# RSA® NetWitness

Version 11.7

# Release Notes

## Contact Information

RSA Link at https://community.rsa.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

## Trademarks

RSA Conference Logo, RSA, and other trademarks, are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

## License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

## Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

# What's New

The NetWitness 11.7 release provides new features and enhancements for every role in the Security Operations Center.

## Upgrade Paths

The following upgrade paths are supported for NetWitness 11.7.0.0:

- NetWitness 11.5.3.2 to 11.7.0.0
- NetWitness 11.6.0.0 to 11.7.0.0
- NetWitness 11.6.0.1 to 11.7.0.0
- NetWitness 11.6.1.0 to 11.7.0.0
- NetWitness 11.6.1.1 to 11.7.0.0

For more information on upgrading to 11.7.0.0, see Upgrade Guide for NetWitness 11.7

## Security Fixes

For more information on Security Fixes, see Security Advisories.

## Enhancements

The following sections are a complete list and description of enhancements to specific capabilities:

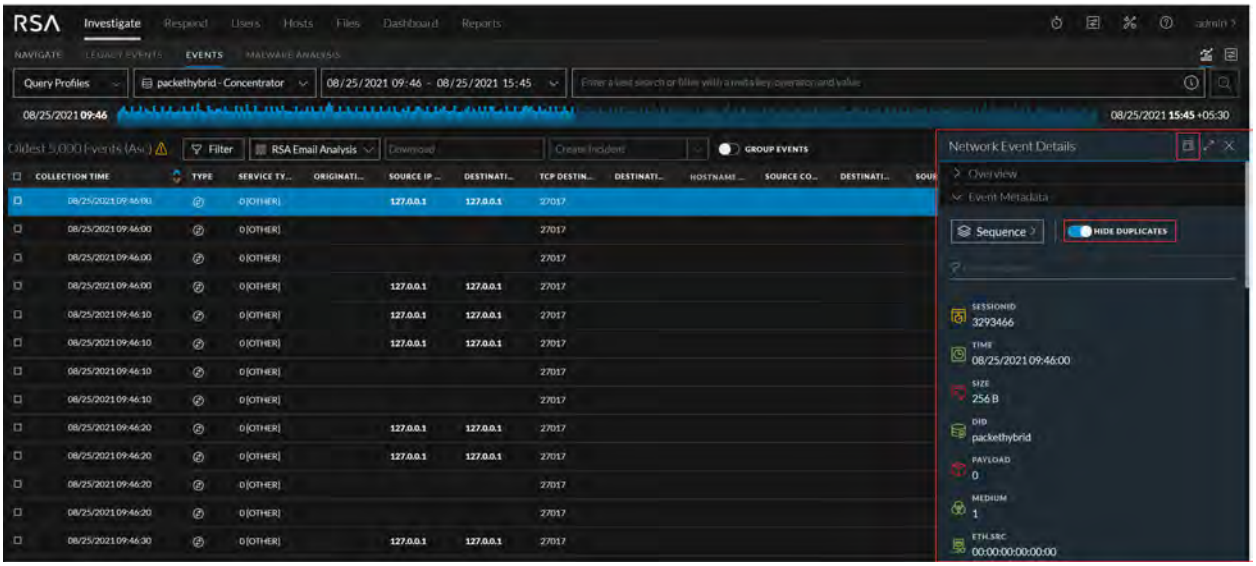
- Investigation
- Endpoint Investigation
- Concentrator, Decoder, and Log Decoder Services
- Event Stream Analysis (ESA)
- Platform
- Upgrades
- NetWitness Services

To locate the documents that are referred to in this section, go to the NetWitness 11.x Master Table of Contents. Product Documentation has links to the documentation for this release.

# Investigation

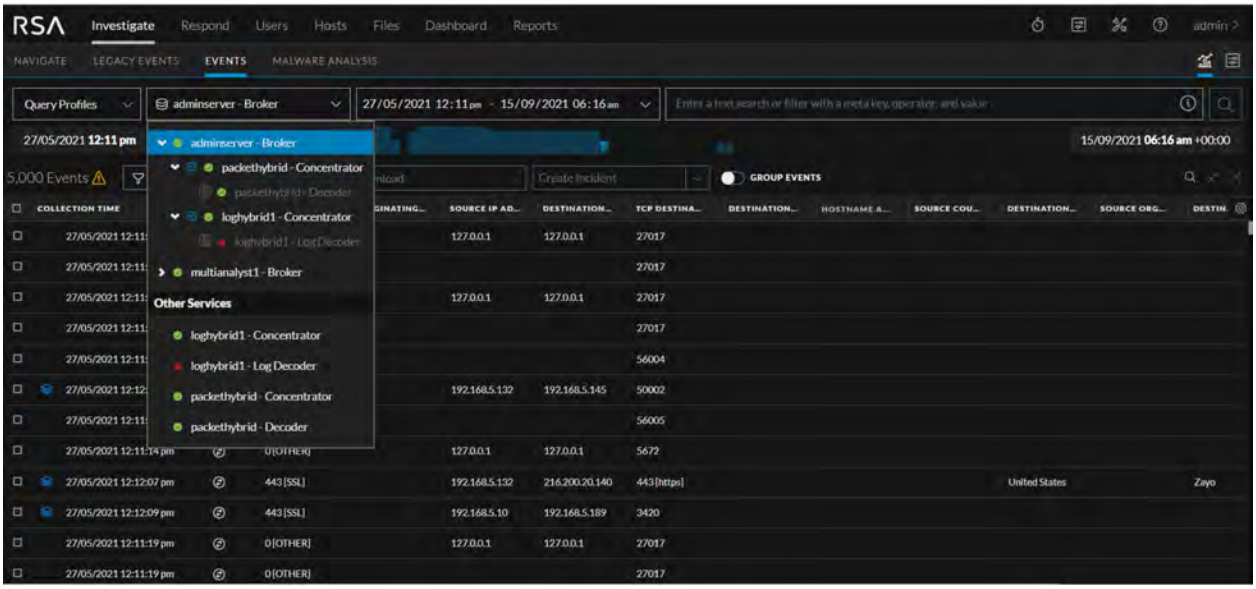
## Meta Only Event Reconstruction

As analysts review events, the new compact and expanded metadata views provide an alternative workflow to only view the high-level details of the event and in use cases where no raw data is present.



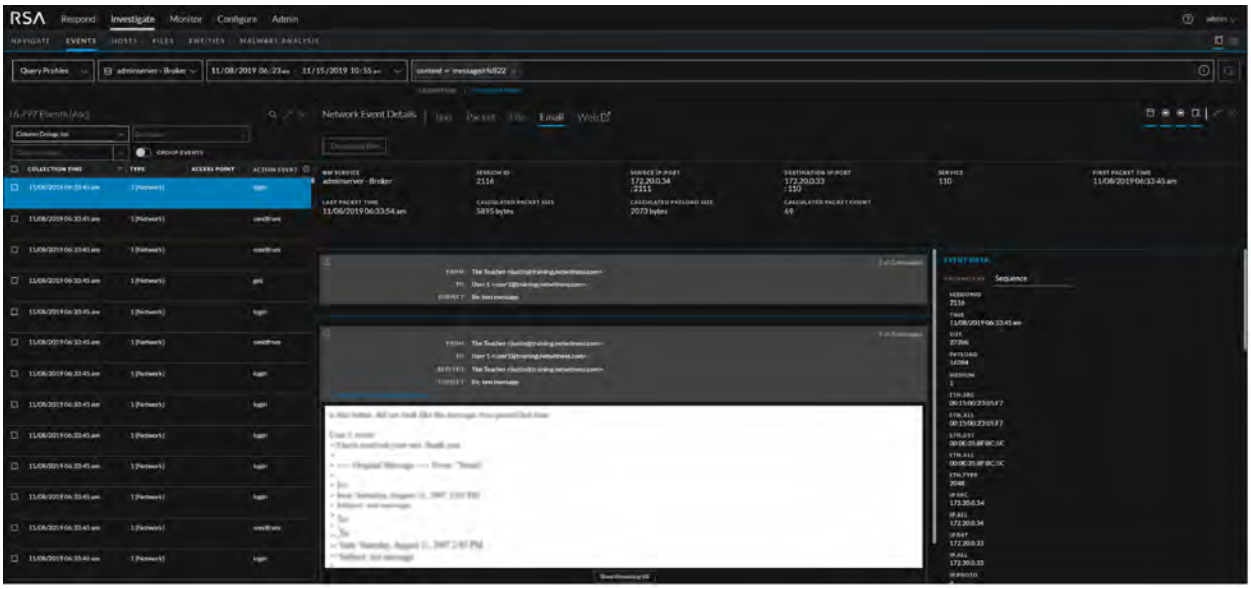
## Improved Broker Query Experience

Analyst queries at the top-level Broker now by default provide partial results when one of the sub-services loses connectivity or times out. In addition, a hierarchical view of what is attached to the Broker is available to analysts to exclude certain sub-services prior to query if necessary.



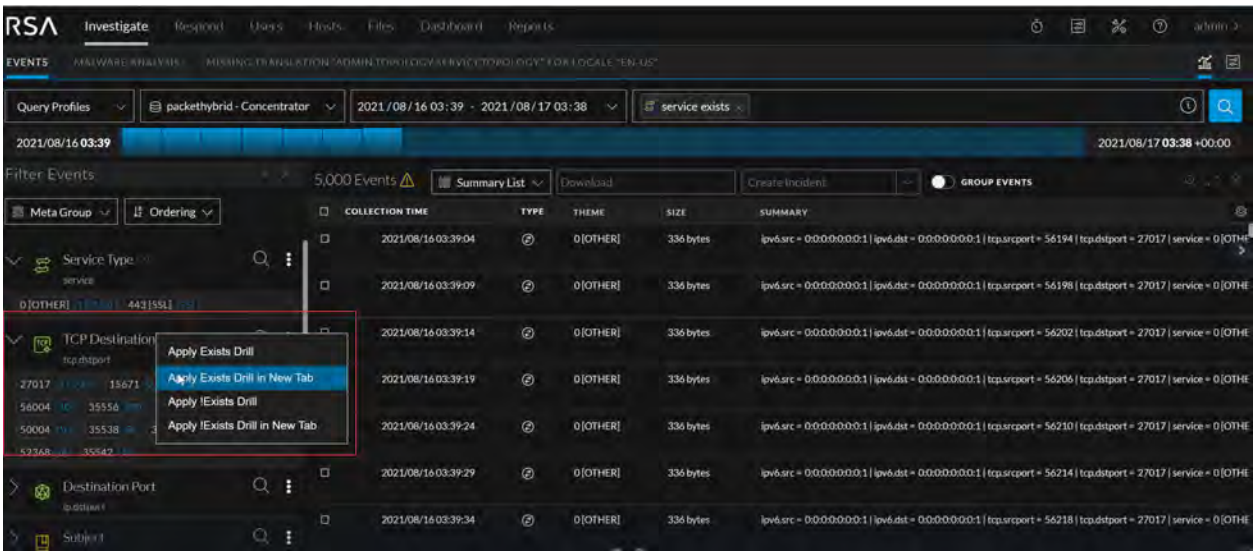
## Email Reconstruction Improvement

Analyst can view the content of all the emails in a single session using the Expand All Emails option available on the Email view.



## Direct Query Interaction with Meta Keys in Event Filter Panel

Analyst steps to create a query have been streamlined by clicking directly on the meta key name to generate a query with only the meta key. Alternatively, searches with combination of key value pairs are available inside the Event Filter panel without requiring direct interaction with the query bar.

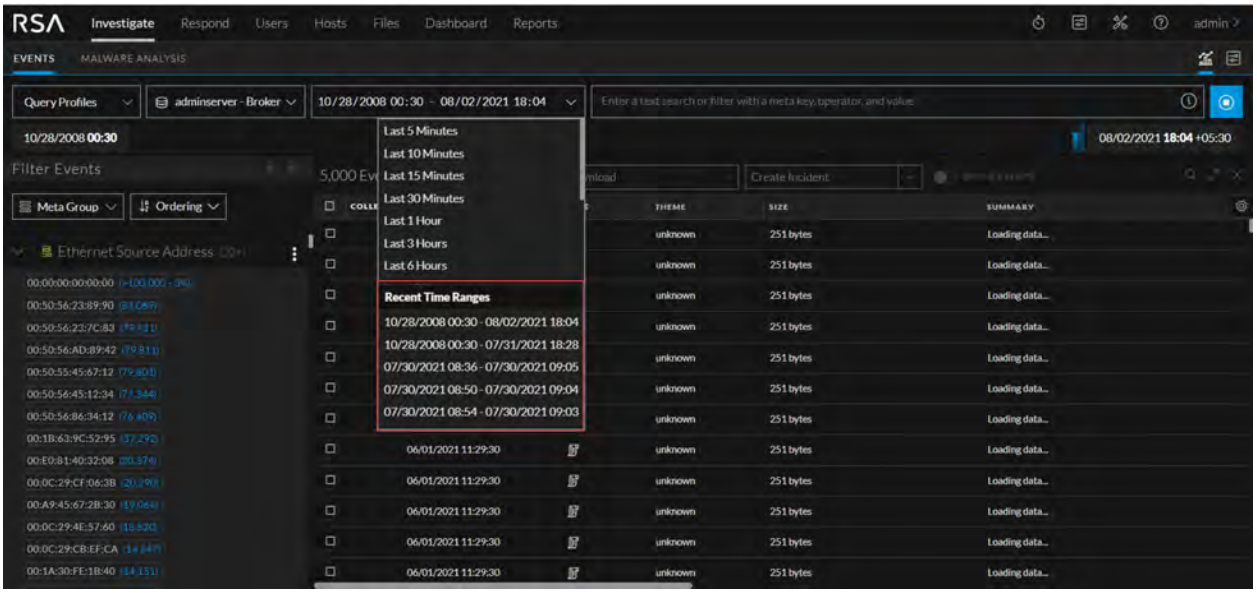


## Network Fragment Identification

Analysts can view the related sessions for an event for analysis and investigation by hovering over the icon for the event.

## Saved Time Ranges

Analysts can take advantage of the last five recently used time ranges for future searches saving the investigation time. The saved time ranges are displayed under the Recent Time Ranges section.

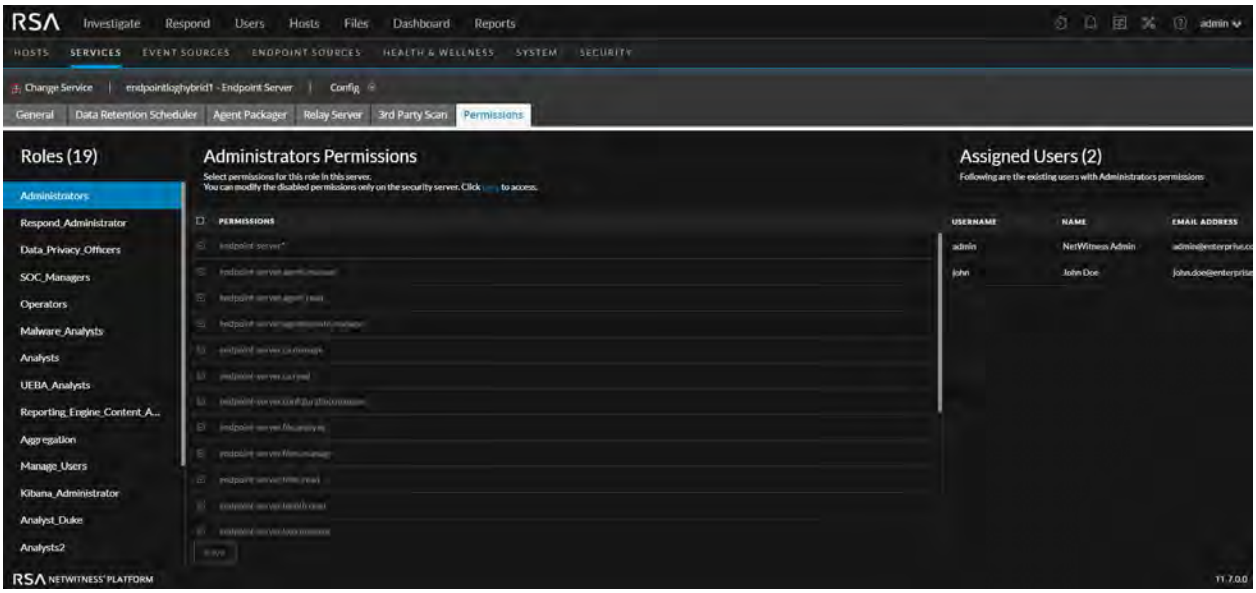


For more information, see the Investigation User Guide.

# Endpoint Investigation

### Granular Role Based Access Control for Endpoint Server

With the enhanced RBAC (Role-Based Access Control), administrators can grant or revoke access to specific Endpoint servers rather than all. And the addition of new permissions called endpoint-server.file.analyze and endpoint-server.tag.manage, adds flexibility in managing user privileges. For more information on managing permissions for an individual Endpoint server, see NetWitness Endpoint Configuration Guide.

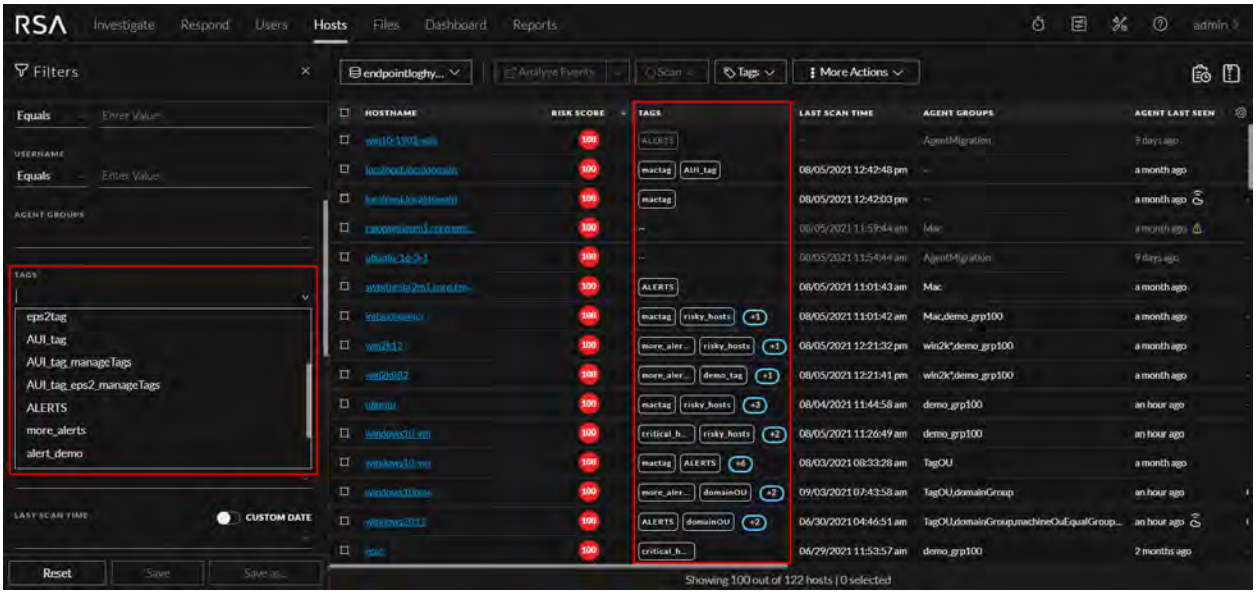


## Few Privileges Removed From *endpoint-server.agent.manage* And Added to *endpoint-server.file.analyze*

Analyze File, Save Local Copy and Scan with OPSWAT privileges are removed from *endpoint-server.agent.manage* and added to a new permission called *endpoint-server.file.analyze*. For more information see the System Security and User Management Guide.

## Manage Hosts Using Tags

Analysts can create Tags to manage the hosts. Tags are custom texts (can combine alphanumeric and special characters) that you can create and assign to hosts. You can create host groups based on tags, and on the Hosts view, you can filter hosts by tags using the filters pane. Administrators can create and assign tags while generating the agent packager, and these are added to the hosts by default when the Endpoint agent is installed. For more information on managing tags, see NetWitness Endpoint User Guide.



### Enhanced Windows Agent to Support Detecting the Persistence Techniques Targeting the Registry

The enhanced Windows agents detects persistence techniques that use the Windows registry. The registry monitor is more reliable now as it detects suspicious activity in an enhanced manner. For more information, see the NetWitness Endpoint User Guide.

### Enhanced Suspicious Thread Detection

This enhancement to the suspicious thread detection helps detect and report suspicious threads more effectively using different methods. This enhancement enables analysts to have access to all the details and capabilities related to the suspicious threads as before. For more information, refer NetWitness Endpoint User Guide.

### Delete Blocked Files Through Elevated Command Prompt

You can delete the blocked files on the host using the delete command on the elevated command prompt on the host.

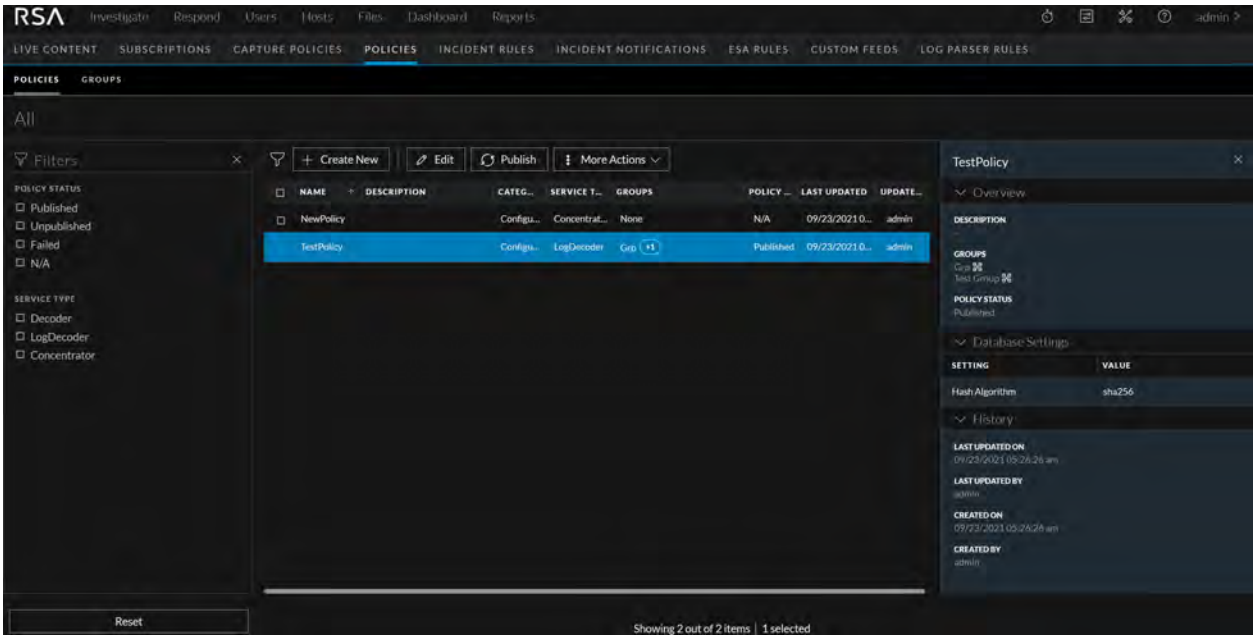
## Concentrator, Decoder, and Log Decoder Services

### Introduction of Centralized Configuration Management

The management of general NetWitness core services namely Concentrator, Decoder, and Log Decoder configurations can be administered centrally from a single policy-based interface and distributed to multiple services. With centralized configuration management, administrators can:

- Create a group of the same service type based on similar hardware profiles or other criteria
- Add configuration items to policies in order to customize settings. Any settings which are not in the policy will be left as default
- Apply customized settings to any number of services in one step
- Restart all services within a group to apply changes
- View when an action is required, such as service restart, unpublished policies or out-of-compliance services indicated by the icon.
- Revert changes to a policy or group quickly

  For more information, see Host and Services Getting Started Guide.



### Enhanced Query Accuracy

An optional index configuration is available on a per meta key basis to extend the default key-value search into an N-gram layout. In addition to enabling query and reporting capabilities, this combination also provides complete and accurate search results, even if a maximum value threshold has been met.

For more information, see N-grams in the Core Database Tuning Guide.

## Event Stream Analysis (ESA)

### Enhancements for persisting Events and Incidents

Analysts can persist events encompassed in an incident, thus enabling to view the incident in the future, regardless of its age. Analysts can:

- Pin or unpin multiple events at an incident and alert level
- View details on when the events were persisted.
- Check the status of the persisted events, whether it is Completed, Partial, or None.
- Administrators can set up permissions for users to persist raw data associated with a particular incident.

For more information, see the Respond User Guide.

# Platform

### Backup and Restore Improvements

A new NetWitness Recovery Wrapper tool is introduced to centrally back up and restore individual or multiple hosts. This tool allows custom files to be incorporated in restorations and handles all supported deployment installations (Physical, Virtual, and Cloud).

With NetWitness Recovery Tool administrators can:

- Back up (export) an individual, a specific, or all hosts at a time
- Restore (import) an individual host at a time
- Customize files or folders during backup and restore
- Copy backup data to remote host location from NetWitness hosts and vice versa

For more information, see "Disaster Recovery (Back Up and Restore)" topic in the NetWitness Recovery Tool User Guide *for NetWitness*.

# Upgrades

### Introduction of Pre-Upgrade Check Utility

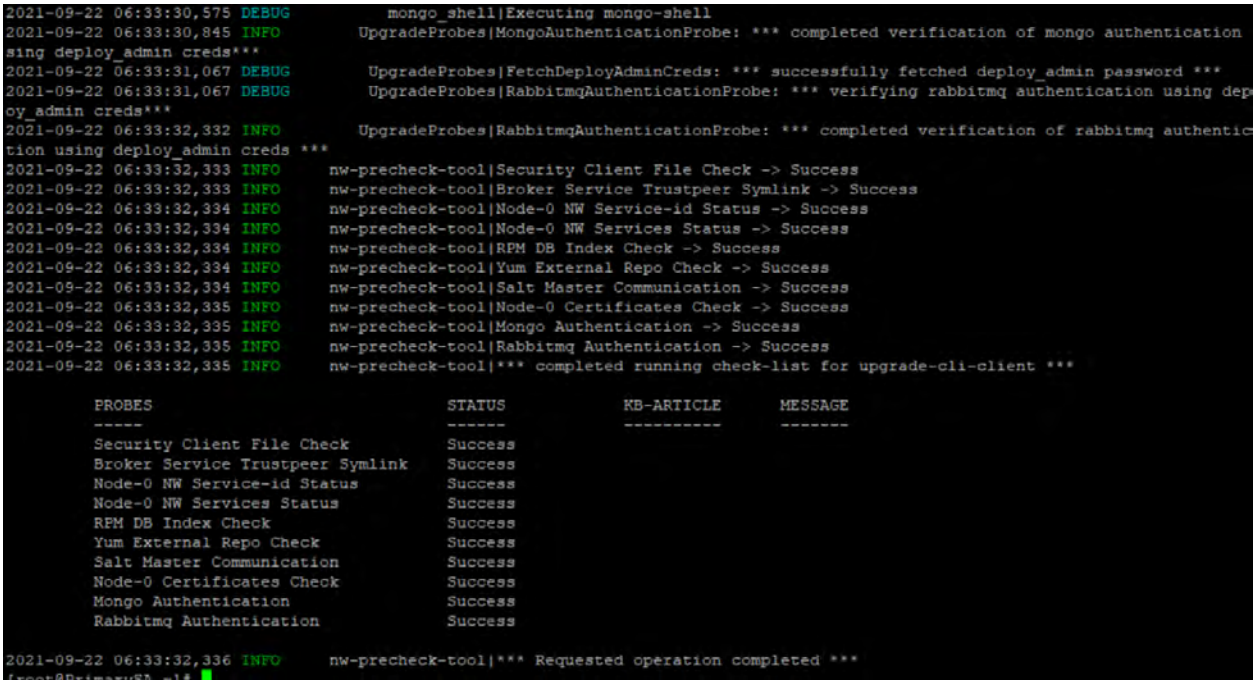
A new health-check utility is introduced for administrators to analyze the current NetWitness setup and identify conditions that may impact the upgrade. If any issues are detected, the issues can be resolved before proceeding with the upgrade.

The pre-upgrade check verifies the following:

- **Security Client File Check** - Ensures `security-client-amqp.yml` file is not present
- **Node-0 NW Service-id Status** - Ensures all the service-ids are intact with the services in Node 0
- **Broker Service Trustpeer Symlink** - Ensures Broker symlink file `(/etc/netwitness/ng/broker/trustpeers/)` is not broken

- **Node-0 NW Services Status** - Checks the status of all the services in Node 0
- **Yum External Repo Check** - Ensures external repos are not available
- **RPM DB Index Check** - Checks if the RPM DB is corrupted
- **Salt Master Communication** - Verifies the salt communication from Node 0 to all the Nodes
- **Node-0 Certificates Check** - Checks if any certificates are missing, expired, or invalid
- **Mongo Authentication** - Validates the `deploy_admin` credentials fetched from `security-cli-client` using Mongo client
- **RabbitMQ Authentication** - Validates the `deploy_admin` credentials fetched from `security-cli-client` using RabbitMQ

For more information, see Upgrade Guide for NetWitness 11.7.



# NetWitness Services

## Introduction of NetWitness Service Topology Map

A view of the hierarchical layout of all NetWitness core services depicting the collection and aggregation of services provides administrators and analysts quick insights into their deployment and the services that are online or offline. This topology displays only the Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, and Log Collector services. For more information, see the System and Security User Management Guide.

**Note:** Reporting Engine, Malware Analysis, UEBA, Endpoint Server, Cloud Link service, and Warehouse Connectors are not supported.

# Fixed Issues

This section lists issues fixed after the last major release. For additional information on fixed issues, see the Fixed Version column in the RSA NetWitness® Platform Known Issues list on RSA Link.

## Administration Fixes

| Tracking Number | Description |
|---|---|
| ASOC-105322, SACE 14678 | NetWitness Active Directory External Group Mapping does not support the same group name for different domains of the same name. |

# Security Fixes

## Administration Fixes

| Tracking Number | Description |
|---|---|
| ASOC-112493 | Capture Policy deployment fails, when you try to create a new Capture Policy in **Configure** > **Capture Policies**. As a result, the status is displayed as **Failed** under **Publication Status** and **Service Assignment**. |
| ASOC-112805 | Administrators are not permitted to download **Events** or **Jobs** created by other users in **Admin**>**System**>**Jobs**. |

## Context Hub Fixes

| Tracking Number | Description |
|---|---|
| ASOC-112636 | While configuring a STIX custom feed in **Config** > **Custom Feeds** > **Feeds**, Sightings data (*sightings_count=1* in the STIX xml file ) such as Sources, Timestamps, Confidence, and References are not available under **Define Columns** preview. |

## Log Collection Fixes

| Tracking Number | Description |
|---|---|
| ASOC-112547 | When you add more than 50 Remote Destination Log Collectors under **Local Collectors** > **Destination Groups** in the **Config** window, pagination does not work. As a result, Destination Log Collectors above 50 are not displayed on the UI. |

## Endpoint Fixes

| Tracking Number | Description |
|---|---|
| ASOC-112285 | After downloading a file (present across different Endpoint servers) in one of the Endpoint servers, when you try to save a local copy of it from any other Endpoint server (where it was not downloaded), an error message **Download failed. Check the audit logs for more details.** is displayed. The download status of the file is changed from **Downloaded** to **File Deleted on server**. |

## Respond Fixes

| Tracking Number | Description |
|---|---|
| ASOC-111459 | When you edit any incident rule in **Configure** > **Incident Rules** page and save the changes, after sometime these changes are reverted. Consequently, incidents associated with these incident rules are not created with the new changes. |

# Product Documentation

The following documentation is provided with this release.

| Documentation | Location URL |
|---|---|
| NetWitness 11.x Master Table of Contents | https://community.rsa.com/t5/netwitness-platform-online/rsa-netwitness-platform-11-x-master-table-of-contents/ta-p/567788 |
| NetWitness 11.7 Product Documentation | https://community.rsa.com/t5/netwitness-platform/ct-p/netwitness-documentation |
| NetWitness 11.7 Upgrade Guide | https://community.rsa.com/t5/netwitness-platform-online/upgrade-to-netwitness-platform-11-7/ta-p/655210 |

## Feedback on Product Documentation

You can send an email to nwdocsfeedback@rsa.com to provide feedback on NetWitness documentation.

# Getting Help with NetWitness Platform

## Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.rsa.com/community/products/netwitness/documentation
- Use the **Search** field in RSA Link to find specific information here: https://community.rsa.com/
- See the NetWitness Knowledge Base: https://community.rsa.com/community/products/netwitness/knowledge-base
- See Troubleshooting the NetWitness: https://community.rsa.com/community/products/netwitness/documentation/troubleshooting
- See also NetWitness Blog Posts.
- If you need further assistance, contact RSA Support.

## Contact RSA Support

If you contact RSA Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the RSA NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

| | |
|---|---|
| RSA Link | https://community.rsa.com<br>In the main menu, click **Support > Case Portal > Manage My Cases**. |
| International Contacts (How to Contact RSA Support) | https://community.rsa.com/t5<br>https://community.rsa.com/t5/support-information/how-to-contact-rsa-support/ta-p/563897-information/how-to-contact-rsa-support/ta-p/563897 |
| Community | https://community.rsa.com/t5/rsa-Community/ct-p/support |

# Build Numbers

The following table lists the build numbers for various components of NetWitness 11.7.0.0.

| Component | Version Number |
|---|---|
| NetWitness Audit Plugins | rsa-audit-plugins-11.7.0.0-4695.5.36a93c8d9.el7.noarch.rpm |
| NetWitness Appliance | rsa-nw-appliance-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Archiver | rsa-nw-archiver-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Broker | rsa-nw-broker-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Concentrator | rsa-nw-concentrator-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Config Management | rsa-nw-config-management-11.7.0.0-2109091739.5.be0ffac.el7.noarch.rpm |
| NetWitness Config Server | rsa-nw-config-server-11.7.0.0-210908042413.5.a52e0dc.el7.centos.noarch.rpm |
| NetWitness Console | rsa-nw-console-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Content Server | rsa-nw-content-server-11.7.0.0-210906060842.5.022d0d1.el7.centos.noarch.rpm |
| NetWitness ContextHub Server | rsa-nw-contexthub-server-11.7.0.0-210908050143.5.589ec75.el7.centos.noarch.rpm |
| NetWitness Correlation Server (ESA) | rsa-nw-correlation-server-11.7.0.0-210914062311.5.730e55a.el7.centos.noarch.rpm |
| NetWitness Decoder | rsa-nw-decoder-11.7.0.0-12232.5.66442bab8.el7.x86_64.rpm |
| NetWitness Deployment Upgrade | rsa-nw-deployment-upgrade-11.7.0.0-2105111629.5.286995c.el7.noarch.rpm |

# The Basics

This guide describes the basic requirements of a NetWitness deployment and outlines optional scenarios to address the needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

**Note:** This document refers to several additional documents available on RSA Link. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

There are many factors you must consider before you deploy NetWitness. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors:

- The size of your enterprise (that is, the number of locations and people that will use NetWitness)
- The volume of network data and logs you need to process
- The performance each NetWitness user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness
  - RSA Physical Hosts (software running on hardware supplied by RSA)
  - Software Only provided by RSA:
    - On-Premises (On-Prem) Virtual Hosts
      See the *NetWitness Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *NetWitness AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *NetWitness Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.
      - Google Cloud Platform (GCP)
        See the *NetWitnessGoogle Cloud Platform Installation Guide* for detailed instructions on how to deploy virtual hosts in Google Cloud.

# Basic Deployment

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

## Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the NetWitness Hardware Setup Guides and the *NetWitness Physical Host Installation Guide*.
  2. Set up licensing for NetWitness as described in the *NetWitness  Licensing Guide*.
  3. Configure individual physical hosts and services as described in *NetWitness Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *NetWitness Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *NetWitness AWS Installation Guide*.
- For Azure, follow the instructions in the *NetWitness Azure Installation Guide*.
- For Google Cloud, follow the instructions in the *NetWitnessGoogle Cloud Platform Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *RSA NetWitness Host and Services Getting Started Guide*.

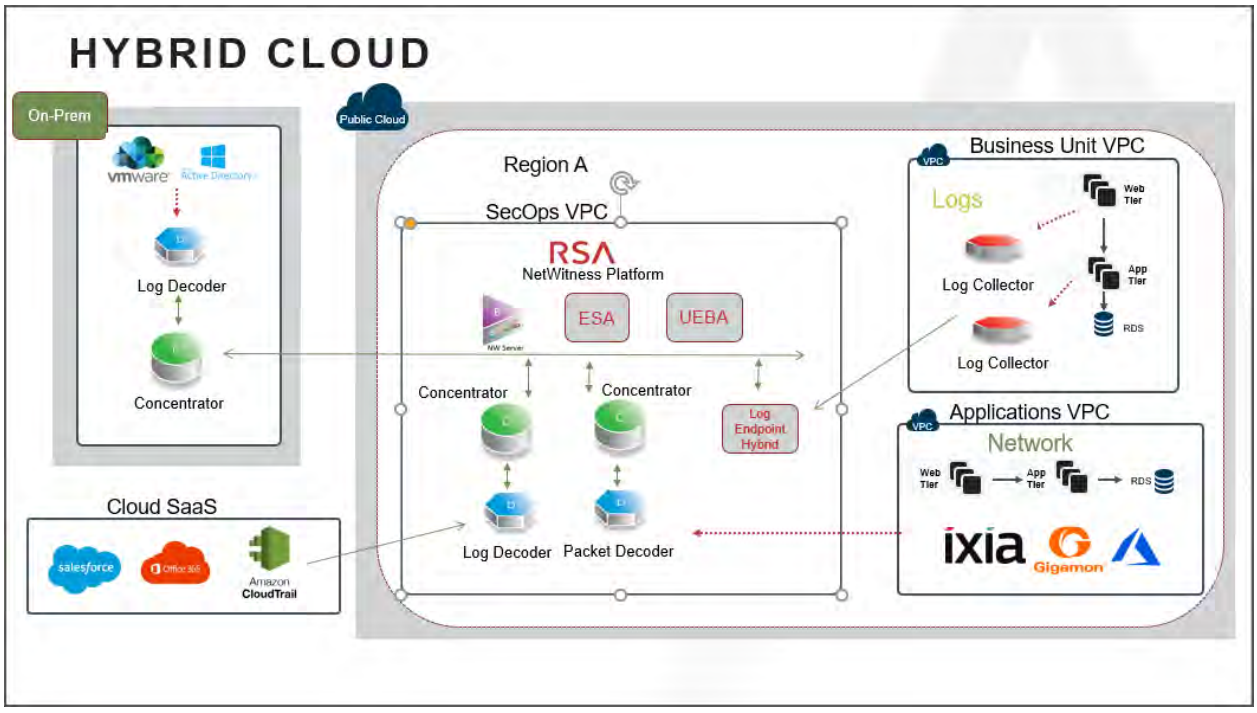
## NetWitness High-Level Deployment Diagrams

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log, and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.



# Deployment Optional Setup Procedures

You can deploy NetWitness with the following options.

Analyst User Interface
Group Aggregation
New Health and Wellness Search
Hybrid Categories on Series 6 (R640) Hardware
NW Server Deployment on ESA Hardware
Second Endpoint Server
Warm Standby NW Server

## Analyst User Interface

The Analyst User Interface (UI) gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).

You can have can have multiple Analyst UI instances provisioned in the same manner as the other NW component hosts.

### Features and Limitations

Each Analyst UI host:

- Can be deployed to specific organizational groups. For example: the Americas, EMEA, APAC, Tier 1 Analysts, Tier 3 Analysts.
- If Analyst UI hosts are deployed regionally, you have the capability of querying those regional brokers directly (less latency), instead of than having to route through the Primary UI.
- Helps distribute load off the Primary UI.
- Has its own Reporting Engine (RE).
- If it becomes unavailable for any planned or unplanned reason, it will not affect the Primary UI or any other Analyst UI instances.
- Provides the same pre-query filter verification, Data Privacy protection, and RBAC functionality as the Primary UI.
- Points back to the primary NW Server for authentication and configuration.
- Does not have access to any administrative functions. All administration functions take place on the Primary UI.
- Does not allow you to create or manage Content (that is, ESA rules, app rules, feeds). All Content creation and management takes place on the Primary UI.

## Use Case

Large environments that include Geo distribution with a single data center and multiple NW Servers require Analyst UI instances in all their NetWitness locations or managed entities.

For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary user Interface (Primary UI).

## Deployment

You must install the **Analyst UI** service category on a dedicated host and you install it in the same manner as any component service category on a host.

See the "Task 2 - Install 11.7 on Other Component Hosts" in the RSA NetWitness Platform Installation Guides for instructions on how to install any component service. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

After you provision the Analyst UI host (that is after you run the nwsetup-tui for the component host designated for the Analyst UI), complete the following steps to install the Analyst UI service category on the provisioned host.

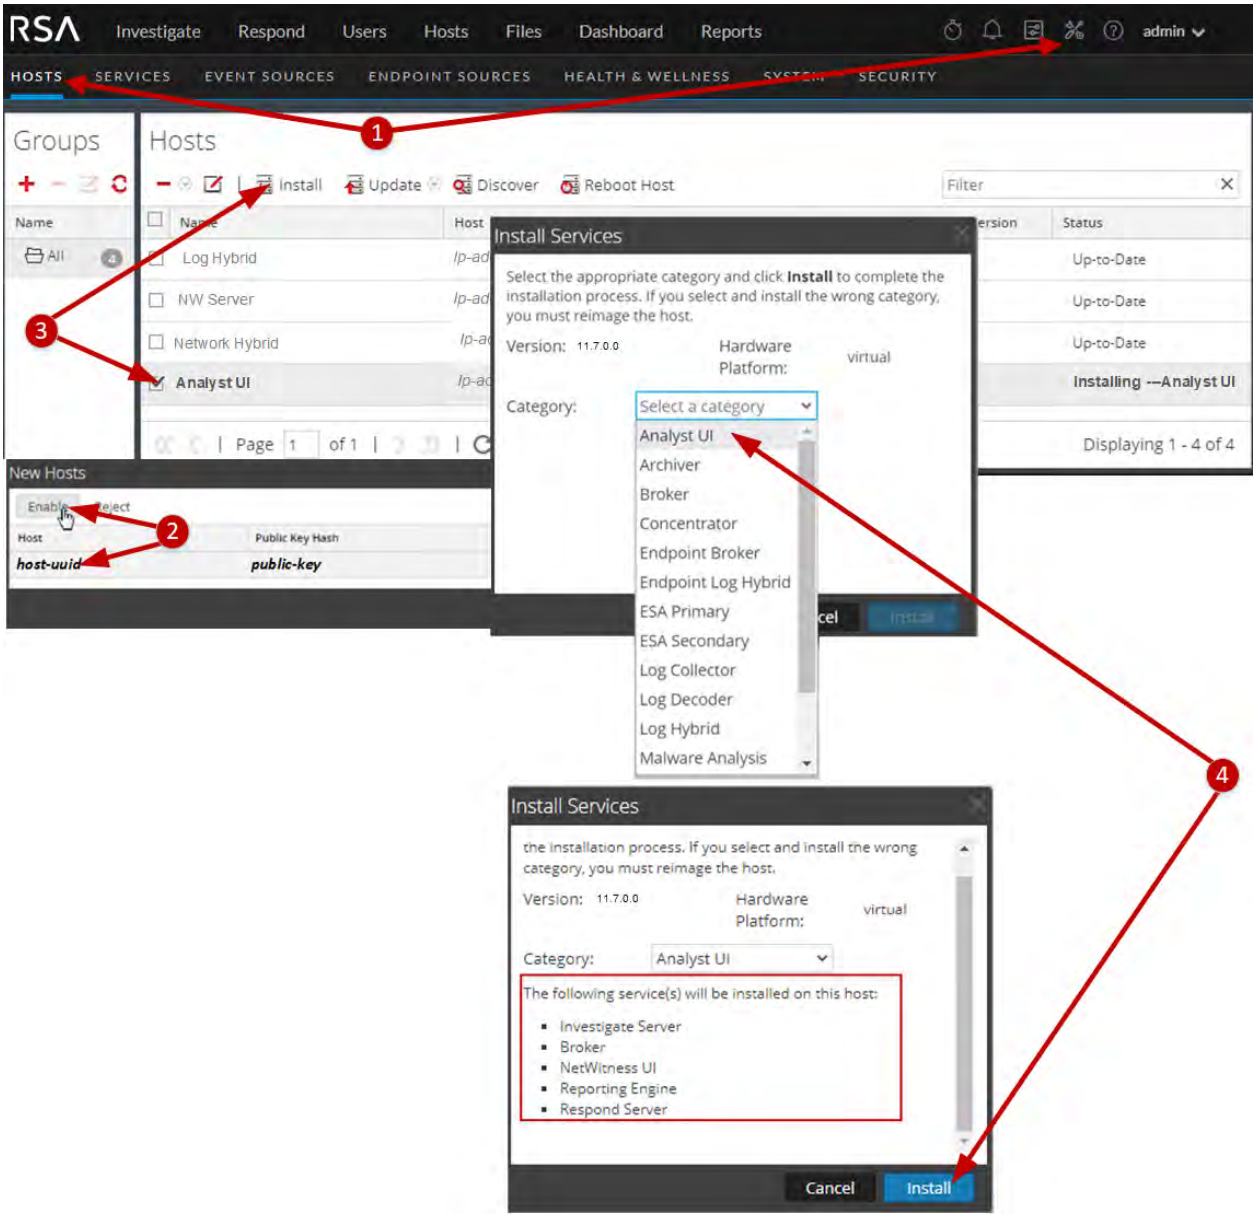
1. Log in to **NetWitness** and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **Analyst UI**) and click 
   .
   The **Install Services** dialog is displayed.

4. Select **Analyst UI** in **Category** and click **Install**.



5. Configure NetWitness Platform for each Analyst UI instance.Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

   a. Make sure that each Analyst UI instance is connected to the correct local Reporting Engine and has the appropriate Investigation parameters set. The *Getting Started Guide for RSA NetWitness Platform* describes the default Analyst UI Dashboard and how you manage dashboards.

   **Note:** You must add data sources to each Reporting Engine instance to execute Reports and Charts on an Analyst UI. See "Configure the Data Sources" in the*Reporting Engine Configuration Guide for RSA NetWitness Platform* for instructions.

b. Configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization. "Configure Analyst UI for Respond Server Alert Normalization" in the *NetWitness Respond Configuration Guide for RSA NetWitness Platform* tells you how to configure Respond Server alert normalization for the Analyst UI.

# Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

## RSA Group Aggregation Deployment Recommendations

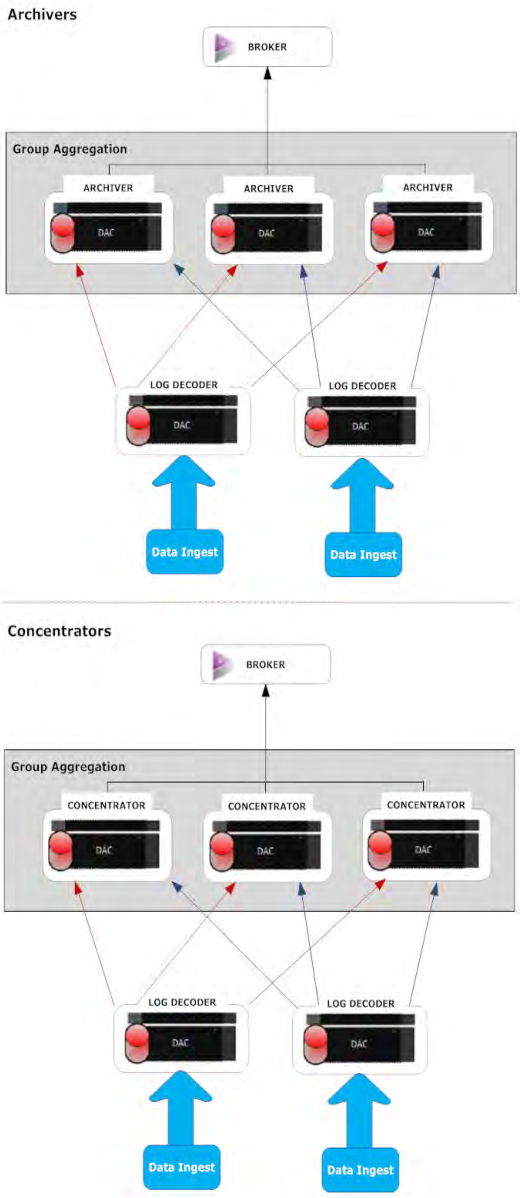
RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

## Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.



You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.

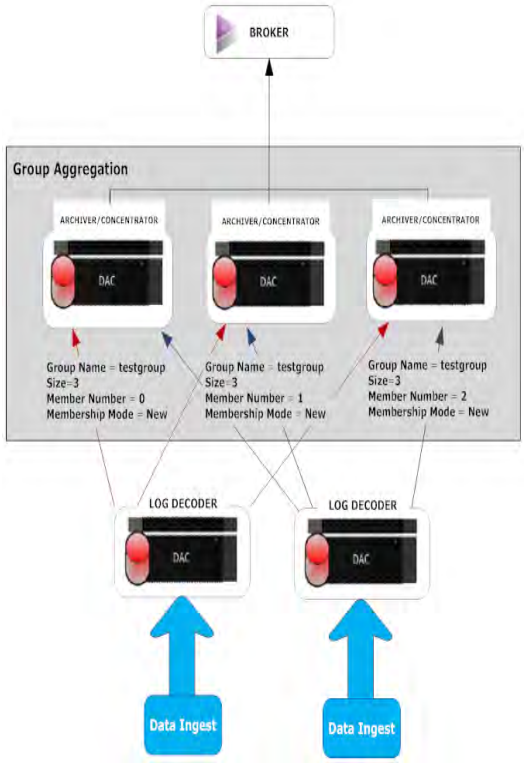
| Archiver 0 or Concentrator 0 | Archiver 1 or Concentrator 1 |
|---|---|
| 1 - 9,999 | 10,000 - 19,999 |
| 20,000 - 29,999 | 30,000 - 39,999 |
| 40,000 - 49,999 | 50,000 - 59,999 |

## Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

### Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



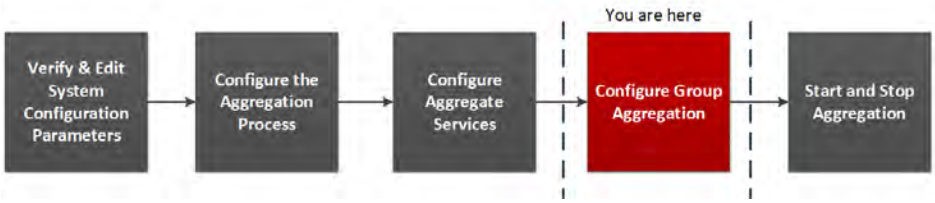
Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

| Parameter | Description |
|---|---|
| Group Name | It determines the group to which the Archiver or Concentrator belongs.<br>You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name. |
| Size | It determines the number of Archiver or Concentrator services in the aggregation group. |
| Member Number | It determines the position of the Archiver or Concentrator in the aggregation group.<br>For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group.<br>For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1. |
| Membership Mode | There are two membership modes:<br>• **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service.<br>• **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from. |

**Note:** The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

## Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.



Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

   g. Select the **Enabled** checkbox and set the following parameters:

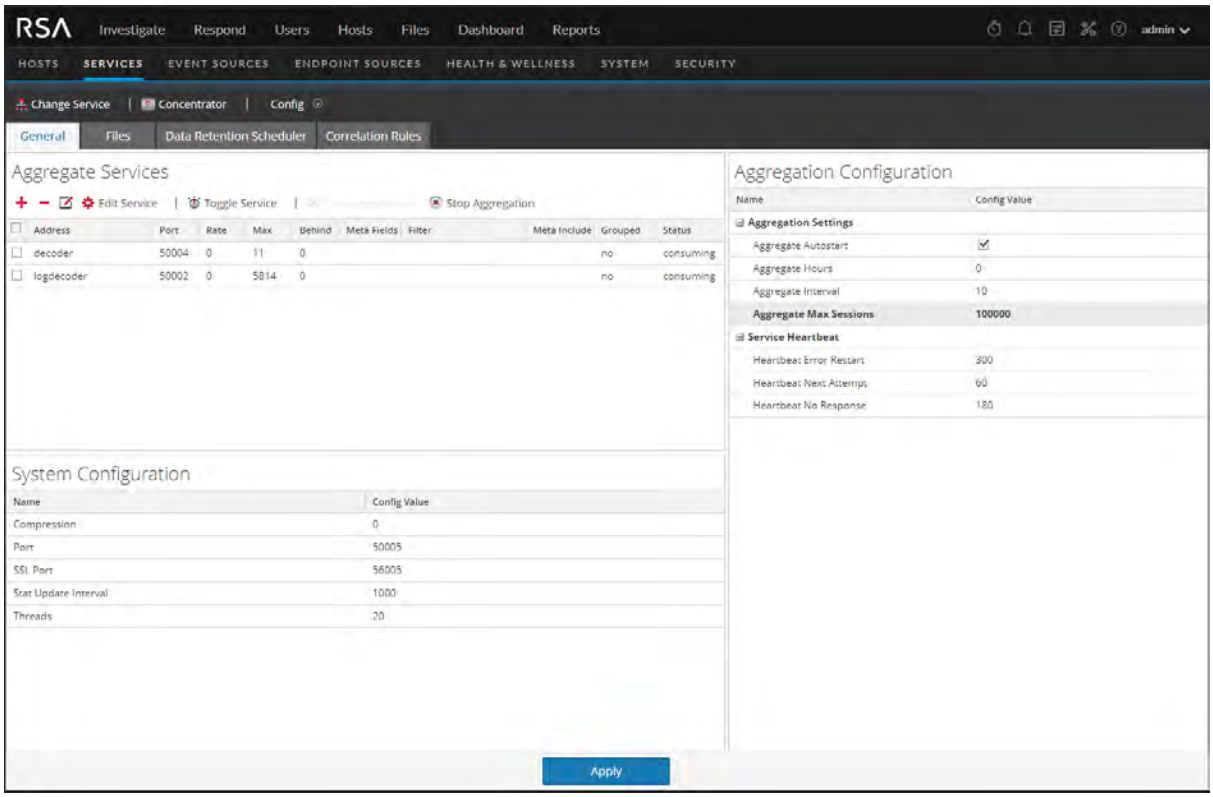
- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.



# New Health and Wellness

New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.

## System Requirements

The following tables list the memory, disk, and CPU recommended for the New Health and Wellness based on the size of the deployment.

**Note:** The recommended values might differ when you install and try the new features and enhancements.

**Caution:** If the New Health and Wellness node is on a different subnet, you must open the respective NetWitness Platform hosts port. For more information, see "New Health and Wellness on Different Subnet" section in the Network Architecture and Ports.

### Standalone Virtual Host

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of New Health and Wellness metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

| CPU | Memory |
|---|---|
| 4 cores | 16 GB |

### Physical Host

| Deployment Size | Memory | CPU | DISK per day |
|---|---|---|---|
| Small (~5-10 hosts / 20-40 services) | 16 GB | 15% | 1.5 GB |
| Medium (~150-200 hosts / 300- 400 services) | 18 GB | 15% | 29 GB |
| Large (~250-300 hosts / 500-600 services) | 22 GB | 15% | 44 GB |

Based on the resources available, you can deploy the 11.7 New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)

- Physical host:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts in your deployment to start sending metrics to monitor New Health and Wellness. After you deploy New Health and Wellness , see the "Monitor New Health and Wellness " topic in the *System Maintenance Guide* for instructions on how to configure and use this feature.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@rsa.com.

After you provision the New Health and Wellness host, complete the following steps to install the **New Health and Wellness** service category on the provisioned host.

1. Log in to NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   **Note:** If you are not installing New Health and Wellness on a standalone virtual host ignore step 2.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
3. Select that host on which New Health and Wellness should be installed in the **Hosts** view (for example, **New Health and Wellness**) and click    
   .
   The **Install Services** dialog is displayed.
4. Select **New Health and Wellness** in **Category** and click **Install**.
5. Refresh all hosts to write to elastic search.
   a. SSH to the NW Server host.
   b. Run the following commands.
      ```
      nw-manage --refresh-host --host-all
      ```
      This may take few minutes for the changes to take effect based on the number of hosts in your deployment.

**Note:** (For Standalone Virtual host only) After you review your initial datastore configuration, you may determine that you need to add a new volume. For information on adding a new volume see “Add New Volume and Extend Existing File Systems” topic in the *Virtual Host Installation Guide*.

**Note:** After you have installed New Health and Wellness, for some reason, if you want to uninstall New Health and Wellness, you must refer to "Uninstall New Health and Wellness" in the *Upgrade guide*.

## Hybrid Categories on Series 6 (R640) Hardware

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.

## NW Server Deployment on ESA Hardware

You now have the option to deploy the NW Server host on Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.

**Note:** You can install the NW Server on ESA hardware, but you cannot co-locate any ESA services (categories) with the NW Server on this hardware.

# Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 16 in "Install RSA NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - For a virtual host, complete steps 1 to 6 in "Step 4. Install RSA NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

     Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   ```
   mkdir -p /etc/pki/nw/nwe-ca
   ```

   **Note:** You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   ```
   /etc/pki/nw/nwe-ca/nwerootca-cert.pem
   /etc/pki/nw/nwe-ca/nwerootca-key.pem
   ```
5. nstall Endpoint on the host.
   a. Log in to NetWitness Platform and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

   **Note:** If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 
   .
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

# Warm Standby NW Server Host

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server host to increase reliability.

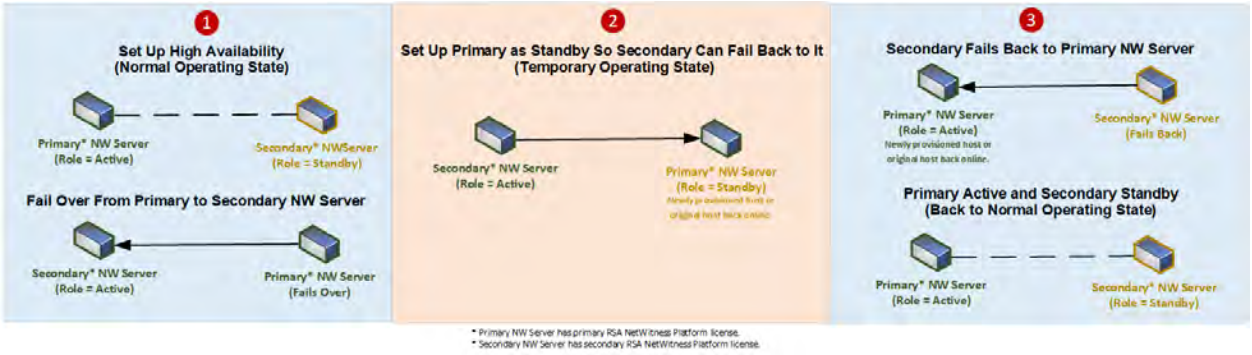
A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

In version 11.5 and later, we support a secondary NW Server that has a different IP address from the primary NW Server. Having the same IP address for both the primary NW Server and secondary NW Server is no longer necessary.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.



**Note:** When you set up the secondary NW Server, follow the same administrative procedures, for example, for upgrade and maintenance, as the procedures for the primary active NW Server.

## Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability:

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

## Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

## Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact Customer Support to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

## Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact Customer Support to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

## Set Up Secondary NW Server in Standby Role

1. Before you install a secondary NW Server host for the standby role, make sure that:
   a. The primary NW Server is running 11.7.
   b. All component hosts are running 11.7
      If you are:
      - Installing NetWitness Platform 11.7, follow the instructions in the *RSA NetWitness Platform Physical Host Installation Guide for Version 11.7*.
      - Updating from 11.x to 11.7, follow the instructions in *RSA NetWitness Platform Update Guide for Version 11.x to 11.7*.
        Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.
2. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
      See the *RSA NetWitness Platform Build Stick Instructions* for more information.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *NetWitnessBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

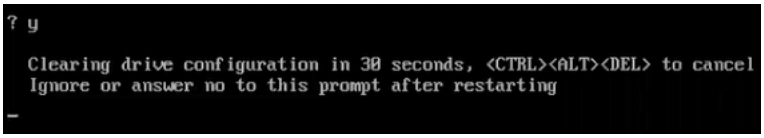
```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.7** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install RSA NetWitness Platform 11.7** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

**Caution:** You must respond y or Y to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.



The system displays the all installation tasks it is performing. This can take a minute or so.After it completes the tasks, the installation program reboots the host.

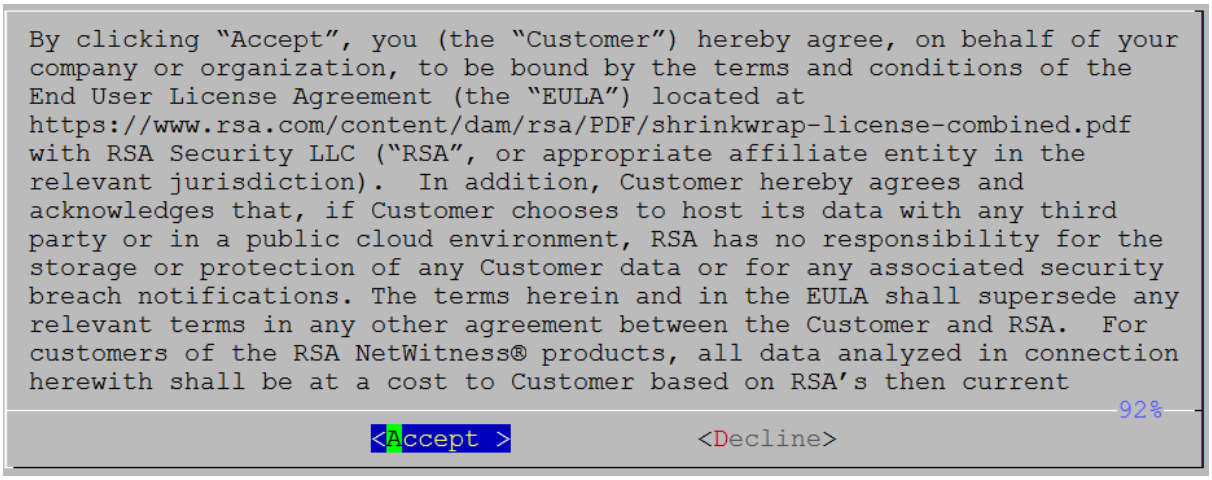
**Caution:** Do not reboot the attached media (media that contains the ISO file, for example a build stick).

f. Log in to the host with the `root` credentials.

2. Run the `nwsetup-tui` command.

**Note:** 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

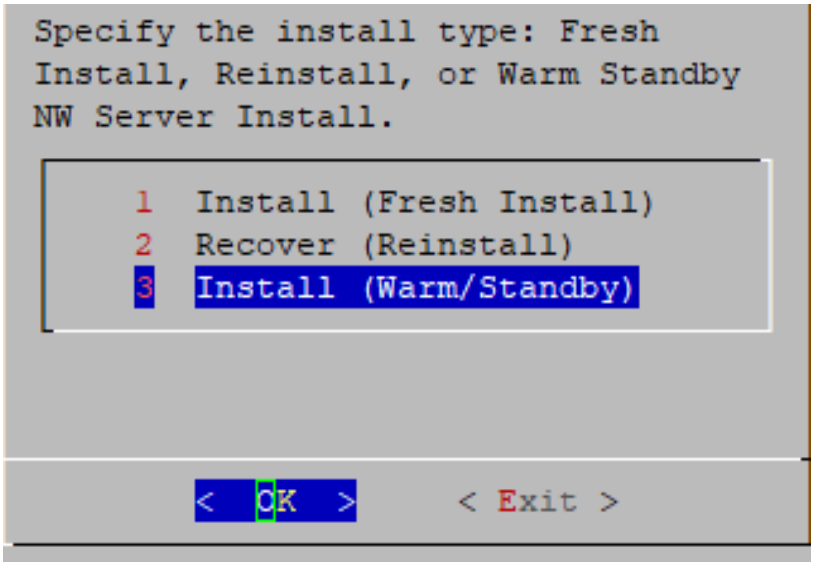
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



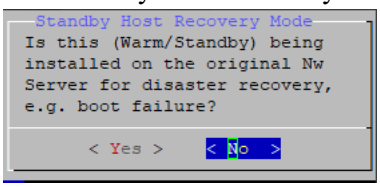
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Recover** prompt is displayed.



5. Tab to **3 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.

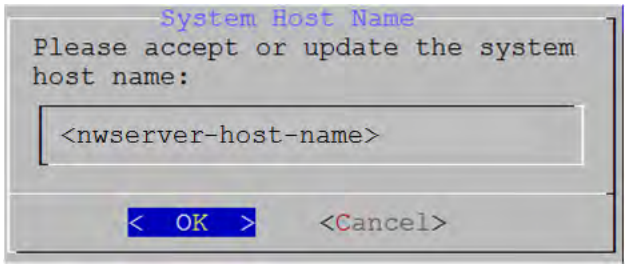


6. Tab to:

   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

     The NW Active Server IP Address prompt is displayed.

7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed



**Caution:** If you include "." in a host name, the host name must also include a valid domain name.

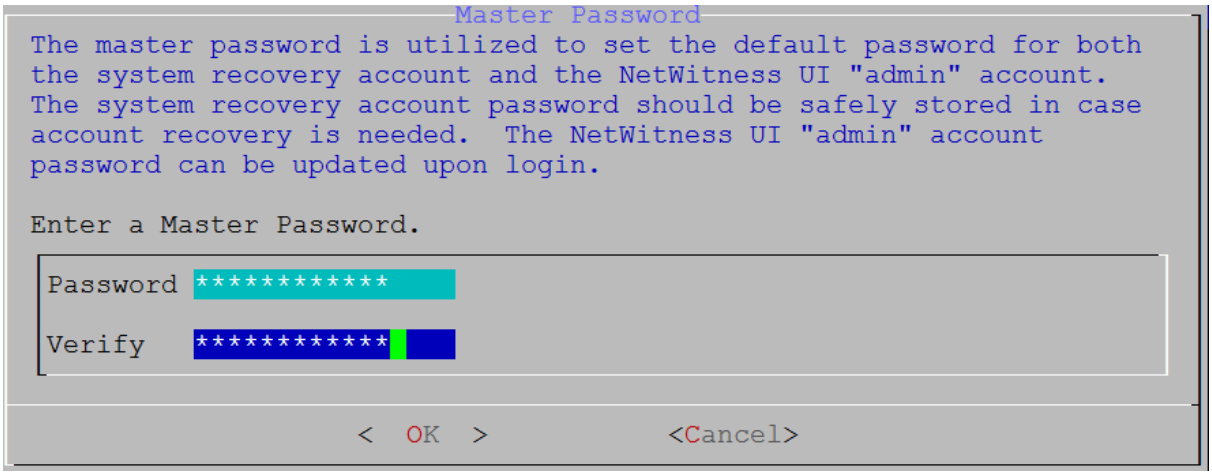
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   **Note:** You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

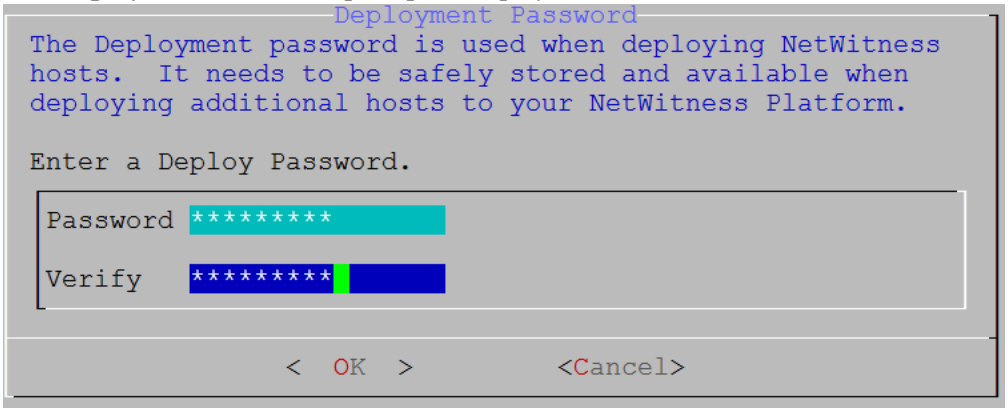
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : .< > -



9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.



10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

    - If the Setup program finds a valid IP Address for this host, the following prompt is displayed.

      Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

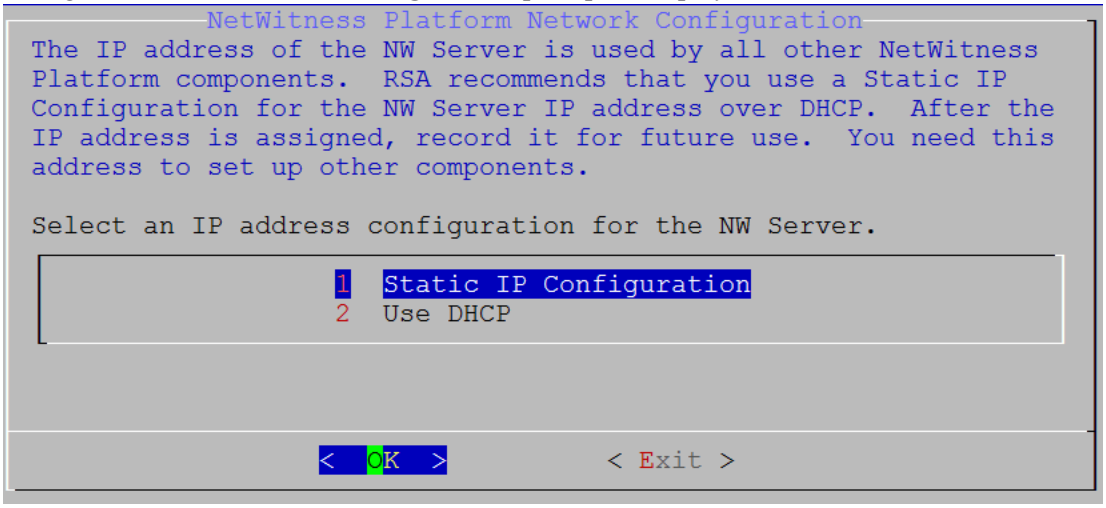
    - If you are using an SSH connection, the following warning is displayed.

> **Note:** If you connect directly from the host console, the following warning will not be displayed.

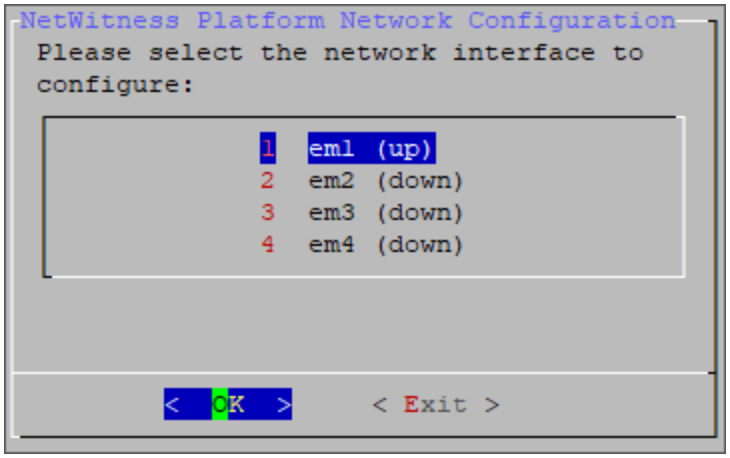
      Press **Enter** to close warning prompt.

    - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

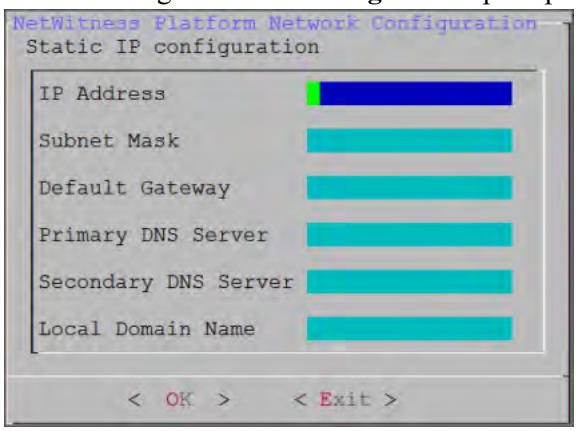
    - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.



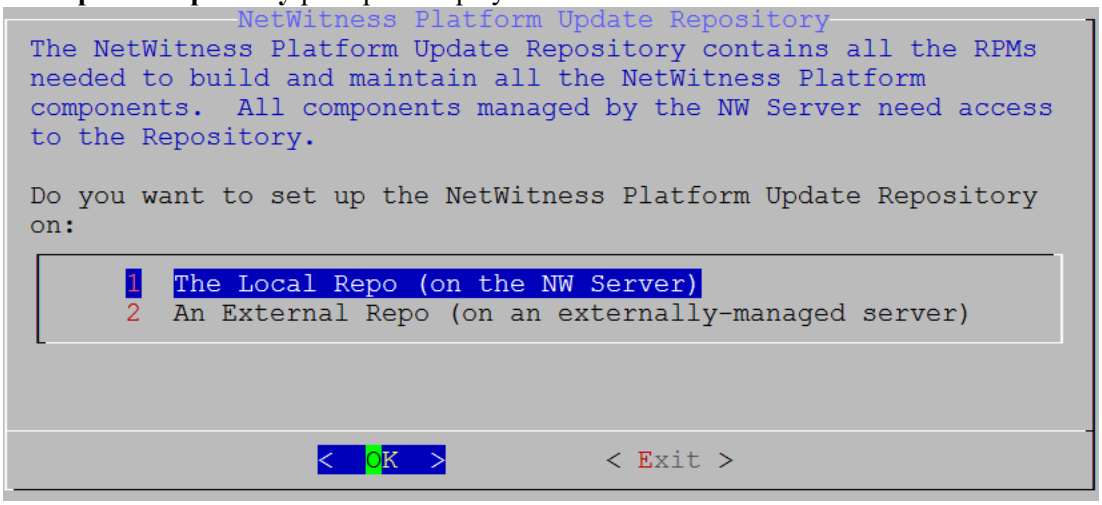
12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.



13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

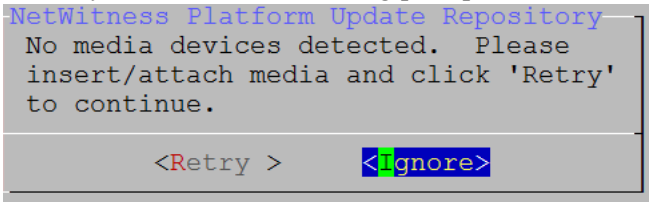
    **Caution:** If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.

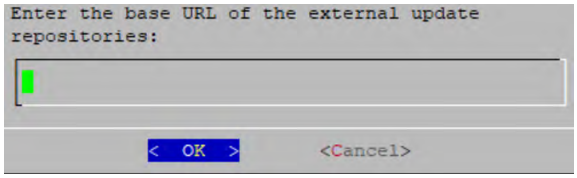


14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7.0.0. If the program cannot find the attached media, you receive the following prompt.



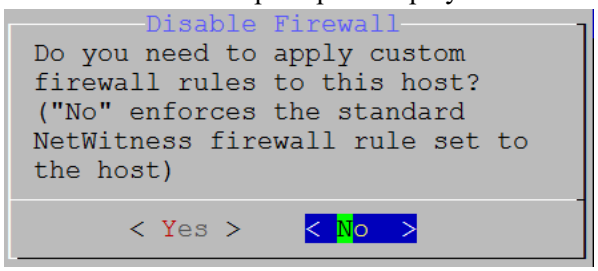
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in the *Physical Host Installation Guide* for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

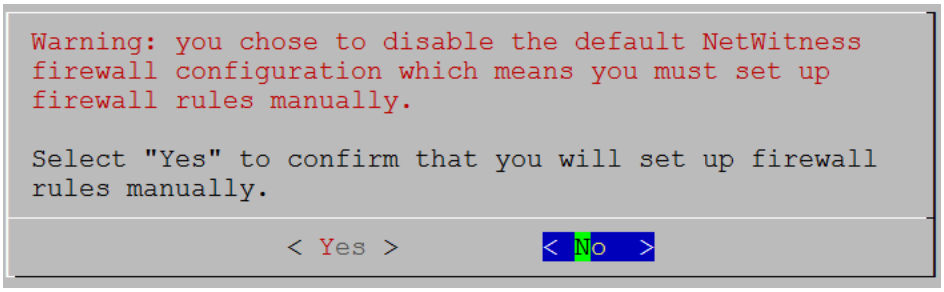
See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for instructions. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

The Disable firewall prompt is displayed.

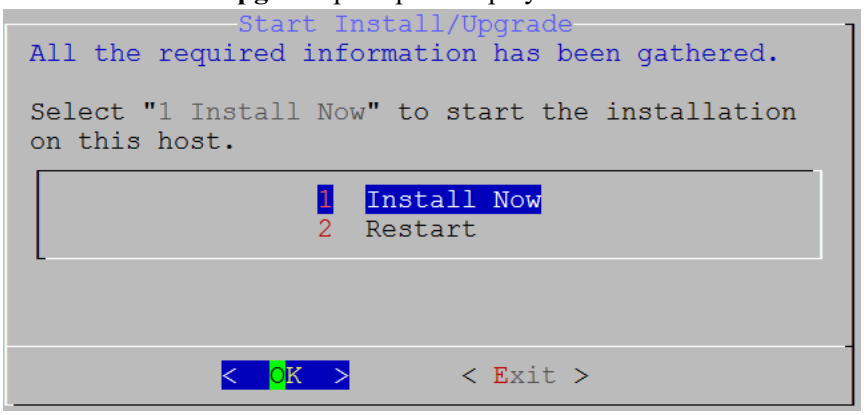


15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

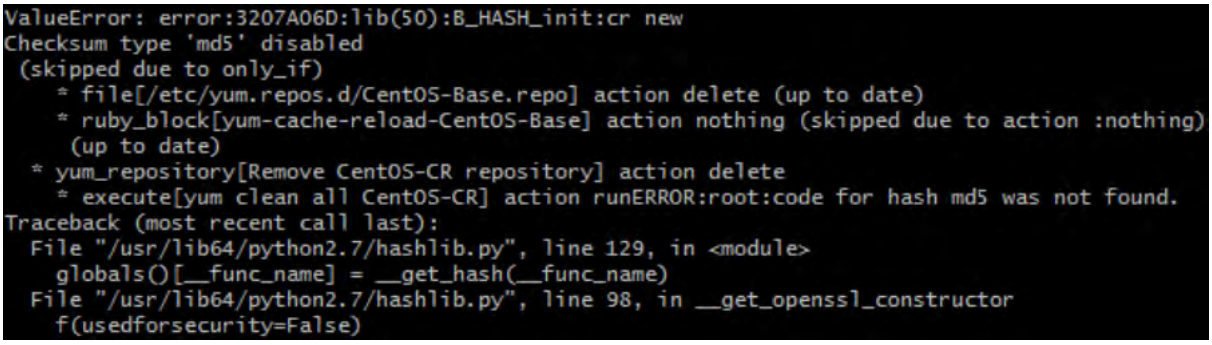


The **Start Install/Upgrade** prompt is displayed.



16. Press **Enter** to install 11.7 on the NW Server.
When **Installation complete** is displayed, you have installed the 11.7 NW Server on this host.

**Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



17. License the secondary NW Server.

    a. Log in to the secondary NW Server User Interface, click (Admin) > **System** > **Info**, and note the **License Server ID** under **Version Information**.

    b. SSH to the primary NW Server.

    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID** ).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.
    ```
    # Hostid of the backup server, if in fail over configuration.
    #backup-hostid:
    ```
    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.
    ```
    # Hostid of the backup server, if in fail over configuration.
    backup-hostid: "000c2918c80d"
    ```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>
```

**Note:** If the Warm Standby server becomes active, and if it will be accessed by any NW host with a NAT IP address, the NAT IP address must be added to the command:
`/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>-p<warm-standby-NAT-admin-server-ip>`

This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.
Usage:
schedule-standby-admin-data-sync command [options]
```

```
Commands:

-h, --help                  Display Help
-d, --daily                 Schedule daily data
                            synchronization
-w, --weekly                Schedule weekly data
                            synchronization
-c, --custom <crontab       Schedule custom data
formatted>                  synchronization
                            i.e. to schedule for
                            midnight on 1st and
                            10th of the month:
                            '0 0 1,10 * *'
-i, --standby-ip <IP        (required) IP
address>                    address of standby
                            NW Server
-p, --standy-ip-public <NAT (optional) NAT-based
IP address>                 IP address of
                            standby NW Server
-v, --verbose               Enable verbose
                            output
```

## Fail Over Primary NW Server to Secondary NW Server with Same IP Address

Initially, the primary NW Server fails over to the secondary NW Server. When the primary NW Server is back up, the secondary NW Server fails over to the primary NW Server, and that is referred to as a fail-back. When it is possible for the secondary NW Server to have the same IP address as the primary NW Server after failover, complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

**IMPORTANT:** If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness ) from Primary NW server to standby NW server using the NRT:

```
nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search
```

You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the `nw-failover` script with the `--make-active` argument:
   ```
   nw-failover --make-active
   ```
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      ```
      nw-failover --make-standby
      ```
   c. Shut down the primary NW Server.

   **Note:** If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.
4. Validate that the component hosts have connected to the new active NW Server by running the following command on the new active NW Server:
   ```
   nw-manage --check-hosts-status
   ```

   **Note:** Do not continue to the next step until all component hosts have successfully connected to the new active NW Server. Rerun `nw-manage --check-hosts-status` as needed to continue verification.
5. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**Note:** If the primary NW Server is going to remain online, you must update its IP address so that it no longer conflicts with the Warm Standby NW Server IP address when it is changed. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

6. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

**IMPORTANT:** After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

## Fail Over Primary NW Server to Secondary NW Server with Different IP Address

If your secondary NW Server will maintain a different IP address from your primary NW Server after a fail-over event, for example, if the secondary NW Server is located in a different data center from the primary NW Server, follow these steps to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

**IMPORTANT:** If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness ) from Primary NW server to standby NW server using the NRT:
`nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search`
You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the failover script:
   `nw-failover --make-active`
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      `nw-failover --make-standby`
   c. Shut down the primary NW Server.

      **Note:** If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.

4. If you are running in a mixed-version environment, log in to each component host that is still on a version prior to 11.7 and execute the following:
   - `netconfig --update-dns --dns <active-nw-server-ip-address>`
   - `sed -Ei 's/^master:.*/master: <active-nw-server-ip-address>/g' /etc/salt/minion`
   - `systemctl restart salt-minion`

   **Note:** If you have a component host that uses a NAT IP address to reach the NW Server, substitute the `<NAT-IP-address>` for the `<active-nw-server-ip-address>` in both bullet items above.

5. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

**IMPORTANT:** After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

**Note:** If the secondary NW Server had any custom certificates, you must re-apply them after failover. For information about how to re-apply custom certificates, see "(Optional) Use a Custom Server Certificate" in the *System Security and User Management Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

**Note:** After upgrading the NW Server host or a component host to 11.7, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, RSA recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

**Note:** While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

## SSO

### Update Configuration for Single Sign-On

**Note:** You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.
   d. Log in to admin server using the `login` command.
   e. Enter the admin username and password.
   f. Execute the following commands:
      - `cd /rsa/security/authentication/web/saml/sso-enabled`
      - `set false`
      - `logout`
      - `exit`

- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.
3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

## Reporting Engine

### Update Configuration for Reporting Engine

**Note:** You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to (Admin) **> Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.

4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

## UCF

To enable UCF to communicate with NetWitness Platform:

1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   **Note:** Do not change any other setting.

## PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

## ECAT

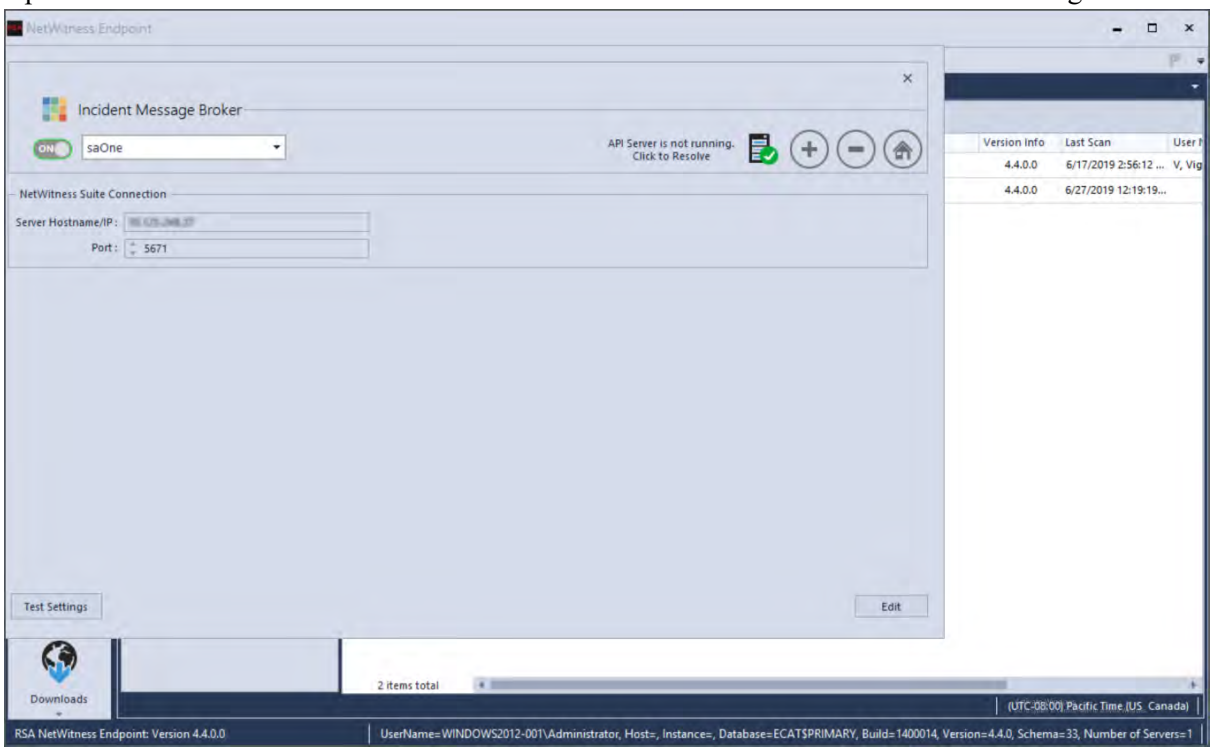
Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

### Incident Message Broker

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.

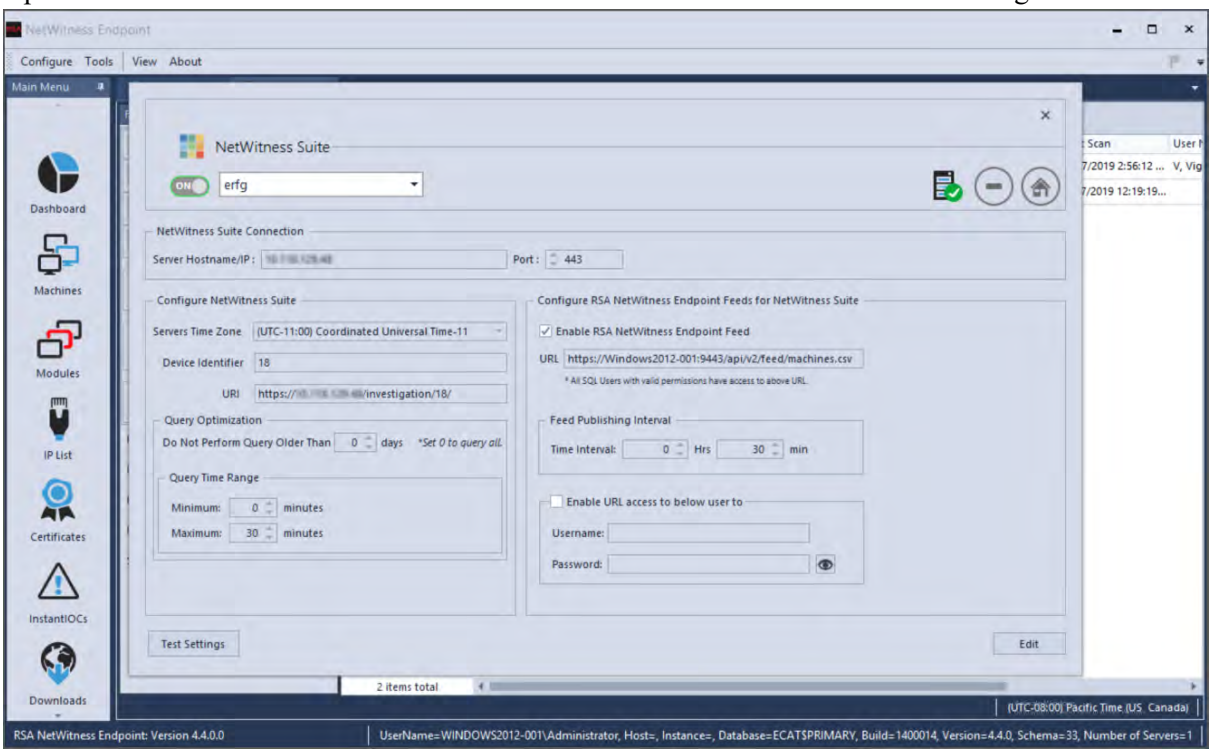
2. Update the server Hostname and IP Address to the current active server and test the settings.



## NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

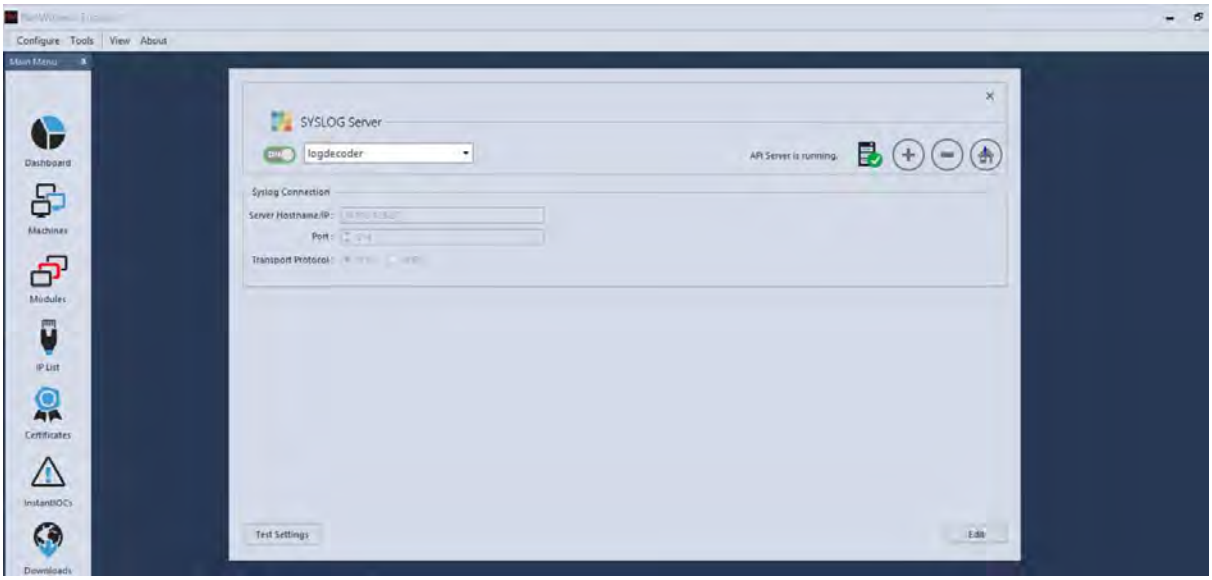
2. Update the server Hostname and IP address to the current active server and test settings.



## Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.

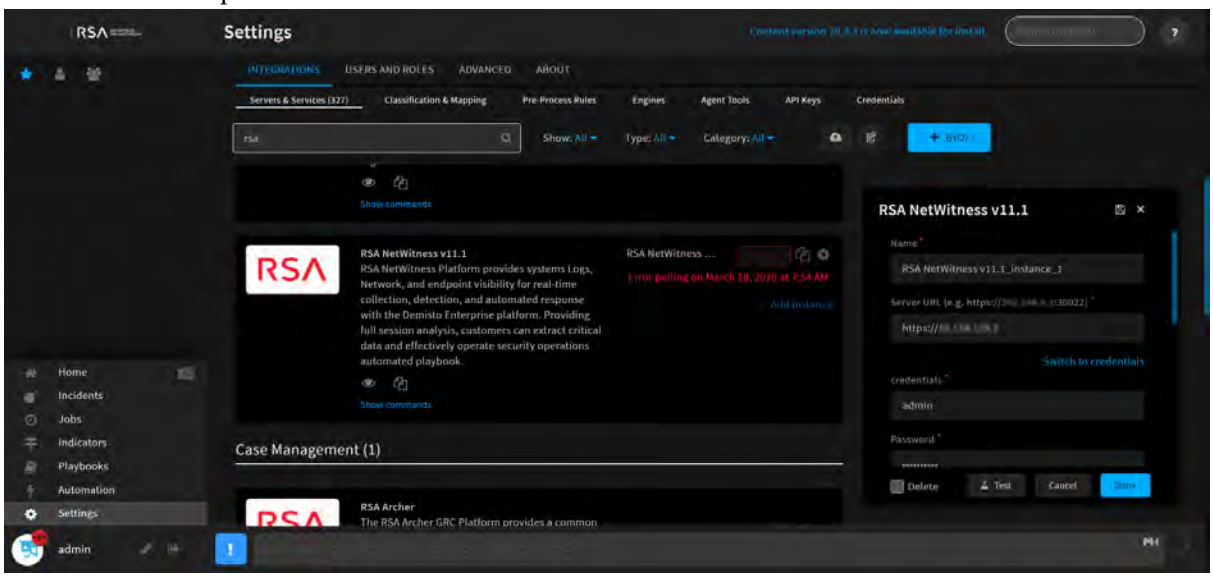


2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

## RSA NetWitness Orchestrator (By Demisto)

### Update the Current Active NW Server to Fetch Respond Incidents and Alerts

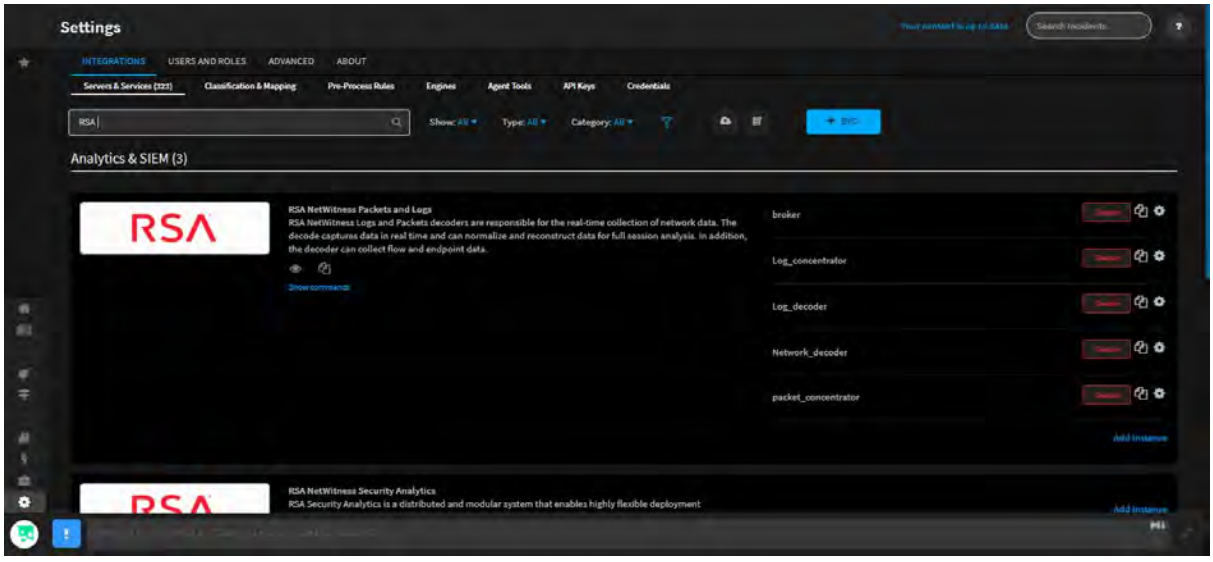
1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



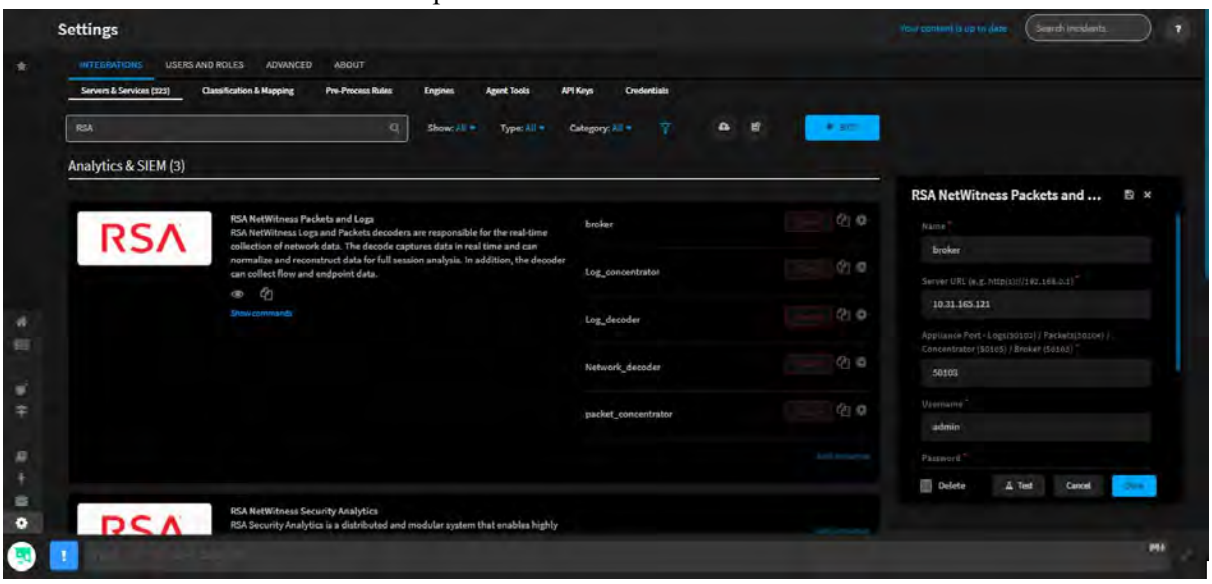
### Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.



2. Enter the new IP address of the component host in **Server URL** and click **Done**.



## Audit Logging

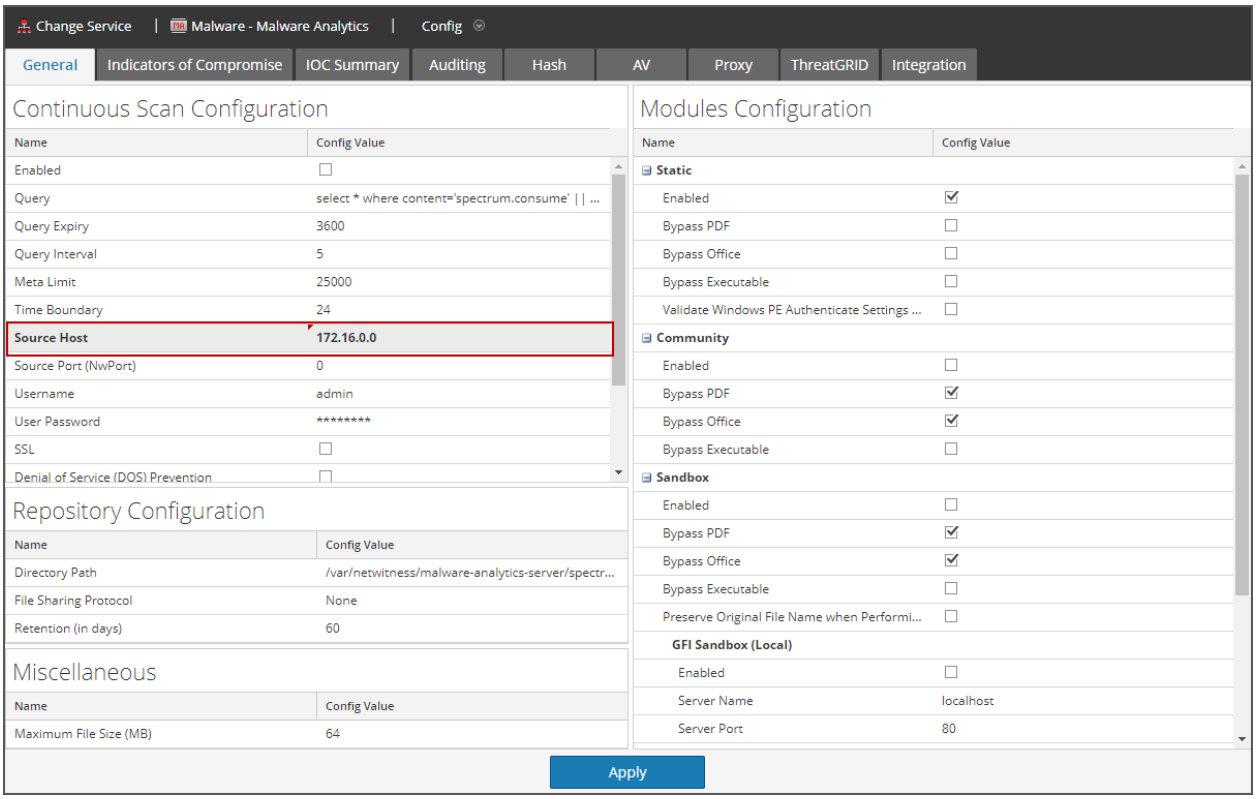
If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

## Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

## Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.



## Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

### Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

### Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

**Note:** If you added any content to the `/etc/hosts` file on the primary server, the contents of that file are available under `/var/netwitness/standby-data/unmanaged/etc` on the failover server. You can manually copy those files to the `/etc/hosts` file on the failover server after the failover is complete.

## Fail Back Secondary NW Server to Primary NW Server

After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

# Network Architecture and Ports

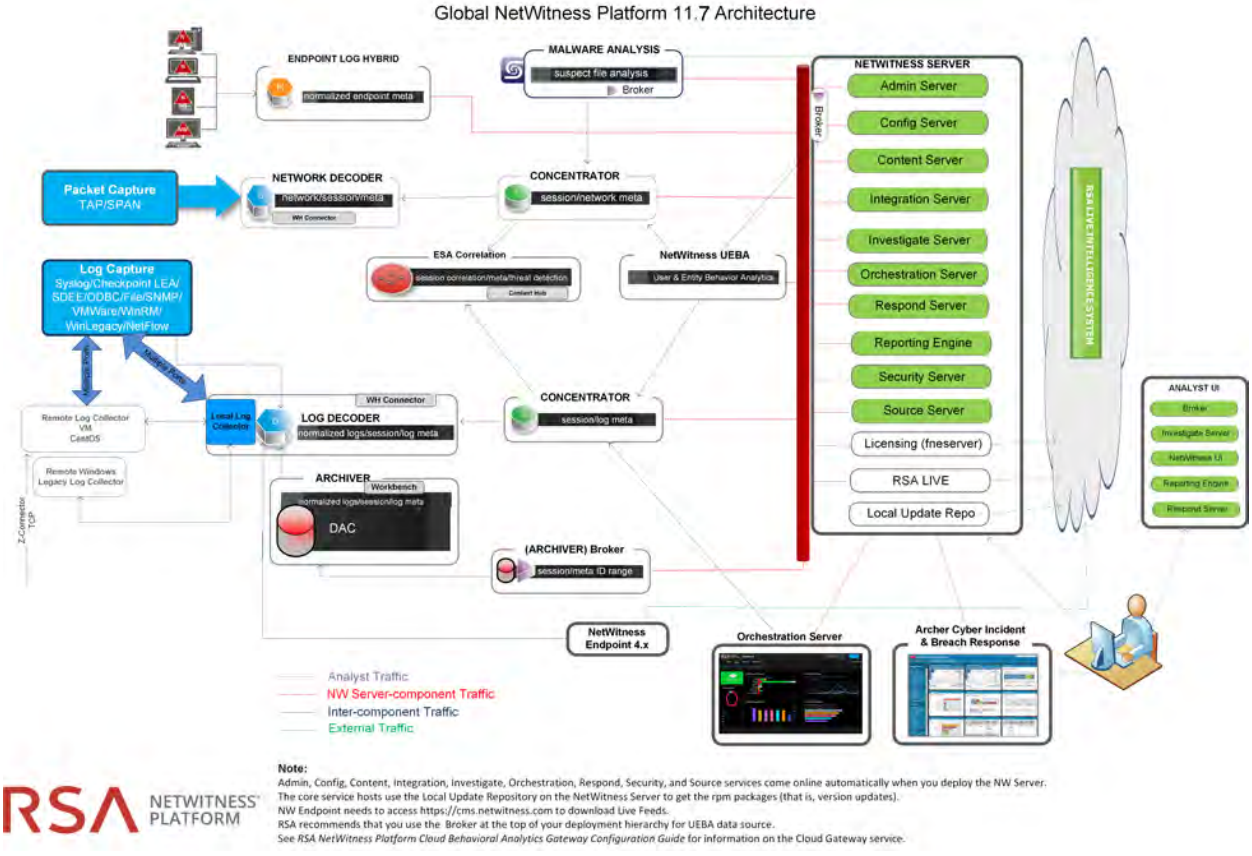
Refer to the following diagrams and port tables to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.

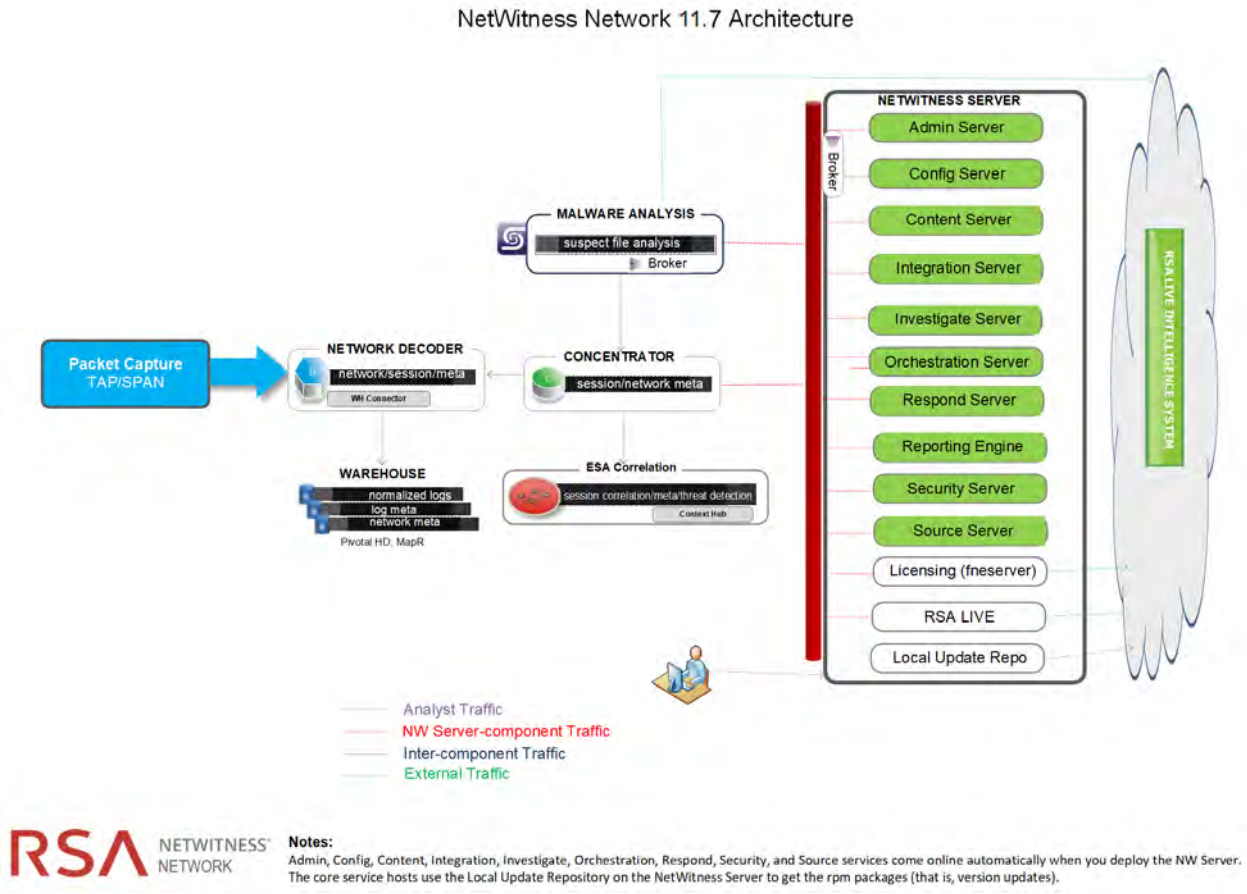
## NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.

**Note:** NetWitness core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.



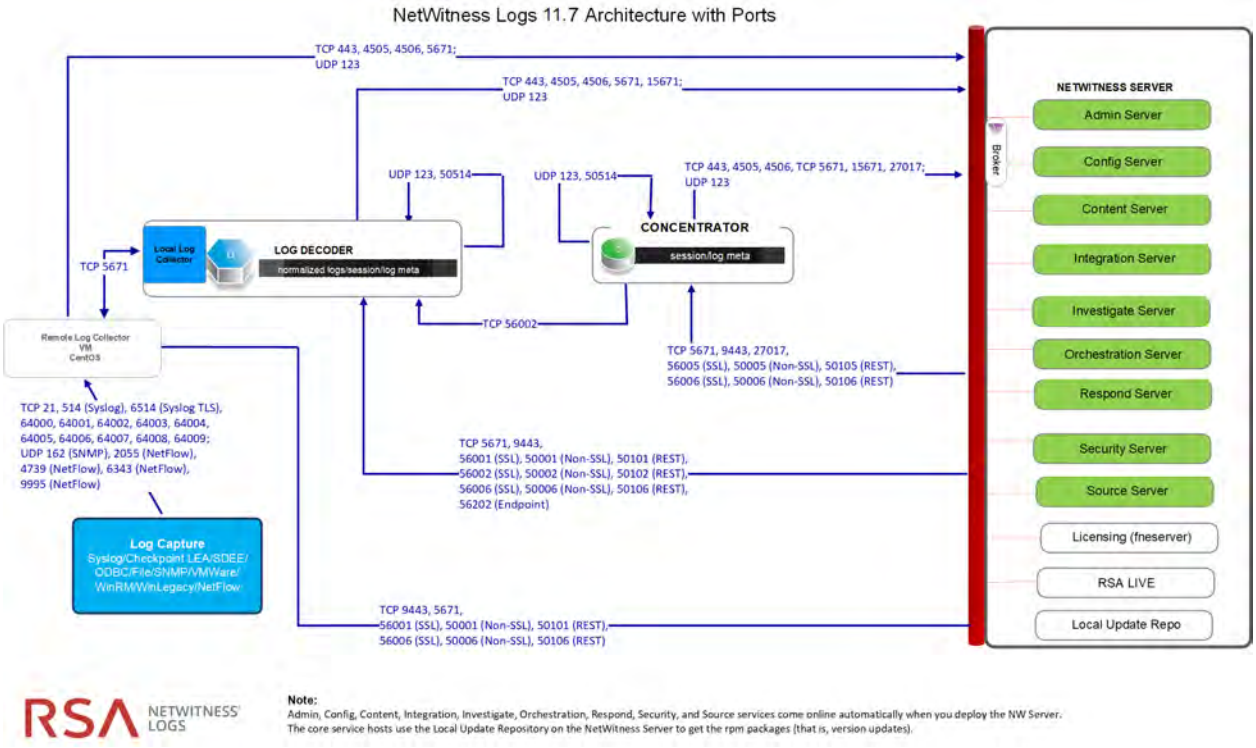
# NetWitness Network (Packets) Architecture Diagram with Ports



RSA NETWITNESS NETWORK

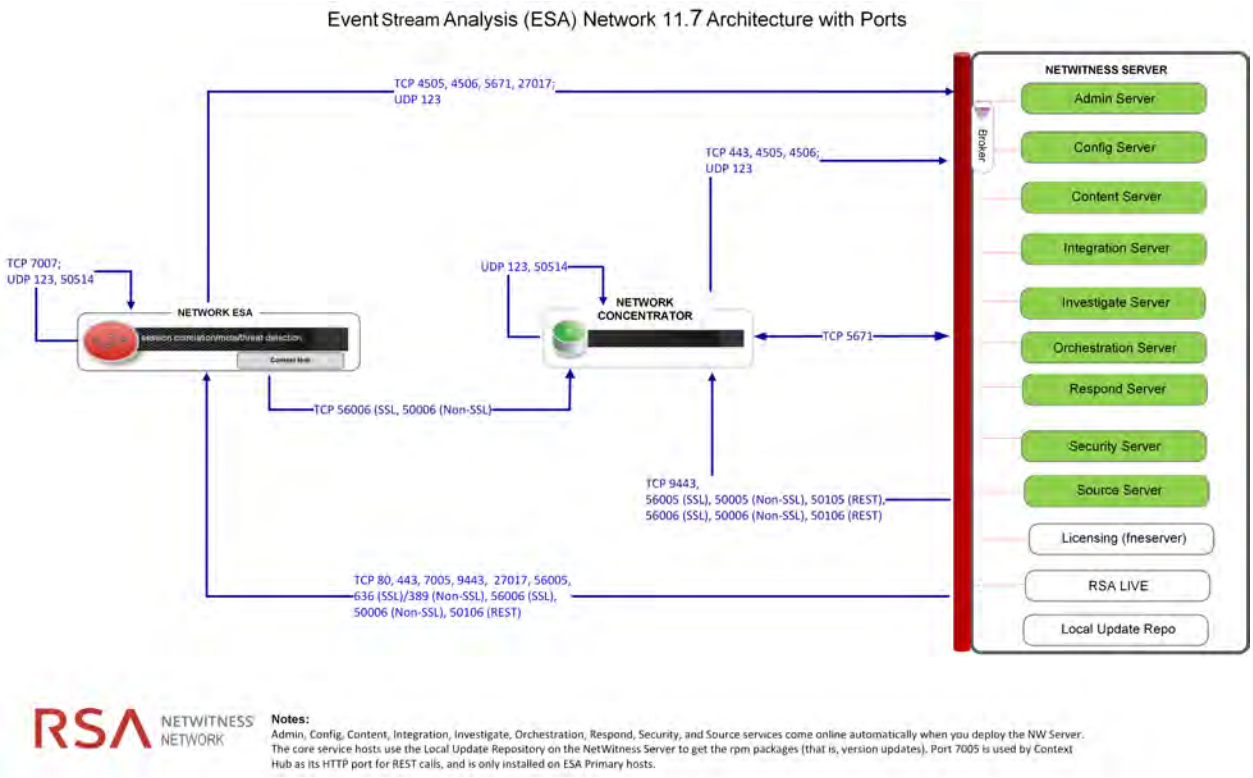
**Notes:**
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).

# NetWitness Logs Architecture Diagram with Ports



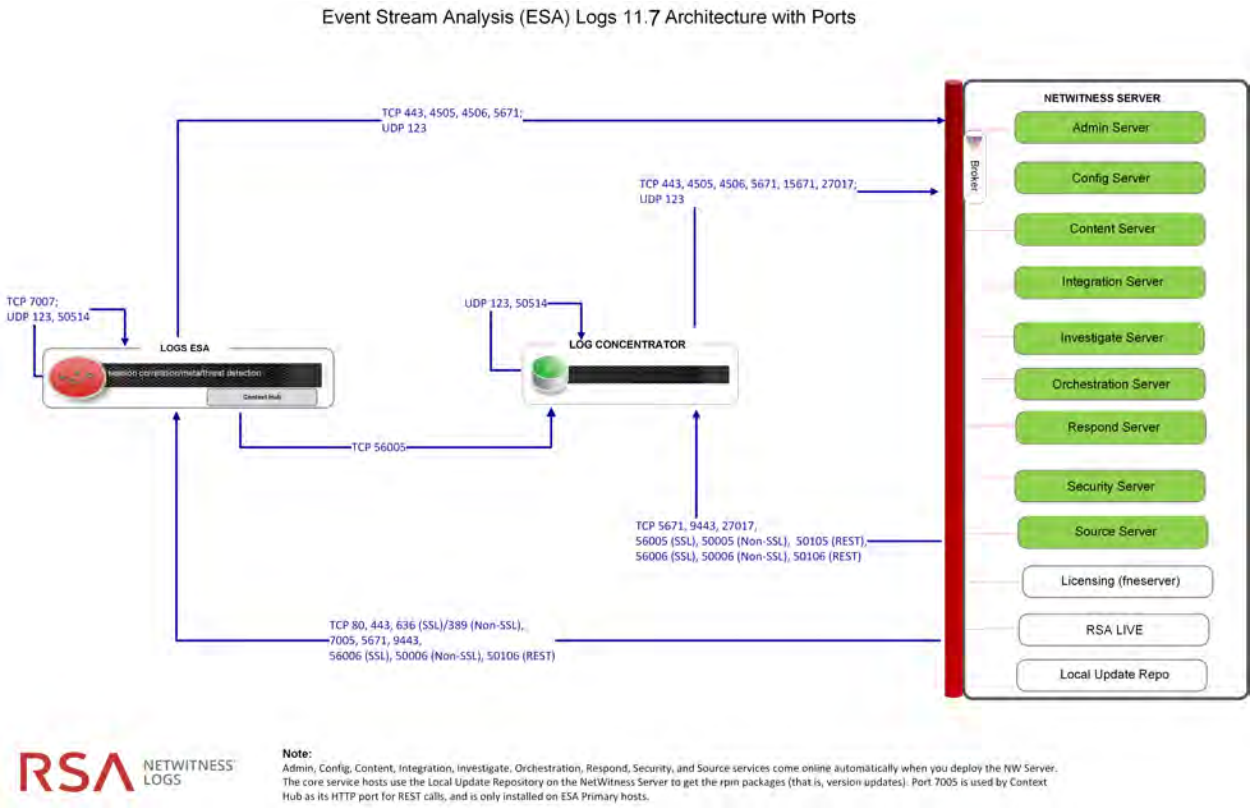
# Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.



# Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.



# NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

**Note:** The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

| Source Host | Destination Host | Ports |
|---|---|---|
| NW Server | ESA Primary | **TCP:** 22, 5671, 7005<br>**UDP:**123 |
| NW Server | ESA | **TCP:** 22, 5671<br>**UDP**: 123 |
| NW Server | Network Decoder | **TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL)<br>**UDP:** 123 |
| NW Server | Broker | **TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL)<br>**UDP:** 123 |

# Comprehensive List of NetWitness Host, Service, and iDRAC Ports

**Note:** For ports used in event collection through the NetWitness Logs, see the *Log Collection Configuration Guide for RSA NetWitness Platform*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.

This section contains the port specifications for the following hosts.

| | |
|---|---|
| NW Server Host | iDRAC Ports |
| Analyst UI Host | Log Collector Host |
| Archiver Host | Log Decoder Host |
| Broker Host | Log Hybrid Host |
| Concentrator Host | Log Hybrid - Retention |
| Endpoint Log Hybrid Host | Malware Host |
| Endpoint Relay Server | Network Decoder Host |
| Event Stream Analysis Host | Network Hybrid Host |
| New Health & Wellness | UEBA Host |

## NW Server Host (Primary and Warm Standby NW Server Host)

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | NW Server | TCP 443, 80 | nginx - NetWitness UI |
| Admin Workstation | NW Server | TCP 15671 | RabbitMQ Management UI |
| Admin Workstation | NW Server | TCP 22 | SSH<br>Primary to Standby NW Server synchronization port. |
| NW Hosts | NW Server | TCP 53<br>UDP 53 | DNS |
| NW Hosts | NW Server | TCP 15671 | RabbitMQ Management UI |
| NW Hosts | NW Server | TCP 4505, 4506 | Salt Master Ports |
| NW Hosts | NW Server | TCP 443 | RSA Update Repository |
| NW Hosts | NW Server | TCP 5671 | RabbitMQ-amqp |
| NW Hosts | NW Server | UDP 123 | NTP |
| NW Hosts | NW Server | TCP 27017 | MongoDB |
| NW Server | cms.netwitness.com | TCP 443 | Live Content Management System (CMS) Library |
| NW Server | download.rsasecurity.com | TCP 443 | RSA Licensing |
| NW Server | rsasecurity.subscribenet.com | TCP 443 | RSA Licensing |
| NW Server | update.netwitness.com | TCP 443 | Netwitness Software Updates |
| NW Server | NFS Server | TCP 111, 2049,<br>UDP 111, 2049 | iDRAC Installations |
| NW Server | NW Hosts | UDP 123 | NTP |
| NW Server | NW Endpoint | TCP 443, 9443 | For NW Endpoint 4.x integrations |
| NW Hosts | NW Server | TCP 444 | nw-node-infra service failover check |

## Analyst UI Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Analyst UI | NW Server | TCP 7006 | The Content Server is listening on this port. |
| Analyst UI | NW Server | TCP 7009 | The Admin Server is listening on this port. |
| Analyst UI | NW Server | TCP 7012 | The Integration Server is listening on this port. |
| Analyst UI | NW Server | TCP 7015 | The Source Server is listening on this port. |
| Analyst UI | NW Server | TCP 7016 | The License Server is listening on this port. |
| NW Hosts | Analyst UI | TCP 5671 | RabbitMQ-amqp |
| Analyst UI | NW Server | UDP 123 | NTP |
| Analyst UI | NW Server | TCP 444 | nw-node-infra service failover check |

## Archiver Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Archiver | TCP 15671 | RabbitMQ Management UI |
| Archiver | NW Server | TCP 15671 | RabbitMQ Management UI |
| Archiver | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Archiver | TCP 22 | SSH |
| NW Server | Archiver | TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST) | Archiver Application Ports |
| NW Server | Archiver | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Archiver | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| NW Server | Archiver | TCP 50007 (Non-SSL), 56007 (SSL), 50107 (REST) | Workbench Application Ports |
| Archiver | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Archiver | NW Server | TCP 444 | nw-node-infra service failover check |

## Broker Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Broker | TCP 15671 | RabbitMQ Management UI |
| Broker | Concentrator | TCP 50005 (Non-SSL), 56005 | Concentrator Application Port |
| Broker | NW Server | TCP 15671 | RabbitMQ Management UI |
| Broker | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Broker | TCP 22 | SSH |
| NW Server | Broker | TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST) | Broker Application Ports |
| NW Server | Broker | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Broker | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Broker | NW Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Endpoint Broker | NW Server | TCP 443 | RSA Update Repository |
| Broker | NW Server | TCP 444 | nw-node-infra service failover check |

## Concentrator Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Concentrator | TCP 15671 | RabbitMQ Management UI |
| Concentrator | Log Decoder | TCP 50002 (Non-SSL), 56002 (SSL) | Log Decoder Application Port |
| Concentrator | Network Decoder | TCP 56004, 50004 (Non-SSL) | Network Application Port |
| Concentrator | NW Server | TCP 15671 | RabbitMQ Management UI |
| Concentrator | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Concentrator | TCP 22 | SSH |
| NW Server | Concentrator | TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST) | Concentrator Application Ports |
| Malware | Concentrator | TCP TCP 50005 (Non-SSL), 56005 (SSL) | Malware |
| NW Server | Concentrator | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Concentrator | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Concentrator | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Concentrator | NW Server | TCP 444 | nw-node-infra service failover check |

## Endpoint Log Hybrid

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Endpoint Agent | Endpoint Log Hybrid | TCP 443<br>UDP 444 | NGINX HTTPS<br>NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid. |
| Endpoint Agent | Log Decoder or Virtual Log Collector | TCP 514 (Syslog)<br>UDP 514 (Syslog)<br>TLS 6514 | Windows Log Collection |
| Endpoint Log Hybrid | Log Decoder (External) | TCP 50102 (REST)<br>56202 (Protobuf SSL)<br>50202 (Protobuf) | To forward meta to an external Log Decoder |
| Endpoint Log Hybrid | NW Server | TCP 443 | RSA Update Repository |
| NW Server | Endpoint Log Hybrid | TCP 7050 | UI web traffic |
| Endpoint Log Hybrid | NW Server | TCP 5671 | Message Bus |
| Endpoint Log Hybrid | NW Server | TCP 27017 | MongoDB |
| NW Server | Endpoint Log Hybrid | TCP 7054 | UI web traffic |
| NW Server | NFS Server | TCP 111, 2049<br>UDP 111, 2049 | iDRAC Installations |
| NW Server | Endpoint Log Hybrid | TCP 50001 (Non-SSL), 56001 (SSL), 50101(REST) | Log Collector application ports |
| NW Server | Endpoint Log Hybrid | TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST) | Log Decoder application ports |
| Admin Workstation | Endpoint Log Hybrid | TCP 15671 | RabbitMQ Management UI |

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Endpoint Log Hybrid | NW Server | TCP 15671 | RabbitMQ Management UI |
| Endpoint Log Hybrid | NW Server | TCP 444 | nw-node-infra service failover check |

## Endpoint Relay Server

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Endpoint Agent | Relay Server | TCP 443 | To forward host data to the Relay Server |
| Endpoint Log Hybrid | Relay Server | TCP 443 | Pull host data from the Relay Server |

## Event Stream Analysis (ESA) Host

**Note:** The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | ESA | TCP 15671 | RabbitMQ Management UI |
| ESA Primary and Secondary | NW Server | TCP 15671 | RabbitMQ Management UI |
| ESA Primary and Secondary | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | ESA | TCP 22 | SSH |
| NW Server, ESA Secondary | ESA Primary | TCP 27017 | MongoDB |
| NW Server | ESA Primary | TCP 7005 | Context Hub Launch Port - (ESA Primary) |
| NW Server | ESA | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| ESA Primary and Secondary | cms.netwitness.com | TCP 443 | Live |
| ESA Primary and Secondary | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| ESA Primary and Secondary | Active Directory | 636 (SSL)/389 (Non-SSL) | |
| NW Server | ESA | 80 (HTTP)/ 443 (HTTPS)(REST) | |
| ESA Primary | Archer | 443 (SSL)/80 (Non-SSL) | |
| ESA Primary | ESA Primary | TCP 7007 | Launch Port |
| ESA Primary and Secondary | NW Server | TCP 444 | nw-node-infra service failover check |

## New Health and Wellness

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | New Health and Wellness | TCP 22 | SSH |
| Admin Workstation | New Health and Wellness | TCP 5601 | Kibana UI |
| NW Hosts | New Health and Wellness | TCP 9200 | Elasticsearch REST API Port |
| NW Server | New Health and Wellness | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| NW Server | New Health and Wellness | TCP 15671 | RabbitMQ Management UI |
| NW Server | New Health and Wellness | TCP 7018 | Metrics Server Launch Port |
| NW Server | New Health and Wellness | TCP 7020 | Node Infra Server Launch Port |

### New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform hosts port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and LogHybrid host is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| New Health and Wellness | Log Decoder | 50002(Non-SSL),56002 (SSL) | Log Decoder Application Ports |
| New Health and Wellness | Log Collector | 50001(Non-SSL),56001 (SSL) | Log Collector Application Ports |
| New Health and Wellness | Concentrator | 50005(Non-SSL)/56005 (SSL) | Concentrator Application Ports |

## iDRAC Ports

| Port | Function | Comments |
|---|---|---|
| 22* | SSH | Default, configurable port through which iDRAC listens for connections |
| 443* | HTTP | Default, configurable port through which iDRAC listens for connections |
| 5900* | Virtual Console keyboard and mouse redirection,<br>Virtual Media, Virtual Folders, and Remote File Share. | Default, configurable port through which iDRAC listens for connections |
| 111, 2049 | TCP | NetWitness Platform hosts to NFS Server |
| 111, 2049 | UDP | NetWitness Platform hosts to NFS Server |

## Log Collector Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Log Collector | TCP 15671 | RabbitMQ Management UI |
| Log Collector | NW Server | TCP 15671 | RabbitMQ Management UI |
| Log Collector | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Log Collector | TCP 22 | SSH |
| Log Collector | Log Event Sources | See *Log Collection Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents. | |
| Log Event Sources | Log Collector | TCP 514 (Syslog)<br>UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow),<br>4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)" | Log Collection Ports |
| Log Event Sources | Log Collector | TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008,64009 | Log Collection FTP/S Ports |
| NW Server | Log Collector | TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST) | Log Collector Application Ports |
| NW Server | Log Collector | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Log Collector | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Log Collector | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC installations |
| Log Collector | Virtual Log Collector | TCP 5671 | In Pull Mode |
| Virtual Log Collector | Log Collector | TCP 5671 | In Push Mode |
| Log Collector | NW Server | TCP 444 | nw-node-infra service failover check |

## Log Decoder Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Log Decoder | TCP 15671 | RabbitMQ Management UI |
| Log Decoder | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Log Decoder | TCP 22 | SSH |
| Log Decoder | Log Event Sources | See *Log Collection Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents. | |
| Log Event Sources | Log Decoder | TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow) | Log Collection Ports |
| Log Event Sources | Log Decoder | TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008, 64009 | Log Collection FTP/S Ports |
| NW Server | Log Decoder | TCP 50001 (Non-SSL),56001 (SSL), 50101 (REST) | Log Collector Application Ports |
| NW Server | Log Decoder | TCP 50002 (Non-SSL), 56002 (SSL),56202 (Endpoint), 50102 (REST) | Log Decoder Application Ports |
| NW Server | Log Decoder | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Log Decoder | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Log Decoder | Log Collector | TCP 6514 | |
| Log Decoder | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Log Decoder | NW Server | TCP 15671 | RabbitMQ Management UI |
| Log Decoder | NW Server | TCP 444 | nw-node-infra service failover check |

## Log Hybrid Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Log Hybrid | TCP 15671 | RabbitMQ Management UI |
| Log Hybrid | NW Server | TCP 15671 | RabbitMQ Management UI |
| Log Hybrid | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Log Hybrid | TCP 22 | SSH |
| Log Collector | Log Event Sources | See *Log Collection Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents. | |
| Log Event Sources | Log Hybrid | TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow) | Log Collection Ports |
| Log Event Sources | Log Hybrid | TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008, 64009 | Log Collection FTP/S Ports |
| NW Server | Log Hybrid | TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST) | Log Collector Application Ports |
| NW Server | Log Hybrid | TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST) | Log Decoder Application Ports |
| NW Server | Log Hybrid | TCP TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST) | Concentrator Application Ports |

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| NW Server | Log Hybrid | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Log Hybrid | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Log Hybrid | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Log Hybrid | NW Server | TCP 444 | nw-node-infra service failover check |

## Log Hybrid - Retention Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Log Hybrid - Retention | TCP 15671 | RabbitMQ Management UI |
| Log Hybrid - Retention | NW Server | TCP 15671 | RabbitMQ Management UI |
| Log Hybrid - Retention | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Log Hybrid - Retention | TCP 22 | SSH |
| Log Collector | Log Event Sources | See *Log Collection Configuration Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents. | |
| Log Event Sources | Log Hybrid - Retention | TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow) | Log Collection Ports |
| Log Event Sources | Log Hybrid - Retention | TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008, 64009 | Log Collection FTP/S Ports |
| NW Server | Log Hybrid - Retention | TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST) | Log Collector Application Ports |
| NW Server | Log Hybrid - Retention | TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST) | Log Decoder Application Ports |
| NW Server | Log Hybrid - Retention | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Log Hybrid - Retention | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Log Hybrid - Retention | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Log Hybrid - Retention | NW Server | TCP 444 | nw-node-infra service failover check |

## Malware Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Malware | TCP 15671 | RabbitMQ Management UI |
| Malware | NW Server | TCP 15671 | RabbitMQ Management UI |
| Malware | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Malware | TCP 22 | SSH |
| NW Server | Malware | TCP 60007 | Malware Application Ports |
| NW Server | Malware | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Malware | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| NW Server | Malware | TCP 5432 | Postgresql |
| NW Server | Malware | TCP 56003 (SSL), 50103 (REST) | Broker Application Ports |
| Malware | panacea.threatgrid.com | TCP 443 | Threatgrid |
| Malware | cloud.netwitness.com | TCP 443 | Community evaluation / Opswat |
| Malware | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Malware | NW Server | TCP 444 | nw-node-infra service failover check |

## Network Decoder Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Network Decoder | TCP 15671 | RabbitMQ Management UI |
| Network Decoder | NW Server | TCP 15671 | RabbitMQ Management UI |
| Network Decoder | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Network Decoder | TCP 22 | SSH |
| NW Server | Network Decoder | TCP 56004 (SSL), 50104 (REST), 50004 (Non-SSL) | Network Decoder Application Ports |
| NW Server | Network Decoder | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Network Decoder | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Network Decoder | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Network Decoder | NW Server | TCP 444 | nw-node-infra service failover check |

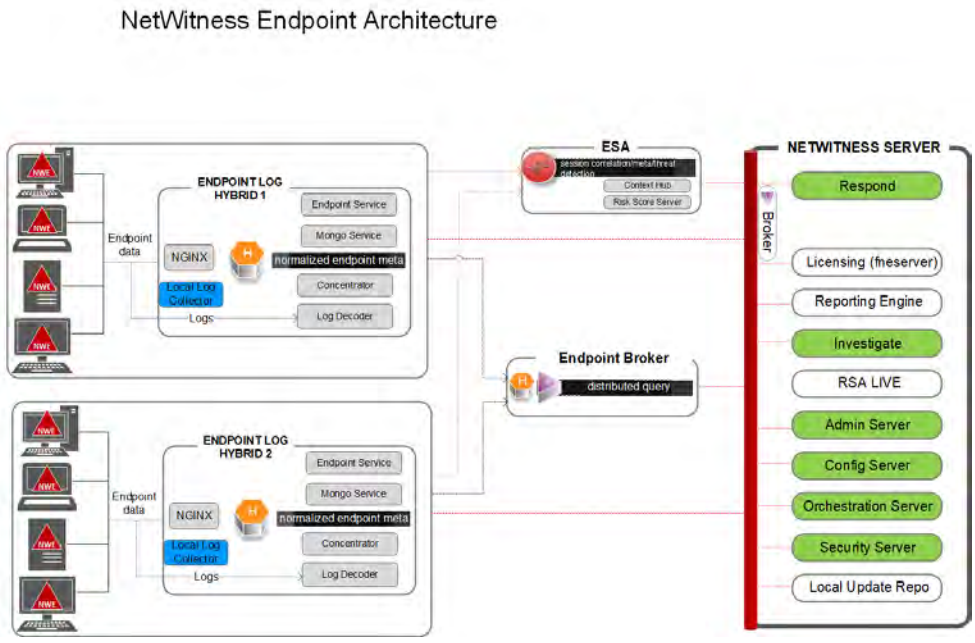
## Network Hybrid Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| Admin Workstation | Network Hybrid | TCP 15671 | RabbitMQ Management UI |
| Network Hybrid | NW Server | TCP 15671 | RabbitMQ Management UI |
| Network Hybrid | NW Server | TCP 443 | RSA Update Repository |
| Admin Workstation | Network Hybrid | TCP 22 | SSH |
| NW Server | Network Hybrid | TCP 56004 (SSL), 50104 (REST), 50004 (Non-SSL) | Network Decoder Application Ports |
| NW Server | Network Hybrid | TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST) | Concentrator Application Ports |
| NW Server | Network Hybrid | TCP 56006 (SSL), 50106 (REST) | NetWitness Appliance Ports |
| NW Server | Network Hybrid | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts. |
| Network Hybrid | NFS Server | TCP 111 2049<br>UDP 111 2049 | iDRAC Installations |
| Network Hybrid | NW Server | TCP 444 | nw-node-infra service failover check |

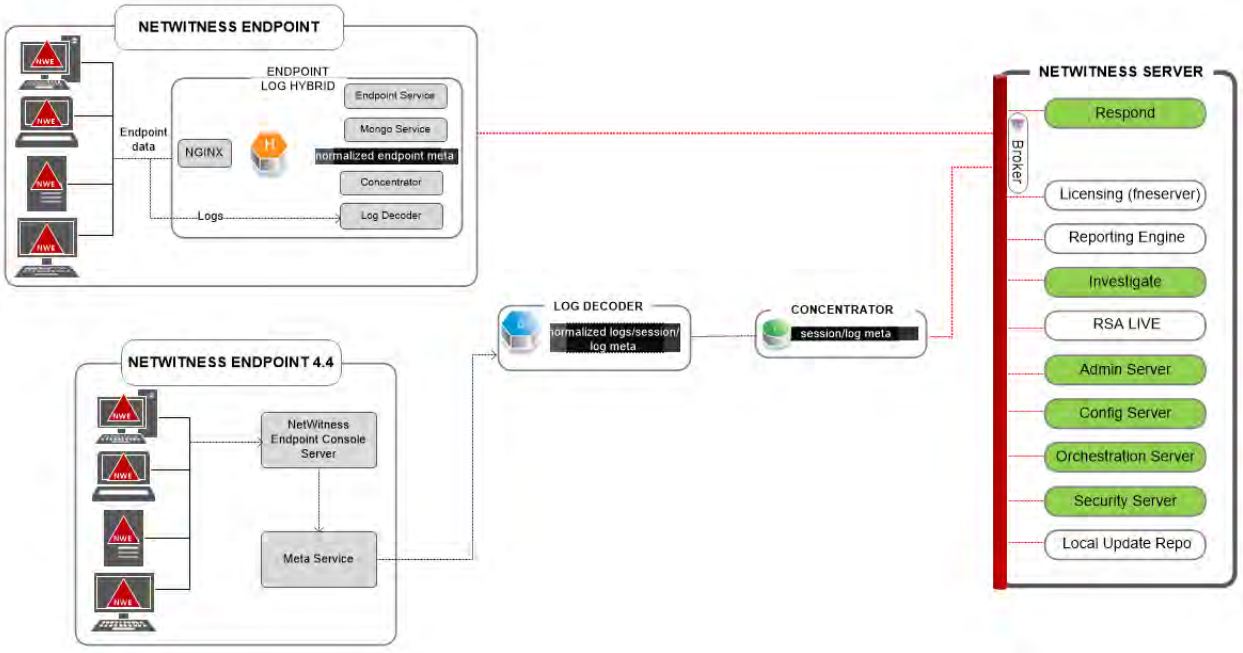
## UEBA Host

| Source Host | Destination Host | Destination Ports | Comments |
|---|---|---|---|
| UEBA Server | NW Server | TCP 443 | RSA Update Repository |
| UEBA Server | Broker | TCP 56003 (SSL), 50103 (REST) | Broker Application Ports |
| UEBA Server | Concentrator | TCP TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST) | Concentrator Application Ports |
| Admin Workstation | UEBA Server | 443 | UEBA Monitoring |
| Admin Workstation | UEBA Server | 22 | SSH |
| Admin Workstation | UEBA Server | TCP 15671 | RabbitMQ Management UI |
| UEBA Server | NW Server | TCP 15671 | UEBA Alerts forwarding to Respond |
| NW Server | NFS Server | TCP 111, 2049<br>UDP 111, 2049 | iDRAC Installations |
| NW Server | UEBA Server | TCP 5671 | RabbitMQ (AMQPS) message bus for all NW hosts |
| UEBA Server | NW Server | TCP 444 | nw-node-infra service failover check |

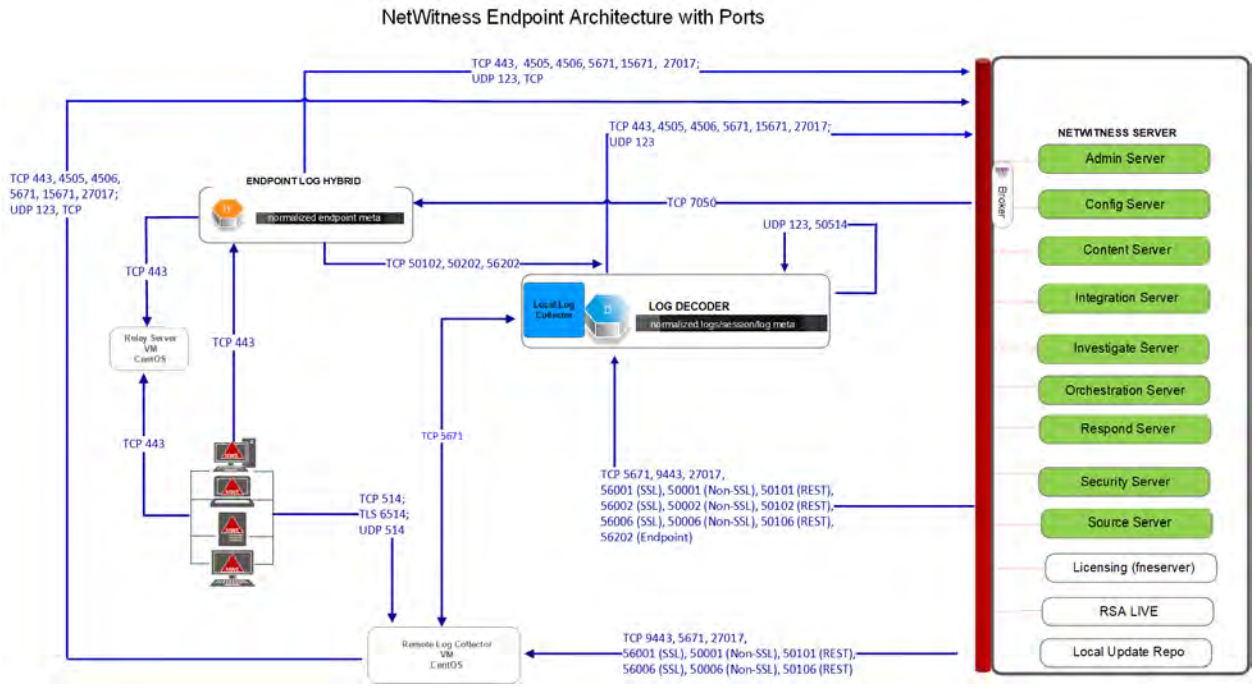
# NetWitness Endpoint Architecture



## NetWitness Endpoint 4.4 Integration with NetWitness Platform



## NetWitness Endpoint Architecture with Ports



For more information on the services running on Endpoint Log Hybrid, see *RSA NetWitness Endpoint Configuration Guide*.

# How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

**Note:** If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.rsa.com/docs/DOC-93651) if this is the case.

## Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select (Admin) > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.

2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

## Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
   ```
   vi /etc/sysconfig/iptables
   ```
   b. Restart `iptables` with the following command string.
   ```
   systemctl restart iptables
   ```
   c. Verify the change with the following command string.
   ```
   iptables -L -n
   ```
   The following is an example of what is displayed for a correct change.
   ```
   ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
   EndpointNginxPort */ ctstate NEW
   ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
   ```
   semanage port -a -t http_port_t -p udp 555
   ```
   If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
   ```
   semanage port -l | grep http_port_t
   ```
   The following is an example of what is displayed for a correct change.
   ```
   http_port_t udp 555, 444
   ```
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
   ```
   vi /etc/nginx/nginx.conf
   ```
   b. Search for the following string.
   ```
   listen 444 udp;
   ```
   c. Replace `444` with `555`.
   d. Restart nginx with the following command string.
   ```
   systemctl restart nginx
   ```

4. Verify that agents are communicating over the new port.
   a. Run the following command string.
      ```
      tcpdump -i eth0 port 555
      ```
   b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
      ```
      09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP, length 20
      09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP, length 1
      ```
      Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

# Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your RSA devices.

## Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

## Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

## Safety Information

### Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

### Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

## Power and Electrical Warnings

**Caution:** The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

## Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

## Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

**Product Validation Checklist** ..... **3**

Hardware Validation ..... 3

Software Validation ..... 4

# Product Validation Checklist

This checklist provides procedures for validating that the hardware and software products that you receive are the ones that you purchased from RSA.

## Hardware Validation

Before you open the packaging of the hardware, ensure that the box in which the hardware arrives is not damaged or previously opened, and has not been tampered with. Verify the following:

The package is not dented or broken.

All labels are sealed and unbroken.

There is no text on the package that says “OPENED.”

When you open the package, inspect the hardware. Verify the following:

The hardware that was shipped is the version that you ordered. When you first boot the system, the version number of the product displays in the start process.

The appliance serial number on the hardware matches the appliance serial number on the RSA packing slip. The following is an example of where the serial number is displayed on the RSA packing slip:

| RSA Model # | RSA Description For Labels | Dell Reg. No | Serial Number |
|---|---|---|---|
| NW-S6H-AS | NW S6 Analytics Server | E39S | 3KDMYR2 |

## Software Validation

**NOTE:** The Common Criteria evaluation is based on RSA NetWitness 11.7.1.2. The end user needs to download the 11.7.0.0 OVA or ISO from my.rsa.com and then update the stack to 11.7.1.2.

All product software is included in the OVA download. A VM instance can be created out of the OVA download

Validate the checksum of each OVA file for the product that you purchased, and compare it to the checksum of the OVA file from the download site to be sure that the checksum files match.

1. On a Windows system, verify the checksum by running the `CertUtil` command:

   At a command line prompt, in the folder where the OVA files are installed, run the following command:

   ```
   CertUtil -hashfile pathToFileToCheck <HashAlgorithm>
   ```

   Applicable examples of hash algorithms are:

   ```
   MD2 MD4 MD5 SHA1 SHA256 SHA384 SHA512
   ```

   For example, on the RSA-NW OVA system, you can find the MD5 hash by running the following command:

   ```
   certutil -hashfile rsa-nw-11.7.0.0.17934-x86_64.ova MD5
   ```

   which results in output similar to the following:

   ```
   MD5 hash of rsa-nw-11.7.0.0.17934-x86_64.ova:
   3fc3be89e5e03784d15800c41713a2ba
   CertUtil: -hashfile command completed successfully.
   ```

2. On a Unix system, verify the checksum by running either the `md5sum` or `sha (sha1, sha256, sha512)` command. In the folder where the OVA files are installed, run the following command:
   `md5sum pathToFileToCheck`

   For example, on the RSA-NW OVA system, you can find the MD5 hash by running the following command:

   `md5sum rsa-nw-11.7.0.0.17934-x86_64.ova` which results in output similar to the following: `3fc3be89e5e03784d15800c41713a2ba`

   `rsa-nw-11.7.0.0.17934-x86_64.ova` and you would ensure that `3fc3be89e5e03784d15800c41713a2ba` matches the checksum provided on the download site.

# How NetWitness Investigate Works

NetWitness Investigate provides analysts the means to analyze events that have been captured by NetWitness. Using Investigate, analysts can examine packet, log, and endpoint data, and identify possible internal or external threats in their environment. There are several different views available to analysts to gain different perspectives into the data in their environment. A key element that all the views have in common is metadata.

**Note:** In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

## Metadata, Meta Keys, Meta Values, and Meta Entities

RSA NetWitness audits and monitors all data communications in an environment. One type of service--a Decoder--ingests, parses, and stores the original packets captured on the network, logs forwarded by a device, and endpoint events seen by the endpoint agent. The configured rules, parsers, and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs, packets, and endpoint data. Another type of service, called a Concentrator, indexes and stores the metadata, making it more efficient to search through all types of metadata.

The metadata is created to give analysts valuable points of reference associated with the original data. This allows analysts to quickly get a sense of what has transpired without being required to examine every detail of an event. The metadata is in the form of a *meta key* and *meta values* for the key. For example, `ip.src` is a meta key, and an IP address (192.168.1.1) that is the source of the traffic is a meta value tagged as `ip.src`. When you view data in Investigate, you see the meta key `ip.src` and all of the IP addresses (meta values) that are tagged with that key. Some meta keys are built-in and others may be custom keys specific to your environment and defined by the administrator. All metadata, no matter the source of the data, is normalized into the Unified Data Model for RSA NetWitness Platform to keep similar metadata concepts grouped together into like meta keys (see https://community.rsa.com/community/products/netwitness/rsa-content/udm).

Meta entities are available in Version 11.1 and later. A *meta entity* is an alias that groups together the results from other meta keys. Meta entities organize similar meta keys into a single, easier to use, meta type. For example, the default Core database language includes distinct meta keys for IP source and IP destination. One of the built-in meta entities named `ip.all` represents the combined set of all IP sources and destinations. Some meta entities are already included by default, and the administrator can create custom meta entities. Analysts can use a meta entity in a query, a meta group, a column group, and a query profile. Parallel coordinates visualizations do not support meta entities. Administrators can use meta entities to define a query prefix to apply to a user role and a user as described in the *System Security and User Management Guide*. The *Decoder Configuration Guide* provides additional information about creating meta entities and how they can be used in rules.

**Note:** Meta entities need to be configured on all upstream Concentrators. If any Concentrator does not have a meta entity configured, that meta entity will be empty when you query the Broker.

Analysts usually query the Broker or Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder for raw logs or endpoint events or a full reconstruction of network events. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information about the event without having to query each Decoder. In some special cases, analysts may query a Decoder.

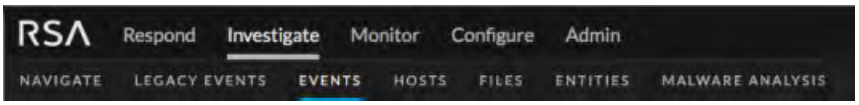
## Triggers for an Investigation

These are a few examples of triggers for an investigation:

- You receive intelligence about a new active directory hack. Starting in the Events view, you use that intelligence to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its popularity. Starting in the Navigate view, you craft a query to look for an HTTP session using a specific user agent related to the malware that your SOC manager found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host. Starting in the Hosts view, you examine that host to find specific details.
- You are looking for the next zero day attack and start drilling into the network metadata in the Navigate view (or the Filter Events panel in the Events view) to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee who was just let go. Starting in the Users view you can filter for that username to make sure there is no longer any activity for that user and see if that user deviated from their typical behavior prior to being let go.
- A phishing attack detected has an associated attachment, and you want to know what devices in your environment have seen that file by searching for the file hash in the Files view.
- A malicious file has been automatically found in your environment, and you want to review the static and dynamic analysis done on that file along with how many systems it has been transmitted to or from. Starting in Investigate > Malware Analysis you can see the analysis results.

## Workflow of an Investigation

Analysts can investigate data captured by NetWitness, and deep dive from information on a NetWitness dashboard, the Springboard (Version 11.5 and later), a NetWitness Respond incident or alert, a report created by the NetWitness Reporting Engine, or a third-party application. During the course of an investigation, analysts can move seamlessly between views: the Navigate view, the Events view, the Legacy Events view, the Hosts view, the Files view, the Users (Entities) view, and the Malware Analysis view. By default, the Navigate view and the Legacy Events view are disabled. This figure illustrates the NetWitness Investigate submenus in Version 11.4 and earlier.



This figure illustrates the Version 11.5 menu, which is optimized for the analyst workflow with Users, Hosts, and Files moved to the top-level menu.

**Note:**
- The Files and Hosts views are available in Version 11.1 and later. Before Version 11.5, they were a submenu of Investigate.
- The Users view is available in Version 11.2 and later; in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.

The views are closely integrated to reduce the need to jump from one view to another. Each use case determines the starting point for your investigation; every situation is unique in terms of the types of information you are attempting to find. Many investigations start in one view, and end in a different view as you learn something and then need to follow that result to a different line of questioning. Experienced analysts frequently begin an investigation in the Navigate view or the Events view. Less experienced analysts can begin in the Dashboard, Respond view, or the Springboard (Version 11.5 and later), in which clickable incidents and alerts link to detailed information and analyses in the different views.

| Go to... | Focus |
| --- | --- |
| Navigate view | The Navigate view (Version 11.5 and earlier) works well for providing a high-level vantage point of what has been seen in your environment for a specific time range by showing meta keys and meta values for log, endpoint, and network events. After drilling into meta values, go to the Events view to see the raw event (See Filter Results in the Navigate View.) |

| Go to... | Focus |
| --- | --- |
| Events view | The Events view (default Investigate view) is the workflow for analysts interacting with events, presenting different facets of the same data in adjacent panels. In Version 11.6, there is no need to go to the Navigate view to drill into meta values as the Filter Events Panel in the Events view provides this functionality.<br>(See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.) |

| Go to... | Focus |
| --- | --- |
| Legacy Events view | The Legacy Events view was the original workflow for looking at event details in Version 11.0 to 11.3.x.x. The Legacy Events is replaced by the 11.4 and later Events view and it is hidden unless the administrator enables it.<br>(See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.) |

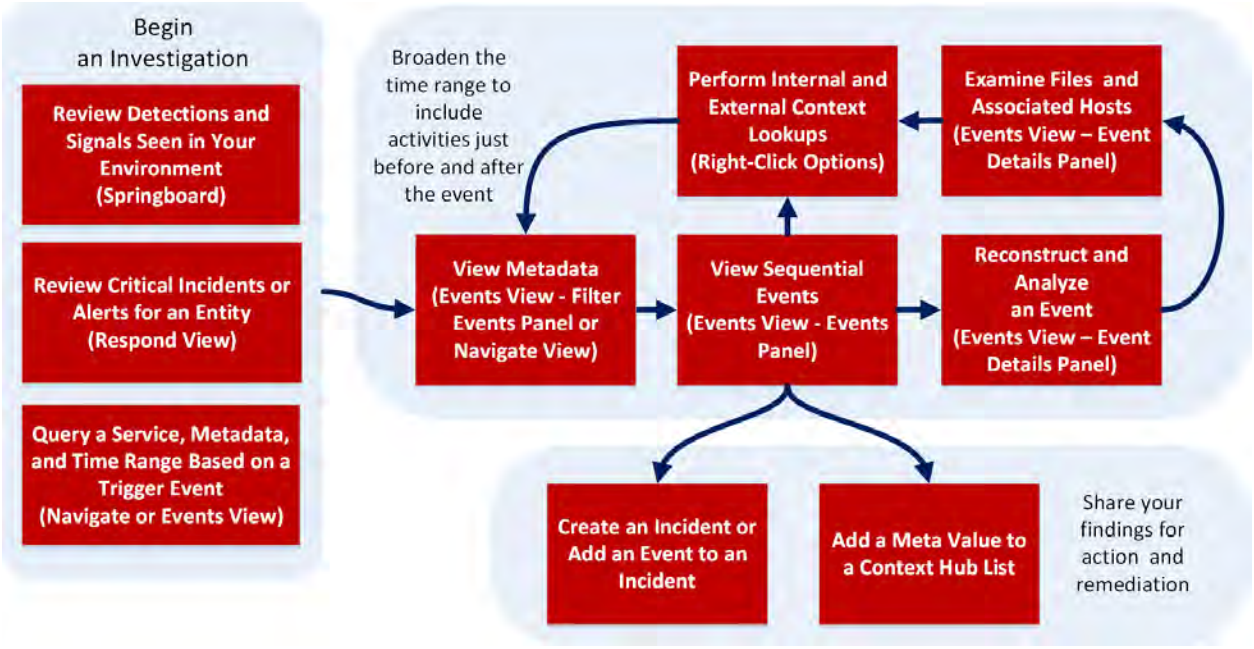
| Go to... | Focus |
| --- | --- |
| Hosts view | The Hosts view option was moved to the main menu in Version 11.5. Hosts on which the NetWitness Endpoint agents are running are listed. For every host, you can view processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See the *NetWitness Endpoint User Guide*.) |

| Go to... | Focus |
| --- | --- |
| Files view | The Files view option was moved to the main menu in Version 11.5. Unique files in your deployment, such as PE, Macho, and ELF, are listed. For each file, you can view details such as file name, reputation status, file status, risk score, signature, checksum, and others. (See the *NetWitness Endpoint User Guide*.) |
| Malware Analysis view | If you are running a Malware Analysis appliance, you can scan files and see results of four types of analysis: network, static, community, and sandbox. If a file is malware, you can go to the Hosts view to see which hosts downloaded the file. (See the *Malware Analysis User Guide*.) |

| Go to... | Focus |
| --- | --- |
| Users view | The Users view (labeled as the Entities view in Version 11.4) was moved to the main menu in Version 11.5. It provides visibility into risky user behaviors across your enterprise using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior, and a timeline during which the behaviors occurred. NetWitness Platform users assigned the Administrators or UEBA Analysts role have access to this view. (See the *NetWitness UEBA User Guide*.) |

## Focus on Metadata, Query, and Time

The following figure depicts the workflow for an investigation with focus on metadata, a query, and time range.



Analysts use Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. Beginning in the Navigate view, Events view, or Legacy Events view:

1. Start by executing a query on a service for a specific time range, filter results to get a subset of events, reconstruct or analyze an event, and repeat the process to reconstruct or analyze another event. Built-in query profiles, meta groups, and column groups provide a good starting point. For example, you can choose the RSA Email Analysis query profile to see only metadata that is useful when investigating email risks.
2. When an event bears a closer look, view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you can run another query to gain further insight, which starts again at the beginning of the workflow.
3. If you notice suspicious activity or files on a specific host in the network, gather additional information about the host and files found on the host in the Hosts and Files view, or in a standalone NetWitness Endpoint server.
4. If you find a file or event that potentially contains malware, do a Malware Analysis scan of the file or open Malware Analysis and start a scan of the service on which the event was seen.

Here is one simple use case: If there is a concern regarding suspicious traffic with certain countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses. When suspect IP addresses are identified, looking at the addresses in the Navigate view or Events view with a broader time range can provide clues about what happened before and after the event being investigated.

Another use case is to investigate an alert to discover a malicious insider in the network who is exfiltrating intellectual property or other sensitive data from a specific IP address. The investigation begins with this meta value: `Upload without change request followed by download alert`. Start in the Navigate view or Events view by filtering the values to the IP address during the time range in which the alert was generated. Alerts metadata shows risk indicators as meta values, and you can click on different meta values to filter the events list and then reconstruct the event. Next extract files and examine the files to understand what happened. With this information, you can filter on the same IP address and broaden the time range to see activities before and after the event.

### Focus on Respond View Incidents and Alerts

An analyst who is working on an incident or an alert in Respond can open the incident in Investigate to do a deeper analysis of the event or alert.

- The workflow to respond to an incident typically begins in the Respond view, where the analyst who is investigating an incident needs to gather intelligence about the incident in Investigate. Hover over an underlined entity in an incident or alert, such as an IP address, and select the action **Pivot to Investigate**. The Events view opens and is filtered for the selected entity. Defined meta keys are queried and the captured packets, logs, and endpoint events are displayed in the Events view.
- If you find events that are relevant to the incident, add the events to the incident in Respond. You can also create a new incident in Respond based on one or more events found in Investigate.
- From the Incident Details view Indicators panel in Respond, open the Events view to get a better understanding of an indicator event.

## NetWitness Investigate Views

This section provides a brief description and example of the Navigate view, Events view, and Legacy Events view, as well as the context information, event details and reconstructions available in those views. Refer to the *Malware Analysis User Guide* for information about features and functions of the Malware Analysis view.

### Navigate View

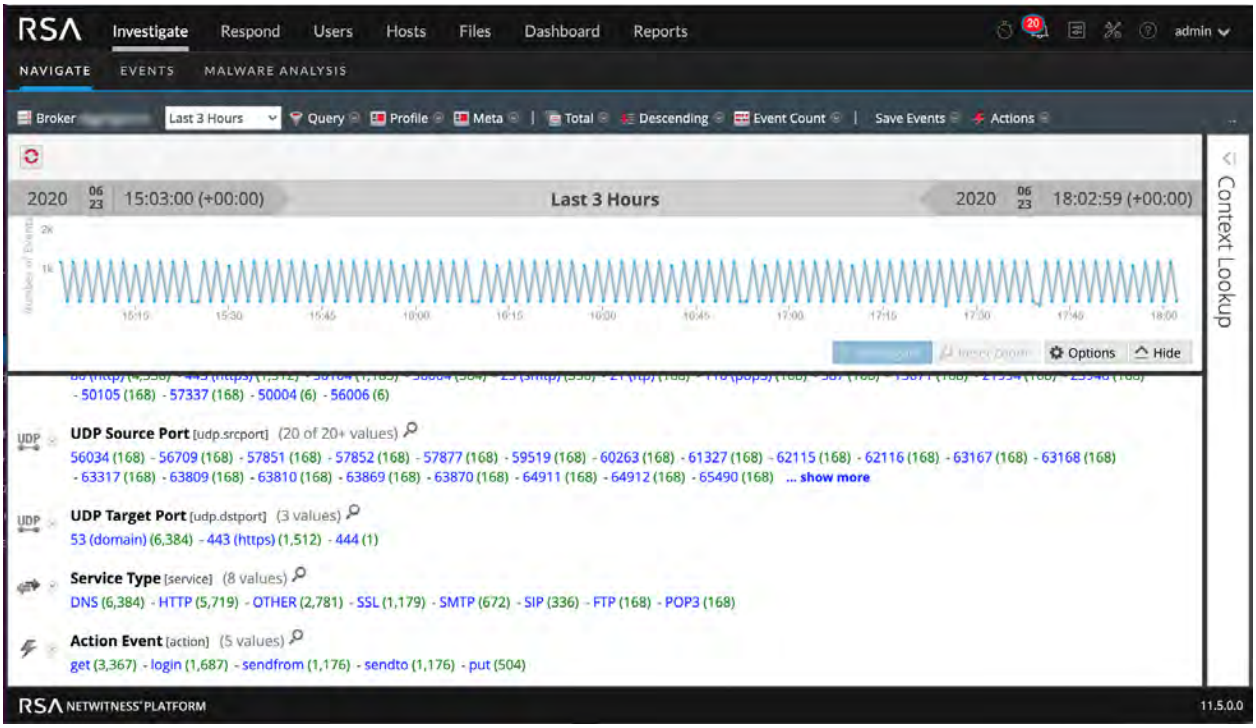
**Note:** By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

The Navigate view provides the capability to drill into and query metadata for network, logs, and endpoint events on a Broker, Concentrator, or Decoder (though investigating a Decoder is not typical). For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The Navigate view also provides a sequential visualization of the data in a timeline. This figure illustrates the Navigate view.

- Each meta key listed displays the top 20 values based on how many events have those values.
- Drilling into the meta values by successive left or right clicking of values applies each clicked value as an additional filter to your query. As you drill, the subset of metadata seen grows smaller based on

the filters you have applied. For example, if you filter to only show HTTP (service=80), all the remaining metadata presented will be what is contained inside those HTTP events.

- With a smaller set of refined results, you can go to the Events view to examine further event details, or perform other lookups inside or outside the platform to gain further insight.



## Events View

The Events provides the ability to view events sequentially, analyze raw event data and metadata, and (in Version 11.5) drill into metatdata as you can in the Navigate view.

- **In the Events panel**, Network, endpoint, and log events are listed in order by time. You can view the raw event, filter, sort, search, look at details and reconstructions, and download events. Clicking an event opens the Event Details panel for the event. Different reconstructions are available in the Events view (packets, text, files, email, and web) with helpful cues to identify points of interest, such as interesting bytes, file types, and encoded data.

- **In the Event Meta panel**, you can view related metadata for an event that is open in the Event Details panel. Analysts reviewing the metadata can change the order of the metadata to better track down what they are looking for. The items in the list of metadata can be grouped by the sequence they were generated or alphabetically.
- **In the Filter Events panel** (Version 11.5 beta feature), you can drill into meta values for the listed events with your actions reflected in the Events panel. When the Filter Events panel is expanded to the full width of the browser, you can drill into meta values to hunt for specific information before

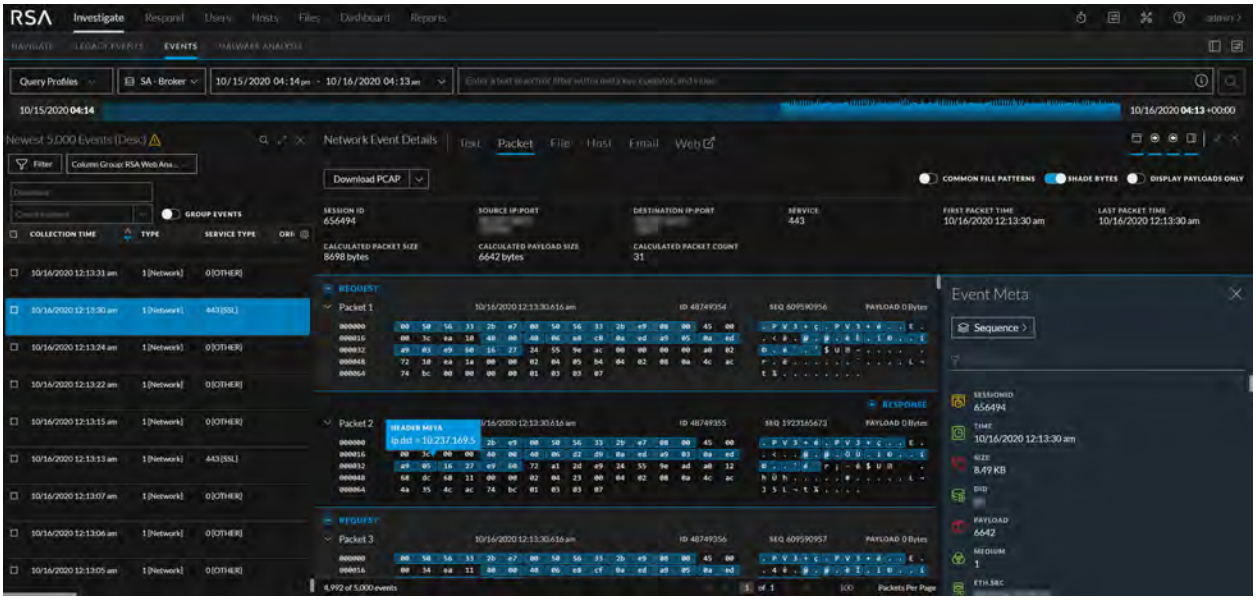
listing the events in the Events panel (comparable functionality to drilling into data in the Navigate view).
(Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

- **In the Event Details panel**, you can view details of a network, log, or endpoint event and safely reconstruct an event in a format similar to the original format. The tabs are Text, Packet, Files, Hosts, Users, Email, and Web.
- From various points in the Events view, you can pivot to standalone Endpoint, look up in Live, and do other internal lookups. External lookups allow you to search the internet for meta values with which you interacted, determine passive DNS information related to an IP address, check if a URL is blacklisted, and other third-party context integrations.
- (Version 11.5) If network data is enriched with endpoint data from an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility, host information for network events is also displayed in the Events view in the header and in the Hosts tab.

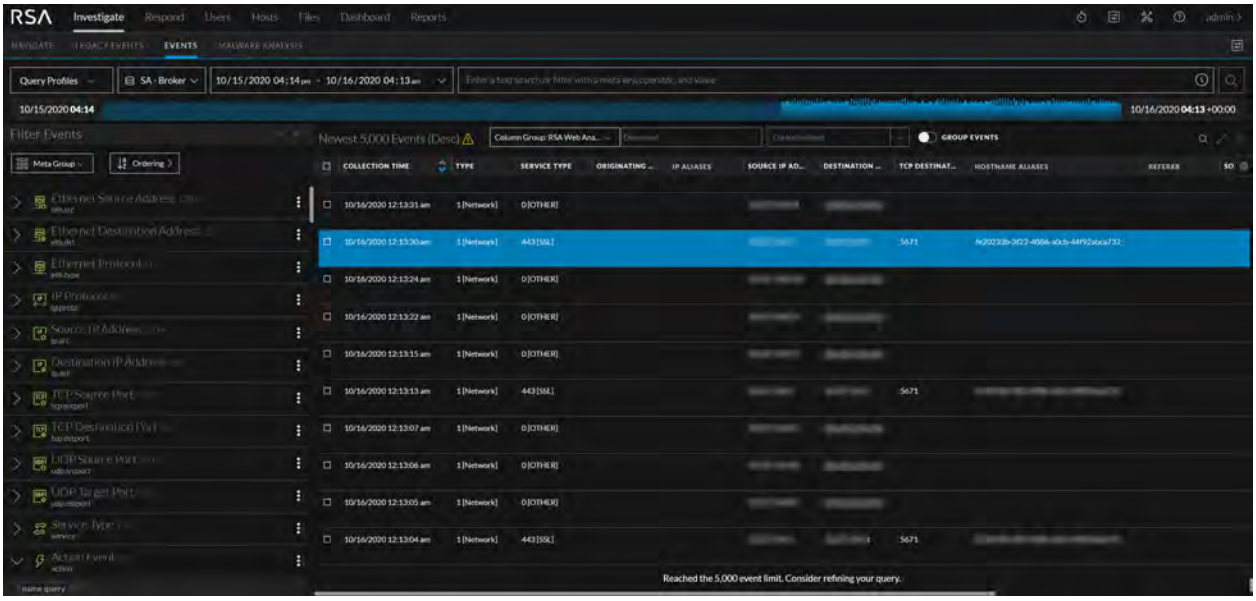
  **Note:** For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for RSA NetWitness Platform*.

- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, Threat Intelligence, and other sources where the value was mentioned.
- You can export different types of data. When viewing files, you can export files in a zip archive to your local file system. When viewing email reconstructions, you can download attachments. You can download logs from the text reconstruction, and export packets from the packet reconstruction. You can download multiple events from the Events list.
- (Version 11.6) To view the download jobs, click . Unlike the icon in the **Legacy Events** and **Navigate** page, it does not open the Jobs tray. It opens the Jobs page where all jobs are listed. To display the Jobs tray, go to **Investigate** > **Navigate** (Version 11.5 and earlier) or **Investigate** > **Legacy Events** (Version 11.3 and earlier), and click the (Jobs) icon.

This figure is an example of the Events view with a network event selected in the Events list, analyzed in the middle panel, and related metadata in the right panel.



This figure illustrates the Events view with the Filter Events panel open on the left side to filter the results set by drilling into meta values.

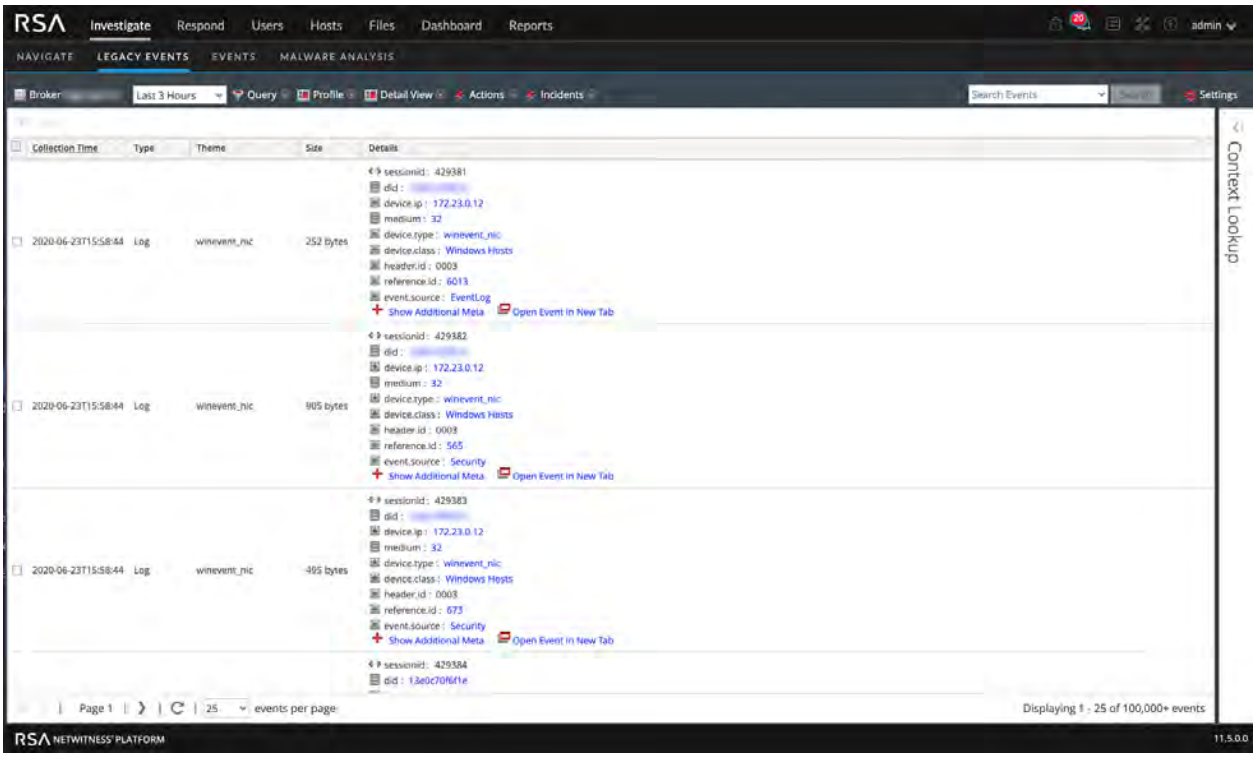


## Legacy Events View

The Legacy Events view was the original user interface for analysts examining raw event data (11.0 to 11.3.x.x). The Legacy Events view is no longer needed in Version 11.4; it is hidden unless the administrator enables it as described under "Configure Investigation Settings" in the *System Configuration Guide*. When the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar. The Legacy Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely.

- You can open the Legacy Events view for a meta value that you see in the Navigate view.
- For analysts without sufficient privilege to navigate a service, the Legacy Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Core service without having to drill down through metadata first.
- The Legacy Events view presents event information in three standard forms, a simple list of events, a detailed listing of events, and a log view.
- For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- You can export events and associated files, and create an incident from an event.

This figure illustrates the Legacy Events view.



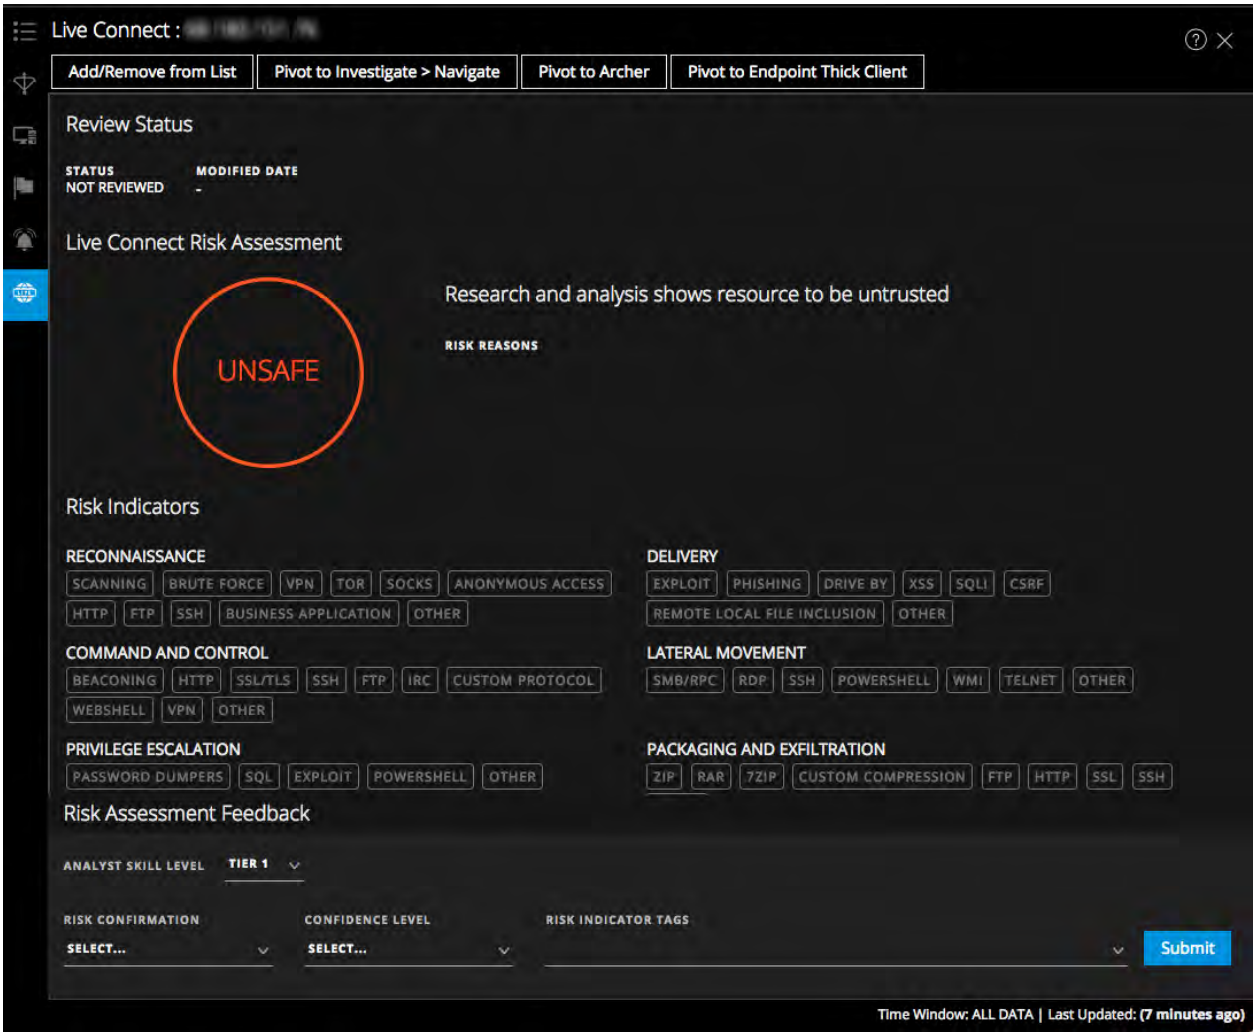
## Contextual Information for an Event

In the Navigate view, Events view, and Legacy Events view, the Context Lookup panel shows details about elements associated with an event in the Context Hub for these meta types: IP Address, User, Host, Domain, MAC Address, Filename, and File hash. In addition, you can right-click all meta keys except time to see additional context.

You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, NetWitness Endpoint IIOCs, and STIX data sources (namely File, TAXII Server, and REST Server). (See Look Up Additional Context for Results.)

**Note:** Archer assets and active directory details are available in the Events view context lookup. Endpoint context lookup is available for NetWitness Endpoint 4.4.0.2 or later hosts, but not for the NetWitness Endpoint 11.1 or later hosts.

The following figure shows the Context Lookup panel, which opens to the right of the Events panel in the Events view.



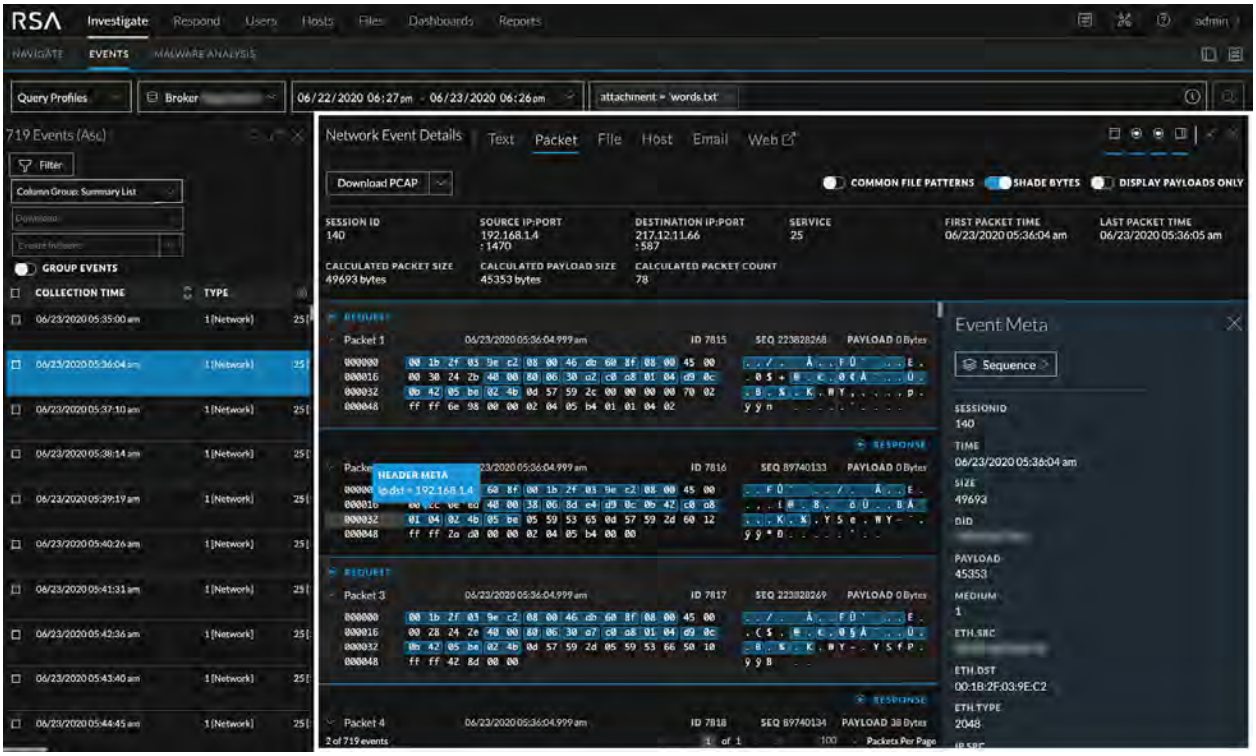
The following figure shows the Context Lookup panel, which opens to the right of the Events list in the Legacy Events view.

## Reconstruction and Event Analysis

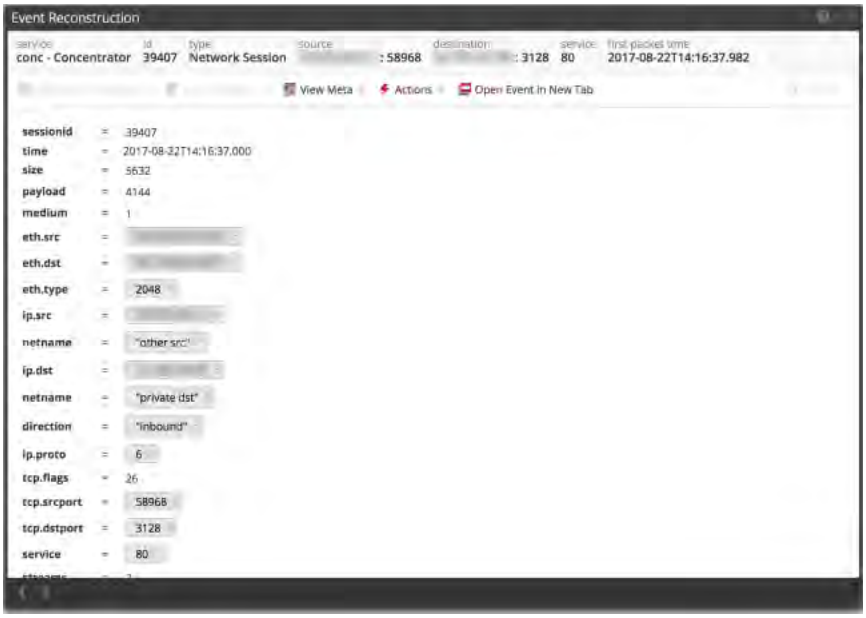
When you discover an event that merits additional investigation, you can analyze it in a form that best suits the content of event. Some forms of analysis involve safely reconstructing the event in a form similar to its native form, for example, packets, text, email, and web content. The rendering of events restricts the use of dynamic or active code that may be contained in the event to limit adverse outcome to your system or browser. Using cache improves performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

Some network events are enriched with host data if you have an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility. For such an event, you can view the host details.

The Events view gives you the ability to interactively analyze an event, looking at raw data, meta keys, meta values. This figure is an example of a network event rendered as packets in the Events view.



The Event Reconstruction in the Legacy Events view presents the raw data and the meta keys and meta values for an event in a list form. This figure is an example of the Event Reconstruction.



# Configuring NetWitness Investigate Views and Preferences

Analysts can configure some aspects of NetWitness Investigate views and behavior. You can customize the way that Investigate views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in the *System Security and User Management Guide*.

These topics provide details:

- Configure the Navigate View and Legacy Events View
- Configure the Events View

# Configure the Navigate View and Legacy Events View

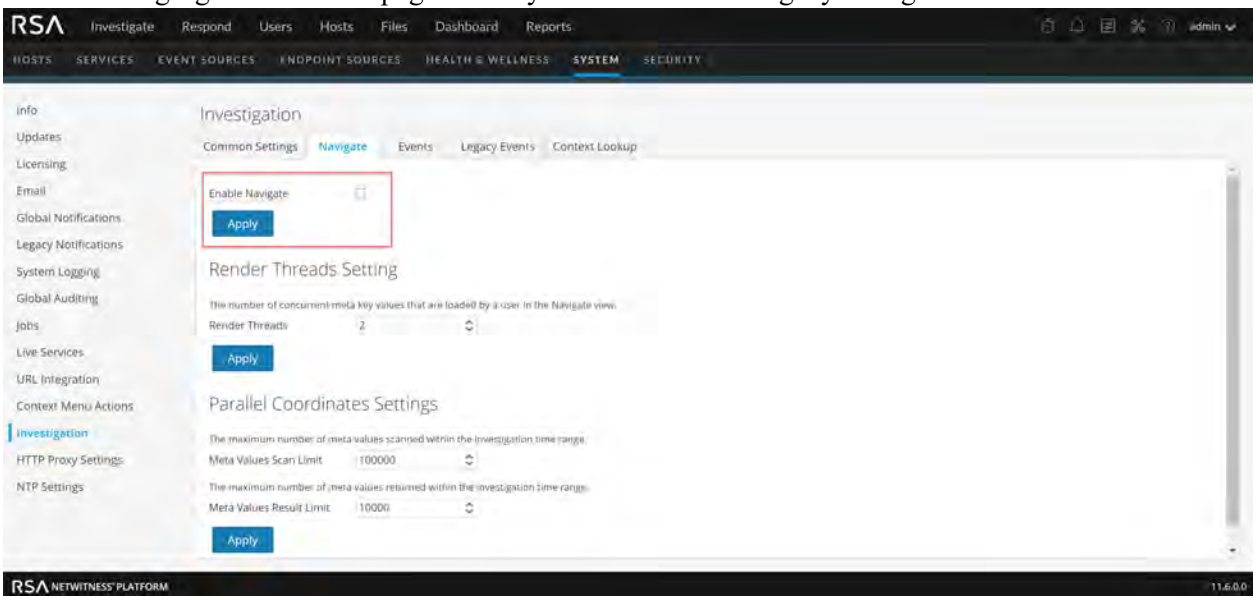
Analysts can set preferences that affect performance and behavior of NetWitness when using the Navigate view and Legacy Events view. Some of the same settings are available in two places in NetWitness, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog for the Navigate view and the Legacy Events view.
- Profiles > Preferences panel > Investigation tab.
- Navigate view and Legacy Events view Search Options drop-down.

By default, the legacy Navigate view is disabled. To enable the Navigate tab in Investigate:

1. Go to (Admin) > **System** > **Investigation** > **Navigate**.
2. Select the **Enable Navigate** checkbox.
3. Click **Apply**.

The following figure shows the page where you can enable the legacy Navigate view.



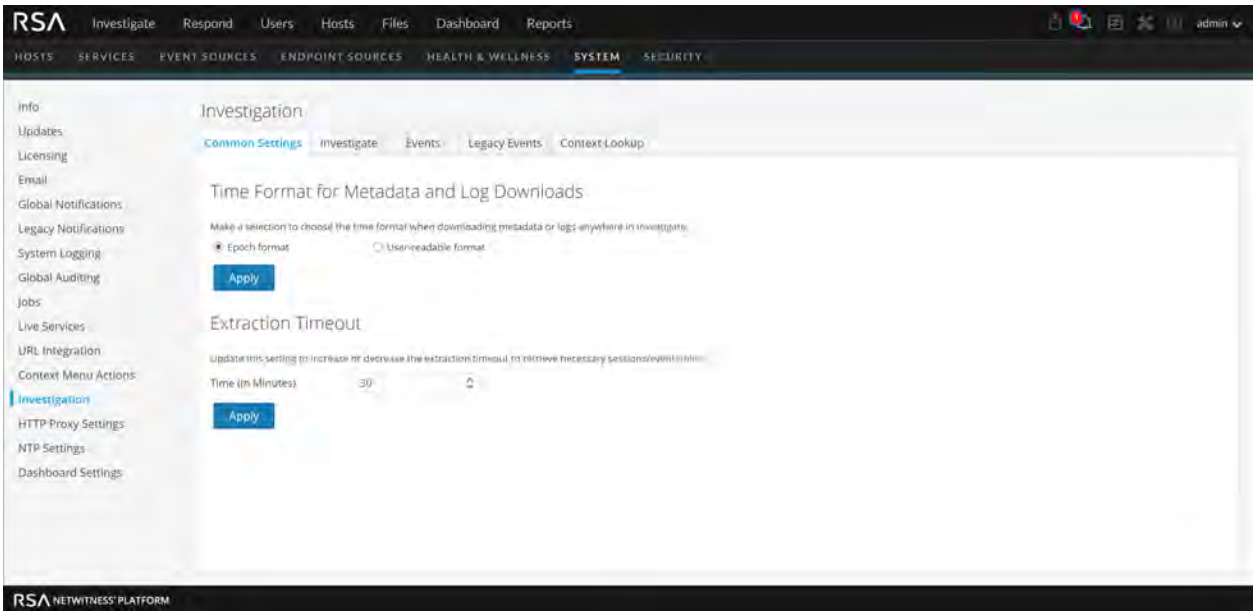
## Configure Common Settings

In version 11.5 and later, the Common Settings tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. You can set the time format used when downloading metadata and logs, and extraction timeout settings.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.5 Investigate views.

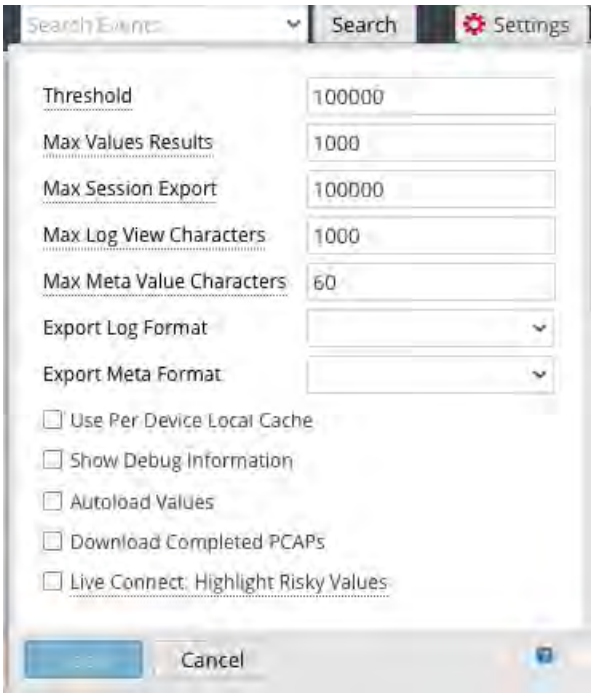
Go to **(Admin) > System**, and in the options panel, select **Investigation**.
The Investigation Configuration panel is displayed.



## Access the Navigate View and Legacy Events View Settings

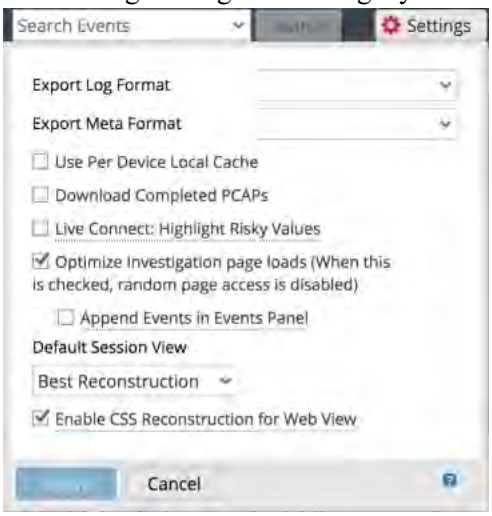
To access the settings, do one of the following:

- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



**Note:** Version 11.0 included a setting to Append Events in Events Panel, which was moved to the Events view settings panel in Version 11.1.

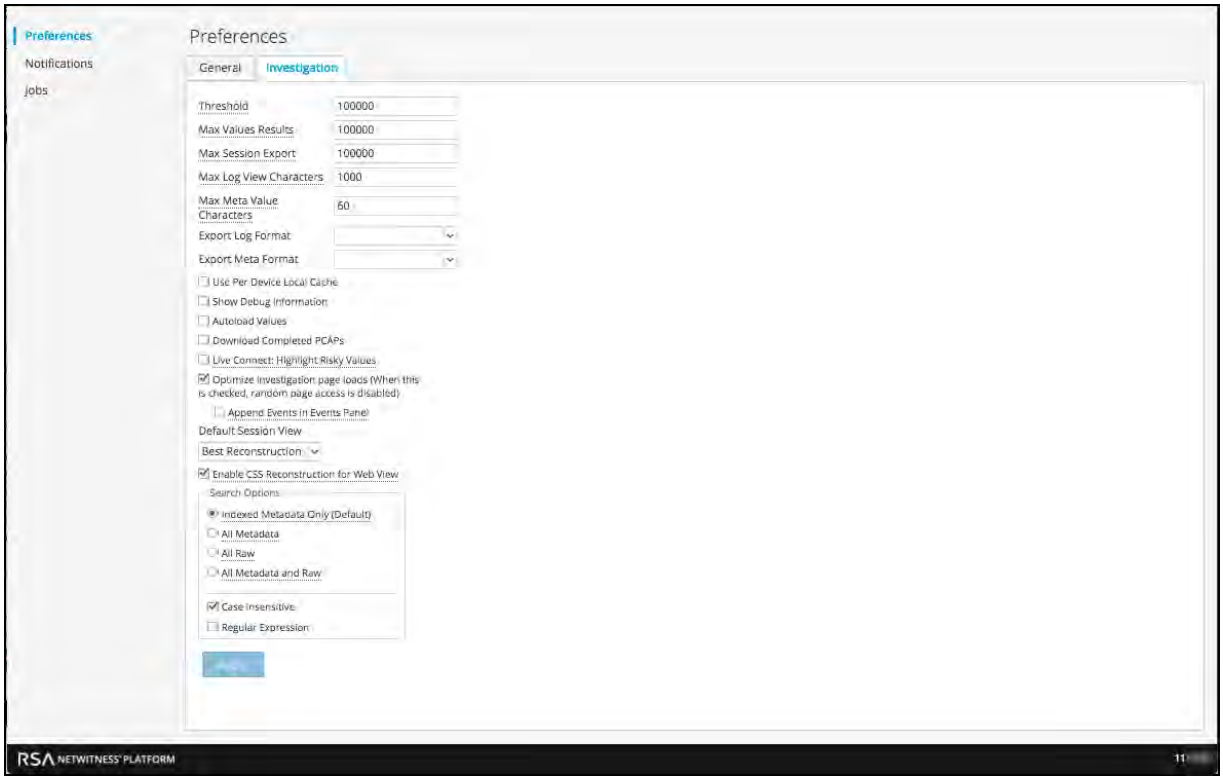
- In the **Legacy Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Legacy Events view is displayed.



**Note:** Version 11.1 and later includes the Append Events in Events Panel setting.

- In the top right corner of NetWitness, go to > , Profile, and in the **Preferences** panel click the **Investigation** tab.

The Investigation panel is displayed. The figure below illustrates the Investigation panel.



## Calibrate Navigate View Value Loading Parameters

Several settings influence the performance of NetWitness when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:
   - **Threshold:** Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
   - **Max Values Results:** Set the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
   - **Max Session Export:** Specify the number of events that can be exported in a single PCAP or Log file.
   - **Max Log View Characters:** Set the maximum number of characters to be displayed on **Investigate > Events > Log Text**. The default value is **1000**.
   - **Max Meta Value characters:** Set the maximum number of characters in a meta value name displayed in the Navigate view Values panel. The default value is **60**.

- **Show Debug Information:** If you want NetWitness to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
- **Append Events in Events Panel:** This option affects paging in the Events view and is described below under "Calibrate Events View Retrieval and Default Reconstruction."
- **Autoload Values:** If you want NetWitness to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.

3. Click **Apply**.
   The settings become effective immediately and are visible the next time you load values.

## Configure Navigate View and Legacy Events View Parameters

Several settings influence the performance of NetWitness when loading values in the Navigate view and the Legacy Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. You can set these parameters separately in the Navigate view and the Legacy Events view. When configured in one view, the setting does not automatically apply to the other view. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or the Legacy Events view.
2. Adjust the following parameters:
   - **Live Connect: Highlight Risky Values:** If you want NetWitness to highlight and display only IP addresses that are considered as risky by RSA community, check this option. When not selected, NetWitness displays all IP addresses. By default, this option is not selected (**Off**).
   - **Use Per Device Local Cache:** You can specify the use of locally cached data from the selected service. By default, this option is not selected **(Off)**. When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
   - **Download Completed PCAPs:** You can automate the downloading of extracted PCAPs in the Navigate view and Legacy Events view so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark. By default, this option is not selected (**Off**). If you are going to enable this option, ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.
   - **Live Connect: Highlight Risky Values:** If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
3. Click **Apply**.
   The settings become effective immediately.

## Configure the Default Log Export Format

You can export logs from the Navigate view and the Legacy Events view as Text, XML, comma-separated values (CSV), and JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of logs. To select the format for exported logs:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Events view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

## Configure the Default Meta Value Export Format

You can export meta values from the Navigate view and Legacy Events view as Text, CSV, tab-separated values (TSV), and JSON. There is no built-in default value for the meta value export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of meta values. To select the format for exported meta values:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Eventsview.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

**Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.

## Calibrate Legacy Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness retrieves events and reconstructs events in the Legacy Events view. To adjust these paramaters:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Legacy Events view.
2. Configure the following parameters.
   - **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible,and you cannot go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
   - **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Legacy Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.

3. Go to the **Preferences** panel > **Investigation** tab, or to the **Settings** dialog for the Navigate view (11.1) or the Legacy Events view (11.2 and later), and set the **Append Events in Events Panel** option. When this option is selected, the events displayed in the Events Panel are added incrementally. For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the **Optimize Investigation Page Loads** option is enabled.
4. To activate the changes immediately, click **Apply**.

## Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes CSS styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

**Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically through the client side javascript is not rendered in the reconstruction because all client side javascript is removed for security purposes.

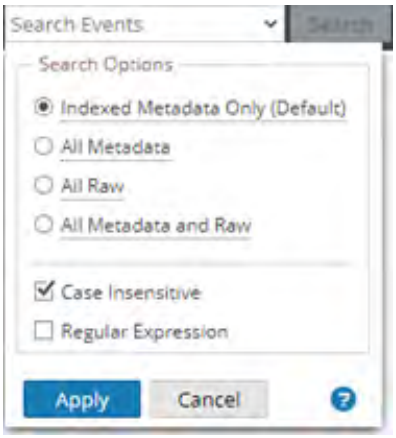
To enable or disable this option:

1. Go to the **Preferences** panel > **Investigation** tab.
2. Select the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

## Configure Search Options

You can configure search options to apply when you type a search string in the Search field. Edit the Search Options in the Profile > Preferences panel > Investigation tab or in the Navigate and Legacy Events view Search Options drop-down menu. To configure search options:

1. Go to the Search Options.
   The following figure illustrates the Search Options drop-down menu for Version 11.2 and later.



2. Select one or more search options to apply to the search. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information about each option.
3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

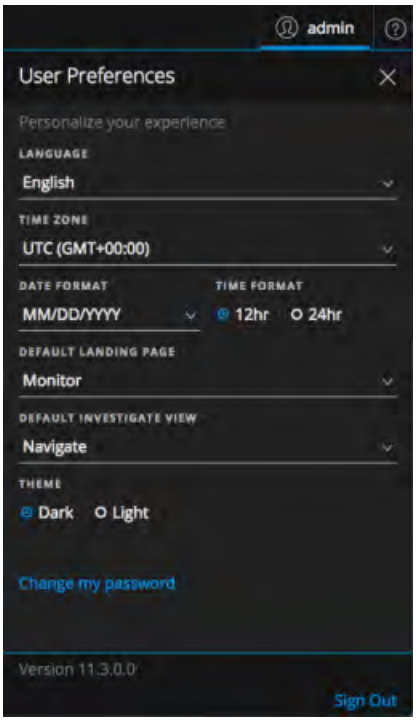
# Configure the Events View

**Note:** The information in this topic applies to NetWitness Version 11.1 and later.

Analysts can set preferences that affect the behavior of NetWitness when using the Investigate > Events view. If the Events view is open; these two buttons give access to preferences dialogs: and . The User menu ( ) is focused on global user preferences such as time zone, while the Events preferences menu ( ) is focused on user preferences for behavior in the Events view. The rest of this section describes both sets of preferences.

## Set the Default Investigate View

You can select the default view when you open Investigate: Navigate view, Events view, Hosts view, Files view, Entities view, or Malware Analysis view. The default Investigate view is set in the global User Preferences dialog (in the upper right corner of the NetWitness browser window, select ). The global user preferences are described in detail in the *NetWitness Platform Getting Started Guide*.

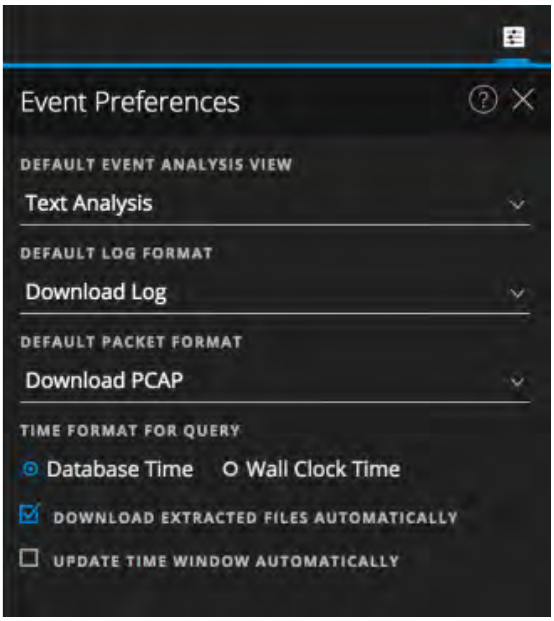


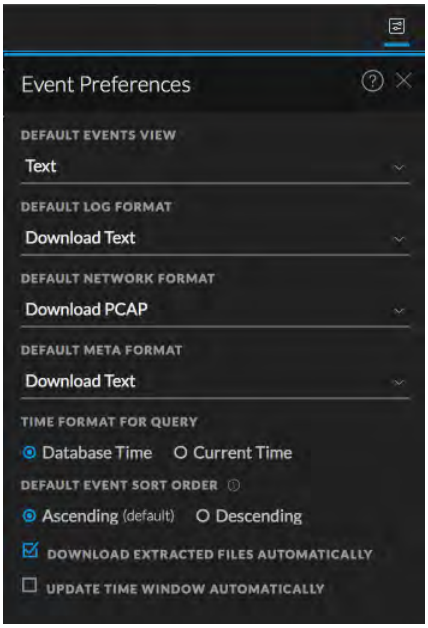
## Set User Preferences for the Events View

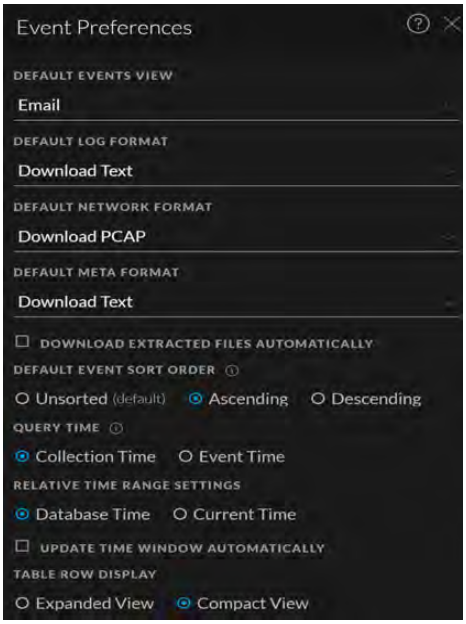
You can set your own preferences relevant to the Events view. The preferences selected persist per user and are available whenever the specific user logs in to the application.

To set default values for working in the Events view:

1. In the **Events** view, click .
   The Event Preferences dialog is displayed. Different versions of the dialog have some differences in labeling and available options as shown in the following figures. The first two figures are examples of the Version 11.3 and 11.4 dialogs respectively, and the third figure shows the dialog for Version 11.6.







2. In the **Default Events View** field, select the default reconstruction type when you open an event in the Events panel: **Text**, **Packet**, **File**, (Version 11.5 and Later) **Host** or **Email** .
   If you have not selected a default analysis type, when you open an event, the default reconstruction type is the Packet analysis, except for log and endpoint events, which open to the Text analysis. If you select a default reconstruction type, the reconstruction type is the default reconstruction that you specified. In both cases, the default is the starting point, and if you change the type while you are working, the type you choose is used for the next reconstruction.
3. In the **Default Log Format** field, select the download format for exporting logs: **Download Log** (11.3) or **Download Text** (11.4), **Download XML**, **Download CSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**. These options are also available at the time of download in a drop-down menu.
4. In the **Default Packet Format** (11.3) or **Default Network Format** (11.4) field, select the default format for downloading packets. If you do not select a format here, the default download format is **Download PCAP**. These options are also available at the time of download in a drop-down menu:
   - **Download PCAP** to download the entire event as a packet capture (*.pcap) file
   - **Download All Payloads** (11.3) or **Download Payloads** (11.4) to download the payload as a *.payload file
   - **Download Request Payload** to download the request payload as a *.payload1 file
   - **Download Response Payload** to download the response payload as a *.payload2 file
5. (Version 11.4 and later) In the **Default Meta Format** field, select the download format for exporting metadata: **Download Text**, **Download CSV**, **Download TSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**.
6. (Version 11.5.1 and later) To change the preference for the time that is matched when you submit queries, select an option in the **Query Time** field.
   - When **Collection Time** is selected, the time of an event reflects when it was received and stored into the system. This is the default setting.
   - When **Event Time** is selected, the time of an event reflects the time at which the event actually occurred. A good case for using the event time is when investigating logs or endpoints and looking for events that occurred around the same time. Using Event Time filters out all network events.

   **Note:** By default, the time range for a query is based on the time that the Decoder consumed the event, which is always not the same time that the event occured. To see the actual event time instead of the collection time in the Events view, select Event Time.

   **Note:** When you query with the event time preference enabled, you must use the collection time column and time zone column. This is to help you differentiate if the events are listed in a sequential order or not. This scenario occurs because there is no global standard to follow while logging the event times, which results in different events from different sources being in different time zones.
7. (Version 11.5.1 and later) Under **Relative Time Range Settings**, choose either **Database Time** or **Current Time**. The Events view can display results based on the relative time range, Last 2 hours or Last 30 Days, for example. The time range can be relative to the time when the event was received

and stored into the system or the current time zone's clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.

- When **Database Time** is selected, the time range is relative to the time of the last stored event.
- When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the time range is relative to the current time in the timezone set in user preferences.

**Note:** (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users.

8. (Version 11.4 and 11.5) Under **Time Format for Query**, choose either **Database Time** or **Current Time**. The Events view can display results based on the database time or the current clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.
   - When **Database Time** is selected, the end time for a query is based on the time that the event was stored.
   - When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the query is executed with the current time in accordance with the timezone set in user preferences.
9. (Version 11.4 and later) To set the sort sequence by collection time for the events listed in the Events panel, select one option under **Default Event Sort Order**. After you have selected a preference, you can also interact with the table column headers to request the results again sorted differently as described in Use Columns and Column Groups in the Events List.
   - **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
   - **Ascending** (default for Version 11.4 and earlier): To put the events with the earliest collection time first in the list. The oldest events are displayed first if in ascending order.
   - **Descending**: To put the events with the latest collection time first in the list. The newest events are displayed first if in descending order. When investigating logs, you may want to change the sort sequence to see the latest collection time first.
     If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. When Unsorted is selected, the oldest portion of events is matched and then listed unsorted. if you changed the sort order preference after events were loaded, you must refresh the view to apply the new sort order.
10. If you want all extracted files to be downloaded automatically, select the **Download extracted files automatically** checkbox. You can go to the Jobs queue to view the extracted files.

11. (Version 11.3 and later) To automatically update the time range window in the query bar when the service is polled (at one minute intervals) and sends fresh results, select the **Update Time Window Automatically** checkbox. When the time range is updated, the (Submit Query) button is activated and you can submit a query to get fresh results. To keep the time range window in the query bar synchronized with the current results, clear the checkbox (this is the default value
12. (Version 11.6 and later) If you have multiple rows of data and want to word wrap or unwrap the content of an event , choose either **Compact View** or **Expanded View**. Based on the selection you make the rows will appear compact or expanded.

# Beginning an Investigation

Based on the question you are attempting to answer, NetWitness Investigate offers different starting points: Navigate view (Version 11.5 and earlier), Events view, Legacy Events view (Version 11.3 and earlier), Hosts view, Files view, Users (Entities) view, and Malware Analysis view.

Specific user roles and permissions are required for a user to conduct investigations in NetWitness. If you cannot perform a task or see a view, the administrator may need to adjust the roles and permissions configured for you.

**Note:**
- The Files and Hosts views are available in Version 11.1 and later (refer to the *NetWitness Endpoint Quick Start Guide* and *NetWitness Endpoint User Guide* for details). Before Version 11.5, these views were submenu of Investigate.
- The Users view is available in Version 11.2 and later (refer to the *NetWitness UEBA Quick Start Guide* and the *NetWitness UEBA User Guide* for details); in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.
- The 11.4 Events view is the default view for investigating events. The default workflow for analysts interacting with events is optimized to limit the need to transition from one view to another. By combining capabilities that were previously in two distinct workflows, known as Event Analysis and Events, the analyst has a single workflow for analyzing events. With the new functionality added to the Events view, the Legacy Events view is no longer needed. By default the previous workflow is not in the Investigate menu, but an administrator can re-enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

## Focus on Metadata, Raw Events, and Event Analysis

To hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event, go to **Investigate > Navigate**, **Investigate > Events**, or **Investigate > Legacy Events**. You can investigate the metadata and raw events for a single Broker or Concentrator. In each of these views, you can execute a query and filter the results by narrowing the time range and querying metadata. These topics provide details about beginning an investigation:

- Begin an Investigation in the Events View
- Begin an Investigation in the Navigate or Legacy Events View

## Focus on Hosts and Files

To hunt for information on hosts that have the Endpoint agent running, go to **Hosts** (Version 11.5) or **Investigate > Hosts** (Version 11.4). For every host, you can see processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. To begin an investigation by looking at files in your deployment, go to **Investigate > Files**. (See the *NetWitness Endpoint User Guide* for detailed information.)

## Focus on Risky User and Entity Behavior

To discover, investigate, and monitor risky behaviors across all users and entities in your network environment, go to **Users** (Version 11.5), **Investigate > Entities** (Version 11.4), or NetWitness UEBA (User and Entity Behavior Analytics) . In versions 11.3 and earlier, the menu option is **Investigate > Users**. You can detect malicious and rogue users, pinpoint, high-risk behaviors, discover attacks, and investigate emerging security threats. (See the *NetWitness UEBA User Guide* for detailed information.)

## Focus on Scanning Files for Malware

To scan files for potential malware, or set up a continuous scan of a service, go to **Investigate > Malware Analysis**. Scan results are expressed as four types of analysis: network, static, community, and sandbox with an indicator of compromise (IOC) rating. There are several other ways to begin working in Malware Analysis:

- You can begin Malware Analysis from the Malware Analysis dashlets in the Monitor view to quickly see the riskiest potential threats.
- You can right-click a meta key in the Navigate view, and select **Scan for Malware**.

See the *Malware Analysis User Guide* for detailed information.

# Begin an Investigation in the Navigate or Legacy Events View

The Navigate view is the default view for Investigate unless you have selected a different view as your opening view. This user preference is set on the application level as described in Configuring NetWitness Investigate Views and Preferences. In the Navigate view and Legacy Events, you are hunting for events of interest based on a query. In the Navigate view you can also refine results by clicking on meta keys and meta values. When you find interesting events, you can take a closer look at the event in the other Investigate views.

To begin an investigation in the Navigate view or Legacy Events view, a service must be specified.

- Investigate opens the Navigate view or the Legacy Events view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, Investigate presents a dialog for selecting the service or collection to investigate.
- When a service is selected manually or by default in the Navigate view or Legacy Events view, you can change the service or collection to investigate by selecting the service name in the toolbar. Investigate presents the dialog for selecting the service to investigate.

**Note:** The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Legacy Events view for log exports and enhanced search capabilities.

With a service or collection selected, Investigate is ready to load data for the service or collection. It is recommended that you also select a time range so that results load faster. Several settings in the Navigate view and Legacy Events view Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring NetWitness Investigate Views and Preferences).

**Note:** In the Legacy Events view data loads automatically. If you specified Autoload Values in the Navigate view preferences, Investigate populates the data automatically. Otherwise, you must select Load Values. Investigate populates the metadata in the Navigate view Values panel and results become visible almost immediately.

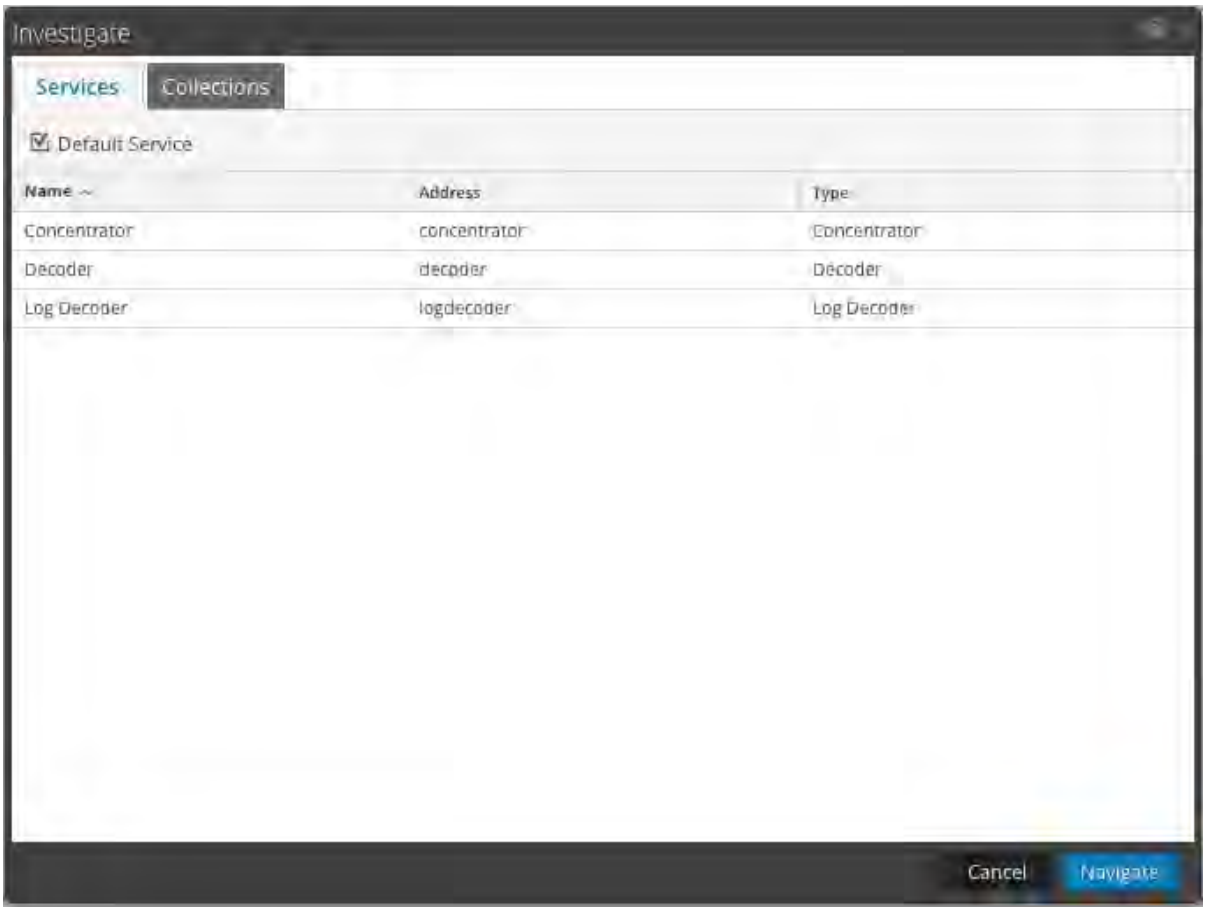
The rest of this topic provides instructions for beginning the investigation of data on a service.

**Note:** Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

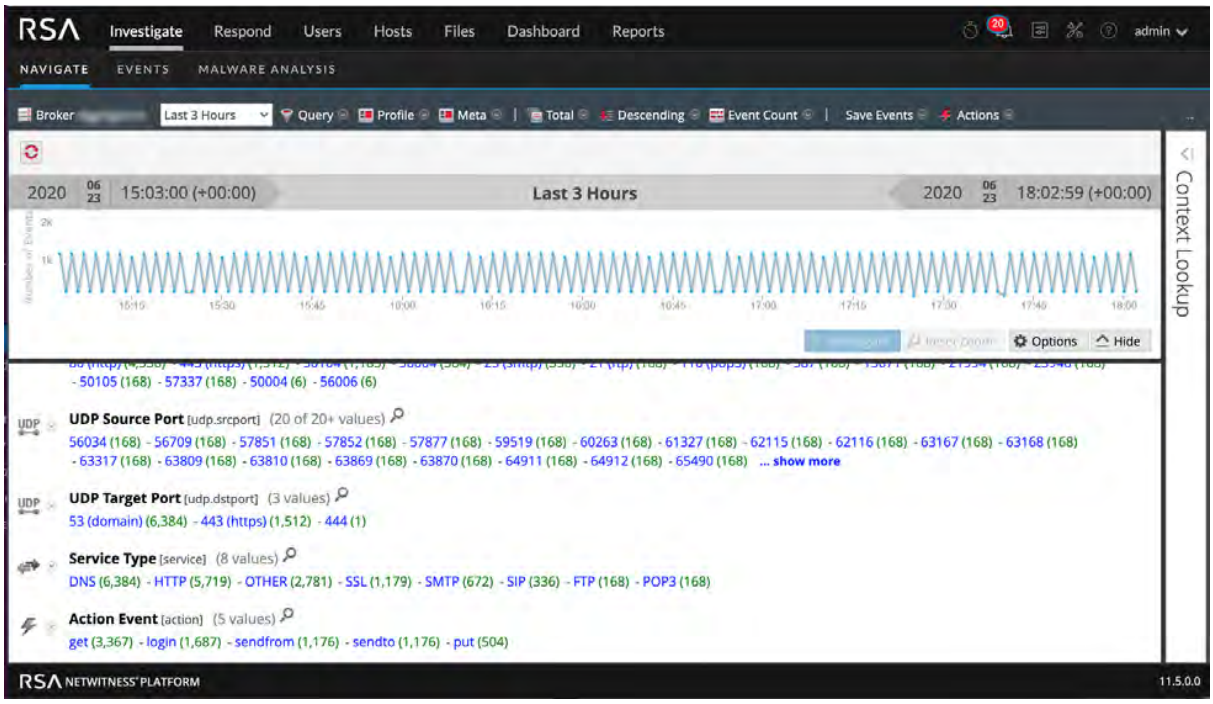
After loading data in the Navigate or the Legacy Events view, refine results, reconstruct and analyze events, then download and act upon results (see Refining the Results Set and Reconstructing and Analyzing Events and Downloading and Acting Upon Results).

## Begin an Investigation (No Default Service)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.



2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The data loads automatically in the Legacy Events view. If you are working in the Navigate view, the resulting panel displays the activity for the selected service, but the data is not loaded automatically.
3. (Recommended) Select a specific time range so that results load faster.
4. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described Refining the Results Set. You can also modify options at any time during the investigation.
5. To load data in the Navigate view, click Load Values.
   The data for the selected service begins loading.

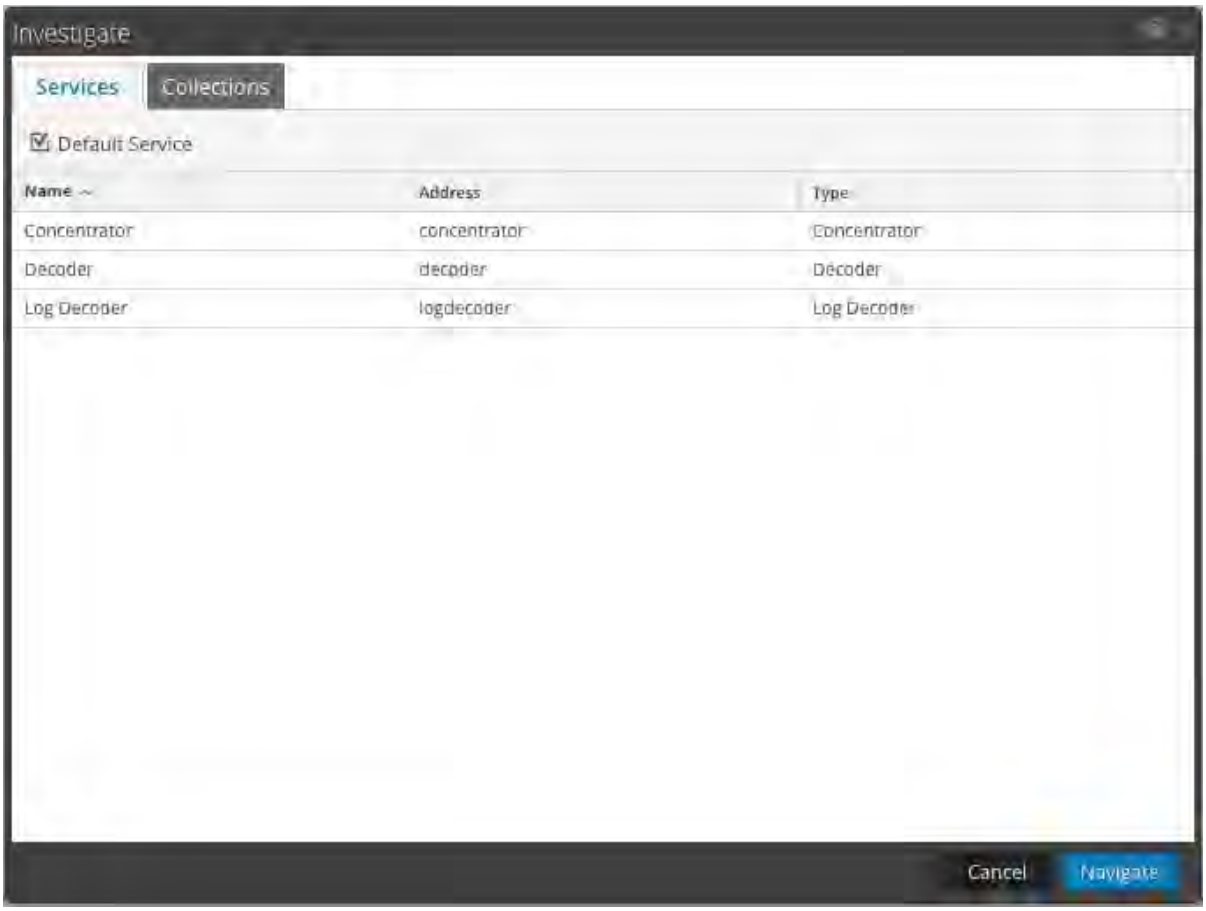


With the service selected and data loaded, you are ready to begin analyzing the data.

## Set or Clear the Default Service

You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.



2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

> **Note:** Clicking cancel does not cancel your selection of the default service. It closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and navigate to a different service.

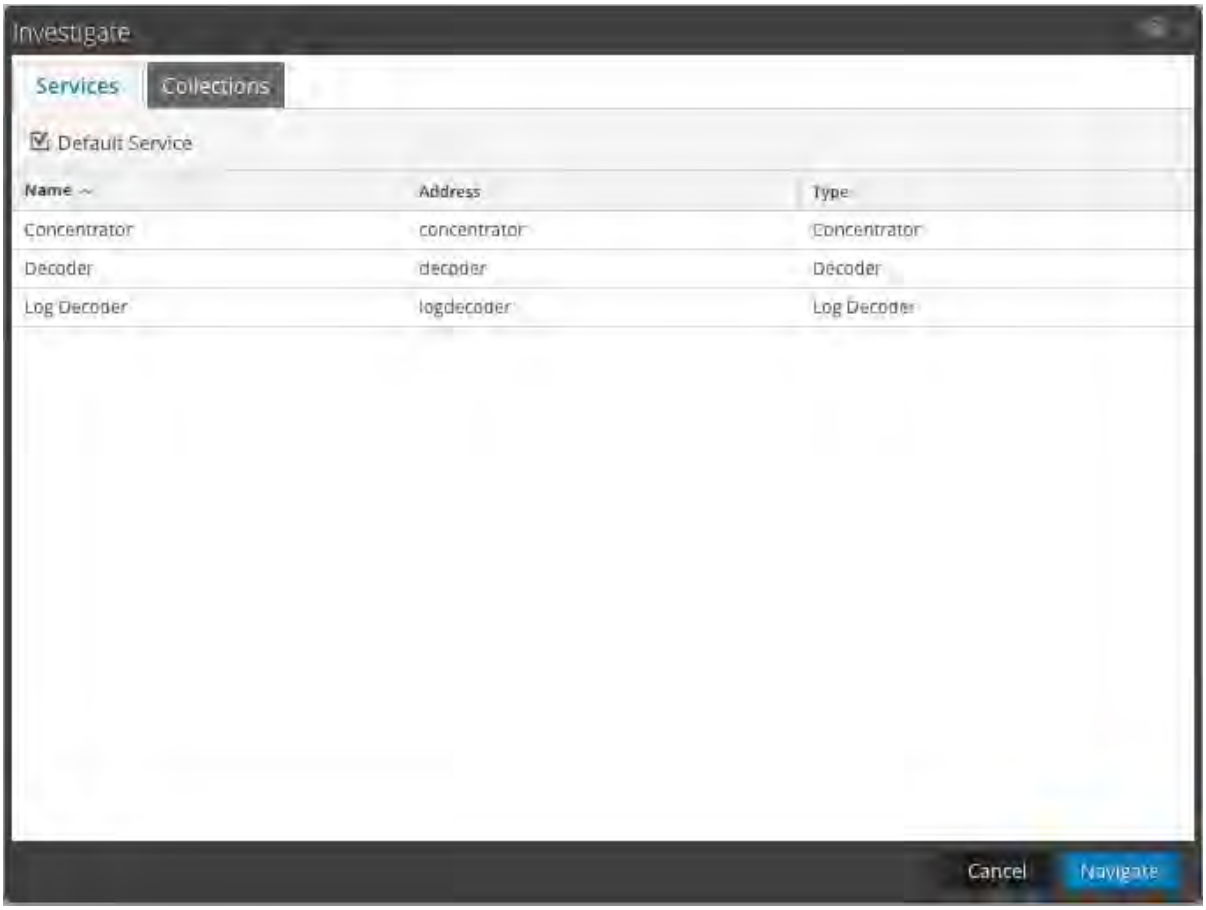
## Begin an Investigation (Default Service Specified)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3. In the Legacy Events view, the data is loaded automatically.

2. If you want to modify investigation options in the Navigate view before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options. With the service selected and data loaded you are ready to begin analyzing the data.

## Change the Service or Collection to Investigate

1. In the Navigate view or the Legacy Events view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.



2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3. Otherwise, the Navigate view is displayed with the default service selected, and data ready to load. In the Events view the data is loaded automatically.

3. When ready, click Load Values.
   The values for the service begin loading in accordance with the selected options.

   With the service selected and data loaded you are ready to begin analyzing the data.

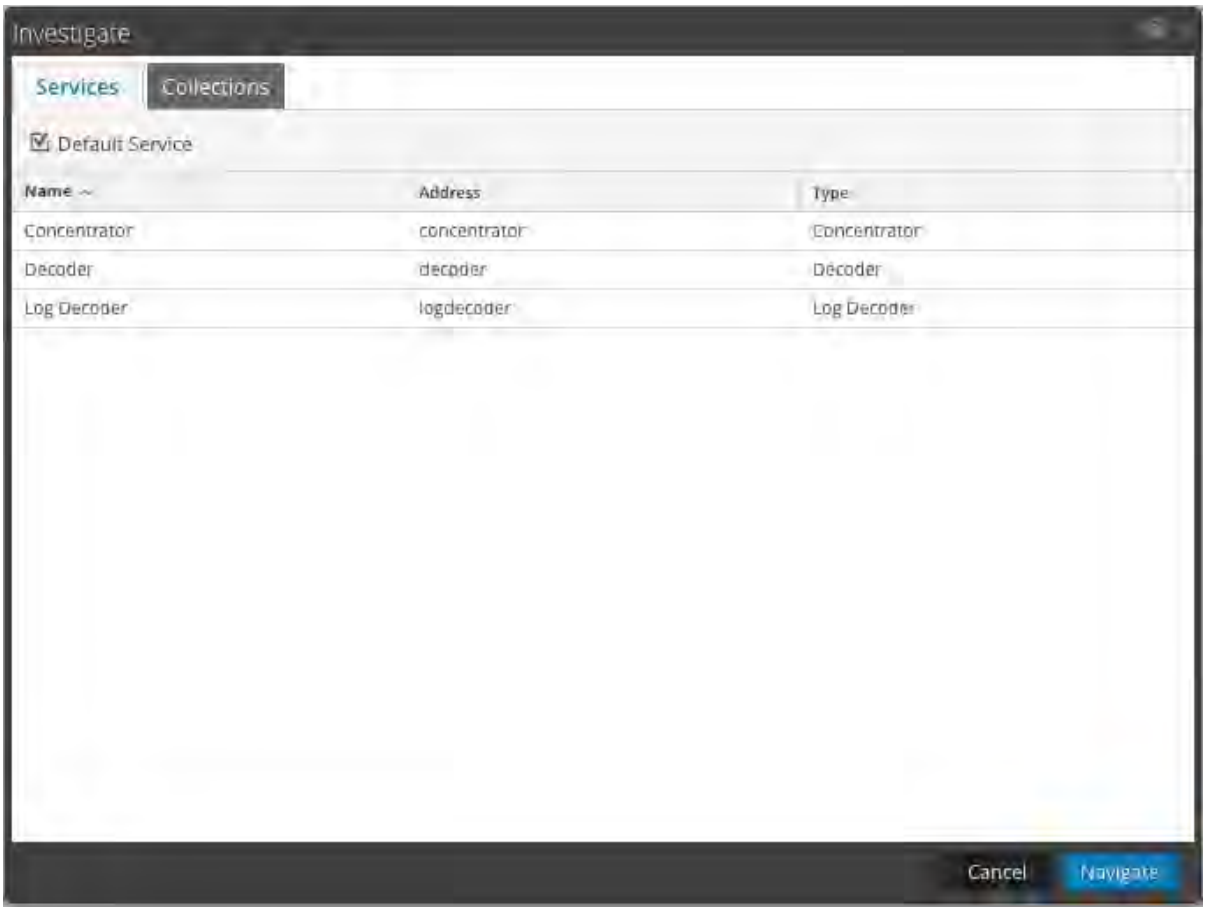
## Investigate Workbench Restoration Collections

This procedure enables administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

**Note:** Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.

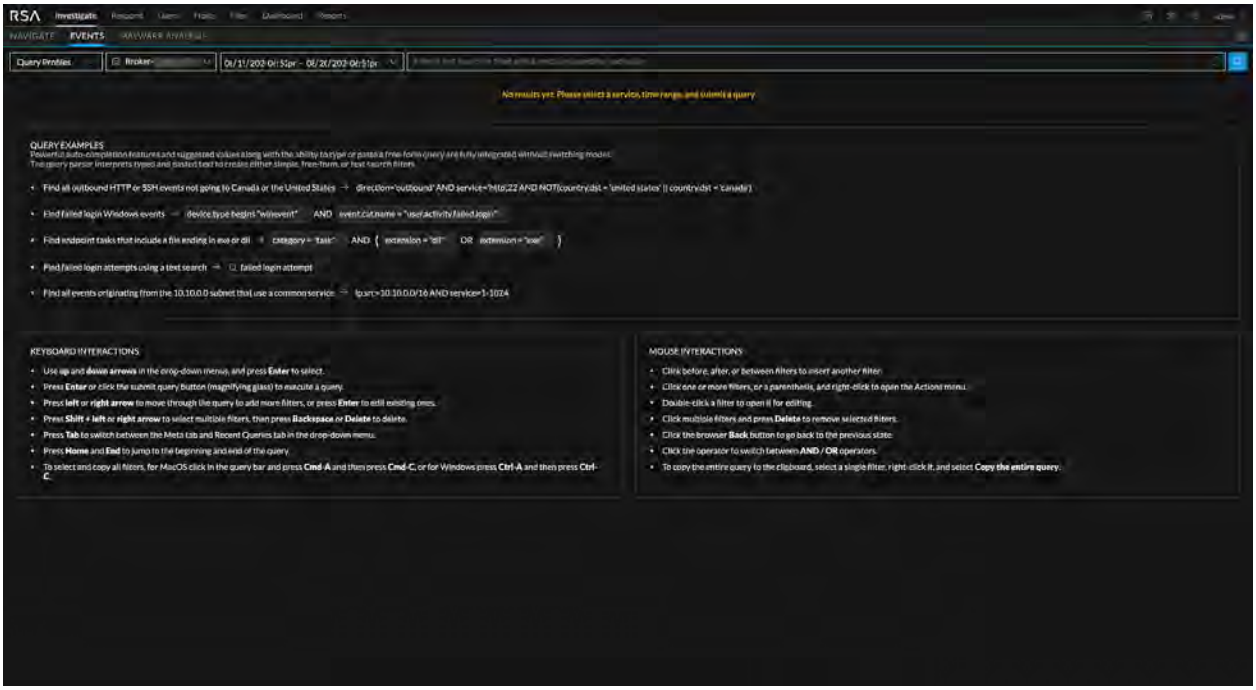


2. Select a workbench service and workbench name that you want to investigate.
3. Click **Navigate** to perform an investigation on the selected workbench service.
   Click **Cancel** to select a different workbench service to investigate.
   The Investigation view is displayed. With the collection selected and data loaded, you are ready to begin analyzing the data.

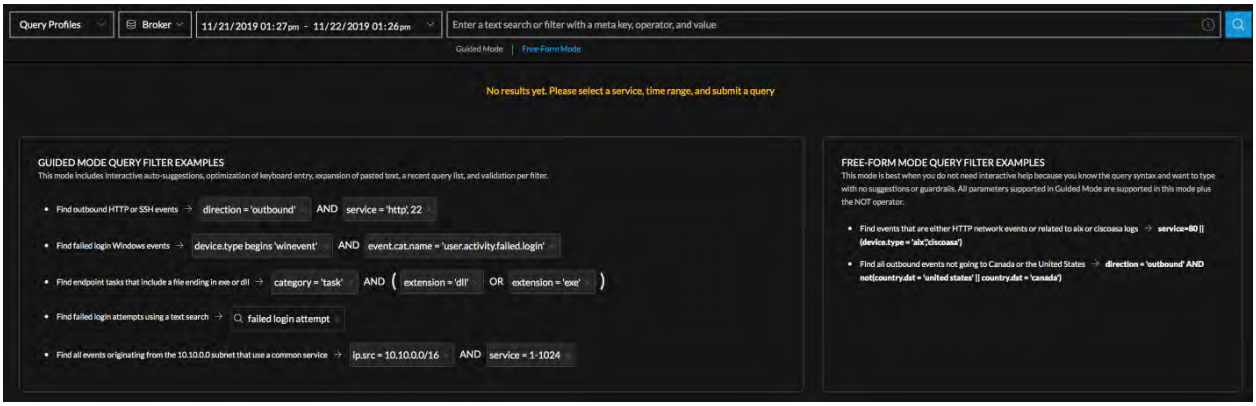
# Begin an Investigation in the Events View

The Events view offers most of the features that are available in both the Navigate view and the Legacy Events view. Similar to the Navigate view, there is a view into meta keys and meta values for logs, endpoints, and packets. Like the Legacy Events view, an events list shows events listed in the order by time, and you can view the raw event, related metadata, and a reconstruction of an event. The Event reconstruction has some helpful cues to identify points of interest. See Reconstructing and Analyzing Events.

The following figure shows the initial Events view with some examples of queries and information about keyboard and mouse interaction. This figure depicts the initial view.



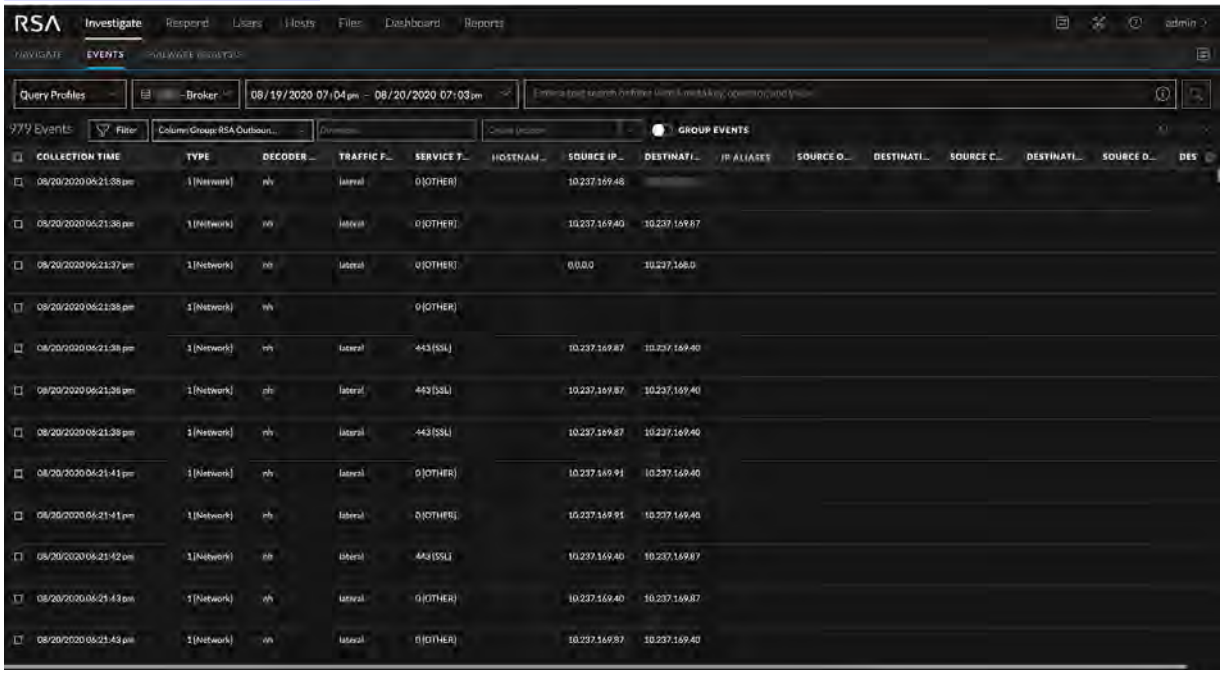
This figure show the examples provided in Version 11.4, which has two modes for creating queries.



## Access the Events View

Several ways to access the Events view are available in Version 11.1 and later.

- Go to **Investigate > Events** or select the **Investigate** option in the main menu if you have made the Events view your default Investigate view. The following procedure provides detailed steps.
- Hover over and click a count (the green number after a meta value) in the Navigate view. The Events view opens with the list of events for the selected drill point, and you can begin working as described in Analyze Events in the Events View.
- Hover over a count and control-click **Open Events in new tab**. The Events view opens in a new tab with the list of events for the selected drill point, and you can begin working as described in Analyze Events in the Events View. The following figure is an example of the list of events.

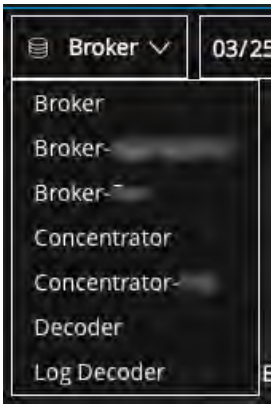


### To begin an investigation in the Events view using direct access:

1. Go to **Investigate** > **Events**.
   The Events view opens with a service selected and no data displayed. A drop-down list offers a list of available services in alphabetical order. The **Select a service** field is populated with the first service in the list or the most recently selected service. By default the list of available services is retrieved every twelve hours and cached on the NetWitness server. If a service is added or removed from the NetWitness server before the next time to retrieve, the cache is updated with the latest list of services. An icon provides the status of the service.

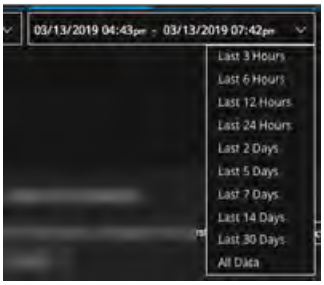
- and selected service name = The service is selected.
- = Investigate is attempting to connect to the selected service.
- = There was an error connecting to the selected service or there is no data in the selected service. In this state, the service selector control also turns red, and a tooltip explains why the connection attempt failed and advises you to choose another service.

2. (Optional) Select a service, usually a Broker or Concentrator, from the drop-down list.



The time range selector shows either the default time range of 24 hours, or the time range that you last selected for this service. The or Query Events button becomes active and you can create filters. If you launch a query without creating filters, the selected time is used.

3. (Optional) Edit the time range as described in Filter Results in the Events View.



The selected time range is stored in your browser for this service; you can set different time ranges for different services.

4. Create a query that consists of one or more filters that contain a meta key, operator, and optional value. See Filter Results in the Events View for details on creating queries.

5. When ready to submit the query, click or **Query Events**.
The Events view displays the data for the selected service, time range, and query, in accordance with permissions assigned to your role by the administrator. You are ready to begin analyzing the data. Refer to Examine Event Details in the Events View and Analyze Events in the Events View to learn how to work in the Events view.

## Access the Events View (Version 11.0)

To open an event in the Event view:

1. Go to **Investigate** > **Events**.
2. Do one of the following:
   a. Right-click an event in the listed events, and select **Event Analysis**.

   b. Right-click an event in the listed events and select **Event Reconstruction**. Then click the **Event Analysis** button in the reconstruction.

Refer to Examine Event Details in the Events View and Analyze Events in the Events View to learn how to work in the Events view.

# Refining the Results Set

When conducting an investigation, results load faster and it is easier to find what you are looking for if you refine the results to get a smaller number of results. In addition, limiting the time range and submitting a good query gives you more relevant results to answer the question at hand. Use a combination of the methods described in the rest of this section to get the information you need quickly.

- Use Meta Groups to Focus on Relevant Meta Keys
- Use Columns and Column Groups in the Events List
- Use Query Profiles to Encapsulate Common Areas for Investigation
- Filter Results in the Events View
- Filter Results in the Navigate View
- Filter Results in the Legacy Events View
- Create a Query in the Navigate and Legacy Events Views
- View and Modify Queries Using URL Integration
- Search for Text Patterns in the Navigate and Legacy Events Views

# Use Meta Groups to Focus on Relevant Meta Keys

A meta group combines selected meta keys and meta entities into a group to show only data in which the meta keys and meta entities were found. In the Navigate view and the Version 11.5 and later Events view, you can use meta groups to filter data displayed in the Navigate view (Values panel) and the Events view (Filter Events panel). The same shared meta groups are available for use in both views. Private meta groups created in the Events view are not available for use in the Navigate view or in query profiles in the Legacy Events view.

**Note:** In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Filter Events panel) in the Events view. The Events view (Filter Events panel) can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.

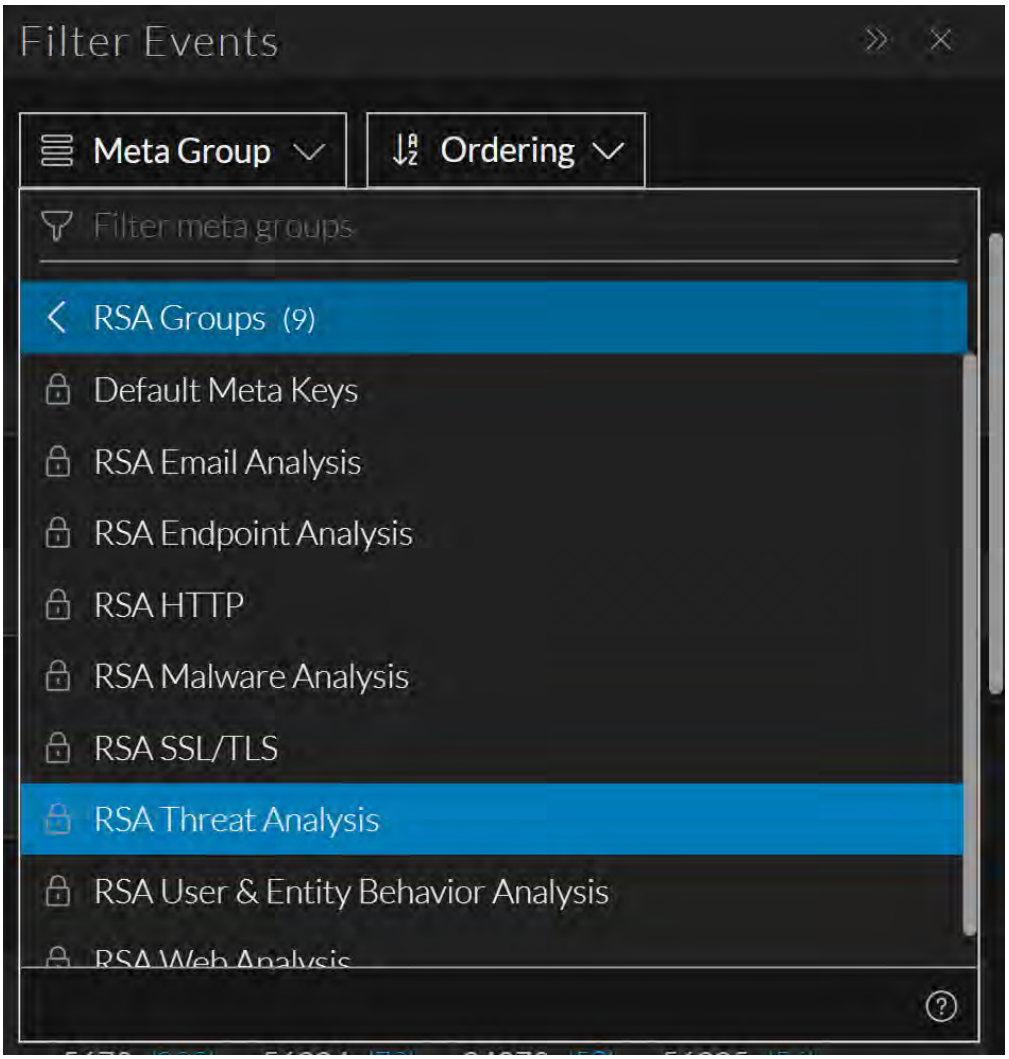
With a meta group in effect during an investigation, the information in the Values panel or the Filter Events panel shows only the meta keys in the selected group. When you open a Parallel Coordinates visualization in the Navigate view, the meta keys and meta entities in a group appear as axes from left to right. It may be useful to create two versions of each custom meta group; one for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups can be duplicated but cannot be edited or deleted. You can also create your own groups and edit a copy of a built-in group to create a custom group.

All groups in the Navigate view are shared and visible to all users of a service; you can export a group for import to any service, limited by the available meta keys for that service. In the Version 11.5 Events view Filter Events panel, you can create both shared and private custom meta groups; only the shared groups are visible and usable in the Navigate view.

## Live Meta Groups

In 11.6 and later, NetWitness supports deploying the investigate content from live. The meta groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The content deployed from Live are marked by the live symbol (). The content is displayed in a folder structure. The groups are displayed as non-editable folders and sub-folders. The number inside **()** depicts the number of contents inside a folder and **>** symbol helps you to drill down inside the folder.



Built-In Meta Groups

RSA NetWitness has built-in meta groups, prefixed with RSA, that are available immediately after installation. The built-in meta groups are useful to focus an investigation on common use cases and to support threat detection using the RSA Hunting Pack. You can copy these groups, give the copy a new name, then edit the copy. These are the built-in meta groups:

- RSA Email Analysis includes meta keys that outline email interactions.
- RSA Endpoint Analysis contains meta keys that provide insight on processes, files, users, and connections from NetWitness Endpoint (NWE) hosts.
- RSA Malware Analysis includes meta keys that mark indicators of compromise in files contained in events.
- RSA HTTP includes meta keys that provide insight into outbound web traffic.
- RSA SSL/TLS includes meta keys that focus on encrypted web traffic.
- RSA Threat Analysis includes meta keys that mark potential threats in the data set.

- RSA User & Entity Behavior Analysis includes meta keys that encompass all the meta keys to analyze user and entity behavior.
- RSA Web Analysis includes meta keys that mark anomalies in web traffic.

## Default Meta Keys Group (Version 11.5 Events View)

The Default Meta Keys meta group is a special type of built-in meta group that consists of all the meta keys for the currently selected service, returned in the order of appearance in the index file for the service. The Default Meta Keys group is always at the top of the list in the Meta Groups menu.

The Default Meta Keys group is used to select meta keys shown in the Filter Events panel when no meta group has been selected and none exists in local storage. You can also select this group as you would any other group. When using the Default Meta Keys group in the Filter Events panel, only the first 30 meta keys with values are open and the remaining are closed.

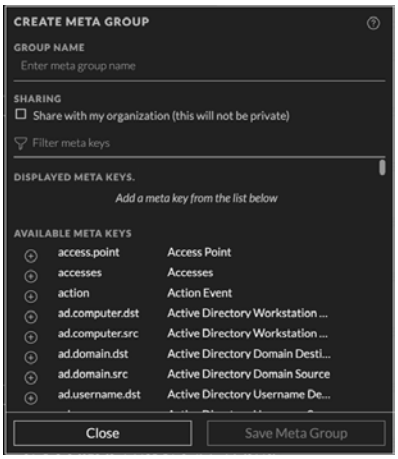
## Custom Meta Groups

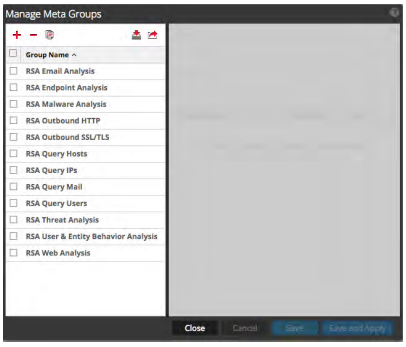
You can create custom meta groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in meta groups after the service is restarted. Custom meta groups can be shared or private . Shared meta groups are available globally within your organization in the Navigate view and in the Filter Events panel. If you edit a shared custom meta group, your changes are applied globally. If you delete a shared custom meta group, the group is deleted and no longer available for all analysts. The Navigate view supports only shared groups. When you create custom meta group in the Events view, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.

**Note:** Private custom meta groups created in the Events view are not visible or usable in the Navigate view.

Icons identify the group type in the Meta Groups menu. These are examples of each type of custom meta group with the edit icon displayed at the end of the row.

While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Meta Group dialog and the (Navigate view) Manage Meta Groups dialog.





Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Copy and edit the copy of a built-in or custom meta group.

Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group.

The rest of this topic provides instructions for working with meta groups in the 11.5 Events view and the Navigate view.

## Work with Meta Groups in the Events View (Version 11.5 and Later)

After the upgrade to Version 11.5 or later, all of the existing meta groups -- both built-in and custom -- are available for filtering events in the Filter Events panel. The meta group selection persists between logins unless browser cache is cleared.

### View the Meta Keys in a Meta Group

To view details of a meta group:

1. Go to **Investigate > Events** and click to load events.
   The events for the default service and the default time range are loaded in the Events panel.

2. To display the Filter Events panel, click Filter above the Events panel.
   The Filter Events panel opens to the left of the Events panel.
3. To display the Meta Groups menu, click the Meta Groups menu title. The menu title is either Meta Group: Default Meta Keys or Meta Group: <currently selected meta group>. If this is your first visit after logging in, the Default Meta Key group is selected; any subsequent visits use the meta group selected in the previous session. If the selected meta group from the previous session is deleted, the Default Meta Keys group is selected when you log in. When opened, the menu displays a list of built-in meta groups (RSA), shared custom meta groups, and your private custom meta groups. Above the list, visibility options and a filter make it easier to find a particular meta group.

4. (Optional) To filter the listed meta groups by name, type some text in the **Filter Meta Groups** field. The list is updated to show only the group names that contain the exact text.
5. Hover over the meta group name and click the information icon ( ) to see which meta keys are included in the group.
   The figure on the left shows the columns for the RSA HTTP meta group. The figure on the right shows the columns for the Default Meta Keys meta group.

Select Meta Group

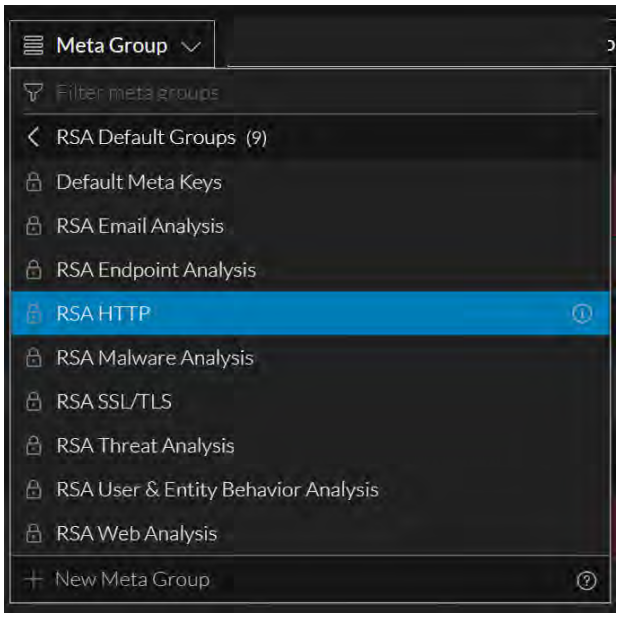
6. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the meta group, click **Select Meta Group**.
      The dialog closes and the Filter Events panel is updated to reflect the meta keys in the selected meta group.

## Select a Meta Group

1. With the Filter Events panel open in the Version 11.5 Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with a filtering option and a New Meta Group option. The list is sorted alphabetically and the name of the selected meta group is displayed in the menu label. This figure shows the menu after RSA HTTP was highlighted, but not selected.



2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. Begin typing text in the **Filter Meta Groups** field to search for a meta group name. As you type, the list is filtered to show only the meta group names that contain that string.
      When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
      The Filter Events panel is refreshed to include only meta keys in the selected meta group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view.

**Note:** If a meta key in a meta group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

## Create a Custom Meta Group

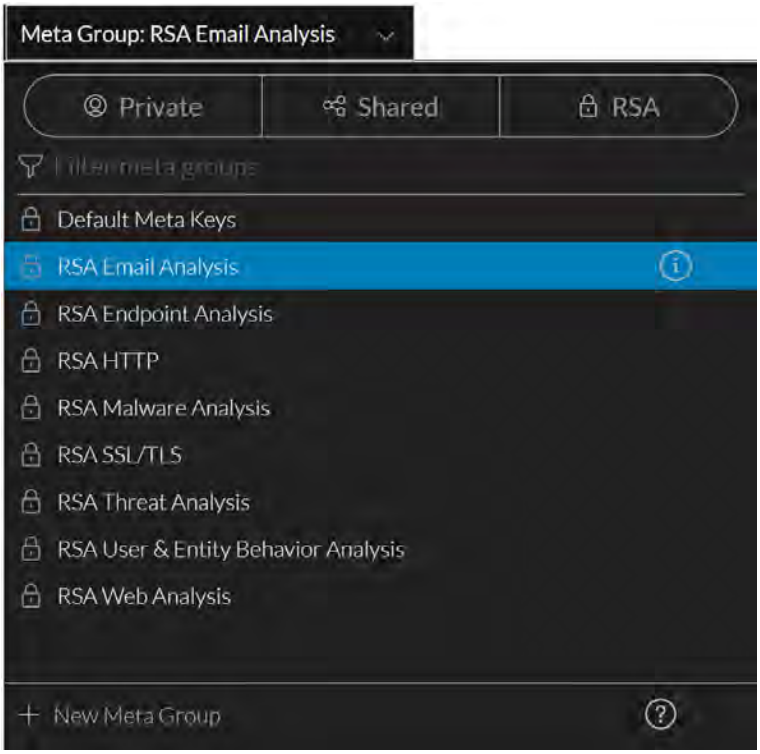
Custom meta groups must have a unique name up to 80 characters in length, and must have at least one meta key. If any other meta group has the name you type, whether shared or private, a message informs you that you need to use a different name. The Save Meta Group button is enabled when these criteria have been met. You can adjust the order of meta keys in a group by dragging keys in the Displayed Meta Keys list.

You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting).

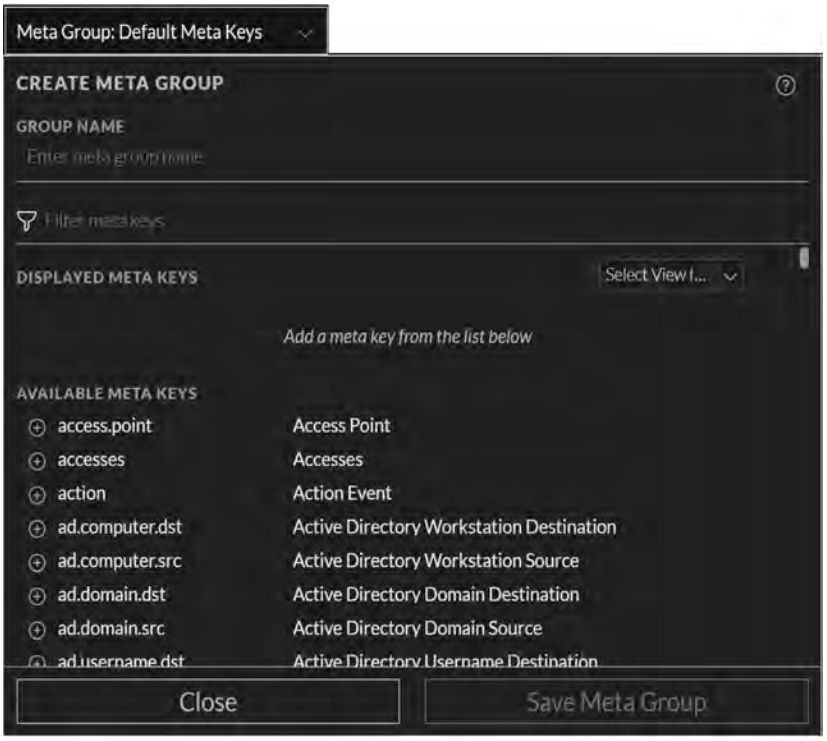
**Note:** You can also set the desired value for all meta keys at once. Make a note that changing the value of all meta keys might impact the performance.

- When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto.
- Open meta keys are listed in the Filter Events panel, and the values are loaded.
- Closed meta keys are listed in the Filter Events panel, but the meta values are not loaded until you open the meta key.
- Hidden meta keys are not listed in the Filter Events panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state.

1. With the Filter Events panel open in the 11.5 Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group and Folder icon option at the bottom.



2. Select + **New Meta Group**.
   The Create Meta Group dialog is displayed.



3. In the **Group Name** field, type a unique name (maximum length of 80 characters) for the new meta group, for example, **Custom Meta Group A**.

4. If you want to share the new meta group with your organization, set the **Share with my organization** option.
5. To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.
   b. When you see the meta key that you want to add, click the add icon that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) The maximum number of meta keys in a meta group is 500. If you attempt to add another meta key when 500 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

6. (Optional) Next to each meta key, choose the initial view for the meta key: **Open**, **Close**, **Hidden**, or **Auto**.
7. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the meta key that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom meta group, click **Cancel**.
   b. To create the group, click **Save Meta Group**.
   The new meta group is saved. If the new group is shared, it becomes available for all analysts. If it is private, only you can use the meta group. The buttons change to Done and Select Meta Group.

10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new meta group, click **Select Meta Group**.
    The new group is added to the Meta Groups menu (in alphabetical order), and if you clicked Select Meta Group, the Filter Events panel is updated to show the meta keys and values in the new meta group.

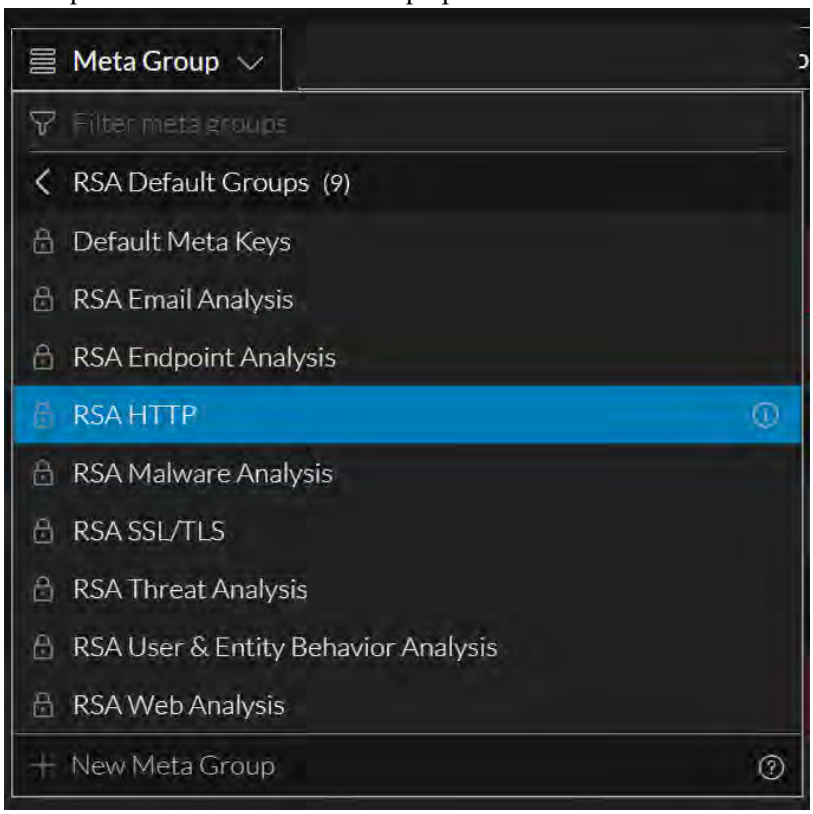
## Delete a Custom Meta Group

You can delete any custom meta group, shared or private, that is not currently applied in the Events list and not used in a query profile. When you click the Delete button, a confirmation message allows you to confirm or cancel the deletion. If a meta group is being used in a query profile, the Delete button is disabled and a message identifies the query profile in which the meta group is used. The built-in meta groups are read only, and cannot be deleted.

