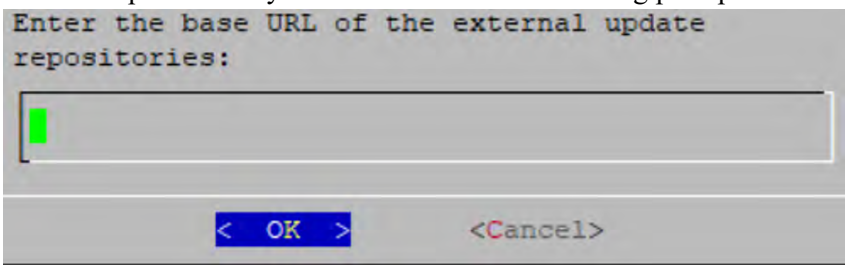


**For the NW Server**:

- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7. If the program cannot find the attached media, you receive the following prompt.



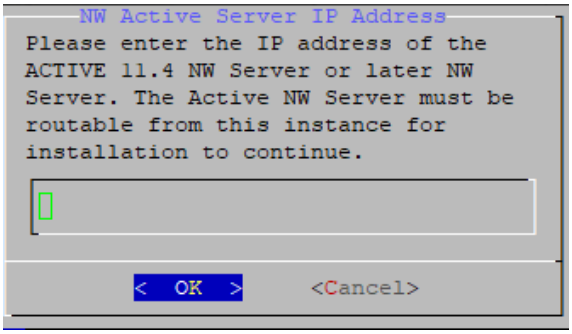
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

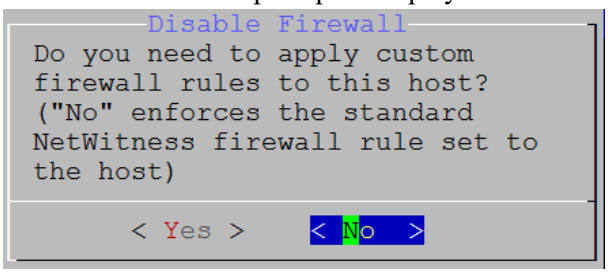
**For component hosts**:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.

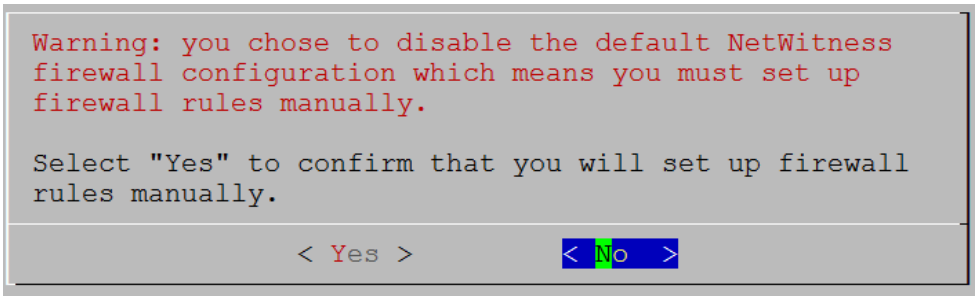


Type the NW Server IP address. Tab to **OK** and press **Enter**.

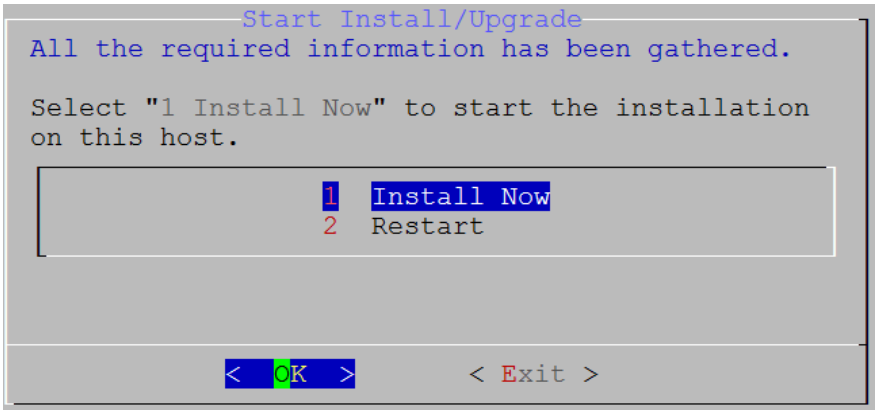
13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



14. The **Start Install** prompt is displayed.



15. Press **Enter** to install 11.7.
When **Installation complete** is displayed, you have installed 11.7 on this host.

**Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled
 (skipped due to only_if)
    * file[/etc/yum.repos.d/CentOS-Base.repo] action delete (up to date)
    * ruby_block[yum-cache-reload-CentOS-Base] action nothing (skipped due to action :nothing)
     (up to date)
  * yum_repository[Remove CentOS-CR repository] action delete
    * execute[yum clean all CentOS-CR] action runERROR:root:code for hash md5 was not found.

  File "/usr/lib64/python2.7/hashlib.py", line 98, in __get_openssl_constructor
    f(usedforsecurity=False)
```

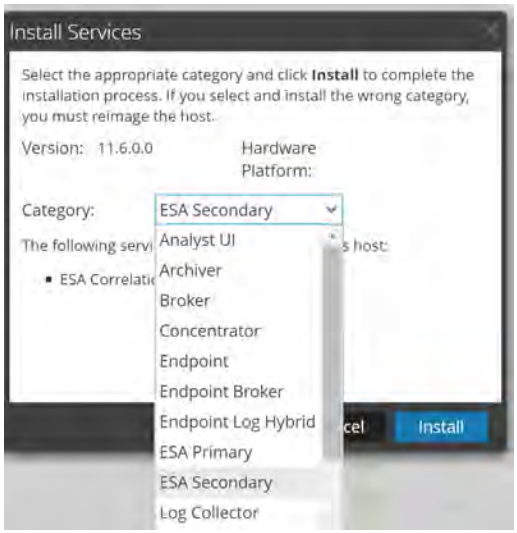
16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

## Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 11.7 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > :

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:



## Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.

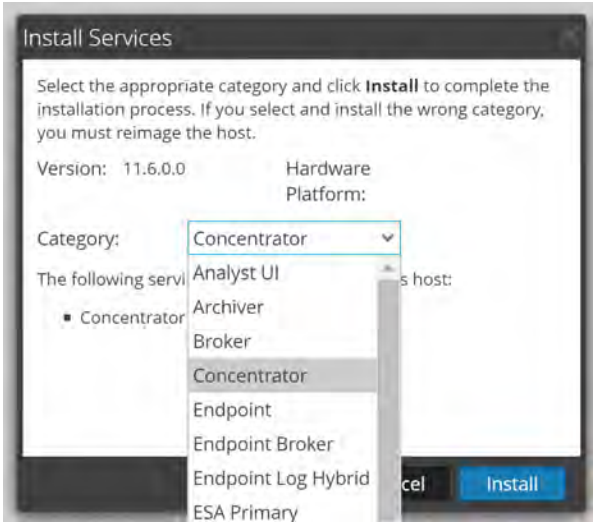
   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.



## Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 11.7 Licensing Management Guide* for more information. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

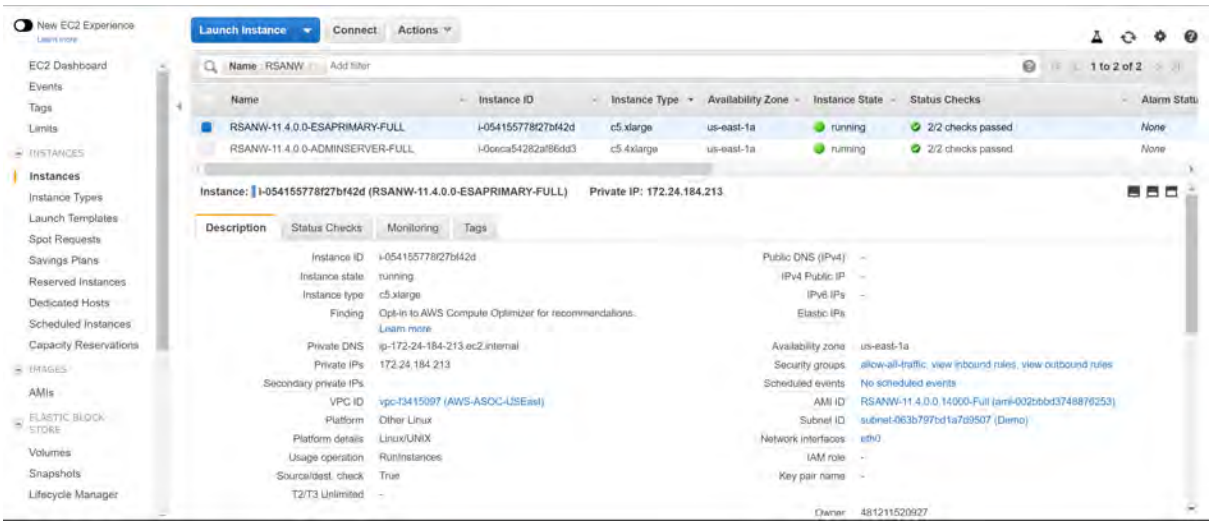
## (Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for RSA NetWitness Platform 11.7* for instructions on how to set up a Warm Standby NW Server.

## (Optional) Boot NetWitness 11.4 EC2 Instance using c5 Instance Types

Following are the steps:

1. Deploy an EC2 instance using NW 11.4 Lite/Full AMI (RSANW-11.4.0.0.14000-Full, ami-002bbbd3748876253).
2. Select a non-nitro based instance type. For example, "_m4.large_" and boot the instance.
3. Install the package "_dracut-config-generic_" and rebuild the initramfs image.
4. For environment without internet connection, copy the provided RPM package to target 11.4 EC2 instance and install it.
5. Shutdown or stop the EC2 instance. Ensure that the instance shutdown behavior is set to "Stop" and not "_Terminate._".
6. Change the instance type of existing EC2 instance to nitro-based c5 types (For example, c5.4xlarge) and start the EC2 instance.
7. The EC2 instance boots successfully now, passing the system and instance status health checks.



**Note:** Once the instance is moved to c5 instance types and booted successfully, the system will remain fixed in c5 instance state and cannot be reverted back to m4 instance types.

# Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

**Note:** After you successfully launch an instance, AWS assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname.Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Network Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP
- VPC Traffic Mirroring

## Integrate Gigamon GigaVUE with the Network Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Network Decoder

## Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution, see "Gigamon® Visibility Platform for AWS Data Sheet"https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf.

For more information on the deployment details, see "Gigamon® Visibility Platform for AWS Getting Started Guide" https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf.

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Network Decoder Tunnel.

## Task 2. Configure Tunnel on the Network Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255 key 0

$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

ip_tunnel 25216 1)

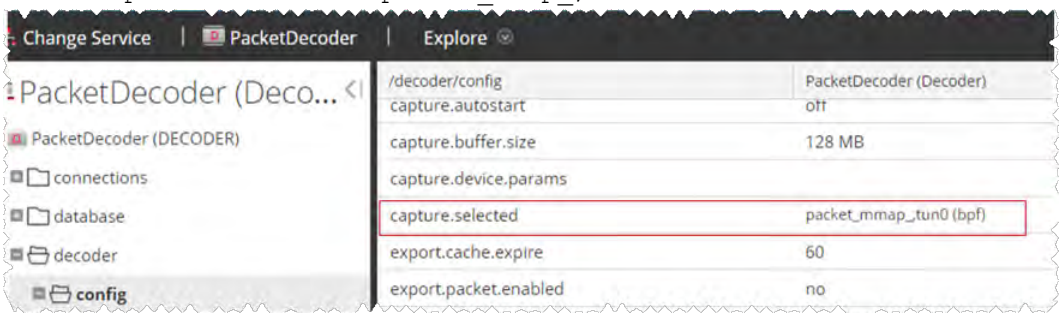
If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```

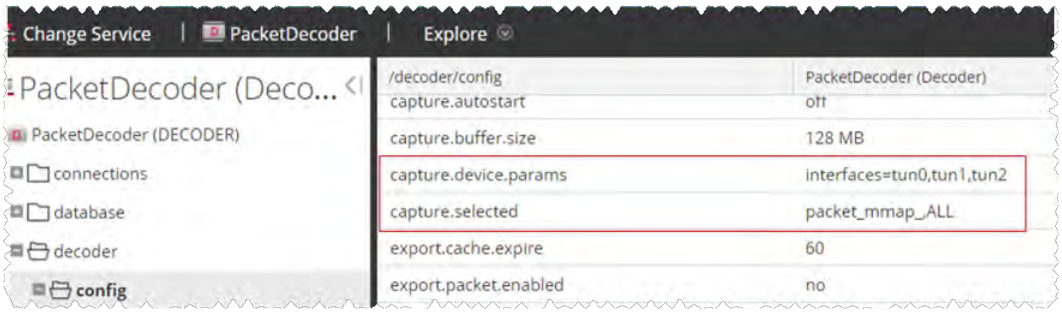
3. Create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
      `service ip6tables restart`
4. Set the interface in the Network Decoder.
   a. Log in NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service.

b. Set the `capture.selected` = `packet_mmap_,tun0`.



5. (Conditional) - If you have multiple tunnels on the Network Decoder.
   a. Restart Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service, and set the following parameters.

      ```
      capture.device.params = interfaces=tun0,tun1,tun2
      capture.selected = packet_mmap_,All
      ```



6. Restart decoder service.

   ```
   $ sudo restart nwdecoder
   ```

   The user should be all set to capture the network traffic in Decoder.

## Integrate Ixia with the Network Decoder

You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines

Task 2. Create CloudLens Project

Task 3. Install Docker Container on Decoder

Task 4. Install Docker Container on Clients

Task 5. Map Network Decoder to Ixia Clients

Task 6. Validate CloudLens Packets Arriving at Decoder

Task 7. Set Interface in Network Decoder

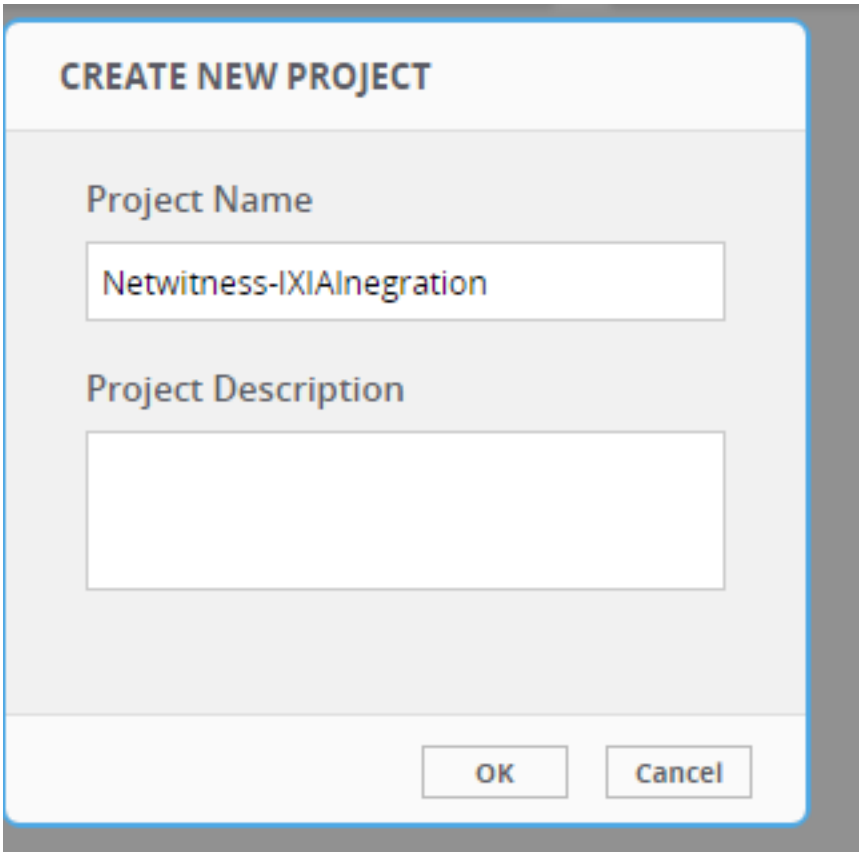
## Task 1. Deploy Client Machines

- Deploy client machines onto which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (https://www.ixia.cloud/help/Default.htm) for specifications needed for supported client machines.
- For Client Machines (as well as Decoder machine) the following ports must be opened on AWS Security Group Inbound Rules; UDP 19993 from all, TCP 22 from Admin IP.

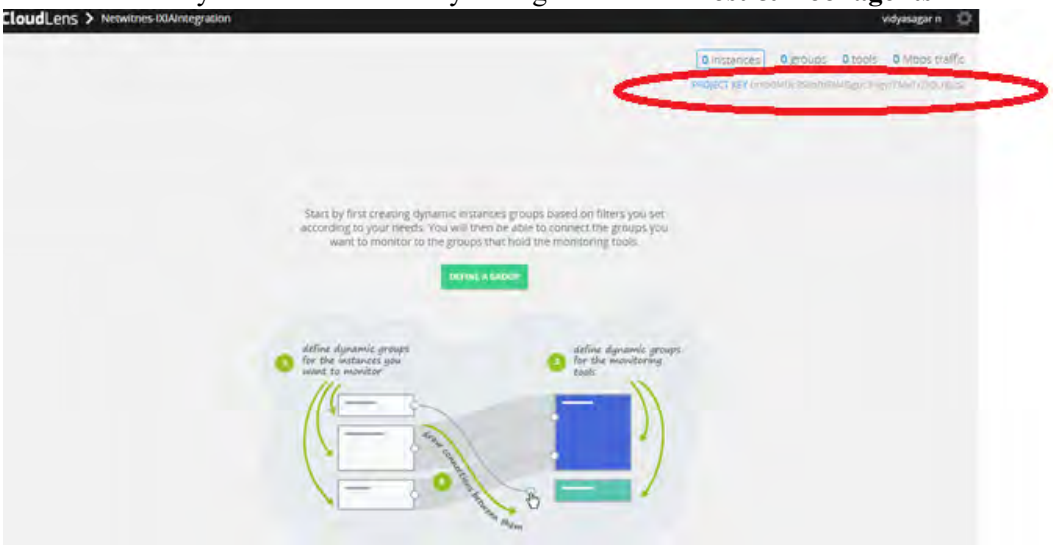
## Task 2. Create CloudLens Project

Complete the following steps to create a new project and get your project key.

1. Get Cloudlens login credentials and access to a free trial.
   a. Create an Ixia login account at https://www.ixiacom.com/products/cloudlens-trial-a.
2. Go to the Cloudlens public site (https://www.ixia.cloud).
3. Click + (add) to create a new project with a name of your choosing (for example, **NetWitness-IxiaIntegration**).



4. Click on your newly created project and make note of your Project Key.
   You need the key later for the API key configured on the **Host & Tool agents**.



## Task 3. Install Docker Container on Decoder

Complete the following steps to install the Docker container onto the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following commands to complete the install the Docker service on the Decoder.

```
#yum clean all
# yum -y install docker
```

3. Enter the following command string to start the Docker service.

```
# service docker start
```

4. Enter the following commands to:
   - Access the Ixia repository and obtain the cloudlens-agent container.
   - Replace the **ProjectKeyFromIxiaProjectPortal** variable, which identifies your project key in Ixia portal, with the Project Key you created in Task 2. Create CloudLens Project.

```
sudo docker run \
--name cloudlens \
 -v /:/host \
-v /var/run/docker.sock:/var/run/docker.sock \
-d --restart=always \
--net=host \
--privileged \
ixiacom/cloudlens-agent:latest \
--server agent.ixia.cloud \
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

## Task 4. Install Docker Container on Clients

Complete the follow steps to Y install the Docker Container onto the client machines for which you want to route the traffic to the Network Decoder.

1. SSH to the AWS Client instance.
2. Enable root access to OS CLI (for example `sudo su -`).
3. Enter the following commands to install Docker.
   ```
   # yum -y install docker
   ```
   **Caution:** The above example of the installed docker engine is for CentOS7. The instructions may vary slightly for different Linux Distributions. For more information, see the Docker docs at https://docs.docker/install.
4. Enter the following commands to start the Docker service.
   ```
   # service docker start
   ```
5. Enter the following commands to:
   - Access the Ixia repository and obtain the **cloudlens-agent** container.
   - Replace the variable **ProjectKeyFromIxiaProjectPortal**, which identifies your project key in Ixia portal, with the Project Key you created in the previous section.
   ```
   sudo docker run \
   --name cloudlens \
    -v /:/host \
   -v /var/run/docker.sock:/var/run/docker.sock \
   -d --restart=always \
   --net=host \
   --privileged \
   ixiacom/cloudlens-agent:latest \
   --server agent.ixia.cloud \
   --accept_eula y \
   --apikey ProjectKeyFromIxiaProjectPortal \
   ```

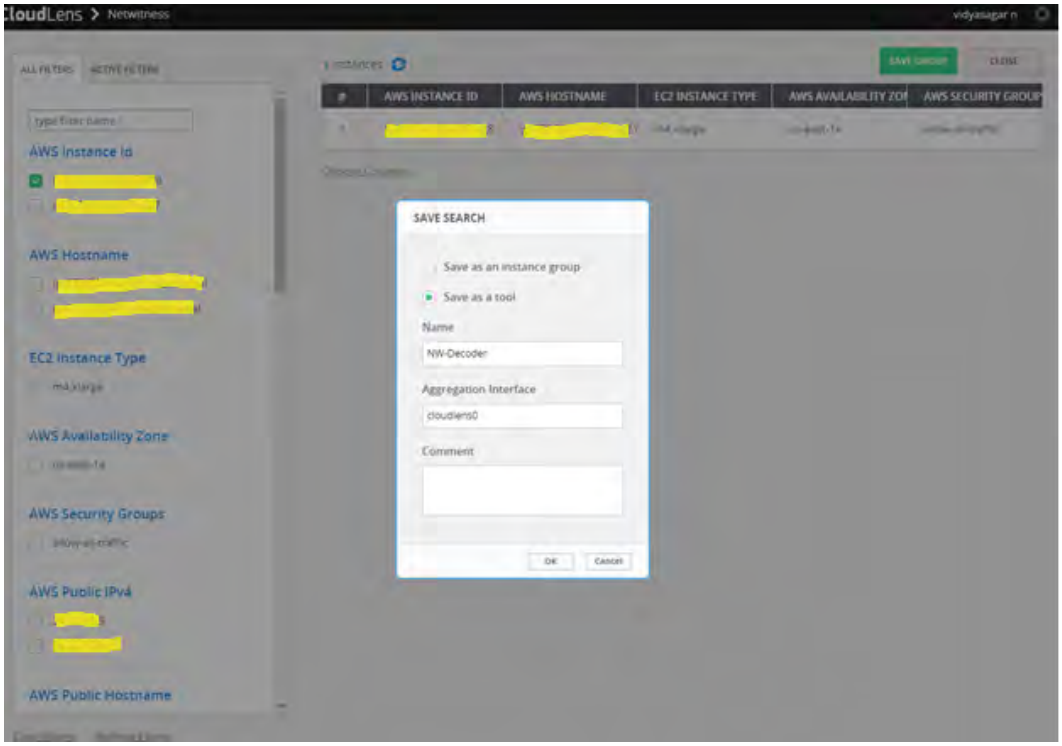
**Warning:** If you cut and paste commands from a PDF, first paste them into a test editor such as Notepad to confirm the syntax before pasting into the OS CLI. Direct cut and paste between PDF and CLI can contain dashes or other special characters that should not be part of the commands.

## Task 5. Map the Network Decoder to Ixia Clients

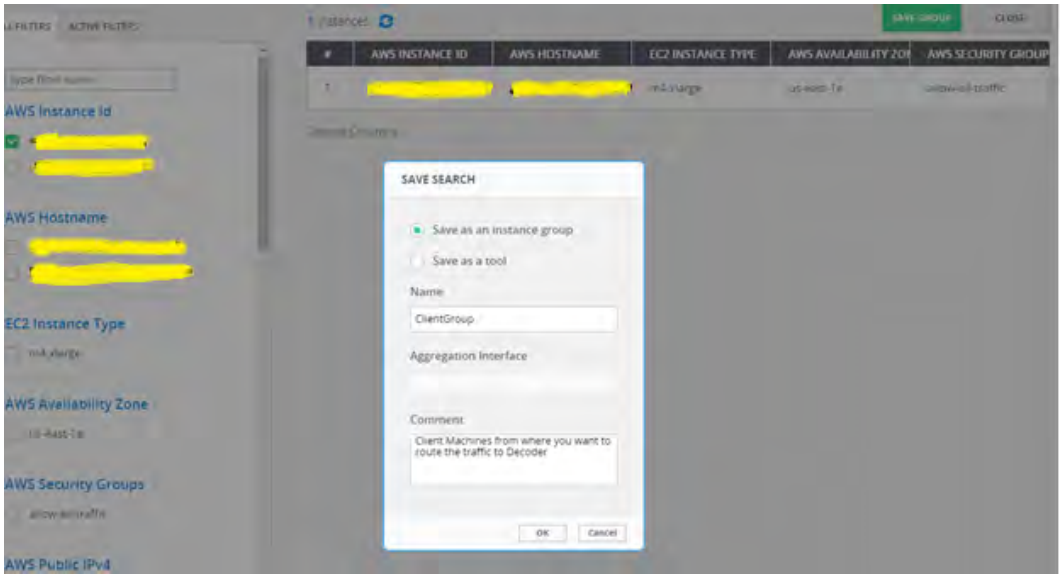
Complete the following steps to map the Network Decoder to the client machines to route the traffic to the Network Decoder.

1. Go to the Cloudlens public site (https://www.ixia.cloud).
2. Double-click on your project to open it.
3. Click the **Define Group** button or the Instances count.
   You should see two instances listed, one for your decoder and the other for the client machines.
4. Filter for the decoder instance and click **Save Search**.
5. Choose **Save as a tool**.
6. Specify a name for the tool, and the **Aggregation Interface**.
   Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual

interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

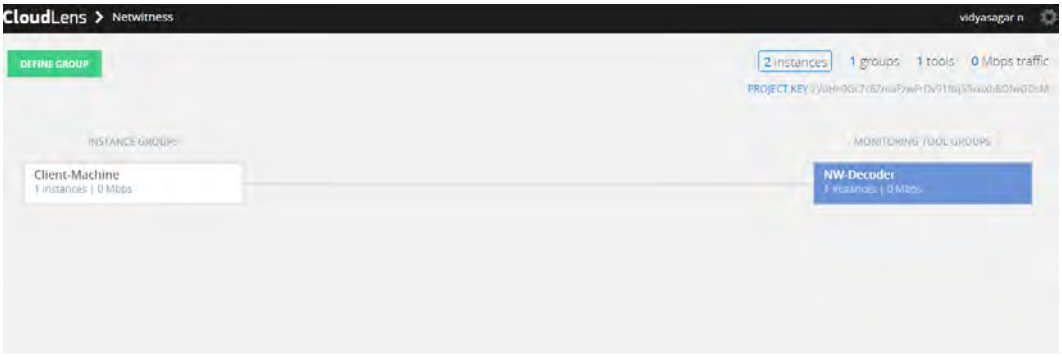


7. Filter the client host instance from the list, and click **Save Search**.



8. Navigate back to the top-level view of the project.
   Your client machine instance and Decoder instance are now displayed.

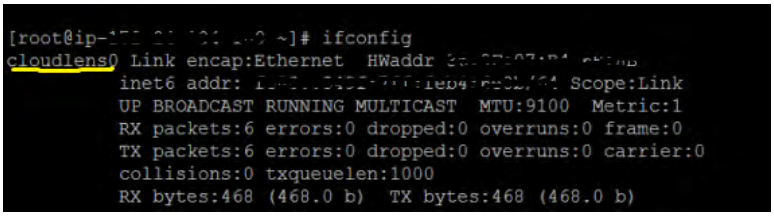
9. Drag a connection between the your client machine instance and Decoder instance to allow the flow of packets.



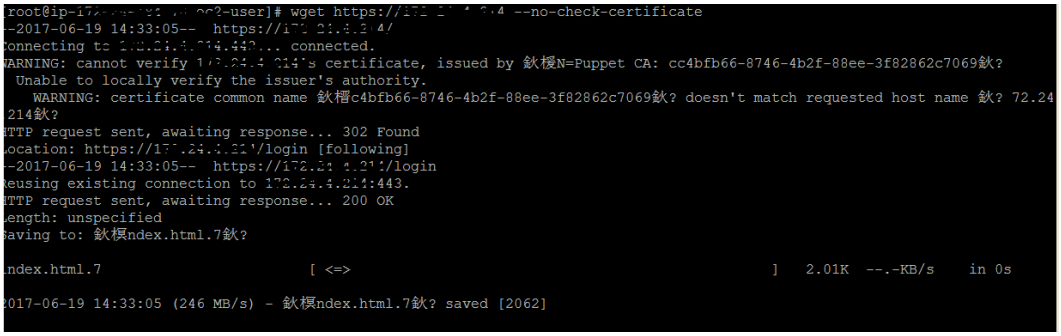
## Task 6. Validate CloudLens Packets Arriving at Decoder

Complete the following steps to validate that packets are actually arriving at the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following command.
   `ifconfig`
   The new aggregation interface you created is displayed.

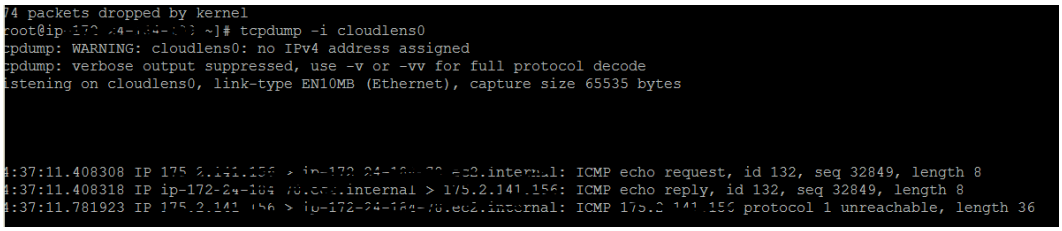


3. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).



4. SSH to Network Decoder to go to your Network Decoder instance CLI.

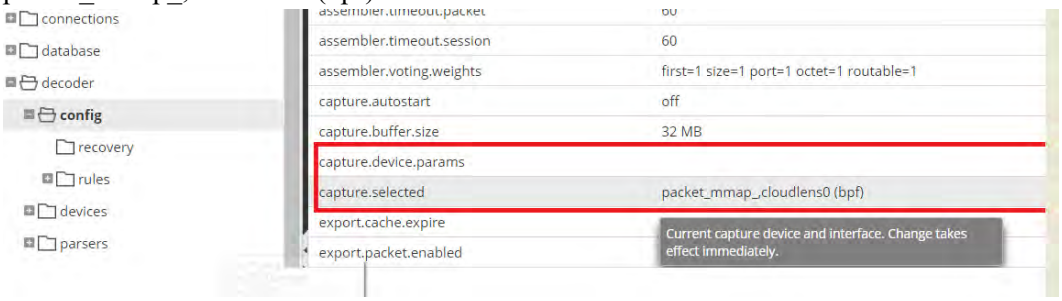
5. Enter the following commands to look for suitable results in the tcpdump.
   ```
   tcpdump -I Cloudlens0
   ```



## Task 7. Set the Interface in the Network Decoder

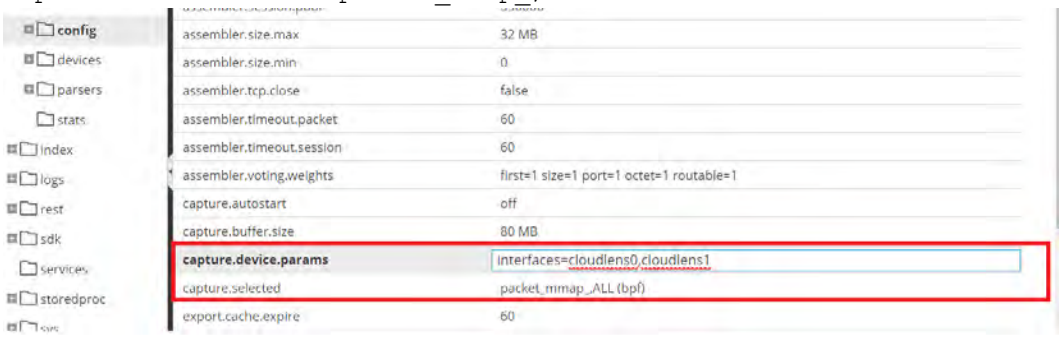
Complete the following steps in the Network Decoder to set the interface to use for the Ixia integration.

1. SSH to the Network Decoder.
2. Enter the following commands to restart decoder service.
   ```
   $ sudo restart nwdecoder
   ```
   The Network Decoder is now set to capture network traffic.
3. Log in to NetWitness and click **(Admin) > Services**.
4. Select a Decoder service and click > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.
6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)



7. (Conditional) - If you have multiple capture interfaces on the Network Decoder, set the parameters with the following values.
   ```
   capture.device.params --> interfaces=cloudlens0,cloudlens1
   ```

```
capture.selected --> packet_mmap_,All
```



8. Restart the Decoder service after you set the **capture.selected** parameter.

## Integrate f5® BIG-IP with the Network Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to NetWitness flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

### f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

### Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" ( https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

### Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a

network interface. MAC address rewriting can be used to route packets to another subnet.

2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

### Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. RSA recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

### Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

## Integrate VPC Traffic Mirroring with the Network Decoder

VPC Traffic Mirroring allows users to capture and inspect network traffic to analyze packets without using any third-party packet forwarding agents. The solution provides insight and access to network traffic across VPC infrastructure. Users can copy network traffic at any ENI (Elastic Network Interfaces) in VPC, and send it to NetWitness to analyze, monitor, and troubleshoot performance issues.

You must complete the following tasks to integrate the Network Decoder with VPC Traffic Mirroring:

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination

Task 2. Configure a VPC Traffic Mirroring Filter

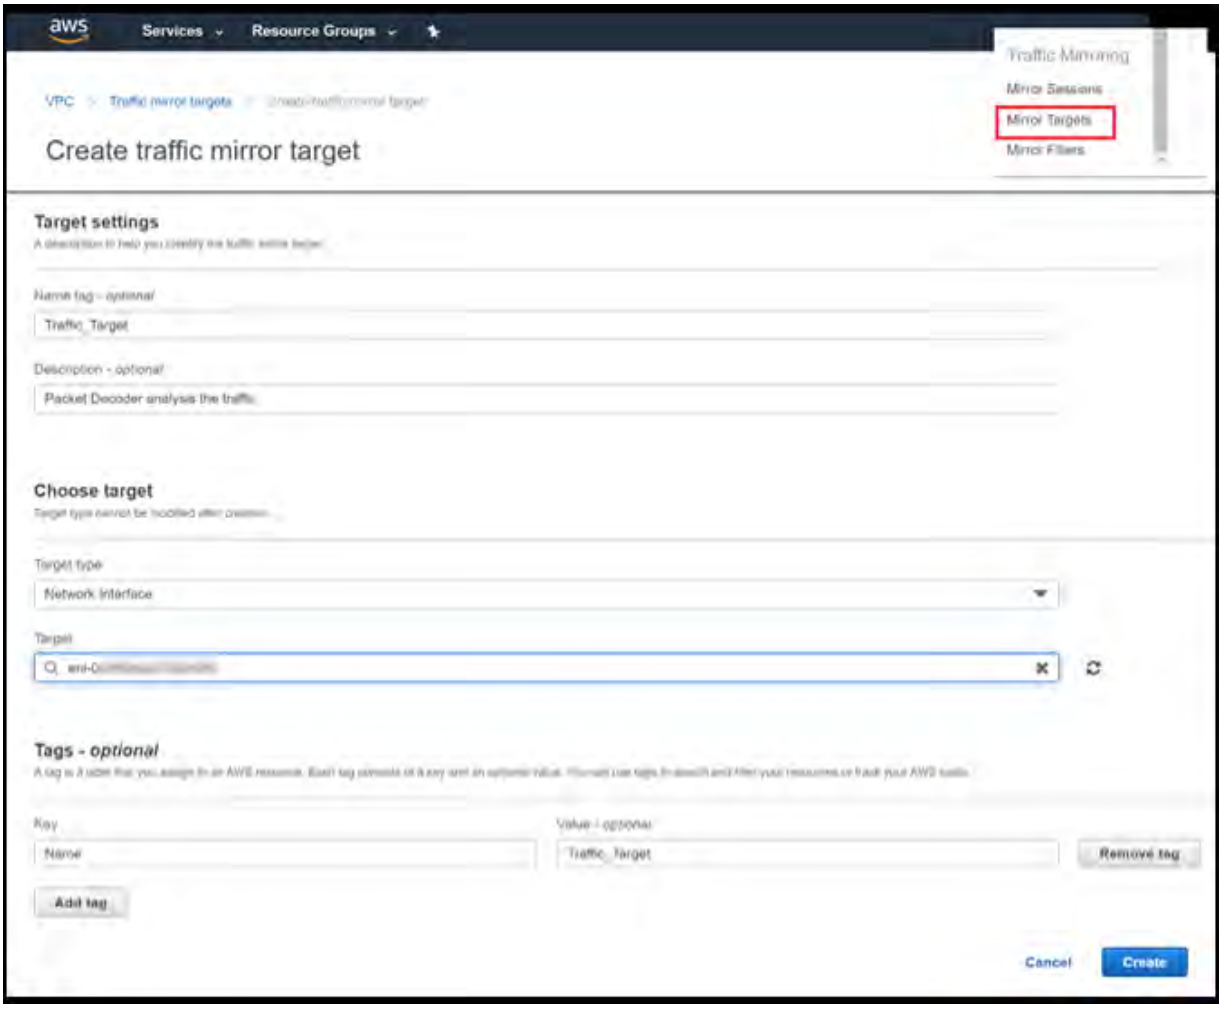
Task 3. Configure a VPC Traffic Mirroring Session

Task 4. Setup a new VXLAN interface on the Network Decoder

Task 5. Validate VPC Traffic Mirroring Packets Arriving at Network Decoder

## Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination.

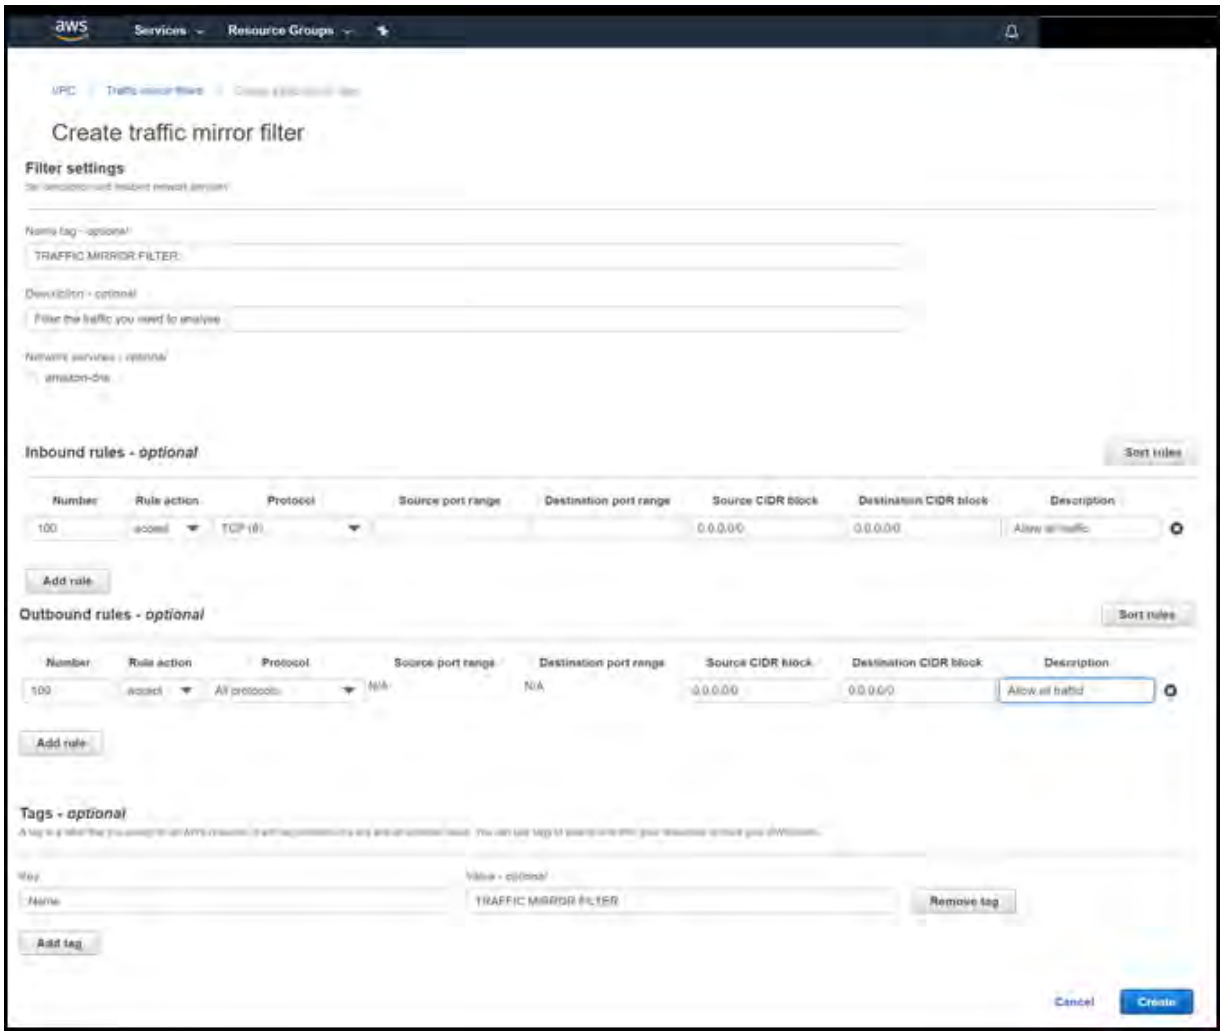
1. Open the VPC service console view at https://console.aws.amazon.com/vpc/home.
2. In the navigation panel, select **Traffic Mirroring**.
3. Select **Mirror Targets**.



## Task 2. Configure a VPC Traffic Mirroring Filter

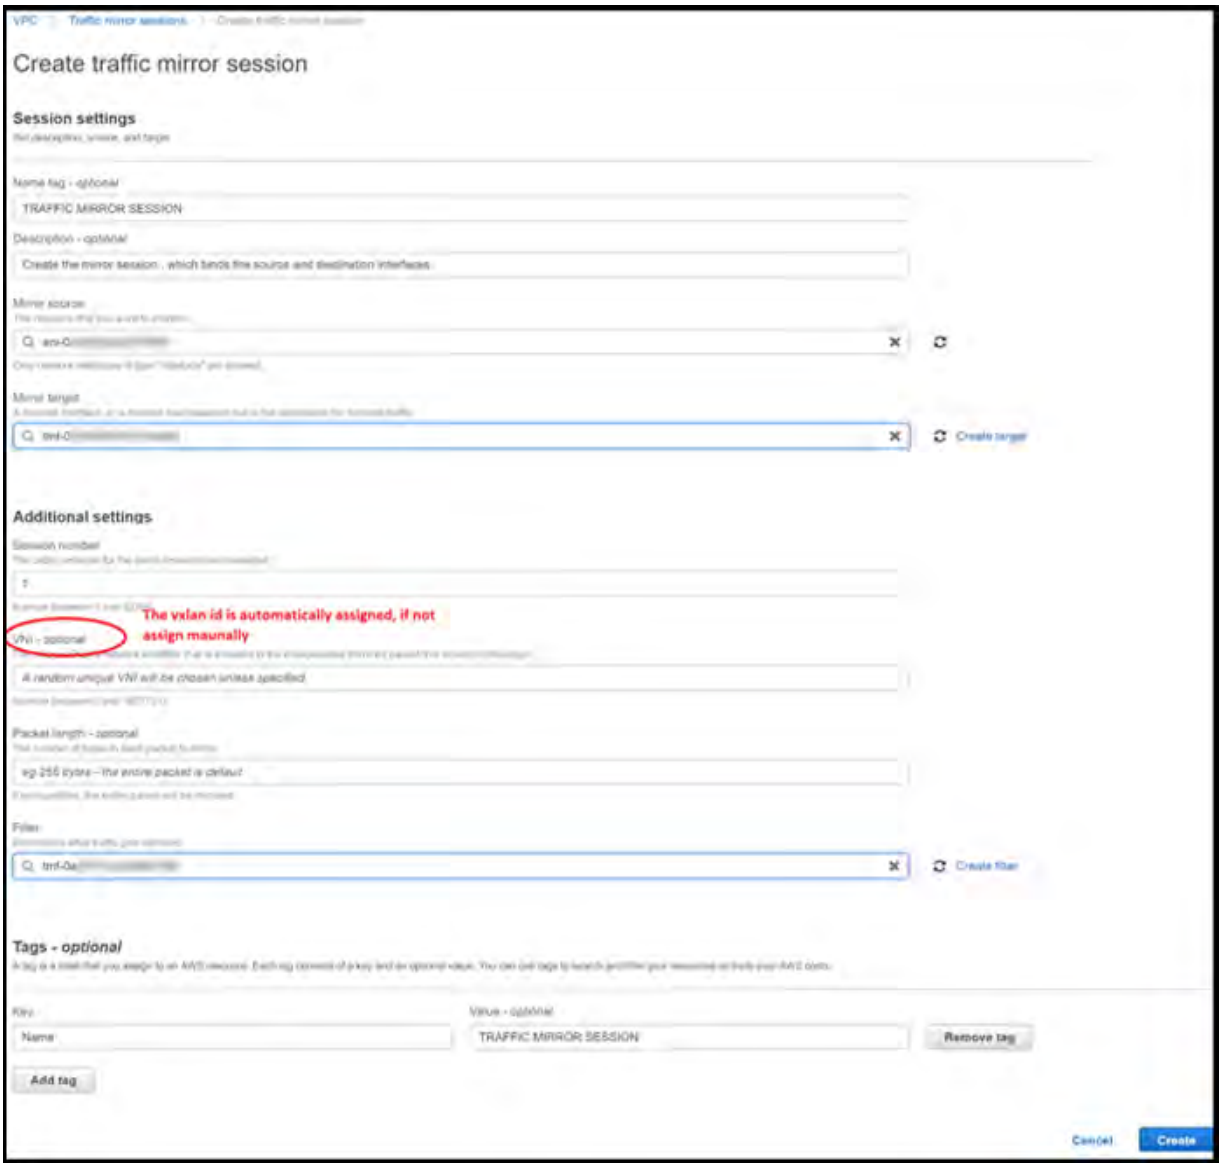
You must configure a VPC Traffic Mirroring Filter to send only the required packets to the Network Decoder. You can determine if the inbound or outbound traffic needs to be captured or not.

**Note:** Make sure the UDP port 4789 is open on the AWS instance of Network Decoder.



## Task 3. Configure a VPC Traffic Mirroring Session

You must configure a VPC Traffic Mirroring Session to mirror the traffic by a communication channel between source ENI and destination ENI.



## Task 4. Set Up a new VXLAN Interface on the Network Decoder

To capture the UDP enabled traffic you must create an interface and tunnel it to Network Decoder by performing the following steps.

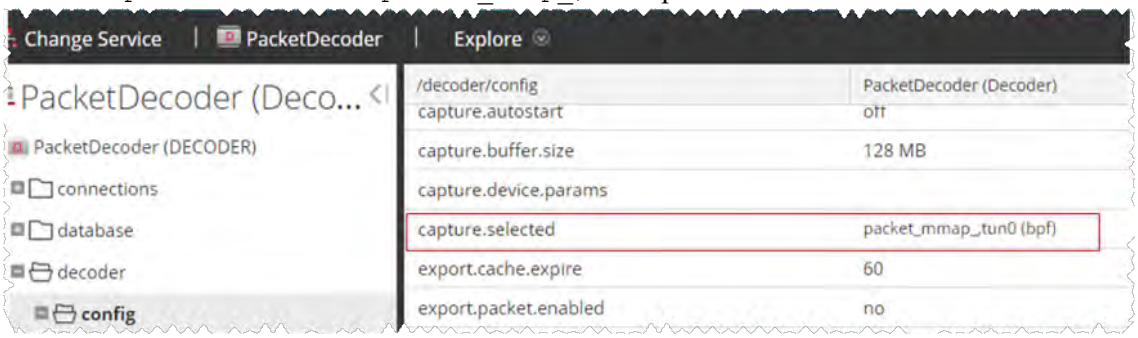
1. SSH to the Decoder.
2. Enter the following commands.

```
sudo ip link add tun0 type vxlan id <VXNLAN ID> local any dev <primary
interface ex: eth0> dstport 4789
```

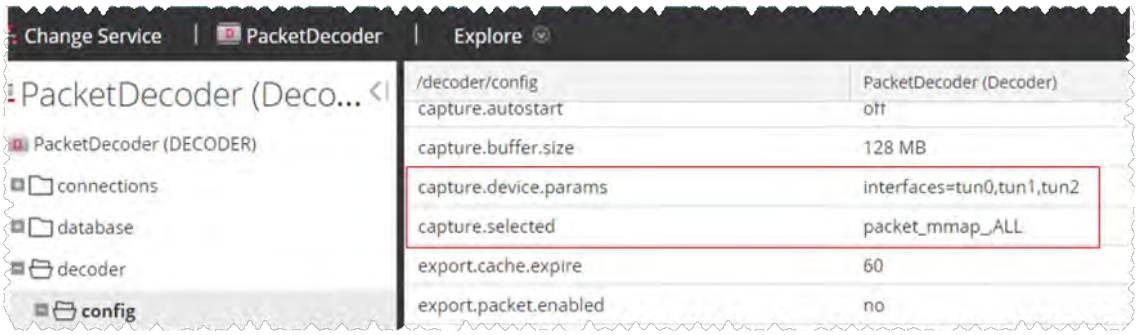
```
sudo ip link set tun0 up
ifconfig
```

```
tun0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 8951
        inet6 fe80::bc58:afff:fe06:ec29  prefixlen 64  scopeid 0x20<link>
        ether be:58:af:06:ec:29  txqueuelen 1000  (Ethernet)
        RX packets 989  bytes 74140 (72.4 KiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 8 overruns 0  carrier 0  collisions 0
```

3. To create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the IP tables file using the command `vi /etc/sysconfig/iptables`.
   b. Append the line `-I INPUT -p udp -m udp --dport 4789 -j ACCEPT`.
   c. Restart IP tables by using the following commands.
      ```
      service iptables restart
      service iptables status
      ```
4. To set the interface in the Network Decoder.
   a. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service.
   b. Set the `capture.selected = packet_mmap_,tun0` parameter.



5. (Conditional) If you have multiple tunnels on the Network Decoder.
   a. Restart the Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service, and set the following parameters.
      ```
      capture.device.params = interfaces=tun0,tun1,tun2
      capture.selected = packet_mmap_,All
      ```



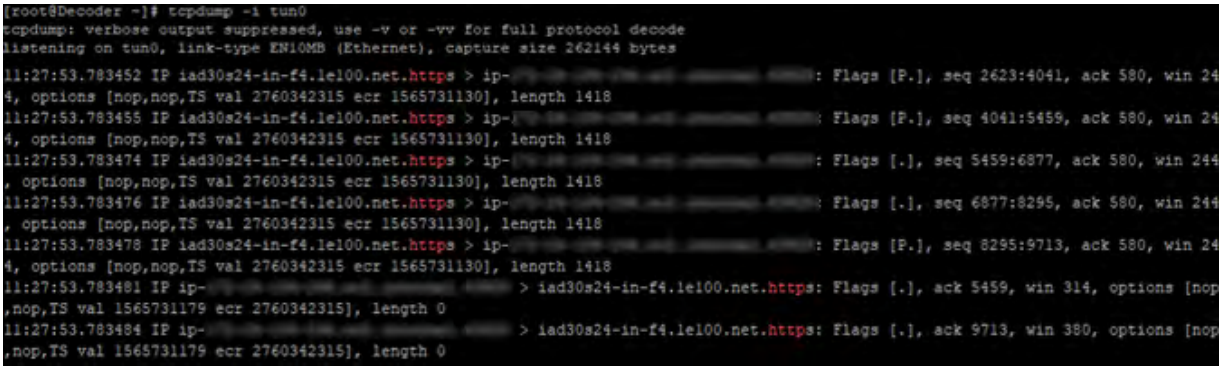
6. Restart the Decoder service.
   `$ sudo restart nwdecoder`
   The user should be all set to capture the network traffic in the Network Decoder.

## Task 5. Validate VPC Traffic Mirroring Packets Arriving at the Network Decoder

Perform the following steps to validate if the Network Decoder is receiving the network data (packets) successfully.

1. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

2. Enter the `tcpdump -i tun0` command to look for suitable results in the tcpdump.



3. The NetWitness reflects meta values as shown below.

**Note:** You can mirror traffic from an EC2 instance that is supported by the AWS Nitro system (A1, C5, C5d, C5n, I3en, M5, M5a, M5ad, M5d, p3dn.24xlarge, R5, R5a, R5ad, R5d, T3, T3a, and z1d).

**Note:** For more information, see "New – VPC Traffic Mirroring" documentation at https://aws.amazon.com/blogs/aws/new-vpc-traffic-mirroring/.

# AWS Instance Configuration Recommendations

**Note:** These recommendations can be used as a baseline for 11.7.0.0 and adjusted as needed.

This topic contains the minimum AWS instance configuration settings recommended for the NetWitness virtual stack components.

- EC2 Instance:
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the NW component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Network Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond is receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Block Storage

  For more information on the required volumes and the storage allocations, see the Storage Guide for RSA NetWitness® Platform 11.x.

## Archiver

| EC2 Instance | | | |
|---|---|---|---|
| **EPS** | **Instance Type** | **Enhanced Networking Enabled** | **Tenancy Type - Dedicated - Run a Dedicated Instance** |
| 5,000 | m4.xlarge<br>No of CPU: 4<br>Memory: 16 GB | No | Yes |
| 10,000 | m4.2xlarge<br>No of CPU: 8<br>Memory: 32 GB | No | Yes |
| 15,000 | m4.4xlarge<br>No of CPU: 16<br>Memory: 64 GB | No | Yes |

| Cloud Provider Block Storage | | | |
|---|---|---|---|
| **Volumes** | **Device** | **Volume Type** | **IOPS/Baseline Throughput** |
| / (root) | /dev/sda1 | General Purpose SSD | N/A |

| **Volumes** | **Device** | **Volume Type** | **IOPS/Baseline Throughput** |
| / (root) | /dev/sda1 | General Purpose SSD | N/A |
| usr,var,opt,home,tmp | /dev/sdf | General Purpose SSD | N/A |
| index,session,meta (Log Decoder) | /dev/sdg | Throughput Optimized HDD | 240 MB/s |
| packet (Log Decoder) | /dev/sdh | Throughput Optimized HDD | 240 MB/s |
| index (Concentrator) | /dev/sdi | Provisioned IOPS | 10,000 |
| session,meta (Concentrator) | /dev/sdj | Throughput Optimized HDD | 240 MB/s |
| mongoDB | /dev/sdl | Throughput Optimized HDD | 240 MB/s |

# Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

**Note:** In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

## Arguments

| Argument | Description |
|---|---|
| `--help-install-opts` | Display all the arguments in this table. |

| Argument | Description |
|---|---|
| `--eula` | Accept or decline the End User License Agreement (EULA). Specify:<br>• `true` (default) to accept the agreement<br>• `false` to decline it and cancel the installation.<br>For example: `--eula=true` |
| `--is-head` | Designate the host as the NW Server host or a component host. Specify:<br>• `true` for NW Server host.<br>• `false` for Component host.<br>For example: `--is-head=true` |
| `--host-name` | Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname.<br>For example: `--host-name=<hostname>` |
| `--master-pass` | Enter master password. For example: `--master-pass=<password>` |
| `--deploy-pass` | Enter deployment password. For example: `--deploy-pass=<password>` |
| `--iface-name` | Specify network interface.<br>For example: `--iface-name=eth0` |
| `--ip-override` | Accept or override IP address found for this host or change the IP configuration found on the host. Specify:<br>• `true` provide IP address.<br>• `false` use IP address found on the host.<br>For example: `--ip-override=false` |
| `--ip-type` | Select ip address configuration type. Specify:<br>• `1` Static IP Configuration)<br>• `2` DCHP<br>For example: `--ip-type=1` |
| `--ip-addr` | For Static IP configuration, enter IP Address for static address.<br>For example: `--ip-addr=<ip-address>` |
| `--ip-netmask` | For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>` |

| Argument | Description |
|---|---|
| `--ip-gateway` | For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>` |
| `--ip-nameserver` | IP address assigned to DNS server. `--ip-nameserver=<ip-address>` |
| `--ip-nameserver-secondary` | Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>` |
| `--ip-domain` | For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>` |
| `--repo-type` | Select type of update repository. Specify:<br>• `1` Local repository<br>• `2` External repository<br>For example: `--repo-type=1` |
| `--repo-url` | For an external update repository, specify the url of the repository. For example: `--repo-url=<url>` |
| `--head-ip` | For a component host, specify IP Address of the NW Server.<br>For example: `--head-ip=<ip-address>` |
| `--custom-firewall` | Disable default firewall configuration and use your custom configuration. Specify:<br>• `true` use custom firewall configuration.<br>• `false` use default firewall configuration.<br>For example: `--custom-firewall=true` |
| `--use-nat` | Configure the host to use Network Address Translation (NAT) based IP addresses:<br>• `true` use NAT IPs to connect to other hosts<br>• `false` do not use NAT IPs to connect to other hosts (default)<br>For example: `--use-nat=false` |

# Azure Installation Overview

**Note:** The NetWitness Platform 11.7 and 11.6. VHD images for the Azure environment are not available temporarily due to maintenance. The updated images will be available soon.

Azure instances have the same functionality as the NetWitness hardware and virtual hosts. RSA recommends that you perform the following tasks when you set up your Azure environment.

Before you can deploy NetWitness in Azure, you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for RSA NetWitness® Platform 11.x.
- Make sure that you have a NetWitness Throughput license.
- Use Chrome for your browser (Internet Explorer is not supported).

## Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness hardware hosts. RSA recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database on SSD.

# Azure Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

## Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *RSA NetWitness Host and Services Getting Started Guide*.

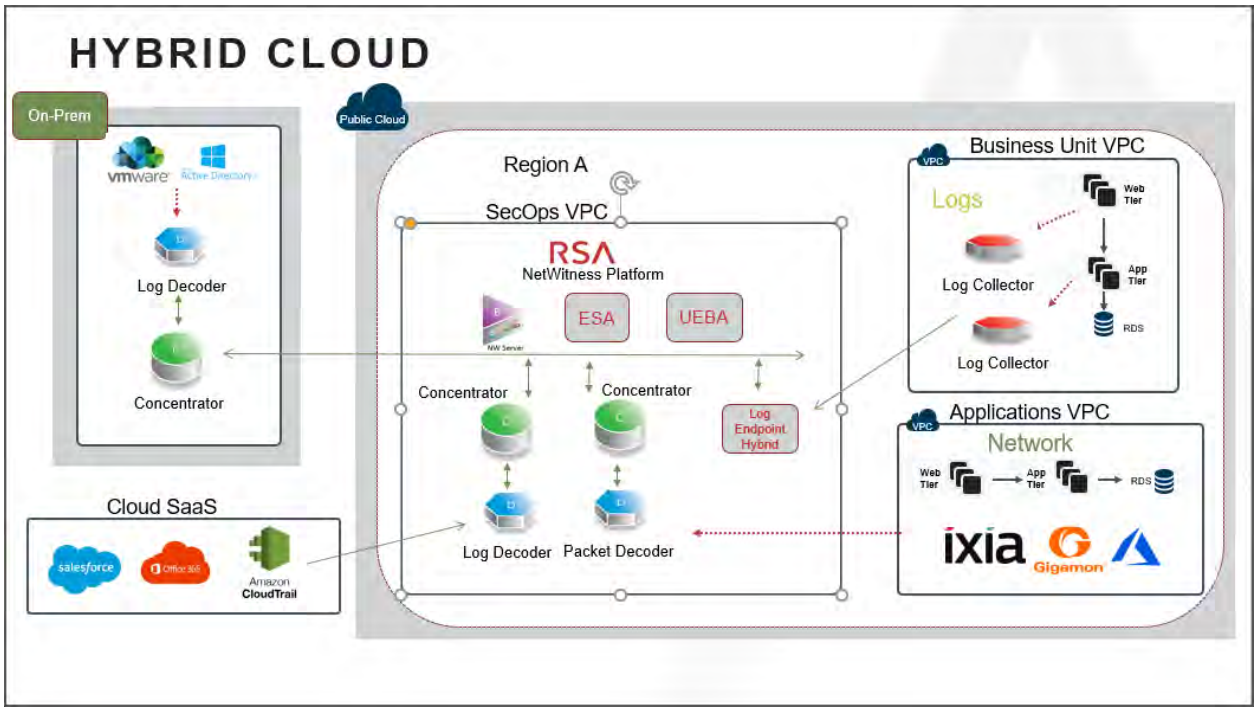
## NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.



# Azure Configuration Recommendations

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
    - The default partition size of Azure VM hosts for `/root` is 8GB and for `/var/netwitness` is 15GB. These partitions can be increased to a minimum of 40GB. For more information see, Updating Partition Size.
- VHD (Storage)
  For more information, see Storage Guide for RSA NetWitness® Platform 11.x on how to increase the number of volumes based on your storage requirements using the RSA Sizing & Scoping Calculator.

## Azure Instance Recommendations

The following table shows the storage recommendations for NetWitness Azure VMs.

| Azure Image Type | Rate (EPS) | CPU (Cores) | RAM (GB) | Instance Type (Azure Name) |
|---|---|---|---|---|
| NW | Does not apply | 16 | 112 | Standard D14_v2 |
| Log Decoder | 15,000 | 32 | 128 | Standard D32s_v3 |
| Log Concentrator | 15,000 | 16 | 112 | Standard DS14_v2 |
| Archiver | 15,000 | 16 | 112 | Standard D14_v2 |
| ESA | 15,000 | 20 | 140 | Standard D15_v2 |
| Log Collector | 15,000 | 8 | 32 | Standard D8s_v3 |
| UEBA* | Does not apply | 16 | 112 | Standard D14_v2 |

**Note:** *If your log collection volume is low, RSA recommends you to deploy UEBA only on a virtual host. If you have a moderate to high log collection volume, RSA recommends you to deploy UEBA on the physical host as described under "RSA NetWitness UEBA Host Hardware Specifications" in the *Physical Host Installation Guide*.

Refer to the *Storage Guide for RSA NetWitness Platform* for additional storage information.

## Updating Partition Size

You can increase the partition size to a minimum of 40GB each.

After adding additional required disk size to the Azure VM, you can extend the partition sizes using the following commands:

1. SSH to the VM, login as a root user and execute the following command to view the existing partitions along with the new partition added.
   `lsblk`
2. Check the name of the new partition. Eg: `sdc`

```
pvcreate /dev/sdc -y
vgextend netwitness_vg00 /dev/sdc -y
lvextend -L 40G /dev/netwitness_vg00/root -y
xfs_growfs /dev/netwitness_vg00/root
lvextend -L 40G /dev/netwitness_vg00/nwhome -y
xfs_growfs /dev/netwitness_vg00/nwhome
```

These commands are provided assuming that `sdc` is the new disk added and 40GB is the extended partition size for each of the partitions.

# Azure Deployment

This topic contains the rules and high-level tasks you must perform to deploy NetWitness components in Azure.

## Rules

You must adhere to the following rules:

- It is recommended to use private IP addresses when you provision Azure NetWitness VMs.

## Checklist

| Step | Description | √ |
|---|---|---|
| 1. | Deploy NW Server Host | |
| 2. | Deploy Component Core Services in Azure | |
| 3. | Configure Host VMs in NetWitness Platform | |

# Storage Configurations

This topic contains the recommended Azure storage configurations.

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for RSA NetWitness® Platform 11.x*.

## Enabling Swap Partition in Azure Deployments

After completing the Azure deployment, you must enable the swap in your deployment.

To do this, perform the following steps:

1. Modify the default parameters at `/etc/waagent.conf` to

```
ResourceDisk.Format=y
ResourceDisk.Filesystem=ext4
ResourceDisk.MountPoint=/mnt/resource
ResourceDisk.EnableSwap=y
ResourceDisk.SwapSizeMB=2048
```

The following screenshot displays the default parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=n

# Size of the swapfile.
ResourceDisk.SwapSizeMB=0
```

The following screenshot displays the modified parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=y

# Size of the swapfile.
ResourceDisk.SwapSizeMB=2048
```

**Note:** You can set the `ResourceDisk.SwapSizeMB` parameter based on your requirement.

2. Restart the `waagent.service` using the command: `systemctl restart waagent.service`

**Note:** To check the status of the swap use the command `swapon --show`.

# Deploy NW Server Host

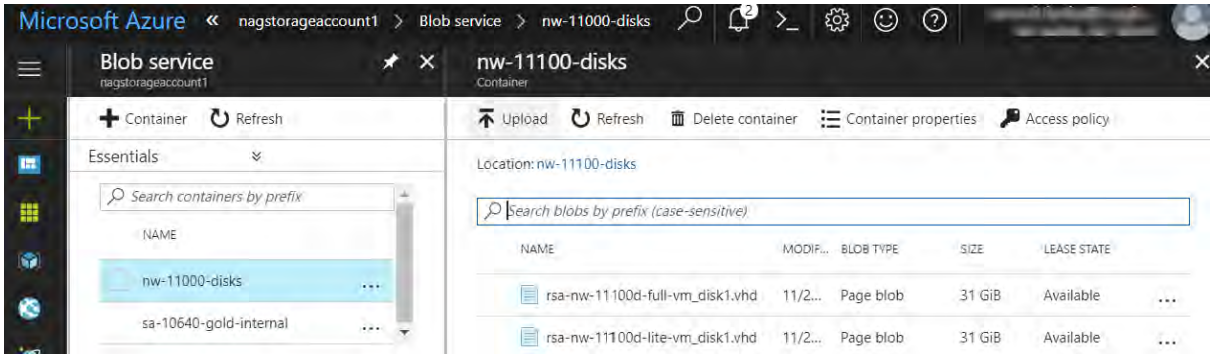
The following tasks must be performed to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

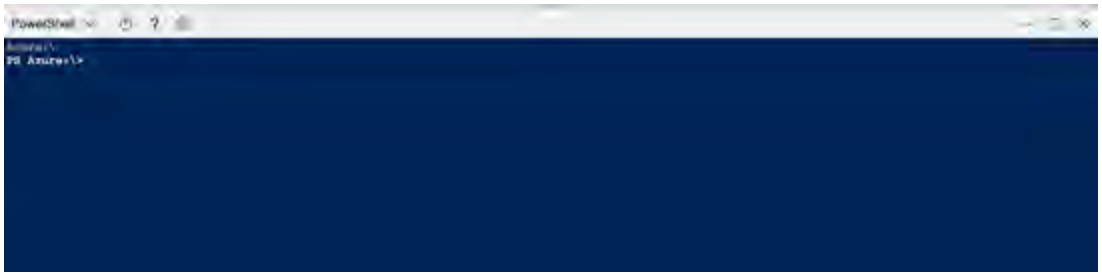
**Note:** It is not mandatory to deploy the NW Server in the Azure Cloud environment . For more information on how to deploy other components, see Azure Deployment Scenarios.

## Task 1. - Upload NW Server VHDs

To upload NW Server VHDs to Azure.

1. Contact Customer Support (https://community.netwitness.com/t5/support/ct-p/support) to open a support case requesting the NW Server VHDs. A valid throughput license is required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.





You will need a storage account, blob service and container setup. This is where the VHD's are copied. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell on your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell on your workstation, log in to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> –Name <storage-account-name>).Context`

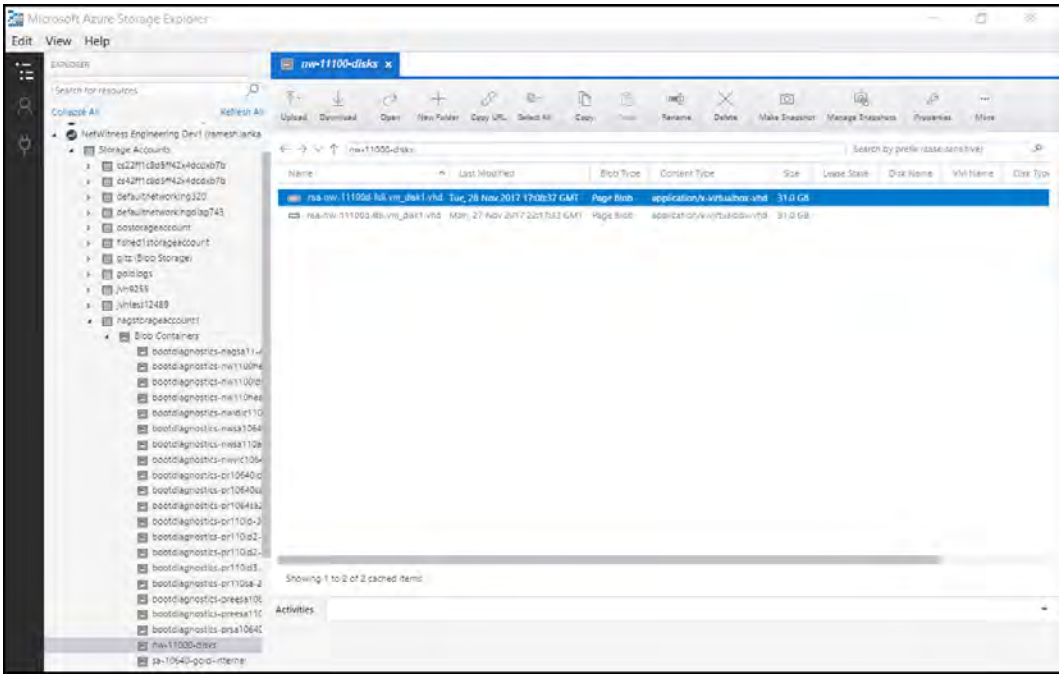
g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. Obtain the Blob copy status by using the command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " –Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll must create an image and a VM.

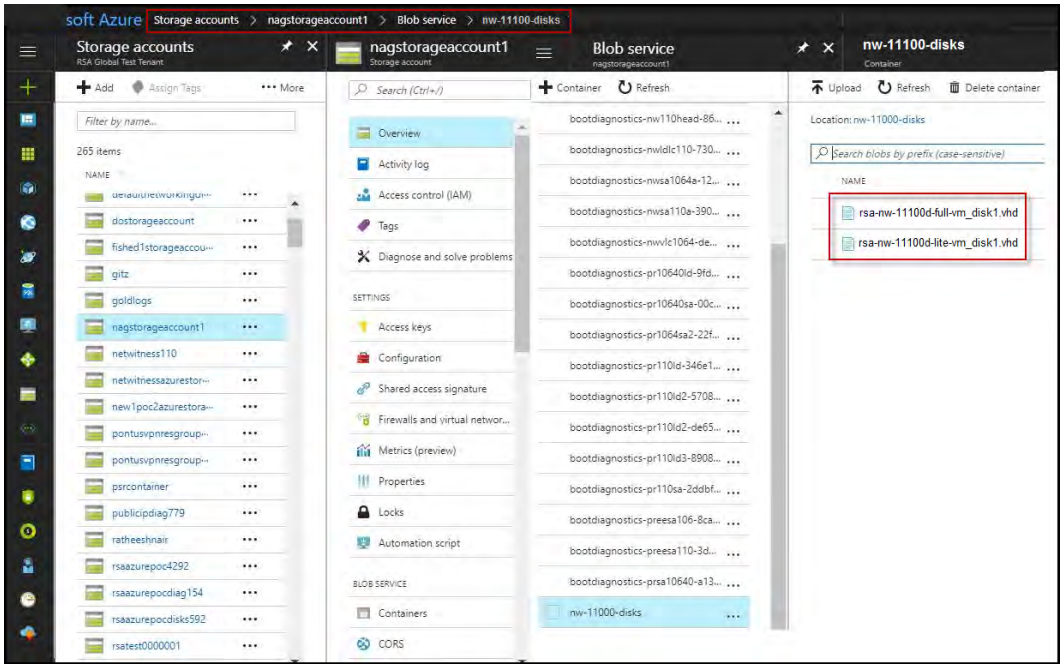
5. Verify if all the NW Server VHDs are uploaded into the Azure Cloud.

**Note:** Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents of your storage.



a. Log in to the Azure portal (https://portal.azure.com).

b. From the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



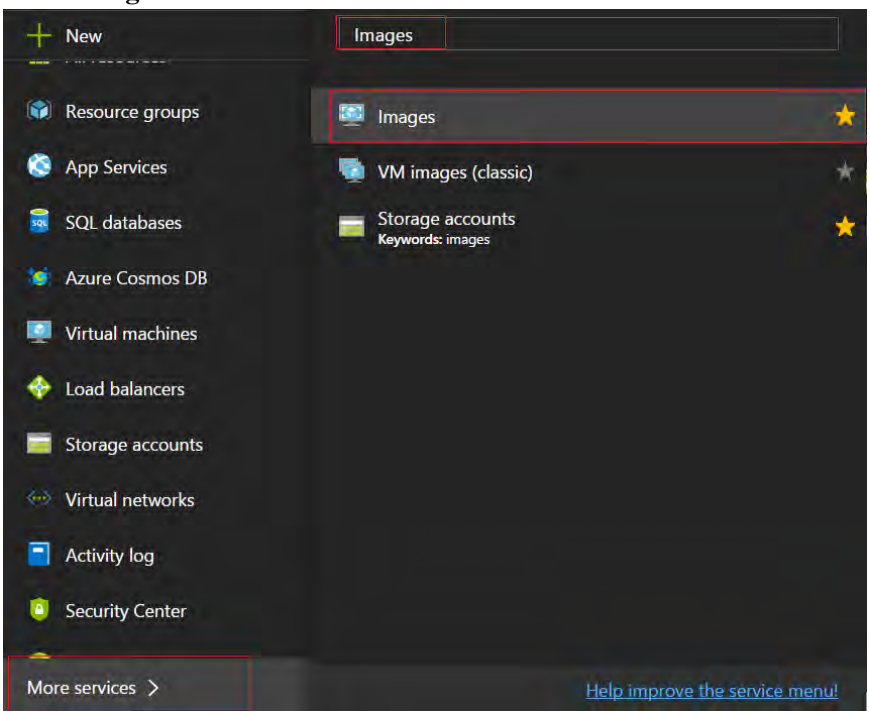
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**).

## Task 2. - Create NW Server Image

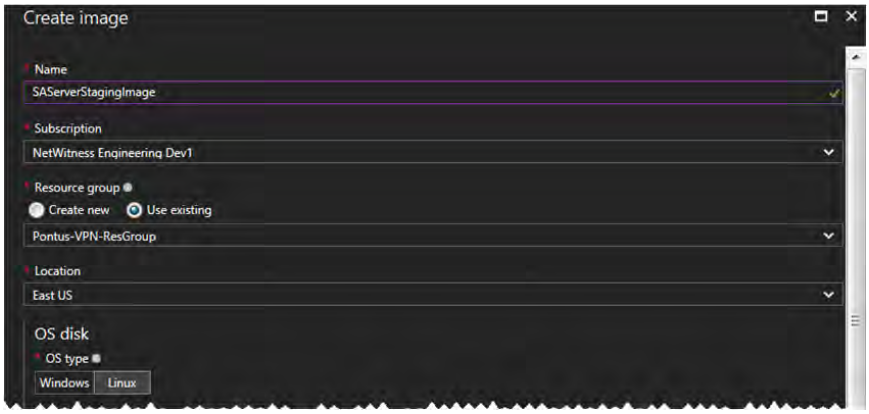
To create a NW Server image in Azure from upload VHDs, perform the following steps:

1. Log in to https://portal.azure.com.
2. From the left panel, click **More Services** and filter by Images.

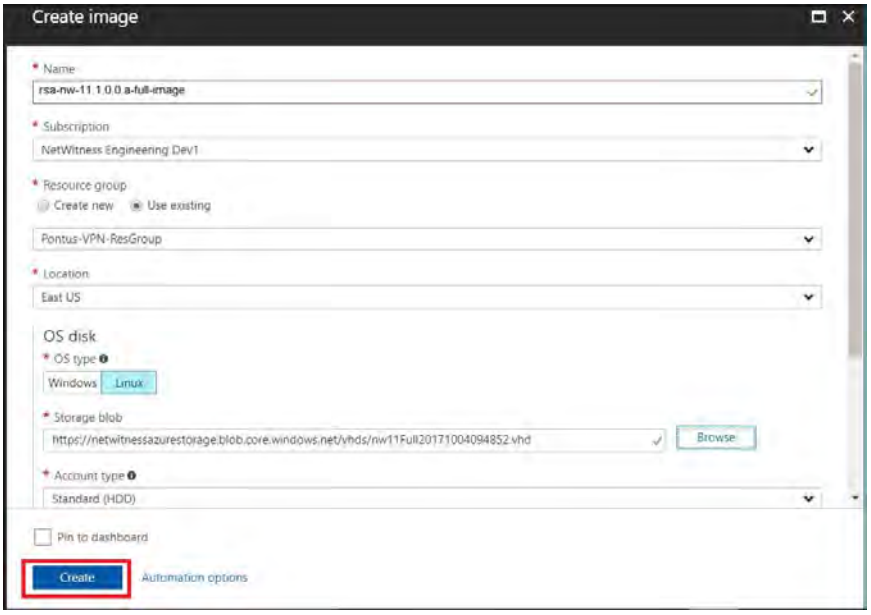
3. Click **Images**.



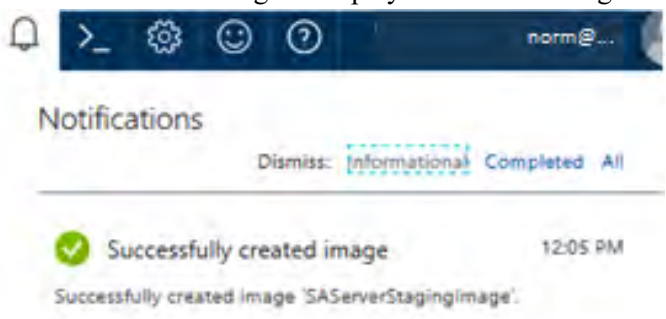
4. To create and configure the Image.
   a. Click **Add**.
   b. Enter an image **Name**, select the correct **Resource Group**, select a valid **Location**, and set the **OS Disk** to Linux.
   In the **Storage blob**, browse to the uploaded location of the VHDs .



c. Make sure that **Standard (HDD)** is selected for **Account Type**.
The following screen shot illustrates a completed **Create Image** view.



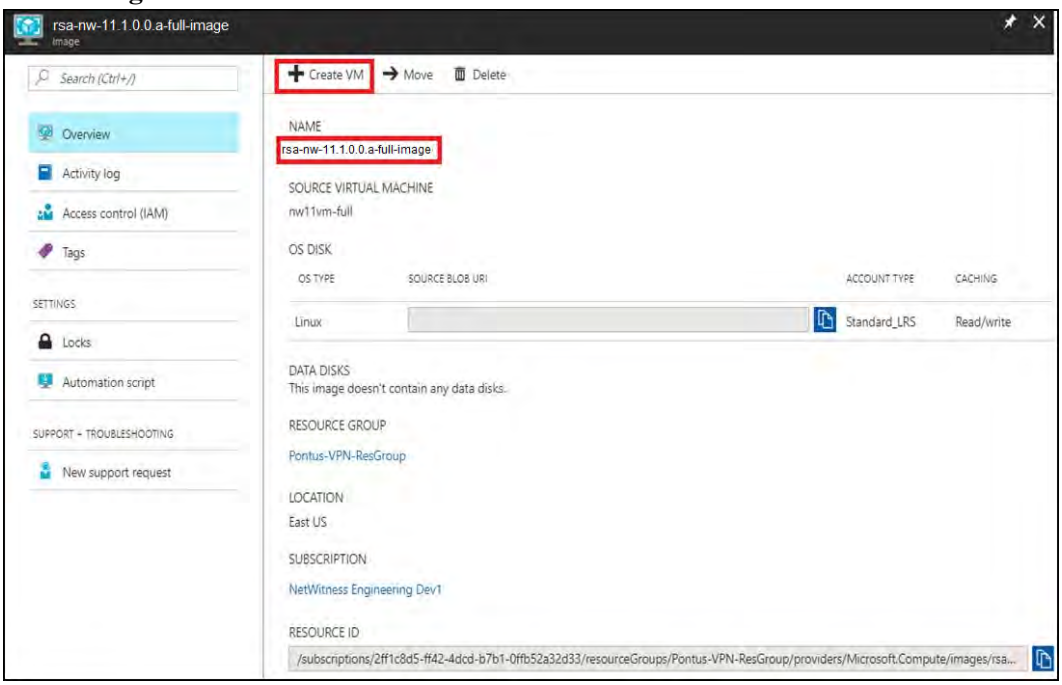
d. Click **Create** to create the image.
A confirmation message is displayed when the image is created.



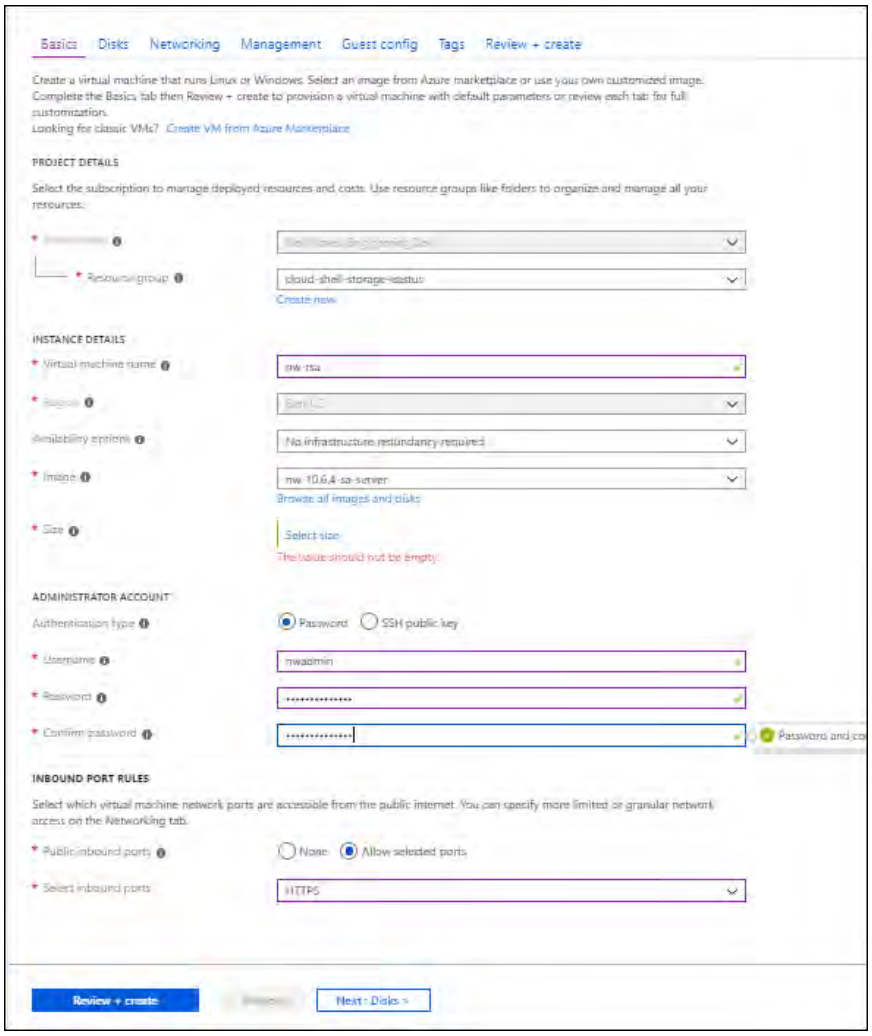
## Task 3. Create Virtual Machine (VM)

To create a VM in Azure using the NW Server image:

1. Go to **Images** and click **Create VM**.



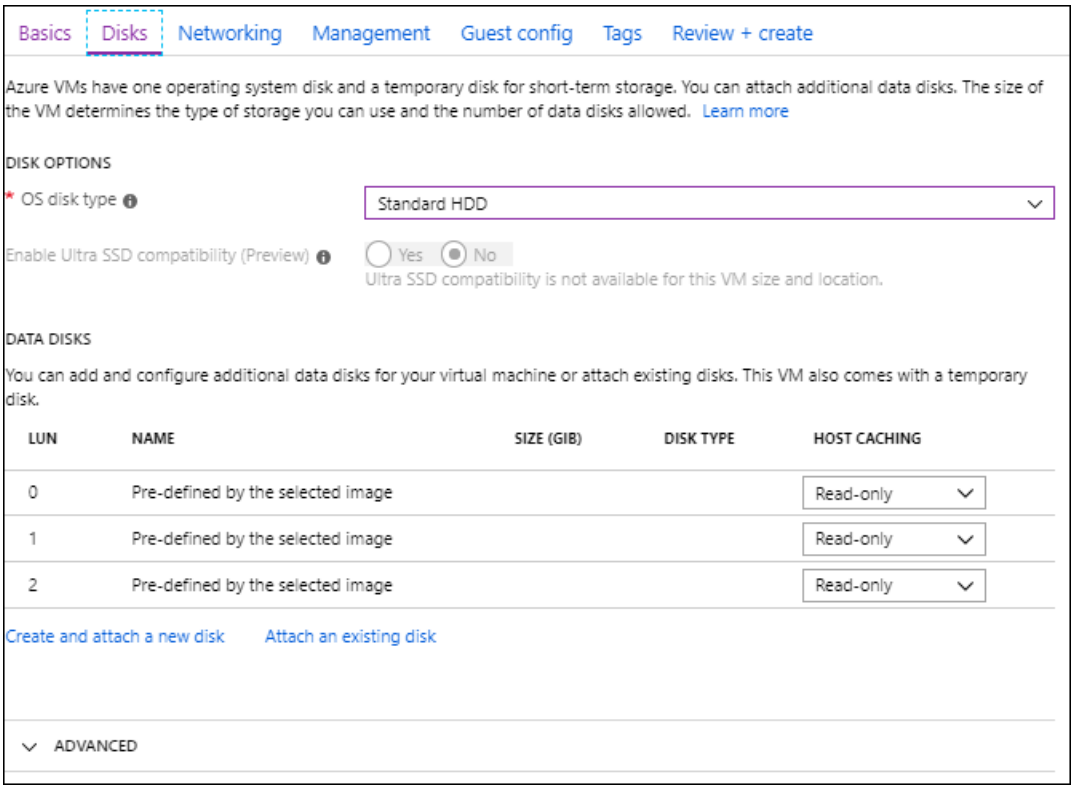
The **Basics** tab is displayed.



2. Enter the values in following fields.
   a. In the **Name** field, enter a user-defined name (for example, **NWServer1100**).
   b. In the **VM disk type** field, select **HDD** from the drop-down list.

      **Caution:** The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).

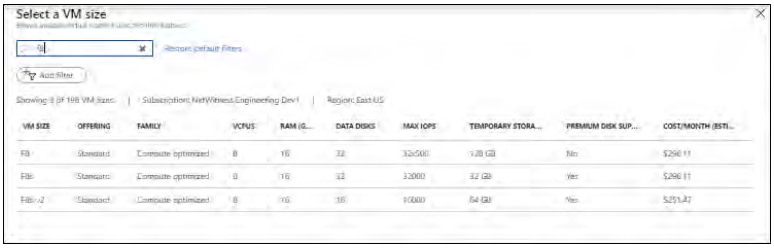
   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Make sure that the values selected in the **Subscription**, **Resource group and Location** fields are correct.
   f. Click **Next** > **Disks**.
      The **Disks** tab is displayed.



The **Select a VM size** dialog is displayed.

3. Click ***size-required-based-on-capacity*** (for example, **F8 Standard**) field, and click **Select**.

**Note:** The sizing is based upon the capacity requirements of your enterprise. For more information on RSA VM size recommendations based on log capture rates, see Azure Configuration Recommendations. The minimum size RSA recommends for the NW Server is **F8 Standard**.



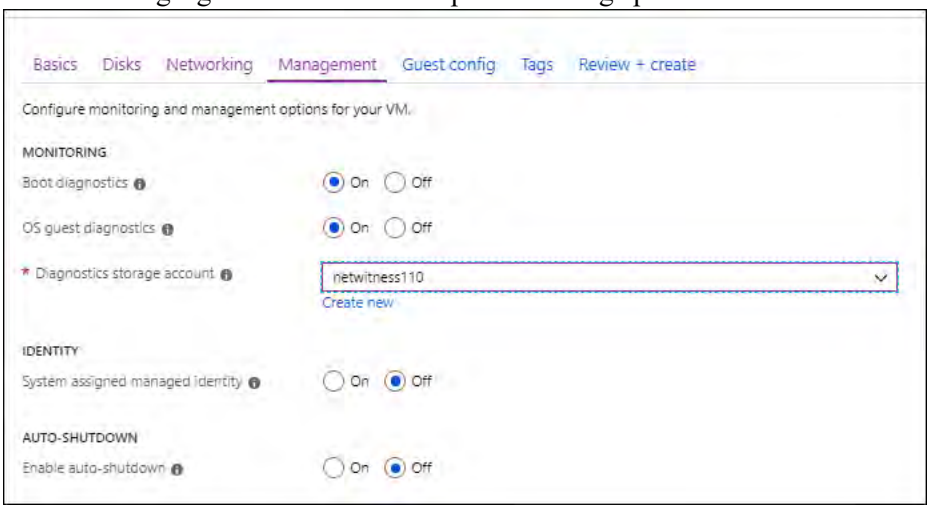
The **Networking** tab is displayed.

4. Click and define the fields.
   a. In the **Networking** tab, select:
      - A valid **Virtual network** and **Subnet**.

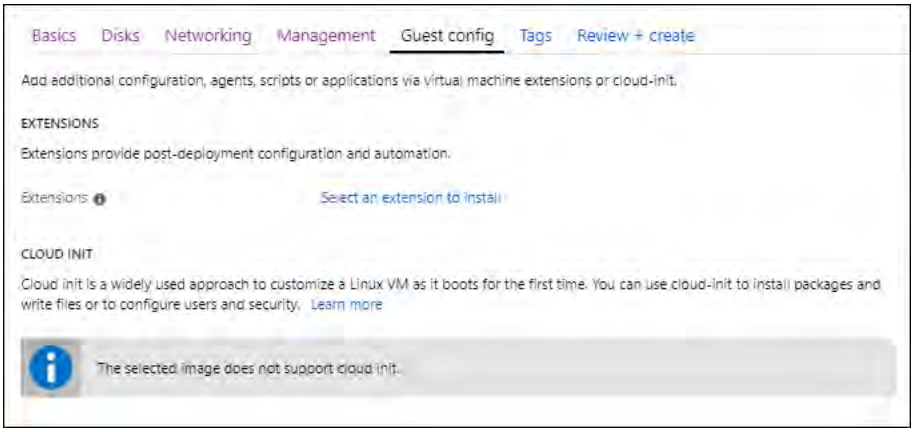
      - **None** for the **Public IP address**.
        RSA recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.
      - A valid **Network security group**.
        For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).

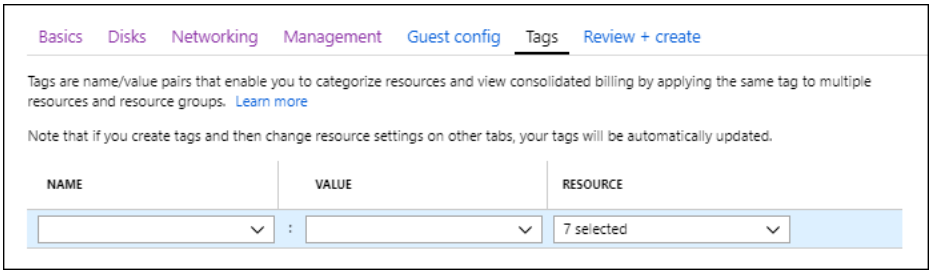
   b. In the **Management** tab, select:
      - **On** for **Boot Diagnostics**
      - **On** for **Guest OS diagnostics**
      - a valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.

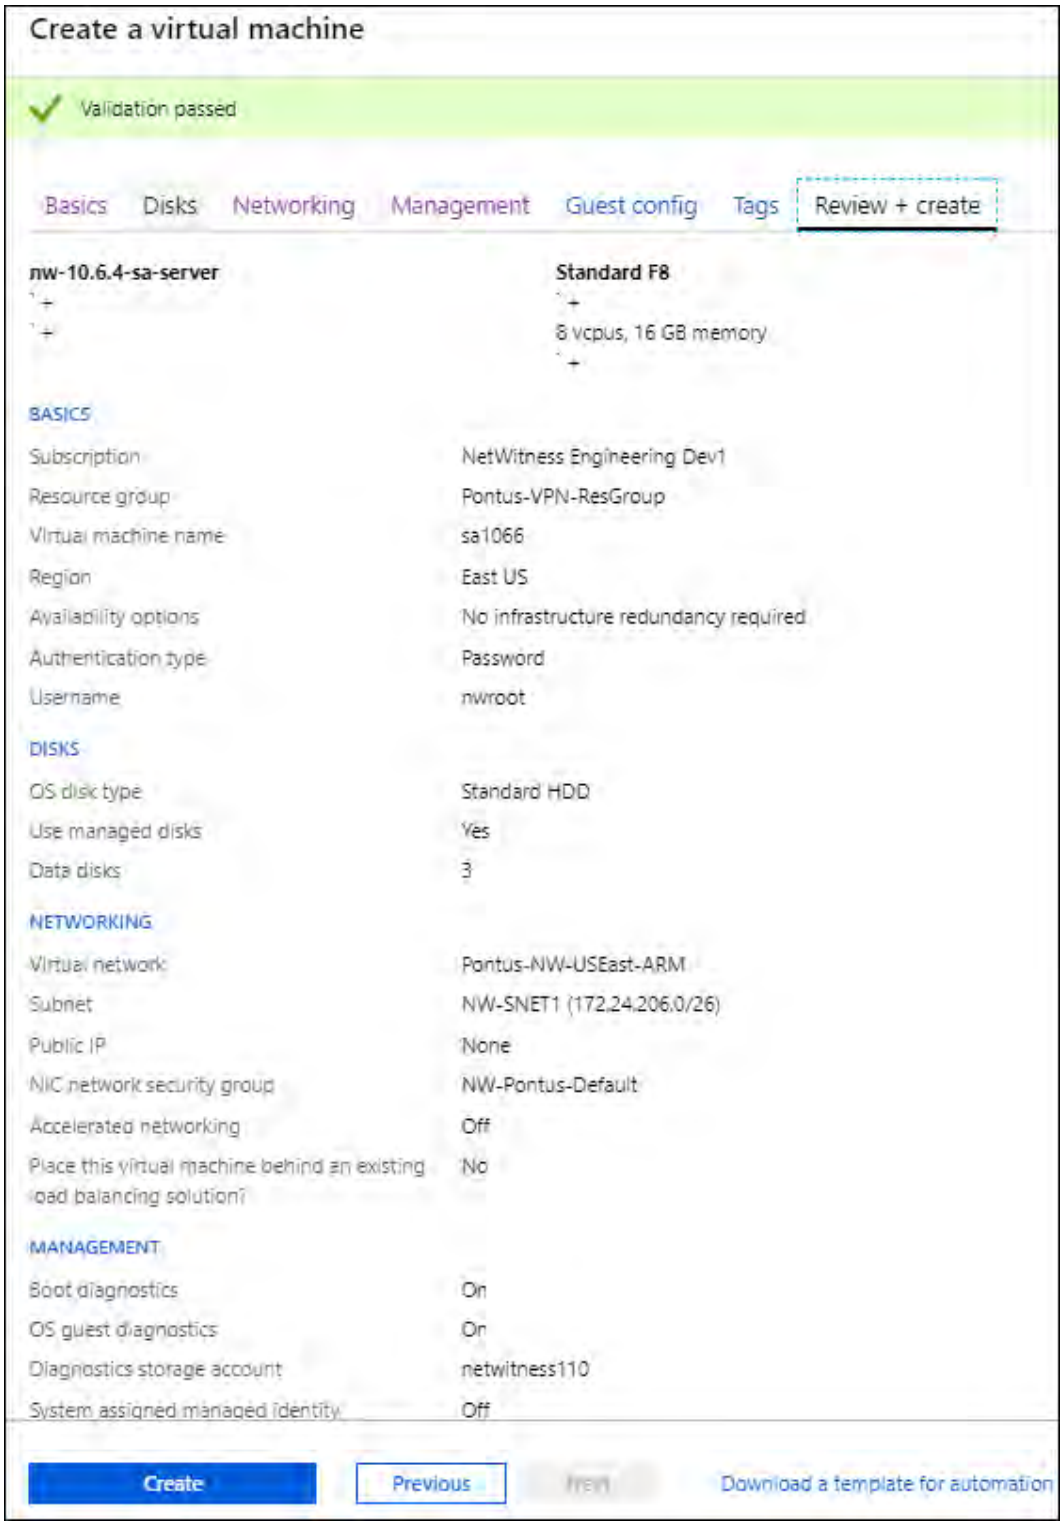


c. Click **OK**.
In the **Guest config** and **Tags** tab the settings remain unchanged.



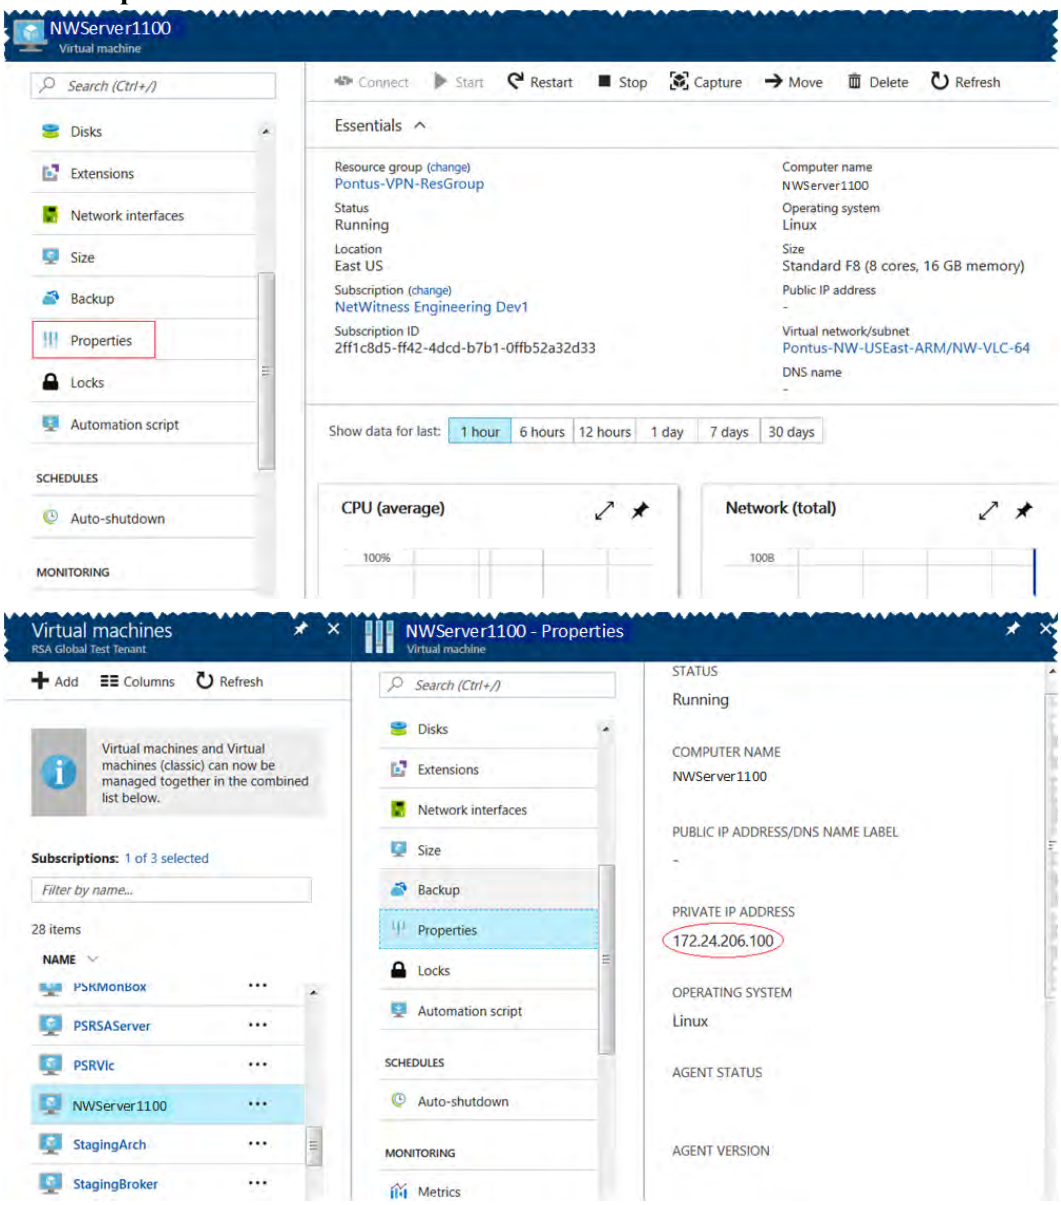


5. Click **Create** after the validation is successful.

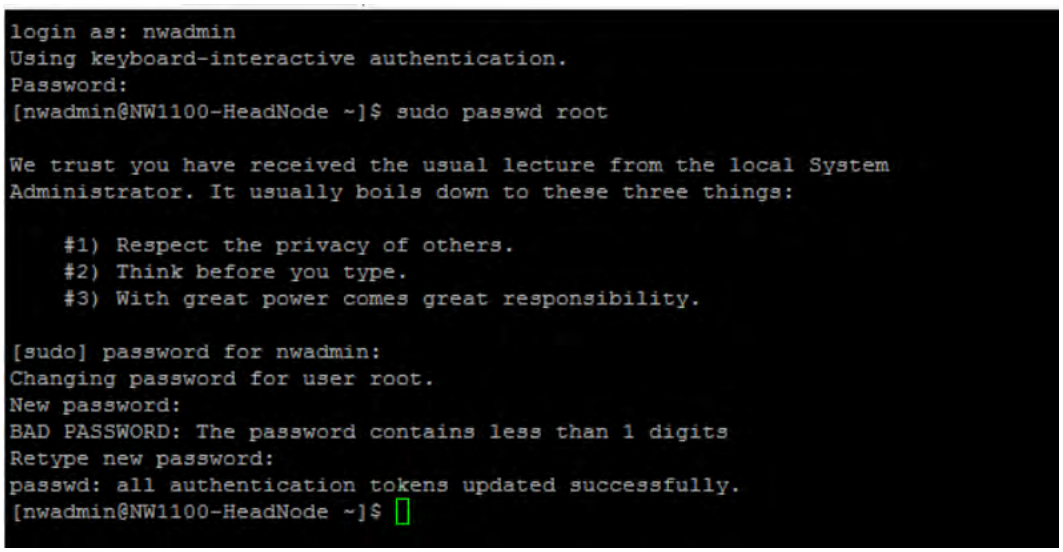


The NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Properties** to view the **IP Address** details.



7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password.



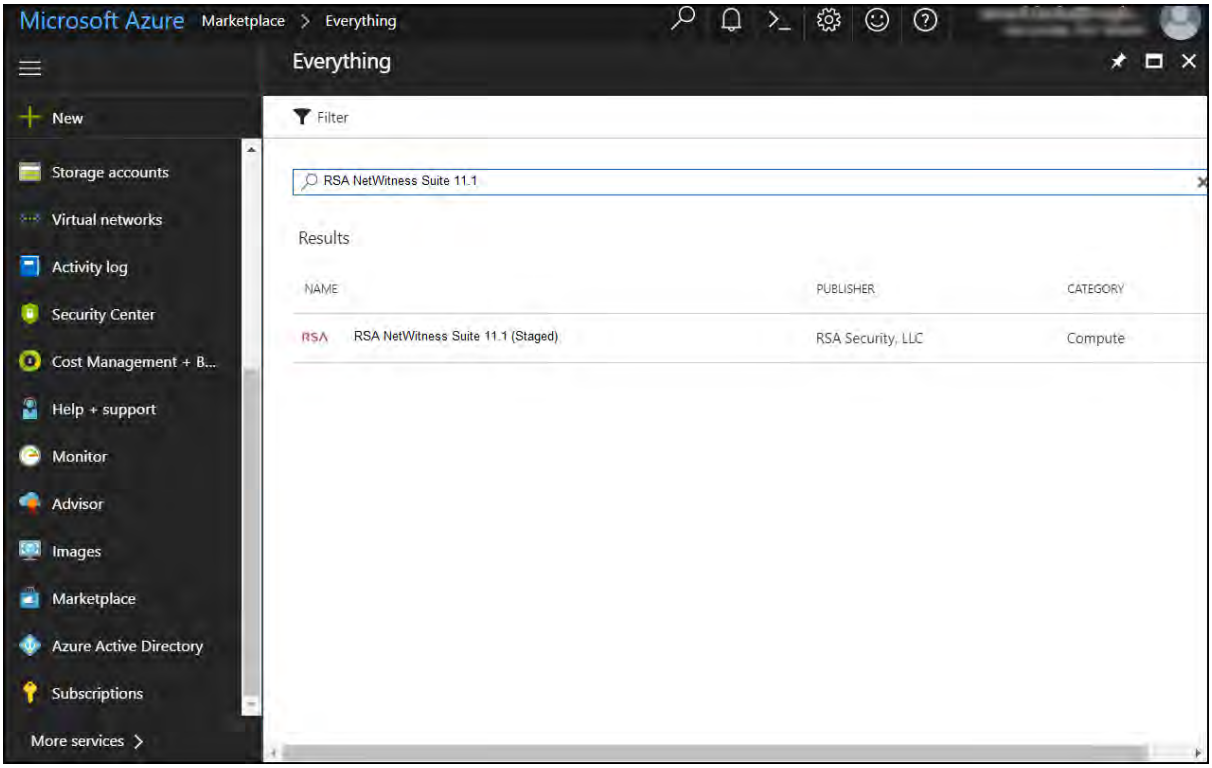
8. Close the current SSH session and open a new SSH session with **root** using the username and the password created in the previous step.

**Note:** Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the NetWitness User Interface will not load.

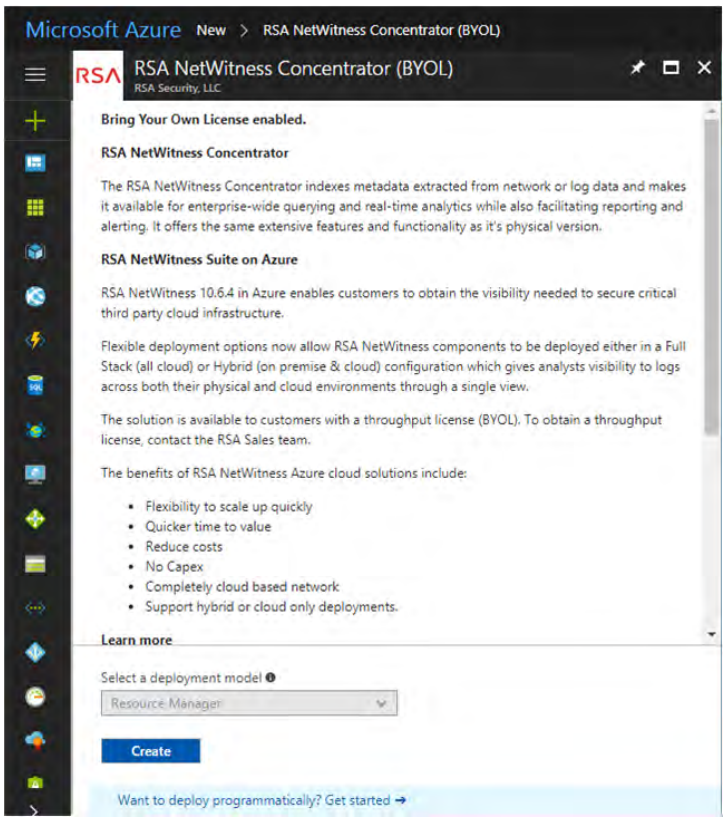
# Deploy Component Core Services in Azure

You must perform the following tasks to configure the core NetWitness component services on a virtual machine (VMs) in the Azure Cloud environment.

1. Go to azuremarketplace.microsoft.com and sign in with your credentials.
2. Search for RSA.

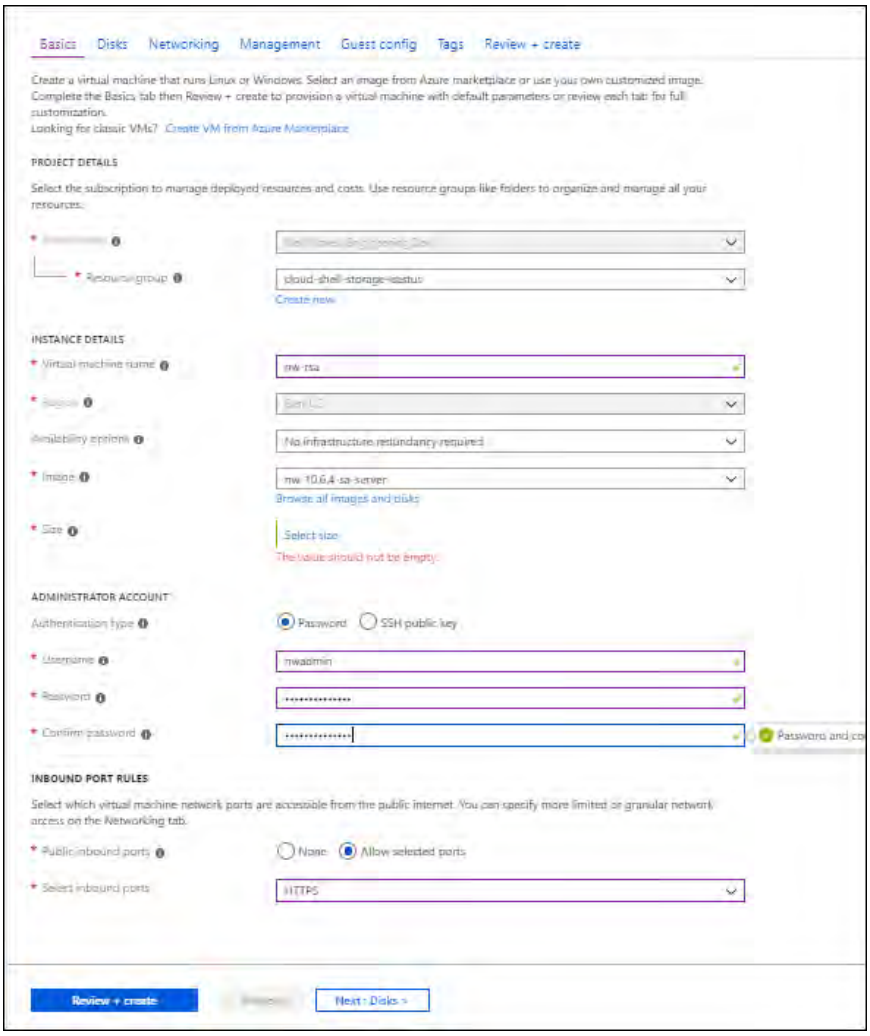


3. Click NetWitness core service (for example, **RSA NetWitness Concentrator**) and click **Create**.



The **Create virtual machine** wizard opens and displays the **Basics** tab.

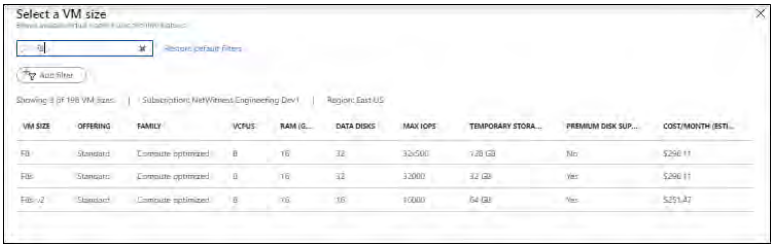
4. Enter the values in the following fields:
   a. Specify a VM **Name** (for example, **Concentrator**).
   b. Select **SSD** for the **VM disk type** of the Concentrator or **HDD** for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).
   c. Select **Password** for **Authentication type**.
   d. Enter your credentials (that is **User name** and **Password**) and **Confirm Password**.
   e. Click **OK**.



Azure validates the **Basic** specifications and the **2 Size** page is displayed.

5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   For more information on RSA's recommendations of the VM sizes for each service, see Azure Configuration Recommendations.



Azure validates the **Size** specifications and the **Networking** page is displayed.

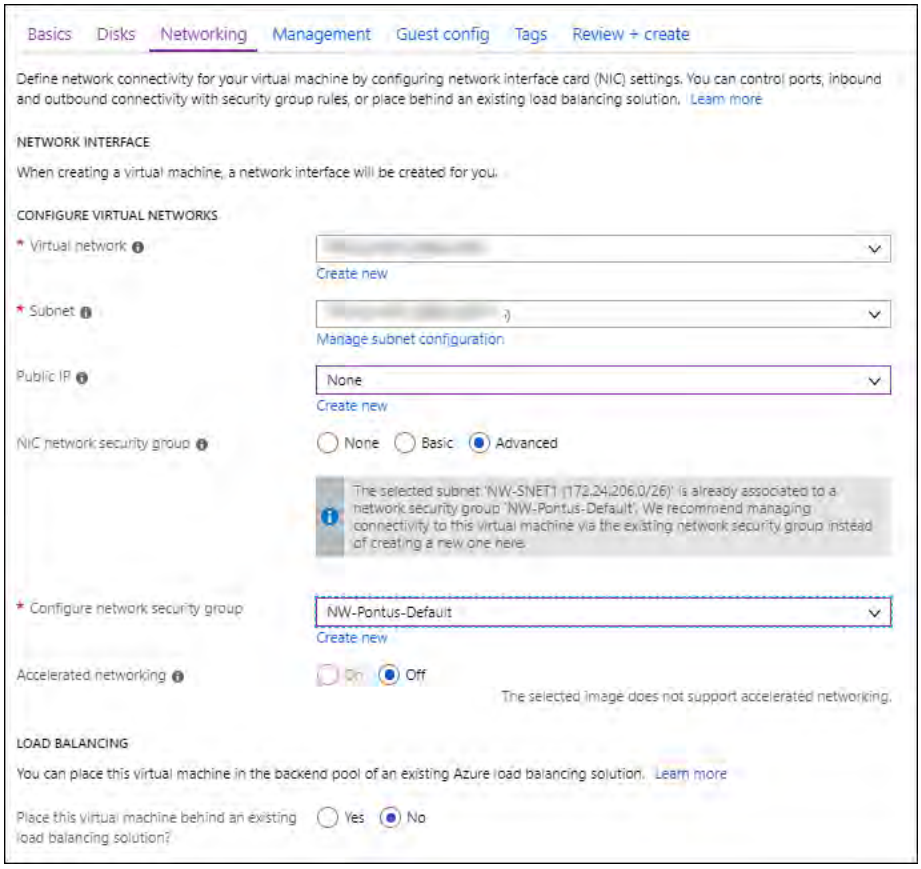
6. Enter the **Settings**.

   a. In the **Storage** field, make sure **Use manage disks** is set to **Yes** .

   b. Under **Networking**:

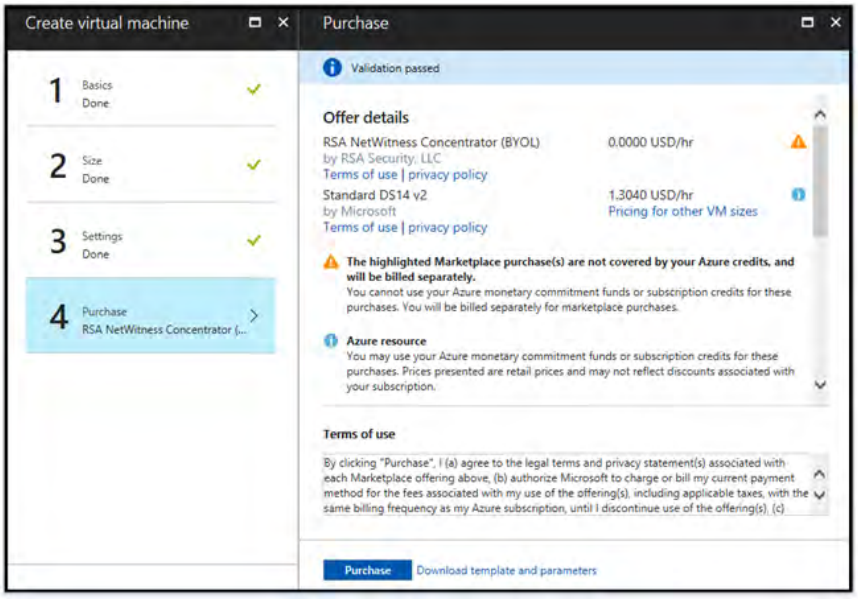
- Adjust **Virtual network**, **Subnet** and **Public IP address** according to the requirements of your network.
- Specify a valid **Network ecurity group**.

  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to Deployment: Network Architecture and Ports (https://community.netwitness.com/t5/netwitness-platform-online/network-architecture-and-ports/ta-p/668996) for a comprehensive list of the ports you must set up for all NetWitness components.



c. Click **OK**.

   Azure validates the VM and the **Purchase** page is displayed.



7. Click **Purchase** to create the core RSA Security Analytics component service (for example, **Concentrator**) VM in Azure.
8. Configure the host VM in NetWitness 11.7.0.0.

   For more information, see Step 3. Configure Host VMs in NetWitness Platform .
9. Repeat steps 1 through 8 inclusive for the rest of the core RSA NetWitness component services.

# Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform 11.7.*

**Caution:** Do not proceed with the installation until the ports on your firewall are configured.

## Install 11.7.0.0 on the NetWitness Server (NW Server) and Component Hosts

**Note:** You can perform this task for INTERNAL-RSANW-11.7.0.0.17034-Full-Signed instance.

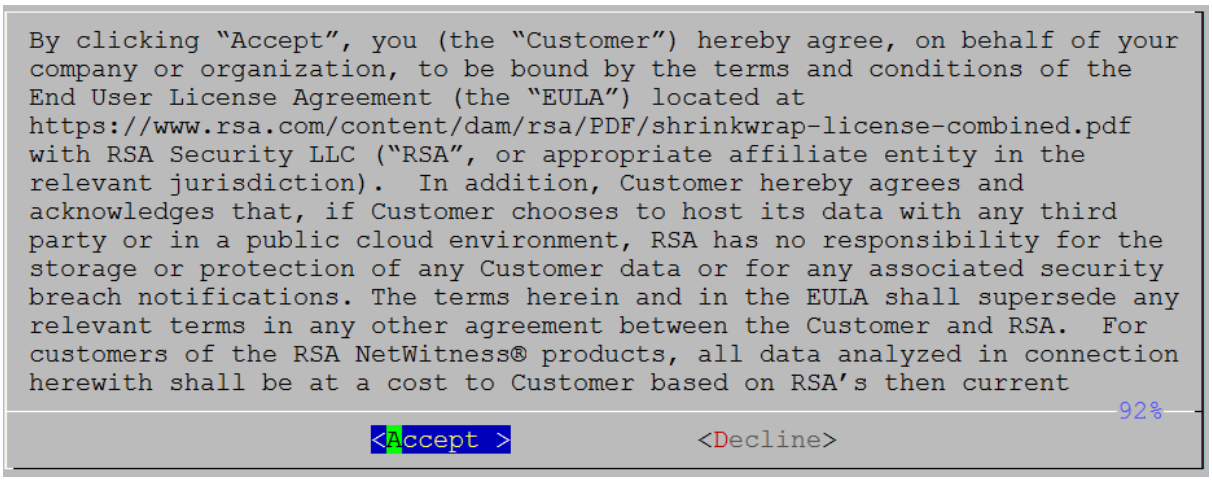
**Caution:** If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

**IMPORTANT:** In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

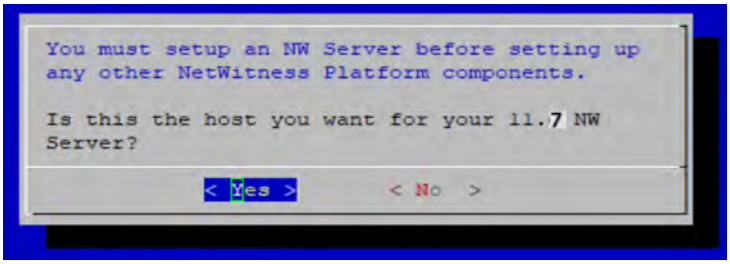
1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   **Note:** Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.



3. Tab to **Yes** and press **Enter** to install 11.7 on the NW Server.
   Tab to **No** and press **Enter** to install 11.7 on other component hosts.

   **Caution:** If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 11.7 Disaster Recovery.).
   **NW Server Host prompt**:

   **Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)**

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   **NW Server prompt**:

   **Other Component Hosts prompt says <non-nwserver-host-name>**

   **Caution:** If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

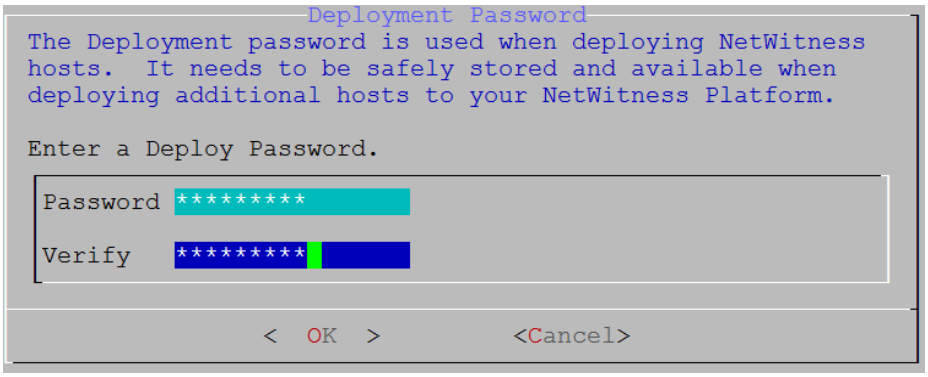
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

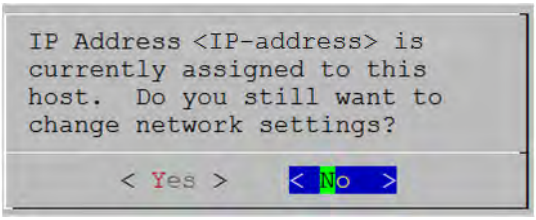
7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.



Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. One of the following conditional prompts is displayed.

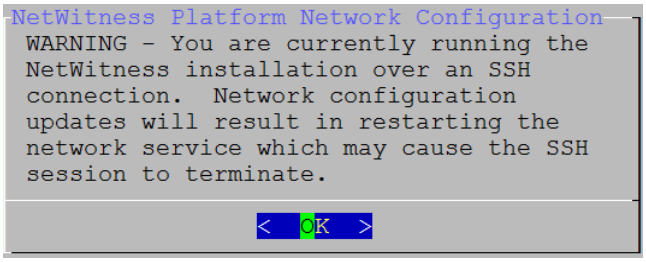
- If the Setup program finds a valid IP address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

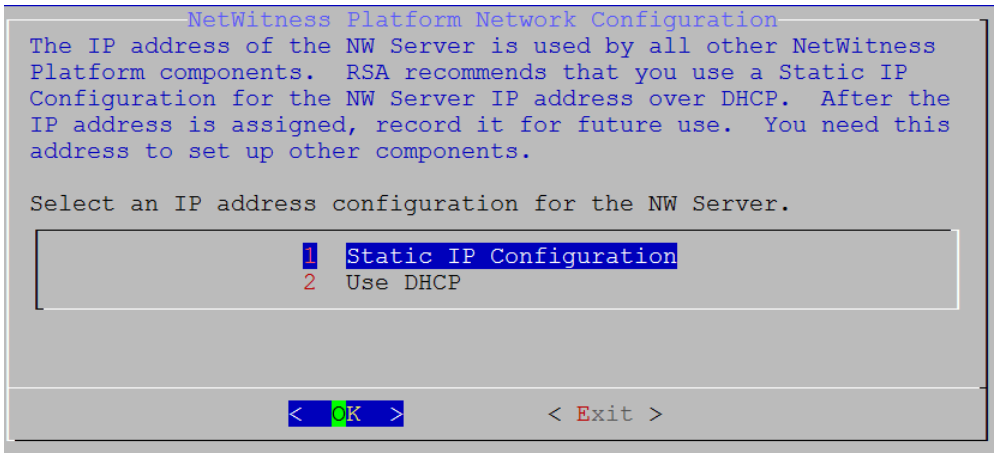
**Note:** If you connect directly from the host console, the following warning is not displayed.



Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

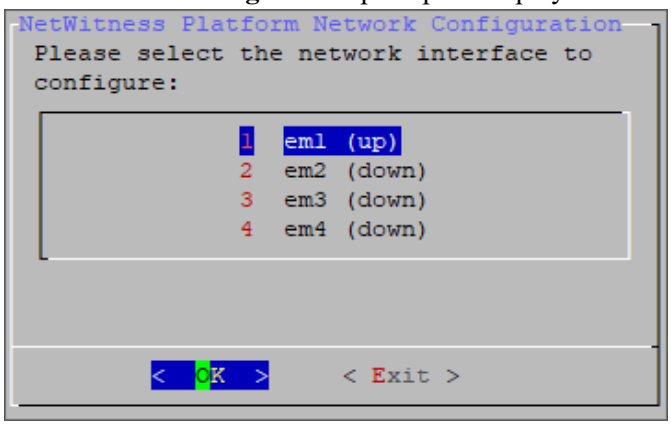
**Caution:** Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.



Tab to **OK** and press **Enter** to use **Static IP**.

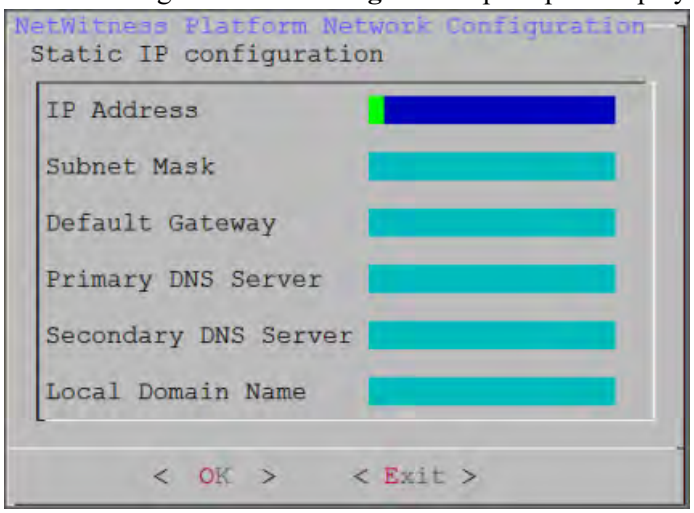
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

   The following **Static IP Configuration** prompt is displayed.



10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    **Caution:** If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

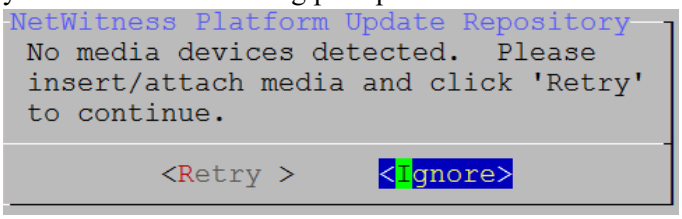
11. The Use Network Address Translation (NAT) prompt is displayed.

    **For the NW Server**, tab to **No** and press **Enter**.
    **For component hosts**, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

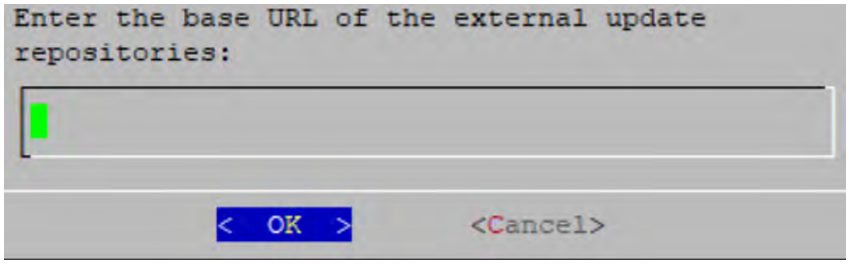
12. The **Update Repository** prompt is displayed.

    **For the NW Server**:

    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7. If the program cannot find the attached media, you receive the following prompt.



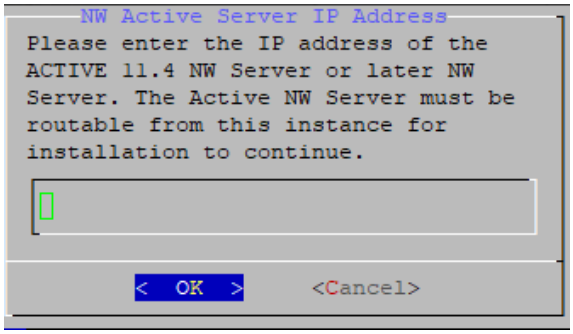
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

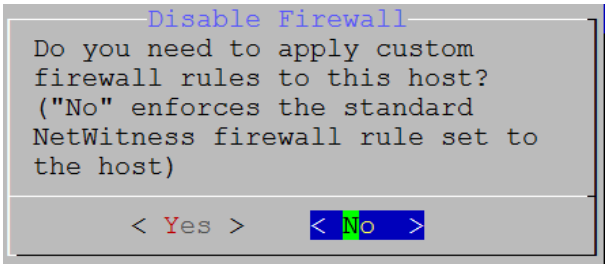
**For component hosts**:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



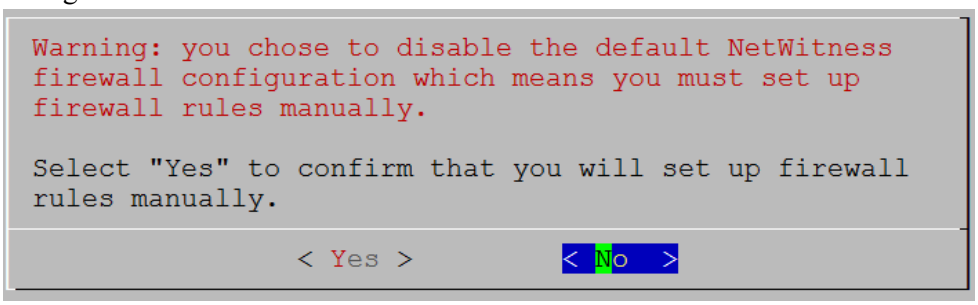
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.

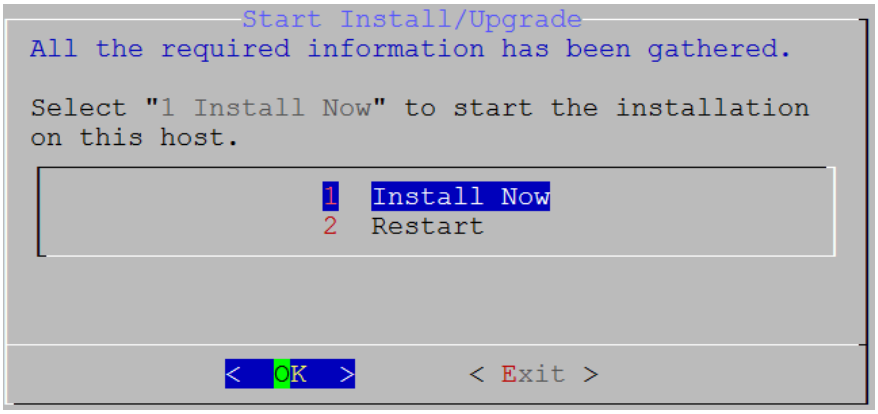


Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

configuration.

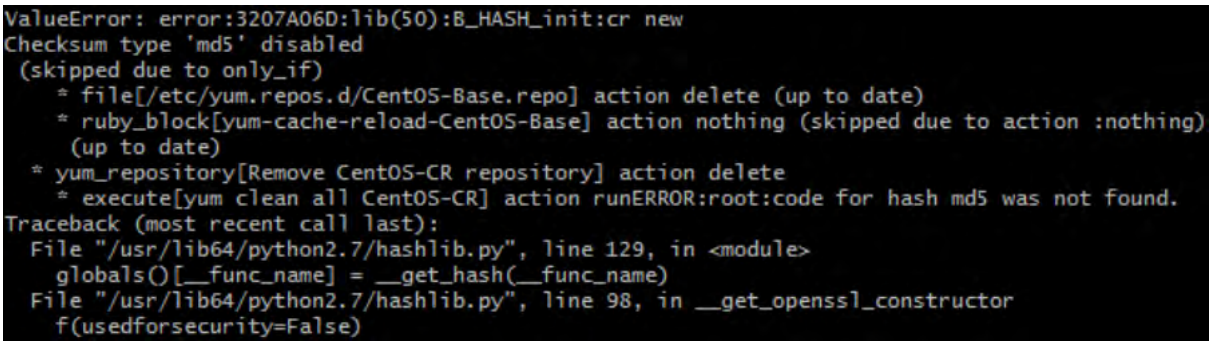


14. The **Start Install** prompt is displayed.



15. Press **Enter** to install 11.7.
When **Installation complete** is displayed, you have installed 11.7 on this host.

**Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



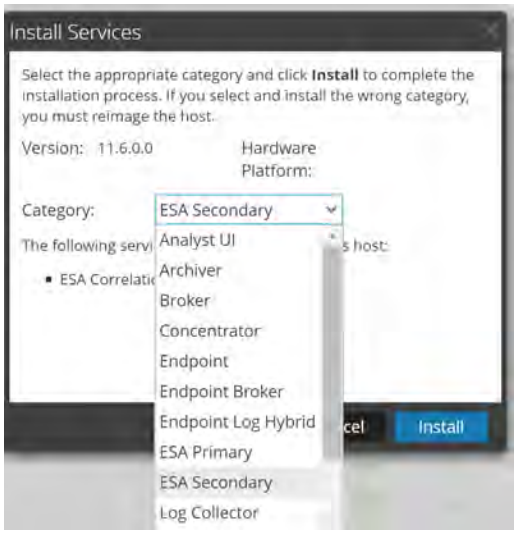
16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

## Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 11.7 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:



## Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.

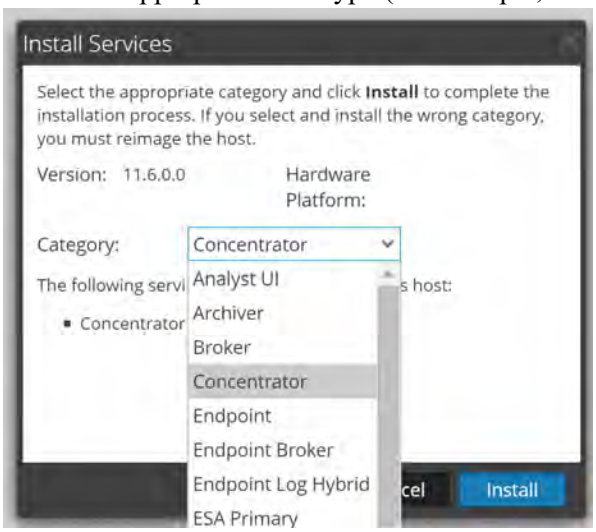
   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.



## Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 11.7 Licensing Management Guide* for more information. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

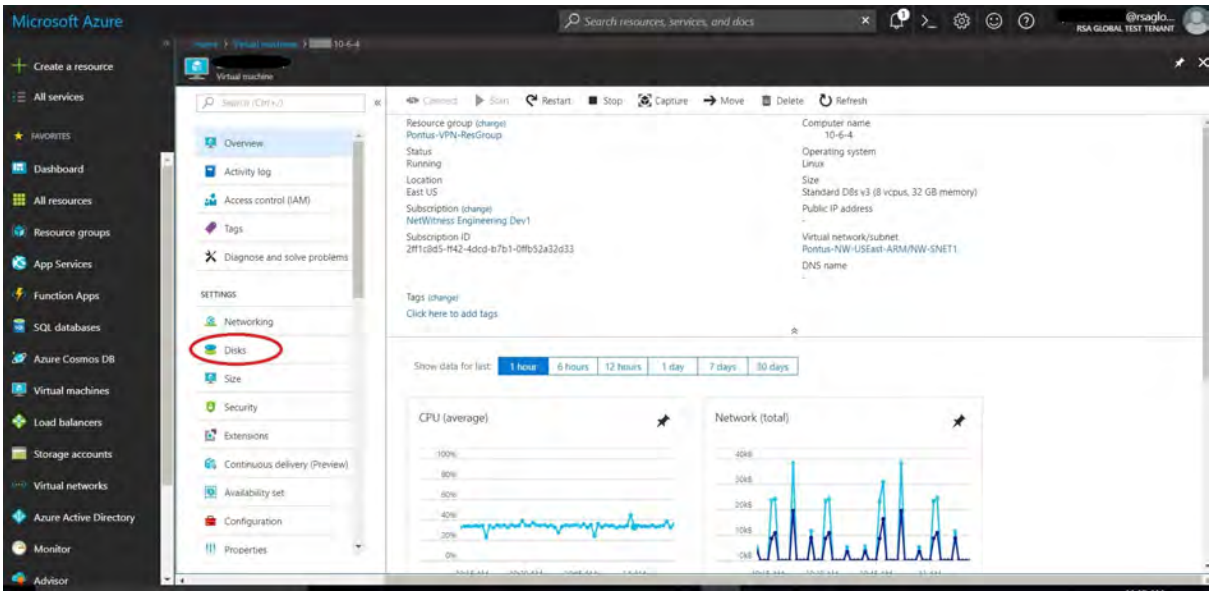
## (Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for RSA NetWitness Platform 11.7* for instructions on how to set up a Warm Standby NW Server.

## NetWitness Azure Storage Allocation Procedure

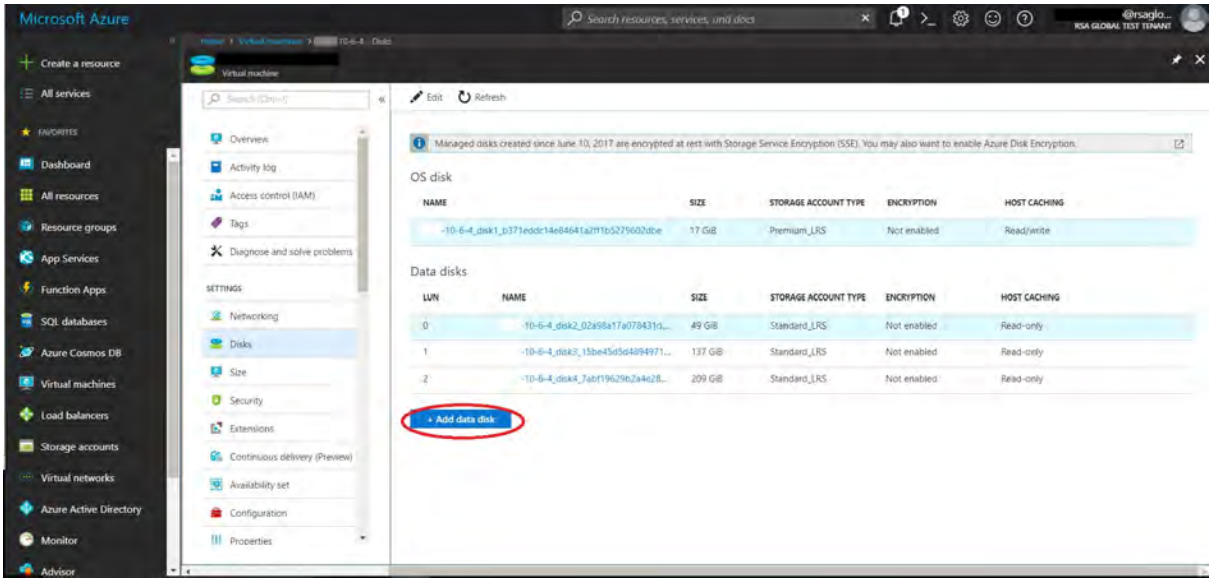
To allocate storage in NetWitness Platform 11.7.0.0, perform the following steps:

1. In Microsoft Azure portal (https://portal.azure.com/), go to **Virtual Machines**.
2. Click on the required VM > **Disks**.

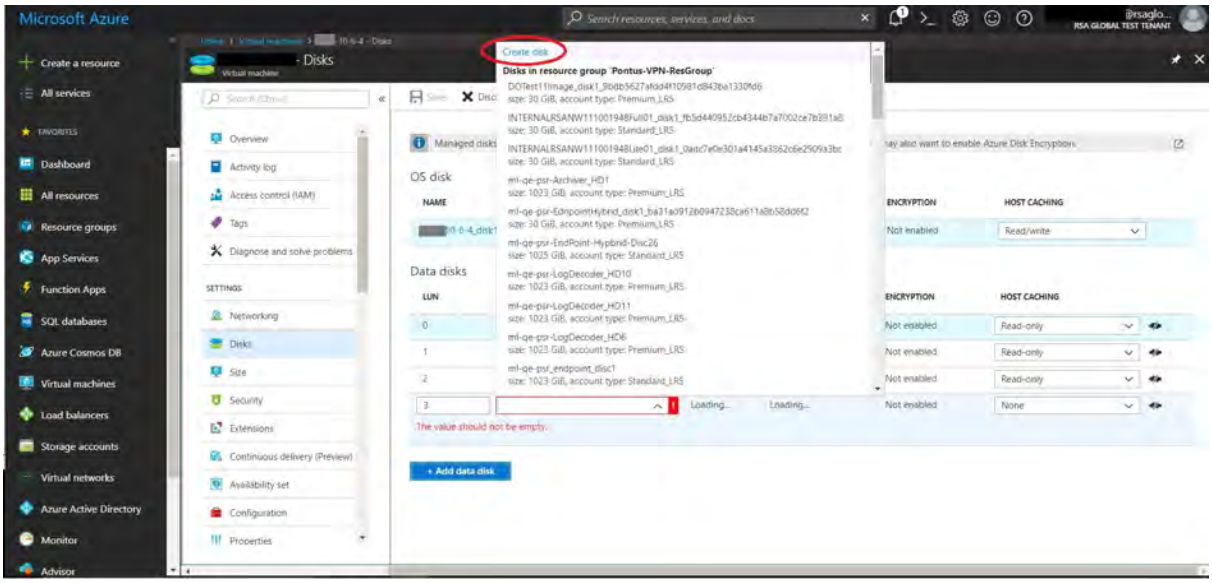


3. Click **Add data disk**.

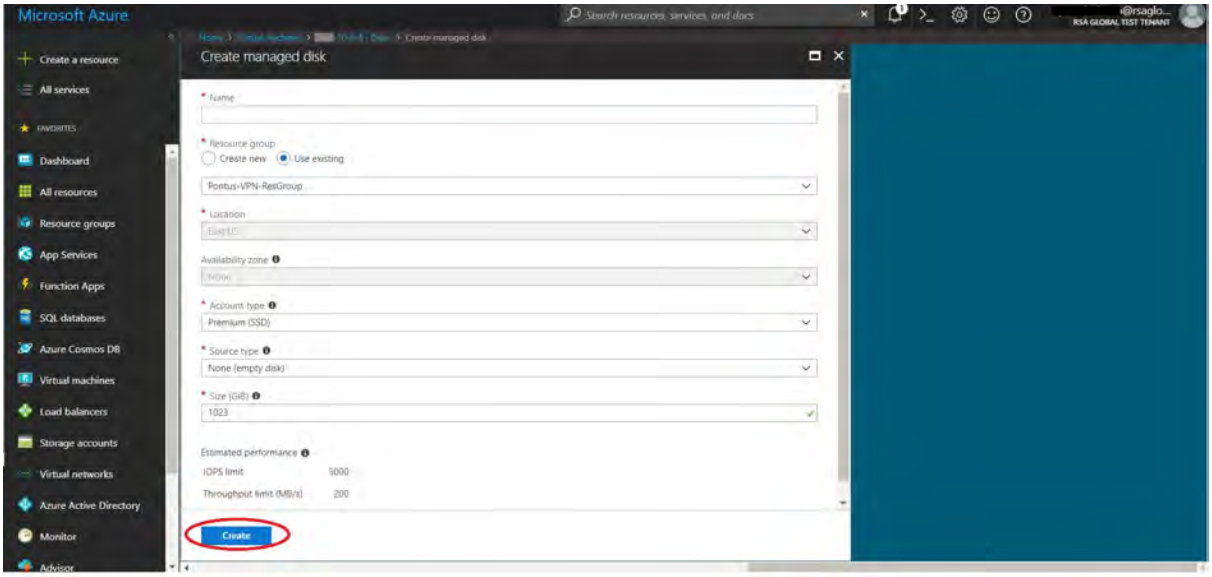
> **Note:** You need to add the appropriate amount of disks to meet the retention requirements. If you need to add more than a single disk, a RAID configuration is needed. For more information, see RAID Configuration Instructions.



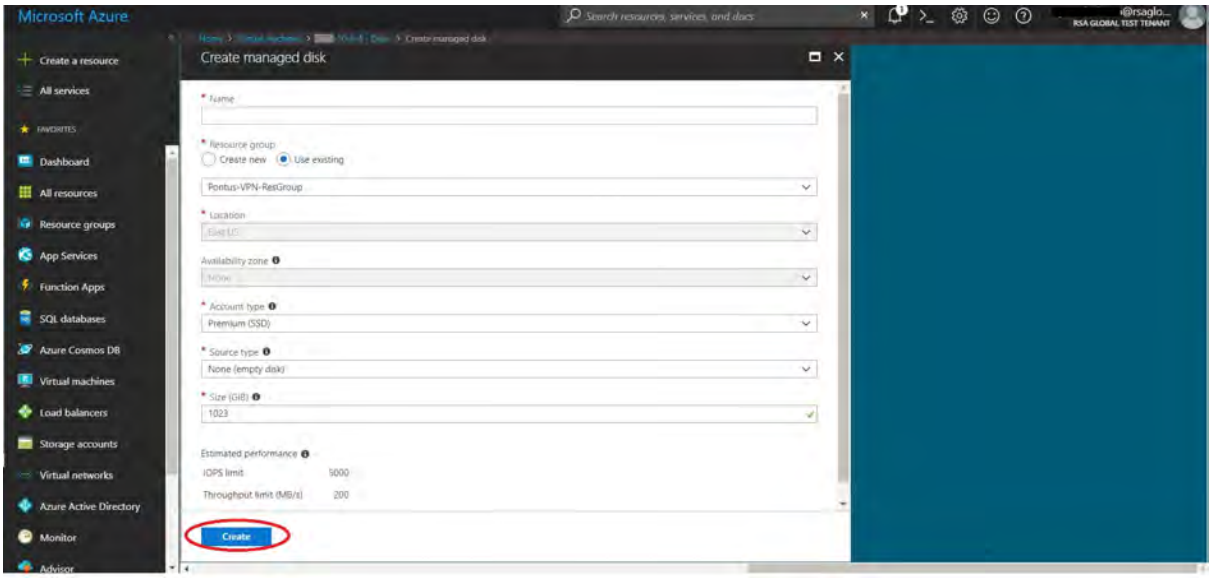
4. In the drop-down list, select **Create disk**.



5. Enter the **Name**, **Resource group** (Select Use existing), **Account type** (SSD for Concentrator Index DB and HDD for others), **Source type** (select **None (empty disk)**), **Size** and fill the other fields.