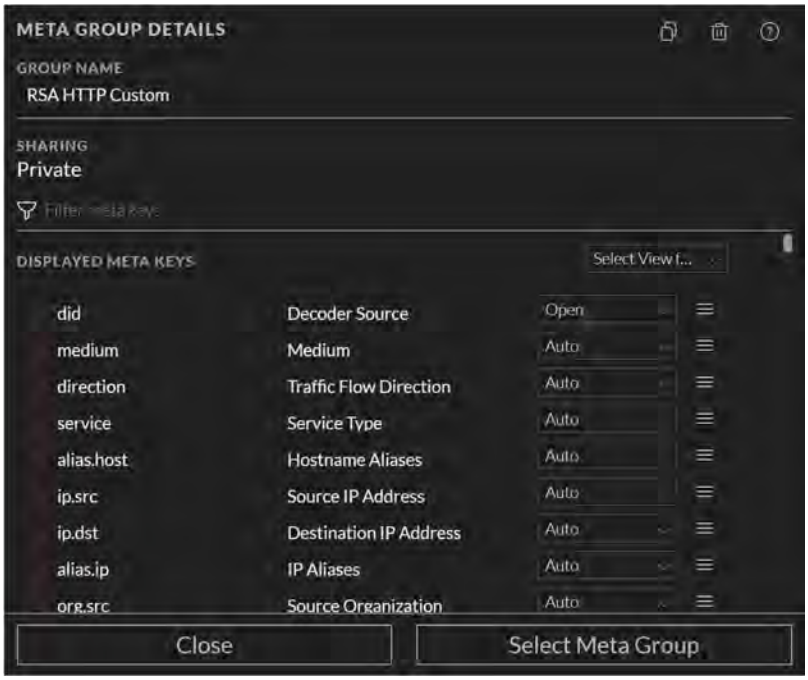
**Caution:** When you delete a shared meta group, the effect is global and the group is no longer available to any analyst.

To delete a custom meta group:

1. With the Filter Events panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group option at the bottom.



2. To delete a meta group, highlight a custom meta group and click the edit icon ( ) to the right of the name.
3. The Meta Group Details dialog opens with the details for the selected group displayed.

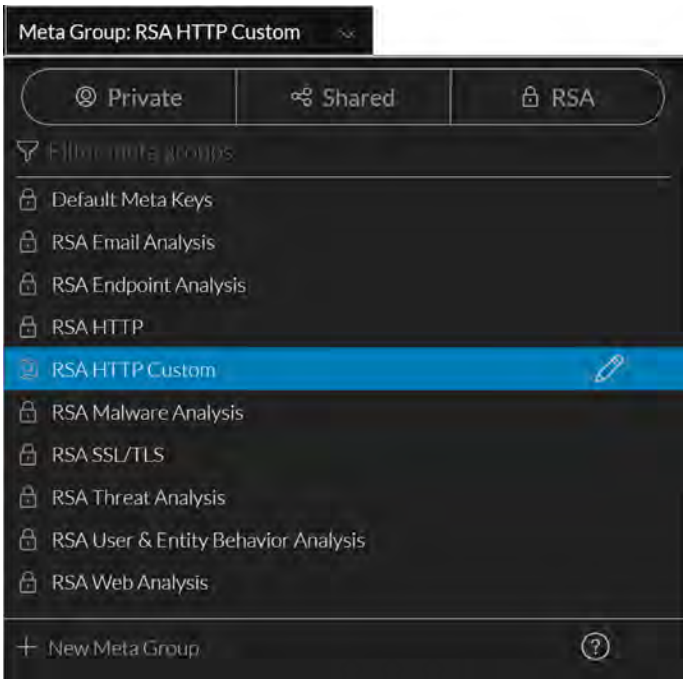


4. Click the delete group icon ( ).
   If the meta group is currently in effect, the following message is displayed: `This meta group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Meta Group**.
   The group is deleted and removed from the Meta Group menu. The meta group no longer appears anywhere for any analyst working in Investigate.

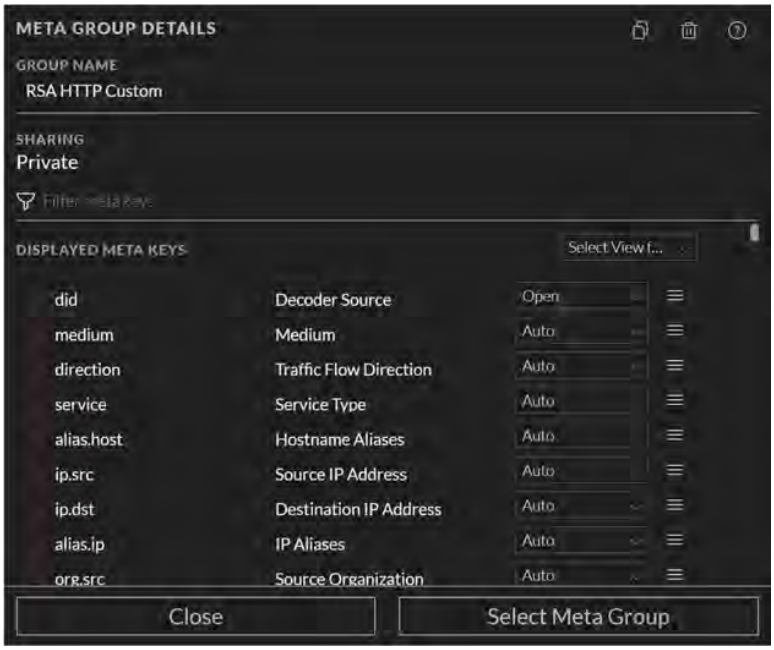
## Edit a Custom Meta Group

You can edit a shared custom meta group, your own private meta group, a copy of a built-in meta group or a copy of live meta groups.

1. With the Filter Events panel open in the 11.5 Events view, click the **Meta Group** menu title and highlight the meta group that you want edit. This figure shows private column group RSA HTTP Custom highlighted with the edit icon is displayed to the right.

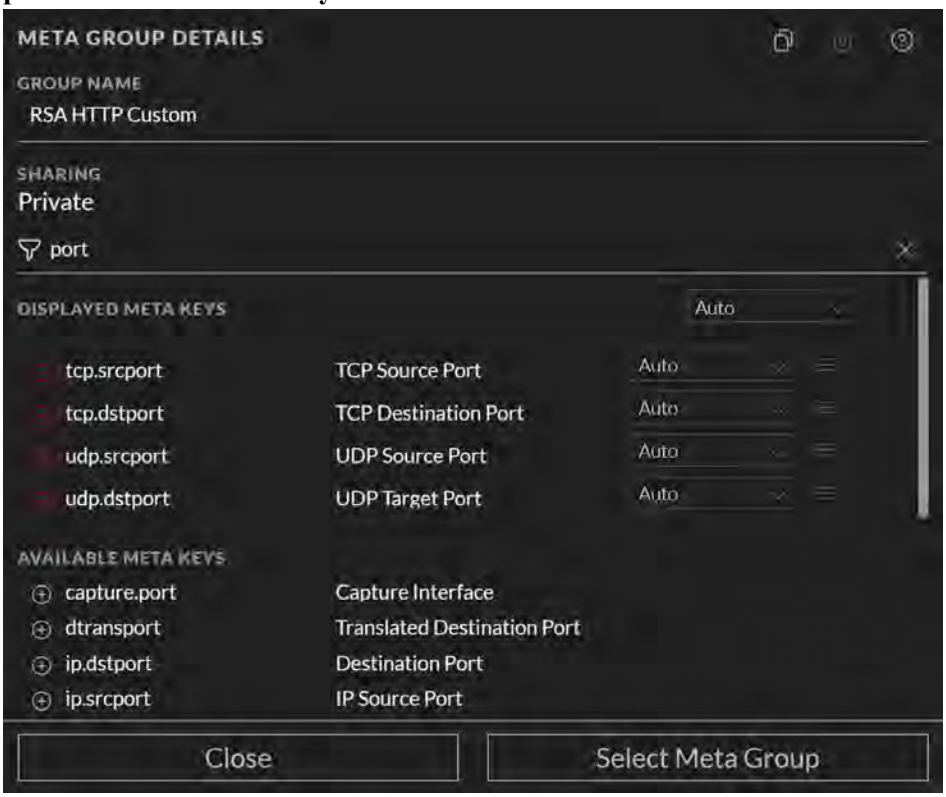


2. Click the edit icon ( ).
   The Meta Group Details dialog is displayed so that you can edit the location. You can add or delete meta keys and rearrange the order of the meta keys in the list.



3. (Optional) In the **Group Name** field, edit the name and location of the meta group.
4. (Optional) To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key. For example, type

**port** in the **Filter meta keys** field.



b. When you see the meta key that you want to add, click the add icon that precedes the meta key name.

5. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Dispayed Meta Keys** list, or simply scroll through the list. When you see the meta key that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
6. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
7. Do one of the following:
   a. To close the dialog without saving the changes to the custom meta group, click **Reset**.
   b. To save the edits to the meta group, click **Update Meta Group**.
      The updated meta group is saved, and the dialog is closed.

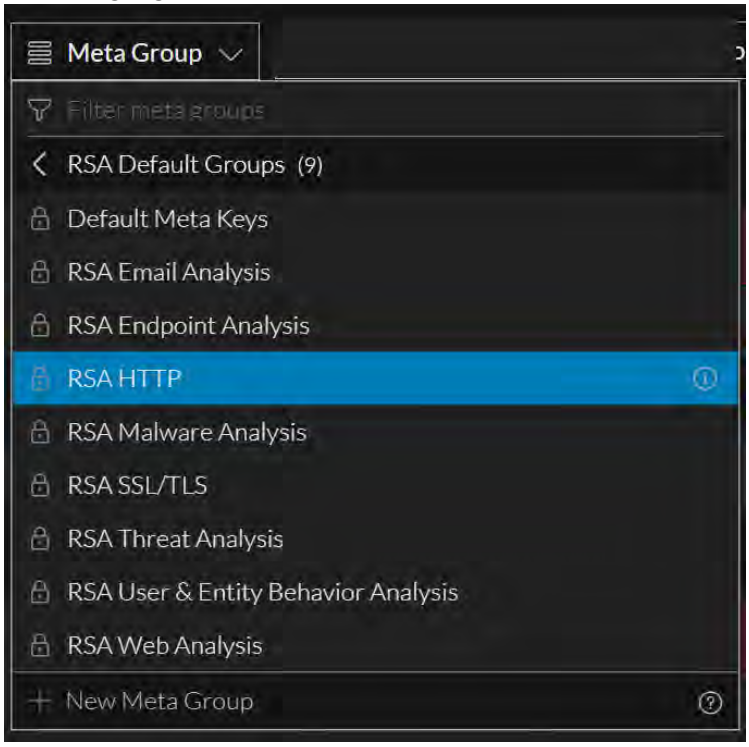
## Copy a Meta Group (Version 11.5 and Later)

You can copy any meta group, built-in or custom, Live meta group, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a meta group, the same name is used with a number appended. For example, if you copy RSA HTTP twice, the first copy is named RSA HTTP-1, and a second copy is named RSA HTTP-2. After you copy the group, you can edit the copy to give it a new name and manage meta keys in the group.

**Note:** Some meta groups created in the Legacy Events view may have more 500 meta keys, which is above the limit for meta groups in the Events view. If you copy a group with more than 500 meta keys, you must remove the excess meta keys when you edit the meta group.

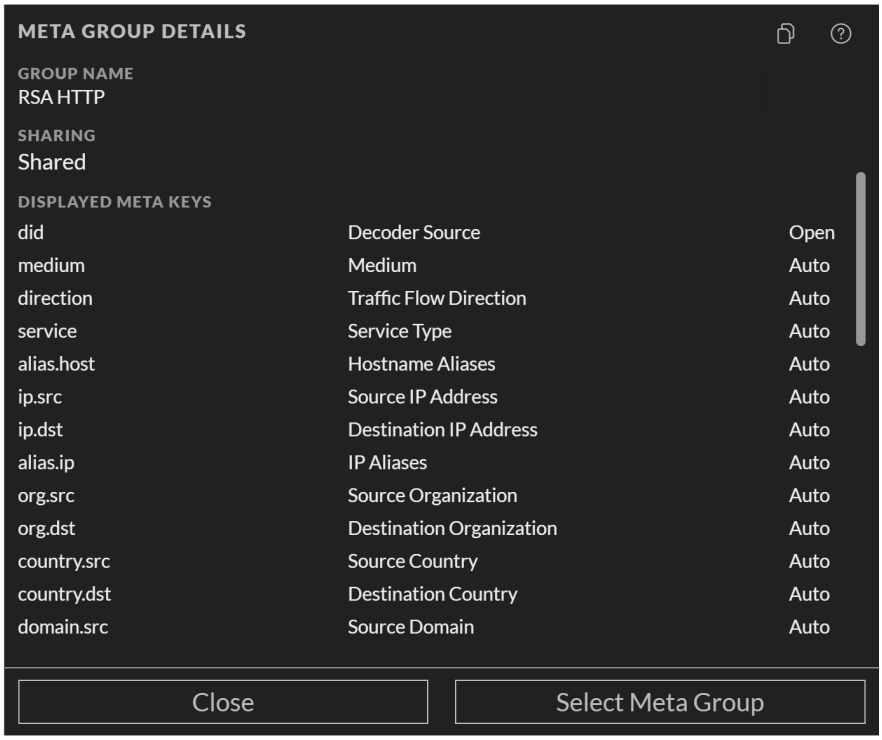
To copy a meta group:

1. With the Filter Events panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders.
2. Highlight the meta group that you want copy.
   If you highlighted a built-in meta group, the information icon ( ) is displayed to the right. If you highlighted a custom meta group, the edit icon ( )is displayed to the right. This figure shows RSA HTTP highlighted.

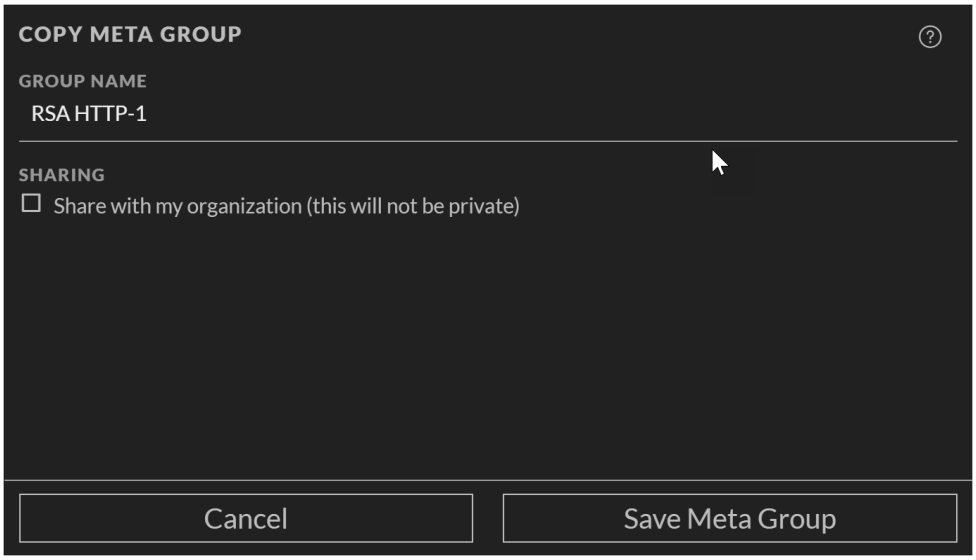


3. Do one of the following:
   a. Click the information icon ( ).

b. Click the edit icon ( ).
The Meta Group Details dialog is displayed. This figure shows the dialog for a built-in group.

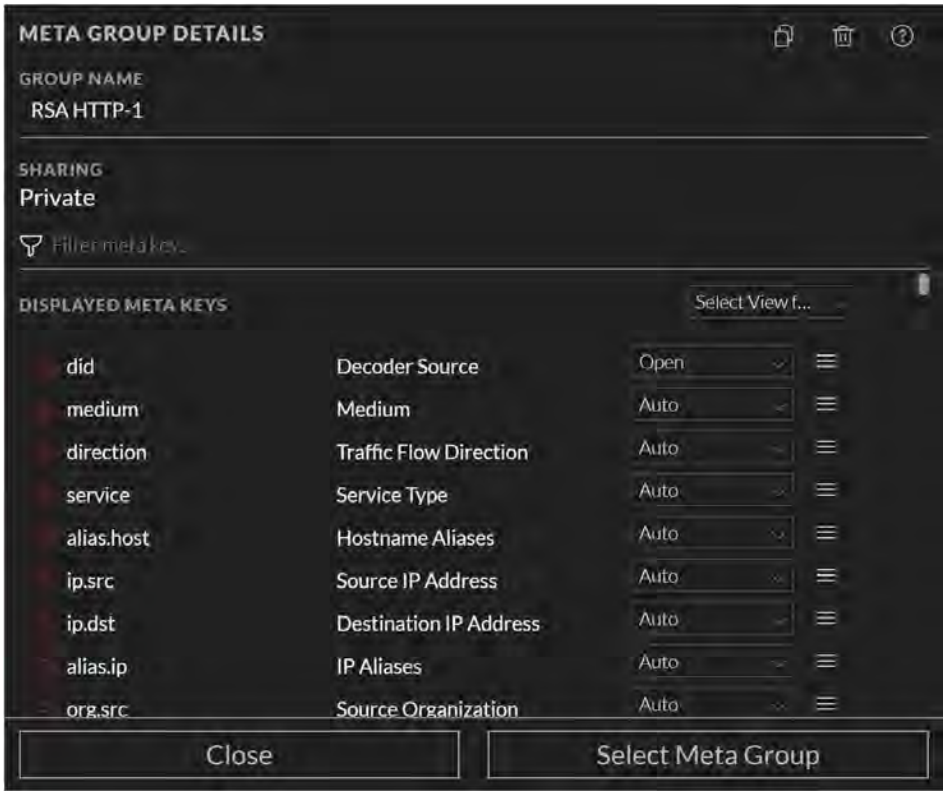


4. Click the Copy icon ( ).
The Copy Meta Group dialog is displayed with a `-n` appended to the original meta group name.



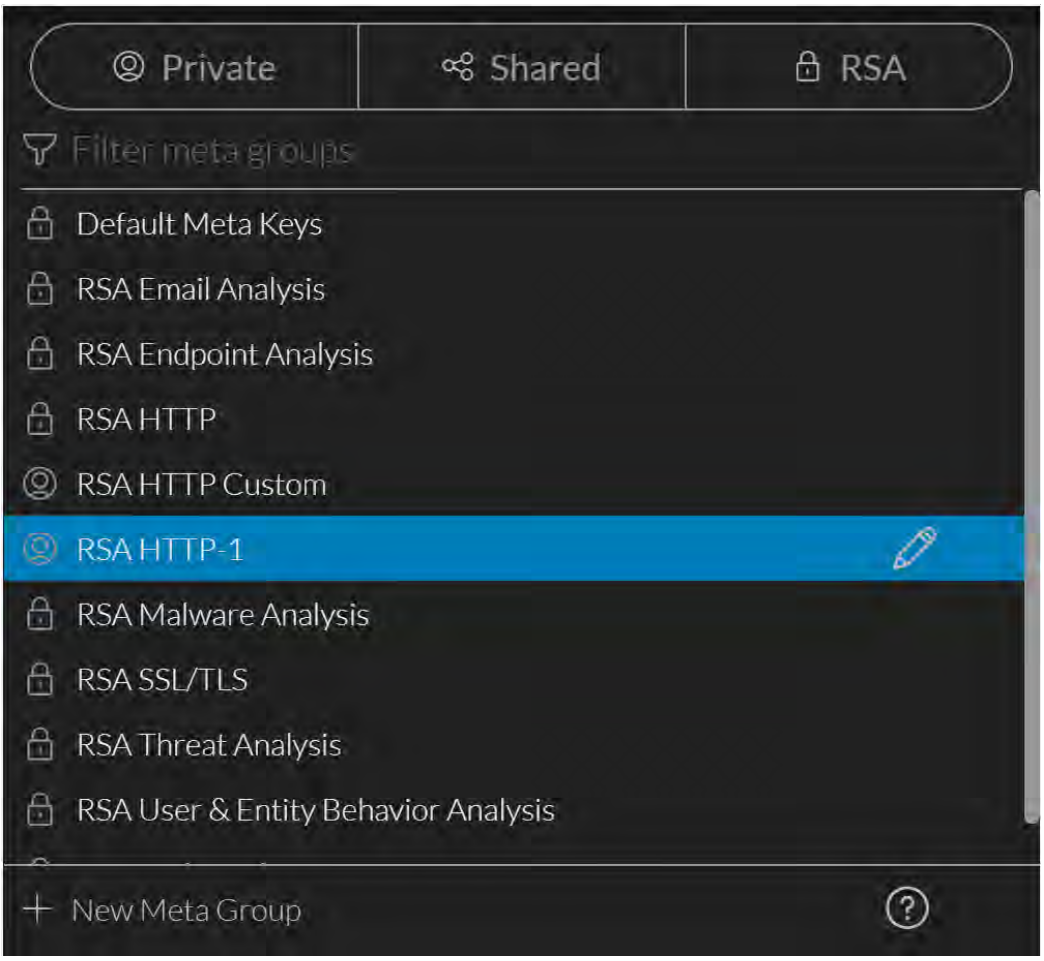
5. (Optional) In the **Group Name** field, edit the name and location of the meta group.
6. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the meta group, click **Save Meta Group**.
   The copy of the meta group is saved, and the Meta Group Details dialog for the copied group is

displayed.



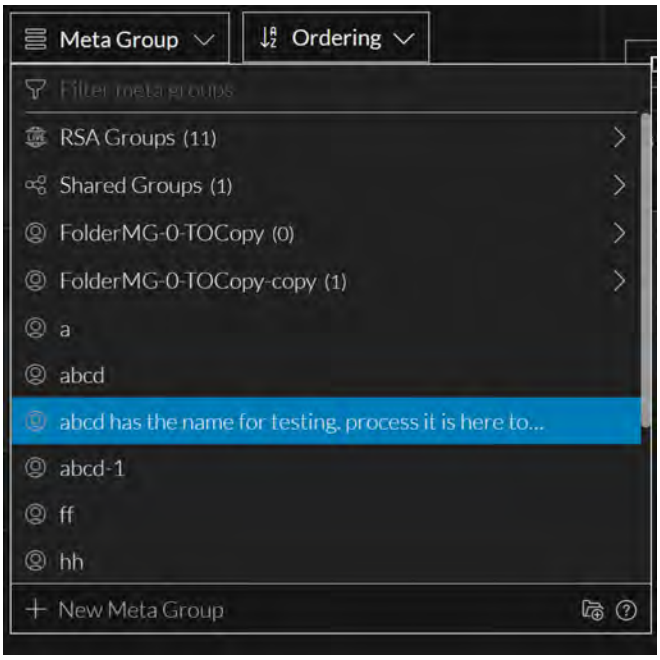
7. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA

HTTP meta group.



## Meta Group Folders

Users can create editable Shared and Private group folders. The contents of a private group folder and their contents are displayed outside RSA Groups and Shared group folders. For example, the below image shows private content below the Shared Groups folder.

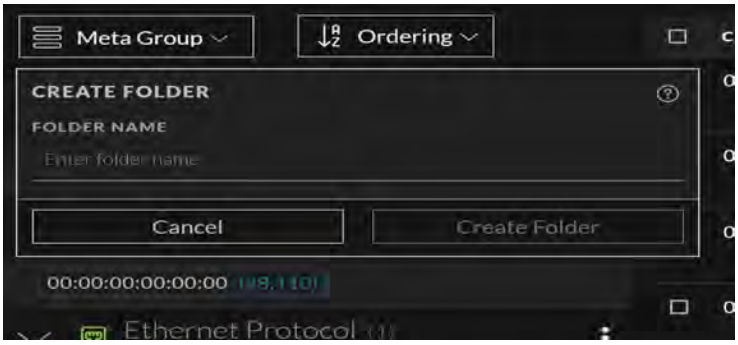


This section describes how to add, edit, import, export, copy, and delete custom meta groups and folders.

## Create a Meta Group Folder

You can create meta group folders as shared and private folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Meta Groups menu title. The menu drops down to display a list of meta groups and folders.
2. Click .
   The Create Folder dialog is displayed.

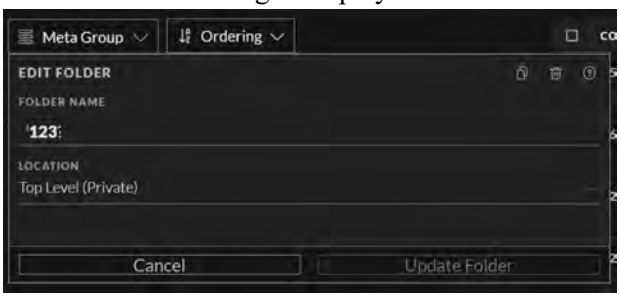


3. In the **Folder Name** field, type a unique name for the new meta group folder.
4. Click **Create Folder**.

## Edit and Move Meta Group Folder

After you create a meta group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

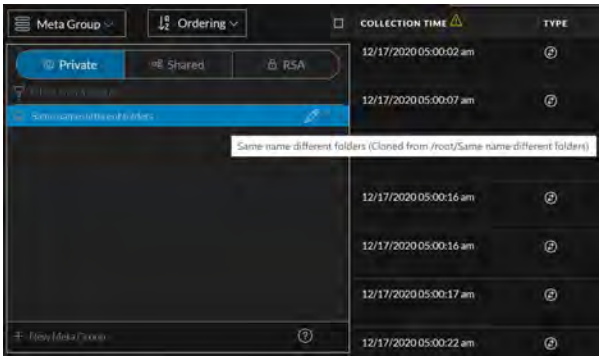
1. With the Filter Events panel open in the 11.6 Events view, click the Meta Group menu title and highlight the meta group that you want edit.
2. Click .
   The Edit Folder dialog is displayed.



3. In the **Folder Name** field, type a unique name for the meta group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

## Copy Meta Group Folder

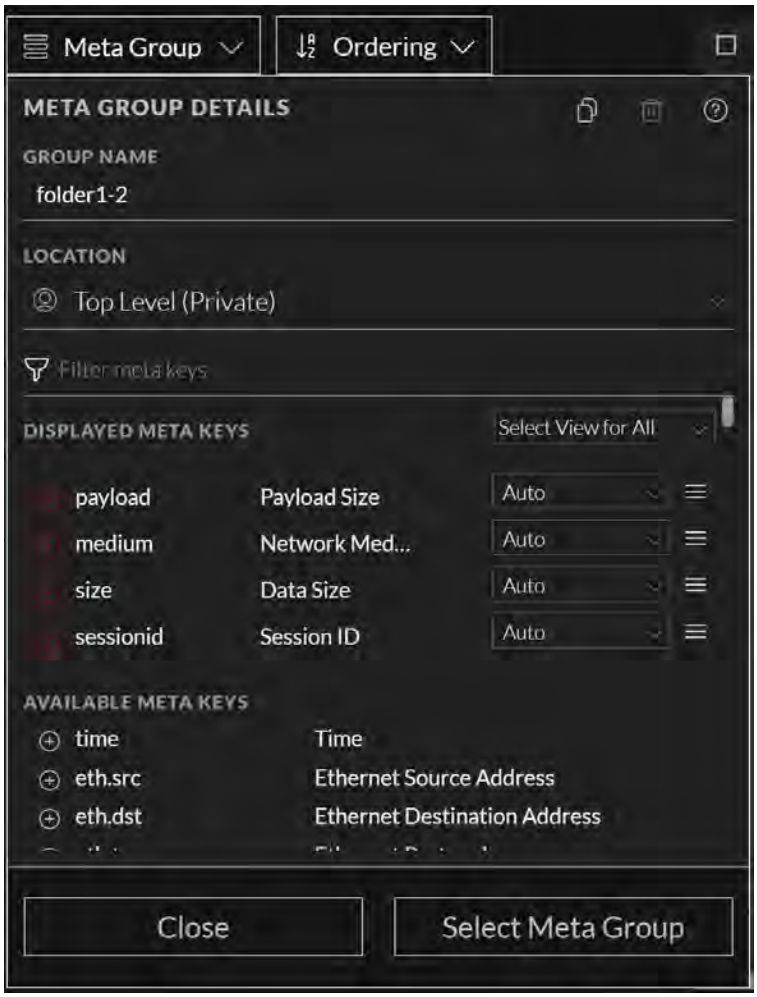
Users can copy any type of meta group folders namely - RSA , Shared and Private. However, by default for RSA groups copy folder will create a copy in the private section (root level) but can change the location of the folder to a shared folder or any other private folder. The meta group can be copied by clicking the clone icon ( ). After copying, the meta group folders are displayed selected location (Shared or Private category). You can hover over on the copied item to view a tooltip that indicates the path from which the meta group has been copied. In case you need to search for a specific meta group, you can type the name of the meta group in the filter field ( ) at the folder level and the meta group will be filtered from the selected folder.



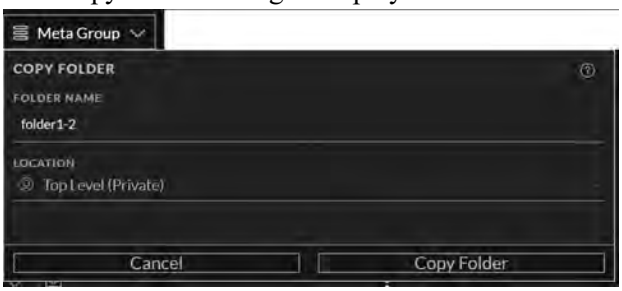
## Copying Meta Group Private or Shared Folders

You can copy meta group folders from RSA groups to private and RSA groups to shared, private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder you want to copy.
3. Click edit and then click copy .



The Copy Folder dialog is displayed.



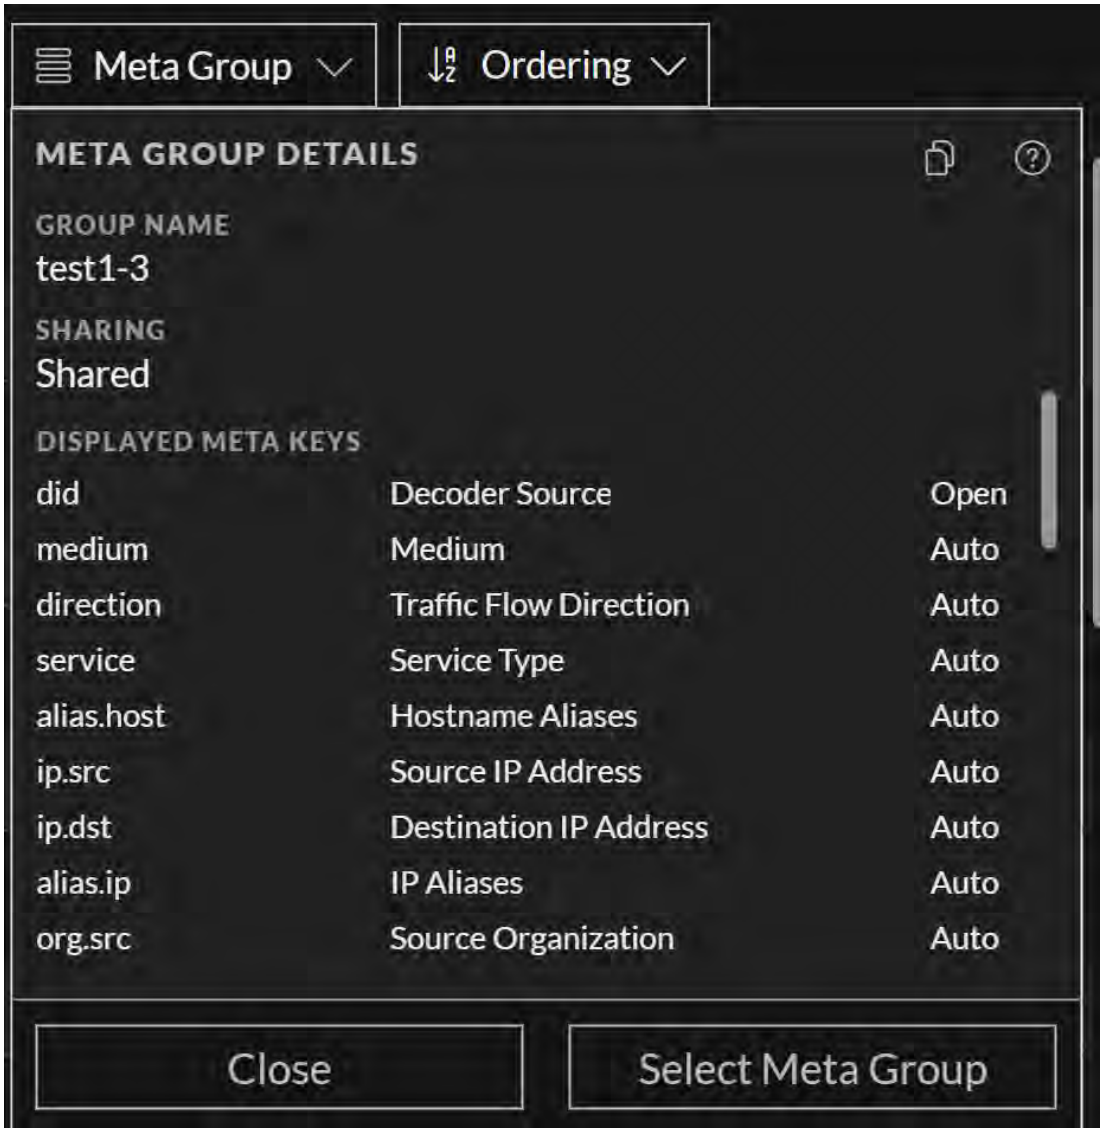
4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be copied.
6. Click **Copy Folder**.

### Copy Meta Group Folder Deployed from Live

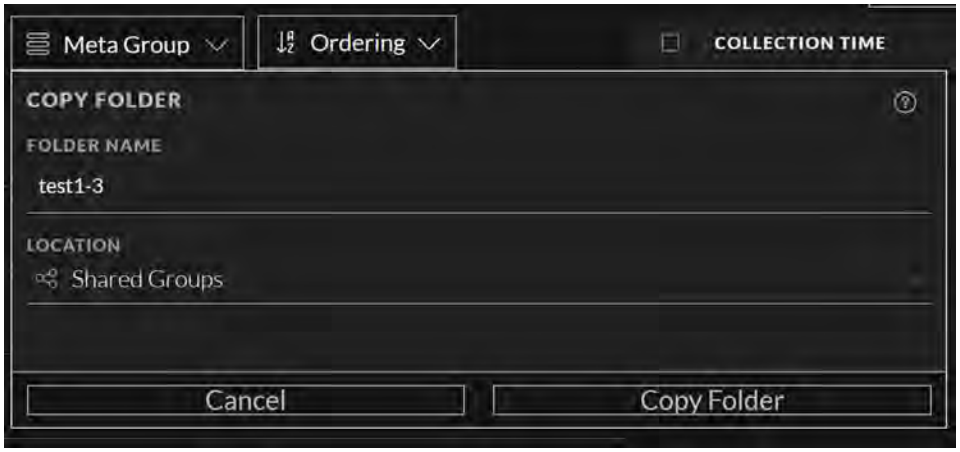
You can copy meta group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Filter Events panel open in the Events view, click Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Click on RSA groups and select a Live Meta Group folder you want to copy.

3. Click and the click copy .



The Copy Folder dialog is displayed.

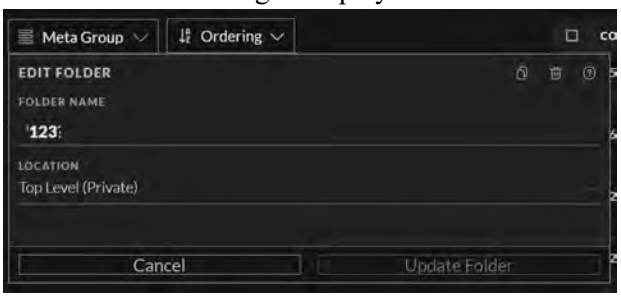


4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder and the first level contents are copied, sub-Folders are not copied. The copied Meta Group Folder and its contents are displayed as the original meta group name appended with a -n .

## Delete Meta Group Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.



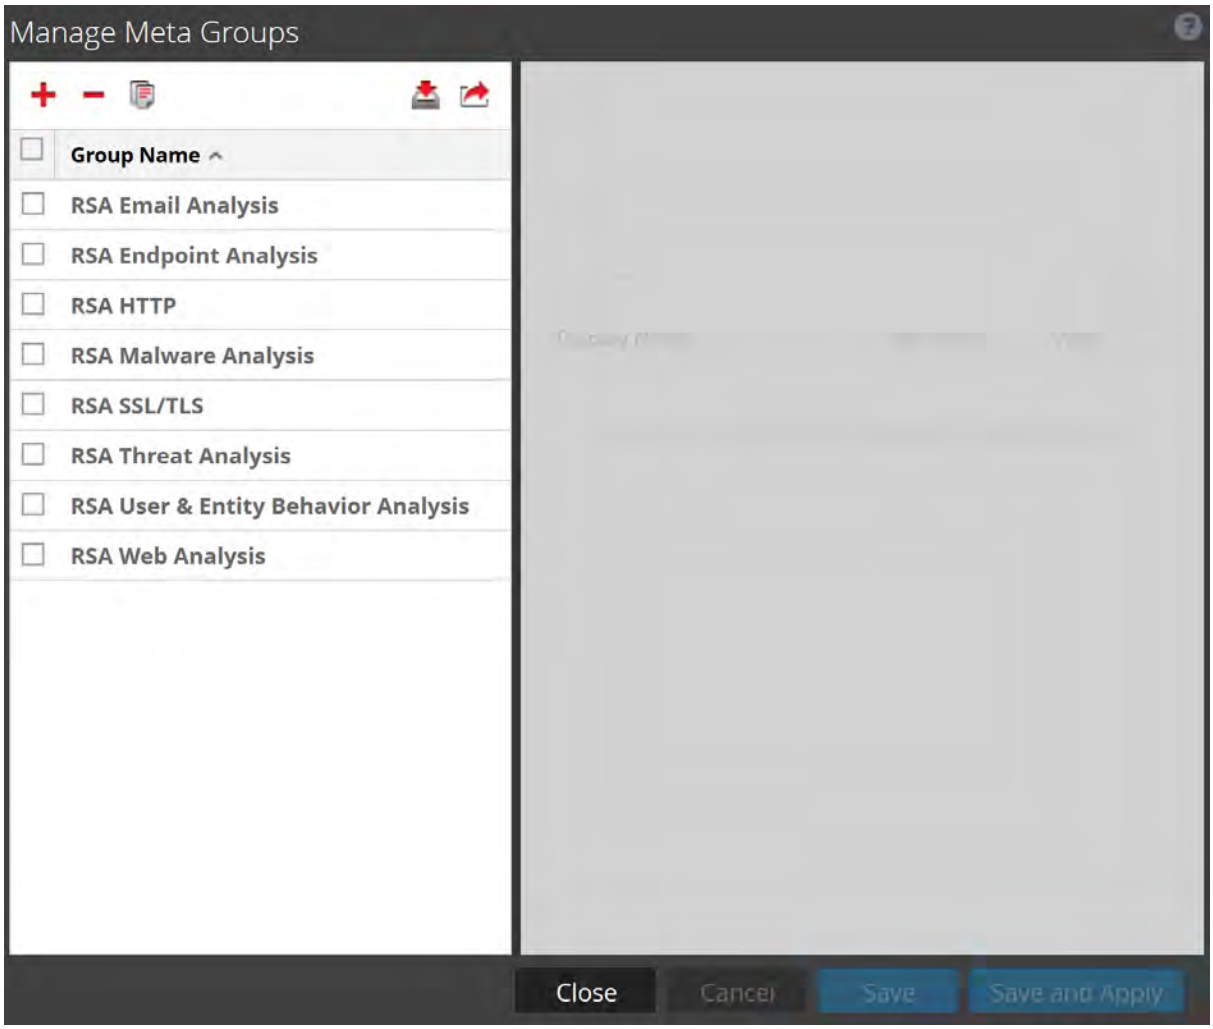
4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

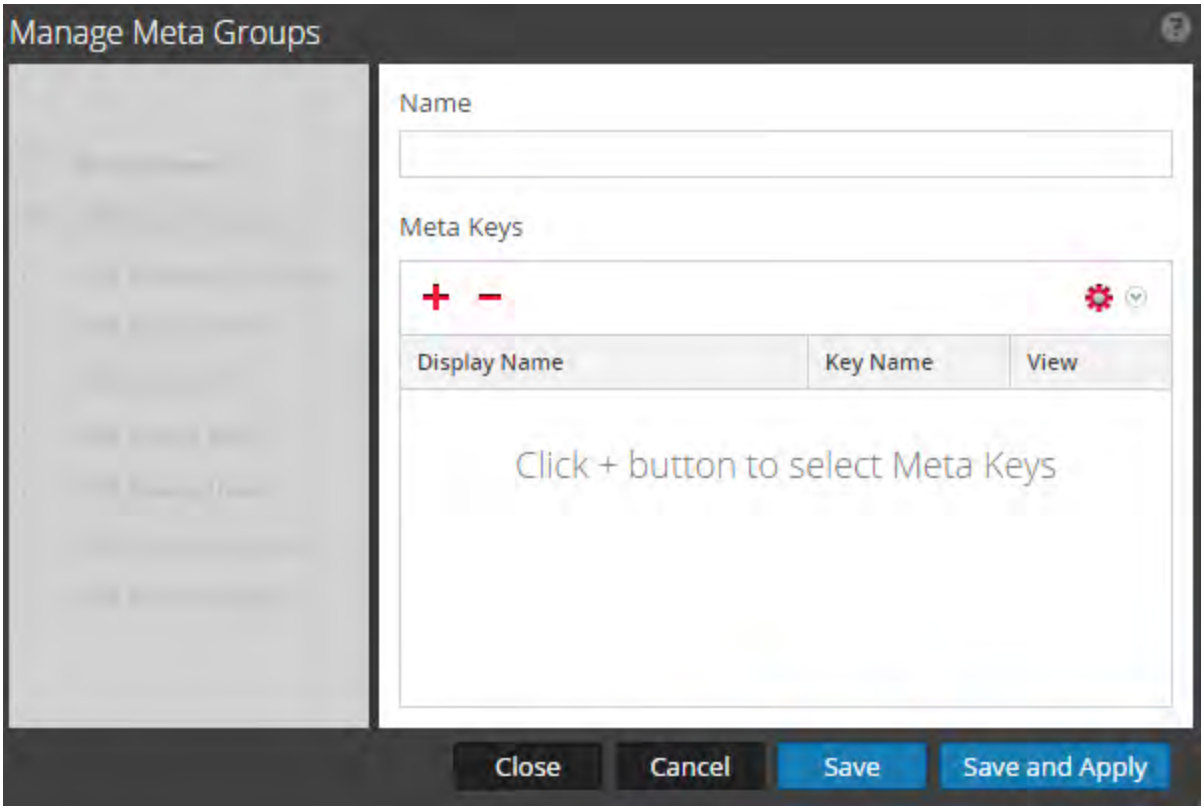
# Work with Meta Groups in the Navigate View

## Create a Meta Group and Add Meta Keys

1. While investigating a service in the **Navigate** view, select **Meta > Manage Meta Groups** in the toolbar.
   The Manage Meta Groups dialog is displayed. Initially only built-in groups are configured for a service and listed under Group Name. If other custom groups have been configured, they are also listed under Group Name.

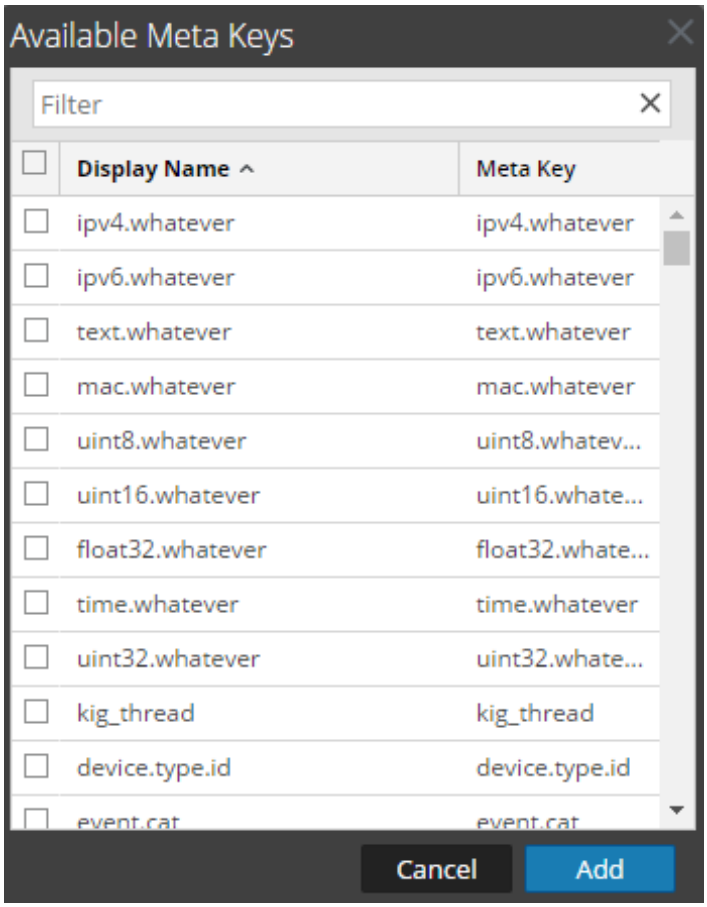


2. In the toolbar at the top of the Meta Groups list, click +.
   The form to the right opens for editing.



3. Type a name for the new meta group in the **Name** field.

4. In the **Meta Keys** toolbar, click +.
   The Available Meta Keys dialog is displayed, with keys in alphabetical order.

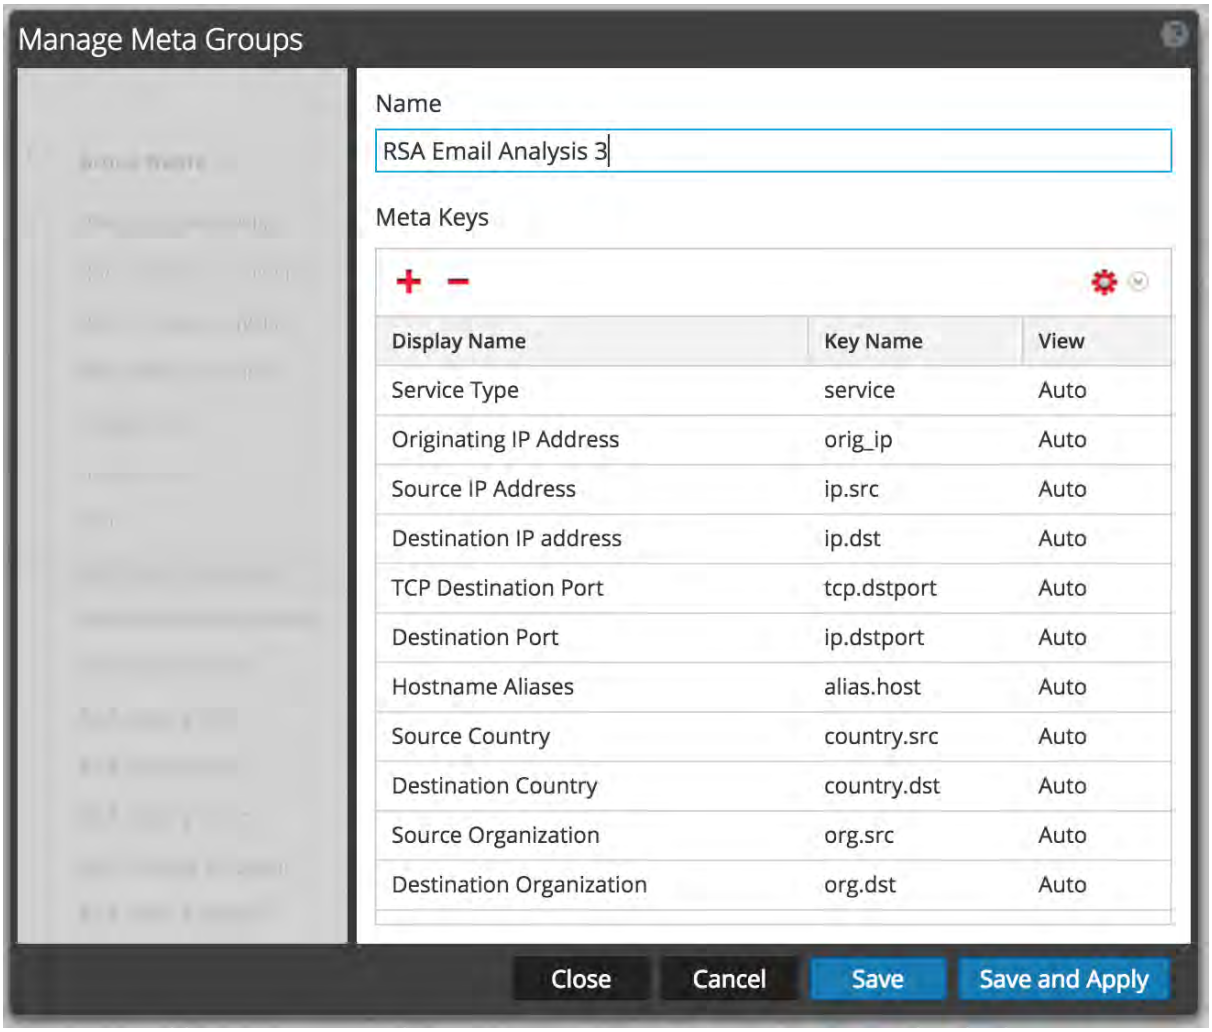


5. To filter the list of meta keys, type a word or phrase in the **Filter** field and press **Enter**.
   The list displays matching meta keys based on a case-insensitive search. Delete the filter text and press **Enter** to remove the filter.
6. To select individual meta keys to include in the meta group, select the checkboxes. To select all meta keys, select the checkbox in the title bar and click **Add**.
   The selected meta keys are added to the meta keys list.
7. (Optional) If you want to change the order in which the meta keys load and are listed in an investigation, click and drag one or more meta keys to a new position.
8. To finish creating the meta group do one of the following:
   a. To save the meta group, click **Save**.
      The group is created and available for use.
   b. To save and apply the meta group to the current Investigation view, click **Save and Apply**.
      The group is created and applied immediately to the current Investigation view.
9. Click **Close**.

## Copy and Edit a Meta Group

If you want to customize a built-in meta group, you need to duplicate the group and then edit the duplicate.

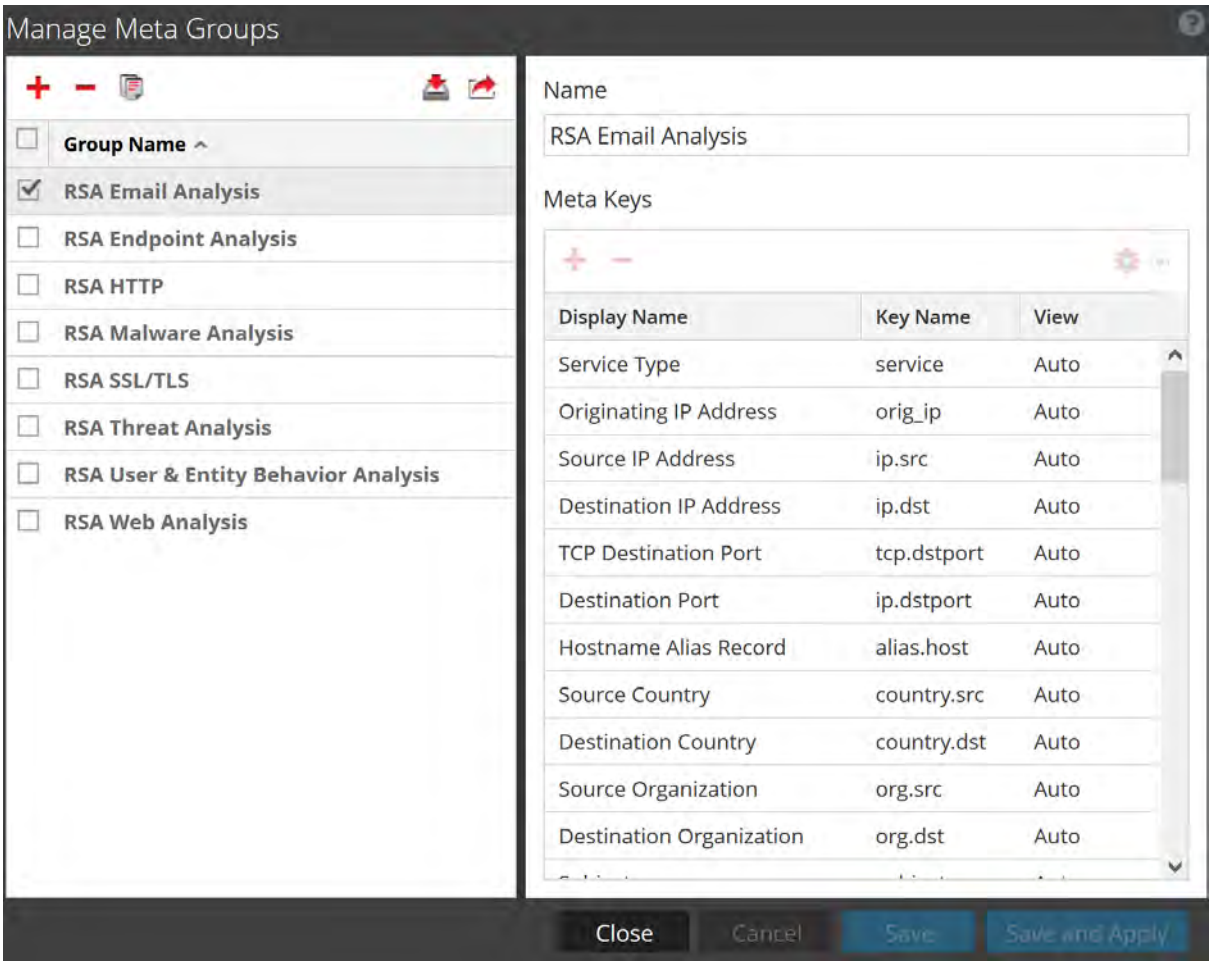
1. Select a built-in meta group from the Manage Meta Groups list and click .
   The form to the right opens for editing with all of the meta keys as they are in the built-in group.



2. Enter a name for the new group and continue editing as described in "Edit a Meta Group" below.

## Edit a Custom Meta Group

1. Select a custom group from the **Meta Groups** list.
   The form to the right opens for editing.



2. (Optional) Edit the Name of the group.
3. (Optional) Add new meta keys, as described above in "Create a Meta Group and Add Meta Keys."
4. (Optional) To set the order for the keys, drag and drop one or more keys.
5. (Optional) To change the initial view of a meta key, click and choose one of the possible views.
   When you modify the meta group, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
   The value for the initial view is displayed in the View column.
6. To save, the changes, click **Save**.
7. To apply the changes to the current Navigate view, click **Save and Apply**.

## Delete a Meta Group

1. In the **Meta Groups** list, select the group to be removed.
2. Click −.
   A confirmation dialog provides an opportunity to cancel or complete the request.
3. Click **Yes**.
   The meta group is deleted. When you close the window, if the deleted group was the currently applied meta group, it is removed and the default meta keys are used to build the view.

## Export a Meta Group

User-defined meta groups are created on individual services. To make meta groups available to another service, you must export them to your local file system. To export one or more meta groups:

1. In the **Meta Groups** list, select one or more groups to be exported.
2. Click .
   The selected groups are downloaded to your local file system as a **MetaGroups.jsn file**. Every download of meta groups has the same name with a numeral appended to avoid overwriting previous downloads.

## Import a Meta Group

To make user-defined meta groups from another service available to the currently investigated service, you must import the `MetaGroups.jsn` file from the local file system. When you import meta groups, an error message is displayed if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To import meta groups:

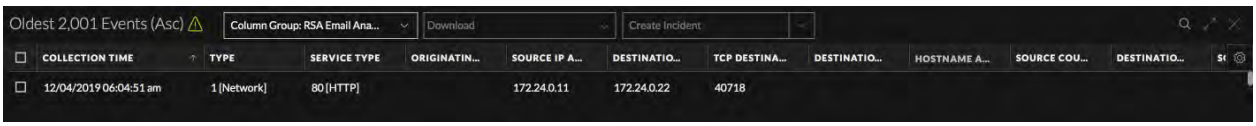
1. In the **Meta Groups** list, select a file to import and click .
   The selection dialog is displayed.

2. Click **Browse** and navigate to the directory on your local file system where the downloaded `MetaGroups.jsn` files are stored. Select a file and click **Open**.
   The filename is displayed in the Upload File field.

3. Click **Upload**.
   The upload process begins, and a message indicates that the upload was successful. The meta groups are added to Meta Group list. If the file is a duplicate of an existing meta group, a dialog tells you that the meta group already exists.

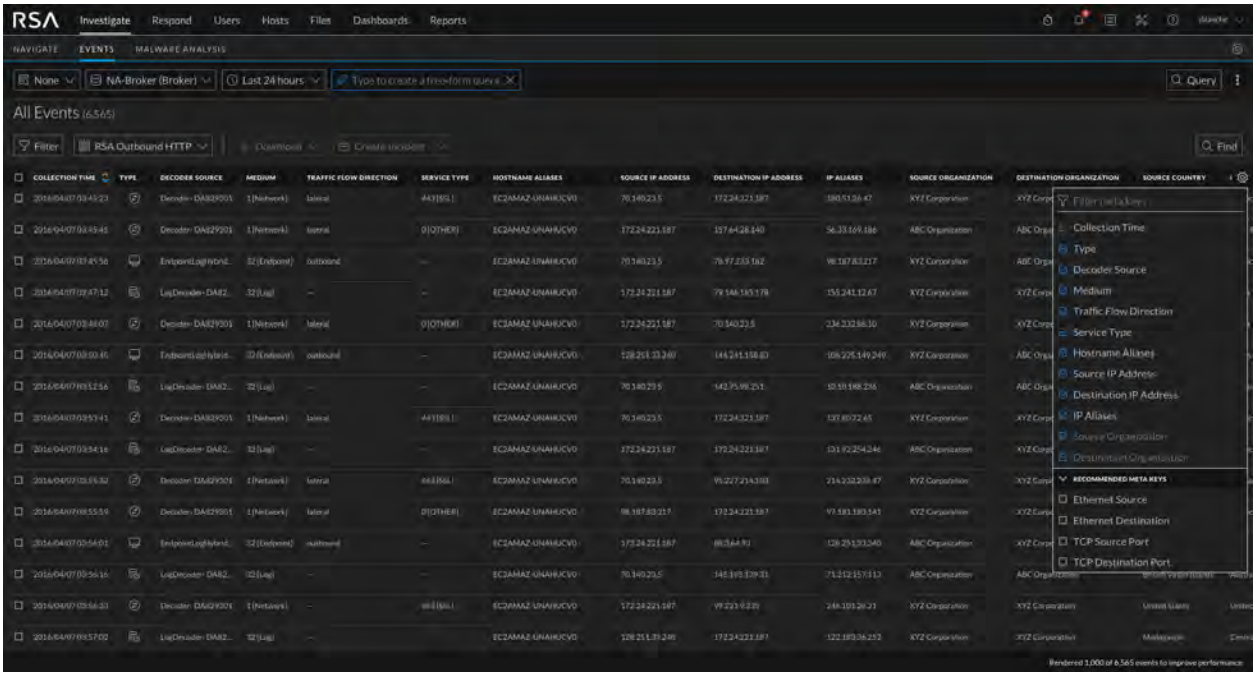
# Use Columns and Column Groups in the Events List

When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, compare these two figures showing the same set of events with different columns. The first figure has five columns, **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The second figure has many more columns that contain information useful when investigating email; you can scroll to the right to see the additional columns.



You can adjust the events list as you work, selecting different columns to be displayed, rearranging the order of the columns, changing the width of the columns, and choosing a column by which the list is sorted. Manual adjustments are easy to make if you know which meta keys are relevant. Manual adjustments apply only to the current session in Version 11.5; in Version 11.5.1, the column width is an exception. When you adjust the column width, it is preserved as a personal preference and is applied every time the column is used in the Events list, overriding any default column width.

In version 11.6, you can select additional columns with data for the meta keys that you are viewing. This will enable you to obtain all the relevant meta key information from the Filter Events panel however the recommendations can change based on the selected meta groups. The following figure displays the additional meta key information under the Recommended Meta Keys section.



To improve your ability to see relevant meta keys quickly when looking at events in the Legacy Events view and the Events view, you can change the set of meta keys displayed by applying a column group. A column group defines the meta keys or meta entities that are displayed as columns, the position of the column in the Events list, and the default width of the column. A column group must have at least one column. Column groups are useful in themselves, and they become even more useful when you combine them with meta groups and preQueries to define query profiles (see Use Query Profiles to Encapsulate Common Areas for Investigation).

The same column groups are shared between the Legacy Events view and the Events view. When importing a column group, the imported group is limited to the available meta keys for the service being investigated. Private column groups created in the Events view are not available in the Legacy Events view or for use in Query Profiles in the Navigate view.

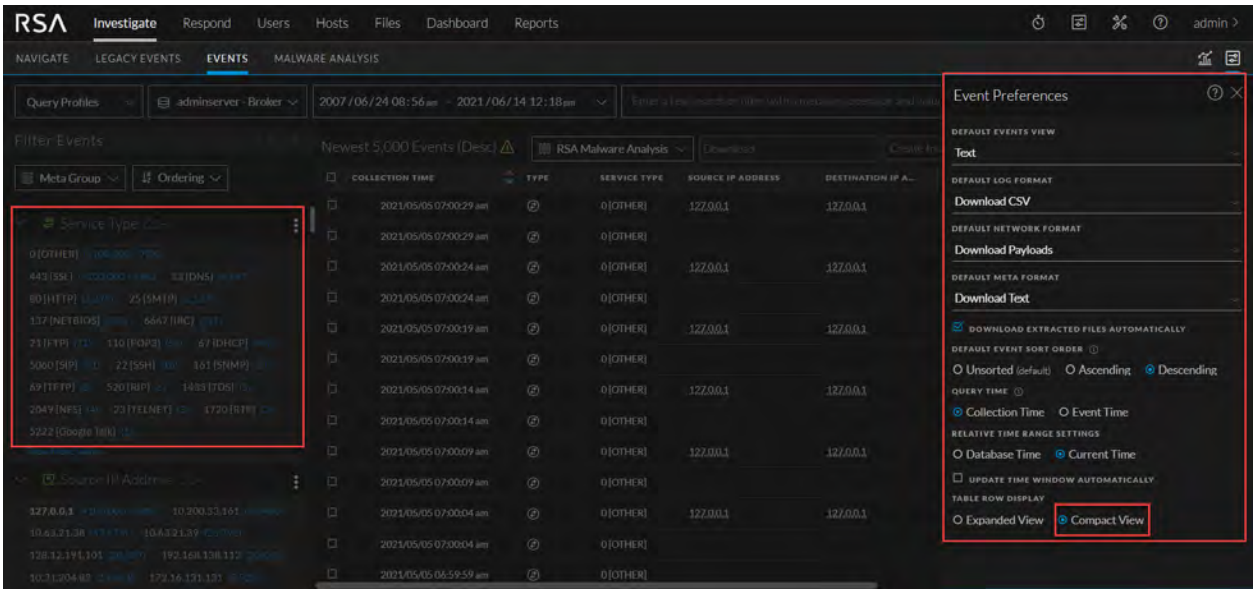
**Note:** In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Filter Events panel) in the Events view. The Events view Filter Events panel can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.

Large column groups can have a performance impact when loading data because the values for each meta key are loaded in the events list. To minimize impact on performance, the Events view has a fixed limit on the number of meta keys in a column group. The maximum number of meta keys in a column group is 40. (Because several default meta keys are included you may see a few more than 40 displayed on the screen.) Meta keys that are not in the selected column group are not loaded in the events list. By default we load all columns in the group, but only 15 are displayed by default.

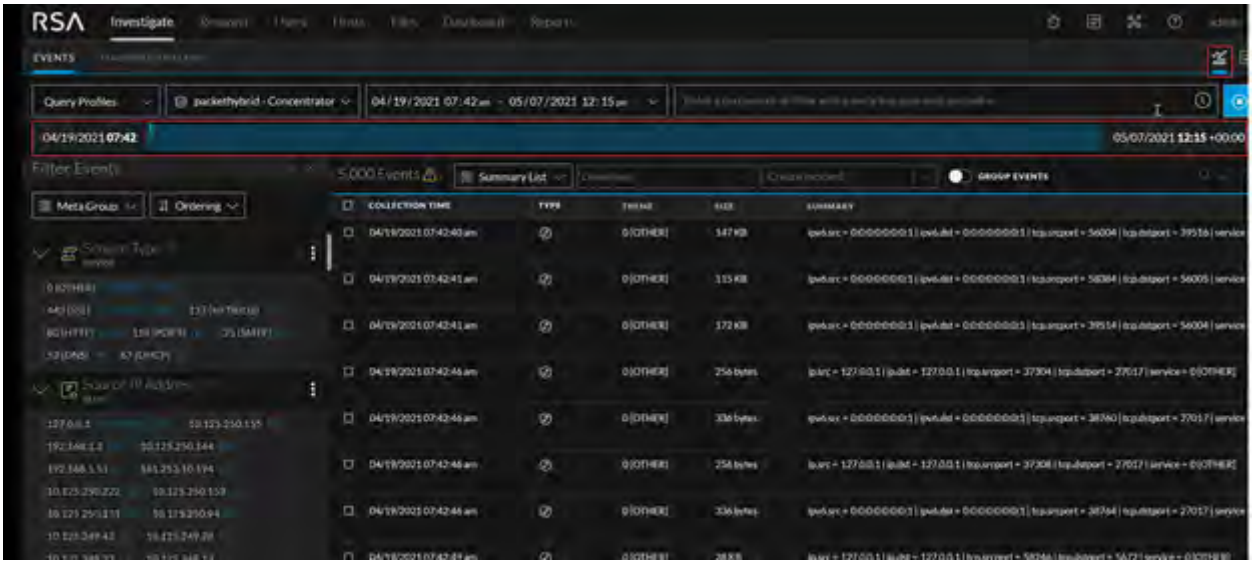
The Legacy Events view does not have a limit on the number of meta keys in a column group, and may have more than 40 meta keys in a column group. If you apply a column group with more than 40 meta keys that was created in the Legacy Events view, all columns are loaded in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

**Note:** In Version 11.3, column groups are created and managed in the Events view and available for use in the Event Analysis view. All existing column groups, both built-in and custom, are available in the 11.4 Events view. The complete column group management functionality is available in the Legacy Events view, and all functionality except cloning, importing, and exporting column groups is available in the 11.4 Events view. In Version 11.5, cloning is also available in the Events view, but importing and exporting are not.

In 11.6.1, the Investigate > Events Preferences view has been added to make optimum use of the space to enable analysts to view maximum details related to the events they are analyzing.

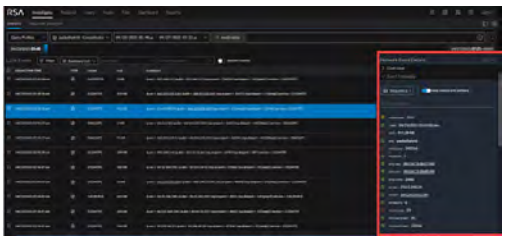


Additionally, an analyst can now view the timeline details of an event by clicking the ■ icon. When clicked the time line that displays the date and time range s displayed as shown in the image.

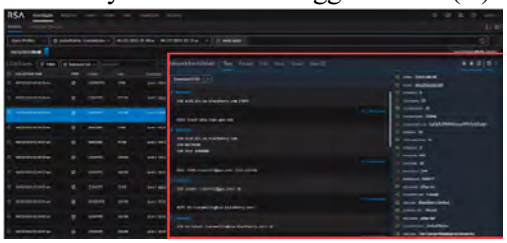


The Investigate > Events reconstruction panel has been modified to display an overlay that will contain an Overview tab and a Meta panel tab that can be expanded or collapsed. This will enable the analyst to view the headers and meta panel of the events optimally. The analysts can also toggle **Hide Duplicate Events** option and view only the relevant details of a selected event.

When an analyst navigates to this page the following view will be displayed.



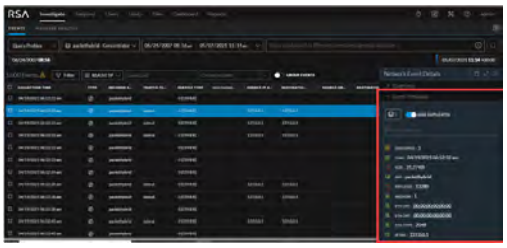
The analyst can use the toggle button ( ) to view the details related to the selected event.



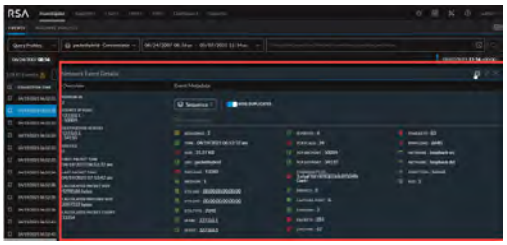
The binocular icon is enabled only if an event payload is open for a search related to a selected event.

The Overview Tab displays all the headers related to a specific event and the Event Metadata Panel displays all the metadata related to the selected event.

In 11.7, when you open the meta panel to view the selected event details, all the available headers will be displayed. The meta panel contains Expand buttons ( ). When you click on an event, the meta panel is displayed. In case, there are no additional headers to display, an error related to the header error is displayed.



The analyst can use the expand option to broaden the meta panels in three different views. When the outward facing arrow is clicked, it expands all the details displayed under the Overview and Event Metadata panel are displayed.



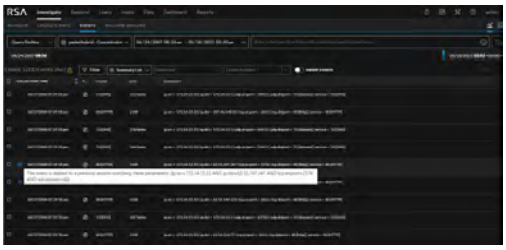
When clicked one more time, you can get an expanded view.

The analyst can revert the screen display by clicking the icon with the inward facing arrow , so that the window reverts to the earlier position. This helps the analyst to view the details of each event in an optimum manner.

The analysts can search for related sessions for a specific event as part of an investigation. The search for related sessions can be performed by navigating to the **Investigate** > **Events** page. You can click the icon and select either Find Related Sessions or Find Related Sessions in New Tab option from the drop-down.

When you select the **Find Related Sessions** option, all the events that are matched by selected event's query will be displayed in the current window. And if you select the **Find Related Sessions in New Tab** option the results are displayed in a new tab. The analyst can further investigate on each of the related session.

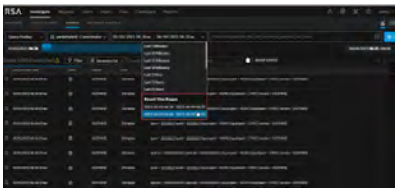
The query is based on the information displayed in the hover over text of an event. For example, in the below image the event has two split sessions where one event is split into one another session.



So, in this case when a search is done on these parameters, the related session for the following query is displayed.

The results are displayed in the following format:

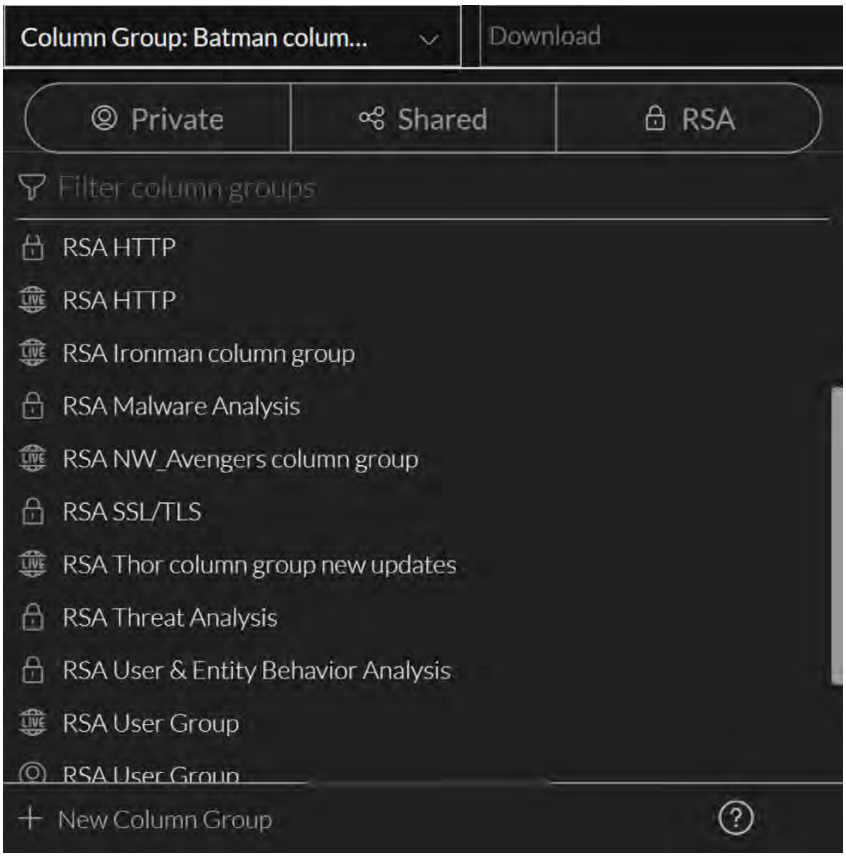
An analyst can view the last five time-ranges that were used recently, as the selection will be saved and displayed under the Recent Time Ranges section. The selection is saved separately for a user per service. For example, for Concentrator service, if you select Last 30 Days as the time-range, this will create an entry under the Recent Time Ranges section for Concentrator and when you select the same service in the next session, then the time range will be shown as below:



Now, if you select Decoder service and if you have not viewed the details of the Decoder recently, then the time range drop-down will not display any details as shown below:

## Built-In Column Groups

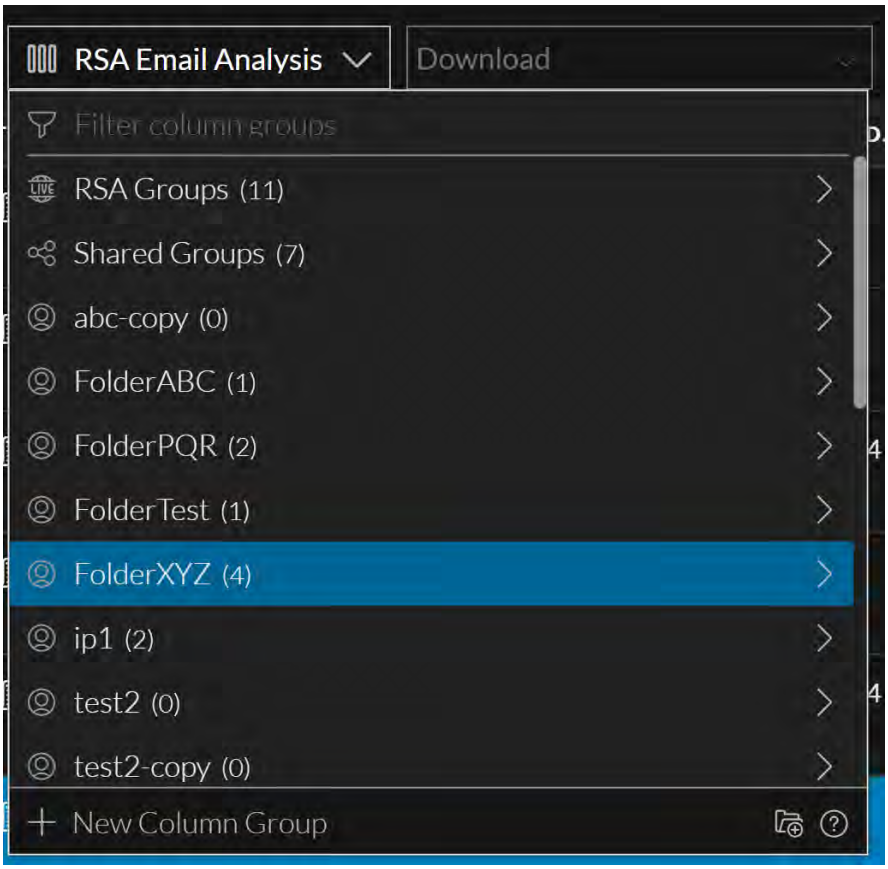
NetWitness Platform has built-in column groups that include useful meta keys for specific types of investigation. The built-in groups cannot be edited or deleted, but you can create a copy of the group and edit the copy. The column groups are listed in alphabetical order in the Column Group menu in a way that makes built-in groups distinguishable from custom groups that you imported or created.



In the Legacy Events view, "RSA" precedes the name of built-in column groups. In the Events view (Version 11.4 and later), RSA precedes the name and the group is marked by the lock symbol ( ). This is an example of a selected built-in column group in the Column Groups menu. The information icon is displayed at the end of the row.

## Live Column Groups

In 11.6 and later, NetWitness Platform supports deploying the investigate content from live and are marked by the live symbol () . The column groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.



RSA Email Analysis

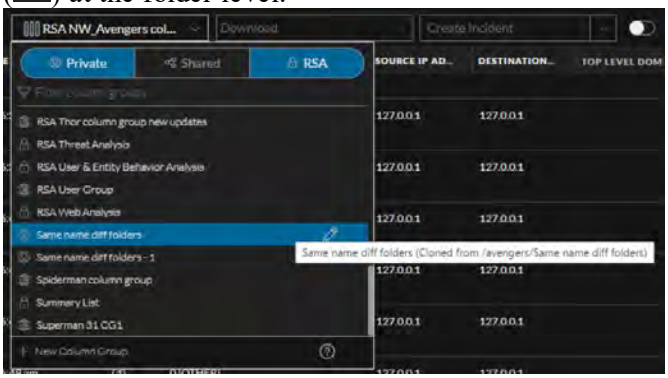
pc

The column group can be copied by clicking the copy icon ( ). After copying, the copied column group is displayed under the selected location (Private folders or Shared groups). You can hover over on the cloned item to view a tooltip that displays the path from which the column group is cloned. In case you need to search for a specific column group, you can type the name of the column group in the filter field ( ) at the folder level.



These are the built-in column groups.

- **RSA Email Analysis**: Includes meta keys that are useful when investigating email-related metadata.
- **RSA Endpoint Analysis**: Includes meta keys that are useful when investigating endpoint-related metadata.
- **RSA Malware Analysis**: Includes meta keys that are useful when investigation potential malware.
- **RSA HTTP**: Includes meta keys that are useful when investigating HTTP related metadata.
- **RSA SSL/TLS**: Includes meta keys that are useful when investigating SSL/TTS analysis related metadata.
- **RSA Threat Analysis**: Includes meta keys that mark potential threats in the data set.
- **RSA User and Entity Behavior Analysis**: Includes meta keys that are useful when investigating UEBA data.
- **RSA Web Analysis**: Includes meta keys that mark anomalies in web traffic.
- **Summary List**: Includes meta keys that are useful in a general investigation. This is the default column group.

## Custom Column Groups

You can create custom column groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in column groups after the service is restarted.

Custom column groups are shared globally within your organization in Version 11.4. If you edit a shared custom column group, your changes are applied globally. If you delete a shared custom column group, the group is deleted and no longer available for all analysts. In Version 11.5 and later, you can create shared column groups as before, and can also create private column groups. When you create a group in Version 11.5, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.

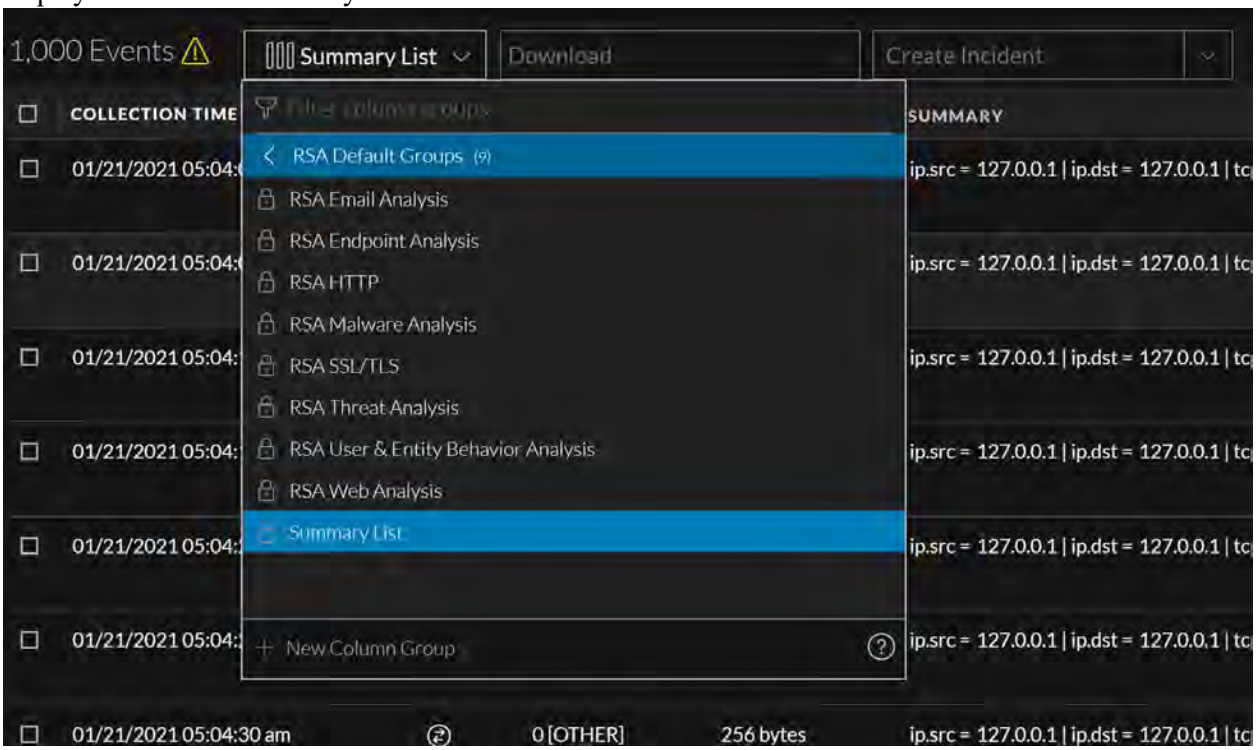
**Note:** Private column groups created in the Events view are not visible or usable in the Legacy Events view.

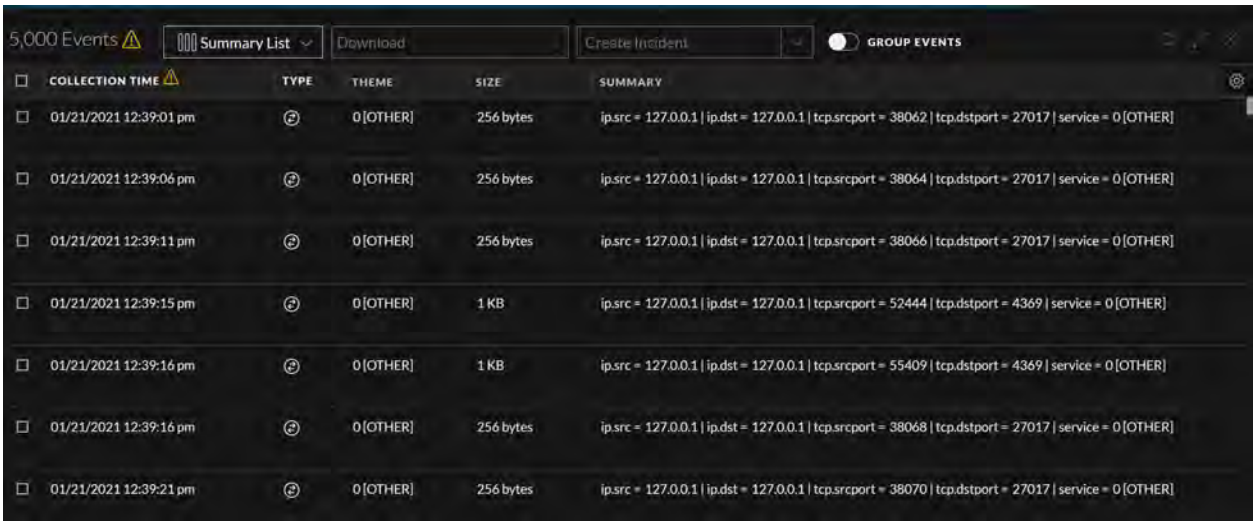
Icons identify the group type in the Column Group menu. These are examples of each type of custom column group with the edit icon displayed at the end of the row.

## Filtering Folders

In case there are many folders, you can type the folder name and filter for a specific folder. The filtering is applicable to the current level folders and will not display folders available within a sub-folder. To search content within a sub-folder you need to navigate to the specific folder and filter.

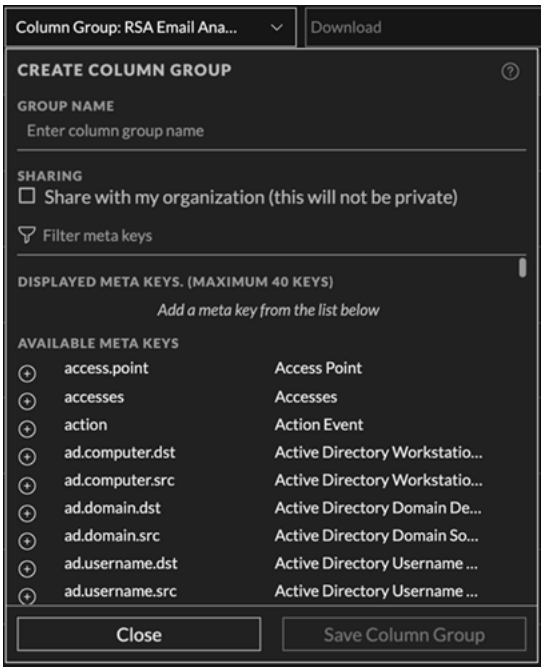
Also, when you select a specific folder, the content of the selected folder is displayed and the filter field becomes empty and when you navigate back the last selected folder is displayed. In the following example, the folder selected is RSA Groups with the its content and the column group drop-down displays the filtered Summary List folder.

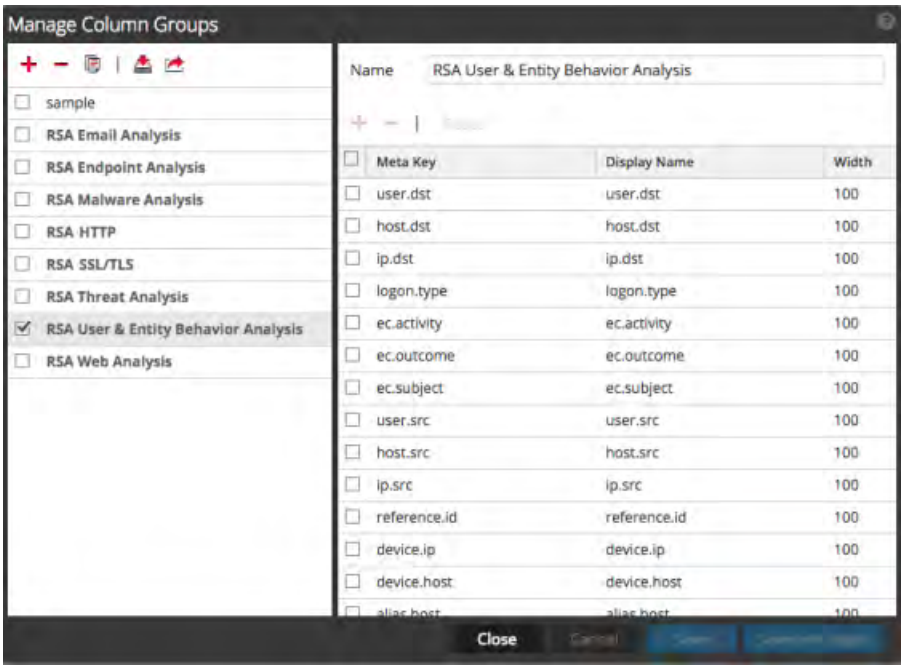




## Dialogs for Managing Column Groups

While the functionality of column groups is similar in the Legacy Events view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Column Group dialog and the (Legacy Events view) Manage Column Groups dialog. The Version 11.5 and later dialog includes a Sharing option.





Using options in the Create Column Group dialog and the Column Group Details dialog, you can:

- See the details of a column group.
- Create, edit, and delete custom column groups.

Using options In the Manage Column Groups dialog, you can do all of above and these additional functions:

- Clone and edit the clone of a built-in or custom column group.
- Import and export a column group.

The rest of this topic provides instructions for working with column groups in the Version 11.4 and later Events view, the 11.3 and earlier Event Analysis view, and the Legacy Events view.

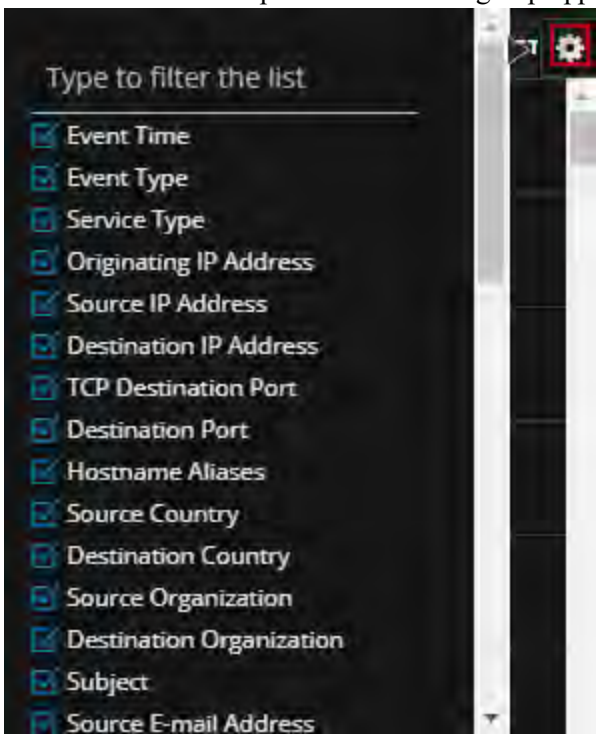
## Work with Columns and Column Groups in the 11.4 and Later Events View

After the upgrade to Version 11.4, all of the existing column groups -- both built-in and custom -- are available for management in the Events view. Unless noted, the procedures in this section are for the Events view.

## Manually Select Columns to Display and Adjust Column Order and Width

**Note:** The Column Selector was also available in the 11.3 Event Analysis view. If a column group includes a column for a meta key that your administrator has blacklisted (hidden), the data for that column cannot be displayed. The column is not available in the Column Selector and is not displayed in the Events panel.

1. With the Events list open and a column group applied, click ⚙ to display the column selector.



2. Select the meta keys or enter the name of a meta key that you want to display in additional columns.
3. Deselect the meta keys that you do not want to display in a column.
   The data is redisplayed using the selected columns.
4. To change the width of the columns in the events list, hover the cursor over the column title and drag the column divider to the right or the left.
5. To rearrange the order of the columns across the top of the events list, hover the cursor over the column title and drag the column to the right or the left.
   The changes that you make in the events list are in effect during the current session and are not retained as part of the column group. The next time the column group is applied, the original composition and order of columns is applied.

## Select a Column for Sorting Events in the Events Panel (Version 11.4)

**Note:** You can sort events in the Events panel after results have finished loading if all connected services are updated to 11.4. or later. Sorting by column is disabled when any connected service is running an earlier version of NetWitness Platform. Version 11.4.1 has more visible sorting toggles in the column heads and the ability to view results without sorting, but otherwise it functions the same as in Version 11.4.

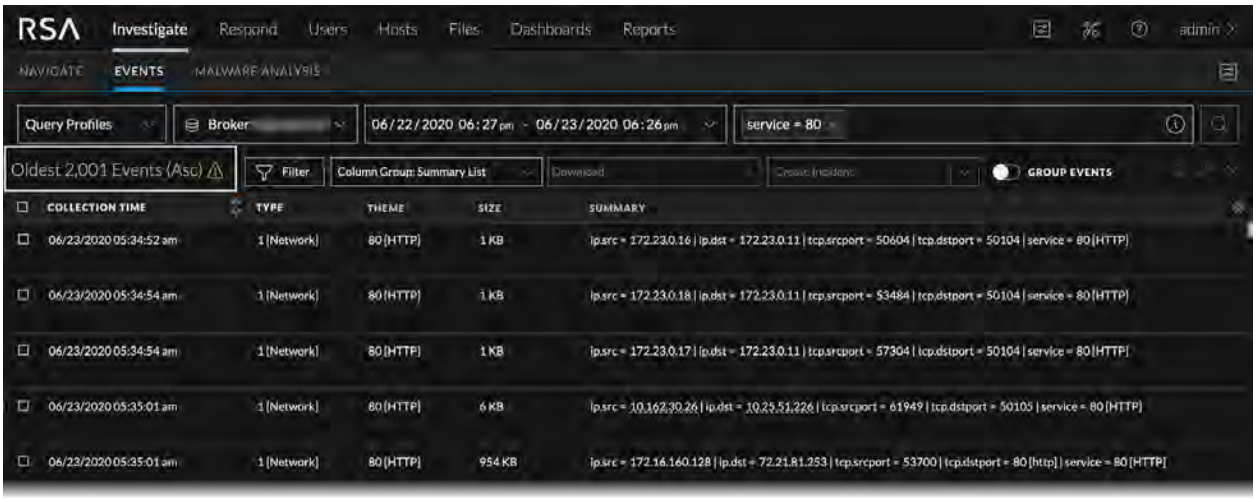
You can change the order of the events list in the Events panel based on the value for a meta key in the event. Each column title represents a meta key, and the column is populated by the values found for the meta key in the displayed events. In Version 11.4, the events in the Events panel are sorted using the method selected in the Event Preferences dialog: Ascending or Descending. If no sort method is selected, the default order is ascending (see Configure the Events View). In Version 11.4.1, the events in the Events panel are sorted only when the sort preference in the Event Preferences dialog is selected and is either Ascending or Descending. The events are not sorted if you do not have a sort preference selected under Events Preferences or if you selected Unsorted.

Sortability of a column is based on the definition of the meta key in the Broker and Concentrator index files. Columns for meta keys that are indexed by value are sortable. If the meta key is not indexed, is indexed by meta key, or has multiple values in the same event, it is not sortable.

- These are some examples of keys that are indexed by value and sortable: `time`, `eth.type`, `city.src`, `ip.src`, `ipv6.dst`, and `ipv6.src`.
- Meta entities are not sortable. For example, the meta entity `ipv6.all` is not sortable because it includes `ipv6.dst` and `ipv6.src`, and a single event has both `ipv6.dst` and `ipv6.src`.
- These are some examples of multiple value keys, which cannot be sorted: `filename`, `filetype`, and `attachment`. A single event can have more than one file and therefore more than one value for `filename`, `filetype`, and `attachment`.
- These are some examples of meta keys that cannot be sorted because they are not indexed or not indexed at the values level: `password`, `query`, and `size`.

## Sorting by Column (Version 11.4.1 and Later)

The initial view of the Events list with the sorting preference set to Unsorted and no column sorting has an event count in the title, with no indication of a sorting method applied to a column. If the event sorting preference is set to Ascending, the count label is "Oldest 1,000 Events." If the event sorting preference is set to Descending, the count label is "Newest 1,000 Events." In the figure below, the Ascending method is in effect, more than 2001 events matched the query, and only the oldest 2001 are displayed. Clicking the amber warning triangle displays an explanation. Refer to Configure the Events View for more information about the sorting preference.



When you move the mouse over a column title, sortable columns have a pair of arrows after the column title, one pointing up for ascending and one pointing down for descending ( ). You can choose one sort column and the direction of the sort. A blue up arrow ( ) indicates that ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A blue down arrow ( ) indicates that descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first.

- When a column has a blue arrow, you can click the white arrow to change the sort order. When you change the sort order, a blue progress bar is displayed in the Events list title bar to show progress. As sorting begins, there is a short segment on the left side of the window; as sorting progresses the blue color extends to the right across the entire title bar. The directional arrow does not change until the events are re-sorted in the chosen sort order.
- To change the column to unsorted, you can click the blue arrow. Both arrows are white now to show that the column is unsorted. This figure shows the Type column sorted in ascending order.

- If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.

Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

**Note:** The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold.

To change the sort order or the sort column:

1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.

2. To sort the list based on a column, move the mouse over a sortable column and click one of the arrows ( ).
   The arrow turns blue and the events are reloaded in the selected order. If both arrows are white, the column is not being used to sort the events list. If one arrow is blue, the column is being used to sort the events list, and the sort order (Asc or Desc) is appended to the events count in the title bar. This figure shows a column sorted in ascending order. When a column is descending order, (Desc) is appended to the event count.

   a. Click a white arrow to sort the events list in that order.

   b. Click a blue arrow to return to unsorted order.

## Sorting by Column (Version 11.4)

When you move the mouse over a column title, sortable columns have an up or down arrow ( or ) after the column title. You can choose one sort column and the direction of the sort. An up arrow indicates that Ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A down arrow indicates that Descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first. When you select a sort column, it is sorted in descending order by default, with events having a null value for the meta key first.

- A column that is being used to sort the events list has a bright white arrow indicating the direction that you can choose for sorting: click to change to Ascending or to change to Descending order. When you click to change to Ascending sort order, the directional arrow does not change until the events are re-sorted in ascending order. The same behavior applies when you click the to change to Descending order.
- If a sortable column is not being used to sort the events list, the arrow is dimmed. If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.
- If you click the arrow on a different column, the column is sorted in the same order as the previously active sort column. You can select a different sort order if desired.

Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

**Note:** The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold. If some of those events have the exact same time, they will not change order as you might expect when you reverse the sort order.

To change the sort order or the sort column:

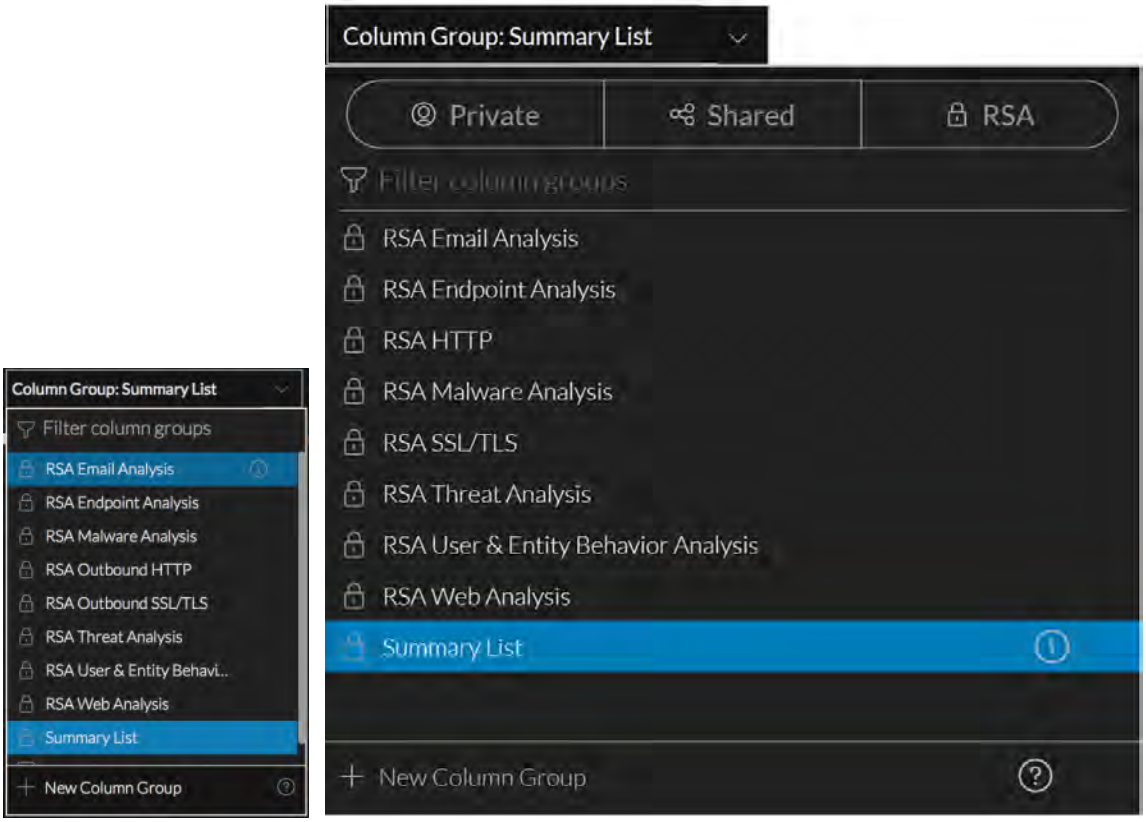
1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.
2. To sort the list based on a column:
   a. Move the mouse over a sortable column and click the arrow ( or ).
   The events are sorted in the correct sort order. If you hover over the column title, you can see that the arrow is no longer dimmed. A column that is being used to sort the events list has a bright white arrow that you can click to change the sorting direction.
   b. To change the sort order, click to change to Ascending or to change to Descending order.
   The direction of the arrow changes and the events are reloaded in the selected order.

## View the Meta Keys Included in a Column Group

To view details of a column group:

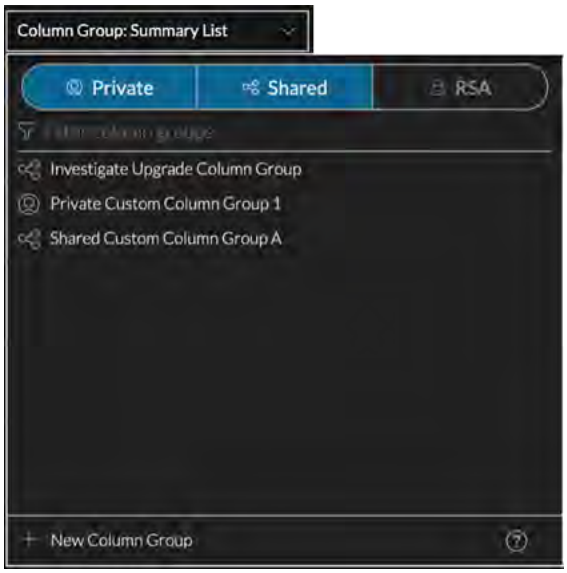
1. Go to **Investigate > Events** and click to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list.
2. To display the Column Groups menu, click the Column Groups menu title. The Column Group menu title includes the title of the currently selected column group. If this is your first visit after logging in, the Summary List group is selected; any subsequent visits use the column group selected in the previous session. When opened, the menu displays a list a list of built-in column groups (RSA), shared custom column groups, and your private custom column groups. Visibility options (Version 11.5) and a filter field make it easier to find a particular column group. The figure on the left shows the Version 11.4 menu initially when Summary List is selected by default and the first column group in the list is highlighted. The figure on the right shows the Version 11.6 menu initially when Summary

List is selected by default and all types of column groups are visible: Private, Shared, and RSA.

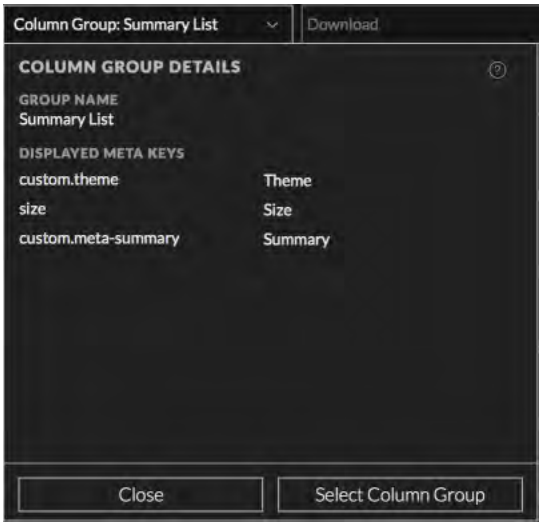


3. (Optional) To control the types of column groups that are visible in the list, use any combination of the visibility options (blue = selected, black = not selected):
   **Private** = display private groups that only you can manage
   **Shared** = display shared groups that anyone in your organization can manage
   **RSA** = display built-in groups that only RSA can manage
   The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. The figure below shows private and shared visibility options

selected.



4. Hover over the **Summary List** group and click the information icon ( ) to see which columns are included in the group.
   This figure shows the columns for the Summary List. The Collection Time and Type column are always the first two columns in the Events list, but are not listed in the Column Group Details dialog.

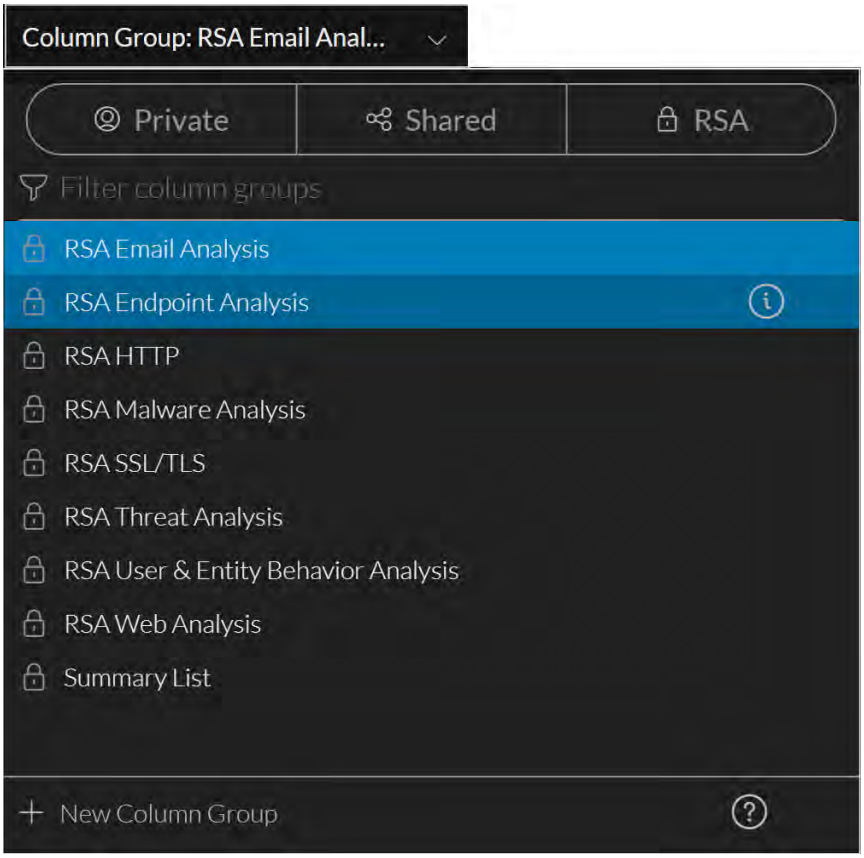


5. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the column group, click **Select Column Group**.
      The dialog closes and the Events list is updated to reflect the selected column group.

## Select a Column Group

1. With the Events panel open in the 11.4 or later Events view, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with a filtering option and a New Column

Group option. The list is sorted alphabetically and the selected column group is displayed in the menu label. The first option in the list is highlighted. The selected column group has a slightly different background color than the highlighted column group.
The following figure shows the menu after RSA Endpoint Analysis was highlighted, but RSA Email Analysis is still selected.

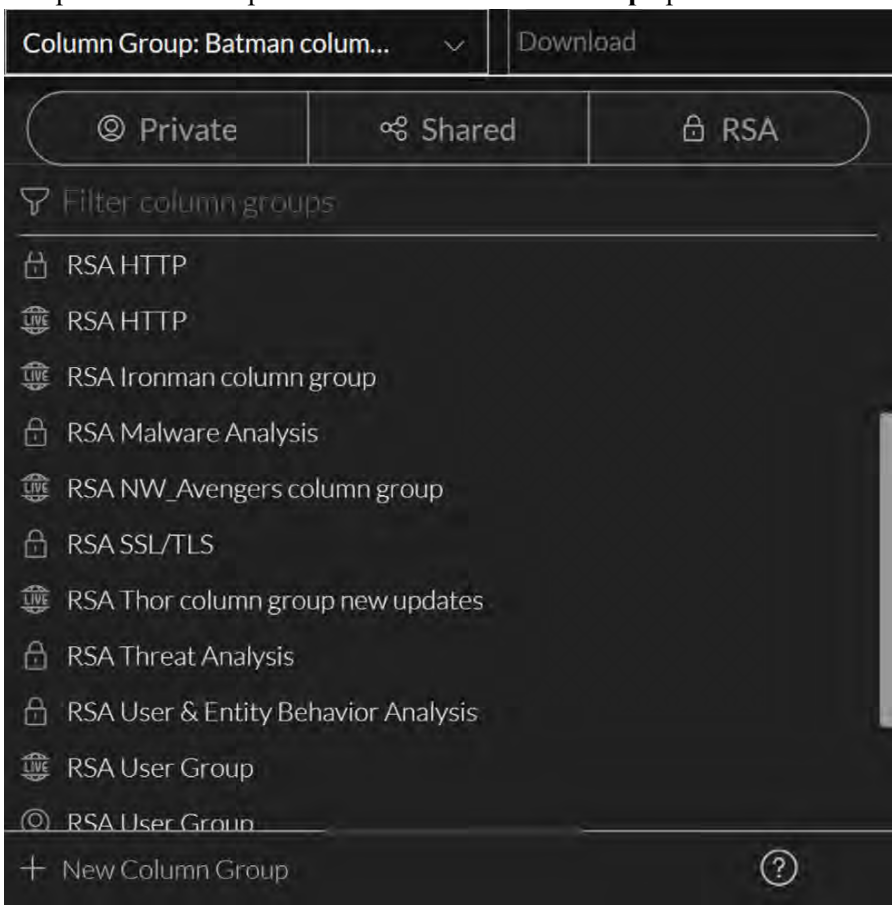


2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. (Version 11.5 and later) If you want to see only certain types of groups, use the visibility options (**Private**, **Shared**, and **RSA**) to hide one or two group types.
   c. Begin typing text in the **Filter column groups** field to search for a column group name. As you type, the list is filtered to show only the column group names that contain that string.
   When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
   The Events list is refreshed to include only columns in the selected column group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view. The order of the columns in the Events list reflects the order of the meta keys in the column group. A column group may contain more columns that are only visible when you scroll to the right. For optimal viewing, the first 15 columns are displayed by default when you select a column group.

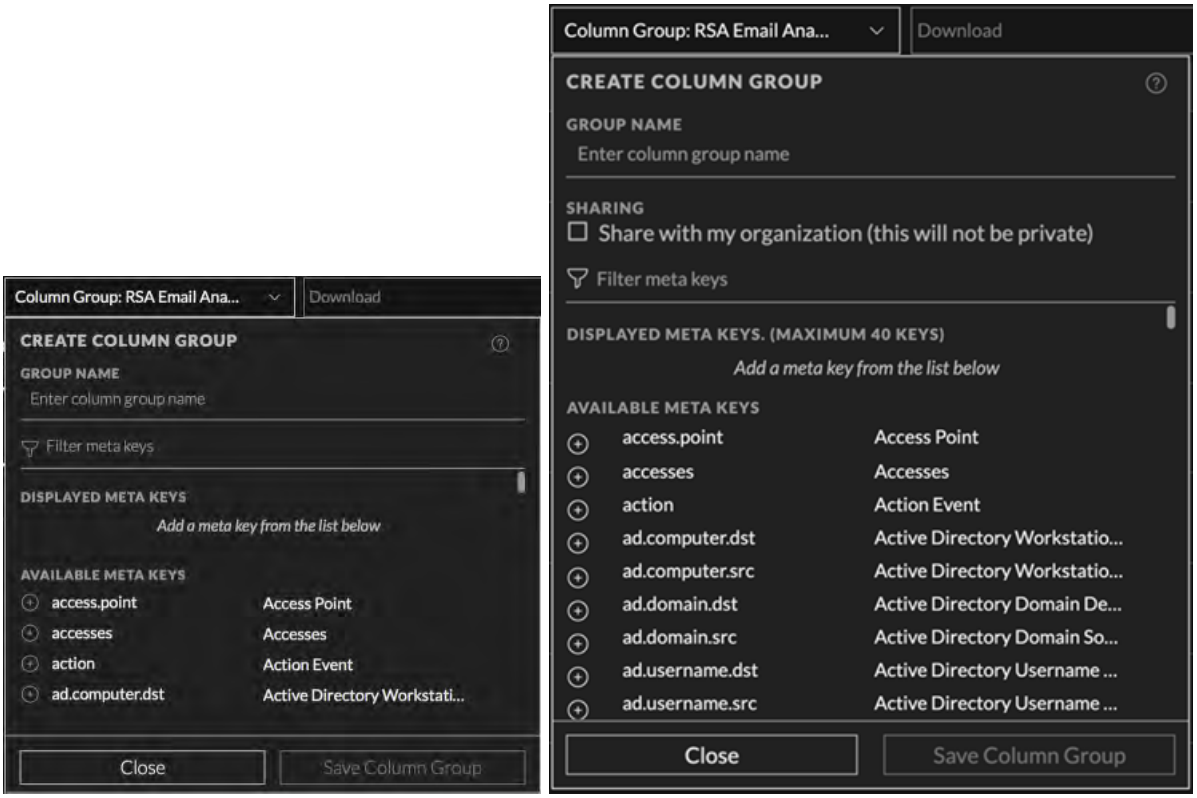
**Note:** If a meta key in a column group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

## Create a Custom Column Group

1. Go to **Investigate > Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with the Visibility Options and Filter Column Groups field at the top and the + **New Column Group** option at the bottom.

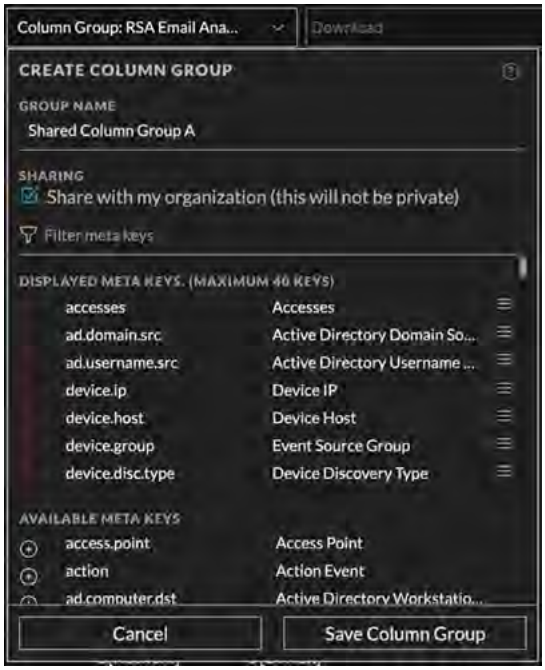


3. Select + **New Column Group**.
   The Create Column Group dialog is displayed. Version 11.5 includes the Sharing option.



4. In the **Group Name** field, type a unique name (maximum length of 256 characters) for the new column group, for example, **Custom Column Group A**.

5. (Version 11.5 and later) If you want to share the new column group with your organization, set the **Share with my organization** option.



6. To add a meta key to the column group, select and add each meta key as follows:

   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.

   b. When you see the meta key that you want to add, click the add icon that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using

the text you typed.) The maximum number of meta keys in a column group is 40. If you attempt to add another meta key when 40 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom column group, click **Cancel**.
   b. To create the group, click **Save Column Group**.
      The new column group is saved and becomes available for all analysts. The buttons change to Done and Select Column Group.
10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new column group, click **Select Column Group**.
       The new group is added to the Column Groups menu (in alphabetical order), and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.

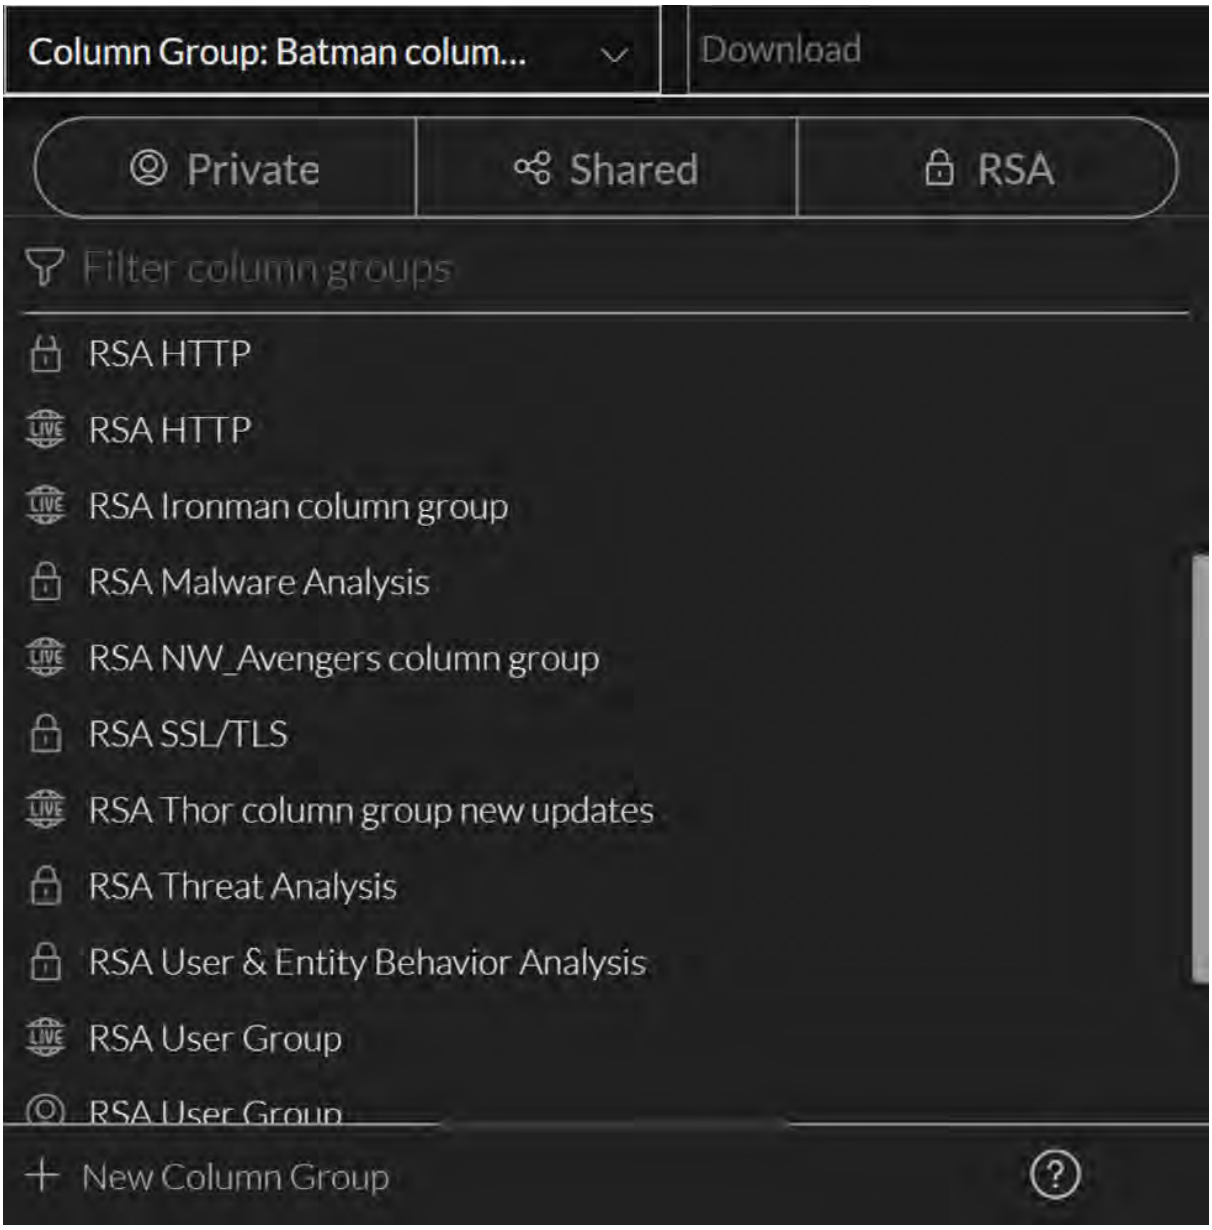
## Delete a Custom Column Group

You can delete any custom column group that is not currently applied in the Events list and not part of a query profile. The built-in column groups are read only, and cannot be deleted. In Version 11.5 and later, a confirmation message allows you to confirm or cancel the deletion. When you delete a custom column group, it is removed from the Column Group menu.

**Caution:** When you delete a custom column group (Version 11.4) or a shared column group (Version 11.5), the effect is global and the group is no longer available to any analyst.

To delete a custom column group:

1. Go to **Investigate > Events** and click to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list. This figure shows the initial view with the Summary List column group selected. The label on the Column Group menu includes the name of the selected column group.



2. To delete a column group, highlight a custom column group as shown in the following figure and click the edit icon ( ) to the right of the name.

3. The Column Group Details dialog opens with the details for the selected group displayed.

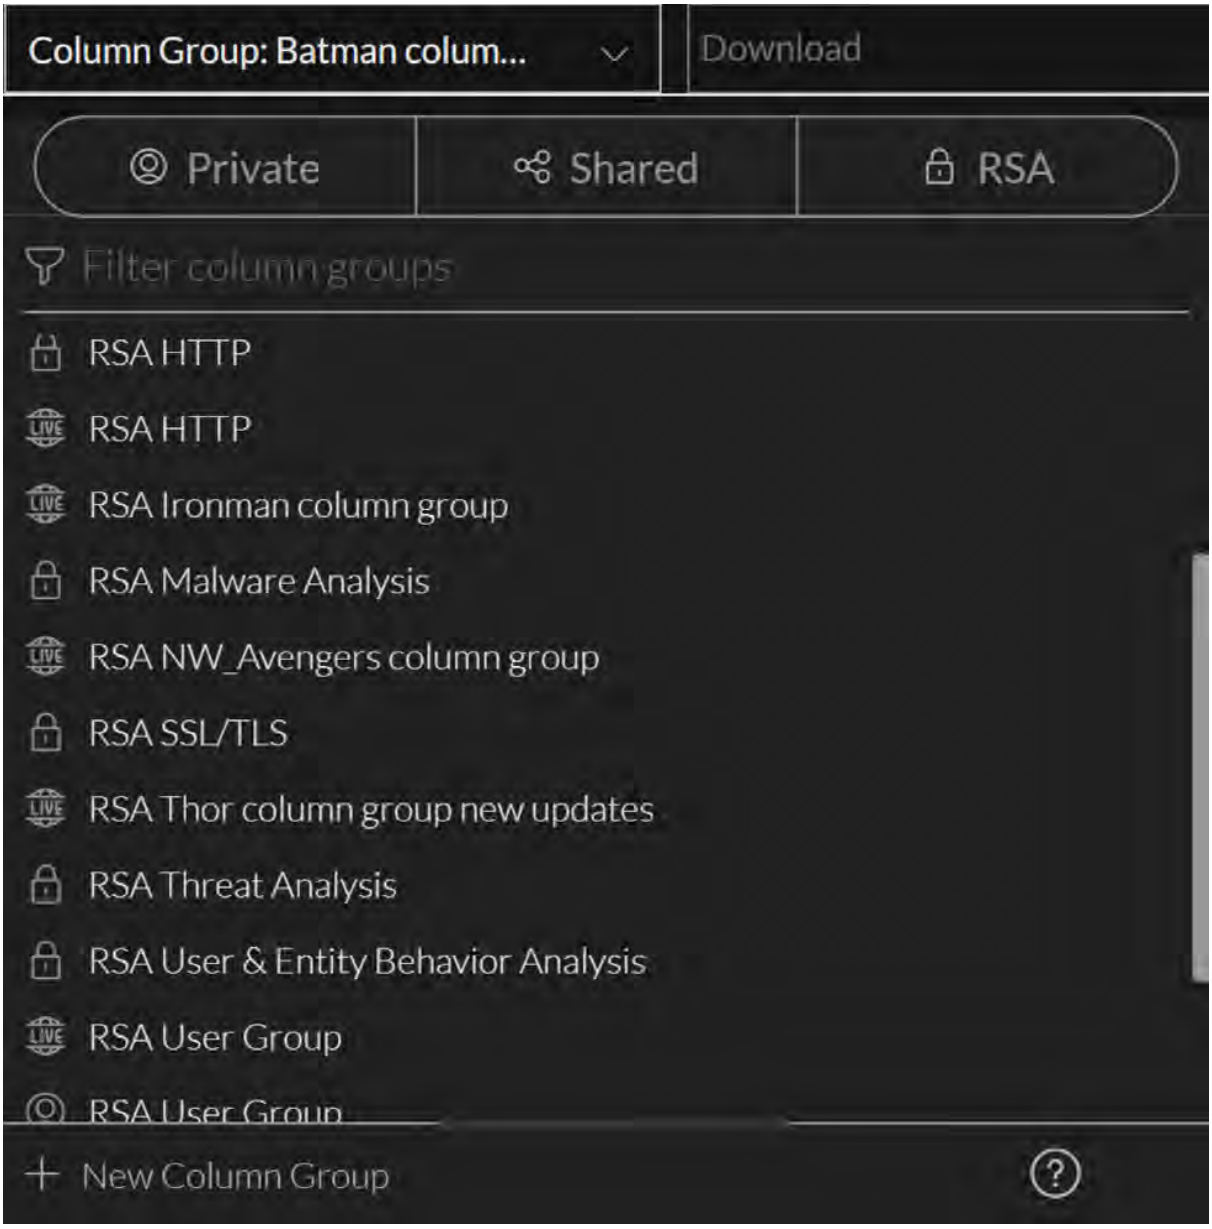
4. Click the delete group icon ( ).
   If the column group is currently in effect, the following message is displayed: `This column group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Column Group**.
   In Version 11.4, if the column group is not in effect and is not a built-in column group, there is no request for confirmation before the column is deleted.
   The group is deleted and removed from the Column Groups menu. The column group no longer appears anywhere for any analyst working in Investigate.

## Edit a Custom Column Group

You can create a shared or private copy of any column group that is not open for editing. After you create the copy, you can edit the new group in the usual way.

1. Go to **Investigate> Events** and submit a query to load data in the Events panel.

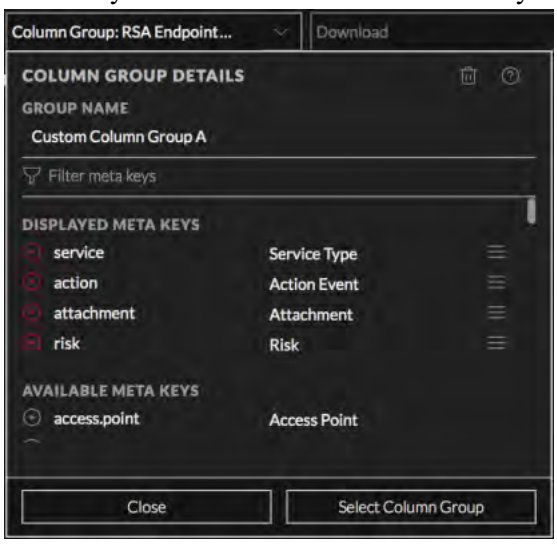
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups.



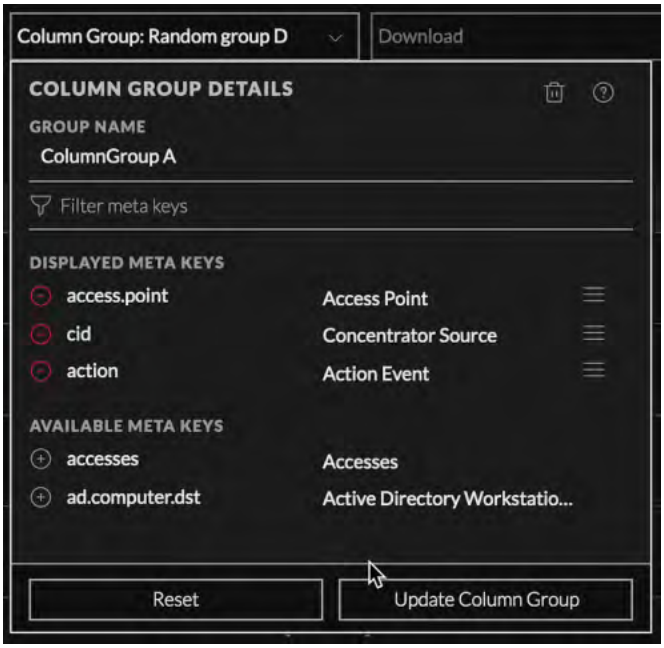
3. Highlight the column group that you want edit. This figure shows a custom column group highlighted, with the edit icon displayed to the right.

4. Click the edit icon ( ).
   The Column Group Details dialog is displayed so that you can edit the Group Name and Displayed

Meta Keys. You can add or delete meta keys and rearrange the order of the meta keys in the list.



5. (Optional) In the **Group Name** field, edit the name of the column group.
6. (Optional) To add a meta key to the column group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key.
   b. When you see the meta key that you want to add, click the add icon ⊕ that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) This figure shows the group name changed to Column Group C and `access.point` added to the Displayed Meta Keys list.



7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Displayed Meta Keys** list, or simply scroll through the list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without saving the changes to the custom column group, click **Reset**.
   b. To save the edits to the column group, click **Update Column Group**.
      The updated column group is saved globally for all analysts, and the buttons change to Done and Select Column Group.
10. Do one of the following:
    a. To close the dialog, click **Close**.
    b. To close the dialog and select the updated column group, click **Select Column Group**.
       The column group is updated, and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.

## Create a Copy of a Column Group (Version 11.5 and Later)

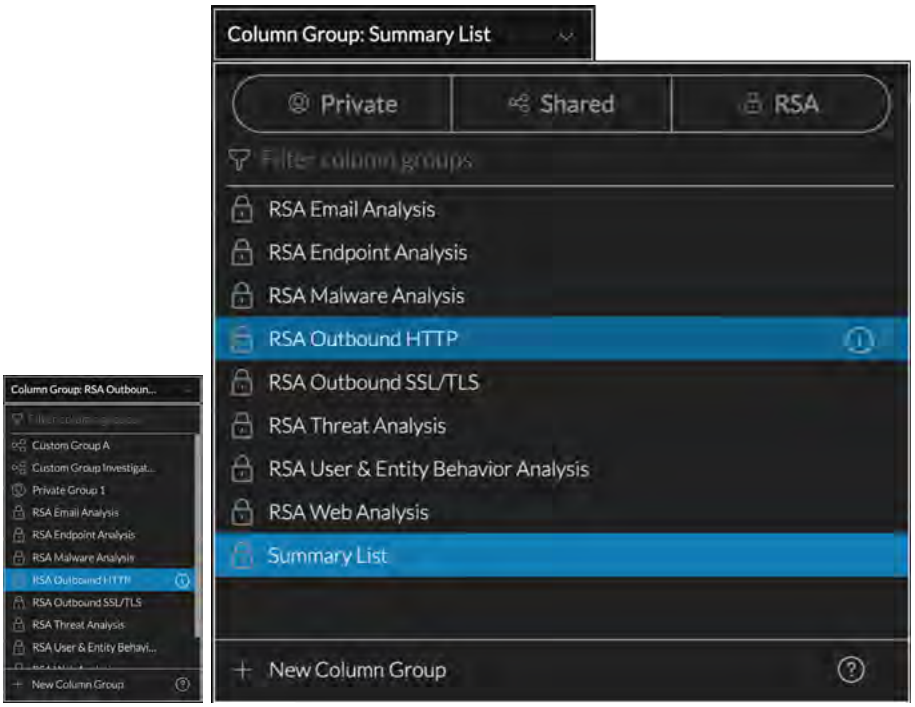
You can copy any column group, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you create a copy of a column group, the same name is used with a number appended. For example, if you copy RSA HTTP, the first copy is named RSA HTTP-1, and a second copy of the same group is named RSA HTTP-2. After you create the copy, you can edit the new group to give it a new name and manage meta keys in the group.

**Note:** Some column groups created in the Legacy Events view may have more the 40 columns, which is above the limit for column groups in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

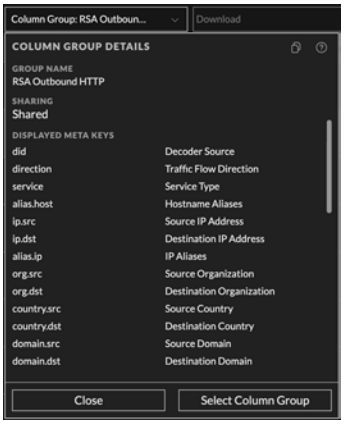
To copy a column group:

1. Go to **Investigate> Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with the Filter Column Groups field at the top and the + New Column Group option at the bottom. The first group on the list is highlighted, and the selected group has a light blue background.
3. Highlight the column group that you want copy. This figure shows RSA HTTP highlighted. The information icon ( ) is displayed to the right. On the left is the Version 11.4 menu and on the right is

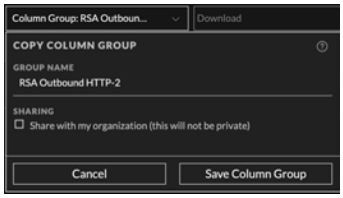
the Version 11.6 and later menu.



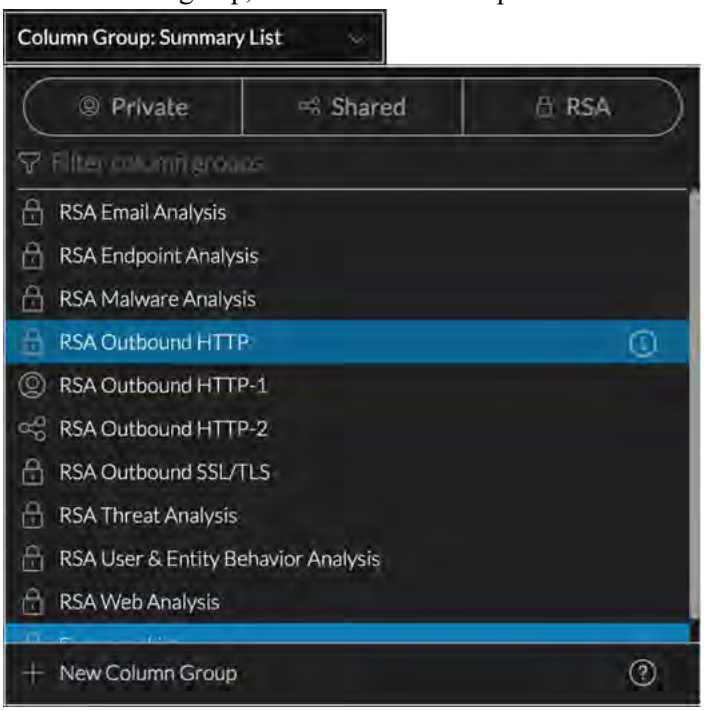
4. Do one of the following:
   a. Click the information icon ( ).
   b. Click the edit icon ( ).
      The Column Group Details dialog is displayed. This figure shows the dialog for a built-in group.



5. Click the Copy icon ( ).
   The Copy Column Group dialog is displayed with a `-n` appended to the column group name. The following figure has -2 because it is the second copy of this column group.

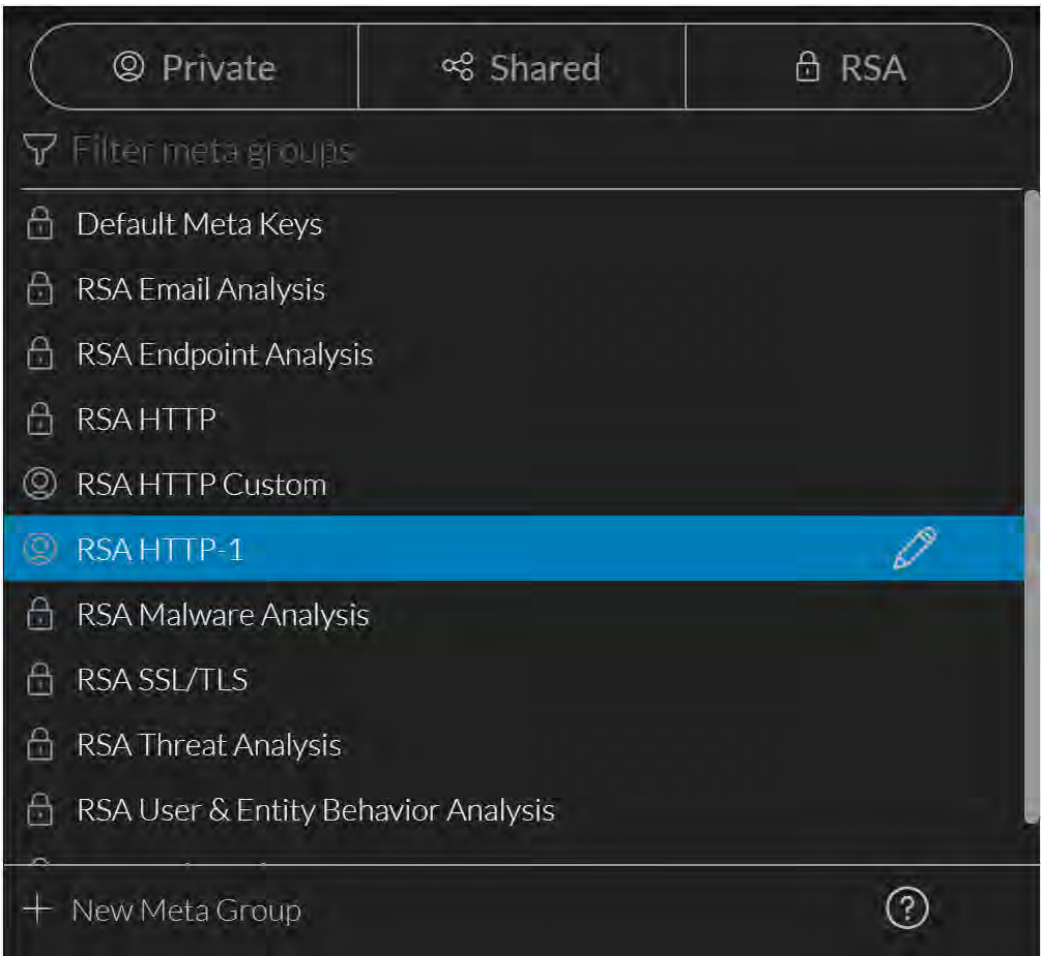


6. (Optional) In the **Group Name** field, edit the name of the column group.
7. If you want to share the new column group with your organization, set the **Share with my organization** option. By default the new group is private.
8. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the column group, click **Save Column Group**.
   The copy of the column group is saved, and the buttons change to Done and Select Column Group.
9. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the copy of the column group, click **Select Column Group**.
   The column group is copied, and if you clicked Select Column Group, the Events list is updated to show the columns in the copy of the column group. The figure below has two copies of the RSA HTTP column group, one shared and one private.



1. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA

HTTP meta group.



## Create a Column Group Folder

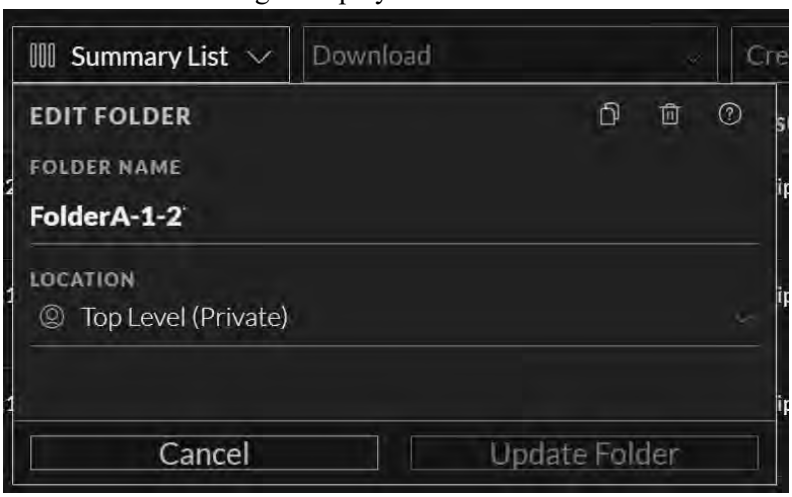
You can create custom column group folders which reside at the current level and are be added as a private or shared folder. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Column Groups menu title. The menu drops down to display a list of column groups and folders.
2. Click .
   The Create Folder dialog is displayed.
3. In the **Folder Name** field, type a unique name (maximum length of 255 characters) for the new meta group folder.
4. Click **Create Folder**.

## Edit and Move Column Group Folder

After you create a column group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. With the Filter Events panel open in the Events view, click the Column Group menu title and highlight the column group that you want edit.
2. Click .
   The Edit Folder dialog is displayed.



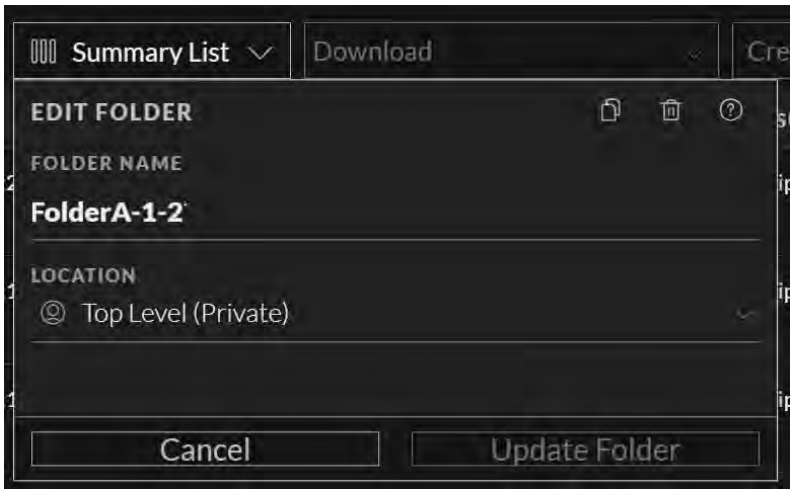
3. In the **Folder Name** field, type a unique name for the column group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

## Copy Column Group Folder

You can copy column group folders from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Select a folder you want to copy.

3. Click edit and the click copy .



The Copy Folder dialog is displayed.

4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

## Copy Group Folder Deployed from Live

You can copy column group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Filter Events panel open in the Events view, click Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Click on a Live Column Group folder you want to copy.

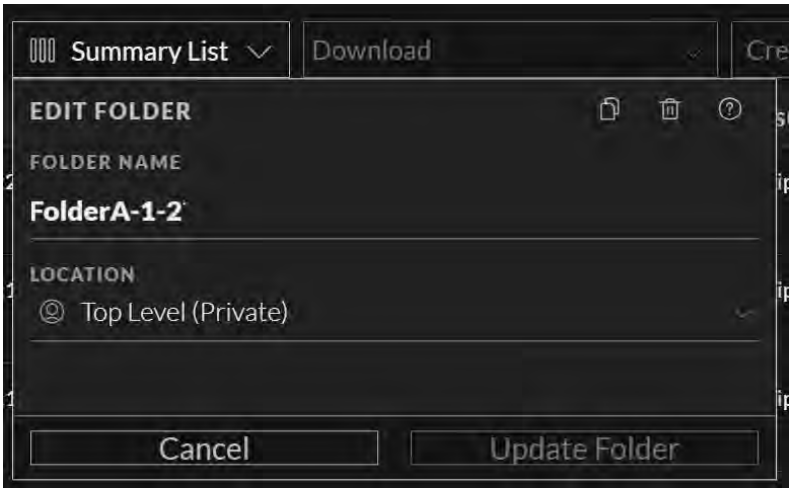
3. Click
   The Copy Folder dialog is displayed.

4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and appended with the 'copy' in the end.

## Delete Column Group Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.



4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

## Select a Column Group and Columns (11.3 and Earlier Event Analysis View)

In the 11.3 and earlier Event Analysis view, you can select a column group to apply to the Events list. These are the built-in groups and custom column groups created in the Legacy Events view.

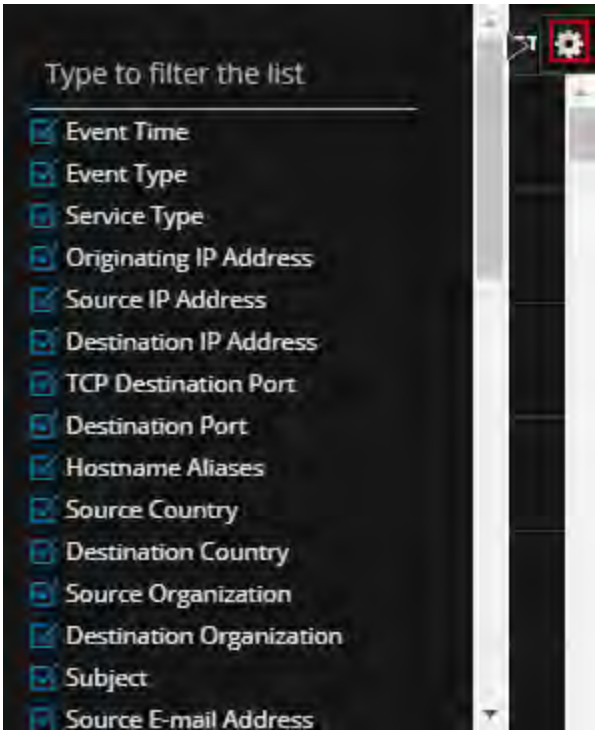
### To select a column group:

Begin in the Column Group menu and do one of the following:

1. Select a column group (for example, **Summary List**).
2. To filter the list of column groups, start typing the name of the column group. Type one character and a list of column groups that contain that character is displayed; as you continue to type the list is filtered to match. When you see the column group that you want, click to select it. To clear the filter text, click **X** or delete the typed text.
   The Events panel displays data in the columns that belong to the selected column group.

**To select columns to display:**

1. With the Events list open and a column group selected, click ⚙ to display the column selector.



2. Select the meta keys or enter the name of a meta key that you want to display in additional columns.
3. If you do not want to see a meta key displayed in a column, deselect the meta key.
   The data is redisplayed using the selected columns.

## Work with Column Groups in the Legacy Events View

This section includes procedures for working in the 11.4 Legacy Events view (and the 11.3 Events view). Three different forms of the events list with hard-coded columns are built in and labeled as follows: Detail View, List View, Log View. You can remove columns, rearrange the order, and change the width of a column. In addition the built-in or custom column groups are available; these give you more flexibility in choosing columns.

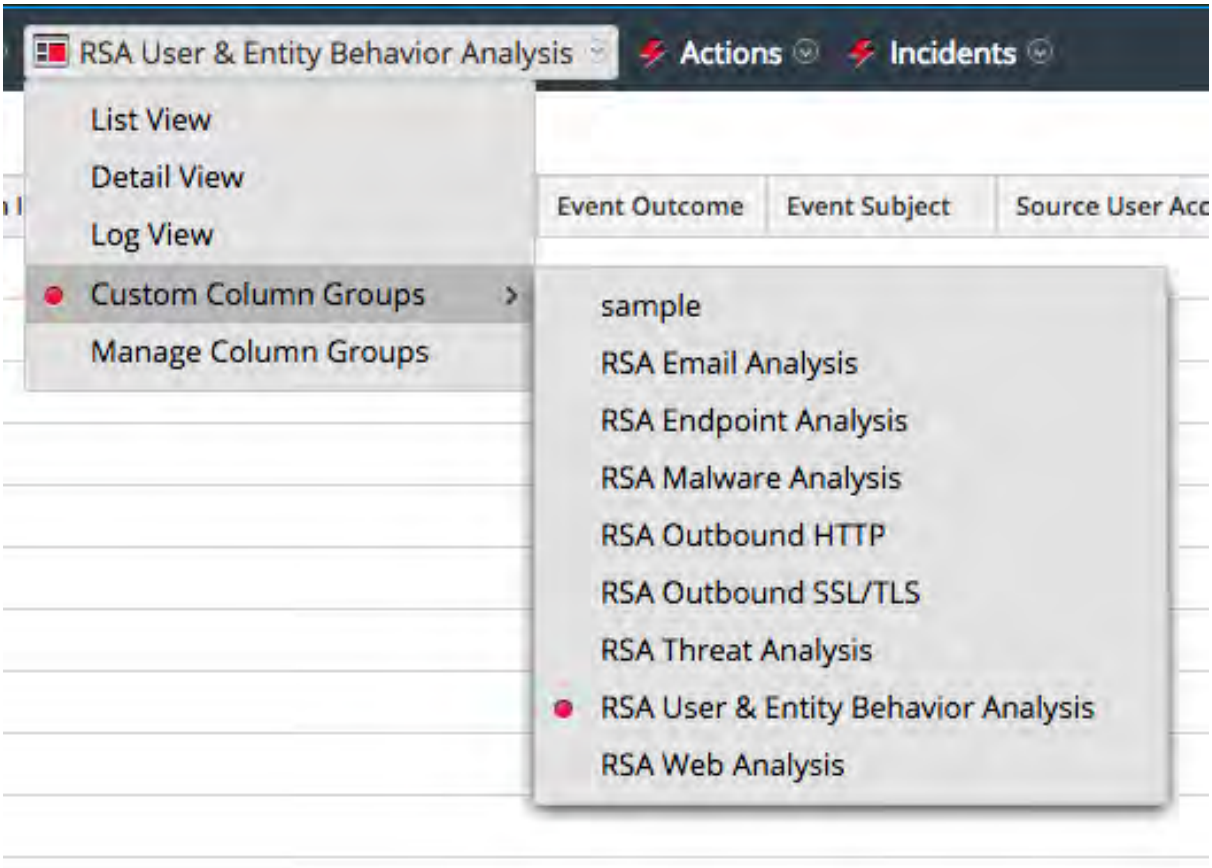
Column groups are shared globally, per service, across Investigate. Any changes you make to custom column groups are applied globally, affecting all analysts using the service. If you delete a column group, the column group is no longer available to anyone who is investigating the service.

### Select a Column Group

**Note:** Investigate profiles can include custom column groups. If a custom column group is used in a profile and you are viewing events in the Legacy Events view using a custom column group, you cannot change the view type (Detail, List, or Log).

To select a column group:

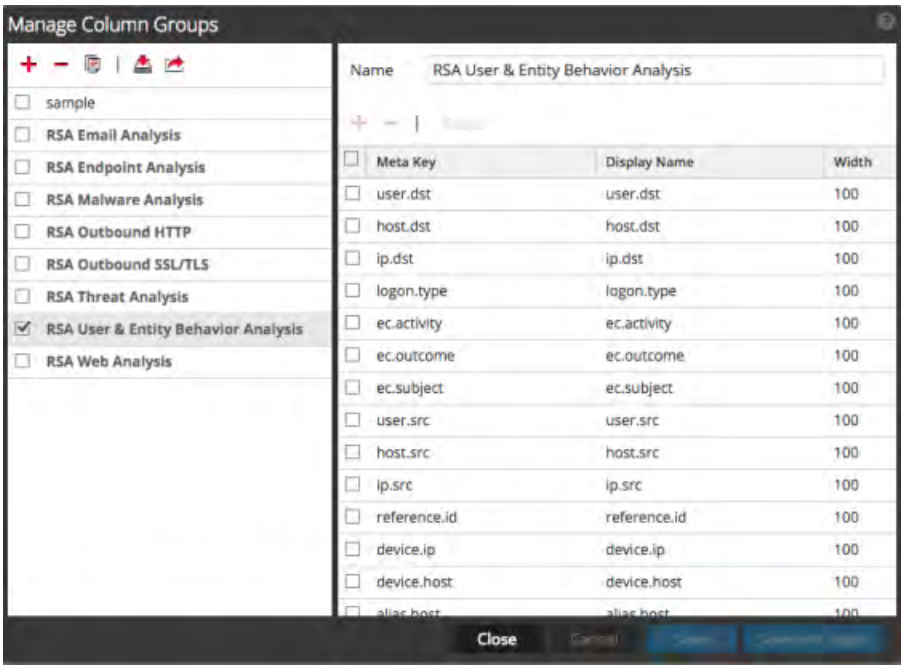
1. With the Legacy Events view open, select **Custom Column Groups** in the **View** drop-down menu. The menu label reflects the selected option: Detail View, List View, Log View, or the currently selected column group.



2. Select one of the column groups from the submenu.
   The Legacy Events view is refreshed to reflect the custom column group.

## Create a Custom Column Group in the Legacy Events View

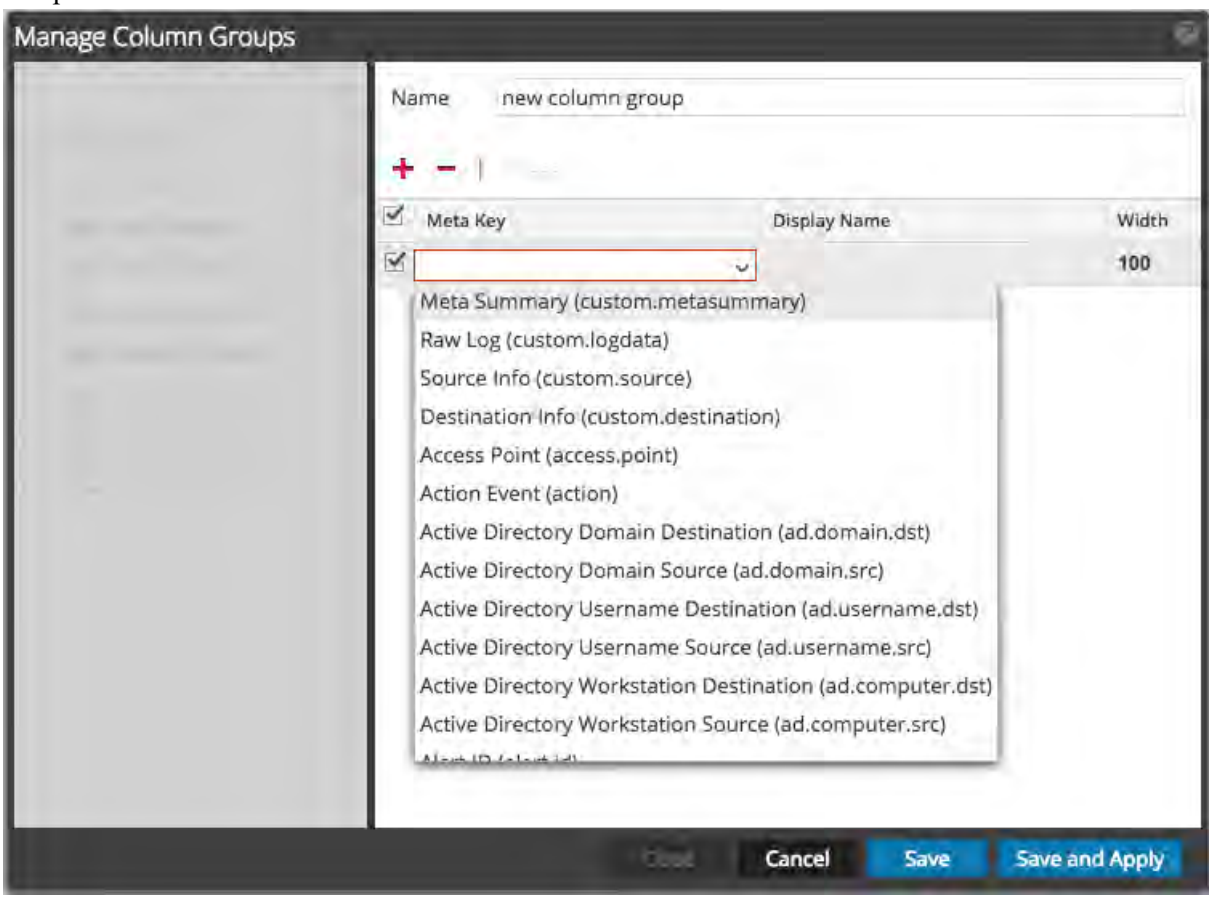
1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.
   The Manage Column Groups dialog is displayed.



3. To add a new column group in the column group panel, click + and type the name of the new group in the resulting field.
   The column definition panel opens on the right with the group name filled in. You can edit the group name.

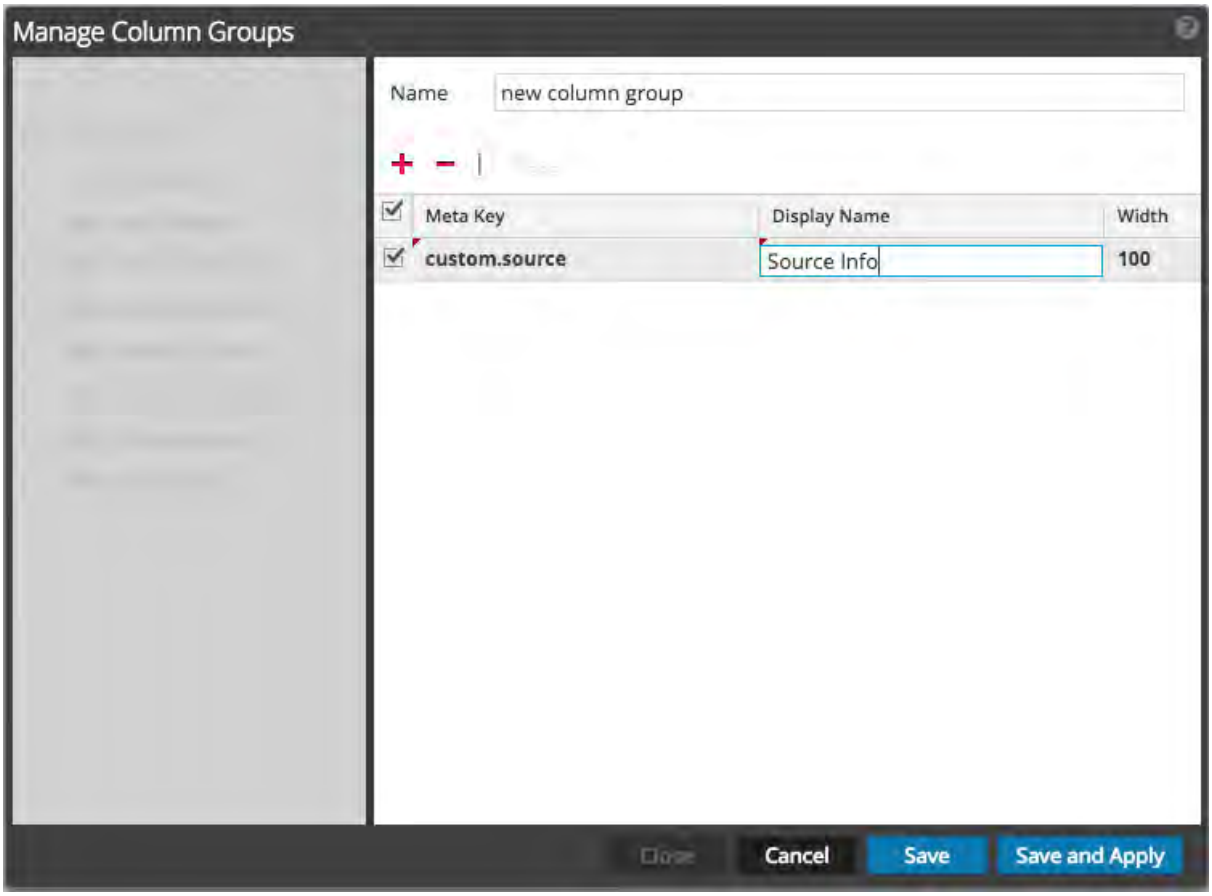
4. To add a column to the group, click +, and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.



5. (Optional) To delete a meta key from the column group, click −.
6. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

7. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

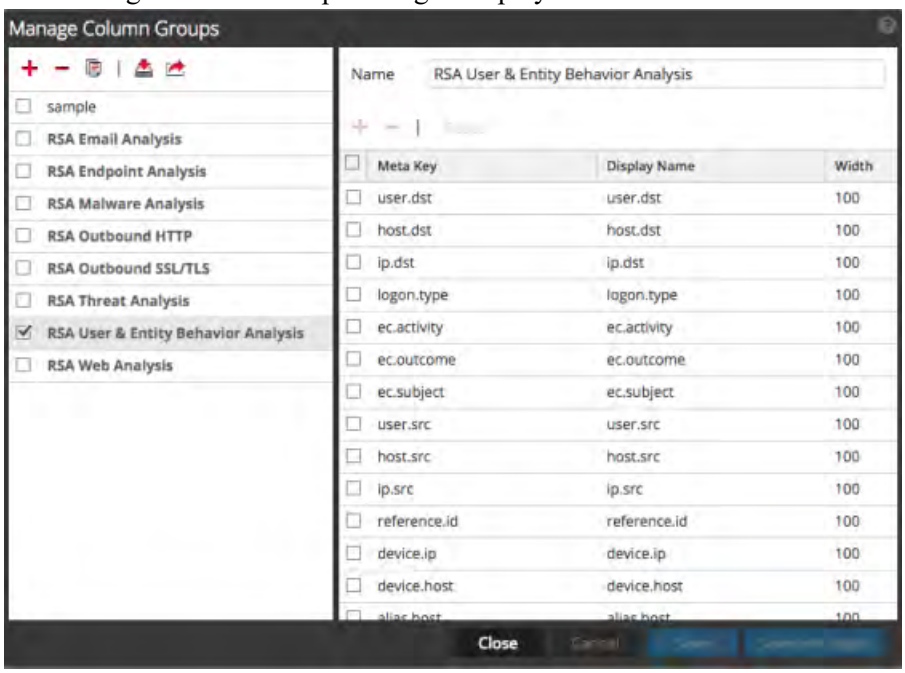


8. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
9. When ready to save, do one of the following:
   a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
   b. To save the edited column group without refreshing the Legacy Events view, click **Save**.

## Delete a Column Group (Legacy Events View)

1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.

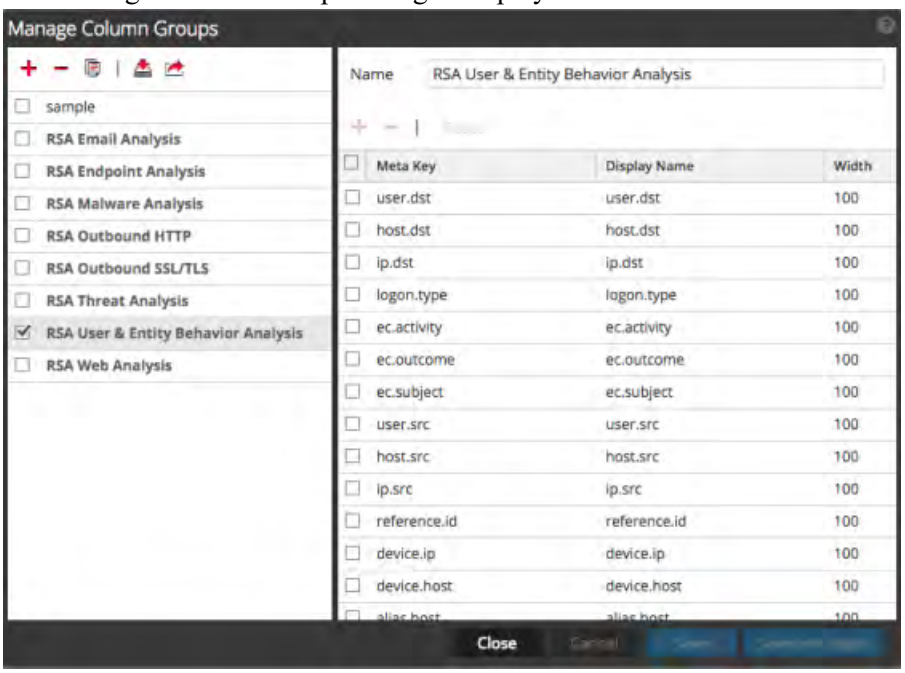


3. To delete a custom column group in the column group panel, select one or more custom column groups and click − in the toolbar.
   A confirmation request is displayed.
4. Do one of the following:
   a. To delete the column group and refresh the Legacy Events view, click **Yes**.
   b. If you decided not to delete the column group , click **No**.
      The selected column groups are deleted and no longer appear anywhere for this service in Investigate.

## Edit a Column Group (Events View)

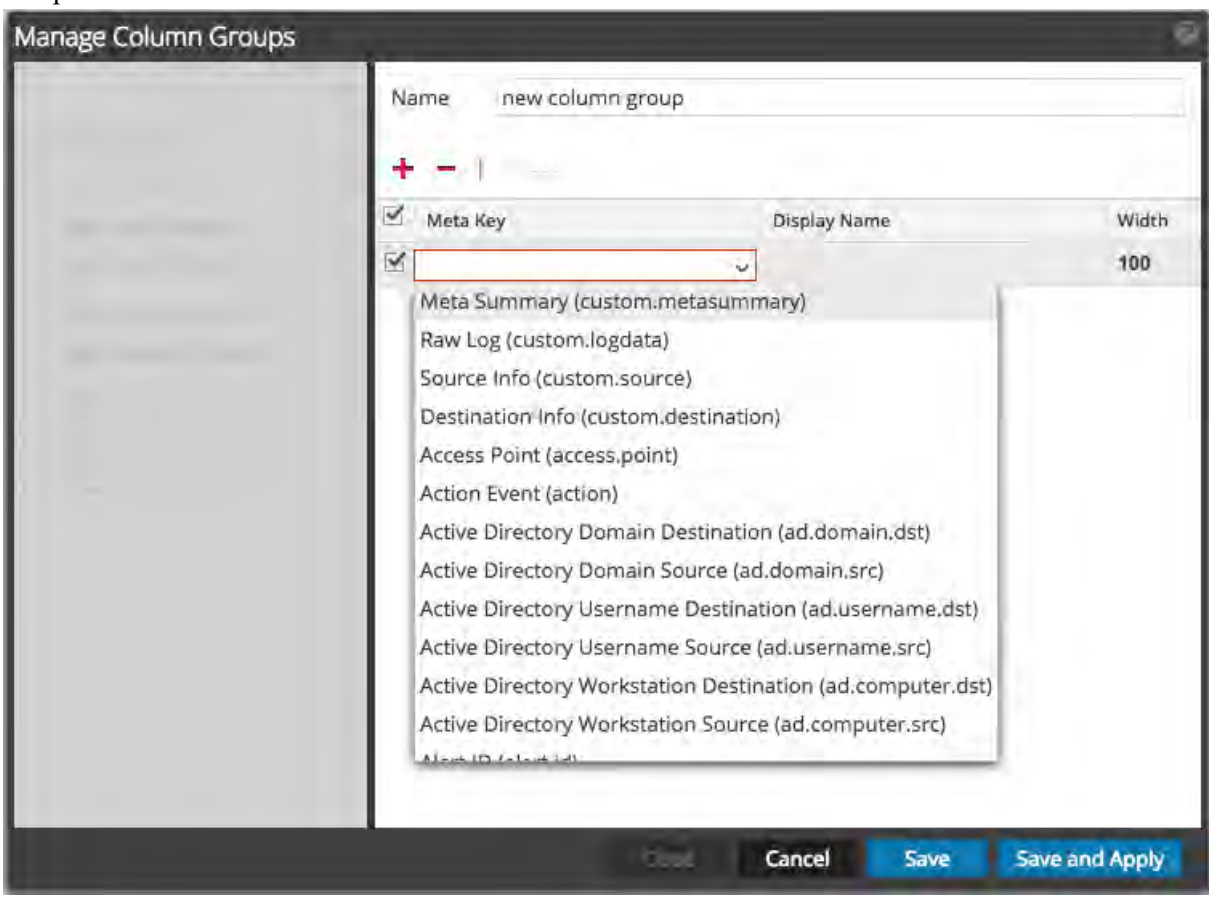
1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.



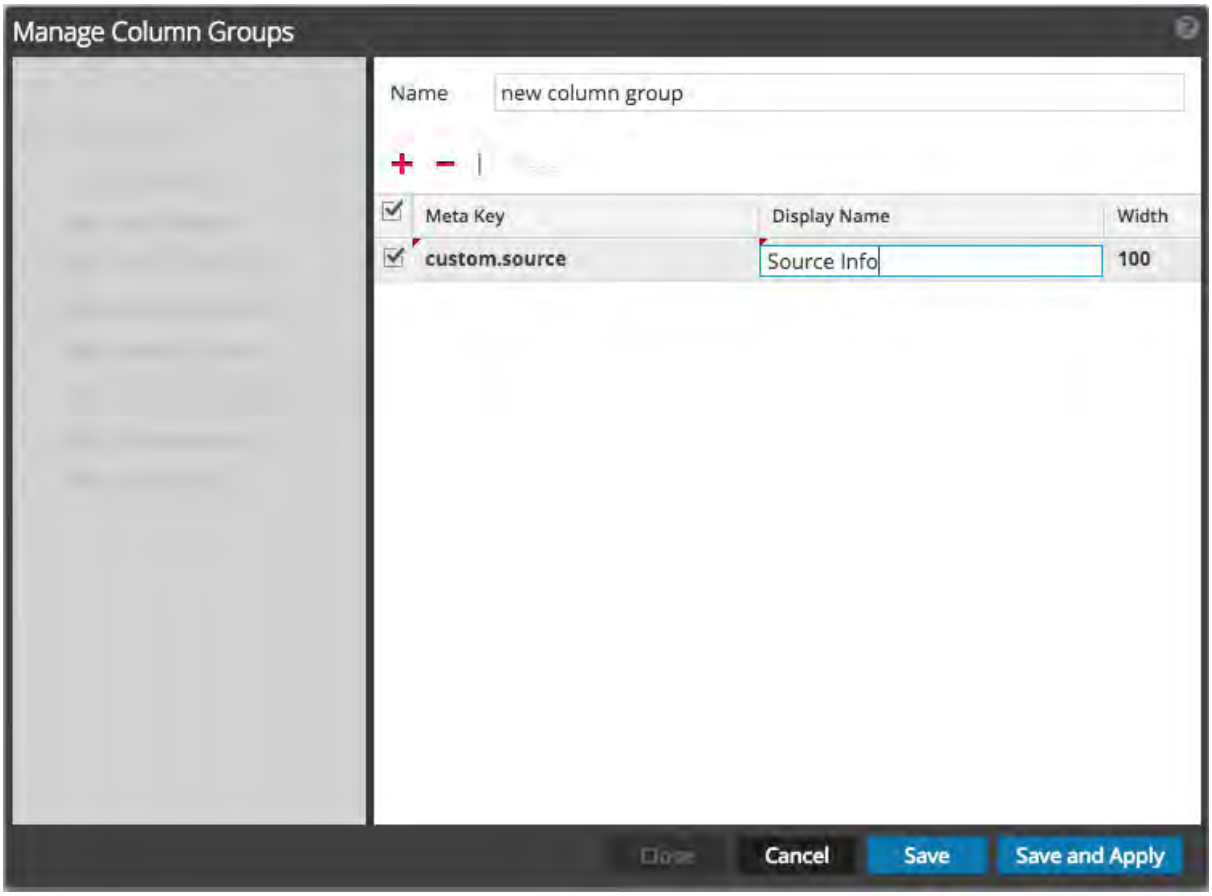
3. Do one of following:
   a. To edit a custom column group in the column group panel, select the checkbox before the name. The column definition panel opens on the right.
   b. To clone and edit a built-in column group or a custom column group, select the checkbox before the name and click the clone icon ( ).
   The column definition panel opens on the right.
4. (Conditional) If you are editing a clone of a group, type the new name of the group.
5. To add a column to the group, click , and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.



6. (Optional) To delete a meta key from the column group, click −.
7. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

8. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.



9. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
10. When ready to save, do one of the following:
    a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
    b. To save the edited column group without refreshing the Legacy Events view, click **Save**.

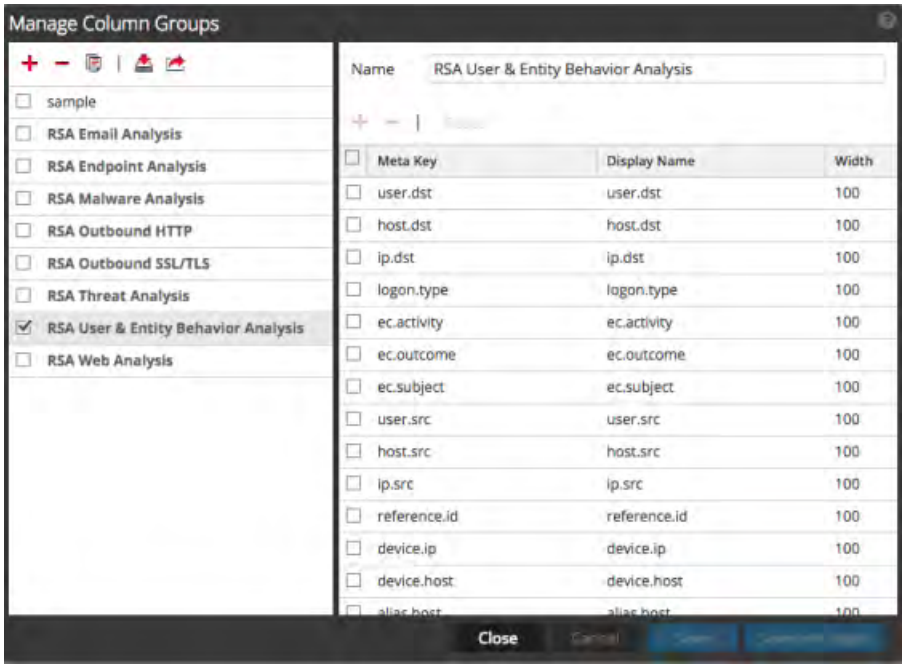
## Import and Export a Column Group (Legacy Events View)

You can export custom column groups for use by other members of your team, and other analysts can import column groups if you give them a copy of the exported file.

To export a column group:

1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group. Each of these views is a differently formatted events list, and each column represents one

meta key.
The Manage Column Groups dialog is displayed.



3. To export a column group, select the checkbox before the name and click the Export option ( ). The column group is exported to your local file system as a .jsn file, for example, `CustomColumnGroupsExport.jsn`. If you export another group, the next file is named `CustomColumnGroupsExport-2.jsn` to differentiate.
4. To import a column group that you have available on your local file system, click the Import option ( ).
   The Import Column Groups dialog is displayed.
5. Browse your local drive to find the column group (jsn file), and click **Upload**.
   The column group is added to the list. If it has the same name as an existing column group, a message is displayed and the column group is not imported.

# Use Query Profiles to Encapsulate Common Areas for Investigation

Query profiles offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view. The same query profiles are shared between all views, and they are available in the Springboard (Version 11.5) for use in panels. Private query profiles created in the Events view are only available in the Events view for the analyst who created them.

Each query profile specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

In a query profile:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the query profile is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View).

## Built-In Query Profiles

You cannot edit or delete built-in profiles, but you can copy an existing profile and edit the copy in the Navigate view, the Legacy Events view, or the Events view. In the Navigate view, the built-in profile names begin with the RSA prefix and are grouped under Default Profiles. The Events view does not support grouping of query profiles. This figure is an example of a built-in query profile as listed in the Query Profiles menu.

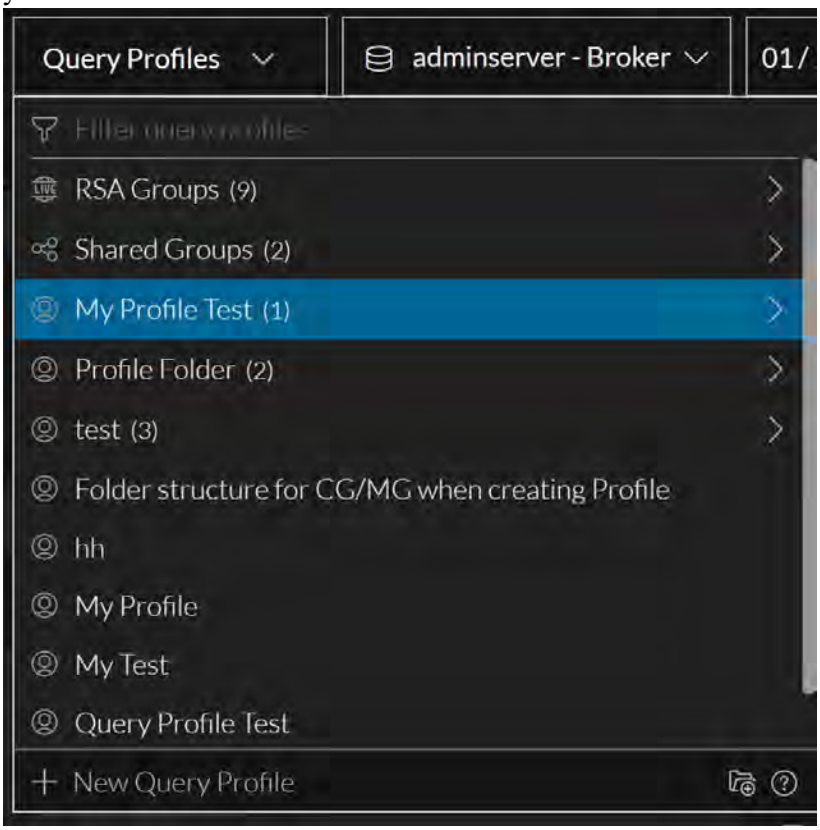
NetWitness Platform has these built-in profiles:

- RSA Email Analysis
- RSA Endpoint Analysis
- RSA File Analysis
- RSA Threat Analysis
- RSA User & Entity Behavior Analysis
- RSA Web Analysis

Built-in query profiles make it easy for you to query a specific area of interest; for example, selecting the built-in RSA Email Analysis query profile automatically specifies the meta group, and column group, and pre-query conditions that are most useful for investigating email activity. As you become familiar with the meta keys, you can create your own custom query profiles.

## Live Query Profiles

In 11.6 and later, NetWitness supports deploying the investigate content from live and are marked by the live symbol () under the query profiles group drop down. The query profiles are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.



## Custom Query Profiles

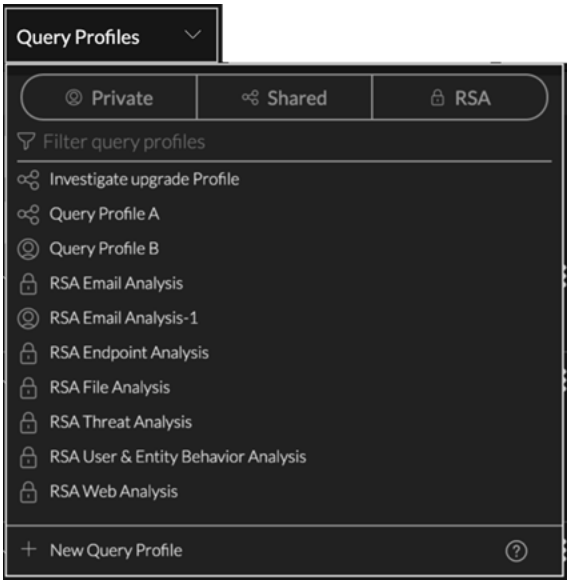
Custom query profiles are shared globally within your organization in Version 11.4. In Version 11.5 and later, you can create shared query profiles as before, and can also create private query profiles. If you edit a shared custom query profile, your changes are applied globally. If you delete a shared custom query profile, the profile is deleted and no longer available for all analysts.

**Note:** If a Springboard panel is using a query profile as a filter, the profile can be edited, but cannot be deleted in the Events view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted query profile as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

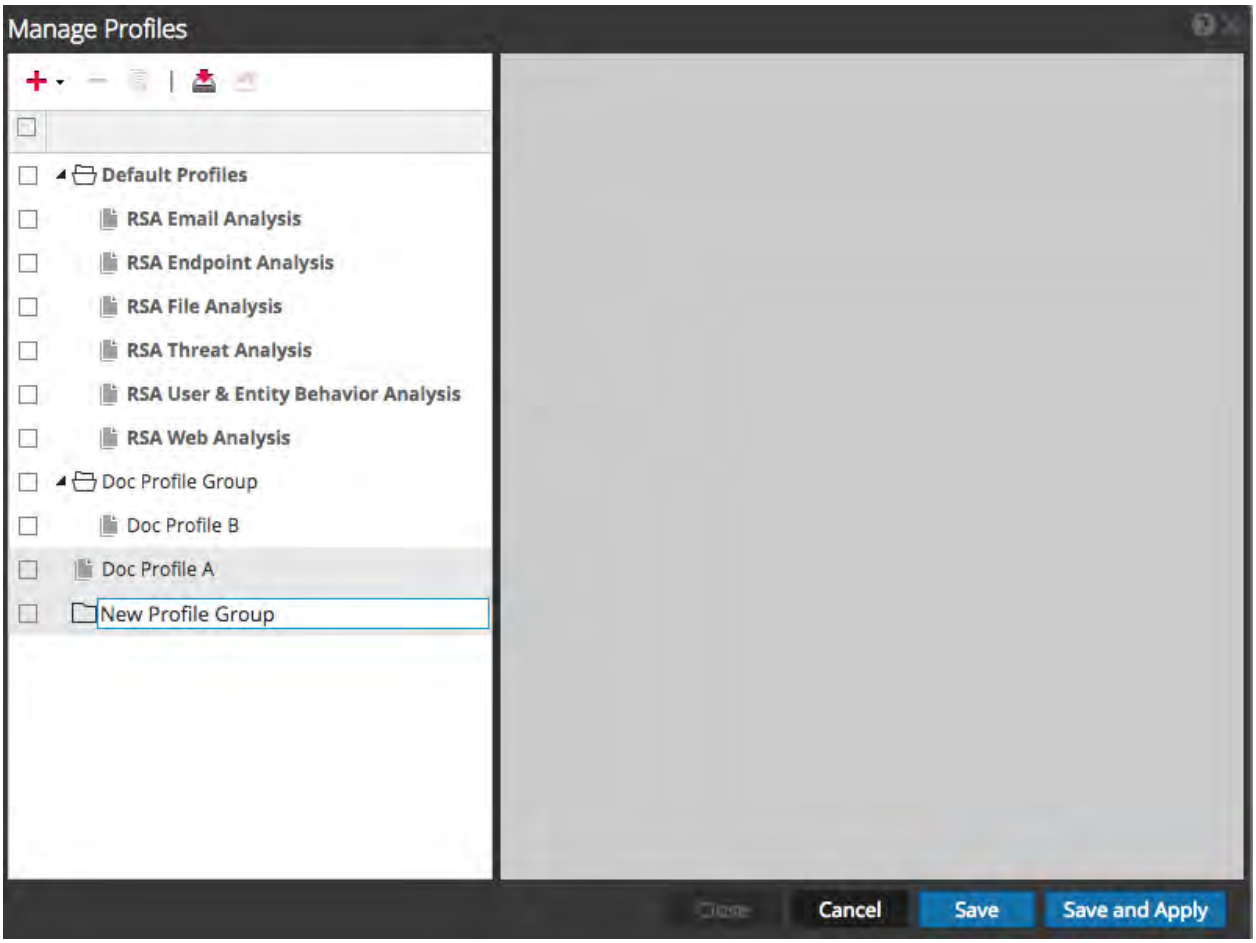
When you create a query profile in Version 11.5, you can choose to share it or you can keep it private (default); you cannot change a shared profile to private or a private profile to shared. Private query profiles are not visible or usable in the Navigate view, the Legacy Events view, or the Springboard. Icons identify the profile type in the Query Profile menu. These are examples of a shared and a private custom query profile as listed in the Query Profile menu, with the edit icon displayed at the end of the row.

## Dialogs for Managing Query Profiles

The profiles are listed in alphabetical order in the Query Profiles menu in a way that makes built-in profiles distinguishable from custom profiles that you imported or created. While the functionality for managing query profiles is similar in the Navigate view, the Legacy Events view, and the Events view, the dialogs are different. The following figure illustrates the Query Profiles menu in the Version 11.5 Events view. This menu lists the same profiles that are available in the Navigate view and the Legacy Events view. You can create, copy, edit, delete, and apply profiles. You can filter the list of profiles using the filtering buttons (Private, Shared, and RSA) at the top to display any combination of private, shared, and built-in query profiles.



This is an example of the Manage Profiles dialog in the Navigate and Legacy Events views.



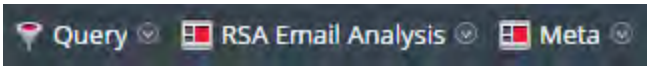
**Note:** Query profiles are available in the Navigate view, the Legacy Events view, and the Events view; in Version 11.4.1 and earlier, they are shared globally across users. If one user modifies or deletes a custom query profile it has an effect on what is available to the other users. In the Events view, use the Query Profiles menu to work with profiles. In the **Navigate** or **Legacy Events** view toolbar, select **Profile > Manage Profiles** to open the Manage Profiles dialog. In Version 11.5, custom profiles can be shared globally, but private custom profiles created in the Events view are not available in the Navigate view or the Legacy Events view.

From the Query Profiles menu (11.4 and later Events view):

- You can apply a query profile and use options in the menu to create (Create Query Profile dialog), copy, edit, and delete (Query Profile Details dialog) custom query profiles.
- Selecting a profile applies the meta group, column group, and pre-query condition, and these are visible in the Meta Group menu title, Column Group menu title, and the query bar.
- In Version 11.4, the Events view does not use meta groups or profile groups defined in other views. Version 11.5 allows you to use meta groups and to create private custom query profiles, in addition to the previously available shared custom query profiles.
- If a query profile created in the Legacy Events view uses the Log View, Detail View, or List View instead of a column group, the same profile in the Events view uses the Summary List column group.

From the Manage Profiles dialog (Navigate view and Legacy Events view):

- You can configure, add, delete, import, and export profiles and profile groups.
- You can organize your custom query profiles in profile groups (Version 11.2 and later). When upgrading to Version 11.4 from an earlier version, only profile groups that contain profiles are imported. The built-in query profiles are in the Default Profiles group, which cannot be edited. Analysts can create new query profile groups, which anyone can use.
- After creating profiles, you can edit a profile group to add profiles, remove profiles, or move profiles from one group to another. When you create a profile, it is not added to any profile group by default.
- Selecting a profile applies the meta group, column group, and pre-query condition, and the label of the Profile menu is replaced with the query profile name. The following figure illustrates the RSA Email Analysis query profile selected in the Navigate view or Legacy Events view.

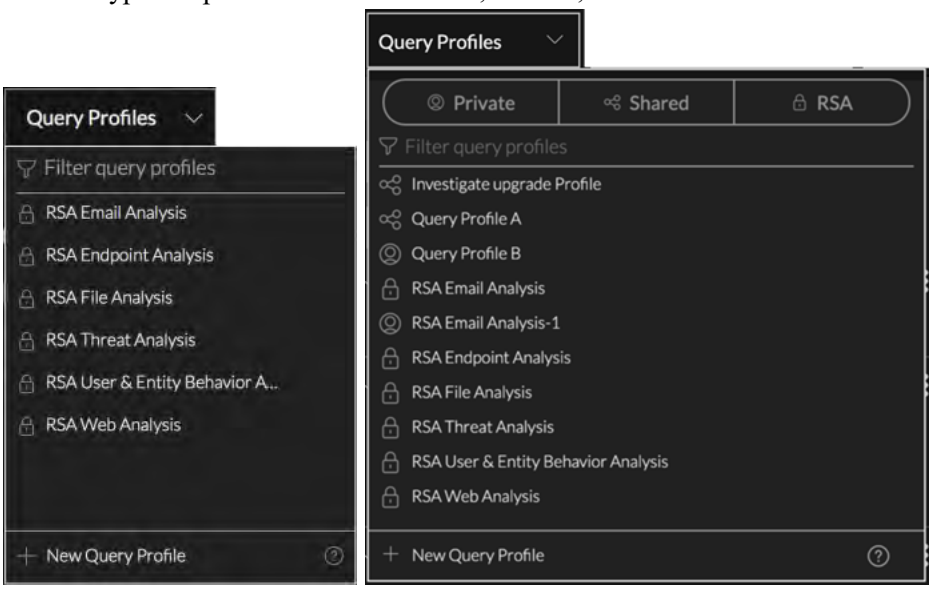


## View Query Profile Details (Events View)

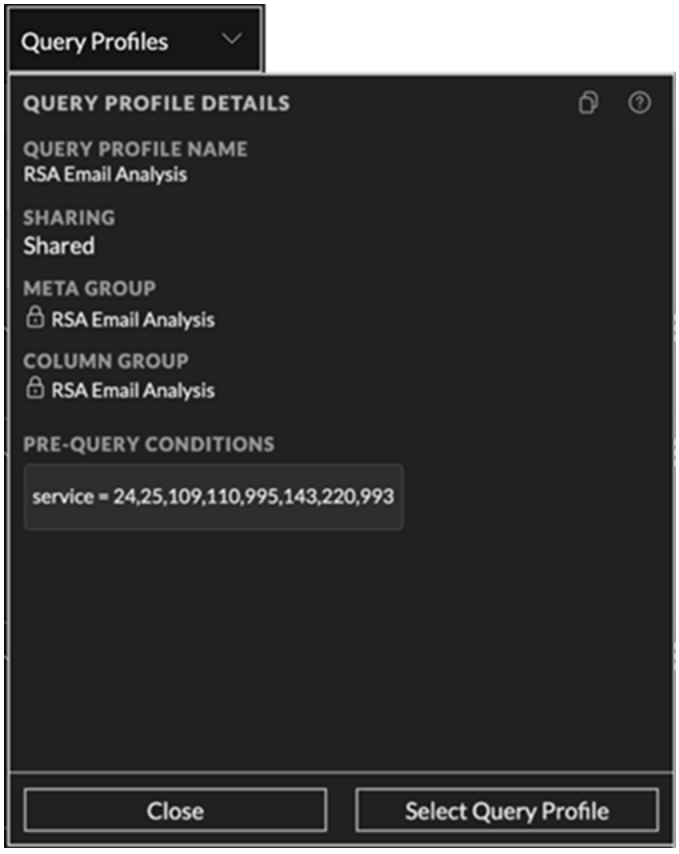
If you want to know which meta groups, column groups, and limiting filters (called pre-query conditions) define a query profile, you can view the details of the profile.

To view the details:

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles. The Version 11.5 menu displays a list a list of built-in query profiles (RSA), shared custom profiles, and your private custom profiles with visibility options and a filter field make it easier to find a particular query profile. The figure on the left shows the Version 11.4 menu. The figure on the right shows the Version 11.5 menu initially with all types of profiles visible: Private, Shared, and RSA.



2. Hover over a query profile in the list and click the information icon ( ) to see the meta group, column group, and pre-query conditions configured for the profile.
   This figure shows the details for the RSA Email Analysis profile, one of the built-in profiles. In Version 11.5.1, an icon identifies the type of meta group and column group (shared, private, or RSA).



3. Do one of the following:

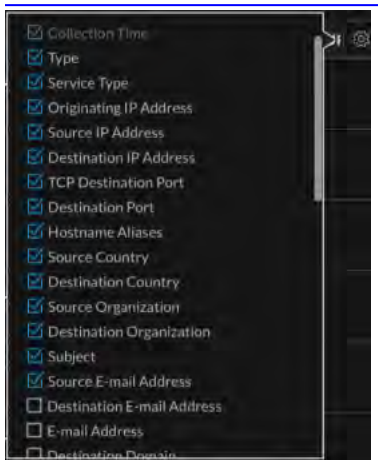
   a. To close the dialog, click **Close**.

   b. If you want to apply the profile, click **Select Query Profile**.
      The dialog closes. The Events list is updated to reflect the selected query profile. If the profile uses a different column group, the query is re-executed with the pre-query conditions and column group for the selected profile. If only the pre-query conditions are different, existing filters in the query bar are removed and the pre-query conditions (for example, this filter: `service=24,25,109,110,995,143,220,993`) is added in the query bar, but the query is not submitted. The first 15 columns in the associated column group are used in the Events list.

      i. (Optional) Create additional filters in the query bar before executing the query (see Filter Results in the Events View).

      ii. (Optional) If you want to select different columns from the associated column group before executing the query, click above the Events list on the right.
      The Column Selection list is displayed and you can choose up to 40 columns to display (see

Use Columns and Column Groups in the Events List.



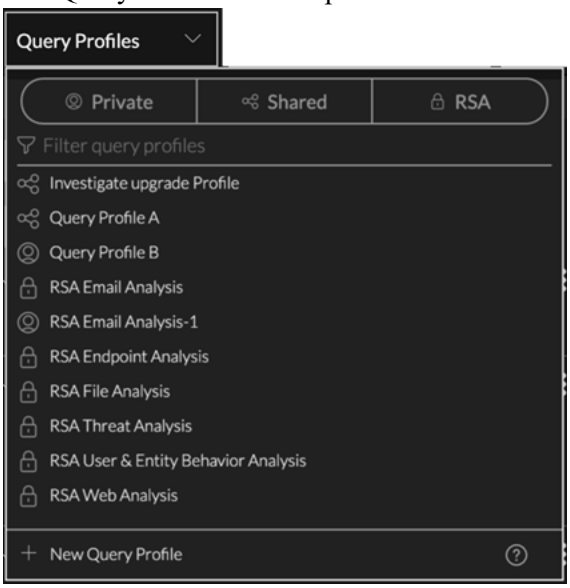
## Apply a Query Profile (Events View)

When a query profile is applied, there is no indication of it in the Query Profile menu, but you can see if a column group or meta group is in effect. If pre-query conditions are applied, the filters are visible at the beginning of the query bar as shown in this figure:

**Note:** If you do not see enough results or the right results in the Events view, an applied profile may be limiting results with pre-query conditions.

To apply a query profile:

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.



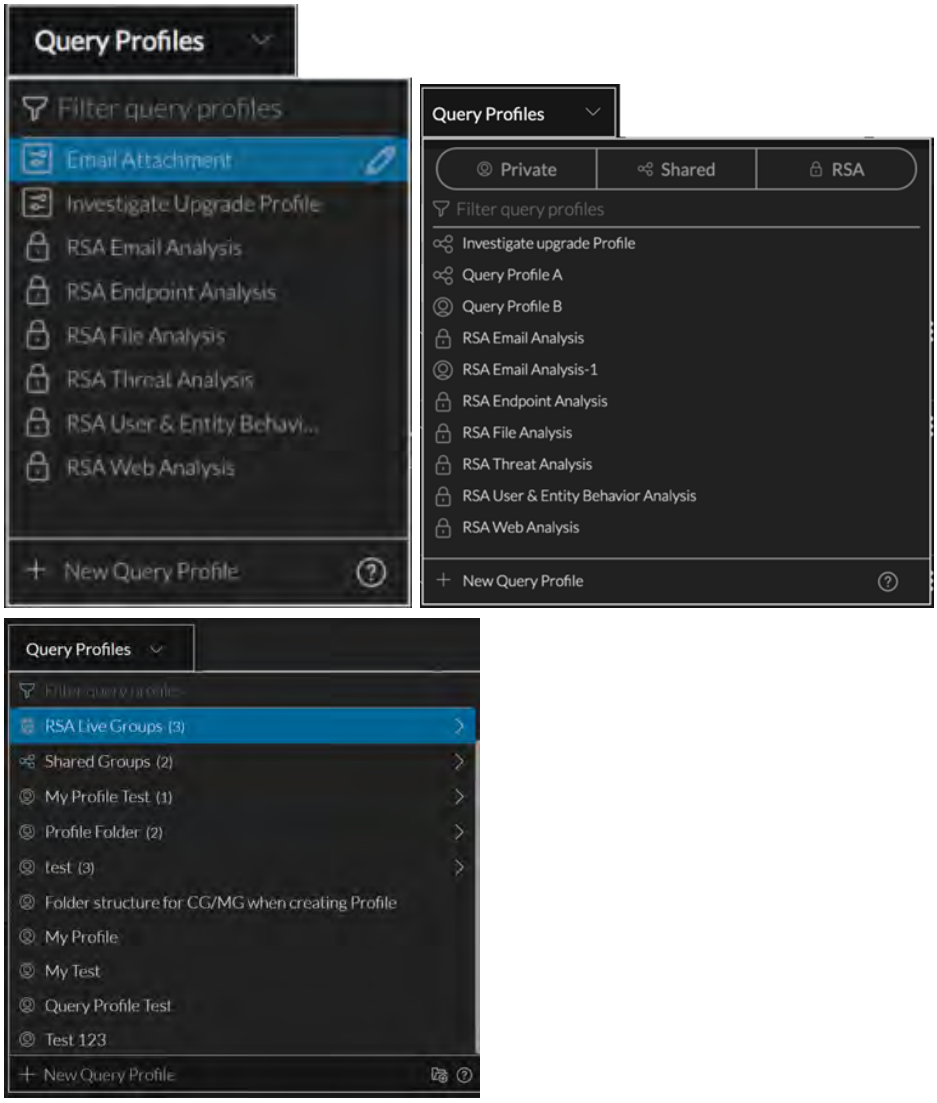
2. Use the Down and Up arrow keys or the mouse to highlight a profile.

3. Click the highlighted profile.
   The query profile settings are applied immediately. The Events list is updated to reflect the selected profile. If the profile uses a different column group the query is re-executed with the pre-query conditions and column group for the selected profile. If only the pre-query conditoins are different, existing filters in the query bar are removed and the pre-query conditions are added in the query bar. The button becomes active so that you can resubmit the query with the new pre-query conditions. You can add more filters as usual before or after resubmitting the query.

## Create or Edit a Custom Query Profile (Events View)

To create or edit a custom query profile:

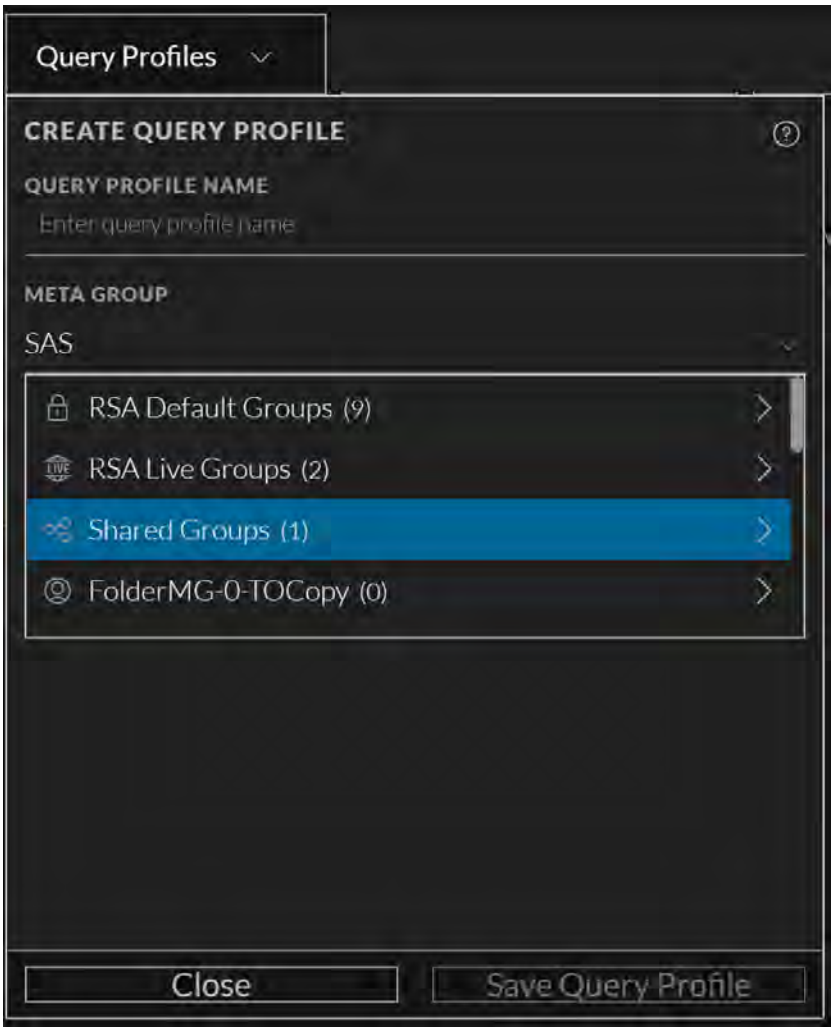
1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles. Version 11.6 (figure on the right) and version 11.5 (figure in the center) supports both private and shared custom profiles; Version 11.4 (figure on the left) supports only shared custom profiles.



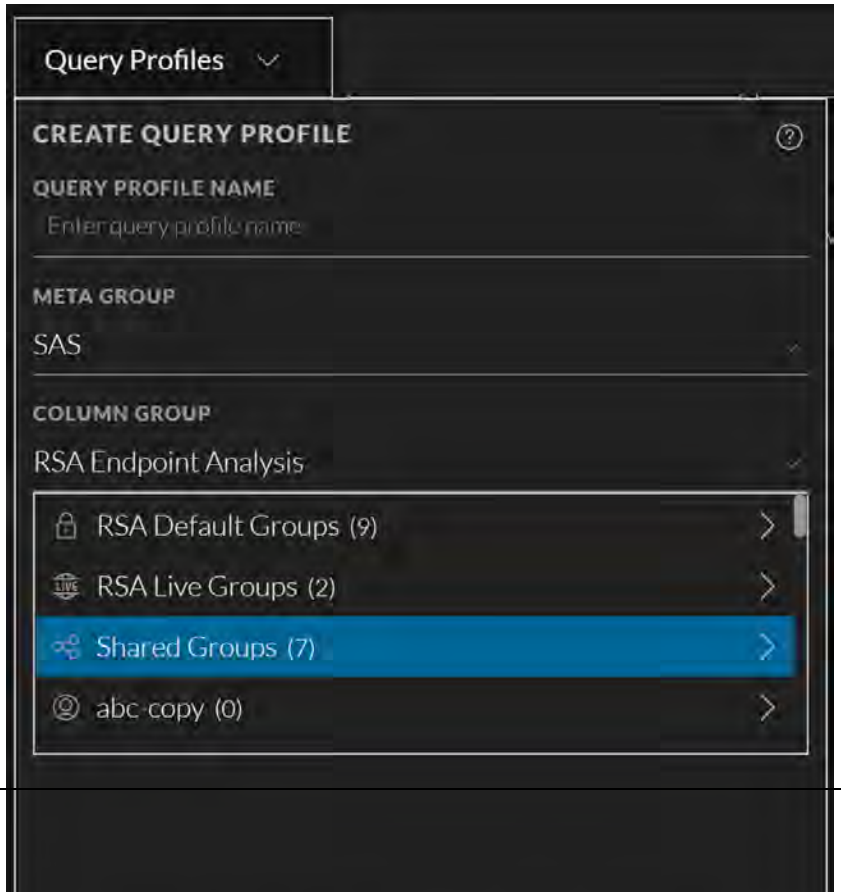
2. Do one of the following:

   a. To create a new query profile, click + **New Query Profile**.
   The Create Query Profile dialog is displayed. The Create Query dialog shows a new empty profile that includes the currently selected meta group, column group, and filter that you have currently typed in the Query bar as a pre-query condition.

   In version 11.6, the meta groups and column groups are displayed in a drop-down in a folder structure.

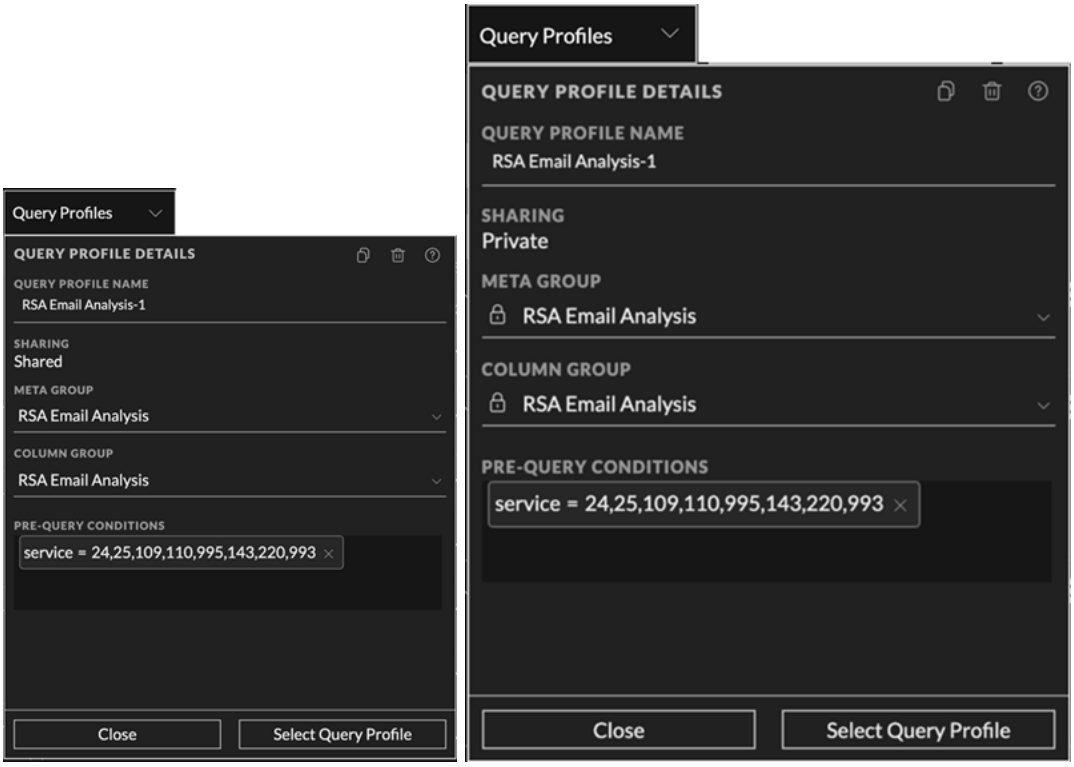


Query Profiles
CREATE QUERY PROFILE
QUERY PROFILE NAME
Enter query profile name
META GROUP
SAS
RSA Default Groups (9)
RSA Live Groups (2)
Shared Groups (1)
FolderMG-0-TOCopy (0)
Close
Save Query Profile



Query Profiles
CREATE QUERY PROFILE
QUERY PROFILE NAME
Enter query profile name
META GROUP
SAS
COLUMN GROUP
RSA Endpoint Analysis
RSA Default Groups (9)
RSA Live Groups (2)
Shared Groups (7)
abc-copy (0)

b. To edit an existing query profile, highlight a custom query profile in the menu, and click the edit ( ) icon.
The Query Profile Details dialog is displayed. The Version 11.5.1 dialog (on the right) identifies the type of meta group and column group as shared, private, or RSA.



3. In the **Profile Name** field, type a unique profile name that has no more than 80 characters.
In the Create Query dialog, the Save Query Profile button is activated. In the Query Profile Details dialog, the Select Query Profile button is relabeled as Update Query Profile.
4. (Version 11.5 and later), do one of the following
   a. If you want to share the new query profile with your organization, set the **Share with my organization** option. You cannot change a query profile from shared to private after it is created.
   b. If you want to create a private query profile that only you can see and manage, leave the **Share with my organization** checkbox empty. You cannot change a query profile from private to shared after it is created.
5. (Version 11.5 and later) Select a meta group from the **Meta Group** drop-down list. If a shared group and a private group have the same name, the private group is listed before the shared group. In Version 11.5.1, an icon before the group name distinguishes private from shared.
6. Select a column group from the **Column Group** drop-down list. In Version 11.5, there can be shared or private groups and they can have the same name. In this case, the private group is listed before the shared group. In Version 11.5.1, an icon in front of the group name distinguishes private from shared.
7. In the **Pre-Query Conditions** field, check the default filters from the query bar and add or remove filters if you wish.

8. Click **Save Query Profile** or **Update Query Profile**.
   The new profile is saved or the edited profile is updated with your changes.
9. To close the dialog, click **Close**.

## Delete a Custom Query Profile (Events View)

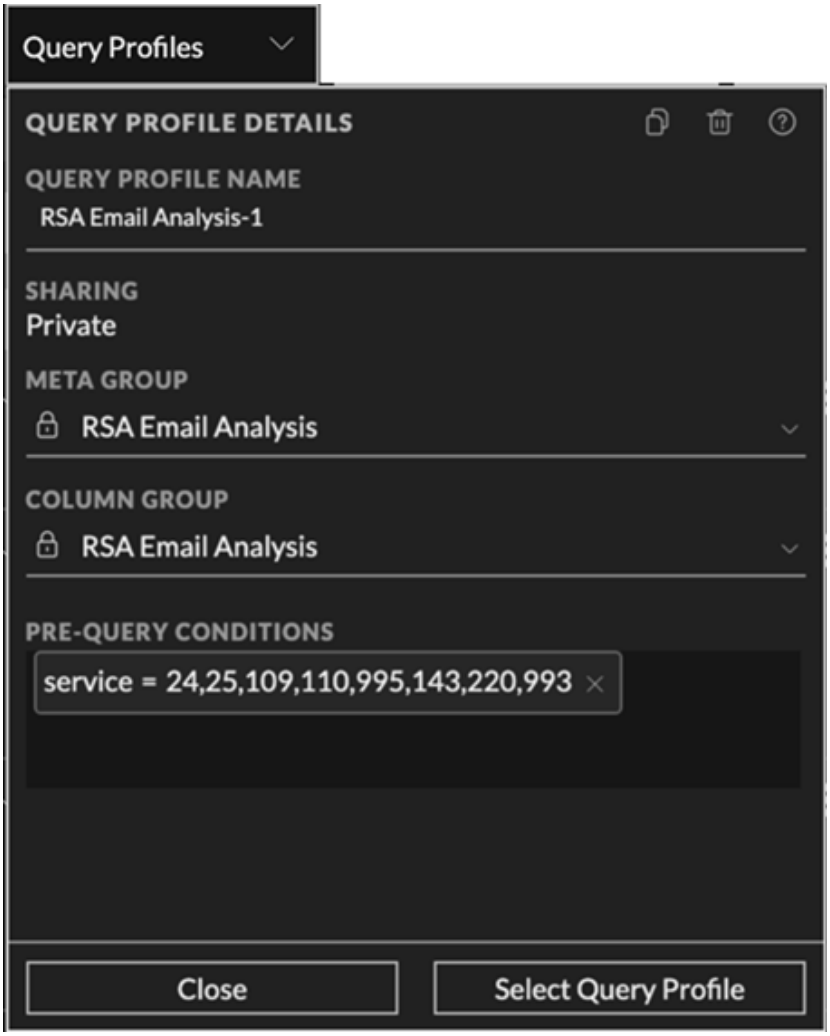
Built-in query profiles are read only, and cannot be deleted, but you can delete any custom query profile. A confirmation message allows you to confirm or cancel the deletion. When you delete a shared query profile, the effect is global and the profile is no longer available to any analyst.

**Note:** If a Springboard panel is using a query profile as a filter, the profile can be edited, but cannot be deleted in the Events view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted query profile as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

To delete a custom query profile:

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.

2. Highlight a custom query profile that you want to delete, and click the edit ( )icon.
   The Query Profile Details dialog is displayed.



3. Click the delete icon ( ).
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Query Profile**.
   In Version 11.4, if the query profile is not a built-in profile, there is no request for confirmation. The profile is deleted and removed from the Query Profiles menu. The profile no longer appears anywhere for any analyst working in Investigate.

## Copy a Query Profile (Version 11.5 and Later)

You can copy any query profile, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in profile. Also since you cannot change a custom profile from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a profile, the same name is used with a number appended. For example, if you copy RSA Email Analysis, the first copy is named RSA Email Analysis-1, and a second copy of the same profile is named RSA Email Analysis-2. After you create the copy, you can edit the new profile to give it a new name and edit the pre-query conditions, meta group, and column group in the profile.

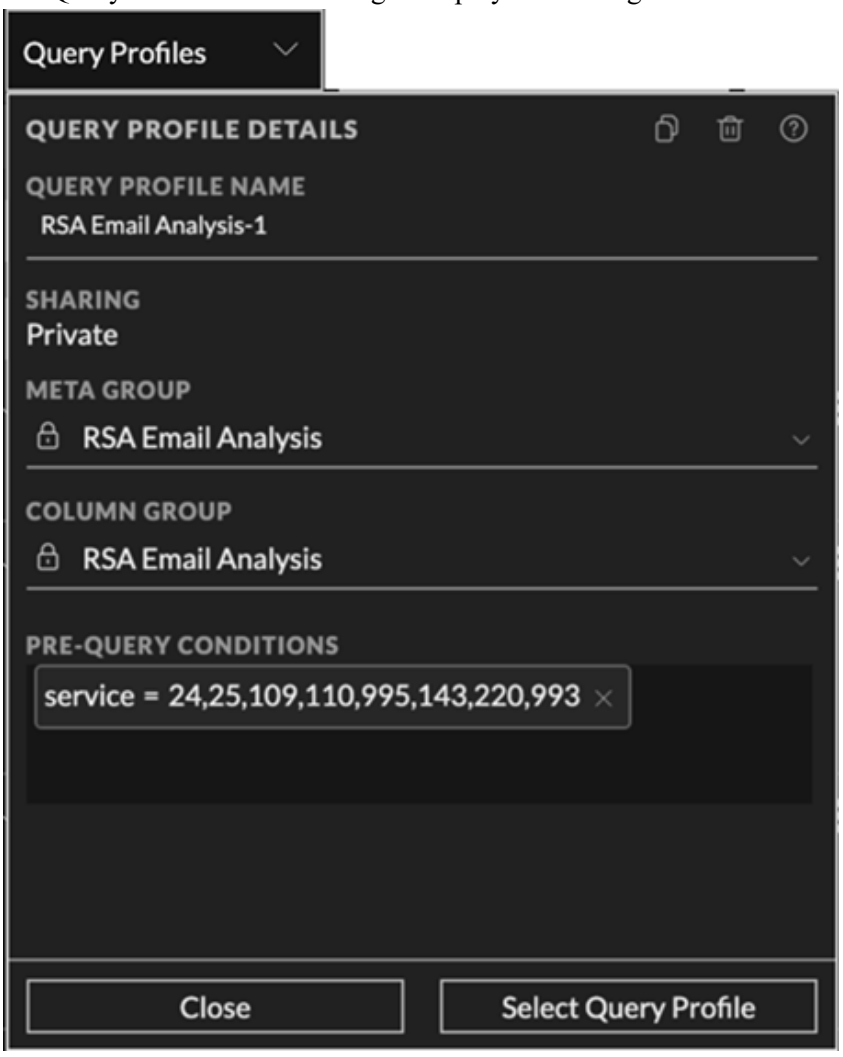
**Note:** If you are making a shared copy of a private query profile that uses a private meta group or column group, a message notifies you that a shared copy of the meta group or column group is being created and used in the query profile. It may take a little longer to copy the query profile when a private meta group or column group has to be copied.

To copy a query profile:

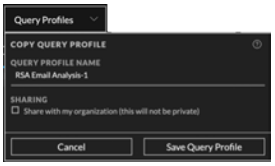
1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.
2. Highlight the query profile that you want copy. This figure shows RSA Email Analysis highlighted. The information icon ( ) is displayed to the right.

3. Do one of the following:
   a. Click the information icon ( ).
   b. For a custom profile, click the edit icon ( ).

The Query Profile Details dialog is displayed. This figure shows the dialog for a built-in profile.



4. Click the Copy icon ( ).
   The Copy Query Profile dialog is displayed with a number appended to the profile name to create a unique name among all query profiles.

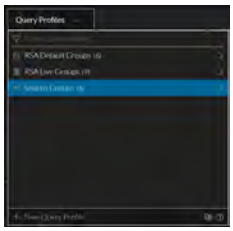


5. (Optional) In the **Query Profile Name** field, edit the name of the query profile.
6. If you want to share the new profile with your organization, set the **Share with my organization** option. By default the new profile is private. If the profile being copied has a private column group or meta group, a shared copy is created and used in the copy of the profile.

7. Do one of the following:
   a. To close the dialog without copying the profile, click **Cancel**.
   b. To save the clone of the query profile, click **Save Query Profile**.
      The clone is saved, and the Query Profile Details dialog for the cloned profile is displayed.
8. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the new profile, click **Select Query Profile**.
      The clone is added to the Query Profiles menu.

## Create a Query Profile Folder

You can create query profiles folders which reside at the top level and are be added as a private or shared folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. In the Events view, select the Query Profiles menu title. The menu drops down to display a list of meta groups and folders with the Filter Query Profiles field at the top and the option at the bottom.


2. Click .
   The Create Folder dialog is displayed.

3. In the **Folder Name** field, type a unique name for the new query profile group folder.
4. Click **Create Folder**.

## Edit and Move Query Profile Folder

After you create a query profile group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. In the Events view, select the Query Profiles menu title that you want edit.
2. Click .
   The Edit Folder dialog is displayed.

3. In the **Folder Name** field, type a unique name for the query profile folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

## Copy Query Profile Folder

You can copy query profiles folder from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except for the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. In the Events view, click the Query Profiles menu title. The menu drops down to display a list of query profiles and folders.
2. Select a folder you want to copy.
3. Click edit and then click .

   The Copy Folder dialog is displayed.

4. In the **Folder Name** field, type a unique name (maximum length of 80 characters) for the new query profile group and folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

## Copy Query Profiles Group Folder Deployed from Live

You can copy query profiles group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. In the Events view, click Query Profiles Group menu title. The menu drops down to display a list of query profiles groups and folders.
2. Click on a Live Query Profiles Group folder you want to copy.
3. Click
   The Copy Folder dialog is displayed.

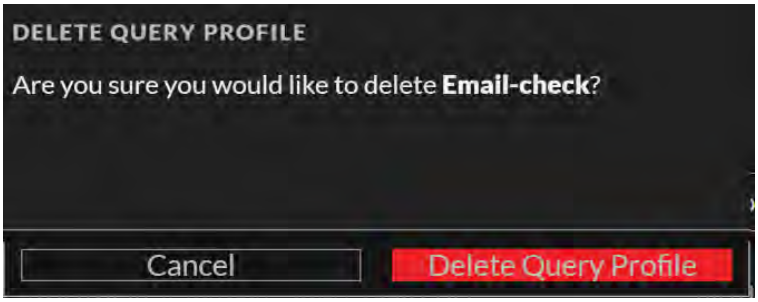
4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and its contents are displayed as the original meta group name appended with a -n.

## Delete Query Profile Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. In the Events view, click the Query Profile menu title. The menu drops down to display a list of query profile groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.

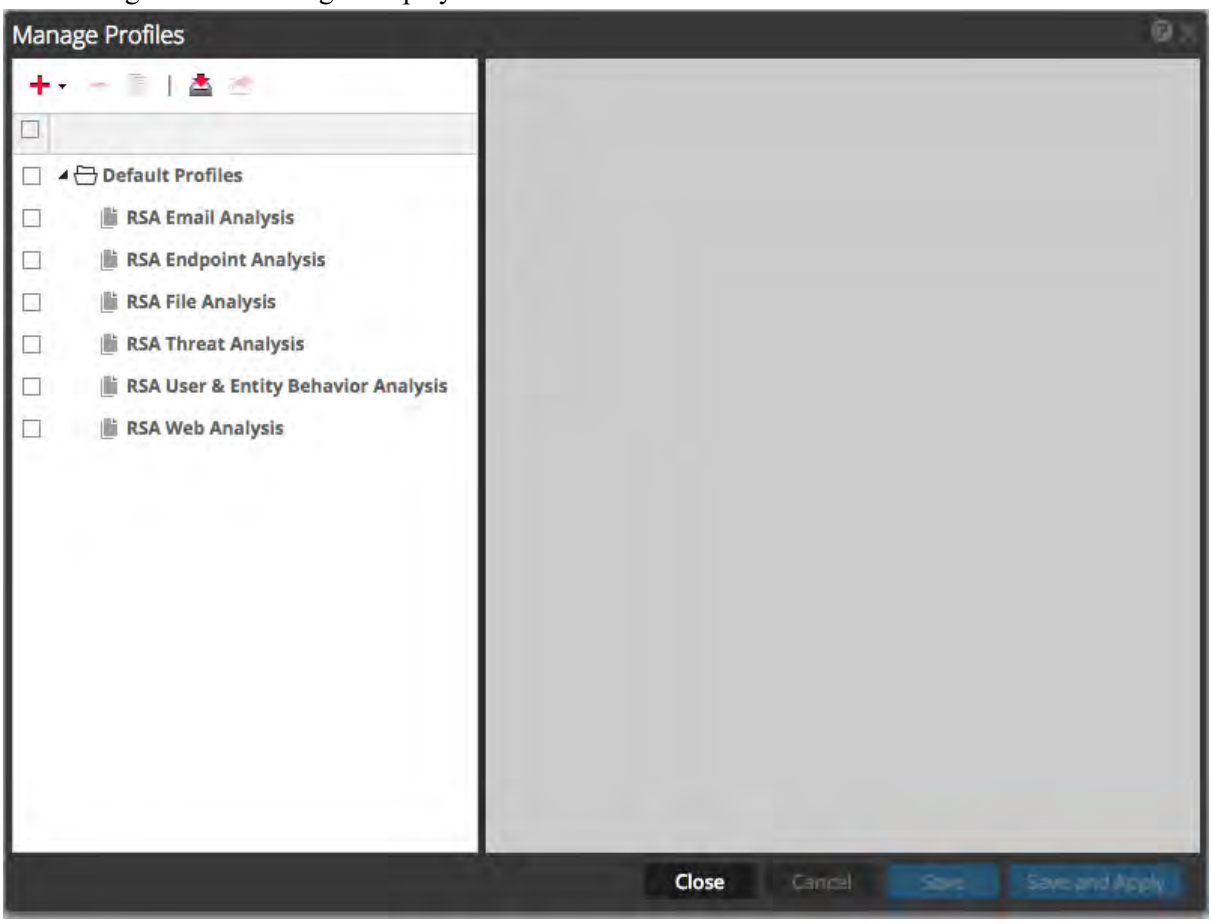


5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

## Navigate to the Manage Profiles Dialog (Navigate and Legacy Events Views)

1. Go to **Investigate > Navigate** or **Legacy Events**. (If the **Investigate** dialog is displayed, select a service and click **Navigate**.)
2. In the toolbar, select **Profile > Manage Profiles**.

The Manage Profiles dialog is displayed.



## Create, Edit, or Delete a Profile Group (Navigate or Legacy Events View)

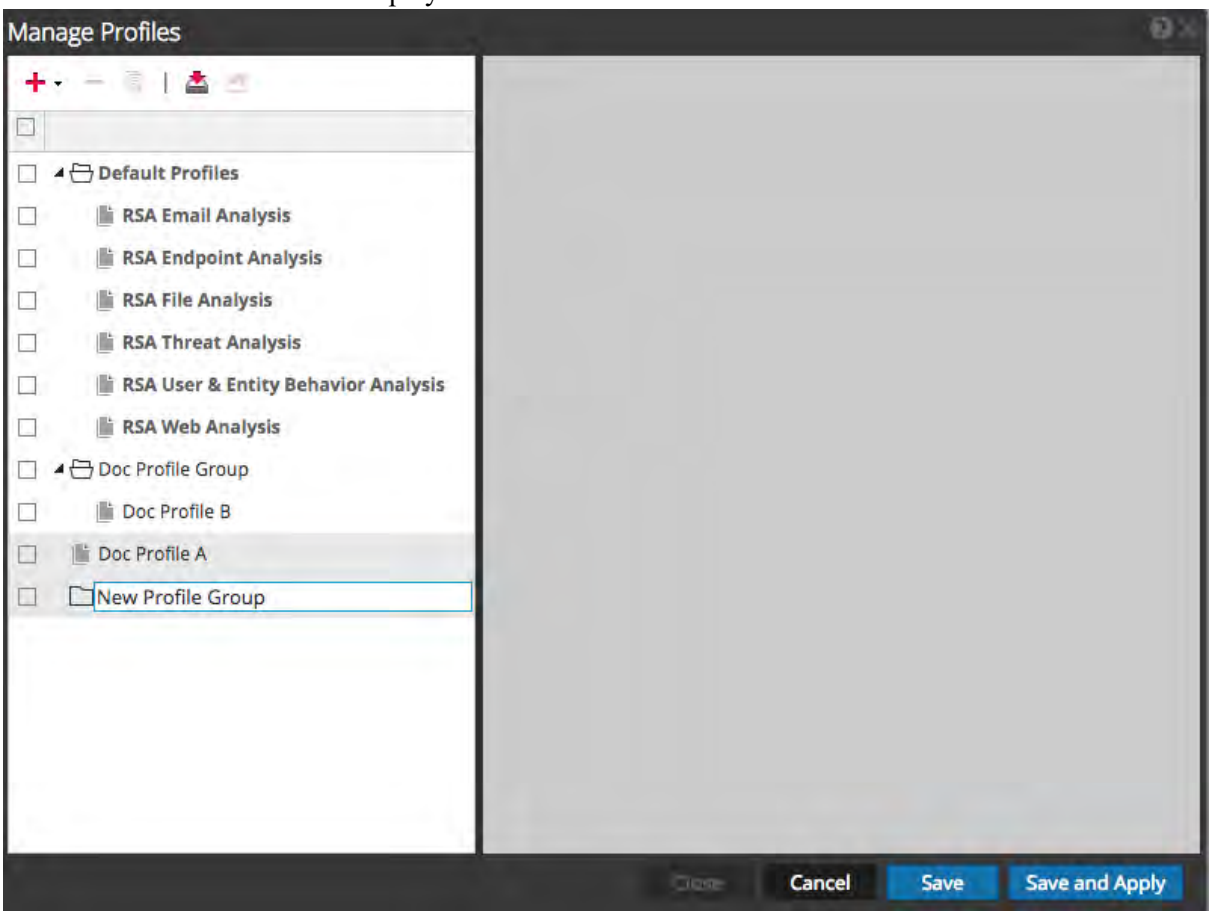
You can create a custom profile group to organize different profiles. Once created, the only edit you can make directly to a profile group is to edit the name of the profile group. To add or remove a profile in a group, edit the profile and assign it to a different profile group as described in Create and Edit Profiles (Navigate or Legacy Events View).

**Note:** If you migrated profile groups from Version 11.3, empty groups were not migrated.

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile group to edit, double-click the profile group.
   - To add a new profile group, click + and select **Add New Profile Group**.

**Note:** If you want to edit one of the built-in profile groups, click to make an editable copy.

A folder with a blank field is displayed at the bottom of the Profiles list in the left column.



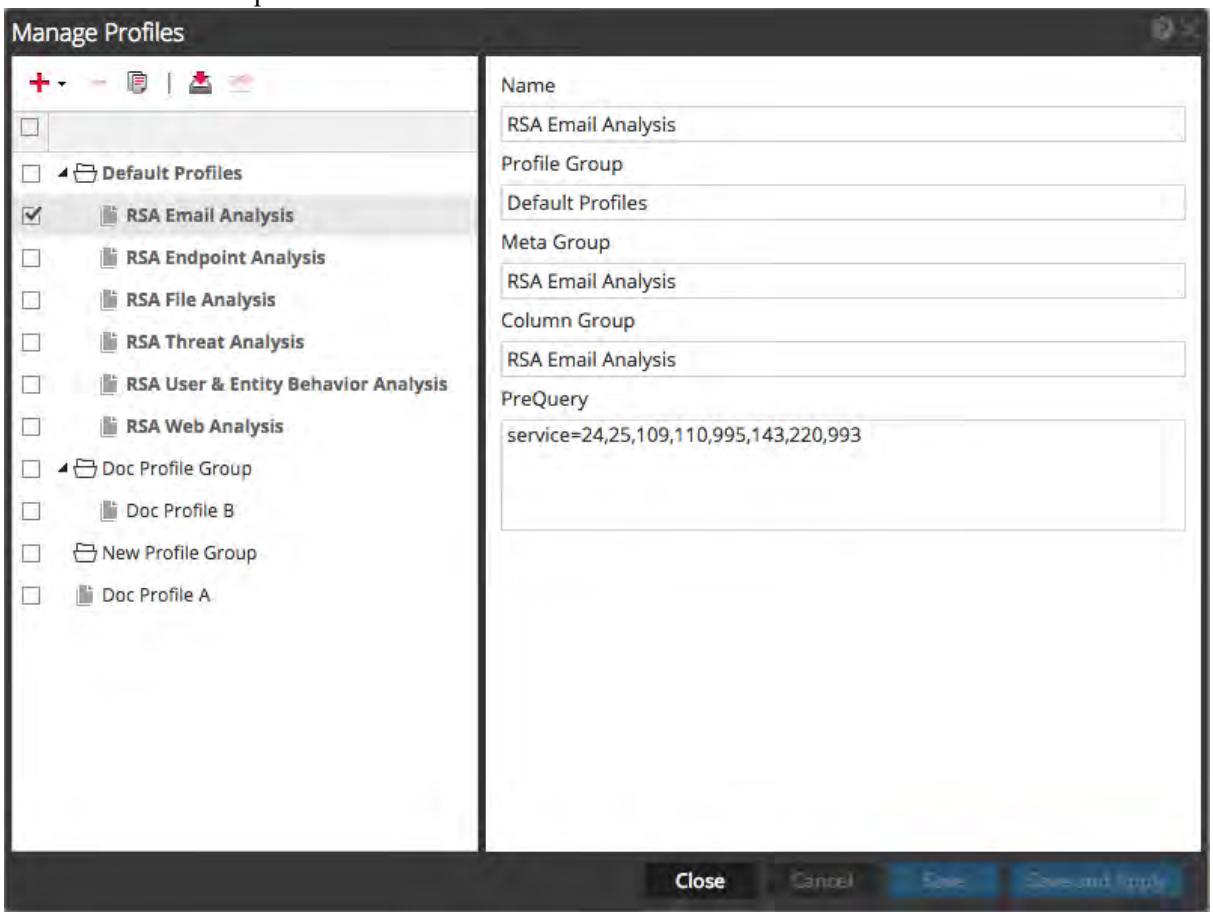
2. To edit or enter the name of the profile group, double-click the Profile Group and type in the entry field. The name must be between 2 and 80 characters.
   The profile group name is applied to a new profile group or to the profile group you edited. The profile group is now available when configuring a profile.
3. To delete a profile group do one of the following:
   - If you want to delete a profile group but keep the profiles, click the checkbox to select the group, uncheck the profiles in the group, and click delete.
   - If you want to delete a profile group and the profiles that the group contains, click the checkbox to select the group, and leave the profiles that you want to delete checked.
     A dialog asks for confirmation that you want to delete the group. If you left the mark in the checkbox next to the profiles, the group and the profiles in the group are deleted. If you unchecked the profiles, only the profile group is deleted and the profiles are moved out of the group and available to add to another profile group.

## Create and Edit Profiles (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile to edit, click the checkbox beside the name.
   - To add a new profile in Version 11.2 and later, click + or click the down arrow next to + and select **Add New Profile**.
   - To create a new profile in versions prior to 11.2, click +.

   **Note:** If you want to edit one of the built-in profiles, click to create a copy, and edit the copy.

   The definition of the profile is available to edit in the right panel. This figure illustrates the definition of one of the built-in profiles.



2. Edit or enter the profile name by typing in the **Name** field. The name must be between 2 and 80 characters.
3. (Optional for Version 11.2 and later) If you want to add the profile to a profile group, select a profile group from the **Profile Group** drop-down list.

If you select a profile group, the profile is added to the group when you save the changes. If you do not select a profile group, the profile is not part of a group.

4. Select a meta group from the **Meta Group** drop-down list. You can add custom meta groups as described in Use Meta Groups to Focus on Relevant Meta Keys. Private meta groups created in the Events view are not available in the Navigate view.
5. Select a column group for the **Column Group** drop-down list. You can add custom column groups as described in Use Columns and Column Groups in the Events List. Private column groups created in the Events view are not available in the Navigate view.
6. Type queries to filter results in the **PreQuery** field. PreQuery follows the same syntax as the Query builder. The PreQuery in the figure uses a meta group called **service = 24,25,109,110,995,143,220,993**.
7. Click **Save** to save the profile without using it, or click **Save and Apply** to save the profile and use it immediately.
   If you click **Save and Apply**, a confirmation dialog is displayed before applying the selected profile. For Version 11.2 and later, the PreQuery that you entered in the Manage Profiles dialog is displayed in the breadcrumb.

## Delete a Profile (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, select a profile by clicking the checkbox beside the name.

   **Note:** You cannot delete any of the built-in profiles.

2. Click −.
   A prompt requests confirmation that you want to delete the profile, and the profile is deleted. The option name in the toolbar reverts to **Profile** to show that no profile is in effect.

## Change the Active Profile (Navigate or Legacy Events View)

If you do not see enough results or the right results in the Navigate or Events views, you may have an active profile that is applying a PreQuery. If you do not want to use any profiles, you can click **Deactivate Profile** in the **Profile** drop-down menu.

To use a different profile:

1. In the **Navigate** or **Legacy Events** view toolbar, open the **Profiles** drop-down menu.
2. Hover over the **Profile** option to display a drop-down list of available profiles.
3. Select the profile you want to use.
   The profile settings are applied immediately.

If you want to change the active profile from the Manage Profile dialog:

1. In the **Navigate** or **Legacy Events** view toolbar, select **Profiles > Manage Profiles**.
   The Manage Profiles dialog is displayed.
2. Select a profile from the left panel and click **Save and Apply**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The profile settings are applied immediately.

## Import Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, you can upload or import .jsn files that have been downloaded from another service. When profile groups are exported and then imported, the grouping of profiles is maintained.

1. In the **Manage Profiles** dialog, click in the left panel toolbar.
   The Profile Import dialog is displayed.
2. Click **Browse** or the **Upload File** field to select a file from your computer.
3. When the file is selected, click **Upload**.
   The profile is displayed in the left panel.

## Download Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, profiles are downloaded as .jsn files.

1. In the **Manage Profiles** dialog, select one or more profiles from the left panel.
2. In the left panel toolbar, click .
   The download begins immediately.

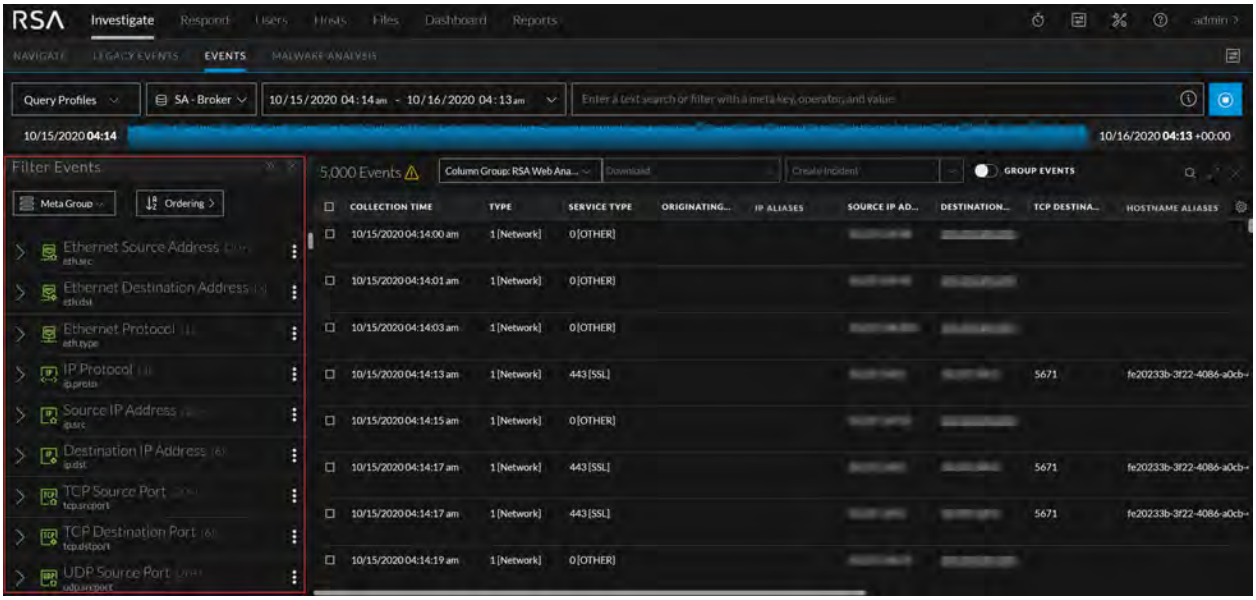
# Drill into Metadata in the Events View (BETA)

**Note:** This section applies to Version 11.5 and later. The feature is a beta feature that is enabled by default, and can be disabled by the system administrator as described in the *System Security and User Management Guide*.

When working in the Events view, the focus of an investigation is the smallest possible set of relevant events in sequential order. You can reduce the number of visible events loaded in the Events view using query profiles, column groups, meta groups, and queries. However, it is more efficient to limit the data set using the metadata indexed on the Concentrator before looking at the actual events stored on the Decoder or Log Decoder.

In Version 11.4.x and earlier, it is best to start by looking at the meta keys and meta values indexed on the Concentrator and drill into the metadata in the Navigate view to find a relevant set of events, with each drill or query further limiting the data set. When you have a meaningful data set, or drill point, you can examine the details of the related events in sequential order in the Events view.

Beginning with Version 11.5, you can drill into the metadata in the Filter Events panel, without leaving the Events view. The list of meta keys and meta values shown is related to all events seen in the environment for the time range in the query. When you find the drill point of interest in the Filter Events panel, you can open the Events panel to see the sequential events. The set of events loaded in the Events view is smaller and loads faster. The flow of an investigation is smoother with less hopping between views. The figure below illustrates the panel, open to the left of the Events panel.



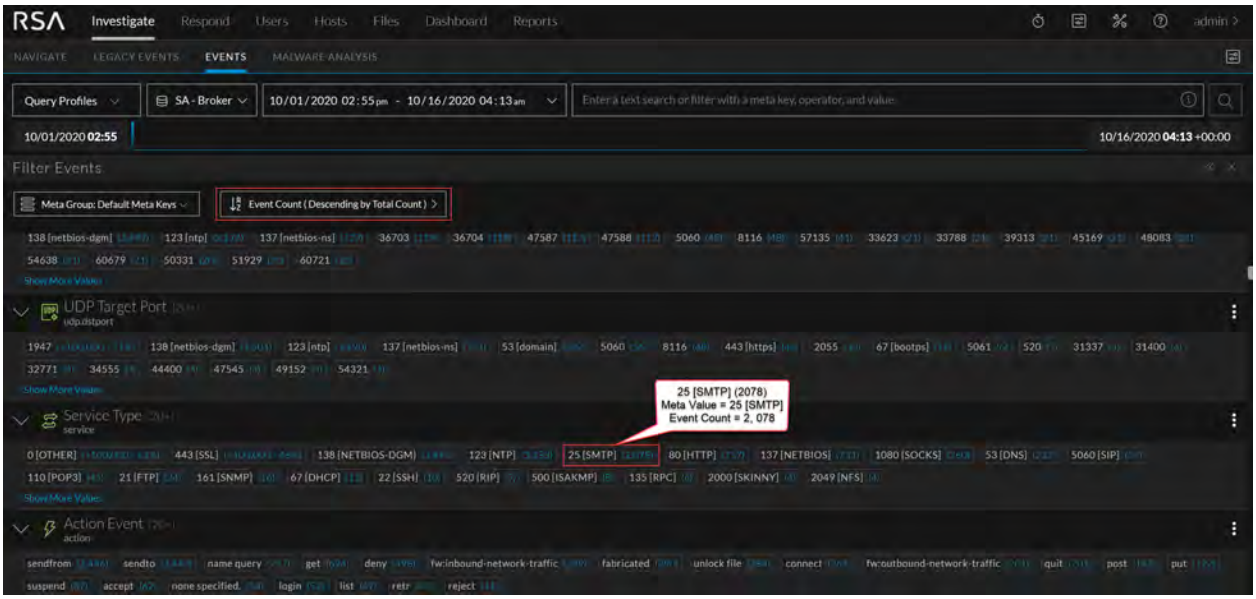
**Note:** There are two situations in which results in the Filter Events panel may not be as expected:
-In a mixed-mode environment with a Version 11.5 Broker and some Core services at RSA NetWitness Platform Version 11.4 or earlier, a text filter is not supported in the Filter Events panel. If the query in the Events panel includes a text filter, the result set in the Events panel and Filter Events panel may be different.
-If the query in the Events view query builder has a logical `OR` or `&&`, the results in the Events view may be different from results for the same query in the Navigate view and Legacy Events view. In this situation, a set of parentheses automatically encloses the logical `OR` expression in the Navigate view and Legacy Events view, while parentheses have to be manually added in the Events view. If this occurs, you need to enclose the logical OR expression in an additional set of parentheses; select the two filters in the query bar, right-click one of them, and select **Wrap in parentheses** in the menu.

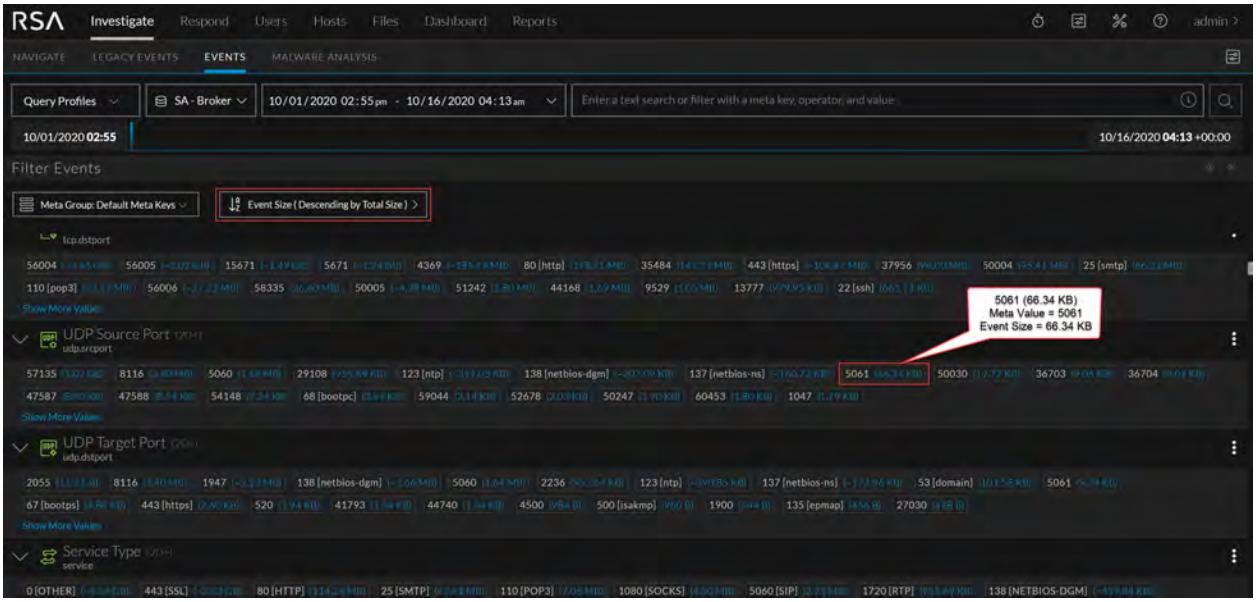
**Note:** (Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

## Modes of Operation

The Filter Events panel has two modes of operation.

- The **narrowFilter Events panel** is part of a faceted search view into the data (shown above). Left- or right-clicking a meta value adds a new filter, automatically executes a new query, and displays matching events in the sequential list of events. When both panels are open, you can drill into the data in both the Filter Events panel and the Events panel . Each time you left-click a meta value in the Filter Events panel, an expression is appended to the query bar, and the query is executed by default. The query results show new metadata to filter by in the Filter Events panel and the resulting events that match the query in the Events panel. If you change the service or other query elements in the Events panel, you need to execute the query to reload the Filter Events panel.
- The **fully expanded Filter Events panel** uses the full width of the browser window to provide ample real estate to hunt through the metadata without the performance load of immediately submitting a query or viewing the sequential events. As you click a new meta value and drill into the meta values, each meta value is added to the query filter and executed in the Filter Events panel, so that the number of events seen is reduced. Because the Events panel is closed, the query in the Events panel is not updated and the query is not executed. When you collapse the Filter Events panel back to original size, the Events list opens and the query is executed. This is an example of the fully expanded panel.



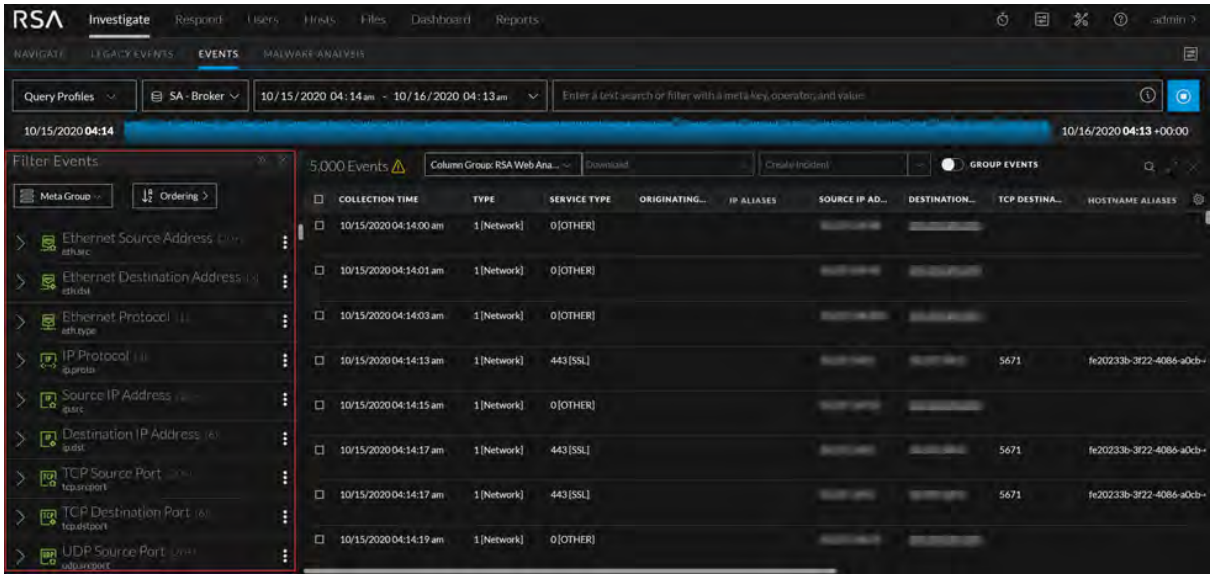


## View Metadata in the Filter Events Panel

To view metadata in the Filter Events panel:

1. Go to **Investigate > Events**, select a service to investigate, and select a time range.
2. (Optional) Select a column group or a query profile.
3. Click to load events in the Events panel.
   A query is executed in the Events panel and matching events are listed,

4. Click the Filter button (Filter) in the Events panel.
   The Filter Events panel opens to the left of the Events panel.

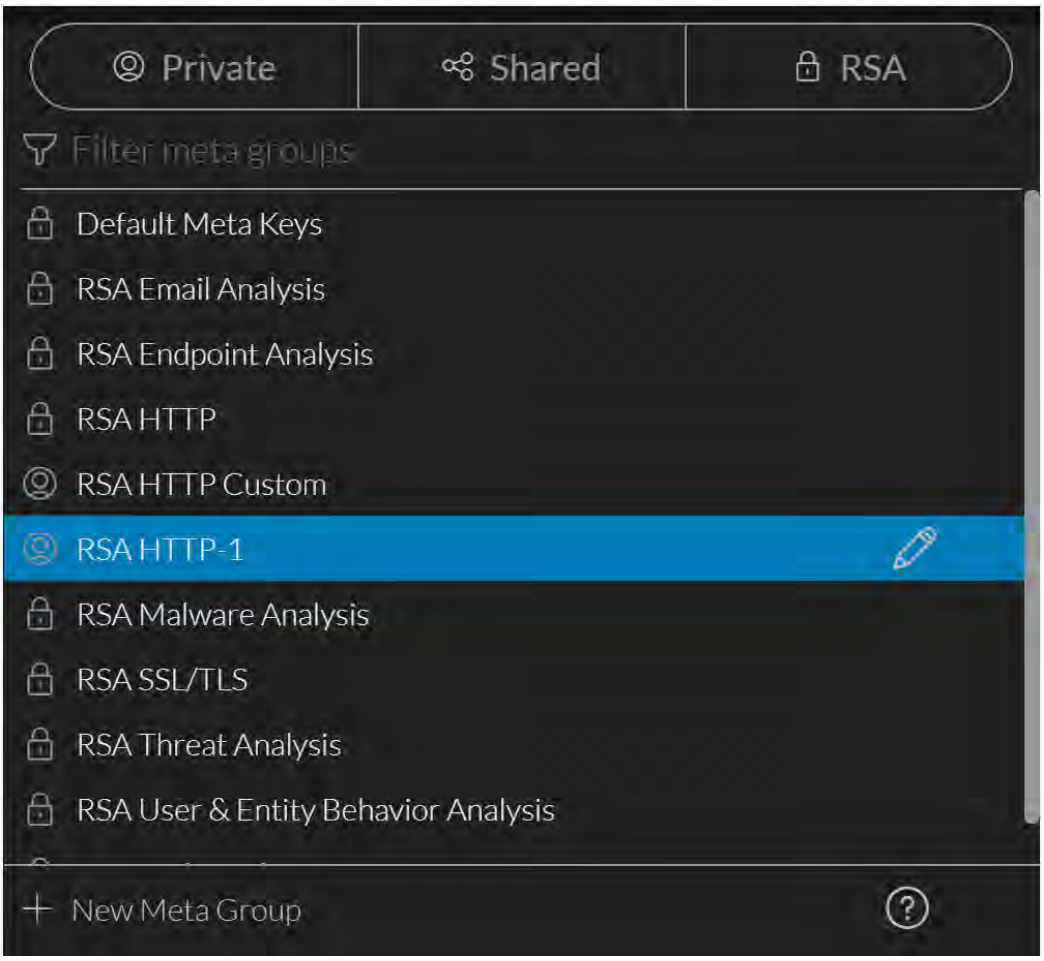


**Note:** (Version 11.6) By default, the Filter Events panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Filter Events panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.

The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. In Version 11.5.1, the meta group you selected previously is not stored in browser cache so it remains in effect until you change it. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups. Based on the contents of the index file for the service, the Filter Events panel is populated with the first 25 meta keys that have at least one meta value and are open. When using the Default Meta Keys group in the Filter Events panel, only the first 30 meta keys with values are open and the remaining are closed. Closed meta keys may be listed, but they do not count toward the 25 or 30 meta keys total. Meta keys with no values are listed at the bottom of the panel. You can expand, collapse, and close the panel using the standard panel controls ( , , and ).

1. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
      The group is added to the Meta Group menu. The figure below has a private copy of the RSA

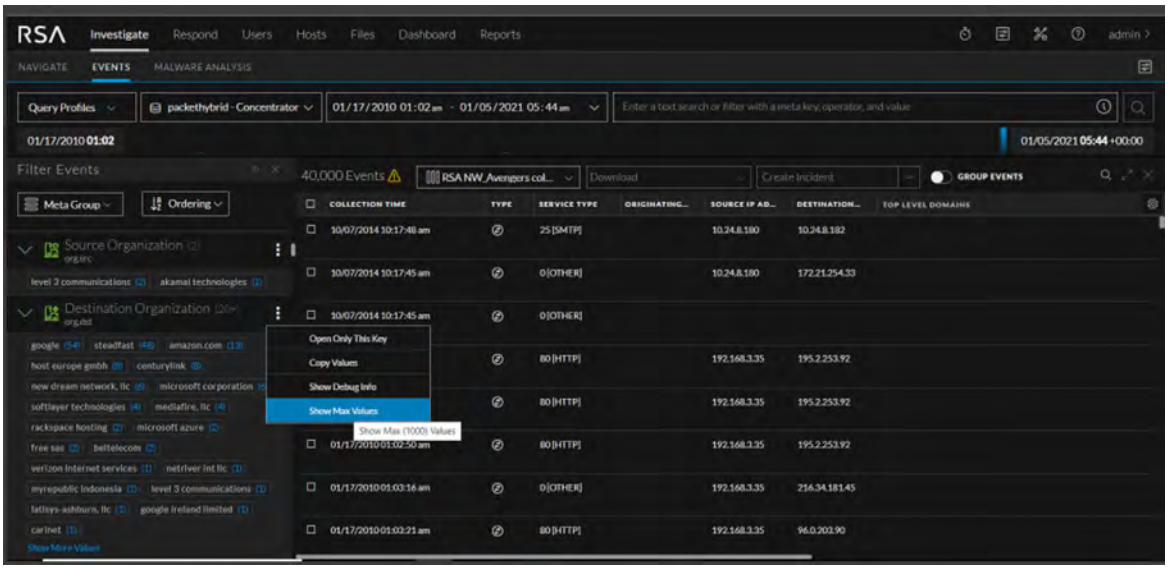
HTTP meta group.



## Show Max Value of Meta Groups

In case all the values have not rendered and displayed, you can click Show Max Value to view all the values at once.

1. With the Filter Events panel open in the 11.6 Events view, click and select the **Show Max Values** option.



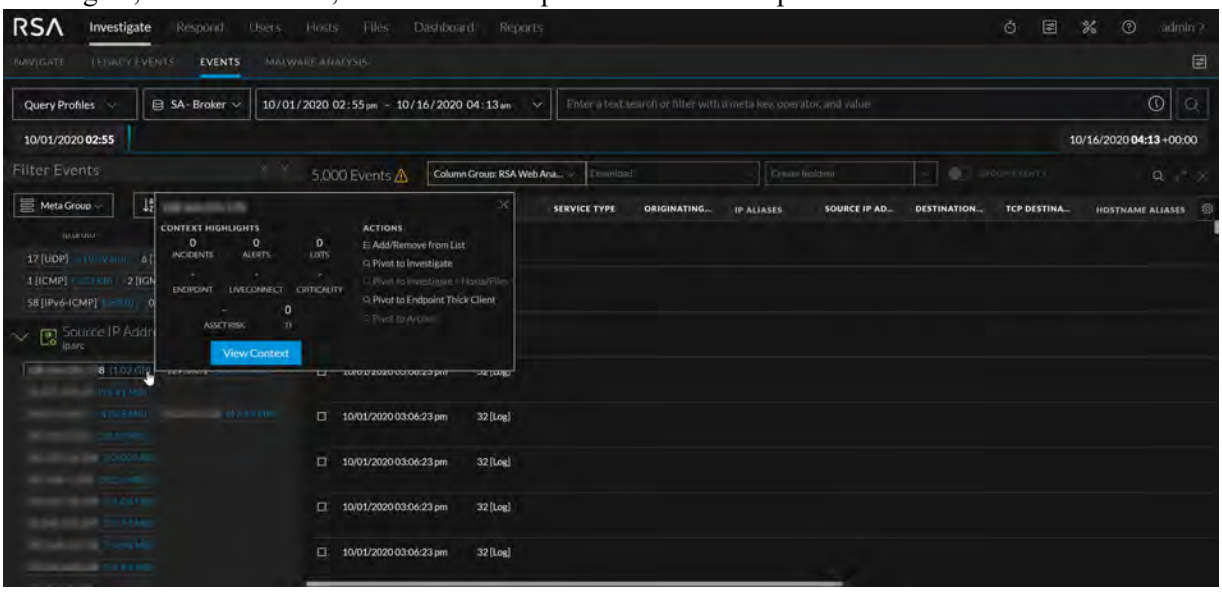
2. The values that were not rendered earlier will begin to load and a maximum of 1000 results are displayed.

## View the Context Lookup Panel in the Filter Events Panel

In the Filter Events panel, you can click a meta entity to open the context tooltip. The context tooltip is available only for the meta keys that are defined as an entity the Context Hub supports. The Context Hub service is pre-configured with default meta types and meta keys mapping. For information about mapping of the context hub meta values with investigation meta keys, see "Configure Meta Type Mapping for Context Hub" in the *Context Hub Configuration Guide*. The context tooltip includes the following two sections.

- **Context Highlights** - The information in this section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality, Asset Risk, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.
- **Actions** - This section lists the available actions. In the example, the Add/Remove from List, Pivot to

Investigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.



## Understand Visible Metadata

Each meta key has a list of meta values, with up to 20 values displayed by default. You can click **Show More Values** to incrementally add 20 meta values, up to a total of 1,000 meta values, which is a hard-coded limit to optimize performance. The meta key name and plain English name of each meta key found in the service, both populated and non-populated, are listed. For each meta value, you can see the number of events in the current results that contain the value (count) or the size of the events in the current results (size). For example, the following might be listed:

```
Action Event [action] (3)
get(3016) login (1346) put (501)
```

In this example, the meta key name is `action`, the English name is Action Event, and three meta values were found for this meta key. There were 3016 events containing `get`, 1346 events containing `login`, and 501 events containing `put`. The values are ordered so that the value with the largest count is listed first.

In the following example, the same meta key has the values ordered based on the event size in bytes. The smallest size is listed first:

```
Action Event [action] (3)
login (13,034,588) put (21,848,760) get (1,409,079,256)
```

An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key.

- This meta key is indexed by value: 
. The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value.
- This meta key is indexed by meta key:

. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that

are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value.

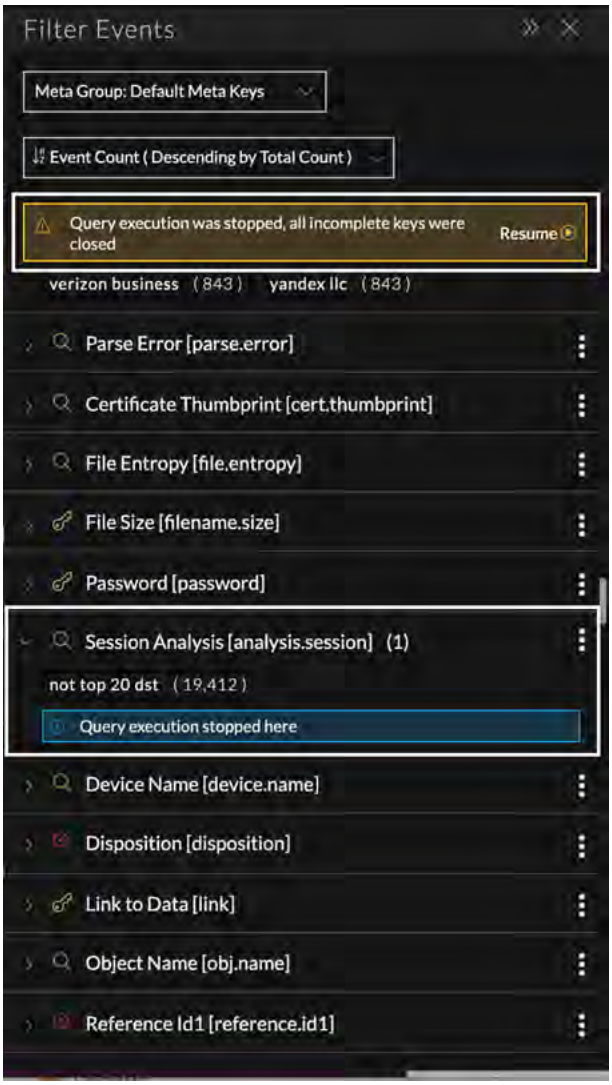
- This meta key is not indexed: . Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key.
- For Version 11.5.1, a set of more than 200 meta key symbols replaces the three indexing method symbols to provide a visual indicator of the purpose of the meta key. The color of the meta key symbol identifies the indexing method using the same colors as before: green, yellow, and red. A tooltip also identifies the indexing method and provides a description of the icon. The icons are defined based on categories outlined in the Unified Data Model (https://community.rsa.com/community/products/netwitness/rsa-content/udm). There is a generic icon for most categories that do not have specific meta keys and a default meta key icon to use when a new custom meta key is added.

If an error occurs while loading a meta key, the other meta keys load as usual and an error message is displayed in the meta key that did not load. When you execute a new query, some error messages disappear. Meta keys that have no values in the set of events are listed at the bottom of the panel.

## Stop and Resume Metadata Loading

You can stop and resume loading of metadata in the Version 11.5.1 Filter Events panel as the meta keys and values are loading. When loading a lot of metadata this can save time because you do not have to wait for all data to load. If you stop loading and still need to see more metadata, you can resume loading, then stop again when you see the data you want.

1. While data is loading in the Filter Events panel, click the Stop button ( ) in the query bar.
   Meta keys stop loading, and keys that did not finish loading are closed. A message above the meta keys list informs about the status, and you can scroll down to find the last meta key to finish loading. In this example, Session Analysis finished loading; all the meta keys below remain closed.



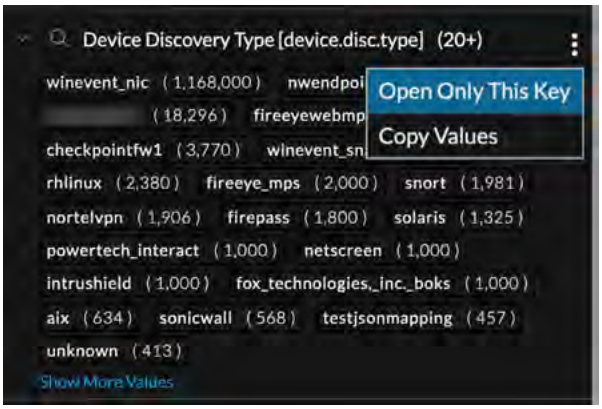
2. Do one of the following:
   a. To resume loading at the meta key where loading stopped, click **Resume**.
   b. If you want to review the values of specific meta keys that were not loaded, without resuming the query, click the meta key name to open any key.

## Close All Except One Meta Key (Version 11.5.1 and Later)

When the Filter Events panel is open, seeing many meta keys at the same time can be distracting.

To close all except one meta key:

1. In the meta key row of an entry, click the Meta Key options button (⋮).
   The Meta Key options are displayed.



2. Select Open Only This Key.
   All except the current meta key close. If the selected key is closed, it opens and data is loaded, while all other keys close.

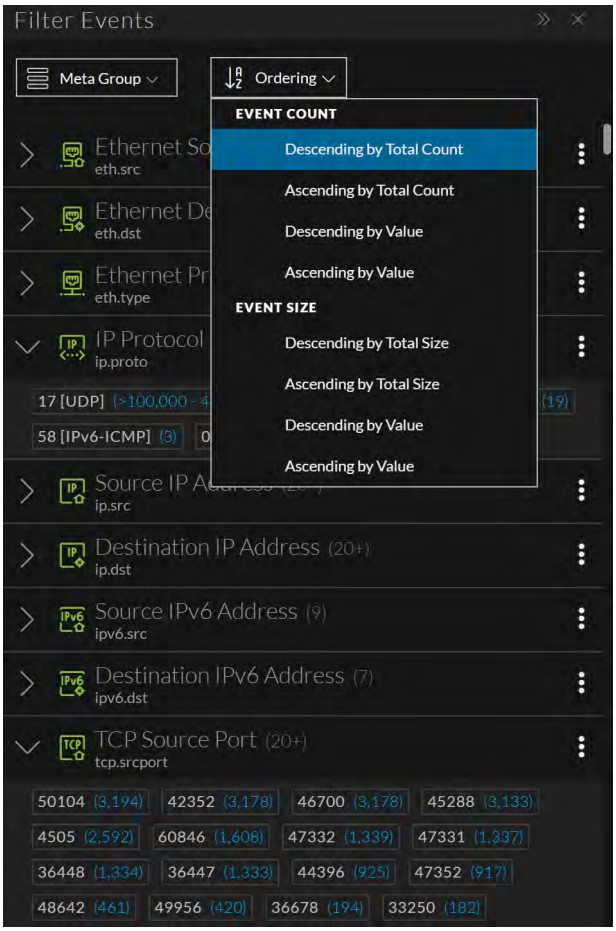
## Set the Ordering Method for Meta Values

With the Filter Events panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering.