6. Click **Create**.
7. Select **Read/Write** for HOST CACHING. and click **Save**.



# Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

**Note:** After you successfully launch an instance, Azure assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-firewall=false --ip-override=false --eula=true
   ```

**Note:** In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

## Arguments

| Argument | Description |
|---|---|
| `--help-install-opts` | Display all the arguments in this table. |

| Argument | Description |
|---|---|
| `--eula` | Accept or decline the End User License Agreement (EULA). Specify:<br>• `true` (default) to accept the agreement<br>• `false` to decline it and cancel the installation.<br>For example: `--eula=true` |
| `--is-head` | Designate the host as the NW Server host or a component host. Specify:<br>• `true` for NW Server host.<br>• `false` for Component host.<br>For example: `--is-head=true` |
| `--host-name` | Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname.<br>For example: `--host-name=<hostname>` |
| `--master-pass` | Enter master password. For example: `--master-pass=<password>` |
| `--deploy-pass` | Enter deployment password. For example: `--deploy-pass=<password>` |
| `--iface-name` | Specify network interface.<br>For example: `--iface-name=eth0` |
| `--ip-override` | Accept or override IP address found for this host or change the IP configuration found on the host. Specify:<br>• `true` provide IP address.<br>• `false` use IP address found on the host.<br>For example: `--ip-override=false` |
| `--ip-type` | Select ip address configuration type. Specify:<br>• `1` Static IP Configuration)<br>• `2` DCHP<br>For example: `--ip-type=1` |
| `--ip-addr` | For Static IP configuration, enter IP Address for static address.<br>For example: `--ip-addr=<ip-address>` |
| `--ip-netmask` | For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>` |

| Argument | Description |
|---|---|
| `--ip-gateway` | For Static IP configuration, enter default gateway for static address. For example:<br>`--ip-gateway=<default-gateway>` |
| `--ip-nameserver` | IP address assigned to DNS server.<br>`--ip-nameserver=<ip-address>` |
| `--ip-nameserver-secondary` | Optional - IP address assigned to a secondary DNS server.<br>For example: `--ip-nameserver-secondary=<ip-address>` |
| `--ip-domain` | For Static IP configuration, enter Local Domain Name for static address. For example:<br>`--ip-domain=<default-gateway>` |
| `--repo-type` | Select type of update repository. Specify:<br>• `1` Local repository<br>• `2` External repository<br>For example: `--repo-type=1` |
| `--repo-url` | For an external update repository, specify the url of the repository. For example:<br>`--repo-url=<url>` |
| `--head-ip` | For a component host, specify IP Address of the NW Server.<br>For example: `--head-ip=<ip-address>` |
| `--custom-firewall` | Disable default firewall configuration and use your custom configuration. Specify:<br>• `true` use custom firewall configuration.<br>• `false` use default firewall configuration.<br>For example: `--custom-firewall=true` |
| `--use-nat` | Configure the host to use Network Address Translation (NAT) based IP addresses:<br>• `true` use NAT IPs to connect to other hosts<br>• `false` do not use NAT IPs to connect to other hosts (default)<br>For example: `--use-nat=false` |

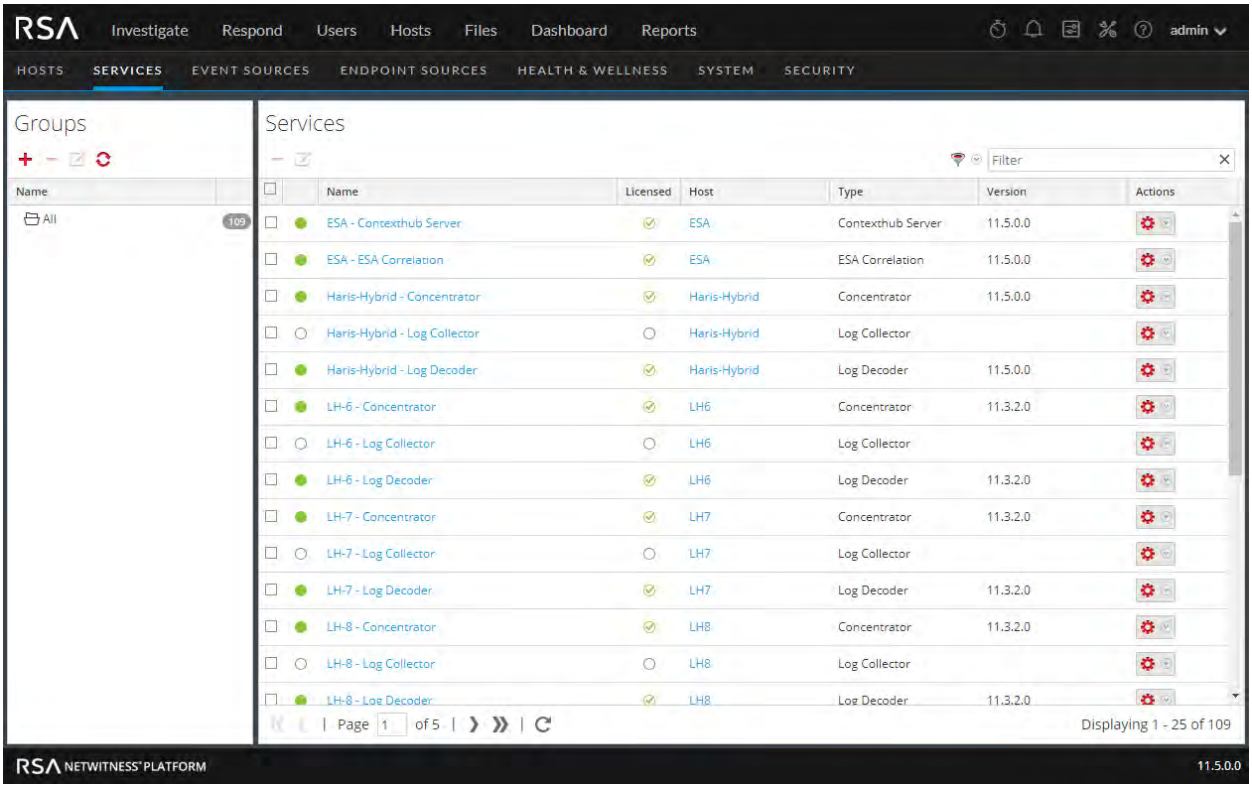
# Broker and Concentrator Basics

Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness user interface. Most of the configuration is performed in the Administration Services view ( **(Admin) > Services**).



You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view ( **(Admin) > Services**).

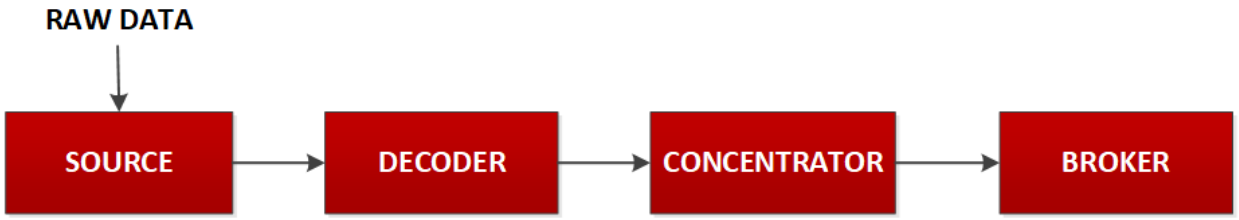
# Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

**Note:** Go to the Master Table of Contents in RSA Link to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

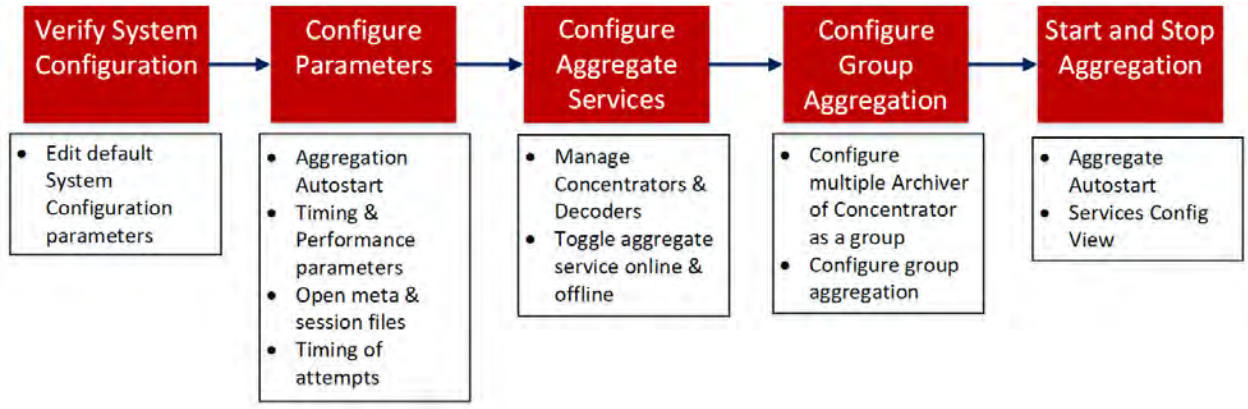


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

# Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



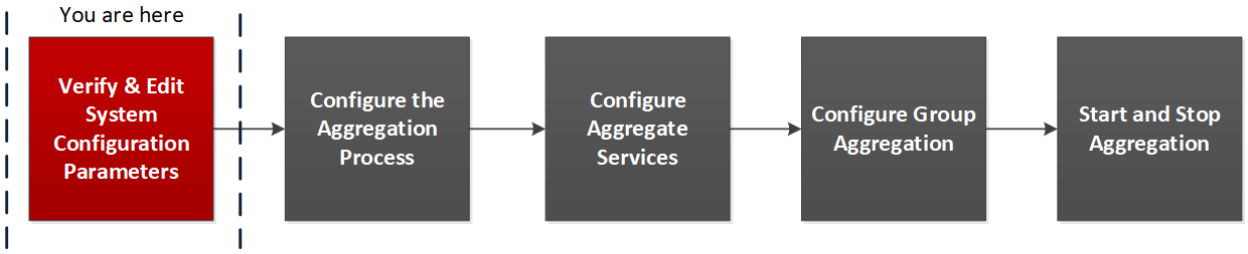
## Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

| Configuration Step | Description |
|---|---|
| Step 1 - Verify System Configuration | Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration |
| Step 2 - Configure Parameters | Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process |
| Step 3 - Configure Aggregate Services | Configure aggregate services as described in Step 3. Configure Aggregate Services |
| Step 4 - Configure Group Aggregation | (Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation |
| Step 5 - Start and Stop Aggregation | Start and stop aggregation as described in Step 5. Start and Stop Aggregation |

## Step 1. Verify Service System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. You can edit these values to tune performance.

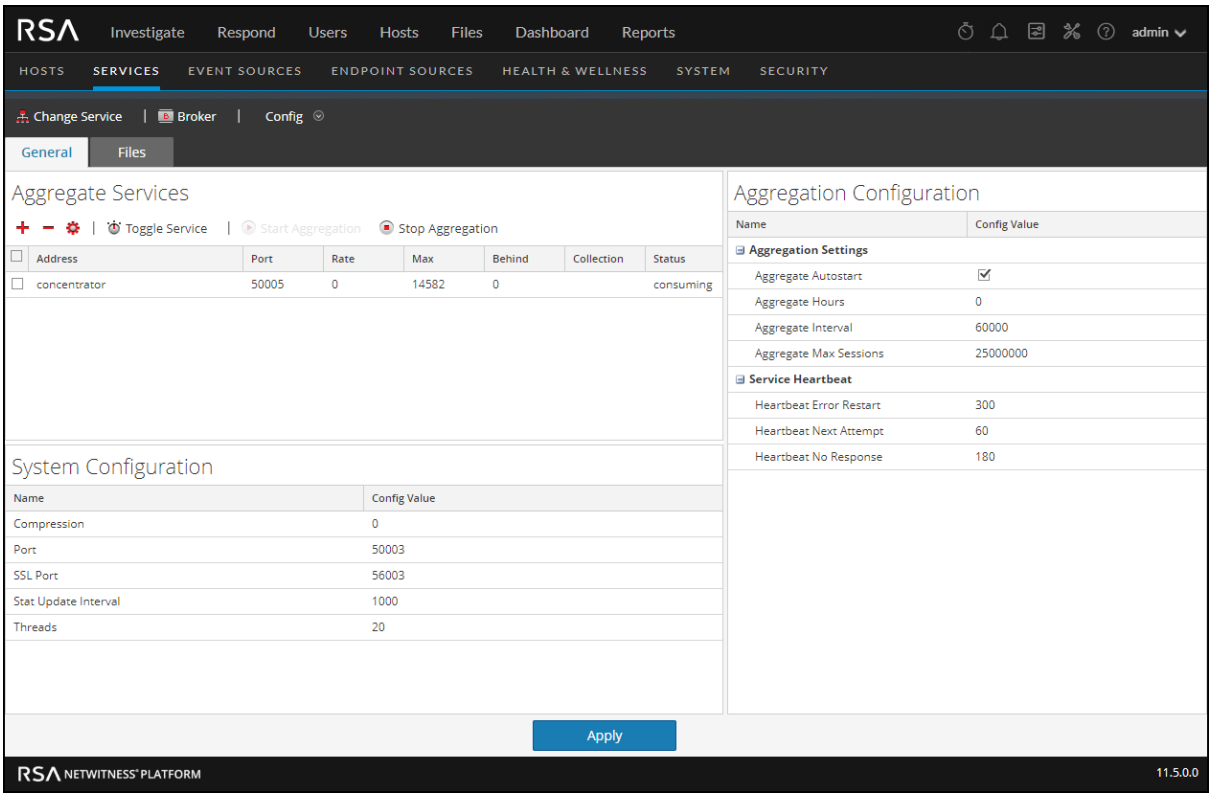


In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

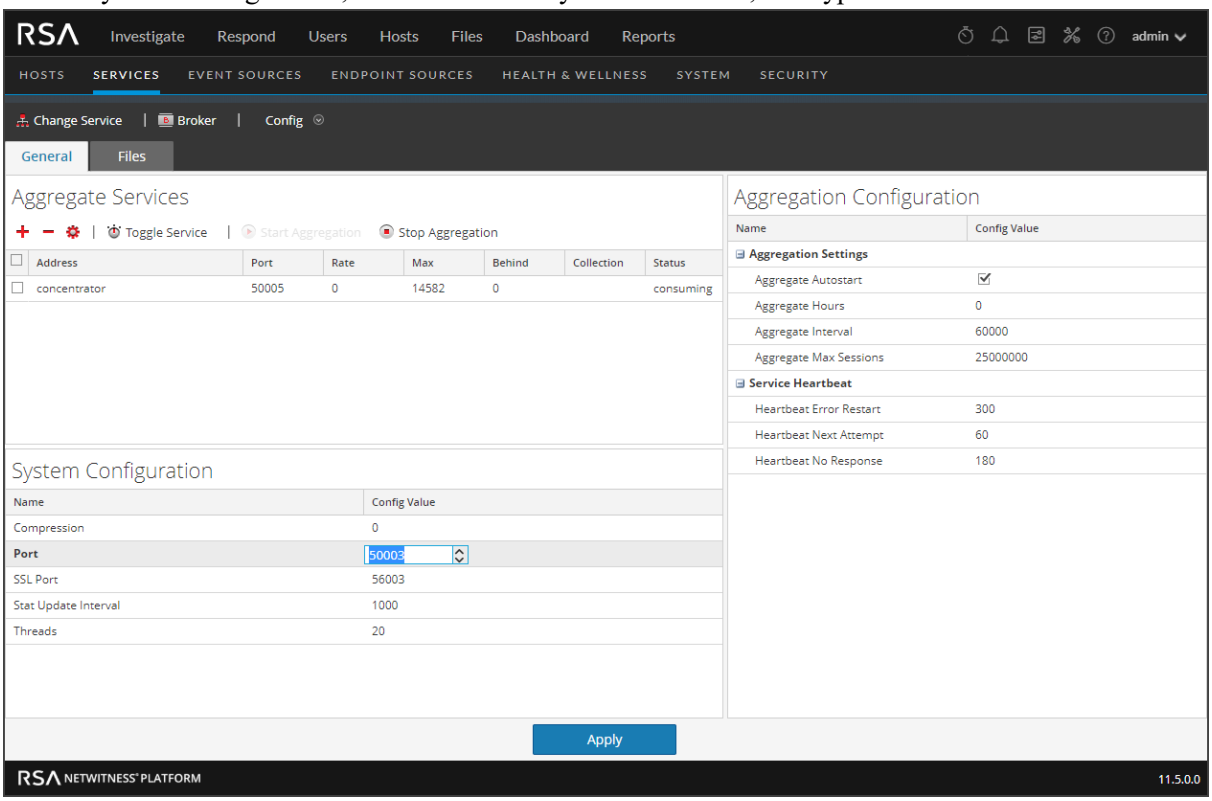
### To edit system configuration parameters for a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

   The Services Config view for the selected service is displayed.



3. Under System Configuration, click a field that you want to edit, and type a new value.

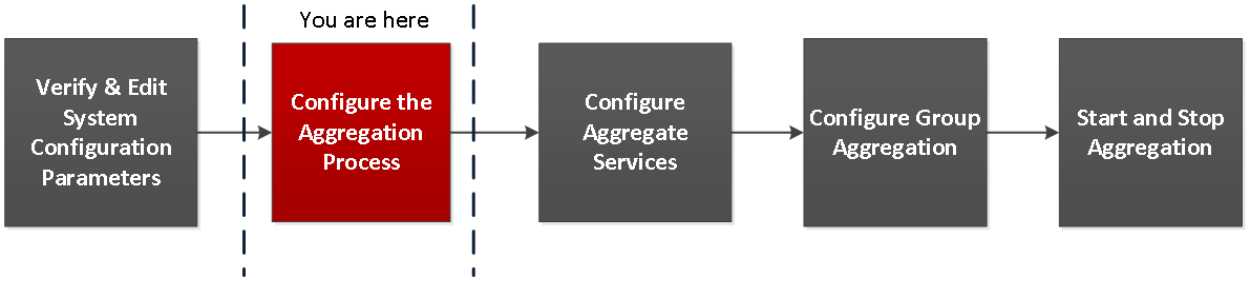


4. When finished editing, click **Apply**.

# Step 2. Configure the Aggregation Process

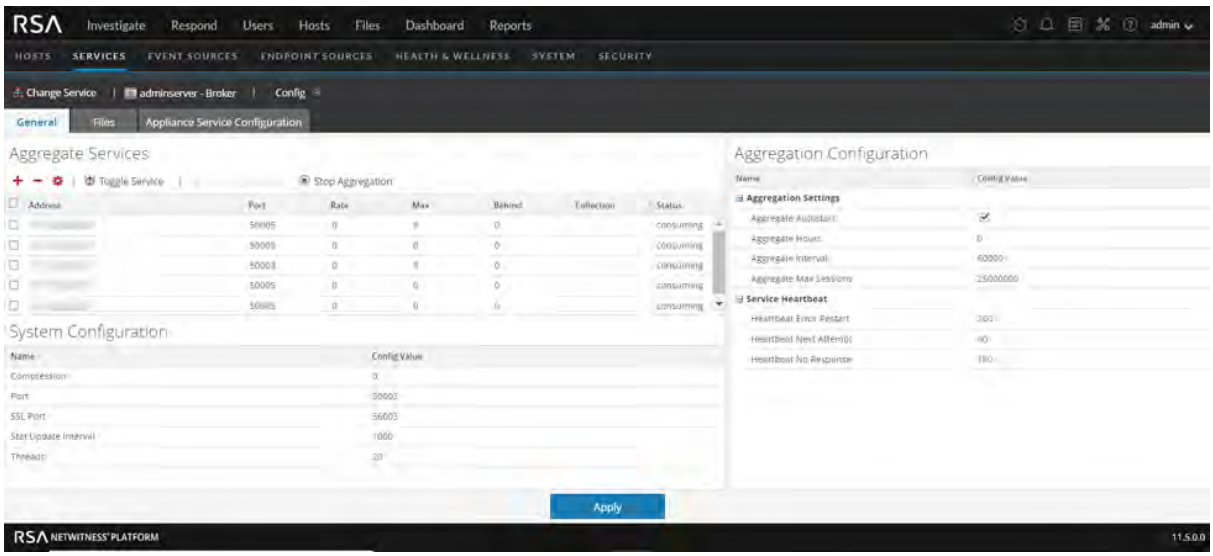
Configuring the aggregation process for a Broker or Concentrator includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

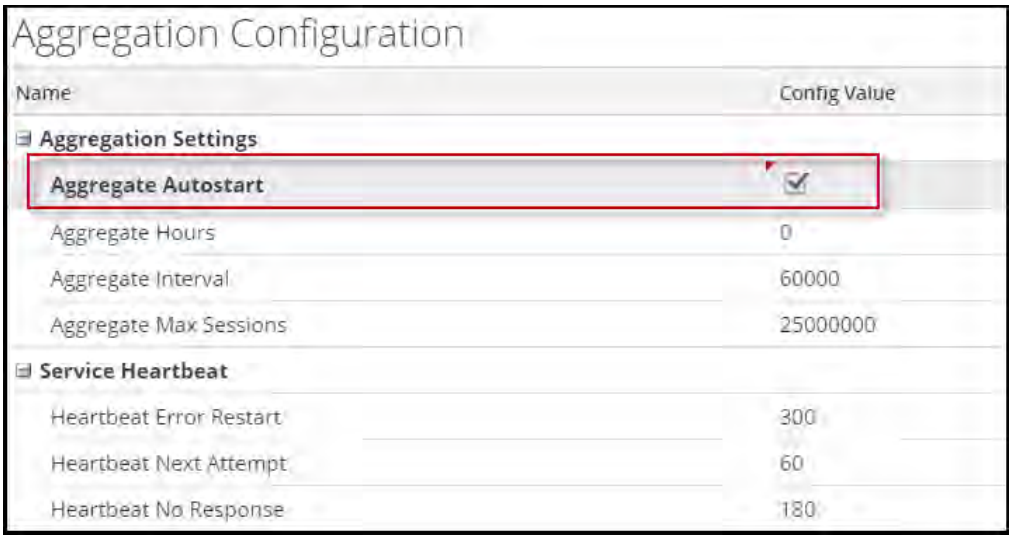


### To configure the aggregation process on a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.



3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.



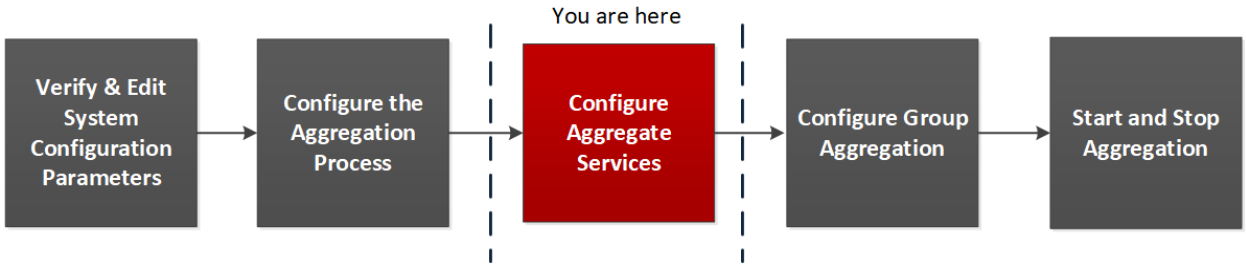
4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

# Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:

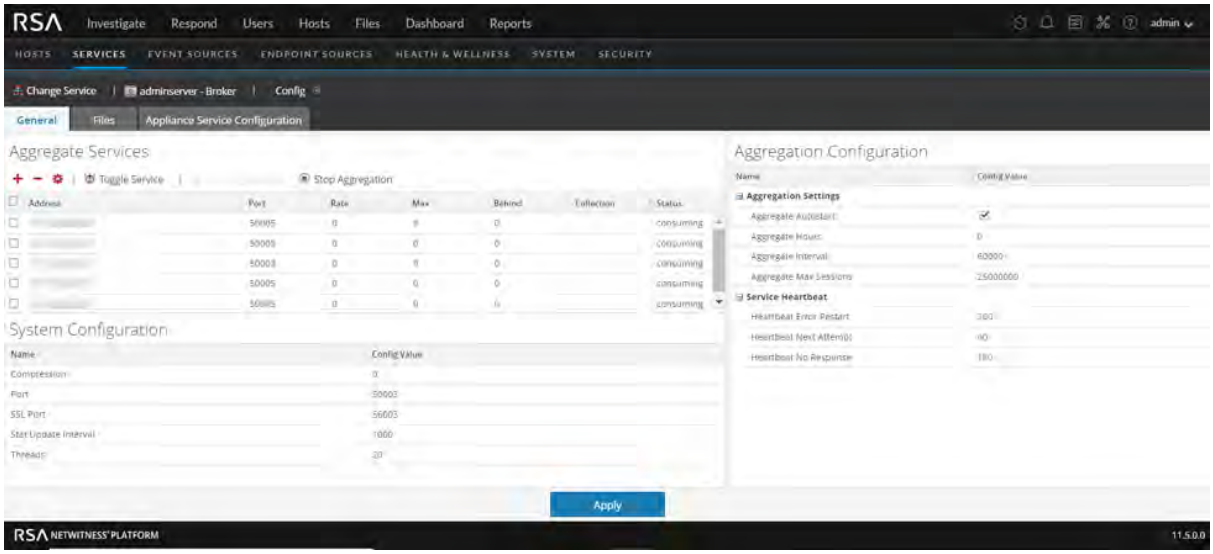
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



### To configure aggregate services to a Broker or Concentrator:

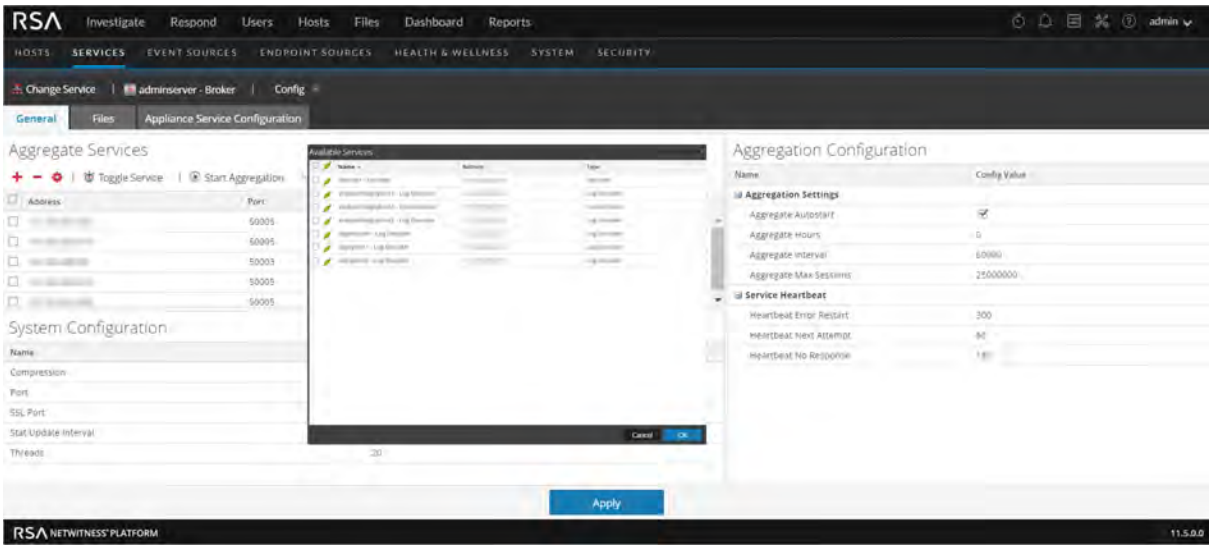
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

   The Services Config view for the selected service is displayed.



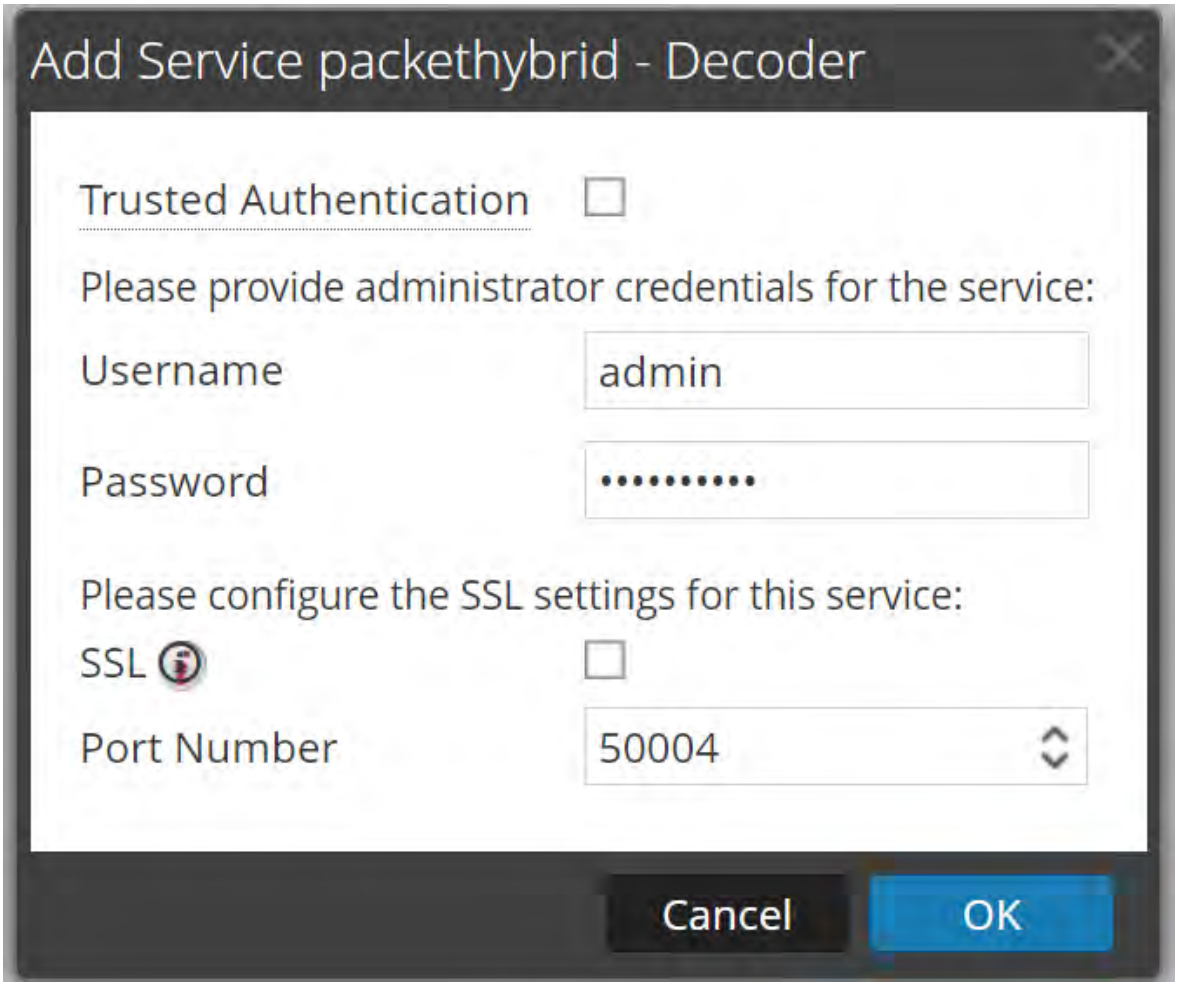
3. Click in the **Aggregate Services** toolbar.

   The Available Services dialog is displayed.

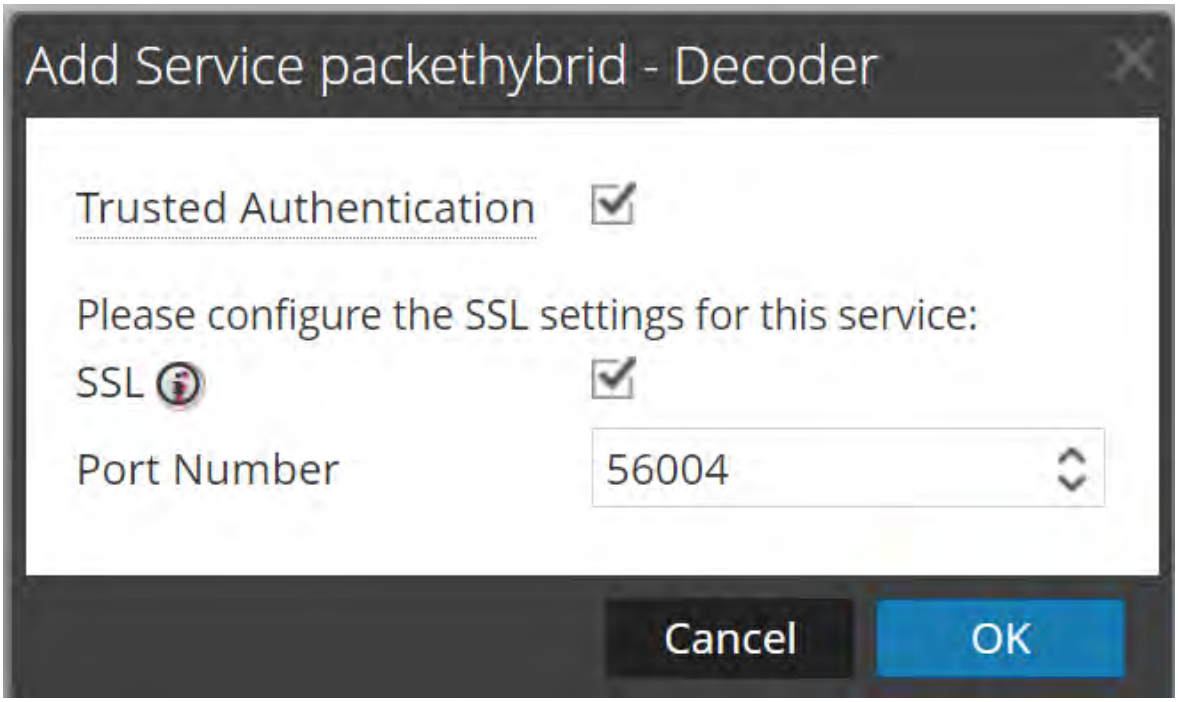


4. Select one or more services to be added and click **OK**.
5. Use one of the following ways to add a service for aggregation:

- Use Password-Based Authentication. Enter the Administrator username and password. Click **OK**.



- Select **Trusted Authentication**. Click **OK**.



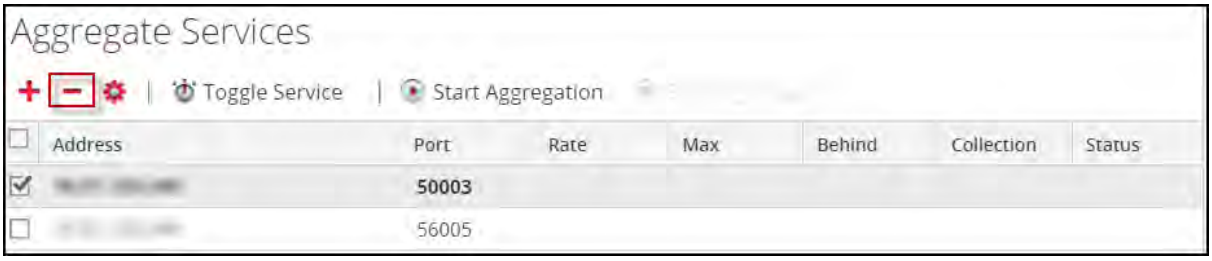
The added services are listed in the Aggregate Services list.

6. To save the changes, click **Apply**.

### To remove aggregate services from a Broker or Concentrator:

**Note:** This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.



The service is removed from Aggregate Services list.

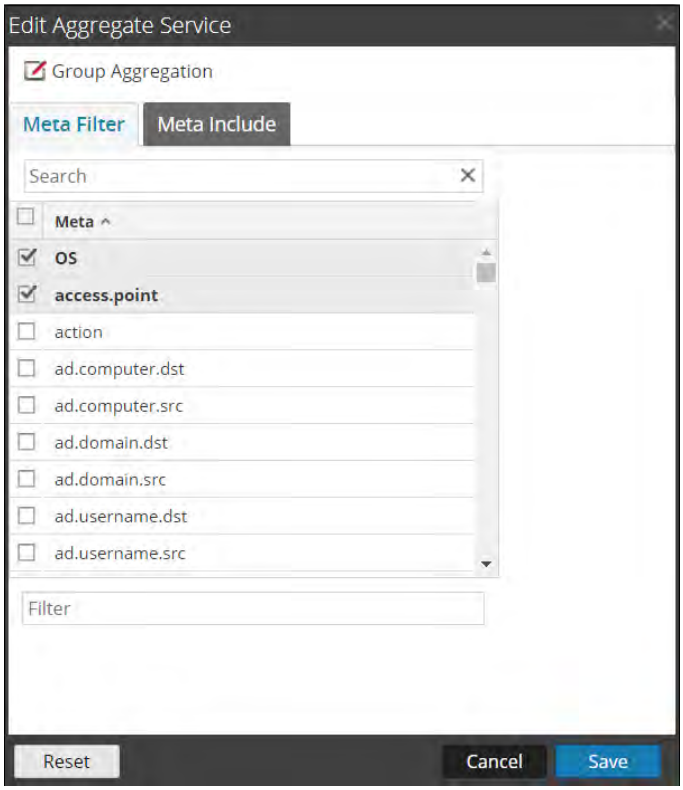
3. To save the change, click **Apply**.

### To edit aggregate services on a Concentrator:

**Note:** This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness, you must add it to this instance of NetWitness in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.



5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

### Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

**To toggle a service between online and offline:**

1. Select a service in the **Aggregate Services** list.
2. Click 
.

   The status is changed.

## Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

### RSA Group Aggregation Deployment Recommendations

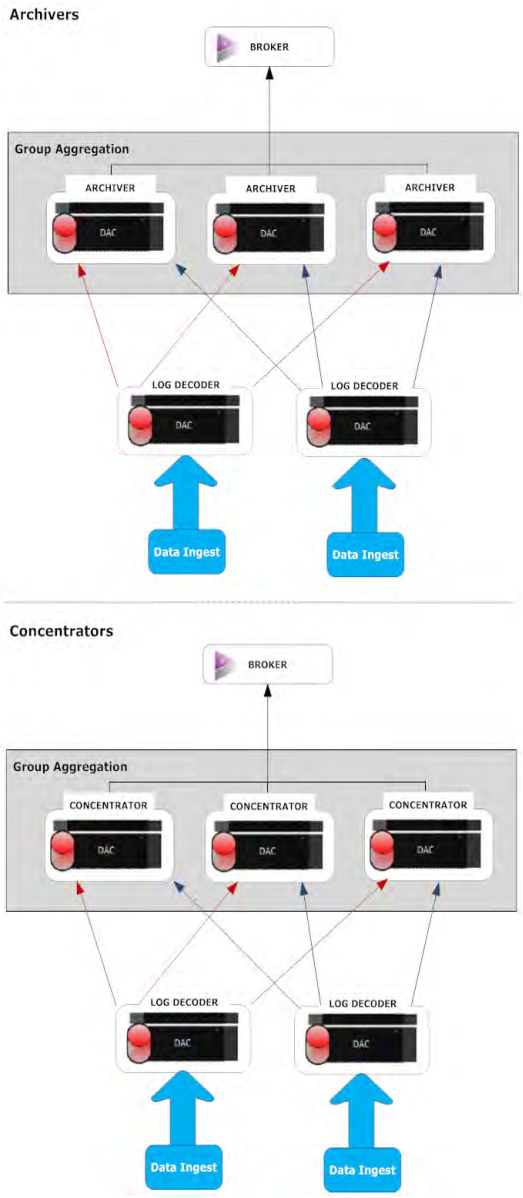
RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

### Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.



You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.

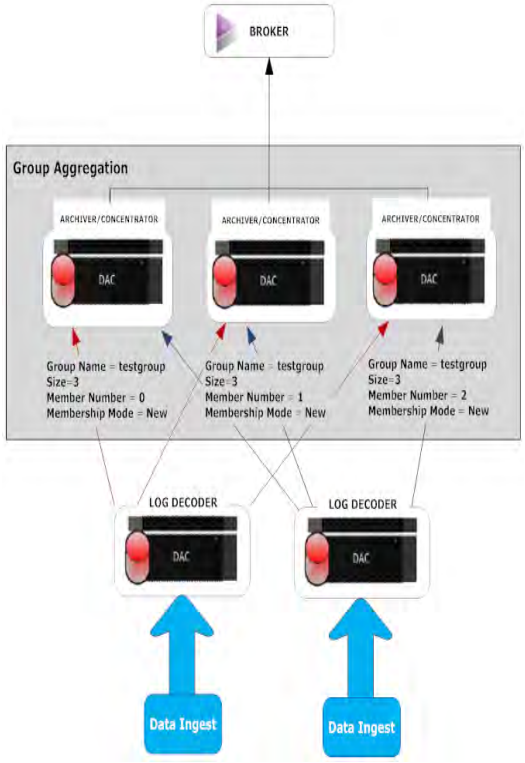
| Archiver 0 or Concentrator 0 | Archiver 1 or Concentrator 1 |
|---|---|
| 1 - 9,999 | 10,000 - 19,999 |
| 20,000 - 29,999 | 30,000 - 39,999 |
| 40,000 - 49,999 | 50,000 - 59,999 |

## Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

### Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



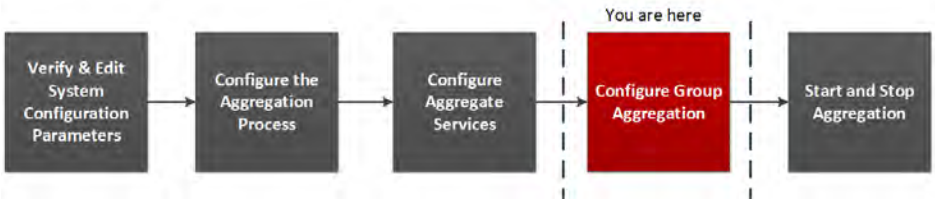
Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

| Parameter | Description |
|---|---|
| Group Name | It determines the group to which the Archiver or Concentrator belongs.<br>You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name. |
| Size | It determines the number of Archiver or Concentrator services in the aggregation group. |
| Member Number | It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group.<br>For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1. |
| Membership Mode | There are two membership modes:<br>• **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service.<br>• **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from. |

**Note:** The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

## Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.



Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

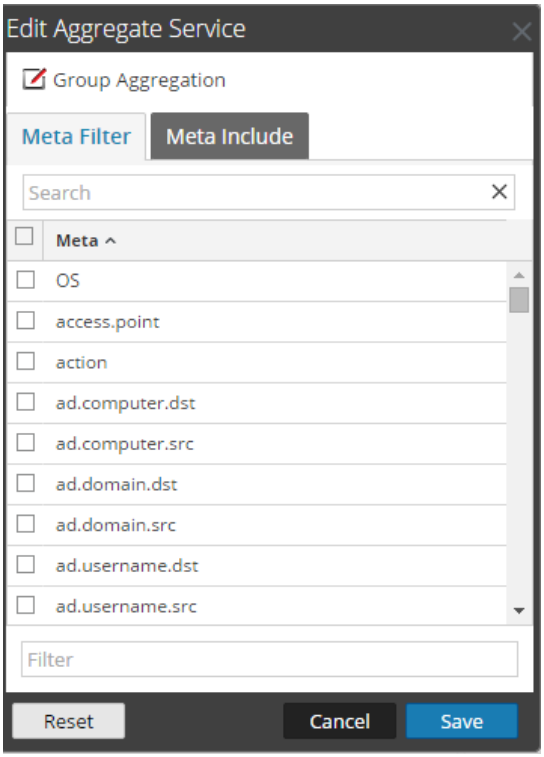
a. Go to **(Admin) > Services**.

b. Select the Archiver or Concentrator service, and select > **View** > **Config**.
The Service Config view of the Archiver or Concentrator is displayed.

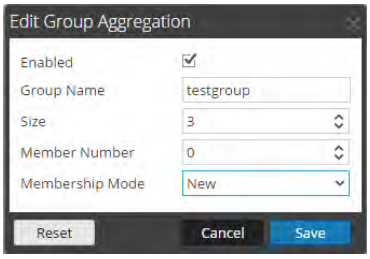
c. In the **Aggregate Services** section, select **Log Decoder**.

d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

e. Click .
The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.
The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

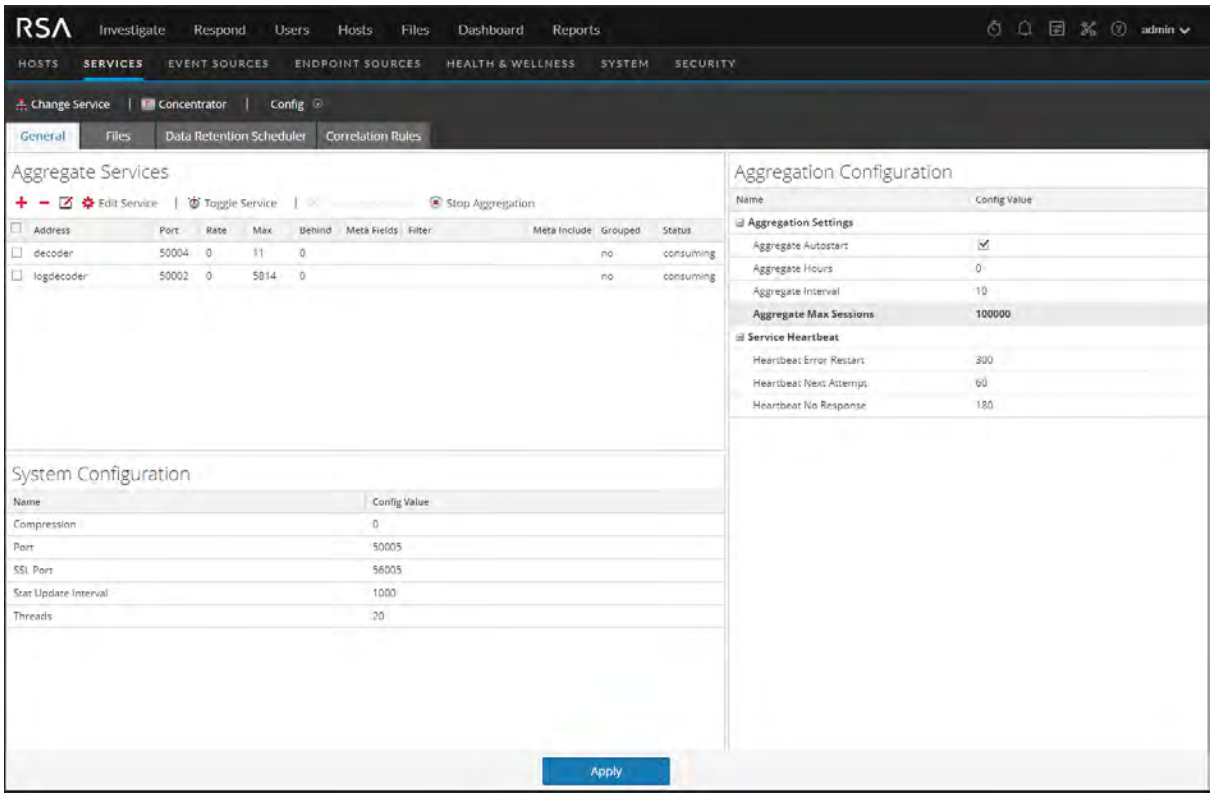
- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

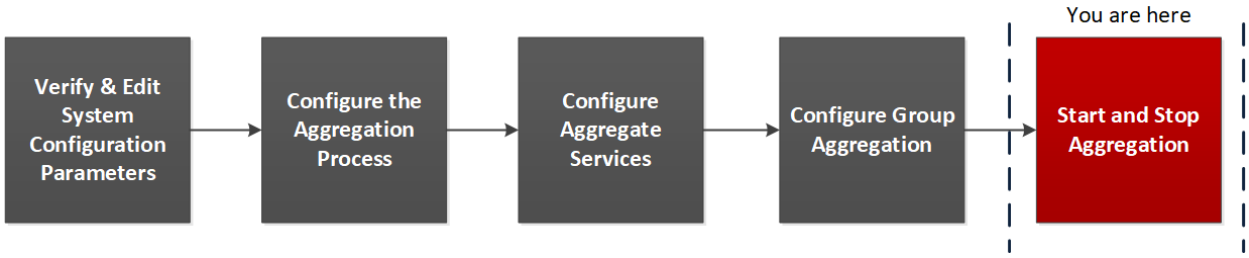
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.



# Step 5. Start and Stop Aggregation

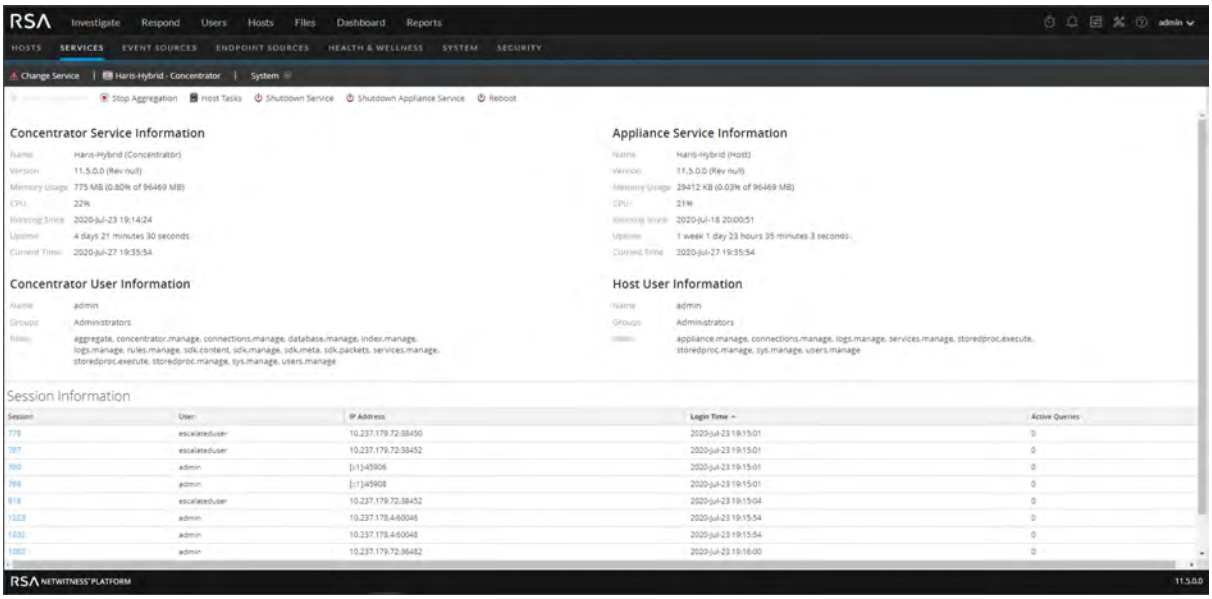
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



**Note:** The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate autostart is enabled, as well as the size of a round of aggregation and time between rounds.

### To start and stop data aggregation in the services system view:

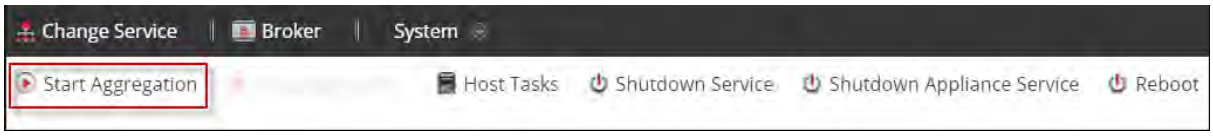
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

4. If you want the service to start aggregating data again, click **Start Aggregation**.

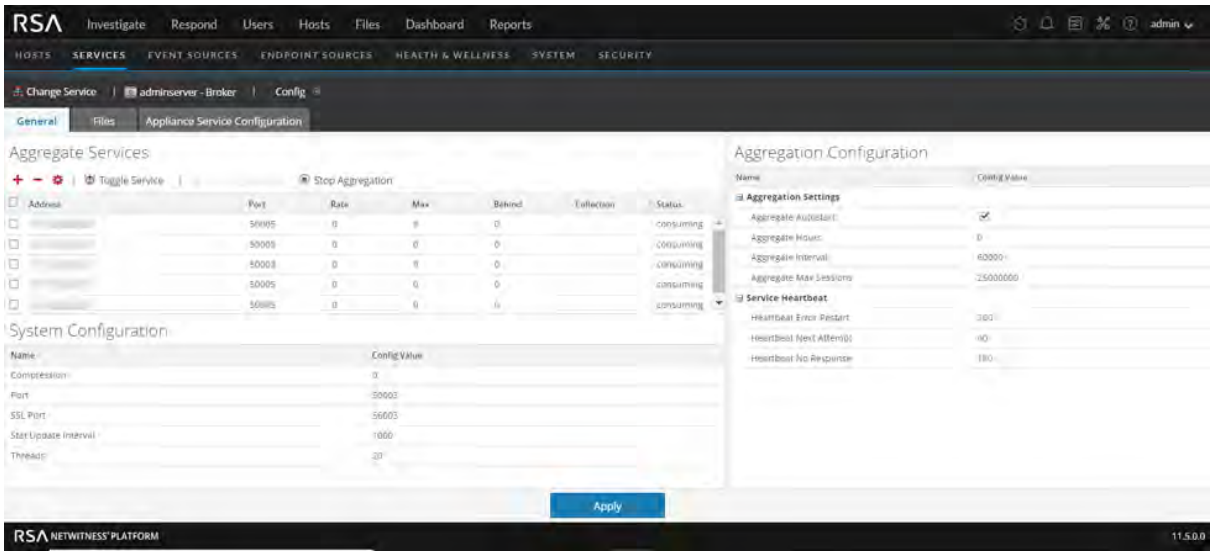
   You can now investigate the captured data in the Investigation module.



### To start and stop aggregation in the services config view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click Start Aggregation in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click  in the **Aggregate Services** toolbar.

   When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

# Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

## Related Topics

# Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

## What do you want to do?

| Role | I want to... | Refer to... |
|---|---|---|
| Administrator | Start and Stop aggregation<br>Add, edit, delete, and toggle an aggregate service | Aggregate Services Section |
| Administrator | Manage System Configuration | System Configuration Section |

## Related Topics

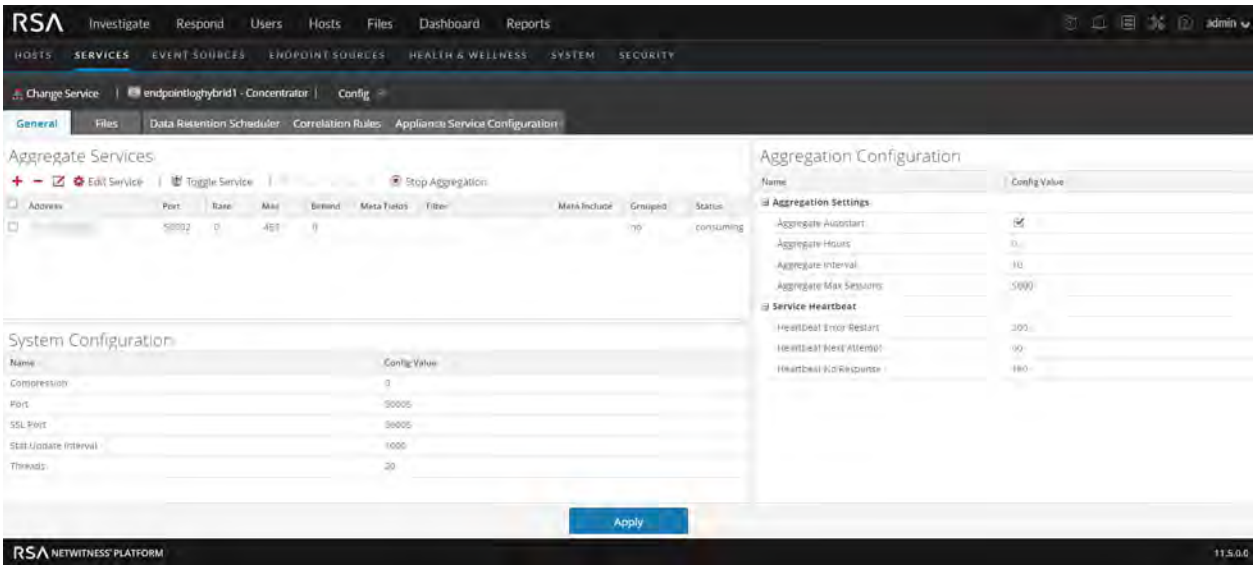
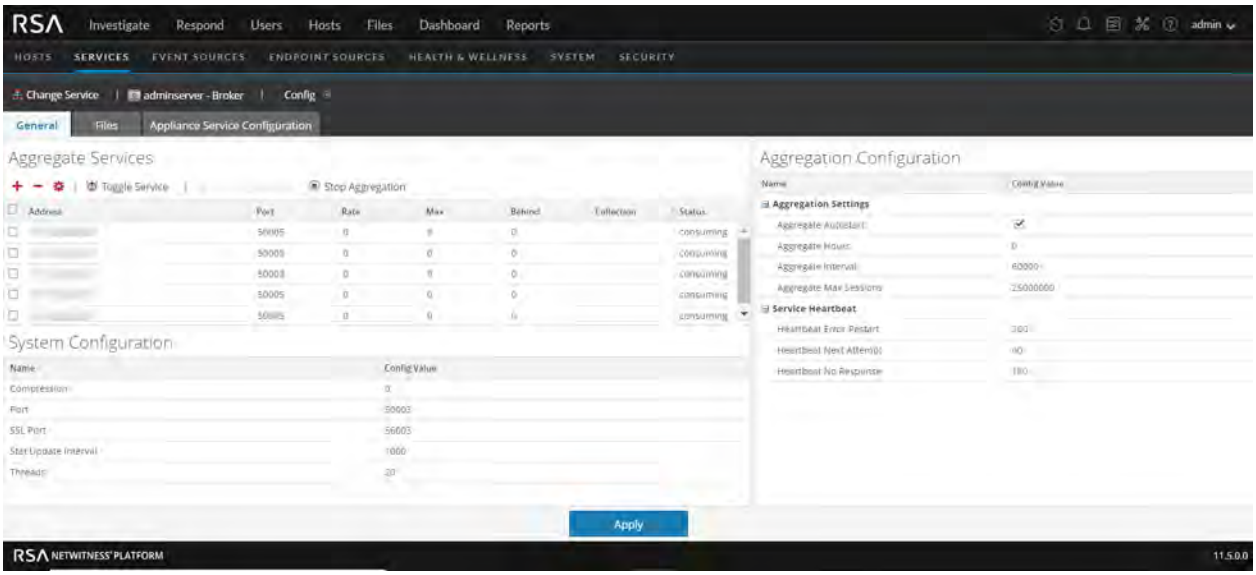
## General tab

This is an example of the General tab for a Concentrator.



This is an example of the General tab for a Broker.

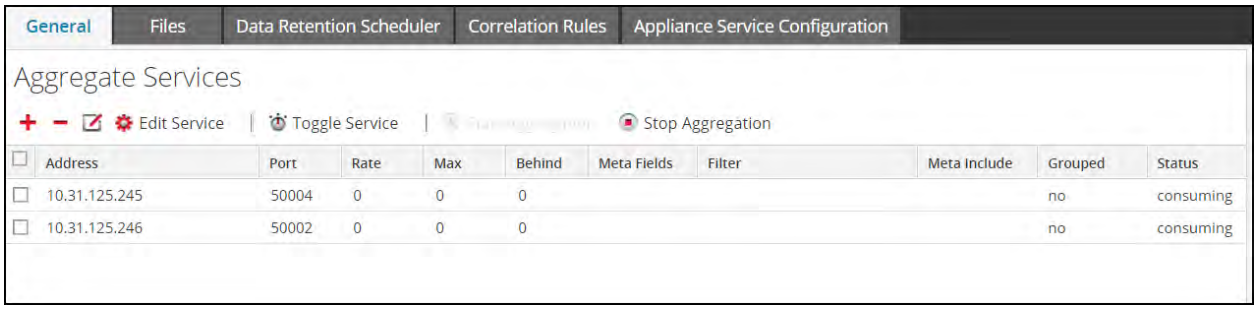


These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration
- Aggregation Configuration

## Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.



The Aggregate Services section toolbar offers these options.

| Option | Description |
|---|---|
| | Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service. |
|  | Removes the selected aggregate service. |
| | For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator. |
|  | Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator. |
|  | When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service. |
| | When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures. |
|  | Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation. |

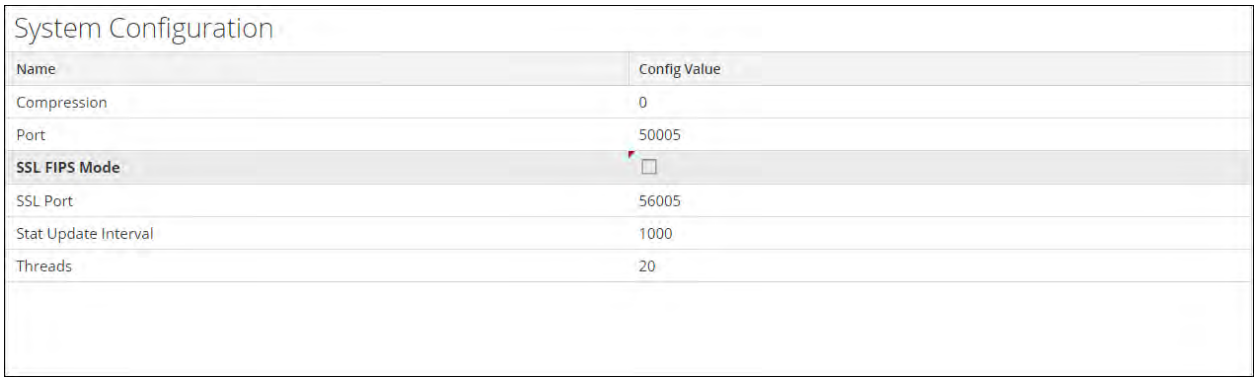
The Aggregate Services section list has these columns.

| Column | Description |
|---|---|
| **Address** | Lists the address of the service. |

| Column | Description |
|---|---|
| **Port** | Lists the port on which the service listens. The default ports are:<br>• 50001 for Log Collectors<br>• 50002 for Log Decoders<br>• 50003 for Brokers<br>• 50004 for Decoders<br>• 50005 for Concentrators<br>• 50007 for other services |
| **Rate** | Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**. |
| **Max** | Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture. |
| **Behind** | Lists the number of sessions on the service that need to be aggregated. |
| **Collection** | For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section. |
| **Meta Fields** | For Concentrators only, lists the types of metadata being consumed by the aggregate service. |
| **Filter** | For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists` |
| **Meta Include** | For Concentrators only, lists the number of types of meta included in the aggregate service. |
| **Grouped** | Whether or not the aggregate service is part of a group. |
| **Status** | Lists the current status of the service:<br>• online = available to provide data for consumption by the Broker or Concentrator<br>• offline = not available to provide data for consumption by the Broker or Concentrator<br>• consuming = providing data for consumption by the Broker or Concentrator |

## System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



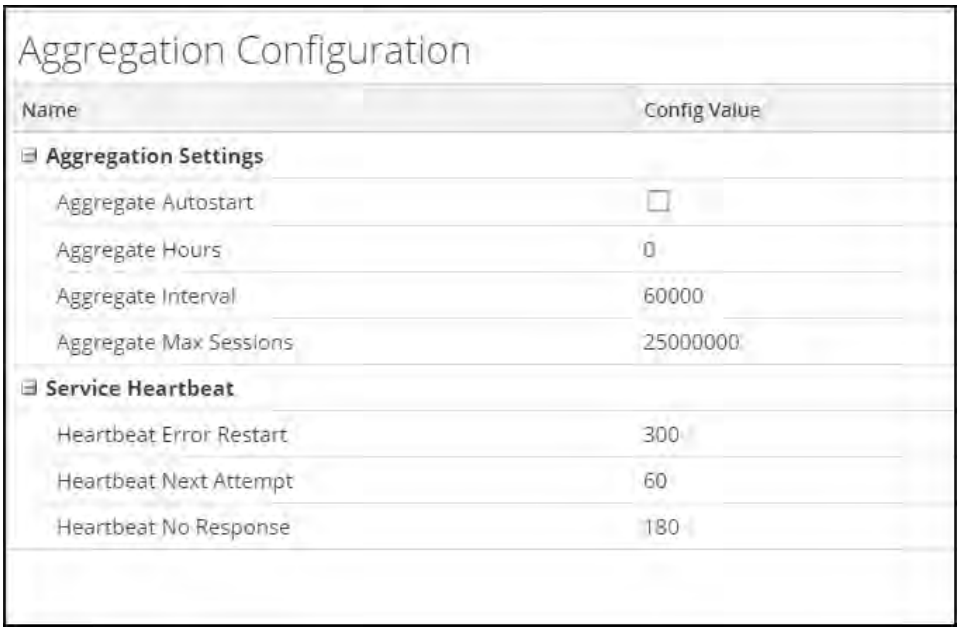
The System Configuration section has these parameters.

| Parameter | Description |
|---|---|
| **Compression** | The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**.<br>A change in value is effective immediately for all subsequent connections. |
| **Port** | The port on which the service listens. The default ports are:<br>• 50001 for Log Collectors<br>• 50002 for Log Decoders<br>• 50003 for Brokers<br>• 50004 for Decoders<br>• 50005 for Concentrators<br>• 50007 for other services |
| **SSL FIPS Mode** | When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**. |
| **SSL Port** | Indicates the SSL port. |
| **Stat Update Interval** | The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**.<br>A change in value is effective immediately. |
| **Threads** | The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**.<br>A change takes effect on service restart. |

## Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

**Caution:** Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.



The following table describes the aggregation settings

| Setting | Description |
|---|---|
| Aggregate Autostart | Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately. |
| Aggregate Hours | The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately.<br>• If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind.<br>• If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back.<br>For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values:<br>• With a value of 12, the Concentrator or Broker starts consuming where it left off.<br>• With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back. |
| Aggregate Interval | The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately. |
| Aggregate Max Sessions | The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart. |

## Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

| Setting | Description |
|---|---|
| Heartbeat Error Restart | After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect. |
| Heartbeat Next Attempt | After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately. |
| Heartbeat No Response | After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately. |

When editing parameters in the General tab, you must click **Apply** to save changes.

# Services System View - Broker or Concentrator

The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

## What do you want to do?

| Role | I want to... | Refer to... |
|---|---|---|
| Administrator | Start and Stop aggregation<br>Add, edit, delete, and toggle an aggregate service | Services System View - Broker or Concentrator |
| Administrator | Manage System Configuration | Services System View - Broker or Concentrator |

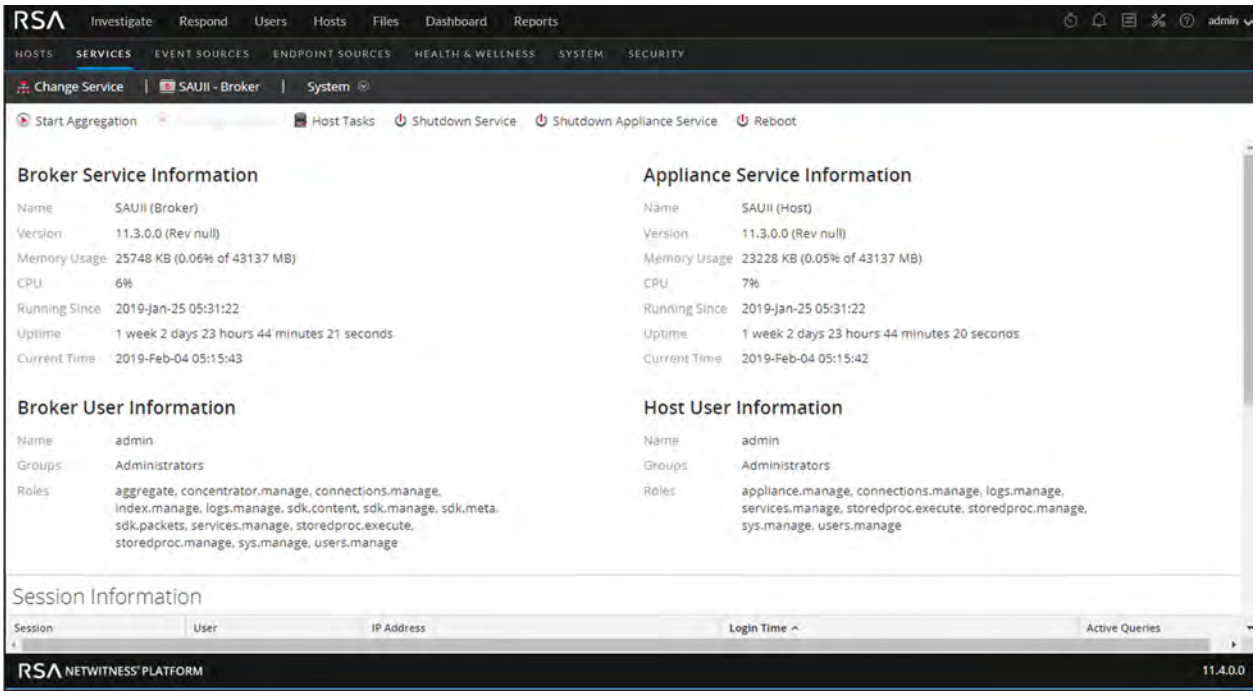
## Related Topics

- Broker and Concentrator Basics
- Broker and Concentrator Configuration

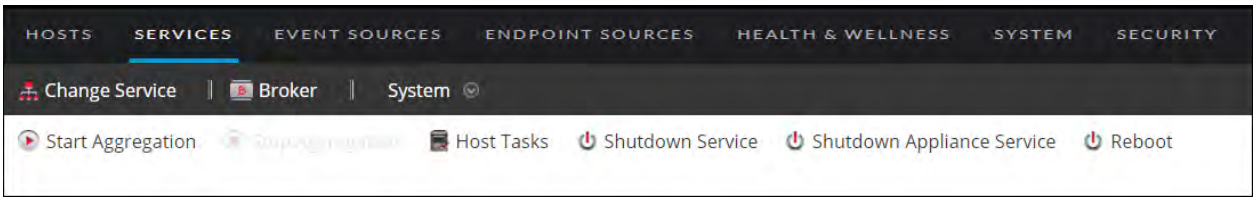
## Services System View

You can access this view by doing the following:

1. Go to **(Admin)** > **Services.**
2. Select a Concentrator or Broker, and select > **View** > **System**.
   The System view for the selected Concentrator or Broker is displayed.



The following figure is an example of the toolbar for a Broker or Concentrator.



Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

| Action | Description |
|---|---|
| Start Aggregation | Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data. |
| Stop Aggregation | Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring. |

# How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness and provide enriched data when configured.

**Lists**- Provides contextual information from a list of blacklists, whitelists, or watchlists.

**RSA Archer**- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

**Active Directory** - Provides contextual information of a user to help determine if the user is suspicious or not.

**RSA NetWitness Endpoint** - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

**Respond**- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

**File Reputation Server** - Provides contextual information for reputation status of files.

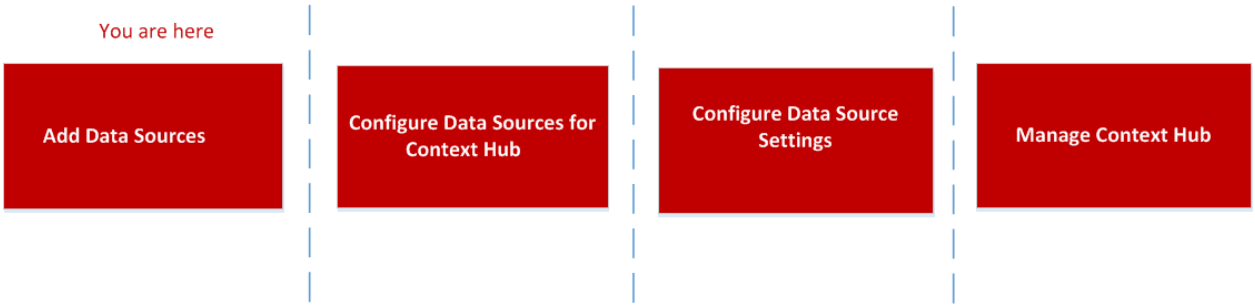
**STIX** - Provides contextual information on IP address, email address, domain, filename, URL, and file hash from STIX sources.

**REST API** - Provides contextual information for any accessible web service with an exposed REST API.

# Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **(Admin) > Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:



Context Hub service is pre-installed on primary ESA host, and automatically added to the NetWitness.

**Note:** You can have only one Context Hub service instance enabled in your NetWitness deployment. If there are multiple ESA service in NetWitness, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

# Configure Lists as a Data Source

Lists as a Data Source use the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful lists such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab. Additionally, all feeds (except STIX feeds ) that are created are converted to lists and displayed on the context lookup. If Context Hub is not configured or the service is down, then the feeds will be made available whenever Context Hub is up and running. For more information on creating feeds, see the *Live Services Management Guide*.

**Note:** When you create a feed, a list is automatically generated with the same name as the feed. If the list name already exists, then the name of the new list is suffixed with the number '2". For example if the existing feed name is test1.csv, then the new list will be named as test2.csv.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

**Note:** You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

## Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

**Caution:** If you are creating a Context Hub list for use as an enrichment source in ESA, the list name cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

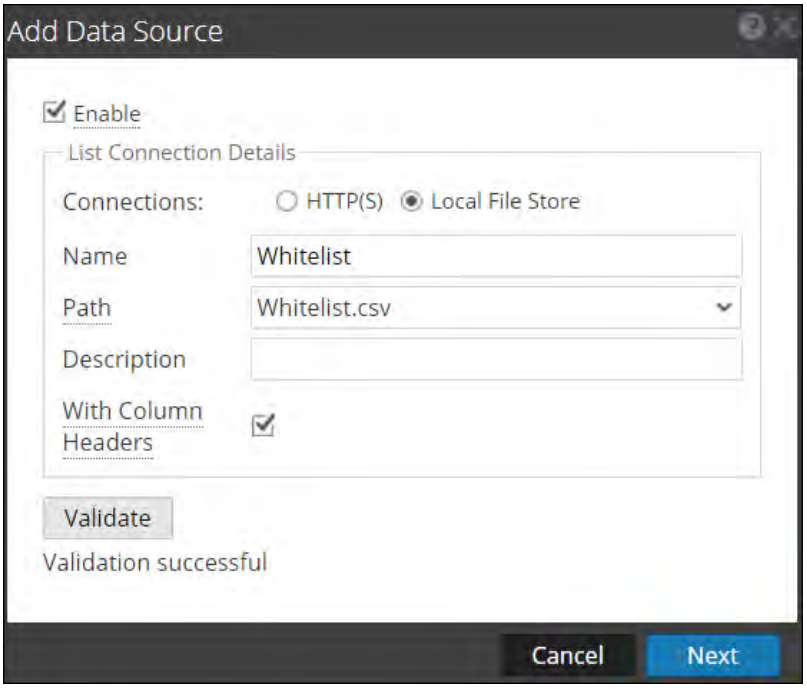
# Add List data source using Local File Store

### To add a List as a data source:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub.

**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

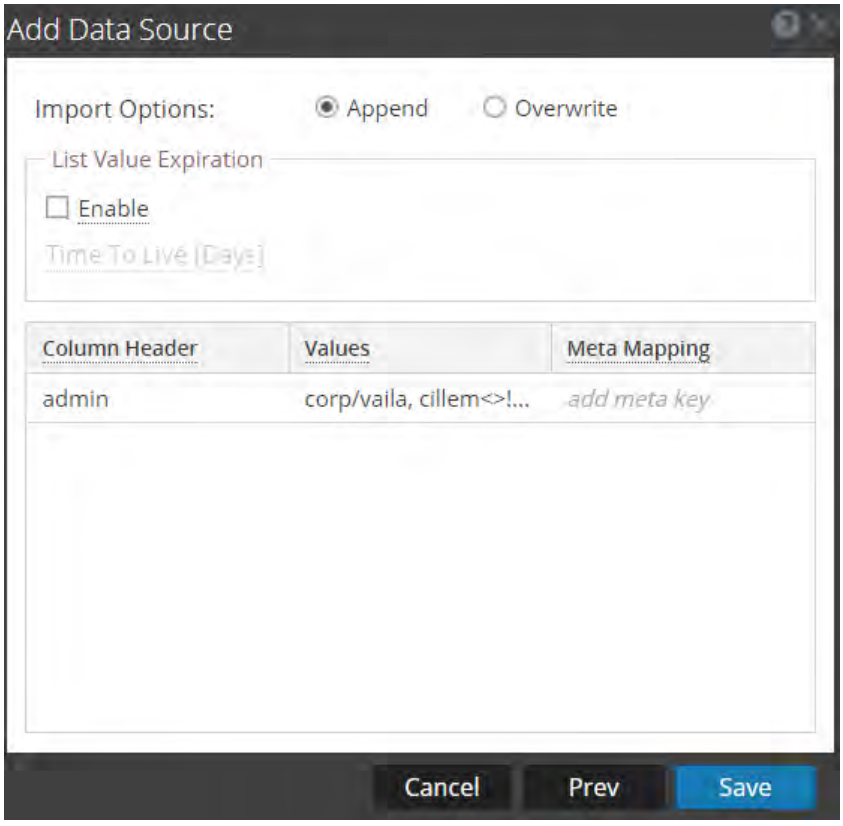
6. Select the **Local File Store** Connection Type.



7. Provide the following database connection details. Enter the following fields for Local File Store Connection Type:
   - **Name:** Provide a name for the list data source.
   - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
     A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
   - (Optional) **Description**: Add a description for the selected file.
   - **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.
8. Click **Validate**.

   If the validation fails, you cannot add the data source.
9. Click **Next**.

   The next dialog is displayed.



10. Select any one of the following options:
    - **Append** - Select this option to add the imported values to an existing list.
    - **Overwrite** - Select this option to replace the values in an existing list with the imported values.
11. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable**

checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.

12. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:
    - **Column Header**: Display headers of the CSV file which must be mapped to a meta type.
    - **Meta Mapping**: Maps a column header field to a meta type.
    - **Values**: Displays the first three values from the imported list.
13. Click **Save**.

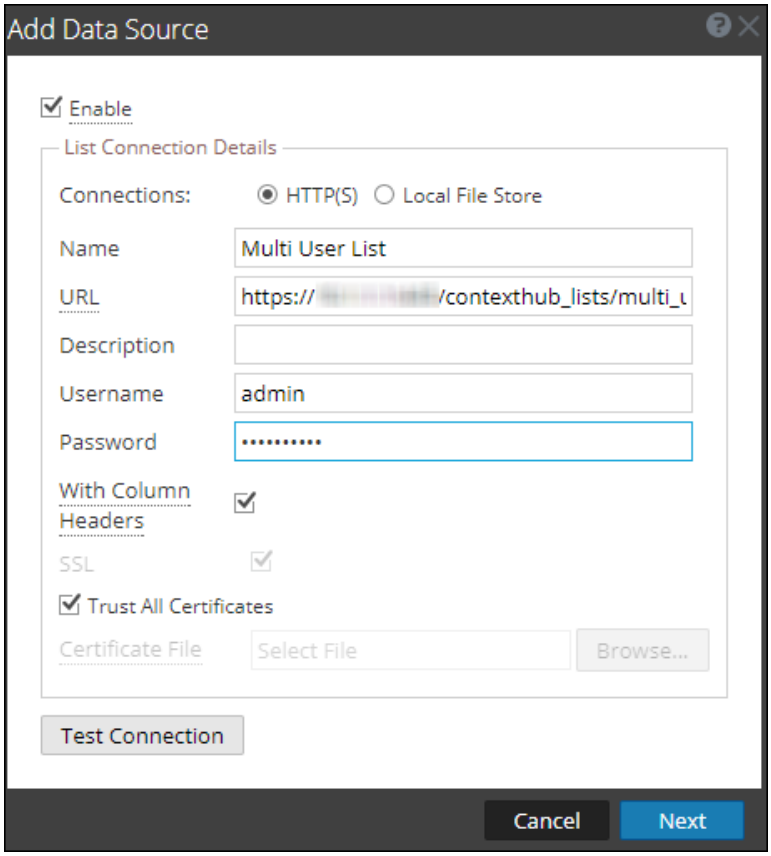
## Add List data source using HTTP(S)

To add List as a data source:

1. Select **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

6. Select the HTTP(S) Connection Type.

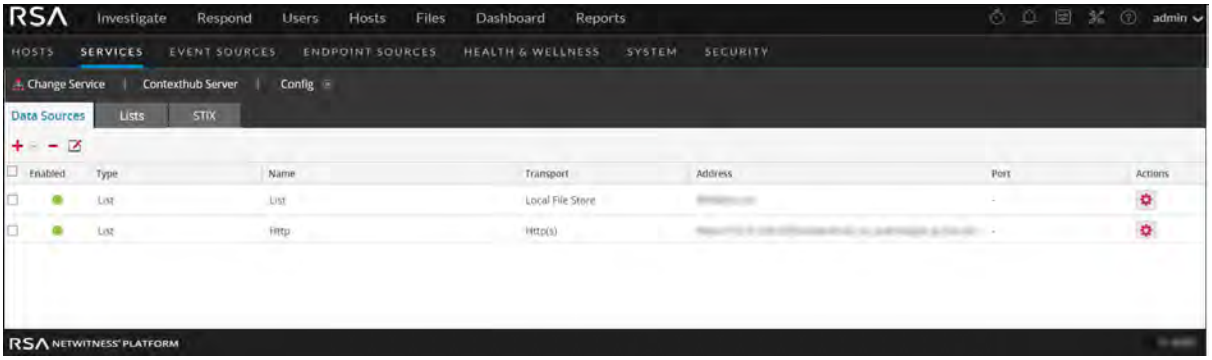


- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-address of the HTTP(S)server>:<Port on which the HTTP(S) server is hosted>/<Absolute path of CSV file>`. For example, `https://10.1.1.1:443/contexthub_lists/multi_user_list.csv`
  - (Optional) **Description**: Add a description for the selected file.
  - (Optional) **Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
  - (Optional) **Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
  - **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
  - **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.

- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP (S)server certificate for the connection to be successful.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save** to save the settings.

   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.



## Next Steps

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub.
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and *RSA NetWitness Investigate User Guide*.

# Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.

## Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Archer**.
   The **Add Data Source** dialog is displayed.

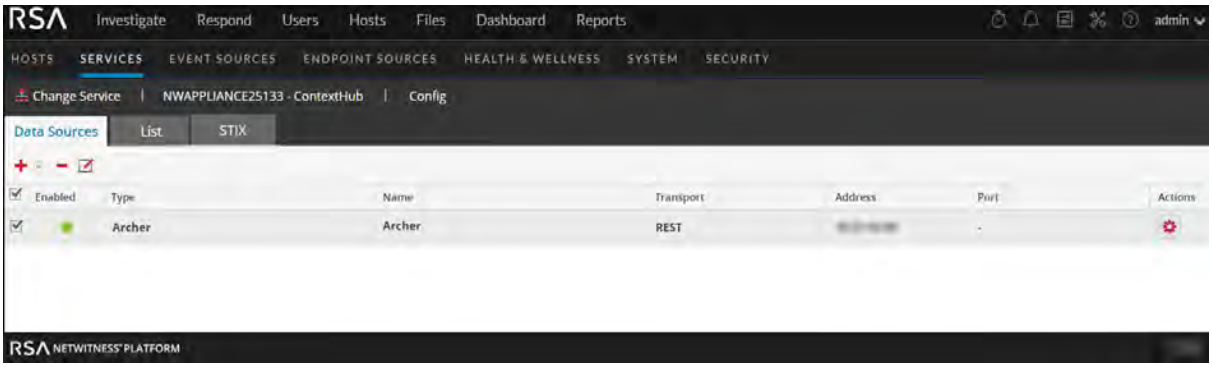
4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Archer server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An RSA Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the RSA Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the RSA Archer web address https://archer.company.com/**rsaarcher**/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.

   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *NetWitness Respond User Guide* and *Investigate User Guide*.

## Configure Archer Data Source

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

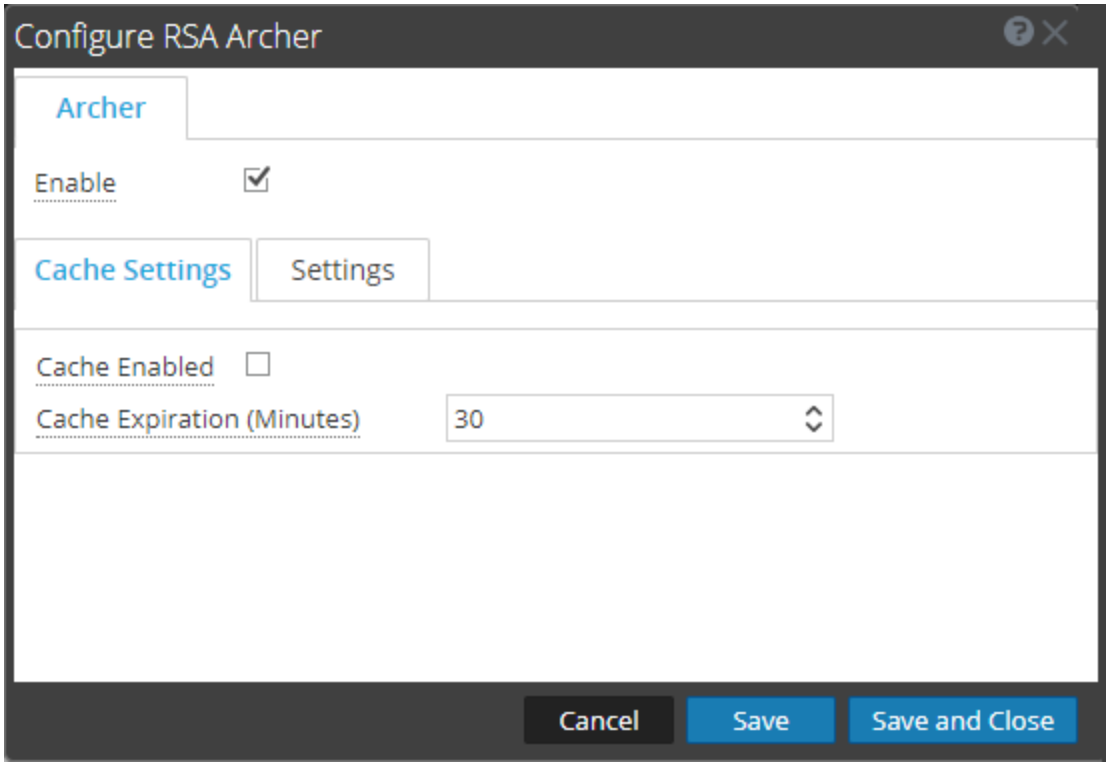
   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

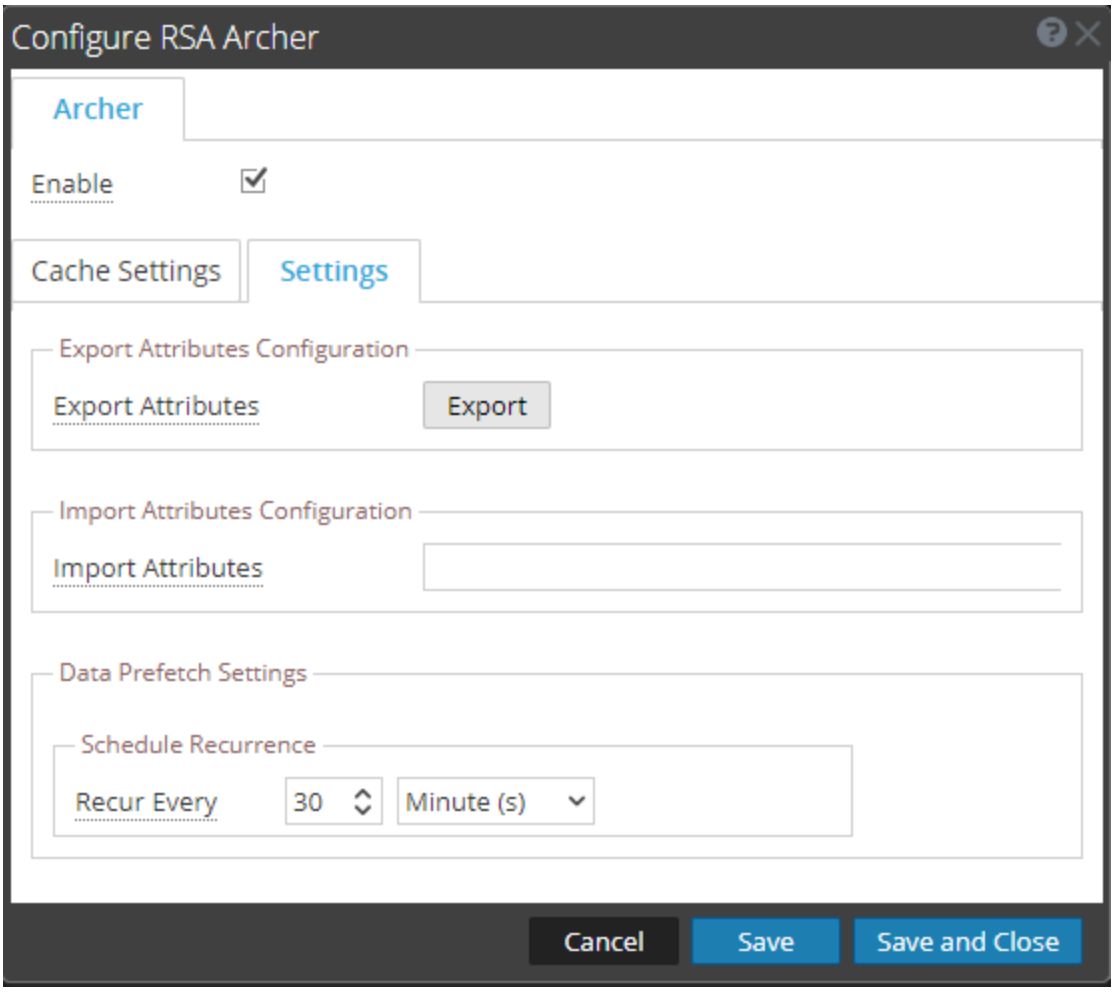
   The following screenshot is an example of the Configure RSA Archer dialog:



4. In the **Settings** tab. Configure the following fields:

| Field | Description |
|---|---|
| Enable | This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source. |
| Cache Settings | Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache.<br>Use this section to define the following cache settings for query lookup:<br>• **Cache Enabled**: By default, this checkbox is selected and the query response is cached.<br>• **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure. |

5. Click **Cache Settings**. Configure the following fields.



| Field | Description |
|---|---|
| Export Attributes Configuration | In **Settings**, **Export Attributes Configuration**, click **Export** to export the Archer Attributes Configuration. These are the attributes visible in Context Lookup while viewing Archer details for a IP, Host, or Mac. A JSON configuration file gets downloaded and the order of the attributes in sync with the listing in the context panel is maintained in the JSON file. |
| Import Attributes Configuration | If you want to update or edit the configuration settings, in **Settings**, **Import Attributes Configuration**, click **Browse**. Select the JSON file containing the configuration attributes.<br>The attributes appear in the Context Lookup panel when a user views the context, in the order which they were imported.<br>**Note:** You can backup the previous attributes before importing any changes made to existing attributes. |
| Data Prefetch Settings | In **Settings**, **Data Prefetch Settings** helps prefetch the data. Configure the **Schedule Recurrence** to provide data faster when you hover over the intended entity in Respond. |
| Schedule Recurrence | In the **Recur Every** field, enter a value or use the drop-down to configure the recurrence for prefetch. The default time duration can be selected from the drop-down list for configuring the duration of recurrence. Available values are minutes, hours, days, or weeks. |

6. Click any one of the following options:

- **Cancel** - select this option to cancel the changes.
- **Save** - select this option to save the changes.
- **Save and Close** - select this option to save and close the dialog.

**Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

# Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

## Prerequisites

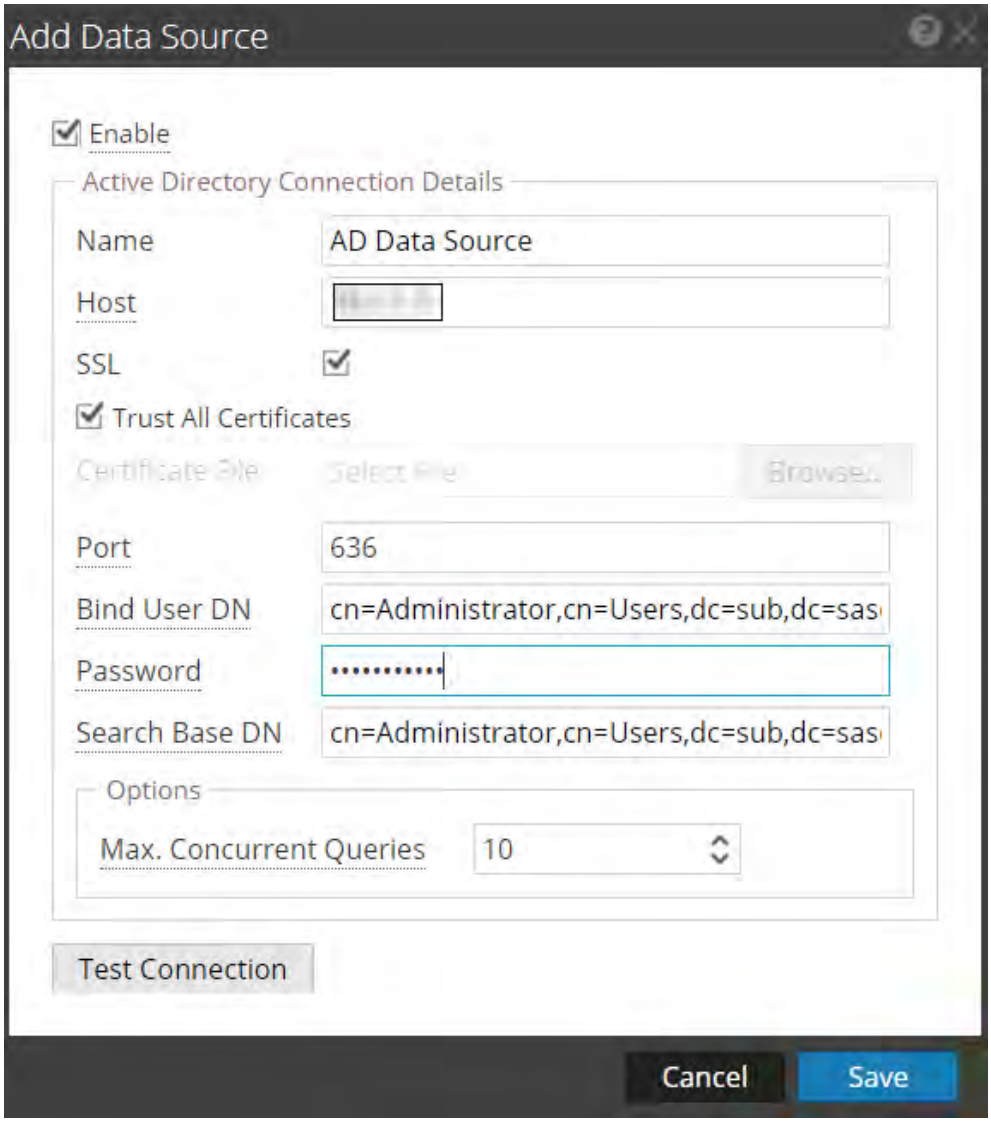
Before you configure Active Directory data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click **> View> Config**.
   The Services Config View of Context Hub is displayed.

3. In the **Data Sources** tab, click + **> Active Directory**.
   The **Add Data Source** dialog is displayed.



You need to configure the Active Directory schema to replicate the following attributes to view the data in the Respond page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

4. Provide the following database connection details:

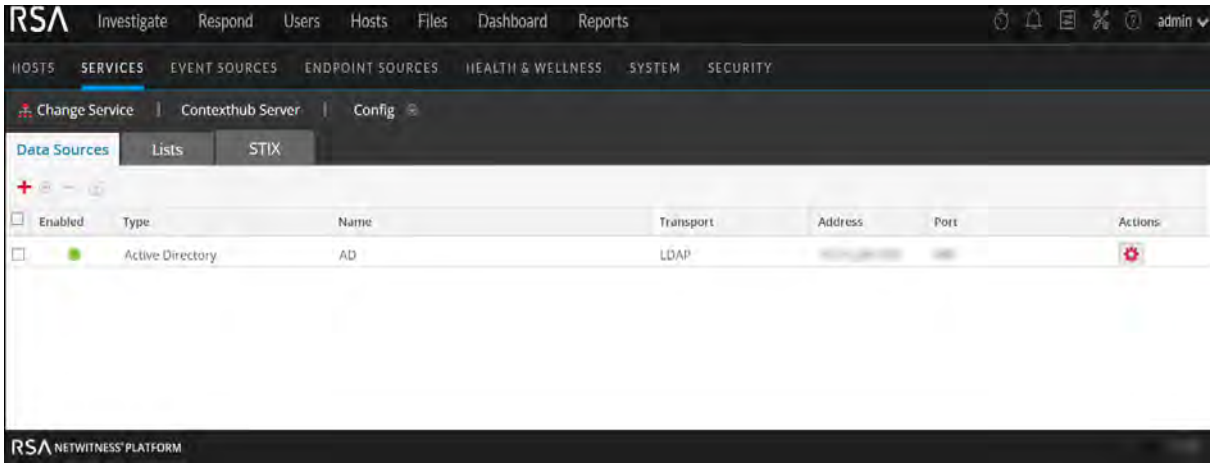
- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields.
  - **Name:** Enter a name for the AD data source.
  - **Host:** Enter the host name or IP address of the AD.
  - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
  - **Port:** The default port is 636 with SSL and 389 without SSL.
    If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).

    Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

    Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
  - **Password:** Enter password of the user DN used to bind with AD.
  - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
  - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is displayed

in the **Data Sources** tab.



After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

## Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

# Configure NetWitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.

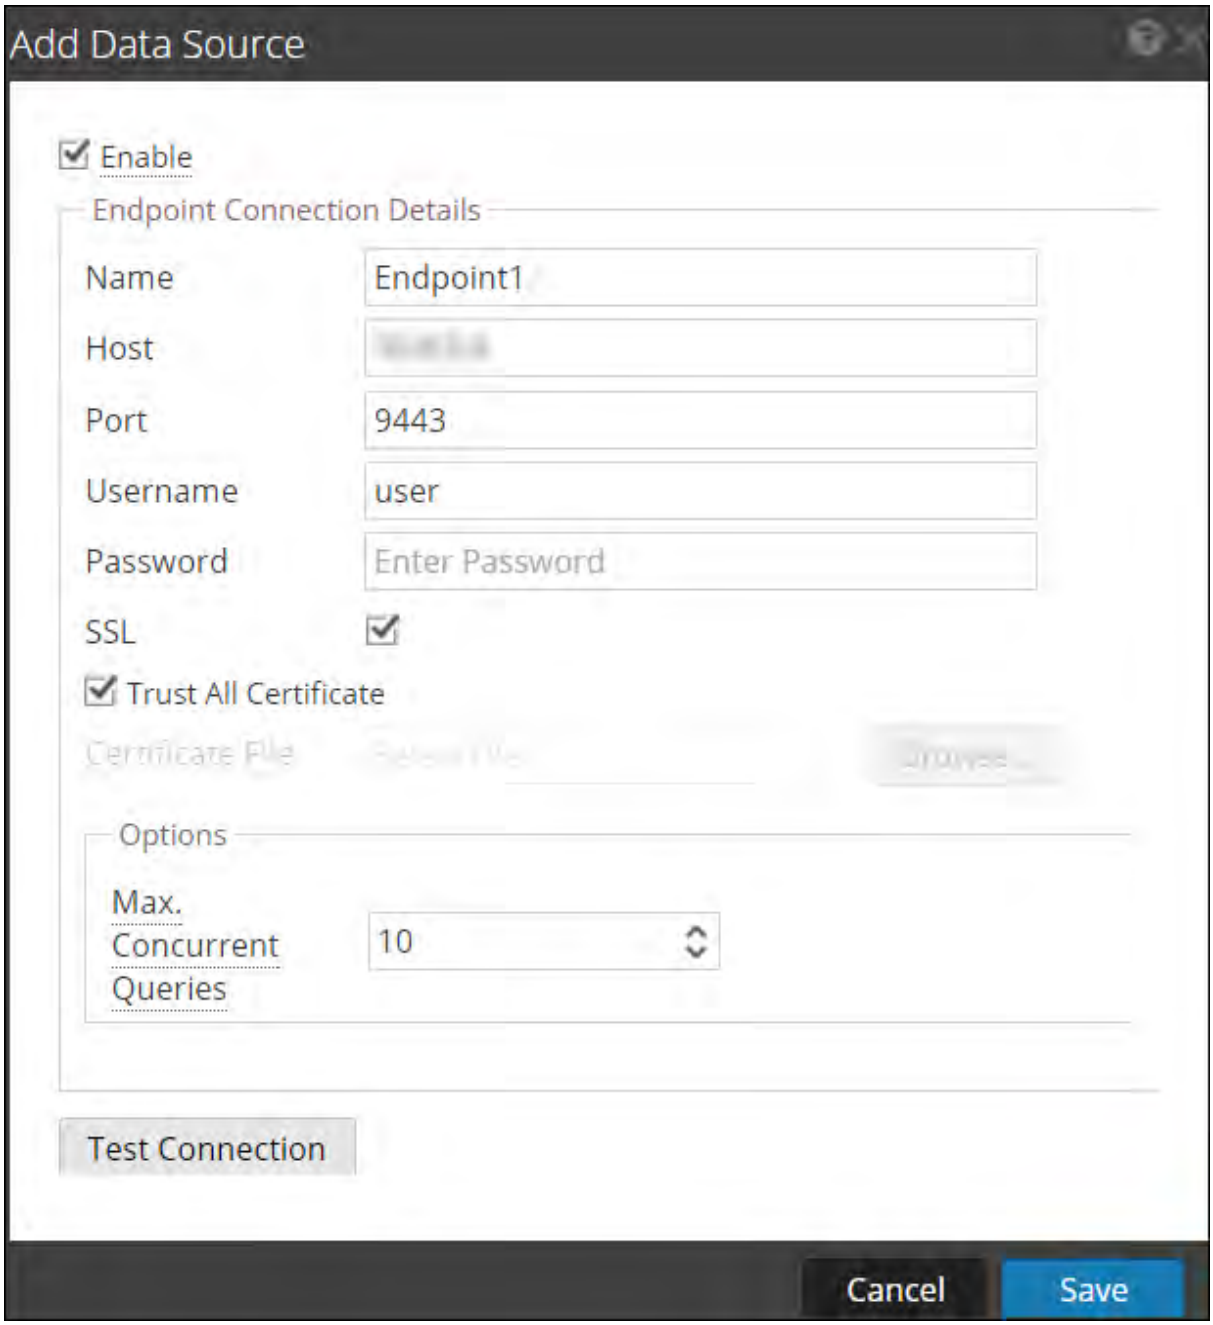
## Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in **(Admin) > Services**.view of NetWitness.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at NetWitness Community.

To add NetWitness Endpoint as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Endpoint**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:

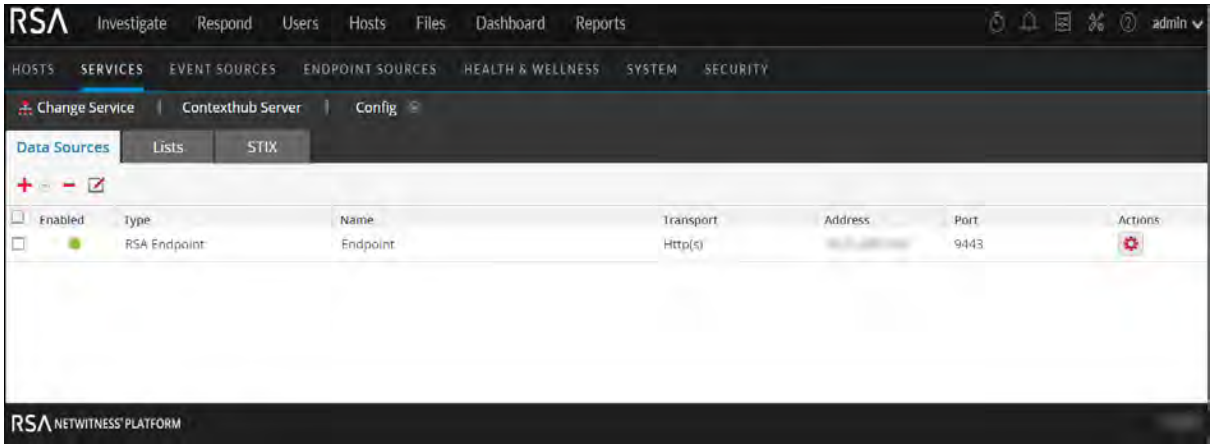
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting** – This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

   **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

   - Enter the following fields:
     - **Name**: Enter a name for NetWitness Endpoint data source.
     - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
     - **Port**: The default port is 9443.
     - **SSL**: Select SSL if you want NetWitness to communicate with the host using SSL. This is enabled by default.
     - **Username**: Enter the NetWitness Endpoint API Server username.
     - **Password**: Enter the NetWitness Endpoint API Server password.
     - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
     - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.

6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



## Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*

# Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.

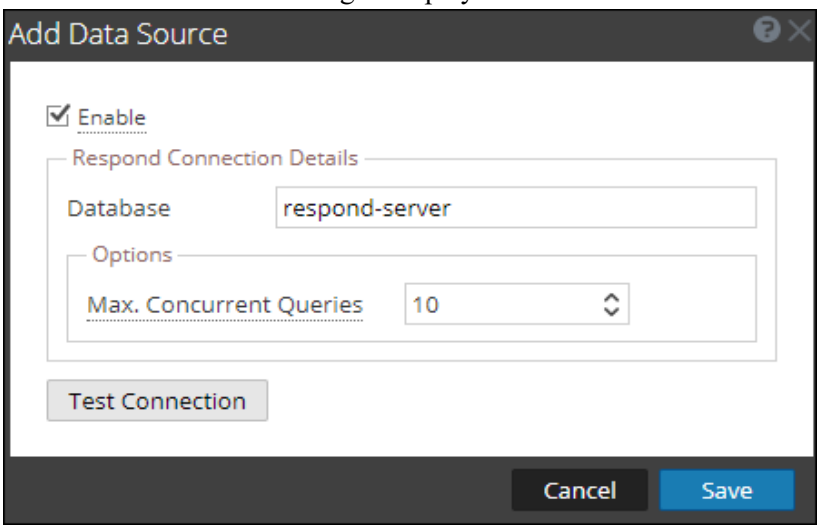
## Prerequisites

Before you configure Respond data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **(Admin) Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **Respond**.
   The **Add Data Source** dialog is displayed.

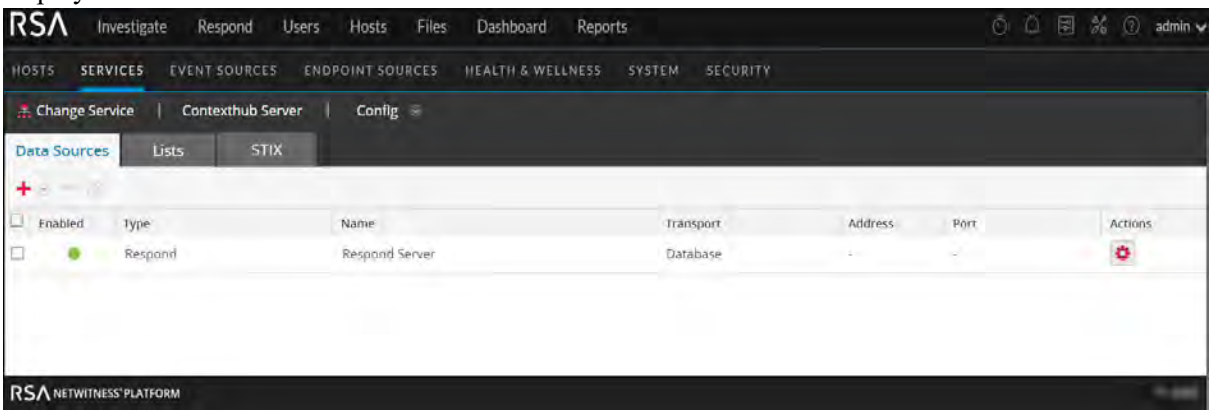


The required fields to configure the Respond data source are automatically updated.

You can enable or disable Context Highlighting. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source is displayed in the **Data Sources** tab.



After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

## Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*.

# Configure File Reputation Server as a Data Source

**File Reputation Server** provides analysts the opportunity to view reputation status of files. By default, File Reputation is enabled in Additional Live Services section.

If Context Hub service is configured, File Reputation Server is automatically added as data source for Context Hub.

## Prerequisites

Ensure that:

- Context Hub is enabled and the service is available in **(Admin) > Services** view of NetWitness.
- RSA Live Account is available.

**Note:** To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **File Reputation** is enabled in **Additional Live Services** section. Before setting up File Reputation data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. File Reputation is automatically added as a data source for context hub.

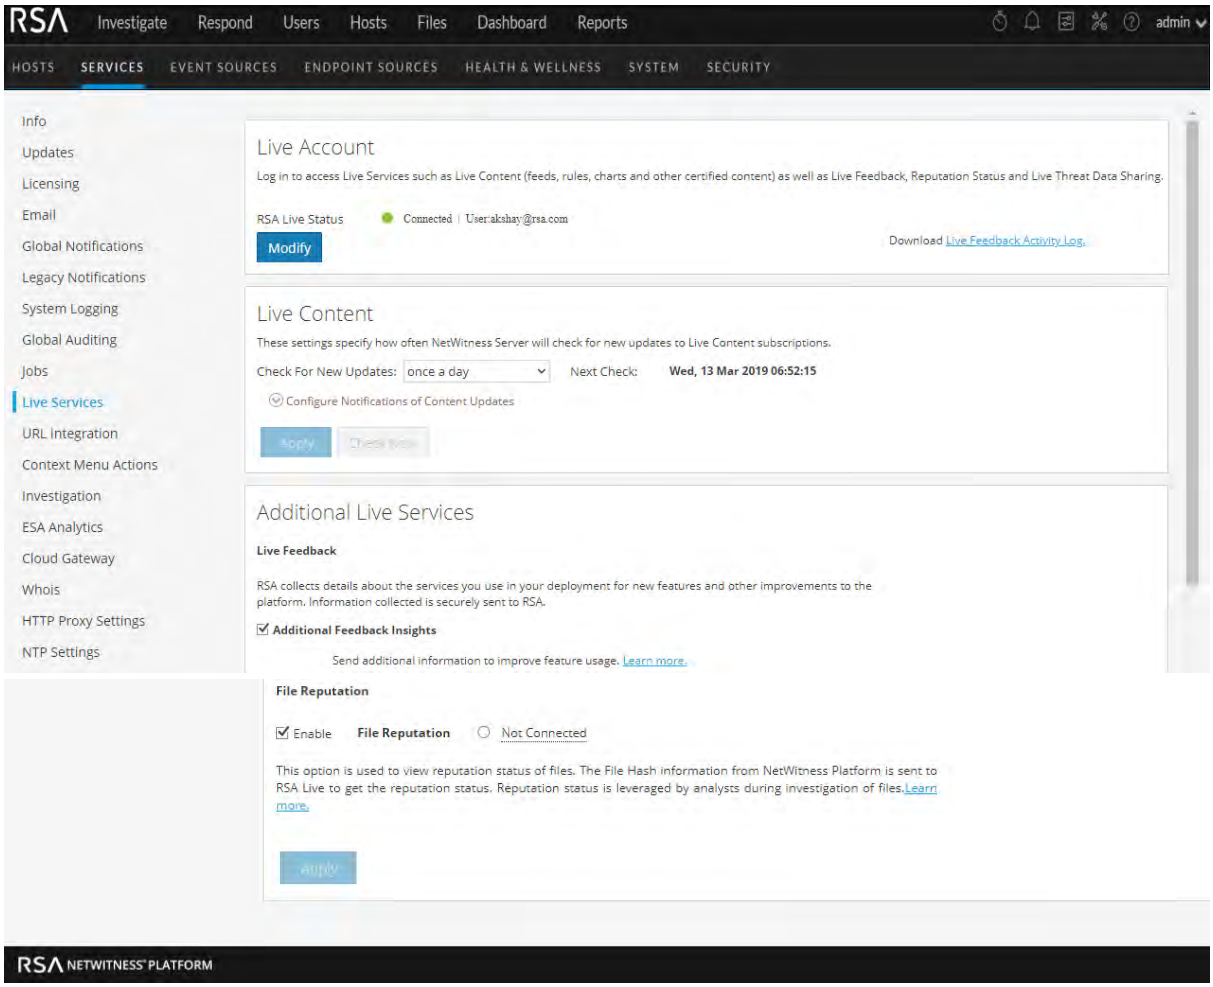
For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.

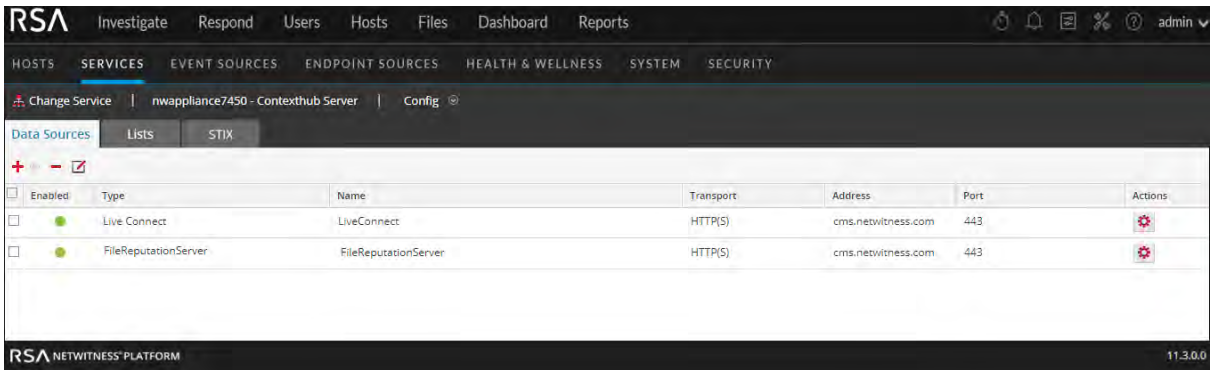
# Enable or Disable File Reputation Data Source

To enable or disable File Reputation data source for Context Hub:

1. Go to **(Admin) > System**.
2. In the left navigation pane, select **Live Services**.
3. In the **Additional Live Services** section, enable **File Reputation**.



4. Click **Apply**.
   File Reputation Server data source is enabled for Context Hub service.
5. To verify, go to the **Data Sources** tab and view the available sources.
   File Reputation source must be added to the list of available sources and the **Enabled** field must be a solid green circle ( ).



6. To disable File Reputation data source, disable **File Reputation** in Additional Live Services panel and click **Apply**.

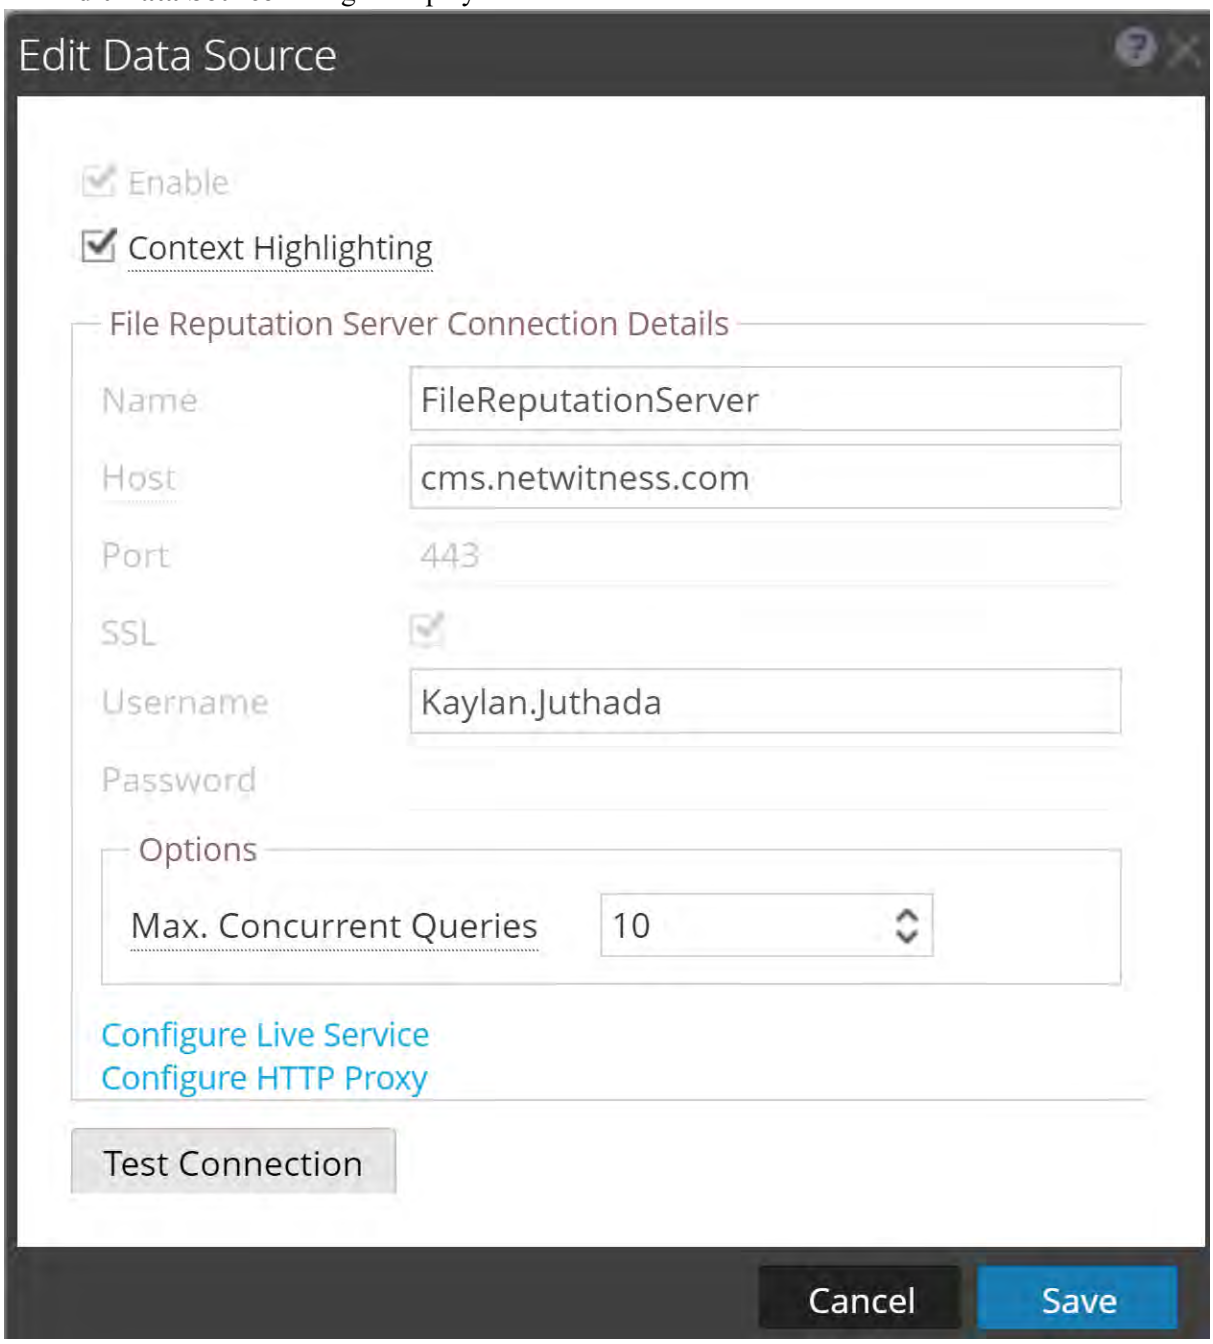
   File Reputation data source is disabled for Context Hub service.

## Edit File Reputation Server Data Source Settings

To edit File Reputation Server data source for Context Hub:

1. Select **(Admin) > Services**.
   The Services view is displayed.
2. In the **Services** panel, select the Context Hub service, and **> View > Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, select the File Reputation Server source and click .

The **Edit Data Source** dialog is displayed.



4. Edit the required fields:

| Field | Description |
|---|---|
| Context Highlighting | This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.<br><br>**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information. |
| Max. Concurrent Queries | You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25. |

5. To edit the Proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.

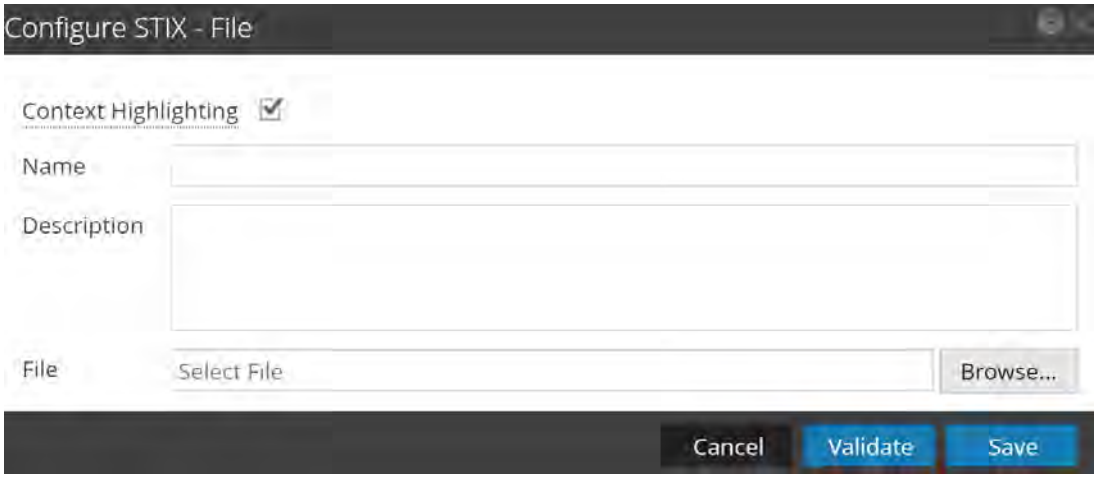
# Configure STIX as a Data Source

You can configure Structured Threat Information eXpression (STIX) as a data source for Context Hub and use the Context Hub service to fetch contextual threat intelligence information from a STIX source.

## Configure STIX File

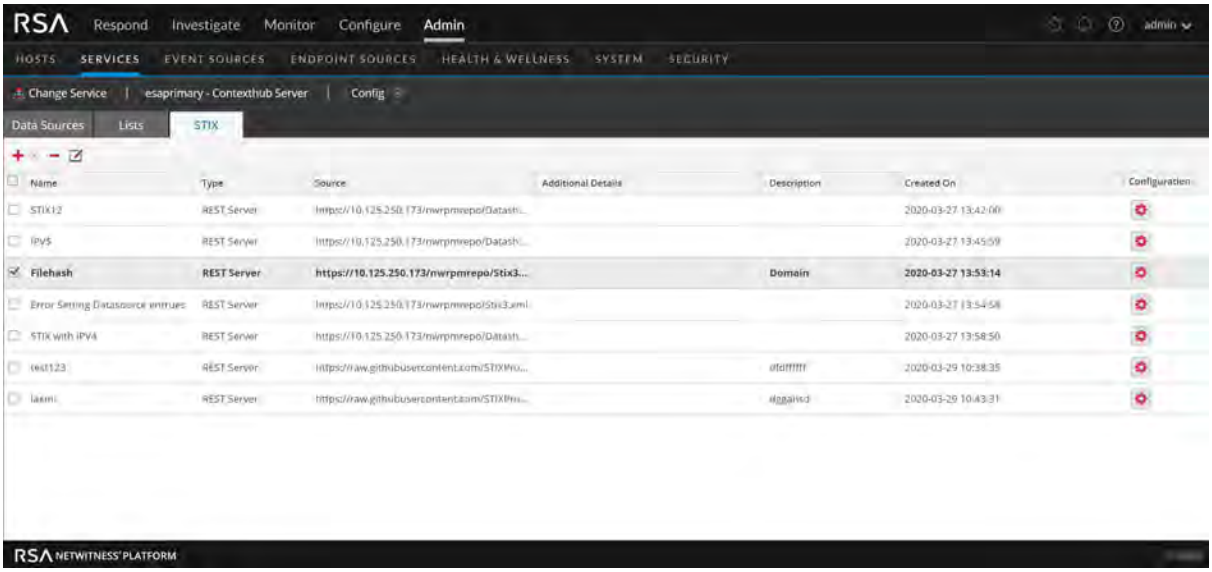
To add STIX as a data source for Context Hub:

1. Go to **(Admin) > Services** .
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **File** as data source.



4. Provide the following details:
   a. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   b. **Name**: Provide a name for the STIX file data source.
   c. **Description**: Provide description of the data source.
   d. **File**: Browse for the file you want to add as a data source.
5. Click **Validate** to verify the format of the file.

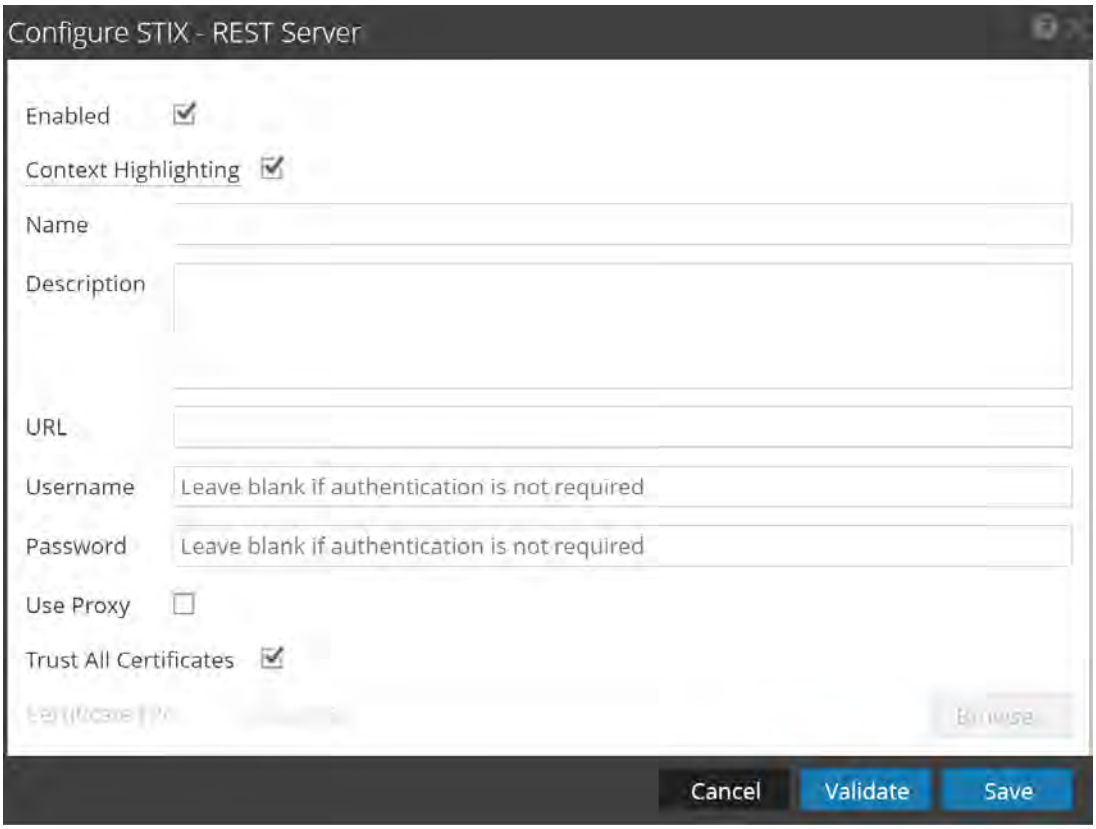
6. Click **Save** to configure the data source.
   The File is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.



## Configure REST Server

To add REST as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **REST Server** as data source.



4. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the REST Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the URL to the STIX file to be hosted on the server.
   f. (Optional) **Username**: Enter the username for the REST server.
   g. (Optional) **Password**: Enter the password for the REST server.
   h. **Use Proxy**: Select this checkbox to use proxy.
   i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate.
   j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.
5. Click **Validate** to verify the connection parameters to the REST Server.

6. Click **Save** to configure the data source.
   The REST Server is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.

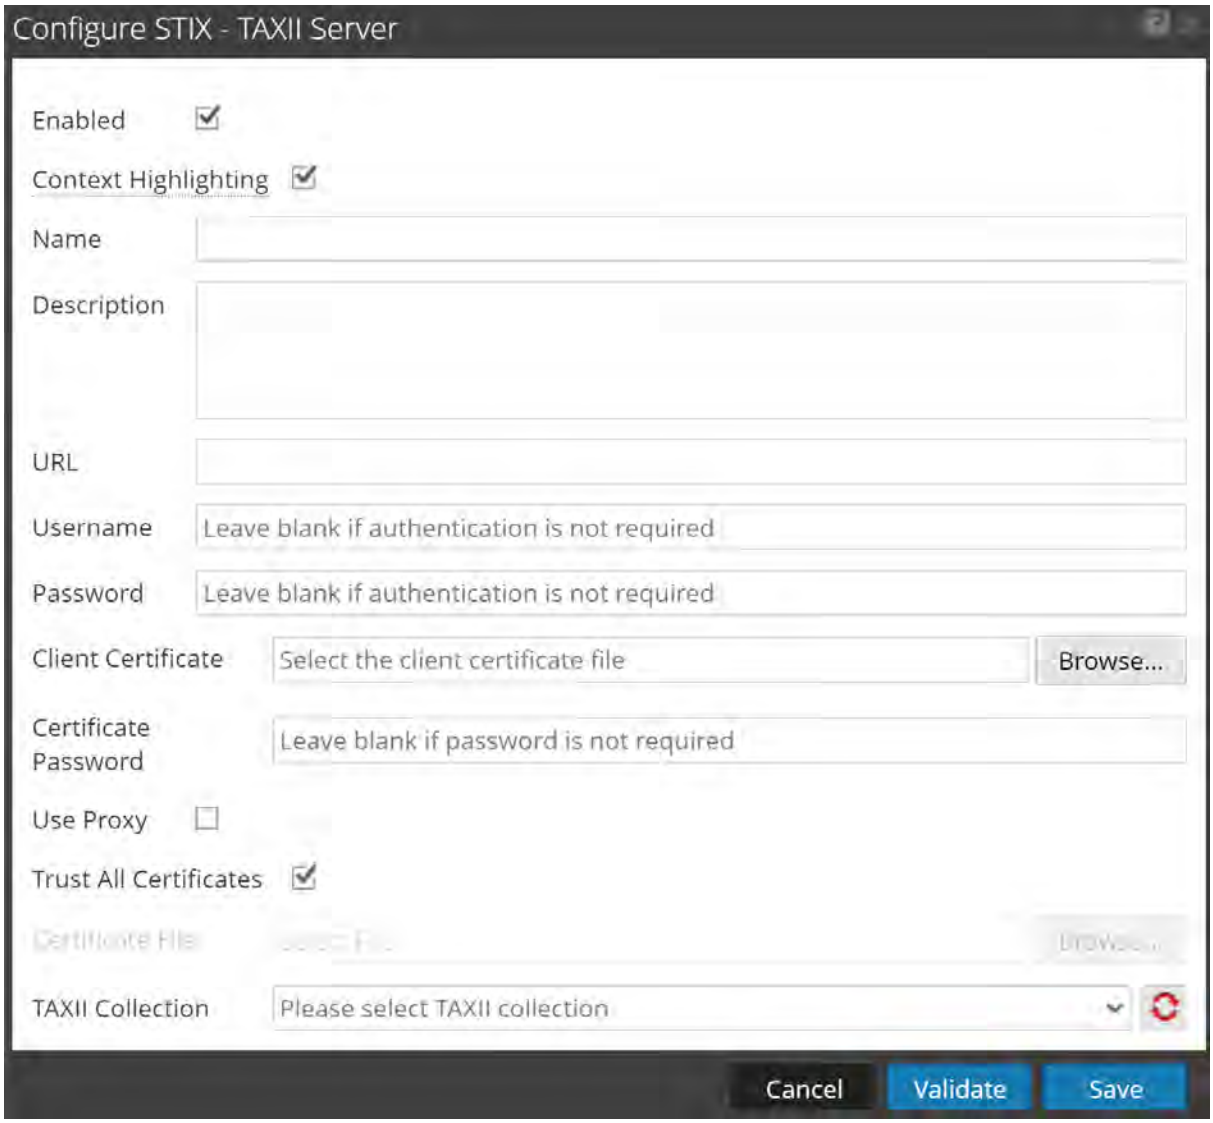
After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

## Configure TAXII Server

To add TAXII Server as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .

4. Select **TAXII Server** as data source.



5. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the TAXII Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the discovery URL to the TAXII Server.
   f. (Optional) **Username**: Enter the username for the TAXII server.
   g. (Optional) **Password**: Enter the password for the TAXII server.

h. (Optional) **Client Certificate**: Browse to upload a pkcs12 format client certificate available on your local system.

i. (Optional) **Certificate Password**: Enter the password to the certificate, if it is password-protected.

j. (Optional) **User Proxy**: Select this checkbox to use proxy.

k. (Optional) **Trust All Certificates**: Select this checkbox if yoenabu want to trust all certificates and do not have a custom certificate.

l. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

m. **TAXII Collection**: Select the TAXII Collection name from the drop-down to automatically download the collection.

6. (Optional) Click to manually retrieve the list of collections available in the TAXII server , if the collections are not downloaded automatically.
7. Click **Validate** to verify the connection parameters to the TAXII Server.
8. Click **Save** to configure the data source.
   The TAXII Server is added as a data source and is displayed in the **STIX** tab.

After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

**Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

### Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

# Configure REST API as a Data Source

You can configure REST API as a data source for Context Hub which allows analysts to use the Context Hub during an investigation to fetch contextual information from any accessible web service with an exposed REST API. Use the procedures in this topic to add REST API as a data source for Context Hub service and configure the settings (if required) for REST API. The maximum number of REST APIs supported by default is ten.

### Prerequisites

Before you configure REST API data source, ensure that:

• Context Hub service is available in (Admin) > **Services** view of NetWitness Platform.

• Third-party REST API web server is reachable.

To add REST API as a data source for Context Hub:

1. Go to (**Admin**) > **Services**.
   The Services view is displayed.

2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config view is displayed.

3. In the **Data Sources** tab, click > **REST API**.
   The Add Data Source dialog is displayed.

4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - Enter the following fields.
     a. **Name** - Enter a name for the REST API data source.
     b. **URL** - Specify the REST API URL with the query parameters.
     The following table lists some examples of URL and associated parameters:

| URL | Parameters |
|---|---|
| https://www.virustotal.com/vtapi/v2/file/report?apikey=<API Key>&resource=$metaValue | • **API key** – Specify your API key<br>• **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, C5D0065B594A4775E26FA9875B21189F |

| URL | Parameters |
| --- | --- |
| https://www.virustotal.com/vtapi/v2/url/report?apikey=<br>1bfdf66f3b0f1875381830ec933f7151f5b48c1cbaa54ac625f2d5a74312e9a2&resource=$metaValue | • **API key** – Specify your API key<br>• **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, textspeier.de |

c. **Description** – Enter the description of the REST API data source.

d. **User name**: Enter the username of the REST API if it needs to be authenticated.

e. **Password**: Enter the password of the RSET API if it needs to be authenticated.

f. **Response Type**: Select the REST API response type. Possible values are:

- HTML
- JSON

g. **Test Meta value**: Enter the meta value to test the REST API connection.

**Note:**
- The meta value you specify will be replaced with `$metavalue` in the URL mentioned in step 2 for test connection.
- During context lookup, the `$metavalue` variable is replaced with meta value in the REST API call.

h. **SSL** - Enables SSL communication to REST API. By default, this option is selected.

i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate. By default, this option is enabled.

j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

5. Click **Test Connection** to test the connection between Context Hub and the REST API data source.
6. Click **Next**.
7. In the **Response Preview** section, you can view the live response for the REST API configured, using the test meta value as a placeholder.
8. In the **Meta Mapping** section, select one or more meta type supported by the REST API to view context lookup (for meta values) in the Respond and Investigation views.
9. In the **Field Mapping** section, you can add friendly display name for the response field for which you want to perform context lookup. Do the following:

a. Click .

b. In the **Field** drop-down, enter the path for which you want to add a friendly name. As you type the path, the auto-suggest function looks for the matches in the JSON path returned in the response preview. You can also add the path that is not available in the response preview but available for other meta values.

c. **Value (from Preview)** field is filled automatically when you select the path.

d. In the **Display Name** field, enter the friendly name.

> **Note:** After configuration, only the fields that are mapped with friendly names are displayed during context lookup. If you do not map any fields, all fields in the JSON will be available during context lookup.

10. Click **Save** to configure the data source.

> **Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to (**ADMIN**) > **Services**> **View** > **Explore** view.

## Edit REST API Data Source

To edit REST API data source for Context Hub:

1. Go to (**Admin**) > **Services**.
2. Select the Context Hub service and click > **View** > **Config**.
3. In the Data Sources tab, click > **REST API**.
4. Edit the required fields.
5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. In the **Meta and Field Mapping** and **Cache settings**, edit the required fields.
7. Click **Save** to save the settings.

## Delete REST API Data Source

To edit REST API data source for Context Hub:

1. Go to (**Admin**) > **Services**.
2. Select the Context Hub service and click > **View** > **Config**.
3. In the **Data Sources** tab, select the data source you want to delete.
4. Click .

### Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

# Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

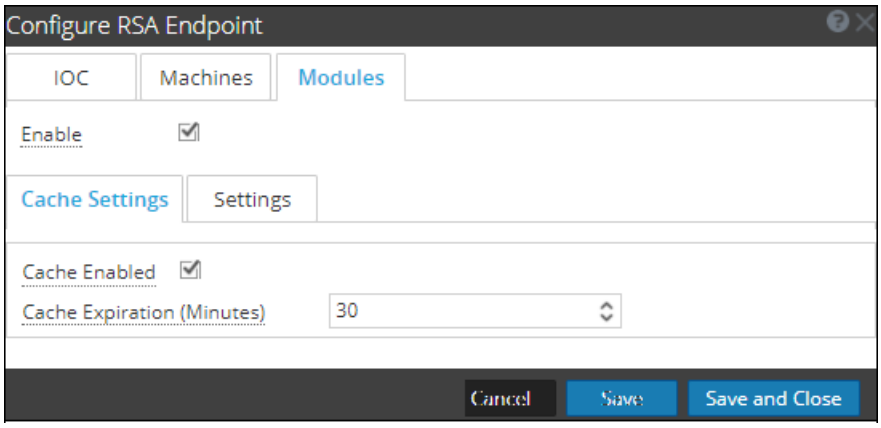
   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

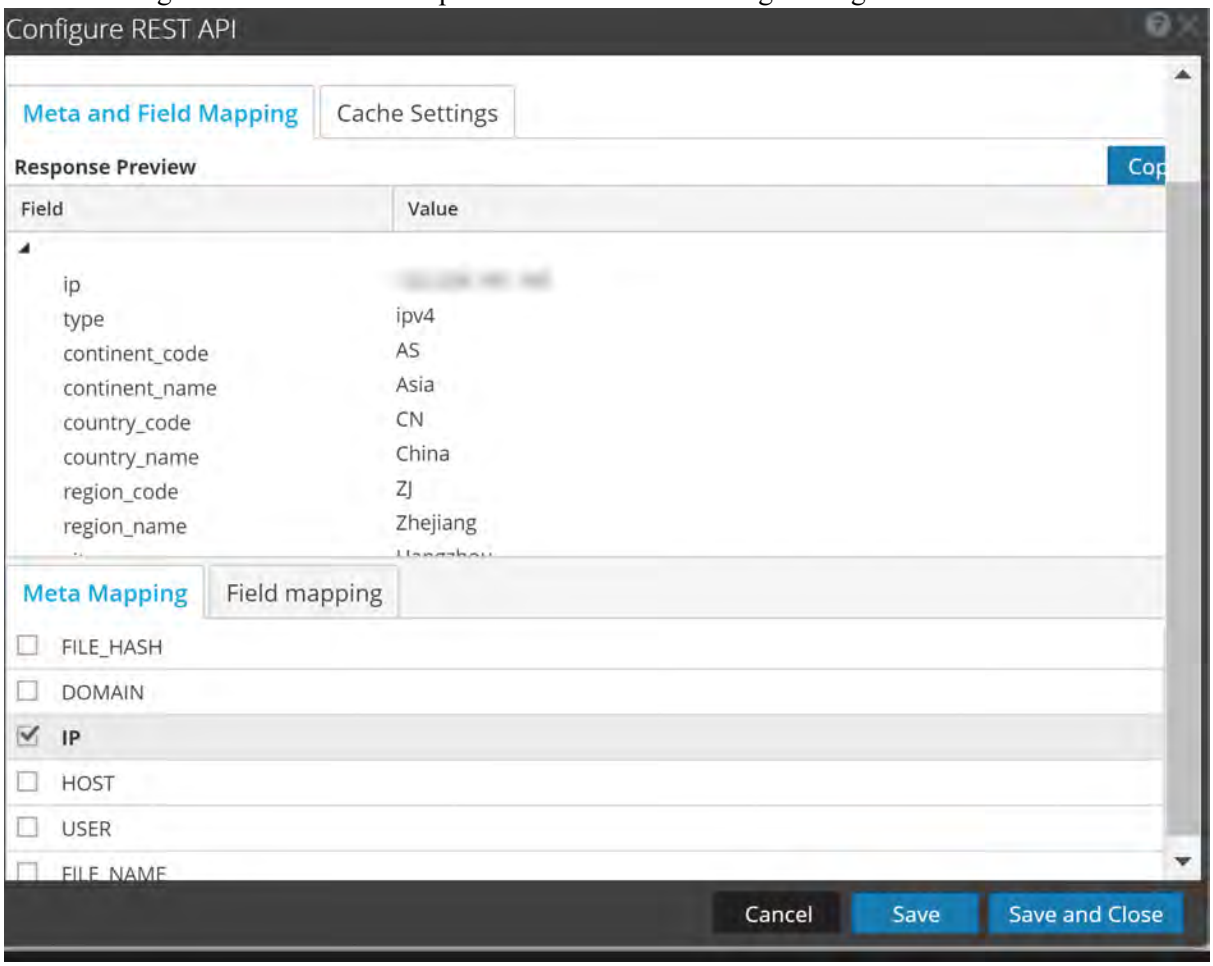
   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the NetWitness Endpoint settings dialog:



The following screenshot is an example of the REST API settings dialog:



4. Configure the following fields:

| Field | Description |
|---|---|
| Enable | This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source. |

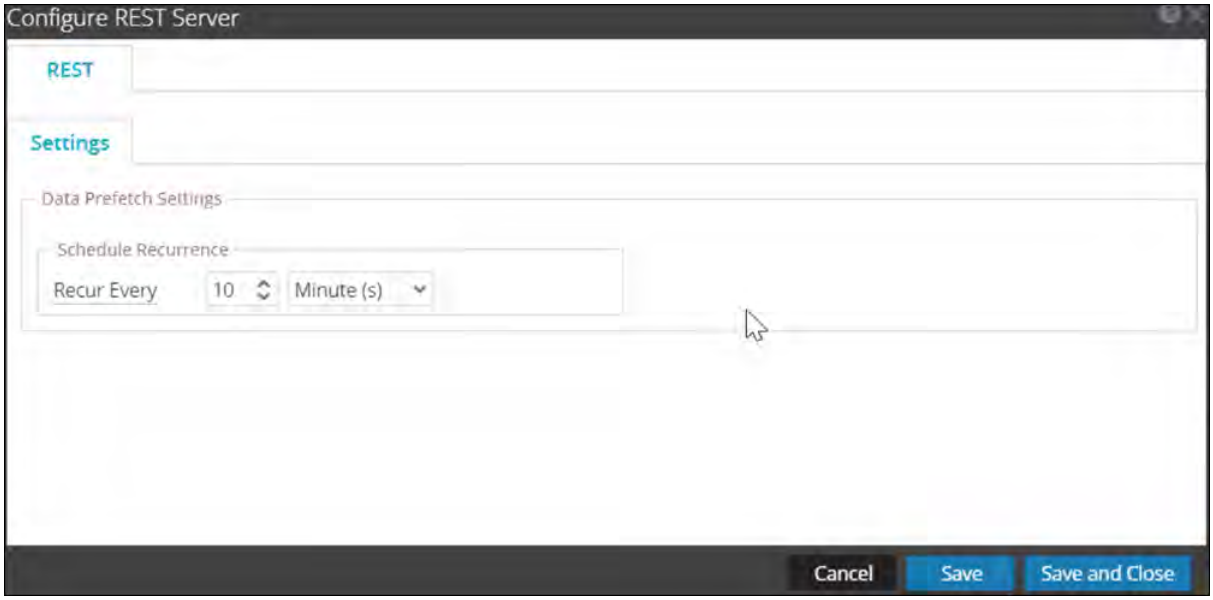
| Field | Description |
|---|---|
| Cache Settings | Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache.<br>Use this section to define the following cache settings for query lookup:<br>• **Cache Enabled**: By default, this checkbox is selected and the query response is cached.<br>• **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure. |
| List value Expiration | **Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained.<br>**Time to Live (Days)**: Enter the number of days you want to the list values to be retained. |
| Meta Mapping | Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER.<br>**Meta Type**: Entities available in Context Hub.<br>**Context Hub Fields**: Column headers from CSV file you have added when creating a list. |
| Meta and Field Mapping | **Response Preview**: You can view the live response for the REST API configured, using the test meta value as a placeholder.<br>**Copy**: Copies the response preview.<br>**Meta Mapping**: Any REST API stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities selected. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER.<br>**Meta Type**: Entities available in Context Hub.<br>**Field Mapping**: Add friendly display name for the response field which is displayed during the context lookup.<br> - Add a field mapping.<br> - Delete a field mapping.<br>**Field**- Enter the path for which you want to add a friendly name.<br>**Value (from Preview)**- The value is filled automatically based on the path.<br>**Display Name**- Enter friendly name. |
| Minimum IIOC Score | The minimum IIOC score to be considered for fetching contextual information of NetWitness Endpoint modules. |

| Field | Description |
|---|---|
| Query Last (Days) | The duration (in days) for which the Context Data must be queried. |
| Limit | The maximum number of records to be displayed when Context Lookup is performed. |
| Recur Every | Configure recurring schedule to fetch and store contextual data for the required intervals. |

5. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

To access and configure settings for STIX data sources

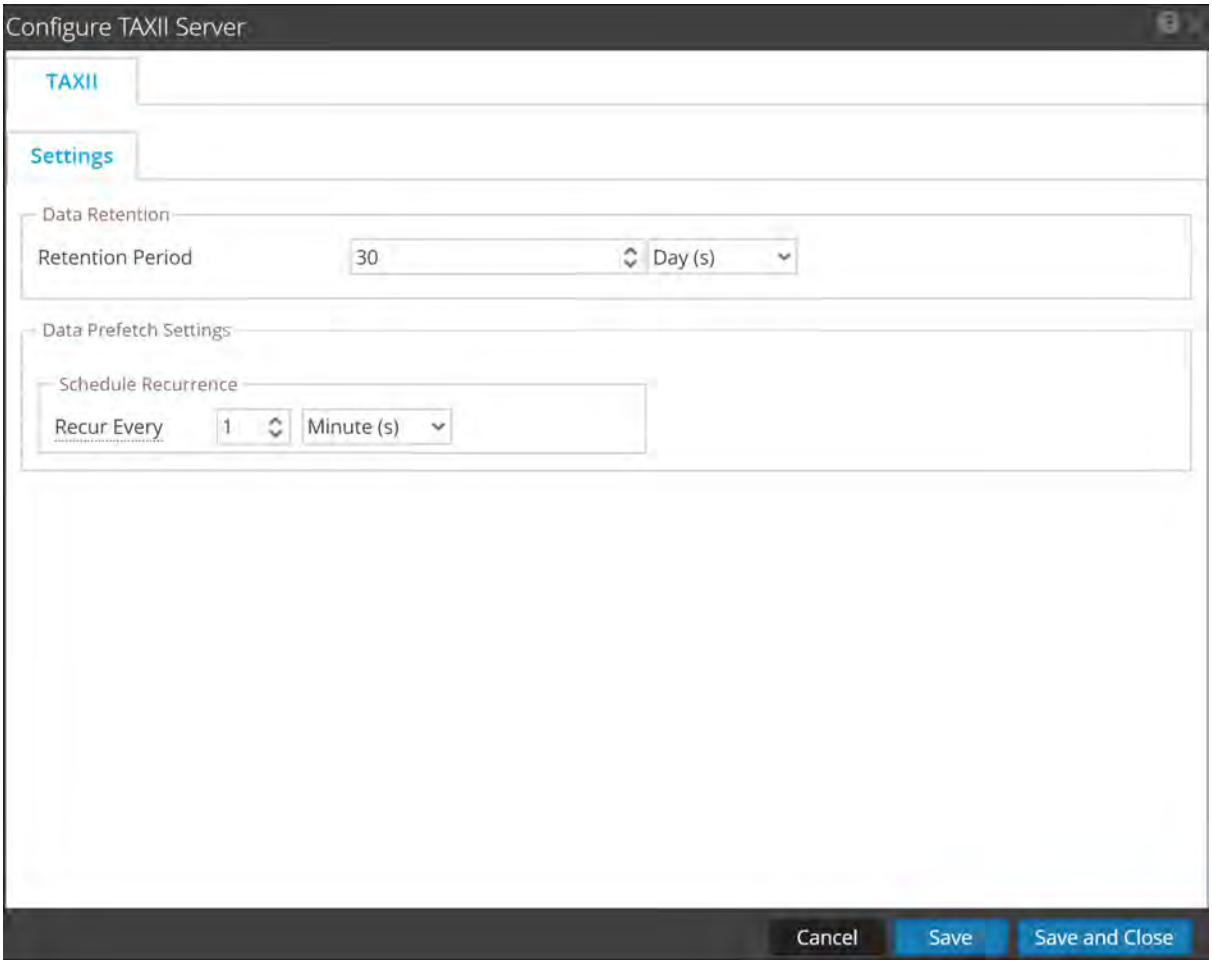
1. Go to **(Admin) > Services** and select Context Hub service.
2. Click > **View** > **Config** > **STIX** tab.
3. Select the data source for which you want to configure the settings and click in the Configurations column.
   a. For REST Server, the following fields are displayed.



Configure the following fields for REST Server.

| Field | Description |
|---|---|
| Recur Every | Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source. |

b. For TAXII Server, the following fields are displayed.



Configure the following fields for TAXII Server.

| Field | Description |
|---|---|
| Retention Period | Specify the number of days the content retrieved from the taxi data source must be retained before it is automatically deleted. |
| Recur Every | Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source . |

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

| Data Source (Connection) | Response Supported Groups | Field Settings |
|---|---|---|
| List | List | Meta Mapping<br>Meta Type<br>Context Hub Fields<br><br>Settings<br>Data Prefetch Settings<br>Schedule Recurrence<br>List Value Expiration<br><br>Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes] |
| RSA Archer | Archer | Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes)<br><br>Settings<br><br>Export Attributes Configuration<br><br>Export Attributes<br>Data Prefetch Settings<br><br>Schedule Recurrence |
| Active Directory | Users | Meta Mapping<br><br>Meta Type<br><br>Context Hub Fields<br><br>Settings<br><br>Data Prefetch Settings<br><br>Schedule Recurrence<br><br>List Value Expiration<br><br>Cache Settings<br><br>Cache Enabled<br><br>Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes] |

| Data Source (Connection) | Response Supported Groups | Field Settings |
|---|---|---|
| RSA Endpoint | IOC<br>Machines<br>Modules | Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes)<br>Settings<br>Context Panel Settings<br>Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes)<br>Settings<br>Context Panel Settings<br>Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes)<br>Settings<br>Minimum IIOC Score<br>Context Panel Settings |
| Respond | Alerts<br>Incidents | Context Panel Settings<br>Data Prefetch Settings<br>Query Last [Days<br>Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes) |
| File Reputation Server | File Reputation Server | Cache Settings<br>Cache Enabled<br>Cache Expiration (Minutes) |
| TI | Displays information for STIX data sources. | IP address, email address, domain, filename, URL's, and file hash.<br>**Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. To map the metas, navigate to (Configure) > **System** > **Investigation** > **Context Lookup**. |

| Data Source (Connection) | Response Supported Groups | Field Settings |
|---|---|---|
| REST API | REST API | • Meta and Field Mapping<br>• Meta Type<br>• Field<br>• Value (from Preview)<br>• Display Name<br>• Cache Settings<br>• Cache Enabled<br>• Cache Expiration (Minutes) |

**Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

# Import or Export Lists for Context Hub

As an administrator you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

## Prerequisites

Ensure that Context Hub is enabled and the service is available in **(Admin) > Services** view of NetWitness.

## Import a List

After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list

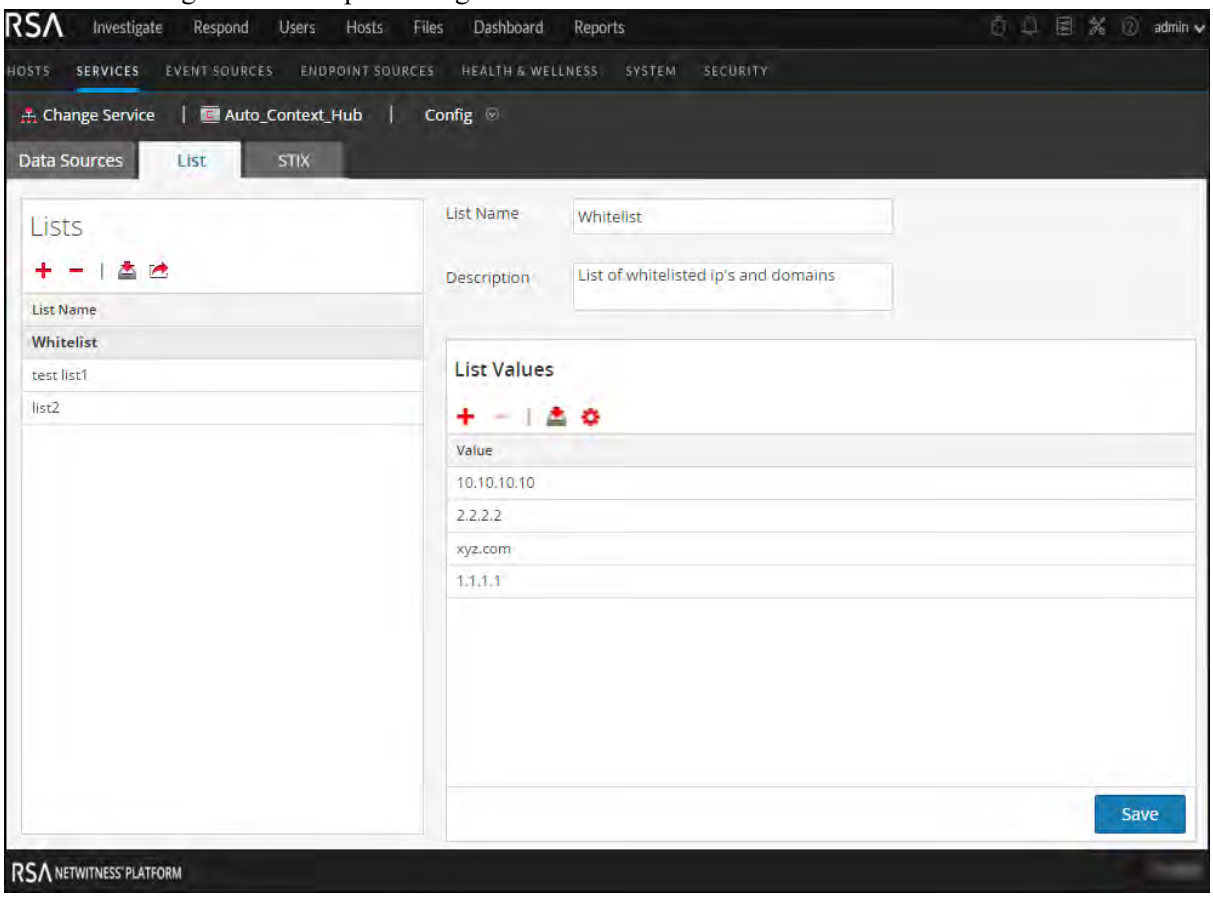
**Note:** You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file when the schedule recurs. In case of a custom feed list, if the feed is edited or deleted, the corresponding Context Hub list also gets edited or deleted.

## Import Single-Column List

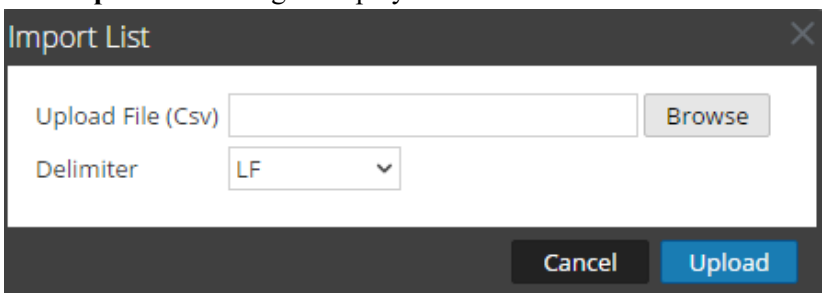
To import a list:

1. Select **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list.



4. Click on the **Lists** panel.
   The **Import List** dialog is displayed.



5. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).
6. Click **Upload** to upload the CSV file to Context Hub.

These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

**Note:** You cannot create a new multi column list by directly importing a CSV file. However, all the feeds that are converted into multi-colum lists will be displayed in the List tab. For information on how to import multi-column list, see Configure Lists as a Data Source

## Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:

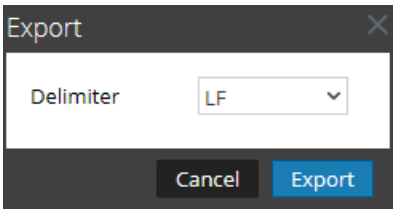
1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

## Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click .
   The **Export** dialog is displayed.



2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file to the local machine.

**Note:** When a custom feed is converted into a Context Hub list, you must map at least one meta key with one or more entity mapping for a column header with a meta. However, if you want to add or edit more entities you can do so by clicking ⚙.

# Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with NetWitness meta keys.

The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the Respond database.

In the (Admin) **> System > Investigation** view, the Context Lookup tab enables the administrator to configure the NetWitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

**Note:** You cannot add a new Meta Type.

The default mapping is given below:

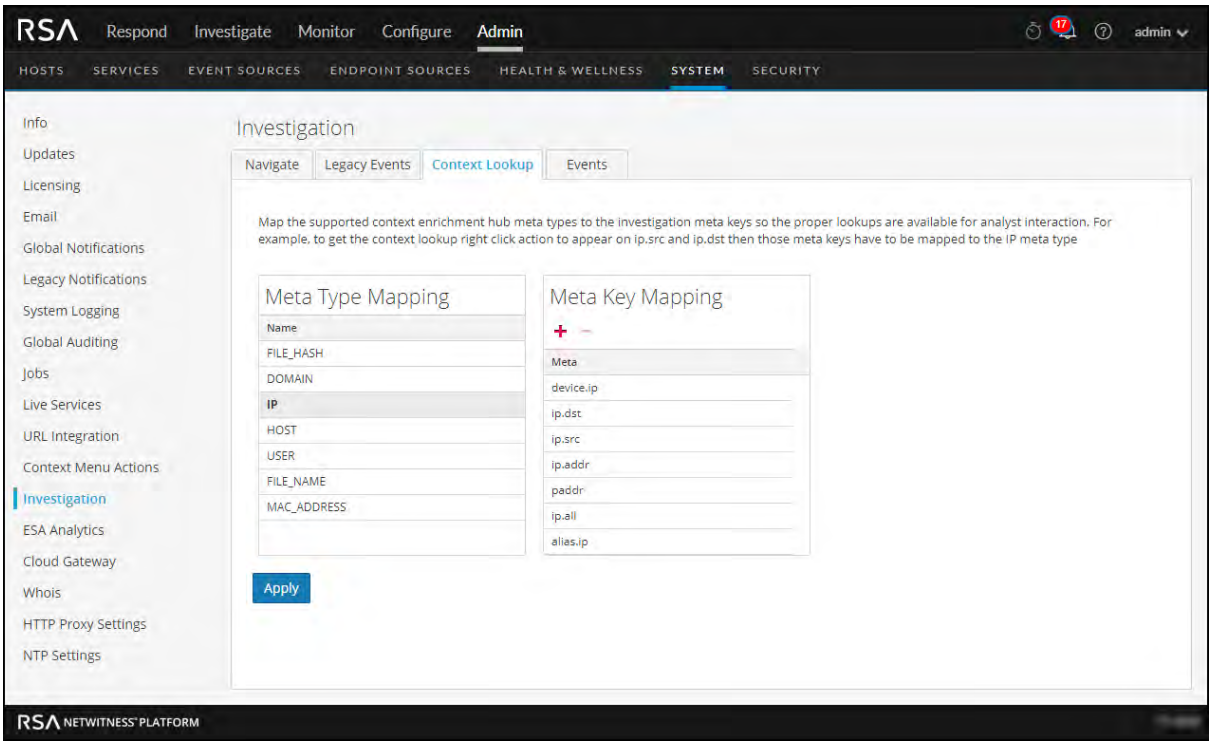
| Meta Type Name | Meta Keys |
|---|---|
| IP | device.ip, ip.dst, ip.src, ip.addr, paddr, ip.all, alias.ip |
| USER | user.all, user.src, user.dst, username |
| DOMAIN | domain.src, domain.all, domain.dst |
| MAC_ADDRESS | eth.dst, eth.src, eth.all |
| FILE_NAME | filename, filename.all, filename.src, filename.dst, sourcefile |
| FILE_HASH | checksum.all, checksum, checksum.dst, checksum.src |
| HOST | device.host, alias.host, host.all |

## Procedure

To manage Investigation meta keys mapping:

1. Go to **(Admin) > System**.
2. In the options panel, select **Investigation**.

   The Investigation Configuration panel is displayed.
3. Select the **Context Lookup** tab.



4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" form-at="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning Guide*. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.

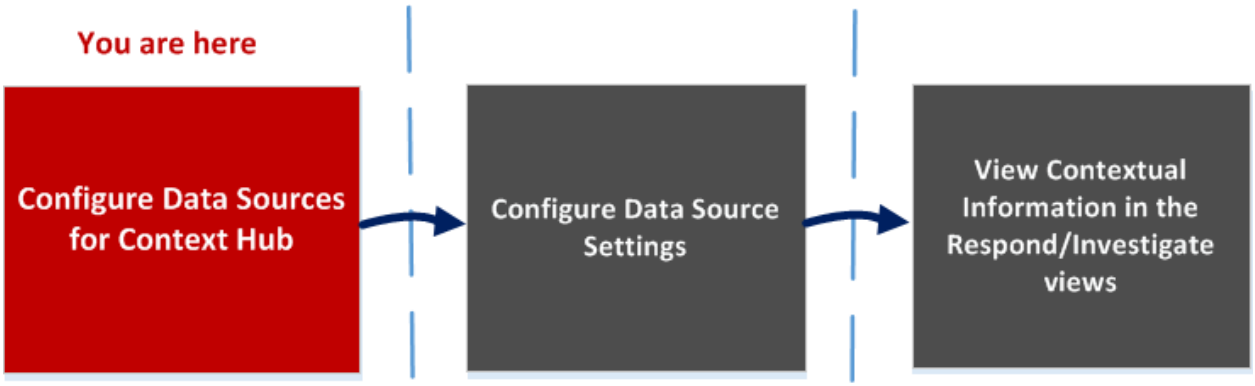
In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

# Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

## Workflow

This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.



- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Data Sources for Context Hub* | Configure Lists as a Data Source<br>Configure Archer as Data Source<br>Configure Active Directory as a Data Source<br>Configure NetWitness Endpoint as a Data Source<br>Configure REST API as a Data Source<br>Configure File Reputation Server as a Data Source<br>Configure STIX as a Data Source |
| Administrator | Configure Hub Data Settings* | Configure Context Hub Data Source Settings |

| Role | I want to ... | Show me how |
|---|---|---|
| Analyst | View Contextual Information in Respond View | See the *NetWitness Respond User Guide*. |
| Analyst | Add, create and delete list from the Respond or Investigate View | See the *NetWitness Respond User Guide*.<br>See the *Investigate User Guide*. |
| Analyst | Add or delete an entry from an existing list | See the *NetWitness Respond User Guide*. |

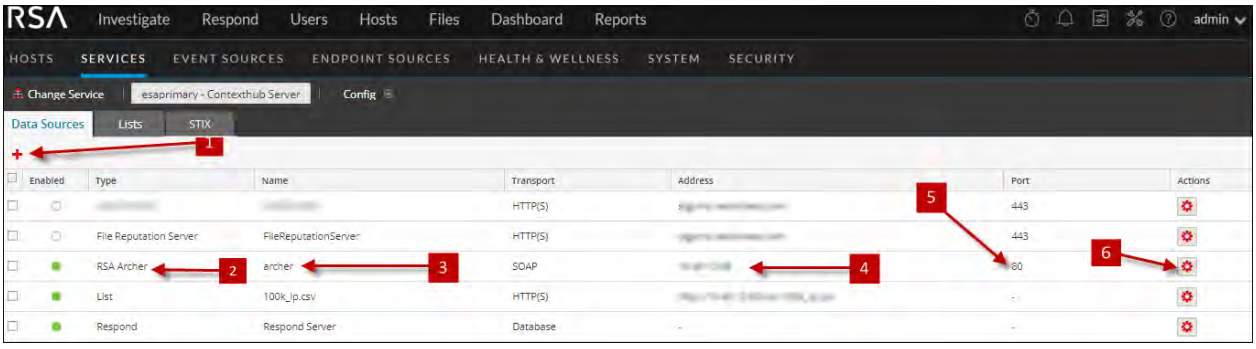
*You can complete this task here (that is in the Context Hub Data Sources Tab.)

## Related Topics

- Configure Lists as a Data Source
- Configure Archer as Data Source
- Configure Active Directory as a Data Source
- Configure NetWitness Endpoint as a Data Source
- Configure Respond as a Data Source
- Configure REST API as a Data Source
- Configure File Reputation Server as a Data Source
- Configure STIX as a Data Source
- Configure REST API as a Data Source

## Quick Look

The following example illustrates how to add a data source for Context Hub service.



1 Click + to display the **Add Data Source** dialog.
2 Displays the type of Data Source.
3 Name that identifies the Data Source.
4 The IP address or hostname of the data source.
5 The connection port for the data source.

6 Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.

7 Click **Test Connection** to verify that the host is connected to the Context Hub service.

## Toolbar

The following table describes the toolbar actions.

| Feature | Description |
|---|---|
| | Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Lists as a Data Source. |
|  | Delete a data source.<br>If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available. |
| | Opens the Edit Data Source dialog. |
| | Opens the Configure Settings dialog. You can view and edit the settings for the data sources.<br>For description of each field in Configure Responses dialog, see Configure Context Hub Data Source Settings . |

## Data Source Configurations

The following table describes the listed configurations.

| Feature | Description |
|---|---|
| Enabled | Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled ( ). An blank white circle indicates that data source is disabled. |
| Type | The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, REST API or File Reputation server. |
| Name | The unique name to identify the data source. For example, Respond. |
| Address | The IP address or hostname of the data source. |
| Port | The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on. |

# Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Lists** tab.

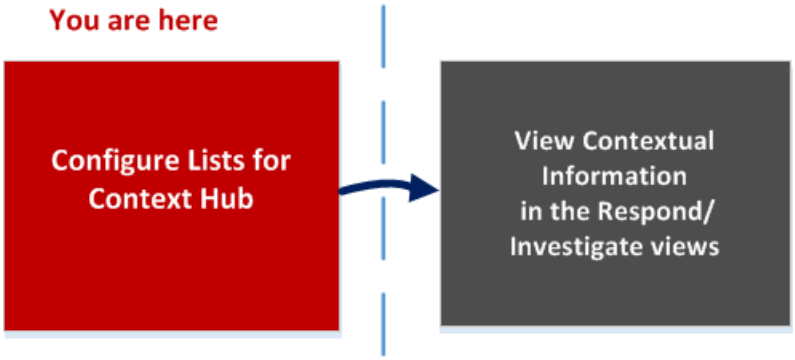
The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing external or custom feed CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

**Note:** You can also create lists and add list values from Respond and Investigation views. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*.

## Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.



Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure List Data Source for Context Hub* | Configure Lists as a Data Source |
| Administrator/ Analyst | View Contextual Information in Respond View | See the *NetWitness Respond User Guide*. |

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator/ Analyst | "Manage Lists and List Values in Investigation | See the *Investigate User Guide*. |
| Administrator/ Analyst | Create a list | See the *NetWitness Respond User Guide* and *Investigate User Guide* |
| Administrator/ Analyst | Update a list | See the *NetWitness Respond User Guide* and *Investigate User Guide* |
| Administrator/ Analyst | Delete list | See the *NetWitness Respond User Guide* and *Investigate User Guide* |
| Administrator/ Analyst | Import a list | Import or Export Lists for Context Hub |
| Administrator/ Analyst | Export list | Import or Export Lists for Context Hub |

*You can complete this task here (that is in the Context Hub Lists Tab).

## Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.

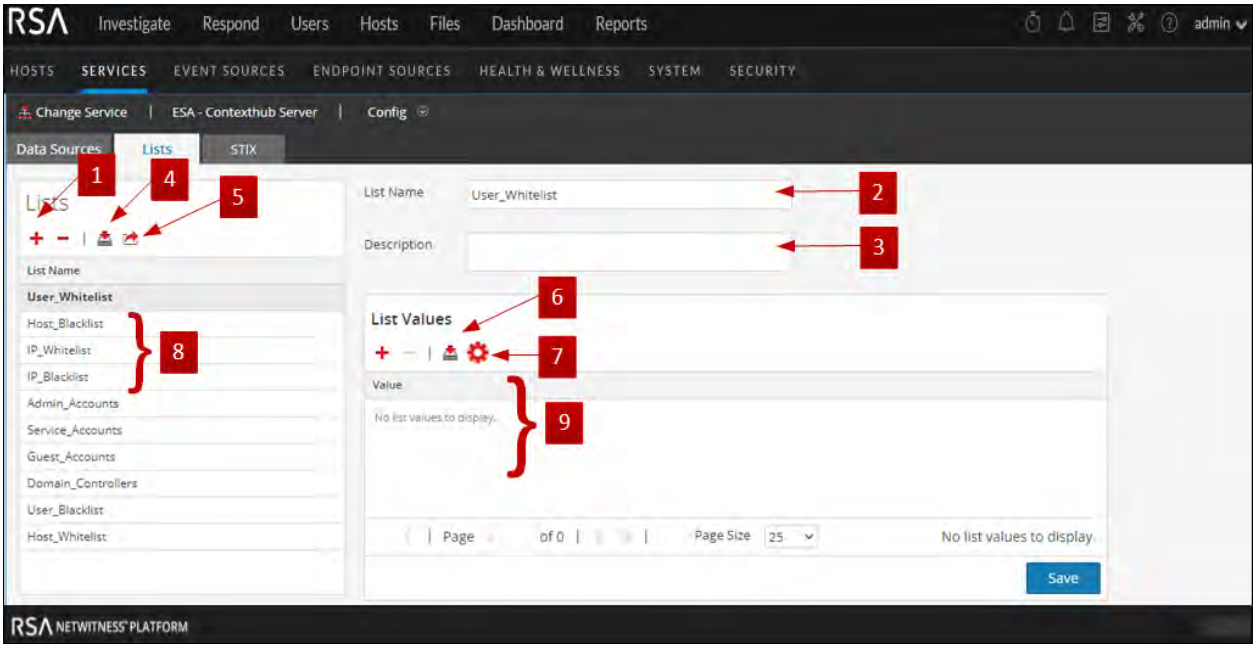
By default, 10 empty single-column lists are available in RSA NetWitness11.1. These lists are empty and you need to add information to these lists. The out of the box 10 list names are used in ESA rules, for more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide*. For users upgrading from previous versions, they will be able to view these new lists in addition to their previously created lists. The lists available by default are:

- Admin_Accounts
- Guest_Accounts
- Service_Accounts
- User_Blacklist
- User_Whitelist
- Host_Whitelist

- Domain_Controllers
- IP_Blacklist
- IP_Whitelist
- Host_Blacklist

**Note:** If a list with the same name already exists prior to updating to or installing RSA NetWitness11.7, then that list will be retained. Either rename that list before updating to 11.1 or update the contents in such a way that it can be used in ESA rules.

The lists are available in ESA rules tab in CONFIGURE > ESA Rules > Settings > Enrichment Sources. For more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide for Version 11.1*.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.



| | |
|---|---|
| 1 | Click + to add a new list. |
| 2 | Name that identifies the list. |
| 3 | Description of the list. |
| 4 | Click to import list(s) to Context Hub. |
| 5 | Click to export a list to the local machine. |
| 6 | Click to import list values to selected list. |

| | |
|---|---|
| 7 | Click to add or edit entity mapping. |
| 8 | Displays the custom list(s) that are added to Context Hub. |
| 9 | Displays the list values that are added to the selected list. |

## Toolbar

The following table describes the toolbar actions.

| Feature | Description |
|---|---|
| | Add a new list.<br>For more information, see Configure Lists as a Data Source. |
|  | Delete a list.<br>If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information. |
| | Import lists to Context Hub.<br>For more information, see Import or Export Lists for Context Hub. |
| | Export a list to the local machine.<br>For more information, see Import or Export Lists for Context Hub. |

**Note:** You can select multiple lists at a time. Do one of the following:
1. Select a list, press and hold Ctrl key, and click the lists to be selected.
2. Select a list, press and hold Shift Key, and use arrow keys to select other lists.

## List View Options

The following table describes the Lists configurations.

| Feature | Description |
|---|---|
| List Name | Unique name to identify the list. |
| Description | Description of the list. |
| Save | Saves the changes made to the list. |

### Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

# Context Hub STIX Tab

In the **STIX** tab, you can create and configure Structured Threat Information eXpression (STIX) data source for Context Hub. Navigate to **(Admin) > Services**> Select Context Hub service > **View** > **Config** > **STIX** tab.

The STIX tab of the Context Hub service allows you to create one or more STIX, REST URLs, or TAXII data sources and edit them whenever required. When STIX is configured, Context Hub service automatically considers it as a data source.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure STIX Data Source for Context Hub* | Configure STIX as a Data Source |
| Administrator/ Analyst | View Contextual Information in Respond View | See the *NetWitness Respond User Guide*. |

*You can complete this task here (that is in the Context Hub Lists Tab).

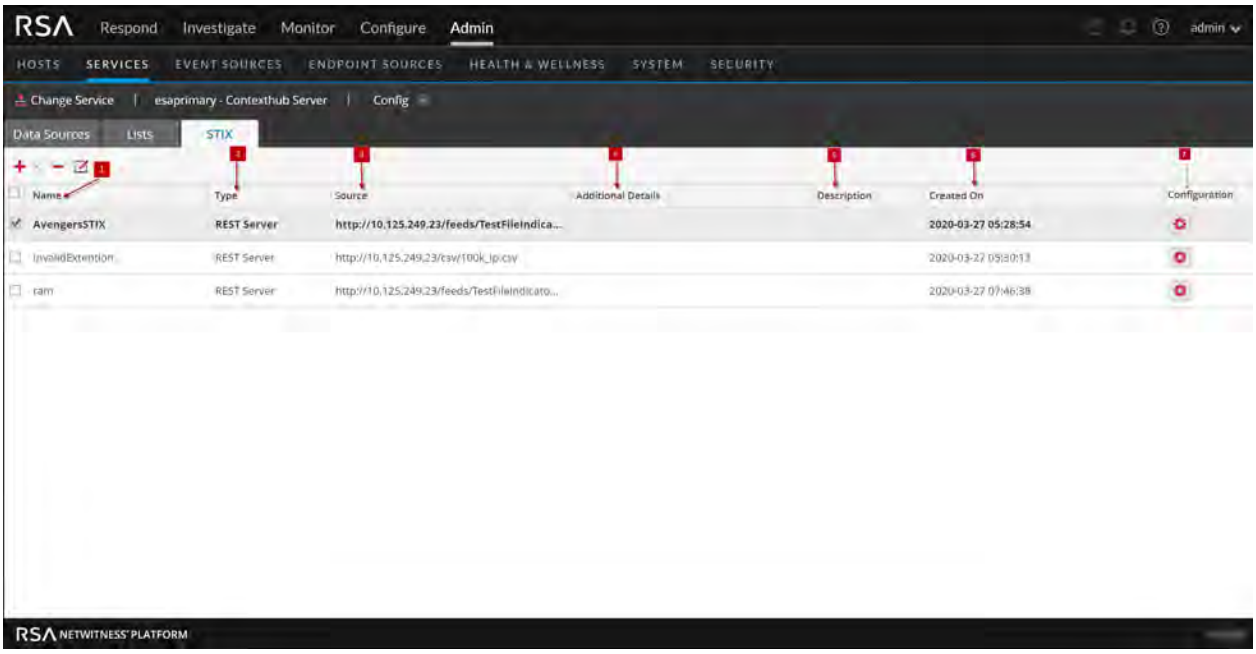
## Related Topics

- Configure STIX as a Data Source

## Quick Look

The following example illustrates how to add STIX to Context Hub service.

The STIX tab consists of add, delete and edit data sources options.



| | |
|---|---|
| 1 | Name that identifies the added STIX source. |
| 2 | Type of data source - REST server, STIX or TAXII server. |
| 3 | The path of the source from which the STIX files are obtained. |
| 4 | Additional details related to the data source being added. |
| 5 | Description of the data source. |
| 6 | Date when the data source was created. |
| 7 | Click to edit the selected data source and configure advanced settings. |

## Toolbar

The following table describes the toolbar actions.

| Feature | Description |
|---|---|
| + | Add a new data source such as File, REST Server, or TAXII Server. For more information, see Configure STIX as a Data Source . |
| − | Delete the selected data source. |
| | Edit the selected data source. |

The following table describes the all the data source server configuration options.

| Field | Description |
|---|---|
| **Common Configuration Options** | |
| Enabled | Select this checkbox to enable the configuration. |
| Name | Provide a name to the data source you want to add. |
| Description | Description of the data source. |
| Cancel | Click to revert the data source addition. |
| Validate | Click to verify the URL path to the Server. |
| Save | Click to save the configuration and add the required server as a data source. |
| **REST Server Configuration Options** | |
| URL | URL of the REST server. |
| Username (Optional) | Provide the username of the REST server if it needs to be authenticated. |
| Password (Optional) | Provide the password of REST server if it needs to be authenticated. |
| Trust All Certificates | Select this checkbox to trust all certificates. |
| Certificate File | Click browse to navigate to the location of the certificate file. |
| **TAXII Server Configuration Options** | |
| URL | URL of the TAXII server. |
| Username (Optional) | Provide the username of TAXII server if it needs to be authenticated. |
| Password (Optional) | Provide the password of REST server if it needs to be authenticated. |
| Client Certificate | Browse to upload a pkcs12 format client certificate available on your local system. |
| Certificate Password | Enter the password to the certificate, if it is password-protected. |
| UserProxy | Select this checkbox to enable proxy. |
| Trust All Certificates | Select this checkbox to trust all certificates. |
| Certificate File | Browse and select the certificate file. |
| TAXII Collections | Select the TAXII Collection name from the drop-down to automatically download the collection. |

| Field | Description |
|---|---|
| | Click to manually retrieve the list of available TAXII Servers, if the collections are not downloaded automatically. |
| **STIX File Configuration Options** | |
| File | Browse and select the STIX file. |

### Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

# Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when setting up their ContextHub service in NetWitness.

| Problem | Solutions |
|---|---|
| Prefetch for list fails if the list is created in append mode. | **Details:**<br>The following error message is displayed in logs indicating that, entries in list exceeds the max allowed.<br>`Error setting data source entries com.rsa.asoc.contexthub.exception.ContextHubException: total.entries.exceed.max`<br>Also, Health & Wellness sets the stat - `Contexthub.Datasource.Health.Data-Sources-Health` to `Unhealthy` and displays the names of the lists for which prefetch has failed.<br>For example, number of entries in the list are 50001 and number of records in the CSV file are 50001 (user did not change the csv since last prefetch.). Upper limit on number of entries in list is 100,000. Now on prefetch, Context Hub will try to append 50001 entries to the list but since 50001 + 50001 > 100,000, prefetch fails.<br>**Solutions:**<br>You should add only those entries in the .csv file which they wish to append to the existing .csv file. If, you do not want to append any entries to the list then perform one of the options, as applicable:<br>• If you created the list with headers: remove all rows from the csv except the header.<br>• If you created list without headers: you should have 0 rows in csv. |
| The Respond service is not able to send incidents to Archer with third party signed certificates. | As a workaround, you need to run a command to add a PEM certificate to the Respond trust store<br>Run the following command on the Respond host:<br>`security-cli-client --add-trusts -s respond-server -x <pem_certfilename> -u <username> -k <password>`<br>Where:<br>• `<pem_certfilename>` is the name of the certificate file.<br>• `<username>` and `<password>` are your NetWitness administrator credentials. |
| SSL handshake with Archer certificate fails while adding it as a data source. | Use an archer generated certificate with the Trust All Certificates option configured. |

| Problem | Solutions |
|---|---|
| Pivot to Investigate option on the Respond page does not navigate to the correct link. | When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the NetWitness Server, login to the NetWitness Server Host and enter the service jetty restart command. |
| When you import a list with missing quotes such as "172.16.0.0, the list is saved without any data to display. | This is because of the Apache bug (CSV-141), which does not parse CSV files with incorrect formats.<br>To fix, import a list with correct quotes to avoid displaying an empty file. For example, “172.16.0.0”, “host.mycompany.com” and so on. |
| Increasing the limit settings for Alerts and Incidents leads to lookup error. | By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased, the looked-up meta for alerts and incidents may lead to lookup error. This happens due to an internal database restriction.<br>Make sure to keep the limit for viewing number of Alerts and Incidents to 50 or less. |
| Multiple incident and alert tabs are displayed while editing advanced configuration of Respond datasource. | You must delete duplicate entries in the Context Hub MongoDB and restart the MongoDB Context Hub Server. Perform the following:<br>1. Log in to control MongoDB on Admin Server.<br>2. Go to contexthub-server > ds_meta collection.<br>**Note:** Make a note of '_id' value of duplicate entries for the incident and alerts documents that you want to delete.<br>3. In the ds_meta collection, delete 1 Incident and 1 Alert document. Once the duplicate entries are deleted only 1 Incident and 1 Alert type document will be available in the ds_meta collection.<br>4. Log in to application MongoDB on ESA Primary.<br>5. Go to contexthub-server, locate and delete the below collections:<br>• ds_entries*_*<id-of-incident-doc-deleted-in-step 3><br>• ds_entries*_*<id-of-alert-doc-deleted-in-step 3><br>6. Under bookmark_store collection, locate and delete documents with id same as _id of Incident and Alert from ds_meta collection.<br>7. Restart Context Hub Server. |

# Data Privacy Overview

This topic introduces the concept and implementation considerations for a data privacy officer or administrator who is managing exposure of privacy-sensitive data in NetWitness. In addition, information about recommended use cases is included.

**Note:** A data privacy plan touches on most components of NetWitness. The person who configures data privacy needs to understand NetWitness network components, configuration of NetWitness hosts and services as described in the *Host and Services Getting Started Guide*, and the types of information that need to be protected.

Regulatory mandates in some locations, for example the European Union (EU), require that information systems have a means of protecting privacy-sensitive data. Any data that could directly or indirectly identify "Who did what when?" may be considered privacy-sensitive data. A few examples are user names, email addresses, and host names. NetWitness provides a range of controls that customers can leverage to protect privacy-sensitive data. These controls can be used in a variety of combinations to protect privacy-sensitive data, without significantly reducing analytical capability.

A user role for a Data Privacy Officer (DPO) supports the management of privacy-sensitive data. The DPO can configure NetWitness to limit exposure of metadata and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness include:

- Data Obfuscation
- Data Retention Enforcement
- Audit Logging

## Data Obfuscation

NetWitness has configurable options for data obfuscation. Data privacy officers and administrators can specify which meta keys in their environment are privacy-sensitive and limit where the meta values and raw data for those keys are displayed in the NetWitness network. In place of the original values, NetWitness can provide obfuscated representations to enable investigation and analytics. In addition, DPOs and administrators can prevent persistence of privacy-sensitive meta values and raw logs or packets.

Three methods work together to implement data obfuscation:

- Obfuscation of meta values for privacy-sensitive meta keys with an optional salt. Meta keys configured as protected are represented by obfuscated values at the time of creation on a Decoder or Log Decoder; the obfuscated values are hashed and considered to be impossible to read. To implement, you must configure the Decoder and Log Decoder hash algorithm and salt, and configure privacy-sensitive language keys as protected on all Core services.
- Role-based access (RBAC) to the raw logs or packets and the privacy-sensitive meta values. The DPO can use roles with granular permission capabilities to restrict what an analyst versus a data privacy officer is able to view during configuration, analysis, and investigation. The *System Security and User Management Guide* provides in-depth coverage of the RBAC implementation in NetWitness. To implement, you must configure metadata and content visibility per role on individual Brokers, Concentrators, Decoders, Log Decoders, and Archivers.

- Preventing persistence of privacy-sensitive meta values and raw logs or packets. To implement, you must configure meta keys on parsers for individual Decoders and Log Decoders as transient.

## Data Retention Enforcement

NetWitness can ensure that data is retained only as long as necessary or as specified. An administrator can configure data retention using age and time thresholds on a per-service basis. Schedulers running on each service automatically delete data meeting those thresholds. Once the data is deleted, it is no longer available through user interfaces, queries, or application programming interface (API) calls. Some of the NetWitness components also support purging of data through overwrites.

An administrator can manage data retention in several ways:

- Configure how long data persists in storage on the system.
- For Core services, strategically remove privacy-sensitive data that may have been written by configuring automatic removal of data of a specific age.
- Configure NetWitness so that original data is not sent or saved to the other components. If privacy-sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, and NetWitness Servers, data retention can be managed there as well. This configuration for Event Stream Analysis is managed in the Services Explorer view.

**Note:** If a situation arises where the DPO decides that already collected data is privacy-sensitive after the system is functional, the administrator can manually overwrite the data from databases or files where the data is saved.

## Audit Logging

Administrators can leverage audit logs that NetWitness creates using the Global Audit Logging feature. The audit logging feature generates audit log entries about many activities, and the following are examples of log entries that are relevant to data privacy:

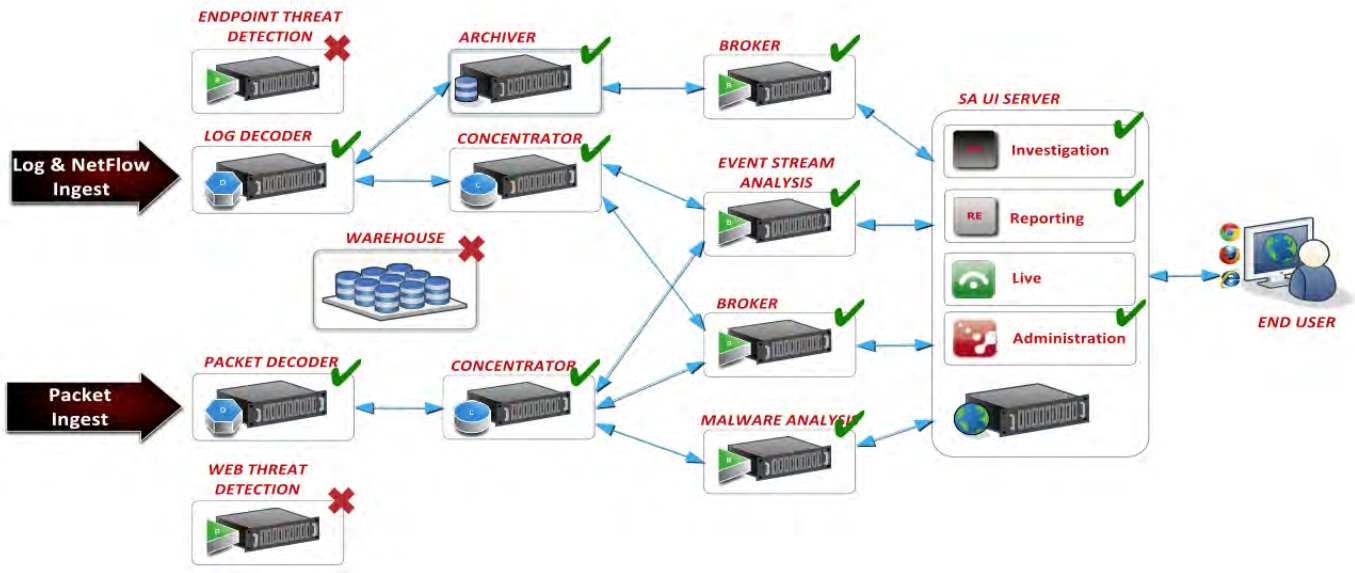
- Modifications to permissions and users assigned to roles.
- Failed and successful attempts to log on to NetWitness and log off.
- Data deletion.
- Data exports and downloads.
- Navigation by users to user interfaces and queries that users performed.
- Attempts (successful or not) to view or modify privacy-sensitive data, including an identification of the user who made the attempts.

All audit log entries are part of a standard audit trail for NetWitness. Administrators can configure NetWitness to forward audit logs to a designated destination, including third-party systems to provide additional filtering and reporting capabilities. For more information on Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

# Components Covered by the Data Privacy Feature

The figure below identifies the NetWitness components covered by the Version 11.x data privacy feature with a green check mark. Components marked with an X are not supported by data privacy functions. The *NetWitness Getting Started Guide* provides a functional description of NetWitness components.

**Note:** NetWitness data privacy features are not supported for Warehouse and protected metadata can make it to Warehouse through Warehouse Connector, unless explicitly configured to be filtered out using Warehouse Connector Meta Filters. If protected metadata makes it to Warehouse, users having direct access to Warehouse can query such data. Data privacy officers need to prevent that through administrative, technical, and procedural controls outside of NetWitness.



# Data Privacy Feature Implementation by Component

The following table identifies which data privacy features are supported for each NetWitness component. For each component, a check mark indicates if the component supports data obfuscation, data retention enforcement, data overwriting, and audit logging.

| Component | Data Obfuscation | Data Retention Enforcement | Data Overwriting | Audit Logging |
|---|---|---|---|---|
| **Ingestion** | | | | |
| Decoder | ✓ | ✓ | ✓ | ✓ |
| Log Decoder | ✓ | ✓ | ✓ | ✓ |
| **Meta Aggregation** | | | | |
| Concentrator | ✓ | ✓ | ✓ | ✓ |

| Component | Data Obfuscation | Data Retention Enforcement | Data Overwriting | Audit Logging |
|---|---|---|---|---|
| Broker | n/a | ✓ (stored in DPO cache only)[1] | | ✓ |
| **Real-Time Analysis** | | | | |
| Investigate | ✓ | ✓ (stored in DPO cache only)[2] | | ✓ |
| Event Stream Analysis | ✓ | | | ✓ |
| Malware Analysis | ✓ | ✓ | | ✓ |
| Respond | ✓ | ✓ | | ✓ |
| **Reporting** | | | | |
| Reporting Engine | ✓ | ✓ | | ✓ |
| **Long-Term Analytics** | | | | |
| Archiver | ✓ | ✓ | ✓(uncompressed)[3] | ✓ |
| Warehouse | | | | |

Notes:
1 - Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker using the Scheduler in the Services Config view Files tab.
2 - Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
3 - The overwriting procedure described in Configure Data Retention applies to uncompressed data.

## Component-Specific Configuration Guidelines

NetWitness components and modules that obtain access to privacy-sensitive metadata and their obfuscated counterparts are Investigate, Event Stream Analysis (ESA), Malware Analysis, Respond, and Reports. They get access to data based on the permissions defined for the role to which the user belongs. The Administrator or DPO configures each Decoder or Log Decoder to identify meta keys that are flagged for obfuscation.

These components have additional guidelines to ensure that they function as expected with a data privacy scheme:

- **Event Stream Analysis**. When ESA receives privacy-sensitive data from NetWitness core, ESA passes on only the obfuscated version of the data. ESA does not store or show protected data. There are some additional guidelines for configuring advanced EPL rules and enrichment sources as well as information on how to remove sensitive data globally from all alerts (see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules User Guide*).

- **Malware Analysis**. Malware Analysis references certain meta keys during scoring, including `alias.host`, `client`, and others. To ensure no loss of analytical functionality Malware Analysis should be configured as a trusted client; that is, configured to connect to the NetWitness Core infrastructure with an account equivalent to a user in DPO role. Otherwise, if meta keys referenced by Malware Analysis do get tagged for obfuscation and are not accessible to Malware Analysis, some of the Indicators of Compromise (IOCs) may be rendered ineffective.
- **Respond Server service.** The Respond Server service uses a data privacy mapping file to display obfuscated data in alerts.(see "Obfuscate Private Data" in the *NetWitness Respond User Guide*) and has a configurable data retention period for alerts (see "Set a Retention Period for Alerts and Incidents" in the *NetWitness Respond User Guide*).
- **Reports.** In Reporting Engine, each Core service is added as two separate data sources, using the two separate service accounts; one data source has a service account representing the Data Privacy Officer role and the other data source has a service account representing a non-Data Privacy Officer role. "Configure Data Privacy for Reporting Engine" in the *Reporting Engine Configuration Guide* provides procedures to configure data privacy for Reporting Engine.

# Recommended Configurations

This topic describes the recommended data privacy implementation for NetWitness and several additional use cases for managing exposure of privacy-sensitive data in NetWitness. Administrators can set up the NetWitness hosts and services to meet data privacy requirements for their environment. This section provides recommended configurations for data privacy and data retention.

## Recommended Data Privacy Configuration

The recommended configuration to obtain the best analytical value with data obfuscation enabled is to define privacy-sensitive metadata and keep both original and obfuscated (hash) values of privacy-sensitive data on disk for Decoders, Log Decoders, Concentrators, and Brokers.

The assumption is that only a handful of metadata (approximately 10 meta keys) will be classified as protected and a FIPS 140-compliant algorithm for hashing will be used along with a salt to make reverse engineering the original value difficult. The recommended solution is SHA-256 with a salt length of at least 16 characters and up to 60 characters.

**Note:** By default, hash values are stored in binary format for faster response times and because it requires less storage space in the database when compared to saving them in string format. The recommended storage method is text/string.

Brokers and Investigate may have original and obfuscated data in cache due to data privacy officers using Investigate to confirm the original value to which the obfuscated value maps during investigations. Downstream services can also limit the use of the original sensitive values to in-memory processing so that data does not persist on disk in those downstream systems; this holds true for ESA and Malware Analysis.

The recommended solution to delete data when ready is the built-in and automatic data retention enforcement, which deletes data at a certain threshold. You can use this method for the following components: Decoder, Log Decoder, Log Collector, Archiver, Malware Analysis, NetWitness Respond, and Reporting Engine. You can manually configure Event Stream Analysis to support similar automatic data retention enforcement.

To manage cache storage, the NetWitness Server clears cache related to investigations of events every 24 hours. The Broker can also be configured to execute a periodic removal of locally stored cache.

## Options for Data Retention Configurations

NetWitness provides alternative controls that the administrator can apply to enforce stronger restrictions on privacy-sensitive data storage when data obfuscation is enabled.

### Data Storage With Data Retention Options in Effect

The following table summarizes where data is stored in the default configuration with no data privacy as well as for each data retention alternative. A checkmark indicates that privacy-sensitive data is saved on the component; a blank indicates that no privacy-sensitive data is stored on the component.

| Component | Default Configuration | Data Storage Options | | |
|---|---|---|---|---|
| | Original Data Stored | Original Data and Hash Stored (recommended) | Only Hash Stored | No Data Stored (all metadata is transient) |
| **Ingestion** | | | | |
| Decoder | ✓ | ✓ | | |
| Log Decoder | ✓ | ✓ | | |
| **Meta Aggregation** | | | | |
| Concentrator | ✓ | ✓ | | |
| Broker | ✓ (Cache only) | ✓ (Cache only) | | |
| **Real-Time Analysis** | | | | |
| Investigate | ✓ | ✓ (Cache only) | | |
| Event Stream Analysis | ✓ | | | |
| Malware Analysis | ✓ | | | |
| Respond | ✓ | | | |
| **Reporting** | | | | |
| Reporting Engine | ✓ | ✓ (Optional) | | |
| **Long-Term Analytics** | | | | |
| Archiver | ✓ (Optional) | ✓ (Optional) | | |
| Warehouse | ✓ (Optional) | ✓ (Optional) | | |
| **Content** | | | | |
| Live | n/a | n/a | n/a | n/a |
| **Fraud Analysis** | | | | |
| RSA Fraud and Risk Intelligence Suite | n/a | n/a | n/a | n/a |

| Component | Default Configuration | Data Storage Options | | |
|---|---|---|---|---|
| | Original Data Stored | Original Data and Hash Stored (recommended) | Only Hash Stored | No Data Stored (all metadata is transient) |
| **End Point Protection** | | | | |
| NetWitness Endpoint | n/a | n/a | n/a | n/a |

Notes:
**Cache Only** means that sensitive data is in the Broker or NetWitness Server cache. Configure Data Retention provides details about automated and manual clearing of cache.
Optional means that sensitive data storage does occur, but can be limited by optional configurations. For example, to limit where sensitive data is stored, do not enable DPO access for Reporting and do not aggregate original protected data into the Archiver.

## Option 1: No Original Data Saved to Disk, Only Hash Stored

Administrators can eliminate the persistence of sensitive data to disk and store only an obfuscated value if the risk of exposure is too great. In this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and must use obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, data obfuscation must be enabled with hash values configured. You can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save the original values for meta keys identified as sensitive, storing only the hash of original values along with other non-sensitive metadata related to the event.

A side effect of these options is some loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds).
- Event stream analysis (ESA) and Malware Analysis systems must rely only on the obfuscated meta values when doing their correlation and scoring respectively.
- Reporting Engine is limited to pulling reports using the non-sensitive and obfuscated values.

- The data privacy officer cannot view the original value, but can use the configured hash and salt to determine if an obfuscated value represents a specific known original value.

### Option 2: No Original or Obfuscated Values Stored: Not Recommended

Administrators can eliminate the persistence of the original value to disk entirely if the risk of exposure is too great. As in Option 1, in this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and have no obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save not save the original values for meta keys identified as sensitive, storing only non-sensitive metadata related to the event.

A side effect of these options is significant loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds). See Configure Data Retention.
- All downstream components have no visibility in  the original values, obfuscated or otherwise.
- The data privacy officer has no visibility into the original value obfuscated or otherwise.

## Optional Data Overwriting Options

Several options for overwriting data are available, and you should thoroughly understand each one before implementing data overwriting.

### Option 1: Limit Disk Space for Continuous Overwriting of Older Data

If the desired data retention period to store the data, and therefore the amount of storage required for that data, is known, the size of the underlying hardware or the partition can be limited to that size. By reducing the hard drive storage or the partition size, the amount of free space available that has to be filled before new data overwrites it would also be limited. The newly ingested data continually overwrites the older data. Either solution must be done at deployment time to be effective.

Side effects of this option are:

- The removal of some disks will limit the number of resources available to distribute the I/O, causing some degradation in performance.

- The smaller partition size may cause some degradation in performance, but would alleviate some of the performance impact of removing disks.

## Option 2: Use Tiered Storage to Overwrite Data on a Scheduled Basis

If overwriting of data is required on a scheduled automatic basis, you can configure the Decoders and Concentrators to use tiered storage. The tiered storage configuration provides a mechanism for invoking a script after a database file has been removed from the application but prior to its removal from the file system. If necessary, instead of moving the file to the second tier, or cold storage, (the intended function in a tiered storage use case), the script can use a utility like the CentOS `shred` utility to overwrite the file. This tool is less effective when the database is stored in a journaling file system like XFS, in which the Core database resides, and on a RAID logical drive like the ones with which the Core hosts connect.

Most other NetWitness components do not have this option; their data is stored in a database that does not support the tiered storage mechanism. The only other component that could use this overwrite method is the Reporting Engine since it saves reports and alerts as individual files. However, the Reporting Engine charts are stored in a database so they would be immune to this technique.

## Option 3: Purge Data Using String and Pattern Redaction Option

Data purging provides a mechanism to strategically overwrite a specific subset of data from the system in case any sensitive data has been persisted either on purpose or by accident. The NetWitness `wipe` utility allows for unique patterns to be written over the data in the meta and packet databases for Core services, which may contain RAW packets or logs for existing sessions, based on a session identifier. All Core components have the capability to overwrite a subset of data that has been found by executing a query string, including regex patterns. The session identifiers resulting from the query are fed into the NetWitness `wipe` utility.

**Note:** This option is not available if the data in the Core database has been compressed (as typically done in Archiver deployments).

In most NetWitness components the database in use does not provide a built-in redaction or secure deletion mechanism. The Malware Analysis component can overwrite the data object in the database with the value `private` instead of deleting it during the data retention management process, but this is not meant to be a secure deletion mechanism.

**Caution:** Using this method on a large number of sessions has two drawbacks: it can be time-consuming and impact performance.

See Purge Data Using String and Pattern Redaction Option for procedure.

## Limitations to Data Overwriting

There are limitations to the overwriting techniques described as Option 2 and 3. To perform the overwrite of the data in the disk sectors, the above options for overwriting and the overwrite command line tool provided as an alternative method (`shred`, a function of CentOS) make assumptions about the disk layout. NetWitness hosts use SSD drives and RAID configurations for performance and reliability reasons, and these inhibit the functionality of the overwrite techniques. If overwrite techniques alter SSD drives and RAID configurations in an attempt to increase security, there will inevitably be an associated performance cost reflected in ingest rates, query speeds, and potentially other areas. The command line tools available for overwrite are recommended only for special use cases when it is necessary to redact specific data. The tools are not for use in a real-time continuous method because of the potential performance cost that will be incurred.

# Quick Start Procedures

This section provides end-to-end instructions for preparing to configure data privacy features, then completing the configuration of the recommended data privacy solution.

- Prepare to Configure Data Privacy
- Configure the Recommended Data Privacy Solution

# Prepare to Configure Data Privacy

This topic provides general guidelines for planning and configuring data privacy policies in the NetWitness network. Before beginning configuration, you must understand the data that needs to be protected on your network and develop a plan. You will need to:

1. Identify the meta keys that hold privacy-sensitive data and need to be protected. This decision is based on requirements specific to your site.
2. Decide which users need access to privacy-sensitive metadata and raw content. The first decision is whether to separate the DPO and administrator roles for your site by configuring a custom administrators system role on Decoder and Log Decoders and removing the `dpo.manage` permission. By default, administrators have all permissions including the ability to configure the salted hash transform used to obfuscate data; some sites may want to reserve this access for data privacy officers. "Service User Roles and Permissions" in the *Hosts and Services Getting Started Guide* has more details on exactly what permissions each role has and the purpose of the permissions.
3. Plan the configuration changes you need to make in your NetWitness deployment to support adequate data privacy.
4. Assess how your configuration may impact out-of-the-box and custom content. For example, by default content available through Live for Reporting Engine is not geared toward obfuscated meta values.

In a single deployment, certain data-privacy configurations in the Core services must be the same. The following table lists these settings and uses a checkmark to identify the services for which the configuration must be the same. In the heading, the following abbreviations are used: D = Decoder, LD = Log Decoder, A = Archiver, C = Concentrator, and B = Broker.

| | Configuration must be the same for these services: | | | | |
|---|---|---|---|---|---|
| **Setting** | **D** | **LD** | **A** | **C** | **B** |
| Hash algorithm and salt for privacy-sensitive data | ✓ | ✓ | | | |
| Language key data privacy attributes in the custom index file (includes configuring keys as protected) | ✓ | ✓ | ✓ | ✓ | ✓ |
| Transient meta keys (not persisted on disk) per service and parser | ✓ | ✓ | | | |
| Meta data and raw content visibility per system user group. (The meta keys must exist in the custom index file.) | ✓ | ✓ | ✓ | ✓ | ✓ |
| User who has the `Aggregation` service user role assigned is added.* | ✓ | ✓ | ✓ | | |

* When trying to access data on an aggregate service, the Log Collector or Broker requests authentication. When prompted to enter user name and password, you must authenticate as a user who is assigned the `Aggregation` service role. "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide* provides detailed information about this role. Follow the instructions in "Add, Replicate or Delete a Service User" in the *Hosts and Services Getting Started Guide* to create a user and assign the new user the Aggregation service user role.

# Configure the Recommended Data Privacy Solution

This topic tells administrators and data privacy officers how to configure the recommended data privacy solution in a NetWitness network. These are the basic steps to follow to configure the NetWitness system to identify sensitive data and determine who can see the sensitive data. The recommended configuration generates obfuscated values of certain original meta keys and then persists both the original and obfuscated data so that it is available to users assigned privileged role access.

This configuration has several parts:

1. Create two users with different levels of permissions. One user (the data privacy officer) can view all metadata and another user (an analyst) is restricted from seeing certain metadata and content with associated metadata.
2. Set up two transforms using a salt and hash to create an obfuscated version of original `username` and `ip.src` meta keys.
3. Configure data retention on the Decoder and Concentrator services.

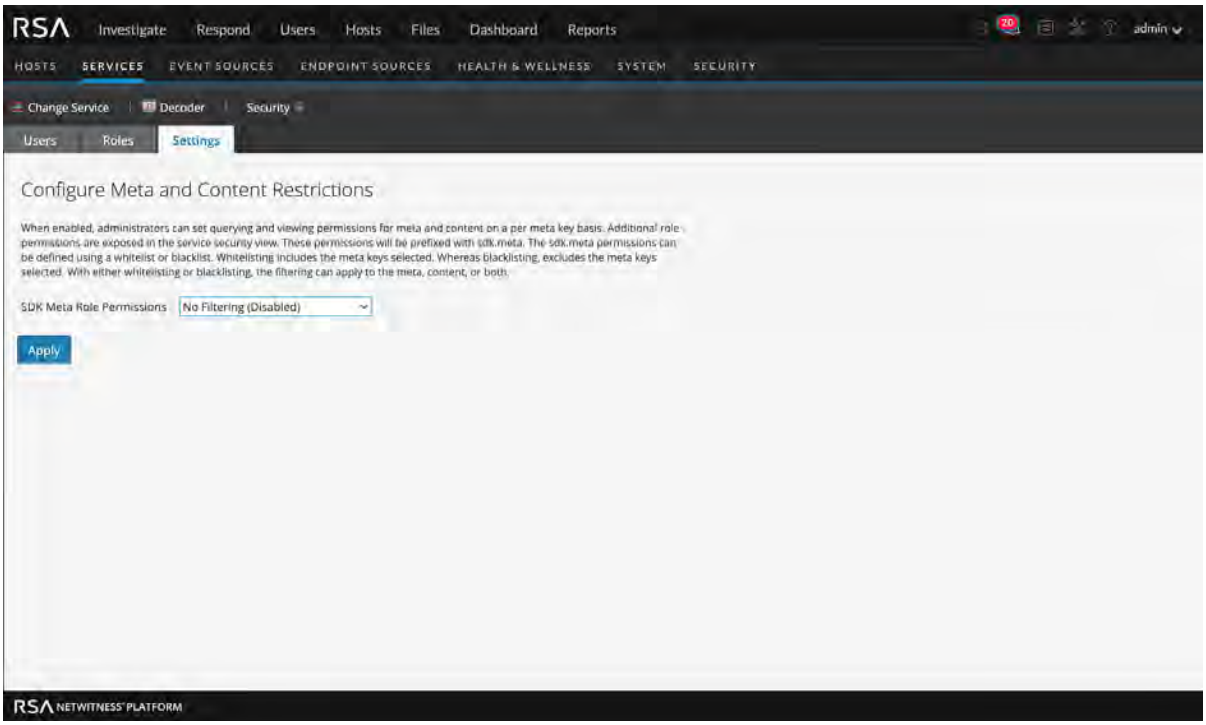
**Note:** The following conditions are required in order to complete this procedure:
-The Concentrator and Decoder must be added to the NetWitness Server using trusted connections.
-The NW Server version must be 11.x or later.
-The Core services must be 11.x or later.
-Aggregation must use Aggregators accounts on all Core services.

## Configure Metadata and Content Restrictions on Brokers, Concentrators, and Decoders

**Note:** In version 11.6, if these 12 metas namely `'sessionid','nwe.callback_id', 'medium','session.split','ip.dst','ip.src','ipv6.src','ipv6.dst','tcp.dstport','tcp.srcport','udp.dstport', and 'udp.srcport'` are restricted then the group events option will be disabled.

To restrict the metadata and raw content that users can view, you must enable SDK system roles to allow more granular controls by configuring metadata and content restrictions on each service in the Services Security view.

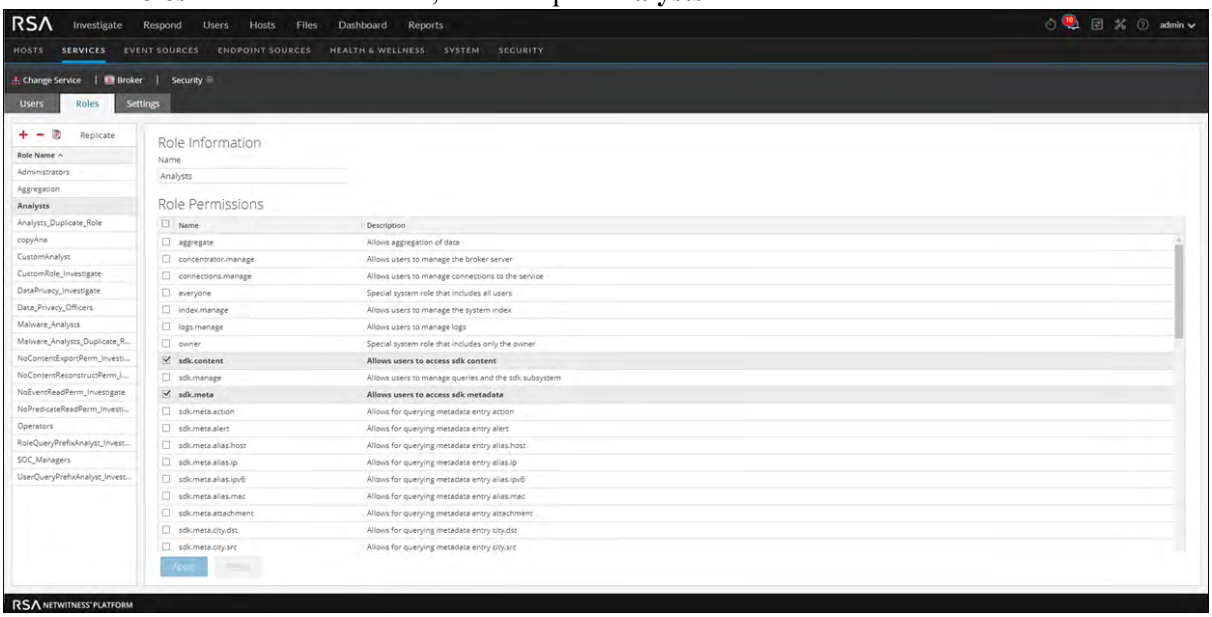
1. Go to **(Admin)** > **Services**, select a service and then select **> View > Security**.
2. Click the **Settings** tab.



3. In the **SDK Meta Role Permissions** field, select **Blacklist meta and content**. Click **Apply**.

   This allows the administrator to blacklist individual meta keys so that only the data privacy officer can see the meta keys and content. New roles per meta key are added to the Roles tab.

4. Click the **Roles** tab and select a role, for example **Analysts**.



5. In the **Roles** tab,
   a. Select the meta keys that you do not want analysts to see, for example, select `sdk.meta.username` and `sdk.meta.ip.src`.
   This restricts the analyst from seeing the privacy-sensitive meta keys `username` and `ip.src` as well as any content for any session that contains that metadata within it.
   b. Ensure that `sdk.packets` is selected.
   If it is de-selected, analysts lose the ability to bulk export raw packets and logs. In RSA Security Analytics 10.6, Role-Based Access Control (RBAC) for the `/sdk packets` command was either on or off, per user. Restricted users usually had access removed, so pcap generation from Investigate was not allowed even for sessions that did not have restrictions. In RSA NetWitness Platform 11.0 and later, RBAC just works for packets. Sessions that are restricted are just skipped during pcap generation in Investigate. Sessions that are allowed have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.
   c. Click **Apply**.
6. In the Roles tab, ensure that the `Data_Privacy_Officers` role has no `sdk.meta.values` selected. Click **Apply**.

   A DPO can view any metadata and any session.

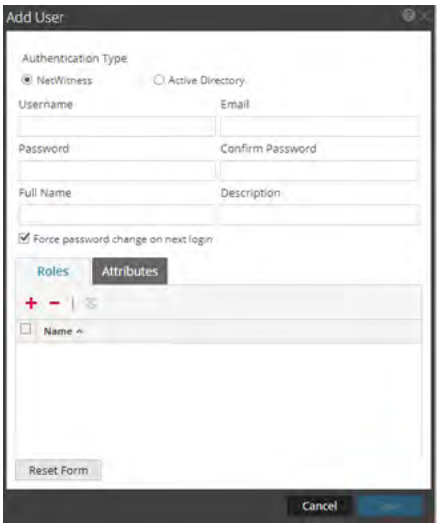
   In the Roles tab, ensure that the `Aggregation` role has the following permissions: select `aggregate`, `sdk.content`, `sdk.meta`, and `sdk.packets`.

## Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You must add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

**Note:** The role name is required to exist on both the server and the services, and the role name for all must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. Go to **(Admin)** > **Security**, select the **Users** tab. In the **Users** tab toolbar, click .
   The Add User dialog is displayed.



b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy1!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. Click the Roles tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

   a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click .

      The Add User dialog is displayed.

   b. Create the new account with the following credentials:

      Username = <new user name for logon, for example, NonprivAnalyst>
      Email = <new user's email, for example, NonprivAnalyst@rsa.com>
      Password = <new user's password for logging on, for example, RSAprivacy2!@>
      Full Name = <new user's full name, for example, Nonprivileged Analyst>

   c. Click the Roles tab, , and select the `Analysts` role for the new user.

   d. Select **Save**.

## Configure Obfuscated Data on Decoders and Concentrators

This procedure creates the obfuscated values to provide to users who do not have access to the original values.

1. Configure a salt so that the obfuscated value becomes unique. Different companies may have analysts of the same first name and potentially the same login username, and using a salt limits the possibility of someone outside your organization determining your obfuscation mechanism. In this example, you use a simple salt and SHA-256, but the salt is configurable and the hash algorithm can be changed. For additional information, see Configure Data Obfuscation.

   a. To define the salt and hash algorithm, go to **(Admin) > Services**.

   b. Select a Decoder in the **Admin Services** view and select > **View > Config**.

   c. Click the **Data Privacy** tab, and select hash algorithm (SHA-256). In the Salt field, type a hash, for example, **rsasecurity**, and click **Apply**.

2. Define the transforms, including the hash format, between the original meta key and obfuscated meta key on the Decoder. The default hash format is binary, but the recommended configuration calls for using the text/string format.

   a. While still in the Services Config view, click the **Files** tab, and in the drop-down menu select **index-decoder-custom.xml.** (You can apply this same configuration to the Log Decoder in the `index-logdecoder-custom.xml` file.)

   b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key name="username" description="Username" format="Text"
protected="true"><transform destination="username.hash"/></key>
<key name="username.hash" description="Username Hash"
format="Text"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
protected="true"><transform destination="ip.src.hash"/></key>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text"/>
</language>
```

   c. To restart the Decoder service, go to **(Admin)** > **Services**, find the Decoder service you want to restart, and select > **Restart**.
   The service should automatically restart.

3. Define the meta keys on the Concentrator in the `index-concentrator-custom.xml` file:

   a. Go to **(Admin)** > **Services**, select a Concentrator in the **Admin Services** view, and select > **View > Config**.

   b. Click the **Files** tab, and in the drop-down menu select **index-concentrator-custom.xml**

   c. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexValues" defaultAction="Auto">
<key name="username" description="Username" format="Text"
level="IndexValues" protected="true"/>
<key name="username.hash" description="Username Hash"
format="Text" level="IndexValues" token="true"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
level="IndexValues" protected="true"/>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text" level="IndexValues" token="true"/>
</language>
```

d. To restart the Concentrator service, go to **(Admin)** > **Services**, find the concentrator service you want to restart, and select > **Restart**.
The service should automatically restart.

## Configure Data Retention on Concentrators and Decoders

Data retention configuration ensures that the data residing in the NetWitness Core components is deleted after a certain time. Configuring data retention on Concentrators and Decoders is not required for all environments, but it may be necessary to be in compliance with applicable laws and regulations. It is important to evaluate an appropriate retention period for your environment. The Data Retention Scheduler settings that you set apply to ALL data on a Concentrator or Decoder.

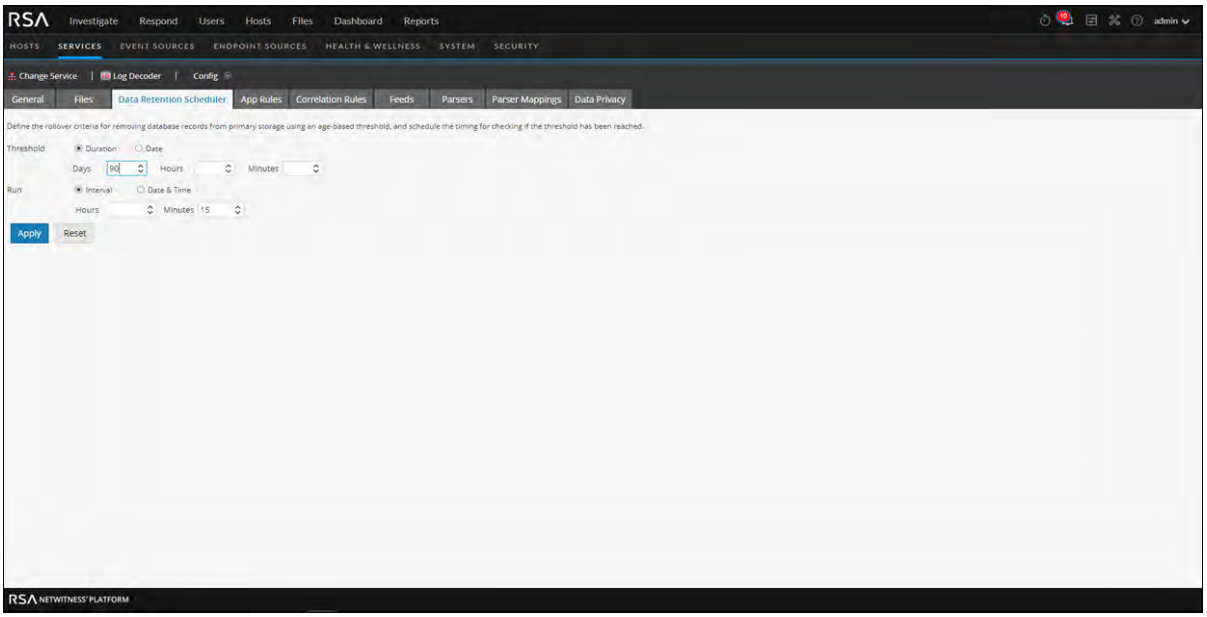
In the following example, NetWitness is configured to execute a check every 15 minutes to determine if the duration threshold has been met. If the threshold is met, NetWitness deletes data older than 90 days in the relevant databases.

**Caution:** The 90 day retention period is just an example. Adjust your rollover criteria depending on the location of the data and the applicable laws. In a strict data privacy environment, such as in Europe where laws require that Personally Identifiable Information (PII) not be saved or removed frequently, you may need to adjust the time.

This procedure is optional. If you do not set a time retention limit, the system automatically deletes the oldest data when the hard drive space is full.

### (Optional) For each Concentrator and Decoder:

1. Navigate to the **Services Config** view **> Data Retention Scheduler** tab.



2. Define the data retention period. For example, set the **Threshold** to **Duration**, and type **90** in the **Days** field.
3. Define how often the scheduler checks to see if the threshold has been met. For example, set the runtime to **Interval** and select **15** in the **Minutes** field.
4. To save the configuration, click **Apply**.

## Validate Data Privacy Protection

At this point, users have been added with roles that have permissions around specific types of metadata. The next step is to make sure the restricted user (the analyst) cannot view what the unrestricted user (the DPO) can. Also you need to ensure that the data retention configuration is limiting how long data is kept on the systems.

1. View role-based obfuscation in action:
   a. Log on as the unrestricted user (DPOadmin) and make sure this user can see all the data including the protected sensitive data `username` and `ip.src` along with any session that contains that metadata.
   b. Log off and the back on as the DPO user.
   c. For each Decoder and Log Decoder, import a PCAP or logfile into the Services System view. Go to **(Admin)** > Services, click a service, and use the **Upload Packet Capture File** option to upload a PCAP file that contains `username` and `ip.src` metadata.
   d. When the import is complete, go to **INVESTIGATE > Navigate**, select the Concentrator connected to the Decoder to which the data was just imported.

e. Scroll down to make sure the `username` and `ip.src` meta keys and corresponding values are visible.

f. Click one of the green numbers next to a `username` or `ip.src` value and verify that the session loads in the Events view.

g. Make a note of the session ID to check when logging on as the restricted user.

h. Log off and log on as the restricted user (NonprivAnalyst).

i. Repeat steps c through f to verify that the user cannot see any `username` or `ip.src` metadata or sessions with that metadata including the one previously mentioned.

j. To jump to a specific session in the **Navigate** view, in the **Actions** menu, select **Go to Event** and enter the session ID.

2. Validate that the data retained in the database falls within the retention time configured in the Data Retention Scheduler.

   a. Log off and log on as the unrestricted user (DPOadmin).

   b. On the Concentrator, navigate to the **Services > Explore** view.

   c. In the node tree, select the **database** node and then **stats**.

   d. Observe the `meta.oldest.file.time` value and verify that this is not older then the threshold put on the data retention scheduler.

   e. Change the service to the Decoder and repeat steps b through d, check for `stats meta.oldest.file.time` and `packet.oldest.file.time`.

# In-Depth Procedures

This topic is a collection of procedures that a Data Privacy Officer uses to implement a data privacy plan for the NetWitness network. These procedures are part of an overall configuration, and are performed as needed to implement the data privacy plan and manage the flow of information in the network.

- Configure Data Obfuscation
- Configure Data Retention
- Configure User Accounts for Use in Data Privacy

# Configure Data Obfuscation

This topic provides the procedures for configuring data obfuscation in NetWitness. In a single deployment, all Core service configurations for a data privacy solution must be the same; be sure to use the same hash and salt across all Decoders and Log Decoders.

**Note:** In order for data obfuscation to work, user accounts need to be configured as described in Configure User Accounts for Use in Data Privacy.

## Configure the Decoder Hash Algorithm and Salt

Value hashing accomplished as part of the data privacy solution occurs at the time of meta key creation on the Decoder and Log Decoder. Both services have default settings for use with all meta keys whose values are transformed without a specified hash algorithm type or salt value. The initial NetWitness values for defaults are: hash algorithm (SHA-256) and salt (none).

**Note:** The SHA-1 algorithm and it is not available.

If you want to change the default settings, you can edit them in the Services Config view > Data Privacy tab or in the following nodes in the NetWitness Services Explorer view:

- `/decoder/parsers/transforms/default.type`

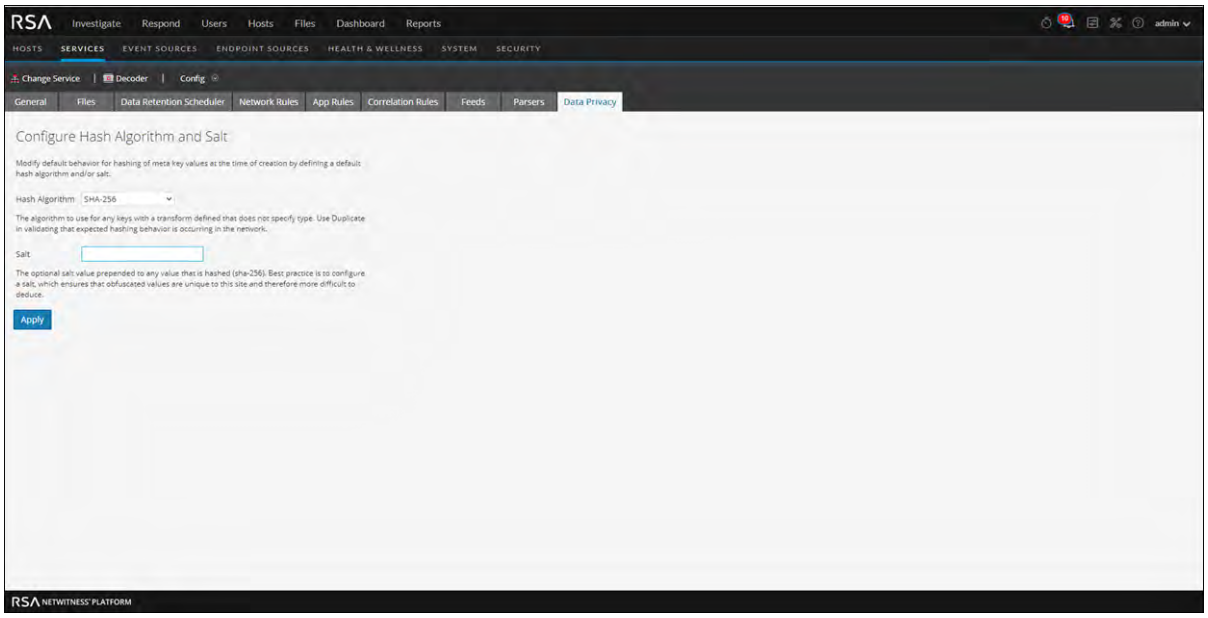
  The algorithm to use for any keys with a transform defined that does not specify `type`. The supported algorithms are: `duplicate` and `sha-256`.

- `/decoder/parsers/transforms/default.salt`

  The salt value prepended to any value that is hashed (`sha-256`). This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. A salt of up to 60 characters can be used without any major impact. A salt of at least 16 characters is recommended.

To edit the default hash algorithm and salt:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Decoder or Log Decoder service, and select **> View > Config > Data Privacy**.



3. In the **Configure Hash Algorithm and Salt** section, select a **Hash Algorithm** to use for any meta keys with a defined transform that does not specify type: `sha-256`. (A second algorithm, `duplicate`, is available for administrators to use in validating that expected hashing behavior is occurring in the network.)
4. (Optional) In the **Salt** field, enter a salt value to be prepended to any value that is hashed. This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. If a unique salt is required for each individual meta key, that needs to be configured in the index file as shown in example 3 below.
5. Click **Apply**.

   The new settings become effective immediately.

## Configure Language Keys

The NetWitness Core Language has several language key attributes to facilitate data privacy. You can edit these attributes in the custom index file for each Decoder or Log Decoder. The custom index file (for example, `index-decoder-custom.xml`) is editable in the Services Configuration view > Files tab. After making changes in the index file, like the ones shown in the examples below, a service restart in a specific sequence is required.

Based on the data privacy requirements for your site, configure individual meta keys to be protected using the following `key` attributes:

- `protected`

  This attribute specifies that NetWitness should consider the values as protected and tightly control any release of the value. When propagating the protected attribute, NetWitness ensures that any downstream trusted system treats the values accordingly. Add this attribute to all services that create the protected values (that is, Decoder or Log Decoder) and any services that will provide trusted access (software development kit (SDK) query/values, aggregation) outside of Core services. The exception to this rule is that a Broker with no index file specified does not need to have the attribute added.

- `token`

  This attribute specifies that values for this key are stand-ins for another value and may not be visually interesting. The `token` attribute is informational, primarily for UI elements to display the value in a more useful or visually pleasing format.

- `transform`

  This child element of `key` indicates that any values for a given meta key should be transformed and the resulting value persisted in another meta key. The `transform` element is only required on Decoders and Log Decoders and is informational if specified on any other Core services. The `transform` element has the following attributes and children:

| Name | Type | Description | Optional or Required |
|---|---|---|---|
| `destination` | attribute | Specifies the key name where the transformed value will be persisted. | required |
| `type` | attribute | The transform algorithm to apply. If not specified, the value of `/decoder/parsers/transforms/default.type` is used. | optional |
| `param` | child-element | A name/value pair, where each `param` element has a required attribute `name` and the child text is the value.<br>The only supported `param` is used to specify a meta key-specific `salt` value. If not specified, the following value is used:<br>`/decoder/parsers/transforms/default.salt` | optional |

## Example 1

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.hash` with the default algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.hash"/></key>
```

## Example 2

On a Concentrator, mark `username` as protected and `username.hash` as token:

```
<?xml version="1.0" encoding="utf-8"?> <language level="IndexNone"
defaultAction="Auto">
<key description="Username" format="Text" level="IndexValues" name="username"
protected="true"/>
<key description="Username Hash" format="Binary" level="IndexValues"
name="username.hash"
token="true"/> </language>
```

### Example 3

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.bin` with the specified algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.bin" type="sha-256">
param name="salt">0000</param> </transform></key>
```

## Configure Metadata and Content Visibility Per User Role on Core Services

On individual Broker, Concentrator, Decoder, Log Decoder, and Archiver services being viewed in the Services Security view (**Admin) > Services > Security**), administrators can configure the visibility of metadata and content based on the user group or role assigned to a user. This is called the SDK meta roles capability, and it is enabled by default. Administrators who want to configure metadata and content visibility per user must not disable the `sdk.content` permission (in the Roles tab). If the `sdk.content` permission has been disabled in the Roles tab, packets and raw logs are not visible to `system.roles` node. The `system.roles` node handles the filtering using the method configured in the Settings tab.

With `sdk.content` capability enabled, the next step is to select the method of filtering metadata and content in the Settings tab. Selecting a blacklist or whitelist option makes additional permissions for specific meta keys available in the Roles tab. The result is that administrators can choose a user role, such as analyst, in the Roles tab and select specific meta keys (and content) to be blacklisted or whitelisted for that user group. The permissions apply to any user in the user group.

For the Events view to display events correctly, the `sdk.meta.medium` meta key must be enabled to display values in the Type column (one of the default columns in the Events list). In addition, any meta keys used in a Query Prefix under User Settings in the Users tab or a PreQuery configured for Investigate must be enabled (**Admin) > Security > Users** or **(Admin) > Security > Roles**). If the meta key is not enabled for the user group, the column will not be displayed in the Events list.

**Note:** In the Version 11.4 and later Events panel, events are listed even when the user does not have permission to view the event reconstruction. In addition, the download options may still be available when a user does not have permission to view the event reconstruction. In these cases the user is allowed to download the events, but the output is an empty file because restricted permissions are enforced during the download.

The following table lists the options for filtering in the Settings tab and the numeric values used to disable (0) and the types of filtering (1 through 6). There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

| system.roles Node Value | Settings Tab Option | Event Metadata | Original Event |
|---|---|---|---|
| 0 | **No Filtering.**<br>System roles that define permissions on a per meta key basis are disabled. | Visible | Visible |
| 1 | **Whitelist meta and content.**<br>By default no meta keys and no packets are visible. Selecting individual SDK meta roles per user group allows users to see metadata and packets for that SDK meta role. | Not Visible-Select to Show | Not Visible-Select to Show |
| 2 | **Whitelist only meta.**<br>By default packets are shown, but no metadata is visible. Selecting individual SDK meta roles per user group allows users to see metadata for that SDK meta role. | Not Visible-Select to Show | Visible |
| 3 | **Whitelist only content.**<br>By default metadata is visible, but no packets are visible. Selecting individual SDK meta roles per user group allows users to see packets for that SDK meta role. | Visible | Not Visible-Select to Show |
| 4 | **Blacklist meta and content.**<br>By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata and packets for that SDK meta role. | Visible-Select to Hide | Visible-Select to Hide |
| 5 | **Blacklist only meta.**<br>By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata for that SDK meta role. | Visible-Select to Hide | Visible |
| 6 | **Blacklist only content.**<br>By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing packets for that SDK meta role. | Visible | Visible-Select to Hide |

Three factors determine what a user sees:

- The SDK meta role setting (blacklist or whitelist).
- The restricted meta keys configured for the group to which the user belongs.

- The meta keys in the session being analyzed. These include meta keys specified in a query prefix for a user at the service level, and for roles and users at the system level.

**Caution:** Be aware that with blacklisting, implicit trust is granted for all except the configured metadata. For a Decoder to have RBAC enabled and use implicit trust, it must only use a blacklist system setting; a whitelist setting will result in some issues with meta keys that are not explicitly enabled and therefore not visible. It is impossible to grant implicit trust under whitelist rules because the universe of meta keys cannot be known. If you want to use whitelisting, a workaround is to turn RBAC off for the Decoder and disable any user accounts from connecting directly to the Decoder if they should use RBAC.

Here is an example of how the SDK meta role configuration meshes with a Group that has restricted meta keys.

**Configuration:**

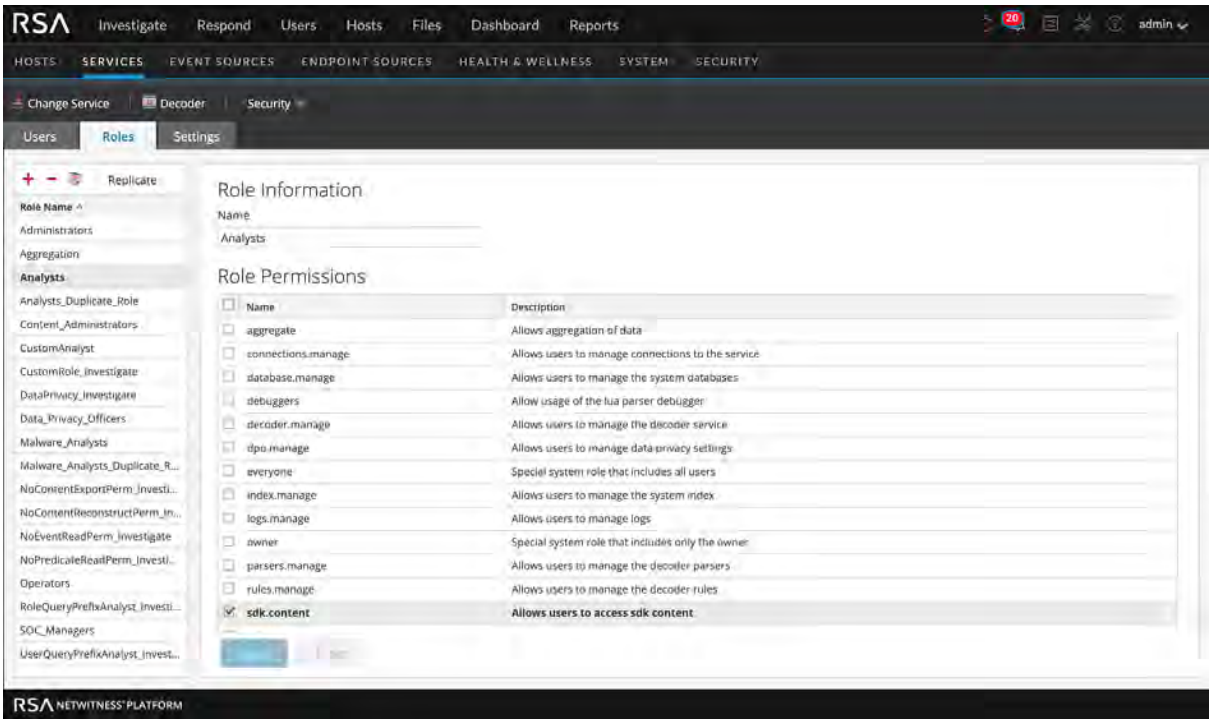
- The SDK meta role setting is **Blacklist meta and content**. With this option implemented, all metadata and all content (packets and logs) are visible by default.
- The administrator has restricted meta keys configured for the Analysts group to prevent viewing of sensitive data (for example, `username`).
- The packets and logs for any session that includes the `username` meta key are not visible to an analyst.

**Result:** Now a user who is a member of the Analyst Group investigates a session. Depending on the content of the session, the results are different:

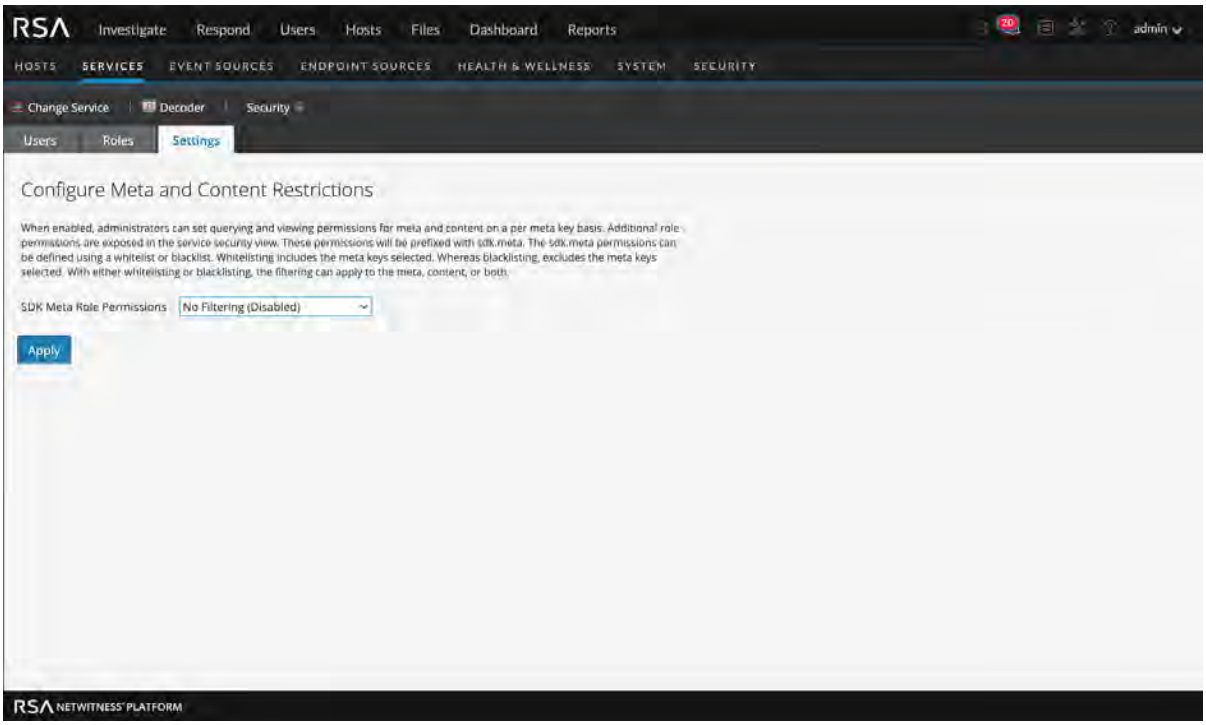
- Session 1 includes the following meta keys: `ip`, `eth`, `host`, and `file` The session does not include `username` so all packets and logs in the session are displayed.
- Session 2 includes the following meta keys, `ip`, `time`, `size`, `file`, and `username`, Because the session includes `username` , no packets or logs from the session are displayed for the analyst.

To configure metadata and content restrictions for a Decoder or Log Decoder:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Broker, Concentrator, Decoder, Log Decoder, or Archiver service and select **> View > Security**. Click the **Roles** tab, select a role, and verify that the `sdk.content` permission is enabled.

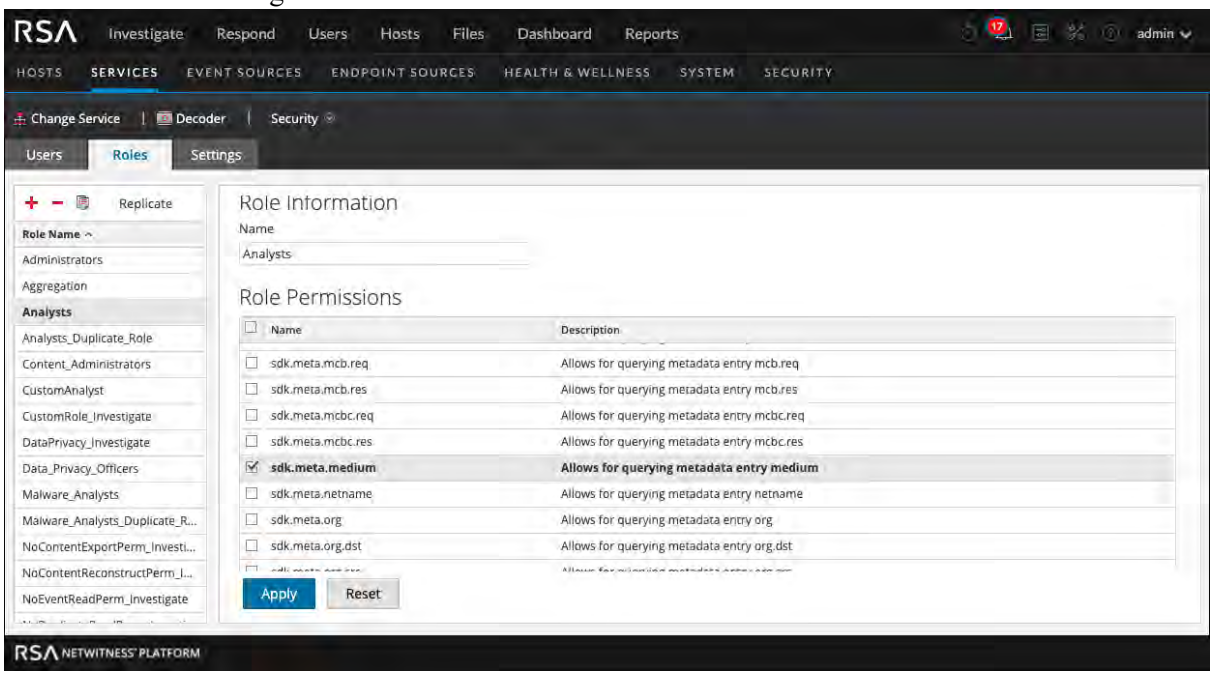


3. Click the **Settings** tab.



4. Select one of the filtering methods (blacklist or whitelist) and content types (meta and content, meta only, or content only), and click **Apply**.
5. Click the **Roles** tab and a role for which you want to allow content (whitelist) or block content (blacklist) as specified in the SDK Meta Role Permissions setting.

The Role Permissions for the selected role are displayed, and the SDK Meta Role Permissions are available for selection, for example, `sdk.meta.medium`. If you selected one of the whitelist options in the SDK Role Permissions setting, you must assign each SDK meta role to make the selected content visible to users assigned that SDK meta role. The `sdk.meta.medium` permission must be enabled in order for the Type column to be displayed in the Investigate > Events view. If you selected one of the blacklist options in the SDK Role Permissions setting, selected content will be hidden from users assigned that SDK meta role.



6. Select the SDK meta role permissions for users assigned this role. Click **Apply**.

The settings become effective immediately and apply to new packets and logs processed by the Decoder or Log Decoder.

## Configure Meta Keys Not Written to Disk Per Parser on a Decoder

On a Decoder and Log Decoder, a Data Privacy Officer can configure individual meta keys that are not written to disk. To do so, the DPO specifies the meta keys as transient in the index and the parser configuration.

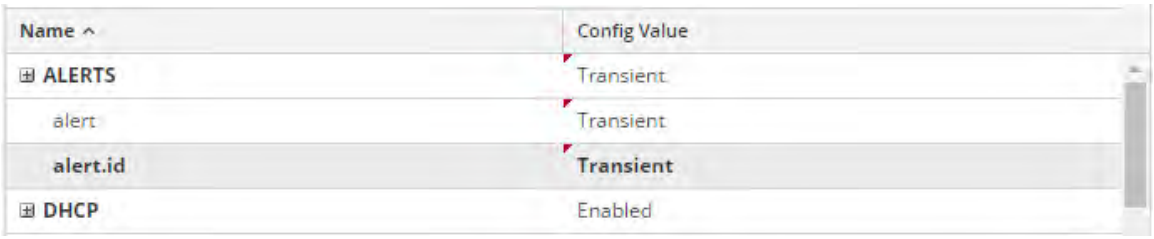
**Note:** The same capability was previously available on Log Decoders, and was configured when setting up parsers by modifying the table-map.xml file. Now it is integrated in the Services Config view.

To configure selected meta keys on individual parsers that will not written to disk:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder or Log Decoder service and select **> View > Config**.

3. In the **Parsers Configuration** section of the **General** tab, select a parser and then select **Transient** in the **Config Value** drop-down list. Access the list by clicking on the configuration value (Enabled, Disabled, or Transient).

   The configuration change is marked by a red triangle.



4. Click **Apply**.

   The change is effective immediately. The parser configured as Transient will no longer store meta keys to disk.

# Configure Data Retention

A NetWitness user with the role of Administrator can configure NetWitness to ensure that sensitive data has been removed after a specific retention period, regardless of system ingest rate. For instance, the policy might be to keep packets (both raw data and metadata) for no more than 24 hours, and to keep some logs (both raw data and metadata) for up to seven days. If sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, Event Stream Analysis, and NetWitness Servers, data retention can be managed there as well. The administrator needs to set up each service individually across all NetWitness components (except Event Stream Analysis) based on policy and data privacy laws.

Sensitive data may also be in cache.

- Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker by editing the `Scheduler` file in the Services Config view Files tab.
- Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
- If the Data Privacy Officer (DPO) exports data, that is the same as saving data on the NetWitness Server in the jobs queue. To clear this data, the administrator or DPO should clean up the jobs queue on a regular basis.

## Data Retention

You can schedule a recurring job for Decoder, Log Decoder, and Concentrator services in NetWitness to check if data is ready to be removed. The Data Retention Scheduler provides a means to configure basic scheduling (see below), and advanced Scheduler settings are also available by editing the `Scheduler` file in the Services Config view Files tab or the node in the Explorer view.

The Archiver has flexible data storage and retention options. You can place different types of log data into individual collections and manage them separately. These collections enable you to specify how much of the total storage space to use and how many days to store the logs in the collection. You can also determine whether to delete the log data or to move it to offline cold storage after it reaches the maximum specified storage space for the collection.

For example, you can put sensitive information in a collection and configure a limitation on how long to keep it, such as 30 days. To delete the data after 30 days, you would not enable warm or cold storage for that collection.

## Deleting versus Retaining Log Data

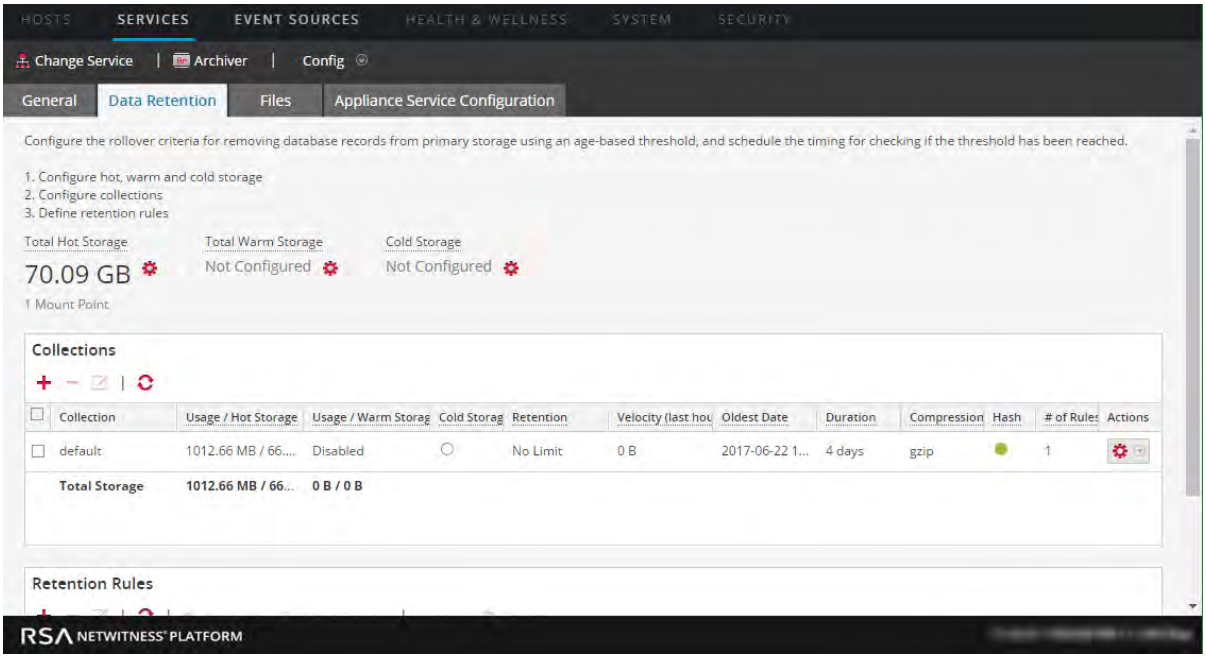
Administrators can configure hot, warm, and cold tiered storage on an Archiver. Cold storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. You can choose whether to enable cold storage for each log storage collection. NetWitness does not manage cold storage.

## Enable or Disable Cold Storage in a Log Storage Collection

When log data in a collection reaches its retention limits for hot and warm storage, you can delete it or move it to offline (cold) storage.

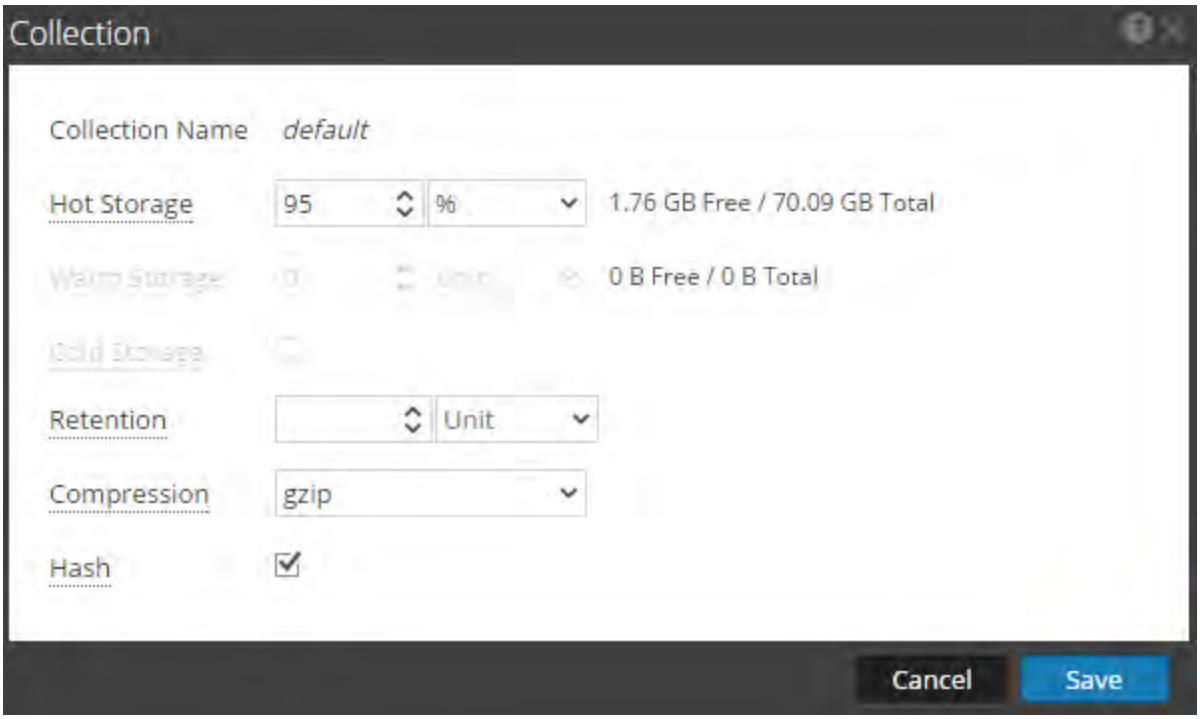
To enable or disable cold storage in a log retention storage collection on an Archiver:

1. Go to **(Admin)** > **Services**.
2. Select the Archiver service and select **> View > Config**.
3. Click the **Data Retention** tab.



4. In the **Collections** section of the Data Retention tab, select a collection and click .

   The Collection dialog is displayed.



**Note:** If the maximum storage size of the collection does not allow full data retention for the retention period specified, NetWitness deletes the data or it goes to warm or cold storage if specified in the collection.

5. Enable or disable cold storage:
   - To delete log data when the collection reaches its specified retention limits, clear the **Cold Storage** checkbox.
   - To move log data to offline storage when the collection reaches its specified retention limits, select the **Cold Storage** checkbox.
6. Click **Save**.

## Configure Log Retention and Storage on an Archiver

To configure log retention and storage on an Archiver, see "Configure Archiver Storage and Log Retention" in the *Archiver Configuration Guide*.

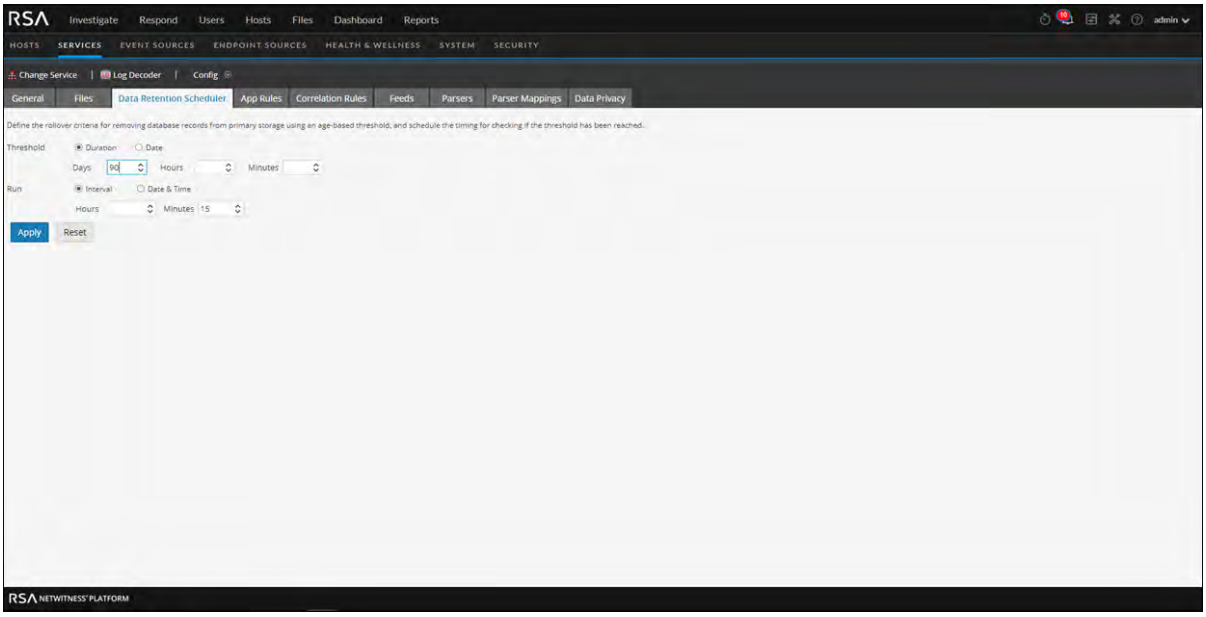
## Schedule a Recurring Job to Check Data Retention Thresholds

The data retention scheduler configuration ensures that the data residing in the Decoder, Log Decoder, and Concentrator components is deleted after a certain time. For example, data retention on a Decoder might be configured to execute a check every 15 minutes to determine if the specified duration threshold has been met. If the threshold is met, NetWitness deletes data older then 4 hours in the relevant databases.

**Caution:** The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

For a  Decoder, Log Decoder, or Concentrator:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder, Log Decoder, or Concentrator service and select **> View > Config**.
3. Click the **Data Retention Scheduler** tab.



4. Set the threshold based on the duration of time the data has been stored or the date on which the data was stored. Do one of the following:
   a. To define the duration of time that data can be stored before removal, select **Duration**, and then specify the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.
   b. To define the removal of data based on the date of the timestamp, select **Date**, and then specify the monthly date and time in the Calendar and Time fields.
5. Do one of the following to configure the **schedule for checking rollover criteria**:
   a. If you want to set a regular interval at which the scheduled database check occurs, select **Interval** and specify the **Hours** and **Minutes** between the scheduled checks.
   b. If you want to set a regular date and time at which the scheduled database check occurs, select **Date and Time** and specify the system clock time in `hh:mm:ss` format for the rollover.
      - To specify the day, select **Every Day**, **Weekdays,** or **Weekends**. The Scheduler defaults to **Every Day**.

- To specify a different set of days of the week, select **Custom** and click on each day on which the database check occurs.

  **Caution:** The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

6. Click **Apply** to complete the configuration.

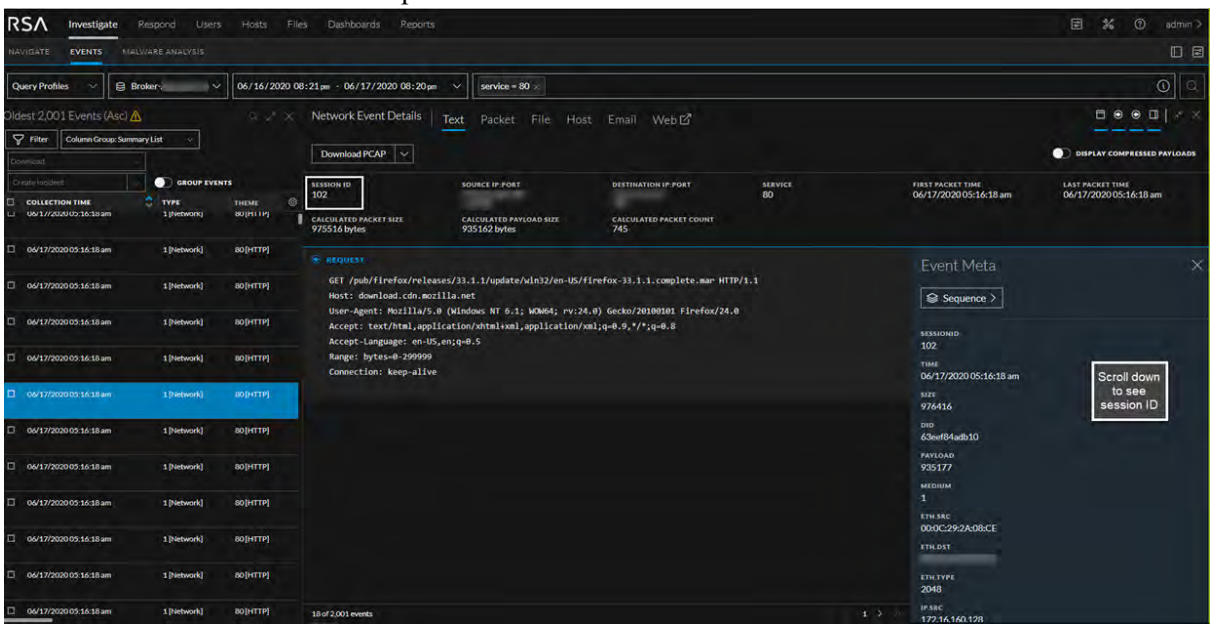
## Purge Data Using String and Pattern Redaction Option

If you have data where you do not want it to be (for example, you have classified data in your unclassified Network Decoder), purging data using string and pattern redaction is the fastest way to wipe data. It is ideal for smaller amounts of data. This method requires that you identify the data to be purged by using a query in either the Investigate view, the REST API interface, or the NwConsole. Using the Investigate view requires additional steps to clear user interface cache on the admin server. This procedure includes the extra steps needed when you find the data to be purged using the Investigate view.

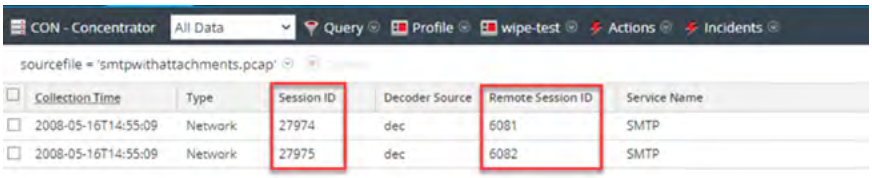
**Note:** If a large amount of data needs to be purged, it is best to start with the data on the storage component. Refer to Optional Data Overwriting Options for additional information.

To purge the data:

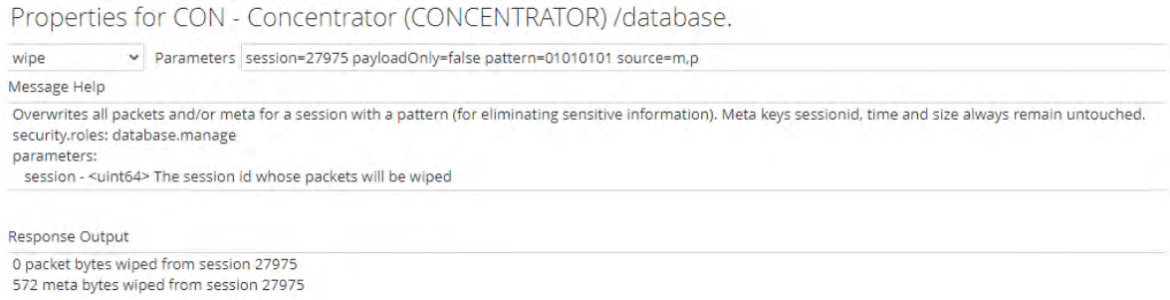
1. Go to **INVESTIGATE** > **Events** or **INVESTIGATE** > **Legacy Events** and find the events that you want to purge. In the Events view you can see the session ID in the reconstruction header. You need to scroll down in the Event Meta panel to see the remote ID.



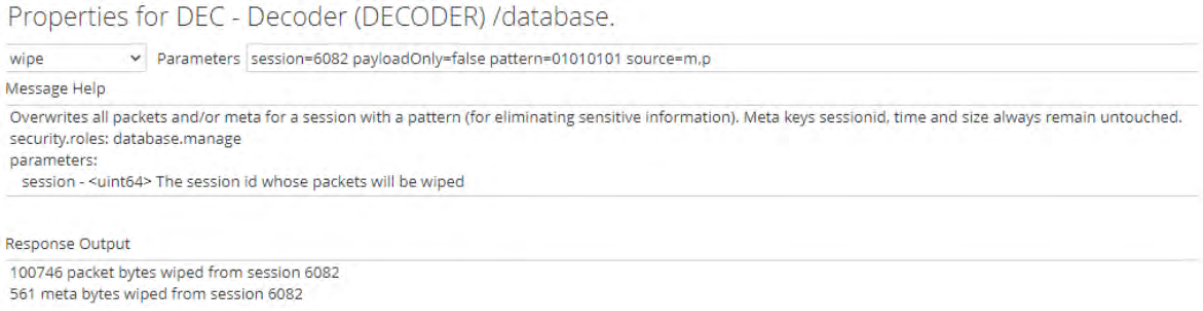
In the Legacy Events view, both IDs are visible in the Events list.



2. Make a note of the session ID and the remote ID of each event to be deleted. In the example above, the session IDs are 27974 and 27975. The remote IDs are 6081 and 6082.
3. Starting with the Concentrator, view the service using the REST API. Refer to the *RESTful API User Guide* for instructions. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
   In the REST API, enter the `wipe` command with the following parameters:
   - **`session=<uint64>`**: The session ID whose packets will be wiped.
   - **`payloadOnly=<bool, optional>`**: If `payloadOnly` is `true`, only the packet payload will be overwritten. The default value is `true`.
   - **`pattern=<string, optional>`**: The pattern uses all zeros by default. If you use a string as your pattern, it will not overwrite any meta values that are not a string type. Therefore, it is best to keep the pattern as a numerical value.
   - **`metaList=<string, optional>`**: Comma-separated list of metadata to wipe. The default (empty) is all metadata.
   - **`source=<string, optional, {enum-any:m|p}>`**: The types of data to wipe: metadata, packets, or both. The default is packets only. The best option here is to wipe both metadata and packets `(m,p)`.



4. For each Network Decoder and Log Decoder in the path of the query, use the `wipe` command and the remote session IDs to overwrite the raw sessions on disk.



5. To ensure that the indexed meta values that were stored on the Concentrator index are removed, rebuild the index. This can take a long time but is necessary because the `wipe` command does not remove any data from the Concentrator index. Refer to the *Core Database Tuning Guide* for instructions.
6. (Optional) If the data was discovered using the Investigate view, additional steps are necessary:
   a. To clear the query path to prevent an analyst from bringing up an old copy of the session, go to: **(Admin)** > **System** > **Investigation** and select **Clear Cache for All Services**.

   b. To clear the cache for a reconstruction in the Events view, restart the Investigate service.

   c. To clear the cache for the Concentrator and Network Decoder, go to **(Admin)** > **Services** > **Concentrator** > right-click **sdk** > **Properties** and **(Admin)** > **Services** > **Decoder** > right-click **sdk** > **Properties** and execute the `delCache` command. The figure below shows this path for the Concentrator.

An analyst attempting to view the same session in Investigate will see that the raw data is unavailable for viewing and the metadata has been overwritten.

# Configure User Accounts for Use in Data Privacy

This topic provides the procedures for configuring user accounts that work with data obfuscation in NetWitness. In order for data obfuscation to work, accounts and permissions for several types of users must be configured.

- Customize the default Administrators system role in NetWitness to remove permissions that should be available only to the Data Privacy Officer.
- Add two new user accounts at the system level to depict a data privacy officer and a typical analyst.
- Add a user account at the service level with the aggregation role so that Decoders and Log Decoders can aggregate data to a Concentrator or Broker.
- On the Reporting Engine, configure two separate service accounts. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. This procedure is described in "Configure Data Source Permissions" in the *Reporting Engine Configuration Guide*.

## Customize the Default Administrators User Role at the Service Level

To separate the data privacy officer and administrator functions on each Decoder and Log Decoder, you need to remove the `dpo.manage` permission from a clone of the Administrators role.

1. Go to **(Admin)** > **Services**, select a Decoder or Log Decoder, then select **> View > Security**.
2. In the **Services Security** view, click the **Roles** tab, select **Administrators** and click .
   In the **Enter Role Name** dialog, enter a new role name such as Non_DPO_Administrators and click **Save**.
3. Select the new role.

   The Role Information is displayed for editing.
4. Clear the box next to **dpo.manage** so that it is no longer checked and click **Apply**.

   The permission to manage data privacy configuration is removed for the new role.
5. In the **Users** tab, select each user who has the **Administrators** role, and change their role to the cloned role.
6. Validate that the users with the modified Administrators role can login as with admin privileges.
7. Validate that the users with the modified Administrators role cannot configure metadata and content restrictions in the Settings tab.

## Add a User Account with the Aggregation User Role at the Service Level

To ensure that Decoders and Log Decoders can aggregate data to a Concentrator or Broker:

1. **Go to** **(Admin) > Services, select a Decoder or Log Decoder, then select** **> View > Security.**
2. In the **Users** tab, add a user with the `Aggregation` role and click **Apply**.

> **Note:** "Aggregation Role" in the *Hosts and Services Getting Started Guide* provides details about the application of this user role.

## Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You need to add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

> **Note:** The role name is required to exist on both the server and the services, and the role name for all places must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. **Go to** **(Admin) > Security,** select the **Users tab** and click **.**

      The Add User dialog is displayed.

   b. Create the new account with the following credentials.

      Username = <new user name for logon, for example, DPOadmin>
      Email = <new user's email, for example, DPOadmin@rsa.com>
      Password = <new user's password for logging on, for example, RSAprivacy!@>
      Full Name = <new user's full name, for example, DPO Administrator>

c. Click the **Roles** tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the **(Admin) > Security** view, click the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the **Roles** tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

# Data Privacy References

The following reference materials are available for management of data privacy and data retention. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

- See "Data Privacy Tab" in the *Decoder and Log Decoder Configuration Guide.*
- See "Data Retention Tab - Archiver" in the *Archiver Configuration Guide.*

# Shell

This guide describes the shell utility `nw-shell` that can be used to troubleshoot the operations of NetWitness Platform management services like `security-server`, `investigate-server`, and `correlation-server`. It is the equivalent of the `NwConsole` utility used to interact with NetWitness Platform capture services like Decoders and Concentrators. The shell utility is independent of the business logic of the service, and works the same with most NetWitness Platform services.

## Features

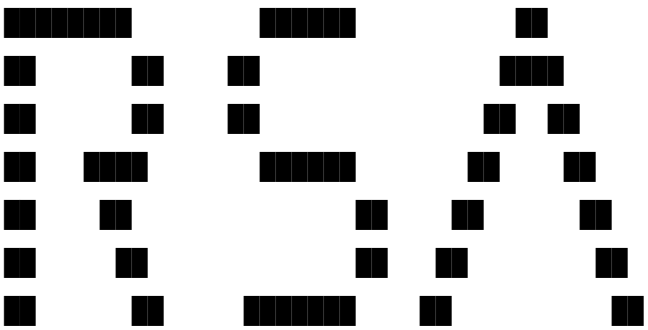
The `nw-shell` utility implements the following features:

- Supports secure connections to the local NetWitness Platform service instances.
- Supports navigation of the service `tree` to explore its operational state (for more information, see Tree View).
- Provides an intuitive display of configuration, metrics, and health-check information to help with troubleshooting.
- Supports scripting to automate simple administration tasks in field deployments.
- Supports Linux, OSX and Windows terminals.

## Installation

The `nw-shell` utility can be installed with the `rsa-nw-shell` RPM as shown here:

```
$ sudo yum install rsa-nw-shell
$ /usr/local/bin/nw-shell
```



```
RSA NetWitness Shell. Version: 4.0.0
See  "help" to list available commands, "help connect" to get started.
offline »
```

# Usage

The primary goal of `nw-shell` is to help a human operator explore the runtime state of a NetWitness Platform service. It is, essentially, an interactive program that invokes APIs on running NetWitness Platform services. Each NetWitness Platform service includes a system API that exposes its runtime state as a *logical* tree. The shell leverages the Tree API structure to present a hierarchical view of a service that is similar to a file system view. Users can navigate the tree by using the `cd` command to access directories, and can view or modify the corresponding configuration at the location, or invoke API methods and view the current state of components in the node.

The set of commands available to users at a given time depend on the current shell *context*, for example, their placement inside the *logical* tree. Certain commands, however, are always available, and we begin with a description of those commands.

## System Commands

Shell *system* commands operate on the shell itself, instead of the nodes of a connected service. These commands are always available.

| Command | Function | Example |
|---|---|---|
| `help [<command>]` | Provides help on available commands or a particular command. | `help` or `help connect` |
| `clear` | Clears the screen (shortcut `Ctrl-l`). | `clear` |
| `exit` or `quit` | Exits the shell. | `quit` |
| `history` | Displays the history of previously-run commands. | `history` |

- Use the `help <command>` to explore the available commands. It is always available.
- `nw-shell` supports tab completion of a command, and the applicable parameter names wherever possible. For example, pressing the **Tab** key after typing **`e`** completes the command to `exit`.
- `nw-shell` also supports a non-interactive mode where it executes scripts from a provided file, used by specifying the absolute filepath prefixed by the `@` argument. See Shell for details.

## Available Commands

```
Built-In Commands
        clear: Clear the shell screen.
        exit, quit: Exit the shell.
        help: Display help about available commands.
        history: Display or save the history of previously run commands
```

```
        script: Read and execute commands from a file.
        stacktrace: Display the full stacktrace of the last error.

Context Commands
      * cd: Change the current node. Usage: cd <path>
        connect: Connect to a service. One of --service or --port must be
specified.Usage: connect [--service <service>[.<id>]] [--broker
amqp://localhost/rsa/system] [--host localhost] [--port] [--insecure false]
      * where: Which service shell is connected to?

Token Commands
        login: Authenticate to a service. Usage: login [connect-parameters]
        login-insecure: Authenticate to a service providing user and password
on the command prompt. The password is recorded in the shell history so this
command must be used with care.Usage: login-insecure --user <user> --password
<password> [connect-parameters]
      * logout: Clear the authentication context: logout
      * whoami: Who am I?

Tree Node Commands
      * json: Print the current node as a JSON string
      * show: Pretty print the current node

Tree Node List Commands
      * config: Summarize configuration of the current subtree
      * health: Summarize health of the current subtree
      * ls: List the children of the current node. Usage: ls [<filter>] [--
values] [--types]
      * lsv: Shorthand for ls --values. Usage: lsv [<filter>] [--types]
      * method: Summarize methods of the current subtree
      * metrics: Summarize metrics of the current subtree
      * snapshot: Snapshot the current subtree

Tree Node Method Commands
      * invoke: Invokes the method that exists on the current method type
```

```
node. Usage: invoke [argument] [--file jsonfile]

Tree Node Value Commands
      * get: Get the value of the current node
      * set: Set the value of the current node. Usage: set <new-value>

Commands marked with (*) are currently unavailable.
Type `help <command>` to learn more.
```

### Help, History Command Usage

```
offline » help connect
    connect - Connect to a service. One of --service or --port must be
specified. Usage: connect [--service <service>[.<id>]] [--broker
amqp://localhost/rsa/system] [--host localhost] [--port] [--insecure false]
    ...
    ...
offline » history
help
help connect
history
offline »
```

You can navigate previously-typed commands in `nw-shell` by using the Up and Down arrow keys, which can help minimize typing by recalling previously-executed commands.

## Authentication Commands

As an administration and monitoring tool, it is important that `nw-shell` authenticates users before handing them control over a running service. The following commands manage the shell authentication context:

| Command | Function |
|---|---|
| `login` | Authenticates and retains tokens for future interactions. |
| `logout` | Clears the security context and token. |
| `whoami` | Prints a summary of the current identity. |

The `login` command can be used to authenticate the user and establish an identity. Service operators can log in once (against the NetWitness Security Server) and then use the token to connect to multiple services and perform administration based on the roles assigned. This single-sign-on workflow is simplified by separating the `login` and `connect` commands to allow the operator to authenticate once (using `login`) and then switch services seamlessly using `connect`.

In general, the `login` command takes the same parameters as `connect` (described below) to specify the service that performs the credential validation. For example:

```
offline » login
user: admin
password: ********
admin@offline » connect --service respond-server
INFO: Connected to respond-server (23e1dab7-0658-41a5-bb1e-d716a37d5ea5)
admin@respond-server:Folder:/rsa »
admin@respond-server:Folder:/rsa » connect --service investigate-server
INFO: Connected to investigate-server 2f21db20-4b50-48cf-8f7f-c0be0d1d1d12)
admin@investigate-server:Folder:/rsa »
```

The current logged-in identity can be confirmed at any point using the `whoami` command. For example:

```
admin@offline » whoami
```

| Subject | admin |
|---|---|
| Issued By | security-server-ebeb90da-761b-4f14-b9ec-30410499d2b8 |
| Issued At | 2018-10-04T17:22:52.041Z |
| Expires After | 2018-10-05T05:22:52.041Z |
| Roles | [ebeb90da-761b-4f14-b9ec-30410499d2b8] |

The shell security context can be cleared by using the `logout` command.

```
security-server:Folder:/rsa » logout
security-server:Folder:/rsa » whoami
You are not logged in.
```

Some operations, such as setting certain configuration properties or invoking a method, require a certain RBAC. To perform such privileged operations, you need to authenticate with an identity that has the necessary permissions. For example:

```
security-server:Configuration » /rsa/logging/operations/max-file-count » get
10
security-server:Configuration:/rsa/logging/operations/max-file-count » set 15
ERROR: Failed to set the node value: Access is denied
security-server:Configuration:/rsa/logging/operations/max-file-count » login
user: admin
```

```
password: **********
admin@security-server:Configuration:/rsa/logging/operations/max-file-count »
set 15
security-server:Configuration:/rsa/logging/operations/max-file-count » get
15
```

## Context-Changing Commands

The following commands change the current shell context.

| Command | Function | Options | Examples |
|---|---|---|---|
| `connect` | Connect to a service | `servicehost`, `port`, `http`, `broker` | `connect --service security-server.d6a55b48...` |
| `cd` | Change context to a node | | `cd /rsa/security`, `cd ../sys`, `cd ..`, `cd` |

## Connecting to a Service

The shell can connect to services over AMQP or HTTP(S), however, AMQP is the preferred and default option.

To connect to a specific instance of a service, `name` and `serviceId` needs to be supplied in the format:
`connect --service {service-name}.{serivceId}`
For example, `foo-server.d6a55b48-6103-46bd-9ead-3b4d589b302b`.

If the service identifier is skipped, it is assumed to be `any`, for example, `connect --service foo-server` will connect with any service named `foo-server` that is connected to the AMQP broker.

### Change Node

The `cd` command can be used to change the current node. Just like `cd` on a file system shell, it takes relative or absolute paths as input and changes the current context to the node at that path.

```
offline » cd
Command 'cd' was found but is not currently available because you are not
connected to any service.

offline » connect
```

```
security-server:Folder:/rsa » cd log
security-server:Folder:/rsa/logging » cd ../security
security-server:Component:/rsa/security » cd /rsa/security/fips-mode
security-server:Configuration:/rsa/security/fips-mode » cd
security-server:Folder:/rsa »
```

The shell prompt summarizes and presents the user's current context. It starts off with `offline`, and once the shell is connected to a service, it displays the service name it is connected to, and the type and the path of the current node. Once the user is authenticated, the userId is included in the prompt.

Invoking `cd` before connecting to a service reminds the user that some commands work only in certain contexts.

**Note:** Some commands are available only in certain contexts. For example, `cd` works only when the shell is *online*. The Help command lists all the commands, but commands marked with (*) are unavailable in the given context.

Certain node-specific commands are enabled only when the current node is of a certain type. For example, method nodes support a command `invoke`, which is not enabled for any other node type.

## Node Display Commands

The following commands are available with all node types. They do not take any arguments, and display the node details for the user to review.

| Command | Function |
|---|---|
| `show` | Pretty-print the current node. |
| `json` | Print the current node as a JSON string. |

For example:

```
security-server:Configuration:/rsa/security/authentication/token-
lifetime » show
```

| Configuration | /rsa/security/authentication/token-lifetime |
|---|---|
| value | 10 hours |
| valueType | com.rsa.asoc.launch.api.helpers.Seconds |
| defaultValue | 10 |
| description | The time-to-live on a token. |

```
security-server:Configuration » /rsa/security/authentication/token-lifetime »
json
{
  "path"  :  "/rsa/security/authentication/token-lifetime",
  "type"  :  "Configuration",
```

```
  "value"  :  "10 HOURS",
  "parent"  : {
    "path"  :  "/rsa/security/authentication",
    "type"  :  "Component"
  },
  "attributes"  : {
    "defaultValue"  : 10,
    "valueType"  :  "com.rsa.asoc.launch.api.helpers.Seconds",
    "description"  :  "The time-to-live on a token."
  }
}
```

The output of `json` dumps the API payload and may contain more details than those shown by `show`.

## Node Value Commands

`Configuration`, `Metric` and `Health` nodes have values. Their current values can be obtained using the `get` command.

| Command | Function | Examples |
|---|---|---|
| `get` | Get the current value of the node. | |
| `set` | Update the value of the node. | `set false`, `set '{"enabled": false}'` |

For example:

```
security-server:Gauge:/rsa/process/hostname » get
"hostxyz.corp.emc.com"
security-server:Gauge:/rsa/process/hostname » cd /rsa/transport/http/secure
security-server:Configuration:/rsa/transport/http/secure » get
true
```

The value of a `Configuration` node can be changed by invoking the `set` command. For example:

```
admin@security-server:Configuration:/rsa/security/pki/tls-protocols »
show
```

| Configuration | /rsa/security/pki/tls-protocols |
|---|---|

| | |
|---|---|
| value | [TLSv1.2] |
| valueType | java.lang.String[] |
| description | This property controls the TLS protocol versions supported by the applications. |

```
admin@security-server:Configuration:/rsa/security/pki/tls-protocols » set '
["SSLv3"]'
admin@security-server:Configuration:/rsa/security/pki/tls-protocols » value
[
  "SSLv3"
]
```

## Node List Commands

`Folder`, `Component` and `Method` nodes can contain other nodes as their children. You can use the `ls` command to list the children nodes, their types, and where available, their current values.

| Command | Function | Options | Examples |
|---|---|---|---|
| `ls <filter>` | List the child nodes of the current node. | `types`, `values` | `ls`, `ls cfg`, `ls --values` |
| `lsv <filter>` | Shorthand for `ls <filter> --values` | `types` | `lsv metrics ls name:fips` |

For example:

```
security-server:Component:/rsa/process » ls
jvm                       Component
modules                   Component
current-time-utc          Gauge
current-time-utc-pretty   Gauge
fips140-mode              Gauge
hostname                  Gauge
mode                      Gauge
service-id                Gauge
service-name              Gauge
status                    Gauge
uptime                    Gauge
uptime-pretty             Gauge
```

```
version                  Gauge
version-full             Gauge
version-raw              Gauge
ready                    Method
shutdown                 Method

security-server:Component:/rsa/process » ls comp
jvm      Component
modules  Component

security-server:Component:/rsa/process » ls name:uptime
uptime         Gauge
uptime-pretty  Gauge

security-server:Component:/rsa/process » ls name:uptime --values
uptime         Gauge  3713854
uptime-pretty  Gauge  1 hour 1 minute 53 seconds

security-server:Component:/rsa/process » lsv
jvm
modules
current-time-utc         1483978142782
current-time-utc-pretty  2017-01-09T16:09:02.782Z
fips140-mode             true
hostname                 hostxyz.corp.emc.com
mode                     Normal
service-id               1fb7572a-4d87-497e-a4da-802819c10a72
service-name             no-op-server
status                   Running
uptime                   512064
uptime-pretty            8 minutes 32 seconds
version                  0.0
version-full             0.0.0.0
version-raw              0.0.0.0
ready
```

```
shutdown
```

Listing commands are not available on nodes that do not have children (for example, configuration or metric nodes):

```
security-server:Component:/rsa/process » cd hostname
security-server:Gauge:/rsa/process/hostname » ls
Command 'ls' exists but is not currently available because you are not logged
in.
```

**Note:** Values displayed in `ls` and `lsv` may be truncated for presentation purposes. Use `get` on the value node to get the complete (unaltered) value of a node.

## Method Node Commands

The `method` command shows all the available methods and all the sub-folders under the current node.

```
security-server:Component:/rsa/process » method
/rsa/process/ready
/rsa/process/shutdown
```

On a node that is of `Method` type , the `invoke` command will invoke the method. For example:

```
security-server:Method:/rsa/process/ready » invoke
{
  "ready" : true,
  "serviceId" : "84f36740-5ae7-409f-b14f-b17e98703983",
  "marketingVersion" : "0.0"
}
```

If the `method` signature takes `input`, then `invoke <input>` will invoke the `method` with given parameters.

```
security-server:Method:/rsa/health/get » show
```

| Method | /rsa/health/get |
|---|---|
| output | java.util.List<com.rsa.asoc.launch.api.health.api.HealthStatus> |
| input | java.lang.String |
| description | Get the details of a single composite health check @param id The health check id @return The composite health check |

| Metric | Value |
|---|---|

| | |
|---|---|
| failed | 0 |
| invoked | 0 |
| timer | 0.0 |

```
Method:/rsa/health/get » invoke 'rsa.health.checks.security-pki'
[
  {
    "name" : "rsa.security.pki.pki-health",
    "status" : "Unhealthy",
    "details" : {
      "Reason" : "Using a self-signed certificate"    }
  }
]
```

For inline `method` execution with input payload, in cases where the input contains any special characters such as `\, \n, \r, \t , ",` the input needs to be properly escaped with a backslash (`\`).

In cases where `method` takes a complex payload, payload can be supplied with a file reference. In this case, payload does not need any special escaping.

```
Method:/rsa/configuration/collections/register » invoke --file
/tmp/jsonfile.txt
```

### Run State of a Service

Once `nw-shell` is connected to a service, commands like `health`, `metrics`, `config` or `snapshot` can be used to retrieve the current state of the service at the current node, and all the sub-folders under the current node.

## Health

The `health` command lists the health of the components, and the all the sub-folders, under the current node.

```
admin@security-server:Component:/rsa/process » health
/rsa/process/jvm/memory-health      Healthy
/rsa/process/modules/module-health  Healthy
```

## Respond Server APIs

You can use `nw-shell` to retrieve and modify the incident details. In order for this to work, make sure that the relevant APIs are exposed. You can perform following actions using these APIs.

Retrieve Incidents

Retrieve Incident Details
Retrieve Incidents
Add Alerts to an Incident
Delete Alerts from an Incident

## Retrieve Incidents

You can retrieve incidents using a single criteria. The criteria can include name, priority, risk score, status, alert count, etc. The `invoke` command returns all the incidents with the matching criteria.

**Note:** You must export the output to a file to avoid rollover in the shell output. You can query using single meta filters only, for example, filter by name or priority. Depending on the load, a large number of results might cause the request time-out.

### Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd find-incident-by-criteria
admin@respond-server:Method:/rsa/respond/incident/find-incident-by-criteria »
invoke '["<meta name>", "<meta value>", "<number of records>"]'
```

### Examples

The following example command reads the query from an input file and exports the results to an output file.

```
invoke --file /root/incident_req.txt outputFile /root/output_incidents.json
```

In the above example, the `incident_req.txt` file contains the following information.

```
[root@SA ~]# cat incident_req.txt
["status", "ASSIGNED", "500"]
```

The output is exported to the `output_incidents.json` file that contains 500 incidents with ASSIGNED status.

The following are some more examples:

- Retrieve incidents with `testinc for rule` as name and a maximum of 10 incidents.
  `["name", "testinc for rule", "10"]`
- Retrieve incidents with HIGH priority and a maximum of 50 incidents.
  `["priority", "HIGH", "50"]"]`
- Retrieve incidents with ASSIGNED status and a maximum of 500 incidents.
  `["status", "ASSIGNED", "500"]`

## Retrieve Incident Details

The `invoke` command is used to list the details of specific incidents.

### Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd find-by-ids
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke '["INC-1", "INC-2"]'
```

The output is incident details in JSON format displayed in `nw-shell`.

### Examples

You can use an input file containing the request to list the incident details.

```
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke --file /tmp/findIncidents.txt
```

The output is incident details in JSON format displayed in `nw-shell`.

In the above example, the file `/tmp/findIncidents.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/findIncidents.txt

["INC-10", "INC-12"]
```

You can store the incident details to an output file.

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd /rsa/respond/alert/add-alerts-to-incident
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke '["INC-1", "INC-2"]' outputFile /root/result_output.json
```

The output is incident details in JSON format stored in the `result_output.json` file.

## Retrieve Alerts

You can retrieve alerts using a single criteria. The criteria can include any field that is part of the alert record (alert name, alert type, alert source, etc). The `invoke` command returns the alert with the matching criteria.

**Note:** You must export the output to a file to avoid rollover in the shell output. You can query using single meta filters only, for example, filter by name or type. Depending on the load, a large number of results might cause the request time-out.

### Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/alert
admin@respond-server:Component:/rsa/respond/alert » cd find-alerts-by-criteria
admin@respond-server:Method:/rsa/respond/alert/find-alerts-by-criteria »
```

```
invoke '["<meta name>", "<meta value>", "<number of alerts to retrieve>",
"<list of alert fields (include fields)>"]'
```

**Note:** If you provide `<null>` as the `<list of alert fields>` value, the output returns all the alert fields.

### Examples

The following example command reads the query from an input file and exports the results to an output file.

```
invoke --file /root/alerts_req.txt outputFile /root/output_alerts.json
```

In the above example, the `alerts_req.txt` file contains the following information.

```
[root@SA ~]# cat alerts_req.txt
["alert.source","Event Stream Analysis", "20", "alert.severity"]
```

The output is exported to the `output_alerts.json` file that contains 20 alerts from Event Stream Analysis and the alert severity field included.

The following are some more examples:

- Retrieve 20 alerts from Event Stream Analysis with the alert severity field included.
  `["alert.source","Event Stream Analysis", "20", "alert.severity"]`
- Retrieve 20 alerts from Event Stream Analysis with all the alert fields included.
  `["alert.source","Event Stream Analysis", "20", "null"]`

## Add Alerts to an Incident

The `invoke` command is used to add alerts to an existing incident. You will require alert IDs and Incident ID.

### Sample Query:

```
admin@respond-server:Folder:/rsa » cd respond/alert

admin@respond-server:Component:/rsa/respond/incident » cd
/rsa/respond/alert/add-alerts-to-incident
admin@respond-server:Method:/rsa/respond/alert/add-alerts-to-incident » invoke
'["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]'
```

Alternatively, you can specify the add alert query in an input file.

```
invoke --file /tmp/add_alerts.txt
```

In the above example, the `/tmp/add_alerts.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/add_alerts.txt

["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]
```

The first parameter is the incident ID (INC-1). The rest of the parameters are alert IDs (for example, 603dcc5091e818391ee57e1e) to be added to the incident mentioned in the first parameter.

The output is a list of alert IDs added to the incident.

## Delete Alerts from an Incident

The `invoke` command is used to remove alerts from an existing incident. You will require alert IDs and Incident ID.

### Sample Query:

```
admin@respond-server:Folder:/rsa » cd respond/alert

admin@respond-server:Component:/rsa/respond/incident » cd
/rsa/respond/alert/delete-alerts-by-alert-ids
admin@respond-server:Method:/rsa/respond/alert/delete-alerts-by-alert-ids »
invoke '["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]'
```

Alternatively, you can specify the delete alert query in an input file.

```
invoke --file /tmp/delete_alerts.txt
```

In the above example, the file `/tmp/delete_alerts.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/delete_alerts.txt

["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]
```

The first parameter is the incident ID (INC-1). The rest of the parameters are alerts IDs (for example, 603dcc5091e818391ee57e1e) to be removed from the incident mentioned in the first parameter.

The output is a list of alert IDs removed from the incident.

# Metrics

The `metrics` command lists all of the available metrics, and all the sub-folders, under the current node.

```
admin@respond-server:Component:/rsa/tree/node » metrics
/rsa/tree/node/get/invoked   14
/rsa/tree/node/get/timer     5666541.077918259
/rsa/tree/node/list/invoked  12
/rsa/tree/node/list/timer    6652400.379371729
```

In the above example, `/rsa/tree/node/get/invoked 14` shows that the method `get` is invoked `14` times, and `timer` shows that it took on average `5666541.077918259` nano seconds to process the `get` request.

Using `cd` into the `timer` node shows more details, such as rate of requests, for the current node for per-minute and five minutes. For example:

```
admin@respond-server:Timer:/rsa/tree/node/get/timer » show
```

| Timer | /rsa/tree/node/get/timer |
|---|---|
| value | 3267513.7521543643 |
| valueType | java.lang.Double |
| stdDeviation | 4381863.808014679 |
| fiveMinuteRate | 0.018725581010540414 |
| max | 181326026 |
| count | 27 |
| sampleSize | 27 |
| oneMinuteRate | 0.038516144812437314 |
| min | 810240 |
| fifteenMinuteRate | 0.009425563630894371 |
| median | 2146170.0 |
| meanRate | 5.189274295248098E-4 |
| mean | 3267513.7521543643 |

## Config

The `config` command shows all the configuration properties in the current node and all the sub-folders under the current node.

```
admin@respond-server:Component:/rsa/logging » config
/rsa/logging/audit/max-file-count       10
/rsa/logging/audit/max-file-size        10 MB
/rsa/logging/forward/categories         [Audit]
/rsa/logging/forward/destination        SYSLOG_UDP
/rsa/logging/forward/enabled            true
/rsa/logging/forward/host               localhost
/rsa/logging/forward/port               50514
/rsa/logging/forward/secure             false
/rsa/logging/levels
/rsa/logging/operations/max-file-count  10
/rsa/logging/operations/max-file-size   10 MB
```

## Snapshot

The `snapshot` command combines `metrics`, `configuration`, and `health` of the current state of the service node and all the sub-folders under the current node. This command is very useful for troubleshooting purposes. When opening a support case, take a `snapshot` dump at the root node `\rsa` of a service that might be having issues, and attach it to the case.

```
admin@security-server:Component:/rsa/security » snapshot
/rsa/security/account/external/get-all/invoked      16
/rsa/security/account/external/get-all/timer        NaN
/rsa/security/account/external/get/failed           6
/rsa/security/account/external/get/invoked          6
/rsa/security/account/external/get/timer            NaN
/rsa/security/account/force-password-change/invoke  1
/rsa/security/account/force-password-change/timer   NaN
/rsa/security/account/get/invoked                   123
/rsa/security/account/get/timer                     902163.0
/rsa/security/account/password-policy/cannot-inclu  false
/rsa/security/account/password-policy/min-chars     8
/rsa/security/account/password-policy/min-lower-ch  0
/rsa/security/account/password-policy/min-non-lati  0
/rsa/security/account/password-policy/min-numeric-  0
/rsa/security/account/password-policy/min-special-  0

----
```

## Scripting

`nw-shell` supports non-interactive executions that can take commands from files. For example:

```
> cat /tmp/foo.script
connect --service security-server
cd /rsa/security/pki/ciphers
get
> time nw-shell @/tmp/foo.script
INFO: Connected to security-server (52c7b92c-23d5-4b3e-9973-31d8b1b27ec4)
[
```

```
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256",
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA",
  "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_DHE_RSA_WITH_AES_128_CBC_SHA"
]
nw-shell    5.89s user 0.33s system 305% cpu 2.032 total
```

`nw-shell` also has a built-in `script` which can be used to execute scripts in the shell once the shell is launched.

```
offline » script --file /tmp/foo.script
INFO: Connected to security-server (52c7b92c-23d5-4b3e-9973-31d8b1b27ec4)
[
  "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256",
  "TLS_DHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_RSA_WITH_AES_128_CBC_SHA256"
]
```

**Note:** `nw-shell` is primarily meant to help a human to explore the runtime state of a NetWitness Platform service. For most other purposes, it is usually best to use the service published APIs.

# Troubleshooting Commands

The `nw-shell` utility provides troubleshooting commands to help recover from misconfigurations that may cause the service to work improperly.

## fix-keystore

When a service's keystore is corrupt or its SSL trust is broken with the rest of NetWitness Platform, you can use the `fix-keystore` command to fix this issue. This command reads the keystore file of the services running on the host and attempts to reestablish trust with the NetWitness Platform CA. For example, the following is the command to repair the respond-server 's keystore:

```
>> fix-keystore --service respond-server
```

This command repairs the keystore `keystore.p12` that is located at `/etc/netwitness/respond-server`. It does not modify the service's original keystore. The repaired keystore can be found with the suffix

`.good`, for example, `keystore.p12.good`. If no fixes can be made to the keystore, this command does not write the new `keystore.p12.good` file.

Once the keystore repair is successful, the system admin can restore the service's communication by renaming `keystore.p12.good` to `keystore.p12` and restart the service.

## print-keystore

The `print-keystore` command prints the requested NetWitness Platform Service's keystore certificates to the given output file in JSON format. Unless verbose is enabled, only a few key attributes of the certificates are printed to the file. For example, the following command prints the respond-server's keystore certificates.

```
>> print-keystore respond-server outputFile /tmp/crts
```

With verbose enabled:

```
>> print-keystore respond-server outputFile /tmp/crts verbose
```

## reconstruct-keystore

The `reconstruct-keystore` command can be used when a service's keystore needs to be restored to its original clean state.

The following command reconstructs the respond-server's keystore to the new file `/etc/netwitness/respond- server/keystore.p12.new` (it does not modify the original keystore).

```
>> reconstruct-keystore --service respond-server
```

To restore the service back to its healthy state, restore `keystore.p12.new` to `keystore.p12`, and restart the service.

# Advanced Customization

The following JVM system properties can be used to customize certain aspects of the `nw-shell` presentation:

| System Property | Controls | Default Value |
|---|---|---|
| `console.width` | The width of text. | 100 |
| `console.colors` | The use of colors. | true |
| `console.prompt` | The prompt. | `%s%s%s »` |
| `timeout` | The API timeout. | 30s |

These can be specified using the `JAVA_OPTS` environment variable. For example:

```
> export JAVA_OPTS="-Dtimeout=100s -Dconsole.width=40 -
Dconsole.prompt=%s%s%s>"
> export JAVA_OPTS="-Dconsole.colors=false"
> nw-shell
```

The API timeout is a time unit which can use typical time unit values such as 30 MINUTES, 30 mins, 30 m, 5 seconds, 5 sec, 5s, 5, 8000 milliseconds, or 8000 ms (ms = milliseconds).

The value of `console.prompt` must contain placeholders (for example, `%s`) for three strings which are replaced, in order, by:

1. The node type
2. A separator (`:`)
3. The node path

Setting `console.colors` to `false` will not turn off *all* use of colors, it only disables colors used by `nw-shell` in its output. The underlying libraries that the program uses may still output some text in color.

# Tree View

A NetWitness Platform service, such as `security-server` or `investigate-server`, is a collection of components working together to implement the goals of the service. This topic describes the support for exposing these components and their associated elements (for example, configuration parameters, metrics, API methods, health checks, and so on) in a `tree-view`. The `tree-view` is a hierarchically-nested arrangement of `tree-nodes`, each of which corresponds to a distinct functional area of the service. The arrangement enables the end-user to navigate the nodes at run-time and to explore the current state of the service. See Shell for an interactive tool that uses the tree-view.

## Features

The `tree-view` implements the following features:

- Supports encapsulation of functionally related elements under the same `tree-node`.
- Supports hierarchical linkage of `tree-node` s to enable navigation from one node to another.

## Implementation

The current implementation of the `tree-view` is described in the following sections.

### Node Types

The `tree-view` is comprised of `tree-node` instances taken from the following types.

| Type | Represents |
|---|---|
| `Component` | A service component with associated configurations, metrics, health, APIs, etc. |
| `Configuration` | A configuration parameter that controls some aspect of the service behavior (for example, `rsa.filesystem.prefix`). |
| `Metric` | A *quantitative* measure of some aspect of the component operations (for example, Requests Processed). |
| `Health` | A *qualitative* assessment of some aspect of the component (for example, "Using too much memory"). |
| `Method` | An API that can be invoked remotely to interact with the component (for example, `/rsa/security/pki/setCertificate`) |
| `Parameter` | A payload parameter that is an input or an output from an API. |
| `Folder` | A logical grouping of nodes that are related to one another but are not a component (for example, the root `/rsa`). |

## Node Structure

All `tree-nodes` have the same structure. In particular, they include the following elements:

| Item | Information |
|---|---|
| `path` | The node path is a backslash (/) separated path, for example, `/rsa/security/pki/api-secure`. |
| `type` | The type of the node, taken from the previous table. |
| `attributes` | A map of string keys to attribute values. The available keys depend on the type of the node. |
| `value` | The value of this node. This can be null if the node has no associated value (or if it has a null value). |
| `children` | A list of child nodes, if the node has any. |
| `parent` | The parent node. This is only null for the root node. |

# Introduction

The instructions in this guide apply to physical hosts exclusively. See the *Virtual Host Installation Guide for RSA NetWitness Platform 11.7* for instructions on how to set up virtual hosts in 11.7.

**Note:** Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Supported Hardware

Series 5, and Series 6.

Refer to the RSA *NetWitness* Hardware Setup Guides for detailed information on each series type (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation).

### Endpoint Log Hybrid Host Hardware Specifications

Series 5 (Dell R730) hardware or Series 6 (Dell R740 hardware. See "(Optional) Task 2 - Install Endpoint Log Hybrid" in Post Installation Tasks for instructions on how to install the Endpoint Log Hybrid.

**Note:** If you have RSA NetWitness Endpoint 4.x hardware, you can re-purpose it for NetWitness Endpoint Log Hybrid 11.7.

### RSA NetWitness UEBA Host Hardware Specifications

S5 (Dell R630 appliance) or S6 (Dell R640) hardware. See "(Optional) Task 3 - Install NetWitness UEBA" in Post Installation Tasks for instructions on how to install NetWitness UEBA.

**SERIES 5 (DELL R630) SPECIFICATIONS**

| Specification | Capacity |
|---|---|
| Model | Dell PowerEdge R630xl |
| Processor Type | Intel Xeon E5 -2680v3 |
| Processor Speed | 2.5 GHz |
| Cache | 30MB |
| Number of Cores | 12 |
| Number of Processors | 2 |
| Number of Threads | 24 |
| Total Memory | 256GB |
| Internal Disk Controller | Dell PERC H730 |
| External Disk Controller | Dell PERC H830 |

| Specification | Capacity |
|---|---|
| SAN Connectivity (HBA) - Optional | N/A |
| Remote Management Card | iDRAC8 Enterprise |
| Drives | Total - 6 Drives<br>2 x 1TB, 2.5" HDD<br>4 x 2TB, 2.5" HDD |
| Chassis | 1U |
| Weight | 18.4 kg (40.5 lbs) |
| NIC Card* | On Board<br>2 x 10 Gb Copper<br>2 x 10 Gb & 2 x 1Gb Copper<br>(Other options are available) |
| Dimensions | H: 4.28 cm (1.68 in.) x<br>W: 48.23 cm (18.98 in.)<br>x D: 75.51 cm (29.72 in.) |
| Power | 1100W Redundant |
| BTU/hr | 4100 BTU/hr (max) |
| Amps (Spec) | 1100W / 220VAC = 5A |
| Actual Amp Draw (Post Startup) | 2.1 Amps |
| Events Per Second (EPS) | 100K EPS |
| Throughput | N/A |

**Note:** Network Interface Controller (NIC) card options are available for swap with on-board daughter cards or add ons.

## External Attached Storage

If you have external storage devices (for example, DACs or PowerVaults) attached to physical hosts, refer to the Hardware Setup Guides on NetWitness Community (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation) for information on how to configure this storage.

## Physical Host Installation Workflow

The following diagram illustrates the NetWitness 11.7 Physical Host Installation workflow.

## Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Ask it** fields in NetWitness Community to find specific information here: https://community.netwitness.com/
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the Guides.
- See also RSA NetWitness® Platform Blog Posts.
- If you need further assistance, contact RSA NetWitness Support.

## Contact RSA NetWitness Support

If you contact RSA NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the RSA NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

| | |
|---|---|
| NetWitness Community | https://community.netwitness.com/<br>In the main menu, click **Support** > **Case Portal** > **View My Cases**. |
| International Contacts (How to Contact RSA NetWitness Support) | https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897 |
| Community | https://community.netwitness.com/t5/support/ct-p/support |

# Installation Tasks

This topic contains the tasks you must complete to install NetWitness 11.7 on physical hosts.

## Checklist

Complete the installation tasks in the following order.

| Step | Description | Instructions |
|---|---|---|
| 1 | Install 11.7 on NetWitness hosts. | Install 11.7 on the NetWitness Server (NW Server) Host and Other Component Host |
| 2 | Set up ESA hosts. | Set Up ESA Hosts |
| 3 | Install component services on your hosts. | Install Component Services on Hosts |
| 4 | Complete licensing requirements for services. | Complete Licensing Requirements |
| 5 | (Optional) Install warm standby NW Server host. | (Optional) Install Warm Standby NW Server |

**Caution:** Before you begin the installation process, open all your firewall ports. The"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform 11.7* lists all the ports in a deployment. Do not proceed with the installation until the ports on your firewall are configured.

## Install 11.7 on the NetWitness Server (NW Server) Host and Other Component Host

Complete the following steps to install 11.7 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

### Create a Base Image on the RSA Appliance

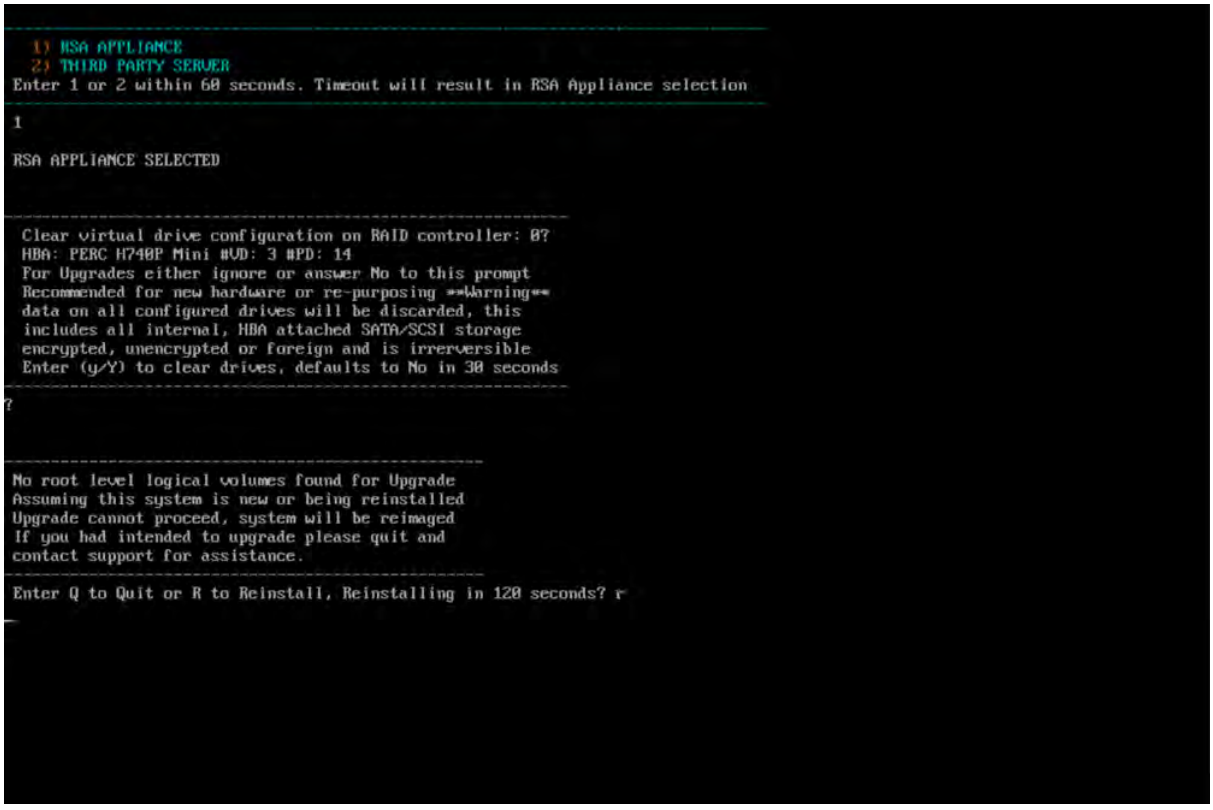
1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for RSA NetWitness 11.x* for more information. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
   - Hypervisor installations - see the *Virtual Host Installation Guide for RSA NetWitness Platform 11.7*

- Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie
- iDRAC installations - the virtual media type is:
  - **Virtual Floppy** for mapped flash drives
  - **Virtual CD** for mapped optical media devices or ISO file.

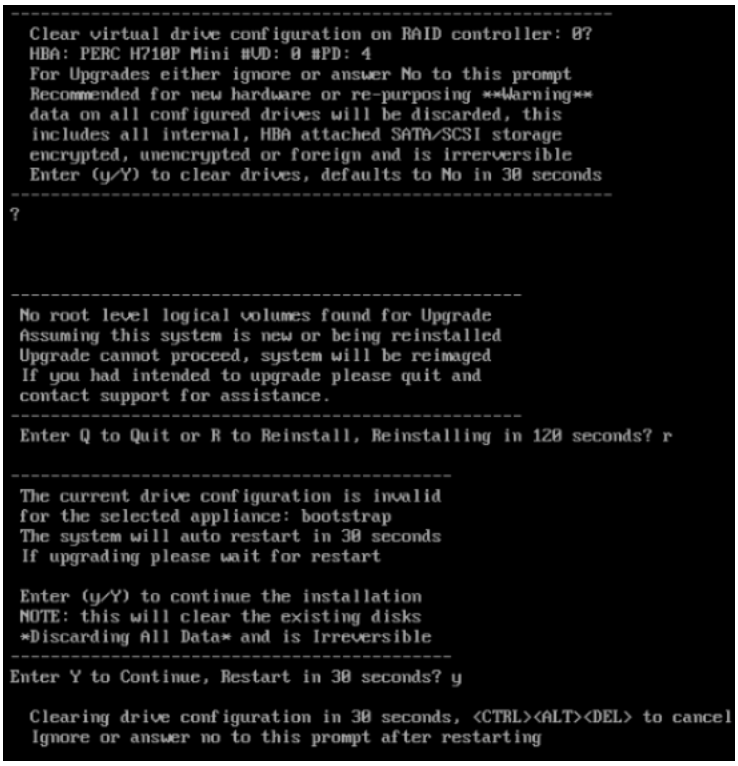
2. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to RSA NetWitness Platform 11.7** installation menu is displayed.
4. Select **Install RSA NetWitness Platform 11.7** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.
5. You must enter **1** to select RSA appliance.

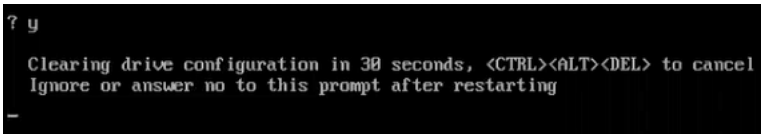


6. The Installation program runs and stops at the Enter (**y**/**Y**) to clear drives prompt that asks you to format the drives.



**Caution:** You must respond **y** or **Y** to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

7. Type **y** to continue. The default action is No, so if you ignore the prompt, it will select No in 30 seconds, and will not clear the drives.



The system displays all the installation tasks it is performing. This can take a minute or so. After it completes the tasks, the installation program reboots the host.

**Caution:** Do not reboot with the attached media attached (media that contains the ISO file, for example a build stick).

## Create a Base Image on the Third Party Server Hardware

### Prerequisites

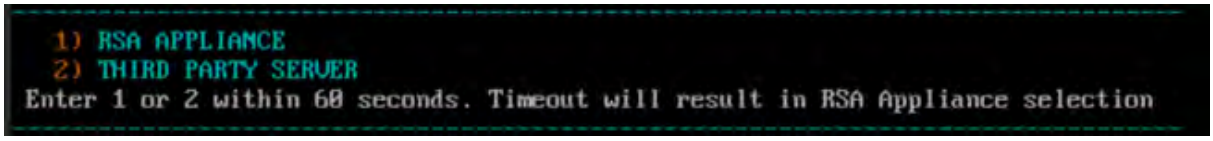
RSA recommends that the Third party Server Hardware meets the criteria defined in Appendix D. Third Party Server System Requirement.

1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for RSA NetWitness 11.x* for more information. Go to the

NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

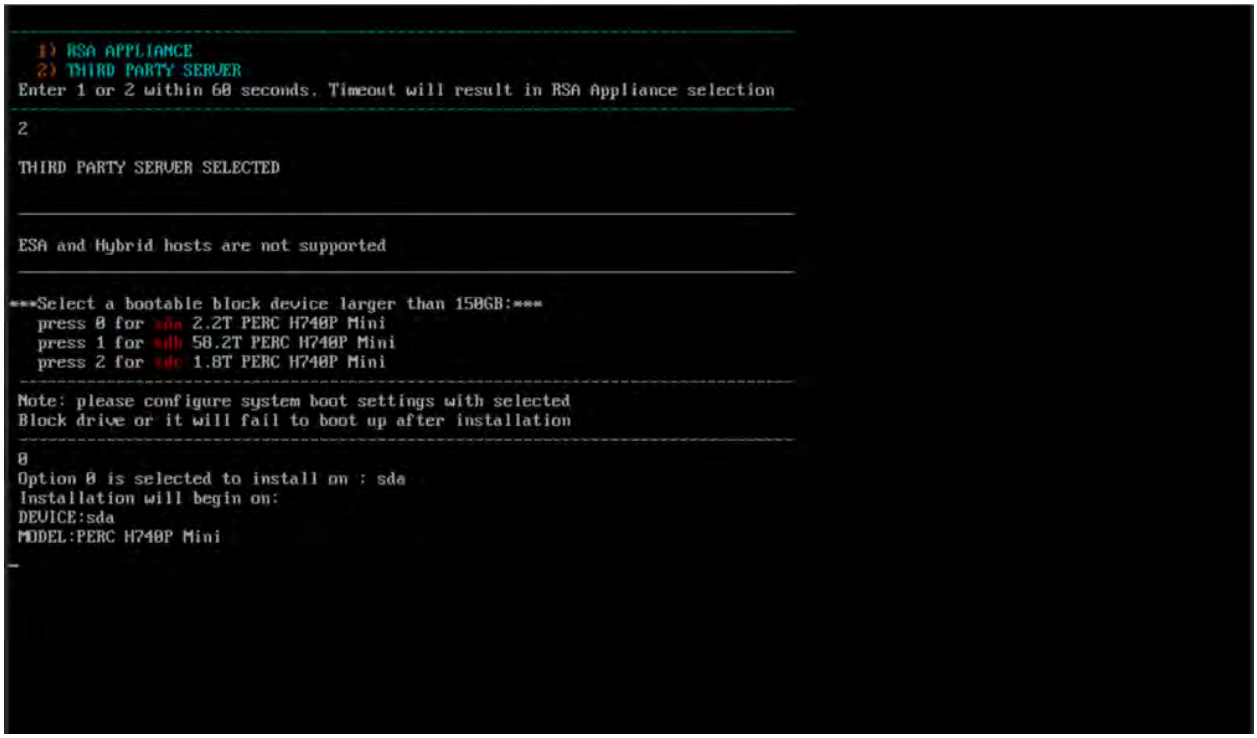
- Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie.

2. Log in to the host and reboot it.
3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to RSA NetWitness Platform 11.7** installation menu is displayed.
4. Select **Install RSA Netwitness Platform 11.7** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.



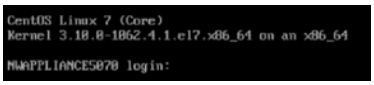
5. Enter **2** to select the Third Party Server.
6. All the available block devices are displayed. Select a block device larger than 150 GB to install the RSA Netwitness Platform.

**Note:** You must configure the system boot settings with selected block device else the system will not boot after imaging.



7. The system displays all the installation tasks running, and it may take few minutes to complete the installation. Once the installation is complete, the installation program reboots the host.

**Caution:** Do not reboot with the attached media that contains the ISO file, for example, build stick.



## Install RSA NetWitness Platform

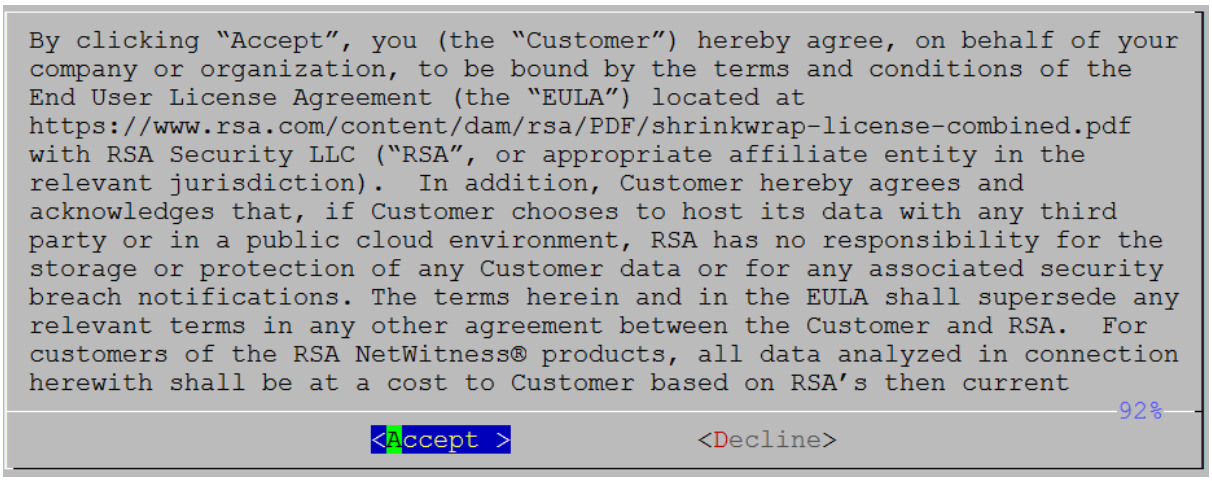
**Caution:** If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

**IMPORTANT:** In NetWitness Platform version 11.6 or Later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

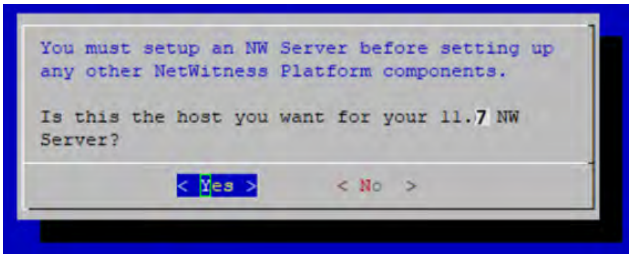
1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   **Note:** Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.



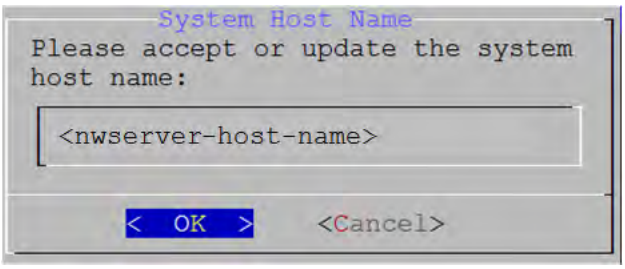
3. Tab to **Yes** and press **Enter** to install 11.7 on the NW Server.
   Tab to **No** and press **Enter** to install 11.7 on other component hosts.

   **Caution:** If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation.).
   **NW Server Host prompt**:

   **Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)**

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   **NW Server prompt**:



**Other Component Hosts prompt says <non-nwserver-host-name>**

**Caution:** If you include "." in a host name, the host name must also include a valid domain name.

Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

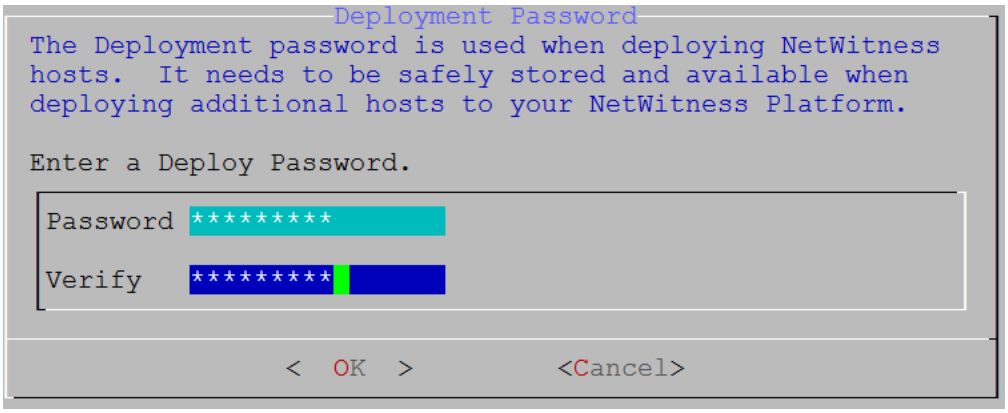
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

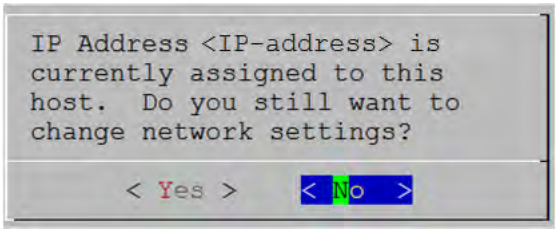
7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.



Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. One of the following conditional prompts is displayed.

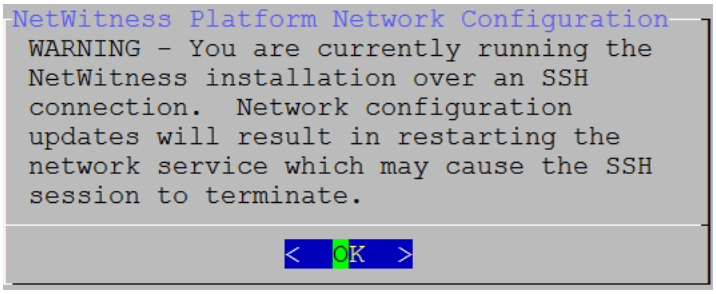
- If the Setup program finds a valid IP address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

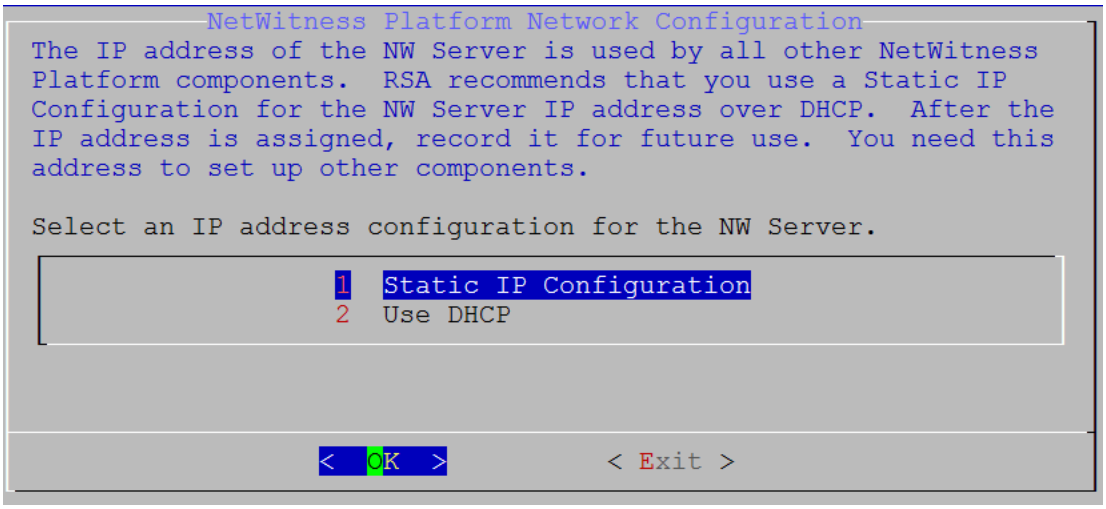
**Note:** If you connect directly from the host console, the following warning is not displayed.



Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

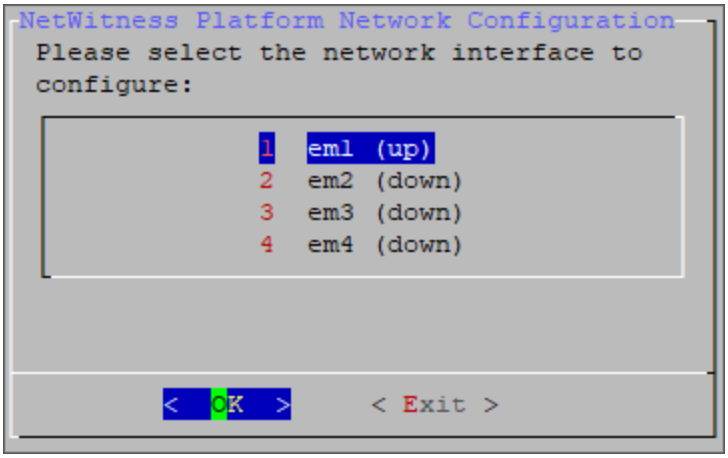
**Caution:** Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.



Tab to **OK** and press **Enter** to use **Static IP**.

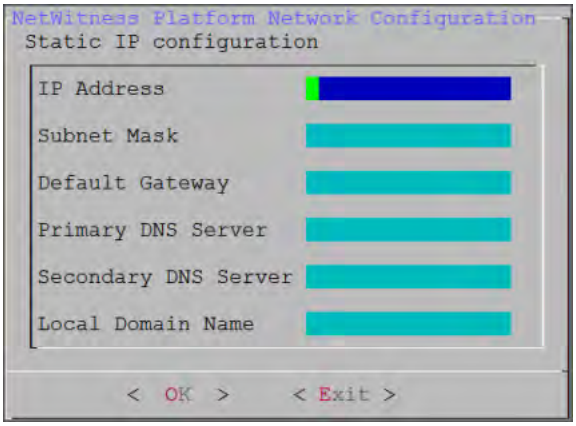
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

   The following **Static IP Configuration** prompt is displayed.



10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    **Caution:** If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

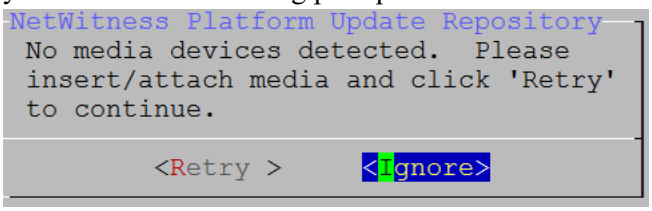
    **For the NW Server**, tab to **No** and press **Enter**.
    **For component hosts**, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

12. The **Update Repository** prompt is displayed.

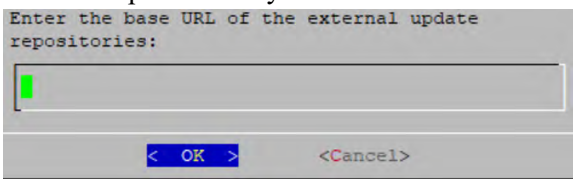
    **For the NW Server**:

    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7. If the program cannot find the attached media,

you receive the following prompt.



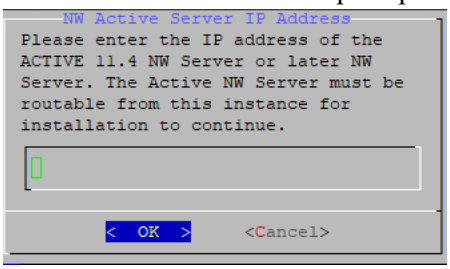
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

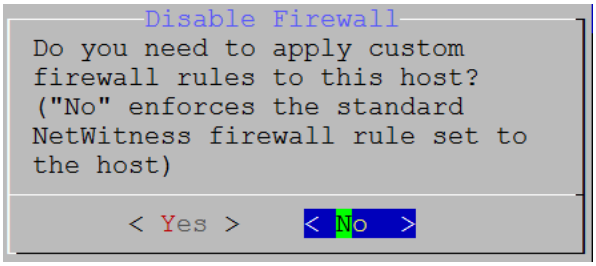
**For component hosts**:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



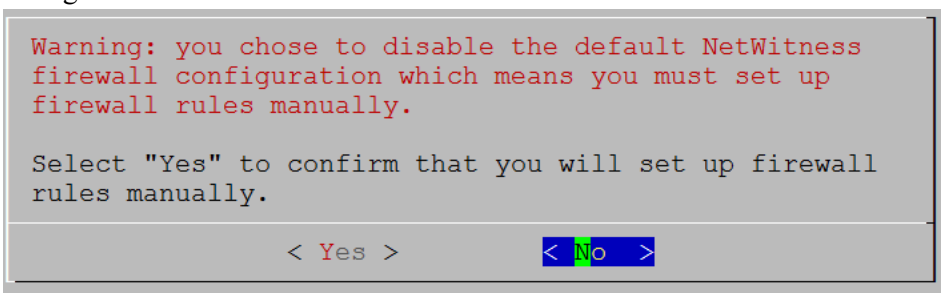
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.

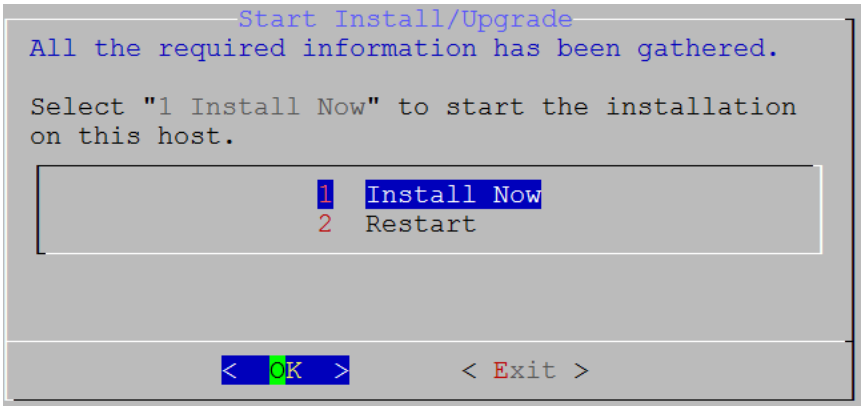


Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

configuration.

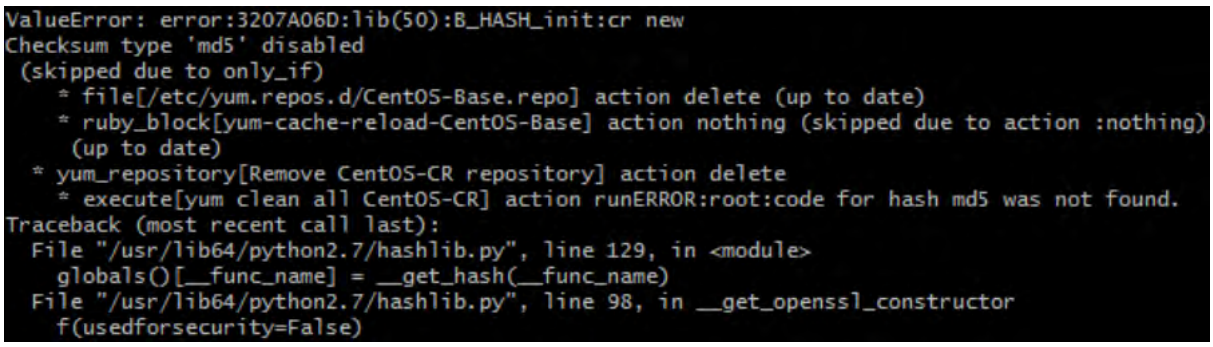


14. The **Start Install** prompt is displayed.



15. Press **Enter** to install 11.7.
When **Installation complete** is displayed, you have installed 11.7 on this host.

**Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

## Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 11.7 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > :
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** >  :

## Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.
   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
   c. Select that host in the **Hosts** view and click  .
   The **Install Services** dialog is displayed.
   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

## Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 11.7 Licensing Management Guide* for more information. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## (Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for RSA NetWitness Platform 11.7* for instructions on how to set up a Warm Standby NW Server.

# Update or Install Windows Legacy Collection

Refer to the Windows Legacy Collection Guide for RSA NetWitness 11.x.

**Note:** After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

# Post Installation Tasks

This topic contains the tasks you complete after you install 11.7.

- Event Stream Analysis (ESA)
- RSA NetWitness Endpoint
- RSA NetWitness UEBA

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Event Stream Analysis (ESA)

### Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.7, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to (Admin) **> Services**, and in the Services view, select the ESA Correlation service and then select **> View > Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to **(Configure) > ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ( ).
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

## RSA NetWitness Endpoint

The tasks in this section only apply to customers that use the RSA NetWitness Endpoint component of NetWitness Platform.

## Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- **Single Endpoint Log Hybrid host** - Deploy NetWitness Server host, Endpoint Log Hybrid host, and ESA host or hosts.
- **Multiple Endpoint Log Hybrid hosts** - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves upto 6 Endpoint Log Hybrid hosts.

  **Note:** RSA recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

  **Note:** You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

Follow these steps to deploy an Endpoint Log Hybrid host.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install RSA NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 11.7*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install RSA NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 11.7*

After NetWitness Platform is installed, complete these steps to set up the Endpoint Log Hybrid hosts:

1. Log into NetWitness Platform and click **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   **Note:** If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

3. Select that host in the **Hosts** view (for example, **Endpoint**) and click 
.

   The Install Services dialog is displayed.

4. Select the **Endpoint Log Hybrid** category and click **Install**.
5. Make sure that the Endpoint Log Hybrid service is running.
6. Configure Endpoint Meta forwarding.

See the *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.

7. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   **Note:** The Endpoint IIOCs are available as OOTB Endpoint Application rules.

8. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   **Note:** In 11.3 or later, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

9. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

   **Note:** You can migrate the Endpoint Agent from 4.4.0.x to 11.7. For more information, see the *NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.7 Migration Guide*.

## Configuring Multiple Endpoint Log Hybrids

Follow these steps to install another Endpoint Log Hybrid.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install RSA NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 11.7*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install RSA NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 11.7*

After NetWitness Platform is installed, complete these steps to set up the Endpoint Log Hybrid hosts:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the second Endpoint Log Hybrid:

   **Note:** RSA recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

3. Repeat steps 1-5 in Install Endpoint Log Hybrid.

# (Optional) Configure an Endpoint Service on an Existing Log Decoder Host

You can install an Endpoint service category on an existing Log Decoder host. For an overview of installing service categories on hosts, see "Hosts and Services Set Up Procedures" in the *Host and Services Getting Started Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

- If you have an existing Endpoint Log Hybrid, you must copy certificates from that Endpoint Hybrid host to the Log Decoder before you install the Endpoint service category on the Log Decoder.
- If you do not have an Endpoint Log Hybrid host, you do not need to copy over the certificates before you install the Endpoint service category on the Log Decoder.

## Do You Need to Install an Endpoint Service onto Separate Hardware

If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for RSA NetWitness Platform 11.x*.

If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

If that doesn't help, RSA recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

## Install an Endpoint Service Category on an Existing Log Decoder

To install an Endpoint service category on an existing Log Decoder if you have an existing Endpoint Log Hybrid:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the Log Decoder on which you are going to install the additional **Endpoint** service category.

   **Note:** RSA recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

3. Log into NetWitness Platform and click **(Admin) > Hosts**.
4. Select the Log Decoder host in the **Hosts** view and click  .

   The Install Services dialog is displayed.
5. Select the **Endpoint** category and click **Install**.

To install an Endpoint service category on an existing Log Decoder if you do not have an existing Endpoint Log Hybrid:

1. Log into NetWitness Platform and click **(Admin) > Hosts**.
2. Select the Log Decoder host in the **Hosts** view and click Install.
   The Install Services dialog is displayed.
3. Select the **Endpoint** category and click **Install**.

# RSA NetWitness UEBA

The tasks in this section only apply to customers that use the RSA UEBA component of NetWitness Platform.

## Install UEBA

To set up NetWitness UEBA in NetWitness Platform 11.7, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 16 in "Install RSA NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - A virtual host, complete steps 1 - 16 in "Step 4. Install RSA NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

   **Note:** The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.
2. Log into NetWitness Platform and go to **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   **Note:** If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.
   The Install Services dialog is displayed.
5. Select the **UEBA** Host Type and click **Install**.
6. Make sure that the UEBA service is running.
7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

**Note:** NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

## Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.
   a. Define UEBA schemas:
   Choose schemas from the following list:

   AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

   **Note:** The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
   If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

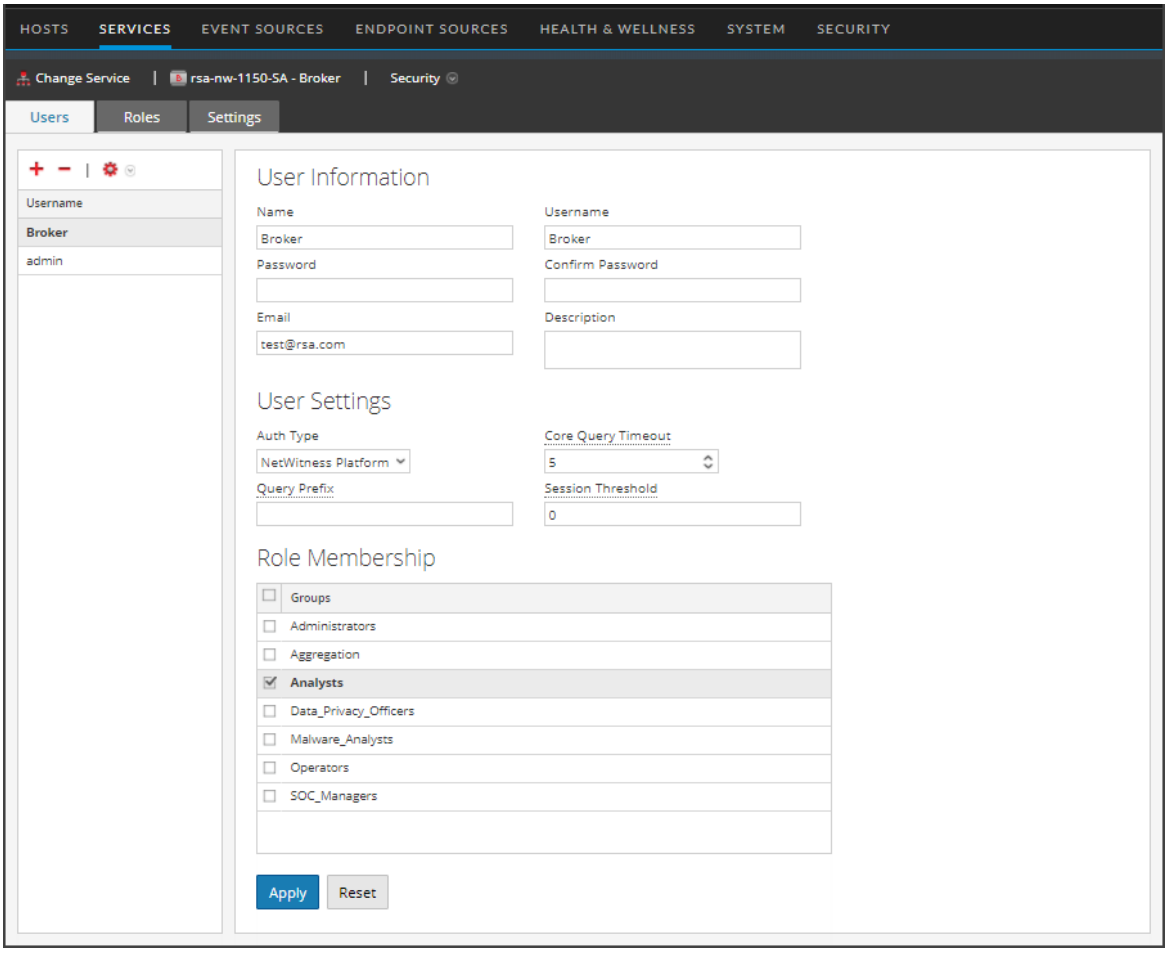
   c. Define the UEBA start-date:

   **Note:** The selected start date must contain events from all configured schemas.

   RSA recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.
   a. Log into NetWitness Platform.
   b. Go to (Admin) > **Services**.
   c. Locate the data source service (Broker or Concentrator).
   Select that service, and select (Actions) > **View** > **Security**.
   d. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.



3. SSH to the NetWitness UEBA server host.
4. Submit the following commands with the above parameters that you already defined.
   `/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -o <type> -t <startTime> -s <schemas> -v -e <argument>`
   Where:

| Argument | Variable | Description |
|---|---|---|
| `-u` | `<user>` | User name of the credentials for the Broker or Concentrator instance that you are using as a data source. |

| Argument | Variable | Description |
|---|---|---|
| -p | <password> | Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password.<br>!"#$%&()*+,-:;<=>?@[\]^_`\{\|}<br>If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example:<br>sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v |
| -h | <host> | IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported. |
| -o | <type> | Data source host type (broker or concentrator). |
| -t | <startTime> | Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z).<br>**Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone. |
| -s | <schemas> | Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS). |
| -v | | **verbose mode**. |
| -e | <argument> | Boolean Argument. This enables the UEBA indicator forwarder to Respond.<br>**Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Enable User Entity Behavior Analytics Incident Rule. |

5. If you are deploying a hot fix on 11.x.x.x version, you must do the following:
   a. Run the presidio-upgrade DAG.
   b. Press the play sign next to the DAG and then click the trigger button.

## Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA 11.7, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

**Note:** To complete NetWitness UEBA configuration according to the needs of your organization, See the *RSA NetWitness UEBA Configuration Guide*.

# Deployment Options

NetWitness Platform has the following deployment options. See the *NetWitness Deployment Guide* for detailed instructions on how to deploy these options.

- **Analyst User Interface** - gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).
- **Group Aggregation** - configures multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.
- **New Health and Wellness Search** - New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.
- **Hybrid Categories on Series 6 (R640) Hardware** - installs Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.
- **NW Server Deployment on ESA Hardware** - installs the NW Server host on RSA Series 5 and Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.
- **Second Endpoint Server** - deploys a second Endpoint Server.
- **Warm Standby NW Server** - duplicates the critical components and configurations of your active NW Server Host to increase reliability.

# Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness creates log messages when it encounters these problems.

**Note:** If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Event Stream Analysis

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Command Line Interface (CLI)

| | |
|---|---|
| **Error Message** | Command Line Interface (CLI) displays: "Orchestration failed."<br>`Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log` |
| **Cause** | Entered the wrong `deploy_admin` password in `nwsetup-tui`. |
| **Solution** | Retrieve your `deploy_admin` password.<br>1. SSH to the NW Server host.<br>`security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password`<br>SSH to the host that failed.<br>2. Run the `nwsetup-tui` again using correct `deploy_admin` password. |

| | |
|---|---|
| **Error Message** | `ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service` |
| **Cause** | NetWitness sees the Service Management Service (SMS) as down after successful upgrade even though the service is running. |
| **Solution** | Restart SMS service.<br>`systemctl restart rsa-sms` |

| | |
|---|---|
| **Error Message** | You receive a message in the User Interface to reboot the host after you update and reboot the host offline.<br> |
| **Cause** | You cannot use CLI to reboot the host. You must use the User Interface. |
| **Solution** | Reboot the host in the Host View in the User Interface. |

## Event Stream Analysis

For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

# Appendix B. Create an External Repository

Complete the following procedure to set up an external repository (Repo).

**Note:** 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in "Appendix A. Offline Method (No Connectivity to Live Services) - Command Line Interface" in the *Upgrade Guide for RSA NetWitness Platform*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
2. Set up the external repo.
   a. Log in to the web server host.
   b. Create directory to host the NW repository (`netwitness-11.7.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 11.7.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.7.0.0`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA`
   e. Unzip the `netwitness-11.7.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0` directory.
      `unzip netwitness-11.7.0.0.zip -d /var/netwitness/<your-zip-file-`

repo>/11.7.0.0
Unzipping netwitness-11.7.0.0.zip results in two zip files (OS-11.7.0.0.zip and RSA-11.7.0.0.zip) and some other files.

f. Unzip the:
OS-11.7.0.0.zip into the /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS directory.
```
unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS
```
The external url for the repo is http://<web server IP address>/<your-zip-file-repo>.

g. Unzip the:
RSA-11.7.0.0.zip into the /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA directory.
```
unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA
```

h. (Conditional - For Azure) Follow these steps for Azure update.

   i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   ii. `unzip nw-azure-11.3-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   iii. `cd /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`

   iv. `createrepo`

i. Use the http://<web server IP address>/<your-zip-file-repo> in response to **Enter the base URL of the external update repositories** prompt from NW 11.7.0.0 Setup program (nwsetup-tui) prompt.

# Appendix C. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

**Note:** In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ . ) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 
.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

## Arguments

| Argument | Description |
|---|---|
| `--help-install-opts` | Display all the arguments in this table. |

| Argument | Description |
|---|---|
| `--eula` | Accept or decline the End User License Agreement (EULA). Specify:<br>• `true` (default) to accept the agreement<br>• `false` to decline it and cancel the installation.<br>For example: `--eula=true` |
| `--is-head` | Designate the host as the NW Server host or a component host. Specify:<br>• `true` for NW Server host.<br>• `false` for Component host.<br>For example: `--is-head=true` |
| `--host-name` | Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname.<br>For example: `--host-name=<hostname>` |
| `--master-pass` | Enter master password. For example: `--master-pass=<password>` |
| `--deploy-pass` | Enter deployment password. For example: `--deploy-pass=<password>` |
| `--iface-name` | Specify network interface.<br>For example: `--iface-name=eth0` |
| `--ip-override` | Accept or override IP address found for this host or change the IP configuration found on the host. Specify:<br>• `true` provide IP address.<br>• `false` use IP address found on the host.<br>For example: `--ip-override=false` |
| `--ip-type` | Select ip address configuration type. Specify:<br>• `1` Static IP Configuration)<br>• `2` DCHP<br>For example: `--ip-type=1` |
| `--ip-addr` | For Static IP configuration, enter IP Address for static address.<br>For example: `--ip-addr=<ip-address>` |
| `--ip-netmask` | For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>` |

| Argument | Description |
|---|---|
| `--ip-gateway` | For Static IP configuration, enter default gateway for static address. For example:<br>`--ip-gateway=<default-gateway>` |
| `--ip-nameserver` | IP address assigned to DNS server.<br>`--ip-nameserver=<ip-address>` |
| `--ip-nameserver-secondary` | Optional - IP address assigned to a secondary DNS server.<br>For example: `--ip-nameserver-secondary=<ip-address>` |
| `--ip-domain` | For Static IP configuration, enter Local Domain Name for static address. For example:<br>`--ip-domain=<default-gateway>` |
| `--repo-type` | Select type of update repository. Specify:<br>• `1` Local repository<br>• `2` External repository<br>For example: `--repo-type=1` |
| `--repo-url` | For an external update repository, specify the url of the repository. For example:<br>`--repo-url=<url>` |
| `--head-ip` | For a component host, specify IP Address of the NW Server.<br>For example: `--head-ip=<ip-address>` |
| `--custom-firewall` | Disable default firewall configuration and use your custom configuration. Specify:<br>• `true` use custom firewall configuration.<br>• `false` use default firewall configuration.<br>For example: `--custom-firewall=true` |
| `--use-nat` | Configure the host to use Network Address Translation (NAT) based IP addresses:<br>• `true` use NAT IPs to connect to other hosts<br>• `false` do not use NAT IPs to connect to other hosts (default)<br>For example: `--use-nat=false` |

# Appendix D. Third Party Server System Requirement

This section contains all the hardware requirements and configuration needed to successfully deploy NetWitness Platform on Third Party Server Hardware. It contains the required compute, memory, drive types and recommendations.

Third Party Server Deployments only support the following NetWitness Platform components:

- Core Services (Broker , Decoder, Log Decoder, Archiver , Concentrator)
- Analyst UI
- New Health & Wellness
- Log Collector
- Malware Analysis
- Warehouse connector

## Hardware Requirements

Administrators must configure single bootable block device (RAID volume/group) and ensure it is bootable. After installation is complete, See core service storage configuration the NetWitness Storage Guide.

| Item | Core |
|---|---|
| Host Type | • NW Server<br>• Warm standby<br>• Analyst UI<br>• Health & Wellness<br>• Core Services<br>• Log Collector<br>• Malware Analytics<br>• Warehouse Connector |
| Memory | 128 GB |
| **Processor** | |
| Processor Speed | 3.2 Ghz |
| # of Processors | 2 |
| # of Cores | 8 Cores Per Processor |
| # of Threads | 16 Threads Per Processor |
| **Storage Configuration** | |

| Item | Core |
| --- | --- |
| Volume | Single block device. 150 GB or greater. |
| Drive Types | 10K SAS or SSD |
| RAID Configuration | 1, 5 or 6 |
| **Network** | |
| NIC | Supported by Centos 7.9 (1G, 10G or 40G) |
| Capture Speed | 3G |

# RSA NetWitness

# Getting Started with NetWitness Platform

## Overview

NetWitness is a powerful threat detection suite that enables Security Operation Centers (SOCs) to quickly locate, prioritize, and triage threats. NetWitness helps you to isolate and remediate known threats as well as those that were previously unknown. It provides deep insight into packets, logs, and endpoints that provide you with an unparalleled view into your enterprise or business.

NetWitness is powerful, but it is easier for Tier 1 Analysts to use because it automates the process of identifying and prioritizing suspicious threats. Tier 2 and Tier 3 Analysts can hunt for and locate threats by searching and filtering events and then examining events using reconstruction and analysis tools.

## Architecture

RSA NetWitness is a distributed and modular system that enables highly flexible deployment architectures that scale with the needs of the organization. NetWitness allows administrators to collect three types of data from the network infrastructure: packet data, log data, and endpoint data. The key aspects of the architecture are:

- **Distributed Data Collection**: The **Decoder** ingests packet data while the **Log Decoder** ingests log data. Decoders parse and reconstruct all collected network traffic from Layers 2 - 7, or log and event data from hundreds of devices and event sources, including NetWitness Endpoint data (if installed and configured). The **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while also facilitating reporting and alerting. The **Broker** aggregates data captured by other devices and event sources. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. Therefore, a Broker bridges the multiple real-time data stores held in the various Decoder or Concentrator pairs throughout the infrastructure.
- **Real-time Alerting**: The NetWitness **Event Stream Analysis (ESA)** service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. ESA uses an advanced Event Processing Language (EPL) that allows analysts to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.
- **Real-time Analytics** (automatic analysis of events): The RSA Automated Threat Detection functionality includes preconfigured ESA analytics module for detecting Command and Control traffic.
- **NetWitness Server**: The NetWitness Server provides reporting, investigation, administration, and other aspects of the user interface.
- **Capacity**: NetWitness has a modular-capacity architecture enabled with direct-attached capacity (DACs) or storage area networks (SANs), that adapts to the organization's short-term investigation and long-term analytic and data-retention needs.

NetWitness provides large deployment flexibility. You can design its architecture using as many as multiple dozens of physical hosts or a single physical host, based on the particulars of the customer's performance and security-related requirements. In addition, the entire NetWitness system has been optimized to run on virtualized infrastructure.

The System Architecture comprises of these major components- Decoders, Brokers, Concentrators, Archivers, ESA, and Warehouse Connectors. NetWitness components can be used together as a system or can be used individually.

- In a security information and event management (SIEM) implementation, the base configuration requires these components- Log Decoder, Concentrator, Broker, Event Stream Analysis (ESA), and the NetWitness Server.
- In a forensics implementation, the base configuration requires these components- Decoder, Concentrator, Broker, ESA, Malware Analysis, and Endpoint Log Hybrid. The Respond Server service is also required and is used to prioritize alerts.

The table provides a synopsis of each major component:

| System Component | Description |
|---|---|
| **Decoder / Log Decoder** | • NetWitness collects packet, log, and endpoint data.<br>• Packet data, that is, network packets, are collected using the Decoder through the network tap or span port, which is typically determined to be an egress point on an organization's network.<br>• A Log Decoder can collect four different log types - Syslog, ODBC, Windows eventing, and flat files.<br>• Windows eventing refers to the Windows 2008 collection methodology and flat files can be obtained via SFTP.<br>• Both types of Decoders ingest raw transactional data that is enriched, closed out, and aggregated to other NetWitness components.<br>• The process for ingesting and parsing transactional data is a dynamic and open framework. |
| **Endpoint Log Hybrid** | • Collects and manages endpoint (host) data from Windows, Mac, or Linux hosts.<br>• Records data about every critical action, such as process, file, registry modification, network connections, and user console interactions.<br>• Collects Windows logs and file logs from Windows host, if configured.<br>• Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.<br>• Performs on-demand memory analysis and suspicious user behavior detection. |

| System Component | Description |
|---|---|
| **Concentrator** | • Provides index and query capability to NetWitness Collections.<br>• Can optionally forward data to ESA. |
| **Broker** | • Distributes NetWitness Collection access across many Concentrators or Archivers, making the entire NetWitness enterprise appear as a single collection. |
| **Archiver** | • The Archiver service enables long-term log archiving by indexing and compressing log data and sending it to archiving storage.<br>• The archiving storage is optimized for long-term data retention, and compliance reporting.<br>• Archiver stores raw logs and log metadata from Log Decoders for long-term retention, and it uses Direct-Attached Capacity (DAC) for storage.<br>**Note:** Raw packets and packet metadata are not stored in the Archiver. |
| **Event Stream Analysis (ESA)** | • ESA provides event stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators.<br>• ESA uses advanced Event Processing Language that allows users to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams.<br>• ESA helps to perform powerful incident detection and alerting. |

## Core Versus Downstream Components

In NetWitness, the Core services ingest and parse data, generate metadata, and aggregate generated metadata with the raw data. The Core services are Decoder, Log Decoder, Concentrator, and Broker. Downstream systems use data stored on Core services for analytics; therefore, the operations of downstream services are dependent on Core services. The downstream systems are Archiver, ESA, Malware Analysis, Investigate, and Reporting.

Although the Core services can operate and provide a good analytics solution without the downstream systems, the downstream components provide additional analytics. ESA provides real-time correlation across sessions and events as well as between different types of events, such as log, packet, and endpoint data. Investigate provides the ability to drill into data, examine events and files, and reconstruct events in a safe environment. The Malware Analysis service provides real-time, automated inspection for malicious activity in network sessions and associated files.

# Logging in to NetWitness Platform

**Note:** NetWitness supports modern (or current) versions of Google Chrome, Mozilla Firefox, Microsoft Edge, and Apple Safari. It is possible to use a different browser, but some features may not function as expected. Internet Explorer is no longer supported.

Logging in to NetWitness can vary based on your environment. You may have an internal user account or an external user account. Internal user accounts are local to the NetWitness and internal users can log in to NetWitness and receive role-based permissions. External user accounts authenticate outside of the NetWitness and are mapped to NetWitness roles. If you are an external user and you cannot access NetWitness or view the information that you need, contact your System Administrator. Your Administrator can assign the appropriate roles to your account.

NetWitness Platform 11.4 or later also supports Single Sign-On authentication (SSO) using Security Assertion Markup Language 2.0 (SAML 2.0) protocol with Active Directory Federation Services (ADFS) as the Identity Provider.

If SSO authentication is enabled by your administrator, you will be redirected to the Identity Provider User Interface instead of the default NetWitness login page. After you enter the username and password you will be securely logged into NetWitness Platform.

**Note:** In 11.4 or later, Single Sign-On (SSO) authentication can be used to access the NetWitness Platform UI, and Analyst UI Deployment.

1. Use the icon provided by your Administrator, or type the following in your web browser:
   `https://<hostname or IP address>/login`
   Where `<hostname or IP address>` is the hostname or the IP address of your NetWitness server.
   If Single Sign-On authentication is enabled, this redirects you to the ADFS login screen.
2. Enter the username and password, and then click **Sign in**.
   If the login is successful, you will be logged into the landing page specified in the user preferences.

**Note:** If you had previously authenticated to any other application configured to the same IDP, then you may be redirected to the requested NetWitness Platform UI without being prompted for the credentials.

### If you are locked out:

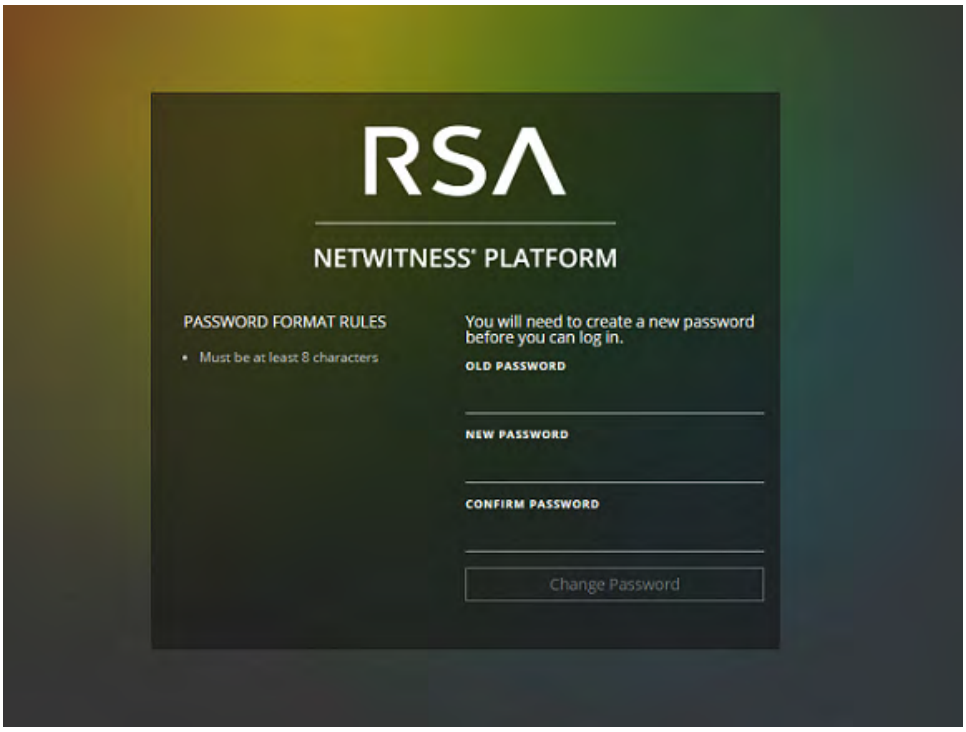
**Note:** This information applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

If you try too many times to log in with an incorrect username or password, your account will be locked. Contact your Administrator to unlock your account.

### If you have a new account or your account is expired:

**Note:** This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

1. In the dialog to create a new password, enter your old password, type a new password, and confirm it. Password format rules (as defined by your system administrator) are provided on the left and your new password must conform to the indicated format rules.



2. Click **Change Password**.

### If you do not have the appropriate access to NetWitness:

If you are able to log in successfully, but you are not able to view the information that you need, it is possible that you need a user role assigned to your user account. Contact your Administrator for assistance.

## Log Off NetWitness Platform

### To log off from the Respond and some Investigate views:

1. In the main menu bar, select your username, for example, admin.
2. In the User Preferences, click **Sign Out**.

### To log off from the other views:

In the main menu bar, select your username and then select **Sign Out**.

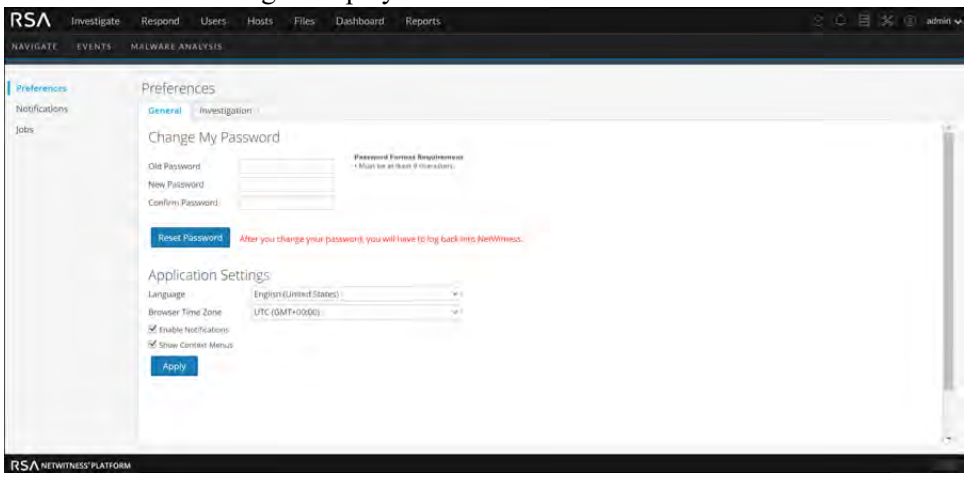
# Changing Your Password

You can change the password that you use for NetWitness authentication at any time in your user preferences. Your administrator defines the appropriate password strength requirements for your NetWitness password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

### To change your password:

1. Do one of the following:
   - For most views, such as Investigate, Dashboard, Reports, (Configure) or (Admin) , select your username, for example admin, and then select **Profile**.
   - In the Springboard, Investigate view (Events), Respond, Users, Hosts, and Files, select your username, for example admin, and in the User Preferences dialog click **Change my password**.

   The Preferences dialog is displayed.



2. In the **Change My Password** section, enter the password that you used to authenticate to NetWitness in the **Old Password** field.
3. In the **New Password** field, enter the password that you want to use for the next login.
4. In the **Confirm Password** field, retype the new password.
5. Click **Reset Password**.
   You will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness.

For more information on user preferences, see Setting User Preferences.

# Identifying Your Role

The roles listed here are the typical roles or functions of a Security Operations Center (SOC). Determine the role or roles that you perform in the SOC. You can use these functions as a guide to decide how to set up and navigate NetWitness so that you can efficiently perform your job tasks.

SOC Team

SOC Manager
(SOC Management and Reporting)

- Manage SOC readiness
- Respond to incidents
- Respond to data breaches

Data Privacy Officer

- Monitor and protect privacy and sensitive information

Incident Responder
(T1 Analyst)

- Respond to incidents
- Remediate incidents

Threat Hunter
(T2/T3 Analyst)

- Hunt for threats
- Conduct forensic analysis
- Recommend issues for remediation
- Remediate issues

Content Expert
(Threat Intelligence)

- Investigate new threat intelligence
- Evaluate and create new feeds
- Create correlation rules to flag indicators of compromise

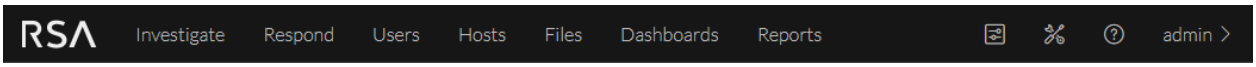
System Administrator

- Install and configure equipment and software
- Manage user access
- Monitor and fine tune performance
- Backup and restore data
- Manage storage and archives
- Update software
- Create reports for regulatory compliance

# NetWitness Platform Basic Navigation

The NetWitness application is divided into ten main functional areas, known as views, that are based on typical Security Operation Center (SOC) roles.

**Note:** On upgrade to version 11.5 or later, by default the Springboard is displayed if you have not configured the default landing page in previous versions.



- **Springboard**: Springboard presents Analysts with the platform-wide detections and signals in a single view to hunt and investigate faster than ever before. System Administrators set up and maintain the Springboard. You can view the Springboard at any time by clicking RSA in the main menu. For more information, see Managing the Springboard.
- **Investigate**: This view is primarily for Threat Hunters, who prefer to manually hunt for threats using NetWitness metadata, raw event data, and event reconstruction and analysis. Incident Responders also use this view to get details about events associated with an incident being investigated. Both Threat Hunters and Incident Responders can use the forensic event reconstruction and event analysis features in this view.
- **Respond**: This view is for Incident Responders, who can view a list of prioritized incidents to triage. These incidents come from sources such as ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection. You can also view all of the alerts received by NetWitness here.
- **Users**: This view is for SOC Managers and Analysts to discover, investigate, and monitor risky behaviors across entities namely Users and Network in your environment.
- **Hosts**: This view is for Analysts, who can investigate or perform analysis on hosts using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Files**: This view is for Analysts, who can investigate or perform analysis on files using attributes such as IP address, host name, Mac address, risk score, and so on
- **Dashboard**: This view is for all users. You can view dashboards on different areas of interest depending on your user permissions.
- **Reports**: This view is for all users. You can view reports on different areas of interest depending on your user permissions.
- **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

## Menu changes

The following table illustrates the top-level menu changes in the 11.5 version.

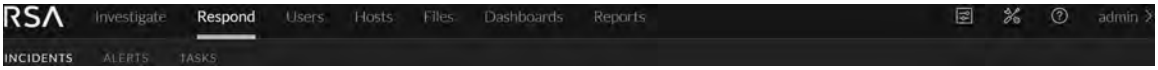
| Previous Version - 11.4 and earlier | 11.5 Version |
|---|---|
| N/A | Click the RSA logo at the top left corner to view the Springboard. |
| Monitor > Dashboard<br>Monitor > Reports | Dashboard<br>Reports |
| Investigate > Hosts<br>Investigate > Files<br>Investigate > Entities | Hosts<br>Files<br>Users |
| Configure | |
| Admin | |

## Accessing Main Views

The options that open each of the main views are listed at the top of the browser window. With the appropriate permissions, you can access any of these views at the top of every UI at any time.

## Secondary Menus

The main views have secondary menus with additional views that you can select, which vary according to the tasks that you can complete. The following example shows the Respond menu.



## Additional Options

In addition to the main views, there are additional options at the top of the UI that are common to the application.

The following table describes the common options.

| Common Option | Name | Description |
|---|---|---|
| | Jobs | In the Investigate, Dashboard, Reports, (Configure) , and (Admin) views, click this icon to view and manage your jobs in the Jobs tray. Jobs are on-demand or scheduled tasks that take some time to complete in the NetWitness application. |
| | Notifications | Click this icon to view notifications from the application. |
| | User Preferences | Click this icon to view your available user preference options. You can manage your user preferences and log out of NetWitness. |

## Main Views

The following sections explain the main views:

- Springboard
- Investigate
- Respond
- Users
- Hosts
- Files
- Dashboard
- Reports
- Configure
- Admin

# Springboard

(From 11.5 and later) RSA NetWitness Platform Springboard is an easy-to-use landing page that presents platform-wide detections and signals in a single view to help analysts hunt and investigate faster than ever before.

Click the RSA logo at the top left corner to view the Springboard.

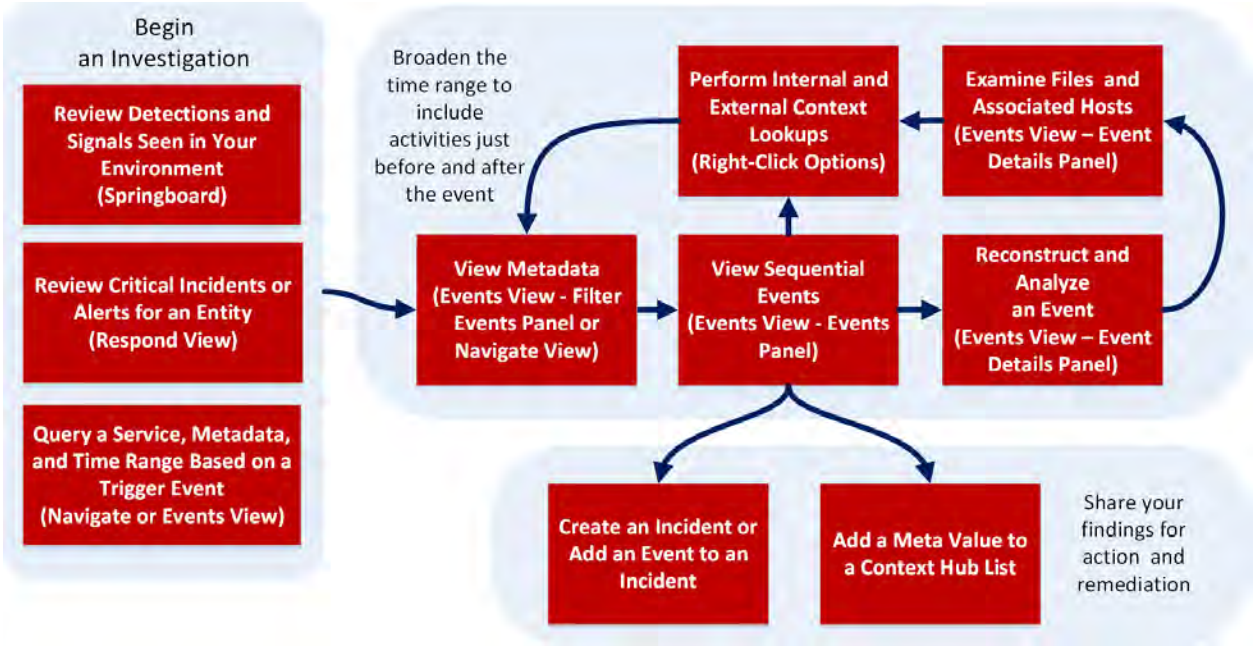
| What can I do here? | Path | Show me how |
|---|---|---|
| View out-of-the-box panels<br>Edit a panel<br>Refresh a panel<br>Select time range<br>View all incidents, alerts, users, files, and hosts<br>View details of selected incident, alert, user, file, and host<br>Manage Board (add, rearrange, and delete panels) | Springboard view | See Managing the Springboard. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

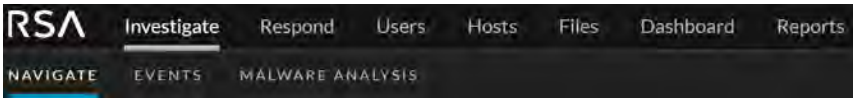
# Investigate

The Investigate view is the tool for SIEM, network, and endpoint data investigation, presenting different views into a set of data. Analysts can see metadata and raw data for endpoints, logs, and events, as well as potential indicators of compromise. In addition to investigating data on a specific service, you can pivot into Investigate from Respond, the Dashboard view, an entry in a report generated by the Reporting Engine, or a properly configured third-party application.

You can begin your investigation in any Investigate view, then continue the investigation seamlessly in another Investigate view. The manner in which you proceed is determined by the question that needs to be answered. If you find an event that needs a response, you can create an incident in Respond where an incident responder will take further action. The following figure depicts the high-level flow of an investigation. The *NetWitness Investigate User Guide* provides detailed information.

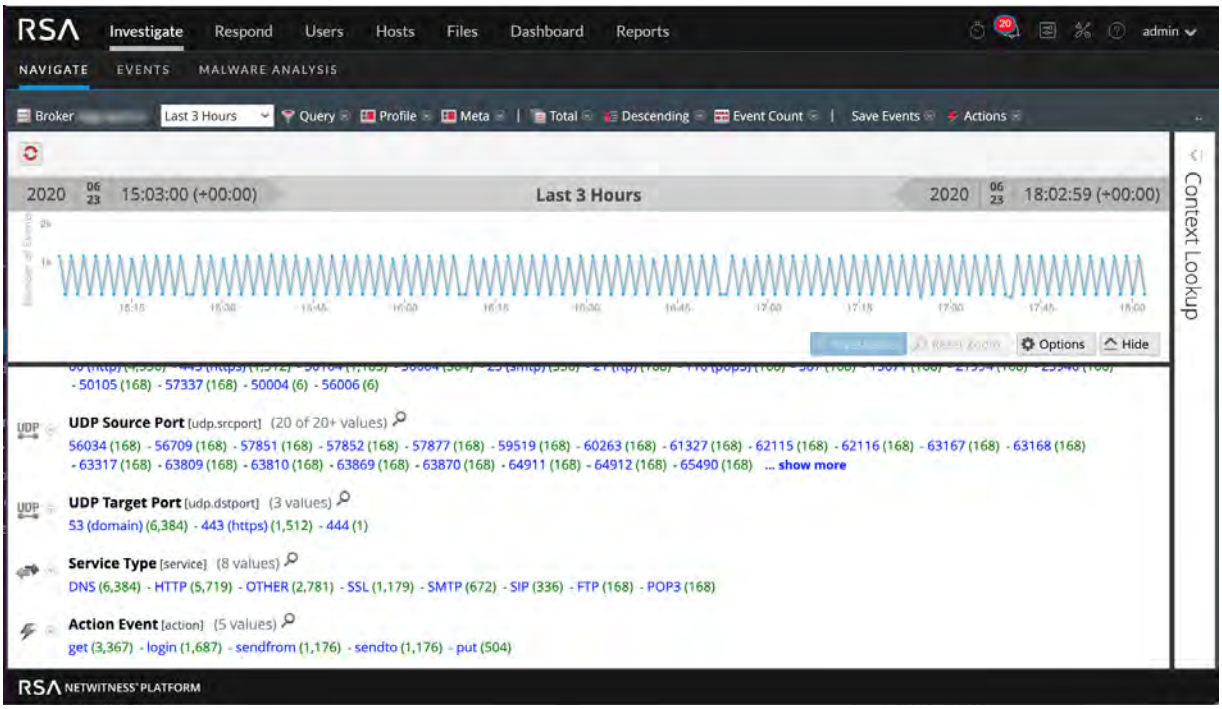


## Investigate Menu

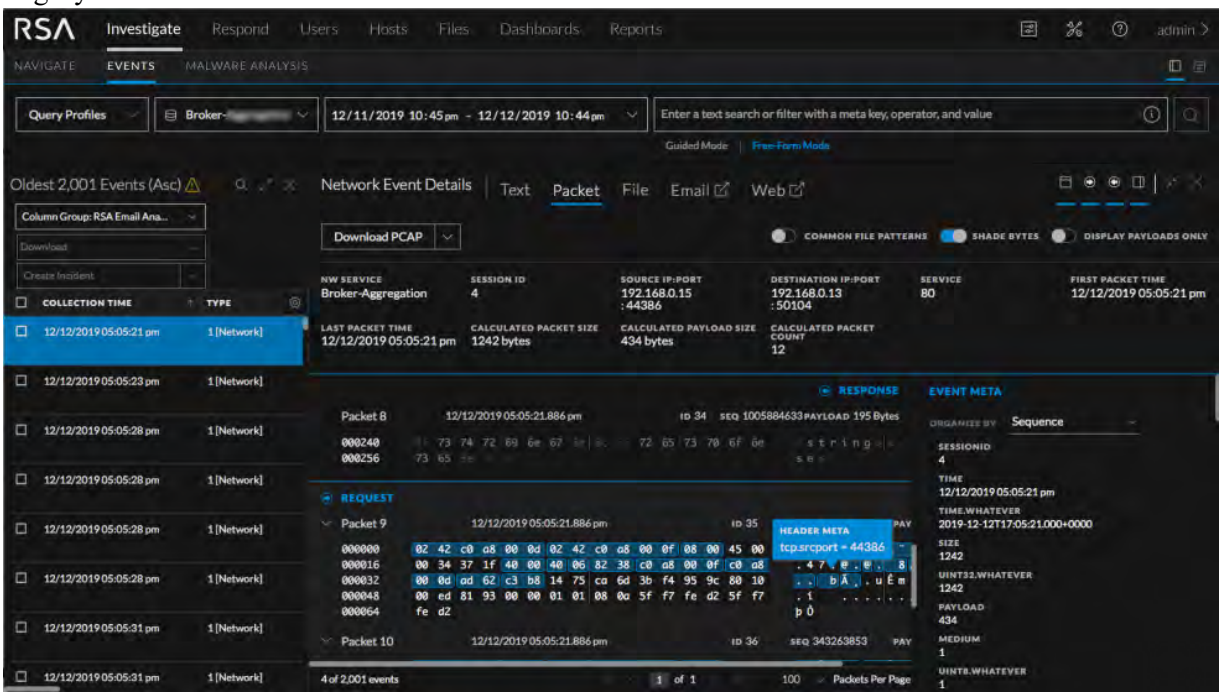


The Investigate menu has the following options:

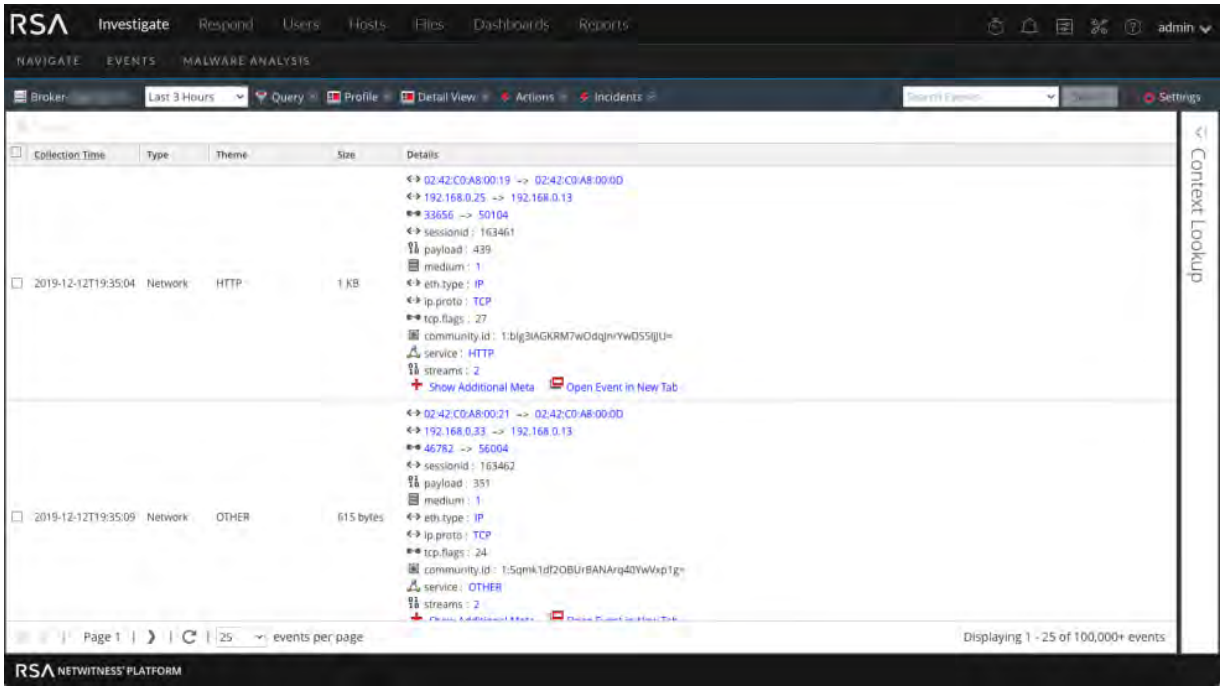
- **Navigate**: The Navigate view provides a list of meta keys and meta values with a focus on metadata. You can drill into the data, search for events, open a selected event in the Events view, and look up additional context from the Context Hub service.



- **Events**: The Events view (formerly Event Analysis view) is the default user interface for interacting with events. It provides a sortable list of events with focus on metadata and raw data. You can search for events, view a reconstruction that offers helpful cues to identify points of interest, pivot to standalone Endpoint, look up additional context from the Context Hub service, look up data in Live, do external lookups, and create an incident for incident responders. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.



- **Legacy Events**: With major functionality added to the 11.3 Events view, the Legacy Events is no longer needed and it is hidden unless the administrator enables it. The Legacy Events view provides a list of events with a focus on raw data. You can browse a simple list of events, a detailed list, and a log list. You can search for events, view a reconstruction of an event, look up additional context from the Context Hub service, and create an incident for incident responders.



- **Malware Analysis**: Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows PE, PDF, and MS Office) to assess the likelihood that a file is malicious. Using Malware Analysis, you can prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

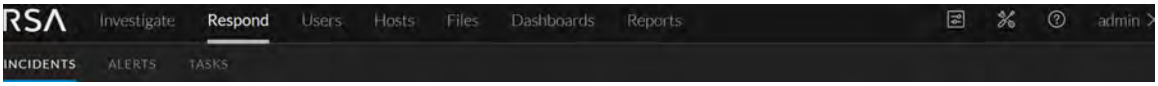
| Scan Files and Events for Malware | Malware Analysis view | See the *Malware Analysis User Guide*. |
| Triage an Incident | Pivot from the Respond view | See the *NetWitness Respond User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Respond

The Respond view presents analysts with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. From there, you can determine the incident scope and escalate or remediate it as appropriate.

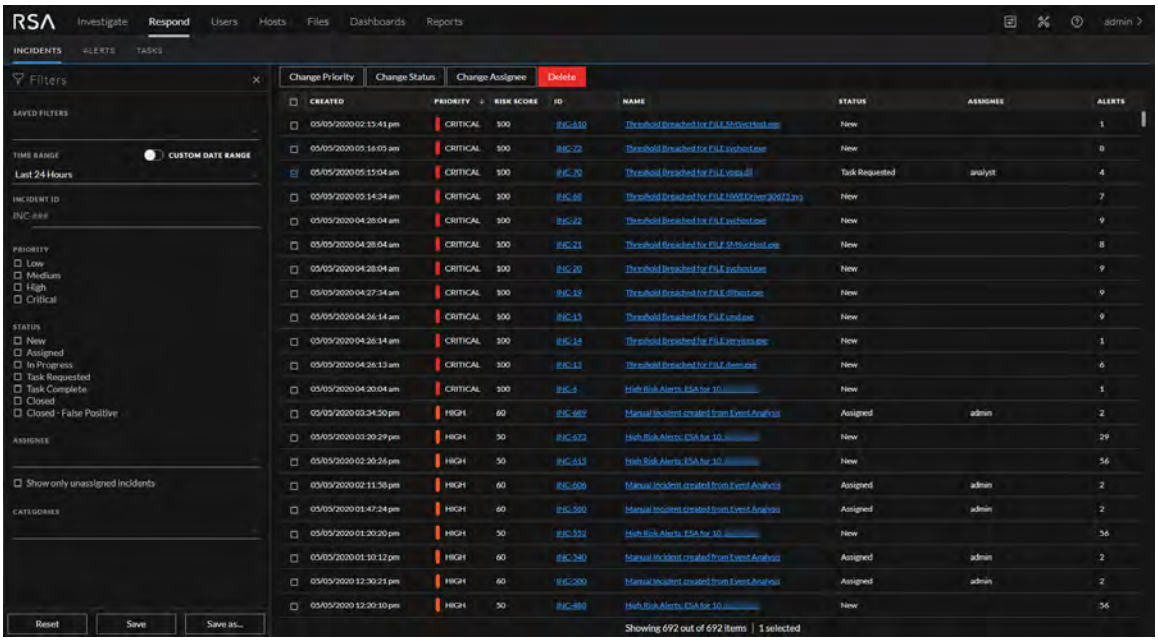
## Respond Menu



The Respond menu has the following options:

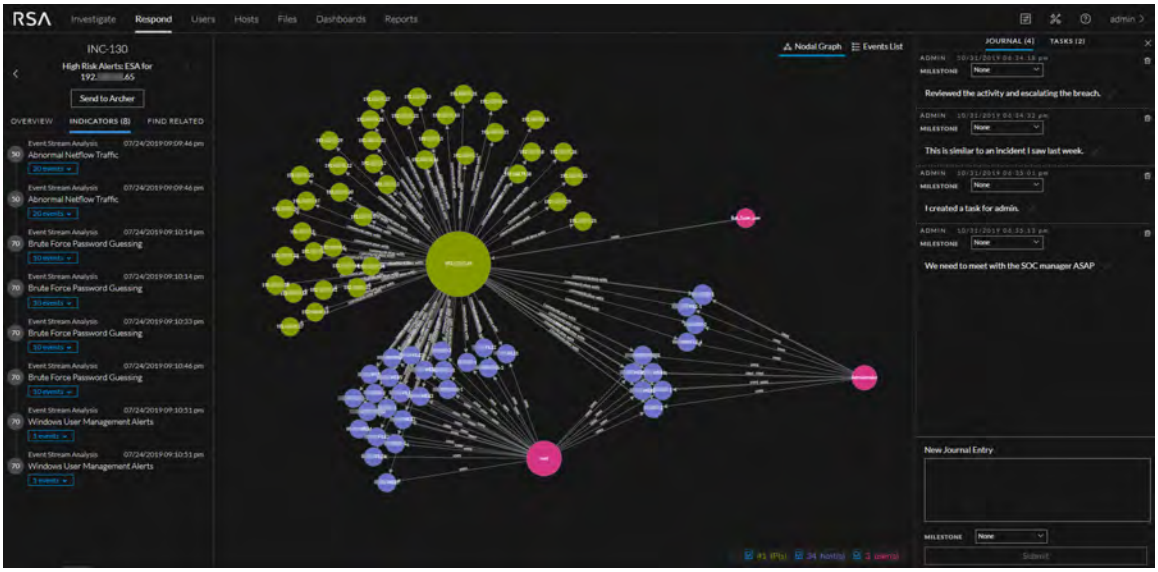
- **Incidents**: The Incidents List view contains a list of all incidents with basic information. The Incident Details view provides extensive details about the incident.
- **Alerts**: The Alerts List and Alert Details views provide information about all of the threat alerts and indicators received by NetWitness in one location.
- **Tasks**: The Tasks List view enables you to create tasks and track them to completion.

The following figure shows the Respond view - Incidents List view, which shows a list of prioritized incidents.

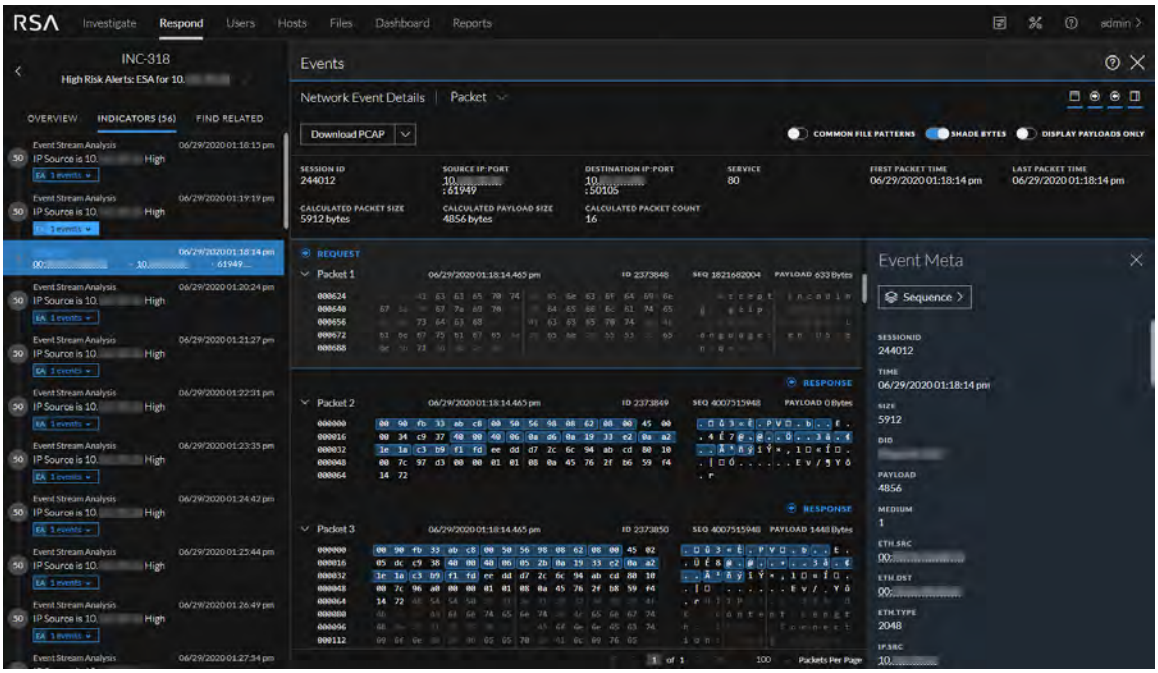


When using NetWitness as your case management tool, you can also manage incidents from this view. New incidents appear at the top of the incident queue.

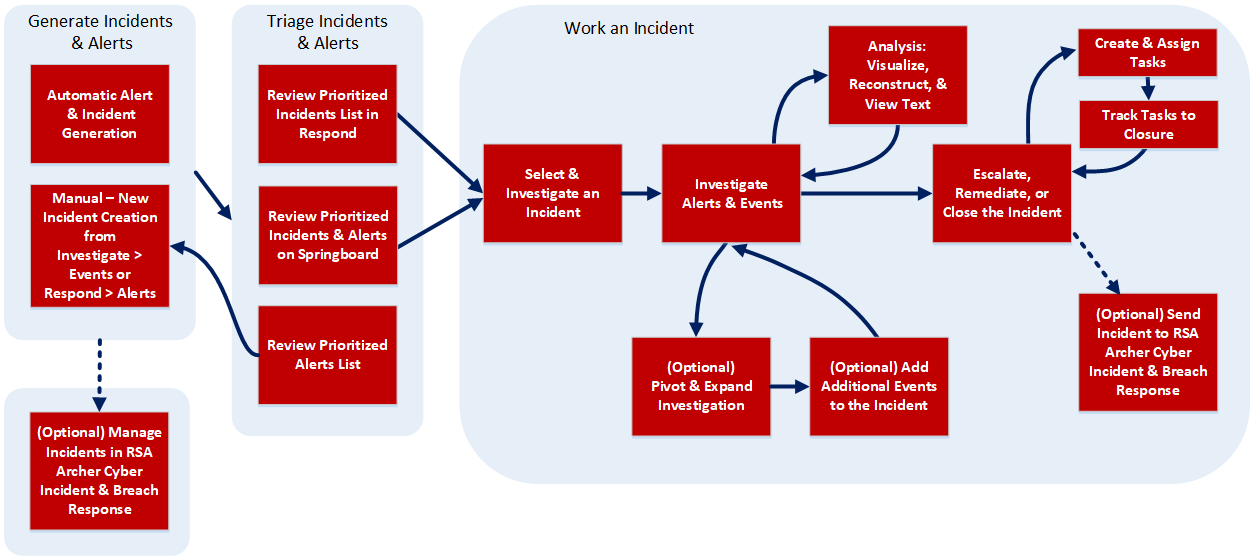
The following figure shows an example of the Respond view - Incident Details view, which shows details for a selected incident.



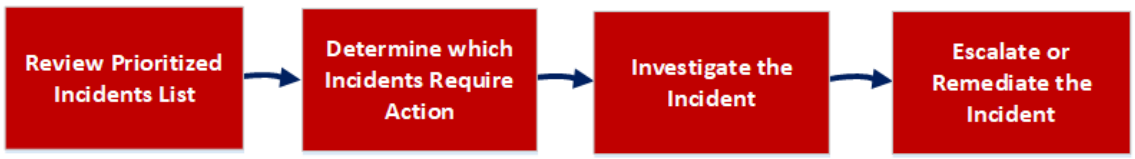
The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.



The following figure shows the high-level Respond workflow process.



The following figure shows the high-level process that Incident Responders use to respond to incidents in the Respond view.



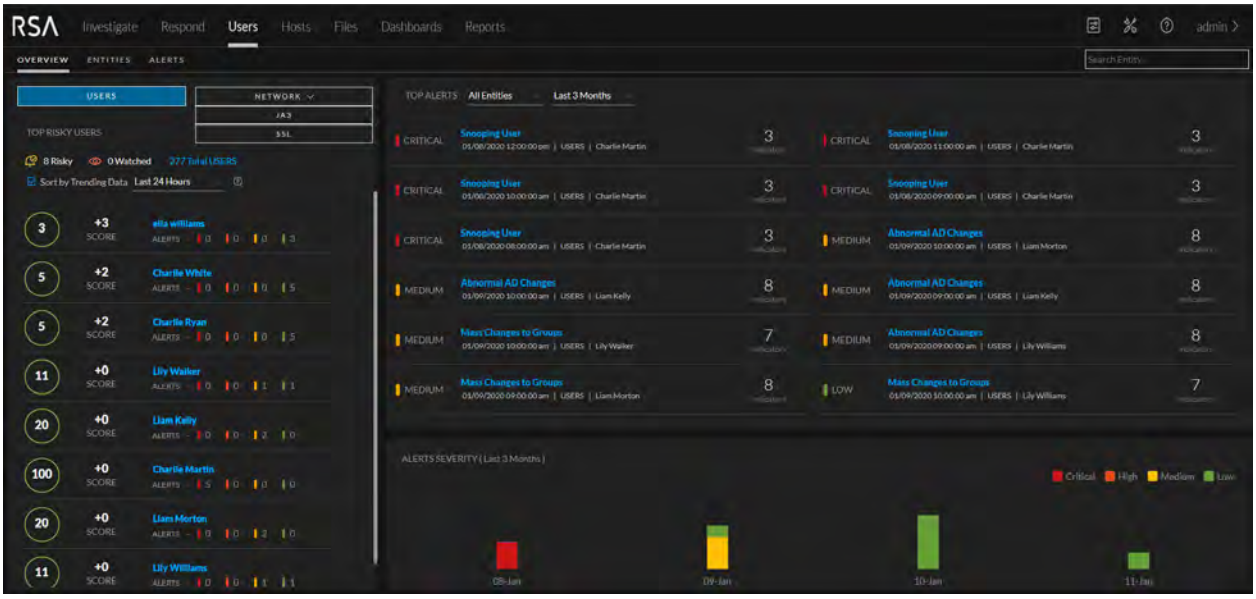
In the Respond view, analysts look at the prioritized list of incidents and determine which incidents require action. They click an incident for a clear picture of the incident with supporting details and they can investigate the incident further. Analysts can then determine how to respond to the threat, by escalating or remediating it.

| What can I do here? | Path | Show me how |
|---|---|---|
| View prioritized incident lists | Respond > Incidents (Incidents List view) | See the *NetWitness Respond User Guide*. |
| Determine which incidents require action (Triage an incident) | Respond > Incidents (Incident Details view) | See the *NetWitness Respond User Guide*. |
| Investigate the incident | Respond > Incidents (Incident Details view) | See the *NetWitness Respond User Guide*. (You can also pivot to the Investigate view.) |
| Escalate or Remediate the Incident | Respond > Incidents (Incident Details view) and Respond > Tasks (Tasks List view) | See the *NetWitness Respond User Guide*. |
| Review Alerts | Respond > Alerts (Alerts List and Alert Details views) | See the *NetWitness Respond User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Users

The Users view provides visibility into risky user behaviors across your enterprise with RSA NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment. Then you can select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred.



The Users menu has the following options:

- **Overview**: It provides an initial view into the recent and most important user or network entity activities in the environment. Each panel shows either prioritized incidents for investigation or consolidated metrics reflecting potential risks to the enterprise.
- **Entities**: It is a proactive threat hunting console. You can use behavioral filters to build use case driven target lists, and to continuously monitor the environment for specific risky behavior patterns.

**Note:** The Entities view is only available if you are assigned the role of Administrator or UEBA Analyst.

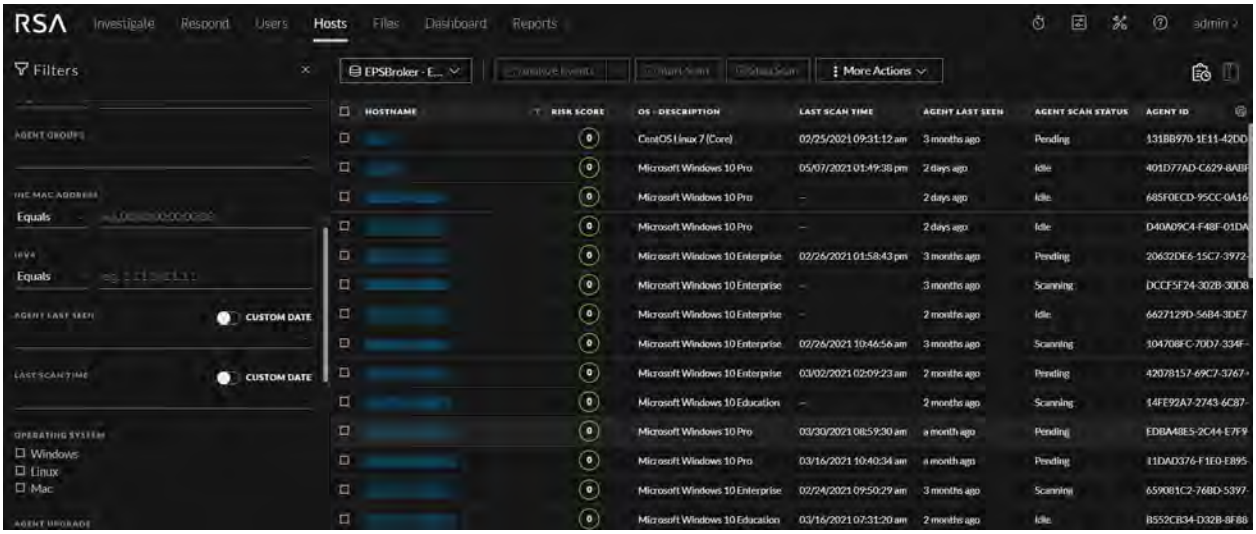
- **Alerts**: It displays details about all the alerts in your environment. You can view forensic information about suspicious activity in your environment that is based on a specific timeframe.

| What can I do here? | Path | Show me how |
|---|---|---|
| Find Risky User Behavior | Users view | See the *NetWitness UEBA User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Hosts

The Hosts view lists all hosts that have a NetWitness Endpoint agent running. You can filter hosts based on operating system, agent last seen, last scan time, risk score, and other factors. You can open a specific host to view events related to alerts, anomalies, process details, and information related to logged-in users.

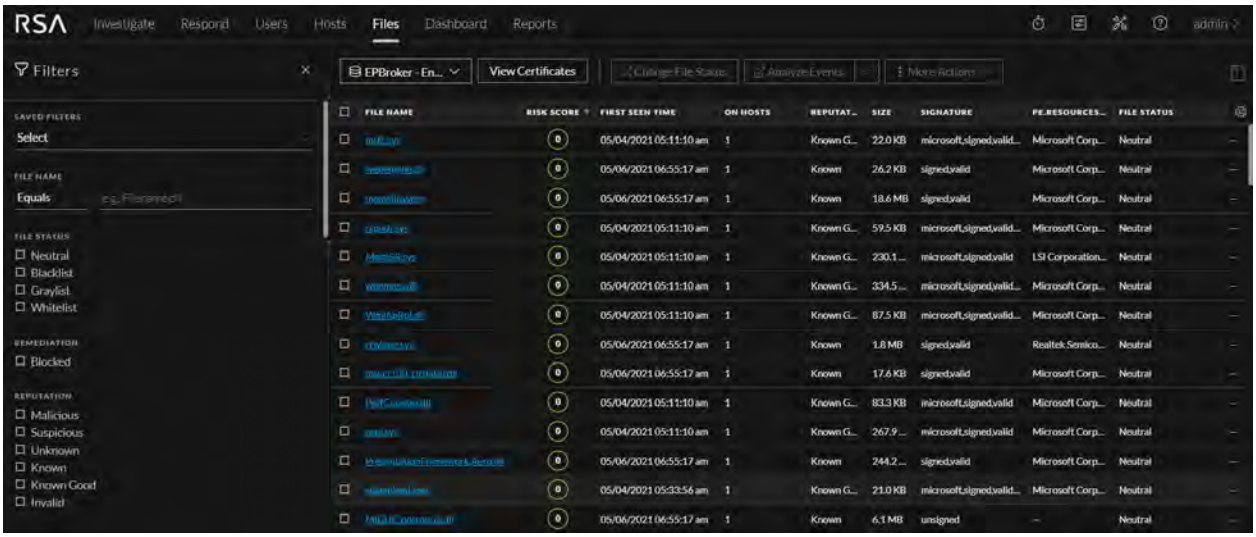


| What can I do here? | Path | Show me how |
|---|---|---|
| Investigate Endpoints | Hosts view | See the *NetWitness Endpoint User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Files

The Files view provides a holistic view of all files in your deployment. You can apply filters, sort, and categorize files by status to reduce the number of files for analysis, and identify suspicious or malicious files.

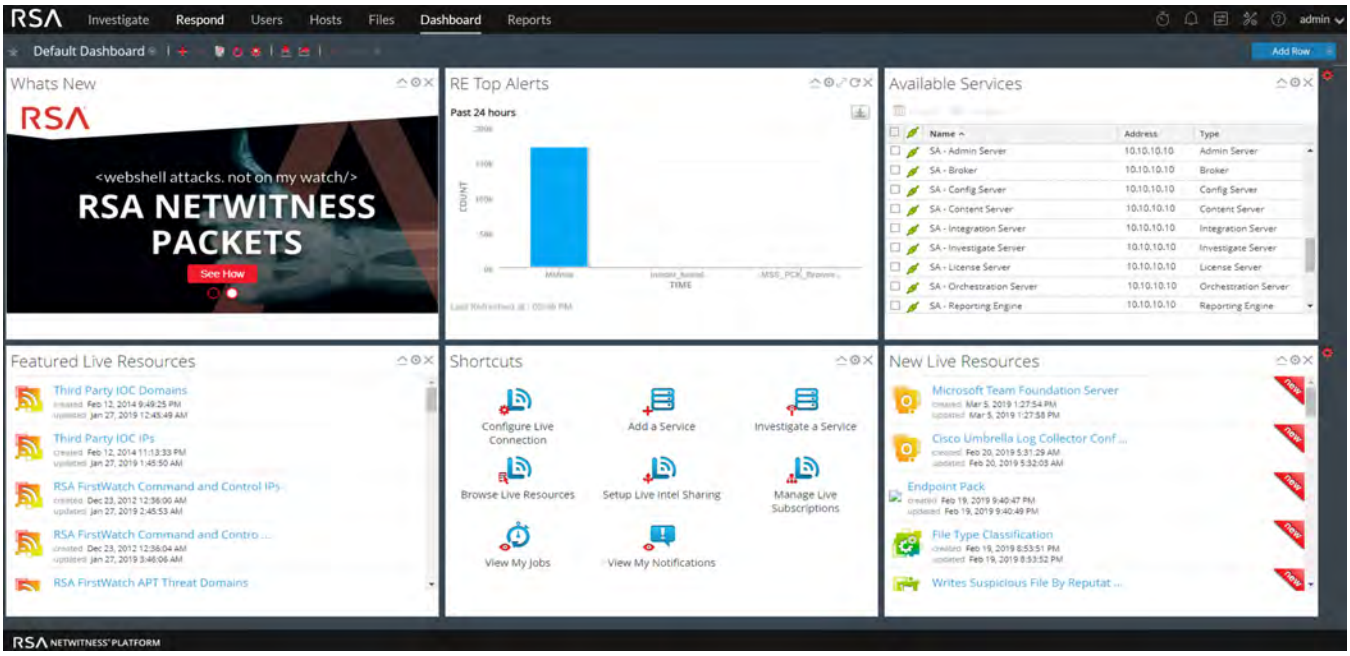


| What can I do here? | Path | Show me how |
|---|---|---|
| Find Suspicious Endpoint Files | Files view | See the *NetWitness Endpoint User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Dashboard

A dashboard is a group of dashlets that give you the ability to view data in one space, the key snapshots of the various components that you consider important. In RSA NetWitness® Platform, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness Platform deployment, displaying only the information that is most relevant to the day-to-day operations.



NetWitness Platform has predefined dashboards that you can select in the Dashboard view depending on the tasks you perform:

You can select the following preconfigured dashboards:

- Default
- Identity
- Investigation
- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

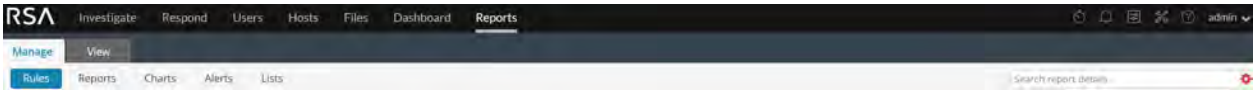
| What can I do here? | Path | Show me how |
|---|---|---|
| Select a Dashboard | Dashboard view | See Managing Dashboards. |
| Create a Dashboard | Dashboard view | See Managing Dashboards. |
| Manage Dashboards | Dashboard view | See Managing Dashboards. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Reports

The Reports view enables you to view and manage reports relevant to your SOC role according to your assigned permissions.

## Reports Menu



The Reports menu has the following options:

- **Manage**: This panel allows you to create or modify an rules, reports, charts, alerts, and lists as per the requirement.
- **View**: You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.

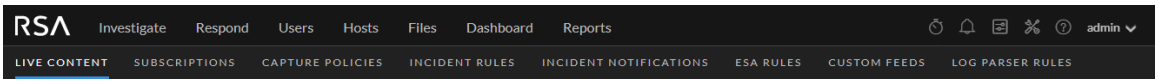
| What can I do here? | Path | Show me how |
|---|---|---|
| View a Report | Reports > View | See the *Reporting User Guide*. |
| Manage Reports | Reports > Manage | See the *Reporting User Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Configure

The Configure view enables Threat Intel personnel (Content Experts) to configure data sources and inputs to NetWitness in one convenient location.

## Configure Menu



The Configure menu has the following options:

- **Live Content** (Live Services): The Live Content view enables you to search for and subscribe to Live Services resources. Live Services is the component of the NetWitness that manages communication and synchronization between NetWitness services and a library of Live content available to RSA NetWitness customers. You can view, search, deploy, and subscribe to content from the RSA Live Content Management System (CMS) to NetWitness services and software. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA Live Services.
- **Subscriptions** (Live Services): The Subscriptions view enables you manage the Live content that you subscribed to, in the Live Content view. To set up Live Services on NetWitness, you configure the connection and synchronize between the CMS server and NetWitness.

- **Capture Policies**: The Capture Policies view enables you to set up selective network data collection, which gives you the ability to apply centrally managed capture policies across your Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. You can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.
- **Incident Rules**: The Incident Rules view enables you to create incident rules with various criteria to automatically create incidents. You can view prioritized incidents in the Respond view.
- **Incident Notifications**: The Incident Notifications view enables you to automatically send email notifications to SOC Managers and the Analysts assigned to the incidents when incidents are created or updated.
- **ESA Rules**: The ESA Rules view enables you to manage the Event Stream Analysis (ESA) rules that specify criteria for problematic behavior or threatening events in your network. When ESA detects a threat that matches the rule criteria, it generates an alert.
  You can create ESA rules yourself or download them from Live Services. The Rule Library shows all ESA rules created or downloaded. To activate rules, you have to add them to a deployment. Deployments map rules from your rule library to the appropriate ESA services.
- **Custom Feeds** (Live Services): The Custom Feeds view streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. You can set up and maintain custom and identity feeds.
  NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created.
  You can create custom feeds to provide extra metadata extraction, for example, to accommodate custom network applications.
- **Log Parser Rules**: The Log Parser Rules tab displays information about individual log parsers, as well as the default, "parse all" parser that can parse logs that are not associated with a particular log parser. This tab contains the following information:
  - You can view the rules for a particular event source type, including the default parser.
  - You can view the names, literals, patterns, and metadata for each configured log parser.
  - You can add log parsers.
  - You can add, edit, and delete custom rules for log parsers.

  **Note:** The Log Parser Rules tab is available in the Configure menu in versions 11.2 and later. For earlier versions, it is located in Admin > Event Sources.

# Admin

In the Admin view, administrators can manage network hosts and services; monitor the health and wellness of NetWitness; and manage system-level security. They can also configure global system resources and manage event sources.

## Admin Menu

The (Admin) menu has the following options:

- **Hosts**: The Hosts view is where you set up and maintain hosts. A host is the machine on which services run and a host can be a physical or virtual machine.
- **Services**: The Services view enables you to manage services, manage service users and roles, maintain service configuration files, and explore and edit service properties. A service performs a unique function, such as a Decoder service, which captures network data in packet form.
- **Event Sources**: The Event Sources view enables you to manage event sources and configure alerting policies for them. Organizations typically monitor event sources in groups based on the criticality of

the event sources. You can create monitoring policies for each event source group and order them based on priority.

- **Endpoint Sources**: The Endpoint Sources view enables you to manage and update endpoint agent configurations through groups and manage the agents behavior using policies. You can either use the default policies or customize these policies.
- **Health & Wellness**: The Health & Wellness view enables you to monitor the health of the NetWitness hosts and services in your network environment.
- **System**: The System view enables you to set global NetWitness configurations. You can configure global audit logging, email, system logging, jobs, RSA Live Services, URL integration, Investigation, Event Stream Analysis (ESA), ESA Analytics, and advanced performance settings. In addition, you can manage NetWitness versions and configure the local licensing server.
- **Security**: The Admin Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness roles, and modify other security-related system parameters. These apply to the NetWitness system and are used in conjunction with the security settings for individual services.

**Note:** For versions 11.2 and later, the Event Sources > Log Parser Rules tab can be found in the Configure view.

| What can I do here? | Path | Show me how |
|---|---|---|
| Manage hosts. | (Admin) > Hosts | See the *Host and Services Getting Started Guide*. |
| Manage services including managing service user access and security. | (Admin) > Services | See the *Host and Services Getting Started Guide*. |

| Manage system users with roles and permissions. | (Admin) > Security | See the *System Security and User Management Guide*. |
| Set up Public Key Infrastructure (PKI) authentication. PKI is available in NetWitness 11.3 and later. | (Admin) > Security | See the *System Security and User Management Guide*. |

Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

# Setting Up Your Default View by SOC Role

After logging in to NetWitness, you can navigate into the application easier by setting up your default view based on your Security Operations (SOC) role. You can set your default view, also known as a landing page, in your user preferences.

On upgrade to version 11.5 or later, by default the Springboard is displayed if you have not configured the default landing page in previous versions.

In version 11.4 and prior versions, if you configured the default landing page as Respond or Investigate in the User Preferences, then on upgrade to version 11.5, the default landing page will be Respond or Investigate view.

On fresh install of NetWitness 11.5 version, when you log in, by default Springboard is the landing page.

The following figure shows the main NetWitness views.

- **Springboard**: This view is for Analysts, who can see panels for prioritized alerts, incidents, risky hosts, risky users, risky files, and focused event data to help hunt and investigate faster than ever before.
- **Investigate**: This view is for Threat Hunters, who investigate and hunt for advanced threats. Other analysts such as Incident Responders may pivot into this view for deeper analysis of an incident.
- **Respond**: This view is for Incident Responders, who can view a list of incidents to triage and alerts.
- **Users**: This view is for SOC Managers and Analysts to discover, investigate, and monitor risky behaviors across entities namely Users and Network in your environment.
- **Hosts**: This view is for Analysts, who can investigate or perform analysis on hosts using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Files**: This view is for Analysts, who can investigate or perform analysis on files using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Dashboard**: This view is for all users. You can view dashboards on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard.
- **Reports**: This view is for all users. You can view reports on different areas of interest depending on your user permissions.
- **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

You can select any of the main NetWitness views as your default view. In addition to the main views, NetWitness has predefined dashboards that you can select in the Dashboards view depending on the tasks you perform:

- Default Dashboard
- Identity Dashboard
- Operations - Logs Dashboard
- Operations - Network Dashboard
- Overview Dashboard
- Threat - Indicators Dashboard
- Threat - Intrusion Dashboard

The following table shows typical SOC roles and the available views you can select as your landing page in your user preferences based on your SOC role. If you have more than one role, select the view that is most appropriate for you to start with when you log in to NetWitness.

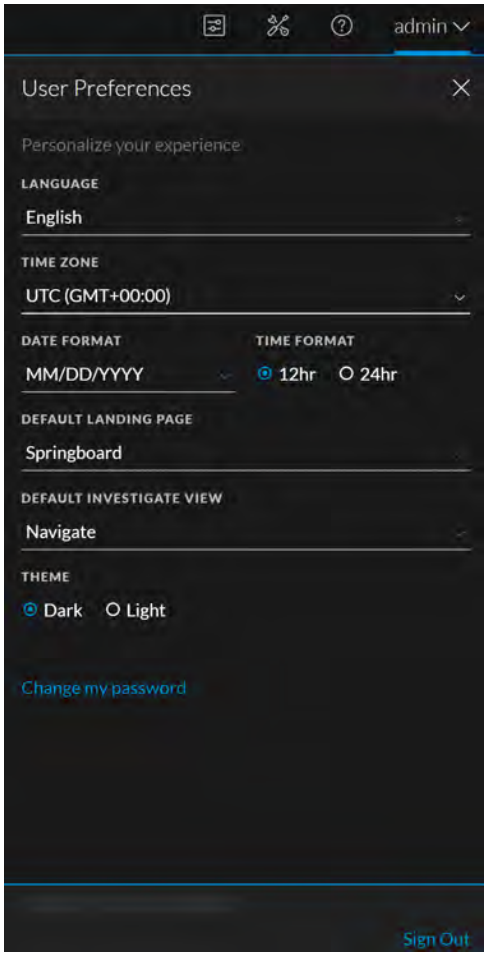
| SOC Roles | Role Description | Consider this Default Landing Page |
|---|---|---|
| Incident Responder (Tier 1 Analyst) | Addresses incidents and alerts queued for them to review and mitigate. | **Springboard** or **Respond** |
| Threat Hunter (Tier 2/Tier 3 Analyst) | Investigates and hunts for advanced threats. | **Springboard**, **Investigate**, **Users**, **Hosts**, or **Files**<br>For information on selecting the default Investigate view, see the *NetWitness Investigate User Guide*. |
| SOC Manager (SOC Management and Reporting) | Manages SOC readiness and responds to incidents and data breaches. | **Springboard** or **Dashboard**<br>When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. |
| Content Expert (Threat Intelligence) | Configures data sources and inputs to NetWitness. | **Dashboard** or (Configure)<br>When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. If you choose Dashboard as your default view, you can navigate to the (Configure) view from the main menu. |
| Data Privacy Officer (DPO) | Similar to an Administrator, but a DPO monitors and protects privacy-sensitive information. | **Dashboard**<br>When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. |

| SOC Roles | Role Description | Consider this Default Landing Page |
|---|---|---|
| System Administrator | Focuses on the configuration and stability of the overall application. Manages user access. | **Springboard** |

## Set Your Default View

1. On the main menu bar, select your username, for example, admin.

   The User Preferences dialog shows your current preferences.



2. In the **Default Landing Page** field, select the default view that you would like to see when you log in to NetWitness. Use the above table to make your selection based on your SOC role. For example, if you are an Analyst, you can select **Springboard**; if you are an Incident Responder you can select **Respond**; and if you are a Threat Hunter, you can select **Investigate**.

   Your preferences become effective immediately. You can change your default landing page at any time. For information on other preferences, see Setting User Preferences.

3. To verify that you can see the correct default view, click **Sign Out** to log out and then log back in to NetWitness.

# Managing the Springboard

(From 11.5 and later) RSA NetWitness Platform Springboard presents platform-wide detections and signals in this view so analysts hunt and investigate faster than ever before.

The Springboard congregates the following information for analysts to view:

- Critical incidents and high severity alerts that require attention.
- Hosts and files with high risk scores that may be potential threats.
- Risky users that are potential leads for investigation.

The Springboard displays important information for the last 24 hours in the following out-of-the-box panels:

- Top Incidents
- Top Alerts
- Top Risky Hosts
- Top Risky Files
- Top Risky Users

For example, the Top Risky Hosts displays the top 25 risky hosts based on the highest risk score and Operating system (Windows, Linux, and Mac). The result displays hosts of all Endpoint Servers if the Endpoint Broker is available. Otherwise, it displays the result of the first Endpoint Server.

### You can perform the following actions on the Springboard:

- Change the time range for some panels namely Incidents and Alerts panels. To change the time range, select the time range selection box from the drop-down menu in the top left corner of the Springboard view.

  **IMPORTANT:** If the selected filter has a time range selected, it is given priority, otherwise the Springboard time range for the specified panel is considered.

- Increase the display of the results in the table to view more than 25 results. Click on the panel, the Edit Panel dialog is displayed. Edit the number of results field and click **Save Panel**.
- Click a row in the table to view details or to investigate.

- Click ▶ at the top of the panel to view all the results. For example, in the Top Incidents panel, click ▶ to view all incidents in the **Incidents** list view.
- Click a row name in the events panel to view or investigate the event details with relevant filters applied in the **Events** view.
- Scroll to view the different panels using the ▶ scroll bar available below the panels.

Administrators can customize the Springboard by performing the following:

- Edit the out-of-the-box panels. For more information, see Edit a Panel.
- Refresh the out-of-the-box panels. For more information, see Refresh a Panel.
- Create new panels with important system indicators. For example, a new panel showing focused event metadata based on pre-defined query conditions can be created. For more information, see Add a Panel.

# Working with the Springboard

**Note:** An administrator must provide the appropriate permissions to allow users to edit the springboard panels. For more information see the the Springboard section in the "Role Permissions" topic in the *System Security and User Management Guide*.

You can customize the information on the out-of-the-box Springboard by adding, editing, copying, moving, and deleting panels.

## Add a Panel

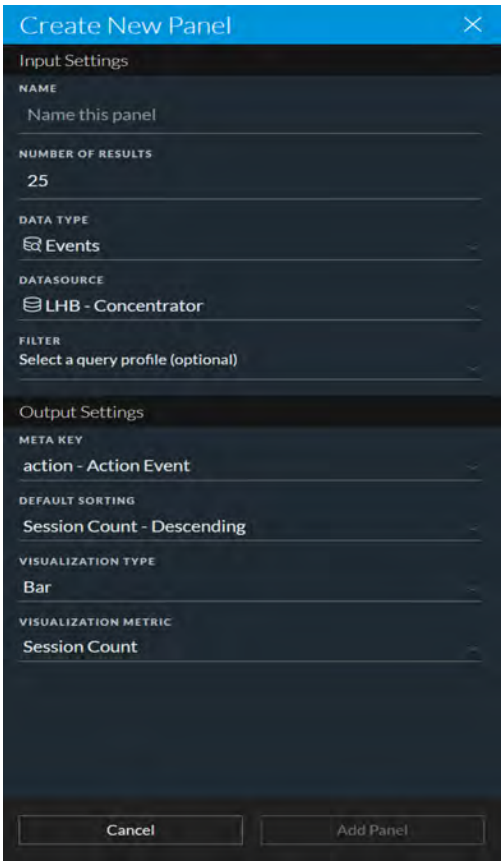
You can add a panel to the Springboard according to the analyst preferences. For example, an analyst can watch top risky users or top risky hosts for a particular region in a panel.

**Note:** The maximum number of panels on the Springboard should not exceed 20 panels.

### To add a panel:

1. Click **Manage Board**.
2. Click + New Panel either on the top or on the right side of the view or click ⊞ at the bottom of the view to add a panel.

   The Create New Panel dialog is displayed. The following figure is an example of the events panel configuration.



3. In the Input Settings section:
   - **Name**: Enter a unique name for the panel. The name can include letters, numbers, spaces, and special characters, such as `_ - ( ) [ ]`.
   - **Number of Results**: By default, the number of results is 25. Specify the number of results that range from 25 to 100.
   - **Data Type**: Select the type of data to use for the panel:
     - Alerts
     - Incidents
     - Events
     - Files
     - Hosts
     - Users
   - **Data Source**: Select the source of the data to use for the panel. This field is enabled when the data type is Events, Files, or Hosts.
     - Events: Select either Broker or Concentrator.
     - Files: Select either Endpoint Broker Server or Endpoint Server.

- Hosts: Select either Endpoint Broker Server or Endpoint Server.

- (Optional) **Filter** : Filter the data as required from the drop-down for each data type from the saved filters list.

4. In the Output Settings section, select the appropriate settings based on the data type.
5. Click **Add Panel**.
6. Click **Save Board** once you have added all the panels.

## Edit a Panel

You can edit the out-of-the-box or newly added panels on the Springboard.

### To edit a panel:

1. Click on the panel that you want to edit.
   The Edit Panel dialog is displayed.
2. Edit and click **Save Panel**.

## Rearrange Panels

You can arrange the panels by dragging and dropping them into a different order on the Springboard.

### To rearrange panels:

1. Click **Manage Board**.
2. To move a panel, click anywhere on the panel, drag and drop the panel to the desired location.
3. Click **Save Board**.

## Delete Panels

You can delete panels permanently in the following situations:

- Services are not installed. For example, if you do not have Endpoint Log Hybrid installed, then you can delete the panels for Top Risky Hosts and Files.
- The maximum number of panels have exceeded the limit, that is 20, and you want to add a new panel.

### To delete existing panels:

1. Click **Manage Board**.
2. Select the panels that you want to delete.
3. Click **Remove Panel**.
4. Click **Save Board**.

## Restore System Default Settings

**Note:** This is enabled only if any changes are made to the out-of-the-box Springboard panels.

### To restore the out-of-the-box panels:

1. Click **Manage Board**.
2. Click **Restore System Default**.

   A confirmation pop-up is displayed to confirm if you want to restore the out-of-the-box panels or not.
3. Click **Restore System Default**.

## Refresh a Panel

### To refresh a panel:

Click on the panel that you want to refresh, it loads the latest data in the panel.

# Managing Dashboards

A dashboard is a group of dashlets that give you the ability to view data in one space, the key snapshots of the various components that you consider important. In NetWitness, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness deployment, displaying only the information that is most relevant to the day-to-day operations.

The dashboards for all NetWitness components are available to add to the default NetWitness dashboard or a custom NetWitness dashboard.

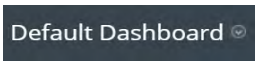
You can view dashboards on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard. The dashboards help you to quickly and easily view reports. You can configure your dashboards to display the information that supports your workflow. This topic explains the high-level tasks that can be done when you are setting up a dashboard.

## Dashboard Basics

If the Dashboard view is your default landing page following logging in to NetWitness, you always see either the default dashboard or the currently configured dashboard immediately after completing the login process. To return to the dashboard from another NetWitness component, click **Dashboard**.

### Dashboard Title

The dashboard title reflects the currently active dashboard; for example, Default Dashboard.



### Dashboard Selection List

You can access preconfigured and custom dashboards on the dashboard selection list. When you select a dashboard, its title is displayed below the NetWitness toolbar.

A dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list.

## Dashboard Toolbar

The dashboard toolbar is available next to the title of the selected dashboard. The dashboard toolbar allows various operations on dashboards and dashlets.

**Note:** The Copy, Delete, Import, Export, Share, and Add Row options are disabled for preconfigured dashboards.

| Option | Description |
|---|---|
| ★ | Sets the selected dashboard as the Favorite. |
| Default Dashboard | Displays the list of available dashboards from which you can make a selection. |
| + | Displays the Create a Dashboard dialog, where you define or add a custom dashboard. |
| − | Deletes a custom dashboard. The default dashboard cannot be deleted. |

| Option | Description |
|---|---|
| | Allows you to copy a dashboard. |
| | Displays the Manage Dashlet dialog. |
| | Exports a dashboard as a .zip file. |
| | Imports a dashboard as .zip or.cfg file. |
|   | Allows you to share a dashboard with another user. |
| | Enables user to add rows and columns to the dashboard based on the requirement. Click the icon in a row to add a dashlet. |

## The Default Dashboard

The default dashboard is configured to display specific dashlets in specific positions. The default dashboard serves as an example of dashboard composition and a starting point for customization.

- You can customize the information on the default dashboard by editing, adding, moving, maximizing, and deleting dashlets.
- After modifying the default dashboard, you can restore the default dashboard ( ) to its original layout.
- The default dashboard cannot be deleted or shared.

# Selecting a Preconfigured Dashboard

On installation of NetWitness, the following preconfigured dashboards are automatically activated and are available to you:

- Default
- Identity
- Investigation
- Operations - File
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview

- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

You cannot perform the following actions on a preconfigured dashboard:

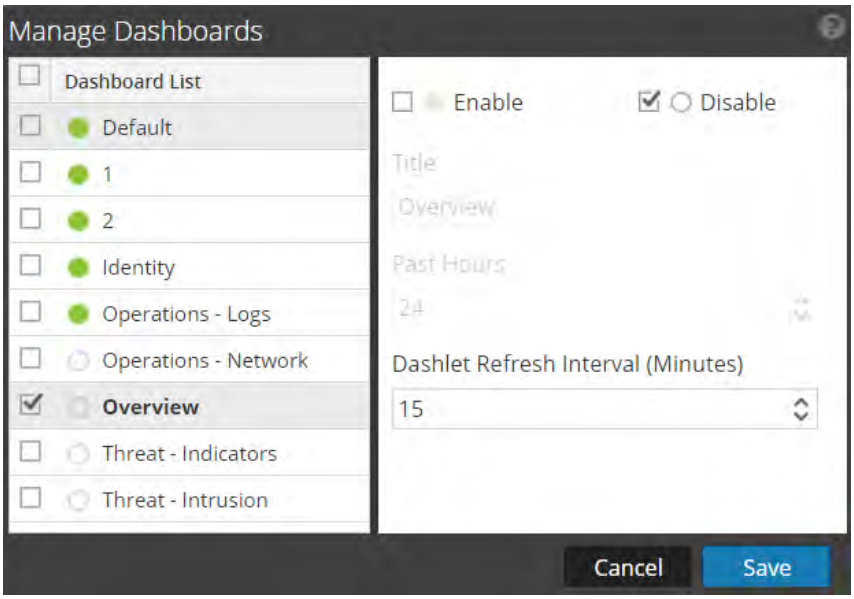
- Edit a dashboard
- Export a dashboard
- Share a dashboard
- Delete a dashboard

For more information on each preconfigured dashboard, see the Dashboards Catalog in the NetWitness Content space on NetWitness Community.

## Enabling or Disabling Dashboards

When you enable or disable a dashboard, all the dashlets within the dashboard are enabled or disabled along with the associated charts, unless they are used in any other dashboard.

NetWitness modules can display only those dashlets presented in the Manage Dashboard dialog. The main dashboard offers all NetWitness dashlets. This is an example of currently available dashlets.

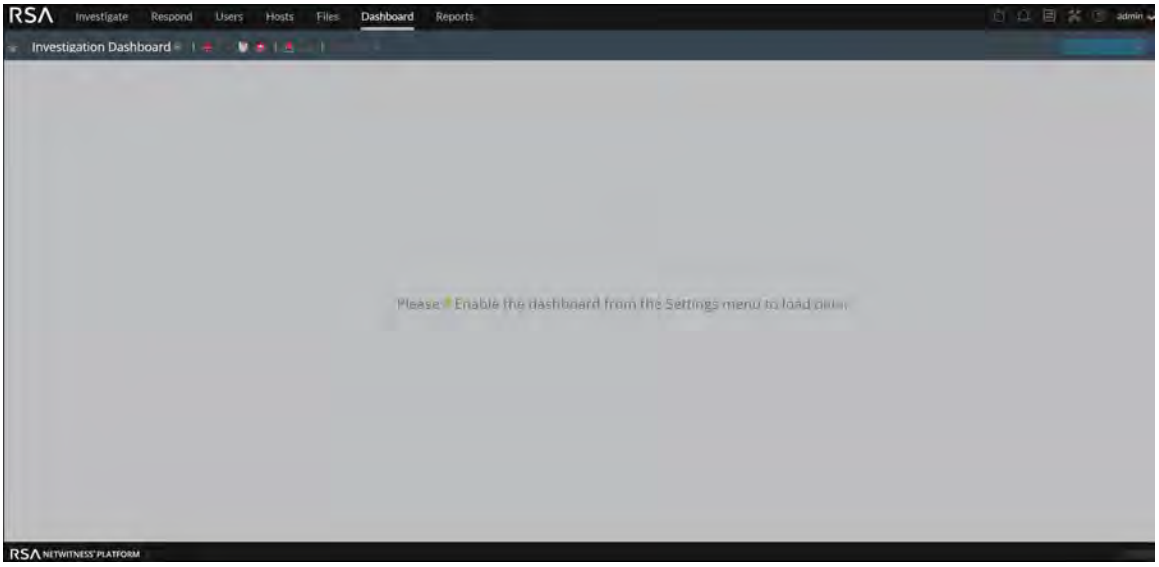


| Name | Description |
|---|---|
| Dashboard List | Displays a list of the default, preconfigured, and custom dashboards. |
| Enable | Indicates if the selected dashlet is enabled. |

| Name | Description |
| --- | --- |
| Disable | Indicates if the selected dashlet is disabled. |
| Title | Displays the title of the selected dashlet and you can also rename the dashboard. |
| Past Hours | Displays the time for which the data is collected. |
| Dashlet Refresh Intervals (Minutes) | Displays the refresh interval time of a dashlet. |

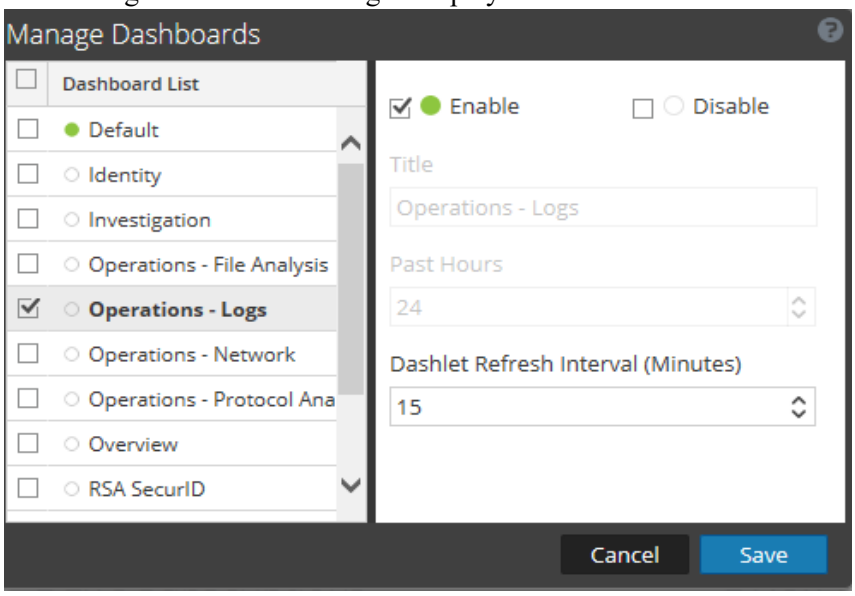
## Enable a Dashboard

If you select a dashboard that is not enabled, a masked screen is displayed.



To enable one or more dashboards:

1. Navigate to the dashboard to be enabled.
2. In the dashboard toolbar, click (Manage Dashboards).
   The Manage Dashboards dialog is displayed.

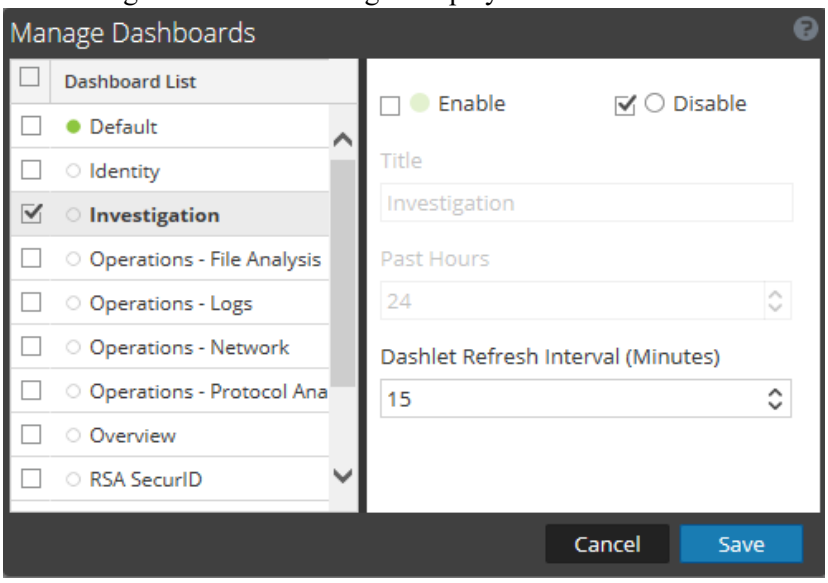


3. From the dashboard list, select the dashboards to be enabled.
4. Select the **Enable** checkbox.
5. Click **Save**.

## Disable a Dashboard

To disable one or more dashboards:

1. Navigate to the dashboard to be disabled.
2. In the dashboard toolbar, click (Manage Dashboards).
   The Manage Dashboards dialog is displayed.



3. From the dashboard list, select the dashboards to be disabled.
4. Select the **Disable** checkbox.
5. Click **Save**.

# Setting a Dashboard as a Favorite

To customize the views in NetWitness, you can set a preconfigured or custom dashboard as a Favorite. The NetWitness dashboard offers all NetWitness dashlets. The Favorite dialog sets a specific dashboard as your favorite dashboard and is listed as favorite every time you log in to NetWitness.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click

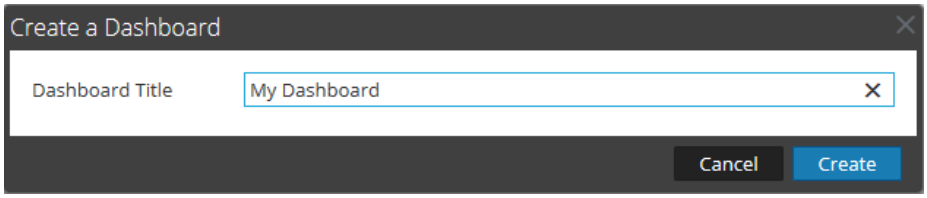
   If the favorite icon is red in color, it indicates that selected dashboard is set as a Favorite and is listed on top above the line.

# Creating Custom Dashboards

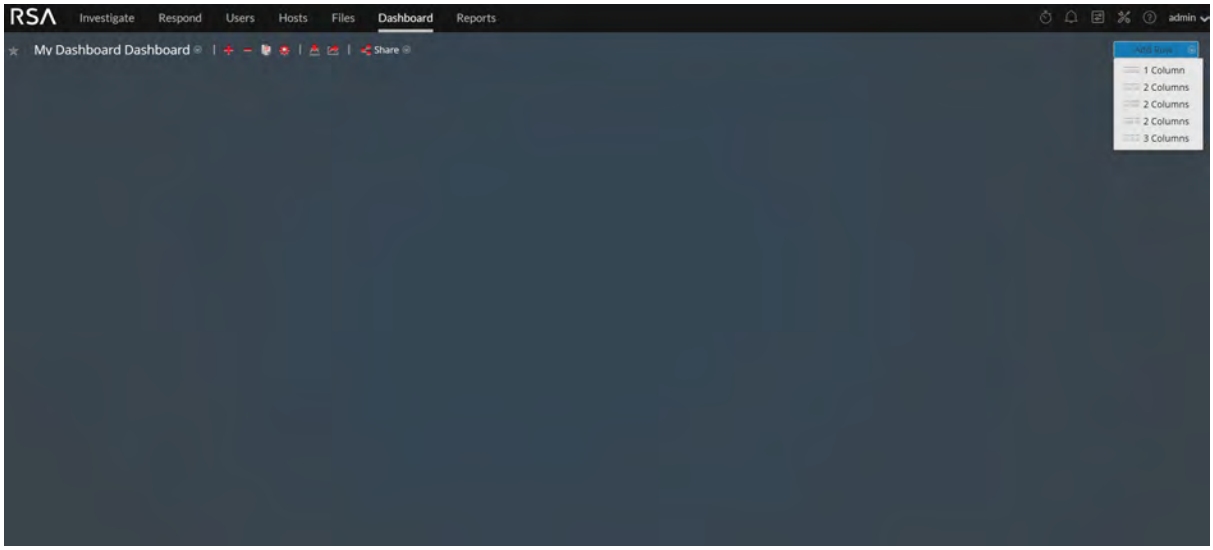
You can create custom dashboards to serve a particular purpose; for example, to represent a specific geographical or functional area of the network. Each custom dashboard is appended to the dashboard selection list.

To create a custom dashboard:

1. In the dashboard toolbar, click .
   The Create a Dashboard dialog is displayed.

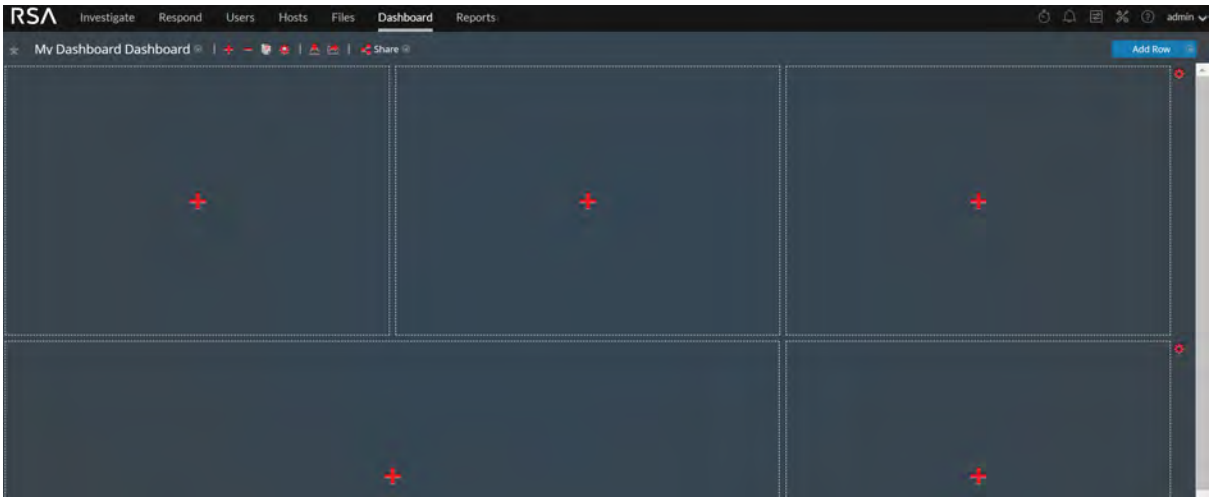


2. Enter a title for the new dashboard and click **Create**.
   The new dashboard is displayed as a blank screen.



3. Add rows to the dashboard, which can contain one or more columns, using the **Add Row** option on the right side of the screen ( ). Click the desired column configuration in the drop-down list to add one row to the dashboard with the selected number of columns. Repeat the process

to add more rows.



4. You can add any desired dashlets to the dashboard by clicking in an empty placeholder in a row. For complete details on adding and managing dashlets, see Working with Dashlets.

After custom dashboards are created, you can:

- Switch between dashboards by selecting an option from the dashboard selection list.
- Delete any custom dashboard.
- Import or export a dashboard.

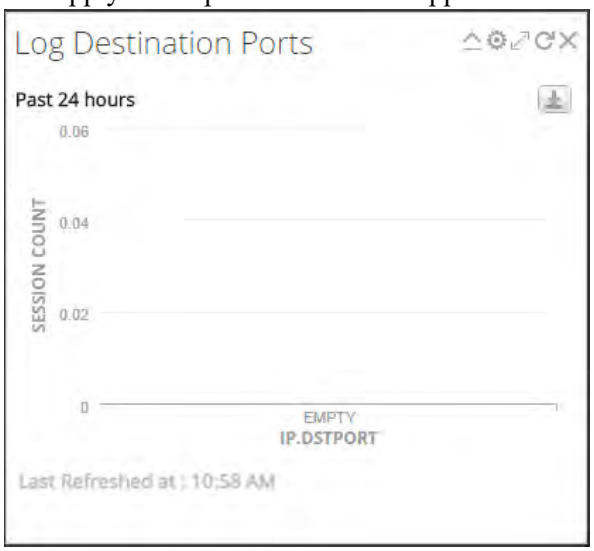
Each dashboard has:

- The dashboard toolbar.
- The dashboard title and the dashboard selection list.
- Zero or more dashlets.

## Working with Dashlets

Dashlets are the parts that make up a dashboard. NetWitness uses dashlets to display focused subsets of system information, services, jobs, resources, subscriptions, rules, and other information.

The controls for a dashlet are in the title bar. All dashlets use a common set of controls, and only those that apply to the particular dashlet appear in the title bar of the dashlet.



The following table displays the description of each icon on the dashlet.

| Icon | Name | Description |
|---|---|---|
| | Collapse vertically | Collapses the dashlet vertically so that only the title is visible. |
| | Expand vertically | Expands the dashlet to its original size. |
| | Reload | Reloads the dashlet. |
| | Settings | Displays configurable settings for the dashlet. |
| | Maximize | In some dashlets with content that does not fit horizontally within the width of the dashlet, maximizes a chart or a dashlet to full screen. |
| | Delete | Deletes the dashlet from the dashboard. |
| Last Refreshed at | | Displays the time at which the data is polled from the related chart. |
| View More | | When clicked, navigates to the corresponding dashboard which is linked to the main dashlet and displays more details. If you have not linked the dashboard to an existing dashlet, this link with not be available on the dashlet. To configure this option, click , and in the Dashboard Link field select a related dashboard view more details of the specific dashlet. |

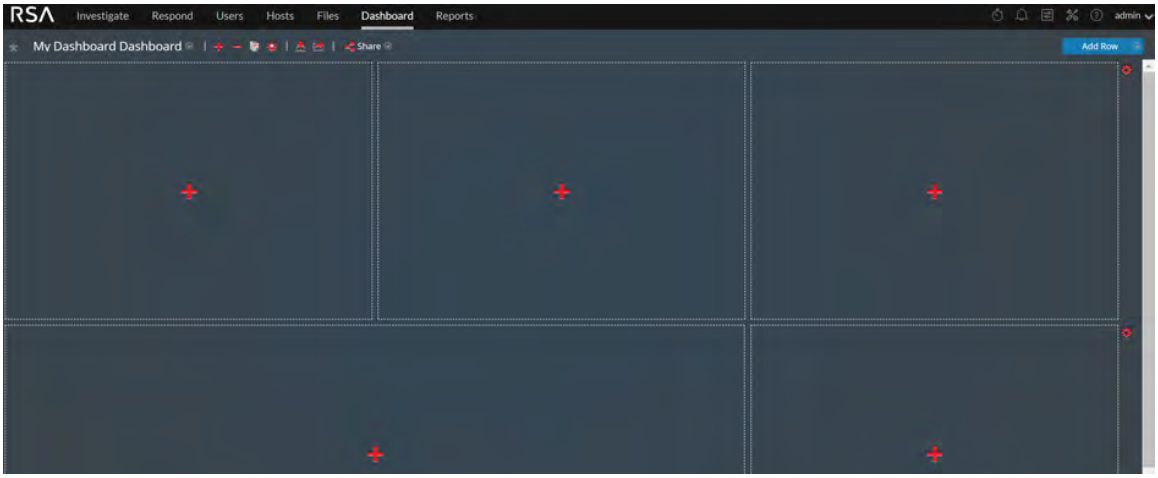
You can add dashlets to the default dashboard or construct a custom dashboard with your own useful set of dashlets to make your workflow more efficient.

## Add a Dashlet

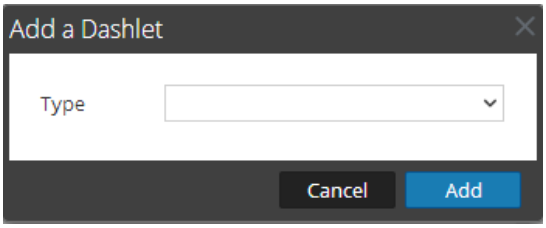
To customize the views in NetWitness, you can add dashlets to a default dashboard or create custom dashboards. However, you cannot add dashlets to preconfigured dashboards.

To add a dashlet:

1. Navigate to any dashboard or create a new dashboard.

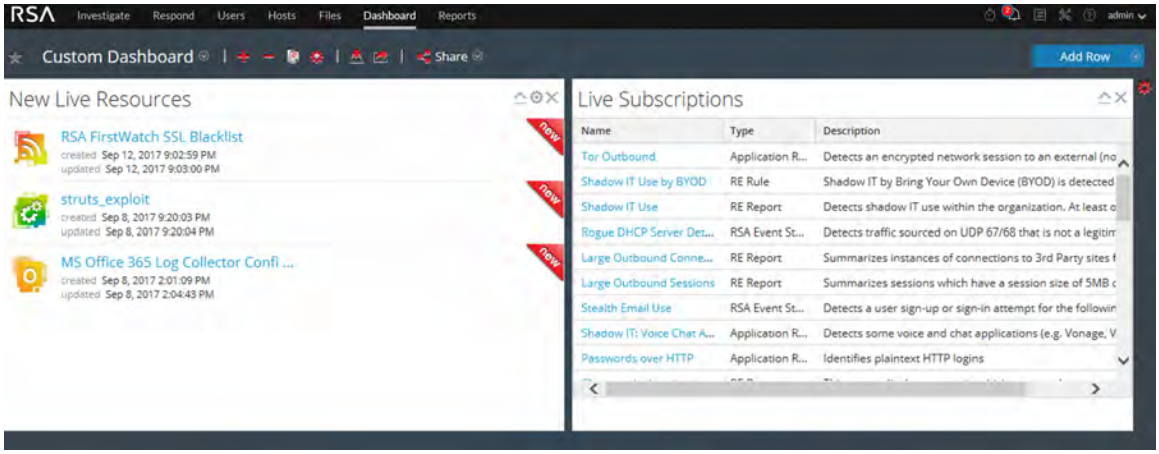


2. Click on the placeholder where you want to add the dashlet.
   The Add a Dashlet dialog is displayed.



3. Click the **Type** selection list to view the available dashlets, and select the type of dashlet you want to add. Depending on the type of dashlet you are adding, some configurable fields appear in the **Add a Dashlet** dialog.
4. Type a title for the dashlet. The title can include letters, numbers, special characters, and spaces.
5. If there are additional configurable fields for the dashlet, set appropriate values.

6. When all required fields have been configured, click **Add**.
   The dashlet is added to the dashboard in the selected placeholder and is automatically saved.



## Edit Dashlet Properties

All preconfigured dashlets are read-only and their properties cannot be edited. Other dashlets are editable and allow users to customize some aspect of the data displayed in the dashlet. A dashlet with editable properties has a settings ( ⚙ ) option that displays all the editing options.

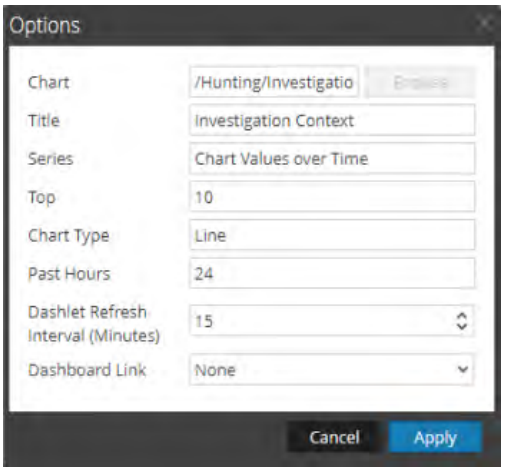
After the dashlets are added, you can drag and drop them and they can be swapped.

A dashlet without editable properties, such as the Live Subscriptions dashlet, does not display the settings option in the title bar. Many dashlets have an editable title where you can edit the following properties:

- Dashlet display title.
- Type of services to monitor; for example, you can monitor only Decoders, or you can monitor Decoders and Concentrators.

Other dashlets have parameters that you define to specify the kind and amount of information you want to see in the dashlet. For example, a Realtime Chart Dashlet has the settings option.

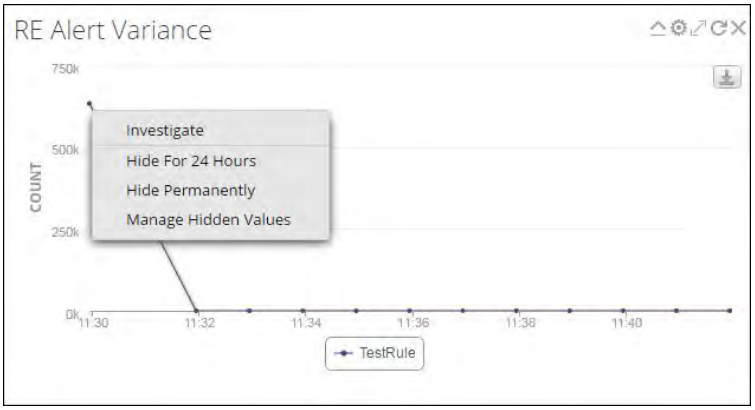
1. To display and modify the options for a dashlet, click settings (⚙) in the dashlet title bar.
   The Options dialog is displayed.



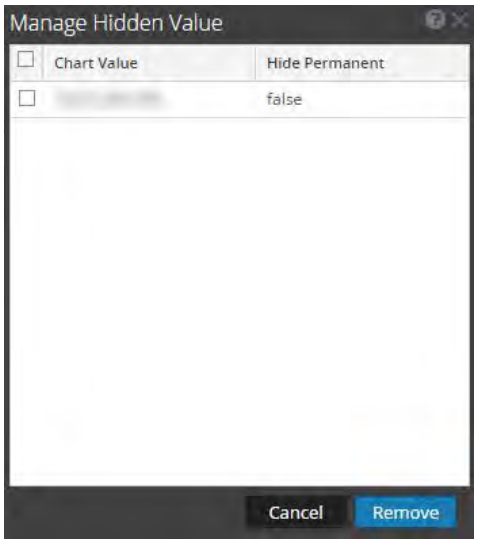
2. Edit any of the displayed properties. For example, in an in Operations - File Analysis Dashboard, edit Dashlet Refresh Interval from 15 to 20.
3. Click **Apply**.

Some dashlets have configuration options to tailor the appearance or the contents of the dashlet. The following options are available for RE Top Alerts, RE Alert Variance, and RE Realtime Charts dashlets on left-click:

- **Hide For 24 Hours**: This option allows you to hide the selected value for the next 24 hours. After 24 hours, the data is automatically displayed on the dashlet, if the value is configured and listed on top.
- **Hide Permanently**: This option allows you to hide the selected value permanently until you add it back using the Manage Hidden Values option.



- **Manage Hidden Values**: This option displays a list of all the hidden values. You can select the checkbox for a value and click **Remove** to view the data back on the chart.



The options to Hide for 24 Hours, Hide Permanently, and Manage Hidden Values are not available for Geomap charts.

**Note:** When you edit a value in a preconfigured dashboard, it is a user-specific change. The changes made to a preconfigured dashboard are applicable only to your dashboard and cannot be viewed by other users who use the same preconfigured dashboard. For example, if you hide a value in an overview dashboard, the change is applicable only to your dashboard. If another user views the same overview dashboard, the value is still displayed. The same applies to a custom dashboard. When you hide a value in the custom dashboard and share the same dashboard with another user, the values are still displayed even though the dashboard is shared.

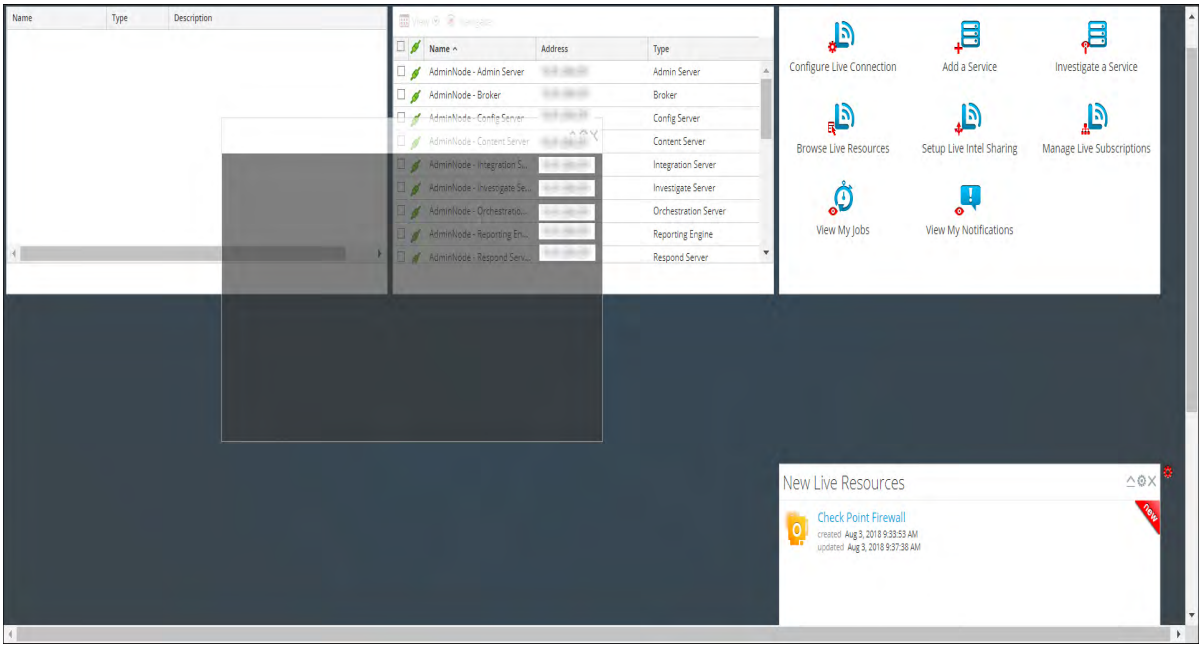
For more information on available dashlets, see the Dashboards Catalog in the NetWitness Content space on NetWitness Community.

## Rearrange a Dashlet

You can arrange dashlets according to your preference by dragging and dropping them into a different order on the dashboard.

1. To move a dashlet, hover in the header of the dashlet that you want to move.
   The directional cursor appears over the dashlet. Click and hold in the header of the dashlet that you want to move.

2. Continue to hold the left mouse button and drag the window toward the new location.
   The figure below shows a dashlet as it is being re-arranged.



3. Release the mouse button when the dashlet is in the desired location.
   The dashlet that currently occupies that position moves down.

## Maximize a Single Dashlet

This section explains how to open a dashlet on the entire area of the main NetWitness dashboard with the same dashlet title. Dashlets that have a lot of columns or charts, for example some Reporting dashlets, are easier to view when maximized so that the entire contents is visible without scrolling.

To maximize a dashlet, click the maximize control icon in the dashlet title bar: ⤢. The dashlet is displayed on full screen.

To minimize a dashlet, click the same control icon in the dashlet title bar: ⤢. The dashlet is restored to previous size.

## Delete a Dashlet

1. Click ✕ in the dashlet title bar:
   A confirmation pop-up is displayed to confirm if you want to delete the dashlet.
2. Click **Yes**, if you want to delete. The dashlet is removed from the dashboard.
   Click **No**, if you do not want to delete.

**Note:** After you remove the dashlet, the empty space is replaced by a placeholder where you can add another dashlet using the above Add a Dashlet procedure.

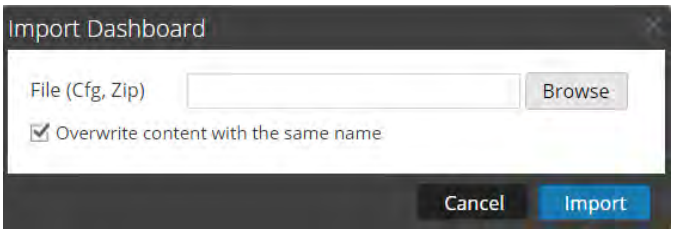
# Importing and Exporting Dashboards

The ability to customize dashboards to changing circumstances and conditions could result in a large number of dashboards that are not needed on a daily basis. Rather than reinvent the wheel each time you want to recreate a particular custom dashboard, you can export your dashboards that are not currently in use. When you are ready to use a previously exported dashboard, import the dashboard into NetWitness.

## Import a Dashboard

**Note:** You can import the Reporter Realtime Charts dashboard and its related charts in different instances of the NetWitness server and Reporting Engine from which it was exported.

1. In the dashboard toolbar, click (Import Dashboard).
   The Import Dashboard dialog is displayed.



2. Browse to the dashboard file in the **Import Dashboard** dialog. You can import .cfg and .zip files.
3. Click **Import**.
   The dashboard is displayed in NetWitness

**Note:** If you import a dashboard from Security Analytics 10.6. x into NetWitness11.x, the dashboard and the associated rules and charts must be imported separately. But when you import a dashboard from NetWitness11.x into NetWitness, the dashboard and all the rules and charts associated with it are imported in .zip format.

## Export a Dashboard

**Note:** When you export a Reporter Realtime dashboard, the corresponding Reporting Engine contents is also exported.

Exported dashboards are designed to work within the same NetWitness instance. It is also possible to share your custom dashboards with other users in your organization, provided they have equivalent permissions.

To export a dashboard, you must have the dashboard open to access the Export Dashboard option under the Edit drop-down menu in the dashboard toolbar.

1. Navigate to the dashboard that you want to export. All existing dashboards appear in the drop-down **Dashboard Selection List** in the currently displayed dashboard.
2. In the dashboard toolbar, click (Export Dashboard).
   The exported file is saved in .zip format.

**Note:** The Export feature is not applicable for preconfigured dashboards.

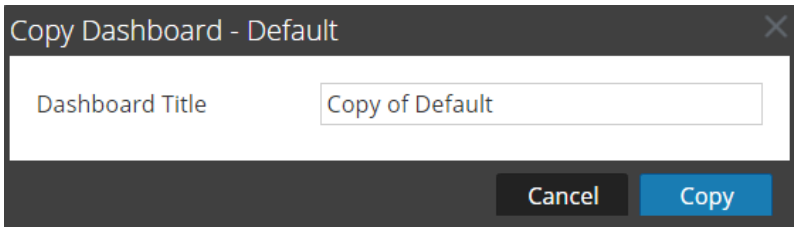
# Copying a Dashboard

To customize the views in NetWitness, you can copy dashboards to the NetWitness dashboard or a custom dashboard. The NetWitness dashboard, as the name suggests, offers all NetWitness dashlets. The Copy Dashboard dialog creates a duplicate dashboard, which can be customized. When you copy a dashboard, the default name is prefixed with `Copy of`. For example, if the name of the original dashboard is `XYZ`, the default title of the copied dashboard will be `Copy of XYZ`.

To copy a dashboard:

1. Navigate to any dashboard.
2. In the dashboard toolbar, click .
   The Copy Dashboard dialog is displayed. The following screenshot is an example of copying a

dashboard.



3. Enter the Dashboard Title.
4. Click **Copy**.

## Sharing a Dashboard

In NetWitness, as an administrator you can share dashboards for viewing purposes with other roles such as Administrators, Analysts, Operators and so on. When you share a dashlet, the users can only view the dashboard, make dashboard as favorite, copy the dashboard, and export the dashboard. In case of other roles such as Analysts, Operators, and so on, you can share the dashboard only with similar roles. For example, an analyst can share a dashboard with other analysts only.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click 
and select the checkbox of the role with whom you want to share the dashboard.

**Note:** If you do not want to share the dashboard, clear the checkbox of the role. If a dashboard is shared, the dashboard name will be displayed with the share icon .

## Removing Unwanted Dashboards

You can remove the following dashboards by enabling the dashboard cleaning job.

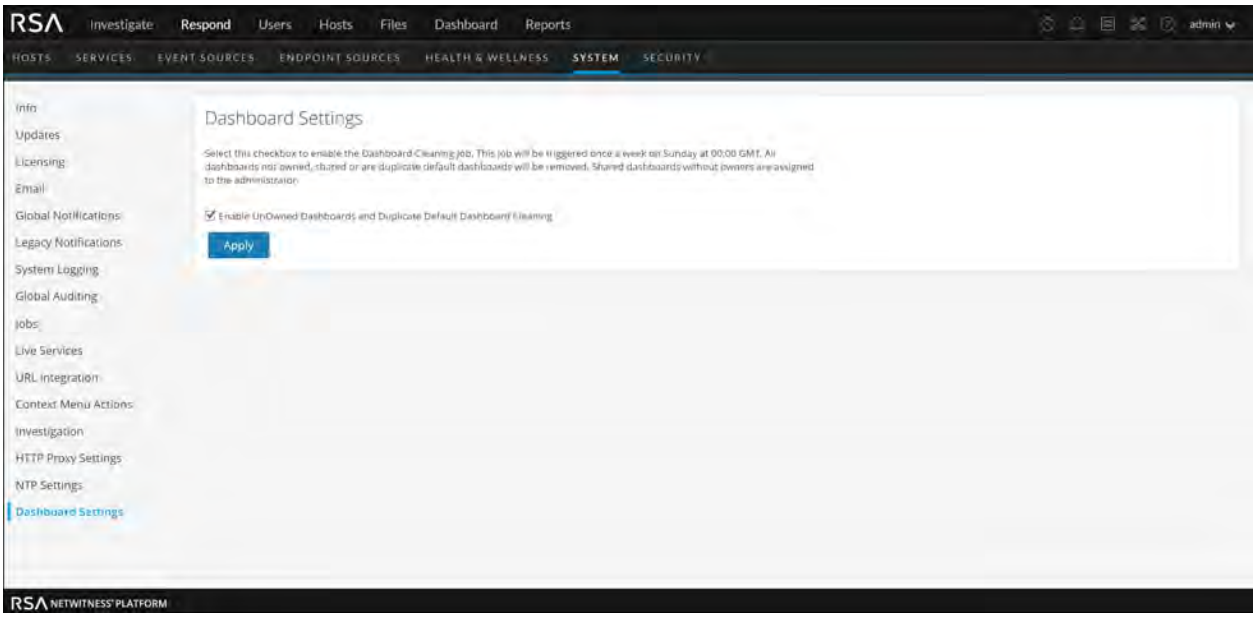
- Dashboards not owned by anyone
- Dashboards not shared
- Duplicates default dashboards

When the dashboard cleaning job is enabled, a scheduled job is triggered once a week on Sunday at 00:00.

Shared dashboards without owners are assigned to the administrator.

### To enable Dashboard Cleaning Job:

1. Go to **(Admin) > System > Dashboard Settings**.
2. Select the **Enable UnOwned Dashboards and Duplicate Default Dashboard Cleaning** checkbox.
3. Click **Apply**.

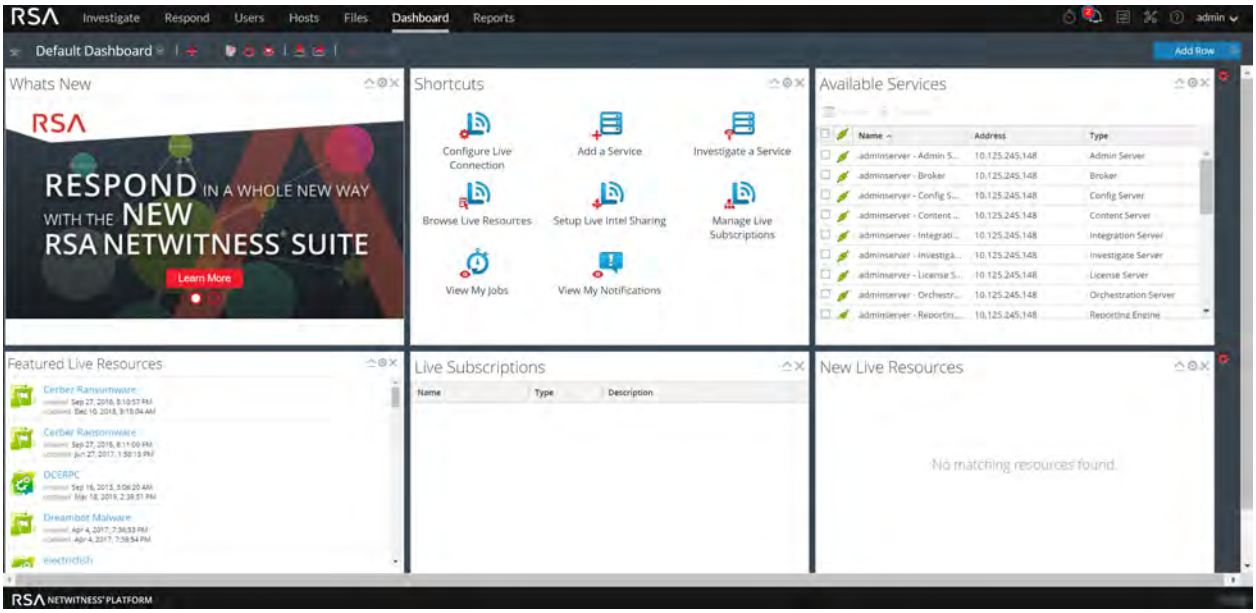


# Using Dashboards in the Analyst User Interface

Large environments that include geographical distribution with a single data center and multiple NetWitness Servers require Analyst UI instances in all their NetWitness locations or managed entities. For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary User Interface (Primary UI).

When using the dashboards in the Analyst UI, these features apply and affect the dashboards available to analysts:

- Each Analyst UI instance is connected to its local Reporting Engine service. Every Reporting Engine has its own copy of the built-in content such as rules and charts and the local Reporting Engine runs them on the default data source (if configured in Reporting Engine) when the dashboard is enabled.
- The built-in Reporting Engine content that is modified on local Analyst UI is available only to that specific Analyst UI. This behavior is same for an Admin UI as well.
- Dashboards that are shared across different Analyst deployments display the Reporting Engine chart data from the shared instance. To edit the shared dashboard, the analyst must create a copy or contact the Admin to customize it.
- When built-in preconfigured dashboards are enabled from an Admin UI, the dashboard is enabled for all the roles and for all the Analyst UIs. However, the data displayed in every Analyst UI is specific to the associated Reporting Engine.
- By default, all the built-in preconfigured dashlets are disabled and can be enabled only from an Admin UI. Before you enable a preconfigured dashlet, you must set up the Live Services Account, see the *Set Up Live Services* topic in the Live Services Management Guide.



**Note:** The Analyst UI functions are similar to the Admin UI functions, except all configurations must be performed from the Admin UI.

# Setting User Preferences

You can view and manage your NetWitness global application preferences from your user profile. There are two global user preference dialogs that have different options. The user Preferences dialog is accessible from the Springboard, Investigate (Events), Respond, Users, Hosts, Files and Configure views.

The Preferences dialog is accessible from the Investigate, Dashboard, Reports, (Configure) , and (Admin) views. The dialog that you see depends on where you access the user preferences.

You can:

- Change the application language
- Set the application time zone
- Set the application date and time format*
- Select your default NetWitness starting location*
- Select your default Investigate view*
- Choose a dark or light theme for the application*
- Change your password (See Changing Your Password for more information.)
- Enable or disable notifications**
- Enable or disable context menus**

* You can make this change from the **User Preferences** dialog accessible from these views:

Springboard, Investigate > Events (formerly Event Analysis), Respond, Users, Hosts, Files, and (Configure) > (Capture Policies, Incident Rules, Incident Notifications, and Log Parser Rules). See User Preferences.

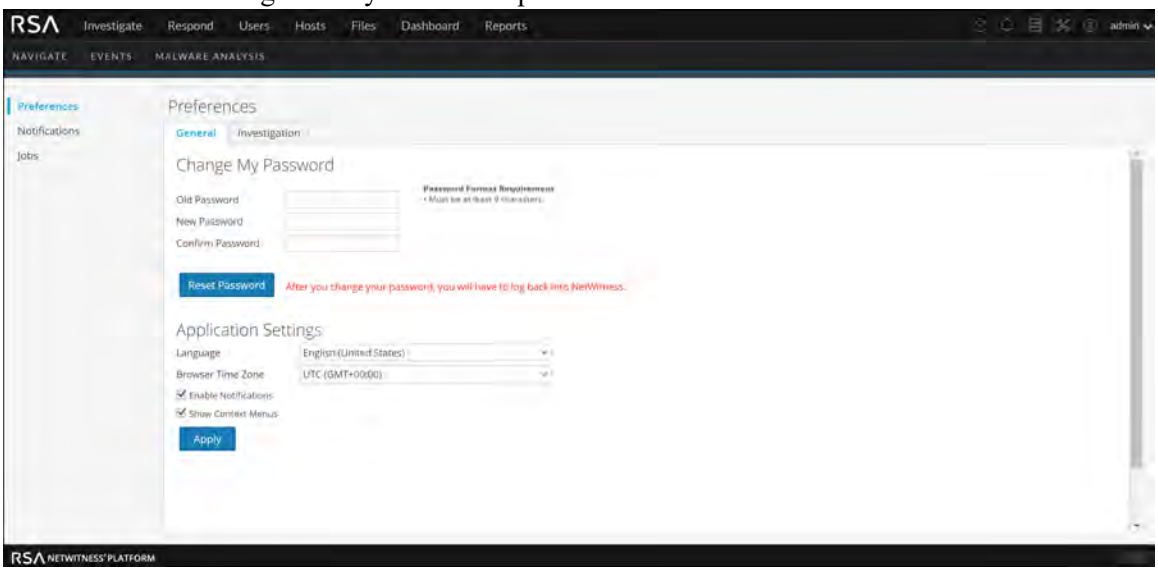
** You can make this change from the **Preferences** dialog accessible from these views: Investigate, Dashboard, Reports, (Configure) > (Live Content, Subscriptions, ESA Rules, and Custom Feeds), and (Admin) . See Preferences.

## Preferences

This section gives instructions for various tasks that can be performed in the Preferences dialog that is accessible in Investigate, Dashboard, Reports, (Configure) , and (Admin) .

## View your Preferences

In the upper right corner of the NetWitness browser window, select your username, for example admin, and then select **Profile**.
The Preferences dialog shows your current preferences.



## Set the Language and Time Zone

**Note:** The Language preference option applies to NetWitness 11.2 and later.

You can change your preferred language for the entire NetWitness Platform. The default language is English (United States).

1. In the Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness.
   b. **Browser Time Zone**: Set the time zone to use in the NetWitness.
2. Click **Apply**.
   Your preferences become effective immediately.

**Note:** When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

## Enable or Disable System Notifications for Your User Account

By default, NetWitness system notifications are enabled when a new user account is created. You can disable and enable these notifications at any time.

1. In the Preferences dialog Application Settings section:
   - To enable notifications for your user account, select the **Enable Notifications** checkbox.
   - To disable notifications, clear the **Enable Notifications** checkbox.

2. Click **Apply**.
   Your preference becomes effective immediately.

## Enable or Disable Context Menus for Your User Account

By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click a view.

1. In the Preferences dialog Application Settings section:
   - To enable context menus for your user account, select the **Show Context Menus** checkbox.
   - To disable context menus, clear the **Show Context Menus** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

**Note:** Settings available on the Investigate tab in the Preferences dialog are documented in the *NetWitness Investigate User Guide*.

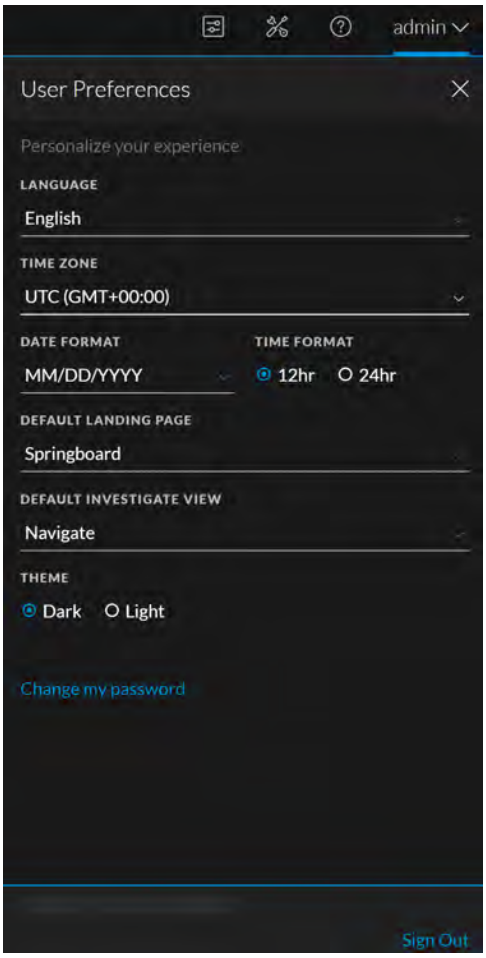
# User Preferences

This section gives instructions for various tasks that can be performed in the User Preferences dialog that is accessible in the Springboard, Events, Respond, Users, Hosts, Files and (Configure) views.

## View Your User Preferences

In the upper right corner of the NetWitness browser window, select your username, for example, 

.
The User Preferences dialog shows your current preferences when accessed through the Springboard, Events, Respond, Users, Hosts, Files and (Configure) views.



Any selections that you make become effective immediately.

## Set the Language, Time Zone, and Date and Time Format

**Note:** The Language preference option applies to NetWitness 11.2 and later.

You can change your preferred language for the entire NetWitness Platform UI. The default language is English (United States). You can also change the time zone and the format of the date and time for your location.

1. Open the User Preferences dialog.
2. In the User Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness.
   b. **Time Zone**: Set the time zone to use in the NetWitness.
   c. **Date Format**: Set the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2019.
   d. **Time Format**: Set the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

Changes in the Investigate and Respond views become effective immediately.

**Note:** When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

## Select the Default NetWitness Platform Starting Location

1. Open the User Preferences dialog.
2. In the **Default Landing Page** field, select the opening view that you would like to see when you log in to NetWitness. You can choose Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, Configure, and Admin, and according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. For more information, see Setting Up Your Default View by SOC Role to help you select the appropriate default view.
   This selection sets the default view for the entire application. The changes take effect immediately.

## Select the Default Investigate View

1. Open the User Preferences dialog.
2. In the **Default Investigate View** field, select the default landing page when you log in to NetWitness and navigate to Investigate. You can choose Navigate, Legacy Events (if enabled), Events (formerly Event Analysis), or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events view to see the events generated for a service. See Setting Up Your Default View by SOC Role to help you select the appropriate default view. For more information, see the *NetWitness Investigate User Guide*.

**Note:** After you have applied the change in the drop-down, sometimes it takes few seconds for the changes to take effect.

## Choose the Appearance of NetWitness Platform

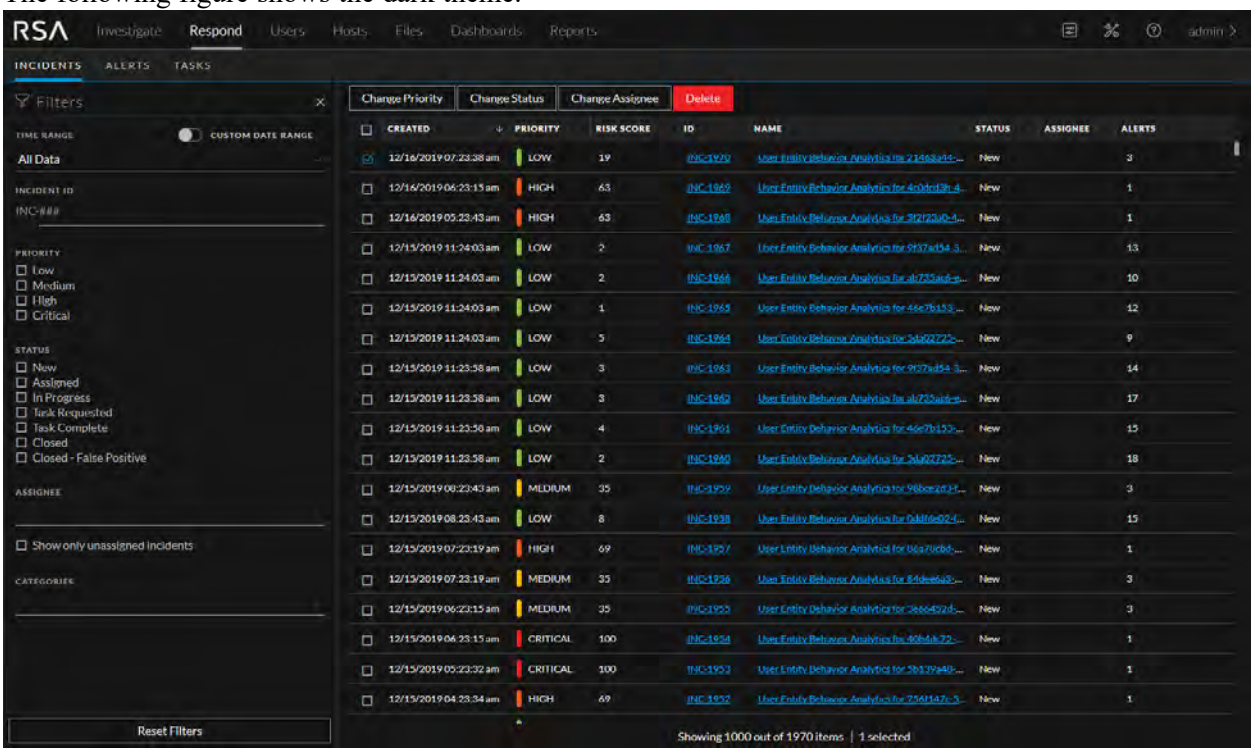
**Note:** This option is only available for NetWitness versions 11.1 and later.

You can choose a dark theme or a light theme for your application, depending on your personal preference. When you change the theme, the Respond view and some Investigate views change to the light or dark theme. Your selection only changes how NetWitness appears to you, not other users.

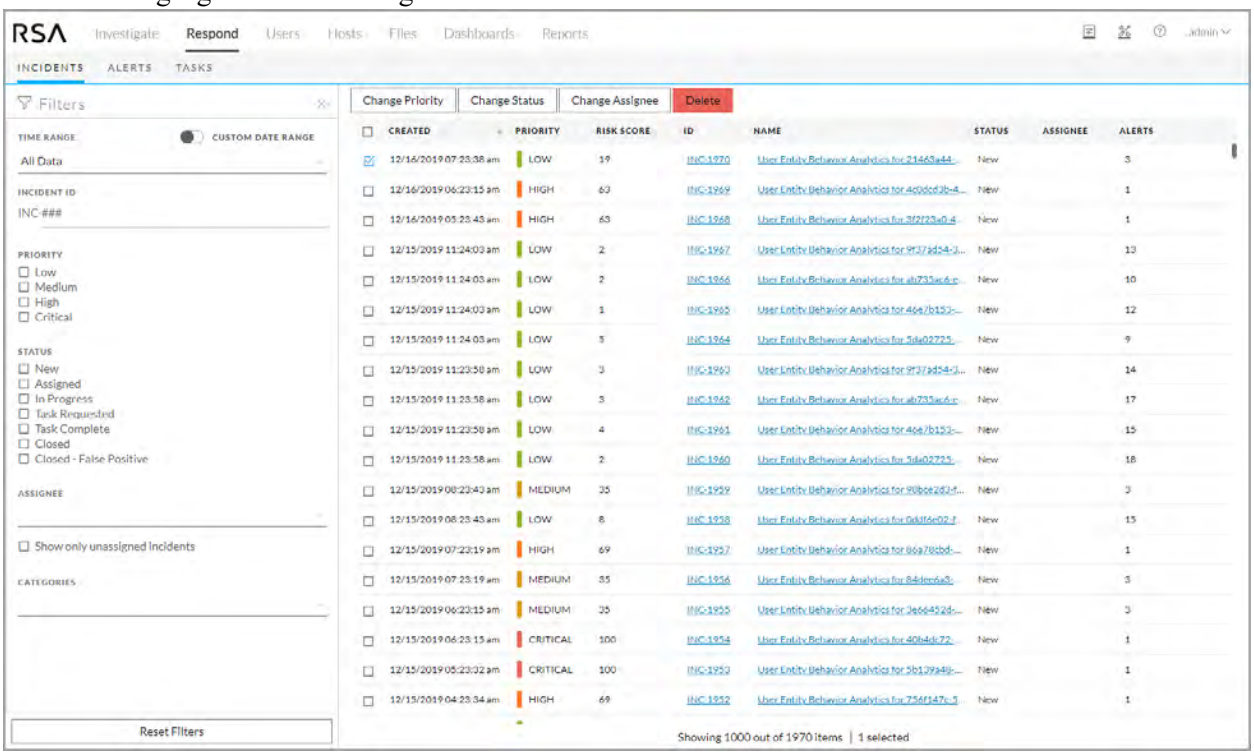
1. Open the User Preferences dialog.
2. Under **THEME**, select one of the following options:
   - **Dark**: The dark theme is best for darker environments or when you do not need as much contrast.
   - **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience.

Changes become effective immediately.

The following figure shows the dark theme.



The following figure shows the light theme.



# Managing Jobs

Inevitably, there are on-demand or scheduled tasks in NetWitness that take a few minutes to be completed. The NetWitness jobs system lets you begin a long-running task and continue using other parts of NetWitness while the job is running. Not only can you monitor the progress of the task, but you can also receive notifications when the task has completed and whether the result was a success or failure.

While you are working in NetWitness, you can open a quick view of your jobs from the toolbar. You can look anytime, but when a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

You can also see the jobs in these two views:

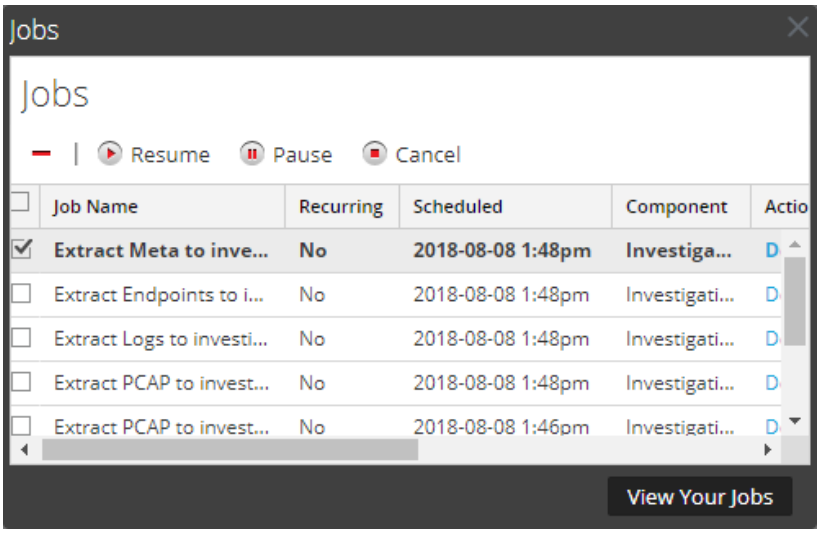
- In the user Profile Jobs panel, you see the same jobs in a full panel. These are only your jobs.
- In the System view, users with administrative privileges can view and manage all jobs for all users in a single jobs panel.

The structure of the jobs panel is the same in all views.

## Display the Jobs Tray

In the NetWitness toolbar, click the Jobs icon ( ).

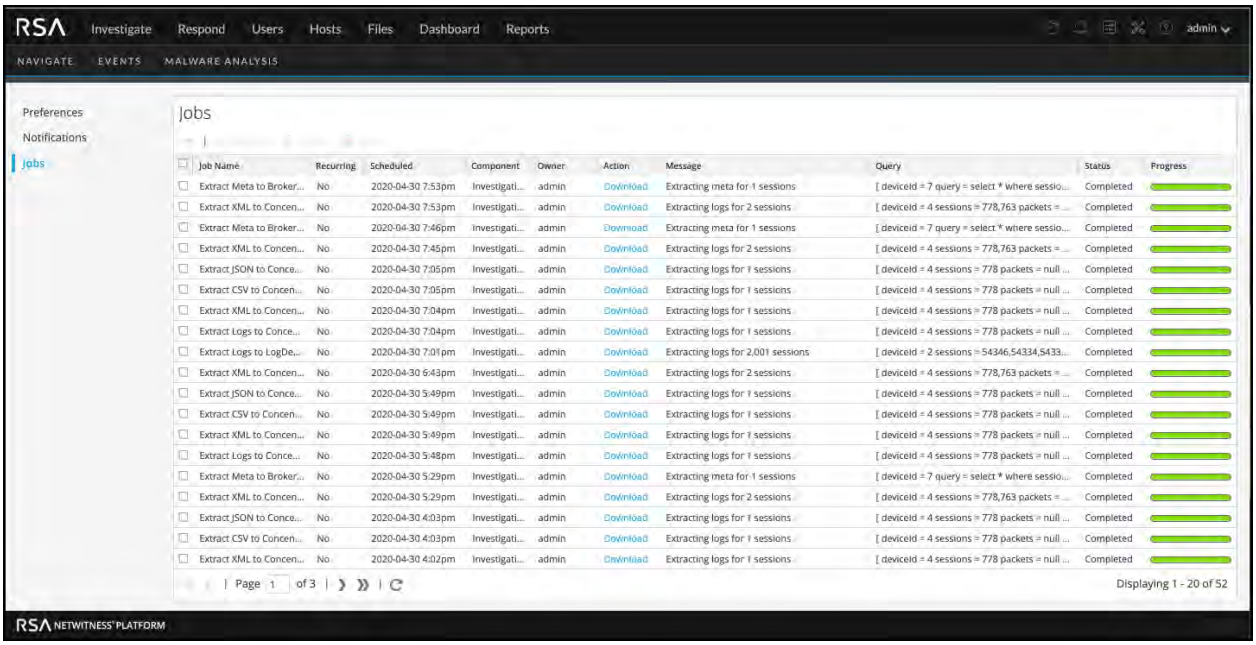
The Jobs Tray is displayed.



The Jobs Tray lists all recurring and non-recurring jobs that you own, using a subset of the columns available in the Jobs panel. Otherwise the Jobs Tray and the user Profile view Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness jobs for all users.

## View All of Your Jobs

To see a complete view of your jobs, in the Jobs Tray, click **View Your Jobs**.
The Jobs panel is displayed. The Query column is available in Version 11.5 and later.



## Pause and Resume Scheduled Execution of a Recurring Job

The Pause and Resume options apply only to recurring jobs. You can pause a recurring job that is running; however, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.

1. To stop the next execution of a recurring job, in any **Jobs panel**, select the job, and click **Pause**.
   The next execution of the job is skipped, and the schedule is paused until you click Resume.
2. To restart execution of paused recurring jobs, select the job and click **Resume**.
   The next execution of the job occurs as scheduled, and the schedule for the job resumes.

## Cancel a Job

To cancel jobs that are executing or in the queue to execute:

1. In the **Jobs Tray** or either **Jobs** panel, select one or more jobs.
2. Click **Cancel**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The jobs are canceled, and the entries remain in the list with a status of **canceled**.

If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.

## Delete a Job

**Caution:** When you delete a job, the job is instantly deleted from the list. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

Users can delete their own jobs before, during, or after execution. Administrators can delete any job. To delete jobs:

1. Select one or more jobs.
2. Click −.
   The jobs are deleted from the list.

## Download a Job

When a job has the Download status in the Action column, you can download the result of the job. If you are working in the Investigate view and extract the packet data for a session as a PCAP file or extract the payload files (for example, Word documents and images) from a session, a file is created. To download the file to your local system, click **Download**.

# Viewing and Deleting Notifications

While you are working in NetWitness, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

Examples of notifications include:

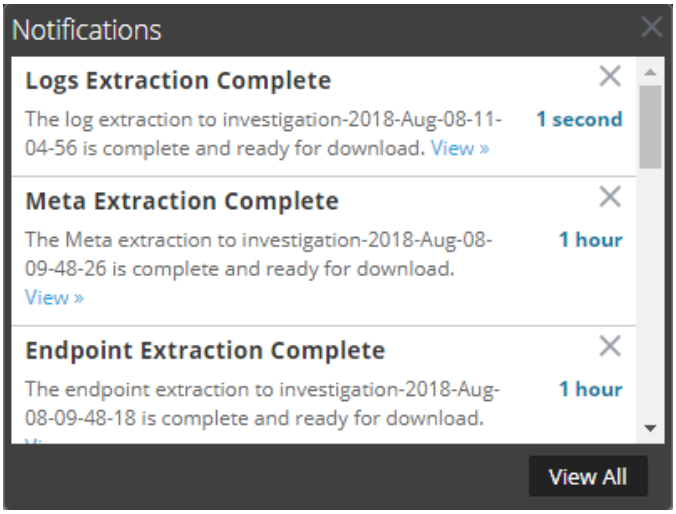
- A host upgrade completed.
- A parser push to decoders completed.
- A newer software version is available.

You can see notifications in these two views:

- In the Notifications tray, you can see your recent notifications.
- In the user Profile Notifications panel, you can view all of your notifications.

## View Recent Notifications

To display recent notifications, click the Notifications icon ( ).
The Notifications tray is displayed.

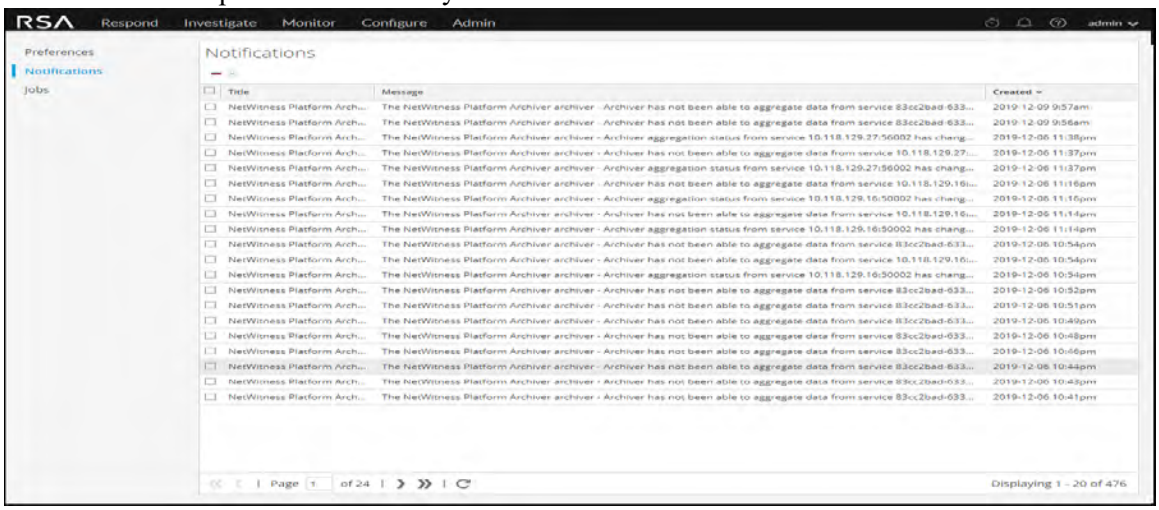


## View All Your Notifications

To view all of your notifications, do one of the following:

- Click to open the Notifications tray and then click **View All** in the Notifications tray.
- In the upper right corner of the NetWitness browser window, select your username and then select **Profile**. In the options panel of the Preferences dialog, select **Notifications**.

The Notifications panel shows all of your notifications.



## Delete Notification Records

To delete notification records:

1. In the **Profile Notifications** list, select the notifications that you want to delete.
2. Click −.

   The selected notifications are deleted from this list and from the Notifications tray.

# Viewing Help in the Application

There are different ways available to get help while using NetWitness. You can use inline help, tooltips, and online help links.

## View Inline Help

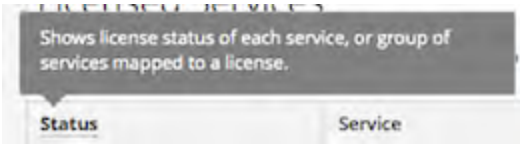
Inline help provides additional information about what to do in sections or fields that you are currently viewing in the NetWitness user interface. To display inline help, hover over . The inline help shows a brief description of the element.

Inline help example:

## View Tooltips

Tooltips are a quick way for you to see a description of the text or additional information about an action, field, or parameter. Tooltips appear as underlined text. To display the tooltip and see a brief description of the term, hover over the underlined text.

Tooltip example:

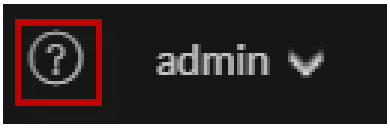


## View Online Help

Online help links take you outside of NetWitness to the RSA Link online documentation. This site has a complete documentation set for NetWitness, and the links take you directly to the topic that describes the part of the user interface currently in view.

To view the online help topic for the current location, click in the NetWitness toobar or in a dialog. The relevant help topic is displayed in a separate browser window. The topic describes the features and functions of the current view or dialog. From that topic, you can quickly navigate to the related procedures.

The following figure is an example of the online help icon in the NetWitness toobar.



# Finding Documents on NetWitness Community

The NetWitness documentation is located on NetWitness Community. NetWitness Community brings all of your NetWitness resources together in one place. It includes advisories, product documentation, knowledge base articles, downloads, and training. To view a *Guided Tour of NetWitness Community*, see https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness.

## Locate NetWitness Documentation

NetWitness Logs, Networks, Endpoints, and UEBA documentation is at the following link: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation

**To navigate to NetWitness Logs, Networks, Endpoints, and UEBA documentation:**

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation**.

## Locate NetWitness Content

NetWitness Content contains feeds, parsers, reports, and rules. It is located at the following link: https://community.netwitness.com/t5/threat-intelligence/ct-p/threat-intelligence.

**To navigate to NetWitness Content:**

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation** > **Threat Intelligence**.

## Locate NetWitness Supported Event Sources

The NetWitness Integrations Catalog is located at the following link: https://community.netwitness.com/t5/netwitness-platform-integrations/tkb-p/netwitness-integrations.

**To navigate to the NetWitness Integrations Catalog:**

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Integrations**

## Locate Hardware Setup Guides

The Hardware Setup Guides are at the following link: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation.

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation** > **Hardware Setup Guides**.

## Follow Content for Updates

You can follow pages or documents to be notified of changes.

1. Log in to NetWitness Community.
2. Navigate to a page or a document and next to the Search bar, click > **Subscribe**.

## Send Your Feedback to RSA

Your feedback is very important to us and helps us to provide a better experience for our customers. Please send your suggestions to nwdocsfeedback@netwitness.com

# Troubleshooting the User Interface

This section describes common issues that users may face during setup and provides basic troubleshooting information.

## Basic Troubleshooting Tips for User Setup

The following table provides basic troubleshooting tips that may be helpful for user setup in NetWitness.

| Problem | Troubleshooting Tip |
|---|---|
| When I log in to NetWitness, I see the wrong default view. | Verify that the correct default view is set in the Default Landing Page field in your user preferences. If you select the Dashboard view, you can select the predefined dashboard that is most appropriate for your SOC role. You can also import or create your own dashboard. |
| I see the correct view, but the metadata does not load. | Make sure that you are using the latest version of the browser. If that does not work, try using another browser. For example, if you are using Safari, try using Firefox or Chrome. |
| I am using Internet Explorer 10 and I get the following error: `The page can't be displayed.` | NetWitness supports current versions of Firefox, Chrome, and Safari. Internet Explorer is no longer supported. |
| When I log in, I cannot see anything. | See your administrator, you may need a user role assigned to your account or additional troubleshooting. |
| I can't see where to change my default landing page. | Go to the User Preferences in the Respond view or Events view (formerly Event Analysis view) or see your administrator. |

## Analyst User Interface Dashlet Issue

| Problem | Cause | Solution |
|---|---|---|
| I see the following error message on my dashboard: `The underlying chart for this dashlet is unavailable.` | This scenario occurs on an Analyst UI deployment when an Analyst creates a dashboard on one NetWitness Server, logs in to another NetWitness Server, and tries to view a dashboard that the Analyst did not share. | Share the dashboard to view the data. For more information, see Sharing a Dashboard. |

## Springboard Issue

| Problem | Cause | Solution |
|---|---|---|
| I see the following error message on a Springboard panel: `Filter definition is missing! Edit the panel to remove the filter or update with a new filter.` | A query profile that is used to filter events in the panel may have been deleted in the Investigate view. Springboard panels that use a deleted query profile as a filter do not work. | Edit the Springboard panel to remove the filter or use a different filter. For more information, see Managing the Springboard. |

## Springboard Fails to Load the Panel Issue

| Problem | Cause | Solution |
|---|---|---|
| I see the following error messages on a Springboard panel: `Request timed out! Contact your administrator or refer to the Getting Started Guide on RSA Link for details.`<br><br>`Failed to fetch the results. Refresh the panel. If the issue persists, contact your administrator or refer to the Getting Started Guide on RSA Link for details.` | • The Springboard panels request time out in 60 seconds.<br>• The associated data sources are offline or not reachable.<br>• Allocated memory is insufficient to execute the query. | • Limit the results by narrowing the time range for the Springboard using the time range field above the panels.<br>• Go to the Investigate > Events view and refine the Query Profile used in the panel as described in "Use Query Profile to Encapsulate Common Areas of Investigation" in the *Investigate User Guide*.<br>• Make sure that the associated data sources are online.<br>• Increase the memory by modifying the `max.query.memory` parameter setting.<br>• If the above solution does not work and if the issue still persists, check the service logs in the given order:<br>  ▪ Admin server<br>  ▪ Investigate server<br>  ▪ Respective core services<br><br>For more information, see “Display System and Service Logs” section in the *System Maintenance Guide*. |

## Inconsistent Event Panel Count Issue

| Problem | Cause | Solution |
|---|---|---|
| Event count on the panel is inconsistent. | The underlying data sources are offline or not reachable. | Make sure that all underlying data sources are online and refresh the panel. For more information, see Managing the Springboard. |

# NetWitness Platform Getting Started References

The following section contains user interface reference information related to getting started with the NetWitness application.

- User Preferences
- Notifications Panel and Notifications Tray
- Jobs Panel and Jobs Tray

# User Preferences

To adjust NetWitness to best fit your environment and work practices, you can set your own global application preferences. You can:

- Change the application language
- Set the application time zone
- Set the date and time formats
- Select your default NetWitness starting location
- Select your default Investigate view
- Choose a dark or light theme for the application
- Change your password
- Enable notifications
- Enable context menus
- Change Investigate preferences - Described in the *NetWitness Investigate User Guide*.

Your global preference options vary depending on whether you access them, such as Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, Configure, and Admin. There are two global user preferences dialogs accessible from the main menu bar:

- **User Preferences** dialog - Accessible from these views: Springboard, Investigate > Events (formerly Event Analysis), Respond, Users, Hosts, Files, and (Configure) > (Capture Policies, Incident Rules, Incident Notifications, and Log Parser Rules).
- **Preferences** dialog - Accessible from these views: Investigate, Dashboard, Reports, (Configure) > (Live Content, Subscriptions, ESA Rules, and Custom Feeds), and (Admin) .

## What do you want to do?

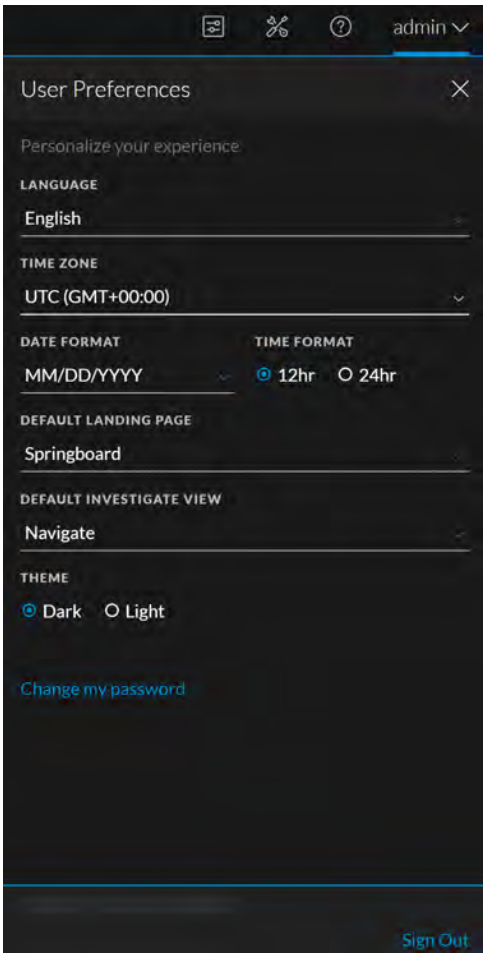
| Role | I want to ... | Show me how |
|---|---|---|
| All | Change my Password | Change My Password Section |
| All | Choose my Default Landing Page | Setting Up Your Default View by SOC Role |
| All | Set my User Preferences | Setting User Preferences |

## Related Topics

- NetWitness Platform Basic Navigation

## User Preferences

To access your user preferences, click your username, for example, admin.
The User Preferences dialog shows your current preferences and the NetWitness version.



The following table describes the global application preference options that you can access from the User Preferences dialog.

| Option | Description |
|---|---|
| Language | (This option applies to NetWitness 11.2 and later.)<br>Sets the preferred language for the entire NetWitness Platform. The default language is English (United States). |
| Time Zone | Sets the time zone to use in NetWitness. |
| Date Format | Sets the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017. |
| Time Format | Sets the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time. |

| Option | Description |
|---|---|
| Default Landing Page | Enables you to select the default view when you log in to NetWitness. You can choose Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, (Configure) , and (Admin) , according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders.<br>This selection sets the default view for the entire application. |
| Default Investigate View | (This option applies to NetWitness 11.1 and later.) Select the default landing page for the Investigate view. You can choose Navigate, Legacy Events (if enabled), Events (formerly Event Analysis), or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service. |
| Theme | (This option applies to NetWitness 11.1 and later.)<br>Changes the appearance of the Respond view and some Investigate views that you see in the application. You can choose between light and dark themes:<br>• **Dark**: The dark theme is best for darker environments or when you do not need as much contrast.<br>• **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience.<br>Your selection only changes how NetWitness appears to you, not other users. |
| Change my password | Opens the Preferences dialog where you can change your password. |
| Version | Shows the NetWitness version. |
| Sign Out | Enables you to log out of NetWitness. |

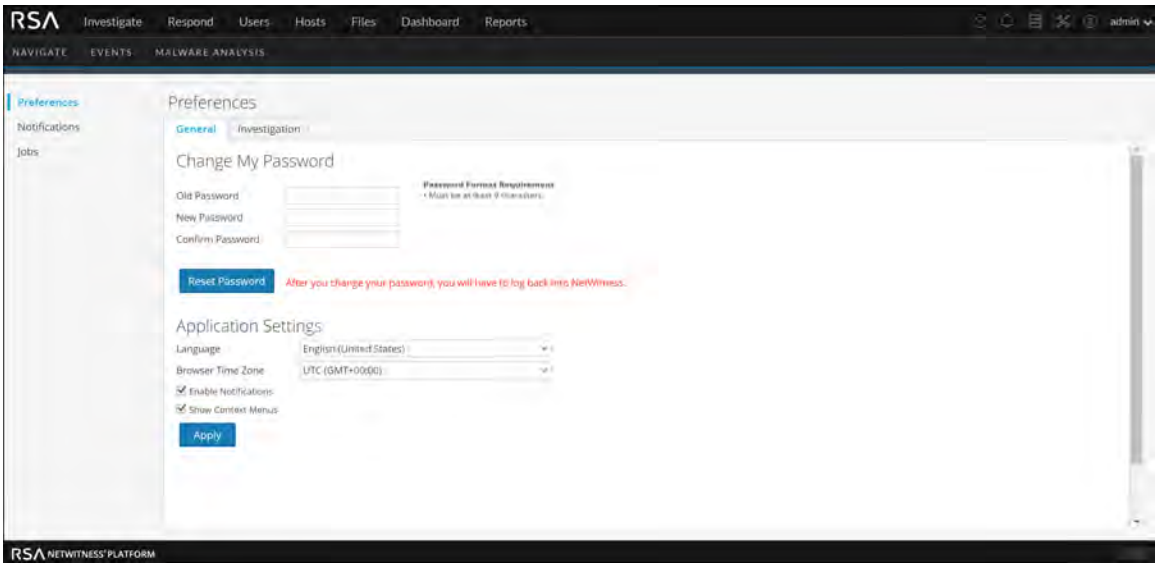
Any selections that you make become effective immediately.

## Preferences

To access additional global user preferences, do one of the following:

- For most views, such as Investigate, Dashboard, Reports, (Configure) , or (Admin) , select your username and then select **Profile**.
- In the Springboard, Investigate view [Events (formerly Event Analysis)], Respond, Users, Hosts, Files, and some (Configure) views, select your username, for example  , and in the User Preferences dialog click **Change my password**.

The Preferences dialog shows your current preferences.



The following tables describe the global application preference options that you can access from the Preferences dialog.

## Change My Password Section

This section enables you to change your password. Your administrator defines the appropriate password strength requirements for your NetWitness password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

The following tables describes the options in the Change My Password section.

| Option | Description |
|---|---|
| Old Password | Enter the password that you used to log in to NetWitness. |
| New Password | Enter the password that you want to use for the next login. |
| Confirm Password | Retype the new password. |
| Reset Password | Updates your user profile with the new password. You will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness. The password change is applied to your system login and to all NetWitness services on which your account has been added. |

If you changed your password, you will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness.

## Application Settings Section

The following tables describes the options in the Application Settings section.

| Option | Description |
|---|---|
| Language | (This option applies to NetWitness 11.2 and later.)<br>Sets the preferred language for the entire NetWitness Platform. The default language is English (United States). |
| Browser Time Zone | Sets the time zone to use in NetWitness. Your time zone preference is displayed on the toolbar. |
| Enable Notifications | This checkbox enables and disables notifications for your user account. By default, NetWitness system notifications are enabled when a new user account is created. |
| Enable Context Menus | This checkbox enables and disables context menus for your user account. By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click in a view. |
| Apply | Updates your preferences and applies the changes immediately. |

# Notifications Panel and Notifications Tray

NetWitness provides system notifications to advise users about certain actions or conditions:

- A host upgrade completed.
- A parser push to decoders completed.
- A service went down (critical log of a certain type).
- A visualization completed.
- A report completed.
- A newer software version is available.

While you are working in NetWitness, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

When you are viewing notifications in the Notifications tray, only recent notifications are displayed. You can access all of your notifications from your user Profile and from the Notifications tray by selecting the View All option. Procedures for viewing notifications are provided in Viewing and Deleting Notifications.

**Note:** In the Analyst UI, the license notifications are not displayed in the notification tray or login window when the license goes out of compliance or when the license expires. This is displayed only on the Admin UI.

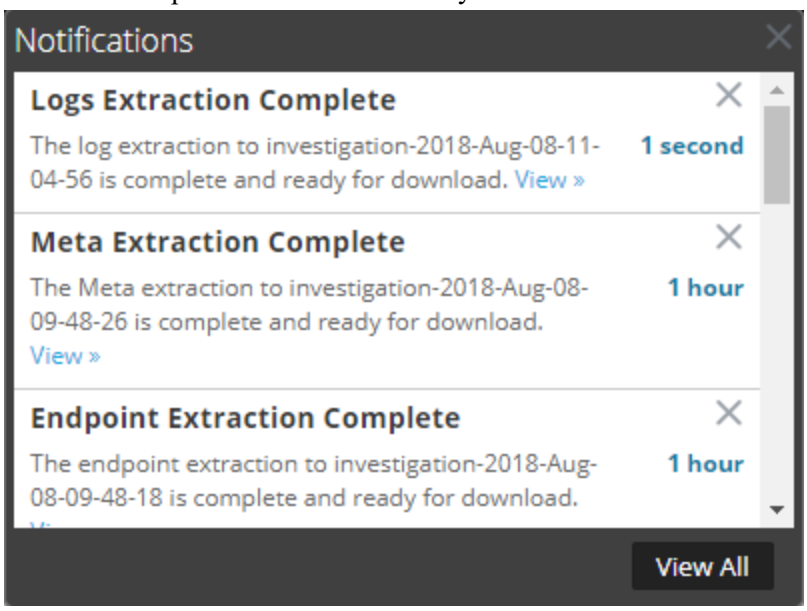
## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| All | View all notifications | Viewing and Deleting Notifications |
| All | Delete notifications | Viewing and Deleting Notifications |

## Quick Look

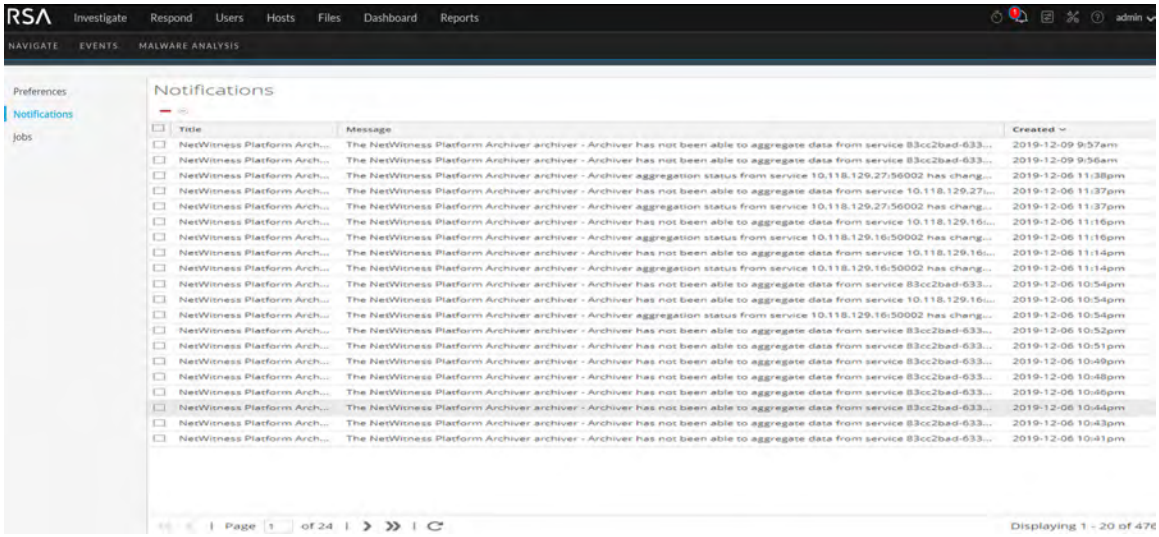
To access the Notifications panel, do one of the following:

- Click to open the Notifications tray and then click **View All** in the Notifications tray.



- In the upper right corner of the NetWitness browser window, select your username and then select > **Profile**. In the options panel of the Preferences dialog, select **Notifications**.

  The Notifications panel is displayed.



The Notifications tray shows your recent notifications. It contains a subset of the information in the Notifications panel. The Notifications panel shows all of your notifications. The following table describes the Notifications panel and Notifications tray features.

| Feature | Description |
|---|---|
|  | (Notifications panel only) Displays a drop-down menu where you can delete the selected notification or all of your notifications in the Notifications panel and in the Notifications tray. |
| Title | The title of the notification, for example, **Logs Extraction Complete**. |
| Message | The entire message, for example, **The log extraction to Investigation is complete and ready for download.** |
| View | Some messages include a **View** link that displays a view where you can take action. For example, if there is a file to download, clicking this link opens the Jobs panel, the view where you can download the file. |
| Created | The date and time the notification was created.<br>In the Notifications tray, it shows the number of hours or days since the notification was created. |
| View All | (Notification tray only) Opens the Notifications panel, which lists all of your notifications. |

# Jobs Panel and Jobs Tray

Jobs are started by various NetWitness components; for example, downloading Content Management System (CMS) resources from Live Services and extracting logs, meta, and PCAP files from NetWitness Investigate.

In the (Admin) > System view, Administrators can manage all NetWitness jobs in the Jobs panel. Other non-administrative users can view their own jobs in the user Profile Jobs panel.

In addition, while working in NetWitness, you can open a quick view of your jobs from the NetWitness toolbar. When a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

In the Jobs panel, you can:

- View and sort the jobs
- Pause or resume a job
- Cancel a job
- Delete a job
- Download a job

The structure of the jobs panel is the same in all views.

## What do you want to do?

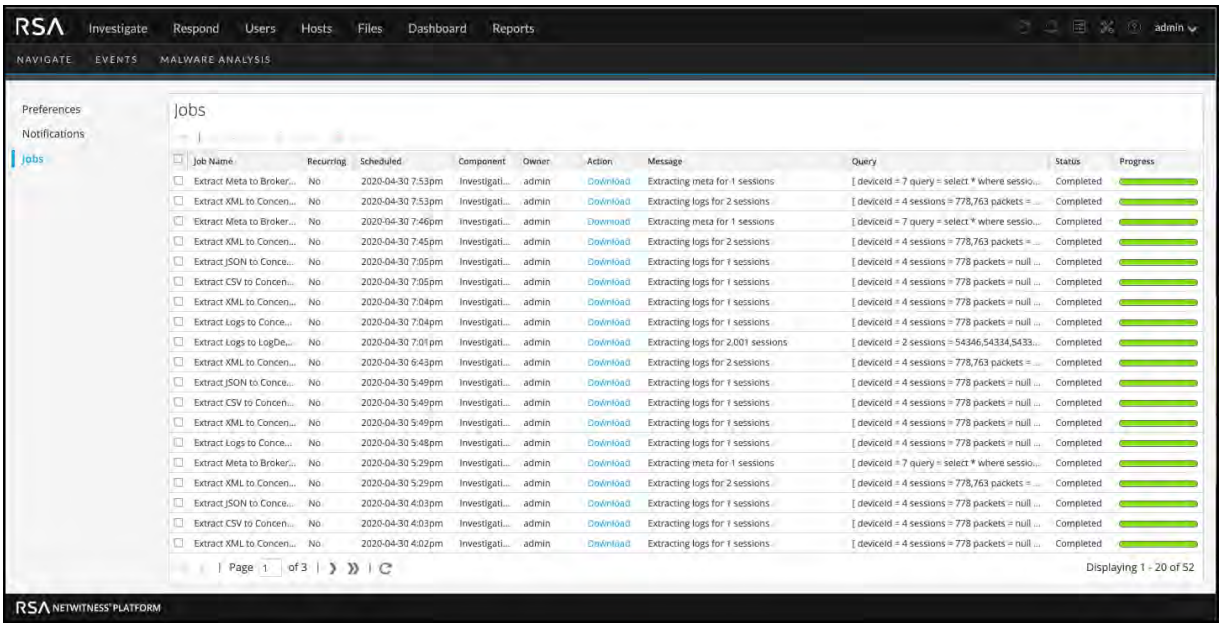
| Role | I want to ... | Show me how |
|---|---|---|
| All | Pause and Resume a Scheduled Job | Managing Jobs |
| All | Cancel or Delete a Job | Managing Jobs |
| All | Download a Job | Managing Jobs |

Your actions may be limited to your own jobs depending on your permissions.