To use the ordering options:

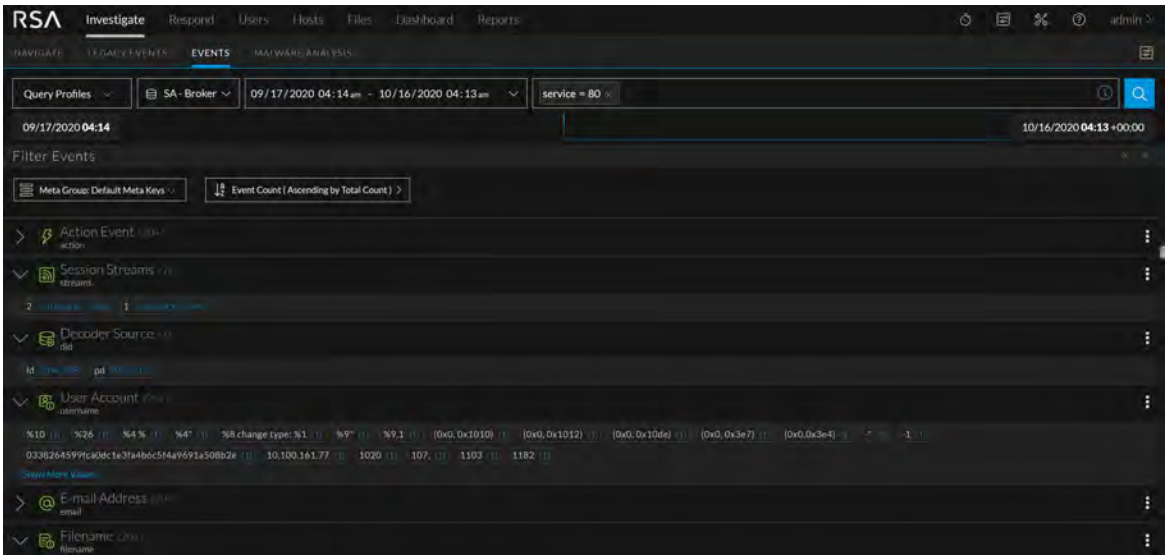
1. With the Filter Events panel open, click the ordering menu label, which is named according to the selected ordering option. This is an example of the menu label when ordering by event count in ascending order by total count:

   .
   The Ordering menu is displayed. This figure shows the narrow version of the menu.



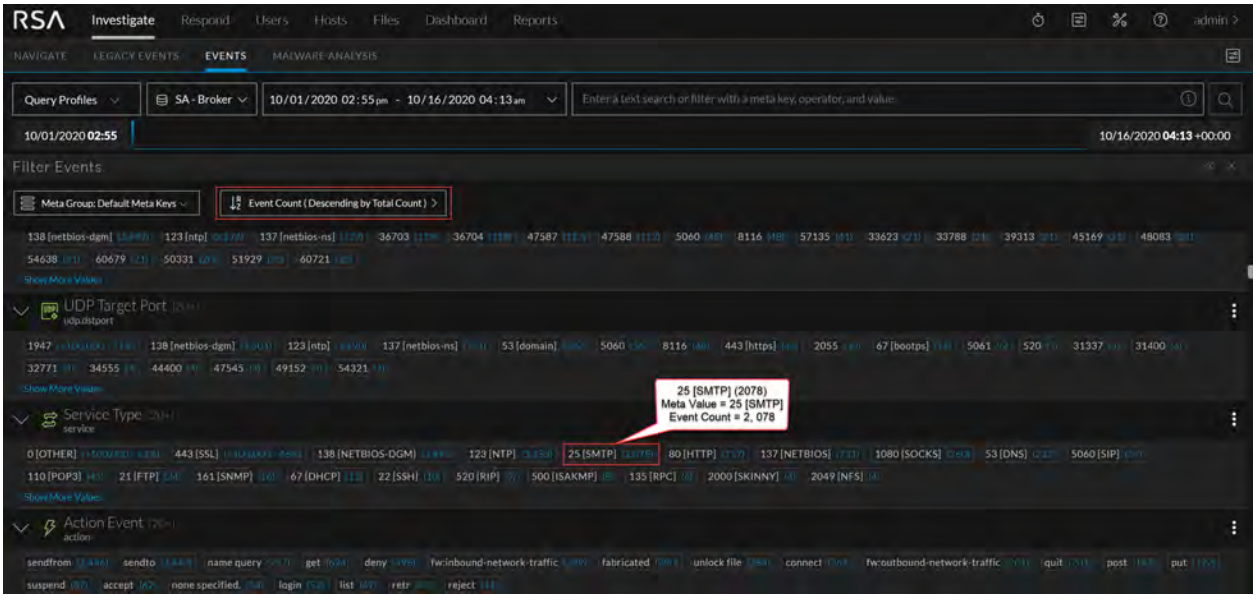
2. If you want to see the event count in parentheses after each value, select one of the following options. By default, the meta keys are displayed using the Event Count > Descending by Total Count method.
   a. To order by total count of events in which the value was found, select either **Descending by Total Count** or **Ascending by Total Count**.
   b. To order by the name of the value, select either **Ascending by Value** or **Descending by Value**.
3. If you want to see the size in bytes of the events in which the value was found, select one of the following options.
   a. To order by total size of events in which the value was found, select either **Descending by Total Size** or **Ascending by Total Size**.
   b. To order by the name of the value, select either **Ascending by Total Size** or **Descending by Total Size**.
   Under each meta key in the Filter Events panel, the values are ordered according to your

selection.

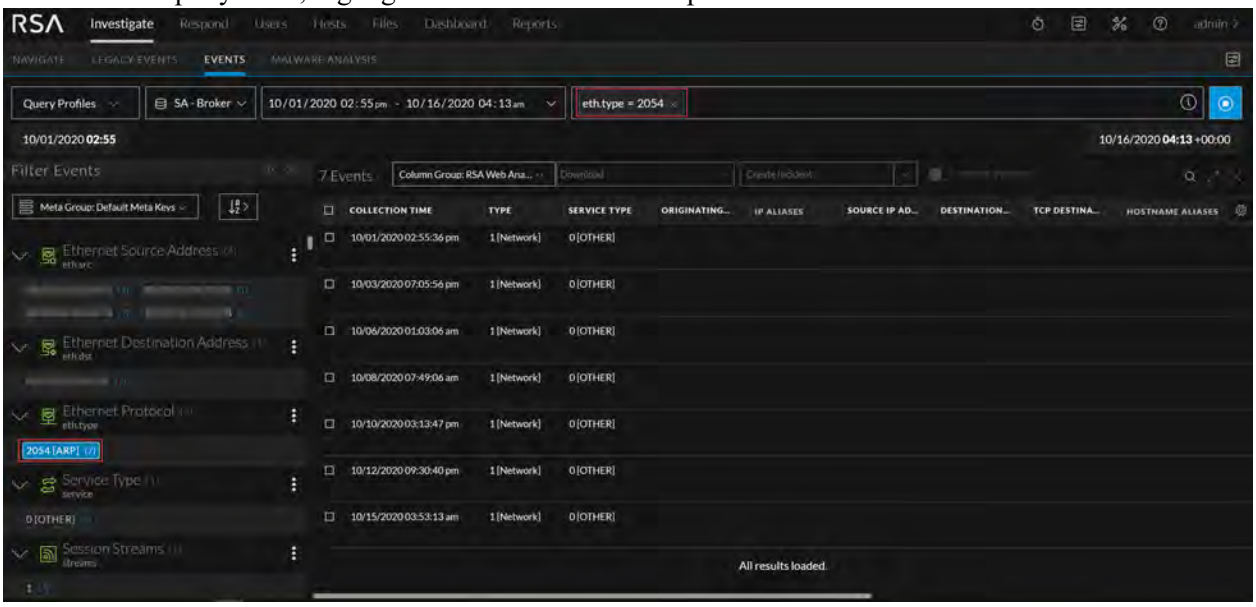


## Drill into Meta Values

With the Filter Events panel open, you can drill into meta values to focus an investigation down to the smallest possible set of relevant events. Drilling in the fully expanded Filter Events panel adds filters to the query bar and refines the displayed metadata in the Filter Events panel, but does not execute the query in the Events panel. Drilling in the narrow panel, side by side with the Events panel, adds the filter to the query bar and executes the query in the Events panel and the Filter Events panel. This figure is an example of the fully expanded panel with some metadata loaded.



You can drill into metadata in the Filter Events panel to find relevant meta values. A simple query using the (=) operator highlights the meta value used in the Filter Events panel. This helps to associate the metadata with the filter added to the query. For example, the following figure shows the meta key value, related to the query filter, highlighted in the Filter Events panel.



### To drill into meta values in the fully expanded Filter Events panel:

1. Look for a meta value that is of interest, and click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
   The other service types are filtered out of the metadata in the Filter Events panel, but the query is not executed in the Events panel.
2. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
   b. (Version 11.5.1) Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
   c. (Version 11.5.1) Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
3. Repeat step 1 with another meta value, for example, **writetoexecutable** in the **Action Event [action]** meta key. Continue drilling into values until you find a set of events (drill point) that you want to see in sequential order.

4. To view the sequential events for the drill point, click to shrink the Filter Events panel.
   The Events panel opens to the right, and the query is executed in the Events panel so that you can see the raw events in sequential order.

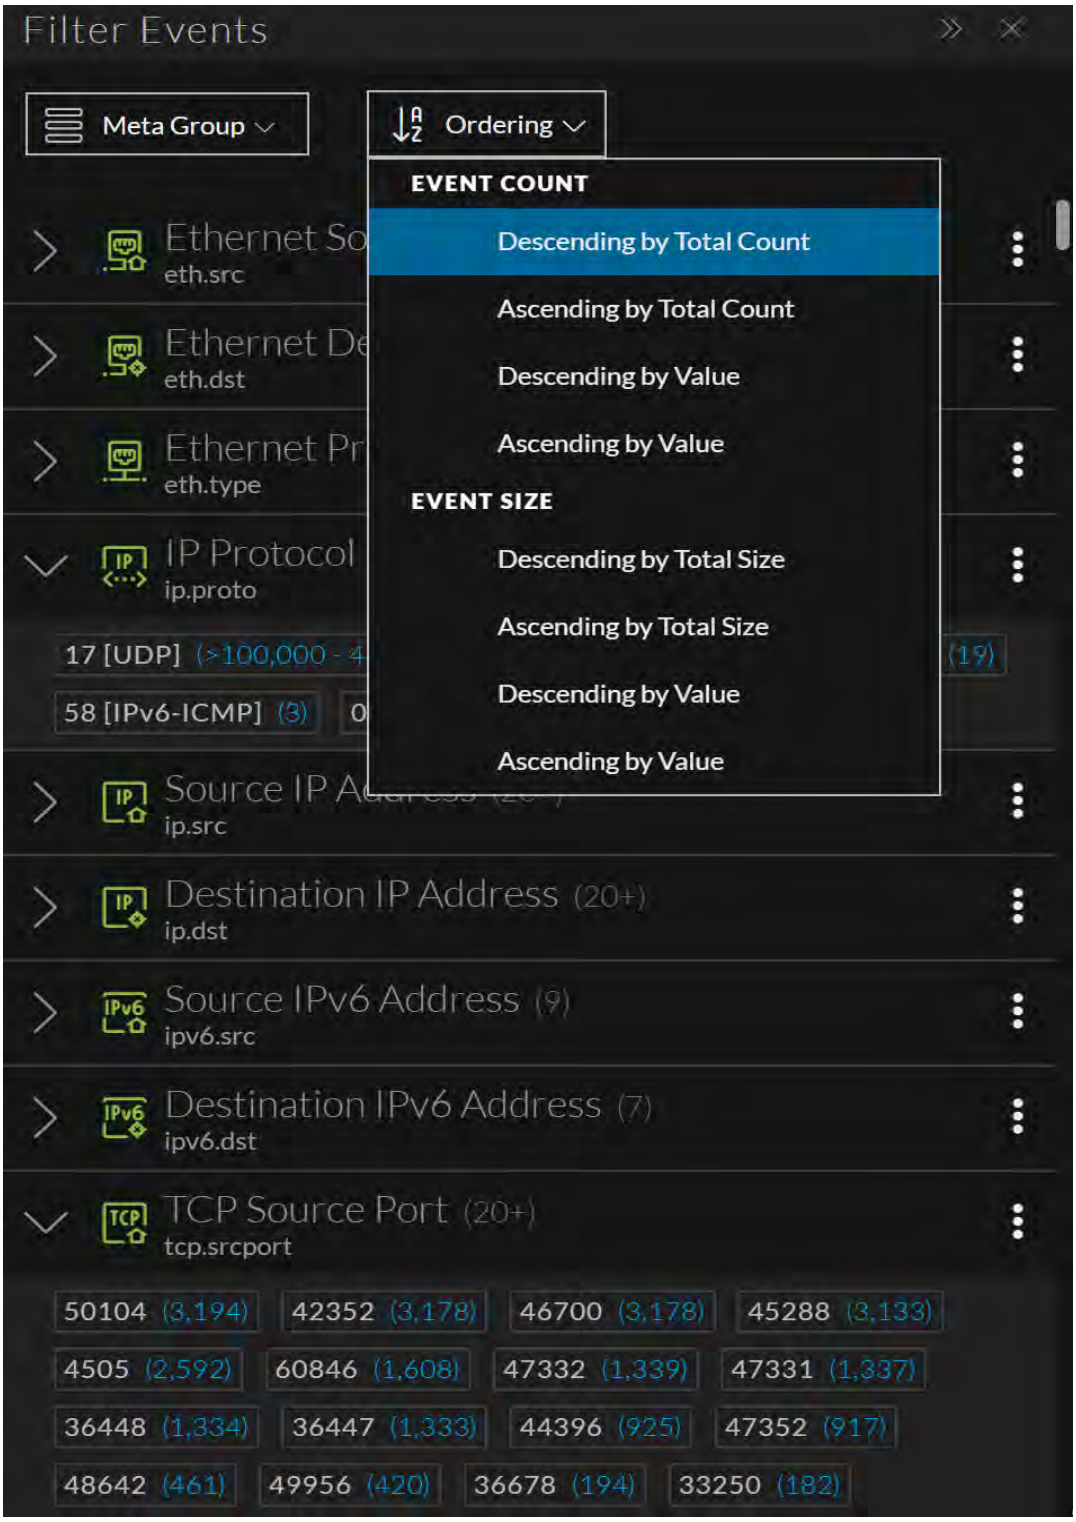
**To drill into meta values in the narrow Filter Events panel:**

1. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Filter Events panel and the data set showing in the Events panel.
   b. Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel, and the query is not executed in the Events panel until you click the query button.
   c. Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata, and the query is not executed in the Events panel until you click the query button.
2. Continue clicking values to refine the set of events (drill point). As you refine the set of events, examine and reconstruct the raw events for the same set in the Events panel.

## Copy the Meta Values for a Meta Key

To copy all of the visible meta values for a meta key:

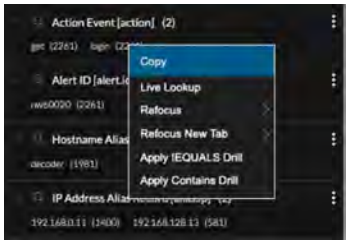
1. In the meta key row of an entry, click the Meta Key options button (⋮).
   The Meta Key options are displayed. Currently the only option is Copy Values.



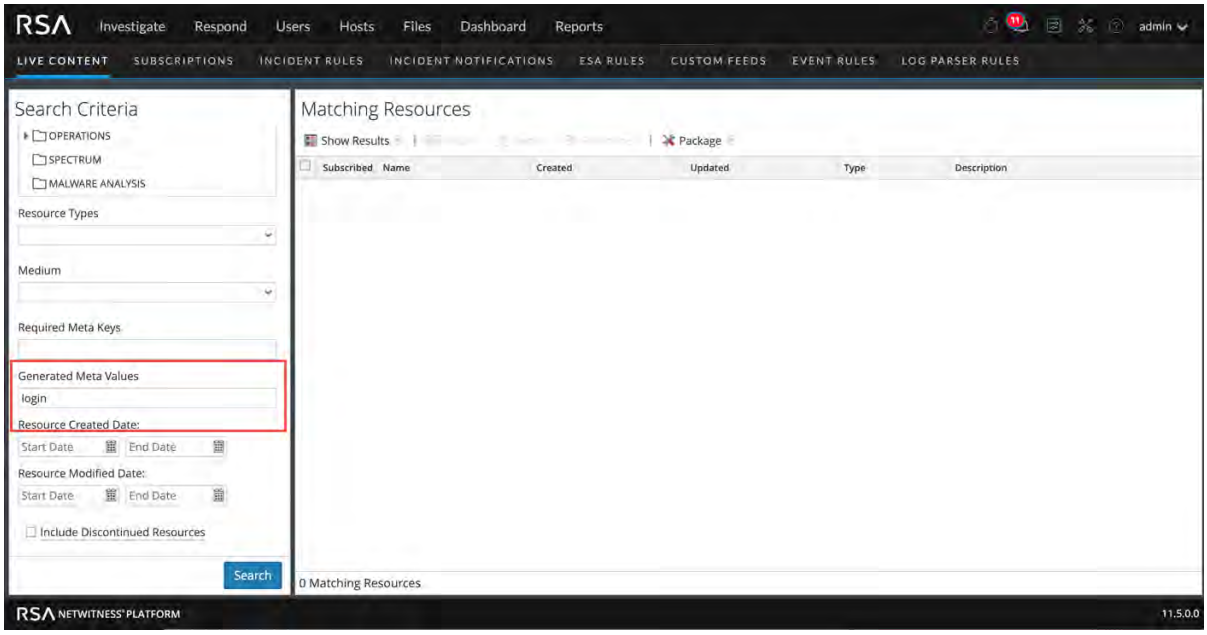
2. Click **Copy Values**.
   A comma-separated list of the values is copied to your local clipboard. This is an example of the clipboard contents: `"get", "login", "put"`.

## View a Selected Meta Value in RSA Live

1. Right-click a meta value, for example **login**.
   The Meta Value drop-down menu is displayed with the Copy option selected initially.



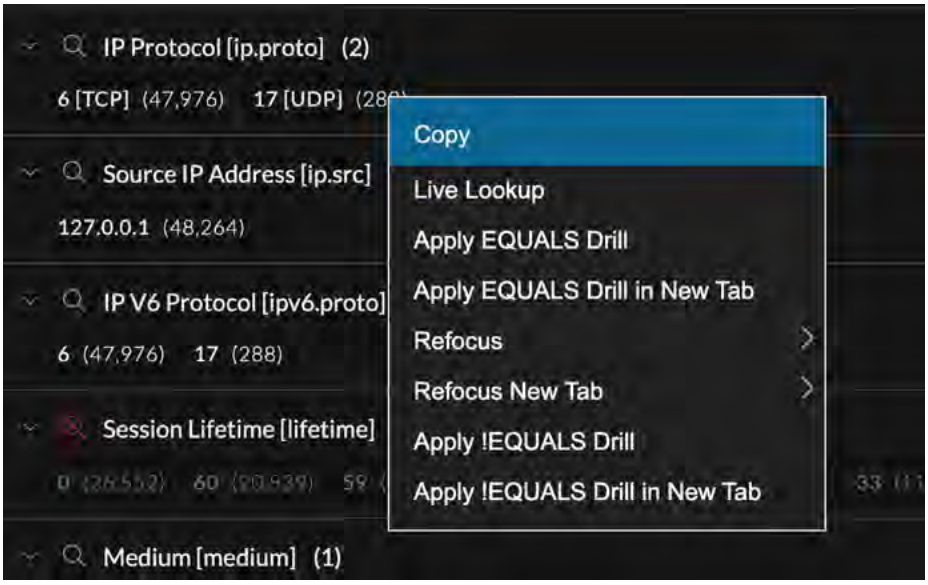
2. To look up the meta value, for example **success**, in RSA Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Values field, and ready for a search.



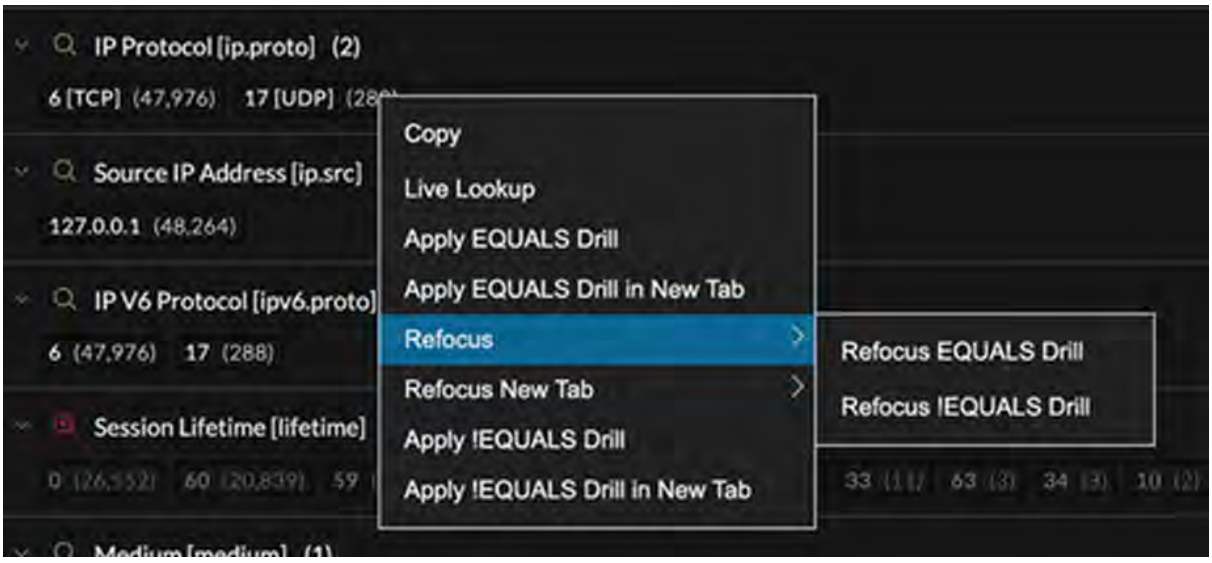
## Refocus the Investigation of a Meta Value

For each value listed under a meta key, the focus is `<meta key> = <meta value>`. When you right-click a meta value, a context menu with different refocus options is displayed. All of the refocus actions update the drill point in the Events panel and the Filter Events panel.

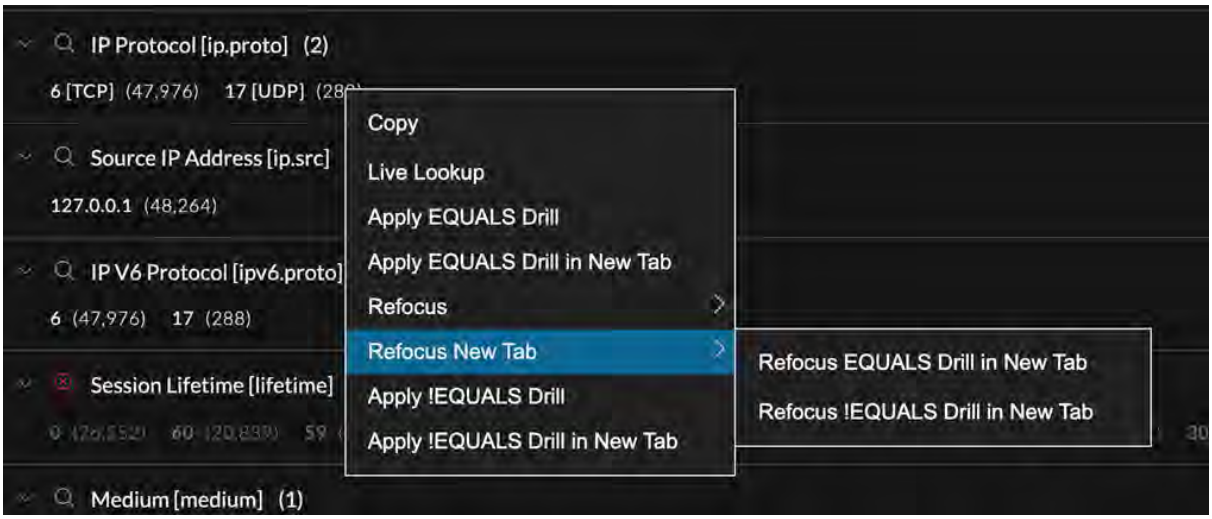
1. To append the key-value pair to the query with different operators (=, `!=`, `contains`), right-click a meta value (for example **UDP** in the figure below) and select one of the **Apply <operator> Drill** options.



2. To start the query over with the key-value pair and a different operator (=, `!=`, `contains`), right-click a value and select one of the **Refocus <operator> Drill** options.



3. To append the key-value pair to the query or start the key-value pair over in a new browser tab, right-click a value and select one of the **Refocus New Tab > Refocus <operator> Drill in New Tab** or **Refocus <operator> Drill in New Tab** options.



The drill is refocused according to your choice, and the new query is executed in the Events panel.

# Filter Results in the Events View

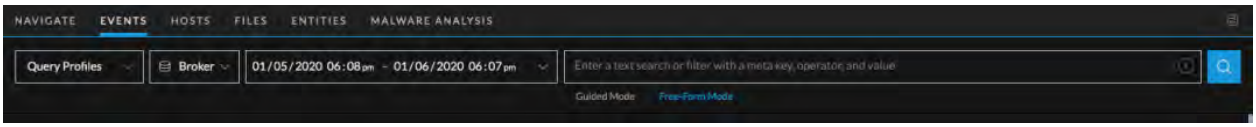
**Note:** This section applies to version 11.1 and later.

Filtering events in the Events view helps to narrow the focus of an investigation to a smaller, relevant set of events. You can filter events in the Events view using the Events Filter panel (Version 11.5 and later), the options in the query bar, and the options in the Events panel.

## Initial Filter Using the Query Bar

When initially opening the Events view, the most basic filtering is to select a service, and time range and then query the service in the query bar. This returns a list of matching events in the Events panel. You can also select a query profile (Version 11.4 and later) and build a query to look for events that contain certain meta keys, meta values, and text in the query bar.

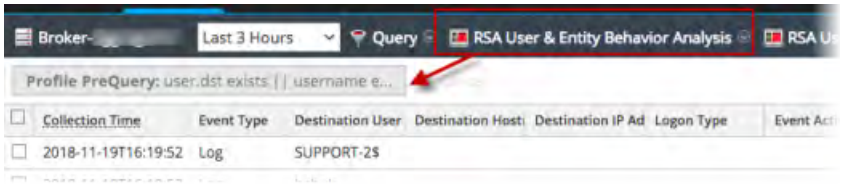
This figure illustrates the Version 11.4 and earlier query bar with the options to select a query profile, service, and time range to filter events and load them in the Events panel. Two modes are available Guided Mode and Free-Form Mode.

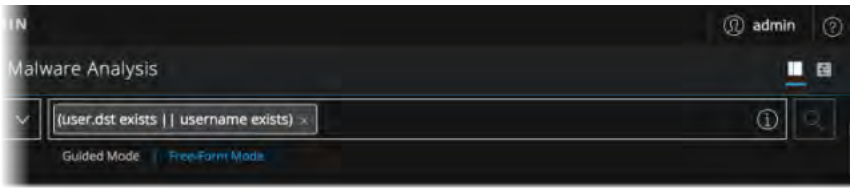


This figure illustrates the Version 11.4.1 and later query bar in which the Guided and Free-From Modes are no longer necessary. The simplified filter entry form allows you to use advanced auto-suggest options and also to enter a free-form query.

- The Query Profiles menu is available in Version 11.4 and later. You can encapsulate a query and a column group in a profile so that a useful combination of attributes is easily recalled and applied to a set of events in the Events panel (see Use Query Profiles to Encapsulate Common Areas for Investigation.)
- By default, the first service is automatically selected (unless you previously selected a service and the selected service is in browser cache). You can select a service as described in Begin an Investigation in the Events View
- If you do not select a time range, the default time range (24 hours) is used.
- The query builder field is an empty field to the right of the time range selector. This is where you build a query by creating filters. Clicking submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the (console icon) opens the query console, where detailed status of the query is provided.
- When you go to the Events view from the Legacy Events view or the Navigate view, the service, time range, and any filters that were selected in the Legacy Events view or Navigate view are displayed in the query bar. The service, time range, and individual filters can be modified.

- If a profile is selected in the Legacy Events view when you right-click or double-click an event and go to the Events view, the filters from the profile (preQuery) are added to the query builder field as an editable filter. The following figures show a preQuery in the Legacy Events view, and the same query added as the first filter in the Events view.

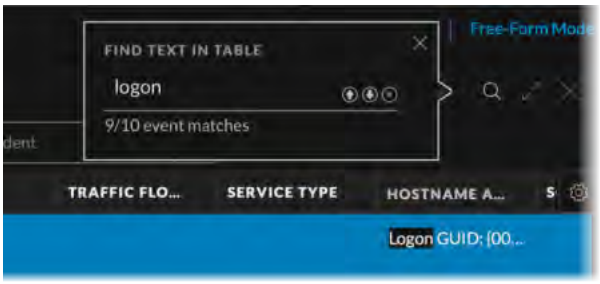




## Find a Text String in the Events Panel (Version 11.4 and Later)

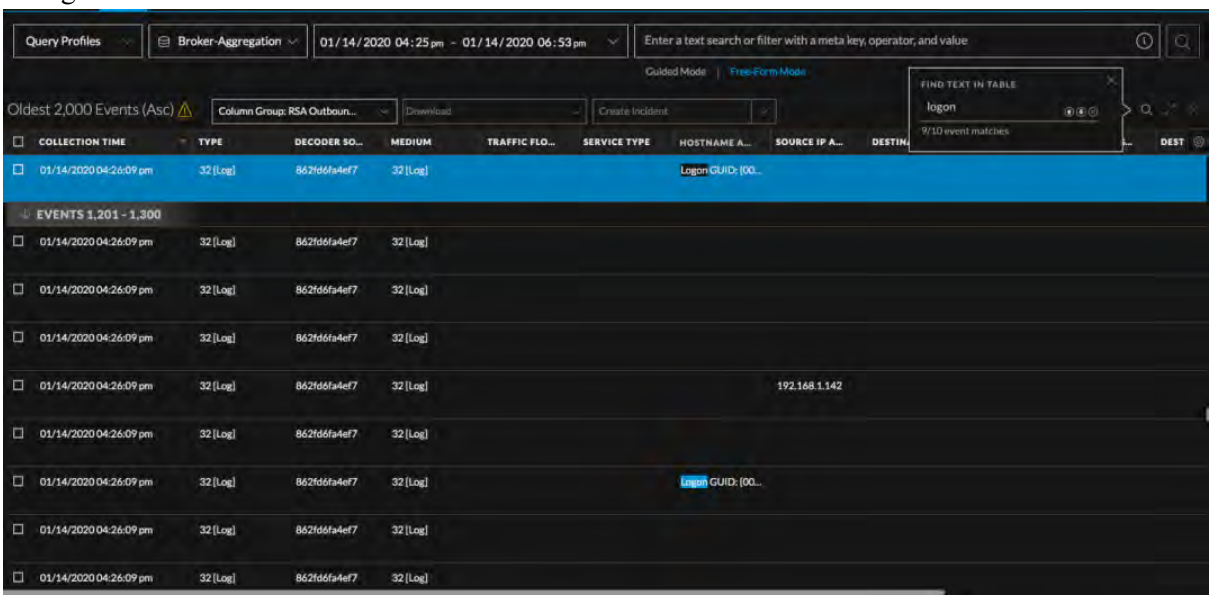
With the Events panel open, you can search for a text string in the list of events. This search is similar to the CTRL-F search in a browser window. The search scans all text in every row of the table, visible columns only, to find matching text and highlights the matches. Columns that are not displayed are not searched. The search function is disabled if the Summary column is part of the table.

1. With events loaded in the Events panel, click on the right side of the toolbar.



2. In the **Find Text in Table** dialog, start typing a text string.
   After you type two characters, exact matches of the text string without regard to case are highlighted in the Events panel. As you type more text, highlighted events are further refined. The following figure is an example of the results found after entering "192.168" in the Find Text in Table dialog. The text string was found in 10 events. The first event is highlighted in blue with the text string within the event also highlighted. Icons are available for navigating the search results and closing the

dialog.



3. To navigate through the search results, click the up and down arrows.
   - To view the next event that contains the text string and navigate downward through the search results, click the down arrow. If you click the down arrow when viewing the last result, the first result is highlighted.
   - To view the immediately prior event that contains the text string and navigate upward through the search results, click the up arrow. If you click the up arrow while viewing the first result, the last result is highlighted.
4. To close the search dialog, click X or press the ESCAPE key. The dialog also closes if you open a reconstruction, select a new column group, or execute a new query.

## Refining the Results in the Events Panel

After the initial filter and query submission, you can continue to use the options in the query bar to refine results, with two added methods of filtering the results.

- In Version 11.4, you can use column groups to optimize the number or attributes (meta keys, meta groups, meta entities) you look at for a given event (see Use Columns and Column Groups in the Events List).
- In Version 11.5 and later, you can filter events by exploring meta keys and meta values in the results in the Filter Events panel, which is a Beta release feature. This allows you to pivot through the metadata as you can in the Navigate view, and offers the added convenience of immediately seeing the matching events in sequence in the Events panel based on your drill point. The administrator can enable or disable this feature as describe in the *System Configuration Guide*.

## Query Builder Concepts

In the query builder, you can reduce the number of events to an interesting set by creating three types of filters: simple, free-form, or text.

The basic syntax for each filter is as follows: `<meta key><operator><meta value>`. Here is an example: `direction = 'outbound'`.

In Version 11.4, when you type or paste a query in the query bar, the text is parsed into individual filters separated by the AND operator if the parsing engine determines that AND is needed. Earlier versions use only the AND operator between filters, and the logical operator is not visible.

- If you type `action = 'get' action = 'put'`, the result is two filters separated by AND.
- If you type `action = 'get' OR action = 'put'`, the result is two filters separated by OR.

When typing or pasting a filter for `event.time`, use one of the following formats:

- `event.time = '2020-DEC-02 23:00:00'`
- `event.time = '2000-12-20 21:00:00.000'`
- `event.time = '2000-12-20 21:00:00'`

In Version 11.4, the parsing engine converts a longer string of text that you type or paste in the query bar into individual filters. Parts of the filter that are not parsable are converted to a free-form filter. In earlier versions, a long text string is added to the query bar as a single filter. Further enhancement in Version 11.4.1 provides the ability to keep typing text for any query, where you type a meta key and an operator or an operator and a value, as a free-from query. The free-from query is parsed as usual.

- If you type, `action = 'GET' OR action is 20 || action = 'PUT'` in the query bar the Free-Form option is used. Part of this text cannot be parsed so the result is three filters separated by OR. The following figures show the query bars of version 11.4 and version 11.6 respectively.

- In Version 11.4.1, If you type a meta key-operator-value sequence and you continue typing without pressing Enter, the Free-Form option is automatically used so that you can continue typing the query. For example, you can type `medium = 1 OR medium = 2` without pressing the Enter key before `OR`. The Free-Form option is highlighted while you type and when you press Enter at the end, a free-form filter is created in the query bar.
- Text filters (Version 11.4 and later) are text strings that do not contain spaces. You can search the data set for any exact match of indexed meta keys, not all meta keys. Here are some examples: `failed`, `login`, or `attempt`.

**Note:** In some cases, when you are typing a text filter that is close to matching a meta key and operator statement, the auto-suggest feature erroneously suggests a filter using the meta key and operator. The workaround is to begin typing the text and select Text Filter at the point where the auto-suggest feature turns the text into a meta key and operator. For example, there is meta key named `crypto`, and an operator named `contains`, and you want to create a text filter to search for `cryptocurrency`. As you type `c-r-y-p-t-o`, the next `c` in "currency" triggers the `contains` operator instead of continuing to type as a single word. To complete the text filter, right before typing that `c` in `currency`, which would trigger the `contain` operator, highlight the Text Filter option to let the system read the input as text filter.

In the query builder, each filter becomes an editable field. Filters line up from left to right, representing the sequence in which the filters were created. As more filters are added and exceed the length of a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

Successive versions of RSA NetWitness® Platform 11 have more capability than the original 11.1 query bar, with Version 11.4 offering extensive help as you create a query.

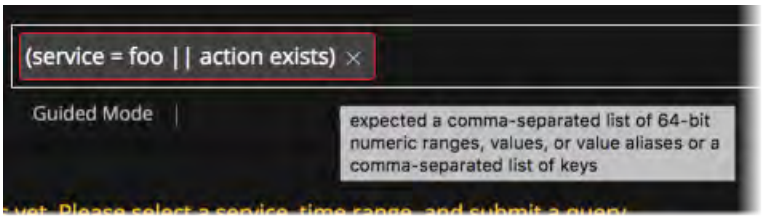
## Guided Mode vs. Free-Form Mode

**Note:** Version 11.4 offered two modes for entering queries in the filter entry form: Guided Mode and Free-Form Mode. Beginning with Version 11.4.1, the powerful auto-completion features and suggested values of Guided Mode and the ability to type or paste a free-form query are fully integrated. References in this document that differentiate between Guided Mode and Free-Form Mode are for analysts using Version 11.4.0.x and earlier.

In Guided Mode, you are guided with suggestions for auto-completion that show valid meta keys and operators, and suggested values in the filter entry form. In version 11.4, you can type, paste, choose a recent query, or select from the drop-down menu. Earlier versions do not support pasting text and recent queries. This is an example of the 11.4 filter entry form.

As you create filters, the syntax of each filter is validated and invalid filters are marked by a red outline. If you hover the mouse over the filter, a message that explains the error is displayed.

In Version 11.3 and later, free-form filters are validated on the server side, which may take additional time. If you submit the query before the server has returned filter validation results, the is replaced by a spinner. When server validation returns, a query with no invalid filters begins execution. If the query contains an invalid filter, execution is terminated and the invalid filter is outlined in red. This is an example of an invalid query.



In Free-Form Mode, you can type or paste a long text string. There is no auto-suggestion, and validation is performed on the server side when you submit the query. If an error is found, the query does not execute.

**Note:** The button has a different label in versions earlier than Version 11.3. It was previously named **Query Events**.

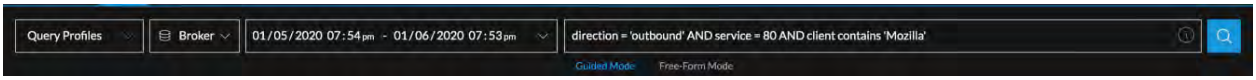
Clicking Guided Mode or Free-From Mode toggles between modes. If you selected Free-Form Mode the last time you logged in, this choice is stored in browser cache and is used until the browser cache is cleared.

- When you switch from Guided Mode to Free-Form Mode, filters that you created in Guided Mode are transformed to a text query in the Free-Form field.
- When you switch from Free-Form Mode to Guided Mode, the query you were typing is added to the query bar as individual simple filters, but it does not include auto-suggest options.

  **Note:** Before Version 11.3, a Free-Form filter could not be edited in Guided Mode.

The following figure is an example of the query bar with the Guided Mode query builder with several filters.

The following figure is an example of the Free-Form query builder in use.

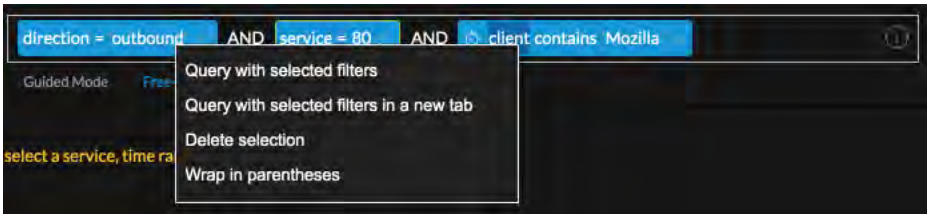


## Concepts for Editing Multiple Filters

As you work in the query builder, you can see when a filter has focus for editing (a green outline) and which filters are selected (blue background). This is useful because you can have multiple filters selected for right-click actions, but only one can be edited at a time. The figure below shows the green outline marking a filter that has focus and the blue background indicating that two filters are selected.

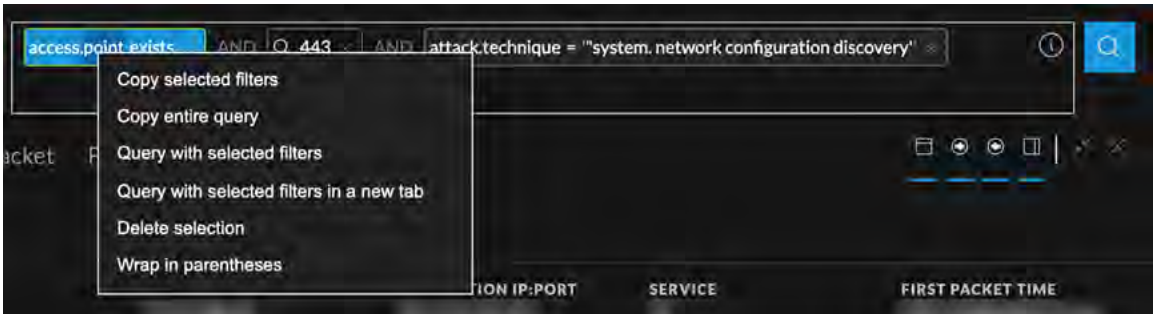
This figure illustrates the same set of filters with all filters selected (blue background) and one filter that has focus (blue background and green outline).

A right-click action from the drop-down menu applies to all selected filters as shown in this figure showing Version 11.4 options.



In Version 11.4.1, the menu has two new copy options as shown in the following figure. The options allow you to share the clipboard contents with other analysts or paste the contents to the query bar. You can:

- Select a single filter, right-click it, and then copy the entire query to the local clipboard.
- Select multiple filters, right-click one of them, then copy the selected filters.



These are a few basic concepts that explain how to work in the query builder:

- You can select multiple filters, but only one can have focus and the last selected filter is the one with active focus at any point in time.
- To select a filter and give it focus, click the filter. To deselect the filter and remove focus, click the filter again, press **Esc**, or click anywhere else on the page.
- To add a filter, click before or after an existing filter. To create a new filter before or after the filter in focus, press the right or left arrow key.
- To open a filter for editing, double-click the filter or click it and press **Enter**. To exit without saving changes and leave the filter in focus, press **Esc**.
- To delete a filter, click the filter and press **Delete** or click **X** on the filter.
- (Version 11.6) If a filter is awaiting user's input, it is highlighted with blue color .

- (Version 11.6) An invalid filter is highlighted with red color.

- You can hover over the filters in the query bar to display tooltip messages.

## The Version 11.3 and Earlier Query Builder

In Version 11.1, the user interface guides you as you create and edit each simple filter: `<meta key> <operator> <meta value>` filter. The user interface supports only simple filters. If you open an event from the Legacy Events view or Navigate view and the filter has more than one operator, `||`,`&&`, `()`, `REGEX`, or `LENGTH`, the filter is added, but editing is not supported in the Events view. Refer to the Investigate User Guide for NetWitness Platform 11.3 for details; it is available here in PDF form: Master Table of Contents for RSA NetWitness Platform Version 11.

In Version 11.2, the user interface has two modes: Guided Mode and Free-Form Mode. Guided Mode guides you as you create and edit each simple `<meta key> <operator> <meta value>` filter. The default mode is Guided Mode, which includes auto-suggest and validation options. You can enter a long text string in Free-Form Mode. In Free-Form Mode validation is performed when you run the query. Refer to the Investigate User Guide for NetWitness Platform 11.2 for details; it is available here in PDF form: Master Table of Contents for RSA NetWitness Platform Version 11.

In Version 11.3, the user interface has these added features:

- When you go to the Events view from the Navigate or Events view, with a preQuery in effect for a profile, the preQuery that was displayed in the breadcrumb is available in the Events view query builder as an editable filter.
- The auto-suggest options in the user interface are augmented with an Advanced Options section that allows for the creation of a free-form filter. Free-Form Mode is still useful for pasting an entire long text string.
- You can cancel a query while it is executing.
- You can view detailed status information about the query being executed in the query console.

## The Version 11.4 Query Builder

You can type; select meta keys, operators, and values from the drop-down menus; or paste a filter in the query bar. Added 11.4 features in the Guided Mode filter entry form are described in detail below.

### Meta Keys Cached for Faster Loading

When the Events view opens, meta keys from all connected services are cached for faster data loading. These meta keys are available in user interface elements that have auto-suggest meta keys. (When you are building a column group or profile, if you are expecting to see a meta key and it is not displayed, select the service where the key was added to force a cache update. This usually occurs only when a meta key is not added to all concentrators.)

## Text Filter

You can create a text filter to find a text string in the data set which is indicated with . You can use a text filter with no knowledge of meta keys that would contain the values. One text filter per query is supported. A text filter looks through indexed meta keys, not all meta keys.

## Pasting Text Instead of Typing

When creating a filter, you can paste a meta key or value in the filter entry form. When you paste text into the filter entry form instead of typing the text, the text is parsed appropriately to create one or more filters. Any portion of the text that cannot be parsed is converted to a free-form filter.

## Select All Filters and Copy All Filters (Version 11.4.1)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Cmd-A for MacOS, Ctrl-A for Windows) and then copy the selection to the clipboard (Cmd-C for MacOS, Ctrl-C for Windows). The clipboard text is available to share with other analysts or to paste in the query bar using Cmd-V or Ctrl-V).

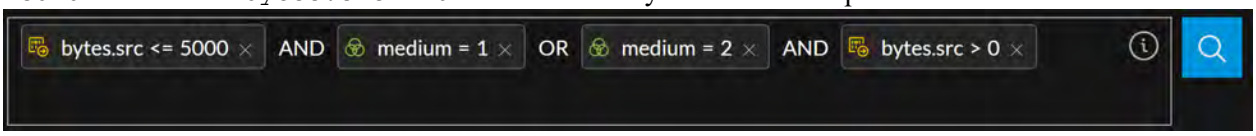
## Use of Recent Queries

The filter entry form offers two methods of entering meta keys, operators, and values: the Meta tab and Recent Queries tab. The Meta tab is the same as the filter entry form for prior versions except that a count of matching results is given in the tab label and icons mark meta keys that are indexed by key, indexed by value, and not indexed. In the Recent Queries tab, up to 100 recent queries are displayed. The list is filtered as you type to show only queries that contain the typed text, and you can select a query from the list.

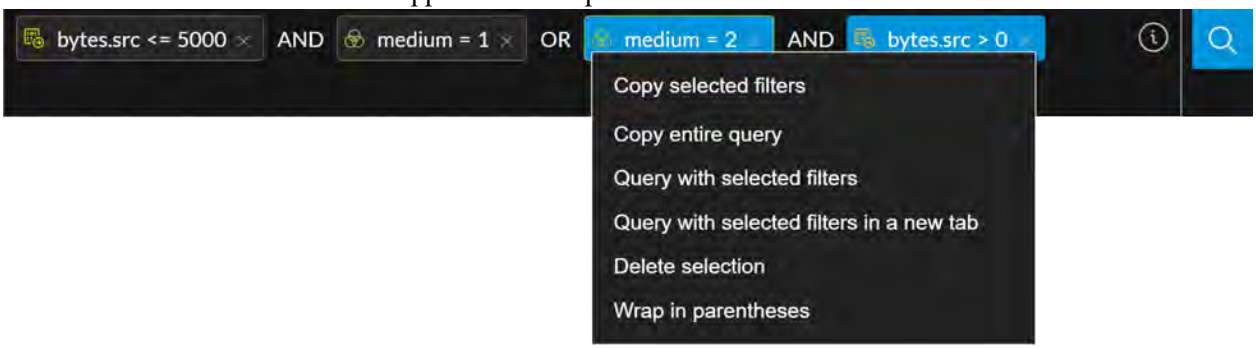
## Use of Advanced Operators

Auto-suggest can parse the following advanced operators that you paste or type into the filter entry form: `<`, `>`, `<=`, `>=`, `OR`, `||`, `AND`, `&&`, `()`, `regex`, and `length`. The text is parsed as multiple filters. For example, if you type or paste `medium > 0 && medium <= 100`, the text is parsed as two simple filters with an explicit AND operator: `medium > 0 AND medium <= 100`. If you type or paste `bytes.src <= 5000 && medium = 1 || medium = 2 && bytes.src > 0`, four simple filters are created with `AND` and `OR` operators separating them: `bytes.src <= 5000 AND medium = 1 OR`

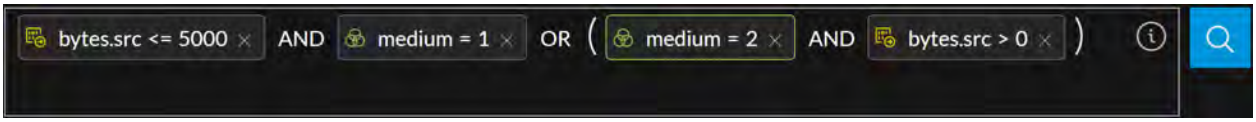
`medium = 2 AND bytes.src > 0` to make as many valid filters as possible.



This filter is an example of a filter in which it would be useful to add parentheses. You can select `medium = 2` and `bytes.src > 0`, then right-click and select **Wrap in Parentheses** from the drop-down menu. Text filters are not supported inside parentheses.



The resulting query is `bytes.src <= 5000 AND medium = 1 OR (medium = 2 AND bytes.src > 0)`.



If you encounter errors while creating filters, look for tooltip messages and check the documentation.

## Easy Use of AND/OR Operators

When you type `||` and `&&`, they are displayed as `OR` and `AND` in the query bar. You can change `OR` to `AND` and `AND` to `OR` by clicking the word. When you insert the cursor to add a filter, the `AND` operator is added before the cursor. When you delete a filter, orphaned `OR` and `AND` operators are removed. The operator for a text filter must be AND because text filters are always ANDed to a query.

## Automatically Balanced Parentheses

When creating and editing filters in the query builder, parentheses pairs are automatically balanced as you type. If you type an open parenthesis in a filter that is open for editing or before a selected filter, the close parenthesis is added at the end of the filter. This works intuitively as you type so that you can add new filters on either side of the parenthesis and between parentheses when there are nested parentheses. Orphaned parentheses are automatically removed. If adding parentheses would create an invalid filter, the parentheses are not added. You can also right-click selected filters, and add parentheses using the Wrap in parentheses option. This option is only available when the result would be a valid filter.

## Hints about Available Values

For properly indexed meta keys, the user interface provides hints about available values related to the time range of the query. Up to 100 suggested values are returned and, when you type text, the list of 100 values is filtered to include only relevant values. If no matching values are returned, a message advises "No suggestions found." (The suggested values are based solely on the time range; filters in the query do not filter the list of 100.)

### CIDR Notation and Shorthand

When entering a value for an IP address in a filter, you can use CIDR notation to filter for addresses within a range.

The IPv4 CIDR block range is 0 to 32. For example `10.20.30.0/24` specifies `10.20.30.0` with a subnet mask of `255.255.255.0`, which will match an IP in the range `10.20.30.0` through `10.20.30.255`.

The IPv6 CIDR block range is 0 to 128, for example,
`1203.0fe1:fe82:b896:89b0:8a7c:99bf:323d/32` specifies
`1203:0fe1:0000:0000:0000:0000:0000:0000` through
`1203:0fe1:ffff:ffff:ffff:ffff:ffff:ffff`.

You can also use shorthand to remove groups of zeros or leading zeros in a group in IPv6 addresses, for example,

`1203:fe1::`

There must be no spaces between the IP address and the CIDR mask that you are using.

### Ranges or Series of Values

For meta keys that have numerical data, you can use a range of values, a series of values, or both to filter data. For example, this query has a comma-separated list, and two of the values in the series are ranges `src.port = 0-1023, 1024-1050, 65535`. If a comma is a part of a value, the value must be wrapped in quotes. For example, `get,post` is interpreted as two separate values, while `'get,post'` is interpreted as one value. A range of values must be a valid range of positive integers, separated by a dash (with our without a space before and after). The first number in the range must be smaller than the second. For example, `0-1023` and `0 - 1023` are valid ranges, but these are not valid ranges: `-10 - 50`, `50 - 10`, `50.8 - 60.2`, `50 - 70x`.

### No Separating Space Required After Meta Key and Operator (Version 11.4.1)

Filters in the query bar need a space between the meta key and the operator, and between the operator and the value. Operators must be typed with a separating space in the filter entry form in order to use the auto-suggest functions for operators and values. To improve the user experience when typing a query, the filter entry form accepts operators typed with no separating space after the meta key. When you type an operator with no separating space, a value is auto-suggested as usual and a space is added between the meta key and the operator. When you type an operator and a value without a separating space, the space between them is automatically added.

## Select a Time Range

The Time Range selector limits the events returned in the Events view to a specific time range. The time range is displayed in the format `Start Time - End Time`, showing the date, hours, and minutes in your current timezone based on timezone settings configured for your profile. In Version 11.3 and later, you can choose a time range relative to the current collection time or create a custom time range. The time and date format is based on preferences set for the Events view in the User Preferences dialog (select > **Profile**).

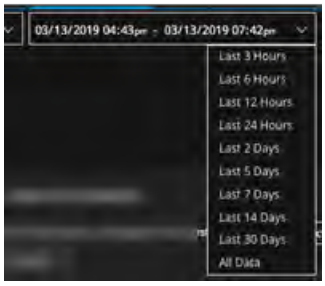
- By default, the date format is MM/DD/YYYY. You can change the format to DD/MM/YYYY, or YYYY/MM/DD in the User Preferences dialog.
- Start time and end time are in the format of HH:MM. Although seconds are not displayed, the value for start time always defaults to HH:MM:00 seconds, and the value for end time always defaults to HH:MM:59 seconds. As an example, a time range of 6:45 pm - 7:45 pm is interpreted as 06:45:00 - 07:45:59 pm.
- The default time range is the 24-hour clock; you can change it to 12-hour periods.

**Note:** By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. Your administrator can change the setting for time format in downloads to combine your user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible. Given this time: `04/13/2020 09:17:36 am` with timezone US/Pacific `(GMT-7:00`, this is an example of the time on the 12-hour clock as it appears in the user interface: `04/13/2020 09:17:36 am`. In the download, Epoch format would represent the time as `61547519856000`. If your administrator set the time format for downloads to the easily readable representation, the same time would be represented as follows: `04-13-2020T09:17:36AM-07:00`.

The time format for a query is based on preferences set for the Events view in the Event Preferences dialog (select ). The time format can be either database time or wall clock time. When Database Time is selected, the start and end time for a query is based on the time that the event was captured (collection time). When Wall Clock Time is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range. This and other Events view preferences are described in Configure the Events View.

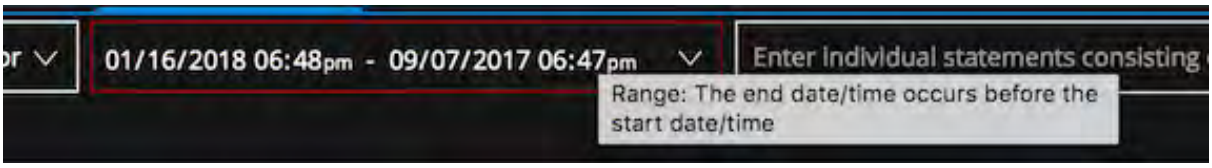
### To edit the time range, do one of the following:

1. Click the drop-down arrow inside the **Time Range** selector and select a time range from the list. Options are in minutes, hours, days, or all data.

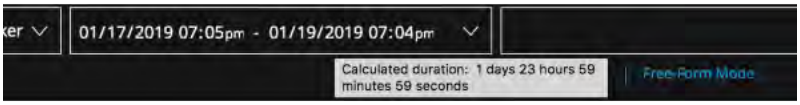


2. (Version 11.3 and later) Edit the time range directly by clicking the year, month, day, hour, or minute displayed in the query bar. When a value is highlighted, type a new value for either the start or end time. If your time format preferences are set to 12-hour periods, click **am** or **pm** to toggle between the two options.

If the time range is invalid (for example, the start time is later than the end time), a red border appears around the Time Range selector. The button is disabled because the query is no longer possible, and a tool tip shows an error message explaining what you need to change. The following figure shows an invalid time range.



The selected time range is stored in your browser for the service being queried; you can set different time ranges for different services. A tool tip shows the calculated duration of the query. The following figure is an example of the tool tip.



## Submit a Query

The button on the right side of the query bar is active as needed to submit a query. In version 11.3 and earlier, when you click , all of the filters are ANDed to generate results and the button becomes inactive. In Version 11.4, because the query may contain other operators besides AND, the query is submitted as is. The button becomes active again in these conditions:

- If you change the service in the query bar or change the column group in the Events panel, a network call for data for a reconstruction in the Events panel continues to use the previous service, time range, and metadata filters until you submit the new query. The button becomes active as an indicator that the data in the view is stale.
- If more than a minute has passed and the original query's time range would no longer generate the same result set, the button becomes active as an indicator that results may be stale. In Version 11.3 and later, a setting in the Events view preferences determines this behavior by enabling or disabling the Update Relative Time Window Automatically option (see Configure the Events View.)

## Cancel Execution of a Query

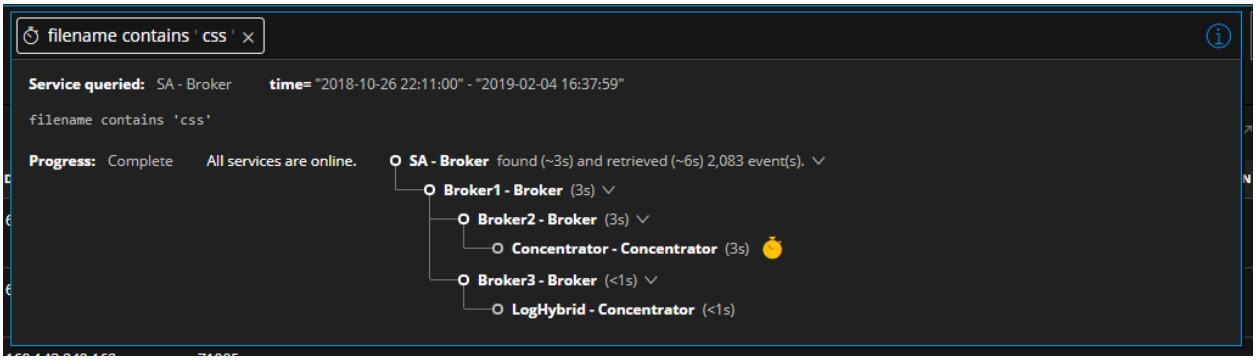
After you click to submit a query, the button changes to (the stop query option). The stop query option remains until all the events are loaded in the Events panel. To cancel the query, click .

If the query is canceled before all results have been returned, the following message is displayed at the end of results in the Events list: "Because the query was canceled, only partial results are displayed."

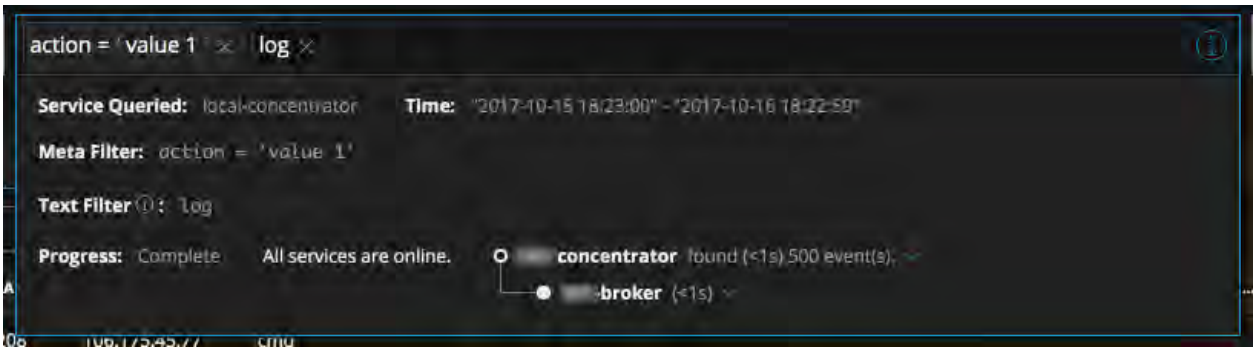
## View Status of a Query

After a query is submitted, you can click the information icon ( ) in the query bar to open the query console. In the query console, you can see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. The time range displayed in the Query console always shows each date as YYYY-MM-DD. Here is an example range from the Query Console: `"2014-09-20 20:57:00"-"2018-11-02 18:57:59"`.)

The following figure is an example of the Query Console for Version 11.3 when a query executes successfully and the slowest service is marked by an amber stopwatch.



The following figure is an example of the information in the Query Console for Version 11.4 after a query that includes a text filter executes. Notice that the query is shown in two fields, Meta Filter and Text Filter.



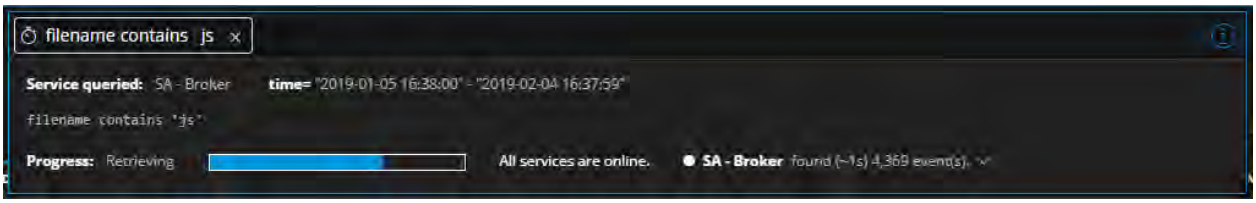
While a query is executing, a progress bar indicates the query's completion percentage at the bottom of the console. The status lets you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color of the query bar changes to amber if a non-fatal error occurs.

Icons provide additional information about individual services.

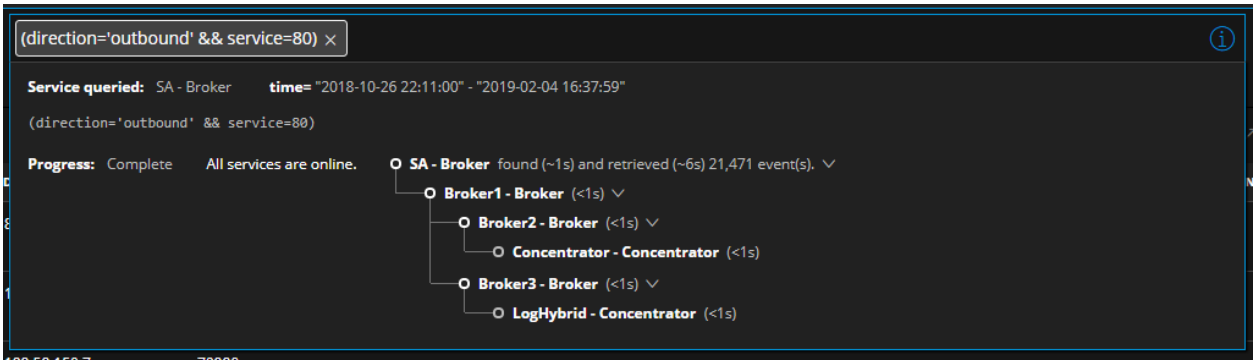
- An amber stopwatch marks the slowest service.
- An amber triangle indicates a warning was received.
- A red triangle shows that an error was received when trying to query the service.

**Executing and Reading the Index File to Find Events.** The first stage of a query is complete when the queried services have found results. The query console provides a nested hierarchical listing of all the services being queried with indicators showing which are online or offline, and the time in seconds that the service took to find results.

**Retrieving Events and Loading in the Events Panel.** While the found events are being retrieved and loading in the Events panel, the progress bar shows a visual indicator and text description of what is happening. In the figure below, results were found and are being retrieved.

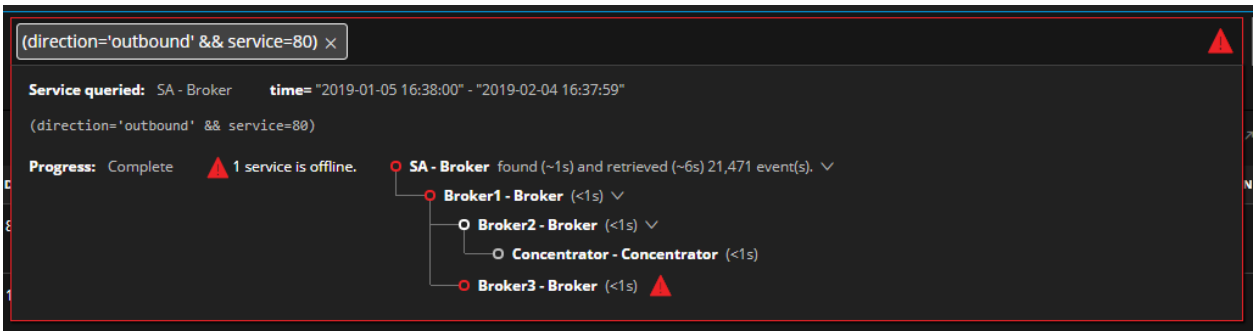


**Request Complete.** If there are no errors or warnings when loading is complete, the query console is outlined in blue and the button is disabled as an indicator that the data in the view is fresh. The following figure is an example of the query console for a completed query with no errors or warnings.



**Errors and Warnings.** A fatal error such as a syntax error in the query, or the queried service being offline, stops execution of the query. A red triangle is displayed in the upper right corner of the query console, and the console is outlined in red to indicate that the query failed. If the queried service is offline, only the queried service with no hierarchy of services is listed in the query console and marked by a red triangle.

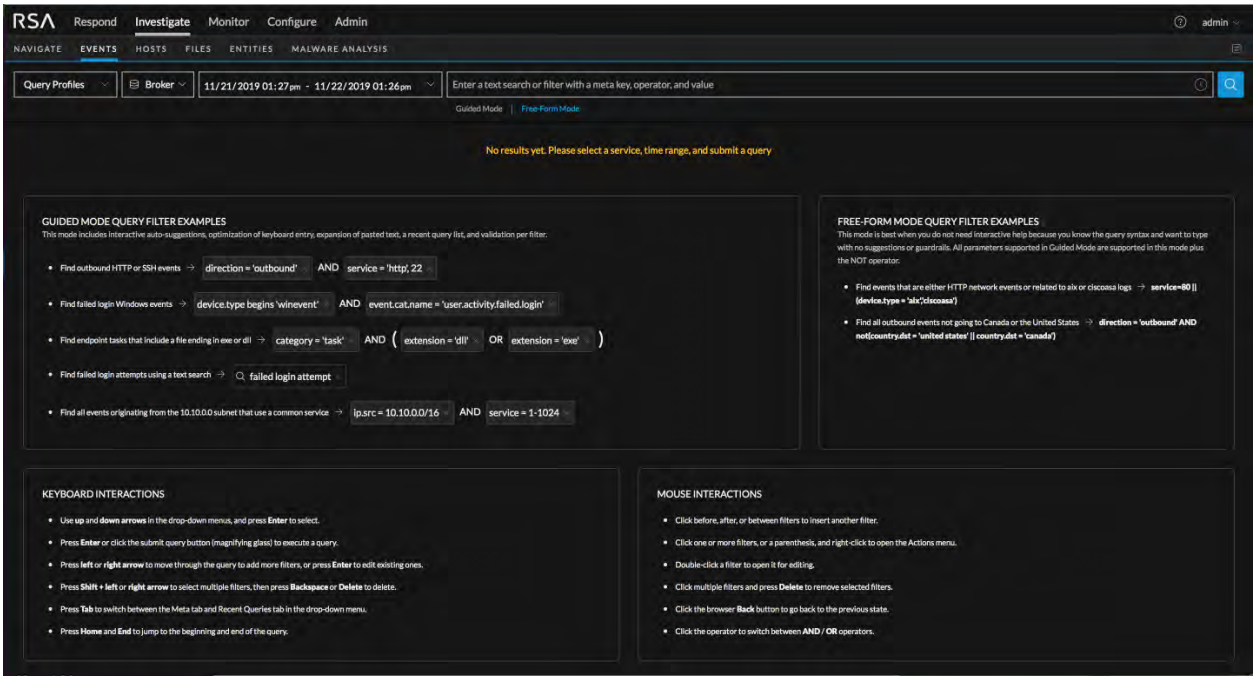
A non-fatal error does not prevent a query from executing. The query is executed and events are loaded, but a red triangle is displayed in the upper right corner of the query console, and the console is outlined in red as a warning. The following figure shows the appearance of the query console when the queried service proxies to another service that is offline.



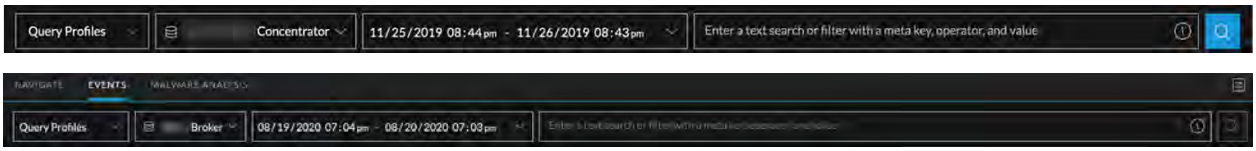
A warning does not prevent a query from executing. The query is executed and events are loaded, but an amber triangle is displayed in the upper right corner of the query console, and the console is outlined in amber.

## Build a Query in Guided Mode

Guided Mode is the easiest way to create a query with features to help analysts enter valid queries. The following figure illustrates the initial Events view with Guided Mode in effect in the query bar (Version 11.3 and earlier).



There is no longer a need to select Guided Mode because all Guided Mode features and more improvements are built in to Version 11.4.1. This figure depicts the query bar in Version 11.4.1.



### Keyboard Actions to Use in Guided Mode

In Guided Mode, the query builder allows entry, editing, and deletion of filters using the key strokes without having to use a pointer. Although you can use the pointer, you have the option to keep your fingers on the keyboard. This table identifies the available keyboard actions in Guided Mode when the cursor is located in the query bar; these do not apply to the service selector and time range.

| Action | Keyboard Entry |
|---|---|
| Copy all filters (Version 11.4.1 and later) | With the cursor in the query bar, but not in a filter being edited, and all filters selected, press **Ctrl-C** (Windows OS) or **Cmd-C** (MacOS). |

| Action | Keyboard Entry |
|---|---|
| Delete characters in a filter | Selected characters: With characters selected in the query bar, press **Delete** or **Backspace**.<br>Previous character (Version 11.4 and later): With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS).<br>All characters (Version 11.4 and later): With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). |
| Delete filters | Selected filters: With one or more filters selected do one of the following:<br>• **Right-click > Delete selected filters** or **Delete selection** (11.4 and later).<br>• Press **Delete**.<br>• Press **Backspace**.<br>Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Backspace** (Windows OS) or **Delete** (MacOS). The focused filter is deleted and focus moves to the left.<br>Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The focused filter is deleted and the focus moves to the right. |
| Delete parentheses in a filter, do not delete the contents (Version 11.4 and later) | With a set of parentheses, but not the contents selected, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The selected parentheses are deleted, but the contents of the parentheses remain. |
| Delete parentheses and their contents in a filter (11.4 and later) | Selected parentheses: With a set of parentheses selected, do one of the following:<br>• **Right-click > Delete selection**.<br>• Press **Backspace** (Windows OS) or **Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the left.<br>• Press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the right. |
| Deselect all filters | With a filter selected, press **Esc**. |
| Edit a selected filter | With a single filter selected, press **Enter**. |
| Insert a new filter at the beginning of the query bar, and open for editing (Version 11.4 and later) | With a filter selected, press **Home** (Windows OS) or **Fn** + **Left Arrow** (MacOS). |

| Action | Keyboard Entry |
|---|---|
| Insert a new filter at the end of the query bar, and open for editing (Version 11.4 and later) | With a filter selected, press **End** (Windows OS) or **Fn + Right Arrow** (MacOS). |
| Insert a new filter to the immediate left of the selected filter, and open for editing | With a filter selected, press **Shift + Left Arrow**. |
| Insert a new filter to the immediate right of the selected filter, and open for editing. | With a filter selected, press **Shift + Right Arrow**. |
| Insert a new filter to the immediate left of the selected filter | With a filter selected, press the **Left Arrow**. |
| Insert a new filter to the immediate right of the selected filter | With a filter selected, press the **Right Arrow**. |
| Open a new tab with the selected filters | With filters selected, **right-click > Query with selected filters in a new tab**. |
| Query with the selected filters | With filters selected, **right-click > Query with selected filters**. |
| Query with content of parentheses (Version 11.4 and later) | With parentheses selected:<br>• To query with the selected parentheses contents, select one side of a parentheses set and **right-click > Query with selected filters**.<br>• To query with the selected parentheses contents in a new browser tab, select one side of a parentheses set and **right-click > Query with selected filters in new tab**. |
| Select all filters in the query bar (Version 11.4.1 and later) | With the cursor in the query bar, but not in a filter being edited, press **Ctrl-A** (Windows OS) or **Cmd-A** (MacOS). |
| Select all filters to the left of the current filter | (Version 11.3.x and earlier) With a filter selected, press **Shift + Up Arrow**.<br>(Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice. |
| Select all filters to the right of the current filter | (Version 11.3.x and earlier) With a filter selected, press **Shift + Down Arrow**.<br>(Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice. |
| Select the filter to the immediate left if one exists | With no filter selected, press the **Left Arrow** key. |

| Action | Keyboard Entry |
|---|---|
| Select the filter to the immediate right if one exists | With no filter selected, press the **Right Arrow** key. |
| Submit a query. | With focus on the query bar and no pending filters, press **Enter**. |

## Visual Feedback in Guided Mode

Guided Mode provides visual feedback during query construction. This table identifies and describes the possible feedback.

| Feedback | Icon | Description |
|---|---|---|
| Blue background on a Filter |   | Indicates that a filter is selected. |
| Green circle between two filters | | (Version 11.3 and earlier) A green circle indicates the location of the cursor between two existing filters. Clicking inserts a new filter at this location.<br>(Version 11.4) A bold cursor indicates the insertion point. |
| Green filter outline | | Marks the single filter that has focus and ready to edit. This is combined with the blue background, when multiple filters are selected and this filter has focus. |
| Red filter outline |   | Indicates that the filter is invalid. A tool tip that explains the error is displayed. |

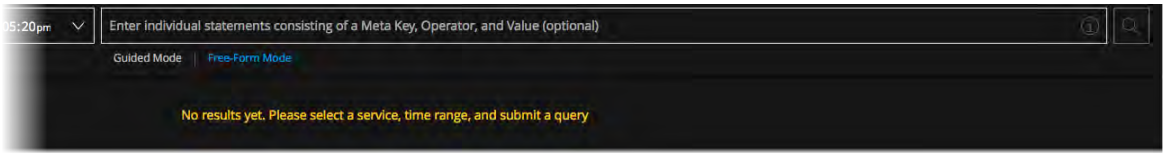
| Feedback | Icon | Description |
|---|---|---|
| Index indicators in the Meta tab | | (Version 11.4 and later) Indicate the index level of the meta keys in the Meta tab, which determines if you can use it in a filter:<br> This meta key is indexed by meta value and can be used in a filter.<br> This meta key is indexed by meta key, and can be used in a filter.<br> This meta key is not indexed, and not selectable for a filter.<br>The `sessionID` meta key is a special case. Unlike other non-indexed meta keys, it is not configurable, but you can use it in a filter so it is marked by the key symbol. Supported operators are `exists`, `!exists`, `=`, and `!=`. |
| Query Events button | | Used to submit a query, show the status of the query, and cancel a query. The button has three possible states:<br> Ready to submit a query using filters in the Query Builder.<br> Waiting for server validation to complete before executing the query.<br> The query is executing, click to cancel execution. |
| Slow Service icon | | In the query console, marks the service that took the longest time to load results from the query. |
| Spinner in the Events list | | Indicates that the query is currently being processed. The **Query Events** button is disabled while this occurs. |

| Feedback | Icon | Description |
|---|---|---|
| Stopwatch | | (Version 11.5 or earlier) Indicates that the meta key/operator combination requires extra time to process. While the query is still executable, a more efficient meta key or operator is recommended. |

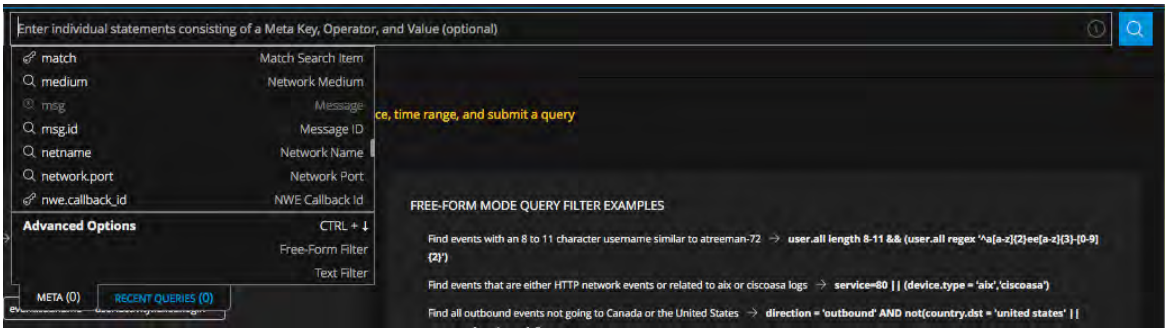
## Add a Simple Filter in Guided Mode

To create a simple filter in Guided Mode:

1. Go to the **Events** view (Event Analysis view in Version 11.3 and earlier) and do one of the following:
   a. (Version 11.4.1 and later) Click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   b. (Version 11.4 and later) Select **Guided Mode**, click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   c. (Version 11.2 and later) Select **Guided Mode** and click in the query bar.
   d. (Version 11.1) Click in the empty query bar, or before or after an existing filter. This is an example of the empty query bar in Guided Mode before you begin entering a filter.



If the insertion point is between two filters, a green circle (Version 11.3 and earlier) or a bold cursor (Version 11.4 and later) marks the insertion point. If the insertion point is at the end of the query bar, the filter entry form opens with a blinking cursor at the entry point. A drop-down list displays the available meta keys passed from the service being investigated in alphabetical order. This figure shows the filter entry form from Version 11.4.



2. To select a meta key do one of the following:
   a. If there is only one option in the drop-down list, press **Enter**.
   b. If there are two or more options in the drop-down list, click a meta key or select a meta key using the up/down arrows, then press **Enter**.
   c. Start typing the meta key. As you type the meta key, the list is filtered to include only meta keys that contain the text you typed. The count next to the label on the Meta (0) tab increments to enumerate the indexed meta keys that match the typed text. Keys that are not indexed are disabled and not selectable and are not included in the count, for example, `alias.mac` in the figure below is not indexed and is dimmed. Click a meta key or select a meta key using the up/down arrow, then press **Enter**.

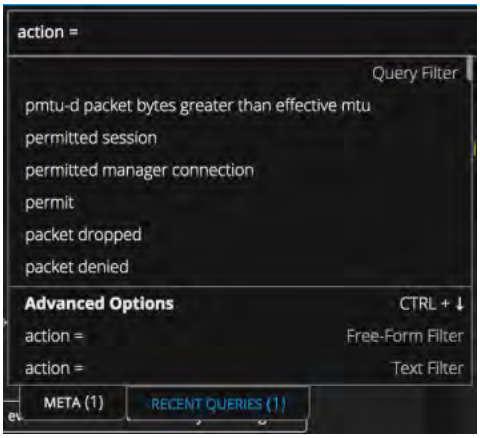
   d. To select a highlighted meta key, press **Enter**.
   The count on the Meta label changes to 1.

> **Note:** If no meta key in the drop-down list is selected, and the list has no meta keys to select, either the Free-Form Filter or the Text Filter option is highlighted based on the content already typed in the query bar.
> --If the text typed in the query bar includes some form of query syntax and other operators not yet supported by the user interface, the Free-Form Filter option is highlighted and you can create a free-form filter. In Version 11.3 and earlier, the `**`, `&&`, `||`, `()`, `AND`, `OR`, `comma`, `-`, `length`, and `regex` operators are not supported by the user interface. The Version 11.4 user interface supports these operators. If the Free-Form Filter is not highlighted, and the query bar has no text filter, the Text Filter is highlighted so you can create one.
> --If the first condition is true, and there is already one text filter, the Free-Form Filter option is highlighted so you can create a free-form filter.

   e. If you want to edit or delete the meta key, press **Backspace** or **Delete**.
   As you backspace and delete characters, the meta key drop-down list is filtered to include meta keys that contain those characters. To select a meta key, press **Enter**.
   The meta key is added to the filter entry form, and a list of valid operators for the selected meta key is displayed. Operations that require more time to process are marked by a (stopwatch

icon). This figure shows the stopwatch icon marking the `contains` operator.

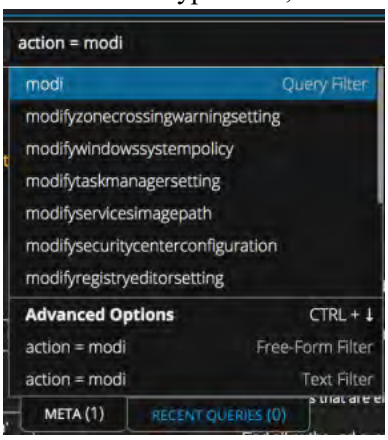
3. To select an operator, do one of the following:
   a. If there is only one option in the operators drop-down list, press **Enter** to select it.
   b. If there are two or more options in the operators drop-down list, click an operator or select one using the up/down arrows, then press **Enter**.
   c. Type the operator and press **Enter**. As you type, the operators drop-down list is filtered to show only operators that contain the typed text. Click an operator or select one using the up/down arrows, then press **Enter**.
   The operator is added to the filter entry form. In Version 11.4 and later, if the operator accepts a value, the suggested values drop-down list is displayed. Earlier versions leave the cursor in the filter entry form so that you can type a value.



4. (Optional) If the selected operator in the filter entry form accepts a value, do one of the following:
   a. In Version 11.3 and earlier, type the value and press **Enter**.
   b. In Version 11.4 and later, paste a value that you have copied from somewhere and press **Enter**.
   c. In Version 11.4 and later, begin typing in the **Query Filter** field.
   As you type, the meta value drop-down list is filtered to return up to 100 properly indexed values that begin with the typed text. The suggested values are based solely on the time range; filters in the query do not filter the list of 100. The auto-suggest function looks for matches in all events in the current data set, not just the (up to 10,000) downloaded events. If nothing in the list matches exactly, the text you typed in the Query Filter field is highlighted and this message tells you that

no suggestions were found. Some values, such as the integers for the `service` meta key, also display the definition of the service type.

If there is an exact match, that value is highlighted. In the following example, there is no exact match for the typed text, modi.



i. If the typed text is the value you want to use in the filter, press **Enter**.

ii. If you see the value that you want to query in the list and it is not highlighted, click the value or use the up/down arrows to highlight the value. Then press **Enter**.

iii. If you want to edit or delete the value, press **Backspace** or **Delete**.
As you backspace and delete a character, the meta value drop-down list is filtered to include values that begin with the remaining characters. To select a value, press **Enter**.
The value is added to the filter entry form.

5. To create the filter, press **Enter**. If you click anywhere outside the box before pressing **Enter**, the filter is not created.
The new filter is inserted, and the blinking cursor is refocused after the last filter, the meta keys drop-down list is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error. This figure shows a query being created with no errors.

6. If the filters have no errors, you are ready to execute the query in the query bar. Click .
The results are returned and loaded in the Events panel. The first 10,000 events that match the query

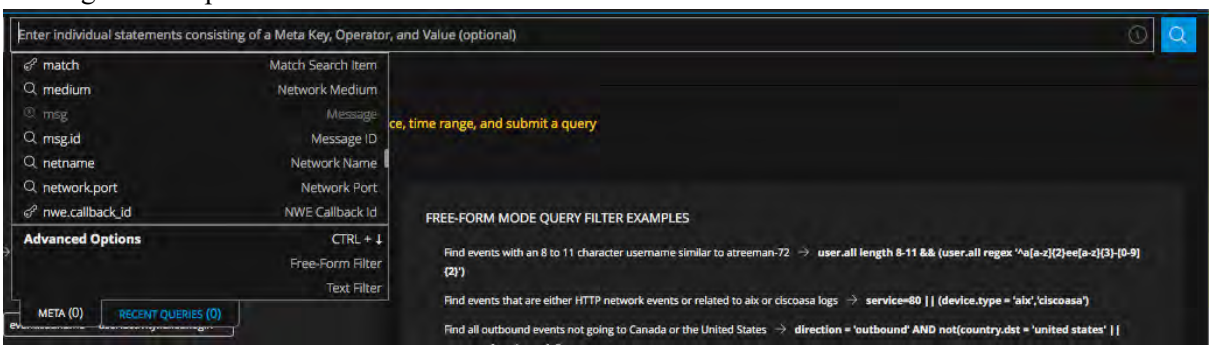
begin loading in the Events panel. As the events are loaded, a status bar at the top tracks progress and you can scroll to the bottom of the list to see the completion status.

7. (Optional in Version 11.3 and later) If you want to see detailed status in the Query Console, click the information icon .
8. (Optional in Version 11.3 and later) If you want to cancel the query before it finishes executing, click .
   The query stops executing and a notification that the query has been canceled is displayed.

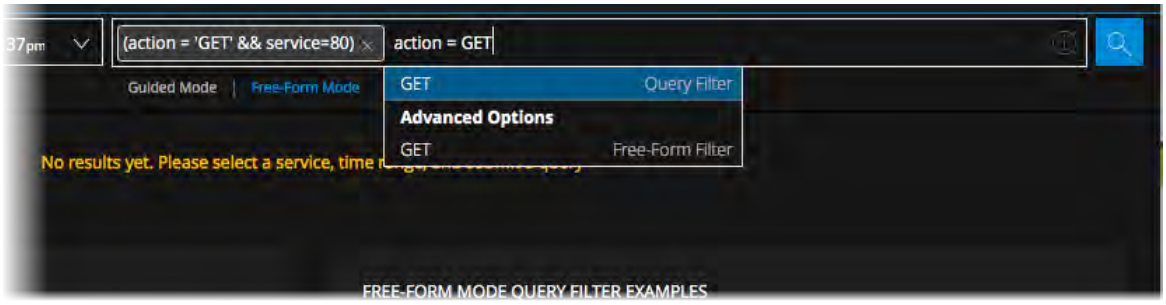
## Add a Free-Form Filter in Guided Mode (Version 11.3 and Later)

To filter the data displayed in the Events view using a free-form filter in Guided Mode:

1. Go to the **Events** view, select **Guided Mode** below the query bar, and click in the query builder field. (For Version 11.4.1, simply click in the query builder field.)
   If the insertion point is between two filters, a green circle or a bold cursor marks the insertion point. If the insertion point is at the end of the query bar, the filter entry field opens with a blinking cursor at the entry point. A drop-down menu lists available meta keys passed from the service being investigated in alphabetical order.



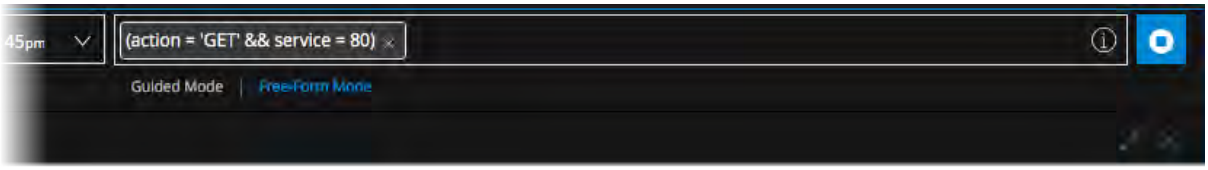
2. Do one of the following:
   a. Place the cursor in the **Free-Form Filter** field and begin typing the query.
   b. Begin typing the filter beginning with a meta key or with an open parenthesis. When entering and editing filters in the query builder, parentheses pairs are automatically balanced. If you type an open parenthesis, the other part of the pair is added to the filter.
   When no matching meta keys or operators are available in the drop-down menu, the Free-Form Filter option becomes available, and the text you typed is available in the **Free-Form Filter** field.



3. Continue typing the entire expression and press **Enter**.
   (If you click anywhere outside the box before pressing **Enter**, the filter is not created.) This figure shows a free-form expression created by continuing to type after the value GET.

   The new filter is inserted, and the blinking cursor is refocused after the last filter, a new filter entry form is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error.

4. To execute the query, click . While the query is executing, the button changes to .



5. If you want to cancel the query before it finishes executing, click .
   If you do not cancel the query, you can click to view the status of query execution. When the query is finished executing, the Events panel displays appropriate results for the query.

## Add a Text Filter to Find a Value Anywhere in the Data Set (Version 11.4 and Later)

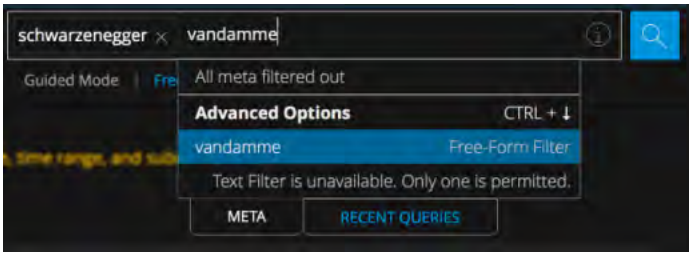
In Version 11.4 and later, the text filter allows you to find a specific value in the current data set (endpoint, logs, and network events). The text filter initiates a case-insensitive search against all the data for meta keys that are indexed by value. The text filter does not search for values that are indexed by meta key or not indexed so you not see all results. A message advises that `Results may be limited by a text filter, which matches only indexed meta keys. If you want to conduct a more exhaustive search against raw events, click here and choose the appropriate options in the Search Events drop-down menu.` Icons in the drop-down list indicate the index level of each meta key:

- filename.size - indexed by meta key
- filename.src - indexed by meta value
- float32.whatever - not indexed

**Note:** All services in the hierarchy being queried (Broker, Concentrators, and Decoders) must be at Version 11.3 or later. The text filter is not available in the drop-down menu when there are services below Version 11.3 in the hierarchy.

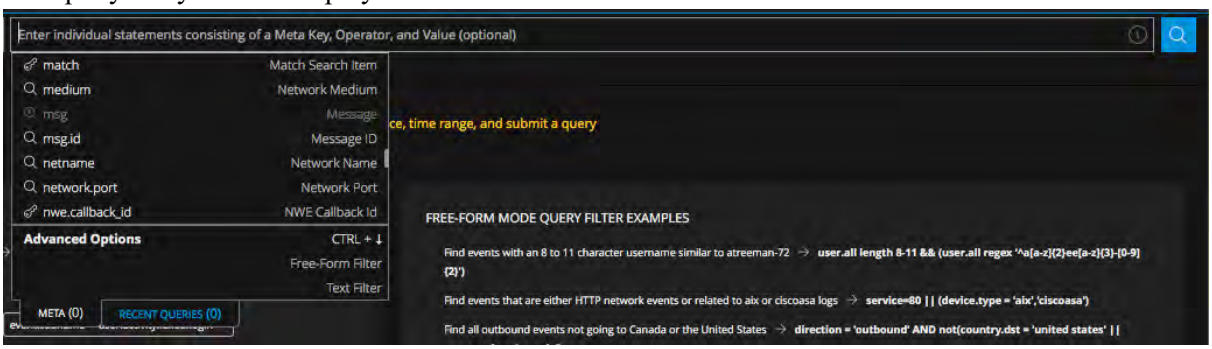
The text filter is useful when you have some idea of what you are looking for, but are not sure where to look (which meta key or service). As an example, if you are interested in looking for a file name, click in the query bar, type the complete text string, and click **Text Filter**. The text filter initiates a search against all the data in the index, within the services and time range being investigated, and returns exact matches to the text string.

A query can include one text filter and any combination of simple and free-form filters. The operator for a text filter must be AND because it acts as a filter over the results of all the other filters in the entire query. If one text filter already exists in the query bar, the Text Filter option is disabled as shown in the figure below. Text filters are not supported inside parentheses.

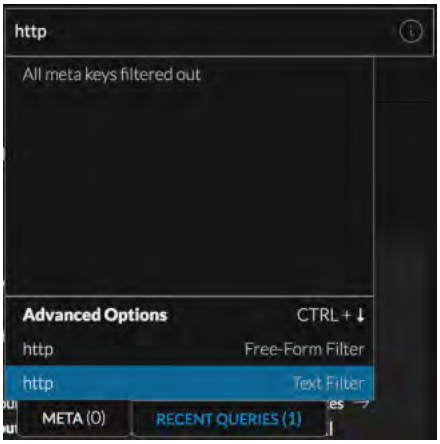


To create a text filter:

1. Go to the **Events** view and click in the query bar.
   The query entry form is displayed.

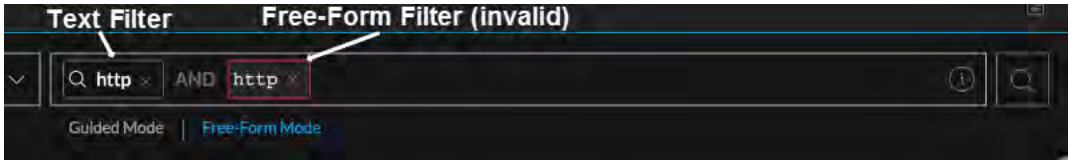


2. Type the text string that you want to find, for example, `http`.
   The text string is displayed in the meta key drop-down list under Advanced Options.



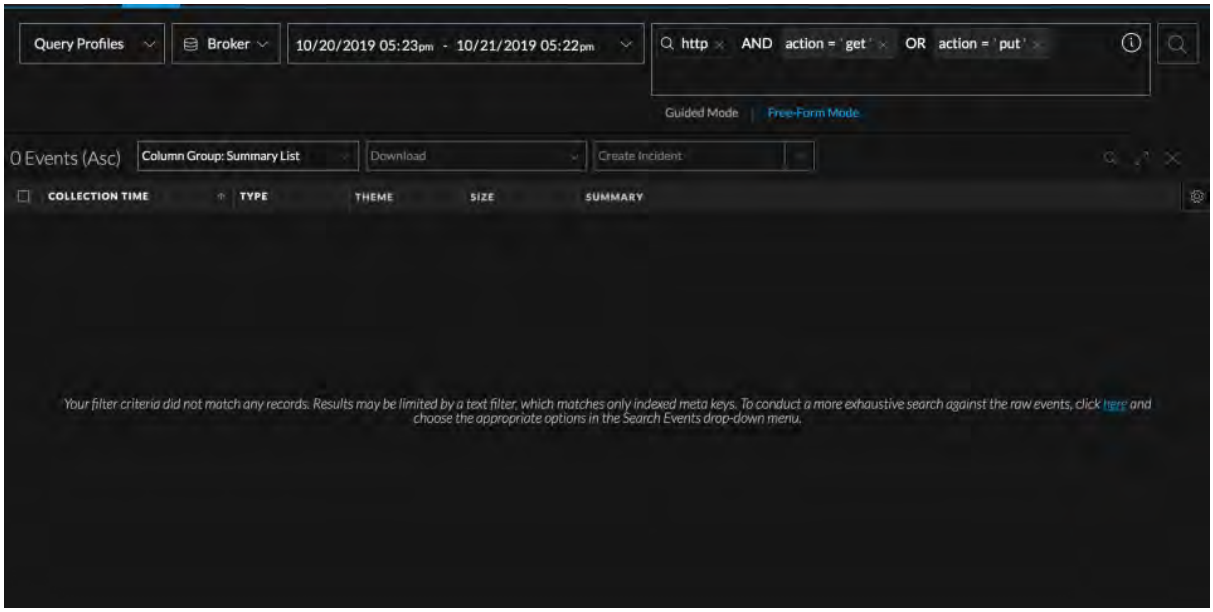
3. Click **Text Filter** under **Advanced Options**.
   The text filter is created in the query bar. The following figure illustrates the different appearance of

a text search filter versus a free-form filter. The free-form filter is in a fixed-space font and outlined in red. The red outline indicates a syntax error because a valid expression is expected in a free-form filter. The text filter is marked by the search icon. No syntax requirements are applied to text search filters.



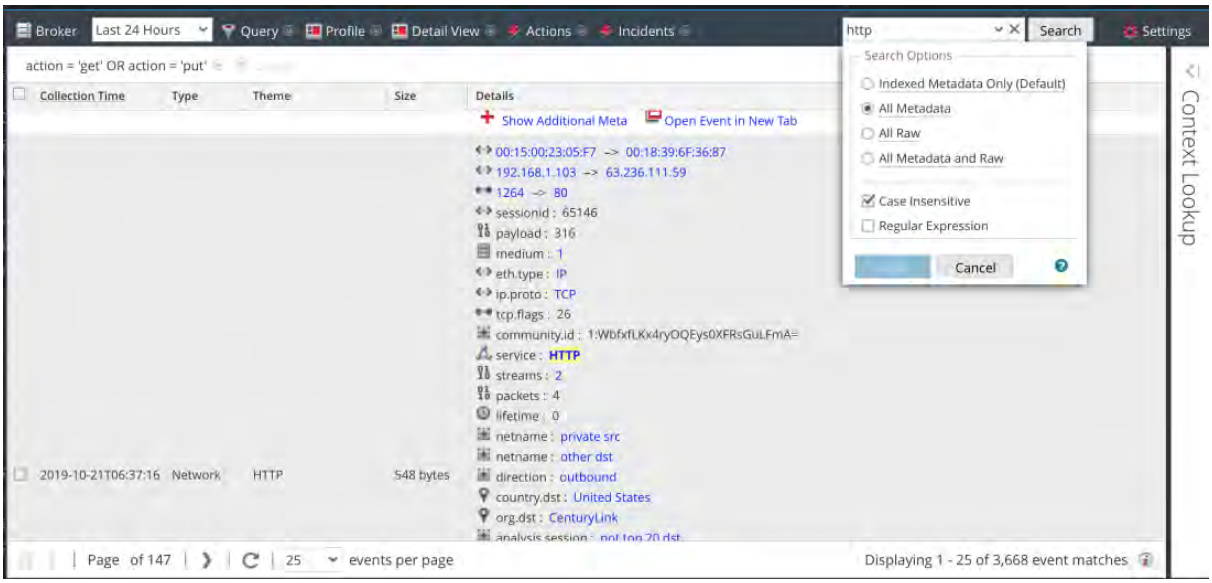
4. (Optional) Create additional simple or free-form filters in the query bar. There can be only one text filter in the query. This example was created by typing `http` as a text filter and then adding two more filters - `action = 'get' OR action = 'put'`

5. To submit the query, click .
The results are displayed in the Events panel. This figure illustrates the Events panel with no results displayed and a message with instructions for improving results. Every time you use a text filter, this message is at the bottom of the results offering a link to expand your search.

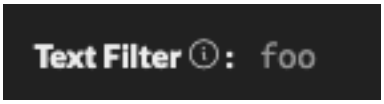


6. Click the **here** link in the message.
A new browser tab opens with the query results displayed in the Legacy Events view, where you have additional options to improve the search. This figure shows the results for the same query when

non-indexed metadata is included.



7. Click the Information icon in the query console to view the status of the query. This figure shows a text filter in the query console.



## Select All Filters and Copy All Filters in the Query Bar (Version 11.4.1 and Later)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Ctrl-A for Windows OS, Cmd-A for MacOS) and then copy the selection to the local clipboard (Ctrl-C for Windows OS, Cmd-C for MacOS).

### To select all filters and copy them to the clipboard:

1. In the **Events** view > **Events** panel, click on a focused pill or in the query entry form, and press **Ctrl-A** for Windows OS or **Cmd-A** for MacOS.
   All filters in the query bar are selected.
2. To copy the selected filters to the clipboard, type **Ctrl-C** for Windows OS or **Cmd-C** for MacOS.
   You can share the clipboard with other analysts or paste the contents in the query bar.

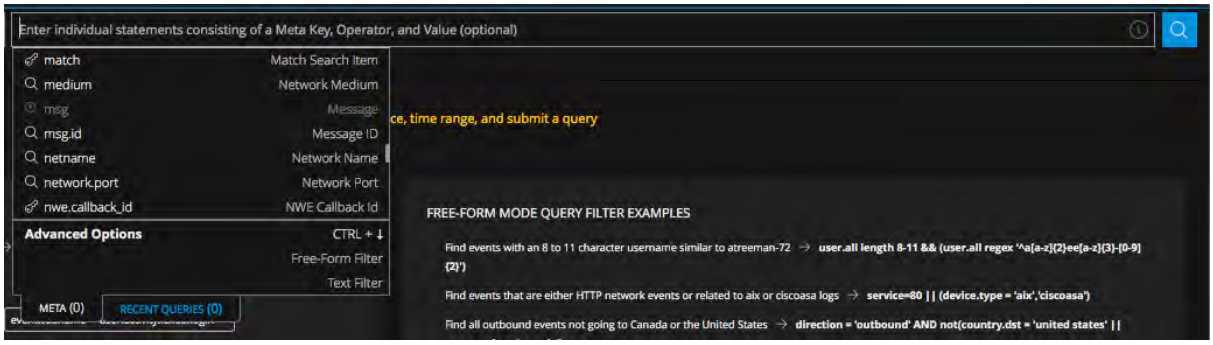
## Paste Text in the Query Bar (Version 11.4 and Later)

While creating a filter in the Events view query bar, you can paste instead of typing the complete text of a filter that you have copied from somewhere else. You can paste the text into an empty query bar or next to an existing filter in the query bar. Depending on the text you typed, the query parsing engine parses the information that you pasted and creates a new filter, which can be a simple filter, a free-form filter, or a text filter.

- A text string of this form is added as a new simple filter in the query bar: `<valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's'`.
- A text string of this form is added as two simple filters in the query bar: `<valid meta key> <valid operator> <optional value> && <valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's' && action exists`, which is converted to `alias.host contains 's' AND action exists`.
- A text string that contains unparsable text may be converted to a free-form filter. For example, using `NOT (device.ip = 10.10.10.10)` is unsupported for creation of a filter in Guided Mode, so this would be converted to a free-form filter. Free-form filters are validated by the server when they are submitted.
- Text that does not conform to the filter syntax is added as a free-form filter.

### To create a filter by pasting text:

1. Go to the **Events** view > **Events** panel, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The query entry form is displayed.



2. Type **Ctrl-V** (Windows OS), **Cmd-V** (MacOS), or **right-click** and **Paste** to paste text that you have copied into the clipboard from somewhere else. Do one of the following:

   a. If the text you pasted is a statement that can be parsed, one or more simple filters is created.
   If the text you pasted is a statement that cannot be parsed, a new free-form filter is created.
   If the text you pasted is not a statement and not a valid meta key, an invalid syntax error is displayed.
   If you pasted a valid meta key for a new filter you are building, the meta key is highlighted in the drop-down list, and you can continue creating a filter as usual by entering an operator and a value.
   After you select a valid meta key and a valid operator (for example, `city.dst =`) any text that you paste is treated as a text string if the meta key supports a text value, and one filter is created.
   If the meta key does not support a text value all of the text in the query bar is parsed as described in step a above.

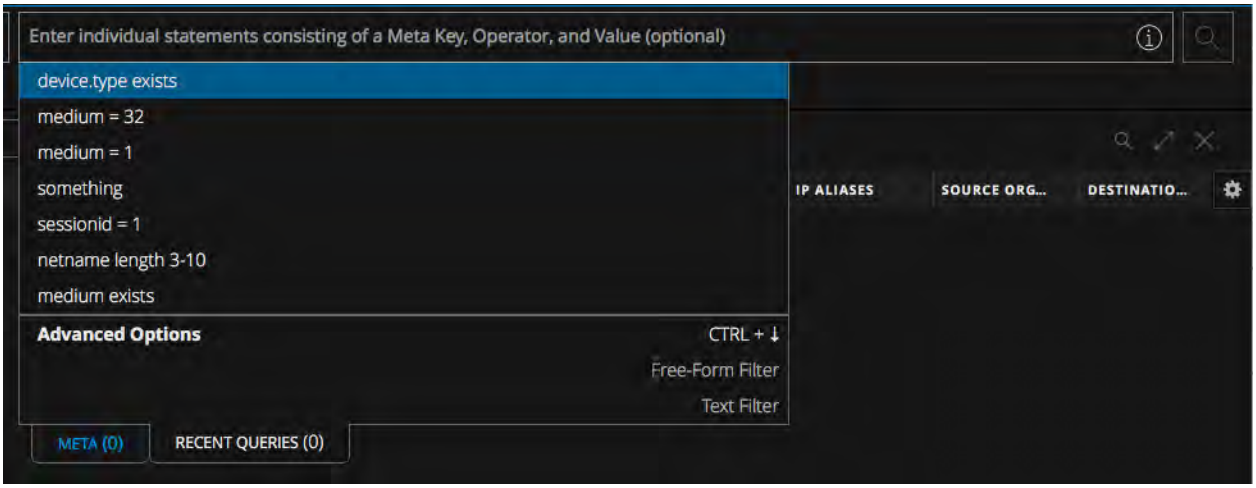
3. Add more filters in the query bar if you wish, and then submit the query.
   The query is executed.

## Insert a Filter Based on a Recent Query (Version 11.4 and Later)

In the Guided Mode query bar, you can insert a filter based on a recent query. When the Recent Queries tab is opened and nothing has been typed in the query bar, up to 100 of your most recently executed queries are displayed in a scrollable list. The list is sorted to show the most recent at the top, and the Recent Query count is set to 0. When you begin typing, the list is filtered to display up to 100 queries from the query history database that contain matching text, even if the matches are not in the most recent 100 queries. The Recent Query count changes to reflect the number of matching queries as you type.

The top entry in the list is highlighted by default. To select a recent query, you can move the highlighting up and down in the list using the up and down arrow or by mouse-over of a recent query. As you type the list is filtered and the highlighting moves back to the top of the list. Clicking a query, or pressing Enter while a query is highlighted, creates a new filter with the text of the selected query.

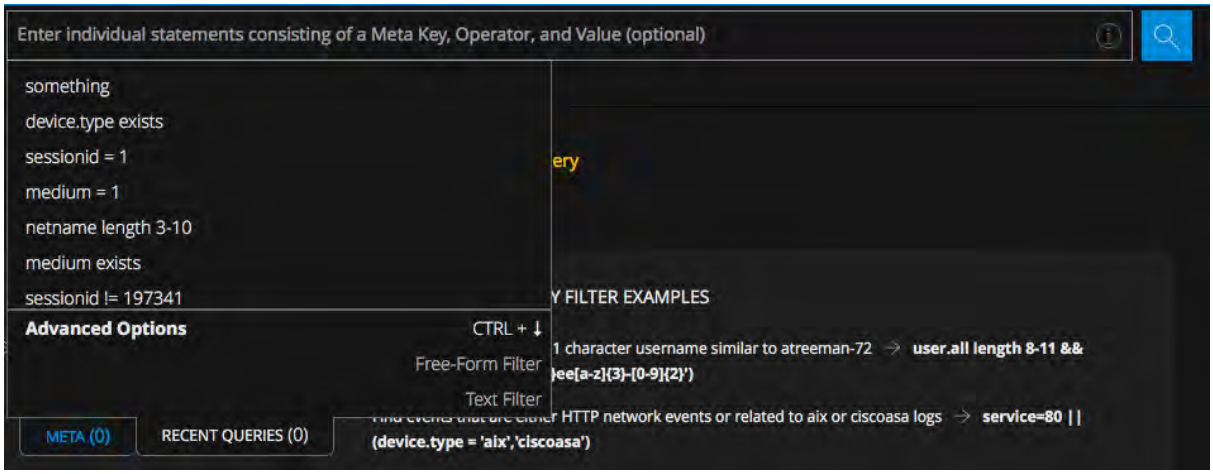
Whenever you submit a query, the list is sorted to add that query, now the most recent, at the top.



### To create a filter based on a recent query:

1. Go to the **Events** view, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The Meta Key drop-down list is displayed in the Meta tab.

2. Select the **Recent Queries** tab.
   The Recent Queries drop-down list is displayed with a count of 0.



3. To search for a recent query, do one of the following:

   a. Begin typing some text.
      As you type more characters or backspace to delete characters, the list is filtered to show recent queries that contain the text you typed. The count in the Recent Queries label increments to show the number of matching queries as you type.

   b. To select a query and add a new filter, continue to type and use the up and down arrows until the query you want to use as a new filter is highlighted.

   c. With a query highlighted, press **Enter** or simply click a query that you see in the list.
      The filter is added in the query bar.

4. Add more filters in the query bar if you wish, and then submit the query.
   The query is executed and the list is sorted to add that query, now the most recent, at the top.

## Edit a Filter in Guided Mode

With a query in the Guided Mode query bar, you can edit a filter. To edit a filter:

1. Double-click the filter, or click the filter and press **Enter**.
2. Edit the filter. When finished editing, press **Enter** to update the filter.
3. If you want to execute the query again, click .
   The Events panel displays results for the updated filter.

## Query Using Selected Filters in Guided Mode

When you have one or more filters in the query bar in Guided Mode, you can refocus the query to include only selected filters, displaying results in the current browser tab or a new browser tab. Some filters include expressions with nested parentheses in Version 11.4, and you can refocus part of a filter that includes nested parentheses. To update the query using only selected filters, do one of the following:

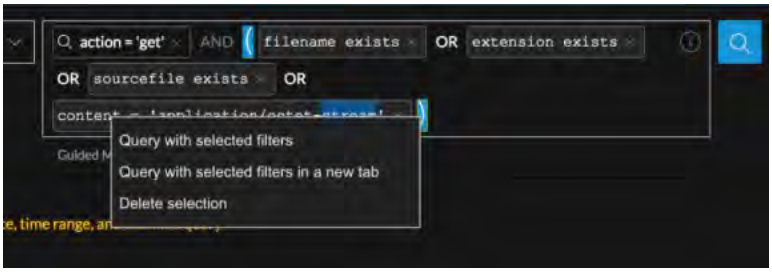
1. Using a query that includes one or more simple filters, for example a query has three filters: `risk.info exists`, `direction ='lateral'`, and `threat.category exists`.
   a. Select `direction = 'lateral'`, right-click the filter and select **Query with selected filters in a new tab** in the drop-down menu.

   A new tab opens with the results for the selected filter and the original query is left intact on the previous tab.

   b. To query the selected filters in the same tab, select `direction = "lateral"` and `threat.category exists`. Then right-click and select **Query with selected filters** in the drop-down menu.

   A query with only the selected filters is submitted and all remaining filters are removed.

2. (Version 11.4) For a query that includes a filter containing nested parentheses, for example: `action = 'get' AND (filename exists OR sourcefile exists OR content = 'application/octet-stream')`, do one of the following:



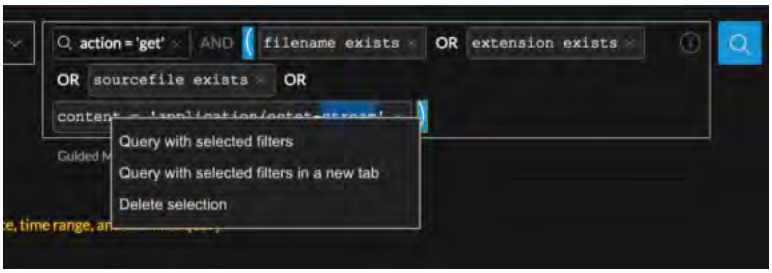
a. Select the close parenthesis after `'application/octet-stream'`, right-click, and select **Query with selected filters in a new tab**.
A new tab opens with results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`.

b. Select the same, right-click, and select **Query with selected filters**.
The results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')` are displayed in the current tab.

## Delete a Filter and Delete Text or Parentheses in a Filter in Guided Mode

Some keystroke editing features became available in Version 11.4; these are labeled in the steps.

1. To delete a filter, do any of the following:
   a. Click **X** in a filter.
   b. Select the filter and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   c. (Version 11.4 and later) Select the filter and press **Backspace** (Windows OS) or **Delete** (MacOS).
   d. Right-click one or more filters and select **Delete selected filters** or **Delete selection** (Version 11.4 and later) in the drop-down menu.
   The filter and the operator to the right or left of the filter is deleted, ensuring that no extraneous operators remain in the query bar.
2. (Version 11.4 and later) To delete characters in a filter or parentheses and contents in a filter, do any of the following:
   a. To delete the previous character: With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS).
   b. To delete all characters: With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   c. To delete the selected characters: With characters selected in the query bar, press **Delete** or **Backspace**.
   d. To delete parentheses, but not the characters inside the parentheses, select one of the parentheses and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   e. To delete a set of parentheses and the contents, for example, `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`, select the parenthesis after `get`, right-click, and select **Delete selection**.

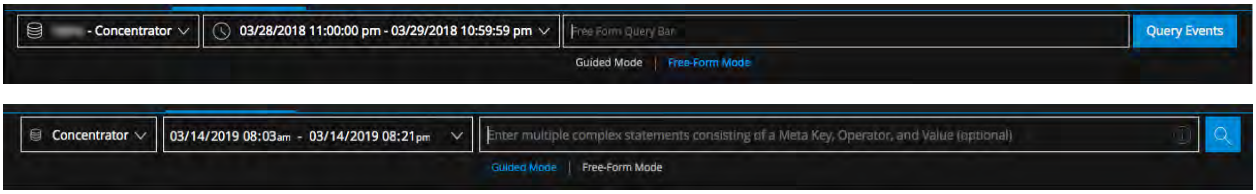


Everything except `action = 'get'` is deleted.

## Create a Query in the Free-Form Mode

Free-Form Mode is used in Version 11.2, 11.3, and 11.4, but no longer available in Version 11.4.1.

Free-form queries are most useful when you have a long text string saved that you want to paste, or if you have one in mind that you want to enter quickly, and you know the meta keys, valid operators, and valid syntax for entering values. The following figure illustrates the initial Events view with the empty Free-Form query builder field. The first example is Version 11.2 and the second example is Version 11.3.



The blinking cursor indicates that you can enter a query. You can enter free text here. As more expressions are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

These are some examples of queries that you can enter in Free-Form mode:

To find events with an 8- to 11- character username similar to atreeman-72:

```
user.all length 8-11 && (user.all regex '^a[a-z]{2}ee[a-z]{3}-[0-9]{2}')
```

To find events that are either HTTP network events or related to aix or ciscoasa logs:

```
service=80 || (device.type = 'aix','ciscoasa')
```

To find all outbound events not going to Canada or the United States:

```
direction = 'outbound' AND not(country.dst = 'united states' || country.dst =
'canada')
```

If you have a submitted query in Guided Mode, the query is transformed into text when you click switch to Free-Form mode. This is an example of a query submitted in Guided Mode as two filters, `service = 80` and `direction = 'outbound'`, and then viewed in Free-Form mode.

The button on the right side of the query builder is visible as needed to input a query. The query is applied when you click . At that time the query is validated to show syntax and logic errors.

Operations that require more processing time are not highlighted as they are in Guided Mode, but this table provides a summary of expensive operations for reference.

| Index Method | Non-Text Value | Text Value | Regular Operations | Expensive Operations |
|---|---|---|---|---|
| By Key | ✓ | | `exists`, `!exists` | `eq`, `!eq` |
| By Key | | ✓ | `exists`, `!exists` | `eq`, `!eq`, `begins`, `ends`, `contains` |
| By Value | ✓ | | `exists`, `!exists`, `eq`, `!eq` | no expensive operators |
| By Value | | ✓ | `exists`, `!exists`, `eq`, `!eq`, `begins` | `ends`, `contains` |
| By None | special case for `sessionid` | | `exist`, `!exits`, `eq`, `!eq` | no expensive operators |

# Filter Results in the Navigate View

When conducting an investigation in the Navigate view, there are several methods available to refine the results displayed when meta key values are loaded in the Navigate view. The rest of this topic is focused on the basic methods of filtering data:

**Note:** By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

- Set the Time Range
- Set the Quantification Method and Sort Sequence of Meta Key Results
- Manage and Apply Default Meta Keys in an Investigation
- Drill into Data in the Navigate View Time Chart
- Drill into Data in the Values Panel

## Set the Time Range

When conducting an investigation in the Navigate view, the time range options limit the results returned. You can select:

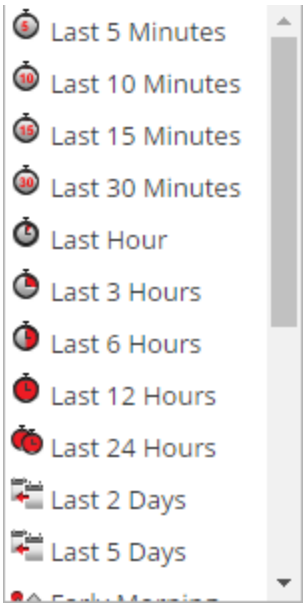
- A time range relative to the collection- ranges relative to the collection are based on the last collection time for data.
- A time range relative to the calendar.
- A custom date range.
- All data.

The selected Date Range is shown in the Navigate view tool bar as the Time Range label. By default the label is **Last 3 Hours**. The Time Range displayed in the timeline banner shows the first and last timestamp for the date range being used for the metadata.

**Note:** Time range is based on the Time Zone configured in the Profile Preferences panel as described in "Setting User Preferences" in the *RSA NetWitnessGetting Started Guide*.

### To select a built-in time range:

1. Click the **Time Range** option in the Navigate view toolbar. The default time range is for the **Last 3 Hours**, but a different value from the selection list, for example, **All Data** or **Last Hour,** may already be selected and used as the label in the options panel.
   The Time Range selection list is displayed.



2. Do one of the following:
   - If you want to see all data, select **All Data**.
   - If you want to set a time range in minutes, hours, or days that is relative to the collection, select a value such as **Last 10 minutes**, **Last 3 Hours**, or **Last 5 days**.
   - If you want to set a time range relative to today, select **Yesterday**, **This Week**(Version 11.1), **Last Week** (Version 11.1), **All Day**, or a part of the day such as **Early Morning**, **Morning**, **Afternoon**, or **Evening**.
   - If you want to set a unique date range, select **Custom** in the **Time Range** menu and follow the procedure below.
     The selected time range is applied to the current results in the Values panel.

### To specify a custom time range:

1. Select **Custom** in the **Time Range** menu.
   Date selection options are displayed in the toolbar.

2. Within the time **Start Date** and **End Date** fields, do the following to specify the date and time:
   a. Click a date from the calendar.
   b. (Optional) Select the time from the Hour and minute fields or click **Now**. The time selection defaults to the current time of day.

**Note:** The value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time is interpreted as "HH:MM:00 - HH:MM:59."

3. To apply the range, click **Go**.
   The selected time range is applied to the current results in the Values panel.

## Set the Quantification Method and Sort Sequence of Meta Key Results

You can select the way results for each meta key are quantified and sequenced in the Navigate view.

**Note:** If meta entities (Version 11.1 and later) are used in meta groups, the results will show the top 20 values that matched any of the meta keys contained in the meta entity.

Each meta key section in the Navigate view contains an ordered list of values showing each meta key value (Value) and its count (Total). You can specify whether:

- The results in each meta key section are sorted based on Value or Total.
- The results are sorted in ascending or descending order.
- The values shown for each meta key are quantified by number of packets (Packet Count), number of sessions or logs (Quantify by Event Count) or by the size of events (Quantify by Event Size).

**Note:** If you have both a log decoder and a packet decoder for which you are viewing the metadata, the calculation of what is actually being counted is dependent on the type of key. If you select to Quantify by Packet Count and are looking at logs, the Navigate view output is the same output as if you had selected Quantify by Event Count (see Navigate View for details).

This image shows the `Event Type` meta key presented in order by **Total** in **Descending** order. The value with the greatest count of matches is presented first. The value `failure audit` has 71 matches and is listed first. The value `logon` has only one match and is presented last. The quantification method is **Event Count**.

This image shows the `Event Type` meta keys presented in order by **Value** in **Descending** order. The value names are presented in alphabetical order starting at the end of the alphabet. The value `success audit` is listed first. The value `connect` is presented last. The quantification method is **Event Count**.

### To select the quantification method of meta key count and ordering of meta key results displayed in the Navigate view:

1. In the toolbar, select **Event Count**, **Event Size**, or **Packet Count** and choose one of the quantification options in the drop-down menu. The label for the menu displays the selected option.
      
   The current view is reloaded according to your selection.

2. In the toolbar, select **Total** or **Value** and choose one of the ordering methods in the drop-down menu. The label for the menu displays the selected option.

   The current view is reloaded according to your selection.

3. In the toolbar, select **Ascending** or **Descending** and choose one of the sort order options in the drop-down menu. The label for the menu displays the selected option.
   The current view is reloaded according to your selection.

## Manage and Apply Default Meta Keys in an Investigation

When analysts are conducting an investigation of captured data in Investigate, a default set of meta keys is loaded and displayed in a default sequence in the Navigate view > Values panel. The default content and sequence is based on the meta keys for the service being investigated. Analysts can specify the meta keys to display during navigation by selecting the default meta keys or by selecting a user-defined group of meta keys, which provides great flexibility to define meta keys. This can help to drill down more directly to the desired data and to reduce the load time by preventing the loading of meta that is not of interest in the current investigation.

**Note:** In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.

If no custom meta groups are in effect, the Navigate view is displayed with the meta key visibility specified in the Default Meta Keys dialog. To optimize loading of meta keys in the Navigate view > Values panel, NetWitness does not open non-indexed meta keys by default. When you open a non-indexed meta key in the Values view, NetWitness begins loading values for that meta key. If the load time is excessive, the load of the meta key times out with a message. Title, values, and counts for non-indexed meta keys are not drillable in the Values panel. Additional labeling in Investigation identifies the non-indexed meta keys.

To select the meta keys to apply to your investigation, you can:

- Select the default meta keys.
- Select a set of meta keys, called a meta group.

**Note:** Investigate has built-in meta groups and user-defined meta groups. Once created, user-defined meta groups can be edited, deleted, exported for use on other services, and imported to the service you are investigating. All of these procedures are provided in a separate topic: Use Meta Groups to Focus on Relevant Meta Keys.

The Default Meta Keys dialog allows you to specify the default view and display sequence for meta keys during navigation in the Investigate > Navigate view for a specific service. For each key or for all keys, you can set the default view to:

- Hidden: Results for default meta key are hidden and are not available to load.
- Open: Results for default meta key are open with all values and counts displayed.
- Close: Results for default meta key are closed with only the meta name visible.

- Auto: The loading of default meta keys is controlled by the index level, which must be Indexed By Value.

When using the default meta keys, be aware that these can be modified for different services, and you may not be seeing the same set of default meta keys when navigating to a drill point on different services. If you do not see the expected data, you may need to change the initial view of the default meta keys.

When you change the initial state of default meta keys from within the Navigate view, the change persists for that service. When new keys are added to the custom index file for a Core service (for example, `concentrator-custom-index.xml` or `decoder-custom-index.xml`), the new keys are added to the default meta keys list. The changes made in the Navigate view apply only to the current service.

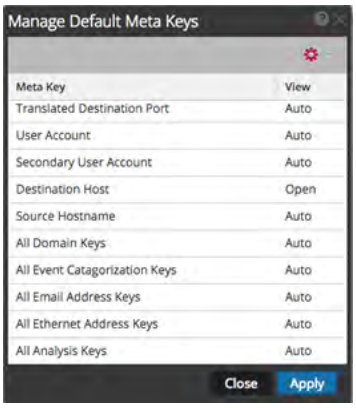
### To specify that the initial Navigate view opens using default meta keys:

1. Go to **Investigate** > **Navigate**.
2. Select a service and select **Navigate**.
3. In the **Meta** menu, select **Use Default Meta Keys**.
   If an investigation is already in progress, the data is reloaded in the current view and an icon highlights the selected option. If no data is loaded yet, the default meta keys are used for the next load.

## Configure Default Meta Keys

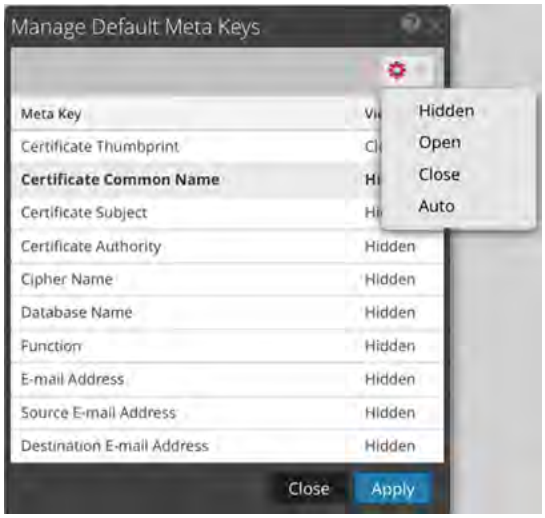
To configure the default view of default meta keys in the Navigate view:

1. In the **Navigate** view toolbar, select **Meta** > **Manage Default Meta Keys**.
   The Manage Default Meta Keys dialog is displayed with the list of available meta keys for the service.



2. (Optional) To change the order of the keys, select one or more keys, and drag the values up or down through the list of keys.
3. Do one of the following:
   - (Optional) To change the default view for all meta keys, make sure that no keys are selected and in the toolbar, select .

- (Optional) To change the default view for one or more keys, select the keys and in the toolbar, select .
  A drop-down menu of possible initial views for all default meta keys is displayed.



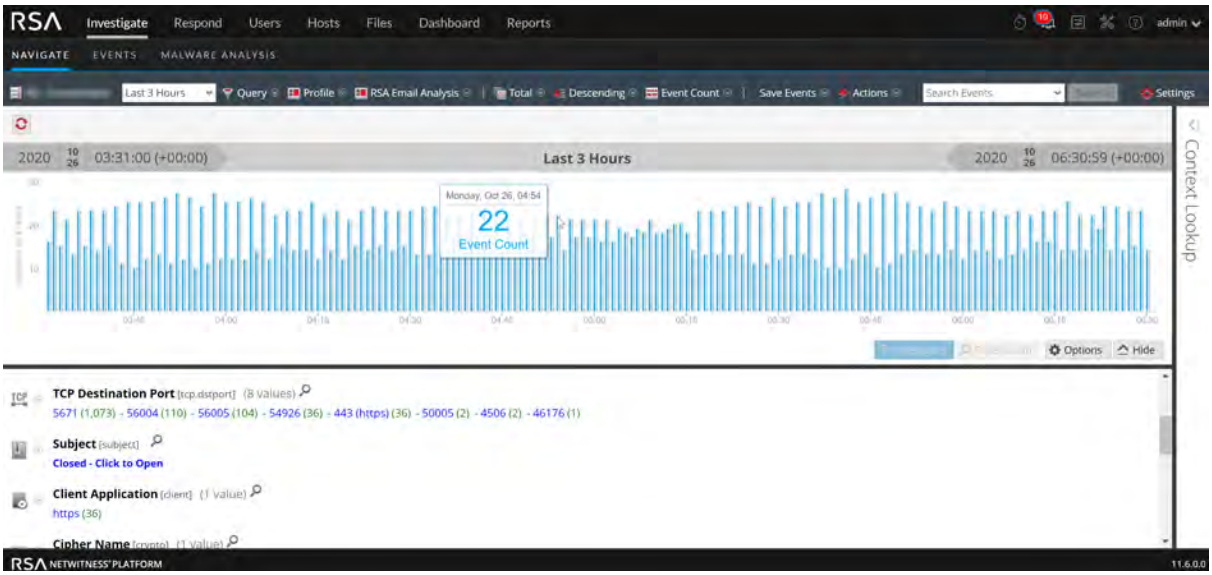
- (Optional) To revert to the default view for meta keys as specified in the service index file, make sure that no keys are selected and in the toolbar, select > **Auto**.
  When you modify the default view for a non-indexed meta key, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.

4. Select one of the views.
5. To save the changes, click **Apply**.
   The meta keys displayed in the Navigate view are set to your specifications. If the default meta keys are hidden, values for the meta keys are not shown in the investigation at all. If the default meta keys are closed, the values for the meta keys are not loaded by default, but you can load individual meta keys manually in the Navigate view.

## Drill into Data in the Navigate View Time Chart

The Time Chart visualization allows analysts to visualize activity over time. You can zoom into the data by selecting a time window then selecting the Investigate option. You can then reset the navigation to the time range that was in effect before zooming.

1. Go to **Investigate > Navigate**.
   The Time Chart for the current drill point and selected time range is displayed. You can hover over the time chart to display total number of events occurred at a specific time.



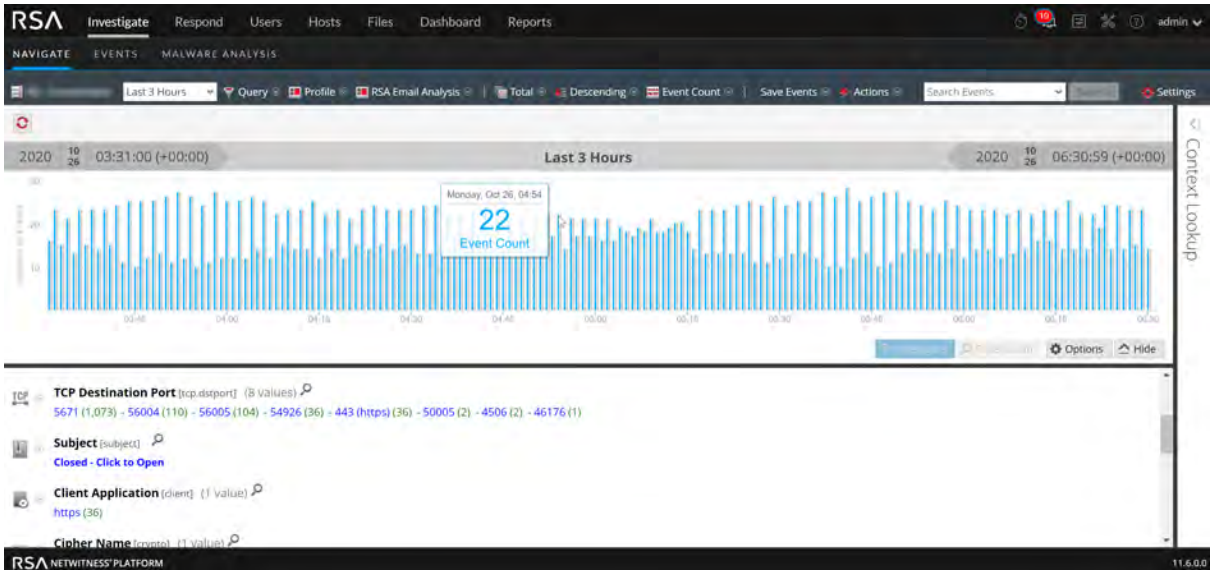
2. To highlight a period of time on the Time Chart, click over the desired time period and drag the mouse.
   The Time Chart is redrawn for the selected time range; however, the meta values are unchanged.
3. To drill into the data for the selected time range, click **Investigate**.
   The URL is updated to reflect the time range override, and the Investigation options panel is updated to reflect the custom time range. The Time Chart is redrawn and the meta values are loaded for the selected time range.
4. To reset the Time Chart to the original time range, click **Reset Zoom**.
   The URL is updated to reflect the original URL prior to zooming into the data, and the Investigation options panel is updated to reflect the time range selected before zoom. The Time Chart is redrawn for the selected time range and the meta values are loaded for that time range.

## Drill into Data in the Values Panel

NetWitness displays the activity and values for the selected service in the Investigation > Navigate view. To investigate data, analysts drill into data by clicking on a meta key or a meta value, which is treaty as a query. In the Values panel, each query is added to the breadcrumb data in the Values panel. This results in a breadcrumb at the top with a crumb for each query. You can edit the breadcrumb to insert or remove a query.

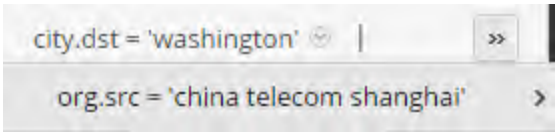
### To drill into a subset of the metadata:

1. Begin an investigation so that metadata is displayed in the Navigate view.



2. To drill down into the metadata, do any combination of the following:
   a. Click a **meta key**, for example, **Service Type**.
   b. Click a **meta value**, the blue text in the results. For example, **OTHER**.
      Each time you click a meta key or meta value, the investigation query pivots to a narrowed focal point, or drill point, in the data. At each drill point, the Values panel is updated and the new drill point is displayed in the breadcrumb. Below is an example of the first breadcrumb.

      This is an example of a long breadcrumb that does not fit in the toolbar. The last query that fits is followed by a drop-down menu that lists additional queries. To select a drill point within the overflow, click the overflow icon and a query in the drop-down list.

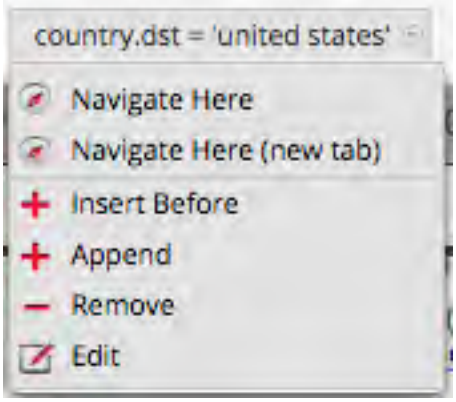


### To add a query in the breadcrumb:

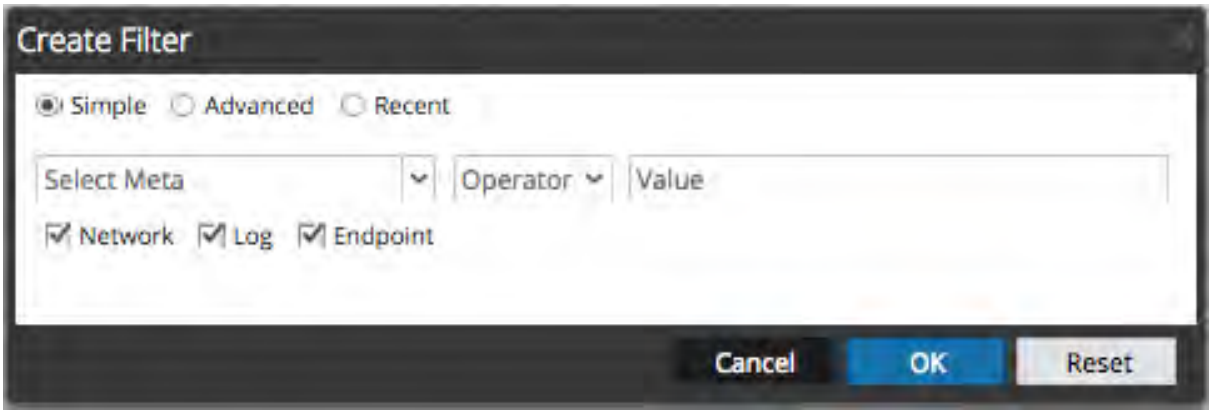
In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To add a query in the breadcrumb:

1. Click a crumb.
   The Breadcrumb menu is displayed.



2. To add a query in the breadcrumb, select **Append** or **Insert Before**.
   The Create Filter dialog is displayed.



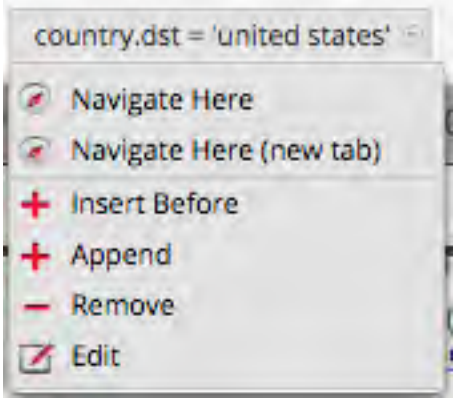
3. Create the Query as described in Create a Query in the Navigate and Legacy Events Views.

### To edit a query in the breadcrumb:

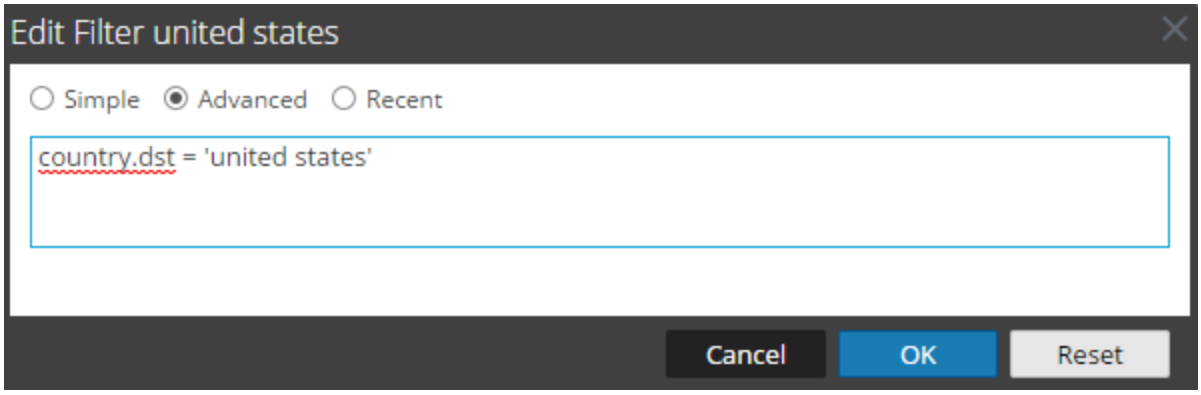
In the breadcrumb, you can click any of the crumbs to display the Query menu. You can delete a crumb and edit a query in a crumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To work with queries in the breadcrumb:

1. Click a crumb.
   The Breadcrumb menu is displayed.



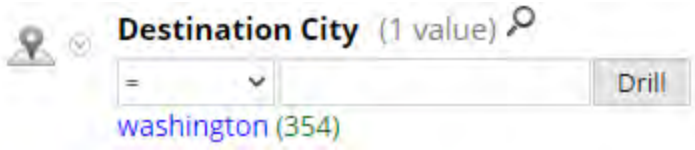
2. To edit a query in the breadcrumb, select **Edit**.
   The Create dialog is displayed with the selected query open for editing.



3. Edit the fields as described in Create a Query in the Navigate and Legacy Events Views.

### To quick search within a meta key:

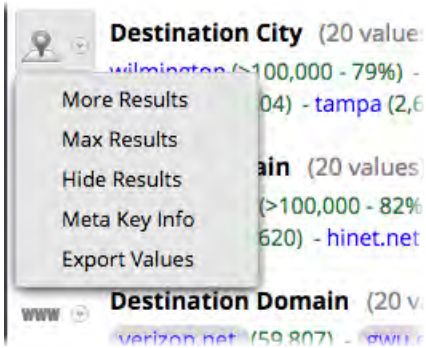
1. Move the mouse over a meta key section and click the magnifying glass.
   The Quick Search form, which contains a comparator and an optional operand for the search, is displayed.



2. (Optional) If you want to close the search form, click the magnifying glass again.
3. Select the operation from the drop-down list on the left and type the text value to search for. Then click **Drill** to perform the execution.
   The metadata for that meta key is used to drill down in the current metadata.

### To view meta key information and copy meta values for a meta key:

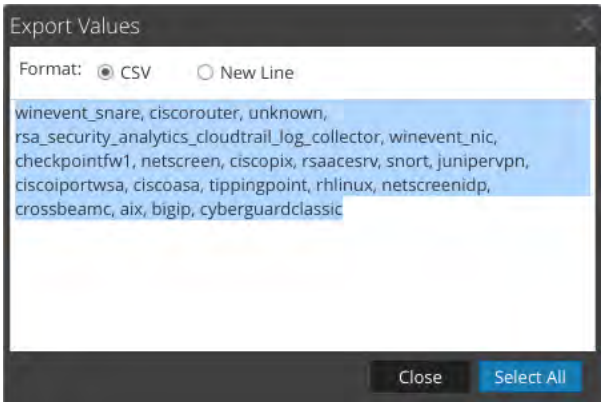
1. To view the key name, index level set for displaying the meta key, and the default view set for the meta key, click the drop-down menu next to the meta key. This figure shows the drop-down menu for Version 11.1 and later.



2. Select **Meta Key Info**.
   The Meta Key Info dialog is displayed.

3. When finished viewing, click ✕.
4. (Optional for Version 11.1 and later) To view meta values found for a meta key in a simple list that you can copy, click the drop-down menu next to the meta key.
   The Export Values dialog is displayed.
   The Version 11.1 dialog displays a list of values with one value per line.

   The Version 11.3 dialog allows you to select the method of separating values: either New Line or CSV.



5. Select the values that you want to copy, and click **Export Values**.
   The values are copied to the local clipboard and you can paste them into a file to save or share them.
6. To close the dialog, click **Close**.

7. (Optional) If you want to hide the results for the meta key in the current drill point, click the drop-down menu next to the meta key and click **Hide Results**.

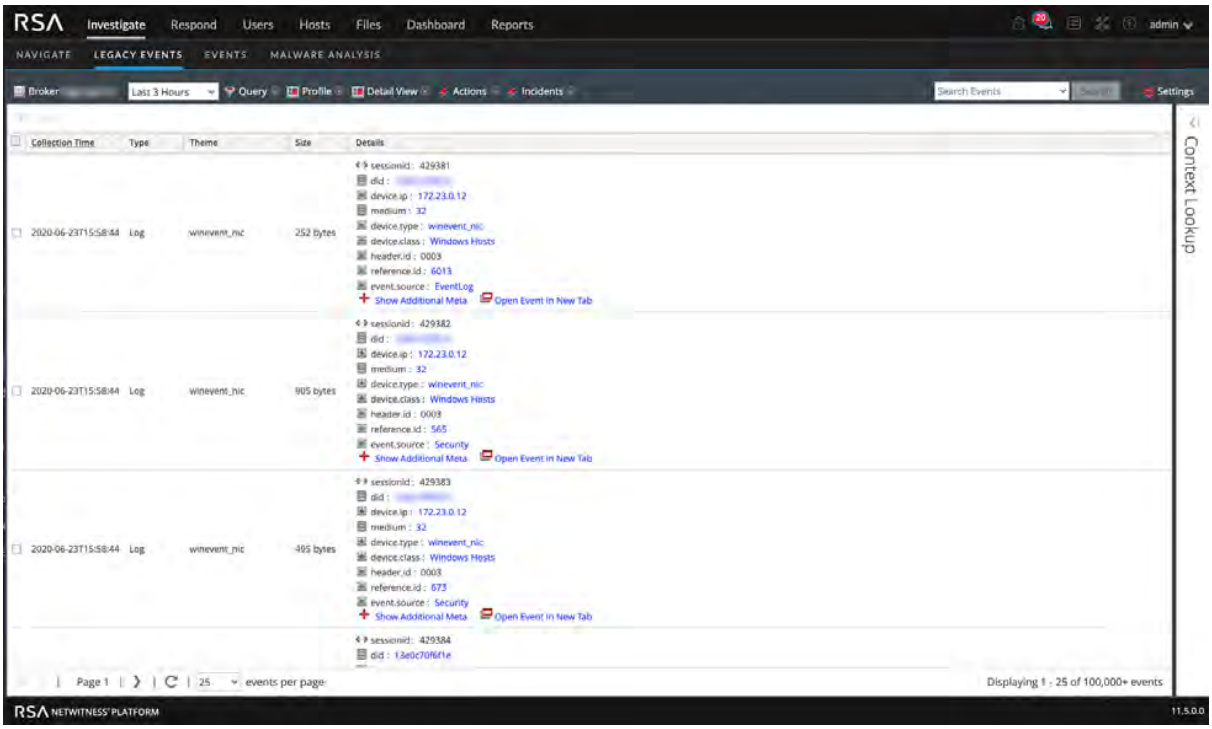
### To display events associated with a meta value:

The Legacy Events view provides additional details for an event in two different views: Events List and Detail View.

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Click the count (the number in green) next to a blue meta value.
   The Events view corresponding to the current drill point is displayed.
   The operations that you can perform in the events view are described in Reconstructing and Analyzing Events.

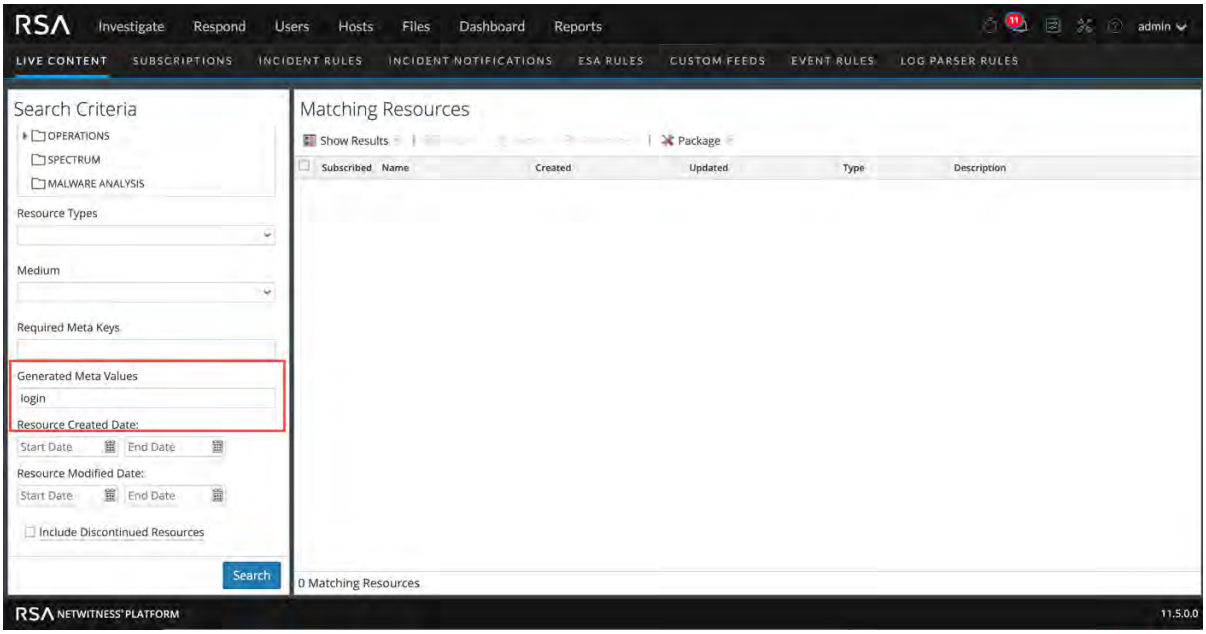
### To search for specific events associated with a meta value:

1. In the **Navigate** view, drill into metadata that is the focus of your investigation (click a meta value or add a query).
2. Type a search string in the Search box and press **Enter** or click **Search**.
   You can also select and set search mode preferences. See Search for Text Patterns in the Navigate and Legacy Events Views for detailed search information.
   The Events view opens in a new tab and shows the search results. If you do not see the search term highlighted, click **Show Additional Meta**. Your time range selection and drills (queries) carry forward to the Events view.



### To view a selected meta value in RSA Live:

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.
3. To look up the meta value in RSA Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Value(s) field, and ready for a search.



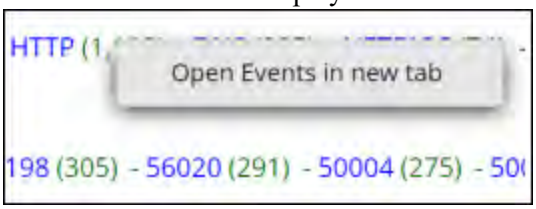
### To refocus the investigation in a drill point:

1. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.

2. Choose one of the refocus options.
   The drill is refocused according to your choice.

### To look at a specific count in a new tab:

To view a count for a meta value in the Legacy Events view or the Events view, right-click a count for a meta value (the green number following the blue meta value).
The context menu is displayed.



# Filter Results in the Legacy Events View

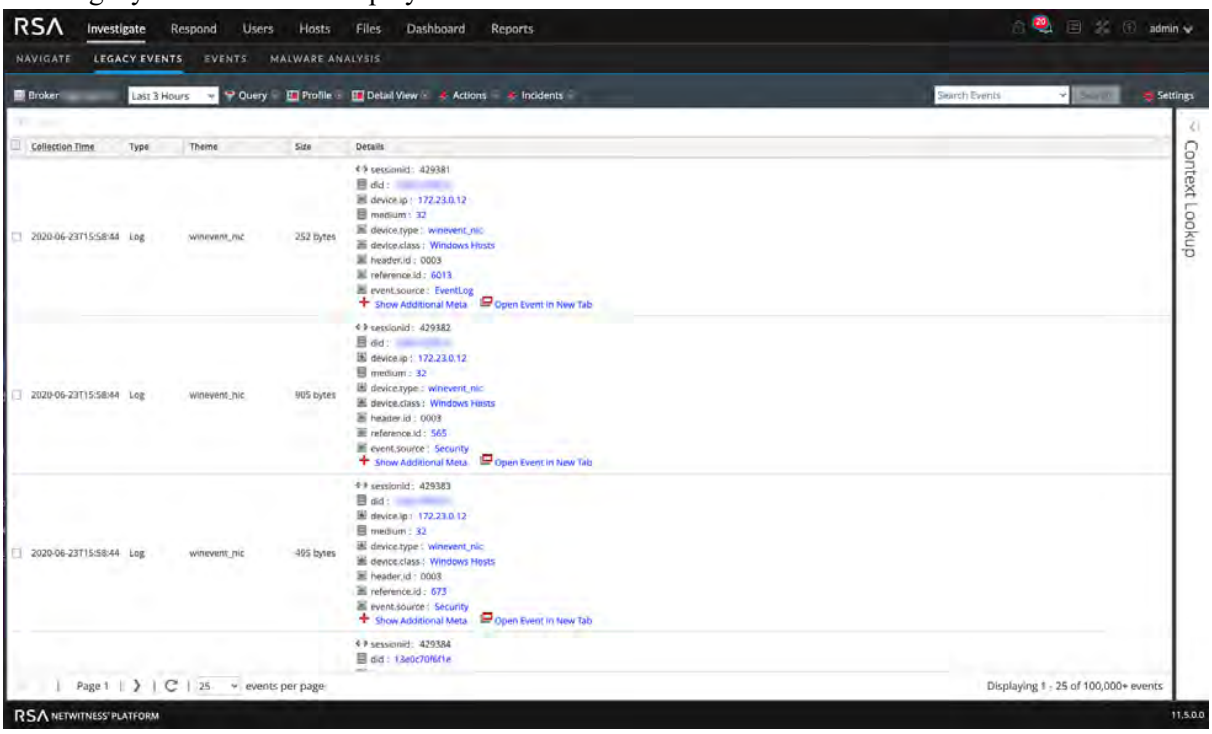
Analysts can filter events in the Legacy Events view by searching for events or selecting the service, setting the time range, and querying the metadata. If you opened the Legacy Events view from a Navigate view drill point, the view opens to the Detail view of events by default. Analysts who do not have permissions to use the Navigate view can query services directly from the Legacy Events view.

**Note:** When an Archiver is the currently selected service in the Legacy Events view and you are searching against a Broker or Concentrator, the search is slower than if searching against a Broker or Concentrator because the data on the Archiver is compressed and there is typically more data.

## Filter Events Displayed in the Legacy Events View

To filter the data displayed in the Legacy Events view:

1. Go to **Investigate** > **Legacy Events**.
   The Legacy Events view is displayed.



2. To select a time range other than the default (**Last 3 Hours**), in the toolbar, click the time range field and select a value. For example, **Last Hour**.
   The Legacy Events view is refreshed with the selected time range.
3. Create a query as described in Create a Query in the Navigate and Legacy Events Views.
   The matching results for the query are displayed in the Detail View in the Legacy Events view. The breadcrumb reflects the query. In the breadcrumb, you can click any of the crumbs to display the

Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, the results are refreshed.

## Page Through Events in the Legacy Events View

Pagination controls allow more flexibility in paging through a list of Events in the List View, Logs View, or Details View. You can select the number of events to display per page, and your selection is saved across logins to the NetWitness application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the ❮ and ❮❮ controls are dimmed.

To use pagination controls:

1. With results displayed in the Legacy Events view, click the current number of events per page (**10**, **25**, **50**, **100**, or **200**), and select the new number of events per page from the drop-down menu.
2. To page forward or back, use the page control icons:
   Click ❯ to go to the next page.
   Click ❯❯ to go to the last page.
   Click ❮ to go the previous page.
   Click❮❮ to go to the first page.
3. To go to a specific page, type a page number in the page number field | 3 Page 3 |.

# Create a Query in the Navigate and Legacy Events Views

In the Navigate view or the Legacy Events view, you can create a query using dialogs for that offer syntax help with drop-down lists of applicable meta keys or meta entities and operators.

When viewing the drop-down list, you can expand and collapse each meta group to view or hide the individual meta keys in that group. When you select a meta group, NetWitness generates the complex query equal to a query with all of the meta keys in that group ORed together. So if a meta group contains `ip.src` and `ip.dst`, the query generated is `ip.src = <value> OR ip.dst = <value>`. If the meta group contains meta keys that have different meta value types, the value input is disabled and the query uses `exists` statements. For example, a meta group that contains `ip.src`, `ip.dst`, and `alias.host` includes meta keys that have different value types; `ip.src` and `ip.dst` are ip addresses and `alias.host` is text. The generated query is `ip.src exists OR ip.dst exists OR alias.host exists`.

A basic query is in the following form:

```
<metakey> <operator> [<metavalue>]
```

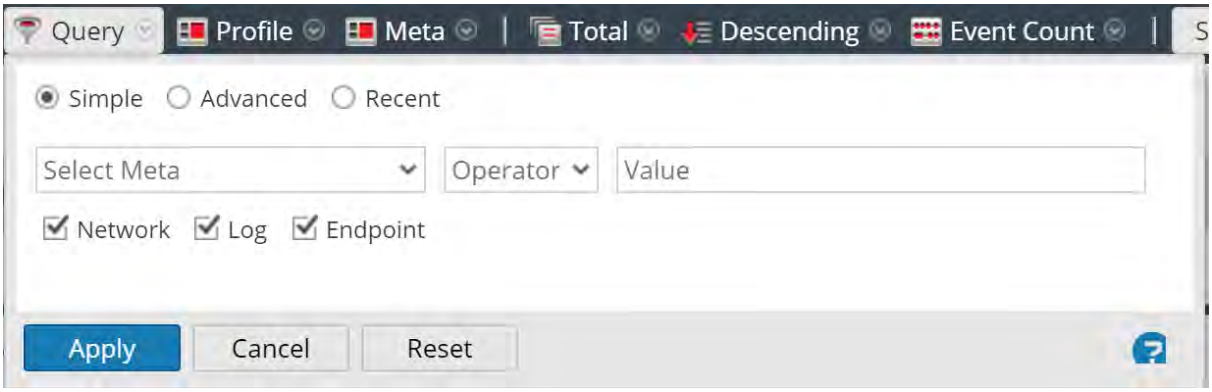
These are a few examples:

```
action exists
action = 'get'
alias.host = '10.25.55.115'
extension = 'exe'
orig_ip != "10.0.0.0" - "10.255.255.255"
```

## Create a Query Using the Basic Method

When you create a query using the basic method, drop-down lists of meta keys and operators are displayed.

1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

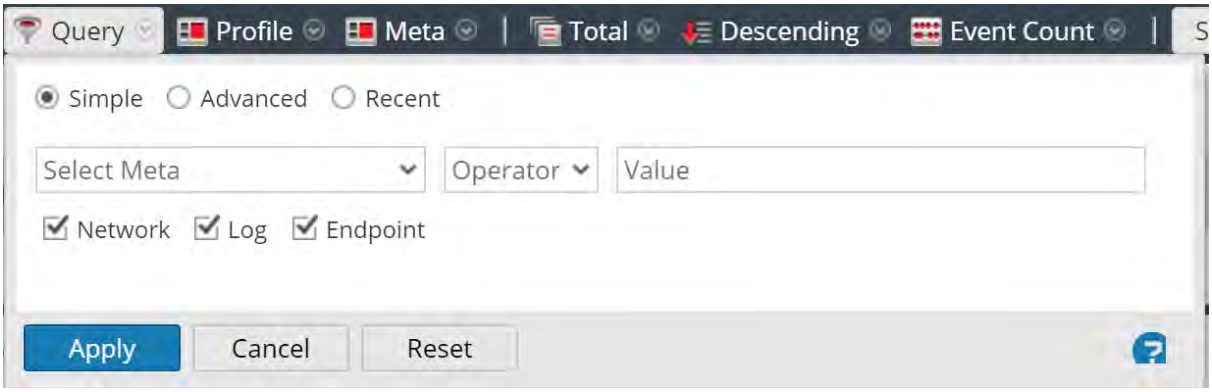


2. In the **Select Meta** field, click to display the drop-down list. The drop-down list has two sections: Meta Groups and All Meta.
3. Select a single meta key under **All Meta** or select a meta group under **Meta Groups**. You can also type in a meta key or meta group in the field.

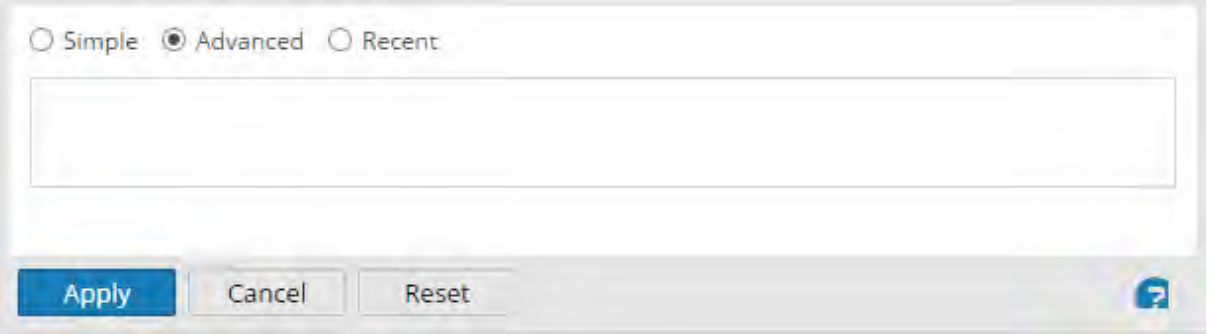
4. In the **Operator** field, type an operator or click on the drop-down list to select a valid operator.
5. (Optional) If you selected an operator that requires a value, for example, =, in the third field type the value for the meta key.
6. In the Network, Log, and Endpoint checkboxes, choose the type of data to query. Do one of the following:
   a. To limit the query to packets select **Network** and de-select **Log** and **Endpoint**.
   b. To limit the query to logs, select **Log** and de-select **Network** and **Endpoint**.
   c. To limit the query to endpoint events, select **Endpoint** and de-select **Network** and **Log**.
   d. To apply the query to packets, logs, and endpoints, select **Network**, **Log**, and **Endpoint**.
7. Do one of the following:
   a. Click **Apply**.
   The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   b. Click **Cancel**.
   The window is closed and no changes are made to the view or current query.

## Create a Query Using the Advanced Method

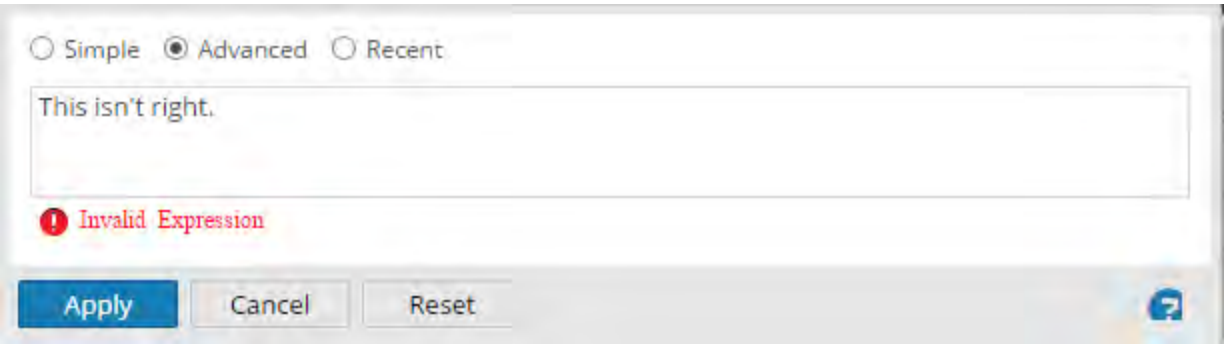
1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed.



2. Select **Advanced**.
   The advanced query field is displayed.



3. In the field, create a query, which can include the meta key, operator, and value. When you begin typing a meta key in the field a drop-down list of available meta keys for the selected service is displayed.
4. Select the meta key for your query.
   The display is updated. If the expression is not yet complete, the status indicates that the query is invalid.
5. Continue with an operator, from the drop-down list, then a value if necessary. The display is updated as you continue to enter the query. If you enter an operator, such as **exists** or **!exists**, which does not use the value field, the value field is disabled and the invalid status is cleared. If you enter an operator, such as =, which requires the value field, the invalid status remains until you enter a value. When the query is valid the invalid status is no longer displayed.

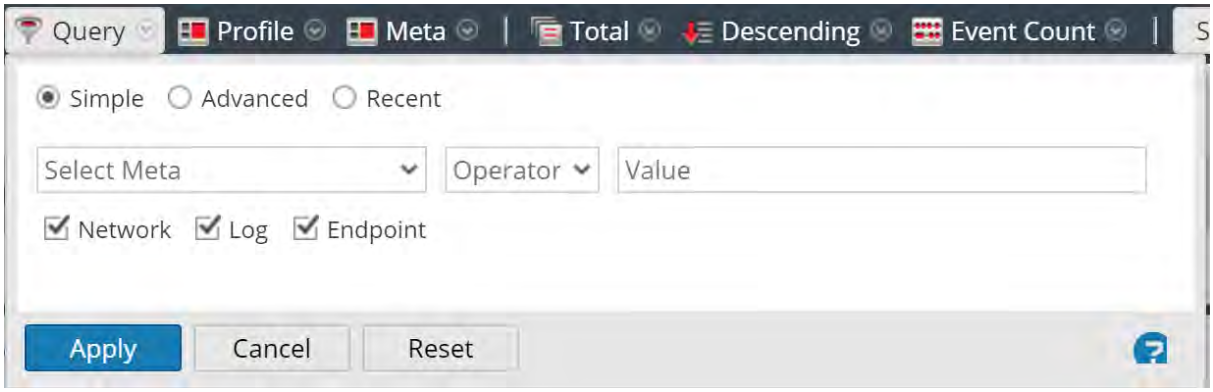


6. Do one of the following:
   - Click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

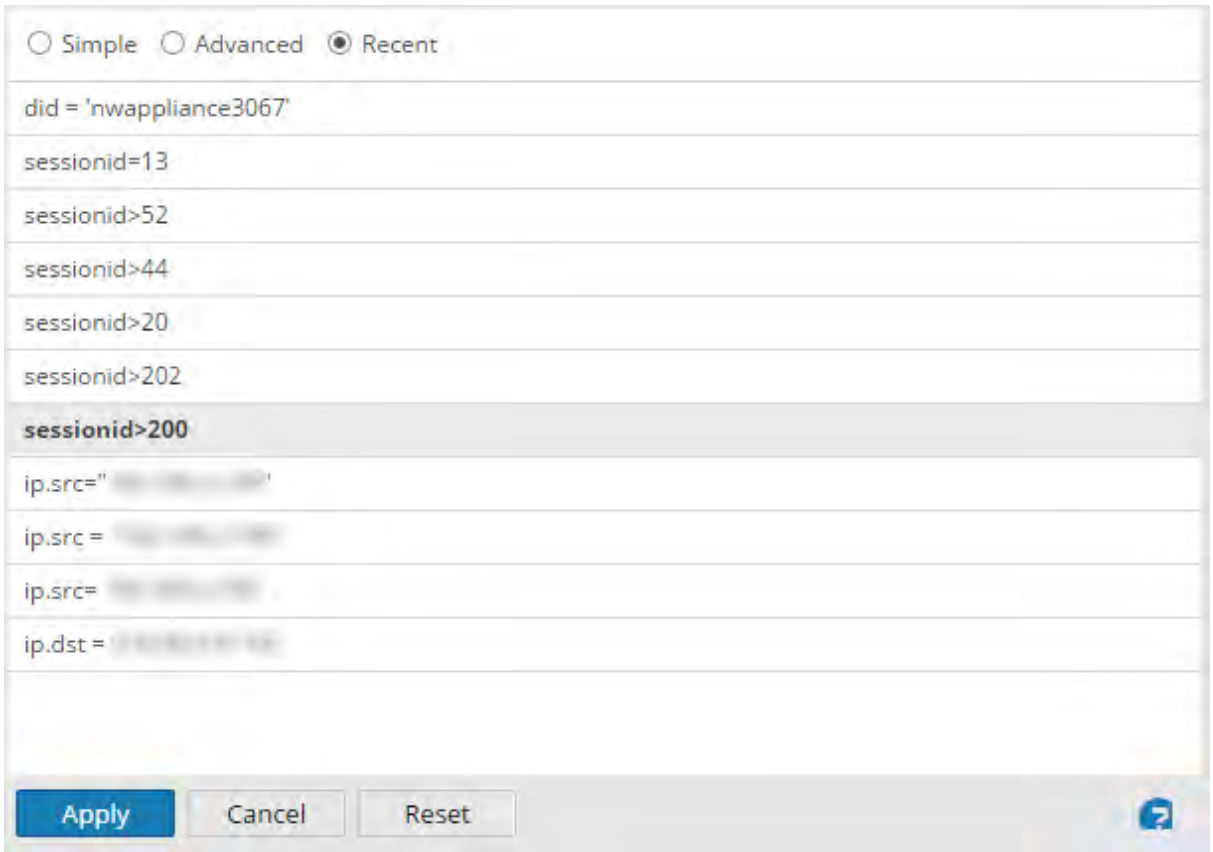
## Apply a Recent Query

You can view recent queries and select one to apply to the current service being investigated. To select a recent query:

1. In the **Navigate view** or the Events view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.



2. Select the **Recent** option.
   The list of recent queries is displayed in the bottom portion of the dialog.



3. In the list of recent queries, click to select a query.
4. Do one of the following:
   - Double-click a query.
   - Select a query and click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

# Search for Text Patterns in the Navigate and Legacy Events Views

You can search for text patterns within the current set of events in the Navigate view, the Events view, and the Legacy Events view. This section provides information about searching in the Navigate view and the Legacy Events view.

You can perform a keyword text search or do regex (Regular Expression) matching. In the Navigate view, you can click a meta value, such as HTTP, to drill into the data and then enter a search string in the Search field to search for events within that subset of data. The search opens a tab in the Legacy Events view, brings your drill and time range forward, and shows your search results. You can also drill into the data using queries before starting a search. To execute the search, enter a search string in the Search box, and press **Enter** or click **Search**.

**Note:** By default search results are only for exact matches found in indexed data. Only meta values shown as blue links in the Events Detail view are indexed. The regex option must be selected if the value contains a space. To broaden the search change the options in the Search Events drop-down menu.

## Keyword Text Search

The text search provides these capabilities:

- Each white space delimited word is ANDed, so that every word must be found, but the order or location position in relation to the other words is irrelevant. For example, if you search on `Mark Albert`, both Mark and Albert must be found in the session, but they need not be together or in any specific order.
- The word OR is special. If you search `Mark OR Albert`, either Mark or Albert must be found in the session to match; both are not required.
- You can mix or match implicit ANDs and ORs together in the search string. The explicit OR has higher precedence than the implicit (whitespace) AND. The following examples make the same logical statement, which requires that both the terms cheese and dumplings be present in a match and one of toast or bread:

```
cheese toast OR bread dumplings
cheese AND (toast OR bread) AND dumplings
```

- You can exclude words from search results using the `-` operator. For example, searching for `cheese -toast` would return any result that has the word cheese, unless the word toast is also present.
- The keyword search can match metadata stored in the following patterns:
  - **IPv4 and IPv6 addresses**. Any term that can be recognized as an IP address is converted to the native metadata format so that it can be found in indexed metadata.
  - **IPv4 CIDR ranges**. You can use CIDR notation to locate IPv4 addresses within a range.

- **Timestamps**. Timestamps are matched against the native time metadata, and any additional time meta fields stored with the Time type.
- **Numbers**. The search function will attempt to automatically identify decimal search terms and match them against numeric meta data fields.

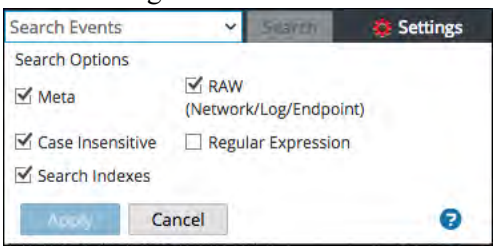
## Options Controlling Search Behavior

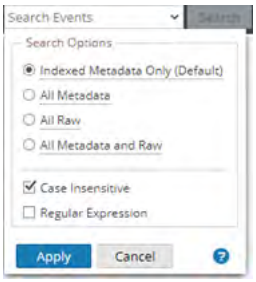
To access the Search box and search options in the Navigate or Legacy Events view:

1. You can see the Search Events field in the toolbar.

> **Note:** If you cannot see the Search Events field in the toolbar, click ·· on the right side of the toolbar.

2. Click in the **Search Events** field to view the Search Options drop-down menu. In Version 11.2 and later, the menu options are slightly different. The first figure illustrates the menu for 11.1 and below; the second figure illustrates the menu for Version 11.2 and above.





The options selected in this box change how the search is executed. The default search mode is to search indexed metadata and raw data only.

> **Note:** Because the Index or Indexed Metadata Only (default) checkbox is selected by default, the search returns results based on data that is indexed. If you want to search for a complete set of metadata or raw data, select those checkboxes and clear the Index or Indexed Metadata Only (default) checkbox. This type of search takes longer, but it contains a more complete set of data.

The following table describes the Investigation search options.

| Feature | Description |
|---|---|
| **Indexed Metadata Only (default)** checkbox (Version 11.2 and later)<br>**Index** radio button (Version 11.1) | This search only returns results on indexed data. Searching the index is the fastest way to locate keywords within a large data set. The index search uses any relevant indexes present within your data collection.<br>**Caution:** Substring matches are not located by index searches. If you require substring matches, clear this checkbox and use a non-index search mode. |
| **All Metadata** radio button (Version 11.2)<br>**Meta** checkbox (Version 11.1) | Searches the metadata. Your keyword or regex pattern is matched against any parsed metadata. |
| **All Raw** radio button (Version 11.2 and later)<br>**RAW** (Network/Log/Endpoint) checkbox (Version 11.1) | Searches the network, log, and endpoint event text. Every event is decoded and content is searched for matches on the keyword or regex pattern.<br>If you select all data with no filters on an Archiver, execution time may be excessive and a warning may be displayed.<br>**Caution:** Searching raw network sessions causes sessions to be decoded, which is very time intensive. You may want to disable raw searches when looking at network-only collections. |
| **All Metadata and Raw** radio button (Version 11.2) | Searches the metadata and the log or event text. This option is a combination of two options in Version 11.1: Meta and RAW (Network/Log/Endpoint), which you could select together. In Version 11.2, you can select only one radio button. |
| Case Insensitive | Ignores case when searching. |
| Regular Expression | Searches using a Perl regular expression, rather than text. By default executes a text search. To execute a regular expression search, select the Regular Expression option.<br>**Caution:**<br>- Regular expression searches can be very slow.<br>- When combining regular expressions and index search options, the regular expression pattern is matched against unique index values instead of meta values. This produces results faster, but it is not an exhaustive search of all the metadata or raw data. |
| Apply | Sets the default search options to apply to a search in the Navigate and Legacy Events views. This also updates your Investigation preferences in your Profile (Profile > Preferences > Investigation tab). The preferences are saved and effective immediately.<br>You can select search options to use for a particular search without changing your default search preferences. |

### Regular Expression Search Syntax

A regular expression search uses Perl regular expression syntax, which is documented in detail in http://perldoc.perl.org/perlre.html.

### Raw Text Keyword Search

The Log Decoder has the capability to create a raw text index for unparsed log events. This functionality creates metadata items that form a full-text index on downstream services such as Concentrators and Archivers. When you enable the Search Indexes option in your search preferences, your search automatically uses the text index. Note that the text index produces meta items that have a coarse granularity. For example, the default text indexer configuration truncates text terms. By comparing the index matches against raw data, the search engine will find accurate results for your search. However, you can improve search times by disabling the raw search checkbox. If you do so, results will be returned faster, but you may see false positive hits in your search results.

## Search Procedures

### Search in the Navigate View

To search within the currently displayed data in the Navigate view:

1. Type a search string in the Search field and press **Enter** or click **Search**.
2. To clear the search box and return to the previous Navigate view with results unfiltered by the search, click the **X** in the search box.

### Search in the Legacy Events View

To search within the currently displayed data in the Legacy Events view:

1. Type a search string in the Search box, and press **Enter** or click **Search**.
   The search results are displayed. Events that match the search criteria are displayed in the events list. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column.
2. If you want to narrow the search, change the query and time.
3. If you want to stop the search and return to the Legacy Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click **X** in the search box.

# View and Modify Queries Using URL Integration

NetWitness Investigate includes an External URL Integration that facilitates integration with third-party products by allowing a search against the NetWitness architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigate view. This integration provides an internal presentation of the user's query.

URL Integration allows the user to identify the service either by the host id or by the service and port, as defined in NetWitness. If NetWitness is unable to resolve the service, the analyst is redirected to the Navigate view, showing the Service selection dialog. Once the service is selected, the Navigate view is loaded with the drill point, defined by the query.

## Service Id Known

When the ID of the service to use for an investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<deviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- `<deviceId>` is the internal Service ID in the NetWitness instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the URL when accessing the Investigate view within NetWitness. This value changes based on the service being connected to for analysis.
- `<encoded query>` is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- `<start date>` and `<end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

## Host and Port Known

When the host and port of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<device host:port>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- <sa host: port> is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- <device host:port> is the host and port of a service defined in the NetWitness instance for the service to query against. NetWitness attempts to resolve the host and port as a service ID defined in NetWitness.
- <encoded query> is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- <start date> and <end date> define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm:ss>Z. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/concentrator:50105/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

## Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the deviceID is identified as 2.

### All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: `alias.host exists`
- `https://192.168.1.10/investigation/2/navigate/query/alias%2Ehost%20exists/date/2013-03-12T05:00:00Z/2013-03-12T06:00:00Z`

### All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: `service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)`
- Encoded Pivot Dissected:
  - `service=80 => service&3D80`
  - `ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `https://192.168.1.10/investigation/2/navigate/query/service%3D80%20%26%26%20%28ip%2Esrc%3D10%2E10%2E10%2E3%20%7C%7C%20ip%2Edst%3D10%2E10%2E10%2E3%29/date/2013-03-12T17:00:00Z/2013-03-12T17:10:00Z`

## Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

# Reconstructing and Analyzing Events

Having refined events in the Navigate view or in the Events list as described in Refining the Results Set, your next step is to learn more about the events by reconstructing them, looking at attachments, and viewing additional context in third-party lookups or internal lookups.

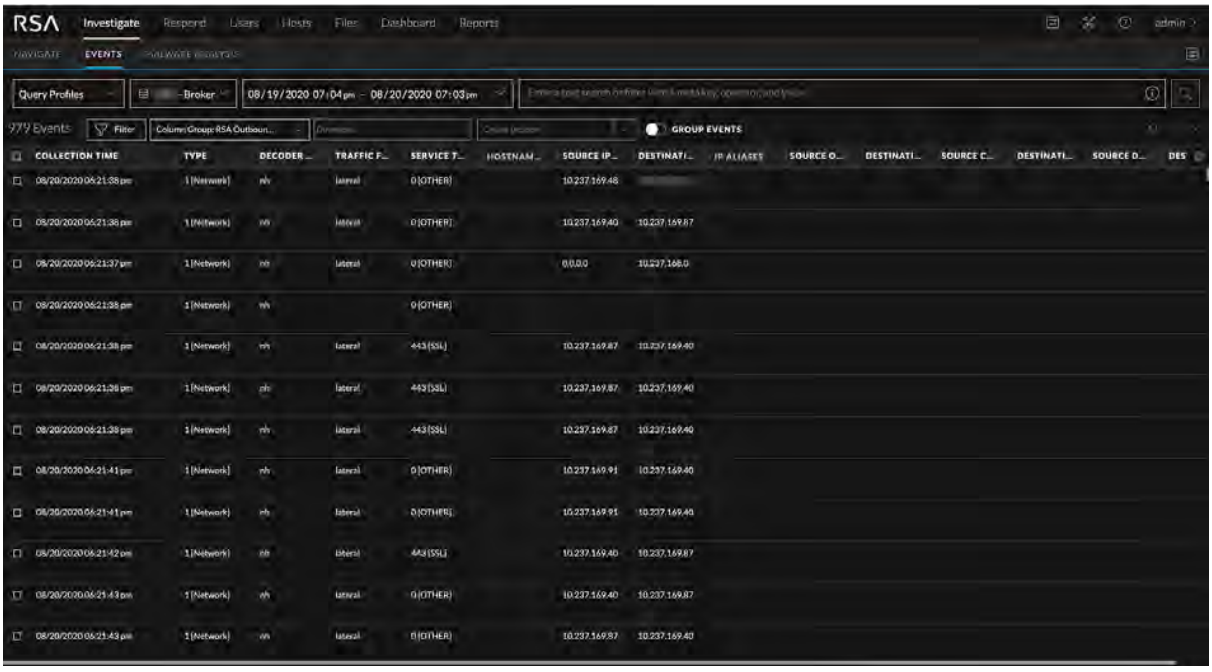
Reconstructions are done in the Events view or the Legacy Events view. If you are starting from the Navigate view, you need to go to the Events view or the Legacy Events view to see a reconstruction.

**Note:** The Legacy Events view is disabled by default. The administrator can enable the view as described in "Configure Investigation Settings" in the *System Configuration Guide*.

### To display events in the Events view, do one of the following:

1. Go to **Investigate** > **Events**.
2. Go to **Investigate > Navigate** (Version 11.5 and earlier), right-click the meta count for a meta value (the meta count is in green text). When the context menu is displayed, select **Open Events in new tab**.

The Events view opens with a list of events for the selected meta value.

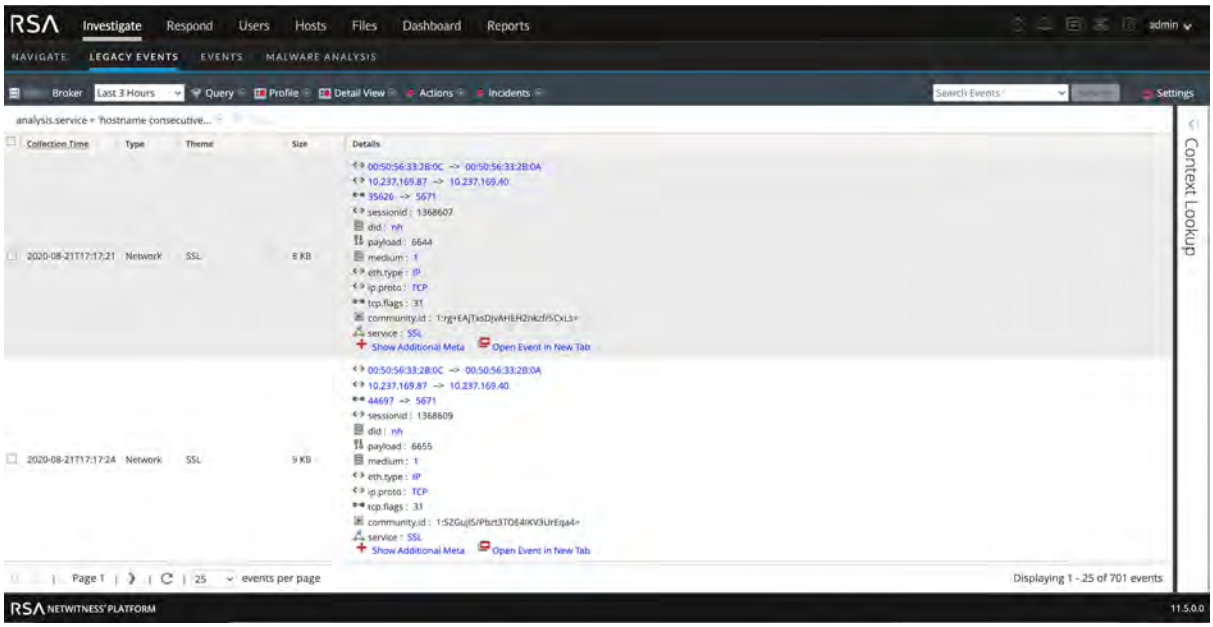


For detailed information about the types of reconstruction and analysis that you can use in this view, see Examine Event Details in the Events View.

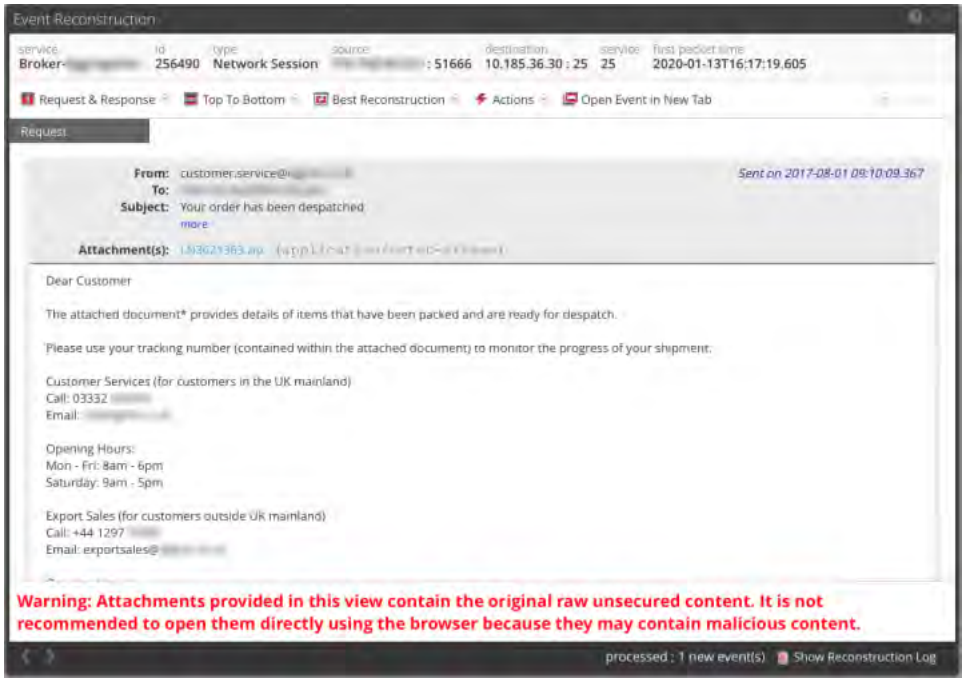
### To display an event in the Legacy Events view, do one of the following:

1. To open the Legacy Events view using the default query for the default service, go to **Investigate** > **Legacy Events**.( This option is available only if the administrator has enabled the view.)
2. To view events for a specific meta value in the Legacy Events view, go to **Investigate > Navigate** and when events are loaded in the Values panel, click a meta count (the meta count is in green text). You can also right-click the meta count for a meta value. When the context menu is displayed, click **Open Legacy Events in new tab**.
   The Legacy Events view displays the events for the selected meta value. The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. This figure is an example of the Detail view. You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. You can extract files, export events, export logs, and open the Event Reconstruction panel by double-clicking an event. See Downloading and Acting Upon Results for detailed information about these capabilities.
   NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events

first.



3. To view a reconstruction of the first event in the list, double-click the event.
   The reconstruction opens in a pop-up window in front of the Events list.



# Examine Event Details in the Events View

When you find an interesting session in the Navigate view or the Events view > Filter Events panel, you can see the list of sequential events for the session in the Events view > Events panel. Clicking an event in the list opens the Network Event Details panel for that type of event: Network Event Details, Log Event Details, or Endpoint Event Details. Within the Event Details panel, you can select a tab that shows an event reconstruction (text, packet, file, email, and web) or (Version 11.5 or later) the tab that shows host information for network events that are enriched with endpoint data.

**Note:** (Version 11.5 or Later) For expanded network visibility of existing network events in your network (packet) deployment. Network events are enriched with endpoint data namely the host and process that triggered the network event and other details such as user name, risk score, reputation, and so on.
You can view endpoint data in the following ways:
- (Quick View) **Investigate** > **Events** - Event Summary Header
- (Detailed View) **Investigate** > **Events** > **Host**

For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

**Note:** For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

## Event Details for Each Event Type

Within the Event Details panel, different tabs are available per event type as shown in the following table. Procedures for working in the Event Details panel are provided in Analyze Events in the Events View.

| Action | Network Event | Log Event | Endpoint Event |
|---|---|---|---|
| View the text reconstruction (default unless last selected overrides) | ✓ | ✓ | ✓ |
| View the file reconstruction | ✓ | | |
| (Version 11.5 or Later) View the host Information for an Endpoint Agent configured with expanded network visibility (see Host Information. | ✓ | | |
| View the packet reconstruction | ✓ | | |
| View the email reconstruction | ✓ | | |
| View the web reconstruction in the Legacy Events view (see Reconstruct an Event in the Legacy Events View) | ✓ | | |

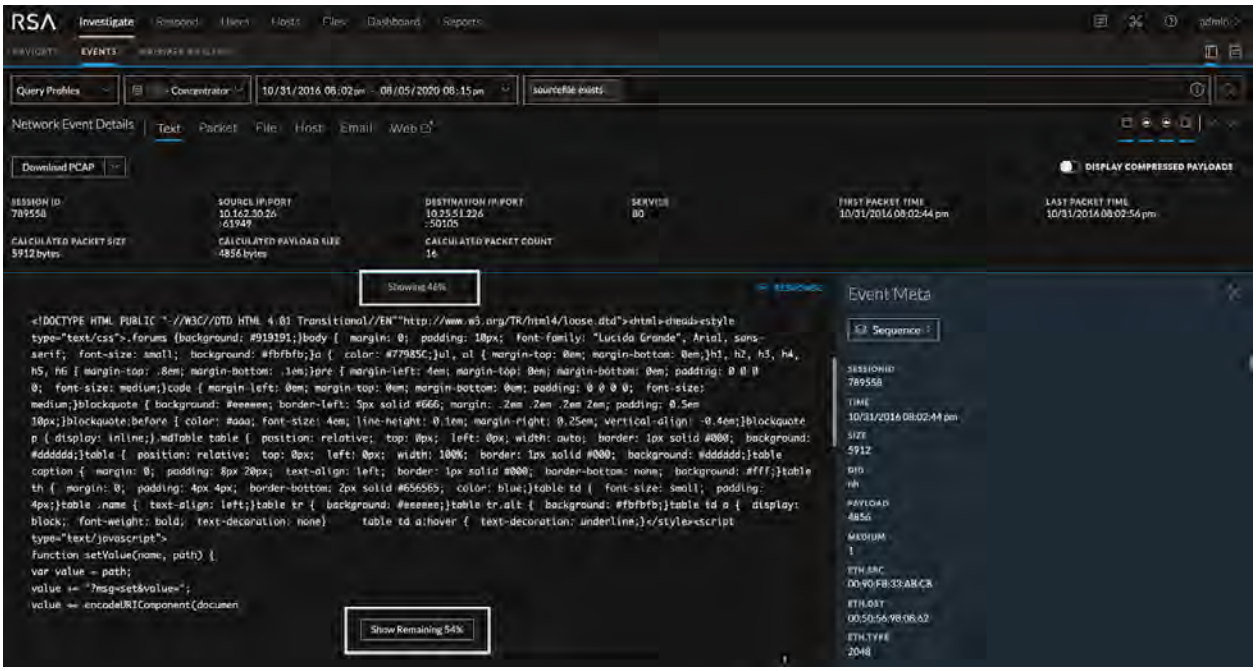
Each tab has settings to enhance your analysis. If you change a setting, the setting is preserved between browser refreshes and logins within the same browser. These are the preserved settings:

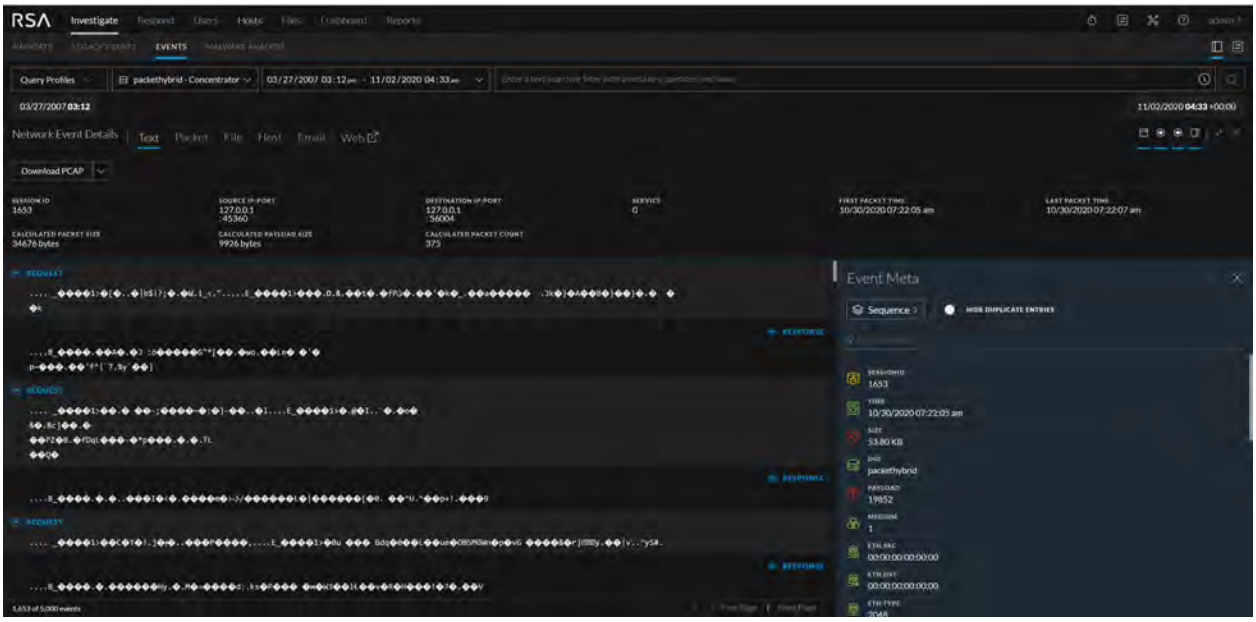
- The currently selected reconstruction: Text, Packet, File, (Version 11.5 and later) **Host**, or Email.
- Whether the Event Meta panel is open or closed.
- Whether the Event header is open or closed.
- Whether the Request or Response, or both are displayed.
- Whether packet payloads are displayed without the headers in the packet reconstruction.
- Whether shaded bytes are displayed in the packet reconstruction.
- Whether other common file types are highlighted in the packet reconstruction.
- The number of packets per page in the packet reconstruction.
- Whether compressed or uncompressed text is displayed in the text reconstruction.

## Text Reconstruction

For Endpoint Events Details, the Pivot options available under Text analysis page has been replaced with a Pivot dropdown menu that contains the three options to perform further investigation.

You can view all types of events (network events, log events, and endpoint events) in their original text format in the Text tab. The text reconstruction for some network events can be quite large. To ensure the best rendering, an excessively large payload is truncated to fit. If a single reconstructed request or response in the reconstructed event exceeds the maximum number of bytes, the header indicates what percentage of bytes is shown. Pagination controls add flexibility when paging through the reconstructed text of an event. This figure illustrates a single response that has been truncated because it exceeds the maximum number of bytes (Version 11.2 and later).





**Note:** Version 11.1 handles large payloads differently; the payload for a single event is limited to 2500 packets. When the packet limit is reached, a warning in the footer advises the limit has been reached and provides the total number of packets in the event. For Version 11.1, the Show More option is still available for messages that are truncated; however, the entire text of the message is not visible without downloading the raw payload.

In the text reconstruction, network events, log events, and endpoint events are presented differently.

- For network events, the reconstruction provides the direction of the packet (Request or Response) and contents of each packet in text format. If you are reconstructing a network event, the text

reconstruction is scrollable. When you scroll, the text identification information and the Request and Response labels remain visible rather than scrolling out of view.

- Log events and endpoint events have no request or response; only the raw event is displayed in the Text tab. Endpoint events include additional information relevant to an endpoint event.
- (Version 11.5.1) Log events that contain JSON snippets are rendered in an easily readable JSON tree view with nested indentations if the RenderJSON option is enabled.

For each type of event (network, log, or endpoint), there are differences in the event header and the options for downloading the event. Below is an example of the text reconstruction for each type of event: a network event, a log event, and an endpoint event.

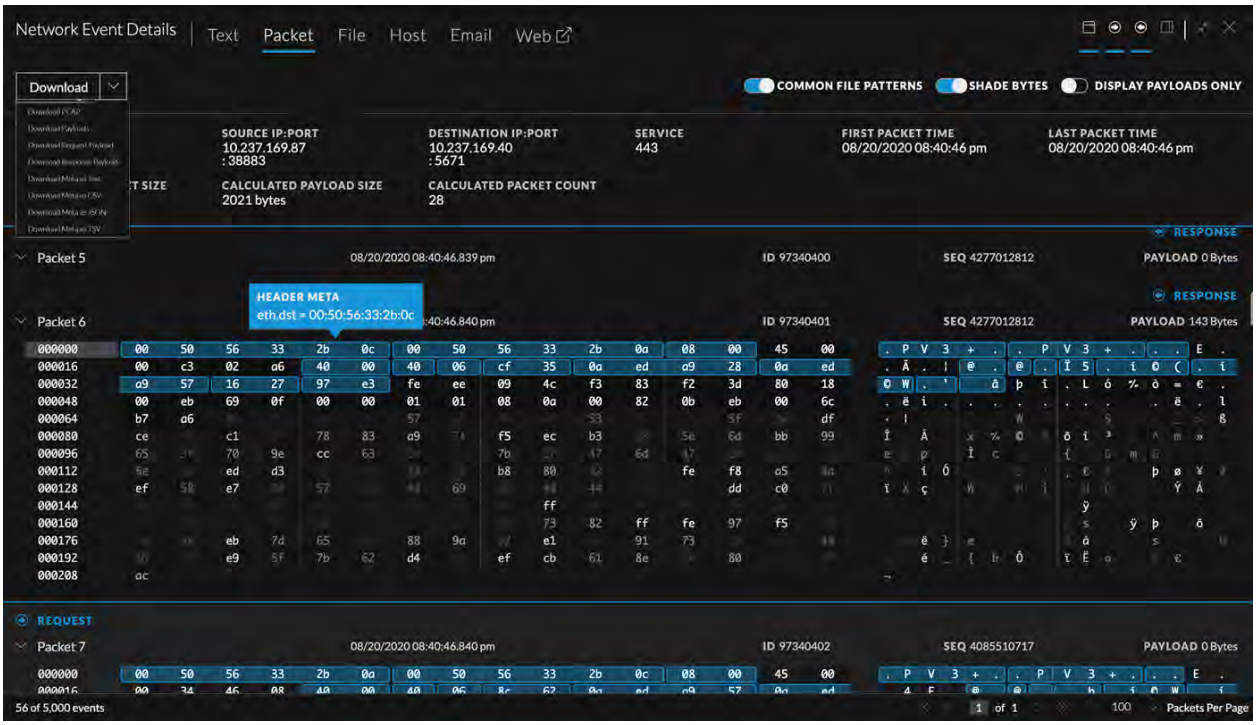
**Note:** The calculated packet count, calculated packet size, and calculated payload size in the Event header may be different than the same statistics in the Event Meta panel because the metadata is sometimes written before event parsing completes and may include packet duplicates.

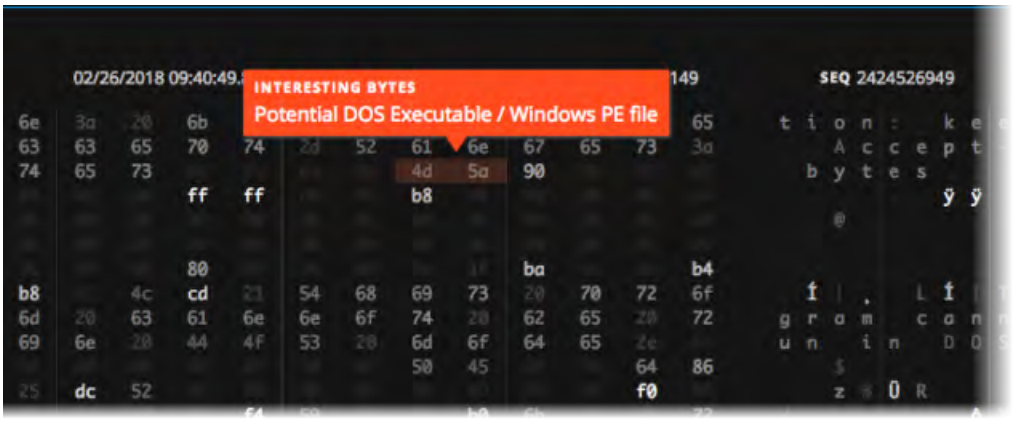
## Packet Reconstruction

The packet reconstruction is for network events. The panel is scrollable, and the packet identification information and the Request and Response labels remain visible rather than scrolling out of view. In the Packet tab, the headings provide the direction of the packet (Request or Response), the packet number, the packet start time, the packet ID and the sequence, and the payload size. All packets begin with a header, and some packets have a footer. Pagination controls add flexibility when paging through packets.

The metadata in the hexadecimal and ASCII data is highlighted in blue; when you place the cursor over the highlighted metadata, the meta key/meta value information is displayed in a hover box.

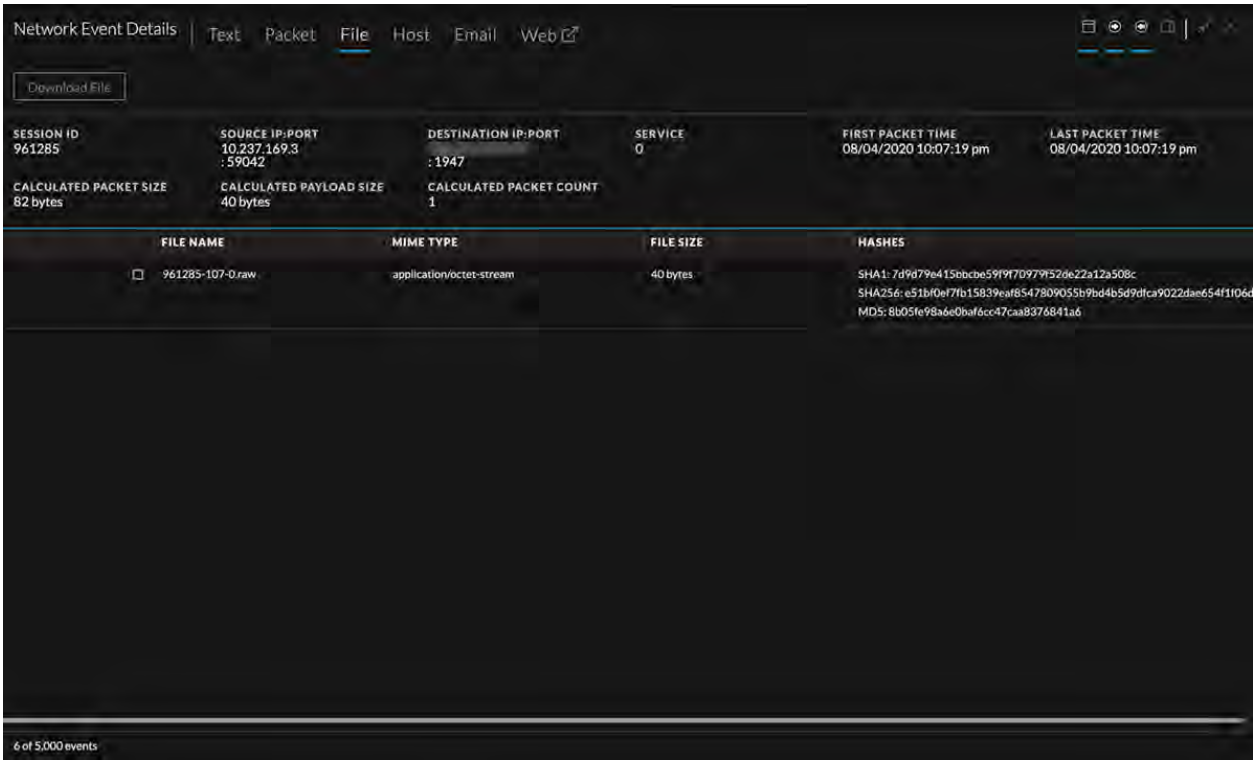


Common file signatures are highlighted with an orange background. When you place the cursor over the highlighted text, the description of the file type is displayed in a hover box.

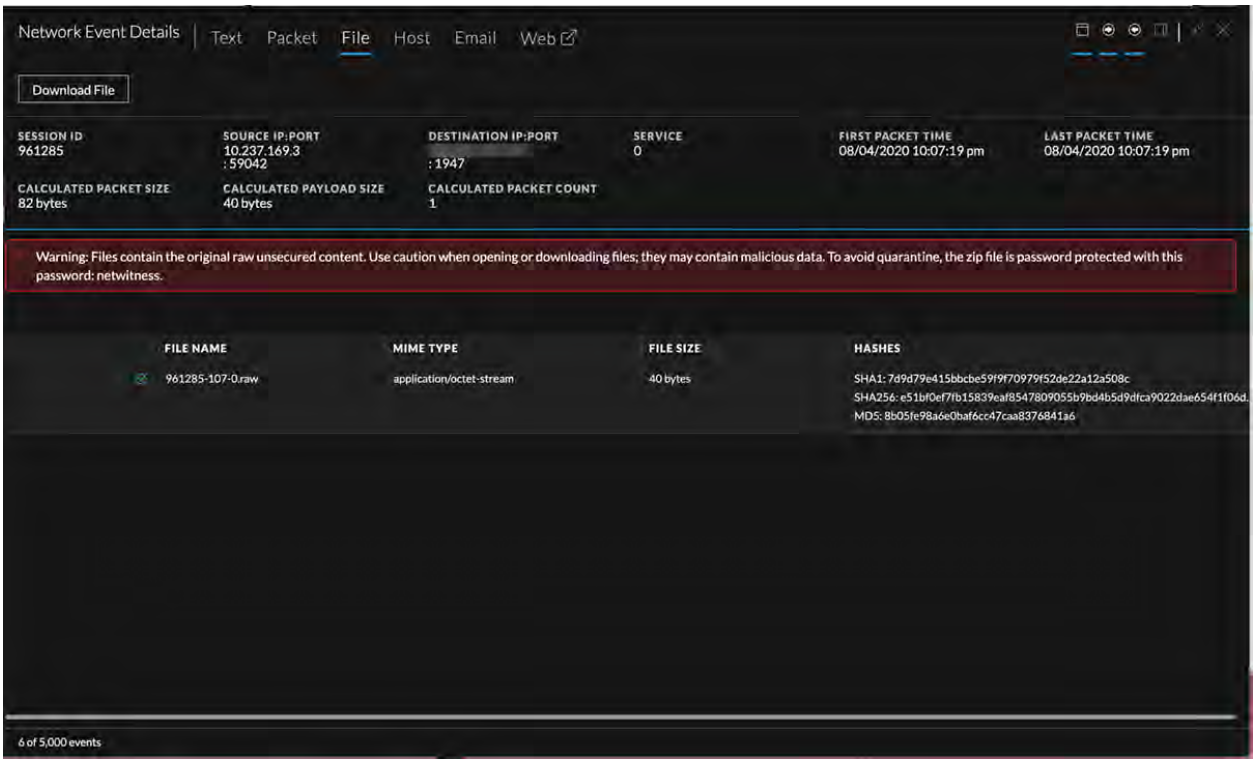


## File Reconstruction

The file reconstruction shows a list of files associated with the selected network event. This is an example of the file reconstruction.



You can select one or more files, or all files, to export to your local file system. When files are selected, The Download File options becomes active and reflects the number of files selected.



**Caution:** Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

## Host Information

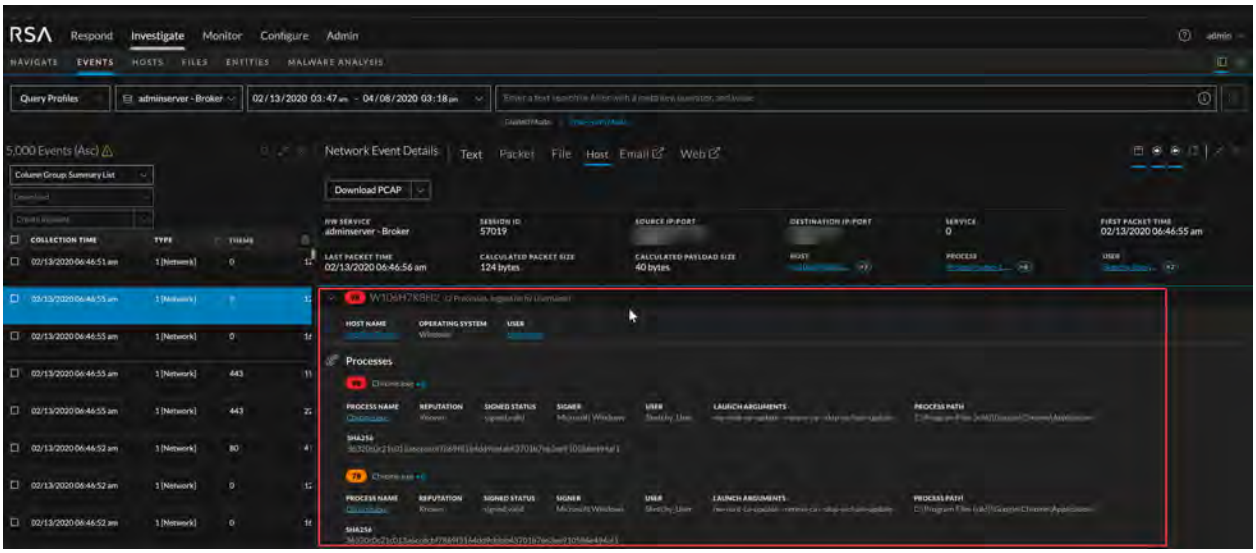
Host information is displayed for network and endpoint events with the endpoint data.

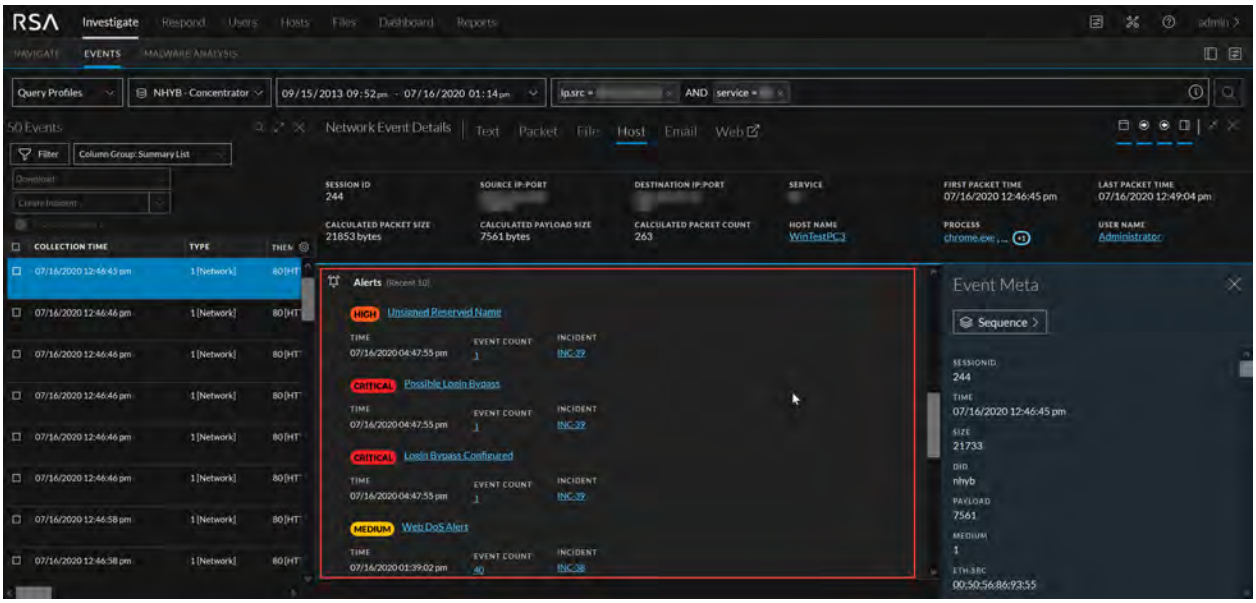
You can filter the events in the Events view using the Events Filter panel (version 11.5 and later). For more information, see Filter Results in the Events View.

**Note:** Endpoint data is displayed only if you have an Endpoint deployment, and the Endpoint agents are configured for expanded network visibility. For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

**Note:** For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

Below are some examples of the host information.





- The event summary header includes the following information from endpoint data:
  - Host name - The host from where the event originated.
  - Process - The source process that triggered the event.
  - User - The user associated with the triggered process.
- The hosts with the closest matching process are listed in the order of event time.
- By default, the first host is expanded, and you can view additional information such as:
  - Host details – This provides details on the host's operating system and the owner (logged in user) associated with the host.

- To investigate on the host name, click the **Host name** link highlighted in blue. For more information, see "Investigating Hosts" in the *NetWitness Endpoint User Guide*.
- To investigate alerts associated with the user, click the **owner** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*

◦ Process details – This provides details like risk score, process name, reputation, event time, on hosts, signed status, process ID, signer, user, launch arguments, SHA256, and path.

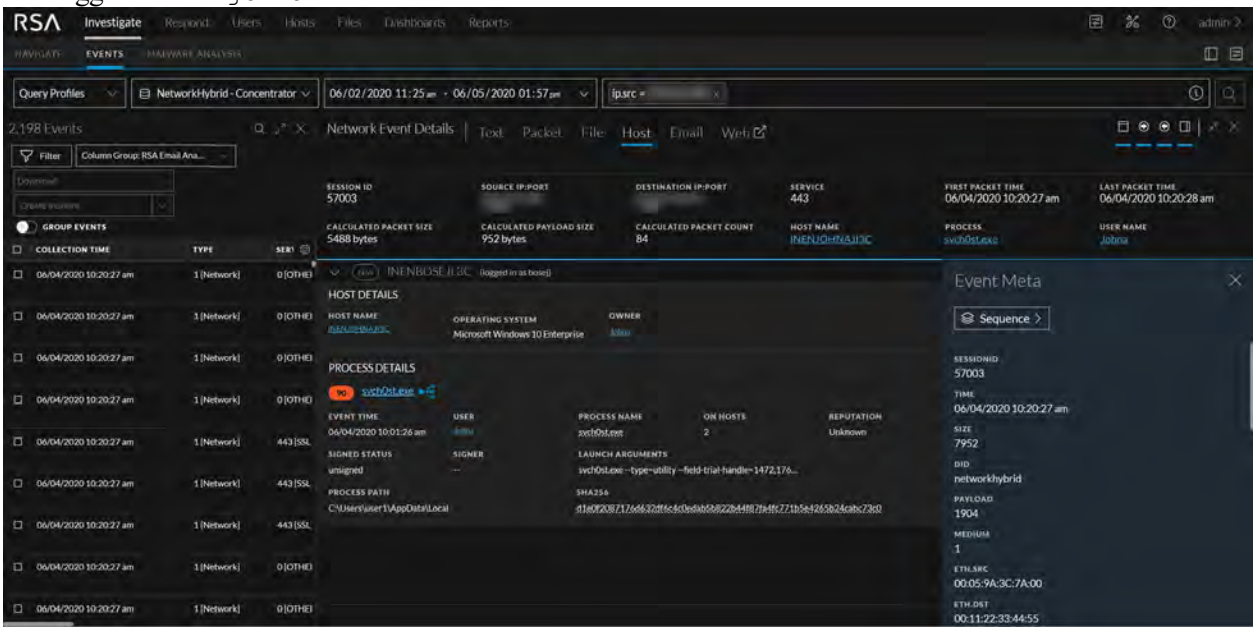
- Click to open the process tree. By default, the process tree will open the process details of last 14 days. The icon to open the process tree does not appear when the process tree is not available.
- To investigate on the process, click the **process** link highlighted in blue. For more information, see "Investigating Files" in the *NetWitness Endpoint User Guide*.
- To investigate alerts associated with the user, click the **user** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*.

◦ Alert details – It displays the recent ten alerts associated with the host. These alerts can be from endpoint, network, and log events. You can click **View All** to open the host details page. The host details page lists all the alerts that contribute to the risk score. You can click on the alert name to open the alert details. For information on how to review an alert, see “Reviewing Alerts” in the *Net Witness Respond User Guide*. This section provides the following details.

- Severity – Displays the severity of the alert.
- Time – Date and time when the alert was triggered.
- Event Count – It displays the number of events that triggered the alert. To view the events associated with the alert, click the **EVENT COUNT** link highlighted in blue. The **EVENT COUNT** link is available only when the events are from the same source.
- Incident – Lists the incidents associated with the respective alerts. To view the details and respond to an incident, click the **INCIDENT** link highlighted in blue. For more information, see "Responding to Incidents" in the *NetWitness Respond User Guide*.

You can hover over the meta values of the host name, process, user, owner, and SHA256 to view additional information about the specific metadata. For more information on context look up, see Look Up Additional Context for Results.

Below is an example of the Host Information tab with a single host, process, and user associated with the selected network event. The `svch0st.exe` is the process associated with the host `INENJOHNAJI3C` and logged in user `johna`.

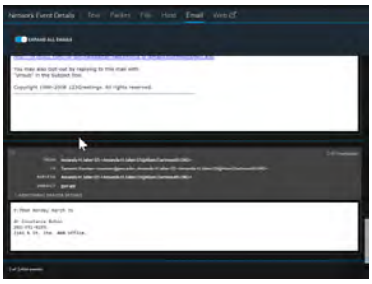


**Note:** You may see multiple hosts and processes triggered for the selected network event; in such cases, the host from where the event is triggered first is listed first and then the other hosts where a similar event is triggered.
For example, if `10.63.0.240` IP address is assigned to Host1, and User1 is logged in to the machine and accessed `www.nyu.edu/` using Chrome. Meanwhile Host1 is powered off (within a span of 30 minutes), and the same IP address is assigned to Host2. The user logged in is User2 and accesses `www.nyu.edu/` using Internet Explorer. In this case, network events for the endpoint data are as follows:
- Hostname - `Host1`, `Host2`
- Process - `chrome.exe`, `iexplore.exe`
- User - `User1`, `User2`

## Email Reconstruction

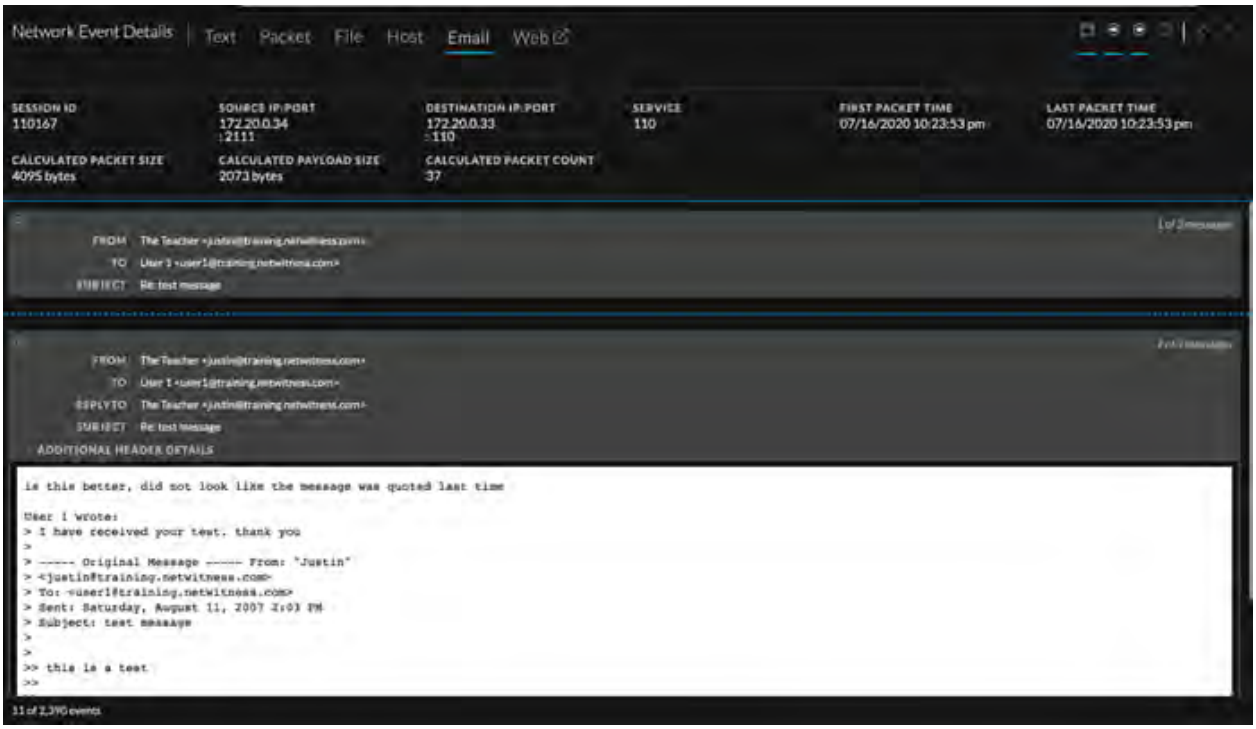
In 11.7 and later, if the analysts need to review all email contents in a single session, then they can click on the Expand All Emails toggle button by navigating to **Investigate** > **Events** > **Email** view.

When the Expand All Emails toggle button switched on, the email content is displayed in an expanded form.



When the Expand All Emails toggle button is switched off, the email content is displayed in a collapsed form. If there are no emails to display the toggle button is disabled.

The email reconstruction shows a list of emails associated with the selected network event. This is an example of the email reconstruction.



- By default, a single email is expanded and multiple emails are collapsed.
- If an email contains attachments, you can download attachments as described in Download Data in the Events View.

  **Caution:** When you download and open attachments from an email, they may contain malicious data.
- An external link in an email cannot be accessed. Clicking an external link displays a **Link Address** popup window that provides the actual link.
- When an email body is too long, **Showing %** is displayed in the beginning of the email. To view the remaining content, click **Show Remaining %** at the bottom of the email.
- If an event contains a web email supported by the `alias.host` metadata of `mail.google.com`, `mail.live.com`, or `mail.yahoo.com`, a message is displayed with a link to view the

reconstruction for the associated session in the Event Reconstruction page. If not, a "*No Email reconstruction is available for this event*" message is displayed.

# Analyze Events in the Events View

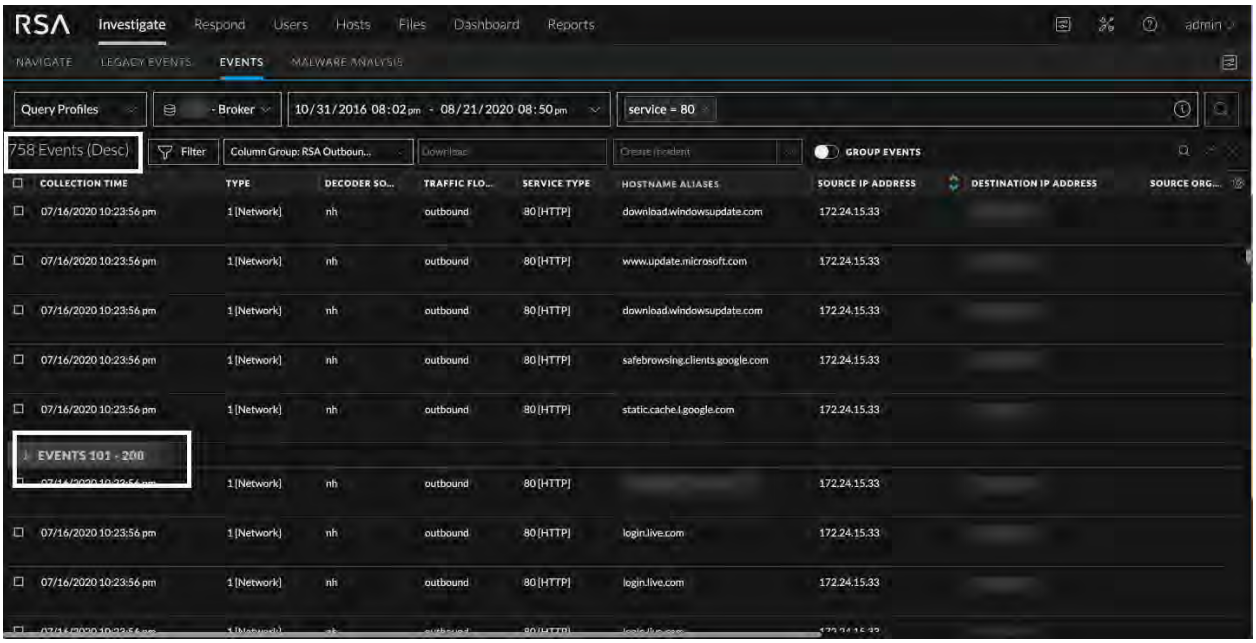
**Note:** In Version 11.4, the Event Analysis view was renamed as the Events view, replacing the Legacy Events view as the default view analyzing events. Information regarding Events view features prior to version 11.4 also applies to the 11.3 and earlier Event Analysis view.
The Legacy Events view is disabled by default, but the administrator can enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

After a query is submitted in the Events view, the Events panel opens with a list of sequential events. The events listed here meet two conditions:

- They match the submitted query.
- They include a value for one or more meta keys required by the selected column group. If you change the column group while viewing the Events list, the original query with the new column group is resubmitted. Unsubmitted query changes made to service, time range, or filter, are ignored.

## How Results Are Loaded and Sorted

There is a configurable limit on the number of events that can be loaded; the default value is 5,000. Administrators can configure the limit as described in the *System Configuration Guide*. The events begin loading into the Events panel; a progress bar at the top of the list tracks progress while events are loaded. Events with the earliest collection time are loaded first and a row number indicator of the form " EVENTS xxx - xxx" is inserted in the list after every group of 100 events as shown in the following figure.



A spinner is displayed while the events are loaded. If that count is greater than or equal to the threshold, a message under the spinner advises that fact and directs you to the Query Console for more details. As data begins loading, the message is removed and the spinner remains until all events are loaded. When all events have loaded, one of these messages is added to the bottom of the list:

- "All events loaded."
- "Reached the 5,000 event limit. Consider refining your query."
- "Retrieved 4,000 of 5,000 events prior to query cancellation."

A message at the top of the list indicates the total number of events loaded, if the 5,000 event limit has been reached, and the sorting method in effect:

- The message when fewer than 5,000 events are listed is: "xx,xxx Events"
- The message when more than 5,000 events are listed is: "Oldest 10,000 Events (Asc)"

If the number of events that match the query exceeds the limit of 5,000 events, the newest or oldest 5,000 events in the time window are loaded in ascending order. The portion of events loaded is based on the sort order. For example, if 300,000 events match your query and the sort sequence is set to Ascending, the oldest 5,000 events are loaded by default. You can change this by changing the sort order to Descending and the newest 5,000 events are loaded. Ascending sort, which loads the oldest events first is usually the best setting for investigating network events. If you want to view the newest 5,000 events in the time window, you can change the Default Event Sort Order to Descending in the Event Preferences dialog.

The sorting method for the list is configured in the Event Preferences dialog (see Configure the Events View). Any change in the setting goes into effect the next time you submit a query. The Default Event Sort Order from the Events Preferences dialog is saved in the database and persists after logging out and logging back in.

- **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
- **Ascending** (default for Version 11.4 and earlier): To list the events with the earliest collection time first. The earliest collection time first is well suited to most investigations. When investigating logs, you may want to change the sort sequence to latest collection time first.
- **Descending**: To list the events with the latest collection time first. The latest collection time first is often useful for investigating logs.

## Actions to Refine the Events List

When the results are loaded in the Events panel, you can take the actions to refine the list:

- Select a column for sorting events (Use Columns and Column Groups in the Events List).
- Select a set of meta keys (column group) that help with a specific type of investigation (Use Columns and Column Groups in the Events List).
- Apply a query profile (Use Query Profiles to Encapsulate Common Areas for Investigation).
- (Version 11.5) Filter events by pivoting through the metadata Drill into Metadata in the Events View (BETA).

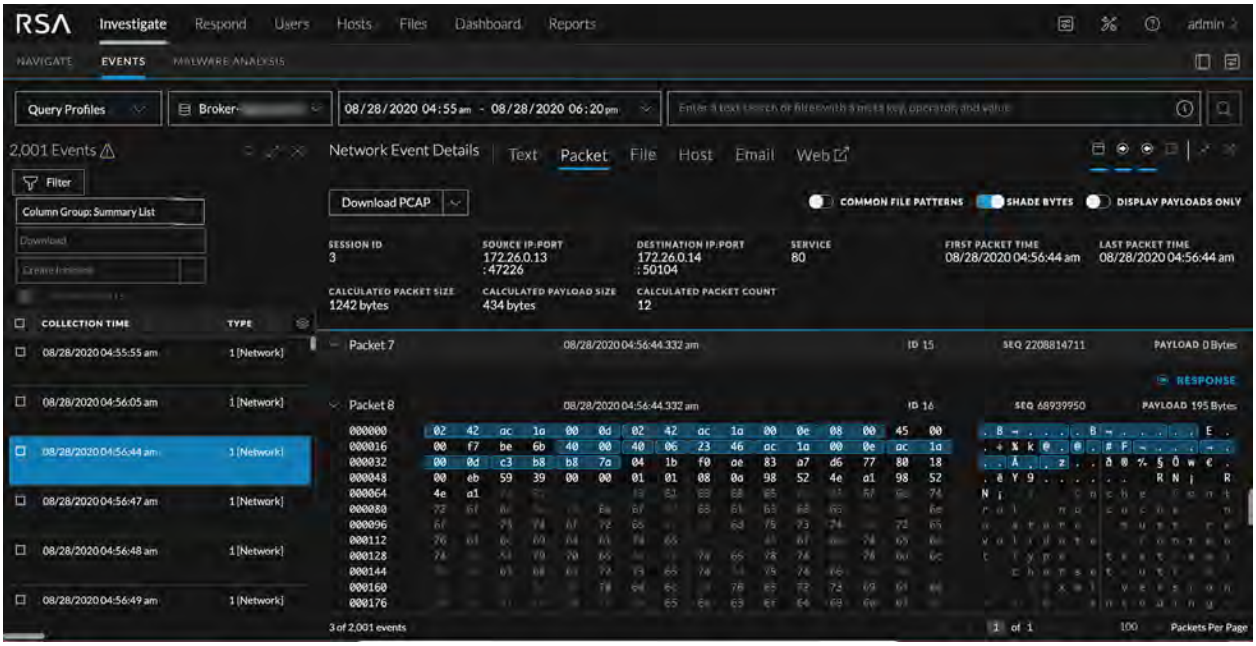
## Actions to Analyze Events

The rest of this section has procedures for working in the Events view and adjust reconstructions to bring interesting data into focus.

- You can download events and create an incident in Respond.
- Clicking an event in the Events panel opens the Event Details panel to a tab that shows an event reconstruction (text, packet, file, email, and web) or the tab that shows host information for network events that are enriched with endpoint data (Version 11.5).
- The Events panel and the Event Details panel can be open at the same time.
- Within the Packet tab and the Text tab, you can use additional features to adjust the way the reconstruction is displayed and bring interesting data into focus.

## Open, Close, and Adjust the Size of the Panels in the Events View

Initially, the Network Event Details, Log Event Details, or Endpoint Event Details panel occupies 75% of the window width by default.

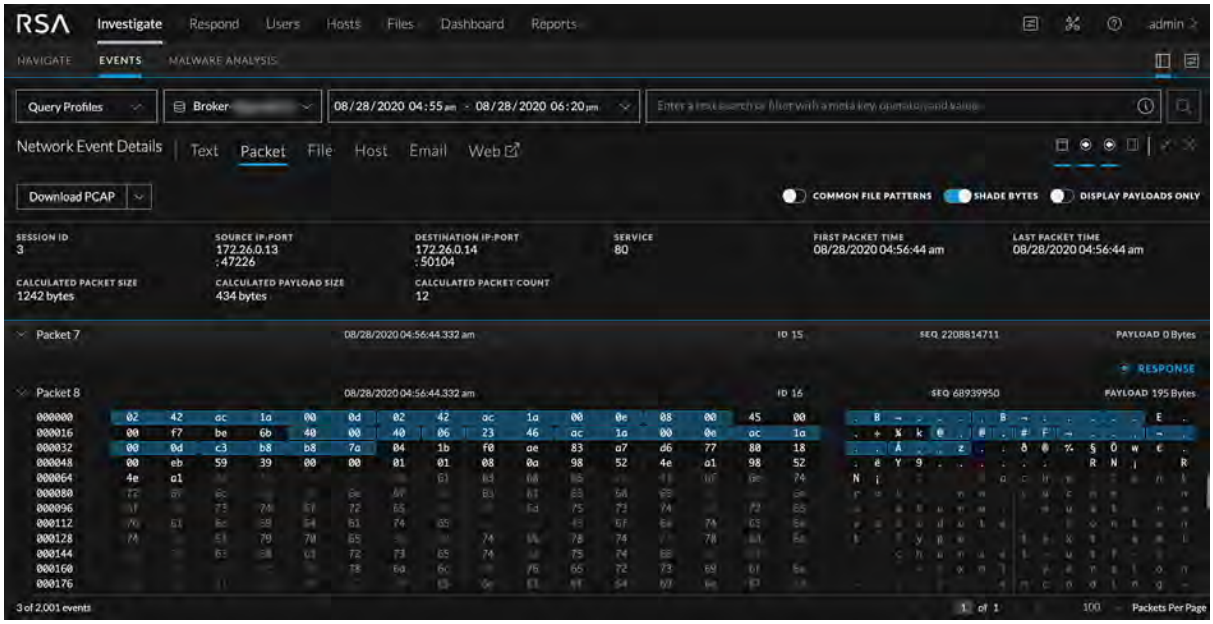


You can adjust the size ratio of the Events panel in relation to the details panels to improve readability by expanding one of the panels, contracting one of the panels, and closing one of the panels. After closing either panel you can reopen it. The ratio you select persists until you change it or refresh the browser.

To optimize your view:

1. To adjust the size ratio of the two panels, do any of the following:
   a. Click ⤢ in the tool bar of the panel that you want to expand.
   b. Click ⤡ in the tool bar of the panel that you want to contract.

2. To close either panel, restoring the open panel to its full width, click .
   This is an example of the reconstruction displayed using the full width of the browser window.



3. To reopen the Events panel after closing, click ◫ in the top right corner of the Events view.
   The Events panel opens to the last state (25%-75% or 50%-50%).
4. To reopen the Event Details panel, click an event in the Events panel.

## Select the Analysis Type for an Event

To select the analysis type for an event, with an event open in the Event Details panel, click one of the tabs: **Text**, **File**, **Host** , **Packet**, **Email**, or **Web**.

- If you chose **Hosts**, the host information from extended endpoint data is displayed.
- If you chose **File**, **Text**, **Packet**, or **Email**, the reconstruction is displayed.
- If you chose **Web**, the reconstruction of the single event opens in a new tab. This is the same reconstruction of a session used in the Legacy Events view (see Reconstruct an Event in the Legacy Events View).

**Note:** The packet reconstruction is only available for network events.

## Adjust the Display of Requests and Responses

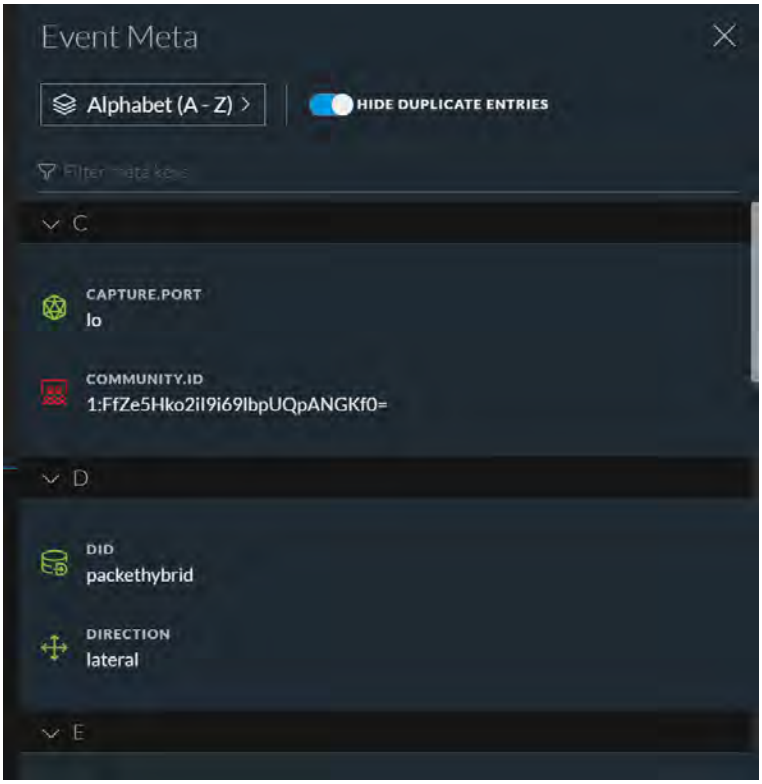
For analysis types that have requests and responses, you can select which side of the conversation to show, Request , Response , or both, click one or both of the direction icons. The reconstruction is refreshed with the selected information.

**Note:** If you do not see any data, you may have deselected both Request and Response. You must select one of the two to see data displayed.

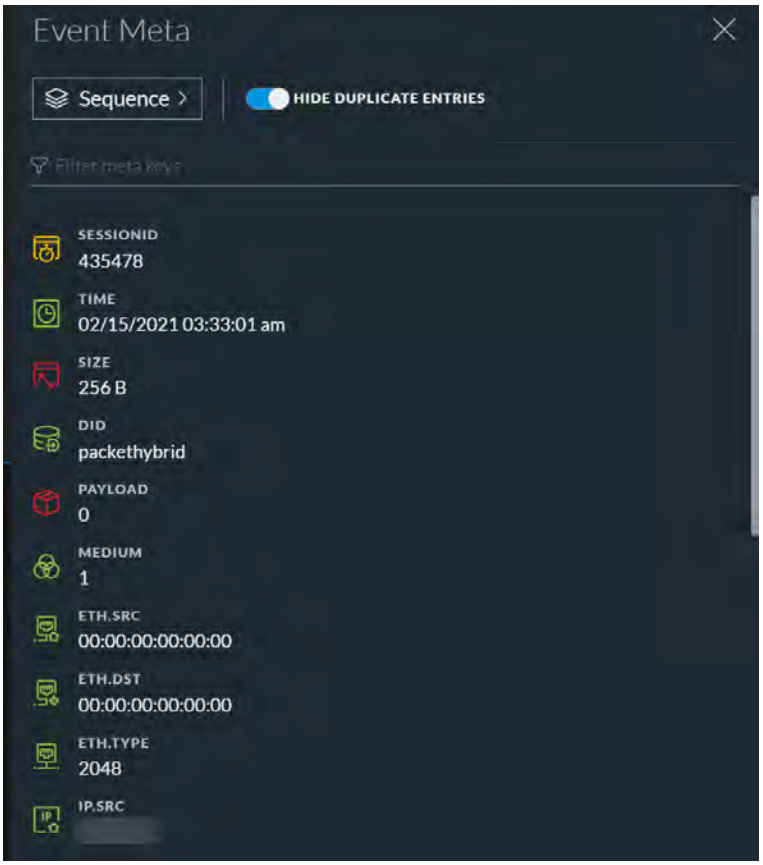
## View Associated Metadata for an Event

When examining events in the Text tab, Packet tab, or Filetab, you can click to show the associated metadata in an adjacent panel, the Event Meta panel.You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically."

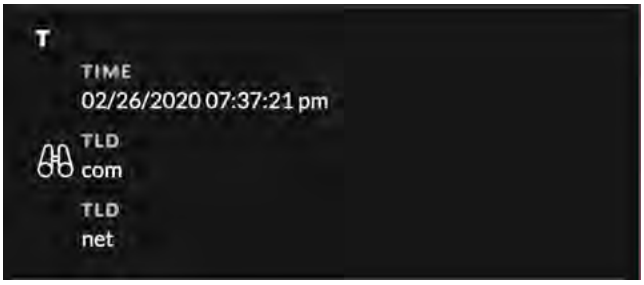
You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically.



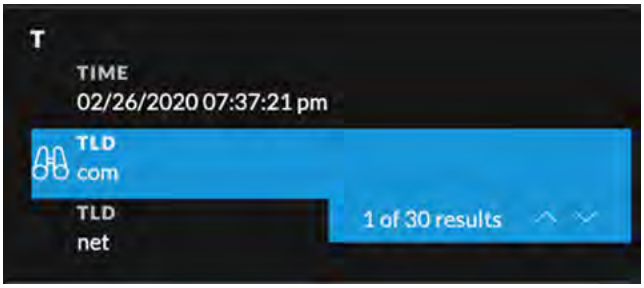
This figure illustrates the same metadata presented in the sequence in which it was generated.



When viewing a text reconstruction and the Event Meta panel, hovering over the meta key/meta value pairs reveals a pair of binoculars if the meta value is searchable in the raw text. This figure is an example of white binoculars on a black background marking a searchable meta key.



Clicking the icon triggers a search for the meta key/meta value pair (case-insensitive) in the Text tab and each instance is highlighted. This is an example of white binoculars on a blue background after clicking a searchable meta key/ meta value combination.

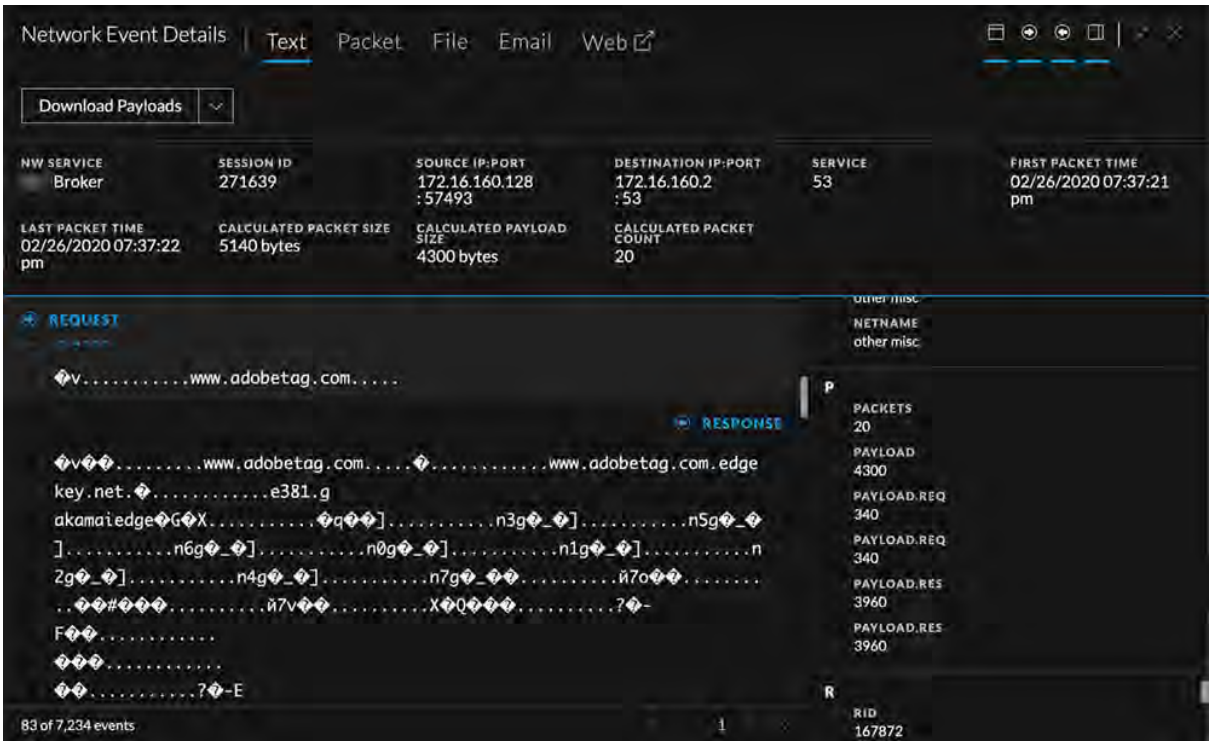


In the Event Meta panel, the highlighted row has a count of the results and up and down arrows that you can use to quickly find each result in the Text tab. You can view each highlighted location of the data that triggered generation of the meta key, going forward to view the next, and back to view the previous.

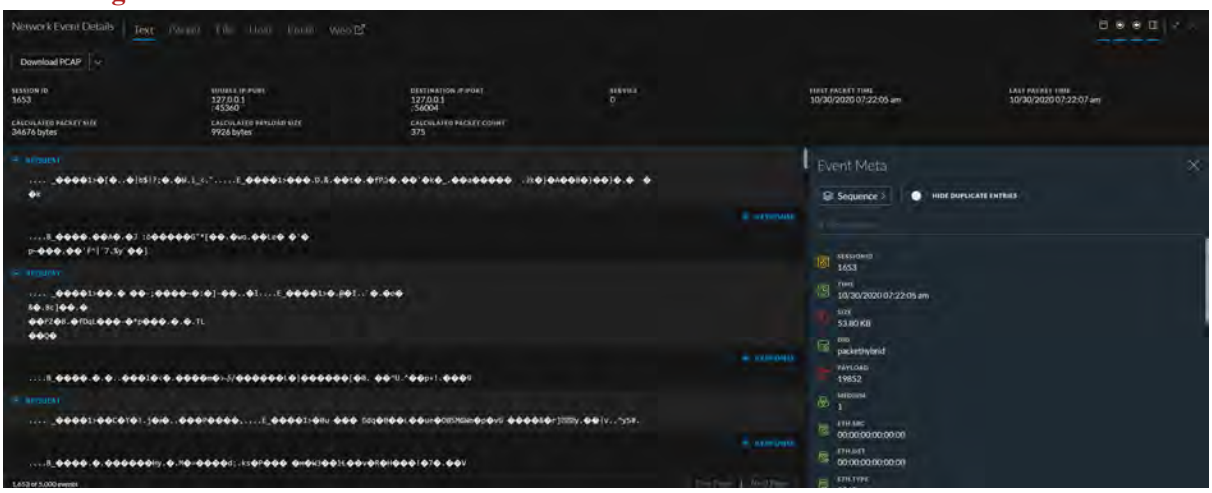
Only meta keys that have relevant values inside the RAW text are searchable. You can search only one meta key at a time. If the value is currently hidden due to truncation of a text entry with more than 3000 characters, the text entry is expanded to reveal the found meta value.

To search the raw text for meta values that triggered a meta key:

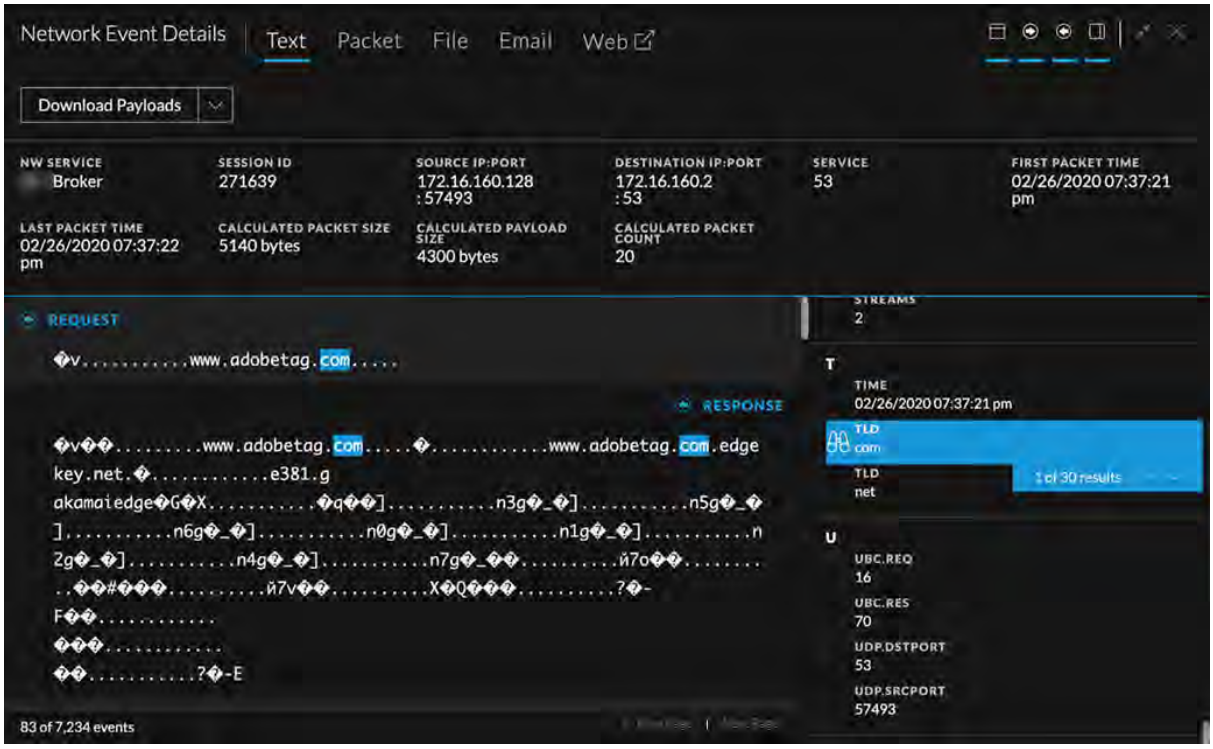
1. Open a network event in the Text tab and click to open the Event Meta panel.



## 11.6 Image



2. Hover the mouse over the meta key/meta value pairs in the list until you see a binoculars icon next to a meta key.
3. To search for the value in the raw text, click a row that has the binoculars icon, indicating it is searchable.
   If no relevant occurrence of the value is in the text, the value that you are searching for is highlighted in the Event Meta panel and nothing is highlighted in the Text tab.
   If one or more relevant instances of the value is found in the Text tab, each occurrence is highlighted. The value that you are searching for is highlighted in the Event Meta panel and the up/down arrows for scrolling are visible.



4. To remove the highlighting, click the same meta key/meta value pair in the Event Meta panel, click a different meta key/meta value pair in the Event Meta panel, or close the Event Meta panel.
   The highlighting is removed from the raw text.

**Note:** When a meta value is more than 255 characters, you can hover over that meta key to view the complete value.

## Show or Hide the Event Header

To hide the Event Header in the Packet tab, Text tab, or File tab, providing more vertical space for the data, click . Clicking the icon again shows the Event Header.

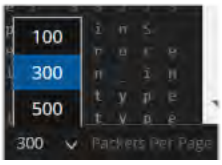
## Page Through Events in the Packet and Text Tabs

Pagination controls allow more flexibility in paging through a list of packets or text. In the Packet tab, you can select the number of packets to display per page, and your selection is saved across logins to the NetWitness Platform application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the < and << controls are dimmed.

**Note:** Pagination controls are available in Version 11.2 and later of the Text tab. When in the Text tab, you must navigate manually to the last page before the last page control icon is available.

To use pagination controls:

1. With an event open in the Events view, click the current number of packets per page (**50, 100**, **300**, or **500**), and select the new number of packets per page from the drop-down menu.

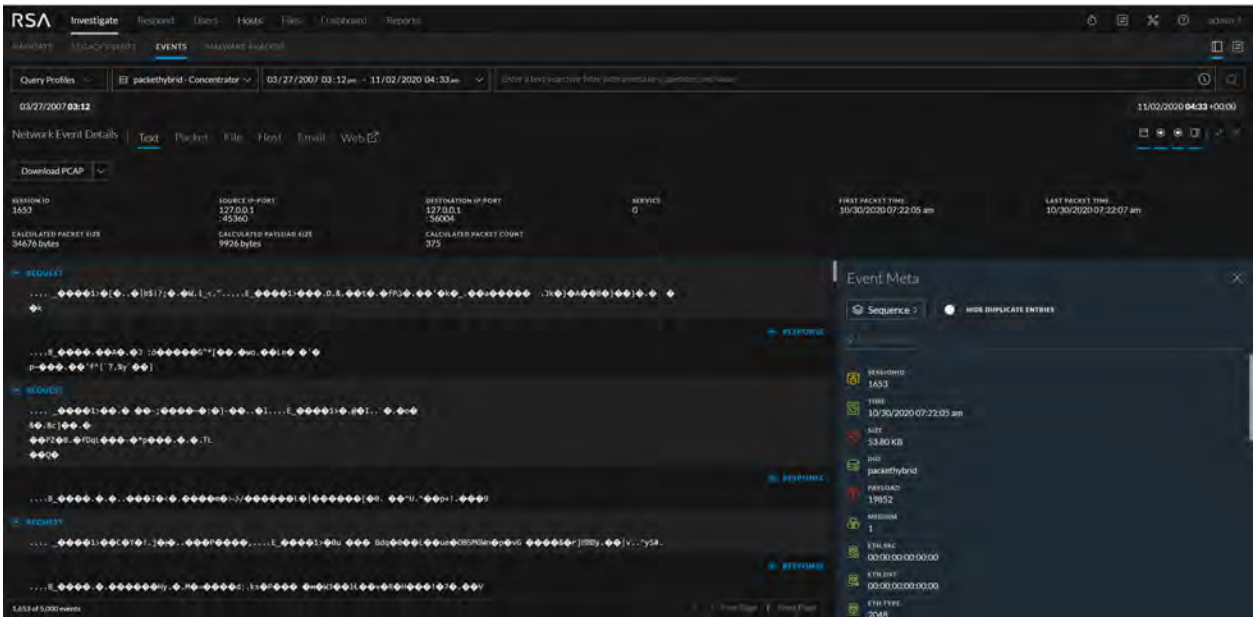


2. To page forward or back, use the page control icons:
   Click > to go to the next page.
   Click >> to go to the last page.
   Click < to go the previous page.
   Click << to go to the first page.

3. To go to a specific page, type a page number in the page number field 1 of 206.

## Expand Truncated Text Entries in the Text Tab

A reconstruction of a network event in the Text tab may include requests and responses of many hundred thousands of characters, and scrolling through a long entry that is not of interest can waste time. To save time, text entries that have more than 6000 characters are truncated to show only the first 2000 characters. This example shows an entry that has more than 2000 characters, and a message in the header indicates the percentage of total characters that is being displayed.



You can see that 46% of the characters (the first 2000) are displayed, and click **Show Remaining 54%** to reveal the rest of the entry.

If you search for metadata seen in the Event Meta panel while text is truncated in the Text tab, the truncated text is searched. If the metadata exists inside hidden text, the text entry expands to reveal the text with the found metadata.

## Perform URL and Base64 Encoding and Decoding in the Text Tab

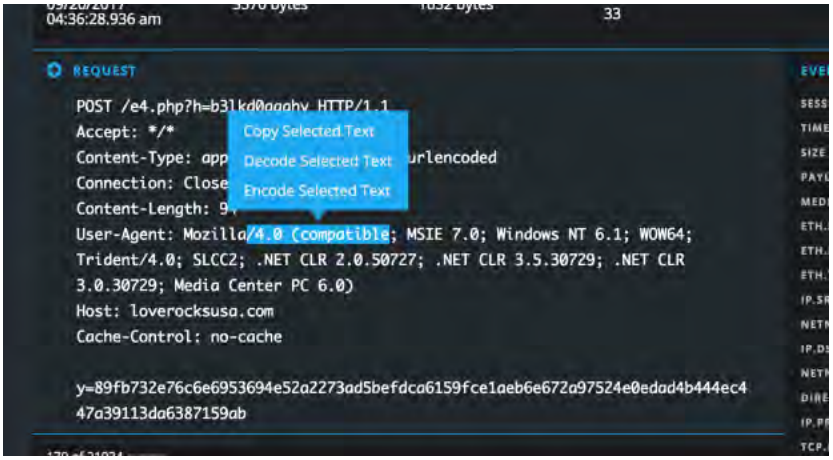
If a network session being reconstructed in the Text tab contains Base64 or URL encoded strings, you can decode a string to better understand the session. If the session contains decoded strings for Base64 or URL, you can view a string in its encoded form in order to search for additional instances of the encoded text in other sessions.

When viewing any network session that contains encoded text in the Text tab, you can select a subset of the text within a single Request or Response to view in either encoded or decoded form. Depending on the content loaded on the Decoder, there may be additional metadata outlining that Base64 or URL encoded data is contained within the session.

To perform encoding and decoding in the Text tab:

1. In the **Events view**, go to the Text reconstruction of a session that contains encoded or decoded content.

2. To view some decoded text in encoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.



3. Click **Encode Selected Text**.
   The encoded text is displayed in a hover box, which remains in place until you click ☒, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.

   When a longer text is selected, the hover box is scrollable and large enough to fit the entire selected text and the decoded text.

4. If the session contains encoded text that you want to see in decoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.

5. Click **Decode Selected Text.**
   The decoded text is displayed in a hover box, which remains in place until you click ☒, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different tab in the Event Details panel.

6. If you want to copy some text from the text reconstruction, do one of the following:
   a. Drag to select some text, right-click, and select **Copy Selected Text** from the pop-up menu.

   b. Drag to select some text, then select either **Decode Selected Text** or **Encode Selected Text**.
   Select the desired text and type **Control-C**.
   The selected text is copied to the clipboard and available to paste in a query.

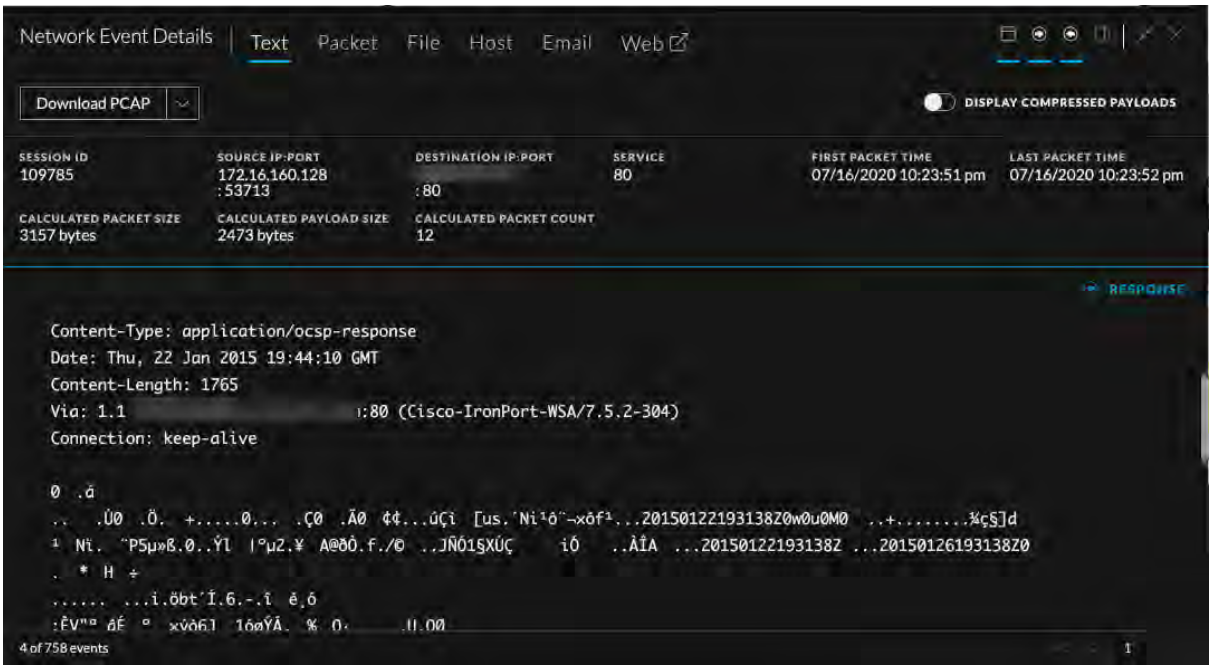
7. When finished, click ☒ to close the hover box.

## View Decompressed Text in an HTTP Network Session in the Text Tab

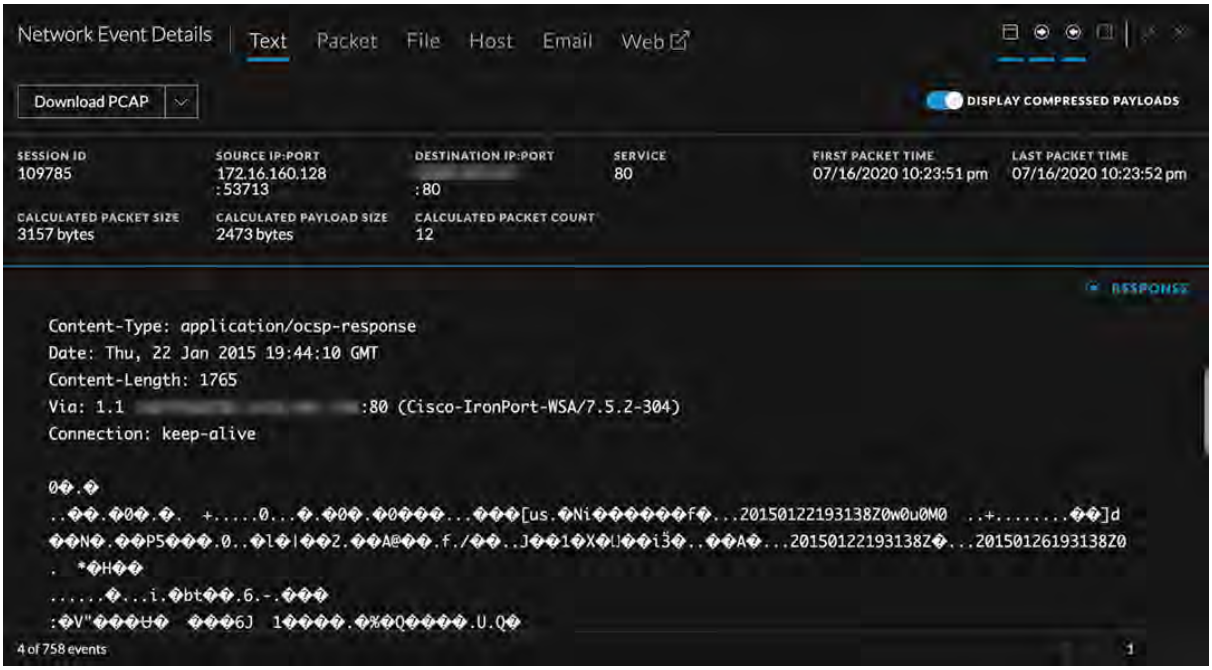
When the content of an HTTP network session is compressed and you are viewing the Text tab, NetWitness displays decompressed content by default. This helps you to determine if there are any patterns and view the readable characters. You can switch between a compressed and decompressed view of compressed text.

The toggle for changing between compressed and decompressed text is only displayed in the Text tab, and is enabled only if there is compressed text content.

1. Open the Text tab of an HTTP session that contains compressed content.
   By default the session is reconstructed with the text decompressed, and above the reconstruction, is the **Display Compressed Payloads** toggle switch.



2. To view the same text in its compressed form, click the toggle switch.
   The view changes so that the compressed text is no longer readable, and the switch indicates the Display Compressed Packets is on.

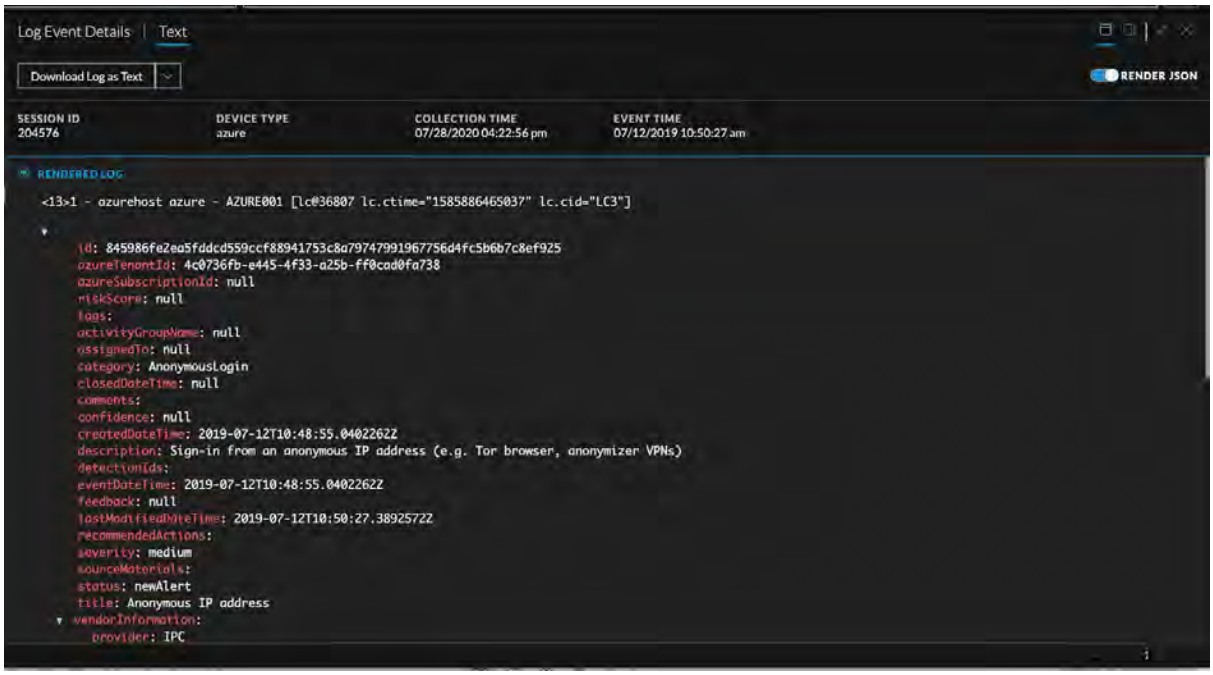


3. To return to the view of decompressed text, click the switch again.

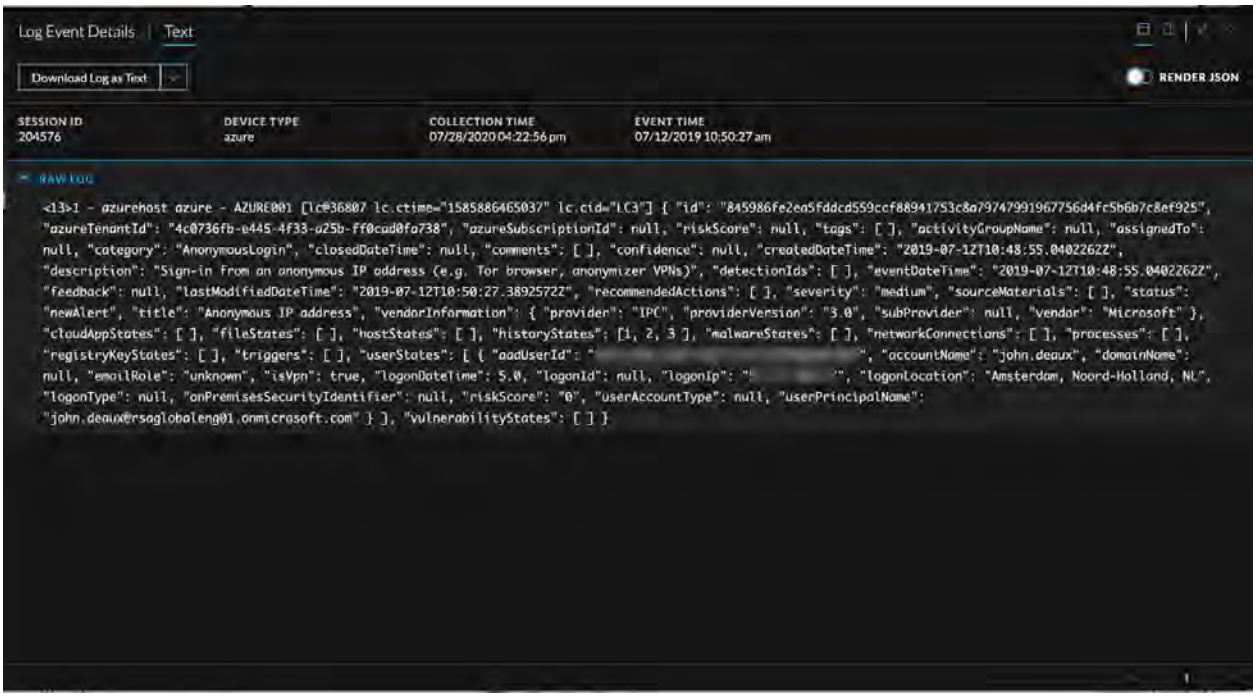
## View a JSON String in Tree Format in the Text Tab (Version 11.5.1)

You can view a text reconstruction of a log event in easy-to-read JSON format instead of the raw block format using the Render JSON toggle switch. By default, the switch is enabled, and JSON snippets in a log event are detected and displayed in fully expanded tree format. Invalid JSON snippets are presented as raw text. If you change the setting of the switch, your setting persists in local storage.