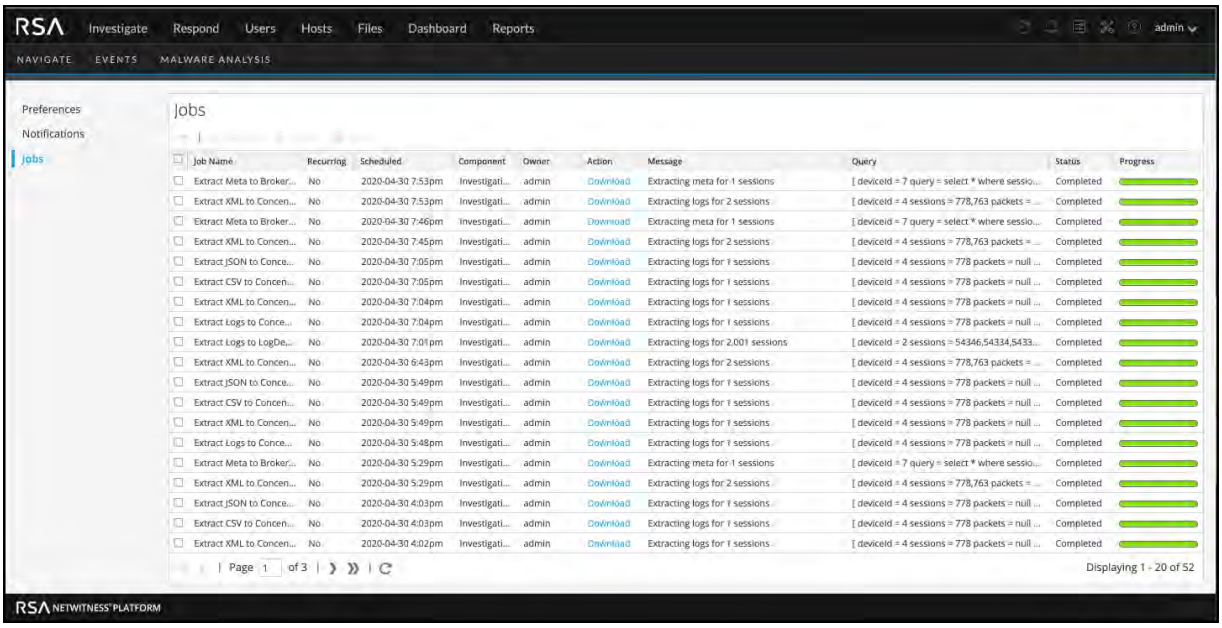
## Quick Look

To access the Jobs panel, do one of the following:

- In the upper right corner of the NetWitness browser window, select your username and then select **Profile**. In the options panel of the Preferences dialog, select **Jobs**.
  The Jobs panel is displayed. It shows the jobs of a particular user.

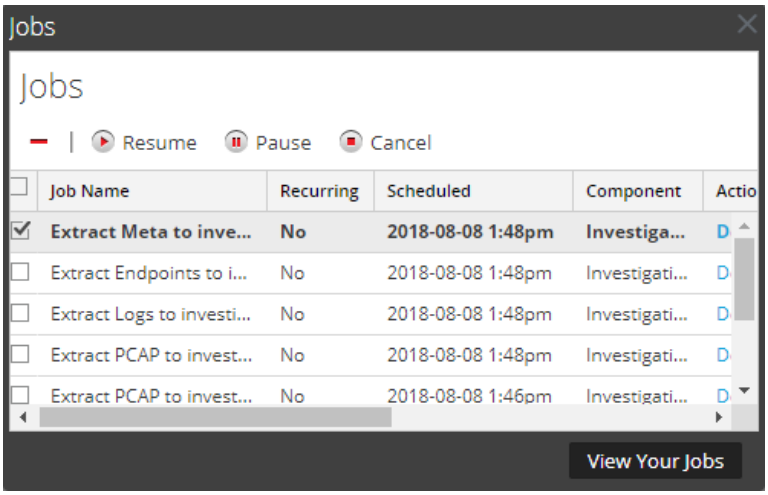


- Go to **(Admin) > System**, and in the options panel, select **Jobs**.
  The Jobs panel in the Admin System view is displayed. It shows the jobs for all users.



The Jobs panel organizes information about jobs into a list. The columns present a job progress bar, the job name, an indication that the job is recurring or not recurring, the NetWitness component that is controlling the job, the owner of the job, the status, any associated message, and a download button to allow downloading of a job's packet capture files or payload files.

To display the Jobs tray, click the **Jobs** icon .



The Jobs tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the **Jobs** panel. Otherwise the Jobs tray and the user Profile Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness jobs for all users.

The following table describes the available options in the Jobs panel.

| Option | Description |
|---|---|
| Resume | The Resume option applies only to recurring jobs that have been paused. When you resume a paused job, the next execution of the job executes as scheduled. |
| Pause | The Pause option applies only to recurring jobs. When you pause a recurring job that is running, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped. |
| Cancel | Cancels a recurring or non-recurring job. You can cancel a job while it is running. If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally. |
| – | Deletes a recurring or non-recurring job from the Jobs panel. When you delete a job, the job is instantly deleted from the Jobs panel. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well. |

The following table describes the Jobs tray and Jobs panel columns.

| Column | Description |
|---|---|
| Selection box | Enables you to select one or more jobs. |
| Job Name | Displays the name of the job; for example, **Extract Files** or **Upgrade Service**. |
| Recurring | Indicates whether the job is recurring or non-recurring. **Yes** = recurring, **No** = non-recurring. |
| Scheduled | Indicates the date and time at which the job was scheduled to begin. |
| Component | Indicates the component in which the job originated; for example, **Investigation** or **Administration**. |
| Owner | Indicates the owner of the job. The owner of the job is not included in the default **Jobs Tray**, because only the current user's jobs are displayed here. The column is available to add. |
| Action | Views the job in another view or downloads job files for the job to the default **Downloads** directory on the local system. Only successfully completed jobs have the **View** link in the **Action** column. Only jobs that create a file have the **Download** link in the **Action** column. |
| Message | Displays additional information about the job; for example, **Extracting files** or **No sessions found.** |
| Query | Displays the query associated with the job to help you understand any issues with the result. This example provides the deviceid and the query that was submitted: `[Deviceid = 7 query = select * where sessionid=35667 size = 0 flags = 0]` |
| Status | Indicates the status of the job. Common values for status are **Paused**, **Running**, **Canceled**, **Failed**, **Completed**, and other status values are possible. |
| Progress | Shows the percentage complete for a job. |
| View Your Jobs | (Jobs tray only) Displays your jobs in the **Jobs panel**. |

# How Reporting Engine Works

NetWitness Reporting Engine is a service on the NetWitness Admin Server. It facilitates the data extraction from different data sources to generate reports for compliance and analysis. Reporting Engine stores the definitions of the charts, rules, reports and alerts that are used to generate reports, charts and alerts.

Reporting Engine configuration includes configuring the data sources, definitions of outputs or notifications and parameters to improve the performance of data extraction and report, chart, and alert generation.

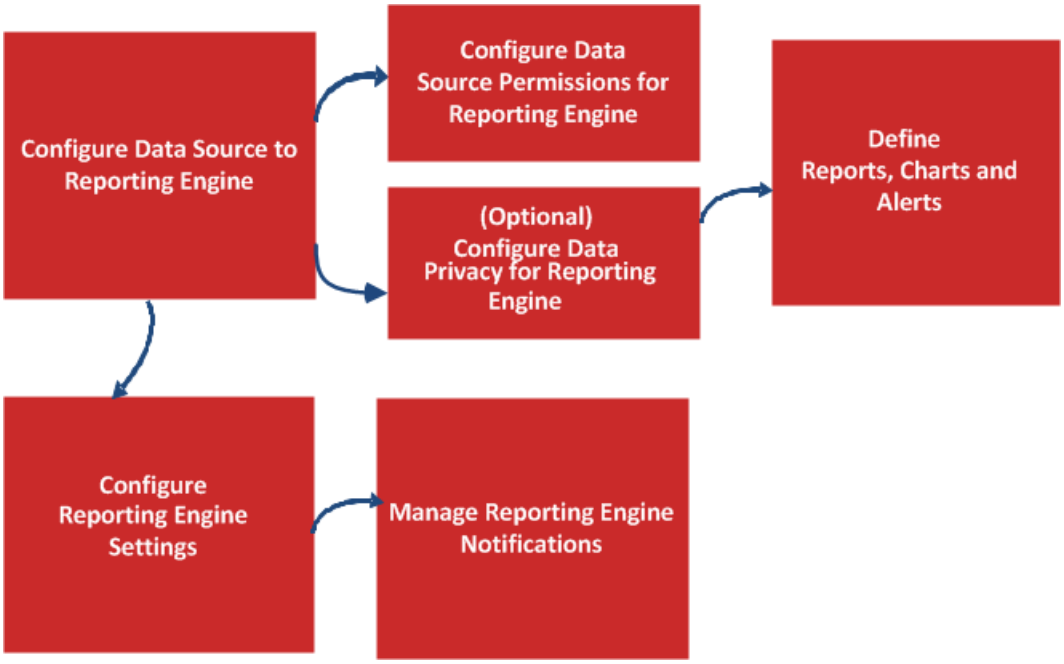
When you install the NetWitness, Reporting Engine is automatically installed as a service. This enables the Reports, Charts, and Alerts to be maintained in the RSA NetWitness and be available to view, download reports as PDF or CSV format, download charts as PDF and be added as dashlets.

For the Reporting Engine to run reports and alerts based on the data drawn from a data source, you must associate a data source, or multiple data sources to a Reporting Engine. There are three types of data sources:

- NWDB - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection. Reporting Engine supports the generation of reports, alerts, and charts.
- Warehouse - The Warehouse data sources are Horton Works and MapR which collects information from the Warehouse Connector and generates reports and alerts. This data source generates Reports only.
- Respond - Respond is used to generate reports on alerts and incidents. This data source generates Reports only.

## Workflow

The following workflow shows an overview of the Reporting Engine configuration which enables the user to generate Reports, Charts, and Alerts.



# Configure the Reporting Engine

On installation of the NetWitness Server, the Reporting Engine service is automatically available and some parameters are pre-populated with default values to achieve optimal results.

Make sure that the data sources are deployed and configured in the NetWitness. For more information, see "Add Service or Edit Service Dialog" topic in the *Host and Service Configuration Guide*.

You can perform the following tasks:

- Check Live for the latest data source content and deploy it on a regular basis. (For more information, see "Manage Live Resources" topic in the in *Live Services Guide*).
- (Optional) Add Additional Space for Large Reports.

# Configure the Data Sources

You must configure NWDB, Warehouse, and Respond to generate Reports, Charts, and Alerts. Optionally, you can also configure Archiver, Collection, and Workbench data sources.

**IMPORTANT:** If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

**Note:** To execute Reports and Charts on an Analyst UI, make sure the admin adds the data sources to each Reporting Engine instance from the admin node using the relevant procedure described in this topic.

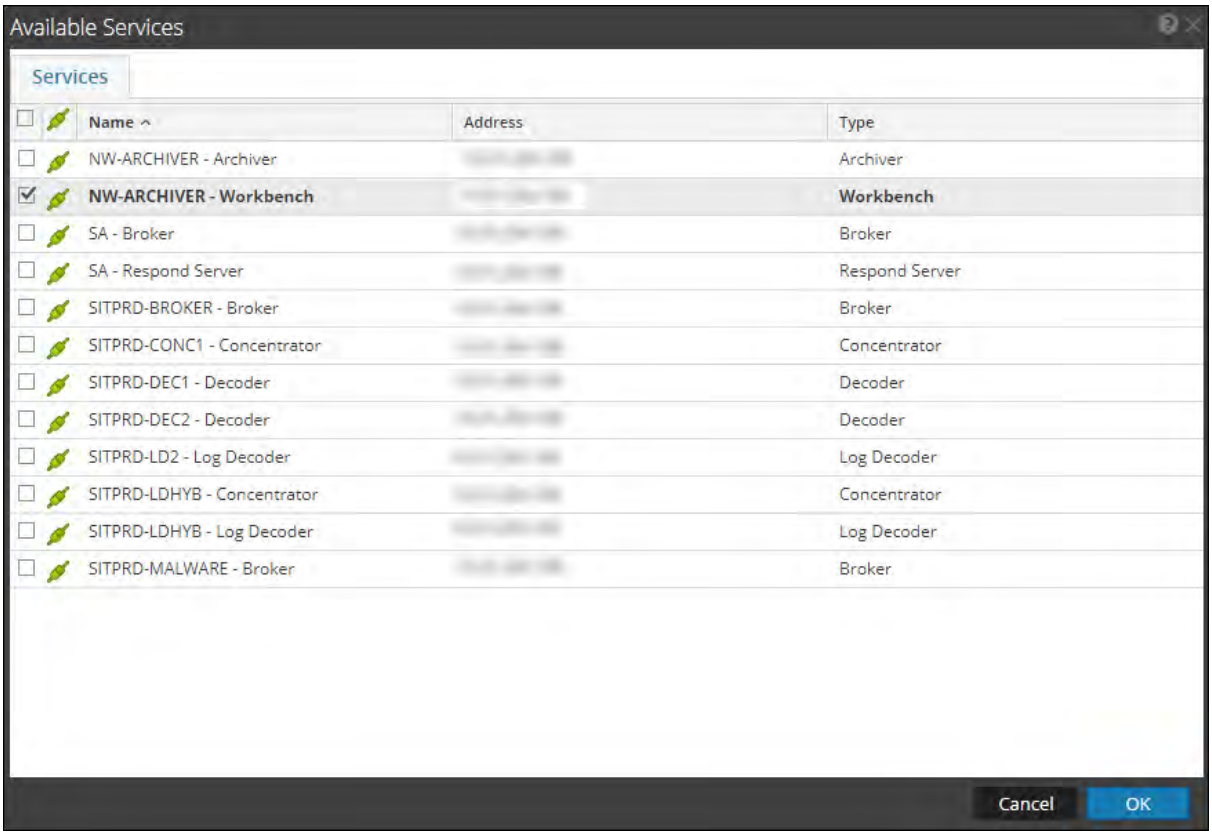
## Configure a NWDB Data Source

To add a NWDB data source:

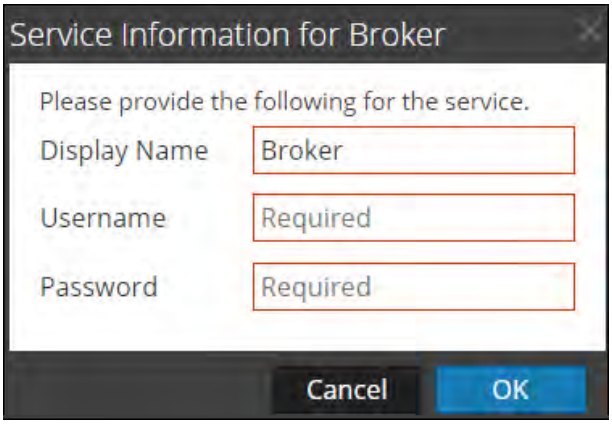
1. Go to **(Admin) > Services**.
2. In the **Services**, select **Reporting Engine** service.
3. Click > **View** > **Config**

   The Services Config View of Reporting Engine is displayed.
4. On the **Sources** tab, click > **Available Services**.

   The **Available Services** dialog is displayed.



5. Select a NWDB service you want to add and click **OK**.
6. In the Service Information for Broker dialog, enter the service information for the service and click **OK**. In this example, we are adding a Broker service.



7. The service is displayed in the Sources tab when it is successfully added.

**Note:** The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

# Configure a Warehouse Data Source

You can add the warehouse data source to Reporting Engine, so that you can extract the data from the required services, store them in MapR or Horton works and generate Reports and Alerts. The procedure to configure Warehouse as a data source differs. To extract data from a Warehouse data source, you must configure it using the following procedure.

**Note:** Warehouse Connector is still supported, as it is reporting against a warehouse in NetWitness 11.x.

## Prerequisite

Make sure you:

- Add a Warehouse Data Source to Reporting Engine.
- Set Warehouse Data Source as the Default Source.
- HIVE server is in running state on all the Warehouse nodes. Use the following command to check the status of the HIVE server:

  ```
  status hive2 (MapR deployments)
  service hive-server2 status (Horton Works deployments)
  ```

- Warehouse Connector is configured to write data to the warehouse deployments.
- If Kerberos authentication is enabled for HiveServer2, make sure that the keytab file is copied to the `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/` directory in the Reporting Engine Host.

  **Note:** The `rsasoc` user should have read permissions for the keytab file. For more information, see Configure Data Source Permissions.

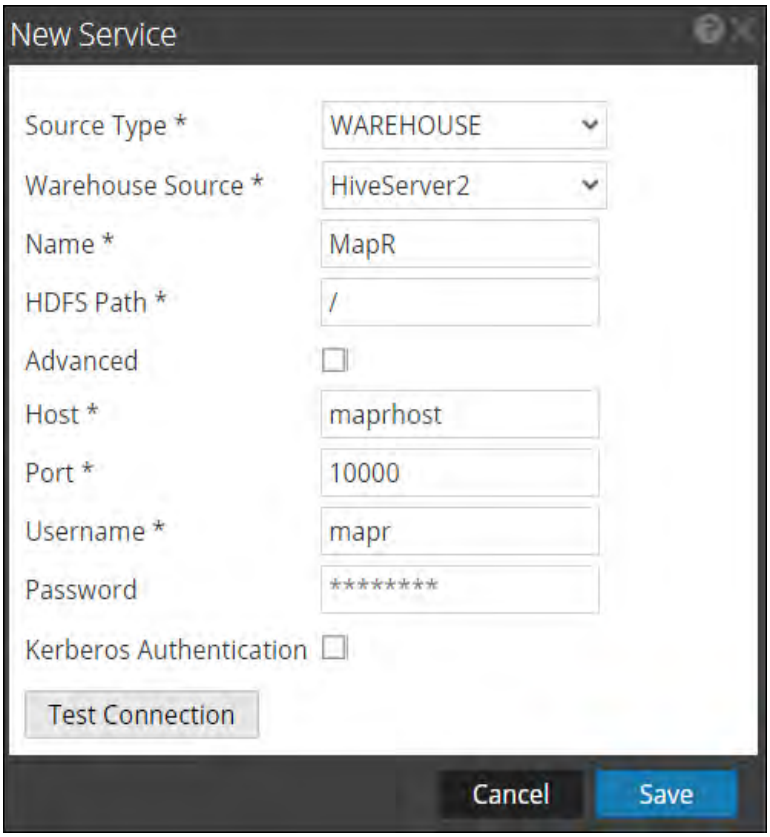
  Also, make sure that you update the keytab file location in the **Kerberos Keytab File** parameter in the Reporting Engine Service Config View. For more information, see Reporting Engine General Tab.

### To add Warehouse data source for MapR:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click > **View** > **Config**.

   The **Service Config** view is displayed with the **General** tab open.
4. Click the **Sources** tab.
5. In the **Sources** tab, click and select **New Service**.

   The New Service dialog is displayed.



6. In the **Source Type** drop-down menu, select **WAREHOUSE**.
7. In the **Warehouse Source** drop-down menu, select the warehouse data source.
8. In the **Name** field, enter the host name of the Warehouse data source.
9. In the **HDFS Path** field, enter the HDFS root path to which the Warehouse Connector writes the data.

   For example:

   If `/saw` is the local mount point for HDFS that you have configured while mounting NFS on the device. And if you have installed the Warehouse Connector service to write to SAW. For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

   If you have created a directory named `Ionsaw01` under `/saw` and provided the corresponding Local Mount Path as `/saw/Ionsaw01`, then the corresponding HDFS root path would be `/Ionsaw01`.

   The `/saw` mount point implies to `/`as the root path for HDFS. The Warehouse Connector writes the data `/Ionsaw01` in HDFS. If there is no data available in this path, the following error is displayed:

   `"No data available. Check HDFS path"`

   Make sure that `/lonsaw01/rsasoc/v1/sessions/meta` contains avro files of the meta data before performing test connection.
10. Select the **Advanced** checkbox to use the advanced settings, and fill in the **Database URL** with the complete JDBC URL to connect to the HiveServer2.

    For example:

If kerberos is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;principal=<Kerberos serverprincipal>
```

If SSL is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;ssl=true;sslTrustStore=<trust_store_
path>;trustStorePassword=<trust_store_password>
```

For more information on HIVE server clients, see https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients.

11. If not using the advanced settings, enter the values for the **Host** and **Port**.
    - In the **Host** field, enter the IP address of the host on which HiveServer2 is hosted.

      **Note:** You can use the virtual IP address of MapR only if HiveServer2 is running on all the nodes in the cluster.

    - In the **Port** field, enter the HiveServer2 port of the Warehouse data source. By default, the port number is **10000**.
12. In the **Username** and **Password** field, enter the JDBC credentials used to access HiveServer2.

    **Note:** You can also use LDAP mode of authentication using Active Directory. For instructions to enable LDAP authentication mode, see Enable LDAP Authentication.
13. Enable Kerberos authentication: see Enable Kerberos Authentication.
14. If you want set the added Warehouse data source as default source for the Reporting Engine, select the added Warehouse data source and click Set default.

### To add Warehouse data source for Horton Works (HDP):

**Note:** Make sure you download the `hive-jdbc-1.2.1-with-full-dependencies.jar`. This jar contains the driver file of HIVE 1.2.1 which connects to Reporting Engine for Hive 1.2.1 Hiveserver2.

1. SSH to the NetWitness server.
2. In the `/opt/rsa/soc/reporting-engine/plugins/` folder, take a backup of the following jar:

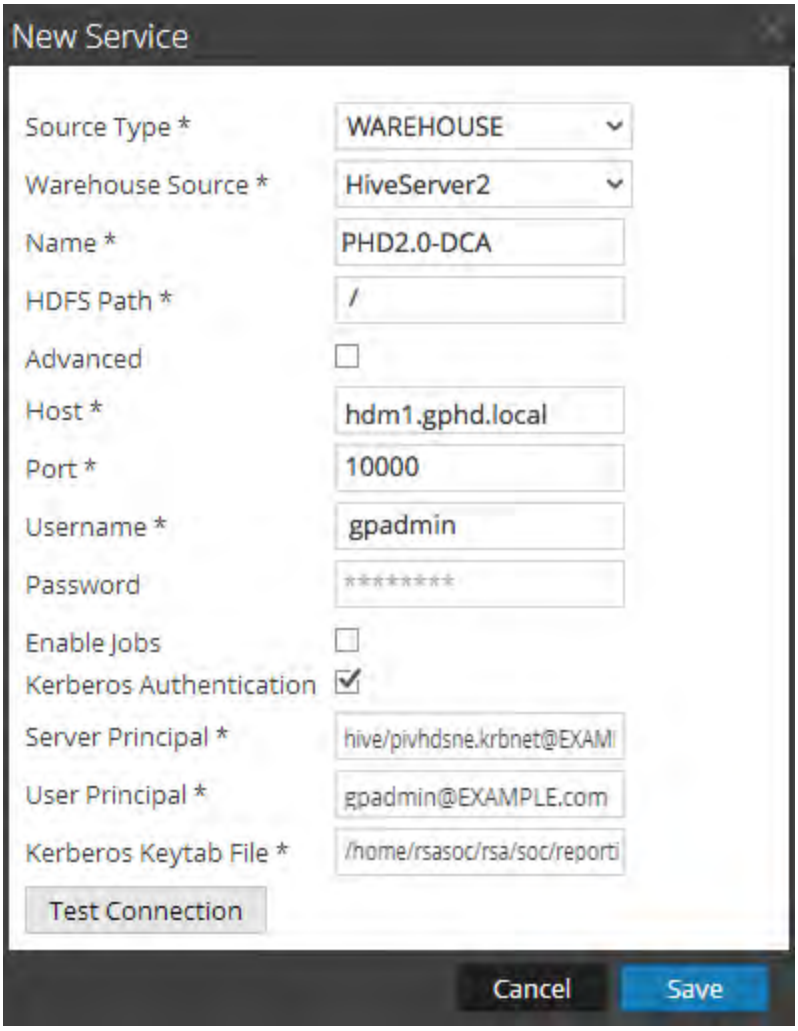
   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
3. Remove the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
4. In the /opt/rsa/soc/reporting-engine/plugins folder, copy the following jar using WinSCP:

   `hive-jdbc-1.2.1-with-full-dependencies.jar`
5. Restart the Reporting Engine service.
6. Log in to NetWitness UI.
7. Select the **Reporting Engine** service and select > **View** > **Explore**.
8. In the **hiveConfig**, set **EnableSmallSplitBasedSchemaLiteralCreation** parameter to **true**.

## Enable Kerberos Authentication

1. Select **Kerberos Authentication** checkbox, if the Warehouse is Kerberos enabled HIVE server.



2. Fill in the fields as follows:

| Field | Description |
|---|---|
| **Server Principal** | Enter the Principal used by the HIVE server to authenticate with the Kerberos Key Distribution Center (KDC) Server. |
| **User Principal** | Enter the Principal that HIVE JDBC client uses to authenticate with the KDC server for connecting the HIVE server. For example, gpadmin@EXAMPLE.COM. |

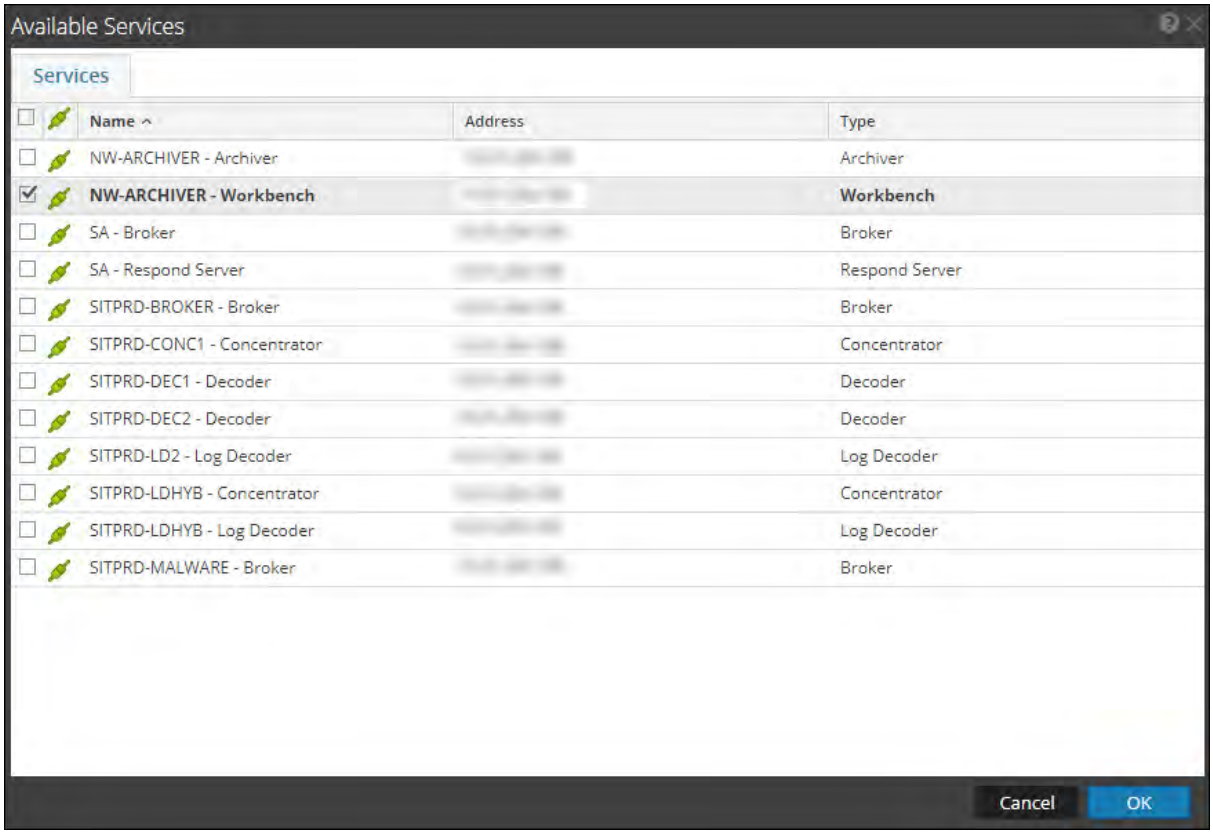
| Field | Description |
|---|---|
| **Kerberos Keytab File** | View the Kerberos keytab file location configured in the HIVE Configuration panel on the Reporting Engine General Tab.<br>**Note:** Reporting Engine supports only the data sources configured with the same Kerberos credentials, like, User Principal and key tab file. |

3. Click **Test Connection** to test the connection with the values entered.
4. Click **Save**.

   The added Warehouse data source is displayed in the Reporting Engine Sources tab.

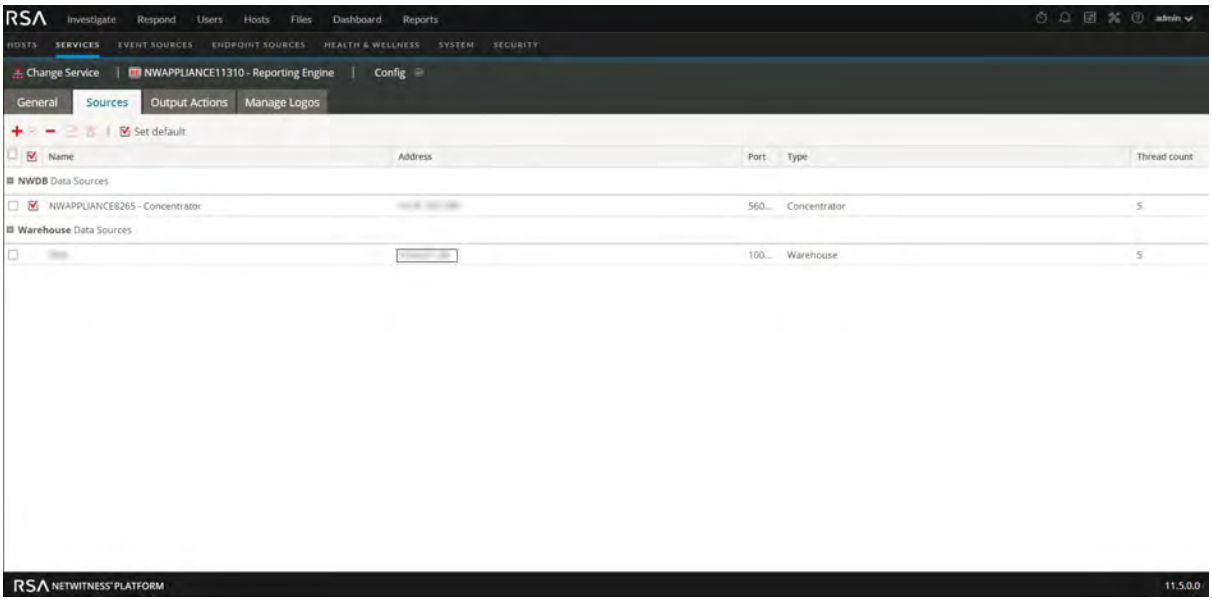
5. Click + > **Available Services**.

   The Available Services dialog box is displayed.



6. In the Available Services dialog box, select the service that you want to add as data source to the Reporting Engine and click **OK**.

   NetWitness adds this as a data source available to reports and alerts against this Reporting Engine.



**Note:** This step is relevant only for an Untrusted model.

## Set a Data Source as the Default Source

To set a data source to be the default source when you create reports and alerts:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View**> **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The **Services Config View** is displayed with the Reporting Engine Sources tab open.
5. Select the source that you want to be the default source (for example, Broker).
6. Click the Set default checkbox.

   NetWitness defaults to this data source when you create reports and alerts against this Reporting Engine.

# (Optional) Add Workbench as Data Source

You must configure Workbench,to be able to use data from Workbench data source to generate Reports and Alerts. The following instructions describe how to add Workbench service as a data source to Reporting Engine to generate report for the data collected by Workbench.

## Prerequisites

Make sure you have:

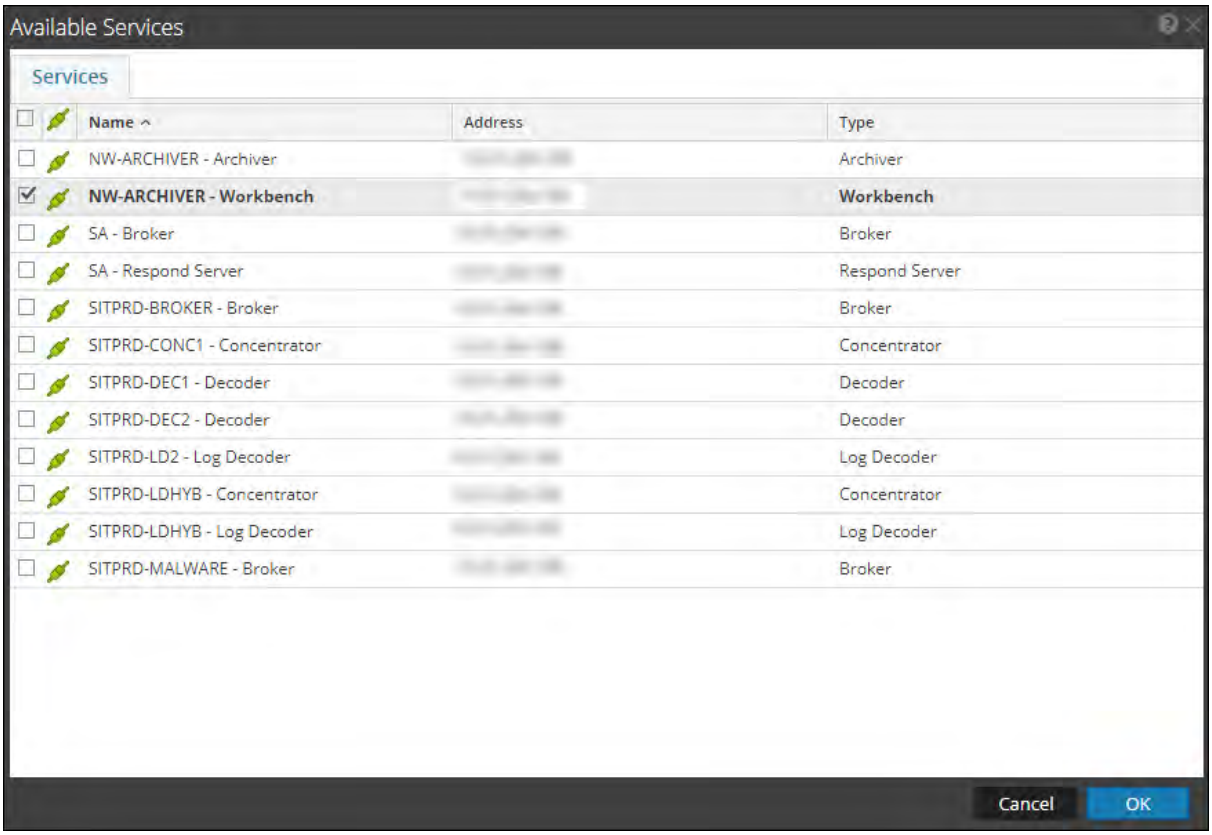
1. Added Workbench as a service to your NetWitness deployment. For more information, see the *Archiver Configuration Guide*.
2. Added a Collection on the Workbench service.

To add Workbench as a data source to Reporting Engine:

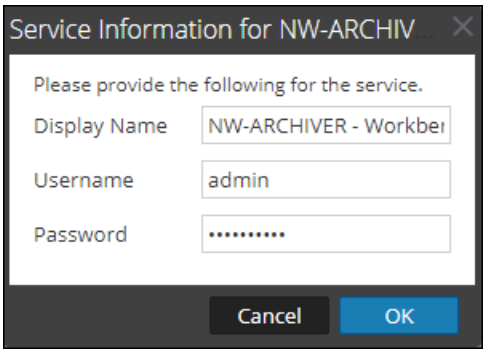
1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.

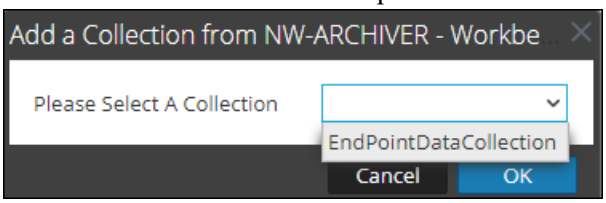
   The Available Services dialog is displayed:



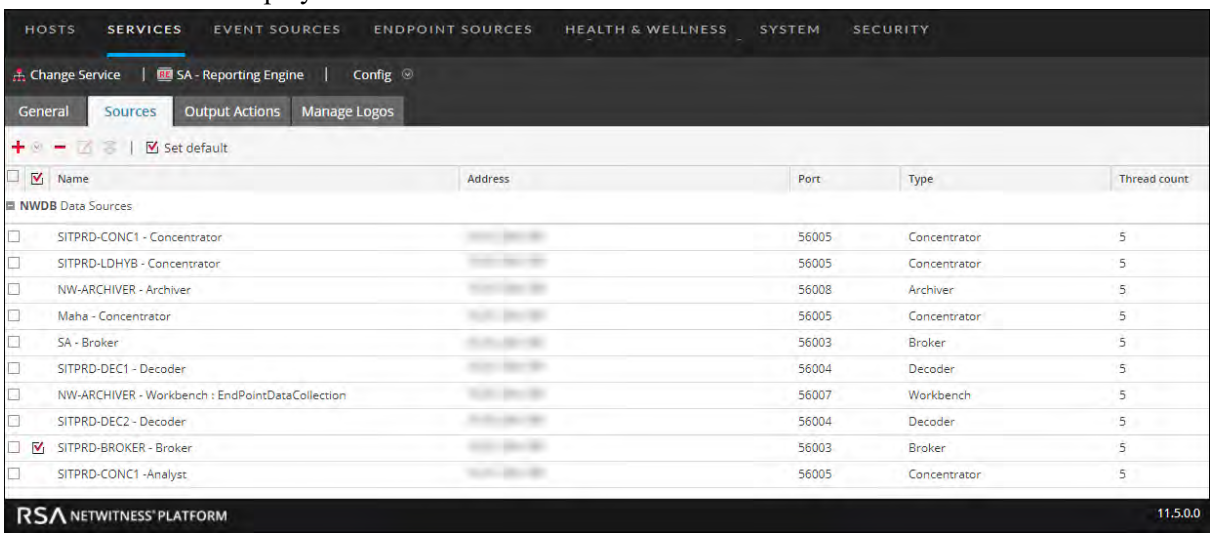
6. Select the Workbench service and click **OK**.
   A list of collections are displayed.
7. Enter the service information, and click **OK**



8. Select a collection from the dropdown.



9. The data source is displayed in the Sources tab.



The workbench service is now added as a data source to the Reporting Engine.

**Note:** The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

# (Optional) Add Archiver as Data Source

You must configure Archiver, to be able to use data from Archiver data source to generate Reports and Alerts:

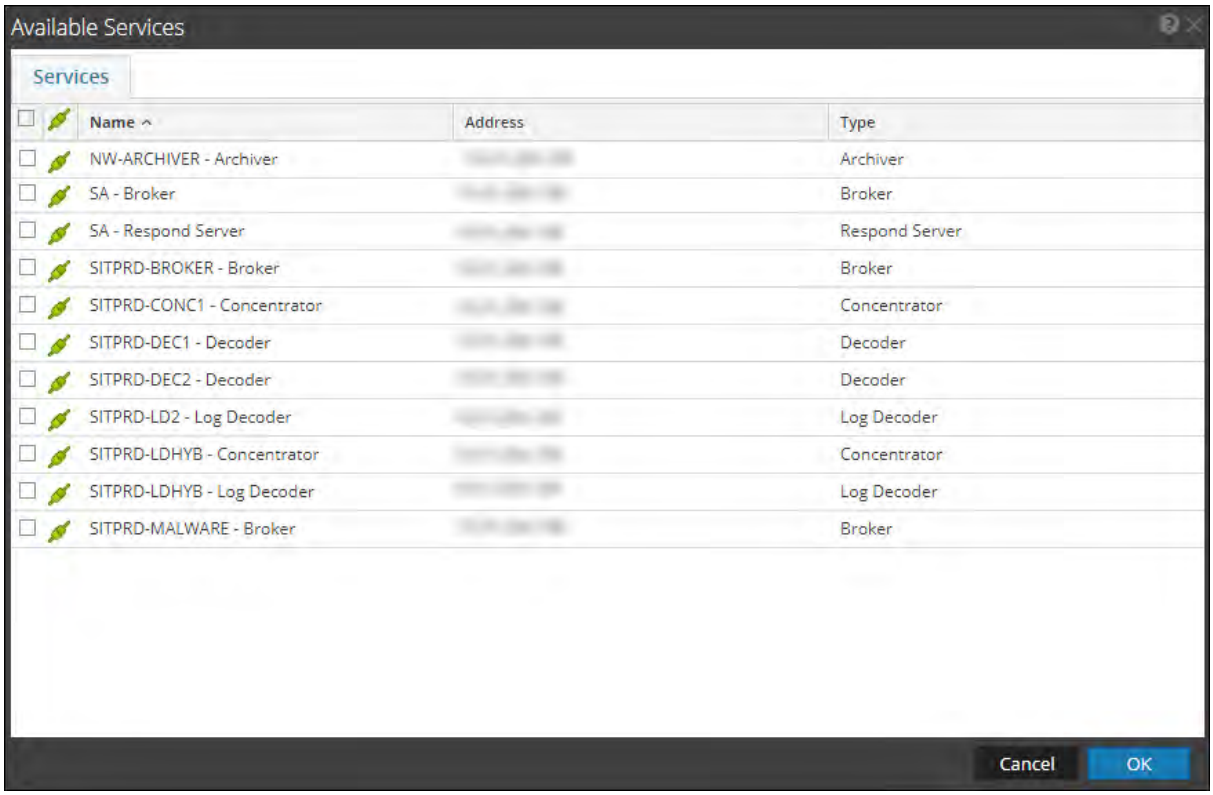
## Prerequisites

Make sure that you have:

1. Installed the NetWitness Archiver host in your network environment. For more information, see the *Hosts and Services Getting Started Guide*.
2. Installed and configured Log Decoder in your network environment. For more information, see "Add Log Decoder as a Data Source to Archiver" in the *Archiver Configuration Guide*.
3. Reporting Engine  service is available in your NetWitness deployment.
4. Added Archiver service to your NetWitness deployment. For more information, see "Add the Archiver Service" in the *Archiver Configuration Guide*.
5. Applied license to the Archiver service.

To add Archiver Data Source to Reporting Engine:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Archiver service and click **OK**.

   The service authentication dialog box is displayed.

   **Note:** The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the Username and Password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the Aggregate Services pane.

# (Optional) Integrate Endpoint Information Into Reports

You can use the Endpoint data by using the following instructions to add the Endpoint information into Reports. The *Endpoint Integration Guide* provides an overview of Endpoint integration into RSA NetWitness.

## Prerequisites

Make sure that:

- You have configured the Endpoint alerts via syslog into a Log Decoder. For more information see, "Configure Endpoint Alerts Via Syslog into a Log Decoder" topic in *Endpoint Integration Guide*).

To integrate Endpoint information into Reports:

1. In **Reporting Engine**> **View**> **Config**> **Sources**.
2. Add the Concentrator that is consuming data from the Log Decoder as a data source. Endpoint meta is populated in Reporting Engine.
3. Run reports by selecting the appropriate meta.

# (Optional) Add Collection as Data Source to Reporting Engine

You must configure Collection, to be able to use data from Collection data source to generate Reports, Charts, and Alerts:

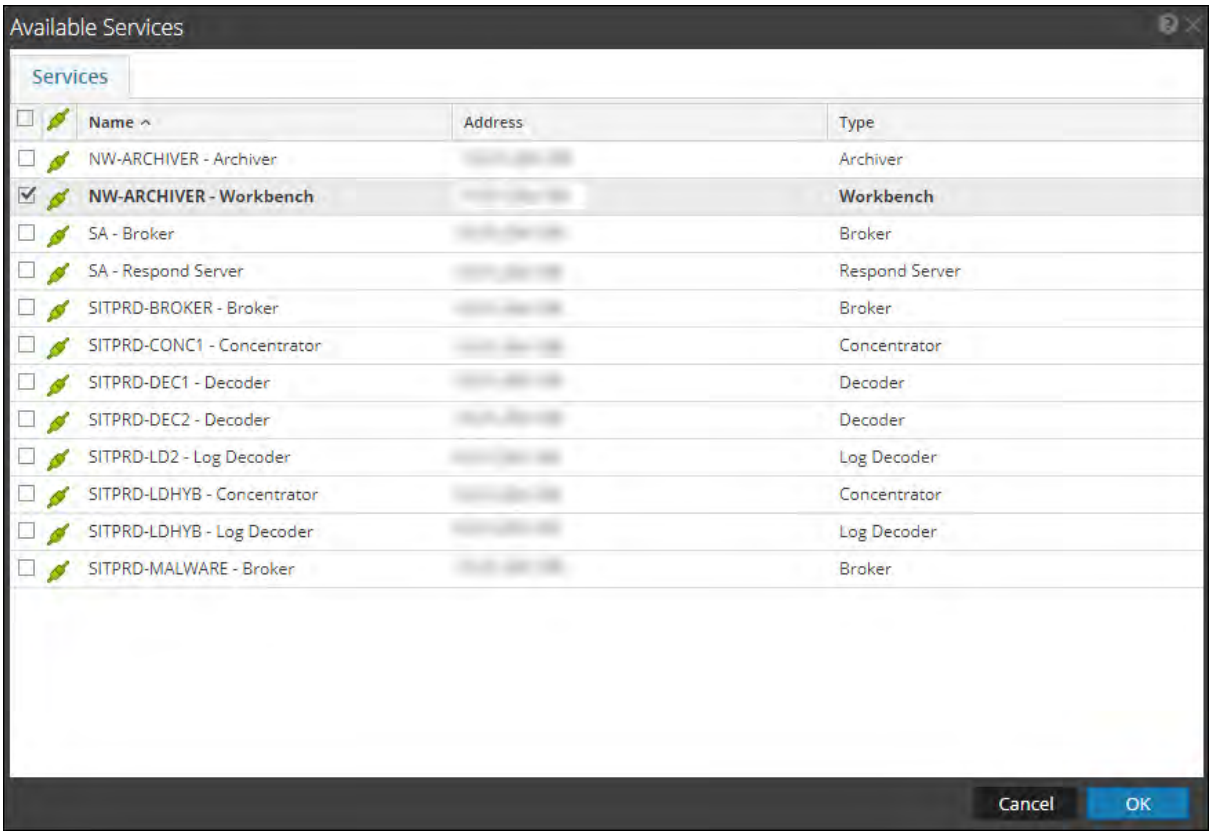
## Prerequisites

Make sure that you have:

- Installed a Workbench service on a Reporting Engine host.
- Backed up data in a known location on your local host, if you are adding a collection using the data restored from the backed up data.

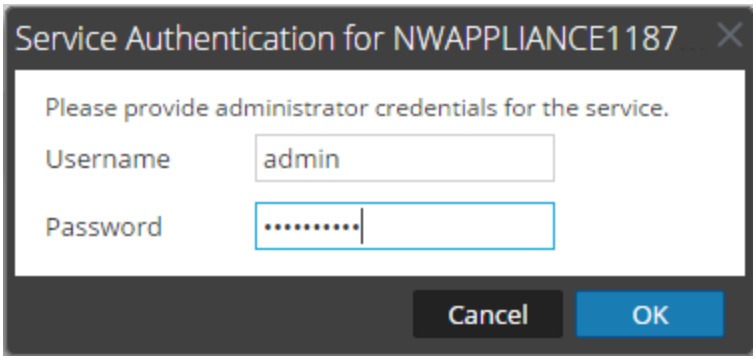
To associate a Collection as a data source with Reporting Engine:

1. Go to **(Admin) > Services**.
2. In the **Services** list , select a **Reporting Engine** service.
3. Click > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Workbench service and click **OK**.

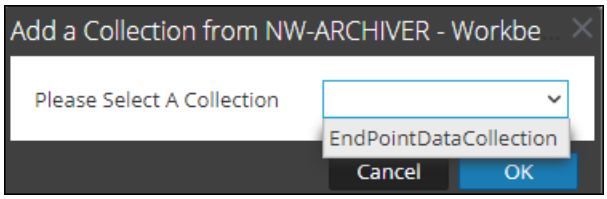
   The Service Authentication dialog for the selected service is displayed.



**Note:** The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the username and password for admin credentials for the service.
8. Click **OK**.

   The add collection dialog is displayed.



9. Select a collection from the drop-down list and click **OK**.

   The workbench service is now added as a data source to the Reporting Engine.

# Configure Data Privacy for the Reporting Engine

You can configure the data privacy for all data sources of Reporting Engine using the Sources tab of the **Services** > **View** > **Config** view.

With the addition of the Data Privacy feature to NetWitness 11.0 and above, access to sensitive meta in NetWitness Core services can be restricted by configuring separate data sources for Data Privacy Officer (DPO) users and non-DPO users, and limiting access to those data sources by assigning appropriate permissions.

In the **Services** > **Config** view, you can add each Core service as two separate data sources: one with a service account having privileges equivalent to a DPO and the other with a service account having privileges equivalent to any other user. Then, to limit access to those data sources based on roles, you can assign read access or no access to those data sources for individual roles. To limit access to Warehouse data sources, you can do the same.or more information, see Configure Data Source Permissions.

**Note:** A user assigned to the `Data_Privacy_Officers` role (or an equivalent custom role), can create a report, chart and alert. Also, configure a report or alert output actions in the Reporting module. In an environment where data privacy features of NetWitness are enabled and one or more meta keys are configured as protected, these actions can result in the following:
- When an alert is created by a DPO user, any protected or sensitive meta involved in the alert is automatically available in Respond. This may inadvertently provide all the users of Respond module access to the sensitive meta values, regardless of their roles. One option to prevent this is to disable publishing into Respond from Reporting.
- When an Output Action is configured by a DPO user, either sensitive meta values, reports with sensitive meta values or both, may become available to target users or destinations of that Output Action, regardless of the role assigned to the target user.

It is strongly recommended that DPO users completely avoid creating alerts or configuring output actions for a report or alert in the Reporting module. If they do such configuration, the above implications must be carefully considered.

NetWitness Core services (for example, Concentrator, Broker, or Archiver) support the ability to restrict meta data based on the configured user role. To make use of the data privacy feature for Reporting Engine, you can configure two separate service accounts against Core services. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. The access to restricted meta data for the two service accounts is configured as part of the data privacy plan on each Core service.

In Reporting Engine, you can add each Core service as two separate data sources (one being the regular data source and the other a privileged data source) using the two separate service accounts. You can configure Reporting Engine to allow only users with privileged roles to access the sensitive data source. Hence, Reporting Engine can connect to a NWDB Data source in two ways:

- Using a service account with DPO role.
- Using a service account without a DPO role.

**Note:** You can also add two or multiple data sources for the same Core service.

After adding two data sources with different service accounts for the same Core service, you can configure data source permissions to manage access to these data sources. For more information, see Configure Data Source Permissions.

**Note:** If the content is changed to utilize the transformed meta key, the hash value of the original meta is displayed in its place when viewing reports, charts and alerts.

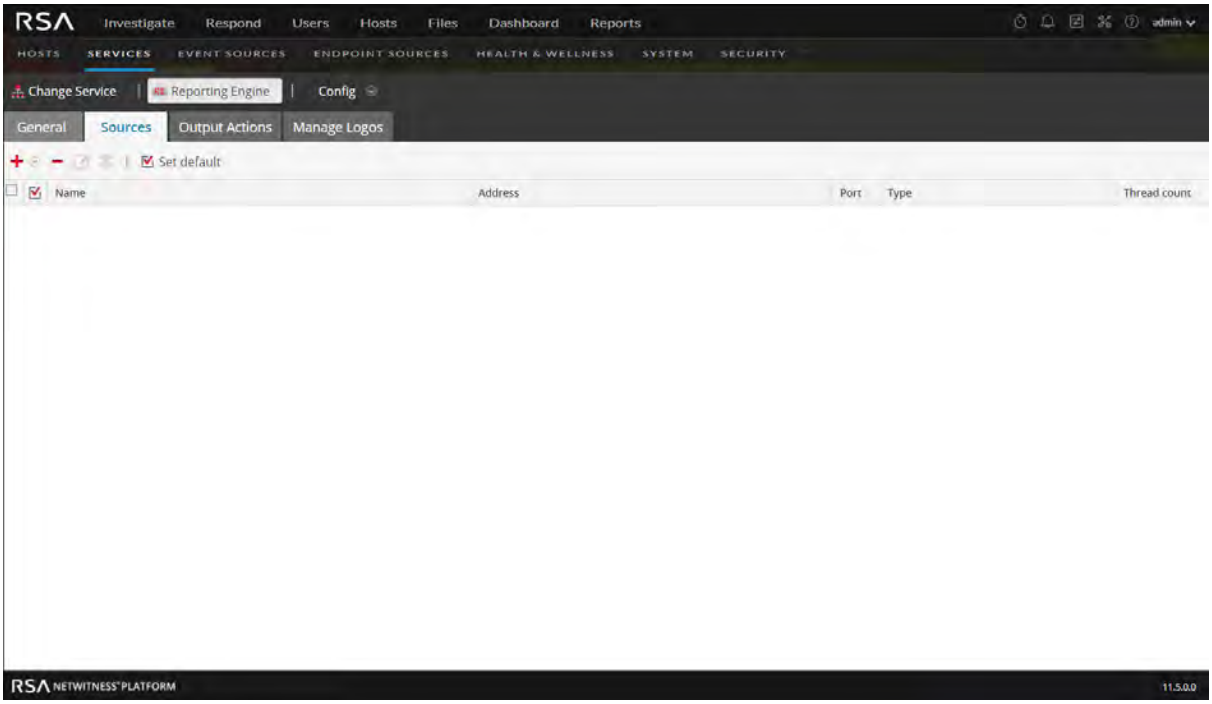
## Add a NWDB Data Source with Different Service Accounts

### To add a NWDB data source:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click **View** > **Config**.

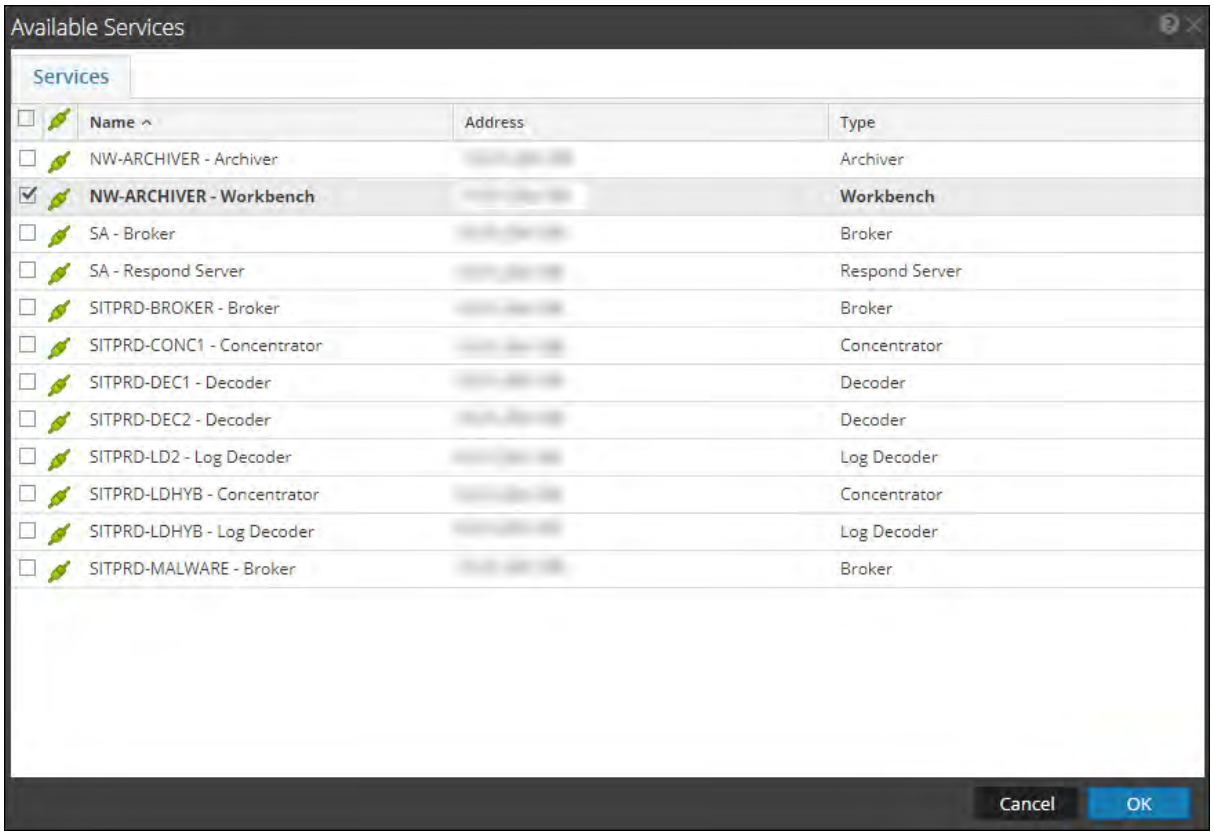
   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Services Config View is displayed.



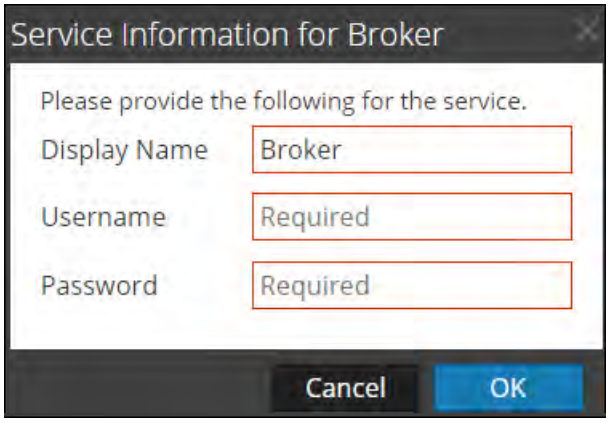
5. Click and select Available Services.

   The Available Services dialog is displayed. All services are listed, including those that have already been added to the Reporting Engine.



6. Select the checkbox next to the service and click **OK**.

   The Service Information dialog for the selected service is displayed.

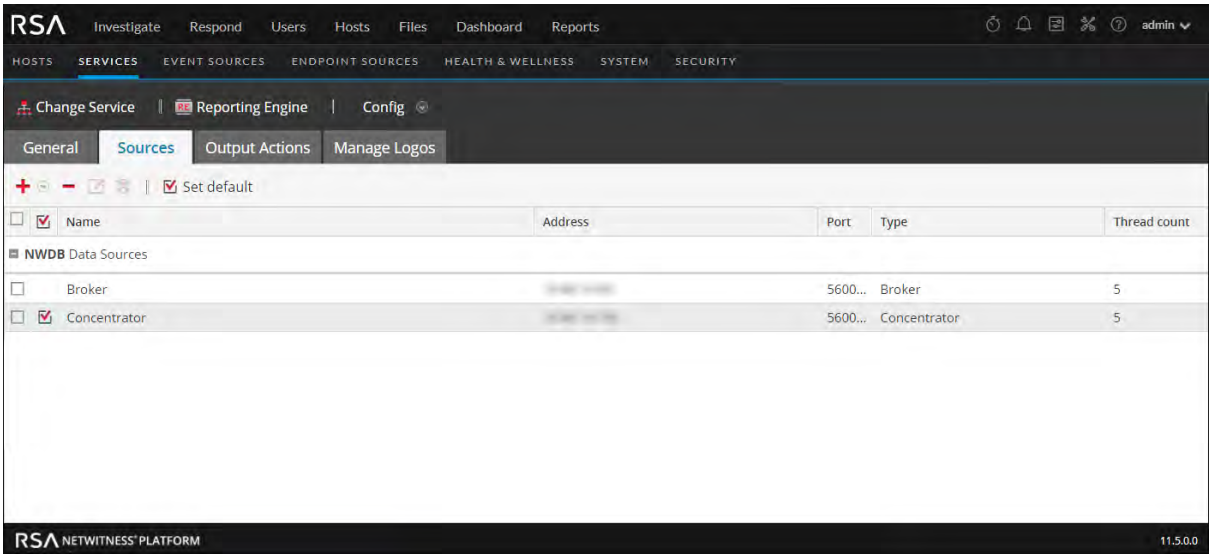


**Note:** NetWitness prompts you to provide a username and password for the selected service. To limit access to sensitive data, DPO users must use their credentials while adding the source instead of using the admin credentials. These credentials need to be applied to the host even if using trusted connections between the NetWitness server and NetWitness Core hosts.

   Repeat the step for Non-DPO data source.

7. Enter the username and password for the required service account.
8. Click **OK**.

The required service is added as a data source to the Reporting Engine. Two data sources are added to Reporting Engine for the same Core device.



# Configure Data Source Permissions

You can configure data source permissions for Reporting Engine using the **Sources** tab of the **Services** > **Config** view. This helps manage access control to the data sources by setting the data source permissions. Now, with the ability to add more than one data source for the same Core service, you can configure different permissions for each data source of the same Core service. For example, data privacy officers (DPO) can create a Warehouse source using their credentials, and that allows them to execute reports against the Warehouse while restricting everyone else from being able to use that source.

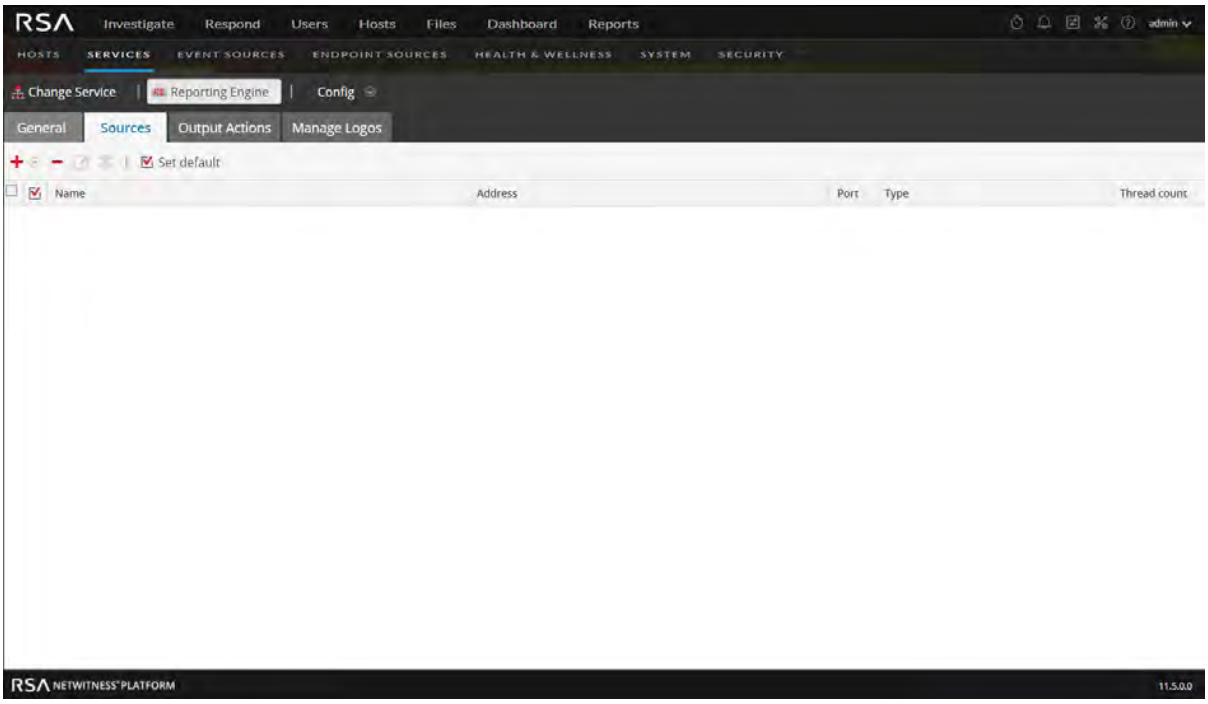
**Note:** In 11.x, the permissions for NWDB and Warehouse data sources are automatically set based on the permissions of the reporting objects. For example, if the role had the permissions set as **Read Only**/**Read & Write** for any reporting object in 10.5, then that role is automatically assigned read only permission for all the data sources that existed in 10.5. If no permission is set for the role, then the data source permission is automatically set to No Access.

To configure permissions to data sources:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

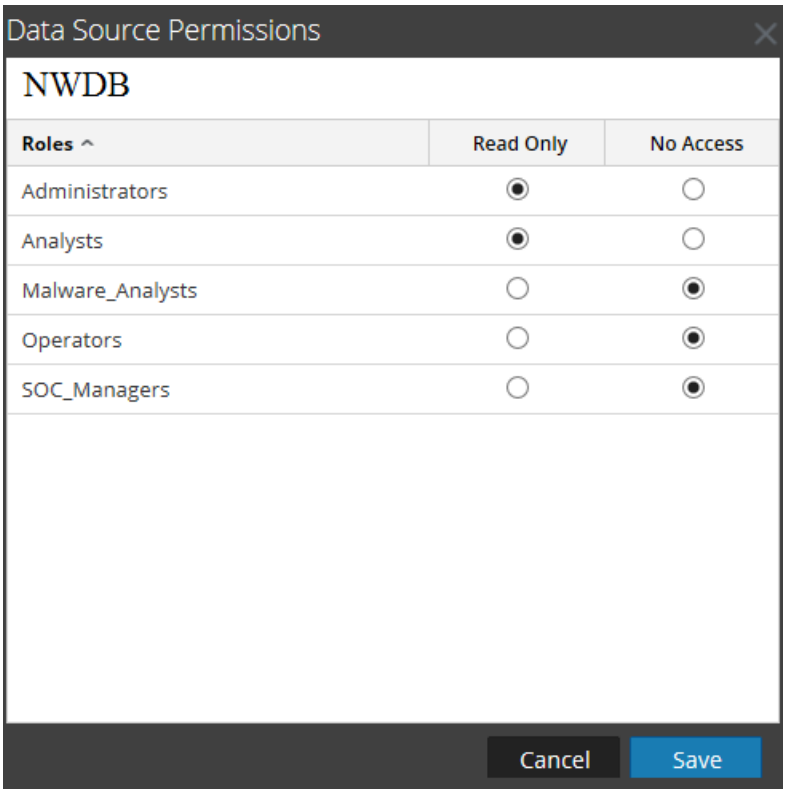
   The Service Config View displays the Sources tab.



5. Select the data source for which you want to configure permissions by selecting the checkbox.

6. Click .

   The Data Source Permissions dialog is displayed.



7. Modify the access permission for different users based on the type of service account of the data source. The permission can be either **Read Only** or **No Access**.
8. Click **Save**.

   The required permissions are configured for the data source. For more information, see the *Reporting Guide*.

# Configure Reporting Engine Settings

After you configure the Reporting Engine and required data sources based on your requirements, you can modify some of the configurations to customize your Reports, Charts, and Alerts.

To configure the settings:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed with the General tab highlighted. For more information on Reporting Engine General tab, see Reporting Engine General Tab.
4. Edit the Reporting Engine service settings and click **Apply**.

   The service settings are configured on Reporting Engine.

## Enable LDAP Authentication

To enable LDAP mode of authentication using Active Directory for HiveServer2 for Warehouse data source, follow these steps.

1. Log on to the RSA Analytics Warehouse appliance as root user.
2. Navigate to `/opt/mapr/hive/hive-0.11/conf.new/` directory. Type the following command and press ENTER:

   ```
   cd /opt/mapr/hive/hive-0.11/conf.new/
   ```
3. Edit the file `hive-site.xml`. Type the following command and press ENTER:

   ```
   vi hive-site.xml
   ```
4. Add the following properties under `<Configuration>` tag:

   ```
   <property> <name>hive.server2.authentication</name> <value>LDAP</value>
   </property> <property> <name>hive.server2.authentication.ldap.url</name>
   <value>LDAP_URL</value> </property>
   ```

   Where `LDAP_URL` is the URL of the LDAP Server.
5. Restart HiveServer2.

## Add Additional Space for Large Reports

To add additional disk space to the Reporting Engine for large reports, follow the below steps. If large compliance reports have to be generated for Warehouse, the Reporting Engine disk space might get consumed quicker than expected. In such cases, you can mount any external storage such as SAN or NAS for storing reports.

The directories that tend to fill up disk space are `resultstore` and `formattedReports` under the Reporting Engine home directory. It is recommended to move only these two directories to SAN or NAS and replace the original locations with soft links pointing to the new locations. It is also recommended to leave the remaining directories in the local disk itself for reliable and high I/O performance.

**Note:** The following steps assume that the Reporting Engine home directory is located at `/var/netwitness/re-server/rsa/soc/reporting-engine/` and the external storage is mounted under `/externalStorage/`. Also, the 'rsasoc' user must have read-write access to the specified external storage path.

To move disk space for the Reporting Engine to external storage:

1. Stop Reporting Engine service as a root user.

   ```
   service rsasoc_re stop
   ```

2. Switch to `rsasoc` user.

   ```
   su rsasoc
   ```

3. Change to RE home directory.

   ```
   cd /var/netwitness/re-server/rsa/soc/reporting-engine/
   ```

4. Move the resultstore directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv resultstore /externalStorage
   ```

5. Move the formatted Reports directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv formattedReports /externalStorage
   ```

6. Create a soft link for resultstore. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/resultstore /var/netwitness/re-
   server/rsa/soc/reporting-engine/resultstore
   ```

7. Create a softlink for formattedReports. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/formattedReports /var/netwitness/re-
   server/rsa/soc/reporting-engine/formattedReports
   ```

8. Exit the `rsasoc` user.

   ```
   exit
   ```

9. Start Reporting Engine service as a root user.

   ```
   service rsasoc_re start
   ```

   **Note:** If the external storage is offline, you cannot perform the following tasks:
   1) Execute Reports or Reporting Alerts
   2) View existing Reports or Reporting Alerts
   However, you can create new Reporting objects such as Reports and Charts, and access Charts and Live Dashboard created for charts. Therefore, you must ensure that the external storage is reliable and has the required space.

   Additionally, if you want to store reports beyond 100 days, change the retention configuration appropriately for the service that you are using as a data source.

# Accessing Reporting Engine Log Files

You can access the Reporting Engine log files which are stored in the following logs directory `/var/netwitness/re-server/rsa/soc/reporting-engine/logs/`

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`)

The Reporting Engine rarely writes command line error messages to the `rsasoc/nohup.out` file.

The Reporting Engine appends the log messages and output written by systemd system and the commands used to start the reporting-engine to the directory `/var/log/messages`.
A `/var/log/messages` log file is a system log file so only the root user can read it.

# Configure Task Scheduler for a Reporting Engine

You can configure queues and pools in the Reporting Engine to schedule NWDB or Warehouse reports. For more information on Task Schedulers, see "Task Scheduler for Warehouse Reporting" in the *Reporting Guide*

## Prerequisites

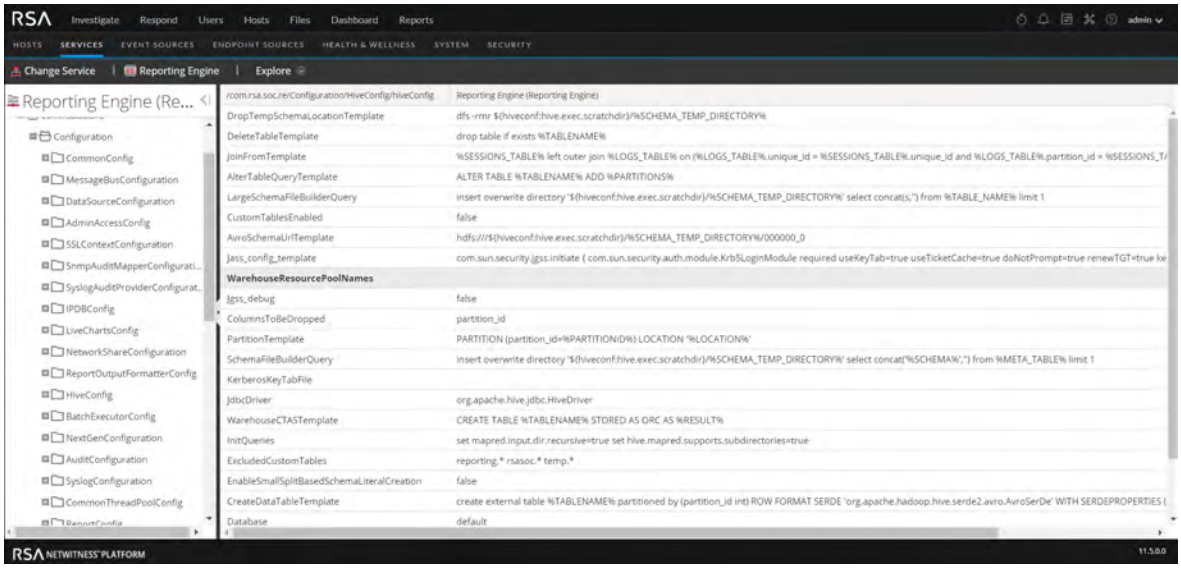
Make sure that you have identified the following:

- Scheduler type and pools or queues you want to use. You can configure only one scheduler for the Reporting Engine. By default the Fair Scheduler is configured.
- Names of the queues or pools, and the resources given to each queue and pool.
- NetWitness does not support multiple queues or pools per cluster. RSA recommends that you either provide unique names to queues or pools in all the clusters or use the same queue or pool names in both the clusters. If cluster size is large, there may be more than 3 pools or queues.
- If you are using an unsupported scheduler, the Reporting Engine does not set any property for the jobs that it launches.
- If the name of the pool or queue does not exist in the cluster, then Capacity Scheduler uses the default queue for the report. The Fair Scheduler may not execute the rule or creates a new pool with the lowest share. This is based on the value specified for the Fair Scheduler property `mapred.fairscheduler.allow.undeclared.pools`.
- If you do not specify a pool or queue, the job launched by the test rule is in the `mapr` pool or the default queue. RSA recommends that you configure a pool mapr with low (around 1/10 of total capacity) share with `maxRunningJobs = 2` so that these rules do not disrupt running reports. Make sure that you do not specify this pool name for any reports.

## Specify the Pools and Queues

To specify the pools and queues:

1. Go to **(Admin) > Services**.
2. Select **Reporting Engine** and click > **View** > **Explore**.
3. Select **com.rsa.soc.re** > **Configuration** > **HiveConfig** > **hiveconfig** > **WarehouseResourcePoolNames**.
4. In the **WarehouseResourcePoolNames** field, enter the pool or queue names separated by spaces. For example, to configure four pools or queues with the names pool1, pool2, wrong and default, enter the names separated by a space.



# Define Reports, Charts and Alerts

After you configure the Reporting Engine and the required data source based on your requirement, you can generate your Reports, Charts, and Alerts.

## Define Reports

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a Rule
- Test a Rule
- Schedule Reports
- Add an Alert
- Add a Chart
- Test a Chart

For more information, see the above topics in the *NetWitness Reporting Guide*.

## Define Charts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a chart and Chart Groups
- Test a Chart
- Investigate Charts
- Manage Charts

For more information, see the above topics in the *NetWitness Reporting Guide*.

## Define Alerts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Alerting module:

- Configure Alerts
- Generate Alerts
- Add an Alert
- View an Alert

- View and Alert
- View Alerts Schedule
- Investigate an Alert

For more information, see the above topics in the *NetWitness Reporting Guide*.

# Configure Reporting Engine General Settings

After you add and configure the Reporting Engine service, the system settings are defined with default values to achieve optimal results. However, you can modify and customize the Reporting Engine notifications based on your requirement by navigating to the **General** tab in the **Services** > **Config** view for a Reporting Engine.

## Access the General Tab

You need to open the General tab to configure the general parameters for Reporting Engine.

To access this view:

1. Go to **(Admin) > Services**.
2. In the Services list, select a **Reporting Engine** service.
3. Click **View** > **Config**.
4. Select the **General** tab.
5. Click **Apply** after you edit the parameters.

After you navigate to the General tab, you can modify the following parameters.

- System Configuration
- Logging Configuration
- Warehouse Kerberos Configuration

For more information see, General tab for details on the configuration parameters.

# Troubleshooting Reporting Engine Configuration

| Problem | Solution |
| --- | --- |
| When the NetWitness Server IP address is changes, the Reporting Engine datasource configuration does not get updated with the new IP | You must manually configure the new IP.<br>Perform the following manual steps to configure the new IP address:<br>1. Login in NetWitness Platform.<br>2. Go to **(Admin) > Services** > **Reporting Engine** > **View** > **Config**.<br>3. Click the **Output Actions** tab.<br>4. Add the new IP address in the **Hostname** field.<br>5. Click **Apply**.<br>6. Click the **Sources** tab and add the data sources again. |

# References

You can customize and make optimum use of the service by modifying the Reporting Engine settings in the **Services** > **Config** view, which has parameters that specifically pertain to the Reporting Engine.

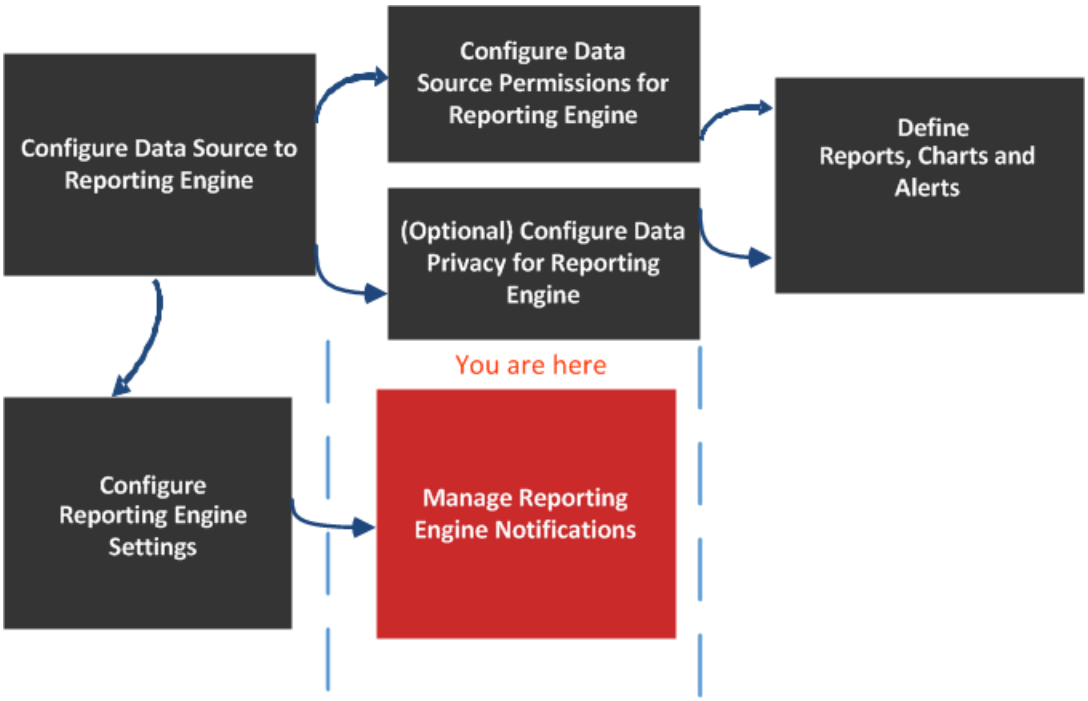
See the following sections for details:

- Reporting Engine General Tab
- Reporting Engine Sources Tab
- Reporting Engine Output Actions Tab
- Reporting Engine Manage Logos Tab

# Reporting Engine General Tab

The General tab for the Reporting Engine service controls several settings that can tune the performance of a service and specify the user credentials for the service. Navigate to Services > View > Config > Reporting Engine > General. These settings are used for the Reporting Engine service exclusively.

The required permission to access this view is Manage Services.



## What do you want to do?

| Role | I want to ... | Refer to... |
|---|---|---|
| Administrator | Configure Data Source to Reporting Engine | Configure the Data Sources |
| Administrator | Configure Data Source Permissions for Reporting Engine | Configure Data Source Permissions |
| Administrator | Configure Data Privacy for Reporting Engine | Configure Data Privacy for the Reporting Engine |
| Administrator | Define Reports, Charts, and Alerts | Define Reports, Charts and Alerts |
| Administrator | Configure Reporting Engine Settings | Configure Reporting Engine Settings |
| Administrator / SOC Manager | Configure System Settings* | Configure Reporting Engine General Settings |

| Role | I want to ... | Refer to... |
|---|---|---|
| Administrator / SOC Manager | Configure Logging* | Configure Reporting Engine General Settings |

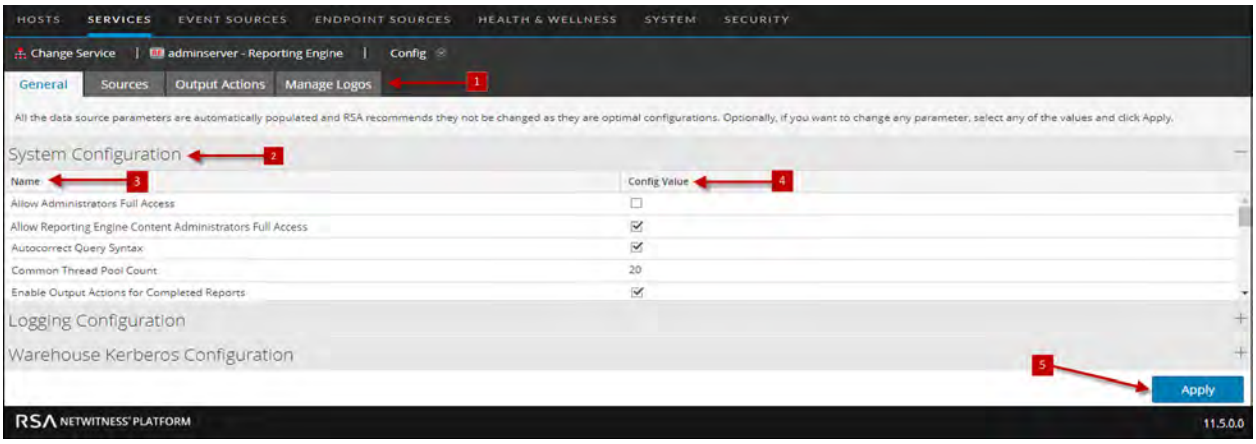
- How Reporting Engine Works

## Quick Look

Here is example of the General tab where service configurations are displayed.

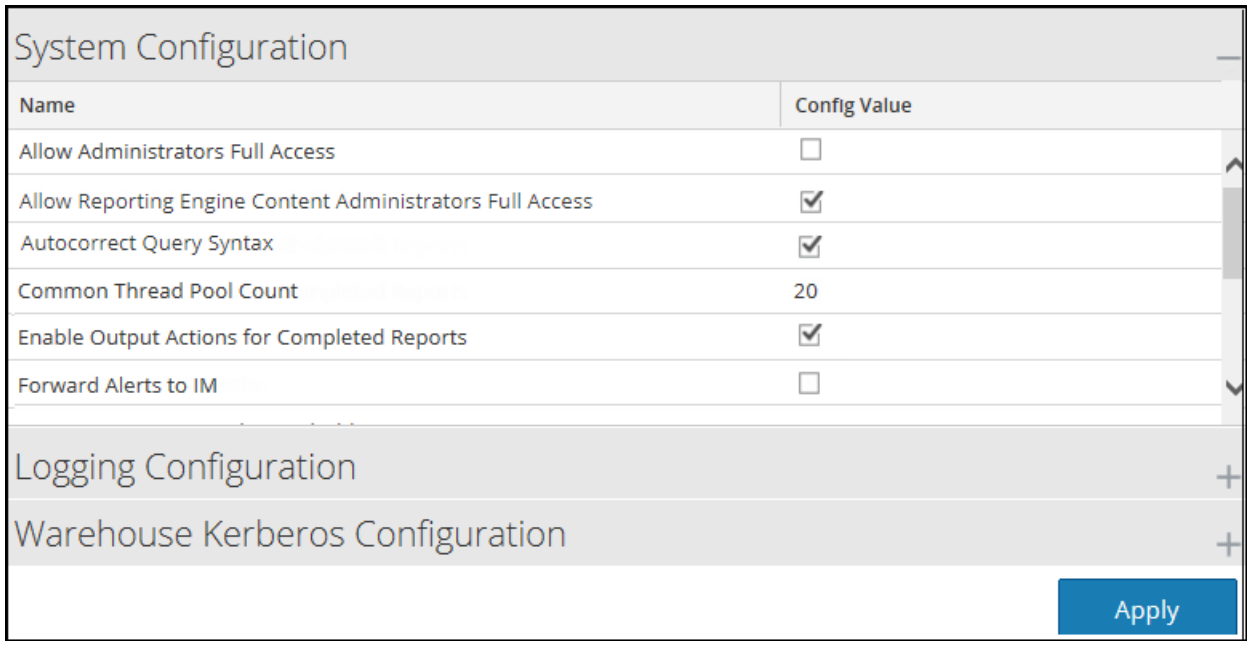


1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the system.
3 Displays the name of the parameter.
4 Displays the set values for each parameter.
5 Applies the changes.

### System Configuration

The System Configuration panel parameters for the Reporting Engine manage service configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. The default values are designed to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following figure displays the fields that can be configured in the System Configuration panel:



The following table describes the System Configuration panel features.

| Name | Config Value |
|---|---|
| Allow Administrators Full Access | Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users (non-admin). By default, this is not enabled.<br><br>**Note:** If you enable the checkbox and then disable it, the access on all Reporting Engine objects that were enabled by selecting the checkbox will not be accessible. But, if you have defined the access on specific objects via Permissions window (**Reports > Manage > RE Object >** **> Permissions**), enabling/disabling this checkbox will not have impact on these objects. |
| Allow Reporting Engine Content Administrators Full Access | Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users. By default, this is enabled. If disabled, you cannot access the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users. |
| Common thread pool count | The number of thread pools assigned for executing common tasks on the Reporting Engine. A valid value is an integer (**20** default). |
| Enable Output Actions for Completed Reports | Select the checkbox to process the output actions only for reports with all rule executions successful. By default, this is enabled. If disabled, the output actions are processed for all scenarios (completed, partial, failure). |
| Forward Alerts to Respond | Select the checkbox to forward all the alerts to Respond. By default, this is not enabled. |

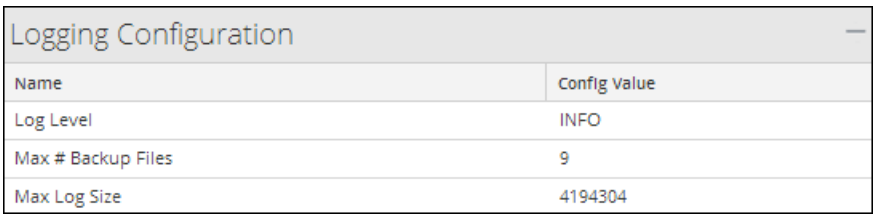
| Name | Config Value |
|---|---|
| Max# of Concurrent Alerts | The maximum number of alerts that can be run simultaneously. This has a direct impact on the RSA service against which the alerts are run, as each alert consumes a query thread on the RSA service. A valid value is an integer (**10** default). |
| Max # of Concurrent Charts | The maximum number of charts that can be run simultaneously. A valid value is an integer (**10** default). |
| Max # of Concurrent LookupAndAdd Queries | The maximum number of parallel LookupAndAdd Queries that can be run per NWDB rule. A valid value is an integer (**2** default).<br>When you increase this value, for better performance, you must ensure the NWDB data source is configured to handle the parallel queries. |
| Max # Concurrent List Value Reports | The maximum number of list value reports per schedule that can be generated in parallel. A valid value is an integer (**1** default). |
| Max # List Value Reports | The maximum number of list value reports generated, irrespective of the number of values in the list. A valid value is an integer (**10000** default). |
| Max rows stored per Rule (Billions) | The maximum number of rows that a rule can fetch when queried. A valid value is an integer (**100** default). |
| Maximum disk space threshold | The maximum disk space threshold allotted (in GB) to execute reports, alerts and charts. The initial value is configured based on the available system space. |
| Minimum disk space threshold | The minimum disk space threshold allotted (in percentage) required to execute reports, charts, and alerts. By default, this is value is set to 5.<br>**Note:** If the minimum threshold is reached, then the execution of reports, charts and alerts will stop even if the service is running. |
| NWDB Info Queries Time Out | The info queries time out in seconds for NWDB server. A valid value is an integer (**1800** default). |
| NWDB Maximum aggregate Rows | The maximum number of rows that is returned when an aggregation is used in the NWDB rule. A valid value is an integer (**1000** default). |
| NWDB Query Time out | The time out in seconds for NWDB server to time out the rule execution, if it cannot process the result in configured time. A valid value is an integer (**259200000** default). |

| Name | Config Value |
|---|---|
| Process output actions for successful reports only | Select this checkbox to process output actions only for reports whose all rule executions are successful. When you de-select this checkbox, output action will be triggered for partial, completed, and failed reports.<br>**Note:** This is applicable for all output actions except for dynamic list output actions. |
| Retain Alert history for # days | The maximum number of days to retain the alert history and alert status. A valid value is an integer (**100** default). |
| Retain Chart history for # days | The maximum number of days to retain the chart history and chart status. A valid value is an integer (**30** default). |
| Retain Report history for # days | The maximum number of days the system retains report history and report status. A valid value is an integer (**100** default). |
| Schedule Thread pool count | The number of thread pools assigned for scheduled tasks (for example, clearing history) on the Reporting Engine. A valid value is an integer (**5** default). |

## Logging Configuration

The Logging Configuration panel parameters of the Reporting Engine manages the logging configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance of the Reporting Engine.

The following figure displays the fields that can be configured in the Logging Configuration panel.



The following table describes the Logging Configuration panel features.

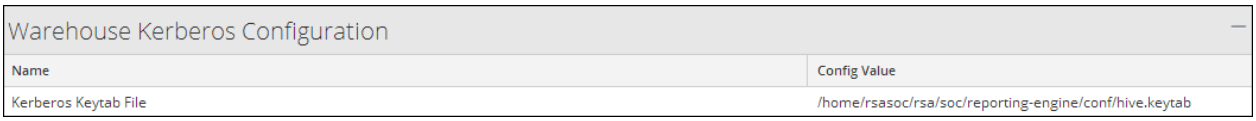
| Name | Config Value |
|---|---|
| Log Level | The logging level that determines the scope of information included in log files. Possible values are:<br>• ERROR<br>• WARN<br>• INFO (default)<br>• DEBUG<br>• ALL |
| Maximum # Backup Files | The maximum number of backup log files the system retains. A valid value is an integer (**9** default). |
| Max Log Size | The maximum size (in bytes) of the primary log file. A valid value is an integer (**4194304** default). |

For more information on Reporting Engine logging, see Accessing Reporting Engine Log Files.

## Warehouse Kerberos Configuration

The Warehouse Kerberos Configuration panel provides a way to specify the Kerberos Keytab file on this Reporting Engine.

The following figure displays the field that can be configured in the Warehouse Kerberos Configuration panel:



The following table describes the Kerberos Configuration panel features:

| Name | Config Value |
|---|---|
| Kerberos Keytab File | The Kerberos keytab file location. For example:<br>`/var/netwitness/re-server/rsa/soc/reporting-engine/conf/hive.keytab` |

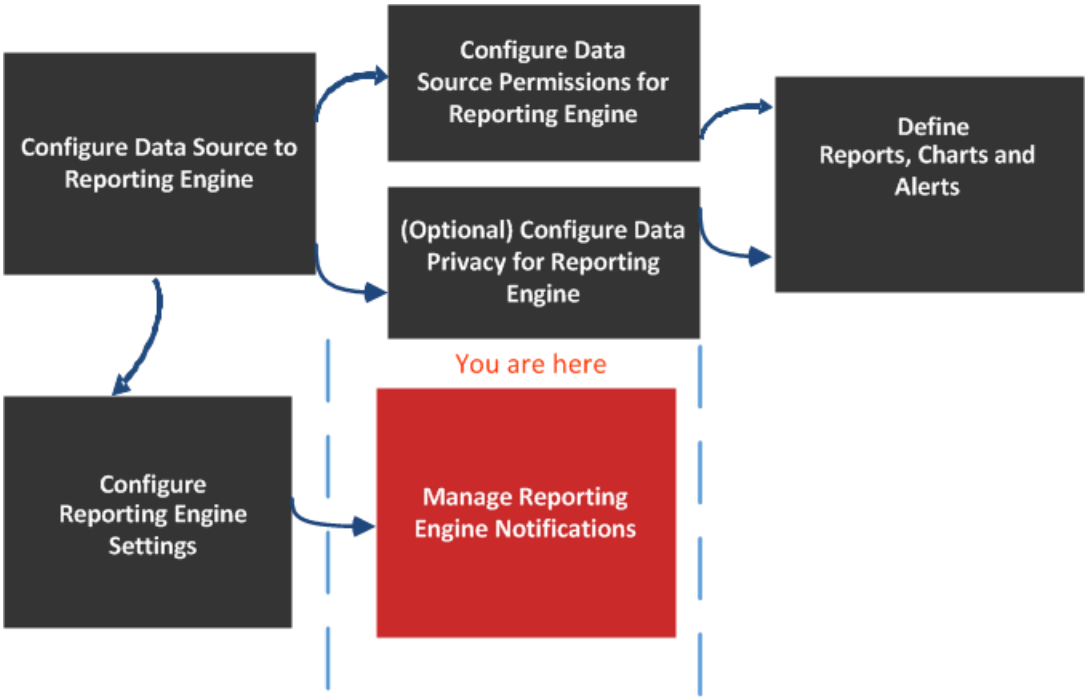
The default Kerberos configuration file is located at, `/etc/kbr5.conf` in the Reporting Engine. You can modify the configuration file to provide details for Kerberos realms and other parameters related to Kerberos.

Added the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the `/etc/hosts` file in the host on which the Warehouse Connector service is installed.

# Reporting Engine Sources Tab

The services configuration parameters are available in the Sources tab of the Services Config view for the Reporting Engine. The Sources tab for the Reporting Engine service in the Services Config view controls that data sources associated with a Reporting Engine. The Source tab consists of a single panel with a toolbar and a grid that lists the data sources associated with the Reporting Engine.

## Workflow



| Role | I want to... | Refer to... |
|---|---|---|
| Administrator | Configure Data Source to Reporting Engine | Configure the Data Sources |
| Administrator | Configure Data Source Permissions for Reporting Engine | Configure Data Source Permissions |
| Administrator | Configure Data Privacy for Reporting Engine | Configure Data Privacy for the Reporting Engine |
| Administrator | Define Reports, Charts, and Alerts | Define Reports, Charts and Alerts |

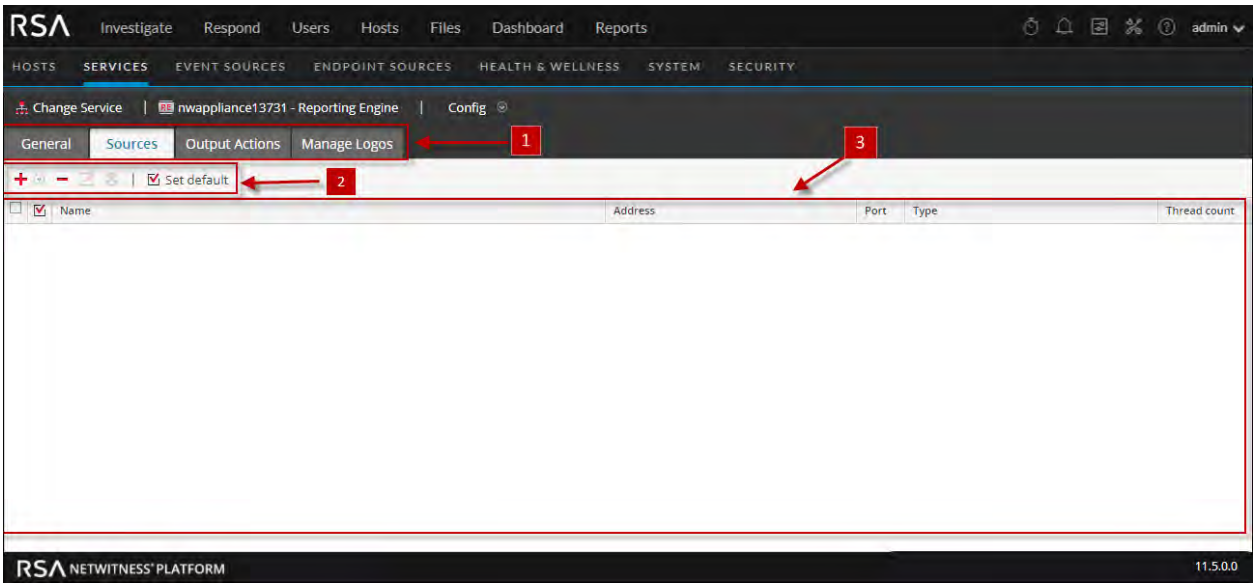
## Related Topics

- How Reporting Engine Works

## Quick Look

Here is example of the Sources tab where the available services are displayed.



1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the selected service .
3 Displays the field parameters for the selected service.

The data sources available to the Reporting Engine for which you are defining reports, charts and defining alerts are:

- **NWDB Data Sources** - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection.

  **Note:** When a data privacy plan has been implemented to limit access to sensitive data on a data source, you must configure different service accounts in Reporting Engine for privileged and non-privileged users. To configure different service accounts for data privacy, you can add more than one NWDB data source. This procedure is available under Configure Reporting Engine Settings.

**IMPORTANT:** If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

- **Warehouse Data Sources** - The Warehouse data sources are Horton Works and MapR.
- **Respond Data Sources** - Respond is used to generate reports on alerts and incidents. The Respond data sources are Reporting Engine, ESA, Malware, EndPoint, and Web Threat Detection. Respond is used to store the alerts and incidents reports.

If you set a source as the default data source, NetWitness uses that source when you create reports and alerts unless you choose to override it with one of the other sources listed in this tab.

**Note:** You can manage access control to NWDB and Warehouse Data Sources. For more information, see Configure Reporting Engine Settings.

## Features

You can perform the following actions on the Sources tab:

| Icon | Actions |
|---|---|
| | This option adds new services as data sources for Reporting Engine. Add existing services (Archiver, Workbench, and Collection) as data sources for Reporting Engine.<br>For details, see the corresponding topic:<br>• (Optional) Add Archiver as Data Source<br>• (Optional) Add Collection as Data Source to Reporting Engine<br>• (Optional) Add Workbench as Data Source |
|  | This option removes data sources from a Reporting Engine. |
| | This option configures the Data Source Permissions. This is enabled only for NWDB and Warehouse Data Sources. For more information, see Configure Data Source Permissions. |
| | This option sets the default data sources for a Reporting Engine. This is the source to which NetWitness defaults in the **Data source** field of the following views:<br>• Rule Definition view.<br>• Create or Modify Alert view. |

The NetWitness data sources are listed under the different categories as follows:

- NWDB Data Sources category displays the NetWitness data sources.
- Warehouse Data Sources category displays the Warehouse data sources.

| Column | Description |
|---|---|
| | Clicking the check box selects the data source. After you select it, you can use toolbar to remove the source or set the source as the default. |

| Column | Description |
|---|---|
| Name | Displays the name of the data source. |
| Address | Displays the IP Address of the data source. |
| Port | Displays the port of the data source. |
| Type | Displays the service type of the data source. |
| Thread Count | Displays the thread pool size used for executing rules on the data source. |

# Reporting Engine Output Actions Tab

You can configure output actions for a Reporting Engine to determine the format you want the data to be presented to you based on your requirements. The service configuration parameters are available in the Output Actions tab of the Services Config view configured for a report or an alert execution. This tab consists of the following panels:

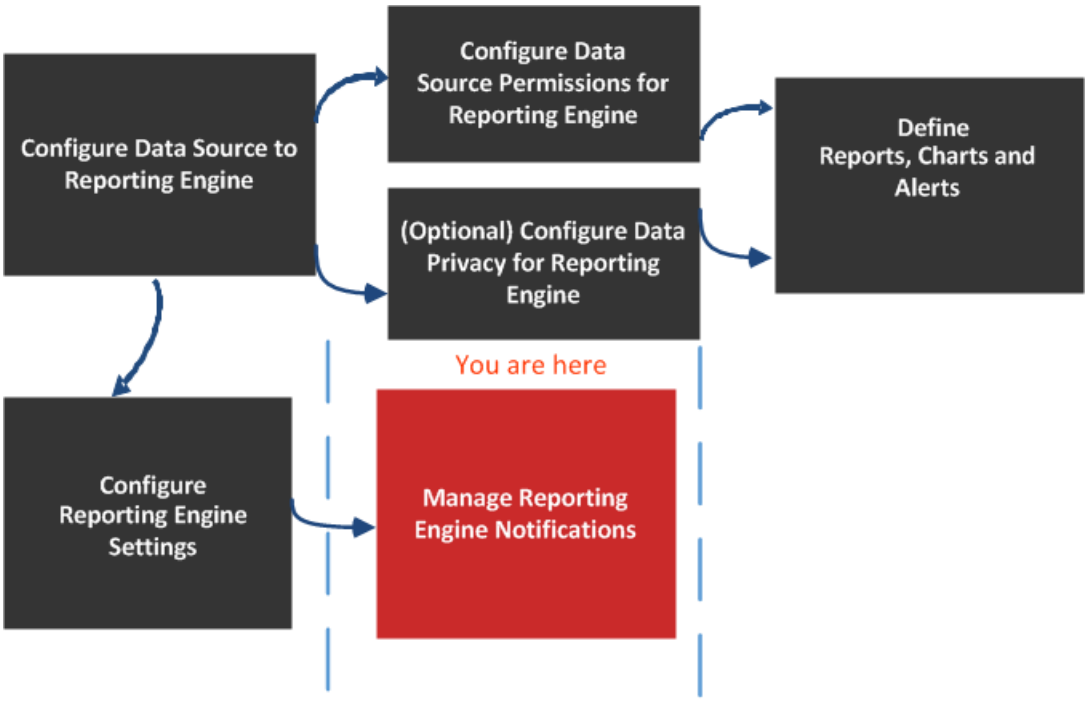
- NetWitness Configuration
- Simple Mail Transfer Protocol (SMTP)
- Simple Network Management Protocol (SNMP)
- Syslog
- Simple File Transfer Protocol (SFTP)
- Uniform Resource Locator (URL)
- Network Share

For instance, Syslog output action is used specifically for Reporting Engine Alerts, whereas, SFTP, URL, and Network Share output action is used specifically for Reporting Engine Reports.

You can configure the required permission to access this view in Manage Services.

You must ensure that the Reporting Engine is up and running and the data source from which you want to generate a report is configured in the NetWitness.

## Workflow



## What do you want to do?

| Role | I want to... | Refer to... |
|---|---|---|
| Administrator | Configure Data Source to Reporting Engine | Configure the Data Sources |
| Administrator | Configure Data Source Permissions for Reporting Engine | Configure Data Source Permissions |
| Administrator | Configure Data Privacy for Reporting Engine | Configure Data Privacy for the Reporting Engine |
| Administrator | Define Reports, Charts, and Alerts | Define Reports, Charts and Alerts |
| Administrator | Configure Reporting Engine Settings | Configure Reporting Engine Settings |
| Administrator | Configure NetWitness Configuration * | Configure Reporting Engine General Settings |
| Administrator | Configure SMTP Configuration* | Configure Reporting Engine General Settings |
| Administrator | Configure SNMP Configuration* | Configure Reporting Engine General Settings |

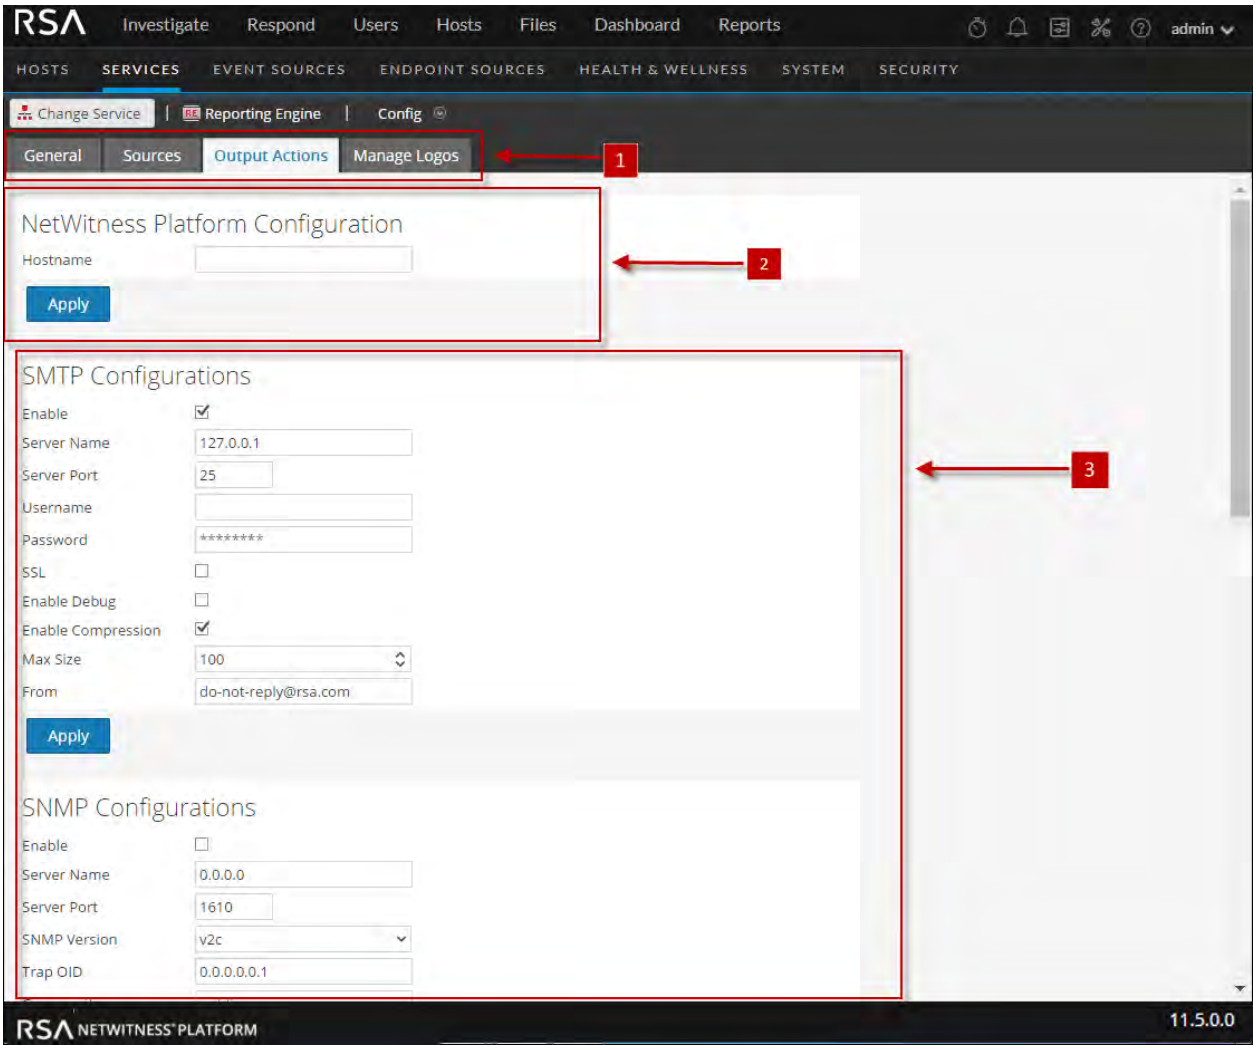
| Administrator | Configure Network Share Configuration* | Configure Reporting Engine General Settings |

*You can complete these tasks here.

## Related Topics

- How Reporting Engine Works

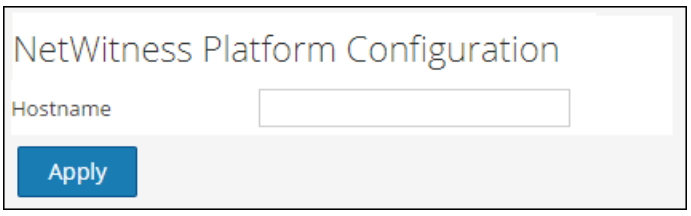
## Quick Look



| | |
|---|---|
| 1 | Displays all the available configurable tabs. |
| 2 | Displays the NetWitness configuration host. |
| 3 | Displays all the types of output action that can be configured. |

### NetWitness Configuration

The following figure shows the NetWitness Configuration on the Output Actions Tab.



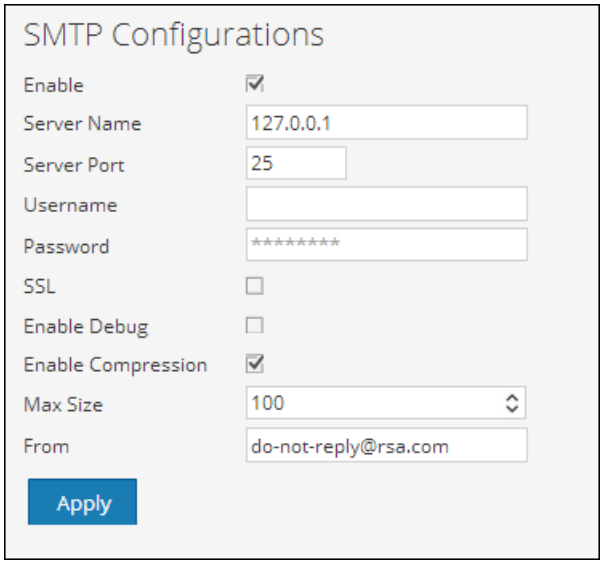
The following parameters identify the NetWitness host that is associated with the Reporting Engine.

| Name | Config Value |
|---|---|
| Host Name | IP Address or Hostname of the NetWitness server. You must specify this parameter for all kind of deployments so that you can refer to this address to create investigation links to NetWitness from Reports, Alerts, and so on. The NetWitness uses this parameter to correctly generate:<br>• SMTP Output Action<br>• SNMP Output Action<br>• Syslog Output Action<br>• SFTP Output Action<br>• URL Output Action<br>• Network Share Output Action<br>• Hyperlinks for meta values in Report PDFs |
| Apply | Update the configuration. |

## SMTP

After an execution is completed, an email notification is sent to the user based on the SMTP configuration.

The following figure shows the SMTP Configuration on the Output Actions Tab.



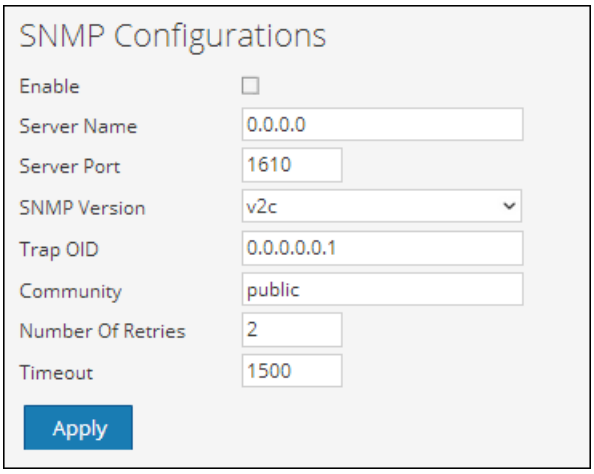
The following parameters manage SMTP (email) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| Enable | Check this box to enable SMTP as an output action for both alert and report from this Reporting Engine. By default, this value is enabled. |
| Server Name | Specify the hostname or IP Address of the server on which the target SMTP server runs. Default value is 0.0.0.0. |
| Server Port | Specify the SMTP server port number. Default value is 25. |
| Username | Specify the username of your SMTP account. Default value is blank. Password Specify |
| Password | Specify the password of your SMTP account. |
| SSL | Check this box to use Secure Socket Layer (SSL) to communicate with the SMTP server. Default value is do not use SSL. |
| Enable Debug | Check this box to enable debugging. Default value is do not enable debug. |
| Enable Compression | Check this box to enable compression. Default value is enable compression. If this value is enabled, the output files will have `.zip` extension. |
| Max Size | Specify the maximum size of attachments that can be sent. Default value is 100. |
| From | Specify the email address from which Security Analytics sends all messages. Default value is `do-not-reply@rsa.com`. |
| Apply | Update the configuration. |

## SNMP

After an execution is completed, a trap notification is sent to the user based on the SNMP configuration.

The following figure shows the SNMP Configuration on the Output Actions Tab.



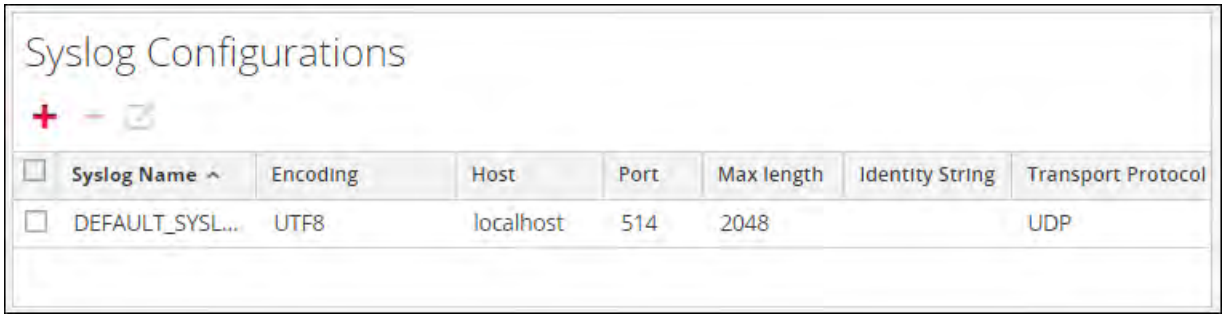
The following parameters manage SNMP (messages to network-attached services) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| Enable | Check this box to enable SNMP output action as an output for alert messages from this Reporting Engine. Default value is Disable. |
| Server Name | Specify the hostname or IP Address of the server on which the target SNMP server runs. Default value is **0.0.0.0**. |
| Server Port | Specify the port number of the server on which the target SNMP server listens for faults and exceptions. Default value is **1610**. |
| SNMP Version | Specify the version number of the SNMP protocol NetWitness uses to send SNMP traps. |
| Trap OID | Specify the object identification number that identifies the type of trap to send. Default value is **0.0.0.0.0.1**. |
| Community | Specify the SNMP group to which NetWitness belongs. The default value is **public**. |
| Number Of Retries | Specify the maximum number of times NetWitness tries to resend the alert message through SNMP. Default value is **2**. |
| Timeout | Specify the number of seconds after which NetWitness times out (stops trying to send SNMP alerts). Default value is **1500**. |
| Apply | Update the configuration. |

## Syslog

After an execution is completed, all notifications are sent via Syslog messages to a particular host based on the Syslog configuration. Multiple Syslog servers can be configured on the Syslog Configuration panel.

The following figure displays the Syslog Configuration on the Output Actions Tab.



The following parameters manage syslog output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| Syslog Name | The name of the Syslog configuration.<br>**Note:** You cannot create a Syslog configuration with a name that already exists in the Reporting Engine Syslog configuration list. |
| Encoding | Specify the internationalization encoding for Syslog messages. Default value is **UTF8**. |
| Server Name | Specify the hostname or IP Address of the server on which the target Syslog process runs. Default value is blank. |
| Server Port | Specify the port number of the server on which the target Syslog server listens for faults and exceptions. Default value is **514**. |
| Max Length | Specify the maximum size (in bytes) of each Syslog alert message. Default value is **2048**. If **UDP** is the transport type and the Syslog message size is greater than 1024 bytes, you must configure a Syslog server that supports message sizes greater than 1024 bytes. |
| Identity String | Specify the string NetWitness inserts as a prefix in all Syslog alert messages. Default value is blank. |
| Include Local Hostname | Check this box to include the local hostname in all Syslog alert messages. Default value is do not include local hostname. |
| Truncate Message | Check this box to truncate all Syslog alert messages. Default value is do not truncate Syslog messages. |
| Use Identity | Check this box to use the IDENT protocol. Default value is does not use this protocol. |
| Include Local Timestamp | Check this box to include the local timestamp in all Syslog alert messages. Default value is do not include local timestamp. |
| Transport Protocol | Specify the transport type for Syslog message delivery. There are three parts to the Syslog transport type: UDP, TCP, and SECURE_TCP. Default value is **UDP**. |
| Syslog Message Delimiter | Specify the delimiter for the Syslog message. There are three delimiters: CR, LF, and CRLF. By default the value is **CR**.<br>**Note:** This field populates when you select TCP or SECURE_TCP as the transport protocol. |
| Trust Store Password | Specify the password for the Trust store.<br>**Note:** This field populates when you select SECURE_TCP as the transport protocol. |
| Key Store Password | Specify the password for the Key store.<br>**Note:** This field populates when you select SECURE_TCP as the transport protocol. |

| Name | Config Value |
|---|---|
| Apply | Save the configuration. |

## SFTP

After an execution is completed, you can send or transfer files to a remote location based on the SFTP configuration.

The following figure displays the SFTP Configuration on the Output Actions Tab.

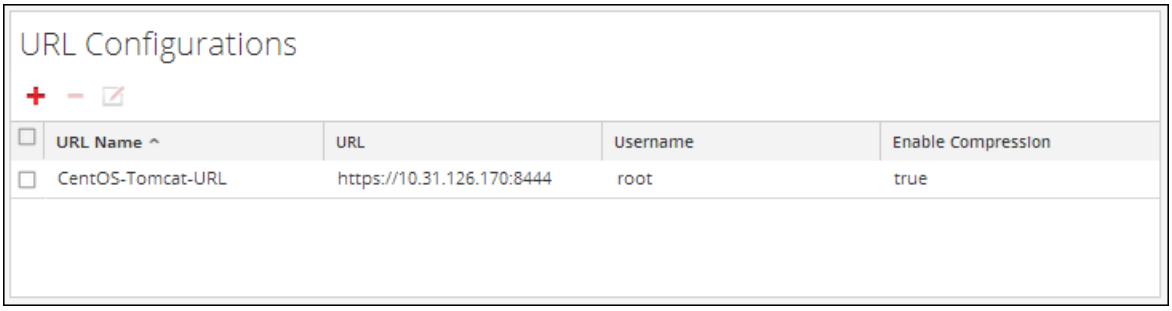
The following parameters manage SFTP (file transfer to a local drive) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| SFTP Name | The name of the SFTP configuration.<br>**Note:** You cannot create an SFTP configuration with a name that already exists in the Reporting Engine SFTP configuration list. |
| Host | The IP Address or Hostname of the Reporting Engine server associated with the file transfer. |
| Port | If you want to use a different port than the default port, enter a port number. Default value is **22**. |
| Username | Specify the username for the SFTP configuration. |
| Password | Specify the password for the SFTP configuration. |
| Custom Folder | Select an SFTP location where you want to transfer the file to. You can use the pre-defined Windows or Linux directory structure in the custom folder path. For example, **/root/Downloaded_Files**.<br>**Note:** If the directory does not exist, RE will create the directory in the custom folder path and copy files to this directory. |
| Enable Compression | Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension. |

## URL

After an execution is completed, the output files are published to a URL based on the URL configuration.

The following figure shows the URL Configuration on the Output Actions Tab.



The following parameters manage URL (file transfer to a URL) output action configuration for a Reporting Engine service. When you add an Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the Config Values of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| URL Name | The name of the URL configuration.<br>**Note:** You cannot create a URL configuration with a name that already exists in the Reporting Engine URL configuration list. |
| URL | The URL address associated with the file transfer. |
| Username | Specify the username for the URL configuration. |
| Password | Specify the password for the URL configuration. |
| Enable Compression | Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension. |

After the URL is configured, the files will be copied under the "URL_OUTPUT_ACTION" directory and the following parameters are sent to the server along with the compressed file.

| Name | Config Value |
|---|---|
| filename | The name of the file. |
| filesize | The file size in bytes. |
| filetype | The file type associated with the file. |
| filechecksum | The number computed from a file that can be used to confirm that this is the one you expect and has been downloaded and stored properly. |
| hashingalgorithm | The hashing algorithm used to calculate the file checksum. |

| Name | Config Value |
|---|---|
| reportname | The name of the downloaded report. |
| executionid | The execution id associated with the report execution. |
| reportexecutionstarttime | The start time the report was executed. |
| status | The report creation status. |
| status description | The status description. |

## Network Share

After an execution is completed, you can transfer the output files to a mounted path or shared location based on the Network Share configuration.

The following figure shows the Network Share Configuration on the Output Actions Tab.

The following parameters manage Network Share (file transfer to a shared location on the network) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

| Name | Config Value |
|---|---|
| Network Share Name | The name of the Network Share.<br>**Note:** You cannot create a Network Share configuration with a name that already exists in the Reporting Engine Network Share configuration list. |
| Mounted Path | The path (location) associated with the file transfer. You can use the pre-defined Linux directory structure in the mounted path. For example, **/mnt/win**.<br>**Note:** The 'rsasoc' user must have read-write access to the specified Network Share mounted path. |
|  | Click to view how the mounted path is created. This pop-up notifies that you must manually create the mounted path. |

| Name | Config Value |
|---|---|
| Destination Directory | Name of the directory where the transferred file is stored in the shared location. |
| Enable Compression | Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension. |

The following table lists the common operations you can perform in the Syslog, SFTP, URL and Network Share sections.

| Operation | Description |
|---|---|
| | Create a Syslog, SFTP, URL and Network Share configuration. |
|  | Delete a Syslog, SFTP, URL and Network Share configuration. |
| | Edit a Syslog, SFTP, URL and Network Share configuration. |

# Reporting Engine Manage Logos Tab

The Manage Logos option available in the **Services Config View** > **Manage Logos** tab, helps you to manage the logos associated with the Reporting Engine. The Manage Logos tab consists of a single panel with a toolbar and a grid that lists the logos.

You can upload the logos that you want to use in your report. After you upload the logo, you can set any logo as a default logo which will be automatically used in all the scheduled reports. You can choose to override the default logo with any other logo listed in this tab when you schedule a report. For more information, see "Select a Logo Dialog" topic in the *Reporting Guide*.

The supported image formats are:

- .jpg
- .png
- .gif

# Reporting Overview

Reporting is a collection of data as a result of monitoring the network traffic, which can be used for further analysis. In NetWitness you can run a report against NetWitness Database core services to identify the network activities. For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities etc.

The reporting typically consist of: Reports and Charts. You can report on the log, packet and endpoint data collected, and customize the reports and charts to enhance the visual appearance. You can create real-time reports for historical data. You can create charts and dashlets, that can be added in the real-time chart dashlets as well.

## Reporting Engine

Reporting relies on the Reporting Engine to provide data for the reports, alerts and charts. Hence, you must configure the Reporting Engine as a service to NetWitness before you can generate the reports. You must also specify the data source in the Reporting Engine from which the data is extracted.

The data that you can report or alert depends on the configuration of Reporting Engine and the data sources that you specify as part of the rule definition.

**Note:** Make sure you have access to the components in the Reporting.

**Note:** Reporting is accessible based on the role based access, defined for the user.

## Report

A report is a combination of rules and other formatting objects such as headers and HTML-formatted notes that describe and identify data pertaining to a particular area of interest. Reports are defined and managed in the Build Report page and can be scheduled to run on an adhoc or timely basis. Once a report is run, results are stored centrally and can be automatically sent over email, SFTP, URL, and NFS to users, viewed via the NetWitness web interface, downloaded as PDF and CSV files.

A report consists of the following:

| Property | Description | Example |
|---|---|---|
| Report Name<br>**Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column. | Used to identify the report to schedule them at a later time. | Report1 |
| Text | Pre-defined text fields used within a report to make the report more meaningful to the user. | Header1, Comment |

| Property | Description | Example |
|---|---|---|
| Rules | The rules (queries) used to create a report. | select user.dst<br>where ip.src = 10.10.10.1 |

**Note:** In the Reporting user interface, the displayed date or time is always according to the user-selected time zone profile.

## Rule

A rule is the basic and essential building block in the Reporting. You must create a rule which can be used in a Report, Chart or Alert.

A rule represents a unique query that detects and summarizes the requested information within a collection of network data.

The rule syntax is very similar to that of Standard Query Language (SQL) where you can use the select clause, where clause, sort and group options and limits for the result set. A rule consists of the following:

| Property | Description | Example |
|---|---|---|
| Name | The name of the rule. | Windows System Account Activity |
| Select | List of meta types that are returned in the result set. The list of meta types is provided in the Meta Library. Meta Library in the Rule Builder is continually synchronized with the index configuration of the NetWitness host to which NetWitness is connected. The number of meta types that this property can represent depends on how the rule is to be sorted. If the Sort by property is 'None' or Custom, a rule can have more than one select field, for example, for each match, include the ip.src, ip.dst, size, time in the rule result. If a rule is set to be sorted, either by session count, session size, or packet size, then there can only be one field on which to select. | |
| Where | A clause that is the base query for the rule. | alert='cleartext_ftp_password' |
| Then (Rule Actions) | A series of functions that manipulate the original result set of a rule in order to make the output in a report more meaningful or add additional functionality other than querying and displaying data. | lookup_and_add ('username','ip.src',10); |

| Property | Description | Example |
|---|---|---|
| Sort By | Determines how the data in the result set is sorted. The various possibilities are:<br>• Total<br>• Value<br>• Column Name | Total |
| Limit | Designates how large a result set can be for the given rule. Users must note that if a result set is sorted by count or size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned. | 20 |

**Note:** In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

## Rule Types

There are different rule types in the Reporting. Rule types designate the source of data for the report rule. Following are the rule types:

| Rule Type | Description |
|---|---|
| NetWitness Database ( **NetWitness DB** ) | The NetWitness database extracts the meta from a Reporting Engine configured to use a Concentrator, Broker and Archiver as the data sources and provides the meta for rules. |
| Warehouse Database (**Warehouse DB**) | The Warehouse database, also referred to as the RSA NetWitness Warehouse, warehouses large volumes of data. The Warehouse is designed so that you can retrieve large volumes of data easily and efficiently. The Warehouse also extracts the meta from the Reporting Engine. |
| Respond Database (**Respond DB**) | The Respond database contain alerts and incidents generated from different services and you can create a report on those alerts and incidents. |
| Unused Rules | The Unused Rules is an option that helps in listing out the rules that are not used by any chart, alert and, report. For more information, see Filter Unused Rules. |

**Note:** In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

## List

A list is a variable that refers to a series of comma-separated values (CSV). You can insert a list into a rule or use it as an argument to a rule action. Lists can act as placeholders for other values, which you can populate and update as needed.

You can create, manage and view lists that can be used to define rules for Reporting and Alerting. You can also filter and delete the unused lists.

Lists cannot be empty or have duplicate or blank values.

**Note:** If you are defining a report with a rule which has lookup_and_add in the **Then** clause and direct the report output to a list, the list is not populated with the result.
For example, if you create a rule with ip.src in the **Select** clause and lookup_and_add ('ip.dst','ip.src', 10) in the **Then** clause, the report displays the result, but if you have redirected the output to a list, the list will be empty

### Chart

Chart is a tabular or grid representation of data. It consists of the following:

| Property | Description | Example |
|---|---|---|
| Chart Name | Identifies the chart. | Chart1 |
| Rule Basis | Identifies the rule path chosen from the folder hierarchy. | |

Any NetWitness DB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. In NetWitness, the chart interval can be adjusted from the chart definition panel itself. Each time a chart runs, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations. You can also filter the unused charts from Chart View.

**Note:** In the Reporting user interface, the output for the field where Date and Time are displayed is always according to the user-selected time zone profile.

**Note:** The Reporting Engine (RE) will automatically check for the available disk space before you execute a Test Rule, Report, Chart and Alert. If the RE disk space (in percentage) is less than the minimum disk space threshold (default value is 5), the RE will stop the current execution and an error message 'Available disk space of Reporting engine home is <5%, please clean up the space to proceed further' is displayed. Additionally, you may also configure the minimum disk space threshold by using the following path: **RE>Config>General>System Configuration>Mini disk space threshold in %.**

## Reporting Guidelines

This section lists the RSA recommended guidelines to enhance the execution time of your reporting entities such as rules, reports, alerts, charts, and lists. The guidelines are provided for the following:

- NWDB Rules
- Timeout Configuration for NWDB Rules
- Lookup and Add rule action
- List value Reports

### NWDB Rules

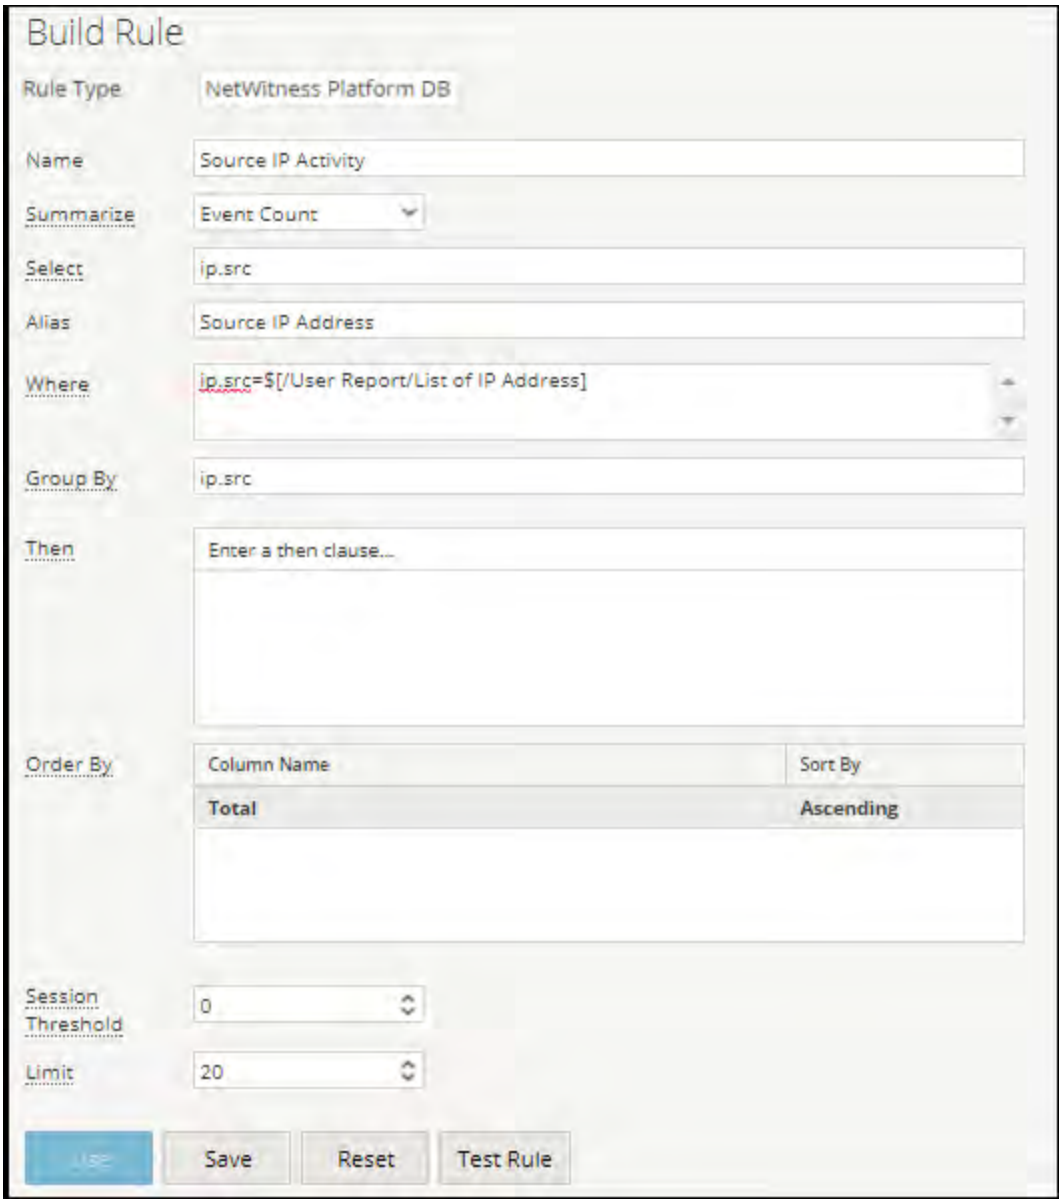
If the reporting entities such as report, alert, or chart contain NWDB rules (in most cases where the query contains Group By) takes a long time to execute, you may do the following:

1. Refine the Where clause:

   You may limit the number of sessions scanned by using or refining the Where clause (especially when you use the Group By option). For example, consider the following rule.

   If you use a Where clause as mentioned above, the number of sessions aggregated is huge. To avoid this, you can filter only required sessions by specifying the list of IP addresses or creating a List (list of IP Address) that contains relevant IP addresses.

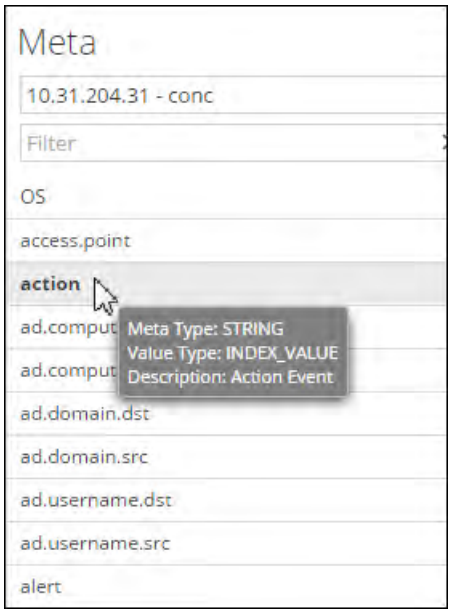
   **Note:** The NWDB rule where clause is appropriately quoted if the syntax has an invalid quote. For example, in case of an invalid meta, or missing separator, the status and the error message is updated appropriately.



2. Using indexed Meta keys in the Where clause:

   To understand if the Meta is indexed or not, mouse hover the Meta List present on the right panel. If the Value Type is INDEX_VALUE, then the Meta is indexed. The Value Type is INDEX_KEY or INDEX_NONE if the Meta is not indexed.

   Below is a snapshot of a Meta key that is indexed.



3. Configure the Timeout option:

   If the query is taking a long time and fails due to timeout issues, you can configure the timeout for the NWDB rule executions. For more information, see below section "Timeout Configuration for NWDB Rules".

4. Schedule the queries to run at different times:

   If multiple query aggregates are concurrently executed and timeout occurs, you may schedule the queries to run at different times without much overlap.

## Timeout Configuration for NWDB Rules

**Note:** It is a good practice to check the statistics of the Reporting Engine and the NWDB data sources before you make any changes to the configuration. For more information, see the "Monitor Service Details" topic for Reporting Engine and "Monitor System Statistics" topic in the *System Maintenance Guide*.

If NWDB rule execution fails due to timeout, you may get the following errors on the View a Report panel:

- Reporting Engine timeout error

  “Data source ‘`10.31.x.x Concentrator`' did not respond within the configured time `30` minutes for the ‘`/sdk/values`' request.”

- NWDB timeout error

  "Error occurred while fetching data from source '`10.31.x.x Concentrator`'. `{Timeout message from NWDB}`”

In such cases, you need do the following:

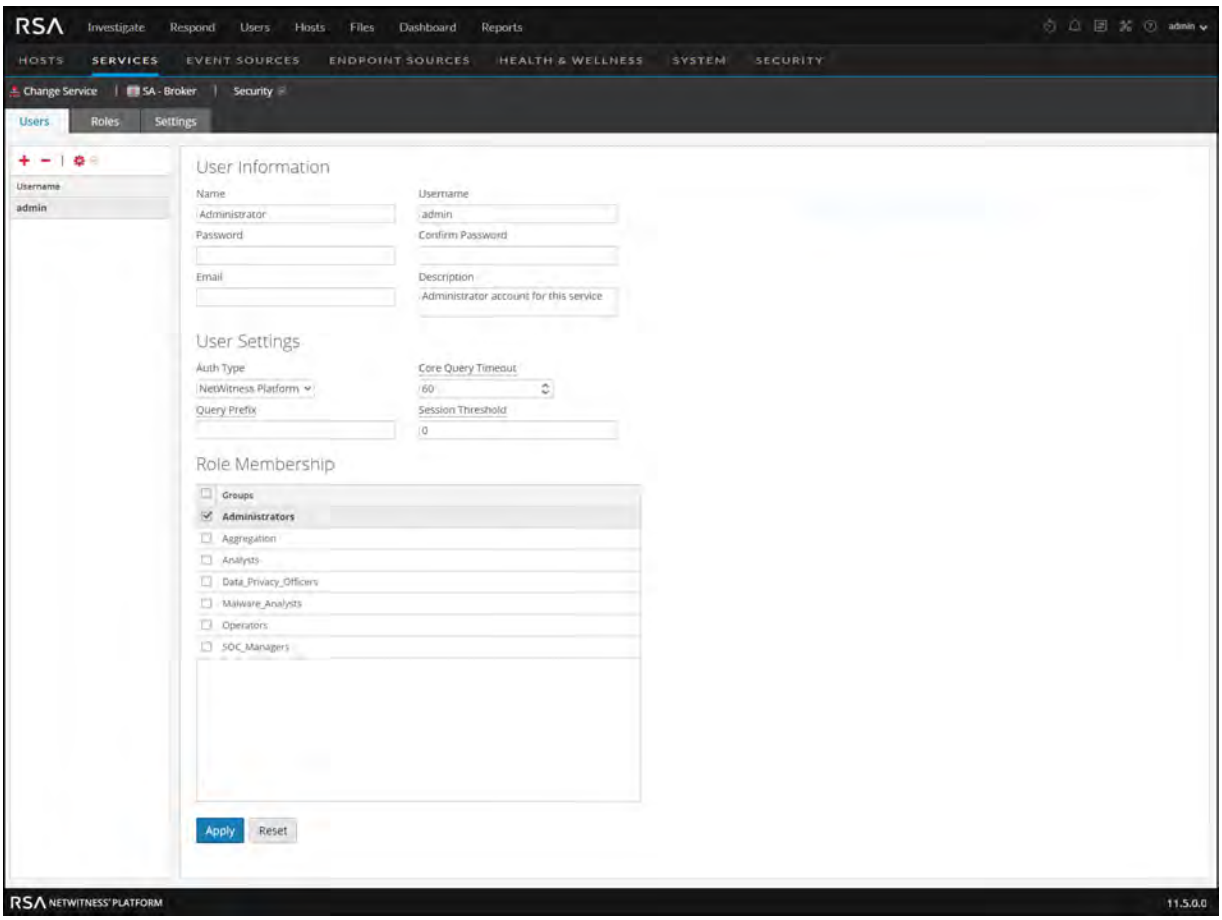
- Reporting Engine timeout

  In case of Reporting Engine timeout, you may set the timeout to a longer duration so the long running queries can be executed. For more information on setting the `NWDB Queries Time Out` and `NWDB Info Queries Time Out` option for the Reporting Engine, see "Step 2. Configure Reporting Engine Settings" topic in the *Reporting Engine Configuration Guide*. RSA recommends you set the `NWDB Query Time Out` to zero minutes (implies no timeout) and `NWDB Info Queries Time Out` to 60 minutes.

- NWDB timeout

  In case of NWDB timeout, you may need to configure the `query.level.timeout` and `max.concurrent.queries` parameters for the NWDB data source based on the recommendations in the *Core Database Tuning Guide* to fine tune the queries.

  The following figure is an example of Explorer view where you can set the parameters for NWDB data source.



- Schedule Reports at different times

  If the NWDB core devices are heavily utilized, you may schedule the reports to run at different times without overlap.

- Split the Report

If you have many rules in a Report, split the report into multiple reports with each report containing logical set of rules. If you have multiple rules, all rules will begin to execute at the same time based on available threads, therefore you may group the rules logically into separate reports.

## Lookup_and_Add Rule Action

If a rule that consists of single or multiple `lookup_and_add` rule actions, takes a long time to execute the report, it is because each of the rule action triggers multiple lookup queries on the NWDB data source resulting in longer execution time.

To improve the report execution time, you may do the following:

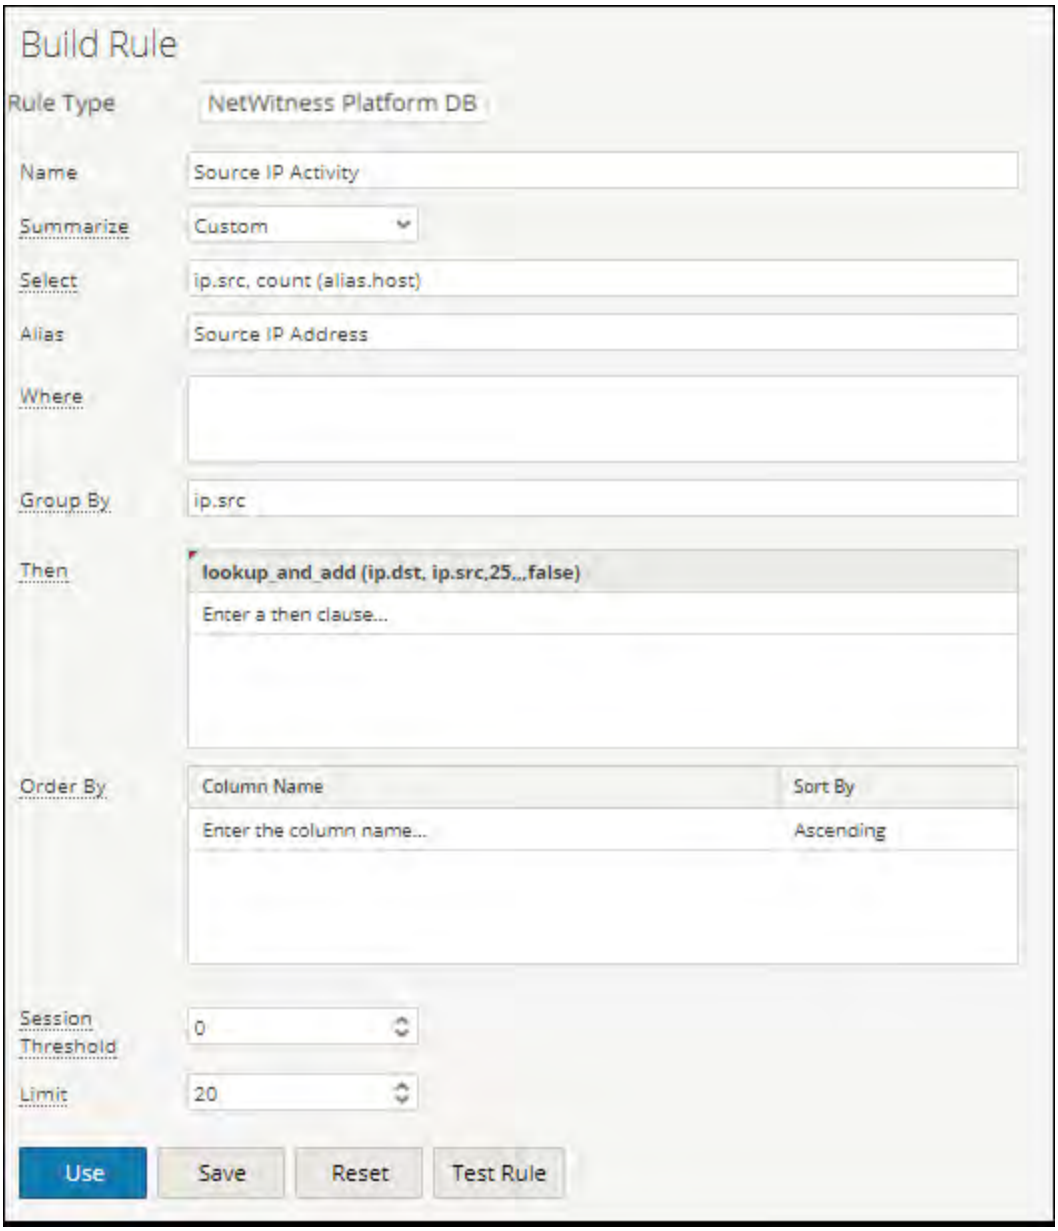
- Refine the Where clause in the following:
  - Rule that contains the `lookup_and_add` rule action
  - `lookup_and_add` rule action
- Set Limits

  You must set appropriate limits for the rule and rule actions. If the limit is high it will result in many queries being triggered and hence the report will take a long time to execute.
- Set the boolean aggregate parameter

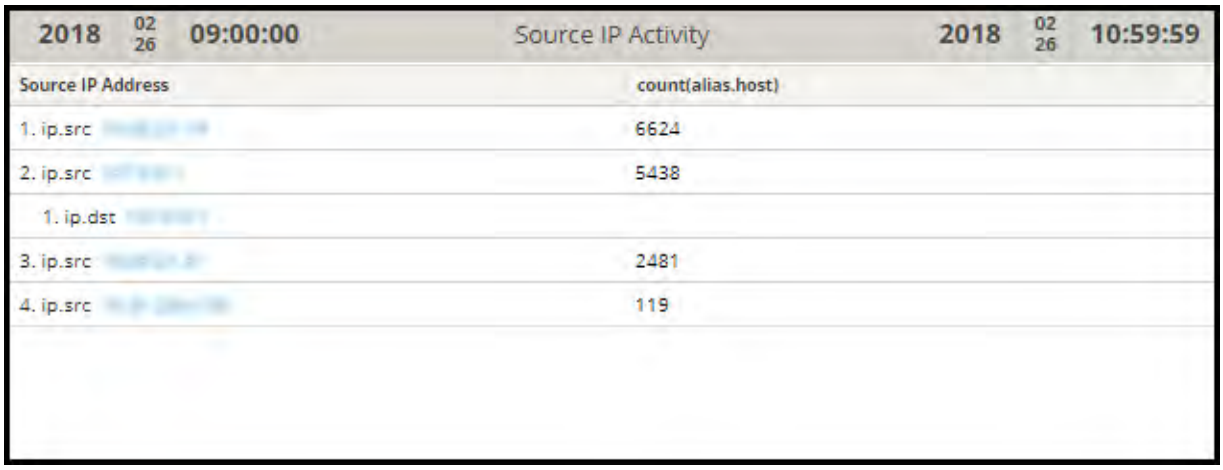
  If you do not want the aggregate value such as `sum(meta), count(meta)` etc. for the lookup values, set the boolean aggregate parameter to false in the `lookup_and_add` rule action. For more information, see the "NWDB Rule Syntax" section in Rule Syntax.

  ```
  lookup_and_add(string select, string field, int limit, boolean inherit,
  string extraWhere, boolean aggregate)
  ```

  Consider the rule with lookup_and_add rule action:



The output is displayed:

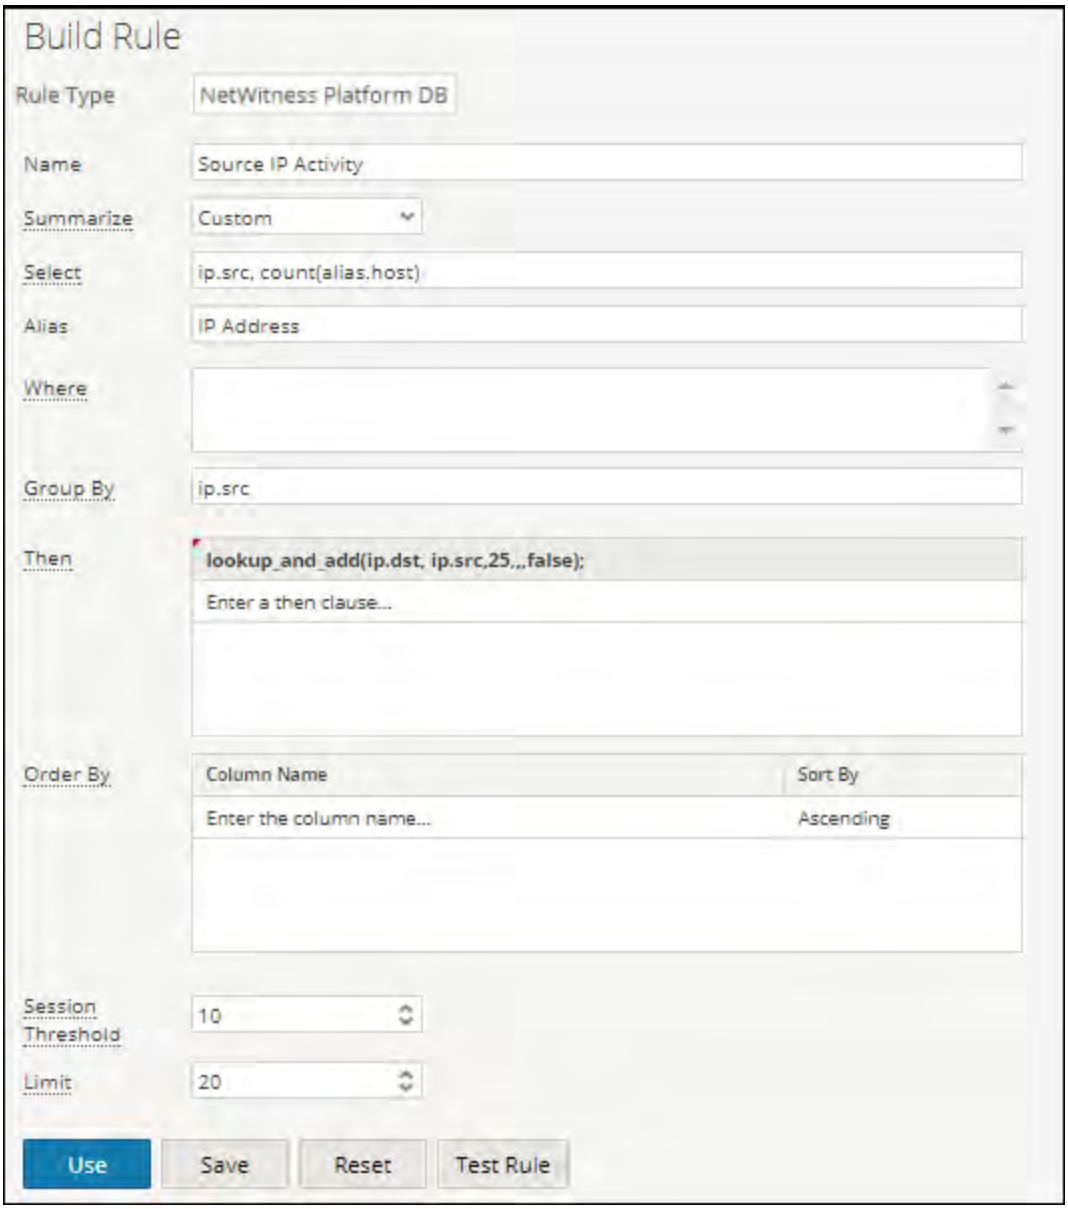


- Each `lookup_and_add` rule action triggers by default two concurrent lookup queries on the data source. RSA recommends that you retain the default setting, however if you want to increase the value you may want to ensure the value of `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine is less than the `Max Concurrent Queries` value in the NWDB data source configuration.

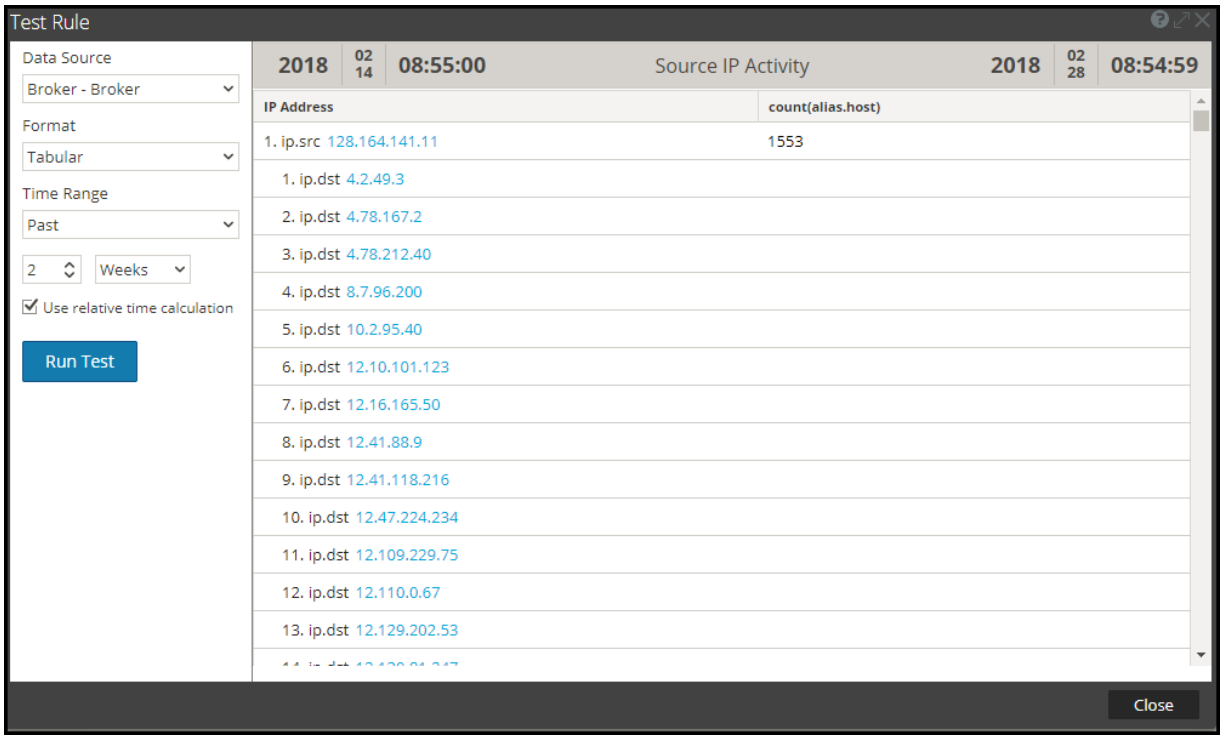
  If the NWDB data source is shared across other services, then you may retain a low value for the `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine as increasing it will impact the queries from other services. For more information, see "Reporting Engine General Tab" topic in *Reporting Engine Configuration Guide*.

- If you are interested only in unique values and not accurate aggregates, then set the `Session Threshold` to a non-zero value for the NWDB rule. For more information, see "Create a Rule Using NetWitness Data Source" section in Configure a Rule. The higher the value, the longer is the rule execution. If the value is set to zero it will take a longer time but will provide accurate aggregates.

  Consider a rule with lookup_and_add rule action and Session Threshold set to 10.



The output is displayed:



### List Value Reports

Use a Refined List:

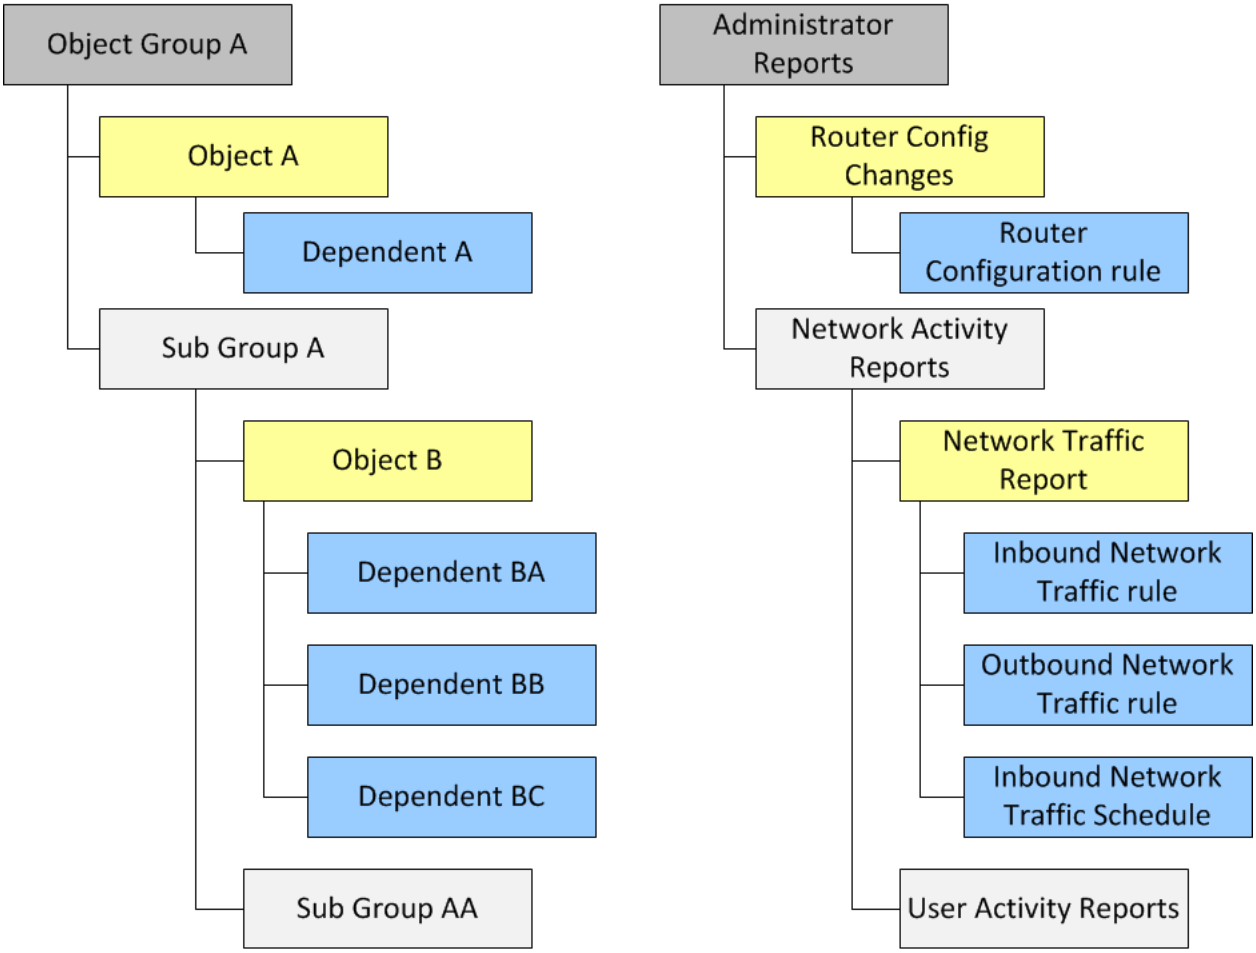
In case of List value reports (for any data source type), individual reports will be generated for each value in the list. Therefore, more the number of values in the list the longer the reports will take to execute. Hence, you must use a refined list to generate such reports.

## Access Control for Reporting

Reporting Module provides you the option to set up access control for all the components in the module. In NetWitness, you can define different roles and specify the access control for each of the role from the System Security module. You can define the access control to be provided for the Reporting module for each role. For more information, see "Step 1: Review the Pre-Configured NetWitness Platform Roles" and "Step 2: (Optional) Add a Role and Assign Permission" topics in the *System Security and User Management Guide*.

In the Reports module, you can modify the role permissions or access to the following Reporting objects:

The Following is an example of the hierarchy of the object groups, objects and dependents. This is an illustration of the Report Groups and Reports hierarchy.



**Report Groups and Reports Hierarchy**

## Permission for Object Groups

- You must have the Read & Write permission to set the permissions for the Object Group, Objects, or Dependents. The dependents with “No Access” permission are grayed out and dependents with “Read-Only” permission are indicated with an icon.
- When you set the permission for the Object Group, the Objects and Dependents in the Object Group do not inherit the permission automatically. You must select the "Apply these permissions to sub-groups and <Objects> in this group" option to achieve this. For example, if you do not want Operators roles to access reports in Report Group A, then you must set the permission on Group A to No access for the Operator role and select the "Apply these permissions to sub-groups and Reports in this group" option.
- When you set the permissions for the Object Group and select the "Apply these permissions to sub-groups and <Objects> in this group" option, the dependents such as rules or schedules in the objects do not inherit the permissions automatically. You must use the "Apply Read-only permission to Rules in the <Object>" option to apply the permission to the rules.

- When you set the permissions for the Objects, you must ensure that the Objects in hierarchy should always have a permission that is less than or equal to the one above in the hierarchy for the permission to be applied. For example, if the reports in a Report Group have Read & Write permission and you apply a Read-Only or No Access permission at the Report Group level and select the "Apply these permissions to sub-groups and Reports in this group" option, then the permission on the rules will remain unchanged.
- The permissions are cascaded from top to down in the hierarchy and not vice-versa. For example, if you apply a permission to a rule, it does not change the permission of the Report that contains the rule.

## Permission for Objects or Dependents

- You must have the Read & Write permission to set the permissions for the Objects or Dependents.
- You can specify the permission for multiple objects at once instead of setting the permission for each object.
- When you set the permission for the Object, the dependents in the Object do not inherit the permission automatically. You must select the "Apply Read-only permission to Rules in the <Object>" option to achieve this.

When you apply the permission to dependents the permission is applied based on the existing permission for the role. For example, consider an Analyst and a Operator with the following permissions for the different dependents (Report A object has Rule AA, Rule AB, and Rule AC as dependents).

| Object or Dependent | Analyst | Operator |
|---|---|---|
| Report A | Read & Write | No Access |
| Rule AA | Read & Write | No Access |
| Rule AB | Read and Write | Read and Write |
| Rule AC | Read-only | No Access |

When the Analyst applies a Read & Write permission for the Operator role and selects the option "Apply Read-only permission to Rules in the <Object>", the permissions is set for the different dependents as follows:

## Modify the Permissions

- **Group Level:** Set the permissions at the Object Group level and for all the object and entities in the Group. For example, if you have 80 reports in the Administrators Reports group and you do not want anyone except the Administrator to add or modify these reports, you can set the permission for all the other roles at the group level to Read-Only and select the option to apply it to all the reports and sub-groups in the report group.
- **Multiple Objects:**Select multiple objects and specify the access for all the selected objects. For example, if you have 10 reports in the Network Traffic sub group with sensitive information that you do not want anyone to access, select the 10 reports and then set the permission for all the roles as "No Access".

- **Single Object:** Select only the object and specify the permission. For example, select the Network Traffic Report and specify the Read-Write permission for the Security Analyst role or select the Login Failure Alert and specify the Read-Write permission for a Security Analyst role.

| Object or Dependent | Operator (Before Permission is applied) | Operator (After Permission is applied) |
|---|---|---|
| Report A | No Access | Read & Write |
| Rule AA | No Access | Read-only |
| Rule AB | Read and Write | Read & Write |
| Rule AC | No Access | Read-only |

## Roles and Permissions for Reporting Module

Although NetWitness has five pre-configured roles, you can add custom roles. For example, in addition to the pre-configured Analysts role, you can add custom roles for AnalystsEurope and AnalystsAsia.

| Role | Permission |
|---|---|
| Administrators | Full system access |
| Operators | Access to configurations but not to data |
| Analysts | Access to data but not to configurations |
| SOC_Managers | Same access as Analysts and an additional permission to handle incidents |
| Malware_Analysts | Access to malware events only |

Depending on the user role, you can set the following access permissions to access the Reporting module components (Rules, Reports, Charts, Alerts, Lists):

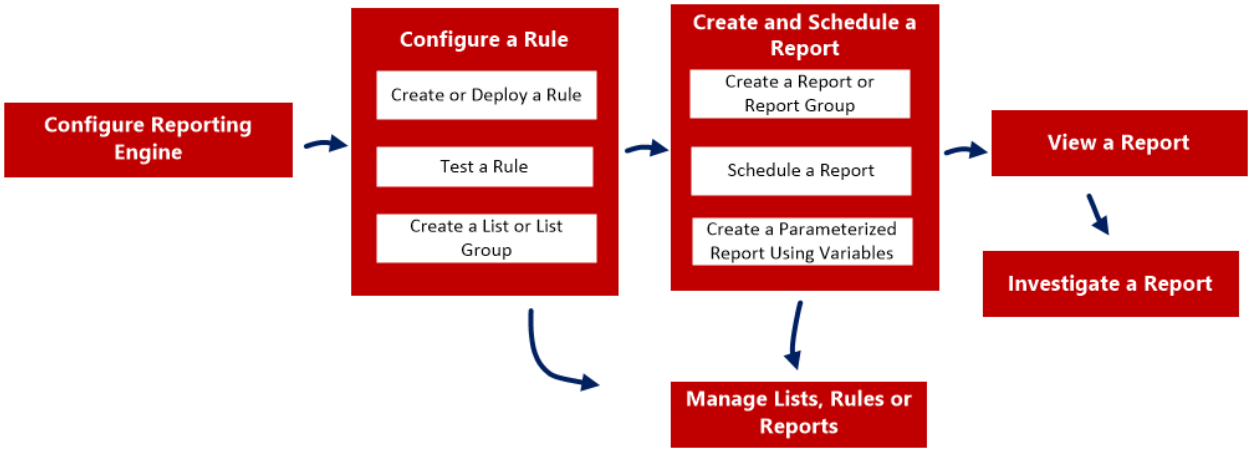
- Create
- Delete
- Export
- Manage
- View

**Note:** You must enable all these permissions for a user role to be able to define, delete, manage and view each of the Reporting modules. You must also have appropriate permissions for the data source to be listed, while defining the reports, charts, or alerts. For more information, see "Configure Data sources Permissions" topic in the *Reporting Engine Configuration Guide*.

For a detailed list of permissions and how to add a role and assign permissions, see "Role Permissions" and "Step 2. (Optional) Add a Role and Assign Permissions" topics in the *System Security and User Management Guide*.

# Configure and Generate a Report

This figure is an overview of the entire process of configuring and generating a report.



To configure and generate a report, perform the following tasks:

1. Configure Reporting Engine - You must configure the Reporting Engine before you can configure and generate a report. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure Reporting Engine, see "Configure Reporting Engine" topic in the *Reporting Configuration Guide*.
2. Configure a Rule
3. Create and Schedule a Report
4. View a Report
5. Investigate a Report
6. Manage Lists, Rules or Reports

# Configure a Rule

You can create a new rule or deploy an existing rule from the Live Services which can be used in a report. You can use different conditions to refine the data or information in the data sources such as:

- Select clause
- Where clause
- Group By
- Order By and so on

For example, you can write a rule to view the top 20 web addresses that the users visit daily.

You can create different type of rules using different data sources. Based on your requirements you can select any of the following options to create a rule:

- Create a Rule Using NetWitness Data Source
- Create a Rule Using Warehouse Data Source
- Create a Rule Using Respond Data Source

You can also use a list in a rule to refine a search result from the data source. Once a rule is created you can test a rule to see the results returned by the rule.

## Create a Rule Group

**To create a rule group or rule sub-group, perform the following:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Do one of the following.
   - To define a rule group:
     a. In the **Rules Groups** Panel, click .
     The new rule group is added to the Rule Groups panel.
     b. Enter the name for the rule group and press ENTER.
   - To add a rule sub-group:
     a. In the **Rules Groups** panel, select the rule group to which you want to add a sub-group.
     b. Click .
     The new rule sub-group is added to the rule group.
     c. Enter the name for the rule sub-group and press **ENTER**.

# Create a Rule Using NetWitness Data Source

You can create a rule to fetch data or events from a NetWitness data source. The same procedure is used to define a rule to fetch data or events from an Archiver data source.

The Archiver data source can be added in the Services Config View of the Reporting Engine. For more information, see "(Optional) Add Archiver as a Data Source to Reporting Engine" topic in the *Archiver Configuration Guide*.

## Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Decoder and Log Decoder Configuration Guide*.

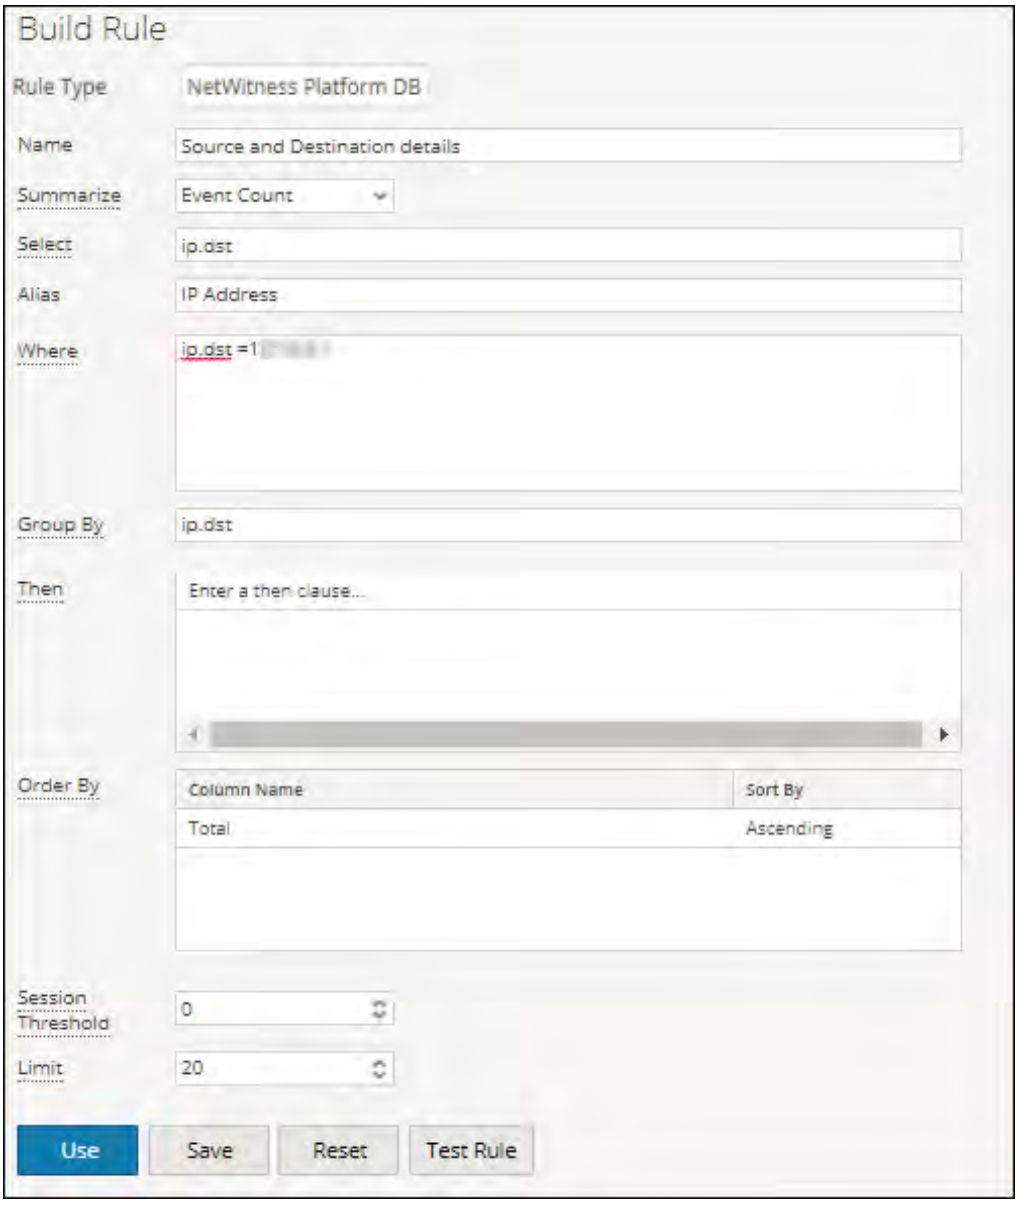
**To create a rule to fetch data or events from a NetWitness Data Source, perform the following:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.

   The Build Rule view tab is displayed.



3. In the **Rule Type** field, **NetWitness Platform DB** is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select: **None**
   - To define an **Aggregate** rule with special aggregation like the collection (sessions/events/packets) related aggregates, select one of the following:
     - Event Count
     - Packet Count
     - Session Size

- To define an **Aggregate** rule with meta values and custom aggregates like sum(), count(), and so on, select: **Custom**

  Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause. For example, select ip.src, countdistinct(ip.dst), distinct(ip.dst). The supported aggregate functions are:

  - sum (<meta>)
  - count(<meta>)
  - countdistinct(<meta>)
  - min(<meta>)
  - max(<meta>)
  - avg(<meta>)
  - first(<meta>)
  - last(<meta>)
  - len(<meta>)
  - distinct(<meta>)

  For more detailed information about Aggregate and Non-aggregate rule, see "NWDB Rule Syntax section" in Rule Syntax.

6. In the **Select** field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. The meta name to fetch raw log is raw. raw can only be used in the **Select** field. It cannot be used in the **Where** and **Then** fields. Multiple aggregate functions are supported for Custom aggregate rule in the **Select** field. For example, Select: *ip.src, username, service, distinct(country.src), sum(payload).*
7. In the **Alias** field, enter the alias name for columns used in the Select clause.
8. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
9. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.

   **Note:** In earlier versions of NetWitness, only one meta was supported for Custom aggregate rule in the **Group By** clause. From now, a maximum of six meta are supported in the **Group By** clause.

10. In the **Then** field, enter the rule actions that manipulate the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it, for example, creating a feed from the results. For a complete list of available rule actions, see "NWDB Rule Syntax" in Rule Syntax.

    **Note:** When a rule is executed for an Archiver data source, it is recommended not to use query intensive rule actions such as lookup_and_add() and show_whats_new().

11. In the **Order By** field, perform the following:

a. In the **Column Name** column, enter the name of the columns by which you want to sort the results. By default, the value is empty. The value gets populated based on the value selected in the **Summarize** field.

- For Summarize 'None', if no **Order By** is selected, then by default it is ordered by session or collection time.
- For other Summarize values, the default sorting is based on the first 'group by' meta selected when no 'order by' is defined. For Event Count, Packet Count, and Session size, the accepted values are Total and Value.

b. In the **Sort by** column, select one of the following ways to sort the results:

- Ascending Order
- Descending Order

12. In the **Session Threshold** field, enter the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647.

> **Note:** This is applicable to only NWDB Aggregate rules. If the default value is specified, all the matching sessions will be scanned and the accurate value will be returned. A higher session threshold allows accurate counts for a value. However, this causes longer rule execution time. For example, consider you set the Session Threshold as 1000 for ip.src. If there are 5000 matching sessions then for a particular ip.src value which is present in more than 1000 sessions, NWDB stops the scan after 1000 sessions and returns the extrapolated aggregate value. This optimizes the query execution time. If the value is present in less than 1000 sessions, then the actual value is returned.

13. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
14. Click **Save**.

> **Note:** Unlike parsed meta, raw logs are fetched from decoders. When both raw log and parsed meta are queried in a single rule, due to different retention periods, parsed meta might be available and raw logs missing in the same session. So the result will have parsed meta values and empty raw value for those sessions. For example, for the rule Select **ip.src**, **ip.dst**, **service**, **username**, **raw**, the parsed meta might be populated and the **raw** meta remains empty for a few sessions.

## Create a Rule Using Warehouse Data Source

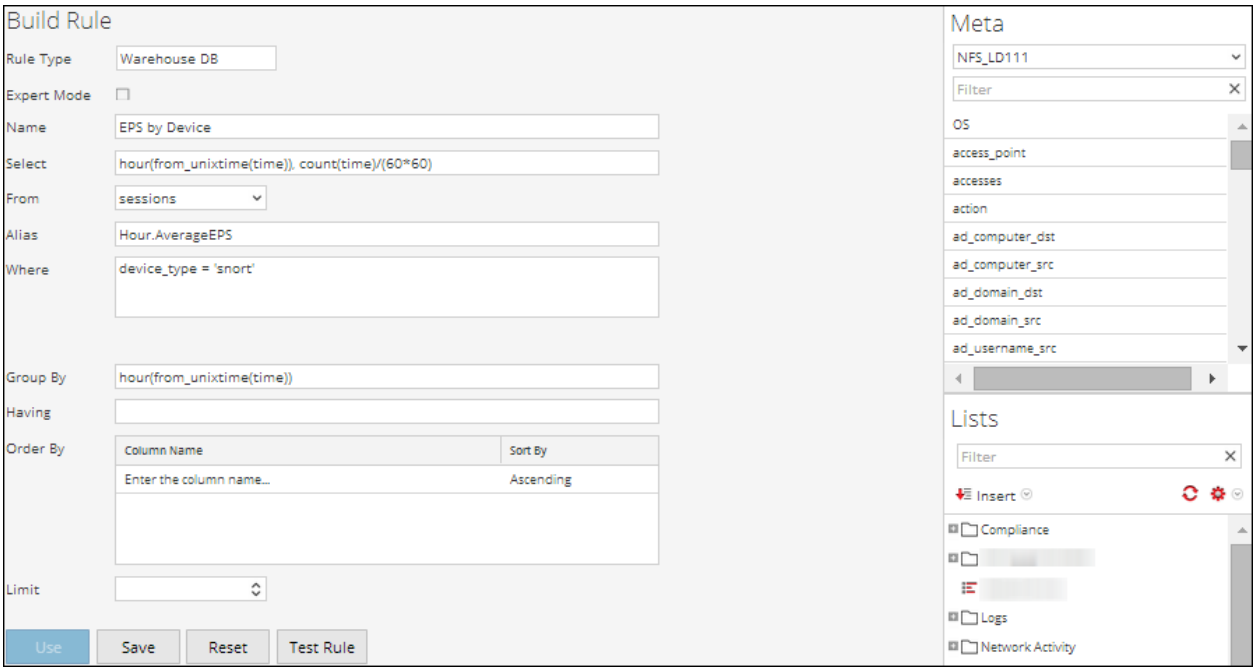
You can create a rule to fetch data or events from a Warehouse event source. You can define the rules in two modes:

- Default Mode
- Expert Mode

## Default Mode

In Default Mode, you can create rules containing simple SQL like HIVE queries that contain clauses like Select, Where, Group By, and Having. By default, you can create rules to query sessions or raw logs. For more information on "Simple query syntax and examples", see Warehouse DB Simple Rules Syntax.

The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** without the Expert Mode selected.

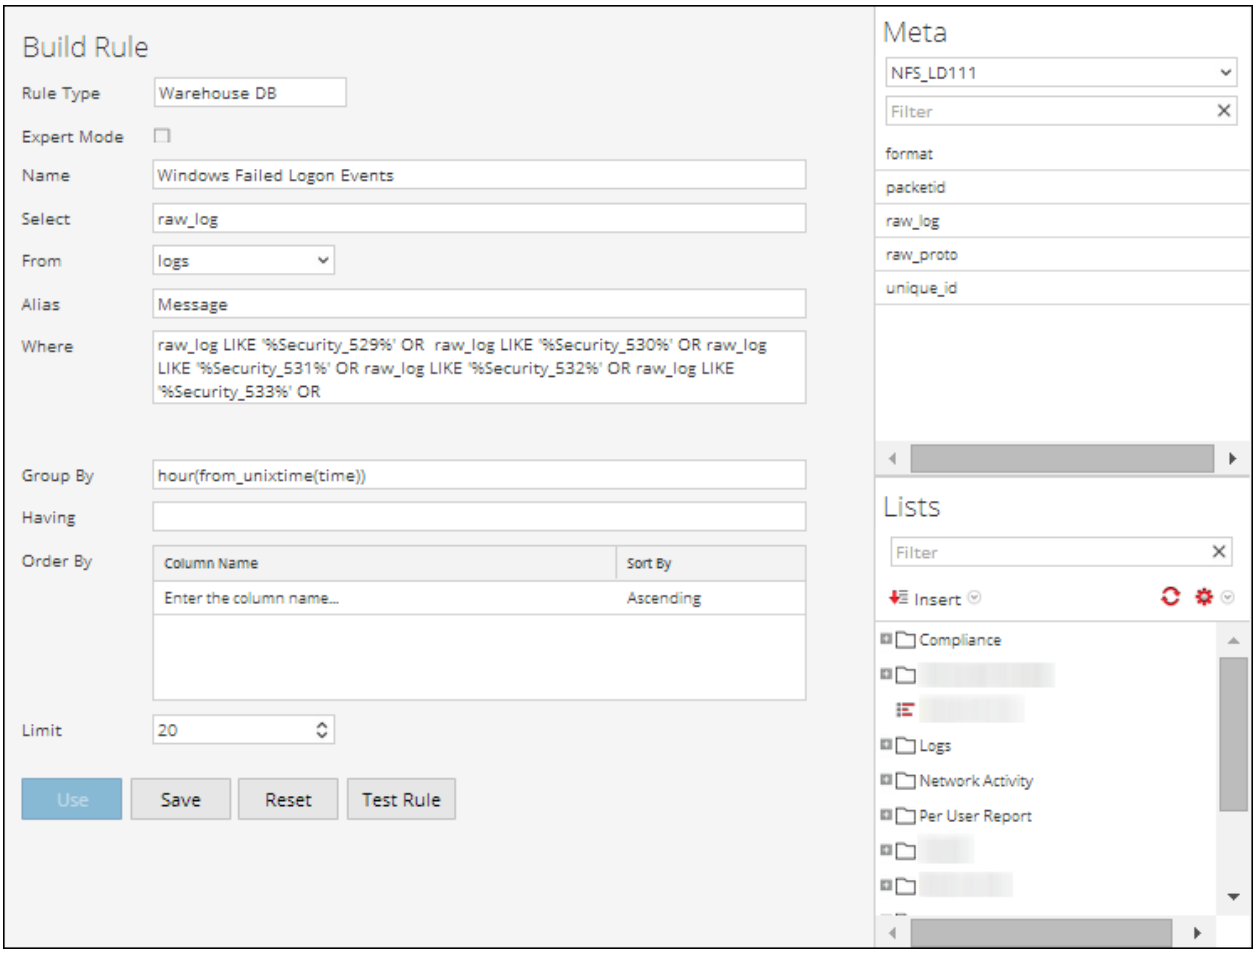


## Querying Raw Logs

The raw log format is used in the select or where clause to query for raw logs.

**Note:** The time range that you can specify in your query is a day (24 hours). If you have specified a time range less than a day in your query, the result set contains data of at least a day (24 hours).

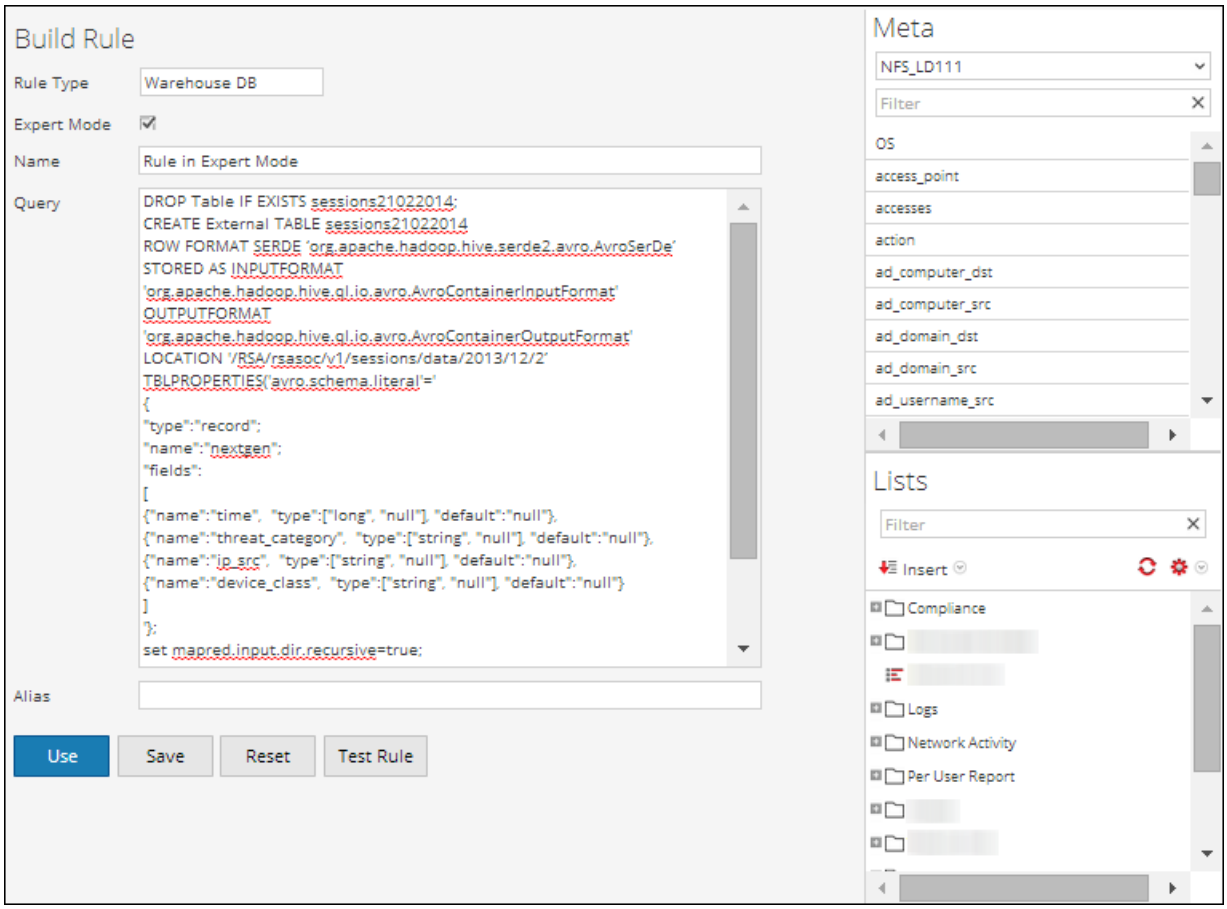
The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** and create a rule for querying raw logs.



## Expert Mode

Advanced rules are defined using complex HIVE queries created using the clauses DROP, CREATE, and so on. Unlike simple rules, we always insert the results into a table. For more information on "Advanced HIVE query language", see *HIVE language manual*.

The following figure is an example of the Build Rule view that is displayed when you select **Warehouse DB** for **Rule Type** with Expert Mode selected.



If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

- ${report_starttime} - The starting time of the range in seconds.
- ${report_endtime} - The ending time of the range in seconds.

For example, **`SELECT col1, col2 FROM custom_table WHERE timecol >= ${report_starttime} AND timecol <= ${report_endtime};`**

**Note:** By default, Reporting Engine treats `${keyword}` as a variable. If you want to specify HIVE variables, you must mention the complete syntax of a variable. For example, `${hiveconf:hive.exec.`scratchdir}.

## Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Host and Services Configuration Guide*.

### To create a rule to fetch data or events from a Warehouse data source, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click

> **Warehouse DB**.

The Build Rule view is displayed.

3. In the **Rule Type** field, **Warehouse DB** is selected by default.

   If you are defining the rule in Default mode, perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Select** field, enter a meta or select the meta from the drop-down or select a meta from the list of available meta types provided in the Meta Panel. For more information, see " Meta Panel" in Build Rule View.

   c. In the **From** drop-down menu, select one of the following:

      - Session
      - Logs

   d. In the **Alias** field, enter the alias name for columns used in the Select clause.

   e. In the **Where** field, enter a meta or select a meta from the list of available meta types provided in the Meta Panel. The Where clause provides the base query criteria for the rule.

   f. In the **Group By** field, enter the meta selected in the Select clause, so that the result set is grouped based on the meta.

   g. In the **Having** field, enter the criteria to filter the result set for aggregated queries.

   h. In the **Order By** field, perform the following:

      1. In the **Column Name** column, enter the name of the columns by which you want to group the results.
      2. In the **Sort by** column, select one of the following ways to sort the results:

         - Ascending Order
         - Descending Order

   i. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by session count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

   j. Click **Save**.

4. If you are defining the rule in Expert mode, select the **Expert Mode** checkbox and perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Query** field, enter the Hive query statement to query the data source.

   c. In the **Alias** field, enter the alias name for columns used in the Select clause.

   d. Click **Save**.

# Create a Rule Using Respond Data Source

You can create a rule to fetch incidents or alerts from a Respond data source.

## Prerequisites

Make sure that you:

- Ensure Reporting Engine service is up and running.
- Ensure the Incident Management service is up and running. For more information, see "Configure a Database for the Respond Server Service" topic in the *NetWitness Respond Configuration Guide*.
- (Optional) Ensure the Event Stream Analysis service is up and running. For more information, see "Step 2. Configure Advanced Settings for an ESA Service" topic in the *ESA Configuration Guide*.
- (Optional) Ensure the Malware Analysis service is up and running. For more information, see " (Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Configuration Guide*.

**Note:** You need to configure any one of the services (Event Stream Analysis, Reporting Engine, Malware Analysis, or Endpoint) based on your requirement and the type of alerts or incidents you want to generate.

### To create a rule to fetch data or events from a Respond Data Source, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click > **Respond DB**.

   The Build Rule view tab is displayed.

3. In the **Rule Type** field, Respond is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and incident reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select **None**
   - To define an **Aggregate** rule with meta values and custom aggregates select **Custom**

     Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause based on the report type you have selected.

     For more detailed information about Aggregate and Non-aggregate rule, see Rule Syntax.
6. In the **From** field, based on the type of report output to be displayed, you must select one of the following:
   - Alert
   - Incident
7. In the **Select**field, enter a meta or select a meta from the list of available meta types provided in the

Meta Library. For more information, see "Meta Panel" in Build Rule View. It cannot be used in the **Where** field. Only one aggregate function is supported at a time in a query.

For example, the supported metas for alert are:

- alert_host_summary
- alert.name
- alert.numEvents
- alert.severity
- alert.source
- alert.timestamp
- incidentCreated
- incidentId
- receivedTime

For example, the supported metas for incident are:

- categories
- created
- priority
- riskScore
- sealed
- status

For more detailed information, see "Aggregate and Non-aggregate rule" topic in the Rule Syntax.

8. In the **Alias** field, enter the alias name for columns used in the Select clause.
9. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
10. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.
11. In the **Order By** field, perform the following:
    a. In the **Column Name** column, enter the name of the columns by which you want to sort the results.

    **Note:** by default the first meta in the select clause will be dispalyed.

    b. In the **Sort by** column, select one of the following ways to sort the results:
    - Ascending Order
    - Descending Order

12. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
13. Click **Save**.

# Deploy a Rule

In RSA NetWitness you can deploy the selected rules on the service (for example, Reporting Engine), using the Deployment Wizard.

## Prerequisites

Make sure that:

- The services on which you deploy a rule is up and running.
- The Live Services is configured.

**To deploy a rule, perform the following:**

1. Go to **(Configure) > LIVE CONTENT**.
2. In the **Search Criteria** panel, search Live resources (for example, search for the **Application Rule** resource Type).
3. In the **Matching Resources** panel, select **Show Results > Grid**.
4. Select the checkbox to the left or the rules that you want to deploy.
5. In the **Matching Resources** toolbar, click .
6. Click **Next**.
7. Select the service on which you to deploy a rule (For example, Reporting Engine) and click **Next**.
8. Click **Deploy**.
   The rule is deployed successfully.

## Use Meta Aliases for Reporting

When you refer to meta data in Reports and Charts, you can only view aliases for the meta names. These aliases makes them more understandable to a broader audience.

You cannot provide alias values for any meta in the WHERE clause because NetWitness uses the WHERE clause to fetch data from the data source (for example, in the Concentrator) and data sources do not support aliases. In other words, you cannot provide the alias value **HTTP** for the HTTP port # 80.

**Note:** * You cannot create aliases for meta other than the ones that have existing aliases by Reporting Engine. Also, the format of the aliases cannot be changed.
* Aliases are not supported for Alerts and CSV reports.

**To use alias in a rule, perform the following:**

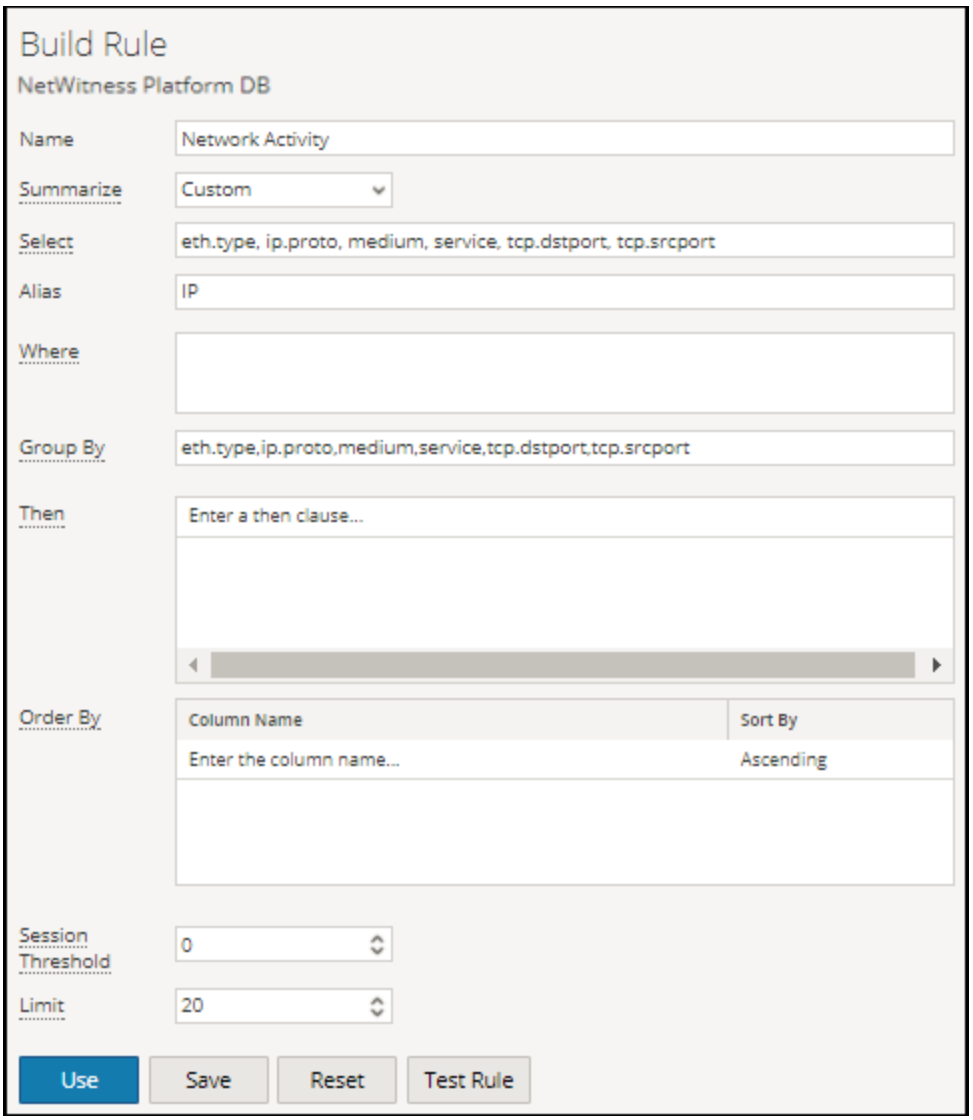
1. Go to **Reports**.
   The Manage tab is displayed.

2. In the **Rules** panel, do one of the following:

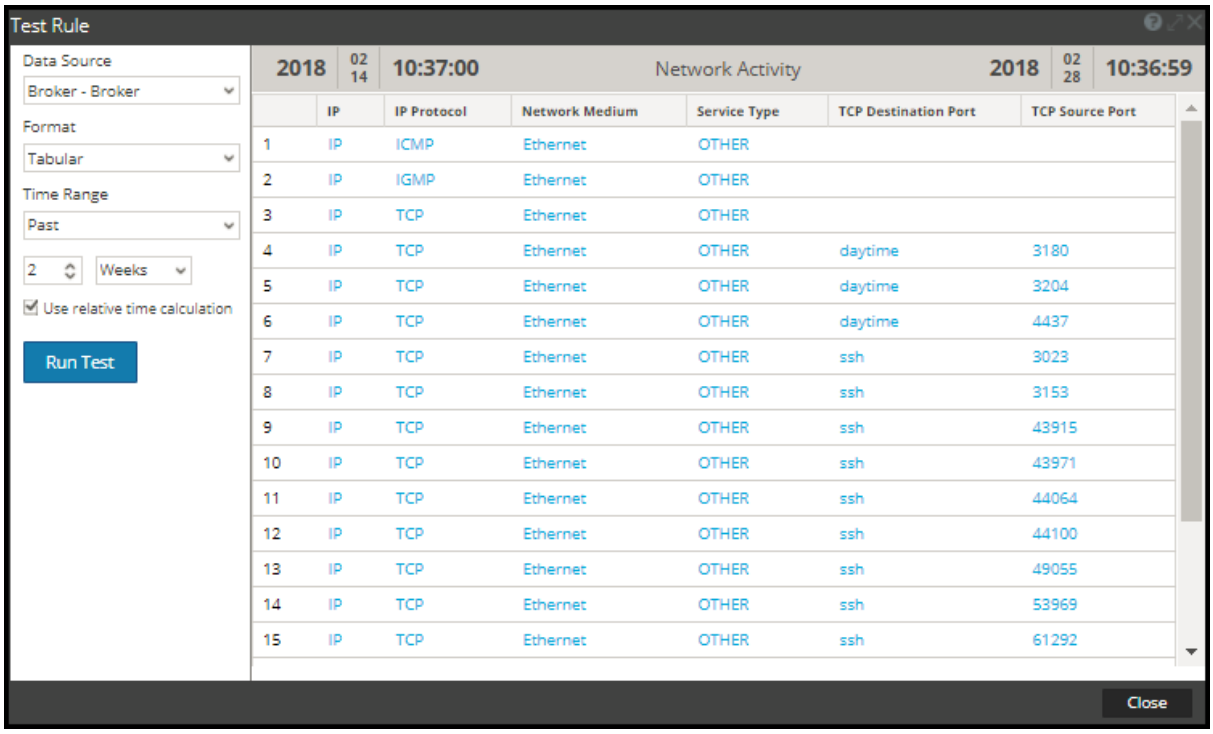
   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.

3. Specify the meta key with aliases in the **Select** field.

The following example specifies the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** meta in the Select field.



4. Click **Test Rule**.
   The following example displays the results under the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** alias columns that were specified in the **Select** field of the rule.



## RSA-Supplied Alias Definitions

The alias files in this section are examples only and are based on current alias definitions in the Reporting Engine. NetWitness cannot modify these definitions in the Reporting Engine depending on the changes in the concentrator xml file. Since any changes in the Concentrator xml file are not reflected in the Reporting Engine.

The details of different meta are explained in each of the **meta.aliases**.

**eth.type**

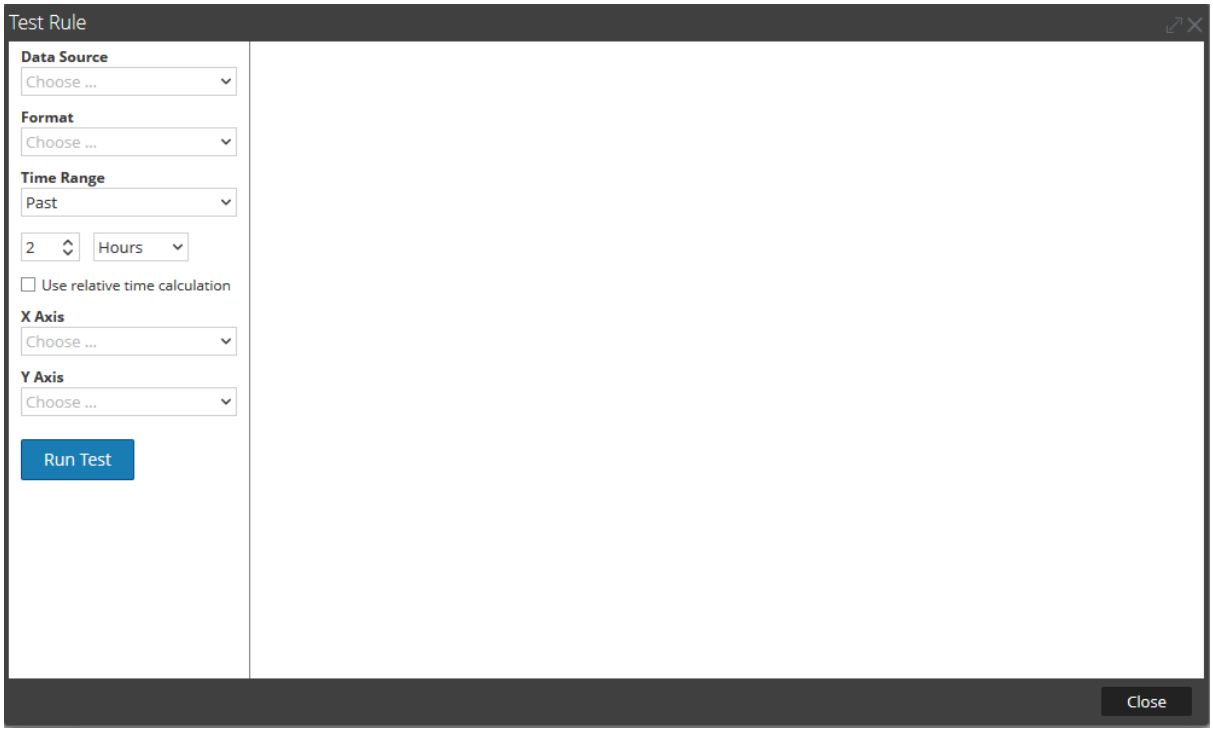
# Test a Rule

You can test a rule based on the time range and the data source selected.

### To test a rule, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following:
   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.
     The Build Rule view tab is displayed.

3. Click **Test Rule**.
   The Test Rule view is displayed.



> **Note:** When you click **Test Rule**, the rule is not saved. You have to click **Save**in the Build Rule view to save the rule.

4. From the **Data Source** drop-down list, select a data source.
   You must select the appropriate data source for the rule defined.
5. From the **Format** drop-down list, select the format in which you want the result displayed.
6. From the **Time Range** drop-down list, select one of the following.
   - **Past** -To specify number of years, days, weeks, months, days or hours.
   - **Range** - To specify a date range and time period.

   > **Note:** In the User Interface (UI), the date or time displayed depends on the time zone profile selected by the user.

7. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
   In **X-Axis**, the Meta for the 'Group by' rule is displayed. In **Y-Axis**, the aggregate functions used in the rule are displayed.

> **Note:** Sum, Count, Countdistinct and Average are the supported aggregate functions for rule. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.

8. Click **Run Test** to execute the rule.
   The rule data (if any) for the selected time range is displayed.

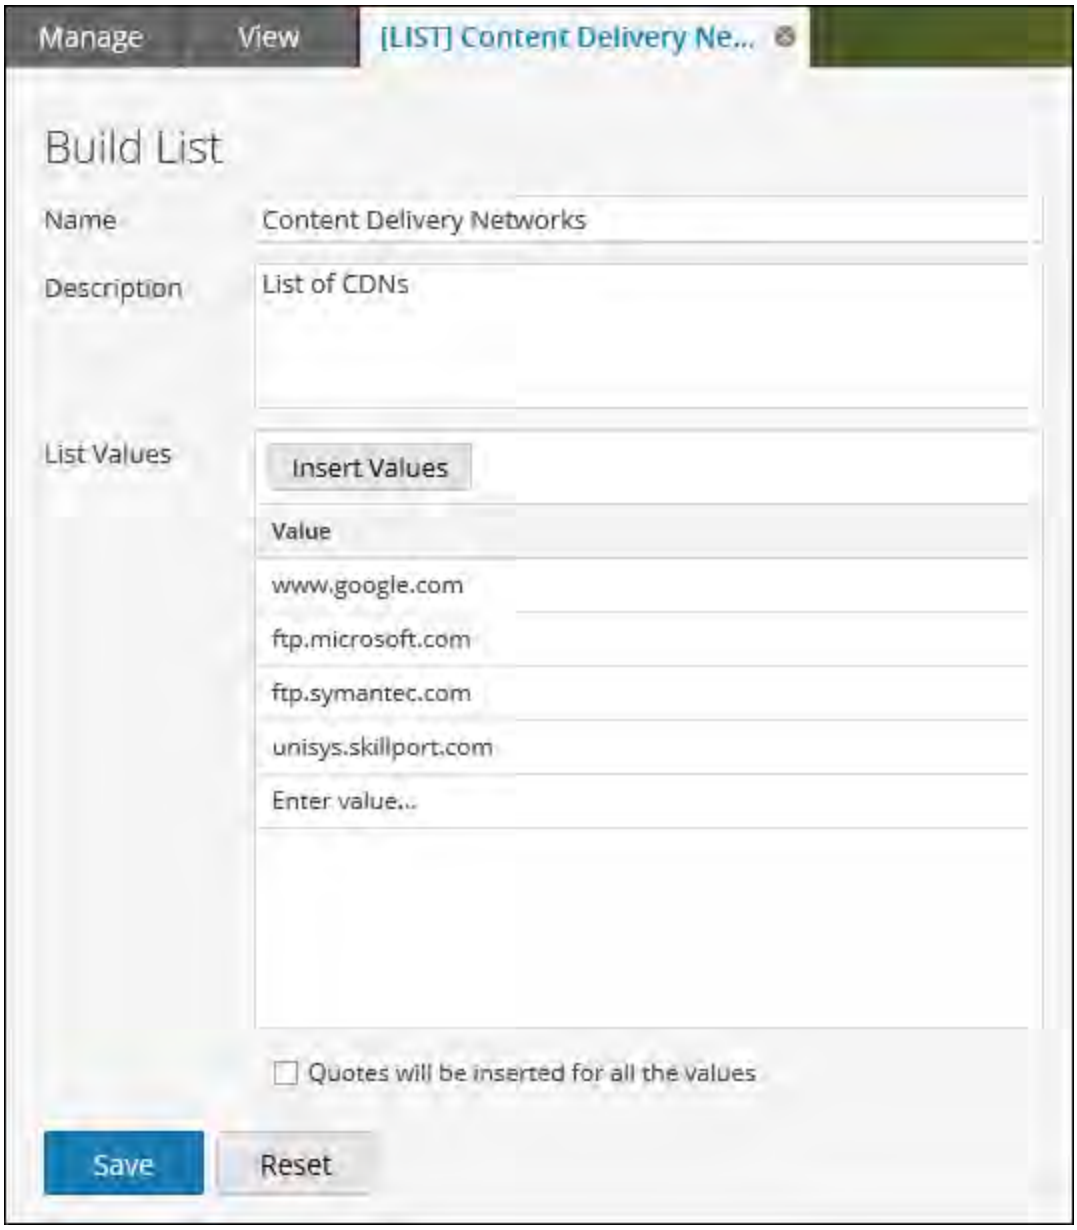
# Create a Lists or List Group

### To create a list, perform the following:

Lists can be added within a group or in the root folder.

1. Go to **Reports**, and click **Lists**.
   The List view is displayed.

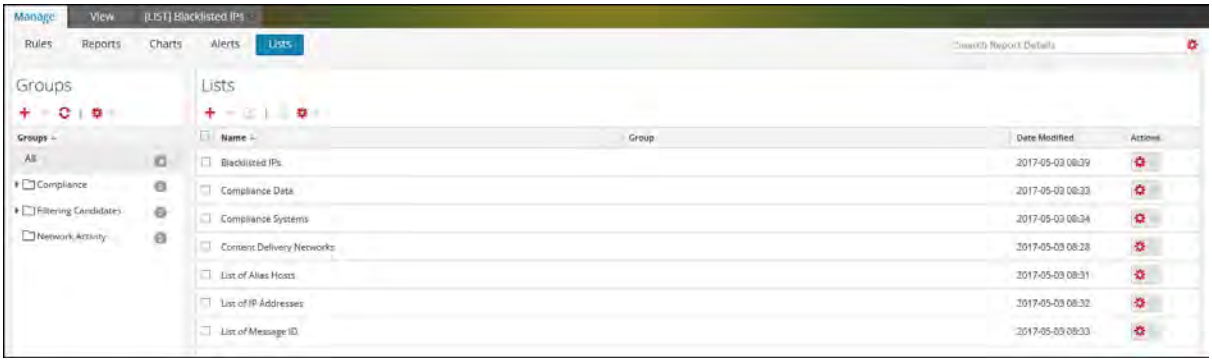
2. In the **Lists** toolbar, click .
   The Build List view tab is displayed.



3. In the **Name** field, enter a unique name for the list.
4. In the **Description** field, enter a description for the list.
5. In the **List Values** field, do one of the following:
   - Click **Insert Values** and enter the values separated by commas. You can paste a list of values from a file or other lists.
   - In the **Value** column, enter the values.
6. If you want quotes to be inserted directly for the values at runtime, select **Quotes will be inserted for all the values**.
7. Click **Save**.

### To create a list group, perform the following:

1. Go to **Reports**, and click **Lists**.
   The List view is displayed.



2. Do the following:
   - To create a list group:
     a. In the **Lists Groups** panel, click .
        A new list group is added to the List Groups panel.

     b. Enter the name for the list group and press **ENTER**.
   - To create a list subgroup:
     1. In the **Lists** Groups panel, select the list group to which you want to add a subgroup.
     2. Click .
        A new list subgroup is added to the list group.
     3. Enter the name for the list subgroup and press **ENTER**.

# Create and Schedule a Report

You can create a simple or complex report and configure its execution properties by scheduling a report. A report can include multiple rules and you can schedule different time range to execute the same report. For example, depending on your requirement, you can schedule a report to run daily, weekly or monthly.

When you run a report, the results are stored in Reporting Engine.

After you generate a report, you can perform the following:

- Send the reports by email to other users by configuring the output actions. You can also configure the output actions before generating a report.
- Download the reports as PDF or Comma-Separated Values (CSV) format files.

**Note:** The cancel operation is not supported for Respond Reports.

## Create a Report or Report Group

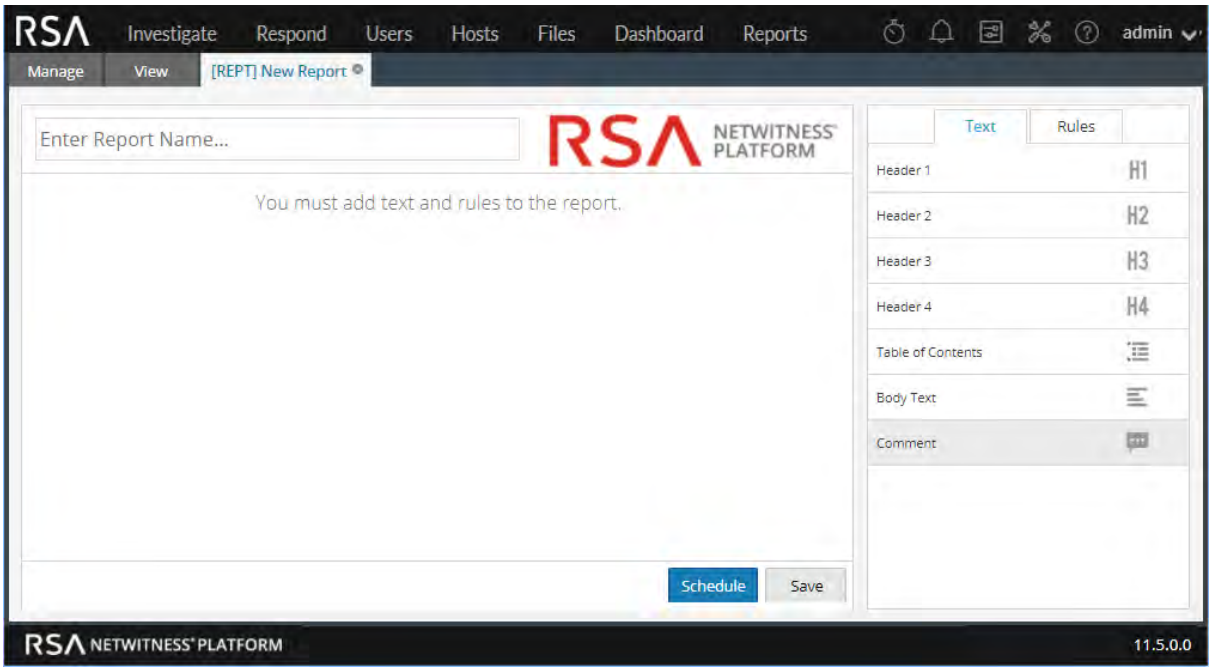
### To create a report to a group or sub-group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Reports** toolbar, click .

   The Build Report tab is displayed.



4. Enter the name of the report.
5. Drag and drop the text and rules to the report.

> **Note:** The text entered is optional and you may need this option only when you want to display user-defined headers or content.

6. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

### To create a group to the default folder or add sub-groups under a report group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, click **+**.

   A default group is added in the Report Groups panel.

4. Enter the name of the new group.
5. Press **Enter**.

   The group is added to the Report Groups panel.

# Schedule a Report

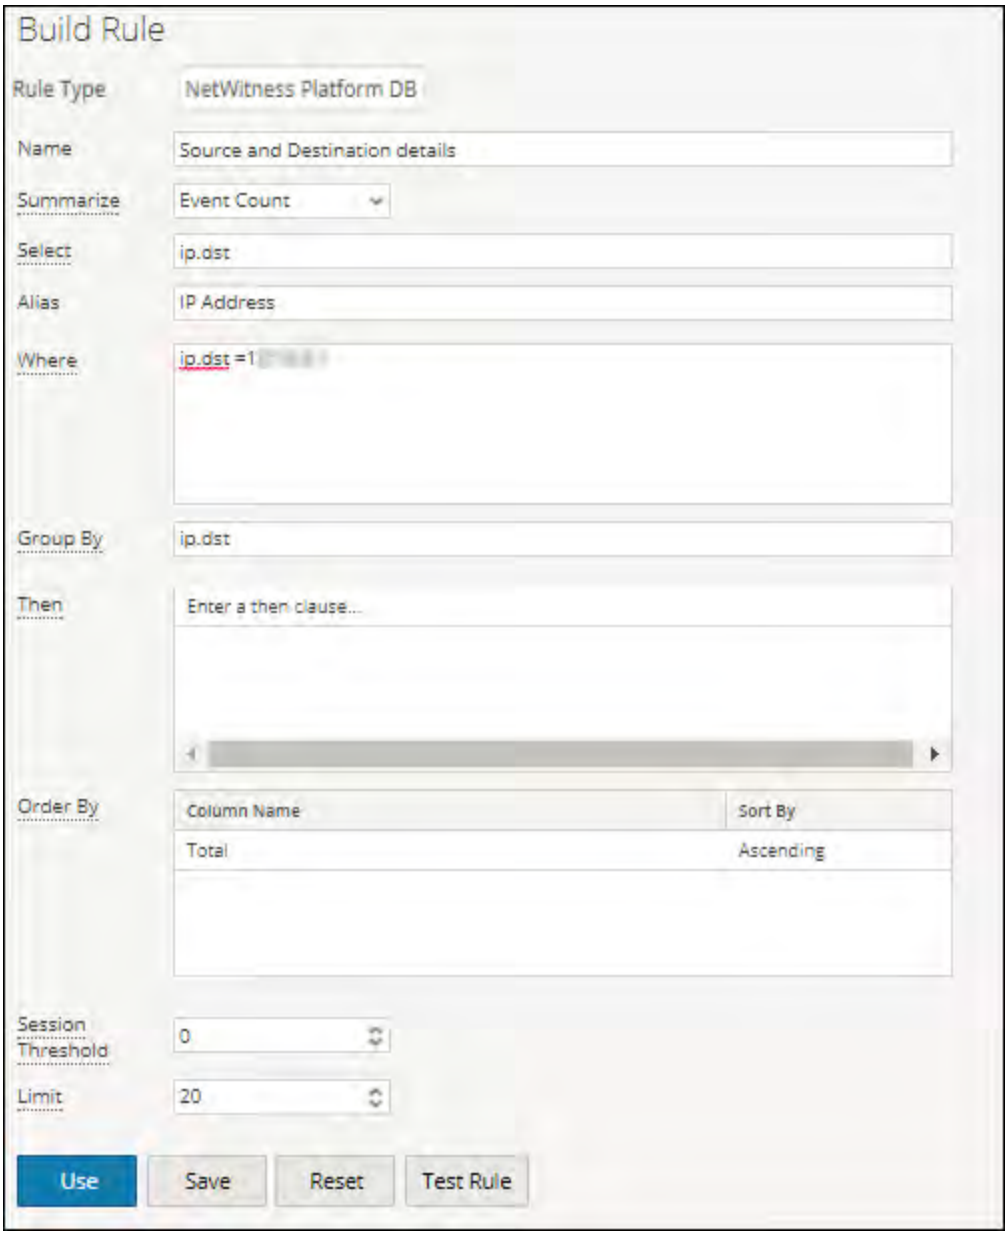
**Note:** When you schedule a Warehouse report, you can use a supported task scheduler to allocate specific resources in a cluster for the scheduled job. For more information on "supported task schedulers", see Task Scheduler for Warehouse Reporting.

### To schedule a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, click to create a rule.
3. Click **Save**.
4. Click **Use**.



5. Go to **Reports**.

   The Manage tab is displayed.

6. Click **Reports**.

   The Report view is displayed.

7. On the **Reports** panel, click + to create a report.
8. Enter the Report Name in the field.
9. Add the rule by drag and drop which has the user defined variable from the Rules tab.
10. Click **Schedule**.

The Schedule Report view is displayed.

If you provide another user with access permissions to a report, you must also provide permissions for the report group, the rules used in the report, and the rule groups otherwise an error message is displayed.

11. To execute the reports as per the schedule, select the **Enable** checkbox.
12. In the **Schedule Name** field, enter a name for the schedule report configuration.
13. From the Data Source field, select the data source.

    **Note:** If the data source is not listed, then ensure you have **Read**permissions set for the data source. This is applicable for NWDB, Respond and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in *Reporting Engine Configuration Guide*.

14. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

    **Note:** All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

    **Note:** If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property mapred.fairscheduler.allow.undeclared.pool.

15. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
16. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).

    Depending on the type of run schedule, choose one of the following:

    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    **Note:** While scheduling a report, if you select **Past** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

    For information on how to generate a report with variables, see Create a Parameterized Report Using Variable.

17. (Optional) In the **Output Actions** panel, do the following:

a. Enter the email address and subject.

b. Edit the body of the message for the report.

c. Select the format of the attachment.

d. Enter a value for the CSV and Multi-value delimiters.

e. (Optional) In the Other Options field, do the following:

i. Click + and select SFTP, URL, or Network Share output action.

A row gets added with the selected output action.

ii. Select the appropriate options to send the report in PDF or CSV format, or both to the RE configured SFTP, or URL, or Network Share output action.