1. In the **Events** view, open a log event in Text tab.
   If the raw log contains JSON strings and the Render JSON switch is enabled, all JSON strings found are rendered in tree format.



2. If you prefer to see the log as raw text, click the Render JSON switch.
   The log is rendered as a single block of text without the nested indentation. The setting persists until you change it and will be in the same state when you log in again.

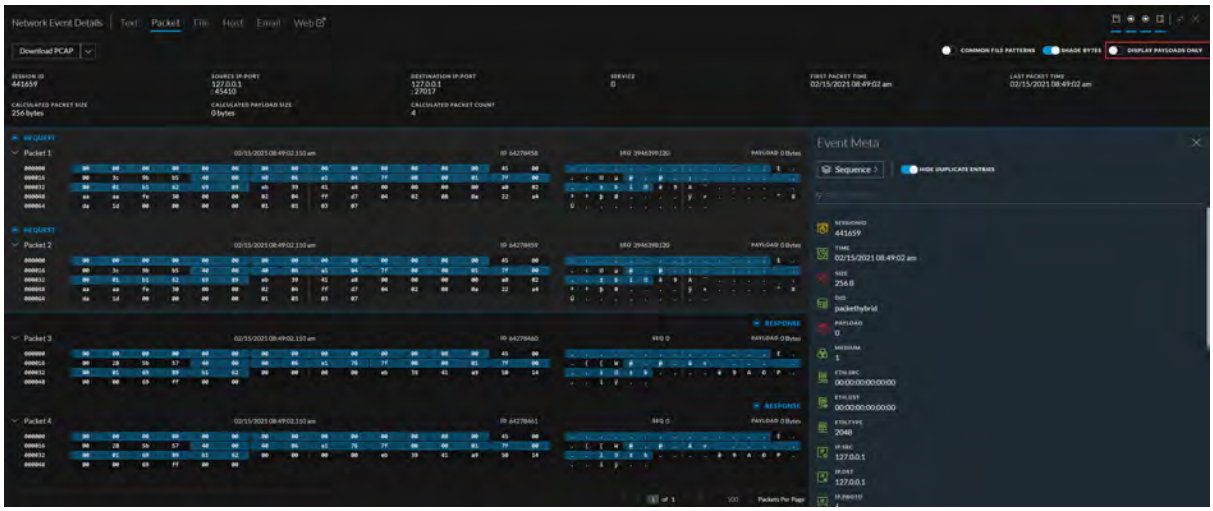


## Use the Payload Only Option in the Packet Tab

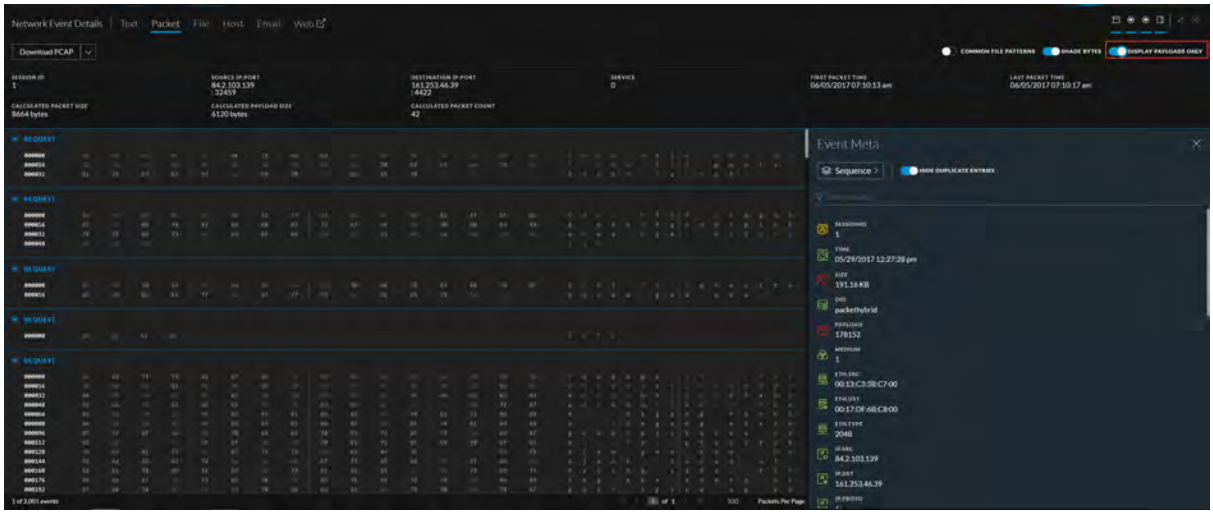
When viewing a reconstruction of a network session in the Packet panel, you can hide the header and footer bytes. The view changes so that only the payload is visible and contiguous same-side packets are concatenated together to make the payload more readable and understandable. This setting persists until you change it or refresh the browser.

- With the Display Payloads Only option off, the number of packets, packet header, packet footer, and payload are displayed.
- With the Display Payloads Only option on, no packet header and footer bytes are displayed. Only the packet content of 16 hexadecimal bytes per line and the corresponding ASCII per line is displayed.

1. In the **Events** view, go to the Packet tab of a network session.
   By default the session is reconstructed with the packet header, footer, and payload displayed.

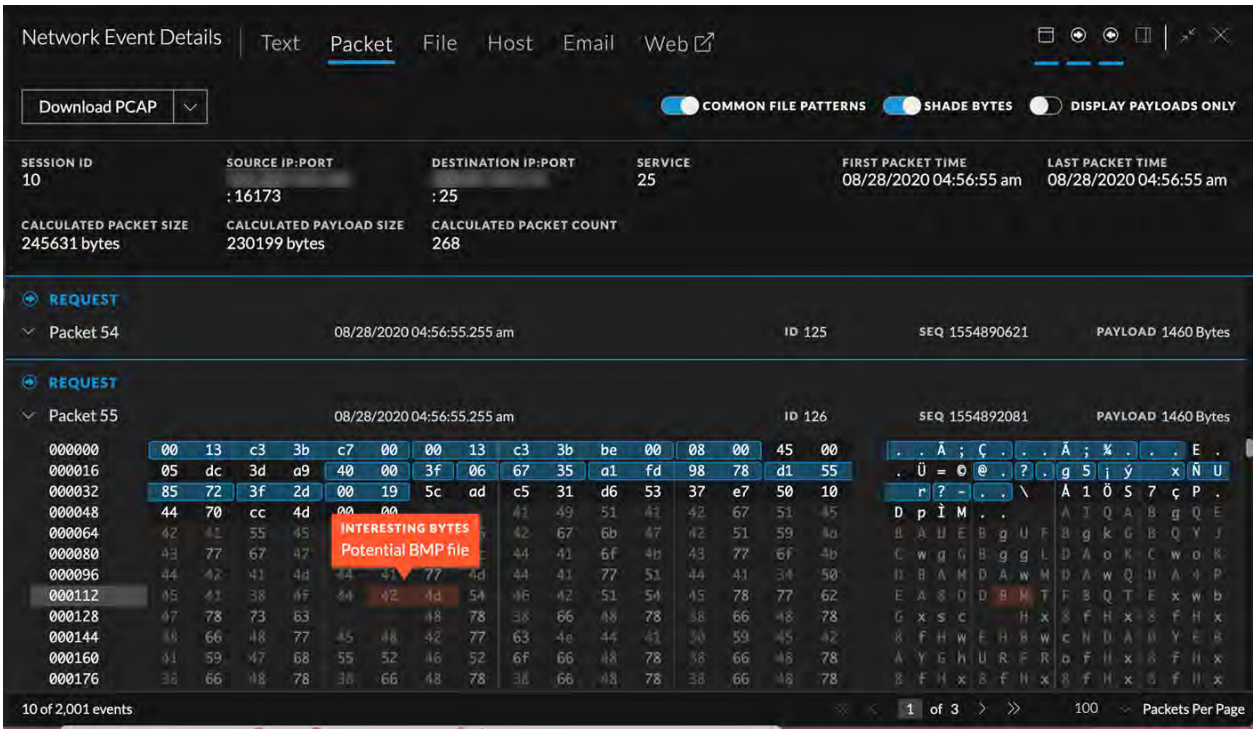


2. To change the view to show only the payload for each packet, click the **Display Payloads Only** toggle switch.
   The view changes so that only the payload is visible.

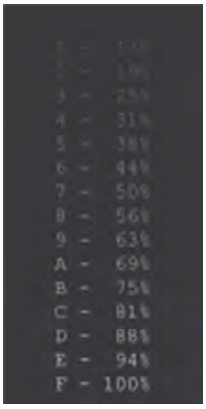


## View Highlighted Bytes in the Packet Tab

When you open a reconstruction in the Packet tab, the significant header bytes in each packet are highlighted in blue, and the payload bytes are distinguished using shading to help you understand the contents of the packet. This figure shows the default appearance of the packet reconstruction with highlighting and byte shading.



The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. Bytes near the lower range are more transparent, and bytes near 255 are more opaque. Both hexadecimal and ASCII bytes are shaded. This is an example of the shading applied to each hexadecimal byte.



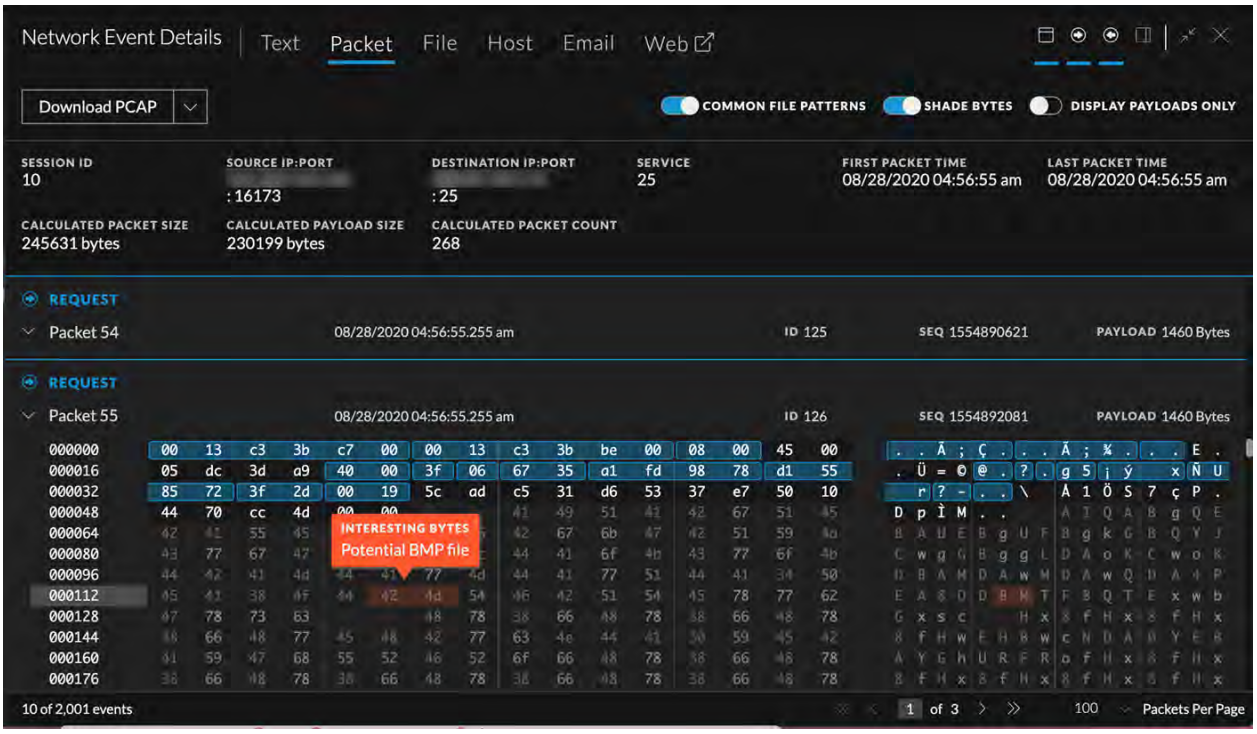
The Shade Bytes switch controls the shading of bytes. When you set Shade Bytes on or off, your setting persists until you change it or refresh the browser.

## Highlight Common File Types in the Packet Tab

In the Packet tab, analysts can show or hide highlighting of certain common file types based on the file signature. When the Common File Patterns feature is turned on, the magic number bytes in the file signature are highlighted in the payload and you can hover over the highlighting to see the potential type of file. In this example, `42 4d` is highlighted in the hexadecimal payload and `BM` is highlighted in the ASCII payload. When you hover over the highlighted bytes, the potential file type associated with the magic number is provided in a hover box.

To view common file signatures in the Packet tab:

1. With a reconstruction open in the Packet tab, turn on the **Common File Patterns** option. If there is more then one highlight in view, all are shown.
2. To view the hover box, place the cursor over the highlighting.



These are the file types and corresponding magic numbers that are highlighted if present in the payload:

| File Type | Hexadecimal Signature | ASCII Encoding |
|---|---|---|
| DOS Executable / Windows PE | 4D 5A | MZ |
| Portable Network Graphics (PNG) | 89 50 4E 47 0D 0A 1A 0A | PNG |
| JPEG | FF D8 FF | JPEG |
| JPEG/JFIF | 4A 46 49 46 | JFIF |
| JPEG/Exif | 45 78 69 66 | Exif |
| GIF | 47 49 46 38 37 61 | GIF87a |
| GIF | 47 49 46 38 39 61 | GIF89a |
| Non-portable Executable | 5A 4D | ZM |
| BMP | 42 4D | BM |

| File Type | Hexadecimal Signature | ASCII Encoding |
|---|---|---|
| PDF | 25 50 44 46 | %PDF |
| Old Office Document (doc, xls, ppt, msg, and other) | D0 CF 11 E0 A1 B1 1A E1 | ÐÏ.à¡±.á |
| ZIP file formats and formats based on it, such as JAR, ODF, OOXML | 50 4B | PK.. |
| 7-Zip File Format (7z) | 37 7A BC AF 27 1C | 7z¼¯' |
| Java Class File, Mach-O Fat Binary | CA FE BA BE | Êþº¾ |
| Postscript | 25 21 50 53 | %!PS |
| Unix/Linux Shell script | 23 21 | #! |
| Executable and Linkable Format (ELF) executables | 7F 45 4C 46 | .ELF |

# Reconstruct an Event in the Legacy Events View

When viewing a list of events in Legacy Events view, you can safely create a reconstruction of the event in a readable form that matches the original. By default, the initial view of a reconstructed event is the most suitable format (Best Reconstruction); for example, web content is reconstructed as a web page; an IM conversation is displayed with both parts of the conversation. Each user can select a different default reconstruction in the Profile > Preferences view.

You can also open a reconstruction from the Navigate view if you know the Event ID of the event.

In the reconstruction, you can:

- Select event information to view. Possible values are: request data, response data, both request and response data.
- Select the reconstruction type: details, text, hex, packets, web, mail, or IM.
- Export raw logs.
- Export the event as a PCAP file.
- Extract any files available in the event.
- Extract all the meta data associated with the event.

> **Caution:** Be careful when clicking a link to a file in the Reconstruction. If your system has an application associated with the file, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

- Display the event in a separate window or tab (depending on your browser configuration).
- If you are viewing the reconstruction as a preview in the current view, you can page forward to the next event and back to the previous using the navigation buttons in the bottom left corner.

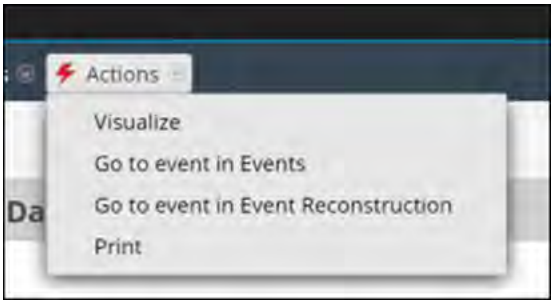
**Note:** Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation (as described in the *System Configuration Guide*). When analysts reconstruct sessions, two situations can affect performance and results.
- Some large events contain many thousands of source packets. Reconstructing these sessions can degrade application performance.
- In some cases, the reconstruction cache can present incorrect content; for this reason, NetWitness cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

## Reconstruct an Event Using an Event ID

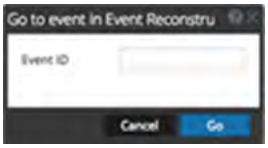
You can reconstruct an event directly from the Navigate view given a known Event ID. You can use this option without executing a query as you usually do when beginning an investigation. A service and time range must be selected to be able to jump directly to an event using just its `eventid`.

To view a reconstruction or event analysis directly from the Navigate view:

1. Go to **Investigate > Navigate** and select **Actions > Go to event in Events** or **Go to event in Event Reconstruction**.



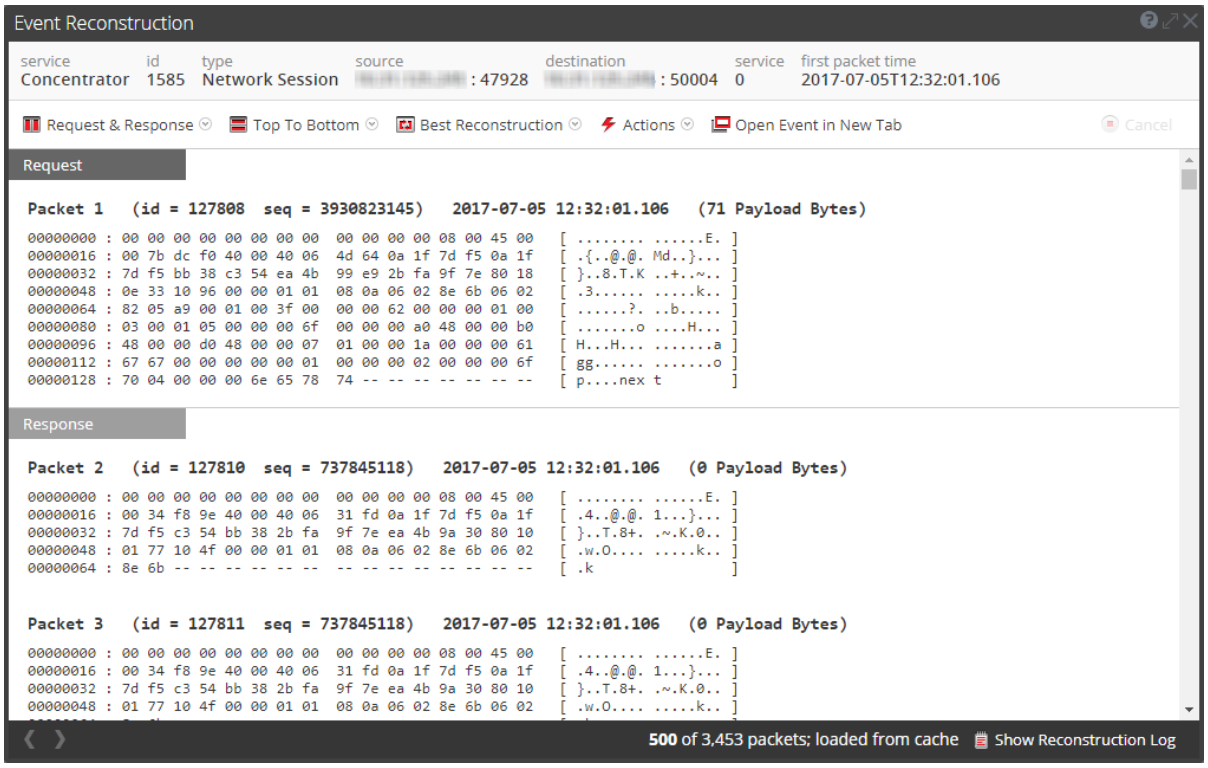
The Go to event dialog is displayed. There are two dialogs, one for Events and one for Legacy Event reconstruction. Both ask for the Event ID.



2. In the **Event ID** field, type the ID and click **Go**.
   The specified event is reconstructed in the legacy Event Reconstruction view or the Events view.

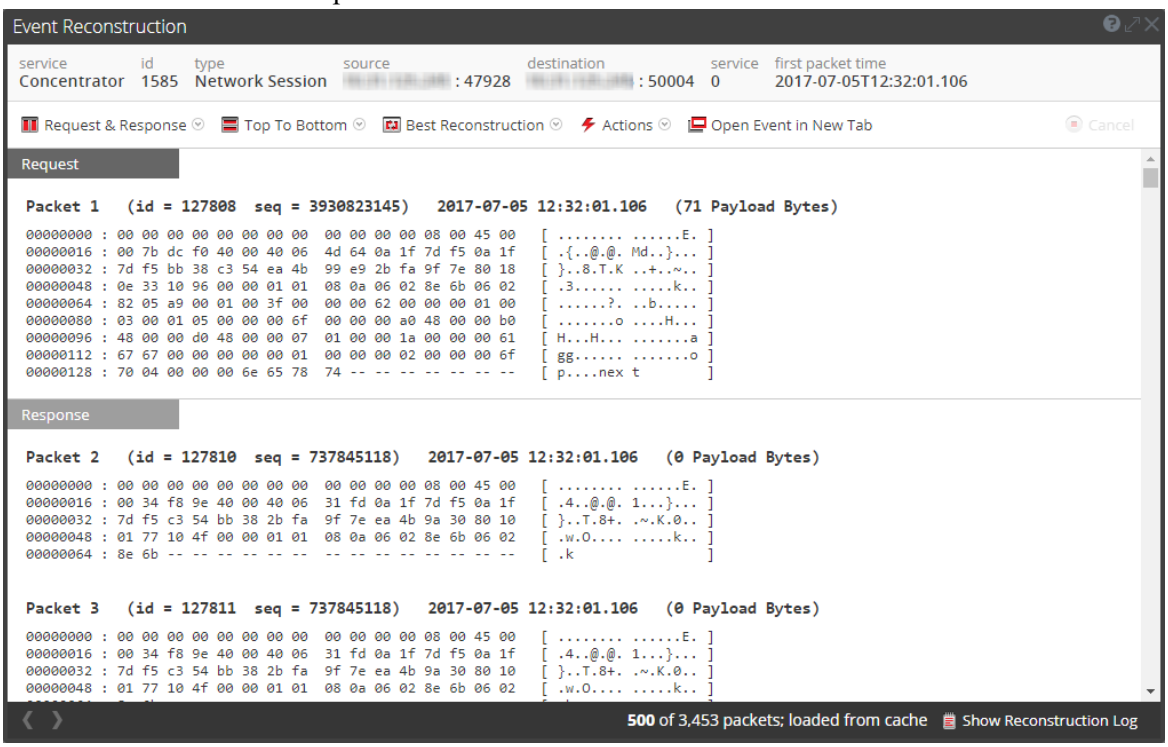
## Reconstruct an Event from a Drill Point in the Navigate View

1. Click the count (the green number following a value) for a value in the Navigate view to open a drill point in the **Events** view.
2. To show all meta data, click + Show Additional Meta .
3. To open an event reconstruction in the Legacy Events view, select an event to reconstruct and select **Actions > View Event > Preview Inline**.
   The Event Reconstruction opens in a popup window in the same view. By default, NetWitness displays the best reconstruction for the event determined by the event content or the reconstruction that you have selected in the Default Session View setting for Investigation. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view side-by-side results, export an event, open an email attachment, extract files, and open the event in a new tab. The toolbar options vary depending on the type of event being reconstructed (network event, log event, or endpoint event). This is an example of the reconstruction for a network event.



4. To preview a reconstruction of the next event, click in the lower left corner of the reconstruction or to preview a reconstruction of the previous event, click .
5. To open an event reconstruction in a new tab, do one of the following:
   a. In the **Legacy Events** view, select an event to reconstruct and select **Actions > View Event > Open in New Tab**.
   b. In the **Event Reconstruction** toolbar of previewed reconstruction, click **Open Event in New Tab** in the toolbar.

The Event Reconstruction opens in a new tab.



## View Side by Side or Top to Bottom

To select the way requests and responses for an event are displayed:

1. In the **Event Reconstruction** toolbar, click **Top to Bottom** or **Side by Side**.
2. In the drop-down menu, select the information you want to see in the event: **Side by Side** or **Top to Bottom.**
   The reconstruction is refreshed with the selected information.

## Select Event Information to View

To select what event information to view:

1. In the **Event Reconstruction** toolbar, click **Request & Response**.
2. In the drop-down menu, select the information you want to see in the event: **Request & Response**, **Request**, or **Response**.
   The reconstruction is refreshed with the selected information.

## Select Event Reconstruction Type

To select the reconstruction type for an event:

1. In the **Event Reconstruction** toolbar, click **Best Reconstruction**.
2. In the drop-down menu, select the reconstruction type to view: **meta**, **text**, **hex**, **packets**, **web**, **mail**, or **files**.
   The reconstruction is refreshed with the selected reconstruction type.

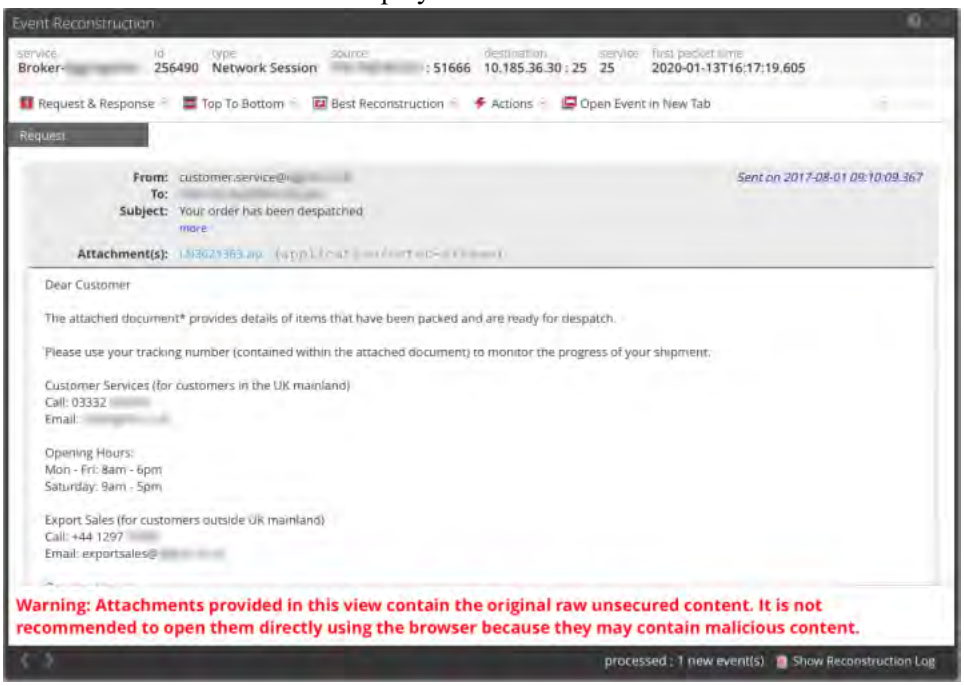
## Open or Download an Email Attachment

When viewing a reconstruction of an email that has attachments, you can open supported file types or download the files to the local system.

**Caution:** Be careful when selecting file attachments. If your system has an application associated with the file attachments, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

To open or download email attachments:

1. In the **Event Reconstruction** toolbar, select the **View** drop-down and select **View Mail**.
   The Event Reconstruction is displayed.



2. In the **Event Reconstruction** section of the email, click the Attachment.
   If the file type is supported by the browser, the attachment will open in a new tab.
   If the file type is not supported, the Download dialog is displayed so that you can download the attachment.

## Export an Event as a PCAP File

The PCAP export option downloads the sessions for the current time range and drill point to a PCAP file. To export an event as a pcap file:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Export PCAP**.
3. A confirmation dialog is displayed.
4. Click **OK**.
   The job is scheduled and when complete the PCAP is downloaded to the local file system. In the Profile > Jobs tab, you can download the PCAP.

## Extract Files from a Reconstructed Event

The Extract Files option extracts and downloads the files associated with the event. To extract files:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Extract Files**.
   The File Extraction dialog is displayed.
3. Select the types of files to extract, and click **OK**.
4. The job is scheduled and when complete the selected file types are downloaded to the local file system. In the Profile > Jobs tab, you can download the files.

# Look Up Additional Context for Results

The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

To enable viewing of contextual information, your administrator must add the Context Hub service in RSA NetWitness Platform and configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*. Analysts also need a role with the permission `Context Lookup` as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

When the Context Hub service is enabled and configured, NetWitness provides enrichment data from NetWitness Respond, custom lists, and NetWitness Endpoint directly in the Navigate view, Events view, and Legacy Events view. A visual cue highlights meta values for which enrichment data is available in the Investigate views, and you can click on the highlighted value to look up the contextual information and intelligence. You can look up details and intelligence about elements associated with an event in the Context Hub. These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name, or a file hash. The data from configured sources, such as RSA NetWitness Endpoint, can help you understand what is happening. In Version 11.5 and later, you can add STIX data sources and view related data using context lookup; associated elements are IP address, file name, file hash, domain name, and URL.

In addition, you can add lists and list values for Context Hub enrichment; you can view lists, edit meta values in an existing list, or create a new list. When you add meta values to a list, you can investigate the meta values using the context lookup option.

**Note:** In Version 11.2 and earlier, you can look up additional context in the Navigate view or the Legacy Events view, but not the Event Analysis view.

For an analyst to manage lists in Investigate, the administrator must:

- Enable the Context Hub service.
- Assign an analyst role with permission `Manage List from Investigation` to the user who will perform Context Lookup from Investigation views.
- Configure appropriate roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

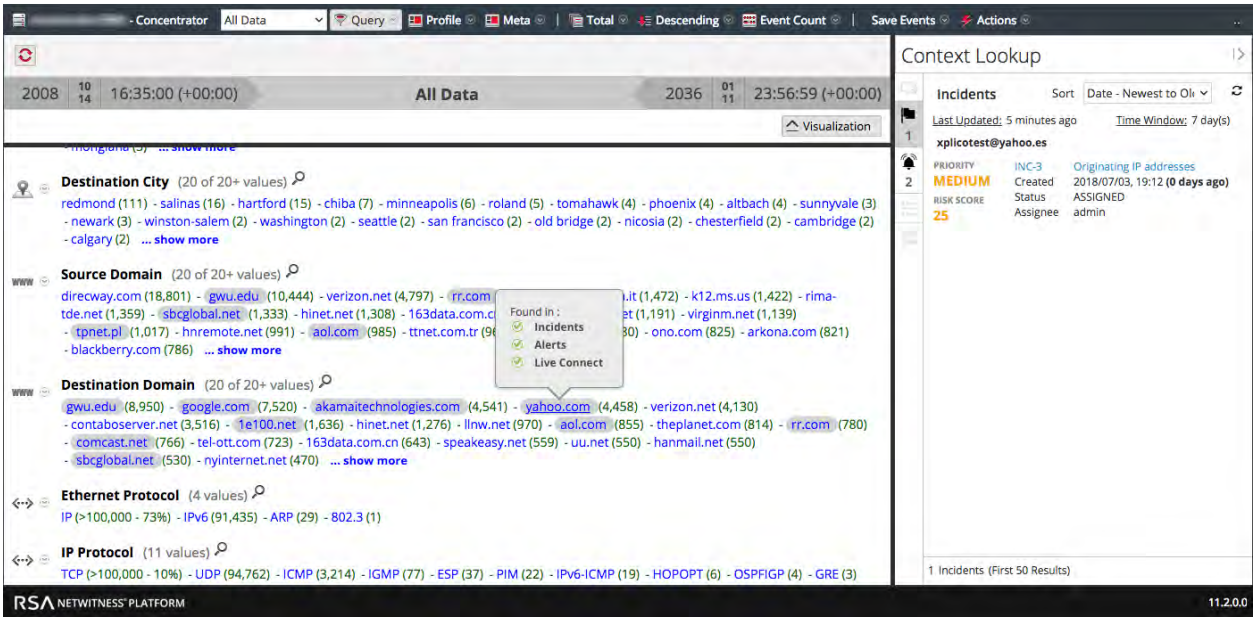
In Version 11.6 and later, you can add REST API data sources and view related data using context lookup. Also, Administrators can now configure specific Context Hub sources (For example, specific lists, Respond, Endpoint, and so on) for context highlighting during investigation. If context highlighting is disabled for a Context Hub source, analysts will see results from all the data sources when opening the Context Panel for a meta value, but the values are not highlighted in the Investigation views. In the View Context:

- No data is shown if the meta values is not highlighted.
- If there are entities common across different data sources, the meta values for those entities are underlined for all the data sources, but the data is shown only for the data source on which context highlighting is enabled.

## Open the Context Lookup Panel

In the Context Lookup panel, you can view and explore individual data sources for further investigation. For a detailed description of the information displayed for each data source, see Context Lookup Panel.

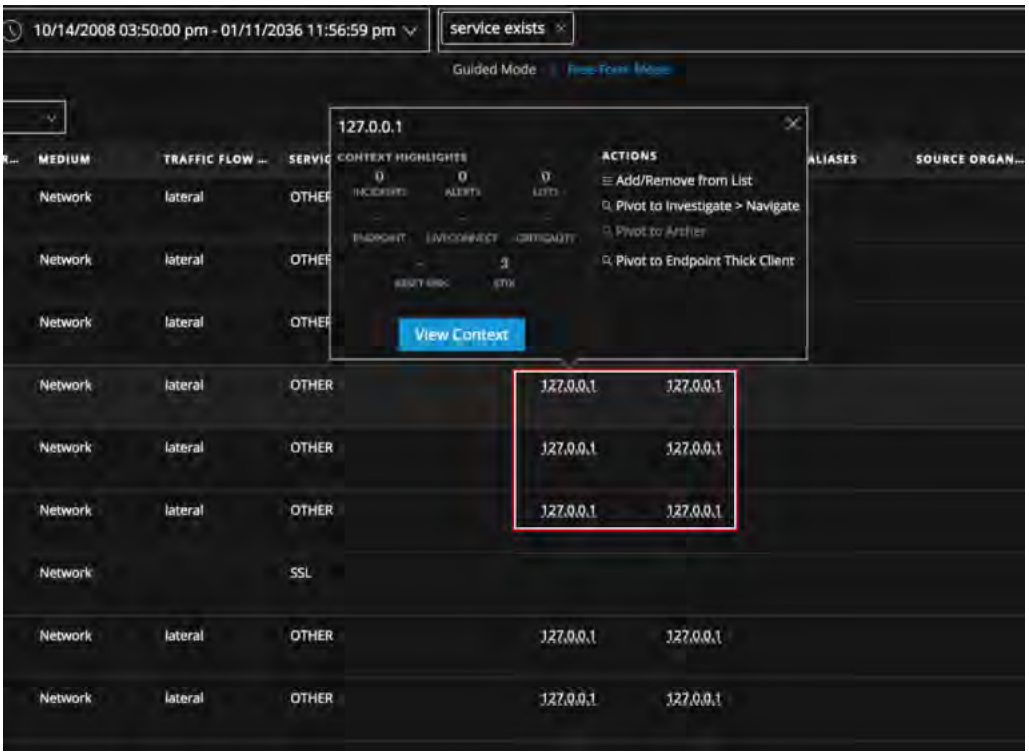
In the Navigate view and Legacy Events view, entities that have associated context data available are highlighted with a gray background; hovering over an entity displays a hover box giving a summary of the available data. When you right-click the entity, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by right-clicking on another entity, and the Context Lookup panel is updated with that entity's information.



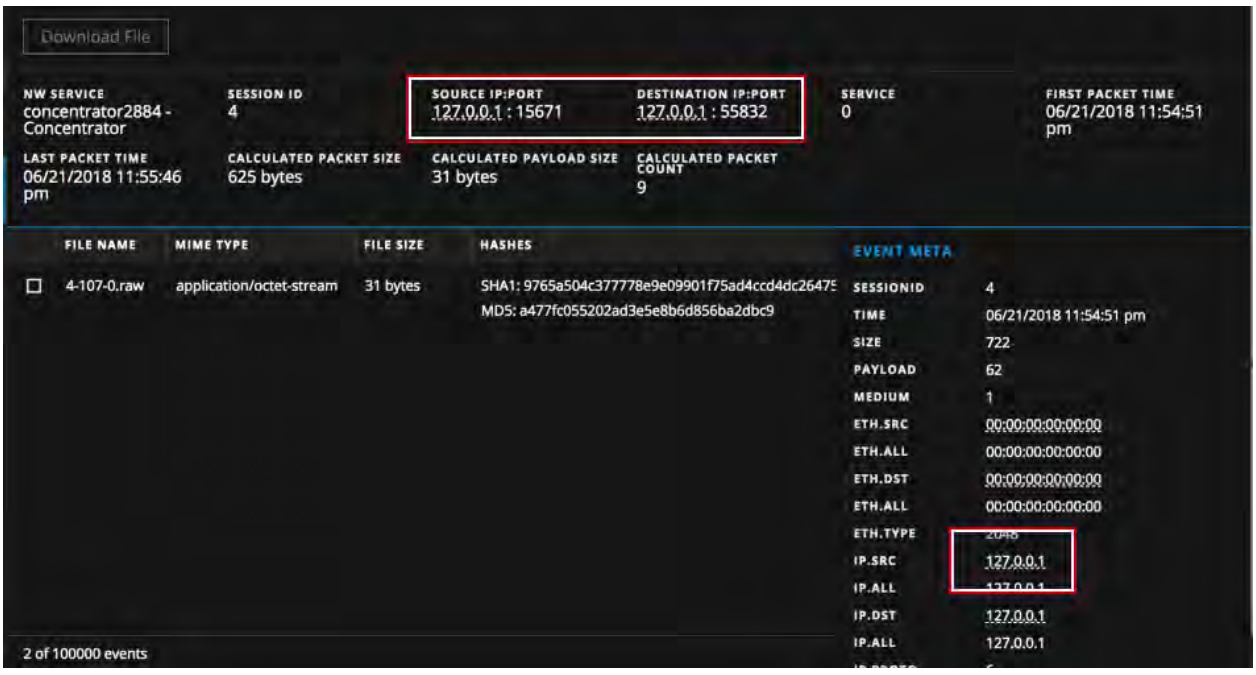
In the Events view, you can see underlined entities in the Events panel, the Event Header, or the Event Meta panel. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Events panel with the context tooltip open. The context tooltip has two sections: Context Highlights and Actions.

- The information in the Context Highlights section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality, Asset Risk, and STIX. Depending on your data, you may be able to click these items for more information.
- The **Actions** section lists the available actions. In the example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.



The following figure shows underlined entities in the Event Header and the Event Meta panel.

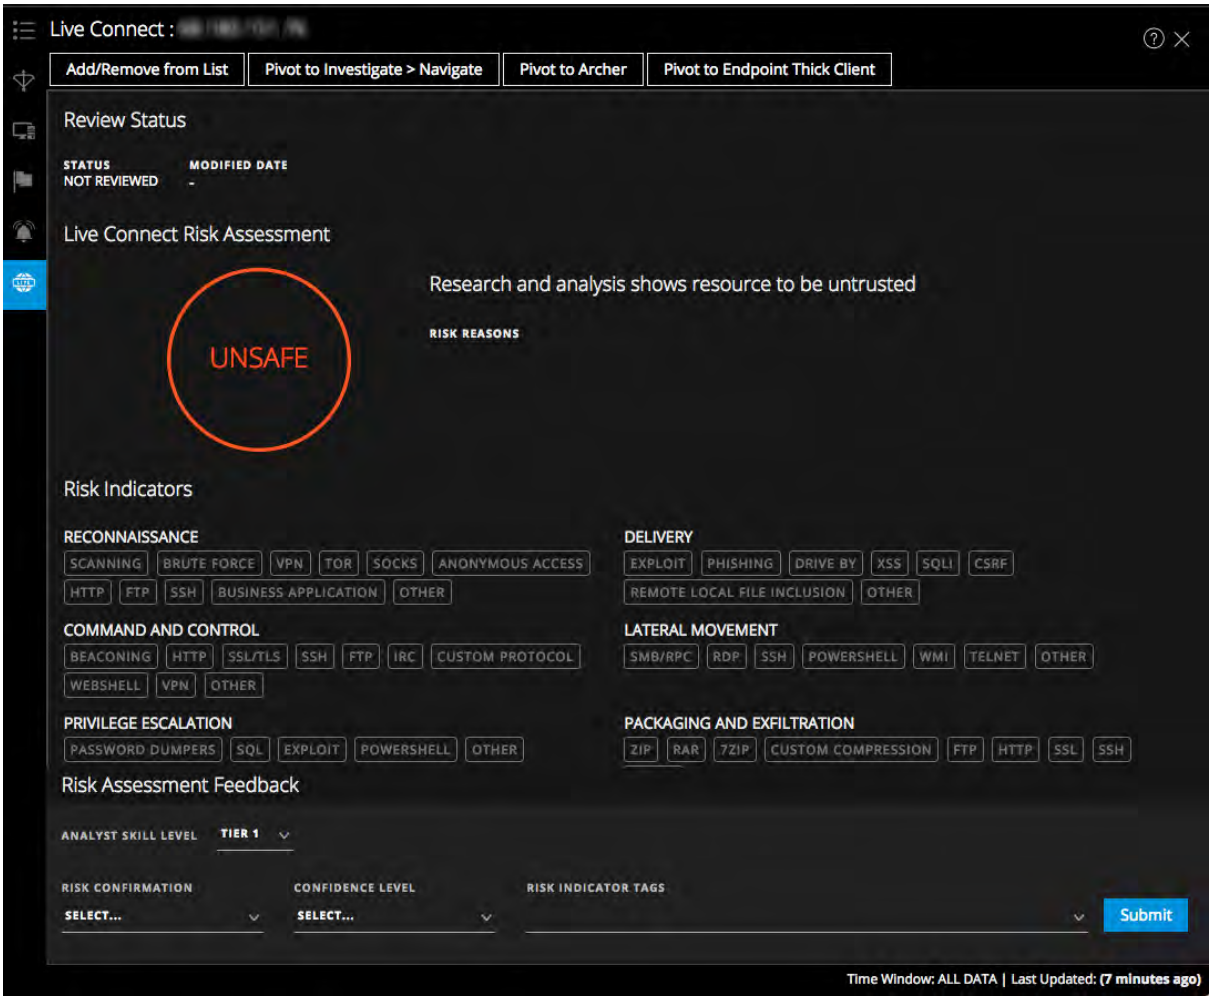


When you click View Context in the context tooltip, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by using the View Context option on another entity, and the Context Lookup panel is updated with that entity's information.

You can also take any available action in the Actions section.

### To view information in the Context Lookup panel in the Events view:

1. Hover over different meta values to see the data sources for which data is available.
   A context tooltip displays a list of the context data available for the selected meta value.
2. Click **View Context** in the context tooltip to open the Context Lookup panel.
   The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.



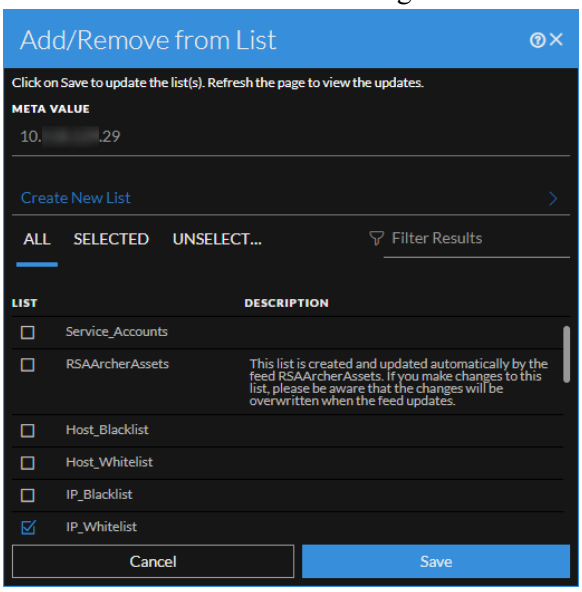
3. To perform actions on an entity, select one of the available actions in the context tooltip: Add /Remove from List, Pivot to Investigate > Navigate, Pivot to Archer, Pivot to Endpoint Thick Client. For more information, see Pivot to Investigate > Navigate (Events View), Pivot to Archer (Events View), Pivot to NetWitness Endpoint Thick Client (Events View), and Add an Entity to a Whitelist.

**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the RSA Archer configuration is enabled and configured properly.

## Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity is added to the selected lists.

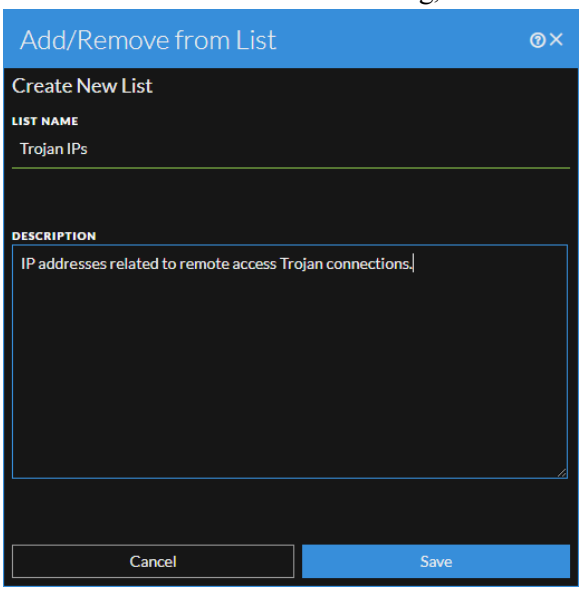
## Create a List (Events View)

You can create lists in Context Hub from the Events view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

### To create a list in the Context Hub:

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.

3. In the Add/Remove from List dialog, click **Create New List**.



4. Type a unique **List NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

## Pivot to Investigate > Navigate (Events View)

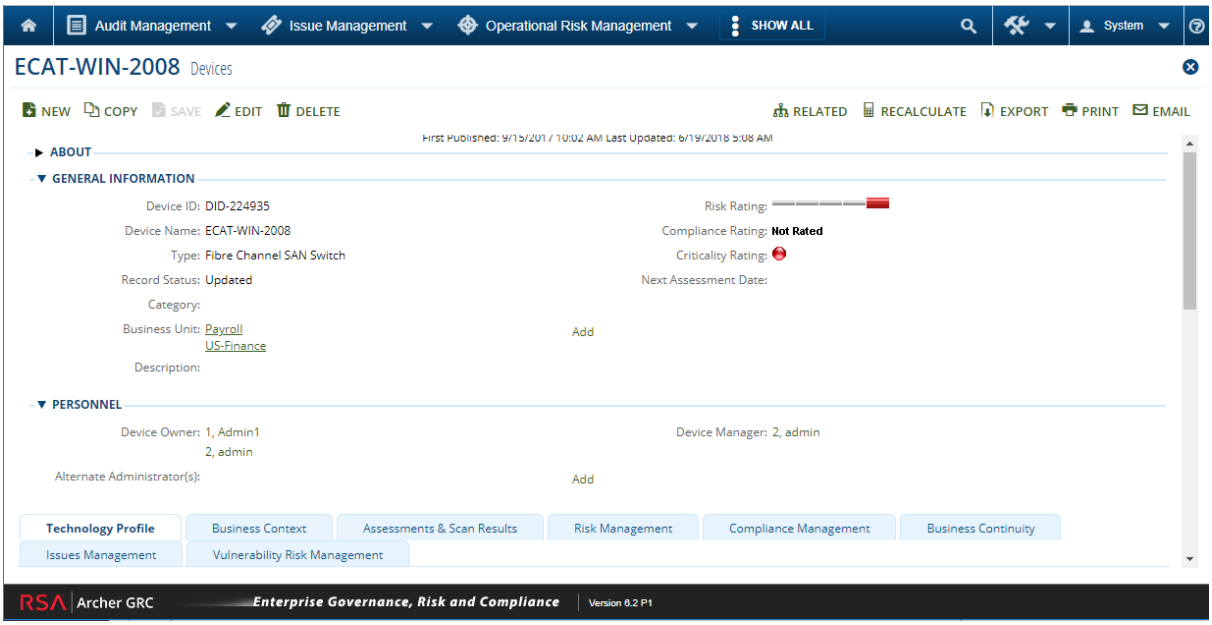
For a more thorough investigation of an entity, you can open the the Navigate view.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate > Navigate**.
   The Navigate view opens, enabling you to perform a deeper dive investigation. For more information, see Begin an Investigation in the Navigate or Legacy Events View.

## Pivot to Archer (Events View)

For viewing more details about the device in RSA Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity (IP address, host, and Mac address).
2. In the **ACTIONS** section of the context tooltip, select **Pivot to Archer**.
3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *Archer Integration Guide*.

### Pivot to NetWitness Endpoint Thick Client (Events View)

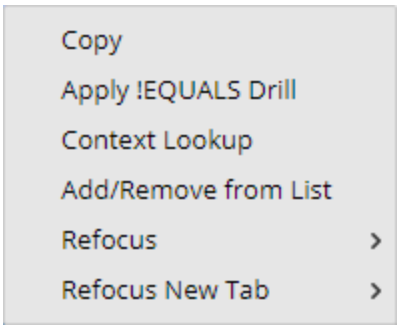
If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

## View the Context Lookup Panel in the Navigate View or Legacy Events View

1. Hover over different meta values to see the data sources for which data is available.
   A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.
2. Right-click a meta value, and click **Context Lookup** in the drop-down menu to open the Context Lookup panel.



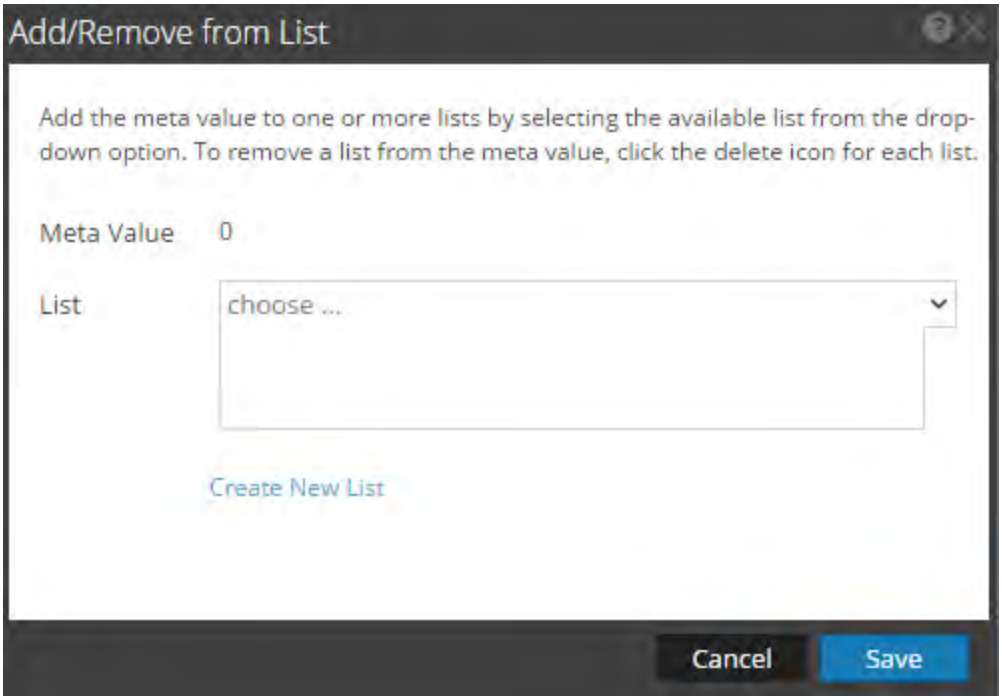
The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.

3. To perform actions from the Context Lookup panel, right-click an entity such as IP address.
   The following options are available: Open Link in New Tab, Query in Investigate, Copy Link, Paste, Google Lookup, Virus Total Lookup, and Query in Endpoint.
4. To close the Context Lookup panel, click ☒ in the panel.

## Add Meta Values to an Existing List (Navigate and Legacy Events Views)

To add a meta value to an existing list in Context Hub:

1. While investigating a service in the **Navigate** view or the **Legacy Events** view, right-click a meta value (for example, values under Source IP, Destination IP, or Username) and select **Add/Remove from List** in the context menu.
   The Add/Remove from List dialog is displayed.



2. In the **List** field, select one or more lists from the drop-down option to which the meta value must be added.
3. Click **Save**.
   The meta value is added to the selected lists.

## Remove a Meta Value from a Context Hub List (Navigate and Legacy Events Views)

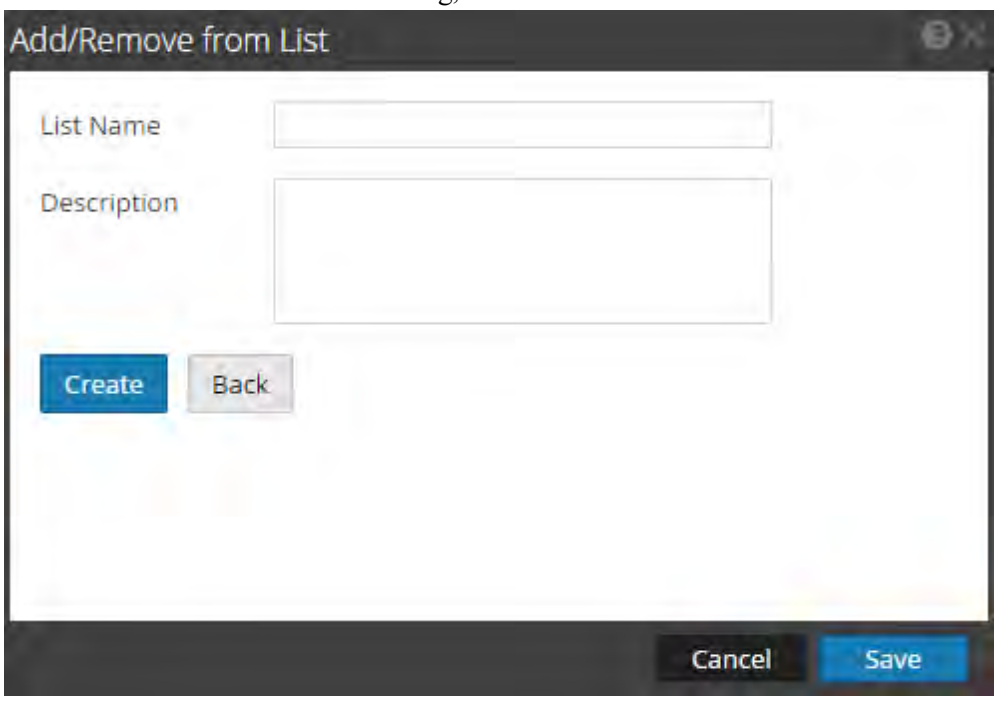
To remove a meta value from list:

1. In the **Add/Remove from List** dialog, in the **List** field, view the lists which include the meta value.
2. Click the delete icon (x) for each list that should not include the meta value.
3. Click **Save**.
   The meta value is removed from the deleted list.

## Create a New List (Navigate and Legacy Events Views)

To create a Context Hub list in Investigate:

1. In the **Add/Remove from List** dialog, click **Create New List**.



2. In the **List Name** field, enter an unique name for the list.
3. In the **Description** field, enter the description of the list.
4. Click **Create** to create the list.

5. Click **Save** to add the meta value to the created list.
   These lists are considered as data sources for retrieving context information.

# Launch a Lookup of a Meta Key

When you have found data of interest in the Navigate view, the Events view, or the Legacy Events view, you can do internal lookups to NetWitness Endpoint and RSA Live, as well as external lookups of meta values in community resources such as SANS IP History and ThreatExpert Search.

Analysts can use the external lookups to save time during investigations. The external lookups are available by right-clicking one of the these meta keys: IP address (`ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip`), `host (alias-host, domain.dst)`, `client`, and `file-hash`.

For all `ip` and `host` meta keys, the following lookups are built in to NetWitness:

- Google Malware: Opens a Google Malware search in a new tab.
- SANS IP History: Opens a SANS IP History search in a new tab.
- McAfee SiteAdvisor: Opens a McAfee SiteAdvisor search in a new tab.
- Endpoint Thick Client Lookup: Opens a search in the NetWitness Endpoint Thick Client in a new tab.
- BFK Passive DNS Collection: Opens a BFK Passive DNS collection search in a new tab.
- CentralOps Whois for IPs and Hostnames: Opens a CentralOps Whois search for IPs and hostnames in a new tab.
- Malwaredomainlist.com Search: Opens a Malwaredomainlist.com search in a new tab
- Robtex IP Search: Opens a RobtexIP search in a new tab.
- ThreatExpert Search: Opens a ThreatExpert search in a new tab
- IPVoidSearch: Opens a UrlVoid Search in a new tab n a new tab

For the `file-hash` and `alias-host` meta keys, the Google lookup opens a Google search in a new tab.

For the `client` meta key, the NetWitness Endpoint Lookup option opens an Endpoint Thick Client in a new tab if the client is installed on the same system on which the browser is being used.

Administrators can add additional external lookups and other custom actions as described in "Add Custom Context Menu Actions" in the *System Configuration Guide*.

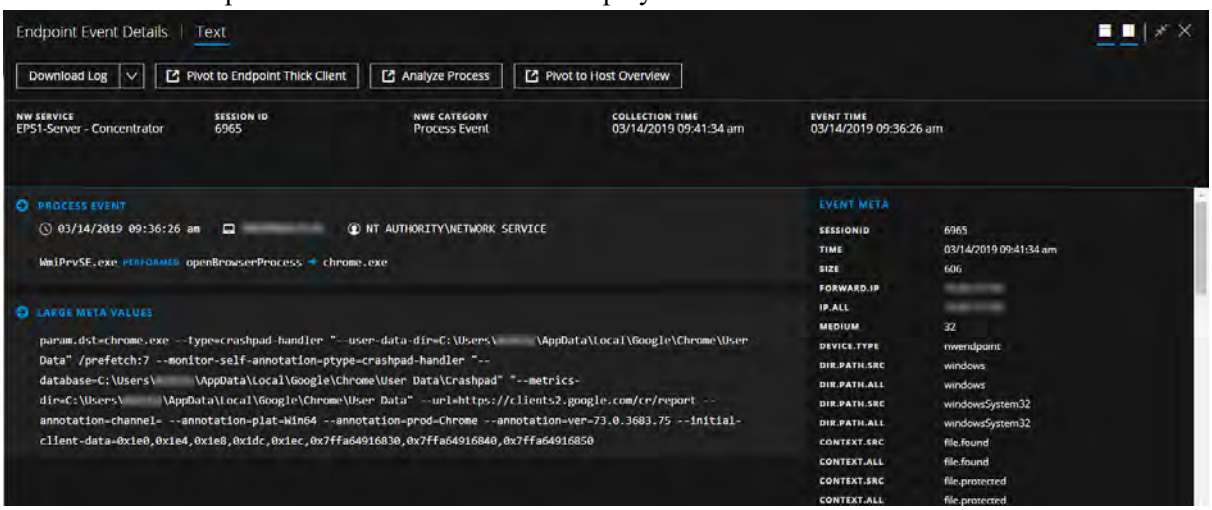
## Launch an Endpoint Thick Client Lookup in the Events View

When viewing an endpoint event in the Text panel, you can pivot to analyze the same event in NetWitness Endpoint.

**Note:** Version 4.4.0.x of the NetWitness Endpoint (NWE) thick client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE thick client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

To open an event in NetWitness Endpoint:

1. Starting from the Navigate view:
   a. In the **Query** drop-down, select **Advanced**, and enter one of the following queries:
   `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Values panel.
   b. Right-click an event, and select **Events** in the menu.
2. (Version 11.1 and later) Go to **INVESTIGATE > Events**. In the **Query** drop-down, select **Advanced**, and enter one of the following queries: `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Events panel.
3. Select an event.
   The Events view opens with the selected event displayed in the Text view.



4. In the Event Header click **Pivot to Endpoint.**
   A new browser tab with the url `ecatui://<id>` opens and the NWE Thick Client is launched. If the NetWitness Endpoint Thick Client is not installed, no data is displayed and the following message is displayed: `Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`

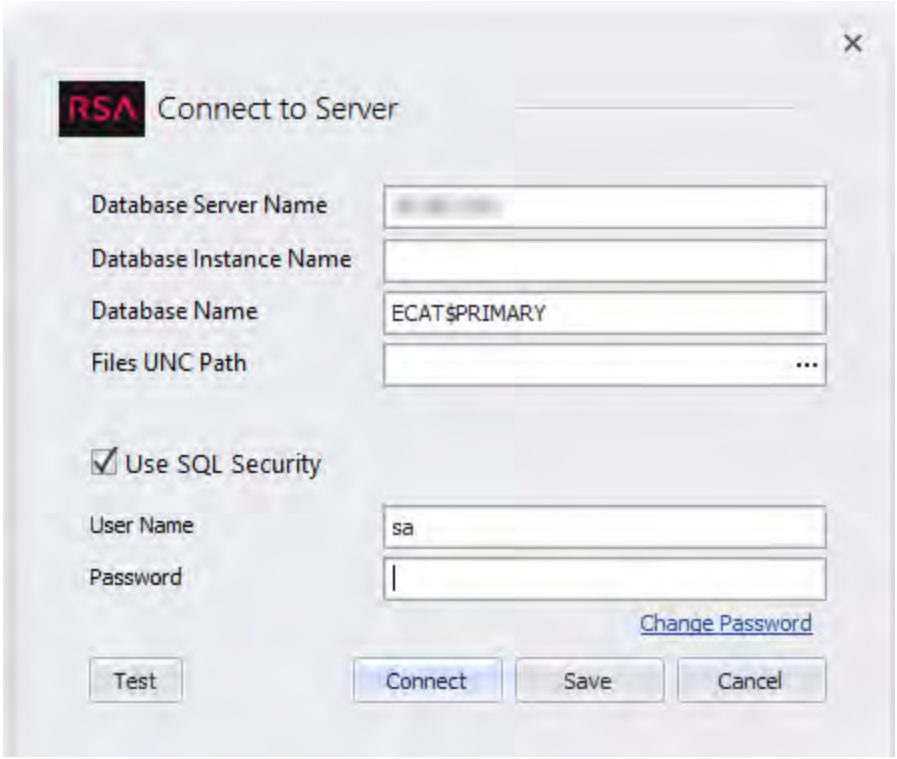
## Launch an Endpoint Thick Client Lookup in the Navigate View

To launch an Endpoint Thick Client lookup of data from the Navigate view:

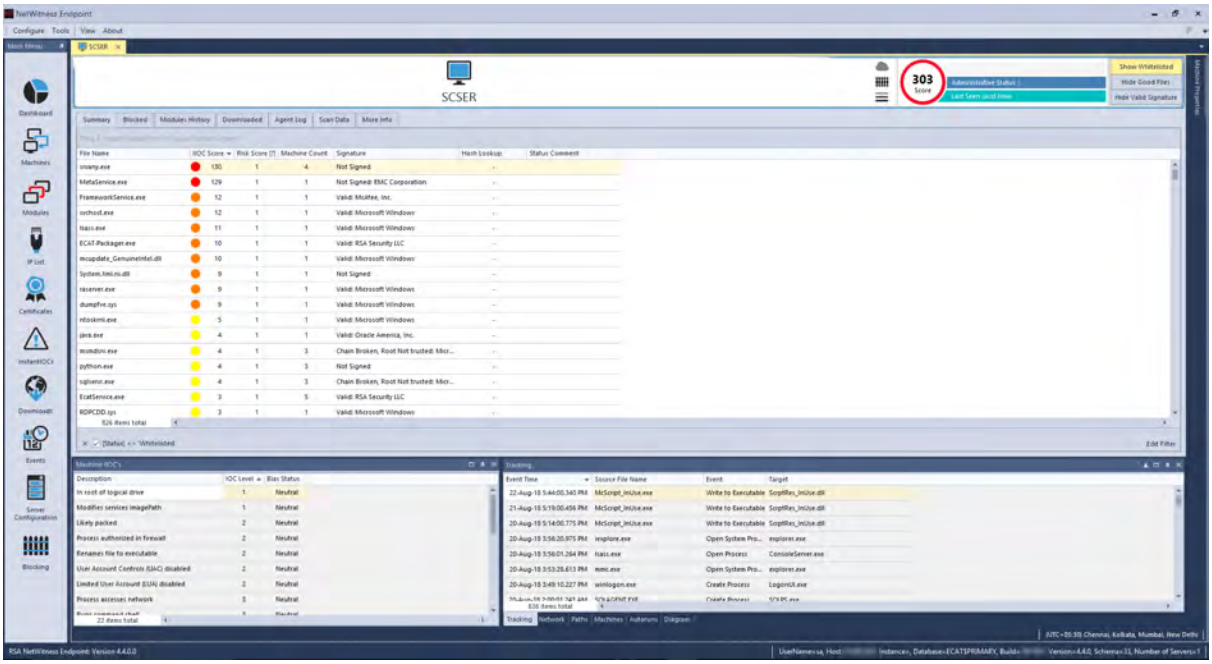
1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.

2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.

3. Select **Endpoint Thick Client Lookup**.
   The Connect to Server dialog is displayed.



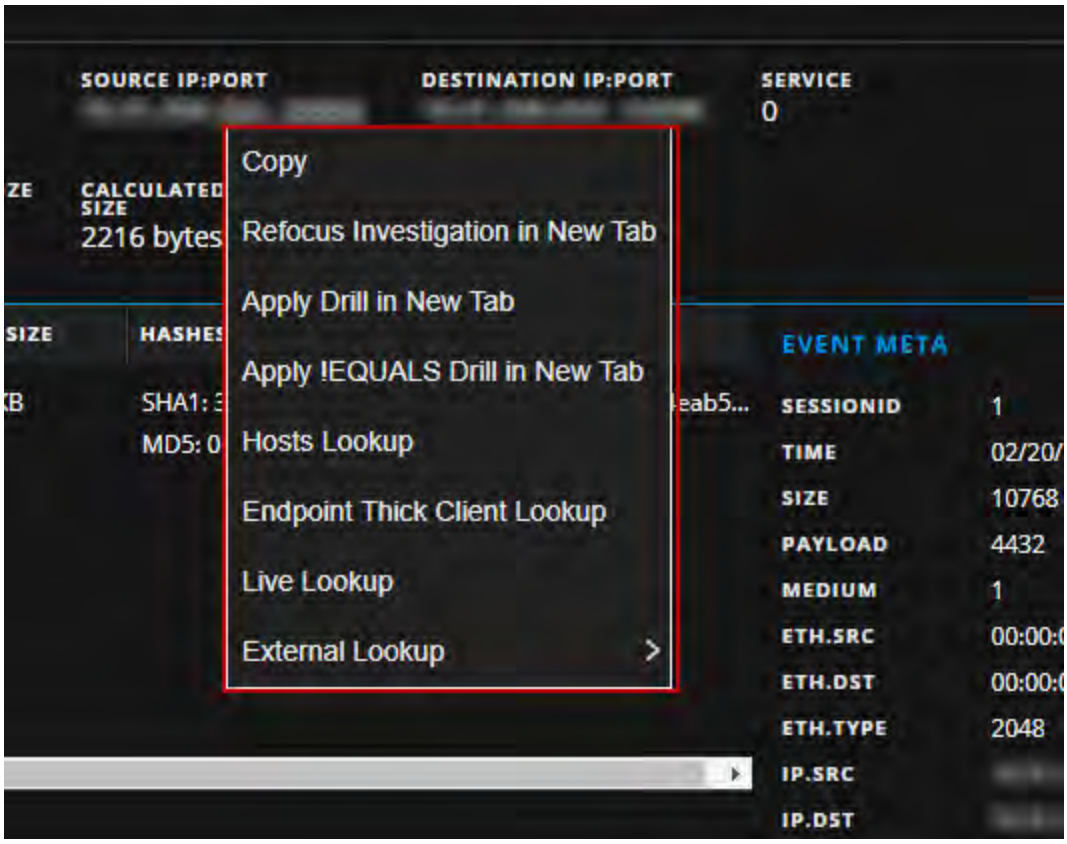
4. Enter the user name and password required to log in to the Endpoint Thick Client, and click **Connect.** The drill point opens in NetWitness Endpoint.



## Perform Lookups of Meta Values in Events

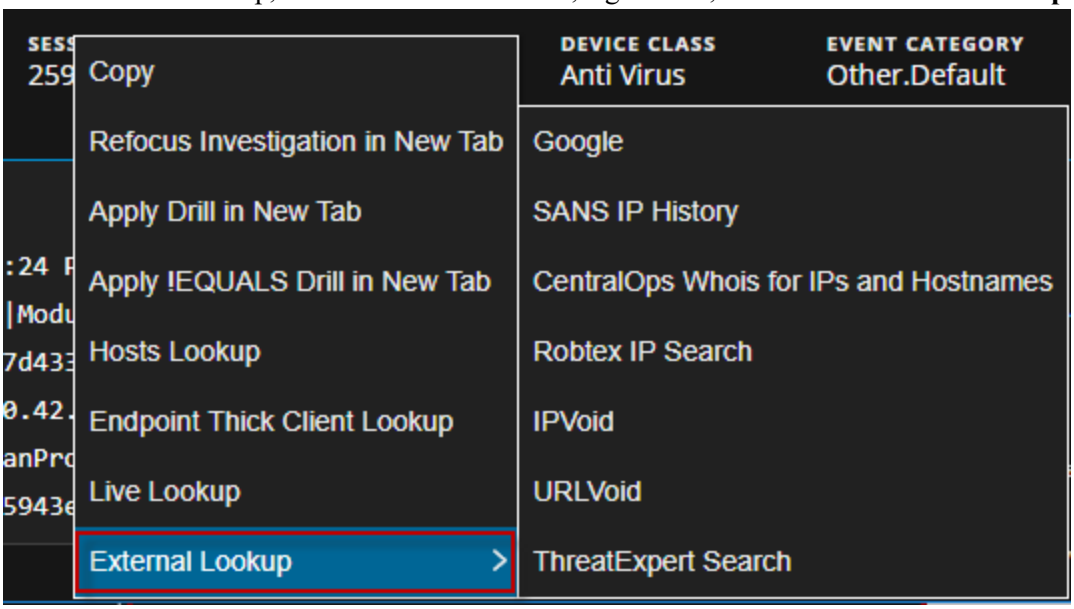
In the Events view, you can further investigate meta values in an event by right-clicking certain meta values and using the options in a drop-down menu. Not all fields have right-click actions. To perform internal and external lookups:

1. In the Events view, right-click a meta value in the Events List, the Event Meta panel, or the Event Header. Some meta values have a drop-down menu.



2. Select one of the following internal lookups:
   - **Copy**: Copies the meta value to the clipboard.
   - **Refocus Investigation in New tab**: Launches the another investigation in a new tab with the focus on the selected meta value.
   - **Apply Drill in New Tab**: Applies the drill and launches it in a new tab to drill the data in Navigate view.
   - **Apply !EQUALS Drill in New Tab**: Applies (!EQUALS) to the meta and launches a new tab, effectively excluding the meta value from the results.
   - **Hosts Lookup**: Looks up the value in the Investigate > Hosts view.
   - **Endpoint Thick Client Lookup**: Analyzes the meta value in the Endpoint Thick Client (for clients which have Endpoint Agent).
   - **Live Lookup**: Looks up a meta value on Live for further analysis.

3. For an external lookup, hover over a meta value, right-click, and select **External Lookup**.



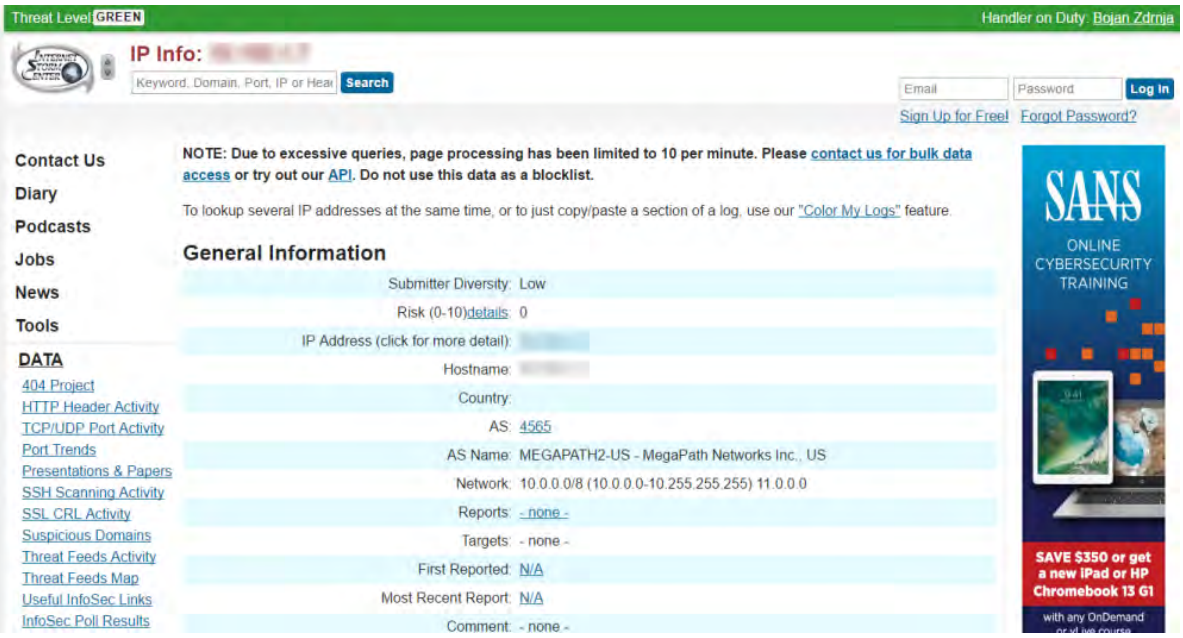
4. In the submenu select one of the available external lookups:
   - **Google**: Looks up a meta value on Google.com
   - **SANS IP History**: Looks up a meta value on SANS IP History, domain = http://isc.sans.org/ipinfo.html?ip=ipaddress
   - **CentralOps Whois for IPs and Hostnames**: Looks up a meta value on CentralOps Whois for IPs and Hostnames, domain = http://centralops.net/co/DomainDossier.aspx?addr=domain&dom_whois=true&dom_dns=true&net_whois=true
   - **Robtex IP Search**: Looks up a meta value on Robtext IP Search, domain = https://www.robtex.com/cidr/domain.ipaddress
   - **IPVoid**: Looks up a meta value on IPVoid, domain = http://www.ipvoid.com/scan/domain/
   - **URLVoid**: Looks up a meta value on URLVoid, domain = http://www.urlvoid.com/scan/ipaddress/
   - **ThreatExpert Search**: Looks up an IP meta value on ThreatExpert Search, domain = http://www.threatexpert.com/reports.aspx?find=IP address

## Launch Other External Lookups from the Navigate View

To launch an external lookup of data from the Navigate view (other than NetWitness Endpoint Thick Client Lookup):

1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.

3. Select one of the lookup options.
   The selected meta value opens in the selected lookup, for example, if you selected SANS IP History, the drill point information is displayed in SANS Internet Storm Center.



# Launch a Malware Analysis Scan from the Navigate View

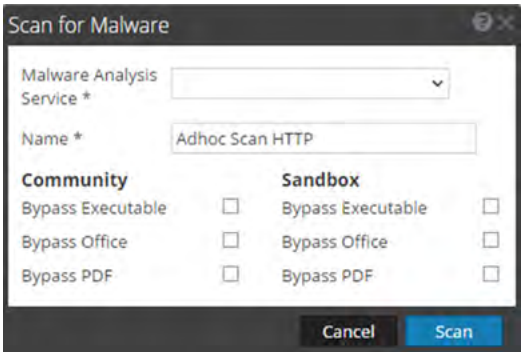
From within Investigate, analysts can launch an on-demand Malware Analysis scan by selecting a service and meta value, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis.

To launch a Malware Analysis scan of data from the INVESTIGATE > Navigate view:

1. Right-click a meta value (for example, OTHER, DNS, or FTP) and select **Scan for Malware** in the context menu.

   The Scan for Malware dialog is displayed with a suggested name for the on-demand scan and no service selected.

2. In the Scan for Malware dialog, select a service to perform the scan, edit the name, and select the types of files to bypass under community and sandbox.

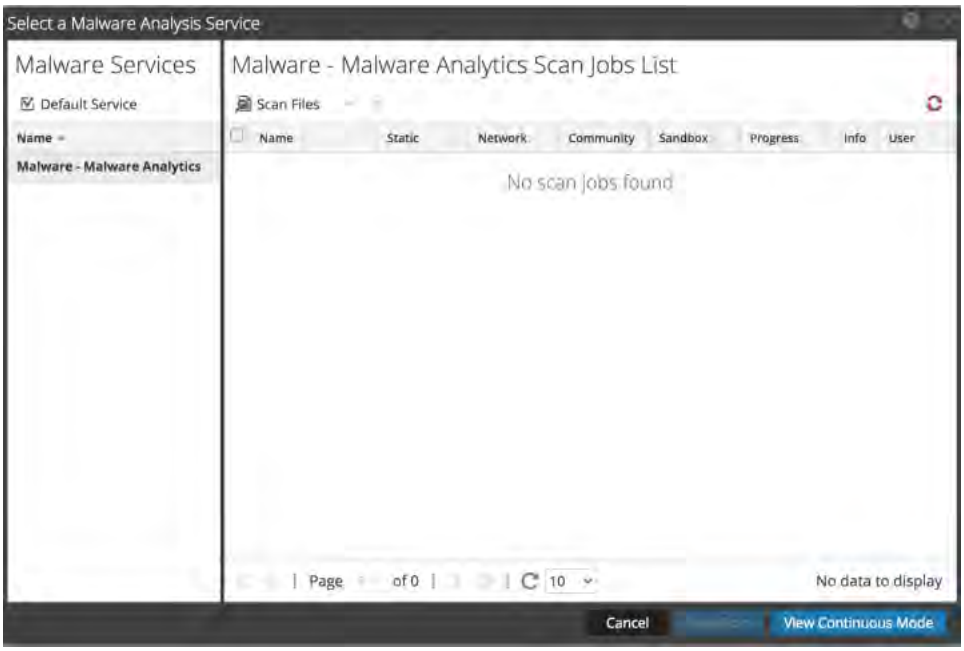


3. Click **Scan**.

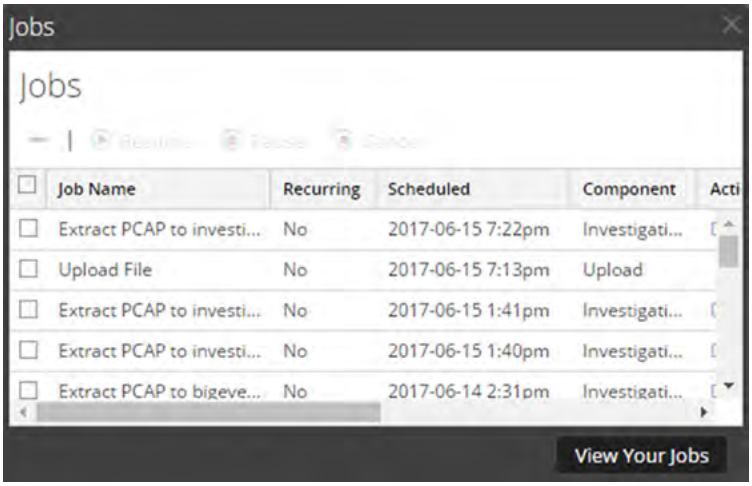
   The scan request is added to the Scan Jobs List dashlet and the Jobs Tray. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.

4. To view the jobs, do one of the following:

   a. Go to the Scan Jobs List in the Malware Analysis view or in the Unified dashboard. Double-click a scan to view the scan.



b. To view the job in the Jobs tray, click in the NetWitness toolbar. When the job is complete, scroll to the left and click **View**.



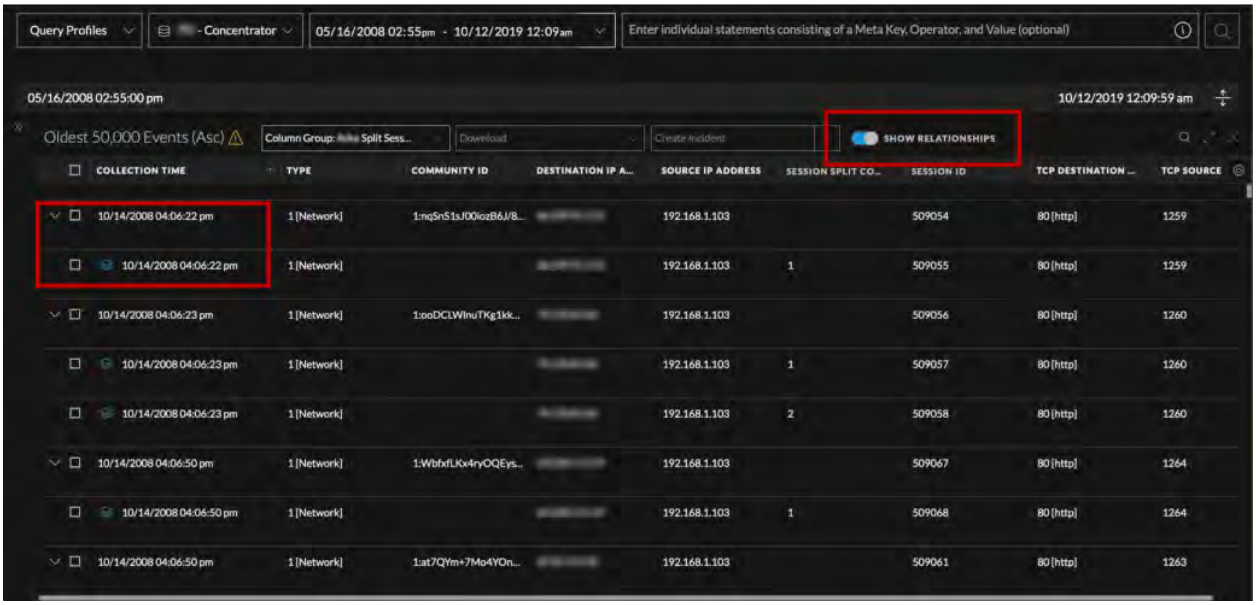
The Malware Summary of Events for the selected scan is displayed. The scan is also added to the list of available scans in the dialog for selecting scans in the Investigation > Malware tab.

# Group Events from Split and Related Sessions in the Events and Legacy Events Views

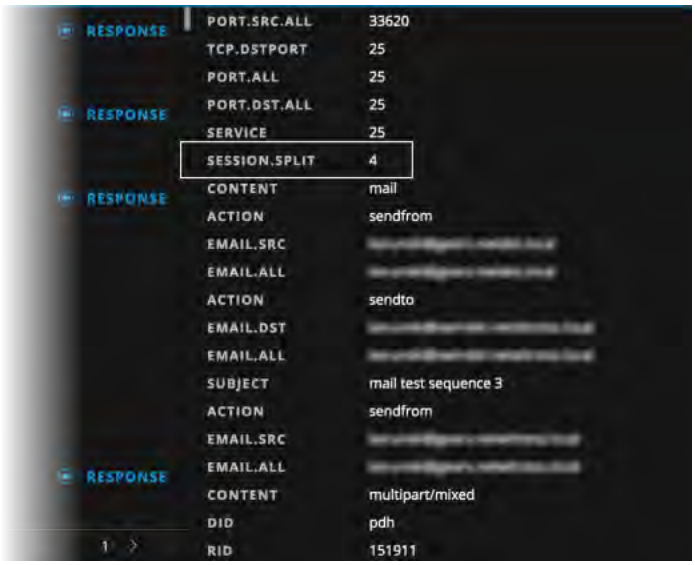
In the Events view listing of events, events from split and related sessions are listed in the order they were parsed; for this reason, they are not always listed together in the Events list. In Version 11.4.1 and later, the Group Events option allows you to change the order in which the events are listed so that you can more easily detect relationships in the captured data. When events are grouped, we refer to the first event as the leading event.

The user interface is designed to help you identify grouped events. Solid row lines delineate different groups of related events while dotted lines depict the events that are part of the same related group. In a group of events, the leading event is first and subsequent events are nested under the leading event with indentation and relationship icons for subsequent events. The numbers next to the relationship icon distinguish the session split count.

If the leading event is not included in the current data set, the subsequent events are still grouped together under the first subsequent event. Only the leading event or the first subsequent event, in the case of no leading event, is sorted; indented events are not sorted. Hovering over the subsequent event marker ( ) displays a tool tip explaining the relationship. The following figure is an example of related events as they are displayed in the Events list.



If events are related based on session fragments, when you select a subsequent event and open the reconstruction, you can see the `session.split` meta key in the Event Meta panel.



## Split Network Session

If you see a tool tip like this, the listed events are part of a split network session:
`The event is part of a split session (session.split: #) matching these parameters: ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND tcp.dstport=1234.`

The reason for the split is one of the following:

- The original event was split into sub-parts by creating additional events for each transaction inside the original event.
- The original session was split as it was ingested into the Network Decoder because the size was larger than the Assembler Maximum Size (default=32 MB).
- The original session was split as it was ingested into the Network Decoder because the time was longer than the Assembler Timeout Session (default=60 sec).

### Session Size and Time Split

Network Decoders are configured with a default session size (`assembler.size.max`) and a session timeout (`assembler.timeout.session`). The configuration is described in "Configure Session Split Timeouts" in the *Decoder Configuration Guide*. When a session exceeds either limit, the Network Decoder splits the session, and all subsequent packets become part of a new session, fragmenting the actual network session across multiple Network Decoder sessions. To process session fragments with the context that they are fragments of the larger network session and to improve association of source and destination addresses, ports, and application protocols, Network Decoders parse contextual fragments and highlight session fragments.

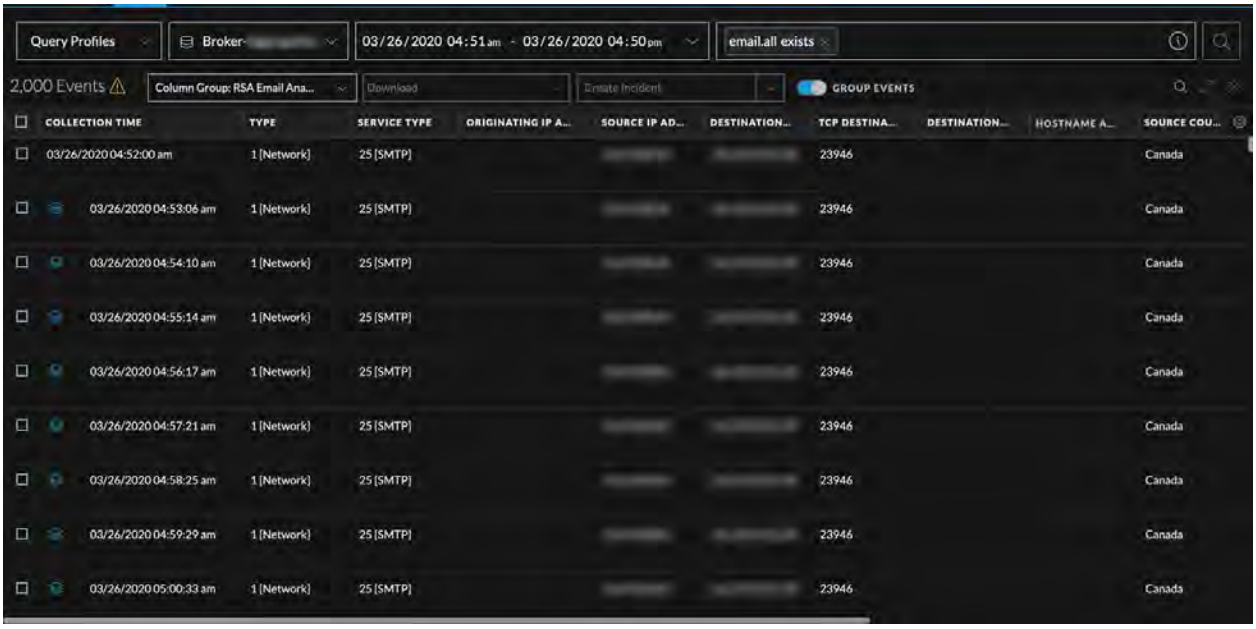
**Note:** In the Legacy Events view, you can find session fragments and export all packets viewed in the Events list to a single PCAP as described in Find and Combine Fragments in the Legacy Events View.

The Network Decoder completes session parsing before splitting the session based on the configured maximum session size (default = 32 MB) or the configured timeout (default = 60 seconds). When parsing is complete, the parsed results include the proper address directionality and application protocol, which are propagated to each subsequent session fragment to ensure consistency with the logical network session they represent.

## Transaction Handling Split

Administrators can configure a Network Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers that are designed to create transactions. The configuration is described in "Configure Transaction Handling on a Decoder" in the *Decoder Configuration Guide*. The Decoder service configuration node has a parameter that controls the behavior of the Network Decoder when a parser defines a transaction within a network session: `/decoder/parsers/config/parser.transaction.mode`. If the mode is set to `split`, a large session with multiple application-level transactions is split when a parser generates an application-level transaction such as an email. An example of this is a large session containing multiple emails. For each email (transaction), a new session item (split session) is created, network meta items are copied into the new session, and meta items marked in the transaction are copied from the original session to the new session.

Transactions require a parser update to function, and initially they only support SMTP and HTTP pipelining use cases. This is an example of the reconstruction of an email that is separated based on the individual emails inside the original event. Each transaction highlights a single email and the metadata associated with the transaction is only related to that email. To provide this functionality, the original packets are stored on the Network Decoder as usual for a network event, but the new related transaction events are created on the Concentrator. As a result, analysts see visual queues in the user interface, and they also have the ability to query to find only specific emails or attributes of emails that were previously all bundled together. To eliminate the original event from the query results, the `session.split` meta key has been indexed. When there are transaction splits, the original event does not have that meta key associated with it while all the related transactional events do.



### Session Fragments Highlighting

Both types of session fragments have an additional meta key: `session.split`. The earliest fragment is session 0 and sessions with a later time stamp are incrementally numbered 1, 2, 3, and so on. The `session.split` meta key indicates the number of preceding sessions fragments; however, it does not always indicate that there are subsequent session fragments, even with a value of 0. It is also possible for the first fragment of the session to not have `session.split` metadata if the session is parsed before exceeding the maximum session size.

Transaction splits start with a `session.split` value of 1. When viewing sessions, the `session.split` meta key clearly identifies sessions that are fragments in the Events view and the Legacy Events view (Events List view and the Events Detail view).

If this was a session size and timeout split, you can view the session fragments and determine the maximum session size or session timeout necessary for parsing to combine the split sessions into one again. For example, if you have four fragments at 32 MB, you need to configure your test Decoder (usually a virtual machine set up separately from the production service) with a maximum session size greater than 128 MB. The steps are the same to find all fragments based on a session timeout.

## Related Network Session

If you see a tool tip like this, separate events processed by the Network Decoder share a set of four values that identify the IP source, IP destination, source port, and destination port:

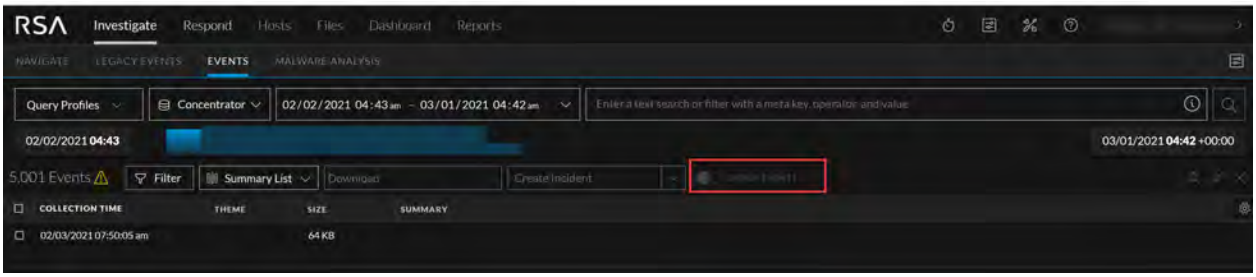
```
The event is related to a previous session matching these parameters:
ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND
tcp.dstport=1234"Second category: Related Network Session
```

In this case, the Network Decoder has not inserted a split, and there is no `session.split` metadata associated to any of the events. The reason these events grouped together is to highlight the events that are worthy of scrutiny based on a pattern. Each event has the same source IP address, the same destination IP address, the same source port, and the same destination port. The grouping of related events does not occur if any of the four meta keys is obfuscated for data privacy reasons.

These are the combinations of meta keys that must match to categorize an event as a Related Network Session:

- `ip.dst`, `ip.src`, `tcp.dstport`, `tcp.srcport`
- `ip.dst`, `ip.src`, `upd.dstport`, `udp.srcport`
- `ipv6.dst`, `ipv6.src`, `tcp.dstport`, `tcp.srcport`
- `ipv6.dst`, `ipv6.src`, `upd.dstport`, `udp.srcport`

In Version 11.6, the group events option that retrieves events from logs, network and endpoints is disabled when data privacy is enabled. For example, if the `'ip.src'` is blacklisted or restricted by the admin, then the option shown in the following image is disabled.



This option is disabled if one or more of the following 12 metas are restricted:

```
'sessionid'
'nwe.callback_id'
'medium'
'session.split'
'ip.dst'
'ip.src'
'ipv6.src'
'ipv6.dst'
'tcp.dstport'
'tcp.srcport'
'udp.dstport',
'udp.srcport'
```

## Use Cases for Viewing Events from Split and Related Network Sessions

These are examples of practical use cases for viewing events from split sessions:

- A Network Decoder that is inline with a proxy server receives a lot of email connections that get bundled into a single session based on event time as NetWitness sees them. The single session has multiple meta values for `subject`, `email.src`, `email.dst`, and other meta keys relevant to email, which are difficult to map together correctly. Seeing the session organized as leading and subsequent events, gives the analyst a clear idea of the details of each email.
- An analyst is attempting to understand what IP address out of all the metadata associated with a session resulted in the generated metadata or an alert, but the IP address is not in the output. For example, a feed that is parsing for an indicator of compromise may have many triggers in a session that has many IP addresses. By viewing the complete event organized as leading and subsequent events, the analyst can understand which IP triggered the alert.
- An analyst wants to know which file was deleted from which directory versus which file was read out in which directory, but the session encompasses multiple files and directories. For example, an HTTP connection with commands: `directory /keep/`, `directory /temp/`, `filename foo.txt`, `filename me.doc`, `action delete`, and `action read`. Viewing the leading and subsequent

events tells the analyst that `/temp/me.doc` was deleted and `/keep/foo.txt` was read. Now the analyst or analytics can form an opinion about how bad these actions really were.

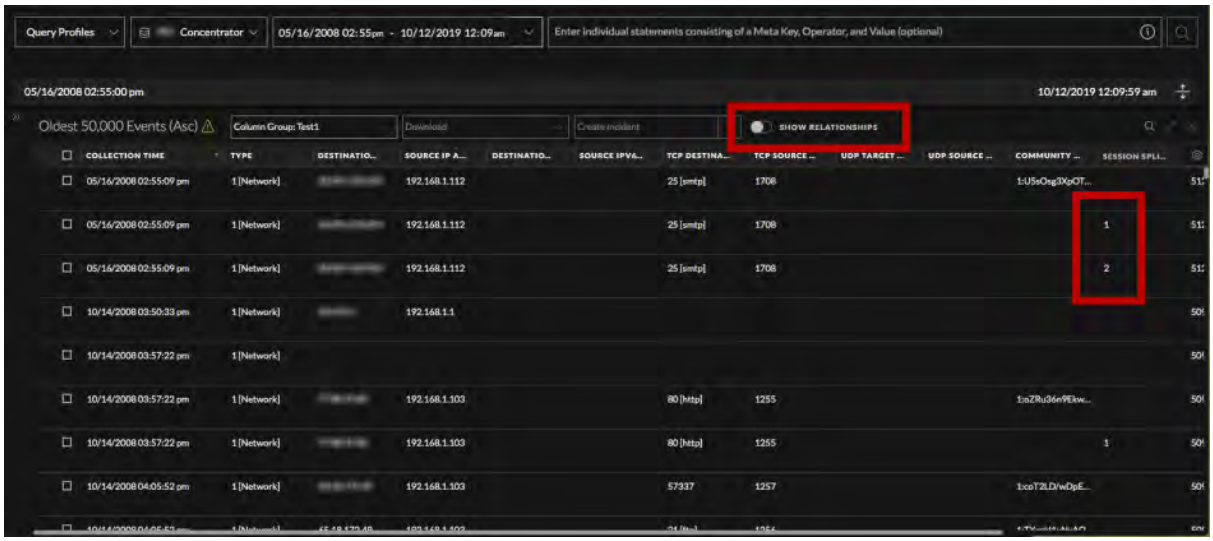
- An analyst is attempting to retrieve a large file related to an event that triggered a suspicous alert. However, the file that was transferred was so large that the network decoder split it into 100 separate sessions. When viewing this group related split sessions, the analyst can download a PCAP of the sessions, then extract the original file by either running it through a Decoder with larger assembler settings or a third-party tool.

## Show and Hide Relationships in the Events List

For both types of related events, you can see the relationship of events in the Events view Events list. When the Events list is first displayed, you can tell if set of results includes related events by looking at the Group Events switch at the top of the Events list. If the results do not include related events, the switch is dimmed as shown in the following figure.

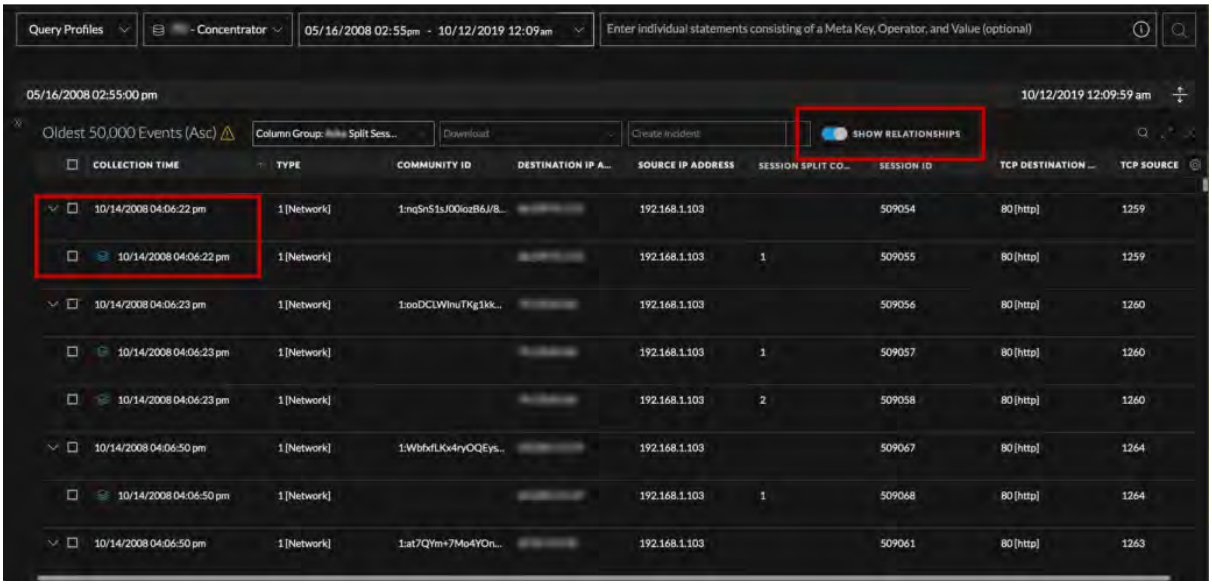
To look for related events in the Events list:

1. Go to **Investigate > Events** and submit a query.
   If the results include related events, the Group Events switch is active, but not enabled. The figure below illustrates a set of results that include split sessions, and the Group Events switch is disabled. The related events are not nested.



2. Click the **Group Events** switch.
   Related subsequent events are nested below the leading event. The subsequent events are indented

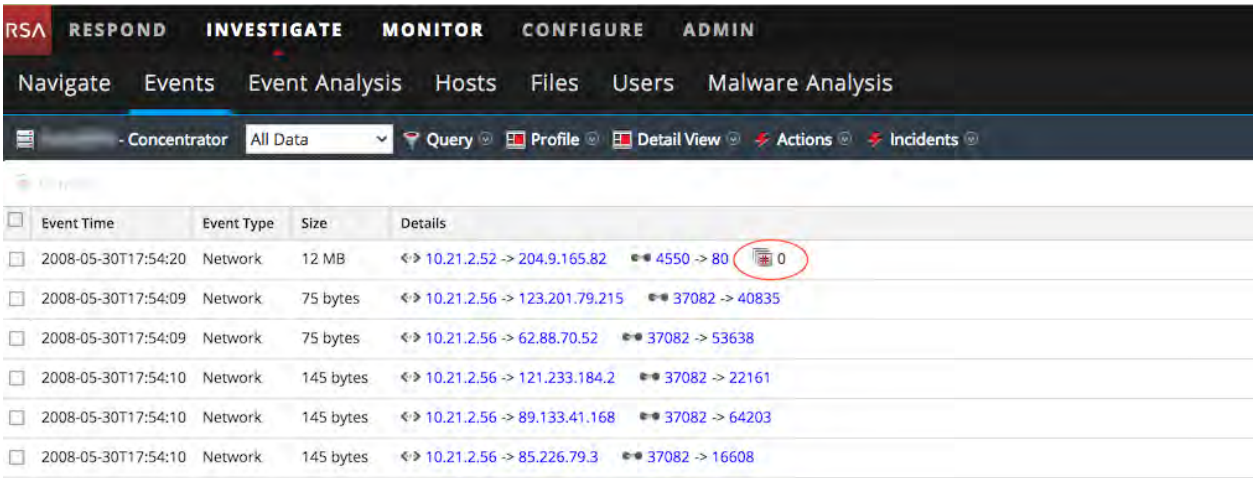
and marked by an icon. Clicking on the icon explains why the event is grouped.

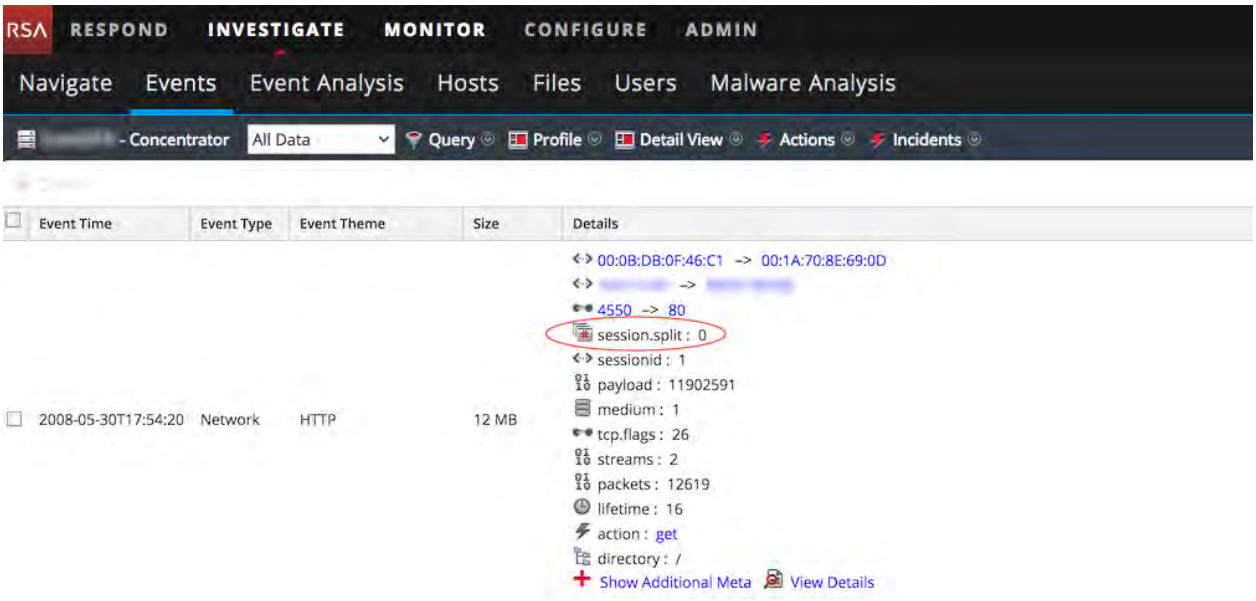


## Session Fragments Highlighting (11.3 Events View)

The figures below show the Events List view and the Events Detail view with fragmented session information highlighted.

**Note:** A maximum session size of 12 MB was configured at the time the screen captures below were created.





**Note:** The `session.split` meta key must be indexed to help you find the split sessions in the results.

The `session.split` metadata is displayed immediately following the address and port metadata in the details view (Legacy Events view). These enhancements make it possible to quickly:

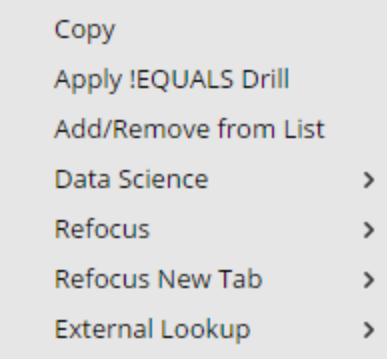
- Identify sessions that are fragments of a network sessions.
- View all of the session fragments of a network session given a single session fragment.
- Export the packets for the entire network session as a single PCAP file.

## Find and Combine Fragments in the Legacy Events View

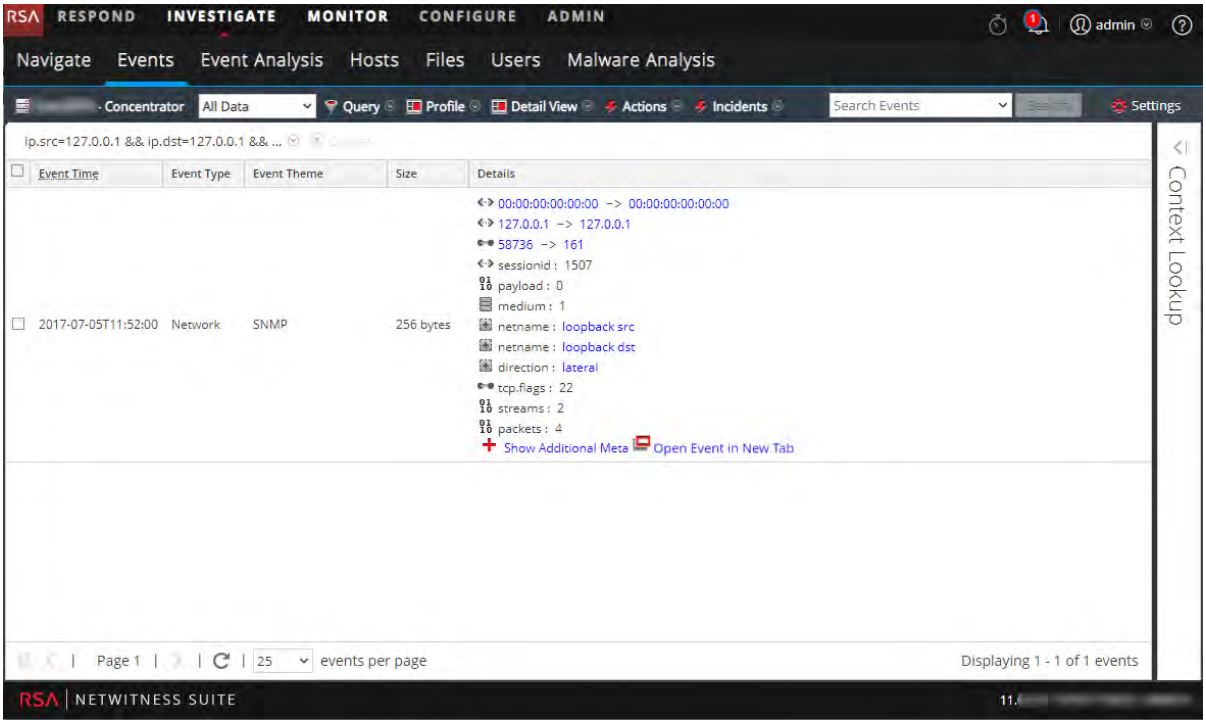
From within the Legacy Events view, you can find fragments of a session using the Refocus > Find Session Fragments context menu option. NetWitness composes a query using the source and destination addresses and ports of the selected session and displays all sessions that match that query within the current time window.

To find session fragments:

1. In the **Legacy Events** view, right-click any of the source and destination address and port values: `ip.src`, `ip.dst`, `ipv6.src`, `ipv6.dst`, `tcp.srcport`, `tcp.dstport`, `udp.srcport`, and `udp.dstport`) as well as `session.split` values.
   The context menu is displayed.



2. Select **Refocus > Find Session Fragments** or **Refocus New Tab > Find Session Fragments**. NetWitness repopulates the Events list with session fragments for a single session within the current time range. Depending on the option you selected, the refocus replaces the current view or opens in a new tab. (All data is used in these examples but is not recommended on production systems).



3. If necessary, adjust the time range to include any session fragments that may precede or follow the current time window. You can tell that the time range needs to be expanded if the fragments occur near the time boundary, especially if the first visible fragment does not have a split value of 0 (or none). Alternately, inspecting the packets of the last visible session may lead you to believe that the session continues. Here is an example:

   a. If you are looking at fragments that are obviously not the first fragment, for example, 1, 2, 3, and 4 in time range 10:30 to 10:35, there should be a fragment 0. You can increase the time range to start earlier (for this example, 10:25) to find the additional fragment.

b. If the session size of last fragment is close to maximum session size (12 MB in this example), look for additional fragments by increasing the time window to include a later time (for this example, 10:40).
When all of the session fragments of a network session are included within a single Events list, the list can span multiple pages.

4. (Optional) To export the packets for every session fragment to a single PCAP file, select **Actions > Export All PCAP**.
A message informs you that the PCAP is being downloaded. When download is complete, PCAP file includes the entire network session that was fragmented.

# Visualize Metadata as Parallel Coordinates

Analysts can use the parallel coordinates visualization in the Navigate view to focus the investigation on combinations of meta keys and meta entities, and values that may indicate events are abnormal and worth investigation. The parallel coordinates chart is a way of visualizing the current drill point in Investigate to examine more than two meta keys simultaneously. Visualizing multiple meta keys simultaneously can help in identifying security issues associated with multivariate patterns and comparisons, such as when individual meta keys and values may not be of concern, but combining them together may bring an abnormal pattern or relationship to light. Meta groups (see Use Meta Groups to Focus on Relevant Meta Keys) can be used effectively to define a collection of meta keys that you want to visualize as parallel coordinates.

## Best Practices for Effective Parallel Coordinates Charts

To create effective parallel coordinates charts, follow these recommendations:

- Use the RSA built-in meta groups that are included in a new installation.
- Start from a drill point rather than attempting to visualize all data.
- Limit the time range if necessary.
- Choose the smallest useful set of meta keys to display as axes.
- Specify the sequence of axes to highlight anomalies between the meta values as you follow a line across the chart.
- When you can identify a useful set of meta keys and sequence, create a custom meta group to use for future investigations. For example, you can create a custom meta group for Windows executable file types.
- Reuse and share custom meta groups by importing and exporting groups as `.jsn` files.
- It may be useful to create two versions of each custom meta group. One for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

**Note:** When you import meta groups, an error message is displayed if any group is already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To help build better parallel coordinates charts, several optimizations are included in NetWitness.

- Analysts can specify that only sessions in which all meta keys exist are rendered in the chart.
- The administrator can increase the number of meta values rendered in the Parallel Coordinates Settings in the ADMIN > System > Investigation panel > Navigate tab.

## RSA Meta Groups for Parallel Coordinates Use Cases

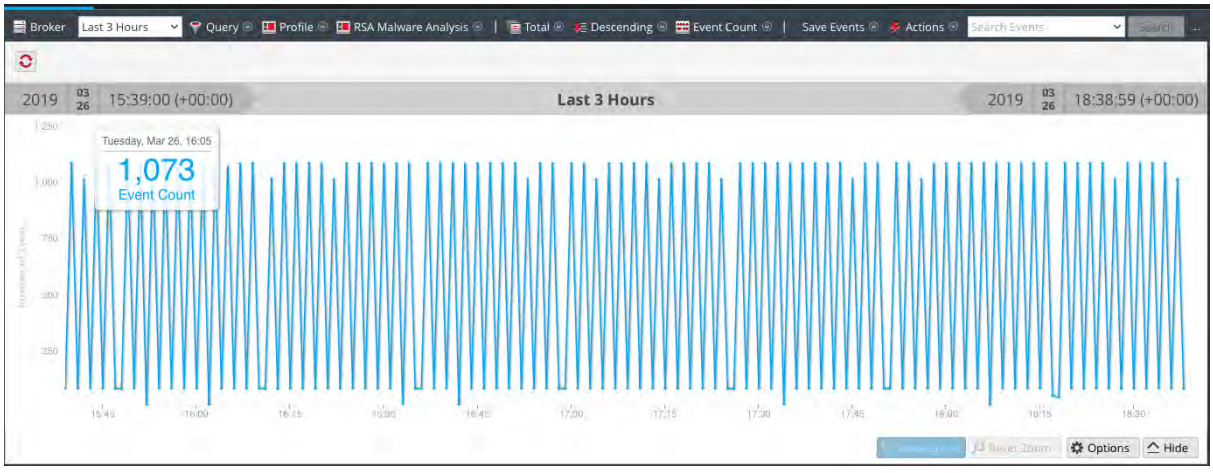
A set of predefined meta groups is included with NetWitness. If you want to get the latest version, you can import the meta groups file, `MetaGroups_ootb_w_query.jsn`, in the Manage Meta Groups dialog. Some of the targeted activities that lend themselves well to Parallel Coordinates visualizations are:

- Botnet Beaconing
- Covert Channels
- Email Analysis
- Encrypted Sessions
- Endpoint Analysis
- File Analysis
- Malware Analysis
- HTTP
- SSL/TLS
- SQL Injection Attacks
- Threat Analysis
- Web Analysis

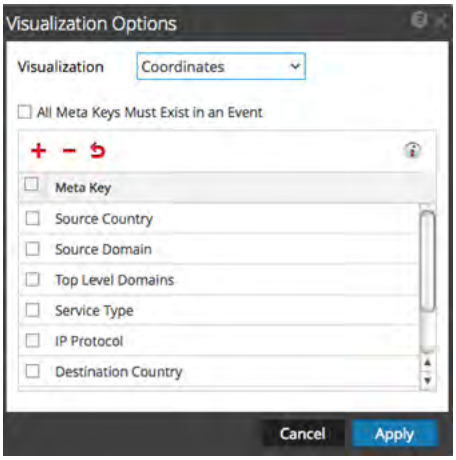
## View a Parallel Coordinates Visualization

From an investigation in the Investigate > Navigate view:

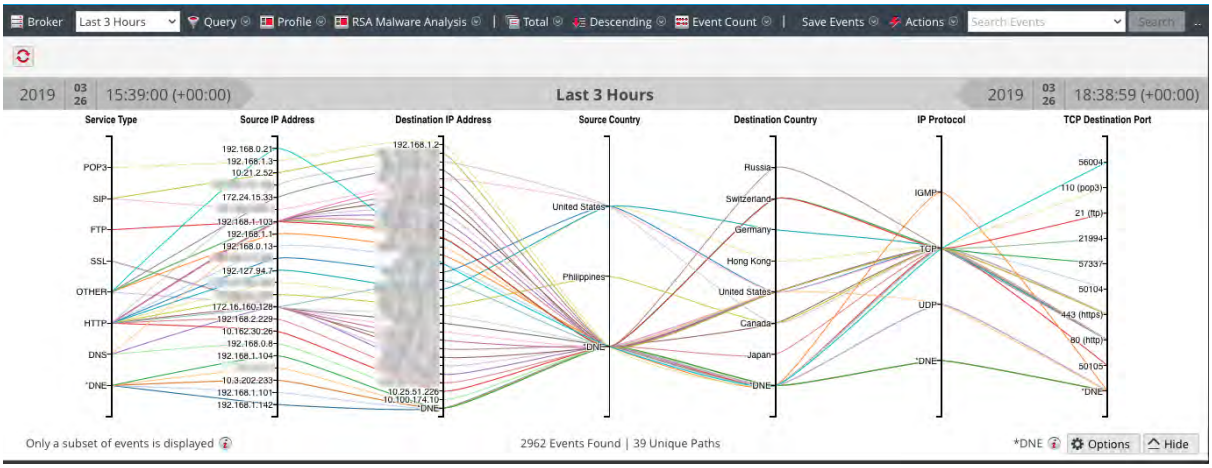
1. If the Visualization panel above the Values panel is closed, select **Visualization**.
2. In the toolbar, select **Meta** > **Use Meta Group** > **RSA Malware Analysis**.
3. A default visualization for the current drill point is displayed as a timeline.



4. In the **Visualization** panel, select **Options**.
   The Visualization Options dialog is displayed.
5. In the **Visualization** drop-down list, select **Coordinates** and click **Apply**.



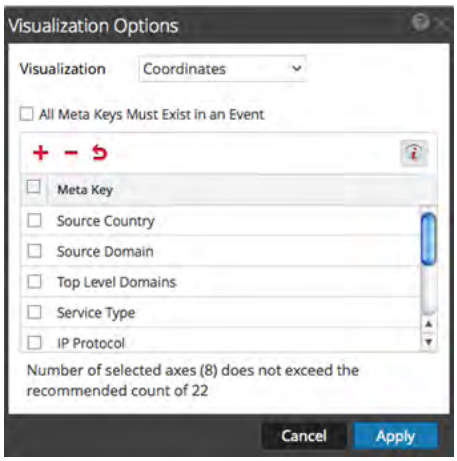
The visualization is loaded. In this example, 2962 events are found and 39 unique paths are visualized.



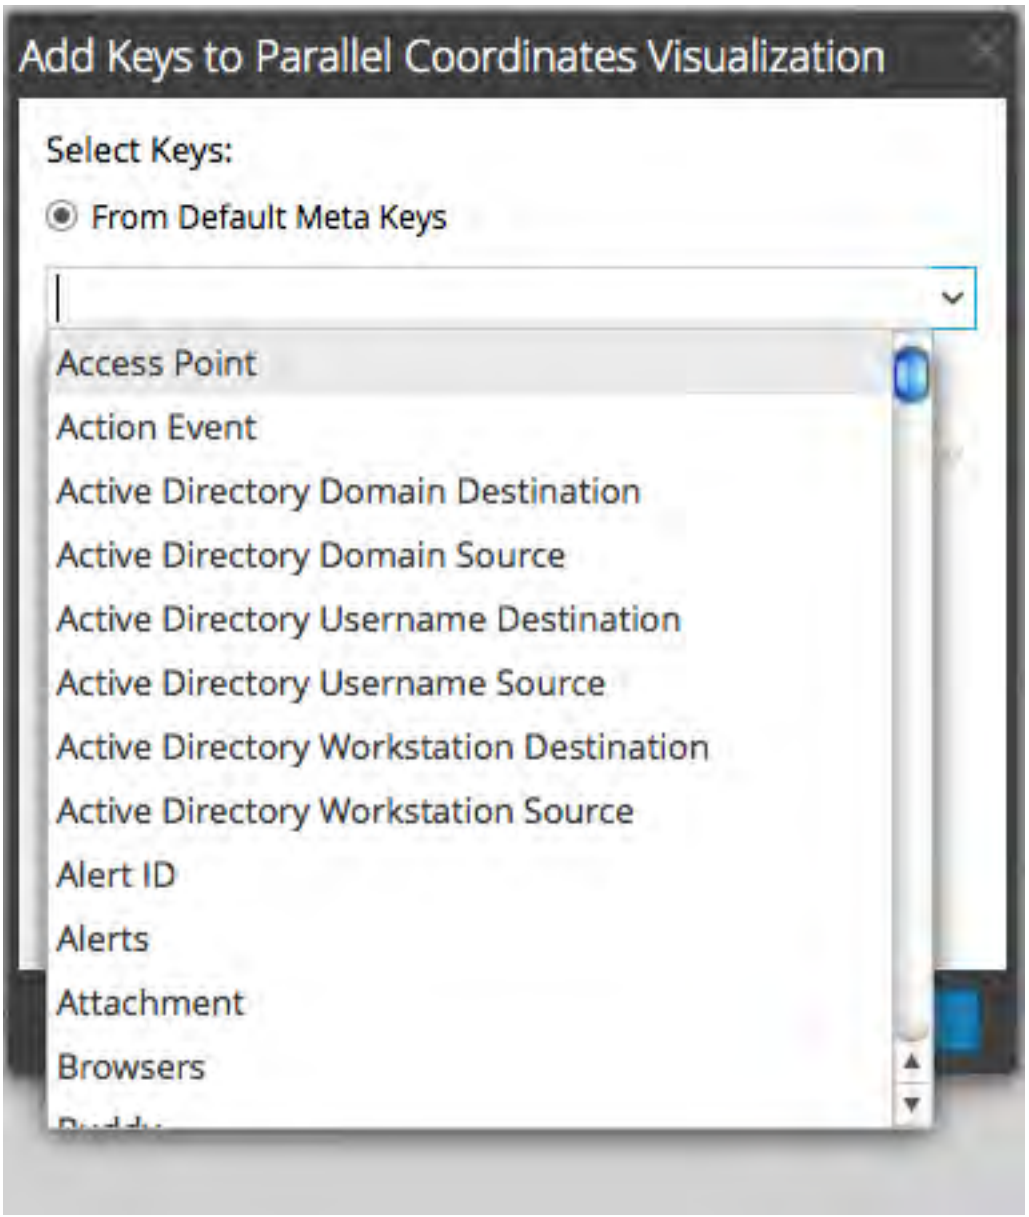
## Select Meta Keys for a Parallel Coordinates Visualization

With a Parallel Coordinates visualization open, do the following:

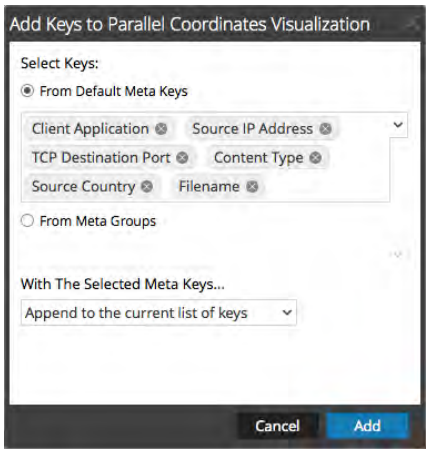
1. In the Visualization panel, select **Options**.
   The Visualization Options dialog is displayed. In the toolbar, click to display the recommended number of axes for a readable visualization. When a recommended count of keys is displayed, the count changes based on the browser size. If you make the browser window larger, the recommended count is increased.



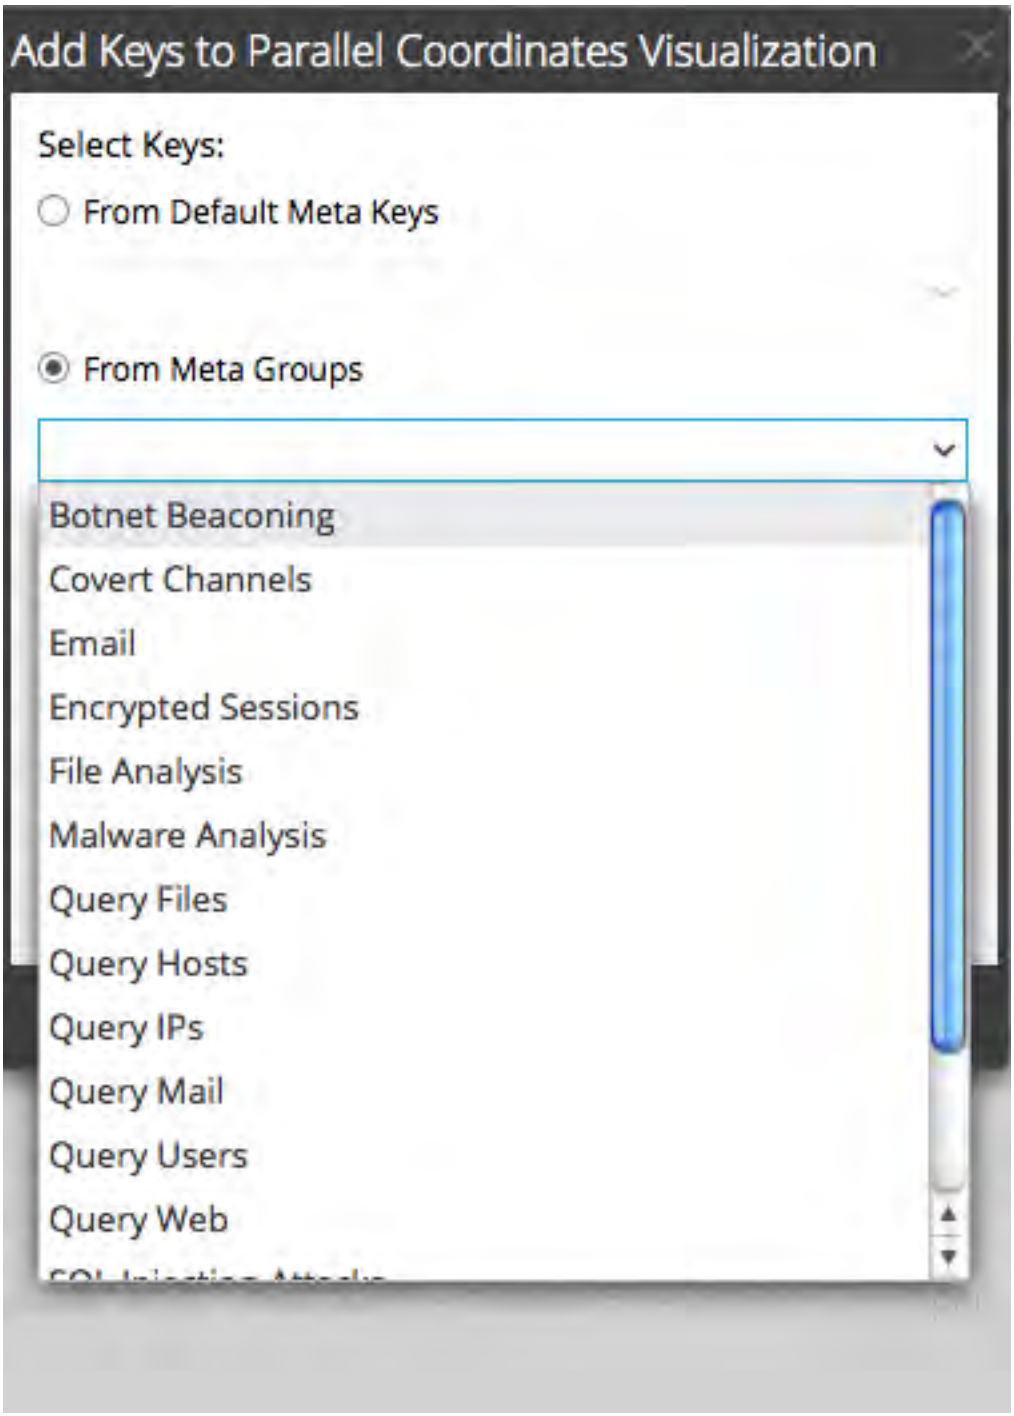
2. If you want to change the sequence of the meta keys, drag meta keys up or down to the desired sequence.
3. If you want to delete any meta keys, click in the selection box, and click −.
   The meta keys are removed, but the change has not been applied.
4. If you want to revert to the previous state, click ↩.
   Any meta keys you have deleted are restored and any changes that you made are removed.
5. If you want to select individual meta keys, click +, select **From Default keys**, and in the drop-down list, select the meta keys.



The selected keys are listed.

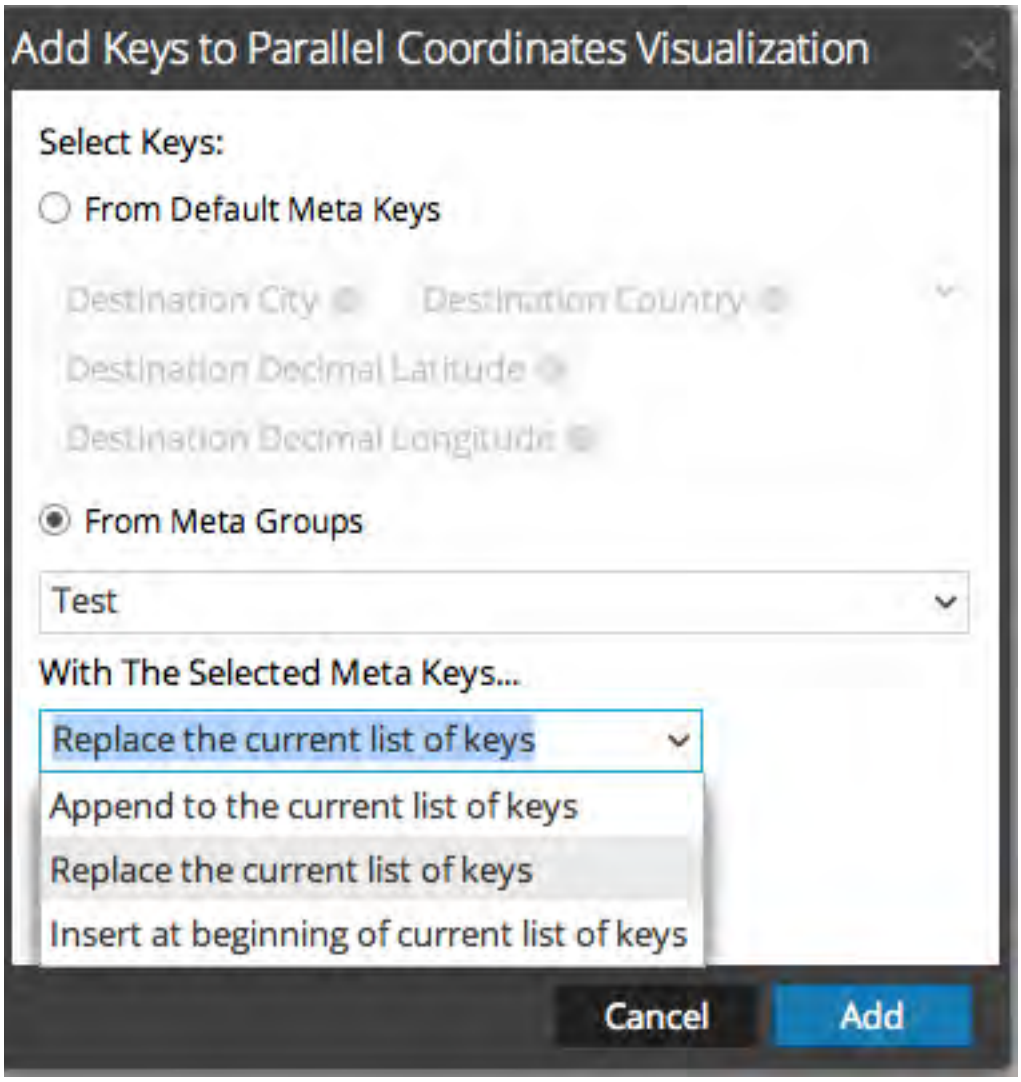


6. If you want to add all the keys in a meta group, you cannot add individual meta keys. Select **From Meta Groups**, and select a group from the drop-down list.



The selected meta groups are listed in the field.

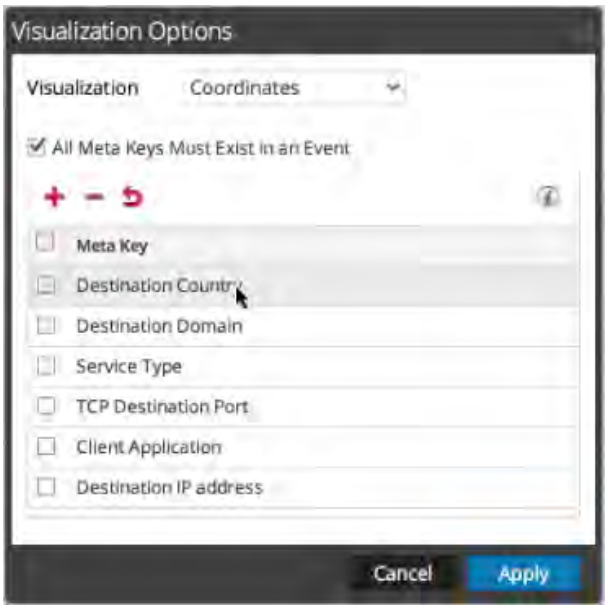
7. Select the method of adding the keys or groups: **Replace the current list of keys**, **Append to the current list of keys** (at the end), or **Insert at the beginning of current list of keys.**



8. To complete the procedure, click **Add**.
   The Visualization Options dialog is displayed with the meta keys or groups you selected.
9. To display the new visualization chart, click **Apply**

## Optimize a Parallel Coordinates Visualization

1. To optimize the visualization by removing events in which not all meta keys exist, select **Options.**



2. In the Visualization Options dialog, select **All Meta Keys Must Exist in an Event**. Click **Apply**. The resulting graph is more readable and useful and has fewer unique paths.

3. If you want to highlight a small set of points to see the path of the line from right to left, click on an axis. The cursor changes to cross hairs, which you can drag to select one or more values. When you

let go of the mouse, the lines are highlighted.

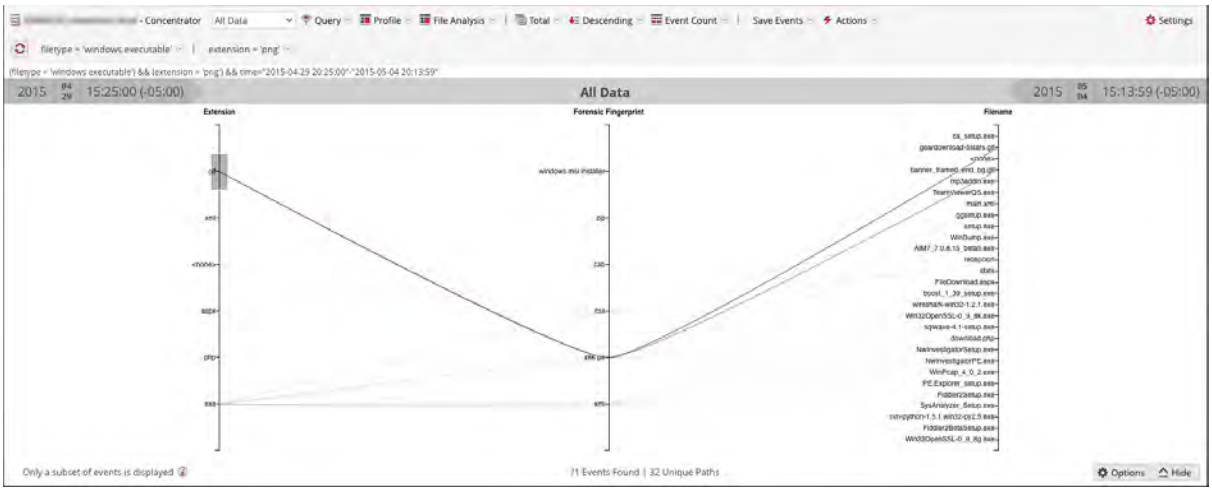
4. If you want to enlarge the visualization, drag the bottom edge of the panel down and drag the right edge of the browser window wider.

## Sample Use Case

Below is an example of a parallel coordinates visualization of meta keys representing file metadata in a session. There are three meta keys or axes from left to right: Extensions, Forensic Fingerprint, and Filename with values listed along each axis. Values on the Extension axis show the file extension, and values on the Forensic fingerprint axis are windows executables. Normally the file type matches the expected forensics fingerprint; however, it is abnormal for a `gif` file type to be combined with the Windows executable fingerprint. The `gif` file type is selected to highlight the correlations of that file type, `x86pe` , and two filenames in the third axis so that an analyst can quickly identify the files that merit investigation.

To reach this view:

1. Order by Value and Sort in Ascending order.
2. Apply two filters (file type = 'windows executable' and extension = 'gif') in the Navigate view to limit the amount of data.
3. Configure a parallel coordinates chart by choosing three axes: `file extension`, `forensic fingerprint`, and `filename`.

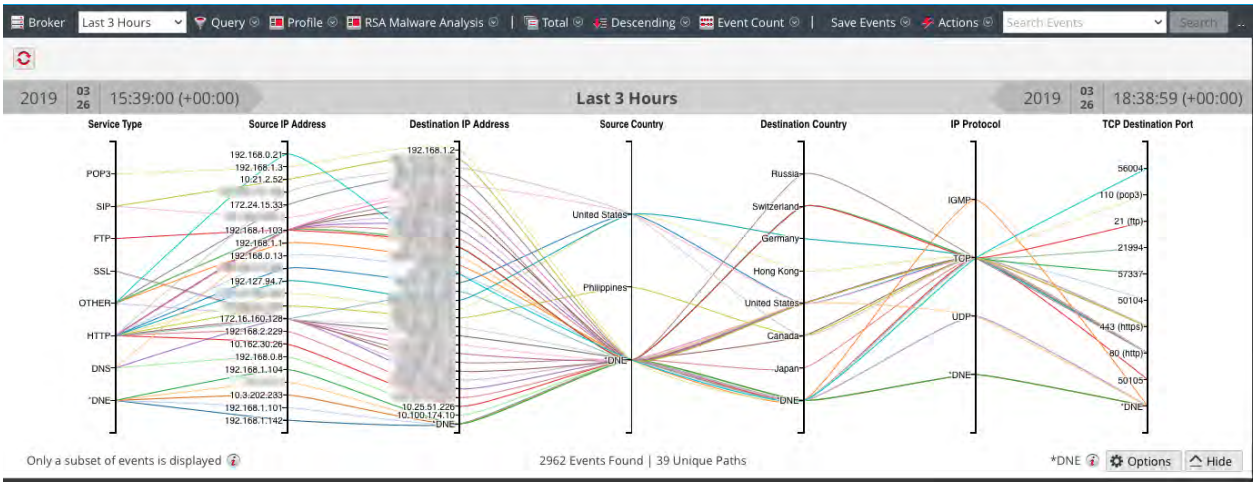


## Sample Visualization of a Large Data Set

This example of a parallel coordinates visualization applied to a larger set of data illustrates several messages that help analysts to understand what has been charted.

- To create a chart, NetWitness begins scanning meta values and returning results. A typical time range could have up to 10,000,000 meta values. When the number of meta values returned reaches the Meta Values Result Limit, the chart is rendered even if NetWitness has not scanned a number of meta values equal to the Meta Values Scan Limit.
- There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart.The administrator configures parallel coordinates limits as part of the Investigation settings In the ADMIN > System view.

With a larger set of data, the parallel coordinates chart takes longer to process than the smaller set of data and meta keys. To preserve performance, NetWitness renders the meta values from the Values panel below until the limits set by the Administrator are reached. An informational message tells you: **Only a subset of events is displayed.**



Of all the data visualized for 2962 events, there were only 39 unique parallel coordinates paths. Some events are included though they do not include some of the meta keys; these are labeled **DNE** because the metadata does not exist in the event.

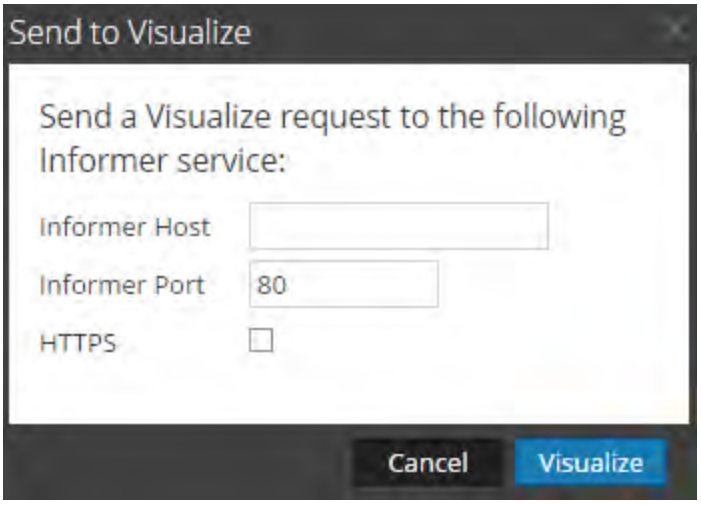
# Visualize the Current Drill Point in Informer

This topic provides instructions for sending a drill point in the Navigate view to an Informer visualization.

Informer must be installed in your network and accessible by the service being investigated. You need to supply the host name and the port used on the Informer host to communicate with NetWitness.

To display a visualization in Informer of the current drill point:

1. With a drill point open in the Navigate view, click **Actions > Visualize**.
   The Send to Visualize dialog is displayed.



2. Type the Informer hostname or IP address, and verify the NetWitness server port used to communicate with the Informer host.
3. (Optional) Select the HTTPS option if the Informer host uses secured communications.
4. Click **Visualize**.
   The visualization is displayed in a new tab.

# Downloading and Acting Upon Results

When working in Investigate, you may want to extract and shared data with other analysts, incident responders, SOC managers, and others. The topics in this section provide instructions for downloading results and creating incidents that appear in the Respond view:

- Download Data in the Events View
- Export or Print a Drill Point in the Navigate View
- Export Events in the Legacy Events View
- Add Events to an Incident in the Events View
- Add Events to an Incident in the Legacy Events View

# Download Data in the Events View

In the Events view, you can download data from the Events panel and from a reconstruction. The Events panel download available in Version 11.4 and later is a bulk download of log and network events for all event types.

- Version 11.4.1 has the added capability to download visible metadata for all event types. From within a reconstruction, you can download events, logs, and files.
- Version 11.5 has the added capability to download metadata for all event types in the Events panel and in the event reconstructions.

**Note:** The information that you can view and download is managed by Role-Based Access Controls (RBAC) that your administrator has implemented. When RBAC is configured to prevent downloads of certain data, events for which you do not have download permission may appear to download successfully, but they are 0 byte in size. When RBAC is configured to prevent reconstruction of certain events, the reconstruction is disabled from the Events panel, but the bulk download button is still enabled.

## Download Events or Metadata in the Events Panel

After submitting a query, you can download logs, network events, visible metadata (Version 11.4.1), or all metadata (Version 11.5) for events in your preferred format, directly from the Events panel. The preferences are set in the Event Preferences dialog and any changes made there are reflected inside the **Download** menu. See Configure the Events View for more information about preferences.

In the Events panel, you can select events individually or select all events returned by your search. The selection checkboxes appear only if you have permission to download the events. All checkboxes are deselected when a new query is submitted. When you select events and click Download, the Download menu is displayed. The number of events selected for each event type is displayed next to each option in the format `Events of this type selected/ Total number of events selected`. If an event type has no events selected, the corresponding download option is disabled and the number of events selected is displayed as `0 / Total number of events selected` as shown in the following figures. Version 11.5 has options to download all metadata or visible metadata, Version 11.4.1 menu has options to download visible metadata, and the Version 11.4 menu does not have those options.

If the Select All checkbox is selected in the Events list, the Download All options are available. In addition to the options that download all logs or network events, Version 11.5 has options to download all metadata or visible metadata. Version 11.4.1 menu has options to download visible metadata, and the Version 11.4 menu does not have the metadata options.

The difference between the All Meta options and the Visible Meta options are as follows:

- In Version 11.4.1 and later, visible metadata for the selected events is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**) or the format that you select under **Other Options** in the

**Download** menu at the time of download. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. The visible columns are determined by the selected column group and the Column Selector. For additional information about selecting columns, see Use Columns and Column Groups in the Events List. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded. When you use one of the Download Visible Meta options; the downloaded metadata is sorted in order of collection time rather than the current sort order in the Events panel.

- In Version 11.5, all metadata for the selected events is downloaded in the default format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, or **All Meta as TSV**) or the format that you select under **Other Options** in the **Download All** menu at the time of download. The resulting download includes all metadata for the events selected, regardless of what columns are visible in the Events list. For example, if an event has 40 meta keys in the meta database, even if the column group in the Events list has 20 columns with 10 columns visible, all 40 meta keys for that event are included in the downloaded file.
- In Version 11.5.1, all metadata for the selected events is downloaded in the default format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**) or the format that you select under **Other Options** in the **Download All** menu at the time of download. The resulting download includes all metadata for the events selected, regardless of what columns are visible in the Events list. For example, if an event has 40 meta keys in the meta database, even if the column group in the Events list has 20 columns with 10 columns visible, all 40 meta keys for that event are included in the downloaded file.

**Note:** When you select all events for download, only the events in the current result set are downloaded. If you canceled the query before all results were returned, only the events that were loaded are downloaded.

**To download event data for one event, multiple events, or all events in the Events panel:**

1. Do one of the following:
   a. To select events individually, select the checkbox next to each event you want to download, and click the downward arrow on the **Download** menu button to see the options.

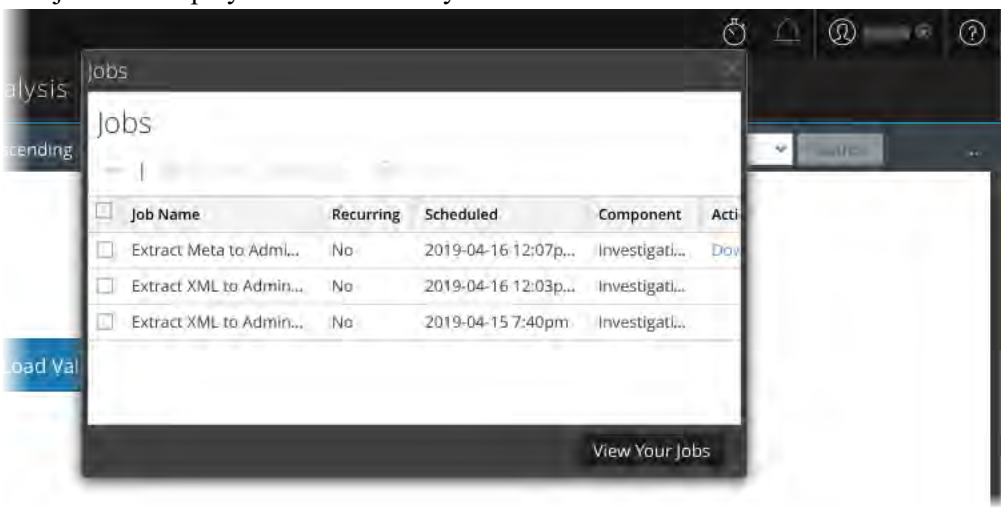
   b. To select all events displayed in the Events panel, select the checkbox at the top of the Events panel and click the **Download All** menu button.

2. Review the **Default Options** in effect in the top section of the menu. If you do not want to use the default format, you can choose a different format from the **Other Options** section of the menu.
   - Logs are downloaded in the preferred format that you selected in the Events Preference menu (**Logs asText**, **Logs as CSV**, **Logs as JSON**, or **Logs as XML**). If you want to choose a different format for this download, select one of the formats from **Other Options**.
   - Network events are downloaded as a PCAP. When downloading multiple network events in the Events panel, the format is always PCAP. The preferred format that you specified in the Events Preference menu (**Network as PCAP**, **Network as Payloads**, **Network as Request Payload**, or

**Network as Response Payload**) is ignored in this menu. Your preferred format applies only to downloading a single network event in the network reconstruction panel.

- Visible metadata is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded.
- All metadata is downloaded in the format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event includes all metadata, not just the visible columns.

3. Click the menu label: **Download** or **Download All**.
   The download begins immediately within the browser window if the **Download extracted files automatically** preference is set (**Events** view > ). If the preference is not set, the download job for the selected events is added to the Jobs tray, where you can download the events.
   If the download fails, a message provides feedback regarding why the download failed. The download button is re-enabled and any selected events remain selected. These are examples of reasons for a failed download: timeout after X minutes, connection failed, event limit reached, and permission denied.
4. To display the Jobs tray, go to **Investigate > Navigate** or **Investigate > Legacy Events**, and click the Jobs icon, which looks like a stop watch.
   The jobs are displayed in the Jobs tray.



## Download a Log in the Text Reconstruction

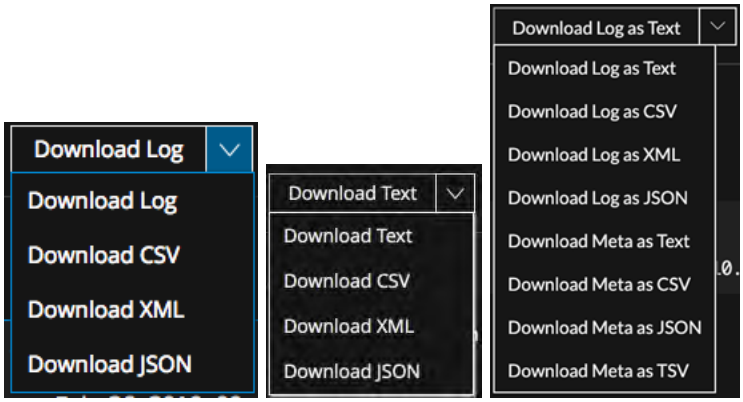
When viewing a text reconstruction of a log event, you can download a log file in the following formats using options in the Download Log menu:

- Raw log (log) using the **Download Log** (11.3) or **Download Text** (11.4 and later) or **Download Log as Text** (11.5 and later) option.
- Comma-separated values (CSV) using the **Download CSV** or **Download Log as CSV** (11.5 and later) option.
- Extensible Markup Language (XML) using the **Download XML** or **Download Log as XML** (11.5 and later) option.
- JavaScript Object Notation (JSON) using the **Download JSON** of **Download Log as JSON** (11.5 and later) option.

In Version 11.5 and later, you can also download the metadata for the log using one of these options:

**Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

This is an example of the menu with the **Download Log** (11.3) or **Download Text** (11.4 and later) or **Download Log as Text** (11.5 and later) option. Version 11.5 has additional options to download metadata for the selected logs.



**Note:** For endpoint events, the **Download Log**, **Download Text**, or **Download Log as Text** option applies only to events that have at least one meta value exceeding 256 characters. For an endpoint event, the raw log is populated only when the meta value exceeds 256 characters. Long-running or historically downloaded files are not downloadable. For example, meta values like launch arguments can exceed 256 characters. In this case, 256 characters are available as a meta value while the full value is available in the raw log to view.

The downloaded log file contains the log and is named to help identify the service on which the log was collected, the session ID, and the file type. This is an example of the filename for a raw log: **Concentrator_SID2.log**. The exported log file is named using the following convention:

```
<service-ID or host name>_SID<n>.<filetype>
```

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<filetype>` identifies the format of the downloaded log. These are the possible log types: raw log, CSV, XML, and JSON. By default, the format is a raw log.

**Note:** Some formats do not have time stamps or the device IP where the event was generated, so a log downloaded in CSV, XML, or JSON format has an extra value called `timestamp` along with the raw log content. The additional information inside the log is in this form: `Log timestamp="1490824512" source="10.12.35.65".`

### To download the log or the metadata for a log:

In the text reconstruction of a log event, do one of the following:

1. To download the log as a raw log (the default format), click **Download Log**, **(Download Text)** or **(Download Log as Text)**.
2. To download the log in one of the other formats, click the downward arrow on the **Download Log**, **Download Text**, or **Download Log as Text** button, then select one of the file formats for the downloaded log.
3. To download the metadata for the log, click the downward arrow on the **Download Log**, **Download Text**, or **Download Log as Text** label, then select **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**).

The log file or the metadata for the log is downloaded to your local file system in the format specified. If you initiate a download and move away from the view while the log is being extracted and before the log starts to download, the log is not downloaded in your browser. A message notifies you that you can find the downloaded log in the job queue.

## Download Network Event Data in the Text or Packet Reconstruction

When viewing a packet reconstruction or a text reconstruction of a network event, you can export network data files for further analysis. In Version 11.5 and later, you can also download metadata for the reconstructed event.

The download includes events for the current time range and drill point. You can download the data in these formats:

- The entire event as a packet capture (`*.pcap`) file using the **Download PCAP** option.
- The payload as a `*.payload` file using the **Download All Payloads** (11.3) or **Download Payloads** (11.4) option.
- The request payload as a `*.payload1` file using the **Download Request Payload** option.
- The response payload as a `*.payload2` file using the **Download Response Payload** option.
- (Version 11.5) The metadata for the event using one of these options: **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

The label on the download menu button is one of these formats, based on the setting selected in the Event Preferences dialog. If the event does not have that type of data, the menu button is dimmed. You can click the downward arrow on the menu button to see which options are available. For example, if an event has a request payload, but no response payload, the Download Response Payload label is dimmed. You can click the downward arrow on the button and select **Download Request Payload** for this download. After selecting a valid format, clicking the button executes the download.

This is an example of the filename for a PCAP file: `C01 - Concentrator_SID1697309.pcap`. The exported network data file is named using the following convention:

`<service-ID or host name>_SID<n>.<filetype>`

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<filetype>` is pcap, payload, payload1, or payload2.

The network data is downloaded directly into your browser if the download is quick. If the download takes longer due to network factors or file size, the file is downloaded in the background and the task is tracked in the Jobs queue. In this case, you can check your jobs in the queue and get the file when the download is complete.

**Note:** If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded document in the job queue.

### To export an event as a network data file or to download the metadata for the event:

Go to the packet reconstruction of a network event and do one of the following:

1. To download the event as a PCAP file (the system-defined default format) or in the user-defined default format, click the **Download <format>** button. The label is the same as the download option set in the Events Preferences dialog.
2. To download the event in one of the other formats, click the downward arrow on the button, and select one of the file formats for the downloaded event data.

3. To download the metadata for the event, click the downward arrow on the button, and select one of the file formats for the downloaded metadata.

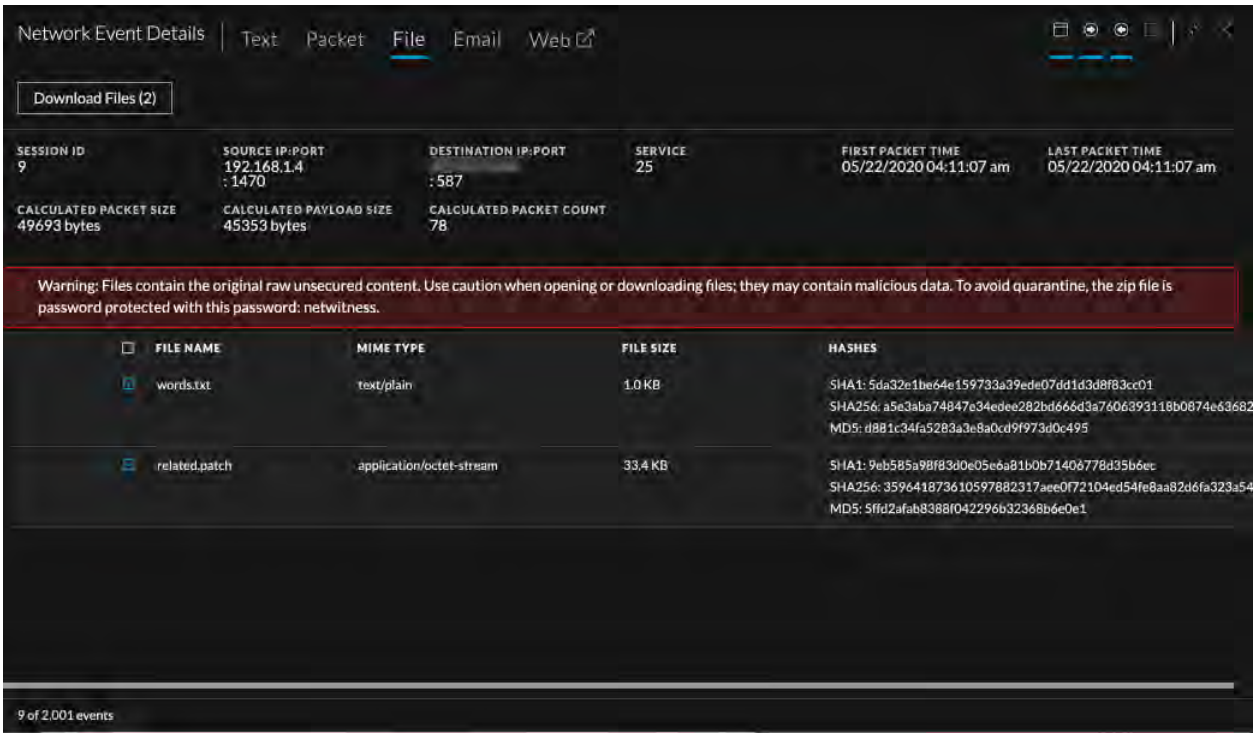
The network data file is downloaded to your local file system in the format specified or the metadata for the event is downloaded in the format specified.

## Download Files from a Network Event in the File Reconstruction

When viewing reconstructed network events that contain files in the file reconstruction, you can select one or more files, or all files, to download to your local file system.

**Note:** If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded file in the job queue.

When files are selected, the Download Files button becomes active and reflects the number of files selected.



Clicking Download Files exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

When downloading files form the file reconstruction, the exported archive is of the form `<service-name>SID<service ID><file-count>_FILES_FILES`, for example, `Broker_SID8_1_FILES_FILES.zip`. This is the password to open the zip archive: netwitness.

`<service-ID or host name>_SID<n>_<file-count>FILES_FILES.zip`

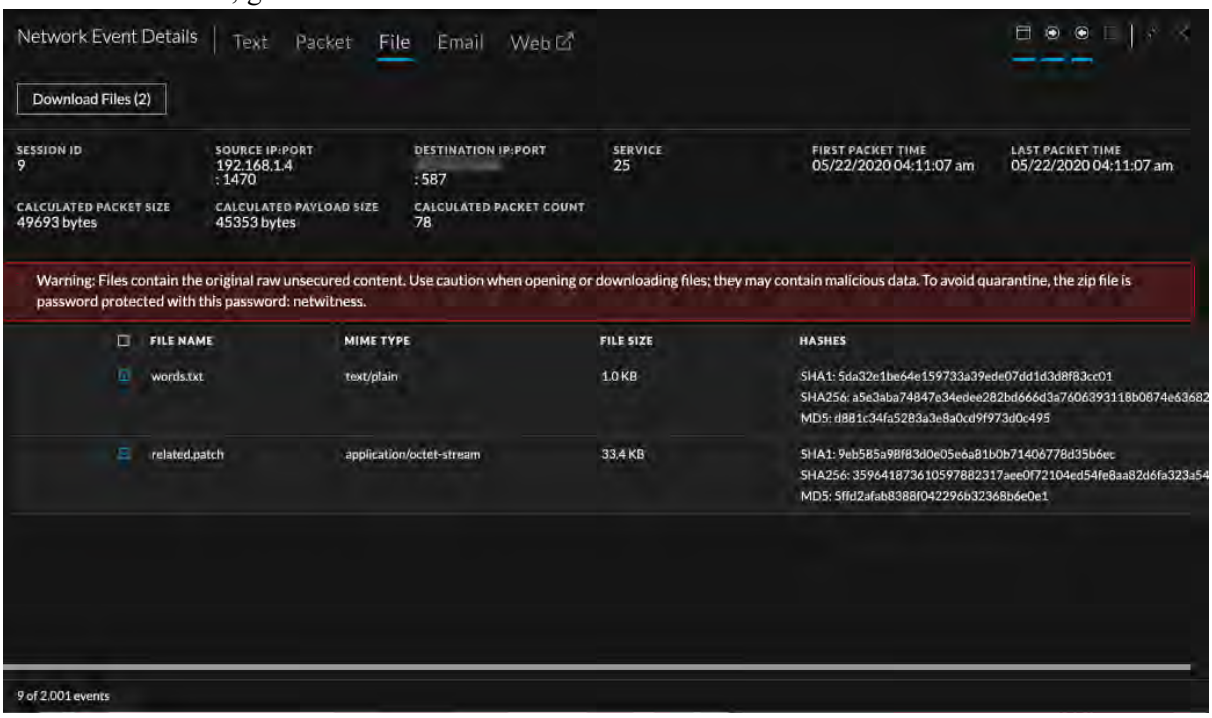
where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<file-count> FILES` is the number of files in the archive.
- `FILES` identifies the reconstruction type from which the files were downloaded.

**Caution:** Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To export files in a reconstructed event:

1. In the **Events** view, go to the file reconsruction of an event that contains files.



2. Click one or more files that you want to extract, and click **Download File** or **Download Files**. The job is scheduled and when complete the selected file are downloaded, in the form of a password-protected zip archive, to the local file system.
3. To open the archive on your local file system, enter the following password when prompted: `netwitness`.

## Download Attachments from an Email Reconstruction

When viewing an email reconstruction that contains attachments, you can select one or more attachments, or all attachments (Version 11.4.1.x), to download to your local file system. This feature exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

When downloading files from an email reconstruction, the filename is of the form `<service-name>_SID<n>_EMAIL`, for example, `Broker-_SID34_EMAIL.zip`. This is the password to open the zip archive: netwitness. The exported archive is named using the following convention:

`<service-ID or host name>_SID<n>_EMAIL.zip`

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `EMAIL` is the type of reconstruction from which the files were downloaded.

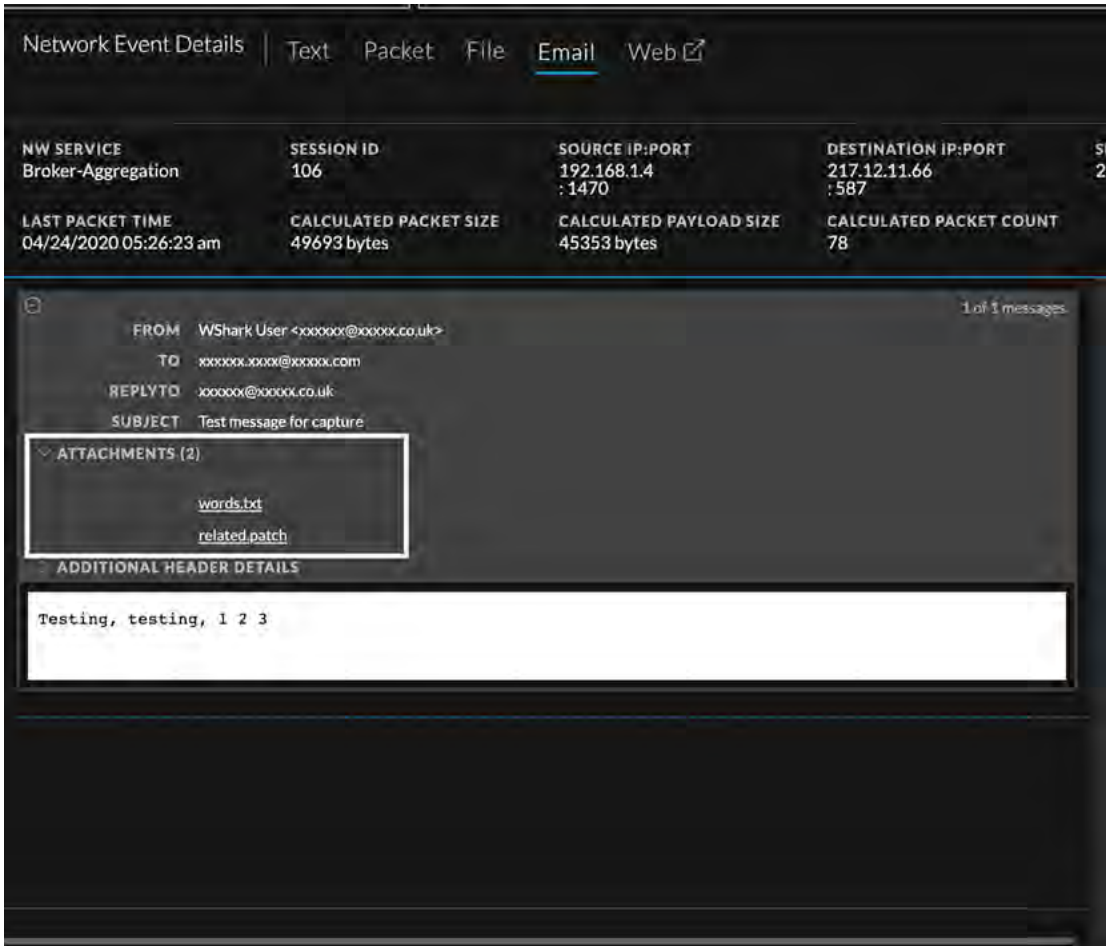
**Caution:** Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To download email attachments:

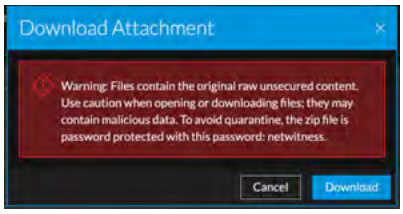
1. Go to the **Events** view and open an email reconstruction by clicking an event that contains an email with attachments.

2. Expand the **Attachments** drop-down list and do one of the following:

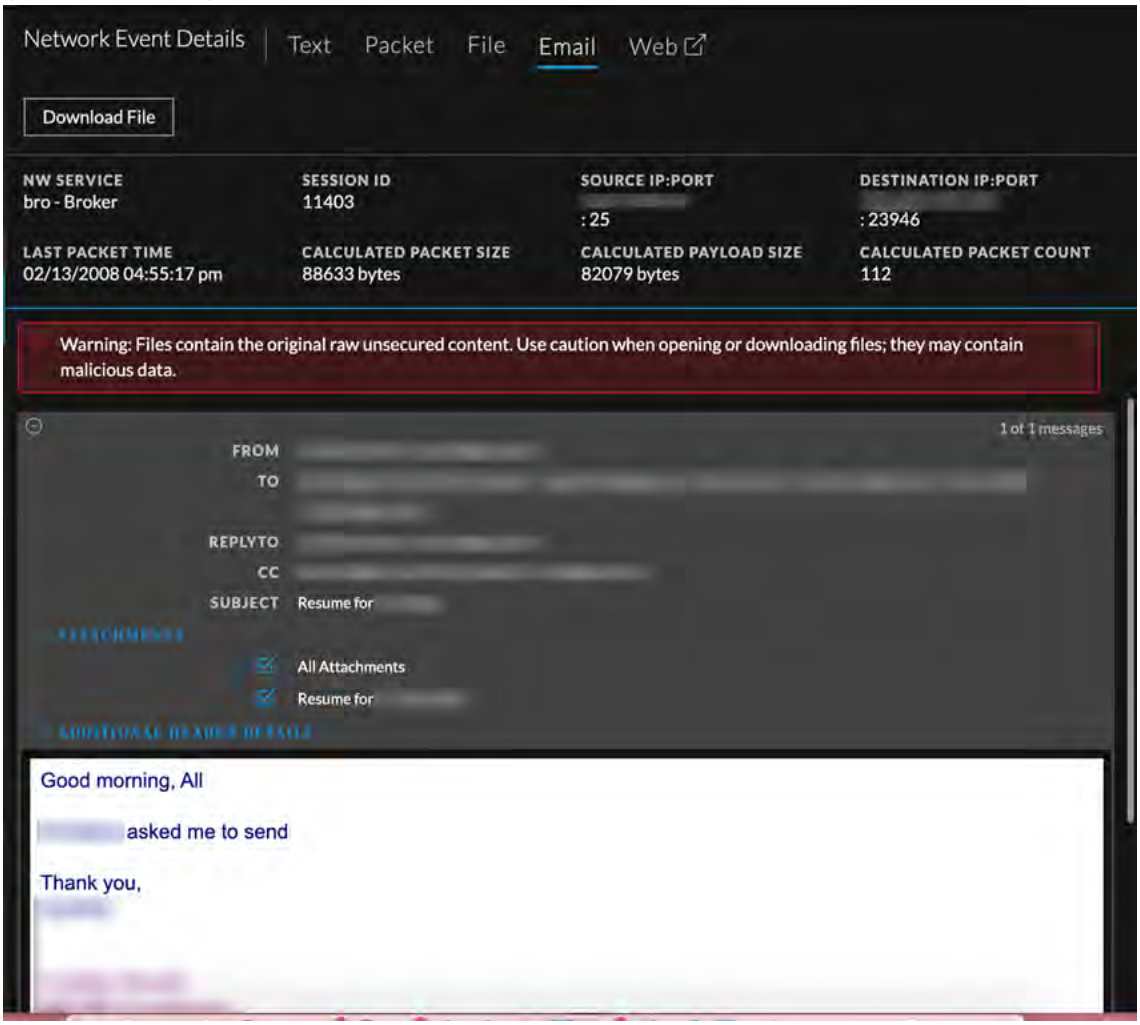
   a. (Version 11.5 and later) Click a link to an attachment.



A dialog warns you that downloaded email attachments may contain malicious data and asks you to cancel or confirm the download. If you want to complete the download, click **Download**. Otherwise, click **Cancel** to cancel the download.



b. (Version 11.4.1.x) Select one or more attachments or **All Attachments**.



A warning message is displayed in the reconstruction. Click the **Download File** or **Download Files** button. The attachments are downloaded with no additional opportunity to cancel.

# Export or Print a Drill Point in the Navigate View

In NetWitness Investigate, when the data for a drill point is displayed in the Navigate view, you can:

- Extract files from a session and choose the type of files to extract: archives, audio BitTorrent, documents, executable, images, other, video, and web.
- Export the drill point as a packet capture (PCAP) file, a log file, or a metadata file.
- Print the drill point.

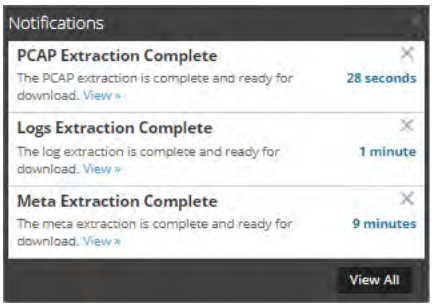
The details being exported are affected by both the time range and drill point at the time of exporting.

**Note:** When you export the drill point as a log file, only the log sessions are exported. The job queue message refers to the total number of sessions in the drill point rather than the number of logs. For example, if the drill point has 505 sessions and only five log sessions, the job queue message states that NetWitness is extracting logs for 505 sessions.

### To export a drill point from the Navigate view:

1. Conduct an investigation until you reach the desired drill point.
2. For Version 11.0, In the toolbar, select **Actions > Export** and select one of the export options: **PCAP**, **Logs**, or **Meta**.
   The drill point is extracted, and a message advises that the job is scheduled. You can check the jobs page for the status.
3. For Version 11.1, in the toolbar, select **Save Events** > and select one of the export options: **PCAP**, **Logs**, **Files**, or **Meta**.
   A dialog gives you an opportunity to edit the default filename for the file. The default filename is in the form `investigation-Feb-21-15-44-33`. When you are exporting a PCAP, the file is exported with no choice of formats. If you are using one of the other export options, a dialog is displayed.
4. In the dialog, select:
   - The export log format: **Text**, **XML**, **CSV**, or **JSON**.
   - The file types to export: Archives, Audio, BitTorrent, Documents, Executables, Images, Other, Video, and Web.
   - The Meta format: **Text**, **CSV**, **TSV**, **JSON**.

5. When the scheduled file extraction is complete, it is displayed in the Job Notifications tray.



6. Click the **View** link in the Jobs tray and download the specific extraction file requested.

### To print the current drill point:

In the Navigate view, you can display the contents of the current drill point in printer friendly format in the browser window.

To display the current drill point in a print view:

1. With a drill point open in the **Navigate** view, select **Actions** > **Print** in the toolbar.
   A new tab is created with the print view of the current drill point.

2. Use the print option in your browser to send the printable view to the printer.

# Export Events in the Legacy Events View

In the Legacy Events view, the Actions menu has an option to export events from the event being viewed to an archive.

**Note:** You can only export files that you have permission to view or access.

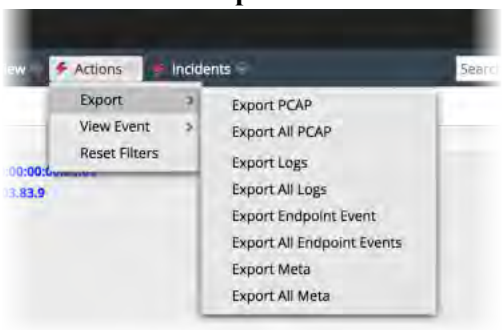
The export function queries the service for all sessions inside the selected time range and drill point to extract the content of each session. The details being exported are affected by both the time range and drill point at the time of exporting. In the File Extraction dialog, you can choose to export:

- PCAPs
- Logs
- NetWitness Endpoint events
- Meta values

The format of the exported archive: ZIP or GZIP file. After you send the request, a job is scheduled and you can track the job in in the Jobs tray. If there is an error retrieving the log or PCAP from the service, an error notification is displayed.

To extract files from an event:

1. While in the **Event view**, click an event.
2. Click **Actions > Export.**.



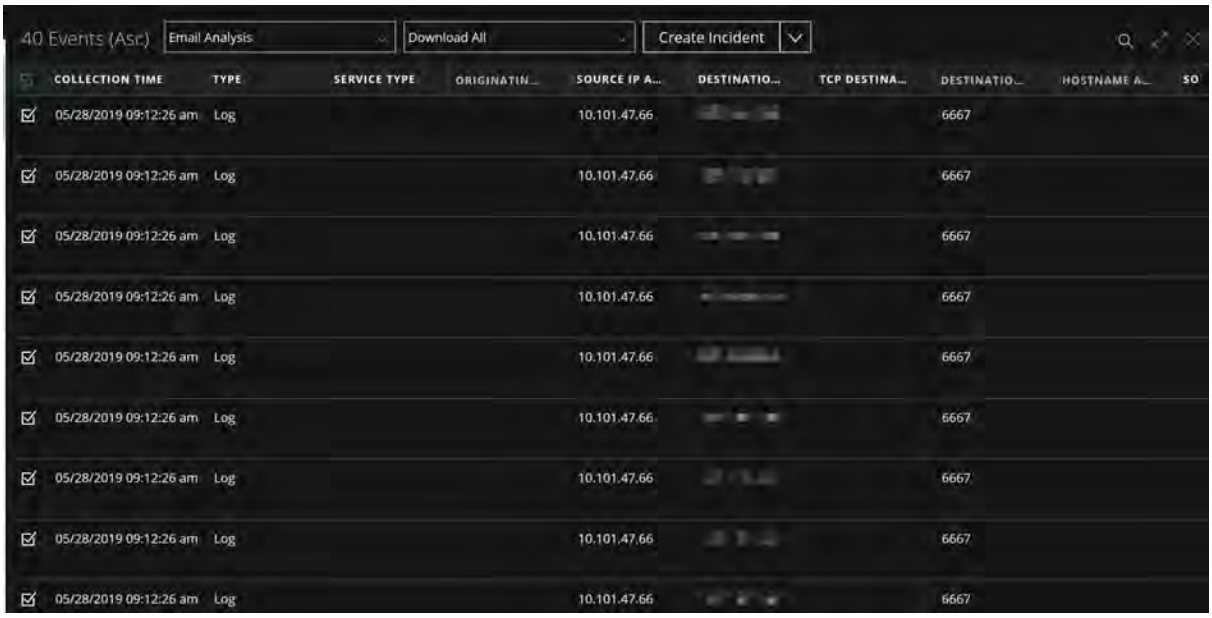
3. Select the export option.
   A message informs you that the PCAP is being downloaded.

# Add Events to an Incident in the Events View

When conducting an investigation in the Events view, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

**Note:** An administrator must configure the `respond-server.incident.manage` and `investigate-server.incident.manage` roles and permissions. For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate > Events**.
2. In the Events view, select one or more events.



3. Click **Create Incident.**
   The Create Incident dialog is displayed. Complete the information in the Create Incident dialog.

a. Select the severity. The alert summary field is a pre-defined value which is auto-populated but can be edited if required.

b. Type a name for the incident in the **Incident Name** field.

c. From the **Priority** drop-down list, select a priority for the incident. For example, an incident may be critical, high, medium, or low priority.

d. Select an assignee for the incident from the drop-down list. This list includes the built-in users that have access to Investigate as well as any custom users that have been added to your system. For example, this list might include users for admin, analyst, dpo, operator, and users for incident responders.

e. From the Categories drop-down list, select one or more categories of events that apply to this incident.

f. Click **OK**.
   An incident is created with the selected event in Investigate.

4. To add one or more events to an existing incident, select one or more events, and then click **Add to Incident**.

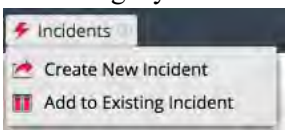
5. In the Add to Incident dialog, select the alert summary and severity, and select one or more open and existing incidents to which the incidents will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **OK**. The event is added to the selected incidents and updated in Respond.

# Add Events to an Incident in the Legacy Events View

When conducting an investigation in the Legacy Events, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

**Note:** An administrator must configure the required roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate > Legacy Events**.
2. In the Legacy Events view, select one or more events, and then **Incidents > Create New Incident**.



3. Complete the information in the Create an Incident dialog.

   a. Select the severity, an integer between 1 and 100, with 100 being the most severe.
   b. Type a name for the incident and describe the incident in the **Summary** field.
   c. Select an assignee for the incident from the drop-down list. This list includes the built-in roles that have access to Respond as well as any custom roles that have been added to your system. For example, this list might include roles for admin, analyst, dpo, operator and roles for incident responsers.
   d. From the **Categories** drop-down list, select one of more categories of alerts that apply to this incident.
   e. From the **Priorities** drop-down list, select a category for the incident. For example, an incident may be critical, high, medium, or low priority.
   f. Click **Save**.
   The new incident is created and is available immediately in the incident queues for the selected role in Respond.

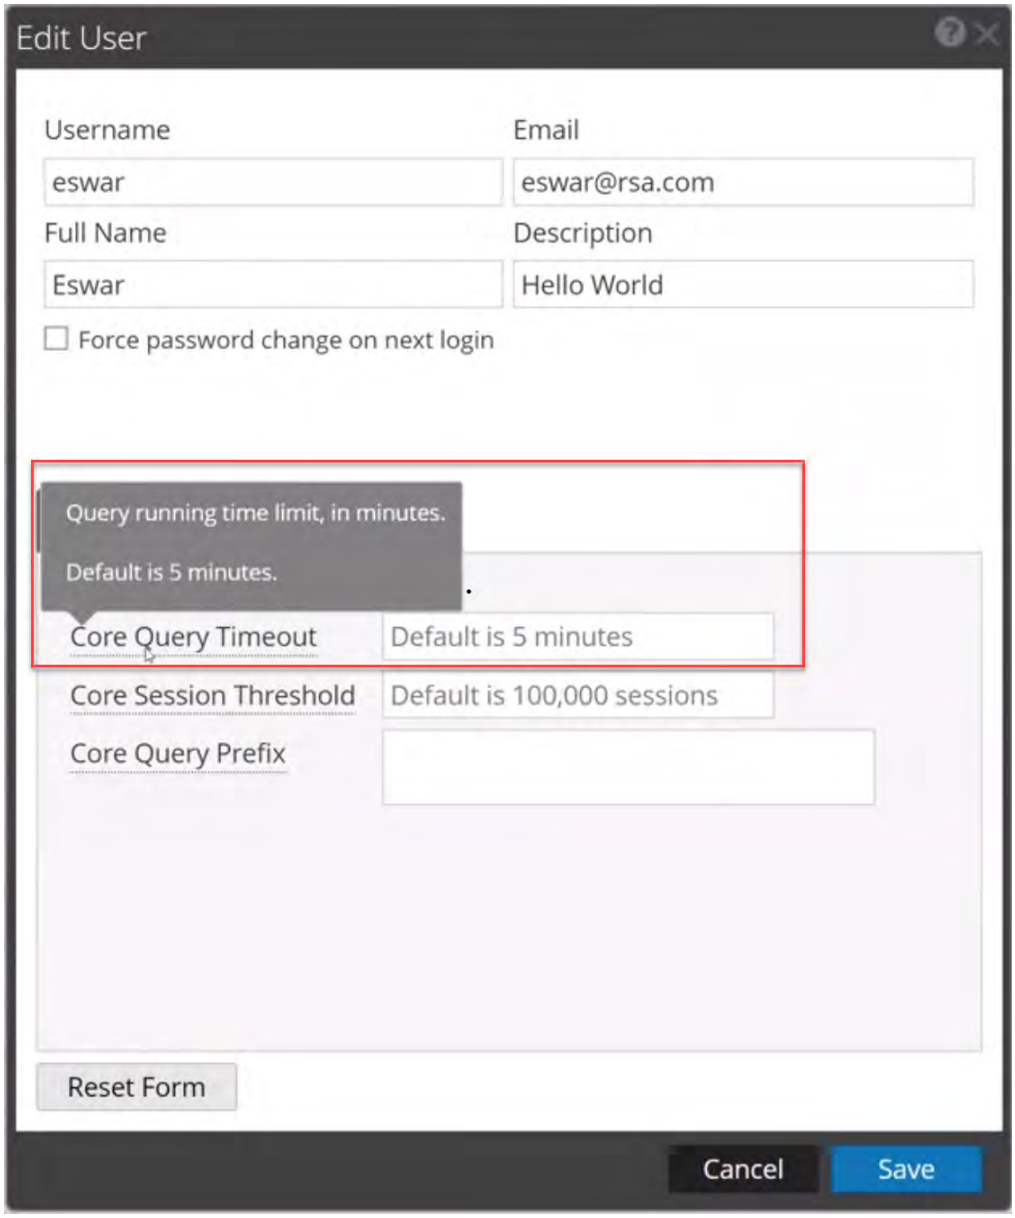
4. To add one or more events to an incident, select one or more events, and then **Incidents > Add to Existing Incident**.
5. In the Add Events to an Incident dialog, select the severity, and select one or more incidents to which the events will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **Add to Incident**.
   The events are added to the selected incidents and updated in Respond.

# Troubleshooting NetWitness Investigate

This section provides information about possible issues when using NetWitness Investigate.

## PCAPS and SDK Issues

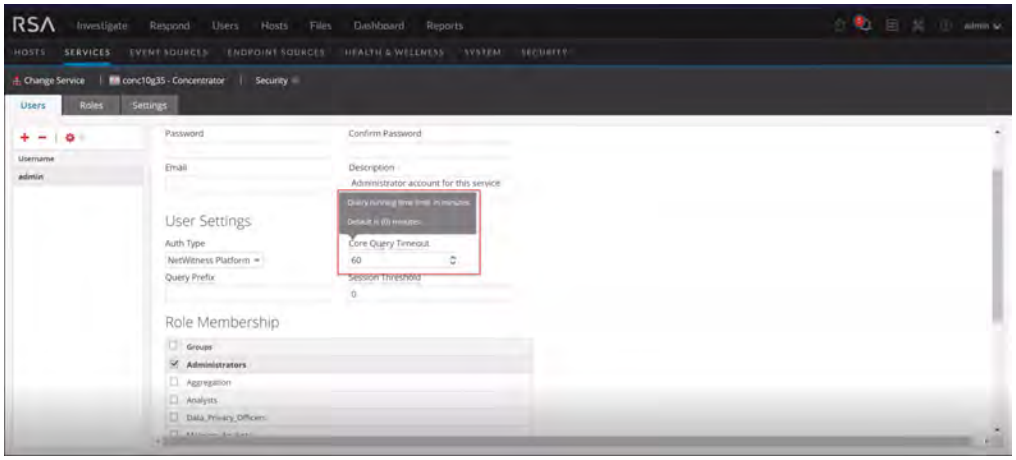
| | |
|---|---|
| Behavior | When you extract a large set of pcaps or run SDK Queries with huge matching sessions, the query fails or the session times out. |
| Issue | All users have default timeout of 5 minutes, when this time exceeds, the query stops running. Also, the Core service account has a default timeout of 60 minutes. |
| Explanation | Verify the query time for the user and the service accounts. You can modify the default settings from the user interface based on your requirement:<br>To edit the timeout settings for a user:<br>1. Log in to NetWitness Platform,<br>2. Navigate to **Admin** > **Security**<br>3. Select a user you want to edit.<br>4. Click the **Attributes** tab.<br>5. Edit the default **Core Query Timeout** settings. |



6. Click **Save**.

To edit the timeout settings for a core service account:

1. Log in to NetWitness Platform.
2. Navigate to **Admin** > **Security**.
3. Select a user you want to edit.
4. Click the **Attributes** tab.
5. Enter the credentials in the **Password** and **Confirm Password** fields.



6. Click **Save**.

## Navigate View and Legacy Events View Issues

| | |
|---|---|
| Behavior | A meta key that normally returns values in the Navigate view returns values, but has a `Not Indexed` message following the meta key name. For example, the in this figure the Service Type meta key is followed by the message: `Service Type[service] Not Indexed`.<br> |
| Issue | When you first set up the environment or very rarely after performing a data reset on the broker due to other issues, you see meta keys as Not Indexed when they are indexed at meta key or meta values level. |
| Explanation | To fix the issue on a Broker, log out of NetWitness Platform and then log in again. Valid sessions will be displayed. |

| | |
|---|---|
| Message | `Not indexed; will experience longer than usual load times.` in the Manage Meta Groups dialog. |
| Issue | Meta keys in the Manage Meta Groups dialog are marked by a red exclamation point, and the error message is displayed. This can occur when investigating a Broker or Decoder while adding a meta group with meta keys that are not indexed in the index file or the custom index file for the service.<br>For a Broker, it could mean that the Broker has not begun aggregating data from a Concentrator. In this case the Broker will not have the contents of the custom index file from the aggregate services and the keys will not be indexed.<br>For a Decoder, it means that the meta keys are not indexed in the Decoder index or custom index file. |

| | |
|---|---|
| Explanation | To fix the issue on a Broker, log out, log in, and restart the Broker service so that it can aggregate the meta key information from connected Concentrators. To fix the issue on a Decoder, edit the custom index file to index the meta keys, log out, log in, and restart the Decoder service. |

| | |
|---|---|
| Behavior | When downloaded from the Event Reconstruction view, logs and metadata are always in text format irrespective of the format selected in the Legacy Events view. |
| Issue | When you download metadata or a log in the Event Reconstruction view, the format that you selected in the Legacy Events view is not used. The exported data is always in text format. |
| Explanation | Download metadata and logs from the Legacy Events view if you want to use a format other than text format. |

## Events View Issues

| | |
|---|---|
| Message | `Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.` |
| Issue | When you click **Pivot to Endpoint** in the Events view, no data is displayed and the message is displayed. |
| Explanation | Version 4.4 of the NetWitness Endpoint Thick Client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the `index-concentrator-custom.xml` file on the Concentrator. The NWE Thick Client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4. |

| | |
|---|---|
| Behavior | Download jobs are in a Waiting state or Failed state in the Jobs tray during and after upgrading the software to Version 11.4. |
| Issue | If you had download jobs running while your administrator was upgrading the software, you may see a job in a Waiting state while the upgrade is in progress and then in a Failed state after the upgrade is complete. You cannot resume or cancel the failed job. |
| Explanation | To delete the failed jobs, select the failed jobs in the Jobs tray and click  . |

| | |
|---|---|
| Message | Event counts in the Filter Events panel and the Events panel may sometimes differ when showing results for the same query. |
| Issue | The Filter Events panel uses only index data to produce counts of events, which is less |

| | |
|---|---|
| | accurate than the Events panel. The Events panel results are filtered for exact matches on data retrieved from the meta database, which takes longer to process. |
| Explanation | At worst the difference is in false positives in the Filter Events panel, not false negatives; so you will not miss an event. |

| | |
|---|---|
| Message | `Event Analysis requires all core services to be NetWitness 11.1. Connecting prior versions of services to the 11.1 NetWitness Server results in limited functionality (see "Investigate in Mixed Mode" in the *Physical Host Upgrade Guide*).` |
| Issue | When attempting to investigate a service that has not been updated to Version 11.1 in the Event Analysis view, the informational message is displayed. |
| Explanation | When an analyst opens the Event Analysis view in mixed mode (that is, some services are upgraded to 11.1 and later, and some are still on 11.0.0.x or 10.6.x), Role-Based Access (RBAC) is not applied uniformly. This affects viewing and downloading content, and validation of filters in the interactive breadcrumb. You will see this informational message when you open Events. As you select a service, services that are not up to date are displayed in a red box, with the message that the service is not up to date. When your administrator has upgraded all connected services to 11.1 and later, these features work as expected. |

| | |
|---|---|
| Message | `Forbidden. You cannot access the requested page.` |
| Issue | When attempting to access the Events view, the view opens with the message. |
| Explanation | Your administrator has prevented access to the Events view using role and permissions. |

| | |
|---|---|
| Behavior | If you can download an event in the Events view, but get a 0-byte file, the administrator may have restricted access to the content. |
| Issue | Role-Based Access Controls applied by your administrator allowed you to download an event for which you did not have permission; therefore, the file download was empty. |
| Explanation | If you believe you should have access to the event, contact your administrator. |

| | |
|---|---|
| Message | `Insufficient permissions for the requested data.` |
| Issue | While attempting to access an event in the Events view, the message is displayed. |
| Explanation | You have entered an event ID for an event that you do not have permission to view. The administrator may have placed some restrictions to limit access by role and permissions. |

| | |
|---|---|
| Message | `Invalid session ID: <<eventId>>` |
| Issue | No `sessionId` matches the `sessionId` that you queried. |
| Explanation | The reason for an invalid session ID can vary. Perhaps you edited the session ID manually, and no such session exists. Another case may be when you query a Broker, and the aggregated data has not been refreshed, you may see this error for a session that no longer exists. |

| | |
|---|---|
| Behavior | Investigation Profiles and built-in column groups are not present in 11.1 Event Analysis. |
| Issue | Post upgrade to RSA NetWitness v11.1, the default column groups - Endpoint Analysis, Outbound SSL and Outbound HTTP are not added under column groups. Also, a few of the Investigation Profiles are missing post upgrade. |
| Explanation | It is observed that this issue occurs only when you have created a custom column group with the name which is same as one of the new 11.1 OOTB custom column group name. For example, if you create a custom column group in 11.0 with name **RSA Endpoint Analysis** then after upgrade to 11.1. Due to the same name already existing in 11.1, OOTB column groups and built-in profiles will not be available in the UI.<br>To fix this, change the name of custom column group to something other than one of the OOTB column groups and restart the jetty server by using the following command on the NetWitness server:<br>`systemctl restart jetty` |

| | |
|---|---|
| Message | `Memory limit of <XXXXXX> GB reached, controlled by setting max.query.memory` |
| Issue | The query that you submitted failed because the result set was too large, and the memory limit set by `max.query.memory` was reached. |
| Explanation | To avoid this error, try to further limit results by narrowing the time range, adding filters, and decreasing the number of columns in the column group. You can also ask an administrator to limit the number of events returned. |

| | |
|---|---|
| Behavior | No text data was generated during content reconstruction. This could mean that the event data was corrupt or invalid, or that an administrator has disabled the transmission of raw endpoint events in the Endpoint server configuration. Check the other reconstruction views. |
| Issue | When you reconstruct an event as text in the Events view, no data is displayed and the message is displayed. |
| Explanation | If you do not see the raw text in other Events views or Legacy Events view reconstructions, and you believe the data is not corrupted or invalid, your administrator has likely disabled transmission of raw endpoint events on the NetWitness Endpoint server. Contact your administrator for additional information. |

| | |
|---|---|
| Message | `Rule Syntax error: Unrecognized key "<meta key or meta entity name>"`<br>`Syntax error: Unrecognized key "<meta key or meta entity name>"` |
| Issue | While querying a service, the matching events are not listed and the message is displayed in the query console and the Events view.<br>  |
| Explanation | The query you entered is querying a meta entity that is not configured properly. All upstream devices connected to the Broker being queries should have the same entity configuration. This error indicates that the Broker is operating with mismatched entity definitions. Ask your administrator to review the configuration described in "Index Customization" in the *Core Database Tuning Guide*. |

| | |
|---|---|
| Message | `Selected Column Group is no longer available. The default summary column group has been selected instead.` |
| Issue | If you had set a preferred column group before the 11.4 upgrade, on your first visit to the Events view, the flash message is displayed even when the column group is available or is the default group (summary). This issue was resolved in Version 11.4.1. |
| Explanation | This is a one-time occurrence. If you reload the Events view, the message is not displayed. |

| | |
|---|---|
| Message | `Session is unavailable for viewing.` |
| Issue | While querying an event ID, the reconstruction is not displayed and the message is displayed. |
| Explanation | The query you entered is trying to look at restricted data, for example, if you are allowed to see only log data and you are using a link to network data . |

| | |
|---|---|
| Message | `The query on channel <channel-number> was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)` |
| Issue | If you continually get this timeout message, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or |

| | |
|---|---|
| Explanation | other warnings that may need to be addressed to increase query response time. |
| | If there are no messages indicating any specific warnings, ask your administrator to increase the Core Query Timeout from 5 minutes to 10 minutes as described in the *System Security and User Management Guide*. |

| | |
|---|---|
| Message | `The session id is too large to be handled:<<eventId>` |
| Issue | The session id that you typed in, or got from the Legacy Events view or Navigate view is too large. |
| Explanation | If you manually typed the sessionId or edited a sessionId in the Events view, you may have created an integer that is too large for Events to process. |

| | |
|---|---|
| Behavior | When reconstructing network events with a large number of packets (>250) in the Events view > Packets panel, with the option to display only payloads enabled and the packets per page setting higher than the default (100), the current browser tab may become unresponsive for up to 45 seconds as it is working to render the payloads. |
| Issue | Depending on the amount of resources (memory and CPU) on the client machine and the number of packets in the event there may be a performance lag when displaying only payloads in packet reconstruction. |
| Explanation | To limit the amount of data processed in a reconstruction of a single event, change the Packets per Page setting in the footer to a lower value.<br>  |

| | |
|---|---|
| Behavior | When working in the Version 11.4 Events view, the Query Profile drop-down menu and Column Group drop-down menu do not function. |
| Issue | You do not have permission to read columns groups and profiles. The default column group , Summary List, is applied to the Events list, and you cannot change the column group, create a column group, or delete a column group. |
| Explanation | This occurs only when the administrator has created a custom role for you instead of assigning the default Analyst role. Ask your administrator to enable column group read and profile read permission for your role. |

| | |
|---|---|
| Issue | No matching Endpoint data available on Investigate > Events view > Host tab. |
| Explanation | The Endpoint data may not be available due to any of the following:<br>• **No Endpoint Deployment** – You must install Endpoint Log Hybrid, see "RSA NetWitness Endpoint" in the *Physical Host Installation Guide*. |

- **Endpoint data is not captured for the host associated with the selected network event-** Make sure that NetWitness Endpoint Agent is installed, and expanded network visibility is configured to track the network events. To enable expanded network visibility, see “Creating Groups and Policies” in the *NetWitness Endpoint Configuration Guide*.

  **Note:** For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for RSA NetWitness Platform*.

- **Concentrators or Endpoint services are offline or very slow** – You must check the status (online or offline) of the services on Health and Wellness. If the service is online, you must check the Endpoint server logs and (Endpoint) Concentrator logs for details.
- **Endpoint data is rolled over for the host associated with the selected network event** - The Endpoint data may be rolled over due to data retention period configured. You must configure the data retention period to retain the endpoint data for a longer period. For more information, see “Configure Data Retention” in the *Data Privacy Management Guide*.

# Investigate Reference Materials

This section provides is intended to help you understand the purpose and application of NetWitness Investigate views. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Investigate View
- Navigate View
- Legacy Events View
- Events View
- Add/Remove from List Dialog
- Add Events to an Incident Dialog
- Column Groups Dialogs
- Context Lookup Panel
- Create an Incident Dialog
- Events View - Email Tab
- Events View - Text Tab
- Events View - Packet Tab
- Events View - File Tab

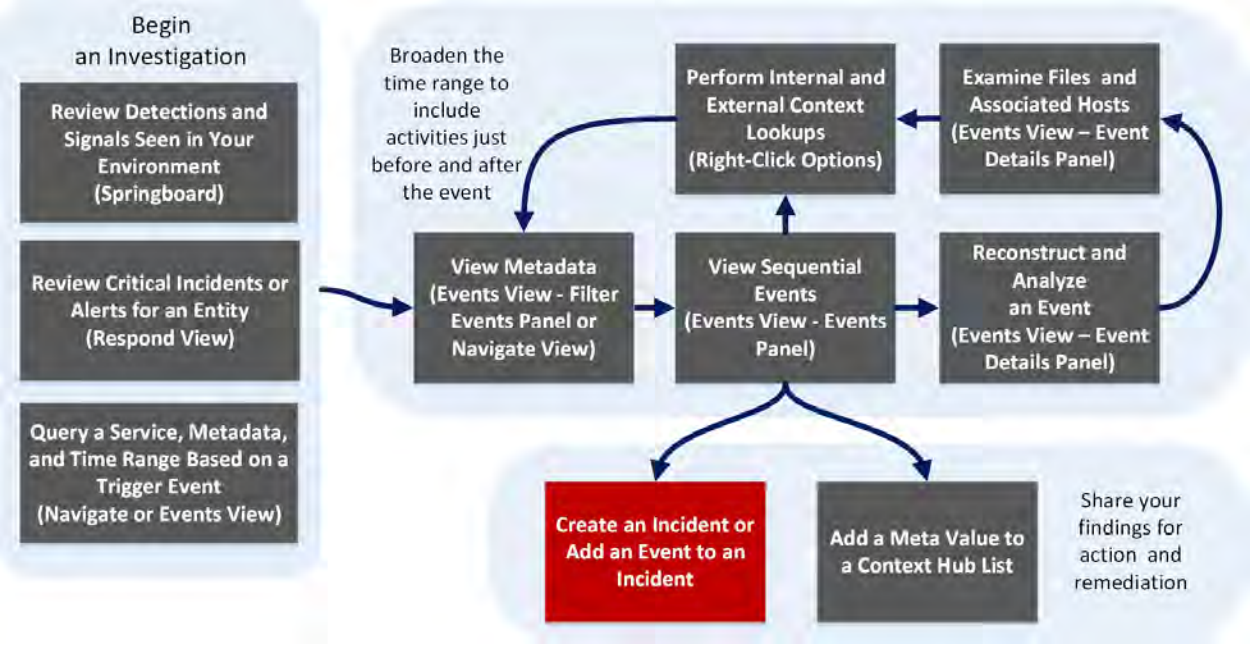
- Investigation Tab - User Preferences Panel
- Legacy Event Reconstruction View
- Manage Default Meta Keys Dialog
- Meta Groups Dialogs
- Navigate View
- Query Dialog
- Query Profiles Dialogs
- Settings Dialogs for Investigate Views

# Add Events to an Incident Dialog

In the Add Events to an Incident dialog, analysts can add alerts to an existing incident so that incident responders look at the associated events as part of an incident response. To access this dialog while investigating a service in the Events view and the Legacy Events view, see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View.

## Workflow



## What do you want to do?

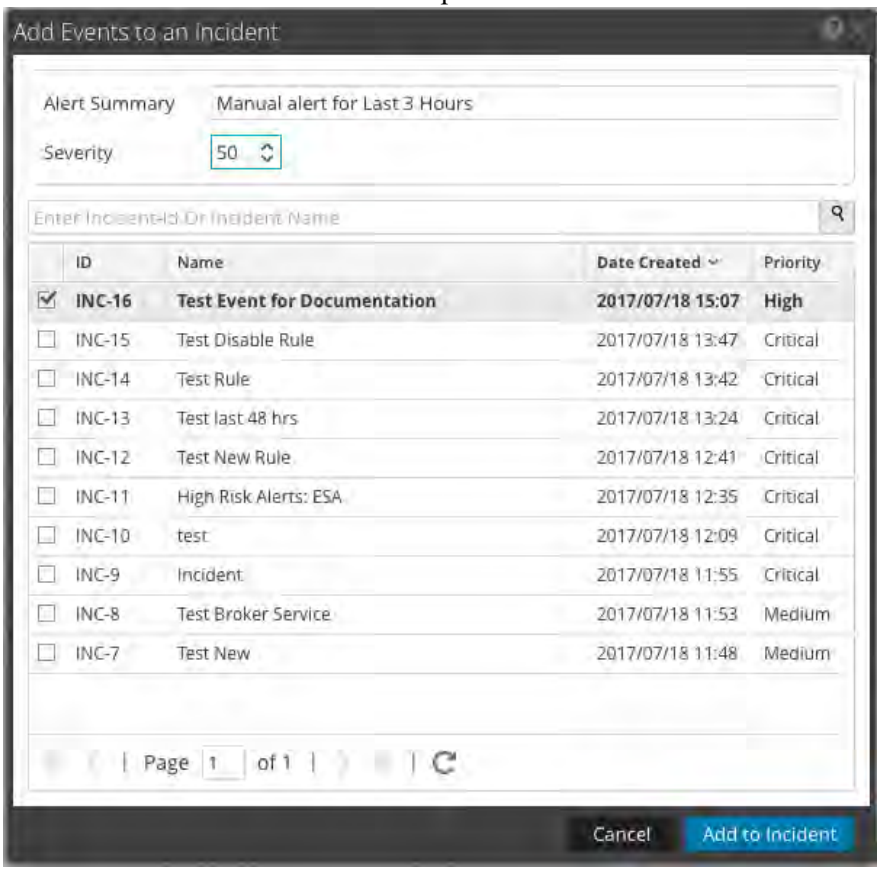
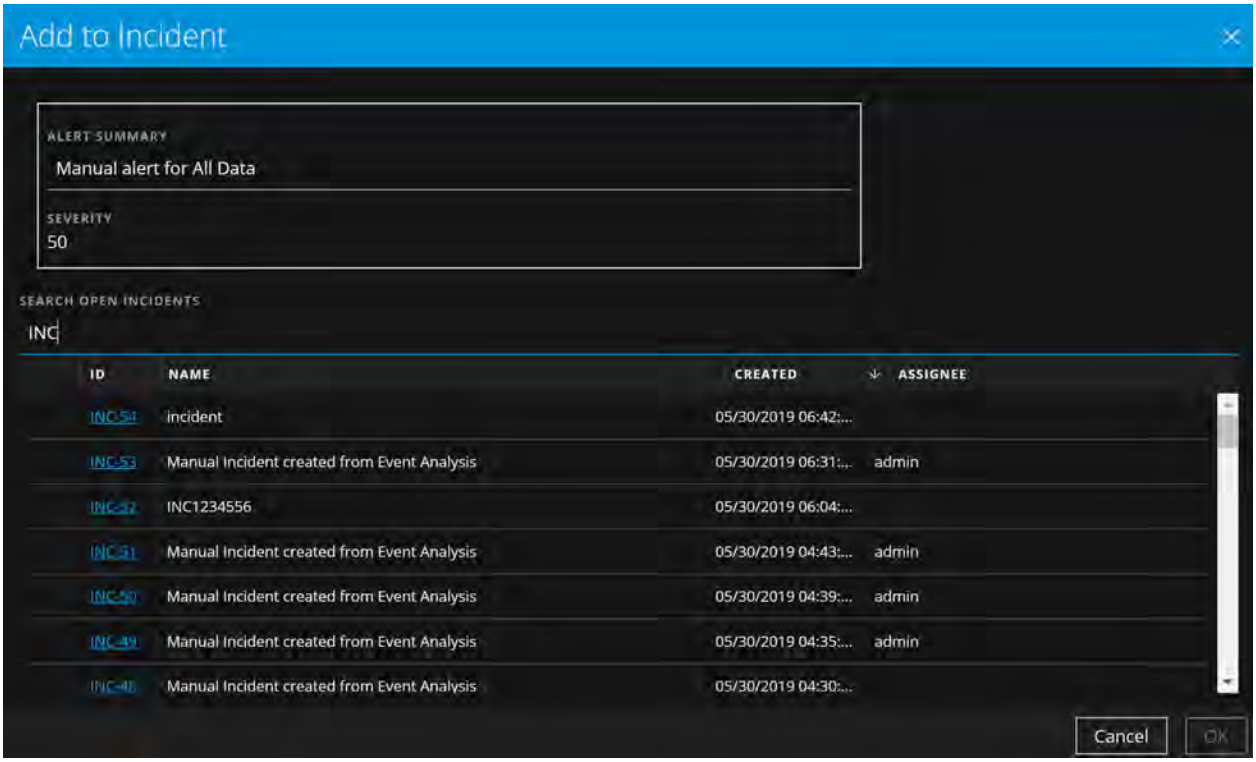
## Quick Look

The following figure is an example of the Add Events to an Incident dialog in the Legacy Events. The table describes the information and options in the Add Events to an Incident dialog .



| Feature | Description |
|---|---|
| Alert Summary | The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100. |
| Search | Allows you to search for an existing event. |
| ID | The ID of the incident. You can sort IDs in ascending or descending order. |
| Name | The incident name. You can sort the Name in ascending or descending order. |
| Date Created | Displays the date and time the incident was created. You can sort the dates in ascending or descending order. |
| Priority | Displays the priority of the incident: either low or critical. |
| Cancel | Closes the dialog without saving changes. |
| Add to Incident | Adds the alerts to the incident. A dialog confirms that alerts are successfully added |

The following figure is an example of the Add to Incident dialog in the Events view. The table describes the information and options in the Add to Incident dialog.



| Feature | Description |
|---|---|
| Alert Summary | The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. |
| Severity | The Severity field reflects the Severity of the selected alert, an integer between 1 and 100. |
| Search Open Incidents | Allows you to search for an existing incidents. |
| ID | The ID of the incident. |
| Name | The incident name. |
| Created | Displays the date and time the incident was created. |
| Assignee | Displays the team member currently assigned to the incident |
| Cancel | Closes the dialog without saving changes. |
| OK | Adds the alerts to the incident. A confirmation message is displayed after the incident is successfully added |

# Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add an entity or meta value to an existing Context Hub list, remove an entity or meta value, or create a new Context Hub list containing the entity or meta value. When you look up an IP address or other entity and you find it suspicious or interesting, you can add it to a list that has been added as a data source. An example of a commonly used list is a white list or black list. This improves the visibility of the suspicious IP addresses and reduces false positives that do not need further investigation.

You can add entities or meta values to more than one list. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connection IP addresses related to remote access. If a list is not available, you can create a list.

The dialog is available in NetWitness Investigate and in NetWitness Respond. When working in Investigate, in the Navigate view, Legacy Events view, or Events view, you can add meta values for the `Source IP`, `Destination IP`, or `Username` meta keys to an existing context hub list or you can create a new list containing the meta values. When you add meta values to a list, you can look up additional context on those meta values.

- To display the dialog in the Navigate view or the Legacy Events view, right-click a meta value under `Source IP`, `Destination IP`, or `Username`) and select **Add/Remove from List** in the context menu.
- To display the dialog in the Events view, hover over a value and select **Add/Remove from List** in the Actions section of the context tooltip.

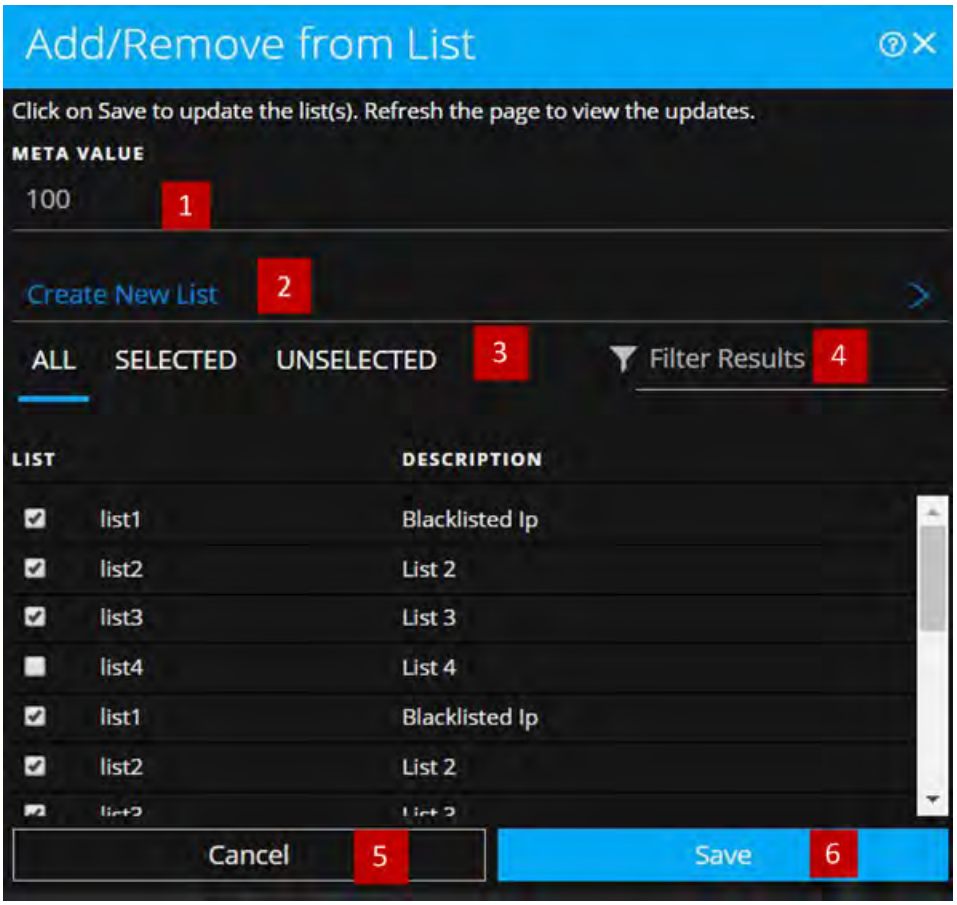
## Quick Look in the Events View

The following is an example of the **Add/Remove from List** dialog in the Events view.



1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.

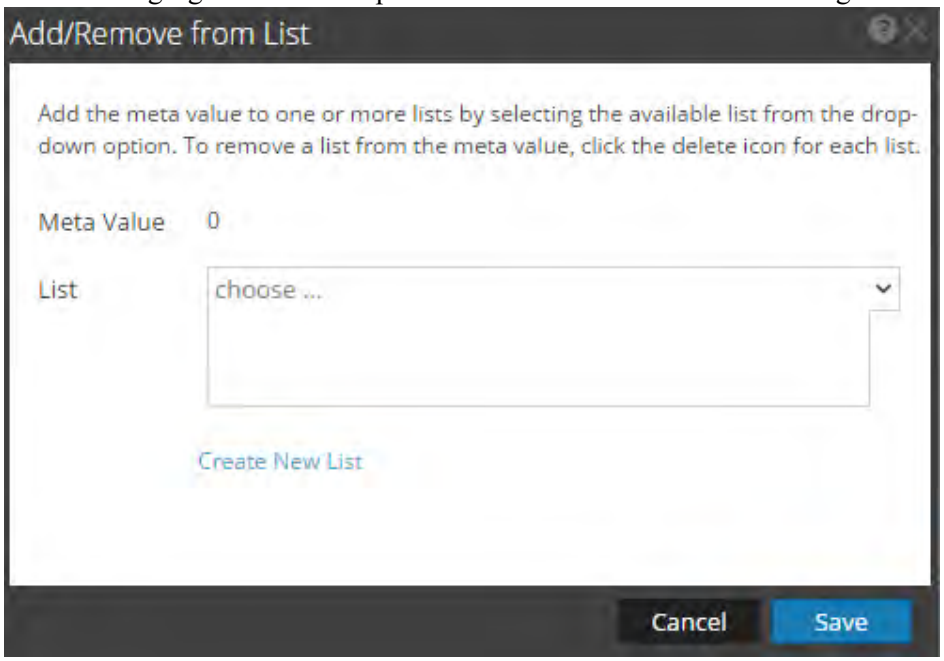
The following table shows the options in the Add/Remove from List dialog.

| Option | Description |
|---|---|
| META VALUE | Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value. |

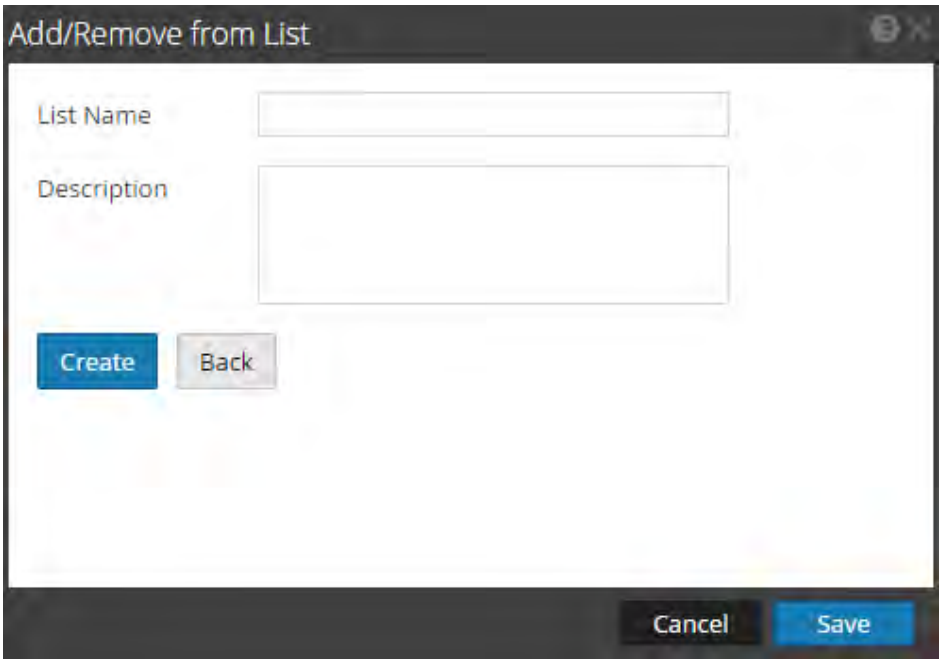
| Option | Description |
|---|---|
| Create New List | Displays a dialog to create a new list using the selected meta value. |
| ALL | Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list. |
| SELECTED | Shows only the lists that contain the selected entity or meta value. (All lists are selected.) |
| UNSELECTED | Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.) |
| Filter Results | Enter the name or description of a specific list to search from multiple lists. |
| LIST | Displays the name of all the lists. |
| DESCRIPTION | Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses. |
| Cancel | Cancels the operation. |
| Save | Saves the changes. |

## Quick Look in the Navigate and Legacy Events Views

The following figure is an example of the Add/Remove from List dialog when initially opened.



The following figure shows the dialog when you select Create New List.



The following table describes the features of the Add/Remove from List and Create New List dialogs.

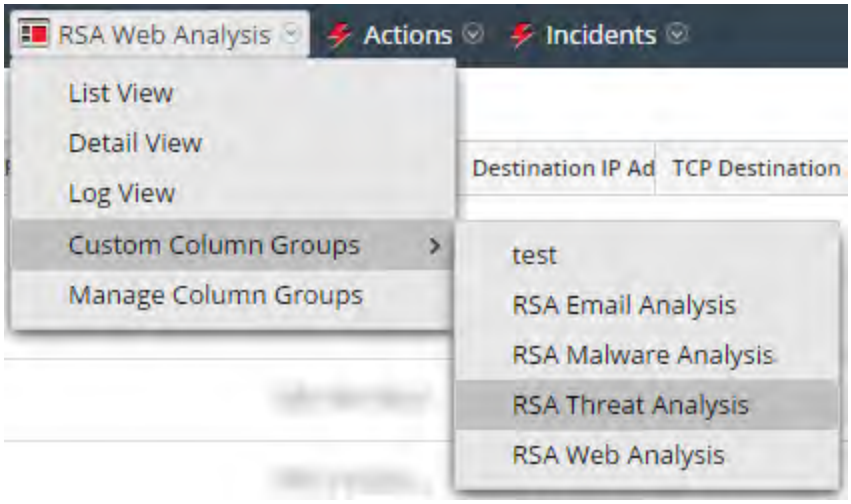
| Feature | Description |
|---|---|
| Meta Value | The selected meta value to be added to the existing or new list. |
| List | The list to which the selected meta value must be added. A drop-down menu provides a list of available lists to which you can add the meta value. |
| Create New List | Opens a new dialog in which you can create a new list for the selected meta value. |
| List Name | The name of the new list. |
| Description | The description of the new list. |
| Create | Creates a new list after entering the required fields. |
| Back | In the new list mode, cancels the new list creation and returns to the original dialog. |
| Cancel | Cancels the addition of the meta value to a list and closes the dialog. |
| Save | Saves the changes made to the lists and closes the dialog. |

# Column Groups Dialogs

Column groups allow you to format the events list to include only the relevant meta keys in the Events view and Legacy Events view (see Use Columns and Column Groups in the Events List). When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, the default column group includes columns for **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The RSA Email Analysis list has only that contain information useful when investigating email.

The column group definition includes the meta keys to use as column titles, the position of the column in the list, and the default width of the column. You can add, delete, import, export, and edit column groups. At fresh installation, built-in column groups are available. The built-in column groups are prefixed with RSA and can be duplicated but cannot be edited or deleted. You can also create custom column groups.

- The Create Column Group dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group > New Column Group** in the **Events** view toolbar.
- The Column Group Details dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group** in the **Events** view toolbar, then click the edit icon ( ) next to a custom column group name.
- The Manage Column Groups dialog is for the Legacy Events view (Version 11.4) , and the Events view (Version 11.4 and earlier). The Manage Column Groups dialog has these features that are not yet available in the Create Column Group dialog: set column width, import, and export. To access this dialog, go to **Investigate > Legacy Events** and in the **View** drop-down list select **Manage Column Groups**. The **View** option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.



After column groups are defined, you can use them in other Investigate views. In the Navigate view, Query Profiles allow you to select a column group to use when the profile is applied. In the Events view and the Legacy Events view, you can select a column group to apply to the Events panel.

RSA Threat Analysis
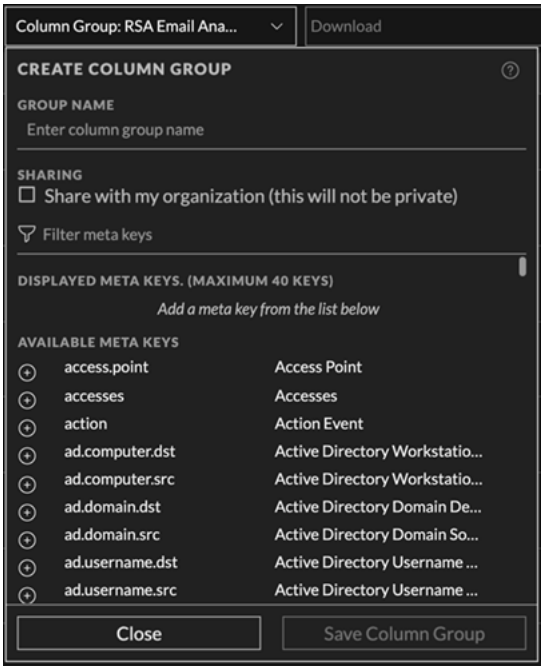
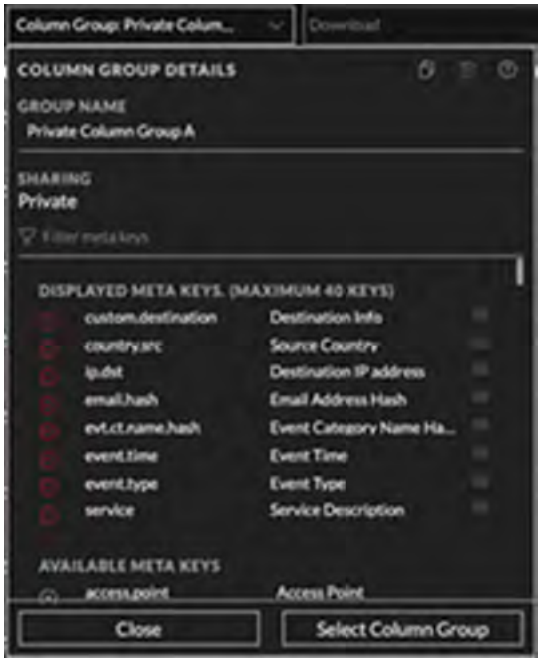
RSA User & Entity Behavior Analysis
RSA User Group
RSA User Group
New Column Group

| Feature | Description |
|---|---|
| Visibility Options | (Version 11.5 and later) Control the types of column groups that are visible in the list, using any combination of the visibility options (blue = selected, black = not selected):<br>**Private** = display private groups that only you can manage<br>**Shared** = display shared groups that anyone in your organization can manage<br>**RSA** = display built-in groups that only RSA can manage<br>The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. |
| Filter Column Groups | Filters the list of column groups as you type text so that only group names that contain that text are displayed. |
| Column Group List | The list of column groups consists of custom and built-in groups, which are distinguished by the icons that precede the name. In Version 11.5 and later, custom groups can be shared or private. The RSA column groups are built-in column groups. The icons distinguish the private custom groups, shared custom groups, and built-in groups. |
| New Column Group | Displays the Create Column Group dialog, where you can create a custom column group. |

The Create Column Group dialog, shown in the figure on the left, allows you to define a custom column group. The figure on the right illustrates the Column Group Details dialog, in which you can edit a custom column group. The table describes the fields and options in the dialogs.

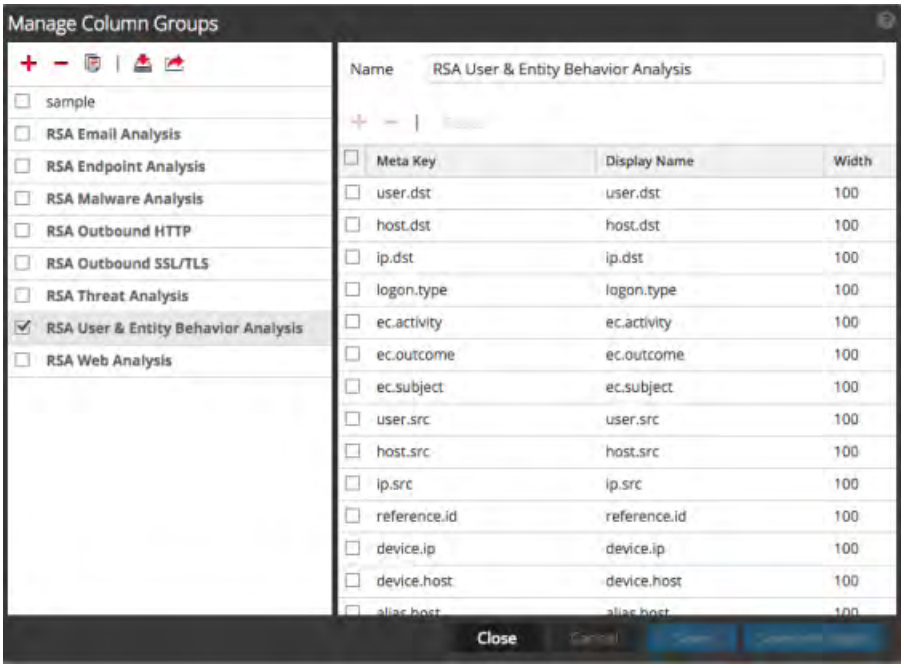




| Feature | Description |
|---|---|

| Feature | Description |
|---|---|
| | Deletes the custom column group in the Column Group Details dialog. This action is irreversible and applies globally; the column group is no longer available to anyone who is using it on this service. |
| Group Name | Displays the name of the column group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom column group. |
| Sharing | In Version 11.5 and later, you can create column groups that are shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared. |
| Filter Meta Keys | Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed. |
| Displayed Meta Keys | Displays a scrollable list of meta keys that are selected for use in the custom column group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list , and drag meta keys up or down to change the order in this list ( ). |
| Available Meta Keys | Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking next to the meta key name adds it to the Displayed Meta Keys list. |
| Close button | Closes the dialog. |
| Save Column Group | For the Create Column Group dialog only, saves the new column group. |
| Reset | For the Column Group Details dialog only, reverts the edited column group to the last saved state. |
| Update Column Group | For the Column Group Details dialog only, applies changes to an edited column group. |
| Select Column Group | Applies the column group. |

## Quick Look - Manage Column Groups Dialog



The Manage Column Groups dialog has two panels: Groups and Settings. At the bottom of this dialog are four buttons: Close, Cancel, Save, and Save and Apply.

The left panel is the Groups panel. This is where you can add, delete, import, or export column groups. At the top of the panel is a toolbar. Below the toolbar is a list of added column groups, where you can select one or more groups.

The following table lists the actions in the toolbar.

| Action | Description |
|---|---|
| + | Adds a column group. Clicking this button highlights the Settings panel on the right, where you can name the column group and add or delete meta keys. At least one meta key is required to add a group. |
| − | Deletes a column group. A confirmation dialog is displayed before the selected group is deleted. OOTB column groups cannot be deleted. |
| | Creates a copy of the selected column group. |
| | Displays the Import Column Groups dialog, where you can select a file to upload. |
| | Exports one or more selected groups to your local file system. |

The right panel is the Settings panel. This is where you can create and edit column groups. This panel contains the Name field, a toolbar, and a list. The following table describes the features of the Settings panel.

| Feature | Description |
|---|---|
| Name | The name of the selected column group. |
| + | Adds a new row to the list of meta keys, where you can open a drop-down menu to select a new meta key. |
| − | Deletes one or more selected meta keys. Displays a confirmation dialog before deleting. |
| Reset | Returns the column group to its most recently saved settings. |
| Meta Key | Lists the meta keys added to the selected column group. |
| Display Name | Lists the names of the meta keys as they are displayed in the Navigate, Events, and Event Analysis views. |
| Width | Specifies the width of each meta key's column. The width can be set between **10** and **1000**. The default width is **100**. |

The following table provides descriptions of the action buttons.

| Feature | Description |
|---|---|
| Close | Closes the dialog without saving. |
| Cancel | Cancels all unsaved changes. |
| Save | Saves all changes without closing the dialog. |
| Save and Apply | Saves and applies all changes immediately, closing the dialog. |

# Context Lookup Panel

After an administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view, Legacy Events view, and Events view (Version 11.2 and later). The Context Hub service is pre-configured with a default meta type and meta key mapping. For information about mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

The Context Lookup panel is displayed on the right side of the Navigate view, Legacy Events view, or Events view. Meta values that have been added to a Context Hub list are highlighted in gray in the Navigate view or Legacy Events view results. In the Events view, they are marked by an underscore. When you right-click a highlighted value and select **Context Lookup** in the resulting context menu, the lookup results are displayed in the Context Lookup panel for configured sources for the selected meta value. You can select a source in the Context Lookup panel icon bar to view the contextual information.

There are some differences between the appearance and contents of the Context Lookup panel when open in the Navigate view or Events view and when open in the Events view.

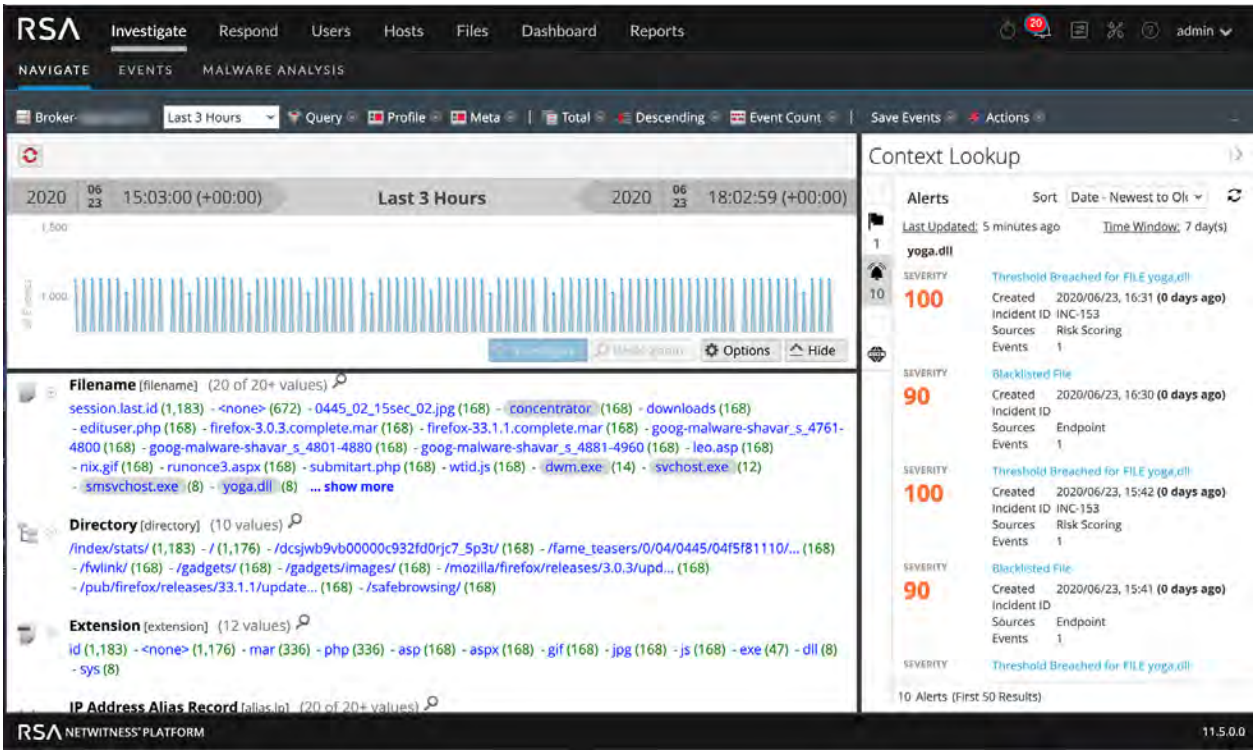
## Quick Look (in the Navigate and Legacy Events Views)

The following figure is an example of the Context Lookup panel as it appears in the Navigate view. Controls and features are described in the table.



| Feature | Description |
|---|---|
| Source Options Bar | Displays the icons for the available sources: Endpoint, Incidents, Alerts, and Lists. |
| Source Name | Displays the source name based on the selected icon:<br>• Endpoint<br>• Incidents<br>• Alerts<br>• Lists<br>• Live Connect |
| Sort | Provides a drop-down of sort options for the listed context information. Possible sort options are Severity - High to Low, Severity Low to High, Date - Oldest to Newest. and Date - Newest to Oldest. The sorting options vary by source type. |
| | Refreshes the lookup results. |

| Feature | Description |
| --- | --- |
| <n items> (First <n> Results) | The footer provides a count of results currently displayed and the total number of results. For example, 5 Alerts (First 50 Results). |

## Incidents

Incidents are displayed based on time first (Newest to Oldest) and then priority status. The following information is displayed for incident lookups:

- Incident Name and ID
- Priority status of the incidents
- Risk Score value of the incidents
- Date when the incident was created
- Status of the incident
- Assignee for the incident
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*.
- Sort: This drop-down field provides options to change the sorting of result based on time or priority.

## Alerts

Alerts are displayed based on the Severity. ;The following information is displayed for alert lookups:

- Alert Name
- Severity value of the alerts
- Date when the alert was created
- Incident ID: This is the ID of the incident that the alert is associated with (If any).
- Sources: Event source name
- Number of events associated with the alert.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*
- Sort: This drop-down field provides option to change the sorting of result based on time or priority.

### Lists

The following information is displayed for list lookups.

- List Name
- Owner who created the list
- Created Date
- Last Updated Date
- Description of the list

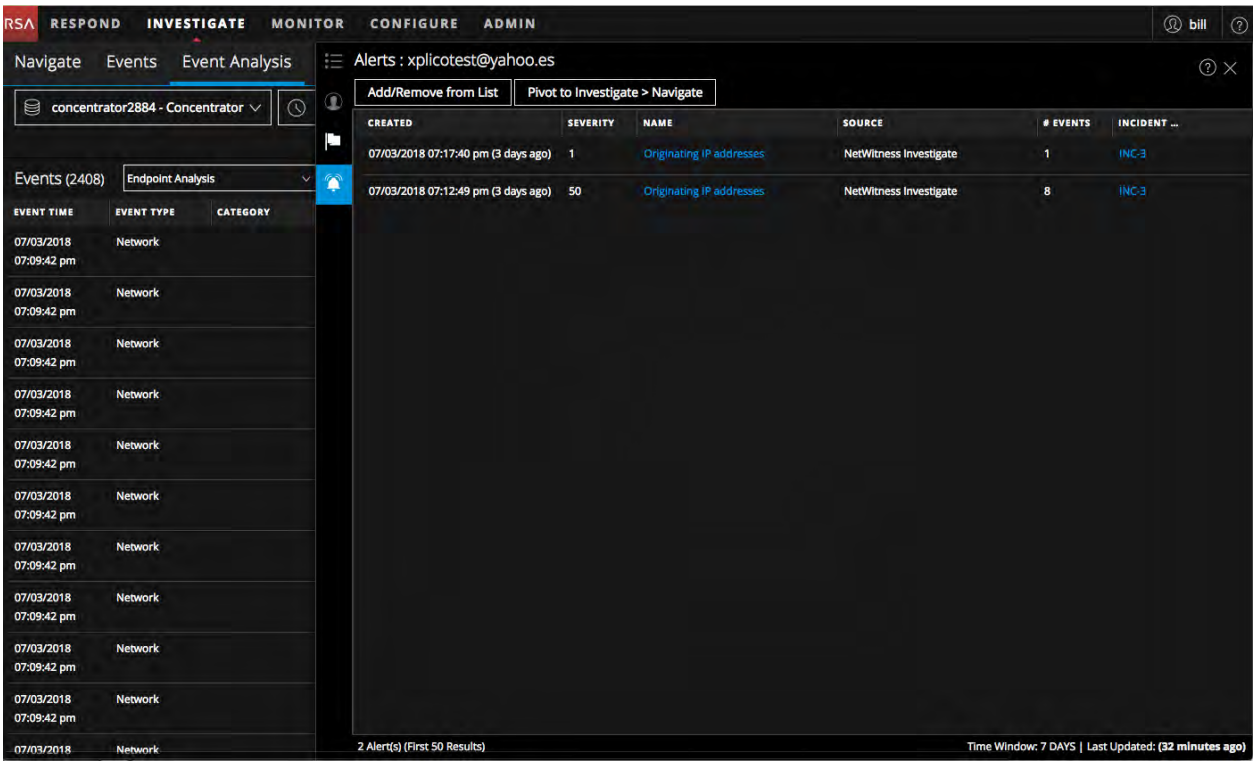
### Endpoint

The following information is displayed for Endpoint lookups.

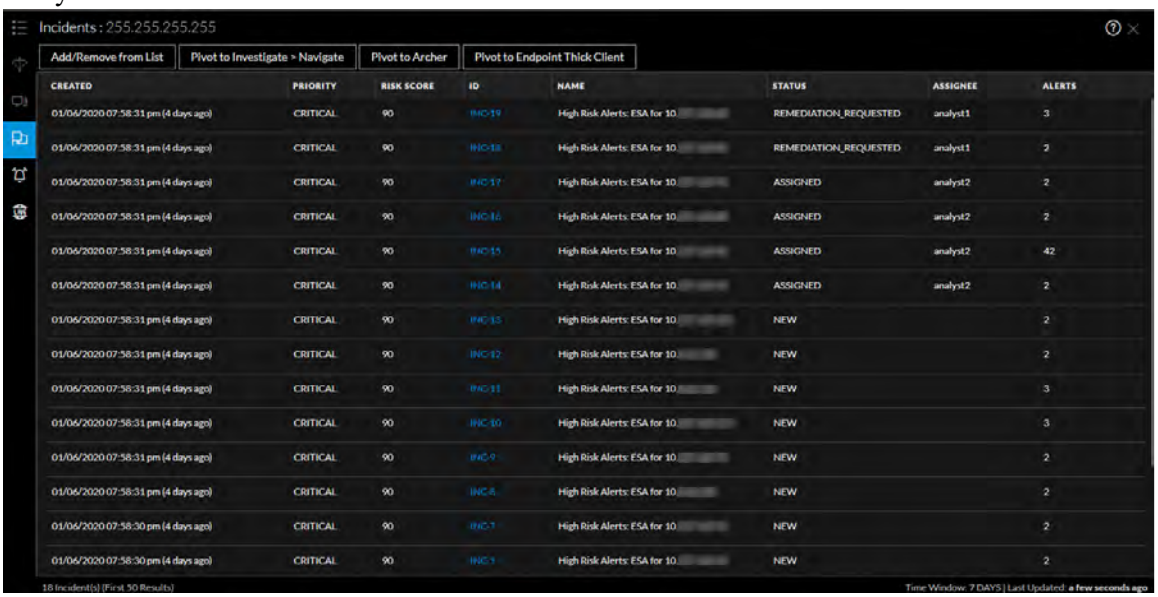
- Machine name and IP address of the machine.
  By clicking on the IP or Endpoint machine name, you will be navigated to Endpoint UI to perform further investigation.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Machine Score: A machine IIOC score is aggregated based on the module scores.
- Number of modules: Number of active files for the selected machine.
- Last Updated: Indicates when the scan results were last updated in Endpoint database.
- Last Login User
- Machine MAC Address
- Operating System Version
- Admin Notes (if any)
- Admin Status (if any)
- Top Suspicious Modules (Modules that have an IIOC score > 500). This is based on the value set for "Minimum IIOC Score" field in the Configure Endpoint window. The default value for "Minimum IIOC Score" is 500.
- Machine IIOC Levels

## Quick Look in the Events View (Version 11.2 and Later)

The following figure is an example of the Context Lookup panel as it appears in the Events view.



The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, Live Connect, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.



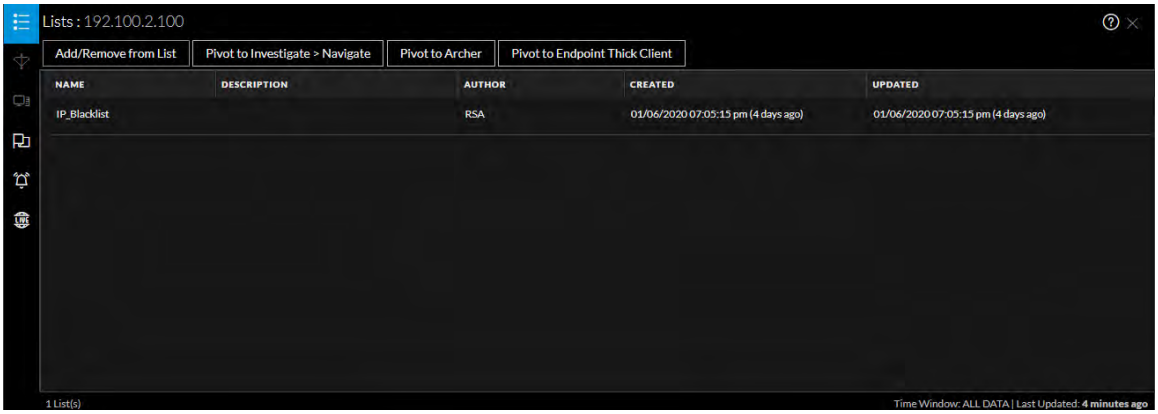
The following table describes the data available on each tab and the supported entities.

| Tab | Description | Supported Entities |
|---|---|---|
| (Lists) | Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list. | All entities |
| (Archer) | Displays asset information along with criticality ratings using the Archer data source. | IP, Host, and Mac |
| (Active Directory) | Displays all user information for the selected user. | User |
| (NetWitness Endpoint) | Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels. | IP, MAC address, and Host |
| (Incidents) | Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents. | All entities |
| (Alerts) | Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts. | All entities |
| (Live Connect) | Displays information related to Live Connect. | IP, Domain, and Filehash |
| (File Reputation) | Displays file reputation status for Filehash entities. | Filehash entities |

| Tab | Description | Supported Entities |
|---|---|---|
| TI | Displays information for STIX data sources. | IP address, email address, domain, filename, URL's, and file hash.<br>**Note:** The context lookup for email address and URL will be displayed only if these metas are mapped.<br>Navigate to (Admin) > System > Investigation > Context Lookup. |
| REST API | Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity. | All entities |

## Lists Tab

The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.



| Field | Description |
|---|---|
| Name | The name of the list (defined while creating the list). |
| Description | The description of the list (defined while creating the list). |
| Author | The owner who created the list. |
| Created | The date when the list was created. |
| Updated | The date when the list was last updated or modifed. |
| Count | The number of lists in which the selected entity or meta value is available. |
| Time Window | The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

## Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.

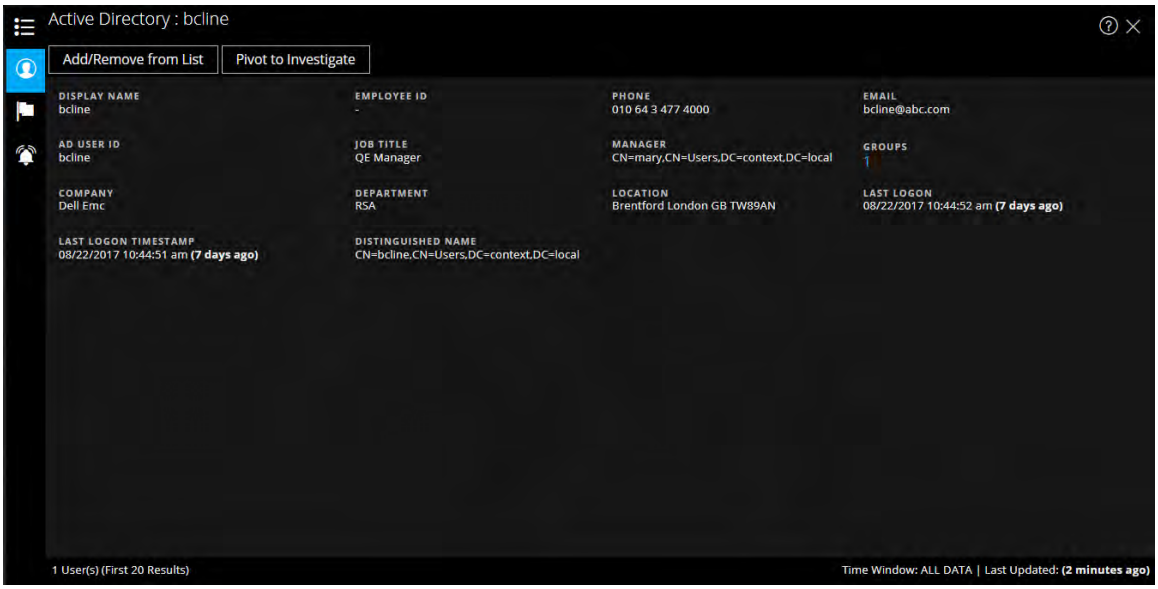
| Field | Description |
|---|---|
| Criticality Rating | The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High. |
| Risk Rating | The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal. |
| Device Name | The unique name of the device. |
| Host Name | The host name of the device. |
| IP Address | The primary internal IP address of the device. |
| Device ID | The automatically populated value that uniquely identifies the record across all applications within the system. |
| Type | The device type, for example, server, laptop, desktop, and others. |
| Facilities | Links to records in the Facilities application that are related to this device. |
| Business Unit | Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values. |
| Device Owner | The person who is responsible for the device and receives read and update rights of the record. |

| Field | Description |
|---|---|
| Count | The number of assets available. |
| Time Window | The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

**Note:** In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

## Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.



The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName

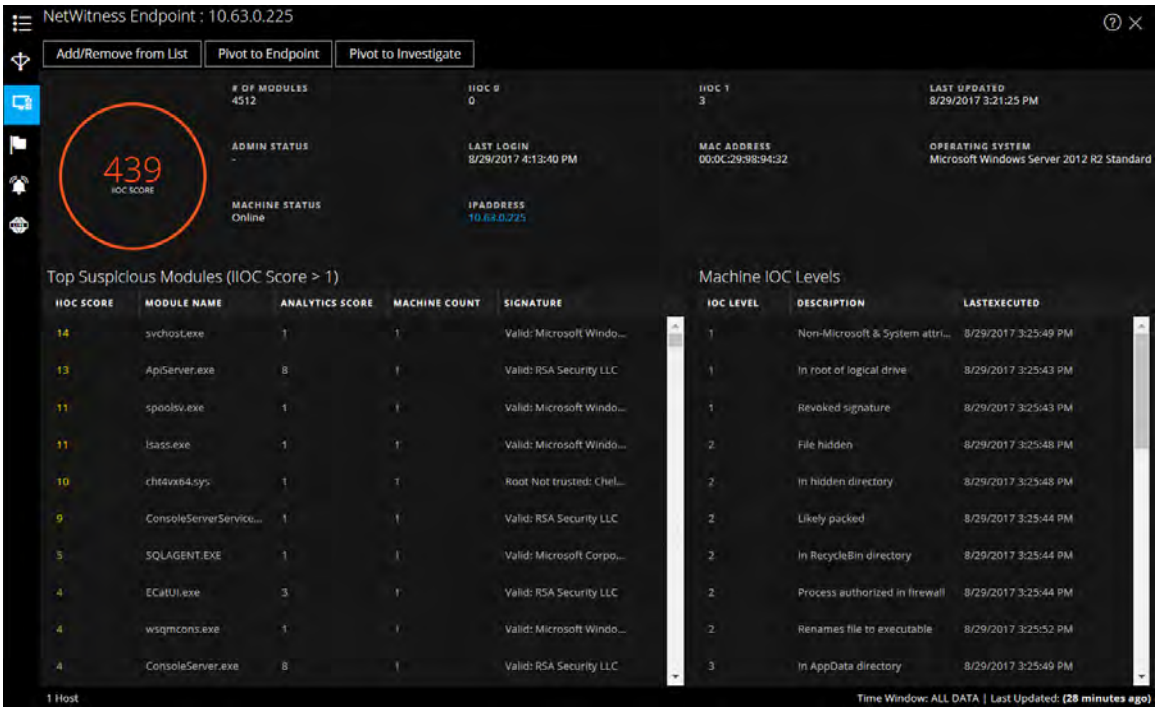
The following information is displayed for Active Directory.

| Field | Description |
|---|---|
| Display Name | The name of the user. |
| Employee ID | The employee ID of the user. |

| Field | Description |
|---|---|
| Phone | The phone number of the user. |
| Email | The email ID of the user. |
| AD User ID | The unique identification of the user within an organization. |
| Job Title | The designation of the user. |
| Manager | The name of the user's manager. |
| Groups | The list of groups of which the user is a member. |
| Company | The name of the user's company. |
| Department | The department name to which the user belongs within the organization. |
| Location | The location of the user. |
| Last Logon | The time when the user logged into the system, only if the Global Catalogue is defined. |
| Last Logon TimeStamp | The time when the user logged into the system. |
| Distinguished Name | The unique name assigned to the user. |
| Count | The number of users. |
| Time Window | The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

## NetWitness Endpoint Tab

The following figure is an example of the Context Lookup panel for NetWitness Endpoint.



The following information displayed for IIOCs.

| Field | Description |
|---|---|
| # Of Modules | The number modules that are looked up. |
| Admin Status | The admin status (if any). |
| Last Updated | The time when the data was last refreshed. |
| Last Login | The time when the user last logged in. |
| MAC Address | The Machine MAC Address. |
| Operating System | The Version of the Operating System used by the NetWitness Endpoint machine. |
| Machine Status | The state of the module being viewed: Online, Offline, Active, or Inactive. |
| IP Address | The IP address of the specific module. |

The following information is displayed for modules.

| Field | Description |
|---|---|
| IIOC Score | A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |

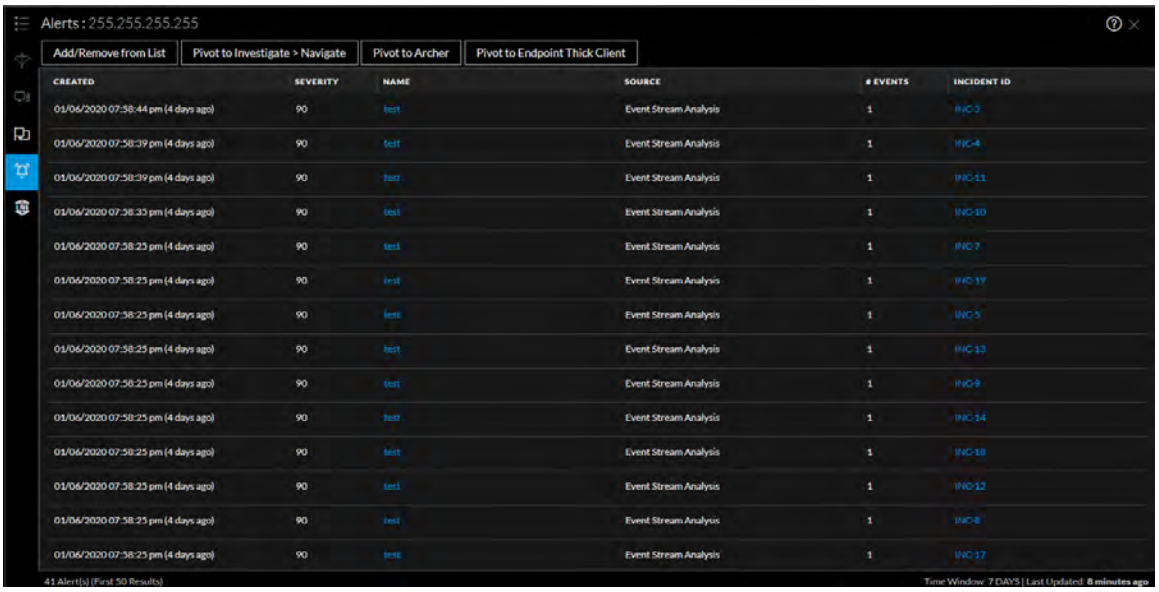
| Field | Description |
|---|---|
| Module Name | The name of the module that is being looked up. |
| Analytic Score | The number of active files for the selected machine. |
| Machine Count | The number of machines on which that particular IOC got triggered. |
| Signature | Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on. |

The following information is displayed for machines.

| Field | Description |
|---|---|
| IOC Levels | The IOC levels. |
| Description | The description for he IOC level if available. |
| Last executed | The time when the action was executed. |
| Count | The number of hosts that are being looked up. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched. |
| Last Updated | The time when scan results were last updated in NetWitness Endpoint database. |

## Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

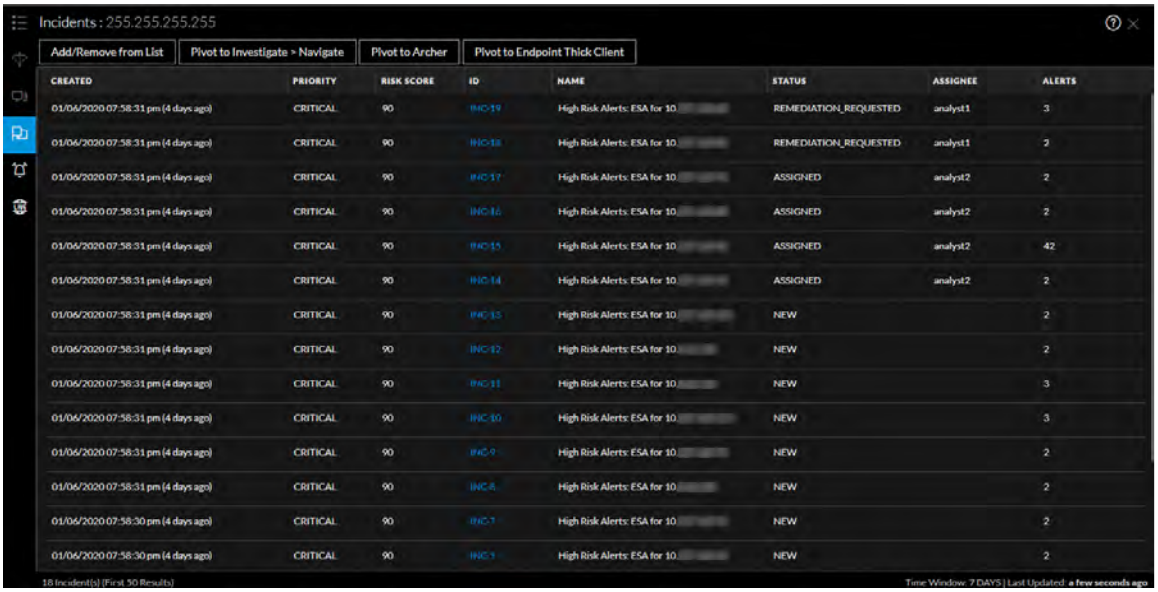


The following information is displayed in the Context Lookup panel for Alerts.

| Field | Description |
|---|---|
| Created | The date and time when the alert was created. |
| Severity | The severity value of the alerts. |
| Name | The name of the alert. You can click the name to view the details of a specific alert. |
| Source | The alert source name from which the alert is triggered. |
| #Events | The number of events associated with the alert. |
| Incident ID | The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert. |
| Count | The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched. |
| Last Updated | The time when contextual data was last fetched from data source. |

## Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

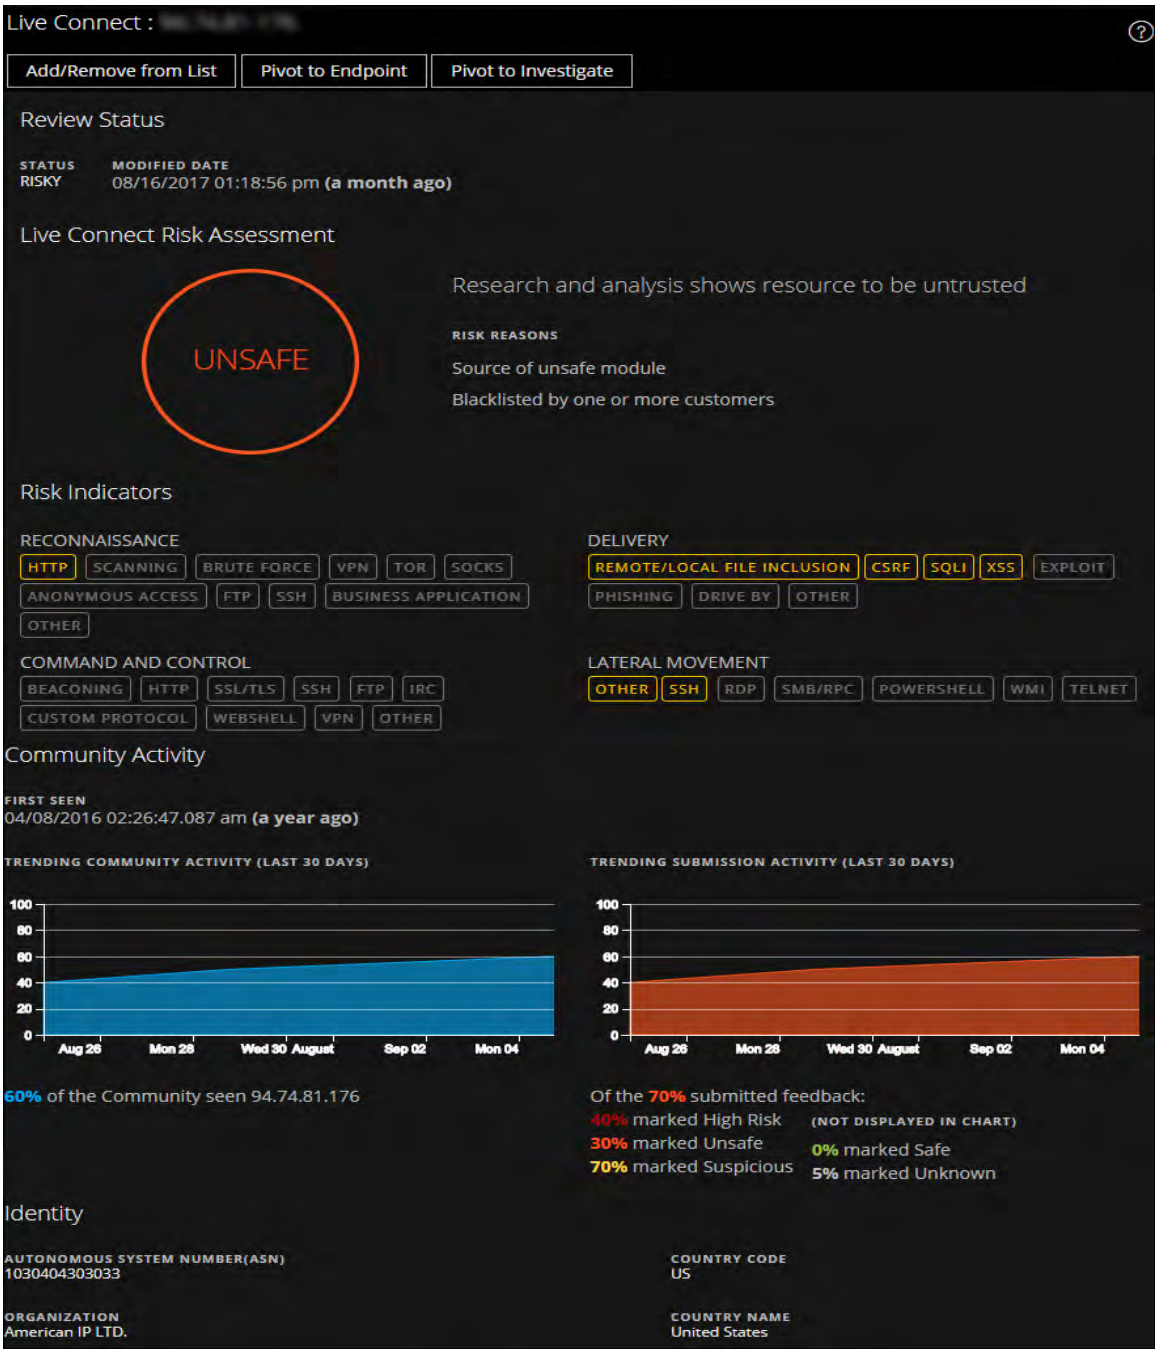


The following information is displayed in the Context Lookup panel for Incidents.

| Field | Description |
|---|---|
| Created | The date when the incident was created. |
| Priority | The priority status of the incidents. |
| Risk Score | The risk score of the incidents. |
| ID | The Incident ID of the incident. You can click on the ID to display further details about the incident. |
| Name | The incident name. |
| Status | The status of the incident |
| Assignee | The current owner of the incident. |
| Alerts | The number of alerts associated with the incident. |
| Count | The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched. |
| Last Updated | The time when contextual data was last fetched from data source. |

## Live Connect Tab

The following figure is an example of a Context Panel for Live Connect, and the table describes the information displayed.



| Field | Description |
|---|---|
| Review Status | The review status of the selected Live Connect entity (IP, file, or domain) based on the analyst activity. This gives the visibility of the analyst activity within an organization.<br>**Status**<br>Below are the types of status:<br>• **New:** Lookup results for an IP address are viewed for the first time within the organization.<br>• **Viewed:** Any analyst within the organization has already viewed the lookup results for an IP address.<br>• **Marked as Safe:** Any analyst within the organization has already viewed the lookup results and marked the IP address as safe.<br>• **Marked as Risky:** Any analyst within the organization has already viewed the lookup results and marked the IP address as risky. |
| Risk Assessment | The risk assessment for the selected Live Connect entity (IP, file, or domain) based on the Live Connect analysis and analyst feedback. The Risk Assessment categories are:<br>• **Safe:** The Live Connect entity is considered to be safe.<br>• **Unknown:** Live Connect does not have enough information about this entity to calculate the risk.<br>• **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention.<br>• **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action.<br>• **Unsafe:** Marked as unsafe based on the analysis and risk reasons provided by the community.<br>The entity is rated as High Risk, Suspicious, or Unsafe and displays the associated risk reasons accordingly. |

| Field | Description |
|---|---|
| Risk Assessment Feedback |  <br>Risk Assessment Feedback allows the analyst to submit threat intelligence feedback about an entity to the Live Connect server.<br>• **Analyst Skill Level**<br>Below are the Analyst skill level options:<br>◦ **Tier 1** - Analysts at this level define procedures for remediation, and decide if an incident should be escalated to other areas in a Security Operation center (SOC). This is the default value.<br>◦ **Tier 2** - Analysts who investigate incidents and capture intelligence from an investigation to feed back into the various workflows in a SOC.<br>◦ **Tier 3** - Analysts who share the investigation results to the SOC organization. They generally manage incidents and have a wide breadth and depth of skills and tools necessary for incident response.<br>**Note:** While creating a new user for NetWitness (Analyst), an administrator should be able to identify the user as Tier 1, Tier 2, or Tier 3 Analyst.<br>• **Risk Confirmation** - The risk confirmation for the selected Live Connect entity (IP, file, or domain). The Risk confirmation categories are:<br>◦ **Safe**: The Live Connect entity is considered to be safe.<br>◦ **Unknown**: The analyst does not have enough information to provide a risk confirmation<br>◦ **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention.<br>◦ **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action.<br>◦ **Unsafe**: Marked as unsafe based on the analysis and risk reasons provided by the community.<br>• **Confidence Level** - The confidence level of an analyst in providing feedback for the Live Connect entity. The confidence level categories are: High, Medium, and Low.<br>• **Risk Indicator Tags** - Allows you to select a tag category based on the analysis. |

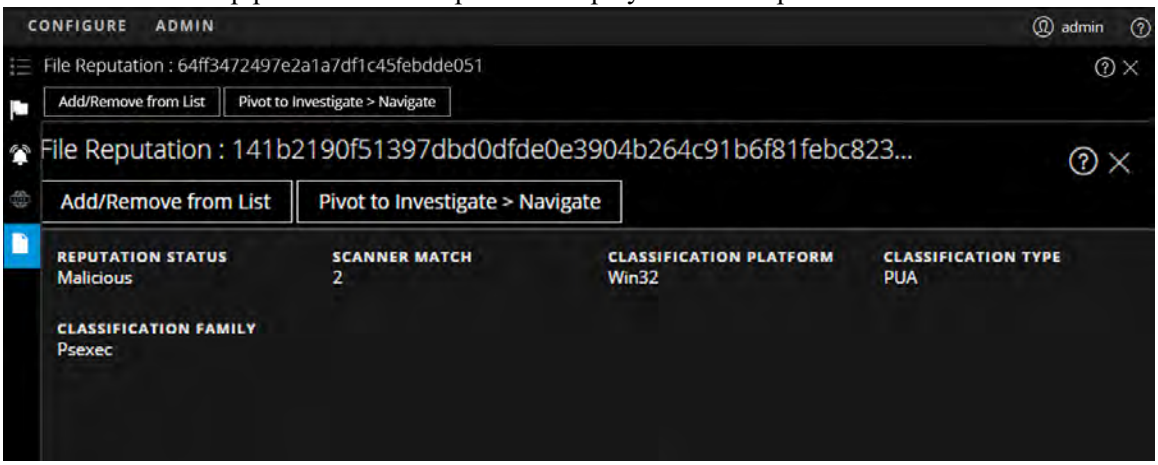
| Field | Description |
|---|---|
| Community Activity | Community activities such as:<br>• Date first seen in the community.<br>• Time since the IP/File/Domain was seen for the first time (Current time - First seen time).<br><br>**Trending Community Activity:**<br>If the IP address is known within the RSA community, a graphical representation of the community activity trend is displayed for the following:<br>• Users (in %) who have viewed the IP address in the Live Connect community over time.<br>• Users (in %) who submitted feedback for the IP address.<br>• Users (in %) who marked the IP address as unsafe over time. |
| Risk Indicators |  <br>Risk indicators are highlighted based on the tags that are assigned by the community to the entities (IPs, Files, or Domains).<br>The tags are categorized as follows: Reconnaissance, Delivery, Command and Control, Lateral Movement, Privilege Escalation, and Packaging and Exfiltration.<br>These tags are samples and vary based on the inputs received from the community on the Live Connect server. The analyst can choose the appropriate risk indicator tags while providing the review feedback. A highlighted tag indicates that the selected entity is associated with that particular category and tag. Clicking a highlighted tag displays the description of the tag. |
| Identity | Provides the following identity information for the selected entity or meta value:<br>For IP address: Autonomous System Number (ASN), Prefix, Country Code and Country Name, Registrant (Organization), and Date.<br>For File Hash: File Name, File Size, MD5, SH1, SH256, Compile Time, and Mime Type.<br>For Domain: Domain Name and Associated IP Address. |
| Certificate Information | Provides the following certificate information for the selected file hash: Certificate Issuer, Validity of the Certificate, Signature Algorithm, and Certificate Serial Number. |

| Field | Description |
|---|---|
| WHO IS Information |  <br>The **WHO IS** information provides the ownership details for a given domain.<br>The following information about the domain owner is displayed: Created Date, Updated Date, Expired Date, Type (Registration Type), Name, Organization, Address with Postal code, Country, Phone, Fax, and Email. |
| Related Files | Related Files are displayed for entity types IP and Domain. A list of known associated files is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), File Name, MD5, Compile Time and Date, API Function, Import Hash, and Mime Type. |
| Related Domains | Related Domains are displayed for entity types IP and Files. A list of known associated domains is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), Domain Name, Country Name, Registered Date, Expired Date, and Registrant Email address. |

| Field | Description |
|---|---|
| Related IPs | <br>Related IPs are displayed for entity types Domain and Files. A list of known associated IPs is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), IP Address, Domain Name, Country Code and Country Name, Country Name, Registered Date, Expired Date, and Registrant Email address. |

## File Reputation Tab

The Context Lookup panel for File Reputation displays the file reputation status of a file.

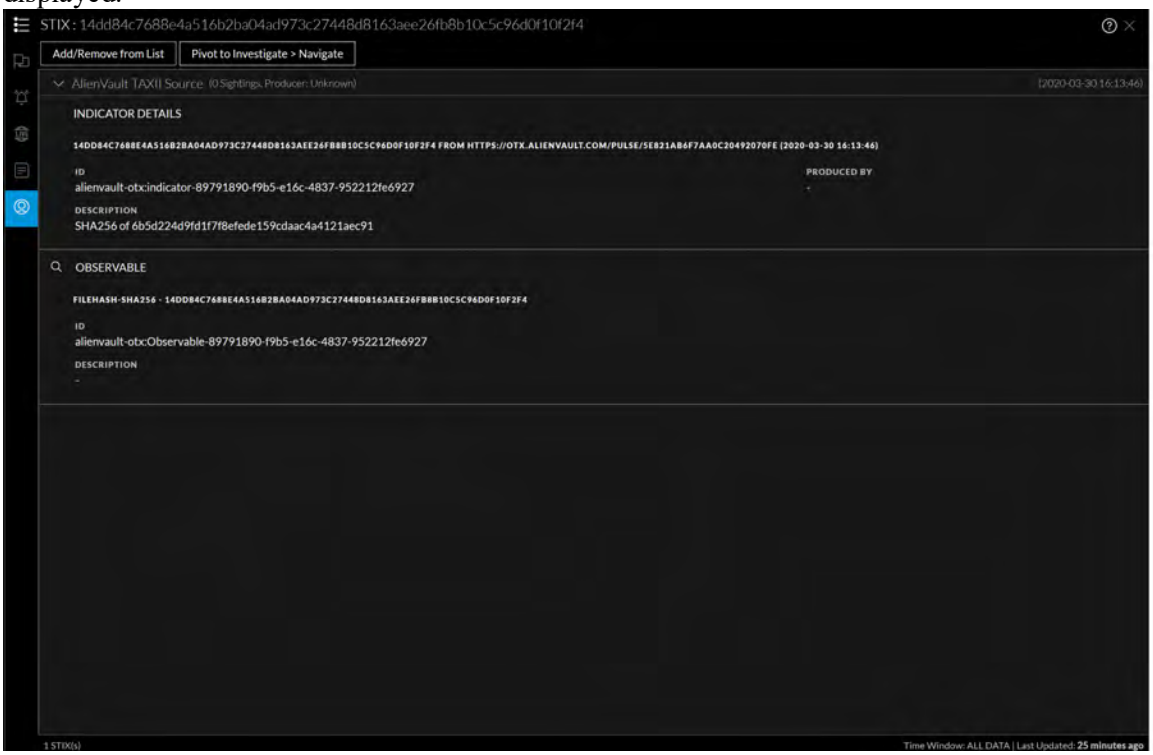


| Field | Description |
|---|---|
| Reputation Status | Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*. |
| Scanner Match | Number of scanners that detected malware or suspicious activity in the last scan. |

| Field | Description |
|---|---|
| Classification Platform | Classification for the queried filehash based on the platform. For example, the platform can be Win 32. |
| Classification Type | Classification for the queried filehash based on the type. |
| Classification Family | Classification for the queried filehash based on the malware family name. |

## TI Tab

The following figure is an example of a Context Panel for TI, and the table describes the information displayed.



| Field | Description |
|---|---|
| Data Source name | Displays the STIX data source name from where the data is retrieved. |
| Timestamp | The time when the event was created. |
| Indicator Details | Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity.<br>ID: Displays the ID of the selected indicator.<br>Produced by: Displays the user role who requested for the STIX data.<br>Description: Displays details about the selected IP address which are being watch listed. |

| Field | Description |
|---|---|
| Observable | Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs).<br>ID: Displays the ID of the selected observable. |
| (Optional) SightingsREST | Sightings Title: Displays the name of the sighting source.<br>Confidence: Displays the criticality of the sighting.<br>Reference: Displays the reference URL of the sighting source. |

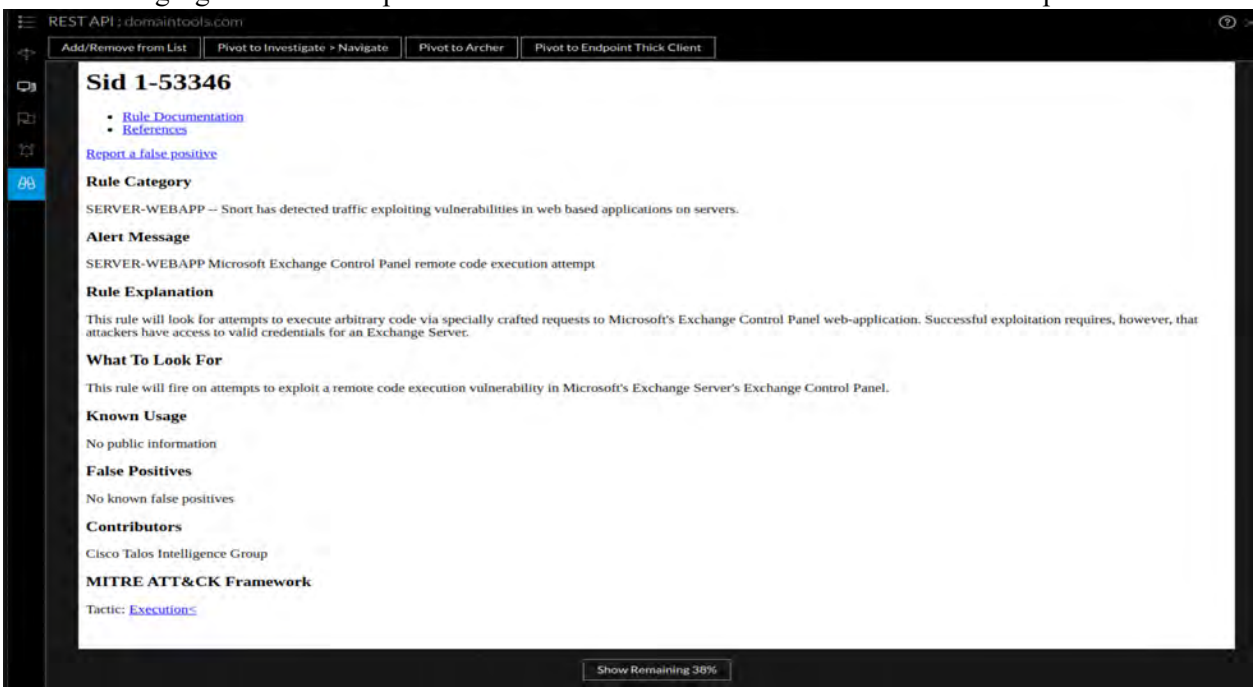
## REST API Tab

The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

**Note:** For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:

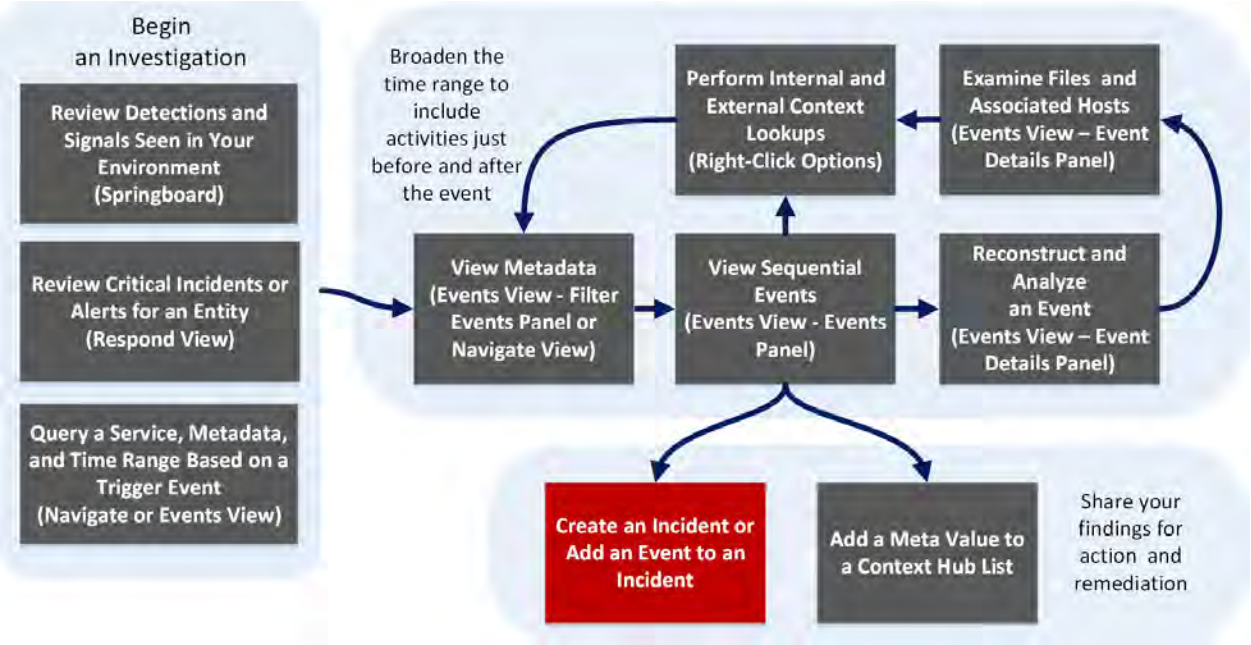


# Create an Incident Dialog

In the Create an Incident dialog, analysts can create an incident from selected events in the Events view. The incident is then available to incident responders working in Respond.

To access this dialog, while investigating a service in the Investigation > Events view, select **Incidents > Create New Incident** from the toolbar.

## Workflow



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Incident Responder or Threat Hunter | review detections and signals seen in my environment | *NetWitness Platform Getting Started Guide* |
| Incident Responder | review critical incidents or alerts | *NetWitness Respond User Guide* |
| Threat Hunter | query a service, metadata, and time range | Begin an Investigation in the Events View<br>Begin an Investigation in the Navigate or Legacy Events View |
| Threat Hunter | view metadata | Filter Results in the Navigate View<br>Drill into Metadata in the Events View (BETA) |

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | view sequential events | Filter Results in the Events View<br>Filter Results in the Legacy Events View |
| Threat Hunter | reconstruct and analyze an event | Examine Event Details in the Events View<br>Reconstruct an Event in the Legacy Events View |
| Threat Hunter | examine files and associated hosts | Download Data in the Events View<br>Export or Print a Drill Point in the Navigate View<br>Export Events in the Legacy Events View |
| Threat Hunter | perform lookups | Look Up Additional Context for Results<br>Launch a Lookup of a Meta Key |
| Threat Hunter | create an incident or add to an incident* | Add Events to an Incident in the Legacy Events View<br>Add Events to an Incident in the Events View |
| Threat Hunter | add a meta value to a Context Hub list | Look Up Additional Context for Results |

*You can perform this task in the current view.

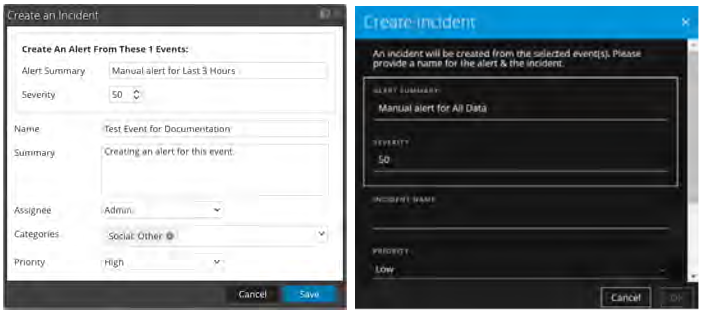
## Quick Look

The following figure is an example of the Create an Incident Dialog, and the features are described in the table.



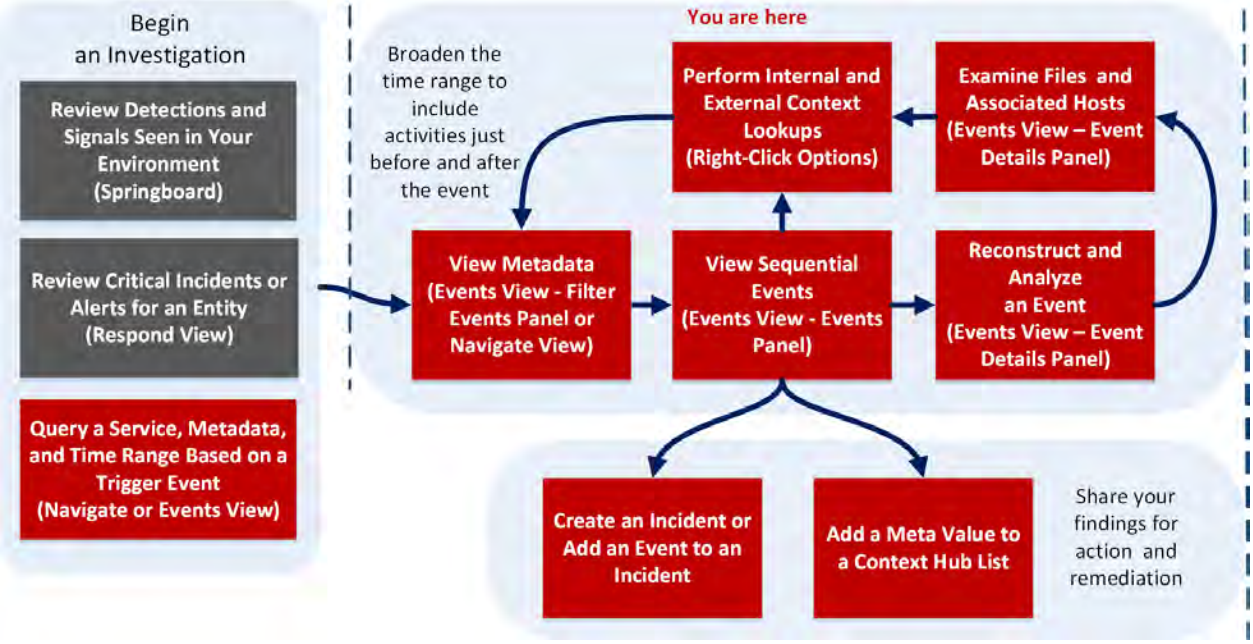
| Feature | Description |
|---|---|
| Create Summary from These Events | The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100. |
| Name | (Required) Specifies a name to identify the incident. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident |
| Summary | (Optional) Specifies a description for the incident. A good summary clearly identifies the incident for other analysts and responders. |
| Assignee | (Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents. |
| Categories | (Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social. |
| Priority | Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list. |
| Cancel | Closes the dialog without saving changes. |
| Save | Saves the incident and closes the dialog. A message confirms that the incident was created successfully. |

# Events View

In the Events view analysts can view a sequential list of network, log and endpoint events, select an event for reconstruction and analysis, and view the raw event and metadata with interactive features that enhance the ability to see meaningful patterns in the data. In Version 11.5 and later, you can drill into metadata for the listed events. The Events view offers packet, file, host, text, log, and email reconstruction. When you open a web reconstruction of an event, the same web reconstruction used in the Legacy Events view is displayed.

## Workflow

The following figure is a high-level workflow illustrating the tasks you can do in NetWitness Investigate, with the Events view tasks highlighted in red.



## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Incident Responder or Threat Hunter | review detections and signals seen in my environment | *NetWitness Platform Getting Started Guide* |
| Incident Responder | review critical incidents or alerts | *NetWitness Respond User Guide* |

- Events View - Email Tab
- Events View - Host Tab

## Quick Look

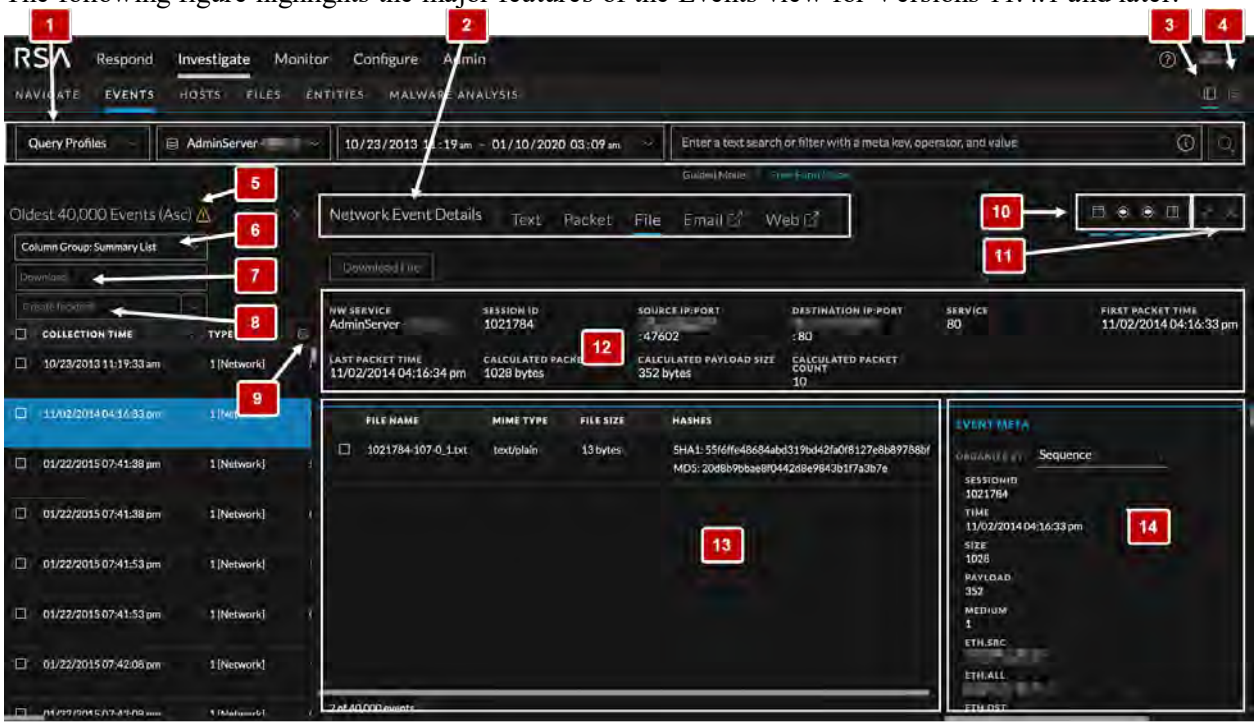
There are multiple access points to this view, which are described in Begin an Investigation in the Events View. If you access the Events view from the Respond view, you can see the analysis for a selected event in an incident. The options are a subset of the options available when you open an event from within the Investigate view. To get complete functionality and examine other events, you can go to the Event view directly (INVESTIGATE > Event ).

The Events view lists events in ascending order by time in the Events panel. The events displayed can be results for the drill point in the Navigate view or Legacy Events view, or results for a query entered in the Events view query bar.

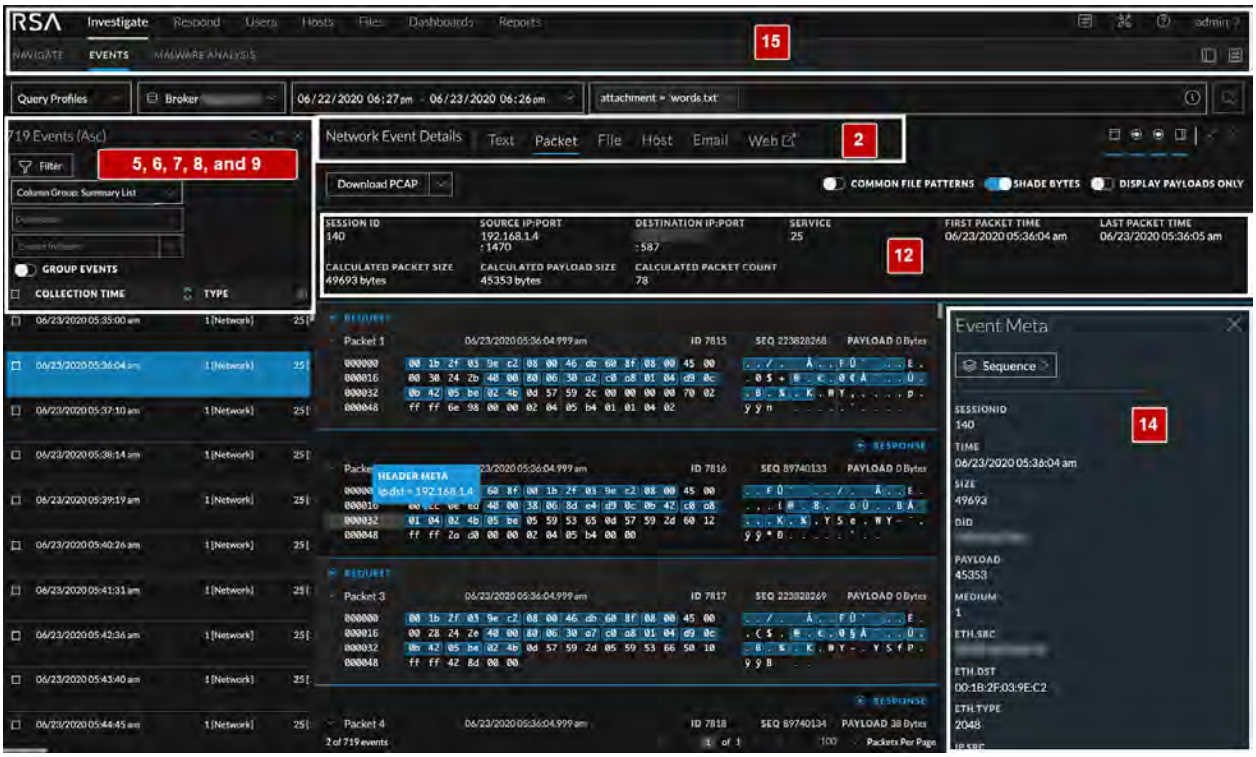
Input fields for a query are displayed so that you can select a service and time range, and type an optional query. When you submit a query, the service being investigated counts the results up to a limit of 10,000 events, and 10,000 network, log, and endpoint events are loaded in the Events panel. Different columns are displayed, depending on the selected column group. You can rearrange and resize the columns, choose a built-in or custom column group, and choose individual columns that you want to see. When you find an event of interest, clicking the event opens the reconstruction in a new panel (Packet, Text , or File).

**Note:** For versions earlier than 11.3, the first 100 events are loaded. You can scroll through the list and click **Show Next 100 Events** at the bottom of the list. If the next page contains fewer than 100 events, the button changes to reflect the number of remaining events.

The following figure highlights the major features of the Events view for Versions 11.4.1 and later.



This figure illustrates the changed elements in Version 11.5 and later.



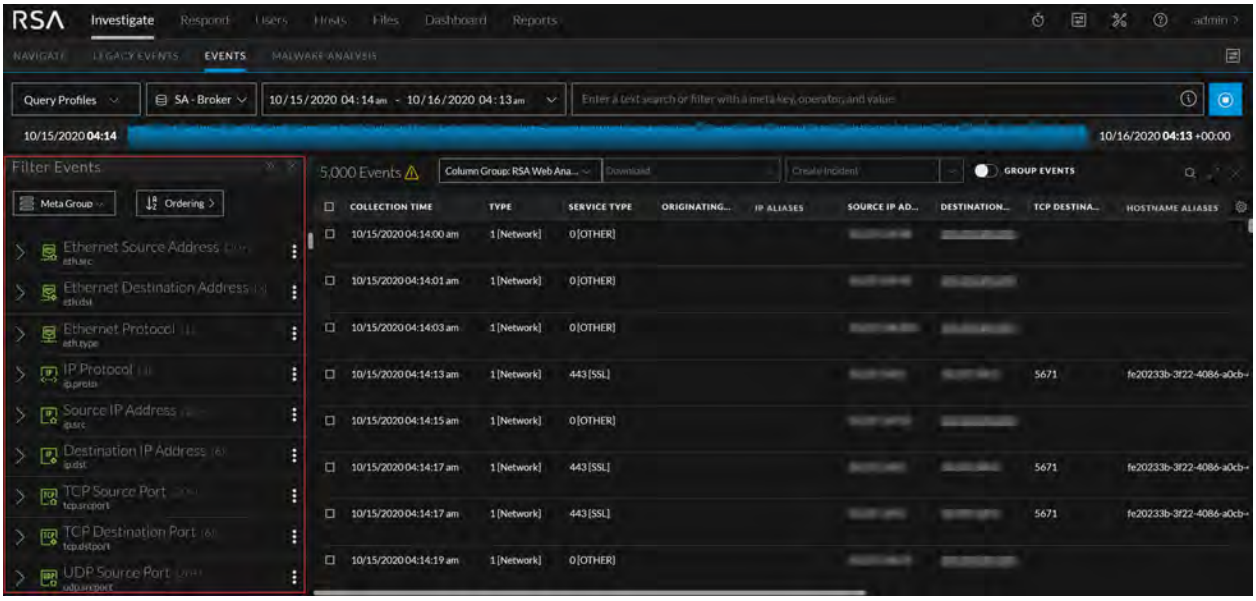
| | |
|---|---|
| 1 | **Query Bar**: When a service is selected, displays the service selector, time range selector, and the queries you have entered. You can select a service as described in Begin an Investigation in the Events View and refine the query as described in Filter Results in the Events View. Clicking submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the (console icon) opens the query console, where detailed status of the query is provided (see Events View below). |
| 2 | The type of event being analyzed and the type of reconstruction are reflected in the heading.<br>• These are the event types: **Network Event Details**, **Log Event Details**, or **Endpoint Event Details**.<br>• The types of analysis available for the event type are Text, Packet, File, Host, Email, and Web. Network events can use all types of analysis: text, packet, file, and email (Version 11.4.1 and later). Log and endpoint events use only text analysis. The email (Version 11.4.0.x and earlier) type and web type open the current event as an email or web reconstruction in the Events view. For details, see Examine Event Details in the Events View. |
| 3 | Reopens the Events panel if you have closed it. For details, see Analyze Events in the Events View. |
| 4 | Sets preferences for the Event view (see Configure the Events View). |
| 5 | The Events panel title.<br>• In Version 11.3 and later, the Events panel title is slightly different than the title in prior versions, and a row number indicator has been added. The title lists the number of events and sort order; for example, **24,000 Events (Asc)** means that 24,000 events |

| | |
|---|---|
| | were found and they are listed in ascending order by time. If more than 10,000 events are found, only the oldest 10,000 events are displayed in ascending order, and an amber triangle highlights the fact that not all events were loaded. This may indicate that you need to refine the query. For more information about refining the events listed here, see Filter Results in the Events View.<br>• Versions prior to 11.3 simply list the number of events found, and you can load 100 of them at a time. In Version 11.4 and later, clicking opens the Find Text in Table dialog. |
| 6 | The Column Group drop-down lists built-in and custom column groups that you can apply to the Events panel. Built-in column groups are sometimes updated between one version and the next. Some examples of built-in column groups are Email, Endpoint Analysis, Malware Analysis, Outbound HTTP, Outbound SSL/TLS, and Summary List. Summary List is the default column group. For details, see Use Columns and Column Groups in the Events List. |
| 7 | The Download drop-down menu lists the available options for downloading event data. The options are Log, Visible Meta, and Network (see Downloading and Acting Upon Results. You can change the preferred format of the event type data in the Event Preferences dialog (see Configure the Events View). |
| 8 | The Create Incident button enables you to create incidents from events. The Add to Incident button enables you to add selected events to an open and existing incident (see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View). |
| 9 | Displays the column selection settings to select the individual columns displayed in the Events panel. For details, see Use Columns and Column Groups in the Events List. |
| 10 | Controls to show or hide the Event Header, show or hide requests and responses, and open the Event Meta panel. For details, see Analyze Events in the Events View. |
| 11 | Controls to change the size of the panel and close the panel. For details, see Analyze Events in the Events View. |
| 12 | The Event Header provides summary information about the event you are currently analyzing. The selected event is highlighted in the Events panel with a blue background. The summary information is different for the different event types (packet, log, and endpoint). In Version 11.5, the redundant NW Service is removed. |
| 13 | The event data for the event you are currently analyzing. |
| 14 | The Event Meta panel is redesigned in Version 11.5, but has the same functions as in Version 11.4. The Event Meta panel lists the meta keys and values found in the data. This data can be sorted in two ways - Alphabets or Sequence. Some metadata are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Analyze Events in the Events View).<br>• For a packet, the data is called a payload and is displayed in the form of a request and response.<br>• For a log event, the data is a line of text from the raw log.<br>• For an endpoint event, the event data is relevant to data from the NetWitness Endpoint agents running on hosts in the network. It may be a single process, driver, DLL, file (executable), service, or autorun, and information related to logged-in users. (See the *NetWitness Endpoint User Guide* for complete information about endpoint event data.) |
| 15 | The Version 11.5 main menu for RSA NetWitness Platform has relocated Hosts, Files, and Users (Entities) options for easier access. |

## Filter Events Panel

The Filter Events panel is a beta feature added from Version 11.5. Clicking the Filter button (Filter) in the Events panel, opens the panel to provide a view of meta keys and meta values found in the data set. (Version 11.6) By default, the Filter Events panel is open in the Events view. The user preference (open, closed, or fully expanded) is saved across sessions and logins. See Drill into Metadata in the Events View (BETA) for more information about drilling into metadata.

**Note:** (Version 11.6) By default, the Filter Events panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Filter Events panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.



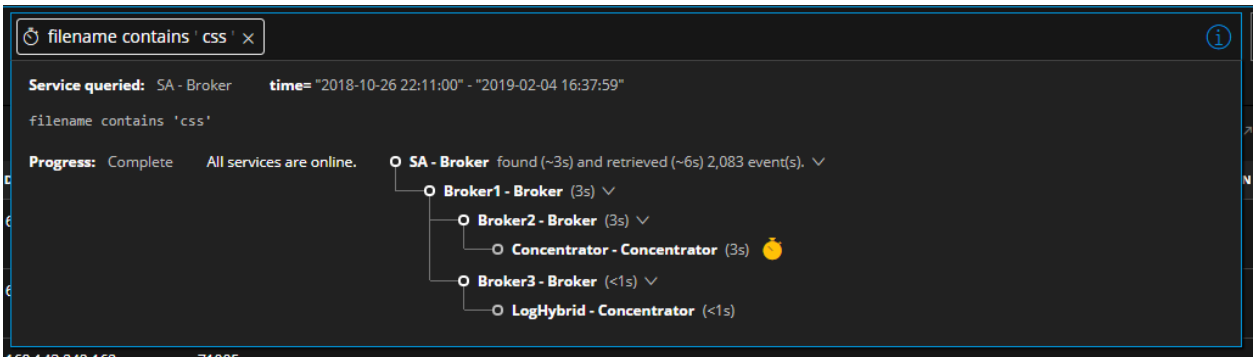
**Meta Groups Menu**

With the Filter Events panel open, you can select a meta group to define the meta keys displayed in the Filter Events panel.The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. In Version 11.5.1, the meta group you selected previously is not stored in browser cache so it remains in effect until you change it. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups.

| | |
|---|---|
| **Ordering Menu** | With the Filter Events panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering:<br>• By default, the meta keys are displayed using the Event Count > Descending by Total Count method. When showing the event count for each value, you can order by Descending by Total Count, Ascending by Total Count, Ascending by Value, and Descending by Value.<br>• When you prefer to see the size of the event that contains the value, you can use one of the four Event Size ordering options: Descending by Total Size, Ascending by Total Size, Ascending by Value, and Descending by Value. |
| **Meta Key options button (Ē)** | The Meta Key options button offers actions that you can take on an individual meta key. In Version 11.5, the only action is to copy all of the visible meta values for a meta key. |
| **Meta Key List** | An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key.<br>• This meta key is indexed by value: Action Event [action] (40+). The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value.<br>• This meta key is indexed by meta key: Bytes Sent [bytes.src]. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value.<br>• This meta key is not indexed: MAC Alias Record [alias.mac]. Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key. |

## Query Console

Clicking (the console icon) opens the query console, where detailed status of the query is provided.



In the query console, you can see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. A progress bar indicates the query's completion percentage at the bottom of the console. The statuses let you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color changes if a non-fatal error occurs. View Status of a Query provides additional details on this subject.

Several messages that may be displayed in the query console require additional explanation.

### Message: Maximum value limit (`valueMax`) of %1% reached on meta key %2% in index slice %3%

Explanation: The `valueMax` property on the specified meta key has been reached in the index being queried. An administrator configures this inside the index files available in `ADMIN > Services > [Service Name] > Files > index-[service type].xml` or `index-[service type]-custom.xml`. As an example, the statement below from the index file states the meta key called `client` has a limit of 250,000 values by default.

```
<key description="Client Application" level="IndexValues" name="client"
format="Text" valueMax="250000" />
```

### Message: The query on channel %2% was auto-canceled by the system for exceeding time usage limits. Check timeout values.

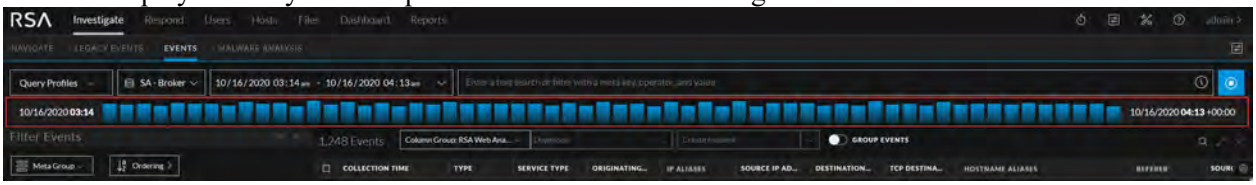
The server has a per-operation limit on execution time, and the requested operation exceeded the limit. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.

### Memory limit of %1% reached, controlled by setting max.query.memory

The server has a per-operation limit on memory utilization, and the requested operation exceeded the limit. The limit is related to the amount of memory in the server, which an administrator can adjust in **ADMIN > Services > [Service Name] > sdk > config**. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.

## Timeline

The timeline visualizes the events count that occurs at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a bar chart.



The following are some key features of the timeline:

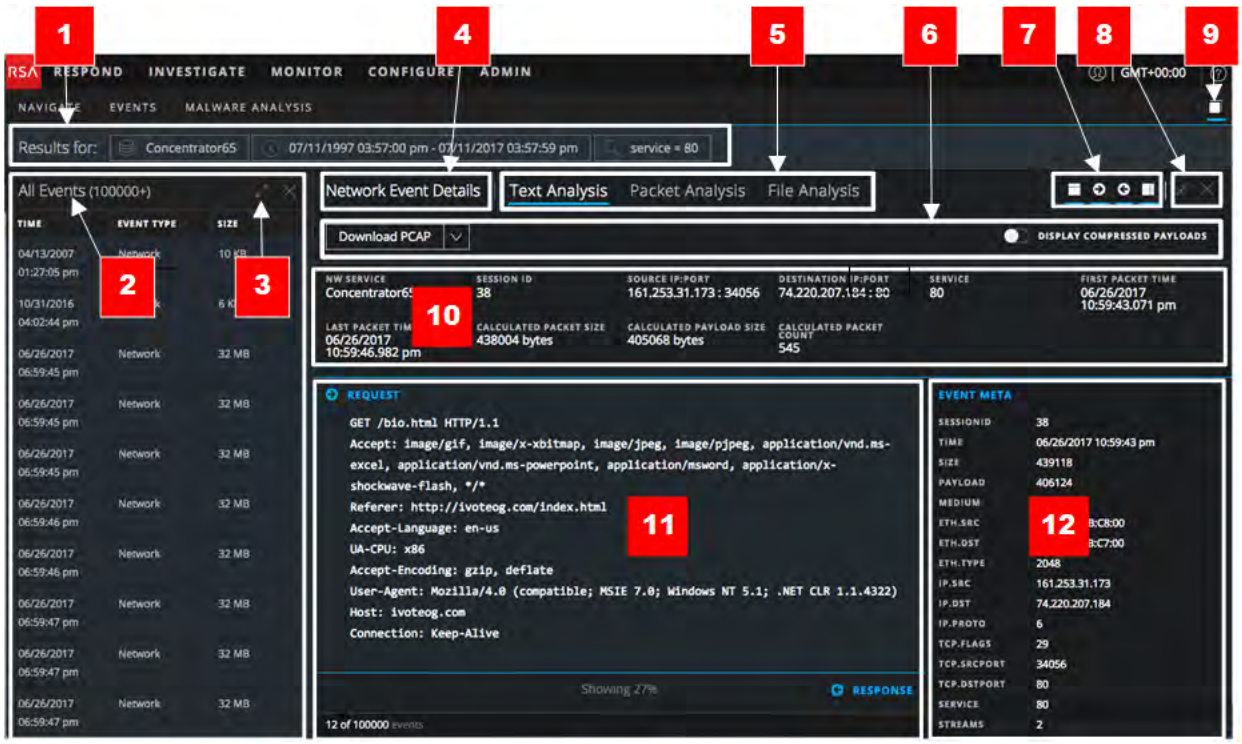
- The start time and end time are displayed on either side of the timeline to depict the matching events over the duration of the query. The timezone is also displayed on the right side of the timeline by showing the offset from UTC.
- The section of the timeline that matches the event data is highlighted. The data is highlighted up to the specified threshold. If the data is not sorted using time, the entire timeline is highlighted. Also, if the

data is not sorted in a specific order, it might highlight the individual bars in the timeline as events are not ordered using time.

- The query results that exceed the threshold are displayed in grey color. If events are sorted using time, the threshold highlight shifts from left (ascending) to right (descending) depending on your sort preference.
- Hover over the timeline to display the total number of events that occurred in the queried time duration. You can hover over the individual bars in the timeline to get the total number of events that occurred at a specific time.
- When you sort the events, the timeline does not refresh. You must run the query again to refresh the timeline.
- All capabilities of the timeline work when user is querying using the collection time (`time`) or when the preference is set to use the event time (`event.time`).

## Quick Look for Version 11.0.0.x (End-Of-Life)

The following figure highlights the major features of the Event Analysis view for Version 11.0.0.x.



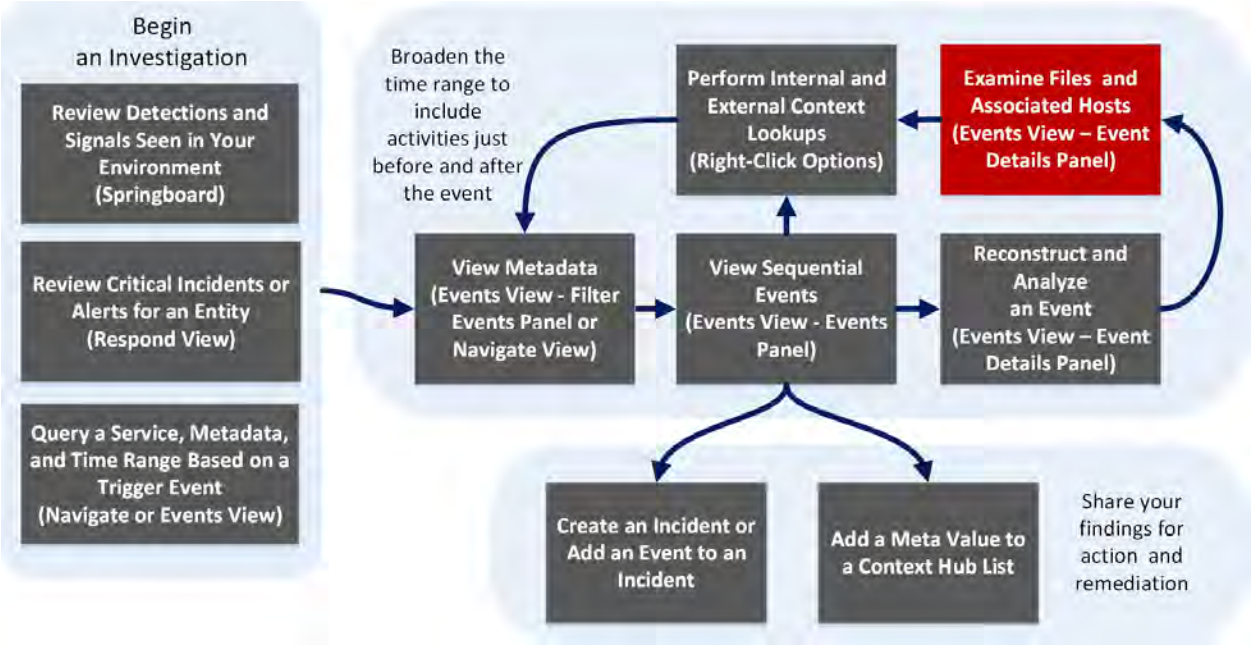
| | |
|---|---|
| 1 | The read-only breadcrumb displays the selected service, time range, and query entered in the Navigate view or Events view. |
| 2 | This is a read-only list of events based on the query made in the Navigate or Events view. The Events panel includes a count of the events. You can rearrange and resize columns. You can scroll to the bottom of the list, and load more events (see Analyze Events in the Events View). |
| 3, 8 | Controls to change the size of the panel and close the panel. |
| 4 | The type of event being analyzed is reflected in the heading: Network Event Details, Log Event Details, or Endpoint Event Details. Each view is discussed in detail in Analyze Events in the Events View. |

| | |
|---|---|
| 5 | The types of analysis available for the event type. Network events can use all three types of analysis: text, packet, and file. Log and endpoint events use only text analysis. |
| 6 | These options vary for the different types of analysis. They are discussed in detail in Analyze Events in the Events View. |
| 7 | Controls to show or hide the Event Header, show or hide requests and responses, and open the Event Meta panel (12). These controls are described in Analyze Events in the Events View. |
| 9 | Reopens the Events panel or the Event Meta panel if you have closed it. |
| 10 | The Event Header provides summary information about the event. This information is different for the different event types (packet, log, and endpoint). |
| 11 | The event data (sometimes called a payload for packets). The event data for a log event or endpoint event is typically a line of text from the raw log rather than request and response shown for a packet. |
| 12 | The Event Meta panel lists the meta keys and values found in the data. Some meta data are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Analyze Events in the Events View. |

# Events View - Email Tab

The Email tab is in the Event Details panel. Here you can view a list of email received and associated attachments for an event.

## Workflow



## Related Topics

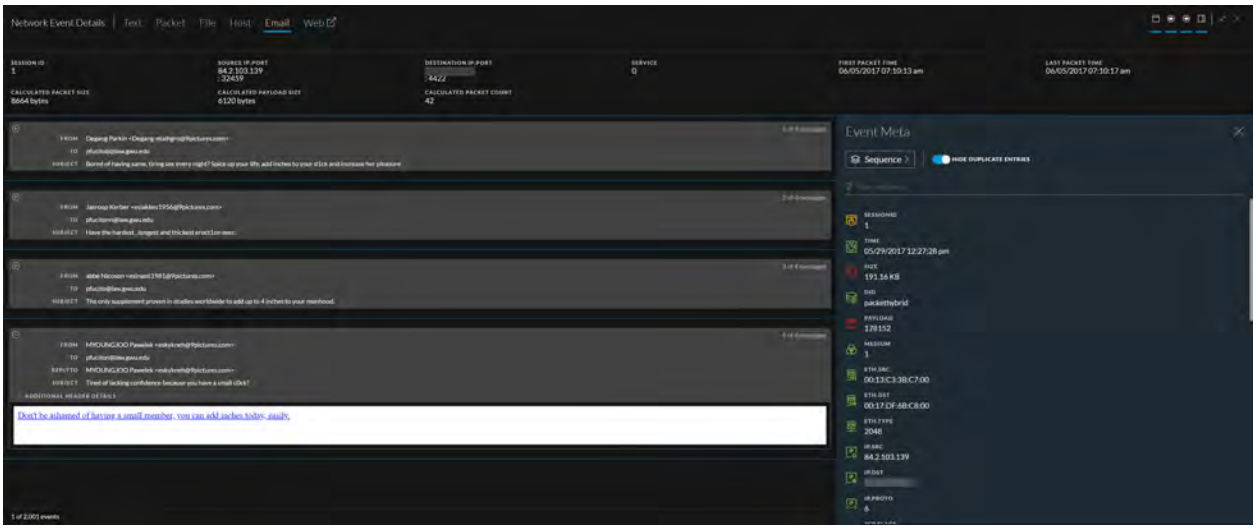
## Quick Look

The Email panel displays a list of emails associated with a network event. When an analyst opens the email, the email reconstruction is displayed along with the associated attachments and additional header details, if any.
The following figure is an example of an email reconstruction.



The following table describes all the fields within an email.

| Field | Description |
|---|---|
| From | Displays the email address of the sender of the email. |
| To | Displays the email addresses of the recipients of the email. |
| CC (Carbon Copy) | Displays email addresses of additional recipients of the email. The field is displayed only if the sent email has any value and the email addresses are visible to the recipient. |
| BCC | Displays email addresses of additional recipients privately. This field is displayed only if the sent email has any value and the email addresses are not visible to the recipient. |
| Reply to | Displays the address designated to receive replies, the sender address. |
| Subject | Displays the subject of the email. |
| Attachments | Displays any files shared by the sender that can be downloaded by the recipient. This field is displayed only if email contains attachments. See Download Data in the Events View for details about downloading email attachments. |
| Additional Header Details | Provides additional details of the email event such as Received, Sender, Message-ID and others. |

# Events View - File Tab

The File tab is in the Event Details panel. Here you can safely view a list of files and download one or more files in an event.

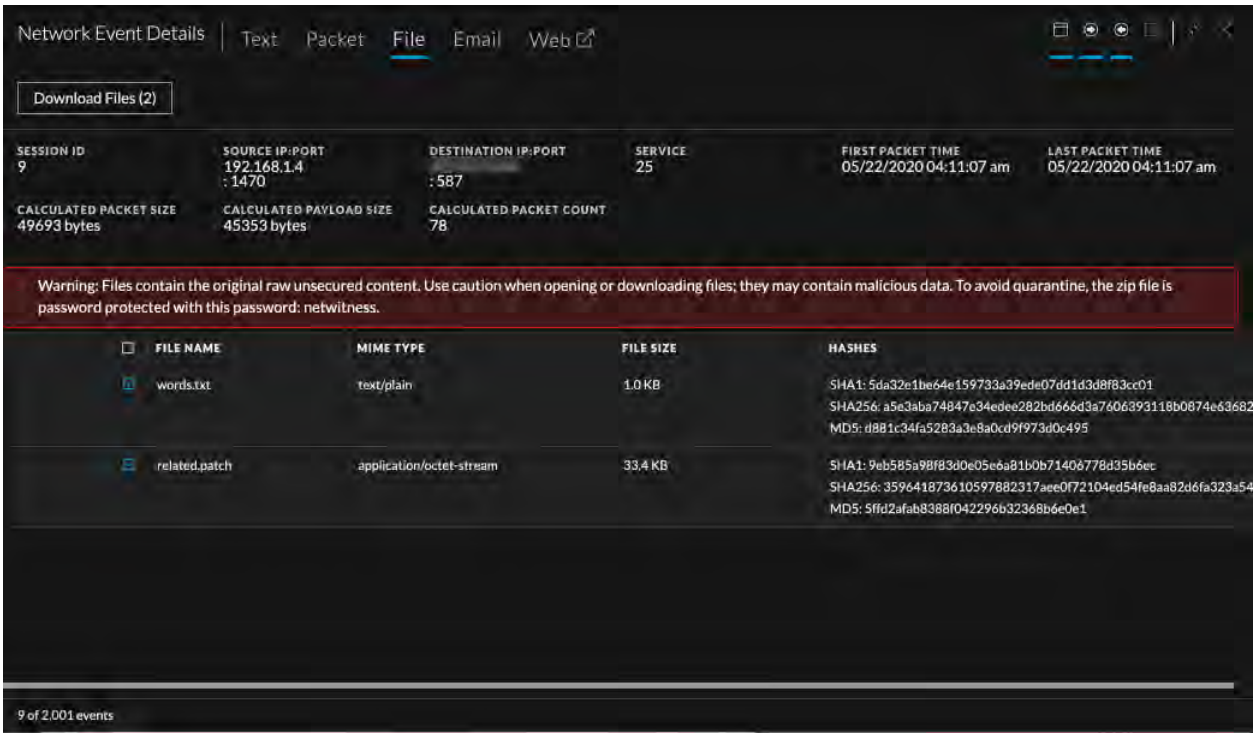
## Quick Look

The File panel displays a list of files associated with a network event. You can download files in this view.

Below is an example of the File panel.



| Feature | Description |
|---|---|
| Download Files button | Click to download one or more selected files. |
| Event Header | The Event Header displays summary information for the network event that contains the files. |
| Files List | Scrollable list of associated files that you can select and download. |

# Events View - Host Tab

The Host tab is in the Event Details panel. Here you can view network events enriched with endpoint data such as host and process triggered for the selected network event and other details such as risk score, reputation, and logged in user. The host panel is available for network events with endpoint data only.

## Related Topics

- How NetWitness Investigate Works
- Events View - Packet Tab
- Events View - Text Tab
- Events View - File Tab
- Events View - Email Tab
- Events View - Host Tab

## Quick Look

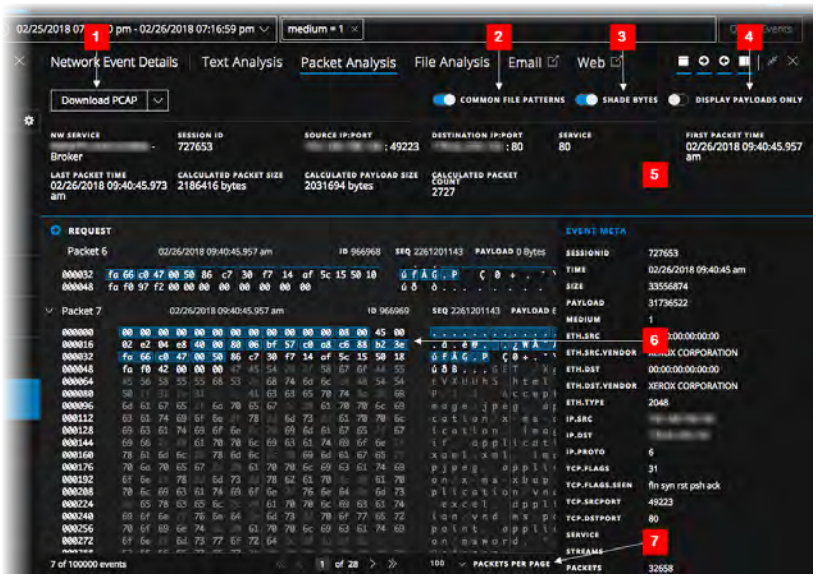
Only network events can be analyzed in the Packet panel. The Packet panel lists each packet in the event. The list of packets is scrollable. When you scroll, the packet or text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.

In Version 11.1 and later, you can use pagination controls to go backward and forward through the pages, go to a specific page, and select the number of packets to display per page (50, 100, 300, or 500).

Each packet is displayed with shading and highlighting to help identify common file patterns: significant header and payload bytes, hexadecimal and ascii bytes, and common file signatures. In addition, you can adjust the request/response display, and display or hide the packet summary.

Below is an example of the Packet panel (formerly known as Packet Analysis) with labels to identify features. For details and examples of each feature, see Analyze Events in the Events View.



| | |
|---|---|
| 1 | Options for exporting a network event. You can export a PCAP, all payloads, request payloads, or response payloads for deeper analysis and to share with others. |
| 2 | The option to identify common file signatures is activated by default. Common file signatures are highlighted in orange; hovering over the highlight reveals the file type. |
| 3 | The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. |
| 4 | The option to display payloads only hides the packet headers, leaving more space for the payload. |
| 5 | The Event Header. |
| 6 | Significant bytes are highlighted in a blue background; as you move the cursor over the highlighting the meta data is displayed in a hover box. |
| 7 | (Version 11.1 and later) Packet pagination controls allow more flexibility in paging through a list of packets. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed.<br>⟪ - Go to the first page<br>⟨ - Go to the previous page<br>1 of 206 - Go to a specific page<br>⟩ - Go to the next page<br>⟫ - Go to the last page<br>  - Select the number of packets per page. If you are reconstructing large packets, lowering this limit can improve performance. |

# Events View - Text Tab

The Text tab is in the Event Details panel. Here you can safely view and analyze the raw text payload of an event. The Text reconstruction includes features that can show decompressed or compressed text, expand truncated entries, perform URL and Base64 encoding and decoding, and download network events, logs, and endpoint events. The text reconstruction is available for all types of events: network, log, and endpoint.

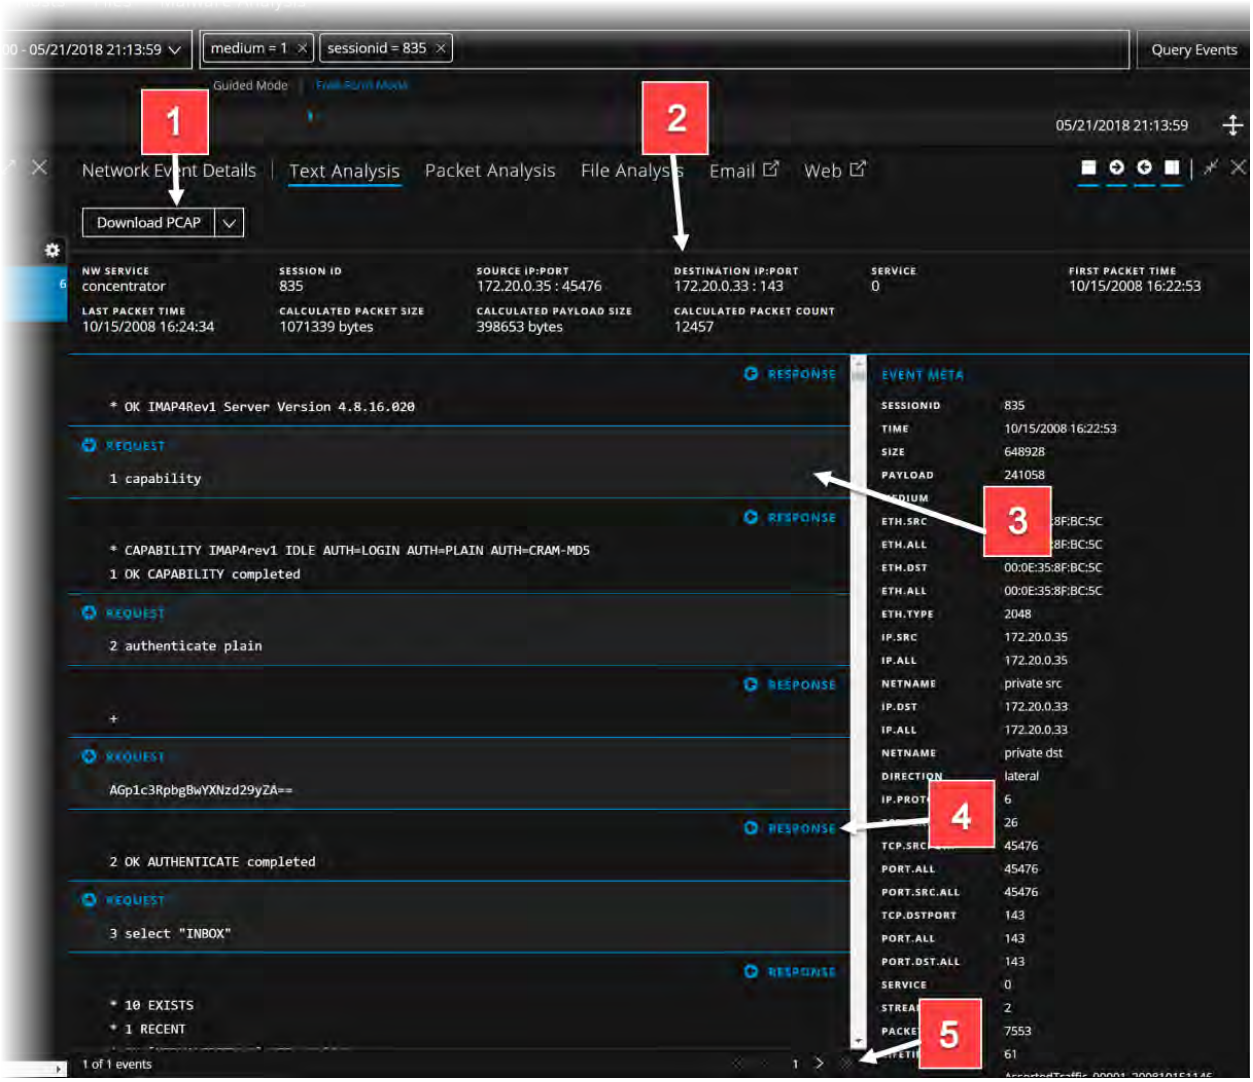
- Events View - File Tab
- Events View - Email Tab
- Events View - Host Tab

## Quick Look

The Events view displays the text of a single event in the Text panel (formerly known as Text Analysis). When you click an event in the Event list panel, the adjacent panel shows the text reconstruction. Only the raw log for log events and endpoint events is shown in the Text panel. For network events, the direction of the packet (Request or Response) and contents of each packet are provided in text format. For more examples of the Text, see Reconstructing and Analyzing Events. For detailed procedures, see Analyze Events in the Events View.



| | |
|---|---|
| 1 | Options for exporting a log, a PCAP, or files for deeper analysis and to share with others. This download menu is for network data. |
| 2 | The event header information. |
| 3 | The payload for a network event includes requests and responses. This is the request side of the packet. |
| 4 | This is the response side of the packet. |
| 5 | (Version 11.2 and later) Event pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed.<br>⟪ - Go to the first page<br>⟨ - Go to the previous page<br>⟩ - Go to the next page<br>⟫ - Go to last page (Only available after last page has already been navigated to) |

# Investigate Dialog

In the Investigate dialog, analysts can select a service or a collection to investigate. The dialog is automatically displayed when you first go to the Navigate view or Legacy Events view and have not selected a default service to investigate. To access the dialog from a current investigation, select the current service name in the toolbar.

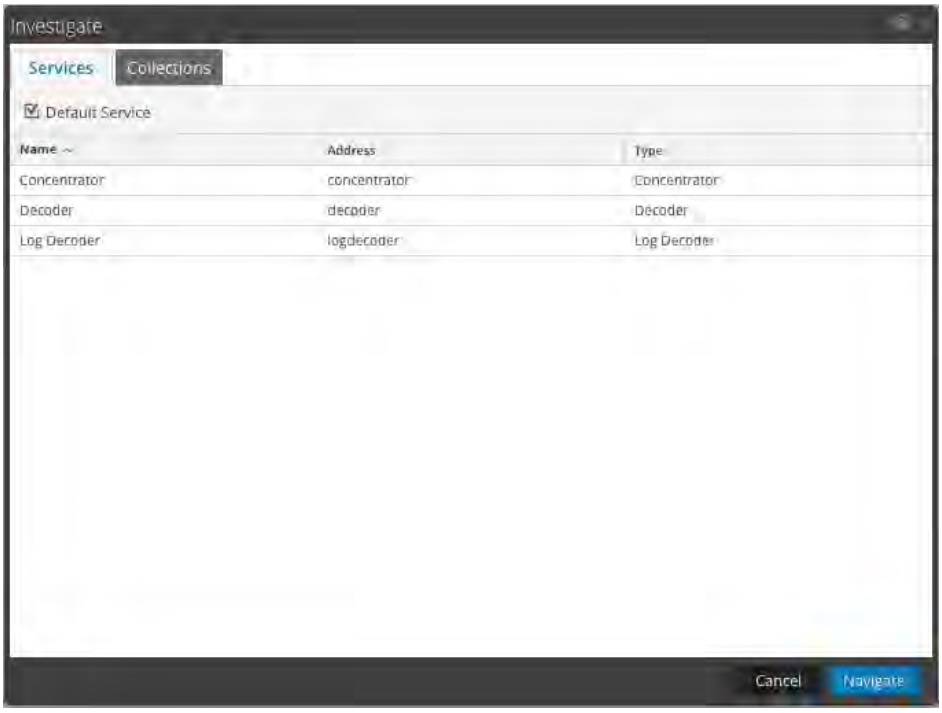
- How NetWitness Investigate Works
- Navigate View
- Legacy Events View

## Quick Look



The Investigate dialog has two tabs: Services and Collections.

**Note:** Collections are also known as workbench collections. You can only view workbench collections that you have created, and only administrators can create a workbench collection.

The Services tab includes a list of services available for investigation, and three buttons. All features are described in the following table.

| Feature | Description |
|---|---|
| Default Service | Clicking this button sets or clears the default service to investigate. When a service has been set as the default service, the word (Default) is appended to the service name. |
| Name | The name of the service. |
| Address | The IP address of the service. |
| Type | The type of service. |
| Cancel | Closes the dialog. |
| Navigate | Opens the selected service in the Navigate or Legacy Events view. |

The Collections tab has two buttons and two panels: Workbench and Collections.

The Workbench panel lists available Workbench services by name. After a Workbench service is selected, you can select a collection from the Collections panel.

The Collections panel lists available collections to investigate. After a collection is selected, you can click Navigate to view the collection.

The following table describes the features of the Collections panel.

| Feature | Description |
|---|---|
| Name | The name of the collection. |
| Type | The type of collection. |
| Size | The size of the collection. |
| Data Type | The type of data within the collection. |
| Date Created | The date the collection was created. |

# Investigation Tab - User Preferences Panel

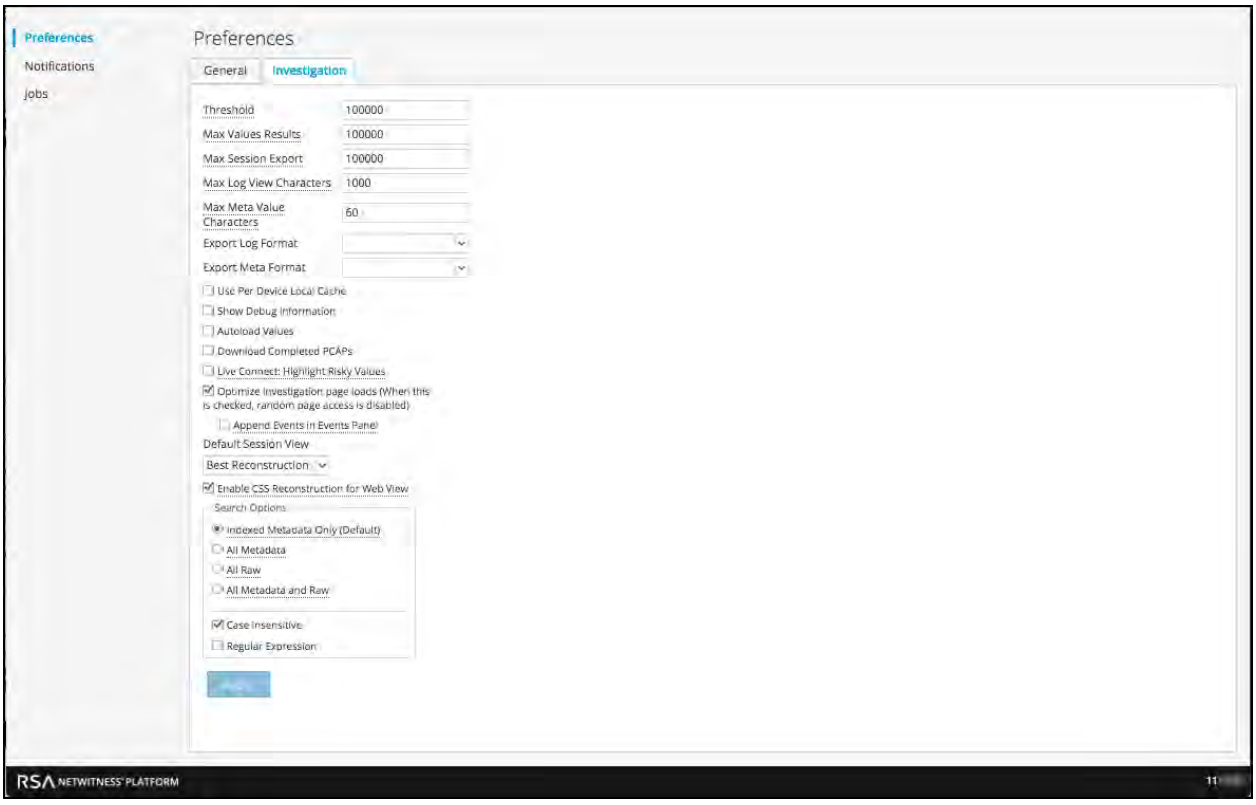
In the Profile view > Preferences panel > Investigation tab, users can set several preferences that affect the performance and behavior of NetWitness when analyzing data, viewing events, and reconstructing events in NetWitness Investigate. To access this tab, select > Profile from the Navigate view or the Legacy Events view. When the Profile view is displayed, select **Preferences > Investigation**. You can change user preferences at any time when you are working in NetWitness.

## Related Topics

- How NetWitness Investigate Works
- Navigate View
- Legacy Events View

## Quick Look

This figure is an example of the Investigation tab, and the following table describes the preferences that affect Investigate. There are slight differences between the 11.1 search settings and later versions of the search settings and these are explained in Search for Text Patterns in the Navigate and Legacy Events Views.



| Feature | Description |
|---|---|
| Threshold | This setting controls the count shown for a meta key value in the Navigate view during the load. A higher threshold allows more accurate counts for a value. However, a higher threshold causes longer load times. When the threshold is reached, NetWitness displays the count and the percentage of time used to reach the count in comparison to the time necessary to load all sessions with that value. For example, **(>100000 - 18%)** indicates that the threshold was set at 100000 and this load took only 18% of the time it would have taken with no threshold set. The default value is **100000**. |
| Max Values Results | This setting controls the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open meta key. The default value is **1000**. |
| Max Session Export | This setting controls the maximum number of sessions that can be exported. The default value is **100000**. |
| Max Log View Characters | This setting controls the maximum number of characters to be displayed on **Investigate > Legacy Events > Log Text**. The default value is **1000**. |
| Export Log Format | This setting specifies the default format for exporting logs from Investigate. Available options are **Text**, **XML**, **CSV**, and **JSON**. There is no default value for the log export format. If you do not select a format for logs here, NetWitness displays a selection dialog when you invoke export of logs. When you select one of the options from the Export Log Format drop-down menu and click Apply, the setting goes into effect immediately. |
| Export Meta Format | This setting specifies the default format for exporting meta values from Investigate. Available options are Text, XML, CSV, and JSON. There is no default value for the meta export format. If you do not select a format for exporting meta values here, NetWitness displays a selection dialog when you invoke export of meta values. When you select one of the options from the Export Meta Format drop-down menu and click Apply, the setting goes into effect immediately.<br><br>**Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2. |
| Use Per Device Local Cache | Allows you to specify the use of locally cached data from the selected service. By default, this checkbox is cleared (Off), which means that Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the option is set, Investigate uses the data from local cache. |
| Show Debug Information | When this option is set, NetWitness displays the `where` clause beneath the breadcrumb in the Navigate view. For each meta value load, the load time is displayed. If the service is a Broker, the elapsed time for each aggregated service is reported. The default value is **Off.** |

| Feature | Description |
|---|---|
| Append Events in Events Panel | When this option is set, the events displayed in the **Events Panel** are added incrementally rather than overwriting the currently displayed events. Each time you click the next page icon, the additional events are appended to the previous events; 1 -25, then 1 -50, then 1 -75 and so on.<br>**Note:** This option is available only if the Optimize Investigation Page Loads option is enabled. |
| Autoload Values | When this option is set, the service values are automatically loaded in the Navigate view. When not set, NetWitness displays a **Load Values** button, allowing the user the opportunity to modify the options. The default value is **Off**. |
| Download Completed PCAPs | This setting automates the downloading of extracted PCAPs in the Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP format. |
| Live Connect: Highlight Risky Values | If you want NetWitness Platform to highlight and display only IP addresses that are considered to be risky by the RSA community, set this option. When not enabled, NetWitness Platform displays all IP addresses. By default, this option is cleared (Off). |
| Optimize Investigation Page Loads | This option is enabled by default (checked) and controls how the Legacy Events view retrieves events. When enabled, results are returned as quickly as possible, but you cannot go to a specific page in the event list. Clearing the checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). Being able to go to any page in the list costs additional overhead to determine the events in advance. |
| Default Session View | This setting selects the default reconstruction type for the initial reconstruction view. By default events are reconstructed using the reconstruction type most appropriate to the event. |
| Enable CSS Reconstruction for Web View | This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for stylesheets and images used in the target event. The option is enabled by default. Clear the checkbox if there are problems viewing specific websites.<br>**Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and stylesheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript does not render in the reconstruction because all client side javascript is removed for security purposes. |
| Search Options | This setting specifies the default search options to apply to a search in the Navigate and Legacy Events views. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information. |
| Apply | Saves your preferences and puts them into effect immediately. |

# Investigate View

The Investigate view is the primary entry point to NetWitness Investigate. In Version 11.5, several of the Investigate submenus are moved to the main menu for easier access. Prior to Version 11.5, the Investigate view had six submenus, which opened different views that allow you to analyze events from different perspectives. The submenus that remain under Investigate are: Navigate, Legacy Events, Events (formerly Event Analysis), and Malware Analysis. The Hosts, Files, and Users views (formerly Entitites) are available from the main menus to improve the workflow for analysts.

**Note:** The Legacy Events view was the original Events view (11.0 to 11.3.x.x). In Version 11.4 and later, the Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

How NetWitness Investigate Works provides an introduction to all of the capabilities available in the Investigate view.

# Legacy Event Reconstruction View

The Event Reconstruction view is deprecated in favor of the Events view. The Legacy Events view provides a reconstruction of a selected event from the Legacy Events view. By default, NetWitness displays the best reconstruction for the event determined by the event content, or the default reconstruction that you have selected in the Default Session View setting for Investigate. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view top-to-bottom or side-by-side results, select request and response views, export an event, export meta values, extract files, open an email attachment, and open the event in a new tab.

To access this view, do one of the following:

- In any Legacy Events view, double-click an event.
- In the Legacy Events view with Detail View selected, right-click **Events** at the end of the event, and select **Event Reconstruction.**
- In the Event Reconstruction toolbar of previewed reconstruction, click **Open Event in New Tab**.
- In the Navigate view, select **Actions > Go to event in Event Reconstruction**, and enter an event ID.

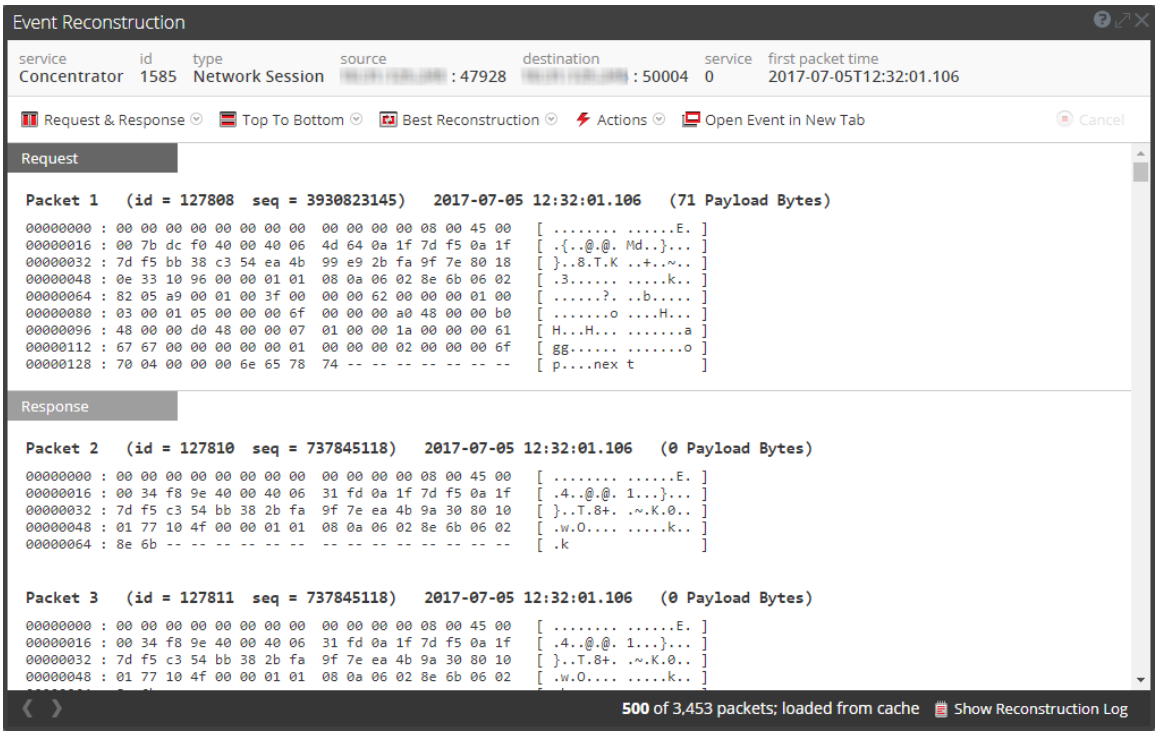
## Quick Look

This figure is an example of the Event Reconstruction view. The following table describes the toolbar options.



| Feature | Description |
|---|---|
| Request & Response | Displays a drop-down menu for selecting whether the view displays:<br>• Request & Response<br>• Request<br>• Response |
| Organization | Displays a drop-down menu for selecting whether the information is displayed top to bottom or side by side. |
| Reconstruction View | Displays a drop-down menu for selecting what information is displayed. By default, Best Reconstruction is selected. Other options are:<br>• View Meta<br>• View Text<br>• View Hex<br>• View Packets<br>• View Web<br>• View Mail<br>• View Files |
| Actions | Displays a drop-down menu with the actions available in the Event Reconstruction view (Export PCAP, Extract Files, and Export Meta). |

| Feature | Description |
|---|---|
| Open Event in New Tab | Opens the event in a new browser tab. |
| Event Analysis | Open the event in the Event Analysis view. |

Beneath the toolbar is a list of meta keys and values. Some of the keys offer a drop-down menu with available actions.

The bar at the bottom of the view offers several options.

| Feature | Description |
|---|---|
| | Displays the previous event. |
| | Displays the next event. |
| Show Reconstruction Log | Displays the reconstruction log at the bottom of the view. Once you click this button, it changes to Hide Reconstruction Log. |

# Legacy Events View

The Legacy Events view is deprecated in favor of the Events view. In the Legacy Events view a list of events associated with a session is available; this view is optimized for viewing raw events in sequence by time. You can display the events list in several forms, filter events, search for events, and open a reconstruction of an event.

There are two ways to display the Legacy Events view:

- Go to **Investigate > Legacy Events.** NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Legacy Events view displays events on the selected service, with the oldest events first.
- From within the **Navigate** view, double-click an event. The Legacy Events view displays the events on the selected service based on the drill point in the Navigate view.

**Note:** The Legacy Events view was the original Events view (11.0 to 11.3.x.x). The Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Incident Responder or Threat Hunter | review detections and signals seen in my environment | *NetWitness Platform Getting Started Guide* |
| Incident Responder | review critical incidents or alerts | *NetWitness Respond User Guide* |
| Threat Hunter | query a service, metadata, and time range* | Begin an Investigation in the Events View<br>Begin an Investigation in the Navigate or Legacy Events View |
| Threat Hunter | view metadata | Filter Results in the Navigate View<br>Drill into Metadata in the Events View (BETA) |
| Threat Hunter | view sequential events* | Filter Results in the Events View<br>Filter Results in the Legacy Events View |
| Threat Hunter | reconstruct and analyze an event* | Examine Event Details in the Events View<br>Reconstruct an Event in the Legacy Events View |

| User Role | I want to ... | Show me how |
|---|---|---|
| Threat Hunter | examine files and associated hosts* | Download Data in the Events View<br>Export or Print a Drill Point in the Navigate View<br>Export Events in the Legacy Events View |
| Threat Hunter | perform lookups* | Look Up Additional Context for Results<br>Launch a Lookup of a Meta Key |
| Threat Hunter | create an incident or add to an incident* | Add Events to an Incident in the Legacy Events View<br>Add Events to an Incident in the Events View |
| Threat Hunter | add a meta value to a Context Hub list* | Look Up Additional Context for Results |

*You can perform this task in the current view.

## Related Topics

- Downloading and Acting Upon Results

## Quick Look

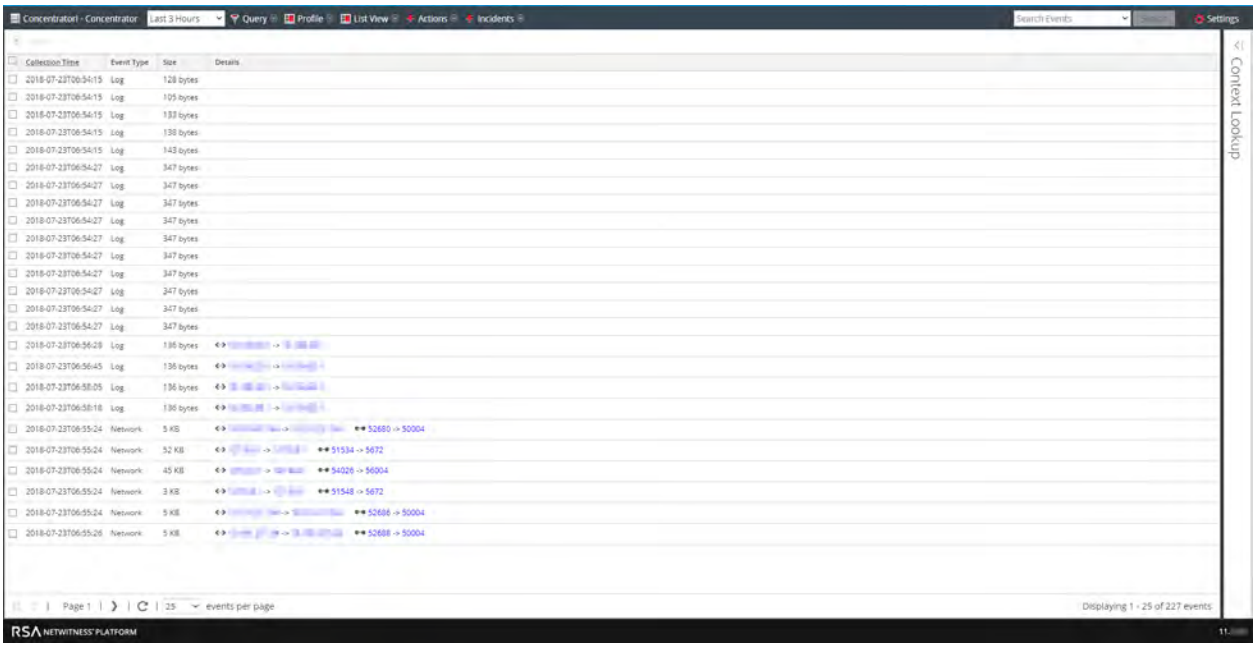
The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. The List view and Detail view provide more information for each event including the timestamp, event type, event theme, and size.

- The List View shows corresponding source and destination address and port information for events in summary form in a grid.
- The Detail View shows all metadata collected for the event in a paged view.
- The Log View is optimized for viewing log and endpoint information, and provides more information for each log including the timestamp, event type, service type, service class, and the logs.

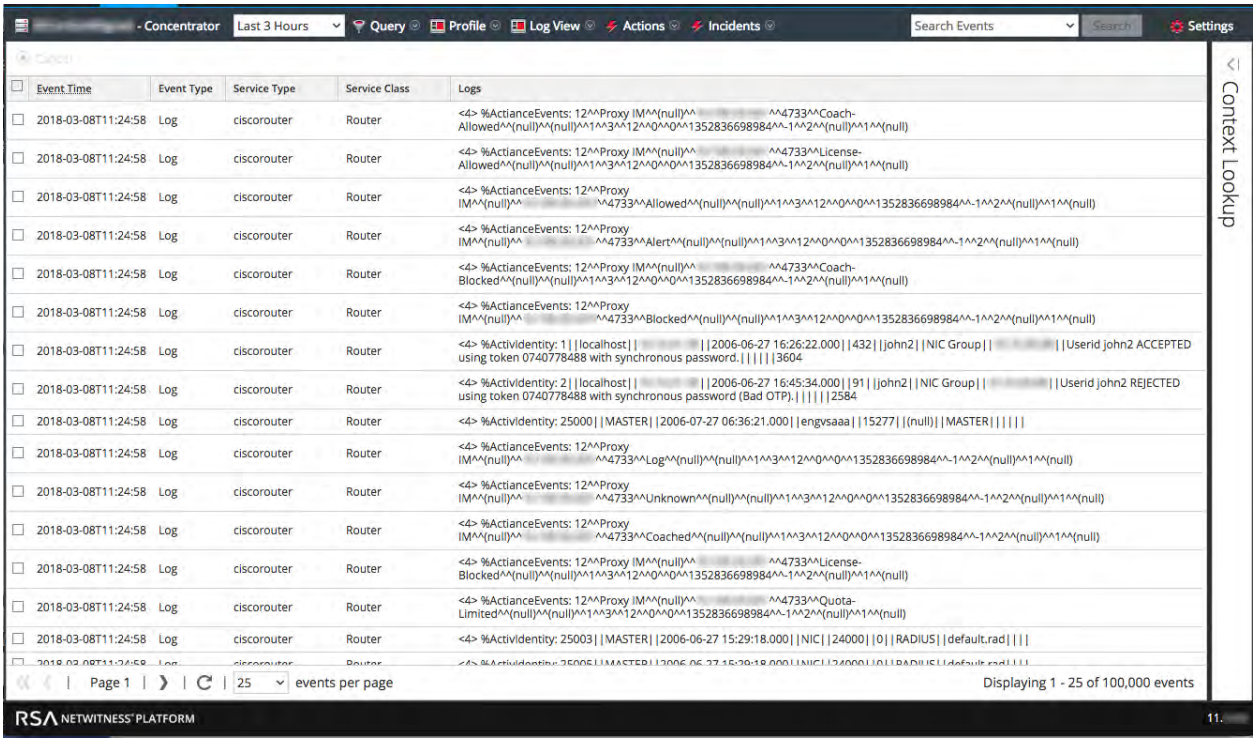
You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. From any view type in Legacy Events view, you can extract files; export network events, endpoint events, logs, and meta values, and open the Event Reconstruction panel. In the Detail View you can also open the event in the Events view.

The following figure is an example of events in the Detail View. The Context Lookup panel is visible only if the Context Hub service is configured.

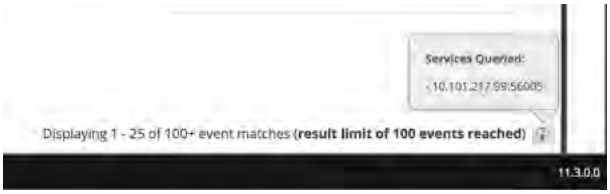
The following figure is an example of events in the List View.



The following figure is an example of the Log View.



The following figure shows the information added to the footer for Version 11.3 and later.



## Detailed Description

The Legacy Events view has a toolbar at the top with the following options.

| Feature | Description |
|---|---|
| Select Service | Displays the selected service name next to the icon. Opens the Investigate dialog, in which you can select a service for which the event list is displayed. |
| Time Range | Displays a drop-down menu for selecting the time range to apply to the event list. You can choose one of the standard options or specify a custom time range. |
| Query | Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data (see Create a Query in the Navigate and Legacy Events Views). |
| Profile | Displays the Profile menu; the currently selected profile is displayed in the toolbar. The menu options include built-in (Default) profiles and custom profiles, as well as an option to manage profiles. Each profile can include a meta group, a column group, and a beginning query that is applied to the Navigate view (meta groups and queries) and the Legacy Events view (column groups and queries) as you investigate events. (see Use Query Profiles to Encapsulate Common Areas for Investigation). |
| View Type Drop-down | Displays a drop-down menu for selecting the event view type.<br>• Detail View shows events in a paged format with detailed information for each event.<br>• List view shows the events in table form with a summary of each event in a separate row.<br>• Log View shows a log-oriented events grid with a summary of each log in a separate row.<br>• Custom Column Groups displays the event list using a column group selected from a drop-down list of custom column groups.<br>• Manage Column Groups displays the dialog for creating and editing custom column groups. |
| Actions | Displays a drop-down menu with actions in the Legacy Events view:<br>• Export an events as PCAP files, export logs, export endpoint events, or export meta values.<br>• View an event reconstruction in a popup window or in a new tab.<br>• Reset all filters in the Legacy Events view. |
| Incidents | Create a new incident in Respond and add the selected events, or add selected events to an existing incident in Respond. |

| Feature | Description |
|---|---|
| Search | Displays the Search Events options, which allow you to specify the export log and export meta value format with additional options explained in Search for Text Patterns in the Navigate and Legacy Events Views. |
| Settings | Displays the Investigation settings for the Legacy Events view (which are also available in the Profile view) so that you can change Investigation settings without navigating away from the Legacy Events view. When you change a setting In the Legacy Events view, the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View). |

Other features of the Legacy Events view are described in this table.

| Feature | Description |
|---|---|
| Show Additional Meta (in the Detail View of an event) | Displays the rest of the metadata for the event. |
| Event Analysis (in the Detail View of an event) | Opens the selected event in the Events view. |
| (in the footer) | Pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the « and ‹ controls are dimmed.<br>« - Go to the first page<br>‹ - Go to the previous page<br>\| 3 Page 3 \| - Go to a specific page<br>› - Go to the next page<br>» - Go to the last page<br>  - Select the number of packets per page<br>When you select a number of events per page, the setting is saved in browser cache so that you do not have to select your preferred number of events each time you log in. The setting applies to all views: Log View, List View, and Details View. |

| Feature | Description |
| --- | --- |
| Displaying 1-100 of 100,000 events (in the footer)<br>Displaying 1-25 of 100+ event matches (result limit of 100 events reached)<br>(in the footer) | Displays the count of events displayed versus the total number of matching events. In Version 11.3 and later, the footer includes a notification if the results limit configured by the administrator has been reached to let you know that more results are available but not viewable. To view the additional results, you need to refine the filter to get fewer results. Clicking the information icon in the footer displays the IP address and connecting port number for all services queried. |

# Manage Default Meta Keys Dialog

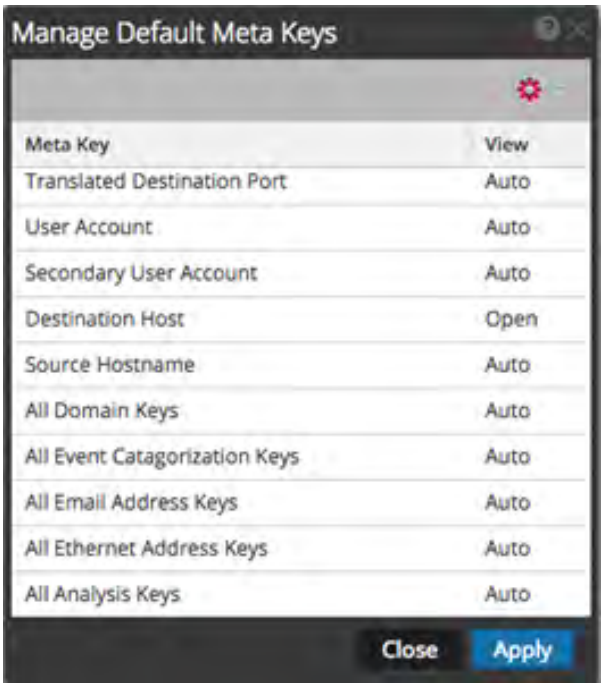
In the Manage Default Meta Keys dialog, analysts can specify the meta keys to be displayed in the Navigate view > Values panel (see Manage and Apply Default Meta Keys in an Investigation. This can help you find the desired data more quickly and prevents the loading of meta keys that are not of interest. To access this dialog, in the **Navigate View** toolbar, select **Meta > Manage Default Meta Keys**.

## Related Topics

- How NetWitness Investigate Works
- Use Meta Groups to Focus on Relevant Meta Keys

## Quick Look

The following figure illustrates the Manage Default Meta Keys dialog, which has a list of meta keys, toolbar, Close button, and Apply button. In the list, you can view, sort, and manage default meta keys. If you click and drag meta keys, you can rearrange their order. The following table describes columns in the list.



| Column | Description |
|---|---|
| Meta Key | This column displays the meta keys available for the service. In Version 11.1 and later, default meta entities are also included, for example All Domain Keys and All Email Address Keys. |

| Column | Description |
|---|---|
| View | This column displays the type of view assigned to each meta key. By clicking on the view in each row, you can assign the meta key a different default view. There are four views:<br>• Auto: Reverts to the default view for meta keys as specified in the service index file.<br>• Close: The values of this meta key are closed by default, and can be opened manually.<br>• Hidden: These meta keys are hidden by default, and are not shown in Investigation at all.<br>• Open: The values of this meta key are displayed by default.<br>When you modify the default meta keys for a non-indexed meta key, you cannot set the key to **Open**. If you change the default view for a group of meta keys to **Open** and some of the meta keys are non-indexed, the non-indexed meta keys revert to **Auto**. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are **Closed** until opened manually. |

The following table describes the toolbar options and buttons.

| Feature | Description |
|---|---|
| | Displays a drop-down menu that allows you change the default view of all the meta keys. There are four views:<br>• Auto: Reverts to the default view for meta keys as specified in the service index file.<br>• Close: The values of this meta key are closed by default.<br>• Hidden: The values of this meta key are hidden by default.<br>• Open: The values of this meta key are displayed by default. |
| Close | Closes the dialog. Any unsaved changes are lost. |
| Apply | Applies the changes, and they become effective immediately. |

# Meta Groups Dialogs

You can use meta groups to filter data displayed in an investigation. A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can create your own groups and you can duplicate and edit a built-in group to create a custom group. With a meta group in effect during an investigation, the information in the Navigate view and Events view includes only the meta keys in the selected group.

While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different.

Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Clone and edit the clone of a built-in or custom meta group.

Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group. Refer to Use Meta Groups to Focus on Relevant Meta Keys for detailed information.

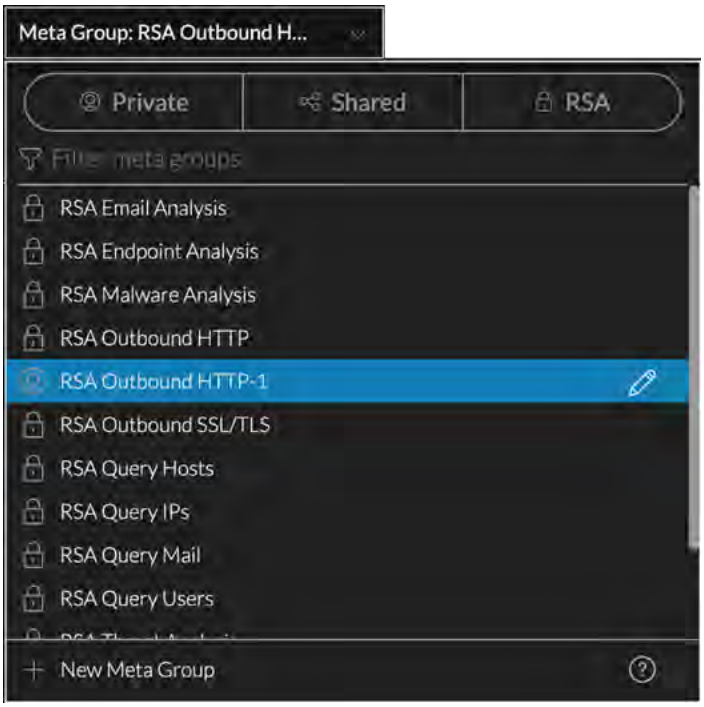
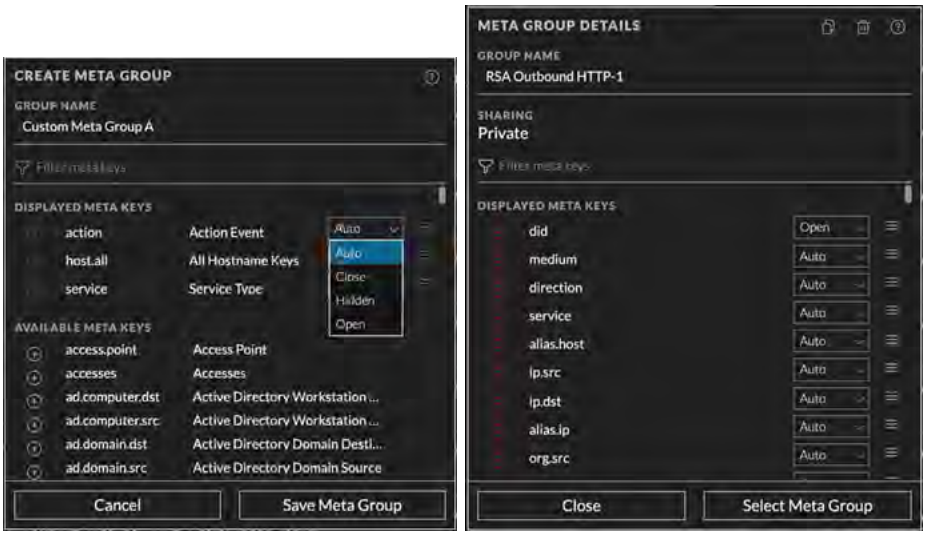
## Quick Look - Meta Groups Menu, Create Meta Group Dialog, and Meta Group Details Dialog

This section introduces the Meta Groups Menu, Create Meta Group dialog, and the Meta Group Details dialog. The following figure is an example of the Meta Group menu. The table describes the options.



| Feature | Description |
|---|---|
| Visibility Options | Control the types of meta groups that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all meta group types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter Meta Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty.<br>Private = display private groups that only you can manage<br>Shared = display shared groups that anyone in your organization can manage<br>RSA = display built-in groups that only RSA can manage |
| Filter Meta Groups | Filters the list of meta groups as you type text so that only group names that contain the typed text are displayed. |
| Meta Group List | The list of meta groups consists of custom and built-in groups. Custom meta groups can be shared or private. The RSA meta groups are built-in meta groups; you cannot edit or delete these, but you can make a copy and edit the copy. Icons preceding the meta group name distinguish the private groups, shared groups, and built-in groups. |
| New Meta Group | Displays the Create Meta Group dialog, where you can create a custom meta group. |

The Create Meta Group dialog, shown in the figure on the left, allows you to define a custom meta group. The figure on the right illustrates the Meta Group Details dialog, in which you can edit a custom meta group. The table describes the fields and options in the dialogs.

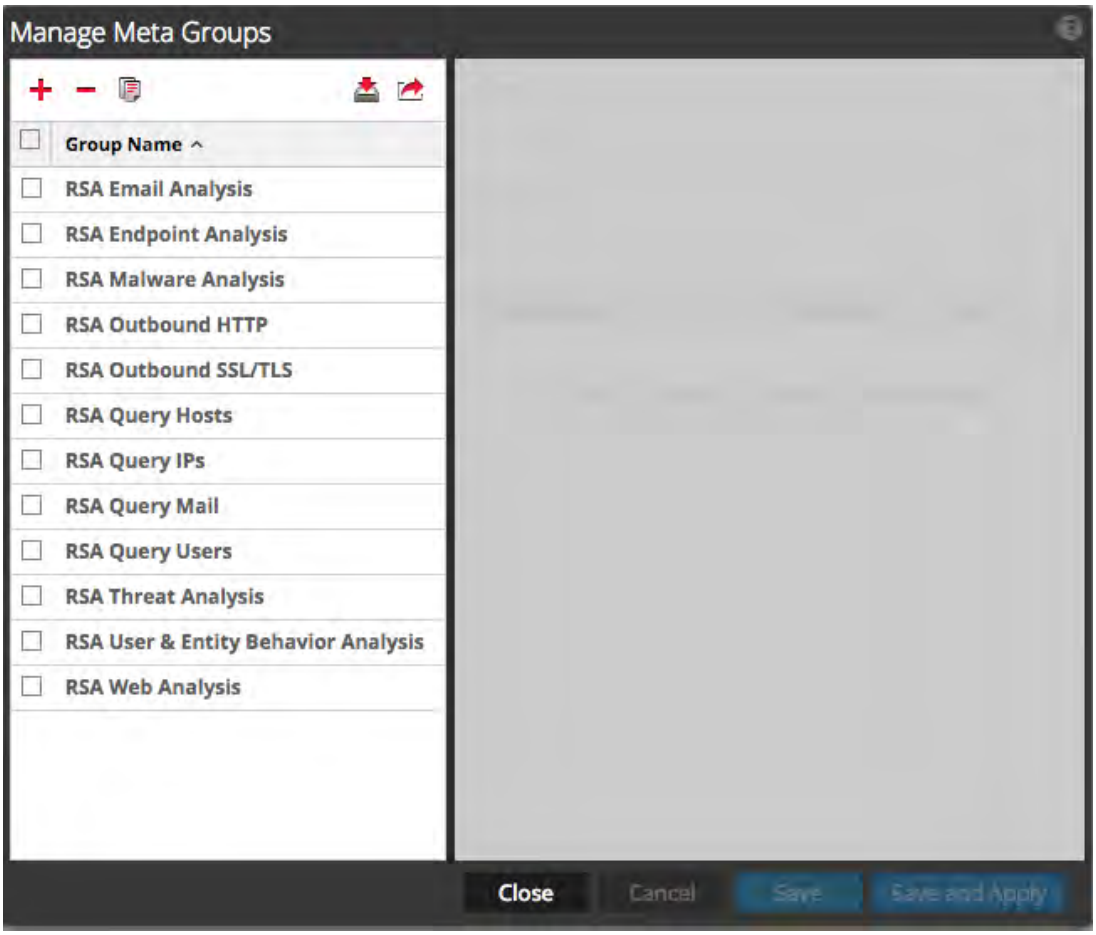


| Feature | Description |
|---|---|
| | Creates a copy of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group. |
| | Deletes the custom meta group that you are currently editing. This action is irreversible and applies globally. If the meta group is a shared group, it is no longer available to anyone. |
| Group Name | Displays the name of the meta group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom meta group. |
| Sharing | Specifies whether the meta group is shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared. |
| Filter Meta Keys | Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed. |
| Displayed Meta Keys | Displays a scrollable list of meta keys that are selected for use in the custom meta group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list , and drag meta keys up or down to change the order in this list ( ). Drag and Drop is disabled when text is typed in the Filter Meta Keys field. For each displayed meta key you can choose: |
| Available Meta Keys | Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking next to the meta key name adds it to the Displayed Meta Keys list. You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting). |

| Feature | Description |
|---|---|
| Initial View Option | For each meta key, you can set the initial view option:<br>-When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto.<br>-Open meta keys are listed in the Filter Events panel, and the values are loaded.<br>-Closed meta keys are listed in the Filter Events panel, but the meta values are not loaded until you open the meta key.<br>-Hidden meta keys are not listed in the Filter Events panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state. |
| | Allows you to drag and drop meta keys in the Displayed Meta Keys list so that you can see the data in the order you prefer. |
| Close button | Closes the dialog. |
| Save Meta Group | For the Create Meta Group dialog only, saves the new meta group. |
| Reset | For the Meta Group Details dialog only reverts the edited meta group to the last saved state. |
| Update Meta Group | For the Meta Group Details dialog only, applies changes to an edited meta group. |
| Select Meta Group | Applies the meta group. The Filter Events panel is refreshed to display only the meta keys in the selected meta group. |

## Quick Look - Manage Meta Groups Dialog

The following figure is an example of the Manage Meta Groups dialog.



The Meta Groups panel is on the left side of the Manage Meta Groups dialog. This is where you can add, delete, import, and export meta groups. The following table describes the features of the Meta Groups panel.

| Feature | Description |
|---|---|
| + | Adds a meta group using the Settings panel on the right side of the Manage Meta Groups dialog. |
| − | Deletes the selected meta group. A confirmation dialog is displayed before the meta group is deleted. |
| | Creates a copy of the selected meta group. |
| | Displays the Meta Group Import dialog, where you can upload a file. |
| | Exports the selected meta group to your computer. |
| Group Name | Lists all meta group names. |

The Settings panel is on the right side of the Manage Meta Groups dialog. This is where you create and edit meta groups. Below the Name field is the Meta Keys list. The following table describes the features of the Settings panel.

| Feature | Description |
|---|---|
| Name | Displays the name of the selected meta group. |
| | Displays the Available Meta Keys dialog, where you can select meta keys to add to the group. |
|  | Deletes the selected meta keys. |
| | Displays a drop-down menu, where you can select the view for all meta keys. There are four options based on the possible values for the `defaultAction` property used to define a key in the custom index file for the service:<br>• Hidden: These meta keys are hidden by default, and are not shown in Investigation at all.<br>• Open: The values of this meta key are displayed by default.<br>• Close: The values of this meta key are closed by default, and can be opened manually.<br>• Auto: Reverts to the default view for meta keys as specified in the service index file. |
| Display Name | Indicates the name that is displayed for the key in Investigate views, and is defined by the `description` property for the key in the custom index file for the service.. |
| Key Name | Indicates the `name` of the meta key as defined in the custom index file for the service. |
| View | Indicates the view to which the meta key is set. You can change:<br>• Change the view for all meta keys by clicking in the View column header, then selecting a view from the drop-down menu.<br>• Change the view for a single meta key by clicking a single meta key in the View column, then and selecting a view from the drop-down menu. |

The following table describes the buttons at the bottom of the dialog.

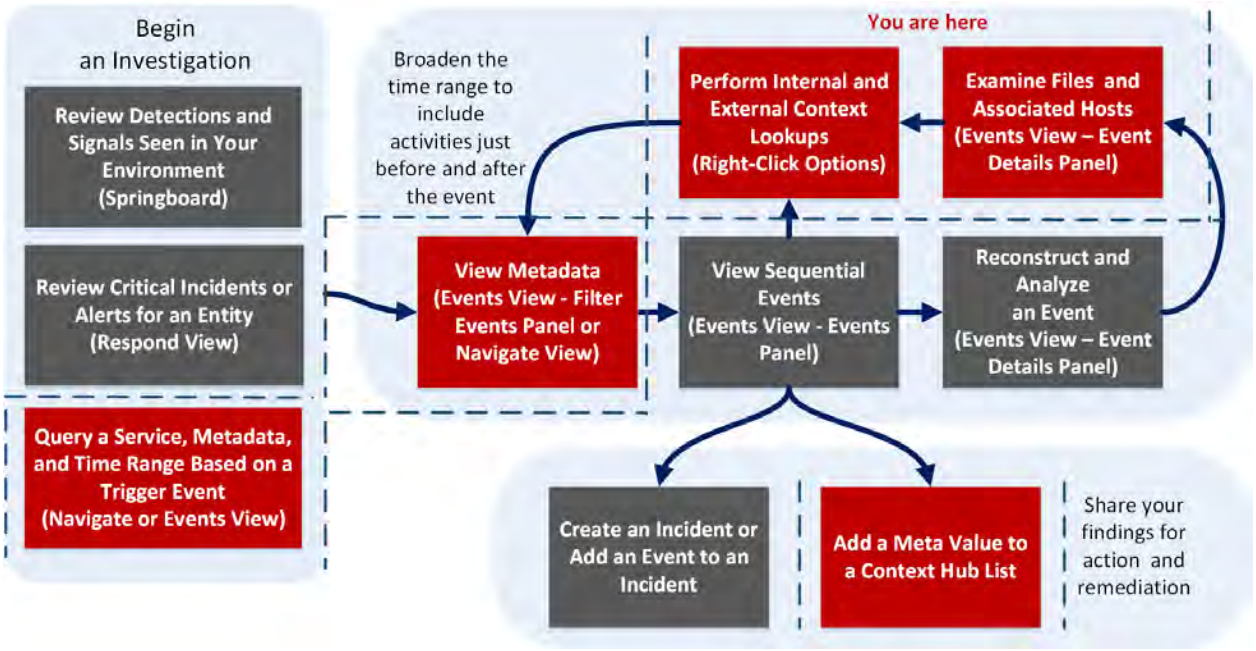
| Feature | Description |
|---|---|
| Close | Closes the dialog. |
| Cancel | Cancels all changes. |
| Save | Saves all changes. |
| Save and Apply | Saves and immediately applies all changes. |

# Navigate View

The Navigate view ( **Investigate** > Navigate) displays event metadata--the meta keys and meta values--that were found in captured data for the selected service. The data is filtered and displayed in accordance with the options you set for profile, time range, meta group, and query. You can also drill into the data by clicking meta keys and meta values.

**Note:** By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

## Workflow



In the Navigate view, you can:

- View metadata for events in the Values panel.
- Visualize events in a timeline or parallel coordinates chart.
- Save events, go to an event using the event ID, visualize an event, and print an event.
- View additional contextual data for meta keys and values.
- Open a drill point or an event in the Legacy Events or the Events view.

## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Incident Responder or Threat Hunter | review detections and signals seen in my environment | *NetWitness Platform Getting Started Guide* |
| Incident Responder | review critical incidents or alerts | *NetWitness Respond User Guide* |
| Threat Hunter | query a service, metadata, and time range* | Begin an Investigation in the Events View<br>Begin an Investigation in the Navigate or Legacy Events View |
| Threat Hunter | view metadata* | Filter Results in the Navigate View<br>Drill into Metadata in the Events View (BETA) |
| Threat Hunter | view sequential events | Filter Results in the Events View<br>Filter Results in the Legacy Events View |
| Threat Hunter | reconstruct and analyze an event | Examine Event Details in the Events View<br>Reconstruct an Event in the Legacy Events View |
| Threat Hunter | examine files and associated hosts* | Download Data in the Events View<br>Export or Print a Drill Point in the Navigate View<br>Export Events in the Legacy Events View |
| Threat Hunter | perform lookups* | Look Up Additional Context for Results<br>Launch a Lookup of a Meta Key |
| Threat Hunter | create an incident or add to an incident | Add Events to an Incident in the Legacy Events View<br>Add Events to an Incident in the Events View |
| Threat Hunter | add a meta value to a Context Hub list* | Look Up Additional Context for Results |

*You can perform this task in the current view.

## Related Topics

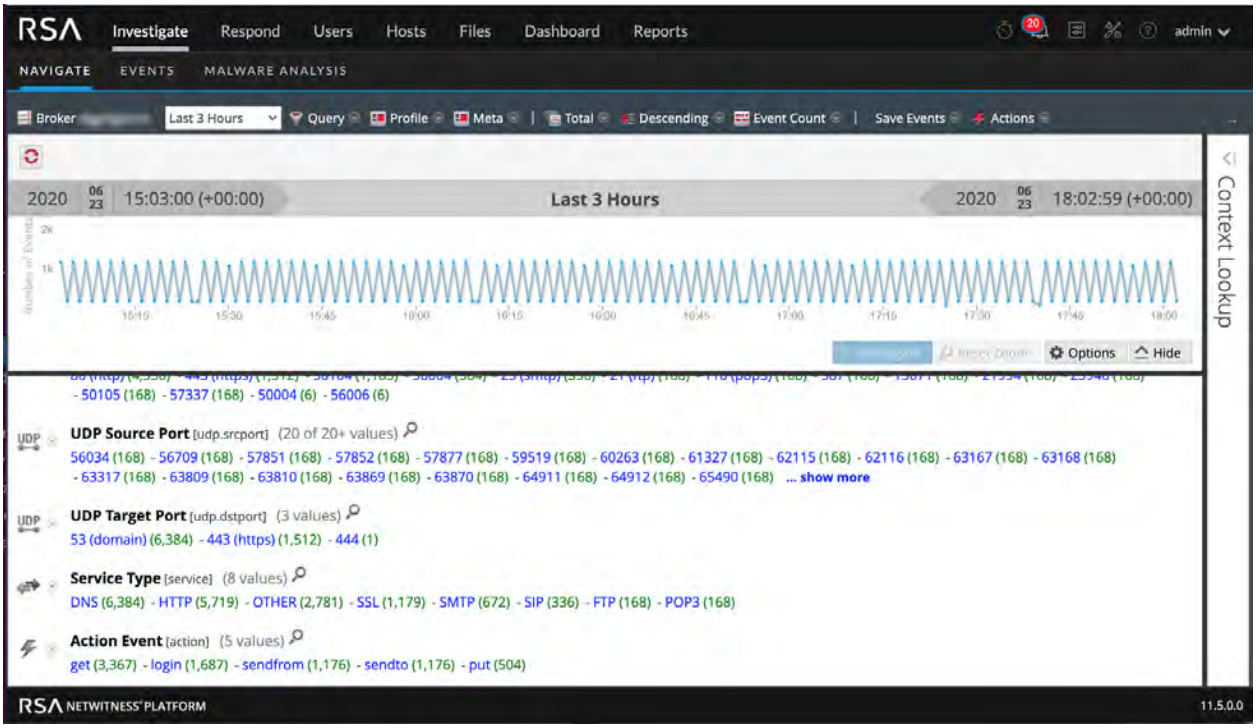
- Events View

## Quick Look

This figure illustrates the Version 11.5 Navigate view.



The Navigate view consists of these features:

- Toolbar
- Pause/reload button and breadcrumb
- Time banner
- Optional debug information.
- Collapsible Visualization panel
- Values panel
- Context Lookup panel
- Context menus

## Toolbar

The following figure is an example of the toolbar. The toolbar provides a way to:

- Change the service being investigated.
- Control the range of data displayed: You can select use profiles, set a time range, use meta groups, and create queries to apply to the data.

- Set the quantification method and sorting method for data in the Values panel.
- Perform actions on the results. You can export and print results, open an event for which you have an event ID in the Legacy Events view or Events view, and pass a query to Informer.
- Configure Investigate settings without navigating away from the Investigate views.

Some of the toolbar options are labeled with the default value or the selected value rather than displaying the name of the option. For example, the time range option in the example above is labeled **Last 5 Minutes** to reflect the currently selected value. These are the toolbar options.

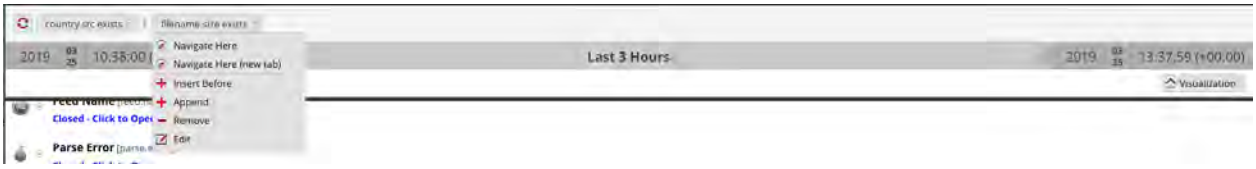
| Option | Description |
|---|---|
| | Displays the selected service name next to the icon. Clicking the icon opens the Investigate a Service dialog, in which you can select a service to investigate and set the default service to investigate (see Begin an Investigation in the Navigate or Legacy Events View). Changing the service does not cause a reload of the data. |
| Time Range | Displays the Time Range options; the currently selected option is displayed in the toolbar (see Filter Results in the Navigate View). Possible choices are:<br>• All Data<br>• Last 5, 10, 15, or 30 Minutes<br>• Last Hour, Last 3, 6, 12, or 24 Hours<br>• Last 2 or 5 Days<br>• Early Morning<br>• Morning<br>• Afternoon<br>• Evening<br>• All Day<br>• Yesterday<br>• This Week<br>• Last Week<br>• Custom<br>**Note:** If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time will be interpreted as `HH:MM:00 - HH:MM:59`. Seconds display in this format in Investigate functions. |

| Option | Description |
|---|---|
| Query | Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data. See Query Dialog for a description of the dialog. |
| Profile | Displays the Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries), the Legacy Events view, and the Events view (column groups and queries). See Use Query Profiles to Encapsulate Common Areas for Investigation for more information. |
| Meta | Displays the Meta Group menu. You can use Default Meta Keys or a custom Meta Group. You also have the option to make changes to both group types (see Use Meta Groups to Focus on Relevant Meta Keys). |
| Sort Field | Displays the Sort Field menu; the currently selected option is displayed in the toolbar. The menu has two options: Order by Total and Order by Value. The Sort Field is a complement to the Sort Order option; the data for each meta key is ordered based on the total (green number) or the meta value (blue text) (see Filter Results in the Navigate View). |
| Sort Order | Displays the Sort Order menu; the currently selected option is displayed in the toolbar. The menu has two options: Sort in Ascending Order and Sort in Descending. The Sort Order is a complement to the Sort Field option; the selected sort field for each meta key is ordered in ascending or descending order (see Filter Results in the Navigate View). |
| Quantification Method | Displays the Quantification Method menu; the currently selected option is displayed in the toolbar. The Quantification Method only applies to the meta key results in the Values panel. It does not apply to the timeline.<br>The drop-down menu contains three options for calculating the quantity (green number in parentheses) for a meta value: Quantify by Event Count, Quantify by Event Size, and Quantify by Packet Count (see Filter Results in the Navigate View).<br>These are applied differently depending on the type of data in view.<br>For packet data:<br>• Quantify by Event Count shows the number of sessions.<br>• Quantify by Event Size shows the size in bytes.<br>• Quantify by Packet Count shows the number of packets.<br>For log data:<br>• Quantify by Event Count shows the number of logs.<br>• Quantify by Event Size shows the size in bytes.<br>• Quantify by Packet Count shows the number of logs. |
| Save Events | Displays the Save Events menu, in which you can use options to: extract files associated with an event, export the current drill point as a PCAP file, and export the current drill point as a log file (see Export a Drill Point). |

| Option | Description |
|---|---|
| Actions | The Actions menu includes actions that you can perform in the Navigate view (see Refining the Results Set). In Version 11.1 and later, the options are Visualize, Go to event in Event Reconstruction, Go to event in Events view, and Print). |
| Search Events | Enables you to search for text patterns within the current set of events. If you click in the Search field, it shows a drop-down menu with search options. If you click Apply, it saves the selected options and also updates the search options in the Legacy Events view and the Investigations profile (see Search for Text Patterns in the Navigate and Legacy Events Views). |
| Settings | Displays the settings for the Navigate view (which are also editable in the Profile view) so that you can change Investigate settings without navigating away from the Navigate view. When you change a setting In the Navigate view the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View). |

## Pause/Reload Button and Breadcrumb

The breadcrumb tracks each query as you drill down through the metadata for the service. The following figure is an example of the breadcrumb.



Each query is listed with a drop-down menu in a pipe separated string. The last point is the current point, also called the tip. The icon in front of the breadcrumb allows you to pause the loading of meta values and to reload meta values. The breadcrumb does not include the service name and appears only if a query is in effect. If too many drill points exist for display, the overflow is shown as double angle brackets, >>, at the end of the breadcrumb. Each drop-down menu in the breadcrumb is the same, with slight variation based on the position of the crumb.

The following table describes the controls and menu options in the breadcrumb.

| Feature | Description |
|---|---|
| Pause | Pause and Reload button. Controls the loading of data in the view. It has three possible functions: pause loading, continue loading, and reload. |
| Navigate Here | Opens the selected drill point in the current Values panel. |
| Navigate Here (new tab) | Opens the selected drill point in a new tab. |
| Insert Before | Inserts a query before the current drill point. The Create Filter dialog opens and you can define a custom query to insert in the breadcrumb (see Create a Query in the Navigate and Legacy Events Views). |

| Feature | Description |
|---|---|
| Append | Appends a query after the current drill point. The Create Filter dialog opens and you can define a custom query to append to the end of the breadcrumb (see Create a Query in the Navigate and Legacy Events Views). |
| Remove | Removes the selected drill point from the breadcrumb. |
| Edit | Opens the selected drill point in the Create Filter dialog so that you can edit the query. |
| >> | Clicking the angle brackets displays a drop-down menu of the breadcrumb overflow. |

## (Optional) Debug Information

If you have activated the Show Debug Information setting and the service you are navigating is a Broker, NetWitness, displays the debug information beneath the breadcrumb.

The debug information is the `where` clause from the current query. The only time there is no `where` clause is when the time range is all data and there are no drill points. If the Broker has at least one aggregate service that is offline, the debug information also lists the offline service.

For example:

```
(attachment exists)&&(tcp.dstport = '80')&&(risk.info exists)$$time='2014-05-
04 18:50:00"-"2014-05-09 18:59:59(attachment exists) && (tcp.dstport = '80')
&& (risk.info exists) && time="2014-05-04 18:50:00"-"2014-05-09 18:50:59"
```

In addition, the time taken to load is displayed at the end of each meta key in the Values panel.

## Time Banner

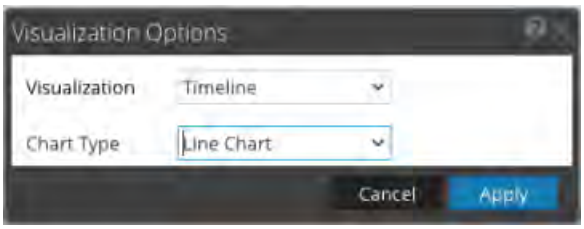
Just below the breadcrumb and debug information (if present), the time banner shows the time range used to create the chart. The following figure is an example of the time banner.

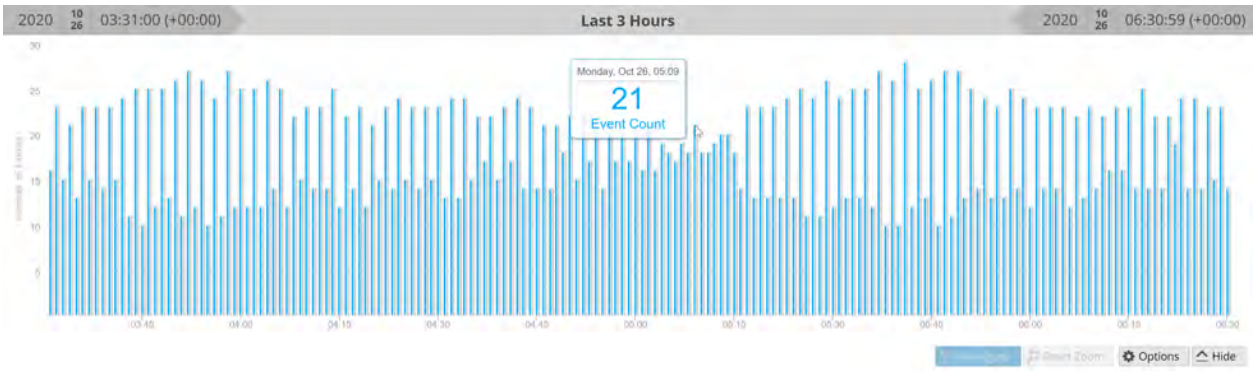
## Visualizations

At the top of the Navigate view is a visualization of the current drill point. You can use this to drill into data from the Visualization panel (see Filter Results in the Navigate View). You can show or hide the visualization, and choose one of thevisualization options: Timeline or Coordinates. The Visualization opens initially to the last saved Visualization.

### Timeline Chart

The timeline is the count of the number of events that occur at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a line chart or a bar chart based on your choice in the Options menu. The second figure illustrates a line chart and third figure illustrates a bar chart.





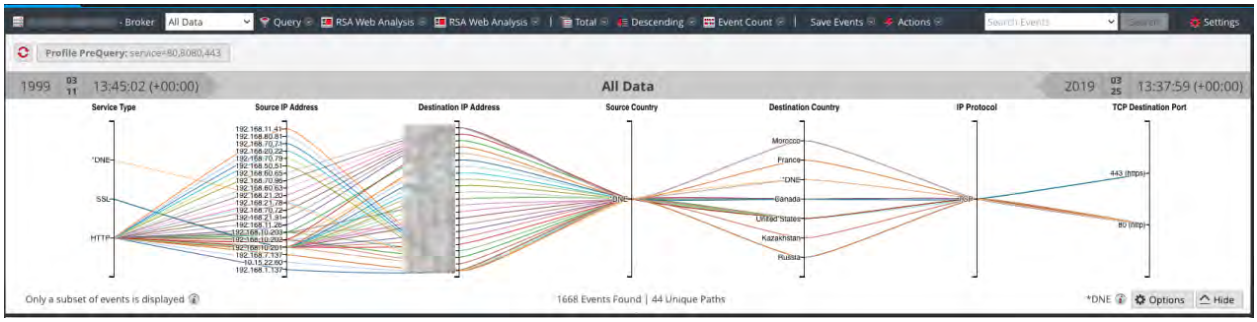
The timeline displays activity for the specified service and time range, as a line chart or a bar chart based on your choice in the Options menu.

| Feature | Description |
|---|---|
| Number of Events (Timeline) | The Y axis of the chart based on thousands of events. |
| Time Line (Timeline) | The X axis of the chart based on the time the events occurred. |
| Event point (Timeline) | If you want to explore a specific section, simply select the range from the chart. The new time range will be reflected in the chart. |
| Investigate (Timeline) | Displays the meta values for the selected subset. |
| Reset Zoom (Timeline) | To return to the original time range, click Reset Zoom. |

| Feature | Description |
|---|---|
| Options | Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed. |
| Hide | Collapses the chart. |

## Parallel Coordinates Chart

The Parallel Coordinates chart is one of the choices in the Options menu for visualizing the current drill point. With Coordinates selected in the Visualization Options dialog, you can select the meta data to be displayed (see Visualize Metadata as Parallel Coordinates). An easy way to view a useful Parallel Coordinates chart is to choose a profile group as shown in the following figure.



| Feature | Description |
|---|---|
| Axes | Each axis is a meta key. The number of meta keys affects the load time for the chart. All meta keys are loaded, but it there the number of events per meta key is limited. |
| Lines | Lines represent events and they connect values on the axes to show the correlation between multiple meta keys. |
| Options | Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed. |
| Only a subset of events is displayed. | This message is a notification that not all events in the values panel are drawn in the chart. Removing axes or filtering the data in the Values panel can help to display all events. |
| Events Found \| Unique Paths | Displays the total number of events charted versus the number of unique paths charted. Setting the All Meta Keys Must Exist in an Event option redraws the chart so that it is more targeted and legible. |
| DNE | Indicates that there is no values for this meta key in the event. |

In the Visualization Options dialog for Coordinates, you can select the meta keys to chart.

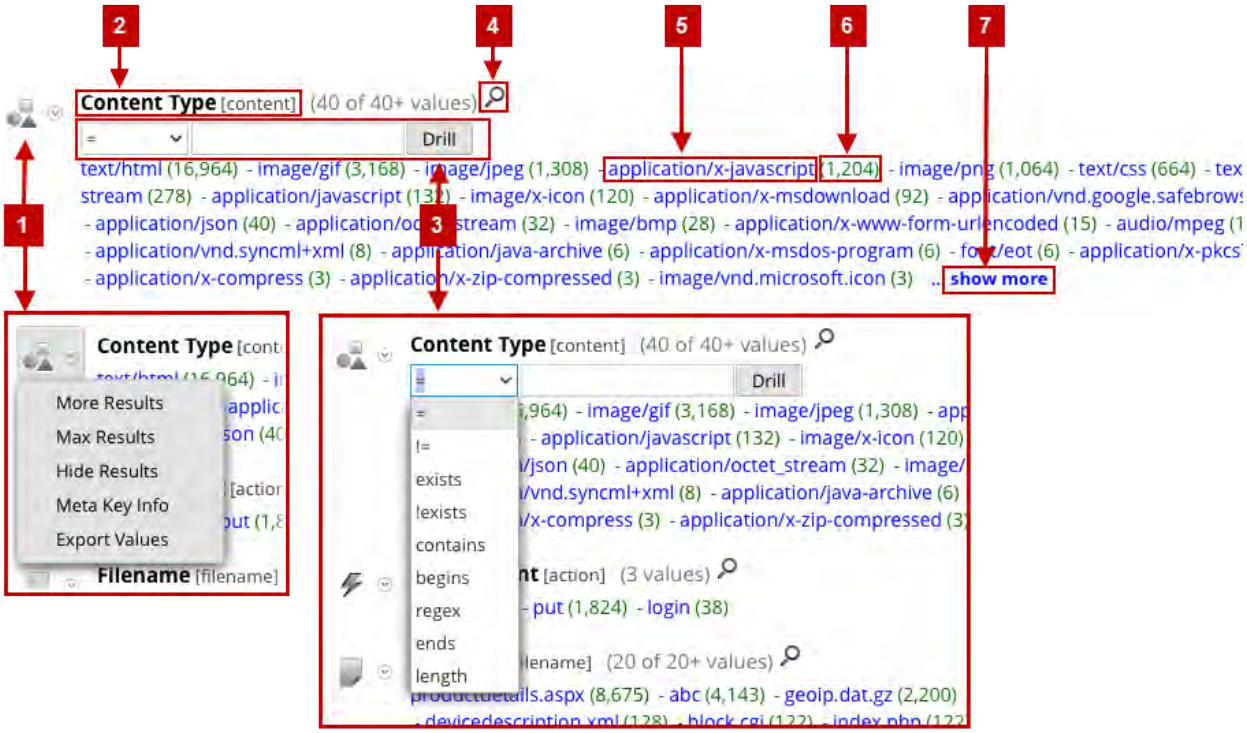
| Feature | Description |
|---|---|
| Visualization selection | Displays a drop-down list of visualization types: Timeline and Coordinates |
| All Meta Keys Must Exist in an Event | Limits the data represented in the visualization to only those events that include all selected meta keys. This can result in a cleaner, more targeted visualization. |
| | Displays the Add Keys to Parallel Coordinates Visualization dialog so that you can add axes to the visualization. This is useful if you are looking for relationships between the default meta keys and some additional ones. |
|  | Deletes the selected keys so that they do not appear as axes in the visualization. This can help to make the visualization less cluttered and allow for more data points to be included in the visualization. |
| | Reverts to the default meta keys for visualization, which consist of all meta keys in the current drill point. |
| | Controls the display of additional information about the number of selected axes versus the recommended count. This helps to make you aware of possible performance improvements by removing axes. |
| Axes | Lists the meta keys selected as axes in the visualization. |
| Cancel | Cancels any changes made to the visualization options. |
| Apply | Saves the changes made to the visualization options and applies to the current visualization. |

In the Add Keys to Parallel Coordinates Visualization dialog, you can select the meta keys or meta groups to use as axes the Parallel Coordinates visualization.

| Feature | Description |
|---|---|
| Visualization selection | Select Keys: Two options for selecting meta keys are:<br>• From Default Meta Keys<br>• From Meta Groups<br>Each option offers a drop-down list from which to select. |
| With the Selected Meta Keys... | The options for the method of adding meta keys allow you to:<br>• Replace the current list of keys<br>• Append to the current list of keys<br>• Insert at beginning of the current list of keys |
| Cancel | Closes the dialog and does not add any keys. |
| Add | Closes the dialog and adds the selected keys as specified. |

## Values Panel

The major feature of the Navigate view is the Values panel, which presents meta keys and meta values found in the service being investigated. Procedures for analyzing data in the Values panel are provided in Filter Results in the Navigate View.



**Note:** Title, values, and counts for non-indexed meta keys are not drillable; the Values and counts are shown in black.

1 The meta keys in the Values panel have drop-down menus, which offer actions that can apply to that meta key. You can use these to change the way the results for the meta key are displayed in the current view. Changes made to meta keys are displayed in the current view and persist until you refresh the page or select a new service in the Navigate view toolbar. See Drill into Data in the Values Panel

Refresh reverts to the current view of meta keys as defined in the Manage Default Meta Keys dialog (see Manage and Apply Default Meta Keys in an Investigation). If you have never made modifications in the Manage Default Meta Keys dialog, NetWitness, a refresh restores the default meta keys from the core service.

- More Results
- Max Results
- Hide Results
- Meta Key Info

| | |
|---|---|
| | • Export Value |
| 2 | The name of the meta key for which values are listed. In Version 11.3 and later, the user friendly name of the meta key is displayed with the index file name of the meta key following in brackets. For example **Content Type [content]** gives the user friendly name of the `content` meta key with the index file name in parentheses. For meta groups, the name of the group is given in plain English with the meta group name following in parentheses. This is an example of a meta group name as it would appear in the Values panel: **All User Keys [users.all]**. |
| 3 and 4 | Clicking on an indexed meta key opens the Search dialog in which you can enter a filter for the current meta key. The search function is not available for non-indexed meta keys, and is based on the actual meta value rather than the alias. Drilling in the Search dialog using aliases is not supported.<br>NOTE: Check with your administrator to obtain a list of aliases used for a meta key in Investigation. When an alias is used, this search dialog does not provide results. Instead, you must query the meta key using the Right-click query capability or the Query dialog. |
| 5 | The meta value associated with the found meta key. These are listed in order by meta value name or by the count of events in which the meta value was found, according to your preference. |
| 6 | The number of events that include the meta value. |
| 7 | The number or values rendered is specified by the Render Threads value in the Investigation Preference settings. In the example above, the meta key is **Content Type**, and 40 of 40+ values are currently displayed. You can display additional values by clicking **...show more**. The number of instances found for a particular meta in the session. |

## Values Panel Loading Behavior

The default view is for the last 3 hours of collection, using the default meta keys and non-indexed meta keys closed. The meta keys within the meta groups are displayed in the order that NetWitness queries the keys. As the data loads into the Values panel, NetWitness is optimized to show partial results, loading progress, and service status as the data loads.

The loading behavior is determined by several configuration settings. The highest level settings are configured by the administrator for each user. These are:

- The maximum amount of time allowed for this user to run a query (Query Timeout).
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of results loaded. Any session that does not show a percentage is accurate and was processed to completion. If there is a percentage, that reflects how much processing was completed. The percentage displayed is estimated by extrapolating from the value at the time processing finished, considering the amount of work remaining. Larger percentages are generally more accurate because they require less extrapolating
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of query time used to reach the threshold.

**Note:** The values for non-indexed meta keys take longer to load in the Values panel. To optimize loading, NetWitness does not open non-indexed meta keys by default. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

When you have launched an investigation of a service, NetWitness displays results in the Values panel.

1. NetWitness loads meta keys and meta values in the Values panel. For each meta key load, the stages of load are:
   a. **Waiting to Be Loaded** or **Closed**. If Closed, no data for that key is loaded.
   b. **Loading**
      i. **Loading progress**: NetWitness is receiving and displaying progress messages.
      ii. **Partial results**: NetWitness is receiving values messages and partial results are displayed in the Values panel.
   c. **Load Complete**: All results are finished loading.
2. As each meta key load is completed, and final values are displayed, the next meta key is started. The number or values rendered for each meta key is specified by the Render Threads value in the Investigation Preference settings. Loading continues until all keys to be loaded have finished.
3. If **Show Debug Information** is active and the service you are navigating is a 10.4 or later Broker, NetWitness displays load time information beneath the values for each meta key and displays additional load details for the aggregated services. NetWitness also displays the debug information beneath the breadcrumb.

## Iterative results

Iterative results provide feedback on the status of queries within the interfaces to provide additional context for how long the data load will take and if any service data is missing. For example, if you are querying a Broker that is aggregating from two Concentrators, NetWitness starts displaying the results from the first Concentrator as soon as it is available, even if the second Concentrator is still waiting for results.

Iterative results also include a notification that service data is missing because the service is unreachable.

## Partial results

When partial values from the Core service are returned but not completed, a message at the end of the meta key listing shows the progress of values loaded. For example, Currently looking at 38 ip.src values 71% indicates that loading of values for the meta key is 71% complete.

## Debug Information

If the Show Debug Information setting is in effect, a field at the end of the values displays the status for the different systems against which you are querying within NetWitness. For example, when you are querying against a 10.4 broker pulling from multiple concentrators, NetWitness displays the status of the query on each of the Concentrators, which provides insight into the relative speed of data loading from each of the Concentrators. Each service that participated in the query is listed with the total elapsed time for the query.

Each service that participated in the query is listed with the total elasped time for the query. In the example above, two services returned in 3.207 seconds, localhost:50005 took 2 seconds to return the results. In addition, the where clause of the query is displayed below the breadcrumb. You can copy this syntax directly into an application rule or Reporting where clause of a rule.

## Load Complete

For each meta key, there is a list of values (blue text) and counts (green text) found in the current drill point. When you click a value to drill down into a subset of the currently selected data, the display is updated and the new drill point is recorded in the breadcrumb. You can specify the sorting and quantification methods for the values list using the option in the toolbar.

# Query Dialog

In the Navigate view or Legacy Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. To access this dialog in the **Navigate** or **Legacy Events** view toolbar, select **Query**.

## What do you want to do?

| User Role | I want to ... | Show me how |
|---|---|---|
| Incident Responder or Threat Hunter | review detections and signals seen in my environment | *NetWitness Platform Getting Started Guide* |
| Incident Responder | review critical incidents or alerts | *NetWitness Respond User Guide* |
| Threat Hunter | query a service, metadata, and time range* | Begin an Investigation in the Events View<br>Begin an Investigation in the Navigate or Legacy Events View |
| Threat Hunter | view metadata | Filter Results in the Navigate View<br>Drill into Metadata in the Events View (BETA) |
| Threat Hunter | view sequential events | Filter Results in the Events View<br>Filter Results in the Legacy Events View |
| Threat Hunter | reconstruct and analyze an event | Examine Event Details in the Events View<br>Reconstruct an Event in the Legacy Events View |
| Threat Hunter | examine files and associated hosts | Download Data in the Events View<br>Export or Print a Drill Point in the Navigate View<br>Export Events in the Legacy Events View |
| Threat Hunter | perform lookups | Look Up Additional Context for Results<br>Launch a Lookup of a Meta Key |
| Threat Hunter | create an incident or add to an incident | Add Events to an Incident in the Legacy Events View<br>Add Events to an Incident in the Events View |
| Threat Hunter | add a meta value to a Context Hub list | Look Up Additional Context for Results |

*You can perform this task in the current view.

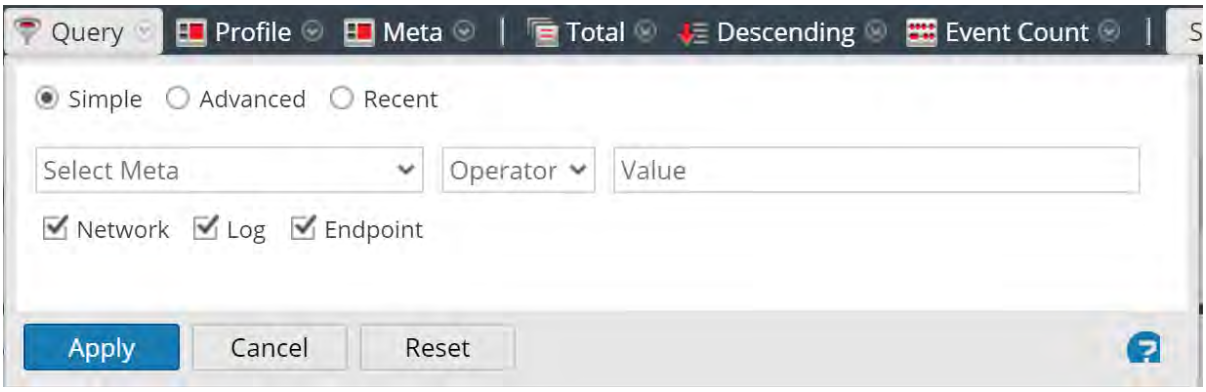
## Quick Look

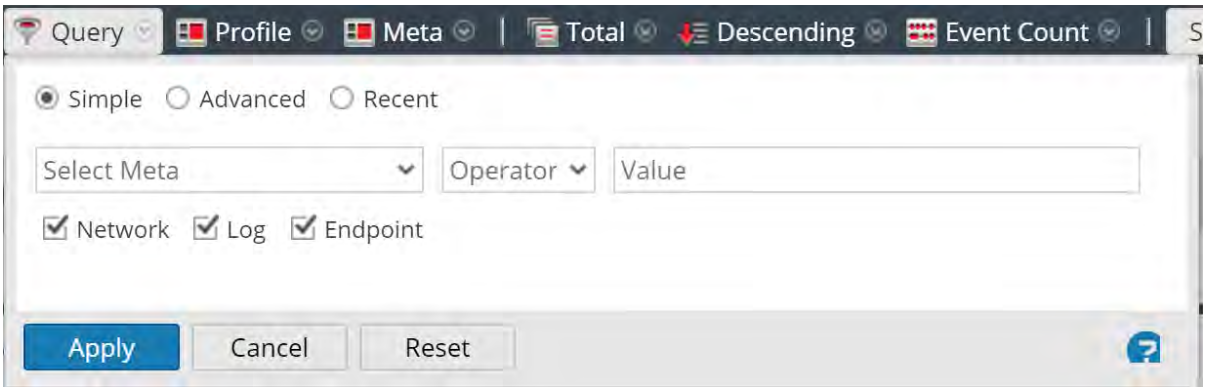


The Query dialog has three views:

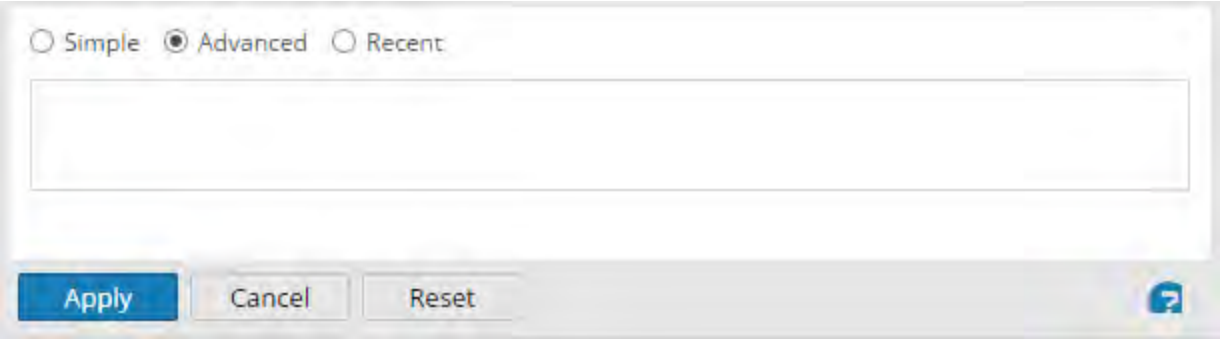
- Simple
- Advanced
- Recent

In the Simple view, you can create a query using the options displayed in the dialog. In the Advanced view, you can create a query without guidance. In the Recent view, you can select a query from a drop-down list of recent queries.

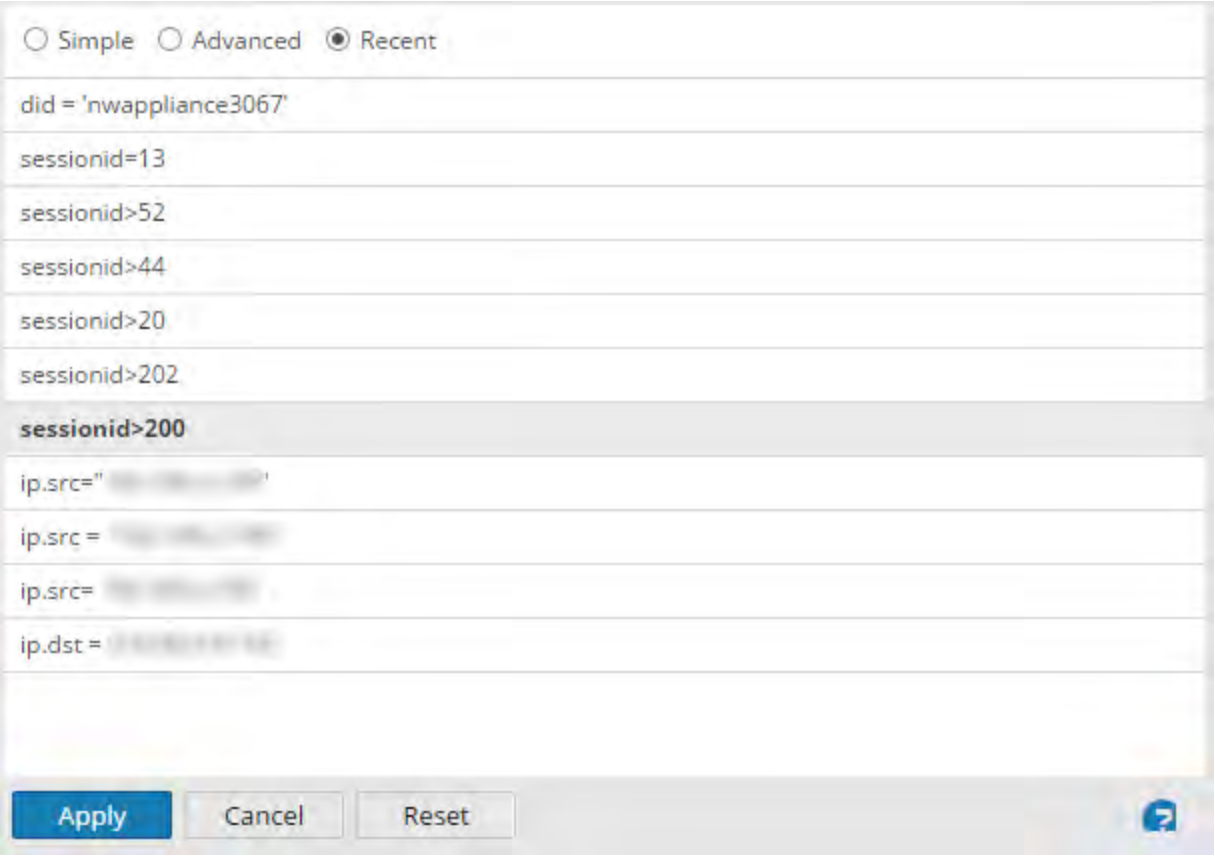
### Simple View



## Advanced View



## Recent View



The following table describes features of the Query dialogs.

| Feature | Description |
|---|---|
| Select Meta | Displays a drop-down list of meta groups. |
| Operator | Displays a drop-down list of operators (=,NetWitness!=,NetWitnessexists,NetWitness!exists) |

| Feature | Description |
|---|---|
| Value | Allows you to enter a value to complete the query. |
| Network | Limits the query to packets if Log is not selected. |
| Log | Limits the query to logs if Network is not selected. |
| Query box | Allows you to enter a query in the Advanced view. When you begin typing, a drop-down list of available meta keys for the service is displayed, then a drop-down of operators is displayed as you type. If the expression currently entered in the query box is invalid, a warning appears near the box. When the query is valid, the warning is removed. |
| Query list | Allows you to select a query from a list of recent queries in the Recent view. Double-clicking a query automatically applies it. |
| Apply | Applies the new query to the current Investigation view. |
| Cancel | Closes the dialog without applying changes. |
| Reset | Resets all fields. |

# Query Profiles Dialogs

Query profiles offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view (see Use Query Profiles to Encapsulate Common Areas for Investigation). The same query profiles are shared between all views, and they are available in the Springboard (Version 11.5) for use in panels. Private query profiles created in the Events view are only available in the Events view for the analyst who created them.

Each query profile specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

In a query profile:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the query profile is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View)

You can manage profiles in the Manage Profiles dialog, the Create Query Profile dialog and the Query Profile Details dialog.

- The Manage Profiles dialog is for the Navigate view, the Legacy Events view (Version 11.4 and later) , and the Events view (Version 11.3 and earlier). To access this dialog, select **Profile > Manage Profiles** in the **Navigate** or **Legacy Events** view toolbar.
- The Create Query Profile dialog is for the 11.4 and later Events view. To access this dialog, select **Query Profiles > New Query Profile** in the **Events** view query bar.
- The Query Profile Details dialog is for the 11.4 and later Events view. To access this dialog, select **Query Profiles** in the **Events** view query bar, then click the edit icon ( ) next to a custom profile name.

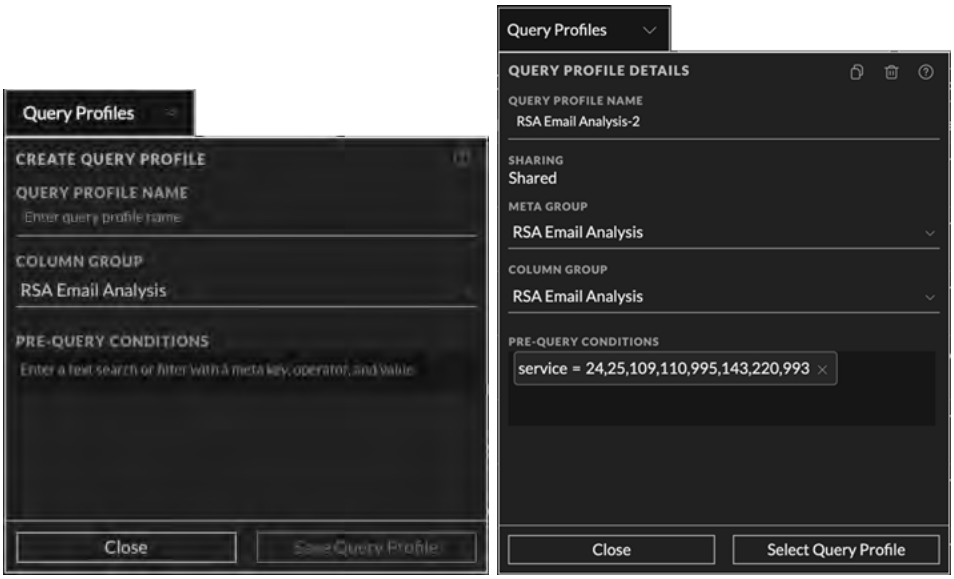
## Quick Look - Query Profile Menu, Create Query Profile Dialog, and Query Profile Details Dialog

This section introduces the Query Profile menu, Query Profile dialog, and the Query Profile Details dialog. The following figure is an example of the Query Profiles menu and the table describes the options. The example on the left has built-in profile highlighted so that the information icon is visible. The Version 11.4 menu is on the left and the Version 11.5 menu is on the right.

| Feature | Description |
|---|---|
| Visibility Options | Control the types of query profiles that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all profile types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter Query Profiles field. If the visibility option is hiding built-in profiles (which include "RSA" in the name) and you search for a name that contains "RSA," the list is empty.<br>Private = display private groups that only you can manage<br>Shared = display shared groups that anyone in your organization can manage<br>RSA = display built-in groups that only RSA can manage |
| Filter Query Profiles | Filters the list of query profiles as you type text so that only profile names that contain that text are displayed. |
| Query Profile List | The list of profiles consists of custom and built-in profiles, which are distinguished by the icons that precede the name. In the example, RSA Email Analysis-1 and RSA Email Analysis-2 are custom profiles. The RSA Email Analysis is a built-in profile. |
| New Query Profile | Displays the Create Query Profile dialog, where you can create a custom profile. |

The Create Query Profile dialog, shown in the figure on the left, allows you to define a custom profile. The figure on the right illustrates the Query Profile Details dialog, in which you can edit a custom profile. The table describes the fields and options in the dialogs.

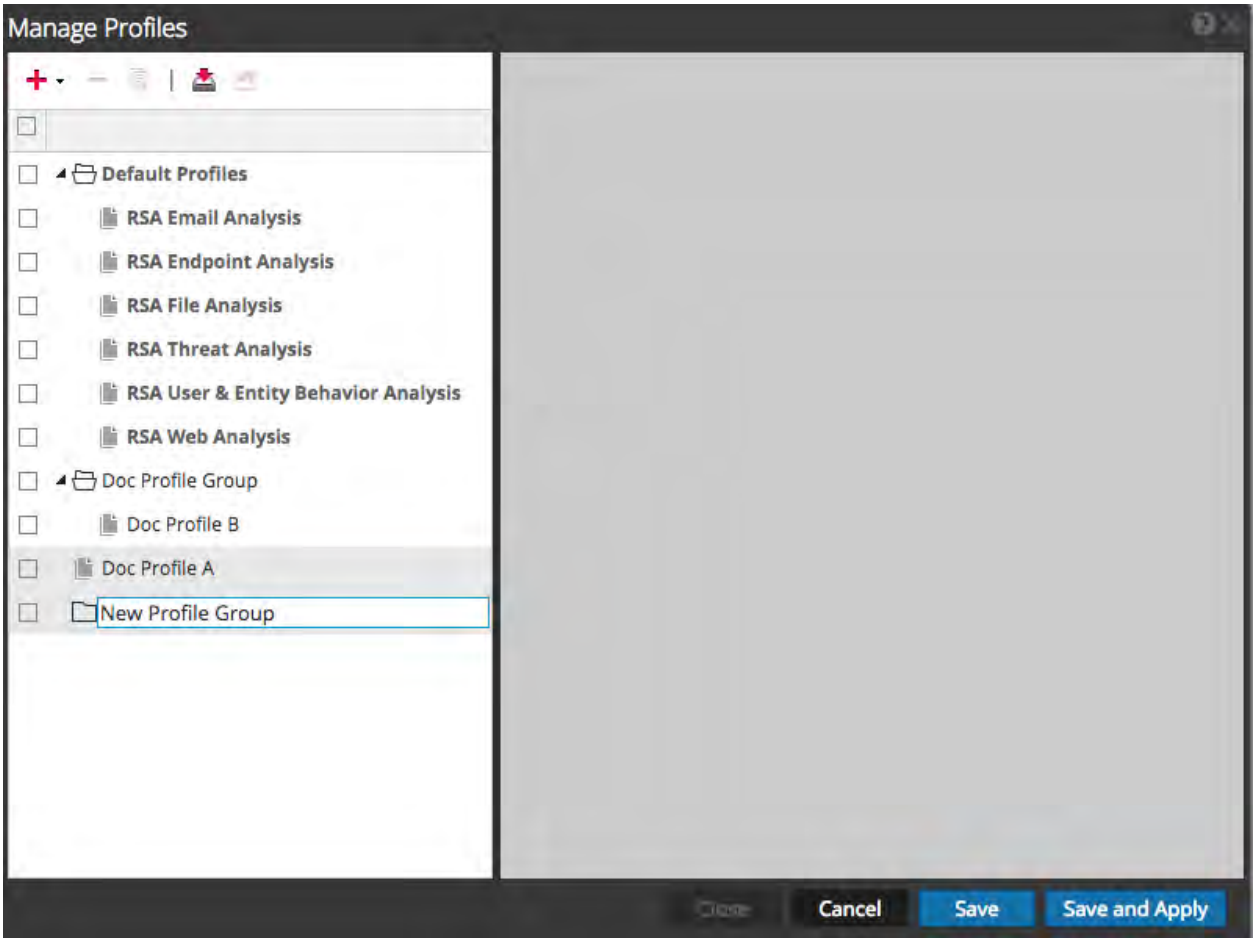


| Feature | Description |
|---|---|
| | Creates a clone of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group. |
| | Deletes the custom profile in the Query Profile Details dialog. This action is irreversible and applies globally; the profile is no longer available to anyone who is using the profiles on this service. |
| Query Profile Name | Displays the name of the profile. The name must be unique and contain fewer than 64 characters. You can edit the name in a custom profile. |
| Column Group | Displays a drop-down menu listing available column groups, with the currently selected column group from the Events list already selected. You can change the column group in a custom profile. |
| Pre-Query Conditions | Defines a limiting filter for results in the Events view. If you had a query active in the query bar when you began to create the new profile, the active query is added to the pre-Query field. In a custom profile, you can delete the prepopulated pre-query condition and type additional text for a text search or additional filters in the Pre-Query Conditions field. This is an example of a pre-query condition: `'service=80,25,110'`. |
| Close button | Closes the dialog. |
| Save Query Profile | For the Create Query Profile dialog only, saves the new profile. |

| Feature | Description |
|---|---|
| Reset | For the Query Profile Details dialog only, reverts the edited profile to the last saved state. |
| Update Query Profile | For the Query Profile Details dialog only, applies changes to an edited profile. |
| Select Query Profile | Applies the query profile. |

## Quick Look - Manage Profiles Dialog

This is an example of the Manage Profiles dialog showing several profile groups.



The Profile panel on the left side of the dialog displays available profiles and allows you to add, delete, import, and export profiles. The following table describes the fields in the Profile panel.

| Field | Description |
|---|---|
| | Adds a new profile using the Settings panel on the right side of the Manage Profiles dialog. |
|  | Deletes the selected profile. A confirmation dialog is displayed before the profile is deleted. |
| | Creates a copy of the selected profile. |
| | Displays the Profile Import dialog, where you can upload a file. |
| | Exports the selected profile to your computer. |
| Profile Name | Lists all profile names. |

The Settings panel on the right side of the dialog offers options to configure profiles. It can only be used when one profile is selected. The following table describes the fields in the Settings panel.

| Feature | Description |
|---|---|
| Name | Displays the name of the profile. |
| Meta Group | Displays a drop-down menu listing available meta groups. |
| Column Group | Displays a drop-down menu listing available column groups. The OOTB column groups and these three groups are available by default:<br>• List View<br>• Detail View<br>• Log View |
| PreQuery | Defines a limiting query for filtering Investigate results. This query is used when the associated profile is activated and the preQuery applies to any queries used in the Navigate and Events views. This is an example of a preQuery: `'service=80,25,110'`. |

The following table describes the buttons.

| Field | Description |
|---|---|
| Close | Closes the dialog. |
| Cancel | Cancels all changes. |
| Save | Saves all changes. |
| Save and Apply | Saves and applies all changes immediately. |

# Settings Dialogs for Investigate Views

NetWitnessVersion 11.0 has two settings dialogs, one for the Navigate view and one for the Legacy Events view. With the addition of the settings dialog for the Events view in Version 11.1, Investigate has three settings dialogs.

The settings in these dialogs are a subset of the Investigation settings made in the Profiles > Preferences panel > Investigation. Analysts can save time by editing these settings within the Investigate view. If you change a setting here, the same setting is changed in the Profiles view, and if you change a setting in the Profiles view, the same setting is changed here.

To access this dialog, go to the **Navigate** or **Legacy Events** view, and select the **Settings** option in the toolbar.

The settings in the Events view have no corresponding settings in the Profiles > Preferences panel.

## Related Topics

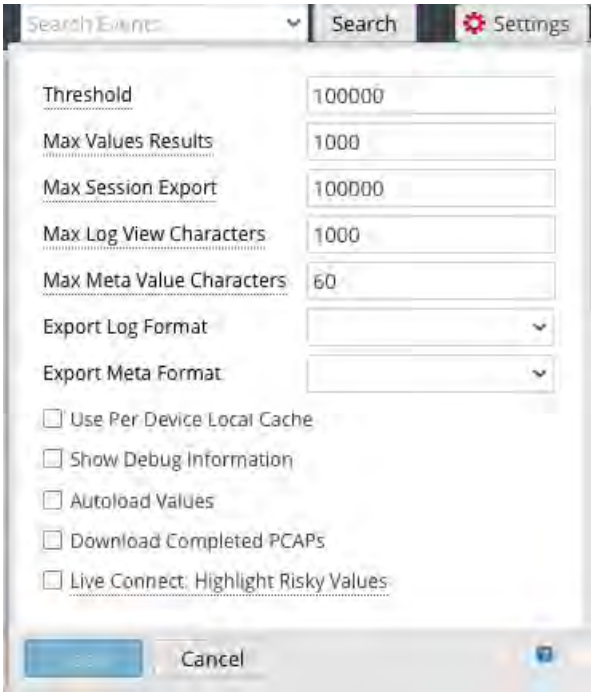
- How NetWitness Investigate Works

## Quick Look

This is a quick look at the settings dialog for the Navigate view, Legacy Events view, and Events view.

## Navigate View Settings Dialog

The following figure illustrates the Navigate view Settings dialog. The settings that influence performance when loading values in the Values panel have default values based on common usage, and individual analysts can adjust these settings for their own investigations. The following table describes the features.

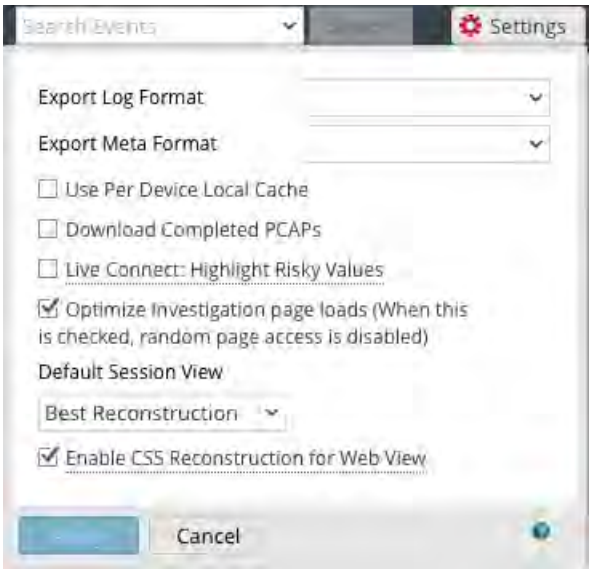


| Feature | Description |
|---|---|
| Threshold | Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**. |
| Max Values Results | Sets the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key menu for an open meta key. The default value is **1000**. |
| Max Session Export | Sets the maximum number of sessions that can be exported. The default value is **100000**. |
| Export Log Format | Sets the file format of exported logs. There are four formats available:<br>• **Text**: Raw log format.<br>• **SML**: Structured Markup Language format.<br>• **CSV**: Comma-separated values (CSV) format.<br>• **JSON**: The JavaScript Object Notation (JSON) format. |

| Feature | Description |
|---|---|
| Export Meta Format | Sets the file format of exported meta values. There are four formats available:<br>• **Text**: Raw log format.<br>• **SML**: Structured Markup Language format.<br>• **CSV**: Comma-separated values (CSV) format.<br>• **JSON**: The JavaScript Object Notation (JSON) format.<br>**Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2. |
| Use Per Device Local Cache | When the checkbox is cleared, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the checkbox is selected, Investigate uses the data from local cache. |
| Show Debug Information | This option controls the display of the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker. When the checkbox is selected, the debug information is displayed. The default value is **Off** (checkbox cleared). |
| Autoload Values | This option controls automatic loading of values for the selected service in the Navigate view. When the checkbox is selected, values are automatically loaded when you select a service to investigate. When the checkbox is cleared, Investigate displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**. |
| Download Completed PCAPs | This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form. When the checkbox is selected, the option is enabled. The default setting is disabled (checkbox is cleared). |
| Live Connect: Highlight Risky IPs | If the checkbox for this option is cleared, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the checkbox is selected, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is disabled (checkbox cleared). |
| Apply | Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view. |
| Cancel | Cancels the editing operation and closes the dialog, leaving the settings unchanged. |

## Legacy Events View Settings Dialog

The following figure is an example of the Settings dialog for the Legacy Events view, and the table describes the features.

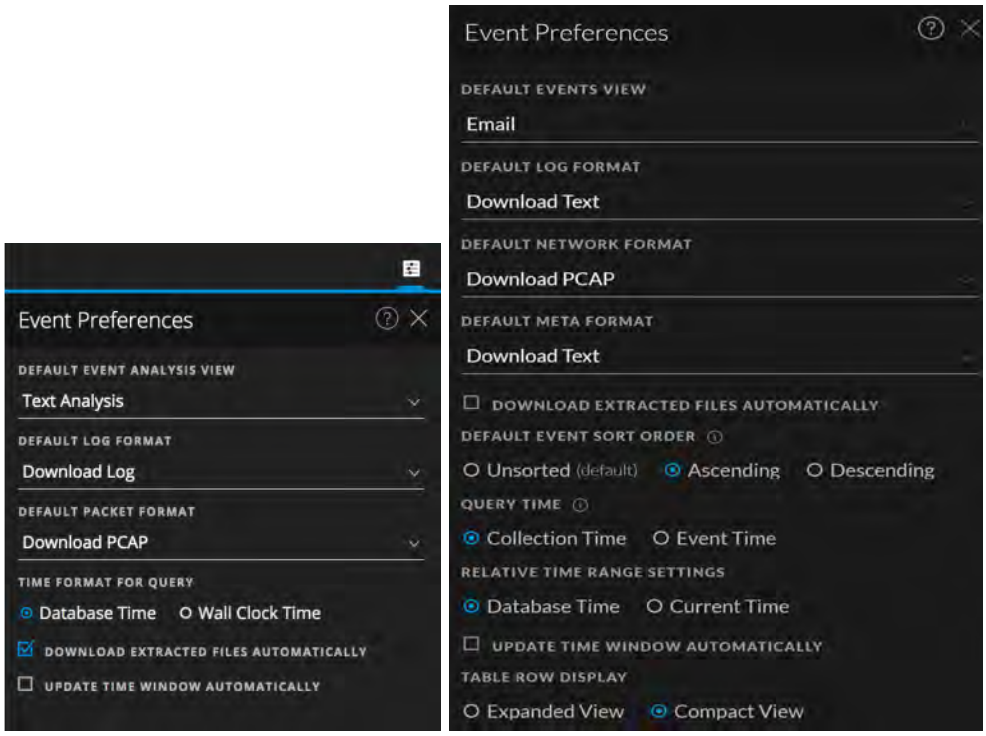


| Feature | Description |
|---|---|
| Export Log Format | Sets the file format of exported logs. There are four formats available:<br>• **Text**: Raw log format.<br>• **SML**: Structured Markup Language format.<br>• **CSV**: Comma-separated values (CSV) format.<br>• **JSON**: The JavaScript Object Notation (JSON) format. |
| Export Meta Format | Sets the file format of exported meta values. There are four formats available:<br>• **Text**: Raw log format.<br>• **SML**: Structured Markup Language format.<br>• **CSV**: Comma-separated values (CSV) format.<br>• **JSON**: The JavaScript Object Notation (JSON) format. |
| Download Completed PCAPs | This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form. |
| Live Connect: Highlight Risky IPs | When the checkbox is selected, Investigate uses a filter to fetch only IP addresses that are considered as risky by RSA community. When the checkbox is cleared, NetWitness displays all IP addresses. By default, this option is disabled (checkbox cleared). |

| Feature | Description |
|---|---|
| Optimize Investigation page loads | Sets a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Clearing this checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is enabled (checkbox selected). |
| Append Events in Event Panel | This option affects paging in the Legacy Events panel and in prior releases was located in the Navigate view settings dialog. When the checkbox is selected, the next group of events is appended to the already displayed events. When cleared, the previous page of events is replaced by the next page. The default value is Off (checkbox cleared). |
| Default Session View | Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event. |
| Enable CSS Reconstruction for Web View | This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Clear the checkbox to disable this option if there are problems viewing specific websites. |
| Apply | Applies the settings immediately and they are visible the next time you view events. The same changes are also applied in the Profiles view. |
| Cancel | Cancels the editing operation and closes the dialog, leaving the settings unchanged. |

## Events View Preferences Dialog

Beginning with Version 11.1, the Events view has user preferences that you can configure in the Events view > Event Preferences dialog. These settings persist so that they are applied each time you log in and go to the Events view. The following figures are examples of the dialog for Version 11.3 and Version 11.6. The table below describes the options.



| Feature | Description |
|---|---|
| Default Events View | Selects the default event analysis view that is displayed every time you open the Events view. For example, if you select File, the File Analysis panel is highlighted and displayed every time you investigate an event in the Events view. These are following options:<br>• **Text** : View and analyze the raw text payload of an event.<br>• **Packet** : View and interactively analyze the packets and payload of an event.<br>• **File** : View a list of files and download one or more files in an event. |
| Default Log Format | Selects the default format for downloading logs:<br>• **Download Log** or **Download Text**: Raw log (log) format.<br>• **Download CSV**: Comma-separated values (CSV) format.<br>• **Download XML**: The Extensible Markup Language (XML) format.<br>• **Download JSON**: The JavaScript Object Notation (JSON) format. |

| Feature | Description |
|---|---|
| Default Packet Format or Default Network Format | Selects the default format for downloading packets.<br>• **Download PCAP**: To download the entire event as a packet capture (*.pcap) file.<br>• **Download All Payloads** or **Download Payloads**: To download the payload as a *.payload file.<br>• **Download Request Payload**: To download the request payload as a *.payload1 file.<br>• **Download Response Payload**: To download the response payload as a *.payload2 file. |
| Default Meta Format | Selects the default format for downloading metadata:<br>• **Download CSV**: Comma-separated values (CSV) format.<br>• **Download JSON**: The JavaScript Object Notation (JSON) format.<br>• **Download Text**: Plain text format.<br>• **Download TSV**: Tab-separated values (TSV) format. |
| Time Format for Query | The Events view can display results based on the database time or the current clock time.<br>**Note:** (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users.<br>When **Database Time** is selected, the start and end time for a query is based on the time that the event was captured (collection time).<br>When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range. |

| Feature | Description |
|---|---|
| Event Sort Order (Version 11.4 and Later) | Sets the sort sequence by collection time for the events listed in the Events panel. If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. A change to this setting becomes effective the next time you submit a query.<br>**Unsorted**: Default sorting method for Version 11.4.1. To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.<br>**Ascending**: Default sorting method for Version 11.4. To put the events with the earliest collection time first in the list.<br>**Descending**: To put the events with the latest collection time first in the list. When investigating logs, you may want to change the sort sequence to latest collection time first. |
| Download Extracted Files Automatically | Enables the automatic download of files if they are in the selected default format in the **Default Log Format** and **Default Packet format** fields set in the Event Preferences dialog.<br>Select the checkbox to enable downloading the selected format automatically to local file system. Otherwise, the download job goes to the job queue, and you can download it manually. |
| Update Time Window Automatically | (Version 11.3 and later) Enables automatic update of the time range window in the query bar when the service is polled (at one minute intervals) so that fresh results are sent. The default setting is disabled.<br>When the checkbox is selected, as the time range is updated, the (Submit Query) button is activated so you can click to get the fresh results.<br>When the checkbox is cleared, the automatic update is disabled keeping the time range window in the breadcrumb synchronized with the current results. |

# RSA NetWitness

Version 11.7

# Live Services Management Guide

## Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

## Trademarks

RSA Conference Logo, RSA, and other trademarks, are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

## License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

## Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

# Live Services Management

RSA NetWitness Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

## NetWitness Live

Live is the component of NetWitness that manages communication and synchronization between NetWitness services and a library of Live content available to RSA NetWitness customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Live Content Management System to NetWitness services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

**Note:** Any customer with valid maintenance can access RSA Live.

## The CMS Library

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

## NetWitness Feedback and Data Sharing

**Live Feedback** is intended to help improve RSA NetWitness. Once you set up and configure a Live account, usage data is shared with RSA.

For more details, see NetWitness Feedback and Data Sharing.

## For Debian Linux and NetWitness Endpoint Users

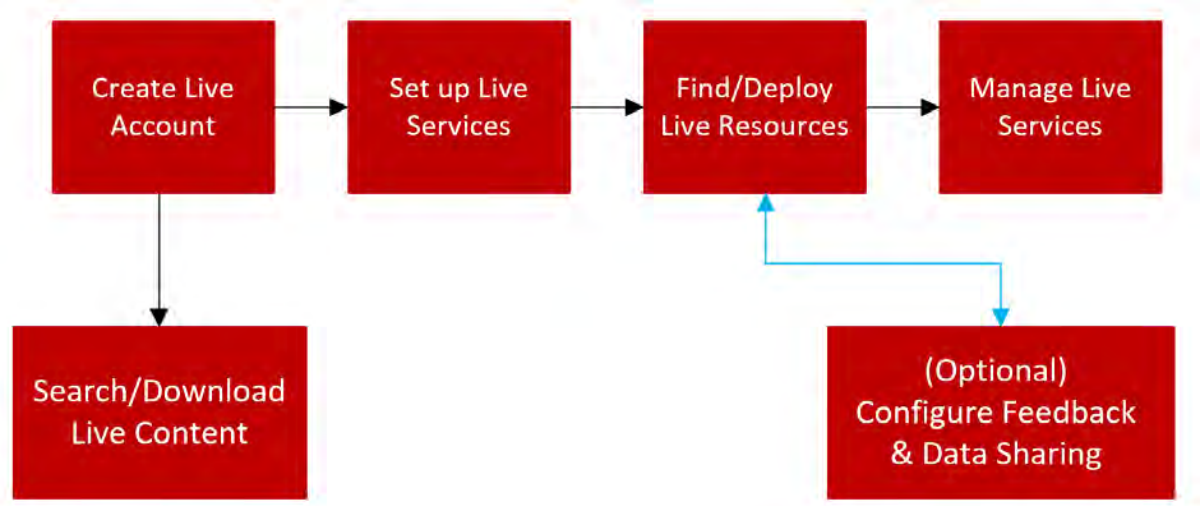
If you are upgrading to NetWitness 11.5 or later, and you are using NetWitness Endpoint and also have any Debian Linux endpoint systems, RSA recommends that you go to Live and download the following application rules:

- autorun debian package mismatch
- autorun file path not part of debian package
- debian package hash mismatch in important system directory

- debian package hash mismatch
- file path not part of debian package in important system directory
- file path not part of debian package

# Live Services Required Procedures

The following workflow describes the basic setup into four steps, which you perform individually.

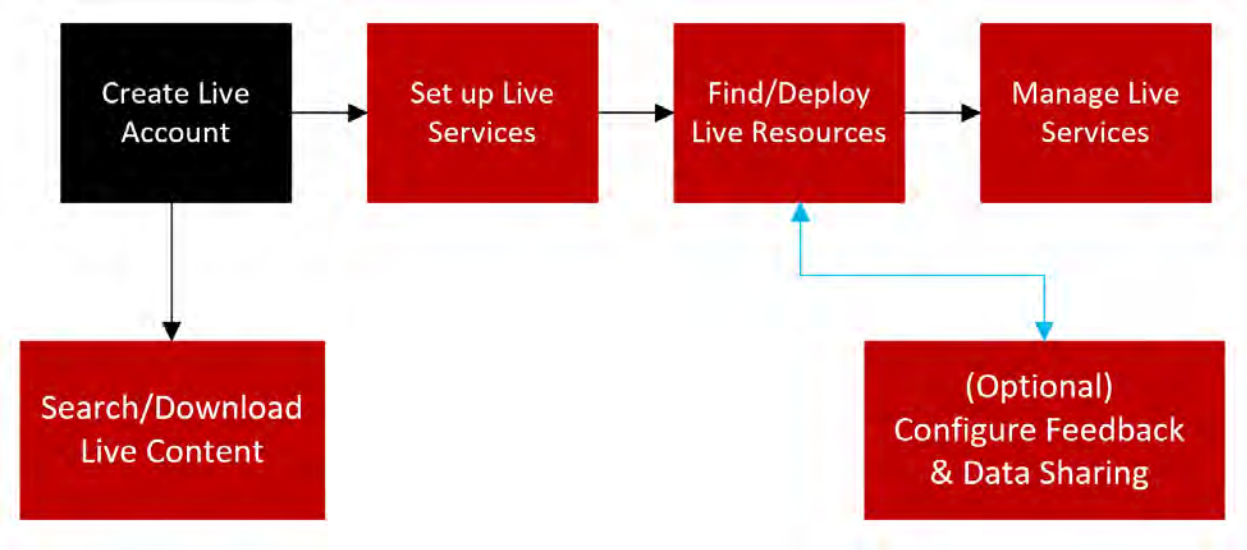


| Configuration Step | Description |
|---|---|
| Create Live Account | Create a Live Account on the Cloud Services Live Registration portal URL: https://live.netwitness.com/registration. If you have an existing account, you can manage your account using this portal. |
| Set Up Live Services on NetWitness Platform XDR | Set Up Live Services on NetWitness Platform XDR by configuring a connection with the CMS server. |
| Find and Deploy Live Resources | Search and browse for resources in the Live Search view, and then, deploy the selected resources. |
| Manage Live Resources | Procedures for administrators to search for, subscribe to, and deploy resources from Live. |
| Search and Download Content from NetWitness XDR Cloud Services Live | Search and browse for contents in the Cloud Services Live, and then, download the selected contents. |
| NetWitness Feedback and Data Sharing | Describes the feedback and data sharing features provided in NetWitness, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community. |

# Create Live Account

**Note:** The NetWitness Live Registration Portal now has a new user interface and supports email verification.

You must create a Live account using the NetWitness Live Registration Portal (https://live.netwitness.com/registration) on the Live server. Live Account is required to access all Live services including CMS. The CMS Library provides access to all NetWitness content in one place where you can view, search, deploy, and subscribe to NetWitness content.



Make sure the following are available to set up a NetWitness Live account:

- Active internet connection to access the portal.
- A valid and registered NetWitness License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **(Admin) > System > Info** panel.

**Note:** If the License Server is not set up, contact NetWitness Customer Support.

### To create a Live Account:

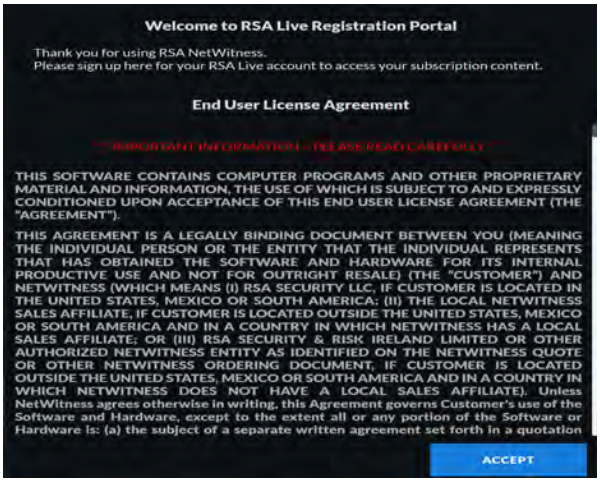
1. Access the NetWitness XDR Cloud Services Live Registration Portal using the URL: https://live.netwitness.com/registration

   The NetWitness XDR Cloud Services Live sign up page is displayed.

2. Click **Sign Up For Live**.

   The End User License Agreement page is displayed.

   Read the Terms and Conditions carefully and click **Accept**.



3. In the **Sign Up for NetWitness Live Account** page, enter all the fields:

   - The **First Name** and **Last Name** of the user.
   - The **Company** for which the Live Account is being created.
   - The **Email address** you enter will be used to receive the verification code for your new Live account and other notifications related to the Live account.
   - The **License ID** can be viewed on **(Admin) > System > Info** panel.
   - The **Username** and **Password** for the Live Account.

4. Click **Create Account**.
   You will be directed to **Confirm Sign up** page.
5. Enter the **Confirmation Code** sent to your registered email address.
   Click **Confirm**.
   You can see the confirmation message for your NetWitness Live Account registration.

   **Note:** You cannot create more than one Live account for the same License ID. For additional license, contact NetWitness Customer Support.
6. Once the account is created, enter your credentials and click **Sign In** to access the NetWitness XDR Cloud Services Live.
7. After you sign in, you can perform the following:
   - Search and Download Content from NetWitness XDR Cloud Services Live
   - Share Telemetry Data to NetWitness

# Reset the Password for Your Live Account

If you want to reset the password for your Live Account, do the following:

1. Access the NetWitness XDR Cloud Services Live Registration Portal using the URL:

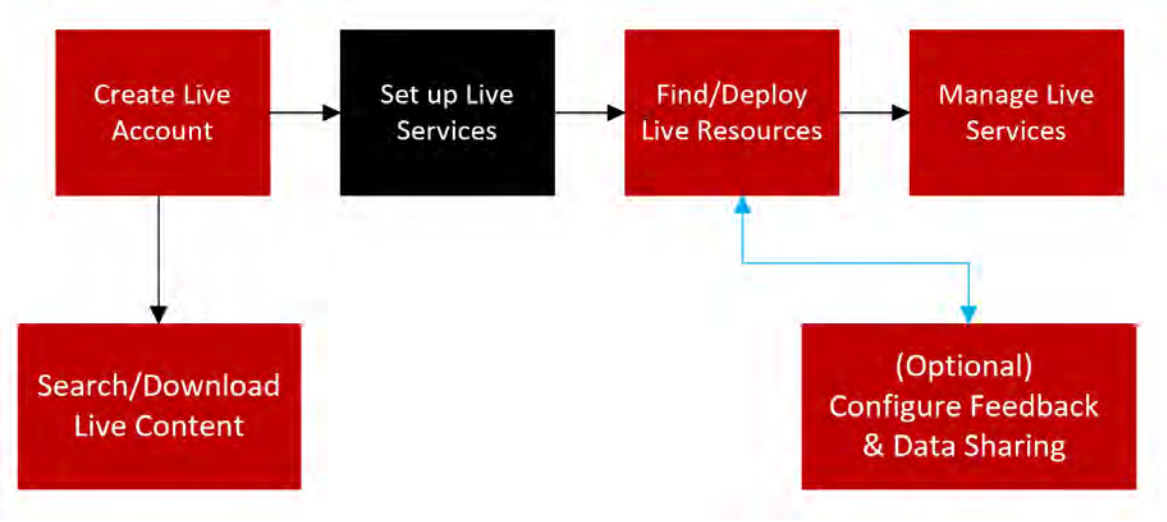
   https://live.netwitness.com/registration

   The NetWitness XDR Cloud Services Live sign up page is displayed.

2. On the Sign Up page, click **Forgot Password?**.
3. Enter your **Username** and click **Send Code**.
   A verification code will be sent to your registered email address.
4. Enter the **Verification Code** and **New Password** on the Reset Password page and click **Submit**.

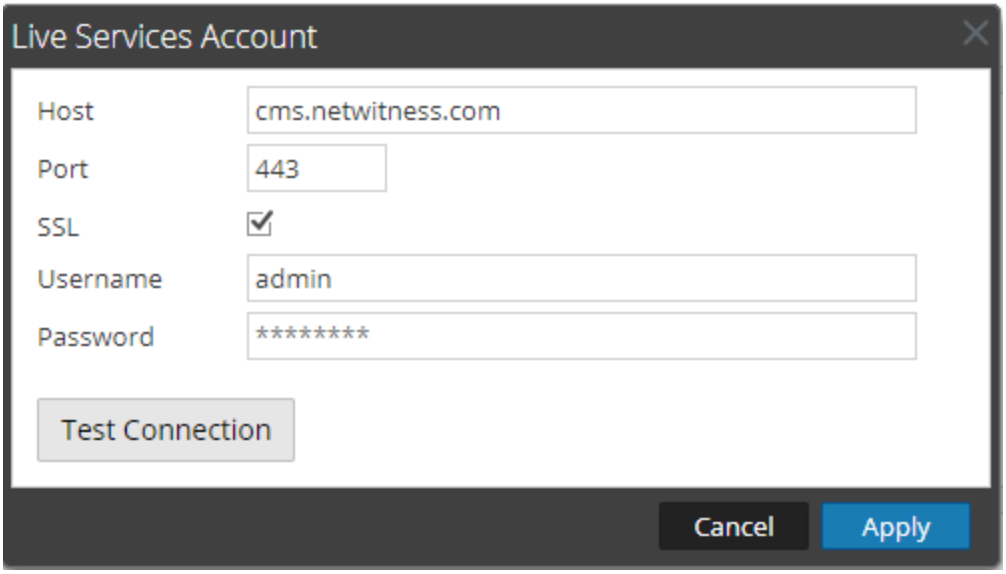
# Set Up Live Services on NetWitness Platform XDR

To set up Live on NetWitness Platform XDR, you configure the connection and synchronization between the CMS server and NetWitness. The user interface for this setup is the **(Admin) > System > Live Services** Configuration panel.



### To configure the connection to the CMS Server:

1. Navigate to **(Admin) > System > Live Services**.
2. Click Sign In and enter your credentials in the Live Services Account dialog box.



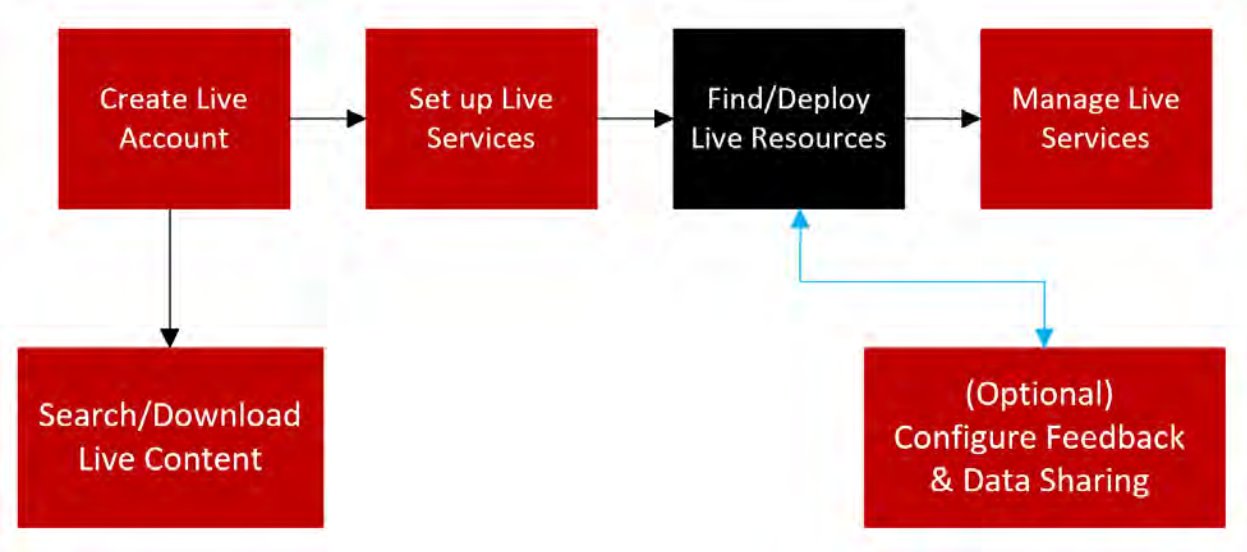
3. Click Test Connection to make sure your connection is working.

4. If the test is successful, click **Apply**. If not, contact NetWitness Customer Support for help connecting to the Live server.
5. Configure the timing for synchronization of NetWitness Platform XDR with updates from Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

# Find and Deploy Live Resources

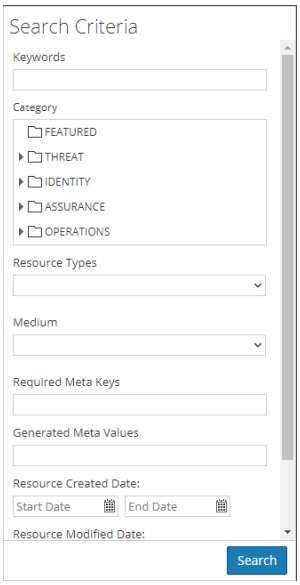
Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



## Find Resources in Live

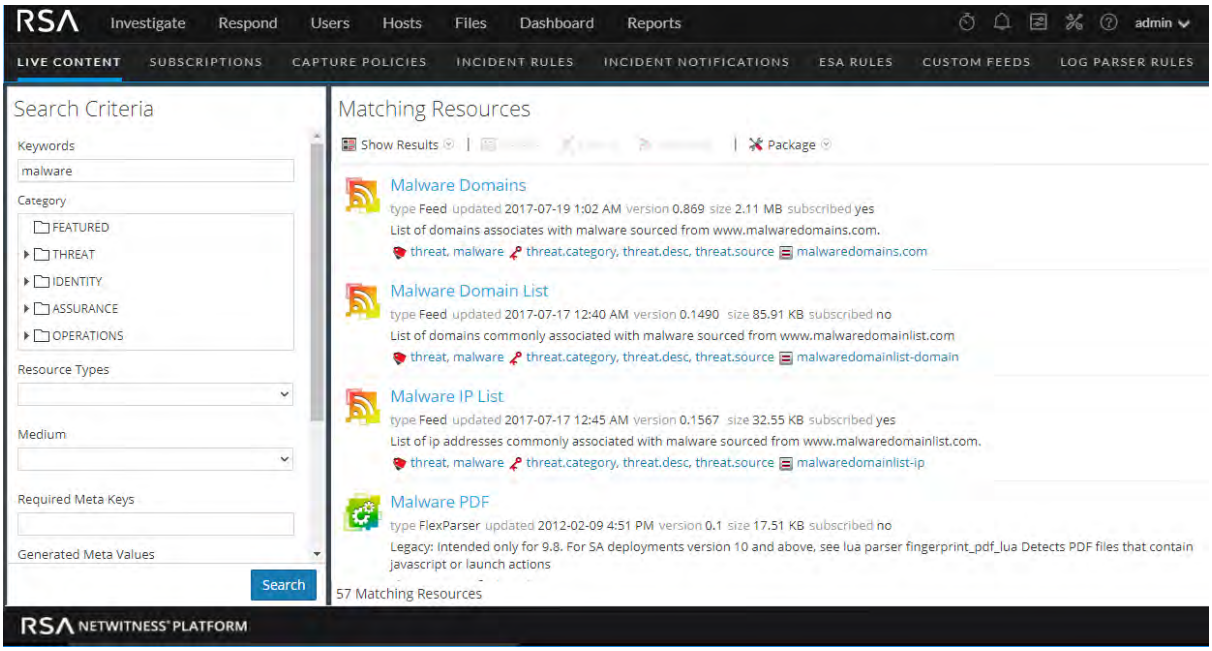
### To find resources:

1. Navigate to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.



3. Click **Search**.

   The Matching Resources panel displays detailed results.



4. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

## Deploy Resources in Live

In RSA NetWitness, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Live, you can deploy resources manually to a service or a service group without subscribing to the resources. To deploy resources, select one or more from the list.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.
- If you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

**Caution:** For NetWitness 11.3, there is a new Content bundle for Endpoint, which contains approximately 400 application rules. Do not deploy this bundle (or the Endpoint application rules) onto any Log Decoder that is running an earlier version of NetWitness. The rules are only useful for 11.3 and newer, and would have major performance implications if deployed on Log Decoders that cannot process them.

### To deploy resources manually:

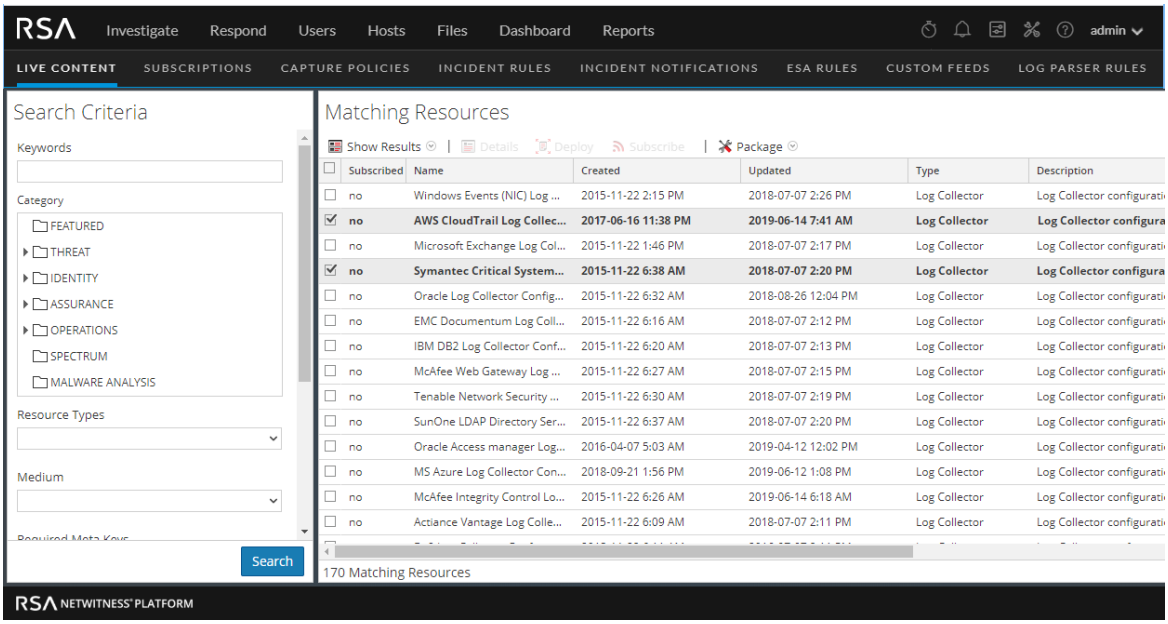
1. Go to **(Configure) > Live Content**.
2. Select a group of resources, or a previously created resource package.

   To select a resource or group of resources:

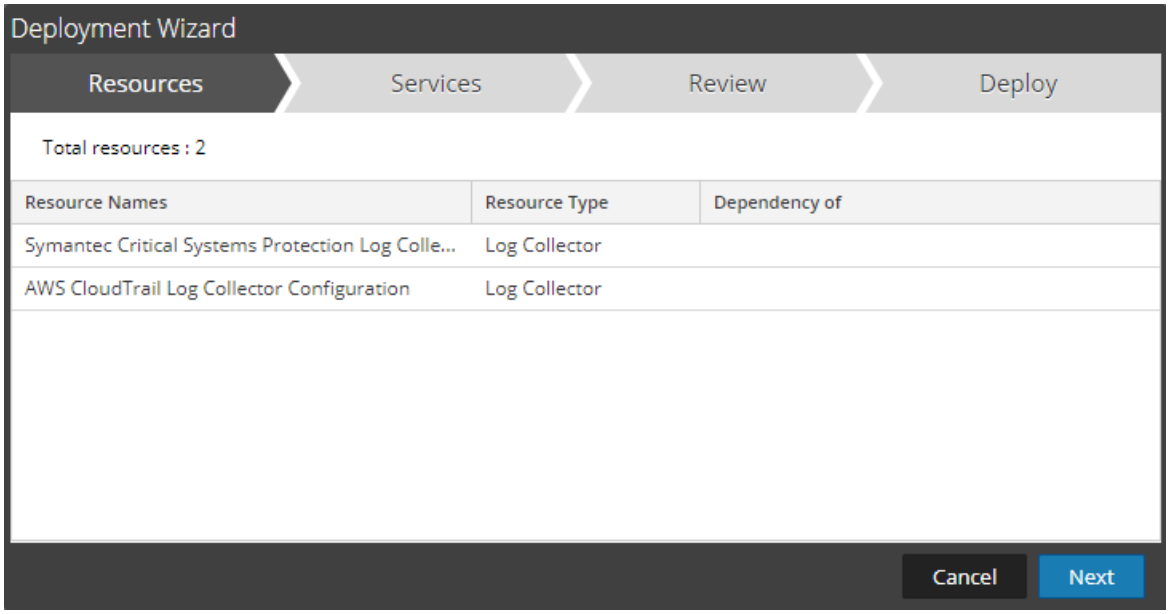
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

   b. In the **Matching Resources** panel, select **Show Results > Grid**.

   c. Select the checkbox to the left of the resources that you want to deploy.



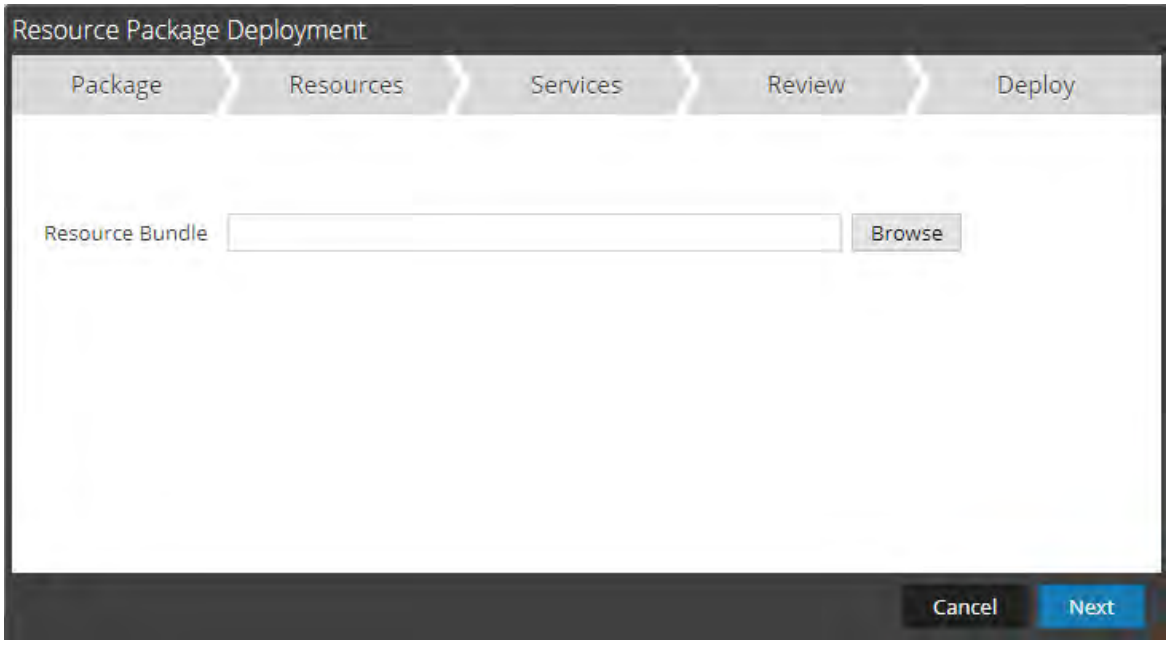
d. In the Matching Resources toolbar, click Deploy.



3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** .

The Package page of the Resource Package Deployment wizard is displayed.



b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.

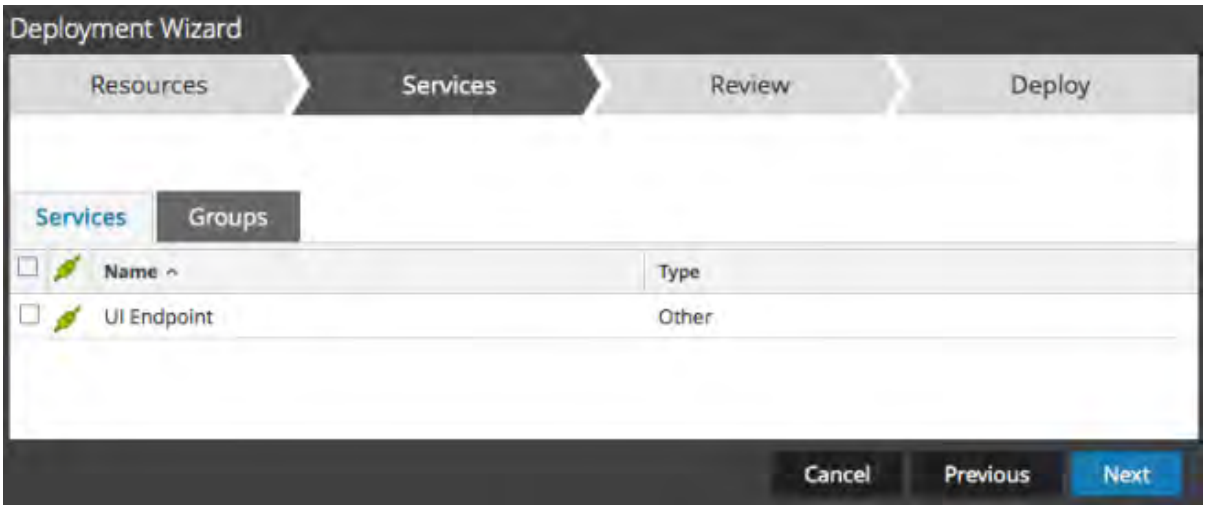
4. Click **Next**.

   The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

   **Note:** The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

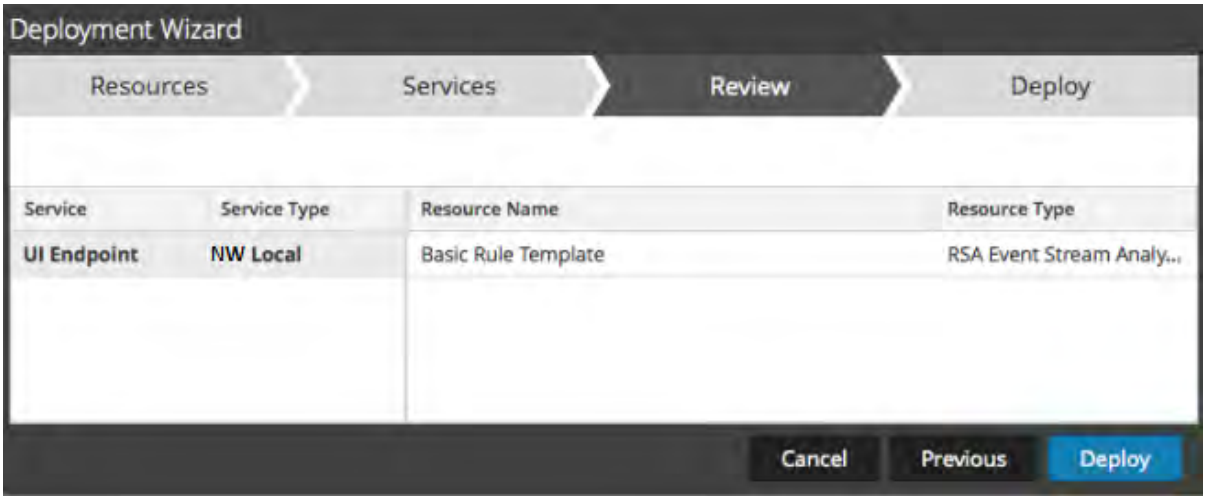
5. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

   - Use the **Services** tab to select individual services, list of services, and service groups that are configured in the **(Admin) > Services** view.
   - Use the **Groups** tab to select groups of services.



6. Click **Next**.

   The **Review** page is displayed.

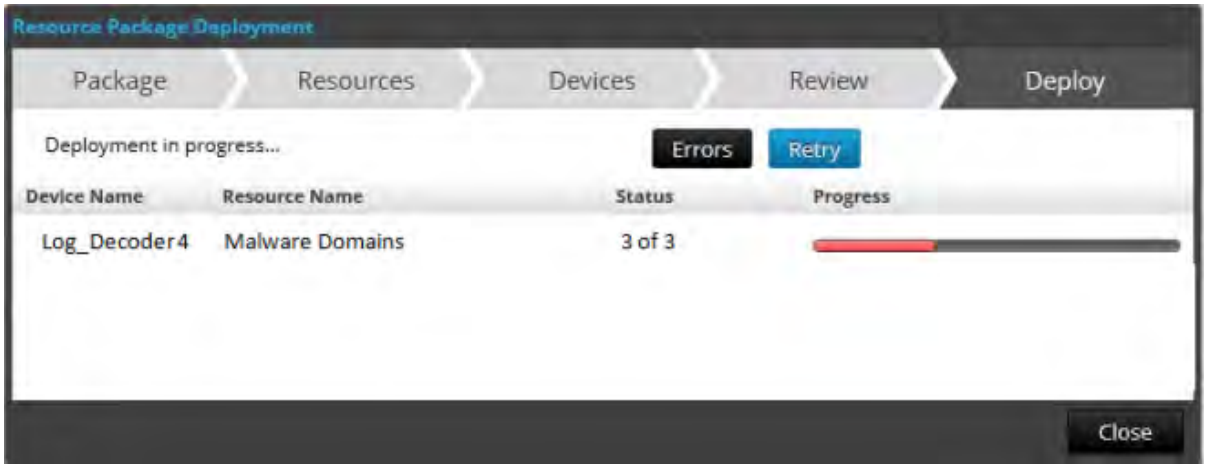


Make sure that you have selected correct resources and the services on which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

   If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you can click to review the errors and re-attempt the deployment.



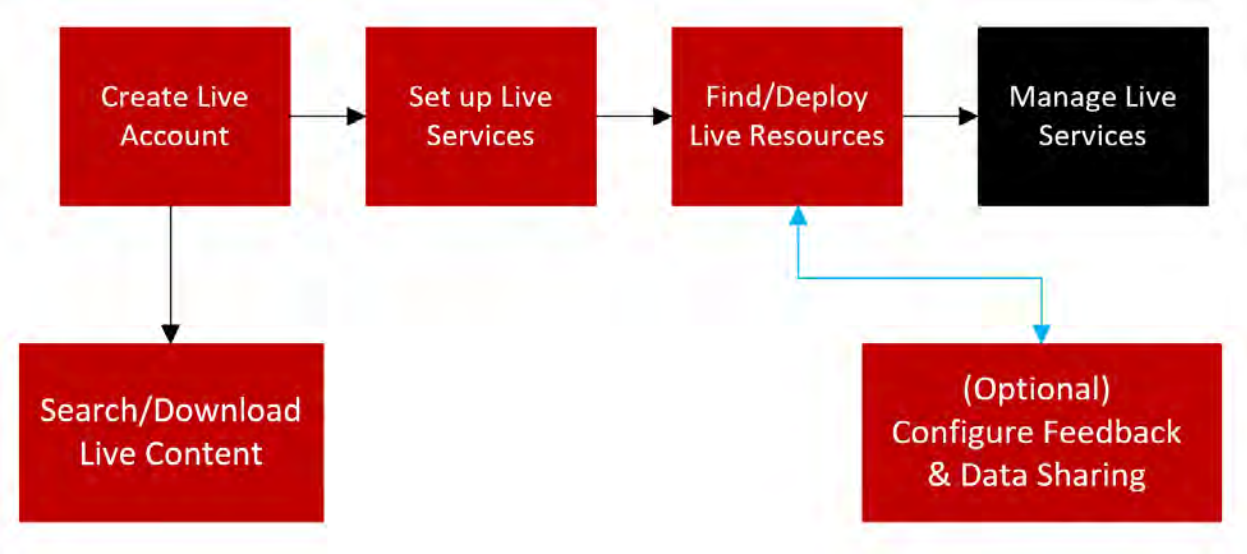
8. Click **Close**.

## Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services. For more information, see the *Decoder and Log Decoder Configuration Guide*.

# Manage Live Resources

With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the the **(Admin) > Services** view.



There are several workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources
- Deploy a resource bundle
- Remove deployments of resources
- Download resources
- Set up data feeds

## Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **(Admin) > System > Live Services panel**.

By adding subscribed resources to the deployments list, you configure NetWitness to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

**To manage subscriptions and deployment:**

1. In the **(Admin) > System > Live Services** panel, specify an interval at which NetWitness checks for updates to subscribed resources in Live and specify the email addresses of people to receive an email listing subscribed resources that have been updated.
2. In the **(Configure) > Live Content** search view, search for and subscribe to Live resources.
3. In the **(Configure) > Subscriptions > Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **(Configure) > Subscriptions > Deployments** tab, click to deploy the resources listed in the Deployments tab immediately.
5. In the **(Configure) > Subscriptions > Deployments** tab, select deployed resources from a Group, and remove them from services.
6. In the **(Configure) > Subscriptions** tab, unsubscribe from resources.

## Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

**To remove deployed resources:**

1. Go to the Live Resource View,
2. Unsubscribe from a resource, and remove it from deployed services.

## Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness accepts packages in **.nwp** files or **.zip** files.

## Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.

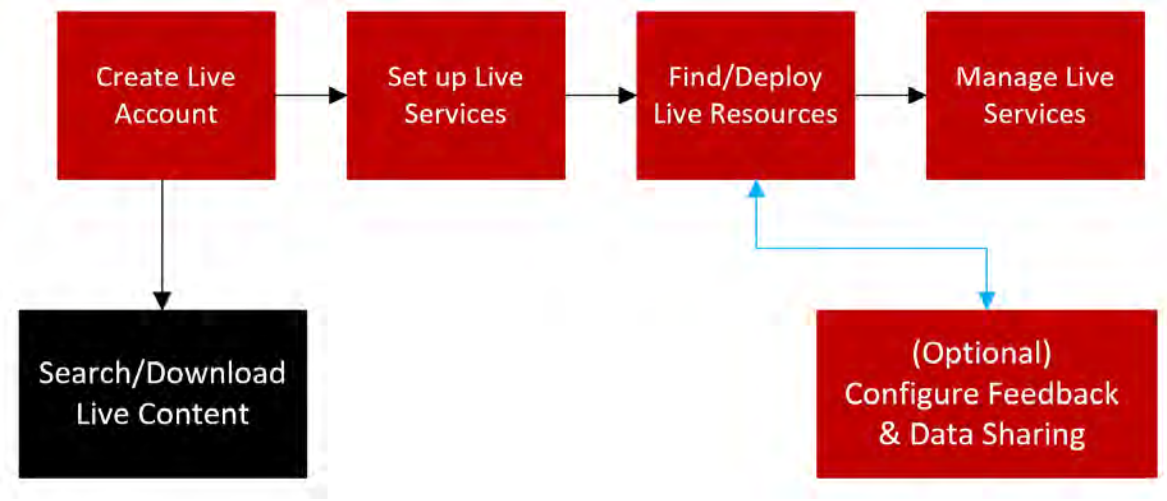
## Set Up Data Feeds

In the Live > Feeds view, you can set up and maintain Custom and Identify feeds.

# Search and Download Content from NetWitness XDR Cloud Services Live

Administrators can search for live content using the Search Content panel in the NetWitness XDR Cloud Services Live, which is similar to browsing the live CMS contents in the (Configure) > Live Content page on the NetWitness Platform XDR.

**Note:** If Admin server is not connected to the Live Services, you can use the NetWitness XDR Cloud Services Live to search and download the required contents.



### Prerequisites

- Ensure that you have created the Live account. For more information, see Create Live Account.

## Quick Search for Content

You can now select and view the contents based on the Sources available in Cloud Services Live. You can select either NetWitness or Community from the Source drop-down list.

- **NetWitness**: Displays all the content provided by NetWitness.
- **Community**: Displays the content collected and retrieved from third party and open source communities.

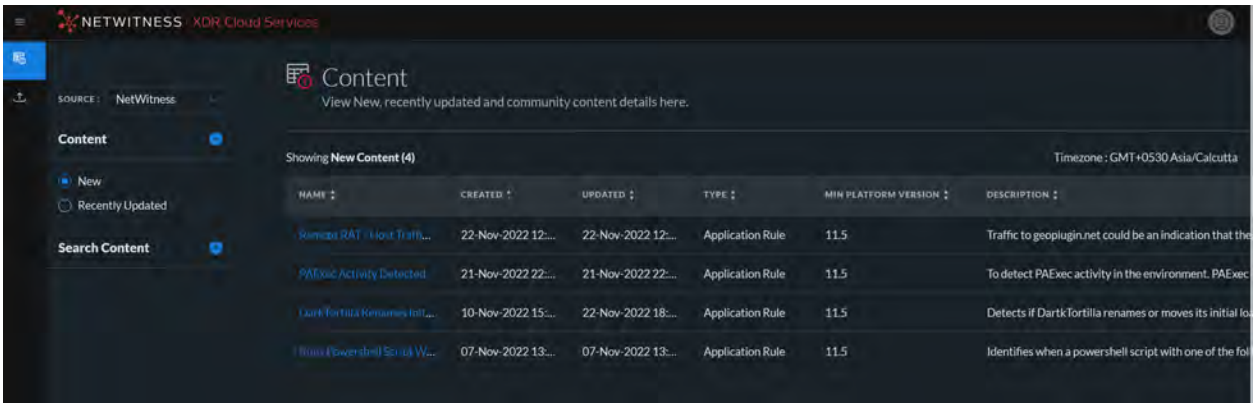
  You can select **Only Opensource** checkbox to retrieve the content from the open-source communities.

  **Note:** The Only Opensource option will appear under the Search Content panel only when the community is selected as the source. You can use this option to select and search open-source related content.

You can also quickly select and view the available content types under Content section.

Clicking expands the **Content** section and displays the following options:

- **New**: Displays the content which is created in the last 21 days.
- **Recently Updated**: Displays the content which is created or updated in the last 21 days..

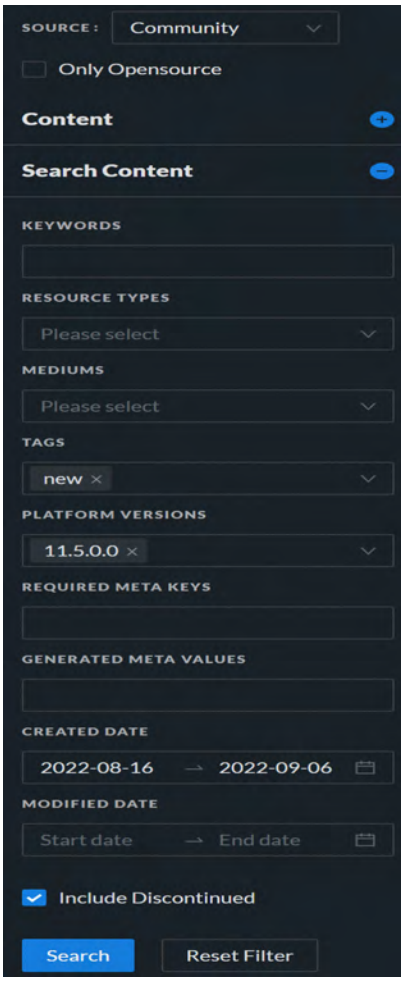


## Advanced Search for Content

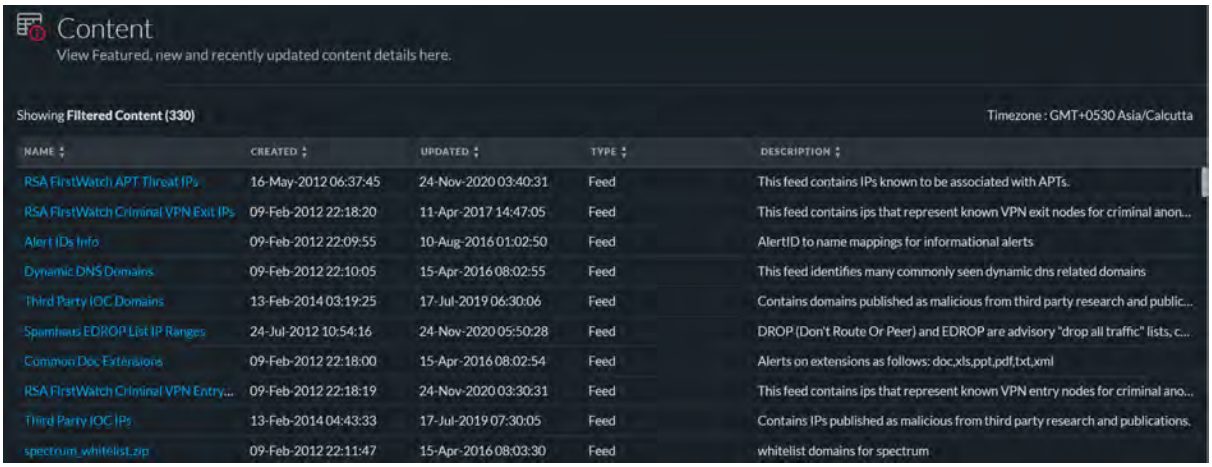
You can search for the specific content in the Search Content view. For more information, see Live Search Content View.

### To search the content:

1. Click to expand the **Search Content** section.
2. In the **Search Content**, specify the search criteria. Enter any or all of these: keyword, type of resource, medium, tag, meta keys, meta values, date when content was created, date when content was modified, and (optional) discontinued content.



3. Click **Search**.
   The matching results are displayed on the right panel.



You can sort the contents using the name, created date, updated date, type, or description.

**Note:** Clicking **Reset Filter** removes the existing filters applied from the **Search Content**, and displays all the available content on the right panel.

## Download Content

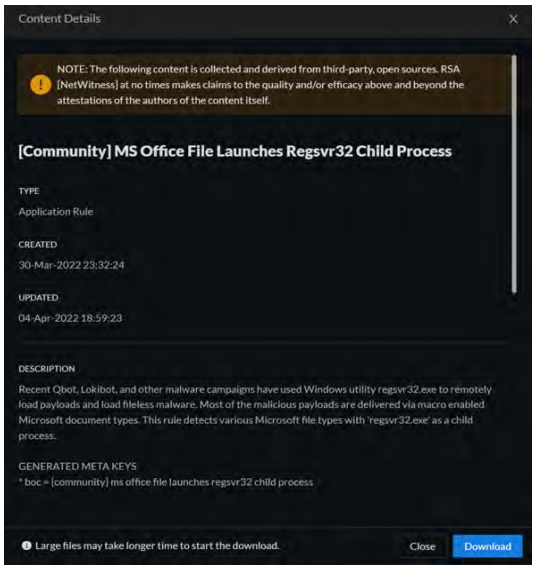
You can download the contents from the results displayed in the right panel by performing the following steps:

**Note:**
- You cannot download a discontinued content.
- NetWitness provides no assurance related to the quality and accuracy of the contents provided by the third parties and open source communities.

### To download the content:

1. Click the name of the content that you want to download.

   The **Content Details** dialog is displayed.



2. Click **Download**.

   The content file is downloaded.

# Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to RSA
- Packaging Resources
- Manage Custom Feeds
  - Creating a Custom Feed
  - Create a STIX Custom Feed
  - Creating and Managing an Identity Feed
  - Editing a Feed
  - Removing a Feed
- Miscellaneous Live Services Procedures

# Export Data to RSA

A NetWitness administrator can export the metrics in NetWitness for Live Feedback.

## About Live Feedback

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

You must first download the Live Feedback historical data, and then upload it to share with RSA.

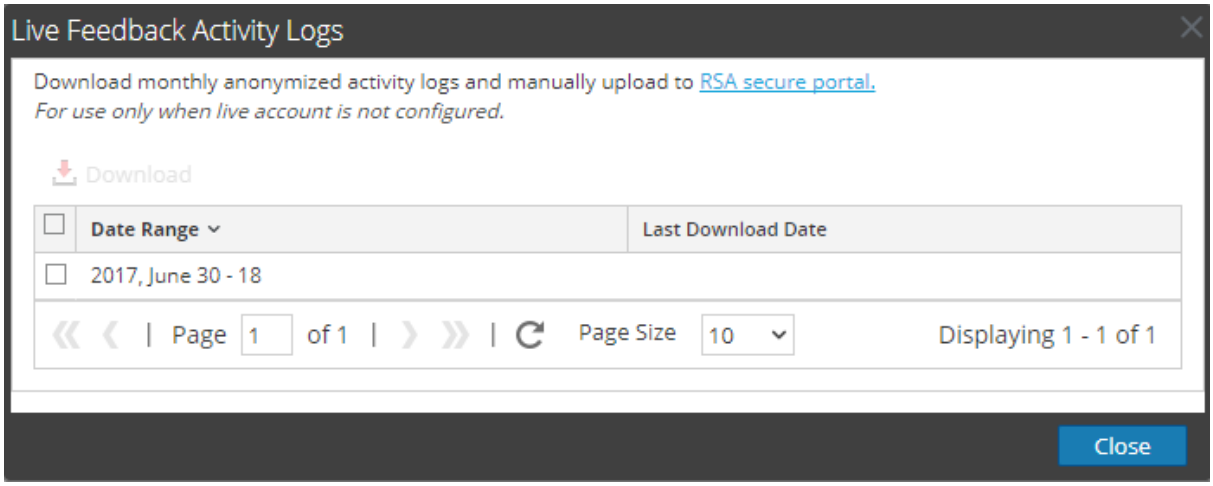
## Download Live Feedback Historical Data

### To download the Live Feedback historical data:

1. Go to **(Admin) > System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   **Note:** If you select multiple entries in the history table, the Live Feedback data is downloaded into a ZIP archive, consisting of individual JSON files for each month.

## Share Telemetry Data to NetWitness

After you download the Live Feedback data, you can then upload it using the following procedure.

**Note:**
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data through NetWitness XDR Cloud Services Live portal. For more information, Create Live Account.

### To share the data to RSA:

1. Log in to the NetWitness XDR Cloud Services Live using your Live account credentials.
2. Click on the left panel.
   The **Telemetry Logs** dialog is displayed.

   **Note:**
   - You can upload only .zip files.
   - Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.

# Packaging Resources

The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on a more secure network.

## Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness instance, deploy the resource package. For more information, see Resource Package Deployment Wizard.

## Prerequisites to Create a Resource Package

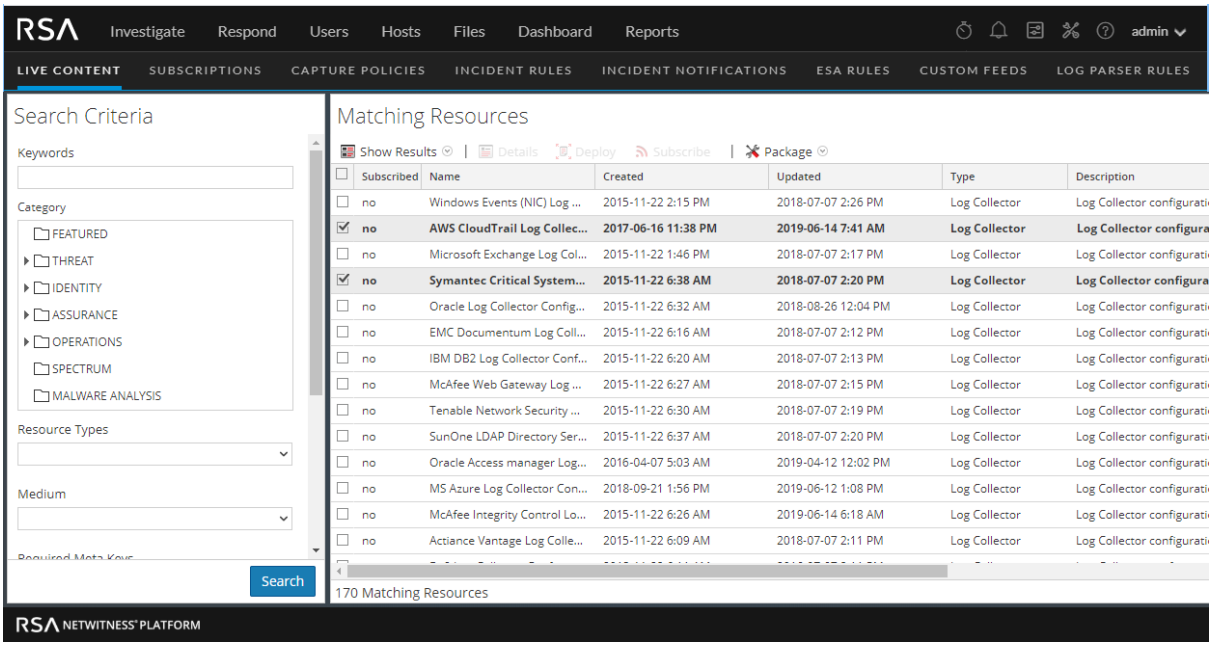
A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness and the ability to search for resources in the User Interface.

## Creating a Resource Package

The following procedure describes how to create a resource package, as a ZIP archive and save it to your local file system.

**To create a resource package:**

1. Go to **(Configure) > Live Content** from the RSA NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.



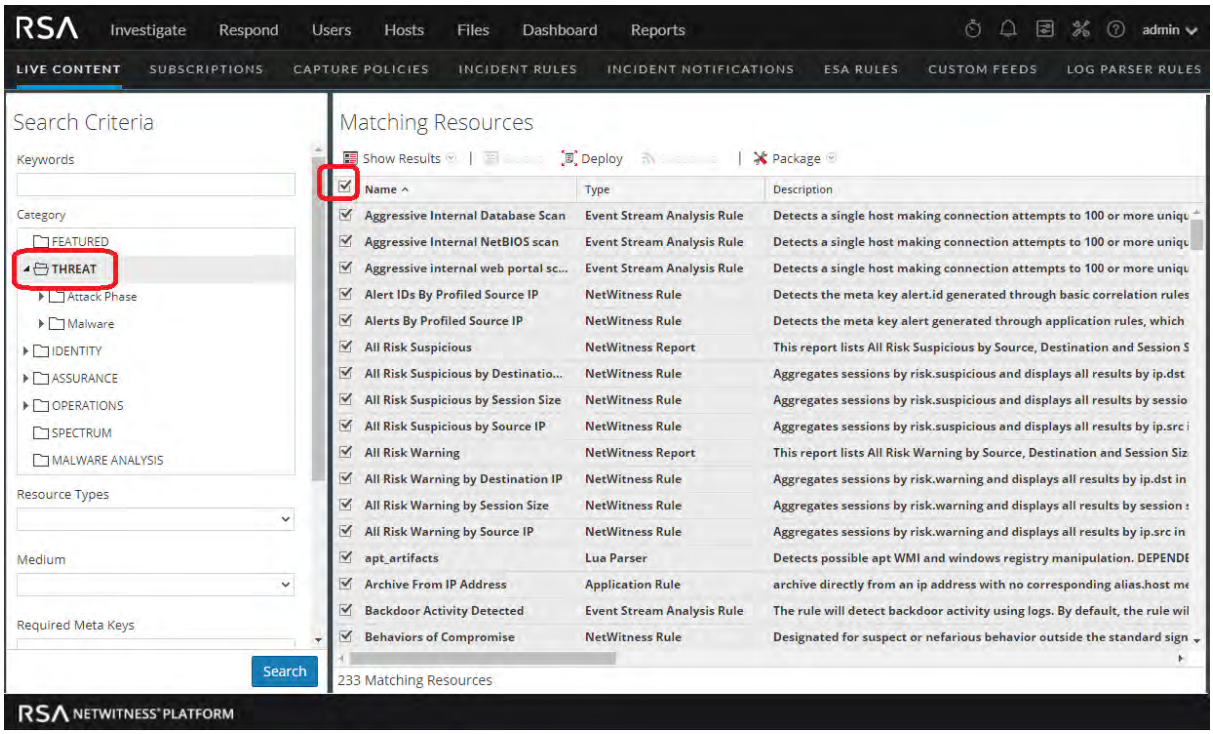
3. Select some or all the resources that are listed in the Matches Resources pane.
4. Select Package > **Create**.

NetWitness creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

## Creating Threat Package

The following procedure describes how to create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Go to **(Configure) > Live Content**.
2. From the **Category** section, select **THREAT**.
3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.



4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.

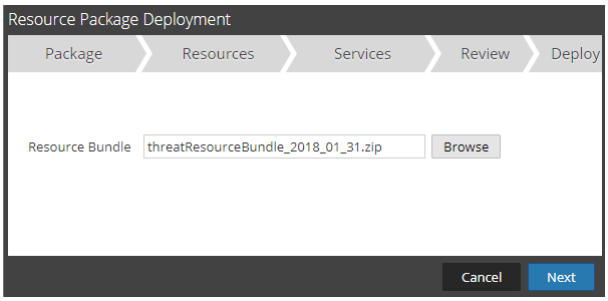
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

## Deploying a Threat Package

This procedure assumes that you saved a package named **threatResourceBundle_2018_01_31.zip**, as described in the previous section. It describes how to deploy a saved resource package

1. Go to **(Configure) > Live Content**.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click **Browse** and navigate to the **threatResourceBundle_2018_01_31.zip** file that were created earlier.



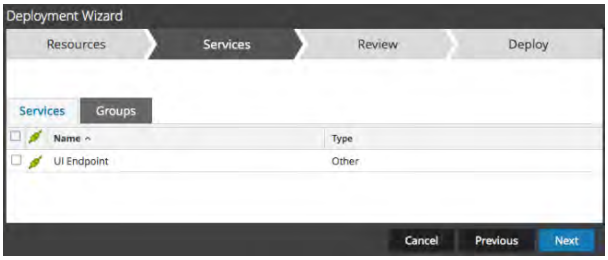
4. Click **Next**.

   The **Resources** page displays details for the resources in the package.

5. Click **Next**.

   The **Services** page displays two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

6. Select the services on which you want to deploy the content. You can select any combination of services and service groups.



7. Click **Next**.

   The **Review** page is displayed.

   **Note:** Make sure that you have selected correct resources and the services to which you want to deploy them.

8. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or **Previous** to either cancel the deployment or go back to the previous screen.

# Manage Custom Feeds

The custom feed capability is implemented using the Custom Feed Wizard in RSA NetWitness, allowing you to quickly populate Decoders with custom and identity feeds.

## Custom Feed Creation

You can use the **Live > Custom Feeds > Setup Feed > Configure a Custom Feed** wizard to create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in RSA NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and edit the NetWitness feed to use the updated feed files.

## Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

**Note:** The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

Sample Feed Definition File

```
<?xml version="1.0" encoding="utf-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
    <FlatFileFeed name="Dynamic DNS Domain Feed"
        path="dynamic_dns.csv"
        separator=","
        comment="#"
        version="1">

        <MetaCallback
            name="alias.host"
            valuetype="Text"
            apptype="0"
            truncdomain="true"/>
```

```
        <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
        </LanguageKeys>

        <Fields>
            <Field index="1" type="index" key="alias.host" />
            <Field index="4" type="value" key="threat.desc" />
            <Field index="2" type="value" key="threat.source" />
            <Field index="3" type="value" key="threat.category" />
        </Fields>

    </FlatFileFeed>
</FDF>
```

## Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| | **Define Feed** tab |
| **Feed Type** | Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file. |
| **Feed Task Type** | Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically. |
| **Name** | Enter a custom feed name in the feed data file that corresponds to the `flatfeedfile name` attribute in the feed definition file; for example, `Dynamic DNS Test Feed`. |
| **File/ Browse** | Enter a name of the feed data file that corresponds to the `flatfeedfile path` attribute in the feed definition file; for example, `dynamic_dns.csv`. |
| (STIX, Recurring) **Trust All Certificate** | Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked). |
| (STIX, Recurring) **Certificate/Browse** | For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files. |
| | **Define Feed** tab - Advanced Options |
| **XML Feed File** | Enter a name of the feed definition file, for example, `dynamic_dns.xml`. |

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| **Separator** | The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file; for example, a comma. |
| **Comment** | The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file; for example, #. |
| **Remove STIX data older than** | The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum. |
| **Select Services tab** | Select the services to which you want to send the data feed. |
| (Define Columns tab, Define Index) **Type** | The type of lookup value in the index position of the feed data file.<br>**IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42).<br>**IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index. |
| (Define Columns tab, Define Index) **CIDR** | Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation. |
| (Define Columns tab, Define Index) **Service Type** | For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type. |
| (Define Columns tab, Define Index) **Truncate Domain** | For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation. |
| (Define Columns tab, Define Index) **Callback Keys** | For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list.<br>The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched. |

| NetWitness Parameter | Feed Definition File Equivalent |
|---|---|
| (Define Columns tab, Define Index) **Index Column** | Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected. |
| (DEFINE VALUES) **Key** | The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute. |

# Creating a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness. For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

After completing this procedure, you will have created a custom feed.

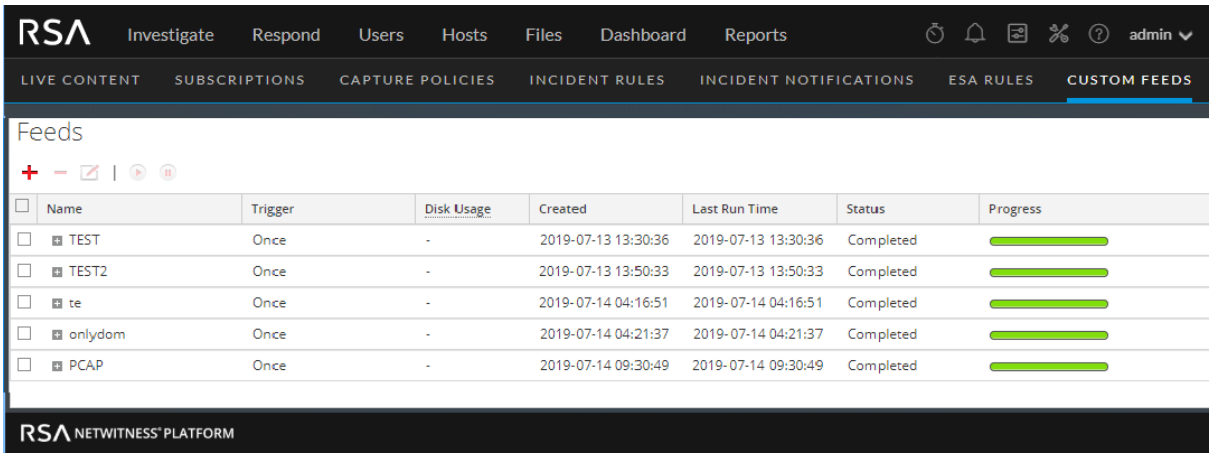
The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

**Note:** Any feeds that are created in 11.2 release or prior will be automatically pushed to Context Hub as Lists. The lists can be looked up in the context lookup panel of the Respond and Investigate pages. If Context Hub is not configured or the service is down, then the feeds will be pushed to Context Hub the next time the server is available.

### To create a custom feed:

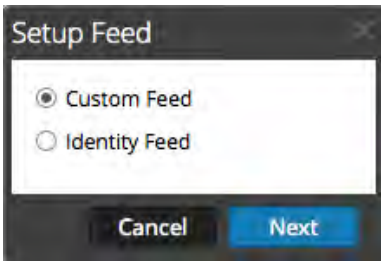
1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



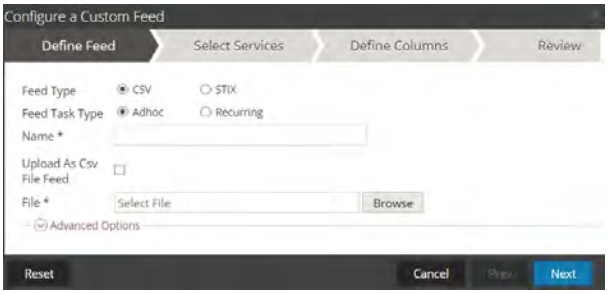
2. In the toolbar, click .

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.

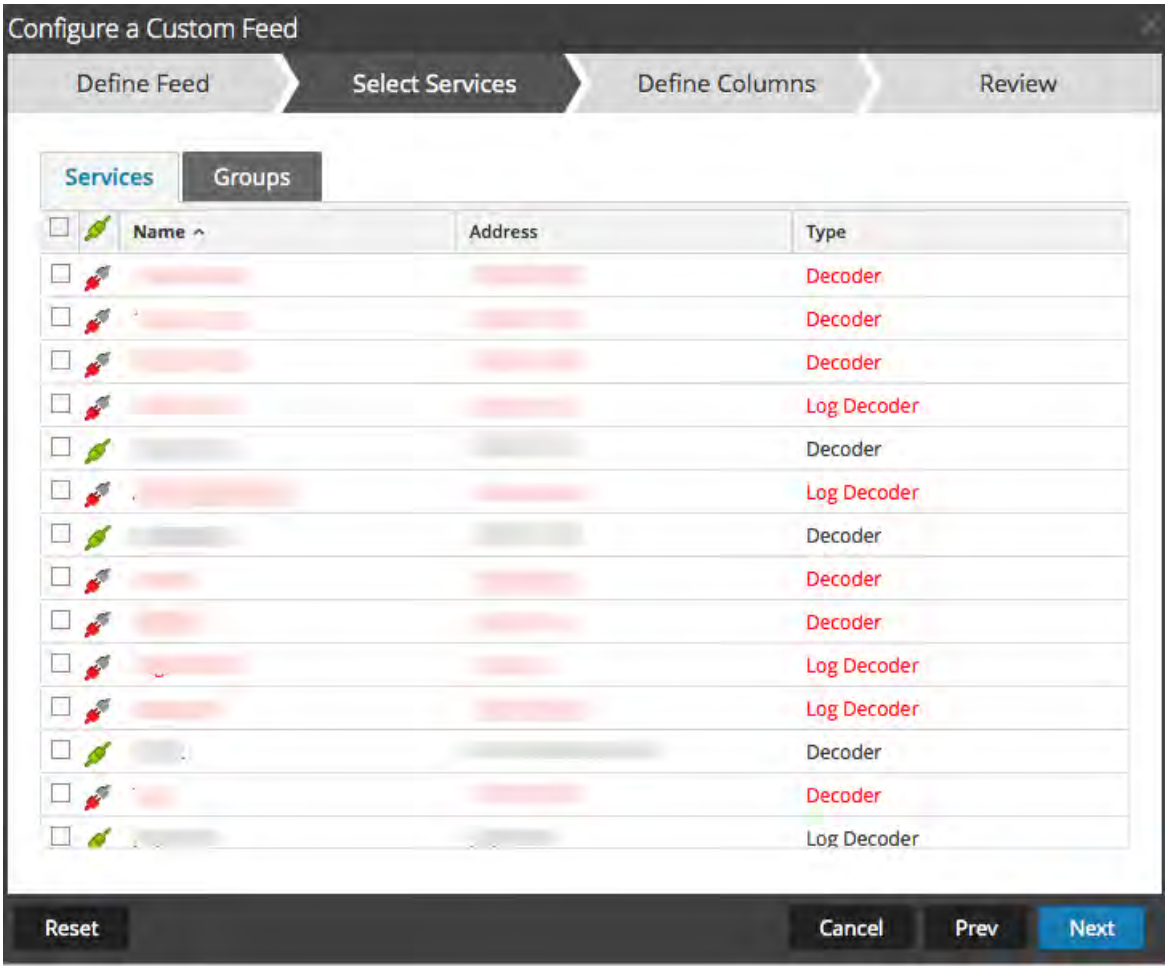


4. To define a feed based on a `.csv` formatted feed data file, select **CSV** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**.
   b. Select the checkbox **Upload As CSV File Feed**, if required.
   c. Select a .csv content **File** from the local file system, and click **Next**.
   d. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:

   e. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.
   f. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the

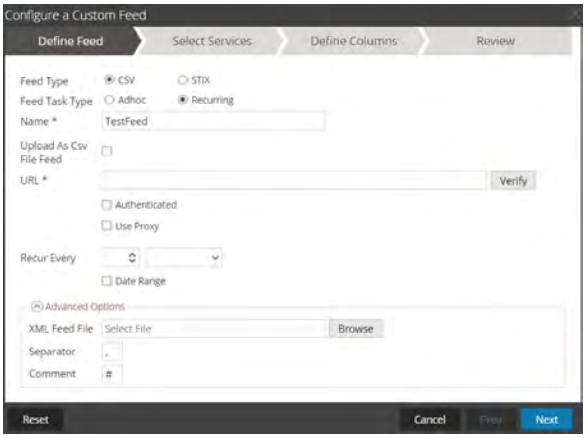
Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

   The Define Feed dialog includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

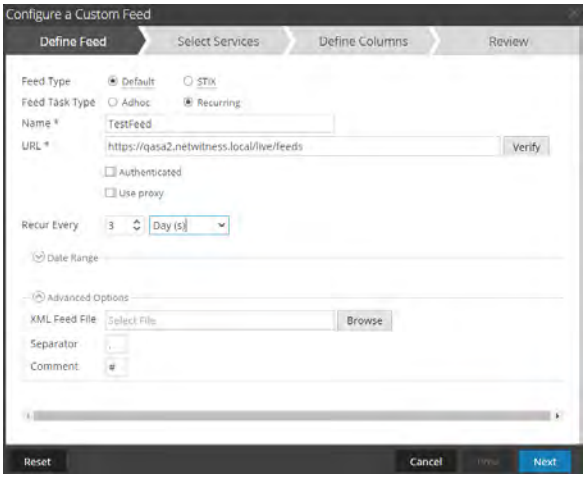
   NetWitness provides your user name and password for authentication to the URL.

d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.
   **NOTE:**
   If you are using an HTTPS based feed server, ensure that you import and install the certificates. For more information, see Import Certificates for HTTPS Service

e. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - Specify recurrence every week, and select the days of the week.

f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



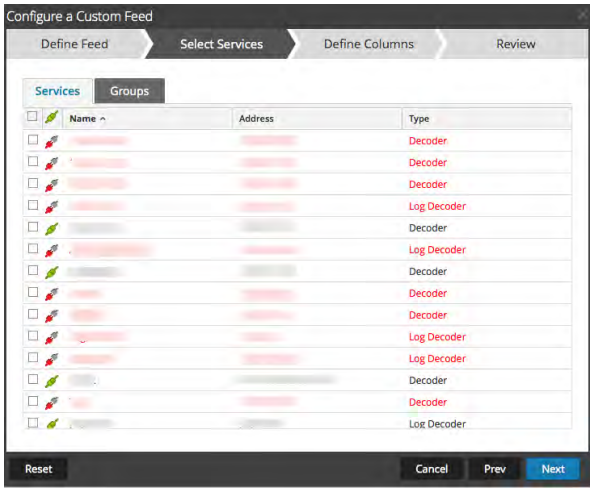
7. (Conditional) If you want to define a feed based on an XML feed file:

   - Type the feed **Name**, select **Advanced Options**.

     The Advanced Options fields are displayed.

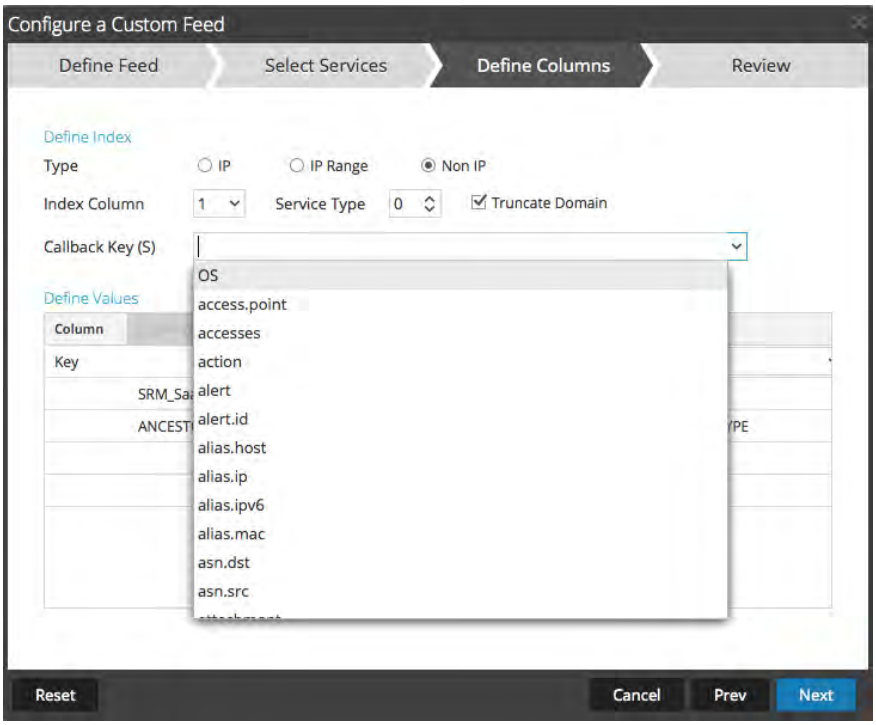
   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services dialog is displayed.

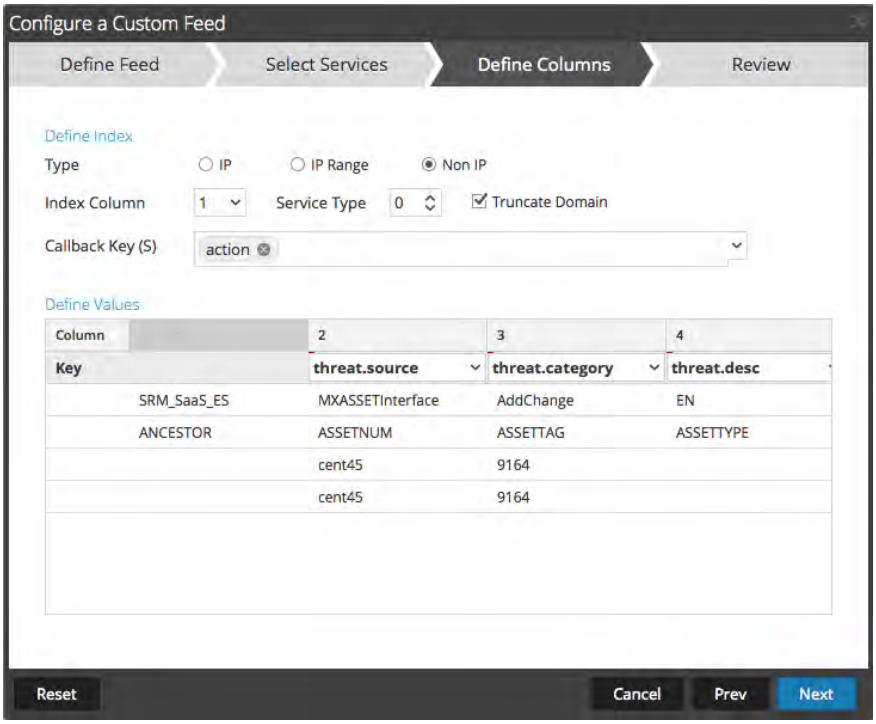


8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



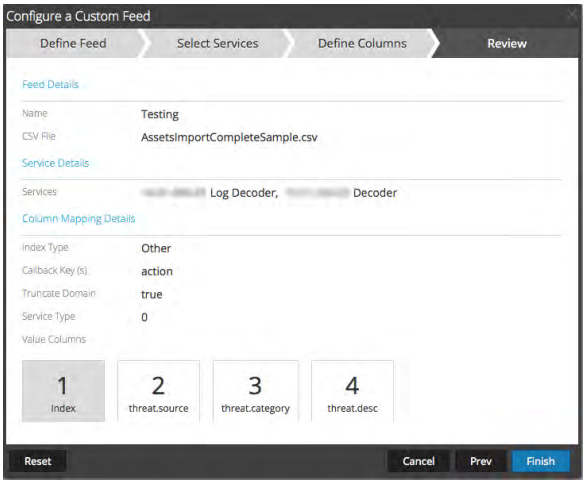
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



**Note:** When a custom feed gets converted into a context hub list, you must map at least one meta key with one or more meta types by mapping a column header with a meta. However, you can add or edit the entity mapping of a list by clicking ⚙ in the Lists tab. For more information, see the *Context Hub Configuration Guide*.

e. Click **Next**.

The Review dialog is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

**Note:** When you create a feed, and if there is no entity mapping done such as in case of custom meta, then those columns in the List will not have entity mappings in Context Hub. You have to manually map the entities from the List page.

## Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

1. SSH to the NW node and copy the CA certificate located in the following directory: */etc/pki/ca-trust/source/*
2. Execute the following command to update the certificates:
   `update-ca-trust`

3. Execute the following command to add the certificate to the java keystore:
   ```
   keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head
   ```
4. Restart the service on the NW node.

**Note:** Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

## Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness.

**Note:** NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://oasis-open.github.io/cti-documentation/.

**Caution:** If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.0, you must re-configure the STIX recurring feed.

In NetWitness Platform, STIX feeds are supported. STIX content (with version 11.x) can be uploaded in an ".xml" format. The constructs such as Indicator Title and Description, Observable Title and Description, and Indicator Sightings information are parsed from STIX and pushed to the decoders or log decoders that are selected during feed configuration. Information such as IP addresses, File hashes, Domain names, URIs, and Email addresses are extracted from the STIX observable to be included in the feed.

Make sure the following criteria are met before you upload the STIX file:

1. Only STIX Observables with property values in the "Equals" operator
2. The uploaded STIX xml file must have only one STIX_Package

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

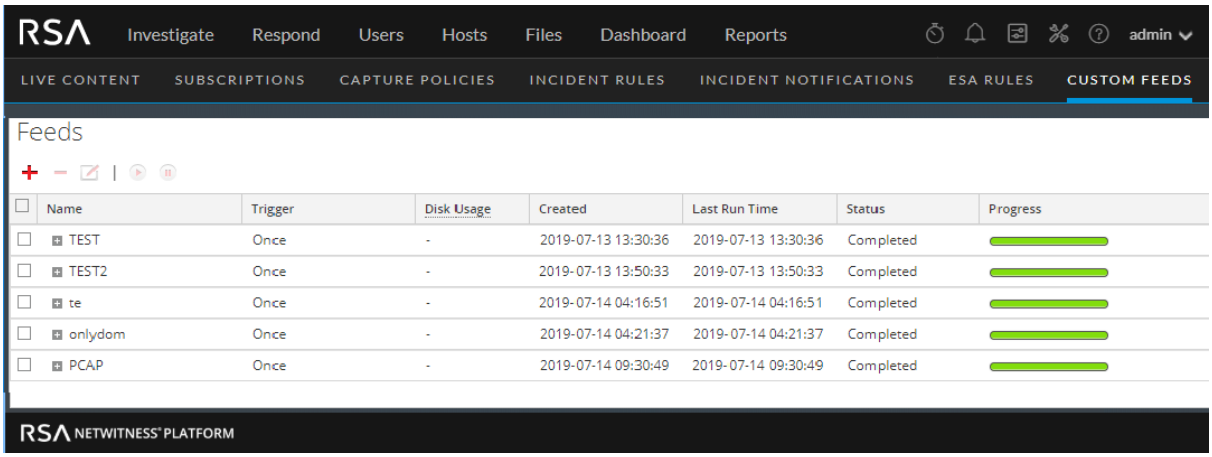
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.

The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

### To create a STIX custom feed:

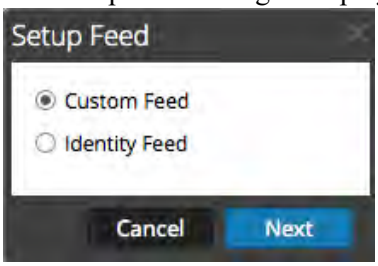
1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



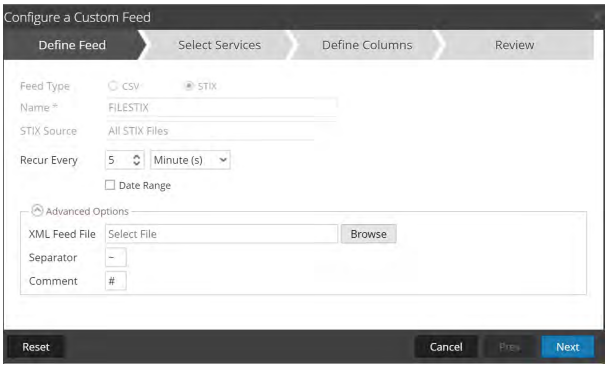
2. In the toolbar, click .

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.



4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

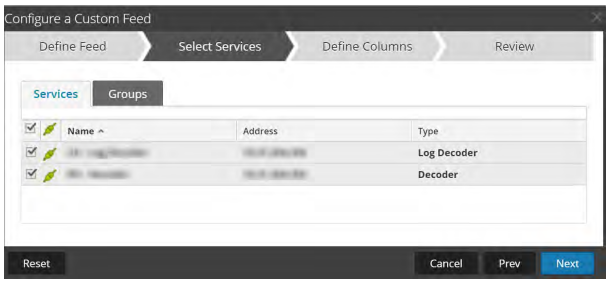
   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

**Note:** NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.

5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.
   a. **XML Feed file**: Browse and select an XML feed file from the local file system.
   b. **Separator**: Choose a separator (default is comma).
   c. **Comment**: Specify the comment characters used in the feed data file (default is #).
6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

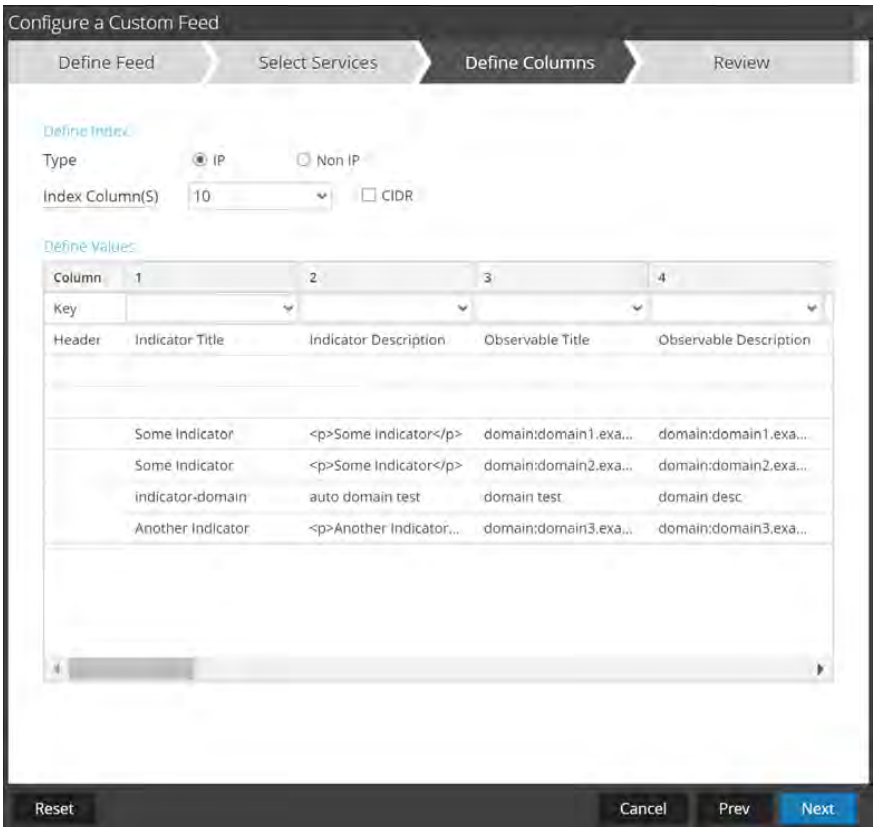
      - If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
      - If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:

a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.

b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.

c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

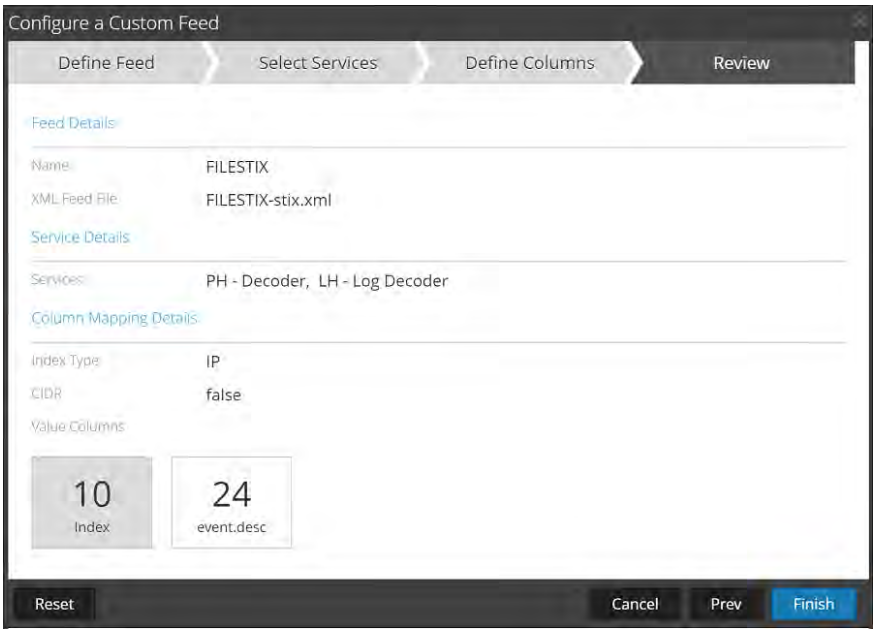


**Note:**
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

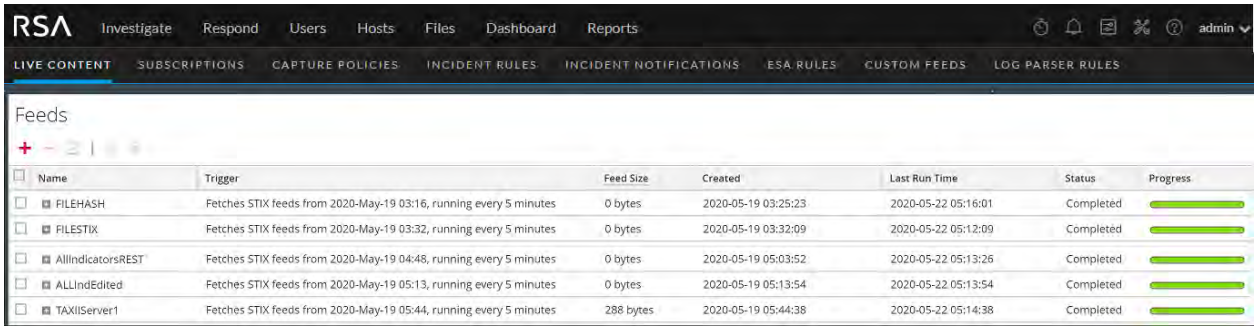
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



**Note:** Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low and the status displays as unhealthy due to low memory. For more information on how to troubleshoot the `OutOfMemoryError` on the Context Hub Server, see "Troubleshooting" in the *Live Services Management Guide*.

## MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

You can use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

**Note:** Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

CSV File Contents

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

XML File Contents

```
<?xml version="1.0" encoding="UTF-8"?><FDF
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
<MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">
<Meta name="ip.dst"/>
</MetaCallback>
<LanguageKeys>
<LanguageKey name="alert" valuetype="Text" />
</LanguageKeys>
<Fields>
<Field index="1" type="index" range="cidr"/>
<Field index="2" type="value" key="alert" />
</Fields>
</FlatFileFeed>
</FDF>
```

**Note:** To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

## Creating and Managing an Identity Feed

You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.

### To create an identity feed:

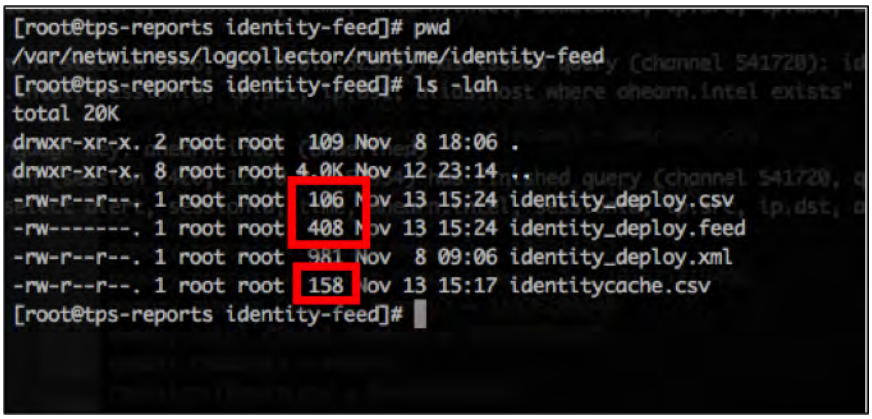
1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.

      The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

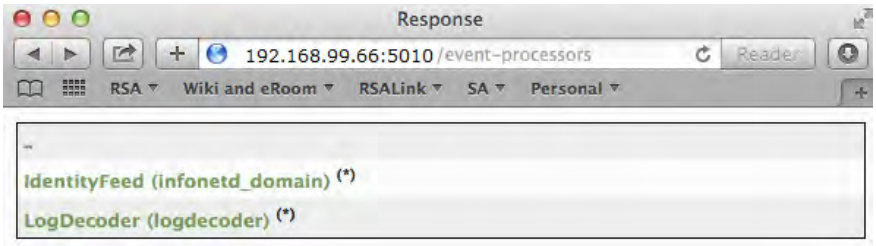
b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.



c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

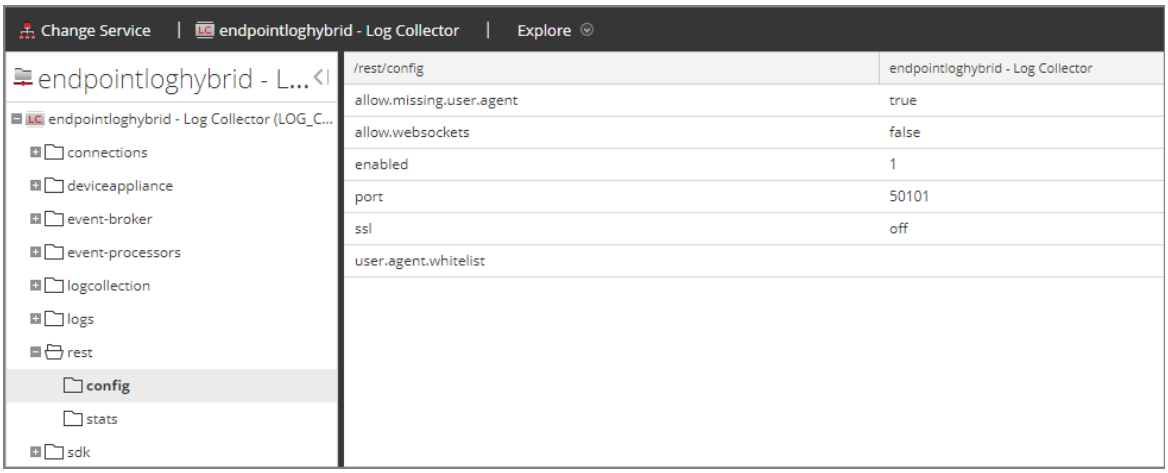


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **(Admin) > Services > <*Log Collector being setup*> > View > Explore**.

e. In the left pane, expand **rest > config**.



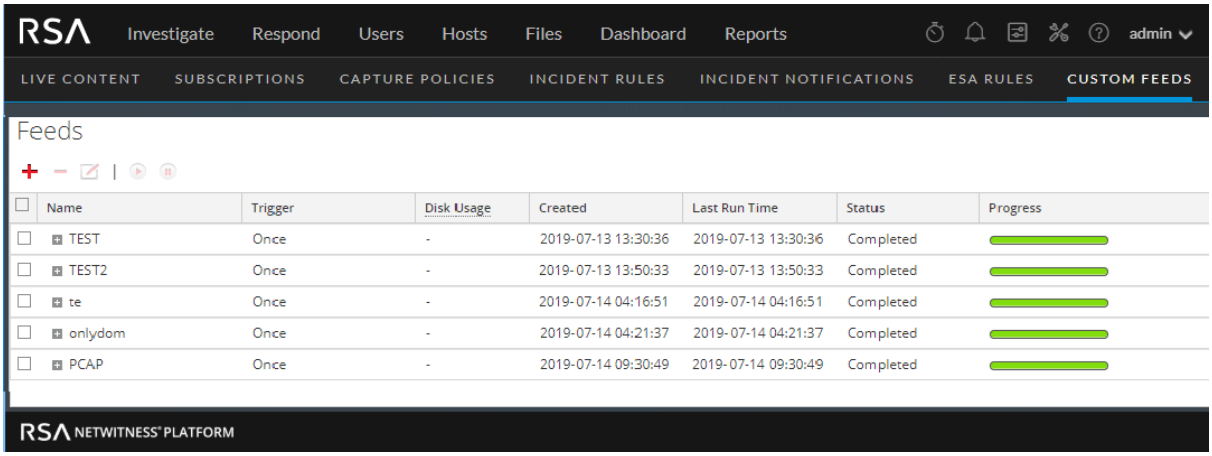
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

**Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

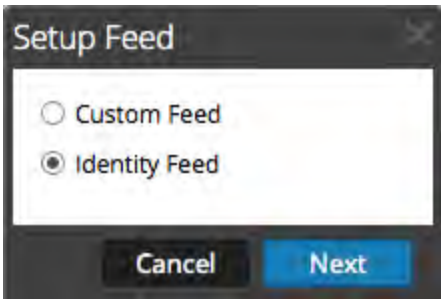
3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.



4. In the toolbar, click .

The Setup Feed dialog is displayed.



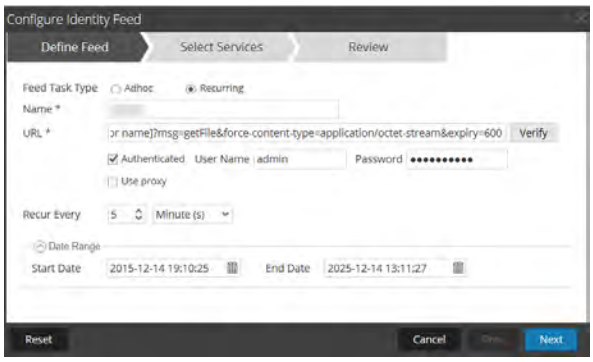
5. Make sure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.