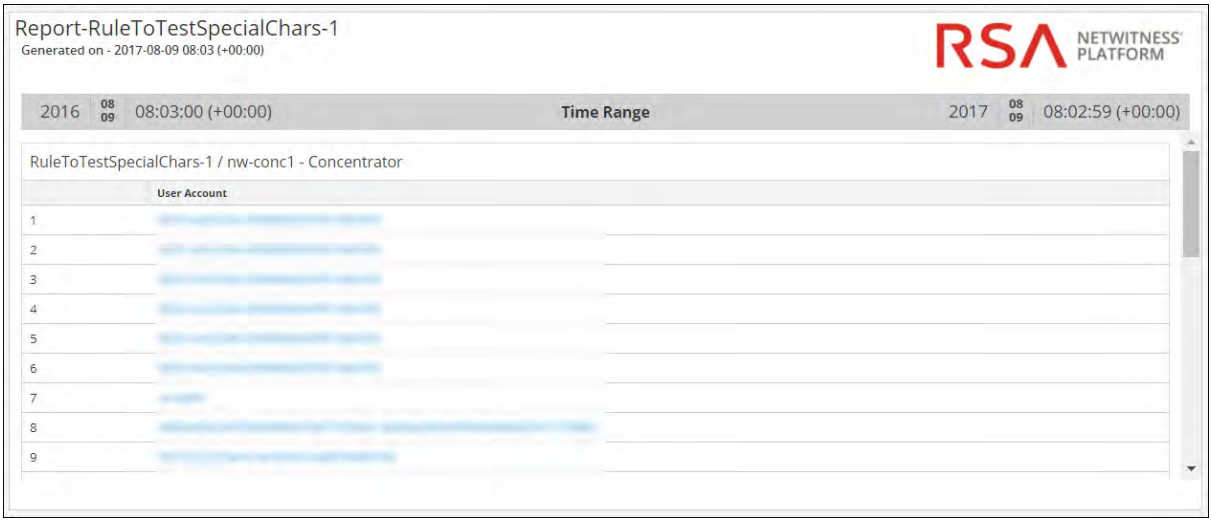
18. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report.

19. (Optional) To choose a logo in the Logo panel, see "Manage and Select a Report Logo" section in Manage Lists, Rules or Reports.

**Note:** If you do not specify a logo, the default RSA logo will be used.

20. Click **Schedule**.

The scheduled report executes as scheduled and provides the configured outputs.



After you create and Schedule a report, you can perform any of the following tasks:

- You can notify the email recipient when the report execution completes and send reports in PDF and CSV formats as attachments in the email.
- You can generate a list based on the scheduled report and view them in the **Lists** module.
- You can send a scheduled report in PDF or CSV format, or both to the RE configured SFTP location, or URL, or Network Share.
- You can change the default logo and view them in the scheduled report.

- You can modify the NetWitness Reporting Engine config details, by navigating to the Reporting Engine General Tab. See the "Reporting Engine General Tab" topic in the *Reporting Engine Guide*.

**Examples**

When you schedule reports in the Schedule Report view, by default, the results for the **Past** option are presented based on the user specified time zone. The following examples provide a clear picture on what results to expect when you select **Hours**, **Days**, **Weeks**, **Months**, or **Years** for the **Past** option based on the absolute or relative duration.

**Note:** By default, the relative duration checkbox is de-selected. This implies that the results for the **Past** option are presented based on the absolute duration.

- **Based on Absolute duration** - Absolute Duration allows a report to be scheduled at an absolute time with respect to the current time, excluding the seconds and considering the time interval as a whole. For example, 12.00pm is the absolute time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.00PM to 4.00PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 12.00AM to August 27, 2014, 12.00AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 2.30PM and the day is Wednesday, the report is generated for the range: Saturday, August 16, 2014, 12.00AM to Saturday, August 23, 2014, 12.00AM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    July 01, 2014, 12.00AM to July 31, 2014, 12.00AM.
  - Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    January 01, 2013, 12.00AM to December 31, 2013, 12.00AM.
- **Based on Relative duration** - Relative Duration allows a report to be scheduled at a time relative to the current time which might vary based on the current time. For example, 12.45 pm is the relative time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.20PM to 4.20PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 10.15AM to August 27, 2014, 10.15AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 12.30PM and the day is Wednesday, the report is generated for the range: Thursday, August 21, 2014 12.30PM to Wednesday, August 27, 2014 12.30PM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014, 2.30PM the report is generated for the range:
    July 27, 2014 2.30PM to August 27, 2014 2.30PM.

- Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range: August 27, 2013 2.30PM to August 27, 2014 2.30PM.

## Generate a List from the Scheduled Report

You can generate a list from the output of the scheduled report. Make sure that your lists are created in NetWitness prior to generating a list to schedule a report.

### To generate a list from the Build Report view, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Reports** panel, select a report and in Actions column, click > **Schedule Report**.

   The Schedule Report view tab is displayed.
4. In the Output Actions section, in **Dynamic List** panel, click .

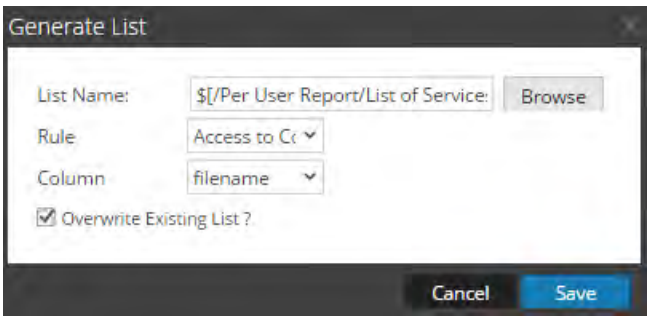
   The Generate List dialog box opens.
5. Click **Browse**.

   The List Selection panel is displayed.
6. Choose a list item and click **Select**.

   The list name gets populated in the List Name field.
7. Select a valid rule to filter the report results further based on the rule definition.
8. Select a value for the **Column** field.

   The column forms the values for the list that gets created.
9. If you want to overwrite the existing list, select the **Overwrite Existing List?** checkbox.
10. Click **Save**.

    The list name gets populated in the Generate List panel.



11. (Optional) Select a list from the Generate List panel and click to delete the selected list.
12. (Optional) Select a list from the Generate List panel and click to edit the list details.

## Create a Parameterized Report Using Variable

You use variables for reporting in the RSA NetWitness Reporting module. Parameterized reporting allows you to specify values dynamically at runtime without changing the rule definition so you can view the results based on a particular value. You can achieve parameterize reporting by using variables in the query or rule. For information on adding a rule, see Configure a Rule. At runtime, you can enter the value for the variable or select the value from the list based on which the result set is displayed.

The syntax to specify the variable is as follows:

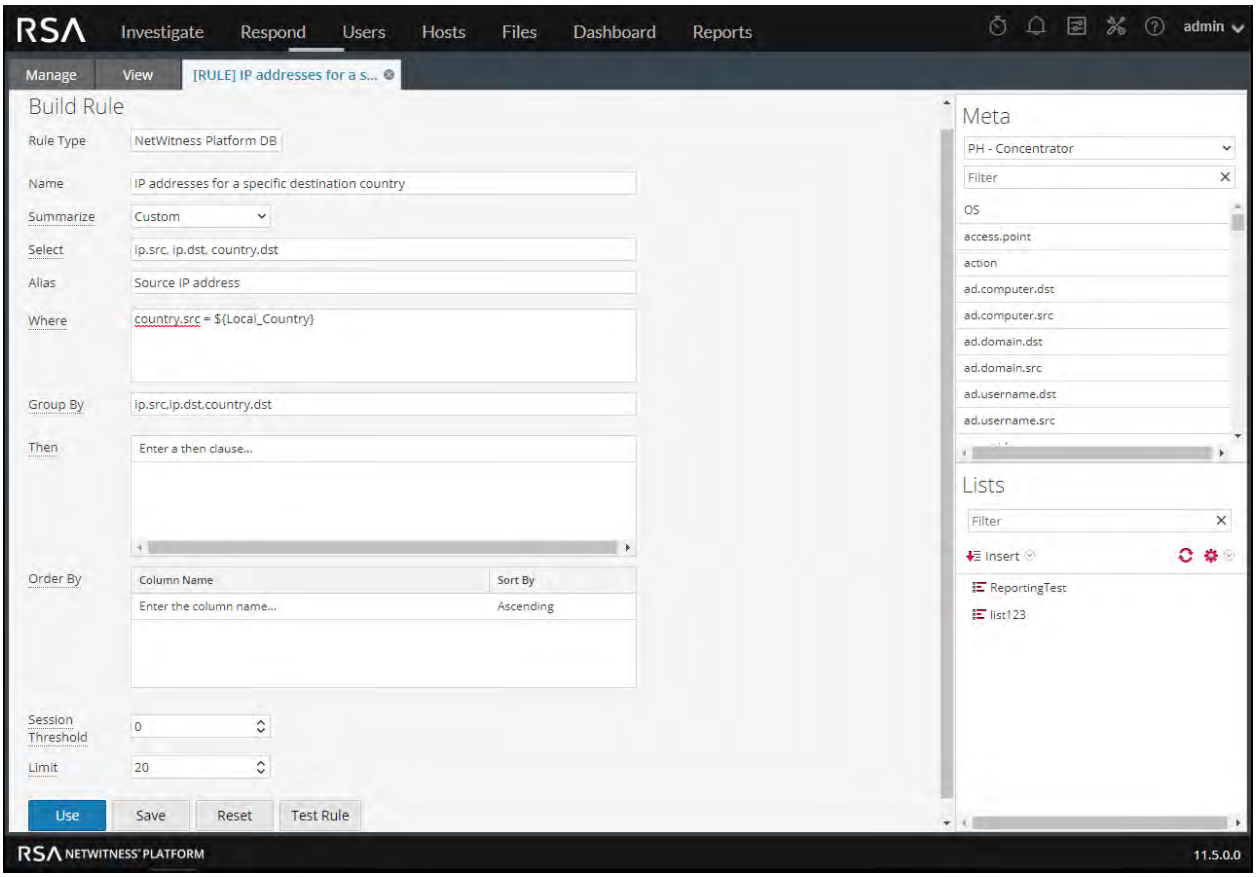
| Description | Examples of Supported Syntax |
|---|---|
| Insert `$` before a variable.<br>Enclose a variable within braces. | `columnname=${<variable>}` |

The syntax to define the variable is the same for NetWitness DB and Warehouse DB data sources. When you assign the value of the variable in a Run Configuration, you must enclose the value within single quotes: `'<value>'`.

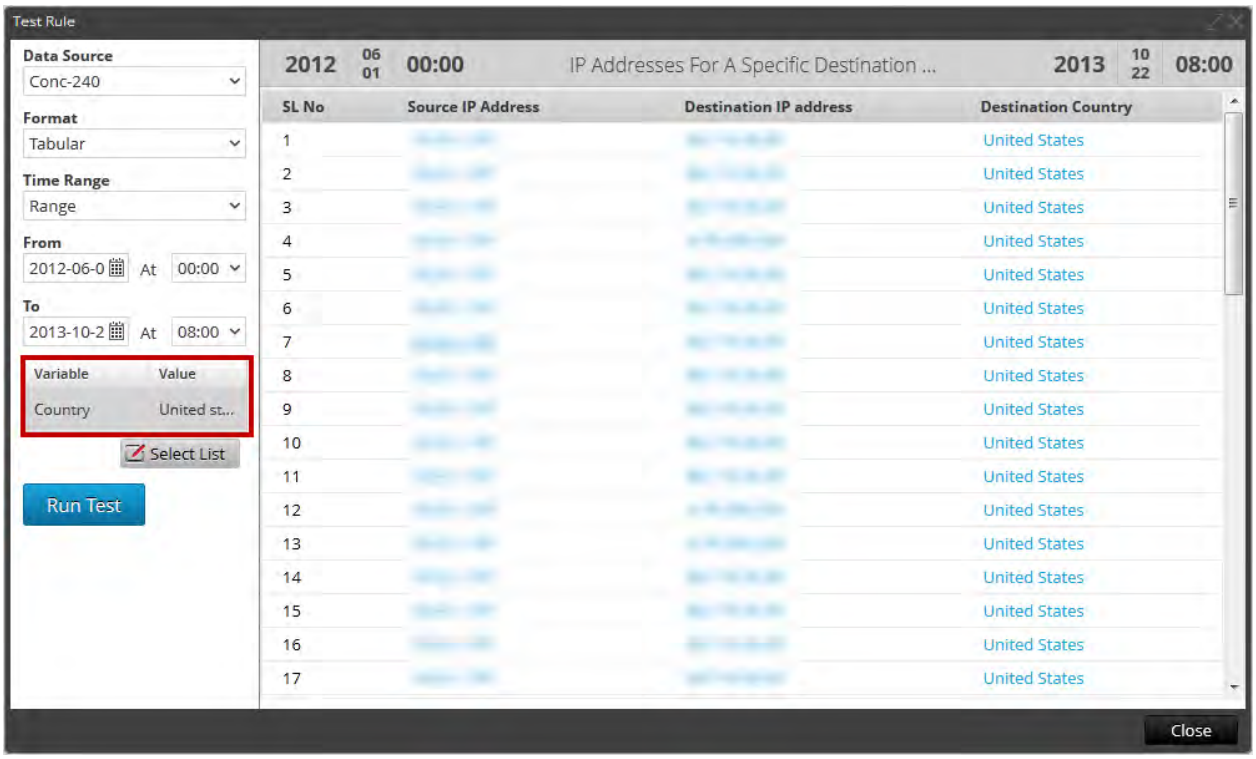
Some examples where a variable can be used are provided in this section.

**View Source IP Addresses for a Specific Destination Country**

The following is an example of a NetWitness DB rule to view the source and destination ip addresses for a specific destination country. Here the value for source country is defined as a variable `${local_country}`.



At runtime, you are prompted to enter the value for the variable. The figure below shows the `local_Country` variable where you can enter the value. If you enter the value as **United states**, all the source and destination ip addresses with destination country as United states are listed.



You can use the above rule to schedule a report. You can schedule two types of reports:

- Report with Dynamic Variables
- Iterative Report

# Report with Dynamic Variables

Dynamic variables allows the user to specify the values for a variable defined in a rule while scheduling a report.

### To schedule a report with Dynamic Variable, perform the following:

1. Go to **Reports**.

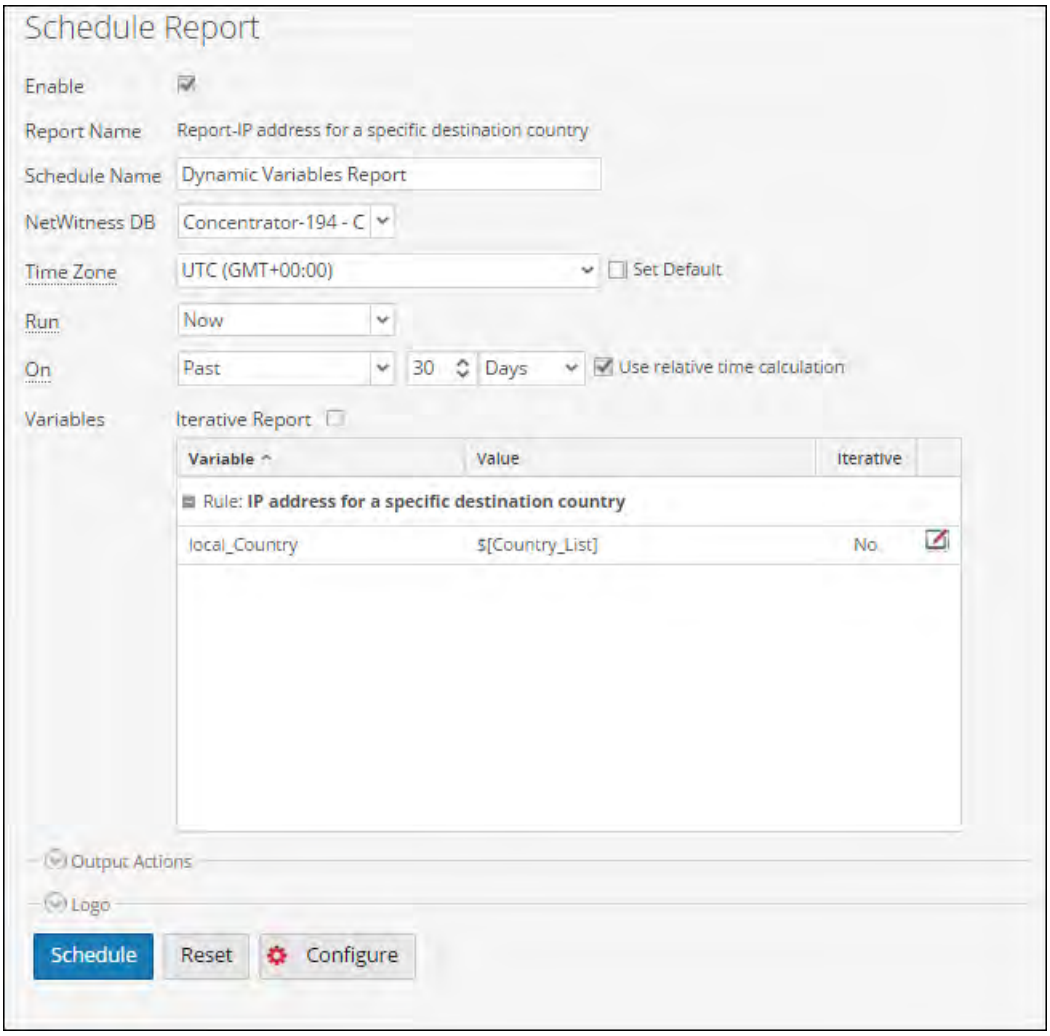
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. On the **Reports** panel, click + to create a report.
4. Enter the Report Name in the field.
5. Add the rule by drag and drop which has the user defined variable from the Rules tab.
6. Click **Schedule**.

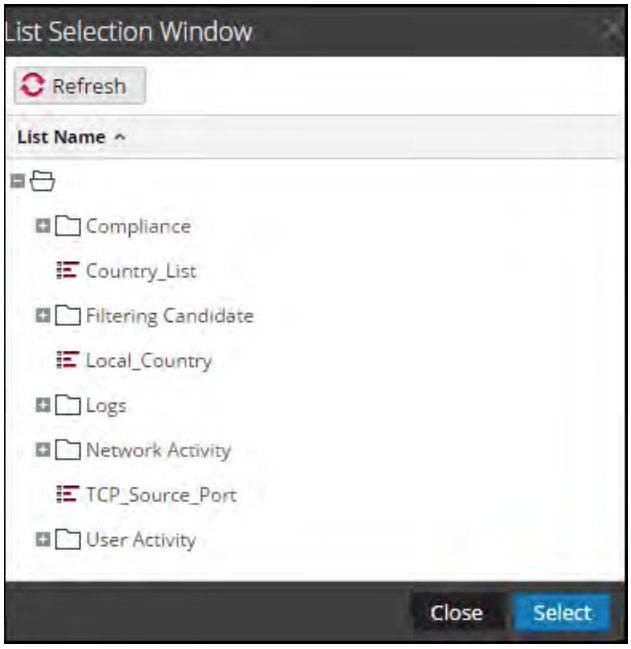
   The Schedule Report view tab is displayed.



7. To execute the reports as per the schedule, select the **Enable** checkbox.
8. In the **Schedule Name** field, enter a name for the schedule report configuration.
9. In the **NetWitness DB** drop-down, select the database.
10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format.This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

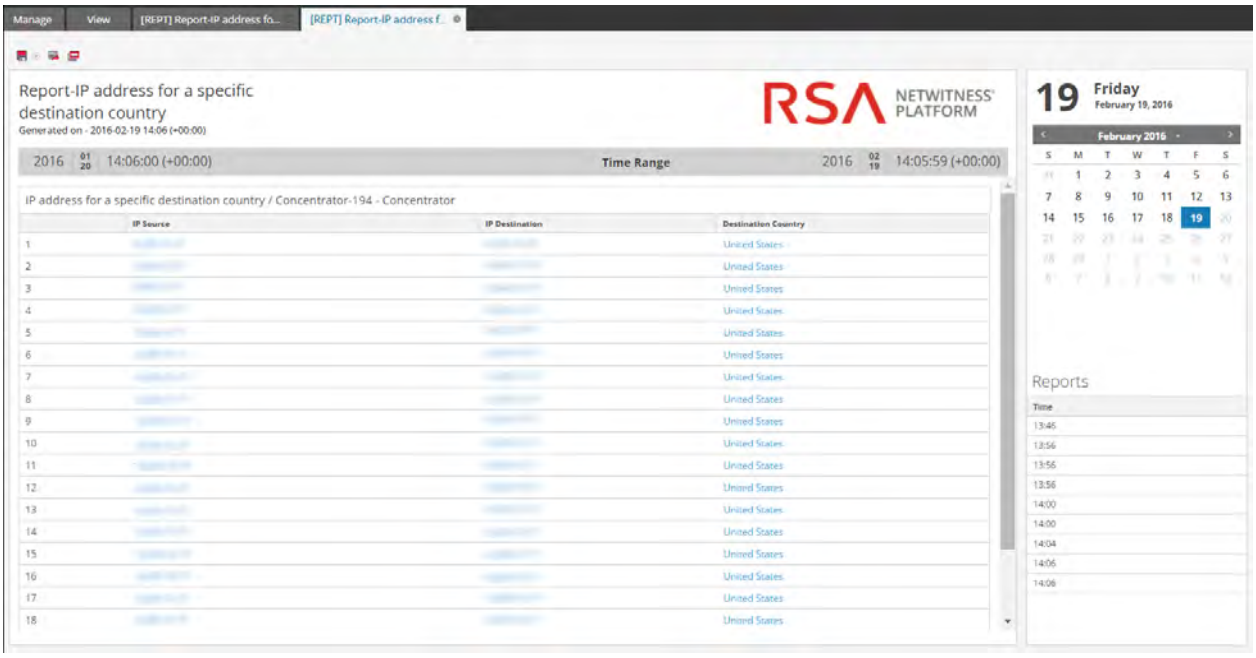
**Note:** While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

12. In the variables field, click .
13. Do one of the following:
    - Enter the value for the variable, or
    - Choose the list value for the variable.



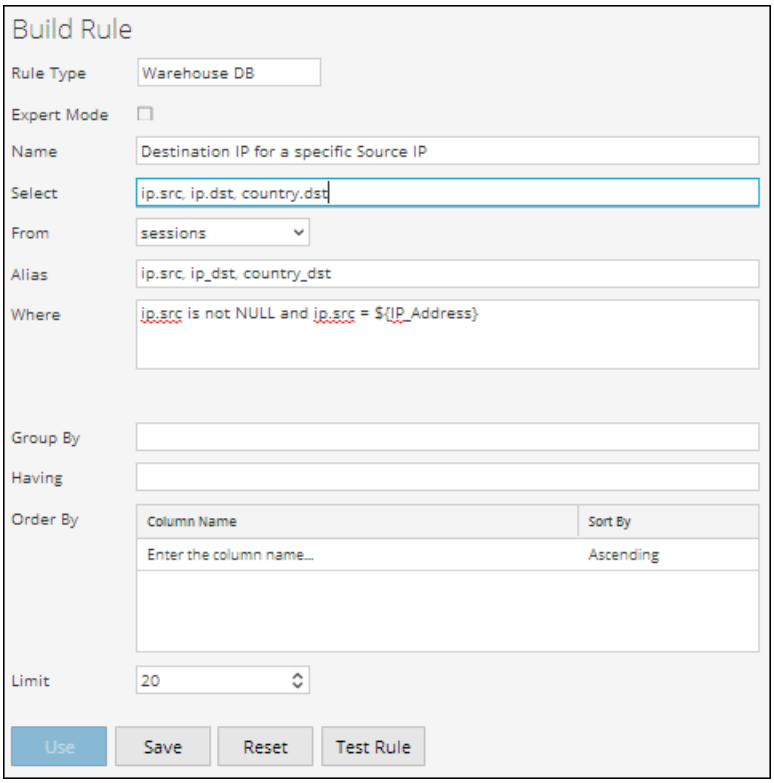
14. Click **Select**.
15. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.



### View All Destination IP Addresses for a Source IP Address

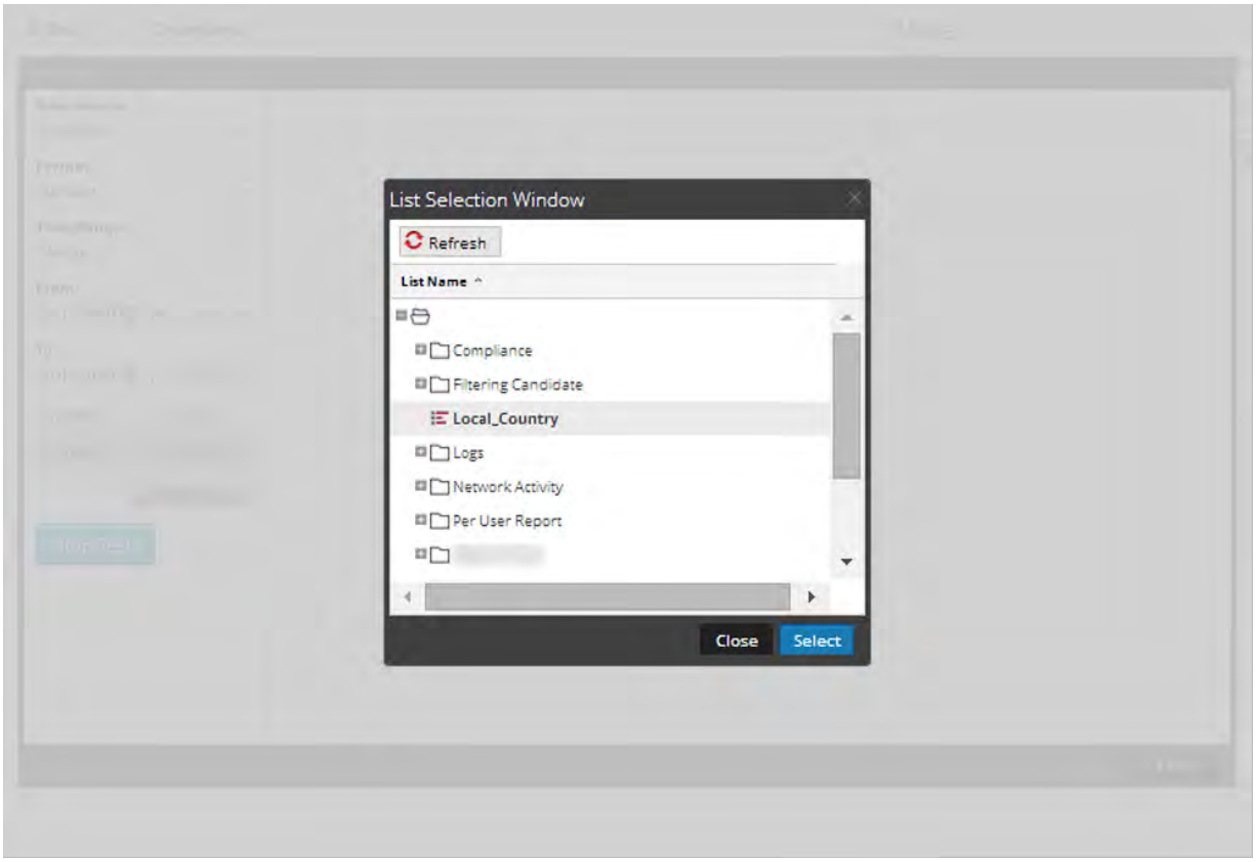
The following is an example of a Warehouse rule to view all the destination IP addresses for a specific source IP. The source IP address `ip_src` is defined as a variable `${IP_Address}`.



At runtime, you are prompted to enter the source IP address. The figure below shows the `IP_Address` variable, and you can enter a valid source IP address. All the destination IP addresses with the specified source IP are listed.

### Associate a Variable to a List of Values

You can associate the variable to a list. For example, you can create a list called `Local_Country` and enter all the country names as values. You can select the list `Local_Country` as the value for the variable `Local_Country`. At Run Configuration, the `Local_Country` list is populated and you can select the country based on which results are displayed.



# Iterative Report

An iterative report generates a report for every value in the list.

### To schedule an iterative report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

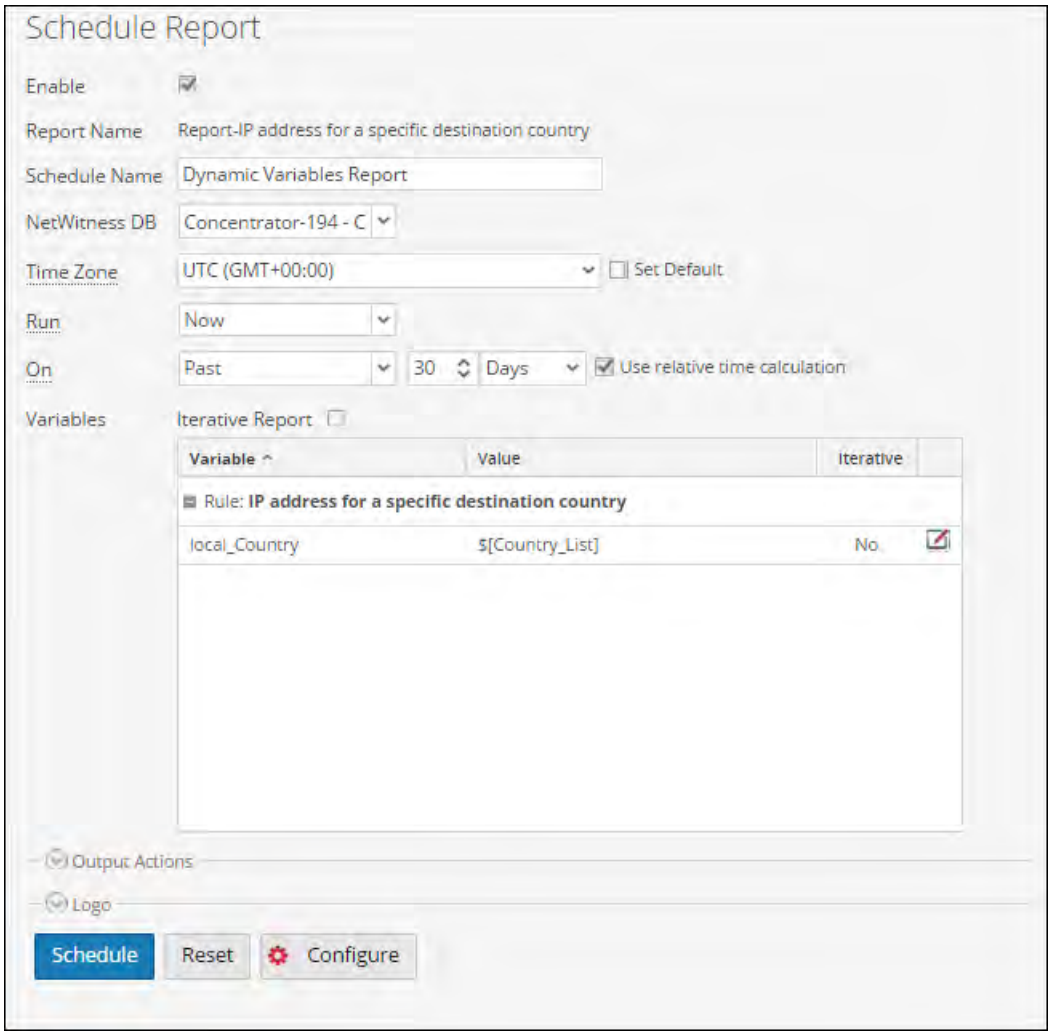
   The Report view is displayed.

3. On the **Reports** panel, click + to create a report.

4. Enter a Report name in the field.

5. Add the rule which has the user defined variable from the Rules tab.

6. Click **Schedule**.
   The Schedule Report view tab is displayed.



7. To execute the reports as per the schedule, select the **Enable** checkbox.
8. In the **Schedule Name** field, enter a name for the schedule report configuration.
9. From the **Data Source** field, select the data source.

> **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

10. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

> **Note:** All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

**Note:** If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

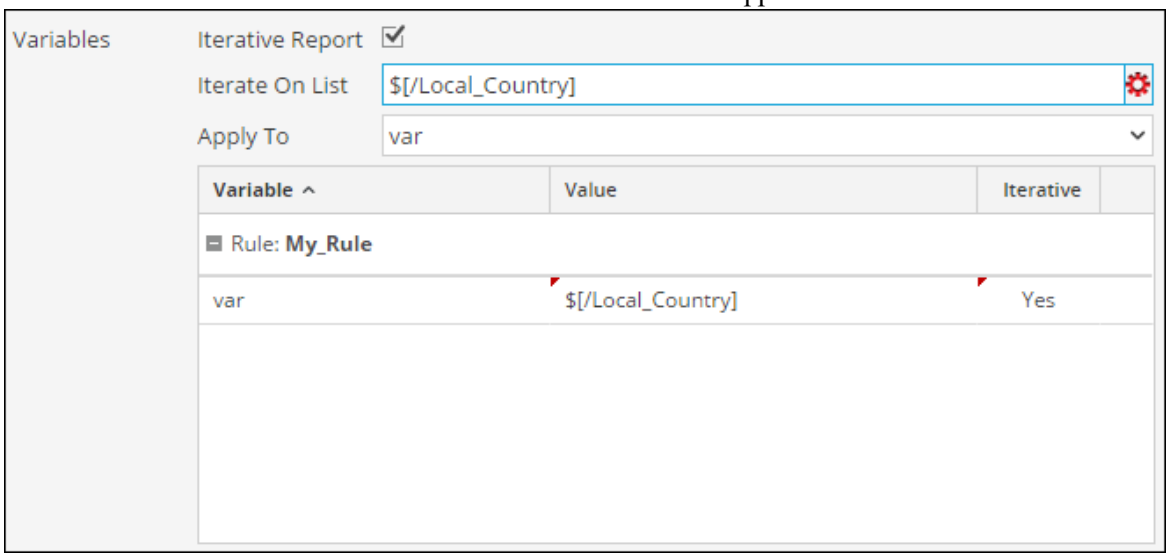
11. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
12. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    **Note:** While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
13. In the variables field, do the following:
    a. To run iterative reports, select the **Iterative Report** checkbox.
    b. To Iterate on List value, click .

       The List Selection Window opens.
    c. Choose a list and click **Select**.

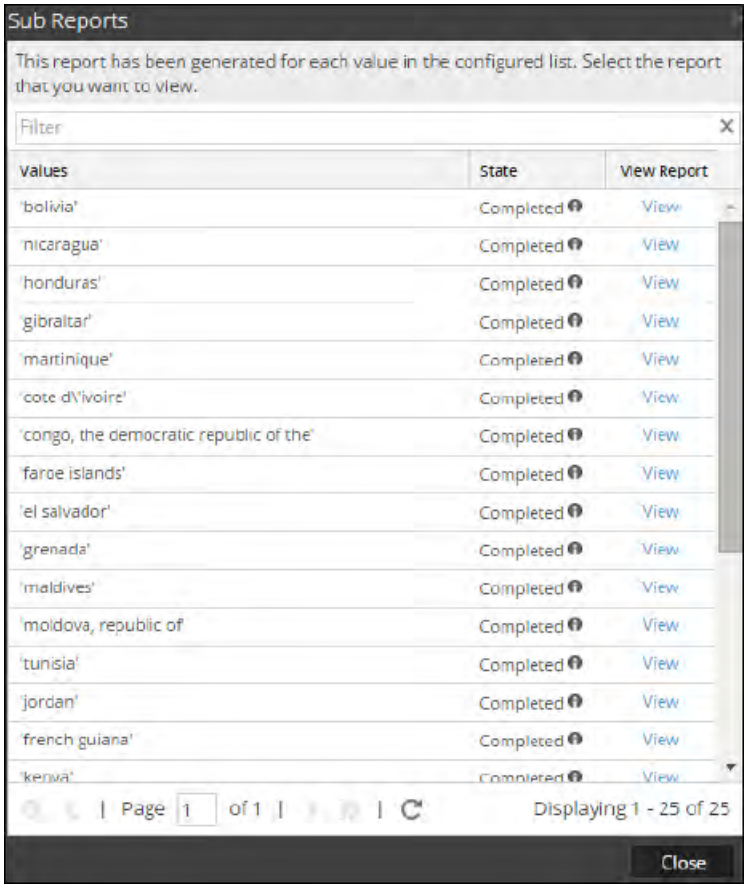
       The list item selected gets added to the **Iterate on List** field.

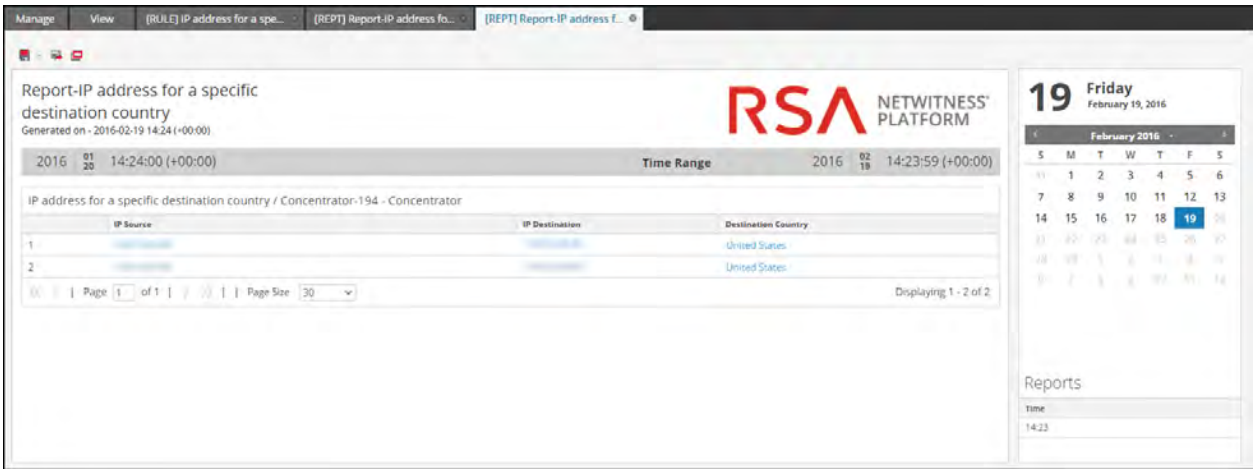
d. Select the variable on which the selected list value has to be applied.



14. Click **Schedule**.
    The scheduled report executes as scheduled and provides the configured outputs.

The following figure shows the Iterative Report view.





# Create a Report Using a Rule

You can create a report using a rule. When you create a report using a rule, a default report is created with this single rule. You can further edit the report to add more rules.

### To create a report using a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Choose any of the following:

   - Create a report using a rule when you create or edit the rule:

     a. In the **Rules** view, select a rule and click > **Use**> **Report**.

     The Use Rule dialog is displayed.

   - Select a rule in the Rules panel and click in the Rule toolbar. From the drop-down menu, select **Use** > **Report**.

   - In the Rules panel click > **Create Report**.

**Note:** Custom rules can be used to create a Report and If you select the view for the rule as "Area" or "Pie", a window pops up for **X-Axis** and **Y-Axis** inputs. By default, you can select only the first meta in **X-Axis**.

3. Select **New Report** or **Existing Report** based on your requirement.
4. Click **Select**.

# View a Report

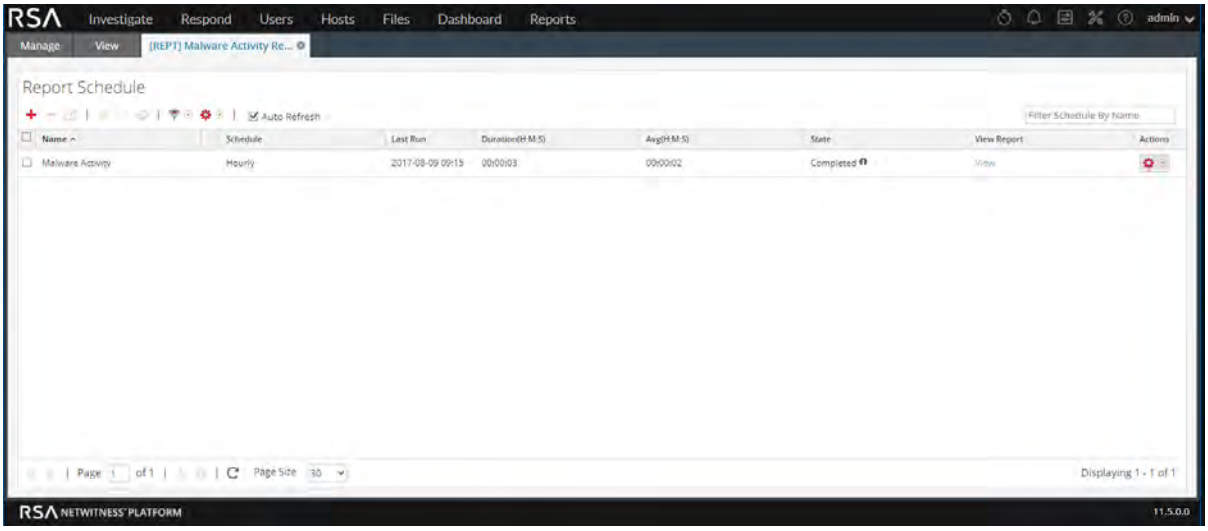
You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.

After you view a report, you can perform any of the following tasks:

1. You can print, save, email and view reports on full screen.
2. You can also select a date from the calendar to view a list of successfully run reports for the chosen date.

### To view a report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and in Actions column, click > **View Scheduled Reports**.
4. Click the **#Schedules** column.
   The Schedule Reports view tab is displayed with the status of each of the scheduled report.



5. Select a scheduled report and click **View**.
   One of the following is displayed:
   - The selected report.
   - The Sub reports panel for a scheduled report having 'Iterative' selected.

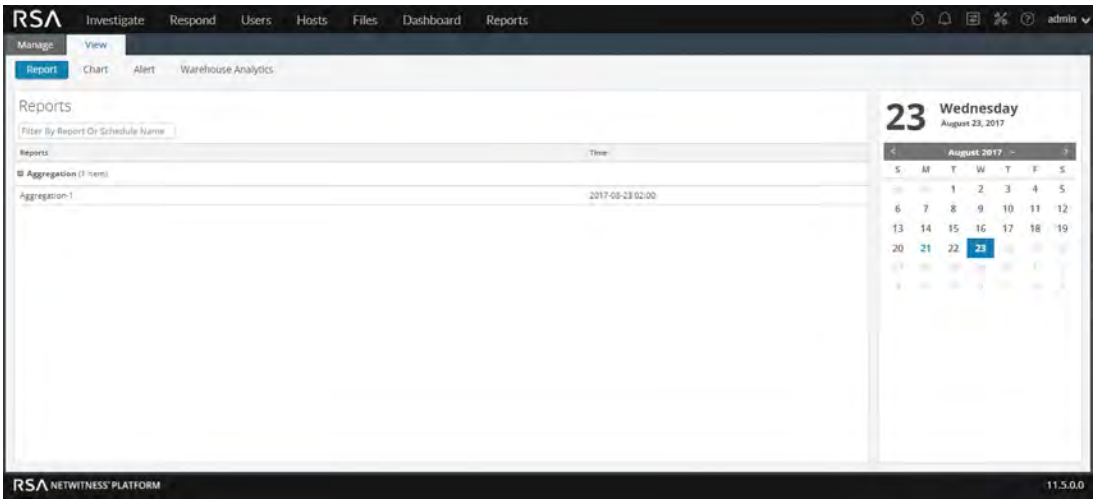
For each value in the configured list a report is displayed.

**Note:** If the report status is partial or complete, the "last run timestamp" and the "last run (seconds)" are updated. However, the average time taken to run the report is updated only when the report status is complete and not when it is partial.

### To view a list of all reports, perform the following:

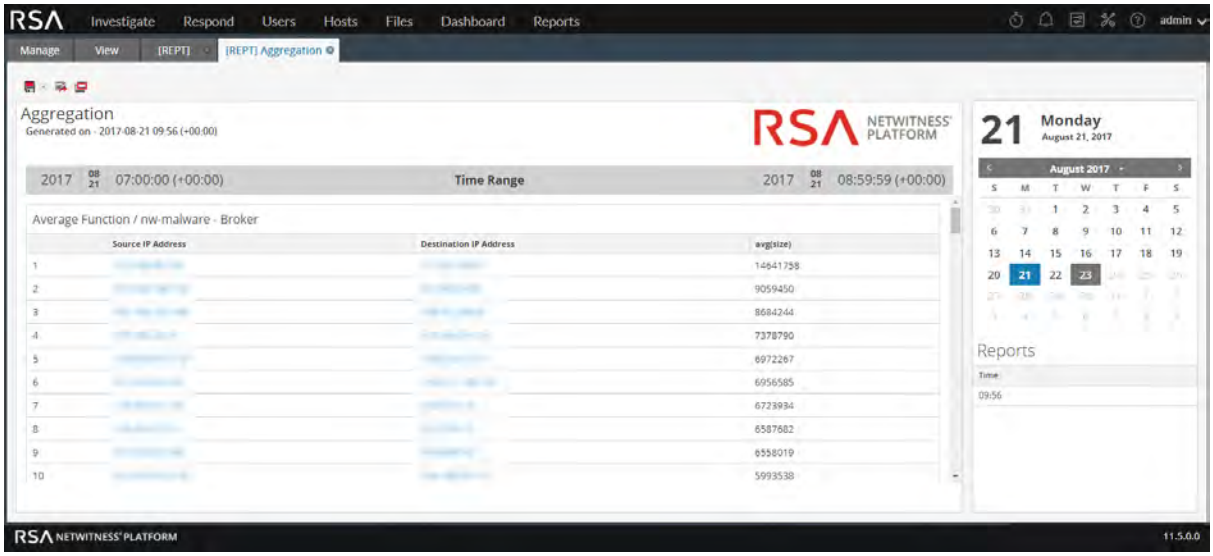
1. Go to **Reports**.
   The **Manage** tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, click **View All Reports**.
   A list of reports along with their schedule name and time are displayed on the View tab.

**Note:** If no list is displayed, select a date from the calendar to view a list of reports for that date.



4. Double-click on a report to view the details of the report.

5. You can select a scheduled report and print, save as PDF/CSV, send email notifications, or view it on full screen.



# Investigate a Report

You can investigate a report by directly navigating to the Investigation View from the report. With the Investigate a report option, you can investigate each event mentioned in the report.

### To investigate a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

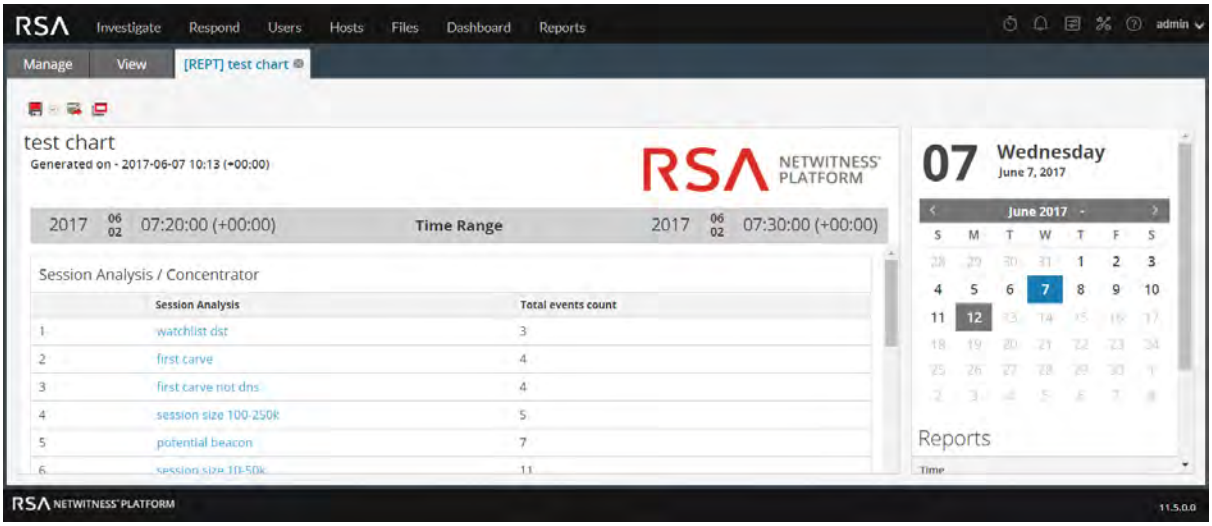
3. In the **Reports** toolbar, click **View All Reports**.

   The View All Reports tab is displayed.

   **Note:** If no reports are displayed in the View All Reports, select a date for which you want to display the reports.

4. Double-click the report name to view the report details.

   The Report details screen is displayed.



You can click on the session analysis to investigate on the report.

**Note:** If you want to manually copy the result data and use it for investigation, make sure that the binary values are prefixed with 'hex:'.

# Manage Lists, Rules or Reports

You can set access control, delete, edit, import, or export a list, rule or report.

## Manage a List

You can perform the following procedures to manage a list.

- Access Control for a List and List Group
- Edit a List
- Delete a List or List Group
- Duplicate a List
- Export a List or List Group
- Import a List or List Group
- Filter Unused Lists

### Access Control for a List and List Group

You can set up the access permissions for the user roles to manage lists or list groups. The Reporting provides access control at the list and list group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the (Admin) > Security > Roles tab.

As an administrator, you must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

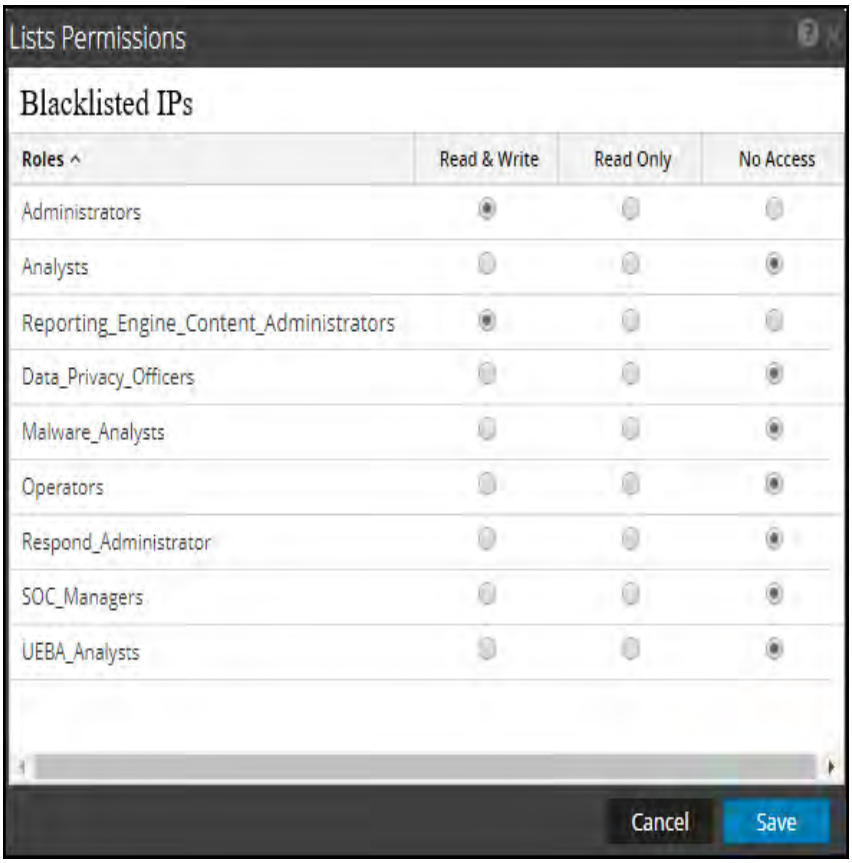
Lists or list groups can be assigned to a specific set of user roles. When users log into NetWitness, they can access only those lists to which they belong. Users who belong to a user role with the **Read & Write** access permission have full access rights on the lists. Further, the access can be strengthened so that lists are accessed only by those who have the **Read Only** access.

**Note:** You must have **Read Only** permission for a list group to view the lists within that group.

For example, if you want **Security Analysts** to have access to all the lists in a list group, you can set the permission **Read & Write** at the list group level. And, if you do not want the **Operator** role to have access to a specific set of lists in a list group, you can set the permission **No Access** at the list group level.

At the list or list group level, you can set the following access permissions for the user roles in NetWitness. For more information, see List View:

- Read & Write
- Read Only
- No Access



The following table lists the columns in the Lists Permissions panel:

| Column | Description |
|---|---|
| Roles | Describes roles of the users logged into the NetWitness user interface. |
| Read & Write | Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule. |
| Read Only | Allows users to only access and view the list on the lists view. |
| No Access | Doesn't allow users to access or view the lists. |

## Access Control for a List

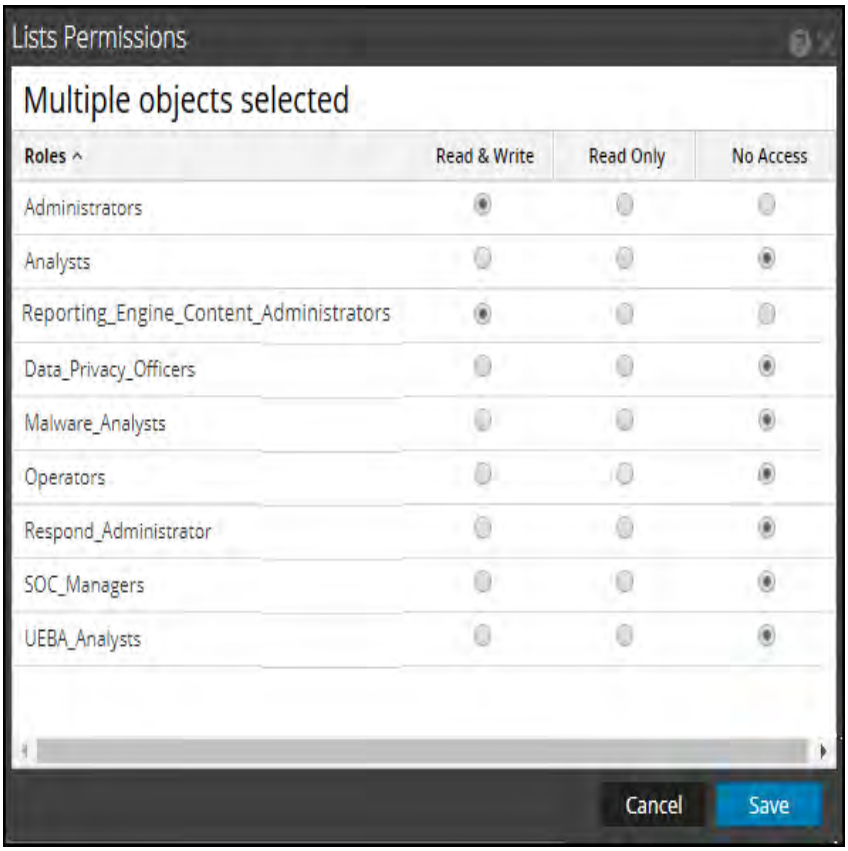
To change the list permissions, you must select a list and set access permissions using the List Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list level. Except for administrators (with full access in Reporting Engine service Config page) and reporting engine content administrators, the default permission set for all the user roles is **No Access** before applying job permissions.

## Access Control Multiple Lists

You can select multiple lists at once and set access permissions using the Lists Permissions Panel. The access permission that you choose is applied to all the selected lists.

**Note:** The **"*"** beside the role name indicates that other permissions are available for the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



**Note:** If a user (other than ADMIN) creates a list, ADMIN cannot access that list.

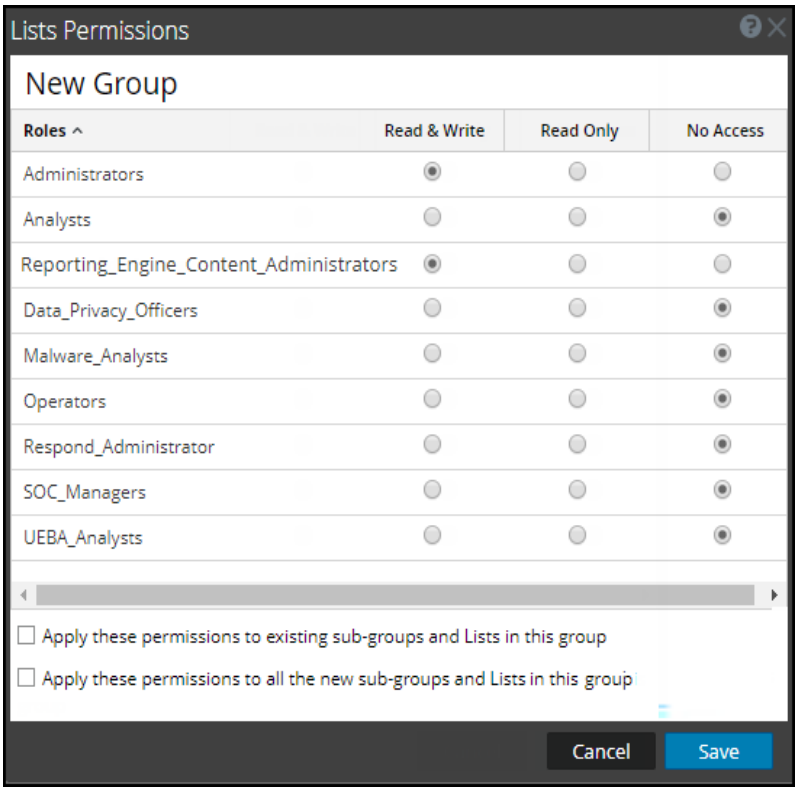
## Access Control for a List Group

To change the list group permissions, you must select a list group and set access permissions using the Lists Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list group level. The default permission set for all the other user roles is **No Access** before applying job permissions.

You can also apply permissions to existing subgroups and lists in the group by selecting the appropriate checkbox.

You can also apply permissions to all the new subgroups and lists in the group by selecting the appropriate checkbox.



The following scenarios describe defining permissions for list groups or subgroups and lists in the groups:

- Scenario 1: Permissions applied to list group or subgroup based on the user role.

  Each of the levels will have a permission set depending on the user role. For example, if a list group is assigned the role of Security Analyst, permissions are set to Read & Write for the list group.

- Scenario 2: Permissions applied to subgroups and lists in the group.

  The access permissions that you set can be applied to subgroups and child objects of this group. Permission at the list group level will be inherited by the subgroups and lists in the group.

| Role (Analysts) | Permissions applied to list group or subgroup based on the user role | Permissions applied to subgroup and lists in the group |
|---|---|---|
| Group | Read & Write | Read & Write |
| Subgroup | Read | Read & Write - Inherited |
| Lists | Read | Read & Write - Inherited |

## Access permission for a list or list group

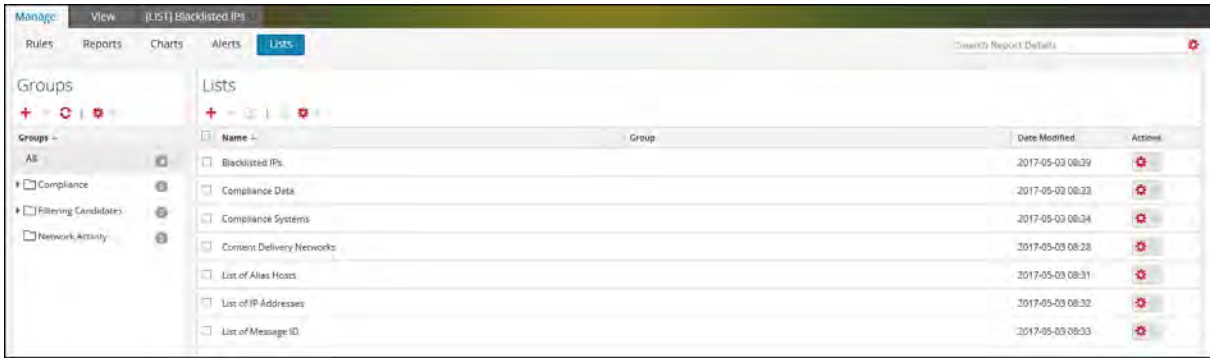
Ensure that you have at least **Read & Write** access permission so that you can set access permissions for lists or list groups.

### To set access permission for a list, perform the following:

1. Go to **Reports**.

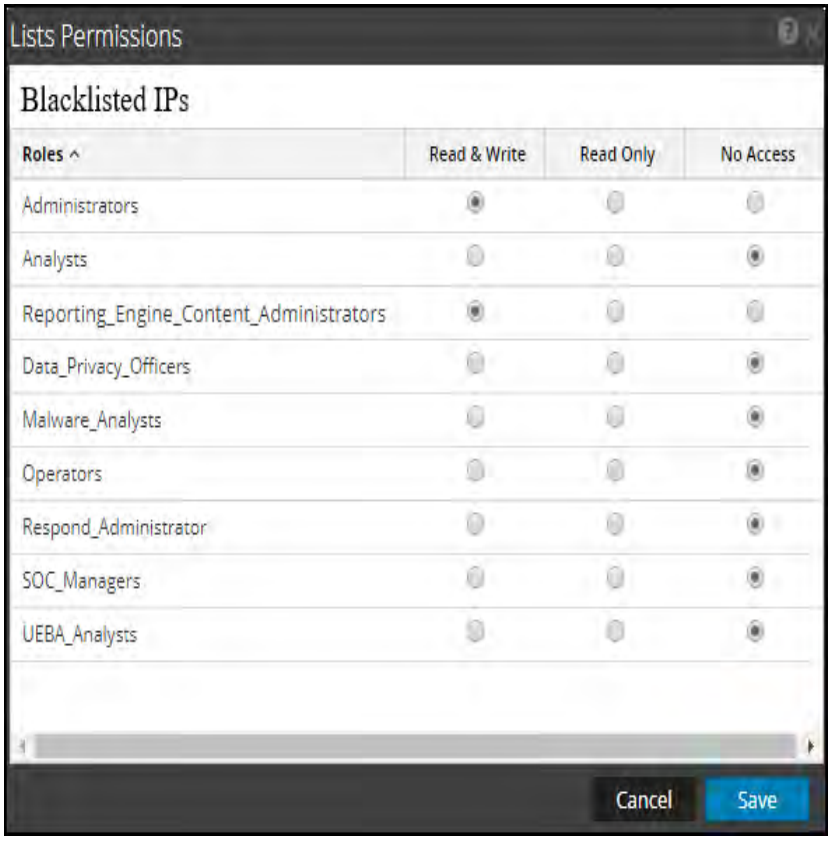
   The Manage tab is displayed.

2. Click **Lists**.
   The List view is displayed.



3. In the **Lists** panel, select a list.

4. Click > **Permissions** in the List toolbar.
   The List Permissions dialog is displayed.



5. Select the appropriate access permission for each of the user roles and click **Save**.

   A confirmation message that the permission is successfully set for the selected list is displayed.

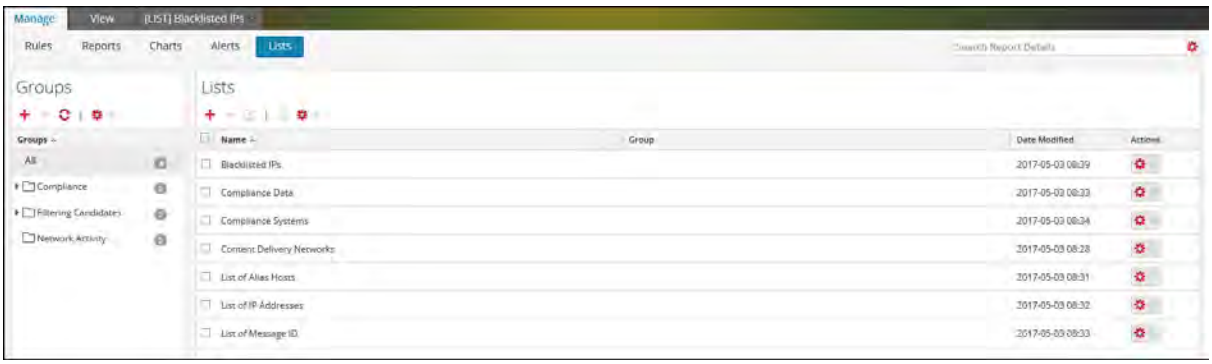
### To set access control for a list group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

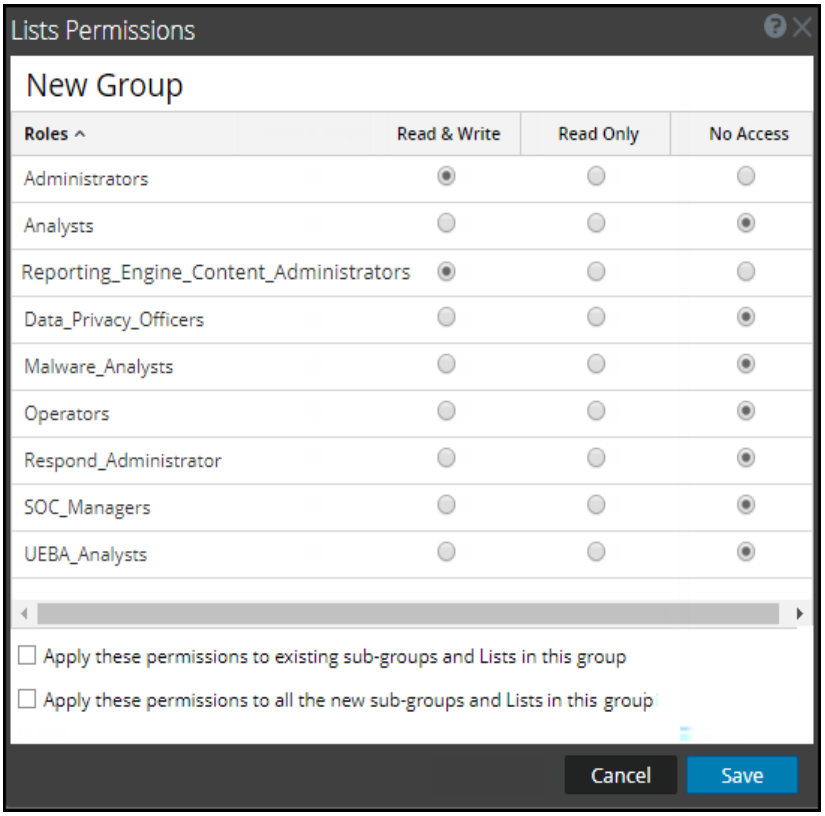
   The List view is displayed.



3. In the **Lists Groups** panel, select a list group.

4. Click > **Permissions**.

   The List Permissions dialog is displayed.



5. (Optional) Select the appropriate checkbox to apply these permissions to existing subgroups and lists in this group.
6. (Optional) select the appropriate checkbox to apply these permissions to all the new subgroups and lists in this group.
7. Click **Save**.

   A confirmation message that the permission is successfully set for the selected list group is displayed.

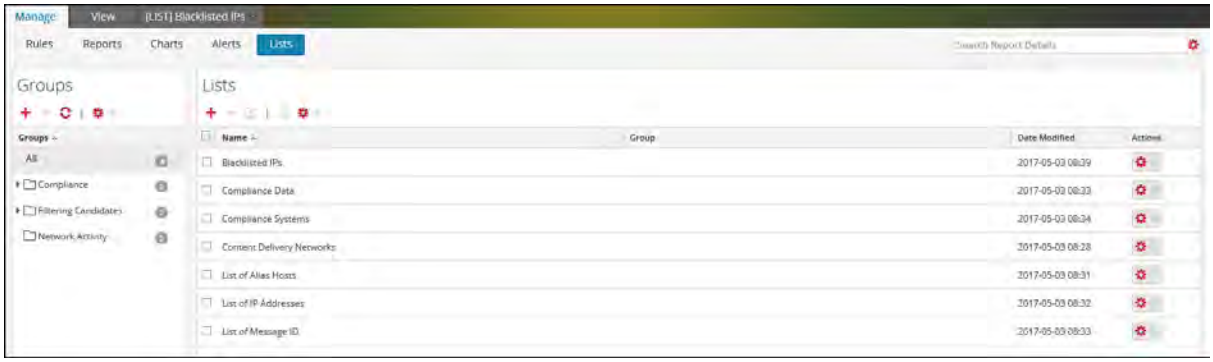
## Edit a List

To edit a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.



3. In the **Lists** panel, select a list that you want to edit and do one of the following.
   - Click in the **Lists** toolbar.
   - In the **Lists** panel, click **> Edit**.

     **Note:** You can only edit one list at a time.
4. Modify the required fields and add new values to the list.
5. Click **Save**.

   A confirmation message that the list is saved successfully is displayed.

## Delete a List or List Group

### To delete a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.

3. In the **Lists** panel, do one of the following:

   - Select a list or multiple lists that you want to delete and click ▬ in the **Lists** toolbar.
   - In the **Actions** column, click ⚙ **> Delete**.

   **Note:** Before you delete a list, make sure that the list is not associated with any rule.

4. Click **Yes** to delete the list.

   A confirmation message that the list is deleted is displayed and the selected list is deleted from the List View panel.

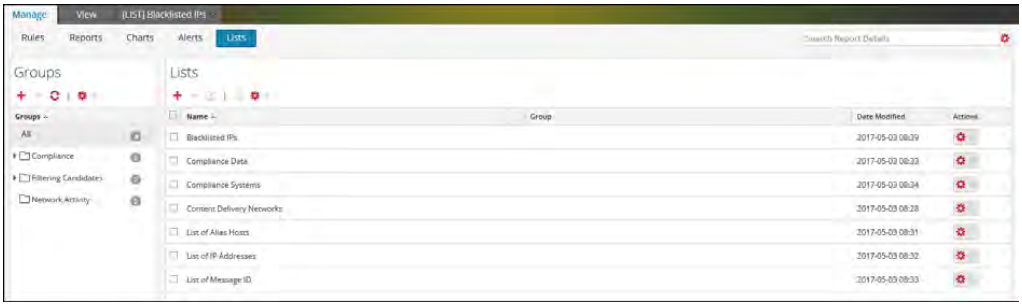
### To delete a list group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

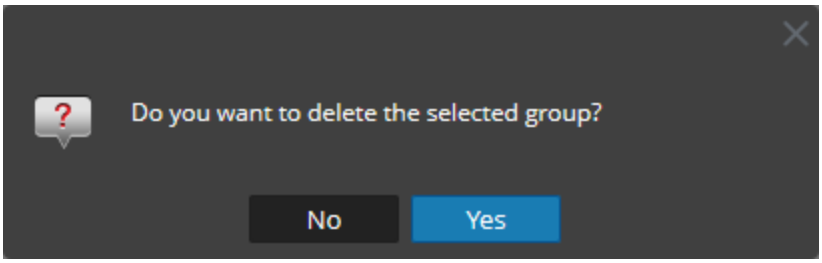
2. Click **Lists**.

   The List view is displayed.



3. In the **Lists Groups** panel, select the group and click ▬ .

   A confirmation dialog is displayed.



**Caution:** If you delete a group, all subgroups and lists in that group are deleted.

4. Click **Yes** to delete the selected group.

**Note:** If you try to delete a list group that has lists referenced in a rule or an alert, a warning message that **Lists are referenced in a rule** is displayed.

## Duplicate a List

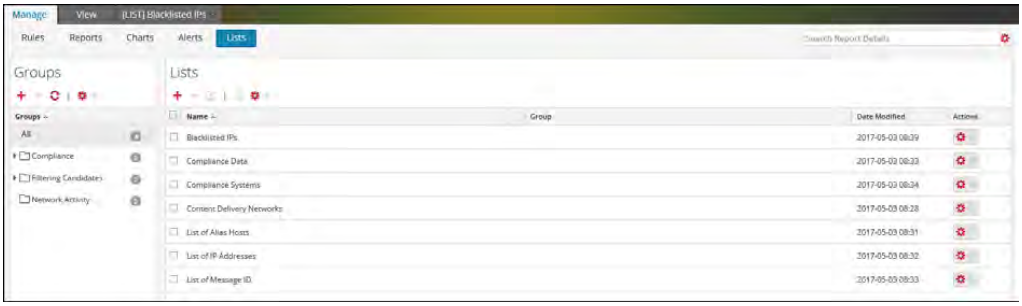
### To duplicate a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **Lists** panel, select a list that you want to duplicate.

   **Note:** You can only duplicate one list at a time.

4. In the **Lists** toolbar, click .

## Export a List or List Group

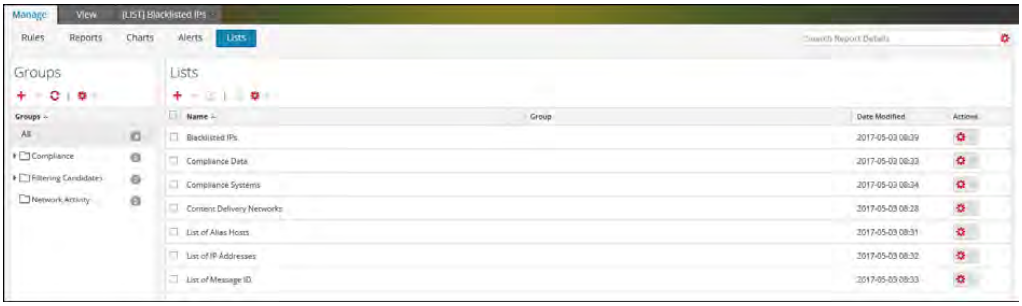
### To export a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

The List view is displayed.



3. In the **Lists** panel, do one of the following:

   - Select a list and click **> Export** in the List toolbar.
   - In **Actions** column, click > **Export**

   You can export multiple lists at a time. To select multiple lists, select the checkbox of the lists to be exported. A browser-specific export dialog may be displayed allowing you to open or save the file.

### To export a list group, perform the following:

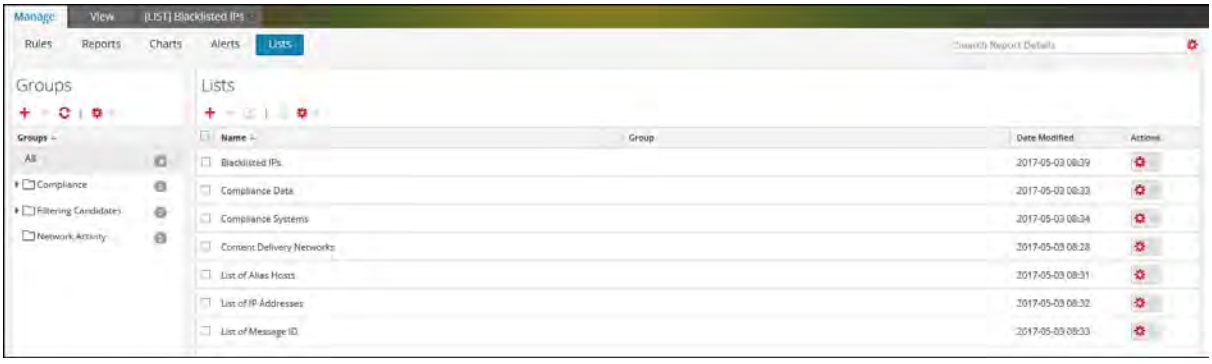
You can export selected list groups to an external file that can be later imported to NetWitness. If nothing is selected in the List Library panel, the entire list tree is exported. When you export, the result is a single export file in binary format.

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **Lists Groups** panel, select the list group containing the lists which you want to export.

4. Click > **Export**.

   You can export multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be exported. The exported file is saved to the local drive.

# Import a List or List Group

### To import a list, perform the following:

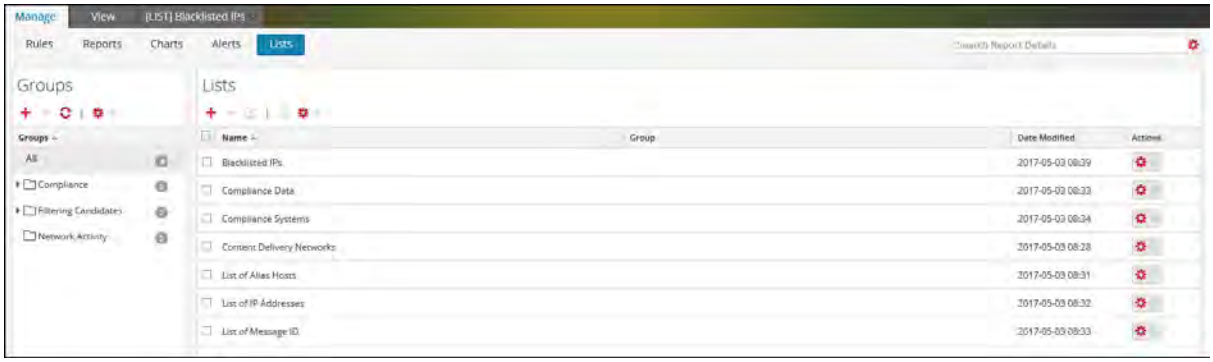
You can import lists from instances of NetWitness into the list tree in the List View panel. Lists must be in a valid binary file exported from a NetWitness instance.

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.

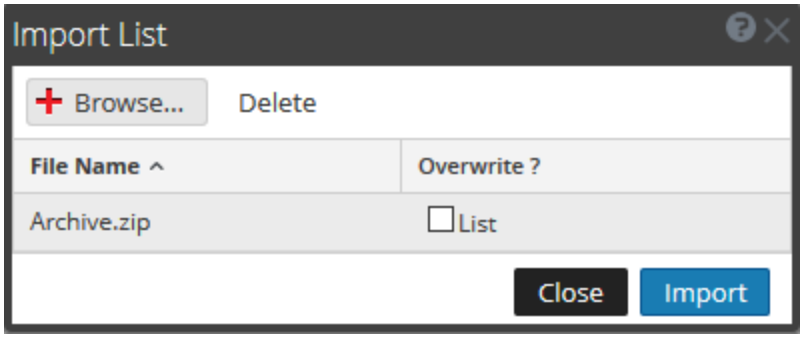


3. In the **Lists** toolbar, click > **Import**.

   The Import List dialog is displayed.

   **Note:** You can import multiple lists at a time. To select multiple lists, press and hold the CTRL button and select the lists to be imported.

4. Click **Browse** and select archived file containing the lists.



5. Click **Import**.

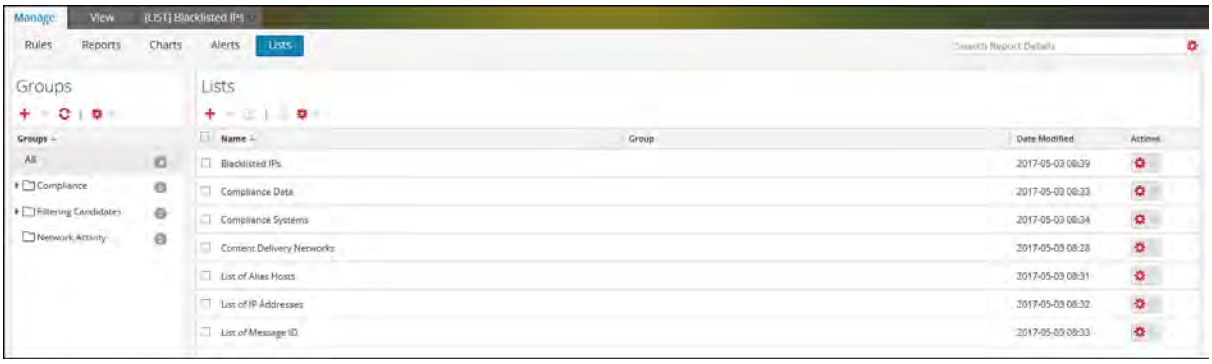
**Note:** During the import process, if a duplicate list exists and you do not select the overwrite option, the list is imported and no message about duplicate lists is displayed.

### To import a list group, perform the following:

You can import list groups from instances of NetWitness into the list tree in the List Groups panel. Lists must be in a valid binary file exported from a NetWitness instance.

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.



3. In the **Lists Groups** panel, click > **Import**.

   The Import List dialog box is displayed.
4. Click **Browse** and select archived file containing the list groups.

   You can import multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be imported.
5. Click **Import**.

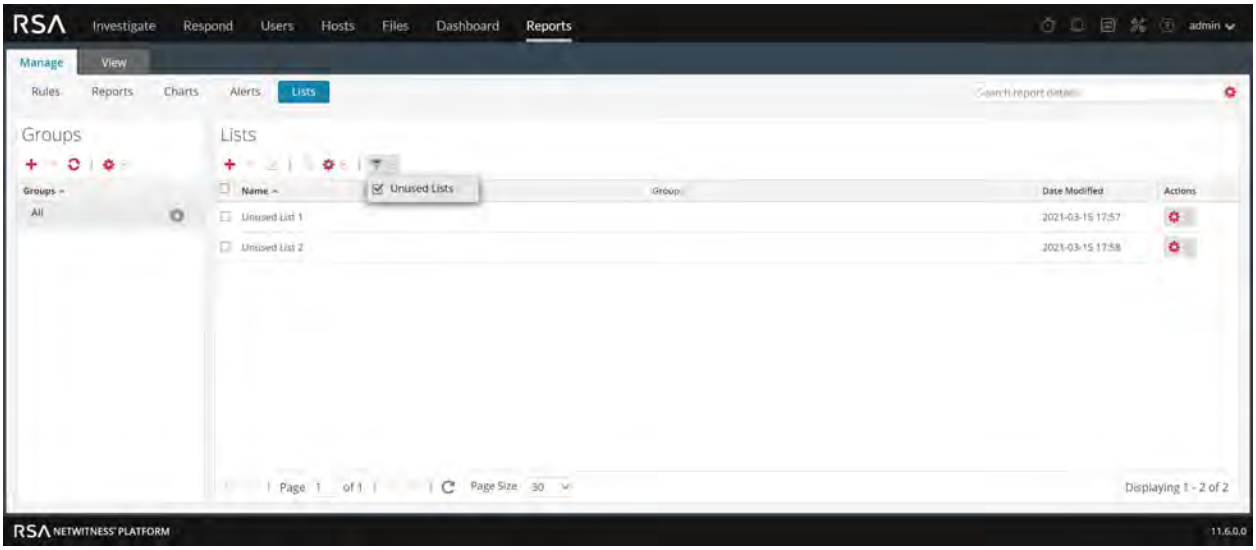
**Note:** During the import process, if a duplicate list group exists and you do not select the overwrite option, the list group is imported and no message about duplicate list group is displayed.

## Filter Unused Lists

You can filter and delete the lists that are not used by any rule. To filter unused lists:

1. Go to **Reports**.
   The **Manage** tab is displayed.
2. In the **Lists** panel, click and select **Unused Lists**.
   List of unused lists will get displayed.

3. [Optional] Delete the unused lists.
   For more information, see Delete a List or List Group.



# Manage a Rule

You can perform the following procedures to manage a rule.

- Access Control for a Rule and Rule Group
- Delete a Rule or Rule Group
- Duplicate a Rule
- Edit a Rule
- View Dependents of a Rule
- Export a Rule or Rule Group
- Filter Unused Rules

## Access Control for a Rule and Rule Group

To set access permissions the user will have depending on the user role to manage a rule or rule group. The Reporting provides access control at the rule and rule group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the **(Admin) > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Rules or Rule Groups can be tied to a specific set of user roles so that when a user logs into NetWitness, the only rules they can access are rules accessible to the group to which the user belongs. Users that belong to a user role with the ‘Read & Write’ access permission have full access rights on the rule. Further, the access can be tightened so that rules are accessed only by those who have the ‘Read Only’ access.

**Note:** You must at least have ‘Read Only’ permission on a group to view the rules within that group.

At the rule level, you can set the following access permissions for the user roles:

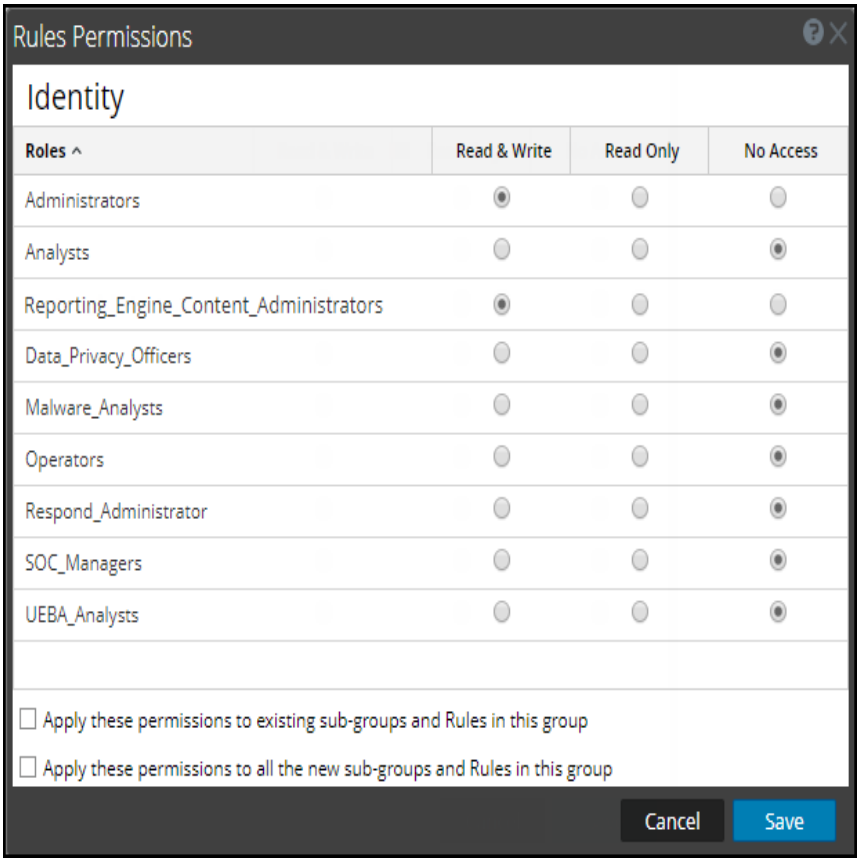
- Read & Write
- Read Only
- No Access

Suppose, you want the **Security Analysts** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' at the Rule Group level. And, if you do not want the **Operator** role to have access to a specific set of rules in a rule group, you can set the permission '**No Access**' at the Rule Group level. The permission is set only for the rule group but not the rules or subgroups in the Rule Group.

## Access Control for a Rule Group

When you want to change the rule group permissions, you must select a rule group and set access permissions using the Rule Permissions panel.

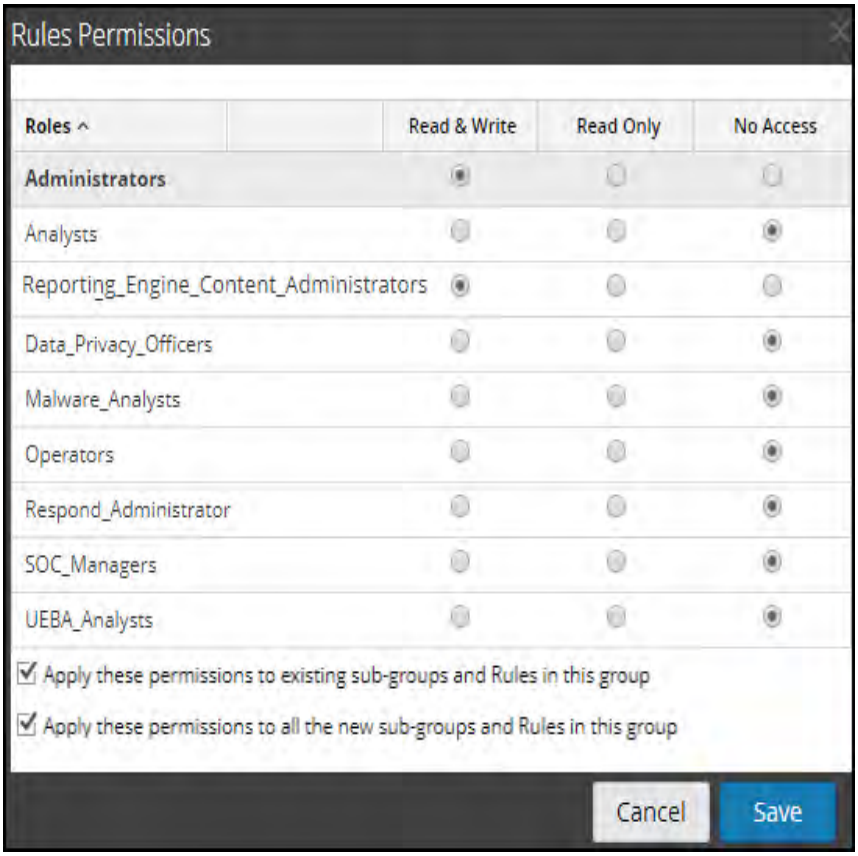
Before applying rule group permissions, the default permission set for all the user roles is 'No Access' permission, and the checkboxes are deselected.



If you want to change the access permission for a specific user role, you must set these at the rule group level, as shown in the figure. Suppose, you want the **Administrators** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' in the Rule Group Permissions panel.

You can also apply permissions to existing subgroups and Rules in the group by selecting the appropriate checkbox.

You can also apply permissions to all the new subgroups and Rules in the group by selecting the appropriate checkbox.



You can also apply permissions to subgroups and rules in the group by selecting the checkbox.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Rule Group/ Sub Group/ Rules based on the user role.
- Scenario 2: Permissions applied to Sub Group and Rules in the Group.

| Role (Analysts) | Permissions applied to Rule Group/ Sub Group/ Rules based on the user role | Permissions applied to Sub group and Rules in the Group |
|---|---|---|
| **Group** | Read & Write | Read & Write |
| **Sub Group** | Read | Read & Write - Inherited |
| **Rules** | Read | Read & Write - Inherited |

The access permissions that you set can be applied to subgroups and child objects of this group.

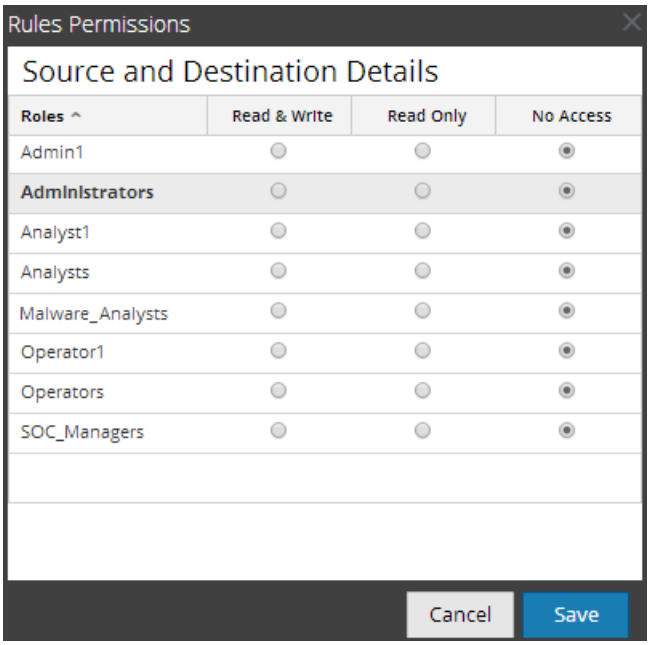
The Rule Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** rule group.

For scenario 1, each of the levels will have a permission set depending on the user role. For scenario 2, the permission at the Rule Group level will be inherited by the Sub Group and Rules in the Group.

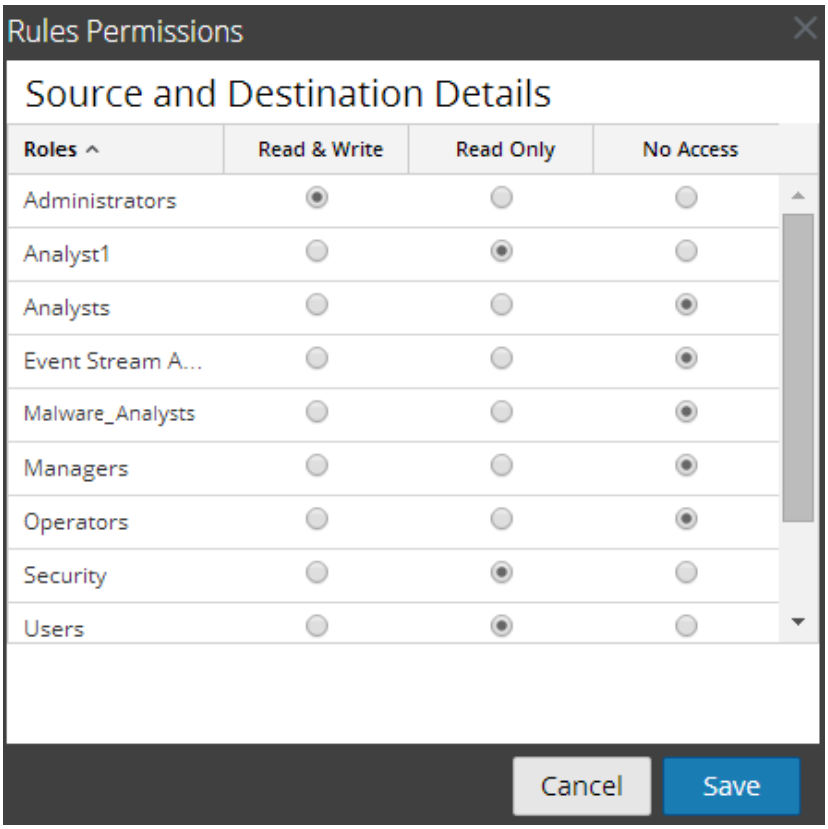
## Access Control for a Rule

When you want to change the rule permissions, you must select a rule and set their access permissions using the Rule Permissions panel.

Before applying the Rule permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is deselected.



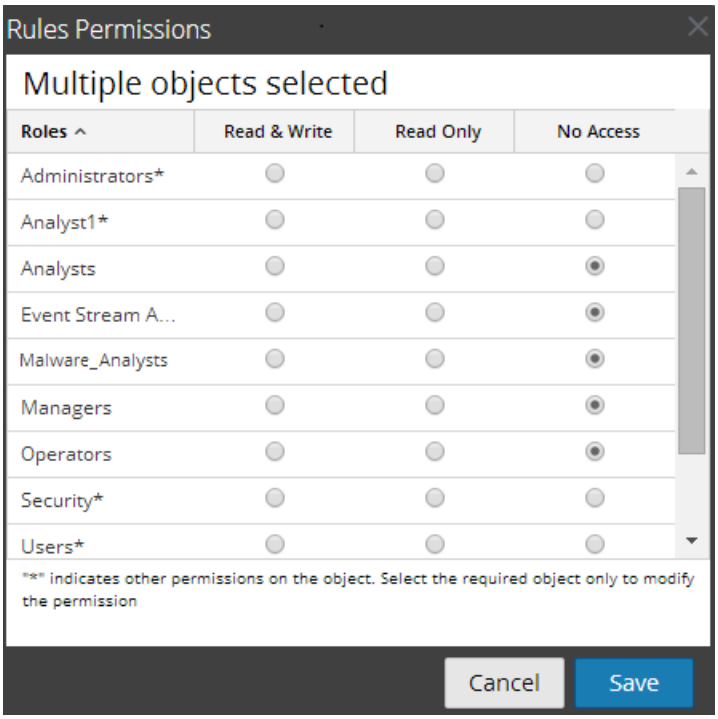
If you want to change the access permission for a specific user role, you must set these at the rule level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific rule, you can set the permission '**Read & Write**' in the Rule Permissions panel.



## Access Control for a Rule When Multiple Rules are Selected

When you want to change permissions of multiple rules, you can select multiple rules at a time and set their access permissions using the Rules Permissions Panel. The access permission that you choose will be applied to all the selected rules.

**Note:** The '*' besides the role name indicates the other permissions available on the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



## Log in as a specific user and view the access details

When you log in to the NetWitness UI as a user having 'Read access' permission, all the rules will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Rules panel.

When you log in to the NetWitness

UI as a user not having 'Read & Write' access permission on a Rule, all the rules will be denoted with the symbol ( 🚫 ) and the rules appear grayed out on the Rules List panel.

The following figure shows the Rules panel when logged in with minimal 'Read & Write' access permission.

| Name | Type | Group | Date Modified | Actions |
|---|---|---|---|---|
| *(raw_log)-RULE | Warehouse | Aggregate Function | 2014-07-13 09:46 | |
| [redacted] | Warehouse | Regular | 2014-07-16 07:34 | |
| Accounts Created | NetWitness DB | Identity Management | 2014-07-14 10:56 | |
| Accounts Created SAW | Warehouse | Compliance_old | 2014-07-14 09:40 | |
| Accounts Created SAW | Warehouse | Warehouse | 2014-07-25 09:48 | |
| Accounts Created SAW(1) | Warehouse | Warehouse | 2014-07-25 09:54 | |
| Accounts Deleted | NetWitness DB | Identity Management | 2014-06-26 08:35 | |

**Note:** If a user (other than administrator) creates a rule, ADMIN cannot access that rule.

## Tabular Listing

The following table lists the columns in the Rules Permissions panel:

| Column | Description |
|---|---|
| Roles | The role of the user logged into the NetWitness user interface. |
| Read & Write | The user can access, view, edit, delete, import, and export rules on the Rules view. The user can also change the permission on the rule. |
| Read Only | The user can only access and view the rule on the Rules view |
| No Access | The user cannot access or view the rule for which this permission is set. |

## Set Access Control for a Rule

You can set access control for a rule. The Reporting Engine provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rules in the rule group.

### Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule.

**To set access control for a rule, perform the following:**

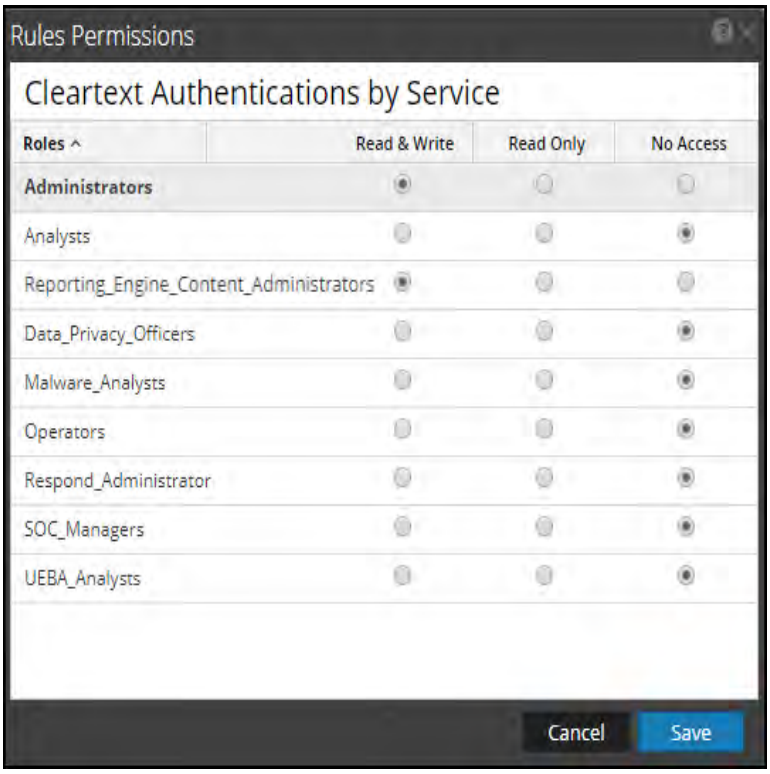
1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, select the rule.

3. Click > **Permissions** in the Rule toolbar.

   The **Rules Permissions** dialog is displayed.



4. Select the following appropriate access permission for the user role and click **Save**.
   - Read & Write
   - Read Only
   - No Access

## Set Access Control for a Rule Group

You can set access control at the rule group level. Only a user who has the right set of permissions can perform the tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule group level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rule in the rule groups.

## Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule group.

To set access control for a rule group, perform the following:

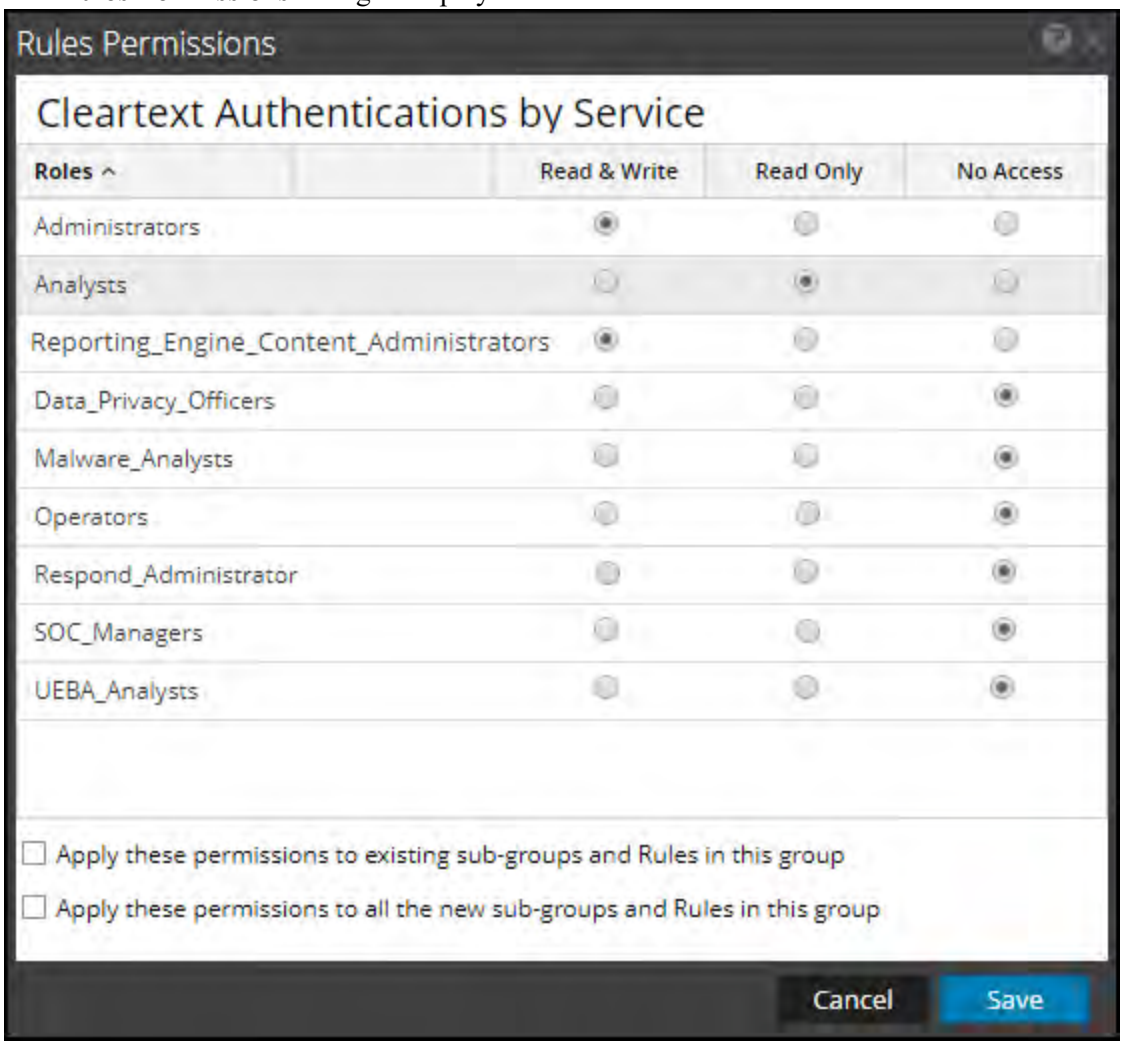
1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules Groups** panel, select the rule group and Click

and select **Permissions**.

The **Rules Permissions** dialog is displayed.



3. (Optional) Select the appropriate checkbox to apply these permissions to existing subgroups and Rules in this group.
4. (Optional) Select the appropriate checkbox to apply these permissions to all the new subgroups and Rules created in this group.
5. Click **Save**.

   A confirmation message that permission is successfully set for the selected rule group is displayed.

## Delete a Rule or Rule Group

To delete a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, do one of the following.
   - Select a rule and click − in the Rule toolbar.
   - Click ⚙ > **Delete**.

   A confirmation dialog is displayed.

   **Note:** If a rule is being used in a report, a warning that the rule is in use and cannot be deleted is displayed.

3. Click **Yes** to delete the rule.

   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rules panel.

To delete a rule group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules Groups** panel, select the rule group that you want to delete.
3. Click −.

   A confirmation dialog is displayed.

   **Note:** If any one of the rules in the group is being used in reports, a warning that the rule is in use and cannot be deleted is displayed.

4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Rule Groups panel.

## Duplicate a Rule

To duplicate a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. In the **Rules** panel, select a rule that you want to duplicate.
3. In the Rule toolbar, click .

## Edit a Rule

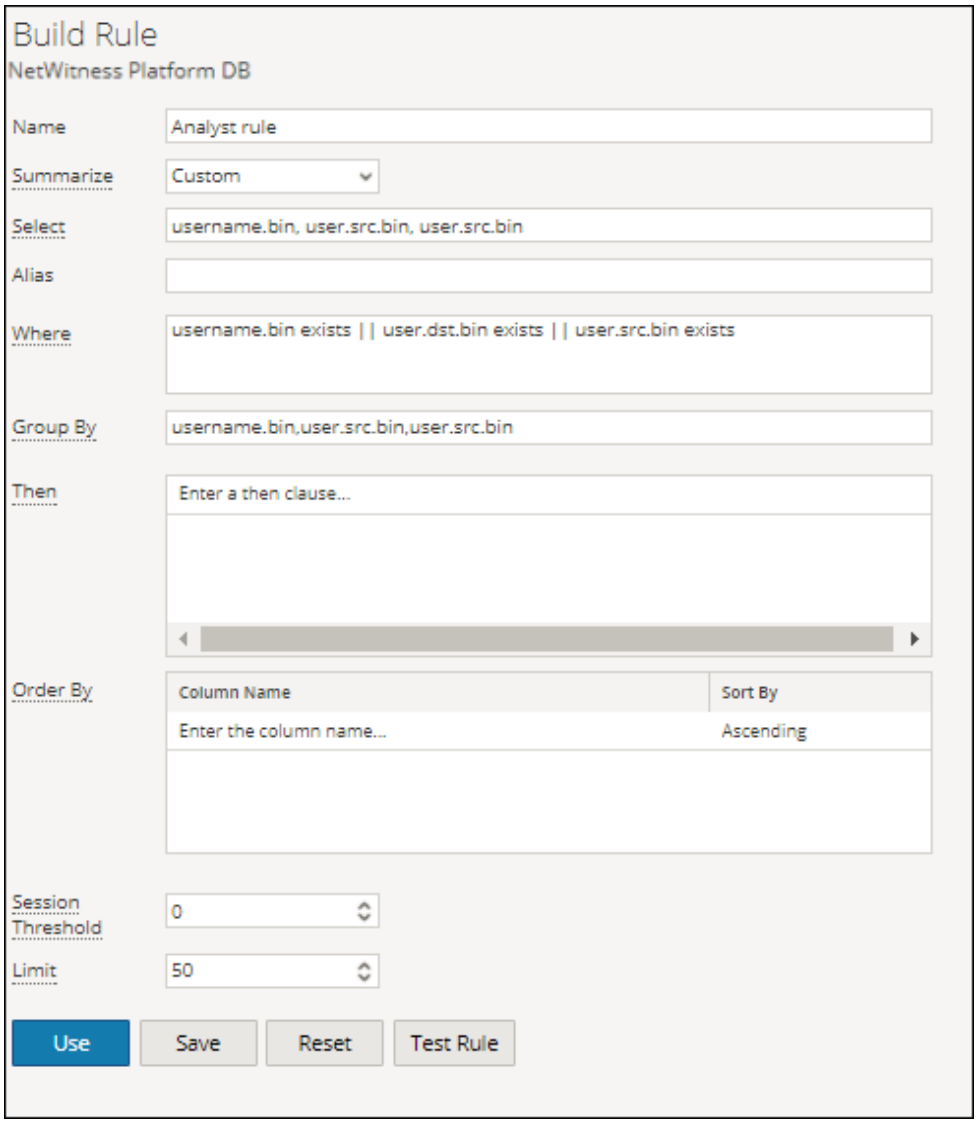
To edit a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following:

   - Select a rule and click in the Rule toolbar.
   - Click > **Edit**.

     The Build Rule view tab is displayed.



**Note:** If a rule is edited, the updated rule definition is applied to the Reports, Charts, and Alerts where the rule is included.

3. Modify the required fields.
4. Click **Save**.

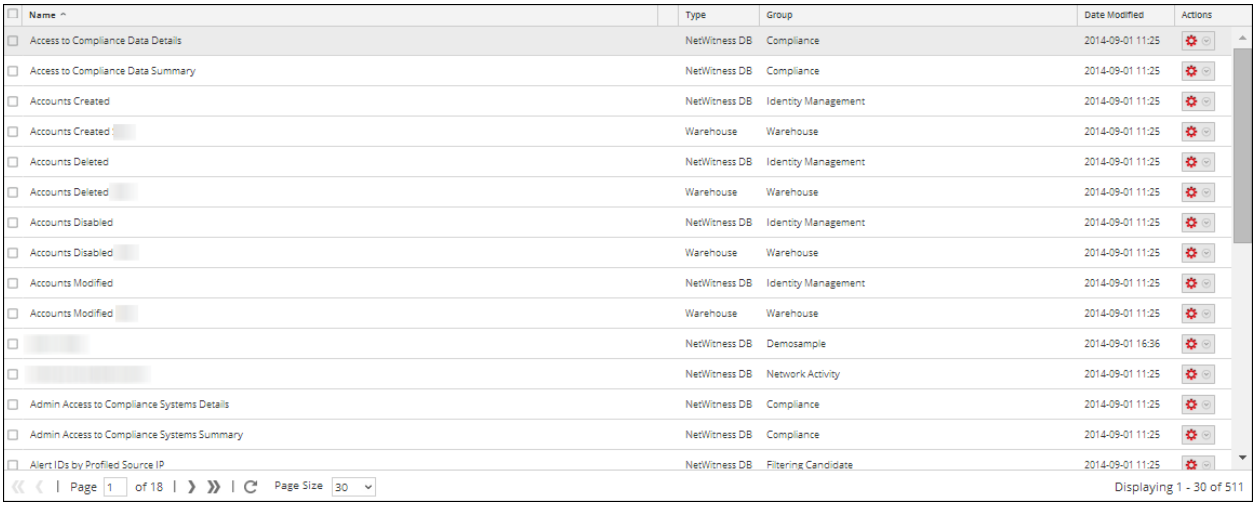
   A confirmation message that the rule is saved successfully is displayed.

When you edit a rule, ensure to re-select the Rule for which you want the Chart to be generated, so that the edited rule is applied. If you do not re-select the Rule and attempt to save or test the rule, the rule is saved and a warning message is displayed.

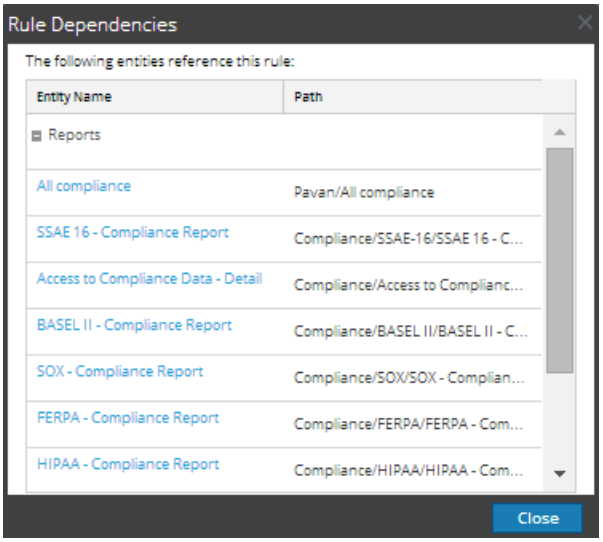
## View Dependents of a Rule

You can view dependents of a rule. You must traverse a rule list, select a rule for which you want to identify the dependency over a report, chart, or alert.

The following figure shows the Rule View where you select the rule 'Access to Compliance Data Details'.



The following figure shows the dependency of the rule over alerts and reports.



The following table lists the various columns in the Rule Dependencies dialog and their description.

| Column | Description |
|---|---|
| Entity Name | The name of the entity referencing the rule. |
| Path | The path where the entity is located in the user interface. |

To view dependents of a rule, perform the following:

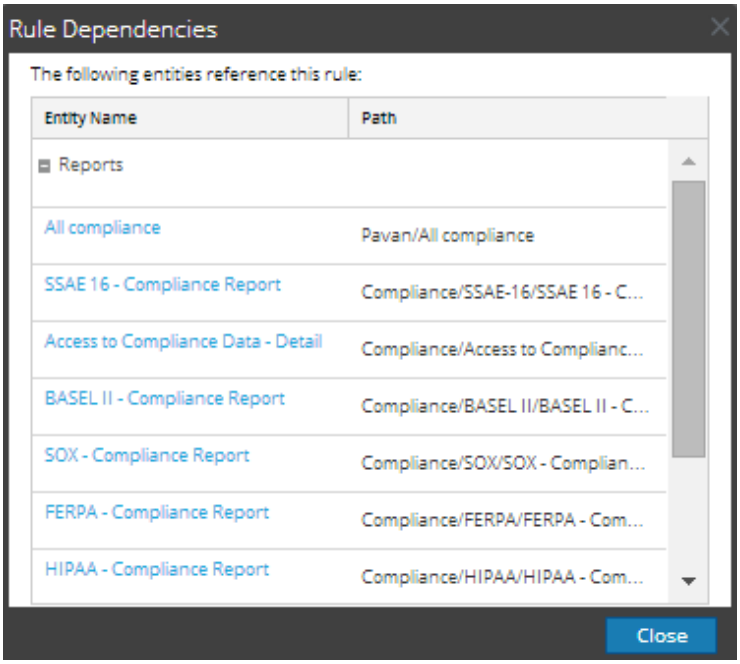
1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Rules**.

   The Rule view is displayed.

3. In the **Rules** panel, select a rule and in Actions column, click > **Dependents**.
   The Rule Dependencies dialog is displayed.



## Export a Rule or Rule Group

**Note:** Make sure that you have rules in the rule group.

To export a rule, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
   In the **Rules** panel, do one of the following:
   - Select a rule and click > **Export** in the Rule toolbar.
   - Click > **Export**.
2. A browser-specific export dialog may be displayed, allowing you to open or save the file. You can export multiple rules at a time. To select multiple rule, press and hold the CTRL button and select the rules to be exported.

To export a rule group, perform the following :

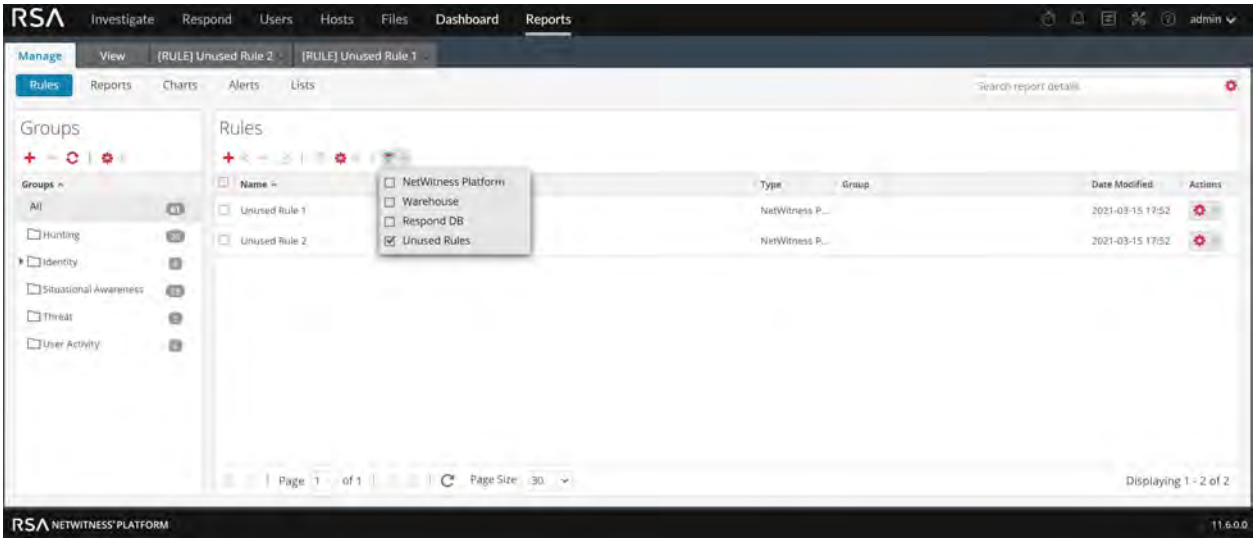
1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules Groups** panel, select the rule group containing the rules which you want to export. You can export multiple rules groups at a time. To select multiple rule groups, press and hold the CTRL button and select the rules groups to be exported.

3. Click > **Export**.
   A browser-specific export dialog may be displayed allowing you to open or save the file.

## Filter Unused Rules

You can filter and delete the rules that are not used by any group in charts, alerts, and reports. To filter unused rules:

1. Go to **Reports**.
   The **Manage** tab is displayed.
2. In the **Rules** panel, click and select **Unused Rules**.
   List of unused rules is displayed.
3. [Optional] Delete the unused rules.
   For more information, see Delete a Rule or Rule Group.



# Manage a Report

You can perform the following procedures to manage a report.

- Access Control for a Report or Report Group
- Delete a Report or Report Group
- Duplicate a Report
- Edit a Report
- Refresh a Report Group or Report List
- Edit a Scheduled Report
- Delete a Scheduled Report

- Export a Report
- Export a Report Group
- Import a Report or Report Group
- Enable or Disable a Scheduled Report
- Start or Stop a Scheduled Report
- View an Execution History of a Scheduled Report
- Manage and Select a Report Logo
- Search Reporting Details

## Access Control for a Report or Report Group

This section covers the access permissions the user has depending on the user role to manage a report and report group. The Reporting provides access control at the report and report group level. The user who has the right set of permissions can only perform the tasks in reporting module. The access control is managed by the administrator from the **(Admin) > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Reports and Report Groups can be tied to a specific set of user roles so that when a user logs into NetWitness, the reports with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define reports. Further, the access can be tightened so that reports are accessed only by those who have the 'Read Only' access.

**Note:** You must have 'Read Only' permission for a group to view the reports within that group.

At the report level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

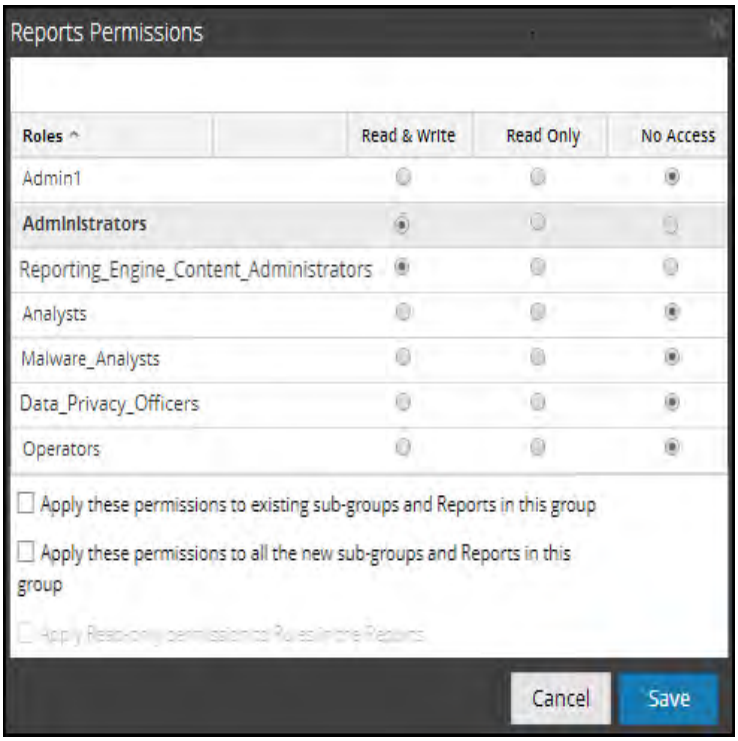
Suppose, you want the NetWitness to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' at the Report Group level. And, if you do not want the **Operator** role to have access to a specific set of reports in a report group, you can set the permission '**No Access**' at the Report Group level.

The permission is set only for the report group but not the reports, rules, or subgroups in the Report Group.

### Access Control for a Report Group

When you want to change the report group permissions, you must select a report group and set access permissions using the Reports Permissions panel.

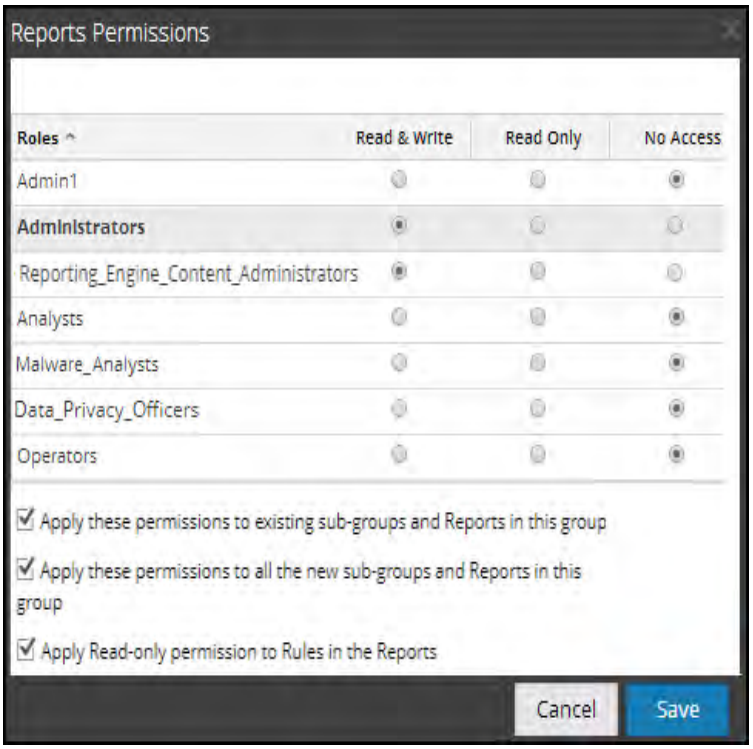
Before applying report group permissions, the default permission set for all the user roles is 'No Access' except for administrators (with full access in Reporting Engine service Config page) and reporting engine content administrators, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report group level, as shown in the figure. <suppose,>Administrators to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' in the Report Group Permissions panel.

You can also apply permissions to existing subgroups and reports in the group, as well as apply read-only permission to rules in the reports by selecting the appropriate checkboxes, as shown in the figure.

You can also apply permissions to all the new subgroups and reports by selecting the appropriate checkbox.



The three scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report based on the user role.
- Scenario 2: Permissions applied to Sub Group and Report in the Group.
- Scenario 3: Read-only permission applied to Rules in the Report.

| | Role (Analyst) | Permissions applied to Report Group/ Sub Group/ Report based on the user role | Permissions applied to Sub group and Report in the Group | Permission (Read-only) applied to Rules in the Report |
|---|---|---|---|---|
| **Group** | Read & Write | Read & Write | Read & Write | Read & Write |
| **Sub Group** | Read | Read | Read & Write - Inherited | Read & Write |
| **Report** | Read | Read | Read & Write - Inherited | Read & Write |
| **Rules** | Read | Read | Read | Read |

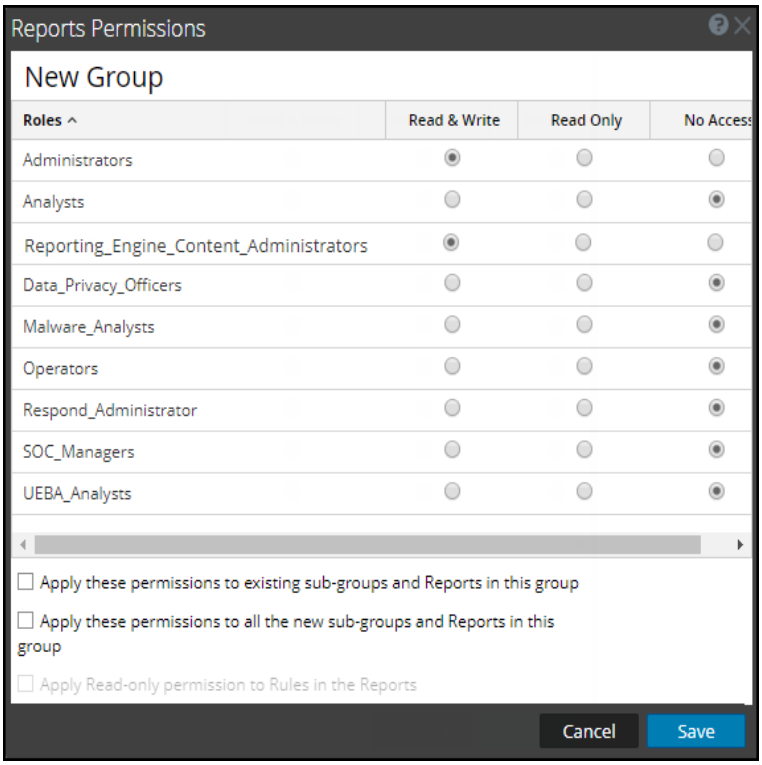
The Report Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** report group.

For scenario 1, each of the levels has a permission set depending on the user role. For scenario 2, the permission at the Report Group level (Read & Write) is inherited by the Sub Group and Reports in the Group. For scenario 3, the Read permission is set for the Rules except that the permission set for the rules cannot be higher than the permissions set for the Report Group.

## Access Control for a Report

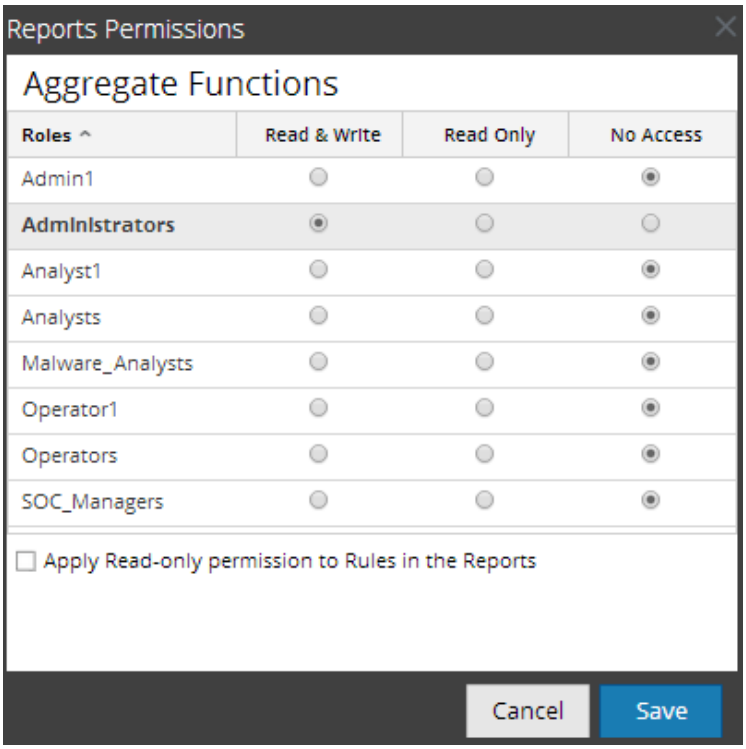
When you want to change the report permissions, you must select a report and set their access permissions using the Report Permissions panel.

Before applying the Report permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is unchecked, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific report, you can set the permission '**Read & Write**' in the Report Permissions panel.

You can apply read-only permission to rules in the reports by selecting the checkbox, as shown in the figure.



The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report/ Rules.
- Scenario 2: Read-only permission applied to Rules in the Report.

| | Role (Analysts) | Permissions applied to Report Group/ Sub Group/ Report/ Rules based on the user role | Permission (Read-only) applied to Rules in the Report |
|---|---|---|---|
| **Group** | Read & Write | Read & Write | Read & Write |
| **Sub Group** | Read | Read | Read & Write |
| **Report** | Read | Read | Read & Write |
| **Rules** | Read | Read | Read |

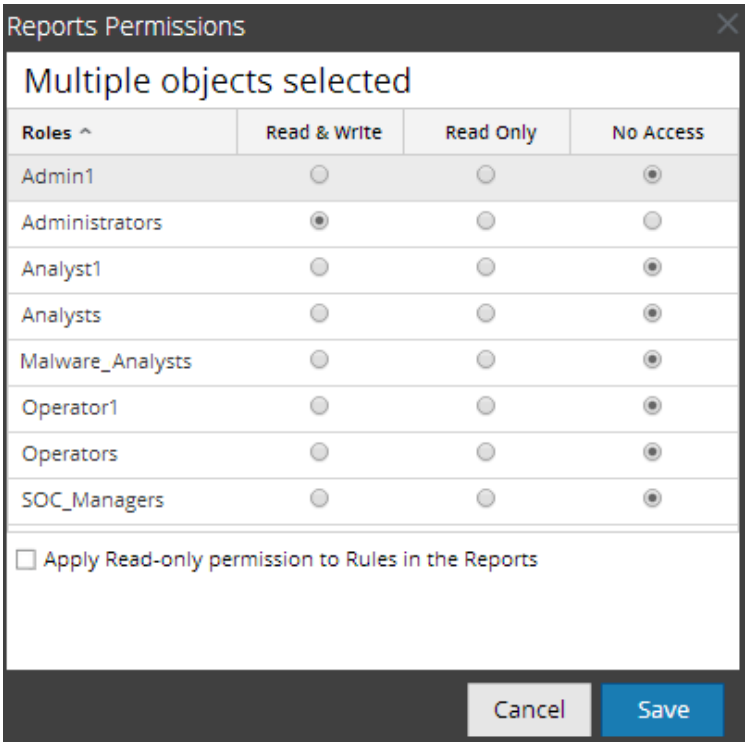
The Report will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** reports.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the Rules except that the permission for the rules cannot be higher than the permission for the Reports.

**Note:** If the permission for the rules is higher than the permission for the Reports then the permission is be applied only to the reports. For example, if you set the permissions for the Report Group as **No Access** and then specify the option *Apply Read-only permission to Rules in the Reports*, then the read-only permission is not set for the rules.

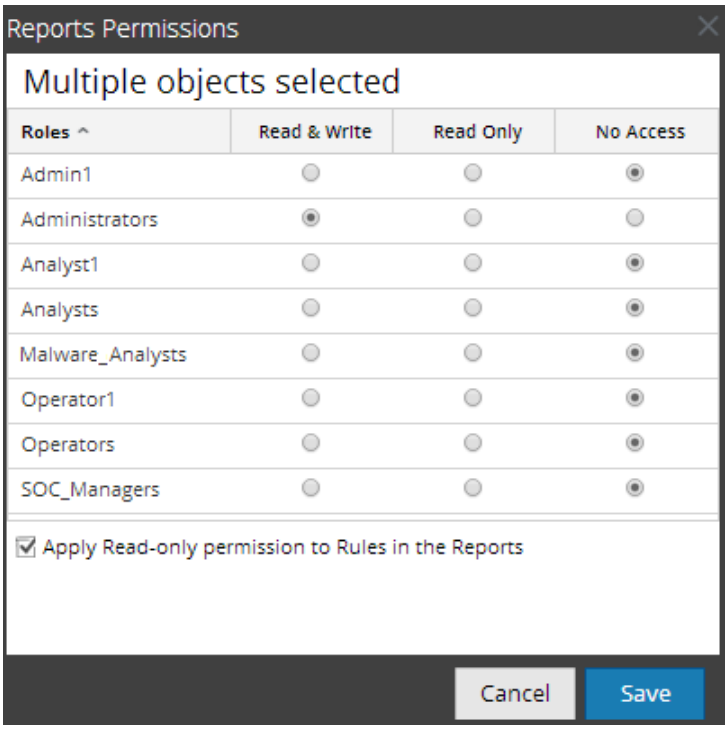
## Access Control for a Report When Multiple Reports are Selected

When you want to change permissions of multiple reports, you must select several reports and set their access permissions using the Report Permissions panel. The access permission that you choose is applied to all the selected reports.



## Access Control for a Report When Multiple Reports with several rules are Selected

When you want to change permissions when multiple reports with several rules are selected, you must select the checkbox in the Report Permissions panel, as shown in the figure. The read-only access permission is applied to all the rules of the selected reports, provided that the permission of the rules are lower than the permission of the reports.

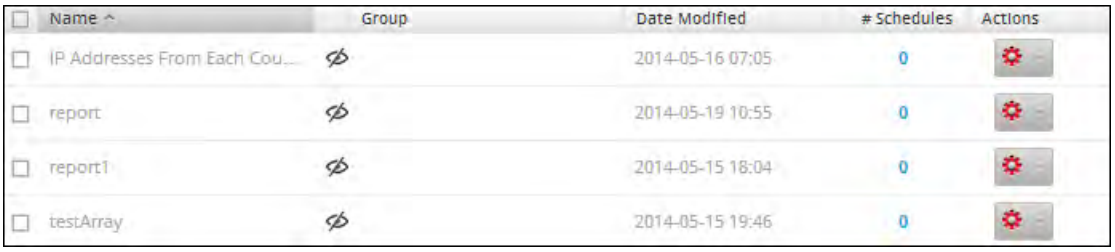


## Log in as a Specific User and View the Access Details

When you log in to the NetWitness UI as a user having 'Read access' permission, all the reports is denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Reports panel.

When you log in to the NetWitness UI as a user not having 'Read & Write' access permission on a Report, all the reports are denoted with the symbol ( ⊘ ) and the reports appear grayed out on the Reports panel.

The following figure shows the Reports panel when logged in with minimal 'Read & Write' access permission.



**Note:** If a User (other than the super user) creates a report there will be no access to that report for the super user.

## Tabular Listing

The following table lists the various columns in the Reports Permissions Panel:

| Column | Description |
|---|---|
| Roles | The role of the user logged into the NetWitness UI. |
| Read & Write | The user can access, view, edit, import, export, and delete the report on the Reports view. The user can also change the permission on the report. |
| Read Only | The user can only access and view the report on the Reports view. |
| No Access | The user cannot access or view the report for which this permission is set. |
| Apply these permissions to existing subgroups and Reports in this group | Select the checkbox to apply the selected permissions to the existing subgroups in the group and reports in the group.<br>**Note:** This checkbox is populated only when you set access permissions for a Report Group. |
| Apply these permissions to all new subgroups and Reports in this group | Select the checkbox to apply the selected permissions to the all new subgroups in the group and reports in the group.<br>**Note:** This checkbox is populated only when you set access permissions for a Report Group. |
| Apply Read-only permission to Rules in the Reports | Select the checkbox to automatically apply permissions to the rules in the reports. |

## Set Access Control for a Report

### Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report.

To set access permissions for a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

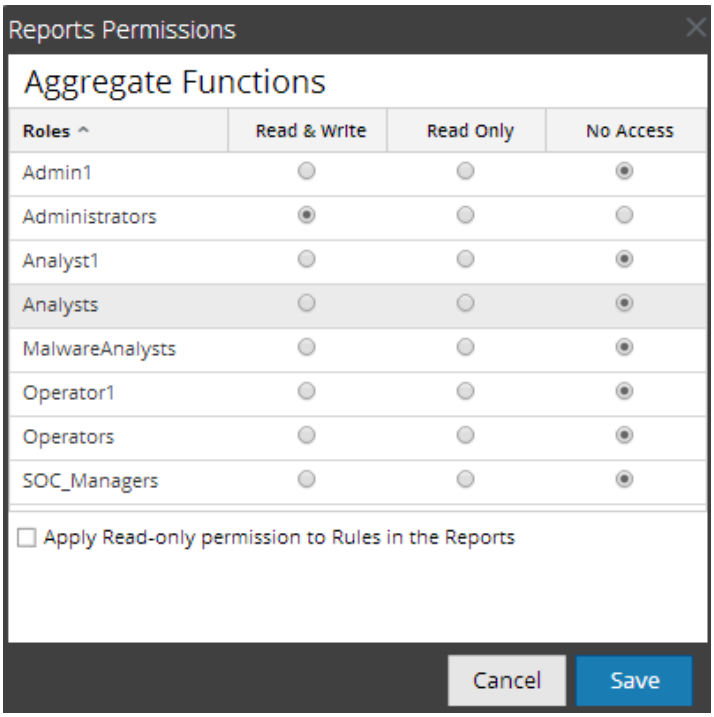
2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report.

4. Click > **Permissions**.

   The Reports Permissions dialog is displayed.



5. Based on the user role, select the appropriate buttons.
6. (Optional) Select the checkbox, if you want to provide read access permission to rules in the reports.

   **Note:** On selecting the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

7. Click **Save**.

   A confirmation message that the permission is set for the selected report is displayed.

## Set Access Control for a Report Group

### Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report group.

**To set access permissions for a Report Group, perform the following:**

1. Go to **Reports**.

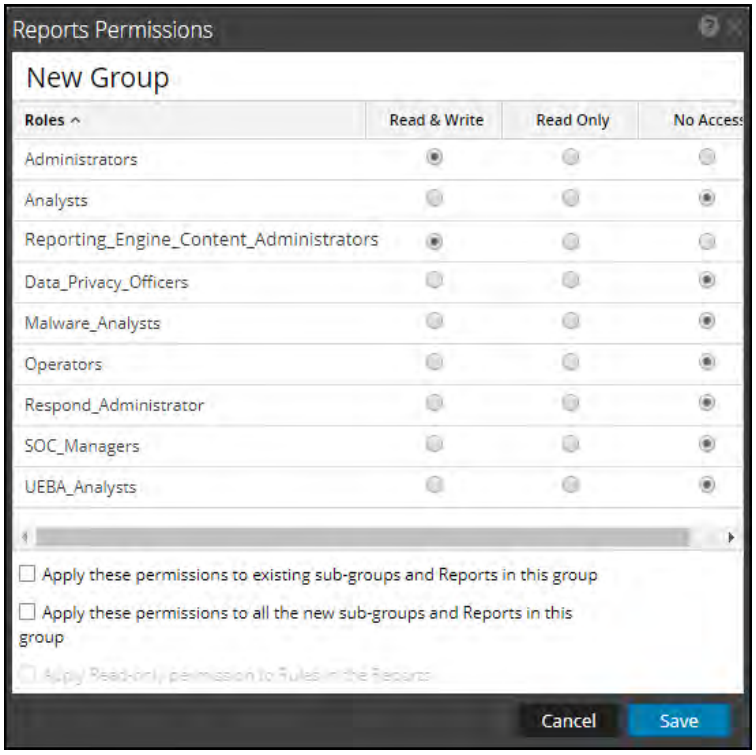
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select or right-click on a report group.
4. Click > **Permissions**.

The Reports Permissions dialog box is displayed.



4. Based on the user role, select the appropriate buttons.
5. (Optional) Select the appropriate checkbox to apply the selected permissions to subgroups and reports in the group.
6. (Optional) Select the appropriate checkbox to apply the selected permissions to all the new subgroups and reports in this group.
7. (Optional) Select the appropriate checkbox to provide read access permission to rules in the reports.

   **Note:** On selecting the check box, all dependent rules is given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

8. Click **Save**.

   A confirmation message that the permission is successfully set for the selected report group is displayed.

## Delete a Report or Report Group

To delete reports in a group or subgroup from the Reports panel:

1. Go to **Reports**.

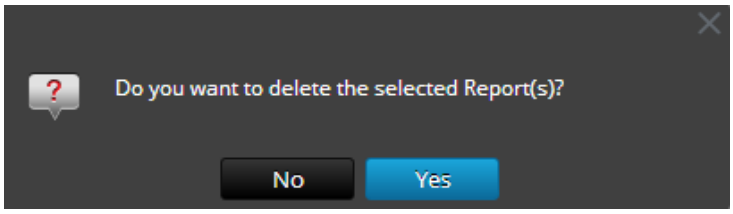
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:
   - Select the reports and click −.
   - Click ⚙ > **Delete**.

     A confirmation dialog is displayed.



4. Click **Yes** to delete the report.

   A confirmation message that the report is deleted successfully is displayed and the selected report is deleted from the Reports panel.

### Delete a Report Group

#### Prerequisites

Make sure that you have no reports associated with the report group.

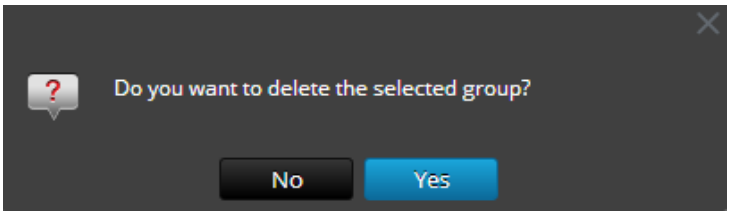
To delete report groups in the default folder or subgroups under a report group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Reports Groups** panel, select the report group and click −.

   A confirmation dialog is displayed.



4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Report Groups panel.

## Duplicate a Report

You can duplicate a report to schedule multiple report for the same report. The duplicated report is displayed in the Reports panel with suffixes. For example, Report (1).

Generally, the duplicate option is used in two scenarios:

- You want to make a copy of the report, to move the same report to another group.
- You want to retain most of the configuration settings for an object but modify few of these settings. For example, when you have a complex query in a rule or several rules in a report, it is very much appropriate to use the duplicate option.

To duplicate an existing report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report that you want to duplicate and click .

   The report is saved successfully and added to the Report list.

You can move the duplicated report to another group.

## Edit a Report

To edit reports in a group or subgroup from the Reports panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. Select a report and in Actions column, click > **Edit**.
   The Build Report view tab is displayed.

4. Modify the text and add more rules to the report (if required).
5. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

## Refresh a Report Group or Report List

You can refresh a report group or reports to view the re-arrangement of groups or reports.

To refresh a report group or reports, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. Do the following to move the group or reports to a new location:

   - In the **Reports Groups** panel, drag and drop the group.
   - In the **Reports** panel, drag and drop the reports to the desired group in the Report Groups panel.
     The report group or reports are moved to the new location.

4. Do the following to refresh a group or report list:

   - In the **Reports Groups** panel, click .

     The report group gets refreshed.

   - In the **Reports** panel, click .

     The Report list gets refreshed.

## Edit a Scheduled Report

To edit a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

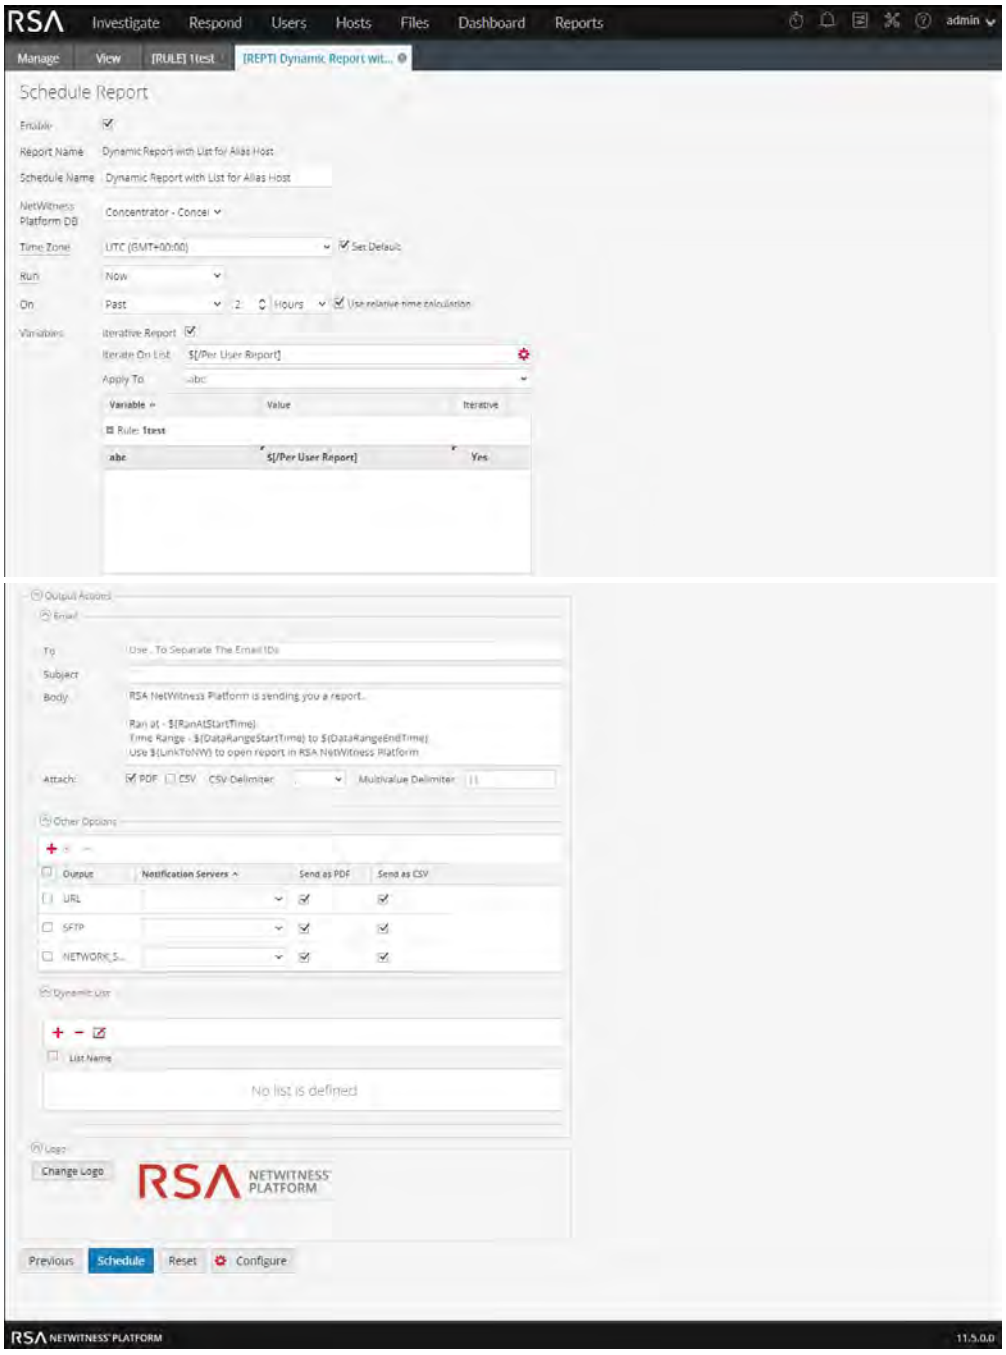
   The Report view is displayed.

3. In the **Reports** panel, select a report and in Actions column, click > **View Scheduled Reports**.

   The Report Schedule tab is displayed.

4. In the **Report Schedule** panel, do one of the following:

   - Select a report and click .
   - Select a report and click > **Edit Schedule**.
     The Schedule Report tab is displayed.



5. In the Schedule Report tab, do the following:

   a. In the **Schedule Name** field, modify the name for the schedule report configuration.

   b. To execute the reports as per the schedule, select the **Enable** checkbox.

   c. From the **Data Source** field, select the datasource.

   > **Note:** If the data source is not listed, ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

6. (Optional) From the **Warehouse Resource Pool** drop-down, select the pool or queue for the report.

   **Note:** The **Warehouse Resource Pool** drop- down is displayed only if the Warehouse Rule is selected. If no pools or queues are entered for the Reporting Engine, this field is disabled.

7. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).
8. Select the date range to run the query based on absolute duration or select the **Use relative time duration** checkbox to run the query based on relative duration.
9. (Optional) In the Output Actions panel, do the following:
   a. Type the email address and subject.
   b. Edit the body of the message for the report.
   c. Select the format of the attachment.
   d. Type a value for the CSV and Multivalue delimiters.
10. (Optional) In the Other Options field, do the following:
    a. Click > **SFTP** or **URL** or **Network Share**. Based on the selected option, a row gets added in the Other options field.
    b. Select the appropriate options to send the report in PDF or CSV format to the configured SFTP, URL or Network Share.
11. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report section in Create and Schedule a Report.
12. (Optional) To choose another logo in the Logo panel, see Manage and Select a Report Logo section.

    **Note:** If you do not specify a logo, the default RSA logo is used.

13. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.

## Delete a Scheduled Report

To delete a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

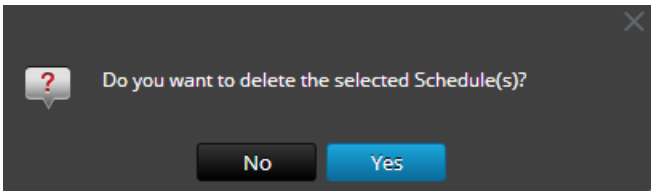
   The Report view is displayed.

3. In the **Reports** toolbar, click **View All Schedules**.

   View Report Schedule is displayed.

4. In the **Report Schedule** panel, select the report.
5. Click >**Delete Schedule**.

   A confirmation dialog is displayed.



6. Click **Yes** to delete the scheduled report.

   A confirmation message that the scheduled report is deleted successfully is displayed and the selected schedule is deleted from the Scheduled Reports List panel.

## Export a Report

You can export the selected reports to an external file that can be later imported to another NetWitness environment.

### Prerequisites

Make sure that you have reports in the report group.

To export selected reports in the Report Groups panel to an external file, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

   In the **Reports** panel, do one of the following:

   - Select a report and click > **Export**.
   - Click > **Export**.

3. You can export multiple reports at a time. To select multiple reports, check the checkbox of the report to be exported. The exported file is saved to the local drive in an archived format.

### Open CSV files with Unicode characters in MS Excel

To open downloaded CSV files containing Unicode characters in MS Excel, follow these steps:

1. Download and save the CSV file.
2. Open Microsoft Excel and navigate to the **Data** tab.
3. Click on **From Text** menu item; find the CSV file that you downloaded and click **Import**.
   The Text Import Wizard is displayed.
4. Select **Delimited** or **Fixed Width** data type from the **Original data type** radio button.
5. Click **File origin** drop down list and select **65001: Unicode (UTF-8)** and click **Next**.
6. Select the delimiter that was used in the file that you imported and click **Next**.
7. Select the data format for each column of data that you want to import and click **Finish**.
   The correct output is displayed in an MS Excel sheet.

## Export a Report Group

You can export a selected report groups to an external file that can be later imported to another NetWitness environment.

### Prerequisites

Make sure that you have reports in the Report Group.

To export selected report groups in the Report Groups panel to an external file, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select a report group and click and select one of the following:

   - **Export** - This selection exports a report in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple report groups at a time. To select multiple report groups, press and hold the CTRL button and select the report groups to be exported. The exported file is saved to the local drive.

## Import a Report or Report Group

You can import a group containing subgroups and reports from other instances of NetWitness into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness instance.
During the import process, you select the binary file and specify whether existing reports with the same name must be overwritten or not by the reports contained in the binary import file.

- If you choose to overwrite, all duplicate rules, lists and reports are overwritten by the contents of the binary import file.
- If you choose not to overwrite, and a duplicate rule, list or report exists in the target folder, the import fails and display a message about duplicate reports.

You cannot import reports to a specific report group. The imported files are stored in the **All**root folder.

### Prerequisites

Make sure that you have the reports or report groups exported from other instances of NetWitness.

To import groups containing subgroups and reports from other instances of NetWitness into Report Groups panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

The Report view is displayed.

3. In the **Reports Groups** panel, select a folder to import the file.
4. Do one of the following:
   - In the **Reports Groups** toolbar, click > **Import** to import a group.
   - In the **Reports** toolbar, click > **Import** to import a report.
     The Import Report dialog is displayed. You can import multiple reports and report groups at a time. To select multiple reports or report groups, press and hold the CTRL button and select the reports or report groups to be imported.
5. Click **Browse** to select the binary file.

   NetWitnessprovides a file system view of the files.
6. Locate the binary file and click **Open**.

   The file gets added to the Import Report list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, check the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, check the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing report in the library with an identically named report in the binary file when importing, check the **Report** checkbox. If you do not select the Overwrite option, and an identical report is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

## Enable or Disable a Scheduled Report

**To enable or disable a scheduled report from the Scheduled Reports List panel, perform the following:**

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and click > **View Scheduled Reports**.
   View Report Schedule is displayed.
4. Select a report from the Report Schedule panel.
5. In the Actions column, click > **Enable**.
   The state of the report is changed to ‘Running’, if the report is scheduled to run immediately.

6. In the Actions column, click > **Disable**.
   The state of the report is changed to 'Inactive'.

## Start or Stop a Scheduled Report

### To start or stop a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and click > **View Scheduled Reports**.
   The Report Schedule view is displayed.
4. Select a report from the Scheduled Reports List panel.
5. In the Actions column, click > **Start**.
   The state of the report is changed to 'Running', if the report is scheduled to run immediately.
6. In the Actions column, click > **Stop**.
   The state of the report is changed to 'Completed'.

**Note:** If you have multiple executions running for a scheduled report and the state of the report is in Queued state, the STOP option is disabled till all the previous executions are completed and last execution is in running state. To stop the individual execution of a particular schedule, refer to Stop an Individual Execution of a Scheduled Report.

## View an Execution History of a Scheduled Report

You can view the execution history of a scheduled report. You can view the history of a scheduled report that is run. You can view the history based on the following criteria:

- Number of past schedules executed
- Start date and end date for the date range

You can view the details such as how many times the scheduled report was executed, the time of execution (seconds), execution state. You can also view the report generated on a full screen.

### To view the execution history of a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Reports** panel, do one of the following:
   - Click > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click > **Execution History**.
   - Select a scheduled report and click .
     The Execution History view is displayed.

   **Note:** By default, you can view 10 number of execution history of a scheduled report. The execution history shown depends on the Retain Report History Configuration set on the **General**tab of the **(Admin) > Services > Reporting Engine Config** view.
   For example, if you set the Retain Report History Configuration to 100 days, the data displayed on the Execution History view. is the past 100 days execution history details considering the current date information.
5. From the **Get history by:** field, select the type of history to be fetched. (For example, Past or Range (Specific))
6. In the **Count** field, enter the number of executions to be displayed.
7. Click **Show History**.
   The execution history of the scheduled report is displayed.

## Stop an Individual Execution of a Scheduled Report

If you have multiple executions running for a scheduled report, you can stop the individual execution of the scheduled report in **Execution History** panel.

### To stop the individual execution of a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, do one of the following:
   - Click > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click > **Execution History**.
   - Select a scheduled report and click .
     The Execution History panel is displayed.

5. Select a schedule, in the **Actions** column, click .
   The state of the execution schedule is changed to 'Cancelled'.

# Manage and Select a Report Logo

## Prerequisites

Make sure that you have the Reporting Engine service defined prior to managing a logo.

## Manage Report Logos

**To manage logos, perform the following:**

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. In the **Services** panel, select an Reporting Engine service and click **View** > **Config**.
   The services config view is displayed.
3. Select the **Manage Logos** tab.
   All the available logos are displayed.

## Add a Logo

**To add a logo, perform the following:**

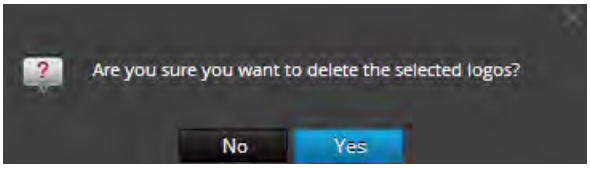
1. In the **Manage Logos** tab, click .
   A file browser opens where you can choose the file from the local drive.
2. Select the logo and click **Open**.
   The selected logo gets added to the Manage Logos section.

## Delete a Logo

**To delete a logo, perform the following:**

1. In the **Manage Logos** tab, do one of the following:
   - Select the logo and click .
   - Perform (Ctrl+click) to select multiple logos and click .

   A confirmation dialog is displayed.



2. If you want to delete the logo, click **Yes**.
   The selected logo is deleted from the Manage Logos section.

### Set Default Logo

To set a default logo, perform the following:

In the **Manage Logos** tab, select a logo and click Set default.

The chosen logo is set as the default logo for the RE service.

### Select a Logo

To select a logo, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report.

4. Click > **View Scheduled Reports**.
   The View scheduled reports view tab is displayed.

5. Select a scheduled report and in Actions column, click > **Edit Schedule**.

   The Schedule Report view tab is displayed.

6. In the Logo panel, click **Change Logo**.

   The Change a Logo dialog box is displayed.

7. Do one of the following:

   - Click **Upload new logo** to upload another logo.
   - Select a logo from the list.

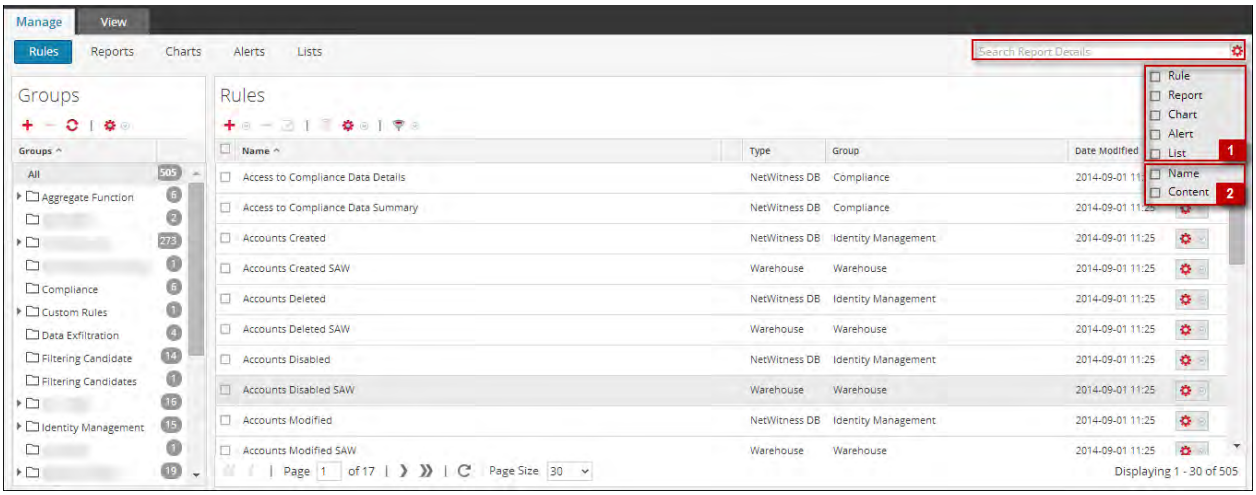
8. Click **Select**.
   The selected logo is available on the Logo panel.

## Search Reporting Details

This section provides instructions on how to perform a keyword search on name and content for each of the Reporting components. You can perform a keyword search on name and content for each of the Reporting components (Rule/Report/Chart/Alert/List) on the Reporting UI.

**Note:** You cannot search based on date and numeric values.

The following figure shows the search parameters available in the Reporting Module:



The following are the search parameters available on the Reporting UI:

1. Search for entities (rule, report, chart, alert, list).
2. Search for the entities based on either the name or content.

**Note:** Searches are case insensitive. For example, Completed is equivalent to completed.

## Prerequisites

In the Reporting Module, you can perform a keyword search based on the name and content (definition). In this context, content implies definition of each of the reporting components. For instance, the value defined in the rule, report, report schedule, chart, and alert panel. You can also prioritize your search by selecting either or all of the components: Rule, Report, Chart, Alert, or List.

**Note:** You cannot search based on the List values and list path stored in schedule definition panel.

For example, to search for the rule name (ExpertRule), you must select **Rule, Name, and Content** in the **filtering options** drop-down to view all the rule names that matched the search. You can similarly search for a report, chart, alert, or list definition.

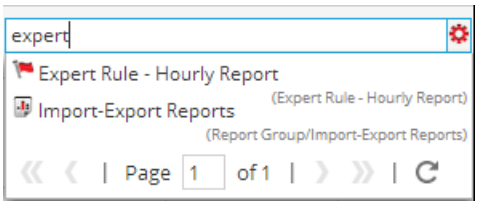
To search for reporting details from the Manage tab, perform the following:

1. Go to **Reports**.

   The **Manage** tab is displayed.

2. Click and select the appropriate criteria to search.
3. In the **Search** field, enter the text to be searched.

   The search drop-down list is displayed:



## Search Syntax and Different Types of Search

The following table explains the search syntax and the possible searches that can be performed on the Reporting user interface.

| Search Types | Description |
|---|---|
| Word or phrase based search | **Word Based Search:**<br>To search for a word such as "action" or "meta", you must enter the word in the search box.<br>The following figure shows the search results for the text **action**.<br>  <br>**Phrase based search:**<br>A Phrase is a group of words surrounded by double quotes such as "action meta". To search for a phrase, you must enclose phrases in double-quotes in the search box.<br>The following figure shows the search results for the phrase "action meta".<br>  |

| Search Types | Description |
|---|---|
| Wildcard Search (Single/ Multiple/ Special Character Search)<br><br>The question mark "**?**" symbol is used to perform a single character wild card search and asterisk "*****" symbol is used to perform multiple character wildcard search. | **Single character search:**<br>The single character wildcard search looks for terms that match with the single character replaced. For example, to search for "Expert" or "Export" you can use the search syntax:<br>`Exp?rt`<br>The following figure shows the search results for the wildcard character **Exp?rt**.<br>  <br>**Multiple character search:**<br>Multiple character wildcard search looks for 0 or more characters. For example, to search for Expert, or Experts, you can use the search syntax:<br>`Expert*`<br>The following figure shows the search results for the wildcard multiple character **Expert***.<br>  <br>**Special character search:**<br>Certain punctuation and special characters are ignored during search (@#$%^&*(){}"~=+-[]\?|!:,.). For example, a search for action-login will be interpreted during search as "action" "login", that is, if rules exist with name "action-login" and "action@login" and search string is "action-login", the search result will return both the rules.<br>  |

| Search Types | Description |
|---|---|
| Search based on name or content | **Search based on name:**<br>When you want to search based on the name of a report, select **Report**and **Name**box from the filtering options drop-down. For example, to search for the report name "Report With Multiple Rules", you can use the search syntax:<br>"Access to Compliance Data"<br>**Note:** When you search for a report, it implies you can search for the report schedules as well.<br>The search result will return the report containing the specific name.<br>  <br>**Search based on content:**<br>When you want to search for the content within an alert, say alert description, select **Alert** and **Content** box from the filtering options drop-down. For example, to search for the alert description "Device IP Got Detected", you can use the search syntax:<br>"Device IP Got Detected"<br> <br>The search will return the result having the specific content.<br>  |

# Working with Charts

The Reporting module user interface provides access to NetWitness charts. The following topics discuss charts:

- Configure and Generate a Chart
- Configure a Chart
- Schedule a Chart
- View a Chart
- Test a Chart
- Investigate a Chart
- Manage a Chart Group and Chart

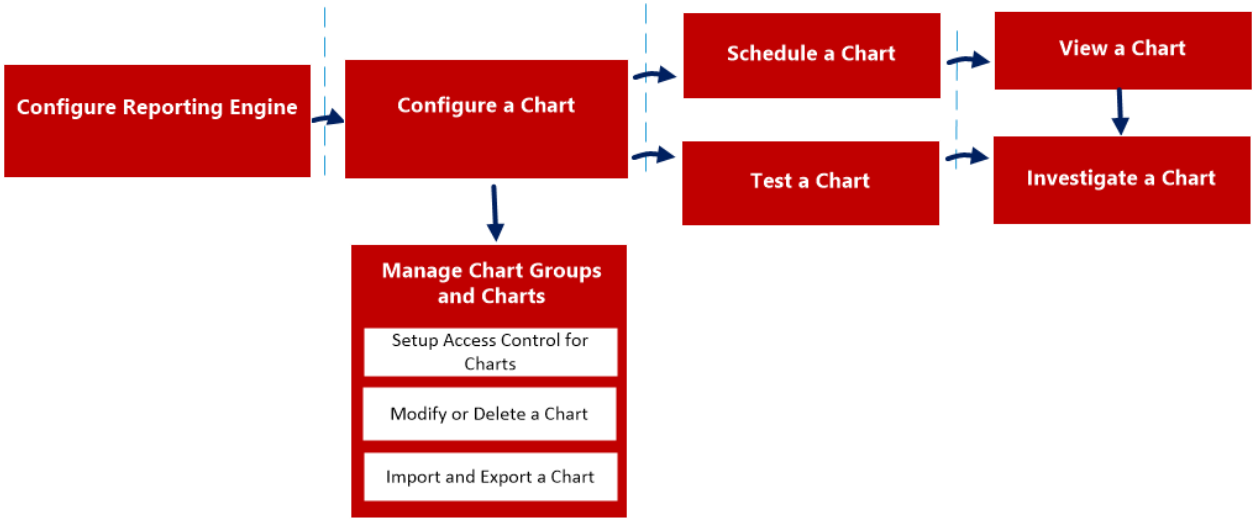
## Configure and Generate a Chart

Chart is a graphical visualization of data. You can view different kinds of charts, including multiple types of plot, line, bar, and area charts.

Any NWDB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. For more information on "How to create an NWDB rule", see Configure a Rule.

The chart interval can be adjusted from the chart definition panel itself. Every time a chart is executed, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations.

The following is an overview of the entire process of configuring and generating a chart.



To configure and generate a chart, perform the following:

1. Configure Reporting Engine
2. Configure an NWDB rule
3. Configure a Chart

4. Schedule a Chart
5. View a Chart
6. Test a Chart
7. Investigate a Chart
8. Manage a Chart Group and Chart

## Configure Reporting Engine

You must configure the Reporting Engine before you can configure and generate a chart. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure a Reporting Engine, see "Configure Reporting Engine" topic in *Reporting Engine Configuration Guide*.

## Configure an NWDB Rule

The NetWitness rule which is not sorted by none is used to create a chart. The NetWitness database extracts the meta from the Reporting Engine and provides the meta for rules. These rules are an essential building block in managing a chart.

**Note:** If the rule contains the lookup_and_add, sum_count, or sum_values rule actions, the associated chart will not contain data. Do not use lookup_and_add function in a rule to create a chart or a report in a chart format as the output of the lookup_and_add function in a rule will not be displayed on the chart and may result in graphical representation of incorrect information. Also, the PDF for that chart created may show an empty chart or incorrect representation of data.

## Configure a Chart

You can configure a chart using the NWDB rules.

## Schedule a Chart

After a chart is defined with the required components, you can configure its execution properties by scheduling a chart. Here, you can quickly view, add, and edit the schedule details for a chart.

## View a Chart

You can view the scheduled charts in the Chart View.

## Test a Chart

You can run the test on a chart and view all the chart details based on the selected time range.

## Access Control for a Chart

The Reporting Module provides access control at the chart level. Only a user who has the right set of permissions can perform the tasks in Reporting module. The access control is managed by the administrator from the **(Admin) > Security > Roles** tab.

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Charts can be tied to a specific set of user roles so that when a user logs in NetWitness, the charts with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define charts. Further, the access can be tightened so that charts are accessed only by those who have the 'Read Only' access.

At the chart level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

To change the access permission for a specific user role, you must set the permission at the chart level. For example, for **Administrators** to have access to a specific chart, you could set the permission 'Read & Write' in the Charts Permissions dialog.

You can apply read-only permission to rules in the charts by selecting the checkbox.

Two scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to Chart Group/ Subgroup/ Chart/ Rules based on the user role.
- Scenario 2: Read-only permission applied to Rules in the Chart.

| | Role (Analyst) | Permissions applied to chart group, subgroup, chart or rules based on the user role | Permissions (Read-only) applied to rules in the chart |
|---|---|---|---|
| **Group** | Read & Write | Read & Write | Read & Write |
| **Subgroup** | Read | Read | Read & Write |
| **Chart** | Read | Read | Read & Write |
| **Rules** | Read | Read | Read |

The chart is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write' charts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the rules except that the permission for the rules cannot be higher than the permission for the charts.

**Note:** If the permission for the rules is higher than the permission for the chart, the permission is not applied. For example, if you set the permissions for the Report Group as **No Access** and specify the option *Apply Read-only permission to Rules in the Reports*, the read-only permission is not set for the rules.

## Access Control for a Chart When Multiple Charts are Selected

To change permissions for multiple charts, you must select several charts and set their access permissions using the Charts Permissions panel. The access permission that you choose is applied to all the selected charts.

## Access Control for a Chart When Multiple Charts with Several Rules are Selected

To change access permissions for a specific user role when multiple charts with several rules are selected, select the checkbox in the Charts Permissions panel.

The read-only access permission is applied to all the rules of the selected charts, provided that the permission of the rules are lower than the permission of the charts.

**Note:** If a user (other than the super user) creates a chart, the super user cannot access that chart.

## Access Control for a Chart Group

To change chart group permissions, select a chart group and set the access permissions using the Charts Permissions panel. Before chart group permissions are applied, the default permission set for all the user roles is 'No Access'.

To change the access permission for a specific user role, set the permission at the chart group level. For example, for administrators to have access to all the charts in a Chart Group, set the permission 'Read & Write' in the Charts Group Permissions panel.

You can also apply permissions to subgroups and charts in the group, and apply read-only permission to rules in the charts by selecting the appropriate checkboxes.

Three scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to chart groups, subgroups, or charts based on user roles.
- Scenario 2: Permissions applied to subgroups and charts in the group.
- Scenario 3: Read-only permission applied to rules in the chart.

| | Role (Analyst) | Permissions applied to chart groups, subgroups, or charts based on user roles | Permissions applied to subgroups and charts in the group | Permissions (Read-only) applied to rules in the chart |
|---|---|---|---|---|
| **Group** | Read & Write | Read & Write | Read & Write | Read & Write |
| **Subgroup** | Read | Read | Read & Write - Inherited | Read & Write |
| **Chart** | Read | Read | Read & Write - Inherited | Read & Write |
| **Rules** | Read | Read | Read | Read |

The chart group is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write'.

For scenario 1, each of the levels will have a permission set depending on the user role.

For scenario 2, the permission at the chart group level will be inherited by the subgroup and by charts in the group.

For scenario 3, the Read permission is set for the rules. However, the permission set for the rules cannot be higher than the permissions set for the chart group.

The following table lists the columns in the Charts Permissions panel:

| Column | Description |
|---|---|
| Roles | The role of the user logged into the NetWitness UI. |
| Read & Write | The user can access, view, edit, import, export, and delete the chart in the Charts view. The user can also change the permission for the chart. |
| Read Only | The user can only access and view charts on the Charts view. |
| No Access | The user cannot access or view charts for which this permission is set. |
| ☐ Apply these permissions to existing sub-groups and Charts in this group | Select the checkbox to apply the selected permissions to the existing subgroups in the group and charts in the group.<br>**Note:** This checkbox is populated only when you set access permissions for a Chart Group. |
| ☐ Apply these permissions to all new sub-groups and Charts in this group | Select the checkbox to apply the selected permissions to the new subgroups in the group and charts in the group.<br>**Note:** This checkbox is populated only when you set access permissions for a Chart Group. |
| ☐ Apply Read-only permission to Rules in the Charts | Select the checkbox to automatically apply permissions to the rules in the charts. |

# Configure a Chart

After a chart is defined with the NetWitness rules with NWDB as the data source, you can configure its execution properties.

## Create a Chart Group

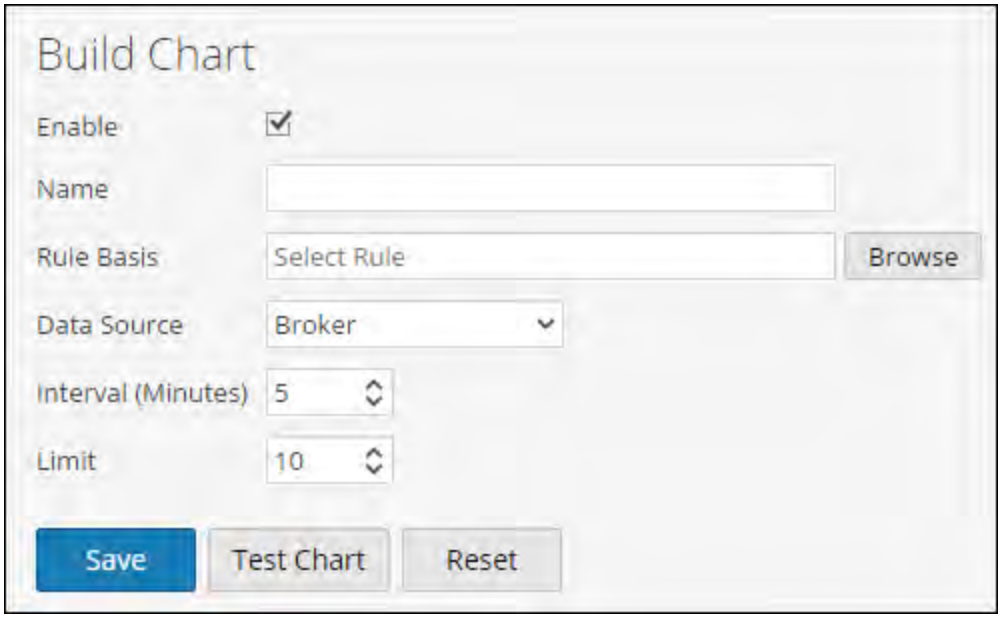
To add groups to the default folder or to add subgroups under a chart group:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts Groups** panel, click .
   A default group is added in the Chart Groups panel.
4. Enter the name of the new group.
5. Press **Enter**.
   The group is added to the Chart Groups panel.

## Create a Chart

To add charts to a group or subgroup:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts** to display the Chart view.
3. In the **Charts** toolbar, click .
   The Build Chart tab is displayed.



4. Enter the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. In the Rule Basis field, do the following:
   a. Click **Browse**. The Add Rule dialog box is displayed.
   b. Navigate the Rule tree and select a rule.
   c. Click **Select**.
7. The Rule appears in the **Rule Basis** field.
8. Select the data source from the **Data Source** drop-down list.

   **Note:** If the default data source is configured in the Reporting Engine, then the data source is displayed by default on the Build Chart page. If the data source is not displayed, ensure you have Read permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the "Configure Data Source Permissions" topic in the *Host and Services Configuration Guide*.

9. (Optional) To modify the Interval value, click the up or down arrow.
   The Interval value is the interval in minutes at which the rule which forms the basis of the chart is

run to collect data.

10. Select the **Limit** value to limit the number of records to be displayed.
11. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
    In the **X-Axis**, the meta for the 'Group by' rule is displayed. In the **Y-Axis**, the aggregate functions used in the rule are displayed.

    **Note:** Sum, Count, Countdistinct and Average are the supported aggregate functions for chart. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.
12. Click **Save**.
    A confirmation message that the chart is saved successfully is displayed.

## Schedule a Chart

You must schedule a chart to further investigate on the chart details.

By enabling a chart, the chart executes as scheduled and provides the configured output with the state of the chart changed to ‘Scheduled’.

To schedule a chart:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts** panel, select a chart or several charts that display ○ in the **Enabled** column.
4. Click .
   A confirmation message indicates that the chart(s) state is changed successfully.

## View a Chart

After you view a chart, you can perform the tasks:

- You can print, save, email and view charts on full screen.
- You can also select a date from the calendar to view a list of successfully run charts for the chosen date.

To view a chart:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, Select a chart and click > **View**.

   The View Chart view tab is displayed.

4. In **Chart Options**, do the following:

   a. Select the **Time Range**.

   > **Note:** When you select the Time Range option, you can select a pre-set time range such as last hour, last 3 hours and the Last N Days...or you can customize the selection by choosing Last N Days or Custom. If you select Last N Days option, you can view the historical data for a maximum of 15 days. If you select the Custom option, you can select a start date and end date to view the data for the selected date range.

   b. Select the **Series**, either **Chart Values over Time** or **Chart with Totals**.
   When you select **Chart Values over Time**, the chart displays the change in values for the selected time. When you select **Chart with Totals**, the chart displays a total for each aggregate value for the selected time.

   c. Select **Items To Plot** to define the number of events to view on the chart.

   d. From the **Chart Type** drop-down list, select the chart type.

   e. Click **Reload** to reload the selected chart.
   If there is a delay in retrieving the historical data for the selected time range, a message is displayed.

After the chart is generated, a notification is displayed in the notification tray available in the NetWitness toolbar. For more information on the NetWitness toolbar, see the "Browser Window" topic in the *NetWitness Getting Started Guide*.

### View all Charts List

To view a list of all the charts:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, click **View All Charts**.

   All the executed charts for the selected date are displayed in a new tab.

   > **Note:**
   > * If no list is displayed, you can select a date from the calendar to view a list of charts.
   > * If you want to view a specific chart, enter the chart name in the search criteria.

4. Click the chart name to view the chart details for that date.

## Test a Chart

You can test a chart in the **Test a Chart** view.

**To test a chart:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. Do one of the following:

   - In the **Charts** toolbar, click .
   - In the **Charts** panel, double-click a chart or select a chart and click .
   - In the **Charts** panel, select a chart and in Actions column, click > **Edit**.

   The Build Chart view tab is displayed.

4. Click **Test Chart** to view the chart.

   The View Chart view tab is displayed.

5. In the **Time Range** drop-down, select the hours range.
6. Select the **Series**, either **Chart Values over Time** or **Chart with Totals**.
7. In the **Items To Plot** field, select the number of items to plot.
8. From the **Chart Type** drop-down list, select the chart type.
9. Click **Run Test** to run the test.

The chart data (if any) for the selected time range is displayed.

## Investigate a Chart

You can investigate the chart by navigating directly to the Investigation module from the chart.

To investigate a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, click **View All Charts**.

   All the executed charts for the selected date from the **Chart Options** panel are displayed on a new tab.

4. Double-click the chart name to view the chart details such as the time at which the chart is executed and the default data source used for the chart execution.
5. Do one of the following:

- Click a data point on the chart to investigate.
- In the toolbar, click **Investigate** to investigate for the entire time range.

# Manage a Chart Group and Chart

You can manage chart groups and charts using the following procedures.

## Manage a Chart Group

Depending on the access permissions set for the user role, you can modify or delete, import or export, drag and drop a chart, or refresh a chart group.

### Modify a Chart Group

**To modify a chart group in the default folder or subgroups under a chart group:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select the chart group to modify.

The selected chart group is modified and can be viewed on the **Charts Groups** panel.

### Delete a Chart Group

**To delete a chart group in the default folder or subgroups under a chart group:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select the group and click −.

   A confirmation dialog asks for confirmation that you want to delete the selected group.

4. Click **Yes** to delete the group.

The selected group is deleted from the Chart Groups panel.

### Import a Chart Group

**To import chart groups from other instances of NetWitness:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. From the **Charts Groups** panel, select a folder to import the file.
4. Do one of the following:

   - In the Chart Groups panel, click > **Import**.

     The **Import Chart** dialog box is displayed.

   - You can import multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be imported.

5. Click **Browse** to select the binary file.

   NetWitness provides a file system view of the files.

6. Locate the binary file and click **Open**.

   The file is added to the Import Chart list.

7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

## Export a Chart Group

### To export selected chart groups:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select a chart group and click and do one of the following:

   - **Export** - This selection exports a chart in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be exported. The exported file is saved to the local drive.

### Drag and Drop Chart to a Group

**To drag and drop a chart from the Charts panel to a group in the Charts Groups panel:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. Select a chart from the **Chart** panel and drag and drop the chart to a group in the **Chart Groups** panel.

The chart is copied to the group in the Chart Groups panel.

### Refresh a Chart Group

**To refresh chart groups:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, drag and drop the group.

   The chart group is moved to the new location.

4. In the **Charts Groups** panel, Click .

The chart group is refreshed.

## Manage a Chart

Depending on the access permissions set for the user role, you can modify or delete, duplicate, import and export, enable or disable charts, search for existing charts, and refresh a chart list.

## Access Control for a Chart

**To set access permissions for a chart:**

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart.

4. Click > **Permissions**.

   The Charts Permissions dialog box is displayed.

5. Based on the user role, select the appropriate buttons.

6. (Optional) Select the checkbox if you want to provide read access permission to dependent rules.

   **Note:** On selecting the check box, all dependent rules with No access permission are granted a READ access permission.

7. Click **Save**.

A confirmation message that the permission is successfully set for the selected chart is displayed.

## Modify a Chart

### To modify a chart in a group or subgroup:

1. Go to **Reports**.

   The Manage tab is displayed.

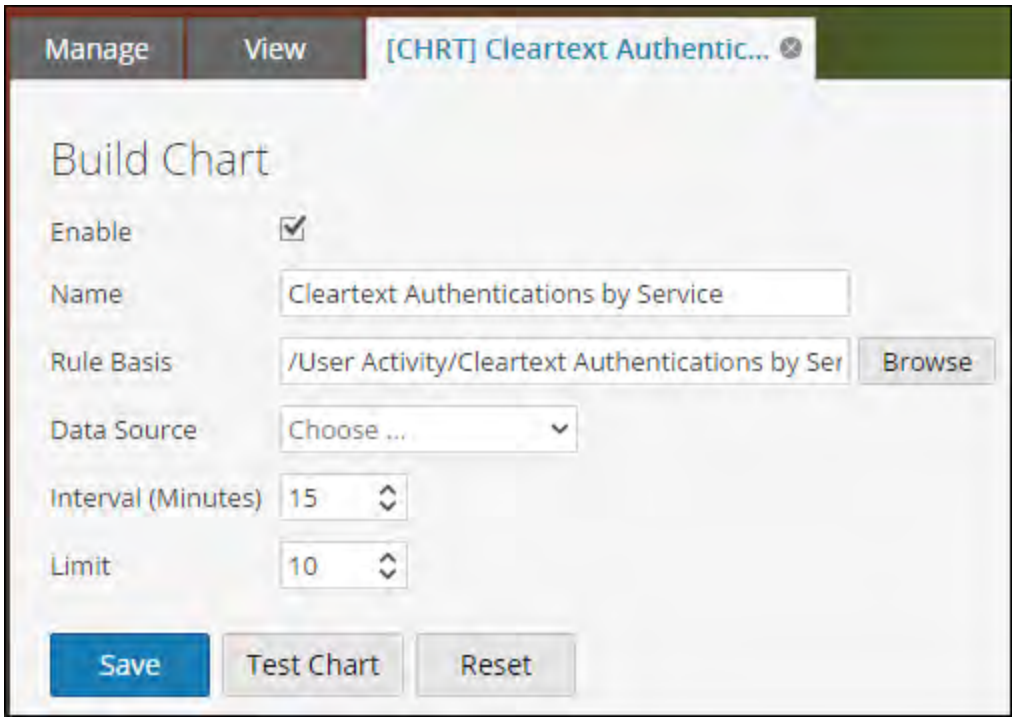
2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, do one of the following:

   - Double-click a chart or select a chart and click .
   - Select a chart and click > **Edit**.

     The Build Chart view tab is displayed.



4. Modify the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. (Optional) In the **Rule Basis** field, do the following:

a. Click **Browse**.

The Add Rule dialog is displayed.

b. Navigate the Rule tree and select a rule.

c. Click **Select**.

The Rule appears in the Rule Basis field.

7. Select the data source from the **Data Source** drop-down list.

> **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the "Configure Data Source Permissions" topic in the *Host and Services Configuration Guide*.

8. (Optional) To modify the Interval value, click the up or down arrows.
9. Select the limit value to limit the number of records to be displayed.
10. Click **Save**.

A confirmation message that the chart is modified successfully is displayed.

## Delete a Chart

### To delete a chart in a group or subgroup:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts** panel, do one of the following:
   - Select the charts and click  .
   - Click > **Delete**.
     A confirmation message asks if you want to delete the selected chart.
4. Click **Yes** to delete the chart.

A confirmation message that the chart is deleted successfully is displayed and the selected chart is deleted from the Charts panel.

## Duplicate a Chart

### To duplicate an existing chart:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.

3. From the **Charts** panel, select a chart to be duplicated.
4. In the **Charts** toolbar, click .

The chart is duplicated and gets added to the Charts panel.

## Import a Chart

### To import charts from other instances of NetWitness:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.
3. From the **Charts Groups** panel, select a folder from which to import the file.
4. Do one of the following:

   - In the **Chart** toolbar, click > **Import**.

     The **Import Chart** dialog box is displayed.
   - You can import multiple charts at the same time. To select multiple charts, press and hold the CTRL button and select the charts to be imported.
5. Click **Browse** to select the binary file.

   NetWitness provides a file system view of the files.
6. Locate the binary file and click **Open**.

   The file is added to the Import Chart list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

## Export a Chart

### To export selected charts to an external file:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart and click and do one of the following:

   - **Export** - This selection exports a chart in a .zip file.
   - **Export as Text** - This selection exports a chart from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple charts at the same time. To select multiple charts, select the checkboxes of the charts to be exported. The exported file is saved to the local drive.

## Enable a Chart

### To enable a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart or several charts that display ○ in the **Enabled** column.
4. Click ●.

A confirmation message indicates that the chart(s) state is changed successfully.

## Disable a Chart

### To disable a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart or several charts that display ● in the **Enabled** column.
4. Click ○.

A confirmation message indicates that the chart(s) status is changed successfully.

## Search an Existing Chart

### To search for an existing chart:

1. Go to **Reports**.

   The Manage tab is displayed.

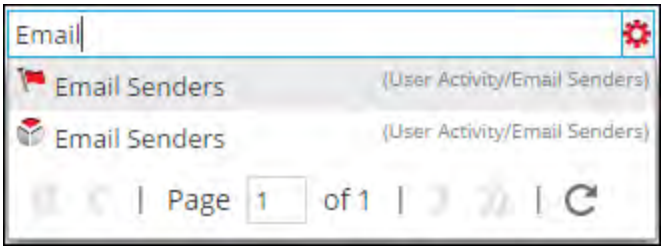
2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, enter text in the Search text box.

4. Click > **Chart**.

All charts that match the search string are displayed in the search drop-down list.



## Refresh a Chart

### To refresh charts:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, drag and drop the charts to the desired group in the **Charts Groups** panel.

   The charts are moved to the new location.

4. Do either of the following:

   - In the **Charts** panel, click .
   - In the **Charts** toolbar panel, select **Auto Refresh**.

   The Chart list is refreshed.

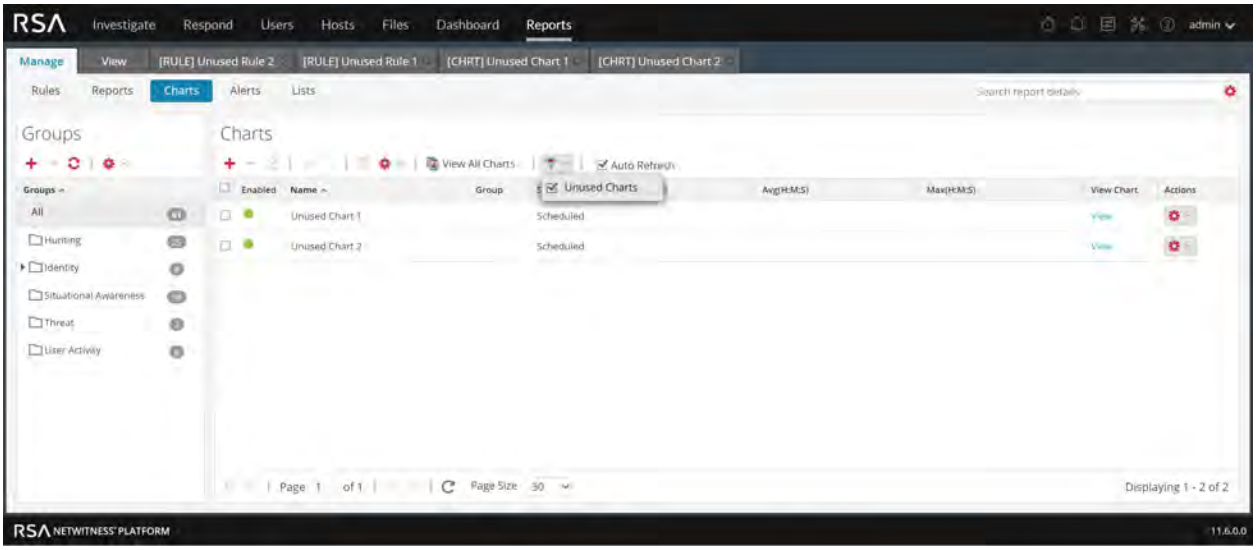
## Filter Unused Charts

You can filter and delete the charts that are not used in any dashlet.

### To filter unused charts:

1. Go to **Reports**.
   The **Manage** tab is displayed.

2. In the **Charts** panel, click and select **Unused Charts**.
   List of unused charts will get displayed.
3. Delete the unused charts.
   For more information, see Delete a Chart.



# Working with Alerts

The Alerting module user interface provides access to NetWitness alerts. The following topics discuss alerts:

- Alerting Overview
- Configure Reporting Engine
- Configure an Alert
- Schedule an Alert
- View an Alert
- Investigate an Alert
- Manage an Alert and Alert Template

## Alerting Overview

Alerts can be used to generate timely insights about current security issues, vulnerabilities, and exploits. For example, when a malicious email is sent from a compromised account, you would need an alert that automatically notifies you when such an event occurs.

The following concepts of alerting will help you understand more about alert rules, conditions, notifications, and templates.

### Alert Rules

Alert rules specify the logic for alert generation. Alert rules allow you to set up threshold limits and define how to be notified if these limits are exceeded. For example, you may set up a rule to be alerted if the CPU usage remains abnormally high for 5 minutes or more.

### Alert Definitions

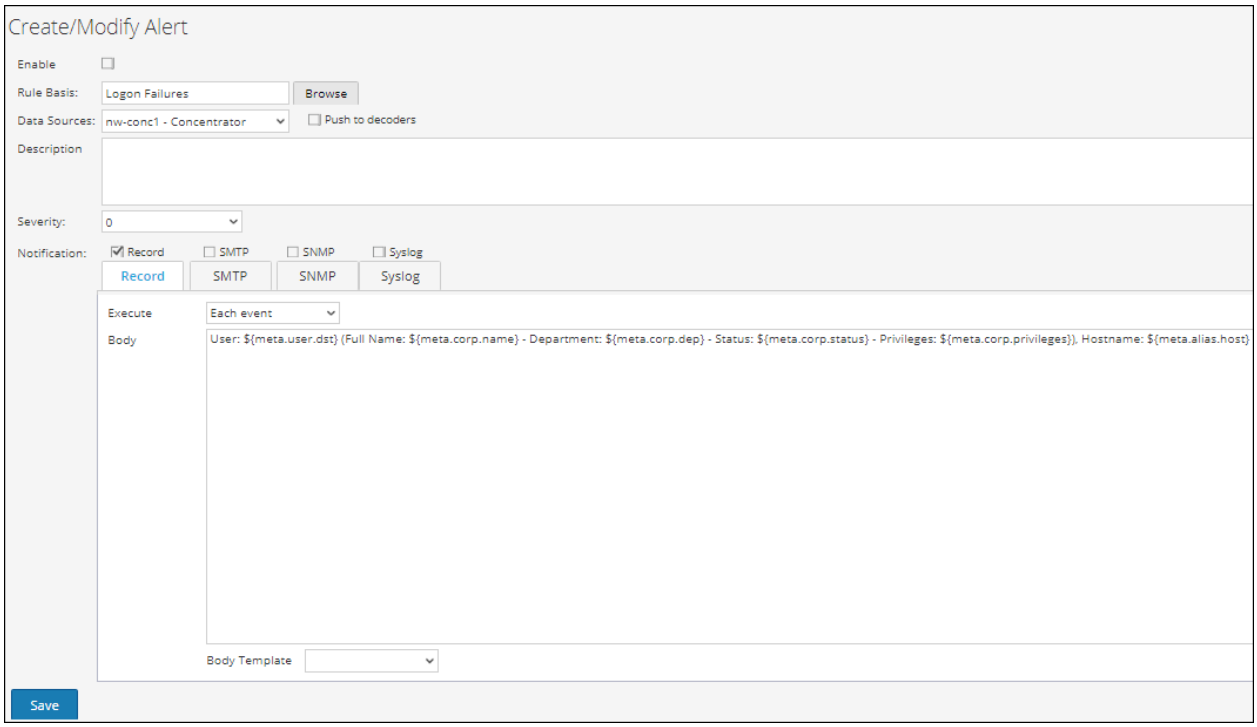
The alert definition is similar to defining rules for reports. These rules must be defined based on your use case. Alert definitions are made by selecting the alert rules you define in the Build Rule view. You select this rule while defining an alert.

**Note:** You can only alert using rules defined for NetWitness data source.

Once an alert is created, this data is collected from the Reporting Engine and displayed on the user interface.

Once an alert is defined, you can schedule the alert to run every minute (by default), or run at the present time, or run at the near future.

**Note:** In the NetWitness user interface, wherever Date and Time is displayed, it is always according to the user selected time zone profile.



## Alert Notifications

The following are the components required to configure alert notifications:

- Notification server – Notification Server is used to send alert notifications. For example, SMTP mail server. Once you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- Notifications – Alert outputs, which can be email, SMTP, SNMP, and Syslog.
- Templates – The pre-defined format of an alert message.

When ever the rule condition is encountered, alerts get generated based on the severity level and notifies the user depending on the notification method set for that specific alert. The following are the various notification methods:

- Email/ SMTP: Simple Mail Transfer Protocol (SMTP) sends alert emails for system activity. Email alerts can be sent to their intended recipients by selecting SMTP as notification type.
- SNMP: Simple Network Management Protocol (SNMP) sends alerts to multiple computers for SNMP traps. SNMP alerts can be sent to other computers by selecting SNMP as notification type.
- Syslog: Syslog alerts generate notifications from Syslog messages. Syslog alerts can be sent by selecting Syslog as notification type.

Alerts can be configured to notify events that require attention, or as mechanisms to take automated actions based on conditions configured in an alert. An alert is sent when conditions within the entity have met the criteria selected for the alert. The notification criteria determines when and at what frequency the alert is generated.

## Alert Templates

Alert templates are pre-defined format for an alert message. You can use these templates to create alerts.

## Access Control for Alerting

Depending on the user role, the user is provided with specific set of access permissions in order to manage an alert. The Administrator manages the access rights provided to each user role from the **(Admin) > Security > Roles** tab. You can set access permissions for the user roles to manage an alert. The Reporting module provides access control at the alert level.

**Note:** Reporting Engine Alert permissions are prefixed with 'RE' to distinguish them from Event Streaming Analysis (ESA).

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Alerts can be combined with a specific set of user roles so that when a user logs into NetWitness, the only alerts they can access are alerts accessible by the role to which the user belongs. Users that belong to a user role with the '**Read & Write**' access permission can define alerts. The access can further be tightened so that the alerts are accessed only by those who have the '**Read Only**' access.

At the alert level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

**Note:** Before applying the Alert permissions, the default permission set for all the user roles is '**No Access**' permission and the checkbox is unchecked.

If you want to change the access permission for a specific user role, you must set it at the alert level. Except for administrators, the default permission set for all the other user roles is '**No Access**' permission.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to alert/ rules based on the user role.
- Scenario 2: Read-only permission applied to rules in the Alert.

| | Role (Analysts) | Permissions applied to Alert/ Rules based on the user role | Permission (Read-only) applied to Rules in the Alert |
|---|---|---|---|
| **Alert** | **Read & Write** | **Read & Write** | **Read & Write** |
| **Rules** | **Read** | **Read** | **Read** |

The Alert is assigned the role of a Security Analyst and permissions are set to **Read & Write** alerts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the **Read** permission is set for the Rules except that the permission for the rules must not be higher than the permission for the Alerts.

If the permission for the rules is higher than the permission for the Alerts, the permission is not applied. For example, if you set the permissions for the Alert as **No Access** and then specify the option *Apply Read-only permission to Rules in the Alerts*, the read-only permission is not set for the rules.

## Access Control for an Alert When Multiple Alerts are Selected

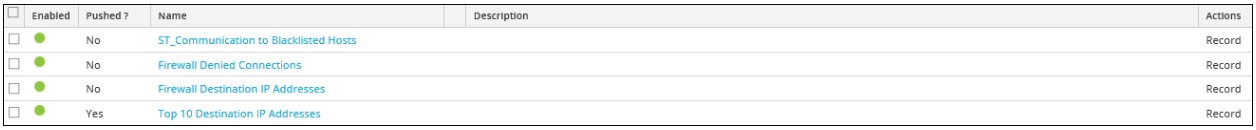
When you want to change permissions of multiple alerts, you must select several alerts and set their access permissions using the Alert Permissions panel. The access permission that you choose is applied to all the selected alerts.

## Log in as a specific user and view the access details

When you log in to the NetWitness UI as a user having **Read** access permission, all the alerts will be denoted with the symbol ( ) and when you click on the symbol the 'Read Only' callout is displayed on the Alert panel.

When you log in to the NetWitness UI as a user not having **Read & Write** access permission on an Alert, all the alerts will be denoted with the symbol ( ) and the alerts appear grayed out on the Alert panel.

The following figure shows the Alert panel when logged in with minimal **Read & Write** access permission.

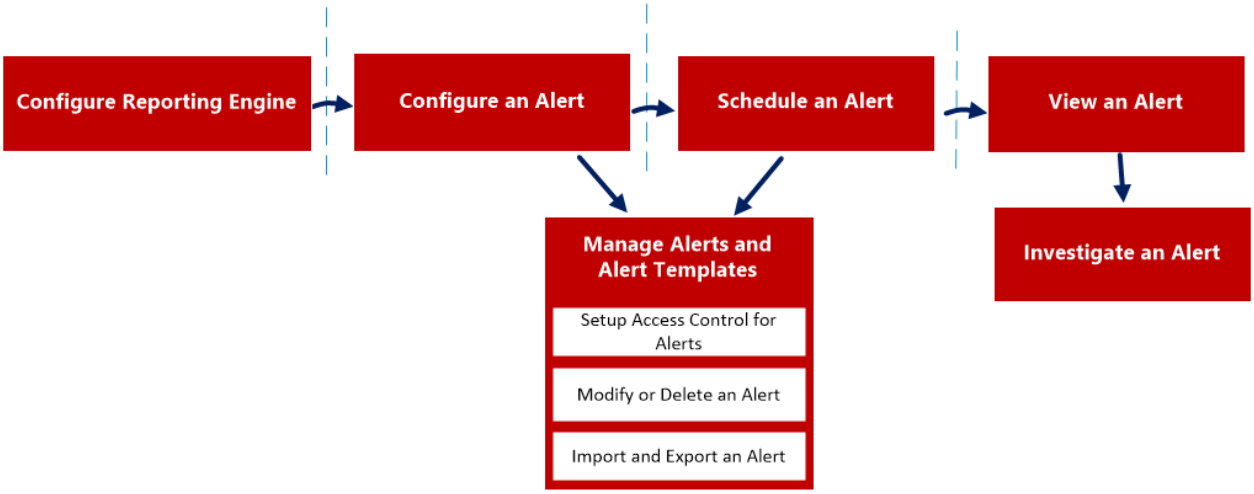


**Note:** If a user (other than ADMIN) creates an alert, ADMIN cannot access that alert.

The following table lists the various columns in the Alert Permissions panel:

| Column | Description |
|---|---|
| Roles | The role of the user logged into the NetWitness user interface. |
| Read & Write | The user can access, view, edit, import, export, and delete the alert on the Alerts page. The user can also change the permission on the alert. |
| Read Only | The user can only access and view the alert on the Alerts page. |
| No Access | The user cannot access or view the alert for which this permission is set. |
| Apply Read-only permission to Rules in the Alerts | The user can automatically apply permissions to the rules in the alerts. |

The following is an overview of the entire process of alerting:



To configure and generate an alert on Reporting Engine, perform the following:

1. Configure Reporting Engine
2. Configure an Alert
3. Schedule an Alert
4. View an Alert
5. Investigate an Alert
6. Manage an Alert and Alert Template

# Configure Reporting Engine

Ensure that:

- You have Decoders that are connected to the Concentrator added to the Reporting Engine for the selected data source, before creating an alert rule.
- You have installed and configured a Syslog server that supports TCP/TLS in your environment. For example, WinSyslog. You can configure the Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered.

To configure the Reporting Engine to send Syslog alerts over TCP with Transport Layer Security (TLS):

1. Obtain the required certificates.
2. Append the CA certificate to the ca.pem file on the NetWitness server.
3. Configure the Syslog server to accept messages from client machines.
4. Configure the delivery of alert messages in the NetWitness UI.

## Task 1: Obtain the required certificates

To generate certificates for configuring Reporting Engine to send Syslog messages over TCP with TLS:

1. Generate a Certifying Authority (CA) certificate. For more information, see http://www.rsyslog.com/doc/tls_cert_ca.html.

**Note:** You can ignore this step if you already have a CA running in your environment.

2. Generate a key pair for the Syslog server. For more information, see http://www.rsyslog.com/doc/tls_cert_machine.html.

**Note:** You can ignore this step if you have already configured security for the Syslog server using the key and certificates generated by the same CA.

### Task 2: Append the CA certificate to the ca.pem file on the NetWitness Server

To append an existing CA certificate to the ca.pem file:

1. Manually append the contents of the CA certificate that you generated to the **/etc/pki/CA/certs/ca.pem** file.
2. Run the following command on the NetWitness server to have the certificate populate to the Truststore:
   ```
   keytool -import -file /etc/pki/CA/certs/ca.pem -keystore cacerts
   ```

### Task 3: Configure the Syslog Server to accept messages from client machines

To configure the Syslog server to accept messages from client machines that have the same CA certificates:

1. Copy the following files to your secure TCP server target location:
   - ca_cert.pem
   - server_cert.pem
   - server_key.pem

   Where:

   *ca_cert.pem* - is the CA certificate

   *server_cert.pem* - is the server certificate

   *server_key.pem* - is the server key

   For more information, see the documentation specific to your Syslog server. If you are using rsyslog, refer to http://www.rsyslog.com/doc/tls_cert_server.html.

### Task 4: Configure the delivery of alert messages in NetWitness

Configure Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered by enabling **SECURE_TCP** in the **Output Actions** tab for the Reporting Engine service in the Reporting Engine Services Config View. For more information, see the **"Reporting Engine Output Actions"** topic in the *Host and Services Configuration Guide*.

# Configure an Alert

You can configure an alert by setting up alert notifications and adding a notification method to a rule.

**Note:** Only Administrators can set up these notifications.

To configure an alert:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Alerts**.

   The Alert view is displayed.

3. In the **Alert** toolbar, click .

   The Create/Modify Alert panel is displayed.

4. Click **Enable** to enable the alert.
5. In the **Rule Basis** field:
   a. Click **Browse**.

      The Lookup Rule Basis dialog box is displayed.

   b. Navigate the Rule tree and select a rule.
   c. Click **OK**.

      The Rule name is displayed in the Rule Basis field.

6. From the **Data Sources** drop-down list, select a data source.

   **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse Connector data sources. For more information, see **"Configure Data Source Permissions"** topic in the *Host and Services Configuration Guide*.

7. Select the **Push to decoders** checkbox for the Reporting Engine to send the rule to the Decoder.
8. (Optional) Enter an alert description in the **Description** field.
9. From the **Severity** drop-down list, select the severity level.
10. In the **Notification** field:
    a. Select the appropriate notification.
       The selected notification tab is displayed in the Create/Modify Alert dialog box.
    b. (Optional) Deselect the notification to disable the notification tab.
    c. Define an action in one of the **Notification** tabs:

i. In the **Record** tab field:

   a. From the **Execute** drop-down list, select the frequency for recording an alert.

   b. Enter the RECORD message. You can create a new message or select a template in the **Body Template** field and modify the template here.

   c. (Optional) If templates have been defined, select a template for the RECORD message that you can use as is or modify.

ii. In the **SMTP** tab field:

   a. From the **Execute** drop-down list, select a value to identify the number of times to send an email message for the alert.

   b. Enter an email address or comma-separated list of email addresses to send this alert.

   c. Enter the subject of the email message.

   d. Enter the body of the message. You can create a new message or select a template in the **Body Template** field and modify the template here.

iii. In the **SNMP** tab field:

   a. From the **Execute** drop-down list, select a value to identify the number of times that you want to send an SNMP message for the alert.

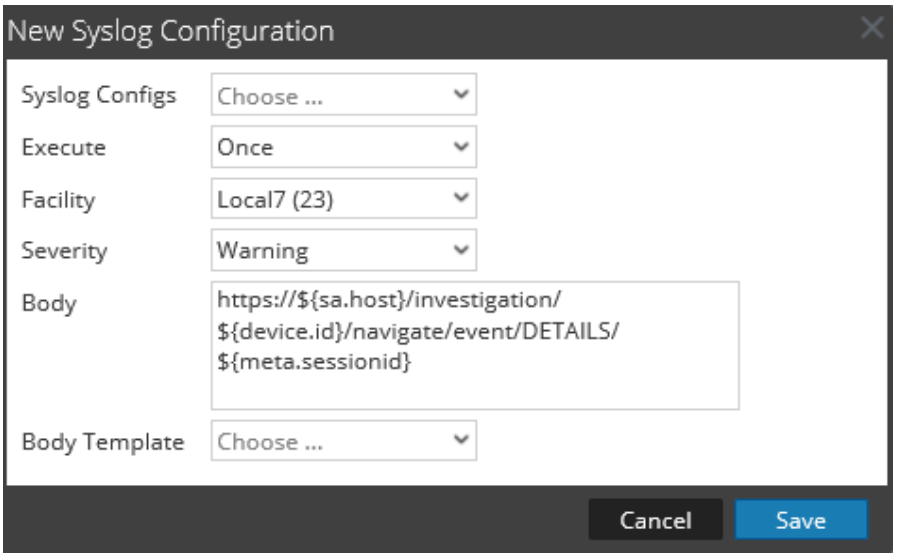
   b. Enter the SNMP message. You can create a new message or select a template in the **Body Template** field and modify the template here.

iv. In the **Syslog** tab field:

> **Note:** You can configure Multiple Syslog servers on the Syslog Configuration panel. For more information, see **"Reporting Engine Output Actions"** topic in the *Host and Services Configuration Guide*.

   a. Click .

   The New Syslog Configuration dialog box is displayed.



b. From the **Syslog Configs** drop-down list, select a value for the syslog configuration.

c. From the **Execute** drop-down list, select a value to identify the number of times to send a Syslog message for the alert.

d. From the **Facility** drop-down list, select the facility.

e. From the **Severity** drop-down list, select the severity level.

f. Enter the Syslog message. You can create a new message or select a template in the **Body Template** field and modify the template here.

> **Note:** If you want to add a metakey, specify the same in the format: ${meta.metakey}. For example, ${meta.ip.dst}.

g. Click **Save**.
The Syslog configuration gets added to the alert.

11. Click **Create**.

NetWitness creates an alert with a confirmation message that the alert is saved successfully. NetWitness generates the alert and executes the output actions every minute.

## Schedule an Alert

You must schedule an alert to search for events on a regular schedule.

To schedule an alert:

1. Go to **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Select an alert to schedule.
4. On the **Alert** toolbar, click **Enable**.
The selected alert is scheduled.

# View an Alert

You can view an alert or a list of all alerts.

You can view the alerts triggered and investigate any alert in the Investigation module and customize these views to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

To view an alert:

1. Go to **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. On the **Alert** toolbar, click **View Alerts**.
   The View Alerts view is displayed.

# Investigate an Alert

You can investigate every alert that is triggered on the Alert View. For more detailed investigation on a particular alert, you can view the alert on the Investigation module.

To investigate an alert:

1. In the **Alert** section toolbar, click **View Alerts** to navigate to the View Alerts view.
2. Do one of the following:
   - Click the button against the alert you want to investigate.
     The Investigation module displays the details of the first session that registered the match for the given alert for immediate analysis.
   - Click on the alert name of the alert you want to investigate.
     The Investigation module displays all matches for that particular alert for the hour surrounding the registered alert.

# Manage an Alert and Alert Template

You can manage alerts, scheduled alerts, and alert templates using the following procedures.

## Manage an Alert

Depending on the access permissions set for the user role, you can modify or delete, import and export, enable or disable alerts, view or refresh an alert list.

### Access Control for an Alert When a Single Alert is Selected

To set access permissions for an alert:

1. Go to **Reports**.
   The Manage tab is displayed.

2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select an alert.
4. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
5. Based on the user role, select the appropriate options.
6. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.

**Note:** When the check box is selected, all dependent rules with the No access permission will be given the READ access permission.

7. Click **Save**.
   A confirmation message that the permission is successfully set for the selected alert is displayed.

## Access Control for an Alert When Multiple Alerts are Selected

To change permissions of multiple alerts:

1. In the **Alerts** panel, select all the alerts whose permissions must be set.
2. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
3. Select the permission to set for the respective user role.
4. Click **Save**.
   A confirmation message that the permission is successfully set for all the selected alerts is displayed.

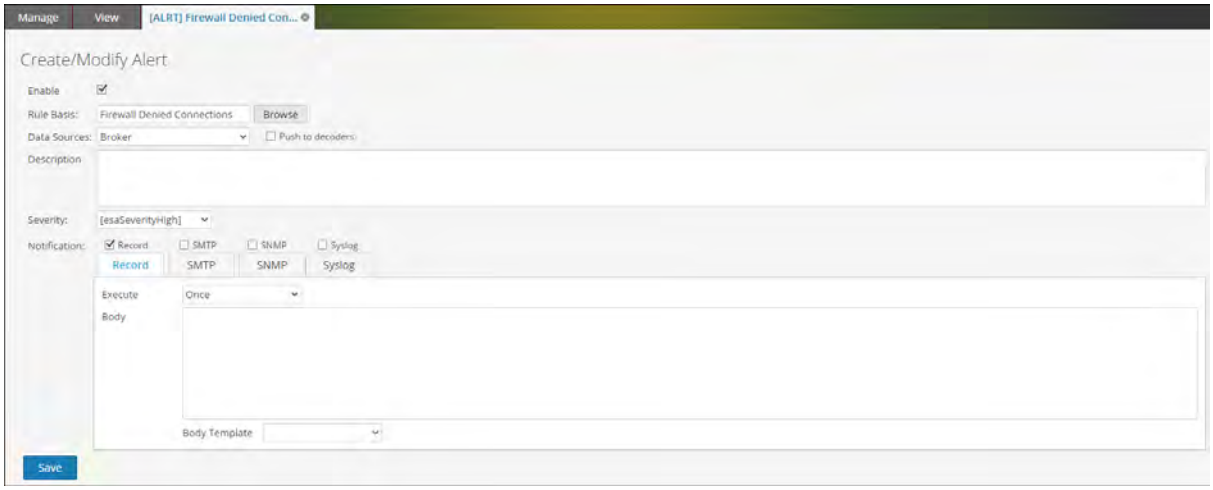
## Edit an Alert

For example, if you want to be notified about the alert over an email on a different Email ID, you will have to modify the alert notification section with the new Email ID details to be reverted over an email when an alert is generated. Additionally, you can also modify the alert description and alert notification in the Create or Modify Alert panel.

To edit an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.

3. In the **Alert** panel, select an alert and click .
   The Create or Modify Alert tab is displayed.



4. In the **Rule Basis** field, navigate the rule tree and select another rule.
   The Rule name is displayed in the Rule Basis field.
5. (Optional) Select a data source from the **Data Sources** drop-down list.

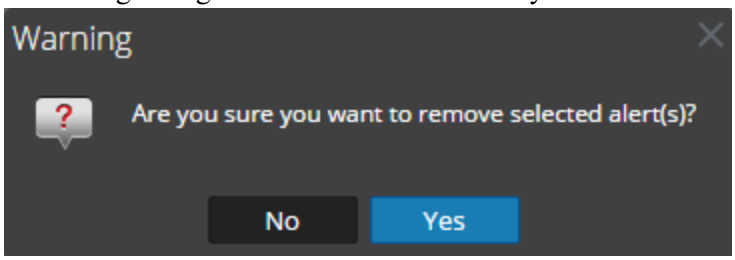
   **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see **"Configure Data Source Permissions"** topic in the *Host and Services Configuration Guide*.

6. (Optional) Modify the alert description in the **Description** field.
7. Modify the appropriate **Notification** tabs – **RECORD**, **SMTP**, **SNMP**, and **Syslog**.
8. Click **Save**.
   A confirmation message that the alert is modified successfully is displayed.

## Delete an Alert

To delete an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert and click .
   A warning dialog asks for confirmation that you want to remove the selected alerts.



4. Click **Yes** to delete the alert.
   A confirmation message that the alert is deleted successfully is displayed and the selected alert is deleted from the Alert panel.

## Import an Alert

To import an alert from other instances of NetWitness in the Alerts panel:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click > **Import**.
   The Import Alert dialog box is displayed.
4. Click **Browse** to select the binary file.
   NetWitness provides a file system view of the files. You can import multiple alerts at a time. To select multiple alerts, select the checkbox of the alert to be imported.
5. Locate the binary file, and click **Open**.
   The file is added to the Import Alert list.
6. (Optional) To overwrite any existing alert in the library with an identically named alert in the binary file when importing, select the Alert checkbox. If you do not select the Overwrite option, and an identical alert is encountered in the binary file, the binary file is imported and no error message is displayed.
7. Click **Import** to import the binary file.

## Export an Alert

To export an alert to an external file that can be later imported to NetWitness:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select an alert and click and do one of the following:
   - **Export** - This selection exports an alert in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.
     You can export multiple alerts at a time. To select multiple alerts, check the checkbox of the alert to be exported.
4. Click > **Export**.
   The exported binary file is saved to the local drive.

## Enable an Alert

To enable an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert that displays ○ in the **Enabled** column.
4. Click 
.
   A confirmation message shows that the change to the alert(s) state was successful.

## Disable an Alert

To disable an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert that displays ● in the **Enabled** column.
4. Click 
.
   A confirmation message shows that the alert(s) status is changed successfully.

## View an Alert List

To view an alert list:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **View Alerts**.
   The View Alerts view tab is displayed.
4. Select the last number of days from the drop-down list.
5. Enter a value for the **Max no of alerts**.
   The alerts list is displayed based on the chosen filter value.

## Refresh an Alert List

To refresh the list of alerts:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. From the **Alert** toolbar, click to refresh the alerts list.
   The Alert panel is refreshed.

## Manage a Scheduled Alert

You can enable or disable a scheduled alert, and view all scheduled alerts.

### Enable a Scheduled Alert

To enable a scheduled alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be enabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert panel.

### Disable a Scheduled Alert

To disable a scheduled alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be disabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert panel.

### View all Alerts Scheduled

To view all the alerts scheduled:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **View Schedule**.
   The View Alerts Schedule view is displayed with a list of all the scheduled alerts.

## Manage an Alert Template

You can modify or delete an alert template, and view all alert templates.

## Edit an Alert Template

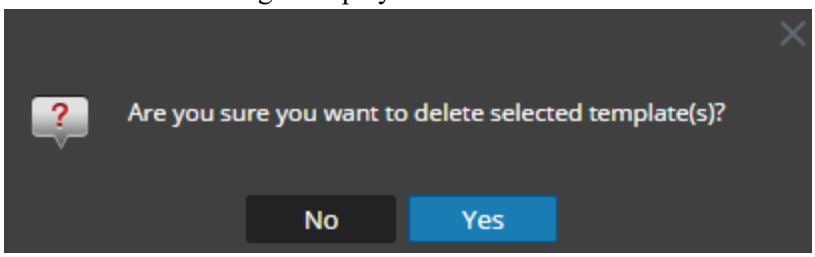
To edit an alert template:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Alert Template view is displayed.
4. In the **Alert Template** panel, select a template and click .
   The Create/Modify Template dialog box is displayed.
5. Click **Save**.
   A confirmation message that the template is modified successfully is displayed.

## Delete an Alert Template

To delete an alert template:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Template view tab is displayed.
4. In the **Alert Template** panel, select a template and click .
   A confirmation dialog is displayed.



5. Click **Yes** to delete the template.
   A confirmation message that the template is deleted successfully is displayed.

## View all Alert Templates

To view all alert template messages:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.

3. In the **Alert** toolbar, click **Template**.
   The Template view tab is displayed with a list of templates.

## List of Available Variables

Below are the list of variables available on the Reporting Engine notification for Reporting Engine alerts.

```
Name: ${name}
Severity: ${severity}
alert count: ${count}
Start_session_id = ${sid1}
end_session_id = ${sid2}
data source id = ${device.id}
netwitness host = ${nw.host}
```

See below example for how to use metadata information on the notification template.

To use ip.src and ip.dst meta, use the format `${meta.<meta-name>}`.

```
ip.src meta = ${meta.ip.src}
ip.dst meta = ${meta.ip.dst}
```

# Appendix

This section provides detailed information about the supported aggregate functions, rule syntax, advanced rules query syntax in Reporting and task scheduler for Warehouse Reporting.

# Rule Syntax

This section describes the different rule syntax supported in the Reporting Engine.

## NWDB Rule Syntax

The NWDB rule is one of the rule syntax supported in the Reporting Engine. To enhance the execution time of your reporting entities, see "Reporting Guidelines" section in Reporting Overview.

A Rule is a function that manipulates the result set of a rule in order to make the output in a report more meaningful or add additional functionality to a rule other than querying data and displaying it. Any combination of these rule actions can be used to create unique and interesting representations of the information collected by NetWitness.

The Reporting Engine supports the following categories of NWDB data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- **then** clause
- **Limit** field
- Rule Actions
- Rule Operators

### Select Clause

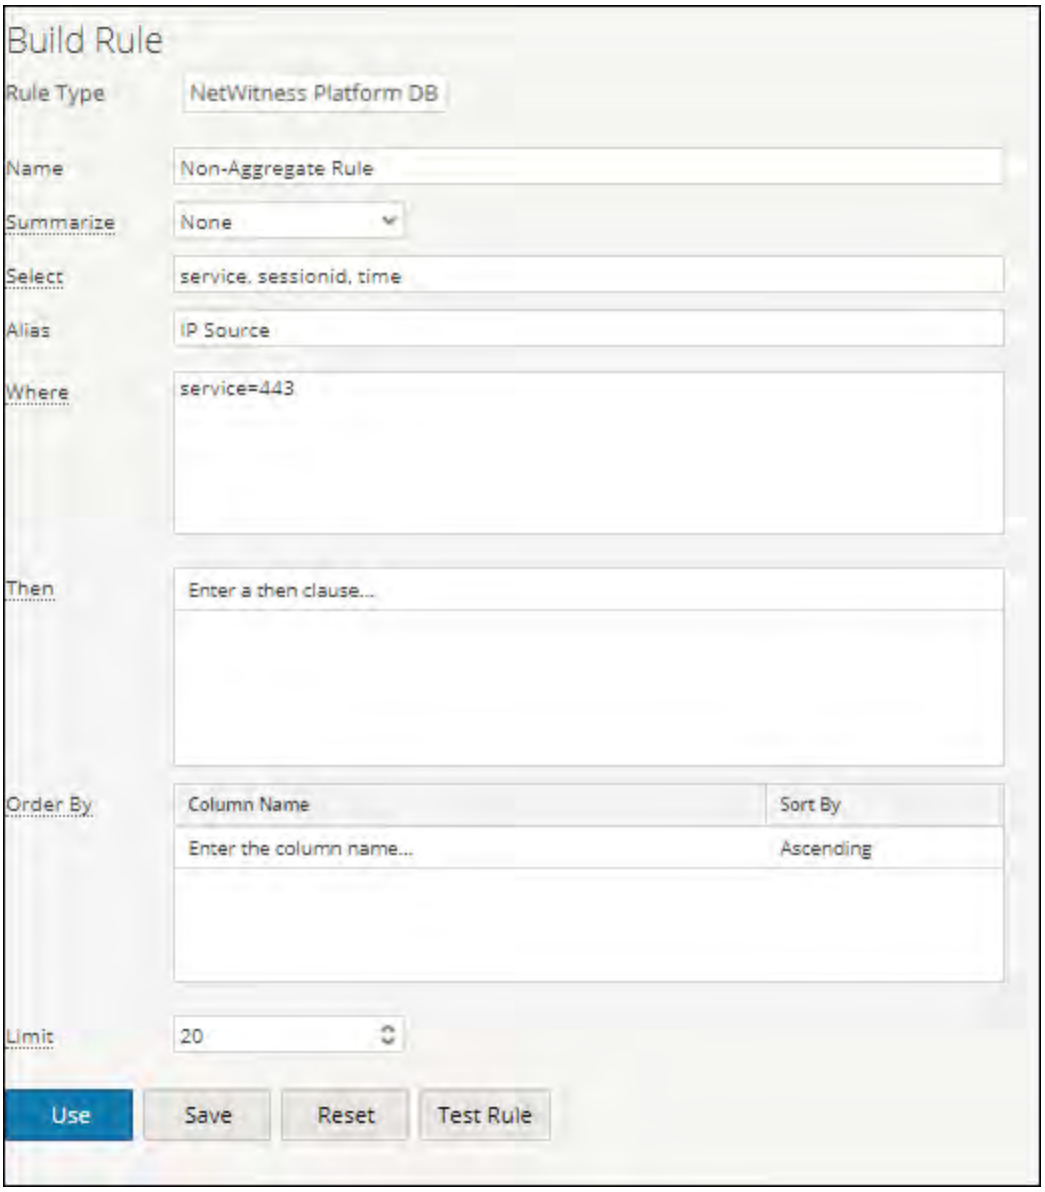
The select clause is a comma separated list of values. For example: select sessionid,time,service.