**Note:** RSA NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.)

9. To define the recurrence interval, do one of the following:

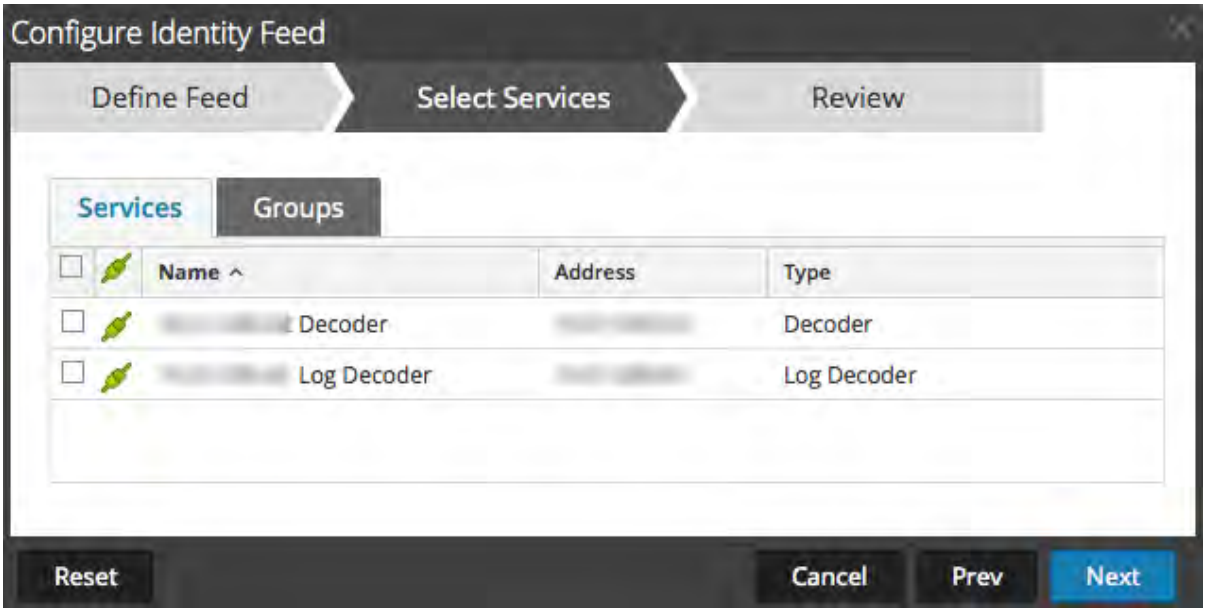
- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

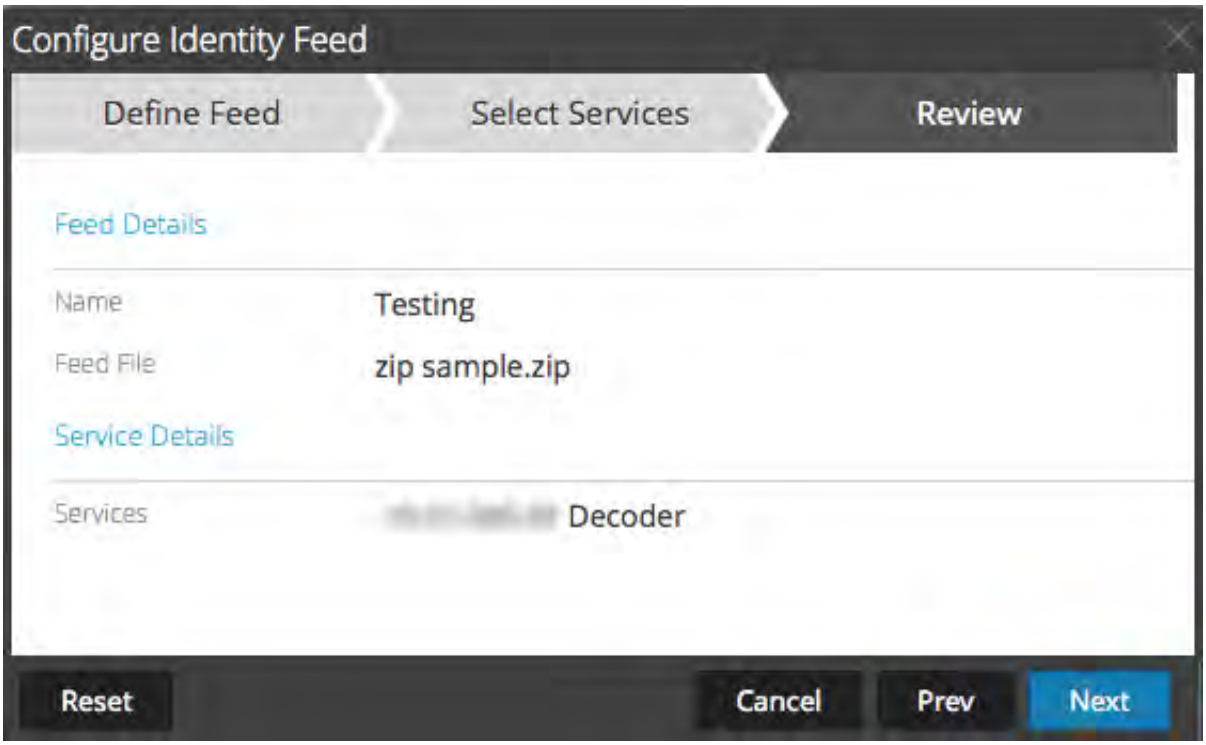
11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

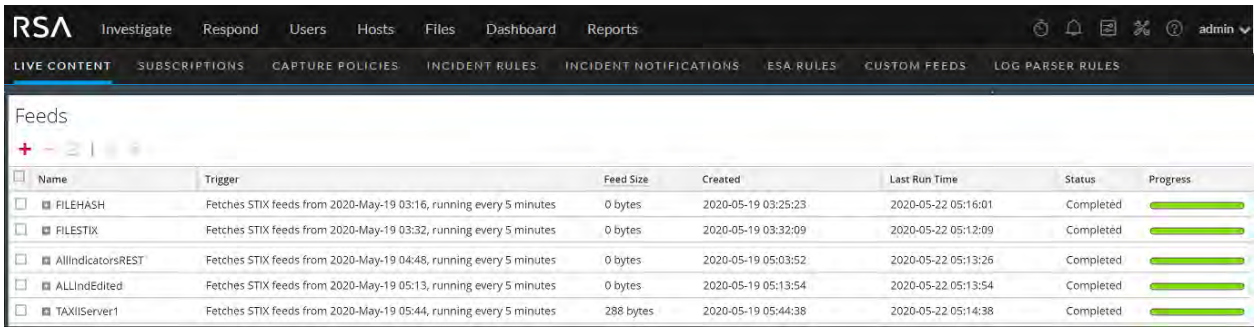
    The Review dialog is displayed.



**Note:** If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



## Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

## Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.

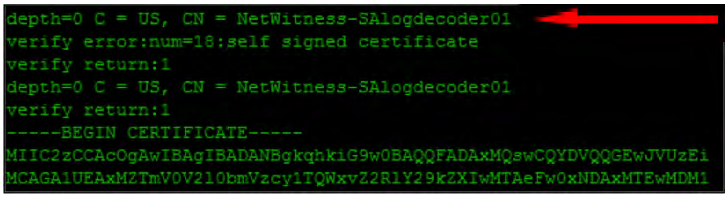
1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

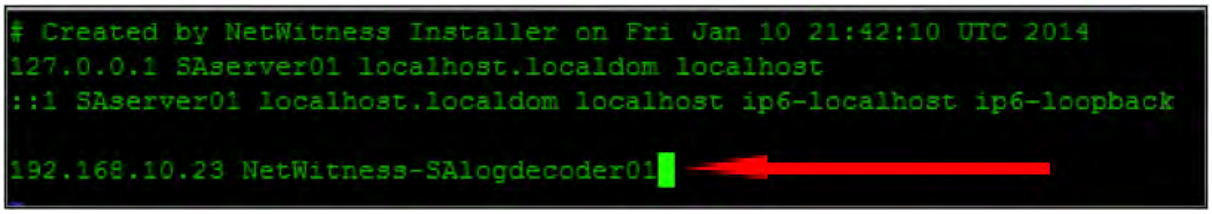
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

## Investigating an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller or non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.

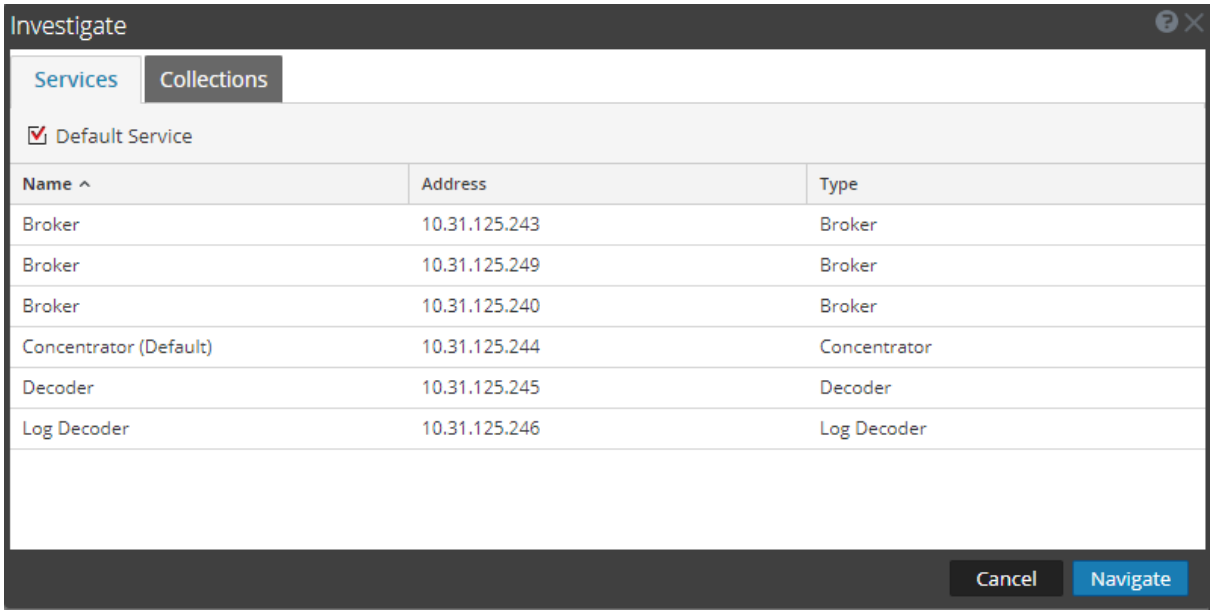
**Note:** An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

### To investigate a configured identity feed:

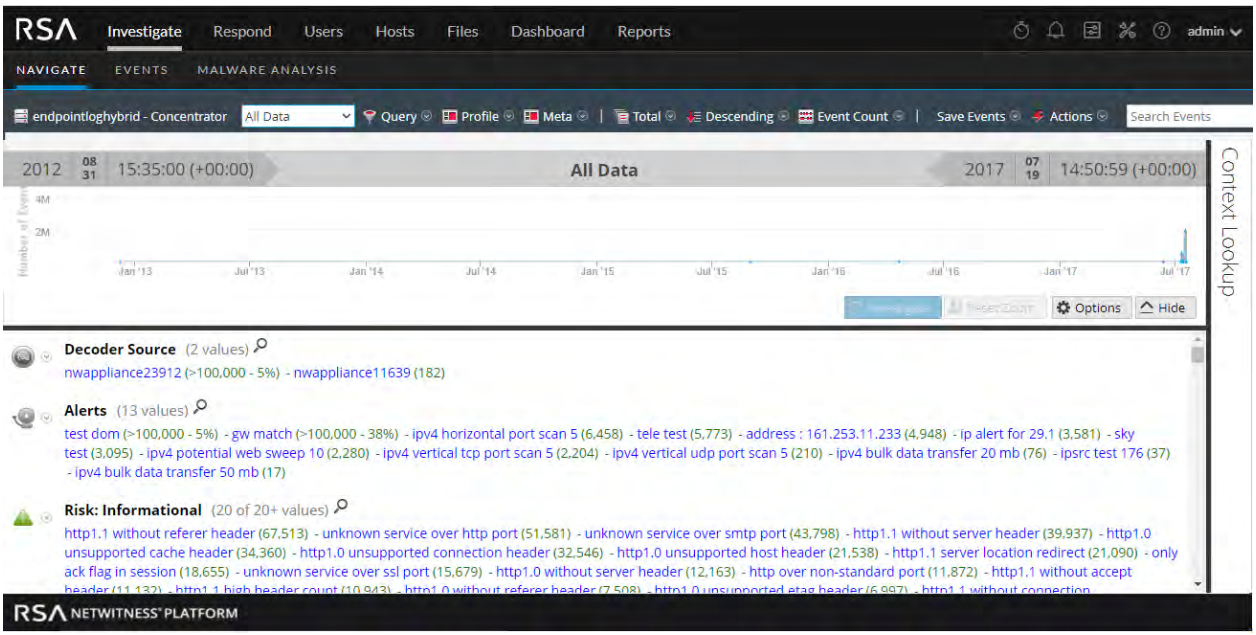
1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.



2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys:



The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

# Editing a Feed

This topic provides instructions for editing a custom feed using the Custom Feed Wizard.

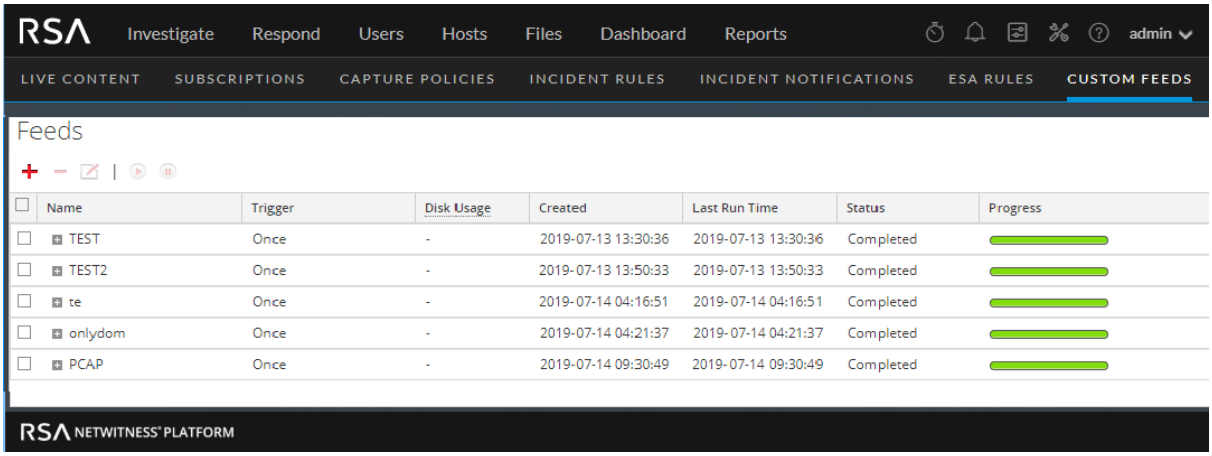
After you edit a feed:

- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) has been downloaded and edited.
- The feed has been recreated with the updated file and new feed specifications.

### To edit an existing feed:

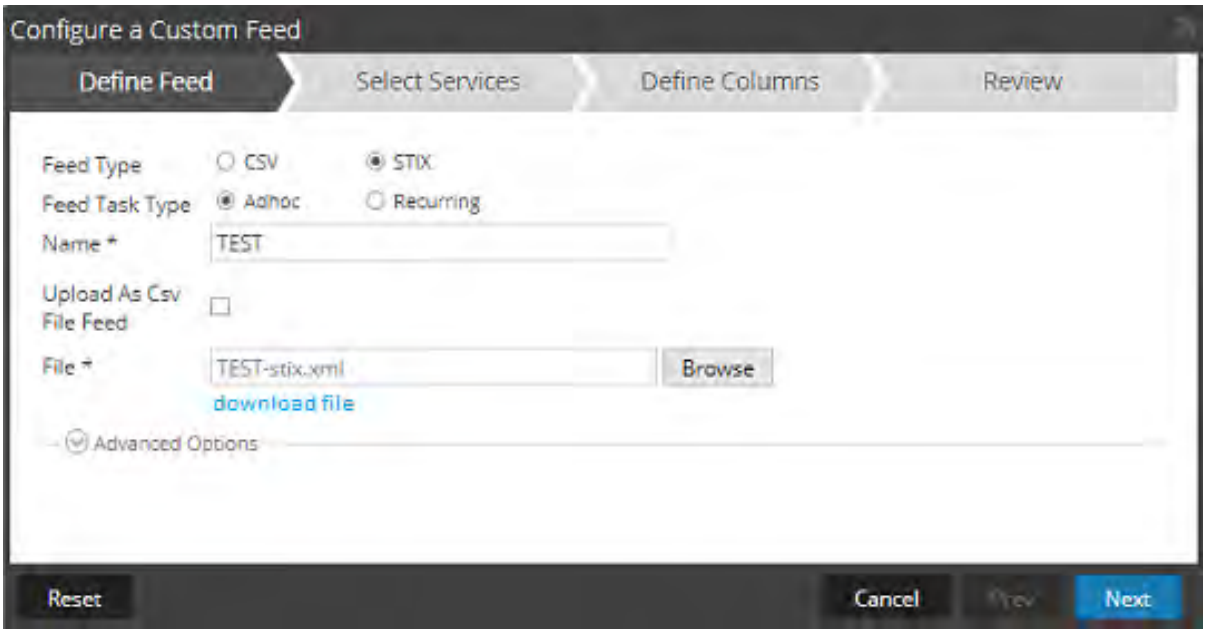
1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous dialog (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

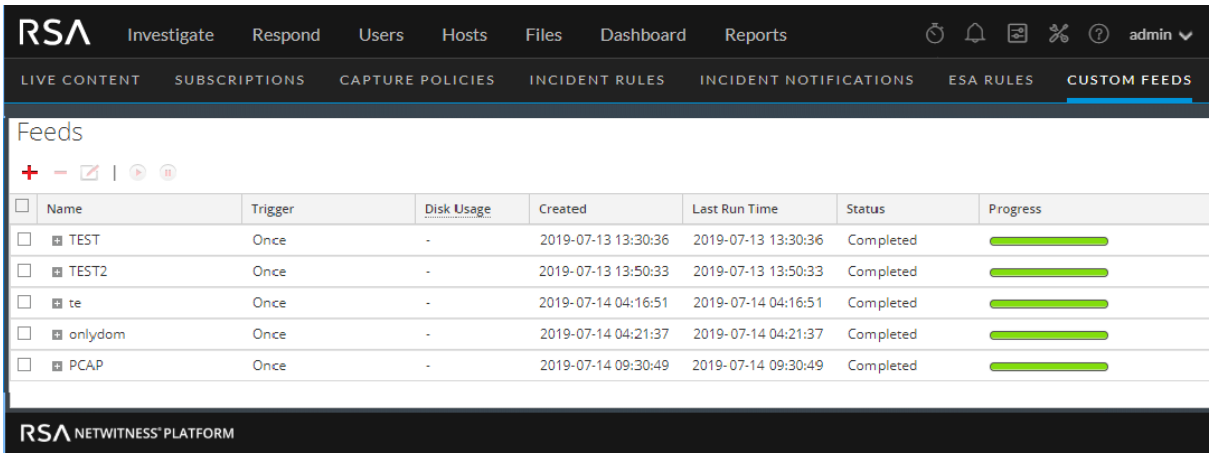
# Removing a Feed

This topic provides instructions for removing a feed. You might want to remove a feed when some or all of the information in the feed is no longer useful for your organization.

### To remove a feed:

1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click .

   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

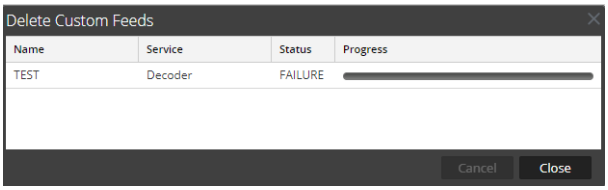
   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer seen on the NetWitness user interface.
   - If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.

- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again

3. Select which feed you want to delete and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the selected areas.



# Subscribing to Live Resources

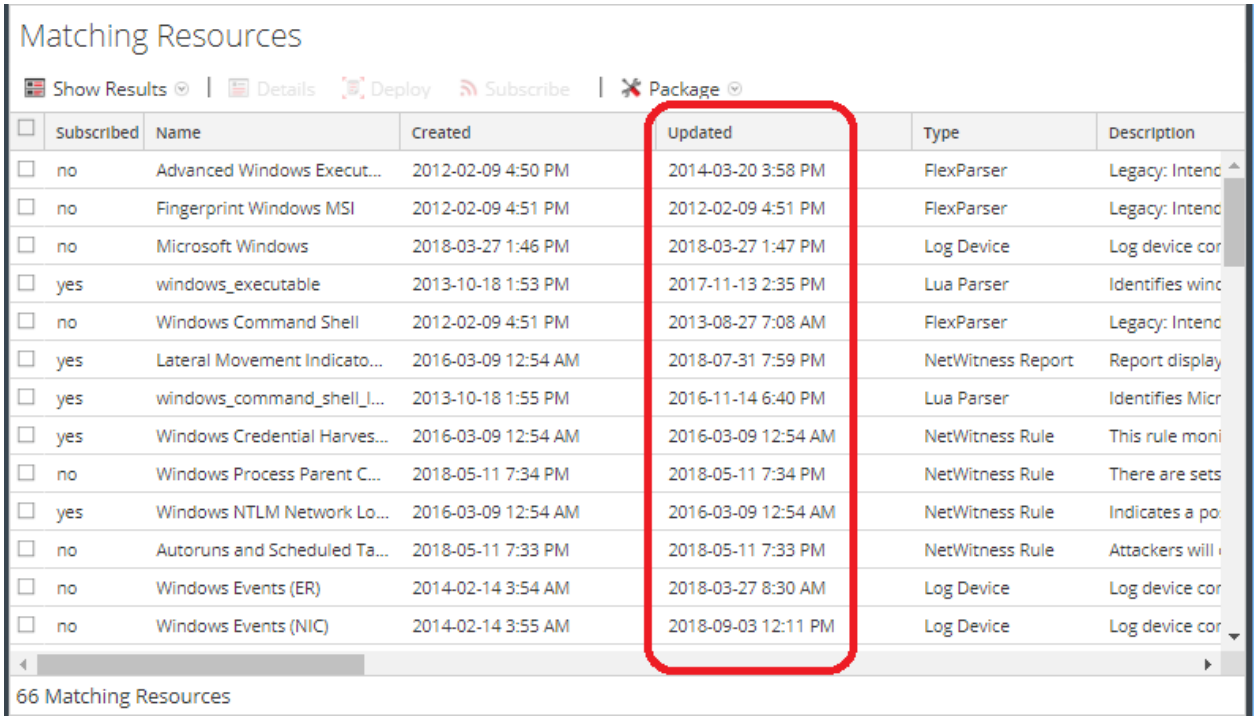
This section describes subscriptions in Live.

Threats and the corporate landscape change over time. RSA periodically reviews existing content to determine whether it needs to be updated based upon current campaigns, or has become irrelevant due to changes in technology or attack techniques and tools.

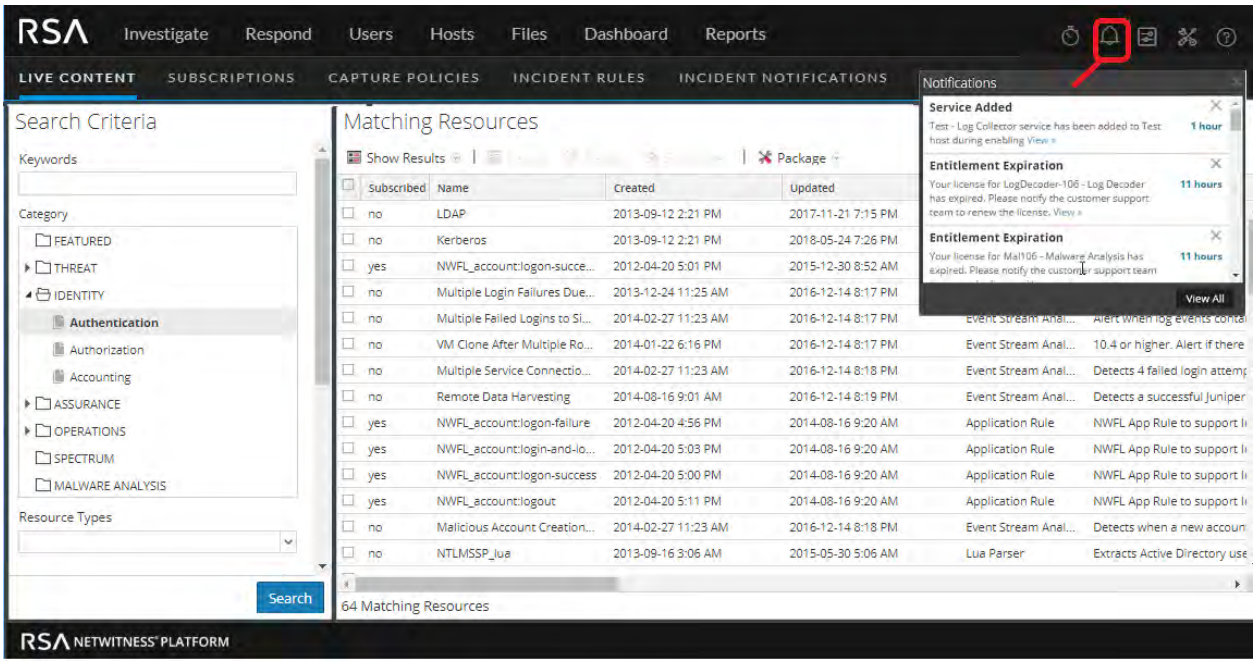
You can discover new content by using the What's New dashlet within the Default Dashboard, or by searching through RSA Live by data range since last deployed. Be sure to subscribe to any content for which you want to receive update notifications.

## Subscription Updates

When you view resources in the Matching Resources panel of the Live Content view, there is a column named **Updated**:



This value is also displayed when you select the detailed view for a resource. Every time a resource changes, its **Updated** value changes to match the specific update. If you are subscribed to a resource, and it gets updated, your system is automatically updated with the latest version, and you receive a notification. You can view your notifications by clicking the Notification icon, , from anywhere in the NetWitness UI.



You can also get email notifications when subscribed resources are updated. System Administrators can add email addresses in the **(Admin) > SYSTEM > Live Services** view. For more information, see the "Live Services Configuration Panel" topic in the *System Configuration Guide*.

## Adding Subscribed Resources for Deployment to Services

1. Go to **(Configure) > Subscriptions > Deployments**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click .
   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.
   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.
6. You can click the Synchronize icon, , to immediately synchronize your changes.

## Deleting a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Live.

### To delete a subscription:

1. Go to **(Configure) > Subscriptions**.
2. In the **Subscriptions** tab, select the subscriptions you want to delete.
3. Click , then choose **Delete** to delete your selected resources or **Delete All** delete all subscriptions.

   A dialog asks for confirmation that you want to delete the subscription.
4. To confirm removal, click **Yes**.

   Your selected subscriptions are deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

## Removing Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization.

You can remove subscriptions from the Live (Configure) > Subscriptions > Deployments panel, but any that have actually been deployed to services remain deployed until someone removes them.

### To remove resources from the Deployments tab Subscriptions panel:

1. Go to **(Configure) > Subscriptions > Deployments**
2. In the **Groups** panel, select a group.

   Subscribed resources, if any, are listed in the Subscriptions panel.
3. In the Subscriptions panel, click .

   A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

## Subscribe and Unsubscribe to a Resource

When you subscribe to resources, you will receive notification when new versions of the resources are available.

### To subscribe to a resource:

1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click Subscribe.

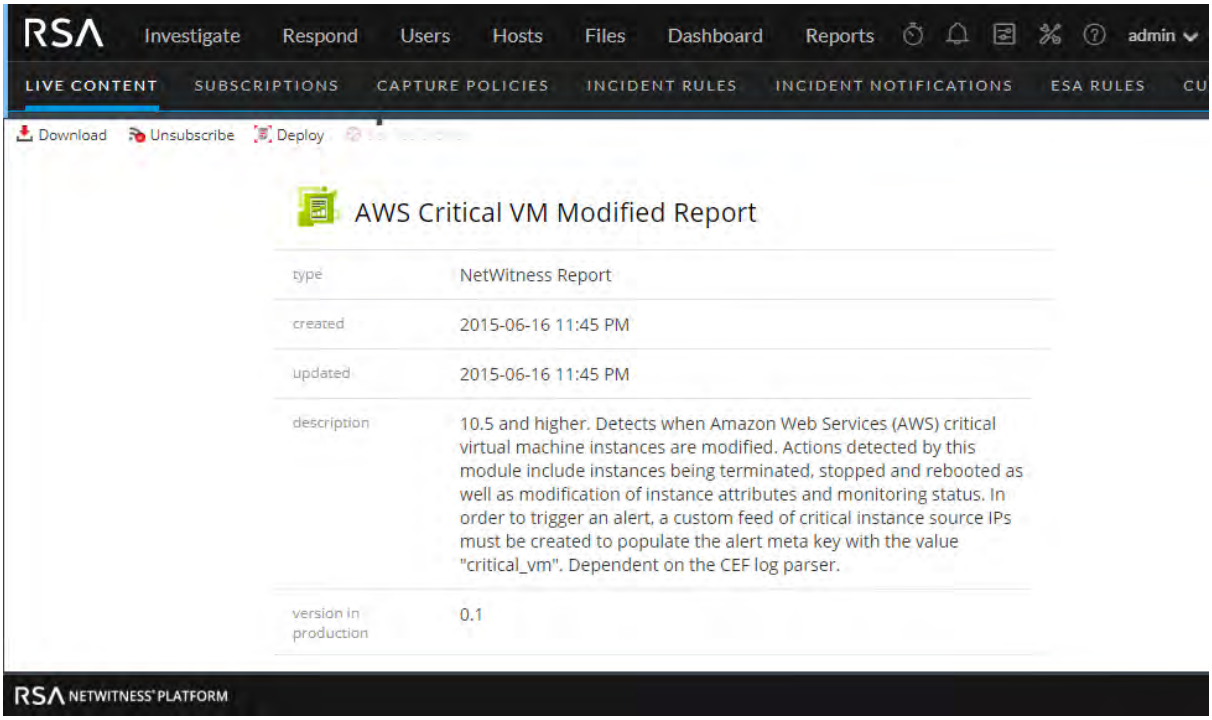
   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.

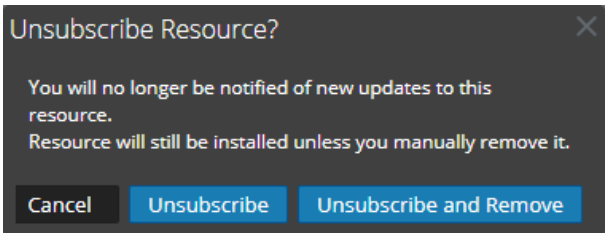
### To unsubscribe from a resource:

1. Open a detailed view of a resource in one of the following ways:
   - Perform a search, **(Configure) > Live Content** > enter search criteria, then select the resource in the Matching Resources panel, then click Details.
   - View subscriptions, **(Configure) > Subscriptions**, select the resource from the Subscriptions list, then click Details.



2. With the detailed view of a resource displayed. click Unsubscribe.

   A confirmation dialog is displayed.



3. Do one of the following:

- To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
- To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
- To close the dialog without unsubscribing, click **Cancel**.

The selected action is applied.

## Viewing Subscribed Resources Selected to Deploy on Services

In the **(Configure) > Subscriptions > Deployments** tab you can view subscribed resources that have been selected for deployment on services.

### To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group. The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

# Miscellaneous Live Services Procedures

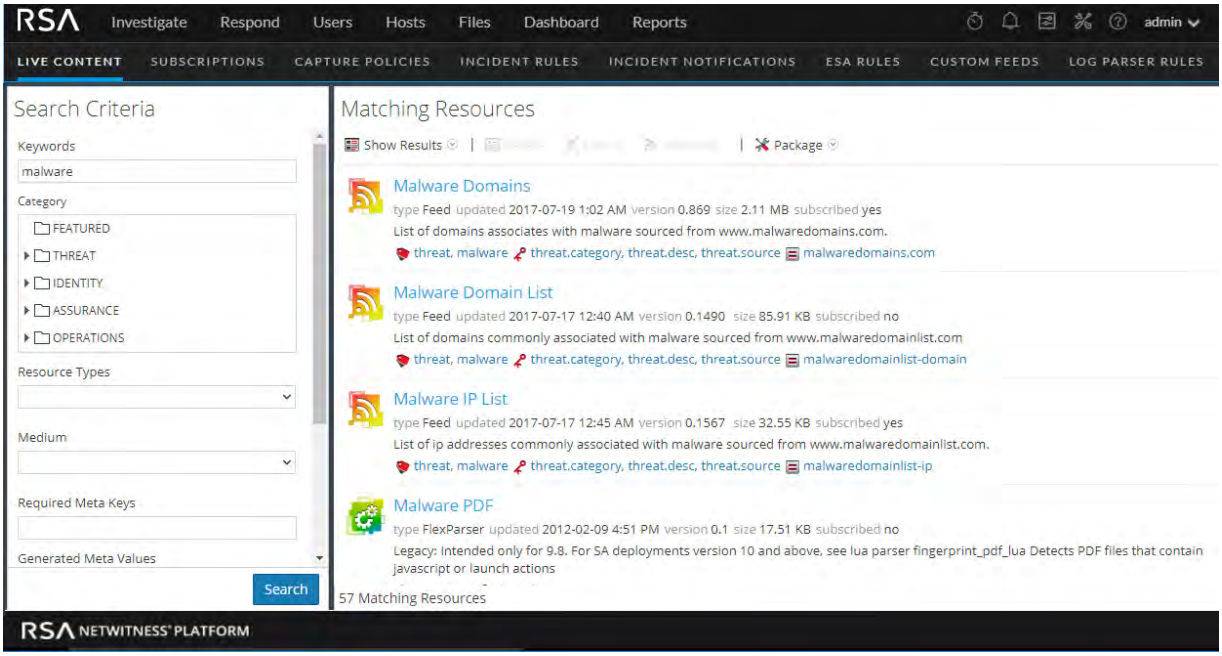
This section describes several other procedures.

## Displaying Resource Details in Live Resource View

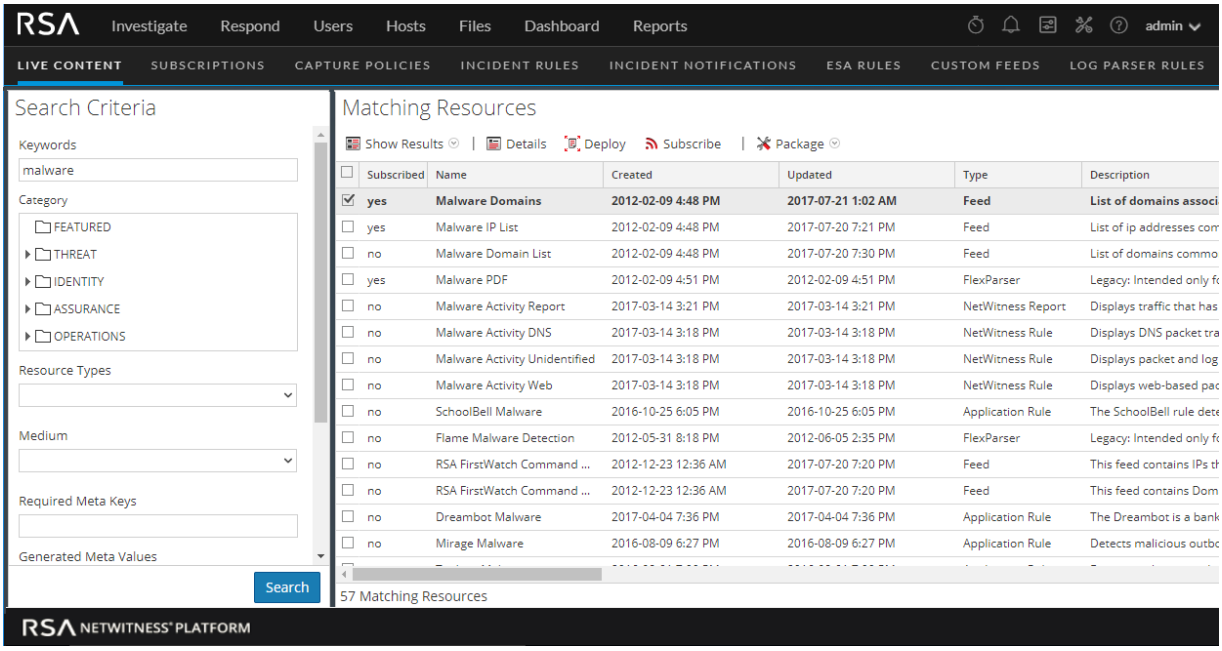
After you select a resource (in the Live Resource View), you can view its detailed information.

To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the **Detailed Results**, click the resource type icon or the resource name.



- If you are viewing the list results, double-click a resource or select a resource and click **Details**.



## Downloading a Resource

You can download a single resource from the Live Resource View.

### To download a resource:

1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource you want to download.
3. Select a single resource, then click

.
4. Click 
.

The resource is saved as a ZIP archive to your local Downloads folder.

## Locating and Removing a Deployed Resource from Services

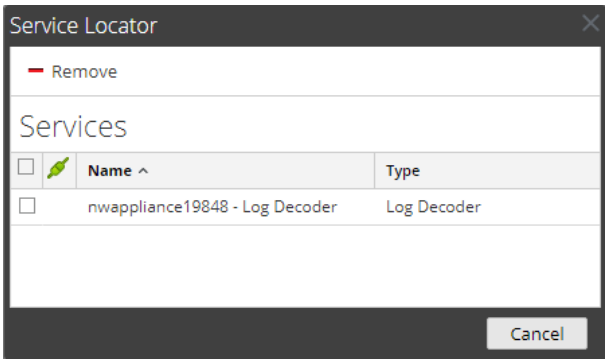
You can locate and remove a deployed resource from services from the Live Resource View.

### To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click

.

   The Service Locator dialog is displayed.

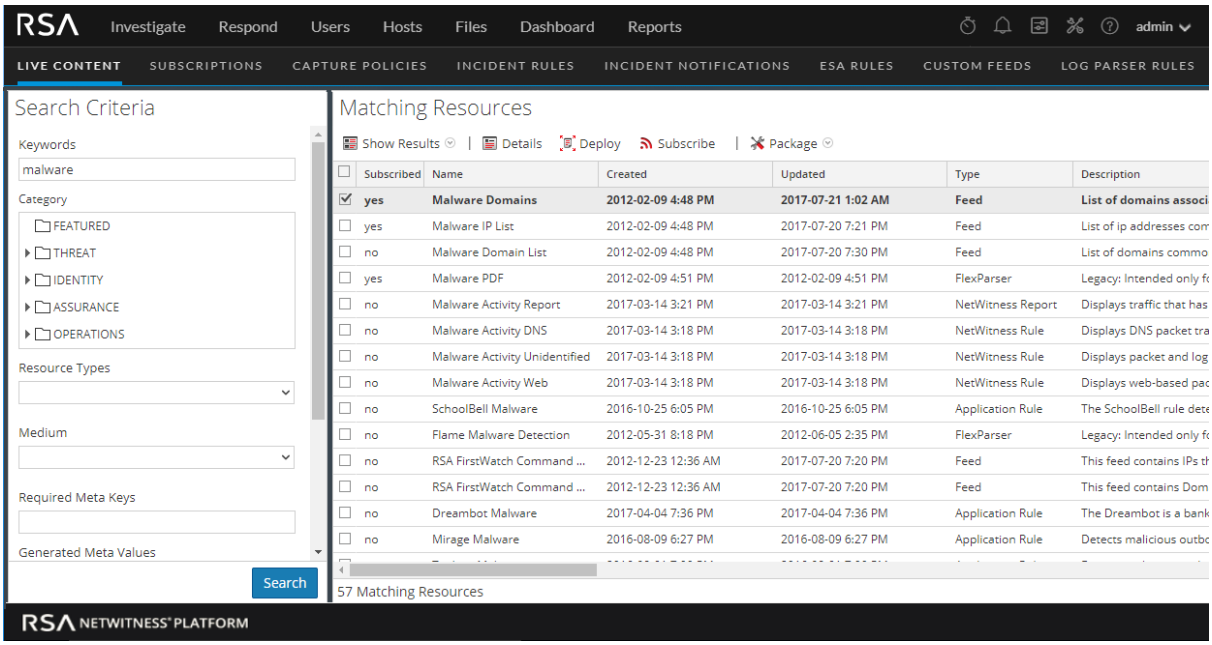


2. Select one or more services in the **Services** list.
3. Click −.

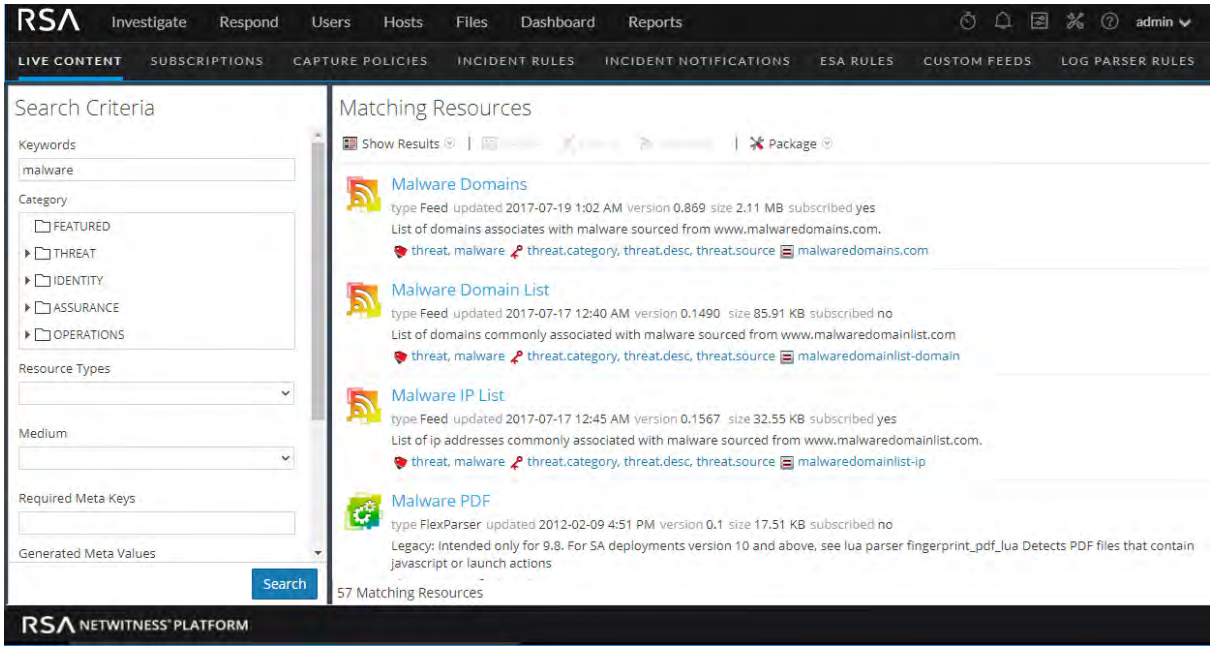
   The resource is removed from the selected services.

## Showing Results as a List or in Detail

1. Select **Show Results > Grid** to change to grid results when viewing detailed results.



2. Select **Show Results > Detailed** to change to detailed results when viewing grid results.



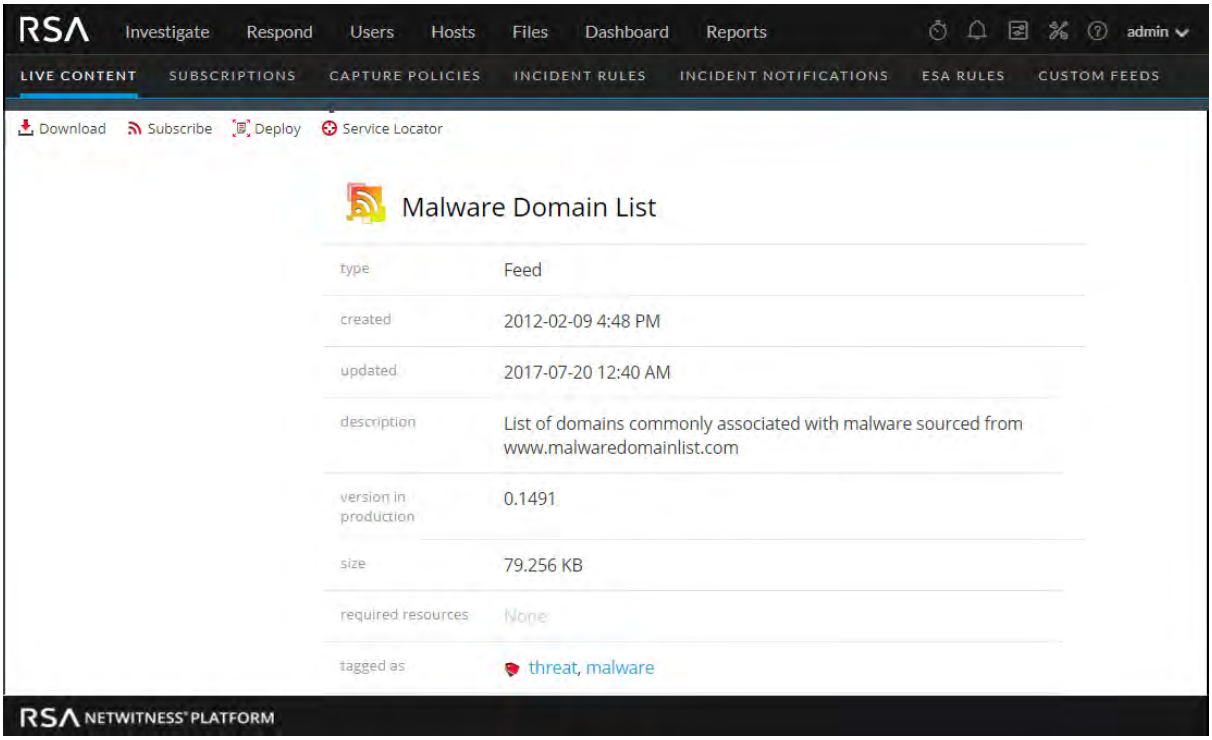
## Viewing Resource Details

You can display detailed information about a subscribed resource in the Resource View.

### To view details:

1. In the **Subscriptions** tab, select a single subscription.
2. Click Details .

The details of the resource are displayed in the Resource View.



# References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in RSA NetWitness. These topics are presented in alphabetical order.

# Live Configure View

In the Live Configure view, NetWitness provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Live, please read Live Services Management.

To access this view, navigate to **(Configure) > Subscriptions**. The view has three tabs: Deployments Tab, Subscriptions Tab, and Discontinued Resources Tab.

# Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.
- Removing resources that are selected for deployment on services in a service group.

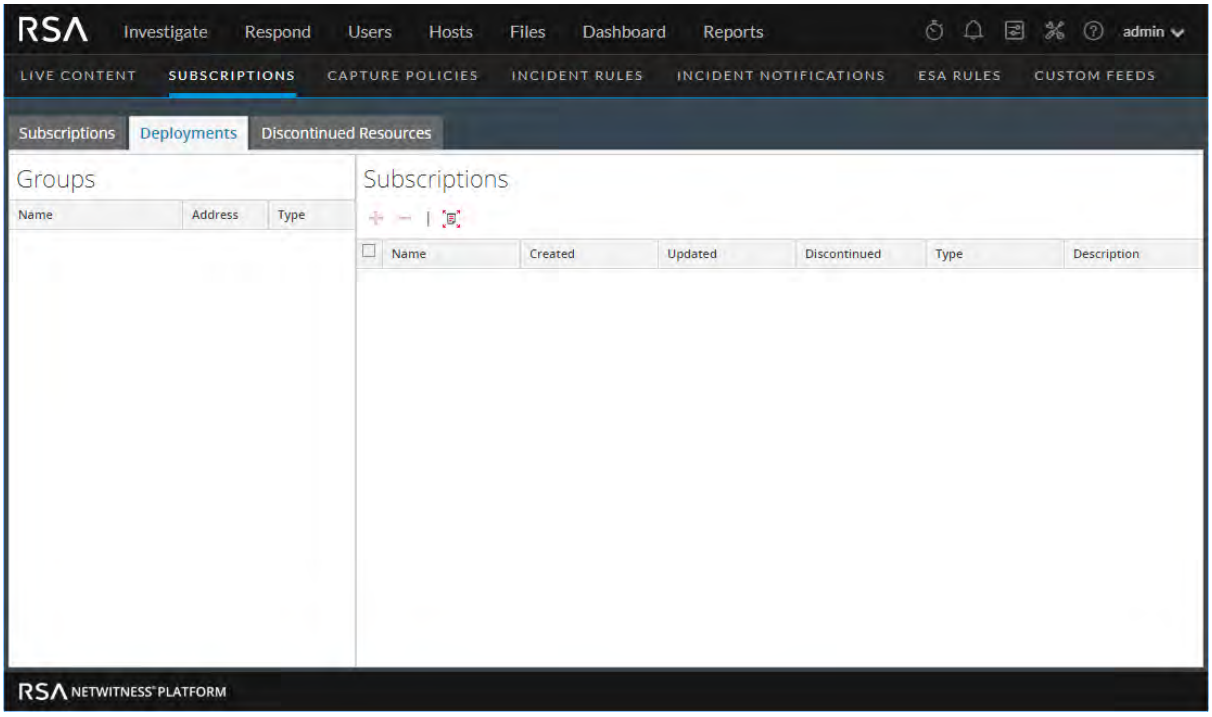
The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness synchronizes with RSA NetWitness Live. The synchronization schedule is configured in the Live Configuration panel. Additionally, you can synchronize immediately in the **(Configure) > Subscriptions > Deployments** tab.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

The required permission to access this view is **Manage Live Resources**.

### To access this view:

1. Go to **(Configure) > Subscriptions**.
   The **Subscriptions** tab is displayed.
2. Click the **Deployments** tab.



The Deployments tab has two panels: **Groups** and **Subscriptions**.

## Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

| Feature | Description |
|---|---|
| **Name** | Displays the service group name. Clicking the plus sign displays a nested list of services in the group. |
| **Address** | Displays the IP address of each service in the group. |
| **Type** | Displays the type of service. |

## Subscriptions Panel

The following table describes the features in the Subscriptions panel.

| Feature | Description |
|---|---|
| | Click to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment. |
|  | Click  to delete the selected subscriptions from the deployment list for service group. |
| | Click to synchronize your resources to the latest versions available on Live. |
| **Name** | Displays name of the resource. |
| **Created** | Displays date and time that the resource was created. |
| **Updated** | Displays date and time that the resource was last updated. |
| **Type** | Displays type of resource. |
| **Description** | Displays description of the resource. |

## Subscriptions Tab

Subscriptions are NetWitness Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA NetWitness Live. The choices made in the Live Configuration panel determine the synchronization frequency and also whether you receive update notifications through email. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness is subscribed is listed in this tab.

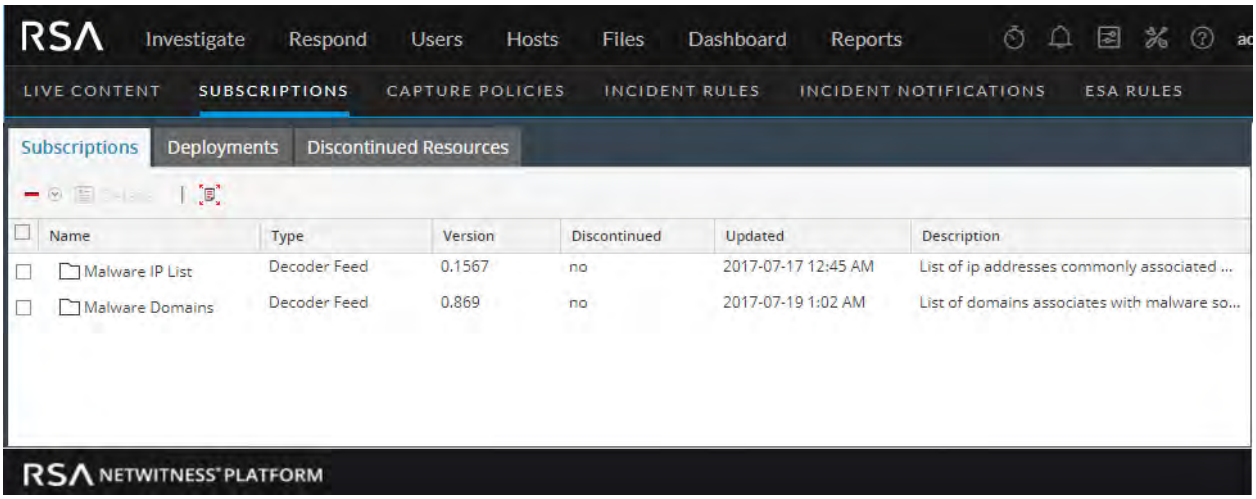
In the Subscriptions tab, you can:

- View all resources to which this NetWitness instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

**Note:** Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **(Configure) > Subscriptions**. The Subscriptions tab is displayed.



The **Subscriptions** tab has a toolbar and a grid.

### Toolbar

This table describes the options available in the toolbar.

| Feature | Description |
|---|---|
|  | Deletes the selected subscriptions. |
|  | Displays the details of a single subscribed resource in the Resource View. |
| | Check the Live Server for the latest discontinued resources. |

## Grid

| Column | Description |
|---|---|
| | Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing. |
| **Name** | Displays name of the subscribed resource. |
| **Type** | Displays type of subscribed resource. |
| **Version** | Displays version of the subscribed resource. |
| **Discontinued** | Indicates the status of the discontinued resources for the subscribed resource.<br>**Yes** - Resource is discontinued.<br>**No** - Resource is not discontinued.<br>**--** - The Live Server is not checked for the discontinued resources. |
| **Updated** | Displays date and time when the subscribed resource was last updated. |
| **Description** | Displays description of the subscribed resource. |

# Discontinued Resources Tab

The Discontinued Resources tab provides a user interface in the Live Configure view:

- Scan the services for the discontinued resources.
- Remove the discontinued resources from any service or service group.

**Note:** Discontinued content still appears. With discontinued content there just won't be any updates, and users won't see these items when they search in Live, unless they check the **Include Discontinued Resources** box while searching.

In the NetWitness Content space on NetWitness Community, you can view the complete, up-to-date list of discontinued resources (Discontinued Content). For each resource, there is a description of why it was discontinued. Use these details to determine whether or not to remove a discontinued resource from your installation. .

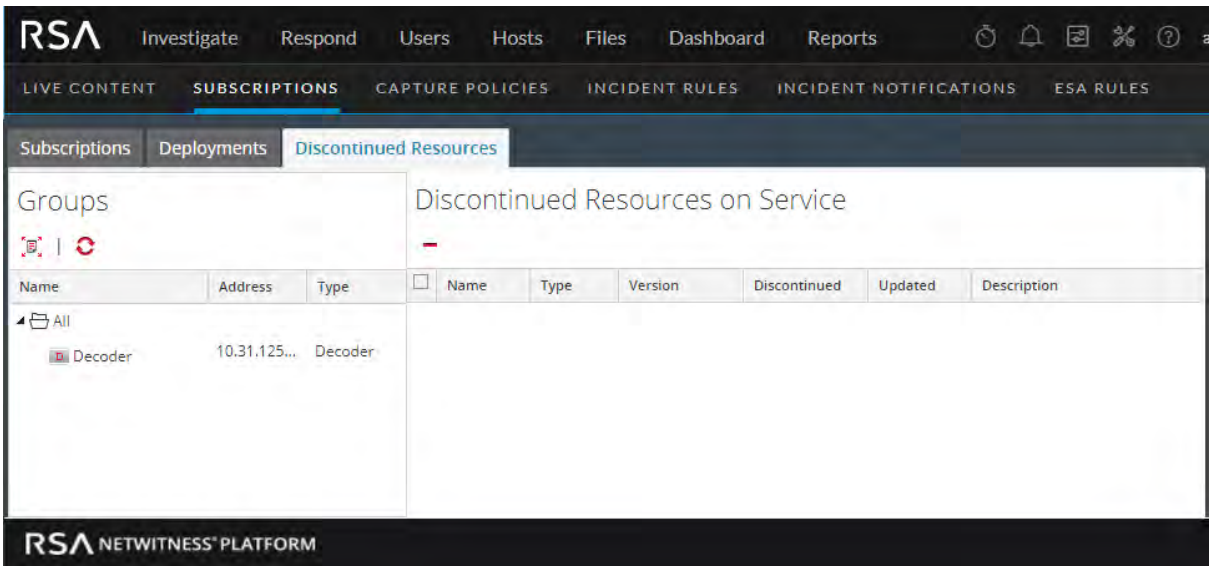
The required permission to access this view is **Manage Live Resources**.

### To access this view:

1. Go to **(Configure) > Subscriptions**.

   The **Subscriptions** tab is displayed.
2. Click the **Discontinued Resources** tab.

   The Discontinued Resources tab is displayed.



The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

## Groups Panel

The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployed on the selected service or service group.

| Feature | Description |
|---|---|
| | Click the button to scan the services for a discontinued resource. |
| | Displays the current status of the discontinued resources on a service.<br>**Note:** The status of a service may change while the services are being scanned. |
| **Name** | Displays service group name. Clicking the plus sign displays a nested list of services in the group. |
| **Address** | Displays IP address of each service in the group. |
| **Type** | Displays type of service. |

## Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

| Feature | Description |
|---|---|
|  | Click the button to delete the selected resources from the service or service group. |
| **Name** | This is the name of the resource. |
| **Type** | This is the type of resource. |
| **Version** | Version of the discontinued resource. |
| **Discontinued** | Indicates the status of the discontinued resources for the subscribed resource.<br>**Yes** - The resource is discontinued.<br>**No** - The resource is not discontinued.<br>**--** - The Live Server is not checked for the discontinued resources. |
| **Updated** | Displays date and time that the resource was last updated. |
| **Description** | Displays description of the resource. |

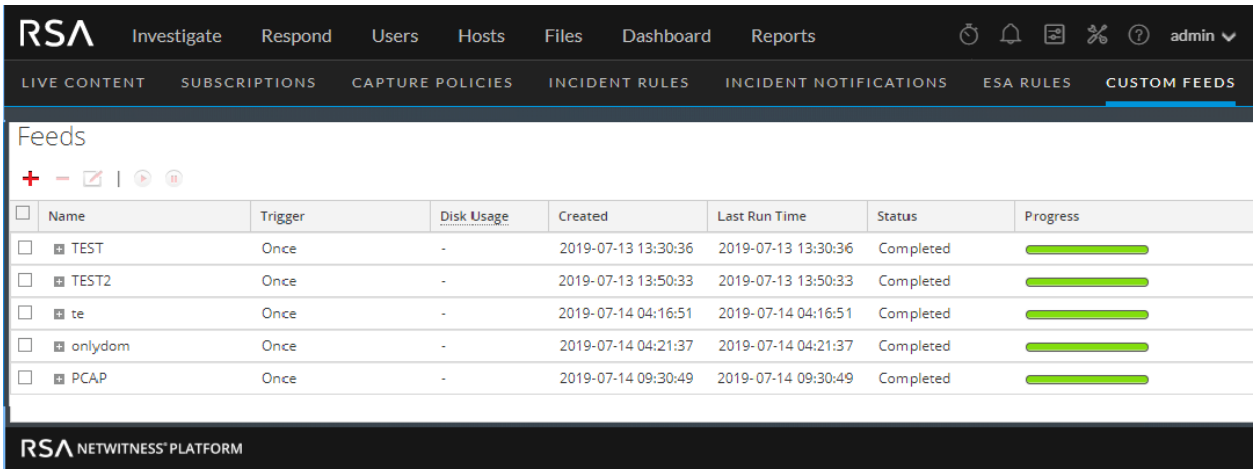
# Live Feeds View

Use the Live Feeds View to:

- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.

To access this view, navigate to **(Configure) > Custom Feeds**.
This is an example of the Feeds view.



The **Feeds** tab has a toolbar and a grid.

## Toolbar

This table describes the options in the toolbar.

| Feature | Description |
|---|---|
| | Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.<br>  <br>• Custom Feed opens the **Configure a Custom Feed** wizard.<br>• Identity Feed opens the **Configure Identity Feeds** wizard. |
|  | Deletes the feed that you selected. |
| | Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Editing a Feed. |
| | Start or resume data feed. |
| | Stop or pause data feed. |

## Feeds Grid

This table describes the columns in the grid.

| Column | Description |
|---|---|
| | Selects a feed. |
| **Name** | Name of the feed.<br>**Note:** You can now use special characters to define the name of the custom feed. |
| **Trigger** | Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created. |
| **Created** | Displays date and time when the feed was created. |
| **Disk Usage** | Displays the MongoDB storage size used by the TAXII feed. |
| **Last Run Time** | Displays date and time when the feed was last run. |
| **Status** | The status of the feed. |
| **Progress** | Progress bar. |

# Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has the following options:

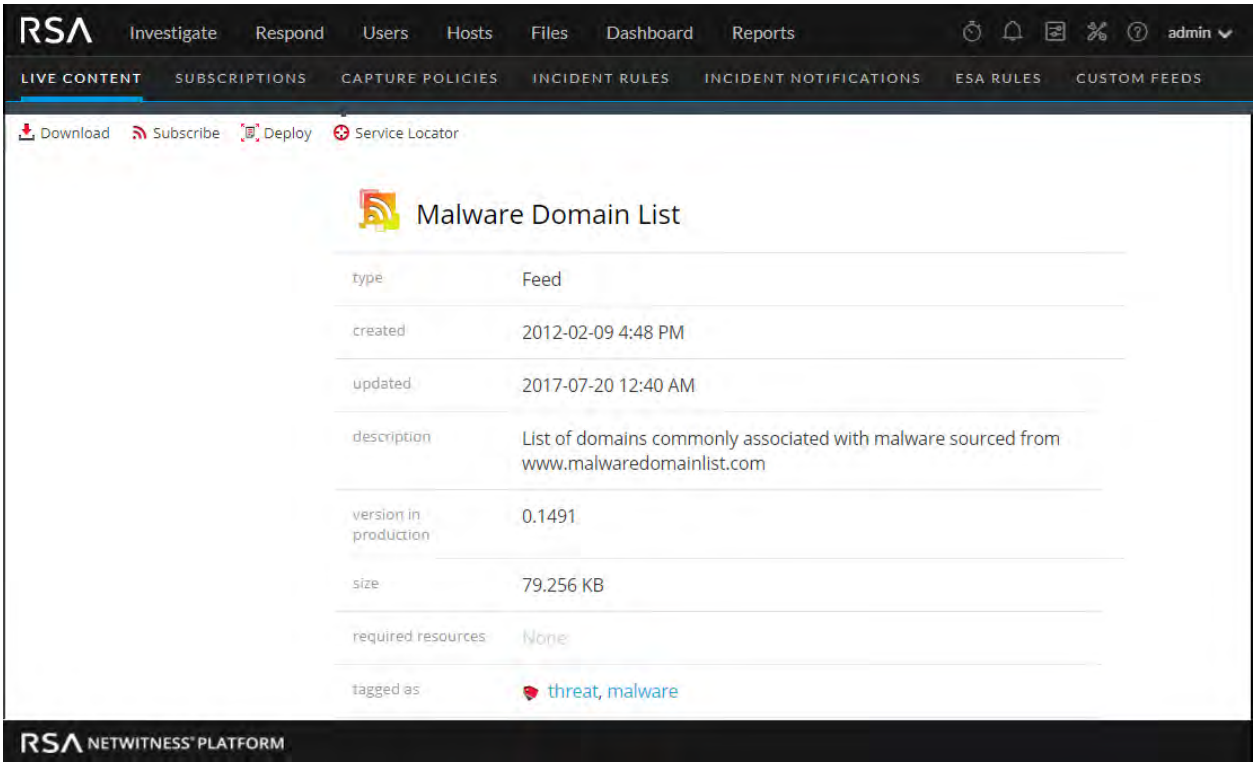
- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

The required permission to access this view is View Live Resource Details.

To access this view, do one of the following:

1. Go to **(Configure) > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.
3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

This is an example of the Resource view.



The Live Resource View has a detailed view of a single resource and a toolbar.

## Resource Details

The following table describes the elements in the Resource Details section.

| Feature | Description |
|---|---|
| **Resource Type Icon** | A graphic representation of the resource type, for example . |
| **Name** | The name of the resource, for example, **fingerprint_office_lua**. |
| **Type** | The type of resource, for example, **RSA Lua Parser**. |
| **Created** | The date the resource was created, for example, **2013-09-15 02:16 PM**. |
| **Updated** | The date the resource was last updated, for example, **2013-09-15 02:16 PM** |
| **Description** | The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**. |
| **Version in production** | The version of the resource, for example, **0.1**. |
| **Size** | The size of the resource, for example, **9.079 KB**. |
| **Required Resources** | A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked. |
| **Tagged as** | The tags that apply to the resource. In the example, the tags are **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag. |
| **Required Meta Keys** | The meta keys that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key. |
| **Generates Meta Values** | The meta values that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value. |
| **Permissions** | The permissions required for the resource. |

## Resource View Toolbar

This table describes the Live Resource view toolbar options.

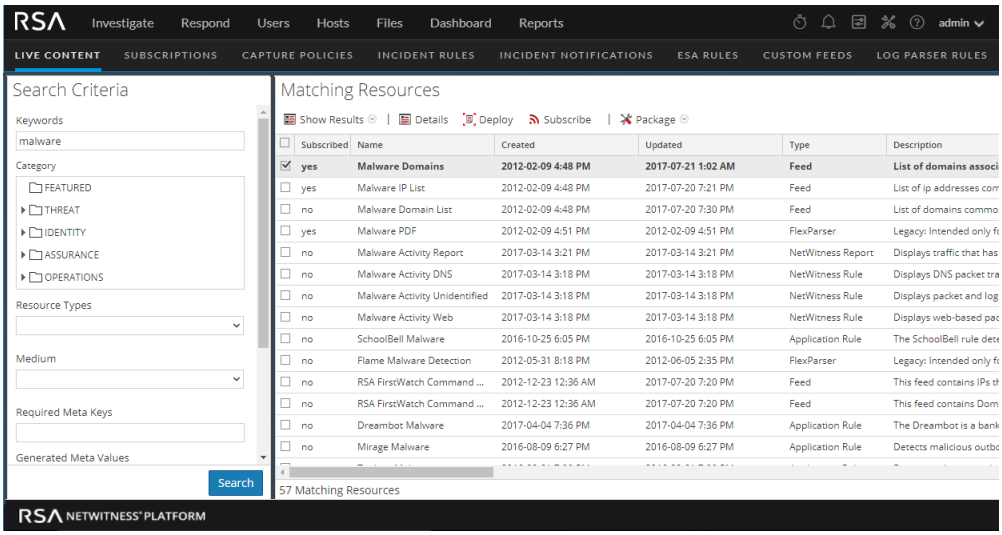
| Feature | Icon | Description |
|---|---|---|
| **Download** |   | This option downloads the resource currently displayed in the Resource View. |

| Feature | Icon | Description |
|---|---|---|
| **Subscribe or Unsubscribe** |  | This option subscribes to or unsubscribes from the resource currently displayed in the Resource View.<br>• Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**.<br>• Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed. |
| **Deploy** | | This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog. |
| **Service Locator** |  | This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services. |

# Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.

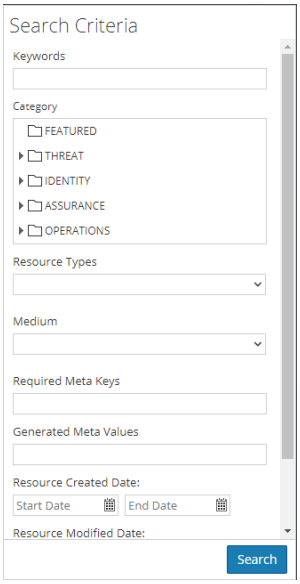
This is an example of the Search view.



The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

## Search Criteria Panel

This is an example of the Search Criteria panel.



The following table provides descriptions of the Search Criteria panel features.

| Feature | Description |
|---|---|
| **Keyword(s)** | Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword. |
| **Category** | The categories mirror the hierarchical Investigation Model that RSA uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more information, see the Investigation Model topic in the NetWitness Content space on NetWitness Community. |
| **Resource Types** | Select resources types from the drop-down list to filter resources by type of resource. Possible values are:<br>• Advanced Analytics (Warehouse)<br>• Application Rule<br>• Bundle<br>• Correlation Rule<br>• Event Stream Analysis Rule<br>• Feed<br>• FlexParser<br>• Investigation Column Group<br>• Investigation Meta Group<br>• Investigation Profile<br>• Log Collector<br>• Log Device<br>• Lua Parser<br>• Malware Rules<br>• NetWitness List<br>• NetWitness Report<br>• NetWitness Rule<br>• (Version 11.5 and later) Health and Wellness Dashboards<br>• (Version 11.5 and later) Health and Wellness Monitors<br>**Note:** Some rules that have been deployed to an earlier version of NetWitness may not deploy or execute on NetWitness 11.x. For more information, see the Troubleshooting Live Services. |

| Feature | Description |
|---|---|
| **Medium** | Select one or more mediums from the drop-down list to search for content based on the meta data source.<br>Available values for medium are as follows:<br>• **endpoint**: for NetWitness 11.3 and later): applied to content that uses meta derived from endpoint agent and endpoint server data<br>• **log**: applied to content that uses meta derived from log data<br>• **packet**: applied to content that uses meta derived from network packets<br>• **log and packet**: applied to content that correlates meta derived across log and packet data |
| **Tags** | Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field. |
| **Required Meta Key(s)** | Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field. |
| **Generated Meta Value(s)** | Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field. |
| **Research Created Date** | Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar. |
| **Research Modified Date** | Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar. |
| **Search** | Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly. |
| **Cancel** | Click **Cancel** to cancel the search in progress. |
| **Include Discontinued Resources** | Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic. |

## Matching Resources Panel

The Matching Resources panel displays search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

### Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

| Feature | Description |
|---|---|
| **Resource Type Icon** | A graphic representation of the resource type. For example . |
| **Name** | The name of the resource, for example, **Group Management**.<br>**Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued. |
| **Type** | The type of the resource, for example, **Rule**. |
| **Updated** | The date when the resource was last updated, for example, **2015-09-15 4:27 PM**. |
| **Version** | The version of the resource, for example, **0.1**. |
| **Size** | The size of the resource, for example, **153 B**. |
| **Subscribed** | Subscription status:<br>• **yes**: This NetWitness instance is subscribed to this content resource.<br>• **no**: This NetWitness instance has not subscribed to this content resource. |
| **Description** | The description of the resource, for example, **Compliance Rule-Group Management**. |
| **Tags** | The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example, . |
| **Meta Keys** | The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example, . |
| **Resource Meta Values** | The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example, . |

## Grid Results

In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

| Feature | Description |
|---|---|
| **Subscribed** | Subscription status:<br>• **yes**: This NetWitness instance is subscribed to this content resource.<br>• **no**: This NetWitness instance has not subscribed to this content resource. |
| **Name** | The name of the resource, for example, **Group Management**.<br>**Note:** The resource name is displayed in red color if it is discontinued. |
| **Created** | The date when the resource was created, for example, **2015-08-12 3:11 PM**. |
| **Updated** | The date when the resource was last updated, for example, **2015-09-15 4:27 PM**. |

| Feature | Description |
|---|---|
| **Type** | The type of the resource, for example, **Rule**. |
| **Discontinued** | The status of the discontinued resources:<br>• **yes**: The resource that matches the search criteria is discontinued<br>• **no**: The resource is not discontinued<br>• **--**: The Live Server is not checked for the discontinued resources |
| **Description** | The description of the resource, for example, **Compliance Rule-Group Management**. |
| | **Toolbar** |
|  | This menu offers two ways to view search results: **Detailed** and **Grid**. |
|  | This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view. |
| | This option applies to one or more selected resources. |
|  | This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated. |
|  | This menu offers two packaging functions for the selected resources:<br>• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:<br>  • open the file, or<br>  • save the file for subsequent deployment.<br>• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it. |

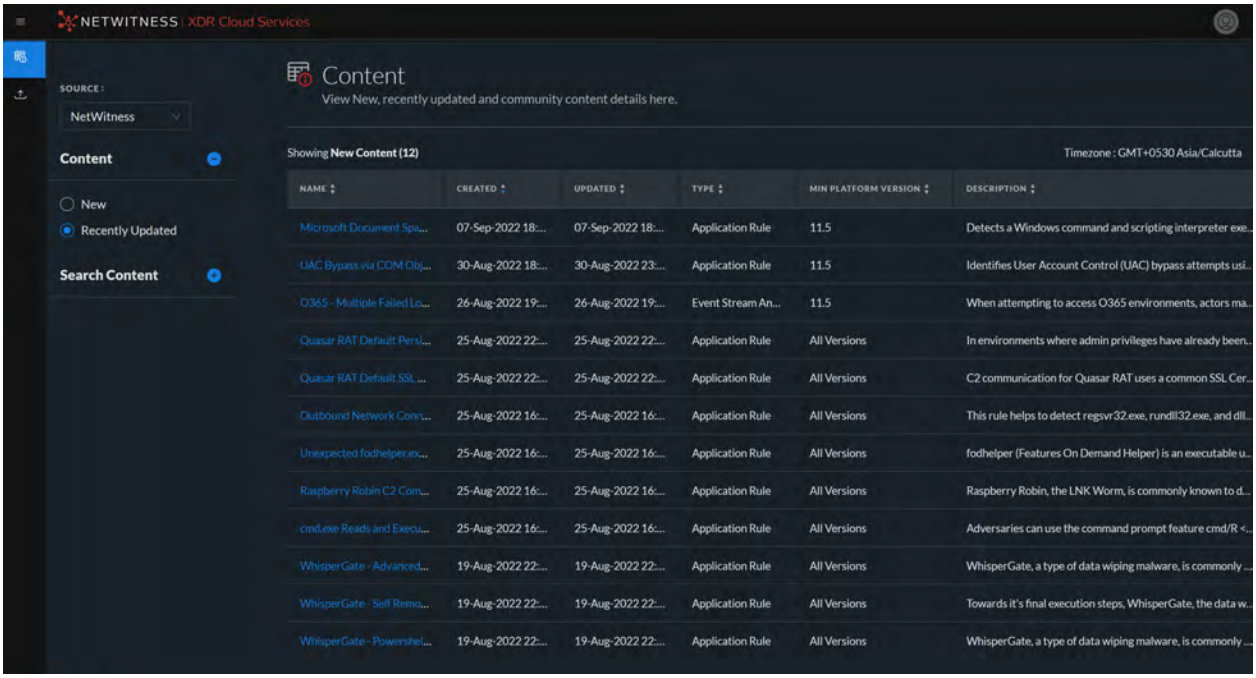
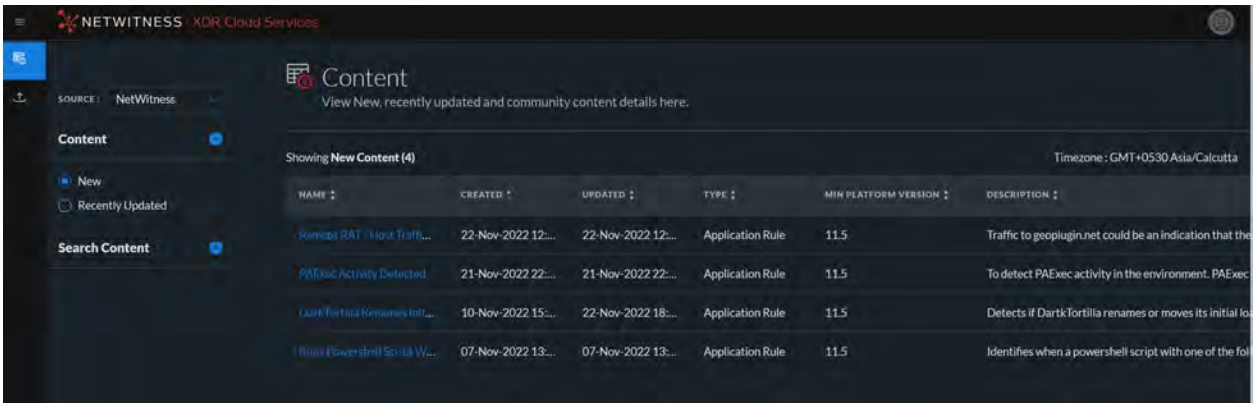
- For more information on Deployment ( ), see Find and Deploy Live Resources.
- For more information on Deploying a Package (  ), see the Resource Package Deployment Wizard,.

# Live Search Content View

The Live Search Content view provides the ability to search the configured Live CMS for contents. Once matching contents are found, you can view the details, and download the contents.

This is an example of the Search Content view.





The Live Search Content view has a panel for selecting the source and specifying search content. The matching contents are displayed on the right panel.

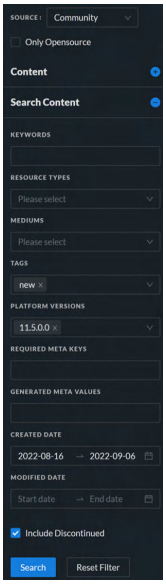
The following table provides descriptions of the Live Search Content panel features.

| Feature | Description |
|---|---|
| **NetWitness** | Select NetWitness from the Source drop-down menu to search for in-built content that NetWitness Platform XDR Live provides. |

| Feature | Description |
|---|---|
| **Community** | Select Community from the Source drop-down menu to search for the content collected and retrieved from third party and open source communities. |
| **Only Opensource** | Select the Only Opensource checkbox to retrieve the content from the open-source communities.<br>**Note:** When the community is selected as the source, the Only Opensource option will be displayed under the Search Content Panel to select and search for open source-related content. |
| **New** | Select New to retrieve the content which is created in the last 21 days. |
| **Recently Updated** | Select Recently Updated to retrieve the content which is updated in the last 21 days. |

## Search Content Panel

This is an example of the Search Content panel.



The following table provides descriptions of the Search Content panel features.

| Feature | Description |
|---|---|
| **Keywords** | Enter a keyword or keywords to browse for contents that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword. |

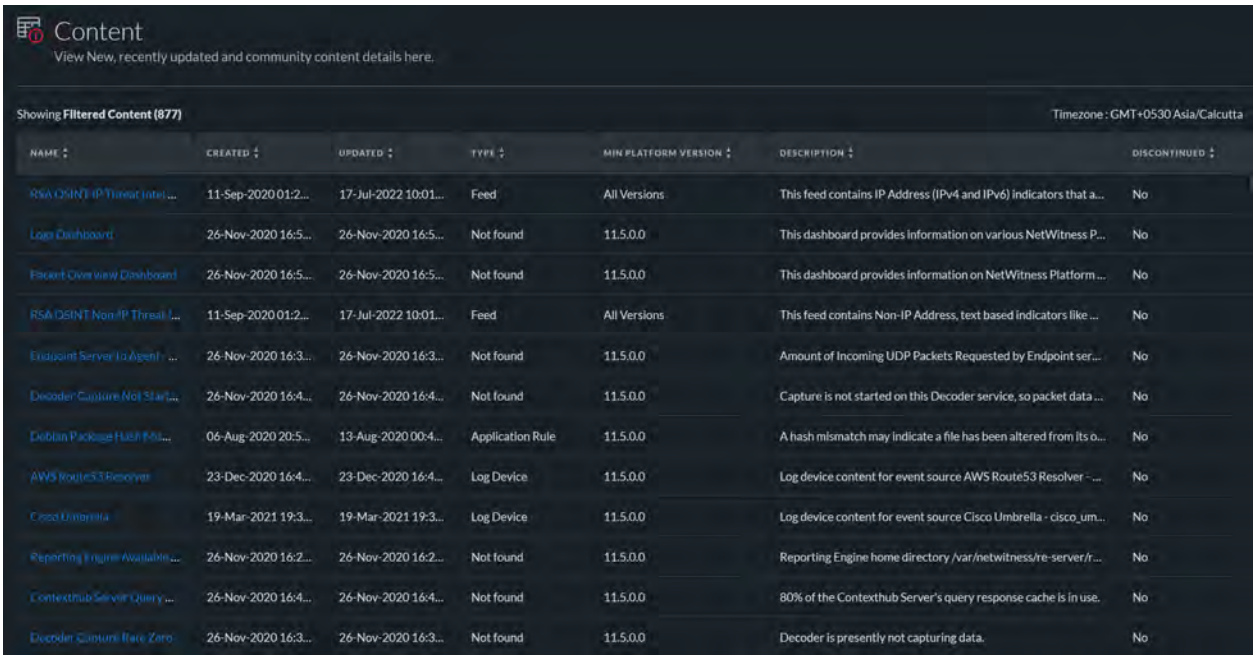
| Feature | Description |
|---|---|
| **Resource Types** | Select resources types from the drop-down list to filter resources by type of resource. Possible values are:<br>• Application Rule<br>• Feed<br>• Log Device<br>• Correlation Rule<br>• NetWitness Rule<br>• NetWitness Report<br>• Lua Parser<br>• Log Collector<br>• NetWitness List<br>• Malware Rules<br>• Event Stream Analysis Rule<br>• Advanced Analytics (Warehouse)<br>• Bundle<br>• Health and Wellness Dashboards<br>• Health and Wellness Monitors<br>• Investigate Profile<br>• Investigate Column Group<br>• Investigate Meta Group |
| **Mediums** | Select one or more mediums from the drop-down list to search for content based on the meta data source.<br>Available values for medium are as follows:<br>• endpoint: for 11.3 and later): applied to content that uses meta derived from endpoint agent and endpoint server data<br>• log: applied to content that uses meta derived from log data<br>• packet: applied to content that uses meta derived from network packets<br>• log and packet: applied to content that correlates meta derived across log and packet data. |
| **Tags** | Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse contents for a Log Decoder, select the **netwitness for logs** tag. |

| Feature | Description |
|---|---|
| **Required Meta Keys** | Enter a specific meta key. For example, **threat.source**. |
| **Generated Meta Values** | Enter a generated meta value. For example, **rsa-firstwatch**. |
| **Created Date** | Specify a date range during which contents were created. For example, to browse contents that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar. |
| **Modified Date** | Specify a date range during which contents were modified. For example, to browse contents that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar. |
| **Search** | Click **Search** to send the search request to the Live server. More specific search criteria return matching contents more quickly. |
| **Reset Filter** | Click **Reset Filter** to reset the existing search results and displays all the content on the right panel. |
| **Include Discontinued** | Check **Include Discontinued** to include the discontinued contents in the search result. For an up-to-date list of contents that have been discontinued, see the Discontinued Content topic. |

## Search Results Panel

The Search Results panel displays search results based on the selections made in the Search Content panel.

This is an example of the Search Results panel.



The following table describes the elements in the search results panel.

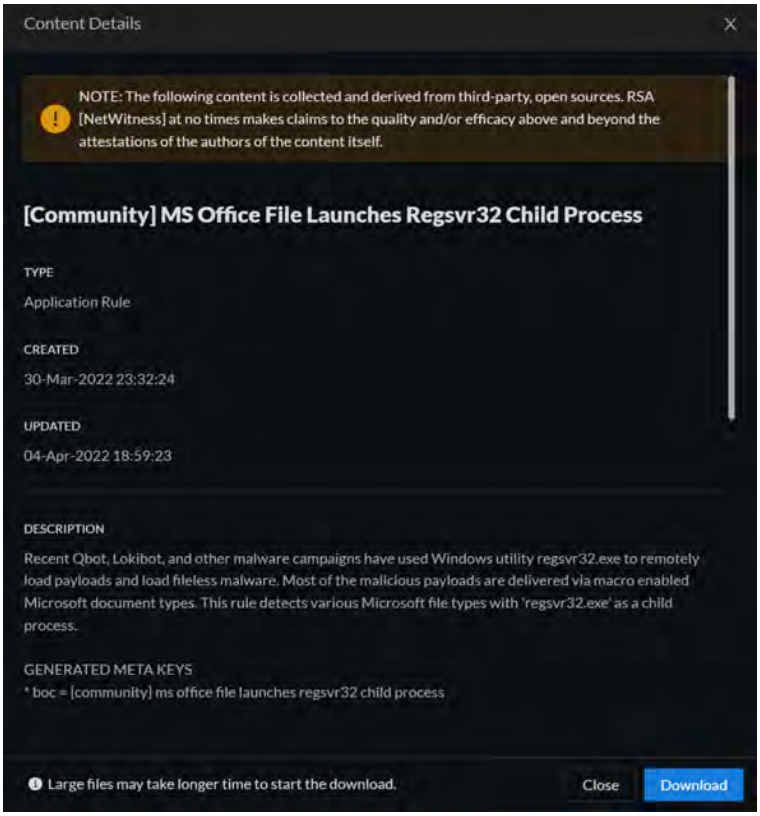
| Feature | Description |
|---|---|
| **Name** | The name of the content. For example, **Log Parser Pack**. |
| **Created** | The date when the content was created. For example, **04-Aug-2017 15:19:06**. |
| **Updated** | The date when the content was last updated. For example, **29-Sep-2020 20:27:14**. |
| **Type** | The type of the content. For example, **Bundle**. |
| **Min. Platform Version** | Platform version that the content supports. For example, 11.5 and higher.<br>**Note:** Min. Platform Version is not applicable for Community content. |
| **Description** | The description of the content. For example, **Contains all parser files and log collection files**. |
| **Discontinued** | The status of the discontinued content:<br>• **Yes**: The content that matches the search criteria is discontinued<br>• **No**: The content is not discontinued |

## Content Details Panel

In the Search Results panel, you can select any content titles to view the details in the pop-up window and download the contents.

**Note:** NetWitness provides no assurance related to the quality and accuracy of the contents provided by the third parties and open source communities.

This is an example of the Content Details panel.



The following table describes the elements in the Content Details section.

| Feature | Description |
|---|---|
| **Name** | The name of the content. For example, **Log Parser Pack**. |
| **Type** | The type of the content. For example, **Bundle**. |
| **Created** | The date when the content was created. For example, **04-Aug-2017 15:19:06**. |
| **Updated** | The date when the content was last updated. For example, **29-Sep-2020 20:27:14**. |
| **Description** | The description of the content. For example, **Contains all parser files and log collection files**. |
| **Version on Production** | The version of the content. For example, **0.5**. |
| **Size** | The size of the content. For example, **14.96 KB**. |
| **Required Resources** | A list of resources on which this resource depends. For example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked in the pop-up window. |
| **Tags** | The tags that apply to the content. For example, **threat**. Clicking a tag opens the Live Search Content view with the search narrowed to match contents with that tag. |

| Feature | Description |
| --- | --- |
| **Required Meta Keys** | The meta keys that apply to the content. For example, **Threat Category**. Clicking a meta key opens the Live Search Content view with the search narrowed to match contents with that meta key. |
| **Generated Meta Values** | The meta values that the content generates. For example, **rsa-firstwatch**. Clicking a meta value opens the Live Search Content view with the search narrowed to match contents with that meta value. |
| **Discontinued** | The status of the discontinued content:<br>• **Yes**: The content that matches the search criteria is discontinued<br>• **No**: The content is not discontinued |

# Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness.

If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.

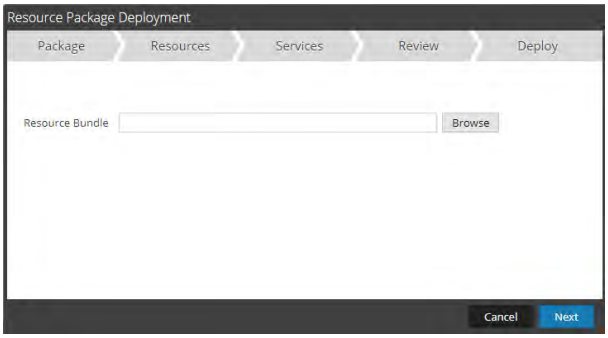
**Note:** Use NetWitness Live to create resource bundles; this is a different application that is not part of NetWitness. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Package File.

The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. Go to **(Configure) > Live Content**.
2. In the **Live Search - Matching Resources** toolbar, select Package > **Deploy**.

   The Resource Package Deployment wizard is displayed.



## Features

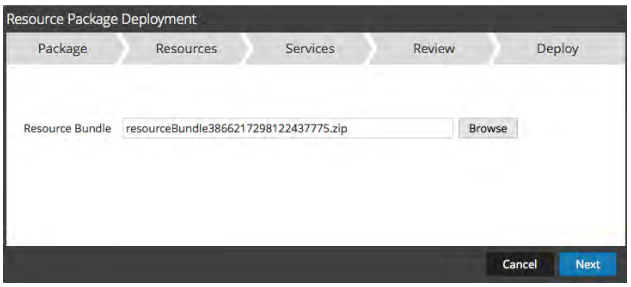
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**.
Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness returns to the Live Resources View.

## Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



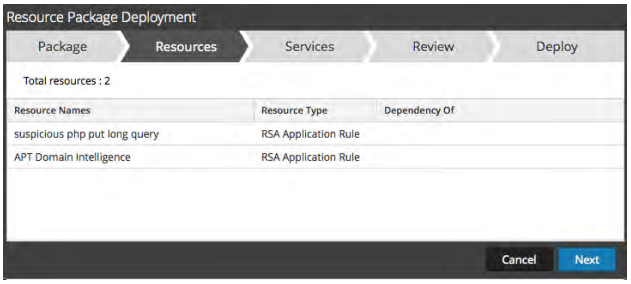
The following table describes the elements in the Package tab.

| Column | Description |
|---|---|
| Resource Bundle | The input field to specify a resource bundle. You can type a path in this field or search using the Browse button. |
| | **Command Buttons** |
| Browse | This button opens a File Upload dialog in which you can browse the local file system and select a bundle. |
| Cancel | Cancels the deployment and closes the wizard. |
| Next | Displays the next tab of the wizard. |

## Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.



The following table describes elements in the Resources tab.

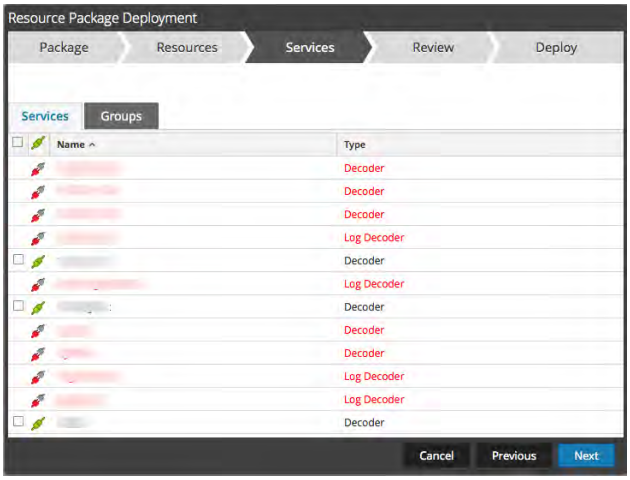
| Column | Description |
|---|---|
| Resource Name | Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**). |
| Resource Type | Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**) |
| Dependency Of | Displays Resources on which the selected resource depends (for example, **AIM lua**). |

## Services Tab

You select the services on which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the **(Admin)** > **Services** view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups on which you want to deploy the resources in the bundle.

This is an example of the Services tab.



The following table describes the elements in the Services tab.

| Column | Description |
|---|---|
| | **Services** |
| | Selects services on which you want to deploy the content. You can select any combination of services and service groups. |
| Name | Displays the services in your environment on which you can deploy the content. |
| Host | Displays the name of the resource host. |
| Type | Displays the type of NetWitness service. |
| | **Groups** |
| | Selects service groups (if you have service groups defined in your environment). |
| Name | Displays the names of the service groups. |

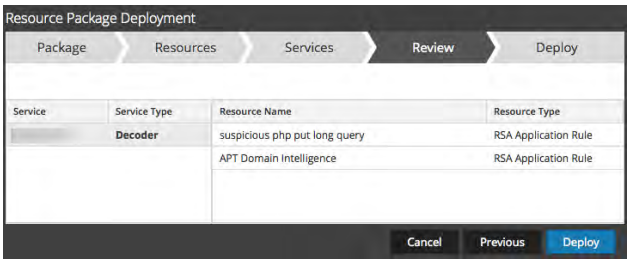
## Review Tab

Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.



The following table describes the elements in the Review tab.

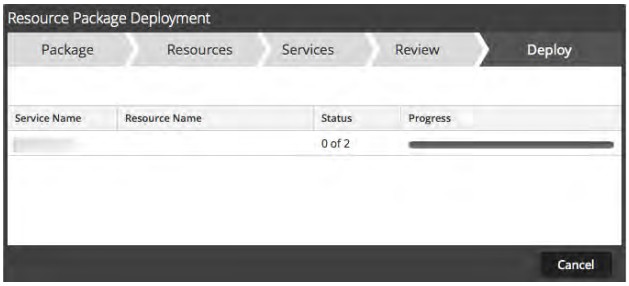
| Column | Description |
|---|---|
| | **Service Information** |
| Service | Displays the services in your environment on which you can deploy the content. |
| Service Type | Displays the type of each NetWitness service (type of host or service). |
| | **Resource Information** |
| Resource Name | Displays the name of the resources you have selected (for example, **NetWitness Lua Library**). |
| Resource Type | Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**). |
| Deploy | Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard). |

## Deploy Tab

This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.



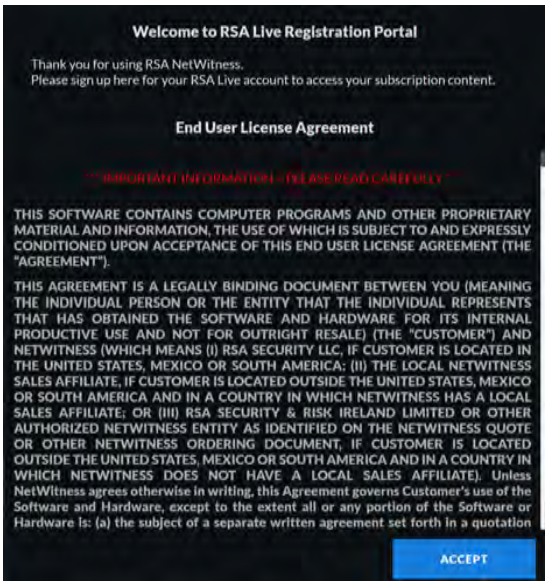
The following table describes the elements in the Deploy tab.

| Feature | Description |
|---|---|
| Service Name | Name of the services to which resources are deployed. |
| Resource Name | Name of the resources. |

| Feature | Description |
|---|---|
| Status | Status of the manual deployment. |
| Progress | Progress of the manual deployment in a progress bar. When complete, the bar turns solid green. |
| | **Command Buttons** |
| Close | Closes the wizard. |
| Errors | Only displays if NetWitness encountered any errors. Click to display the errors. |
| Retry | Only displays if NetWitness encountered any errors. Click this button to try to deploy the resources again using the wizard. |

# NetWitness Live Registration Portal

The RSA Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in RSA Live library. To access the portal, go to the following URL: https://live.netwitness.com/registration.



Click **Sign Up For Live**. The License Agreement page is displayed, once you agree to the Terms and Conditions, click **Accept**: the fields for setting up an account are displayed. These include Contact Information, and License ID.

The following table lists the contact information section fields and its descriptions:

| Parameter | Description |
|---|---|
| First Name | Your first name. |
| Last Name | Your last name. |
| Company | The name of your company. |
| Email | The email address where you want to receive notifications related to the Live account. |

| Parameter | Description |
| --- | --- |
| License ID | This is the License ID on the **(Admin) > System > Info** page.<br><br>**Caution:** The license ID on the NetWitness must be valid and must be registered on the Flexera Server. If not, contact NetWitness Customer Support. |
| Username | The username used to sign in to Cloud Services Live account. The username must contain a minimum of four characters and a maximum of 16 characters. |
| Password | The password for the Cloud Services Live account. The password must contain minimum of eight characters and the maximum length is 24, with at least one uppercase, one lowercase, one number, and one special character. |

# NetWitness Feedback and Data Sharing

The Live Feedback Activity Log enables you to download the usage data required for Live Feedback. After you download the Live Feedback data, you can then upload it to share with RSA.

The settings for these features are available in **(Admin) > System > Live Services** view, in the Additional Live Services section.

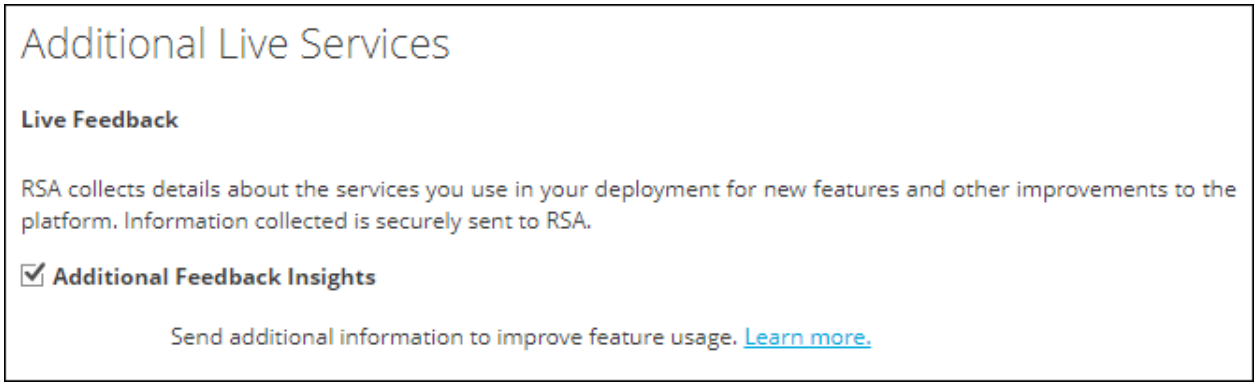
## Additional Live Services

Participation in the Additional Live Services is configured in the **(Admin) > System > Live Services** view.

## Live Feedback

**Note:** For NetWitness 11.4.1 and later, this section in the UI has been removed. As of 11.4.1, RSA has created the Customer Experience Improvement Program. For details, see "Configure the Customer Experience Improvement Program" in the *RSA NetWitness System Configuration Guide*.

Live Feedback is intended to help improve RSA NetWitness.



Once you set up and configure a Live account, usage data is automatically shared with RSA and is protected in accordance with the applicable license agreement. All such data shall be anonymized and shall not have any Personally Identifiable Information.

Before data is sent to RSA, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to RSA.

For more information, see the "Live Feedback Overview" topic in the *System Configuration Guide*.

## File Reputation

File Reputation service provides instant access to the latest signatures via the RSA Live feed so data is more relevant, with fewer false positives. With this service, users always have reliable data about the reputation of files in their NetWitness Endpoint system. In addition to the whitelisting service, it provides blacklisting information as well.

**File Reputation**

☑ Enable **File Reputation** ○ Not Connected

This option is used to view reputation status of files. The File Hash information from NetWitness Platform is sent to RSA Live to get the reputation status. Reputation status is leveraged by analysts during investigation of files.Learn more.

# Troubleshooting Live Services

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness.

## Some Rules Are Invalid for Version 11.x

The rules "NetWitness Incident Management - Alert Details" and "NetWitness Incident Management - Incident Summary" are not valid for RSA NetWitness version 11.x. Do not deploy these rules to an 11.x system.

**Note:** Rules are updated frequently, and the documentation for them is available in the Content space on NetWitness Community. For the latest information on Rules, see RSA NetWitness Rules.

# OutOfMemoryError on Context Hub Server

You may encounter an OutOfMemoryError on Context Hub server, and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following steps:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

   **Note:** If the issue still persists, you must execute step 3.
3. To decrease the number of parallel threads available for processing STIX:
   a. Go to **(Admin) > Services > Context Hub service > View > Explore**.
   b. In the tree panel, navigate to **enrichment/stix/ config**.
   c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.
   d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.
   e. Restart the Context Hub server.

# Troubleshooting Live Connect Threat Data Sharing

This section discusses troubleshooting Live Connect Threat Data Sharing.

## Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you must construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss

The following is an example of the URL used to retrieve query logs:

```
https://<server>/admin/liveconnect/force_aggregation?startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true
```

## System Logging: Debug

### To access debug information:

1. Go to **(missing or bad snippet) > System > System Logging**.
2. Select the **Settings** tab.
3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.

# Disaster Recovery (Backup and Restore Instructions)

You can take a backup and restore of NetWitness Hosts using any of the following:

- (Recommended) NetWitness Recovery Wrapper Tool
- NetWitness Recovery Tool (NRT)

## (Recommended) NetWitness Recovery Wrapper Tool

**Note:** NetWitness Recovery Wrapper tool is supported from NetWitness 11.6.1.4 and later. In case of host with large volume of data (>500GB), NetWitness recommends to use NetWitness Recovery Tool (`nw-recovery-tool`) for backup.

NetWitness Recovery Wrapper Tool (NRWT) provides centralized backup and restore that makes it easy for you to take a backup of all the supported installation options (Physical Host, Virtual Host, AWS, and Azure). With NRWT you can:

- Backup (export) an individual, a specific, or all hosts at a time.
- Restore (import) an individual host at a time.
- Customize files or folders during backup and restore.
- Copy back up data to/from remote host location from/to Netwitness hosts provided:
  - Remote host is reachable via SSH from each NetWitness hosts.
  - The credentials are correct.
  - The location specified has sufficient space to take a backup in case of export.
  - The location specified should contain valid backup data in case of import.
- (For version 11.7.1 and later) Back up Mongo databases for Endpoint and ESA instances.
- (For version 11.7.1 and later) Include Broker index for NetWitness node in which Broker service is running.
- (For version 11.7.1 and later) Back up custom files and folders provided by user.

For details on previous run, check NRWT logs at `/var/log/netwitness/recovery-tool/nw-recovery-wrapper.log` on Admin Server.

# Basic Usage of the NetWitness Recovery Wrapper Tool

You can use the NRWT to back up data by using the `export` option. To restore data, use the `import` option. The basic usage of the tool is to run the following command from the root directory level:

```
nw-recovery-wrapper [command] [option]
```

The commands and options that you can use with this tool are described in the following tables.

**For NetWitness 11.7.0.x**

| Commands and Options | Description |
|---|---|
| `-h, --help` | Display help on commands and option. For example,<br>specify: `nw-recovery-wrapper --help` to get a list of supported operations and arguments. |
| `export` | Export data or configuration. |
| `import` | Import data or configuration. |
| `-d, --dump-dir <path>` | Path for the where data will be exported or imported from (for example, `/var/netwitness/backup`). |
| `--host-key HOST_KEY [HOST_KEY ...]` | Host IP, ID or display name. |
| `--host-all` | specify for all hosts - supported only for export |
| `--include CUSTOM_PATH [CUSTOM_PATH ...]` | Custom path or file. |
| `--remote-location REMOTE_LOCATION` | Remote host path for remote host configuration. |
| `--remote-ip REMOTE_IP` | Remote host IP for remote host configuration. |
| `--remote-password REMOTE_PASSWORD` | Remote host password for remote host configuration. |
| `--remote-user REMOTE_USER` | User for remote host configuration. |

**For NetWitness 11.7.1.x**

| Commands and Options | Description |
|---|---|
| `-h, --help` | Display help on commands and option. For example,<br>specify: `nw-recovery-wrapper --help` to get a list of supported operations and arguments. |
| `export` | Export data or configuration. |
| `import` | Import data or configuration. |

| Commands and Options | Description |
|---|---|
| `-d, --dump-dir <path>` | Path for the where data will be exported or imported from (for example, `/var/netwitness/backup`). |
| `--host-key HOST_KEY [HOST_KEY ...]` | Host IP, ID or display name. |
| `--host-all` | Specify for all hosts and supported only for `export` |
| `--include-file CUSTOM_FILE_PATH [CUSTOM_FILE_PATH ... ]` | Include custom file for backup and restore. |
| `--include-dir CUSTOM_DIR_PATH [CUSTOM_DIR_PATH ... ]` | Include custom directory for backup and restore. |
| `--remote-location REMOTE_ LOCATION` | Remote host path for remote host configuration. |
| `--remote-ip REMOTE_IP` | Remote host IP for remote host configuration. |
| `--remote-password REMOTE_ PASSWORD` | Remote host password for remote host configuration. |
| `--remote-user REMOTE_USER` | User for remote host configuration. |
| `--include-mongo` | Include mongo for backup and restore. |
| `--include-broker-index` | Include broker index file for backup and restore and supported only with the single host-key option. |

# Required Conditions

- Make sure that there is adequate disk space on dump directory to take the backup on each NetWitness Hosts.
- Valid Host key is entered. Host key can be Host ID, IP address or display name.

## Back Up using NRT wrapper:

1. Backup NetWitness Hosts and store on local dump directory of each hosts:
   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name>

   nw-recovery-wrapper export --dump-dir <dir> --host-all
   ```
2. (Optional) Add custom files or folders during backup and restore other than what is predefined in recovery tool:

   **Note:** Make sure the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --include-file <custom files>/--include-dir --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name>
   nw-recovery-wrapper export --dump-dir <dir> --include-file <custom files>/--include-dir --host-all
   ```
3. (Optional) Copy backup data to remote Location:

   **Note:** Make sure that:
   - You specify valid values for `--remote-ip`, `--remote-location`, `--remote-password` arguments for remote copy operation.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name> --remote-ip <IP ADDRESS of remote host> --remote-password <ssh-password> --remote-location <remote-location-where-backups-should-be-copied-to>
   nw-recovery-wrapper export --dump-dir <dir> --host-all --remote-ip <IP ADDRESS of remote host> --remote-password <ssh-password> --remote-location <remote-location-where-backups-should-be-copied-to>
   ```

   **Note:** Optional argument `--remote-user` defaults to root if you do not specify any value.

   Example:

   For adminserver, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

4. Backup (export) including custom files or folders and copy to remote location:

   **Note:** Make sure that:
   - the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.
   - You specify valid values for `--remote-ip`, `--remote-location`, `--remote-password` arguments for remote copy operation.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --include <custom files/folder>
   --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name>
   --remote-ip <IP ADDRESS of remote host> --remote-password <ssh-password> --
   remote-location <remote-location-where-backups-should-be-copied-to>
   ```

   ```
   nw-recovery-wrapper export --dump-dir <dir> --include <custom files/folder>
   --host-all --remote-ip <IP ADDRESS of remote host> --remote-password <ssh-
   password> --remote-location <remote-location-where-backups-should-be-
   copied-to>
   ```

   ```
   optional argument: --remote-user defaults to root if argument is not
   specified.
   ```

Example:

For Admin server, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

5. (For version 11.7.1 and later) (Optional) Include Mongo service.

   **Note:** Make sure that:
   - Mongo service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo
   ```

6. (For version 11.7.1 and later) (Optional) Include Broker index.

   **Note:** Make sure that:
   - Broker service is running on the NetWitness host.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   <Host 2 IP/ID/Name>......<Host N IP/ID/Name> --include-broker-index
   ```

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-all --include-broker-
   index
   ```

7. (For version 11.7.1 and later) (Optional) Backup (export) including Mongo and Broker index.

   **Note:** Make sure that:
   - Mongo service is running on the NetWitness host.
   - Broker service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo --include-broker-index
   ```

8. (For version 11.7.1 and later) (Optional) Backup (export) including custom files or folders, copying to remote location, Broker index and Mongo.

   **Note:** Make sure that:
   - Custom files or directories are present on NetWitness hosts to be backedup, if it is not present it skips the files or directory.
   - Fields such as `--remote-ip`, `--remote-location`, `--remote-password` are mandatory for remote copy operation.
   - Remote host IP credentials should be valid and reachable via SSH from all NetWitness hosts.
   - Remote host location (`--remote-location`) should have sufficient space to contain backups.
   - Mongo service is running on the NetWitness host.
   - Broker service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --include-broker-index --
   include-mongo ---include-file <custom files>/--include-dir <custom folders>
   --host-key <Host 1 IP/ID/Name> --remote-ip <IP ADDRESS of remote host> --
   remote-password <ssh-password> --remote-location <remote-location-where-
   backups-should-be-copied-to>
   ```

## Restore (import) options supported in NRT Wrapper

**Caution:** Use import commands carefully as it performs system level changes.

1. Restore (import) single host at a time (using IP address, Host name, or Host ID).
   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host IP/ID/Name>
   ```
2. Restore custom files or folders (if any).

   **Note:** Make sure the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --include-file <custom files>/-
   -include-dir --host-key <Host IP/ID/Name>
   ```
3. Restore from a remote location.

   **Note:** Make sure that:
   - `--remote-location` contains remote host location in which data is backedup.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-wrapper import --remote-ip <IP address of remote host> --
   remote-password <SSH password of remote host> --remote-location <location-
   of-backup-on-remote-host> --dump-dir <dir> --host-key <Host IP/ID/Name>
   ```
   Optional argument: `--remote-user` defaults to root if argument is not specified.
   Example, for adminserver, the backup folder name should be adminserver-backup-2021-09-08-12:48:13
   ```
   nw-recovery-wrapper import --dump-directory <dir> --host-key <host-1> --
   remote-ip <remote-ip> --remote-password <password> --remote-location
   /home/adminserver-backup-2021-09-08-12:48:13
   ```

4. Restore data from remote location including custom files or folders.

   **Note:** Make sure that:
   - The custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.
   - `--remote-location` contains remote host location in which data is backedup.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --include <custom files/folder>
   --host-key <host1> --remote-ip <IP ADDRESS of remote host> --remote-
   password <ssh-password> --remote-location <remote-location-where-backups-
   should-be-copied-to>
   ```

   Optional argument: `--remote-user` defaults to root if argument is not specified.

   Example, for Admin Server, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

5. (For version 11.7.1 and later) (Optional) Restore Mongo service.

   **Note:** Make sure that:
   - Mongo service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo
   ```

6. (For version 11.7.1 and later) (Optional) Restore Broker index.

   **Note:** Make sure that:
   - Broker service is running on the NetWitness host.
   - `--host-all option is not support for include broker index operation.`

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-broker-index
   ```

7. (For version 11.7.1 and later) (Optional) Restore Mongo and Broker index.

   **Note:** Make sure that:
   - Mongo service is running on the NetWitness host.
   - Broker service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo --include-broker-index
   ```

8. (For version 11.7.1 and later) (Optional) Restore custom files or folders, copying to remote location, Broker index, and Mongo.

**Note:** Make sure that:
- Custom files or directories are present on NetWitness hosts to be backedup, if it is not present the files or directory is skipped for backup.
- Fields such as `--remote-ip`, `--remote-location`, `--remote-password` are mandatory for remote copy operation.
- Remote host IP credentials should be valid and reachable via SSH from all NetWitness hosts.
- Remote host location (`--remote-location`) should have sufficient space to contain backups.
- Mongo service is running on the NetWitness host.
- Broker service is running on the NetWitness host.
- `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

```
nw-recovery-wrapper import --dump-dir <dir> --include-file <custom files>/--include-dir <custom folders> --include-mongo --include-broker-index --host-key <host1> --remote-ip <IP ADDRESS of remote host> --remote-password <ssh-password> --remote-location <remote-location-where-backups-should-be-copied-to>
```

## Status Check

You can check the Backup or Restore status using the below command.

`/var/log/netwitness/recovery-tool/recovery.log`

## Troubleshooting

| | |
|---|---|
| **Error Message** | NRT Wrapper fails during backup or restore. |
| **Solution** | Do any one of the following:<br>• Log in to host where backup is failing and check `/var/log/netwitness/recovery-tool/recovery.log`.<br>• Run in debug mode (`nw-recovery-wrapper -l debug`) on Node 0 to get recovery logs of each host. |

| | |
|---|---|
| **Error Message** | NRT Wrapper fails due to incorrect password for remote copy operation (`--remote-password`). |
| **Cause** | NRWT fails if you enter wrong |

| | |
|---|---|
| | password multiple times during remote copy. Since SFTP uses SSH, it locks the system SSH for a while. |
| **Solution** | You must retry after sometime. |

| | |
|---|---|
| **Error Message** | NRT Wrapper fails after running for long hours for a particular host but the backup is still in progress. For example, Endpoint or ESA node. |
| **Cause** | NRT architecture is designed to take a backup of configuration and not user data. It uses salt to communicate between admin server(SA) and nodex. Due to large volume of data in the particular host, this issue is caused when salt communication times out. |
| **Solution** | SSH to the particular host and check the backup status at `/var/log/netwitness/recovery-tool/recovery.log`.<br>If the data to be backed up is huge, recommend using "nw-recovery-tool" by logging into particular host. |

# NetWitness Recovery Tool (NRT)

You can use the NetWitness Recovery Tool (NRT) to back up and restore data from the NetWitness Server and component host systems. The NRT is a script that you run from the command line to back up and restore data on hosts for RMAs, hardware refreshes, and general backup and restore requirements. Refer to Disaster Recovery in Azure Deployment for specific steps on how to perform disaster recovery for hosts deployed in Azure VMs.

**Note:** You must run the NRT on each host system locally. You cannot run it from remote hosts or an external host.

The following types of hosts can be backed up and restored.

**Note:** In the NRT script, the following terms in bold are referred to as categories.

- **NetWitness Admin Server** (may include Broker, Investigate, Respond, Health and Wellness, and Reporting Engine)
- **AnalystUI** (may include Broker, Investigate, Respond, Reporting Engine)
- **Archiver** Log Archiver (Workbench and Archiver)
- **Broker** Stand-alone Broker
- **Concentrator** Network or Log Concentrator
- **Decoder** Network Decoder (Packets)
- **Endpoint** Endpoint Agents
- **Endpoint Broker** Endpoint Broker
- **Endpoint Log Hybrid** Log Collector, Log Decoder, Endpoint Server, and Concentrator
- **Event Stream Analysis (ESA) Primary** Contexthub, ESA Correlation, and Incident Management database
- **ESA Secondary** ESA Correlation
- **Gateway** Cloud Gateway
- **Log Hybrid Retention** Log Hybrid-Retention Optimized (for RSA Series 6 Hybrid hardware with Log Hybrid-Retention Optimization)
- **Log Collector** Log Collector including Virtual Log Collector if installed
- **Log Decoder** Log Decoder including Local Log Collector and Warehouse Connector, if installed
- **Log Hybrid** Log Collector, Log Decoder, and Concentrator
- **Malware** Malware Analysis and Broker
- **Network Hybrid** Concentrator and Decoder
- **Search** (for Health & Wellness Beta Host)
- **UEBA** User Entity and Behavior Analytics
- **Warehouse** Warehouse Connector

# Basic Usage of the NetWitness Recovery Tool

You can use the NRT to back up data by using the `export` option. To restore data, use the `import` option. The basic usage of the tool is to run the following command from the root directory level:

```
nw-recovery-tool [command] [option]
```

The commands and options that you can use with this tool are described in the following tables.

| Commands and Options | Description |
|---|---|
| `-h, --help` | Display help on commands and option. For example,<br>specify: `nw-recovery-tool --help-categories` to get a list of all the valid category names. |
| `-e, --export` | Export data or configuration. |
| `-i, --import` | Import data or configuration. |
| `-d, --dump-dir <path>` | Path for the where data will be exported or imported from (for example, `/var/netwitness/backup`). |
| `-C, --category <name>` | Select components by category.<br>Valid category names are `AdminServer`, `AnalystUI`, `Archiver`, `Broker`, `Concentrator`, `Decoder`, `Endpoint`, `EndPointBroker`, `EndpointLogHybrid`, `ESAPrimary`, `ESASecondary`, `Gateway`, `LogHybridRetention`, `LogCollector`, `LogDecoder`, `LogHybrid`, `Malware`, `NetworkHybrid`, `Search`, `UEBA`, and `Warehouse`.<br>You can specify a single category or multiple categories if multiple categories are co-located on the same host. For example:<br>• `--category AdminServer` for the Admin Server exclusively. `--category AdminServer --category Gateway` for the Admin Server and the Cloud Gateway.<br>• `--category ESAPrimary` for the ESA Primary exclusively.<br>• `--category Broker` for the Broker exclusively. `--category Broker --category EndpointBroker` for the Broker and the Endpoint Broker. |

# Required Conditions

Make sure that the following conditions are met:

- Read the entire document before backing up any data. The document covers all deployment scenarios, so you want to make sure you have all the information required to back up and restore your implementation of NetWitness Platform before going through this process.
- Run the NRT for both backup and recovery locally, on each system being backed up or restored. You cannot run the NRT on an external host, or back up or restore several hosts simultaneously. However, you can back up several components on the same host system simultaneously.
- Export and import data on the same host. If a host fails and you need to build a new system, the new system must have the same identity parameters (i.e., the same IP address), and must be on the same version of NetWitness Suite.
- Make sure that there is adequate disk space in the backup location (`/var/netwitness/backup` is the recommended directory) before the export command in the nw-recovery tool is executed. Do not use a `tmp` directory because it fills up quickly and may cause the system to crash.
- Check the sizing of the Malware disks and adjust them before you back them up. The following table shows you the maximum size of Malware databases that you can back up by hardware type with the actions you can take to reduce them to the maximum size.

| Host | Source Hardware | Target Hardware | Database | Maximum Size for Backup | Actions to Reduce Size to Backup Maximum |
|---|---|---|---|---|---|
| Malware | Series 4S Hybrid | Series 6 Core | `/var/netwitness` | 2.5TB | Configure a rollover. Purge data that you do not need from the database. |

- Restore to the exact ISO Image that each host had at the time of backup.
- If you have multiple services co-located on a single host, include all the services in a single command string for the `import` and `export` commands in the nw-recovery tool.

**Note:** When you run the NRT, the Malware , Reporting Engine, and Postgresql services are stopped and restarted during both the backup (export) and restore (import) processes.

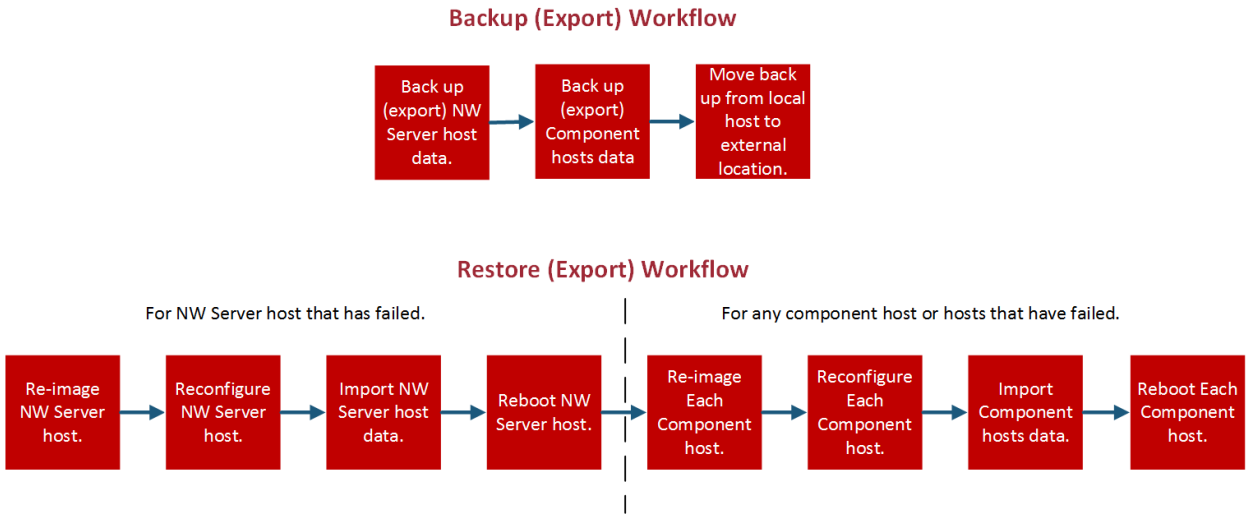
# Disaster Recovery Workflow

The following diagram shows the high-level Disaster Recovery tasks.

**Note:** You only need to recover a host if it failed. This means that you can recover a single host, or any combination of hosts depending on which host or hosts failed.

The following diagram shows the tasks for:

- Backup (perform as soon as possible and as frequently as possible).
- Restore (only required if you need to restore your data).



# Back Up and Restore Data for Hosts

The procedures for backing up and restoring data are different for NetWitness Server host systems and for component systems.

**Caution:** 1.) Do not remove component hosts (that is any host other than the NW Server host) from the Hosts View ( (Admin) > **Hosts**) from the user interface when you are performing the following disaster recovery procedure. 2.) You must retain (restore) the 'Host name' that existed prior to performing the disaster recovery procedure.

# Back Up and Restore Data on the NetWitness Server

**Note:** If you are using shared storage to export data from multiple hosts (for example, a shared mount or drive), use host-specific subfolders for the path to the location of the exported files for each host, to avoid overwriting one host's exported data with another. For example, you could use a path similar to `--dump-dir /mnt/storage/<host-specific-name>` for the path to the location of the exported files.

## Back Up Data on a NetWitness Server Host

Perform this procedure on an existing, functional NetWitness Server host system.

1. At the root level, type the following command:

   ```
   nw-recovery-tool --export --dump-dir /var/netwitness/backup --category
   AdminServer
   ```

   **Note:** If a service is co-located with another category on the same host rather than on its own, dedicated host, you must include it in the command string. The `Gateway` and `EndpointBroker` can be co-located as show in the following examples:

   ```
   nw-recovery-tool--export --dump-dir /var/netwitness/backup --category
   AdminServer --category Gateway
   nw-recovery-tool--export --dump-dir /var/netwitness/backup --category
   Broker --category EndpointBroker
   ```

2. Replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

   a. Ensure that this location has sufficient space to store the backup data.

   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.

The data is backed up on the NetWitness Server host in the location you set up in step 2.

3. Move the backed up data from the local host to an external server or a USB stick.

## Restore Data on a NetWitness Server Host

1. Re-image the NetWitness Server host using the same network configuration settings of the original host. For information about re-imaging the NetWitness Server host, see "Task 1 - Install 11.7 on the NetWitness Server Host" in the *Physical Host Installation Guide for Version 11.7 Guide*

   a. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:

   ```
   netconfig --static --interface <name> --ip <address> --netmask <netmask>
   --gateway <gateway>
   ```

   For example:

   ```
   netconfig --static --interface eth0 --ip 192.168.1.100 --netmask
   255.255.255.0 --gateway 192.168.1.1
   ```

   **Optional**: To specify DNS server(s), include the following additional parameter:

   ```
   --dns <address>
   ```

   **Optional**: To set the local domain name, include the following additional parameter:

   ```
   --domain <name>
   ```

   b. (**Optional**) If you are using DHCP, run the following script:

   ```
   netconfig --dhcp --interface <name>
   ```

   For example:

   ```
   netconfig --dhcp --interface eth0
   ```

   c. Add the backup data to the backup directory path on the local host, for example:

   ```
   /var/netwitness/backup
   ```

2. Run the `nwsetup-tui` command. This initiates the Setup program.

   **Note:** During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of the host.

3. When you are prompted, select install type option **2: Recover (Reinstall)**, click **OK**, and then enter the path to the backup directory containing the backup data.
4. After the installation completes successfully, ensure that the host is running the exact same release and patch version of the data that was backed up:

   - If the data was on an system that was updated to a later patch release, update the host by following the instructions for updating systems offline in the update guide for the same patch version as what was previously running on the host (the exact release or patch version for which data was backed up).
   - If the data was on a major release version (for example, 11.7) that had not been updated to a later patch version, you do not need to update the host system.

5. When the host is running at the correct version, run the following command on the NetWitness Server to restore data:

```
nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
AdminServer
```

**Note:** If a service is co-located with another category on the same host rather than on its own, dedicated host, you must include it in the command string. The `Gateway` and `EndpointBroker` can be co-located as show in the following examples:

```
nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
AdminServer --category Gateway
nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
Broker --category EndpointBroker
```

6. (Conditional) If you use custom firewall rules or custom entries in `/etc/hosts`:
   a. (Conditional) If you use custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.
   b. (Conditional) If you use custom entries in `/etc/hosts`, restore the `/etc/hosts.users` file from the backup copy located at `<dump-dir>/unmanaged/etc/hosts.user` to `/etc` on the host.
   c. If you performed step 6a or 6b, refresh the host by running the following command:
   `nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`
7. Reboot the NetWitness Server host.

**Note:** If you want to add any more custom entries to `/etc/host`, you must add them to the `/etc/hosts.users` file and then refresh the host as described in step 6c.

# Back Up and Restore Data on Other Component Hosts

Perform these procedures on each existing, functional component host system.

## Back Up Data on a Component Host

1. At the root level, type the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --category <category name>`
   where the category name is one of the following:
   `AdminServer`, `AnalystUI`, `Archiver`, `Broker`, `Concentrator`, `Decoder`, `Endpoint`, `EndPointBroker`, `EndpointLogHybrid`, `ESAPrimary`, `ESASecondary`, `Gateway`, `LogHybridRetention`, `LogCollector`, `LogDecoder`, `LogHybrid`, `Malware`, `NetworkHybrid`, `Search`, `UEBA`,or `Warehouse`

   **Note:** 1.) Use the category that matches the host type. 2.) If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   `nw-recovery-tool--export --dump-dir /var/netwitness/backup --category LogDecoder --category Warehouse`

2. **(Optional)** Replace `/var/netwitness/backup` with the path to the location to which the data should be exported:
   a. Ensure that this location has sufficient space to store the backup data.
   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.

3. For **Endpoint Log Hybrid** and **ESA Primary** hosts, you can export application data that is stored in the database by running the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --component mongo`
   You can replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

   **Note:** 1.) Make sure that there is enough space in the export location for the files from the Mongo database. 2.) You can back up the **Endpoint Log Hybrid** or **ESA Primary** host data and Mongo database in a single command string. For example, `nw-recovery-tool --export --dump-dir /var/netwitness/backup --category EndpointLogHybrid --component mongo`

4. For **Malware**, you can export application data from the Malware application database by running the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --component postgresql`
   You can replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

**Note:** Ensure that there is enough space in the export location for the files from the Malware database.

5. Move the backed up data from the local host to an external server or a USB stick.

## Restore Data on a Component Host

1. Re-image the component host using the same network configuration settings of the original host. For information about re-imaging a component host, see "Task 2 - Install 11.7 on Other Component Hosts" in the *Physical Host Installation Guide for Version 11.7 Guide*
2. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:
   `netconfig --static --interface <name> --ip <address> --netmask <netmask> --gateway <gateway>`
   For example:
   `netconfig --static --interface eth0 --ip 192.168.1.100 --netmask 255.255.255.0 --gateway 192.168.1.1`
   **Optional**: To specify DNS server(s), include the following additional parameter:
   `--dns <address>`
   **Optional**: To set the local domain name, include the following additional parameter:
   `--domain <name>`
   a. (**Optional**) If you are using DHCP, run the following script:
      `netconfig --dhcp --interface <name>`
      For example:
      `netconfig --dhcp --interface eth0`
   b. Add the backup data to the backup directory path on the local host, for example, `/var/netwitness/backup`.
3. Run the `nwsetup-tui` command. This initiates the Setup program.

   **Note:** During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of the host.
4. When you are prompted, select install type option **2: Recover (Reinstall)**, click **OK**, and then enter the path to the directory containing the backup data.

5. After you complete the `nwsetup-tui` command setup, you must re-install the appropriate services on the host using the **Install** command from the Hosts View in the NetWitness Platform User Interface.
6. After the service installation completes, ensure that the host is running the exact same release and patch version of the data that was backed up:
   - If the data was on system that was updated to a later patch release, update the host by following the instructions for updating systems offline for the same patch version as what was previously running on the host (the exact release or patch version for which data was backed up).
   - If the data was on a major release version (for example, 11.7) that had not been updated to a later patch version, you do not need to update the host system.
7. When the host is running at the correct version, return to the root level of the component host and run the following command to restore data:
   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
   <category name>
   ```

   **Note:** If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   ```
   nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
   LogDecoder --category Warehouse
   ```
8. For **EnpointLogHybrid** and **ESAPrimary** systems, you can import application data to be restored by running the following command:
   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --component
   mongo
   ```
9. For **Malware**, you can import application data from the Malware application database to be restored by running the following command:
   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --component
   postgresql
   ```

10. For a Decoder, Log Decoder , Concentrator, Archiver, Network Hybrid, or Log Hybrid configured with external storage (that is, DAC, SAN, Unity or Powervault):

    a. Scan the `<dump-dir>/unmanaged/etc/fstab` file for devices with mount points that do not exist in the system `/etc/fstab` file.

    **IMPORTANT:** If you are migrating to new host hardware (that is a new Decoder, Log Decoder, Concentrator, Archiver, Network Hybrid, or Log Hybrid host), before you proceed to the next step you must:
    1. Power off the old hardware host and the external storage device attached to it.
    2. Attach the external storage device to the new host hardware.
    3. Power on both the new host hardware and the external storage device attached to it.

    a. Complete the following steps for each device in the backup copy of `<dump-dir>/unmanaged/etc/fstab`.

        i. Verify that the corresponding device is present and attached. If it not attached, attach it. If the device is no longer applicable, skip it and go to the next device.

        ii. Verify that the mount point directory exists on the file system. If it does not exist, create the directory with the `mkdir <path>` command.

        iii. Add the `fstab` entry from the backup copy to the system `/etc/fstab` file.

        **Caution:** For a Series 5 or 6 Hybrid, you must restore backed up data to the `/etc/fstab` directory according to the instructions in Appendix A. Modify fstab for Series 5 and 6 Hybrid Storage After Recovery.

    b. Run the following command on each host.
    ```
    mount -a
    ```

11. (Conditional) If you use custom firewall rules or custom entries in `/etc/hosts`:

    a. (Conditional) If you use custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.

    b. (Conditional) If you use custom entries in `/etc/hosts`, restore the `/etc/hosts.users` file from the backup copy located at `<dump-dir>/unmanaged/etc/hosts.user` to `/etc` on the host.

    c. If you performed step 11a or 11b, refresh the host by running the following command:
    ```
    nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>
    ```

12. Reboot the component host.

# Hardware Refresh Only - Use Additional Space in New Hardware Hosts

Refer to the *Core Database Tuning Guide for NetWitness Platform* for instructions on how to use all the space you have available on your new hardware. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

# Disaster Recovery in Azure Deployment

This section tells you how to back up and restore NetWitness Platform deployed on Azure virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore data in an Azure deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

## Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery (Backup and Restore Instructions) section of this document.

## Task 2 - Restore and Import Data

You need to refer to the *10.6.6.x to 11.3 Azure Upgrade Guide* to complete this task. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Delete the VM.

   **Caution:** Do not delete the resources (for example, do not delete Disks, Network Interface, and so on).

2. Complete the following steps for the NW Server host, Broker host, ESA host, Endpoint Log Hybrid host, and Log Collector host (where host = `--category`).

   a. Delete all the resources except the network interface card of the older 11.7.x VM.

   b. Deploy the fresh 11.7.0.0 VM with the same disk and resources, and then upgrade it to desired 11.7.x version and power it off.
   For detailed instructions on how to deploy a virtual host in Azure, see the *Azure Installation Guide*.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.6 to 11.3 Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective host as described in Disaster Recovery (Backup and Restore Instructions).

   e. After you restore NRT the component host, restore the following files.

   - `/etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `/etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf` from the `<dump-dir>/unmanaged` folder

3. Complete the following steps for the Log Decoder host, Concentrator host, and Archiver host (where host = `--category`.

   a. Delete all the resources except the disks that are named **external** and the network interface card of the older 11.7.x VM.

   b. Deploy the fresh 11.7.0.0 VM with the same disk and resources listed in the *Azure Installation Guide* and power it off.

   > **Note:** Do not create the **external** disk. Only create the **nwhome** disks.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.6 to 11.3 Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

   e. After you restore NRT the component host, restore the following files.

   - `etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf`

# Disaster Recovery in AWS Deployment

This section tells you how to back up and restore NetWitness Platform deployed on AWS virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore data in an AWS deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

## Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery (Backup and Restore Instructions) section of this document.
2. Record the IP addresses. You need to refer to them later in the Disaster Recovery process.
   Refer to the *10.6.6 to 11.3 AWS Upgrade Guide* for instructions on how retain the IP addresses. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

## Task 2 - Restore and Import Data

You need to refer to the *10.6.6 to 11.3 AWS Upgrade Guide* to complete this task.

1. Delete the VM.

   **Caution:** Do not delete the resources (for example, do not delete Disks).

2. Complete the following steps for the NW Server host, Broker host, ESA (Primary/Seconday) host, Endpoint Log Hybrid host, and Log Collector host (where host = `--category`).

   a. Delete all the resources of the older 11.7.0.0 VM.

   b. Deploy the fresh 11.7.0.0 VM with the same IP address, disk and resources, and then upgrade it to desired 11.7.x version and power it off.
   For detailed instructions on how to deploy a virtual host in AWS, see the *AWS Installation Guide*.

   c. Follow the procedure for the NRT restoration for the respective host as described in Restore Data on a Component Host.

   d. After you restore NRT the component host, restore the following files.

   - `/etc/fstab`
   - `/etc/hosts` (if hostname is not changed)

3. Complete the following steps for the Log Decoder host, Decoder (Network Decoder) host, Concentrator host, and Archiver host (where host = `--category`.

a. Delete all the resources except the **external disks** of the older 11.7.x VM.

b. Deploy the fresh 11.7.0.0 VM with the same IP address, disk, and resources listed in the *AWS Installation Guide* and power it off.

> **Note:** Do not create the **external** disk. Only create the **nwhome** disks.

c. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

d. After you restore NRT the component host, restore the following files.

- `etc/fstab`
- `/etc/hosts` (if hostname is not changed)
- `/etc/krb5.conf`

# Appendix A. Modify fstab for Series 5 and 6 Hybrid Storage After Recovery

**Note:** The procedures in this Appendix do not apply if the hybrid was an 11.4 fresh installation and you had a disaster.

You must modify the `/etc/fstab` file for a Series5 or Series 6 Hybrid if a Series 5 or Series 6 Network Hybrid was upgraded from 11.2.x.x or 11.3.x.x to 11.4 and a disaster occurred.

These are the tasks to recovery from this disaster scenario.

1. Image a new Series 5 or Series 6 Hybrid as Network Hybrid using an 11.4 ISO.
2. Import the backed up data or configuration (`nw-recovery-tool --import`).
3. Modify the recovered `/etc/fstab` file.

## Sample etc/fstab File Before Disaster

The following data is an example of the external storage configuration backup for a Series 5 or 6 Hybrid that was upgraded to 11.4.

The data highlighted in yellow corresponds to internal storage on an upgraded system. This configuration is carried over from prior releases during upgrade process. This lay out changed in 11.4 (Fresh Install). You must only copy the entries corresponding to external storage (highlighted in green) to the new `etc/fstab` file as part of a disaster recovery.

When you export data or configuration using the `nw-recovery-tool --export` command, the storage configuration details are saved to `<back-location>/unmanaged/etc/fstab`. The `fstab` file contains both internal storage (highlighted in yellow) and external storage configuration (highlighted in green). The contents on a upgraded (10.6 or 11.x -> 11.4) Series 5 or Series 6 Network Hybrid look similar to the following storage configuration.

```
/dev/mapper/netwitness_vg00-root / xfs defaults 0 0 UUID=906e2a3d-3b59-46d1-
975d-fa2b8467d009
/boot xfs defaults 0 0 /dev/mapper/netwitness_vg00-usrhome
/home xfs nosuid 0 0
/dev/mapper/netwitness_vg00-varlog /var/log xfs defaults 0 0
/dev/mapper/netwitness_vg00-nwhome /var/netwitness xfs nosuid,noatime 0 0
/dev/mapper/concentrator-vlnwc /var/netwitness/concentrator xfs noatime,nosuid
0 0
/dev/mapper/index-vlnwci /var/netwitness/concentrator/index xfs noatime,nosuid
0 0
/dev/mapper/concentrator-vlnwcm /var/netwitness/concentrator/metadb xfs
noatime,nosuid 0 0
/dev/mapper/concentrator-vlnwcs /var/netwitness/concentrator/sessiondb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwd /var/netwitness/decoder xfs noatime,nosuid 0 0
```

```
/dev/mapper/decoderpacket-vlnwdi /var/netwitness/decoder/index xfs
noatime,nosuid 0 0
/dev/mapper/decodermeta-vlnwdm /var/netwitness/decoder/metadb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwdp /var/netwitness/decoder/packetdb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwds /var/netwitness/decoder/sessiondb xfs
noatime,nosuid 0 0
/dev/mapper/netwitness_vg00-swap swap swap defaults 0 0
/var/netwitness/decoder /var/netwitness/logdecoder none defaults,rbind 0 0
/dev/concentrator0/sessiondb /var/netwitness/concentrator/sessiondb0 xfs
noatime,nosuid 1 2
/dev/concentrator0/metadb /var/netwitness/concentrator/metadb0 xfs
noatime,nosuid 1 2
/dev/decoder0/packetdb /var/netwitness/decoder/packetdb0 xfs noatime,nosuid 1
```

## Sample etc/fstab File After Recovery - Before Modification

After you install 11.4 with the 11.4 ISO and execute the recovery tool execution to restore all previous configurations, the `/etc/fstab` file appears looks like the following example.

```
#
# /etc/fstab
# Created by anaconda on Thu Dec 5 17:31:26 2019
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
/dev/mapper/netwitness_vg00-root / xfs defaults 0 0
UUID=d84db66c-fce6-4fec-9f84-b3449861f664 /boot xfs defaults 0 0
/dev/mapper/netwitness_vg00-usrhome /home xfs nosuid 0 0
/dev/mapper/netwitness_vg00-varlog /var/log xfs defaults 0 0
/dev/mapper/netwitness_vg00-nwhome /var/netwitness xfs nosuid,noatime 0 0
/dev/mapper/netwitness_vg00-swap swap swap defaults 0 0
/dev/hybrid-decoder-meta/decoroot /var/netwitness/decoder xfs noatime,nosuid 1
2
/dev/packet/packetdb /var/netwitness/decoder/packetdb xfs noatime,nosuid 1 2
/dev/hybrid-concentrator/root /var/netwitness/concentrator xfs noatime,nosuid
1 2
/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2
```

**Note:** You can see that it is missing the external storage configurations. You must add the external storage configurations highlighted in green above) to the `/etc/fstab` file on the newly built Hybrid.

# Sample etc/fstab File After Recovery - After Modification

After you make this updater, the `/etc/fstab` looks like the following example.

```
#
# /etc/fstab
# Created by anaconda on Thu Dec 5 17:31:26 2019
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
/dev/mapper/netwitness_vg00-root / xfs defaults 0 0
UUID=d84db66c-fce6-4fec-9f84-b3449861f664 /boot xfs defaults 0 0
/dev/mapper/netwitness_vg00-usrhome /home xfs nosuid 0 0
/dev/mapper/netwitness_vg00-varlog /var/log xfs defaults 0 0
/dev/mapper/netwitness_vg00-nwhome /var/netwitness xfs nosuid,noatime 0 0
/dev/mapper/netwitness_vg00-swap swap swap defaults 0 0
/dev/hybrid-decoder-meta/decoroot /var/netwitness/decoder xfs noatime,nosuid 1
2
/dev/packet/packetdb /var/netwitness/decoder/packetdb xfs noatime,nosuid 1 2
/dev/hybrid-concentrator/root /var/netwitness/concentrator xfs noatime,nosuid
1 2
/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2
/dev/concentrator0/sessiondb /var/netwitness/concentrator/sessiondb0 xfs
noatime,nosuid 1 2
/dev/concentrator0/metadb /var/netwitness/concentrator/metadb0 xfs
noatime,nosuid 1 2
/dev/decoder0/packetdb /var/netwitness/decoder/packetdb0 xfs noatime,nosuid 1
```

# NetWitness Respond Process

NetWitness Respond collects alerts from multiple sources and provides the ability to group them logically and start an Incident Respond workflow to investigate and remediate the security issues raised. NetWitness Respond enables you to configure rules that automatically aggregate alerts into incidents. Alerts are normalized by the system to a common format to provide users with a consistent view for the rule criteria regardless of the data source. You can build query criteria based on the alert data with the ability to query on fields that are common as well as specific to data sources.

The rule engine allows you to group similar alerts together into an incident so that the investigation and remediation workflow can be shared across a set of similar alerts. You can create rules that can group alerts into incidents depending on a common value they share for one or two attributes (for example, source hostname) or if they are reported within a limited time window (for example, alerts that are within four hours of each other).

If an alert matches a rule, an incident is created using the criteria. As new alerts are ingested, if an existing incident was already created that matched those criteria, and that incident is not "in progress" yet, the new alerts continue to be added to the same incident. If there is no existing incident for the grouped value (for example, the specific hostname) or the time window, a new incident is created and the alert is added to it.

You can have multiple incident rules. The rules can either group alerts into incidents or suppress alerts from being matched by any rule. The rules are ranked top-to-bottom and only the first rule to match an incoming alert is used to include that alert in an incident. The incidents provide a context for the alerts, provide tools to record the investigation status, and track the progress of associated tasks.

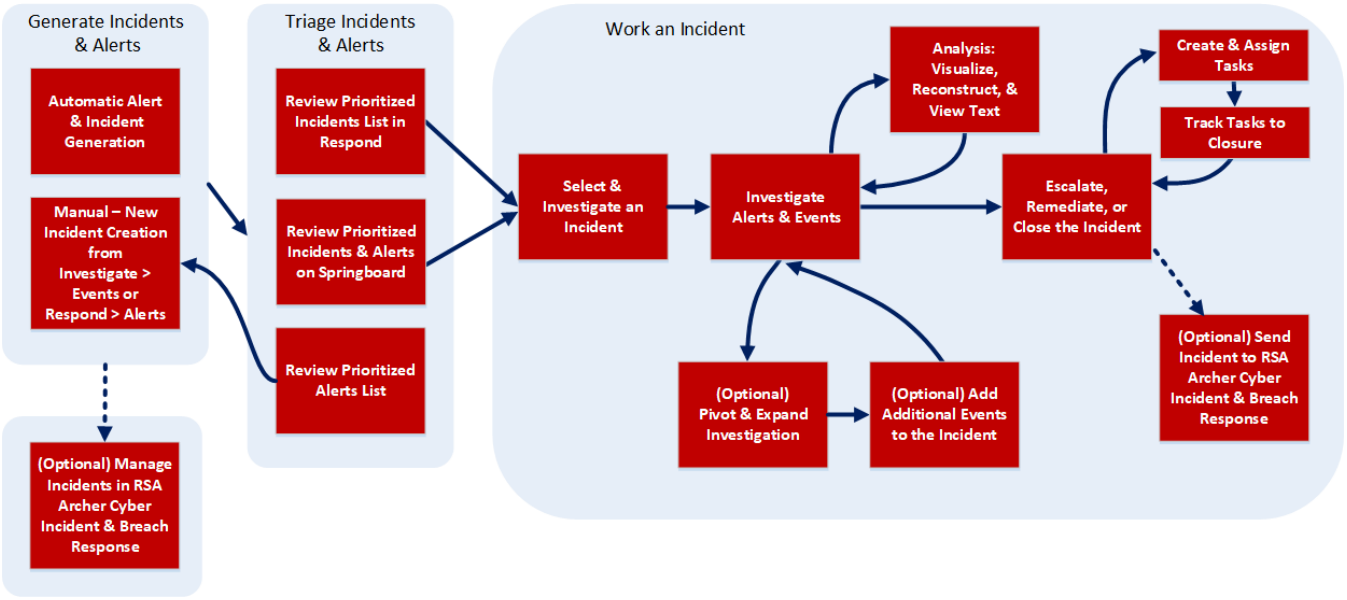
The stages in the NetWitness Respond process are:

- **Generate Incidents & Alerts**
  - Automatic Alert & Incident Generation
  - Manual - New Incident Creation from Investigate > Events or Respond > Alerts
  - (Optional) Manage Incidents in RSA Archer Cyber Incident and Breach Response (If you manage incidents in Archer instead of in NetWitness Respond, the process ends here.)
- **Triage Incidents & Alerts**
  - Review Prioritized Incident List in Respond
  - Review Prioritized Incidents & Alerts on Springboard
  - Review Prioritized Alerts List
- **Work an Incident**
  - Select & Investigate Incident
  - Investigate Alerts & Events
    - Analysis: Visualize, Reconstruct, and View Text
    - (Optional) Pivot & Expand Investigation
    - (Optional) Add Additional Events to Incident

- Escalate, Remediate, or Close the Incident
  - Create & Assign Tasks
  - Track Tasks to Closure
  - (Optional) Send Incidents to RSA Archer Cyber Incident & Breach Response. (In NetWitness version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer Cyber Incident & Breach Response.)

## NetWitness Respond Workflow

The following figure shows the high-level NetWitness Respond workflow process.



# Responding to Incidents

An *Incident* is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An incident, available in the Respond view, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored using a nodal graph. Incidents allow users to ensure that they understand the full scope of an attack or event in their NetWitness system and then take action.

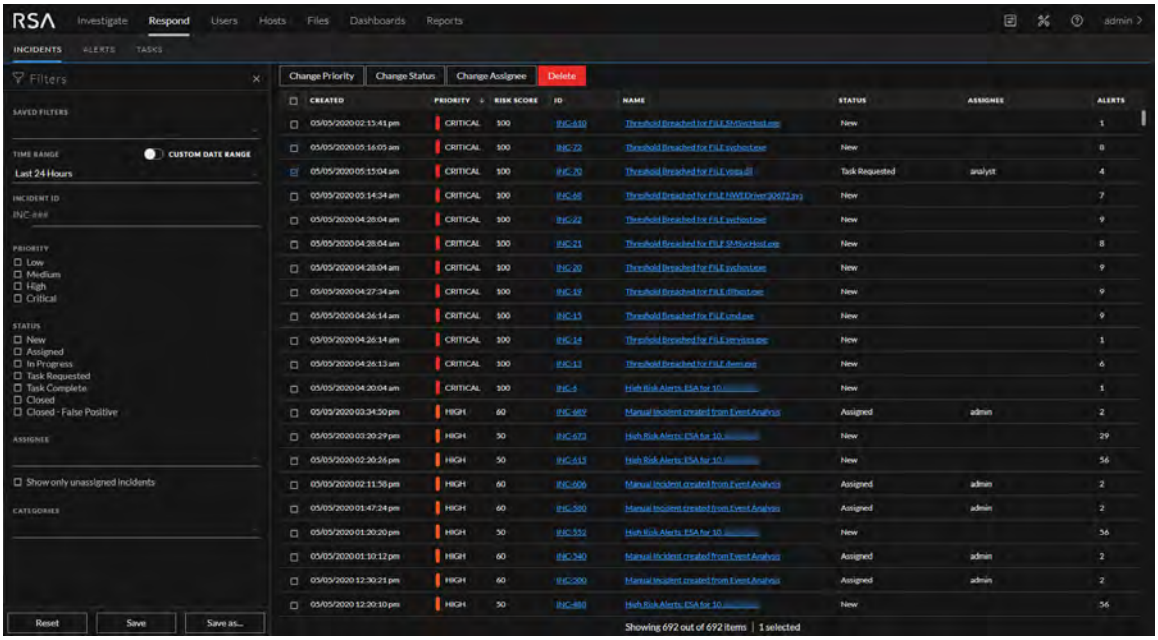
The **Respond** view is designed to help you quickly identify the ongoing issues in your network and work with other Analysts to quickly solve the issues.

The Respond view presents Incident Responders with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. This enables you to determine the incident scope so you can escalate or remediate it as appropriate.

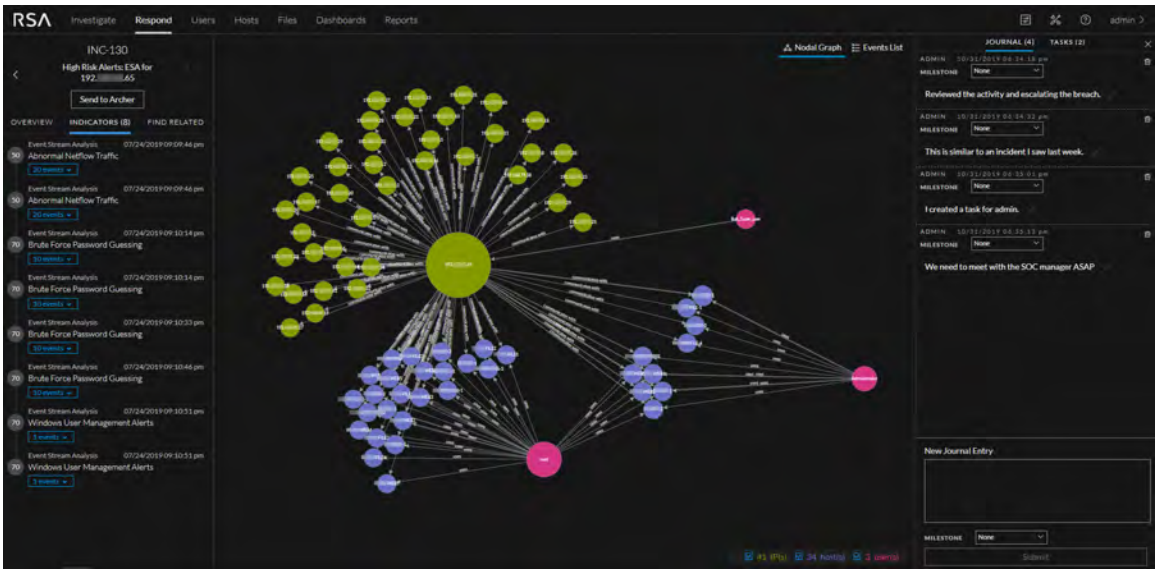
Within the Respond view, you can see Incidents, Alerts, and Tasks:

- **Incidents**: Enables you to respond to and manage incidents from start to finish.
- **Alerts**: Enables you to manage alerts from all sources received by NetWitness and create incidents from selected alerts.
- **Tasks**: Enables you to view and manage the complete list of tasks created for all incidents.

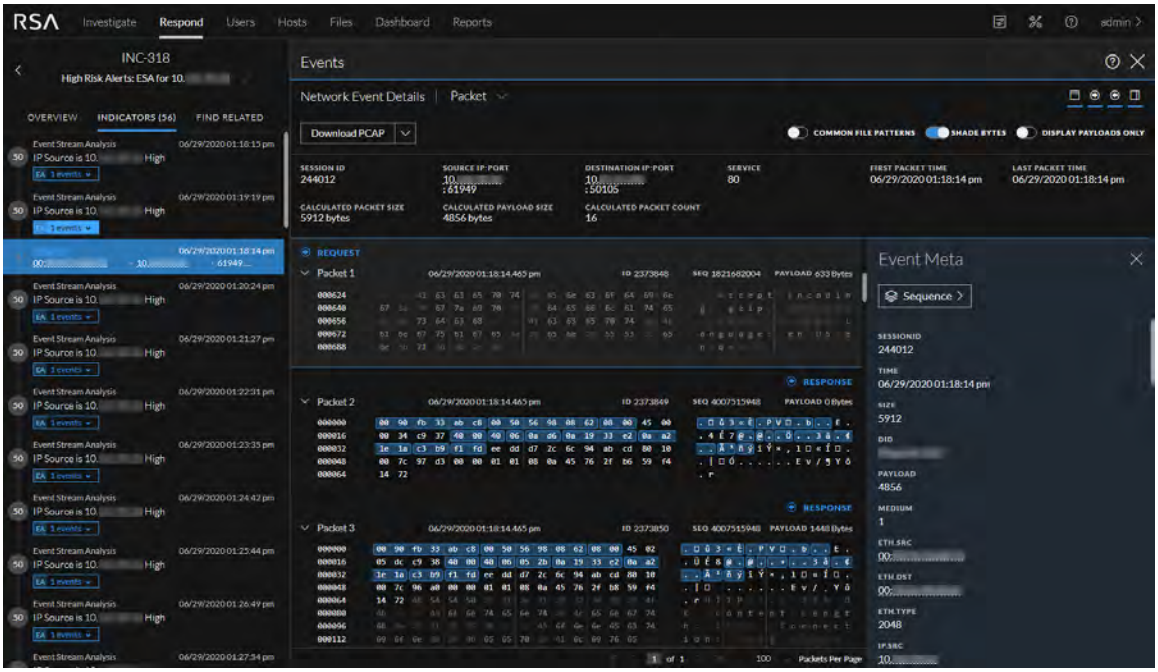
If you navigate to Respond > Incidents, you can see the Incidents List view and from there you can access the Incident Details view for a selected incident. These are the main views that you use to respond to incidents. The following figure shows the list of prioritized incidents in the **Incidents List** view.



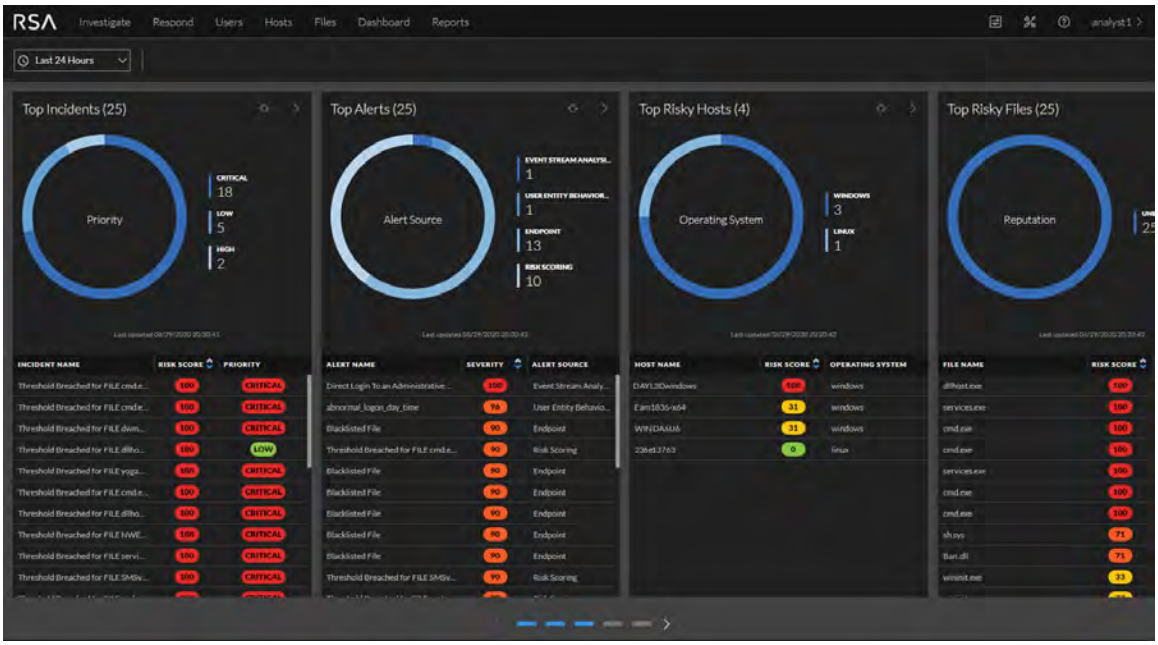
The next figure shows an example of details available in the **Incident Details** view.



The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.



In NetWitness Version 11.4 and later, alerts and incidents are also displayed in the Springboard by default. Springboard is a landing page for analysts showing them all risks detected by the platform in a single place. For more information on the Springboard, see "Managing the Springboard" in the *NetWitness Platform Getting Started Guide*. Go to the NetWitness Documents - All Versions to find all RSA NetWitness Platform 11.x documents.



## Respond Persist Data

The primary objective of this feature is to enable you to investigate events for a longer period of time. When investigating a set of alerts or events, it is important to have the assurance that the underlying data (raw and meta) will be available for both the length of time it takes to run the analysis, and for historical look up. From NetWitness Platform Version 11.6, you can persist events that are associated with particular incidents, thereby enabling you to view the incident in the future, regardless of its age. You can also add a new journal entry in the **JOURNAL** tab for the persisted events for future reference. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database.

Once you persist an event, the data is copied from the NetWitness database into a long term storage cache within the data source. You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident. The roll over in the NetWitness database does not impact the events that are already saved in the long term cache.

You can:

- You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident.
- Perform complete event reconstruction for persisted events even after the session is rolled over from the NetWitness database.

- Filter incidents which has persisted events.
- Suspend persist of all events associated with an incident, even if only a few events persisted in it.
- Remove all associated persisted events by deleting an alert or incident.

This topic contains the following basic Respond Persist Data procedures:

- Customizing Respond Persist Data
- Working with Incident Filters
- Persist and Suspend Persist Events
- Change Event Retention

## Customizing Respond Persist Data

The persisted events are saved in the directory `/var/netwitness/pin-<servicetype>`, by default. You can manually change the event storage location from the default directory to any other directory, as per the requirement. You can increase the storage space as per your requirement by performing an Network File System (NFS) mount. For more information on how to perform an NFS mount, see Configure the Destination Using NFS.

To customize the persist directory:

1. Go to **Admin** >**Services**.
The **Services** page appears.

2. From the **Filter** pull down menu, select the concentrator and the log decoder services.
The concentrator and log decoder are listed in the **Services** page.

3. Go to **Actions** > **View** > **Explore**.
The **Explore** page appears.

4. Go to **sdk** > **config** .

The **Configuration** page appears.

The following table provides information on the default values for each parameter that are configured in the **Configuration** page.

| S.No | Parameter | Default Value |
|---|---|---|
| 1. | Long Term Cache Behavior (pin.cache.behavior) | fail-on-new |
| 2. | Long Term Cache Directory (pin.cache.dir) | /var/netwitness/pin-<serviceType>*** |
| 3. | Long Term Cache Size (pin.cache.size) | 10 GB |

2. [Optional]*** In the **Long Term Cache Directory (pin.cache.dir)**, enter the path of the custom directory where you want to save the persisted events, if you do not want to use the default location. The default path is `/var/netwitness/pin-<serviceType>`.

**Note:** When you install NetWitness Platform for the first time or upgrade to the 11.6 version, the directories are pre-configured with default values.

## Working with Incident Filters

You can filter incidents based on the persisted events.

To filter incidents:

1. Go to **Respond** > **INCIDENTS**.

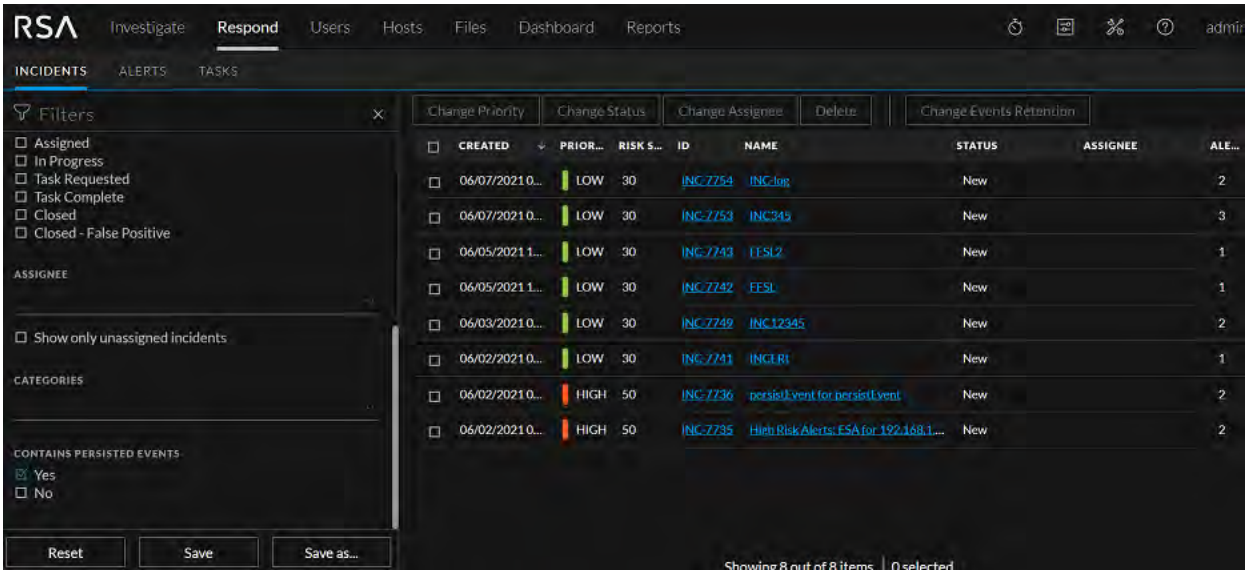
The **INCIDENT** page appears.

2. In the **FILTERS** tab, the **CONTAINS PERSISTED EVENTS** menu provides the filters to view incidents based on the persisted events.

a. Select **Yes** to view the incidents that contain persisted events.

b. Select **No** to view the incidents that do not contain persisted events.

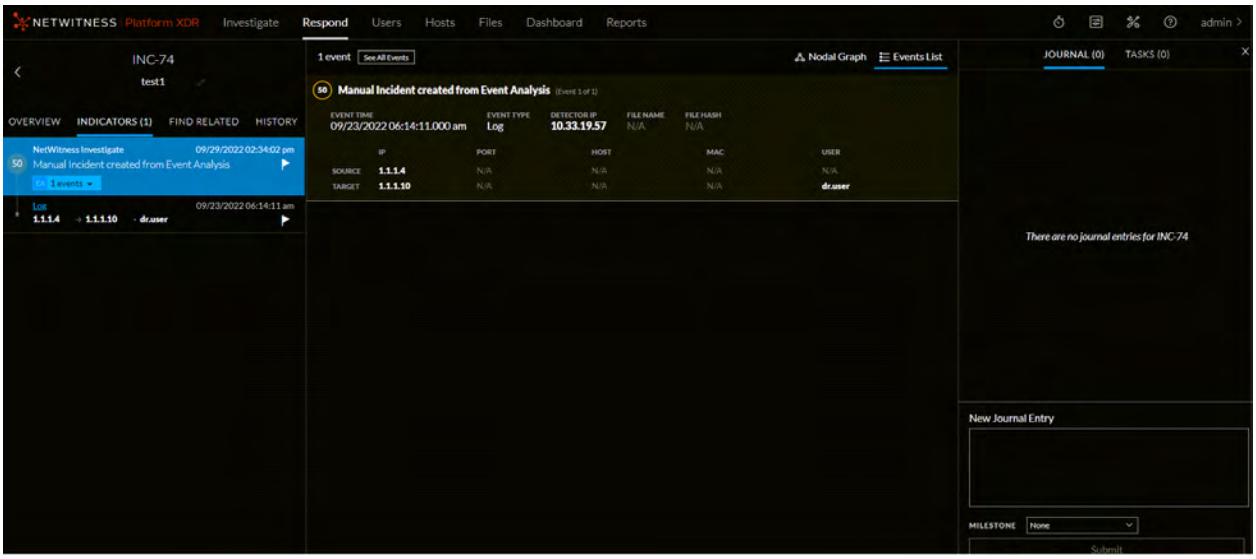
For more information on working with filters, see Filter the Incident List.



## Persist and Suspend Persist Events

Persist an event to retain the event and thereby, copy the event data from the regular database into a long-term storage cache within the NetWitness source. Suspend persist the event to delete the event in the long-term storage cache.

- To persist an event, click the flag listed under each of the event. The selected flag is highlighted, and the message Event Persisted successfully appears.
- To suspend persist event, click a highlighted flag (persisted event) once again. The selected flag is no longer highlighted, and the message Suspended Event Persist successfully appears.
- To persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.
- To suspend persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.



## Change Event Retention

Incidents can contain multiple persisted events, for which analysis has been completed. They can be suspended from persisting at a time using this feature.

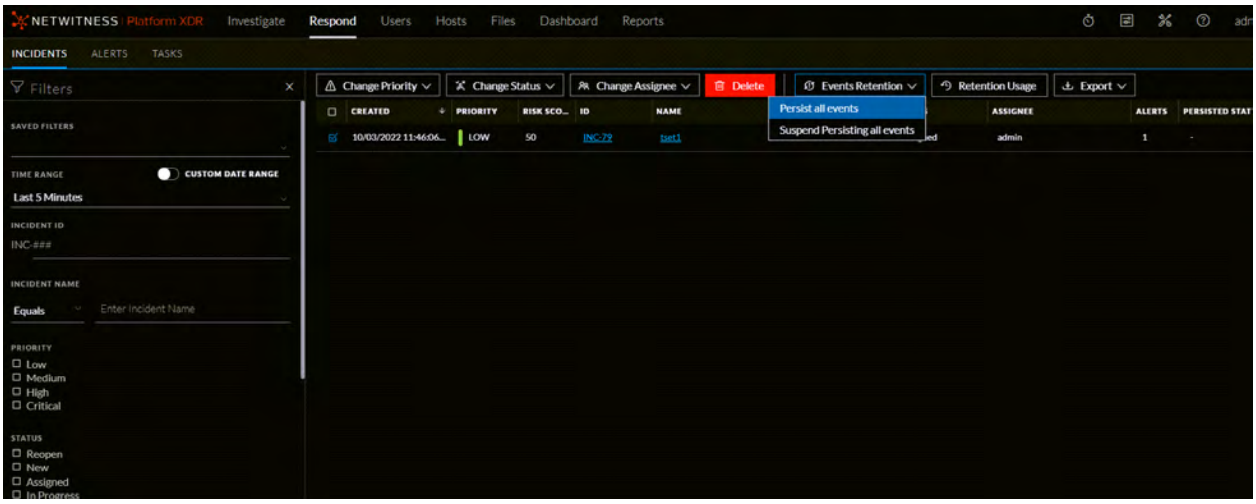
**Note:** A maximum of 1 incident can be persisted or suspend persisted at a time in the source NetWitness database. If you try to change event retention for more than 1 incidents, an error message will be displayed. This limitation is introduced to optimize and extract the best performance for this feature. This limit cannot be changed.

To change event retention:

1. Go to **Respond** > **INCIDENTS**.
   All the incidents are listed in the **INCIDENTS** page.
2. Click the selection check-box to select the incidents.
3. Click **Change Events Retention** > **Persist all events** or **Suspend Persist all events**.The **Confirm change in Retention** window appears.
4. Click **OK**.
   The events in the selected incident are either persisted or suspended from persisting.

**Note:** You cannot change the event retention for incidents that are in New or Closed state.

**Note:** Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database. The events will be deleted permanently.



When you delete incidents or alerts, or suspend persist all the events in an incident, the action will always be successful. However, there are chances for the back-end function to fail due to, but not limited to the following reasons:

- Decoder/Concentrator outage
- Network disruption
- Service Outage

A data retention job is scheduled to run on a daily basis to clean up the events that failed from being deleted. To access the data retention job settings, see To change event retention:

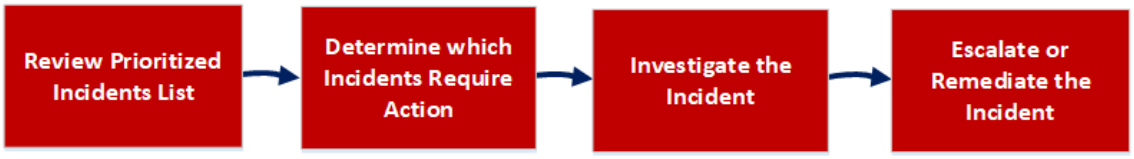
The following table provides information on the parameters that are configured to run the job, which are enabled by default:

| Parameter | Default Setting |
|---|---|
| `failure-count` | 5 |
| `persisted-events-retention-job-enabled` | true - default false. |
| `persisted-alerts-retention-period` | 90 Days |

Everyday at a preset time, the data retention job is executed. The default `failure-count` is set to 5 days. If the data retention job is unable to suspend persist an event from the back-end after 5 days, it deletes the event from the repository.

# Responding to Incidents Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in the Respond view.



First, you review the list of prioritized incidents, which shows basic information about each incident, and determine which incidents require action. You can click a link in an incident to get a clearer picture of the incident with supporting details in the Incident Details view. From there, you can further investigate the incident. You can then determine how to respond to the incident, by escalating or remediating it.

These are the basic steps for responding to an incident:

1. Review Prioritized Incident List
2. Determine which Incidents Require Action
3. Investigate the Incident
4. Escalate or Remediate the Incident

# Review Prioritized Incident List

In the Respond view, you can view the list of prioritized incidents. The incident list shows both active and closed incidents.

This topic contains the following basic incident list procedures:

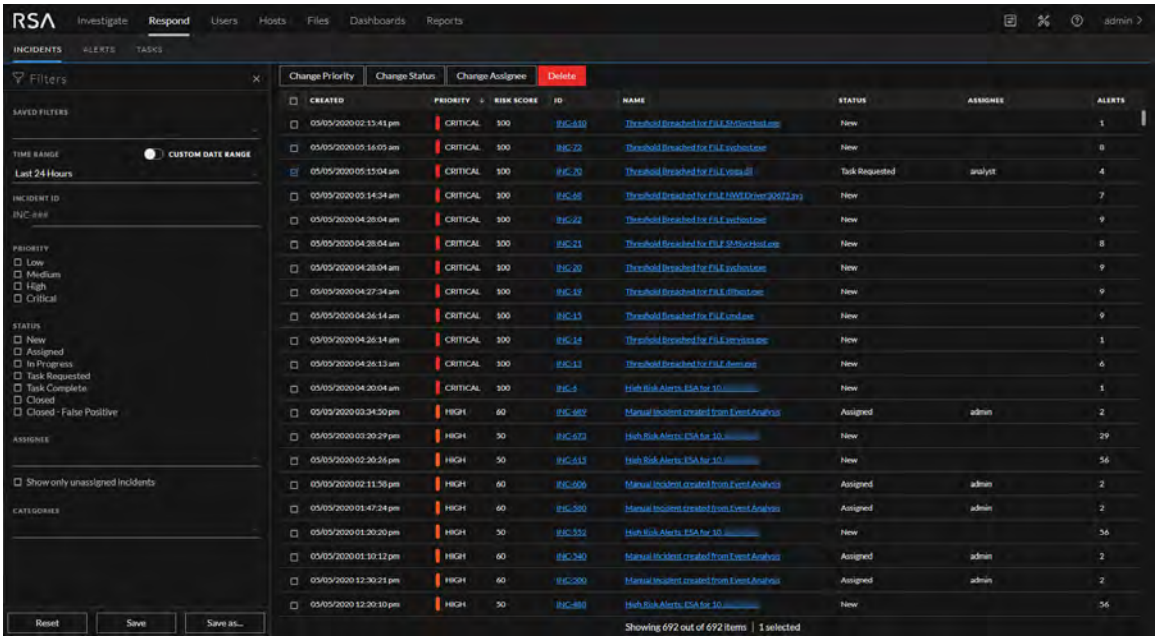
- View the Incidents List
- Filter the Incident List
- Remove My Filters from the Incidents List View
- Save the Current Incidents Filter
- Update a Saved Incidents Filter
- Delete a Saved Incidents Filter
- View My Incidents
- Find an Incident
- Sort the Incidents List
- View Unassigned Incidents

- Assign Incidents to Myself
- Unassign an Incident

## View the Incidents List

After logging in to NetWitness, most Incident Responders see the Respond view, which is set as the default view. If you have a different initial view, you can navigate to the Respond view.

1. Log in to NetWitness.
   The Respond view shows the list of incidents, also referred to as the Incident List view.



2. If you do not see the incidents list in the Respond view, go to **Respond > Incidents**.
3. Scroll through the incidents list, which shows basic information about each incident as described in the following table.

| Column | Description |
|---|---|
| Created | Shows the creation date of the incident. |

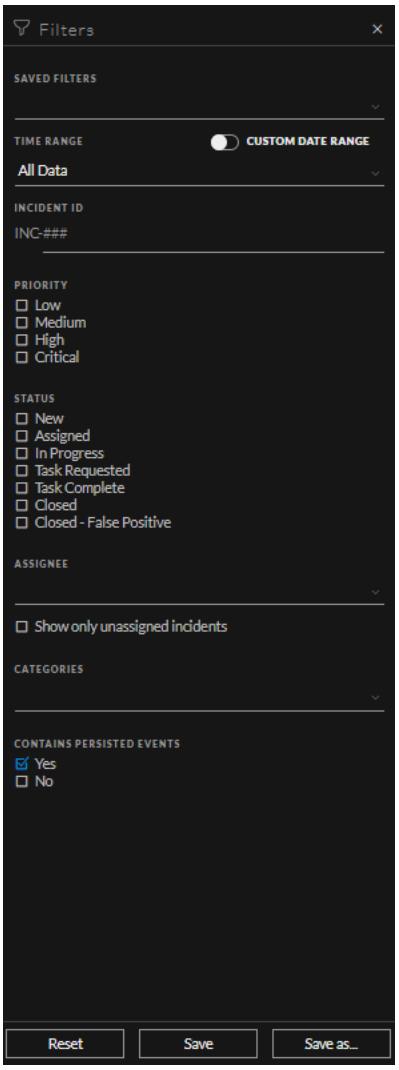
| Column | Description |
|---|---|
| Priority | Shows the incident priority. Priority can be Critical, High, Medium, or Low.<br>The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example:<br>  |
| Risk Score | Shows the incident risk score. The risk score indicates the risk of the incident as calculated using an algorithm and is between 0-100. 100 is the highest risk score. |
| ID | Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident. |
| Name | Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident. |
| Status | Shows the incident status. The status can be: **New**, **Assigned**, **In Progress**, **Task Requested**, **Task Complete,Closed**, and **Closed - False Positive**. |
| Assignee | Shows the team member currently assigned to the incident. |
| Alerts | Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack. |

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number selected. For example: **Showing 1000 out of 1115 items | 3 selected**. The maximum number of incidents that you can view at one time is 1,000.

## Filter the Incident List

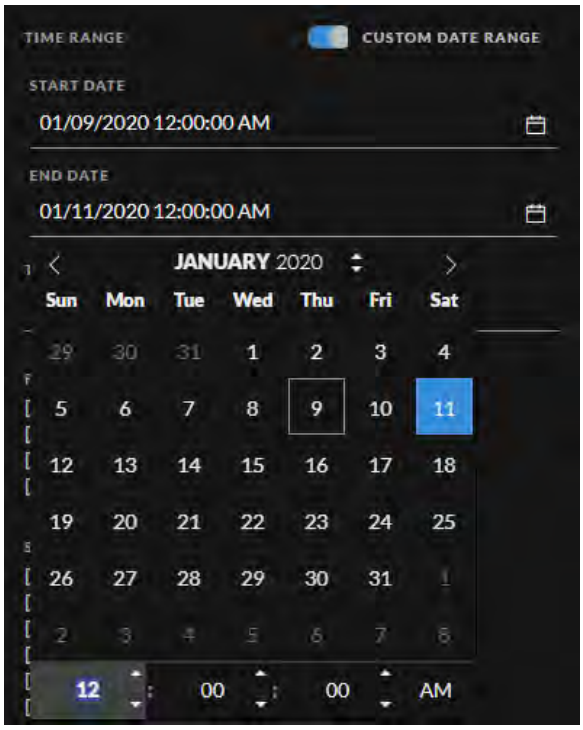
The number of incidents in the Incidents List view can be very large, making it difficult to locate particular incidents. The Filter enables you to specify those incidents that you would like to view. You can also choose the timeframe when those incidents occurred. For example, you may want to view all of the new critical incidents created within the last hour.

1. Verify that the Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident List view toolbar, click , which opens the Filters panel.



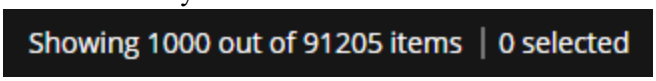
2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the incidents. For example, if you select Last Hour, you can see incidents that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and

End Date fields. Select the dates and times from the calendar.



- **Incident ID**: Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident.
- **Priority**: Select the priorities that you would like to view.
- **Status**: Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
- **Assignee**: Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.
  (Available in version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
- **Categories**: Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.
- **Sent to Archer**: (In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
- **CONTAINS PERSISTED EVENTS**: Select a filter to view incidents based on the persisted events.

The incidents list shows a list of incidents that meet your selection criteria. You can see the number of incidents in your filtered list at the bottom of the incident list.



3. If you want to close the Filters panel, click . Your filters remain in place until you remove them.

## Remove My Filters from the Incidents List View

NetWitness remembers your filter selections in the Incidents List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of incidents that you expect to see or you want to view all of the incidents in your incident list, you can reset your filters.

1. In the Incident List view toolbar, click .
   The Filters panel appears to the left of the incidents list.
2. At the bottom of the Filters panel, click **Reset**.

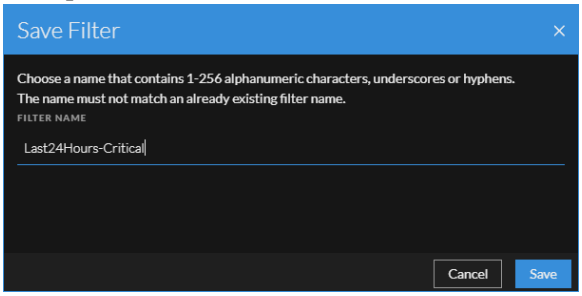
## Save the Current Incidents Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

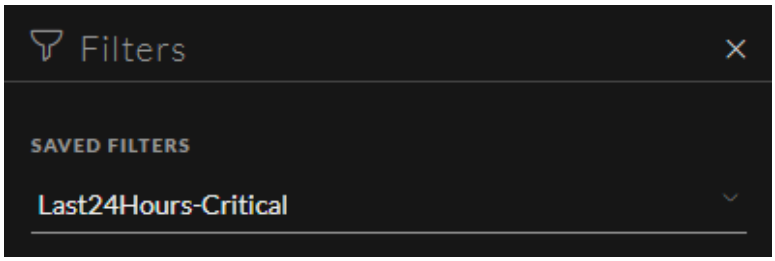
Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of incidents. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only critical incidents over the last 24 hours.

Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field, select Last 24 Hours, and for Priority, select Critical.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Critical.



The filter is added to the **Saved Filters** list.



## Update a Saved Incidents Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

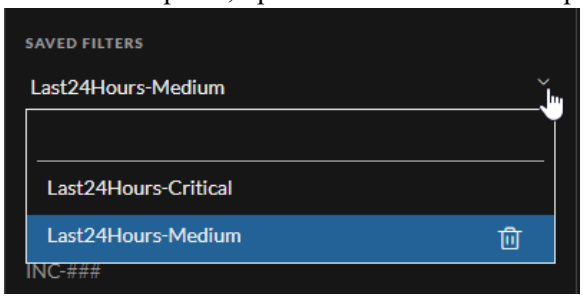
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

## Delete a Saved Incidents Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.

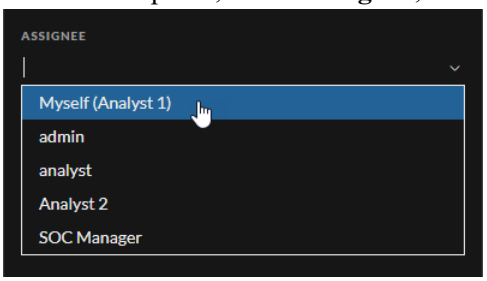


2. Next to the filter name, click to delete it.

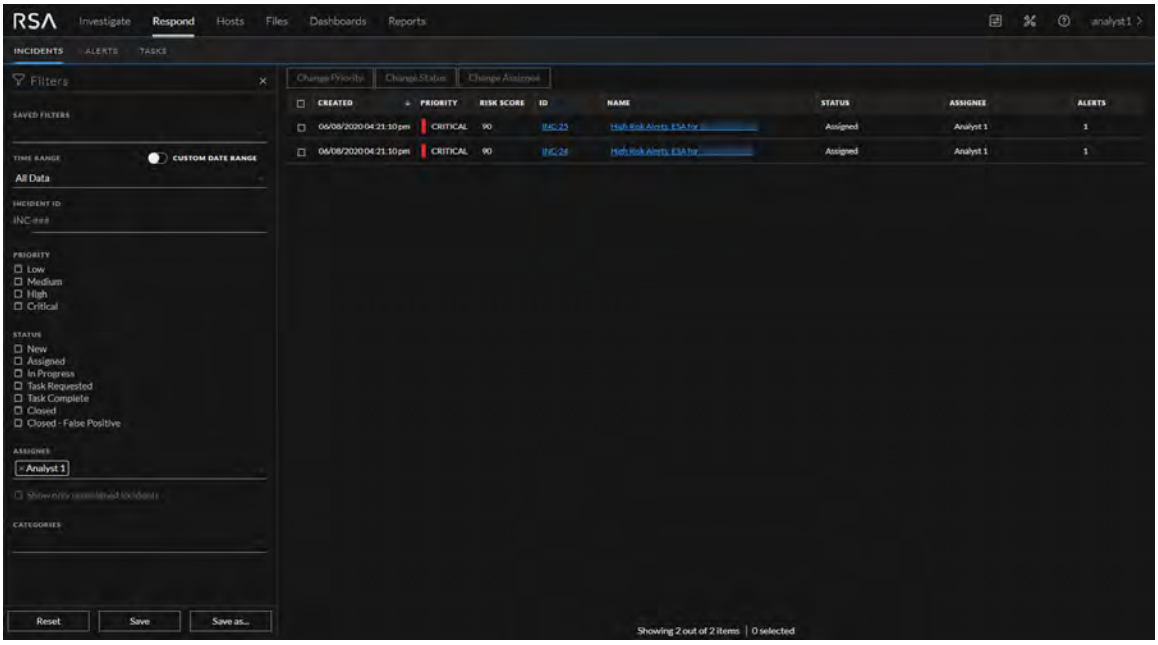
## View My Incidents

You can view your incidents by filtering the incidents by your username.

1. If you cannot see the Filter panel, in the Incidents List view toolbar, click .
2. In the Filter panel, under **Assignee**, select **Myself (your full name)** from the drop-down list.



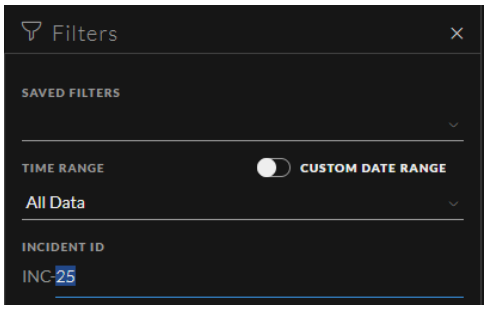
The incidents list shows the incidents that are assigned to you.



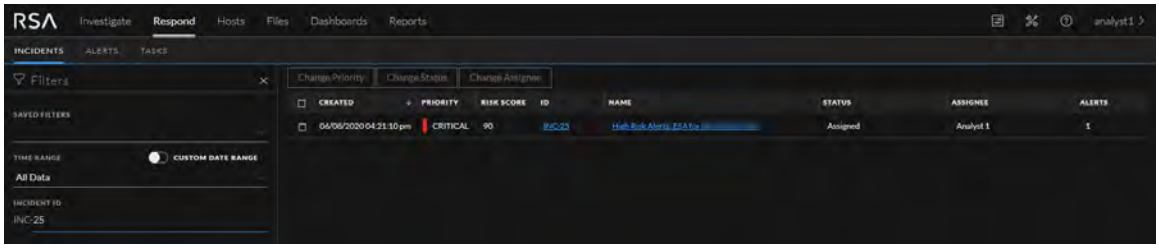
## Find an Incident

If you know the Incident ID, you can quickly locate an incident using the Filter. For example, you may want to locate a specific incident out of thousands of incidents.

1. Go to **Respond > Incidents**.
   The Filters panel is located to the left of the incidents list. If you do not see the Filters panel, in the Incident Lists view toolbar, click , which opens the Filters panel.



2. In the **INCIDENT ID** field, type the Incident ID for an incident that you would like to locate, for example, type **25** for INC-25.
   The specified incident appears in your incident list. If you do not see any results, try resetting your filters.



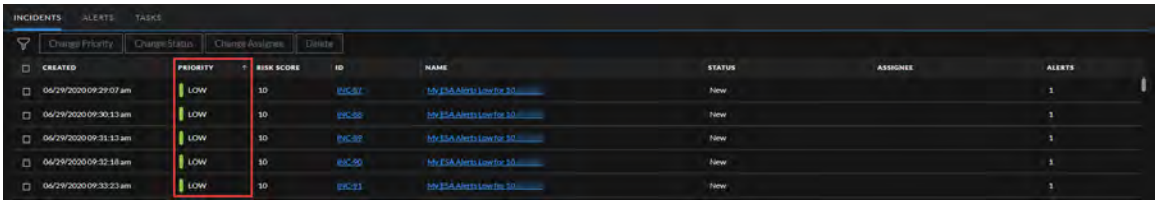
## Sort the Incidents List

The default sort for the incidents list is by Created date in descending order (newest on the top).

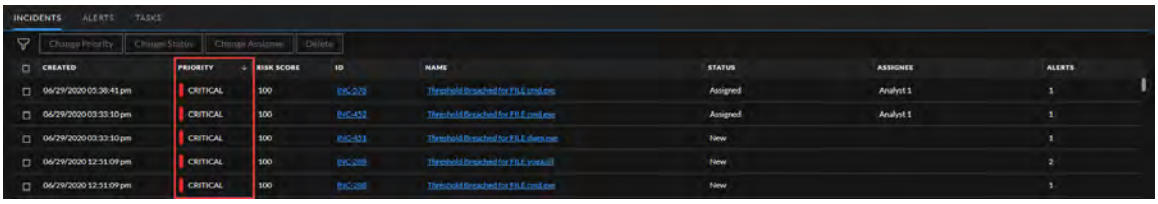
You can change the sort order of the incidents list by clicking a column header in the list.

For example, to prioritize the incidents, you can sort your view by clicking the Priority column header.

The following figure shows the incidents list sorted by Priority in ascending order (lowest priority on top).



To sort by Priority in descending order (highest priority on top), click the Priority column header again. The highest priority incidents are at the top as shown in the following figure.



## View Unassigned Incidents

**Note:** This option is available in NetWitness Platform Version 11.1 and later.

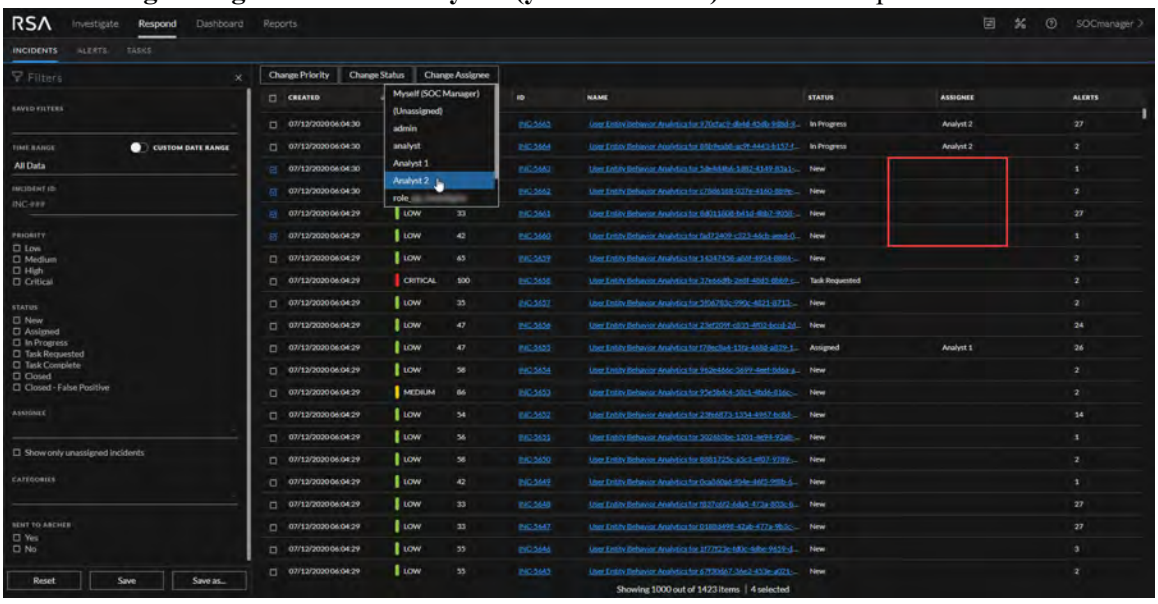
You can view unassigned incidents using the Filter.

1. If you cannot see the Filter panel, in the Incident List view toolbar, click .
2. In the Filters panel, under Assignee, select **Show only unassigned incidents**.

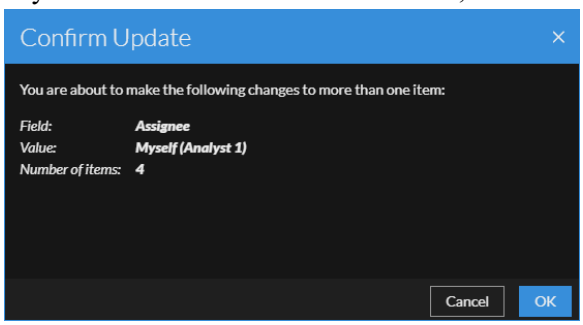
The incidents list is filtered to show unassigned incidents.

## Assign Incidents to Myself

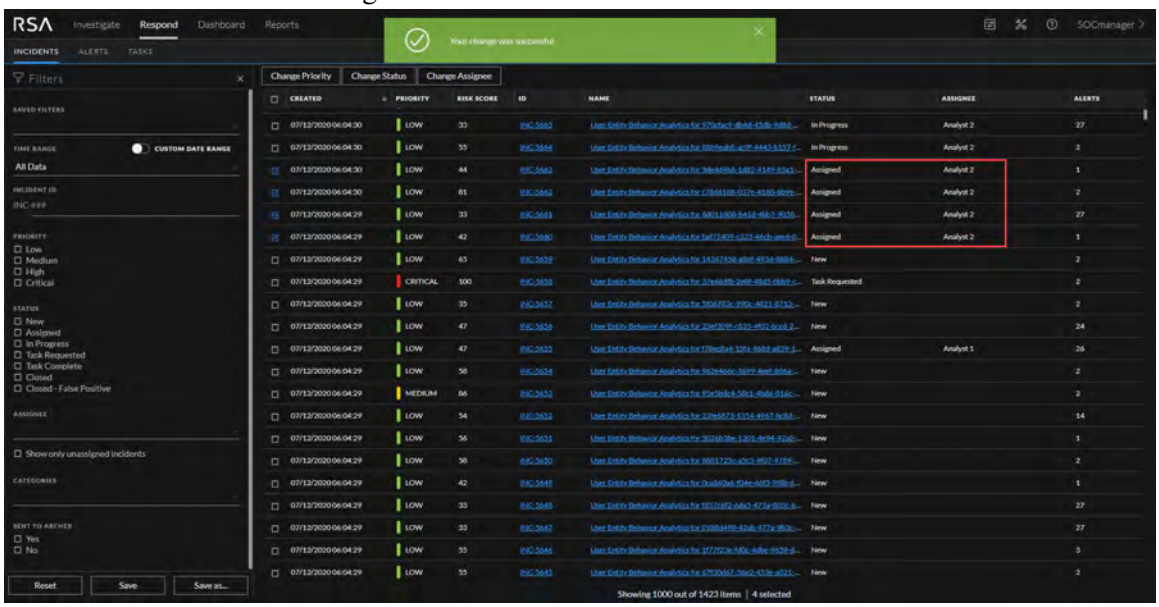
1. In the Incident List view, select one or more incidents that you want to assign to yourself.
2. Click **Change Assignee** and select **Myself (your full name)** from the drop-down list.



3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.

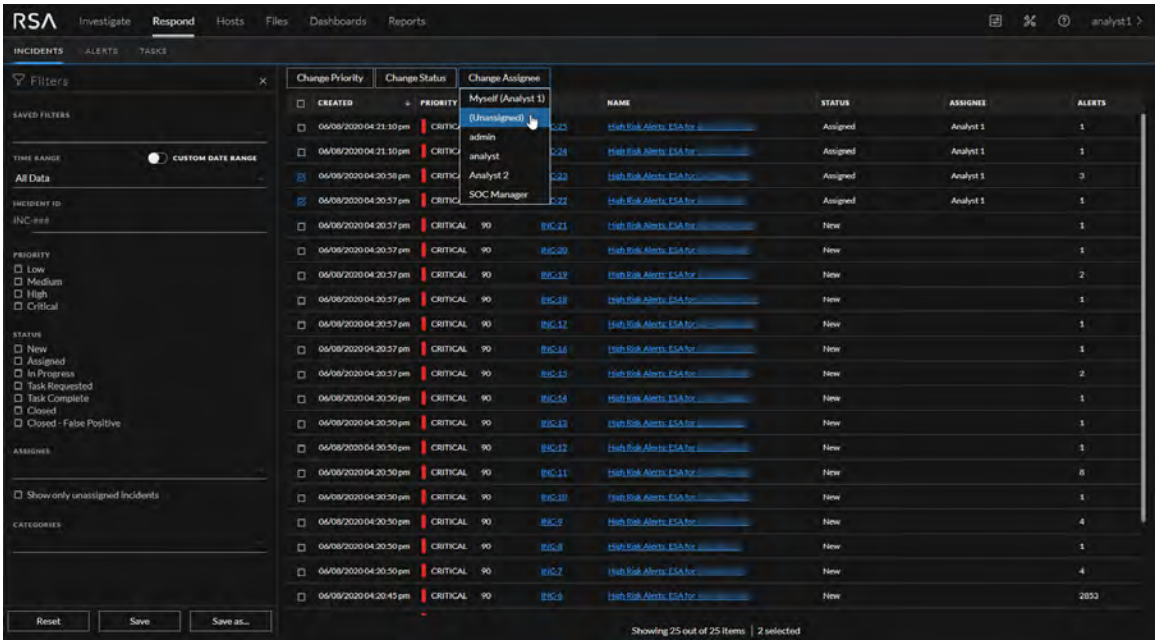


You can see a successful change notification.

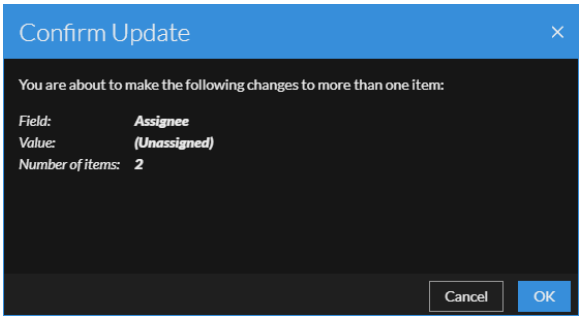


## Unassign an Incident

1. In the Incident List view, select one or more incidents that you want to unassign.
2. Click **Change Assignee** and select **(Unassigned)** from the drop-down list.

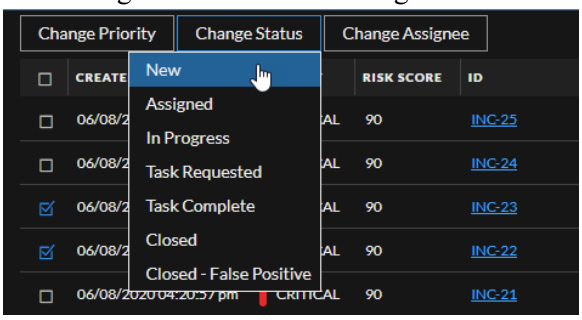


3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.



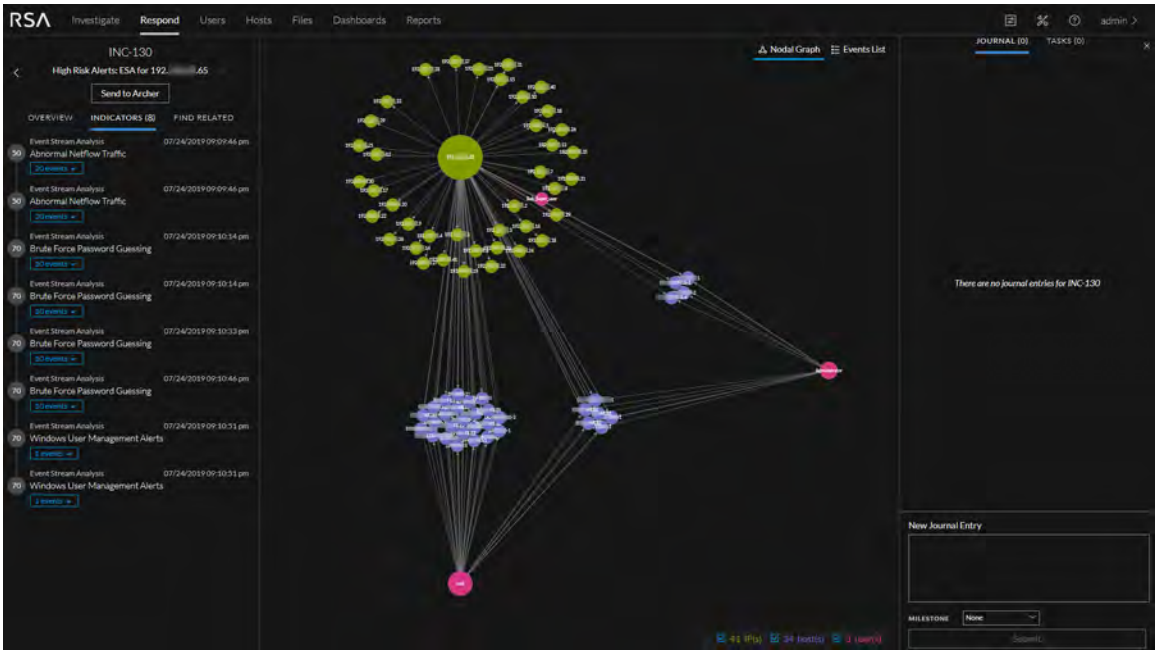
4. Verify that the Status is still correct and make changes as required. To change the status, select one or more incidents, click **Change Status**, and select a new status.
   For example, if you assigned an incident to yourself by mistake, you can unassign the incident and

then change the Status from Assigned back to New.



# Determine which Incidents Require Action

Once you get the general information about the incident from the Incident List view, you can go to the Incident Details view for more information to determine the action required.

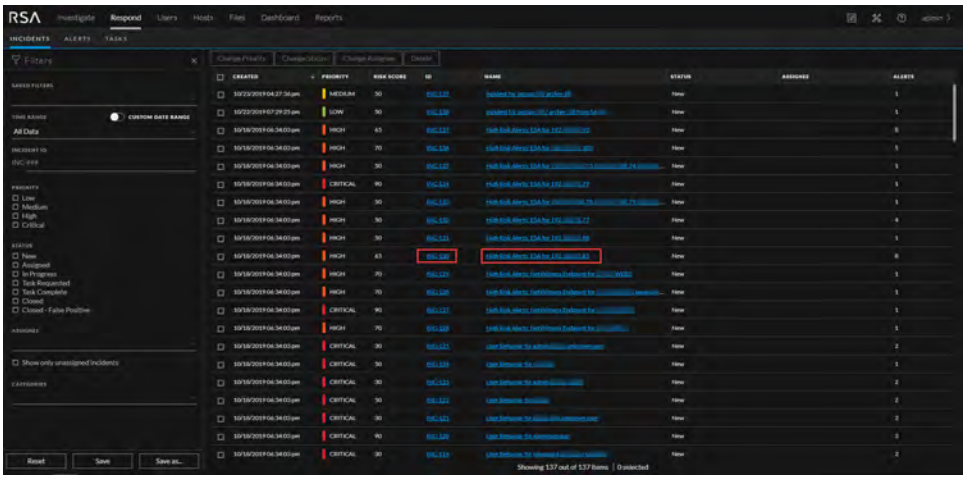


You can perform the following procedures in the Incident Details view to determine the action required on an incident:

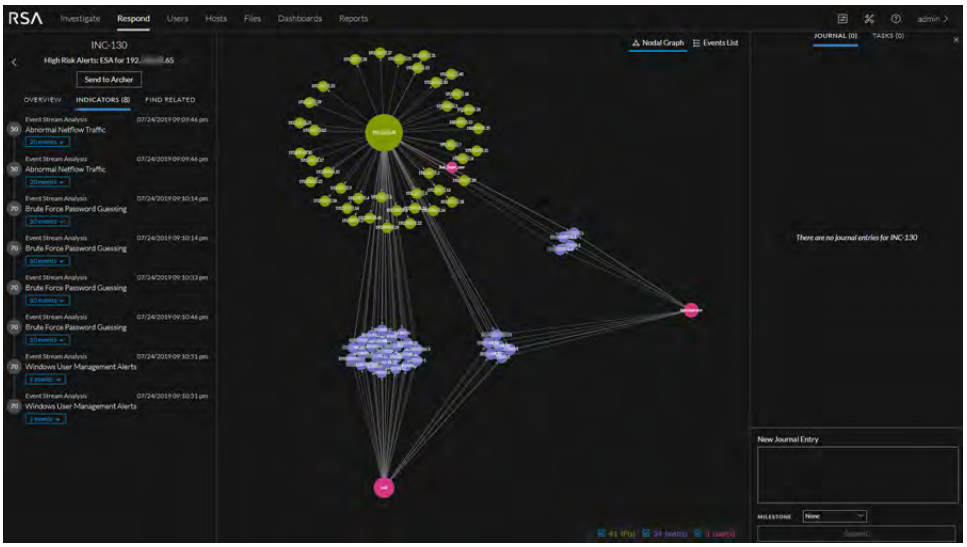
- View Incident Details
- View Basic Summary Information about the Incident
- View the Indicators and Enrichments
- View and Study the Events
- View C2 Enrichment Information for Suspected C&C Incidents
- View and Study the Entities Involved in the Events on the Nodal Graph
- Nodal Graph Behaviors and Characteristics
- Select Node Types to View on the Nodal Graph
- Filter the Data in the Incident Details View
- View the Tasks Associated with an Incident
- View Incident Notes
- Find Related Indicators
- Add Related Indicators to the Incident

# View Incident Details

To view details for an incident, in the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.



The Incident Details view for the selected incident appears with the Indicators panel, Nodal Graph, and Journal in view.



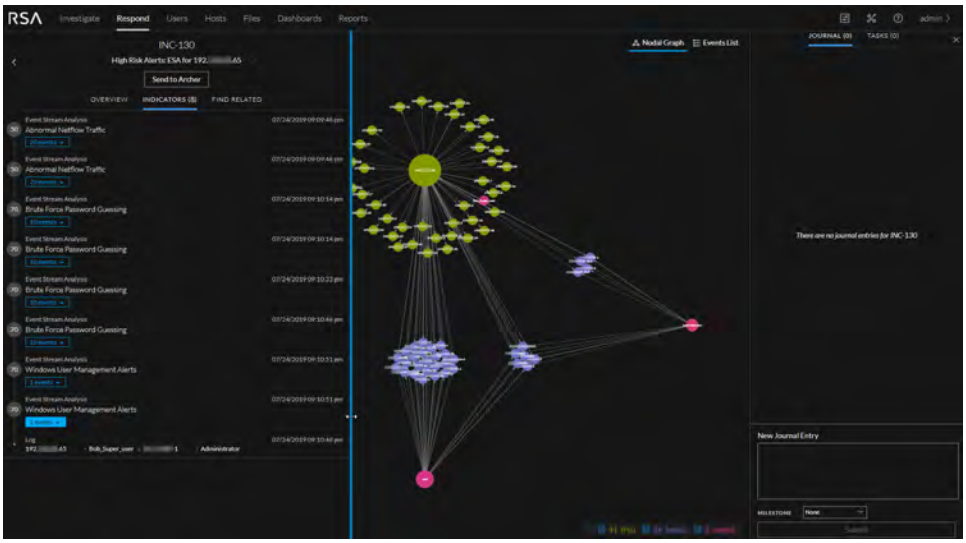
The Incident Details view has the following panels:

- **Overview**: The incident Overview panel contains high-level summary information about the incident, such as the score, priority, alerts, and status. You have the option to send the incident to RSA Archer and change the incident Priority, Status, and Assignee.
- **Indicators**: The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and

notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

- **Related Indicators**: The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can also add related alerts that you find to the incident.
- **Nodal Graph**: The nodal graph is an interactive graph that shows the relationship between the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.
- **Events List**: The Events List, also known as the Events table, lists the events associated with the incident. It also shows event source and destination information along with additional information depending on the event type. You can click the top of an event in the list to view the detailed data for that event.
- **Journal**: The Journal panel enables you to access the Journal for the selected incident, which allows you to communicate and collaborate with other analysts. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.
- **Tasks**: The Tasks panel shows all of the tasks that have been created for the incident. You can also create additional tasks from here.

To view more information in the left-side panel without scrolling, you can hover over the right edge and drag the line to resize the panel as shown in the following figure:

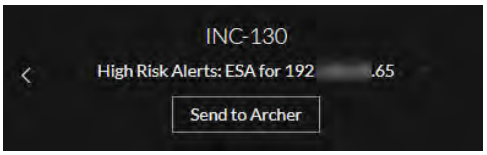


# View Basic Summary Information about the Incident

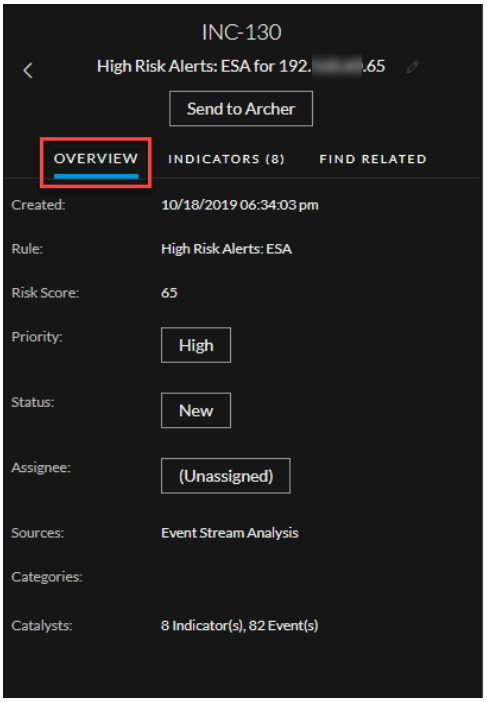
You can view basic summary information about an incident in the Overview panel.

Above the Overview panel, you can see the following information:

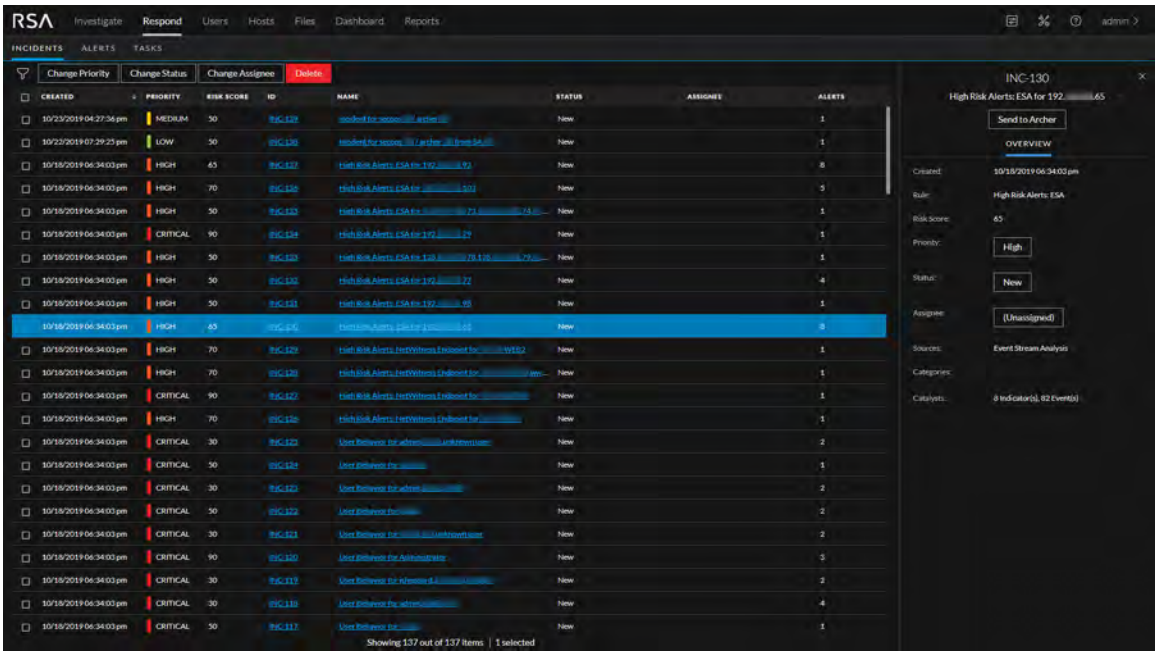
- **Incident ID**: This is an automatically created unique ID assigned to the incident.
- **Name**: The incident name is derived from the rule used to trigger the incident.
- **Send to Archer / Sent to Archer**: (In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option is available in NetWitness Respond.) This shows whether an incident has been sent to Archer Cyber Incident & Breach Response. An incident sent to Archer shows as Sent to Archer. An incident that has not been sent to Archer shows as Send to Archer. You can click the Send to Archer button to send the incident to Archer Cyber Incident & Breach Response.



To view the Overview panel from the Incident Details view, select **Overview** in the left panel.



To view the Overview panel from the Incidents List view, click a row in the incident list. The Overview panel appears on the right.



The Overview panel contains basic summary information about the selected incident:

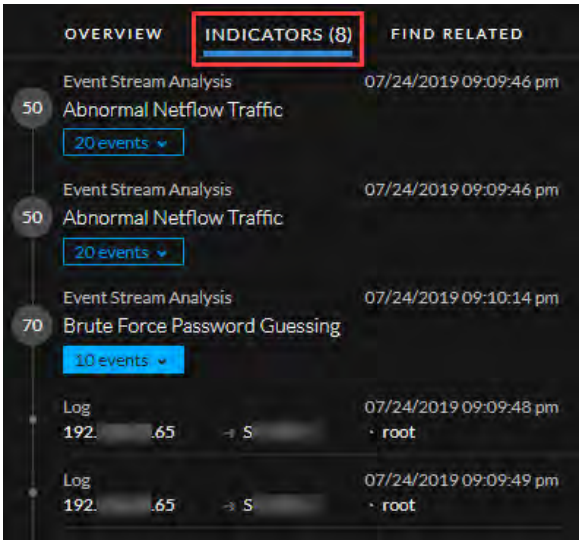
- **Created**: Shows the creation date and time of the incident.
- **Rule / By**: Shows the name of the rule that created the incident or the name of the person who created the incident.
- **Risk Score**: Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score.
- **Priority**: Shows the incident priority. Priority can be Critical, High, Medium or Low.
- **Status**: Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. After you create a task, the status changes to Task Requested.
- **Assignee**: Shows the team member currently assigned to the incident.
- **Sources**: Indicates the data sources used to locate the suspicious activity.
- **Categories**: Shows the categories of the incident events.
- **Catalysts**: Shows the count of indicators that gave rise to the incident.
- **External ID**: Allows storing the Incident ID referrals from a different platform such as Archer.
- **Time to Acknowledge**: Shows the time taken to assign an Incident after creating it.
- **Time to Detect**: Shows the time taken for completing the task after the Incident is assigned.
- **Time to Resolve**: Shows the time taken for closing the task after the Incident is created.
- **Persisted Status**: Shows the persist status of the Incident. The status can be Complete, Partial, or None (-).

# View the Indicators and Enrichments

**Note:** *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert.

You can find indicators, events, and enrichments on the Indicators panel. The Indicators panel is a chronological listing of indicators that helps you to find enrichments and events related to the triggering indicator. For example, an indicator might be a Command and Control alert, a NetWitness Endpoint alert, a Suspicious Domain (C2) alert, or an alert from an Event Stream Analysis (ESA) rule. The Indicators panel helps you to aggregate and order these indicators (alerts) from different systems so that you can see how they are related and also help you develop a timeline of a given attack.

To view the Indicators panel, in the left panel of the Incident Details view, select **Indicators**.



*Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, indicators can show the data found by your rules. In the Indicators panel, the risk score for an indicator is shown within a solid-colored circle.

Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. When data is available, you can see the number of enrichments. You can click the event and enrichment buttons to view the details.

**Note:** The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

# View and Study the Events

You can view and study the events associated with the incident from the Events List. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

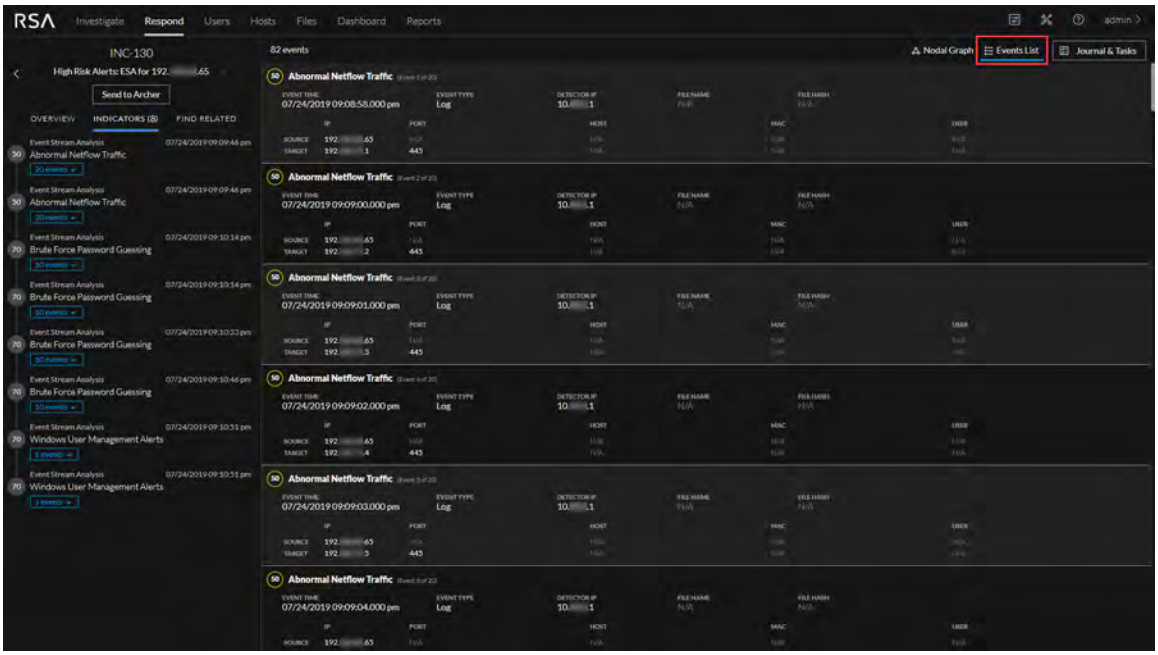
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

### To view and study the events:

1. To view the Events List, in the Incident Details view toolbar, click Events List.



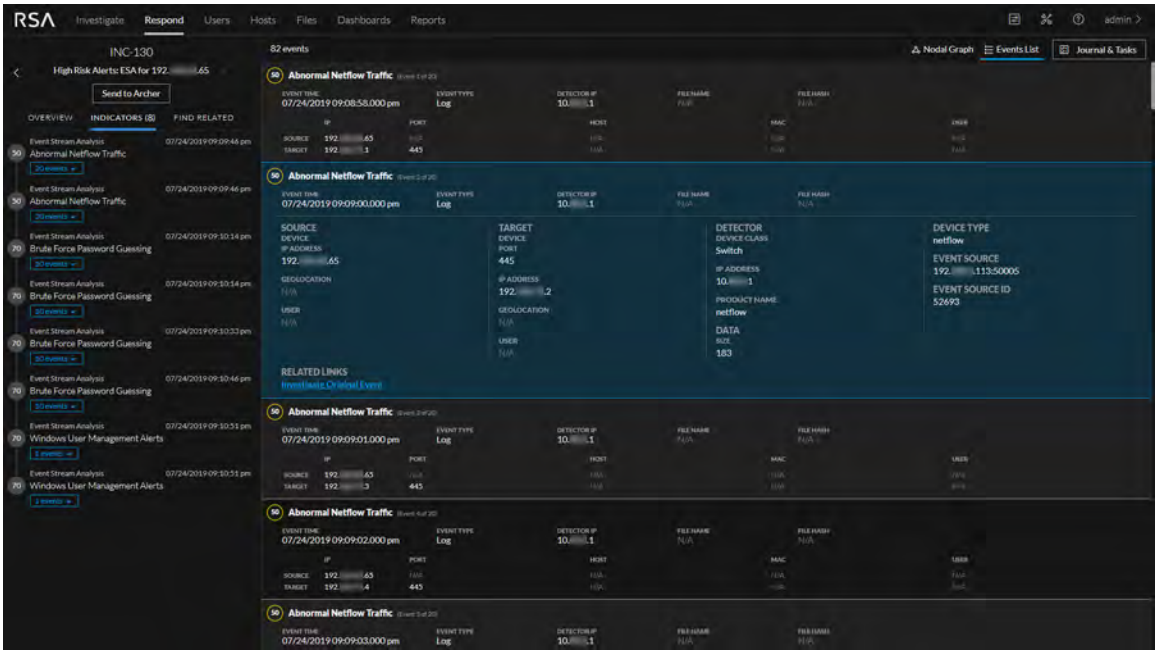
**Note:** The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

The Events List shows different information about each event depending on the event type. The maximum number of events displayed in the Events List is 1,000.

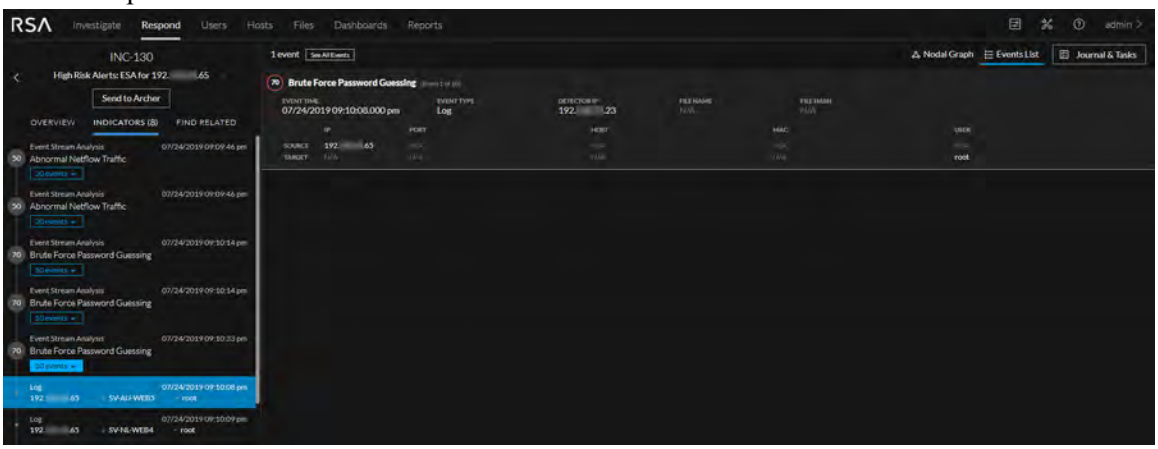
The following table lists typical event information. For details specific to endpoint events, see Events List.

| Field | Description |
|---|---|
| EVENT TIME | Shows the time the event occurred. |
| EVENT TYPE | Shows the type of alert, such as Log and Network. |
| DETECTOR IP | Shows the IP address of the machine where an anomaly was detected. |
| FILE NAME | Shows the file name if a file is involved with the event. |
| FILE HASH | Shows a hash of the file contents. |
| SOURCE IP | Shows the source IP address if there was a transaction between two machines. |
| SOURCE PORT | Shows the source port of the transaction. The source and destination ports can be on the same IP address. |
| SOURCE HOST | Shows the destination host where the event took place. |
| SOURCE MAC | Shows the MAC address of the source machine. |
| SOURCE USER | Shows the user of the source machine. |
| TARGET IP | Shows the destination IP address if there was a transaction between two machines |
| TARGET PORT | Shows the destination port of the transaction. The source and destination ports can be on the same IP address. |
| TARGET HOST | Shows the host name of the destination machine. |
| TARGET MAC | Shows the MAC address of the destination machine. |
| TARGET USER | Shows the user of the destination machine. |

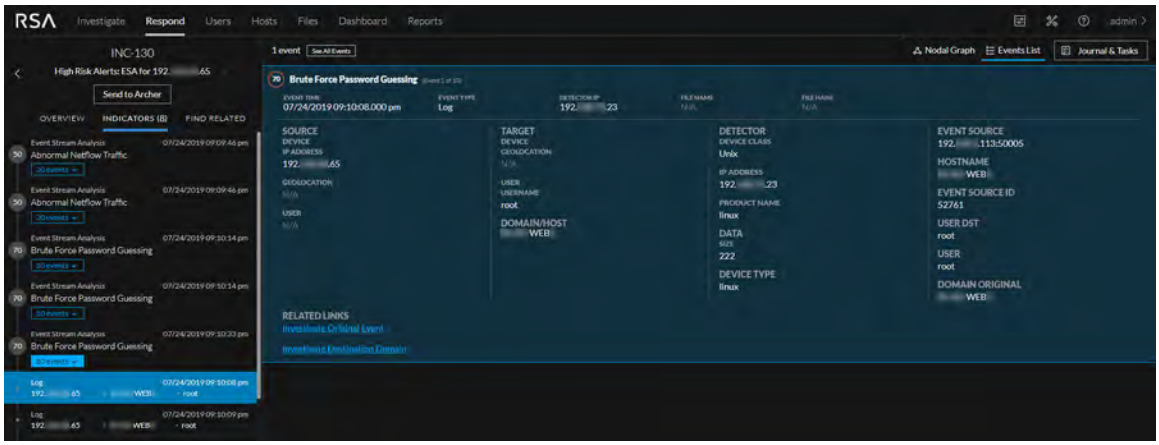
2. Click the top of an event in the Events List to view the event details.
   This example shows the event details for a selected event in the list.



3. To view the events for a specific indicator (alert), go to the Indicators panel on the left and click the indicator to view the events for that indicator in the Events List on the right.
   This example shows one event for a selected indicator.



4. To view event details for a specific indicator event, select an event in the Indicators panel. Click the top of the event to view the details.
   The following example shows information for the selected event.



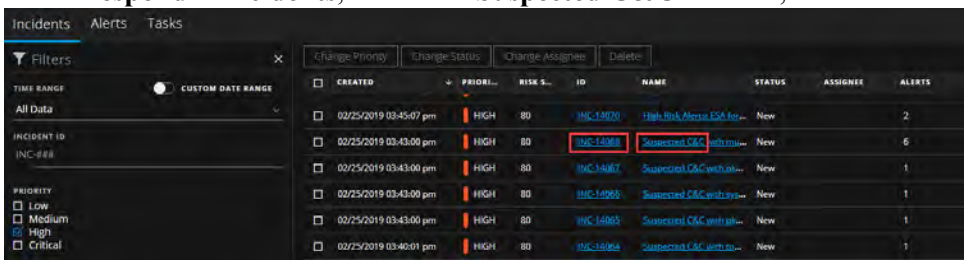
If you have additional Investigate-server permissions, you can also access event analysis details for events. See View Event Analysis Details for Indicators. If you have the UEBA_Analysts role, you can access UEBA details for indicators. See View User Entity Behavior Analytics for Indicators.

# View C2 Enrichment Information for Suspected C&C Incidents

**Note:** This procedure applies only to incidents from ESA Analytics in NetWitness Version 11.3 and 11.4. The Event Stream Analytics Server (ESA Analytics) service, which is used for Automated Threat Detection, is end of life (EOL) and not supported in NetWitness Platform Version 11.5 and later.

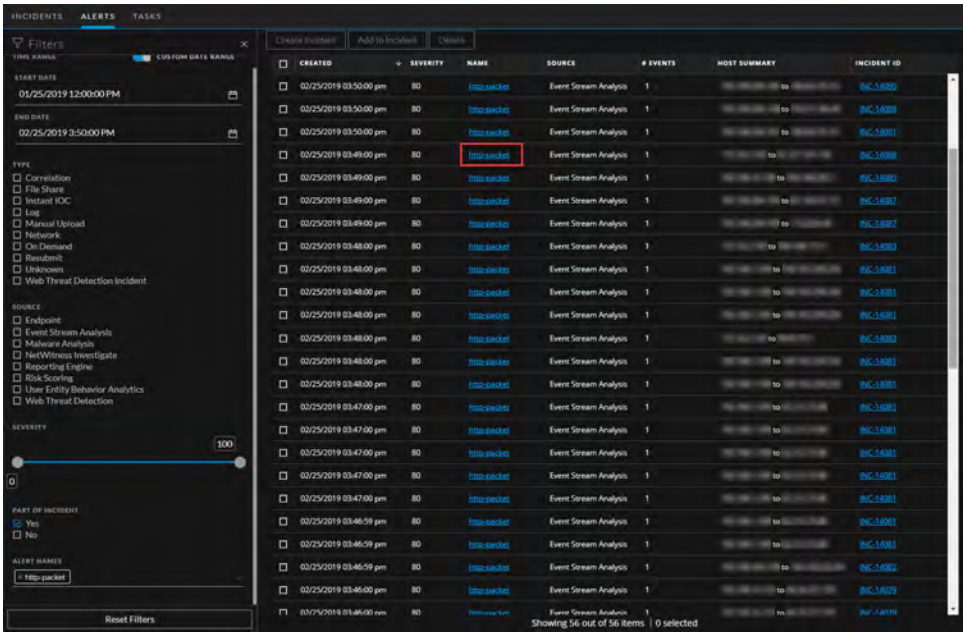
The Events List in version 11.3 and later does not show the Command and Control (C2) enrichment information for HTTP packet alerts in Suspected C&C incidents. However, you can view the C2 enrichment information in the Alert Details view.

1. Go to **Respond > Incidents**, look for a **Suspected C&C** incident, and note the incident ID.

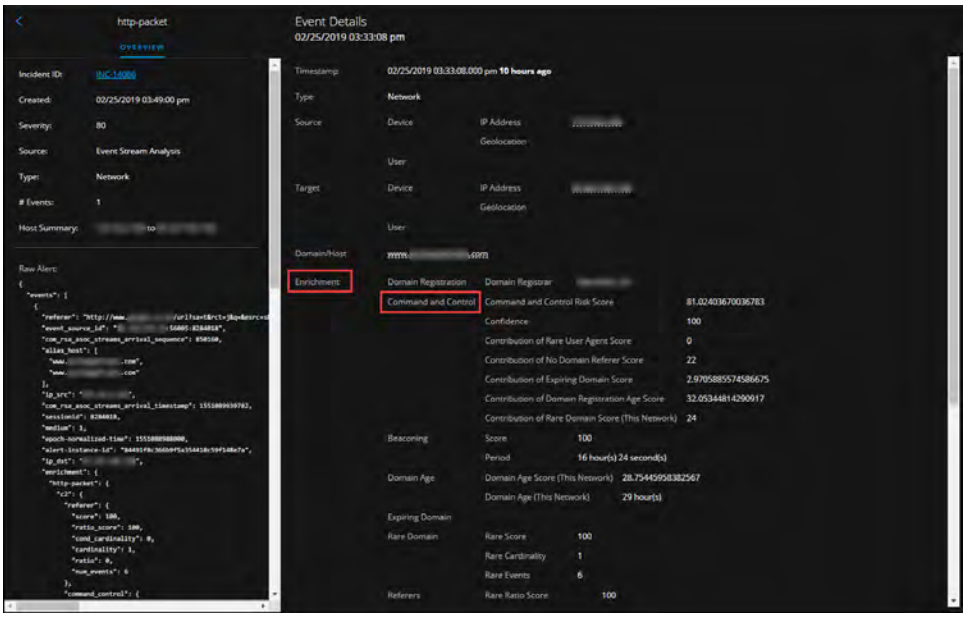


2. Go to **Respond > Alerts** and in the Filters panel, select the following to locate an alert in the Alerts list with the incident ID noted above:
   a. In the **Part of Incident** section, select **Yes**.
   b. In **Alert Names** section, select **http-packet**.

If you are still not able to locate an alert in the Alerts list with the incident ID noted above, try filtering your alerts list more using the time range of the incident.



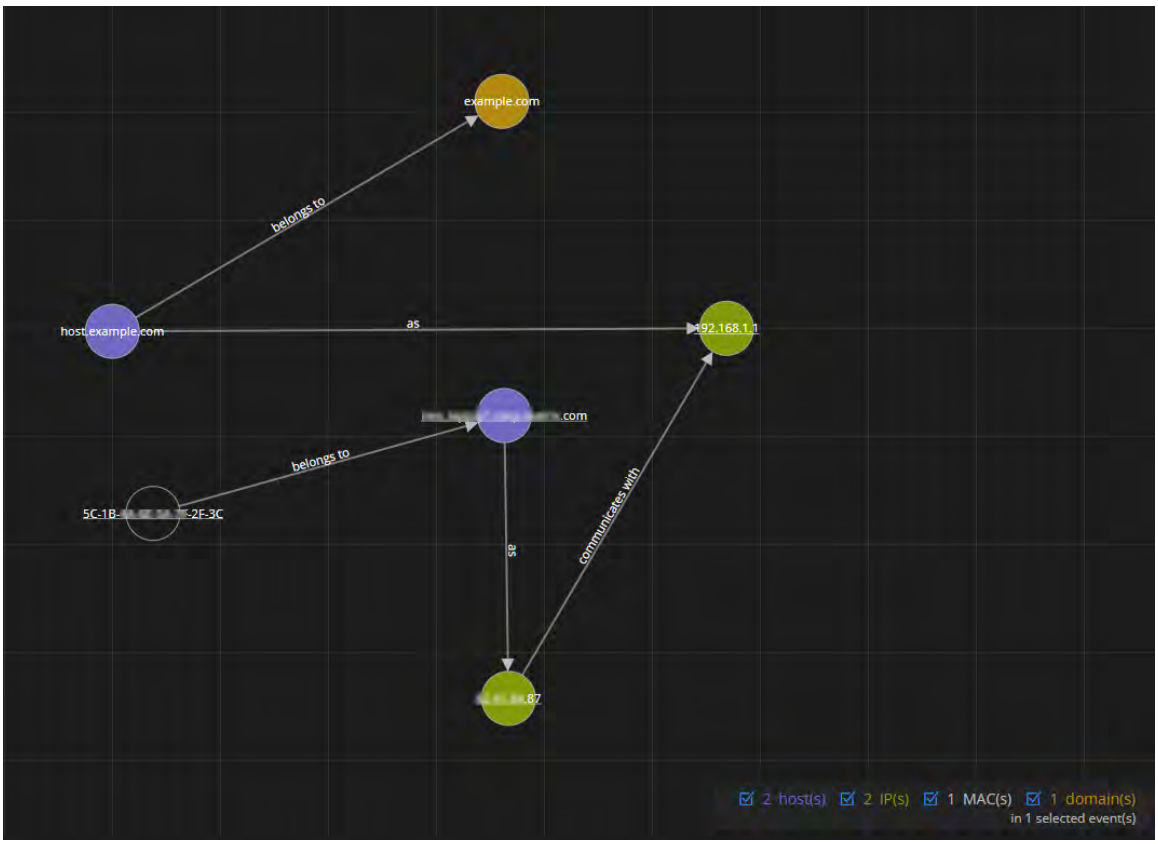
3. In the Alerts list, click the **http-packet** link in the **NAME** field of the alert associated with the incident ID.
The Event Details view shows the C2 enrichment information.



# View and Study the Entities Involved in the Events on the Nodal Graph

An *Entity* is either an IP address, MAC address, user, host, domain, file name, or file hash. The nodal graph is an interactive graph that you can move around to get a better understanding of how the entities involved in the events relate to each other. The nodal graphs look different depending on the type of event, the number of machines involved, whether the machines are associated with users, and if there are files associated with the event.

The following figure shows an example nodal graph with six nodes.



If you look closely at the nodal graph, you can see circles that represent nodes. A nodal graph can contain one or more of the following types of nodes:

- **IP address** (If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.)
- **MAC address** (You may see a MAC address for each type of IP address.)
- **User** (If the machine is associated with a user, you can see a user node.)
- **Host**
- **Domain**

- **Filename** (If the event involves files, you can see a filename.)
- **File Hash** (If the event involves files, you may see a file hash.)

In NetWitness 11.3 events, nodes for source filename and file hash are supported, but nodes for target filename and file hash are not supported. In NetWitness 11.4 and later events, nodes for both source and target filenames as well as file hashes are supported.

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes.

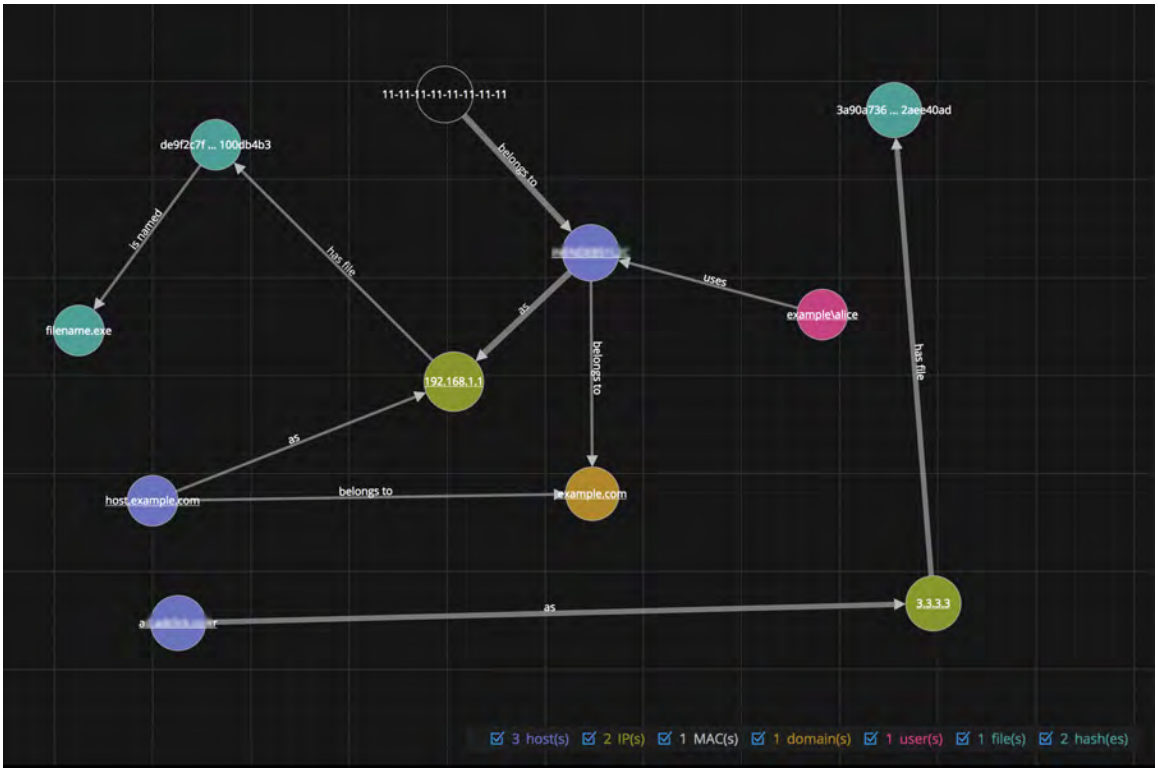
You can click and drag any node to reposition it.

The arrows between the nodes provide additional information about the entity relationships:

- **Communicates with**: An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
- **Has file**: An arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file" indicates that the IP address has that file.
- **Uses**: An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
- **Calls**: (This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash.
- **As**: (This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. In the above example, there is an arrow from the host node circle that points to an IP address node that is labeled with "as". This indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
- **Is named**: (This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
- **Belongs to**: (This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address for the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

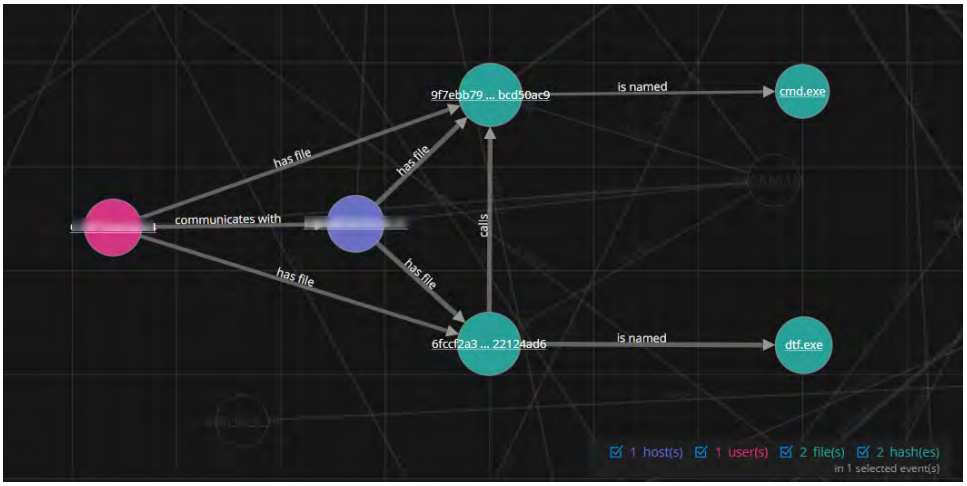
The following nodal graph example has 11 nodes.



In this example, notice that there are two IP nodes. They both have hashed files, but they do not communicate with each other. The IP address at the top (192.168.1.1) represents one machine with two hostnames (host.example.com is one of them) in the example.com domain. The MAC address of the machine is 11-11-11-11-11-11-11-11-11-11 and Alice uses it.

**Note:** The following example applies to NetWitness Platform 11.4 and later.

In the following nodal graph example, you can see the interaction between source and target (destination) files. There are six nodes in the selected event.



In this example, the user communicates with a host that has `dtf.eve` and `cmd.exe` files. The `dtf.exe` file on the host "calls" (in this case, launches) the `cmd.exe` file, which is suspected to be malicious activity. Notice that the "calls" arrow appears between the source and target file hashes, which are associated with the files.

## Nodal Graph Behaviors and Characteristics

**Note:** These nodal graph behaviors and characteristics are available in NetWitness Platform Version 11.4 and later.

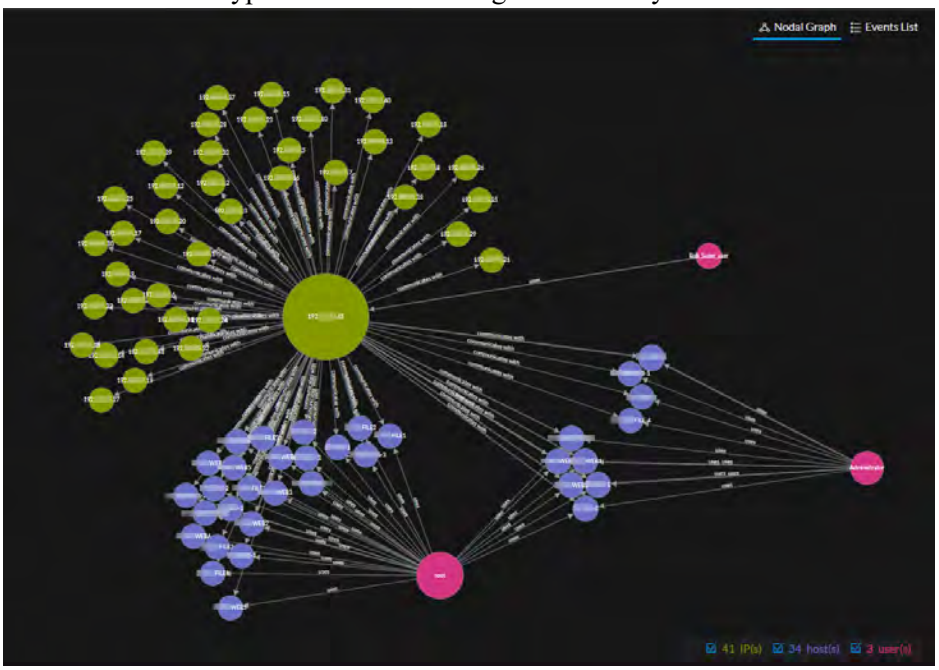
The nodal graph makes it easier for an analyst to get an initial understanding of an incident with minimal effort.

The nodal graph provides the following benefits to an analyst when responding to an incident:

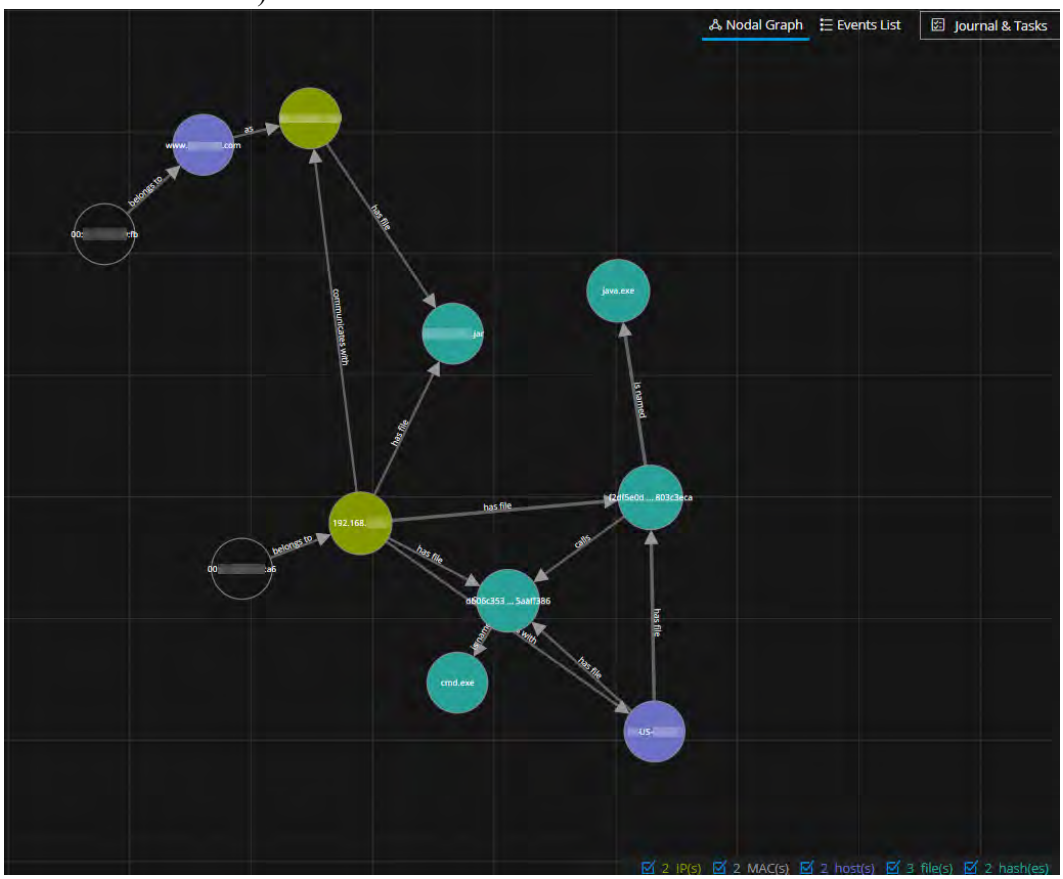
- The nodal graph helps determine scope, commonalities, and outliers in a given dataset, which can be useful context for an analyst.
- In many cases, the initial nodal graph layout presents valuable insight without any interaction from the analyst.
- In cases where the initial layout does not give enough clarity or when an analyst wants to view things differently, a few nodal mouse-drag position adjustments can provide a much faster method of exposing insightful relationships and clusters.

The following behaviors and characteristics are now part of the graph:

- Entities of similar types tend to cluster together visually.

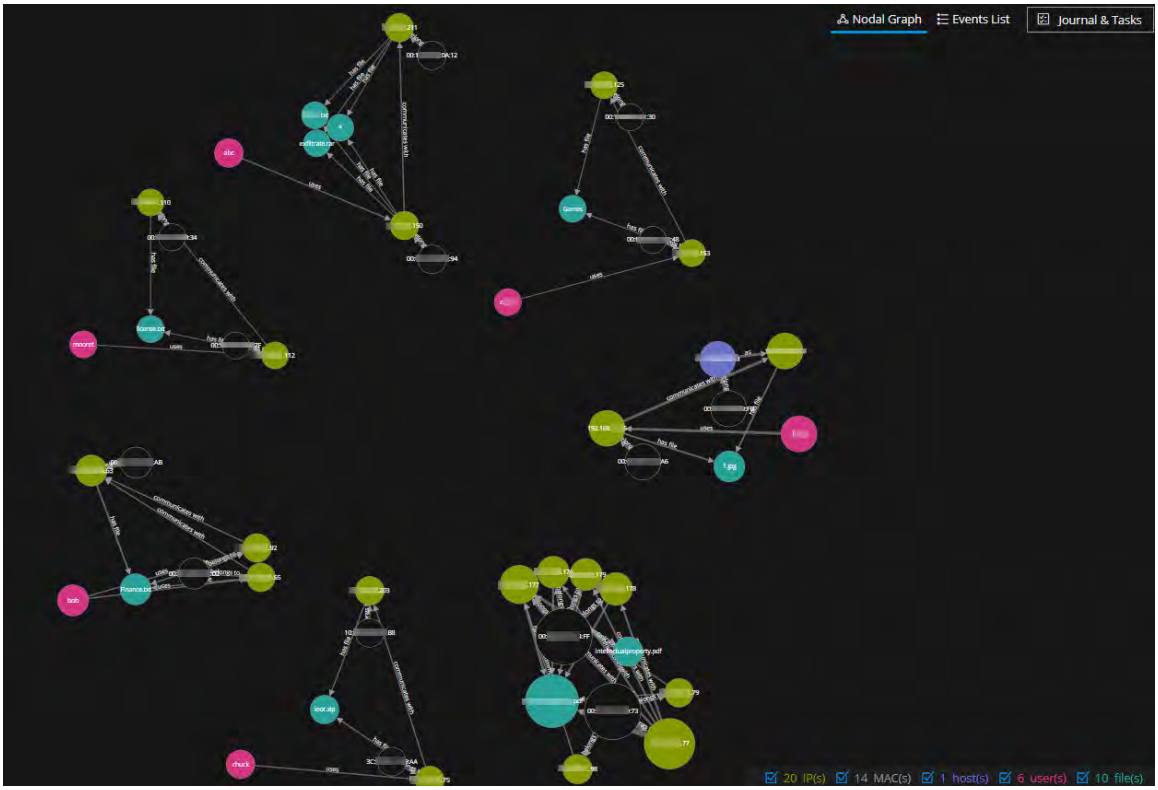


- Attributes and actions are better differentiated. Arrows that represent attributes ("as", "is named", "belongs to", and "has file") tend to be shorter than those representing actions ("call" and "communicates with").



- Leaf nodes, which are nodes that only have a single relationship to a single entity, tend to stay closer together.

- Disjointed graphs, such as clusters of entities and relationships that do not have connections with one another, are forced apart.



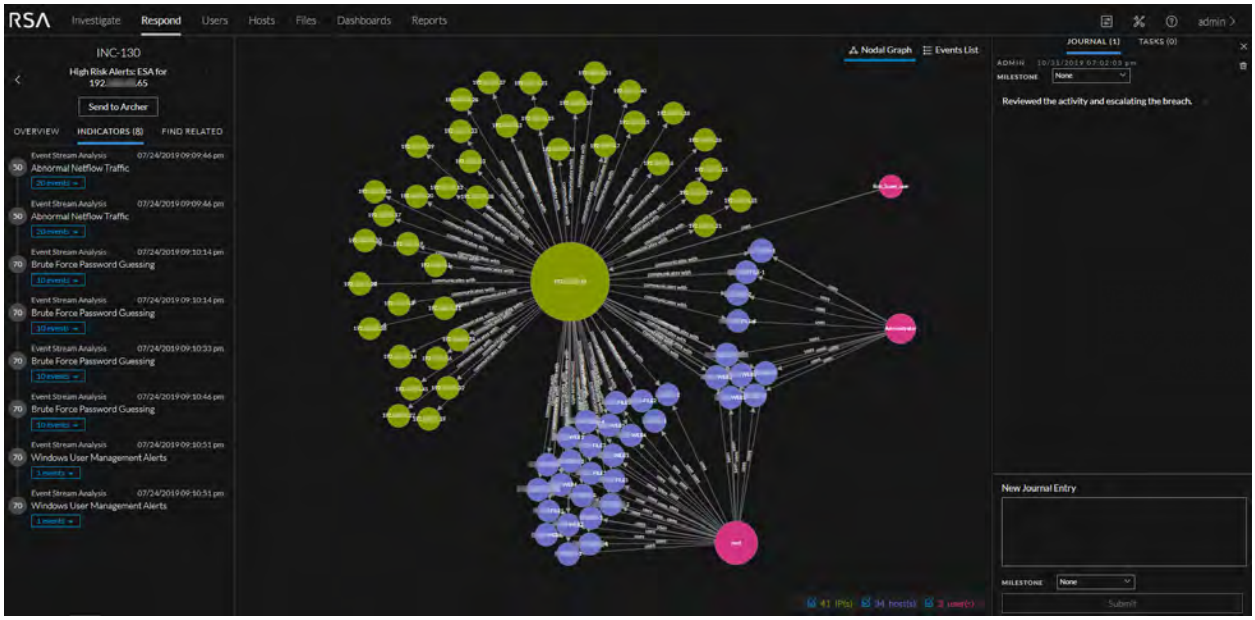
Dragged nodes are pinned in place. Double-click a node to unpin it and allow the forces to apply again to the node.

# Select Node Types to View on the Nodal Graph

**Note:** This option is available in NetWitness Platform Version 11.2 and later.

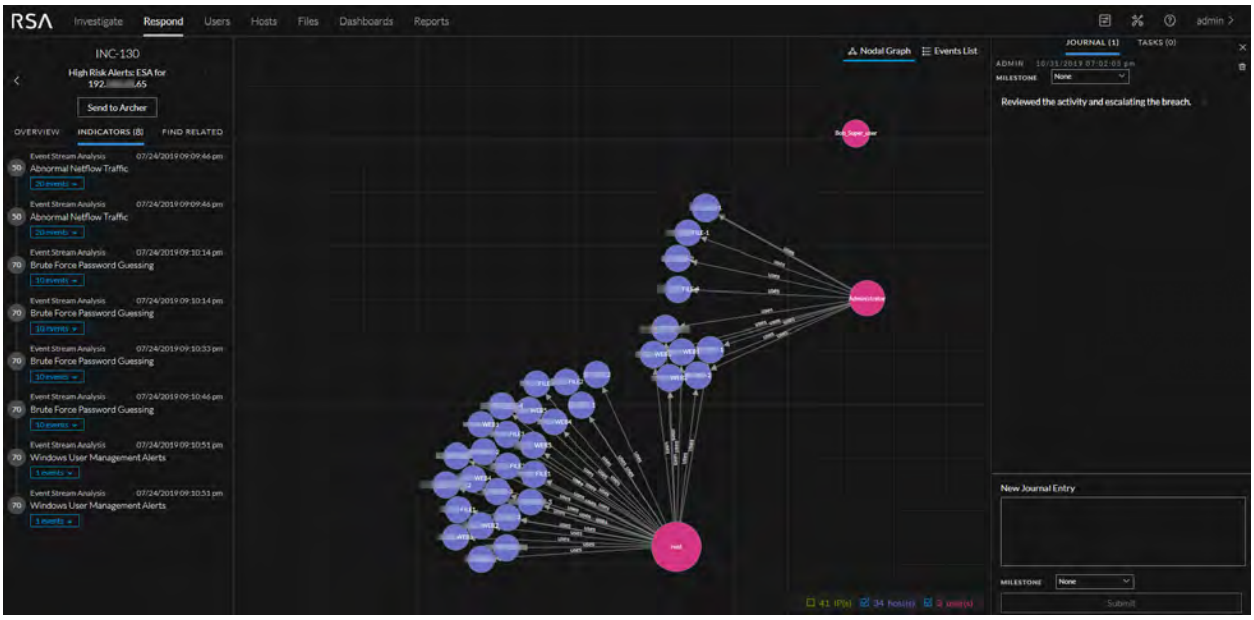
In the Incident Details view nodal graph, you can hide node types to further study the interactions between the entities on the nodal graph.

1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view for the selected incident appears with the Nodal Graph in view. The legend below the nodal graph has all of the entity node types selected by default.
   If you do not see the nodal graph, click Nodal Graph.

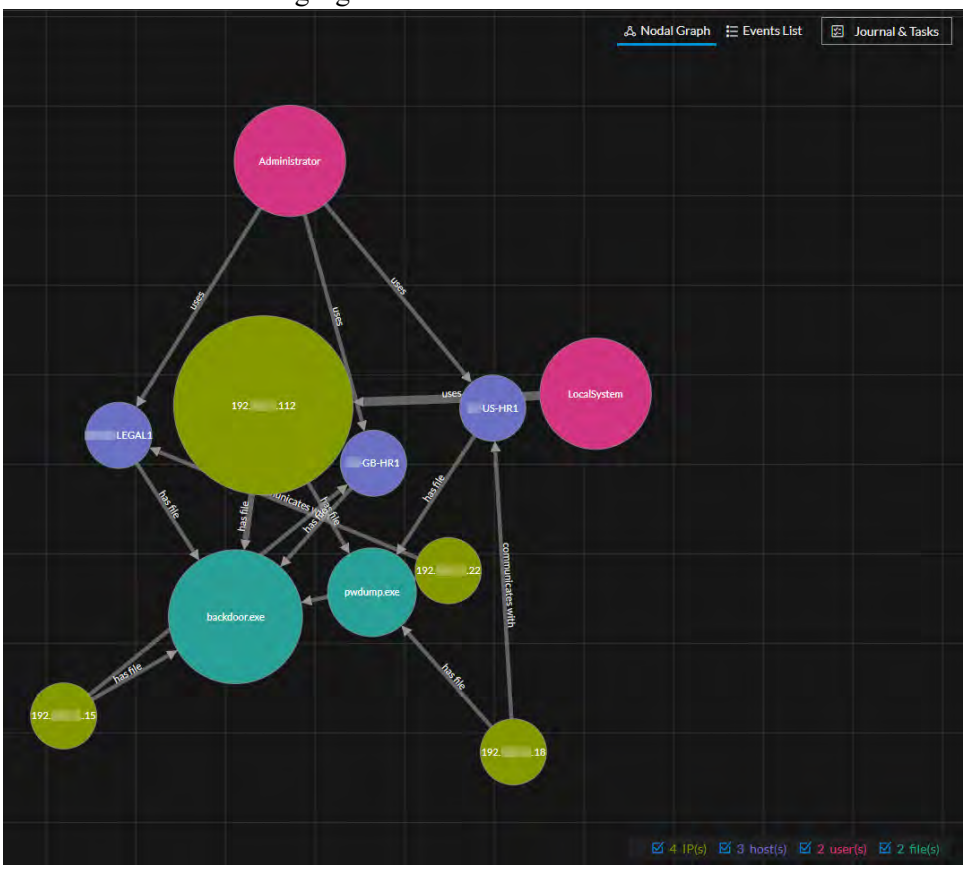


3. To hide node types, in the legend, clear the checkbox for the node types that you would like to hide in the nodal graph.

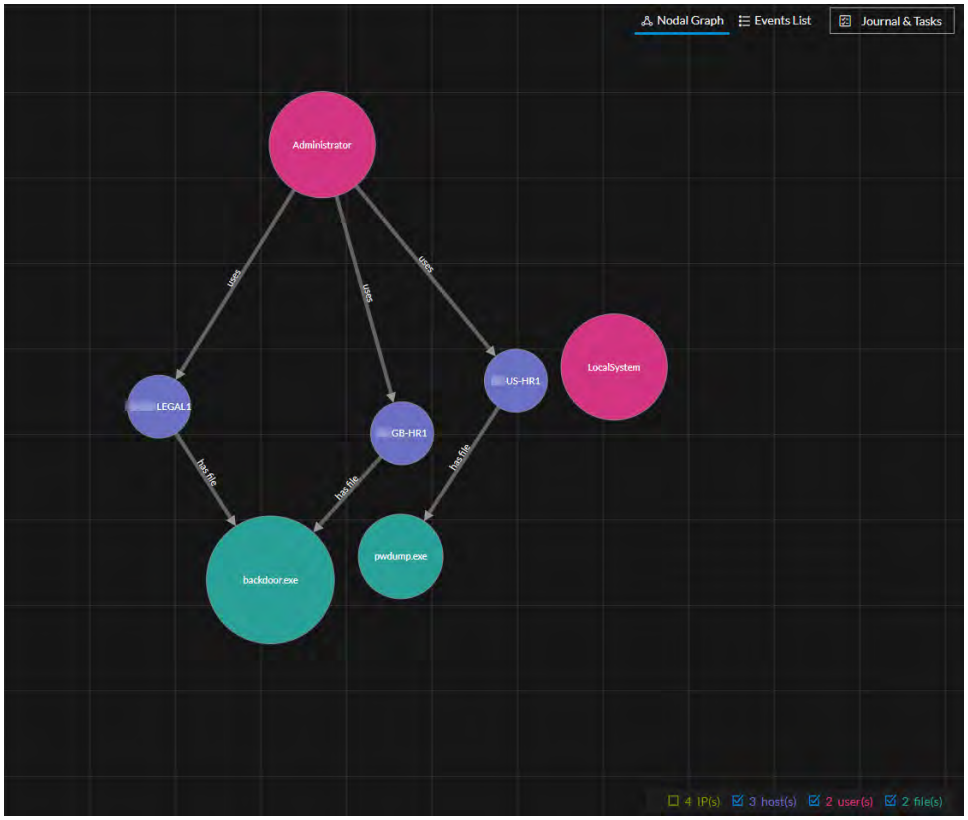
   The following example shows the IP address node type cleared and the IP address nodes are now hidden.



4. To include (unhide) node types, select the checkbox for the node types that you would like to appear in the nodal graph.
   Hiding node types can be especially helpful if the nodal diagram has overlapping entity relationships as shown in the following figure.



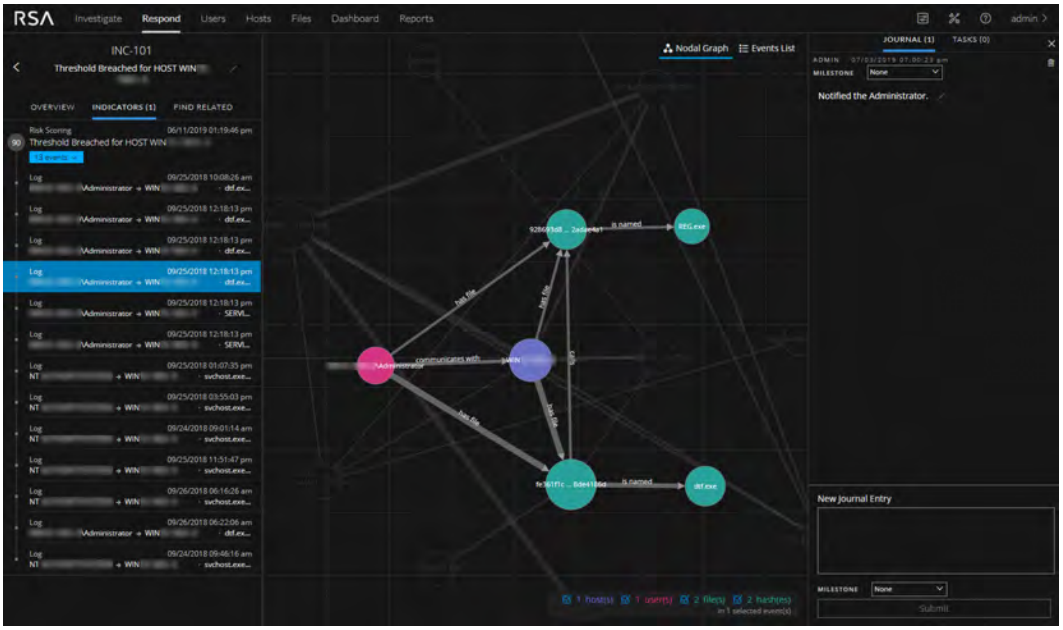
After hiding the IP node types, you can get a better understanding of what is happening with the remaining nodes.



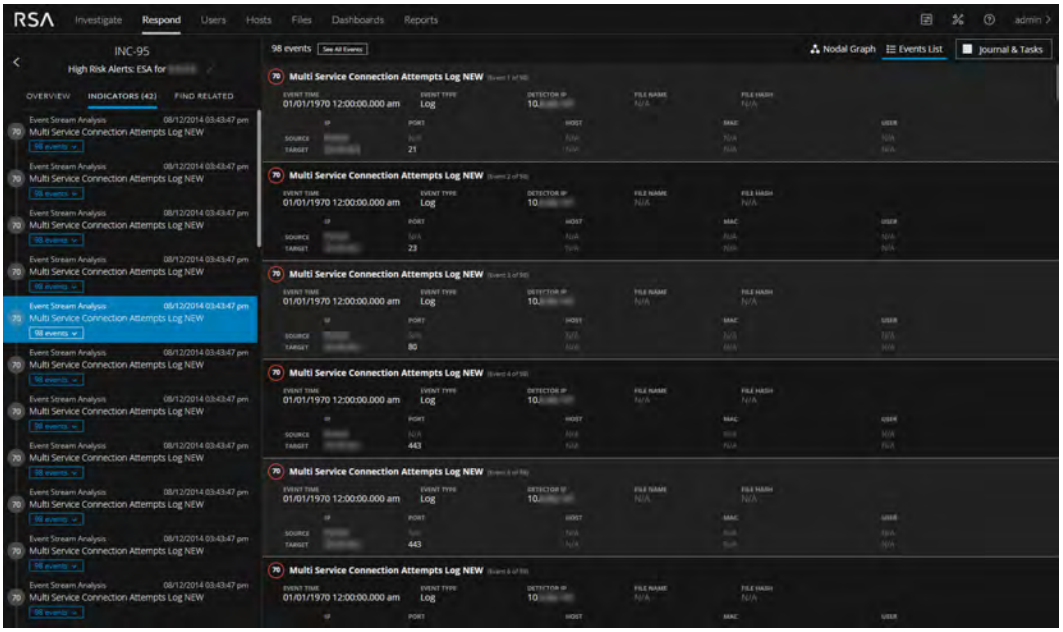
# Filter the Data in the Incident Details View

You can click indicators in the Indicators panel to filter what you can see in the Nodal Graph and the Events List.

If you select an indicator to filter the nodal graph, data that is not part of your selection is dimmed, but it is still in view as shown in the following figure.



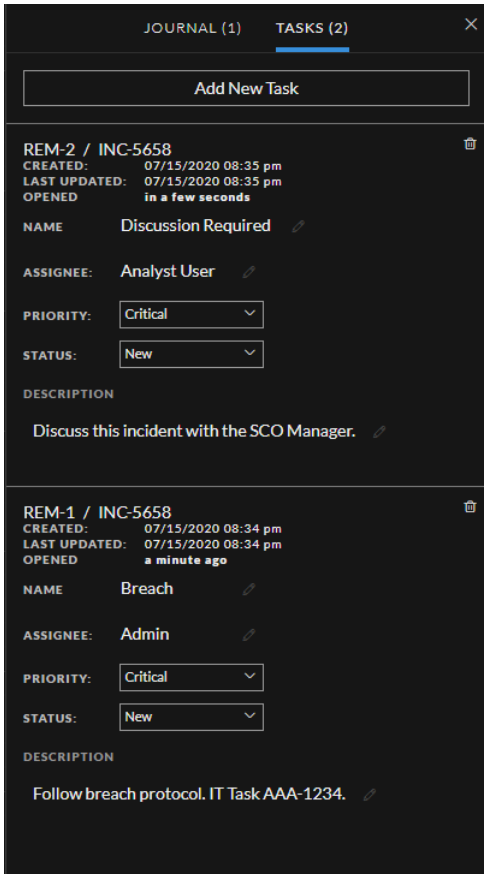
If you select an indicator to filter the Events List, only the events for that indicator are shown in the list. The following figure shows an indicator selected that contains ninety-eight events. The filtered Events List shows those ninety-eight events.



# View the Tasks Associated with an Incident

Threat responders and other analysts can create tasks for an incident and track those tasks to completion. This can be very helpful, for example, when you require actions on incidents from teams outside of your security operations. You can view the tasks associated with an incident in the Incident Details view.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the Journal on the right side of the Incident Details view, click the **TASKS** tab.
   If you cannot see the Journal, click **Journal & Tasks** and then click the **TASKS** tab.
   The Tasks panel shows all of the tasks for the incident.

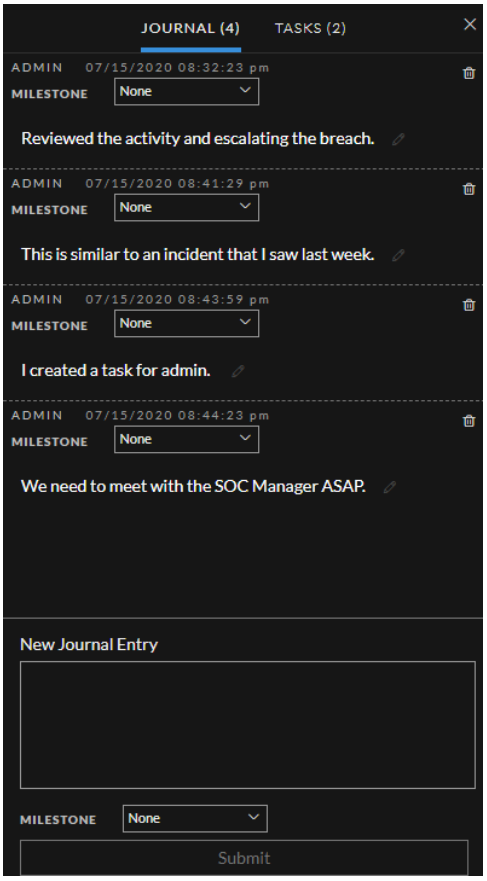


For more information about tasks, see Tasks List View, View All Incident Tasks, and Create a Task.