There are two types of select clause for NWDB Rule:

- Non-aggregate rule
- Aggregate rule

### Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select service, sessionid, time.

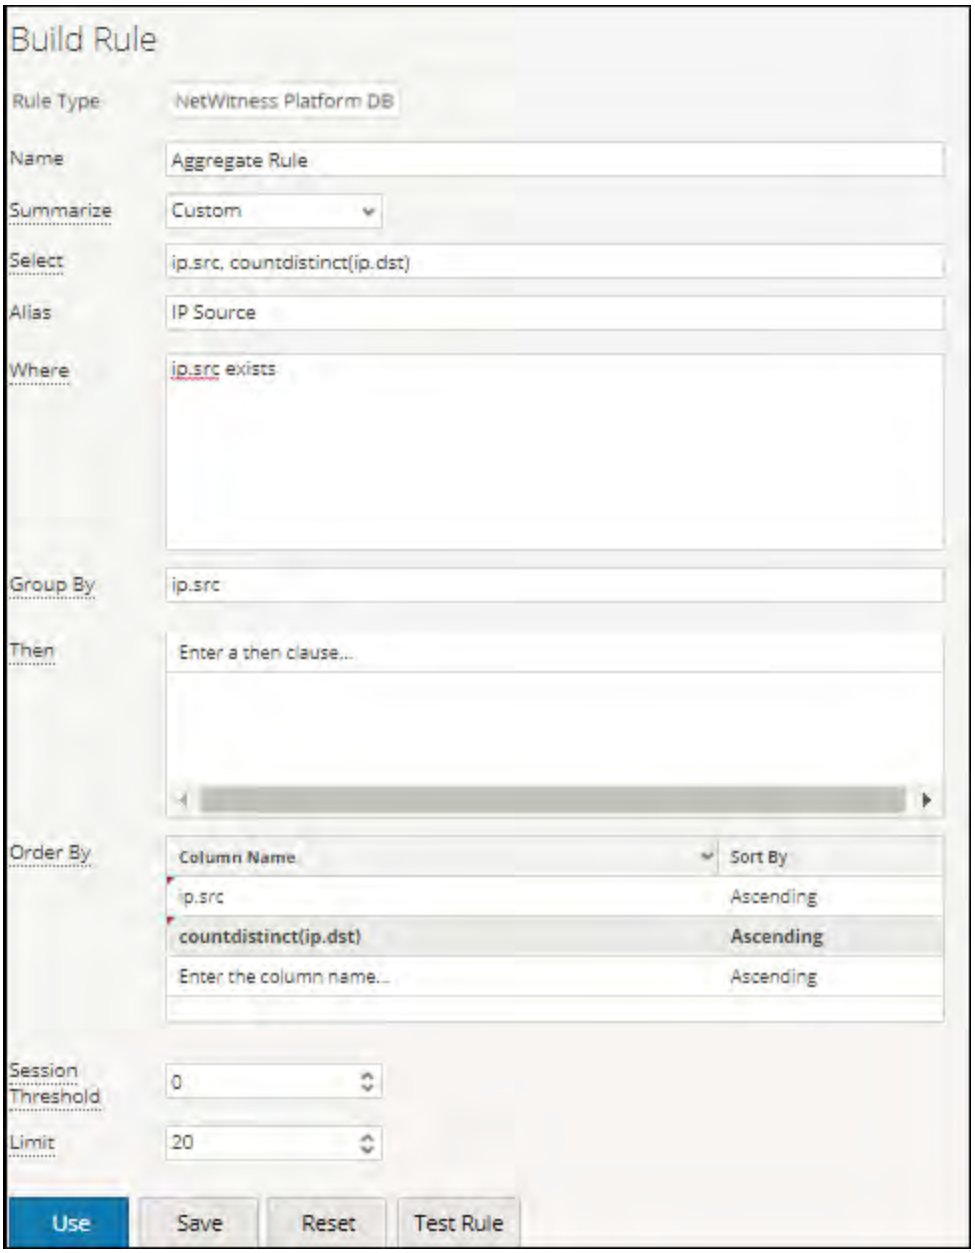


## Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose either of the three metas (Event Count, Packet Count, Session Size) or choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select ip.src, sum (ip.dst). When Custom aggregate rule is enabled, the following fields are populated in the user interface:

- Group By
- Order By
- Session Threshold

The following figure shows the Build Rule view for Aggregate Rule.



There are two types of aggregate values that can be queried:

- Collection aggregation
- Meta aggregation

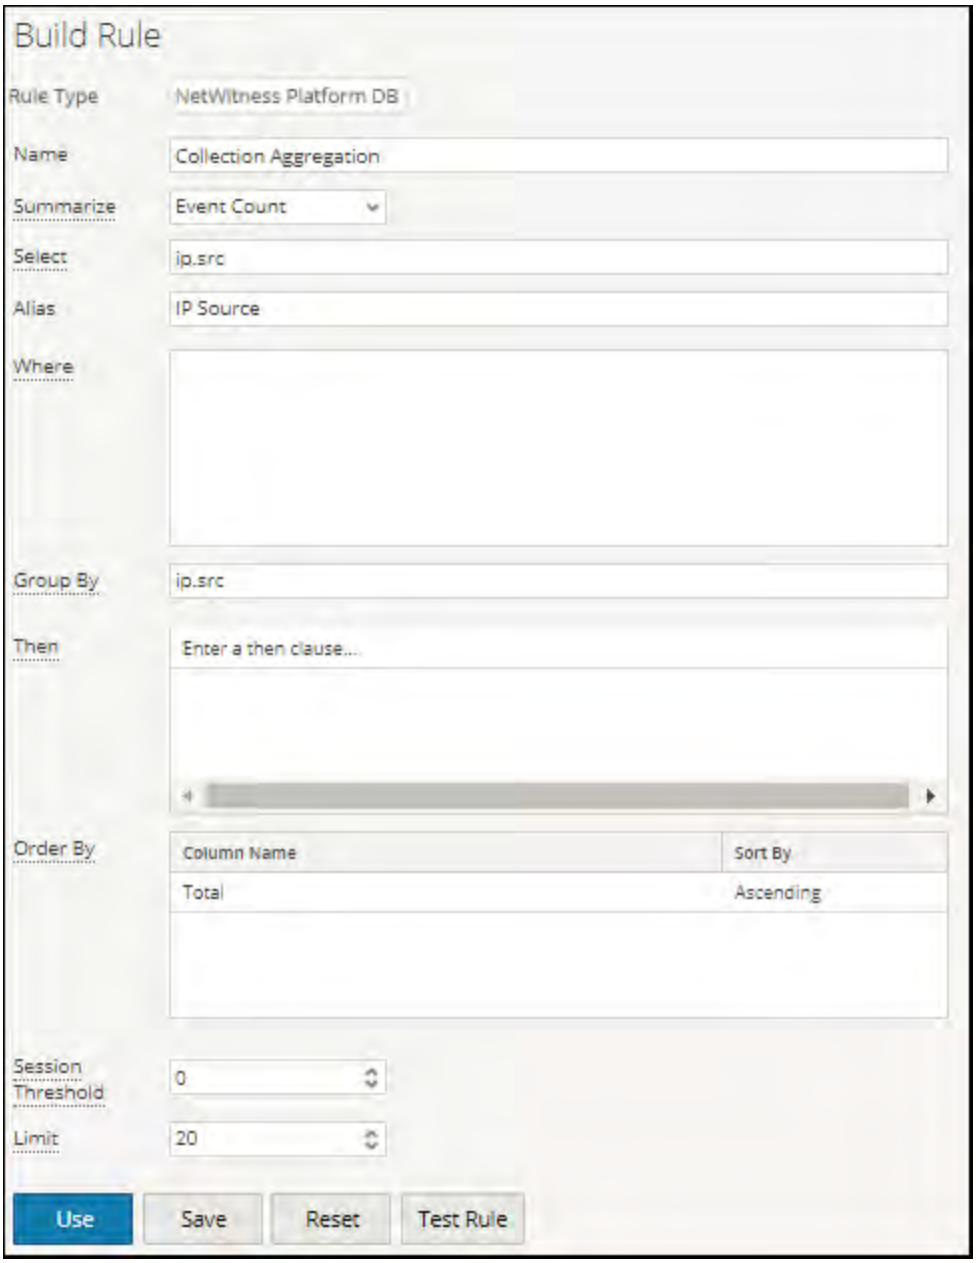
## Collection Aggregation

With collection aggregation, you can get aggregates related to Event, Session or Packets. The following values can be queried in a collection aggregation:

- **Event Count**: The total count of events.
- **Packet Count**: The total count of packets.

- **Session Size**: The total session size.

These options are listed in 'Summarize' field and any one of them can be selected in a rule.
For example, choose any of the Collection aggregates (Event Count or Packet Count or Session Size) in the 'Summarize' field and select ip.src.



## Meta aggregation

With meta aggregation, you can get aggregates of meta values. The following are the supported meta aggregate functions:

- sum(meta)
- count(meta)
- countdistinct(meta)
- min(meta)
- max(meta)
- avg(meta)
- first(meta)
- last(meta)
- len(meta)
- distinct(meta)

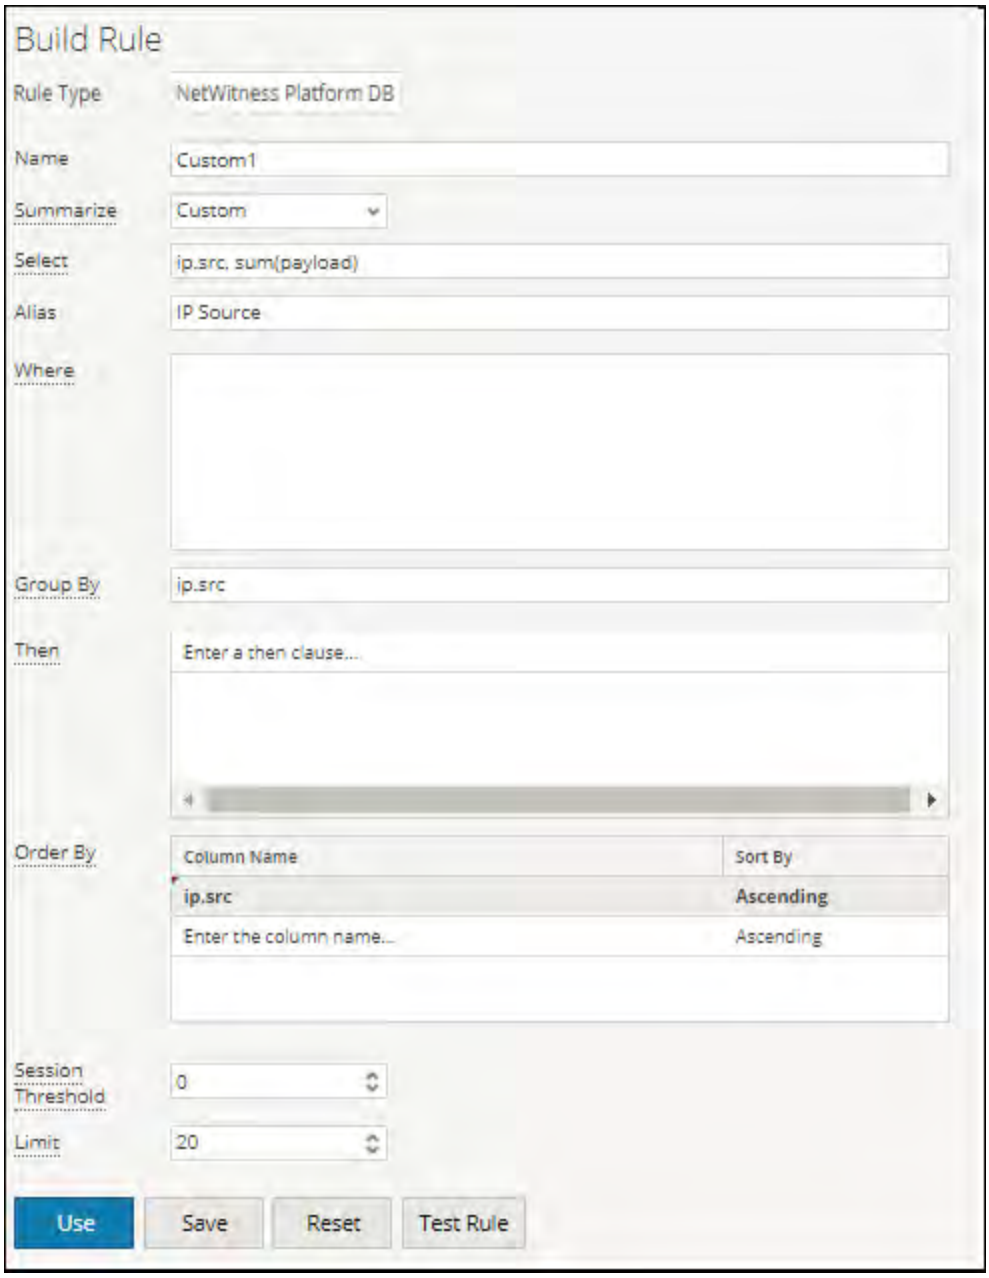
## Supported Meta Aggregate Functions

The NWDB service supports the following meta aggregate functions and syntax in this release.

| Syntax | Function |
|---|---|
| sum (<meta>) | The sum of all meta values.<br>For example, if you provide the field sum(payload) in the select clause, the resultset is the sum of payload size.<br>**Note:** The meta field chosen for the sum aggregate function must be of numeric data type. |
| count (<meta>) | The total number of meta fields that would be returned.<br>For example, if you provide the field count(ip.dst) in the select clause, the resultset is the number of times an ip.dst value is returned. |
| countdistinct (<meta>) | The total number of distinct meta fields that would be returned. For example, if you provide the field countdistinct(ip.dst) in the select clause, the resultset is the number of times a distinct ip.dst value is returned. |
| min (<meta>) | The minimum of all meta values.<br>For example, if you provide the field min(payload) in the select clause, the resultset is the min of payload size. |
| max (<meta>) | The maximum of all meta values.<br>For example, if you provide the field max(payload) in the select clause, the resultset is the max of payload size. |
| avg (<meta>) | The average of all meta values.<br>For example, if you provide the field avg(payload) in the select clause, the resultset is the avg of payload size.<br>**Note:** The meta field chosen for the avg aggregate function must be of numeric data type. |

| Syntax | Function |
| --- | --- |
| first (<meta>) | The first occurrence of the meta value.<br>For example, if you provide the field first(ip.src) in the select clause, the resultset is the first occurrence of ip.src for that group. |
| last (<meta>) | The last occurrence of the meta value.<br>For example, if you provide the field last(ip.src) in the select clause, the resultset is the last occurrence of ip.src for that group. |
| len(<meta>) | Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database.<br>For instance, the meta value "NetWitness" returns a length of 10. All IPv4 fields, like ip.src, returns 4 bytes. |
| distinct (<meta>) | The distinct values of the meta.<br>For example, if you provide the field distinct(ip.src) in the select clause, the resultset is all the distinct ip.src for that group. |

You must select 'Custom' in 'Summarize' field and provide the meta and the meta aggregate functions in the select clause.



**Note:** Meta aggregate functions cannot be used in a WHERE clause and the rule actions like min_threshold/max_threshold can be used to filter aggregate functions. It is advised to use a more refined WHERE clause to get a better rule performance while using 'group by'.

## Aggregate Query for Multiple Meta

To execute aggregate query for multiple Meta, follow these steps:

1. Go to **Reports**.

   The Manage tab is highlighted and the **Rules** view is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.

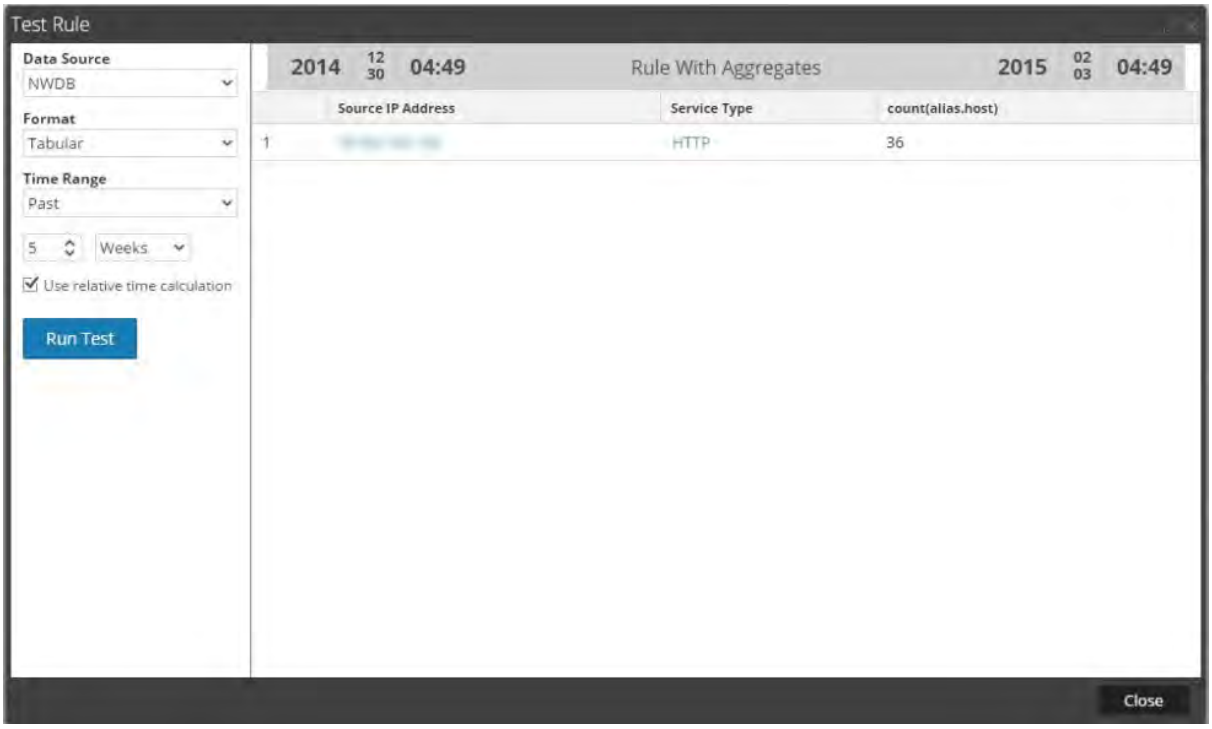
   For example, enter the following meta in the fields highlighted below:

   **SELECT**: ip.src, service, count(alias.host)
   ALIAS: Source IP Address, Service Type, count(alias.host)
   **WHERE**: ip.src = 59.96.136.142

   **Note:** In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1, Field2, Field3, Field4, and alias has only Field1, Field3, Field4, then for Field2 a default description is used.

3. Click the **Test Rule** button at the bottom of the screen.

   The Test Rule page is displayed.



## Summarize

Summarize determines the type of summarization or aggregation for the rule.

| Name | Config Value |
|---|---|
| Summarize | To query metas without any custom grouping, select:<br>• **None**: The data is grouped by session in this case.<br>To get collection (sessions/events/packets) related aggregates, select either of the following:<br>• **EventCount**: The total count of events.<br>• **Packet Count**: The total count of packets.<br>• **Session size**: The total session size.<br>To get meta based aggregates, select:<br>• **Custom**: This indicates that expected meta aggregate function is defined in rule select clause. |

## Order By

Order By determines how to sort the result set.

| Name | Configuration Value |
|---|---|
| Column Name | The **Column Name** is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field.<br>• For 'None' and 'Custom', the value gets populated based on the entries made in the Select field. You can select from this list or add custom name.<br>• For Event Count, Packet Count and Session size, accepted values are Total and Value.<br>• Total - sort by aggregate value<br>• Value - sort by group by meta |
| Sort By | **Sort By** determines the order in which you want to sort the results. The following are the values:<br>• Ascending Order<br>• Descending Order |

## Session Threshold

The session threshold is the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647. The threshold 0 scans for all matching sessions.

**Note:** If you provide a non-zero value (a value higher than zero), the aggregate results are inaccurate. This can be used only when you are interested in unique values and not aggregate values.

## Supported where Clause

| Syntax | Description |
|---|---|
| where <field1> [<field-operator>] < value1>,<value2>,<value3-value4> <logic-operator> <field2>,and so on | The where clause is a comma separated list of language field values and ranges that is used by NwValues function. In the where clause, string values have to be enclosed within single quotes. For example, where username = 'admin' && service = 22. |
| where <field1> [<field-operator>] <List1> | You can use a list in the where clause if you have multiple values to report on. For example, where ip.src exists && alias.host exists && alias.host contains $[User Reports/List of Alias Host]. When you use the list you must specify in the format $[<path>/<List name>]. |

In the where clause, make sure the syntax is correct based on the meta type.
For example,
For all text meta type use quotes for example, username = ‘user1’.
For all IP Addresses, Ethernet Addresses, and Numeric meta types do not use quotes for example, service = 80 && ip.src = 192.168.1.1.
For date and time meta types, if the date and time format is 'YYYY-MM-DD HH:MM:SS‘, use quotes.
If the date and time format is 1448034064 (number of seconds since EPOCH (Jan 1, 1970)), do no use quotes.

**Note:** If list is used in the rule, make sure that the list values are quoted or unquoted based on the type of the meta used. Checking the **Quotes will be inserted for all the values** checkbox in list definition page (for more information see, "Create Lists or List Groups" section in Configure a Rule) would quote all the list values.

## Supported where Clause Operators

| Syntax | Description |
|---|---|
| = | Returns results where the field is equal to any provided value. For example, tcp.dstport = 21-25,110 returns session with TCP destination ports of 21, 22, 23, 24, 25, or 110. |
| != | Returns results for fields that do not match the values specified. For example, eth.type !=0x0800 returns sessions outside of hex value (decimal value of 2048) that is all non-IP based protocols. |
| begins | Checks for a value at the beginning of a text or binary field. |
| contains | Searches a text or binary value for a partial match. |
| ends | Checks for a value at the end of a text or binary field. |
| exists | If the field value exists, regardless of value, the operation evaluates to true. |
| !exists | If the field value does not exist, the operation evaluates to true. |
| length | Evaluates the length of the field. For example, username length 20-u returns any username that is 20 or more characters long. |

| Syntax | Description |
|---|---|
| regex | Performs a regular expression search against text or binary values. |
| not | Not operator is used to negate a clause or condition. For example, (not(user.dst ends "$")) will not display values for user destination. |

### Supported then Clause

| Syntax | Description |
|---|---|
| then <rule action> | The then clause contains a rule action that manipulates the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it. For example, dedup (filename). |

### Limit field

This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event
count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not
sorted, the first N values are returned.

### Rule Actions

The NWDB data source rule syntax supports the following rule actions:

- dedup
- filter_on
- filter_out
- lookup_and_add
- max_threshold
- min_threshold
- regex
- sum_count
- sum_values
- show_whats_new

### dedup (string field)

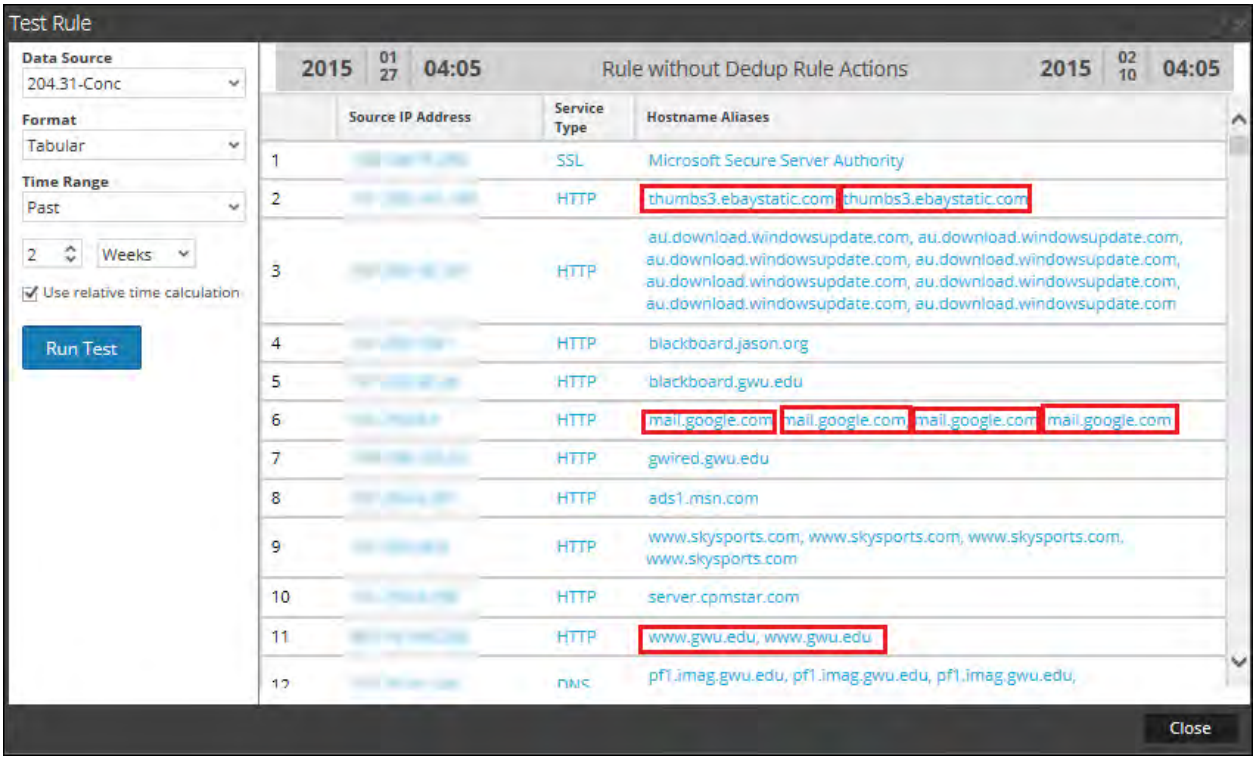
dedup removes the duplicate entries in an unsorted result set and displays only pertinent data.
The dedup rule action removes duplicate entries of a specific field in the report, so that only the first occurrence of that value is listed in the report.

**Note:** The dedup rule action cannot be used with an aggregate rule.

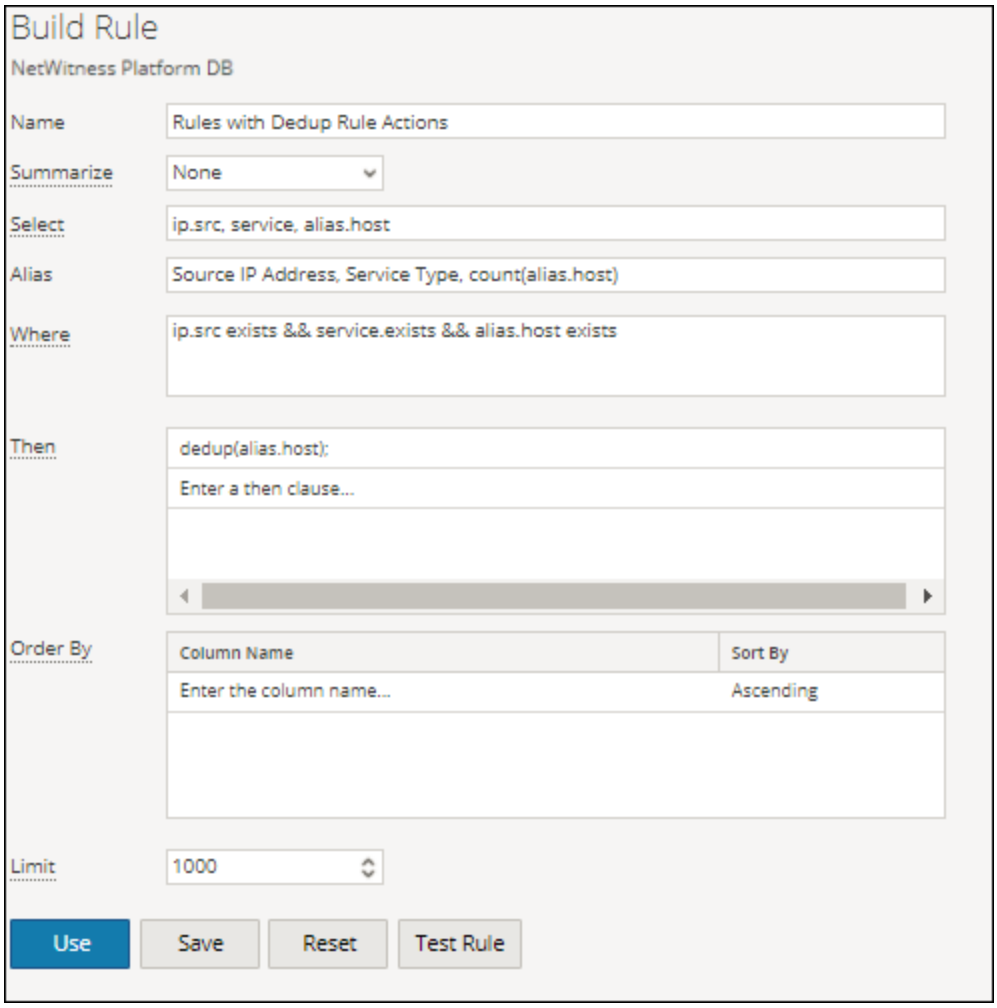
For example, the meta data generated by an individual session is often repetitive, especially when you have sessions with a lot of DNS lookups or web sessions that access the same host multiple times for various resources (such as, javascript, css). To remove the duplicate entries of the host, you can use the dedup rule action.

**Example:**

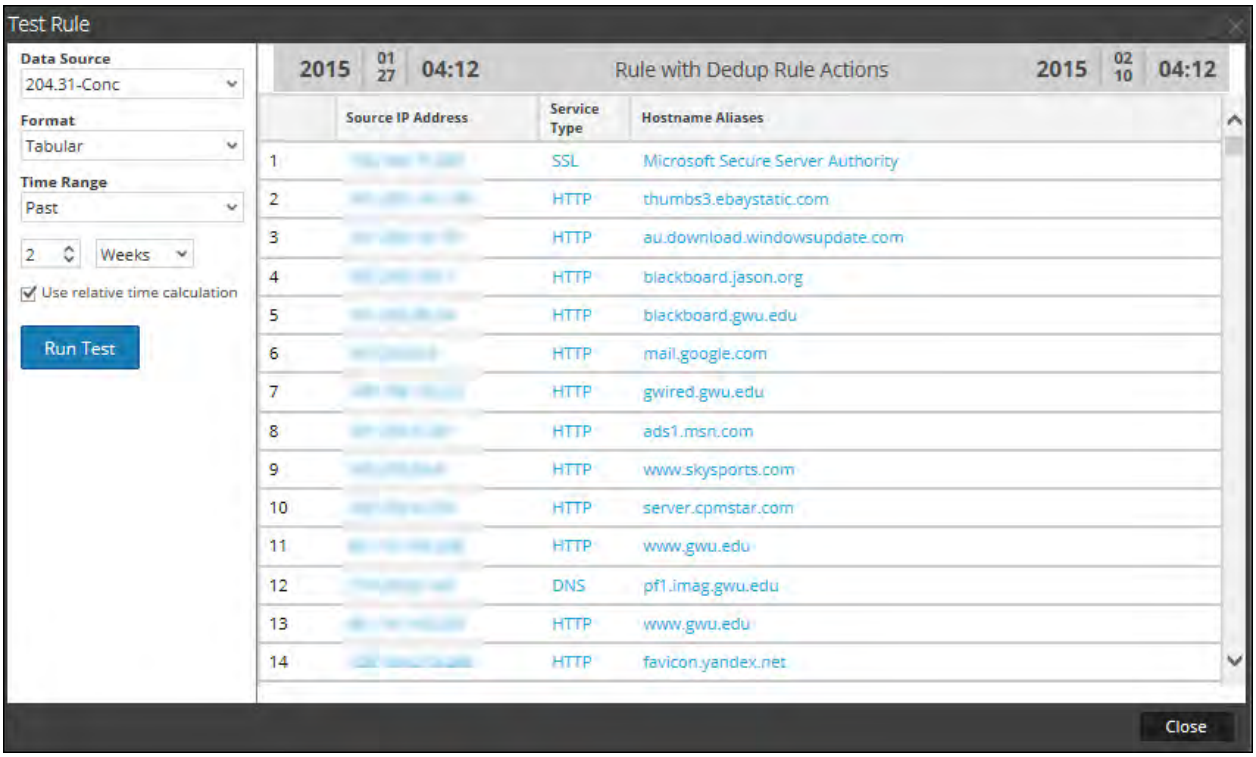
The following example is a lengthy result set that can be trimmed by removing the duplicate values in the same session.



The following figure shows the use of dedup rule action to remove the duplicate entries from the result set.



The duplicate value for each entry in the rule result set is reduced to one value.



## filter_on (string filter, string field, bool matchExact)

`filter_on` removes values that do not contain the `filter` criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied. To add additional results to a single result set, include function such as lookup_and_add.

The matchExact parameter determines if the match is an exact match or contains a match.

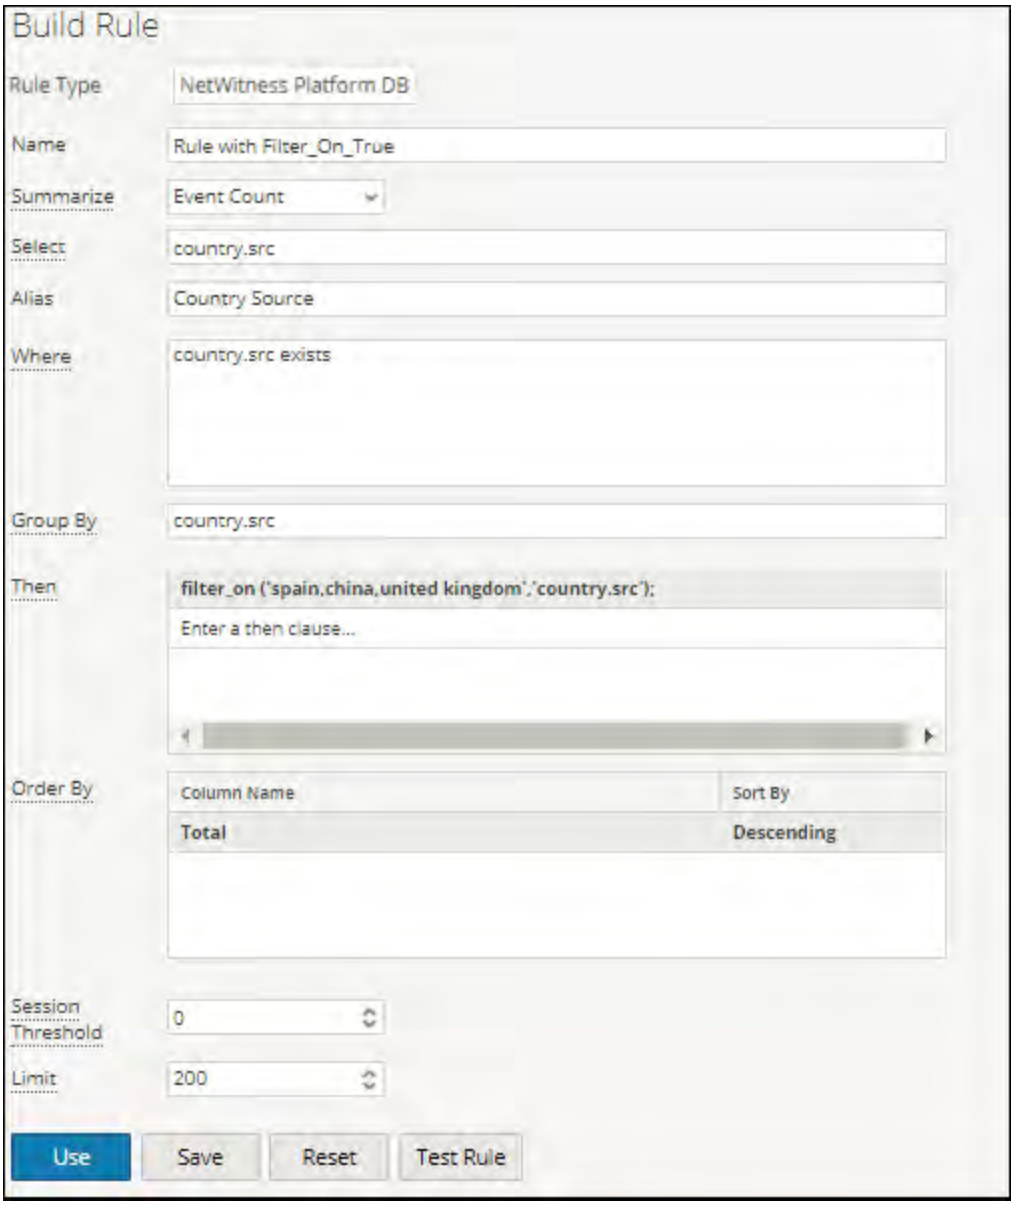
- If matchExact is set to `false`, any value that contains the filter text is considered a match.
- If matchExact is set to `true`, only values that match the provided filter text is included in the result set.

**Note:** Unless the matchExact parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be kept in the result set, users must set the matchExact parameter to false.

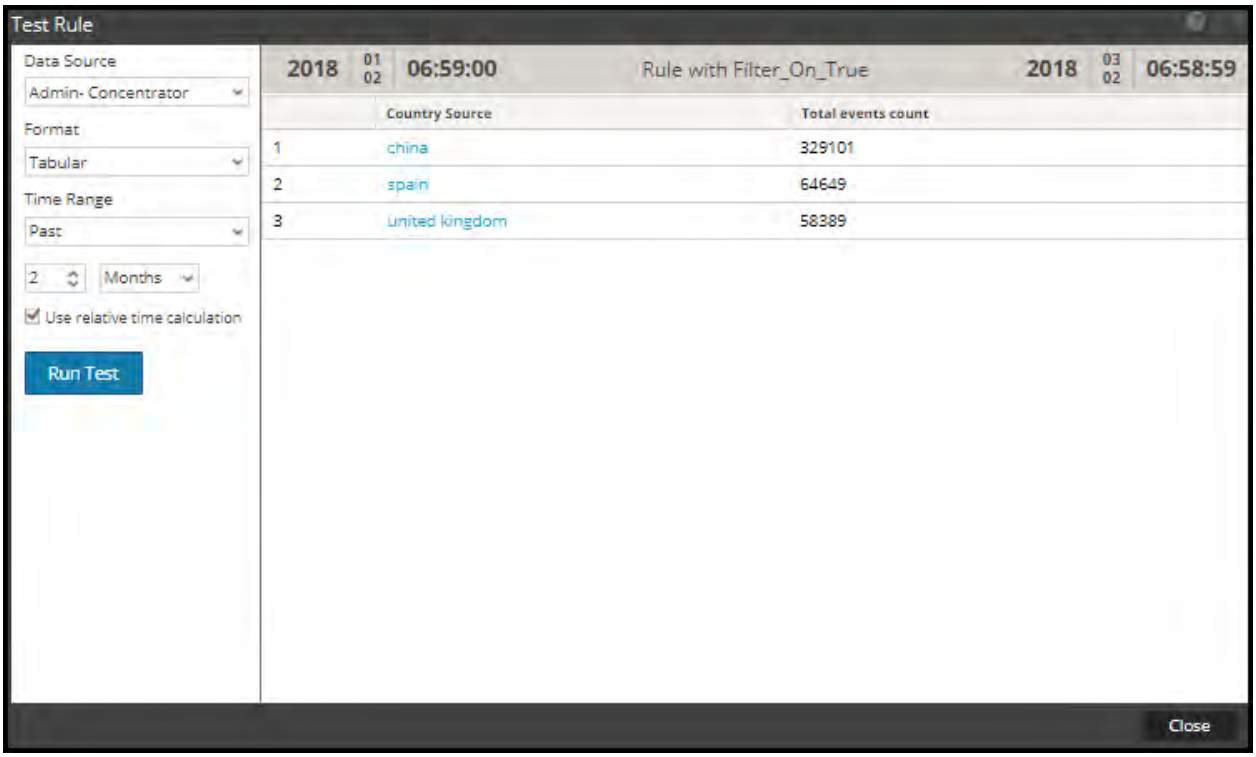
**Example:**

The following figure displays the list of countries and their event count.

The following figure shows a filter_on rule action to filter out countries except Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_on rule action.



Another way of filtering out the entries from the result set is to create a list of variables which you want to filter out. For example, you can create a list with United Kingdom, France and Germany as values in the list. You can use this list in the rule action to get the same result set. For example, if you create a list called COUNTRY_LIST, you can use the list as follows:

```
filter_on ('$COUNTRY_LIST', 'country.src', 'false');
```

```
filter_out (string filter, string field)
```

```
filter_out (string filter, string field, bool matchExact)
```

filter_out removes the values that contain the *filter* criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied (for example, you can use a lookup_and_add to add results to a single result set).

The matchExact parameter determines if the match is an exact match or contains a match.

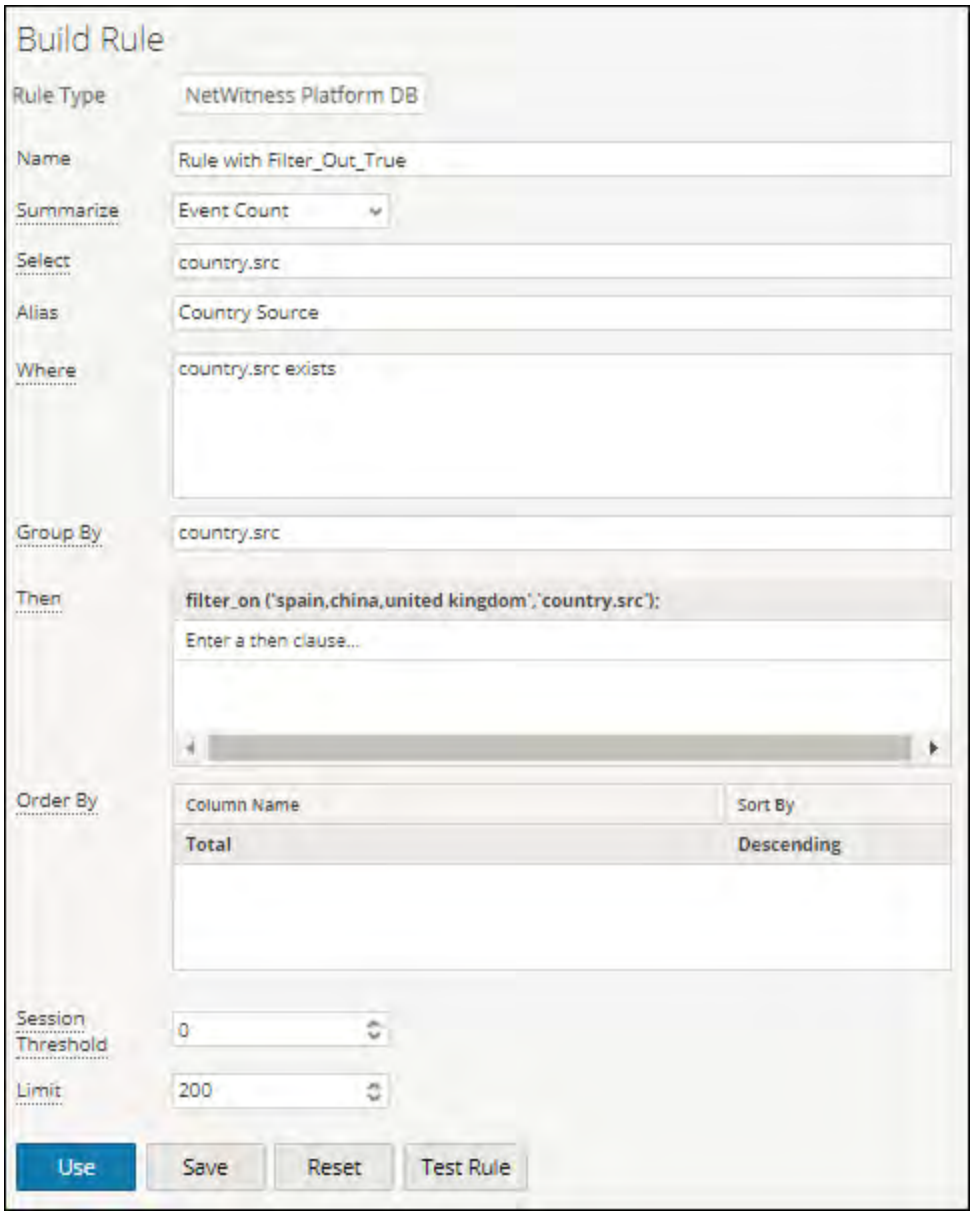
- If matchExact is set to false, any value that contains the filter text is considered a match.
- If matchExact is set to true, only values that match the provided filter text is excluded from the result set.

**Note:** Unless the `matchExact` parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be removed from the result set, users must set the `matchExact` parameter to false.

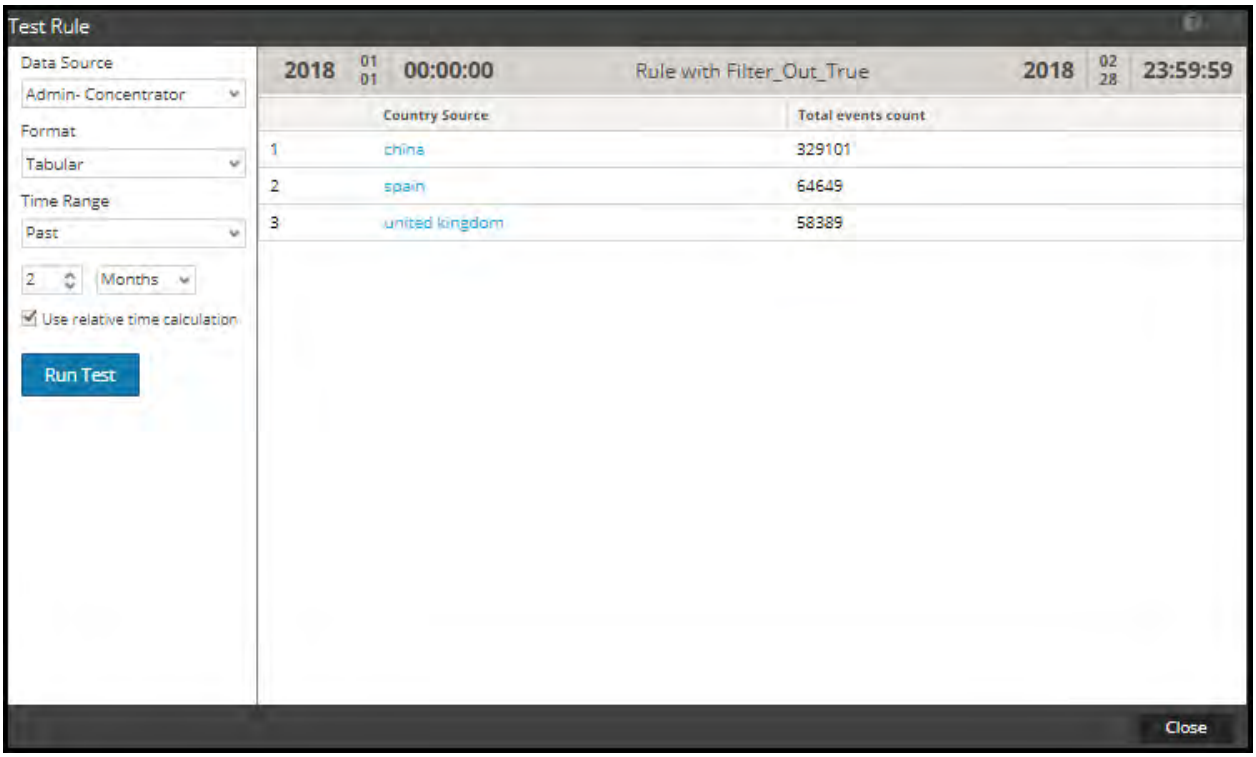
**Example:**

The following figure displays the list of countries and their event count.

The following figure shows the filter_out rule action to remove the event count for Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_out rule action.



```
lookup_and_add (string select, string field)
lookup_and_add (string select, string field, int limit)
lookup_and_add (string select, string field, int limit, boolean inherit)
lookup_and_add (string select, string field, int limit, boolean inherit,
string extraWhere)
lookup_and_add(string select, string field, int limit, boolean inherit, string
extraWhere, boolean aggregate)
```

This rule action iterates through a list of values in a result set and lookup additional meta data to further describe the relationships between various elements in a result set.

**Note:** The lookup_and_add rule action can be used only with an aggregate rule.

The first parameter, select, designates the type of meta data that must be added to elements of the result set. The second parameter, field, specifies where in the result set the append must apply to. Also, a limit can be applied to avoid crowding the result set with a large result set.

By default, subsequent queries to the SDK will inherit the where clause of the parent rule. To use a unique where clause, you can specify a boolean value in the fourth parameter as false and in the fifth parameter you can specify a different where clause.

**Note:** If you are using a unique where clause in your query, make sure that you use a single quote (') for enclosing arguments and double quotes (") for string values.

Now, with the addition of **Custom** summarization and **Group By** feature, the result can be achieved even without having lookup_and_add rule action. The new rule syntax with groupby displays the result in a flat structure which is better than the earlier rule syntax without groupby Hence it is recommended to manually edit/update rules with lookup_and_add rule action and use groupby clause wherever it is applicable.

**Note:** Lookup_And_Add rule action is supported only if the SELECT clause has one meta and aggregate function.

For example, see below scenarios: In Example **2a**, lookup_and_add rule action is used. Instead of using lookup_and_add rule action, the same result can be achieved by using **Custom** summarization and **Group By** feature. See Example **2b** below.

But, lookup_and_add rule action is still supported for NWDB rules on the following conditions:

- All versions of NWDB rules with Summarization as Event Count, Packet Count, or Session Size.
- For Custom summarization, the lookup_and_add rule must have only one group by meta with only one aggregate function where the aggregate function must be either sum() or count().

**Note:** It is not supported for “Summarize-None”.

For example, lookup_and_add rule action can be used for the following rules:

- select ip.src, sum(size) group by ip.src
- select ip.src, count(filename) group by ip.src

It cannot be used for the following rules:

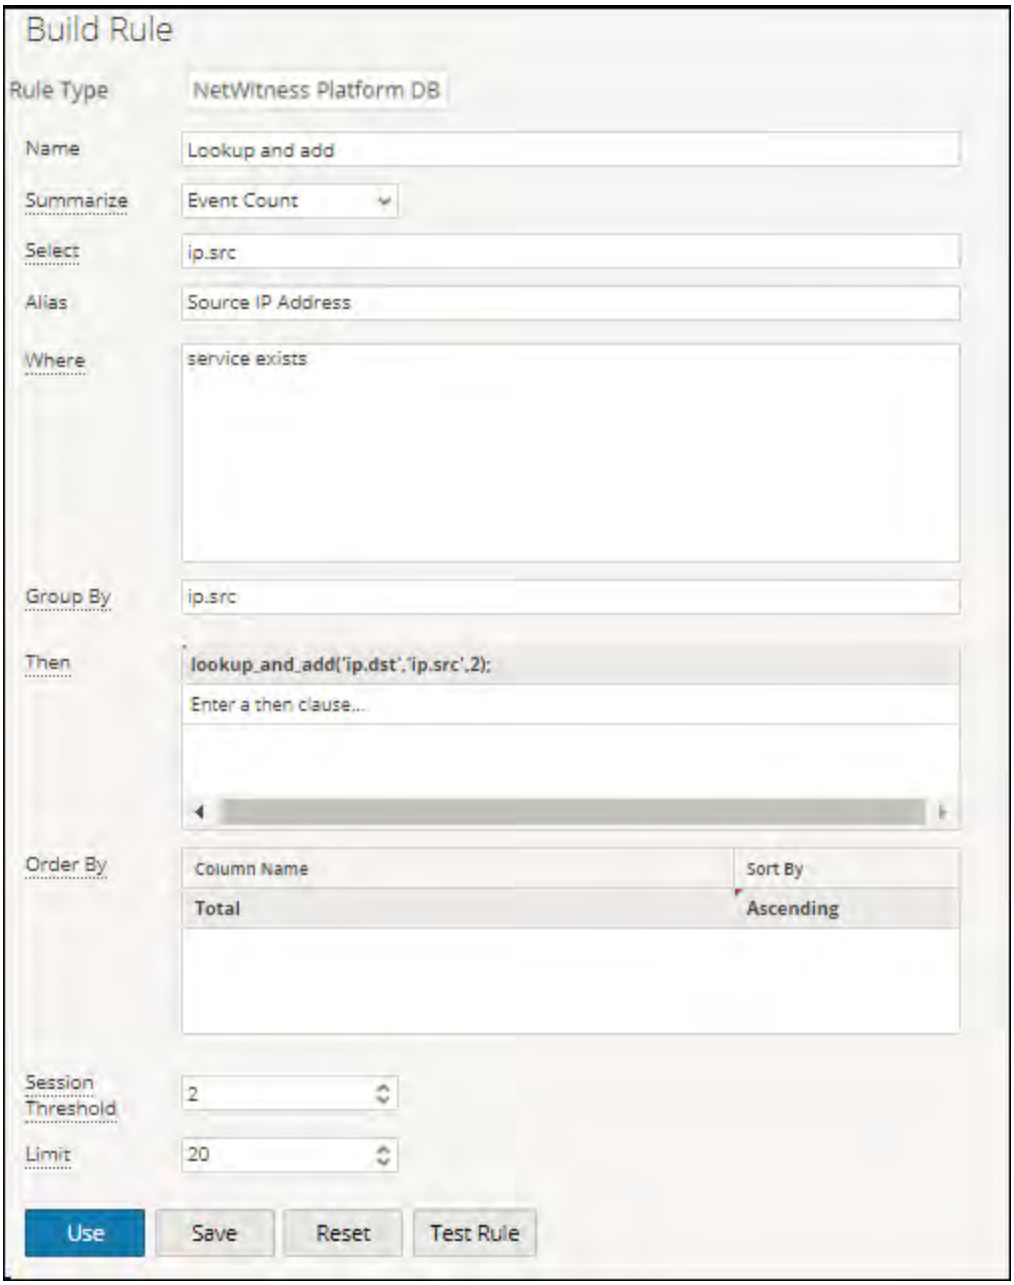
- select ip.src, sum(size),count(filename) group by ip.src
- select ip.src, sum(size),avg(size) group by ip.src
- select ip.src,ip.dst count(filename) group by ip.src,ip.dst

**Examples:**

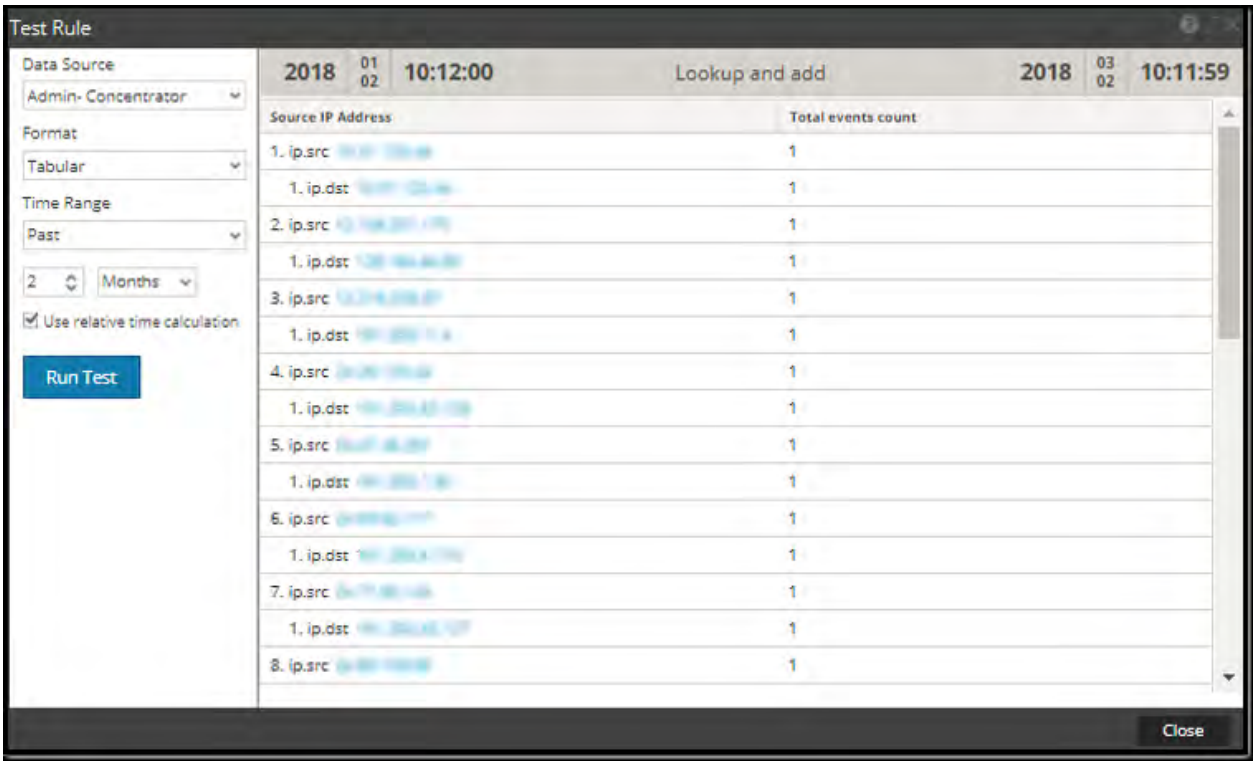
**1. lookup_and_add('ip.dst','ip.src', 2);**

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src.

The following figure shows the rule definition.



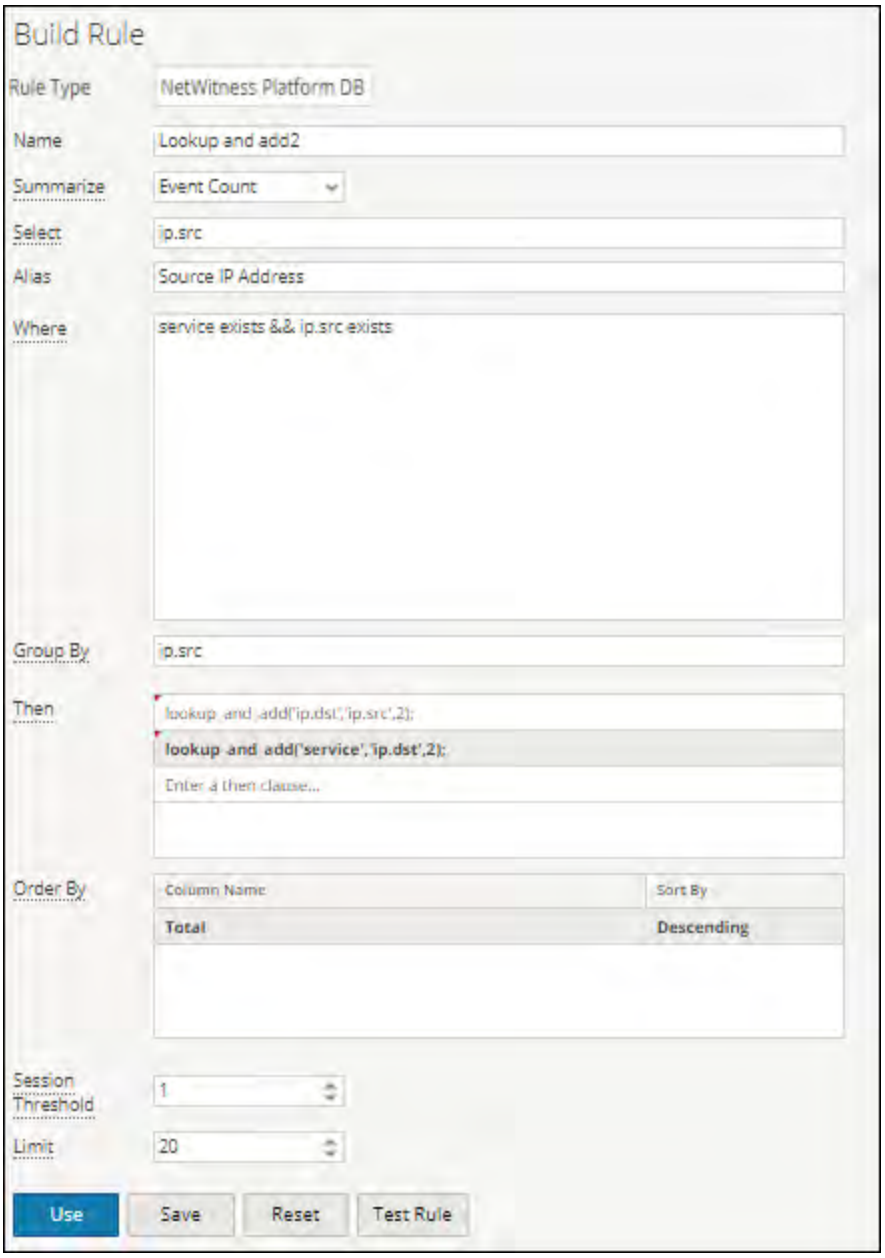
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src.



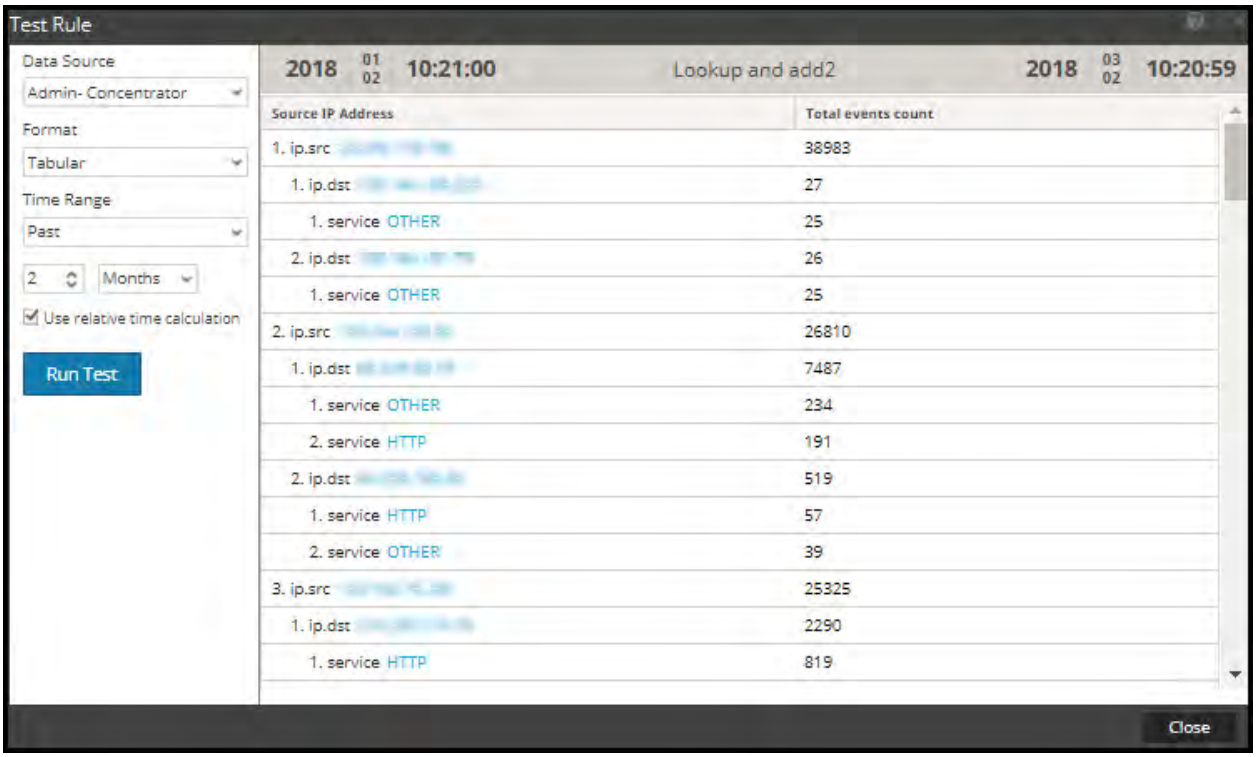
**2a. lookup_and_add('ip.dst','ip.src', 2); lookup_and_add('service','ip.src', 3);**

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

The following figure shows the rule definition.



The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

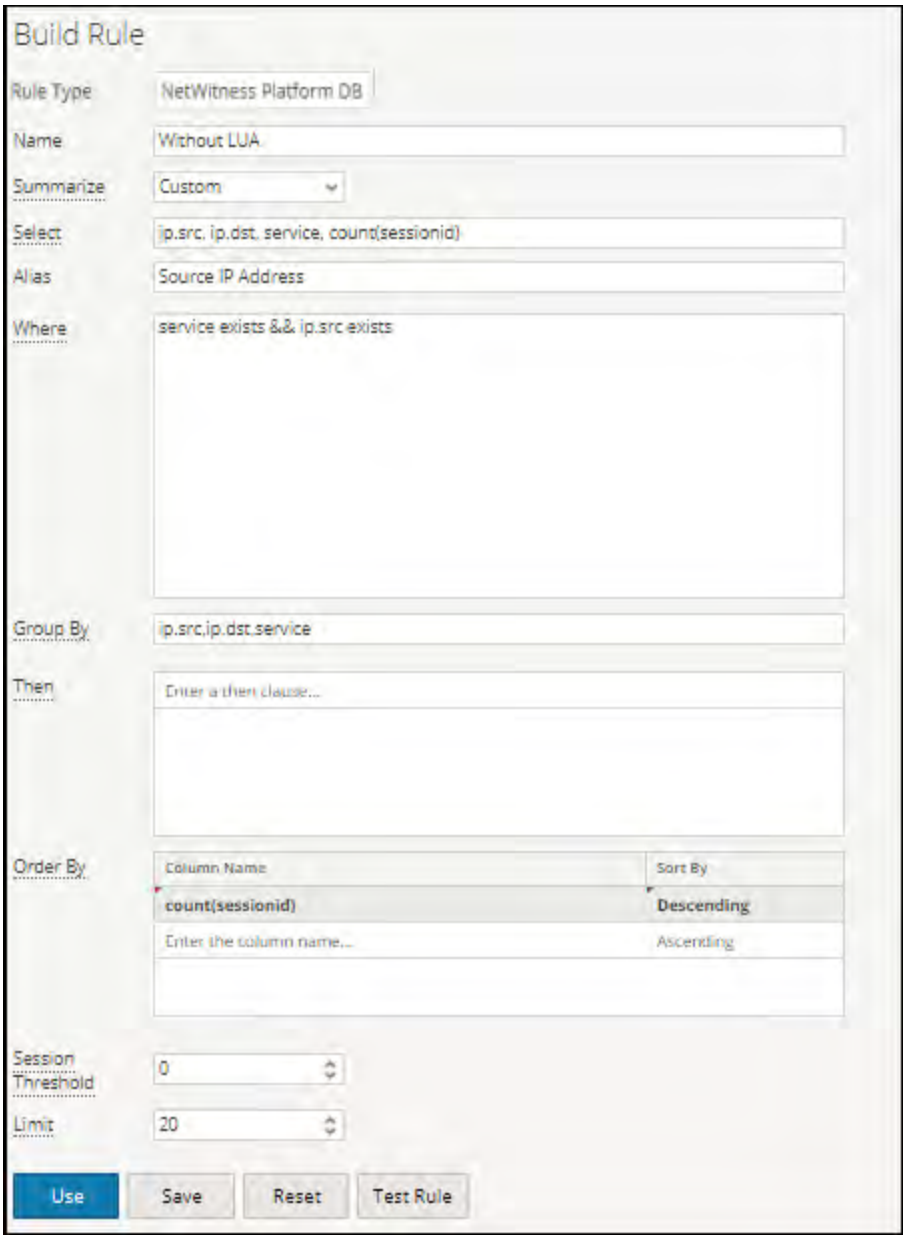


You can make the query as complex as you want by selecting different fields in the result set and by appending to different parts. For example, you may want to know what files each source IP had touched. However, because the parent rule has a WHERE clause of service = 6667 and the default behavior of this rule action is to append to the original WHERE clause, it becomes necessary to override the parent WHERE clause. The easiest way to understand this concept is to look at the previous lookup_ and_add call lookup_and_add('ip.dst','ip.src',2). The actual query that is sent to the server is SELECT ip.dst WHERE service = 6667 &&ip.src = 206.42.199.194. In order to force the WHERE clause to override the service = 6667 portion of the WHERE clause (inherited from the parent rule), the user can specify a 4th parameter of false as shown in example 3.

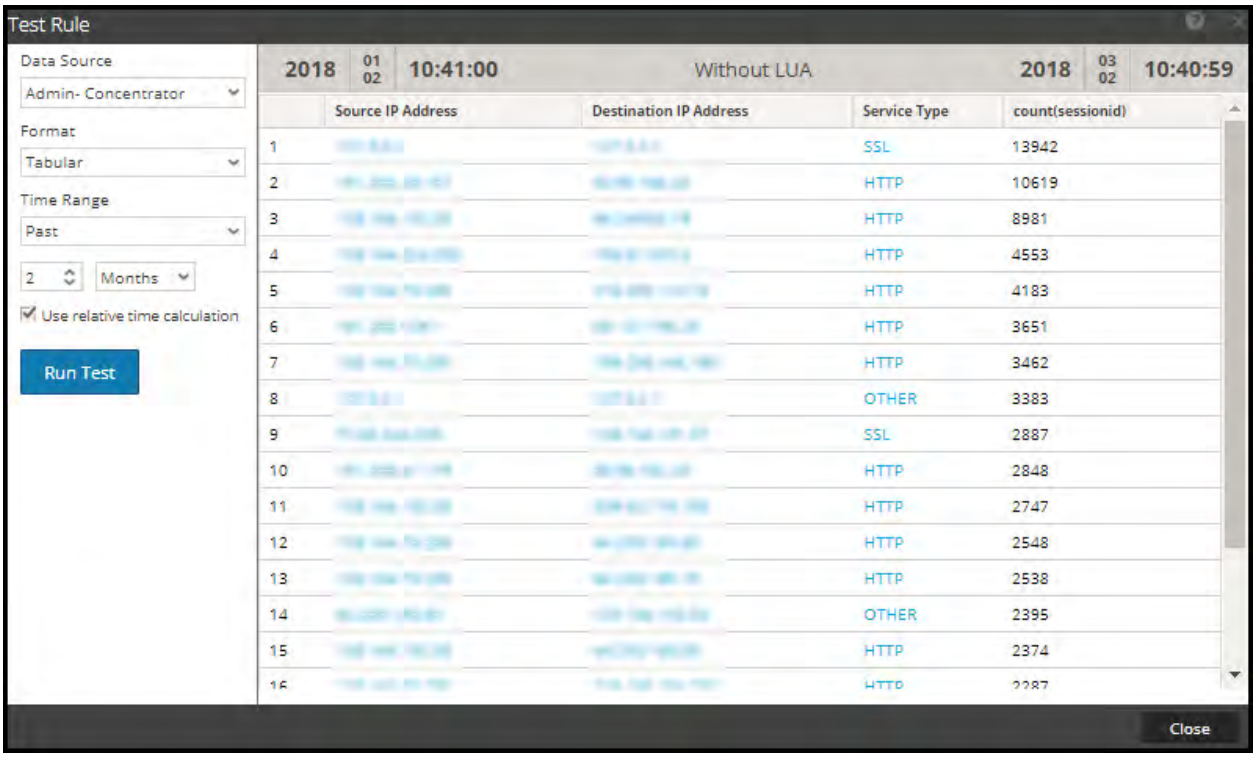
**2b. Without Lookup_and_add Rule**

This rule uses the Custom summarization and Group By feature to sort the results.

The following figure shows the rule definition.



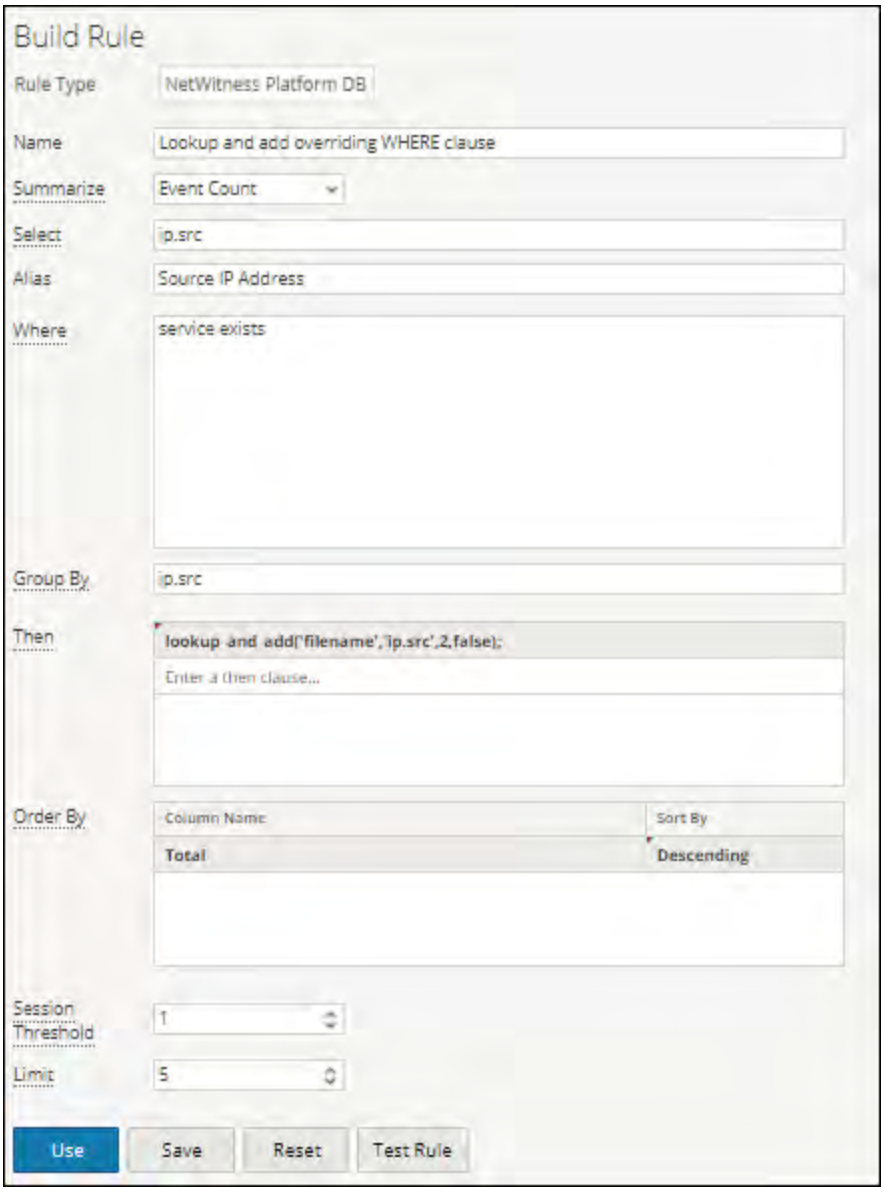
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.



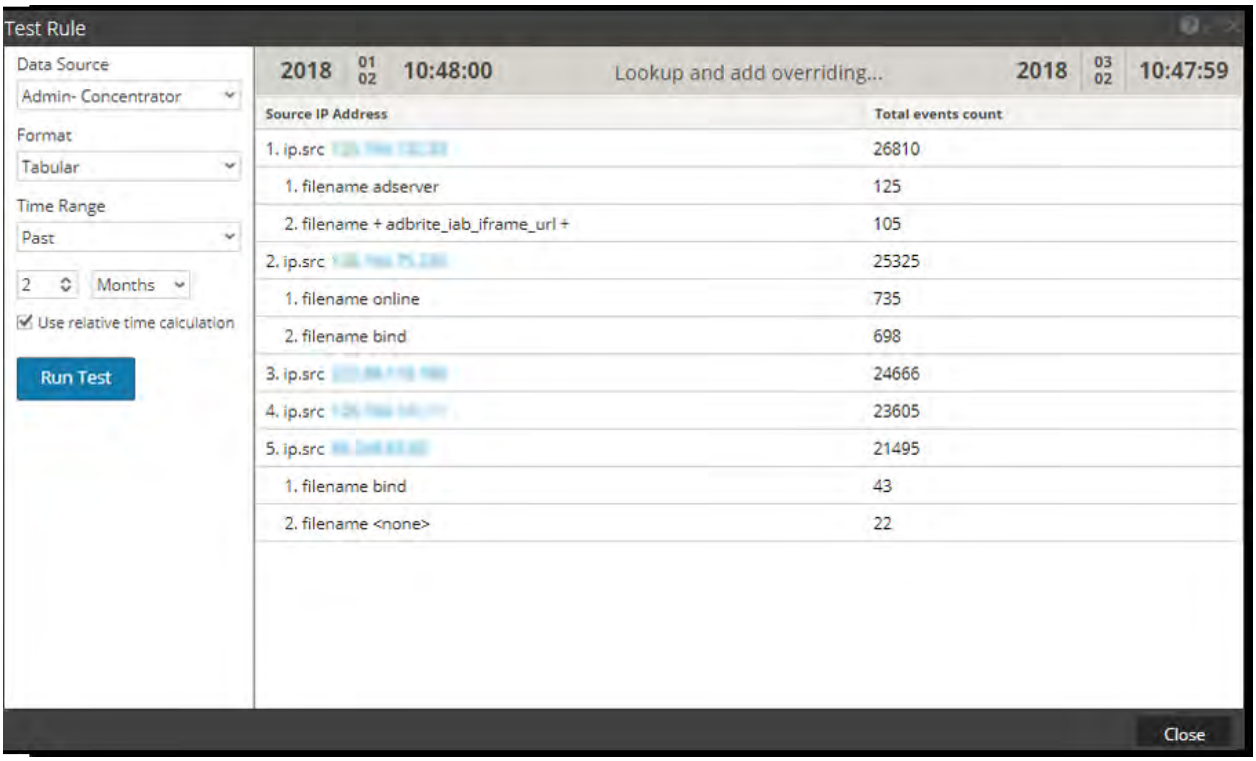
**3. lookup_and_add('filename', 'ip.src', 2, false);**

This call would issue a query to the server, like `SELECT filename WHERE ip.src = 90.0.0.142` rather than `SELECT filename WHERE service = 6667' && ip.src = 90.0.0.142` because you have specified the rule action to ignore the initial `WHERE` clause of the parent rule.

The following figure shows the rule definition.



The following figure shows the result set.

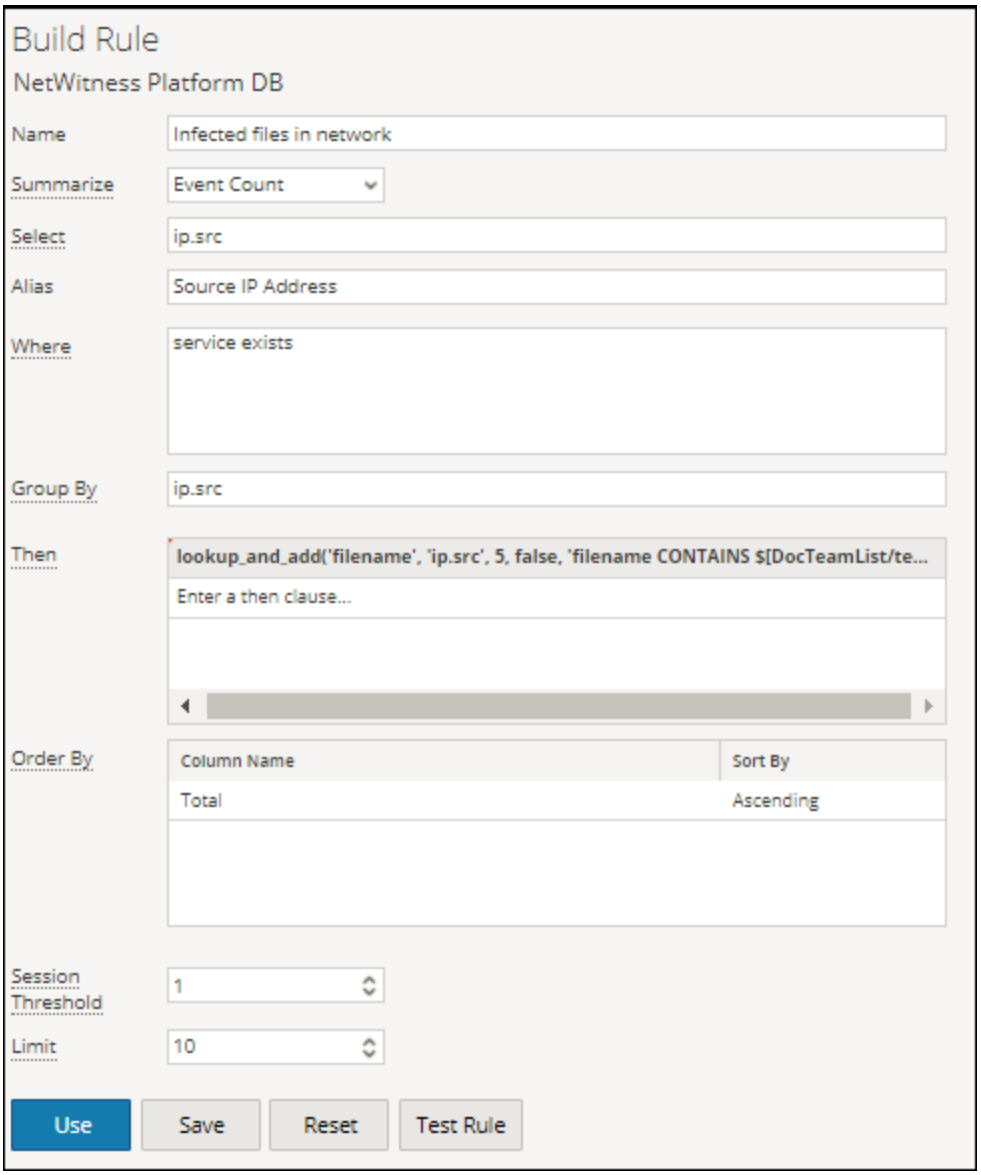


The test list is in a group name netwitness, you can access that list with the following syntax.

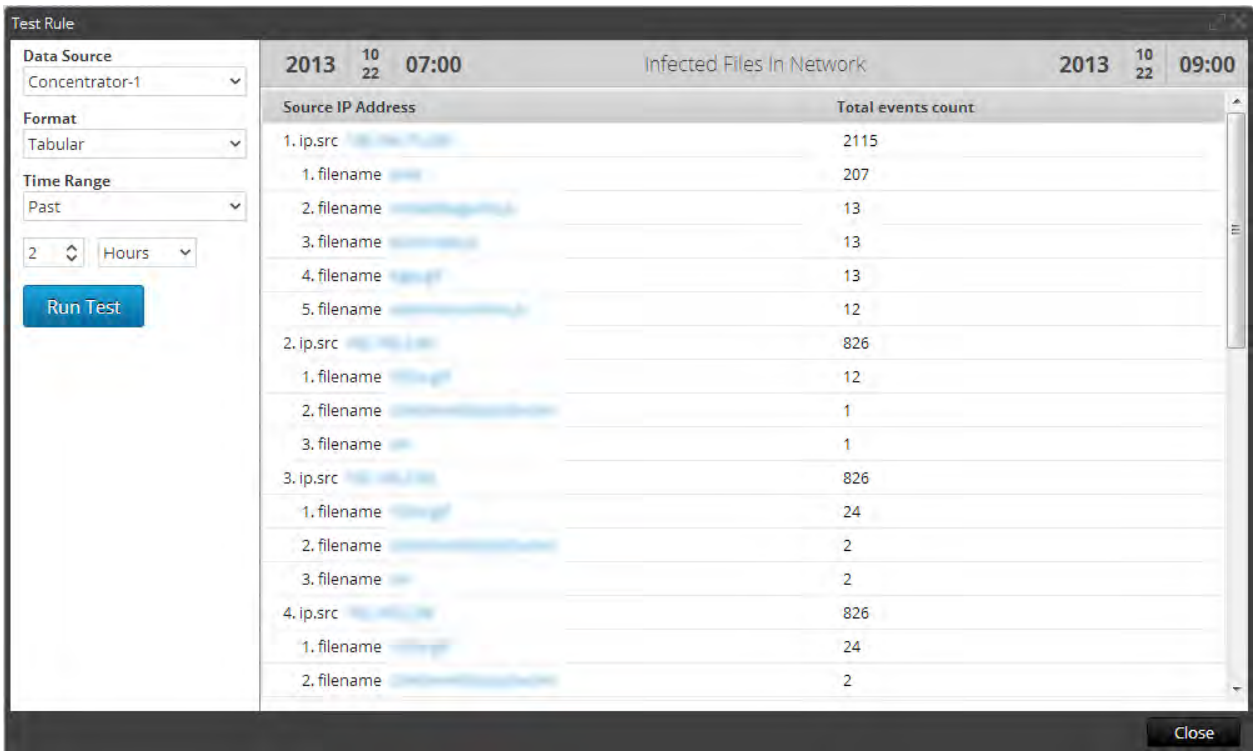
You can even narrow down these appended results even further to only include filenames that have .gif as filename extension by using the fifth parameter in the rule action. The fifth parameter allows you to specify additional WHERE clause criteria. The files with .gif filename extension would be stored in the **test** list within a group named **DocTeamList**. You can access this list with the following syntax: threat.source = $[DocTeamList/test]
This can be referenced in the extra where clause parameter in the following manner:

**4. lookup_and_add('filename', 'ip.src', 5, false, 'filename CONTAINS $[DocTeamList/test]');**

The following figure shows the rule definition.



The following figure shows the result set.

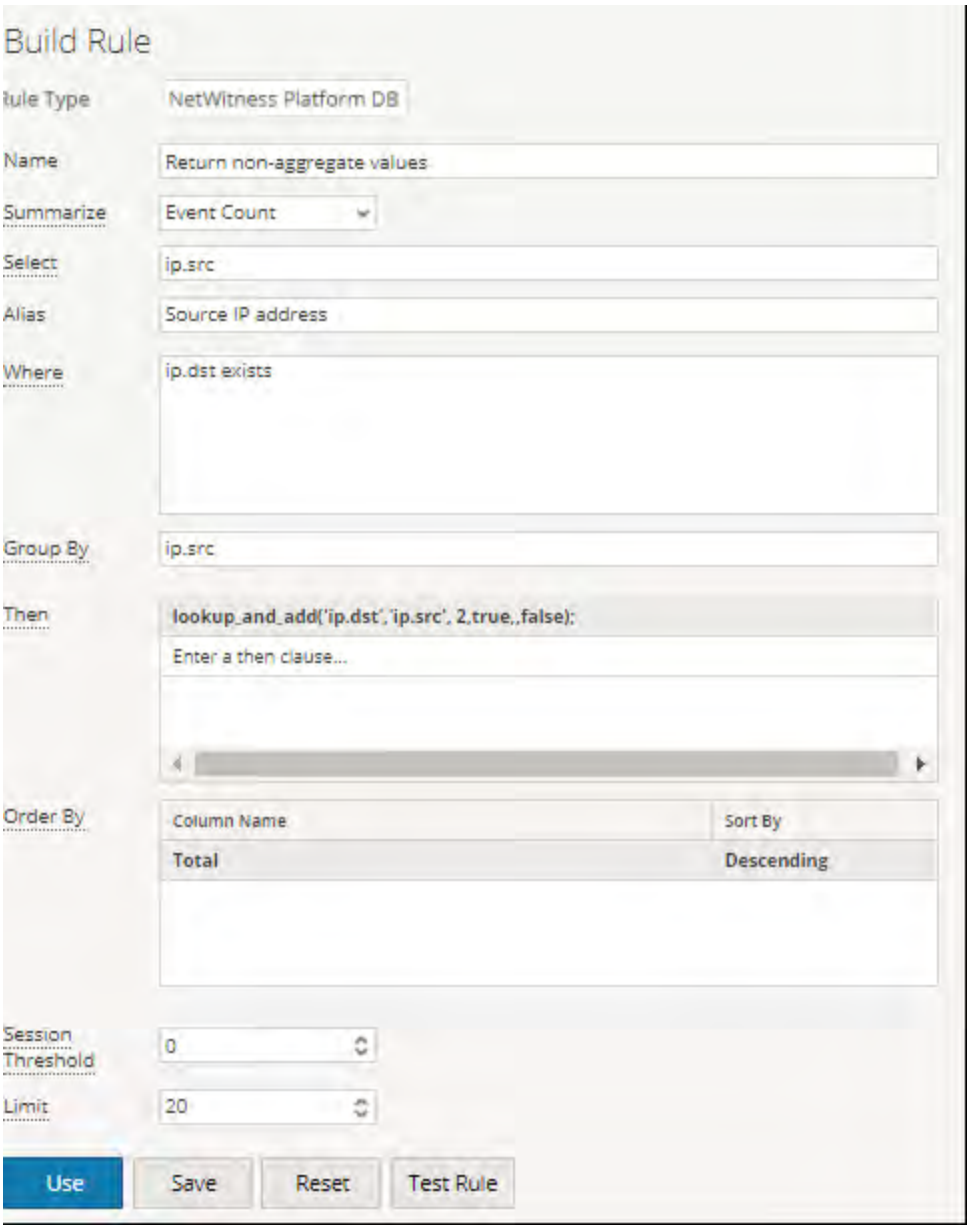


**5. lookup_and_add('ip.dst','ip.src', 2,true,,false);**

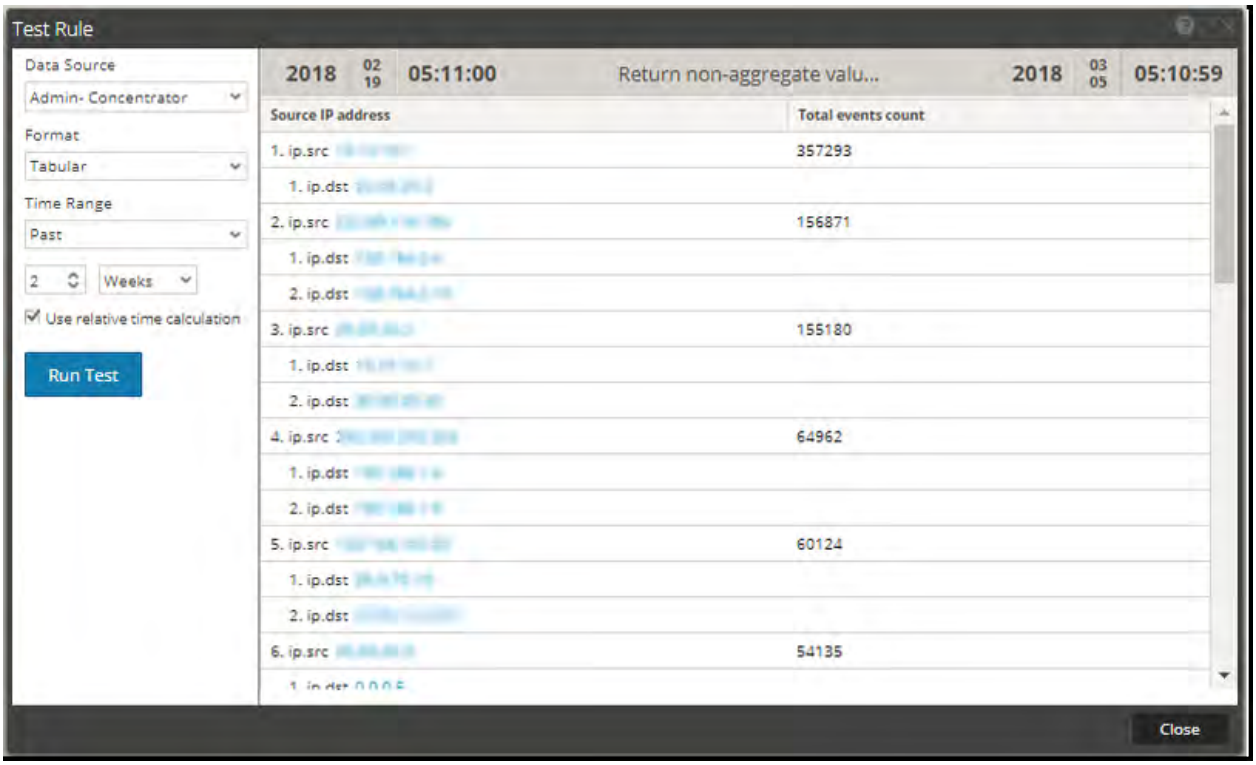
This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src. The 'aggregate' parameter is set to 'false', this implies that aggregates would be skipped for lookup values and hence the lookup query executions will complete faster.

**Note:**
The default value for 'aggregate' is 'true'. When 'aggregate' is set to 'false', Reporting Engine passes threshold=1, Sort by='value' and Order=Ascending to NWDB to make lookup queries run faster.
. You must set the 'aggregate' to false, when rule contains aggregate functions or when the rule is run against a wide time range. This helps the rule to complete the execution faster.

The following figure shows the rule definition.



The following figure shows the result set.



```
max_threshold (string quantity)
max_threshold (string quantity, string field)
```

max_threshold removes any results with a quantity that is larger than the maximum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).

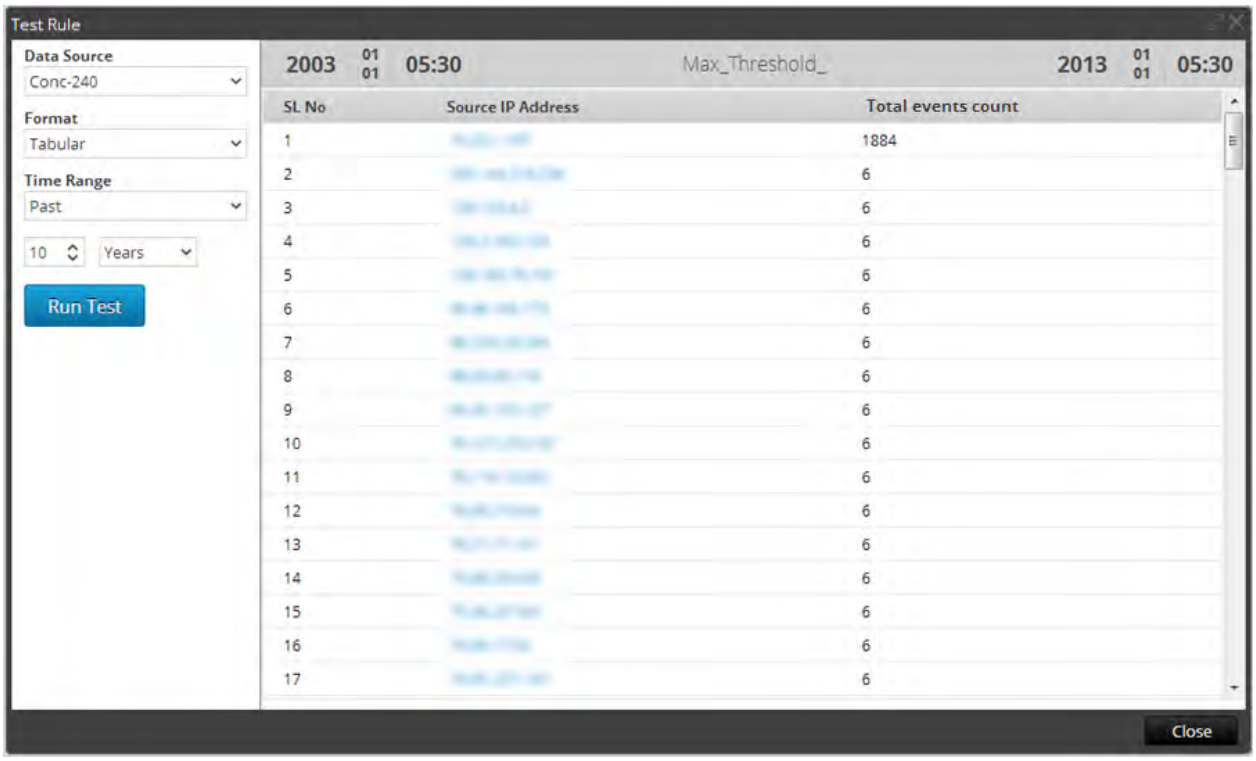
max_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

- max_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- max_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.

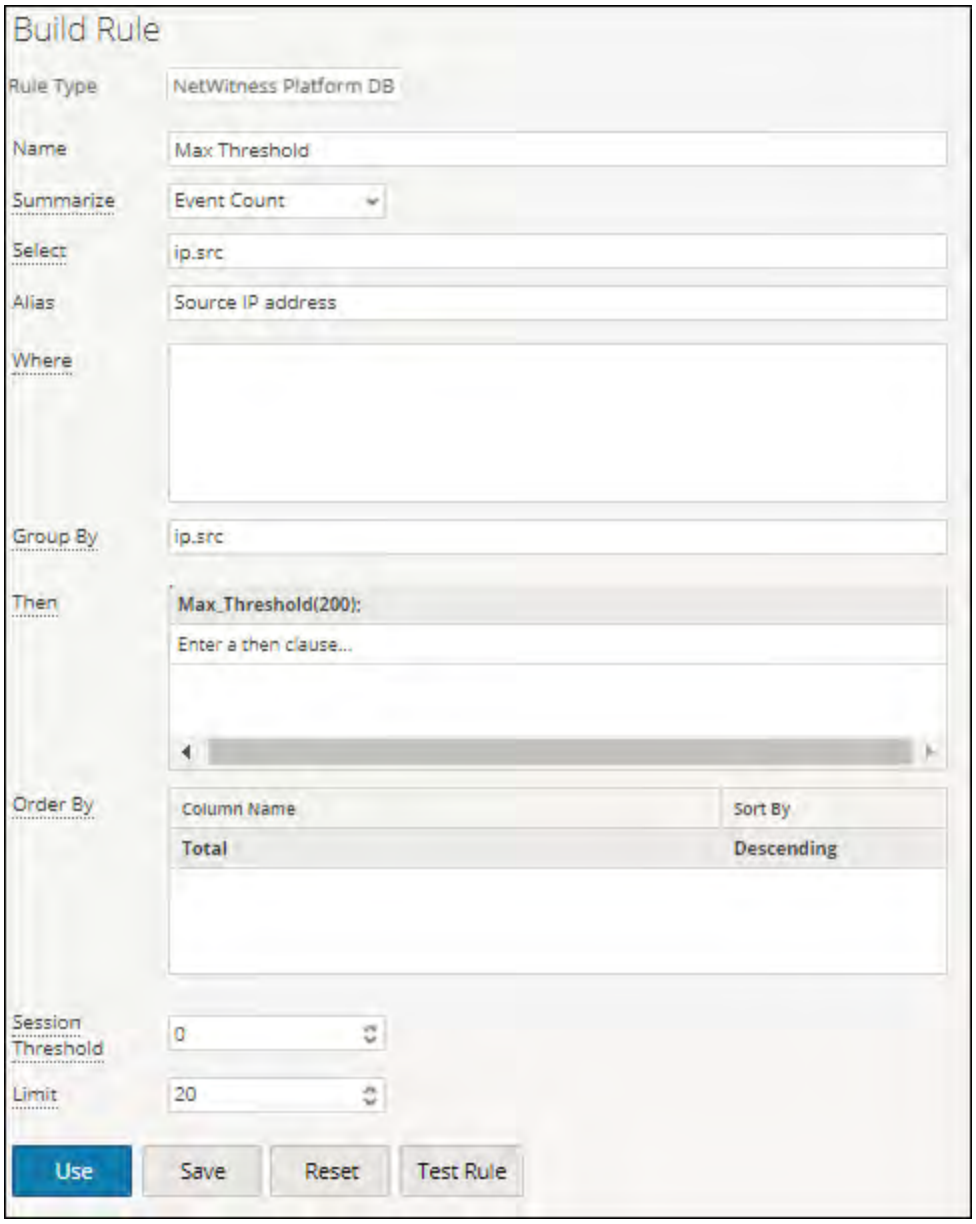
**Examples:**

**1. max_threshold(200);**

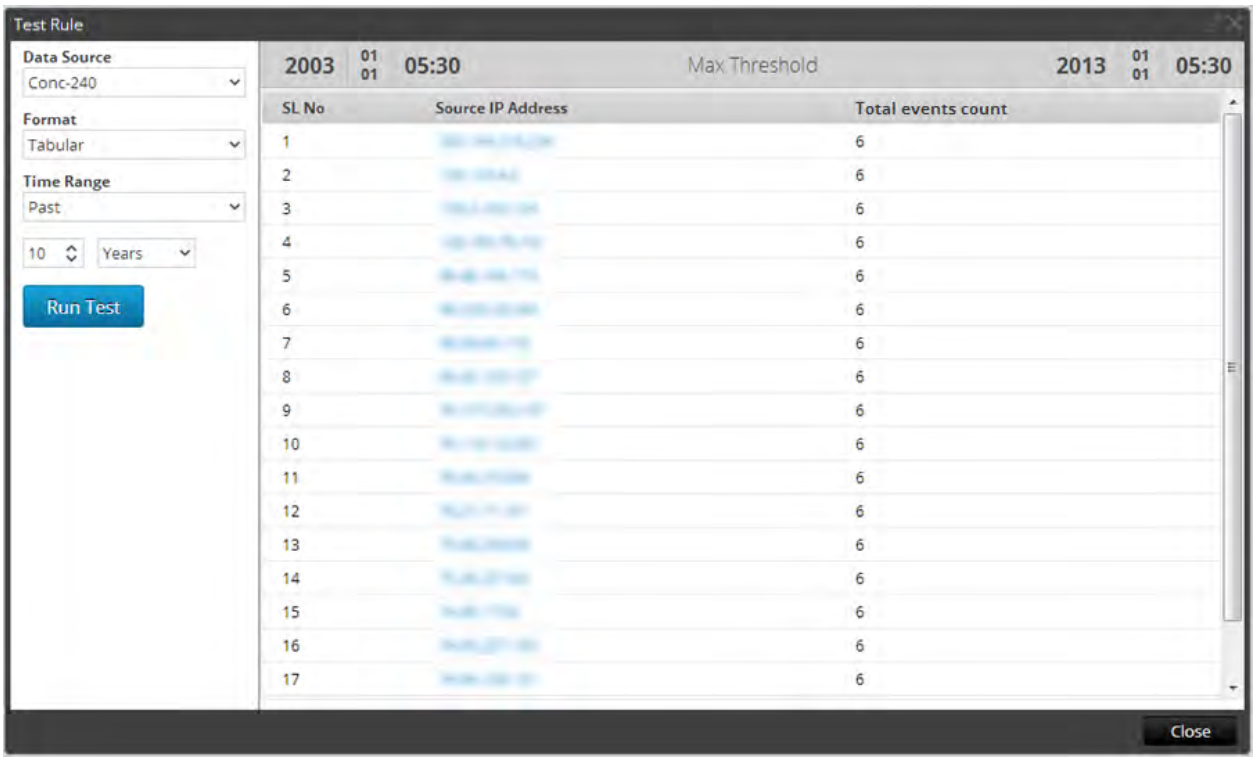
The following figure shows the result without the max_threshold argument. The output results have event counts exceeding 200.



The following figure shows a the max_threshold rule action that puts a limit of 200 bytes on the output. Any output having more than 200 bytes of data are not listed.

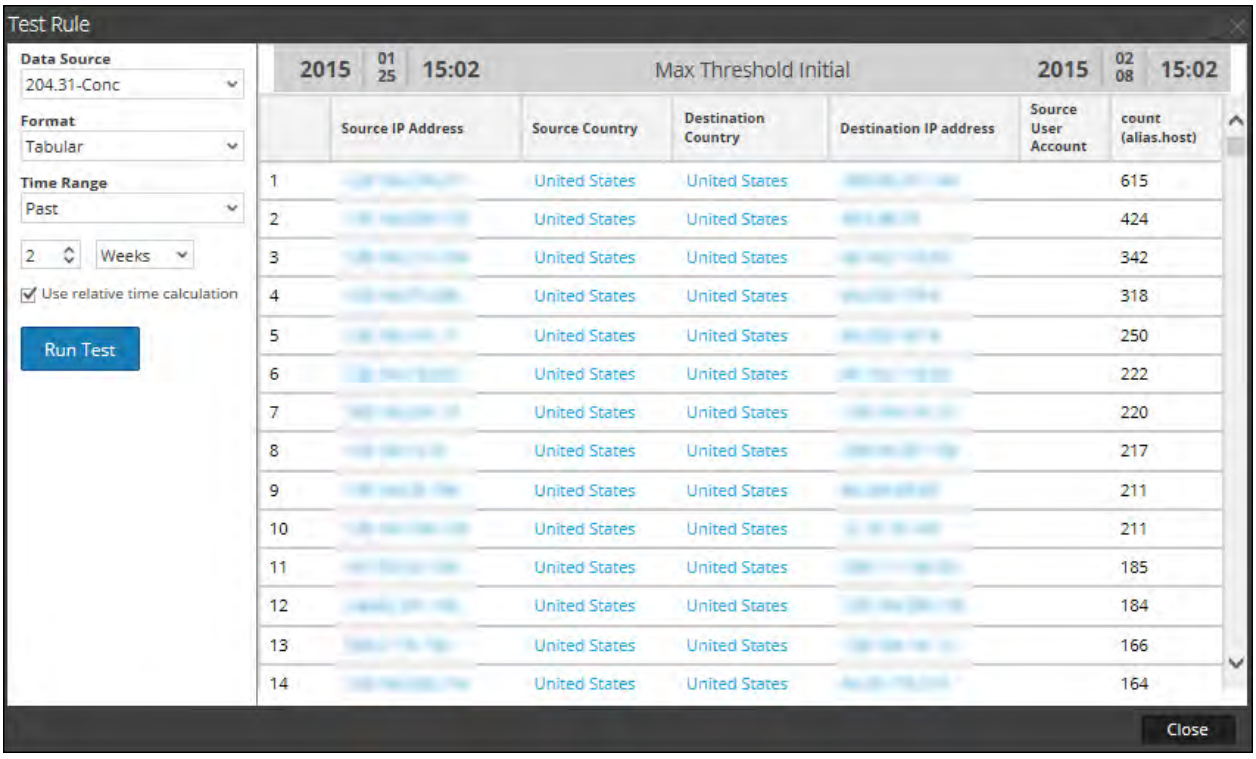


The following figure shows the result when the max_threshold rule action is applied. The result numbered 1 in the above screen capture is removed from the result.

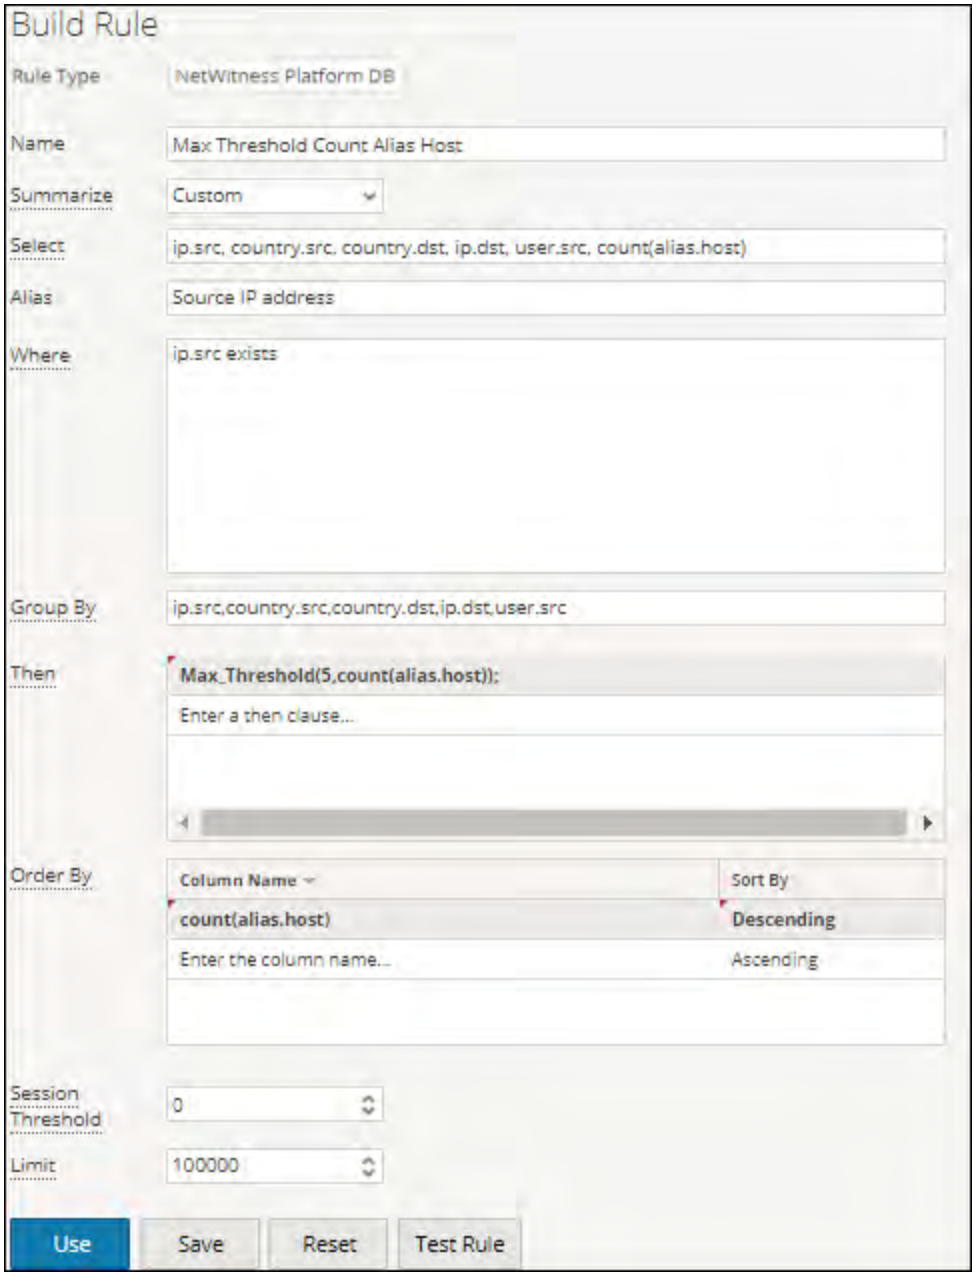


**2. max_threshold(5,count(alias.host));**

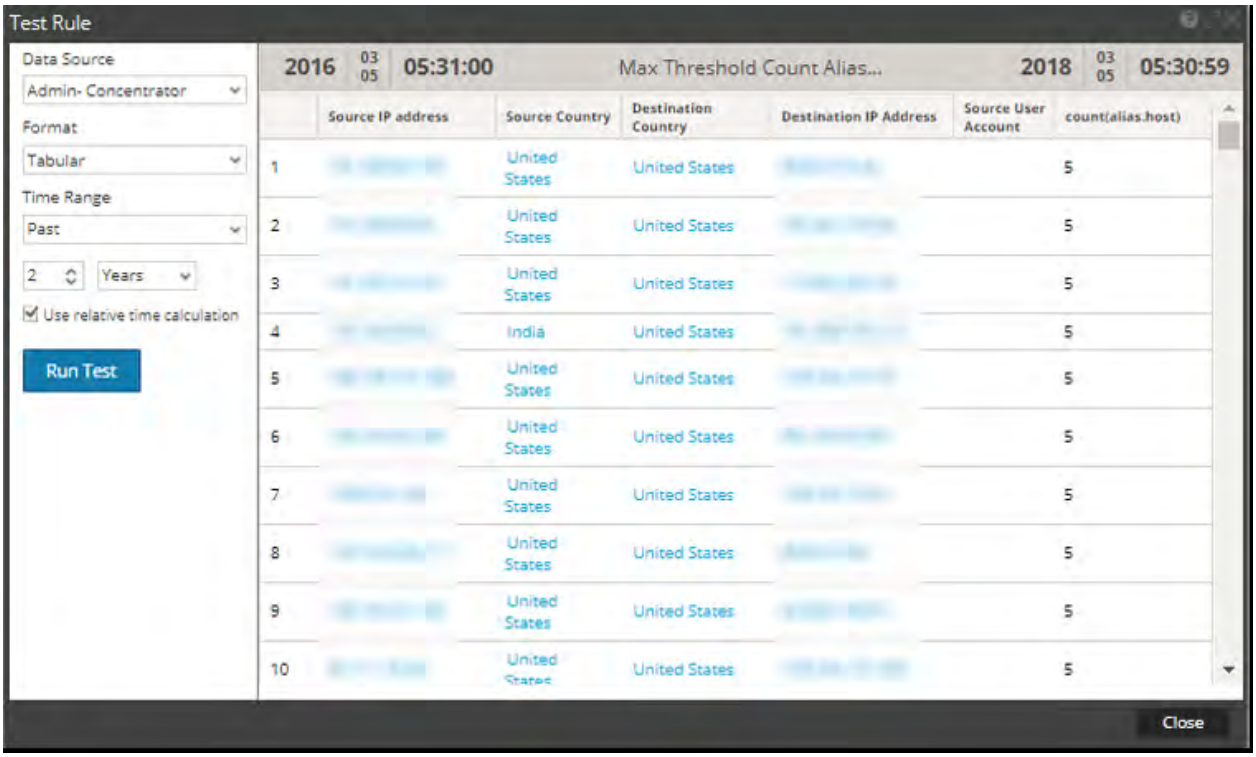
The following figure shows the result without the max_threshold argument. The output results have count of alias.host exceeding 5.



The following figure shows a the max_threshold rule action that puts a limit of 5 on the output. Any output having value more than 5 is not listed.



The following figure shows the result when the max_threshold rule action is applied. Any output having value more than 5 is removed from the result.



min_threshold (string quantity)

min_threshold removes results with a quantity that is smaller than the minimum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).

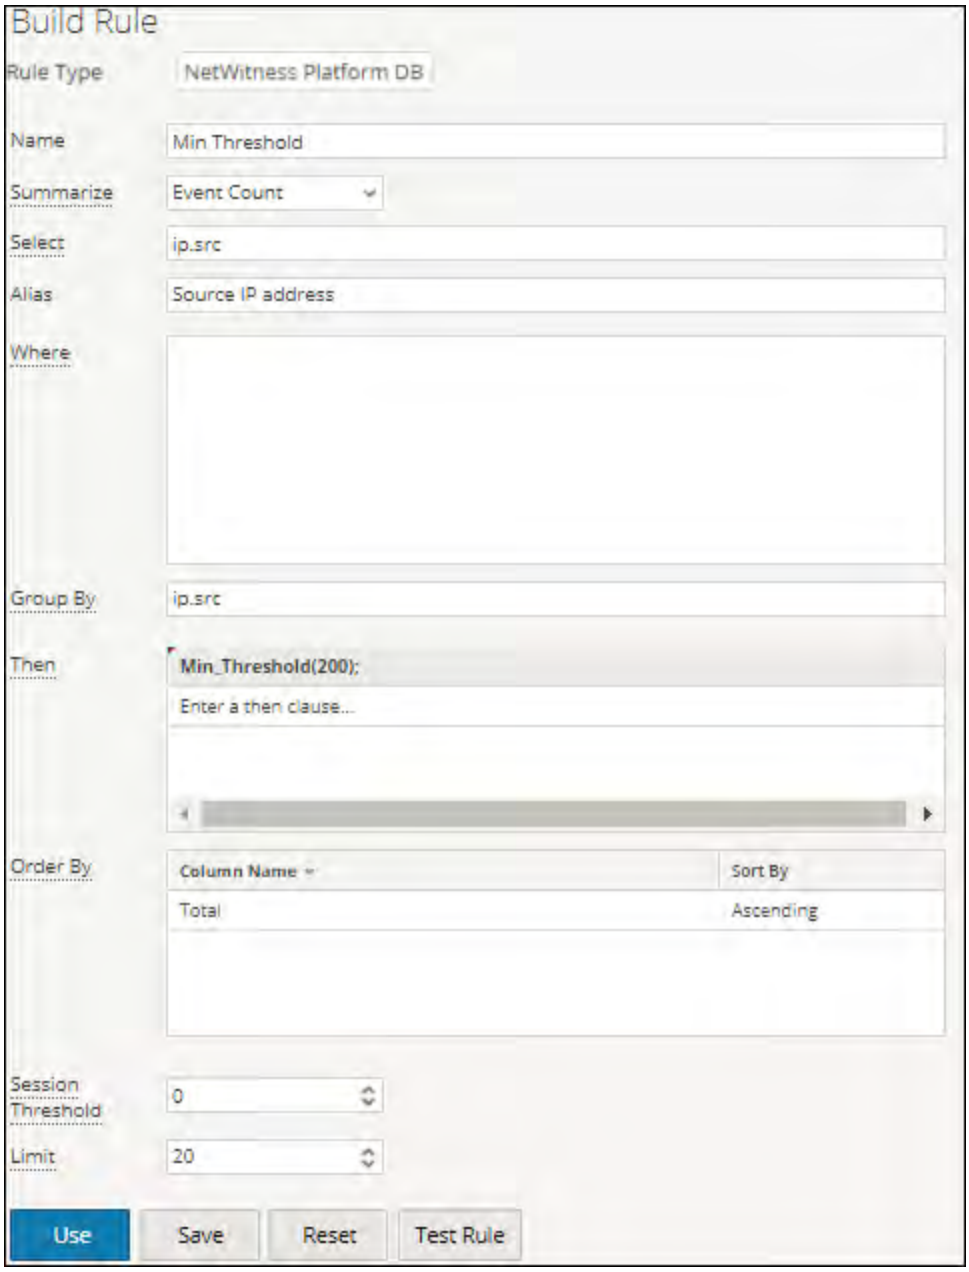
min_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

- min_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- min_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.

**Examples:**

**1. min_threshold(200);**

The following figure shows a sample of the min_threshold query.



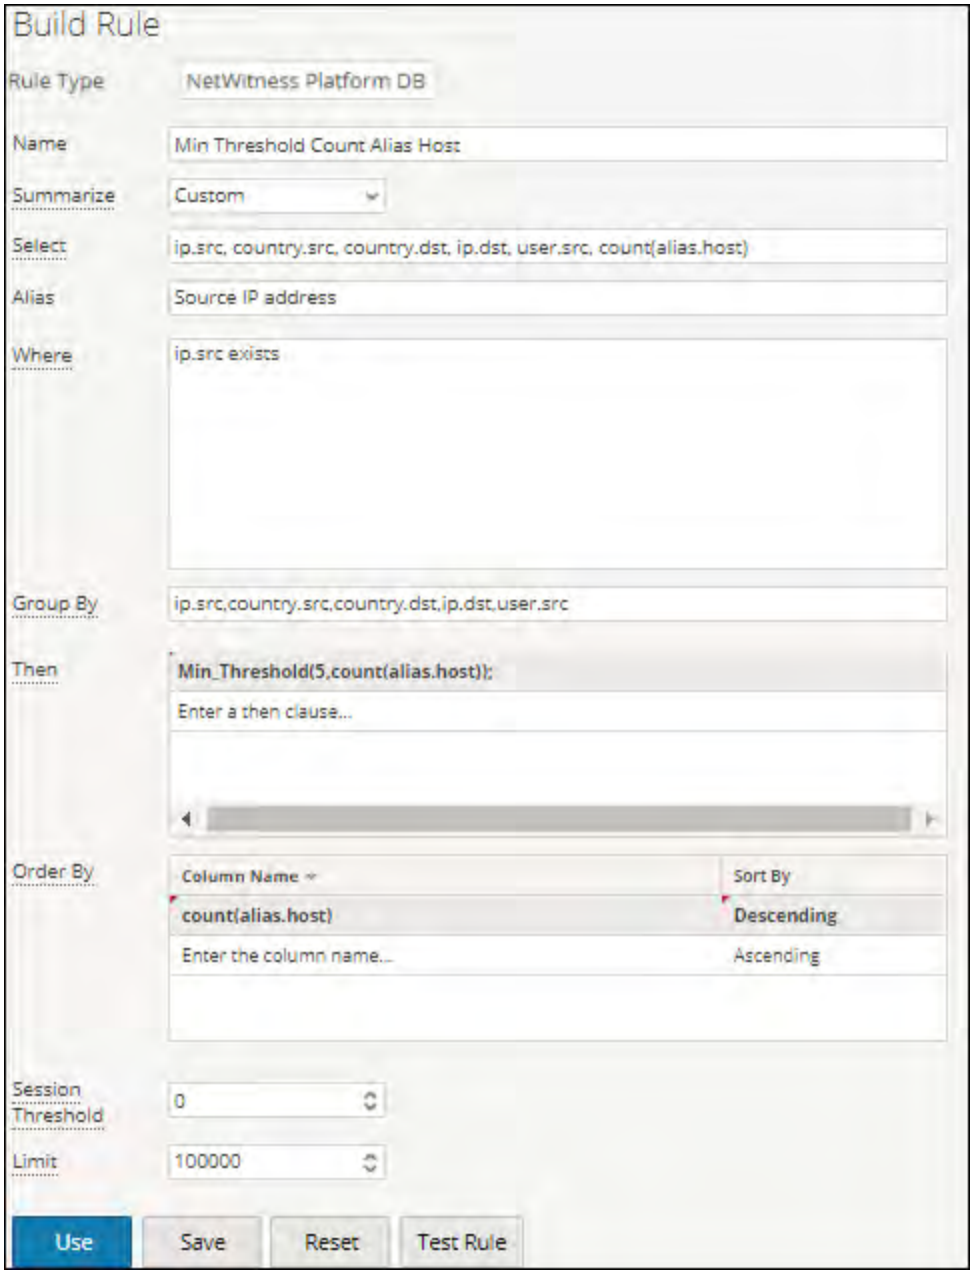
The above figure puts a limit of 200 bytes on the output. Any output having less than 200 bytes of data is not listed. The output with the min_threshold rule action is applied.

As shown, all the values are greater than 200 bytes.

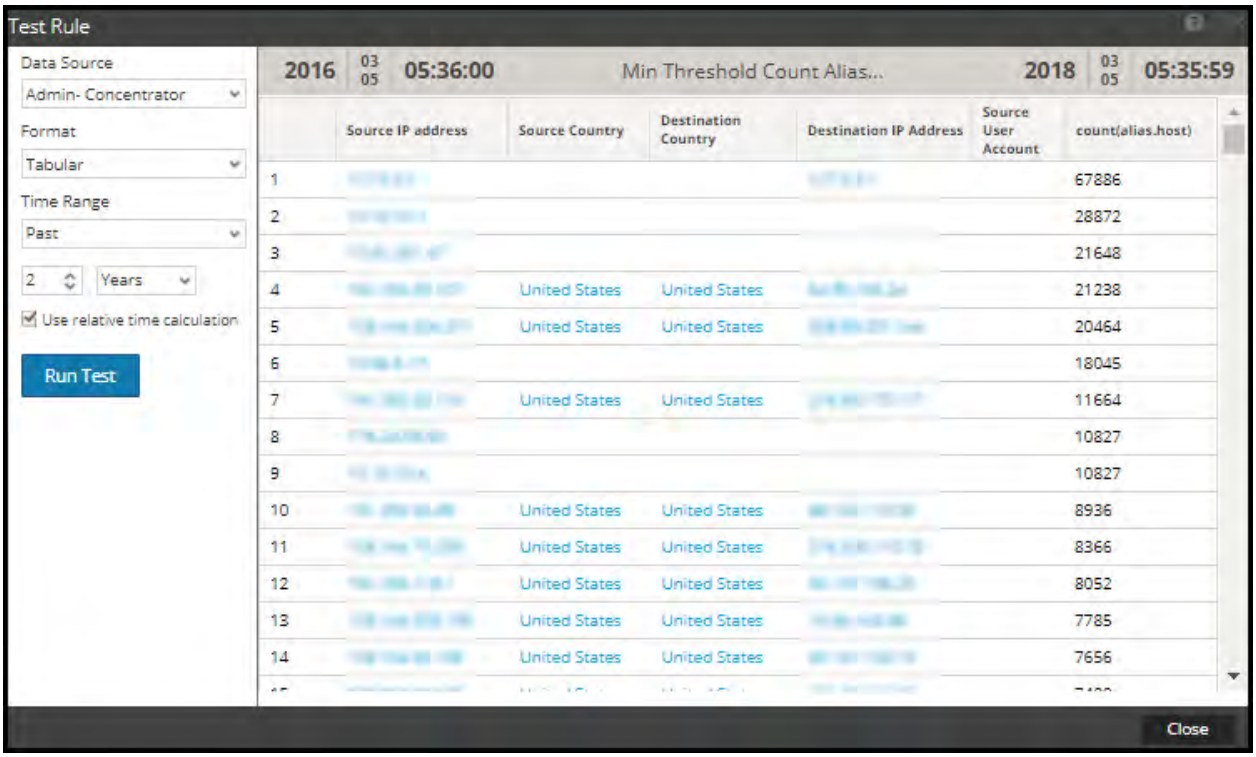
**2. min_threshold(100,count(alias.host));**

The following figure shows the result without the min_threshold argument. The output results have count of alias.host below 100.

The following figure shows a the min_threshold rule action that sets the minimum limit of 100 on the output. Any output having data less than 100 is not listed.



The following figure shows the result when the min_threshold rule action is applied. Any output having data less than 100 is removed from the result.



## regex (string regex, string field)

The regex rule action applies regular expression to the result set. The following is the format of the regex rule action:

regex(regular_expression, meta_name)

Where:

- regular_expression - Regular expression to match the value of the meta.
- meta_name - Meta or field name on which the regex has to be applied.

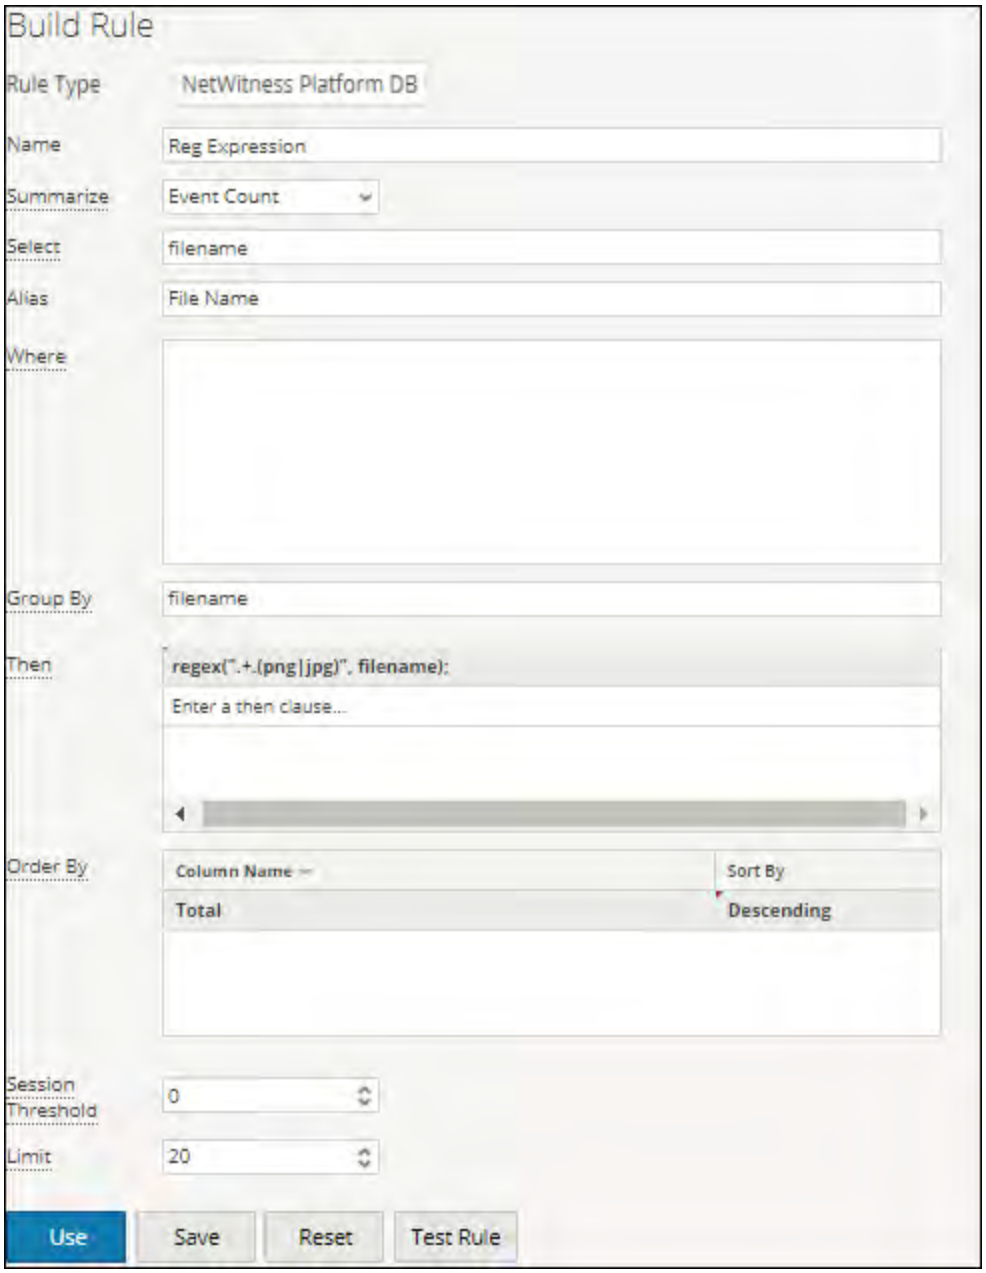
For a comprehensive list of supported regex patterns, refer to http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.

**Sample regex rule action:**

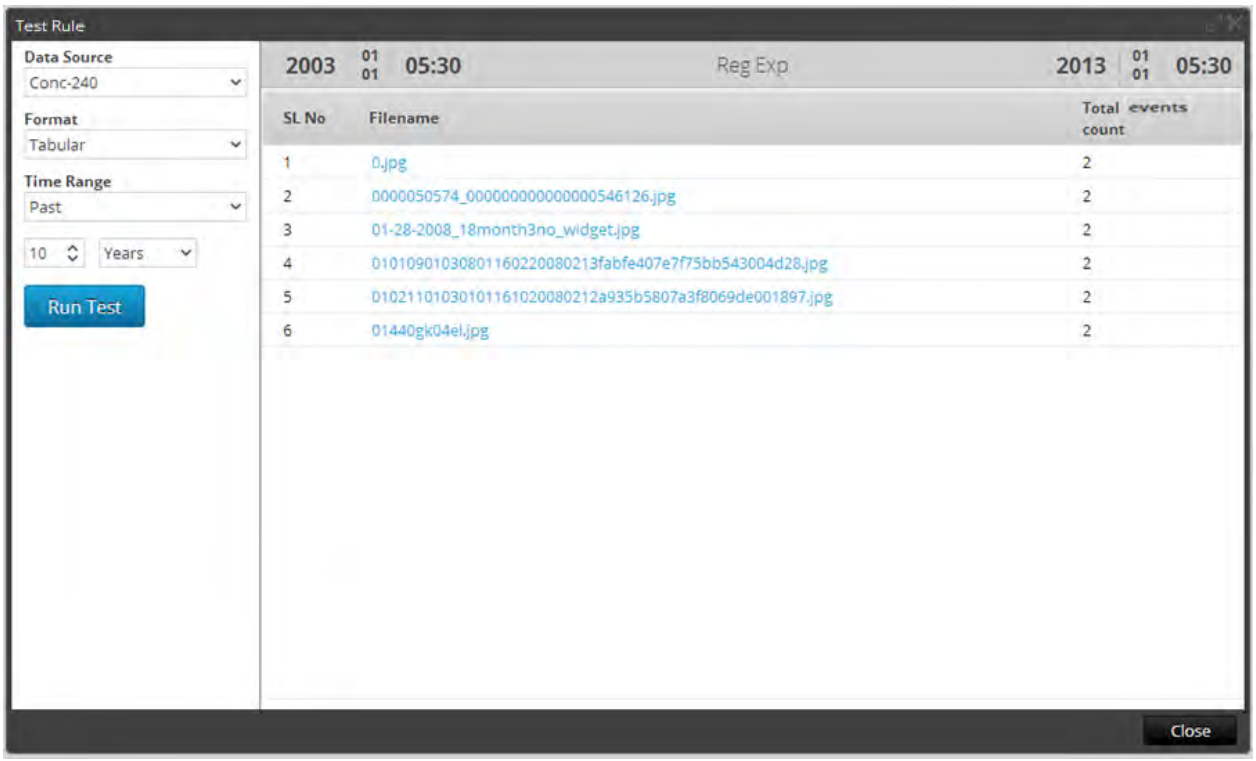
If you want to list filenames of all the PNG and JPEG format files from various sessions, you can write a rule with the following regex rule action:

regex(".+.(png|jpg)", filename);

The following figure shows the rule.



The output with the regex rule action applied is shown in the following figure.

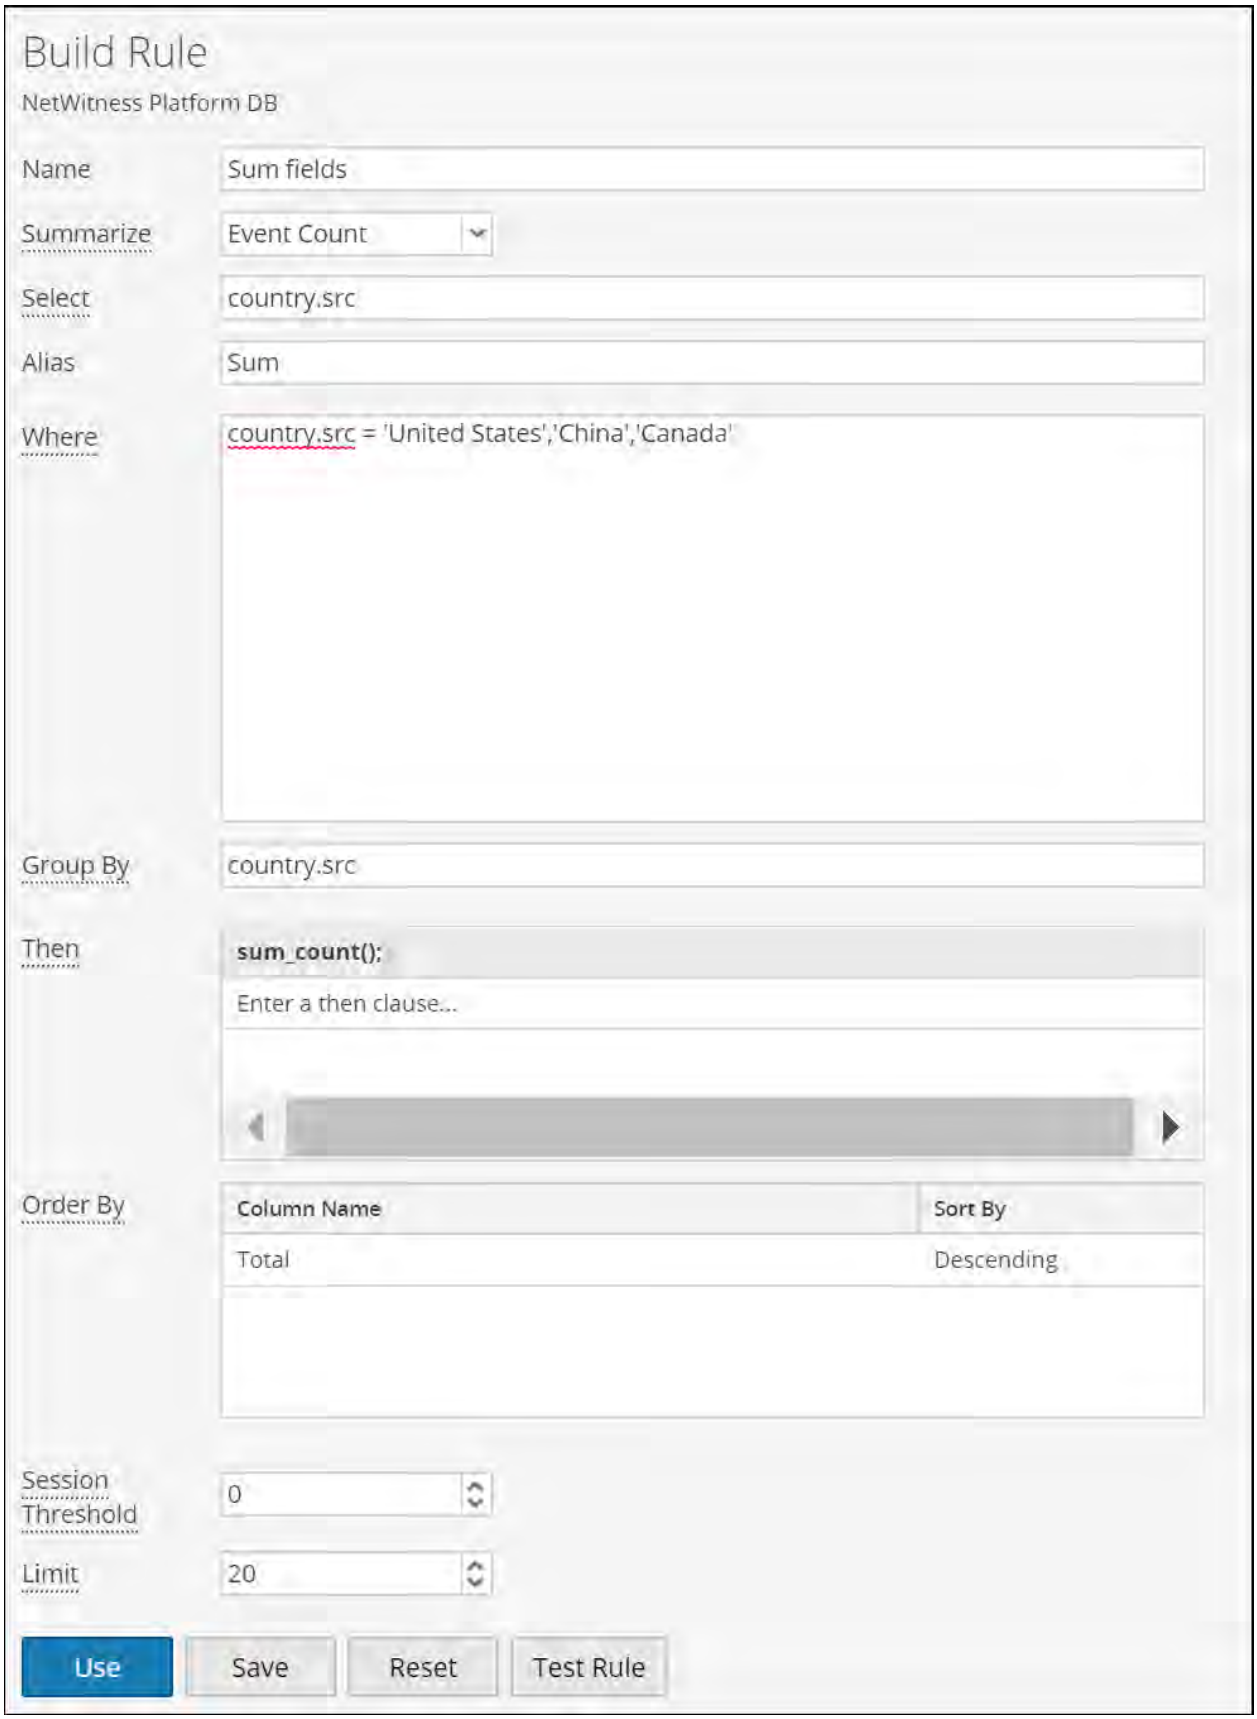


`sum_count()`

Totals the quantifiers for a given result set. For example, calling a sum_count() for a rule that is sorted by event count totals the size of all values in the result set and displays the total in place of the result set.

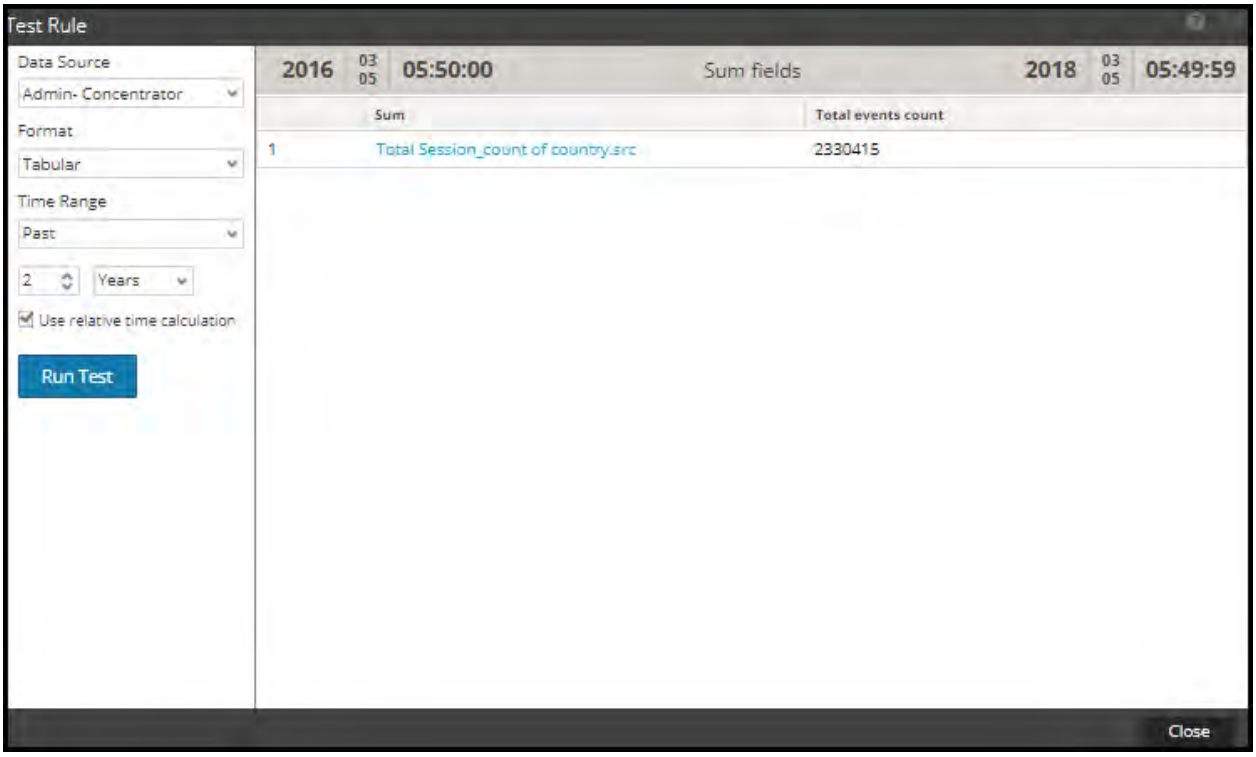
**Example:**

The following figure shows the sum_count() rule action.



Build Rule
NetWitness Platform DB
Name
Sum fields
Summarize
Event Count
Select
country.src
Alias
Sum
Where
country.src = 'United States','China','Canada'
Group By
country.src
Then
sum_count():
Enter a then clause...
Order By
Column Name
Sort By
Total
Descending
Session Threshold
0
Limit
20
Use
Save
Reset
Test Rule

With sum_count() rule action, the output shows the total size of all the event counts.

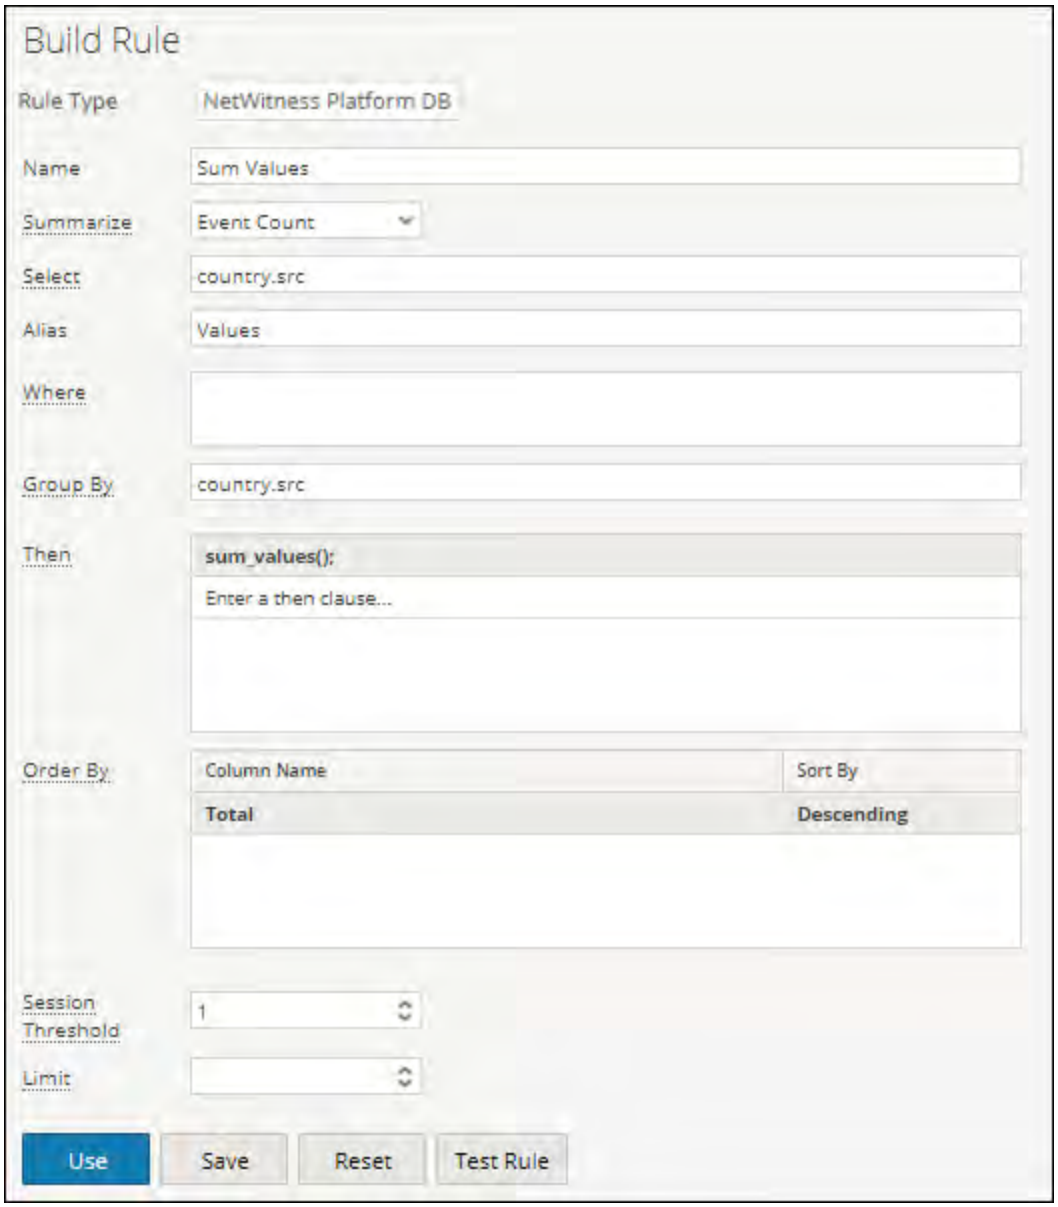


`sum_values()`

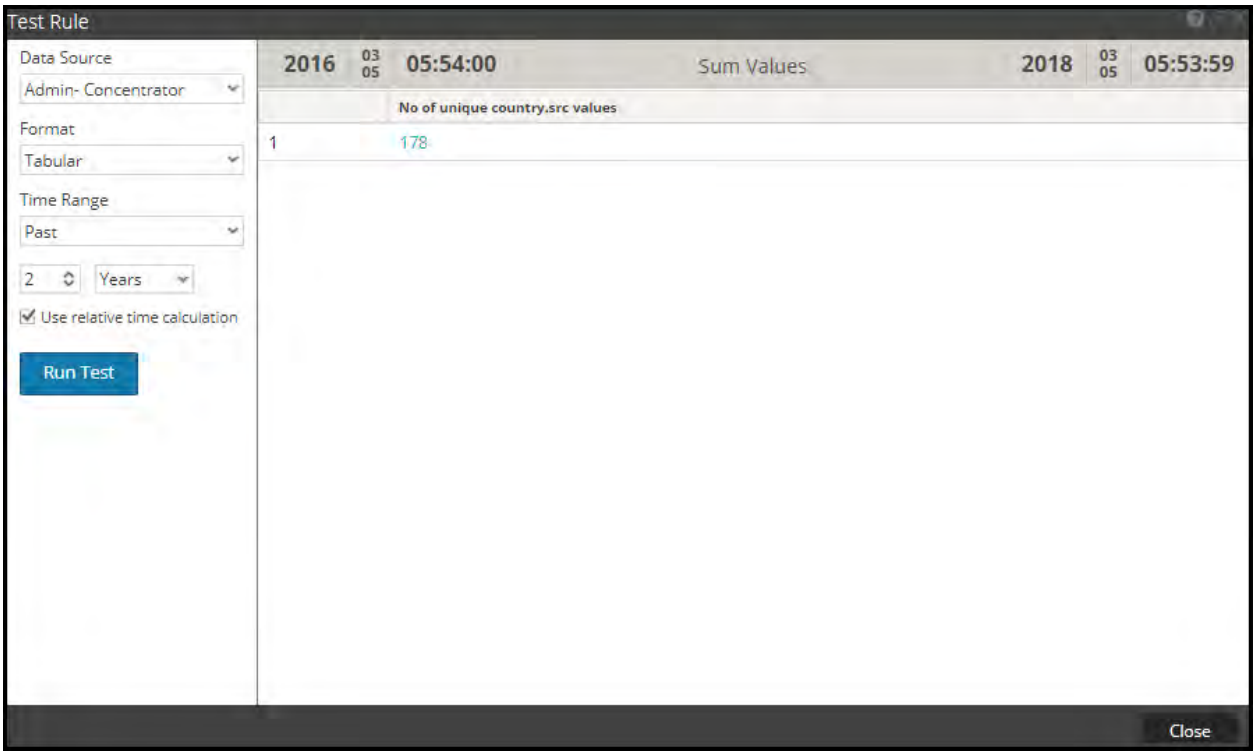
Totals the number of values for a given result set. Use this action to display how many matches exists for a given rule.

**Example:**

The following figure shows the sum_values() rule action.



The following figure shows the result with sum_values rule action.



## show_whats_new()

The show_whats_new() rule action takes any result in a result set and filters out any value that is available in the NetWitness meta database prior to the time frame of the currently running report. When a report runs, NetWitness determines the ID of the first session in the time range of the report. If a value in a result set has a first session id that is greater than the first session id of the report time frame, it did not exist in the NetWitness meta database prior to the report being run and so is new to the NetWitness system relative to the time frame of the report.

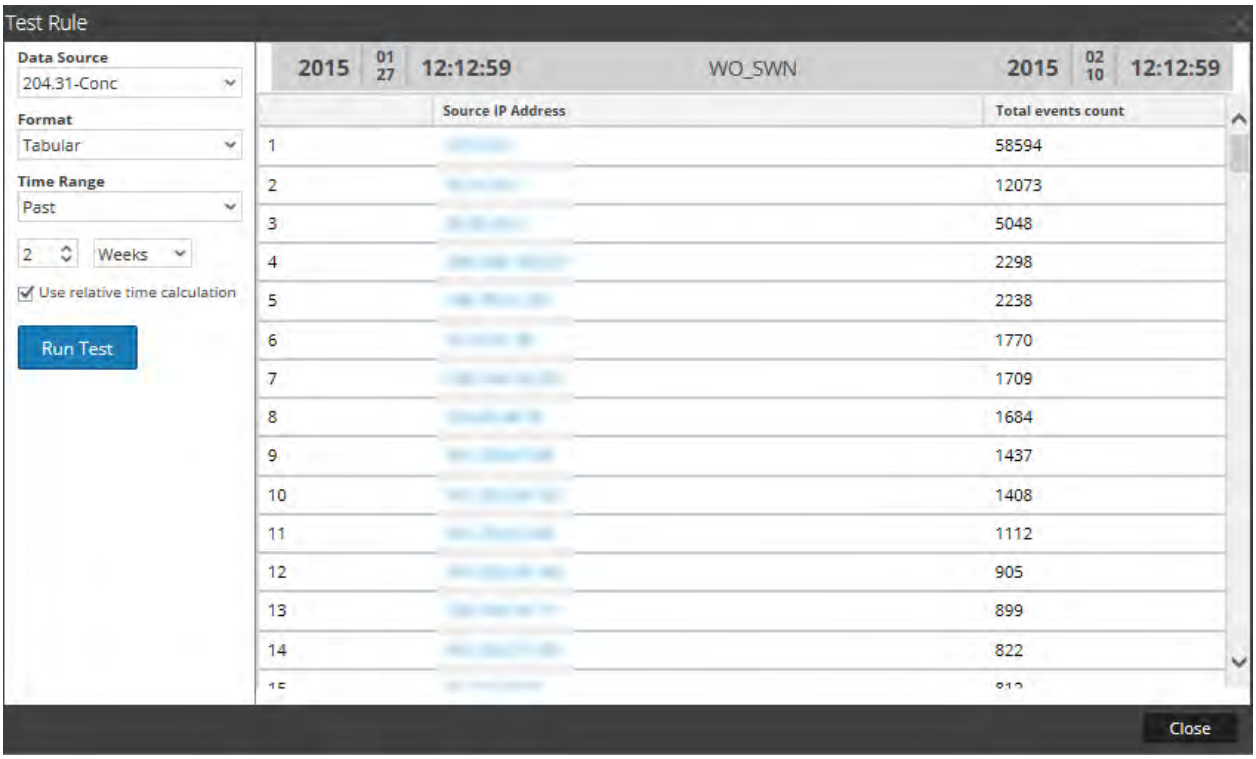
The show_whats_new() rule action is also supported for Custom Aggregate Rule. When multiple meta's are selected in the Custom rule, the first meta is considered for filtering out the old values. See "Example 2" below to understand how this rule action is used for Custom Aggregate Rule.

**Note:** The show_whats_new() rule action can be used only with an aggregate rule.

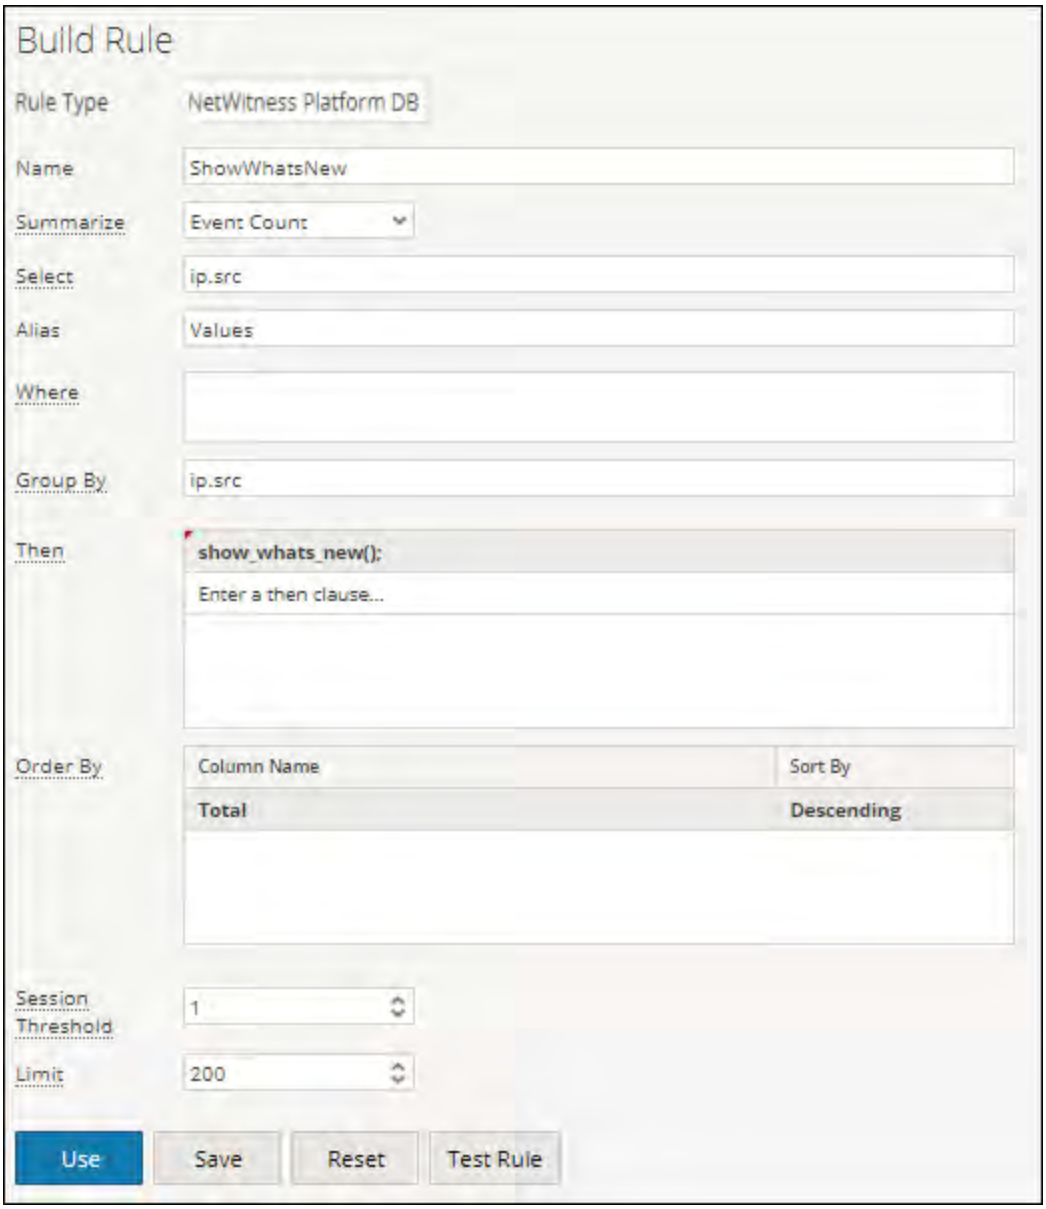
**Examples:**

**1. show_whats_new() for aggregate rule with Event Count**

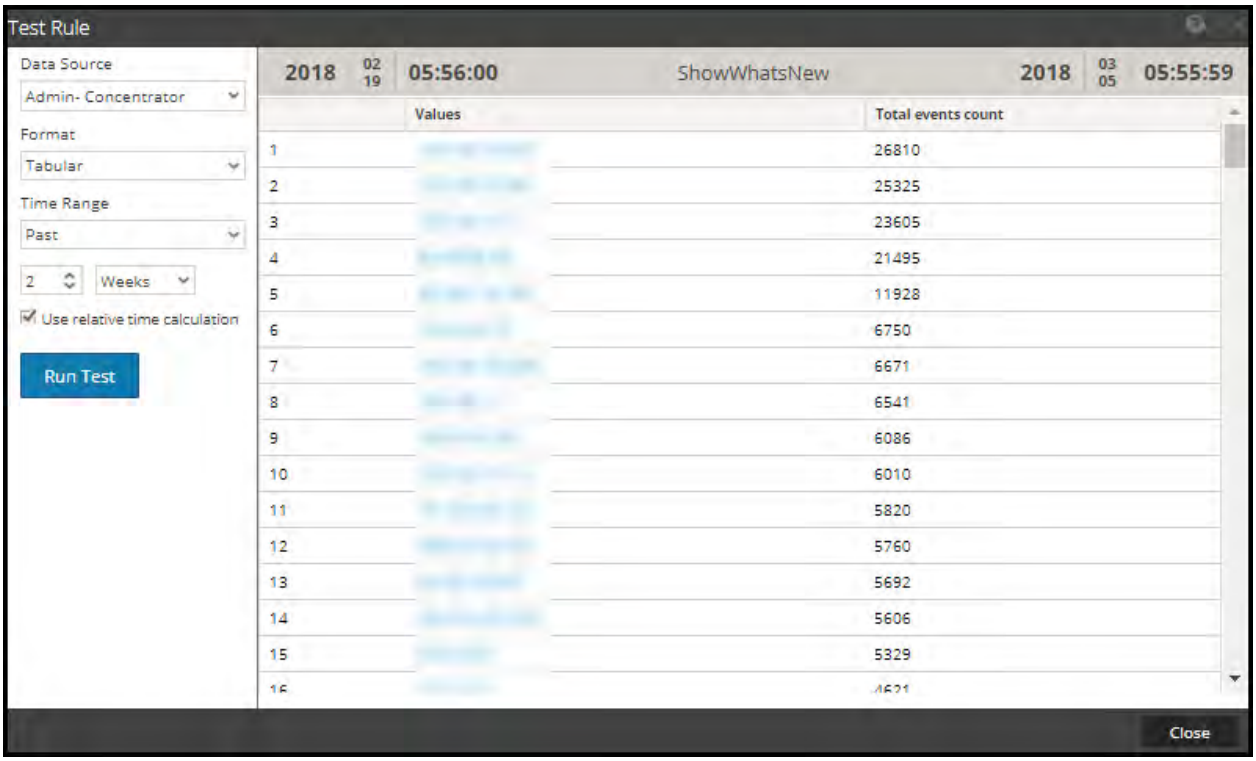
In the following example, all the Source IP Addresses available for the past two weeks are listed.



The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.

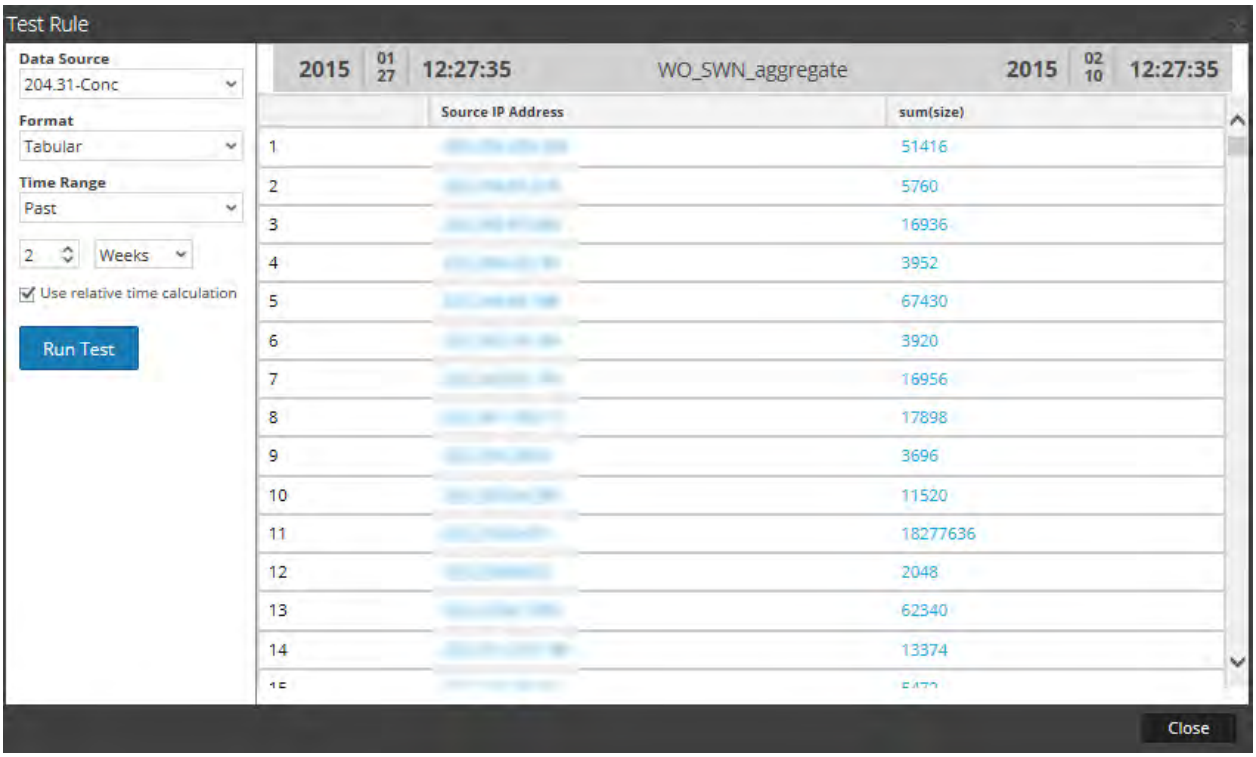


The following figure lists the new entries for the past two weeks.

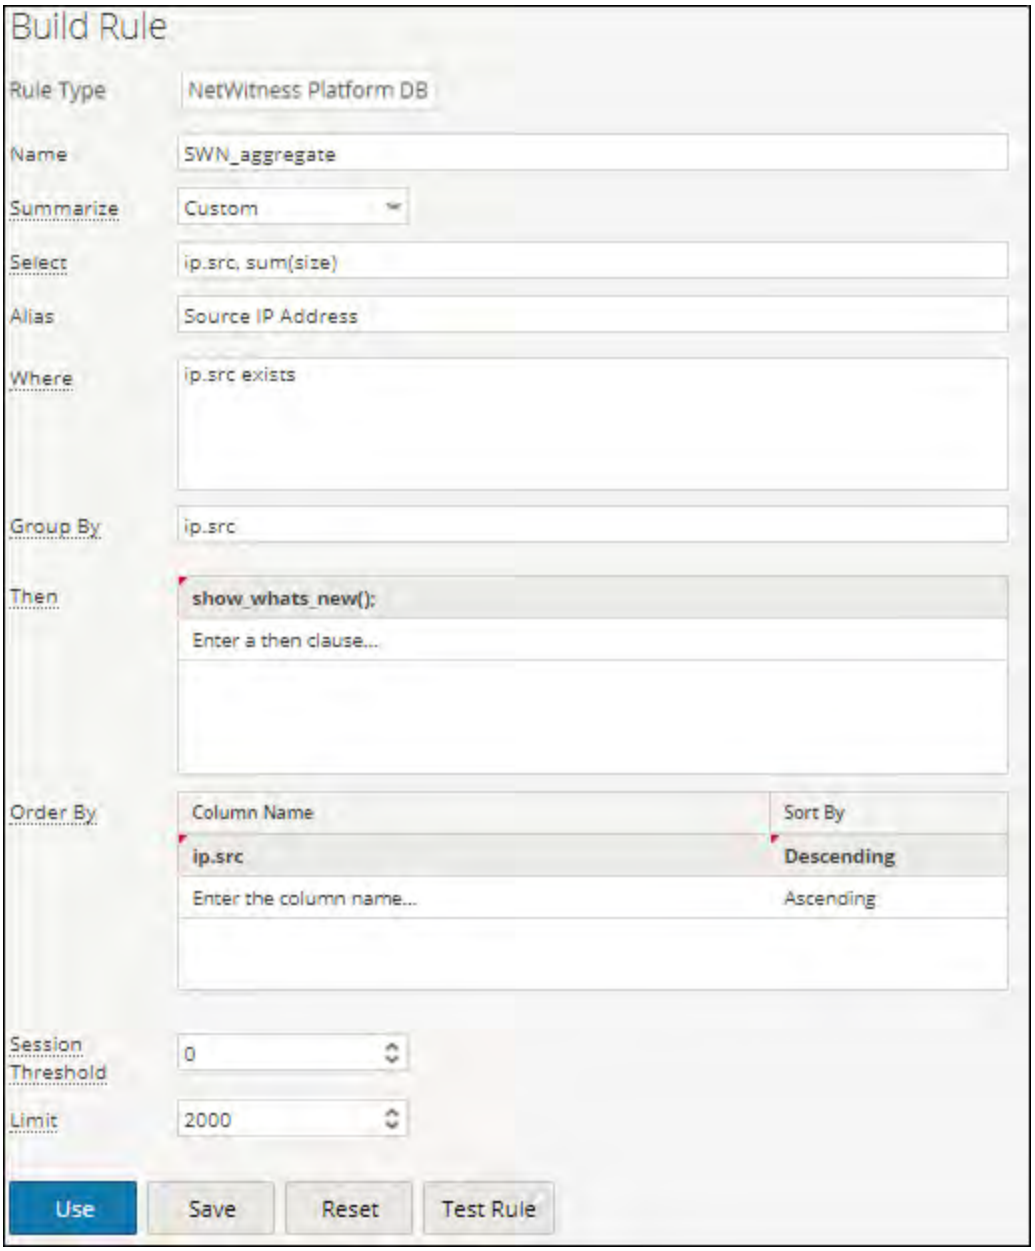


**2. show_whats_new() for Custom aggregate rule**

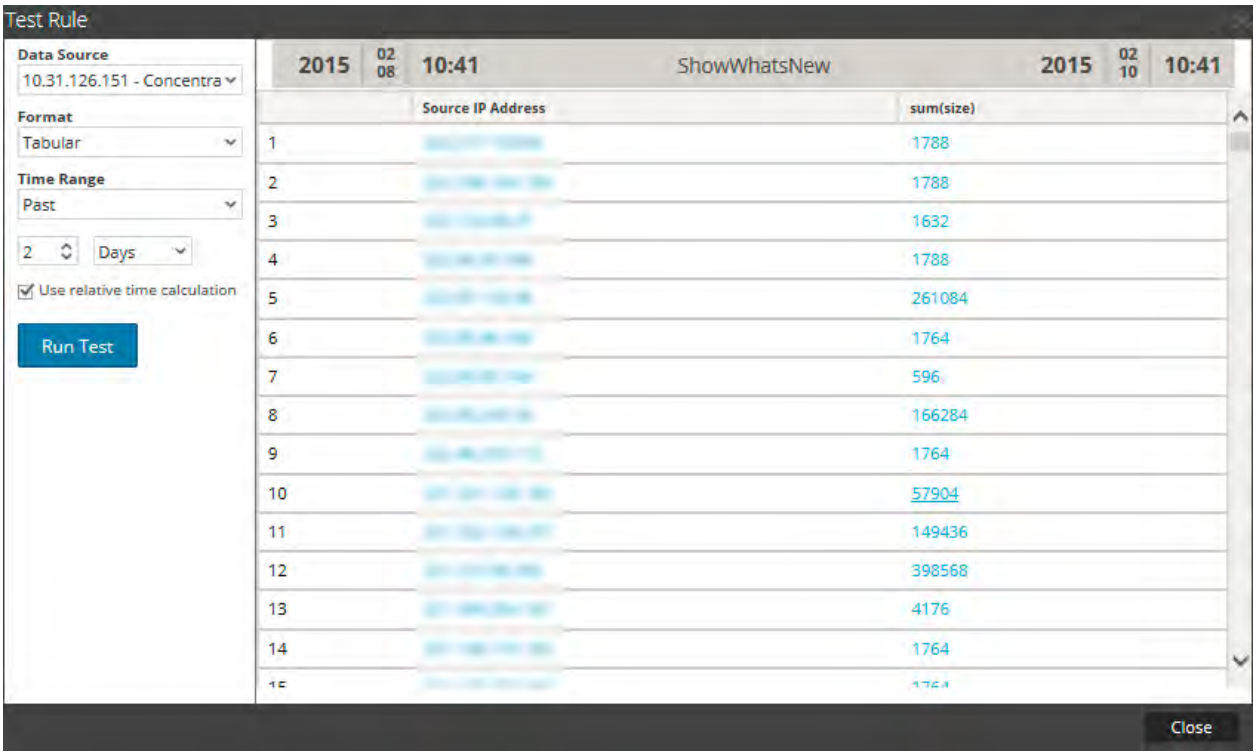
In the following example, all the Source IP Addresses available for the past two weeks are listed.



The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.



The following figure lists the new entries of Source IP Addresses for the past two weeks.



The power of this feature is that it doesn't matter when the report is run in identifying values that are new to NetWitness. The caveat with this feature is that if a data reset occurs, you will lose your data. However, it is easy to baseline a system and identify changes and new items without a tremendous amount of strain on the system (depending on the size of your result set).

## Supported Rule Operators

The NWDB Reporting Engine data source rule syntax supports a subset of rule operators that are supported by NetWitness.

| Syntax | Description |
|---|---|
| * | Use an asterisk (*) as the sole operator in a rule to select all traffic. |
| = | Equals operator |
| != | Does not equal operator |
| && | Logical AND operator |
| \|\| | Logical OR operator |
| -u | Upper boundary. For example, **tcp.port = 40000-u** selects all TCP ports above 40000. |
| l- | Lower boundary. For example, **tcp.port = l-40000** selects all TCP ports below 40000. |
| - | The dash (-) operator only applies to numeric values. Separate the lower and upper boundaries of the range with a dash (-). For example, **tcp.port = 25-443** selects all TCP ports between 25 and 443. |

### Sample Supported Queries

## Respond Rule Syntax

The supported rule syntax for the Respond service through descriptions and examples of supported and unsupported syntax. There is a finite set of syntax that you can use to construct rules for reports using the Respond service in this release.

The Reporting Engine supports the following categories of Respond data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- Group By
- Order By
- **Limit** field

**Note:** List is not supported in Respond Data source rules.

### Select Clause

The select clause is a comma separated list of values. For example: select alert.severity, alert.name, count(*).

There are two types of select clause for Respond Rule:

- Non-aggregate rule
- Aggregate rule

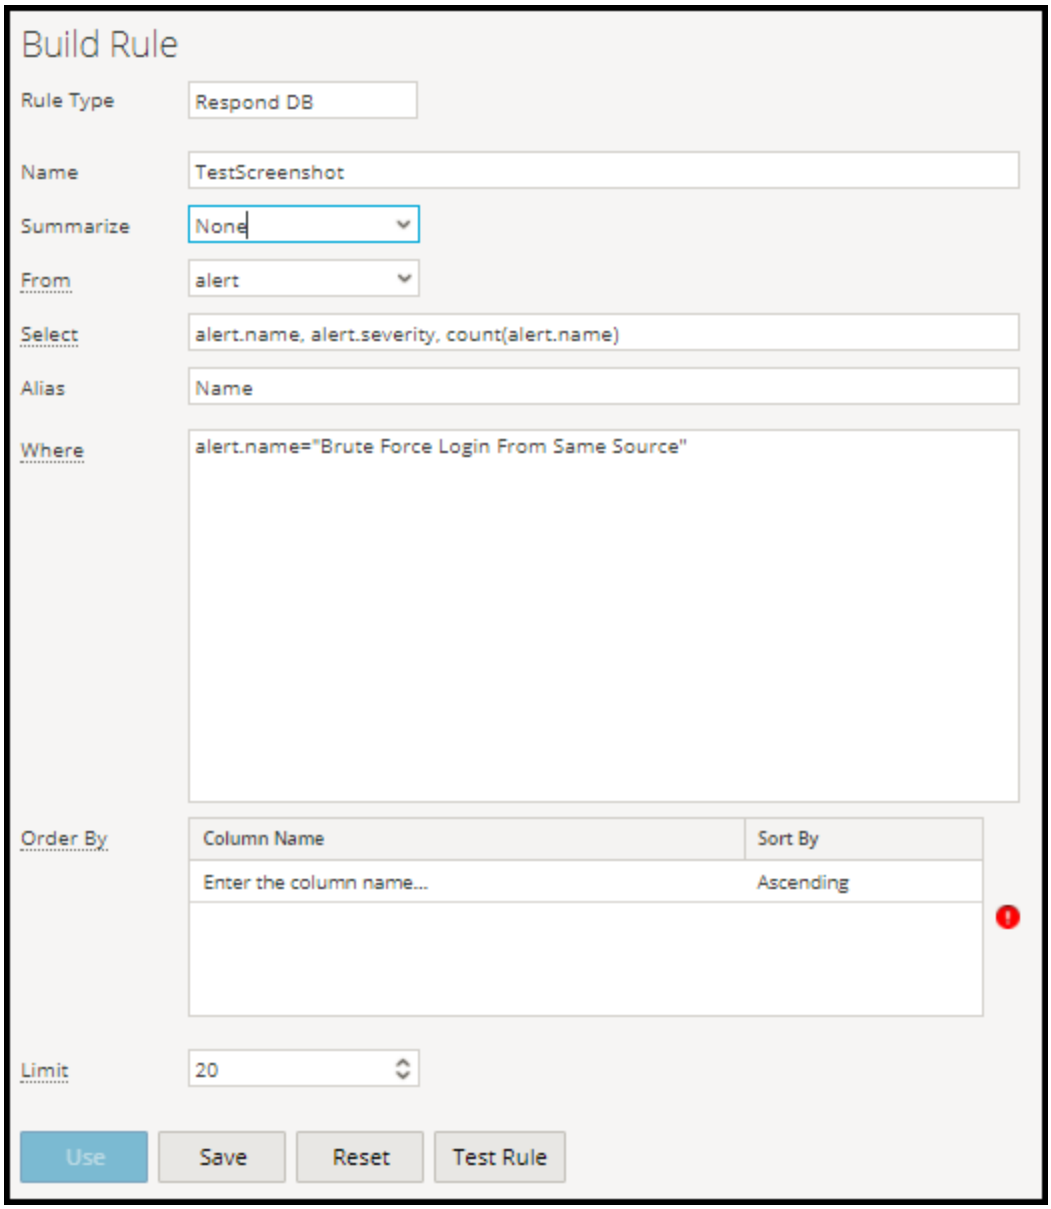
### Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select alert.severity, alert.name.

### Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select alert.severity, alert.name, count(*).

The following figure shows the Build Rule view for Aggregate Rule.



## Supported Aggregate Functions

The rules on Respond service supports the following aggregate functions and syntax.

- count
- max
- min
- sum
- avg

**Note:** The aggregate functions must be added in the end of a select clause for aggregate query. For example, alert.name, alert.severity, sum(alert.numEvents). By default, a maximum of 10,000 rows results are fetched and this can be configured using the **rsa.response.query.QueryProperties**.

**Examples of select Clause Syntax**

The following table provides examples of the select Clause Syntax.

| Examples | Descriptions |
|---|---|
| select *column1* ,*column2*,*column3*,...,*columnN* | Select specific metas from an Respond Data Source (You must separate each column with a comma.). |

**Examples of Supported Select Queries**

select alert.name, alert.numEvents, count(alert.numEvents)

select alert.severity, avg(alert.severity)

select alert.timestamp, incidentCreated where alert.timestamp >= 1475658011

## Summarize

Summarize determines the type of summarization or aggregation for the rule.

| Name | Config Value |
|---|---|
| Summarize | To query metas without any custom grouping, select:<br>• **None**:<br><br>To get meta based aggregates, select:<br>• **Custom**: This indicates that expected meta aggregate function is defined in rule select clause. |

## Alias

Some meta names may not be descriptive, in this case description can be added in the the alias field to make column names more readable. For example, **SELECT**: alert.severity, alert.name, count(*)
**ALIAS**: Alert Severity, Alert Name

In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1,Field2,Field3,Field4, and alias has only Field1, ,Field3,Field4, then for Field2 a default description is used.

## Where Clause

The where clause is a language field values and ranges that is used by Respond function. In the where clause, string values have to be enclosed within single quotes.

| Examples | Descriptions |
|---|---|
| alert.host summary =' (Primary) Link status "Down" on interface INTNAME.' | For TEXT or string type data, enclose the string or text in single or double quote. If there is any special character such as an apostrophe within the data then you need to add an additional single or double quotes. For example, alert.name = 'top alerts from Cote d"Ivoire'. |
| alert.timestamp >= 1475658011 | For Date and Time (date/timestamp data type columns), use the EPOCH syntax. |

## Supported Where Clause Operators

| Operator | Syntax |
|---|---|
| = (equals) | *column1* = '*value*' |
| != (does not equal) | *column1* != '*value*' |
| > | *column1* > '*value*' |
| >= | *column1* >= '*value*' |
| < | *column1* < '*value*' |
| <= | *column1* <= '*value*' |

## Group By

| Syntax | Function |
|---|---|
| group by : alert.severity, alert.timestamp, incidentCreated<br><br>**Note:** Group by field is enabled for Aggregate queries and are not editable. | Respond picks the metas for Group By field from the selected Select clause automatically. |

## Order By

Order By determines how to sort the result set and is not case sensitive.

| Name | Configuration Value |
| --- | --- |
| Column Name | The Column Name is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field.<br>• order by alert.name asc<br>• order by incidentCreated desc<br>• order by count(numEvents)<br>• order by status |
| Sort By | Sort By determines the order in which you want to sort the results such as ascending or descending.<br>**Note:** For all queries, it is mandatory for you to select the order by field. |

### Limit field

This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

# Warehouse DB Simple Rules Syntax

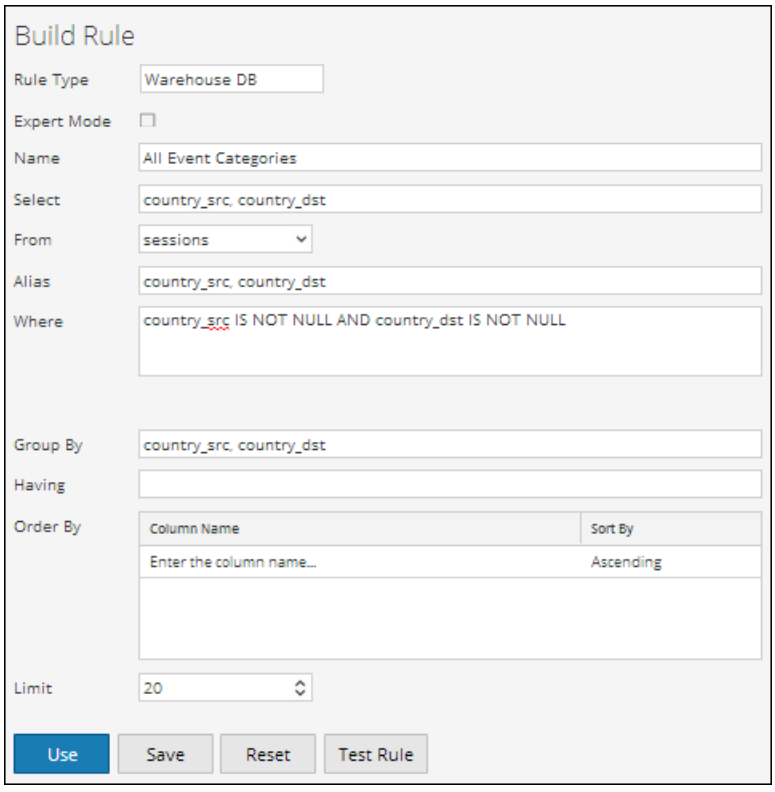
The section explains the simple rules query syntax and examples.

The following examples illustrate simple rules in the default mode:

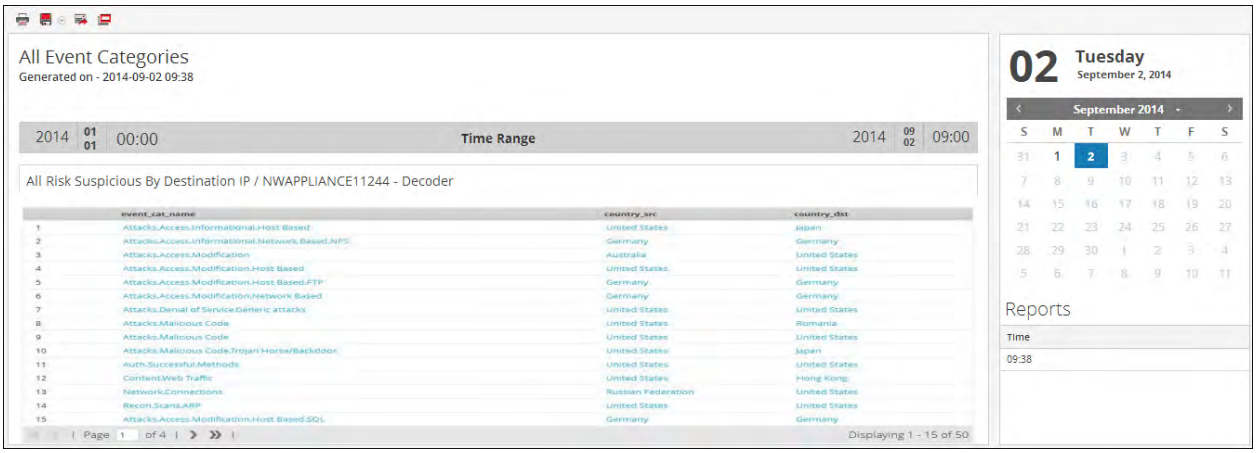
- All Event Categories Report
- Attacks Event Categories Report
- Source: China Event Categories Report
- IP Source and Destination Event Categories Report
- Time Threat Categories Report
- Array Query Report
- Raw Log Query Report

## All Event Categories Report

This rule fetches all event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table, that is, **country_src** for the source country, and **country_dst** for the destination country.

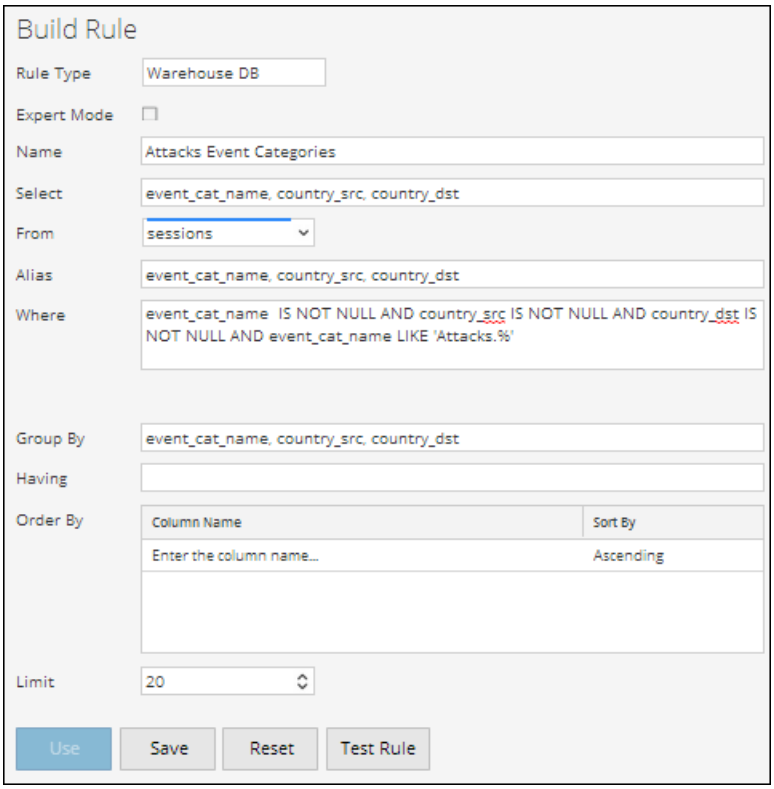


The following figure shows the result set of the All Event Categories rule.

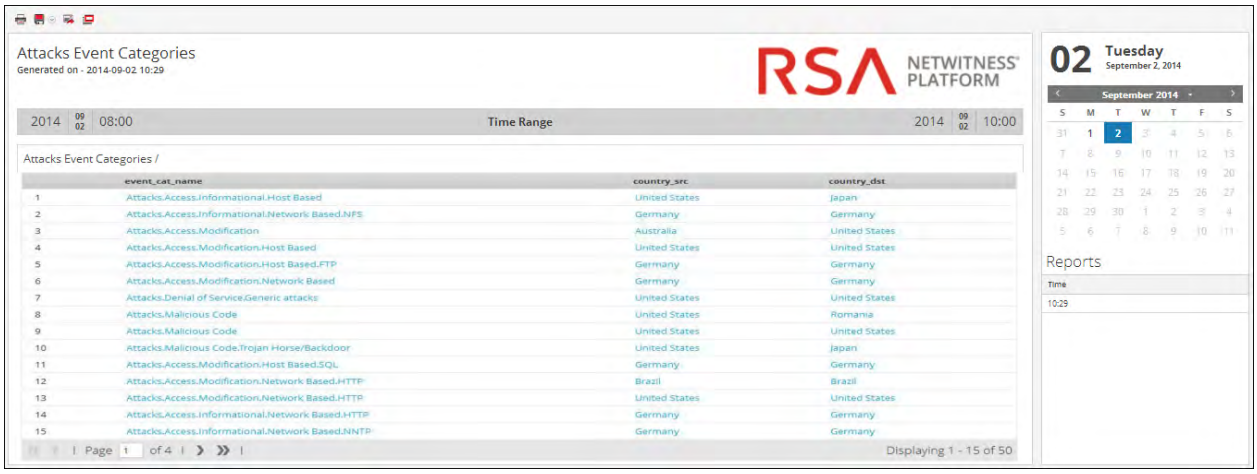


## Attacks Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose event category name like 'Attacks.%'.

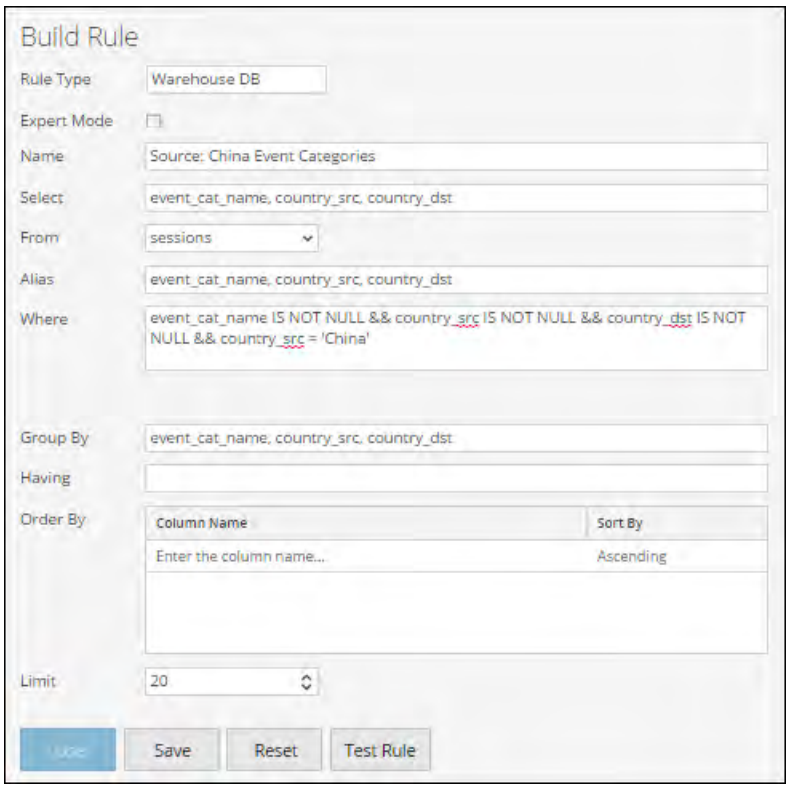


The following figure shows the result set of the Attacks Event Categories rule.

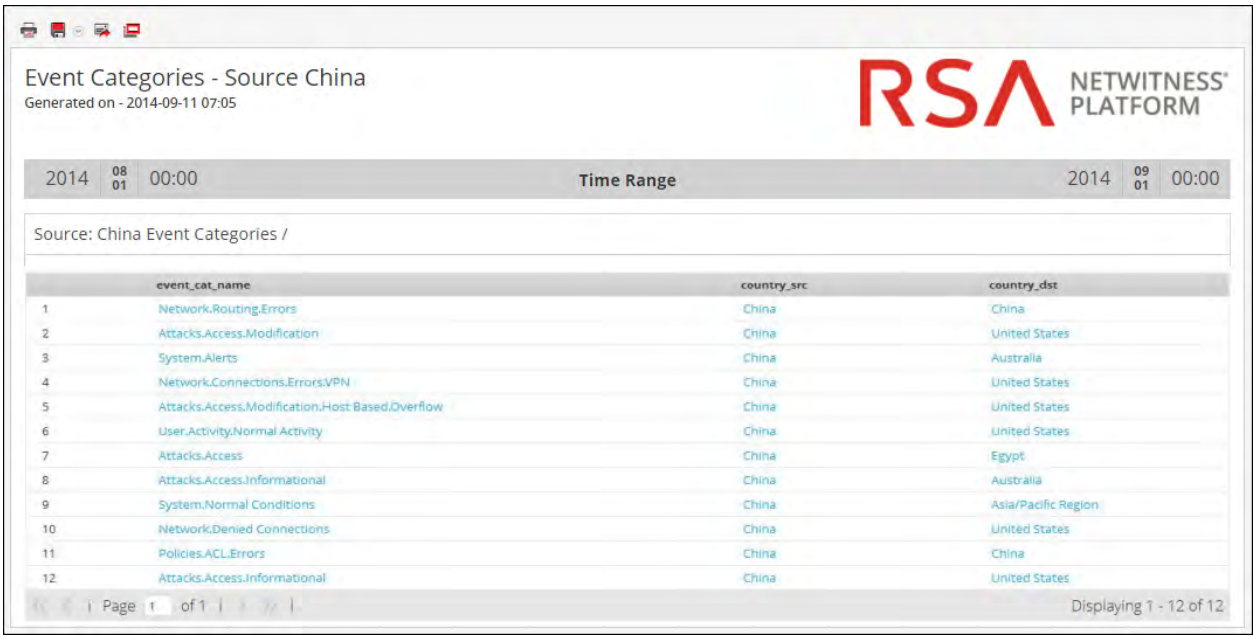


## Source: China Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose source country is 'China'.



The following figure shows the result set of the Source: China Event Categories rule.



Event Categories - Source China
Generated on - 2014-09-11 07:05

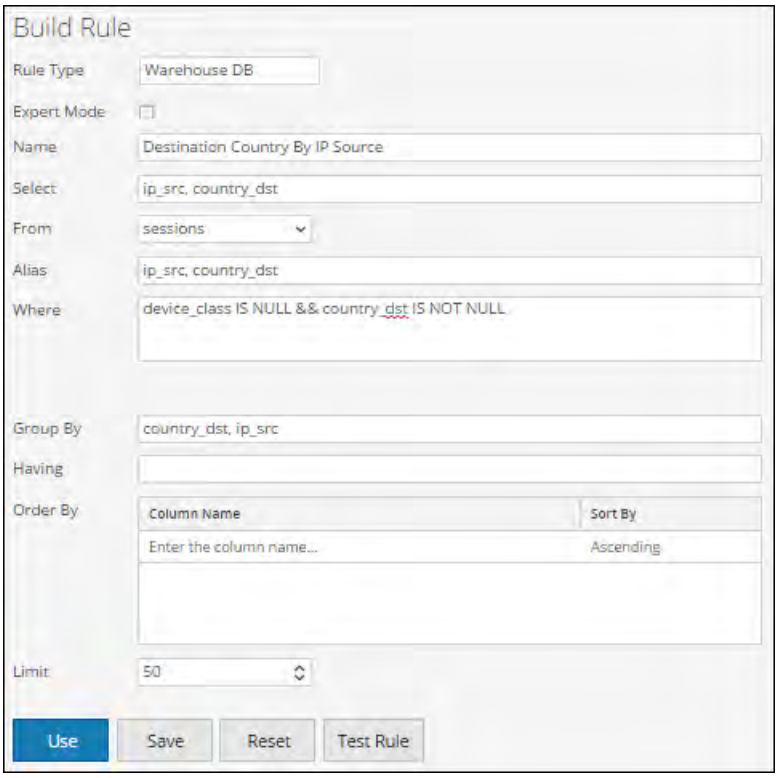
## IP Source and Destination Event Categories Report

This rule fetches the IP address of source and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose destination country is NOT NULL.

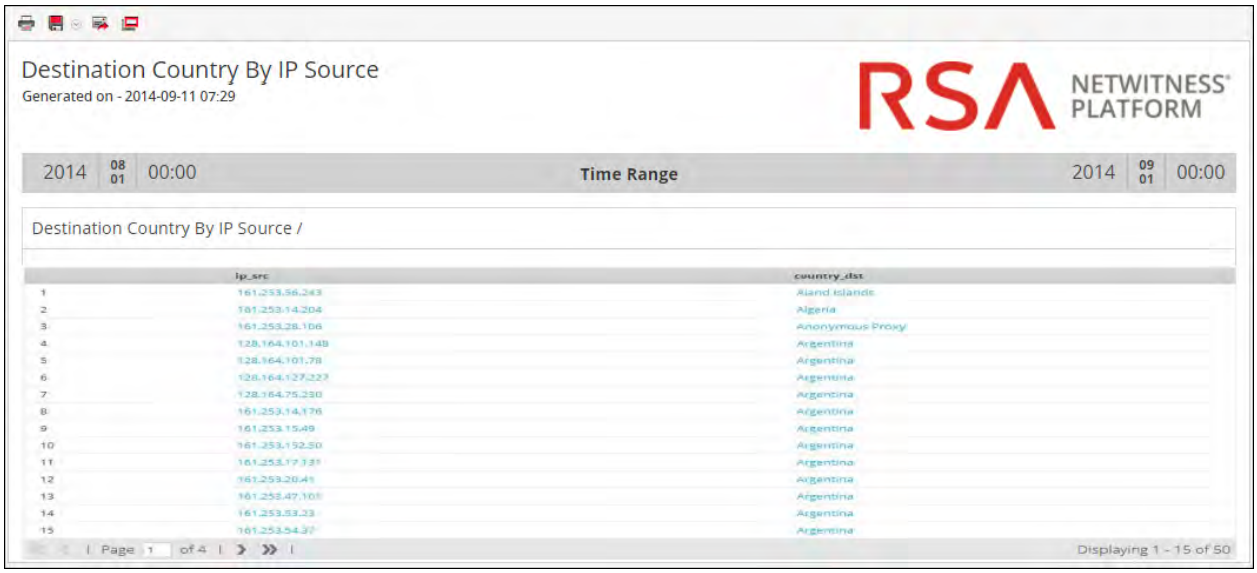


Build Rule

Rule Type: Warehouse DB
Expert Mode:
Name: Destination Country By IP Source
Select: ip_src, country_dst
From: sessions
Alias: ip_src, country_dst
Where: device_class IS NULL && country_dst IS NOT NULL
Group By: country_dst, ip_src
Having:
Order By: Column Name | Sort By
Enter the column name... | Ascending
Limit: 50

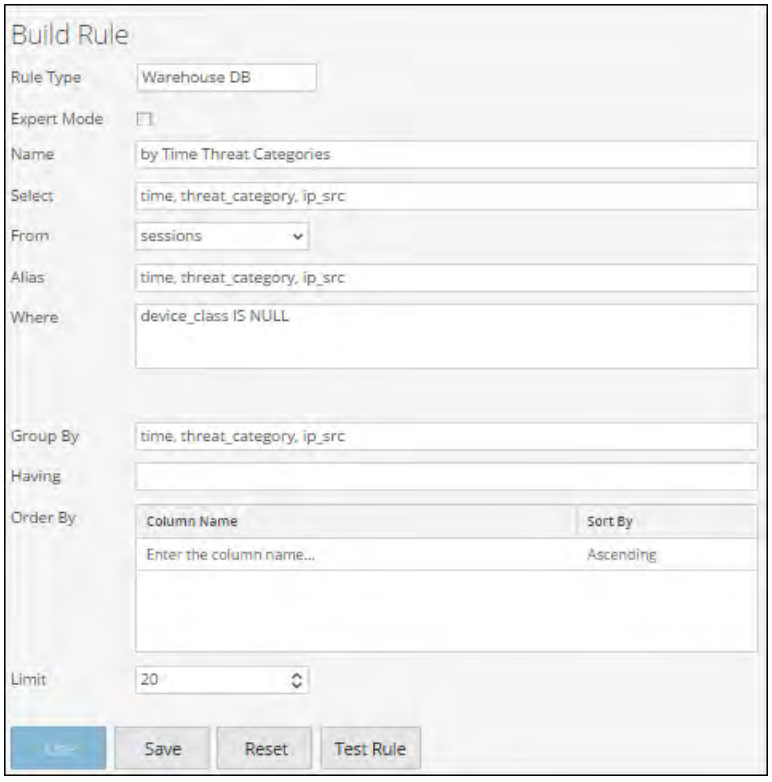
Use | Save | Reset | Test Rule

The following figure shows the result set of the IP Source and Destination Event Categories rule.



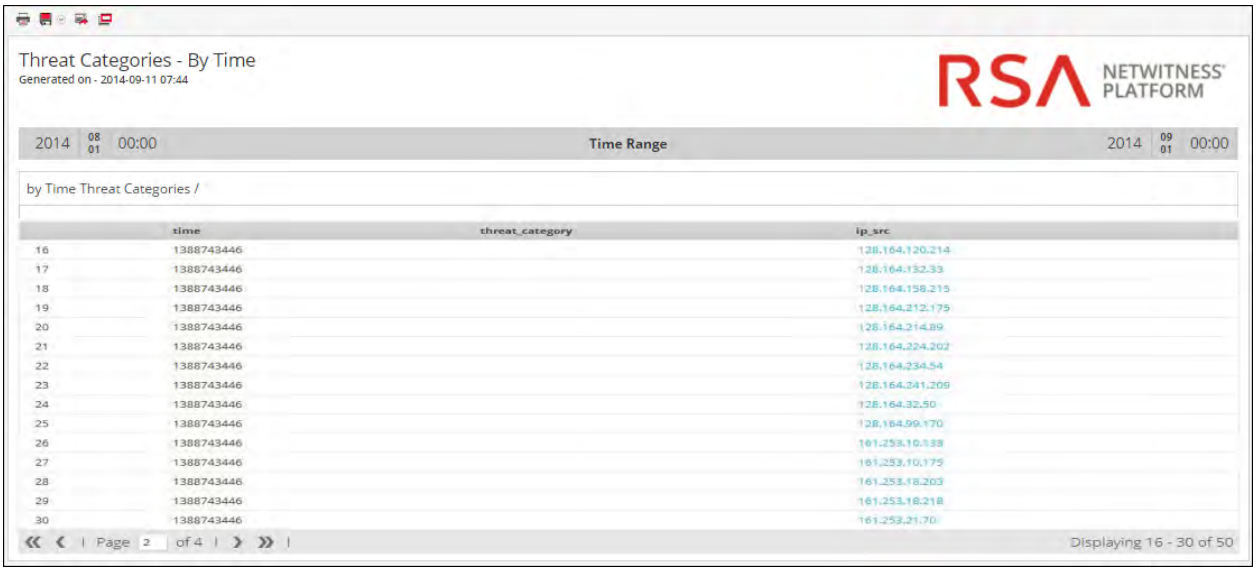
## Time Threat Categories Report

This rule fetches the threat category events, the time the log or event was ingested into Log Decoder/Decoder, and the source IP addresses from the **sessions**table by defining alias names (temporary column names) for each of these fields to be fetched from the table.



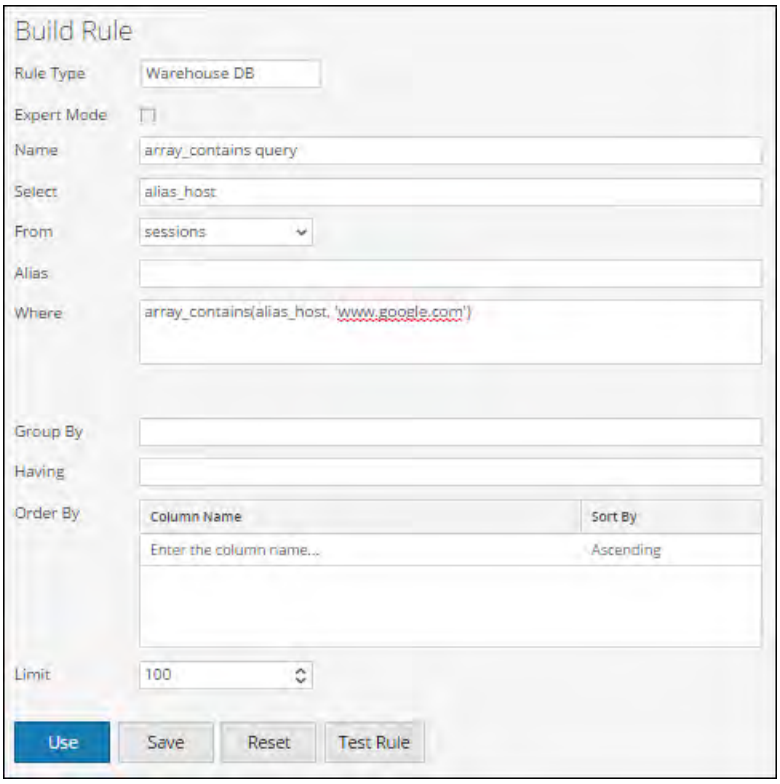
The following figure shows the result set of the by Time Threat Categories rule. The time displayed in the time field is the UNIX time (For example, 1388743446).

**Note:** In the "Select" clause the syntax would be "UNIX time" to convert to UTC time in report. For example, you can use the Epoch time converter tool to convert UNIX time (1388743446) to UTC (Coordinated Universal Time) (1/3/2014 3:34:06 PM).

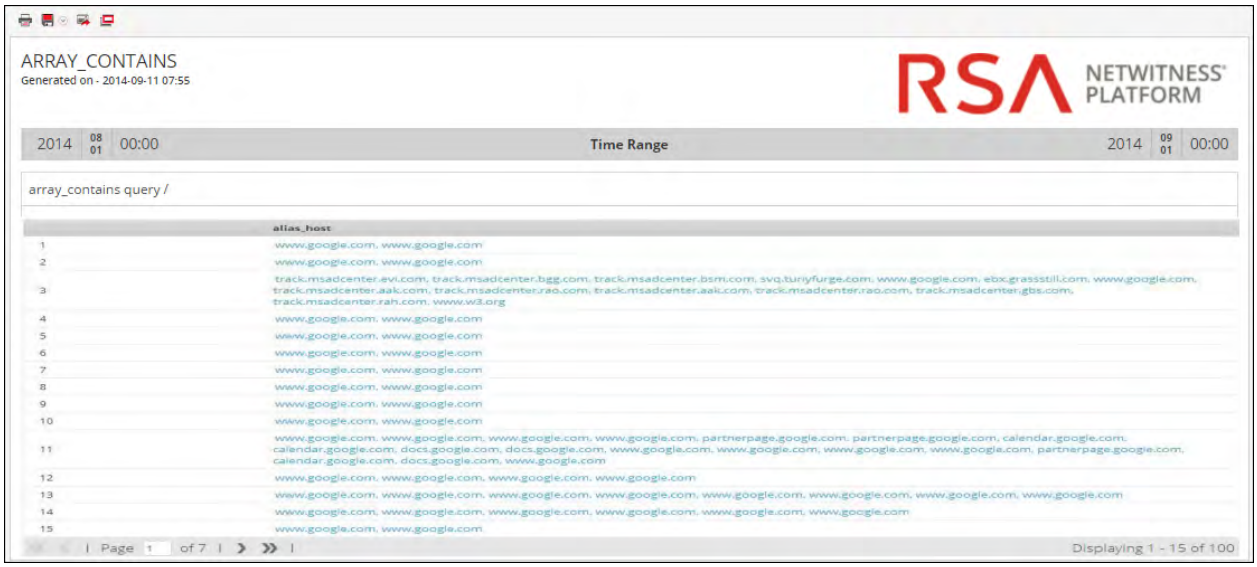


## Array Query Report

This rule fetches an array of alias host names from the **sessions** table which contains the value 'www.google.com'.



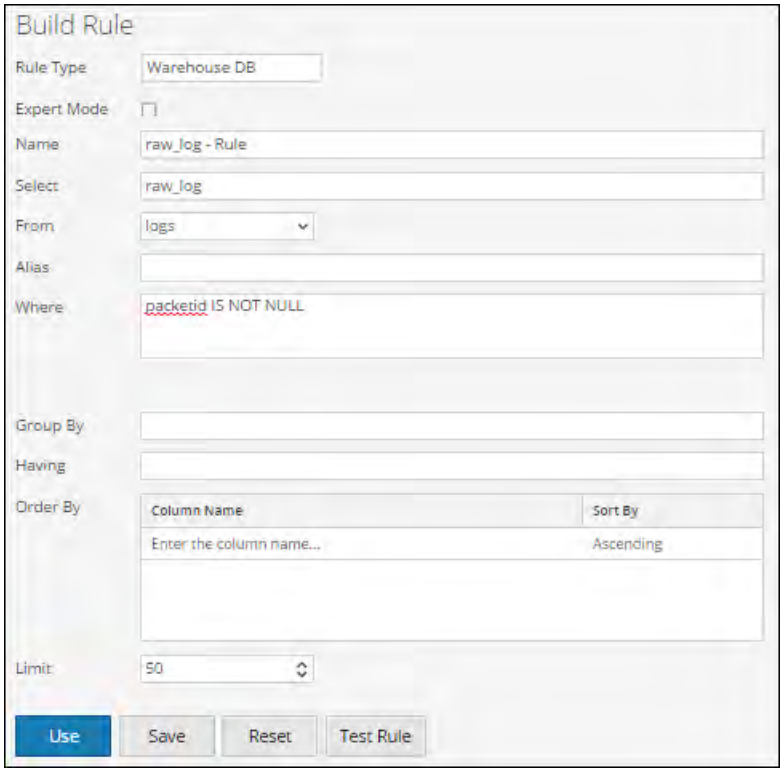
The following figure shows the result set for querying an array from sessions.



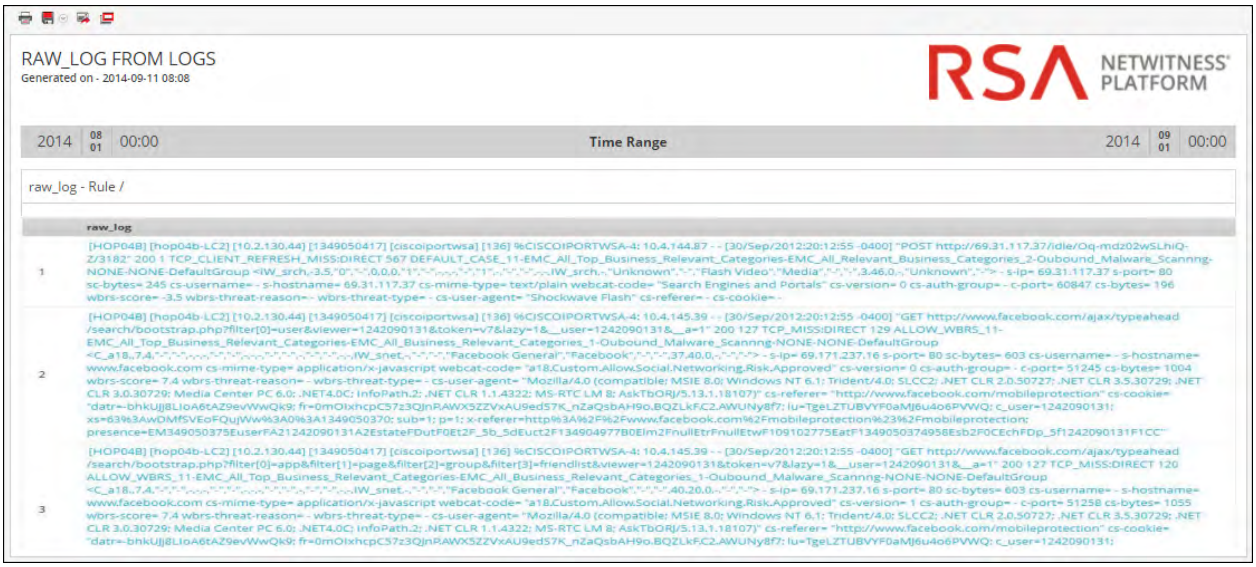
## Raw Log Query Report

Raw logs can be queried either from the logs or sessions table.

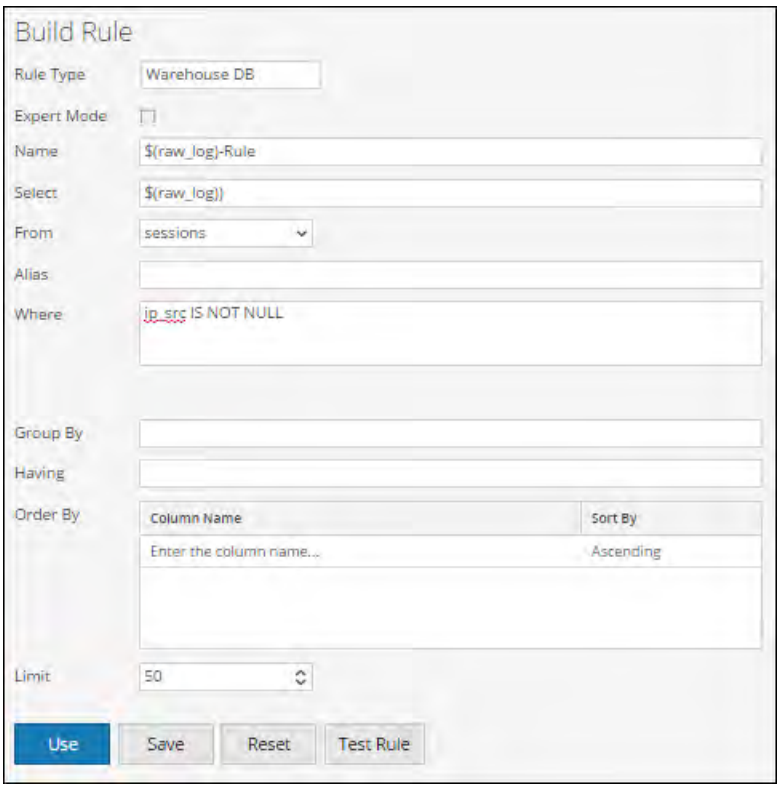
This rule uses **raw_log** as a meta for querying raw log from logs whose packet ID is NOT NULL.



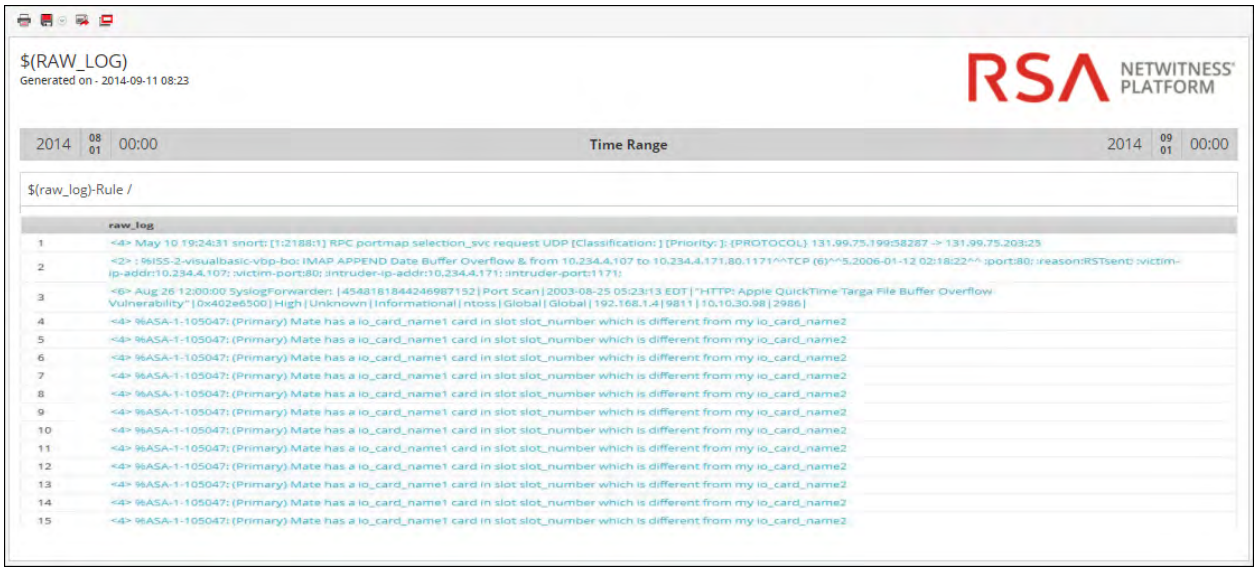
The following figure shows the result set for querying raw logs from logs.



This rule uses **${raw_log}** as a meta for querying raw log from sessions whose source IP address is NOT NULL.



The following figure shows the result set for querying raw logs from sessions.



$(RAW_LOG)

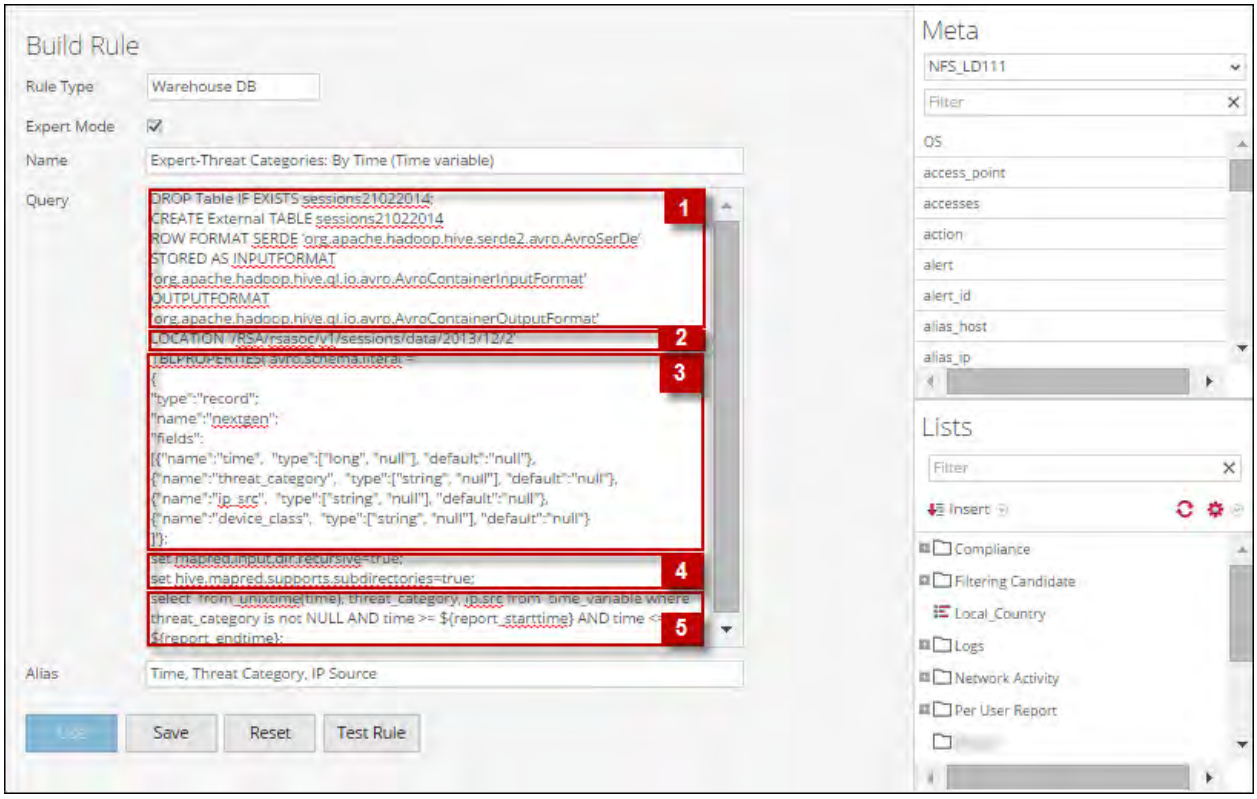
# Warehouse DB Advanced Rules Syntax

The section explains the advanced rules query syntax and examples.