# View Incident Notes

The incident Journal enables you to view the history of activity on your incident. You can view journal entries from other analysts and also communicate and collaborate with them.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
   The Journal on the right side of the Incident Details view shows all of the journal entries for the incident.
   If you cannot see the Journal, in the toolbar, click **Journal & Tasks**.

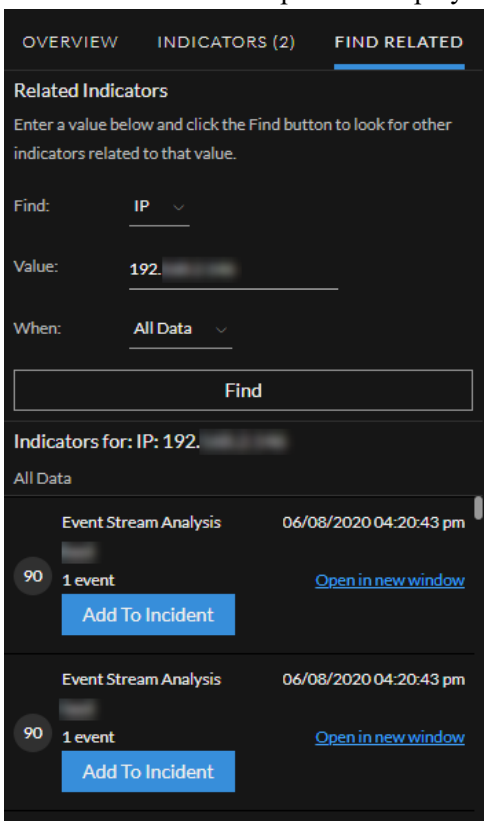


# Find Related Indicators

*Related Indicators* are alerts that were not originally part of the selected incident, but they are related in some way to the incident. The relationship may or may not be obvious. For example, related indicators can involve one or more entities from the incident, but they can also be related due to some intelligence outside of NetWitness.

In the Incident Details view Related Indicators panel, you can search for an entity (such as IP, MAC, Host, Domain, User, Filename, or Hash) in other alerts outside of the current incident.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the left panel of the Incident Details view, click the **FIND RELATED** tab.
   The Related Indicators panel is displayed.

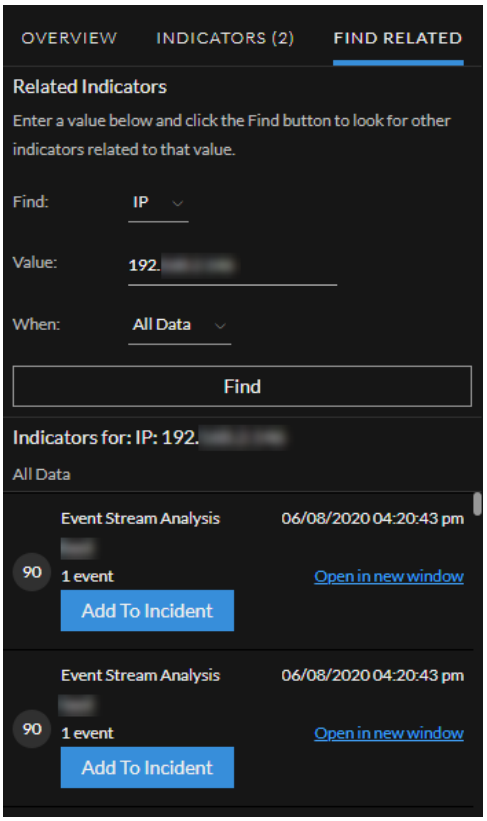


4. In the **Find** field, select the entity type to search, such as IP.
5. In the **Value** field, type a value for the entity, such as a specific IP address.
6. In the **When** field, select the time period to search, such as the Last 24 Hours.
7. Click **Find**.
   A list of related indicators (alerts) appear below the **Find** button in the **Indicators for** section. If an alert is not part of another incident, you can click the **Add to Incident** button to add the related indicator (alert) to the current incident. See Add Related Indicators to the Incident below.

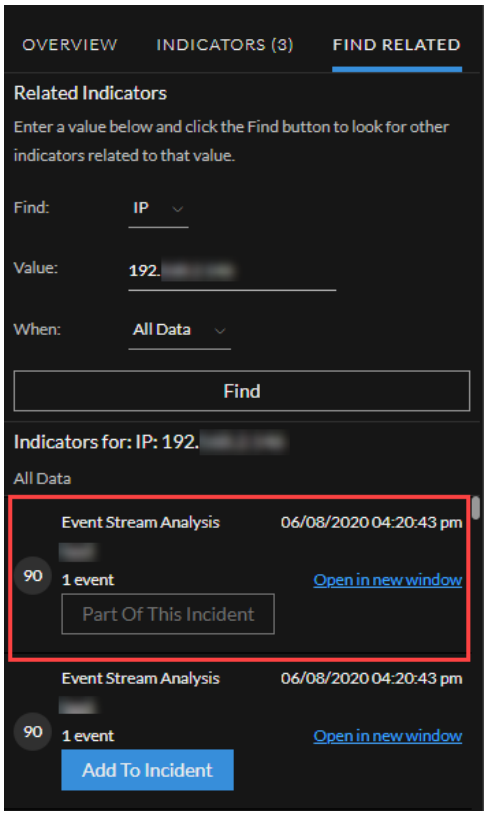
# Add Related Indicators to the Incident

You can add related indicators (alerts) to the current incident from Related Indicators panel. An indicator that is already part of an incident cannot be part of another incident. In the search results, if an alert is not already part of an incident, it has an **Add to Incident** button.

1. In the Related Indicators panel, do a search to find related indicators. See Find Related Indicators above.



2. Review the alerts in the search results. The **Indicators for** section (below the Find button) lists the related indicators (alerts).
3. To inspect the details of an alert before adding it as a related indicator to the incident, you can click the **Open in New Window** link to view the alert details for that indicator.
4. For each alert that you want to add to the current incident as a related indicator, click the **Add to Incident** button.
   The button in the Related Indicators panel now shows **Part of This Incident**.



The selected related indicator adds to the Indicators panel. The Indicators tab now shows the additional indicator.

# Investigate the Incident

To further investigate an incident within the Incident Details view, you can find links that take you to additional contextual information about the incident when it is available. This additional context can help you understand additional technical context and business context about a specific entity in the incident. It can also provide additional information that you may want to research to ensure that you understand the full scope of the incident.

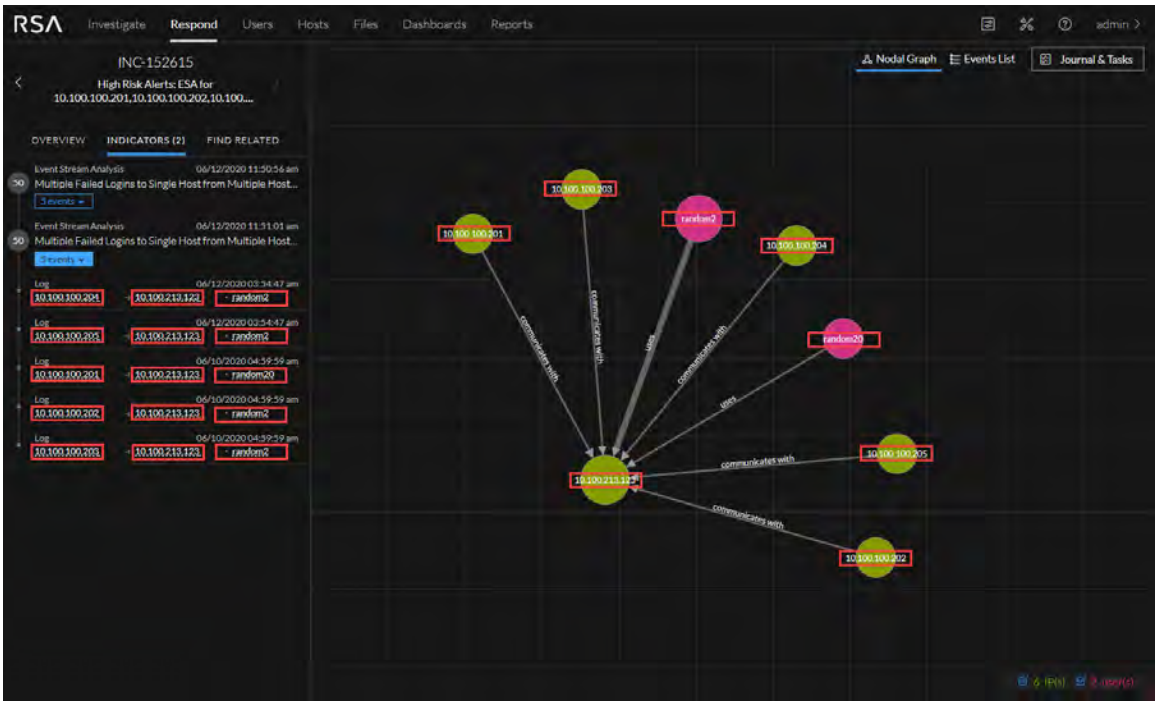
You can perform the following procedures to further investigate an incident:

- View Contextual Information
- Add an Entity to a Whitelist
- Create a List
- View the Reputation Status of a File Hash
- Pivot to the Investigate > Navigate View
- Pivot to the Hosts or Files View
- Pivot to NetWitness Endpoint Thick Client
- Pivot to Archer
- View Event Analysis Details for Indicators
- View User Entity Behavior Analytics for Indicators
- Document Steps Taken Outside of NetWitness
  - View the Journal Entries for an Incident
  - Add a Note
  - Delete a Note

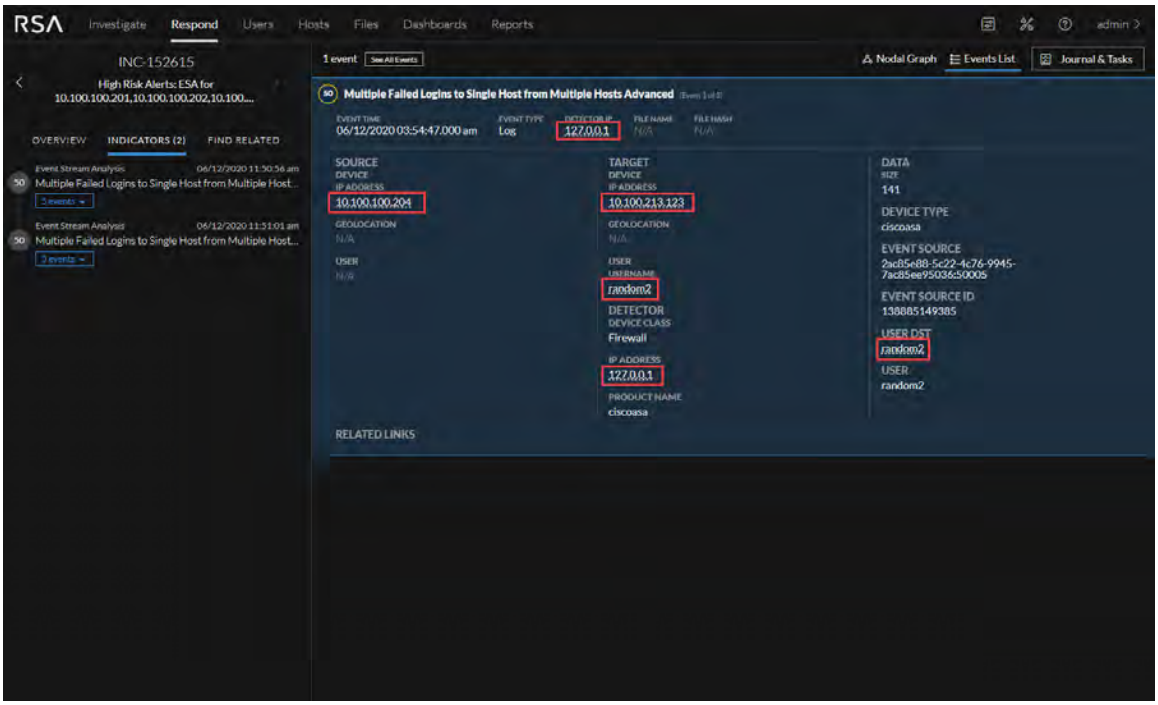
# View Contextual Information

In the Indicators panel, Events List, or the Nodal Graph, you can view the underlined entities. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Indicators panel and the Nodal Graph.



The following figure shows underlined entities in the Events list details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

**Caution:** For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **Admin > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

### To view contextual information:

1. In the Indicators panel, Events List, or the Nodal Graph, hover over an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

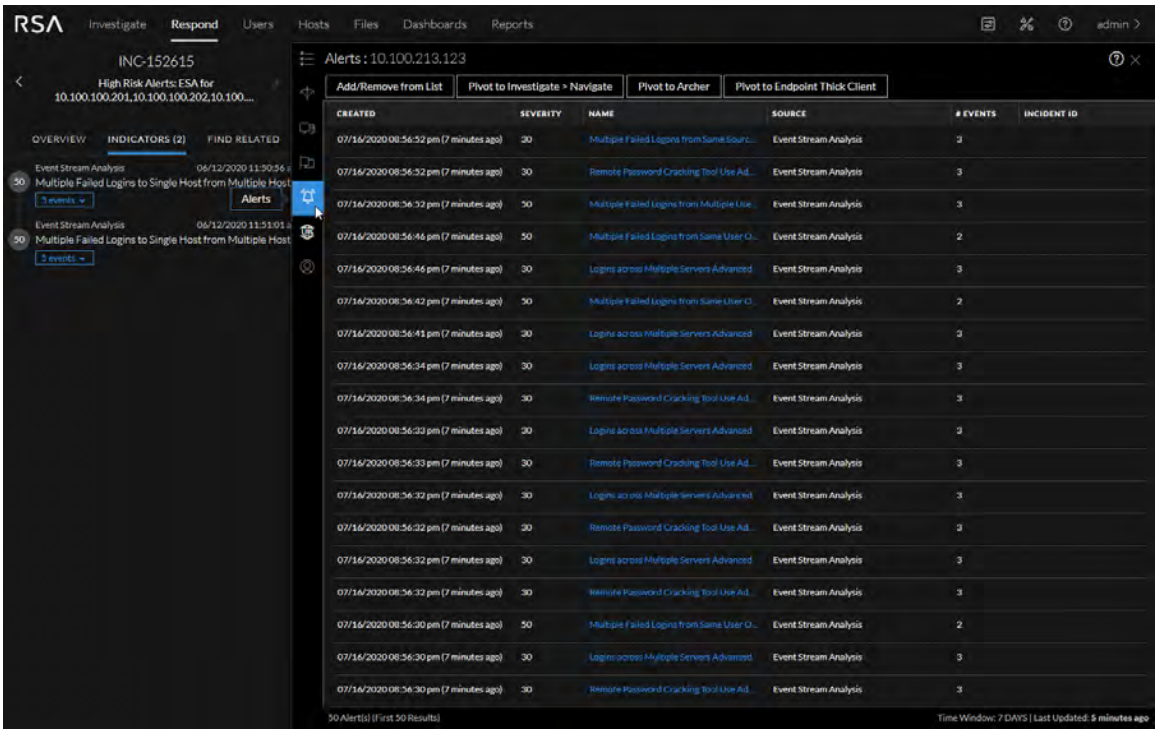
The context tooltip has two sections: Context Highlights and Actions.

The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.
The above example shows 0 related incidents, 6800 alerts, 0 lists for the selected host, 0 incidents for TI, and no information available for Endpoint, Live Connect, Criticality, and Asset Risk.
TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.
The **Actions** section lists the available actions. In the above example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Investigate > Hosts/Files and Pivot to Endpoint Thick Client options are available.

**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see Pivot to the Investigate > Navigate View, Pivot to Archer, Pivot to NetWitness Endpoint Thick Client, Pivot to the Hosts or Files View, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context Lookup panel opens and shows all of the information related to the entity.
   The following example shows contextual information for a selected host. It lists all of the incidents that mention that host.

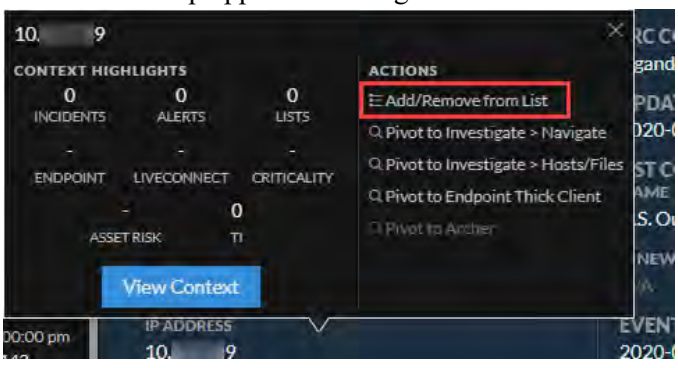


To understand the different views within the Context Hub Lookup panel, see Context Lookup Panel - Respond View.

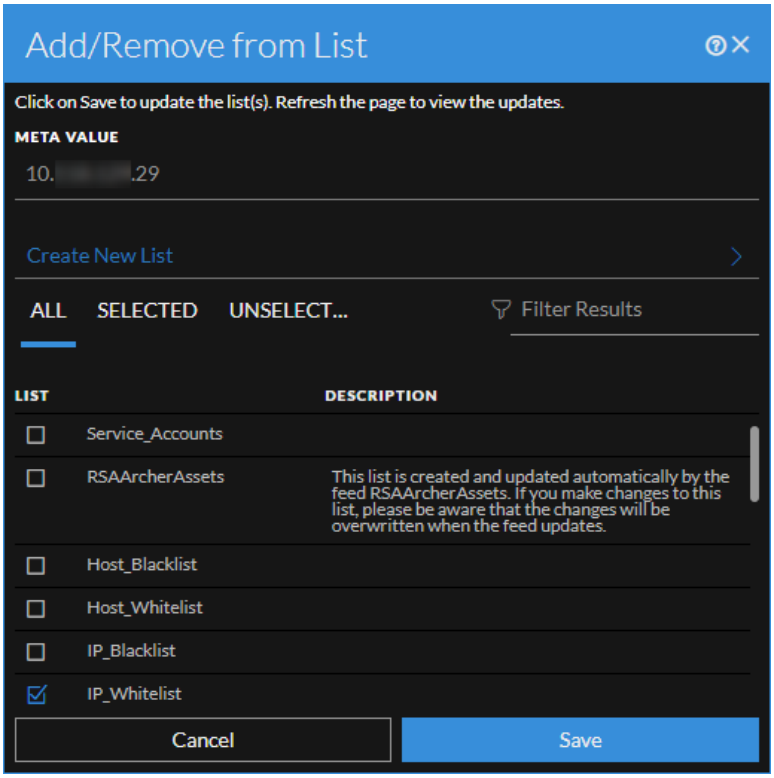
## Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Indicators panel, Events List, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.



2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

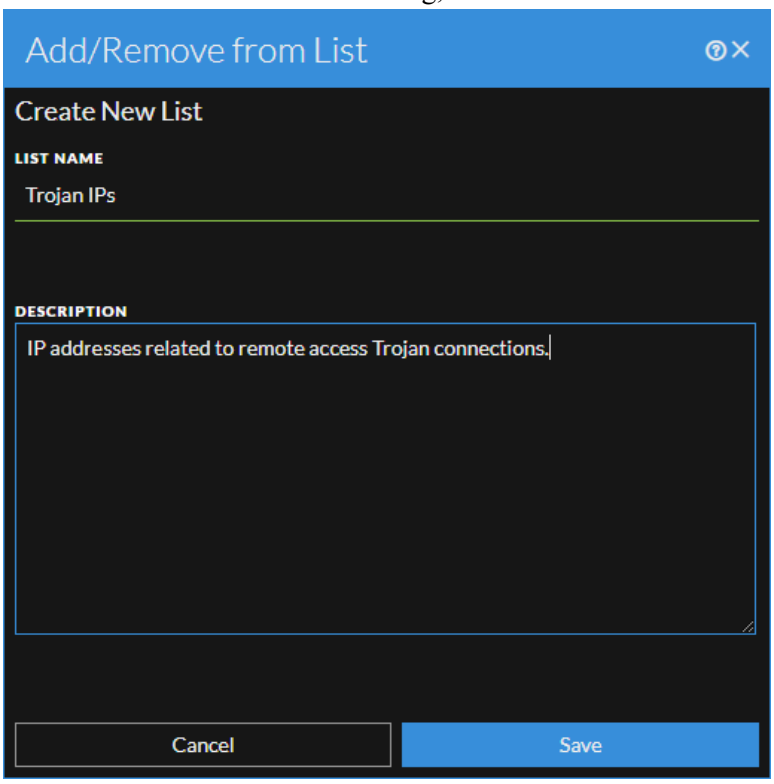
## Create a List

You can create lists in Context Hub from the Respond view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

### To create a list in Context Hub:

1. In the Indicators panel, Events List, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip opens showing the available actions.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.

3. In the Add/Remove from List dialog, click **Create New List**.



4. Type a unique **List Name** for the list. The list name is not case sensitive.
5. (Optional) Type a **Description** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

## View the Reputation Status of a File Hash

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed in the Investigate and Respond views. In the View Context lookup, if the reputation status changes, Context Hub notifies the change in reputation status to all Endpoint servers. Information about the file hash such as any suspicious or malicious activity on the file is populated from Context Hub. There may be additional information available about that entity in the Context Hub.

The following table describes the file hash reputations.

| Reputation | Description |
|---|---|
| Malicious | File hash is labeled as malicious. |
| Suspicious | File hash is suspected to be malicious. |
| Unknown | File hash is not known. |

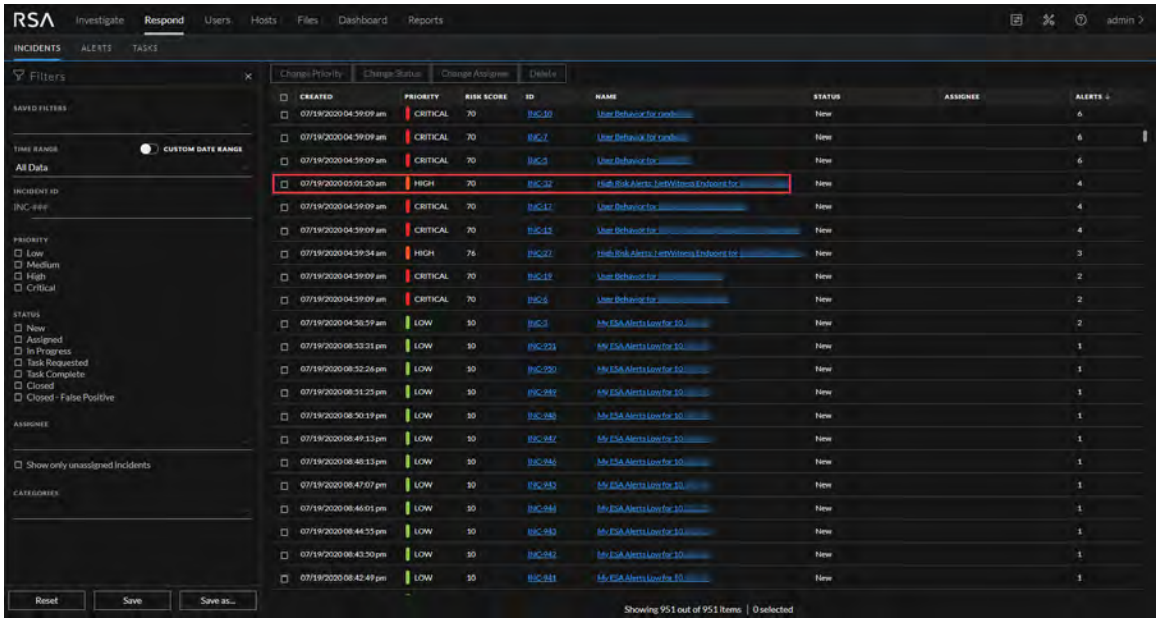
| Reputation | Description |
|---|---|
| Known | File hash information is known to the file reputation service and does not have any previous bad record. |
| Known Good | File hash information is known good, such as files signed by Microsoft or RSA. |
| Invalid | File hash format is invalid. |

**Note:** A reputation status is visible for a file hash entity only and File Reputation service supports a maximum of 10 million files for a reputation of file hash.

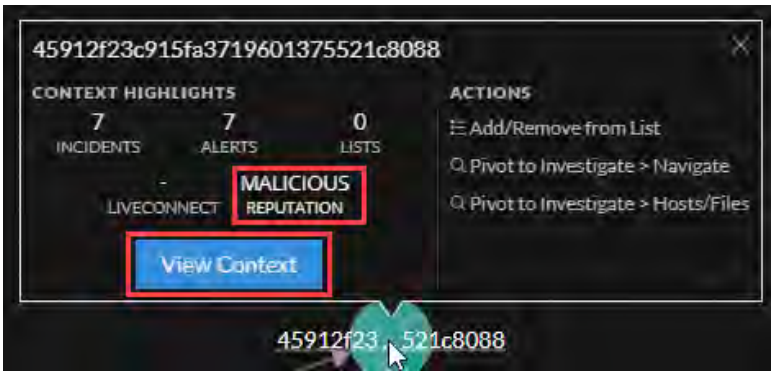
The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide* and the *NetWitness Endpoint User Guide*.

### To view the reputation of a file hash:

1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **Name** column for that incident.

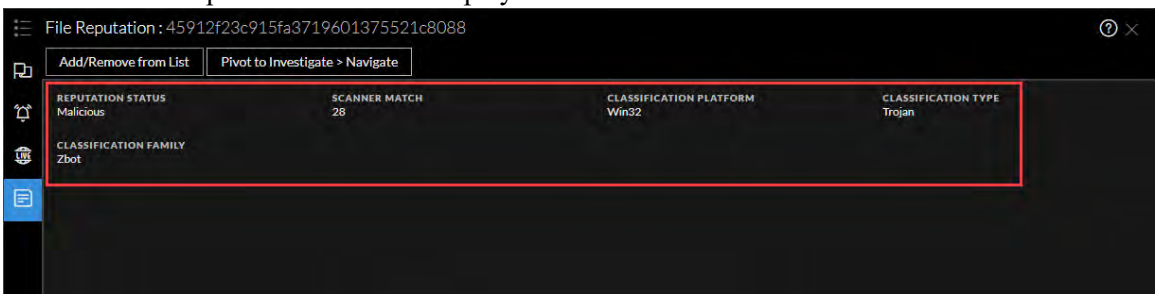


3. In the Incident Details view, hover over the file hash entity.
   The context tooltip displays the reputation status of the selected file hash entity.



4. Click **View Context** or **Reputation** to view the reputation status information.

5. Click the **File Reputation** icon to view further details.
The details for reputation status are displayed.



## Pivot to the Investigate > Navigate View

For a more thorough investigation of the incident, you can access the Investigate > Navigate view.

1. In the Indicators panel, Events List, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate > Navigate**.
The Navigate view opens, which enables you to perform a deep dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Navigate link see the *Alerting with ESA Correlation Rules User Guide*.

## Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

1. In the Indicators panel, Events List, or the Nodal Graph, hover over any entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate > Hosts/Files**.
If you hover over a host or IP or MAC address entity and click **Pivot to Investigate > Hosts/Files**, it

displays the Hosts view with a specific host listed.
If you hover over a filename or file hash entity and click **Pivot to Investigate > Hosts/Files** it displays the Files view with a specific file listed.

**Note:** By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

## Pivot to NetWitness Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

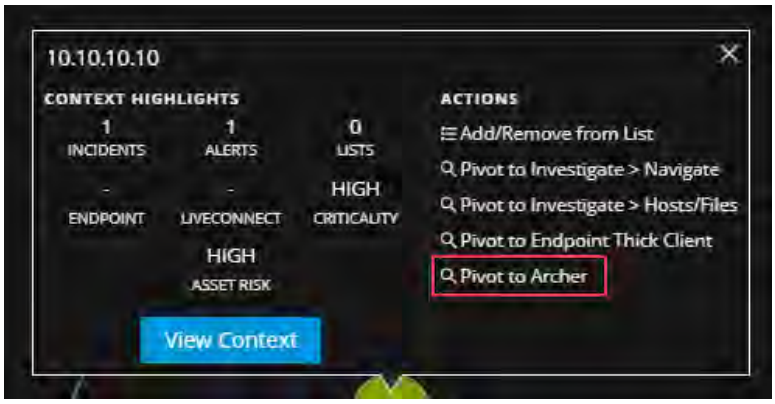
1. In the Indicators panel, Events List, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

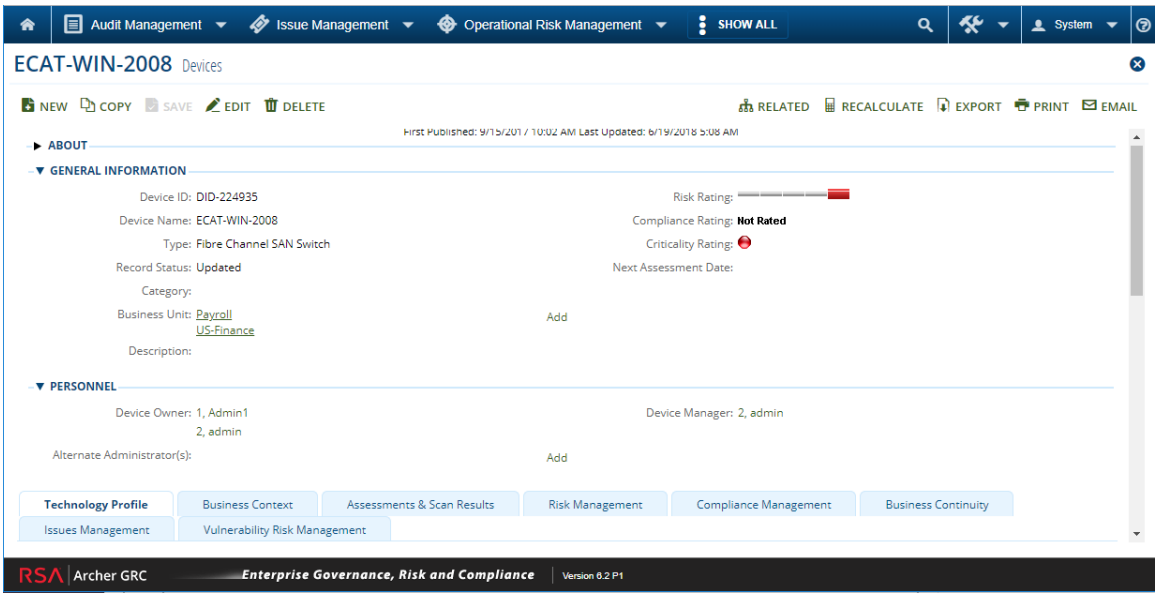
## Pivot to Archer

For viewing more details about the device in RSA Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Indicators panel, Events List, or the Nodal Graph, hover over any underlined entity (IP address, host, and Mac address) to access a context tooltip.
2. In the **ACTIONS** section, select **Pivot to Archer**.



3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *RSA Archer Integration Guide*.

# View Event Analysis Details for Indicators

In the Incident Details view Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events. In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events in the Events panel. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

**Note:** You must have the following Investigate-server permissions to view the Events panel in the Respond view:
`event.read`
`content.reconstruct`
`content.export`
The Events view requires all Core services to be on NetWitness Platform 11.4 or later.

## Migration Considerations

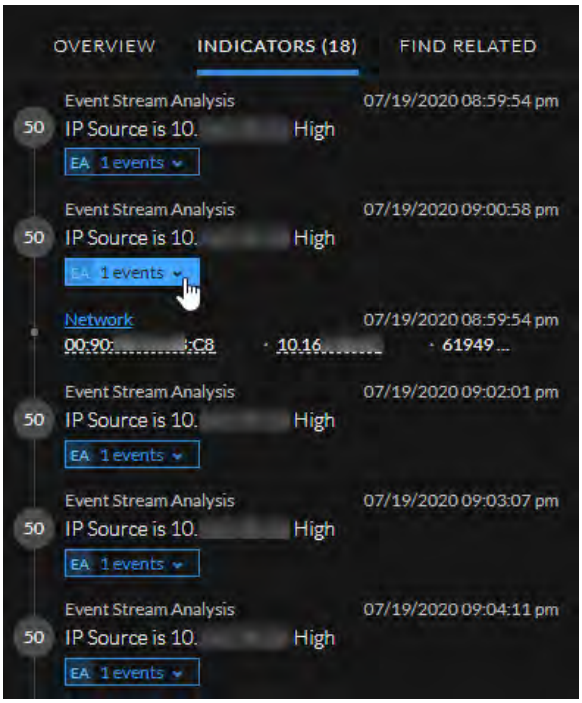
Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.

### To access event analysis details for an event in the Indicators panel:

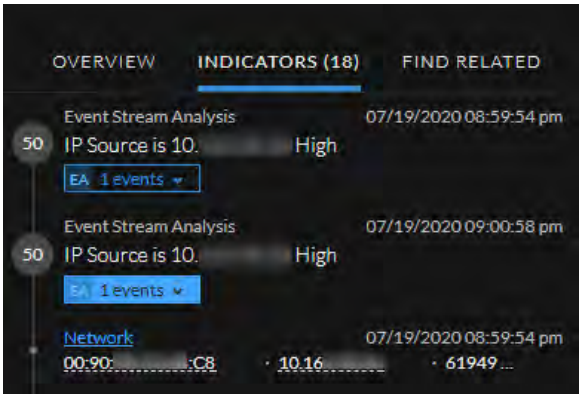
1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view is displayed.
3. In the left panel of the Incident Details view, go to the **Indicators** tab.

Data source information is shown above the names of the indicators. You can also see the creation date and time as well as the number of events in the indicator. If event analysis (EA) information is available, you can see an **EA** icon in front of the event count as shown in the following figure.

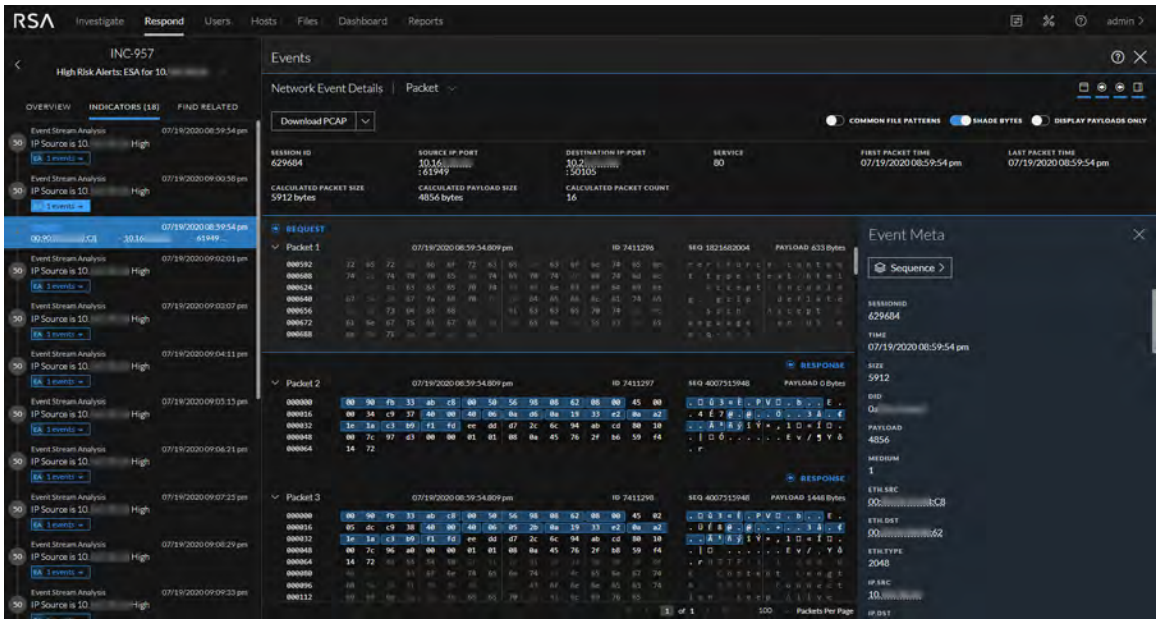
4. Click an event count with an **EA** icon to view additional event information.



5. Click an event type hyperlink within the event to open the Events panel. In the following example, the event type is Network.



The Events panel shows event details for the event, such as packet analysis details. The information available can vary based on the event type.

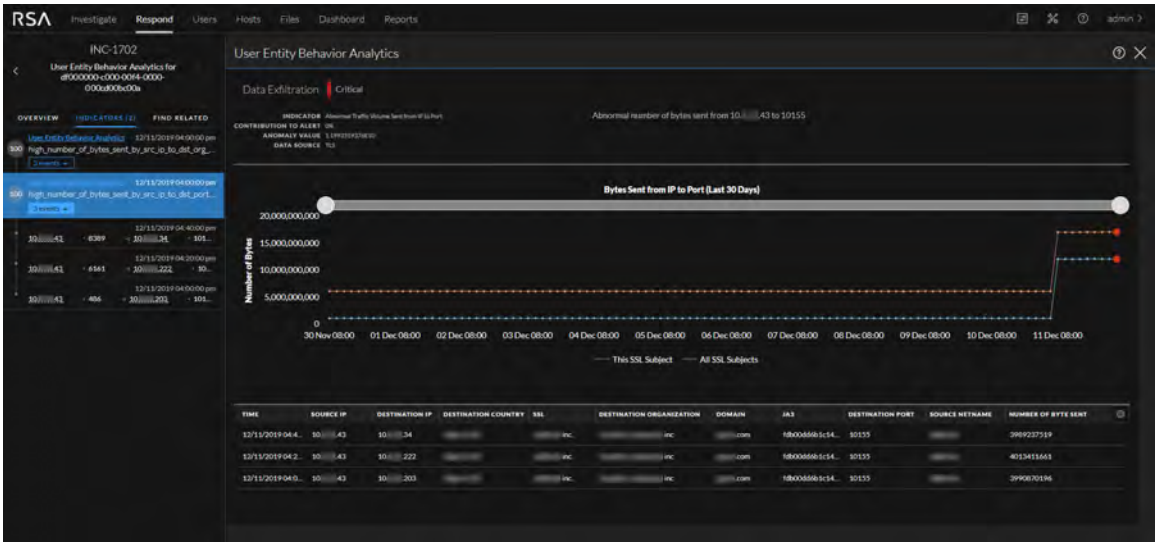


For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

**Note:** If you want to send the Events URL link to another analyst, you can copy the event type hyperlink, for example Network.

# View User Entity Behavior Analytics for Indicators

RSA NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.



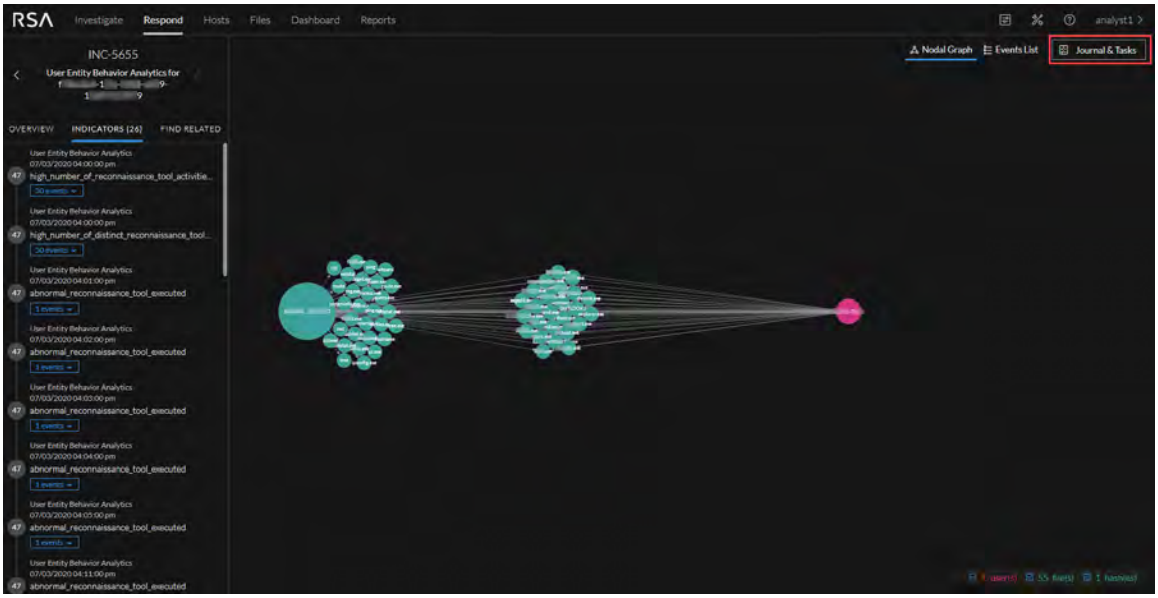
# Document Steps Taken Outside of NetWitness

The journal shows notes added by analysts and it enables you to collaborate with your peers. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.

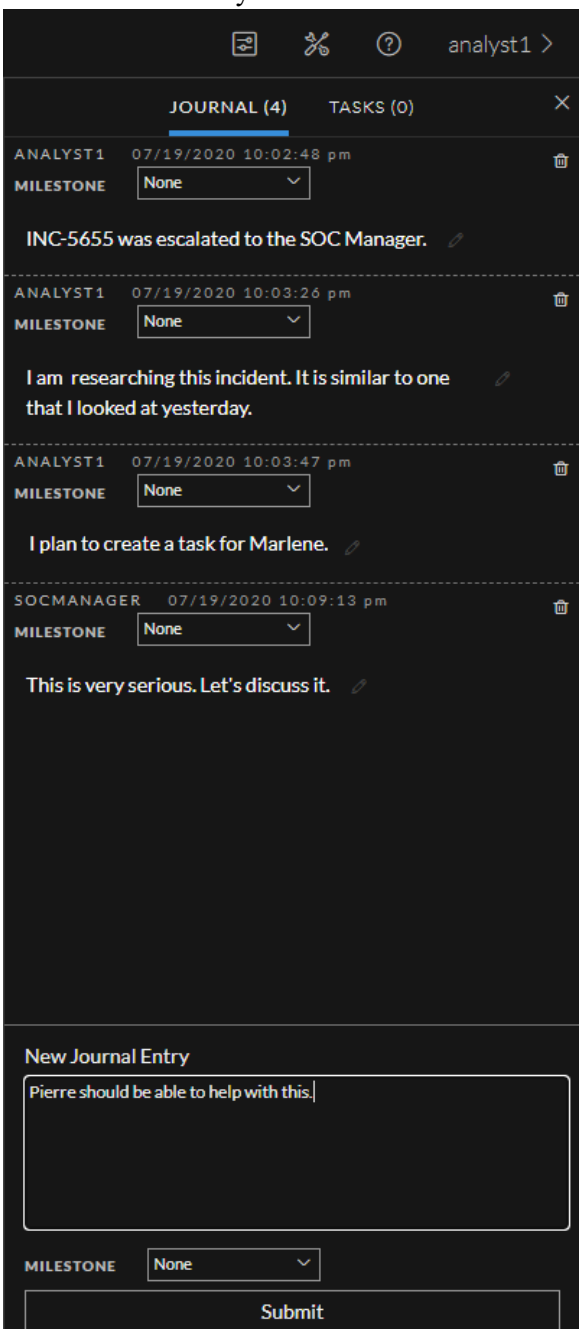
## View the Journal Entries for an Incident

The Journal is on the right side of the Incident Details view.

If you do not see the Journal, in the toolbar, click **Journal & Tasks**.



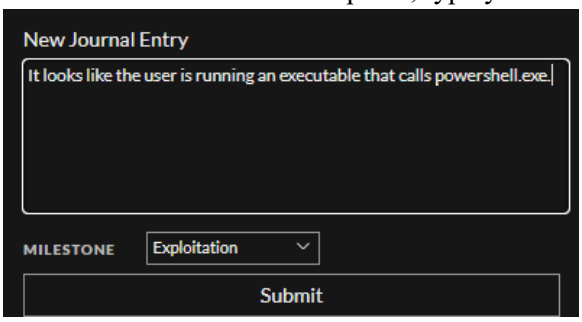
The Journal shows the history of activity on an incident. For each journal entry, you can see the author and time of the entry.



## Add a Note

Typically, you will want to add a note to allow another analyst to understand the incident, or add a note for posterity so that your investigative steps are documented.

1. At the bottom of the Journal panel, type your note in the **New Journal Entry** box.



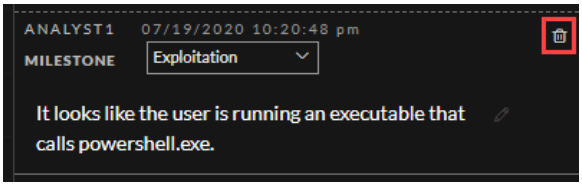
2. (Optional) Select an Investigation Milestone from the drop-down list (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action On Objective, Containment, Eradication, and Closure).

3. After you finish your note, click, **Submit**.
   Your new journal entry appears in the Journal.

## Delete a Note

1. In the Journal panel, locate the journal entry that you would like to delete.

2. Click the trash can (delete) icon next to the journal entry.



3. In the confirmation dialog that appears, click **OK** to confirm that you want to delete the journal entry. This action cannot be reversed.

# Escalate or Remediate the Incident

You may want to escalate an incident, assign incidents to another Analyst, or change the status and priority of an incident as you gather more information about it. This is useful if, for example, you upgrade the priority of an incident from high to critical after determining that the incident is a major breach. You may also want to send the incident to RSA Archer Cyber Incident & Breach Response for additional analysis and action.

You can perform the following procedures to escalate or remediate an incident:

- Send an Incident to RSA Archer
- View All Incidents Sent to Archer
- Update an Incident
- Change Incident Status
- Change Events Retention
- Change Incident Priority
- Assign Incidents to Other Analysts
- Rename an Incident
- View All Incident Tasks
- Filter the Tasks List
- Remove My Filters from the Tasks List
- Create a Task
- Find a Task
- Modify a Task
- Delete a Task
- Close an Incident

## Send an Incident to RSA Archer

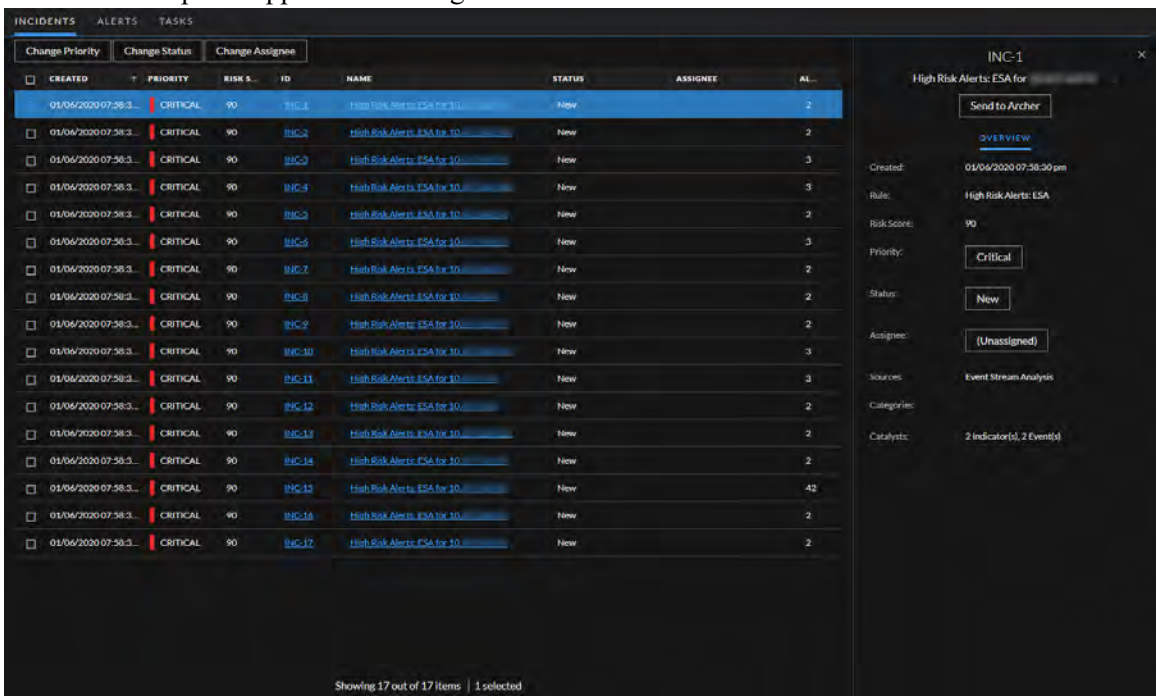
**Note:** This option is available in NetWitness Version 11.2 and later. If RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer and you can see the Send to Archer option and Sent to Archer Status in NetWitness Respond.

When you send an incident to Archer, a Sent to Archer notification appears within the incident. When configured, the NetWitness Platform can start additional business processes in Archer Cyber Incident & Breach Response. You can view all of the incidents that were sent to Archer Cyber Incident & Breach Response using the filter in the Incident Lists view.

You send an incident to Archer by clicking the Send to Archer button in the Overview panel in the Incident Lists view or the Incident Details view.

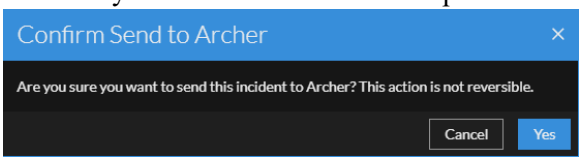
**Caution:** The **Send to Archer** action is not reversible.

1. Go to **Respond > Incidents**.
2. From the Incidents List view, click the incident that you want to send to Archer Cyber Incident & Breach Response.
   The Overview panel appears on the right.

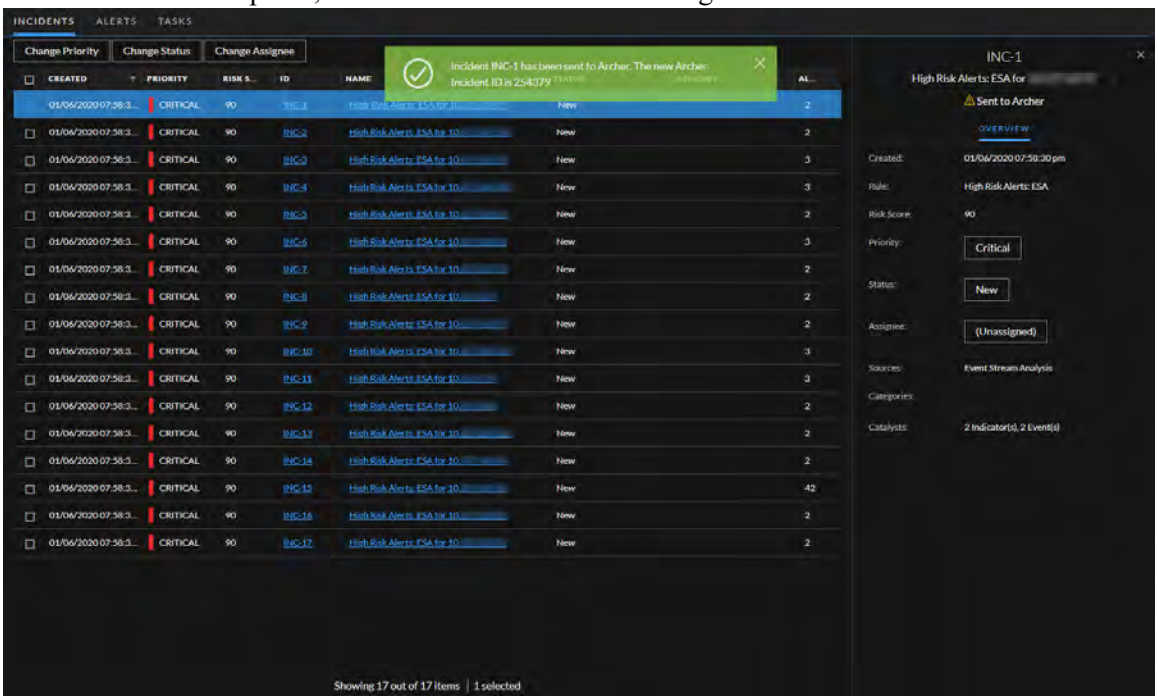


3. In the Overview panel, click **Send to Archer**.

4. Read the **Confirm Send to Archer** dialog and then click **Yes** to confirm sending the incident to Archer Cyber Incident & Breach Response. This action is not reversible.



You will receive a confirmation that the incident was sent to Archer along with an Archer incident ID. In the Overview panel, the Send to Archer button changes to Sent to Archer.



In the Incident Details view (click the link in the ID or NAME field of the incident sent to Archer) you can see the Sent to Archer notification above the Overview and Indicators panels. If you open the Journal, you can see a system journal entry that shows that the incident was sent to Archer and it now has an Archer ID number.

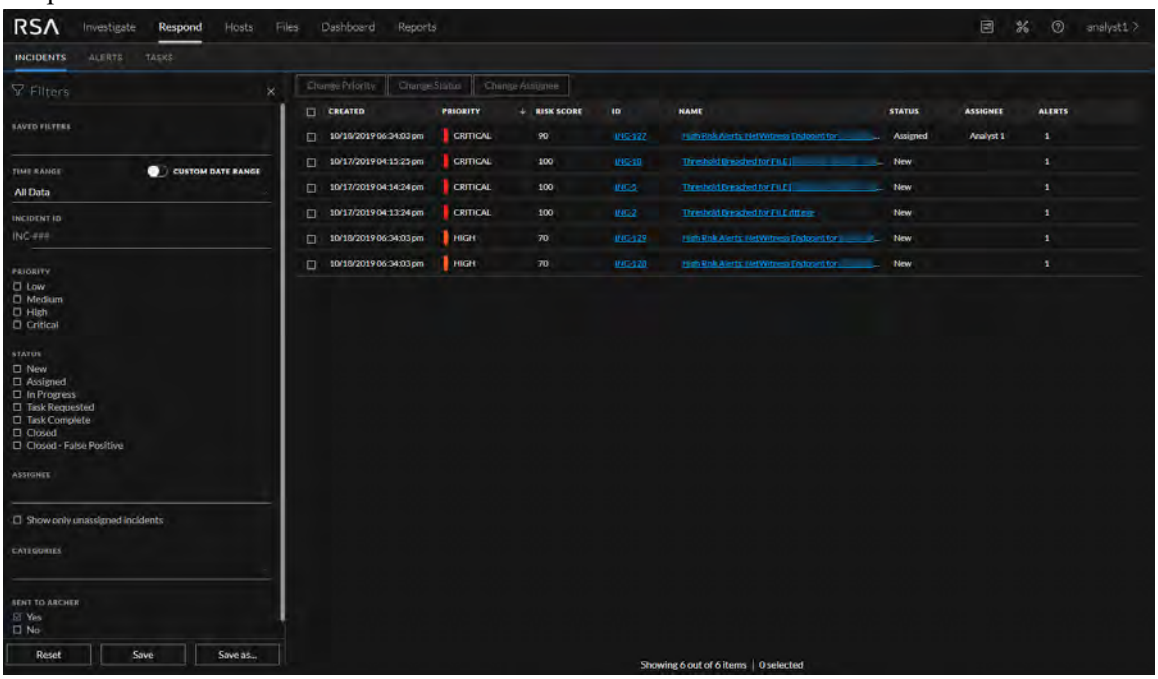
## View All Incidents Sent to Archer

**Note:** This option is available in NetWitness Version 11.2 and later. If RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer and you will be able to see the Sent to Archer option and Sent to Archer Status in NetWitness Respond.

You can view incidents sent to Archer Cyber Incident & Breach Response using the Filter.

1. Go to **Respond > Incidents**.
   The Incidents List is displayed.
2. If you cannot see the Filters panel, in the Incident List view toolbar, click .
3. In the Filters panel, under **Sent To Archer**, select **Yes**.
   The incidents list will be filtered to show incidents that were sent to Archer Cyber Incident & Breach

Response.



## Update an Incident

You can update an incident from several places. You can change the priority, status, or assignee from the Incident List view and the Incident Details view. For example, if you are an Analyst, you may want to assign yourself a case from the Incident List view if you see that it is related to another case you are working on. If you are an SOC Manager or an Administrator, you may want to view unassigned incidents from the Incident List view and assign the incidents as they come in. SOC Managers and Administrators can do bulk updates of the priority, status, or assignee instead of updating them one incident at a time.

From the Details view, you might want to change the status to In Progress once you begin working on an incident, and then update it to Closed or Closed - False Positive after you resolve the issue. Or you might change the priority of the incident to Medium or High as you determine the details of the case.

## Change Incident Status

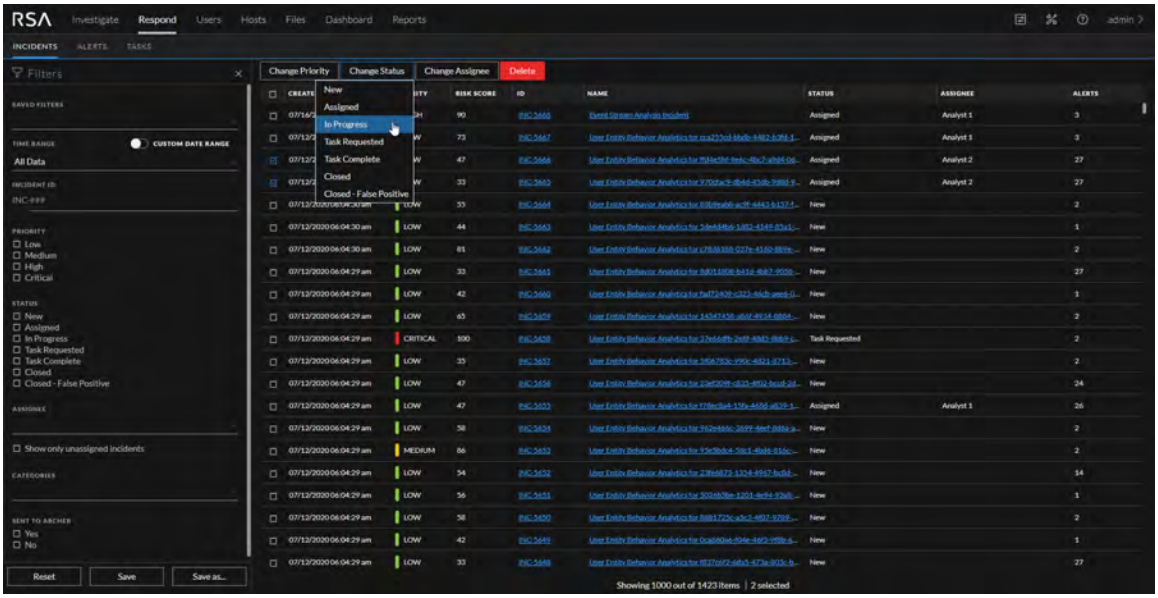
When an incident first appears in the incident list, it has an initial status of New. You can update the status as you complete your work on the incident. The following statuses are available:

- New
- Assigned
- In Progress
- Task Requested

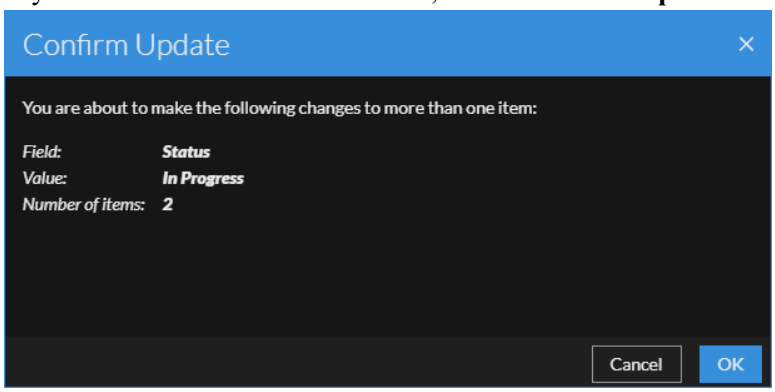
- Task Complete
- Closed
- Closed - False Positive

### To update the status of multiple incidents:

1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Status** and select a status from the drop-down list. In this example, the current status is Assigned, but the Analyst would like to change it to In Progress for the selected incidents.

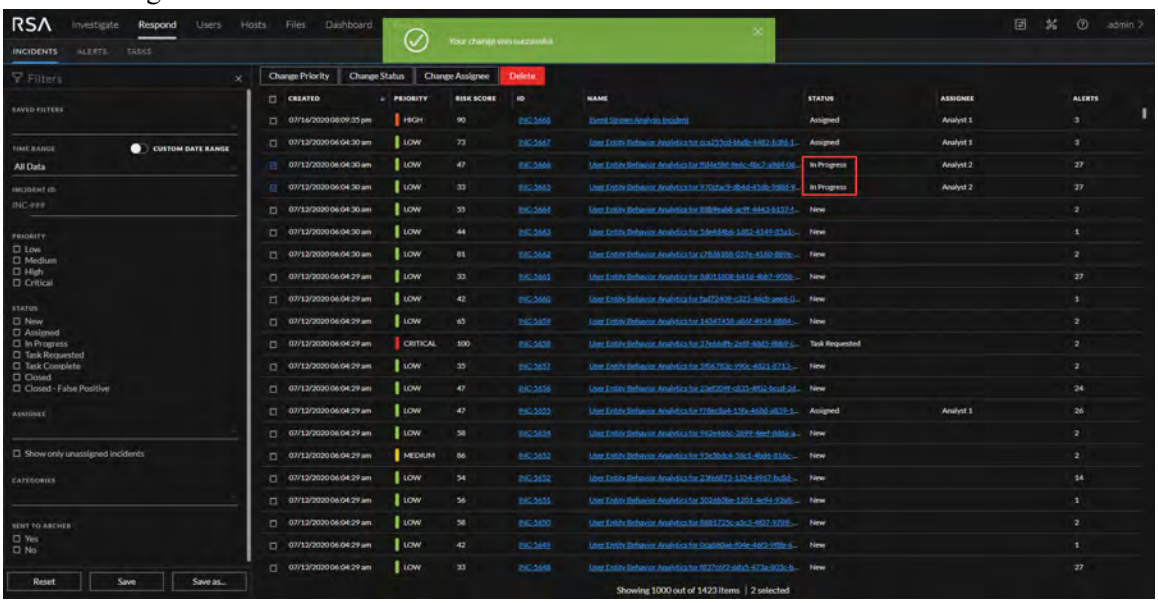


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.



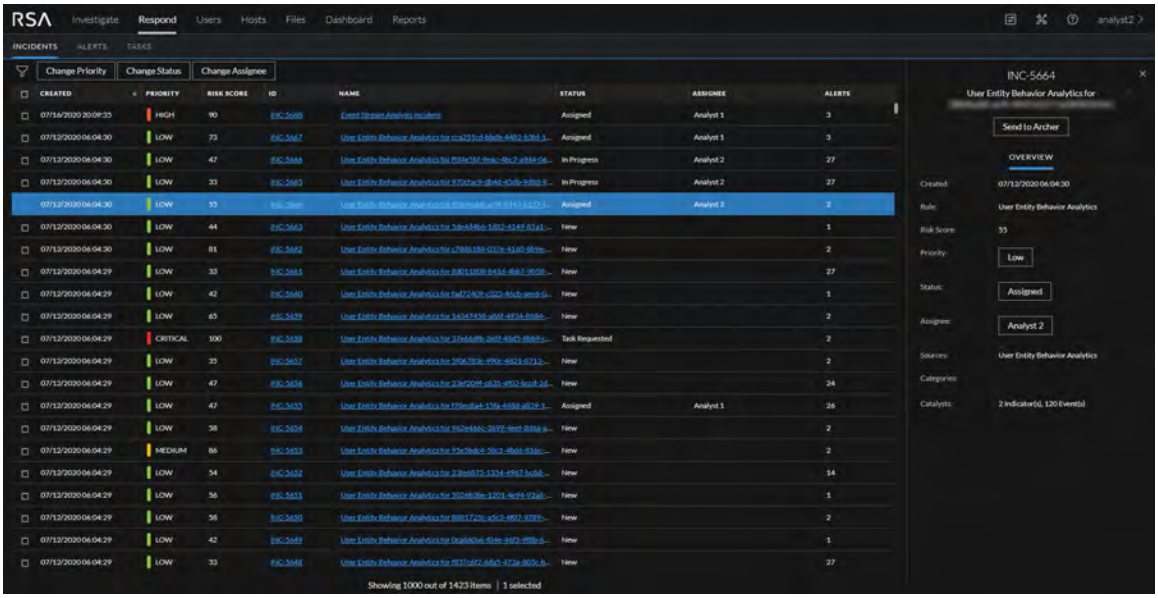
You can see a successful change notification. In this example, the status of the updated incidents now

show In Progress.

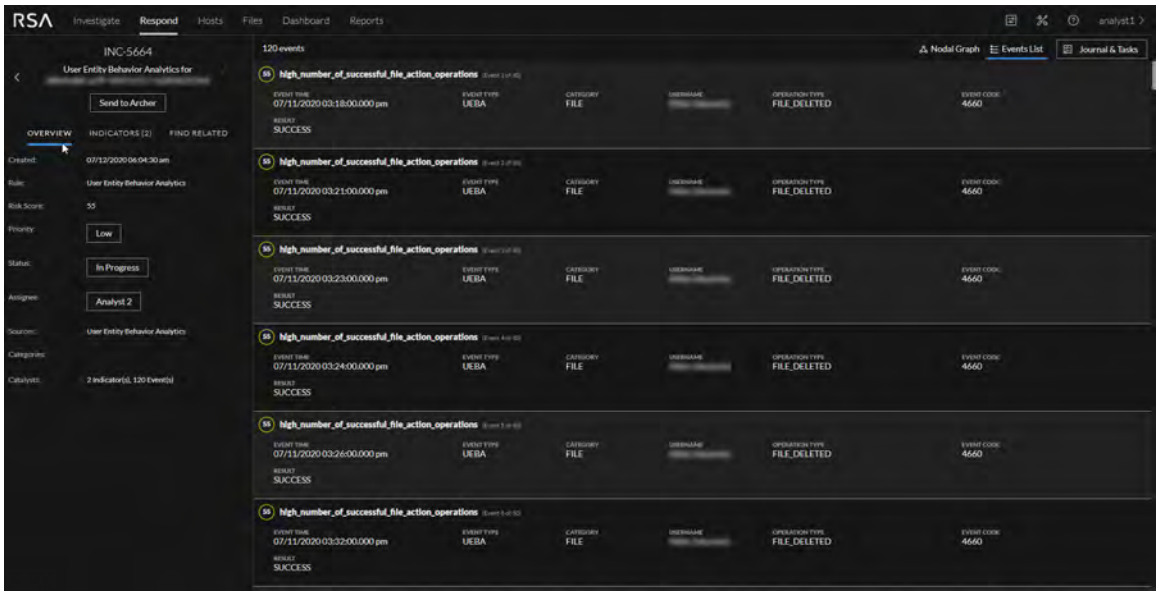


### To change the status of a single incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a status update.

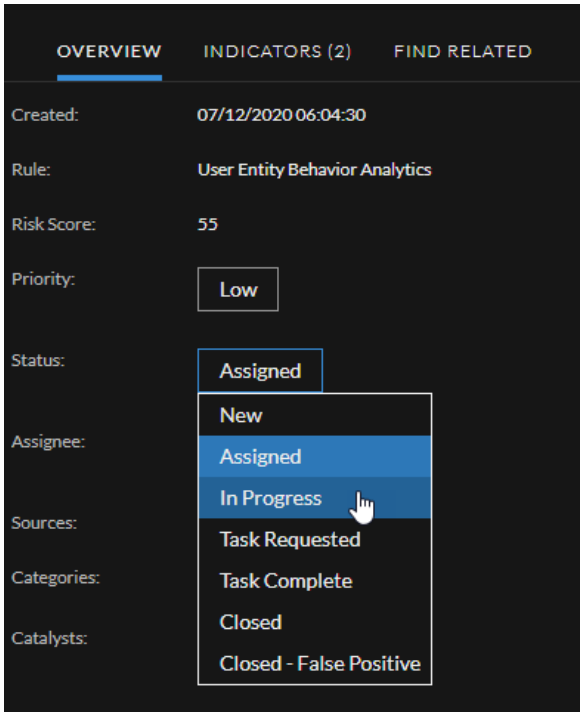


- From the Incident Details view, click the **OVERVIEW** tab.

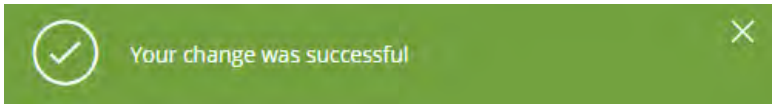


In the Overview panel, the Status button shows the current status of the incident.

2. Click the **Status** button and select a status from the drop-down list.



You can see a successful change notification.



# Change Events Retention

Events retention enables you to persist events that are associated with particular incidents, thereby enabling you to view the incident related events in the future, regardless of its age. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database. You can perform the following functions:

- Persist all events
- Suspend persisting all events

### To change event retention:

1. Select the incidents for which you want to change the event retention plan.
2. Select **Persist all events** from the **Change Events Retention** tab to persist all the events that are associated with the selected incidents.
   a. The confirmation message appears. Click **OK** to persist all events.
   Persisting all events in an incident in NetWitness will save the events data in the long term cache of the source.
3. Select **Suspend Persisting all events** from the **Change Events Retention** tab to stop persisting the events that are associated with the selected incidents.
   a. The confirmation message appears. Click OK to suspend persist all events.
   Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database.

**Note:** You cannot change the event retention for incidents that are in **New** or **Closed** state.

# Change Incident Priority

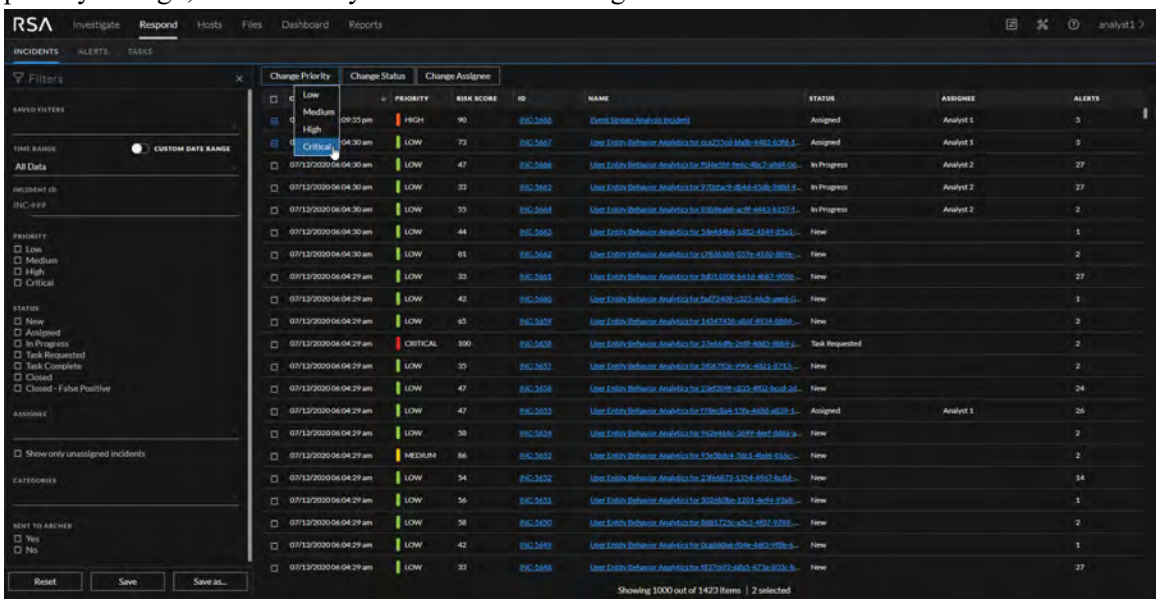
The incident list is sorted by Priority by default. You can update the priority as you study the details of the case. The following priorities are available:

- Critical
- High
- Medium
- Low

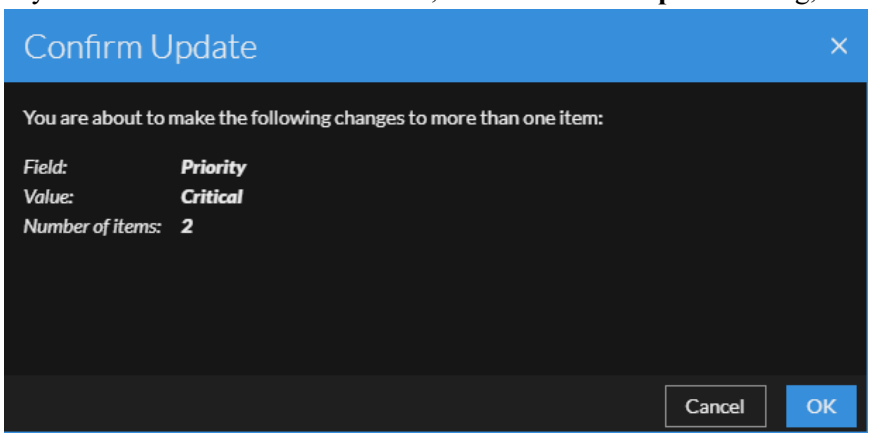
**Note:** You cannot change the priority of a closed incident.

### To update the priority of multiple incidents:

1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Priority** and select a priority from the drop-down list. In this example, the current priority is High, but the Analyst would like to change it to Critical for the selected incidents.

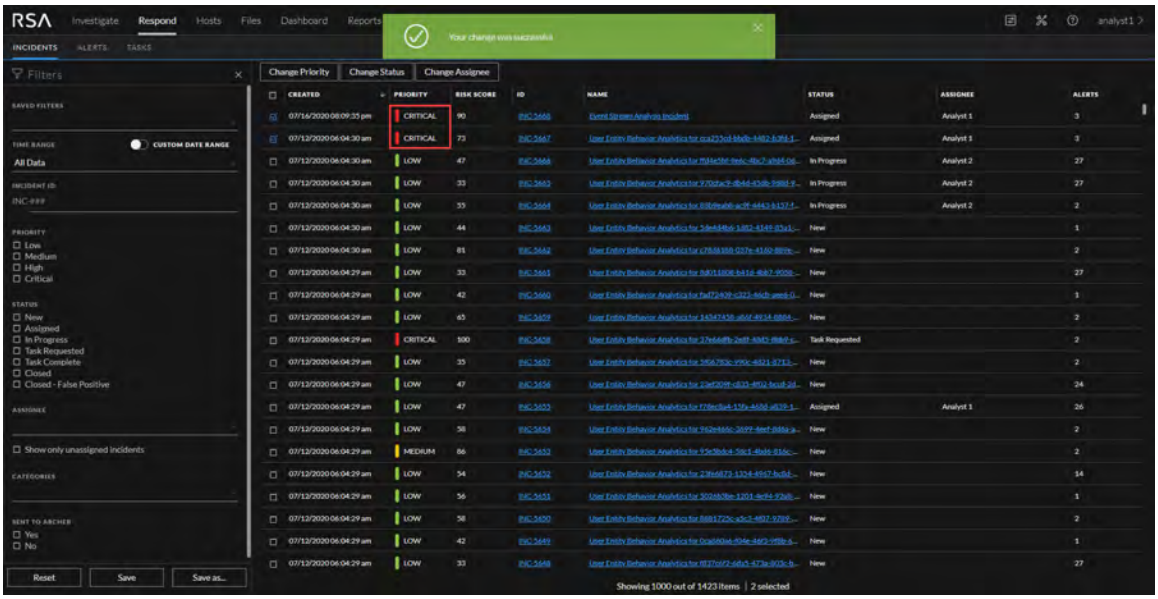


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.



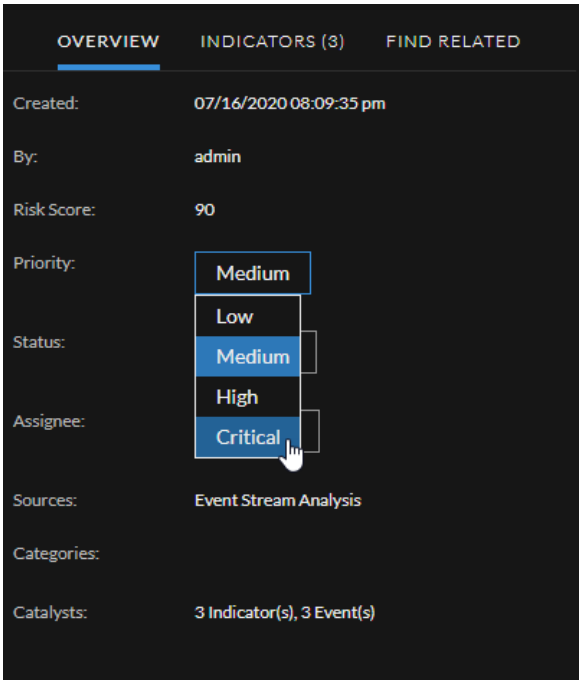
You can see a successful change notification. In this example, the status of the updated incidents now

show Critical.



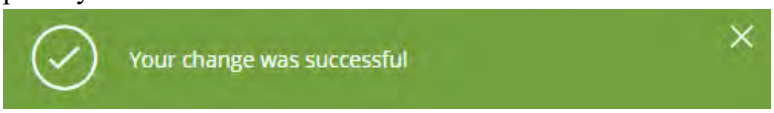
### To change the priority of a single incident from the Overview panel

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a priority update.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Priority button shows the current priority of the incident.
2. Click the **Priority** button and select a status from the drop-down list.



You can see a successful change notification. The Priority button changes to show the new incident

priority.



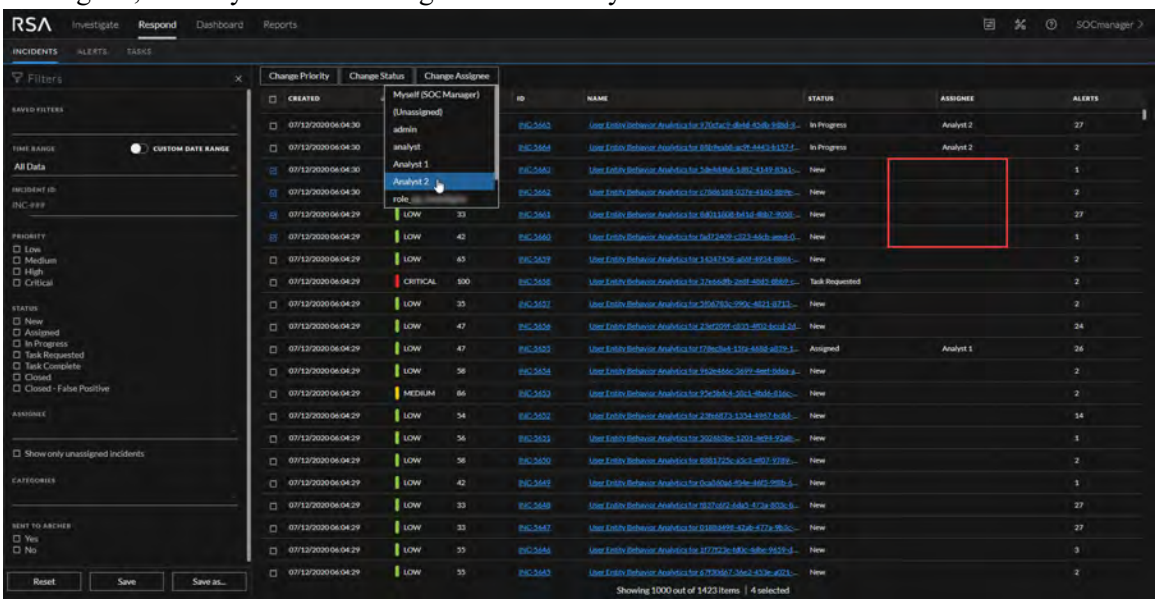
# Assign Incidents to Other Analysts

You can assign incidents to other Analysts in the same way as you assign incidents to yourself. SOC Managers and Administrators can assign multiple incidents to a user at the same time.

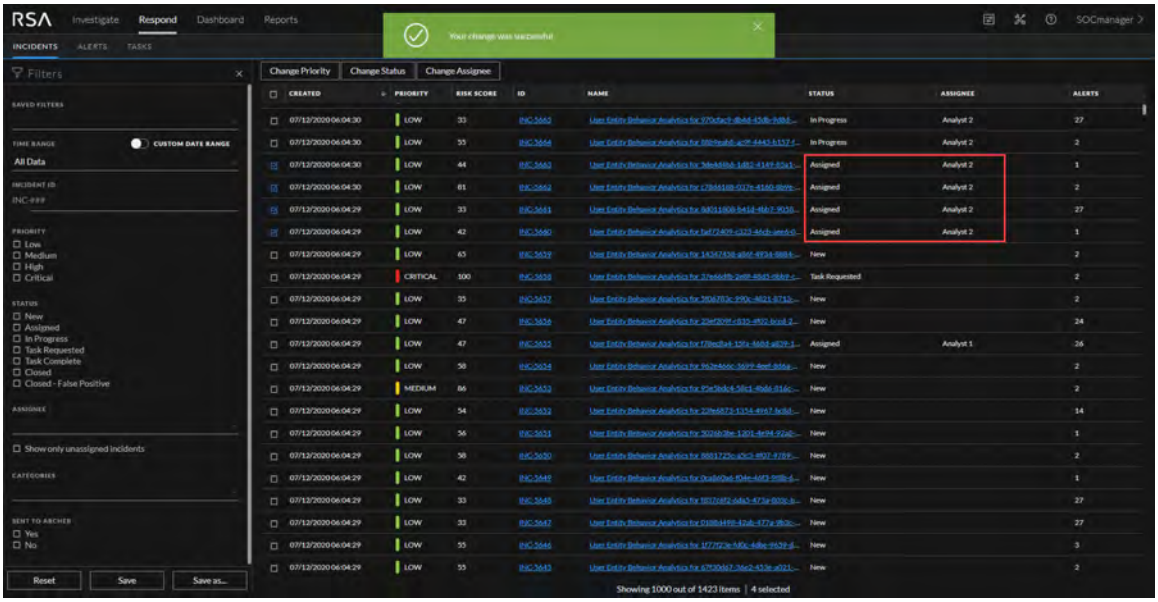
**Note:** You cannot change the assignee of a closed incident.

### To assign multiple incidents to a user:

1. In the Incidents List view, select the incidents that you would like to assign to a user. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Assignee** and select a user from the drop-down list. In this example, the incidents are unassigned, but they should be assigned to an Analyst.



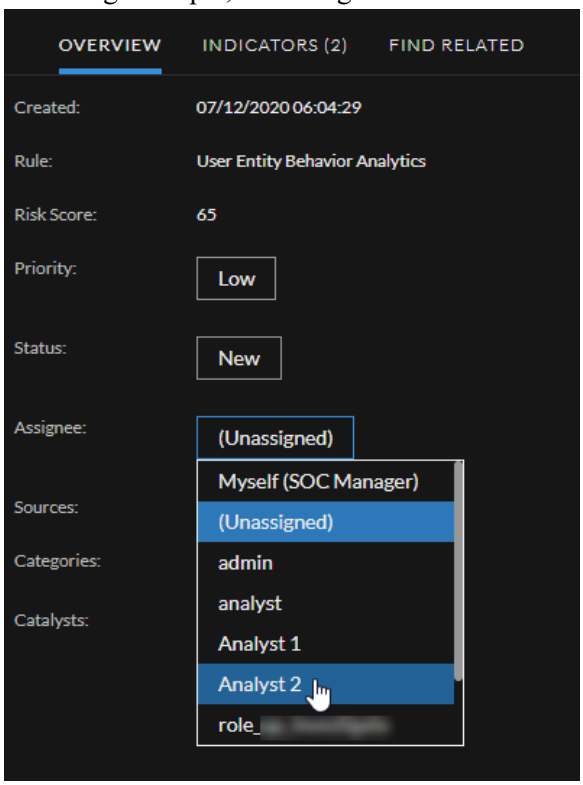
3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You can see a successful change notification. The assignee changes to the selected user.



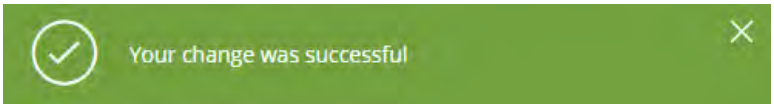
### To assign a user to an incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that you would like to assign to a user.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Assignee button shows the current assignee of the incident. In the

following example, the Assignee button has a current status of Unassigned.



2. Click the **Assignee** button and select a user from the drop-down list.
   You can see a successful change notification. The Assignee button changes to show the assigned user.

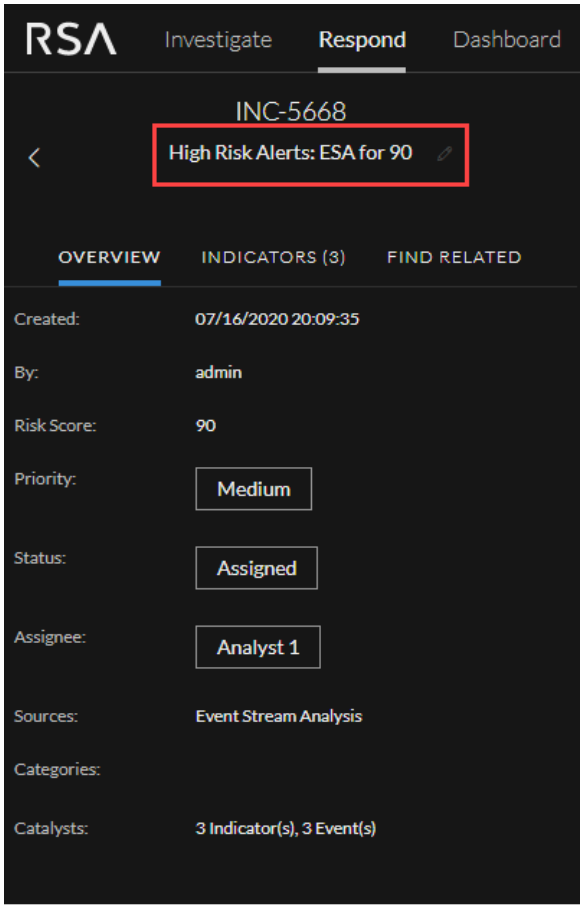


## Rename an Incident

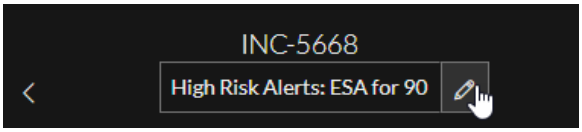
You can rename an incident from the Overview panel in the Incidents List view and the Incident Details view. For example, you may want to rename an incident to provide clarification about the issue, especially if multiple incidents have the same name.

1. Go to **Respond > Incidents**.
2. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a name change.
     The Overview panel opens.

- From the Incident Details view, click the **OVERVIEW** tab in the left panel.
  In the header above the Overview panel, you can see the incident ID and the incident name.

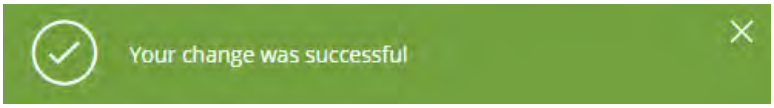


3. Click the incident name in the header to open a text editor.

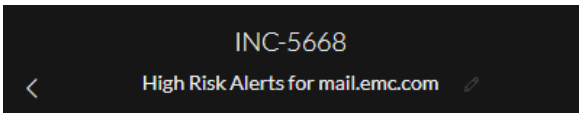


4. Type a new name for the incident in the text editor and click the check mark to confirm the change.

For example, you can change "High Risk Alerts: ESA for 90.0" to "High Risk Alerts for mail.emc.com" for more clarification.
You can see a successful change notification.



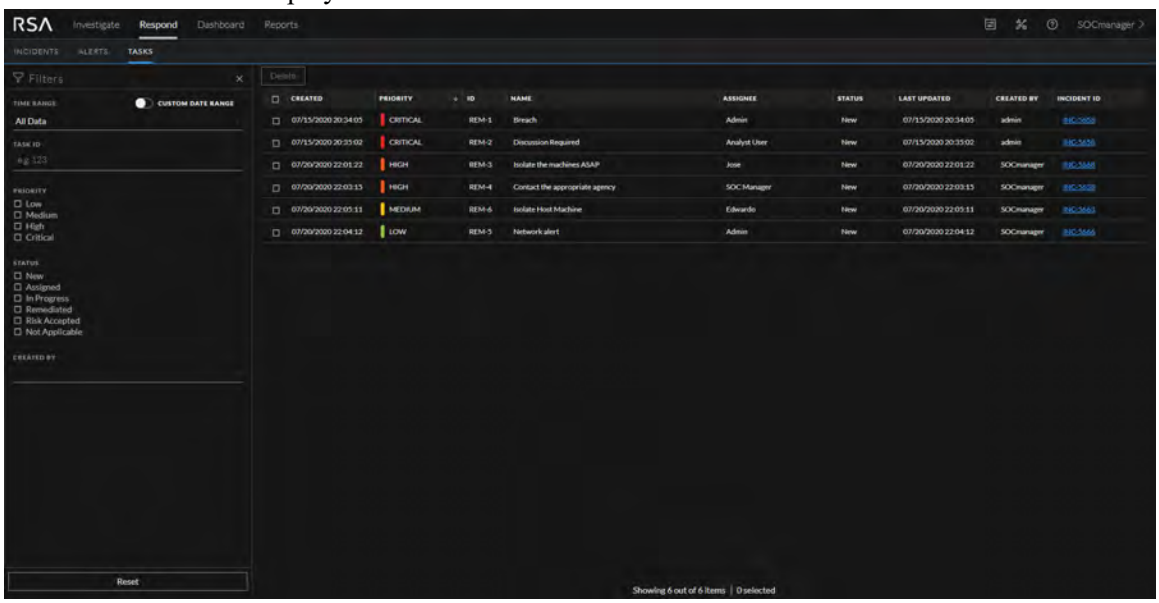
The incident name field shows the new name.



## View All Incident Tasks

When additional work is required for an incident, you can create tasks for the incident and track the progress on those tasks. This is helpful, for example, when the work being done is outside security operations or you make a request for a computer reimage. In the Tasks List view, you can manage and track the tasks to closure.

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.



2. Scroll through the tasks list, which shows basic information about each task as described in the following table.

| Column | Description |
|---|---|
| Created | Displays the date when the task was created. |

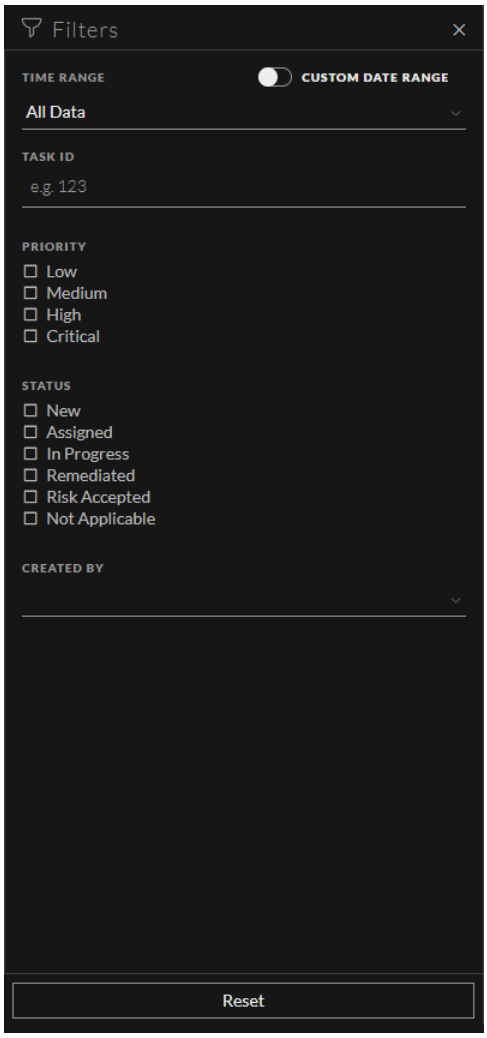
| Column | Description |
|---|---|
| Priority | Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure:   |
| ID | Displays the task ID. |
| Name | Displays the task name. |
| Assignee | Displays the name of the user assigned to the task. |
| Status | Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. |
| Last Updated | Displays the date and time when the task was last updated. |
| Created By | Displays the user who created the task. |
| Incident ID | Displays the incident ID for which the task was created. Click the ID to display the details of the incident. |

At the bottom of the list, you can see the number of tasks on the current page, the total number of tasks, and the number of tasks selected. For example: **Showing 6 out of 6 items | 2 selected**.

## Filter the Tasks List

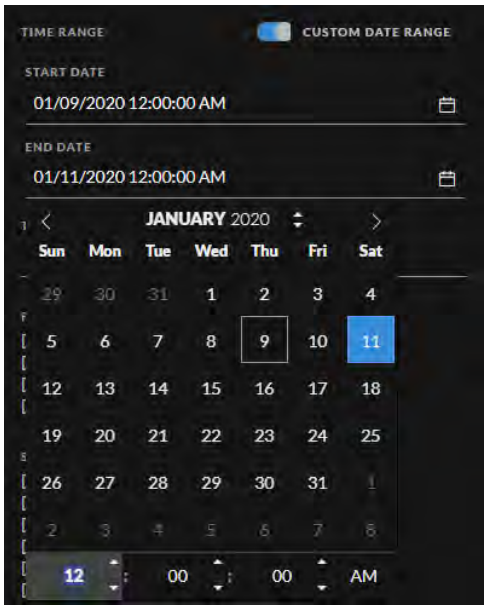
The number of tasks in the Tasks List can be very large, making it difficult to locate particular tasks. The Filter enables you to specify those tasks that you would like to view, such as tasks created within the last 7 days. You can also search for a specific task.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the Start

Date and End Date fields. Select the dates and times from the calendar.



- **Task ID**: Type the Task ID for a task that you would like to locate, for example REM-123.
- **Priority**: Select the priorities that you would like to view.
- **Status**: Select one or more incident statuses. For example, select Remediated to view completed remediation tasks.
- **Created By**: Select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list.
For example: **Showing 6 out of 6 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

## Remove My Filters from the Tasks List

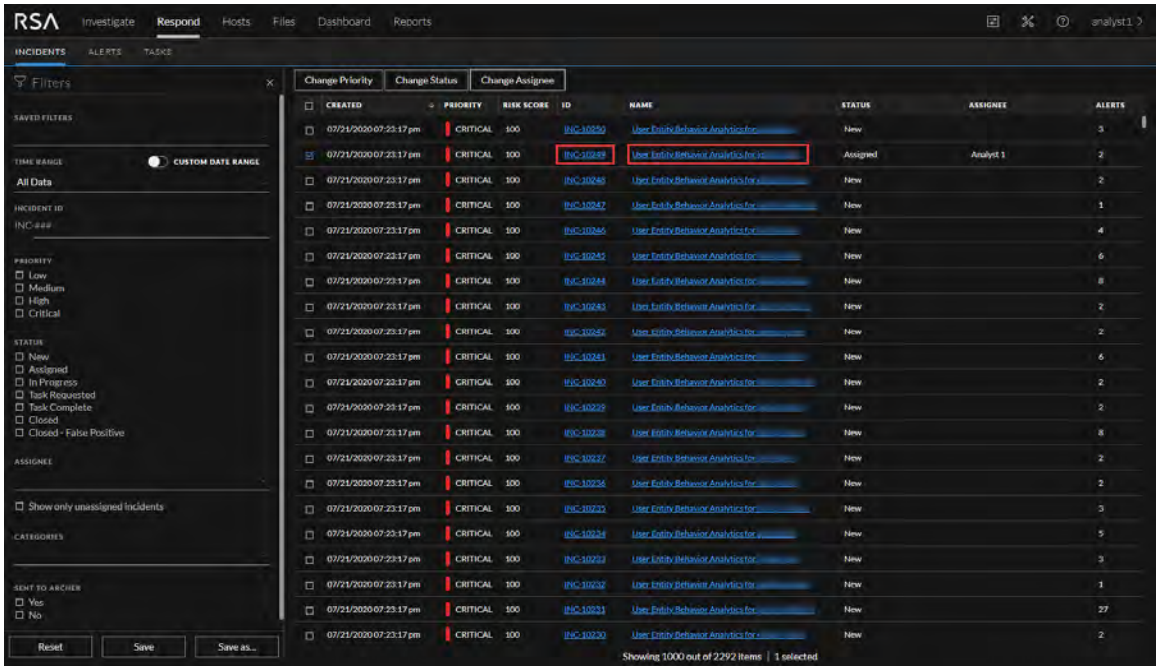
NetWitness remembers your filter selections in the Tasks List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of tasks that you expect to see or you want to view all of the tasks in your tasks list, you can reset your filters.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

# Create a Task

After you investigate an incident and know more about it, you can create a task, assign it to a user, and track it to closure. You create tasks from the Incident Details view.

1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all of the incidents.
2. Locate the incident that needs a task and click the link in the **ID** or **Name** field.



3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

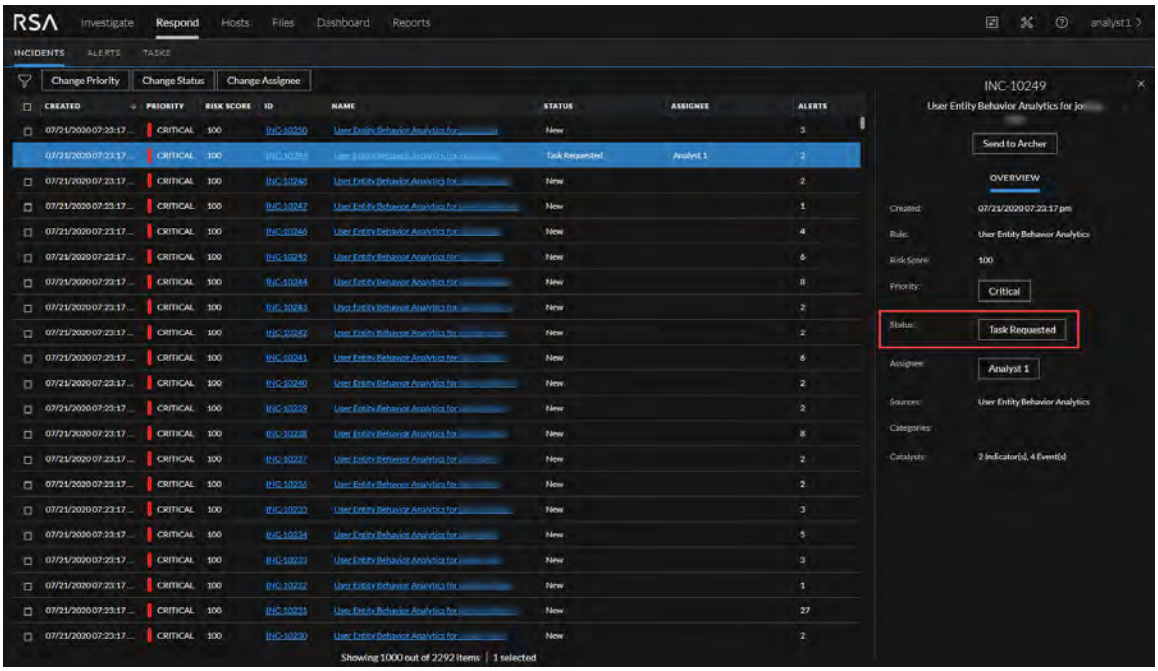
4. In the Tasks panel, click **Add New Task**.

   You can see the new task fields.

If the incident is in a closed state (Closed or Closed - False Positive), the Add New Task button is disabled.

5. Provide the following information:
   - **Name** - Name of the task. For example: Re-image the machine.
   - **Description** - (Optional) Type information that describes the task. You may want to include any applicable reference numbers.
   - **Assignee** - (Optional) Type the username of the user to whom the task is to be assigned.
   - **Priority** - Click the priority button and select a priority for the tasks from the drop-down list: Low, Medium, High, or Critical.
6. Click **Save**.
   You can see a confirmation that your change was successful. The incident status changes to **Task Requested**. (You may need to refresh the Incident Details view to see the changes.) The task appears in the Tasks panel for this incident.

   In the Incidents List view, the incident status also changes to Task Requested.



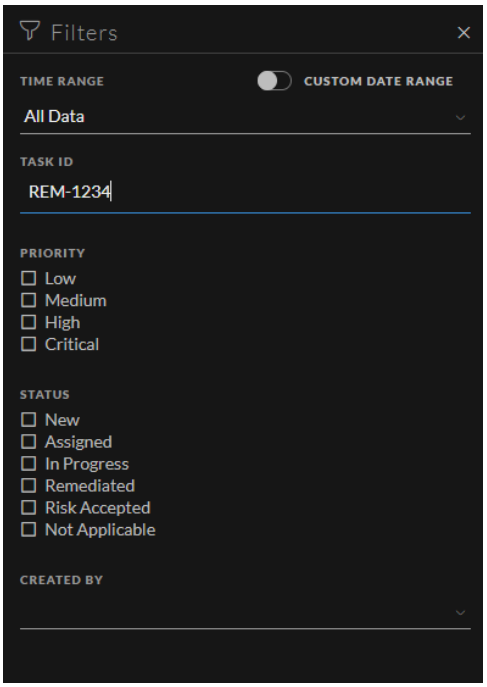
The task also appears in the Tasks list (Respond > Tasks), which shows a list of all incident tasks.

**Note:** If you do not see the status change, you may need to refresh your internet browser.

## Find a Task

If you know the Task ID, you can quickly locate a task using the Filter. For example, you may want to locate a specific task out of thousands of tasks.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.



2. In the **Task ID** field, type the Task ID for a task that you would like to locate, for example REM-1234.
   The specified task appears in your task list. If you do not see any results, try resetting your filters.

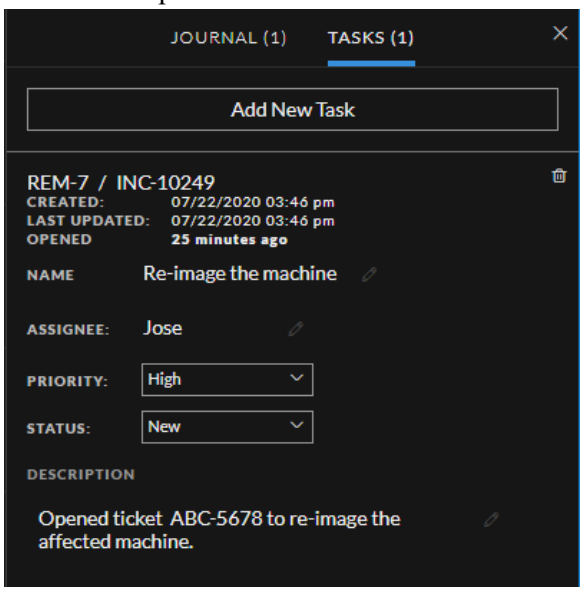
## Modify a Task

You can modify a task from within an incident and from the Tasks list. For example, you may want to show the status of the task as In Progress and add some additional information to the task. If the task is in a closed state (Not Applicable, Risk Accepted, or Remediated), you cannot modify the Priority or Assignee.

### To modify a Task from within an incident:

1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.
   In the Tasks panel, a pencil icon indicates a text field that you can change. A button indicates that

there is a drop-down list to make a selection.



4. You can modify any of the following fields:

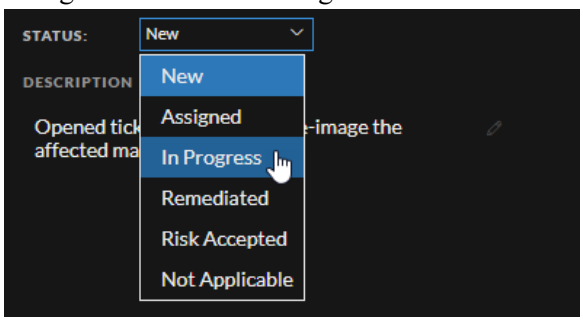
- **Name** - Click the current task name to open a text editor.

  Click the check mark to confirm the change. For example, you can change "Re-image the machine" to "Re-image the machine ASAP!"

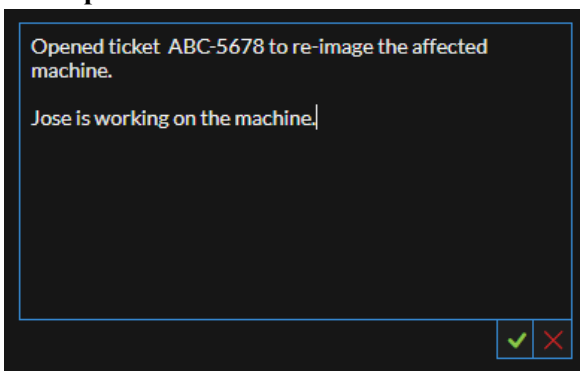
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.
  Click the check mark to confirm the change.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.

- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. For example, you can change the status to In Progress.



- **Description** - Click the text underneath the description to open a text editor.

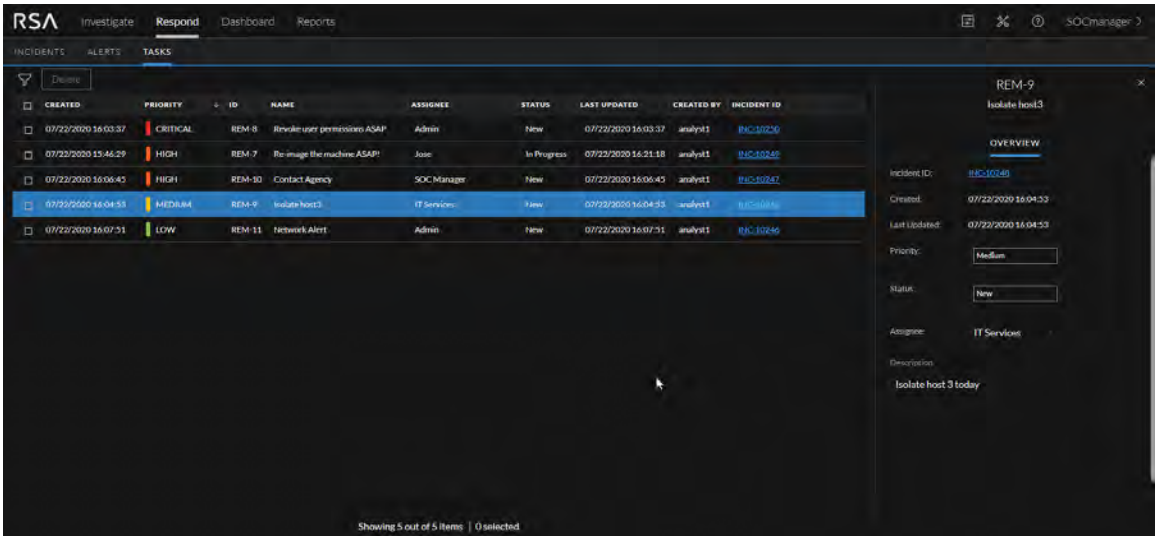


Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.

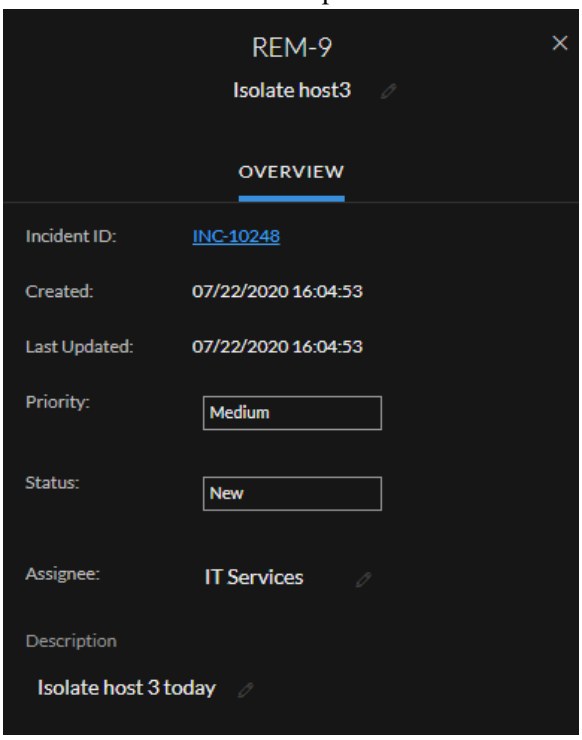
### To modify a Task from the Tasks list:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, click the task that you want to update.
   The Task Overview panel appears to the right of the tasks list.



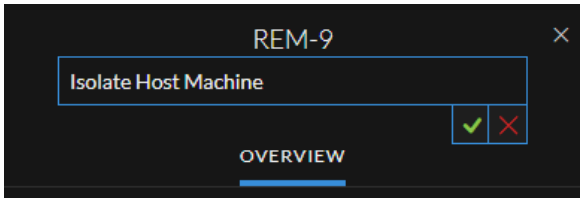
In the Task Overview panel, a pencil icon indicates a text field that you can change. A button

indicates that there is a drop-down list to make a selection.



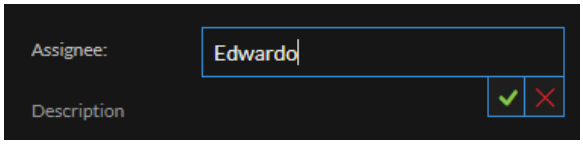
3. You can modify any of the following fields:

- **<Task Name>** - At the top of the Task Overview panel, below the Task ID, click the current task name to open a text editor.



Click the check mark to confirm the change. For example, you can change Isolate Host to Isolate Host Machine.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.



Click the check mark to confirm the change.

- **Description** - Click the text underneath the description to open a text editor.

  Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.

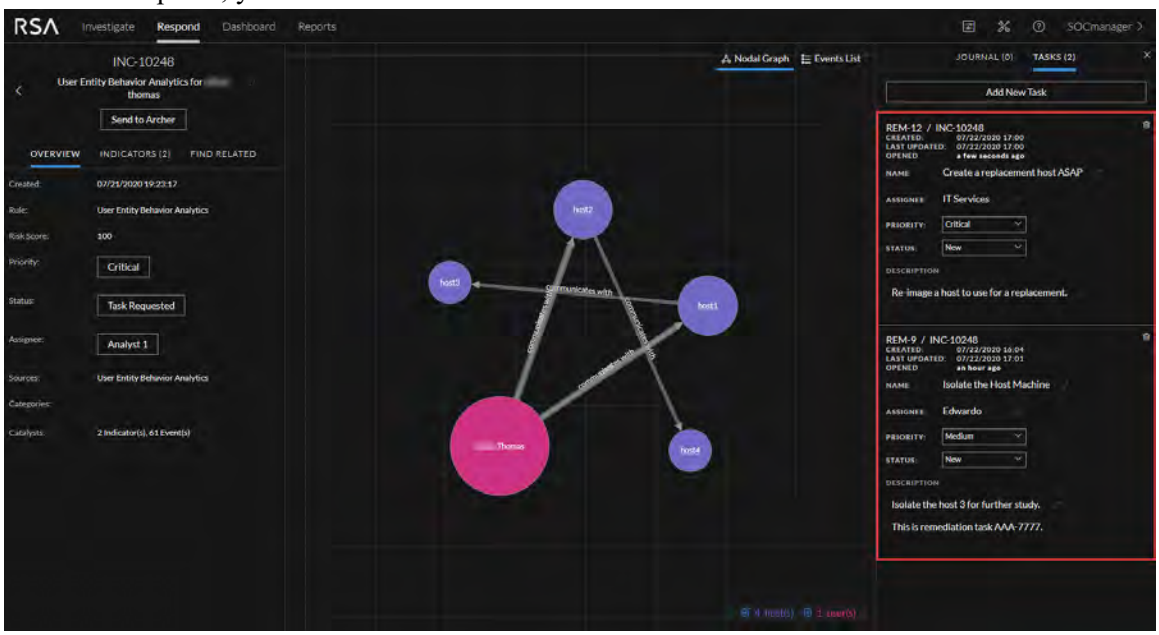
## Delete a Task

You can delete a task, if, for example, you created it in error or you find that it is not needed. You can delete a task from within an incident and also from the Tasks List view. In the Tasks List view, you can delete multiple tasks at the same time.

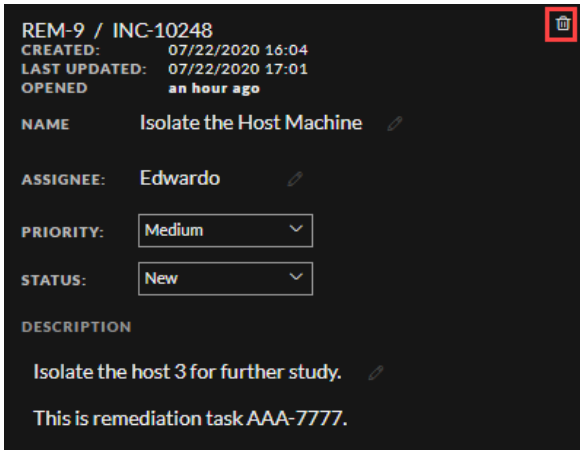
### To Delete a Task from within an incident:

1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

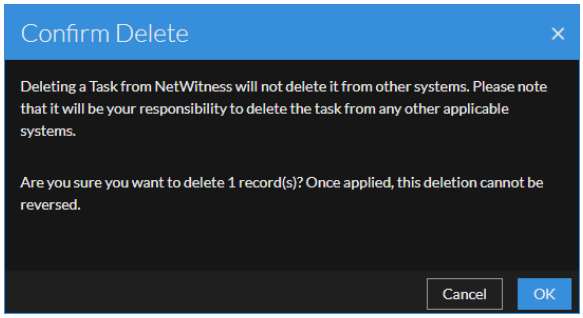
In the Tasks panel, you can see the tasks created for the incident.



4. Click to the right of the task that you want to delete.



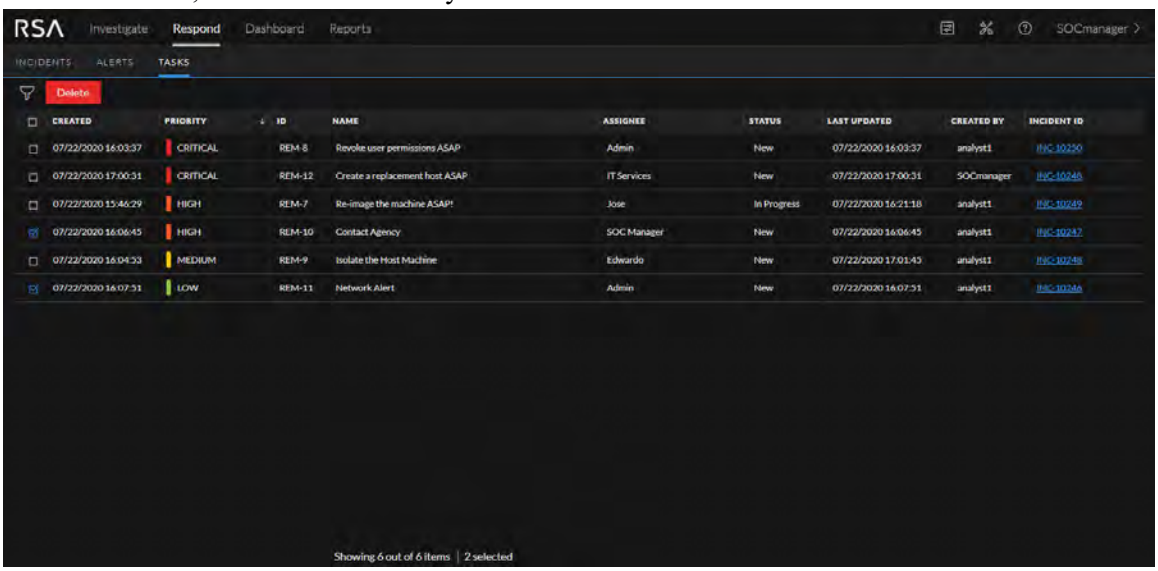
5. Confirm that you want to delete the task and click **OK**.



The task is deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

### To Delete Tasks from the Tasks List:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, select the tasks that you want to delete and click **Delete**.



3. Confirm that you want to delete the tasks and click **OK**.

   The tasks are deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

## Close an Incident

When you have arrived at a solution after investigating an incident and remediating it, you close the incident.

1. Go to **Respond > Incidents**.
2. In the Incident List view, select the incident that you want to close and click **Change Status**.
3. Select **Closed** from the drop-down list.
   You can see a successful change notification. The incident is now closed. You cannot change the priority or assignee of a closed incident.

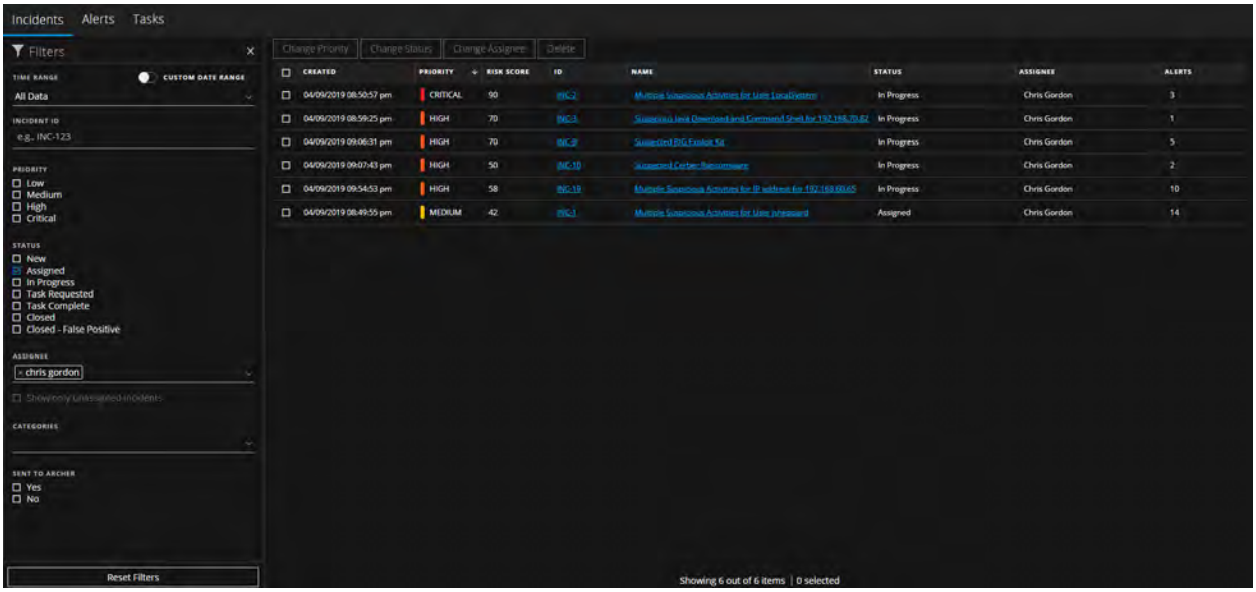
**Note:** You can also close an incident in the Overview panel. You can close multiple incidents at the same time in the Incident List view. Change Incident Status provides additional details.

# Incident Response Use Case Examples

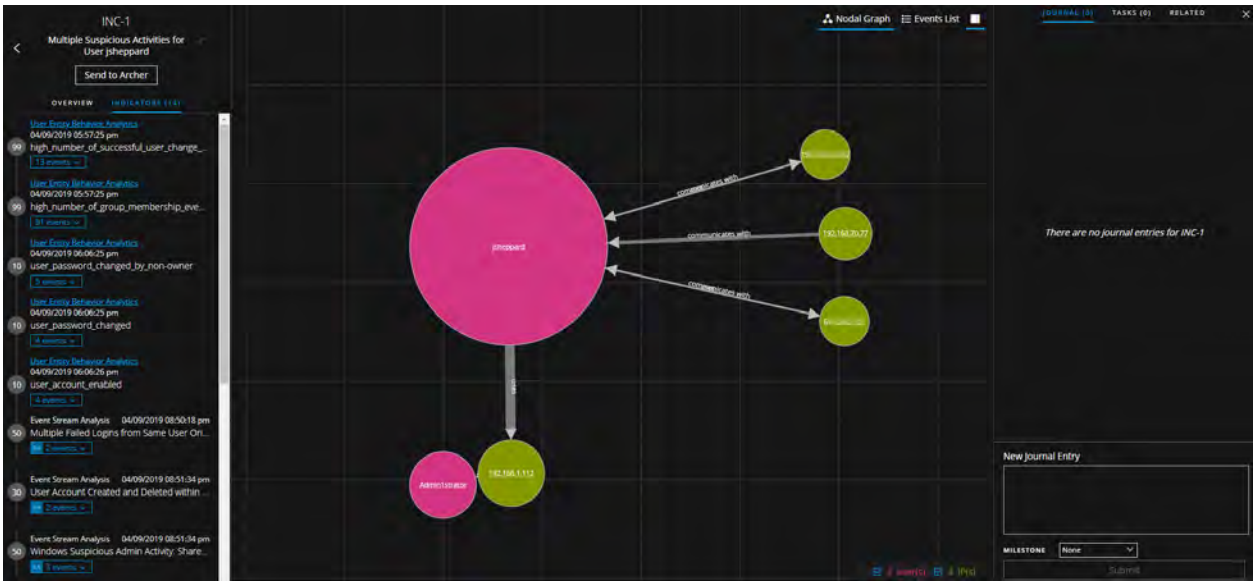
The following use cases provide examples of an analyst using NetWitness to quickly respond to incidents, identify threats, and take action to reduce or eliminate the ability of threat actors to compromise valuable information in the corporate network.

## Use Case #1: UEBA Anomalous User Activity

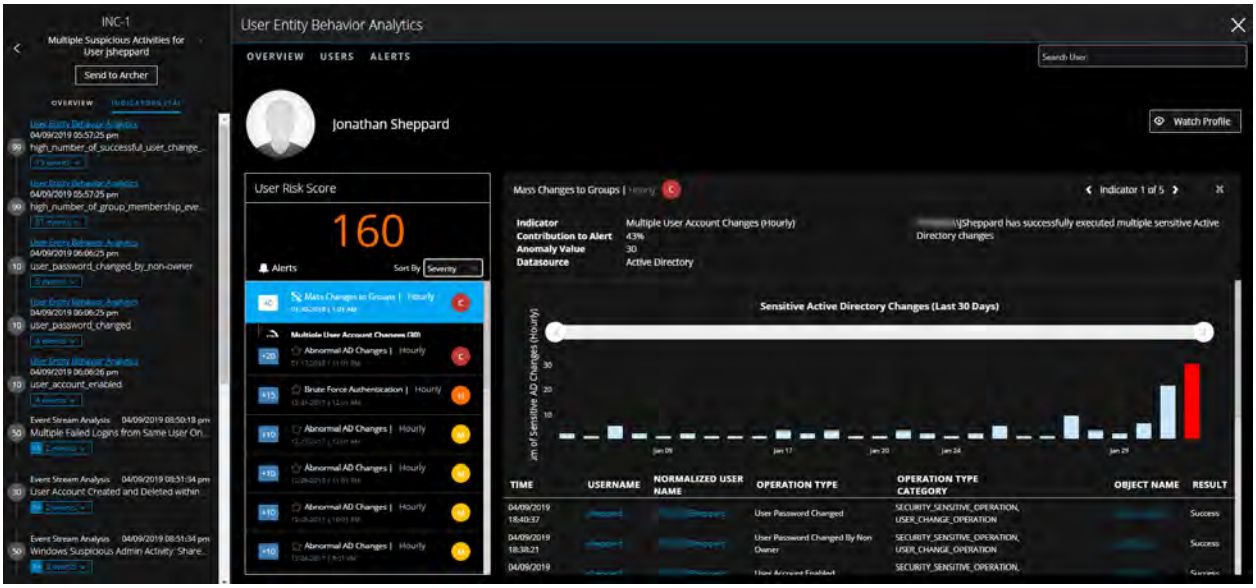
An analyst named Chris logs in, goes to the Incidents List view, and uses the filters on the left-hand side to look at all of the incidents assigned to her. In the list, she notices an incident that she has not yet reviewed (status is Assigned) and opens the incident.



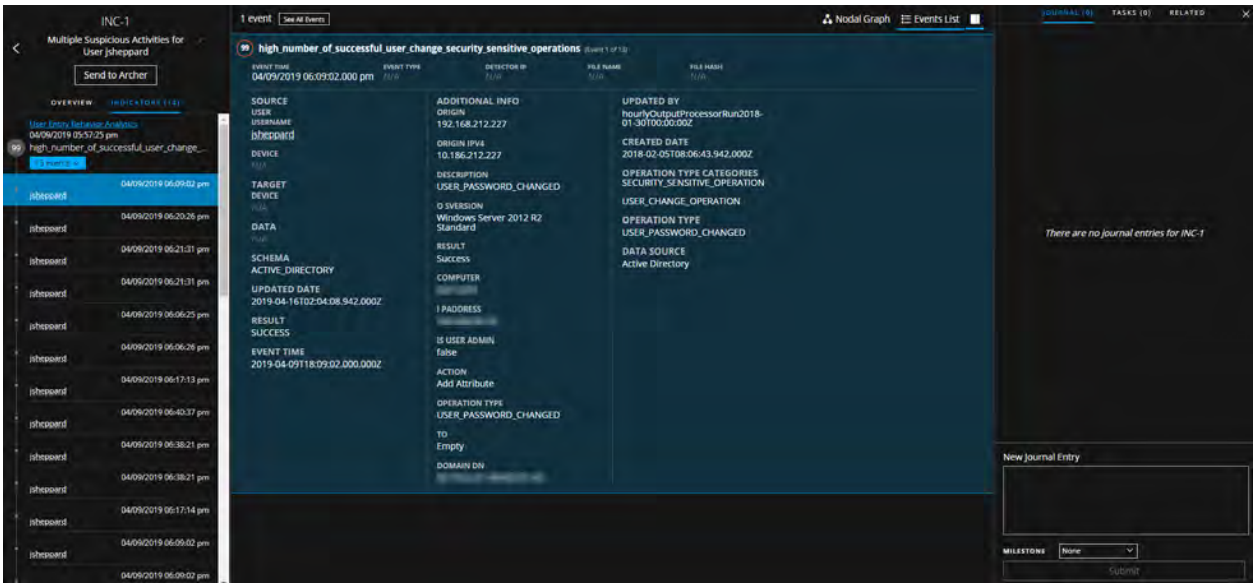
In the Incident Details view, the analyst sees a timeline of contributing events (Indicators panel) on the left, a visualization of the entities involved in the middle, and additional panels on the right where she can keep track of notes and tasks during her review.



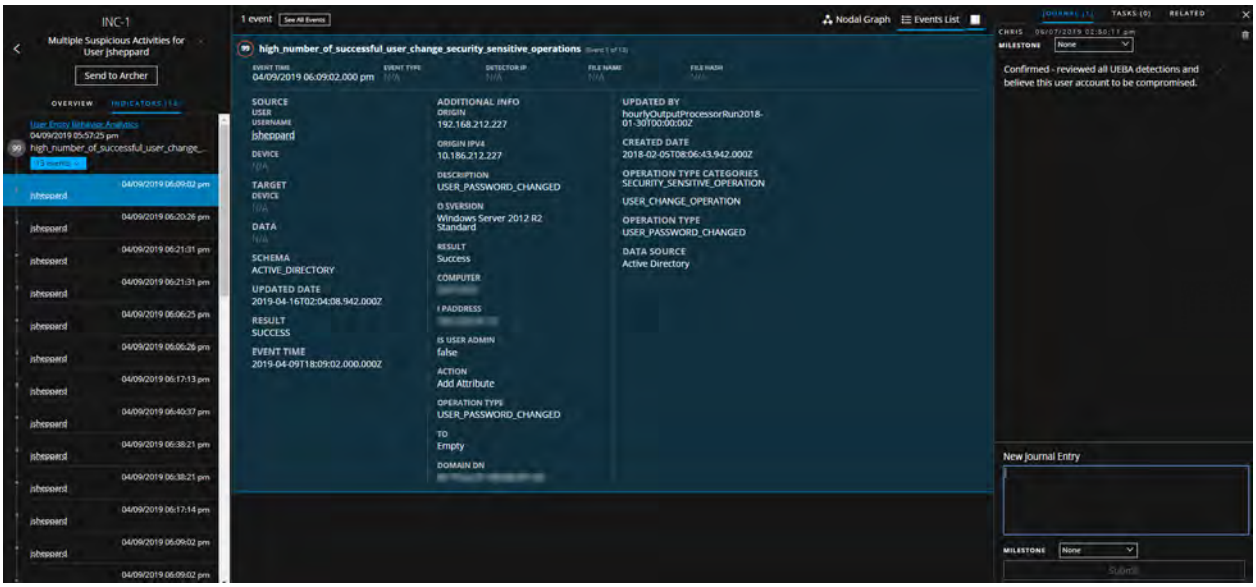
Chris uses the Indicators panel to get finer detail on the events that lead to this incident being created. Clicking the "User Entity Behavior Analytics" link in the Indicators panel exposes the analysis that was done and the anomaly that was detected on the user account "Jonathan Sheppard (jsheppard)." The User Entity Behavior Analytics panel below shows an overall risk score of 160, details the Windows events that contributed to the severity, and shows the actual anomaly in user account changes attributed to this user. She can explore the data in as much depth as required to help validate and understand the alert.



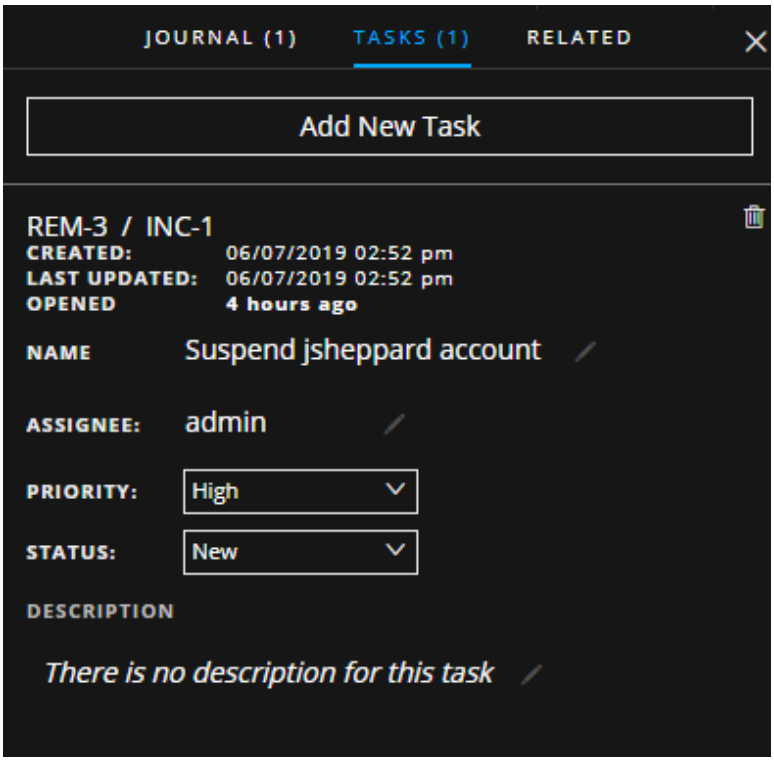
In the Events List, Chris can even inspect the details of the individual log events involved.



During her review and investigation, she can update the incident with her notes, as well as create and assign tasks for herself or other analysts.

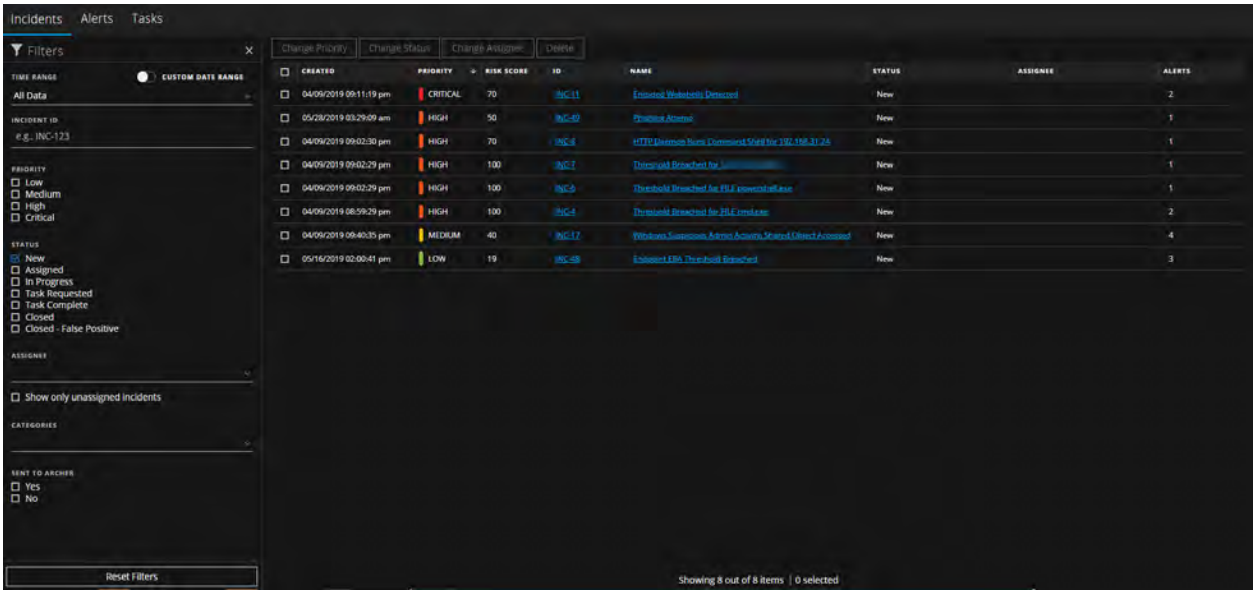


To remediate the incident, Chris opens a task for the administrator (admin) to suspend the jsheppard account.

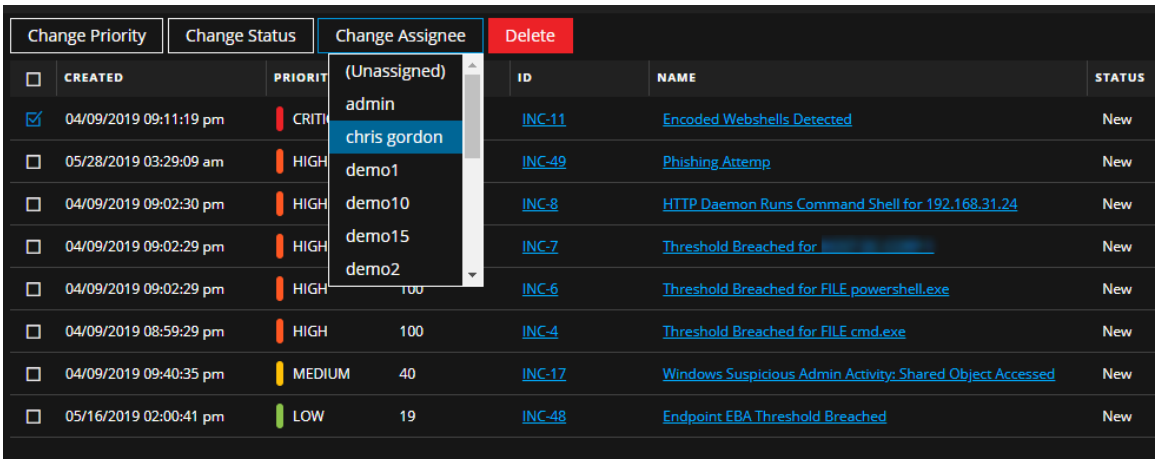


## Use Case #2: Encoded Webshells Detected

Analyst Chris logs in, looks at all of the new incidents that have not yet been assigned to anyone, and notices a highly critical incident "Encoded Webshells Detected."

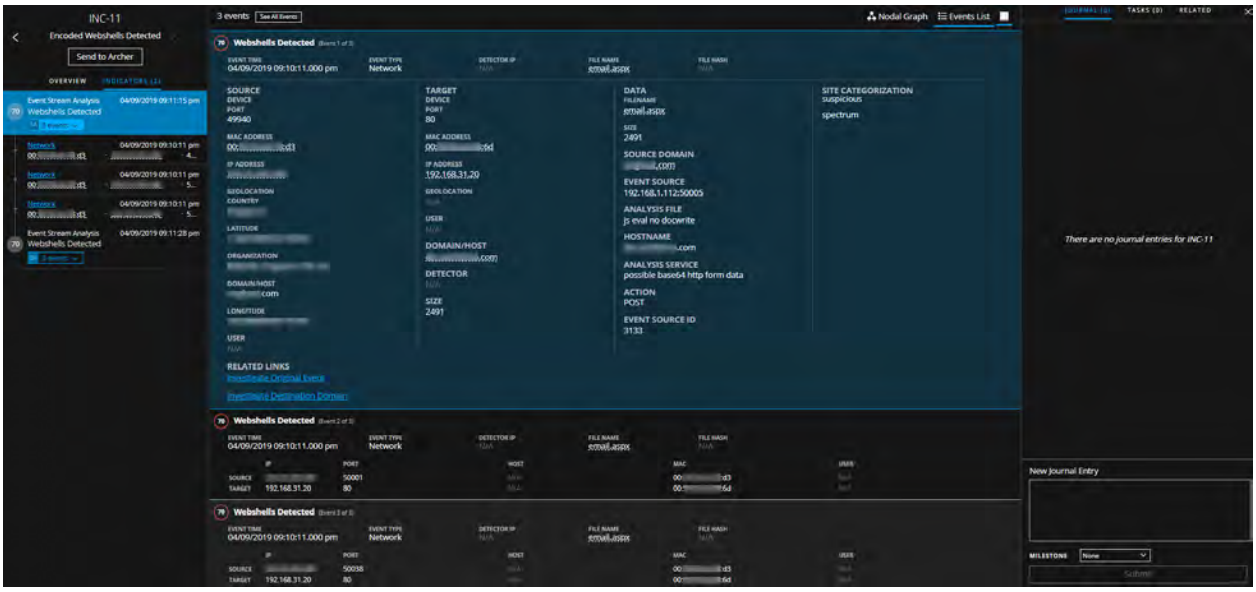


Chris decides to assign this incident to herself and investigate it.

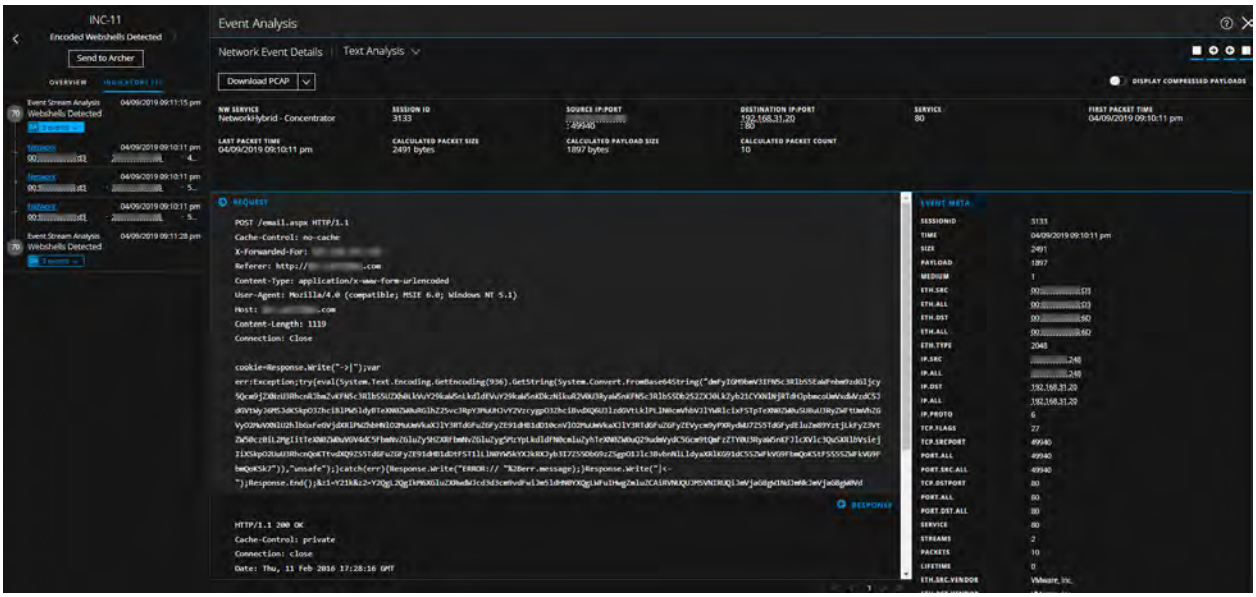


At first glance using the visual summary, Chris can see a couple of specific Event Stream Analysis alerts that kicked off this incident, and the entities associated with the alerts. She sees that a public IP address (xxx.xx.xxx.248) has been detected as interacting with a webshell on the internal web server 192.168.31.20. It looks like the suspicious request was made to the file `email.aspx`. She dives in to investigate.

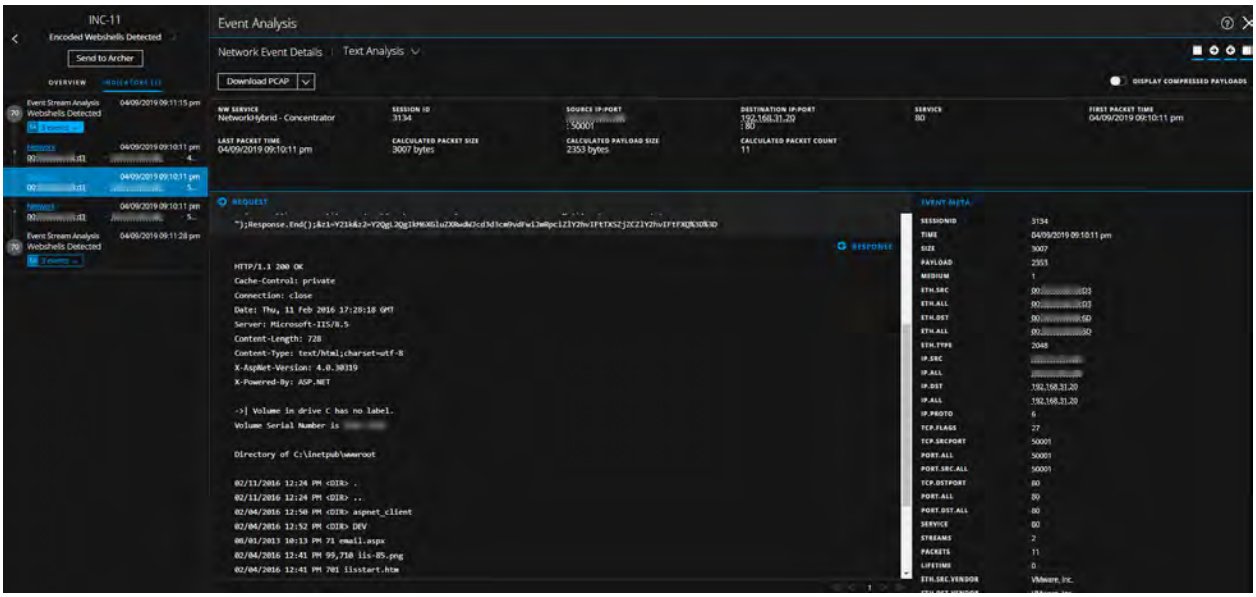
By drilling into the indicator (alert) on the left-hand side, Chris can view the entire list of events associated with the incident and all of the metadata generated by the system, including details about the connections between the external and internal host. She notices that the type of data in this case is "Network," meaning that these events were generated by the full packet capture component of NetWitness.



While the metadata associated with these events does look suspicious to Chris, she wants to investigate even deeper to see what is going on. To do this she can drill into the raw packet reconstruction of the HTTP sessions simply by clicking the "Network" link in the Indicators panel on the left-hand side.

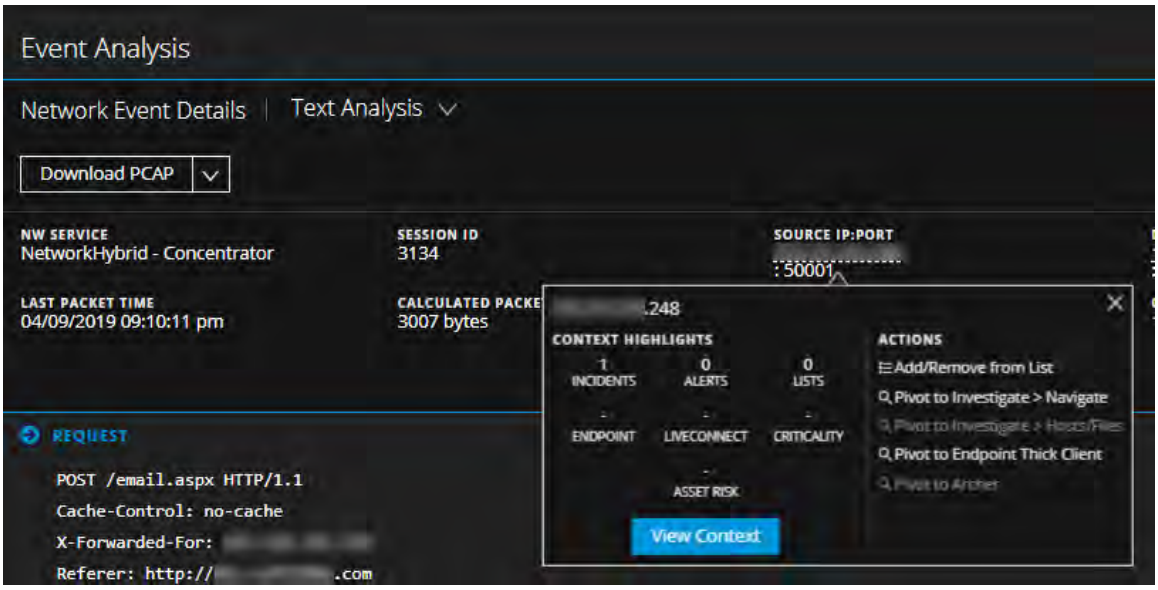


From this deep dive, Chris can examine the raw payload of the suspicious connections and can easily see the strange nature of this request. In the request payload she can see a strange looking request, but most alarmingly, once she scrolls down to the response portion she can see the information that her web server is sending back out to the suspect external IP address.

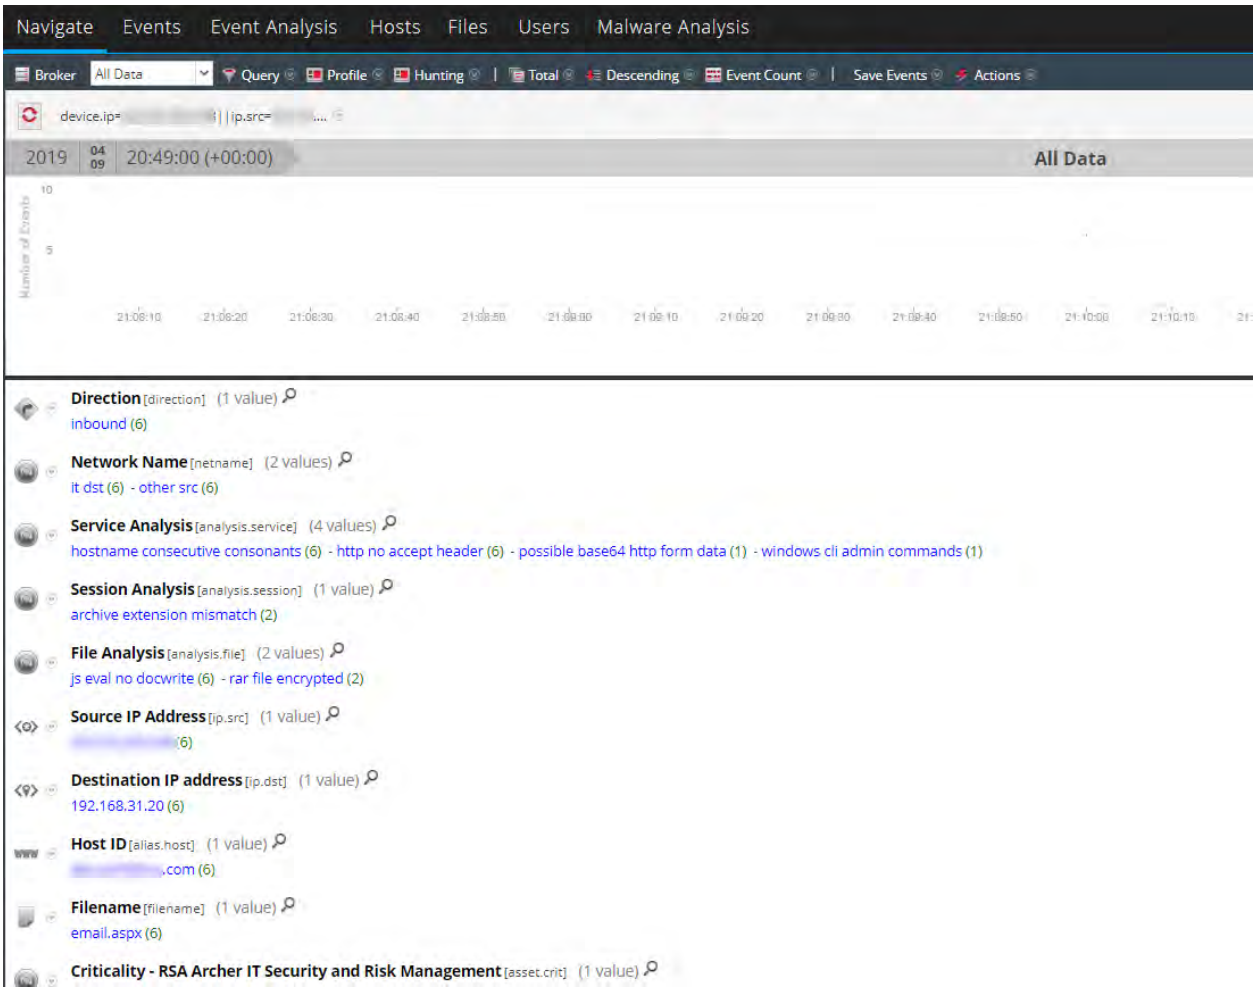


Chris sees what looks to be a directory listing in the packet data, which is not something she would expect from normal web site communications. With this information, she confirms that this is indeed a malicious webshell that has been installed on the internal web server.

From here, Chris can take a number of actions. She can journal her confirmation, assign a task to another user to handle the incident from there, or she can expand her investigation to look for any other activity that has been associated with the malicious external IP address. Chris does this by hovering over the IP address to open a context tooltip and pivoting into Investigate > Navigate.



This pivot brings Chris into another part of the NetWitness interface where she can perform free-form search and analysis outside of the incident.



In this case she did not uncover anything other than the same network events that were part of the original incident, which is a good step in validating the isolated scope of the incident. If, however, she were to find other interesting events across any log, network, or endpoint data in the system, she could easily add those events into the incident to keep track.

# Reviewing Alerts

NetWitness enables you to view a consolidated list of threat alerts generated from multiple sources in one location. You can find these alerts in the Respond > Alerts view. The source of the alerts can be ESA correlation rules, NetWitness Endpoint, Detect AI, Malware Analysis, Reporting Engine, Risk Scoring, as well as many others. You can see the source of the alerts, the alert severity, and additional alert details.

**Note:** ESA correlation rule alerts can ONLY be found in the Respond > Alerts view.

To better manage a large number of alerts, you have the ability to filter the alerts list based on criteria that you specify, such as severity, time range, and alert source. For example, you may want to filter the alerts to only show those alerts with a severity between 90 and 100 that are not already part of an incident. You can then select a group of alerts to create an incident or add to an existing incident.

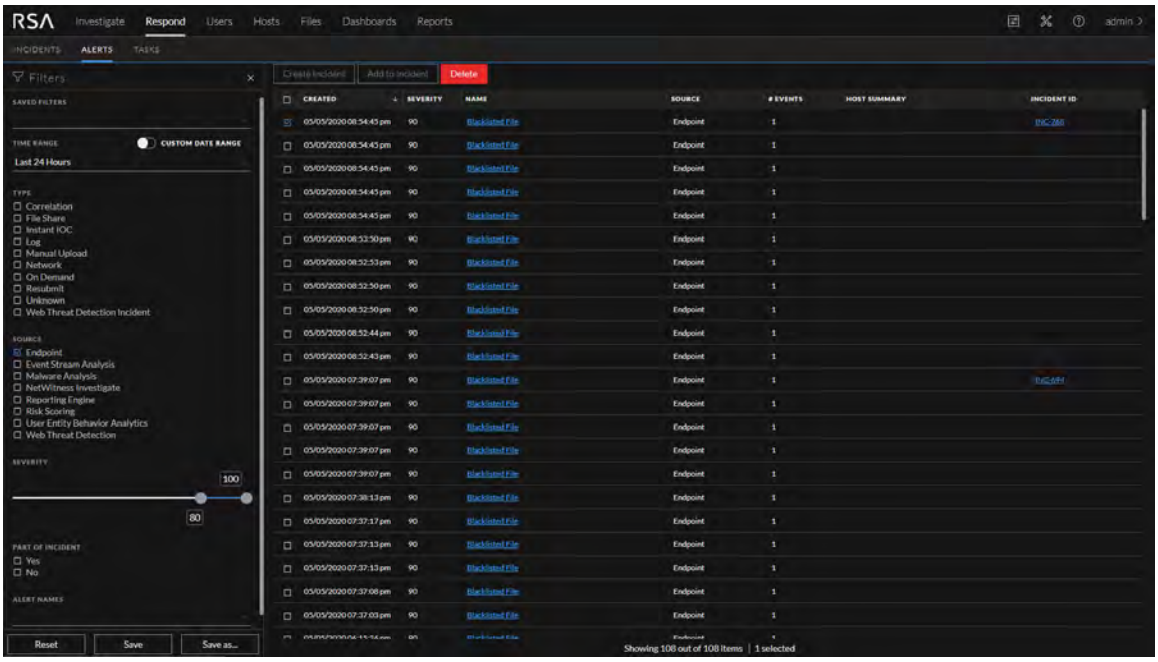
You can perform the following procedures to review and manage alerts:

- View Alerts
- Filter the Alerts List
- Remove My Filters from the Alerts List
- Save the Current Alerts Filter
- Update a Saved Alerts Filter
- Delete a Saved Alerts Filter
- View Alert Summary Information
- View Event Details for an Alert
- Investigate Events
- Create an Incident Manually
- Add Alerts to an Incident
- Delete Alerts

## View Alerts

In the Alerts List view, you can browse through various alerts from multiple sources, filter them, and group them to create incidents. This procedure shows you how to access the alerts list.

1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.



2. Scroll through the alerts list, which shows basic information about each alert as described in the following table.

| Column | Description |
|---|---|
| Created | Displays the date and time when the alert was recorded in the source system. |
| Severity | Displays the level of severity of the alert. The values are from 1 through 100. |
| Name | Displays a basic description of the alert. |
| Source | Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Detect AI, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), Reporting Engine, Web Threat Detection, Risk Scoring, and many others.<br><br>**Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint. |
| # Events | Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky. |

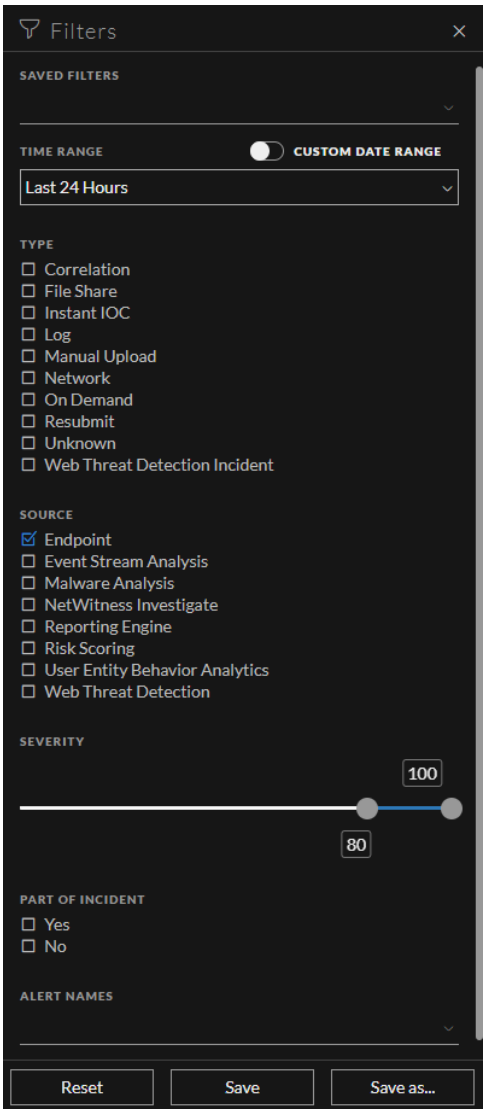
| Column | Description |
|---|---|
| Host Summary | Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host . |
| Incident ID | Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident. |

At the bottom of the list, you can see the number of alerts on the current page and the total number of alerts. For example: **Showing 1000 out of 2069 items**

## Filter the Alerts List

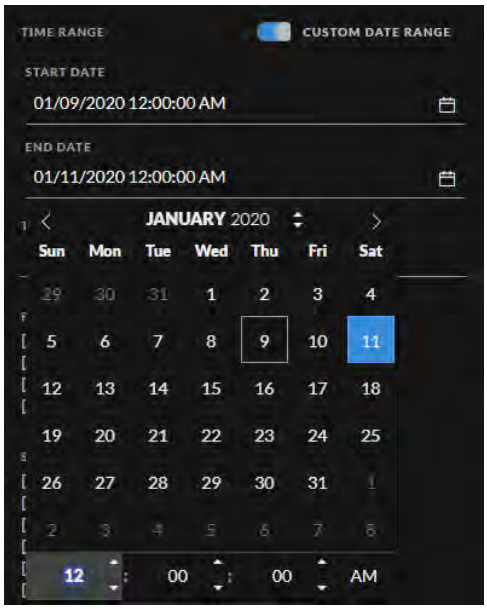
The number of alerts in the Alerts List can be very large, making it difficult to locate particular alerts. The Filter enables you to view the alerts you want to see, for example, alerts from a particular source, alerts of a particular severity, alerts that are not part of an incident, and so on.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the Alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the alerts list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the date that the alerts were received. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and

End Date fields. Select the dates and times from the calendar.



- **Type**: Select the type of events in the alert to view, for example, logs, network sessions, and so on. In NetWitness Platform 11.3 and later, if one of the events in an alert has a device_type of `nwendpoint`, Endpoint is included in the Type field.
- **Source**: Select one or more sources to view alerts triggered by the selected sources. For example, to view NetWitness Endpoint alerts only, select Endpoint as the source. In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device type of `nwendpoint`, the source changes to Endpoint. A **Risk Scoring** source is available in NetWitness Platform 11.3 and later. NetWitness Respond automatically creates incidents from alerts that are over the specified file and host alert thresholds for risk score. For more information, see the *NetWitness Respond Configuration Guide*.
- **Severity**: Select the the level of severity of the alerts to view. The values are from 1 through 100. For example, to concentrate on the highest severity alerts first, you may want to view only those alerts with a severity from 90 to 100.
- **Part of Incident**: To view only alerts that are not part of an incident, select **No**. To view only alerts that are part of an incident, select **Yes**. For example, when you are ready to create an incident from a group of alerts, you can select No to view only those alerts that are not currently part of an incident.
- **Alert Names**: Select the name of the alert to view. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account.

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list.
For example: **Showing 30 out of 30 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

## Remove My Filters from the Alerts List

NetWitness remembers your filter selections in the Alerts List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of alerts that you expect to see or you want to view all of the alerts in your alerts list, you can reset your filters.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

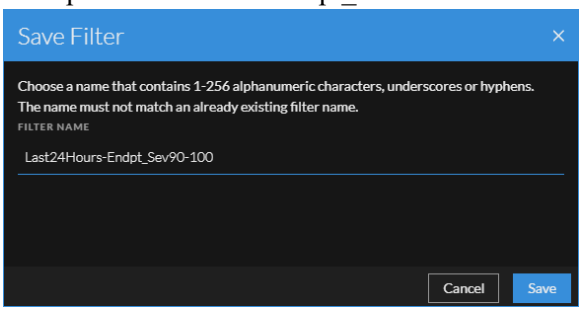
## Save the Current Alerts Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

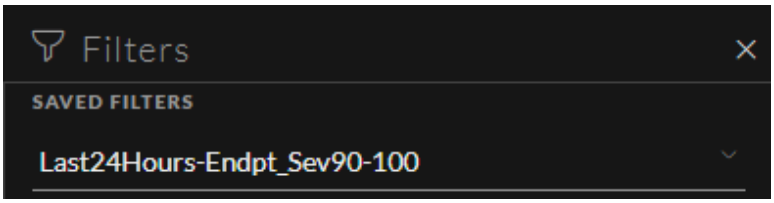
Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of alerts. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only alerts from a specific source and severity level over the last 24 hours. (This option is available in NetWitness Platform 11.5 and later.)

Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field select Last 24 Hours, in the Source field select Endpoint, and for Severity, select the 90 to 100 range.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Endpt_Sev90-100.



The filter is added to the **Saved Filters** list.



## Update a Saved Alerts Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

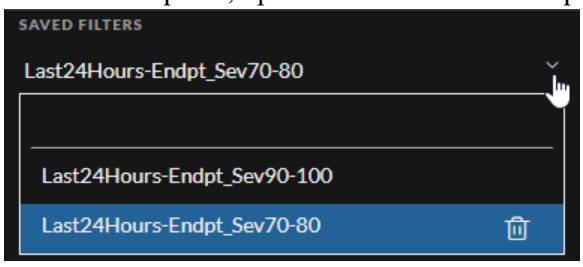
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

## Delete a Saved Alerts Filter

**Note:** This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.

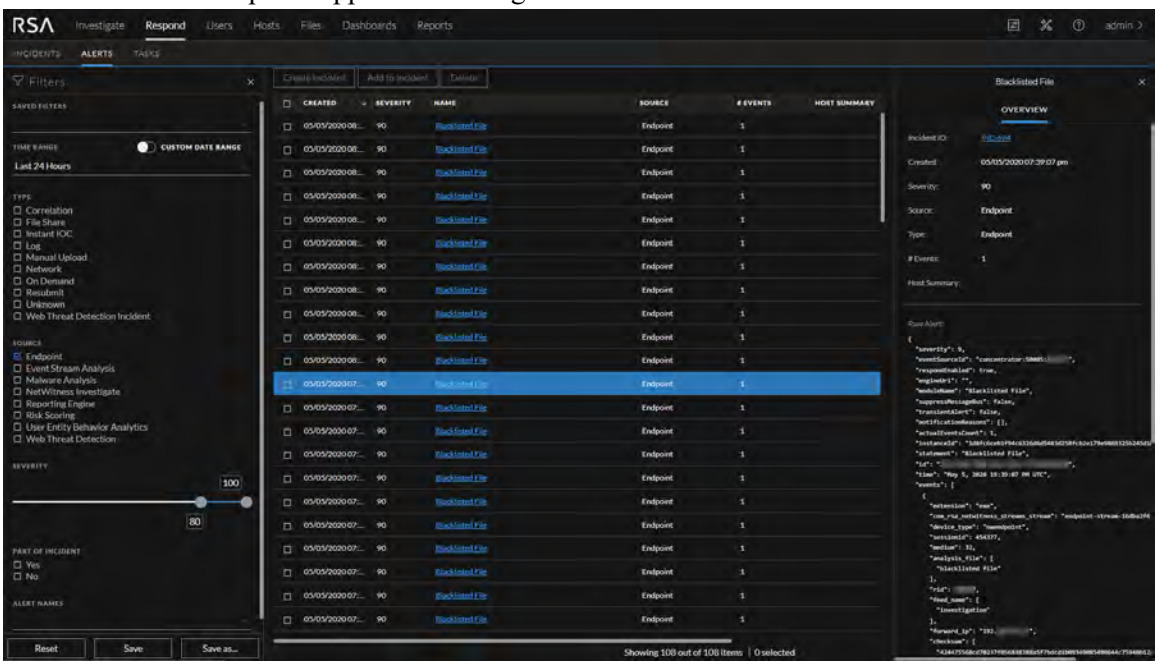


2. Next to the filter name, click to delete it.

# View Alert Summary Information

In addition to viewing basic information about an alert, you can also view raw alert metadata in the Overview panel.

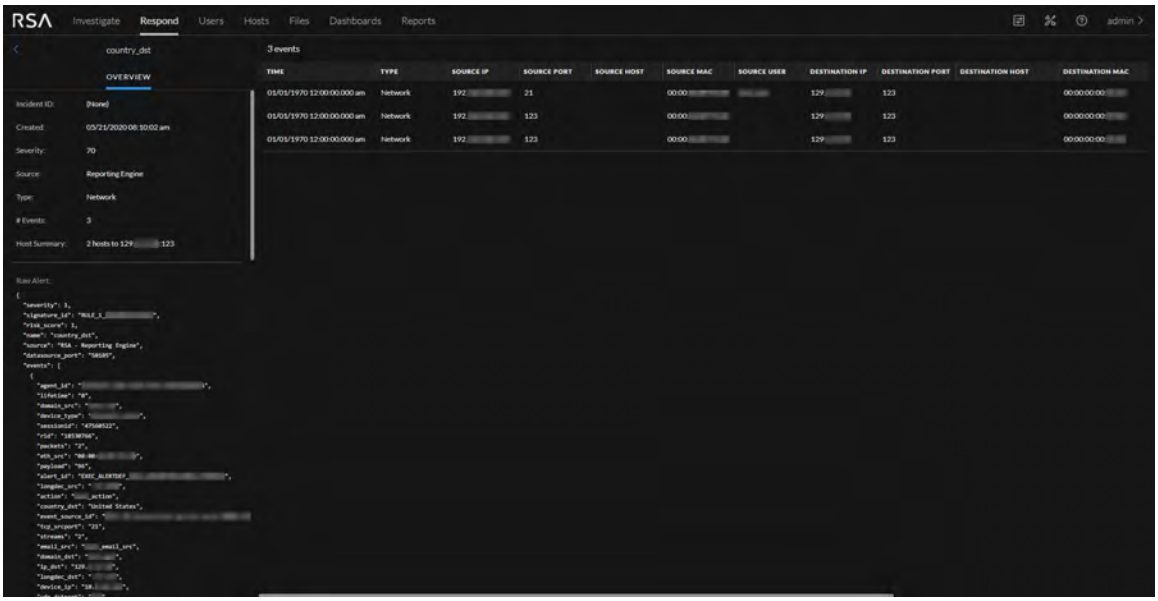
1. In the Alerts list, click the alert that you want to view.
   The Alert Overview panel appears to the right of the Alerts list.



2. In the Overview panel Raw Alert section, you can scroll to view the raw alert metadata.

## View Event Details for an Alert

After you review the general information about the alert in the Alerts List view, you can go to the Alert Details view for more detailed information to determine the action required. An alert contains one or more events. In the Alert Details view, you can drill down into an alert to get additional event details and further investigate the alert. The following figure shows an example of the Alert Details view.



The Overview panel on the left has the same information for an alert as the Overview panel in the Alerts List view.

The Events panel on the right shows information about the events in the alert, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

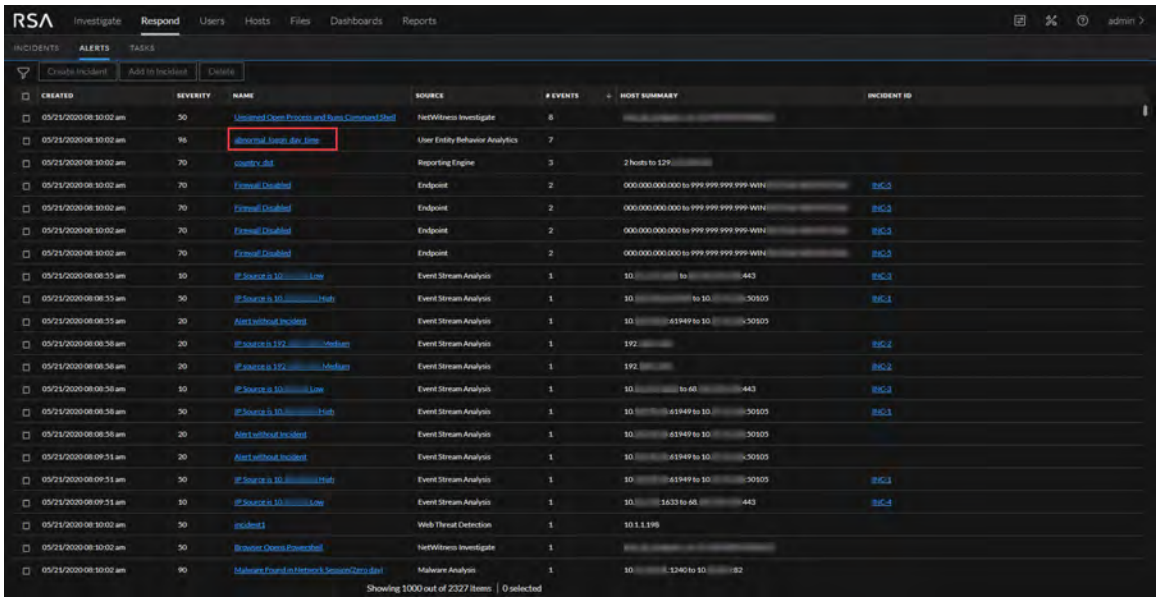
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

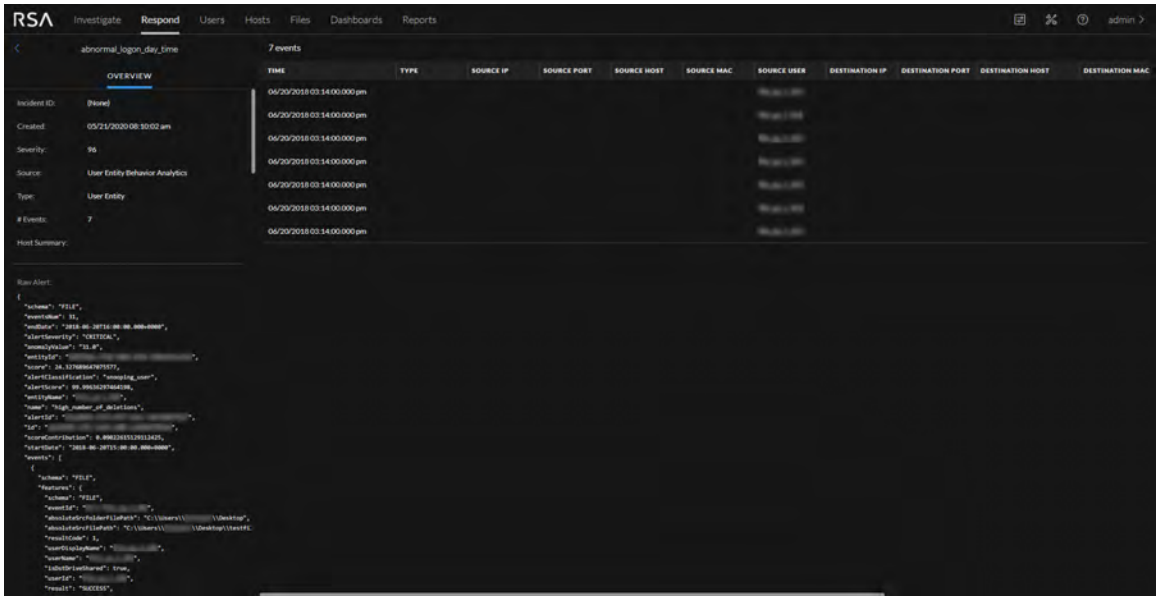
You can drill further into an event to get detailed data about the event.

### To View the Event Details for an Alert:

1. To view event details for an alert, in the Alerts List view, choose an alert to view and then click the link in the **Name** column for that alert.



The Alerts Details view shows the Overview panel on the left and the Events panel on the right.



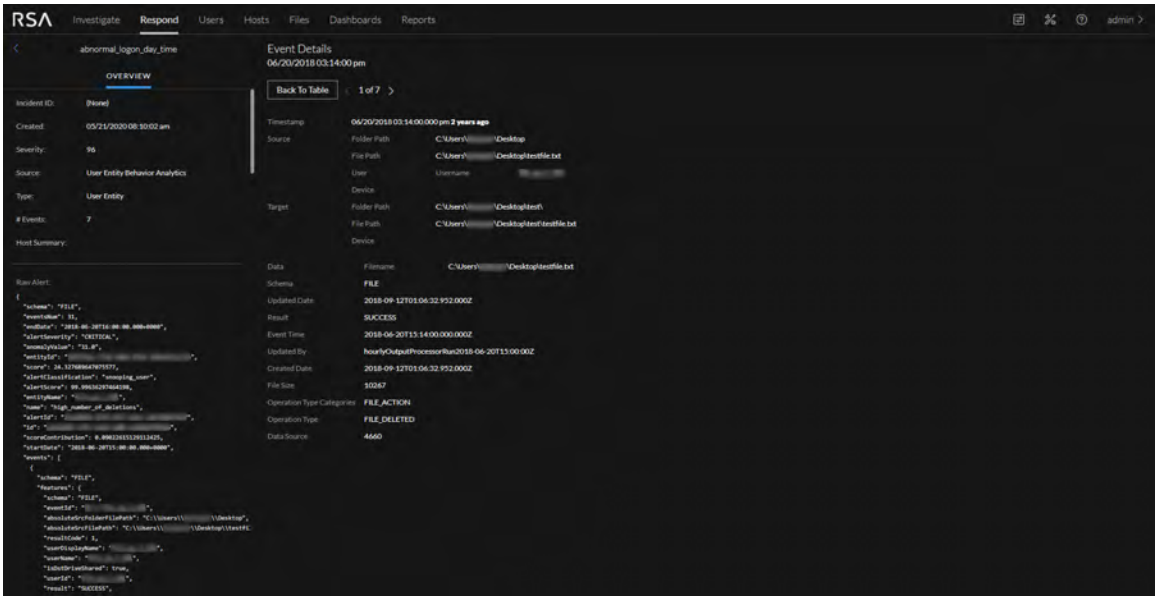
The Events panel shows a list of events with information about each event. The following table shows some of the columns that can appear in the Events List (Events Table).

| Column | Description |
|---|---|
| Time | Shows the time the event occurred. |
| Type | Shows the type of alert, such as Log and Network. |
| Source IP | Shows the source IP address if there was a transaction between two machines. |
| Destination IP | Shows the destination IP address if there was a transaction between two machines |

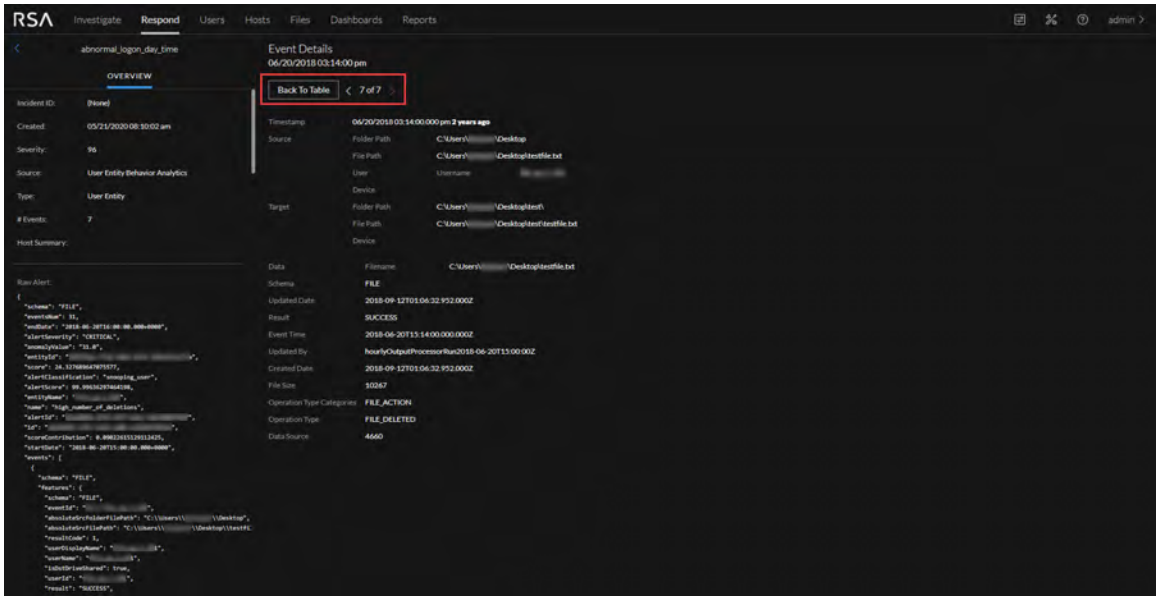
| Column | Description |
|---|---|
| Detector IP | Shows the IP address of the machine where an anomaly was detected. |
| Source User | Shows the user of the source machine. |
| Destination User | Shows the user of the destination machine. |
| File Name | Shows the file name if a file is involved with the event. |
| File Hash | Shows a hash of the file contents. |

If there is only one event in the list, you see only the event details for that event instead of a list.

2. Click an event in the Events list to view the Event details.
This example shows the event details for the first event in the list.



3. Use the page navigation to the right of the Back To Table button to view other events. This example shows the event details for the last event in the list.



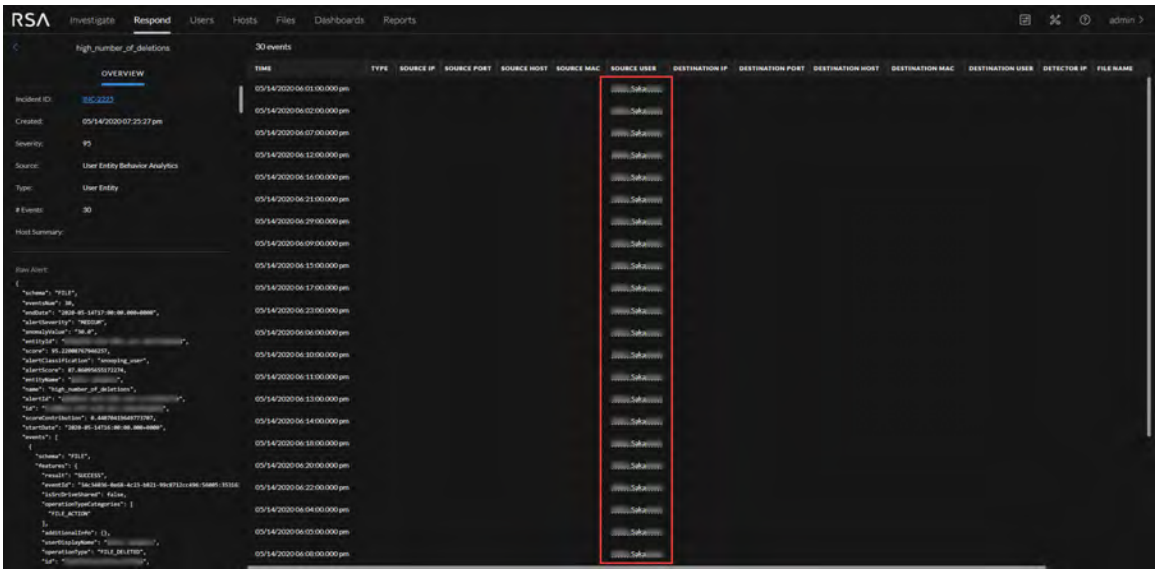
See Alert Details View for detailed information about the event data listed in the Alert Details panel.

# Investigate Events

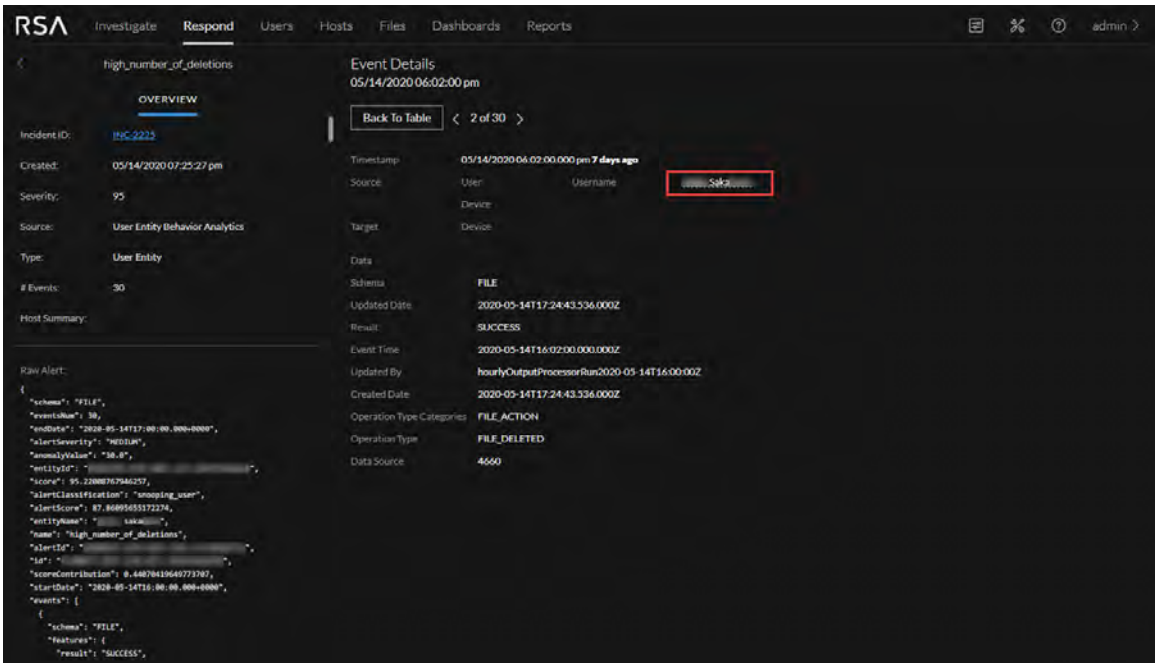
To further investigate the events, you can find links that take you to additional contextual information. From there, you have options available depending on your selection.

## View Contextual Information

In the Alert Details view, you can see underlined entities in the Events panel. An underlined entity is considered an entity in the Context Hub and has additional contextual information available. The following figure shows underlined entities in the Events list.



The following figure shows an underlined entity in the Event Details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

**Caution:** For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **(Admin) > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

### To View Contextual Information:

1. In the Alert Details view Events List or Event Details, hover over an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

   The context tooltip has two sections: Context Highlights and Actions.

   The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It shows the number of related alerts and incidents. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these numbered items for more information. The above example shows 933 related incidents, 24469 related alerts, and one list associated with the selected IP address. There is no information for Endpoint, Live Connect, Criticality, or Asset Risk. TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.

   The **Actions** section lists the available actions. In the above example, the Add/Remove From List, Pivot to Investigate > Navigate, Pivot to Investigate > Hosts/Files, and Pivot to Endpoint Thick Client options are available.

**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

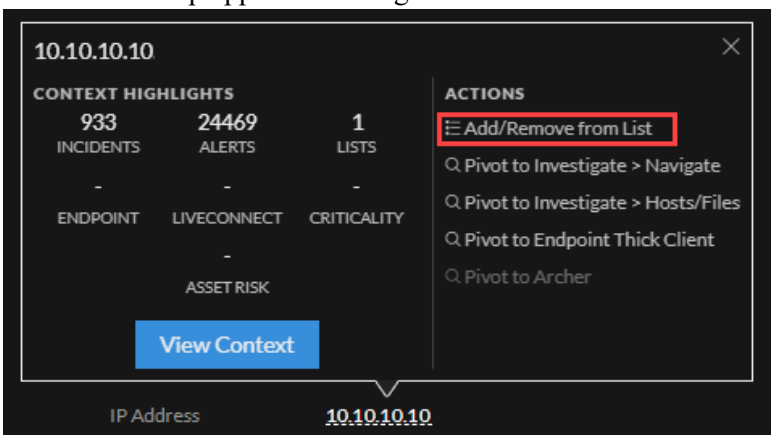
For more information, see Pivot to the Investigate > Navigate View, Pivot to the Hosts or Files View, Pivot to Archer, Pivot to Endpoint Thick Client, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context panel opens and shows all of the information related to the entity.
   Context Lookup Panel - Respond View provides additional information.

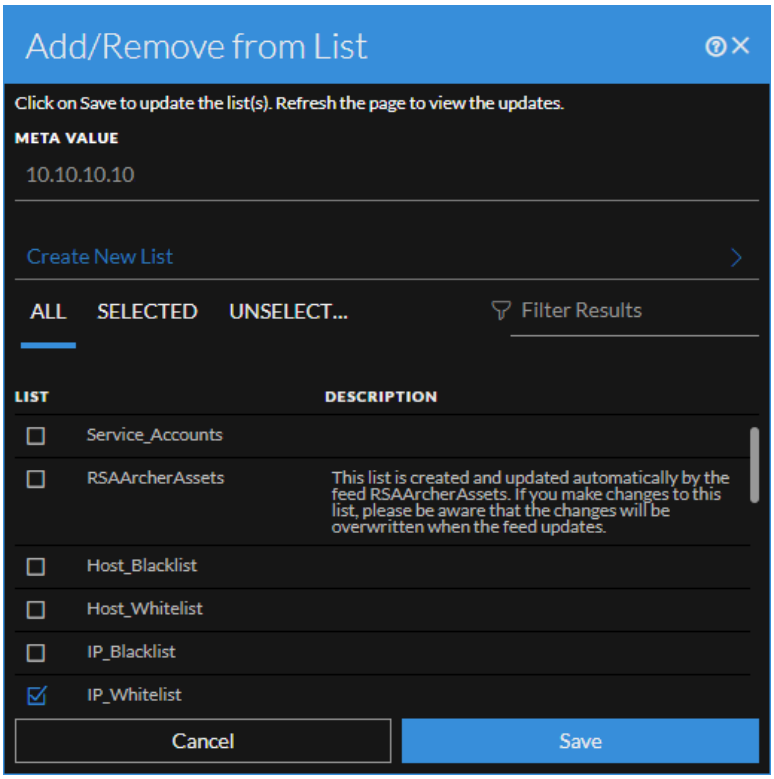
## Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Alert Details view Events List or Event Details, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.



2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove From List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

## Create a Whitelist

You can create a whitelist in the Context Hub in the same way as you would create it in the Incident Details view, see Create a List.

## Pivot to the Investigate > Navigate View

For a more thorough investigation of the incident, you can access the Investigate > Navigate view.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate > Navigate**.
   The Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Navigate link see the *Alerting with ESA Correlation Rules User Guide*.

## Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

1. In the Events List or Event Details in the Alert Details view, hover over any entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate > Hosts/Files**.
   If you hover over a host or IP or MAC address entity and click **Pivot to Investigate > Hosts/Files**, it displays the Hosts view with a specific host listed.
   If you hover over a filename or file hash entity and click **Pivot to Investigate > Hosts/Files** it displays the Files view with a specific file listed.

**Note:** By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

## Pivot to Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

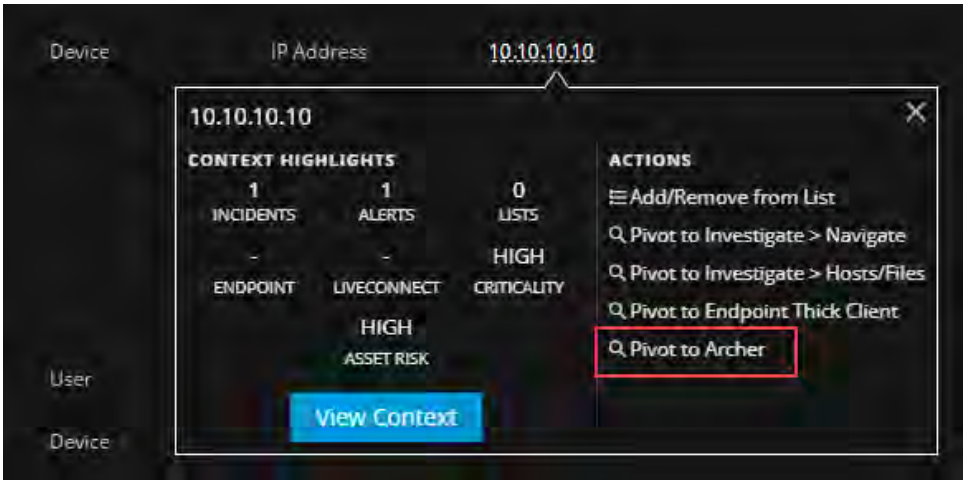
1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

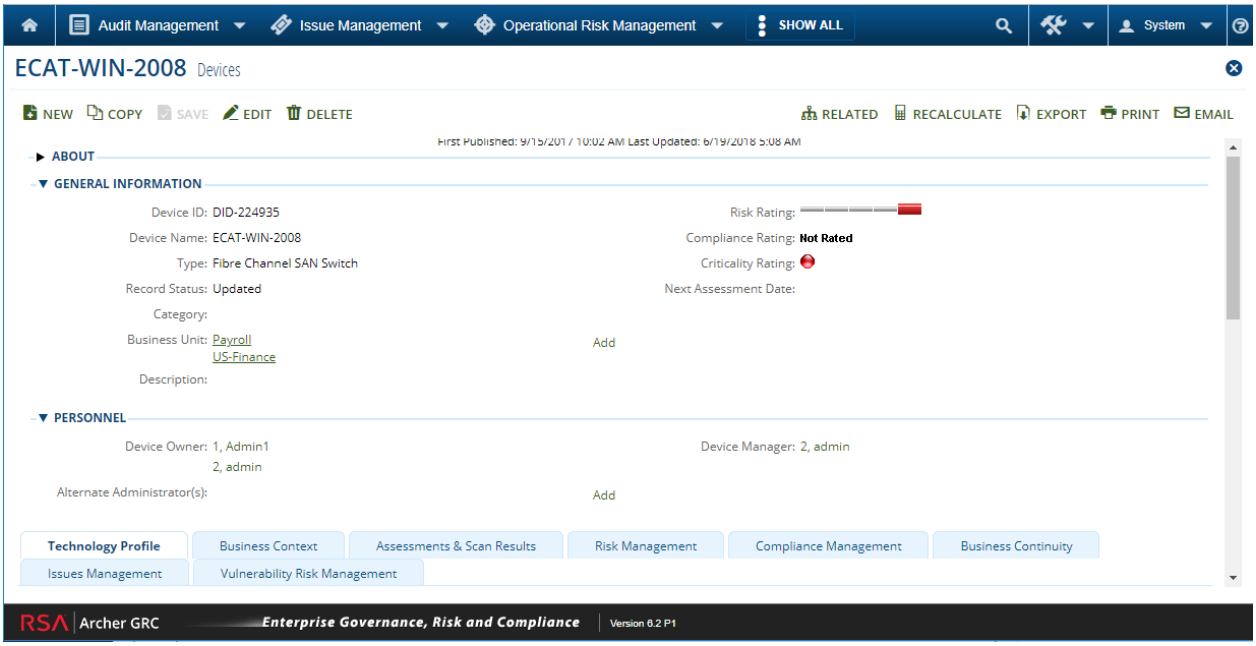
## Pivot to Archer

For viewing more details about a device in RSA Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section, select **Pivot to Archer**.



3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



**Note:** The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *RSA Archer Integration Guide*.

# Create an Incident Manually

You can create incidents manually from alerts in the Alerts List view. The alerts that you select cannot be part of another incident.

In NetWitness Version 11.2 and later, you can change the assignee, category, and priority when you create an incident manually from alerts.

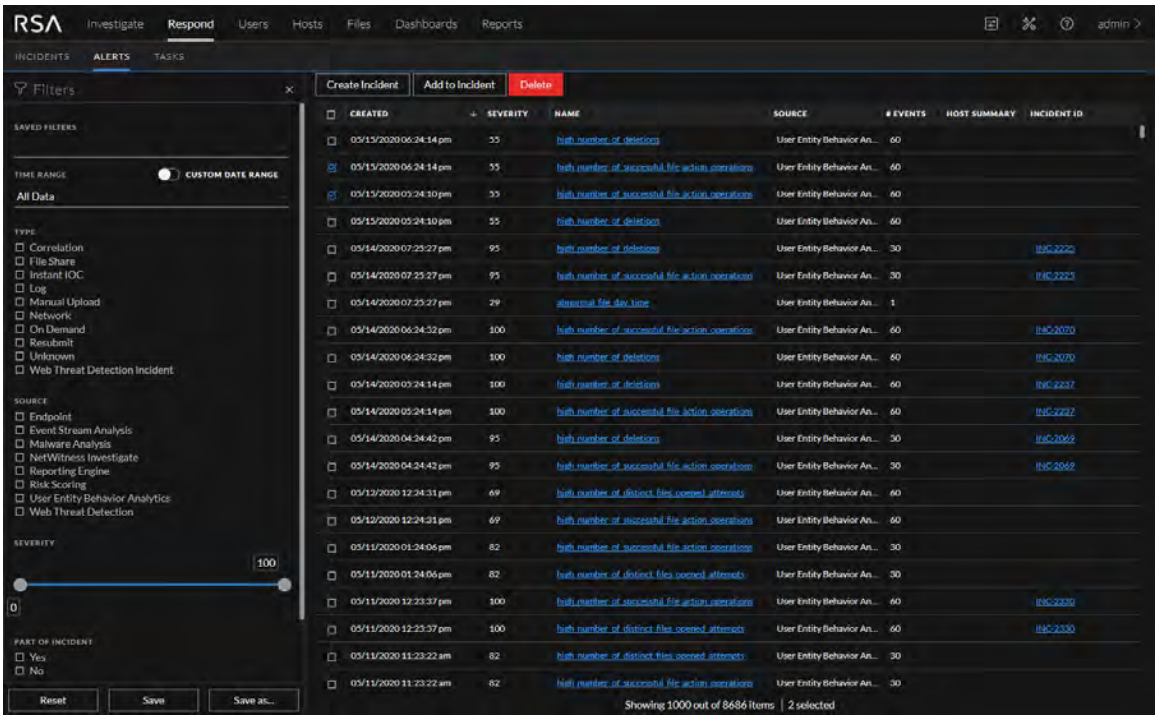
In NetWitness Version 11.1, incidents created manually from alerts default to Low priority, but you can change the priority after you create it. You cannot add categories to manually created incidents in version 11.1.

**Note:** Incidents can be created manually or automatically. An Alert can only be associated with one Incident. You can create incident rules to analyze the alerts collected and group them into incidents depending on which rules they match. For details, see the "Create an Incident Rule for Alerts" topic in the *NetWitness Respond Configuration Guide*.

### To Create an Incident Manually:

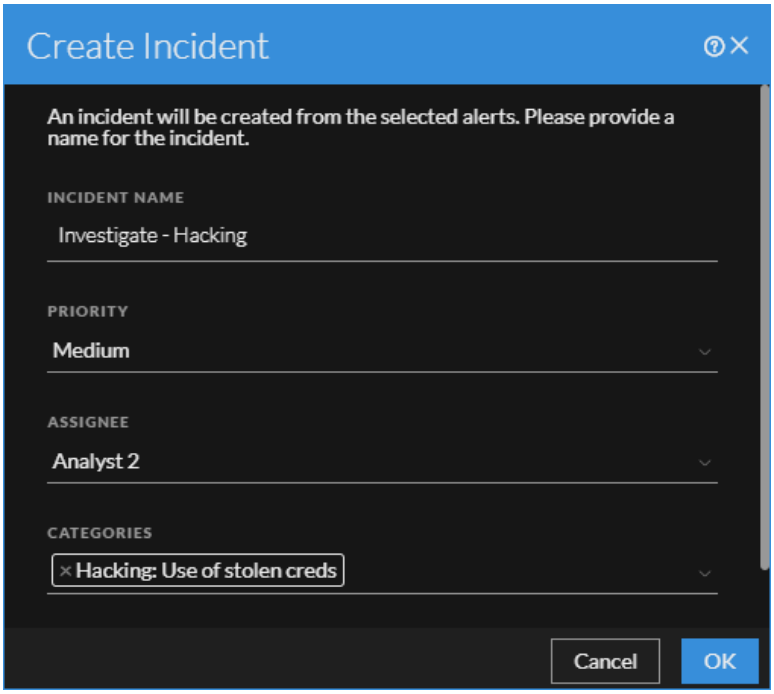
1. Go to **Respond > Alerts**.
2. Select one or more alerts in the Alerts List.

**Note:** Selecting alerts that do not have incident IDs enable the **Create Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incidents** as **No** in the Filters panel.



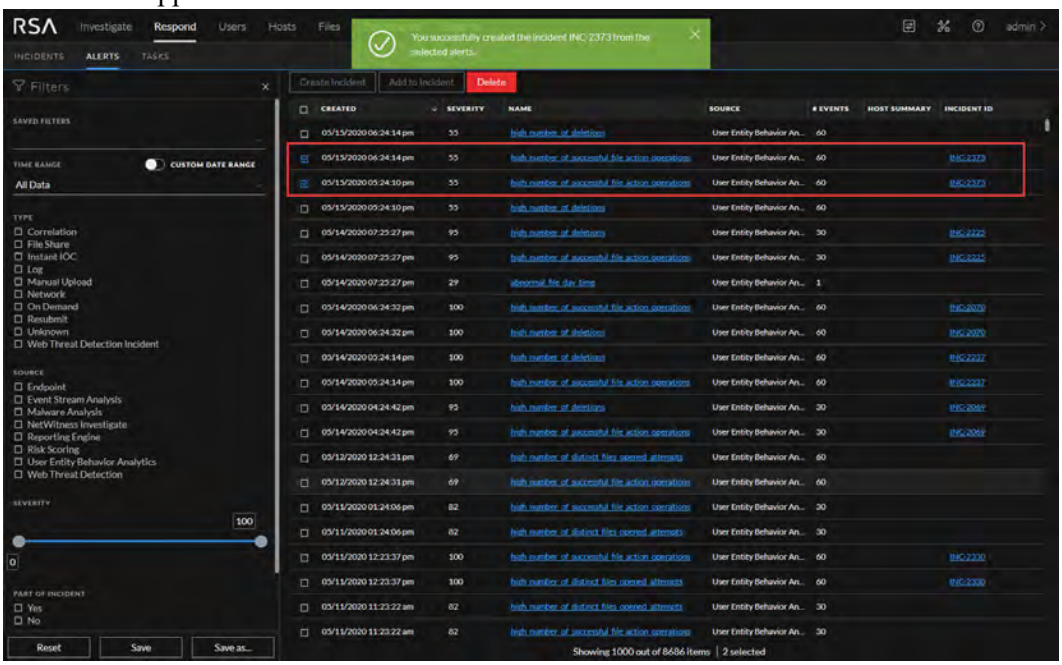
3. Click **Create Incident**.

   The **Create Incident** dialog is displayed.

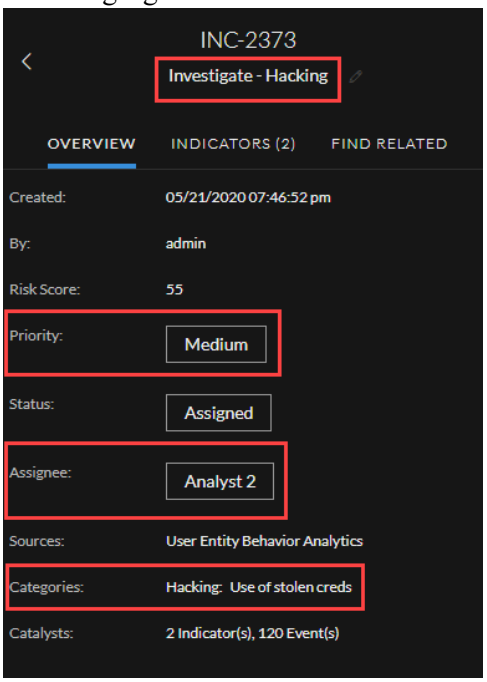


4. In the **Incident Name** field, type a name to identify the incident. For example, Investigate - Hacking.
5. In the **Priority** field, select a priority for the incident. The priority defaults to Low.
6. (Optional) If you are ready to assign the incident, in the **Assignee** field, select a specific user.
7. (Optional) In the **Categories** field, you can select a category to classify the incident, such as Hacking: Use of stolen creds. This is also helpful when trying to locate the incident later using the incidents filter.

8. Click **OK**.
   You can see a confirmation message that an incident was created from the selected alerts. The new incident ID appears as a link in the INCIDENT ID column of the selected alerts.



If you click the link, it takes you to the Incident Details view for that incident, where you can update information, such as changing Priority to high or assigning the incident to another user. The following figure shows the Incident Details view Overview panel for the new incident.



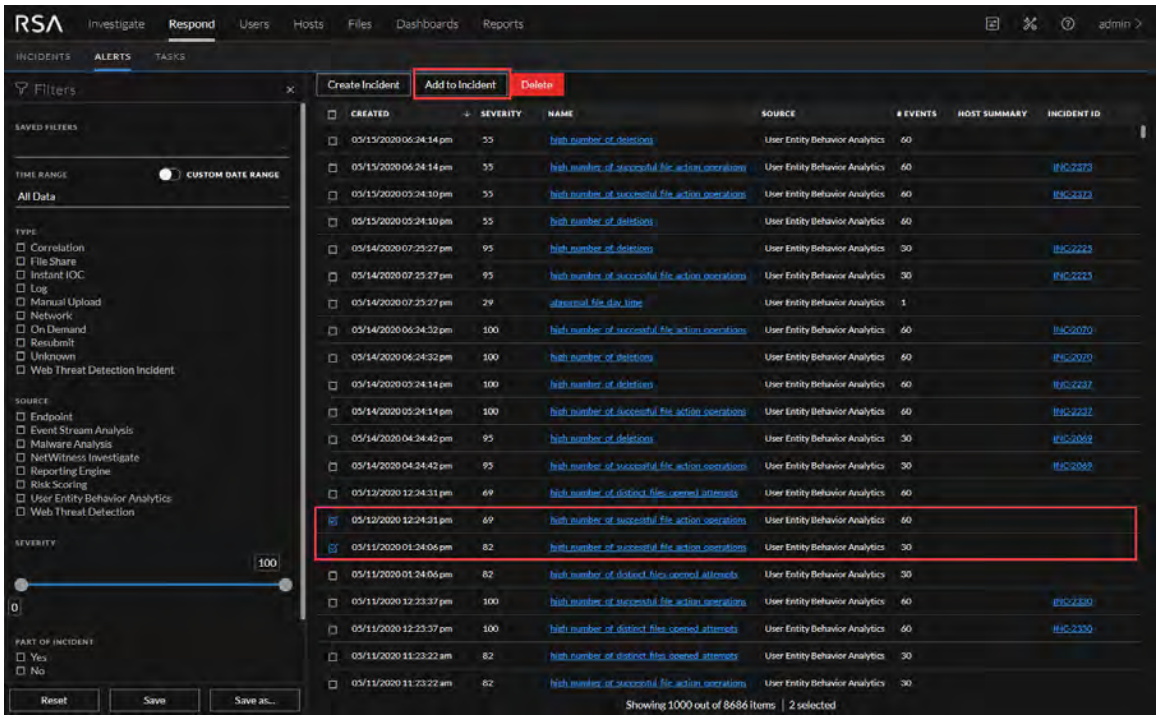
# Add Alerts to an Incident

**Note:** This option is available in NetWitness Version 11.1 and later.

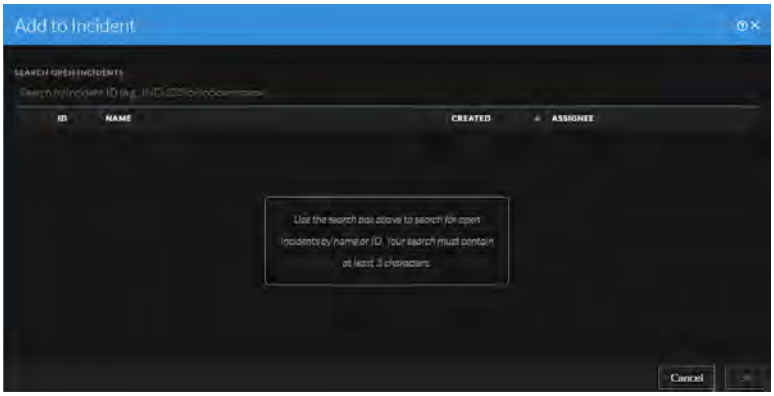
If you have alerts that fit a particular existing incident, you do not have to create a new incident. Instead, you can add alerts to that incident from the Alerts List view. The alerts that you select cannot be part of another incident.

1. Go to **Respond > Alerts**.
2. In the Alerts List, select one or more alerts that you want to add to an incident, and click **Add to Incident**.

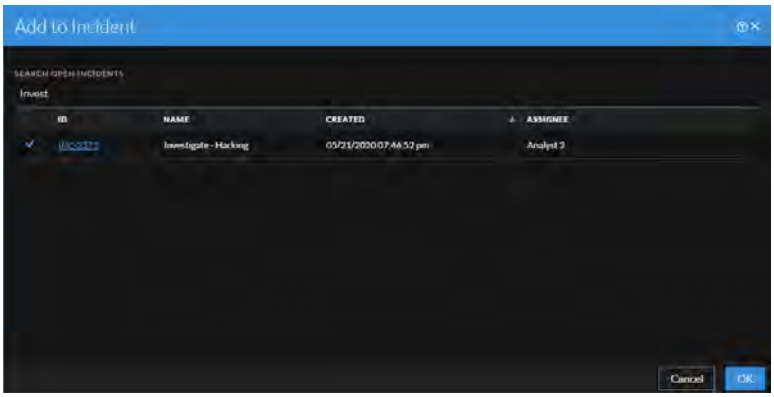
   **Note:** Selecting alerts that do not have incident IDs enables the **Add to Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incident** as **No** in the Filters panel.



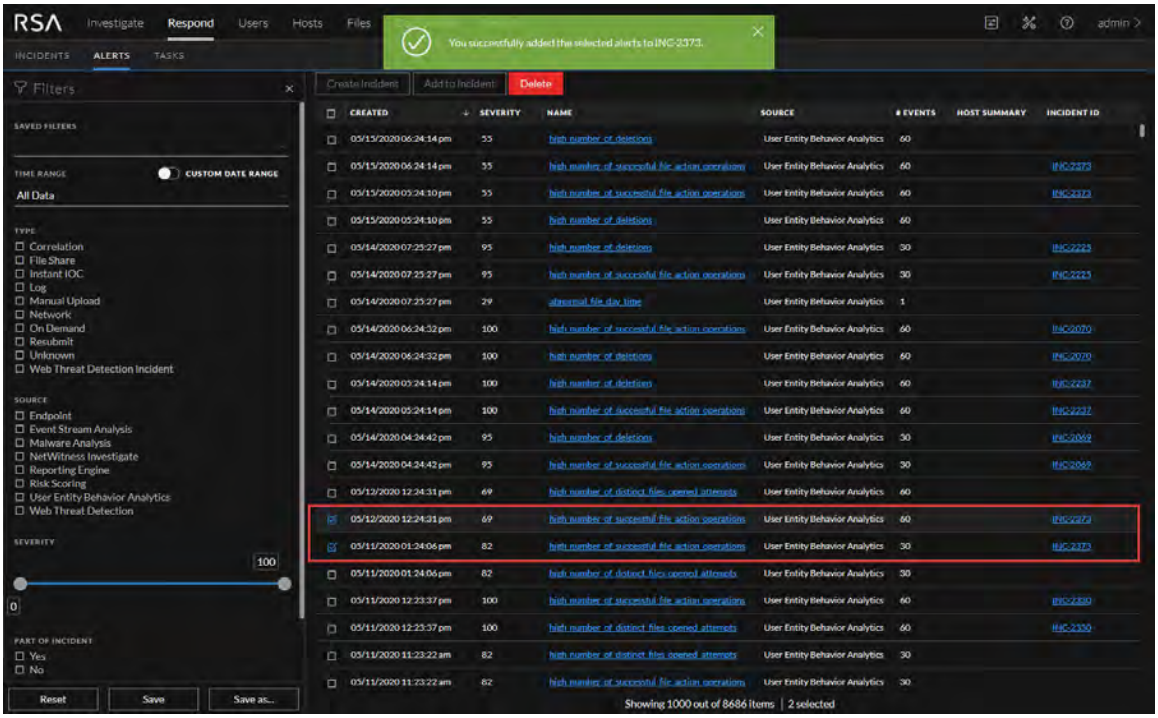
3. In the **Add to Incident** dialog, type at least three characters in the **Search** field to search for the incident by **Name** or **Incident ID**.



4. In the results list, select the incident that will receive the selected alerts and click **OK**.



The selected alert or alerts are now part of the selected incident and will have that incident ID.



# Delete Alerts

Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. This procedure is helpful when you want to remove unnecessary or non-relevant alerts. Deleting these alerts frees up disk space.

1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.
2. In the Alerts list, select the alerts that you want to delete and click **Delete**.

   If you do not have permission to delete alerts, you will not see the Delete button.
3. Confirm that you want to delete the alerts and click **OK**.

   The alerts are deleted from NetWitness. If a deleted alert is the only alert in an incident, the incident is also deleted. If the deleted alert is not the only alert in an incident, the incident is updated to reflect the deletion.

# NetWitness Respond Reference Information

The Respond view user interface provides access to NetWitness Respond functions. This topic contains descriptions of the user interfaces as well as other reference information to help users understand the functions of NetWitness Respond.

**Topics**

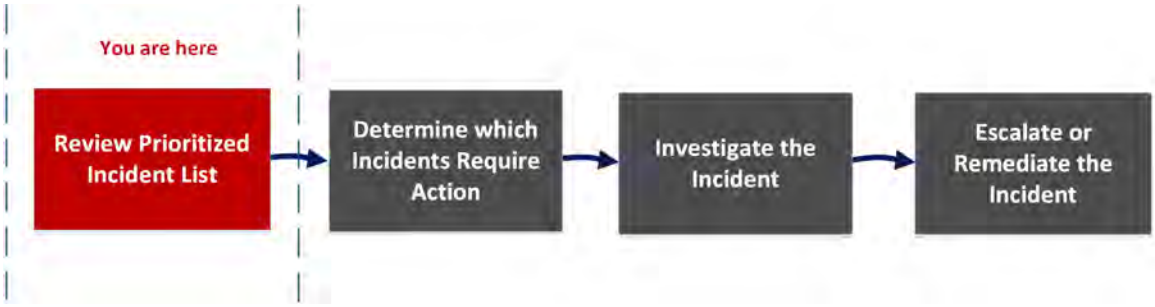
- Incidents List View
- Incident Details View
- Alerts List View
- Alert Details View
- Tasks List View
- Add/Remove from List Dialog
- Context Lookup Panel - Respond View

# Incidents List View

The Incidents List view (Respond > Incidents) shows Incident Responders and other Analysts a prioritized results list of incidents created from various sources. For example, your results list could show incidents created from ESA rules or NetWitness Endpoint. From the Incidents List view, you have easy access to the information that you need to quickly triage and manage incidents through completion.

## Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.



In the Incidents List view, you can review the list of prioritized incidents, which shows basic information about each incident. You can also change the assignee, priority, and status of the incidents. Because the results can be large in the incidents list, you have the option to filter those incidents by time range, incident ID, custom date range, priority, status, assignee, and categories.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts, and SOC Manager | View prioritized incidents* | Review Prioritized Incident List |
| Incident Responders, Analysts, and SOC Manager | Filter and sort the incident list* | Filter the Incident List |
| Incident Responders, Analysts | View my incidents* | View My Incidents |
| Incident Responders, Analysts | Assign incidents to myself* | Assign Incidents to Myself |
| Incident Responders, Analysts, and SOC Manager | Find Incidents* | Find an Incident |
| Incident Responders, Analysts, and SOC Manager | Send an incident to Archer Cyber Incident & Breach Response or update an incident.* | Escalate or Remediate the Incident |
| Incident Responders, Analysts | View incident details. | Determine which Incidents Require Action |
| Incident Responders, Analysts | Further Investigate an incident. | Investigate the Incident |
| Incident Responders, Analysts, and SOC Manager | Create a task. | Escalate or Remediate the Incident |

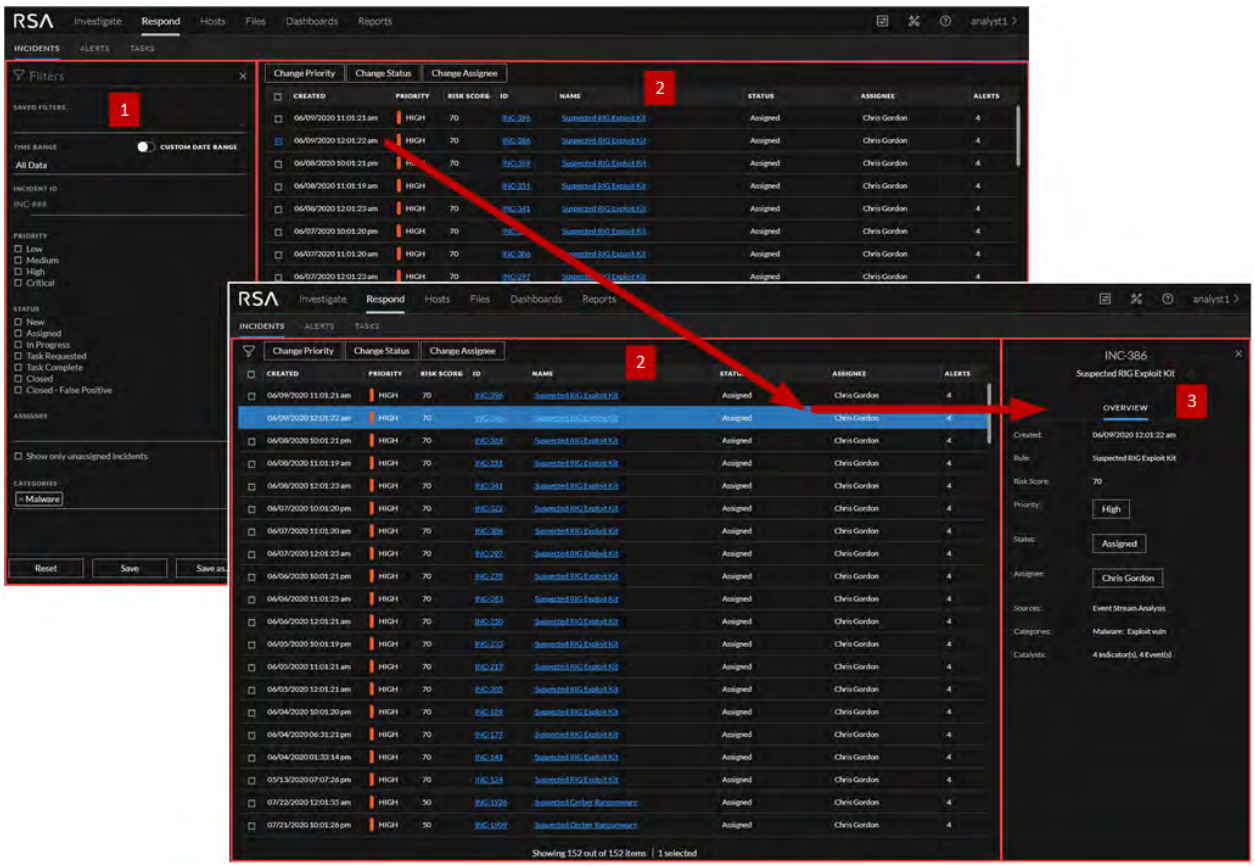
*You can complete these tasks here (that is, in the Incidents List view).

## Related Topics

- Incident Details View
- Responding to Incidents

## Quick Look

The following example shows the initial Incidents List view with the Filter panel. You can open the Overview panel for an incident by clicking an incident in the Incident List.



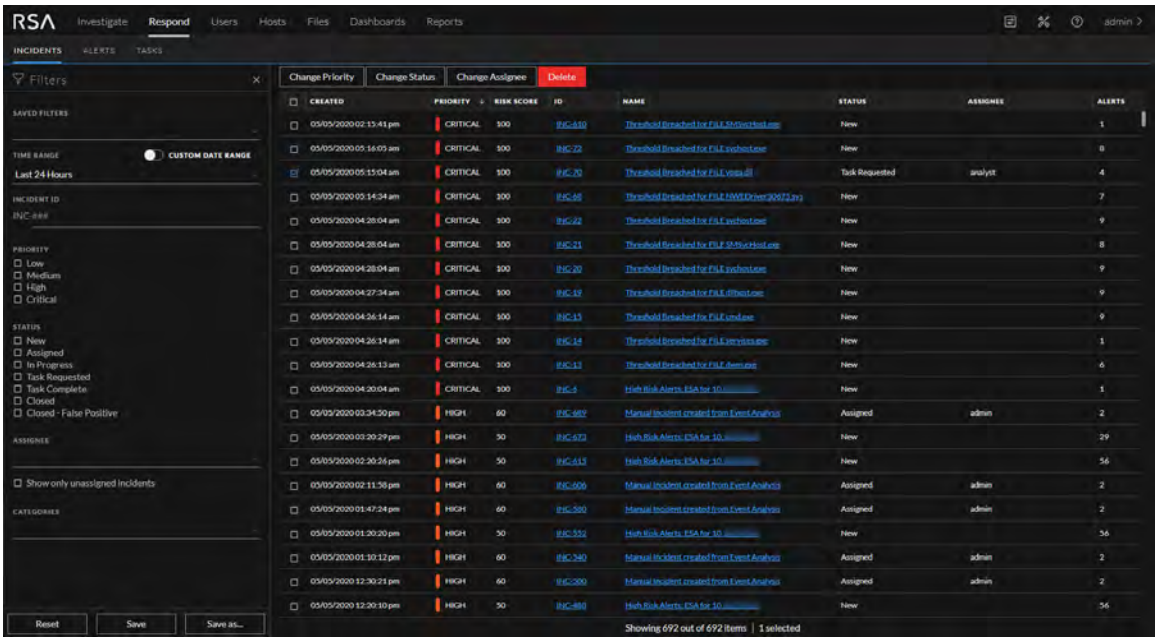
1 Filters Panel
2 Incidents List
3 Overview Panel

You can go directly to the Incident Details view from the Incidents List by clicking the hyperlinked ID or NAME. The Overview panel is also available in the Incident Details view. For more information about the Incidents Details view, see Incident Details View.

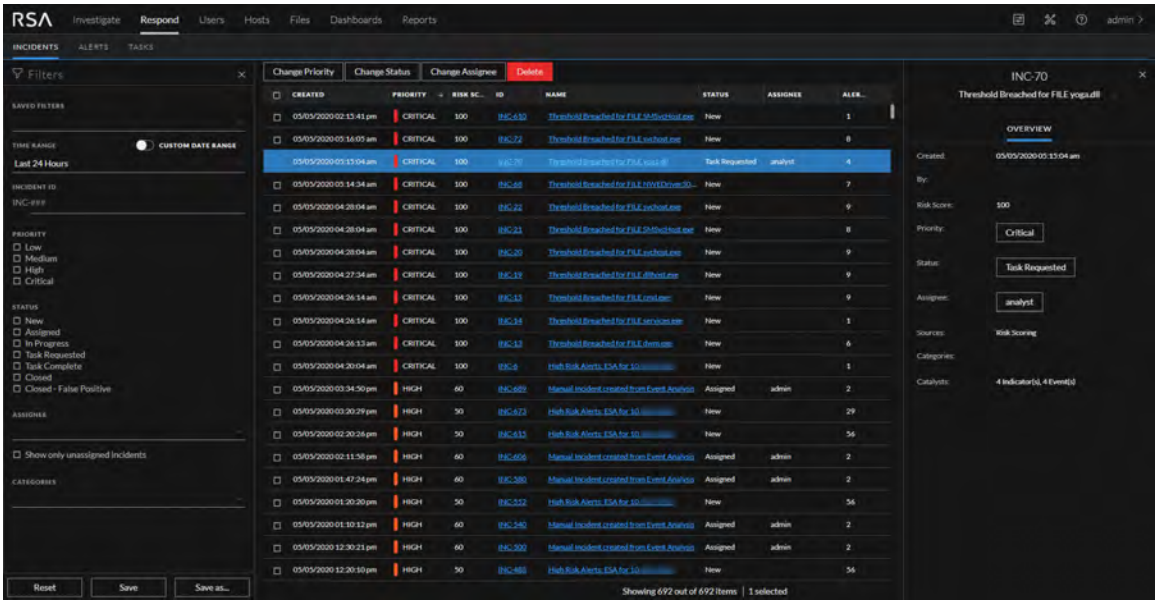
## Incidents List View

To access the Incidents List view, go to **Respond > Incidents**. The Incidents List view displays a list of all incidents. The Incidents List view consists of a Filters panel, an Incidents List, and an Incidents Overview panel.

The following figure shows the Filter Panel on the left and the Incidents List on the right.



The following figure shows the incident Overview panel on the right.



## Incidents List

The Incidents List shows a list of all of the prioritized incidents. You can filter this list to show only incidents of interest.

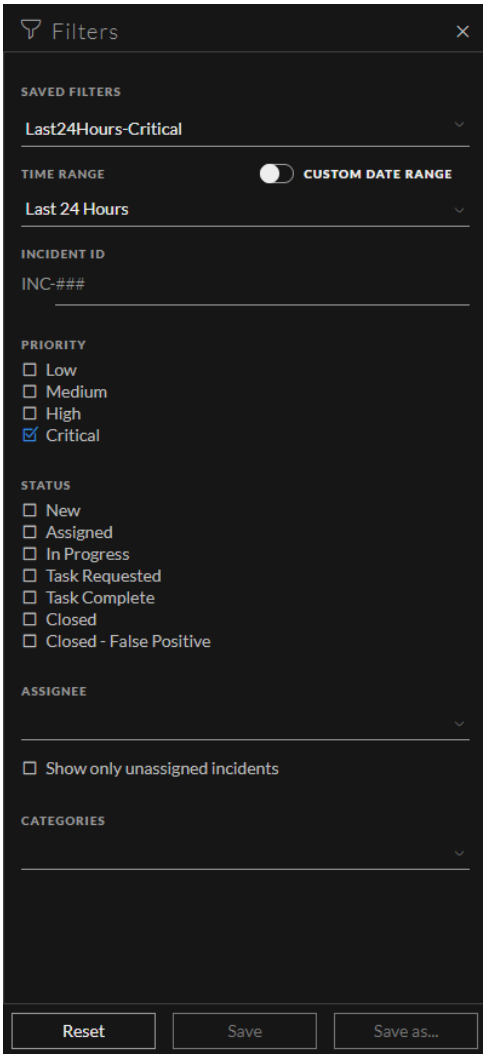
| Column | Description |
|---|---|
| Created | Shows the creation date of the incident. |

| Column | Description |
|---|---|
| Priority | Shows the incident priority. Priority can be Critical, High, Medium, or Low.<br>The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example:<br> |
| Risk Score | Shows the incident risk score. The risk score indicates the risk of the incident as calculated by an algorithm and is between 0-100. 100 is the highest risk score. |
| ID | Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident. |
| Name | Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident. |
| Status | Shows the incident status. The status can be: New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed-False Positive. |
| Assignee | Shows the team member currently assigned to the incident. |
| Alerts | Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack. |

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number of incidents selected. For example: **Showing 1000 out of 2517 items | 2 selected**. The maximum number of incidents that you can view at one time is 1,000.

## Incident Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Incidents List view, has options that you can use to filter the incidents list. When you navigate away from the Filters panel, the Incidents List view retains your filter selections.

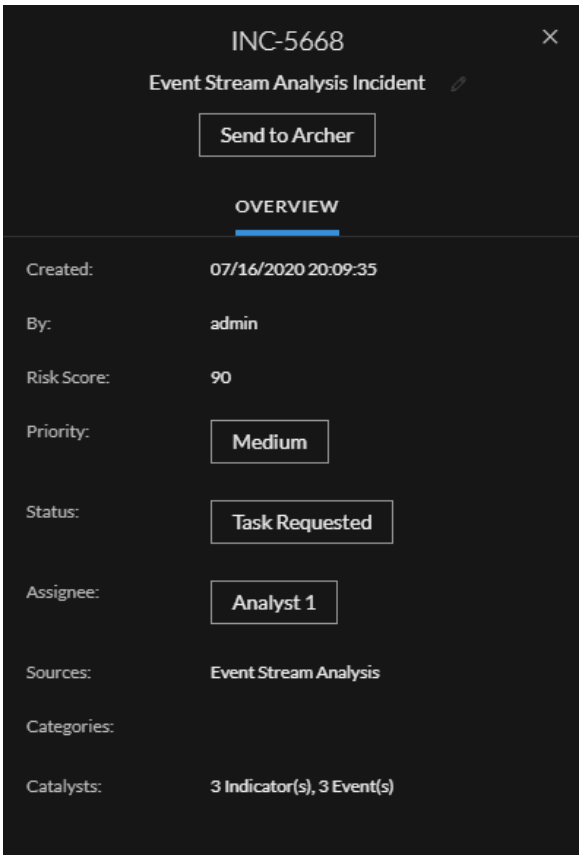
| Option | Description |
|---|---|
| Saved Filters | You can select a saved filter to filter the incident list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.) |

| Option | Description |
|---|---|
| Time Range | You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes. |
| Custom Date Range | You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.<br>  |
| Inident ID | Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident. |
| Priority | Select the priorities that you would like to view. |
| Status | Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe. |
| Assignee | Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.<br>(Available in NetWitness Version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**. |
| Categories | Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse. |

| Option | Description |
|---|---|
| Sent to Archer | (In NetWitness Version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**. |
| Reset | Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter. |
| Save | Saves the currently applied incidents filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.) |
| Save As | Saves the currently applied incidents filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.) |

## Incident Overview Panel

The Overview panel shows basic summary information about a selected incident. From the Incidents List, you can click an incident to access the Overview panel. The Overview panel in the Incident Details view contains the same information.



The following table lists the fields displayed in the Incident Overview panel.

| Field | Description |
|---|---|
| <Incident ID> | Displays the Incident ID. |

| Field | Description |
|---|---|
| Send to Archer / Sent to Archer | (In NetWitness Version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can escalate incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.)<br>Shows whether the incident was sent to Archer Cyber Incident & Breach Response:<br>• **Send to Archer**: The incident was not sent to Archer. You can click the **Send to Archer** button to send the incident to Archer Cyber Incident & Breach Response for additional processing. This action is not reversible.<br> <br>• **Sent to Archer**: The incident was sent to Archer Cyber Incident & Breach Response for additional analysis and action.<br>  |
| <Incident Name> | Displays the name of the incident. You can click the incident name to change it. For example, rules can create many incidents with the same name. You can change the incident names to be more specific. |
| Created | Shows the creation date and time of the incident. |
| Rule / By | Shows the name of the rule that created the incident or the name of the person who created the incident. |
| RiskScore | Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score. |
| Priority | Shows the incident priority. Priority can be Critical, High, Medium or Low. To change the priority, you can click the Priority button and select a new priority from the drop-down list. |
| Status | Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. To change the status, you can click the Status button and select a new status from the drop-down list. |
| Assignee | Shows the team member currently assigned to the incident. To change the assignee you can click the Assignee button and select a new assignee from the drop-down list. |

| Field | Description |
|---|---|
| Sources | Displays the data sources used to locate the suspicious activity. |
| Categories | Displays the categories of the incident events. |
| Catalysts | Displays the count of indicators that gave rise to the incident. |
| External ID | Allows storing the Incident ID referrals from a different platform.<br>**Note:** Click Send to Archer to generate the External ID. The ID generated is automatically stored as External ID. |
| Time to Acknowledge | Displays the time taken to assign an Incident after creating it. |
| Time to Detect | Displays the time taken for completing the task after the Incident is assigned. |
| Time to Resolve | Displays the time taken for closing the task after the Incident is created. |
| Persisted Status | Displays the persist status of the Incident. The status can be Complete, Partial, or None (-). |

## Toolbar Actions

This table lists the toolbar actions available in the Incidents List view.

| Option | Description |
|---|---|
| | Enables you to open the Filters panel so that you can specify the incidents that you would like to see in the Incidents List. |
| | Closes the panel. |
| **Change Priority** button | Allows you to change the Priority of one or more selected incidents in the Incidents List. |
| **Change Status** button | Allows you to change the Status of one or more selected incidents. |
| **Change Assignee** button | Allows you to change the Assignee of one or more selected incidents. |
| **Delete** button | Allows you to delete the selected incidents if you have the appropriate permissions, such as an Administrator or Data Privacy Officer. |

# Incident Details View

In the Incident Details view (Respond > Incidents > click an ID or NAME hyperlink in the Incidents List), you can view and access extensive incident details. The Incident Details view contains multiple panels that provide the following benefits:

- **Overview**: View an incident summary and update the incident.
- **Indicators**: View the indicators (alerts) involved in the incident, the events within those alerts, and available enrichment information. You can also access Event Analysis details for some events and perform event reconnaissance.
- **Related Indicators**: View indicators (alerts) that are related to the incident and add them to the incident if they are not associated with an incident.
- **Nodal Graph**: Visualize the size and interactions between entities (IP address, MAC address, user, host, domain, file name, or file hash).
- **Events List**: Study the events associated with the incident.
- **Journal**: Add notes and collaborate with other analysts.
- **Tasks**: Create incident tasks and track them to closure.

You can also filter the data in the Incident Details view to study indicators and entities of interest.

## Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.

In the Incident Details view, you can use the extensive information provided about the incidents to determine which incidents require action. You also have the tools and information to investigate the incident, and then escalate or remediate it.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts, and SOC Manager | View prioritized incidents, filter and sort the incident list, find incidents, view my incidents, and assign incidents to myself. | Review Prioritized Incident List |
| Incident Responders, Analysts | View incident details.* | View Incident Details |
| Incident Responders, Analysts | View alerts and enrichments.* | View the Indicators and Enrichments |
| Incident Responders, Analysts | View events.* | View and Study the Events |
| Incident Responders, Analysts (Additional permissions required) | View event analysis for an event.* | View Event Analysis Details for Indicators |
| Incident Responders, Analysts | View a graph of the entities involved in the events.* | View and Study the Entities Involved in the Events on the Nodal Graph |
| Incident Responders, Analysts | Filter the incident data.* | Filter the Data in the Incident Details View |
| Incident Responders, Analysts | View and add incident notes.* | View Incident Notes and Document Steps Taken Outside of NetWitness |
| Incident Responders, Analysts | View and create tasks.* | View the Tasks Associated with an Incident and Create a Task |
| Incident Responders, Analysts | Add related alerts and add them to the incident.* | Find Related Indicators and Add Related Indicators to the Incident |
| Incident Responders, Analysts | View contextual information about an incident from Context Hub.* | View Contextual Information |
| Incident Responders, Analysts | Reduce false positives by adding an entity to a whitelist.* | Add an Entity to a Whitelist |
| Incident Responders, Analysts | Pivot to NetWitness Investigate.* | Pivot to the Investigate > Navigate View |
| Incident Responders, Analysts | Pivot to NetWitness Endpoint.* | Pivot to NetWitness Endpoint Thick Client |
| Incident Responders, Analysts, and SOC Manager | Send an incident to Archer Cyber Incident & Breach Response.* | Send an Incident to RSA Archer |

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | Update or close an incident.* | Update an Incident and Close an Incident |
| Incident Responders, Analysts, and SOC Manager | View all tasks. | Escalate or Remediate the Incident |
| Incident Responders, Analysts, and SOC Manager | Bulk update incidents and tasks. | Escalate or Remediate the Incident |

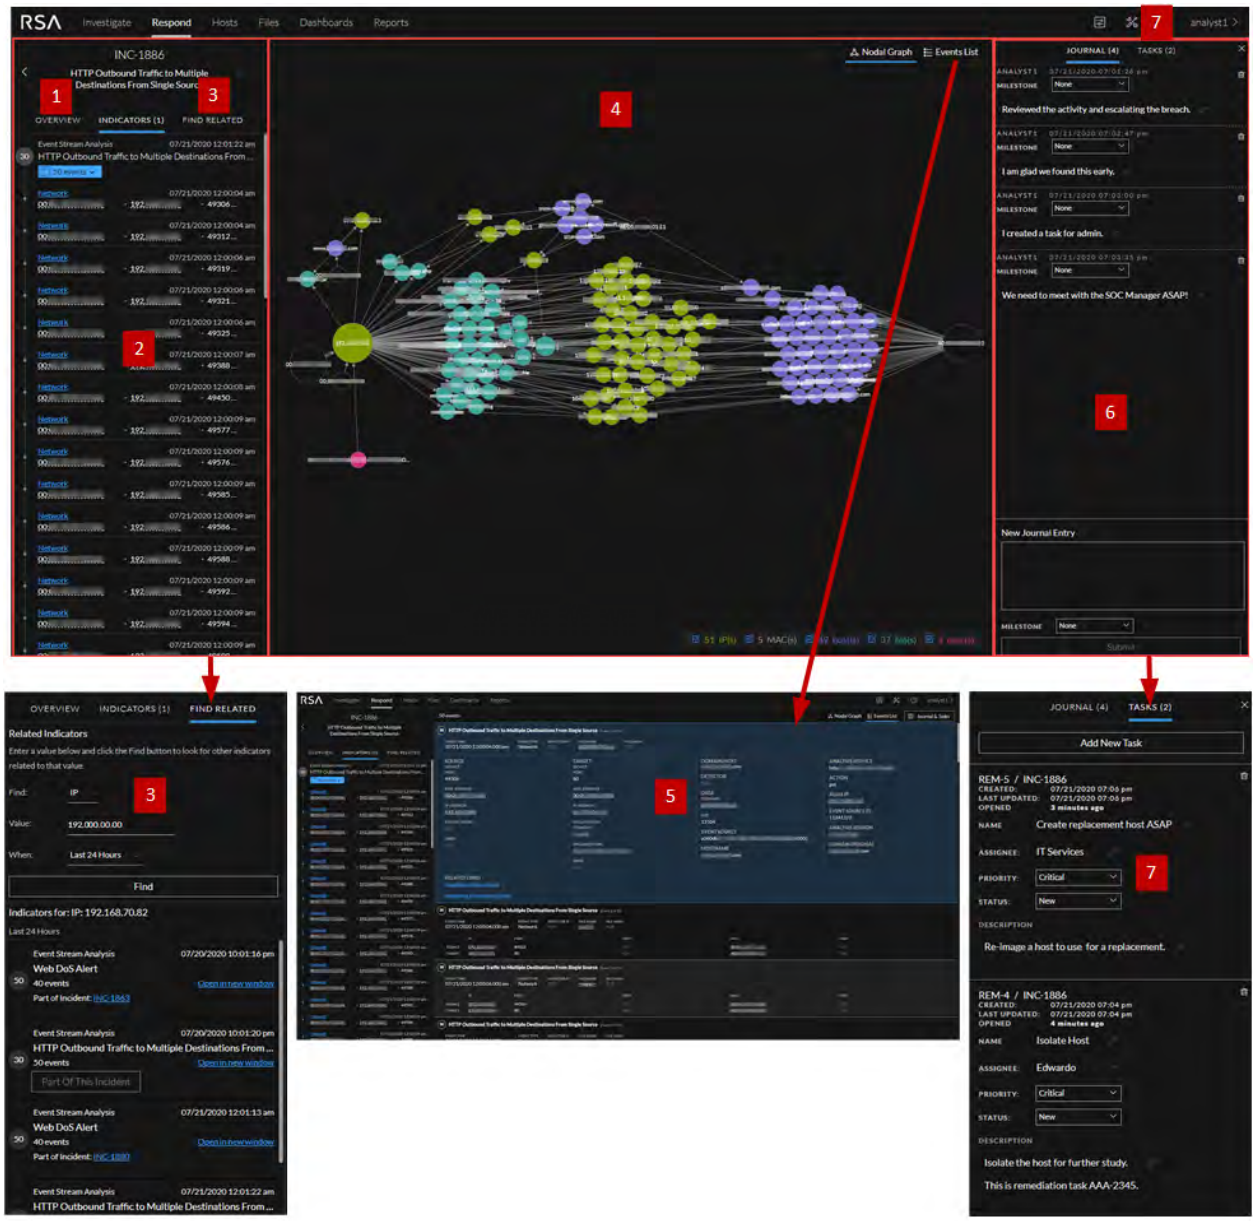
*You can complete these tasks here (that is, in the Incident Details view).

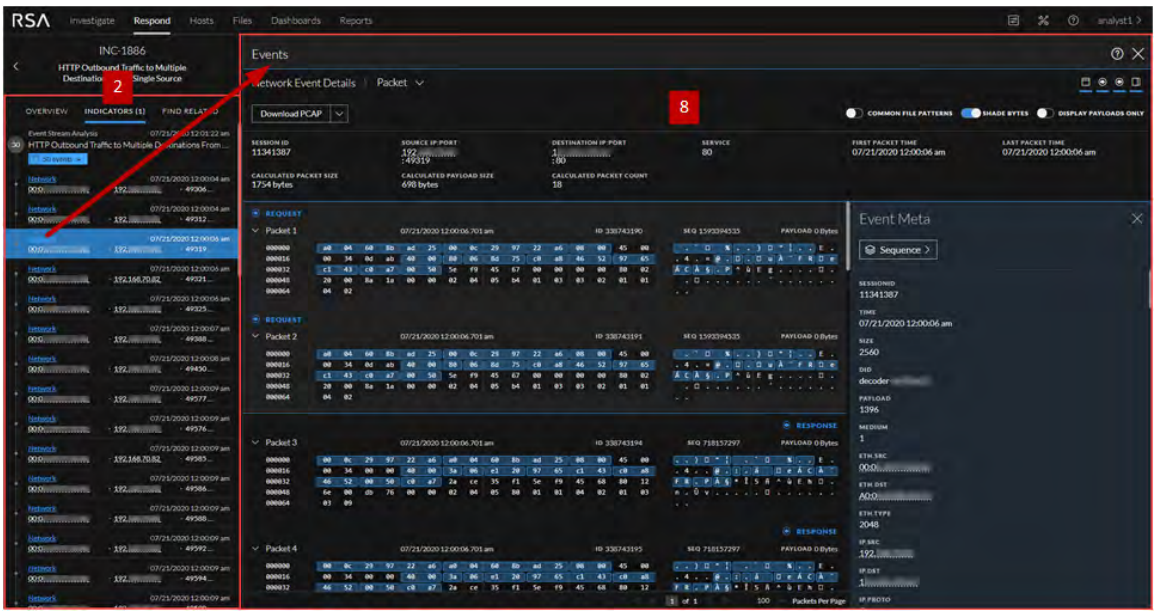
## Related Topics

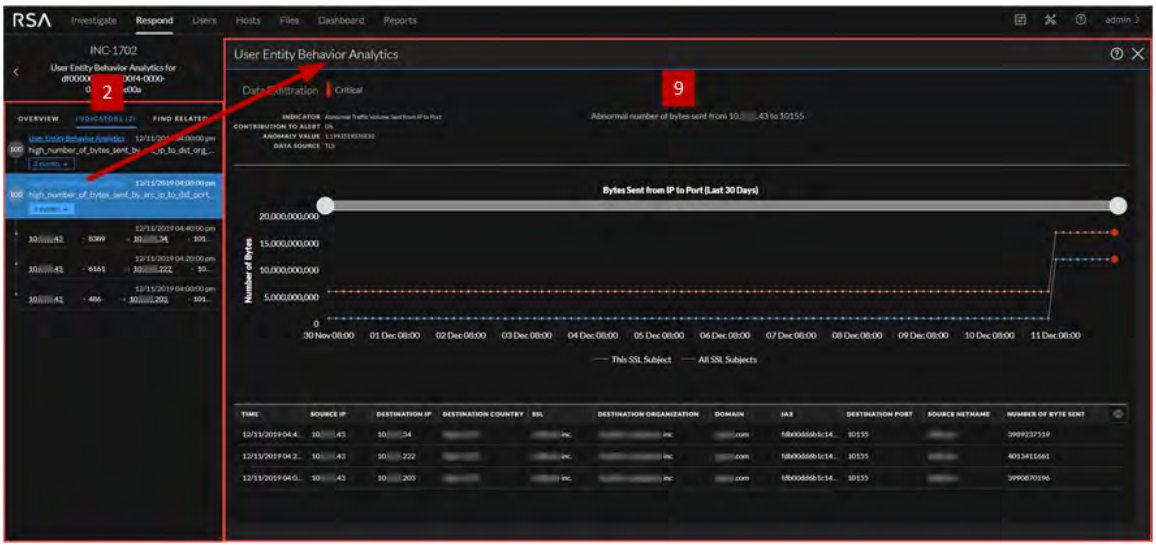
- Incidents List View
- Determine which Incidents Require Action
- Investigate the Incident
- Escalate or Remediate the Incident

## Quick Look

The following example shows the locations of the Incident Details view panels.







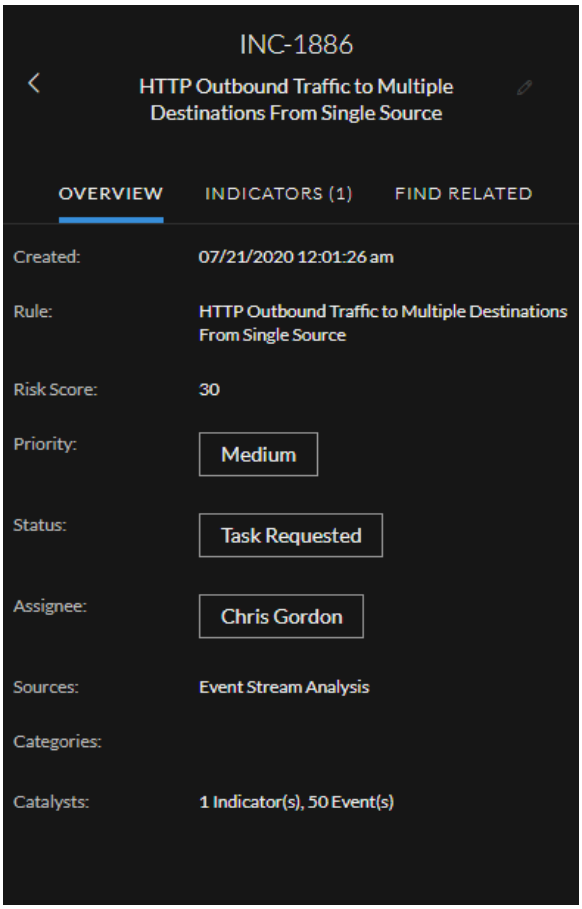
| | |
|---|---|
| 1 | Overview (Click the Overview tab to view the Overview panel.) |
| 2 | Indicators Panel |
| 3 | Related Indicators Panel (Click the Find Related tab to view it.) |
| 4 | Nodal Graph |
| 5 | Events List (Click the top of an event in the Events List to view event details.) |
| 6 | Journal Panel |
| 7 | Tasks Panel (Click the Tasks tab to view it.) |
| 8 | Events (Click an event type hyperlink in the Indicators panel, such as Network, to view the Events view from Investigate for a specific indicator event.) |
| 9 | UEBA (Click a User Entity Behavior Analytics hyperlink in the Indicators panel to view UEBA.) |

**Note:** Your Incident Details view may not look like these diagrams because the layout changed in NetWitness 11.3.2 and later versions.
The Related tab is renamed as the Find Related tab and is located on the left-side panel.
The journal is open by default on the right-side panel. When the journal is closed, the Journal & Tasks button enables easy access to notes and tasks.

## Overview Panel

The Overview panel shows basic summary information about a selected incident. It also allows you to change the incident name and update the incident priority, status, and assignee. The Overview panel in the Incidents List view contains the same information. The Incidents List view Incident Overview Panel topic provides details.

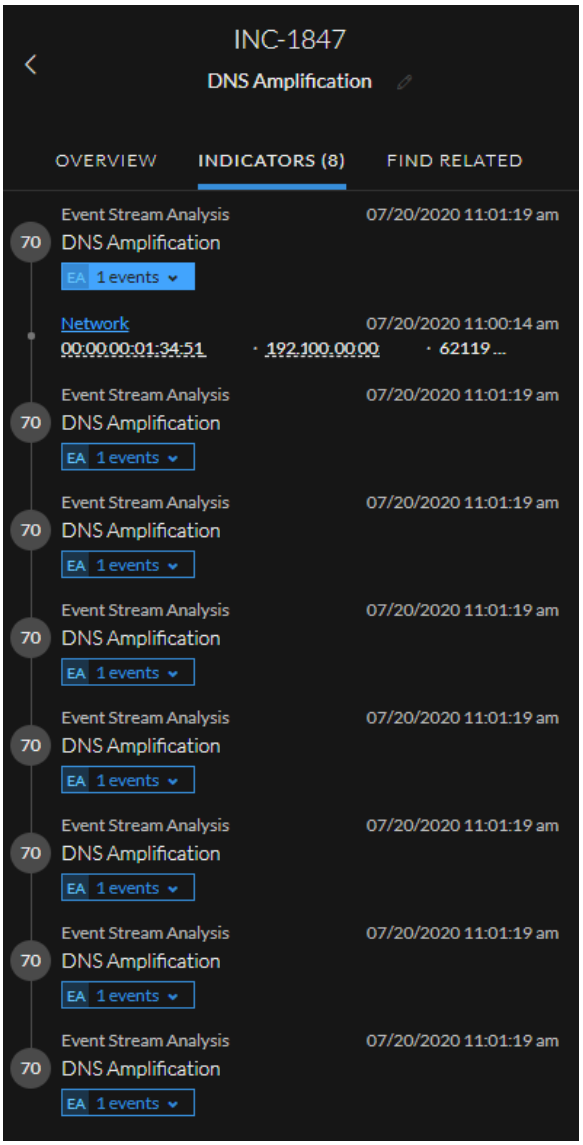
To view the Overview panel in the Incident Details view, click the **Overview** tab in the left panel.



## Indicators Panel

The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. (This is different than a timeline, which provides a visual representation of the timing of the events in the incident). This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

To view the Indicators panel, in the left panel of the Incident Details view, click the **Indicators** tab.



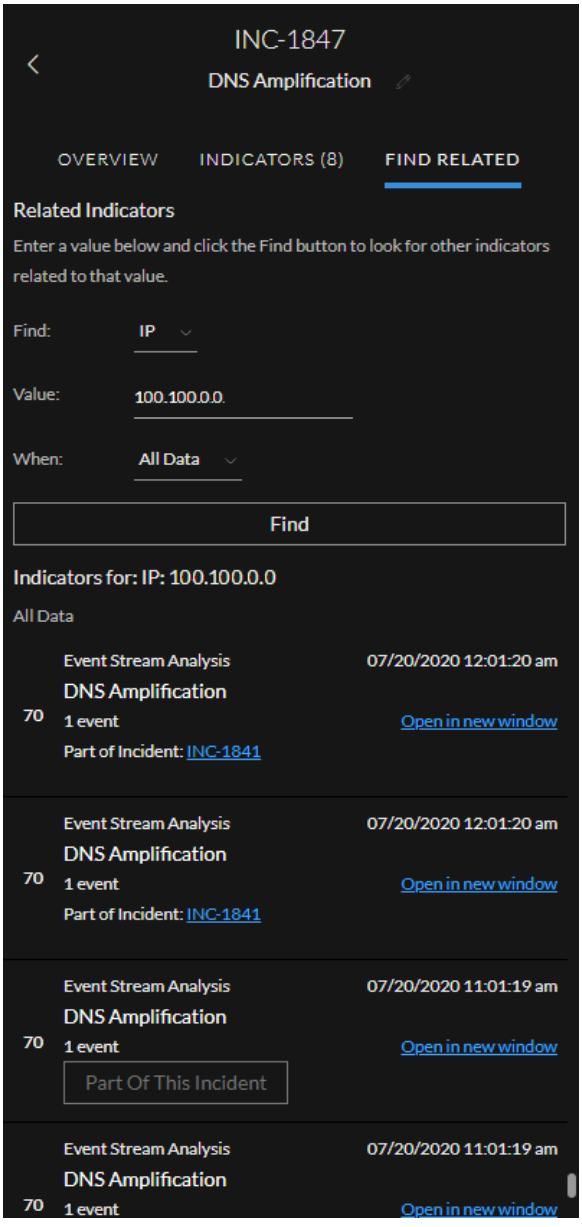
Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. In the Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events.

**Note:** The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

## Related Indicators Panel

The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can add alerts that you find to the incident if they are not already associated with an incident.

To view the Related Indicators panel, in the left panel of the Incident Details view, click the **Find Related** tab.



The following table describes the fields in the search section at the top of the panel.

| Field | Description |
|---|---|
| Find | Select the entity that you would like to locate in the alerts. For example, IP. |
| Value | Type the value of the entity. For example, type the actual IP address of the entity. |
| When | Select a time range to search for the alerts. For example, Last 24 hours. |
| **Find** button | Initiates the search. A list of related indicators appear below the **Find** button in the **Indicators for** section. |

The following table describes the options in the **Indicators for** (results) section at the bottom of the panel.

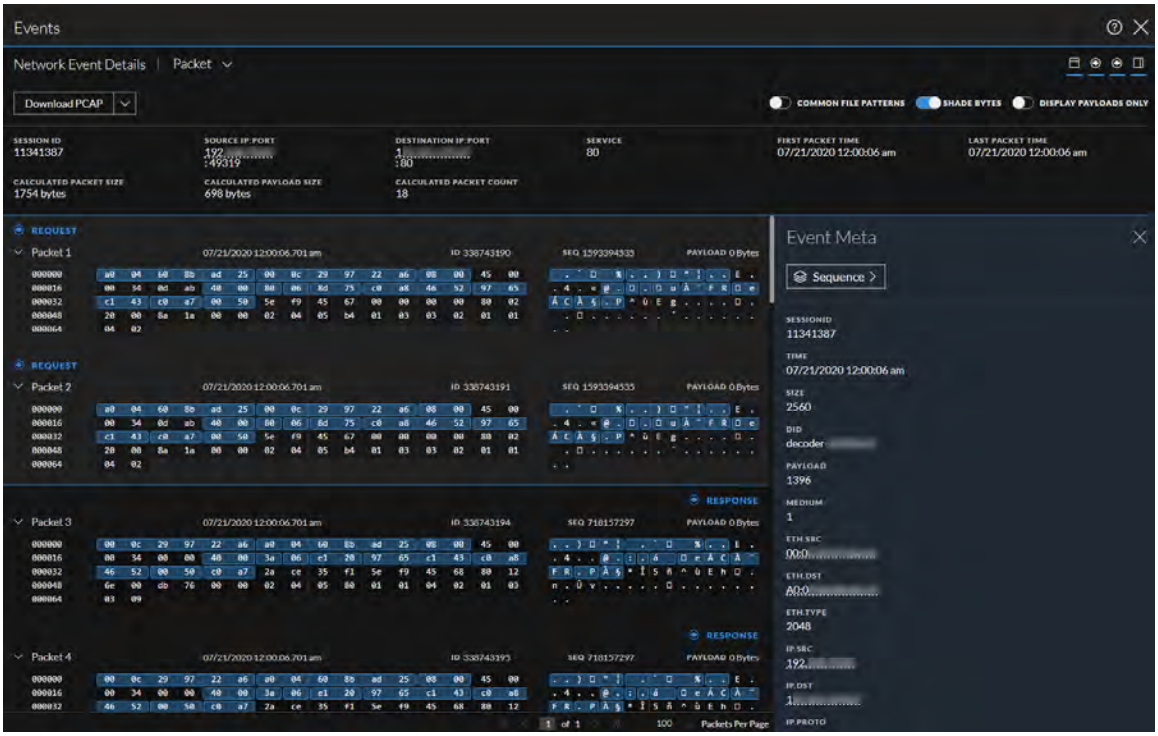
| Option | Description |
|---|---|
| Indicators For: | Shows the search results. |
| **Open in new window** link | Shows alert details for the indicator. |
| **Add To Incident** button | Adds the related indicator to the incident. The related indicator adds to the Indicators panel. |
| **Part Of This Incident** button | Shows that the indicator is already part of the incident. |

## Events

You can perform an event analysis from the Indicators panel. Event counts preceded by an **EA** (event analysis) icon have event reconnaissance information available:

. You can select an event type hyperlink, such as Network, to access the Events panel for the selected event.

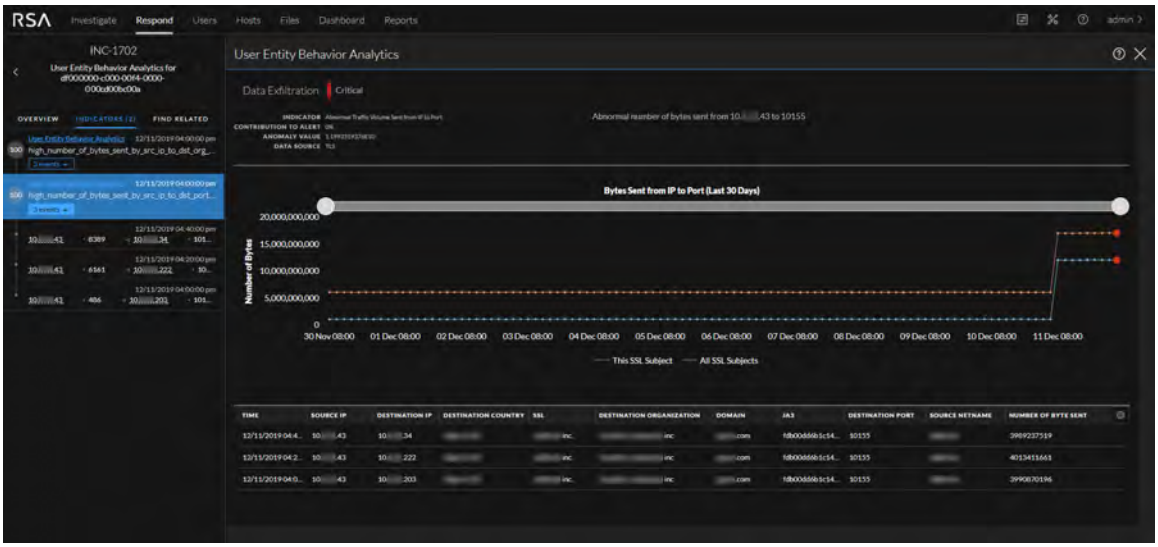
In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.



**Note:** Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.

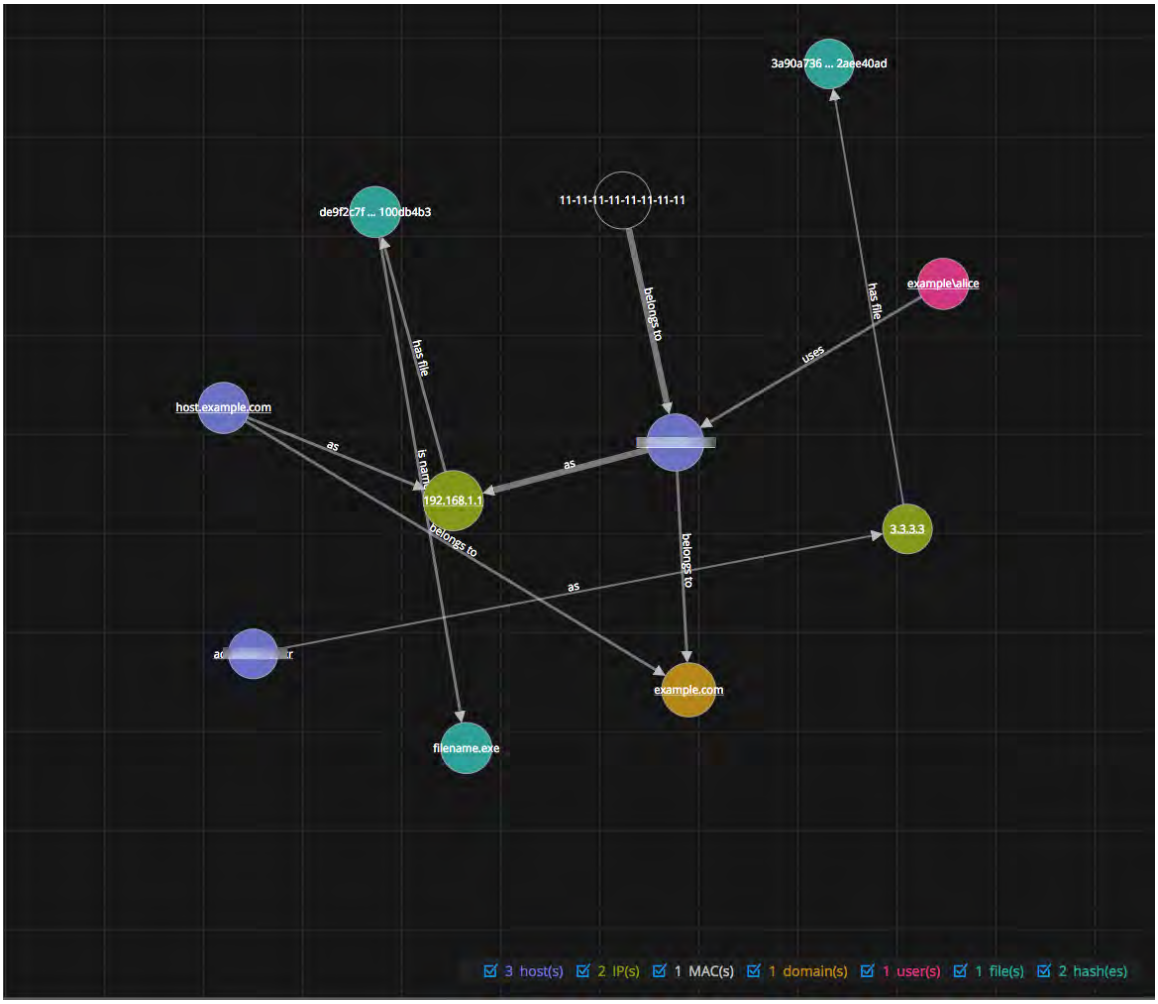
## User Entity Behavior Analytics

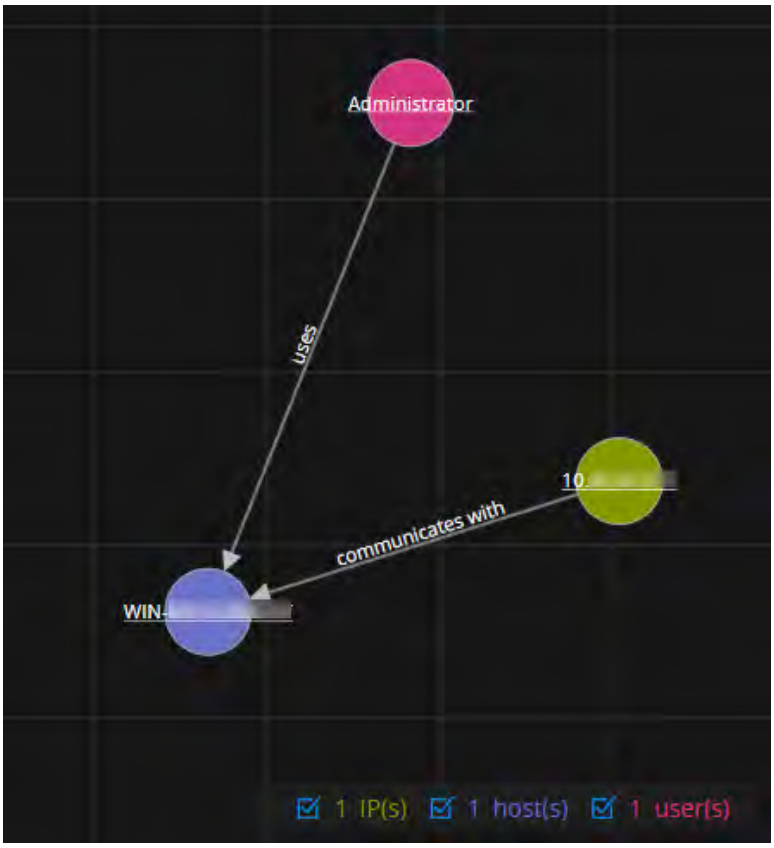
RSA NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.



## Nodal Graph

The nodal graph is an interactive graph that shows the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.





## Nodes

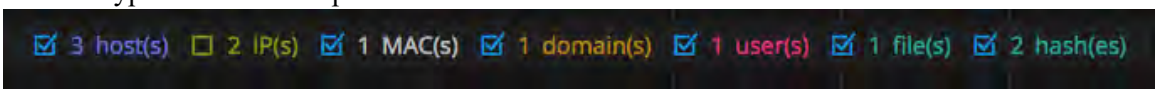
In the nodal graph, circles represent nodes. The following table describes the nodal graph node types.

| Node | Description |
|---|---|
| IP address | If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP. |
| MAC address | You may see a MAC address for each type of IP address. |
| User | If the machine is associated with a user, you can see a user node. |
| Host | A host can be physical equipment or a virtual machine, designated by a Fully Qualified Domain Name (FQDN) or IP address, on which any service is installed. |
| Domain | If a host is associated with a domain, you can see a domain node. |
| Filename | If the event involves files, you can see a filename. |
| File Hash | If the event involves files, you may see a file hash. |

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes. It also helps you to locate the entities when the values, such as the IP addresses, are hashed.

You can click any node and drag it to reposition it.

In NetWitness Version 11.2 and later, you can select the node types that you want to view by clearing or selecting the checkboxes in the legend. The following figure shows an example nodal graph legend with all node types selected except IP.



## Arrows

The arrows between the nodes provide additional information about the entity relationships. The following table describes the nodal graph arrow types.

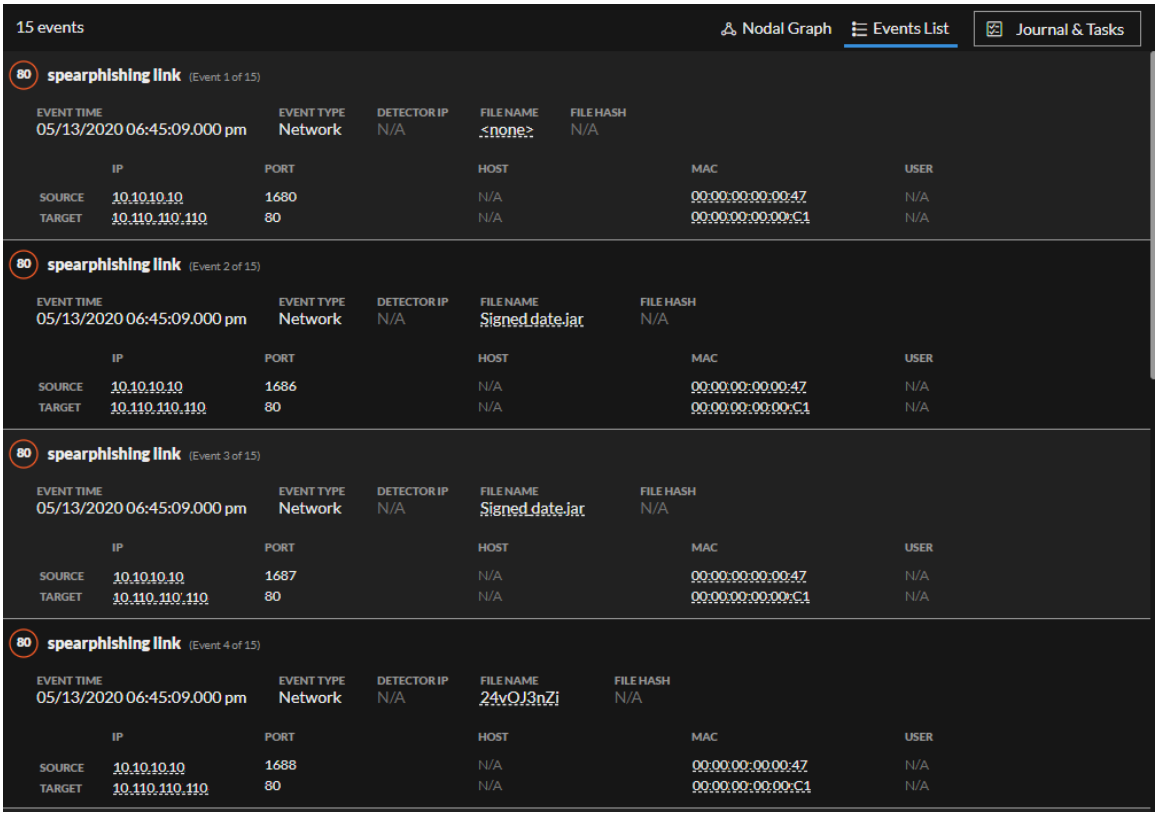
| Arrow | Description |
|---|---|
| Communicates with | An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication. |
| Has file | An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file " indicates that the IP address has that file. |
| Uses | An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event. |
| Calls | (This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash. |
| As | (This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. For example, if there is an arrow from the host node circle that points to an IP address node that is labeled with "as", it indicates that the name on the host node circle is the hostname of that IP address and is not a different entity. |
| Is named | (This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name. |
| Belongs to | (This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address of the host. |

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

## Events List

The Events List shows the events associated with the incident. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, target user, and file information about the events. The amount of information listed depends on the event type. The maximum number of events displayed in the Events List is 1,000.

The following figure shows an Events List for network events.

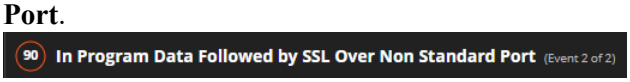


**Note:** The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

Each event has a header row with the following information:

- **Risk score**: This is the risk score of the indicator (alert) that contains the event.
- **Title**: This is the name of the event.
- **(Event x of x)**: This indicates the number of the event out of the total number of events in the indicator.

For example, the following event header shows that this event is event 2 of 2 for an indicator (alert) that has a risk score of 90. The event name is **In Program Data Followed by SSL Over Non Standard Port**.



The following table describes the fields in the Events List for network or log events.

| Field | Description |
|---|---|
| EVENT TIME | Shows the time the event occurred. |
| EVENT TYPE | Shows the type of alert, such as Log and Network. |
| DETECTOR IP | Shows the IP address of the machine where an anomaly was detected |
| FILE NAME | Shows the file name if a file is involved with the event. |
| FILE HASH | Shows a hash of the file contents. |
| SOURCE IP | Shows the source IP address if there was a transaction between two machines. |
| SOURCE PORT | Shows the source port of the transaction. The source and destination ports can be on the same IP address. |
| SOURCE HOST | Shows the destination host where the event took place. |
| SOURCE MAC | Shows the MAC address of the source machine. |
| SOURCE USER | Shows the user of the source machine. |
| TARGET IP | Shows the destination IP address if there was a transaction between two machines |
| TARGET PORT | Shows the destination port of the transaction. The source and destination ports can be on the same IP address. |
| TARGET HOST | Shows the HOST name of the destination machine. |
| TARGET MAC | Shows the MAC address of the destination machine. |
| TARGET USER | Shows the user of the destination machine. |

The following figure shows an Events List for NetWitness Endpoint events.

The following table describes the fields in the Events List for NetWitness Endpoint events. NetWitness Endpoint events have an `Endpoint` Event Type and an `nwendpoint` Device Type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event.

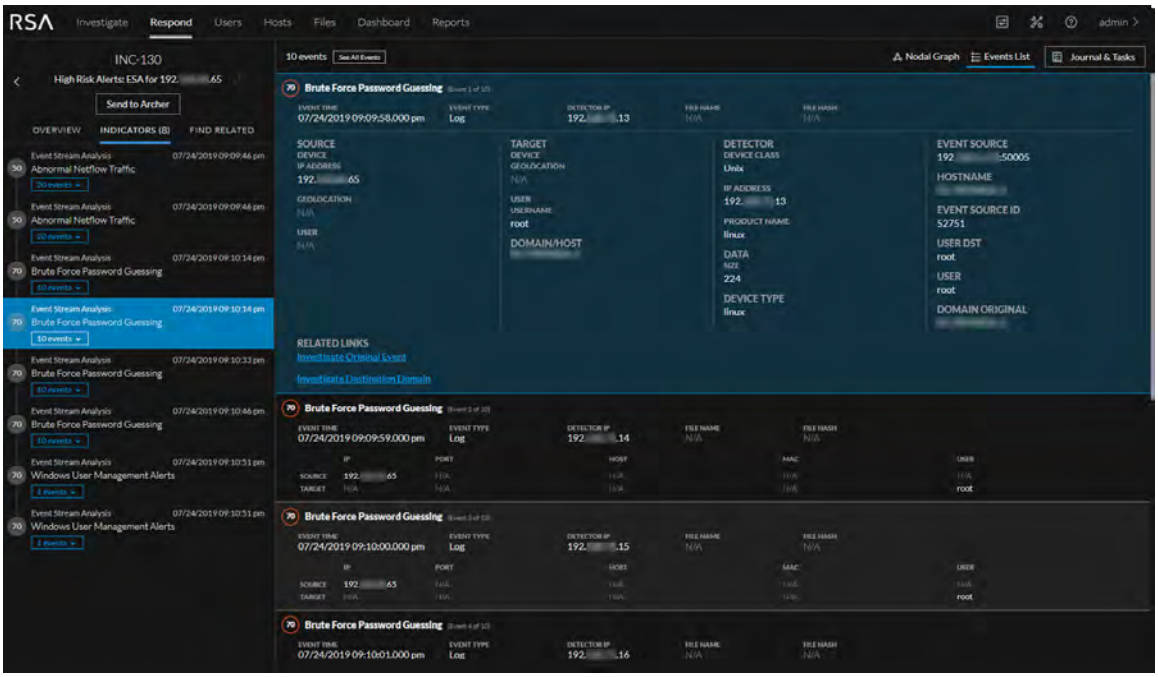
| Field | Description |
|---|---|
| EVENT TIME | Shows the time the event occurred. |
| EVENT TYPE | Shows the type of alert, such as Endpoint or Log. NetWitness Endpoint events have an `Endpoint` event type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event. |
| CATEGORY | Shows the NetWitness Endpoint category. |
| ACTION | Shows the action that the file performed. |
| HOSTNAME | Shows the name of the machine that is running the agent. |
| USER ACCOUNT | Shows the username of the actively logged in user. |
| OPERATING SYSTEM | Shows the operating system of the agent. |
| FILE HASH | Shows the checksum of the file. |

| Field | Description |
|---|---|
| SOURCE FILENAME | Shows the name of the source file. |
| SOURCE LAUNCH ARGUMENT | Shows the command line argument for the running process. |
| SOURCE PATH | Shows the path of the source file. |
| SOURCE HASH | Shows the checksum of the source file. |
| SOURCE IP ADDRESS | Shows the IP address of the agent. |
| SOURCE PORT | Shows the source port of the connection. |
| TARGET FILENAME | Shows the name of the target file. |
| TARGET LAUNCH ARGUMENT | Shows the command line argument for the running process. |
| TARGET PATH | Shows the path of the target file. |
| TARGET HASH | Shows the checksum of the target file. |
| TARGET IP ADDRESS | Shows the destination IP address of this NetWitness activity. |
| TARGET PORT | Shows the destination port of the connection. |
| EVENT SOURCE | Shows the hostname or IP address along with the port of the of the Core service that holds the event information. |
| DEVICE TYPE | Shows the type of the device from which the data is sent or collected. For example, it shows `nwendpoint` for NetWitness Endpoint. |

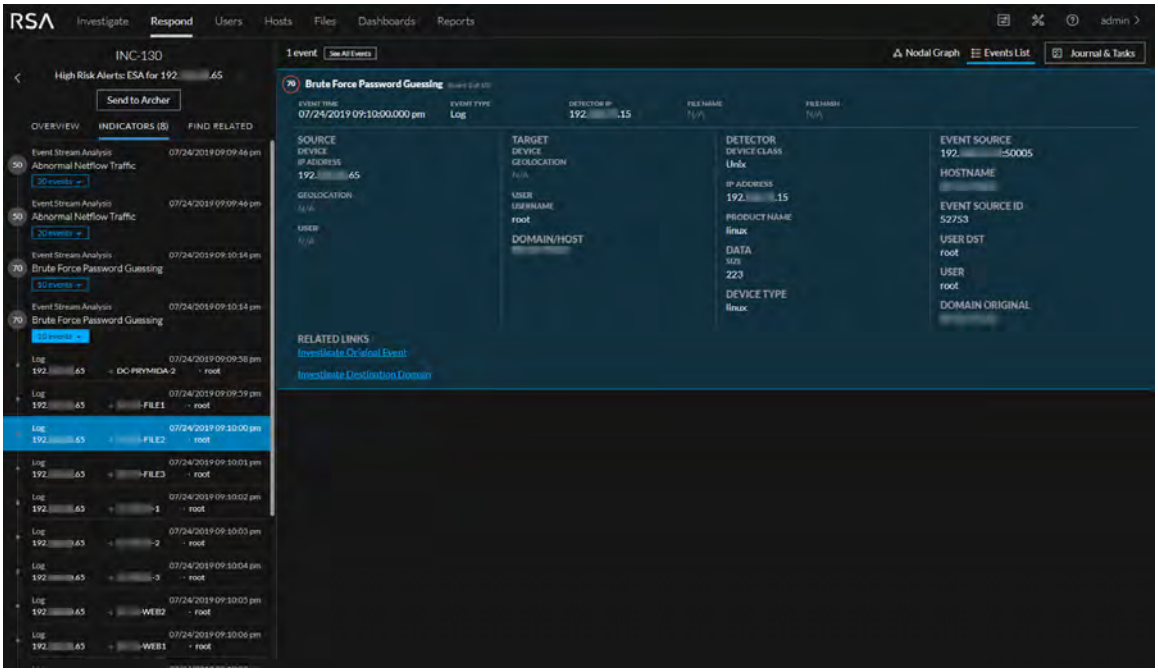
## Event Details

To view the event details, you can click the top of an event in the Events List. The details appear below the event. Viewing inline event details enables you to keep the context of the event as it relates to the other events.

The following figure shows an indicator (alert) selected in the Indicators panel. The events for that indicator appear in the Events List on the right.

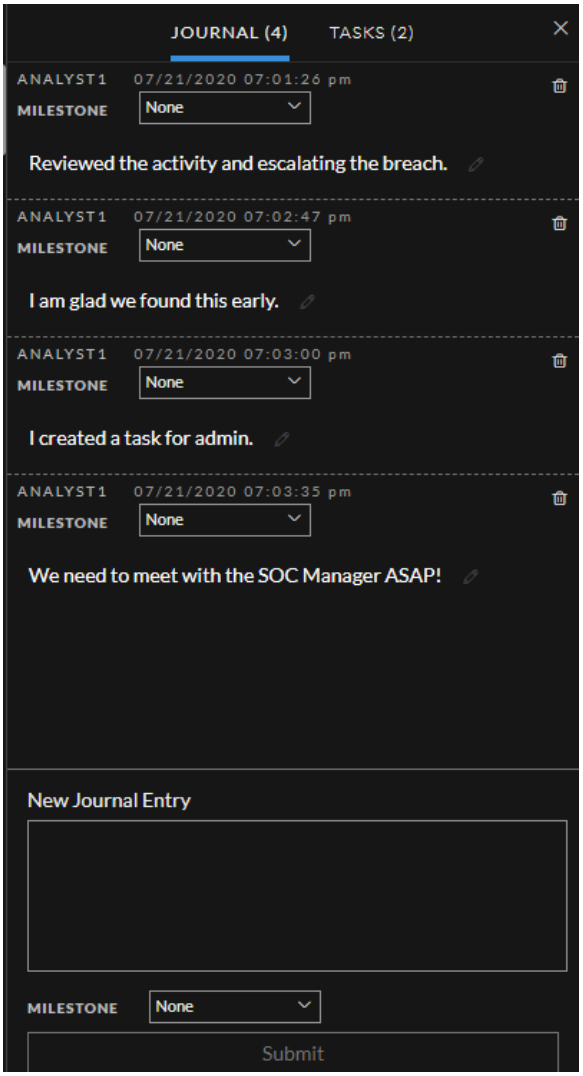


The following figure shows a specific indicator event selected in the Indicators panel. Information about the selected event appears in the Events List on the right.



## Journal Panel

The incident Journal shows the history of activity on your incident.

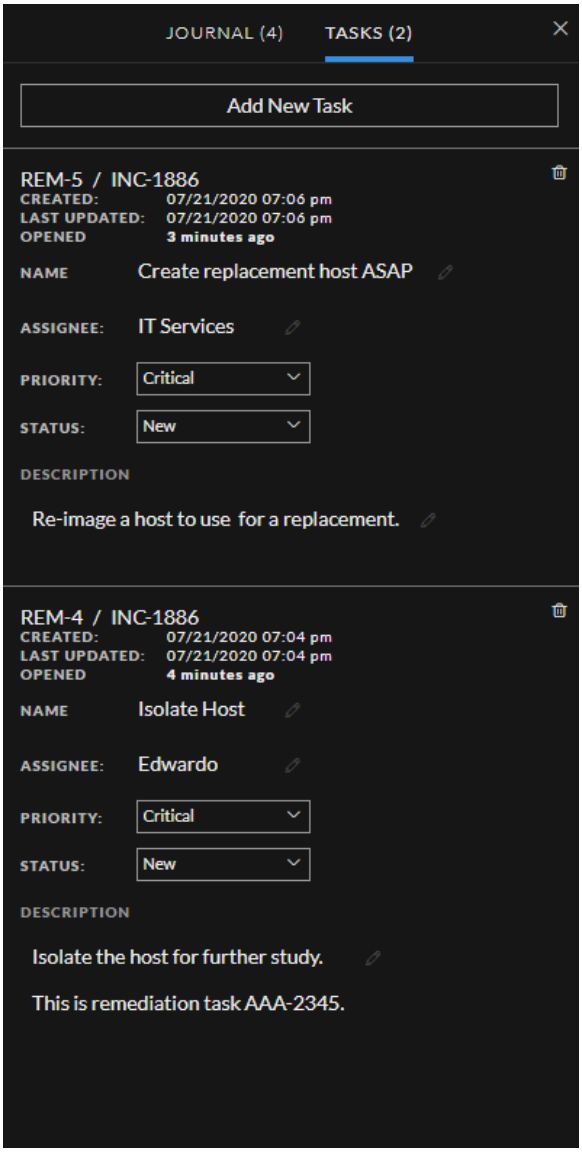


The following table describes the New Journal Entry options.

| Field | Description |
|---|---|
| New Journal Entry | Type your note in the field. |
| Milestone | (Optional) Select a milestone, if applicable. This field is used to track significant events for the incident. |
| **Submit** button | Click submit to add an entry to the journal. You journal entry will be visible to anyone who views the incident. |

## Tasks Panel

In the Tasks panel, you can manage and track the incident tasks to closure.



The following table describes the Task fields.

| Field | Description |
|---|---|
| <Task ID / <Incident ID> | The autogenerated Task ID / The incident associated with the task. |
| Created | The created date of the task. |
| Last Updated | The date that the task was last modified. |

| Field | Description |
|---|---|
| Opened | The time that passed since the task was opened. For example, 3 minutes ago or 2 days ago. |
| Name | The name of the task. For example: Re-image the machine. You can click this field to edit it. |
| Assignee | The username of the user assigned to the task. You can click this field to edit it. |
| Priority | The priority of the task: Low, Medium, High, or Critical. You can click the priority button and select a new priority for the task from the drop-down list. |
| Status | The status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. You can click the status button and select a new status for the task from the drop-down list. |
| Description | Type information that describes the task. You may want to include any applicable reference numbers. You can click this field to edit it. |

## Toolbar Actions

| Option | Description |
|---|---|
| | (Back to Incidents) Enables you to navigate back to the Incidents List view. |
| | Closes the panel. |
| | Deletes the entry, such as a journal entry or task. |
| **Priority** button | (In the Overview panel) Allows you to change the Priority of one or more selected incidents in the Incidents List. |
| **Status** button | (In the Overview panel) Allows you to change the Status of one or more selected incidents. |
| **Assignee** button | (In the Overview panel) Allows you to change the Assignee of one or more selected incidents. |
|  | Enables you to view the Nodal Graph. |
| | Enables you to view the incident Events List. Clicking the top of an event enables you to view the event details below it. |
| | Enables you to view incident notes and tasks. |

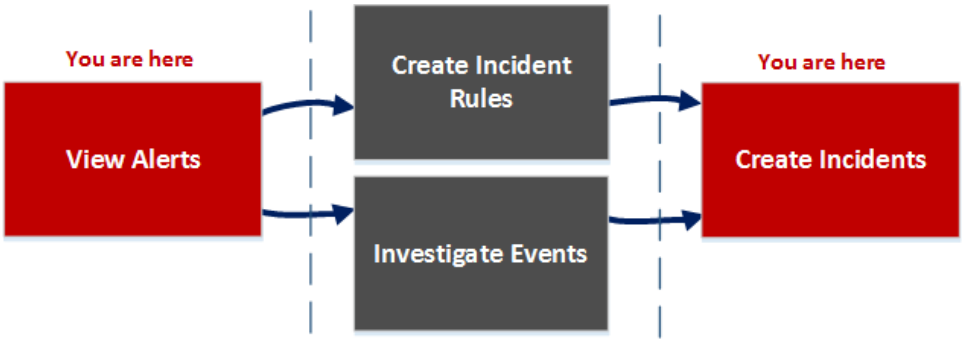
| Option | Description |
| --- | --- |
| (Journal, Tasks, and Related) | (This option is available in NetWitness Version 11.3.1 and earlier 11.x versions.) Enables you to view the Journal, Tasks, and Related Indicators panels. |
| | Enables you to show or hide the event header, request, response, and metadata in the Events panel in the Respond Incident Details view. For more information about event analysis, see "Events View" in the *NetWitness Investigate User Guide*. |

# Alerts List View

The Alerts List view (Respond > Alerts) enables you to view all of the threat alerts and indicators received by NetWitness in one location. This can include alerts received from ESA Correlation Rules, Malware Analysis, Reporting Engine, NetWitness Endpoint, as well as many others. In the Alerts List view you can browse through various alerts, filter them, and group them to create incidents.

## Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.



In the Alerts List view, you can review a list of alerts from all sources received by NetWitness. After that, you can investigate those alerts further and create incidents from the alerts or you can create incident rules to create incidents.

**Note:** You can use NetWitness Automated Threat Detection to create incidents without manually creating rules.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | View all alerts in NetWitness.* | View Alerts |
| Incident Responders, Analysts | Filter alerts.* | Filter the Alerts List |
| Incident Responders, Analysts | View alert overview information and raw alert metadata.* | View Alert Summary Information |
| Incident Responders, Analysts | Create incidents from alerts.* | Create an Incident Manually |

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | (Available in NetWitness Version 11.1 and later) Add alerts to an existing incident.* | Add Alerts to an Incident |
| Administrators, Data Privacy Officers | Delete alerts.* | Delete Alerts |
| SOC Managers, Administrators | Create incident rules. | See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*. |
| Incident Responders, Analysts | Investigate the events in an alert. | View Event Details for an Alert and Investigate Events |
| Incident Responders, Analysts | Add related alerts to an existing incident. | Add Related Indicators to the Incident |

*You can complete these tasks here (that is, in the Alerts List view).

## Related Topics

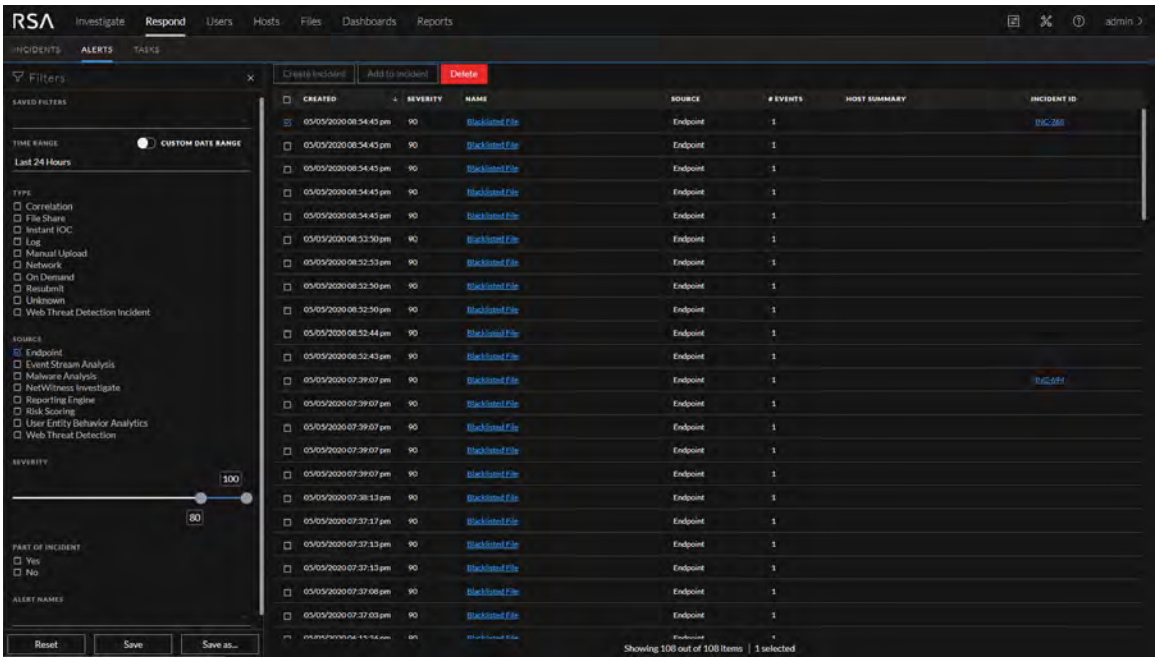
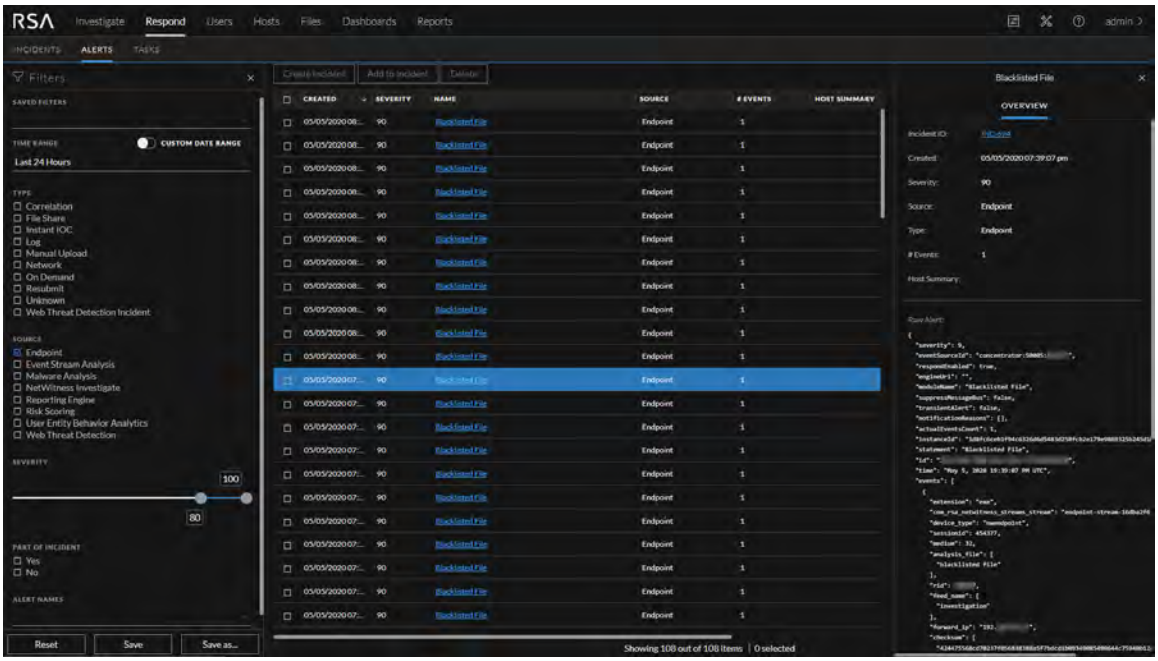
- Reviewing Alerts

## Quick Look

To access the Alerts List view, go to **Respond > Alerts**. The Alerts List view displays a list of all alerts and indicators received by the Respond Server database in NetWitness. The following figure shows the Filters panel on the left.

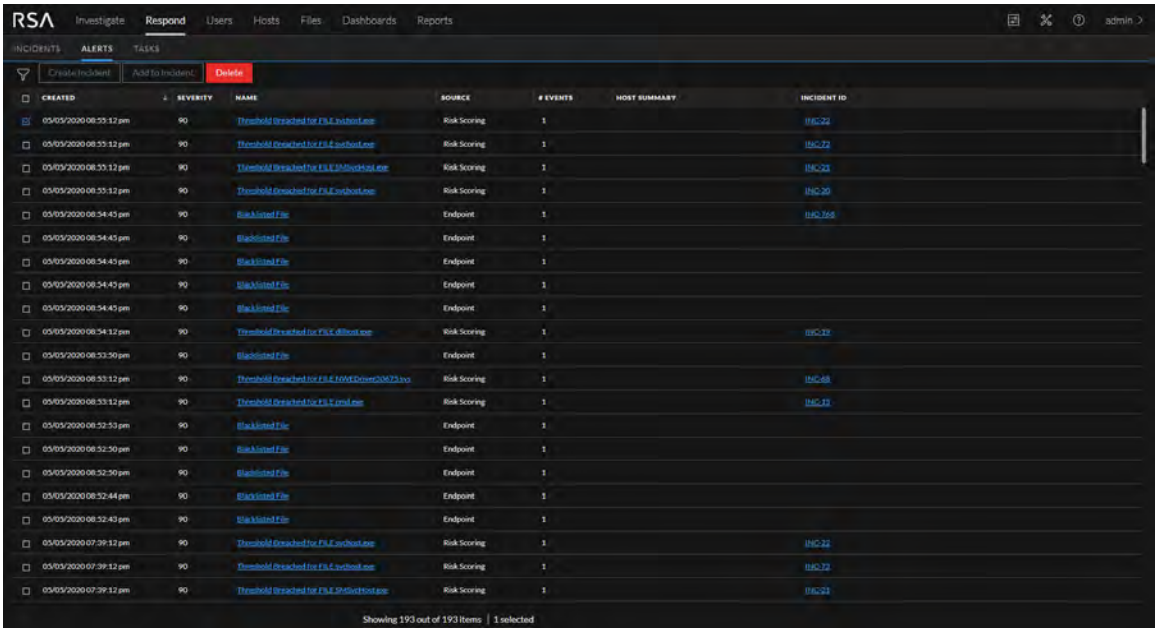


The Alerts List view consists of a Filters panel, an Alerts List, and an Alert Overview panel. You can click an alert in the Alerts list to view the Alert Overview panel on the right.

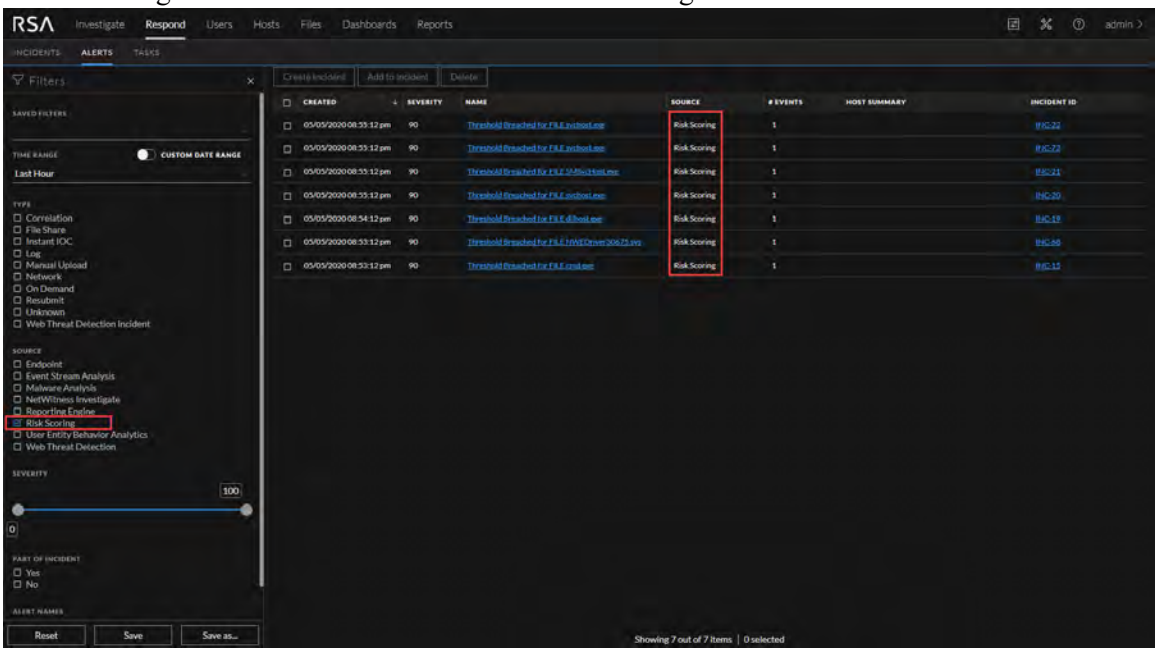


# Alerts List

The Alerts List shows all of the alerts in NetWitness. You can filter this list to only show alerts of interest.



The following Alerts List view is filtered for Risk Scoring Alerts.



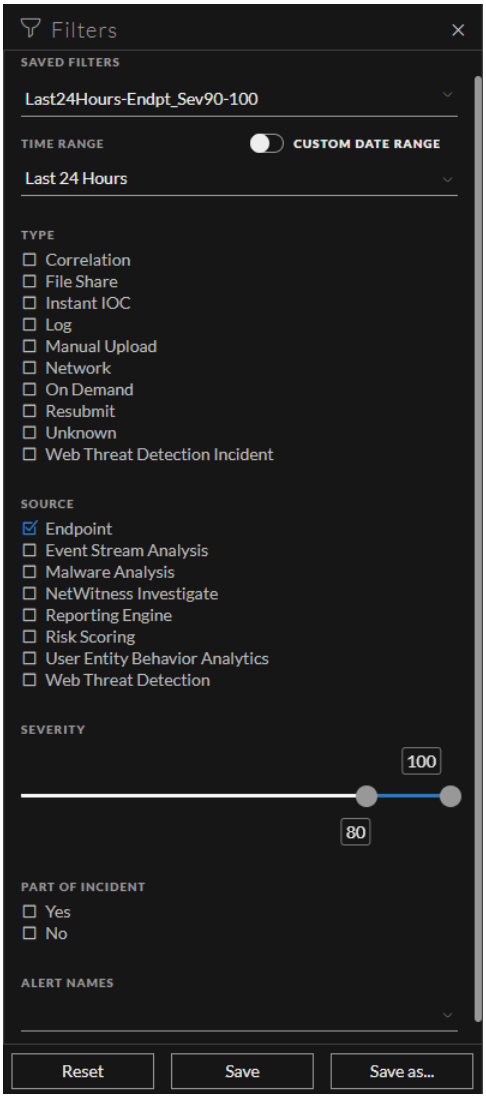
The following table describes the columns in the Alerts List.

| Column | Description |
|---|---|
| | Enables you to select one or more alerts to delete. Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. |
| Created | Displays the date and time when the alert was recorded in the source system. |
| Severity | Displays the level of severity of the alert. The values are from 1 through 100. |
| Name | Displays a basic description of the alert. |
| Source | Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others.<br>**Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint. |
| # Events | Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky. |
| Host Summary | Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host . |
| Incident ID | Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident. |

At the bottom of the list, you can see the number of alerts on the current page, the total number of alerts, and the number of alerts selected. For example: **Showing 4 out of 4 items | 1 selected**

## Alert Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Alerts List view, has options that you can use to filter the alerts list. When you navigate away from the Filters panel, the Alerts List view retains your filter selections.

| Option | Description |
|---|---|
| Saved Filters | You can select a saved filter to filter the alerts list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.) |

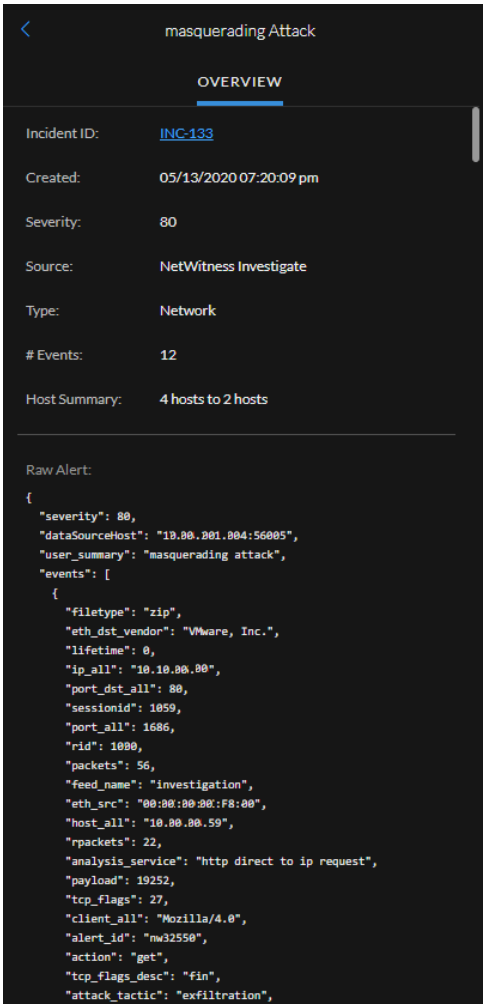
| Option | Description |
|---|---|
| Time Range | You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes. |
| Custom Date Range | You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.<br>  |
| Type | Indicates the type of events in the alert, for example, logs, network sessions, and so on. |
| Source | Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), Reporting Engine, Web Threat Detection, Risk Scoring, and many others.<br>**Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint. |
| Severity | Displays the level of severity of the alert. The values are from 1 through 100. |
| Part of Incident | Categorizes alerts on whether or not they are associated with an incident. Select **Yes** to view alerts that are part of an incident. Select **No** to view alerts that are not part of an incident. For example, before you create incidents from alerts, you may want to select No to view only those alerts that are not already part of an incident. |

| Option | Description |
|---|---|
| Alert Names | Shows the names of the alerts being filtered. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account. |
| Reset | Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter. |
| Save | Saves the currently applied alerts filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.) |
| Save As | Saves the currently applied alerts filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.) |

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list. For example: **Showing 4 out of 4 items**

## Alert Overview Panel

The Overview panel shows basic summary information about a selected alert and raw alert metadata. The Overview panel in the Alert Details view contains the same information, but in the Alerts Details view, you can expand the panel to view more information.



The following table lists the fields displayed in the Alert Overview panel.

| Field | Description |
|---|---|
| <Alert Name> | Displays the name of the alert. |
| Incident ID | Displays the Incident ID associated with the alert. You can click the incident ID link to go to the Incident Details view of the associated incident. If there is no incident ID, the alert does not belong to an incident. You can create an incident for this alert or you can add it to an incident. |
| Created | Displays the date and time when the alert was created. |

| Field | Description |
|---|---|
| Severity | Displays the level of severity of the alert. The values are from 1 through 100. |
| Source | Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others.<br><br>**Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint. |
| Type | Indicates the type of events in the alert, for example, logs, network sessions, and so on. There can be multiple types listed.<br><br>**Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint. |
| # Events | Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky. |
| Raw Alert | Shows the raw alert metadata. |

## Toolbar Actions

This table lists the toolbar actions available in the Alerts List view.

| Option | Description |
|---|---|
| | Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List. |
| | Closes the panel. |
| **Create Incident** button | Enables you to create incidents from alerts. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In thePart of Incident section, select No. |

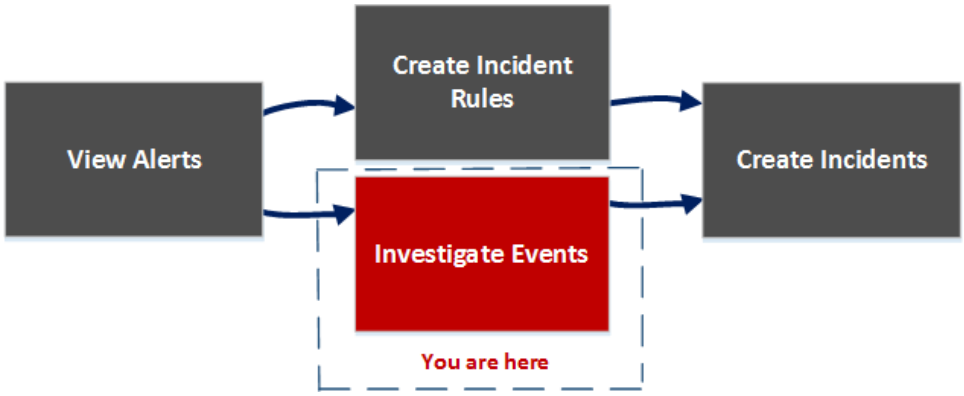
| Option | Description |
| --- | --- |
| **Add to Incident** button | (This option is available in NetWitness Version 11.1 and later.)<br>Enables you to add selected alerts to an incident. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In the Part of Incident section, select No. |
| **Delete** button | Allows you to delete alerts. |

# Alert Details View

In the Alert Details view (Respond > Alerts > click a Name hyperlink in the Alerts List), you can view summary information about an alert, such as the source of the alert, the number of events within the alert, and whether it is part of an incident. You can also view detailed information about the events within the alert as well as the event metadata.

## Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.



After reviewing the alerts list, in the Alert Details view, you can investigate those alerts further and create incidents from the alerts. In the Configure > Incident Rules view, you can create incident rules to create incidents.

**Note:** You can also use NetWitness Automated Threat Detection to create incidents without manually creating rules.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | View all alerts in NetWitness. | View Alerts |
| SOC Managers, Administrators | Create incident rules. | See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*. |
| Incident Responders, Analysts | View a list of events in the alert.* | View Event Details for an Alert |
| Incident Responders, Analysts | View event metadata for each event in the alert.* | View Event Details for an Alert |

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | Further investigate the events in the alert.* | Investigate Events |
| Incident Responders, Analysts | Add alerts to an existing incident. | Add Alerts to an Incident<br>Add Related Indicators to the Incident |
| Incident Responders, Analysts | Create incidents from alerts. | Create an Incident Manually |
| Data Privacy Officers, Administrators | Delete alerts. | Delete Alerts |

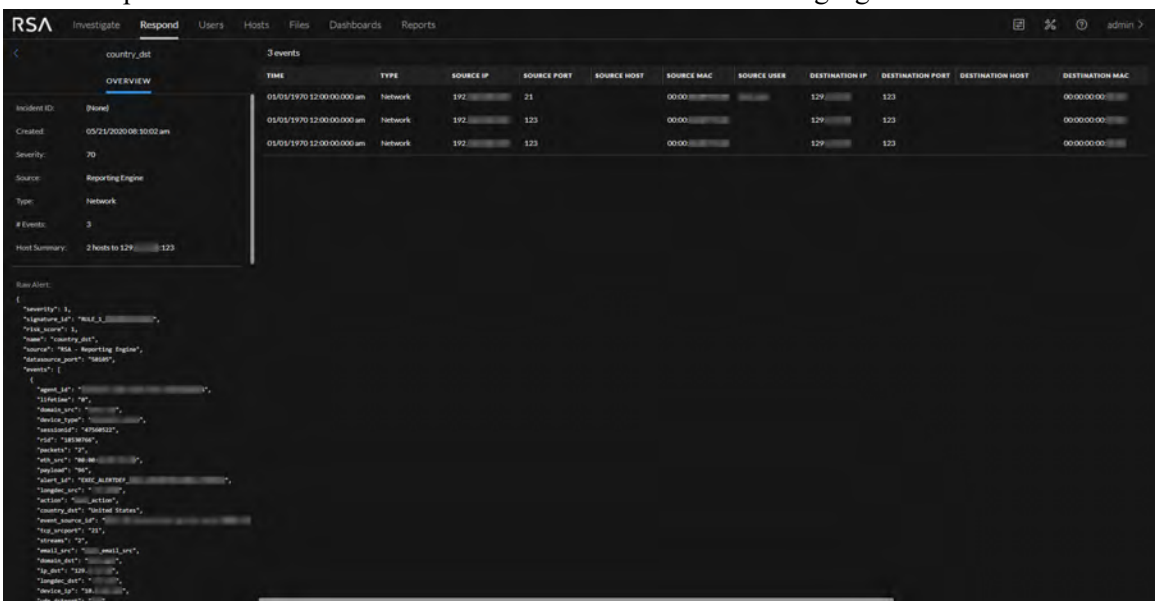
*You can complete these tasks here (that is, in the Alerts Details view).

## Related Topics

- Alerts List View
- Reviewing Alerts

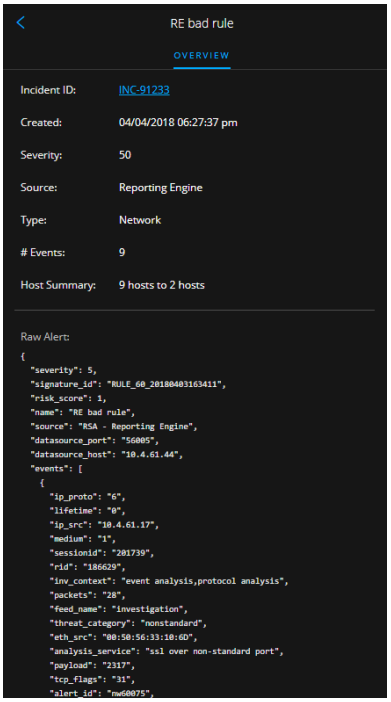
## Quick Look

1. To access the Alert Details view, go to **Respond > Alerts**.
2. In the Alerts list, choose an alert to view and then click the link in the Name column for that alert. The Alert Details view has an Overview panel on the left and the Events panel on the right. You can resize the panels to show more information as shown in the following figure.



## Overview Panel

The Overview panel shows basic summary information about a selected alert. The Overview panel on the Alerts List view contains the same information. The Alerts List view Alert Overview Panel topic provides details.

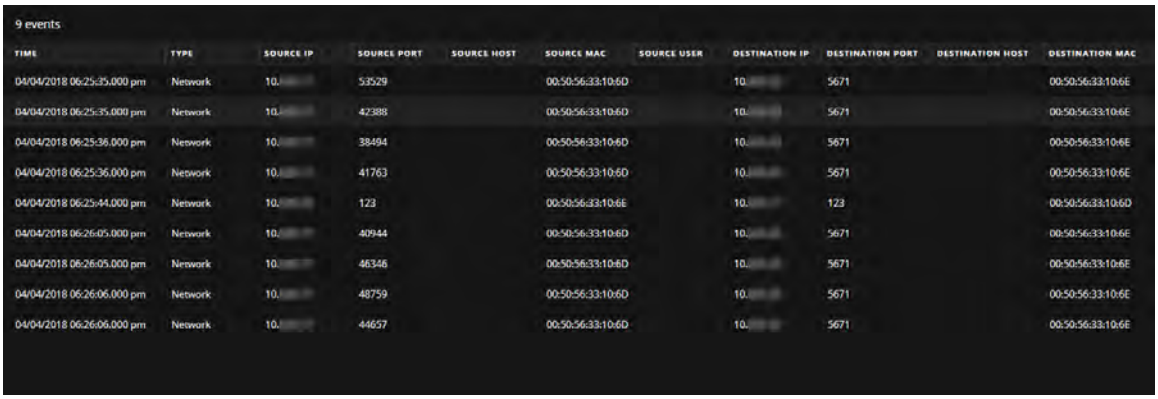


## Events Panel

The Events panel can show an Events List if there is more than one event in the alert. If there is only one event in the alert, or you click an event in the Events List, you can see Event Details in the Events panel.

## Events List

The Events List for a selected alert shows all of the events contained in that alert.

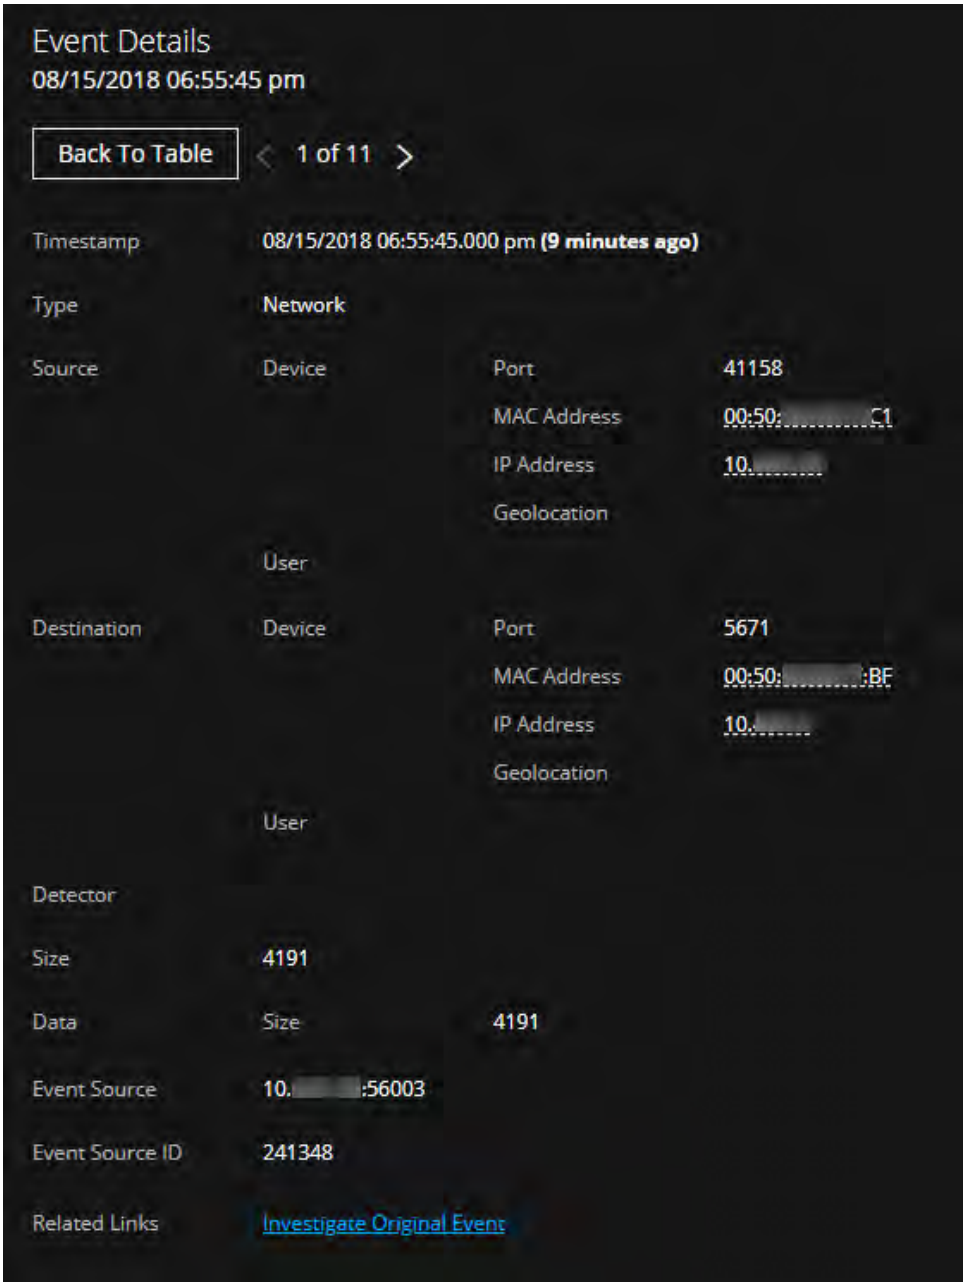


The following table lists some of the columns shown in the Events List, which provide a summary of the listed events.

| Column | Description |
|---|---|
| Time | Shows the time the event occurred. |
| Type | Shows the type of alert, such as Log and Network. |
| Source IP | Shows the source IP address if there was a transaction between two machines. |
| Destination IP | Shows the destination IP address if there was a transaction between two machines. |
| Detector IP | Shows the IP address of the machine where an anomaly was detected. |
| Source User | Shows the user of the source machine. |
| Destination User | Shows the user of the destination machine. |
| File Name | Shows the file name if a file is involved with the event. |
| File Hash | Shows a hash of the file contents. |

## Event Details

The Event Details in the Events panel shows the event metadata for each event in the alert.



## Event Metadata

The following table lists some event metadata sections and subsections shown in the first two columns in the Event Details. This is not an extensive list.

| Section | Subsection | Description |
|---|---|---|
| Data | | Shows information about the data involved with the event, such as the files involved. There may be 0 or more per event. |
| | Filename | Shows the file name if a file is involved with the event. |
| | Hash | Shows a hash of the file contents, for example, MD5 or SHA1. |
| | Size | Shows the size of the transmission or file involved with the event. |
| Description | | Displays a general description of the event. |
| Destination | | Shows the destination device and user. |
| | Device | Shows information about the destination device. See Event Source or Destination Device Attributes below. |
| | User | Shows information about the user or users of the destinationSee Event Source or Destination User Attributes below. |
| Detector | | Shows the host or software product that detected the issue. This is most relevant for malware scanners and logs. |
| | Device Class | Shows the device class of the product that detected the alert. |
| | IP Address | Shows the IP address of the product that detected the alert. |
| | Product Name | Shows the name of the product that detected the alert. |
| Domain | | Shows the domain associated with the event. |
| Enrichment | | Shows available enrichment information. |
| Related Links | | If available, it shows a link back to the user interface (UI) of the source product. |
| | Type | Shows the type of event, such as investigate_original_event. |
| | URL | Shows the URL link back to the UI of the source product. |
| Size | | Shows the size of the transmission or file involved. |
| Source | | Shows the source device and user. |
| | Device | Shows information about the source machine. See Event Source or Destination Device Attributes below. |
| | User | Shows information about the user or users of the source machine. See Event Source or Destination User Attributes below. |
| Timestamp | | Shows the time that the event occurred. |
| Type | | Shows the type of the alert, such as log, network, correlation, Resubmit, Manual Upload, On Demand, File Share, or Instant IOC. |

## Event Source or Destination Device Attributes

The following table lists attributes for an event source or destination device that can be shown in the Events Details.

| Name | Description |
|---|---|
| Asset Type | Displays the type of device, for example, desktop, laptop, server, network equipment, tablet, and so on. |
| BusinessUnit | Shows the business unit associated with the device. |
| Compliance Rating | Shows the compliance rating of the device. It can be Low, Medium, or High. |
| Criticality | Shows how critical the device is to the business (business criticality). |
| Facility | Shows the location of the device. |
| Geolocation | Shows the geographic location for the host. It can contain the following attibutes: city, country, latitude, longitude, organization, and domain. |
| IP Address | Shows the IP address of the device. |
| MAC Address | Shows the MAC address of the device. |
| Netbios Name | Shows the NetBIOS name for the device. |
| Port | Displays the TCP port, UDP port, or the IP Src port (the first one available) used to connect to and from the host. |

## Event Source or Destination User Attributes

The following table lists attributes for an an event source or destination user that can be shown in the Events Details.

| Attribute Name | Description |
|---|---|
| AD Domain | Shows the Active Directory domain. |
| AD Username | Shows the Active Directory username. |
| Email Address | Shows the email address of the user. |
| Username | Shows a general name if you do not know the source of the username, such as UNIX or a username in a particular system. |

## Toolbar Actions

This table lists the toolbar actions available in the Alert Details view.

| Option | Description |
| --- | --- |
| | (Back to Alerts) Enables you to navigate back to the Alerts List view. |
| | Click the arrows to navigate through the event meta details for each event in the alert. The numbers, such as "1 of 2" show the number of the event that you are currently viewing. Click **Back to Table** to go back to the Events List view, which is also known as the Events Table. |

# Tasks List View

After investigating incidents, in the Tasks List view (Respond > Tasks), you can create and track incident tasks. For example, you can create remediation tasks when you require actions on incidents from teams outside of your security operations. You can reference external ticket numbers within the tasks and then track those tasks to completion. You can also modify and delete tasks as required, depending on your user permissions.

## What do you want to do?

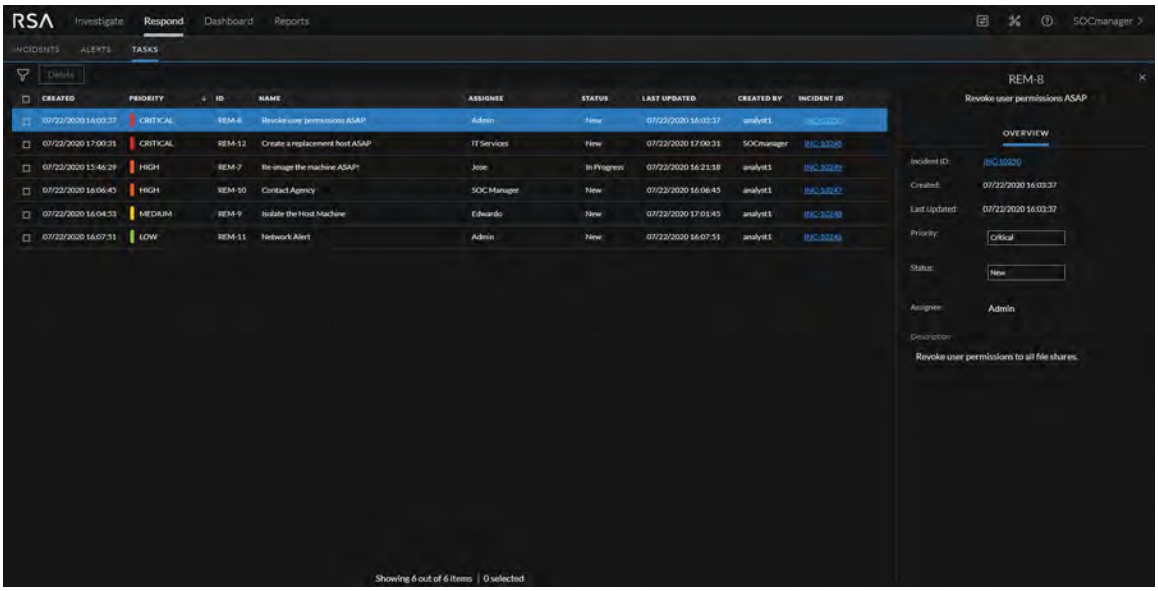
| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | View tasks | View All Incident Tasks and View the Tasks Associated with an Incident |
| Incident Responders, Analysts | Filter tasks. | Filter the Tasks List |
| Incident Responders, Analysts | Create a task. | Create a Task |
| Incident Responders, Analysts | Find and modify tasks. | Find a Task and Modify a Task |
| Incident Responders, Analysts | Close a task (Change the Status to Remediated, Risk Accepted, or Not Applicable). | Modify a Task |
| Incident Responders, Analysts, SOC Managers | Delete a task. | Delete a Task |

## Related Topics

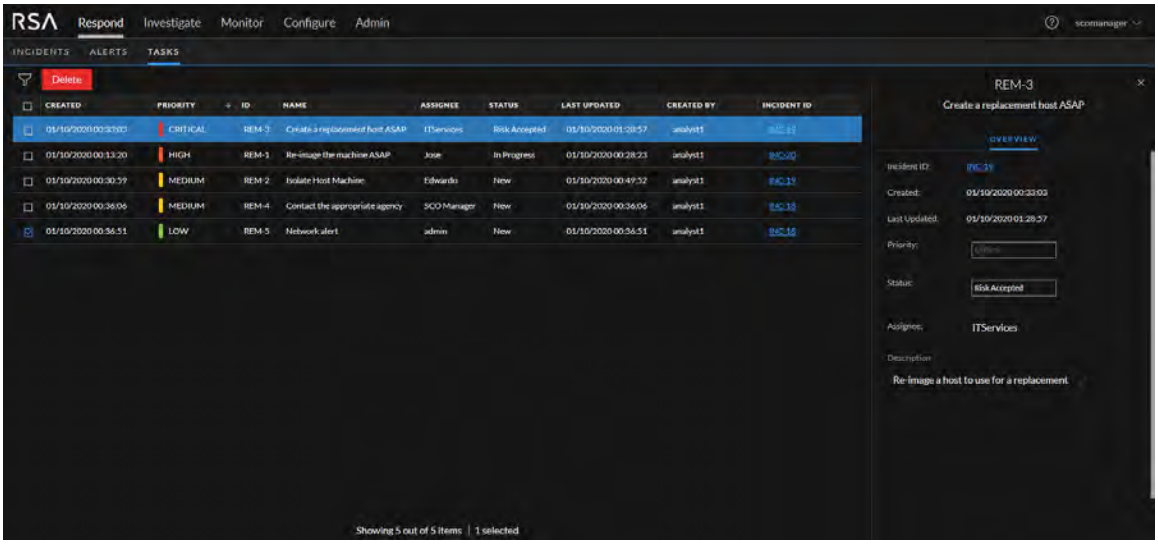
- Incident Details View
- Escalate or Remediate the Incident

## Quick Look

To access the Tasks List view, go to **Respond > Tasks**. The Tasks List view displays a list of all incident tasks.



The Tasks List view consists of a Filters panel, a Tasks List, and a Task Overview panel. The following figure shows the Tasks List and the Overview panel.



## Tasks List

The Tasks List shows all of the incident tasks. You can filter this list to show only tasks of interest.

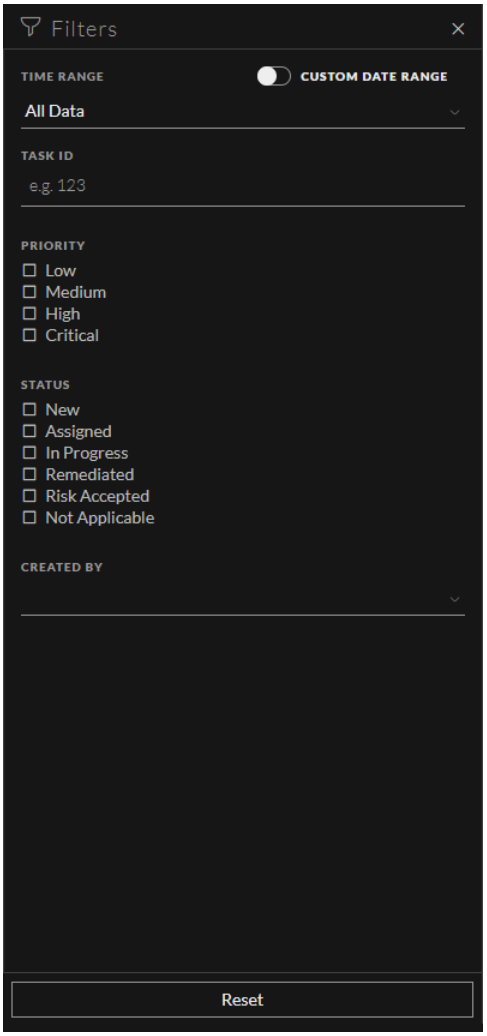
| Column | Description |
|---|---|
| | Enables you to select one or more tasks to modify or delete. Users with the appropriate permissions can make bulk updates and delete tasks, such as SOC Managers. For example, an SOC Manager may want to assign multiple tasks to a user at the same time. |
| Created | Displays the date when the task was created. |

| Column | Description |
|---|---|
| Priority | Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: |
| ID | Displays the task ID. |
| Name | Displays the task name. |
| Assignee | Displays the name of the user assigned to the task. |
| Status | Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. |
| Last Updated | Displays the date and time when the task was last updated. |
| Created By | Displays the user who created the task. |
| Incident ID | Displays the incident ID for which the task was created. Click the ID to display the details of the incident. |

At the bottom of the list, you can see the number of tasks on the current page and the total number of tasks. For example: **Showing 23 out of 23 items**

## Task Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Tasks List view, has options that you can use to filter the incident tasks.

| Option | Description |
|---|---|
| Time Range | You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes. |

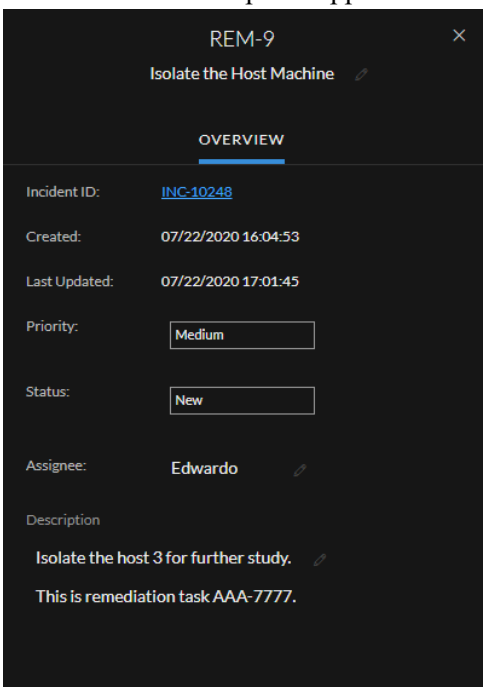
| Option | Description |
|---|---|
| Custom Date Range | You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.<br>  |
| Task ID | You can type the Task ID for a task that you would like to locate, for example REM-123. |
| Priority | You can select the priorities that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected priorities.<br>For example: If you select Critical, the Tasks list shows only the tasks with a priority set to Critical. |
| Status | You can select the statuses that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected statuses.<br>For example: If you select Assigned, the Tasks panel shows only the tasks that are assigned to users. |
| Created By | You can select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY. |
| Reset Filters | Removes your filter selections. |

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list. For example: **Showing 18 out of 18 items**

## Task Overview Panel

To access the Task Overview panel:

1. Go to **Respond > Tasks**.
2. In the Task list, click the task that you want to view.
   The Task Overview panel appears to the right of the Tasks list.



The following table lists the fields displayed in the Task Overview panel.

| Field | Description |
|---|---|
| <Task ID> | Displays the automatically assigned task ID. |
| <Task Name> | Displays the task name. This is an editable field. To change the task name, you can click the current task name to open a text editor. For example, you can change a task name from "Reimage a Laptop" to "Reimage a Server". |
| Incident ID | Displays the Incident ID for which the task was created. Click the ID to display the details of the Incident. |
| Created | Displays details about the date and time when the task was created. |
| Last Updated | Displays the date and time when the task was last updated. |
| Priority | Displays the priority of the task: Low, Medium, High, or Critical. To change the priority, you can click the priority button and select a priority for the task from the drop-down list. |

| Field | Description |
|---|---|
| Status | Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. To change the status, you can click the status button and select a status for the task from the drop-down list. |
| Assignee | Displays the user assigned to the task. To change the user assigned to the task, you can click (Unassigned) or the name of the previous assignee to open a text editor. |
| Description | Shows task details. To modify the description, you can click the text underneath the description to open a text editor. |

## Toolbar Actions

This table lists the toolbar actions available in the Tasks List view.

| Option | Description |
|---|---|
| | Enables you to open the Filters panel so that you can specify the tasks that you would like to see in the Tasks List. |
| | Closes the panel. |
| **Delete** button | Allows you to delete the selected tasks. |

# Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add or remove an entity or meta value to an existing list or create a new list. For example, when you look up an IP address and you find it suspicious or interesting, you can add it to a relevant list, which has been added a data source. This improves the visibility of the suspicious IP addresses. You can also add entities or meta values to different lists. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connections IP addresses related to remote access. If a list is not available, you can create a list. You can also remove the entity or meta value from a list.

**Note:** From the Add/Remove from List dialog, you can only add or remove entities or meta values from single column lists added as a datasource, not multi-column lists. And when you edit a list or a value in a list from the nodal view or the context lookup view, ensure to refresh the web page to view the updated data.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts | Add an entity to a list. | From the Incident Details view, see Add an Entity to a Whitelist.<br>From the Alert Details view, Add an Entity to a Whitelist. |
| Incident Responders, Analysts | Create a whitelist, blacklist, or other list. | Create a List |
| Administrators | Add a Context Hub list as a data source. | See "Configure Lists as a Data Source" in the *Context Hub Configuration Guide*. |
| Administrators | Import or export a list for Context Hub. | See "Import or Export Lists for Context Hub" in the *Context Hub Configuration Guide*. |

## Related Topics

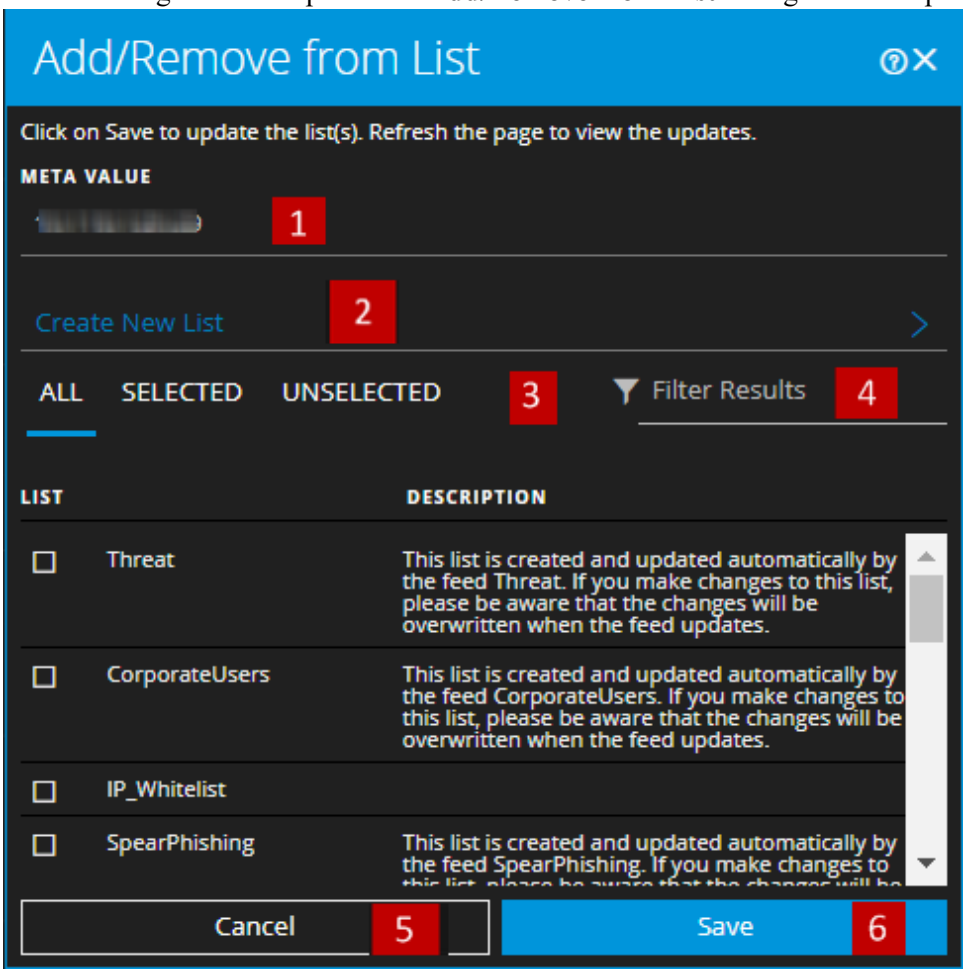
- View Contextual Information (Alert Details view)

**Note:** You cannot delete a list, but you can delete values within a list.

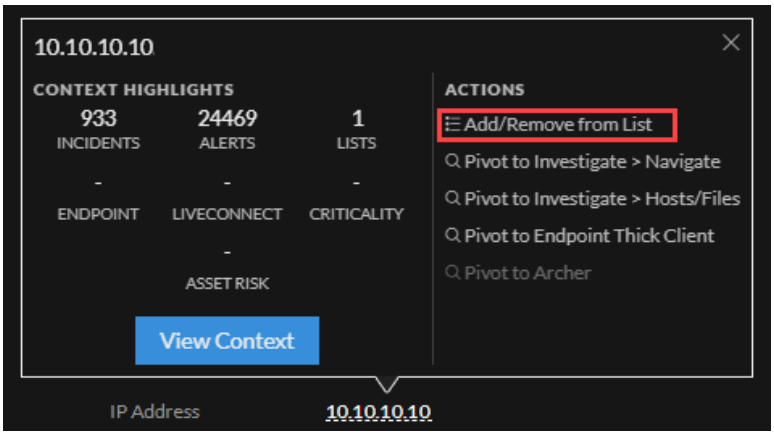
## Quick Look

The following is an example of the **Add/Remove from List** dialog in the Respond view.

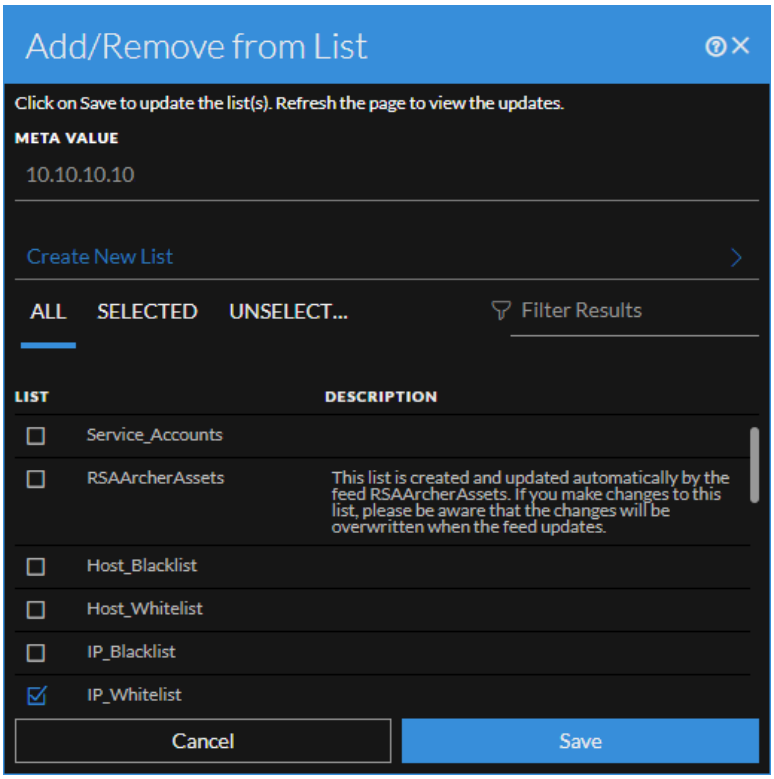


1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta values.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.

To access the Add/Remove from List dialog, in the Incident Details view or the Alert Details view, hover over the underlined entity that you would like to add or remove from a Context Hub list. A context tooltip appears showing the available actions.



In the Actions section of the tooltip, click Add/Remove from List. The Add/Remove From List dialog shows the available lists.



The following table shows the options in the Add/Remove from List dialog.

| Option | Description |
|---|---|
| Meta Value | Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value. |
| Create New List | When clicked, it displays a dialog to create a new list using the selected meta value. |

| Option | Description |
|---|---|
| All | Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list. |
| Selected | Shows only the lists that contain the selected entity or meta value. (All lists are selected.) |
| Unselected | Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.) |
| Filter Results | Enter the name or description of a specific list to search from multiple lists. |
| List | Displays the name of all the lists. |
| Description | Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses. |
| Cancel | Cancels the operation. |
| Save | Saves the changes. |

# Context Lookup Panel - Respond View

The Context Hub service brings together contextual information from several data sources into the Respond view so that analysts can make better decisions during their analysis and take appropriate action. Seeing the entities, meta values, and contextual information in a single interface helps analysts to prioritize and identify areas of interest. For example, recently created incidents and alerts from the Respond view involving a given entity or meta value will be displayed when the analyst queries for additional information for that entity or meta value. The Context Lookup panel displays contextual information for the selected entities or meta values such as IP address, User, Host, Domain, File Name, or File Hash. The data available depends on the configured sources in the Context Hub.

The Context Lookup panel displays the contextual information based on the data available on the configured sources in the Context Hub.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Incident Responders, Analysts, Threat Hunters | Navigate to the Context Lookup panel. | From the Incident Details view, see View Contextual Information.<br>From the Alert Details view, see View Contextual Information. |
| Incident Responders, Analysts, Threat Hunters | Understand the information in the Context Lookup panel for a selected entity. | See the information in this topic. |
| Administrator | Configure Data Sources for Context Hub. | See "Configure Data Sources for Context Hub" in the *Context Hub Configuration Guide*. |
| Administrator | Configure Context Hub settings. | See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |

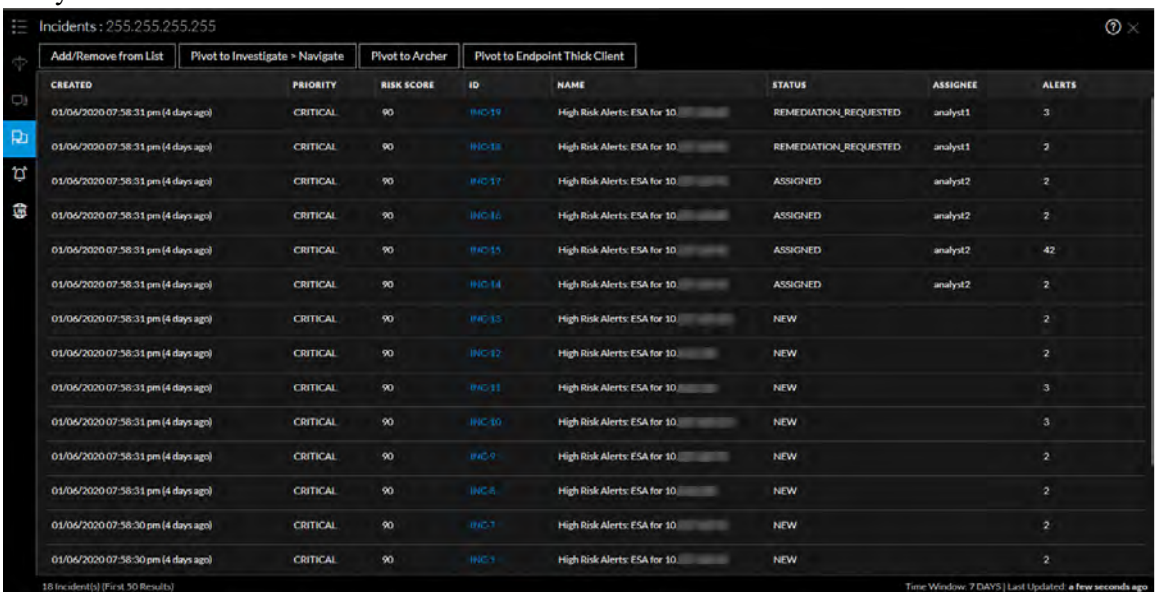
## Contextual Information Displayed in the Context Lookup Panel

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, Live Connect, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.



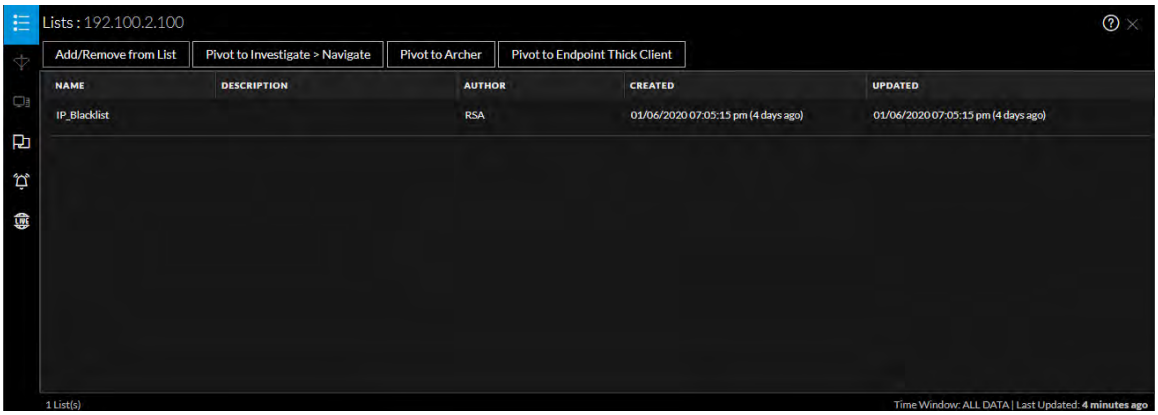
The following table describes the data available on each tab and the supported entities.

| Tab | Description | Supported Entities |
|---|---|---|
| (Lists) | Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list. | All entities |
| (Archer) | Displays asset information along with criticality ratings using the Archer data source. | IP, Host, and Mac |
| (Active Directory) | Displays all user information for the selected user. | User |

| Tab | Description | Supported Entities |
|---|---|---|
| (NetWitness Endpoint) | Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels. | IP, MAC address, and Host |
| (Incidents) | Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents. | All entities |
| (Alerts) | Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts. | All entities |
| (Live Connect) | Displays information related to Live Connect. | IP, Domain, and Filehash |
| (File Reputation) | Displays file reputation status for Filehash entities. | Filehash entities |
| TI | Displays information for STIX data sources. | IP address, email address, domain, filename, URL's, and file hash.<br>**Note:** The context lookup for email address and URL will be displayed only if these metas are mapped.<br>Navigate to (Admin) > System > Investigation > Context Lookup. |
| REST API | Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity. | All entities |

## Lists Tab

The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.



| Field | Description |
|---|---|
| Name | The name of the list (defined while creating the list). |
| Description | The description of the list (defined while creating the list). |
| Author | The owner who created the list. |
| Created | The date when the list was created. |
| Updated | The date when the list was last updated or modifed. |
| Count | The number of lists in which the selected entity or meta value is available. |
| Time Window | The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

## Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.

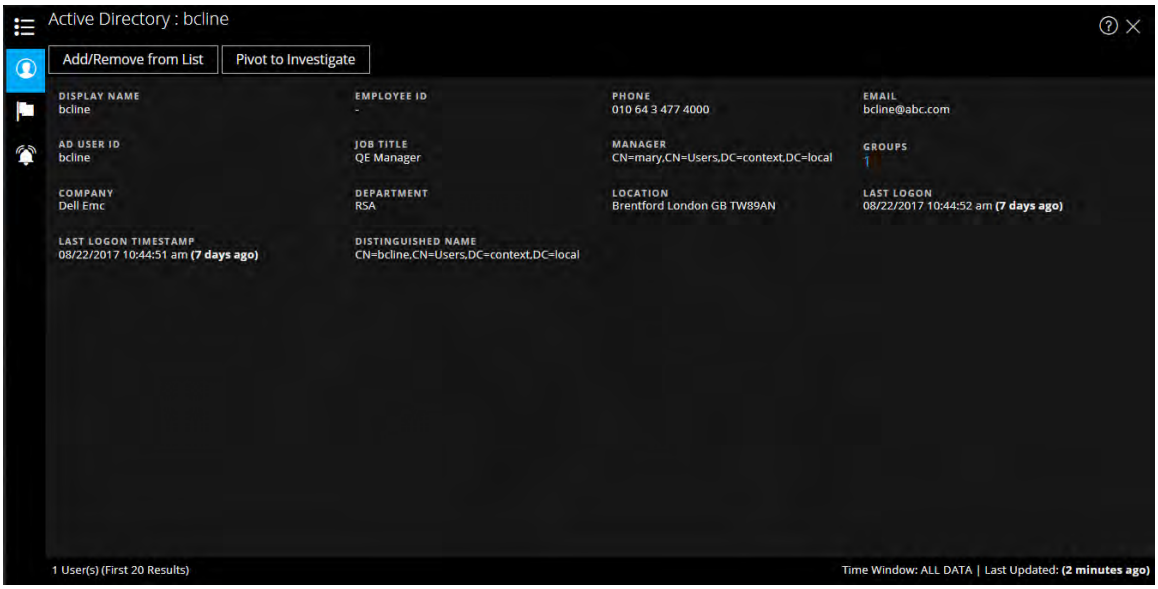
| Field | Description |
|---|---|
| Criticality Rating | The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High. |
| Risk Rating | The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal. |
| Device Name | The unique name of the device. |
| Host Name | The host name of the device. |
| IP Address | The primary internal IP address of the device. |
| Device ID | The automatically populated value that uniquely identifies the record across all applications within the system. |
| Type | The device type, for example, server, laptop, desktop, and others. |
| Facilities | Links to records in the Facilities application that are related to this device. |
| Business Unit | Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values. |
| Device Owner | The person who is responsible for the device and receives read and update rights of the record. |

| Field | Description |
|---|---|
| Count | The number of assets available. |
| Time Window | The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

**Note:** In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

## Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.



The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName

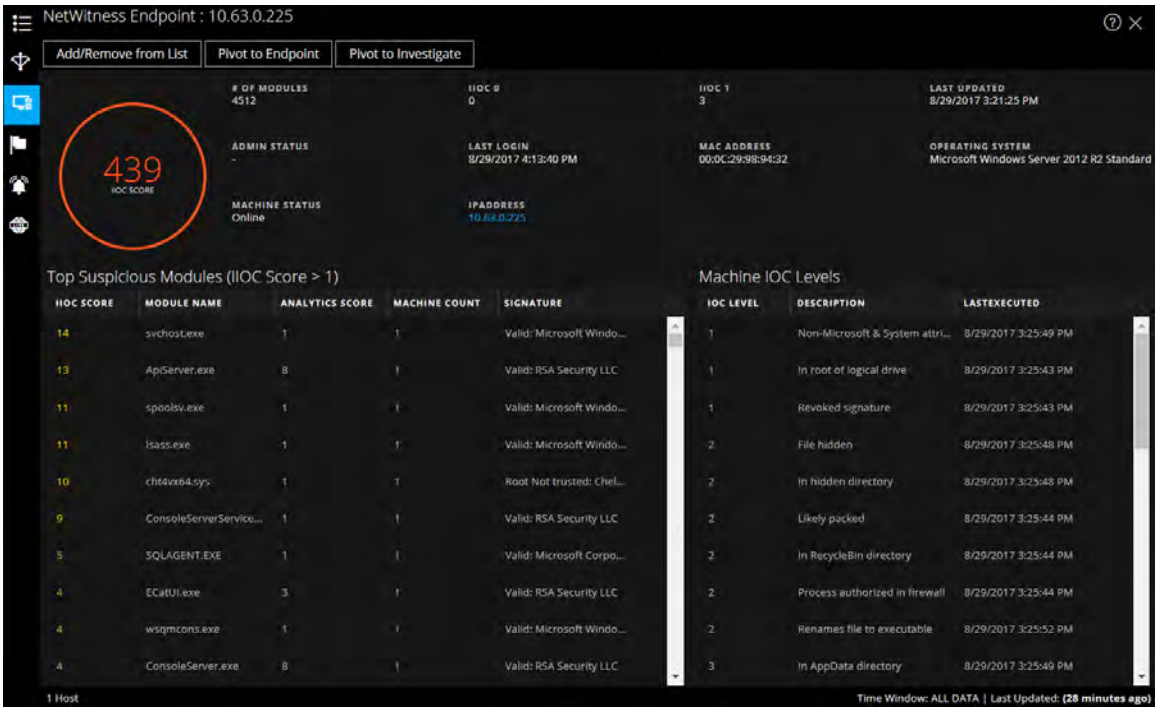
The following information is displayed for Active Directory.

| Field | Description |
|---|---|
| Display Name | The name of the user. |
| Employee ID | The employee ID of the user. |

| Field | Description |
|---|---|
| Phone | The phone number of the user. |
| Email | The email ID of the user. |
| AD User ID | The unique identification of the user within an organization. |
| Job Title | The designation of the user. |
| Manager | The name of the user's manager. |
| Groups | The list of groups of which the user is a member. |
| Company | The name of the user's company. |
| Department | The department name to which the user belongs within the organization. |
| Location | The location of the user. |
| Last Logon | The time when the user logged into the system, only if the Global Catalogue is defined. |
| Last Logon TimeStamp | The time when the user logged into the system. |
| Distinguished Name | The unique name assigned to the user. |
| Count | The number of users. |
| Time Window | The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched. |
| Last Updated | The time when Context Hub fetched and stored the lookup data in cache. |

### NetWitness Endpoint Tab

The following figure is an example of the Context Lookup panel for NetWitness Endpoint.



The following information displayed for IIOCs.

| Field | Description |
|---|---|
| # Of Modules | The number modules that are looked up. |
| Admin Status | The admin status (if any). |
| Last Updated | The time when the data was last refreshed. |
| Last Login | The time when the user last logged in. |
| MAC Address | The Machine MAC Address. |
| Operating System | The Version of the Operating System used by the NetWitness Endpoint machine. |
| Machine Status | The state of the module being viewed: Online, Offline, Active, or Inactive. |
| IP Address | The IP address of the specific module. |

The following information is displayed for modules.

| Field | Description |
|---|---|
| IIOC Score | A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |

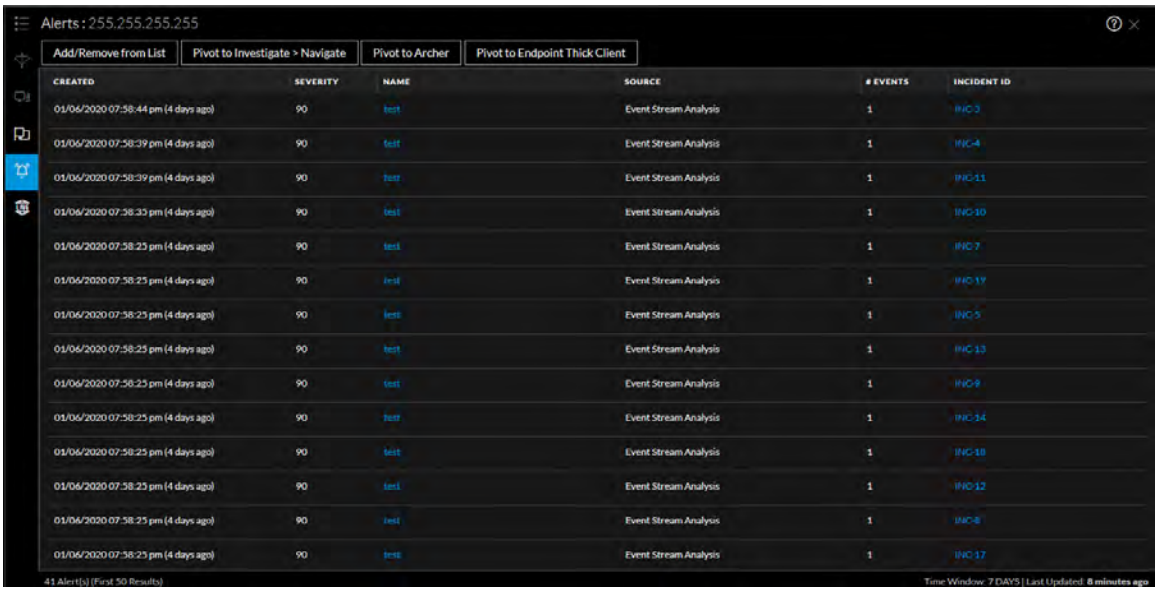
| Field | Description |
|---|---|
| Module Name | The name of the module that is being looked up. |
| Analytic Score | The number of active files for the selected machine. |
| Machine Count | The number of machines on which that particular IOC got triggered. |
| Signature | Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on. |

The following information is displayed for machines.

| Field | Description |
|---|---|
| IOC Levels | The IOC levels. |
| Description | The description for he IOC level if available. |
| Last executed | The time when the action was executed. |
| Count | The number of hosts that are being looked up. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched. |
| Last Updated | The time when scan results were last updated in NetWitness Endpoint database. |

## Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

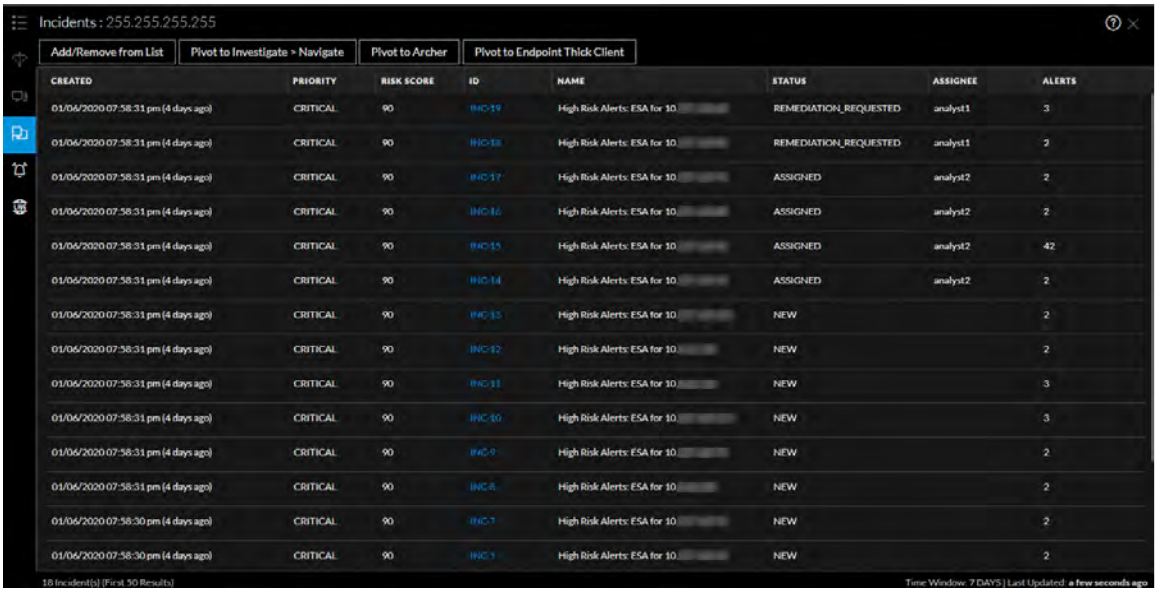


The following information is displayed in the Context Lookup panel for Alerts.

| Field | Description |
|---|---|
| Created | The date and time when the alert was created. |
| Severity | The severity value of the alerts. |
| Name | The name of the alert. You can click the name to view the details of a specific alert. |
| Source | The alert source name from which the alert is triggered. |
| #Events | The number of events associated with the alert. |
| Incident ID | The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert. |
| Count | The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched. |
| Last Updated | The time when contextual data was last fetched from data source. |

## Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

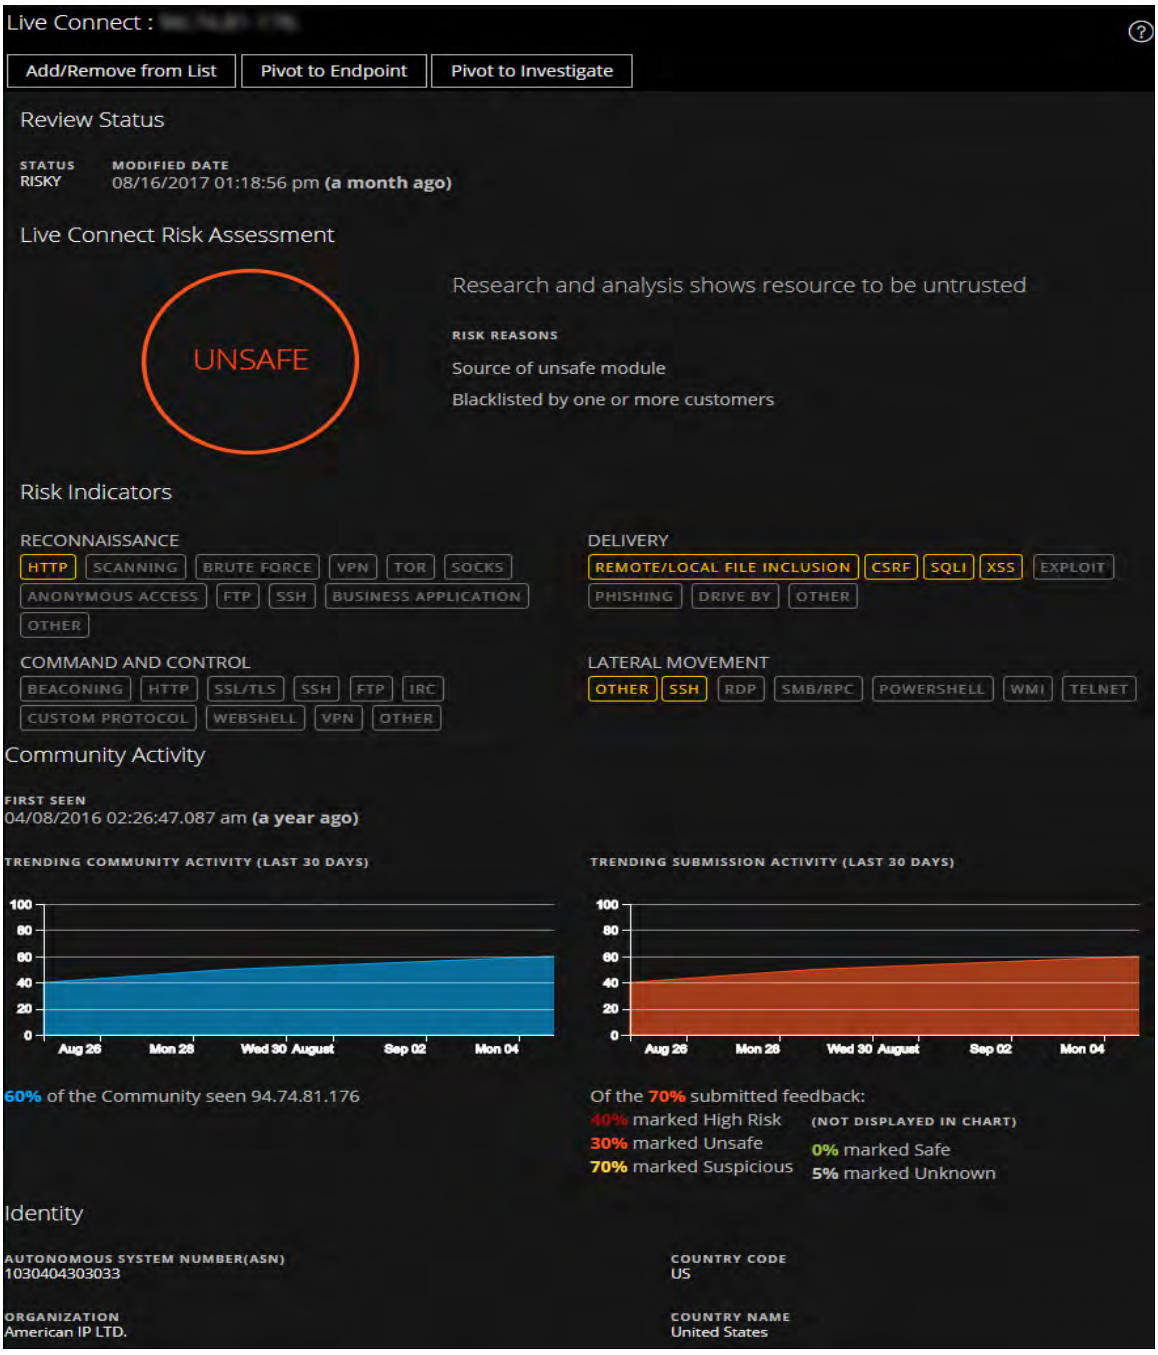


The following information is displayed in the Context Lookup panel for Incidents.

| Field | Description |
|---|---|
| Created | The date when the incident was created. |
| Priority | The priority status of the incidents. |
| Risk Score | The risk score of the incidents. |
| ID | The Incident ID of the incident. You can click on the ID to display further details about the incident. |
| Name | The incident name. |
| Status | The status of the incident |
| Assignee | The current owner of the incident. |
| Alerts | The number of alerts associated with the incident. |
| Count | The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*. |
| Time Window | The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched. |
| Last Updated | The time when contextual data was last fetched from data source. |

## Live Connect Tab

The following figure is an example of a Context Panel for Live Connect, and the table describes the information displayed.



| Field | Description |
|---|---|
| Review Status | The review status of the selected Live Connect entity (IP, file, or domain) based on the analyst activity. This gives the visibility of the analyst activity within an organization.<br>**Status**<br>Below are the types of status:<br>• **New:** Lookup results for an IP address are viewed for the first time within the organization.<br>• **Viewed:** Any analyst within the organization has already viewed the lookup results for an IP address.<br>• **Marked as Safe:** Any analyst within the organization has already viewed the lookup results and marked the IP address as safe.<br>• **Marked as Risky:** Any analyst within the organization has already viewed the lookup results and marked the IP address as risky. |
| Risk Assessment | The risk assessment for the selected Live Connect entity (IP, file, or domain) based on the Live Connect analysis and analyst feedback. The Risk Assessment categories are:<br>• **Safe:** The Live Connect entity is considered to be safe.<br>• **Unknown:** Live Connect does not have enough information about this entity to calculate the risk.<br>• **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention.<br>• **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action.<br>• **Unsafe:** Marked as unsafe based on the analysis and risk reasons provided by the community.<br>The entity is rated as High Risk, Suspicious, or Unsafe and displays the associated risk reasons accordingly. |

| Field | Description |
|---|---|
| Risk Assessment Feedback |  <br>Risk Assessment Feedback allows the analyst to submit threat intelligence feedback about an entity to the Live Connect server.<br>• **Analyst Skill Level**<br>Below are the Analyst skill level options:<br>◦ **Tier 1** - Analysts at this level define procedures for remediation, and decide if an incident should be escalated to other areas in a Security Operation center (SOC). This is the default value.<br>◦ **Tier 2** - Analysts who investigate incidents and capture intelligence from an investigation to feed back into the various workflows in a SOC.<br>◦ **Tier 3** - Analysts who share the investigation results to the SOC organization. They generally manage incidents and have a wide breadth and depth of skills and tools necessary for incident response.<br>**Note:** While creating a new user for NetWitness (Analyst), an administrator should be able to identify the user as Tier 1, Tier 2, or Tier 3 Analyst.<br>• **Risk Confirmation** - The risk confirmation for the selected Live Connect entity (IP, file, or domain). The Risk confirmation categories are:<br>◦ **Safe**: The Live Connect entity is considered to be safe.<br>◦ **Unknown**: The analyst does not have enough information to provide a risk confirmation<br>◦ **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention.<br>◦ **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action.<br>◦ **Unsafe**: Marked as unsafe based on the analysis and risk reasons provided by the community.<br>• **Confidence Level** - The confidence level of an analyst in providing feedback for the Live Connect entity. The confidence level categories are: High, Medium, and Low.<br>• **Risk Indicator Tags** - Allows you to select a tag category based on the analysis. |

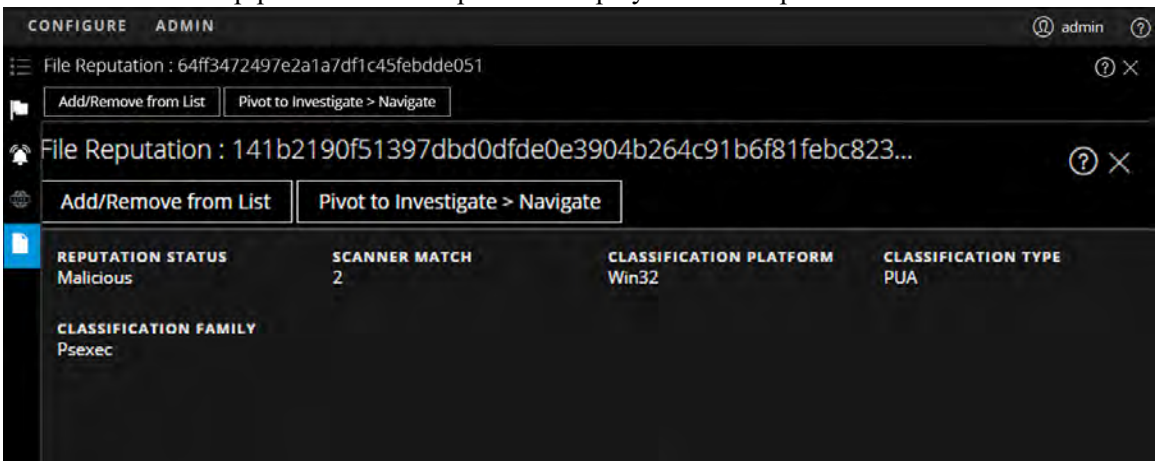
| Field | Description |
|---|---|
| Community Activity | Community activities such as:<br>• Date first seen in the community.<br>• Time since the IP/File/Domain was seen for the first time (Current time - First seen time).<br>**Trending Community Activity:**<br>If the IP address is known within the RSA community, a graphical representation of the community activity trend is displayed for the following:<br>• Users (in %) who have viewed the IP address in the Live Connect community over time.<br>• Users (in %) who submitted feedback for the IP address.<br>• Users (in %) who marked the IP address as unsafe over time. |
| Risk Indicators |  <br>Risk indicators are highlighted based on the tags that are assigned by the community to the entities (IPs, Files, or Domains).<br>The tags are categorized as follows: Reconnaissance, Delivery, Command and Control, Lateral Movement, Privilege Escalation, and Packaging and Exfiltration.<br>These tags are samples and vary based on the inputs received from the community on the Live Connect server. The analyst can choose the appropriate risk indicator tags while providing the review feedback. A highlighted tag indicates that the selected entity is associated with that particular category and tag. Clicking a highlighted tag displays the description of the tag. |
| Identity | Provides the following identity information for the selected entity or meta value:<br>For IP address: Autonomous System Number (ASN), Prefix, Country Code and Country Name, Registrant (Organization), and Date.<br>For File Hash: File Name, File Size, MD5, SH1, SH256, Compile Time, and Mime Type.<br>For Domain: Domain Name and Associated IP Address. |
| Certificate Information | Provides the following certificate information for the selected file hash: Certificate Issuer, Validity of the Certificate, Signature Algorithm, and Certificate Serial Number. |

| Field | Description |
|---|---|
| WHO IS Information |  <br>The **WHO IS** information provides the ownership details for a given domain.<br>The following information about the domain owner is displayed: Created Date, Updated Date, Expired Date, Type (Registration Type), Name, Organization, Address with Postal code, Country, Phone, Fax, and Email. |
| Related Files | Related Files are displayed for entity types IP and Domain. A list of known associated files is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), File Name, MD5, Compile Time and Date, API Function, Import Hash, and Mime Type. |
| Related Domains | Related Domains are displayed for entity types IP and Files. A list of known associated domains is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), Domain Name, Country Name, Registered Date, Expired Date, and Registrant Email address. |

| Field | Description |
|---|---|
| Related IPs | <br>Related IPs are displayed for entity types Domain and Files. A list of known associated IPs is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), IP Address, Domain Name, Country Code and Country Name, Country Name, Registered Date, Expired Date, and Registrant Email address. |

## File Reputation Tab

The Context Lookup panel for File Reputation displays the file reputation status of a file.

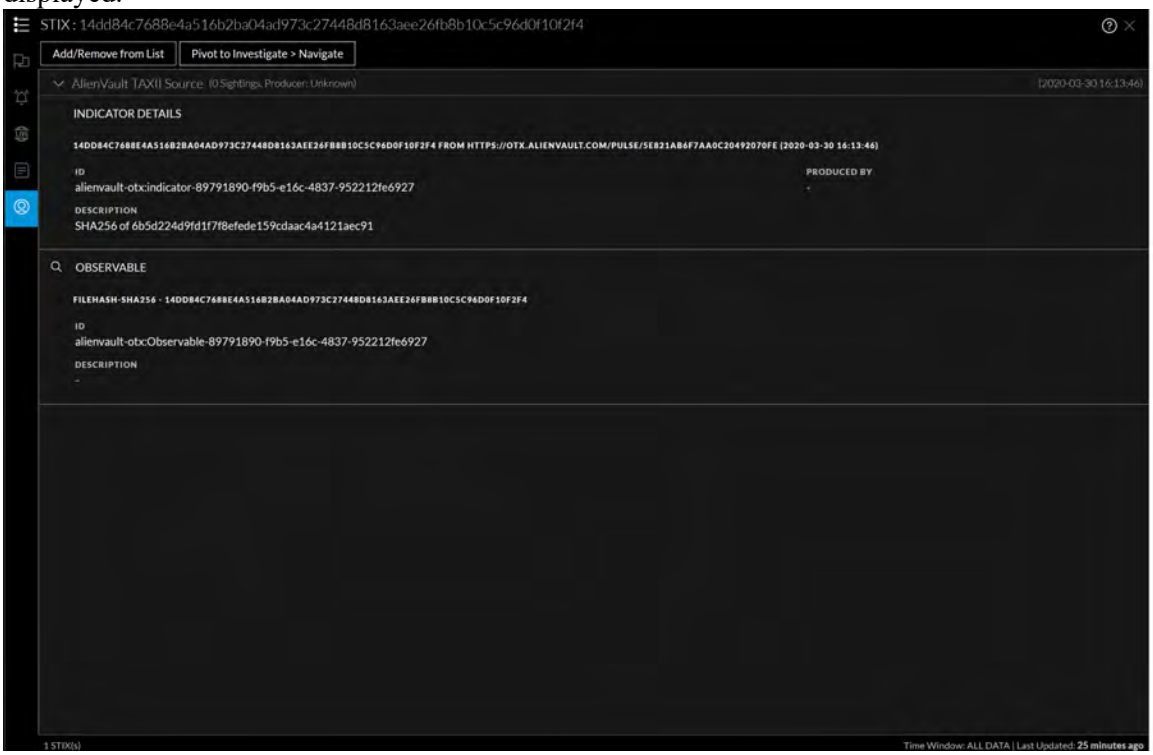


| Field | Description |
|---|---|
| Reputation Status | Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*. |
| Scanner Match | Number of scanners that detected malware or suspicious activity in the last scan. |

| Field | Description |
|---|---|
| Classification Platform | Classification for the queried filehash based on the platform. For example, the platform can be Win 32. |
| Classification Type | Classification for the queried filehash based on the type. |
| Classification Family | Classification for the queried filehash based on the malware family name. |

## TI Tab

The following figure is an example of a Context Panel for TI, and the table describes the information displayed.



| Field | Description |
|---|---|
| Data Source name | Displays the STIX data source name from where the data is retrieved. |
| Timestamp | The time when the event was created. |
| Indicator Details | Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity.<br>ID: Displays the ID of the selected indicator.<br>Produced by: Displays the user role who requested for the STIX data.<br>Description: Displays details about the selected IP address which are being watch listed. |

| Field | Description |
|---|---|
| Observable | Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs).<br>ID: Displays the ID of the selected observable. |
| (Optional) SightingsREST | Sightings Title: Displays the name of the sighting source.<br>Confidence: Displays the criticality of the sighting.<br>Reference: Displays the reference URL of the sighting source. |

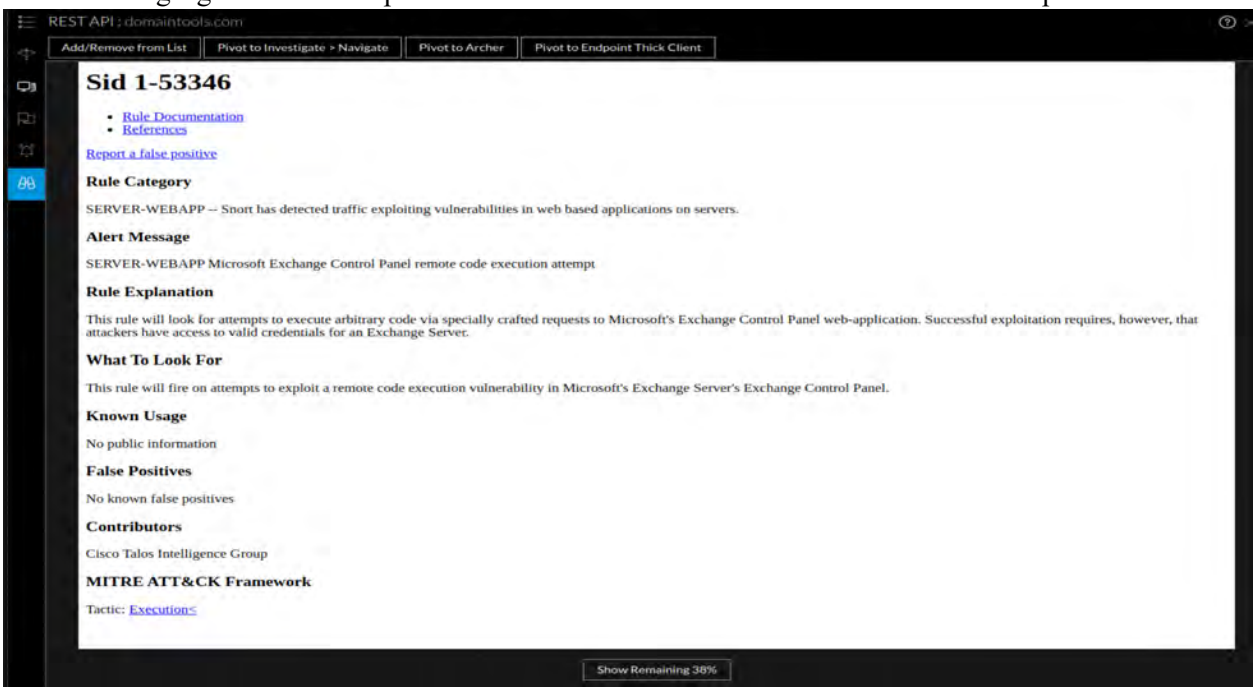
## REST API Tab

The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

**Note:** For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:



# RSA NetWitness

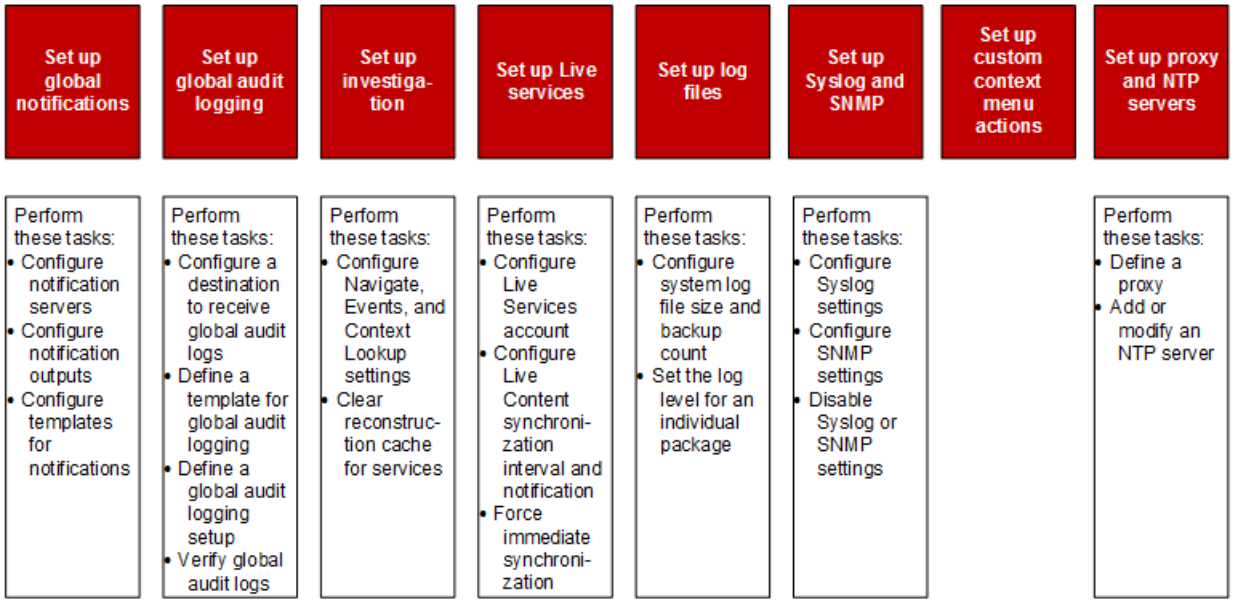
# System Configuration Overview

In the Administration System view, administrators can configure system settings to receive optimal performance from NetWitness. This diagram show the available configuration options.



In this guide, the standard procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values.

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

In addition, reference topics and troubleshooting topics supply detailed information about the user interface and suggestions for resolving possible issues.

The following sections describe system configuration:

- Standard Procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness.
- Additional Procedures provide instructions for setting up customization options that are beyond the usual system configuration.

# Standard Procedures

The topics in this section provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values. The procedures can be performed in any sequence and are listed alphabetically.

Access System Settings

Configure Notification Servers

Configure Notification Outputs

Configure Templates for Notifications

Configure the Email Settings as Notification Server

Configure Email Servers and Notification Accounts

Configure Global Audit Logging

Configure Investigation Settings

Configure Live Services Settings

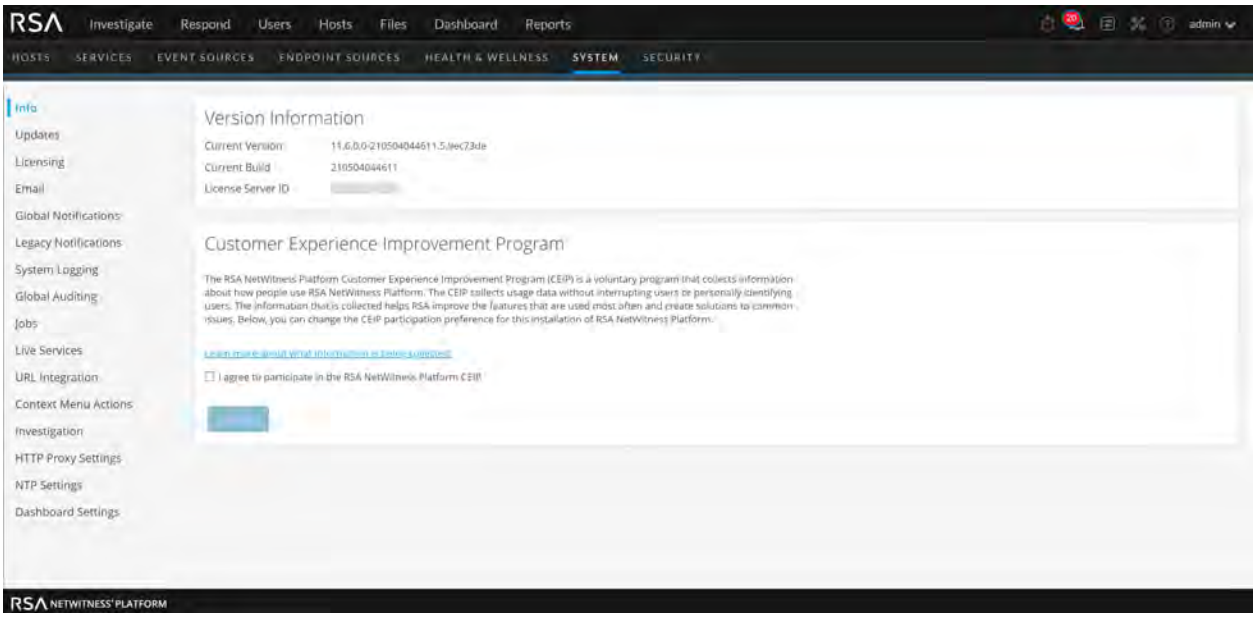
Configure Log File Settings

# Access System Settings

This topic introduces the system configuration capabilities of NetWitness in the Administration System view. Administrators can configure notifications, email notifications, global audit logging, logging settings, connection to Live Services, and URL integration in NetWitness.

To access the system settings:

Go to **(Admin) > System**.
The Administration System view is displayed.



On the left panel of the Administration System view is an options panel listing all system nodes available for configuration. When you select a node, the associated content is displayed in the right panel.

# Configure Notification Servers

This topic provides instructions on how to configure notification servers. For ESA, notification servers are required to define an ESA rule. A notification server is also required to configure global audit logging.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification Servers define the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

You can define, delete, edit, import, and export a notification server in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. You cannot disable or delete notification servers associated with global audit logging configurations.

## Notification Servers Overview

This topic provides an overview of notification servers. You configure notification servers in the Administration System view ( (Admin) > System > Global Notifications > Servers tab).

Global Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, Health and Wellness, New Health and Wellness, Event Source Management (ESM), and Global Audit Logging. Notification settings are called **Notification Servers**.

Event Stream Analysis sends notifications to users through email, SNMP, or Syslog about various system events. In ESA, these alert notification settings are called Notification Servers. You can configure multiple notification servers and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

**Note:** New Health and Wellness supports only Email and Syslog notifications.

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

You can configure the following notification servers:

- Email
- SNMP
- Syslog
- Script

Email notification servers enable you to configure email server settings to send alert notifications. SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

Syslog notification servers enable you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis. For Global Audit Logging, you can only use Syslog Notification Servers.

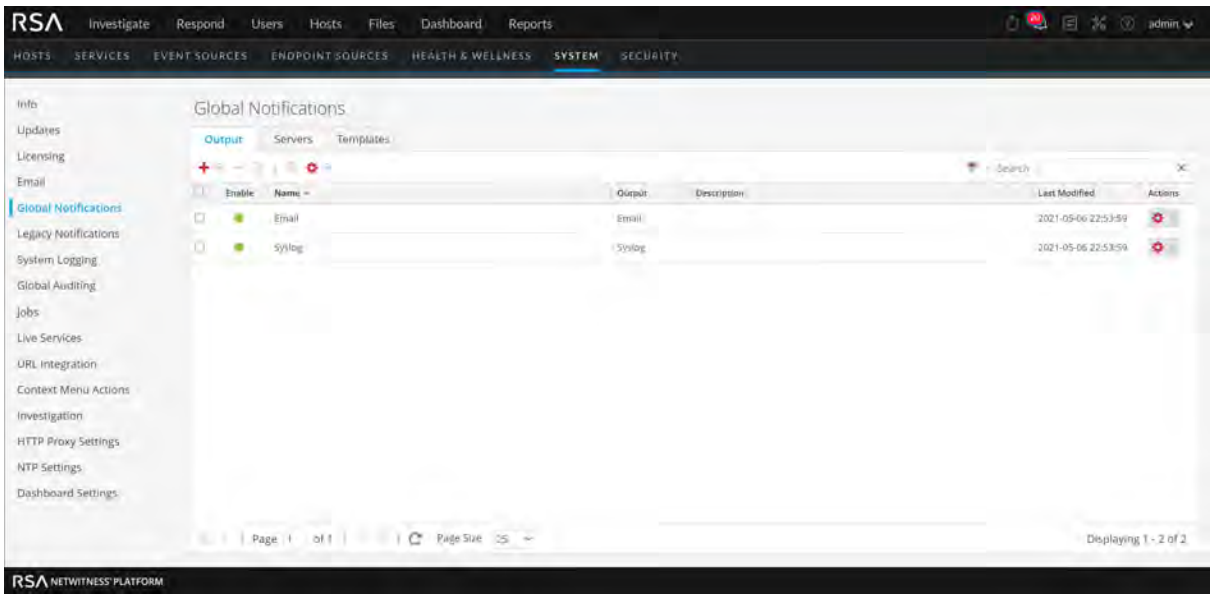
Script notification servers enable you to configure Script as a notification server.

For detailed information on the different notification server configurations, including parameters and descriptions, see Define Notification Server Dialogs.

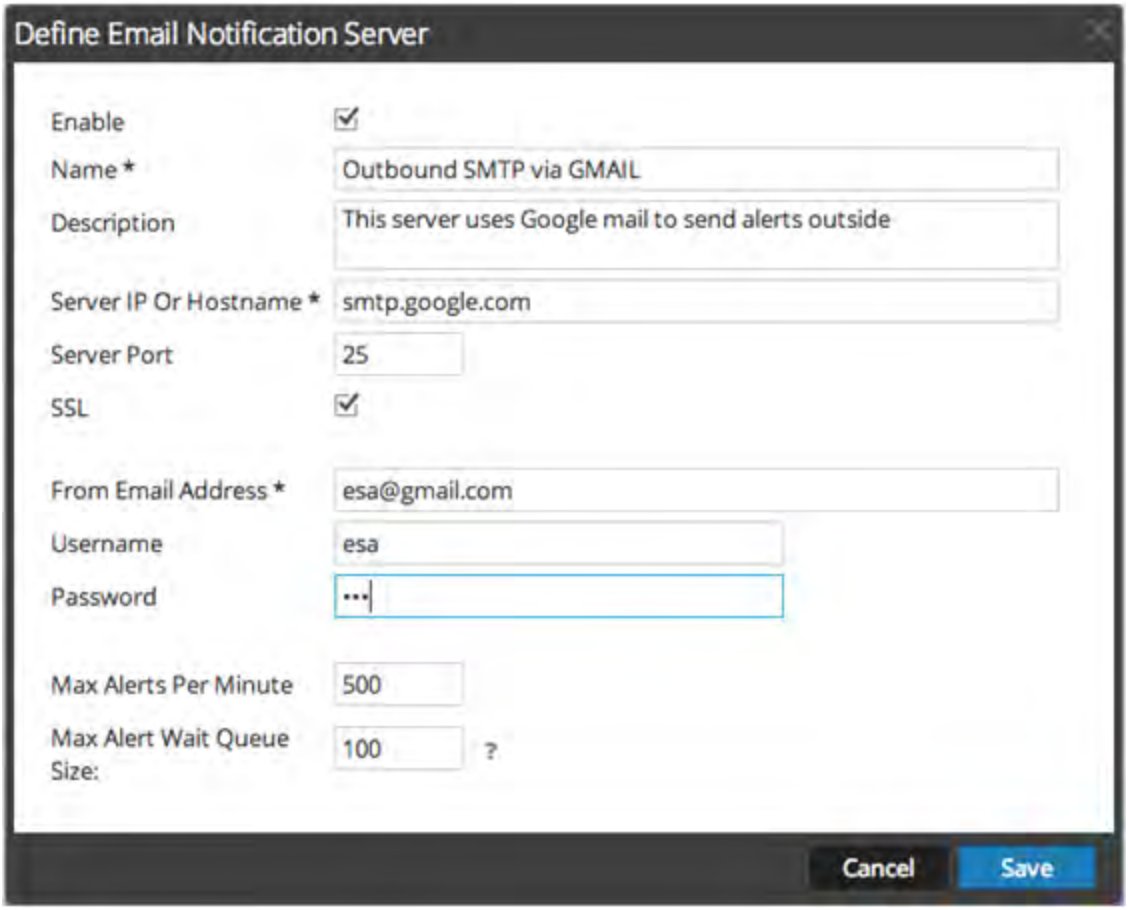
## Configure the Email Settings as Notification Server

To configure email server settings as a notification server to send alert notifications:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
   The **Notifications** configuration panel is displayed with the **Output** tab open.
3. Click the **Servers** tab.



4. From the drop-down menu, select **Email**.



5. In the **Define Email Notification Server** dialog, provide the required information and click **Save**.

**Note:** For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN in the Server IP or Hostname field.

For details of the parameters and descriptions, see Define Notification Server Dialogs

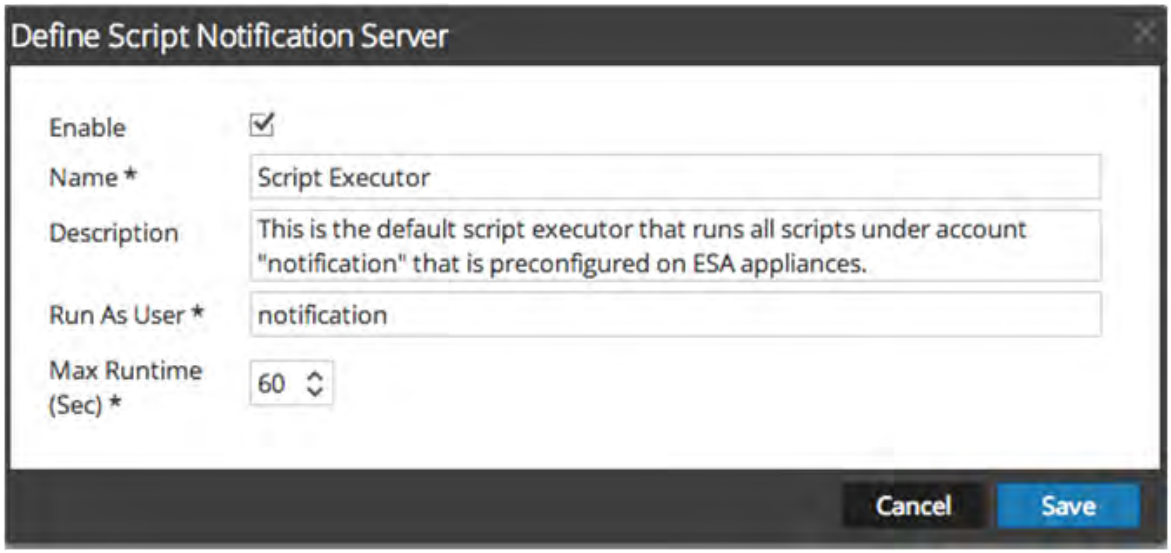
## Configure Script as a Notification Server

ESA allows you to run scripts in response to ESA alerts. However, you must first configure the user identity and other details that are required to run the scripts.

To configure Script as a notification server:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the drop-down menu, select **Script**.



5. In the **Define Script Notification Server** dialog, provide the required information and click **Save**.

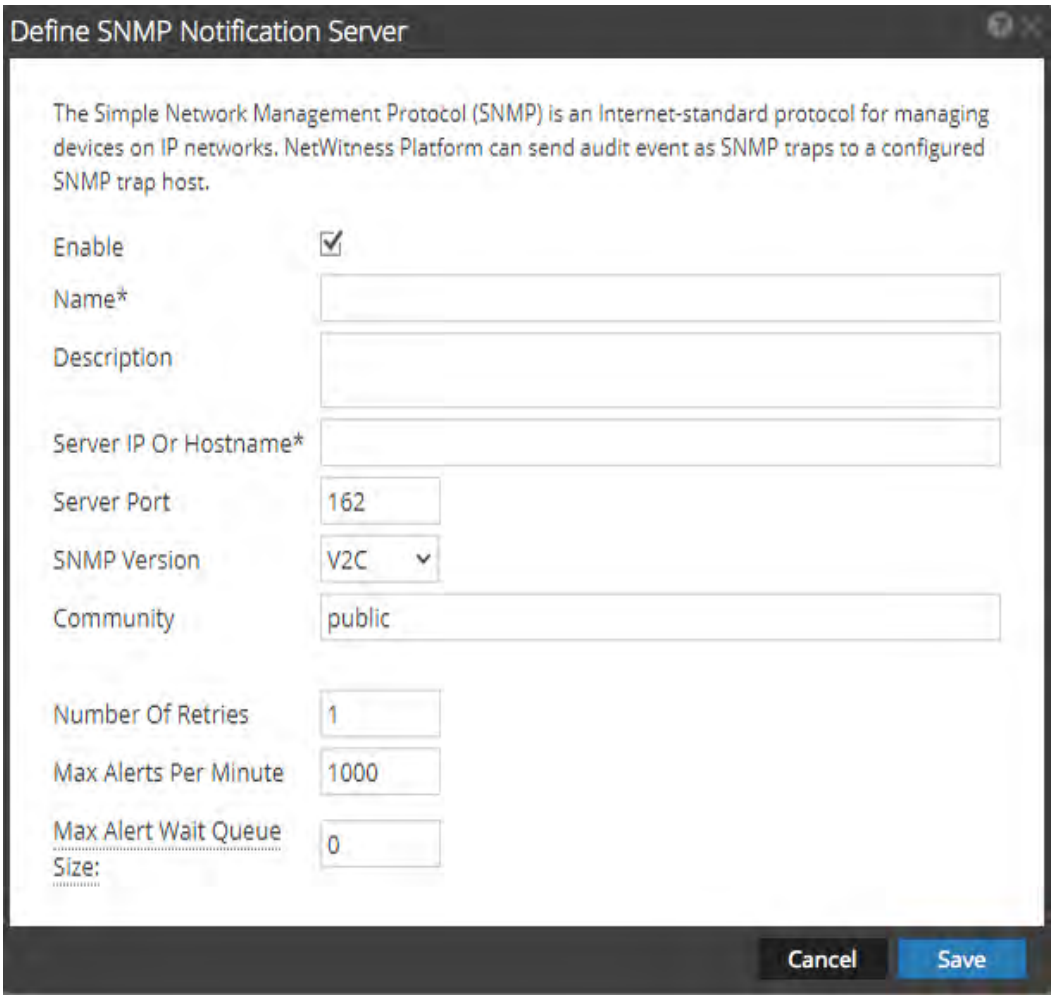
For details of the parameters and descriptions, see Define Notification Server Dialogs.

## Configure the SNMP Settings as Notification Server

To configure the SNMP trap host settings as a notification server to send alert notifications:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the drop-down menu, select **SNMP**.



5. In the **Define SNMP Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

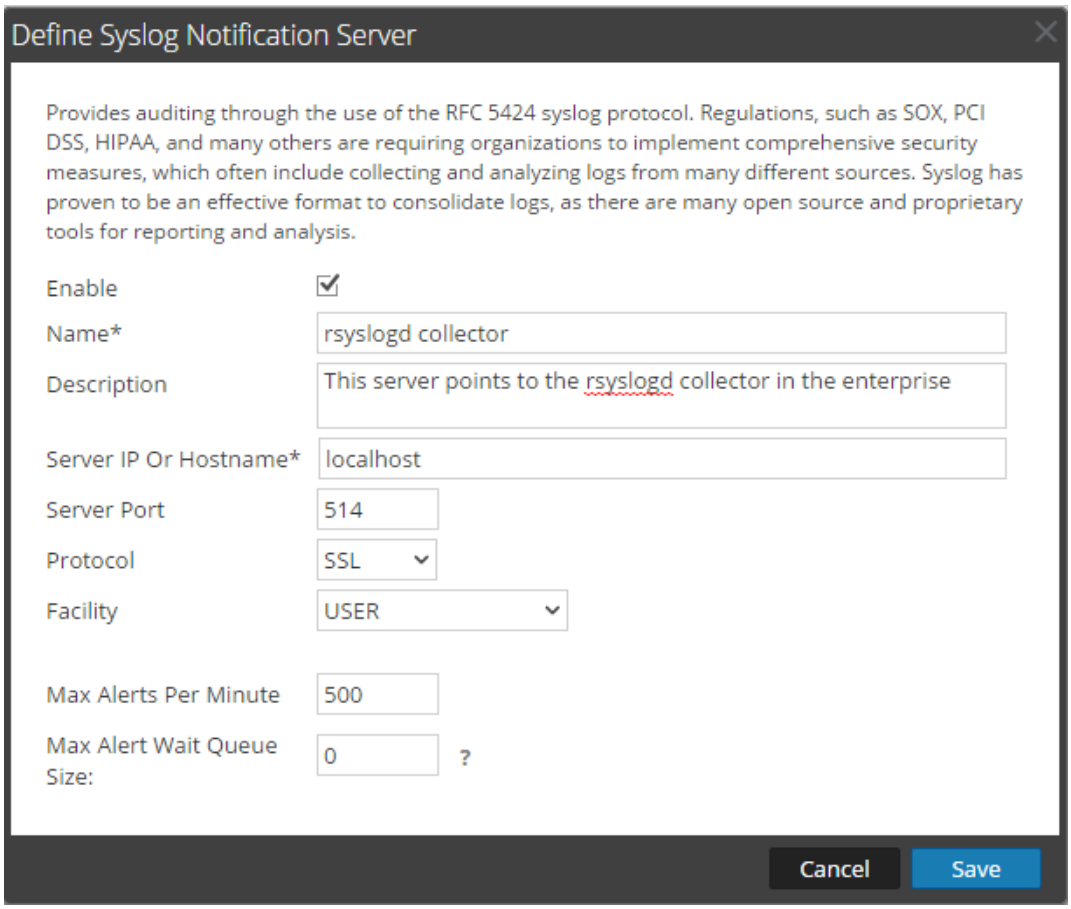
## Configure a Syslog Notification Server

This topic provides instructions on how to configure a Syslog notification server. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

To configure Syslog as a notification server:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the drop-down menu, select **Syslog**.



5. In the **Define Syslog Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

# Configure Notification Outputs

This topic provides instructions on how configure notification outputs. These notification outputs are required to define an ESA rule.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

**Note:** You do not need to configure the Output tab for Global Audit Logging.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

You can define, delete, edit, import, and export notification outputs in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods." in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. If you attempt to delete a notification output being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.

## Notification Outputs Overview

This topic provides an overview of notification outputs. notification outputs are required when defining an ESA rule. You can configure notification outputs in the Administration System view ( (Admin) > System > Global Notifications > Outputs tab).

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

**Note:** You do not need to configure notification outputs (the Output tab) for Global Audit Logging.

Notification outputs are the destinations used for sending notifications. For ESA, notification outputs enable you to define how you want to receive the ESA alerts. The following are the different notification outputs supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

**Note:** New Health and Wellness supports only Email and Syslog notification outputs.

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email notification settings define the destination email address to which you can send the alerts. You can also add a custom description in the subject of the email and define multiple destination email addresses.

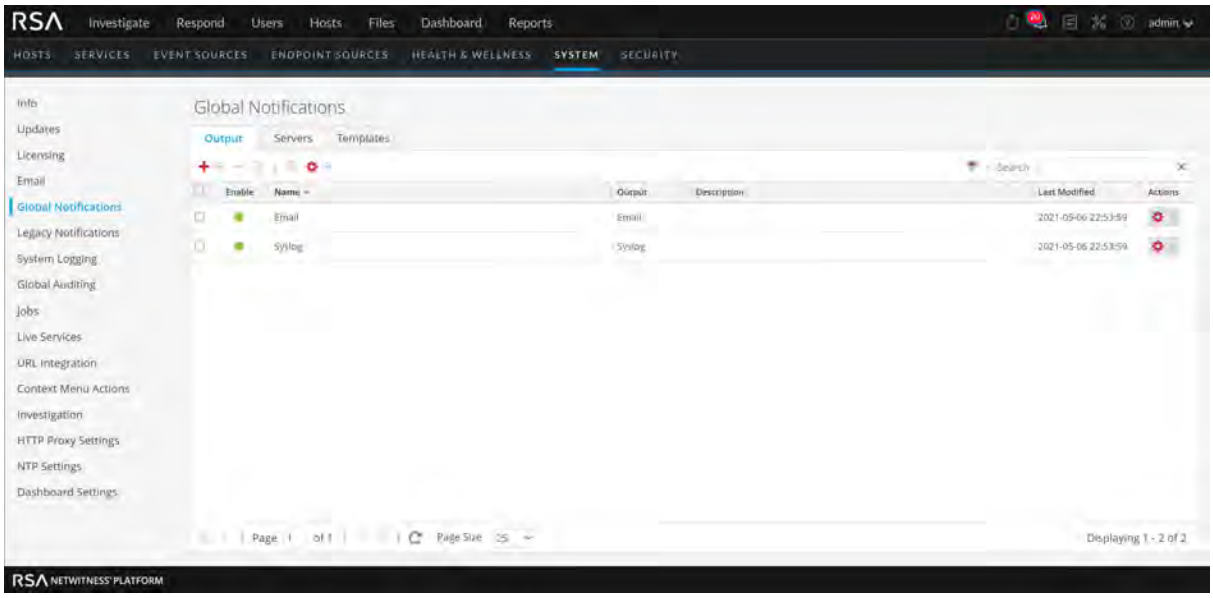
SNMP notification settings enable you to define the SNMP settings to send alert notifications. Syslog notifications enable you to define the Syslog settings used to send alert notifications. Script notifications enable you to define the Script that executes in response to the alert.

For detailed information on the notification configurations, including parameters and descriptions, see Define Notification Server Dialogs.

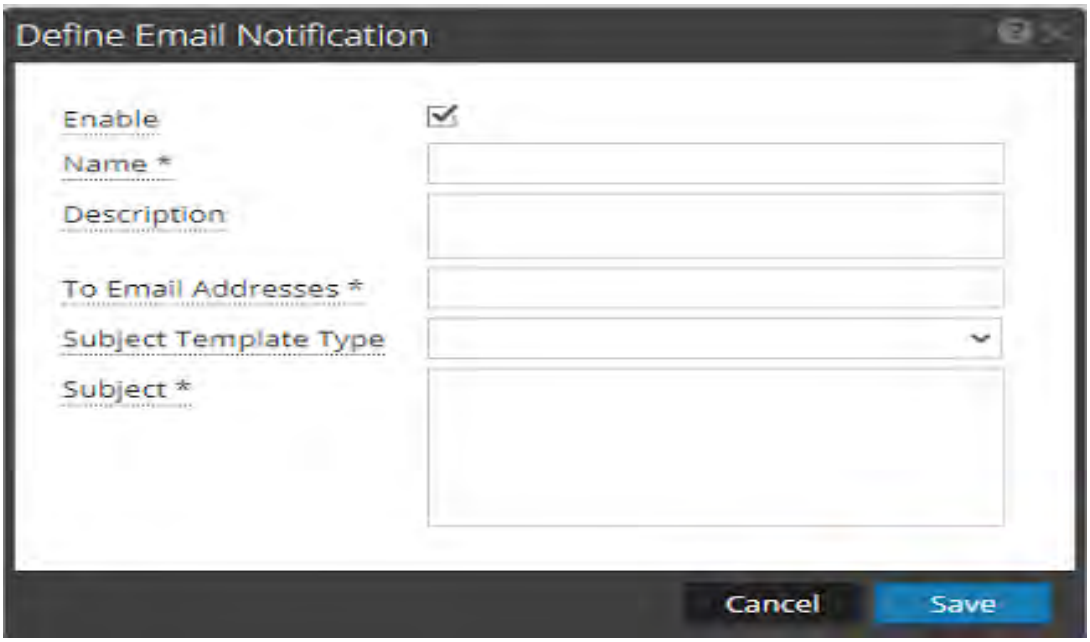
## Configure Email as a Notification

To configure Email as a notification:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.



3. On the **Output** tab, from the + drop-down menu, select **Email**.



4. In the **Define Email Notification** dialog, provide the required information and click **Save**.

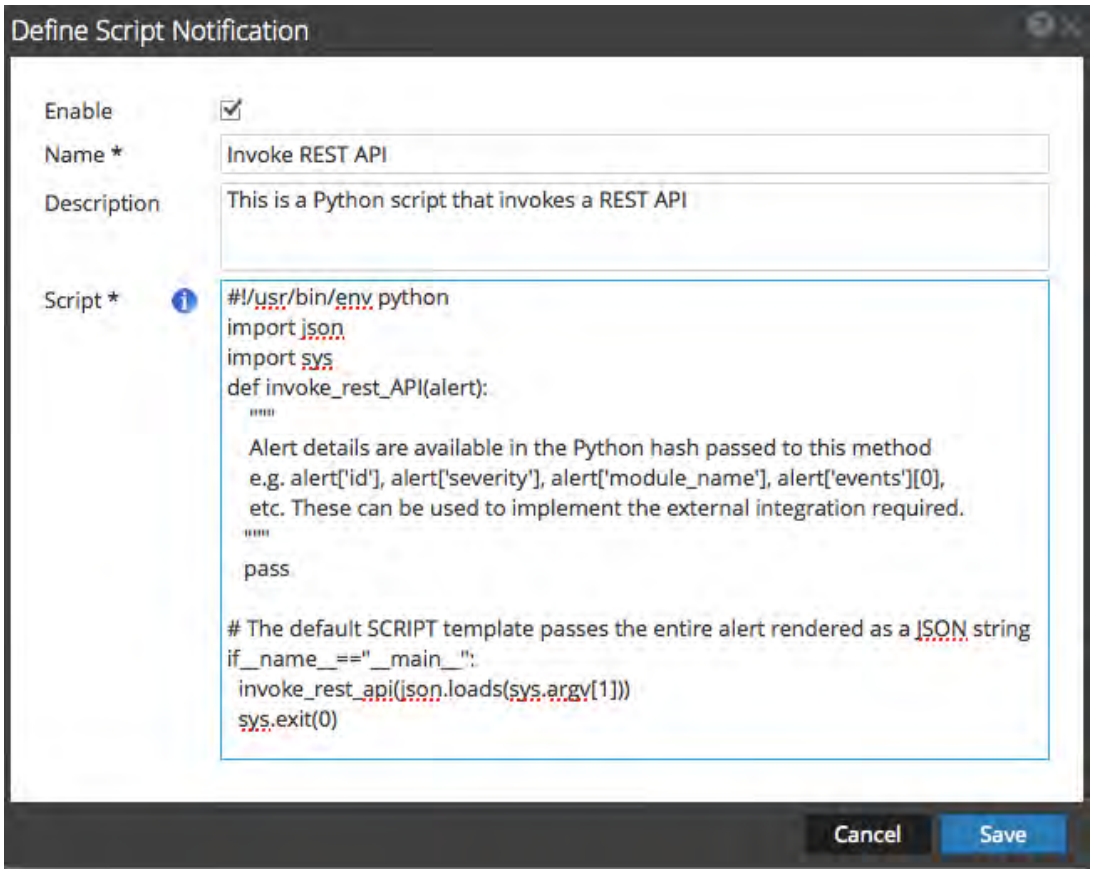
For details of the parameters and descriptions, see Define Notification Server Dialogs.

## Configure Script as a Notification

This topic provides instructions to define and configure a Script as a notification output. ESA allows you to run scripts in response to ESA alerts. You need to define the script using the (Admin) > System > Notifications > Output tab. You can use any script for ESA notifications.

To configure the script as a notification:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the + drop-down menu, select **Script**.



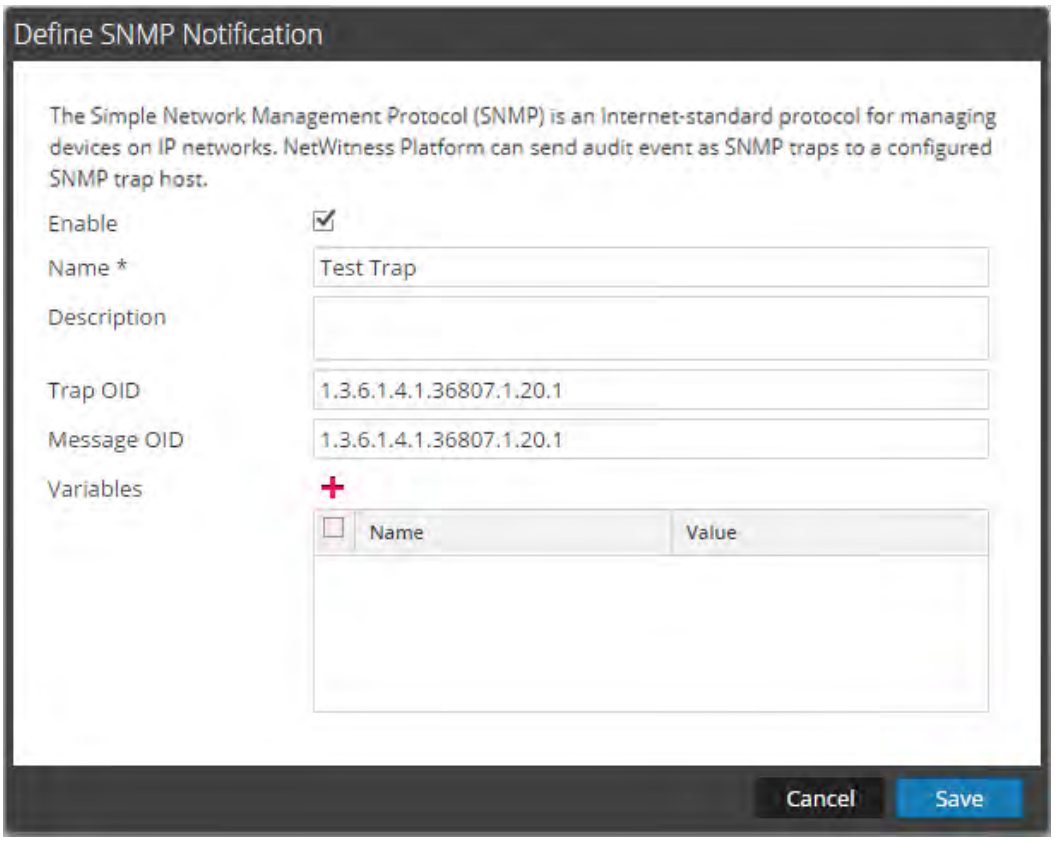
4. In the **Define Script Notification** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

## Configure SNMP as a Notification

To configure SNMP as a notification output to send alert notifications:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the drop-down menu, select **SNMP**.



4. In the SNMP Notification dialog, provide the required information and click **Save**.

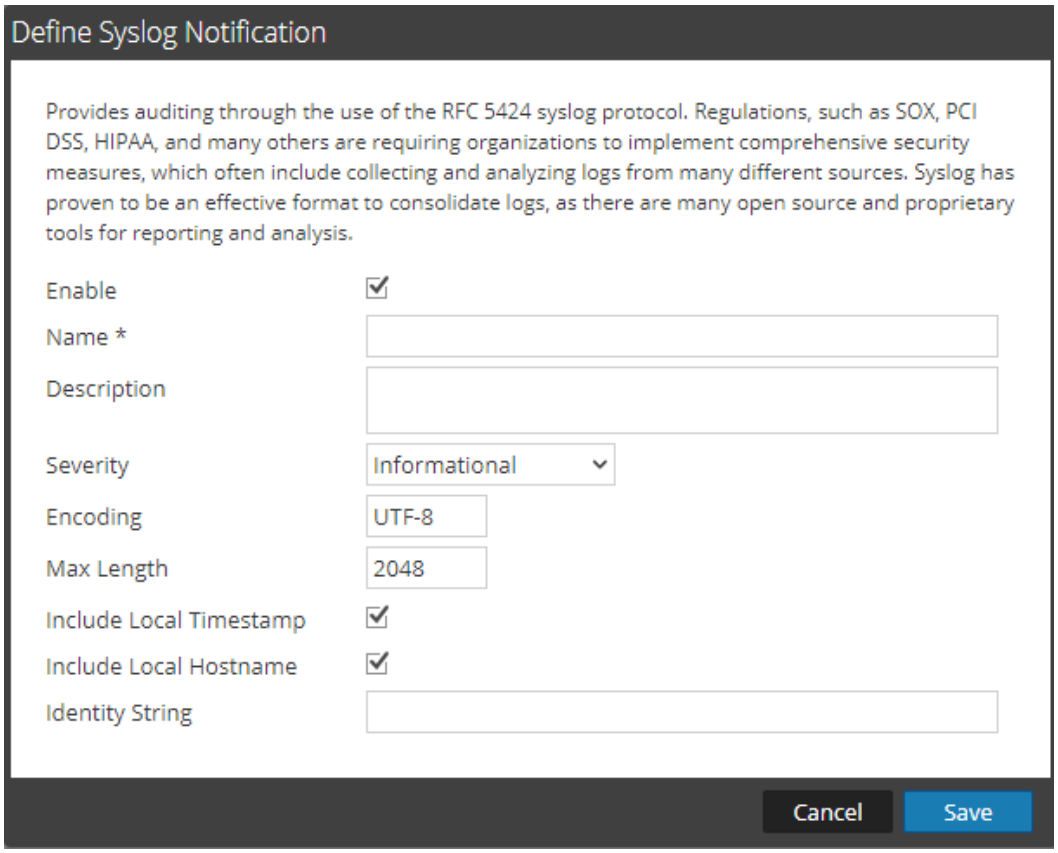
For details of the parameters and descriptions, see Define Notification Server Dialogs.

## Configure Syslog as a Notification

To configure Syslog as a notification output when sending alert notifications:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the drop-down menu, select **Syslog**.



4. In the **Define Syslog Notification** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

# Configure Templates for Notifications

You configure notification templates in the Administration System view ( (Admin) > System > Global Notifications > Templates tab). A notification template defines the format and message fields of the notifications. There are different template types for the notifications that you can configure:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms (Version 11.5 or Later)

You can use the available default templates or you can configure your own templates for Email (SMTP), SNMP, Syslog, and Script, depending on the template type. To learn how to modify or configure your own template, see Define Notification Template Dialog.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see Define a Template for Global Audit Logging.

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You cannot delete templates associated with global audit log configurations.

To learn how to define, delete, edit, duplicate, import, and export a notification template in NetWitness, see:

Configure Global Notifications Templates

Define a Template for ESA Alert Notifications

Import and Export a Global Notifications Template

## Configure Global Notifications Templates

This topic provides instructions for adding, editing, duplicating, and deleting global notifications templates.

**Note:** New Health and Wellness supports only Email and Syslog notification outputs.

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

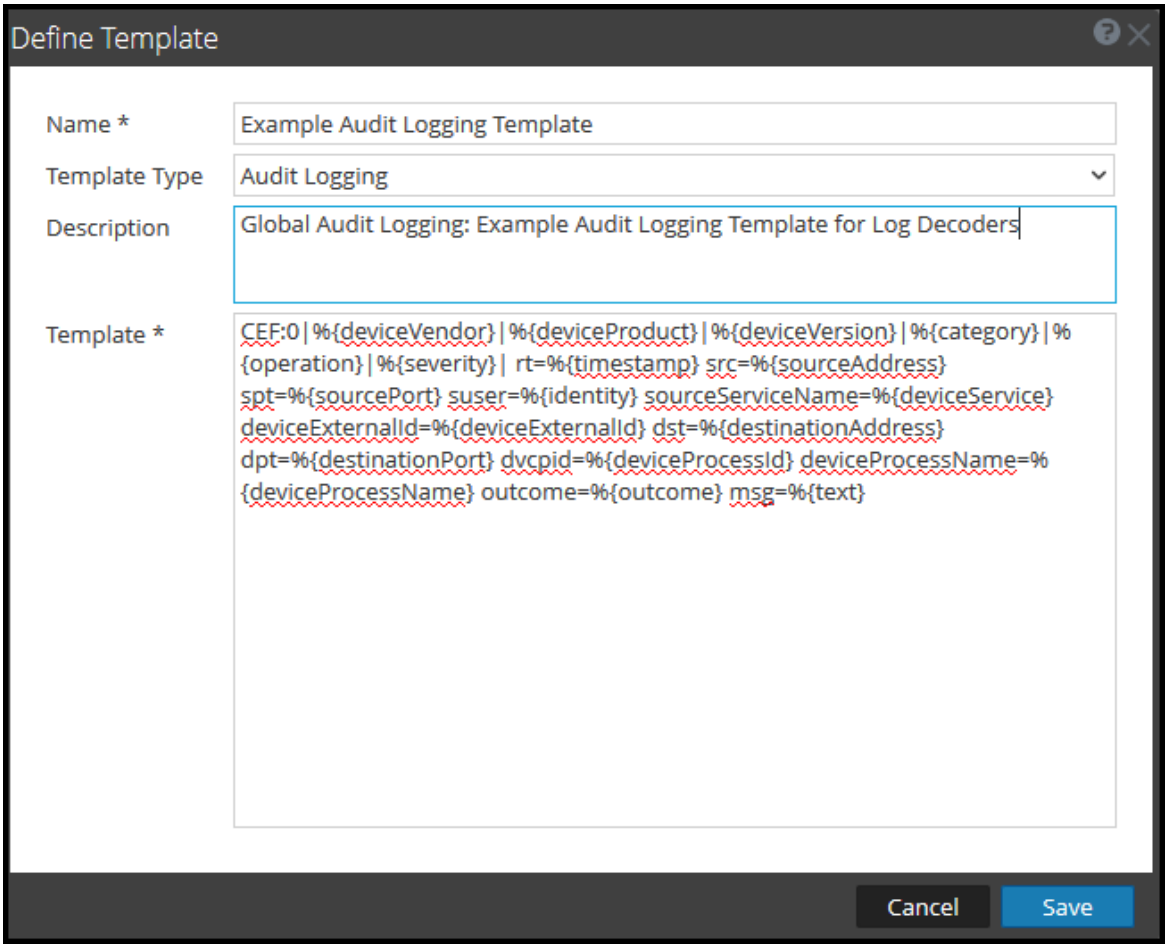
When upgrading from version 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

## Add a Template

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type. For New Health and Wellness, select New Health & Wellness Alarms template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, specify the format for the template, see Define Notification Template Dialog.

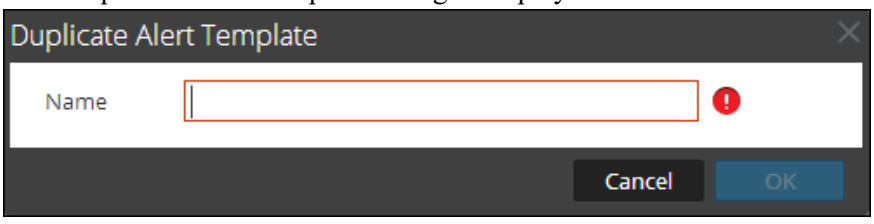
e. Click **Save** to save the template.
The following is an example of a template for Audit Logging.



## Duplicate a Template

You can make a copy of an existing default or user-defined template. To duplicate a template:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click .
The Duplicate Alert Template dialog is displayed.



5. Type the name for the duplicate template.
6. Click **OK**.

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

### Edit a Template

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

### Delete a Template

You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .
   A confirmation dialog is displayed.
5. Click **Yes**.
   The selected template is deleted.

## Define a Template for ESA Alert Notifications

This topic describes how you can define a template for alert notifications. Event Stream Analysis (ESA) allows you to define useful templates for alerts. You need to have a good understanding of FreeMarker and the ESA data model to define a template. For more information on FreeMarker, see FreeMarker Template Author's Guide.

### ESA Data Model

Consider an ESA alert rule as shown below:

```
@Name('module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert')
@Description('Brute Force Login To Same Destination')
@RSAAlert(oneInSeconds=0, identifiers={"ip_dst"})
SELECT* FROMEvent (ec_activity = 'Logon',ec_theme = 'Authentication',ec
outcome = 'Failure',ip_dst IS NOT NULL)
.std:groupwin(ip_dst)
.win:time_length_batch(60 seconds, 2)
GROUPBYip_dst HAVING COUNT(*) = 2;
```

When a rule like the above is fired, the alert generated has two constituent events, each resembling a NextGen session with multiple meta values. The alert data-object passed to the FreeMarker template evaluator are as follows:

```
(root)
  |
  +- id = "4e67012f-9c53-4f0b-ac44-753e2c982b79"                    // Unique identifier for each alert
  |
  +- severity = 1                                                    // The severity of the alert
  +- time = 2018-12-31T11:02Z                                        // The alert time (needs a ?datetime for
proper rendering)
  |  +- moduleType = "ootb"                                          // The module type
  |
  +- moduleName = "Brute Force Login To Same Destination"            // A description of the module
  |
  +- statement = "module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert" // The name of the EPL statement
  |  +- events                                                       // The constituent events - as a sequence
of event maps
       |   +- [0]                                                    // offset 0 (i.e. the first constituent
event)
       |   |       |   |
       |   +- event_cat_name = "User.Activity.Failed Logins"
       |   +- device_class = "Firewall"                             // event meta (accessible as ${events
[0].device_class}$)
       |   |       |   +- event_source_id = "uttam:50002:1703395"    // Investigation URI to the individual
session (used by SA)
       |   |
       |   +- ...                                                   // Other meta
       |   |
       |   +- sessionid = 1703395                                   // NextGen sessionid
       |   |
       |   +- time = 1388487764                                     // event/session time at NextGen source
(as a long Unix timestamp)
       |   |
       |   +- user_dst = "user5"
       |
       +- [1]                                                       // offset 1 (i.e. the second consituent
event)
           |
           +- device_class = "Firewall"
           |
           +- event_cat_name = "User.Activity.Failed Logins"
           |
           +- event_source_id = "uttam:50002:1703405"
           |
           +- ...
           |
           +- sessionid = 1703405
           |
           +- time = 1388487766
           |
           +- user_dst = "user5"
```

There are two types of template variables available in the data model:

- **Alert Meta Data:** These hold alert level details like statement name, module name, alert id, alert time, severity, and others. In FreeMarker terminology, these are top level variables associated with the alert instance itself and can be referenced simply by their names like `${moduleName}`. The `time`

meta is special because it is of type `Date` and it needs to be suffixed with a `?datetime` to be properly rendered.

- **Constituent Event Meta Data**: These include the session meta fields from individual events that constitute the alert. An alert can have multiple constituent events, so there can be more than one such map in the same alert. These show up as a sequence of hashes to the FreeMarker template evaluator and must be referenced. For instance, the alert has two constituent events the event_source_id for the first is available as `${events[0].event_source_id}` and the same for the second is accessible as ${`events[1].event_source_id`.} You also need to be aware of which meta fields are multi-valued because those need be treated as sequences, for example ${`events[0].alias_host`} will not work because it is a sequence.

**Note:** The metadata available in the constituent events for a given alert is determined by the EPL SELECT clause. For example, alerts from `SELECT sessionid, time FROM ...` have only two meta values available (sessionid, time). Constituent events in `SELECT * FROM Event ...` will carry all meta fields from the `Event` type with **non-null** values.

If your template uses meta keys that are not present in all alert output, you should consider using the FreeMarker provisions for default values.

For example, if a template with text Id=${id},ec_outcome=${ec_outcome} is evaluated for an alert which does not include the meta key `ec_outcome` then the template evaluation fails. In such cases, you can use the missing value placeholder `${ec_outcome!"default"}`.

## Import and Export a Global Notifications Template

This topic provides instructions on how to import and export a template for notifications.

- You can export default or user-defined templates.
- You can import a template that has been exported from the NetWitness instance. If you import a template with the same name as an existing template, then the existing template will be overwritten.

### Import a Template

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. In the toolbar, select **> Import**.
   The **Import** dialog is displayed.
5. In the **Select File**field, type the filename or click **Browse** and select the file to be imported.
6. Click **Import**.

### Export a Template

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template you want to export.

   **Note:** You can export all the templates using the **> Export All** option.

5. In the **Actions** column, select **> Export**.
   The **Export** dialog is displayed.
6. In the **Enter File Name** field, type the filename.
7. Click **Save**.

## Configure Email Servers and Notification Accounts

This topic provides instructions for configuring email so that users can receive notifications in NetWitness. NetWitness can send notifications to users through email about various system events. To be able to configure these email notifications, you must first configure the SMTP email server. The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

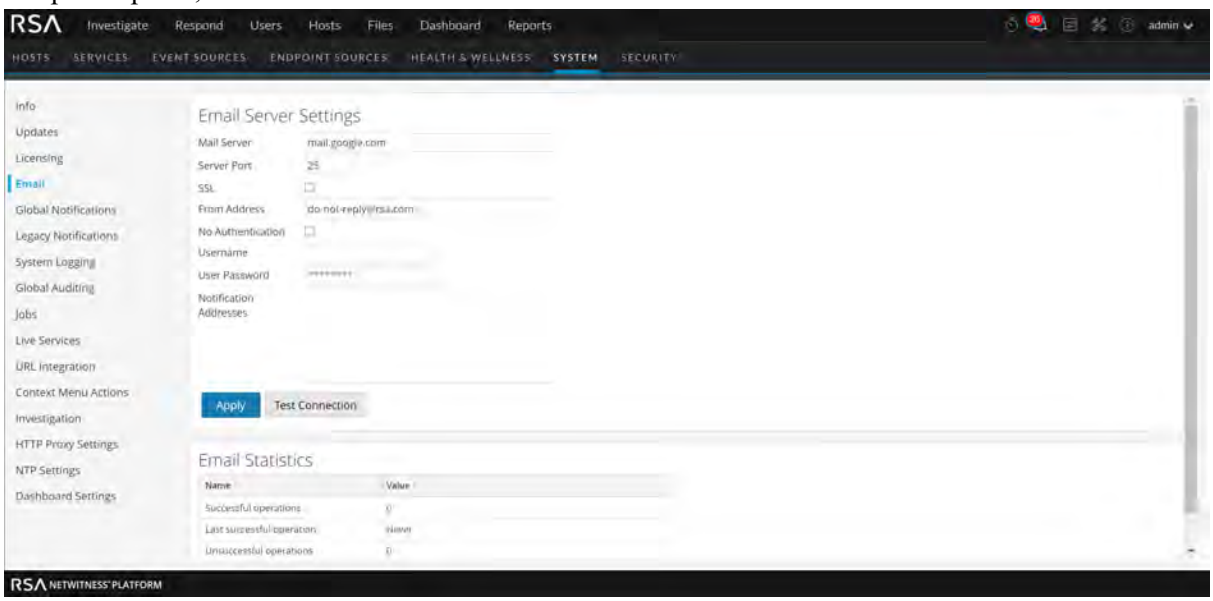
NetWitness requires access to an SMTP mail server in order to send reports to users. Each user account can be configured to receive emailed reports. These reports can be generated manually, through the user interface, or automatically, through the auditing system. The following guidelines apply:

- Any SMTP mail host can be used to deliver emails, and each host requires a different configuration. The SMTP provider provides the settings for configuration.
- Some SMTP servers require user authentication in order to relay emails successfully. Typically, this is the login and password for the email account.
- Best practice is to create a new, dedicated email account on the SMTP email server for NetWitness reports.

To configure NetWitness email notifications:

1. Go to **(Admin) > System**.
   The Administration System view is displayed.

2. In options panel, select **Email**.



3. If you want to change the default mail server, specify the **Mail server** name and **Server port**.
4. If the email server communicates with NetWitness using SSL, set the box next to **Use SSL**.
5. In the **From address** field, type the name of the email account sending NetWitness email notifications.
6. If the SMTP server requires user authentication to relay emails successfully, type the **Username** and **User Password** for logging in to the email account.
7. To activate the settings, click **Apply**.
   You can now configure NetWitness modules to receive various notifications by email.

# Configure Global Audit Logging

Global Audit Logging provides NetWitness Auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location. This visibility includes audit logs gathered from the NetWitness system and the different services throughout the NetWitness infrastructure.

NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder.

You configure global audit logging in the Global Audit Logging Configurations panel. An audit logging template defines the format and message fields of the audit log entries. A Syslog Notification Server configuration defines the destination to send the audit logs. If you want to forward audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

The following are some of the user actions logged from NetWitness:

- User logouts
- All UI pages accessed
- Committed configuration changes
- Queries performed by the user
- Data export operations

**Note:** For examples of some of the user actions logged, see Add New Configuration Dialog

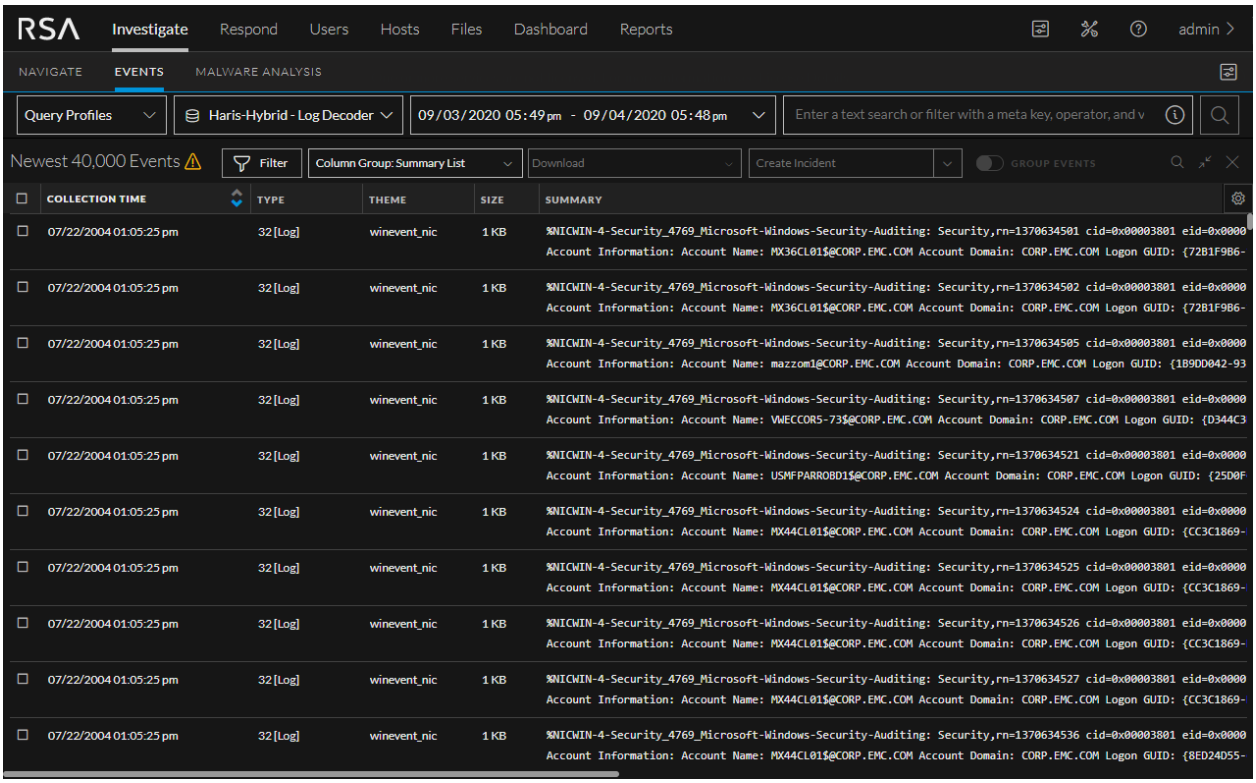
After you create a global audit logging configuration, audit logs containing these user actions automatically go to the external syslog system in the format specified in the selected Audit Logging template. You can create multiple global audit logging configurations for different destinations that use different templates. For example, you can create a global audit logging configuration for an external Syslog server with a template that contains all of the available meta keys and another configuration for a Log Decoder with a template that contains selected meta keys.

For Log Decoders, you use the Default Audit CEF Template. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the CEF meta keys available to use in the audit logging templates.

For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.

Auditors can view the audit logs on the selected Log Decoder or third-party syslog server. If using a Log Decoder, auditors can view the audit logs using NetWitness Investigations or Reports.

The following figure shows global audit logs in Investigation (INVESTIGATE > Events).



For examples of some of the user actions logged, see Add New Configuration Dialog. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

## Global Audit Logging - High-Level Procedure

Global Audit Logging is configured in the Global Audit Logging Configurations panel, which is accessed from (Admin) > System view > Global Auditing. Before you can configure Global Audit Logging, you need to configure a Syslog Notification Server and an Audit Logging template. A Syslog Notification Server defines the destination to send the audit logs. An Audit Logging template defines the format and message fields of the audit log entry.

The Global Audit Logging Configuration panel provides a **view settings** link that takes you to the Global Notifications panel ( (Admin) > System view > Global Notifications) where you can configure the Syslog Notification Server and Audit Logging template.

Perform the following procedures in the order shown to configure Global Audit Logging.

| Procedures | Reference / Instructions |
|---|---|
| 1. Configure a Syslog Notification Server. | Configure a Syslog Notification Server to use for Global Audit Logging. You can define a third-party syslog server or Log Decoder as a destination to receive the audit logs. Configure a Destination to Receive Global Audit Logs. Global Audit Logging configurations use the Syslog notification server type. If you want to forward audit logs to a Log Decoder, create a Notification Server of the Syslog type. |
| 2. Select or configure an Audit Logging template to use. | Select an Audit Logging template for the Syslog notification server. You can use a default Audit Logging template or define your own audit logging template. Global Audit Logging configurations use the Audit Logging template type and a Syslog notification server. Configure Templates for Notifications provides additional information.<br>For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions.<br>For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables. |
| 3. (Optional - Only if consuming with a Log Decoder) Deploy the Common Event Format parser to your Log Decoder from Live. | Ensure that you have deployed and enabled the latest Common Event Format parser from Live. Find and Deploy Live Resources and Enable and Disable Log Parsers provide instructions. |
| 4. Define a global audit logging configuration, which defines how the global audit logs are forwarded to external Syslog systems. | Define a Global Audit Logging Configuration provides instructions. After you add a Global Audit Logging configuration, audit logs are forwarded to the selected Notification Server in the configuration. |
| 5. Verify that the global audit logs show the audit events. | Test your audit logs to ensure that they show the audit events as defined in your audit logging template. Verify Global Audit Logs provides instructions. |

## Configure a Destination to Receive Global Audit Logs

In Global Audit Logging, Syslog Notification Servers are the configurations that define the destinations to receive global audit logs. You need to configure a Syslog Notification Server to use Global Audit Logging. You can define a third-party syslog server or a Log Decoder as the destination to receive the audit logs.

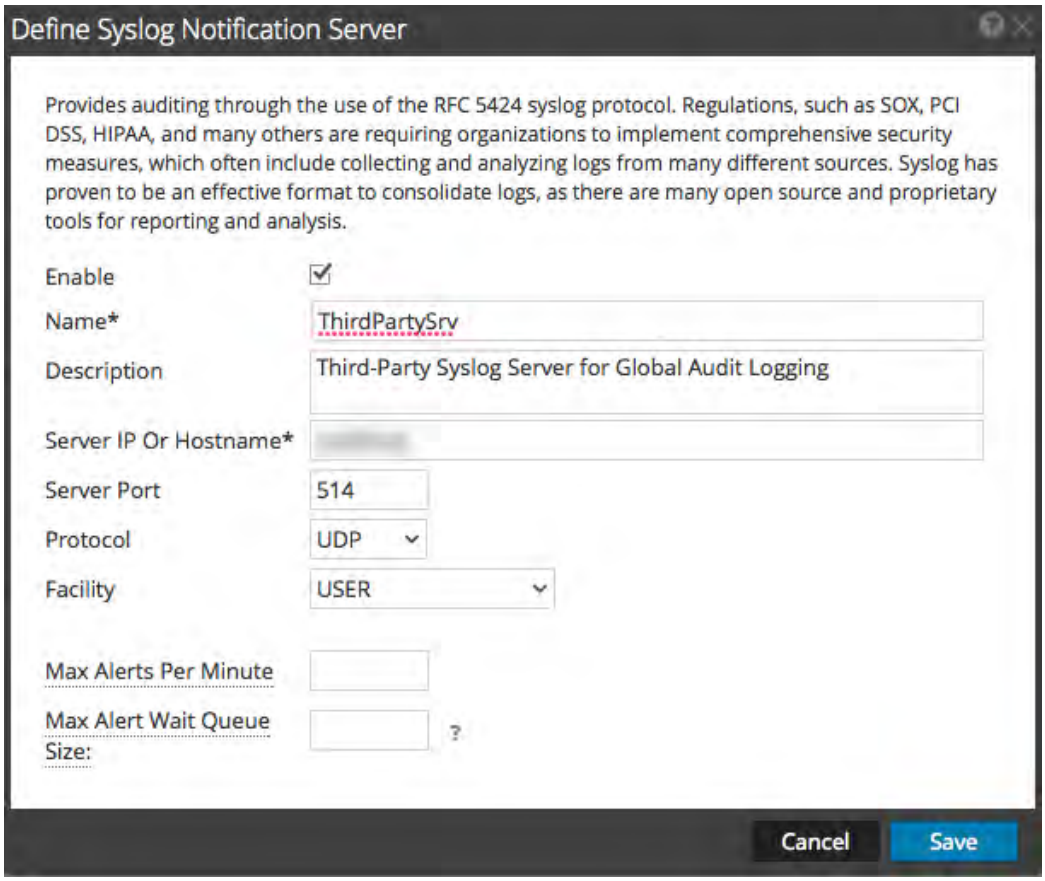
## Configure a Syslog Notification Server for a Third-Party Syslog Server

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   **Note:** You do not need to configure the Output tab for Global Audit Logging.

4. From the drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

| Field | Description |
|---|---|
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the third-party syslog server. |
| Description | (Optional) A brief description of the notification server. |

| Field | Description |
|---|---|
| Server IP or Hostname | The third-party syslog server hostname or IP address. |
| Server Port | The port number where the target syslog process is listening. |
| Protocol | The protocol to be used for transferring formatted audit logs to the third-party syslog server. |
| Facility | The syslog facility to be used for writing formatted audit logs to the third-party syslog server. |

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

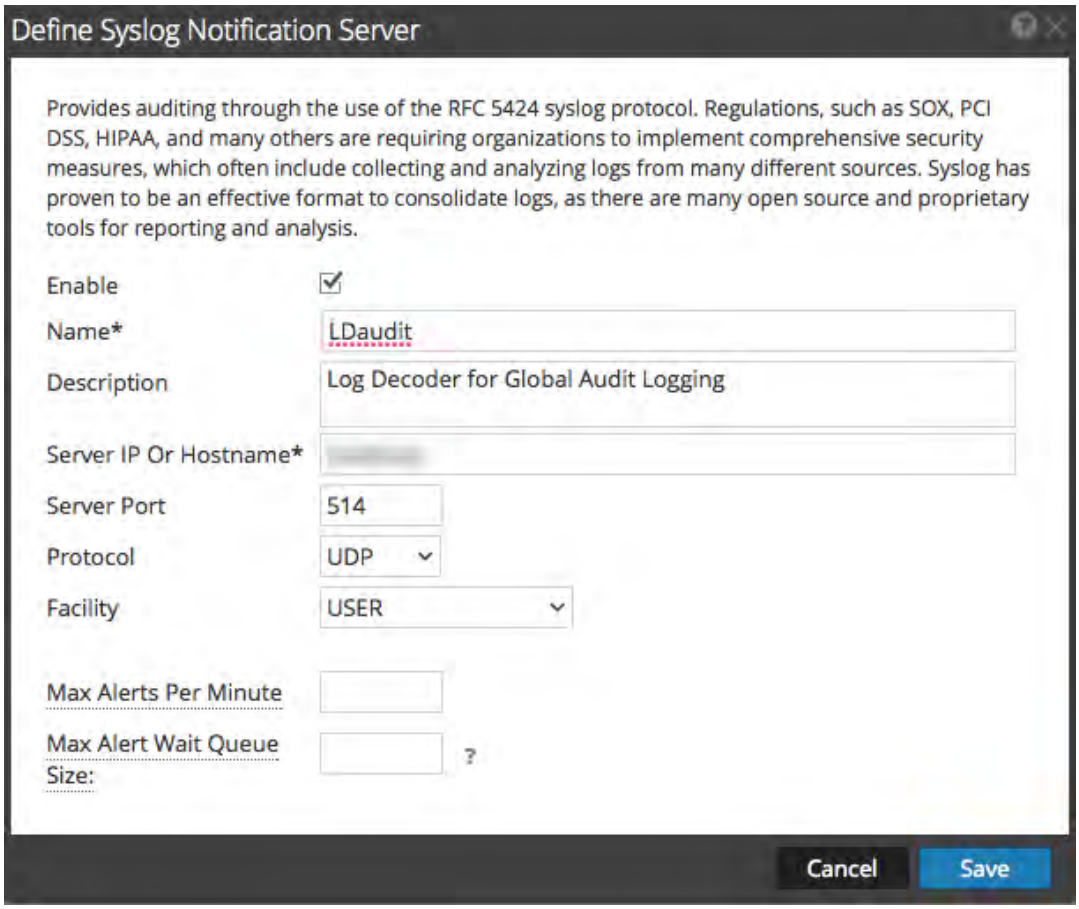
## Configure a Syslog Notification Server for a Log Decoder

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

**Note:** You do not need to configure the Output tab for Global Audit Logging.

4. From the drop-down menu, select **Syslog**.

The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

| Field | Description |
|---|---|
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the Log Decoder syslog notification server. |
| Description | (Optional) A brief description of the notification server. |
| Server IP or Hostname | The Log Decoder hostname or IP address. |
| Server Port | The port number where the target syslog process is listening. |
| Protocol | The protocol to be used for transferring formatted audit logs to the Log Decoder. |
| Facility | The Syslog facility to be used for writing formatted audit logs to the Log Decoder. |

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

### Next Steps

Select a default Audit Logging template to use for Global Audit Logging. If necessary, you can define your own custom template. Define a Template for Global Audit Logging provides additional information.

## Define a Template for Global Audit Logging

This topic provides instructions on how to define an audit logging template to use for Global Audit Logging. Before you configure Global Audit Logging, configure a Syslog notification server and select an Audit Logging template. You can choose to use a default audit logging template or you can define your own template.

NetWitness includes two default audit logging templates:

- **Default Audit CEF Template**: You can use this template for Log Decoders and third-party syslog servers.
- **Default Audit Human-Readable Format**: You can use this template only for third-party syslog servers. Do not forward messages from this template to a Log Decoder.

The first procedure provides instructions on how to define an audit logging template for a Log Decoder. The audit logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions (Key=Value) listed in the Supported CEF Meta Keys table.
- Ensure that the extensions are in the `key=%{string}<space>key=%{string}` format.

The second procedure provides instructions on how to define a custom global audit logging template in human-readable format for a third-party syslog server. For third-party syslog servers, you can define your own format (CEF or non-CEF).

### Define a Global Audit Logging Template for a Log Decoder

You can use the **Default Audit CEF Template** to send global audit logs to a Log Decoder. To define your own template:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click to configure a template.

5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template.
   The following format is a customized template provided as an example. It differs from the default CEF template.

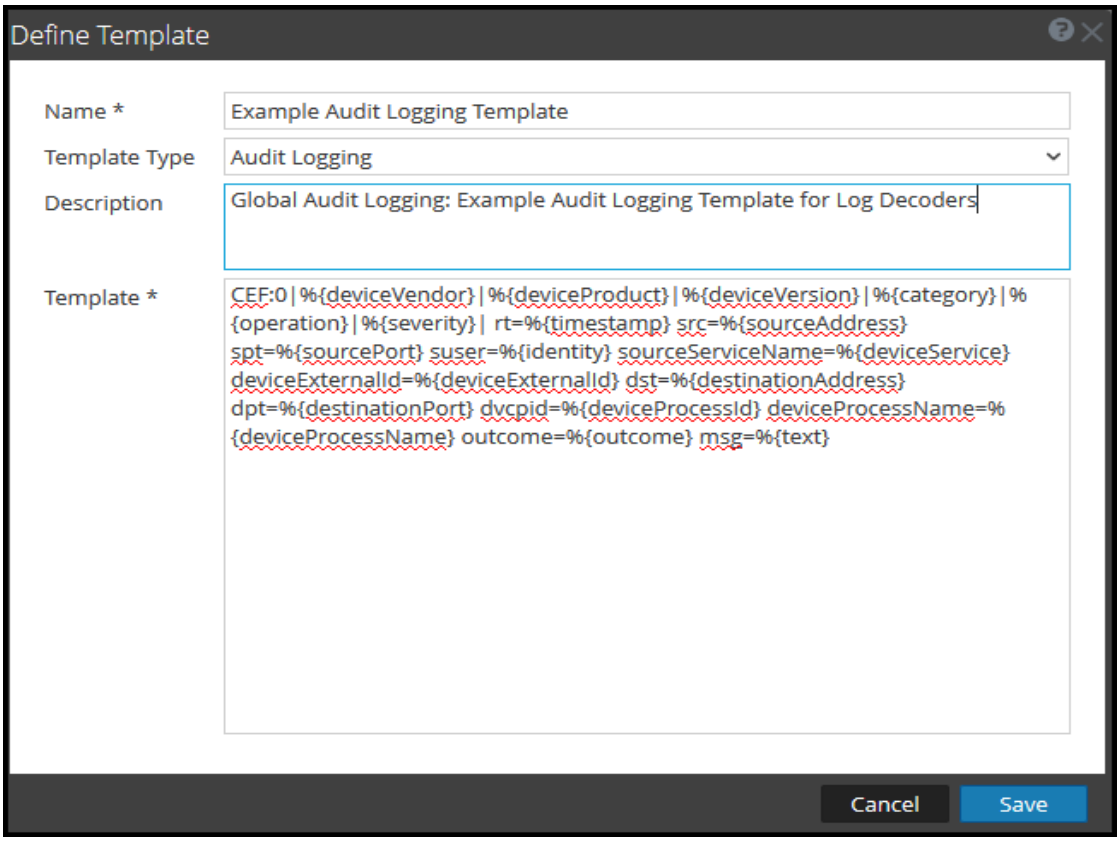
```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|
%{operation}|%{severity}|
rt=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} dpt=
%{destinationPort} dst=%{destinationAddress} dvcpid=%{deviceProcessId}
tpt=%{transportProtocol} sessionId=%{sessionId} scope=%{scope} suser=
%{identity} sourceServiceName=%{deviceService} deviceExternalId=
%{deviceExternalId} deviceProcessName=%{deviceProcessName} device
Facility=%{deviceFacility} outcome=%{outcome} msg=%{text} remoteAddress
=%{remoteAddress} reasonForFailure=%{reasonForFailure} reason=%{reason}
arguments=%{Arguments} user=%{User} referrerURL=%{referrer} role=%{Role}
id=%{id} account=%{Account} deviceIDs=%{deviceIDs} file=%{file} account
Provider=%{AccountProvider} uri=%{uri} addRole=%{Add.Role} addPermission
=%{Add.Permission} userAgent=%{userAgent} userGroup=%{userGroup}
userRole=%{userRole} key=%{key} value=%{value} paramKey=%{Key}
paramValue=%{Value} alert=%{alert} incident=%{incident} action=%{action}
notification Binding=%{NotificationBinding} name=%{name} enabled=
%{enabled} disabled=%{disabled} params=%{parameters}
```

The highlighted CEF syslog header is required to conform to the CEF standard and is a requirement for the CEF parser in the Log Decoder. The other keys are optional and you can configure them. See all the supported meta keys that are supported by the CEF parser in the Log Decoder in the Supported CEF Meta Keys table.

**Note:** Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between each key=%{string} pair in the extension keys section.

**Note:** After you upgrade to 11.x from earlier versions, then '$' is replaced with '%' automatically

6. Click **Save**.



After you define the CEF audit logging template, ensure that you have deployed and enabled the latest Common Event Format (CEF) parser from Live. "Find and Deploy Live Resources" in the *Live Services Management Guide* provides instructions.

**Note:** If you need to use a specific meta key for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. If they are not indexed, follow the instructions in the "Maintain the Table Map Files" topic in the *Host and Services Configuration Guide* procedure to update the table mappings. Ensure that the meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. See the "Edit a Service Index File" topic in the *Host and Services Configuration Guide* for additional information.

## Define a Custom Global Audit Logging Template

For third-party syslog servers, you can define your own template format (CEF or non-CEF). You can use the **Default Audit Human-Readable Format** template to send global audit logs to a third-party syslog server in a format that is easier to read than the CEF format. If you want to define your own template in human-readable format, follow this procedure.

For Log Decoders, you must use a CEF template with some specific requirements. The *Define an Audit Logging Template for a Log Decoder* procedure above provides instructions for creating a template in CEF format.

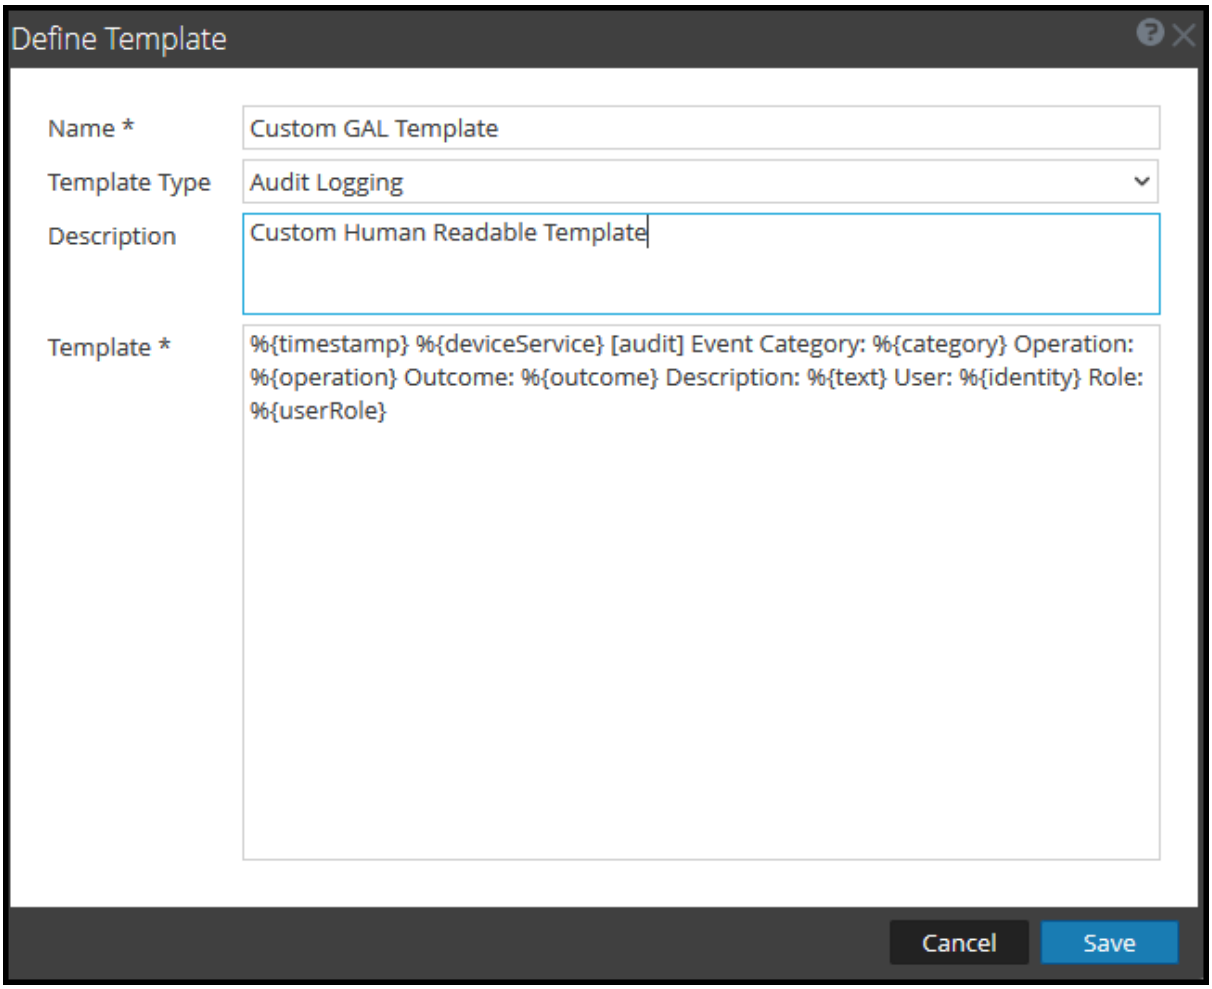
To define a custom global audit logging template in human-readable format:

1. Go to **(Admin) > System**.
2. In the left navigation panel, select **Notifications**.
3. Click the **Templates** tab.
4. Click to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template. The following example is in human-readable format with selected meta key variables.

```
%{timestamp} %{deviceService} [audit] Event Category: %{category}
Operation: %{operation} Outcome: %{outcome} Description: %{text}
User: %{identity} Role: %{userRole} Parameters: %{parameters}
```

   You can use any of the meta key variables that are supported by global audit logging shown in the Supported Global Audit Logging Meta Key Variables table.

6. Click **Save**.



The following example shows global audit logs in human-readable format for this template:

```
Jun 11 2019 04:53:54 UpdateStackConcentrator Jun 11 2019 04:53:54 CONCENTRATOR
[audit] Event Category: DATA_ACCESS Operation: sdk.info Outcome: pending
Description: has requested the SDK summary info User: admin Role: null
params=flags\=1
```

```
Jun 11 2019 04:53:55 updatestackadminserver Jun 11 2019 04:53:55 source-server
[audit] Event Category: API Operation: /rsa/process/ready Outcome: success
Description: null User: Netwitness Web(nw-web) Role: null params=
{"Arguments":"[]"}
```

```
Jun 11 2019 05:15:46 UpdateStackeplh Jun 11 2019 05:15:46 LOG_DECODER [audit]
Event Category: MANAGEMENT Operation: upload Outcome: pending Description: has
started uploading file User: escalateduser Role: null params=file\=esmFeed.zip
```

## Next Step

Define a Global Audit Logging Configuration provides instructions for defining a global audit logging configuration for NetWitness.

# Define a Global Audit Logging Configuration

This topic tells administrators how to define a global audit logging configuration. This procedure is required only if you choose to set up centralized audit logging in your environment. These global audit logging configurations define how the global audit logs are forwarded to external syslog systems or Log Decoders. Audit logs are forwarded to the selected Notification Servers.

## Prerequisites

Before starting this procedure, configure the following to use for global audit logging:

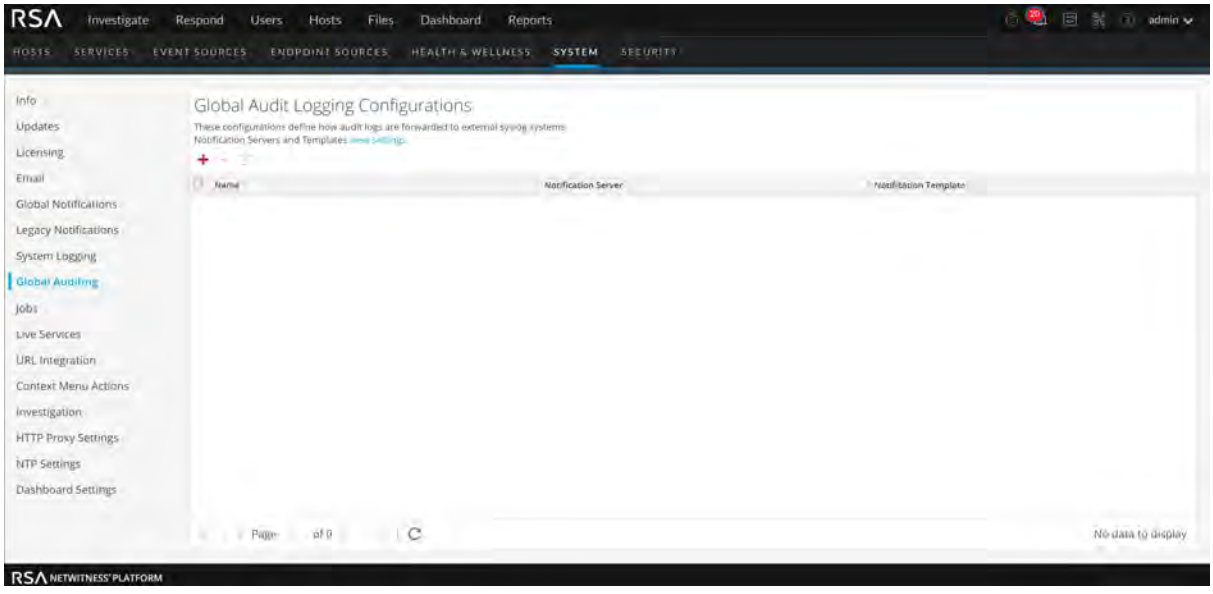
- Syslog Notification Server
- Audit Logging Template

You configure the notification server and template on the Global Notifications panel. You can access the Global Notifications panel by going to (Admin) > System and select Global Notifications. You can only define a Syslog type of Notification Server for global audit logging. For Log Decoders, use a Syslog type of Notification Server and a Common Event Format (CEF) audit logging template. You can use a default audit logging template or define your own template. You can create multiple audit logging templates and Syslog Notification Servers to use for your global audit logging configurations.

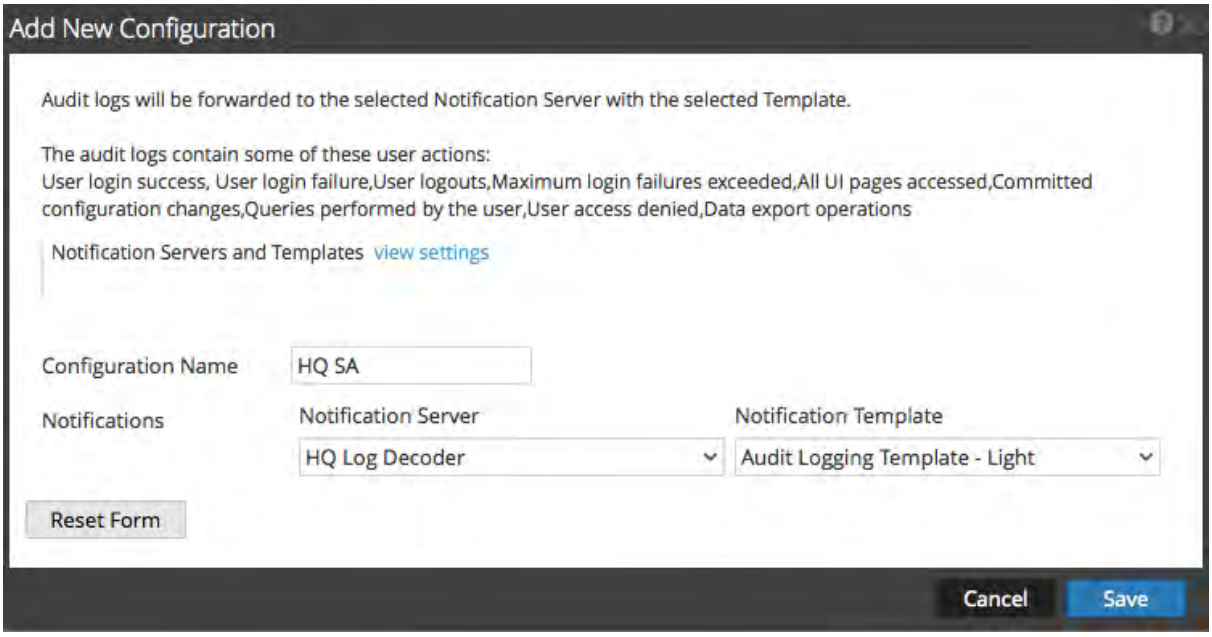
If you are forwarding global audit logs to a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

## Add a Global Audit Logging Configuration

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
   The **Global Audit Logging Configurations** panel is displayed.



3. Click + to add a global audit logging configuration.
   The **Add New Configuration** dialog is displayed.



4. In the **Configuration Name** field, type a unique name for the global audit logging configuration. For example, you can create a configuration for a specific type of global audit logging configuration, such as HQ NW for a NetWitness headquarters configuration.
5. In the **Notifications** section, select the syslog **Notification Server** to use for this configuration. The notification server is the destination to send the global audit logs.
6. Select the audit logging **Notification Template** to use for this configuration. The Audit Logging template defines the format and audit log message fields to be sent.
7. Click **Save**.

Add New Configuration Dialog provides additional information and examples of the user actions logged. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

## Edit a Global Audit Logging Configuration

This topic provides instructions on how to edit a global audit logging configuration. You can edit a global audit logging configuration to change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You make changes to the Notification Server or Template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel.

You cannot change which NetWitness user actions are logged and sent in the global audit logs.

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.

3. In the **Global Audit Logging Configurations** panel, select a configuration to edit and click .
4. In the **Add New Configuration** dialog, modify the global audit logging configuration as required. You can modify the **Configuration Name** and select a different **NotificationServer** or **Template**.
5. Click **Save.**

### Delete a Global Audit Logging Configuration

Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to delete and click .
   A confirmation dialog is displayed.
4. Click **Yes**.
   The selected configuration is deleted.

## Verify Global Audit Logs

This topic provides instructions on how to verify global audit logs. After you have configured global audit logging, you need to test your global audit logs to ensure that they show the audit events as defined in your global audit logging template.

In version 11.5 and later, audit logging provides information about the aggregation account and the actual user who submitted the query. For example, the information is displayed as follows in the audit log:

```
User aggAccount (session 478, [::1]:1133, on behalf of <username of submitter>) has requested the SDK transforms.
```

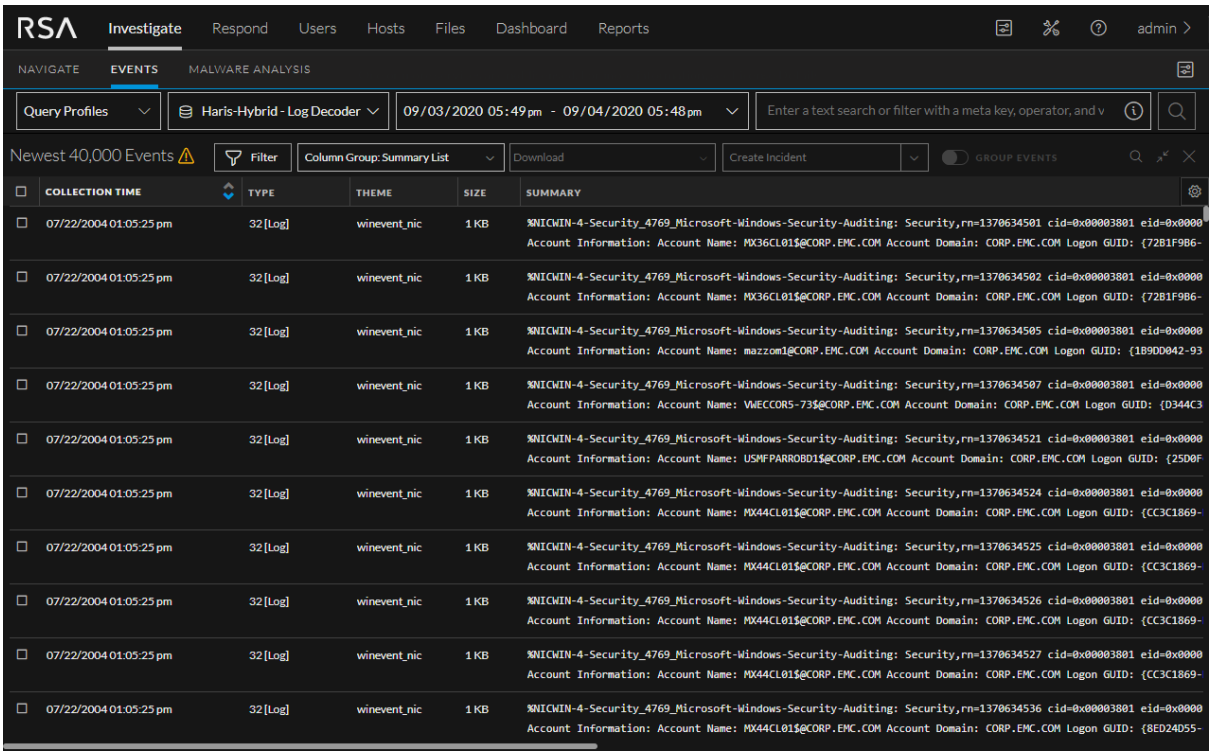
This information is available through multiple levels of Brokers and Concentrators.

**Note:** If you are running a mixed-version environment, any version earlier than 11.5 will not provide the real user information.

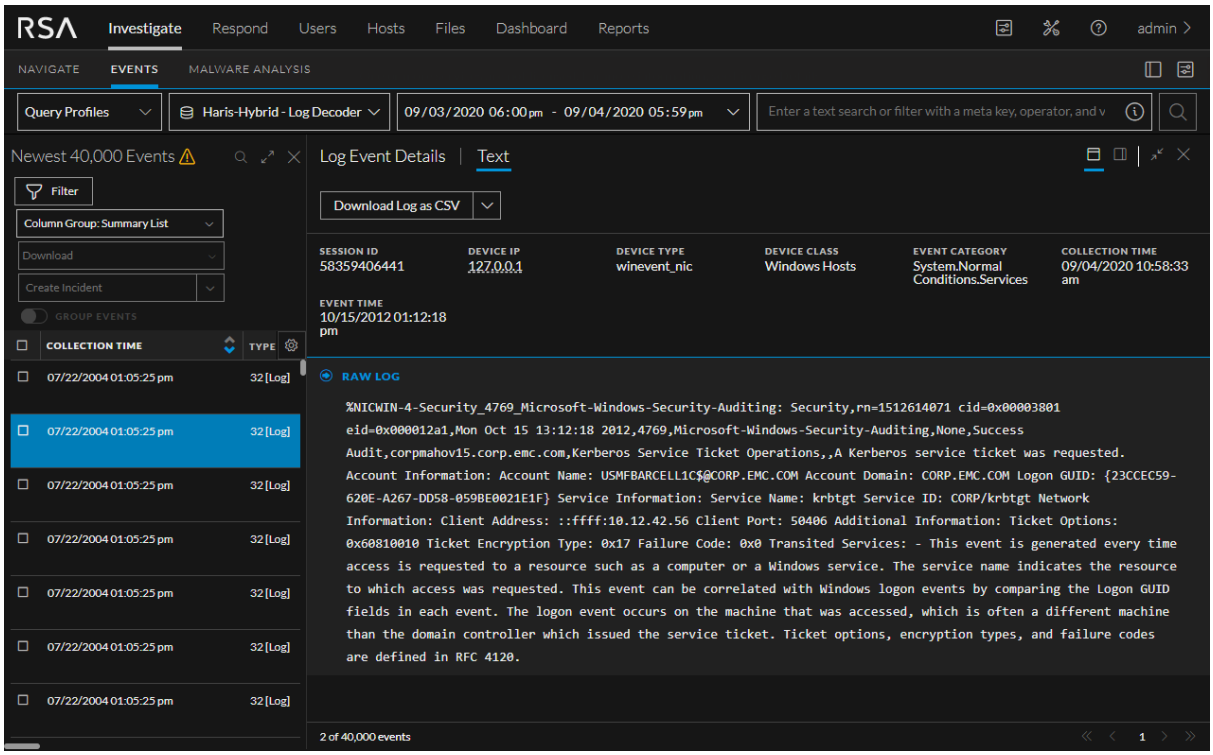
Before starting this task, complete the steps detailed in Configure Global Audit Logging.

To view and verify the global audit logs if you are using a Log Decoder:

1. Go to **Investigate > Events**, select the Log Decoder service and click the submit query icon ( ) to the right of the query bar.



2. Compare the fields in the global audit logs with the fields defined in the global audit logging template that you used in your global audit logging configuration.
3. Double-click a log to open the reconstruction and click to open the Event Meta panel.
4. Verify that the meta that you want to audit is correct.



## Example CEF Output

The following example shows global audit logs for an audit logging Common Event Format (CEF) template.

### Template:

**CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|%{operation}|%{severity}|**

```
t=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} tpt=%{transport
Protocol} scope=%{scope} suser=%{identity} sourceServiceName=%{device Service}
deviceExternalId=%{deviceExternalId} deviceProcessName=%{device ProcessName}
outcome=%{outcome} msg=%{text} remoteAddress=%{remoteAddress}
reasonForFailure=%{reasonForFailure} reason=%{reason} arguments= %{Arguments}
user=%{User} referrerURL=%{referrer} role=%{Role} id=%{id} account=%{Account}
deviceIDs=%{deviceIDs} file=%{file} accountProvider= %{AccountProvider} uri=%
{uri} addRole=%{Add.Role} addPermission= %{Add.Permission} userAgent=%
{userAgent} userGroup=%{userGroup} userRole= %{userRole} key=%{Key} value=%
{Value} alert=%{alert} incident=%{incident} action=%{action}
notificationBinding=%{NotificationBinding} name=%{name} enabled=%{enabled}
disabled=%{disabled} params=%{parameters}
```

### Example logs:

```
Jun 07 2019 09:06:05 UpdateStackConcentrator CEF:0|RSA|NetWitness Audit|
11.3.1.0|AUTHENTICATION|logoff|6|rt=Jun 07 2019 09:06:05 src=101.101.101.
101 spt=55060 scope=scope suser=admin sourceServiceName=CONCENTRATOR
deviceExternalId=3ebf91d9-e879-4727-a473-72d309e1741d deviceProcessName=
NwConcentrator outcome=success \r\n
```

```
Jun 07 2019 09:06:11 UpdateStackConcentrator CEF:0|RSA|NetWitness Audit|
11.3.1.0|AUTHENTICATION|login|6|rt=Jun 07 2019 09:06:11 src=101.101.101.101
spt=55060 scope=scope suser=admin sourceServiceName=CONCENTRATOR device
ExternalId=3ebf91d9-e879-4727-a473-72d309e1741d deviceProcessName=
NwConcentrator outcome=success userGroup=Administrators userRole=admin.owner,
aggregate,concentrator.manage,connections.manage,database.manage,everyone,

sdk.packets,services.manage,storedproc.execute,storedproc.manage,sys.manage,
users.manage \r\n
```

# Configure Centralized Audit Logging

RSA NetWitness collects audit logs from all the NetWitness services and aggregates it into a single file in a centralized location on the NetWitness Admin Server. This aggregated log file provides the advantage for faster access and easy analysis of the audit logs.

The aggregated logs from all services are sent to the following centralized location:

- `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format)
- Syslog running on the local host (human-readable format)

Centralized audit logging is enabled by default. To forward the aggregated logs to the external syslog system (a third-party Syslog server or Log Decoder), you must configure the Global Audit logging in **(Admin) > System > Global Auditing**. The aggregated logs are sent in the format specified in the selected Audit Logging template. A Syslog Notification Server configuration defines the destination to send the audit logs. To forward the audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

- For instructions on how to define a template, see Define a Template for Global Audit Logging
- For instructions on how to configure a syslog notification server, see Configure a Destination to Receive Global Audit Logs
- For instructions on how to configure global Audit logging, see Define a Global Audit Logging Configuration

## Filtering the Aggregated Logs

Before the logs are aggregated, standard filters are applied to the logs to reduce redundancy and filter out logs that are not useful. The filters contain entries that control the content written to the aggregated log file. The following default filters are available in `/etc/logstash/` location.

- `json-filter-action.yaml`
- `json-filter-category.yaml`

`json-filter-action.yaml` - This filter blacklists the log messages based on the `operation` meta key and stops the log message being written to aggregated log file. For example, if `"/rsa/process/ready":"true"` is entered in `json-filter-action.yaml`, any raw log that contains `"/rsa/process/ready"` in the `operation` meta key is blacklisted and not written to aggregated log file.

**Note:** If you do not want to apply filters, then delete all the default entries and replace with `{}` character. Note that this increases the log size and the logs may be redundant.

`json-filter-category.yaml` - This filter whitelists the log messages based on the `category` meta key and writes the log message to the aggregated log file. For example, if `'\b(?i)SECURITY\b':"true"` is entered in `json-filter-category.yaml`, any raw log that contains 'SECURITY' in the `category` meta key is whitelisted and written to the aggregated log file.

### Log Retention Policy

The aggregated log file is retained as per the following default settings:

- If the file size reaches 250 MB, the file is compressed as a single zip file.
- If the number of zip files exceed 90, the oldest zip file in the directory is automatically deleted.

You can modify the log retention policy in the file `logstash` available in `/etc/logrotate.d/` location.

**Note:** The size of the aggregated log file depends on the filters applied, so make sure to set up filters correctly for optimal directory space.

### Disable Centralized Audit Logging

If you do not want the logs to be aggregated, in the `json-filter-category.yaml` filter, delete all the default entries and replace with the `{}` character.

## Configure Investigation Settings

This topic provides instructions for administrators who are configuring the settings that apply to all investigations on the NetWitness instance being configured. The settings for configuring and tuning behavior of NetWitness Investigate are available in the (Admin) > System > Investigation panel. These settings apply to all investigations and reconstructions on the current instance of NetWitness.

### Map Context Hub Meta Types

The Context Hub is preconfigured with meta fields mapped to entities. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

**Caution:** For the Context Lookup to work correctly in the Respond and Investigate views, when mapping meta keys in the (Admin) > System > Investigation > Context Lookup tab, it is best practice to add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB to the Meta Key Mappings. Here is a sample meta key and Mongo DB field; `ip.address` is a meta key and `ip_address` is a field in the MongoDB.

In the **Context Lookup** tab, you can manage mapping of Context Hub meta types with meta keys in Investigate. You can add or remove meta keys in the list of meta types supported in Investigate by Context Hub. Procedures associated with this tab are provided in "Manage Context Hub Lists and List Values in the Navigate and Events Views" in the *NetWitness Investigate User Guide*.

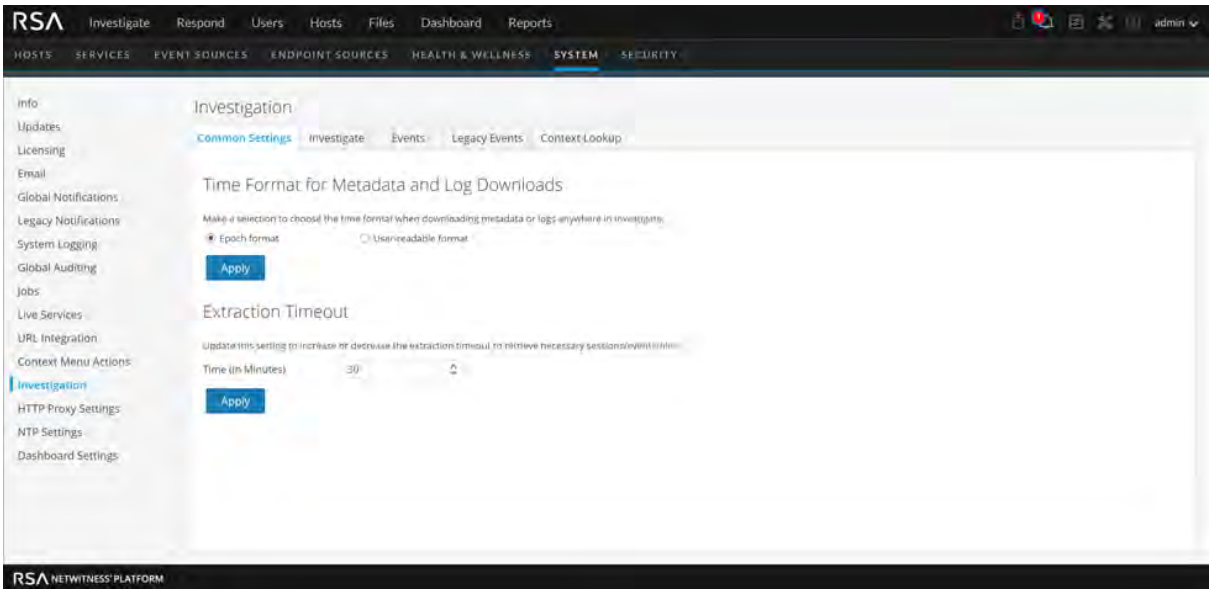
## Configure Common Settings

In version 11.5 and later, the Common Settings tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. Initially, the only setting that you can set for all views is the time format used when downloading metadata and logs, and other settings may be added in future versions.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.7 Investigate views.

1. Go to **(Admin) > System**, and in the options panel, select **Investigation**.
   The Investigation Configuration panel is displayed.



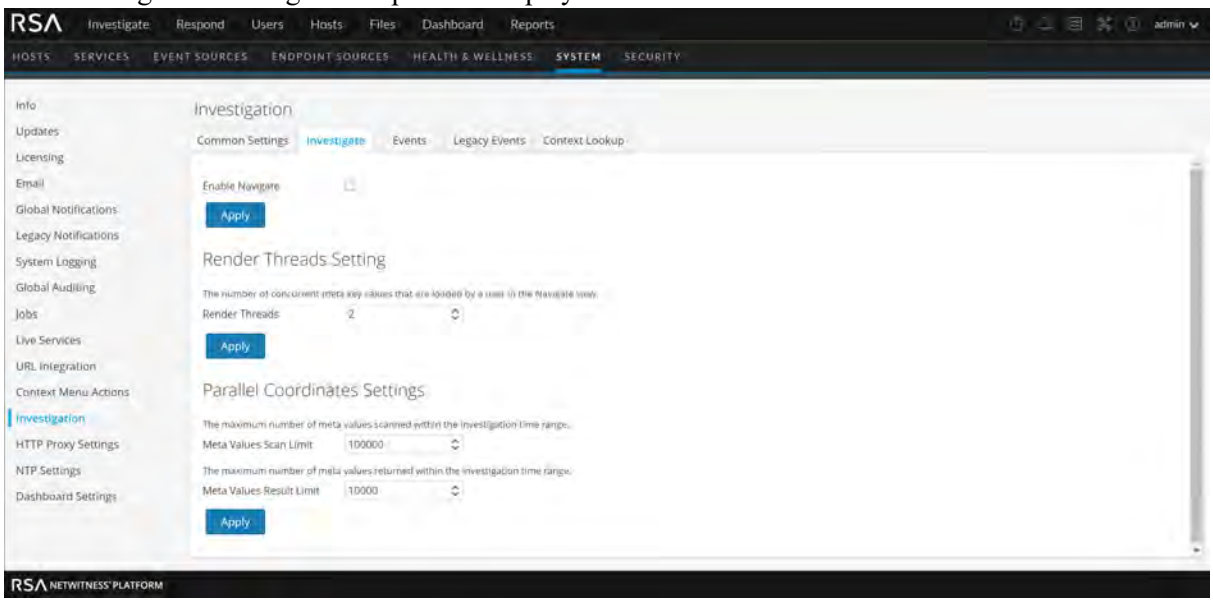
2. In the **Common Settings** tab, do the following:
   a. Select the time format to be used in metadata and log downloads in Investigate.
   b. Edit the time in minutes to set the extraction timeout when the logs are downloaded before the session expires.
      By default, it is set to 30 minutes and can be set to a maximum of 60 minutes.
3. Click **Apply**.
   The setting goes into effect immediately.

## Configure Navigate and Legacy Events View Settings

The name of the Version 11.3 and earlier Events tab was changed to Legacy Events tab in Version 11.4.

1. Go to **(Admin) > System.**
2. In the options panel, select **Investigation.**

   The Investigation Configuration panel is displayed.



3. In the **Investigate** tab, in the **Render Threads Settings** field, select the maximum number of concurrent meta key values that are loaded by a single user in the Navigate view. Click **Apply**.
4. In the **Investigate** tab, in the **Parallel Coordinates Settings** section, set the maximum limits for meta values scanned and meta value results that can be included in a parallel coordinates visualization. For better performance, these are the recommended settings: Meta Values Scan Limit - 100000 and Meta Values Result Limit to 1,000-10,000
   Click **Apply**.
5. In the **Legacy Events** tab, in the **Enable Legacy Events** section, select the check box to view the legacy sub menus and legacy events in classic view. Click **Apply**.
6. In the **Legacy Events** tab, in the **Event Search Settings** section, set the maximum numbers of events scanned and event results displayed when an analyst is conducting an event search in the Legacy Events view. The actual number of events scanned and displayed may be slightly greater than the limit set here. Click **Apply**.
7. In the **Legacy Events** tab, in the **Reconstruction Settings** section, set the limits for the amount of data processed in the reconstruction of a single event. The default values are 500 maximum packets and 2097152 bytes. If analysts are seeing slow performance when reconstructing sessions in Investigate, the reconstruction settings may need adjustment. Click **Apply**.

**Caution:** Setting a higher value affects the performance of the NetWitness Server by increasing the time and memory taken to create a reconstruction of an event. Setting the value to zero disables any limit and may lead to a NetWitness Server crash.

7. (Optional) In the **Legacy Events** tab, in the **Web View Reconstruction Settings** section, enable the use of supporting files in a web view reconstruction, and configure the additional settings to calibrate web view reconstructions. These include the time range (in seconds) to scan for related events, the maximum number of related events to scan, and overrides to Reconstruction Settings for use with web view reconstructions. Click **Apply**.

## Clear Reconstruction Cache for Services

Under Reconstruction Cache Settings, administrators can clear the cache for one or more services. For example, the administrator can clear the cache for a single Broker, a Broker and Decoder, or all connected services. These are a few examples of causes for stale cache being used in a reconstruction.

- The downstream services may have their sessions invalidated or data reset. As an example, if Investigate is browsing a Broker and a downstream Concentrator or Decoder has a data reset, the metadata and session data for the investigating service (Broker) does not match the content if the downstream service has reset and repopulated. The reconstruction in Investigate shows content from cache, which does not match the real content. Even if the Decoder is offline, content is still displayed in the Broker reconstruction. Clearing cache on the Broker causes the NetWitness to reach out to the Decoder and an error is returned because the Decoder is offline.
- Another case where cache may be stale is when a service ID for a downstream service changes. This can happen when exporting, importing, deleting, and adding services to NetWitness because NetWitness can reuse service IDs. In this case, clearing the cache on the Broker causes NetWitness to request data from the services.

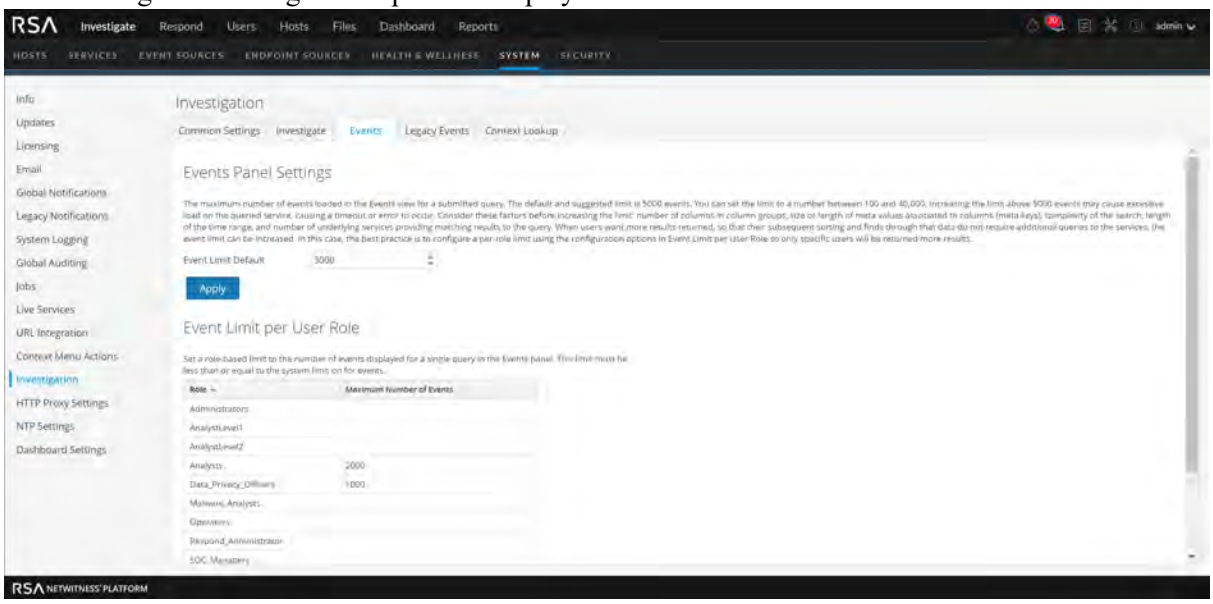
To clear reconstruction cache, do one of the following:

1. To clear cache for one or more services, select the services and click **Clear Cache for the Selected Services**.
2. To clear the cache for all listed services, click **Clear Cache for All Services.**
   The reconstruction cache for the selected services is cleared. NetWitness sends a request for data to the services.

## Configure Events View Settings

These settings apply to the 11.3 and earlier Event Analysis view and the 11.4 and later Events view.

1. Go to **(Admin) > System**, and in the options panel, select **Investigation**.
   The Investigation Configuration panel is displayed.



2. In the Events tab, in the **Event Limit Default** field under **Events Panel Settings**, select the maximum number of events loaded in the Events panel when a query is submitted.
   The default and suggested value is 10,000 events, and you can select a value between 100 and 40,000 events. Increasing the limit above 10,000 events may cause excessive load on the queried service, causing a timeout or error to occur. Consider these factors before increasing the limit: number of columns in column groups, size or length of meta values associated to columns (meta keys), complexity of the search, length of the time range, and number of underlying services providing matching results to the query.
   When users want more results returned, so that their subsequent sorting and finds through that data do not require additional queries to the services, the event limit can be increased. In this case, the best practice is to configure a per-role limit using the configuration options in Event Limit per User Role so only specific users are returned more results. For example, set the global Event Limit Default to 5,000, and then create different Analyst roles that can be set to higher limits, up to the maximum 40,000 events.
3. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment.
4. Click **Apply**.

   The change becomes effective immediately, and applies to any new queries submitted by analysts.
5. Under **Event Limit Per User Role**, select the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000 events; it can be larger than the default or configured limit set under Event Limit Default.
6. Click **Apply**.

The change becomes effective immediately, and applies to any new queries submitted by users assigned to the user role.

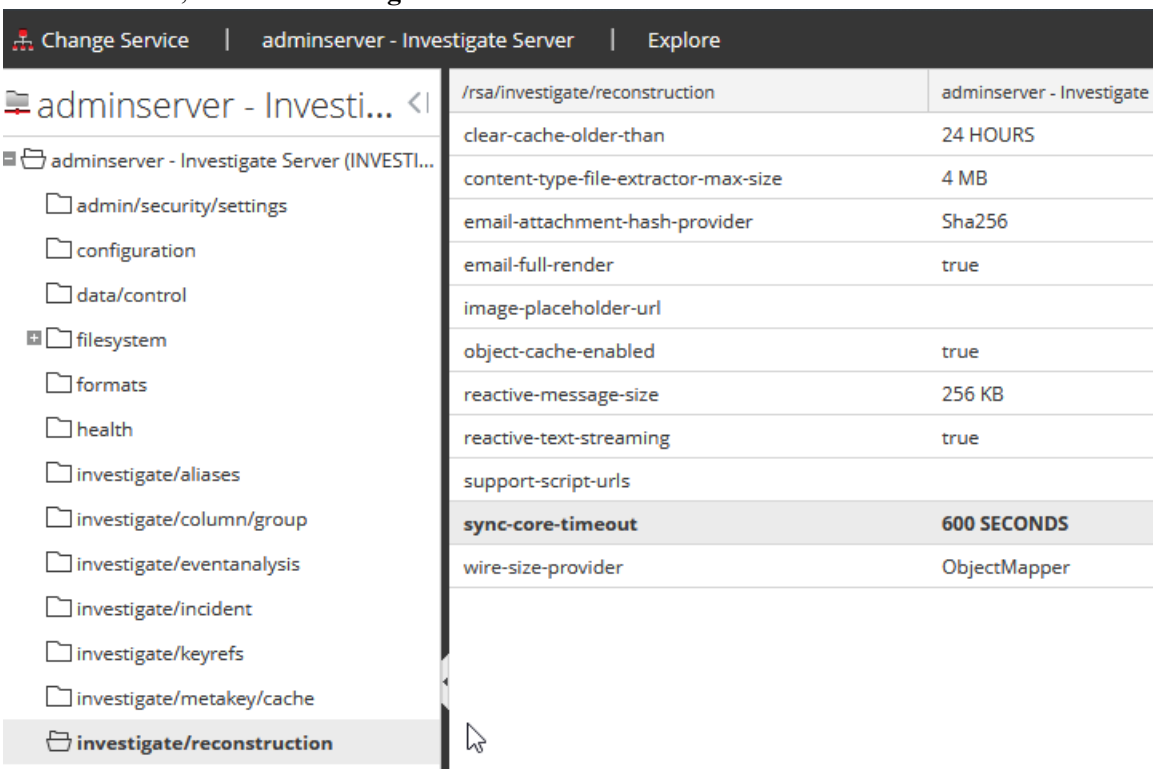
## Configure the Sync Core Timeout to Remedy Deadlocks in Events View Reconstructions

The `sync-core-timeout` is a setting in the `/investigate/reconstruction` node that determines the maximum time to wait for operations for caching core content to complete to prevent deadlocks. The default value is 600 seconds (10 minutes) and needs no adjustment under most circumstances. If analysts are seeing a spinner for a very long time (>10 minutes) when loading a reconstruction in the Events view, for example from events on a 10G Decoder, increasing the length of this timeout may improve the ability to reconstruct events.

**Caution:** Changing the timeout setting to more than 600 seconds may lead to stability issues.

To adjust the sync-core-timeout:

1. Go to **(Admin) > Services > Investigate-server** and **View > Explorer**.
2. In the node list, click the **investigate-reconstruction** node.



3. In the **sync-core-timeout** field, type a new value for the number of seconds before timeout and press **RETURN**.
   The setting is applied and goes into effect immediately.

# Configure Live Services Settings

Options for configuring Live Services are in the System view > Live Services Configuration panel. The Live Configuration panel allows you to configure:

- The Live account.
- The Live Content update schedule and preferences for notification of updates.
- Participation in Live Services Feedback (Version 11.4.0 and earlier).
- Sharing Live Content Usage
- RSA Live Connect (Beta) (Version 11.5.0 and earlier).

## Prerequisite

To activate your Live account for NetWitness, please contact RSA Customer Care. When you have a confirmation that your Live account has been set up, you can configure and test the CMS server connection.

For information on Analyst Behaviors and Data Sharing, see "NetWitness Feedback and Data Sharing" topic in the *Live Services Management Guide*.

## About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

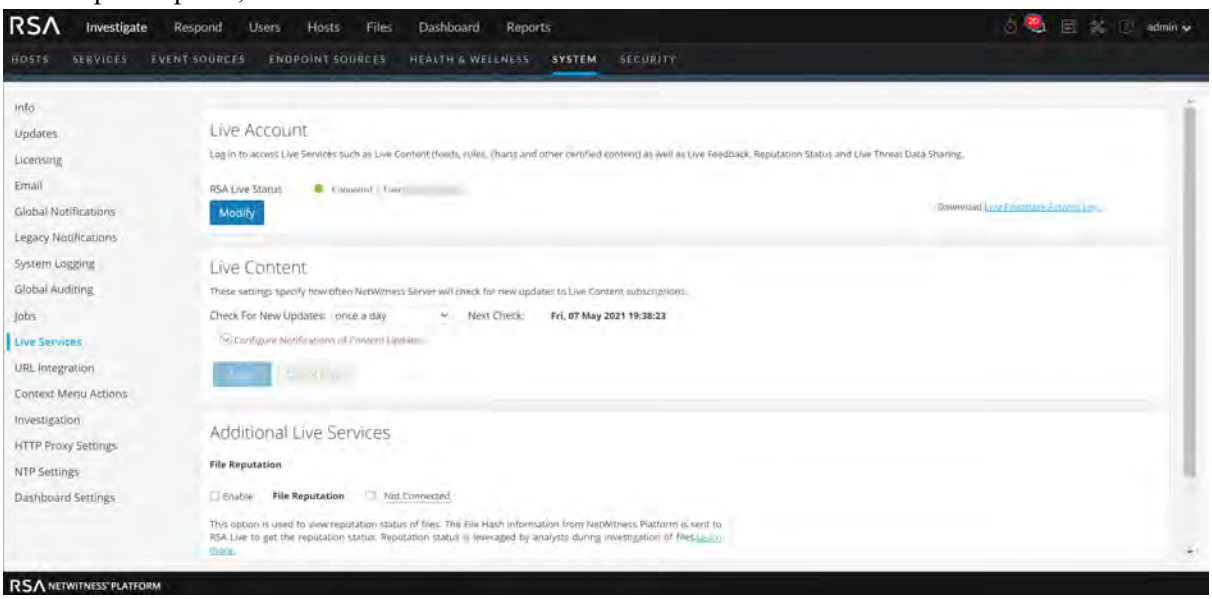
If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

This topic contains the following procedures:

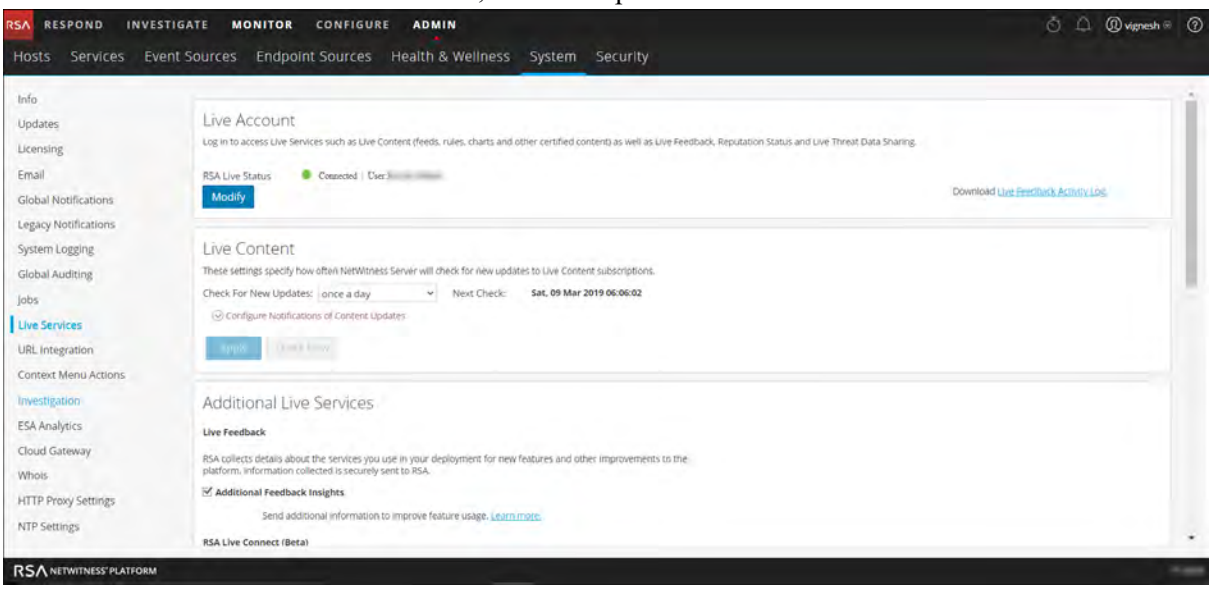
- Access the Live Services Configuration Panel
- Configure Live Account
- Configure the Live Content Synchronization Interval and Notification
- Force Immediate Synchronization

## Access the Live Services Configuration Panel

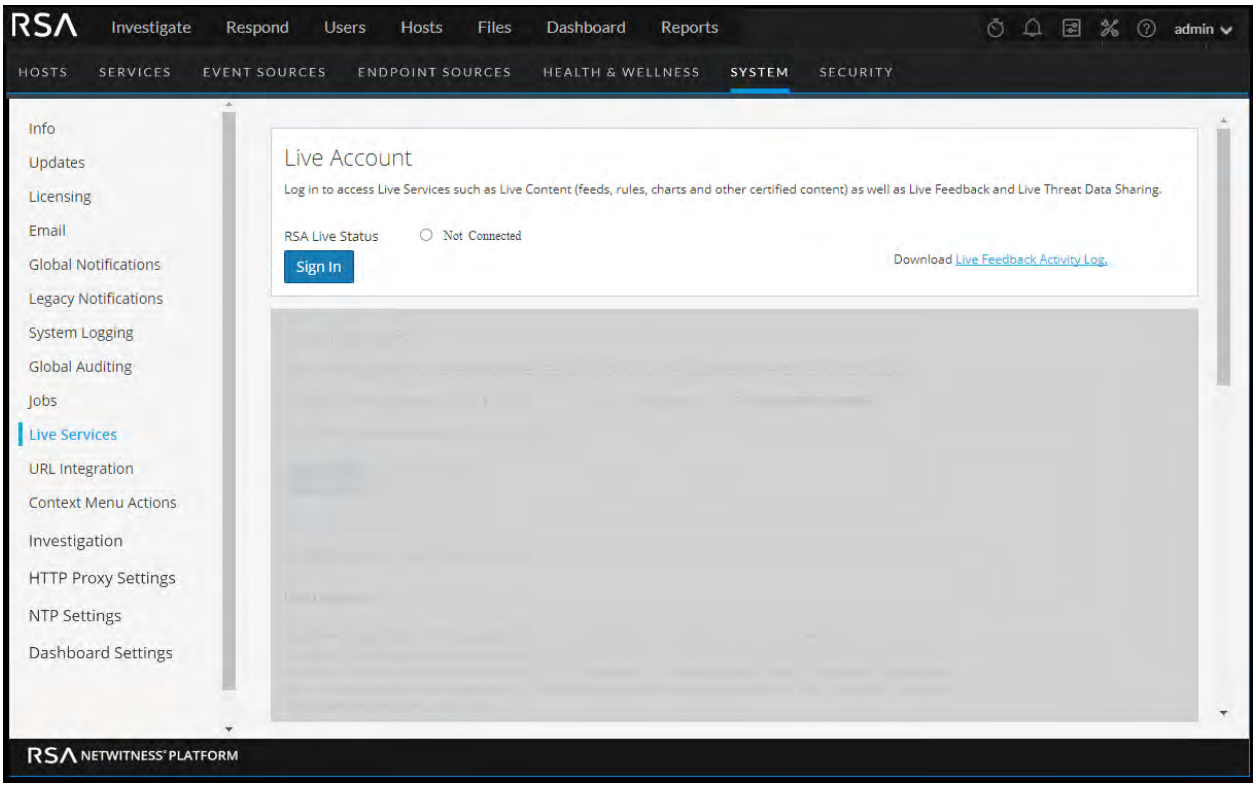
1. Go to **(Admin) > System**.
2. In the options panel, select **Live Services**.



If Version 11.4.0.1 or earlier is installed, this is the panel.



**Note:** If you are not signed in with your Live Account credentials, a masked screen is displayed.



## Configure Live Account

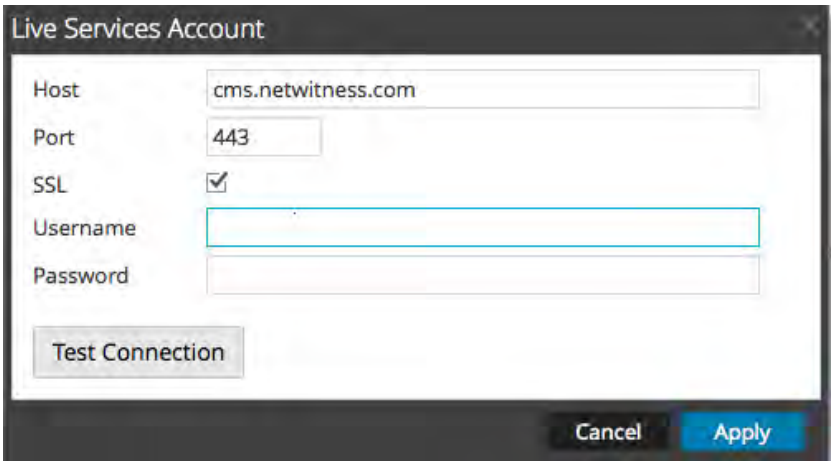
In the **Live Account** section, you must set up the user's Live account. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the Content Management System. This information is provided by Customer Care.

To configure a Live account:

1. In the **Live Account** section, click **Sign In**.

   **Note:** The **Modify** button shows that the live account is configured. Click **Modify** to change the user that is accessing Live Services.

2. In the Live Services Account dialog box, enter the Host (typically **cms.netwitness.com**) and type your username and password.

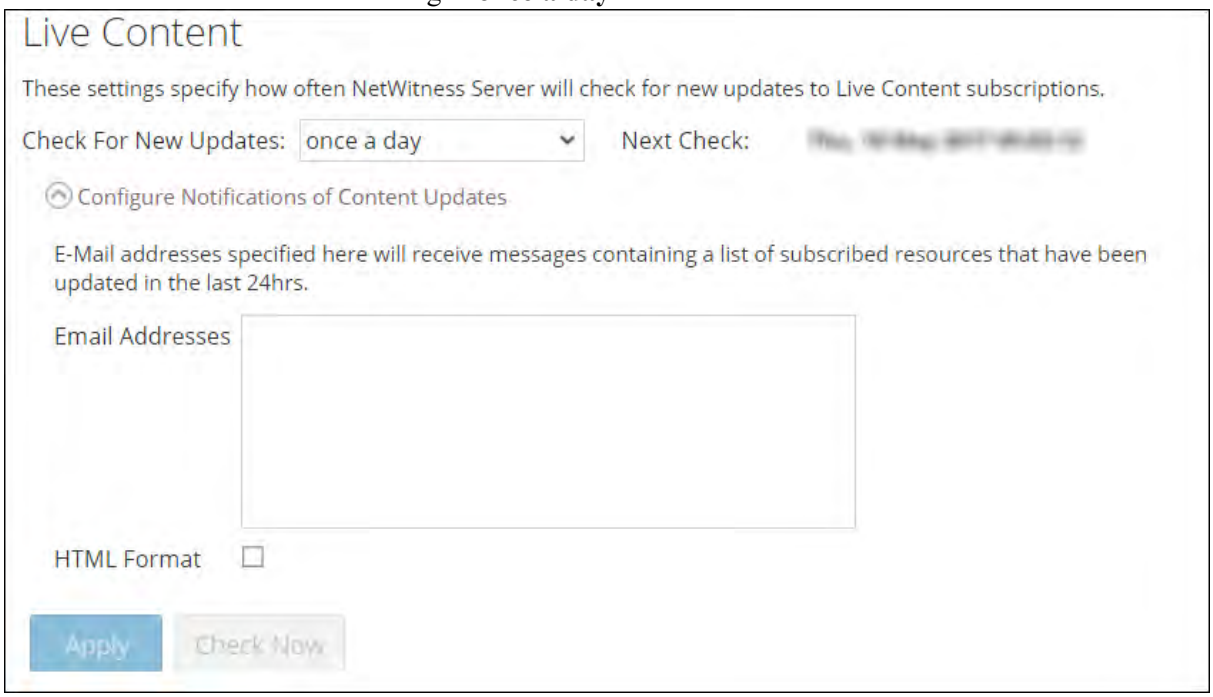


3. (Optional) If you are using a different CMS, type the host URL for the Content Management System. The default points to the CMS at **cms.netwitness.com**.
4. (Optional) If you are using a different CMS, type the communications port for Live to send requests to the Content Management System. The default for this field is **443**, which is the communications port on the Content Management System.
5. (Optional) If you do not want to use SSL, uncheck the **SSL** option. (SSL is enabled by default.)
6. Click **Test connection** to test the connection to CMS.
7. To save and apply the configuration, click **Apply**.

## Configure the Live Content Synchronization Interval and Notification

You can change the interval at which NetWitness checks for new updates to Live Content:

1. Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



2. To configure Live Services to send update reports to one or more people, in the **Email Addresses** field, type the email addresses as a comma-separated list, for example, **john@company.com,ted@company.com,brian@company.com**
3. (Optional) To receive messages in HTML format rather than plain text, select **HTML Format**.
4. To save and apply, click **Apply**.

   The time and date of the next scheduled Live synchronization based on the configured interval for checking is displayed.

## Force Immediate Synchronization

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

**Caution:** Synchronization can cause a parser reload if a FlexParser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

**File Reputation**

File Reputation provides analysts the opportunity to view reputation status of files.

By default, **File Reputation** is enabled in **Additional Live Services** section.

## Live Feedback Overview

This topic provides an introduction to Live Feedback. Live Feedback collects relevant information such as the Licensing usage data for Network Decoder, Log Decoder and Malware Analysis, Threat Detection Enabled or Disabled status, Number of enabled ESA rules,and version number details of all the services of NetWitness. For more information about the licensing usage data for Packer Decoder, Log Decoder and Malware Analysis, see the **License Details** tab topic in the *Licensing Guide*. The information is collected to improve future releases of NetWitness. You will automatically be signed on to live feedback and you cannot disable this option.

In addition to this, information on the Live Content Usage can also be shared with RSA. Live Content usage metrics for resource types from **(Configure) > Live Content > Search Criteria** such as total count of RSA Application Rule, RSA Correlation Rule etc. can be shared with RSA. The information collected is used to improve the use of Live Content. For more information about sharing live content configuration, see Live Services Configuration Panel.

### About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

**Note:** Live Feedback is activated only if you have configured your Live account.

The Live Feedback data is in JSON format as mentioned below. When you sign up with your Live Account credentials, a single encrypted JSON file is automatically uploaded to the RSA servers everyday.

### JSON File

The JSON file consists of usage data information for a component or a set of components. In case of a set of components with the same license id, the usage data for all the components is aggregated and represented as a component called Entitlement. However, even if there is a single component such as a log decoder or decoder, an Entitlement component will be generated and will display the usage data for a single component. This aggregation is for components namely log decoders, decoders or malware analysis.

**Note:** The version of Entitlement is always null as it is the aggregate for a license data.

For example, if there are three Decoders with the same license id "xxx" with the following usage data:
Decoder1 = 150 MB
Decoder2 = 250 MB
Decoder3 = 100 MB
The aggregated usage data of 500 MB is displayed.

This JSON file is described in the following sections:

- Components
- Metrics
- Other Product Details
- Sample

## Components

Details of each service in your NetWitness deployment. This is represented as Component. For each component the following details are displayed.

| Component | Description |
|---|---|
| Version | Version number of the component in the NetWitness deployment. For example, 11.1.0.0.x.x.x.x. |
| ID | This is the unique Component ID that represents the host and is used to link to the metrics generated. |
| Properties | • **Name** - This is the name of the property for that component. For example, malware analysis, ESA, log decoder, etc.<br>• **Value** - This is the unique value to identify the component. |

## Metrics

Metrics of the components (hosts) such as Log Decoder, Decoder and Malware Analysis. The license usage data for each host is shared. For Live Content usage metrics, resource types from **(Configure) > Live Content > Search Criteria** such as total count of RSA Application Rule, RSA Correlation Rule and so on are shared.

| Component | Description |
|---|---|
| Usage | • **Value** - This is the value generated for the specific component ID for each component.<br>• **Name** - This is the name of the statistics for which the metrics is collected. For example, Capture Total Bytes. |
| StartTimeUTC | This is the time from when the metrics is collected. (in EPOCH format). |
| EndTimeUTC | This is the time when the metrics collection is complete (in EPOCH format). |
| Component ID | This is the ID of the component for which the value is recorded. |

## Other Product Details

- **End Time** - This is the time when the metrics collection is complete (in EPOCH format).
- **Product Name** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Version** - This is the version of the JSON file which tracks the changes made to the file format.

- **Start Time** - This is the time from when the metrics is collected. (in EPOCH format).
- **Product Type** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Product Version** - This is the version of the product from which the metrics is collected. In this example, the Product Version is **11.3.0.0-SNAPSHOT**.
- **Product Instance** - This is the License Server ID.
- **Checksum** - This is the information which is used for integrity checks.

The following table describes details of the JSON file with examples.

| Metrics | Description |
|---|---|
| Content | Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum. |

| Metrics | Description |
|---|---|
| Components | The details of all the services in NetWitness are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed.<br>  <br>**Version**: Displays the version of NetWitness service. For example, 11.3.0.0.<br>**ID**: Displays an unique id which is generated for the NetWitness service and is used to link to the metrics for that particular component. In this example, the ID for Malware Analysis is 5 and the metrics is displayed for ComponentId 5 in bytes:<br> <br>**Properties**: Displays the properties for the component such as name and value as shown in the above figure.<br>**Value**: Displays the value of the property which is an internal UUID for a component as shown in the above figure This is generated by NetWitness. For example, For malware analysis the value displayed as "55f7a0b30e502231c42d063f"<br>**Name: "InstanceId"**: Displays the name of the property as shown in the above figure. |

| Metrics | Description |
|---|---|
| | **Name": "malwareanalysis"**: Displays the name of component which is a service name such as LogDecoder, Decoder, or MalwareAnalysis. |
| Metrics | Displays the list of the metrics with the usage data for components namely MacHosts, LinuHosts and WinHosts.<br>In this example, the metrics is displayed for ComponentId 1 in bytes.<br> <br>}],<br>"Metrics": [{<br>"Usage": [{<br>"Value": "0.0",<br>"Name": "MacHosts"<br>}, {<br>"Value": "0.0",<br>"Name": "LinuxHosts"<br>}, {<br>"Value": "0.0",<br>"Name": "WinHosts"<br>}, {<br>"Value": "0.0",<br>"Name": "TotalHosts"<br>}],<br>"StartTimeUTC": 1539043200000,<br>"EndTimeUTC": 1539129599000,<br>"ComponentId": 1<br>}, { |
| | **StartTimeUTC**: Displays the time when the metrics is collected, in the EPOCH format. |
| | **Usage**: Displays the usage value and usage type statistics of the component. |
| | **Value**: Displays the value of the statistics. For example, "Value": "1582940012678" as shown in the above figure. |
| | **Name**: Displays the name of the statistics. For example, Capture Total Bytes or Total File bytes. |
| | **EndTimeUTC**: Displays the time when the metrics collection is complete, in the EPOCH format. |
| | **ComponentId**: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section. |
| Content | Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum. |
| ProductType | Displays the product type that generates the file. For example, `"ProductType": "NetWitness Platform"` |
| ProductInstance | Displays the License server Id and is unique per NetWitness. For example, `"ProductInstance": "00-0C-29-6C-66-E3"` |

| Metrics | Description |
| --- | --- |
| Checksum | Displays the Checksum for the "Content" section in the file. Used by RSA for integrity check. For example, `"Checksum": "883DACF97E4BCD9F590A1461A4DD0A312B5883A6CF82E0518E77AAB6A6DDB654"` |

**Example**

Here is a sample JSON file.

```
{
    "Content": {
        "Components": [{
            "Version": "11.3.0.0",
            "Id": 7,
            "Properties": [{
                "Value": "57470c96e4b0cf62c7bfbd53",
                "Name": "InstanceId"
            }],
            "Name": "esa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 4,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e69",
                "Name": "InstanceId"
            }],
            "Name": "incidentmanagement"
        },
        {
            "Version": "11.3.0.0",
            "Id": 2,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e65",
                "Name": "InstanceId"
            }],
            "Name": "sa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 1,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e63",
                "Name": "InstanceId"
            }],
            "Name": "malwareanalysis"
        },
        {
            "Version": "11.3.0.0",
            "Id": 3,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e67",
                "Name": "InstanceId"
            }],
            "Name": "reportingengine"
        }],
        "Metrics": [{
            "StartTimeUTC": 1464480000000,
            "Stats": [{
                "Value": "Disabled",
                "Name": "Threat Detection"
            },
            {
                "Value": "3.0",
                "Name": "Number Of Enabled ESA Rules"
            }],
            "EndTimeUTC": 1464566399000,
            "ComponentId": 7
        }],
        "EndTime": 1464566399000,
        "Version": "1.0",
        "StartTime": 1464479999000,
        "ProductType": "Security Analytics",
        "ProductInstance": "00-0C-29-A2-57-B4"
    },
    "Checksum": "6445C704D3F9E67D24DBA8F11EB6C003CBCC0E199576342E6E6D2545524F583F"
}
```

The JSON file includes details of all the licenses currently available on the appliance. Here is a sample of the Entitlement information within the JSON file for a appliance license for Broker.

```
    }, {
        "Version": "2015.0506",
        "Id": 14,
        "Properties": [{
            "Value": "M133206102",
            "Name": "SerialNumber"
        }, {
            "Value": "Broker",
            "Name": "DeviceType"
        }, {
            "Value": "PERPETUAL",
            "Name": "FeatureType"
        }, {
            "Value": "-1",
            "Name": "Threshold"

        }],
        "Name": "Entitlement"
    }, {
```

## Upload Data to RSA for Live Feedback

This topic provides instructions for a NetWitness administrator to export the metrics in NetWitness for Live Feedback.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see Live Services Configuration Panel.

The Live Account section has a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with RSA.

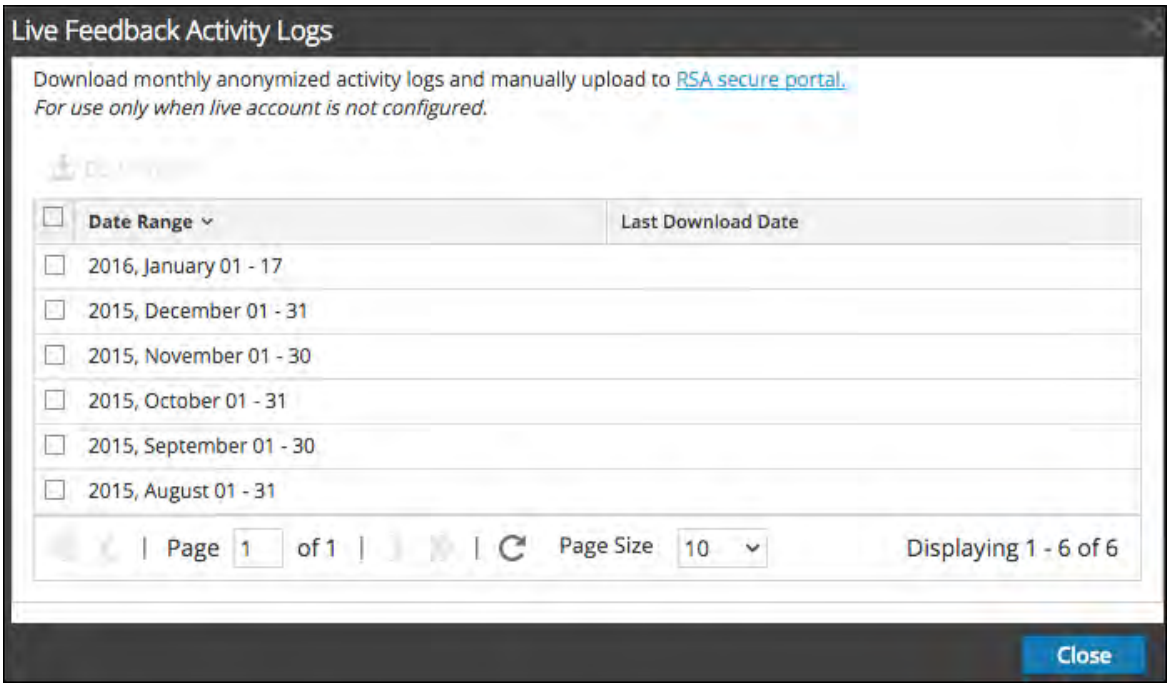
## Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **(Admin) > System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click the **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows the NetWitness user to download the required Live Feedback historical data.



4. Select one or multiple entries by setting the checkboxes and click **Download**.

   **Note:** If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see Live Feedback Overview.

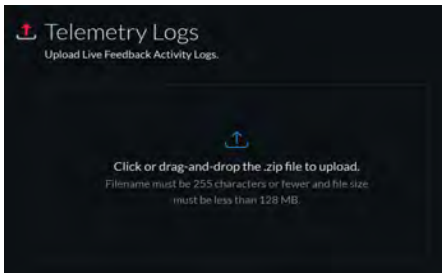
## Share Data with RSA

After you download the Live Feedback data, you can then upload it using the following procedure.

**Note:**
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data using the new live registration portal. For more information, Create Live Account.

### To share the data to RSA:

1. Log in to the NetWitness Platform Live using your credentials.
2. Click on the left panel.
   The **Telemetry Logs** dialog is displayed.



**Note:**
- You can upload only .zip files.
- Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.

# Configure Log File Settings

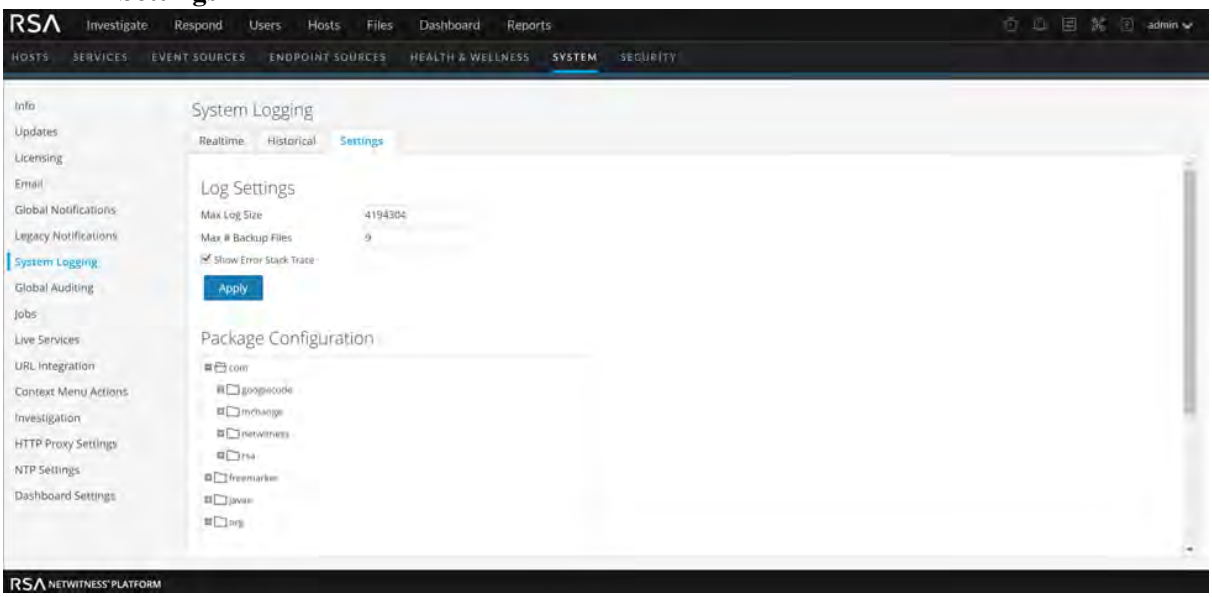
In NetWitness, you can configure the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness.

## Configure System Log File Size and Backup Count

The log file size and backup count are configured with default values. If you want to change the default values for the log file size and number of backups:

1. Go to **(Admin) > System.**
2. In options panel, select **System Logging**.
   The System Logging Configuration panel opens to the Realtime tab by default.

3. Click the **Settings** tab.

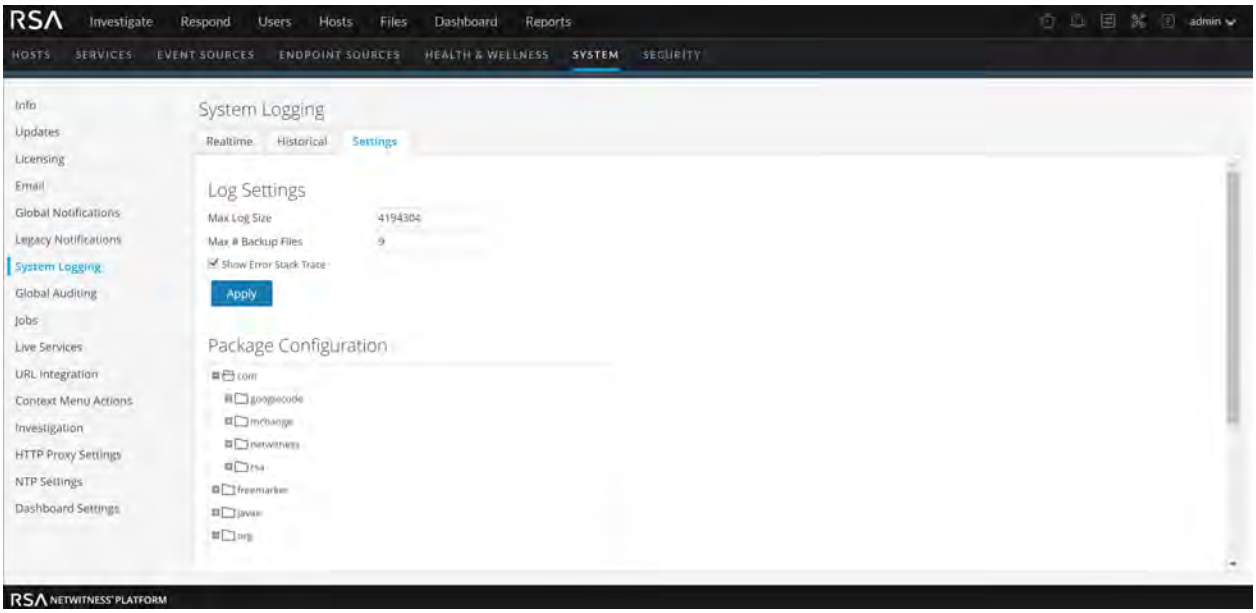


4. In the **Max Log Size** field, type the maximum size in bytes. The minimum value for this setting is **4096**.
5. In the **Max # Backup Files** field, type the maximum number of backup logs to maintain. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
6. Click **Apply**.
   The changes go into effect immediately.

## Set the Log Level for an Individual Package

The Package Configuration section shows the NetWitness Network in a tree structure. The tree contains all the packages used within NetWitness. You can drill down into the tree to view the log levels of each package. The log level for all packages that are not explicitly set is the same as the **root** log level. To set the log level for a package:

1. Select the package in the **Package** tree.
   The name of the package is displayed in the **Package** field. If a log level is already set for the package, that level is shown.



2. Select the **Log Level** in the drop-down list.
3. Click **Apply**.
   The new log level becomes effective immediately.
4. (Optional) If you want to revert to the default log level specified for **root**, click **Reset**.

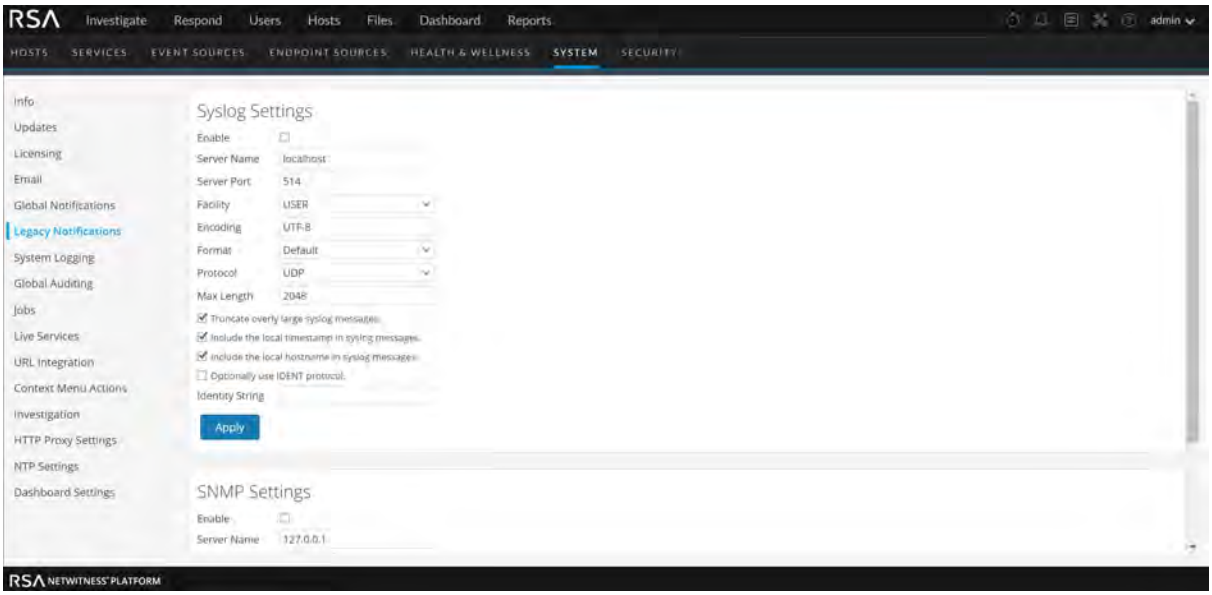
# Configure Syslog and SNMP Settings

On the Legacy Notifications panel, you can configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

## Configure and Enable Syslog Settings

1. Go to **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed.



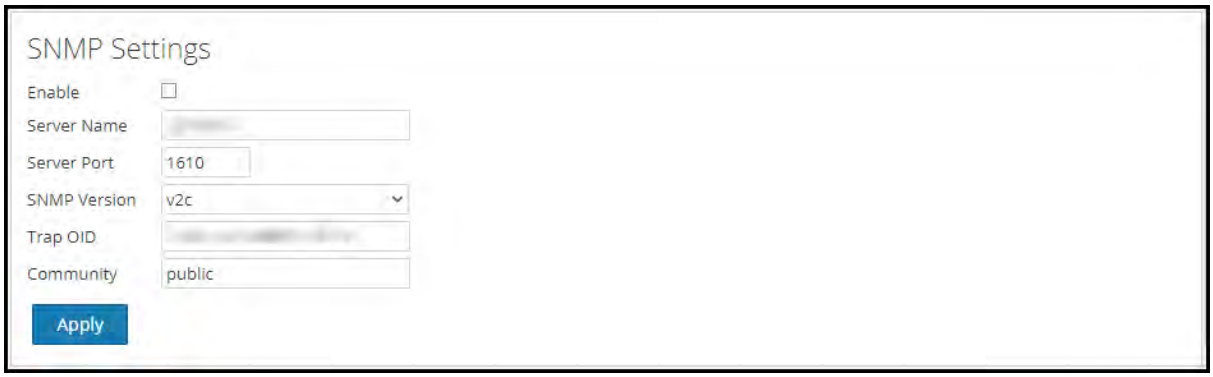
3. In the **Server Name** and **Server Port** fields under **Syslog Settings**, type the host name where the target syslog process is running and the port where the target syslog process is listening.
4. In the **Facility**, **Encoding**, **Format**, and **Max length** fields, specify the syslog facility, message text encoding, message format, and maximum message length.
5. In the **Protocol** field, select either UDP or TCP.
6. (Optional) Select the options for what to include in messages: **Truncate overly large syslog messages**, **Include the local timestamp in syslog messages**, and **Include the local hostname in syslog messages**.
7. (Optional) Configure syslog to prepend an Identity String before each syslog alert.
8. Set the **Enable** checkbox.
9. Click **Apply**.

Syslog notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

## Configure and Enable SNMP Settings

1. Go to **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed, with SNMP Settings at the bottom of the panel.



3. In the **Server Name** and **Server Port** fields under **SNMP Settings**, type the host name and listening port of the SNMP trap host.
4. Select the **SNMP version** in the drop-down menu, **v1** or **v2c**.
5. In the **Trap OID** field. specify the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
6. In the **Community** field, specify the community string used to authenticate on the SNMP trap host, the default value is **public**.
7. Set the **Enable** checkbox.
8. Click **Apply**.

SNMP notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

## Disable Syslog or SNMP Settings

To disable syslog or SNMP settings on this NetWitness instance:

1. Clear the appropriate **Enable** checkbox.
2. Click **Apply**.
   The selected settings are immediately disabled.

# Additional Procedures

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

Add Custom Context Menu Actions

Configure NTP Servers

Configure Proxy for NetWitness Platform

Add New Configuration Dialog

Supported CEF Meta Keys

Supported Global Audit Logging Meta Key Variables

Global Audit Logging Operation Reference

Local Audit Log Locations

## Add Custom Context Menu Actions

In the Context Menu Actions panel, Data Privacy Officer, Administrator, Analyst, and SOC Manager can view, add, edit, delete, import, and export context menu actions for the current instance of NetWitness. Each context menu action applies to a specific context in the NetWitness user interface, and appears as an option when you right-click a specific location in the user interface.

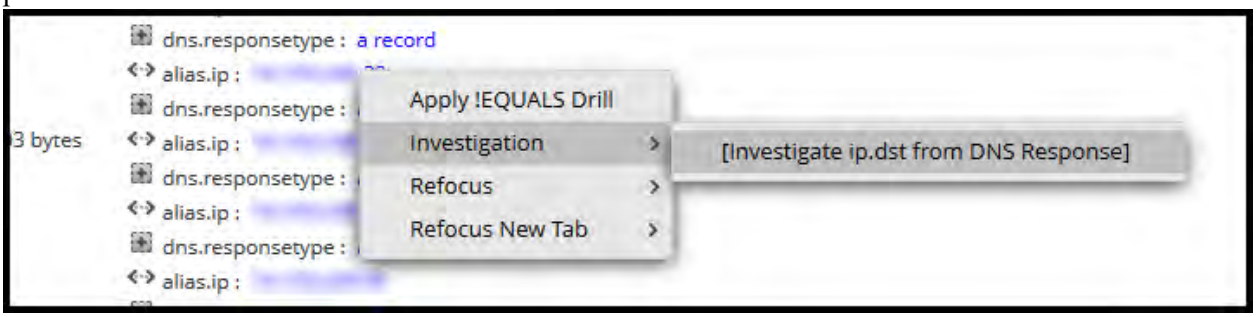
**Note:** All the context menu actions available in Events in NetWitness Suite 11.1 are also now available under Events in NetWitness Platform 11.7.

If you want to create a custom variation of a built-in context menu action, you can copy the configuration to a new context menu action and modify the custom context menu action. To copy, switch to the Advanced view, open the action and copy the