## General Syntax of an Advanced Rule

The following figure shows how to define an advanced query.



The following syntax is an example of an advanced query:

```
DROP Table IF EXISTS sessions21022014;
CREATE External TABLE sessions21022014
ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
STORED AS INPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'
LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2'
TBLPROPERTIES('avro.schema.literal'='
 {
"type":"record";
"name":"nextgen";
"fields":
 [
 {"name":"time",  "type":["long", "null"], "default":"null"},
{"name":"threat_category",  "type":["string", "null"], "default":"null"},
```

```
{"name":"ip_src",  "type":["string", "null"], "default":"null"},
{"name":"device_class",  "type":["string", "null"], "default":"null"}
 ]
 '};
set mapred.input.dir.recursive=true;
set hive.mapred.supports.subdirectories=true;
```

select `from_unixtime(time), threat_category, ip.src` from `time_variable` where `threat_category` is not `NULL` and `time >= ${report_starttime}` and `time <= ${report_endtime};`

**Note:** Reporting Engine treats a line beginning with <hyphen> <hyphen> as a comment in Expert Warehouse Rule.
For example,

```
set mapred.input.dir.recursive=true;
-- This is an Expert comment
 set hive.mapred.supports.subdirectories=true;
```

The general syntax of an advanced query is as explained below:

1. Drop and create an external table, and then format the row:
   Firstly, we drop the table, if the table already exists and create an external table **sessions21022014**

   ```
   DROP TABLE IF EXISTS sessions21022014
    CREATE EXTERNAL TABLE sessions21022014
   ```

   **Note:** You must create an external table only if you are using an other table. For example, if you are using an other table apart from **sessions21022014** then you must drop the table and create an external table.

   Then, specify the row format as Avro.SerDe interface to instruct HIVE as to how a record is to be processed. Avro.SerDe allows you to read or write Avro data as HIVE tables and store them as input format and output format.

   ```
   ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.Avro.SerDe'
    STORED AS INPUTFORMAT
   'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
    OUTPUTFORMAT 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'
   ```

2. Specify the HDFS location:
   Secondly, you must specify the HDFS location '/RSA/rsasoc/v1/sessions/data/2013/12/2' from where the data is queried before executing the HIVE statements.The location parameter specifies the data to be fetched depending on the date input provided. This is a variable parameter hence you can fetch values depending on the date entered.

3. Define the table schema:
   Thirdly, you define the table schema by defining columns with a specific data type and default value as 'null'.

   ```
   TBLPROPERTIES('avro.schema.literal'='
    {"type":"record";
    "name":"nextgen";
    "fields":
    [
    {"name":"ip_src",  "type":["string", "null"], "default":"null"}
    ]
    '};
   ```

4. Import data from directory which contains sub directories:
   Then, you must enable HIVE to recursively scan all sub-directories and fetch all the data from all sub-directories.
   ```
   set mapred.input.dir.recursive=true;
   set hive.mapred.supports.subdirectories=true;
   ```
5. Fetch data from the HIVE table:
   Once you execute all the above statements, you can query the database with the HIVE query **select** clause to fetch the data from the HIVE table.

The following examples illustrate advanced rules in the expert mode:

- Hourly, daily, weekly, and monthly report
- Table partition based on location report
- Join logs and sessions based on unique_id report
- List report
- Parameterized report
- Partition based table with multiple locations
- Automated partition using custom function (10.5.1 onwards)

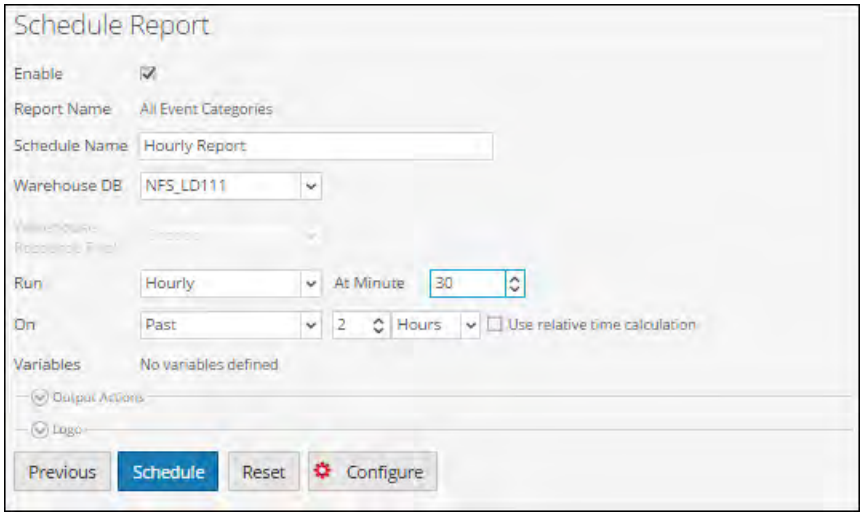
## Hourly, Daily, Weekly, and Monthly Report

In these example rules, you can create various reports for December 02, 2013 (as in the below figure). The date variable in the LOCATION statement can be altered, depending on which you can create an hourly, daily, weekly, and monthly report.

## Hourly Report

In this example rule, you can create an houly report for December 02, 2013. The LOCATION statement can be altered to generate an hourly report.

**LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2'** - the date input (2013/12/2) indicates year/month/day. The entire data for 02 December, 2013 is retrieved using this location statement.

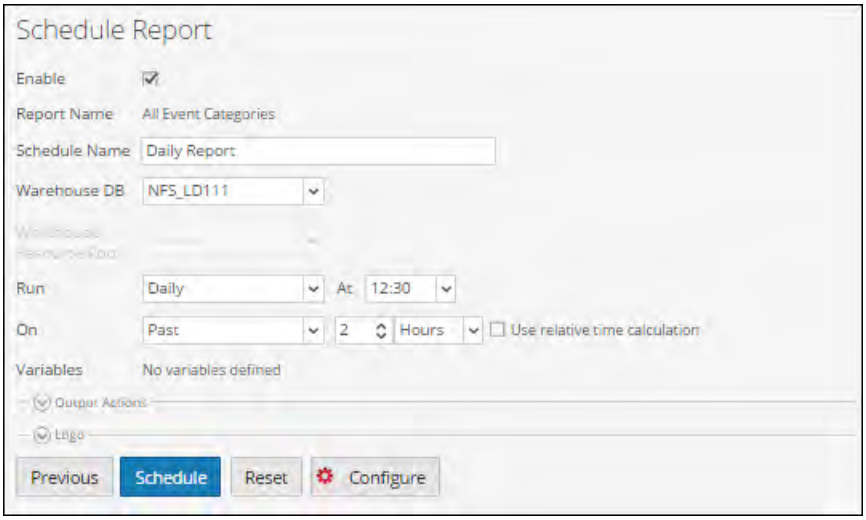


The result set of this query would be an hourly report.

## Daily Report

In this example rule, you can create a daily report for December 2013. The LOCATION statement can be altered to generate a daily report.

**LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12'** - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

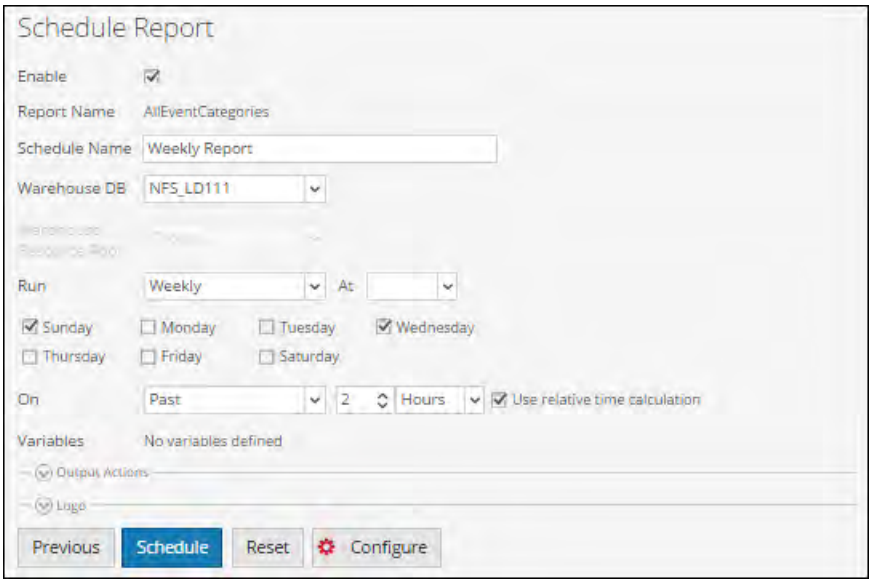


The resultset of this query would be a daily report.

## Weekly Report

In this example rule, you can create a weekly report for December 2013. The LOCATION statement can be altered to generate a weekly report.

**LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12'** - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

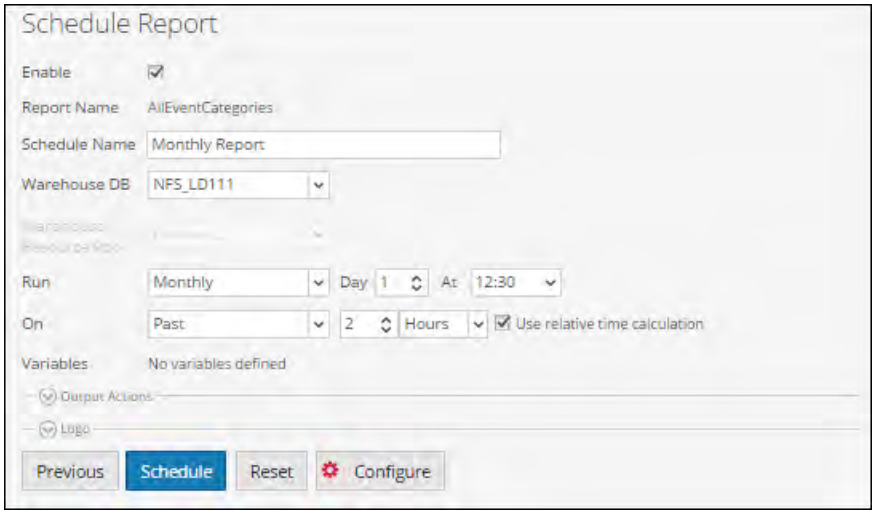


The result set of this query would be a weekly report.

## Monthly Report

In this example rule, you can create a monthly report for the year 2013. The LOCATION statement can be altered to generate a monthly report.

**LOCATION '/RSA/rsasoc/v1/sessions/data/2013'** - the date input (2013) indicates year. The entire data for the year 2013 is retrieved using this location statement.



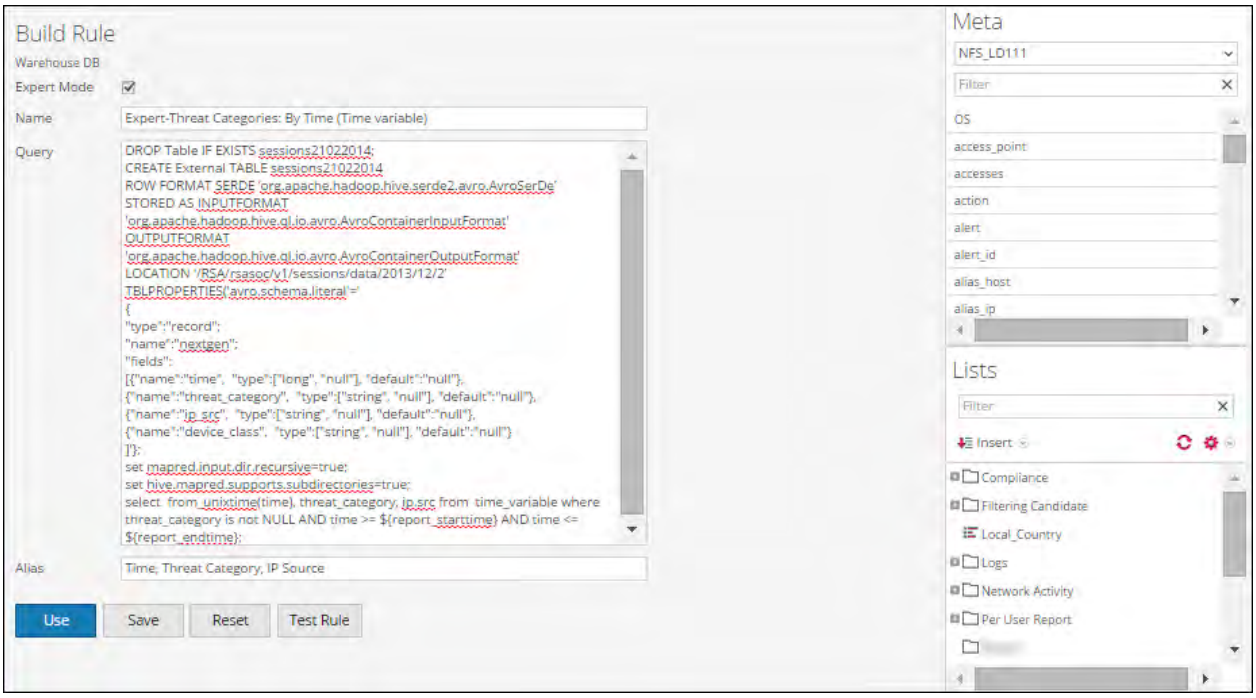
The result set of this query would be a monthly report.

For more information on LOCATION definition, see **Specify the HDFS location** in the **"General Syntax of an Advanced Rule"** section.

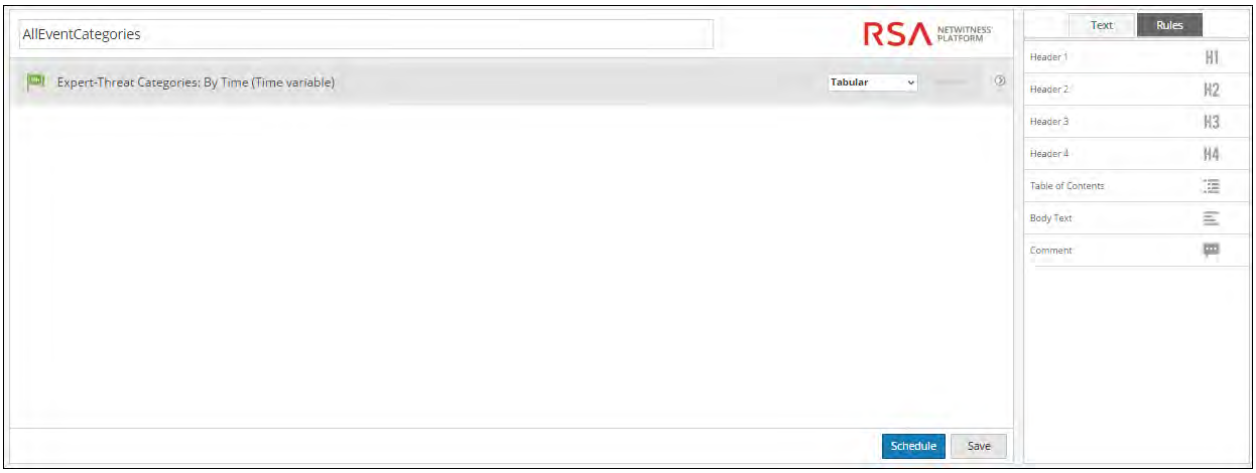
You must perform the following steps in sequence to view the resultset of an advanced rule:

1. Define an Advanced Rule
2. Add an advanced rule to a Report
3. Schedule a Report
4. View a scheduled Report

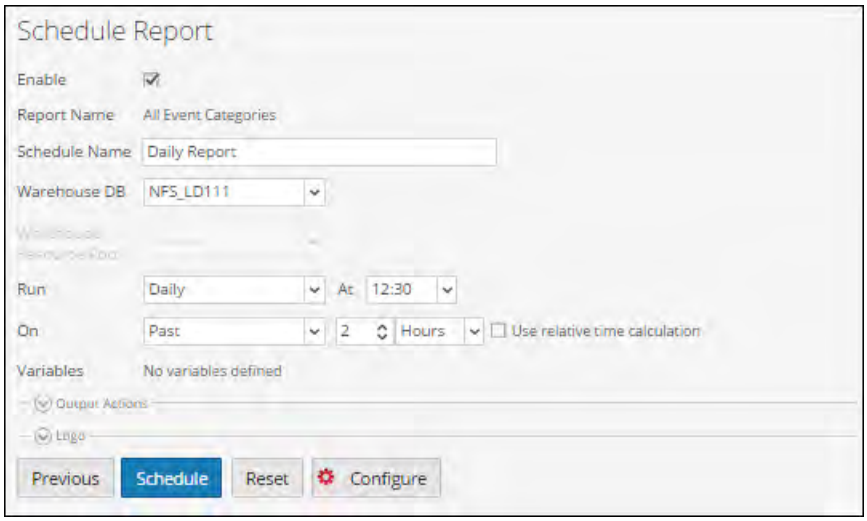
The following figure shows how to define an advanced rule.



The following figure shows how to add an advanced rule to a report (For example, **AllEventCategories**).



The following figure shows how to schedule a daily report.

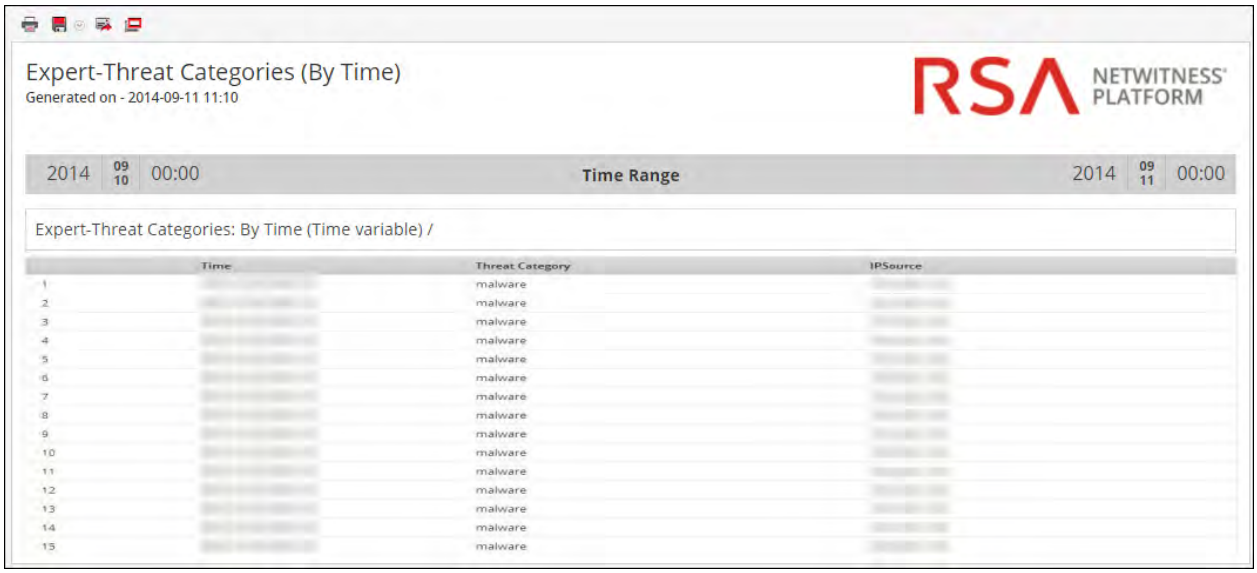


If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

`${report_starttime} - The starting time of the range in seconds.`
`${report_endtime} - The ending time of the range in seconds.`

For example, `SELECT from_unixtime(time), threat_category, ip.src FROM time_variable WHERE threat_category is not NULL AND time >= ${report_starttime} AND time <= ${report_endtime};`

The following figure shows the result set of scheduling a daily report.

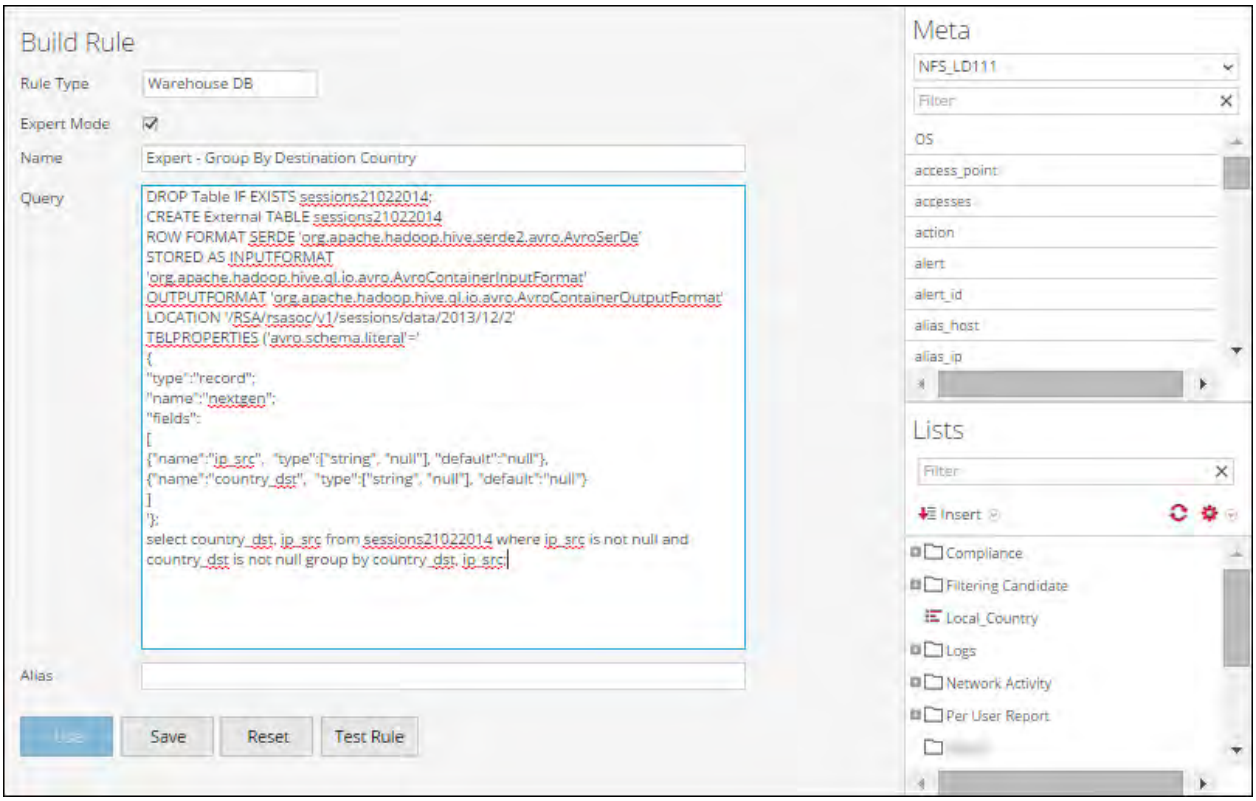


## Table Partition Based on Location Report

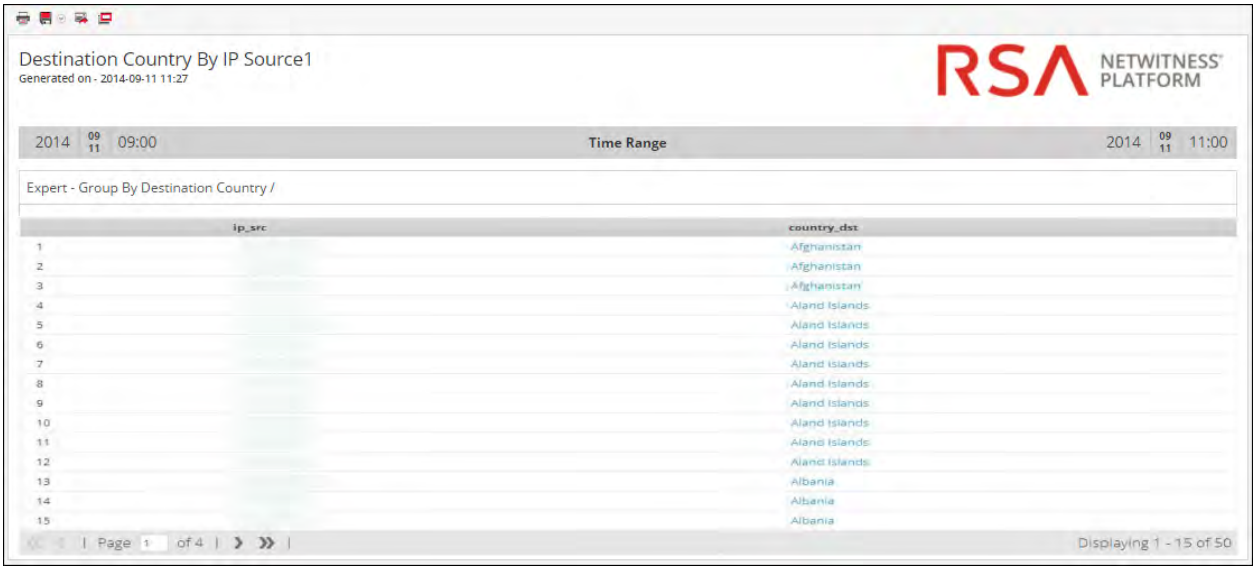
In this example rule, you can create a table partition based on location. Each table can have one or more partition keys which determines how the data is stored. For example, a country_dst of type STRING and an ip_src of type STRING. Each unique value of the partition keys defines a partition of the table.

In the example provided, we execute a HIVE query to fetch destination country and IP address of source from the sessions05032014 table and group the result set by these fields.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see "General Syntax of an Advanced Rule" section.



The following figure shows the result set of creating a table partition based on location report.

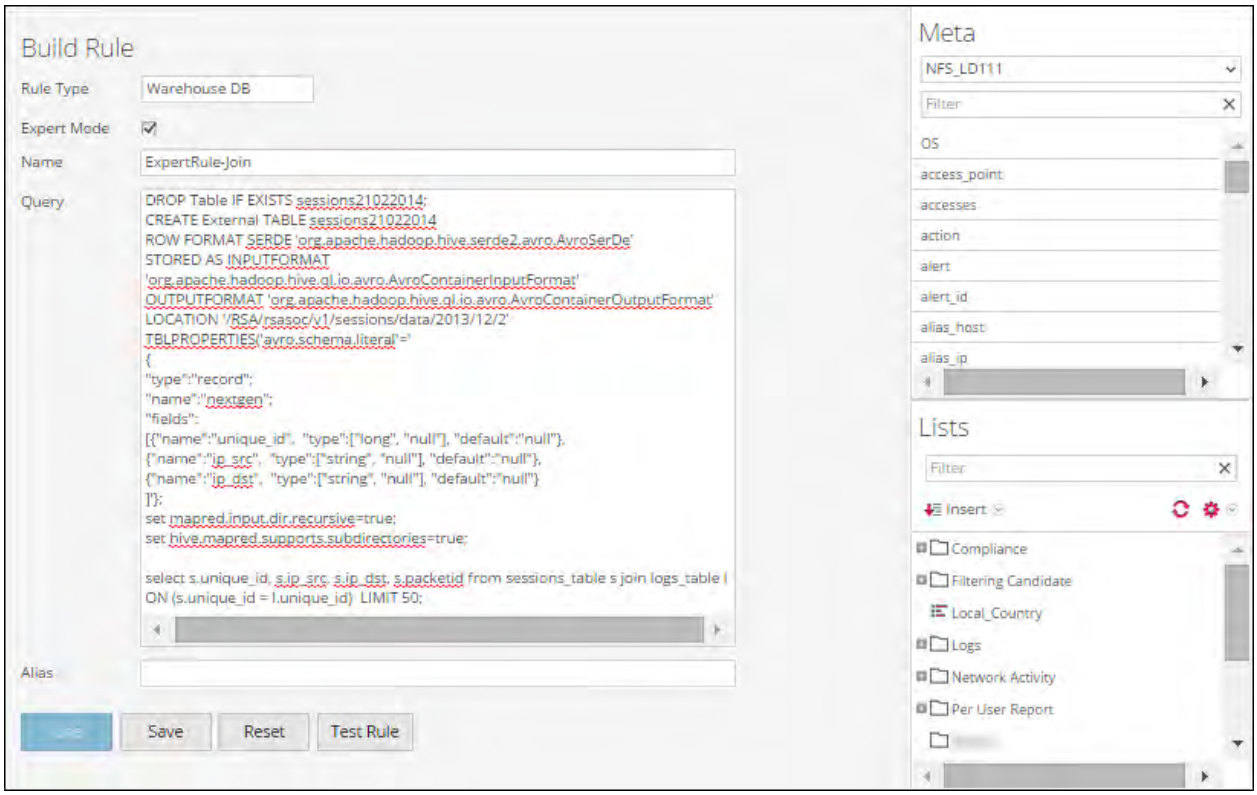


## Join Logs and Sessions Based on unique_id Report

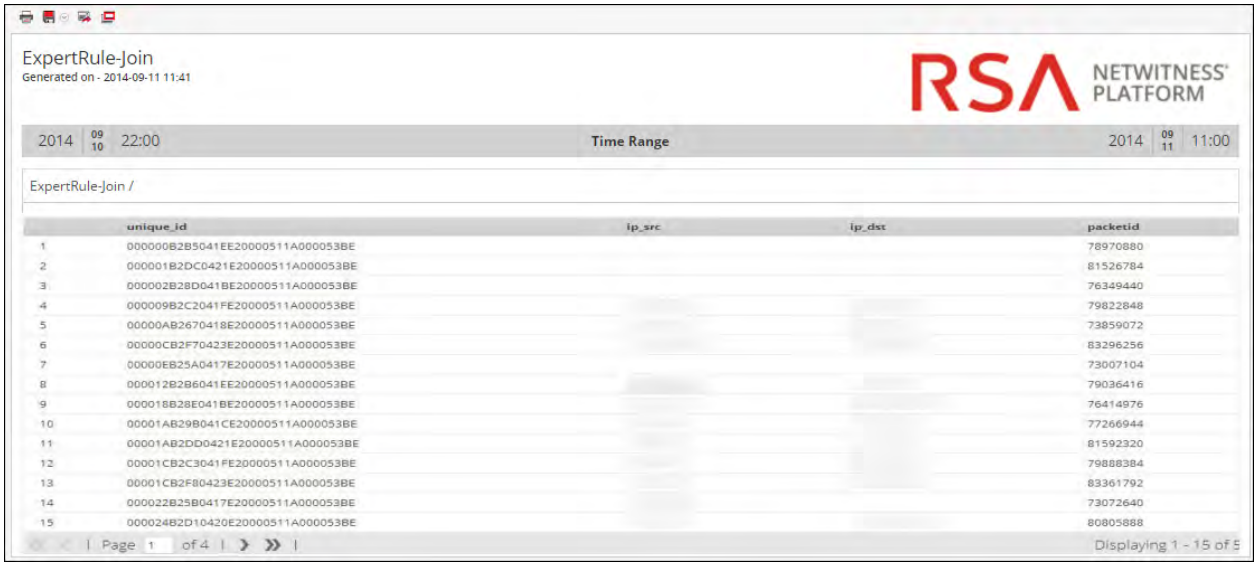
In this example rule, you can create a rule to join logs and sessions table to fetch unique_id, IP address of source and destination, and packet ID based on unique_id.

In the example provided, we execute a HIVE query to fetch certain fields from both the sessions_table and logs_table by performing a join based on the 'unique_id' field.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the **"General Syntax of an Advanced Rule"** section.



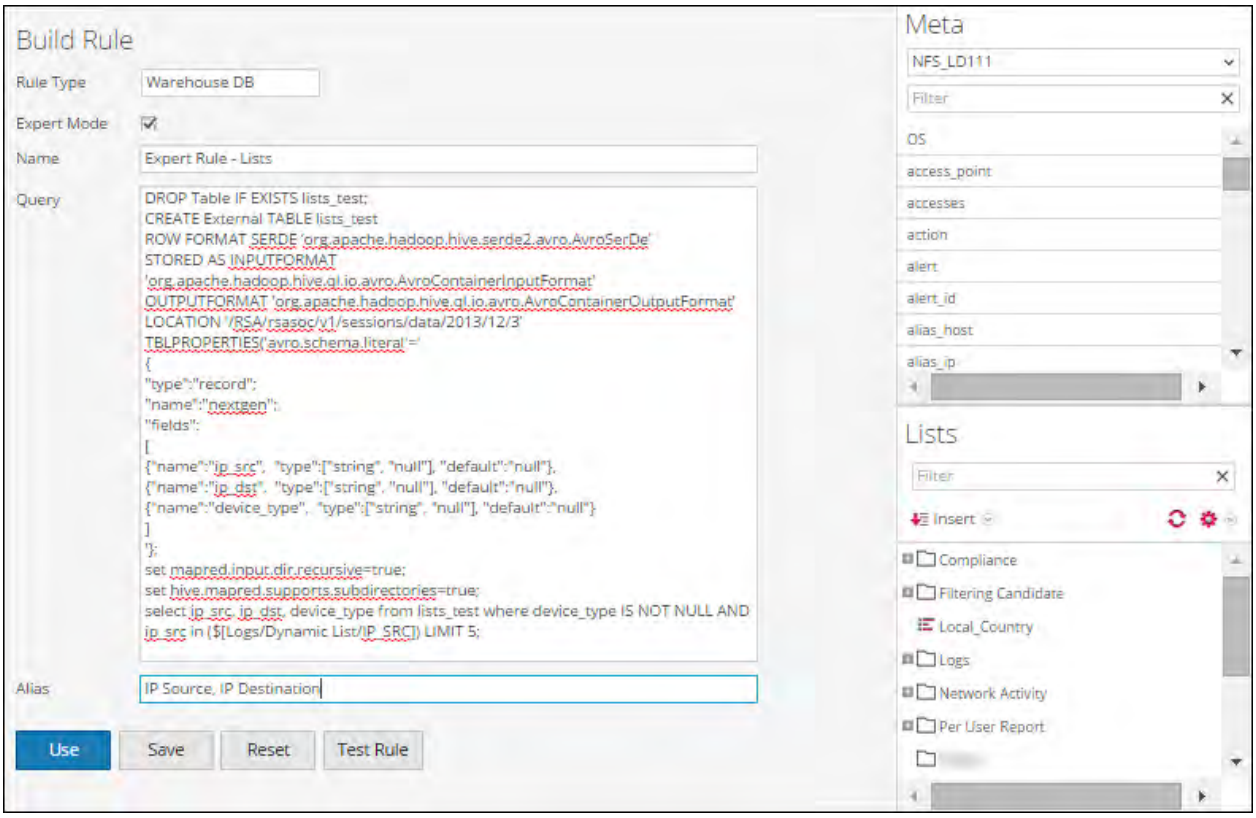
The following figure shows the result set of joining logs and sessions table based on unique_id.



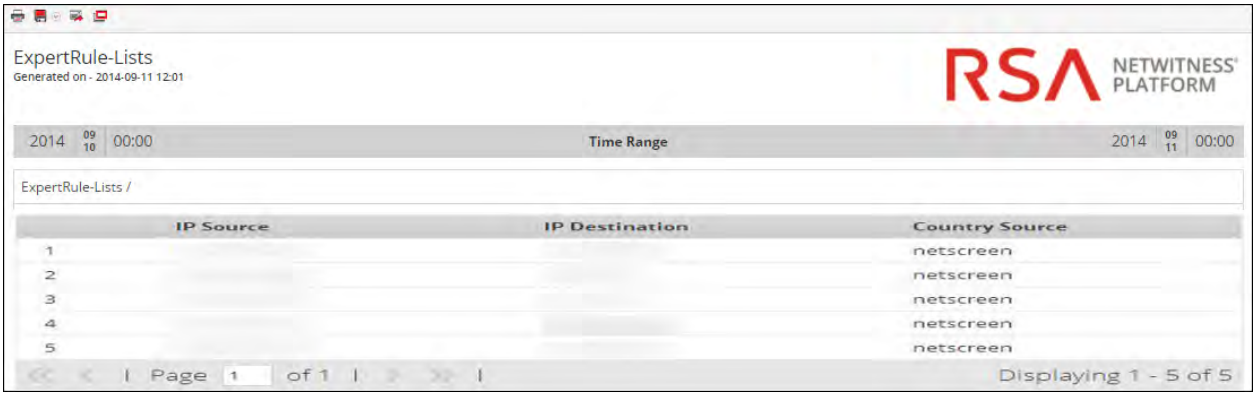
## List Report

In this example rule, you can create a List report to fetch IP address of source and destination, and device type from the **lists_test** table where device type is not null and IP address of source is fetched from the appropriate event list.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the "General Syntax of an Advanced Rule" section.



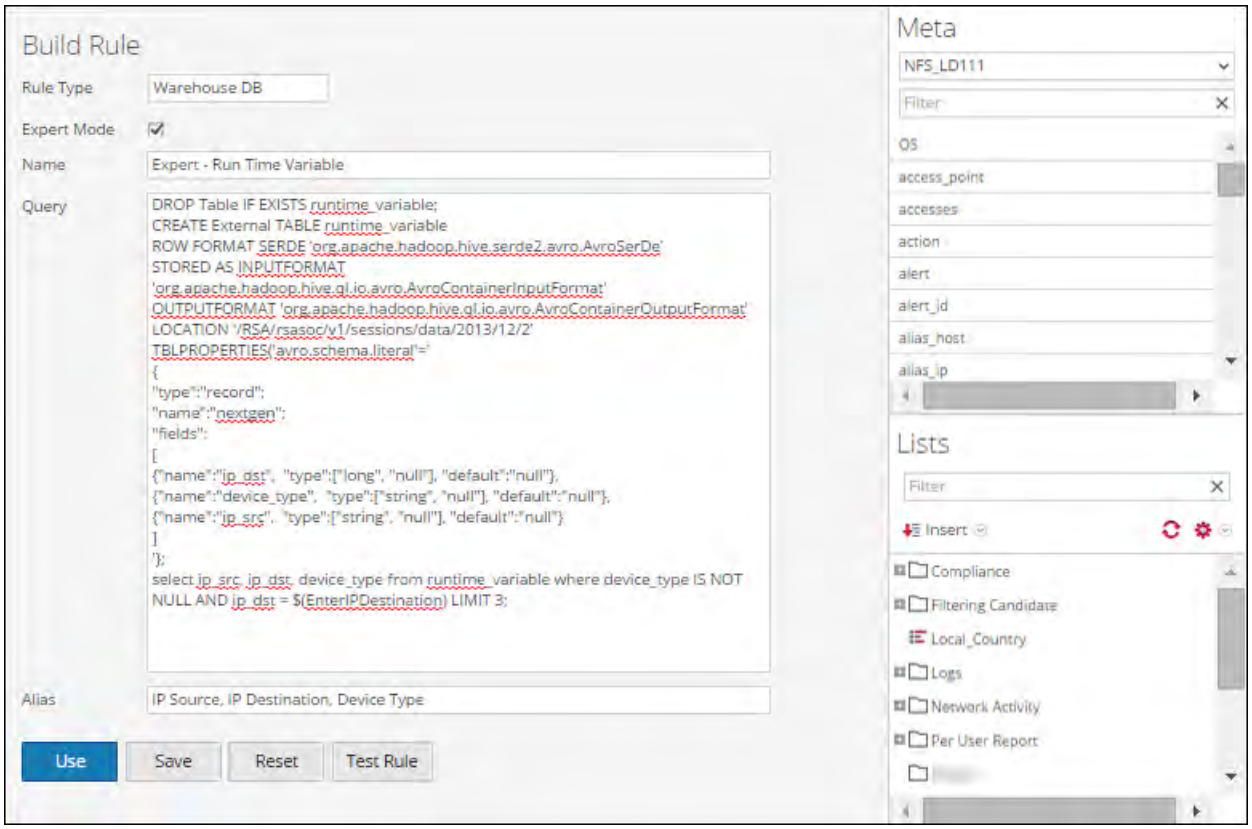
The following figure shows the result set of executing a list report.



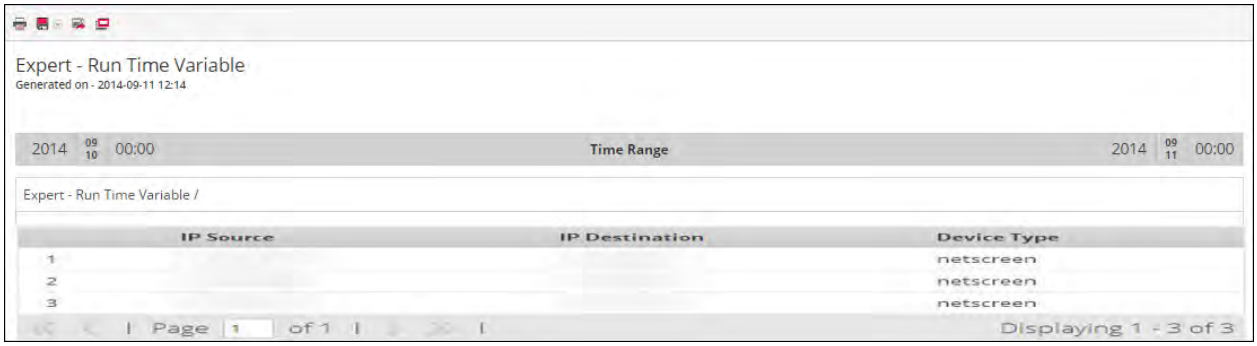
## Parameterized Report

In this example rule, you can create a rule to fetch IP addresses of source and destination, and device type from the **runtime_variable** table based on the specified run time variable `${EnterIPDestination}`. At run time, you are prompted to enter a value for the IP address of destination ip_dst. Based on the value entered, the result set is displayed.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the "General Syntax of an Advanced Rule" section.



The following figure shows the result set of executing a parameterized report.



## Partition Based Table with Multiple Locations

The following is an example of partition based table with multiple locations:

```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;
 CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
 "name": "my_record", "type": "record",
 "fields": [
 {"name":"sessionid", "type":["null", "long"], "default" : null},
 {"name":"time", "type":["null", "long"], "default" : null}
 ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/9';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/10/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/11/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/12/';
 SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >= ${report_
starttime} AND time
 <= ${report_endtime};
```

The partition based table with multiple location is as explained below:

1. Enable HIVE to recursively scan all sub-directories and read all the data from the sub-directories.
   ```
   set mapred.input.dir.recursive=true;
    set hive.mapred.supports.subdirectories=true;
   ```
2. Drop and create an external table, and then format the rows:
   ```
    DROP TABLE IF EXISTS AVRO_COUNT;
    CREATE EXTERNAL TABLE AVRO_COUNT
    PARTITIONED BY (partition_id int)
    ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
    WITH SERDEPROPERTIES (
    'avro.schema.literal'='{
    "name": "my_record", "type": "record",
    "fields": [
    {"name":"sessionid", "type":["null", "long"], "default" : null},
    {"name":"time", "type":["null", "long"], "default" : null}
    ]}'
    )
   ```

```
STORED AS
INPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
OUTPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';
```

**Note:** You must create an external table only if you are using any other table. For example, if you are using any other table apart from **AVRO_COUNT** then you must drop the table and create an external table.

**Note:** Points to remember when you create a table:
- Dropping a 'non-external' table deletes the data.
- The table is partitioned on a single column called partition_id and this is the standard column for Reporting Engine.
- The default value of any column is null as the AVRO file may not contain the specified column.
- The column names should be in the lowercase as HIVE is case insensitive but AVRO is case sensitive.
- You must specify **avro.schema.literal** in the *SERDEPROPERTIES* .

For more information on the "rule syntax", refer to *Apache HIVE*.

3. Add partitions:
   Once you define a table, you must specify the HDFS locations from where the data needs to be queried before you execute the HIVE statements.The location parameter specifies the data to be fetched depending on the specified date. The data is spread across multiple locations or directories in HDFS. For each location you need to add a partition with unique values assigned to the partition column. The locations can be any directory in the HDFS

```
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/9';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/10/';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/11/';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/12/';
```

   **Note:** HIVE reads each file in these locations as AVRO. Incase if there is a non-AVRO file available in one of these locations then the query may fail.

4. Run the query

```
SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >= ${report_
starttime} AND time
<= ${report_endtime};
```

   When a table is created, you can execute specific queries to filter the data. For example, after you create the table you can filter the data as shown in the below examples:
   **Sessions with a specific Source IP Address:**

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime} AND
time <= ${report_endtime}  AND ip_src = '127.0.0.1';
```

**Group by based on user destination:**

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime} AND
time <= ${report_endtime}  GROUP BY usr_dst;
```

## Automated Partition using Custom function

In 10.5.1, you can use the custom function to automate the addition of partitions to a user defined table in the expert mode.

## General syntax

```
RE WH CUSTOM ADDPARTITIONS(table, namespace, rollup, [starttime,
endtime])
```

The following table describes the custom function syntax:

| S.No | Name | Description |
|---|---|---|
| 1 | table | The table name for which the partition has to be added. |
| 2 | namespace | The namespace can be sessions or logs. |
| 3 | rollup | This value determines the level of directory path to be included in partitions. The value can be HOUR, DAY, or MINUTE. If Warehouse Connector is configured for Day rollup, setting this value as HOUR produces ZERO results. The number and location of each partition is based on time range used to run the rule and the rollup value. |
| 4 | (Optional) starttime, endtime | To generate partitions for a specific time range other than the time range mentioned in the rule, you must specify the starttime and endtime in **Epoch Seconds**.<br>**Note:** Expressions are not supported for the starttime and endtime. |

The custom function is invoked when Reporting Engine executes the rule either during test rule or scheduled report. While running a expert rule, whenever Reporting Engine identifies the function declaration, it extracts the required arguments and insert *n* number of ADD PARTITION HiveQL statements and executes them on the Hive Server.

The location and directory structure is determined by the argument passed in the rule and the Hive data source configuration in Reporting Engine. The number of partitions depends on the rollup specified and the time range used while executing the rule. For example, with the rollup as HOUR and the time range as PAST 2 Days results in 48 partitions for 48 Hours while with the rollup as DAY, Reporting Engine creates 2 partitions, one for each day.

The partition query is generated by the Syntax Template as set in Reporting Engine's Hive Configuration attribute AlterTableTemplate.

**Note:** By default, this function starts adding partitions to a table with partition id from 0 to N-1. Hence this requires that the table must be partitioned by single integer column named partition id.

The following is an example of automated partition using custom function:

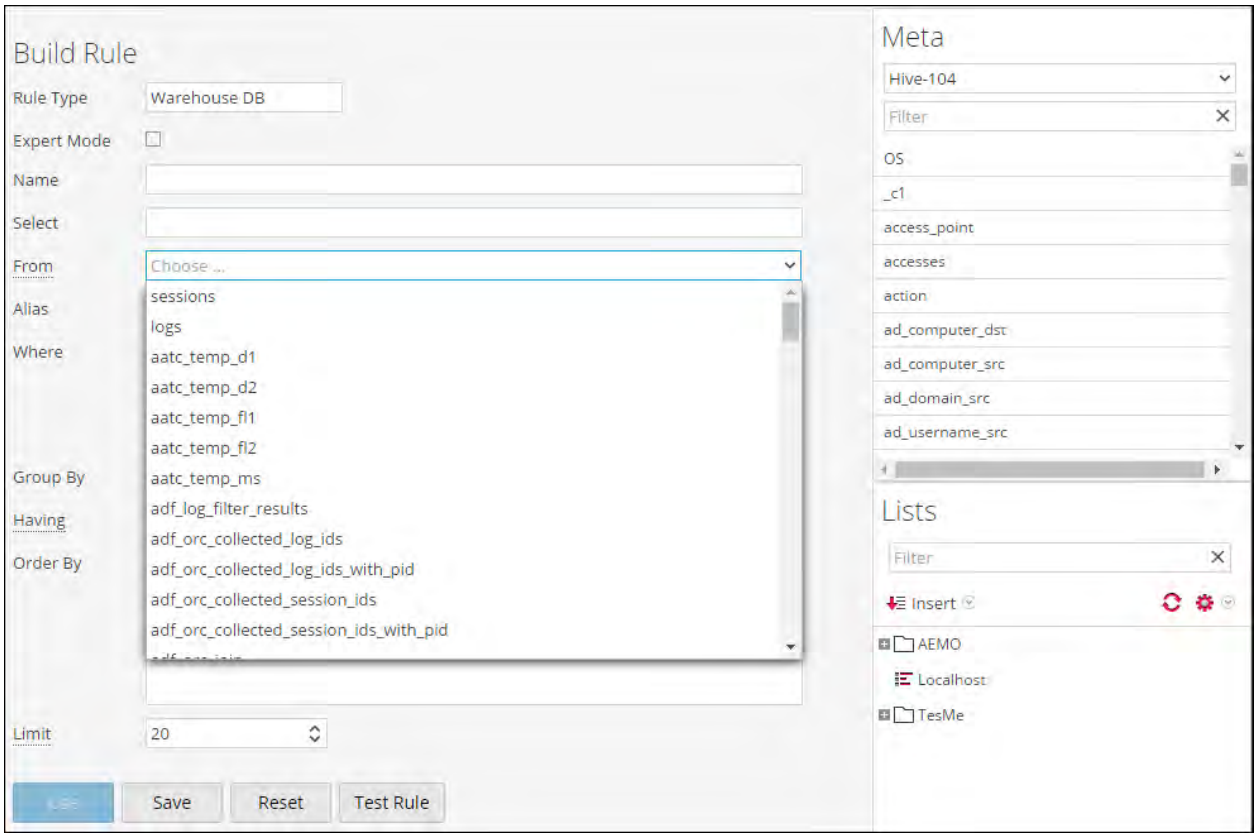
```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;

CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
  "name": "my_record", "type": "record",
  "fields": [
  {"name":"sessionid", "type":["null", "long"], "default" : null}
  ,{"name":"time", "type":[ "null" , "long"], "default" : null}
  ,{"name":"unique_id", "type":["null", "string"], "default" : null}
  ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';

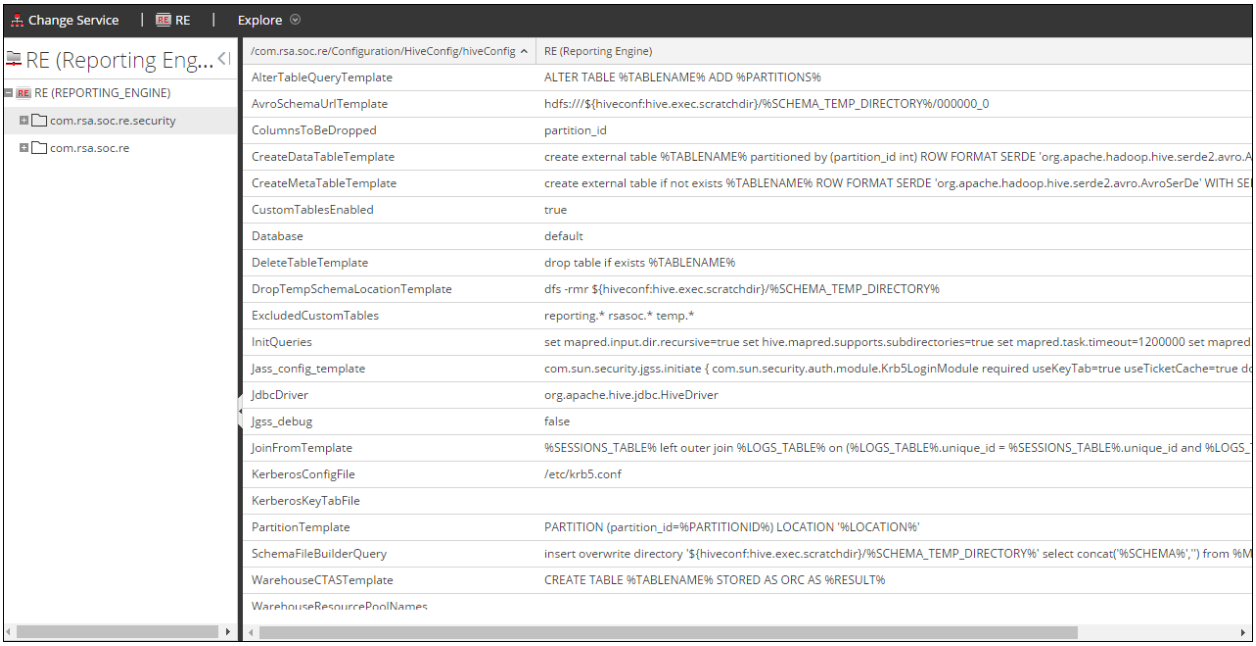
RE_WH_CUSTOM_ADDPARTITIONS(AVRO_COUNT, 'sessions', 'DAY');
 SELECT COUNT(*) as TotalSessions FROM AVRO_COUNT
 WHERE time >= ${report_starttime} AND time <= ${report_endtime};
```

## Creating Custom Tables Report

In 10.6.1, you can use and create Custom Tables on the Hive Server. Reporting Engine supports running queries on user defined tables and the ability to create a new table from a Single Rule output. When this feature is enabled in the Warehouse Rule Builder UI, user can see a list of custom tables available in Hive Server.



To enable this feature set **customTablesEnabled** to **TRUE** by navigating to **Reporting Engine** -> **Explore** ->**Hive Config**.



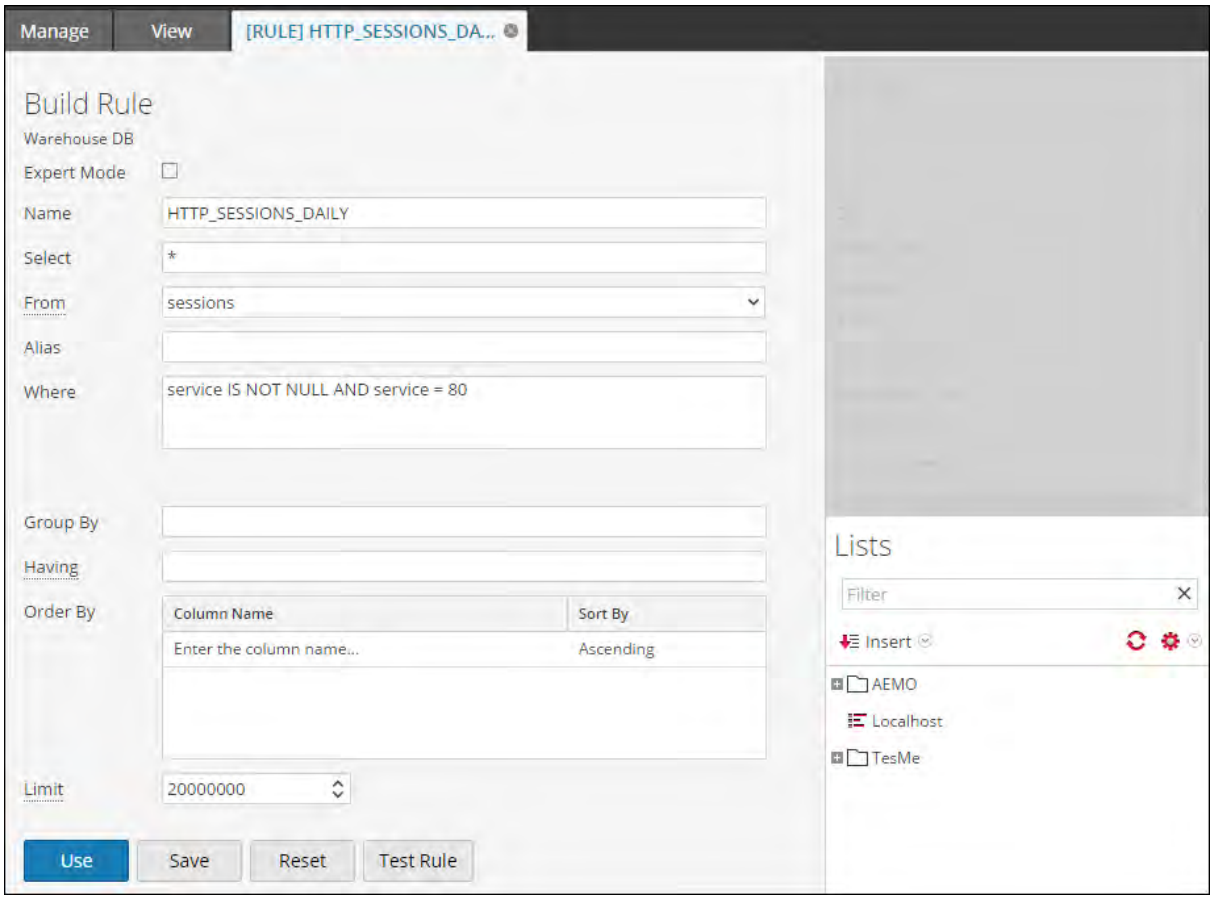
## Creating Custom Table from Regular Rules

To schedule a report which contains a single SAW rule, a new text input with a **Warehouse CTAS Name** is added. The user can now specify a Custom Table name that will be created out of the output of the rule in Report.

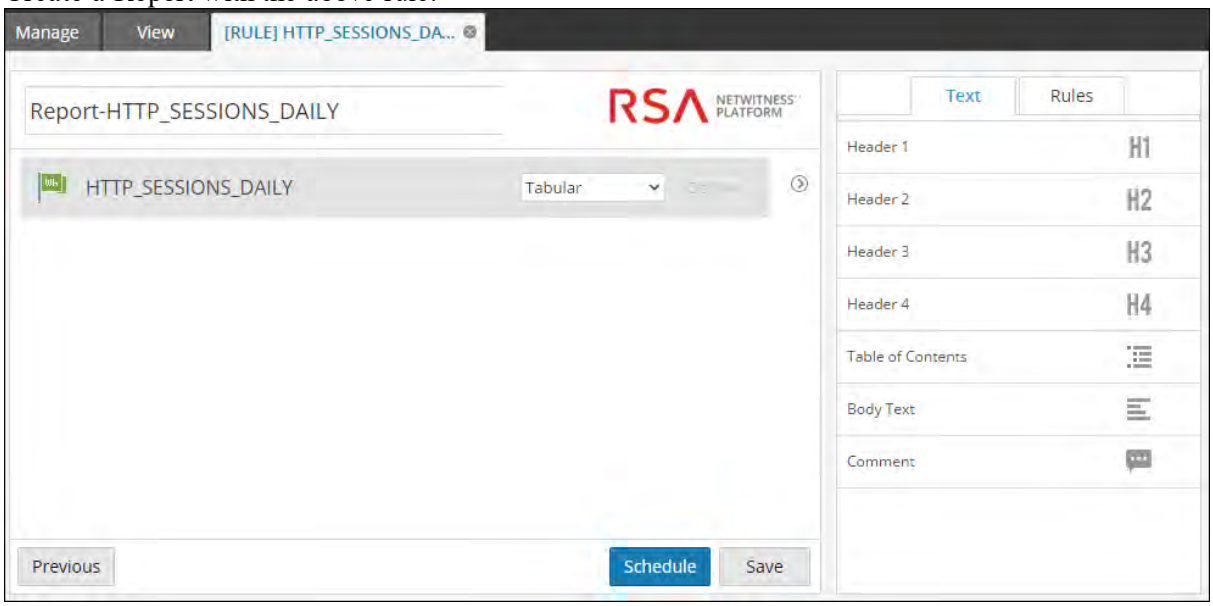
**Note:** This feature is available only if the Report contains a single SAW rule on the Schedule page. Otherwise, this option is hidden.

The process to use the feature is explained below:

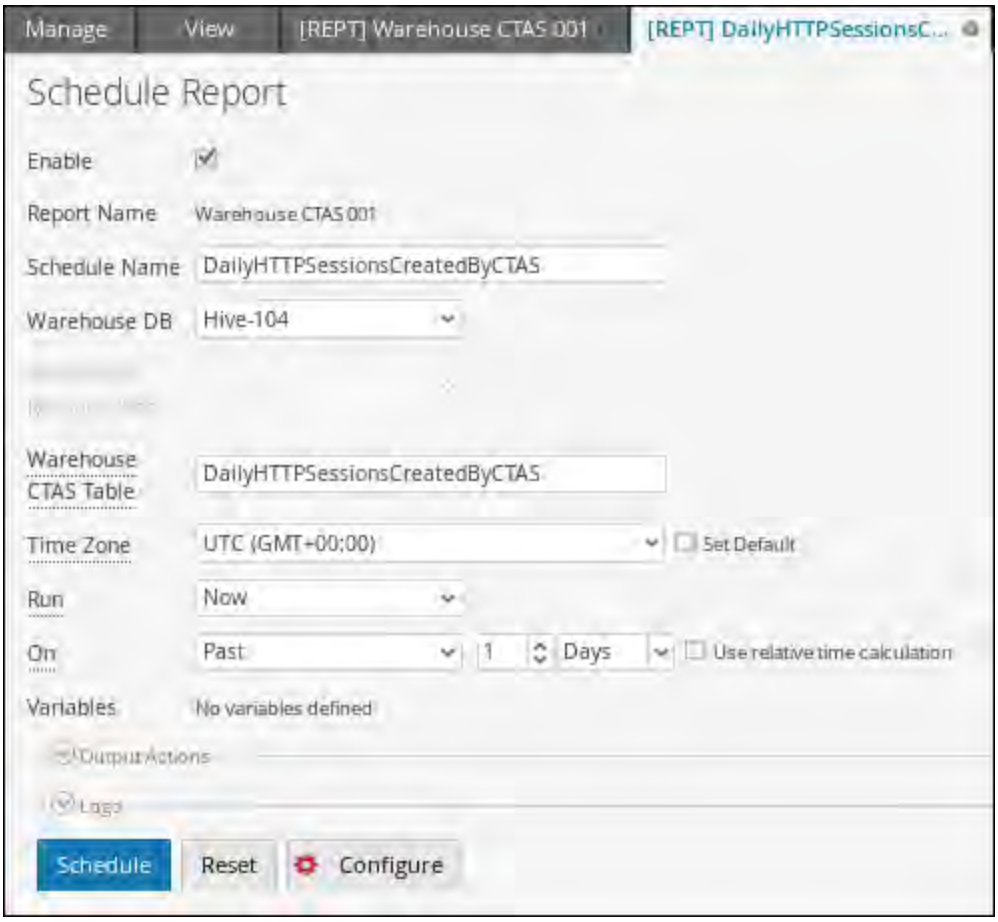
1. Create a rule to filter with data in SAW.



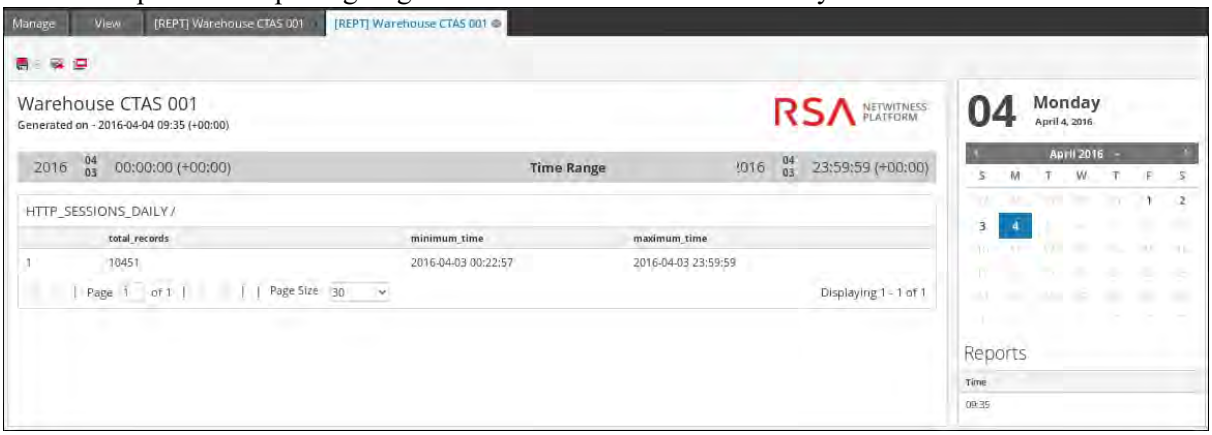
2. Create a Report with the above rule.



3. Create a Schedule and enter the CTAS Table Name.



4. Run the Report and Reporting Engine will create the Result Summary as below for the Schedule.



5. On the next schema refresh or restart of Reporting Engine, the CTAS Table is listed.

# Task Scheduler for Warehouse Reporting

A task scheduler in a Hadoop cluster schedules the jobs consisting of tasks, and allocates specific resources to each job running in a cluster. By default, the task scheduler allocates equal number of resources to all the jobs. For example, if 10 jobs are running they will share resources of the cluster equally. However, you can configure the task scheduler to control the execution of the jobs such that one job runs faster than others by allocating more resources (pools or queues) to the job. This helps you prioritize to run a few reports over others.

## Features

NetWitness supports two task schedulers:

- Fair Scheduler (`org.apache.hadoop.mapred.FairScheduler`)
- Capacity Scheduler (`org.apache.hadoop.mapred.CapacityTaskScheduler`)

## Fair Scheduler

This scheduler divides the total capacity of the cluster into logical pools. You can submit a job to any one of these pools. All the jobs submitted to a pool share the resources allocated to the pool only. Once a pool has free resources, the freed resources are given to other pools with jobs running. For example, a fair scheduler has 100% resources with two pools namely Pool A and Pool B which share the total resources at 40% and 60% respectively. If Pool A has four jobs running, it allocates 10% resources to each job. When the four jobs are completed, the freed resources are allocated to Pool B.

**Note:** You can configure a pool to run more than one job in parallel.

## Capacity Scheduler

This scheduler divides the total capacity of the cluster into queues. Each queue is allocated a pre-configured share of the total capacity. A job may be submitted to any of these queues. If more than one job is submitted to the same queue, the jobs will be executed sequentially. For example, if a capacity scheduler has 100% resources with three queues namely the Default, Low and High and they share the total resources at 20%, 30% and 50% respectively. If Default has two jobs D1 and D2, Low has three jobs L1, L2 and L3, and High has four jobs H1, H2, H3 and H4, these jobs are executed in their respective queues sequentially. If the jobs in a queue are completed, the freed resources will not be distributed to other queues.

# Query Aggregates

This section explains the supported aggregate functions.

## Supported Aggregate Functions

The following table lists the supported Aggregate Functions.

| Aggregate Function | Description | Input data types | Output data types |
|---|---|---|---|
| count | Returns the count of meta values, which includes duplicate values as well. | Numeric | Numeric |
| countdistinct | Returns the total number of distinct or unique values. | Numeric | Numeric |
| distinct | Returns all the unique values. | Any | Any |
| first | Returns the first occurrence of the meta value. | Any | Same as input |
| last | Returns the last occurrence of the meta value. | Any | Same as input |
| sum | Returns a sum of all non-NULL values of metaKey in a group. | Numeric | Numeric |
| avg (Average) | Returns the average value of all non-NULL values of the metaKey within a group. | Numeric | Numeric |
| min (Minimum) | Returns the minimum for all values of metaKey in each group. This value is based on order by field. | Any | Any |
| max (Maximum) | Returns the maximum for all values of metaKey in each group. The maximum value is the value that is returned by order by field. | Any | Any |
| length | Returns the length of the values of metakey. This is called a "scalar function" in SQL. | Any | Numeric |

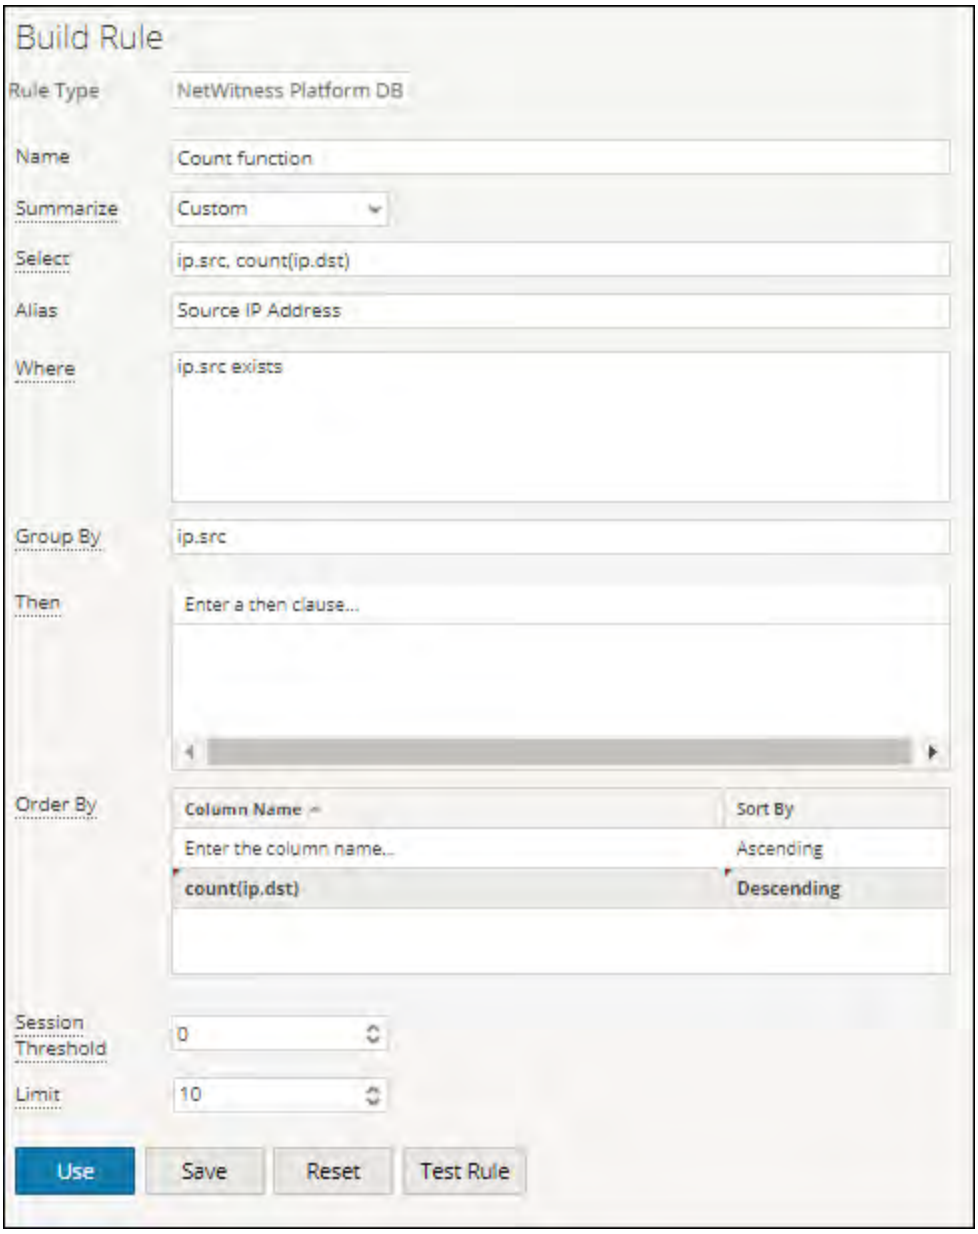
## Examples of Queries and Results per Function

### Count

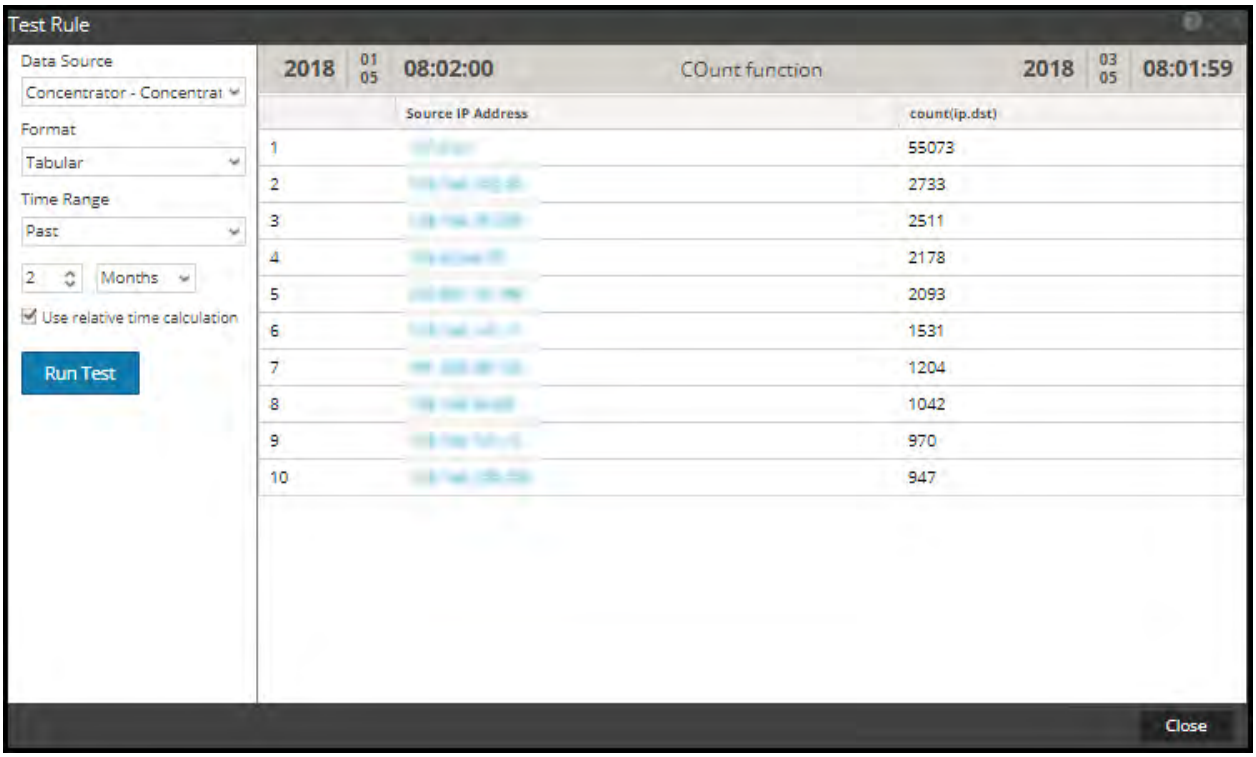
This function returns the number of values for a specified meta key, that exclude null values but include duplicate ones. .

**Example**

The following figure shows a sample query for count function used for the destination IP and the respective source IP.



The following figure shows the result for the above query.



Here, for each unique ip.src (source IP), the page returns the total number or count of ip.dst (destination IP) values, which include the duplicate values as well.

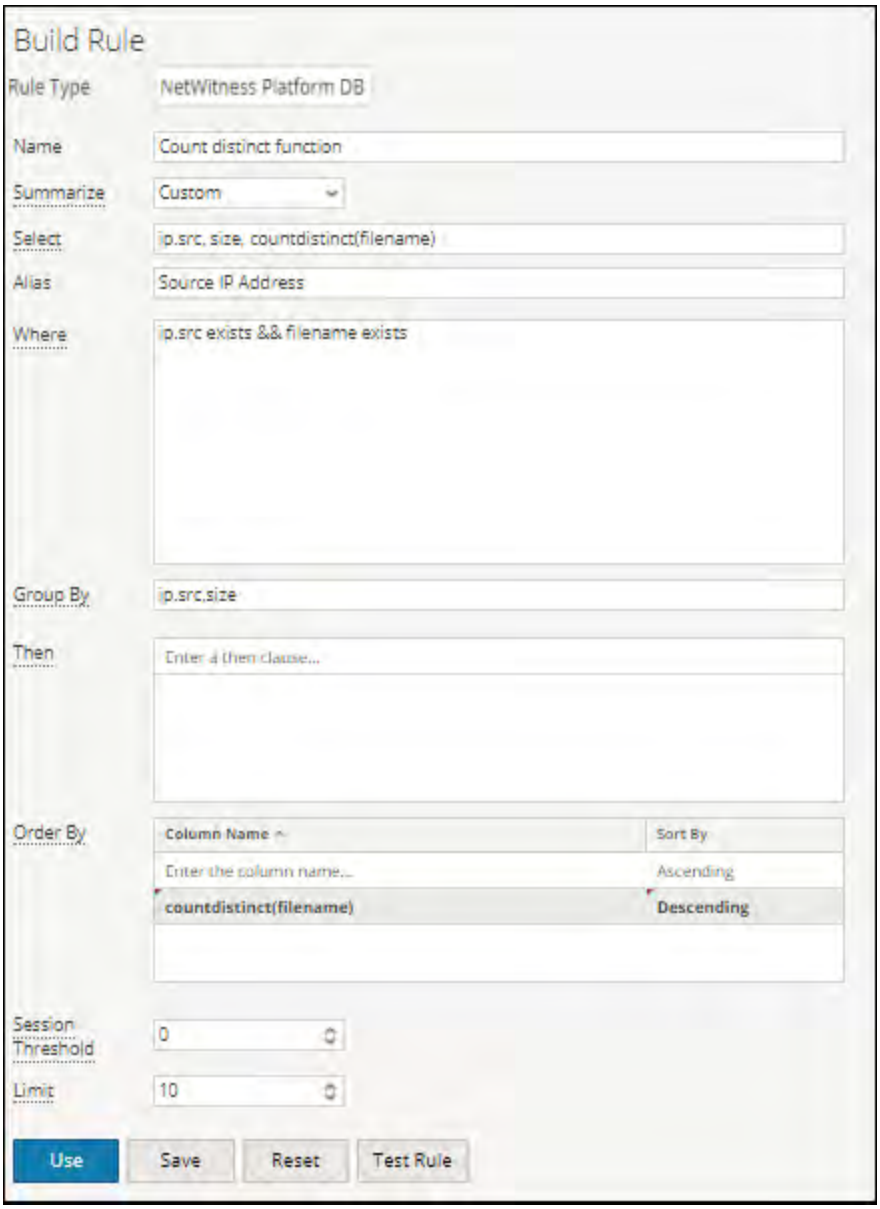
**Note:** If your RSA NetWitness is currently on 10.5 or newer version and any of the NetWitness Core devices are on 10.3 or 10.4 versions, then some of the aggregate functions may display unexpected errors. However, aggregate functions such as sum() and count() are supported in 10.4 version.

## Countdistinct

The countdistinct function returns the count of unique or distinct values for the metakey. In other words, countdistinct function can be used to retrieve a number of distinct values for the specified metakey.

The following figure shows a sample query where the countdistinct function is used along with IP source (ip.src) and data size(size).

**Example**



Build Rule
Rule Type
NetWitness Platform DB

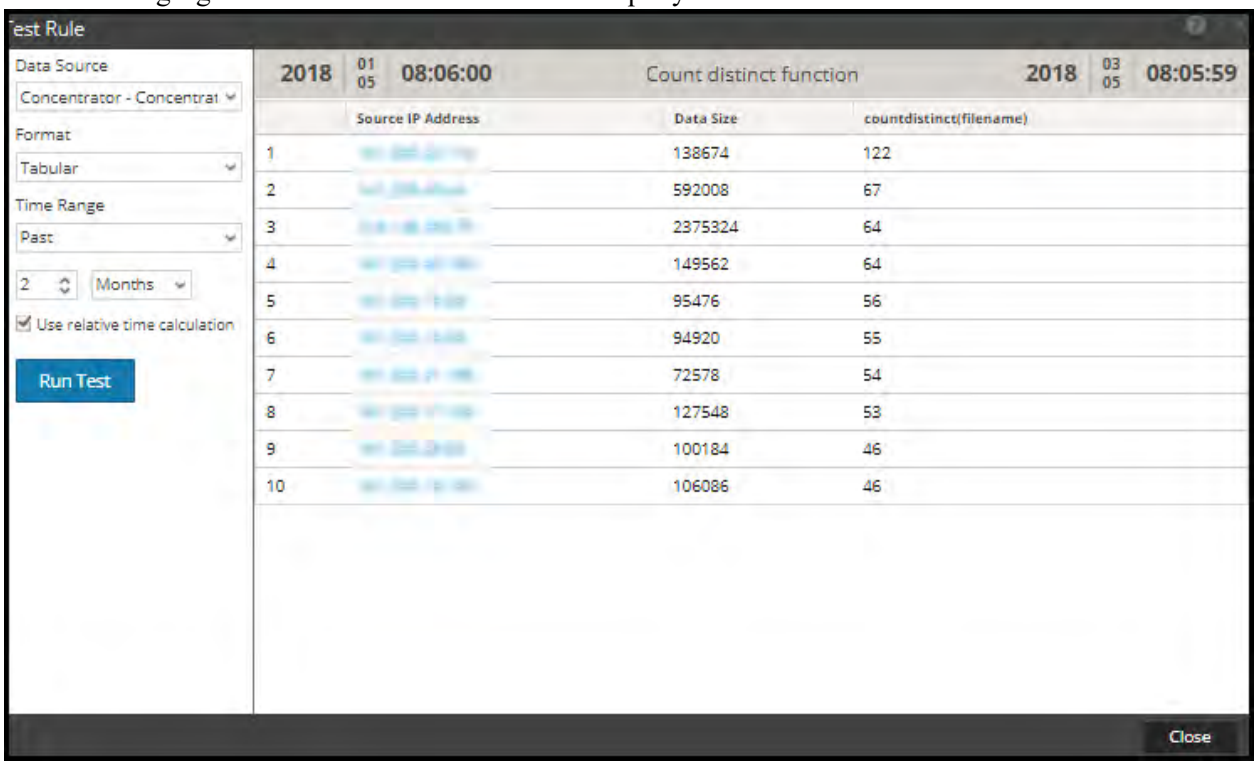
Test Rule

The following figure shows the result for the above query.



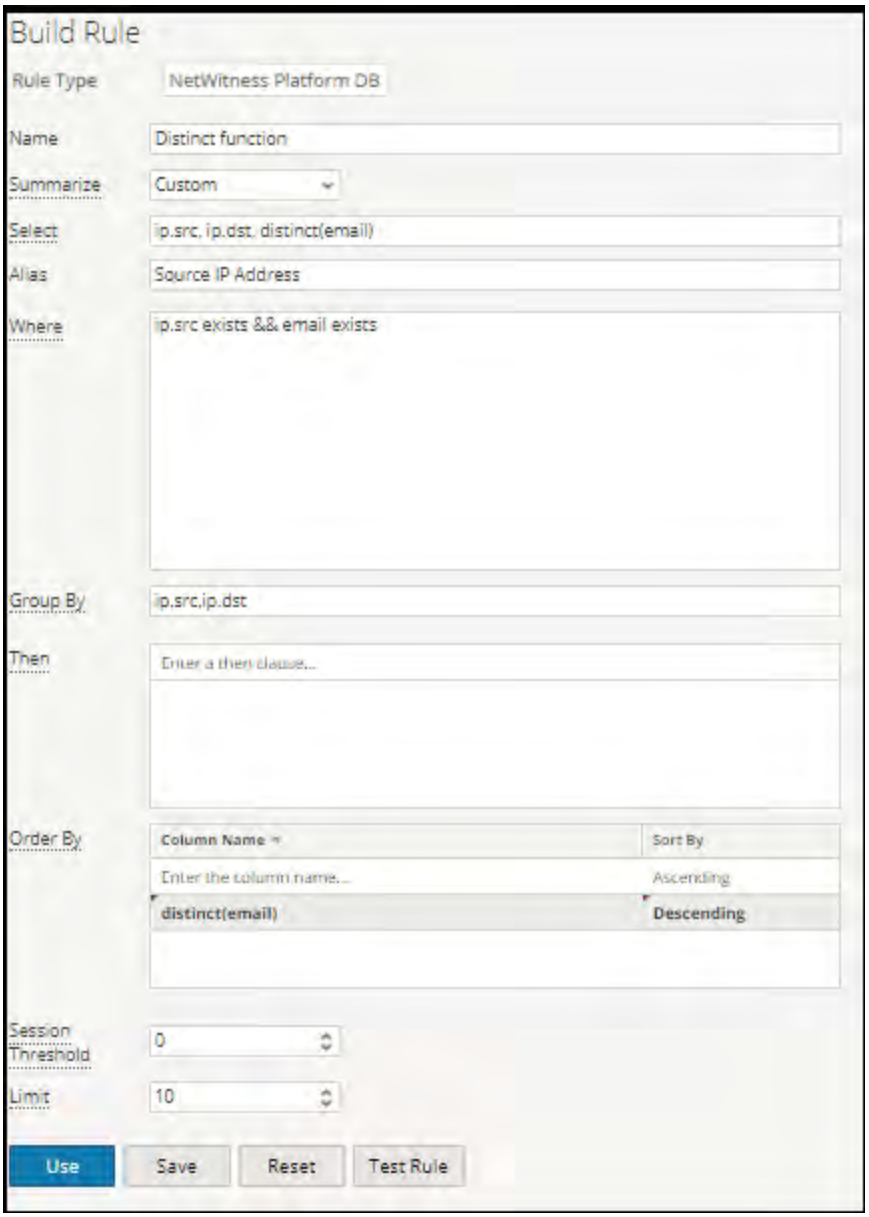
Here, the page displays the data size along with the total number or count of distinct filenames from the respective IP source. Unlike the count function, the countdistinct excludes the duplicate values from the result.

## Distinct

This function returns all the unique or distinct values of the metakey.

**Example**

The following figure shows a sample query for distinct function used to retrieve e-mails, between various source and destination IP (ip.dst).



The following figure shows the result for the above query.

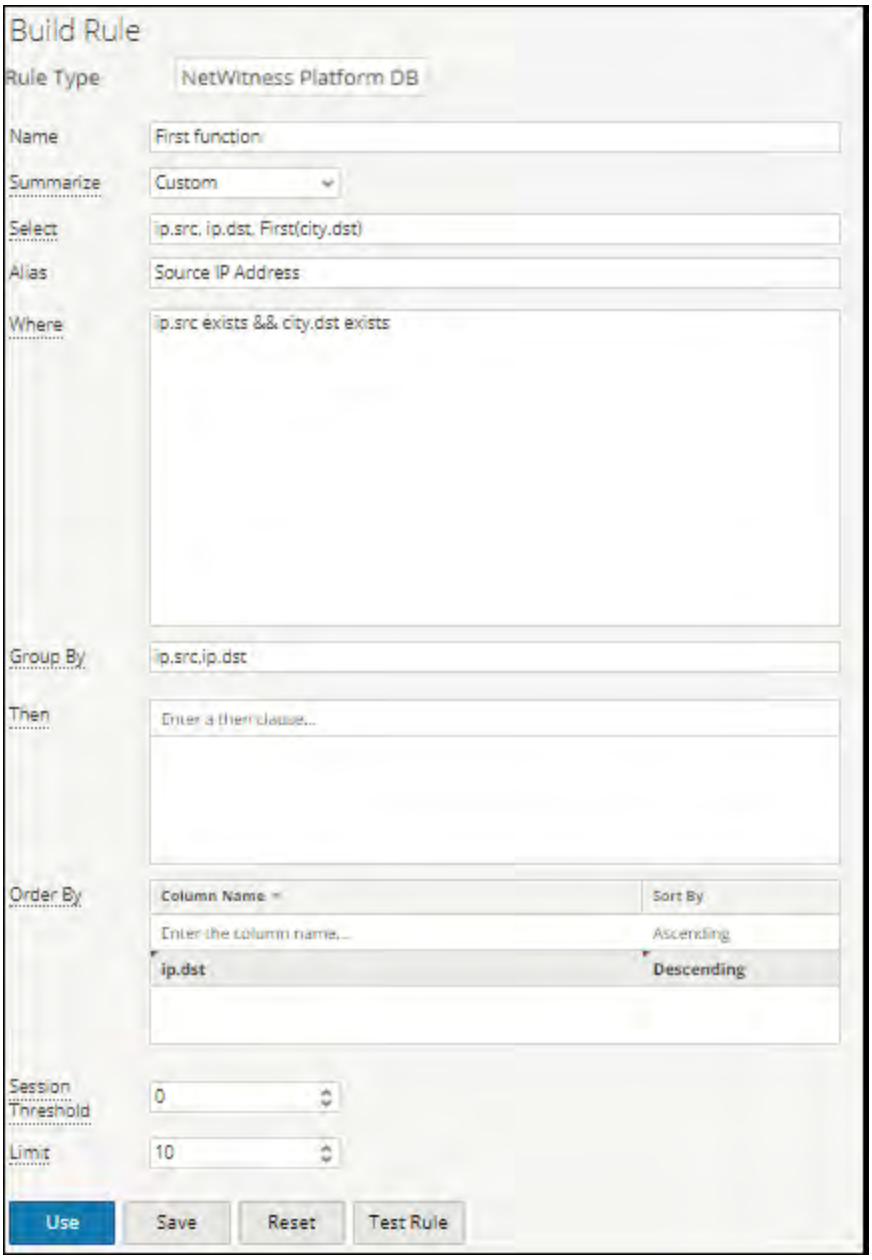
Here, the page displays the list of unique e-mails that were exchanged between the respective IP source and destination.

## First

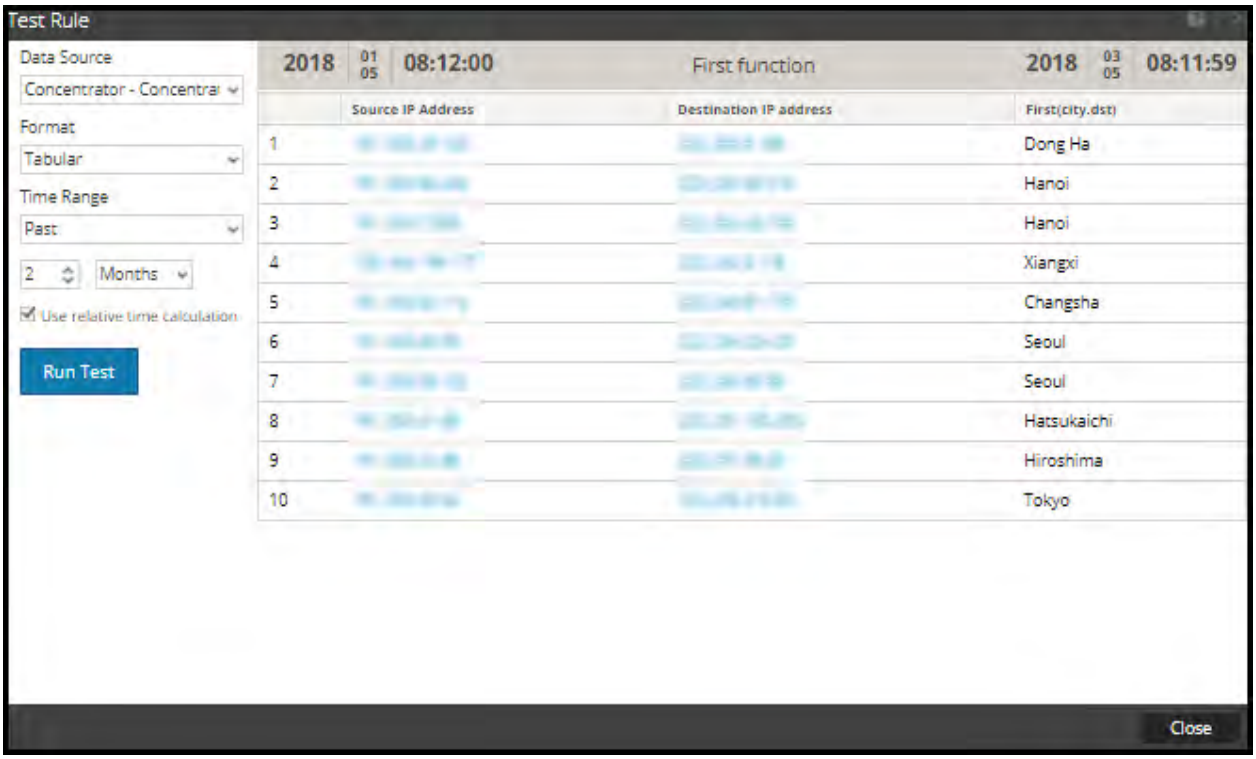
This function is used to retrieve the first value from an ordered sequence of values for a specified metakey.

**Example**

The following figure shows a sample query for first function used to retrieve the first destination city name.



The following figure shows the result for the above query.



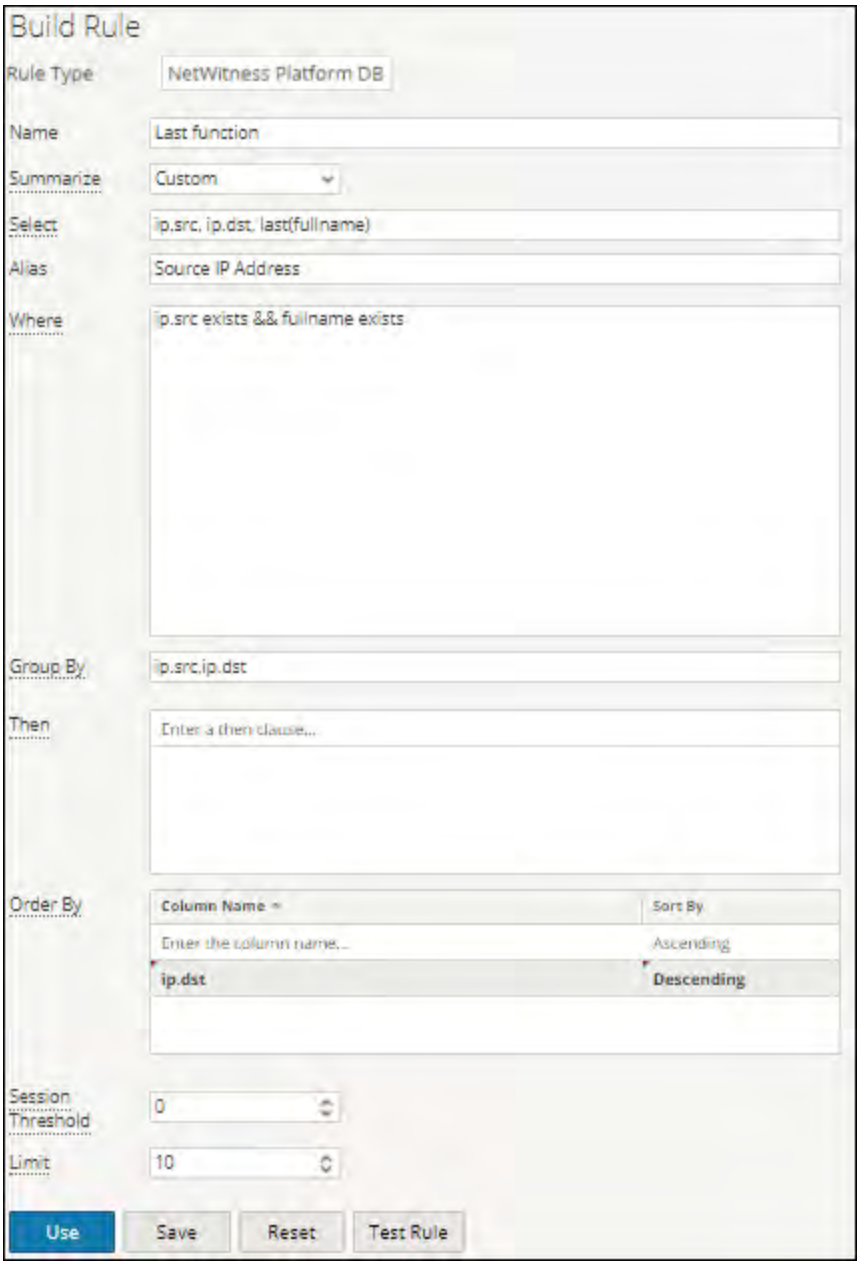
Here, the page displays the the first destination city for the corresponding source and destination IP. You can use the first function to isolate a particular value from a search result.

## Last

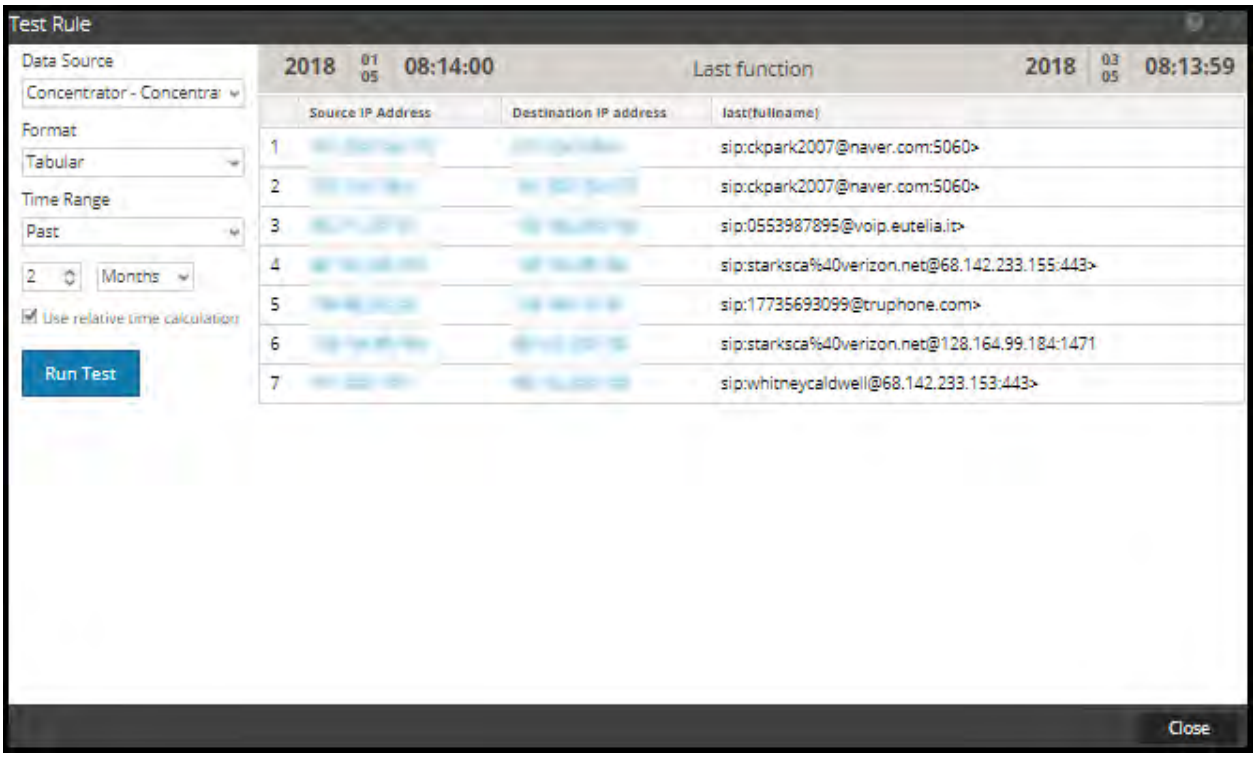
This function is used to retrieve the last value from an ordered sequence of values for a specified metakey.

**Example**

The following figure shows a sample query for last function used to retrieve the most recent user name.



The following figure shows the result for the above query.



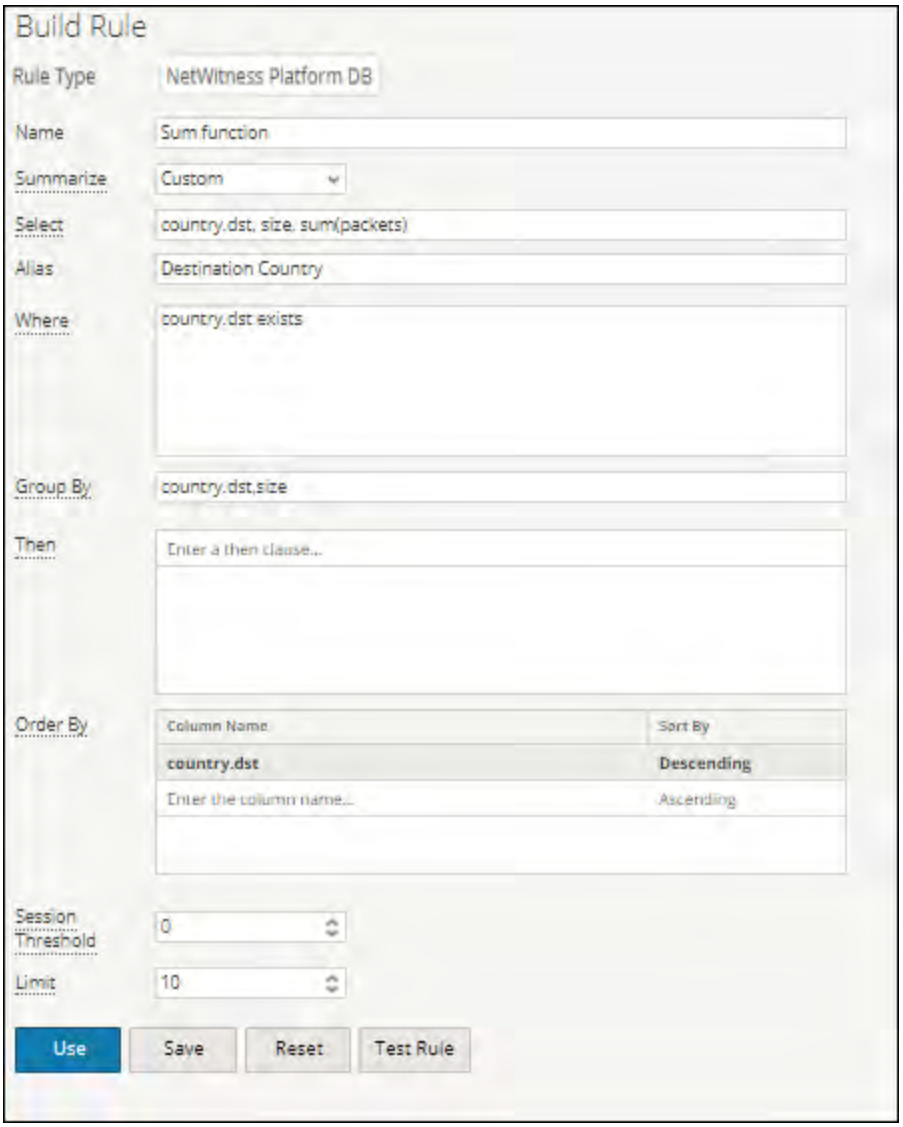
Here, the page displays the list of most recent or last usernames in full, that were exchanged between the source and destination IP.

## Sum

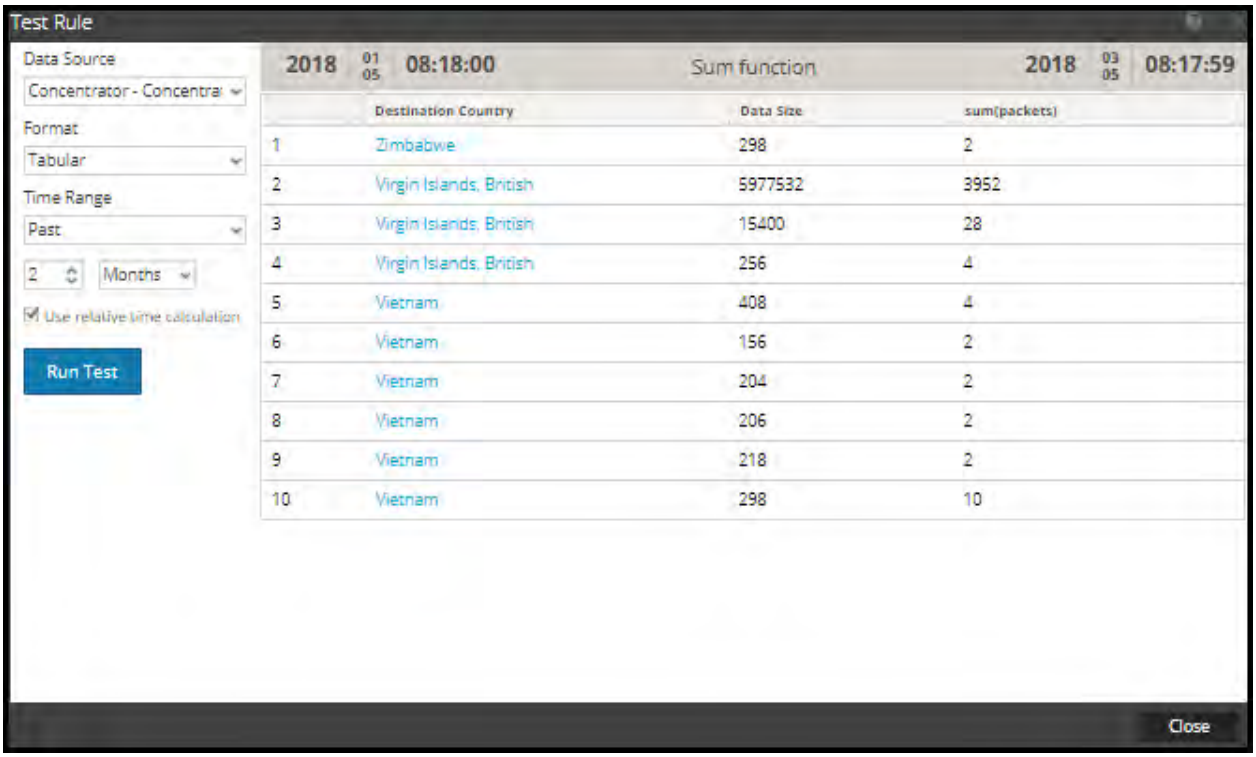
This function returns the total of the non-NULL values of the metaKey within a group.

**Example**

The following figure shows the query for the Sum function used for packets.



The following figure shows the result of the above query.



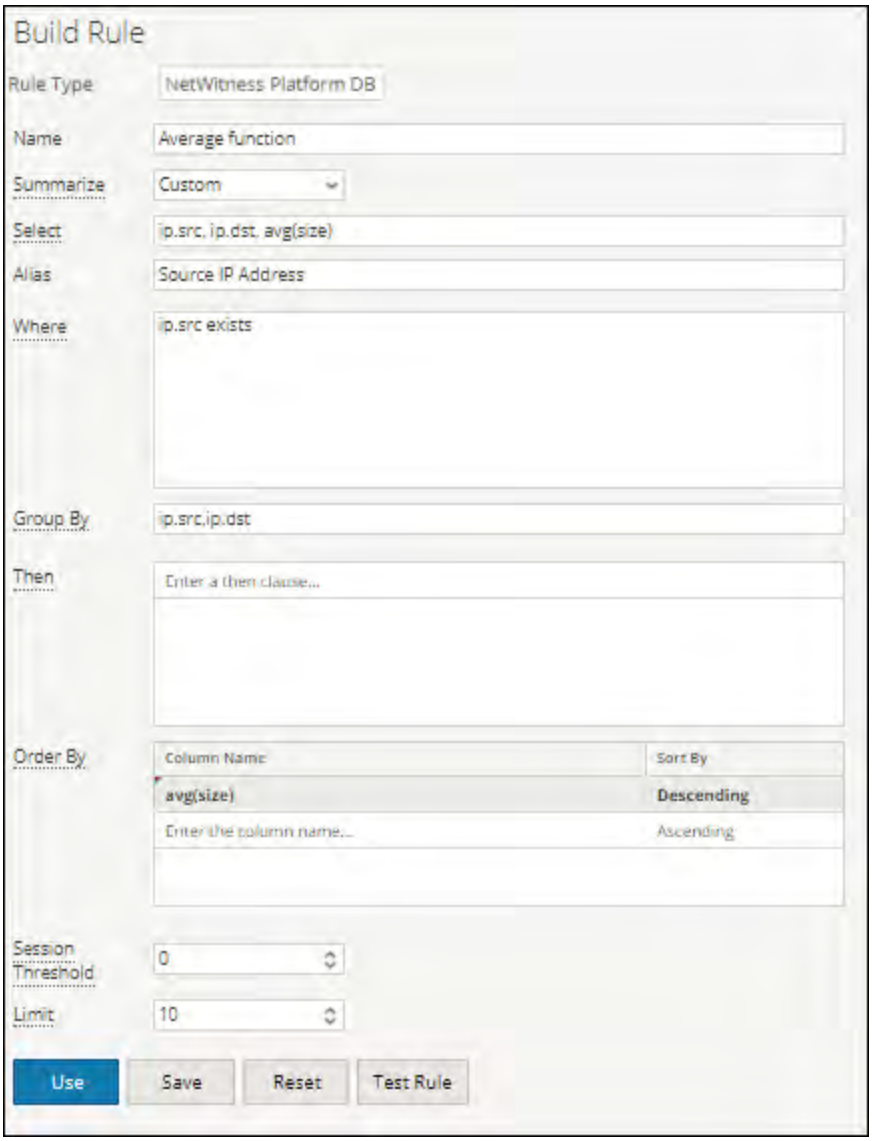
Here the page displays the total or sum of the packets along with the size of the data for the respective destination country.

## Avg

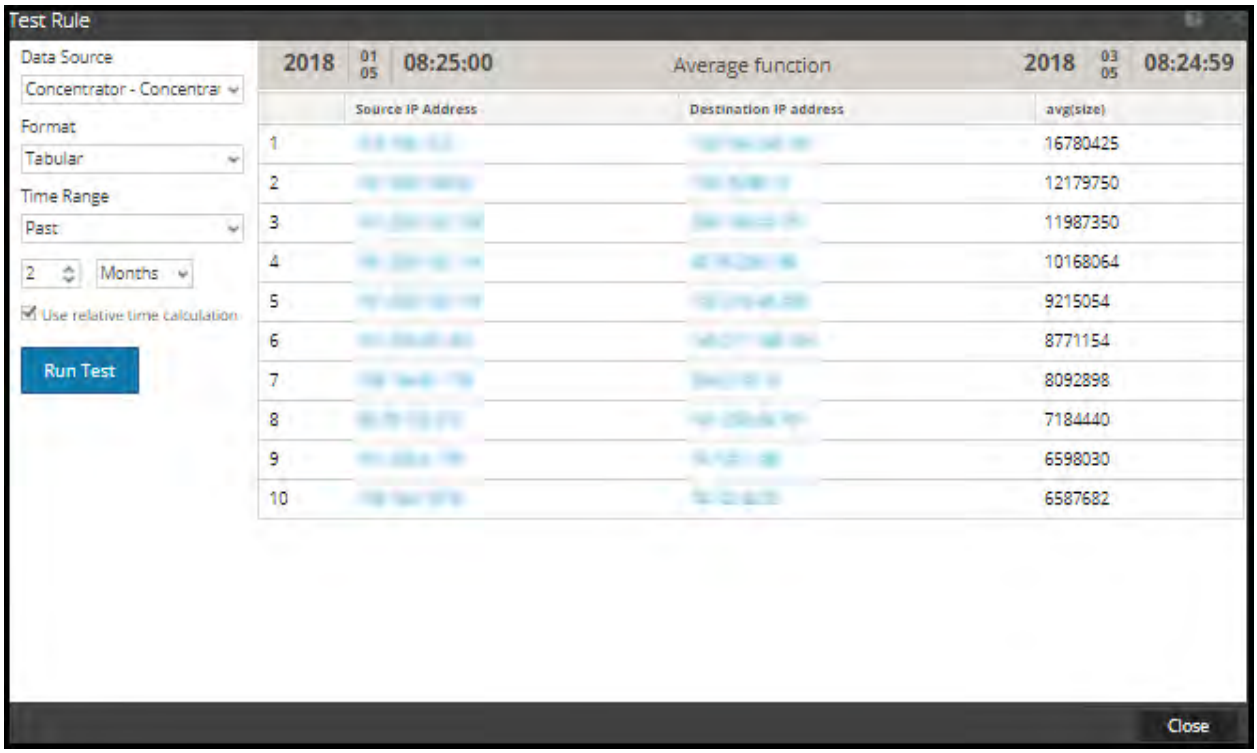
The average function returns the average of non-NULL values of the meta within a group.

**Example**

The following figure shows a sample query for average data size transmitted between a source and destination IP.



The following figure shows the result for the above query.



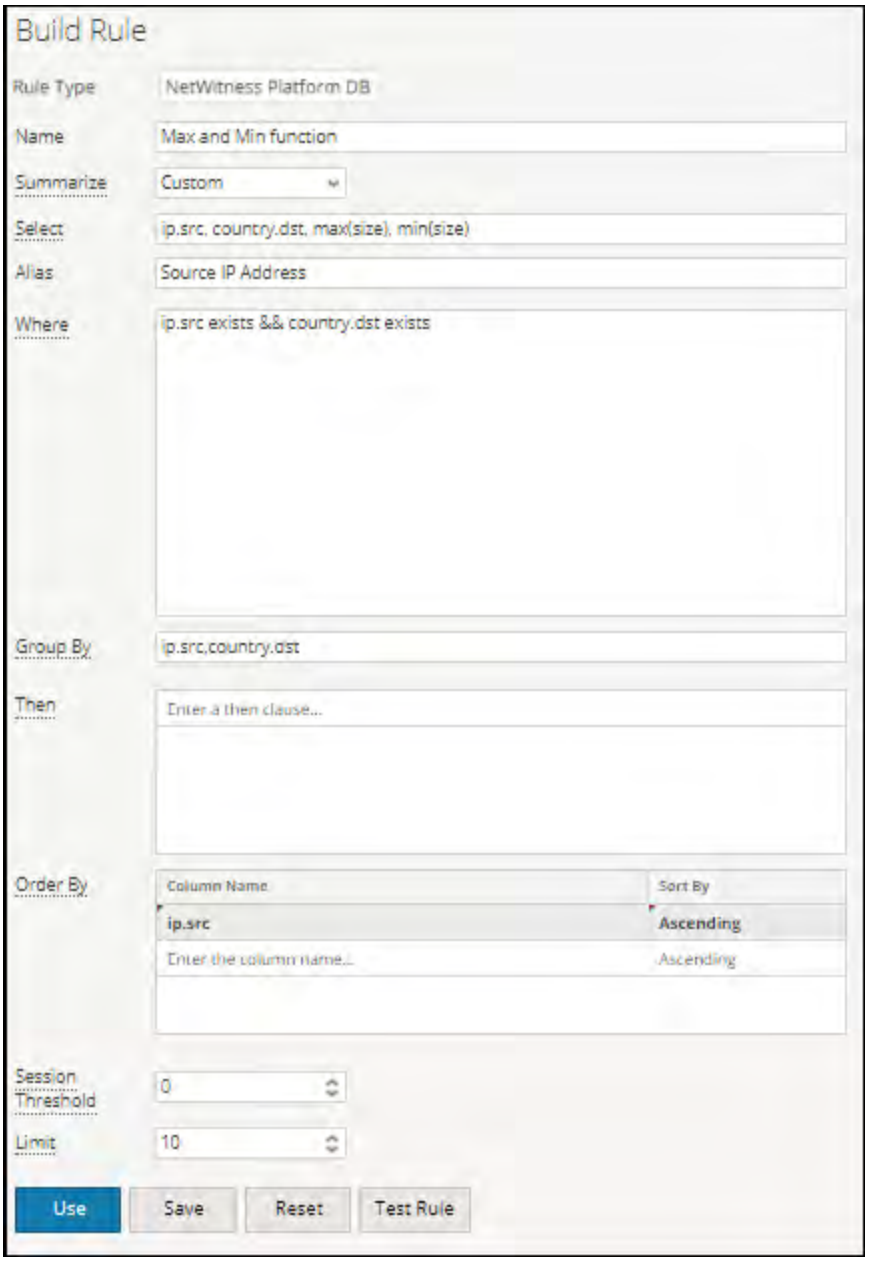
Here, the page displays the average size of data exchanged between source and destination IP:

## Max and Min

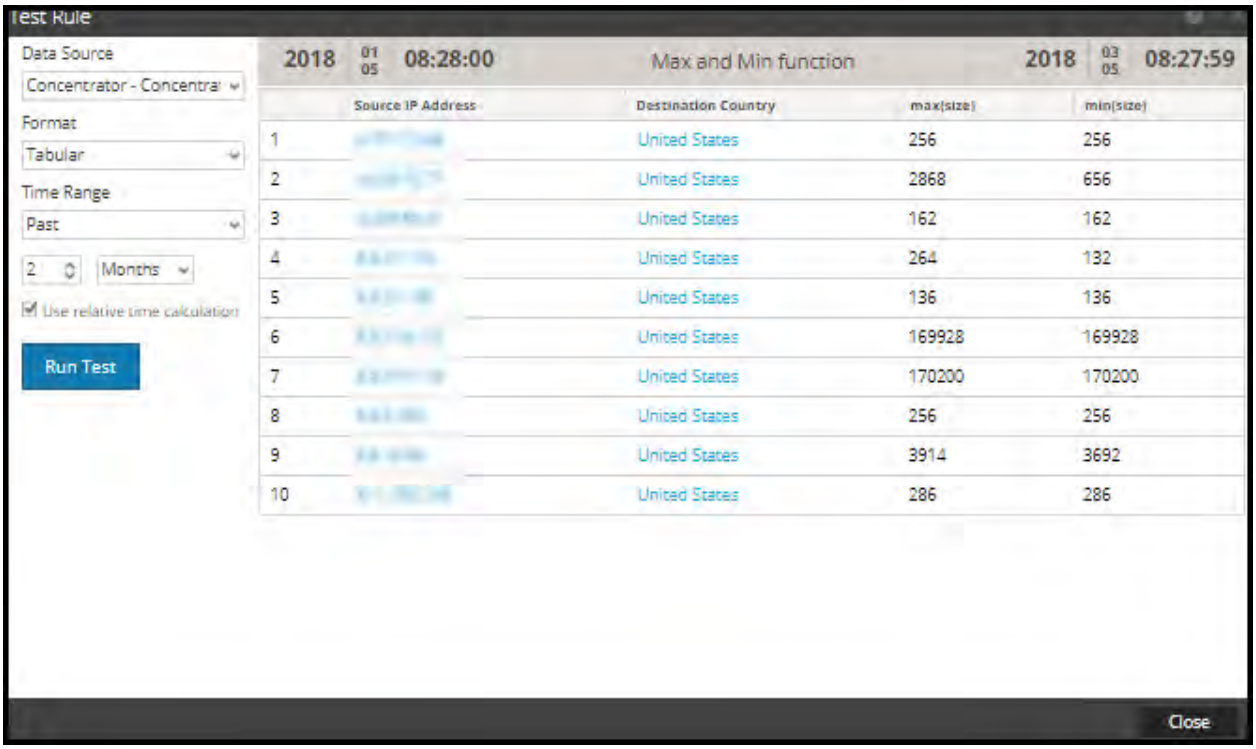
Max and Min functions provide the maximum and minimum for given values of a meta respectively.

The following figure shows a sample query for max and min functions for various data sizes, for source IP and destination country.

**Example**



The following figure shows the result for the above query.



Here, the page displays the max(size) and min(size) columns, along with the list of source IP and destination country. The max(size) column lists the maximum data sizes exchanged while the min(size) column lists the minimum data sizes that were exchanged.

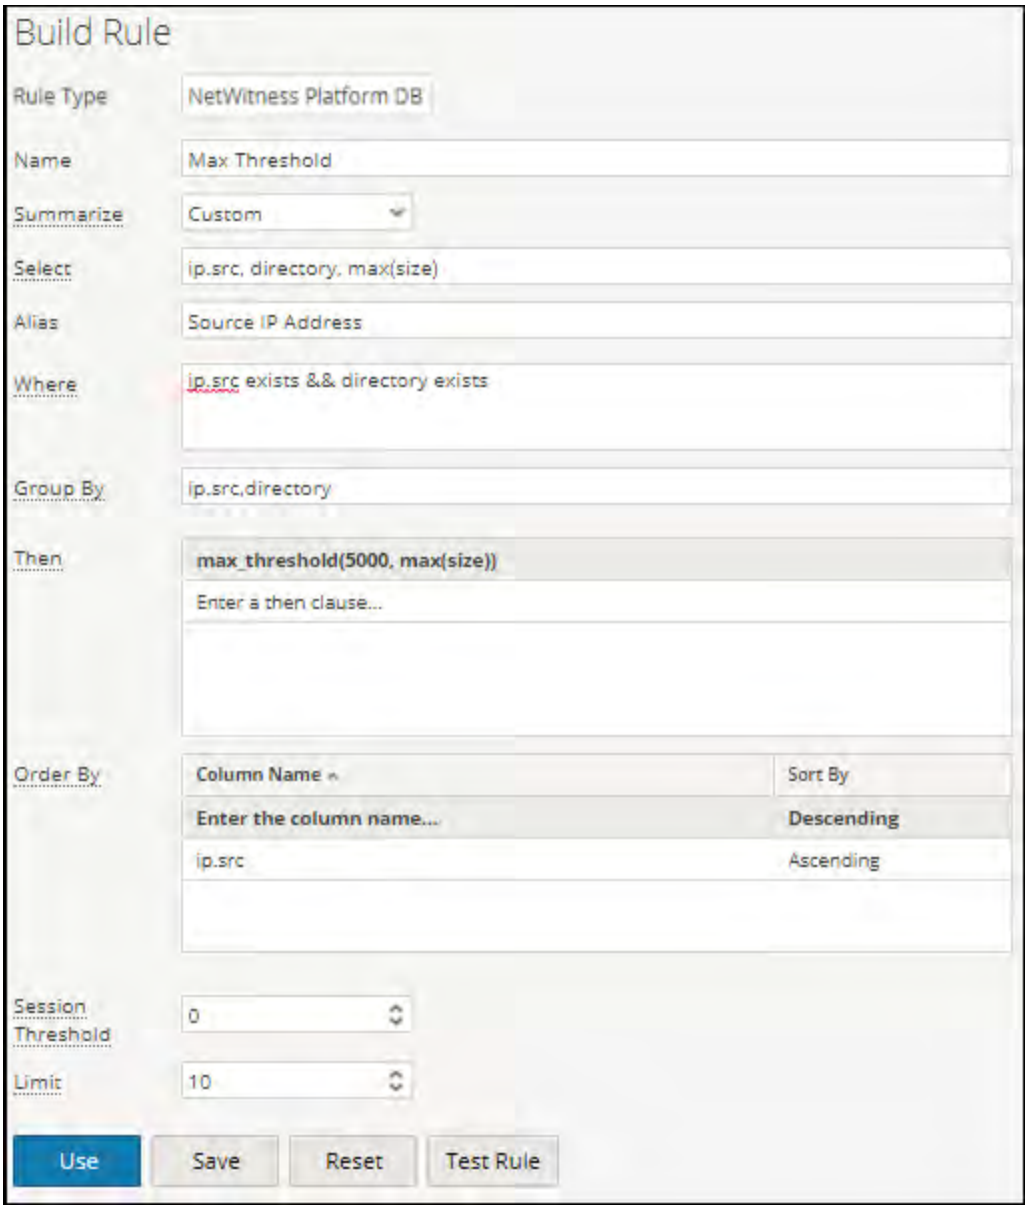
## Filter aggregate meta results with Max_threshold

You can further filter the results of any function by using the threshold rule action.

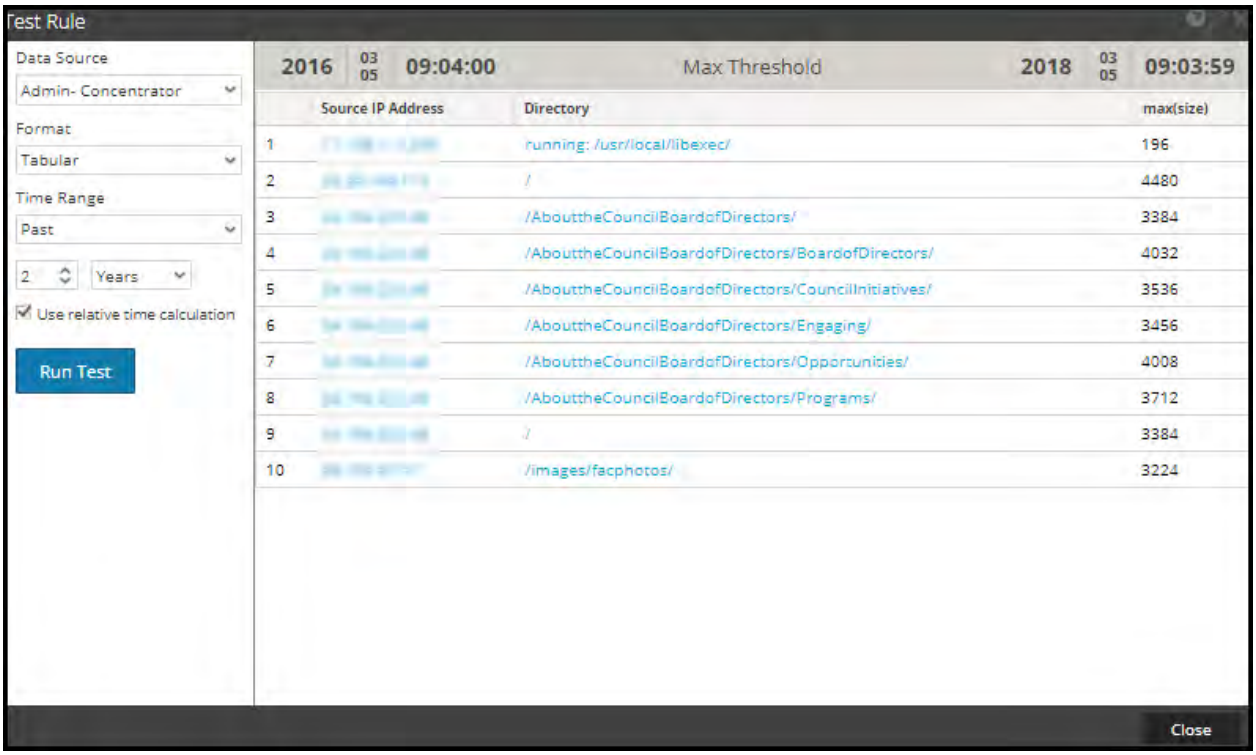
**Example**

Following is a sample query for max_threshold used along with the Max function in the **Then** field is:
**max_threshold(5000,max(size))**

The following figure shows the Build Rule screen for the above query.



Here the max_threshold is applied for data size with an upper limit of 5000. The following figure shows the result.



Here, the result page displays the max(size) column, that lists the data sizes lesser than 5000 as this is the maximum threshold in the query, along with the corresponding IP source and the respective directory.

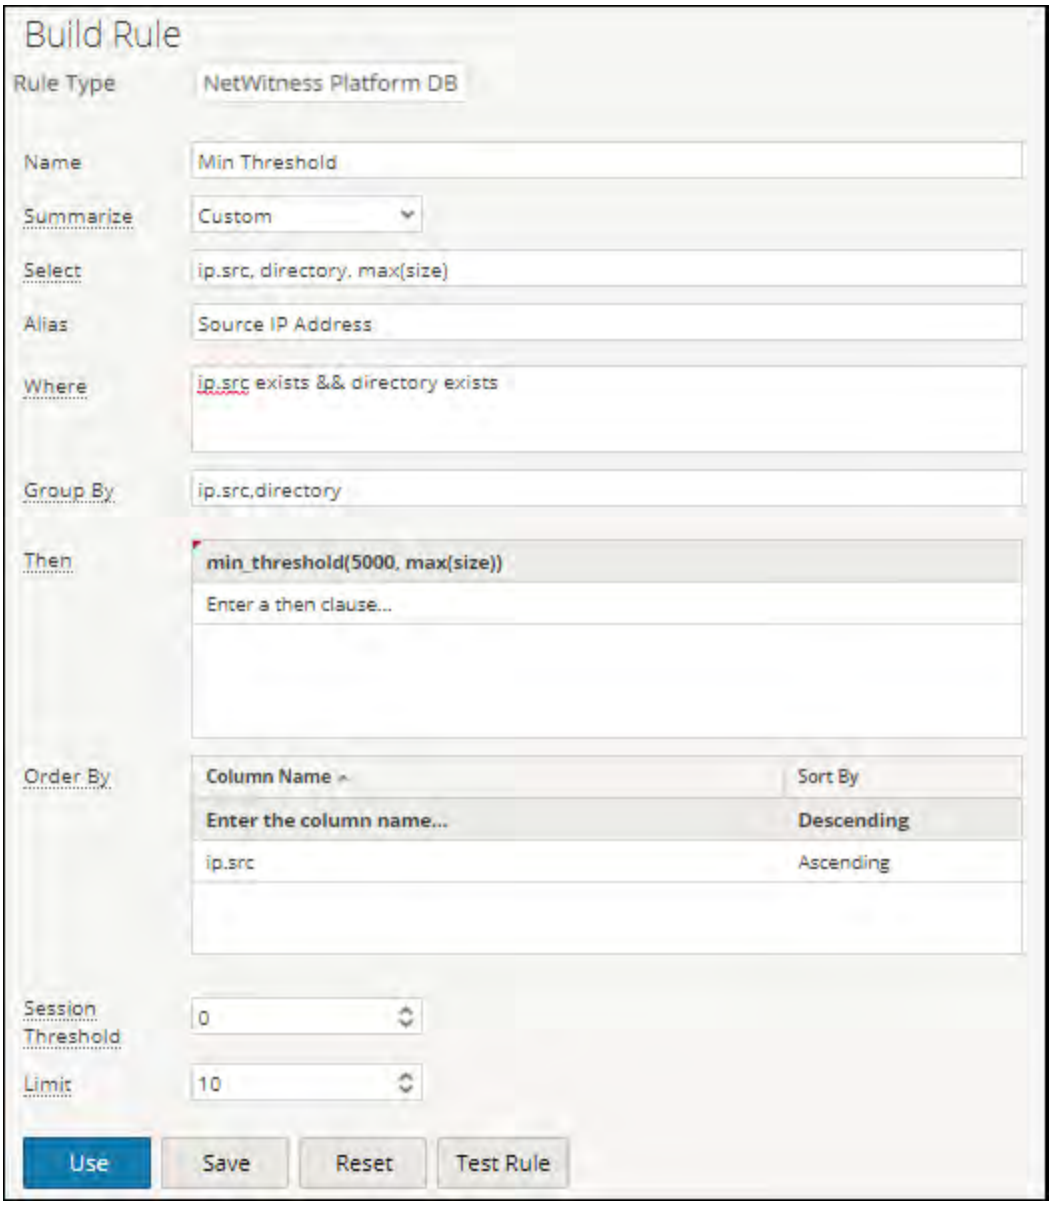
## Filter aggregate meta results withMin_threshold

Similarly, min_threshold is used to filter the results for any function. A similar scenario as max_ threshold is considered to explain this.

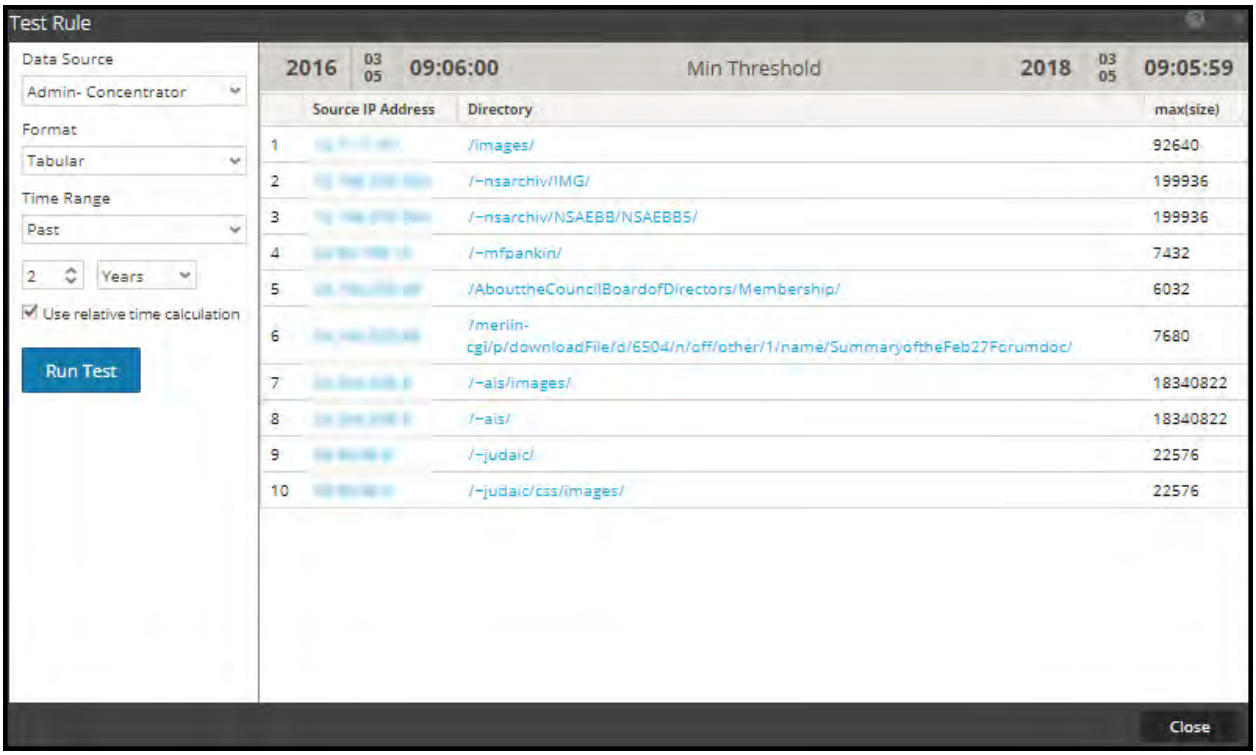
**Example**

Query for min_threshold used along with the Max function in the **Then** field is:
**min_threshold(5000,max(size))**

The following figure shows the Build Rule screen for the above query.



Here the min_threshold is applied for data size with a lower limit of 5000. The following figure shows the result.



Here, the result page displays the max(size) column, that lists the data sizes greater than 5000 as this is the minimum threshold in the query, along with the corresponding IP source and the respective directory.

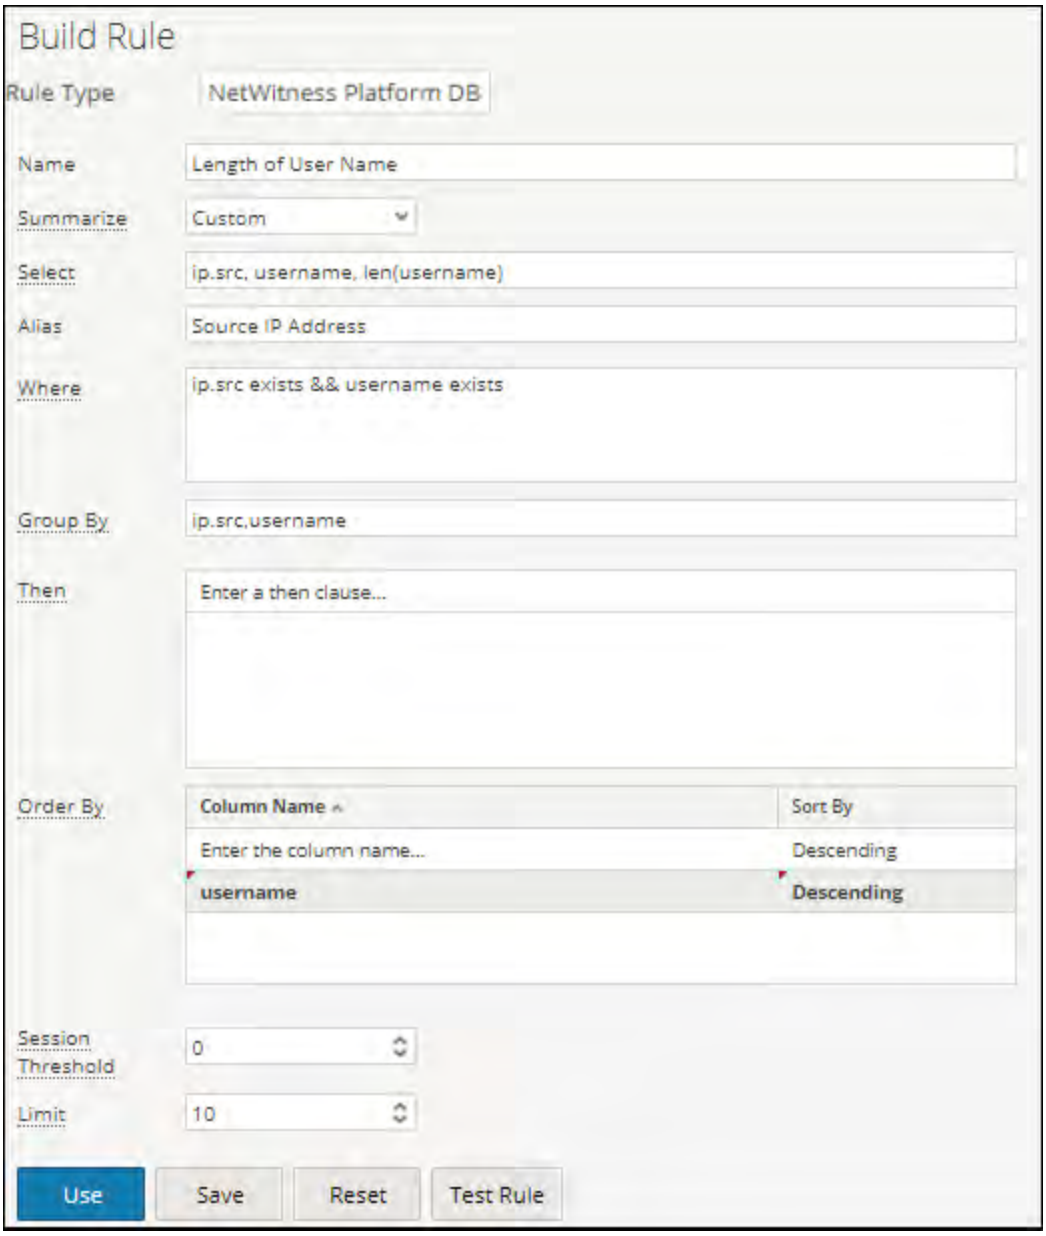
**Note:** Max_threshold and Min_threshold rule actions are common across all the functions, and can be used along with the other queries in the **Then** field to retrieve the respective output.

## Length

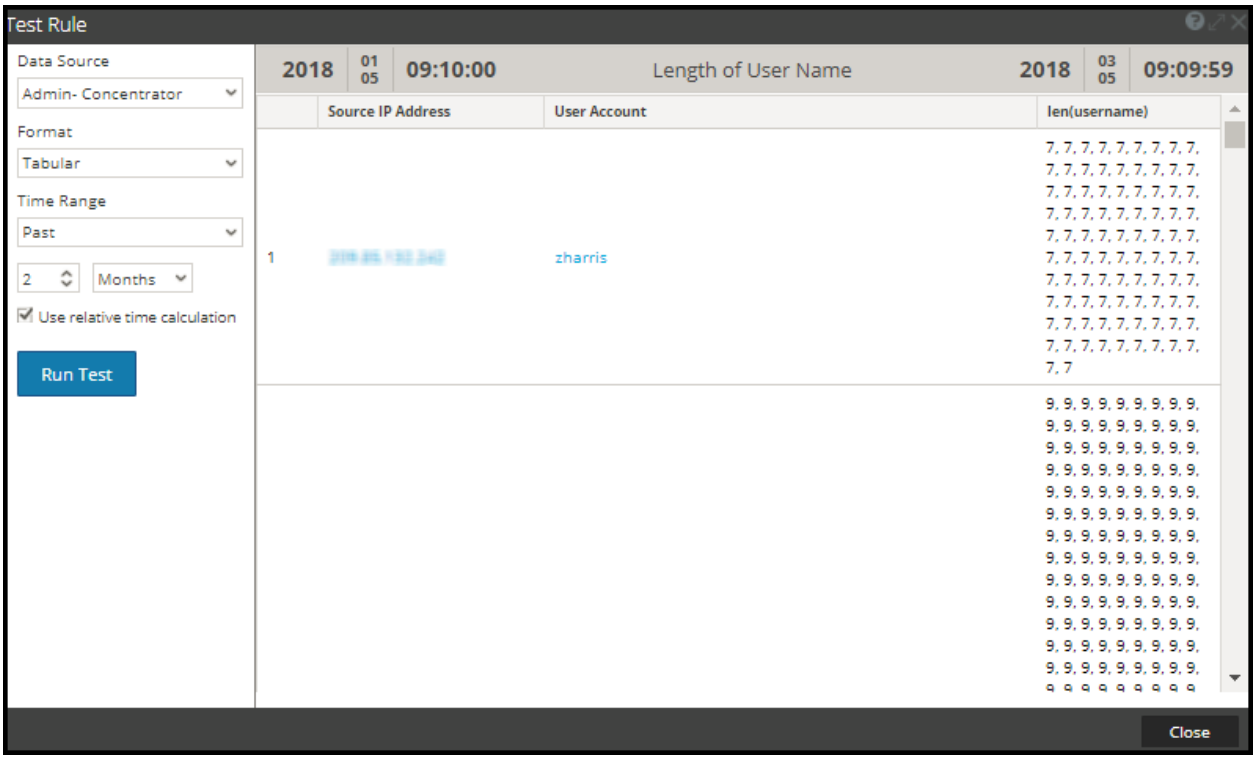
This function returns the length of a meta value. In other words, Length function returns the number of bytes used to store the actual value.
For instance, for the value "Analytics" it returns the length as 9. Similarly, for an IPv4 ip.src, it returns 4 (representing 4 bytes).

**Example**

The following figure shows a sample query for the length function used for usernames.



The following figure shows the result for the above query.



Here, the page displays the length of the usernames associated with the user account and their respective source IP.

## Additional Information

When you query for aggregates (E.g. sum(size)) with **Group By** on a meta which has multiple values in a session, then the session with multiple values is accounted for aggregate calculation for each value of that meta.

**Example**

When you query for the Count aggregate function with Group By on Alias.host and if the column has multiple values in a session, then the session is counted for each occurrence, including the duplicate values.

Consider the following table.

| SessionID | Alias.host | Ip.src | Size |
|---|---|---|---|
| 1 | host-a, host-b, host-a | a | 10 |
| 2 | host-b, host-c, host-a, host-c | c | 20 |
| 3 | host-b, host-c, host-d | b | 30 |
| 4 | host-c, host-a | a | 40 |

In the above table, alias.host for **host-a** and **host-c** has duplicate values listed for a single session. Let us consider the following query:

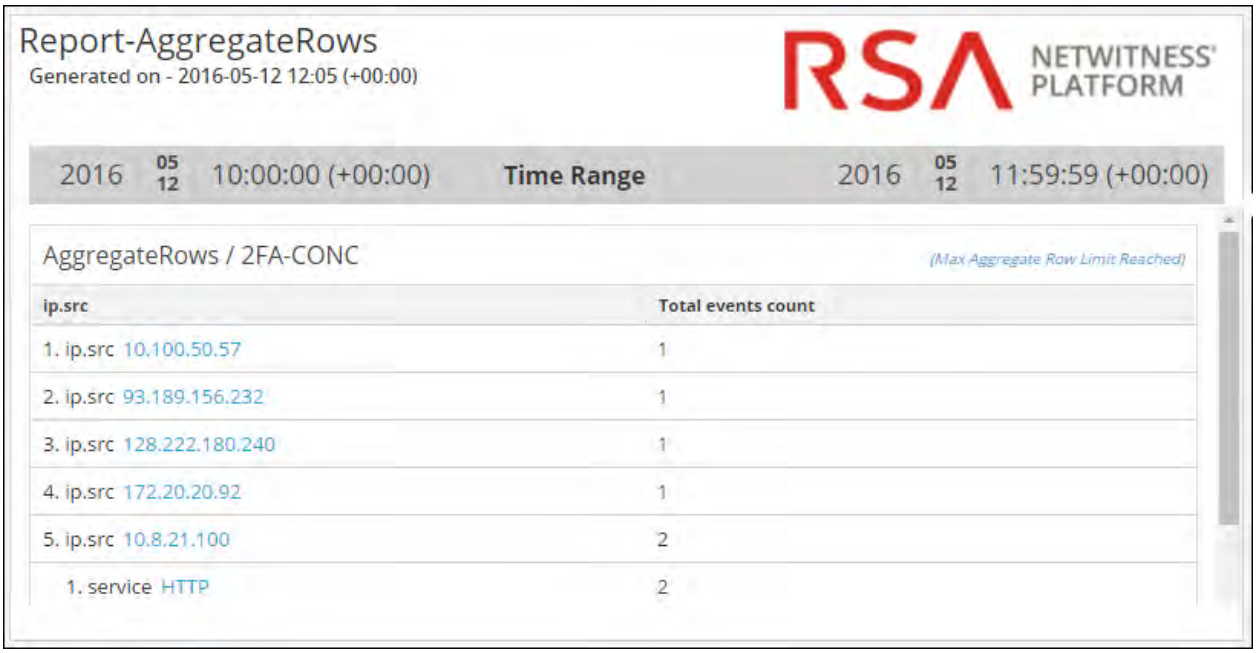
**Select :** alias.host, count(ip.src), sum(size)
**Group By** : alias.host

Here, **host-a** and **host-c** are present in 3 sessions and they are duplicated for two different sessions. However, the output is as shown below.

| Alias.host | count(lp.src) | Sum (size) |
|---|---|---|
| host-a | 4 | 80 |
| host-b | 3 | 60 |
| host-c | 4 | 110 |
| host-d | 1 | 30 |

Output table shows that the count for **host-a** and **host-c** is 4. This is because for each alias.host value, the entire session is considered. Similarly to calculate sum (size), the same sessions are considered for each alias.host value.

In the report output if the number of rows has reached **NWDB maximum aggregate rows** defined in RE configuration, then a message **Max Aggregate Row Limit Reached** is displayed to indicate that there is more information to be displayed. The default limit is 1000, and you can change this value as per your requirement, in the Reporting Engine Configuration page .



# Troubleshoot Reporting

This section provides troubleshooting instructions for issues faced when using the Reporting module in NetWitness.

## Configuring SFTP Server Issue

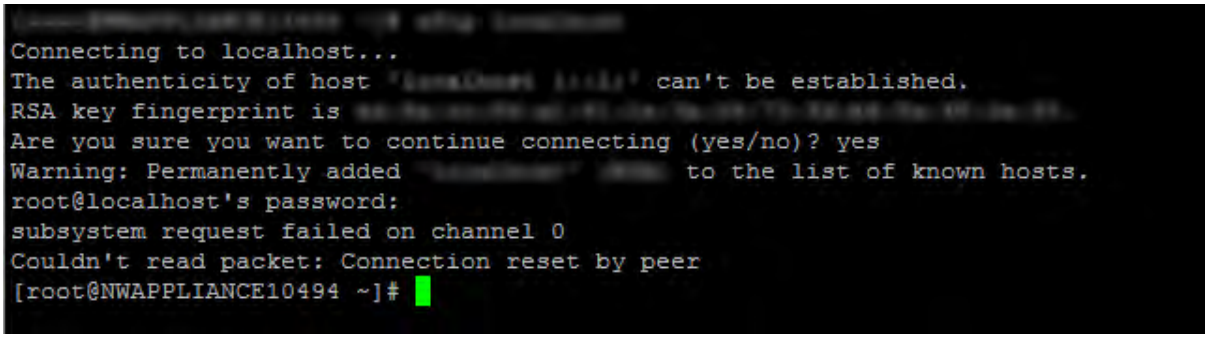
### Procedure

Try the following steps if you face any issues while configuring the Linux SFTP server:

1. If the Report Output Action for the configured SFTP fails, you must SSH to the SFTP server and try to connect locally to check if SFTP is working fine.

   Connect to SFTP server:



2. If the Local connection fails, open the file **sshd_config> vi /etc/ssh/sshd_config.**
3. Check for the entry in the file:

   ```
   # override default of no subsystems
   Subsystem sftp /usr/libexec/openssh/sftp-server
   ```

4. If this entry does not exist, add the two lines mentioned in Step 3 at the bottom of the file and **Save** it.
5. Restart service from **SSH > service sshd restart**.
6. Retry the SFTP connection now.
7. Make sure SFTP port is not blocked by SA server appliance firewall. Update iptables rules to allow sftp port.

## Meta Values in Investigation Link Issue

| | |
|---|---|
| Issue | When the device information on the datasource is changed, the Investigation link for the meta values of the executed reports is not displayed on the NWDB results page. |
| Resolution | Remove and re-add the datasource to Reporting Engine.<br>*Note: This workaround is not applicable for reports that are already generated.* |

## Internet Explorer 10 Browser Issue

| | |
|---|---|
| Issue | When you click the Test Rule multiple times in quick succession, results with large input |

| | |
|---|---|
| Resolution | data may not displayed in Internet Explorer 10. |
| | If this issue occurs, try one of the following steps:<br>• Close the Test Rule window on Internet Explorer 10 and run the test again.<br>• Use other browsers like Chrome or Mozilla Firefox to test the rule execution. |

## Dynamic List Editing Issue

| | |
|---|---|
| Issue | A dynamic list cannot be added from the Edit option on the 'View All Schedules' page to an existing schedule. |
| Resolution | 1. Reports > Select the report ><br>2. Click the #Schedules for the specific report<br>3. Select the schedule to be modified from the Report Schedule page<br>4. Edit the schedule |

## Deployment Failure Issue

| | |
|---|---|
| Issue | Deployment of reports fail, if the dependencies of certain compliance reports in Live are not deployed prior to the reports. |
| Resolution | Retry the deployment. If the problem persists, try to deploy the rule or list dependencies first and then deploy the reports. |

## Respond Server Issue

| | |
|---|---|
| Issue | When the Forward Alerts to Respond option is enabled and RabbitMQ connections to the Respond Server are blocked, some of the Reporting Engine threads may be blocked. |
| Resolution | Disable the Forward Alerts to Respond option until the RabbitMQ broker in the NetWitness server at the Respond has begun and accepts the connections. |

## Post-Upgrade Issue

| | |
|---|---|
| Issue | Post-upgrade from 10.6.x to 11.2, Categories meta for incident collection is not supported. |
| Resolution | When using the Categories meta for incident collection, the results rendered are in an incorrect format. Hence this meta is not supported and you cannot use the categories meta in either select clause or where clause. Also, it is not available in the list of metas for selection in the Rule Builder page. |

## Report Query Timeout Issue

| | |
|---|---|
| Issue | When scheduling the report, if you choose a high time range, the query may timeout with the error message **`Query on channel 12345 was canceled by the system`** |

| | |
|---|---|
| Resolution | **for exceeding time usage limits. Check timeout values.** |
| | Set the **Summarize** option to **None** in the **Build Rule** view to exclude the **Group-By** clause (that is performance intensive) and then re-schedule the report. If the query still times out after 60 minutes, increase the timeout value from 60 minutes to 90 minutes on all the core services.<br>To increase the timeout value:<br>1. Go to **Admin** > **Services** > **Security** > **Users** and set the **Core Query Timeout** to 90 minutes.<br>2. Enter the Service Admin Password and click **Save**.<br>3. Re-schedule the report. |

# Reporting References

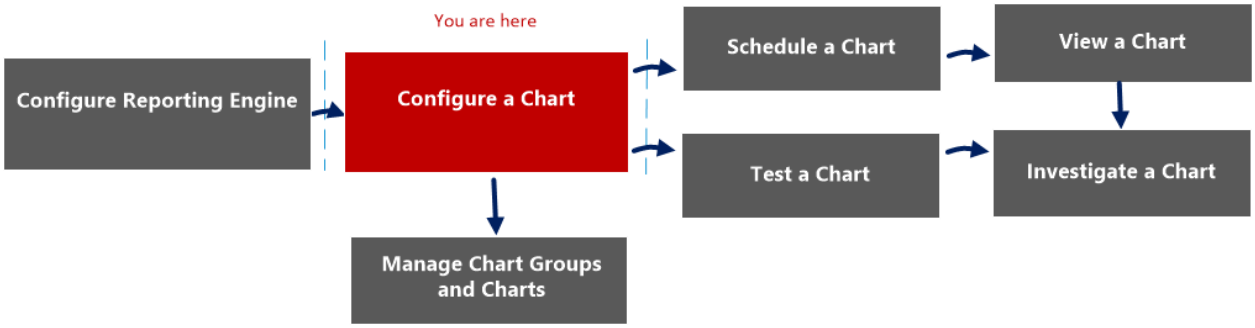
This section provides information about the Reporting user interface. You can look at your place in the workflow for creating and generating a report with theNetWitness, get a quick look at the important features, and follow links to the detailed concepts and procedures.

# Build Chart View

In the Build Chart view, you can define and test a chart. You build a chart by assigning a name and then selecting a rule to include.

**Note:** Only the NetWitness DB rules can be used in charts.

## Workflow



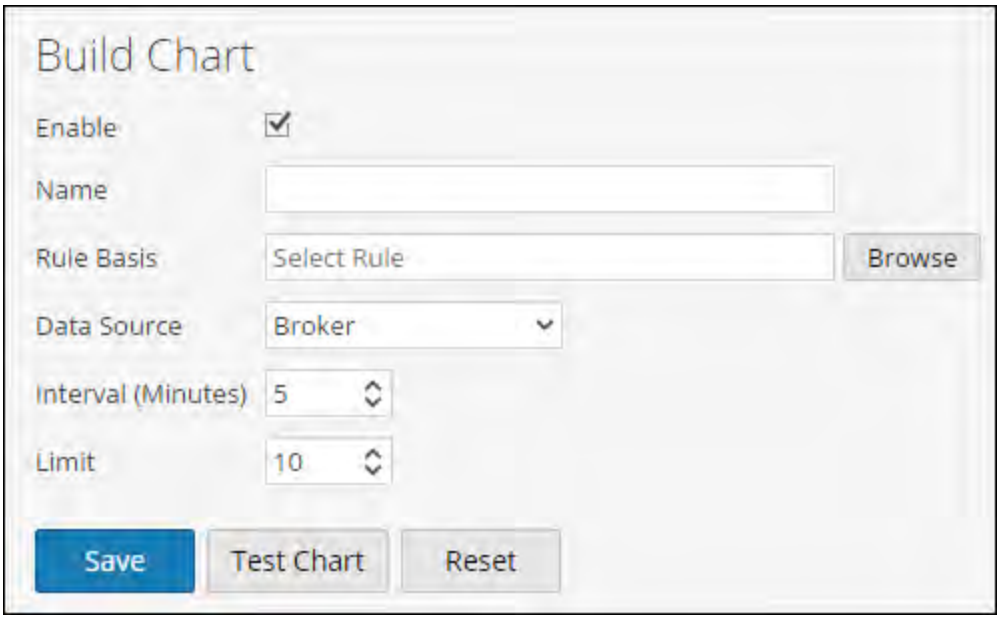
## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart* | Configure a Chart |
| Administrator/ Analyst | Schedule a chart | Schedule a Chart |
| Administrator/ Analyst | View a chart | View a Chart |
| Administrator/ Analyst | Test a chart | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart | Manage a Chart Group and Chart |

*You can complete these tasks here.

## Quick View

The following figure is an example of the Build Chart view.



The following table describes the features in the Build Chart view.

| Field | Description |
|---|---|
| Enable | Specifies if the Reporting Engine must collect the data and generate chart results. If the **Enable** checkbox is not selected, the results are not rendered. |
| Chart Name | Identifies the name of the chart. |
| Rule Basis | Displays the Add Rules dialog box from which you select a rule that is the basis of a chart. The rule that you select must be a rule which is not sorted by none. |
| Data Source | If the default data source is configured in the Reporting Engine, the data source is displayed on the Build Chart page. If a chart is configured to run on any other data source, that data source is displayed on the Build Chart page instead of the default data source. The Reporting module works with the following data sources:<br>• Broker<br>• Concentrator<br>• Decoder<br>• Log Decoder<br>• Log Collector |
| Interval (Minutes) | The chart data refresh interval in minutes. |
| Limit | The number of records for which a chart is generated. |
| Save | Saves a chart to the database. |

| Field | Description |
| --- | --- |
| Test Chart | Plots a test chart based on the chart definition. |
| Reset | Resets the chart details. |

# Build List View

In the Build List view, you can enter or import values to create a list and save or reset the values. You can use lists when you are writing reporting rules to simplify the process of specifying values in the rule.

## Workflow

This workflow shows the procedure to define lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists.

You must ensure that Reporting Engine is configured on the NetWitness.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule* | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access Control for lists, Rules or Reports | Manage Lists, Rules or Reports |

*You can complete these tasks here.

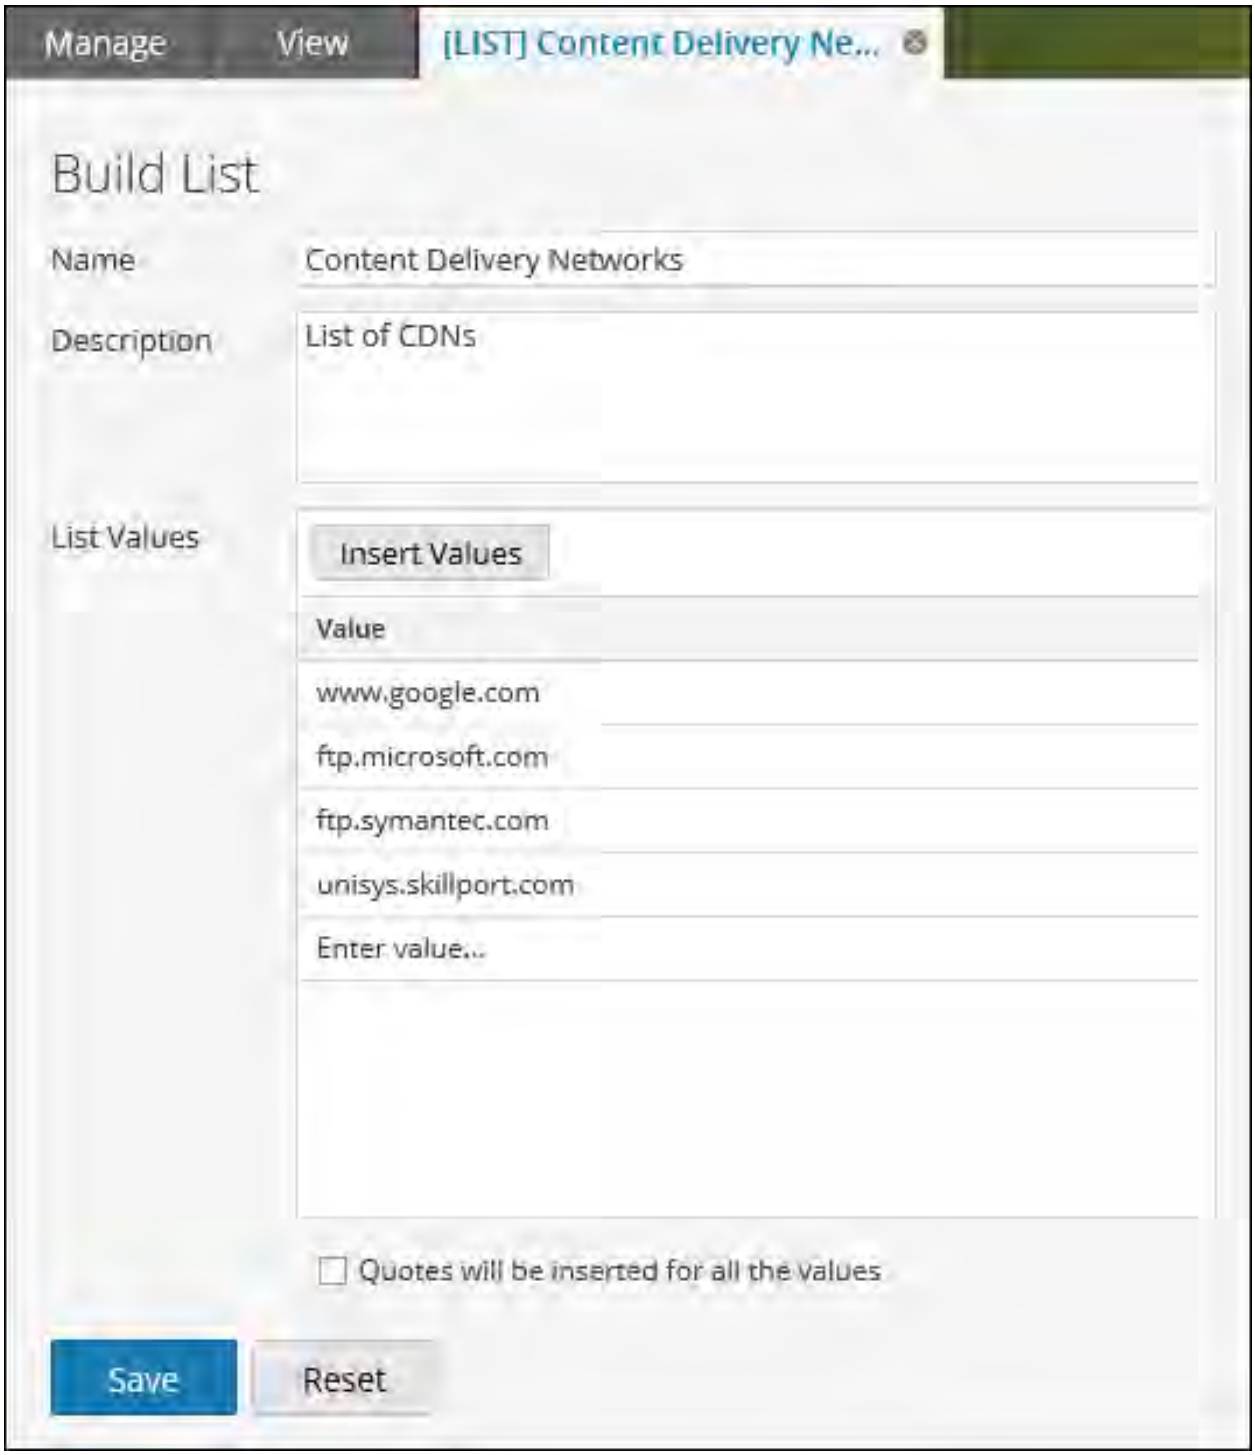
## Quick View

The following figure shows the Build List View.



To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

3. In the **Lists** toolbar, click .

   The Build List tab is displayed.

The following table describes the features in the Build List view.

| Feature | Description |
|---|---|
| Name | Identifies and labels the list. |
| Description | Provides a short description for the list. |
| List Values | Provides the grid of values associated with selected list from the List Library panel. You can import these values from a file or list. You can also enter values manually. |
| Quotes will be inserted for all the values | Automatically includes quotes for the values at runtime if checkbox is selected. If the checkbox is not selected and if a value in the list contains a comma, then that value has to be enclosed within single quotes. This syntax does not apply to list values for an NWDB rule. |
| Save | Saves the rule which can be used to create a report, a chart or an alert. |
| Reset | Deletes all the information from the fields. |

# Build Report View

In the Build Report view, you can create a report, add text and rules, and schedule a report.

## Workflow

This workflow shows the procedure to create and schedule a report.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report* | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access Control for lists, Rules or Reports | Manage Lists, Rules or Reports |

*You can complete these tasks here.

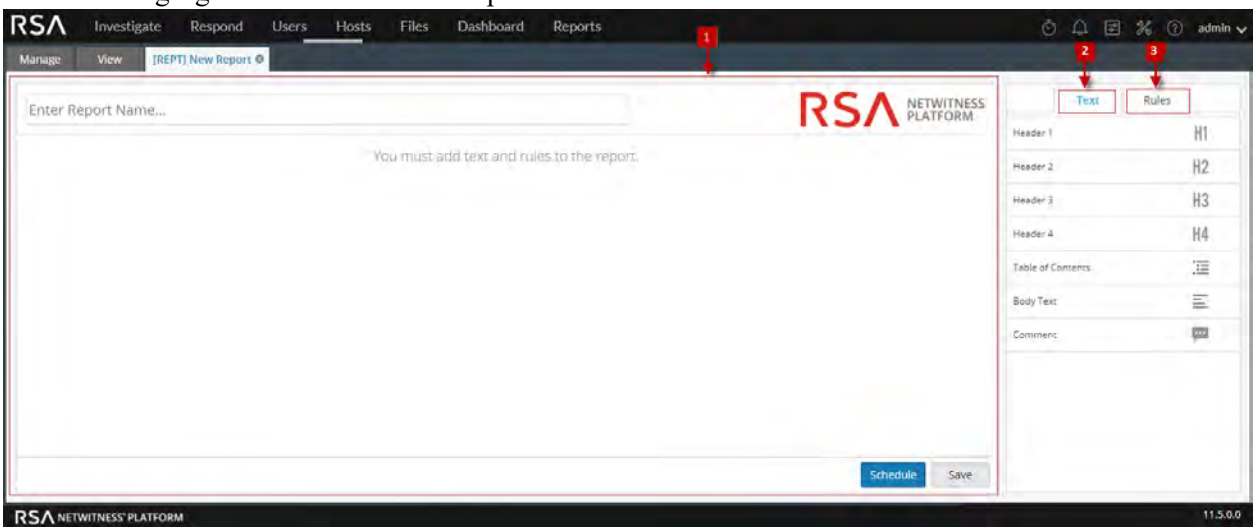
## Related Topics

- Configure and Generate a Report
- Report View

- Scheduled Reports View
- Reports Permissions Dialog

## Quick View

The following figure shows the Build Report View.



To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Reports view is displayed.

3. In the **Reports** toolbar, click +.

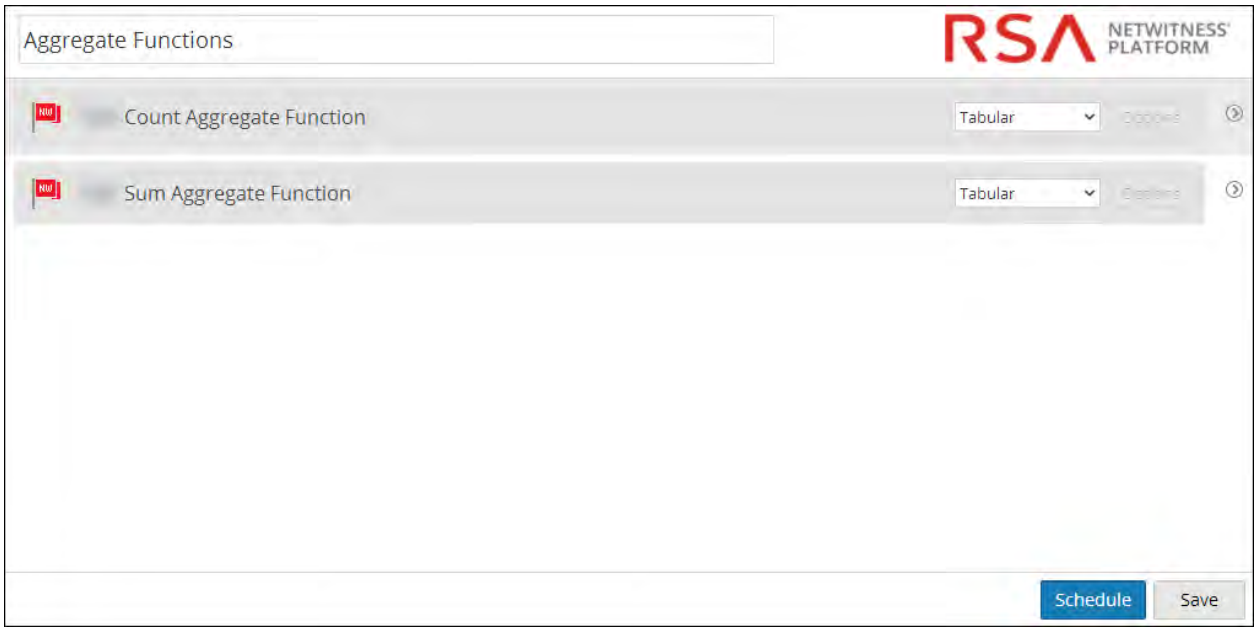
   The Build Report tab is displayed.

The Build Report view consists of the following panels:

| | |
|---|---|
| 1 | Report Panel |
| 2 | Text Panel |
| 3 | Rules Panel |

### Report Panel

The Report panel allows you to create a report by assigning a name to the report. The content in a report depends on the items selected from the Text and Rules panels.



When you add rules to a report, you can change the output format of these rules either to tabular, area, line or pie by clicking the ⌄ button.

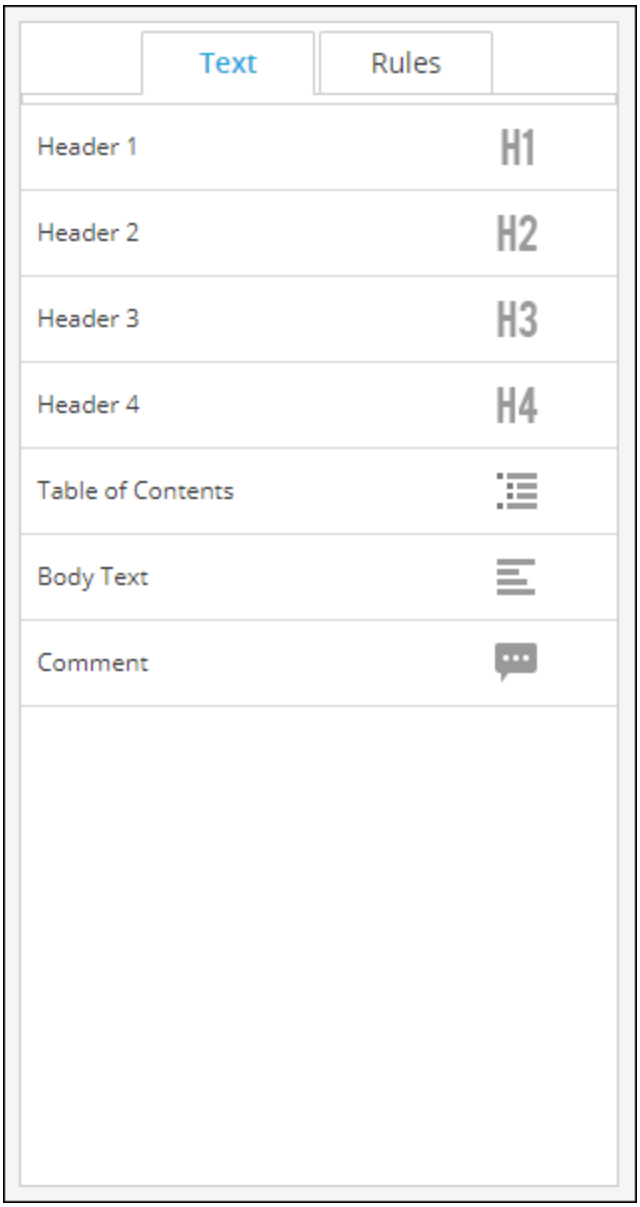
The following table lists the features of the Report Panel and the description.

| Feature | Description |
|---|---|
| Name | This field allows you enter the name of the report. |
| Options | This field allows you to select the output format of the report such as Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area and Spline. |
| Schedule | Clicking this option generates the report. |
| Save | Clicking this option saves the report. |

## Text Panel

The Text panel consists of a list of text elements that add to the look and feel of the report. You can use these text elements to format the report.

- To add more structure to reports, you can use these headers defined in the Text panel to indent up to four levels. This allows you to identify specific sections in a report that can be included in the Table of Contents for easy navigation in the report result.
- To add headers to the Report panel, drag and drop H1, H2, H3, or H4 onto the Report pane based on the desired level of indentation.



The following table lists the text elements used to format a report:

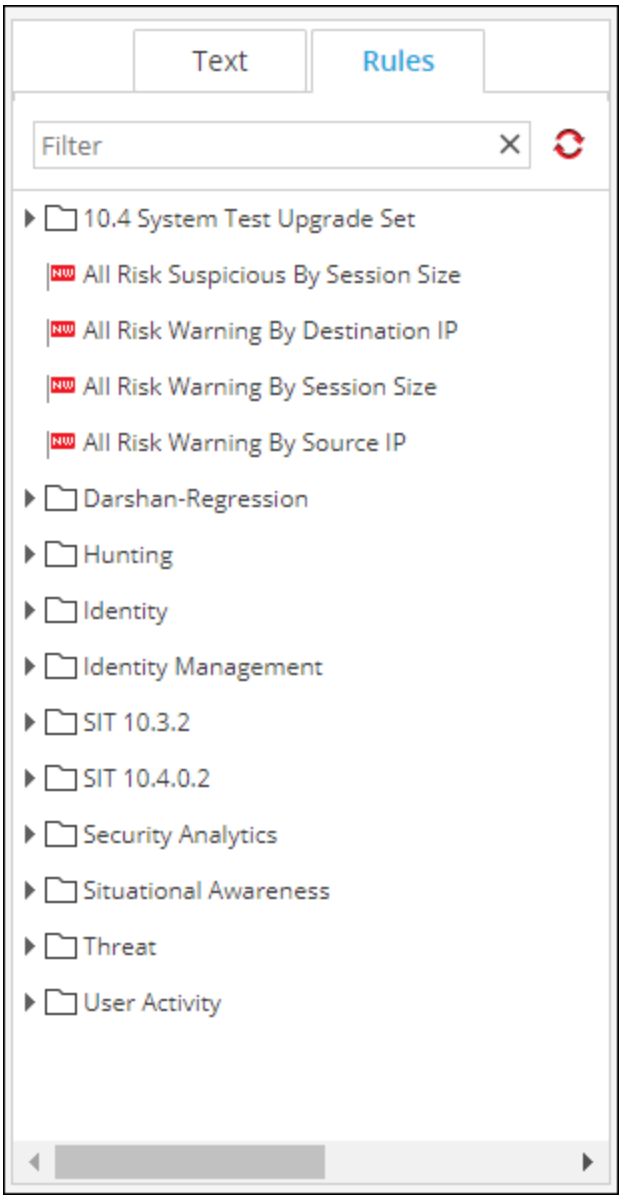
| Text Elements | Description |
|---|---|
| Header 1 H1 | The Header 1 element adds a first-level heading to the report definition. |
| Header 2 H2 | The Header 2 element adds a second-level heading to the report definition. |
| Header 3 H3 | The Header 3 element adds a third-level heading to the report definition. |

| Text Elements | Description |
|---|---|
| Header 4 | The Header 4 element adds a fourth-level heading to the report definition. |
| Table of Contents | The Table of Contents adds table of contents to the report definition. |
| Body Text | The Body Text element adds body text to the report definition. |
| Comment | The Comment element adds comments to the report definition.<br>**Note:** The Comment element is not displayed when you view all the reports. |

## Rules Panel

The Rules panel consists of a list of rules that are defined in the Rules. From the rules list, you can drag and drop rules onto the Report panel to associate those rules with the report.

You can search for a specific rule using search text box provided in the Rules panel.



Text
Rules
Filter
10.4 System Test Upgrade Set
All Risk Suspicious By Session Size
All Risk Warning By Destination IP
All Risk Warning By Session Size
All Risk Warning By Source IP
Darshan-Regression
Hunting
Identity
Identity Management
SIT 10.3.2
SIT 10.4.0.2

Threat
User Activity

# Build Rule View

The Build Rule view explains the actions and associated procedures that you can perform under Rules.

## Workflow

This workflow shows the procedure to create or deploy a rule.

## What do you want to do?

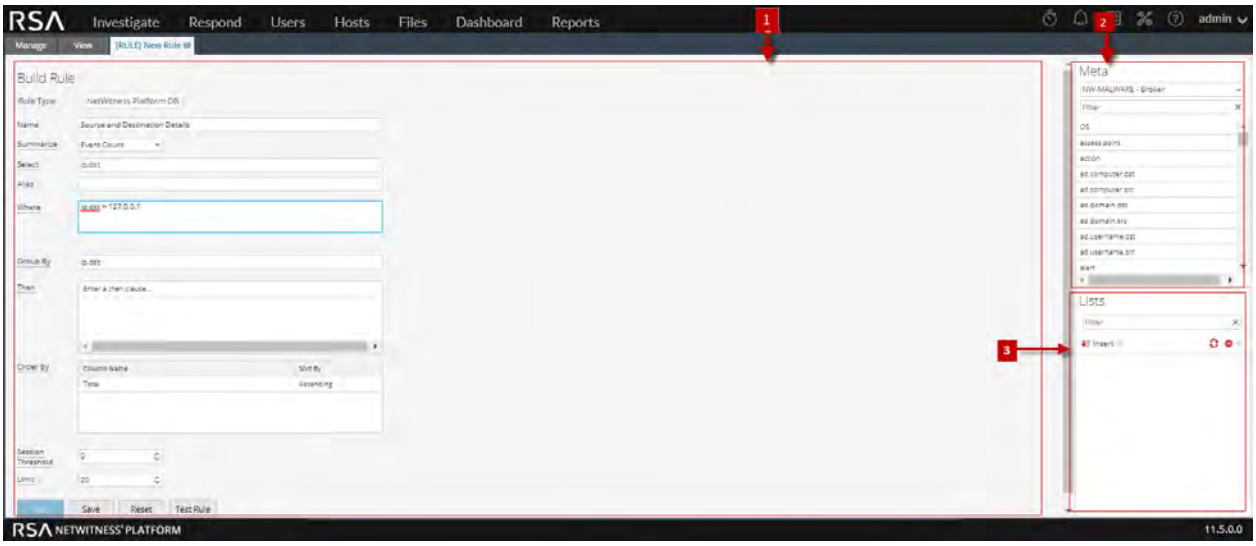
| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule* | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access Control for lists, Rules or Reports | Manage Lists, Rules or Reports |

*You can complete these tasks here.

## Related Topics

- Rule Permissions Dialog
- Rule View

## Quick View



To access the Build Rule view:

1. Go to **Reports**.
   The Manage tab is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.
   The Build Rule view tab is displayed

## Features

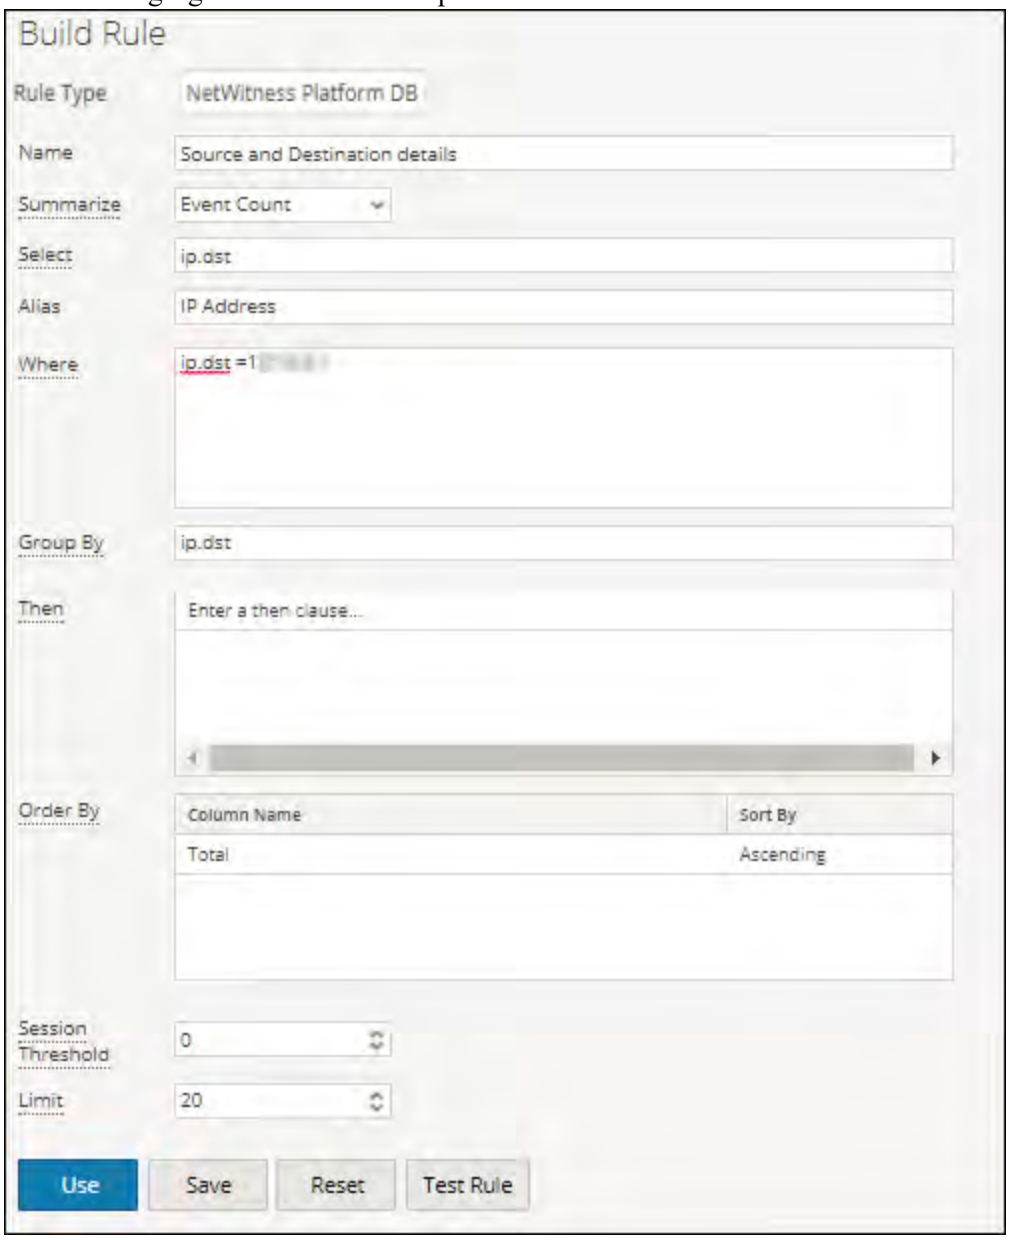
The Build Rule view includes the following panels.

| | |
|---|---|
| 1 | Rule panel |
| 2 | Meta panel |
| 3 | Lists panel |

### Rule Panel

The Rule panel allows you to create a rule for the selected database type.

The following figure shows the Rule panel.



The following table describes the features in the Rule panel.

| Feature | Description |
|---|---|
| Rule Type | A drop-down list of supported database types for which you can create rules. The options are: NetWitness DB and Warehouse DB. |
| Name | The name of the rule that you are creating or editing. |
| Summarize | A drop-down list of summarize options. The options are: None, Event Count, Packet Count, Session Count and Custom. |
| Select | The meta key for which you need the aggregate values; for example, ip.dest. |

| Feature | Description |
|---|---|
| Where | A Where clause that defines the conditions that trigger the rule execution; for example, ip.dest = 127.0.0.1. |
| Group By | The grouping method for the results. For example, specifying ip.dest produces a report in which like ip.dest values are grouped. |
| Then | A Then clause that defines the rule actions for additional processing on the output. |
| Order By | The sequencing method used to show results. For example, specifying Order By the value in the Total column, Ascending, produces a report in which the results are sorted in ascending order based on the value in the Total column. |
| Session Threshold | A selection list for the session threshold, which specifies maximum number of sessions that should be processed for aggregate functions. |
| Limit | A selection list for the maximum number of result rows to be fetched. |
| Use | Clicking Use enables you to use the Rule to generate a Report, Alert of Chart. |
| Save | Clicking Save saves the rule that you are editing and the Build Rule panel remains open. Before testing a rule, you must save it if you want to keep your changes. |
| Reset | Clicking Reset clears all the field information . |
| Test Rule | Clicking test rule opens the Test Rule dialog. |

## Test Rule Dialog

To access the Test Rule view:

1. Go to **Reports**.

   The Manage tab is displayed.

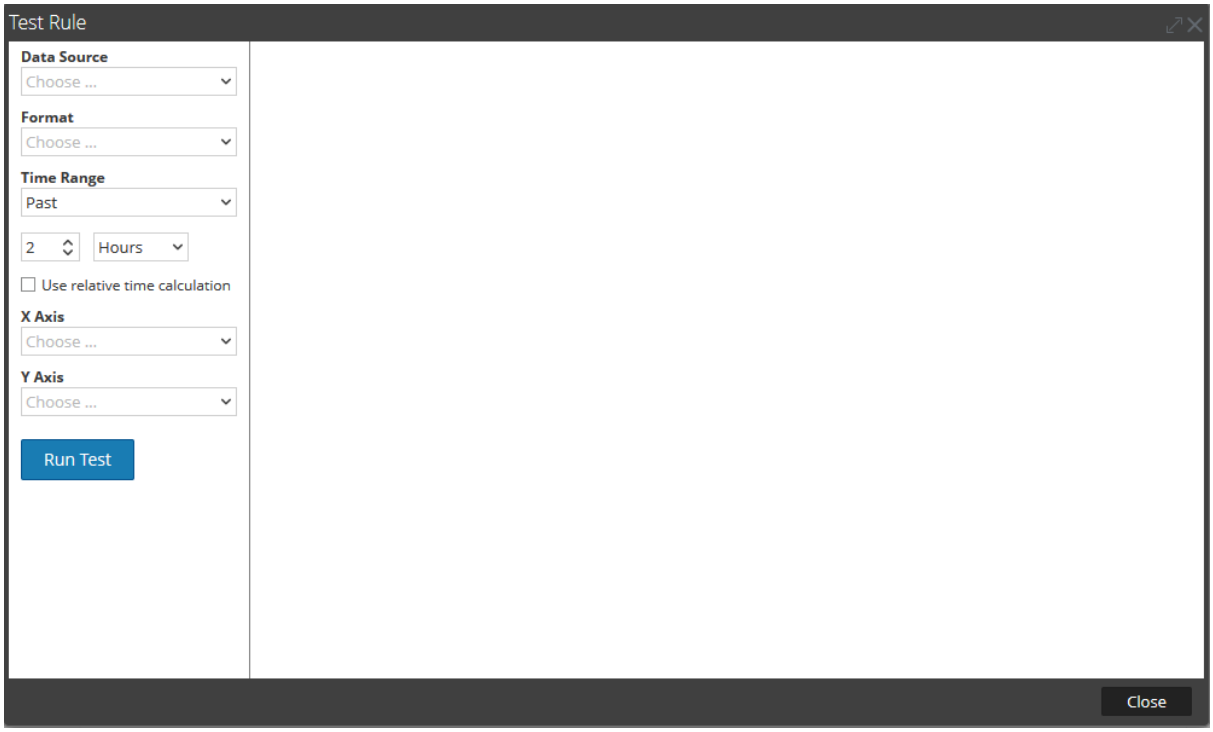
2. In the **Rules** panel, do one of the following:

   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.

     The Build Rule view tab is displayed.

3. Click **Test Rule**.

The Test Rule view is displayed.



The following table describes the features in the Test Rule Dialog.

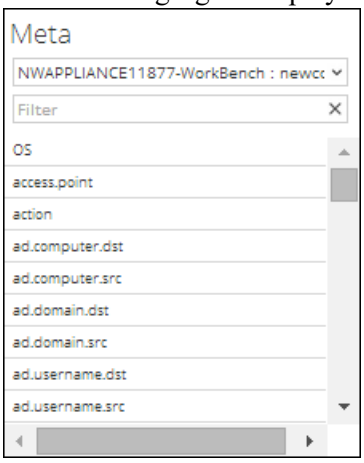
| Feature | Description |
|---|---|
| Data Source | A drop-down list of data sources for the type of rule you are testing. Possible data sources are: Concentrator, Broker, Decoder or Log Decoder. |
| Format | A drop-down list of the formats for displaying results for the rule. Possible formats are: Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area, and Spline. |
| Time Range | A drop-down list of time range specification methods.<br>• Selecting Past allows you to specify a number of years, months, days, weeks, or hours. For example, Hours, Days, Weeks, Months, or Years.<br>• Selecting Range allows you to specify a date range and time period. For example, start date to end date.<br>In the user interface, the date or time displayed depends on the time zone profile selected by the user. |
| Use relative time calculation | Selecting this option calculates the time range relative to the current time. |

| Feature | Description |
|---|---|
| X Axis | X-Axis and Y-Axis specify the metadata to be plotted in charts. In the X-Axis drop-down list, the meta types for the `Group by` setting in the rule are listed. You can select multiple meta types when the rule has a single `Group by` setting. For Custom Rules with multiple `Group by` values, you can select only the first meta type for the X-Axis. |
| Y Axis | In the Y-Axis drop-down list, the aggregate functions used in the rule are listed. Sum, Count, Countdistinct and Average are the supported aggregate functions for rules. You can select one or more aggregate functions. |
| Run Test | Clicking Run Test executes a test of the rule last saved in the Rule Builder dialog. When the test is complete, the rule data (if any) for the selected time range is displayed. |

## Meta Panel

The Meta panel provides a list of available meta types that you can use to build the rule. You can use the meta types in the Select, Where, and Then clauses. The Reporting Engine maintains an active list of the available meta names by continuously synchronizing with the data source to which it is connected.

The following figure displays the Meta panel.



The following table describes the features in the Meta panel.

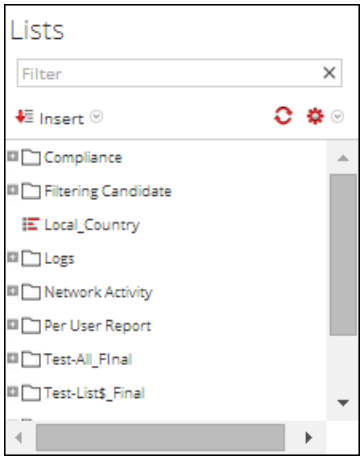
| Operation | Description |
|---|---|
| Choose | Based on the rule type that you have selected, the available data sources are displayed in the drop-down list of the Meta panel. Select the required data source. The available meta types for the data source are displayed. Select a meta. |
| Filter | Filter the meta for a specific meta value. |

## Lists Panel

A List is a placeholder for a set of values that you can use in a meta or a variable. For example, you can define a list with all the whitelisted event source IP addresses. Once the List is defined then you can use the List name in the rule. This provides the flexibility of adding, modifying, and deleting the list values.

The Lists panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected.

The following figure displays the Lists panel.



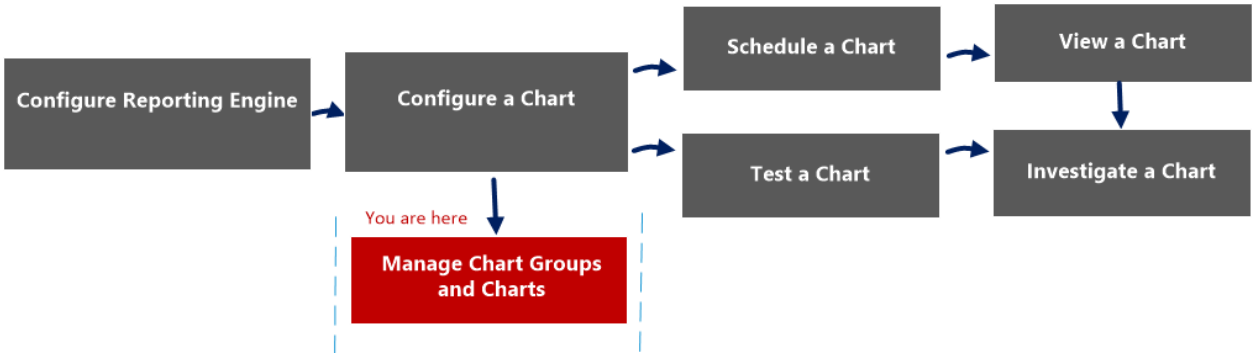
The following table describes the features in the Lists panel.

| Operation | Description |
|---|---|
|   | Import or Export a list. |
| | Refresh the Lists. |
|   | If you select the **NetWitness DB** rule type, the options Where and Then are displayed. Insert the list in the Where or Then clause in the rule. |
|   | If you select the **Warehouse DB** rule type, the option Where is displayed. Insert the list in the Where clause in the rule. |

# Chart Permissions Dialog

In the Chart Permissions dialog, you can manage access permissions for user roles at the chart and chart group level. Only a user with the 'Read & Write' permission can configure the chart in the Reporting module.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |
| Administrator/ Analyst | Schedule a chart | Schedule a Chart |
| Administrator/ Analyst | View a chart | View a Chart |
| Administrator/ Analyst | Test a chart | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart* | Manage a Chart Group and Chart |

*You can complete these tasks here.

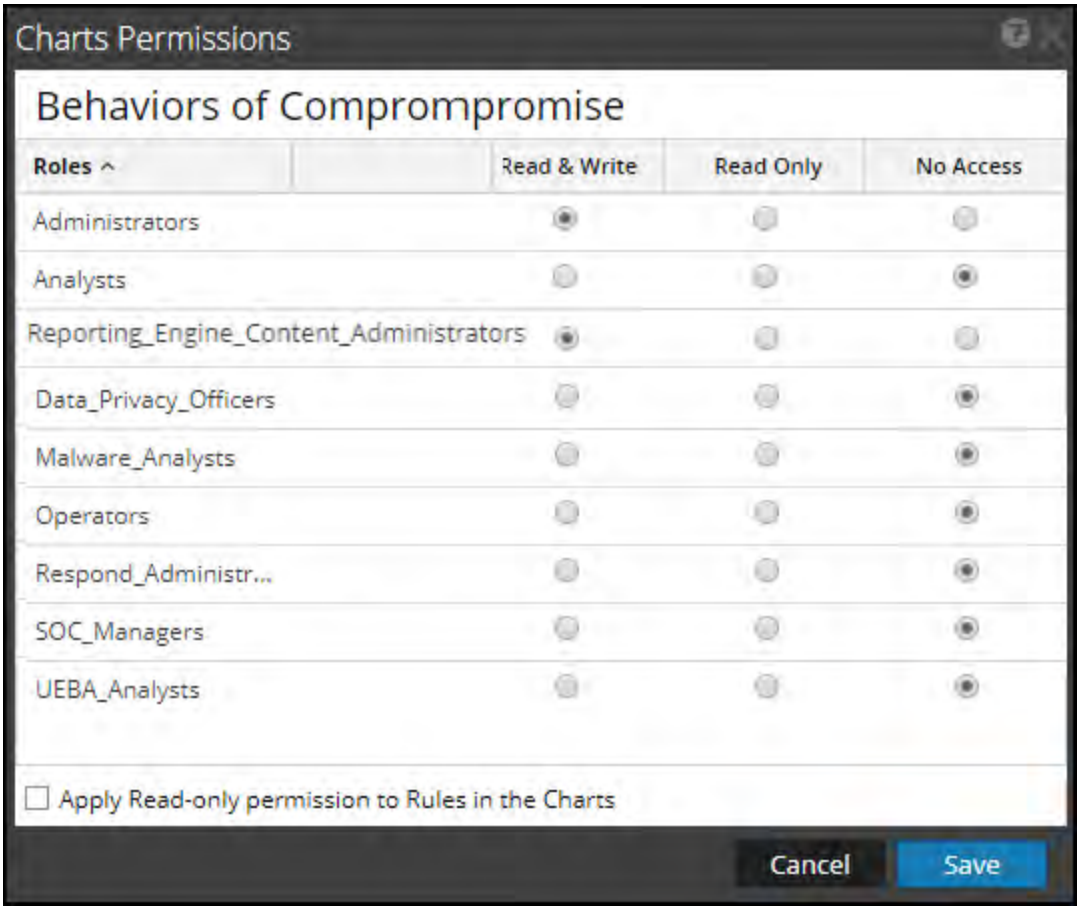
## Related Topics

- Configure and Generate a Chart

## Quick View

The Chart permissions dialog allows you to set chart permissions depending on the user role.

The following figure is an example with the important features labeled.



1. Click **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Charts** panel, select a report and click > **Permissions**. The Chart Permissions dialog box is displayed.
4. Based on the user role, select the appropriate options.
5. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.
6. Click **Save**.

The following table lists the columns in the Charts Permission dialog.

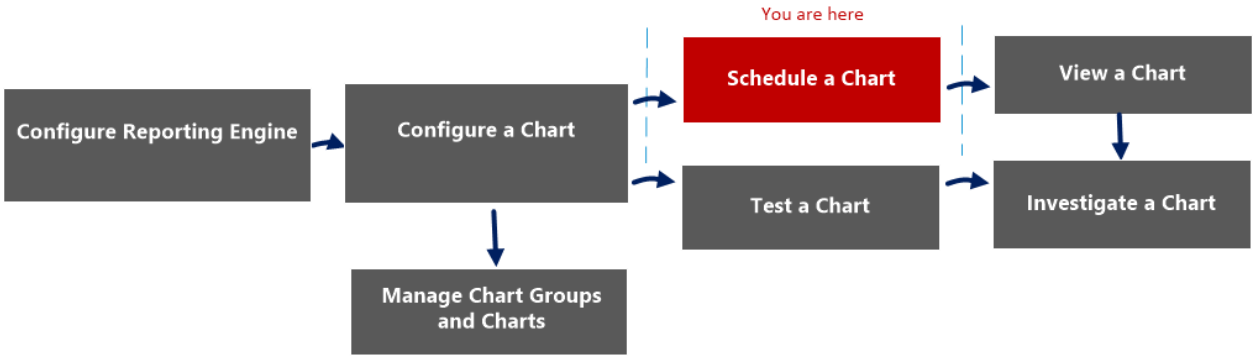
| Column | Description |
|---|---|
| Roles | Displays all the user roles in the NetWitness user interface. |
| Read & Write | Allows you to apply 'Read&Write' access to the chart. |
| Read Only | Allows you to apply only 'Read' access to the chart. |

| Column | Description |
| --- | --- |
| No Access | By selecting this permission, you cannot access or view the chart. |
| ☐ Apply these permissions to sub-groups and Charts in this group | Allows you to apply permissions to the chart group, subgroups in the group and charts in the group.<br>**Note:** This checkbox is populated only when you set access permissions for a Chart Group. |
| ☐ Apply Read-only permission to Rules in the Charts | Allows you to automatically apply permissions to the rules in the charts. |
| Cancel | Cancels all the changes made to the permissions. |
| Save | Saves the selection and provides access to the role based on the selection. |

# Chart View

In the Chart View, you can see the available charts and groups in a grid format and also schedule them by enabling the charts.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |
| Administrator/ Analyst | Schedule a chart* | Schedule a Chart |
| Administrator/ Analyst | View a chart | View a Chart |
| Administrator/ Analyst | Test a chart | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart | Manage a Chart Group and Chart |

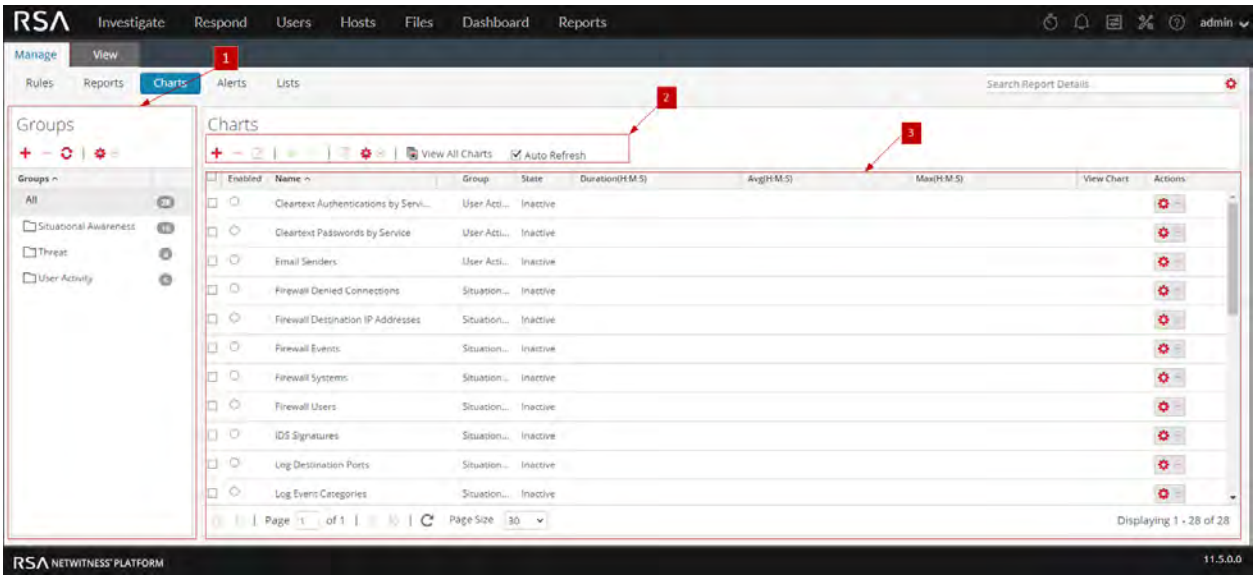
*You can complete these tasks here.

## Related Topics

- Configure and Generate a Chart

## Quick View

The following figure is an example with the important features labeled.

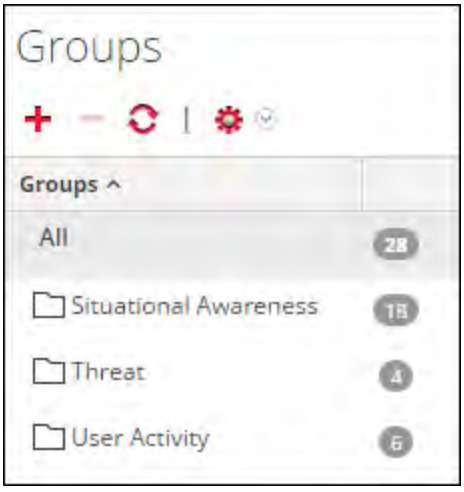


The Chart view includes the following panels:

1. Charts Groups panel
2. Charts toolbar
3. Charts panel

### Charts Groups Panel

The Charts Groups panel allows you to organize charts in a group. You can create a group, add charts to the group and move charts among groups. The following figure shows the Charts Groups panel.



The Charts Groups Panel includes the following options:

| Feature | Description |
|---|---|
| | Adds a new chart to the Reporting module. |
| | Deletes one or more selected charts. |
| | Edits a chart. |
| | Refreshes the view. |
| | Provides the following options: Import, Export and Permissions. |

## Charts Toolbar

The Charts toolbar allows you to add, modify, delete, duplicate, activate, deactivate, import and export a chart. You can also set access permissions for charts in a group.

The Chart toolbar includes the following options:

| Feature | Description |
|---|---|
| | Adds a new chart to the Reporting module. |
| | Deletes one or more selected charts. |
| | Edit charts. |
| | Enables the selected charts. |
| | Disables the selected charts. |
| | Creates a duplicate copy of the selected chart. |
| | Provides the following options: Import, Export, Export as Text and Permissions. |
| View All Charts | Displays all the executed charts. |
| Auto Refresh | Automatically refreshes the charts list. |
| | Allows users to filter unused charts. |

## Charts Panel

The Charts Panel presents all the charts in a tabular or grid format.

The following table lists the columns in the Chart panel and their description.

| Feature | Description |
|---|---|
| Enabled | ● - The chart is enabled.<br>○ - The chart is disabled. |
| Name | The name of the chart. |
| Group | The Chart Group to which the chart belongs. |
| State | The state of the chart:<br>• Queued<br>• Completed<br>• Failed |
| Duration (H:M:S) | The time taken to execute the latest chart. |
| Avg(H:M:S) | The average time taken to run the chart. |
| Max(H:M:S) | The maximum time taken to run the chart. |
| View Chart | A hyperlink that redirects to the View a Chart panel. |
| | The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export. |

# Execution History Panel

The Execution History panel allows you to fetch and display history details.

## Workflow

This workflow shows the procedure to view report or report groups.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports* | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access control for lists, rules or Reports | Manage Lists, Rules or Reports |

*You can complete these tasks here.

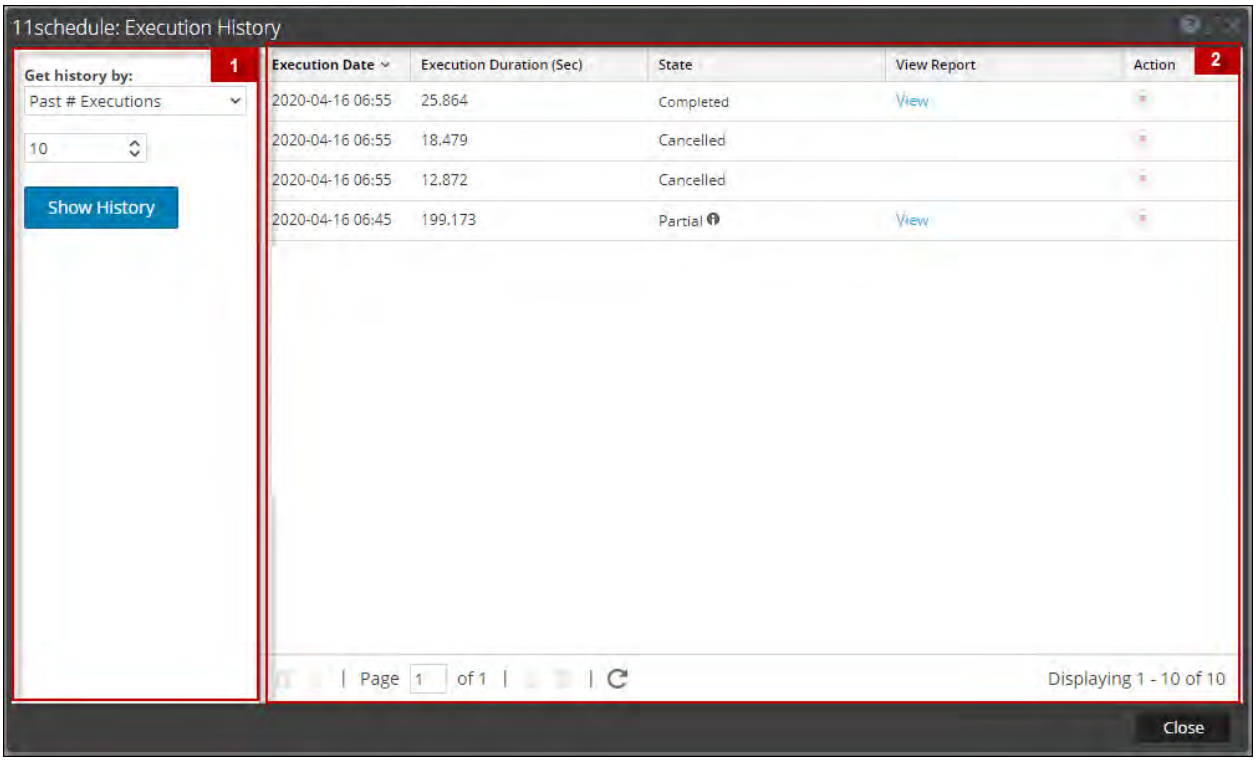
## Related Topics

- Configure and Generate a Report
- Generate List Panel

- Scheduled Reports View

## Quick View

The following figure is an example of the Execution History view.



## Features

The View Execution History has the following panels:

1 Execution History Options panel
2 Execution History Output panel

To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, do one of the following:

   - Hover the mouse over a report and click > **View Scheduled Reports**.
   - Click **#Schedules** column.
     The Schedule Reports view is displayed with the status of each of the scheduled report.
4. Select a scheduled report and do one of the following:

- Click > **Execution History**.
- Click from the **Scheduled Reports** Toolbar Panel.

## Execution History Options Panel

The Execution History Options panel allows you to fetch the history details based on either past n number of scheduled reports or a specific date range.

The following table lists the operations in the Execution History Options panel:

| Operation | Description |
|---|---|
| Get history by: | This is the criteria to view the execution history:<br>• **Past # Executions**: The past n number of scheduled reports. By default this option is displayed.<br>• **Range (specific)**: The start date and end date for the date range.<br><br>**Note:** The **From** and **To** field is populated in the NetWitness UI only when you select 'Range (Specific)' from the **Get history by** list. |
| From | The start date for the date range. |
| To | The end date for the date range. |
| Count | The number of execution history of the scheduled report to be displayed. |
| Show History | Shows the history details based on the selected criteria. |

## Execution History Output Panel

The Execution History Output panel displays the history details with the execution date, execution duration (seconds), state of the scheduled report, and a link to view the report.

The following table lists the various columns in the Execution History Output panel:

| Column | Description |
|---|---|
| Execution Date | The date on which the scheduled report was executed. By default, the execution date is in descending order. |
| Execution Duration (Sec) | The time duration taken to execute the scheduled report. |

| Column | Description |
|---|---|
| State | The state of the scheduled report:<br>• Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run.<br>• Queued: If a report is still waiting to get executed, the state of the report is displayed as queued.<br>• Running: If the report schedule is in progress, the state of the report is displayed as running.<br>• Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial.<br>• Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed.<br>• Completed: If a report schedule is successfully executed, the state of the report is displayed as completed.<br>• Canceled: When cancel request is completed, the state of the report is displayed as canceled.<br>• Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive.<br>• Not available: If the report schedule executed information is not available, the state of the report is displayed as not available. |
| View Report | The hyperlink to View a Report on full screen. |
| Action | Displays the icon to stop the execution schedule. |
| Close | Closes the execution history view. |

# Generate List Panel

The Generate List dialog allows you to generate and customize a list.

## Workflow

This workflow shows the procedure to create and schedule a report.

## What do you want to do?

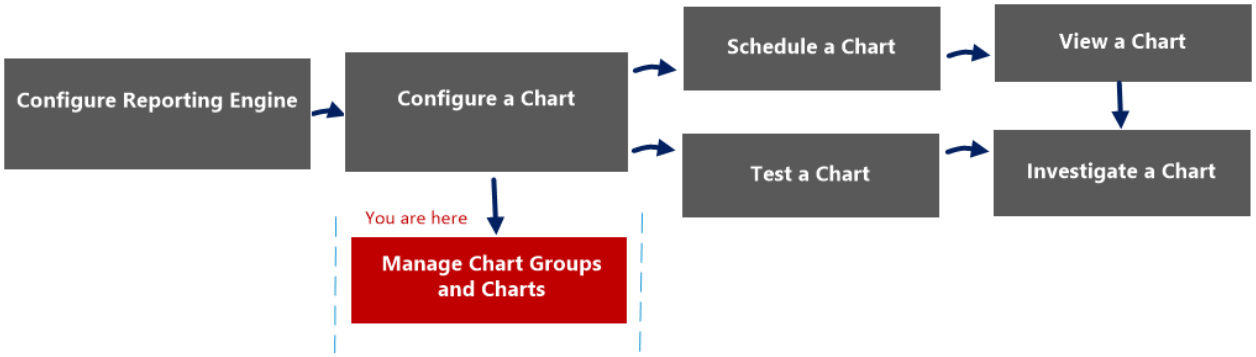
# Import Chart Dialog

In the Import Chart dialog, you can import charts containing subgroups and charts from other instances of NetWitness into the Chart Groups panel. Charts must be in a valid binary file that was exported from another NetWitness instance.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |
| Administrator/ Analyst | Schedule a chart | Schedule a Chart |
| Administrator/ Analyst | View a chart | View a Chart |
| Administrator/ Analyst | Test a chart | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart* | Manage a Chart Group and Chart |

*You can complete these tasks here.

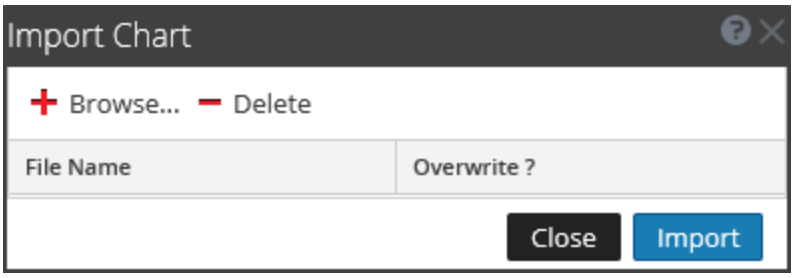
## Related Topics

- Configure and Generate a Chart

## Quick View

This dialog displays differently when you use it to import groups containing subgroups and charts from other instances of NetWitness into the Chart Groups panel.

The following figure is an example of the Import Chart dialog.



1. Click **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Charts Groups** panel, select a folder to import the file.
4. In the **Charts Groups** panel or **Charts** toolbar, click > **Import** to import the file.

The following table describes the features in the Import Chart dialog.

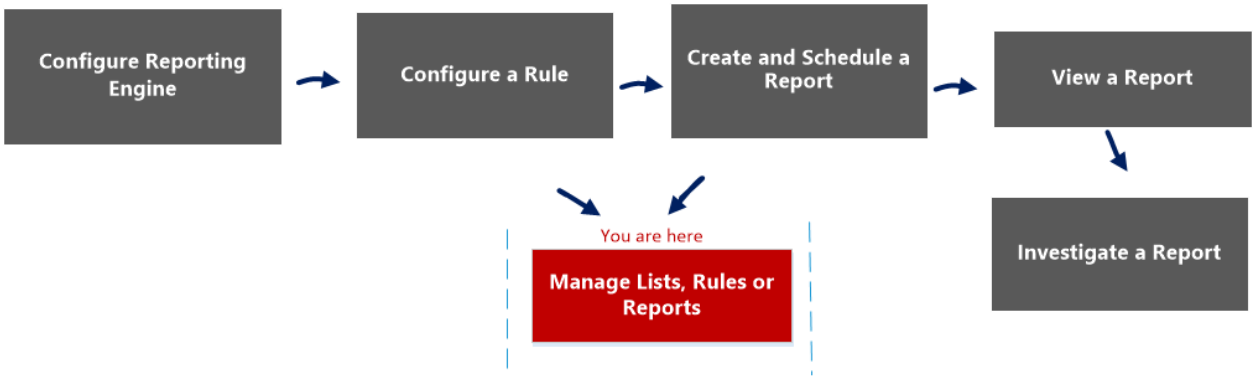
| Feature | Description |
|---|---|
| Browse | Displays a view of the local file system so that you can select the chart to be imported. |
| Delete | Deletes an imported report from the list of imported charts. |
| File Name | Displays a list of chart files that will be imported to your Charts module when you click Import. |
| Overwrite? | Allows you to select the option to overwrite an existing version of the chart you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed. |
| Close | Closes the dialog. If you have charts to select for import, but have not clicked Import. The charts are not imported, and are not saved in this dialog. |
| Import | Imports the selected charts to your Charts module. |

# Import Report Dialog

In Import Report dialog, you can import groups containing subgroups and reports from other instances of NetWitness into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness instance.

## Workflow

This workflow shows the procedure to manage reports or report groups.



## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access Control for lists, Rules or Reports* | Manage Lists, Rules or Reports |

*You can complete these tasks here.

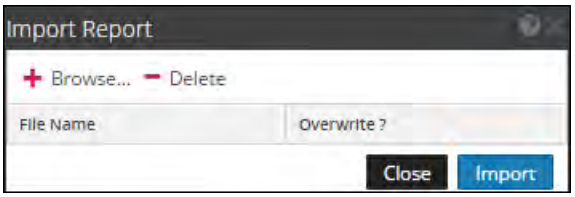
## Quick View



To access the Import Report dialog:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select a folder to import the file.
4. Do one of the following:
   - In the **Reports Groups** panel, click > **Import** to import a group.
   - In the **Reports** toolbar, click > **Import** to import a report.

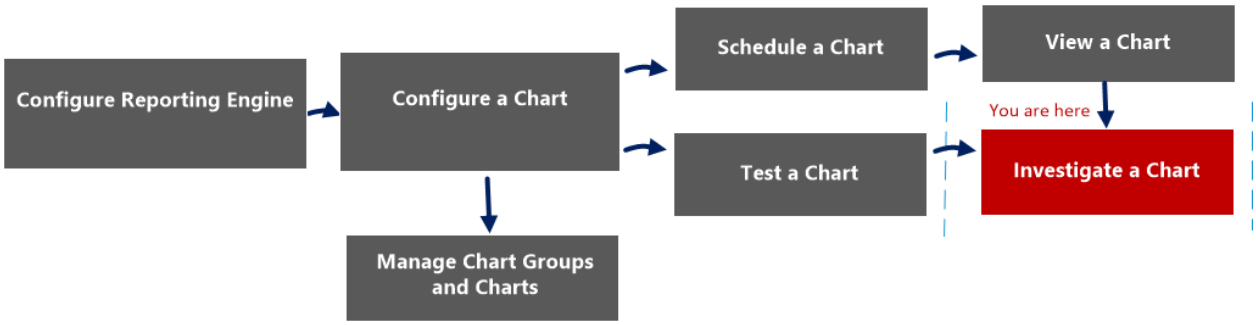
The following table lists the features of the Import Report dialog.

| Feature | Description |
|---|---|
| Browse | This option displays a view of the local file system so that you can select the report to be imported. |
| Delete | This option deletes an imported report from the list of imported reports. |
| File Name | Displays a list of report files that will be imported to your Reports module when you click Import. |
| Overwrite? | Allows you to select the option to overwrite an existing version of the report you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed. |
| Close | This option closes the dialog. If you select a report and not clicked Import. The reports are not imported, and are not saved in this dialog. |
| Import | This option imports the selected reports to your Reports module. |

# Investigate a Chart View

In the Investigate a Chart view, you can view and investigate chart details. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engin" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |

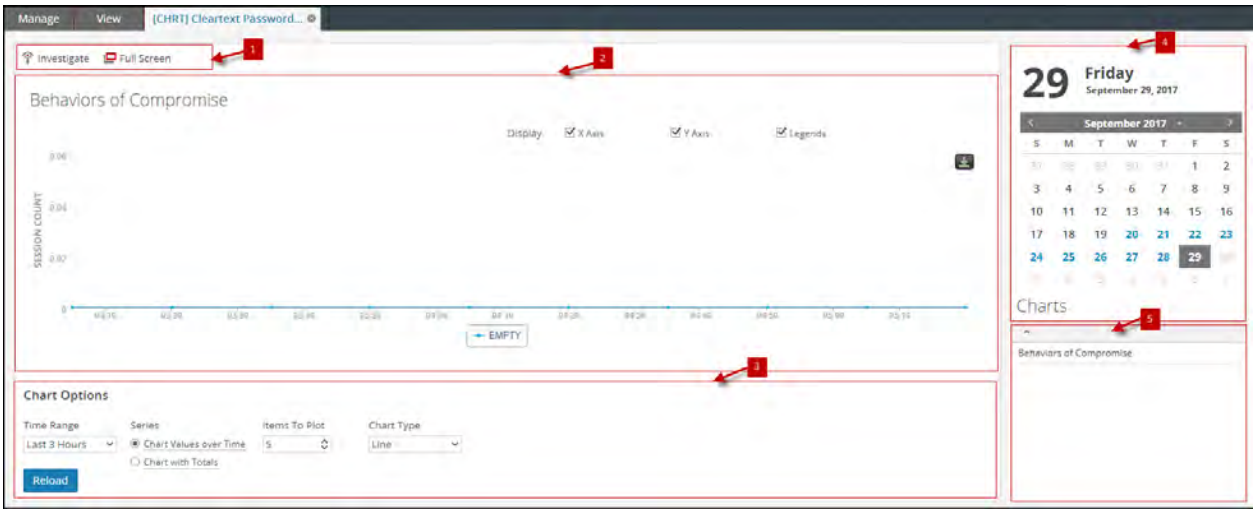
## Quick View

The following figure is an example with the important features labeled.



The View a Chart panel includes the following panels:

1. Chart toolbar
2. Chart Output panel
3. Chart Calendar panel
4. Chart Options panel
5. Chart Executed list

### Chart Toolbar

The Chart toolbar has options that allow you to investigate, and view the chart on another screen.

The following table lists the options in the Chart toolbar.

| Operation | Description |
|---|---|
| Investigate | Investigates the chart details. |
| Full Screen | Displays the chart on a full screen. |

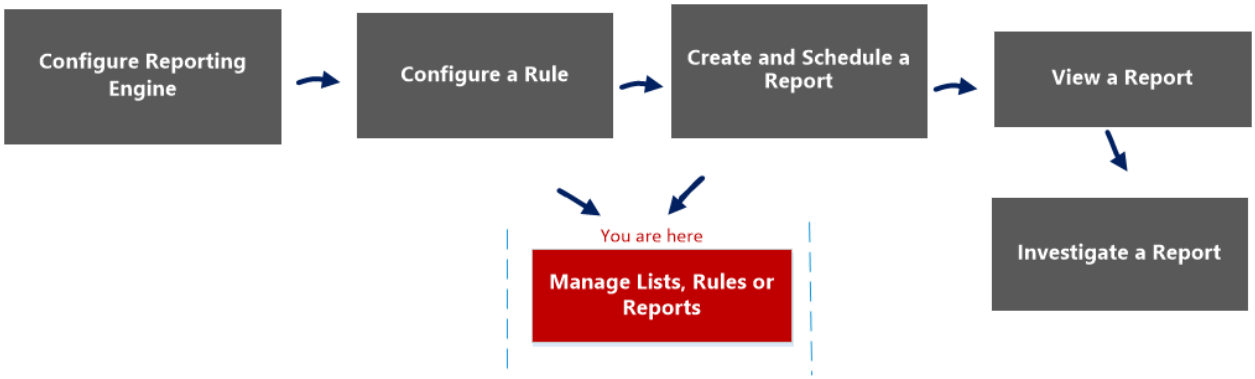
# Lists Permissions Dialog

In the Lists Permissions dialog, you can manage access permissions for a user role at the list or list group level. Only a user with **Read and Write** permission can configure the list in the Reporting Module.

## Workflow

This workflow shows the procedure to manage lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists. You can use lists to define rules for generating reports, charts and alerts.

You must ensure that Reporting Engine is configured on NetWitness.



## What do you want to do?

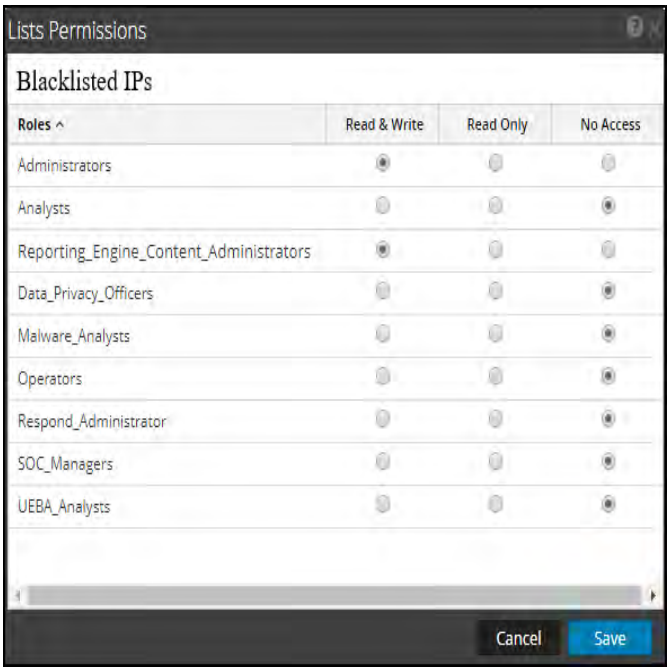
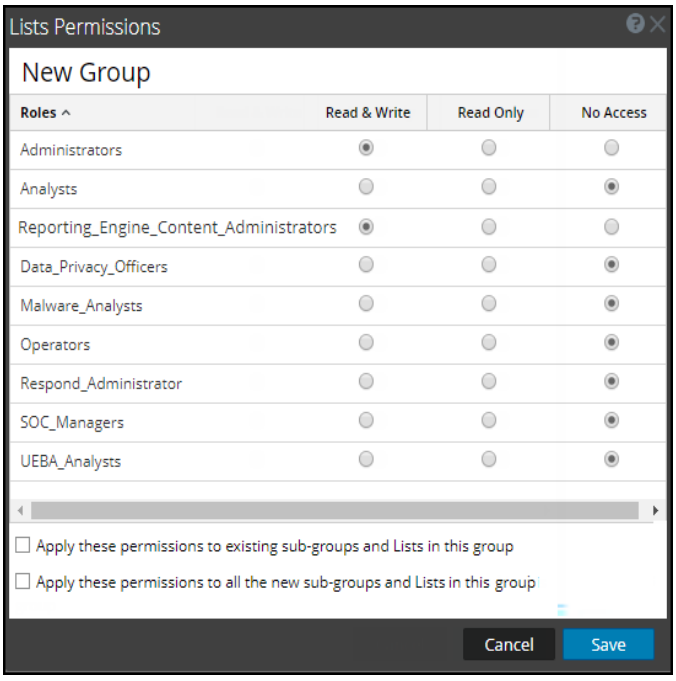
## Quick View

The following figures are examples of the Lists Permissions dialog and List Group Permission dialog:





To access this view

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The Lists view is displayed.
3. In the **Lists** view, select a report.
4. In the **Lists** toolbar, click > **Permissions**.
   The Reports Permissions dialog is displayed.

The following table describes the features in the Lists Permissions dialog:

| Feature | Description |
|---|---|
| Roles | Describes roles of the users logged into the NetWitness user interface. |
| Read & Write | Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule. |
| Read Only | Allows users to only access and view the list on the lists view. |
| No Access | Doesn't allow users to access or view the lists. |
| Apply these permissions to subgroups and lists in this groups | Automatically applies permissions to the subgroups and lists in the groups, if checkbox is selected. |
| Cancel | Cancels all the changes made to the permissions. |
| Save | Saves the selections and provides access to the roles based on the selections. |

# List View

In the List view you can see available lists and groups in a grid.

## Workflow

This workflow shows the procedure to define lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists. You can use lists to define rules for generating reports, charts and alerts.

You must ensure that Reporting Engine is configured on NetWitness.

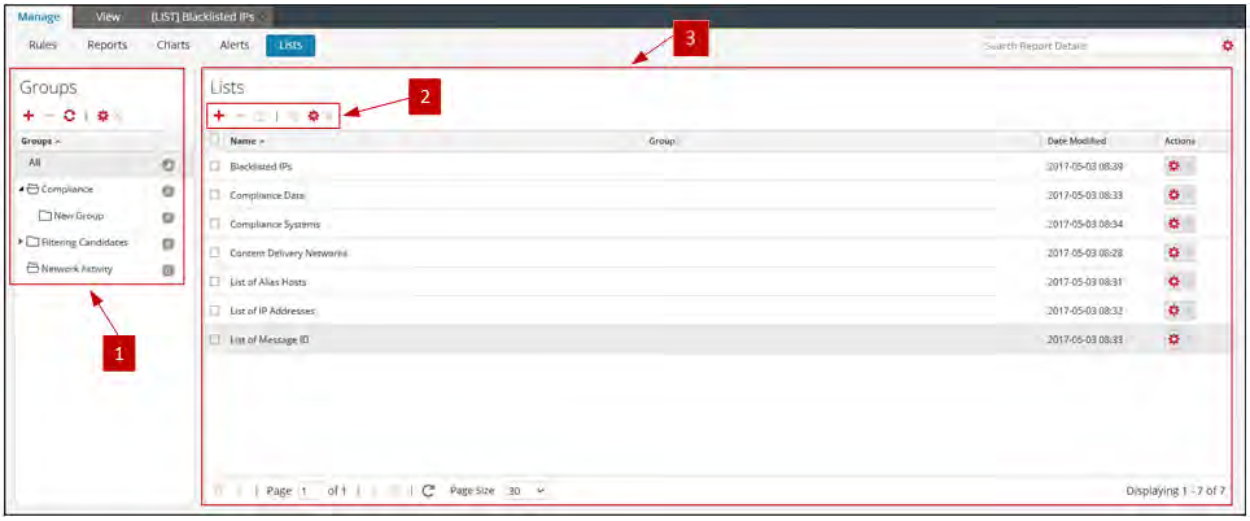
## Quick View

The following figure shows the List view.



To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

The List view includes the following panels:

1 Lists Groups panel
2 Lists toolbar
3 Lists panel

### Lists Groups Panel

The Lists Groups panel provides a list of groups used to organize lists and has a toolbar that allows you to create and manage the groups.

| Feature | Description |
|---|---|
| | Allows users to add a new group to the Reporting module. |
|  | Allows users to delete groups. |
| | Refreshes the view. |

| Feature | Description |
|---|---|
| | Allows users to access following options: Import, Export and Permissions. |
| | Allows users to filter unused lists. |

You can perform the following actions using the Lists Groups panel.

- Refresh lists in a group.
- Move lists between different groups. You can move a list from one group to another by dragging and dropping the list in the required group.
- Create list groups.
- Delete list groups.
- Import list groups.
- Export list groups.
- Set access control for list groups.

## Lists Toolbar

| Feature | Description |
|---|---|
| | Allows user to add a new list to the Reporting module. |
|  | Allows user to delete one or more selected lists. |
| | Allows user to edit lists. |
| | Creates a duplicate copy of the selected list. |
| | Allows user to access the following options: Import, Export and Permissions. |

## Lists Panel

The Lists panel displays all the lists defined in a tabular format.

| Column | Description |
|---|---|
| Name | Displays the name of the list.<br>**Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column. |
| Group | Displays the list group to which the list belongs. |
| Date Modified | Displays the date and time when the list was modified. |

# Reports Permissions Dialog

In the Reports Permissions dialog, the users with 'Read & Write' access permission can configure permissions.

## Workflow

This workflow shows the procedure to manage reports or report groups.

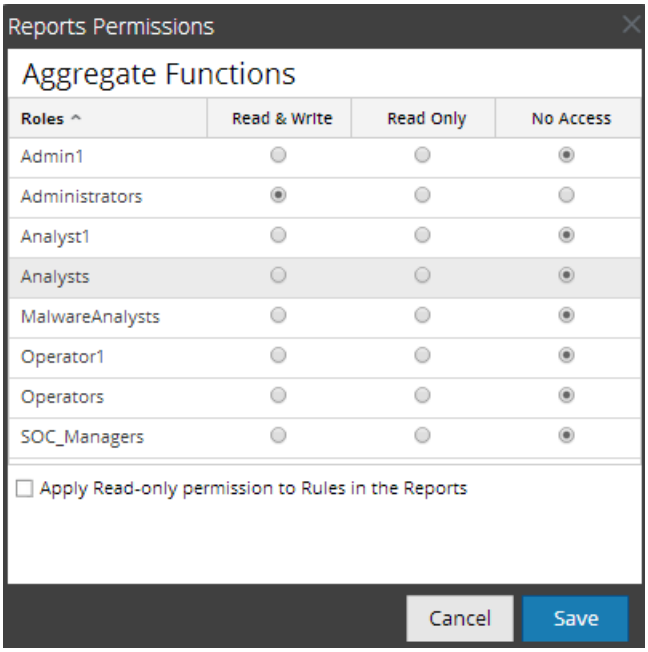
## Quick View



To display the Reports Permissions dialog:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report.
4. Click > **Permissions**.
   The Reports Permissions dialog is displayed.

**Note:** When you select the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

The following table describes the features in the Reports Permissions dialog.

| Feature | Description |
|---|---|
| Roles | Displays all the roles who can get access to the permissions. |

| Feature | Description |
| --- | --- |
| Read&Write | Allows you to get Read&Write access to the Rules in the Reports. |
| Read Only | Allows you to get Read Only permissions to the Rules in the Reports. |
| No Access | If you select this option, you will not get permission to the Rules in the Reports. |
| Apply Read-only permissions to Rules in the Reports | Allows to set Read Only permissions to the Rules in the Reports for all the roles . |
| Cancel | This option cancels all the changes made to the permissions. |
| Save | This option saves the selections and provides access to the roles based on the selections. |

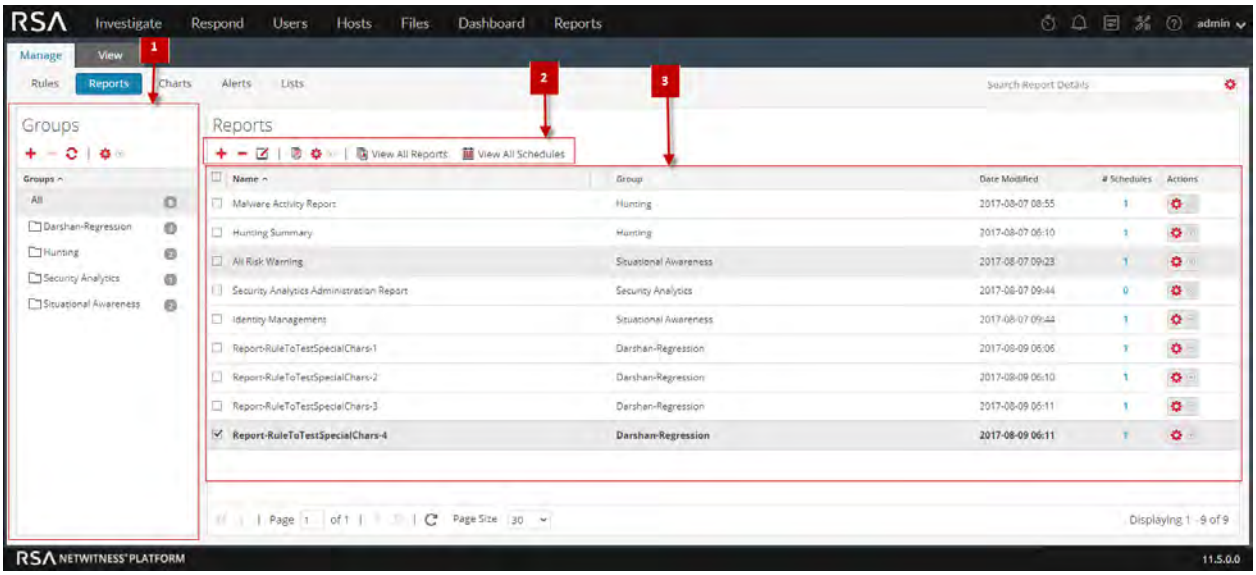
## Quick View



To access this view:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Reports view is displayed.

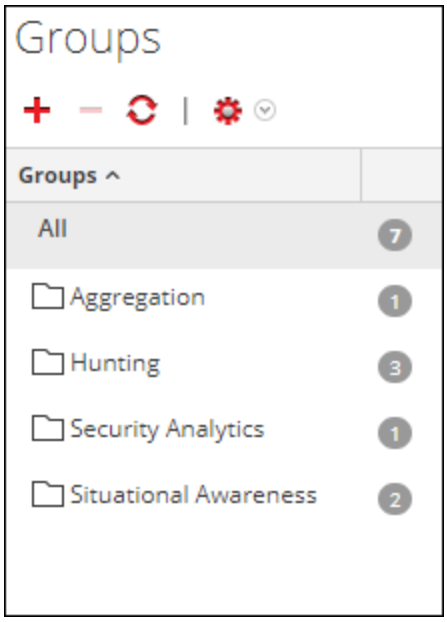
## Features

The Report view includes the following sections:

| | |
|---|---|
| 1 | Reports Groups panel |
| 2 | Reports toolbar |
| 3 | Reports panel |

### Report Groups Panel

The Report Groups panel allows you to organize reports in a group. You can create a report group, add reports to the group, and move reports among groups. You can view all reports by selecting All option under the Groups column.



| Feature | Description |
|---|---|
| + | This option allows you to add a new report to the Reporting module. |
| − | This option allows you to delete one or more selected report. |
| ↻ | This option refreshes the view. |
| ⚙ | The actions menu has the following options: Import, Export and Permissions. |

## Reports Toolbar

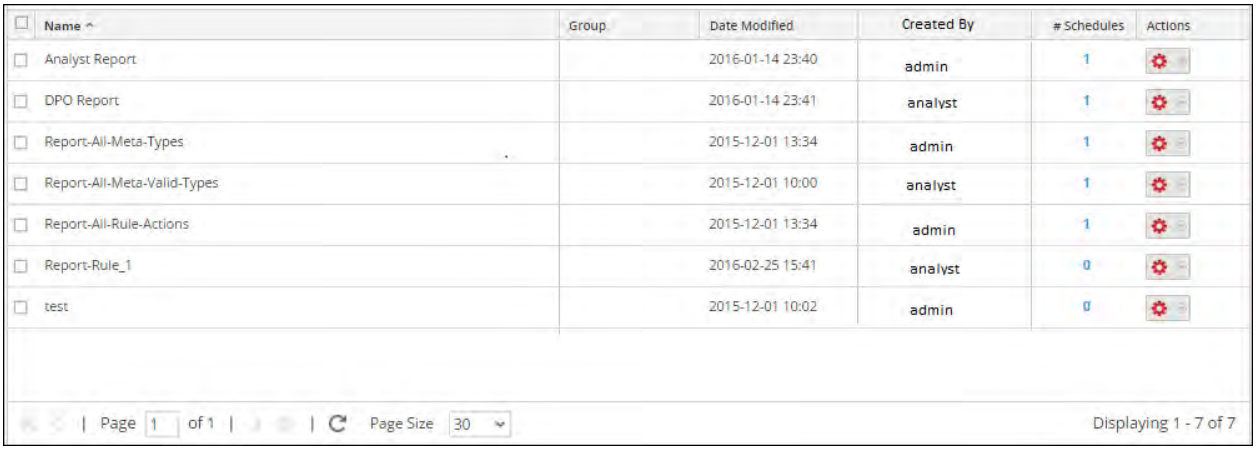
The Reports toolbar allows you to add, modify, delete, duplicate, import and export reports. You can also set access permissions for a report in a group.

| Feature | Description |
|---|---|
| + | This option allows you to add a new report to the Reporting module. |
| − | This option allows you to delete one or more selected reports. |
| ✎ | This option allows you to edit a chart. |
| ⧉ | This option creates a duplicate copy of the selected report. |
| ⚙ | The actions menu has the following options: Import, Export , Export as Text and Permissions. |

| Feature | Description |
|---|---|
| View All Reports | This option allows you to view a list of reports along with their schedule name and time. |
| View A | This option allows you to view all the scheduled reports. |

## Report List Panel

The Report List panel lists all the reports in a tabular format.



The following table describes the columns in the Report List panel.

| Column | Description |
|---|---|
| Name | The name of the report. |
| Group | The Report Group to which the report belongs. |
| Date Modified | The date and time when the report was modified. |
| Created By | The creator of the report. |
| #Schedules | The count indicates the number of schedules created for a report. |
| Actions | The actions menu has the following options: Schedule Report, View Scheduled Reports, Delete, Edit, and Export. |

# Rule Permissions Dialog

The Reporting module provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. When creating user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

## Workflow

This workflow shows the procedure to manage rule or rule groups.

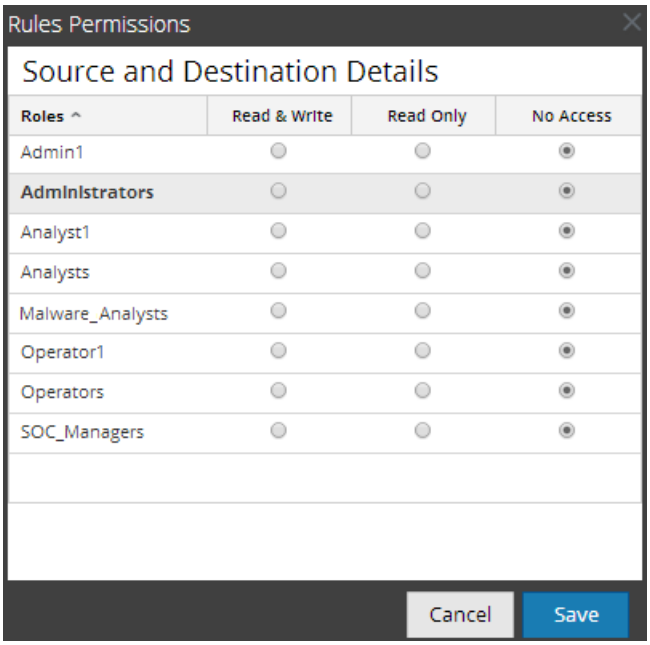
## Related Topics

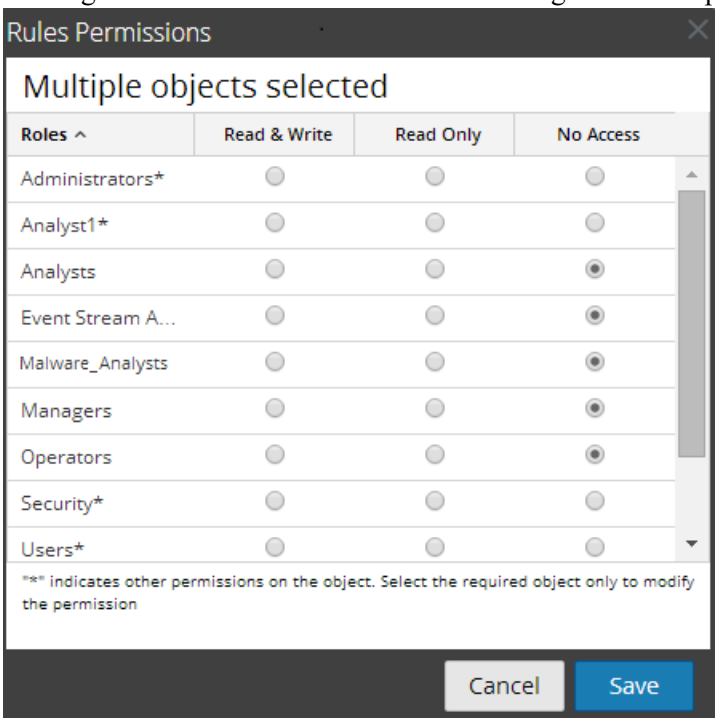
- Rule View

## Quick View

This figure shows the Rules Permissions dialog for a single rule.



This figure shows the Rules Permissions dialog when multiple rules are selected.



The dialog has a different appearance for rule groups versus rules. To access the dialog:

1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, select one or more rules or a rule group.

3. Click > **Permissions** in the toolbar.

   The Rules Permissions dialog is displayed.

| Feature | Description |
|---|---|
| Roles column | Lists the NetWitness user roles, both built-in and custom roles. Each user who is logged in to NetWitness has user roles assigned.<br>When multiple rules are selected, the asterisk beside the role name, for example, `Security*`, indicates there are other permissions available on that user role. To change the other permissions, you must select the user role and change the access permission. |
| Read & Write column | When the checkbox in this column is selected, the corresponding user role has permission to view, edit, delete, import, and export rules in the Rules view. The user can also change the permission on the rule. |
| Read Only column | When the checkbox in this column is selected, the corresponding user role has permission to view the rules in the rule group. |
| No Access column | When the checkbox in this column is selected, the corresponding user role cannot view or edit the rules in the rule group.<br>Before applying rule permissions, this is the default permission set for all the user roles though the checkbox is unchecked. |
| Apply these permissions to sub-groups and Rules in this group checkbox | When checked, NetWitness applies permissions to sub-groups and rules in the group. |
| Cancel option | Clicking Cancel closes the dialog without saving any changes made. |
| Save option | Clicking Save closes the dialog and updates the rule group permissions for user roles.<br>If specified, the access permissions are applied to subgroups and child objects of this group.<br>When multiple rules are selected, the access permission is applied to all the selected rules. |

# Rule View

The Rule view is the user interface for managing rules.

## Workflow

This workflow shows the procedure to define rule or rule groups.

## Related Topics

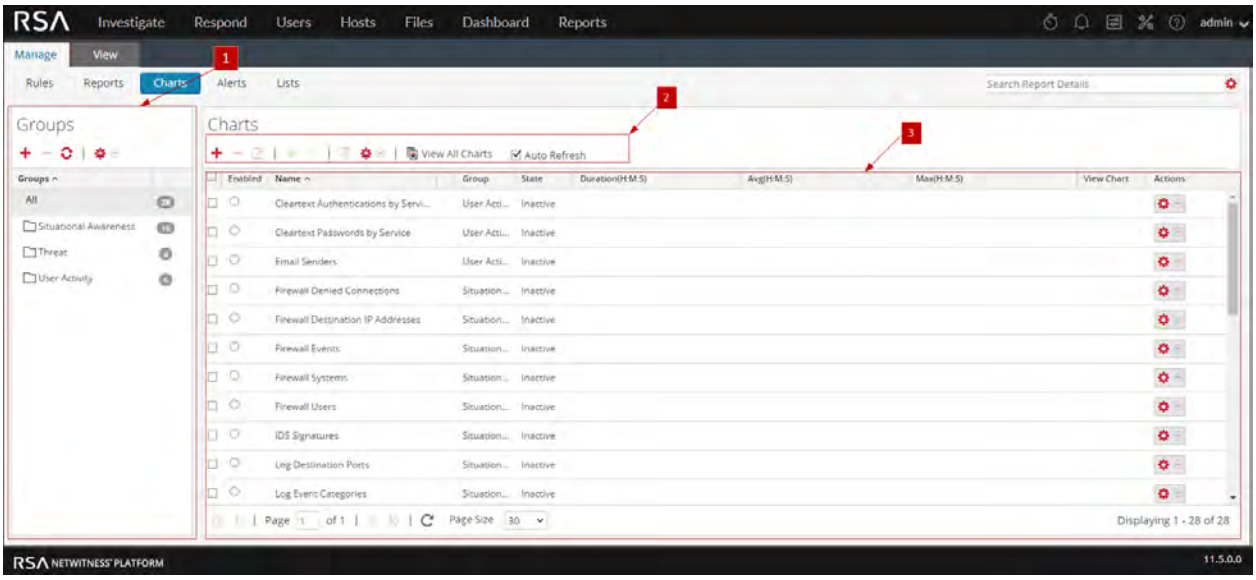
- Configure and Generate a Chart

## Quick View

The following figure shows the Schedule a Chart view.



The Schedule a Chart view includes the following panels:

1 Charts Groups panel
2 Charts toolbar
3 Charts panel

## Charts Toolbar

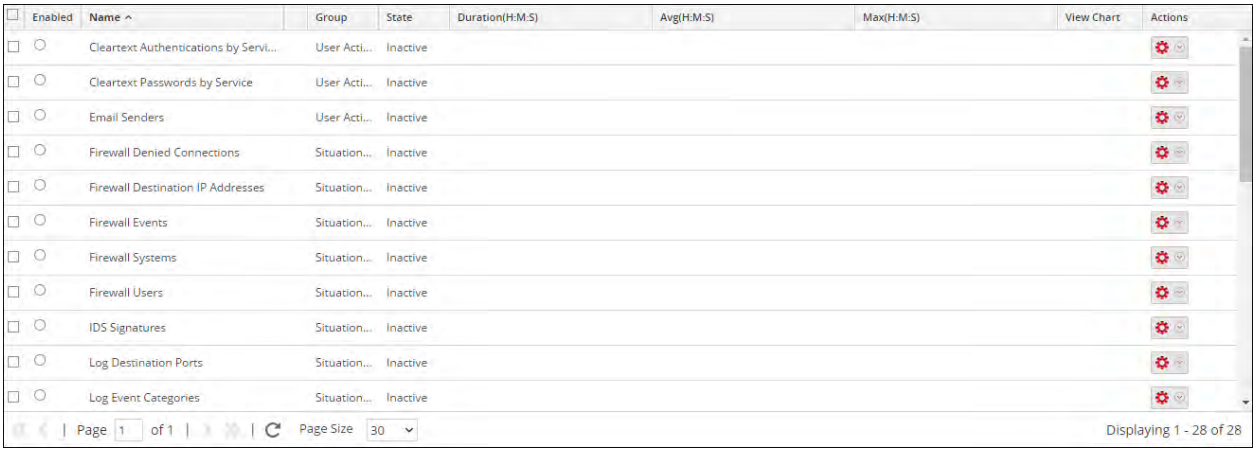
The Charts toolbar allows you to add, modify, delete, duplicate, enable, disable, import and export a chart. You can also set access permissions for charts in a group.

The Charts toolbar includes the following options:

| Feature | Description |
|---|---|
| + | Adds a new chart to the Reporting module. |
| − | Deletes one or more selected charts. |
| | Edit charts. |
| | Enables the selected charts. |
| | Disables the selected charts. |
| | Creates a duplicate copy of the selected chart. |
| | Provides the following options: Import, Export, Export as Text and Permissions. |
| View All Charts | Displays all the executed charts. |
| Auto Refresh | Automatically refreshes the charts list. |

## Charts Panel

The Charts Panel presents all the charts in a tabular or grid format.



The following table lists the columns in the Charts panel and their description.

| Feature | Description |
|---|---|
| Enabled | - The chart is enabled.<br>- The chart is disabled. |
| Name | The name of the chart. |
| Group | The Chart Group to which the chart belongs. |
| State | The state of the chart:<br>• Queued<br>• Completed<br>• Failed |
| Duration (H:M:S) | The time taken to execute the latest chart. |
| Avg(H:M:S) | The average time taken to run the chart. |
| Max(H:M:S) | The maximum time taken to run the chart. |
| View Chart | A hyperlink that redirects to the View a Chart panel. |
| | The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export. |

# Schedule Report Panel

The Schedule Report panel allows you to schedule a customized report. Prior to scheduling a report, you can create a dynamic list (with the overwrite option selected) with services added. For more information, see "Generate a List from the Scheduled Report" section in Create and Schedule a Report. Then use the list to generate a report with details in the report like services and host names.

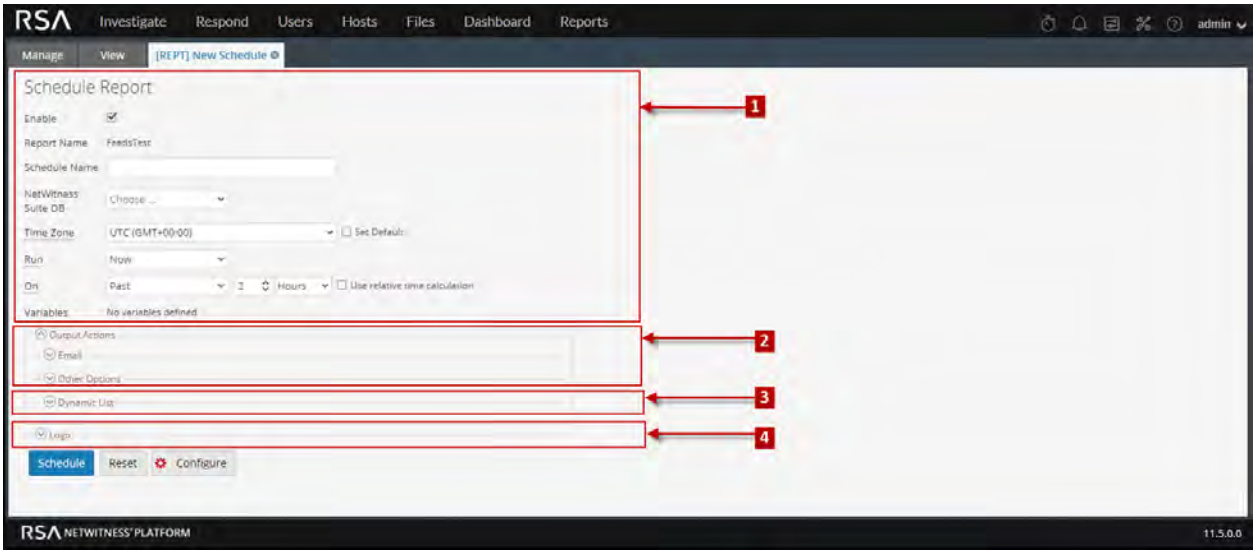
## Quick View



To access this view:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Reports view is displayed.
3. In the **Reports** panel, click > **Schedule Report**.

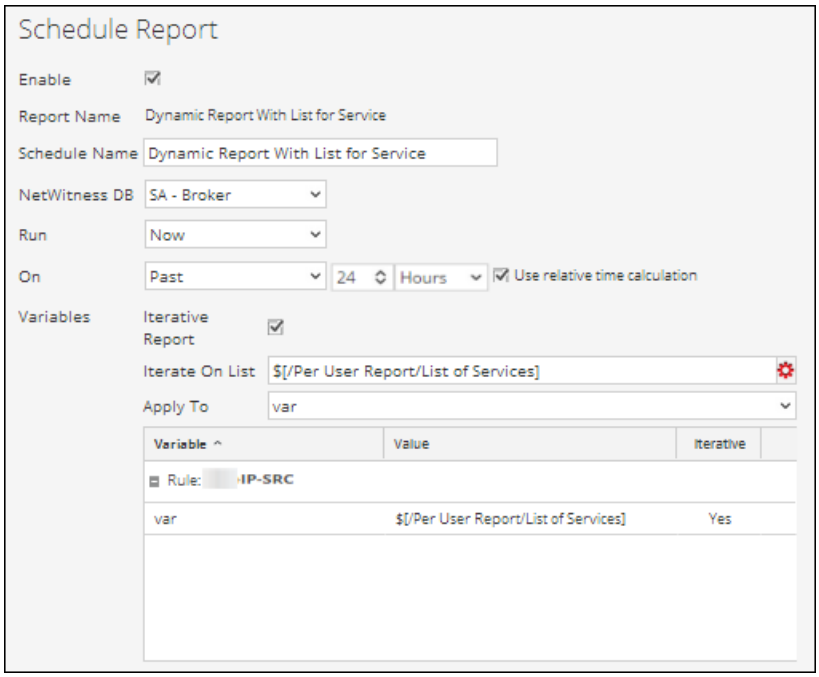
## Features

The Schedule Report view consists of the following panels:

| | |
|---|---|
| 1 | Schedule Report View |
| 2 | Output Actions Panel |
| 3 | Dynamic List Panel |
| 4 | Logo Panel |

### Schedule Report View

The Schedule Report view allows you to schedule reports.



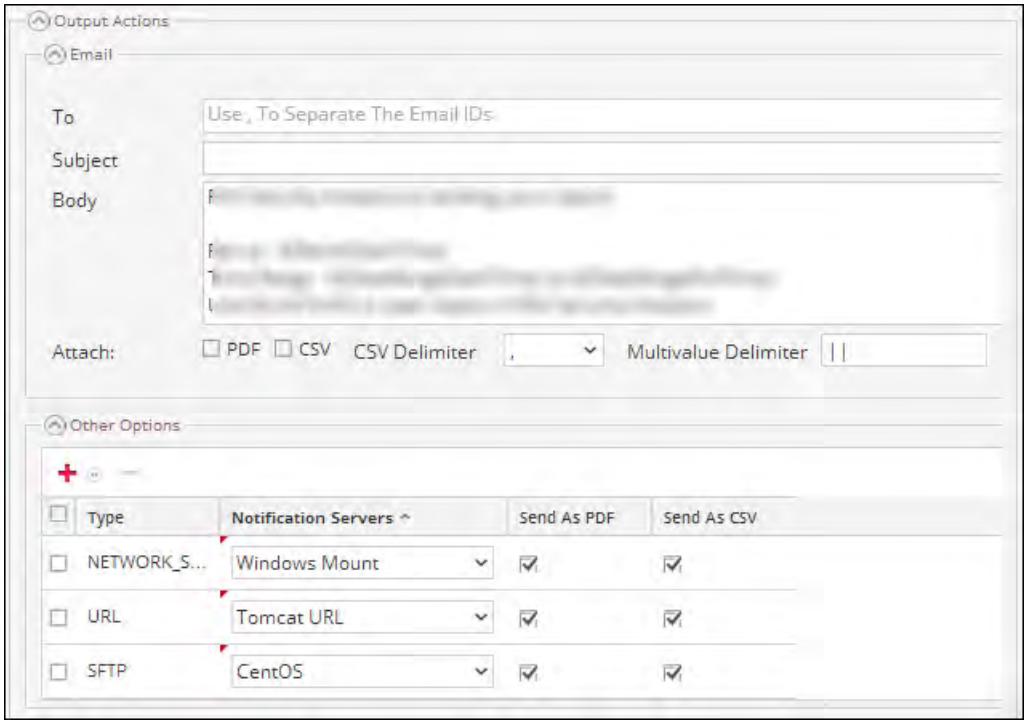
The following table lists the fields in the Schedule Report panel.

| Field | Description |
|---|---|
| Enable | Enables the report schedules and runs the report. |
| Report Name | The name of the report. |
| Schedule Name | The name of the scheduled report configuration. |
| NetWitness DB | The database can be NWDB and Warehouse DB depending on the type of database that you selected in the rule definition. If the report has rules of NWDB and Warehouse DB types, all the database types or rule types are displayed. |
| Warehouse Resource Pool | If the report has rules of Warehouse DB, the Warehouse Resource Pool drop-down is displayed to select the pools or queues available in the cluster. If no pools or queues are entered for the Reporting engine, this field is disabled. For more information, see "Step 5: Configure Task Scheduler for a Reporting Engine" topic in the *Host and Services Configuration Guide*. |
| Run | Provides the type of schedule for the run configuration:<br>• Ad-hoc execution<br>• Hourly execution<br>• Daily execution<br>• Weekly execution<br>• Monthly execution |
| On | The data range on which the query is run. |

| Field | Description |
|---|---|
| Use relative time calculation | Uses the relative time duration to schedule a report. |
| Iterative Report | Select the checkbox to schedule a report for the selected list value. |
| Iterate on List | Click this button to navigate to the List Selection panel and select a list. The following figure displays this panel:<br>  <br>The List Selection panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected. |
| Apply To | Apply list values on the selected variable. |
| Variables | Displays the rule variables along with their associated values and the iterative properties included in the report.<br>**Note:** Depending on the rule chosen while creating a report, you can view dynamic variables defined for the rule in the **Variables** field of the Schedule Report panel. For example, Test-Country is the rule having the dynamic variable var. |
| Schedule | Schedules the report. |
| Reset | Resets the scheduled report. |
| Configure | Allows you to alter the Reporting Engine configuration details on the "Reporting Engine General Tab" topic in the *Host and Services Configuration Guide*.<br>**Note:** This button is visible on the Schedule Report panel only when you have the 'Manage Device' access permissions on the Reporting module. |

## Output Actions Panel

The Output Actions panel specifies output actions to notify the email recipient when the report execution completes and also sends reports in PDF and CSV formats as attachments in the email, based on your selection.



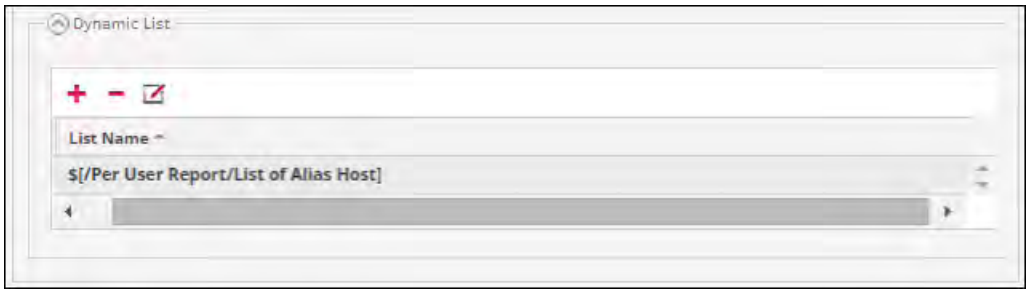
The following table lists the fields in the Output Actions panel.

| Field | Description |
|---|---|
| To | A comma-separated list of email addresses to receive the output. |
| Subject | The subject entered in the mail. |
| Body | The body of the email. By default, the body field is populated with pre-defined text that has certain variables that will add meta appropriate to the generated report.<br>In the Reporting Engine, these variables are replaced with actual values.<br>• `${RanAtStartTime}` : The Start time of the report.<br>• `${DataRangeStartTime}` : The Start time of the data time range.<br>• `${DataRangeEndTime}` : The End time of the data time range.<br>• `${LinkToSA}` : The link to the NetWitnessHost from the email which in turn opens the report in NetWitness interface.<br>• `${ReportName}` : The name of the report.<br>• `${DataSource}` : The name of the data source. |

| Field | Description |
|---|---|
| Attach: | The output format in which the report is attached to the email, such as PDF or CSV as configured in the Schedule Report dialog. |
| CSV Delimiter | The default CSV delimiter is comma (,). If the CSV content contains a comma, you must identify a unique separator so the content is stored in its original form. For example, if msg is a column in the report to be saved as CSV and the msg content is as follows: `ASA-SSM-CSC-20 Module in slot 1," application reloading ""CSC SSM""," version ""6.2.1599.0"" CSC SSM scan services are reloading because of a pattern file or configuration update`<br><br>The above content will be included in three columns due to the commas (,). To avoid this, you must specify a different delimiter such as a pipe line character "\|".<br><br>**Note:** To import the CSV file into Microsoft Excel, use the Data > From Text option in the Excel application. When you import the CSV file you must specify the file type of the file being imported as Delimited and use the same delimiter that you specify to generate the CSV file. |
| Multivalue Delimiter | The data in multivalued fields are separated by the multivalue delimiter. The default Multivalue delimiter is two pipe line characters (\|\|). |
| Other Options | You can select an SFTP, URL, or Network Share location configured in ((RE}} and then send the report either in PDF or CSV format based on the requirement. |
|  | Select this option to send the report to the SFTP, URL or Network Share location configured in the Reporting Engine Services Config view. |
| Type | The type of output action chosen. For example, SFTP, URL or Network Share. |
| Output Actions | Select the SFTP, URL or Network Share name configured in the Reporting Engine Services Config view. |
| Send as PDF / Send as CSV | Select these options to send the report either in PDF or CSV format, or both to the configured Notification Server (SFTP, URL or Network Share). |

## Dynamic List Panel

The Dynamic List panel populates the lists created and you can add, edit or delete the list. The list is generated based on the scheduled report which can be viewed in the Lists view.



The following table lists the operations in the Generate List panel.

| Operation | Description |
|---|---|
| | Adds a new list to the report. |
|  | Deletes all the lists added to the report. |
| | Displays the Generate List dialog. |
| List Name | The name of the list chosen from the List Selection panel. For more information on the List Selection panel topic, see Generate List Panel. |

## Logo Panel

The Logo panel populates the default logo from the Select a Logo panel. For more information on choosing a logo from this panel, see "Manage and Select a Report Logo" section in the Manage Lists, Rules or Reports.

You can set the default logo for a Reporting Engine. This is the logo that is used in the generated reports. For more information on choosing a logo, see Select a Logo Dialog.

**Note:** If you have not selected any logo then the default RSA logo is used on the report. The option **Save as PDF** for the previously executed reports does not support a new customer logo. It displays the default RSA Logo, if the customer logo must be displayed in the Schedule a Report view.

# Scheduled Reports View

The Scheduled Reports view allows you to create, view and manage scheduled reports.

## Workflow

This workflow shows the procedure to create and schedule a report.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator / Analyst | Configure Reporting Engine | For more information, see "Configure the Data Sources" topic in the *Reporting Engine Configuration Guide* |
| Administrator / Analyst | Create a List or List Group/Create or Deploy a Rule/Test a Rule | Configure a Rule |
| Administrator / Analyst | Create and Schedule a Report* | Create and Schedule a Report |
| Administrator / Analyst | View a report or list of all reports | View a Report |
| Administrator / Analyst | Investigate a Report | Investigate a Report |
| Administrator / Analyst | Manage/Access Control for lists, Rules or Reports* | Manage Lists, Rules or Reports |

*You can complete these tasks here.

## Related Topics

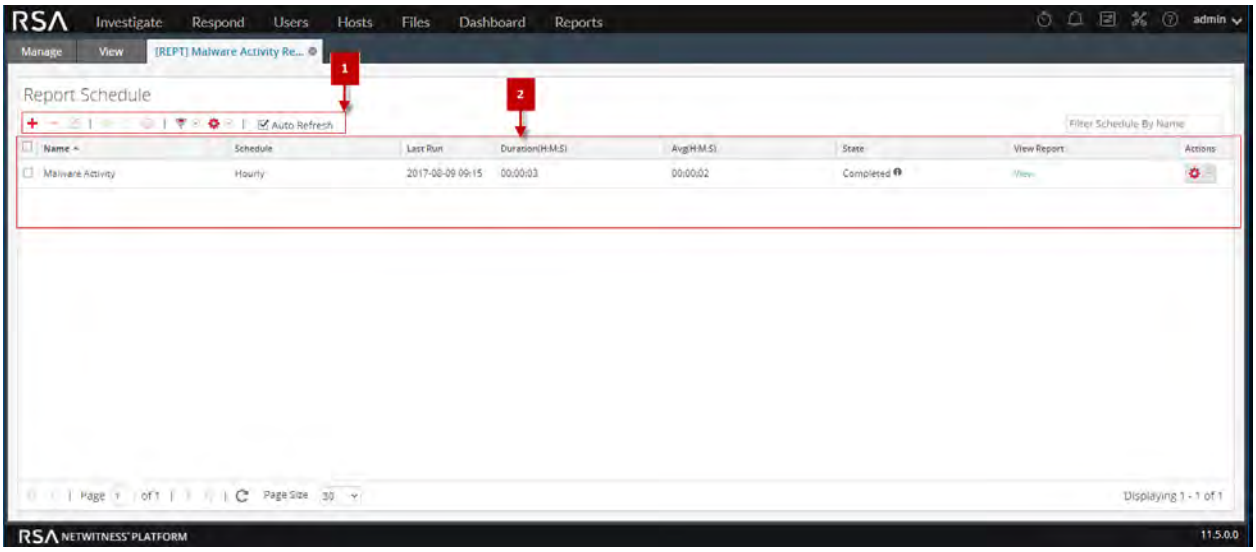
- Schedule Report Panel
- Reports Permissions Dialog

## Quick View



To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:

   - Click > **View Scheduled Reports**.
   - Click the **Schedules** column.

## Features

The View Scheduled Reports has the following features:

1 Report Schedule Toolbar
2 Report Schedule List panel

### Report Schedule Toolbar

The Scheduled Reports has options to add, modify and delete the scheduled report as well as options to enable or disable the selected run configuration.

The following table lists the operations in the Scheduled Reports toolbar.

| Operation | Description |
|---|---|
| | Create a new report schedule. |
|  | Delete the selected report schedule. |
| | Edit the selected report schedule.<br>**Note:** Double-click on a desired report schedule to edit it. |
| | Enables the selected report schedule. |
| | Disables the selected report schedule. |
| | View the history of the scheduled report. |
| | Filter schedules based on the type of schedule. (For example, AdHoc) |
| | Allows you to set permissions for the selected scheduled report. |
|   | Automatically refreshes the scheduled reports list. |
|   | Searches schedules based on the schedule name. |

## Report Schedule List Panel

The Scheduled Reports List panel lists the scheduled reports in a tabular format.

The following table lists the columns in the Scheduled Reports List panel:

| Column | Description |
|---|---|
| Name | The name of the scheduled report. |
| Schedule | The type of schedule for the run configuration:<br>• Ad-hoc execution<br>• Hourly execution<br>• Daily execution<br>• Weekly execution<br>• Monthly execution |
| Last Run | Displays the last time the report was run. |
| Duration(H:M:S) | Displays the time taken for last execution of the report. |

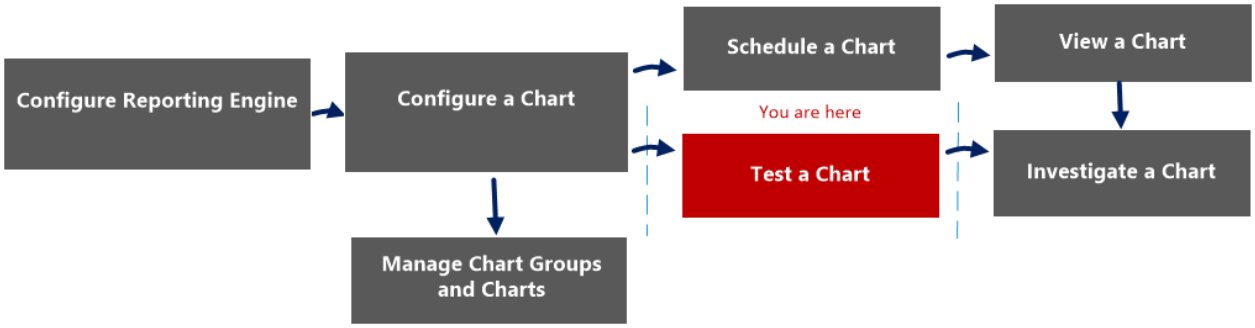
| Column | Description |
| --- | --- |
| Avg (H:M:S) | Displays the average time taken to run the report. |
| State | Indicates the state of the scheduled report.<br>• Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run.<br>• Queued: If a report is still waiting to get executed, the state of the report is displayed as queued.<br>• Running: If the report schedule is in progress, the state of the report is displayed as running.<br>• Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial.<br>• Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed.<br>• Completed: If a report schedule is successfully executed, the state of the report is displayed as completed.<br>• Canceled: When cancel request is completed, the state of the report is displayed as canceled.<br>• Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive.<br>• Not available: If the report schedule executed information is not available, the state of the report is displayed as not available. |

| Column | Description |
| --- | --- |
|  | Click to view the rule execution information and output action information. This pop-up notifies the status of multiple rules in a report and the time taken for its execution.<br><br>**Note:** You can view the rule execution and output action information for a scheduled report having the state **Completed**, **Running**, **Partial** or **Failed**. By default, the Output Actions for Completed Report on Reporting Engine Config page is set to enable, to receive an email when the report status is completed. To receive an email for **Failed** or **Partial** reports, you must disable this option. |
| View Report | Click to view the rule execution information on the View a Report Panel. You can view the rule execution information for a scheduled report having the state 'running' as well. |

# Test a Chart View

In the Test a Chart view, you can view and test the charts.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |
| Administrator/ Analyst | Schedule a chart | Schedule a Chart |
| Administrator/ Analyst | View a chart | View a Chart |
| Administrator/ Analyst | Test a chart* | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart | Manage a Chart Group and Chart |

*You can complete these tasks here.

## Related Topics

- Configure and Generate a Chart

## Quick View

The following figure is an example with the important features labeled.

The Test a Chart view consists of the following panels:

1 Chart toolbar
2 Chart Output panel
3 Chart Options panel

## Chart Toolbar

The Charts toolbar allows you to investigate on a particular chart and change the screen to full screen.

| Feature | Description |
|---|---|
| Investigate | Investigates further on the selected chart. |
| Full Screen | Displays the chart in full screen. |

## Chart Output Panel

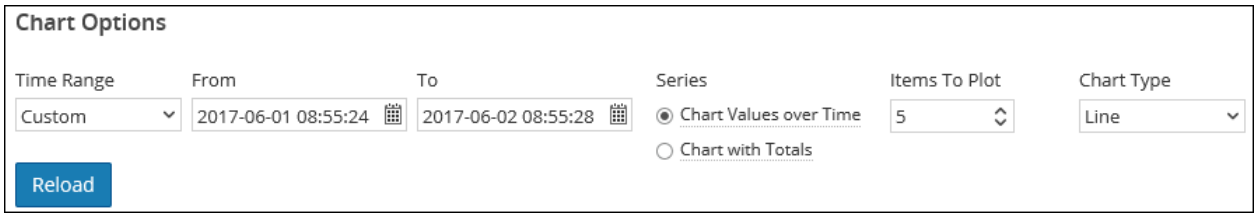
The Chart Output panel displays the information in a chart format for the selected time chart options.

The following table lists the features in the Test a Chart View and their descriptions.

| Feature | Description |
|---|---|
| Display | Allows you select the values that needs to be displayed and have the following options: X Axis, Y Axis and Legends. |
| X Axis | Displays the session count. |
| Y Axis | Displays the actual output. |
| Legends | Displays the list of variables appearing in the chart. |

## Chart Options Panel

The following figure shows the Chart Options panel, which displays the time range, series, and chart type fields to configure the chart display.



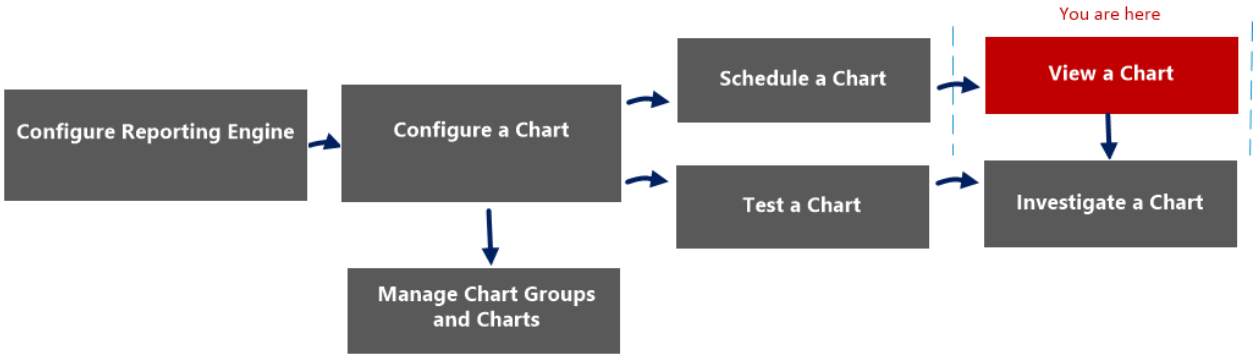
The following table lists the fields in the Charts Options panel and the descriptions.

| Feature | Description |
|---|---|
| Time Range | The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option. |
| From | The start date and time. (only for custom options). |
| To | The end date and time. (only for custom options). |
| Series | The series field provides you with two options:<br>• Chart Values over Time: Renders the chart for the entire time range selected.<br>• Chart with Totals: Renders the summary of data for the selected date range. |
| Items to Plot | The maximum number of events the user wants to view on the chart. |
| Chart Type | The type of chart to be rendered either area, bar, column, line, step line, step area, spline area or spline. |

# View a Chart Panel

In the View a Chart panel, you can view and manage charts. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |
| Administrator/ Analyst | Configure a chart | Configure a Chart |
| Administrator/ Analyst | Schedule a chart | Schedule a Chart |
| Administrator/ Analyst | View a chart* | View a Chart |
| Administrator/ Analyst | Test a chart | Test a Chart |
| Administrator/ Analyst | Investigate a chart | Investigate a Chart |
| Administrator/ Analyst | Manage a chart group and chart | Manage a Chart Group and Chart |

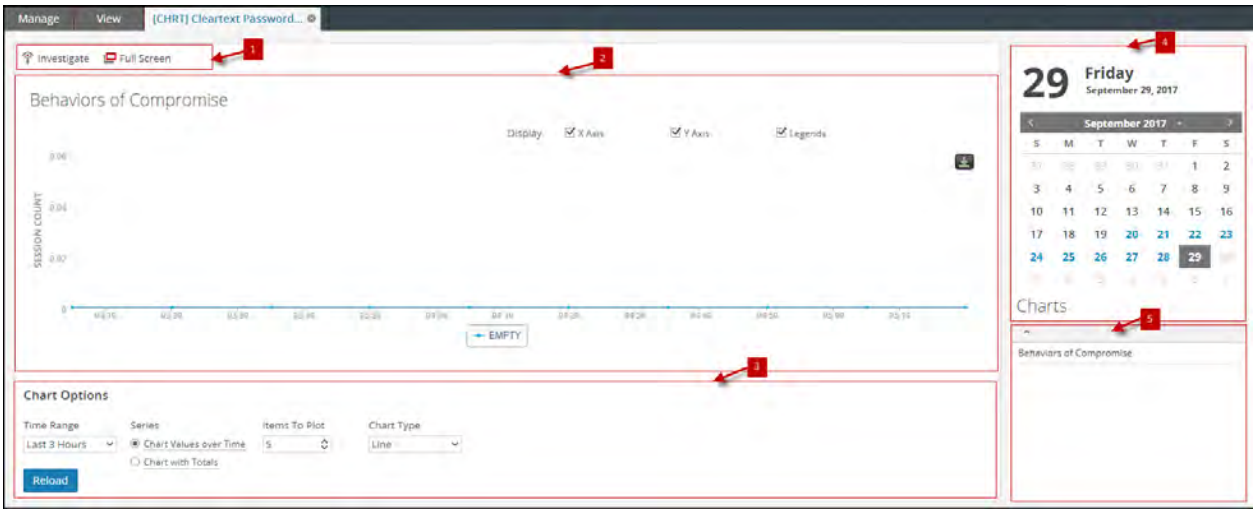
*You can complete these tasks here.

## Related Topics

- Configure and Generate a Chart

## Quick View

The following figure is an example with the important features labeled.



The View a Chart panel includes the following panels:

1. Chart toolbar
2. Chart Output panel
3. Chart Calendar panel
4. Chart Options panel
5. Chart Executed list

### Chart Toolbar

The Chart toolbar has options that allow you to investigate, and view the chart on another screen.

The following table lists the options in the Chart toolbar.

| Operation | Description |
|---|---|
| Investigate | Investigates the chart details. |
| Full Screen | Displays the chart on a full screen. |

### Chart Output Panel

The Chart Output panel displays the chart with sortBy on the Y-axis, time on the X-axis and legends.

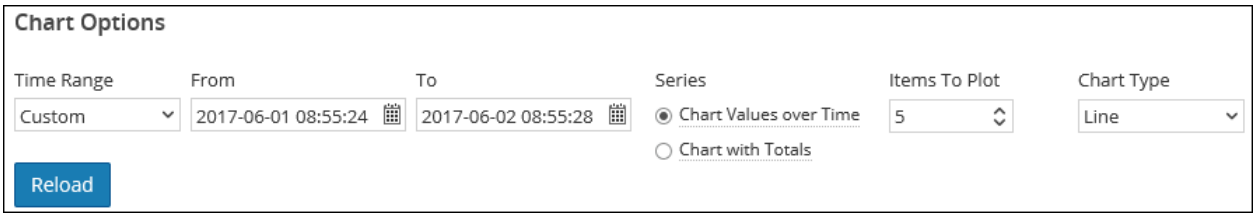
**Note:** You can save the chart as PDF using the icon on the Chart Output panel.

### Chart Calendar Panel

The Chart Calendar panel is the default calendar with which you can filter the list of charts depending on the date you select from the Calendar, as shown in the following figure.

## Chart Options Panel

The Chart Options panel displays the time range, series, and chart type fields to configure the chart is displayed.



The following table lists the fields in the Chart Options panel.

| Field | Description |
|---|---|
| Time Range | The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option.<br>**Note:** The time range selected by you for a chart will be saved. When you open the same chart the next time, the time range that is saved will be displayed. This behavior is not applicable for the custom option. |
| From | The start date and time. (only for custom options) |
| To | The end date and time. (only for custom options) |
| Series | The series field provides the user with two options:<br>• Chart Values over Time: Renders the chart for the entire time range selected.<br>• Chart with Totals: Renders the summary of data for the selected date range. |

| Field | Description |
|---|---|
| Items to Plot | The maximum number of events the user wants to view on the chart. |
| Chart Type | The type of chart to be rendered. Either area, bar, column, line, step line, step area, spline area or spline. |

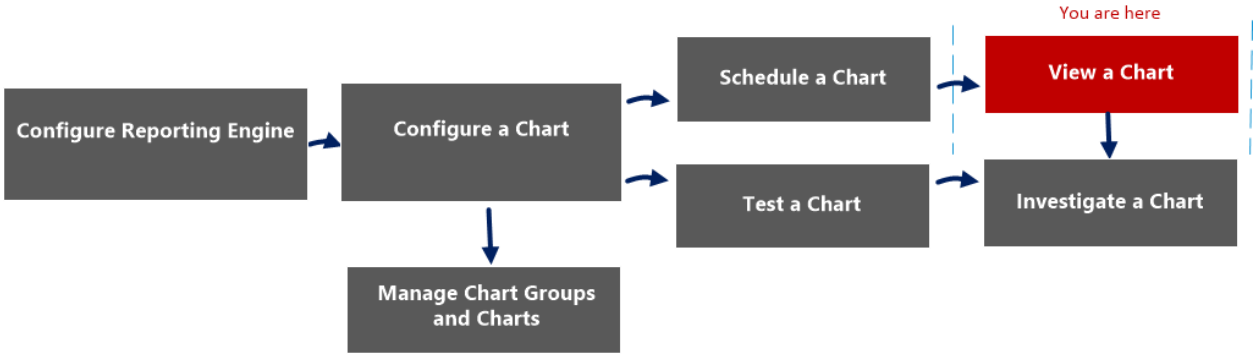
## Chart Executed List Panel

The Chart Executed List panel displays all the executions for a particular chart for the selected date. Double-clicking on any chart execution loads the chart on the Chart Output panel. By default, the last executed chart is displayed in the Chart Output panel.

# View All Charts View

In the View All Charts view, you can display, print, save and email charts.

## Workflow



## What do you want to do?

| Role | I want to ... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*. |

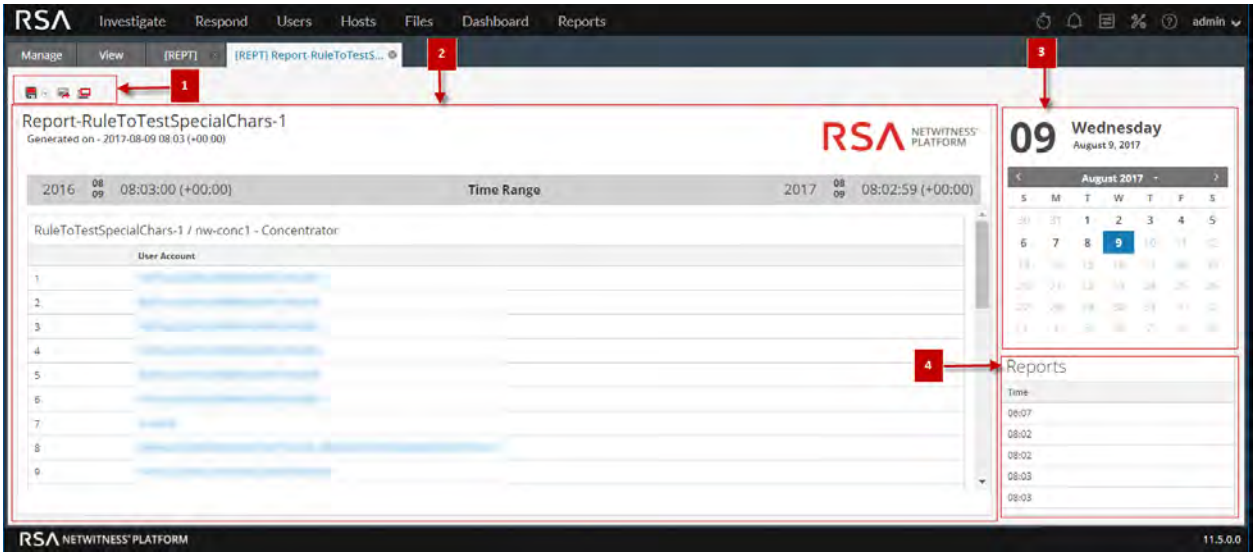
- Reports Permissions Dialog
- View All Reports View
- Report View

## Quick View



To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:

   - Click >**View Scheduled Reports**.
   - Click the **#Schedules** column.

     The Report Schedule view is displayed.

4. Click **View**.

## Features

The View a Report panel has the following sections.

| | |
|---|---|
| 1 | Reports Toolbar |
| 2 | Reports Output panel |
| 3 | Reports Calendar panel |
| 4 | Reports Time panel |

## Reports Toolbar

The Reports toolbar allows you to print, save, email, and view reports on full screen.

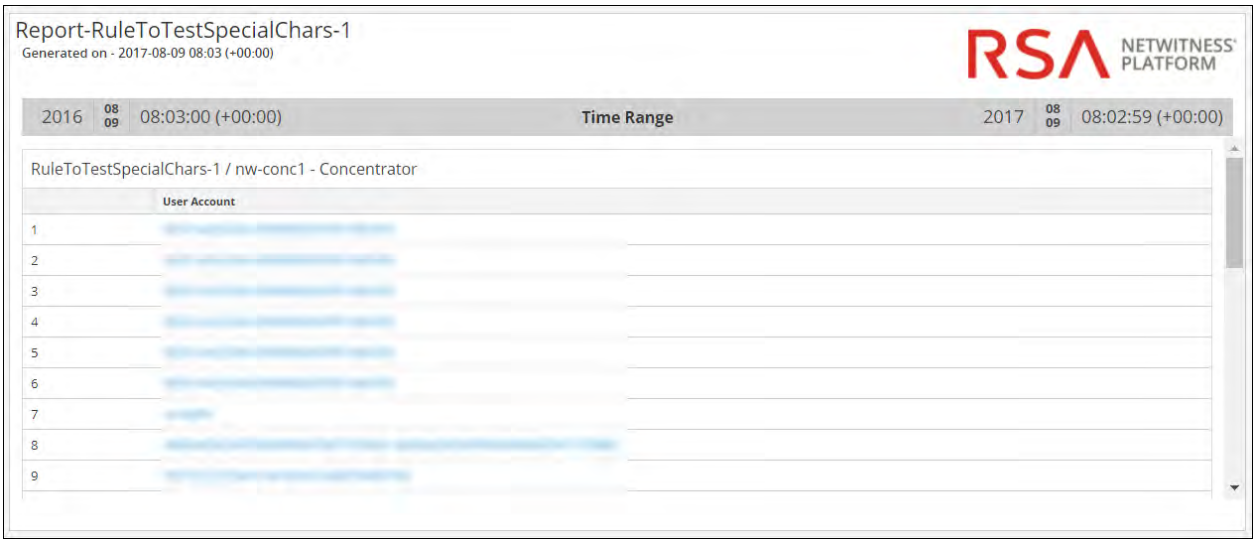
**Note:** The Reporting Engine is responsible for generating PDF and CSV output of the reports based on the report definition. The size of the PDF files for a report must not exceed 50,000 cells.

The following table lists the options in the Reports toolbar.

| Operation | Description |
|---|---|
| | Prints the generated report. |
| | Saves the report as a PDF and a CSV file.<br>**Note:** The **Save As PDF** option is not available for a large report. If you are generating a PDF for a report and it takes a longer time than expected, you get a warning message stating **PDF generation is in progress, please try after some time**.<br>When you click download as a CSV file, the Select Rule to download dialog is displayed. You must select a rule from this dialog to download the rule result in a CSV file.<br>If the file generation takes a while, you can click on the **Notify me** option to be notified once the PDF or CSV is generated. Once the PDF or CSV is generated, you can view the Notifications for the status. |
| | Emails the report with the PDF or CSV attachment. |
| | Opens the generated report on a new window. |

## Reports Output View

The Reports Output panel view the report with the report schedule name, report generated time and the actual report with the selected rule variables.



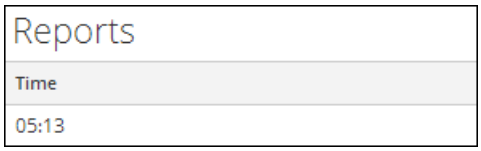
| Feature | Description |
|---|---|
| Name | This field displays the name of the scheduled report. |
| Time | This field displays the time when the report is generated. |
| Report | This field displays the details report with the selected rule variables. |

## Reports Calendar View

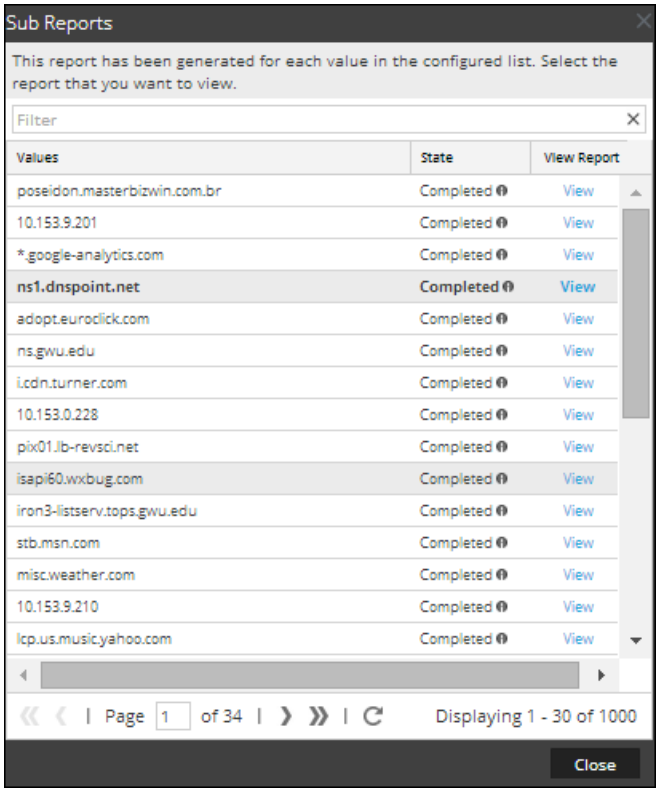
The Reports Calendar view is used to select a date from the Calendar. Based on the date you select, the list of successfully run reports for the date is displayed.

## Reports Time View

The Reports Time view displays the time when the report was actually run.



When you click **View** on the scheduled report having **Iterative** selected, the **Sub Reports** panel is displayed. For each value in the configured list a report is generated.



The following table lists the columns in the Sub Reports panel.

| Column | Description |
|---|---|
| Values | The List values chosen for a dynamic variable from the List Selection panel. |
| State | Indicates the state of the scheduled report for each of the list values.<br>• Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial.<br>• Failed: If in a report with several rules, all the rule executions failed, the state of the report is displayed as failed.<br>• Completed: If a report is successfully executed, the state of the report is displayed as completed. |

| Column | Description |
| --- | --- |
| View | Clicking on any of the report schedules or sub reports listed and then **View** displays the desired report.<br><br>**Note:** You can view the completed rules on the **View a Report** page even when the report is 'running'. |

# View All Reports View

In the View All Reports view, you can display, print, save and email reports.

## Workflow

This workflow shows the procedure view a report or list of all reports.

## What do you want to do?

| Administrator/ Analyst | Manage an alert and alert template* | Manage an Alert and Alert Template |

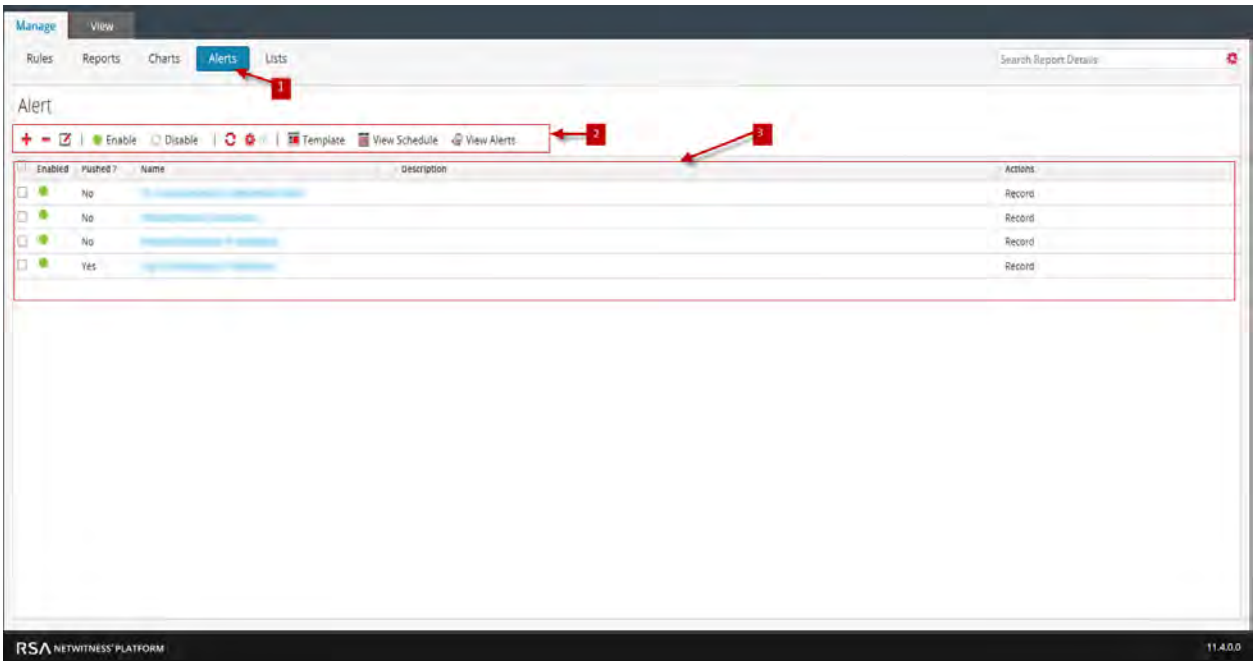
*You can complete these tasks here.

## Related Topics

Alerting Overview

## Quick View

The following figure is an example with the important features labeled.



1. Click **Alerts** to open the Alert view.
2. The Alert toolbar allows you to add, modify, delete, enable, disable, refresh, import, and export an alert. Using this toolbar, you can also set access permissions for the selected alert.
3. The Alert panel lists all the alerts in a tabular format.

The Alerts List view has the following panels:

- Alert Toolbar
- Alert

## Alert Toolbar

The Alert toolbar panel has the following features:

| Feature | Description |
|---|---|
| + | Adds a new alert to the Reporting module. |
| − | Deletes one or more selected alerts. |
| | Edits an alert. |
| Enable | Enables the selected alerts. |
| Disable | Disables the selected alerts. |
| | Refreshes the view. |
| | Enables the following options: Import, Export and Permissions. |

## Alert

The Alert panel lists all the alerts in a tabular format. The following table lists the columns in the Alert panel and their descriptions.

| Feature | Description |
|---|---|
| Enabled | Displays the state of the alert:<br>• Enabled - the alert is active and fires based on the rule assigned to it.<br>• Disabled - the alert is not active. |
| Pushed? | Indicates whether the alert is sent to Decoders or Log Decoders:<br>• Yes - Alert is pushed to Decoders or Log Decoders.<br>• No - Alert is not pushed to Decoders or Log Decoders. |
| Name | Identifies the name of the alert. Clicking the alert name displays the rule on which this alert is based in the Define Rules panel. |
| Description | Indicates the alert description. |
| Actions | Indicates the action the system takes when the alert fires. The different available action types are as follows:<br>• Record<br>• SMTP<br>• SNMP<br>• Syslog |

# Alert Permissions Dialog

In the Alert Permissions dialog, the users with 'Read & Write' access permission can set access permissions for an alert to configure permissions in the Alert Permissions dialog.

## Workflow

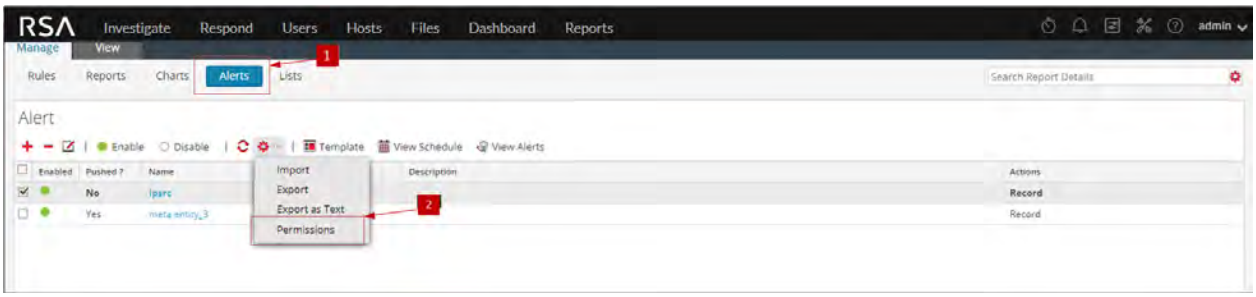
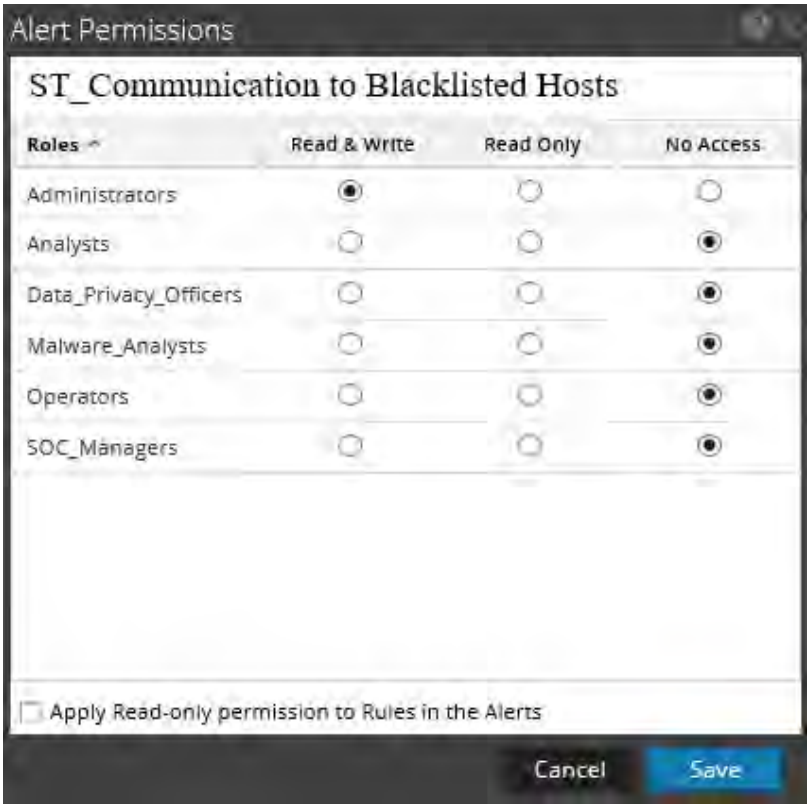
Alerting Overview

## Quick View

The Alert permissions dialog allows you to set alert permissions depending on the user role.

The following figure is an example with the important features labeled.





1. Click **Alerts** to open the Alert view.
2. Click ⚙ > **Permissions**. The Alert Permissions dialog box is displayed.
3. Based on the user role, select the appropriate options.
4. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.
5. Click **Save**.

**Note:** If a User (other than a super user) creates an alert, super users will not be able to access the alert.

The following table lists the columns in the Alert Permissions dialog.

| Column | Description |
|---|---|
| Roles | Displays all the user roles in the NetWitness user interface. |

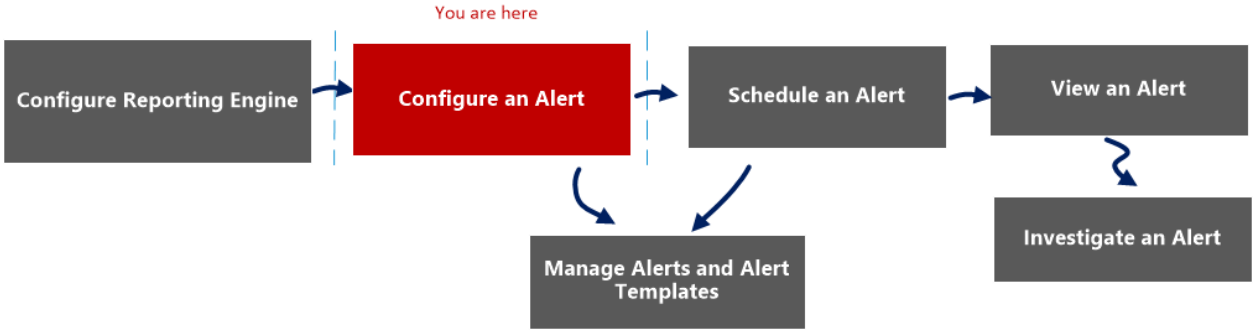
| | |
|---|---|
| Read & Write | Allows you to apply 'Read&Write' access to the alert. |
| Read Only | Allows you to apply only 'Read' access to the alert. |
| No Access | By selecting this permission, you cannot access or view the alert. |
| Apply Read-only permission to Rules in the Alerts | Allows you to automatically apply permissions to the rules in the alerts. |
| Cancel | Cancels all the changes made to the permissions. |
| Save | Saves the selection and provides access to the role based on the selection. |

# Alert Schedules View

In the Alert Schedules view, you can view all the alerts scheduled. Alternately, you can also disable the scheduled alerts.

## Workflow

The following workflow shows the tasks involved in creating or modifying an alert.



## What do you want to do?

| Role | I want to... | Documentation |

1. Click **Alerts** to open the Alert view.
2. Click **View Schedule** to open the View Alerts Schedule view.
3. The Alerts Schedule toolbar allows you to modify the state of the scheduled alert.
4. The Alerts Schedule List panel lists only the Enabled alerts in a tabular format.

## Features

The different panels on the Alert Schedules View dialog are:

- Alerts schedule toolbar panel
- Alerts schedule list panel

### Alerts Schedule Toolbar Panel

In the Alerts Schedule Toolbar panel, the Disable icon disables the selected alert. When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you cannot view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it.

### Alerts Schedule List Panel

The following table lists the columns in the Alerts Schedule List panel and their description.

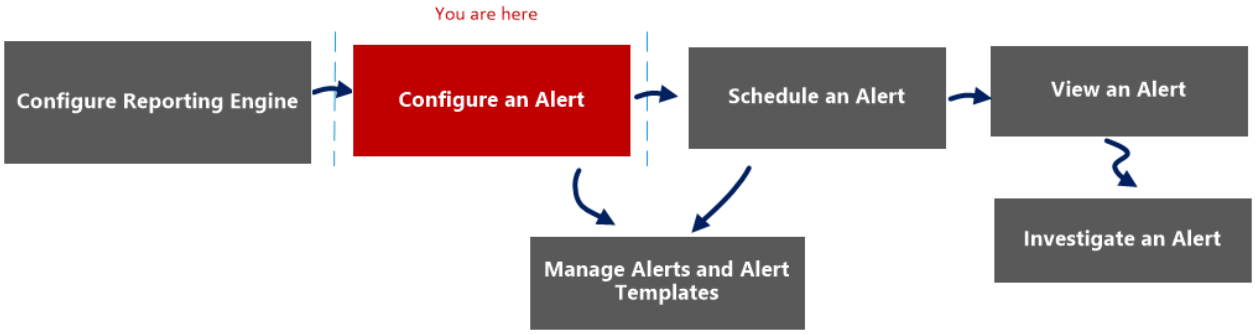
| Column | Description |
|---|---|
| State | The state of the scheduled alert:<br>• Completed<br>• Failed |
| Name | The name of the scheduled alert. |
| Last Run {#time} | The last time the scheduled alert was run. |
| Last Session Id | The Session Id of the last scheduled alert. |
| Total Alerts | The total number of event occurrences. |
| Duration | The time taken to run the scheduled alert. |

| Column | Description |
| --- | --- |
| Avg (s) | The average time taken to run the scheduled alert. |
| Max (s) | The maximum time taken to run the scheduled alert. |

# Create or Modify Alert Panel

The Create or Modify alert panel is a panel in the Alert List view. This panel allows you to create or modify an alert as per the requirement.

## Workflow



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|
| Administrator/ Analyst | Configure Reporting Engine | Configure Reporting Engine |
| Administrator/ Analyst | Configure an alert* | Configure an Alert |
| Administrator/ Analyst | Schedule an alert | Schedule an Alert |
| Administrator/ Analyst | View an alert | View an Alert |
| Administrator/ Analyst | Investigate an alert | Investigate an Alert |
| Administrator/ Analyst | Manage an alert and alert template | Manage an Alert and Alert Template |

*You can complete these tasks here.

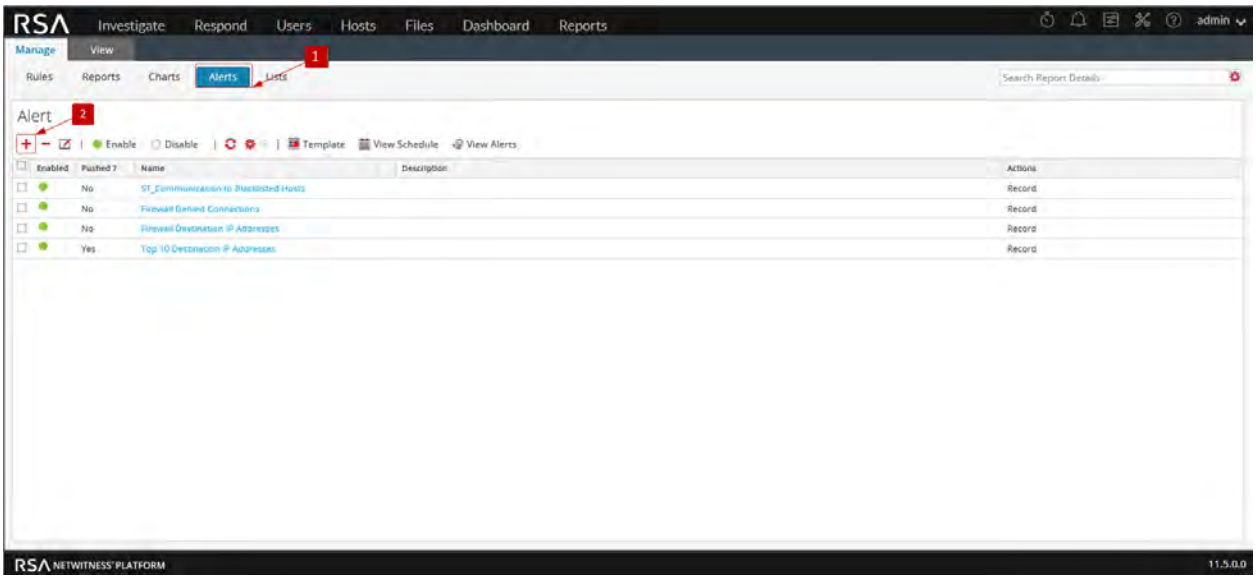
Alerting Overview

## Quick View

The following figure is an example with the important features labeled.



1. Click **Alerts** to open the Alert view.
2. Click + to navigate to the Create or Modify Alert panel.
3. Enable the alert, navigate the rule, and select a data source to alert.
4. Enter a brief description of an alert.
5. Define the alert notification methods(RECORD, SMTP, SNMP, Syslog) to alert, when an alert condition is matched.

The Create or Modify Alert panel has the following sections:

- Alert Definition
- Alert Description
- Alert Notification

## Alert Definition

The following table describes the fields in the Alert Definition:

| Field | Description |
|---|---|
| Enable | • **Enable** activates the alert. The alert executes and sends output actions every minute (by default) when the alert conditions are met.<br>• **Disable** deactivates the alert. The alert does not execute and does not send any output actions. |
| Rule Basis | Click **Browse** to display the Rules Library panel from which you select the rule that is the basis of this alert.<br>You must select a rule that has a unique 'where' clause for an alert. |
| Data Sources | Specifies the data source for the alert. |
| Push to decoders | Pushes the 'where' clause of the alert rule to Decoders connected to the selected NWDB data source.<br>This is the recommended option used to create RE alerts, as the alert conditions are checked on the Decoder itself and the alert queries will be comparatively faster in NWDB.<br>If you deselect this option, the alert rule 'where' clause will be queried against the selected NWDB data source. Based on the complexity and metas in the 'where' clause of the rule, the alert queries might take more time to process in NWDB.<br>**Note:** RSA NetWitness does not send rules to the Decoder automatically. |

## Alert Description

The following table describes the fields in the Alert Description:

| Field | Description |
|---|---|
| Description | Describes the alert. |
| Create | Creates the alert. (This option is displayed when you create an alert.) |
| Save | Saves the changes made to the alert. (This option is displayed when you modify an alert.) |

## Alert Notification

The Alert Notification allows you to define the notification action NetWitness takes when an alert is generated, for example, recording or sending the alert using one of the defined output actions. The output actions are Simple Mail Transfer Protocol (SMTP), Simple Network Management Protocol (SNMP), or Syslog message.

The Notification contains the default Record tab, which you use to create an alert. The icon beside the Record tab allows you to select the notification type from the drop-down list for the output to specify for the alert: SMTP, SNMP, or Syslog.

Depending on the selected notification type, the Notification section is populated with predefined text that contains variables that add Meta that is appropriate for the alert. In the Reporting Engine, these variables are replaced with actual values. The following table lists the variables and their descriptions.

| Variable | Description |
|---|---|
| `${meta.<metakey>}` | The meta key value.<br><br>**Note:** If the <metakey> did not fetch any value, an empty string("") is printed.<br>By default, Reporting Engine displays all the repeated values for a meta key. If you do not want the meta values to repeat in the Alert output, enable the "removeRepeatedMetaValue" option by navigating to **Configuration > Alert Configuration** available for the Reporting Engine in the **Services - Configuration > Explore** view.<br>For example, in an HTTP Session the value for the action is displayed as get, get, put, put, post, get. When this option is enabled, the value is displayed as get, put, post. |
| `${meta.time}` / `${meta.time:<time_format>}` | `${meta.time}` - The session time is printed in "yyyy-MMM-dd HH:mm:ss" format.<br><br>`${meta.time:<time_format>}` - The session time is printed in the user-defined custom time format. For example, `${meta.time:dd-MM-yyyy HH:mm:ss}`.<br><br>For more information on the supported time formats, see http://docs.oracle.com/javase/7/docs/api/java/text/SimpleDateFormat.html<br><br>**Note:** If the time format provided by the user is invalid, the default time format will be used. The default time format is "yyyy-MMM-dd HH:mm:ss". |
| `${name}` | The alert name defined in Reporting Engine. |
| `${count}` | The number of times an alert is detected in a given time frame. (By default, it is one minute) |
| `${nw.host}` | The NetWitness host name as configured in Reporting Engine. |
| `${device.id}` | The NetWitness device ID of the data source. |

The Alert Notification view has four tabs:

- **Record Tab**
- **SMTP Tab**
- **SNMP Tab**
- **Syslog Tab**

## Record Tab

Use the Record tab to define the frequency for recording an alert and the message to generate when an alert is generated.

The following table lists the fields in the Record tab and their description.

| Field | Description |
|---|---|
| Execute | The frequency for recording an alert.<br>• **Once** - Record the alert only once based on the alert interval no matter how often the alert is generated. NetWitness records the number of times the alert has actually generated during that interval in the log file so that analysts know how many times the alert registered a match over a given day.<br>• **Each Event** - Record the alert each time as it generates. If an alert generates unlimited number of times during a day, that alert is often treated as noise and can be ignored, except in case of alerts that require continuous monitoring such as network configuration changes and DDOS attacks.<br>**Note:** Select **Each Event** setting from the **Execute** drop-down list for SNMP and Syslog output actions. |
| Body | The body of the message. |
| Body Template | (Optional) If templates have been defined, select a template for the alert message. |

## SMTP Tab

The SMTP tab allows you to define the SMTP (email) output for this alert.

The following table lists the fields in the SMTP tab and their description.

| Field | Description |
|---|---|
| Execute | The frequency to send an email message for the alert.<br>• **Once** - Sends only one email for an interval, if an alert generates in that interval, irrespective of how many alerts generated.<br>• **Each Event** - Send an email with the alert for every event in which the rule criteria are met. |
| To | The email addresses to which to send this alert. |
| Subject | The subject of the email message. |
| Body | The body of the message. |
| Body Template | (Optional) If templates have been defined, select a template for the SMTP message that you can use as is or modify. |

## SNMP Tab

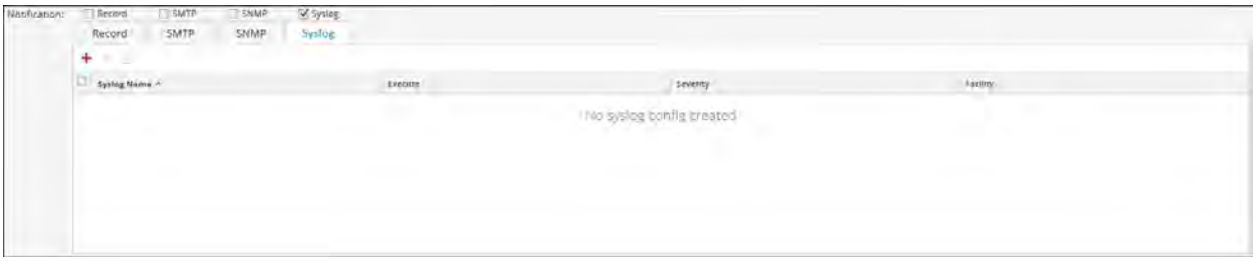
The SNMP tab allows you to define the SNMP output for the alert.

The following table lists the various fields in the SNMP tab and their description.

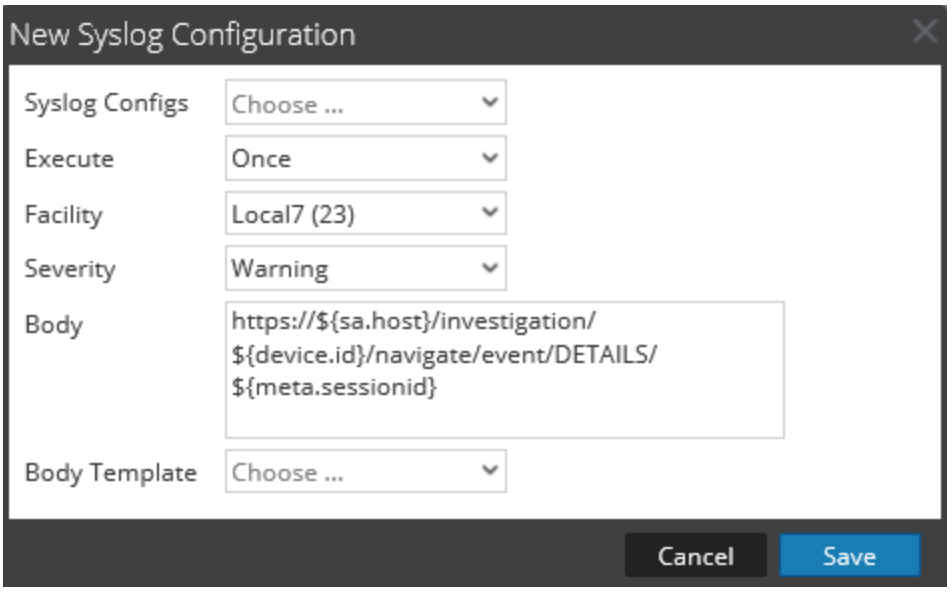
| Field | Description |
|---|---|
| Execute | The frequency to send an SNMP output for an alert.<br>• **Once** - Sends an SNMP message along with an email for an interval, if an alert generates in that interval, irrespective of how many alerts generated.<br>• **Each Event** - Sends an SNMP message with the alert for every event in which the rule criteria are met. |
| Body | The body of the message. |
| Body Template | (Optional) If templates have been defined, select a template for the SNMP message to use as is or modify. |

## Syslog Tab

The Syslog tab allows you to define the Syslog message output for this alert.



Click to add Syslog configuration to an alert. The New Syslog Configuration dialog box is displayed:



The following table describes the fields in the New Syslog Configuration dialog:

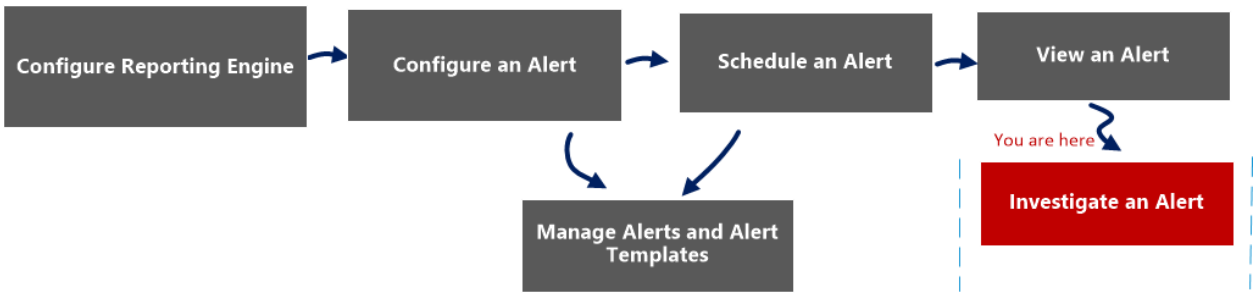
| Field | Description |
|---|---|
| Syslog Configs | The Syslog configuration of the Device Config view located at the Syslog Configuration panel. |
| Execute | The number of times that you want to send a Syslog output for the alert.<br>• **Once** - Sends a Syslog output along with an email for an interval, an alert generates in that interval, irrespective of how many alerts generated.<br>• **Each Event** - Sends a Syslog output with the alert for every event in which the rule criteria are met. |
| Facility | The type of program logging the message. Examples for the type of programs are Syslog, Daemon, Mail, and Kernel. |

| Field | Description |
| --- | --- |
| Severity | The severity level of the alert that generated.<br>• Emergency<br>• Alert<br>• Critical<br>• Error<br>• Warning<br>• Notice<br>• Informational<br>• Debug |
| Body | The body of the message. |
| Body Template | (Optional) If templates have been defined, select a template for the Syslog message to use as is or modify. |

# Investigate an Alert View

In the Investigate an Alert view, you can view and investigate alert details. When investigating an alert, you can open the sessions in the Investigation module for further investigation.

## Workflow



## What do you want to do?

| Role | I want to... | Documentation |
|---|---|---|

Alerting Overview

## Quick View

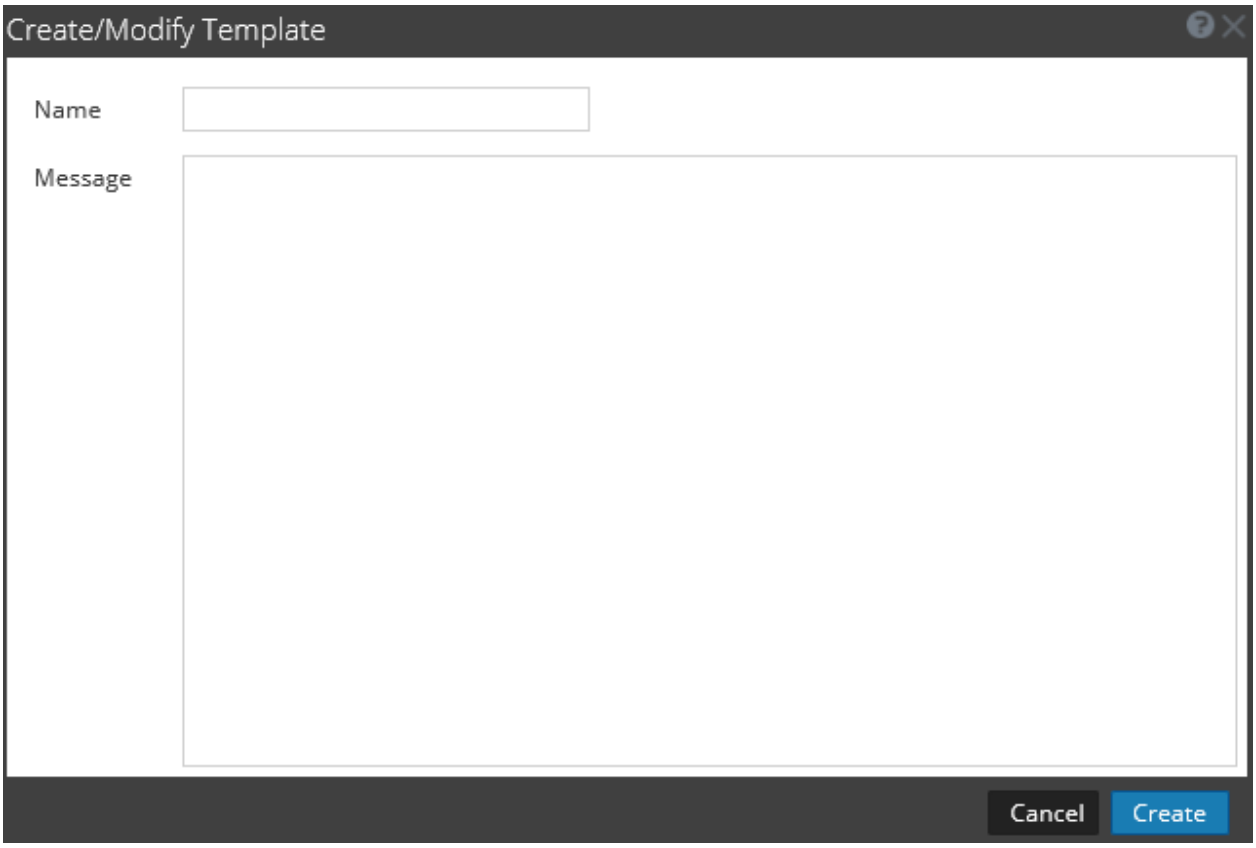
You can create or modify an alert template name and message on this view.

The following figure is an example of the Create or Modify alert template.



The following table describes the fields in the Create/Modify template.

| Feature | Description |
|---|---|
| Name | Indicates the name of the template for Reporting alerts. For example, source IP. |
| Message | Specifies the message that will be sent when an alert is triggered. |
| Create | Creates the template with a confirmation message and becomes available for use in Reporting immediately. |
| Save | Saves the template with the edited details or when a new template is created. This button is visible only in the edit mode. |
| Cancel | Closes the dialog without saving the template or any changes made to the template. |

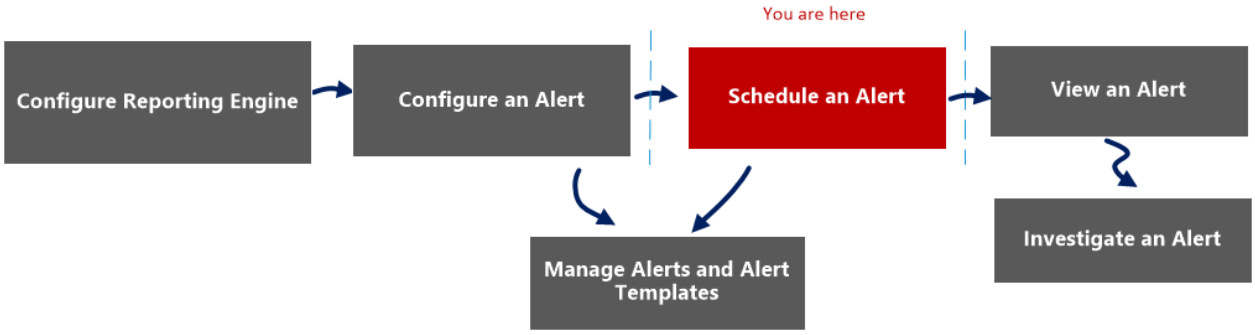
# View Alerts Schedule View

In the View Alerts Schedule view, you can view the following information about each of your scheduled alerts.

- Completion status, name, last run time, last session ID, total alerts triggered.
- Statistics about the time taken to run the scheduled alert: duration, average duration, maximum duration.

**Note:** You can also disable the scheduled alerts.

## Workflow



## What do you want to do?

| Role | I want to... | Documentation |

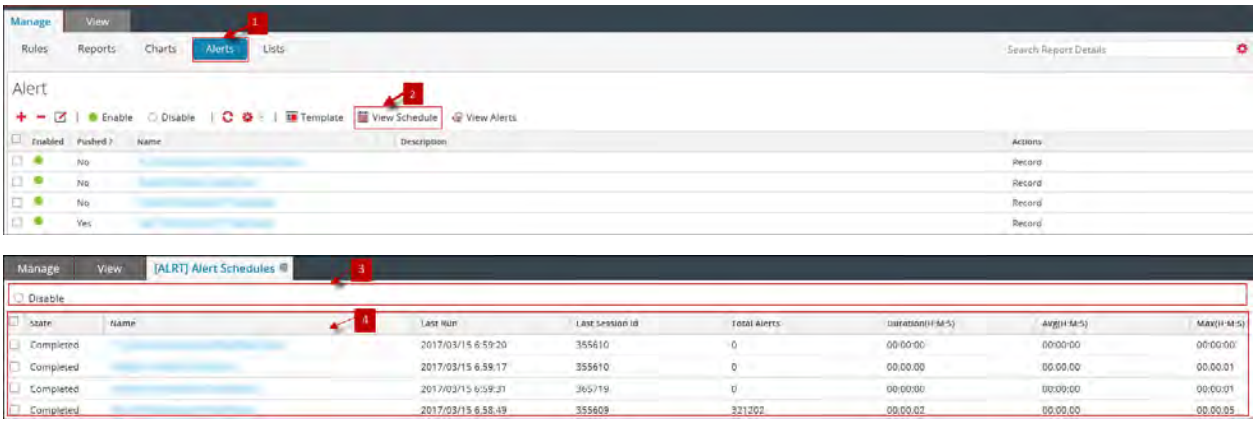
Alerting Overview

## Quick View

The following figure is an example with the important features labeled.



1. Click **Alerts** to open the Alert view.
2. Click **View Schedule**to view all the alerts scheduled.
3. The Alerts schedule toolbar allows you to disable the scheduled alert.
4. The Alerts schedule list allows you to view the scheduled alert details.

The View Alerts Schedule view includes the following panels:

1. Alerts Schedule toolbar
2. Alerts Schedule list

### Alert Schedule Toolbar

The Alerts Schedule Toolbar panel allows you to modify the state of the scheduled alert.

| Feature | Description |
|---|---|
| Disable | Clicking **Disable** disables the selected alert.<br>When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you can't view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it. |

### Alert Schedule List Panel

The Alerts Schedule List panel lists only the Enabled alerts in a tabular format. The following table lists the columns in the Alerts Schedule List panel and their description.

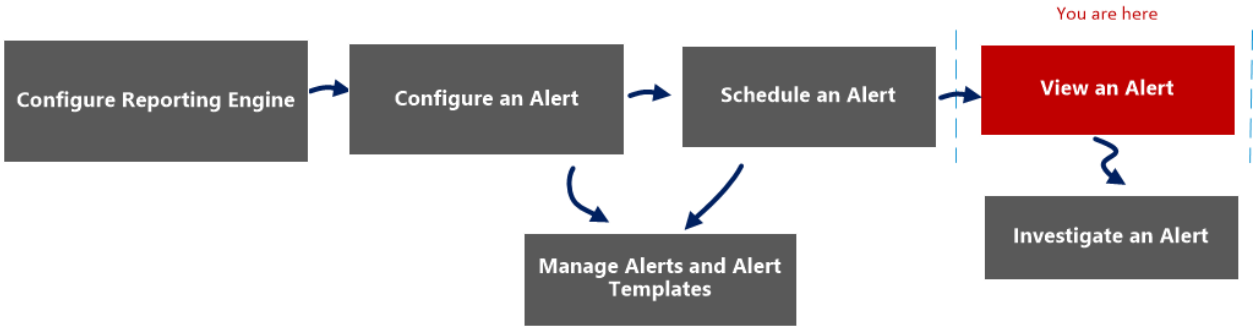
| Feature | Description |
|---|---|
| State | The state of the scheduled alert:<br>• Completed<br>• Failed |

| Feature | Description |
| --- | --- |
| Name | The name of the scheduled alert. |
| Last Run {#time} | The last time the scheduled alert was run. |
| Last Session Id | The Session Id of the last scheduled alert. |
| Total Alerts | The total number of event occurrences. |
| Duration | The time taken to run the scheduled alert. |
| Avg (s) | The average time taken to run the scheduled alert. |
| Max (s) | The maximum time taken to run the scheduled alert. |

# View Alerts View

In the View Alerts view, you can view all the alerts. Also, you can also customize the view to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

## Workflow



## What do you want to do?

| Role | I want to... | Documentation |

# About this Document

The *NetWitness Respond Configuration Guide for RSA NetWitness® Platform 11.x* provides an overview of NetWitness, detailed instructions on how to configure NetWitness Respond in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring NetWitness Respond in your network.

**Topics**

- NetWitness Respond Configuration Overview
- Configuring NetWitness Respond
- Additional Procedures for Respond Configuration
- NetWitness Respond Configuration Reference

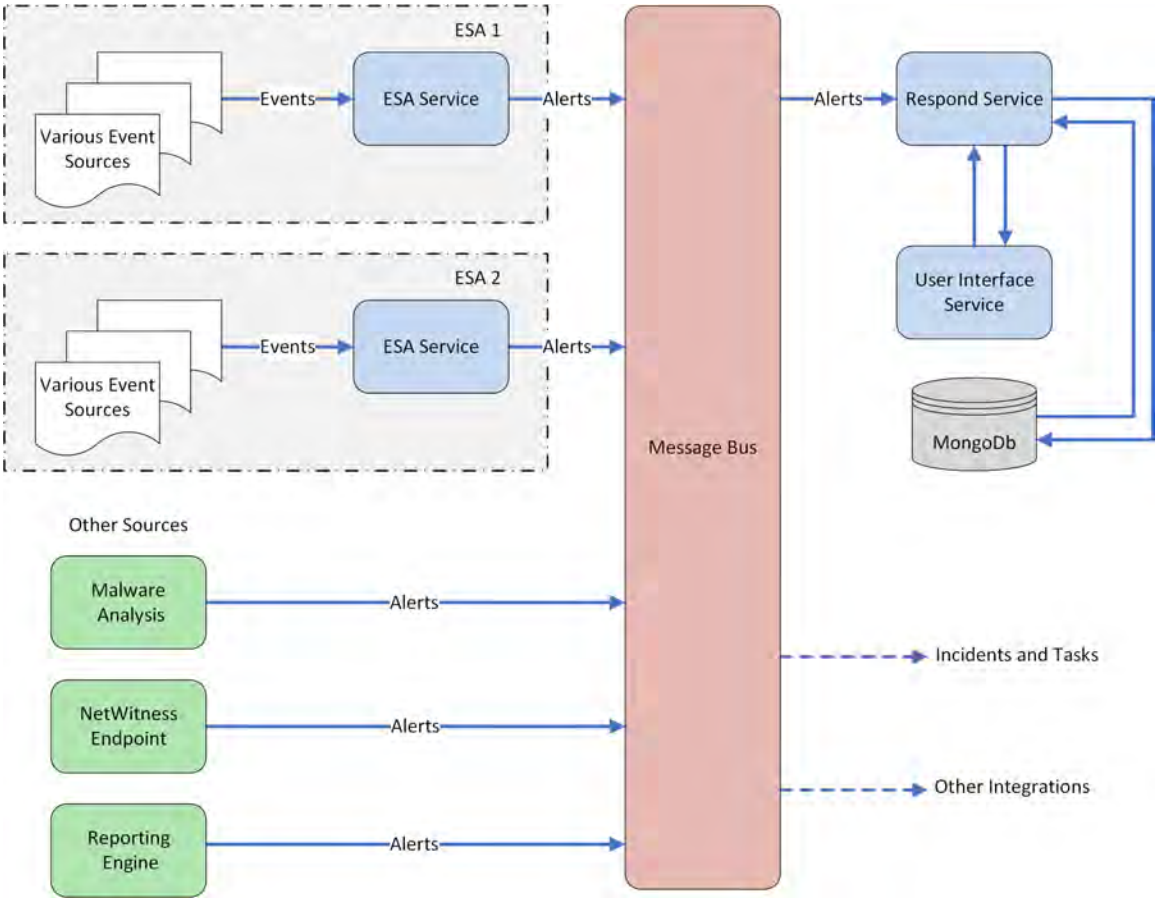
# NetWitness Respond Configuration Overview

NetWitness Respond consumes alert data from various sources via the Message Bus and displays these alerts on the NetWitness user interface. The Respond Server service allows you to group the alerts logically and start a NetWitness Respond workflow to investigate and remediate the security issues raised.

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). The incidents are persisted into MongoDb by the Respond Server service. Incidents are also posted onto the message bus for consumption by other systems (for example, Archer integration).

**Note:** NetWitness Respond requires an ESA primary server that contains the MongoDb. Alerts, Incidents, and Task records are persisted into this MongoDb by the Respond Server.

The following diagram illustrates the high-level flow of alerts.



You have to configure various sources from which the alerts are collected and aggregated by the Respond Server service.

# Configuring NetWitness Respond

This topic provides the high-level tasks required to configure the Respond Server service. The administrator needs to complete the steps in the sequence provided.

**Topics**

- Step 1. Configure Alert Sources to Display Alerts in the Respond View
- Step 2. Assign Respond View Permissions
- Step 3. Enable and Create Incident Rules for Alerts

# Step 1. Configure Alert Sources to Display Alerts in the Respond View

This procedure is required so that alerts from the alert sources are displayed in NetWitness Respond. You have an option to enable or disable the alerts being populated in the Respond view. By default this option is disabled for Detect AI, Reporting Engine, Malware Analysis, and NetWitness Endpoint and enabled only for Event Stream Analysis. So when you install the Respond Server service you need to enable this option in the Reporting Engine, Malware Analysis, and NetWitness Endpoint to populate the corresponding alerts in the Respond view.

## Prerequisites

Ensure that:

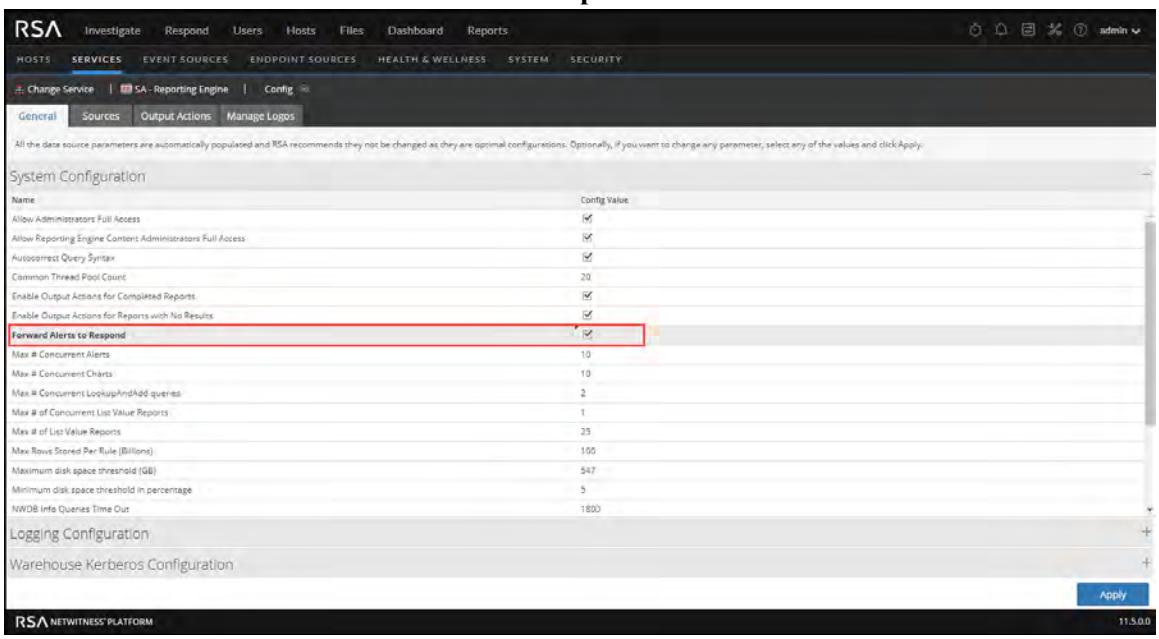
- The Respond Server service is installed and running on NetWitness.
- NetWitness Endpoint is installed and running. This is necessary only if you want to configure NetWitness Endpoint as an alert source in the Respond view.

## Configure Reporting Engine to Display Reporting Engine Alerts in the Respond View

The Reporting Engine alerts are by default disabled from being displayed in Respond view. To display and view the Reporting Engine alerts, you have to enable the NetWitness Respond alerts in the Services Config view > General tab for the Reporting Engine.

1. Go to **(Admin) > Services**, select a Reporting Engine service, and then select **> View > Config**.
   The Services Config view is displayed with the Reporting Engine General tab open.
2. Select **System Configuration**.

3. Select the checkbox for **Forward Alerts to Respond**.



4. Click **Apply**.
   The Reporting Engine now forwards the alerts to NetWitness Respond.

For details on parameters in the General tab, see the "Reporting Engine General Tab" topic in the *Reporting Engine Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Configure Malware Analysis to Display Malware Analysis Alerts in the Respond View

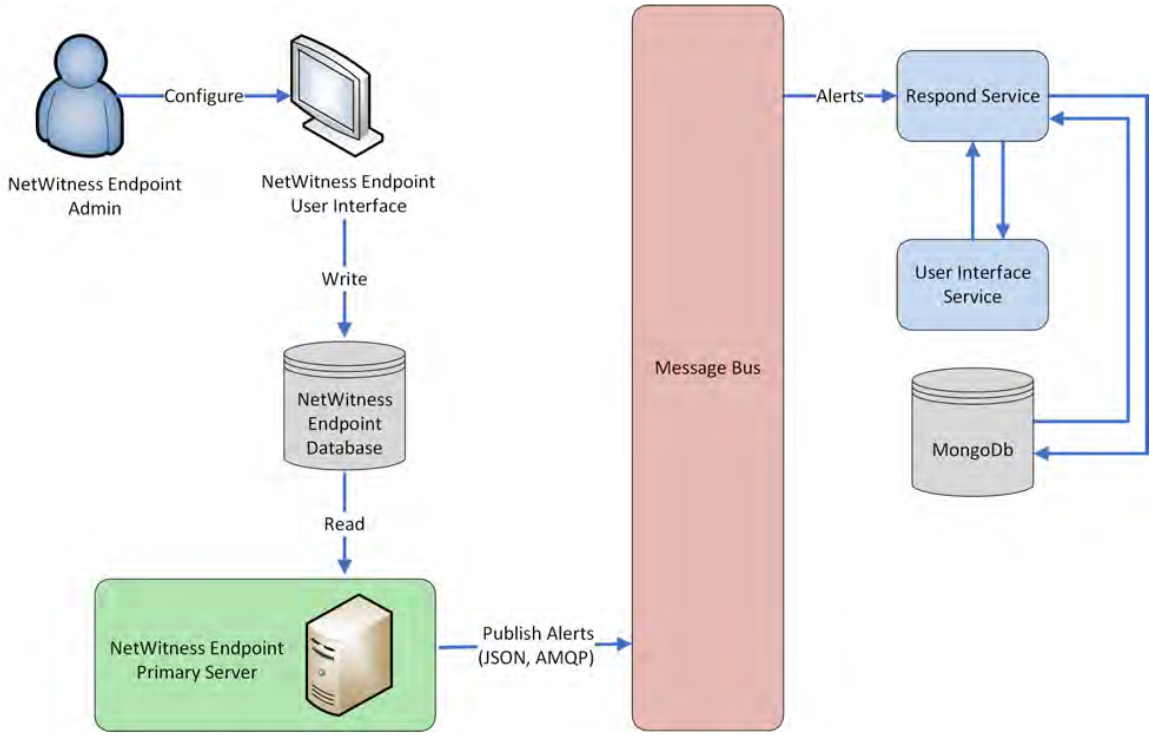
Viewing NetWitness Respond alerts is a function of auditing in Malware Analysis. The procedure for enabling NetWitness Respond alerts is described in the "(Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Analysis Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Configure NetWitness Endpoint to Display NetWitness Endpoint Alerts in the Respond View

This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the NetWitness Respond component of NetWitness and displayed in the **Respond > Alerts** view.

**Note:** RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more detailed information, see "RSA NetWitness Endpoint Integration" in the *NetWitness Endpoint User Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

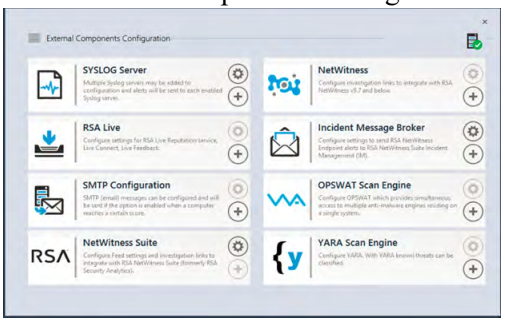
The diagram below represents the flow of NetWitness Endpoint alerts to the NetWitness Respond Server service and its display in the **Respond > Alerts** view.



### To configure NetWitness Endpoint to display NetWitness Endpoint alerts in the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.



2. From the components listed, select **Incident Message Broker** and click + to add a new IM Broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM Broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.

5. Navigate to the **ConsoleServer.exe.Config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   **Note:** In NetWitness 11.0 and later, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".
7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to `ecat`.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NWECA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      client.cer
      ```

      **Note:** In the above code sample, if you upgraded to Endpoint version 4.3 from a previous version and did not generate new certificates, you should substitute `EcatCA` for `NWECA`.
   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the `ConsoleServer.Exe.Config` file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```
9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
   `/etc/pki/nw/trust/import`
10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the **/etc/pki/nw/ca/nwca-cert.pem** and **/etc/pki/nw/ca/ssca-cert.pem** files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

## Step 2. Assign Respond View Permissions

Add users with the required permissions to investigate incidents and alerts in NetWitness Respond. Users with access to the Respond view need both Incidents and Respond-server permissions. Users with access to configure incident email notification settings need additional Integration-server permissions.

The following pre-configured roles have permissions in the Respond view:

- **Analysts**: The Security Operations Center (SOC) Analysts have access to Alerting, NetWitness Respond, Investigate, and Reporting, but not system configurations.
- **Malware Analysts**: Malware Analysts have access to investigations and malware events.
- **Operators**: Operators have access to configurations, but not Investigate, ESA, Alerting, Reporting and NetWitness Respond.
- **SOC_Managers**: The SOC Managers have the same access as Analysts plus additional permissions to handle incidents and configure NetWitness Respond.
- **Data_Privacy_Officers**: Data Privacy Officers (DPOs) are like Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system. See the *Data Privacy Management Guide* for additional information. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
- **Respond_Administrator**: The Respond Administrator has full access to NetWitness Respond.
- **Administrators**: The Administrator has full system access to NetWitness and has all permissions by default.

The NetWitness Respond default permissions are shown in the following tables. You need to assign user permissions from both the **Incidents** and **Respond-server** tabs, which are the Permissions tab names in the (Admin) > Security view Add or Edit Roles dialogs. You may want to add additional user permissions for Alerting, Context Hub, Investigate, Investigate-server, and Reports.

**Caution:** It is very important that you assign equivalent user permissions from BOTH the Respond-server tab AND the Incidents tab.

Users who configure incident email notification settings also need permissions in the Integration-server tab.

## Respond-server

| Permissions | Analysts | SOC Mgrs | DPOs | Respond Admin | Operators | MAs |
|---|---|---|---|---|---|---|
| respond-server.alert.delete | | | Yes* | Yes* | | |
| respond-server.alert.manage | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.alert.read | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.alertrule.manage | | Yes | Yes* | Yes* | | |
| respond-server.alertrule.read | | Yes | Yes* | Yes* | | |
| respond-server.configuration.manage | | | Yes* | Yes* | | |
| respond-server.health.read | | | Yes* | Yes* | | |
| respond-server.incident.delete | | | Yes* | Yes* | | |
| respond-server.incident.manage | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.incident.read | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.journal.manage | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.journal.read | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.logs.manage | | | Yes* | Yes* | | |
| respond-server.metrics.read | | | Yes* | Yes* | | |
| respond-server.notification.manage (Available in 11.1 and later) | | Yes | Yes* | Yes* | | |
| respond-server.notification.read (Available in 11.1 and later) | | Yes | Yes* | Yes* | | |
| respond-server.process.manage | | | Yes* | Yes* | | |
| respond-server.remediation.manage | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.remediation.read | Yes | Yes | Yes* | Yes* | | Yes |
| respond-server.risk.manage | Yes | | Yes* | Yes* | | |
| respond-server.risk.read | Yes | | Yes* | Yes* | | |
| respond-server.security.manage | | | Yes* | Yes* | | |
| respond-server.security.read | | | Yes* | Yes* | | |

* Data Privacy Officers and Respond Administrators have the **respond-server.*** permission, which gives them all of the Respond-server permissions.

## Incidents

| Permissions | Analysts | SOC Mgrs | DPOs | Respond Admin | Operators | MAs |
|---|---|---|---|---|---|---|
| Access Incident Module | Yes | Yes | Yes | Yes | | Yes |
| Configure Incident Management Integration | | Yes | Yes | Yes | | |
| Delete Alerts and Incidents | | | Yes | Yes | | |
| Manage Alert Handling Rules | | Yes | Yes | Yes | | |
| View and Manage Incidents | Yes | Yes | Yes | Yes | | Yes |

The Respond Administrator has all of the Respond-server and Incidents permissions.

## Integration-server

**Note:** The Integration-server permissions are available in NetWitness version 11.1 and later.

Users who configure incident email notification settings also need Integration-server permissions. The following table lists the incident notification permissions in the Integration-server tab assigned to each role.

| Permissions | Analysts | SOC Mgrs | DPOs | Respond Admin | Operators | MAs |
|---|---|---|---|---|---|---|
| integration-server.notification.read | | Yes | Yes | Yes | | |
| integration-server.notification.manage | | Yes | Yes | Yes | | |

## Investigate-server

Users who view Event Analysis in Respond also need Investigate-server permissions. The following table lists the Respond Event Analysis permissions required in the Investigate-server tab and the permissions assigned to each role.

| Permissions | Analysts | SOC Mgrs | DPOs | Respond Admin | Operators | MAs |
|---|---|---|---|---|---|---|
| investigate-server.event.read | Yes | Yes | Yes | Yes | | Yes |
| investigate-server.content.reconstruct | Yes | Yes | Yes | Yes | | Yes |
| investigate-server.content.export | Yes | Yes | Yes | Yes | | Yes |

## Incident Email Notification Settings Permissions

**Note:** Incident email notification setting permissions are available in NetWitness version 11.1 and later.
If you are updating from NetWitness version 11.0 to 11.1 or later, you will need to add additional permissions to your existing built-in NetWitness user roles. For all upgrades to 11.1 or later, you will need to add additional permissions to custom roles.

The following permissions are required for Respond Administrators, Data Privacy Officers, and SOC Managers to access incident email notification settings [ (Configure) > Incident Notifications].

Incidents tab:

- Configure Incident Management Integration

Respond-server tab:

- respond-server.notification.manage
- respond-server.notification.read

Integration-server tab:

- integration-server.notification.read
- integration-server.notification.manage

## Respond Event Analysis Permissions

**Note:** The Event Analysis panel in the Respond view is available in NetWitness version 11.2 and later.

The Events panel in the Respond view, formerly known as the Event Analysis panel, shows the Events view from Investigate for specific indicator events. The following permissions are required to view the Events panel in the Respond view. These permissions are provided by default for users with the Analysts role.

Investigate-server tab:

- investigate-server.event.read
- investigate-server.content.reconstruct
- investigate-server.content.export

Administration tab:

- Access Administration Module

**Note:** Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.2, you will also not be able to view the Events panel in the Respond view for those incidents.

## Respond Saved Filter Permissions

**Note:** Saved filters for the incidents and alerts lists in Respond are available in NetWitness version 11.5 and later.

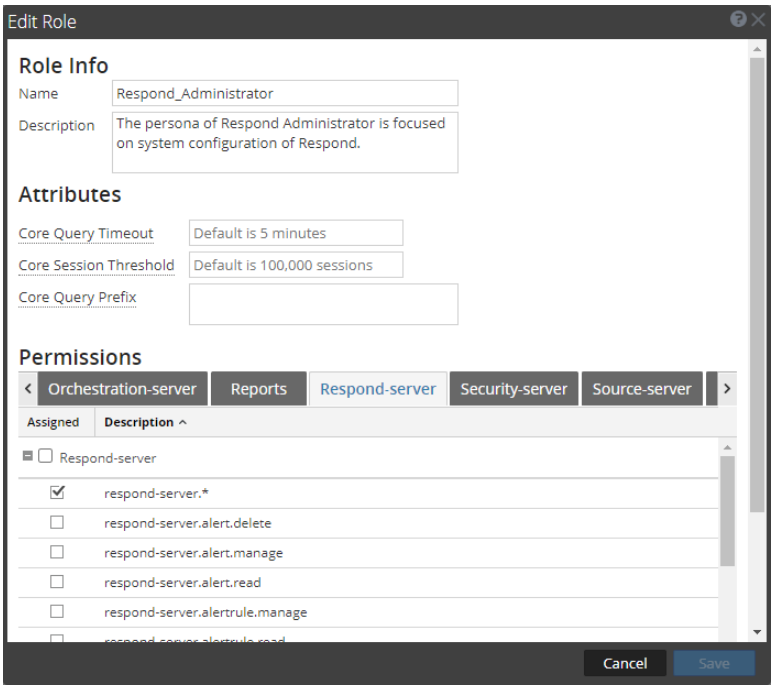
The following permissions are required for the incidents and alerts filters (Respond > Incidents and Respond > Alerts). The Analysts role has the required Respond filter permissions by default.

Respond-server tab:

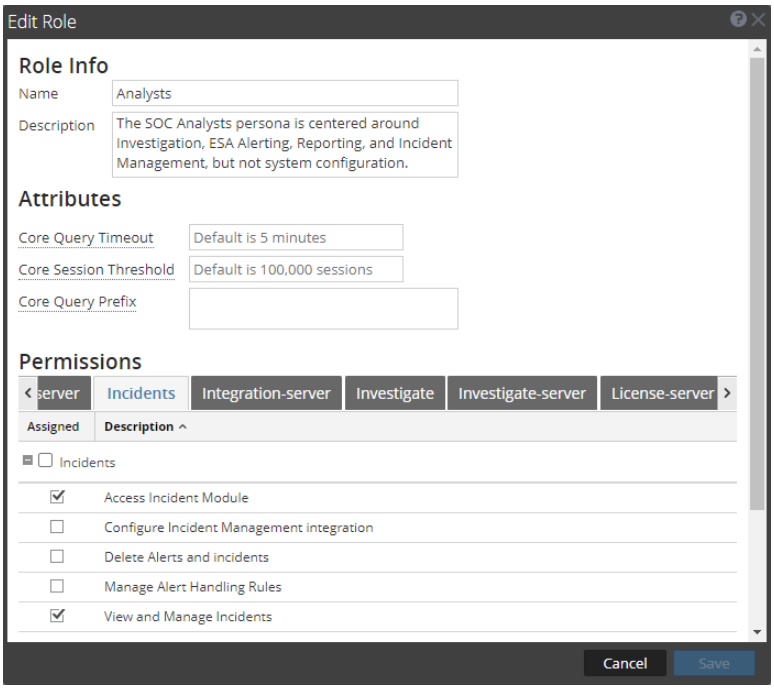
- respond-server.incident.manage
- respond-server.incident.read
- respond-server.alert.manage
- respond-server.alert.read

## Respond Role Permission Examples

The following figure shows Respond-server permissions for the default Respond Administrator role. The Respond Administrator role contains all of the NetWitness Respond permissions.



The following figure shows the Incidents permissions for the default Analysts role:



For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## Restrict Access to Incidents

By default, analysts can view all of the incidents, alerts, and tasks in the Respond view. If you have sensitive or restricted information that should not be shared, you can restrict what analysts and other users can see in the Respond view.

If you restrict access to incidents:

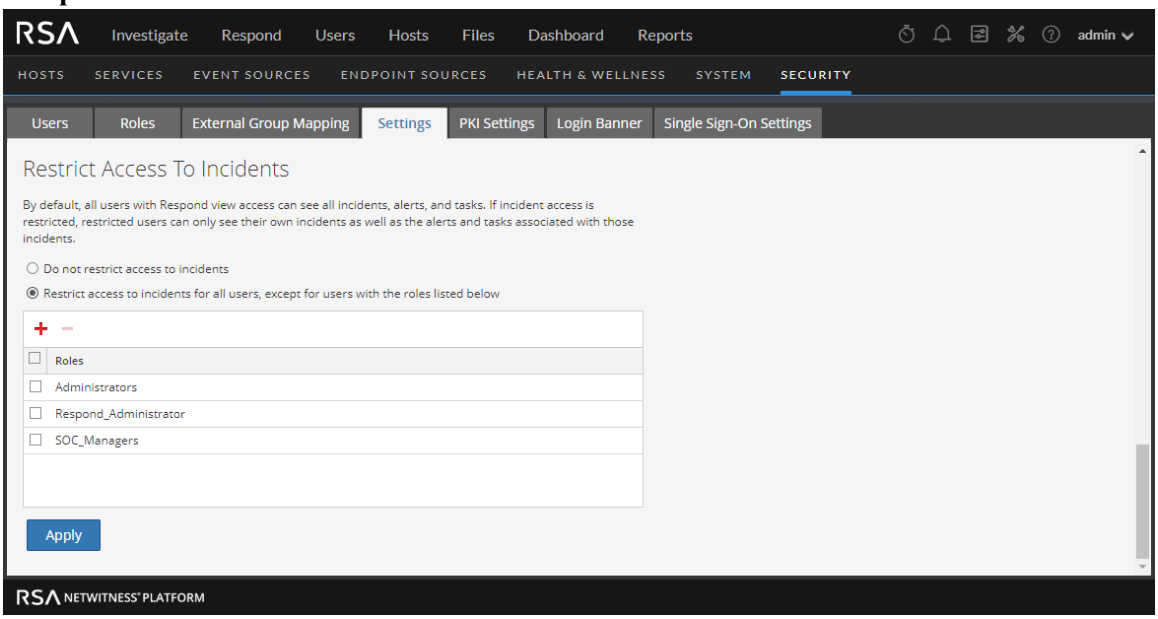
- Analysts can only see incidents assigned to them as well as the alerts and tasks associated with those incidents. Likewise, they can only change the status of and add journal entries (notes) to their own incidents.
- Analysts cannot see the Alerts and Tasks tabs in the Respond view (Respond > Tasks and Respond > Alerts are hidden), so they cannot view all alerts and tasks.
- Analysts cannot see the Assignee button or change the assignee of an incident.
- Analysts cannot see the Related Indicators (alerts) panel (Incident Details view > Find Related tab in the left-side panel).
- When adding events to incidents from the Investigate views, users can only add events to incidents to which they have access. The list of incidents to which users can add events only shows incidents that the user can access.

- When creating incidents from the Investigate views, users must have access to those incidents to view them in the Respond view. For example, when creating incidents from the Investigate view, Analysts must assign the incidents to themselves to view them in the Respond view.

**Caution:** These restrictions apply to all NetWitness users, except users with the **Administrators**, **Respond_Administrator**, and **SOC_Managers** roles. However, you can adjust the list of user roles whose access to incidents should not be restricted.

### To restrict access to incidents:

1. Go to **(Admin) > Security** and click the **Settings** tab.
2. In the **Restrict Access to Incidents** section, select **Restrict access to incidents for all users, except for users with the roles listed below**.



3. In the list, add the user roles whose access to incidents should not be restricted.
4. Click **Apply**.
   Changes take effect on the next log in to NetWitness.

# Step 3. Enable and Create Incident Rules for Alerts

NetWitness Respond incident rules contain criteria to automate the process of creating incidents from alerts. Alerts that meet the rule criteria are grouped together to form an incident. Analysts use these incidents to locate indicators of compromise. Instead of creating an incident for a particular set of alerts and adding the alerts to that incident manually, you can save time by using incident rules to create incidents from alerts for you.

NetWitness provides predefined incident rules that you can use and you can also create your own rules based on your business requirements.

To create incidents automatically, you need to enable at least one incident rule.

When you have two or more incident rules enabled, the order of the rules becomes very important. The highest priority rules are at the top of the Incident Rules list. The highest priority rule has the number 1 in the Order field. The next highest priority rule is number 2 in the Order field, and so on. Alerts can only be part of one incident. If an alert matches more than one rule in the Incident Rule list, it is only evaluated using the highest priority rule that it matches.

In 11.6.1, the Incident rule execution pattern is modified such that the alert aggregation queries refer to the lastRun parameter of the incident rule. So, now multiple incident rules (positioned as per the priority in the order field) in the Incident rules list match the same alert name.

For example,

- INC-rule 1 is at the 4th position in the order field that is associated with the conditions alert.name equal to test and **source** equal to **ESA**.
- INC-rule 2 is at the 24th position in the order field that is associated with the condition **source** equal to **ESA**.

  Before 11.6.1 upgrade, the INC-rule 1 matched the alert name test. On upgrade, the INC-rule 2 at the 24th position in the order field matches the alert name test as the source is ESA.

  To address this scenario, configure each incident rule to have unique conditions. Make sure the conditions in the lower priority incident rules are not duplicate of the conditions in the highest priority rules.

NetWitness has 13 predefined incident rules that you can use. To set up your incident rules, you can do any of the following:

- Enable predefined incident rules
- Add new rules
- Clone rules
- Edit existing rules
- Export and import rules

The Detect AI default incident rule is available in NetWitness 11.6 and later. It captures the network user behavior and uses the deployed RSA Live ESA Rules to create incidents from alerts.

The User Entity Behavior Analytics incident rule is available in 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts. The User Behavior default incident rule is available in NetWitness 11.1 and later. It captures network user behavior and uses deployed RSA Live ESA Rules to create incidents from alerts.

You can select and deploy the RSA Live ESA Rules that you want to monitor. For more information, see Deploy the RSA Live ESA Rules.

To configure the default incident rules or verify your existing default incident rules with the 11.5 default incident rules, see Set Up and Verify Default Incident Rules.

This topic contains the following procedures:

- Enable Incident Rules
- Create an Incident Rule
- Verify the Order of Your Incident Rules
- Clone an Incident Rule
- Edit an Incident Rule
- Export Incident Rules
- Import Incident Rules

## Enable Incident Rules

To create incidents automatically, you need to enable at least one incident rule. Predefined (default) incident rules or rules that you create must be enabled before they start creating incidents.

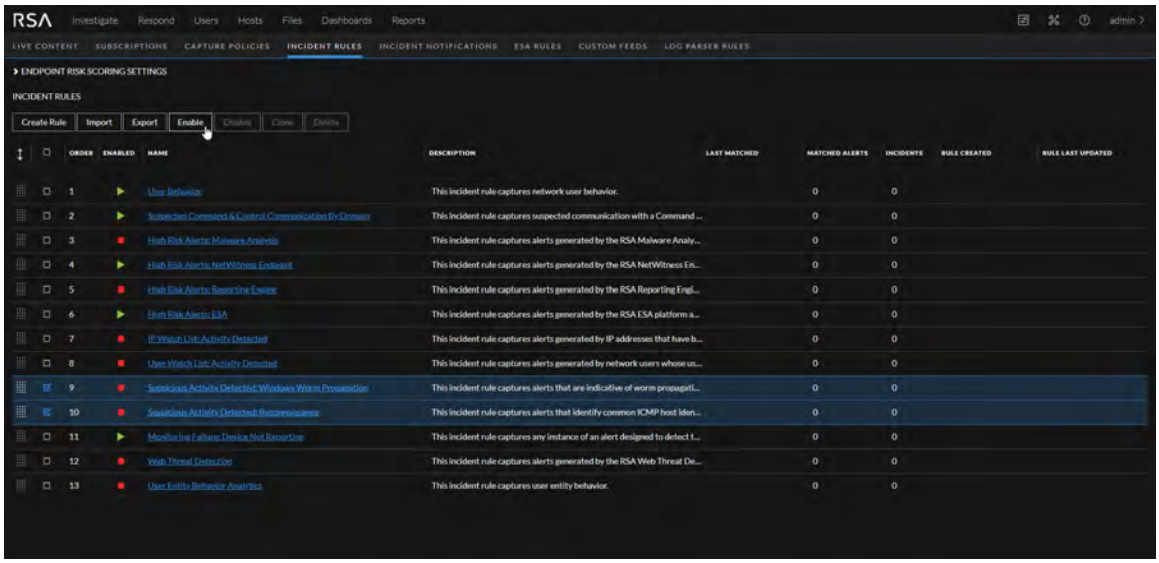
### To enable one or more incident rules:

**Note:** Enabling one or more incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.

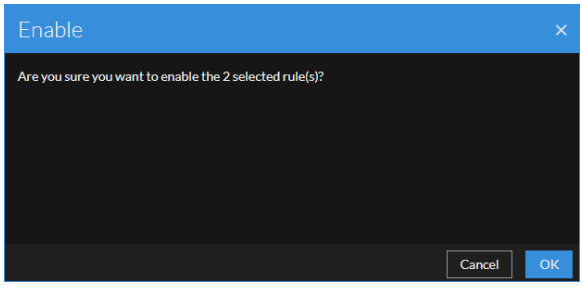
This is the easiest way to enable rules. Use this method after you have made the necessary adjustments to the rules and you just want to quickly enable them.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.

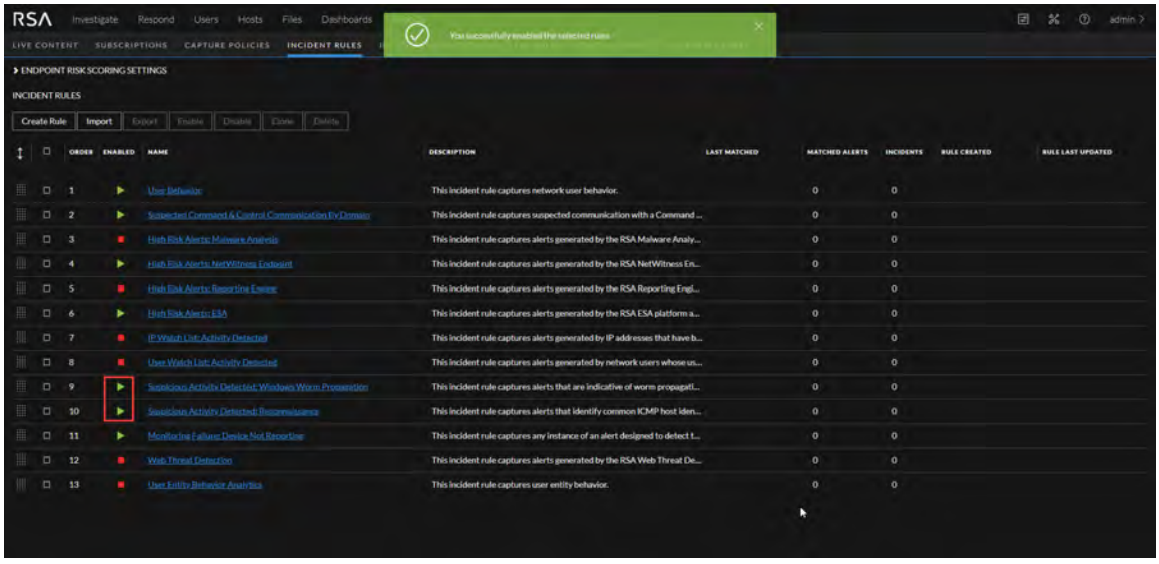
2. Select one or more incident rules and click **Enable**.



3. Click **OK** to verify that you want to enable the selected rules.



In the Incident Rules view, the Enabled column changes from a red square ■ (Disabled) to a green triangle ▶ (Enabled).



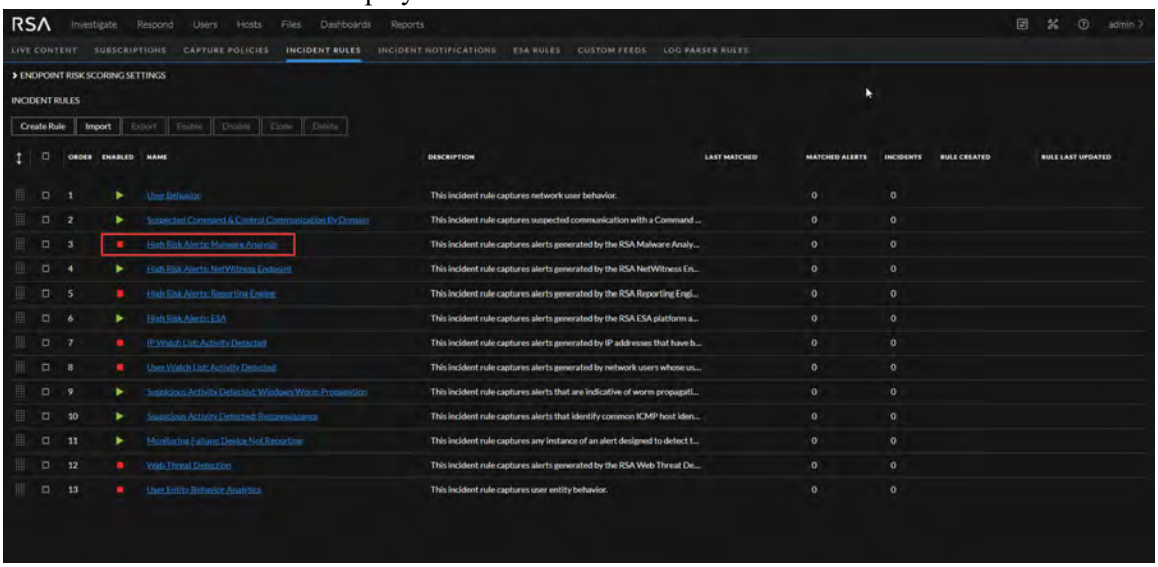
4. Verify the order of your incident rules.

**Note:** To disable incident rules, follow the above procedure but select the Disable button instead of the Enable button.

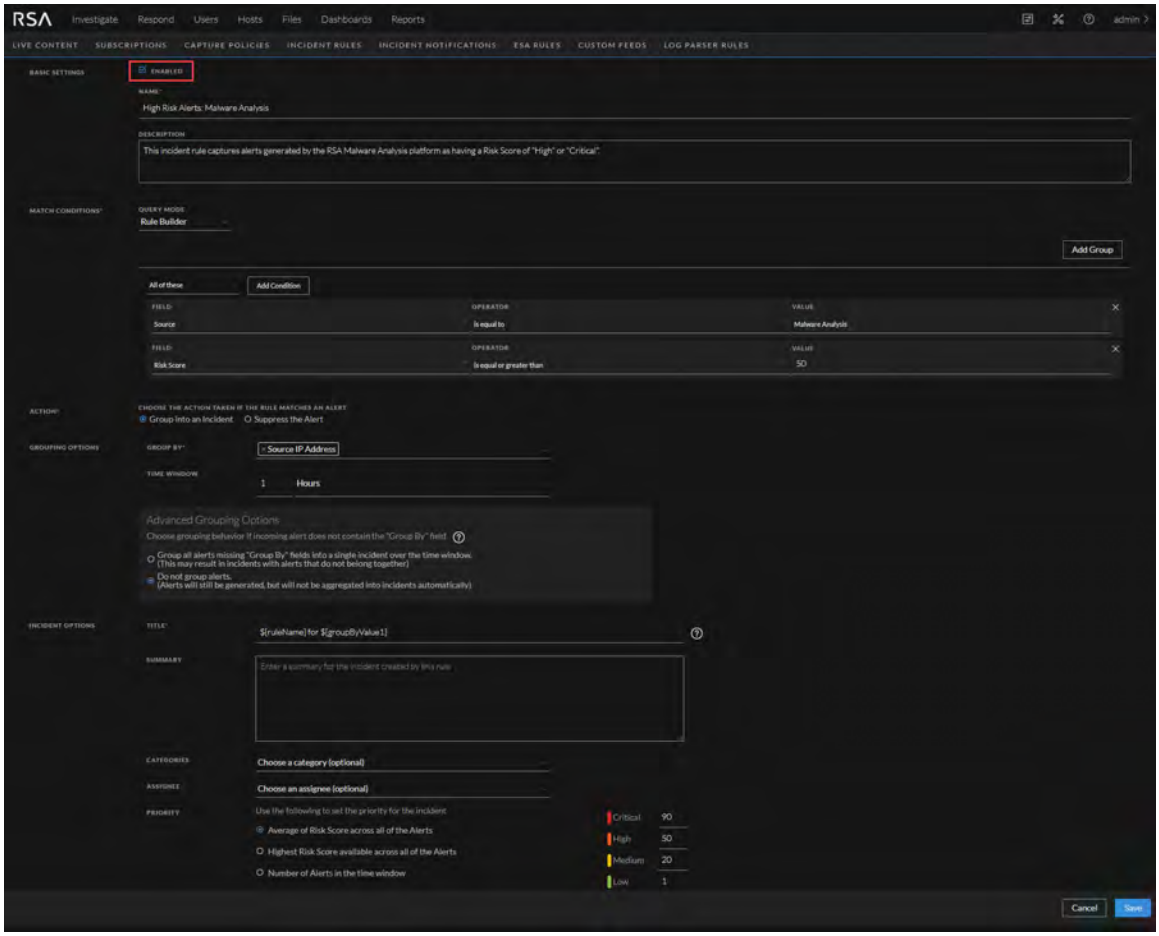
### To enable an incident rule from within the incident rule details:

You can enable rules from within the incident rule details when you save your rule adjustments.

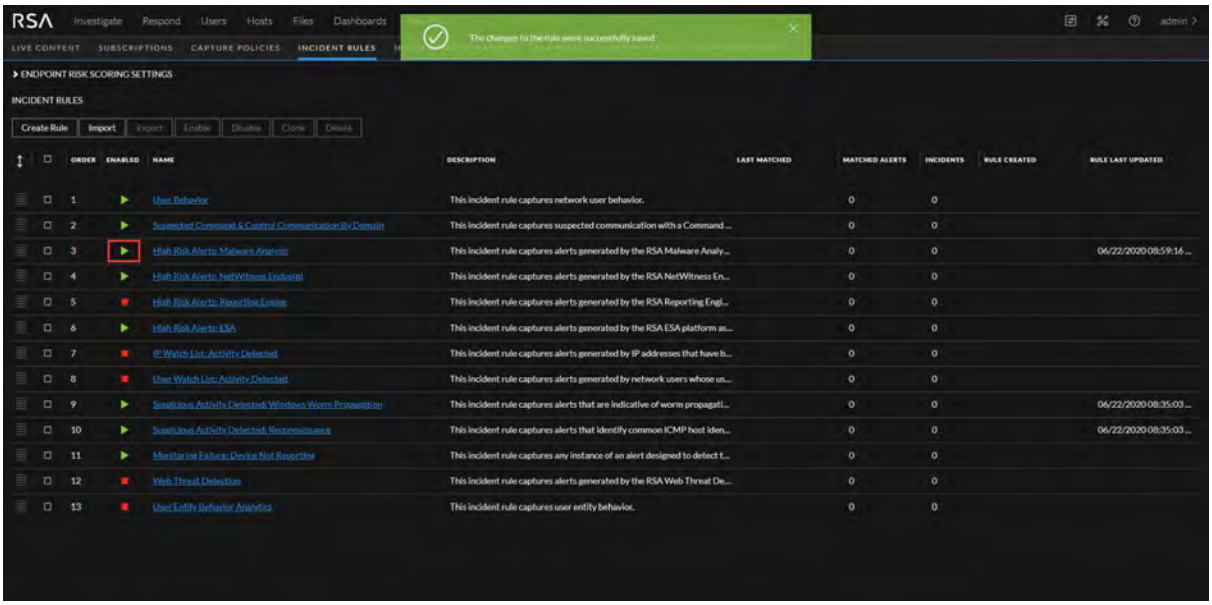
1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.



2. Click the link in the **Name** column for the rule that you want to enable.
   The Incident Rule Details view is displayed for the selected rule.



3. Adjust the parameters and conditions of your rule as required. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View. To adjust the default rules, see Set Up and Verify Default Incident Rules.
4. In the Basic Settings section, select the **Enabled** checkbox.
5. Click **Save** to enable the rule.
   Notice that the Enabled column changes from a red square ■ (Disabled) to a green triangle ▶ (Enabled).



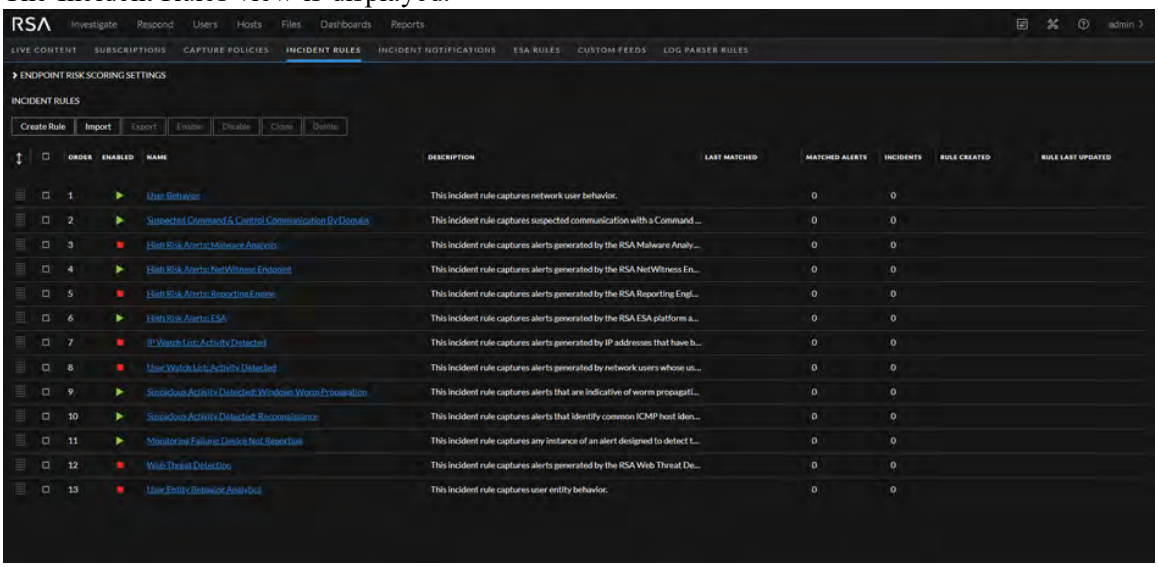
6. Verify the order of your incident rules.

**Note:** To disable an incident rule in the Incident Rule Details view, follow the above procedure but clear the Enabled checkbox instead of selecting it.

## Create an Incident Rule

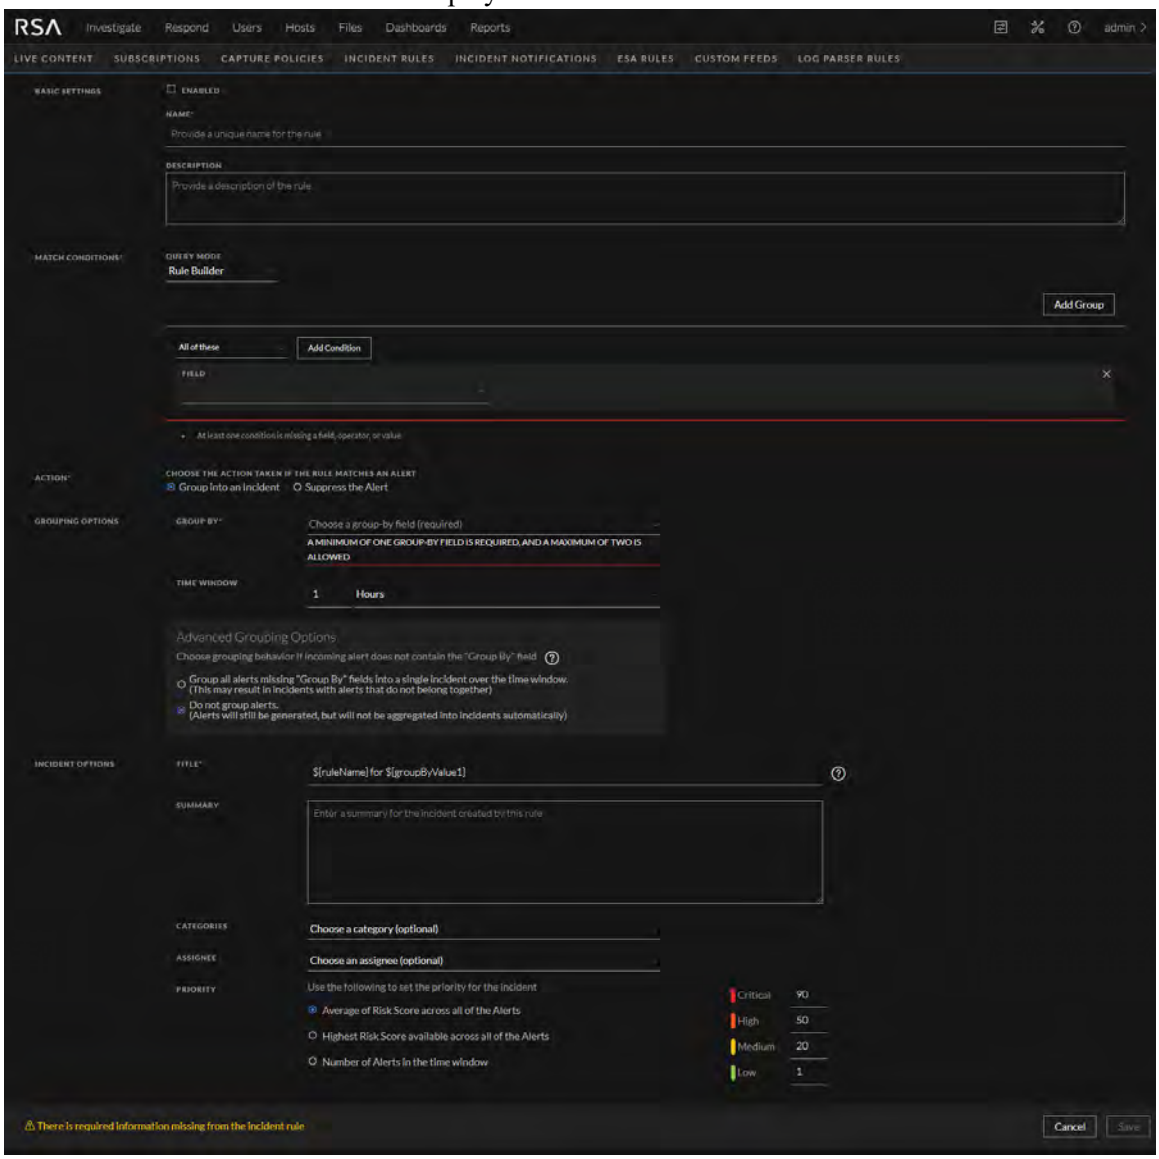
1. Go to **(Configure) > Incident Rules**.

   The Incident Rules view is displayed.



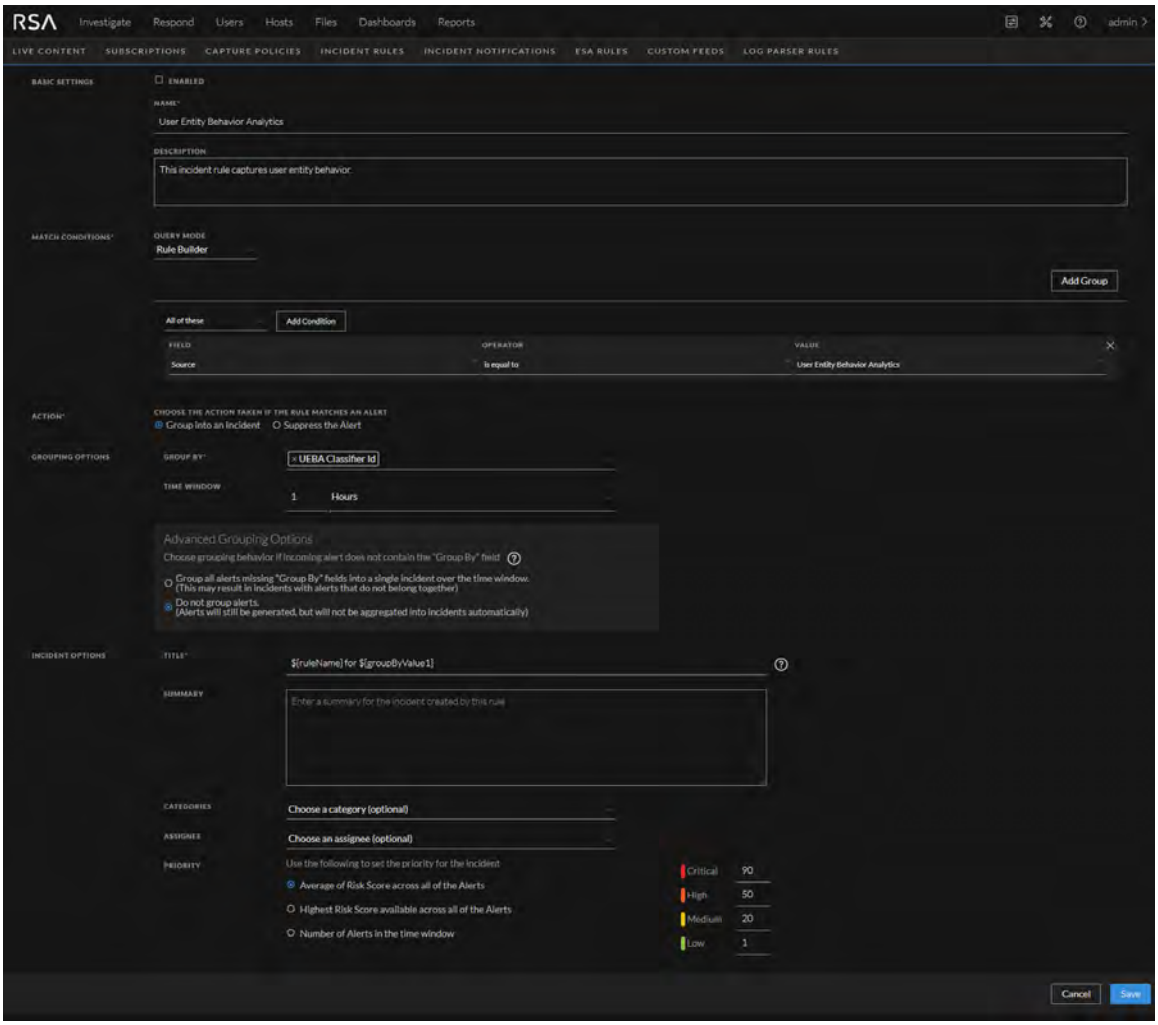
2. To add a new rule, click **Create Rule**.

The Incident Rule Details view is displayed.



3. Enter the parameters and conditions of your rule. All rules need to have at least one condition. For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a rule example. It is the default User Entity Behavior Analytics incident rule. It captures user entity behavior grouped by Classifier ID to create incidents from alerts.



4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save**.

   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that match the selected criteria.
6. Verify the order of your incident rules.

## Verify the Order of Your Incident Rules

NetWitness Respond evaluates incoming alerts against the incident rules in the order that you define. If alerts match the first rule listed, then that rule creates an incident. If alerts match the second rule listed and those alerts did not match the first rule, then the second rule creates an incident. If alerts match the third rule listed and those alerts did not match the first or second rule listed, then the third rule creates an incident, and so on.

To change the order of the rules, use the drag pads ( ) in front of the rules to move them up and down in the list.
The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If multiple rules match an alert, only the rule with the highest priority creates an incident.

## Clone an Incident Rule

It is often easier to duplicate an existing rule that is similar to a rule that you want to create and adjust it accordingly.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the rule that you would like to copy and click **Clone**.
3. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save** to create the rule.
6. Verify the order of your incident rules.

## Edit an Incident Rule

1. Go to **(Configure) > Incident Rules** and click the link in the **Name** column for the rule that you want to update.
   The Incident Rule Details view is displayed.
2. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save** to update the rule.
5. Verify the order of your incident rules.

**See Also:**

- For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

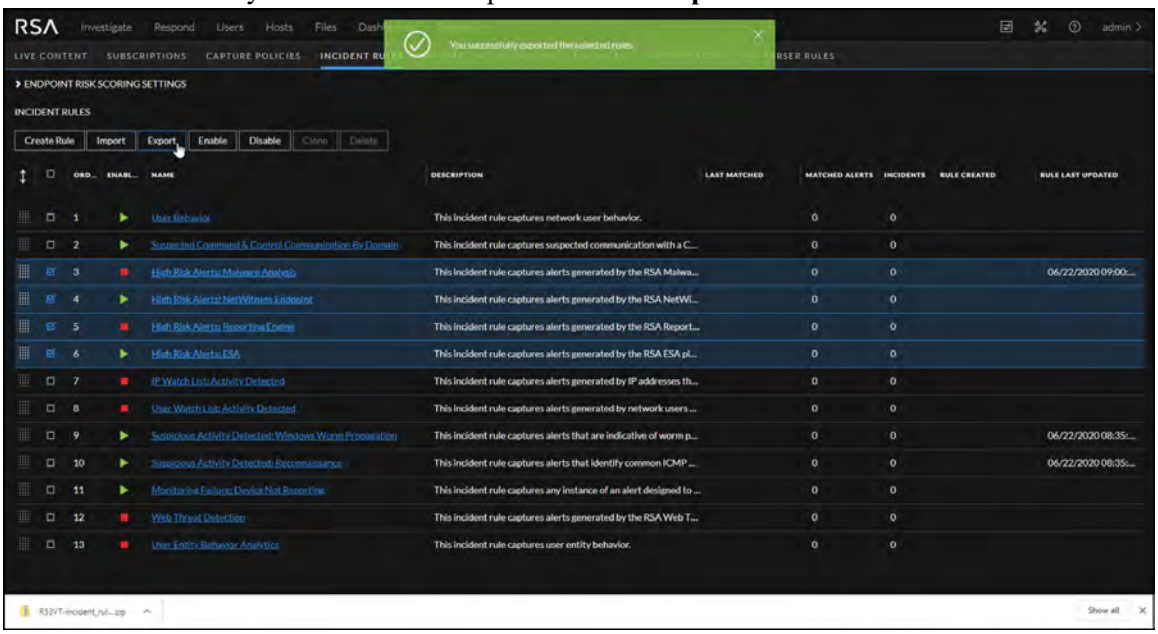
- For details on the parameter and field descriptions in the Incident Rules list, see Incident Rules View.

## Export Incident Rules

**Note:** Exporting and importing incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.

Exporting incident rules enables you to share incident rules with other NetWitness Servers on the same release version. The exported incident rules file is a ZIP file that contains two JSON files: one file contains the incident rules and the other file contains the incident rule schema. You cannot export Advanced incident rules; the export function only allows incident rules created using Rule Builder.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the rules that you would like to export and click **Export**.



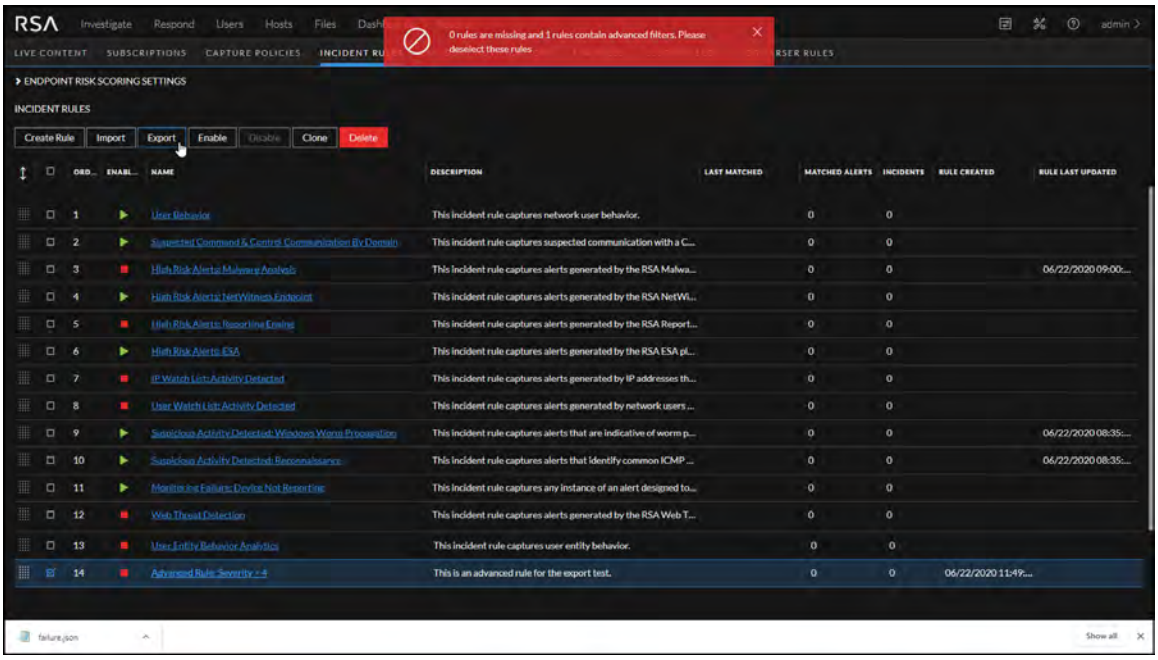
The exported incident rules file is a ZIP file in the format `<random ID>-incident_rules_export.json.zip`, which contains two mandatory JSON files:

- `aggregation_rule_schema.json` contains the incident rule schema.
- `<random ID>-incident_rules_export.json` contains the incident rules.

**Note:** You cannot export Advanced rules.

You can import this ZIP file on another NetWitness Server on the same release version.

If for some reason the export is not successful, and you receive only a .JSON file, for example, `failure.json`, refresh your browser and try again. This could happen if someone made an adjustment to the incident rules at the same time. You can also receive an error if you attempt to export an Advanced incident rule, which is not allowed.



## Import Incident Rules

**Note:** Exporting and importing incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.

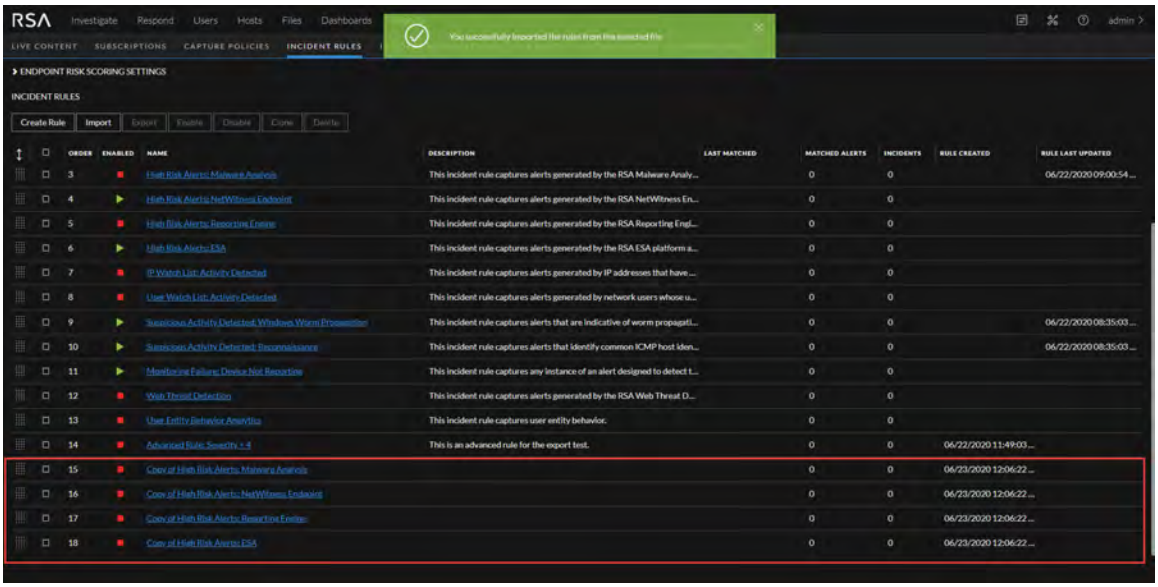
You can import an incident rules ZIP file from NetWitness Servers on the same release version. The incident rules ZIP file must be in the original exported format `<random ID>-incident_rules_export.json.zip` and contain two mandatory JSON files:

- `aggregation_rule_schema.json` contains the incident rule schema.
- `<random ID>-incident_rules_export.json` contains the incident rules.

The import fails if the ZIP file contains additional files or folders. To edit the incident rules ZIP file, see Edit the Incident Rules Export ZIP File.

### To import incident rules:

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Click **Import** and select the incident rules ZIP file to import.
   If the import is successful, a successful import notification is displayed, and the imported incident rules are disabled and shown at the bottom of the incident rules list. The **Rule Created** column shows the date and time of the import.



**See Also:**

- For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
- For details on the parameter and field descriptions in the Incident Rules list, see Incident Rules View.

# Additional Procedures for Respond Configuration

Use this section when you are looking for instructions to perform a specific task after the initial setup of NetWitness Respond.

- Set Up and Verify Default Incident Rules
- Configure Risk Scoring Settings for Automated Incident Creation
- Configure Analyst UI for Respond Server Alert Normalization
- Configure Incident Email Notification Settings
- Set a Retention Period for Alerts and Incidents
- Obfuscate Private Data
- Manage Incidents in Archer Cyber Incident & Breach Response
- Configure the Option to Send Incidents to RSA Archer
- Configure Threat Aware Authentication
- Set a Counter for Matched Alerts and Incidents
- Configure a Database for the Respond Server Service

# Set Up and Verify Default Incident Rules

The User Entity Behavior Analytics default incident rule is available in NetWitness 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts.

The Detect AI default incident rule is available in NetWitness 11.6 and later. It captures the anomalies generated by Detect AI.

The User Behavior incident rule, which captures network user behavior, is available in NetWitness 11.1 and later. This rule uses deployed RSA Live ESA Rules to create incidents from alerts. You can select and deploy the RSA Live ESA Rules that you want to monitor.

The following default incident rules changed slightly for 11.1 and later and now have **Source IP Address** as the Group By value:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: ESA

The following default incident rule changed slightly for 11.3 and later and now has the **Host Name** as the Group By value:

- High Risk Alerts: NetWitness Endpoint*

*If you have NetWitness Endpoint, the High Risk Alerts: NetWitness Endpoint default incident rule captures alerts generated by NetWitness Endpoint with a risk score of High or Critical. To aggregate NetWitness Endpoint alerts based on the File Hash instead of Host Name, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

To verify your existing default incident rules with the 11.5 default incident rules, look at the default incident rule tables following these procedures. If you are missing a default incident rule, you can create it manually. Review the default incident rules and adjust them to your environment as required.

## Set Up the User Behavior Incident Rule

In order to use the default User Behavior incident rule, you need to deploy the RSA Live ESA Rules that you want to monitor from those listed in the User Behavior incident rule conditions. Complete the following procedures to start aggregating alerts for the User Behavior default incident rule:

- Deploy the RSA Live ESA Rules
- Adjust and enable the User Behavior default rule (or create it if you do not have it)

### Deploy the RSA Live ESA Rules

1. Go to **(Configure) > Live Content**.
2. In the **Resource Types** field, select **Event Steam Analysis Rule** and click **Search**.

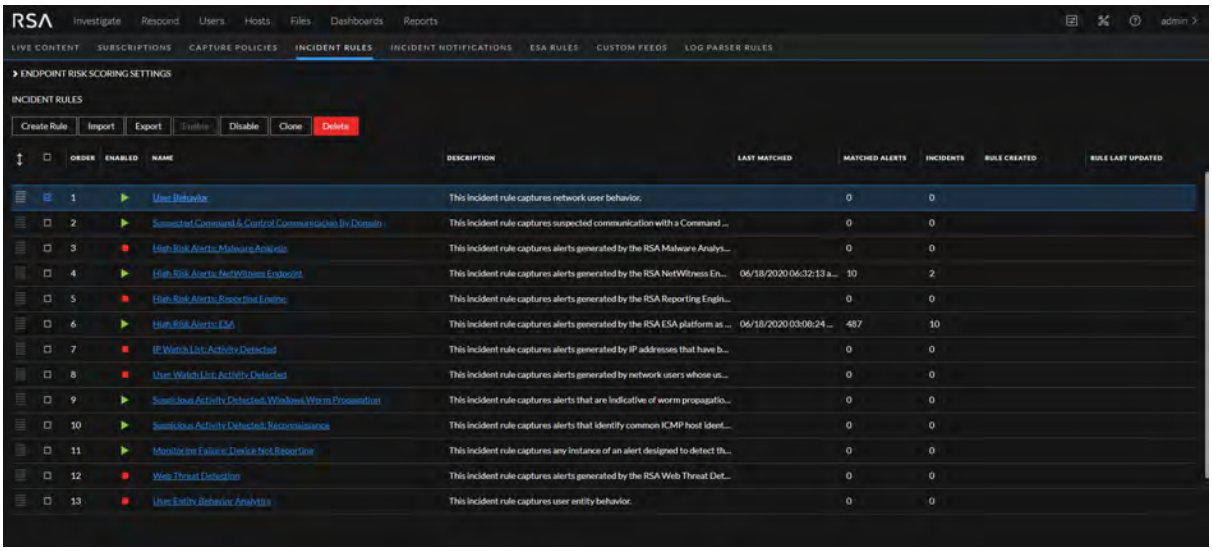
3. In the **Matching Resources** list, select the ESA Rules from the following **User Behavior** table that you are interested in monitoring and deploy them (click **Deploy**).
4. Go to **(Configure) > ESA Rules > Rules** tab, and in the Rule Library **Filter** drop-down list, select **RSA Live ESA Rule**.
5. To add a new ESA rule deployment, in the drop-down list near **Deployments**, click **Add**.
   a. In the ESA Services section, add and then select your ESA service.
   b. In the Data Sources section, click + and add a data source to use for the ESA rule deployment.
   c. In the ESA Rules section, click + and in the Deploy ESA Rules dialog, select the ESA Rules that you selected from the **User Behavior** table, and then click **Save**.
   The selected ESA rules are listed with a status of **Added**.
6. Select the ESA rules that you added from the previous step, and click **Deploy Now**.
   The status of the selected ESA rules changes to **Deployed**.
7. Go to **(Configure) > ESA Rules > Services** tab.
   In the **Deployed Rule Stats** for your ESA service, the rules that you added should have a status of enabled, which is indicated by a green circle in the Enable column.

## Adjust and Enable the User Behavior Default Rule (or Create It If You Do Not Have It)

If you have the User Behavior default rule, you can adjust it for your environment and enable it. If you do not have the User Behavior default rule, you can create it manually.

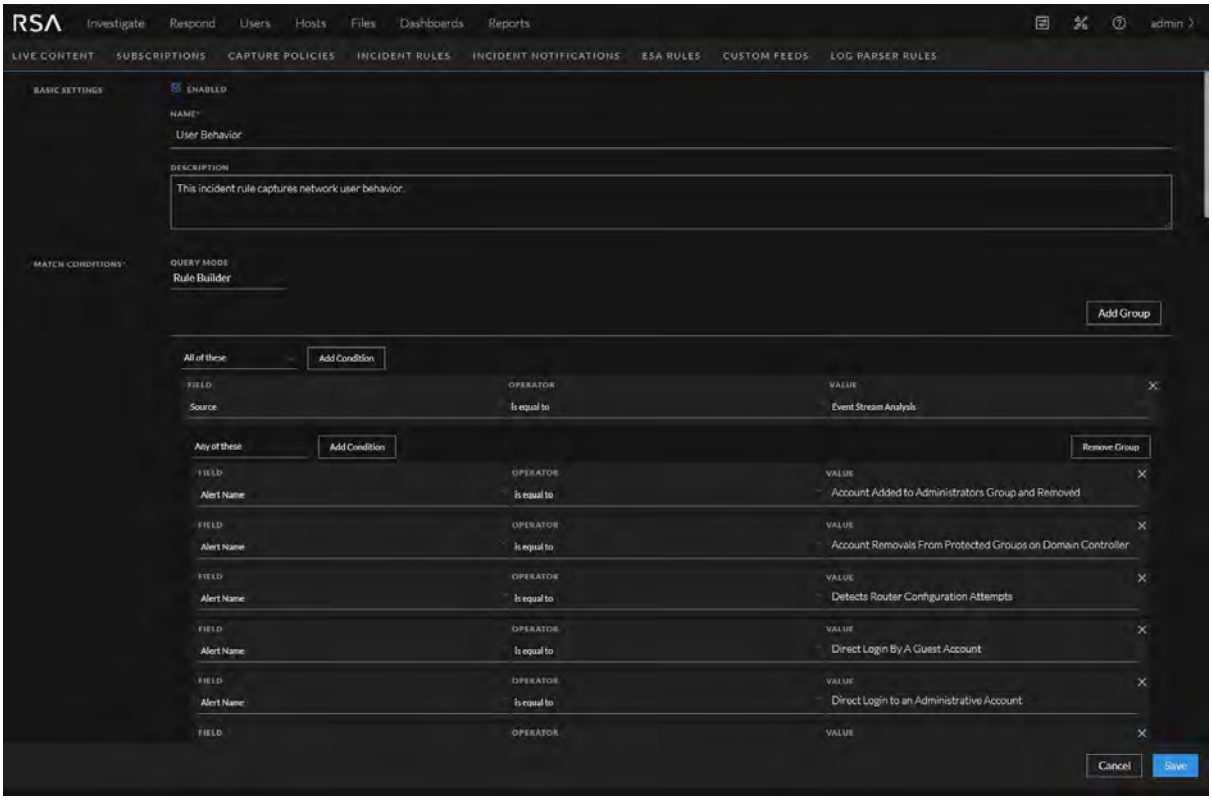
### (Optional) To create the User Behavior default rule:

1. Go to **(Configure) > Incident Rules.**
   The Incident Rules view is displayed. (The following figure shows what the User Behavior rule looks like if it was there.)



2. Click **Create Rule** and in the Incident Rule Details view, create the User Behavior default incident rule using the values in the User Behavior table following this procedure. The conditions as well as the values not listed in the table should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a portion of the User Behavior default rule details. Notice that there are two groups in this rule.



3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.

4. Click **Save**.
   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that are matched as per the rule criteria.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

The following table shows the values for the User Behavior default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | User Behavior |
| Description | | | This incident rule captures network user behavior. |
| Query Mode: | | | Rule Builder<br>**Note:** For information about advanced query mode, see Incident Rule Details View |
| 1st Group: | | | All of these |
| Condition: | Source | is equal to | Event Stream Analysis |
| 2nd Group: | | | Any of these |
| Conditions: | Alert Name | is equal to | Account Added to Administrators Group and Removed |
| | Alert Name | is equal to | Account Removals From Protected Groups on Domain Controller |
| | Alert Name | is equal to | Detects Router Configuration Attempts |
| | Alert Name | is equal to | Direct Login By A Guest Account |
| | Alert Name | is equal to | Direct Login to an Administrative Account |
| | Alert Name | is equal to | Failed Logins Followed By Successful Login Password Change |
| | Alert Name | is equal to | Insider Threat Mass Audit Clearing |
| | Alert Name | is equal to | Internal Data Posting to 3rd Party Sites |
| | Alert Name | is equal to | kbrtgt Account Modified on Domain controller |
| | Alert Name | is equal to | Lateral Movement Suspected Windows |
| | Alert Name | is equal to | Logins across Multiple Servers |
| | Alert Name | is equal to | Logins by Same User to Multiple Servers |

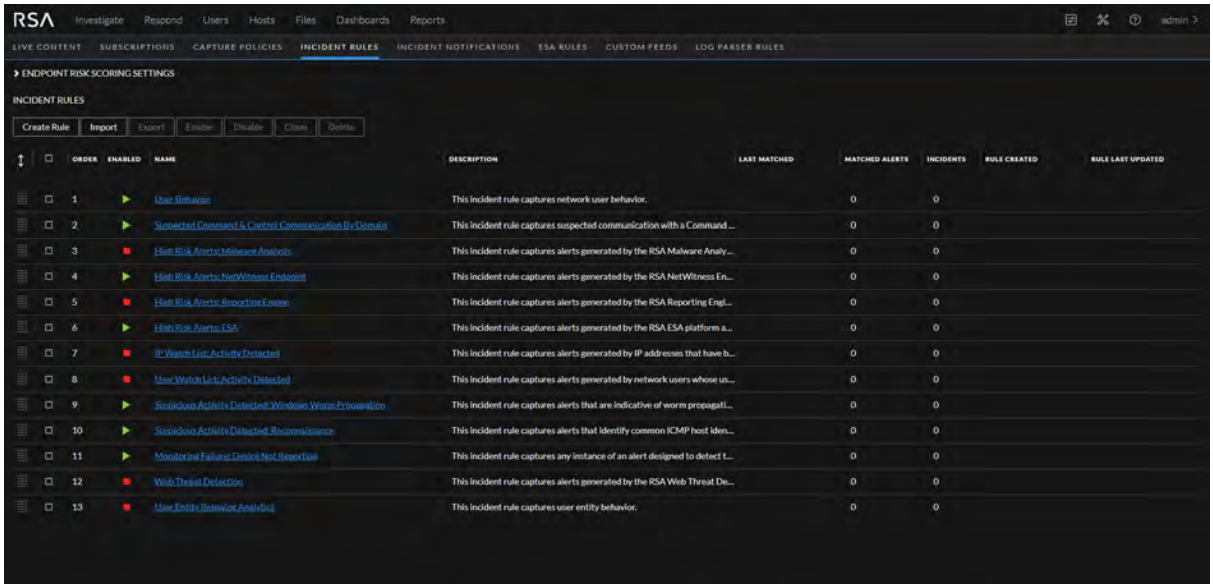
## Set up or Verify a Default Incident Rule

1. Go to **(Configure) > Incident Rules.**
   The Incident Rules view is displayed.



2. Click the link in the **Name** field of a default incident rule to view the Incident Rule Details view. Set up or verify the default incident rule using the values in the default incident rules tables in this topic. Values not listed in the tables should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
3. When you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save**.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

## Suspected Command & Control Communication By Domain

The following table shows the values for the Suspected Command & Control Communication By Domain default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | Suspected Command & Control Communication By Domain |
| Description | | | This incident rule captures suspected communication with a Command & Control server and groups results by domain. |
| Group: | | | All of these |
| Conditions: | Source | is equal to | Event Stream Analysis |
| | Alert Rule Id | is equal to | Suspected C&C |
| Group By | | | Domain for Suspected C& C |
| Time Window | | | 7 Days |
| Title | | | Suspected C&C with ${groupByValue1} |
| Summary | | | NetWitness Platform detected communications with ${groupByValue1} that may be command and control malware.<br>1. Evaluate if the domain is legitimate (online radio, news feed, partner, automated testing, etc.).<br>2. Review the domain registration for suspect information (Registrant country, registrar, no registration data found, etc).<br><br>3. If the domain is suspect, go to the Investigation module to locate other activity to or from it. |

## High Risk Alerts: Malware Analysis

The following table shows the values for the High Risk Alerts: Malware Analysis default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | High Risk Alerts: Malware Analysis |
| Description | | | This incident rule captures alerts generated by the RSA Malware Analysis platform as having a Risk Score of "High" or "Critical". |
| Group: | | | All of these |
| Conditions: | Source | is equal to | Malware Analysis |
| | Risk Score | is equal or greater than | 50 |
| Group By | | | Source IP Address |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

## High Risk Alerts: NetWitness Endpoint

The following table shows the values for the High Risk Alerts: NetWitness Endpoint default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | High Risk Alerts: NetWitness Endpoint |
| Description | | | This incident rule captures alerts generated by the RSA NetWitness Endpoint platform as having a Risk Score of "High" or "Critical". |
| Group: | | | All of these |
| Conditions: | Source | is equal to | NetWitness Endpoint |
| | Risk Score | is equal or greater than | 50 |
| Group By | | | Host Name* |

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

*To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

## High Risk Alerts: Reporting Engine

The following table shows the values for the High Risk Alerts: Reporting Engine default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | High Risk Alerts: Reporting Engine |
| Description | | | This incident rule captures alerts generated by the RSA Reporting Engine as having a Risk Score of "High" or "Critical". |
| Group: | | | All of these |
| Conditions: | Source | is equal to | Reporting Engine |
| | Risk Score | is equal or greater than | 50 |
| Group By | | | Source IP Address |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

## High Risk Alerts: ESA

The following table shows the values for the High Risk Alerts: ESA default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | High Risk Alerts: ESA |
| Description | | | This incident rule captures alerts generated by the RSA ESA platform as having a Risk Score of "High" or "Critical". |
| Group: | | | All of these |
| Conditions: | Source | is equal to | Event Stream Analysis |

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| | Risk Score | is equal or greater than | 50 |
| Group By | | | Source IP Address |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

## IP Watch List: Activity Detected

The following table shows the values for the IP Watch List: Activity Detected default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | IP Watch List: Activity Detected |
| Description | | | This incident rule captures alerts generated by IP addresses that have been added as "Source IP Address" *and* "Destination IP Address" conditions of the rule. To add additional IP addresses to the watch list, simply add a new Source and Destination IP Address conditional pair. |
| Group: | | | Any of these |
| Conditions: | Source IP Address | is equal to | 1.1.1.1 |
| | Destination IP Address | is equal to | 1.1.1.1 |
| | Source IP Address | is equal to | 2.2.2.2 |
| | Destination IP Address | is equal to | 2.2.2.2 |
| Group By | | | Source IP Address |
| Time Window | | | 4 Hours |
| Title | | | ${ruleName} |

## User Watch List: Activity Detected

The following table shows the values for the User Watch List: Activity Detected default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | User Watch List: Activity Detected |
| Description | | | This incident rule captures alerts generated by network users whose user names have been added as a "Source UserName" condition. To add more than one Username to the watch list, simply add an additional Source Username condition. |
| Group: | | | Any of these |
| Conditions: | Source Username | is equal to | jsmith |
| | Source Username | is equal to | jdoe |
| Group By | | | Source Username |
| Time Window | | | 4 Hours |
| Title | | | ${ruleName} |

## Suspicious Activity Detected: Windows Worm Propagation

The following table shows the values for the Suspicious Activity Detected: Windows Worm Propagation default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | Suspicious Activity Detected: Windows Worm Propagation |
| Description | | | This incident rule captures alerts that are indicative of worm propagation activity on a Microsoft network |
| 1st Group: | | | All of these |
| Condition: | Source | is equal to | Event Stream Analysis |
| 2nd Group: | | | Any of these |
| Conditions: | Alert Name | is equal to | Windows Worm Activity Detected Logs |

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| | Alert Name | is equal to | Windows Worm Activity Detected Packets |
| Group By | | | Source IP Address |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} |

## Suspicious Activity Detected: Reconnaissance

The following table shows the values for the Suspicious Activity Detected: Reconnaissance default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | Suspicious Activity Detected: Reconnaissance |
| Description | | | This incident rule captures alerts that identify common ICMP host identification techniques (i.e. "ping") accompanied by connection attempts to multiple service ports on a host |
| 1st Group: | | | All of these |
| Condition: | Source | is equal to | Event Stream Analysis |
| 2nd Group: | | | Any of these |
| Conditions: | Alert Name | is equal to | Port Scan Horizontal Packet |
| | Alert Name | is equal to | Port Scan Vertical Packet |
| | Alert Name | is equal to | Port Scan Horizontal Log |
| | Alert Name | is equal to | Port Scan Vertical Log |
| Group By | | | Source IP Address |
| Time Window | | | 4 Hours |
| Title | | | ${ruleName} |

## Monitoring Failure: Device Not Reporting

The following table shows the values for the Monitoring Failure: Device Not Reporting default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | Monitoring Failure: Device Not Reporting |
| Description | | | This incident rule captures any instance of an alert designed to detect the absence of log traffic from a previously reporting device |
| Group: | | | All of these |
| Conditions: | Source | is equal to | Event Stream Analysis |
| | Alert Name | is equal to | No logs traffic from device in given time frame |
| Group By | | | Source IP Address |
| Time Window | | | 2 Hours |
| Title | | | ${ruleName} |

## Web Threat Detection

The following table shows the values for the Web Threat Detection default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | Web Threat Detection |
| Description | | | This incident rule captures alerts generated by the RSA Web Threat Detection platform. |
| Group: | | | All of these |
| Condition: | Source | is equal to | Web Threat Detection |
| Group By | | | Alert Rule Id |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

### User Entity Behavior Analytics

The following table shows the values for the User Entity Behavior Analytics default incident rule.

| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | User Entity Behavior Analytics |
| Description | | | This incident rule captures user entity behavior. |
| Group: | | | All of these |
| Condition: | Source | is equal to | User Entity Behavior Analytics |
| Group By | | | UEBA Classifier Id |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue1} |

### Detect AI

The following table shows the values for the Detect AI default incident rule.

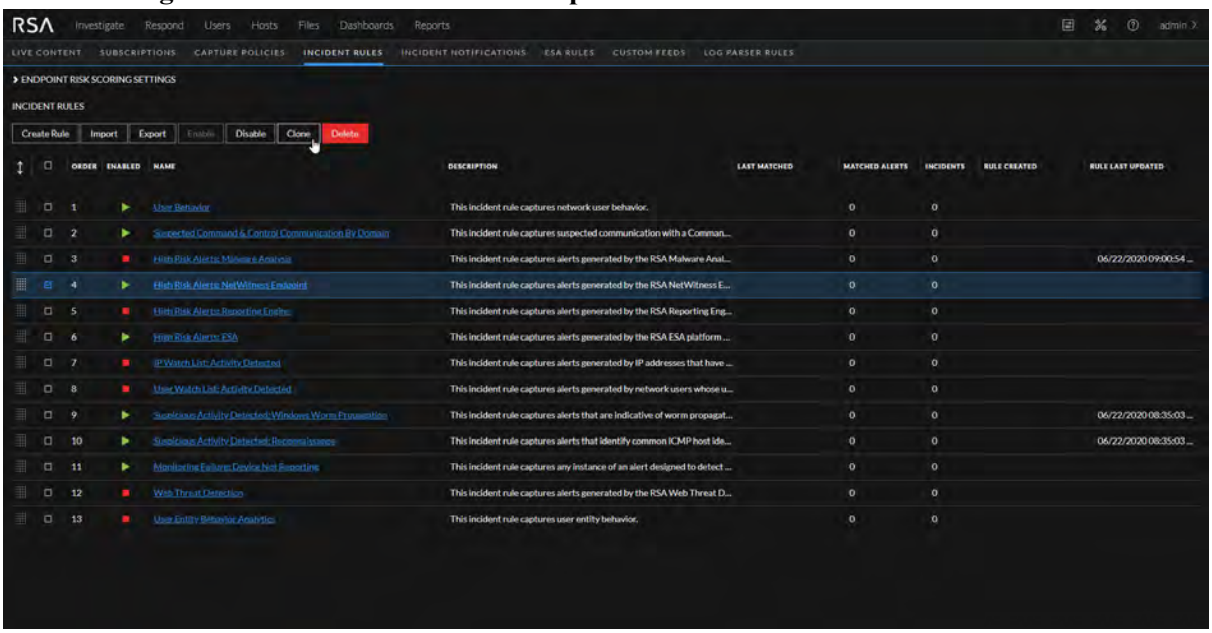
| Field | Condition Field | Condition Operator | Value |
|---|---|---|---|
| Name | | | DetectAI |
| Description | | | This incident rule captures anomalies generated by Detect AI |
| Group: | | | All of these |
| Condition: | Source | is equal to | DetectAI |
| Group By | | | UEBA Classifier Id, UEBA Entity Name |
| Time Window | | | 1 Hour |
| Title | | | ${ruleName} for ${groupByValue2} |

## Create a NetWitness Endpoint Incident Rule using File Hash

To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. To do this, clone the default NetWitness Endpoint incident rule and change the Group By value.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.

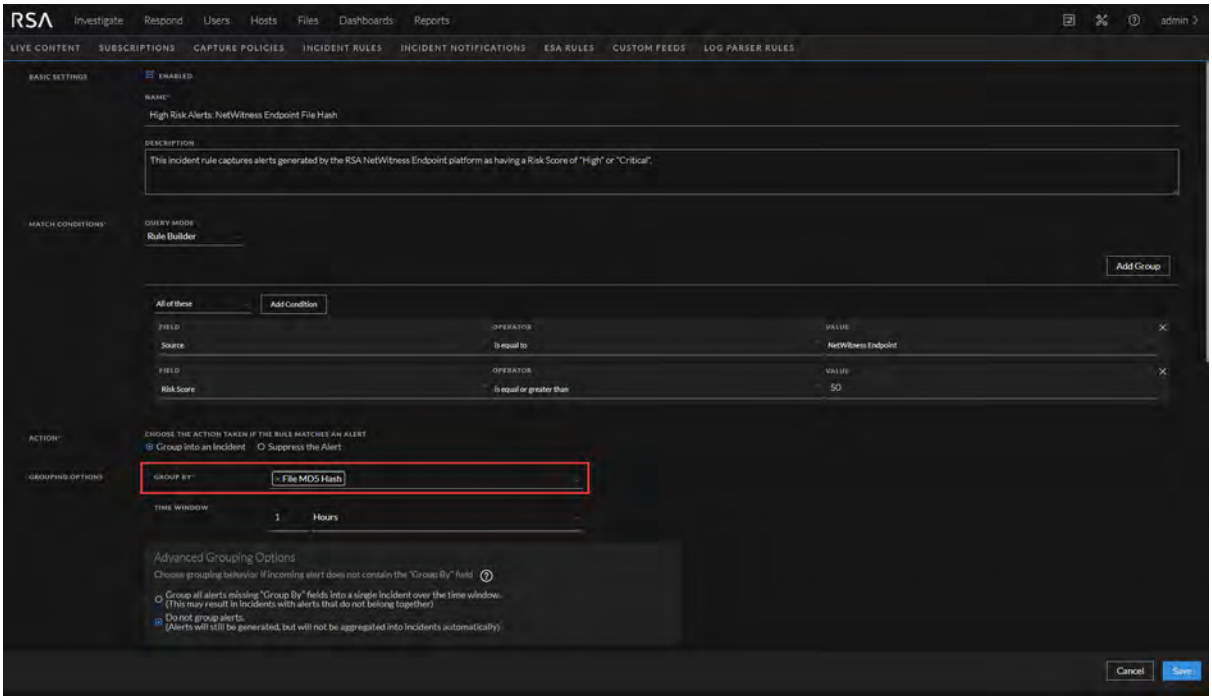
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**.



You will receive a message that you successfully cloned the selected rule.

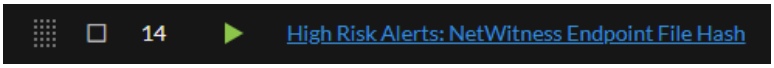
3. Change the **Name** of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File Hash.

4. In the **Group By** field, remove the previous Group By value and add **File MD5 Hash**.
It is important that File MD5 Hash is the only Group By value listed.



5. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.

6. Click **Save** to create the rule.
   The Incident Rules view shows your new rule.



7. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

# Configure Risk Scoring Settings for Automated Incident Creation

**Note:** The information in this topic applies to NetWitness Version 11.3 and later.

Endpoint Risk Scoring Settings only apply to NetWitness Endpoint.

In addition to automatically creating incidents with predefined rules and rules that you define, NetWitness Respond automatically creates risk scoring incidents for suspicious files and hosts when defined risk score thresholds are crossed. In the background, it monitors the following types of alerts and calculates risk scores for each file and host:

- Critical and High priority alerts from NetWitness Respond
- Medium priority Endpoint alerts from ESA

NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. When the calculated risk score exceeds the specified threshold, NetWitness Respond does one of the following during the specified time window, such as 1 day:

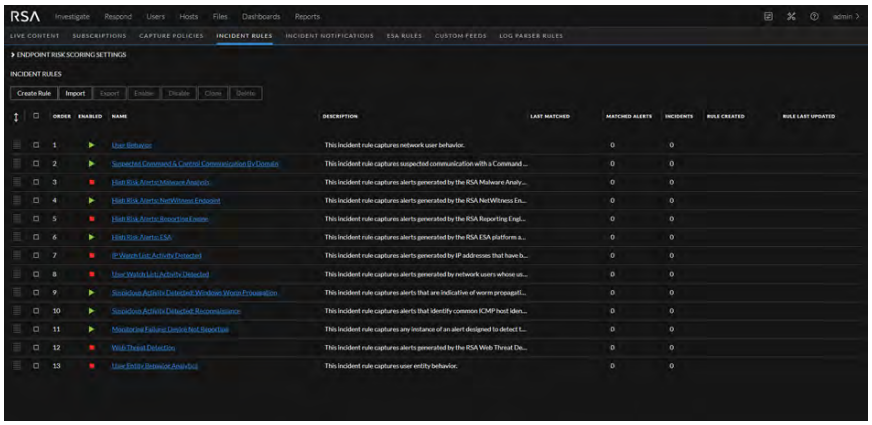
- Creates a risk scoring alert and uses it to create a risk scoring incident
- Adds risk scoring alerts along with associated events to the same incident

For more information on configuring NetWitness Endpoint, see the *NetWitnesss Endpoint Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

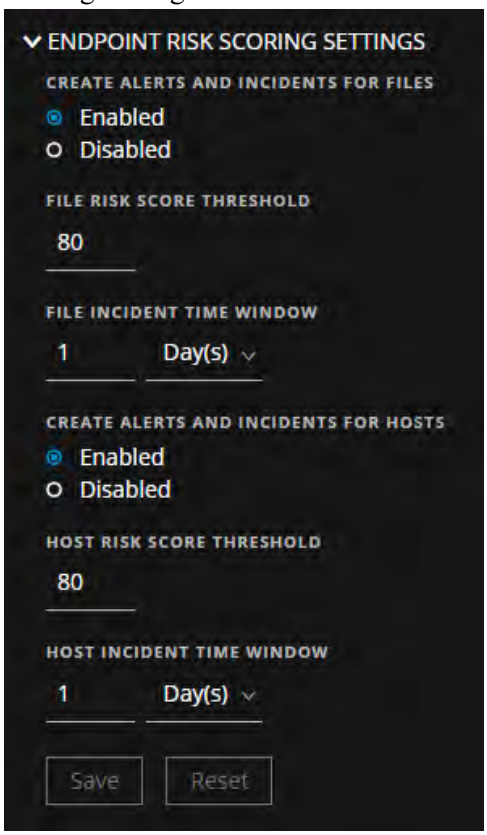
### To configure the Endpoint Risk Scoring Settings:

You should leave the Endpoint Risk Scoring Settings at the default values. However, if you are getting too many risk scoring alerts and incidents created, increase the risk score threshold to a higher value. Also, if you are getting too many incidents created for the same hosts or files, increase the time window to add more alerts to the same risk scoring incidents. If you are not seeing many risk scoring incidents, you can either decrease the risk scoring thresholds for hosts and files or decrease the incident time windows.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.



2. Click the arrow in front of **ENDPOINT RISK SCORING SETTINGS** to expand the Endpoint Risk Scoring Settings section.



3. In the Endpoint Risk Scoring Settings section, adjust the settings as follows:

   a. **Create Alerts and Incidents for Files**:

   - Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious files. When calculated file risk scores go above the file risk score threshold, it triggers the creation of risk scoring alerts and incidents.
   - Select **Disabled** to stop automatically creating risk scoring alerts and incidents. If you disable it, incidents are not created for suspicious files where risk scores are high.

b. **File Risk Score Threshold**: The File Risk Score Threshold is the risk score level used to trigger alert and incident creation. The File Risk Score Threshold range is from 0-100. For example, if the File Risk Score Threshold is 80 and the calculated risk score of a suspicious Openme.rar file is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

- If you are seeing too many alerts and incidents, increase the risk score threshold.
- If you are not seeing many alerts and incidents, decrease the risk score threshold.

c. **File Incident Time Window**: The File Incident Time Window is the period of time to wait before creating another incident. The file incident time window range is from 1-24 (hours or days). For example, the suspicious Openme.rar file has a calculated risk score of 81 and a file time window of 1 day. A risk scoring alert and incident is created for the Openme.rar file. During the time window, any similar risk scoring alerts with the same name created for the Openme.rar file get added to the same incident. At the end of the time window (day 1), if the calculated risk score of the file is still over the file risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created and any new risk scoring alerts associated with the file get added to the new incident until the next time window (day 3).

- If you are seeing too many alerts and incidents, increase the incident time window.
- If you are not seeing many alerts and incidents, decrease the incident time window.

d. **Create Alerts and Incidents for Hosts**:

- Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious hosts. When calculated host risk scores go above the host risk score threshold, it triggers the creation of risk scoring alerts and incidents.
- Select **Disabled** to stop automatically creating risk scoring alerts and incidents when calculated host risk scores go above the host risk score threshold. If you disable it, incidents are not created for suspicious hosts where risk scores are high.

e. **Host Risk Score Threshold**: The Host Risk Score Threshold is the risk score level used to trigger alert and incident creation. The host risk score threshold range is from 0-100. For example, if the Host Risk Score Threshold is 80 and the calculated risk score of a suspicious host IP address is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

- If you are seeing too many alerts and incidents, increase the risk score threshold.
- If you are not seeing many alerts and incidents, decrease the risk score threshold.

f. **Host Incident Time Window**: The Host Incident Time Window is the period of time to wait before creating another incident. The host incident time window range is from 1-24 (hours or days). For example, the suspicious host has a calculated risk score of 81 and a Host Time Window of 1 day. During the time window, any similar risk scoring alerts with the same name created for the suspicious host get added to the same incident. At the end of the time window

(day 1), if the calculated risk score of the host is still over the host risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created. Any new risk scoring alerts associated with that suspicious host add to that incident until the next time window.

- If you are seeing too many risk scoring alerts and incidents, increase the incident time window.
- If you are not seeing many risk scoring alerts and incidents, decrease the incident time window.

4. Click **Save**.

# Configure Custom Respond Server Alert Normalization

**Note:** This procedure is optional. Administrators can use it to change Respond Server alert normalization.

Analysts who are content experts can create ESA Correlation rules that generate alerts. When a rule is more complex than what can be specified in the ESA Rule Builder, they can write advanced Event Process Language (EPL) rules. After the ESA rules are deployed and the alert criteria is met, ESA Correlation-server forwards the raw alerts to Respond-server.

The schema, meta key selection, and event pattern of the raw alerts are unknown to the Respond-server since they depend on the way the ESA rules are written. In this case, you can customize the logic to parse the raw alert to an acceptable format. The parsing (normalization) logic is written in JavaScript language and NetWitness users who know how to write JavaScript code can customize the Respond normalization script files.

In NetWitness version 11.4 and later, to prevent overwriting future customizations in the Respond normalization scripts, add any custom logic to the **`custom_normalize_<alert type>.js`** files. The custom normalization script files have a `custom_normalize` prefix and are located in the **`/var/lib/netwitness/respond-server/scripts`** directory:

```
data_privacy_map.js
custom_normalize_alerts.js
custom_normalize_core_alerts.js
custom_normalize_ecat_alerts.js
custom_normalize_ma_alerts.js
custom_normalize_ueba_alerts.js
custom_normalize_wtd_alerts.js
utils.js
```

For Example, the `custom_normalize_core_alerts.js` is the normalization script used to add custom logic for ESA alerts. This JavaScript file has a `normalizeAlert` function with the parameters `headers`, `rawAlert`, and `normalizedAlert`. The `normalized` variable is an immutable copy object which has an embedded object with a list of normalized events. So if you have any custom meta keys configured for the events then you have to iterate through the `normalized.events` to populate the appropriate meta keys with values from the `rawAlert.events` object. The following figure shows sample code.

Sample Custom Normalize Core Alerts Code

```
normalizeAlert = function (headers, rawAlert, normalizedAlert) { // normalizedAlert is the immutable copy of ootb normalizer alert, make sure you use // normalized object to update/set the values in your scripts var normalized = Object.assign(normalizedAlert); var custom_events; if(normalized.events !== undefined) { custom_events = normalized.events; } else { custom_events = new Array([]); } for (var i = 0; i < rawAlert.events.length; i++) { custom_events[i].legalentity=Utils.stringValue (rawAlert.events[i].isgs_legalentity); custom_events[i].companycode=Utils.stringValue (rawAlert.events[i].isgs_companycode); } if(normalized.events === undefined){ normalized.events = custom_events; } return normalized; };
```

### To Configure Custom Respond Server Alert Normalization:

1. Open the `custom_normalize_core_alerts.js` file.

custom_normalize_core_alerts.js

```
exports.normalizeAlert = function (headers, rawAlert, normalizedAlert) { //
normalizedAlert is the immutable copy of ootb normalizer alert, make sure you use //
normalized object to update/set the values in your scripts var normalized = Object.assign
(normalizedAlert); // Add custom logic below return normalized; };
```

The `normalizedAlert` object has been broadcasted, which already comes through the basic parsing logic flow where some of the meta values have been copied to `normalizedAlert` from `headers` and `rawAlert`.

2. Populate The `normalizedAlert` object with the custom meta values that are not covered in the basic parsing logic:
   a. Add your custom logic below the line: `var normalized = Object.assign (normalizedAlert);`

      The `headers` parameter has very few attributes like:

      `headers.severity`

      `headers.deviceProduct`

      The important parameter is `rawAlert`, which has an embedded `events` object, which is an array. It is basically the list of events associated with the alert. The `events` object has all meta keys governed from the Concentrator. Here are some example meta keys:

      `event.user_dst`
      `event.user_src`
      `event.username`
      `event.domain_dst`
      `event.domain_src`
      `event.host_dst`
      `event.host_src`
      `event.analysis_session`
      `event.analysis_service`
      `event.analysis_file`
      `event.agent_id`
      `event.device_type`
      `event.category`
      `event.action`
      `event.user`
      `event.owner`
      `event.port_dst`
      `event.OS`

`event.process_vid_src`

To view the look-up table for meta keys, go to **(Configure) > Esa Rules > Settings > Meta Key References**.

The `normalized` object also has an embedded `events` object, which is an array.

b. Iterate through each item of the `normalized.events` and `rawAlert.events` and then copy the custom meta attributes from the `rawAlert.events` to the `normalized.events`.

The following example shows how to add custom meta keys to the `custom_normalize_core_alerts.js` file.

Example of Custom Alert Normalization

```
exports.normalizeAlert = function (headers, rawAlert, normalizedAlert) { // normalizedAlert is the immutable copy of ootb normalizer alert, make sure you use // normalized object to update/set the values in your scripts var normalized = Object.assign (normalizedAlert); var custom_events; if (normalized.events != undefined) { custom_events = normalized.events; } else { custom_events = new Array(); } // iterate through each item for (var i = 0; i < rawAlert.events.length; i++) { custom_events [i].metaKey1=Utils.stringValue(rawAlert.events[i].rawCustomMetaKey1); // Utils is a helper module to stringify the object custom_events[i].metaKey2=Utils.stringValue (rawAlert.events[i].rawCustomMetaKey2); } If (normalized.events == undefined) { normalized.events = custom_events; } return normalized; };
```

The `metaKey1` and `metaKey2` meta keys are now assigned meta keys, which you can view in the NetWitness user interface.

When customizing normalization script files, you can also look at the built-in Respond normalization script files for reference, such as `normalize_alerts.js`.

# Configure Analyst UI for Respond Server Alert Normalization

This procedure is optional. Administrators can use it to change Respond Server alert normalization on the Analyst UI.

**Note:** This option is available in NetWitness version 11.4 and later.

The Analyst UI (Analyst User Interface) enhances the performance of investigations for analysts who work in locations geographically separated from the NetWitness Server host. Respond Server alert normalization is disabled by default on the Analyst UI, but with enough bandwidth you can configure the Respond Server on the Analyst UI to normalize alerts for potential performance gains.

Respond Server alert normalization at the Analyst UI should be very carefully considered. If the Analyst UI is deployed in an environment that is geographically separated from the NetWitness Server (NW Server) and ESA services, depending on available bandwidth, normalizing alerts at the Analyst UI can generate large volumes of traffic, potentially impacting other services on the network. Potential gains from normalizing alerts at the Analyst UI can result in a performance decrease on the NW Server and ESA services.

You can configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization.

- Normalization is enabled by default for the Respond Server running on the NW Server host.
- Normalization is disabled by default for the Respond Server running on the Analyst UI.

### To change the alert normalization settings for the Respond Server running on the Analyst UI:

1. Log in to NetWitness on the NW Server host as administrator.
2. Go to **(Admin) > Services**, select the Respond Server service running on the Analyst UI, and then select **> View > Explore**.

3. In the Explore view node list, select **respond/normalization**.

   a. To turn on alert normalization for ESA and other alert generating sources, in the **indicator-normalization-enabled** field, enter **true**. To turn it off, enter **false**.

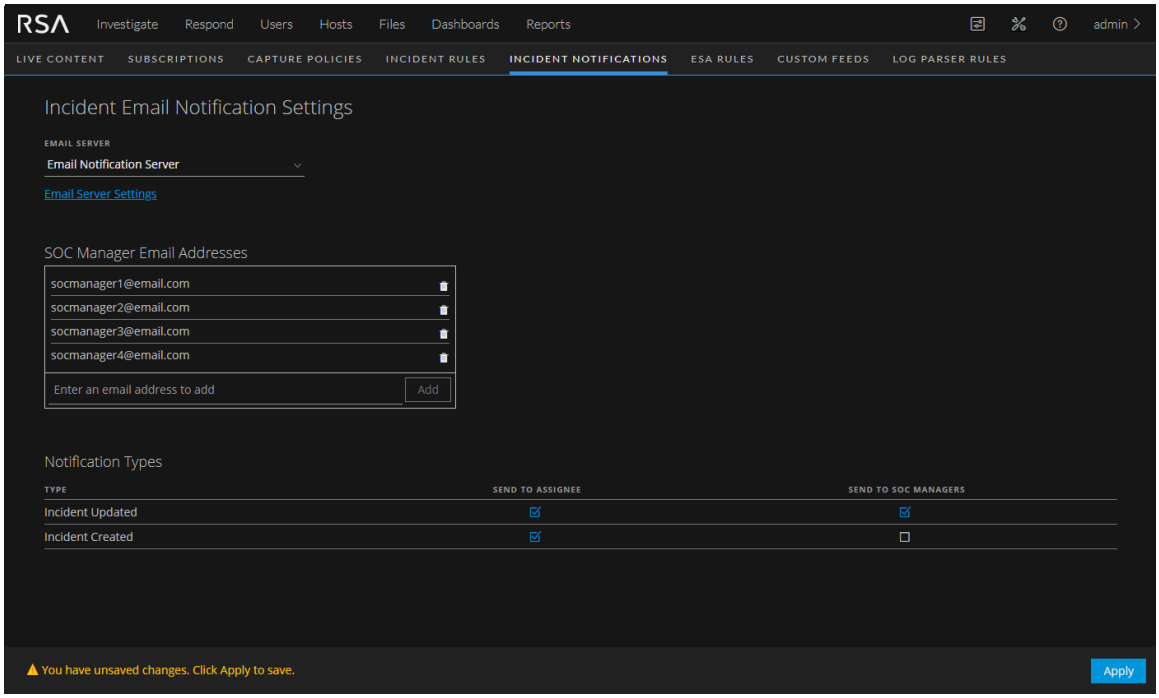
   b. To turn on alert normalization coming from event correlation for risk scoring alerts, in the **transient-indicator-normalization-enabled** field, enter **true**. To turn it off, enter **false**.

4. Restart the Respond Server service on the Analyst UI for the new settings to take effect. To do this, go to **(Admin) > Services**, select the Respond Server service on the Analyst UI, and then select **> Restart**.

# Configure Incident Email Notification Settings

Incident email notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

1. Go to **(Configure) > Incident Notifications**.
   The Incident Email Notification Settings view is displayed.



2. In the **Email Server** section, select the email server from the drop-down list that will send out email notifications when the notification settings are enabled.
   If there is no email server configured, you do not see an email server listed in the drop-down list. You have to configure an email server before you can continue with this procedure. To configure an email server, click the **Email Server Settings** link and go to the **Servers** tab. For more information, click the help icon or refer to the *System Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
3. In the **SOC Manager Email Addresses** section, add the email addresses of the SOC Managers that you want to receive email notifications. To add an SOC Manager email address to the list, type it in the field that shows **Enter an email address to add** and click **Add**. To remove an SOC Manager email address from the list, click next to the email address to be removed.
4. In the **Notification Types** section, select who should receive an email notification when an incident is created and when an incident is updated.

- **Send to Assignee**: An email is sent to the Analyst assigned to the incident.
- **Send to SOC Manager**: An email is sent to all of the addresses listed in the **SOC Manager Email Addresses** list.

5. Click **Apply**. Changes take effect immediately.

**Note:** If user email address information is updated in the (Admin) > Security > Users tab, it can take up to two minutes for the new email changes to take effect. Any incident creation or incident update email notifications sent during this time go to the old email address.

## Migration Considerations

Notification Settings do not migrate from NetWitness version 10.6.x to 11.1 and later. The Incident Management Notification Settings in 10.6.x are different from the Incident Email Notification settings available in 11.1 and later. You will need to manually update the incident notification settings in version 11.1 and later.

Notification Servers from 10.6.x are not displayed in the Email Server drop-down list. The email servers settings must be added to the Global Notification Servers ( (Admin) > System > Global Notifications > Server tab).

Custom Incident Management notification templates cannot be migrated to 11.1 and later. No custom templates are supported in 11.1 and later.

# Set a Retention Period for Alerts and Incidents

Sometimes data privacy officers want to retain data for a certain period of time and then delete it. A shorter retention period frees up disk space sooner. In some cases, the retention period must be short. For example, laws in Europe state that sensitive data cannot be retained for more than 30 days. After 30 days, the data must be obfuscated or deleted.

Setting a retention period for data is an optional procedure. The time that NetWitness Respond receives alerts and creates an incident determine when retention begins. Retention periods range from 30 to 365 days. If you set a retention period, one day after the period ends data is permanently deleted.

Retention is based on the time that NetWitness Respond receives the alerts and the incident creation time.

**Caution:** Data deleted after the retention period cannot be recovered.

When the retention period expires, the following data is **permanently deleted**:

- Alerts
- Incidents
- Tasks
- Journal entries

Logs track retention and manual deletion so you can see what has been deleted. You can view Respond Server logs in the following locations:

- **Respond Server Service log**: `/var/log/netwitness/respond-server/respond-server.log`
- **Respond Server Audit log**: `/var/log/netwitness/respond-server/respond-server.audit.log`

The data retention period that you set here does not apply to Archer or other third-party SOC tools. Alerts and incidents from other systems must be deleted separately.

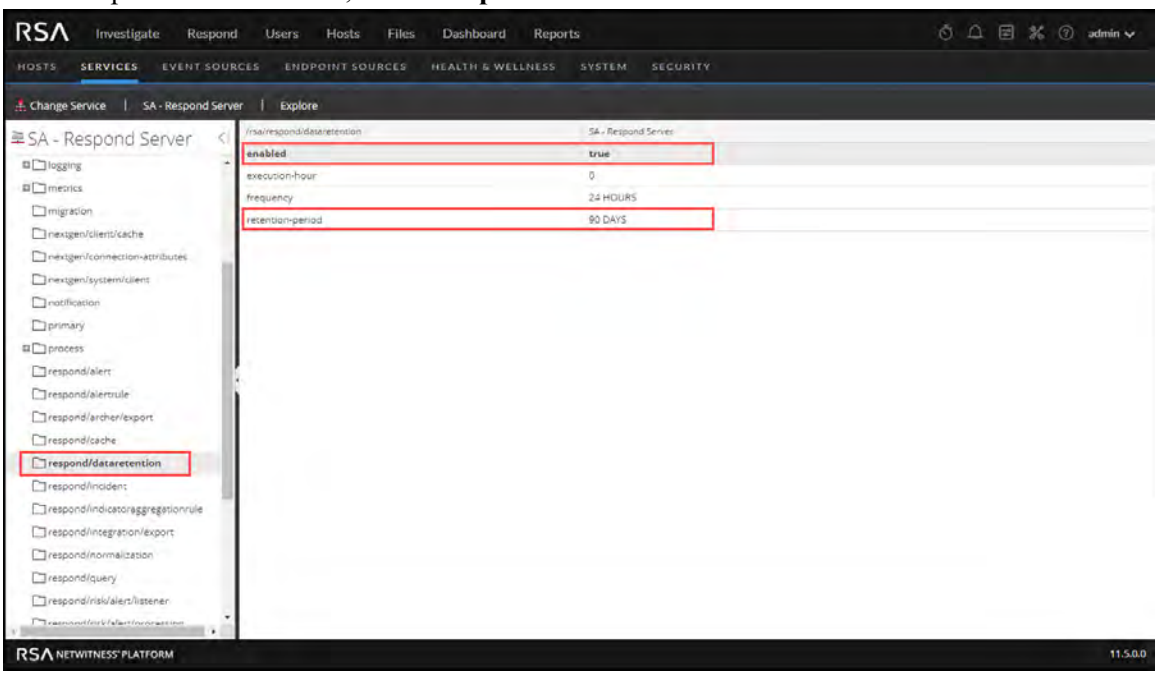
## Prerequisites

The Administrator role must be assigned to you.

## Procedure

1. Go to **(Admin) > Services**, select the Respond Server service, and then select **> View > Explore**.

2. In the Explore view node list, select **respond/dataretention**.



3. In the **enabled** field, select **true** to delete incidents and alerts older than the retention period. The scheduler runs every 24 hours at 23:00.
   You will see a notice that the configuration was successfully updated.
4. In the **retention-period** field, type the number of days to retain incidents and alerts. For example, type 30 DAYS, 60 DAYS, 90 DAYS, 120 DAYS, 365 DAYS, or any number of days.
   A message informs you that the configuration was successfully updated.

## Result

Within 24 hours after the retention period ends, the scheduler permanently deletes all alerts and incidents older than the specified period from NetWitness Respond. Journal entries and tasks associated with the deleted incidents are also deleted.

# Obfuscate Private Data

The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. This topic explains how the administrator maps those meta keys to display a hashed value instead of the actual value.

The following caveats apply to hashed meta values:
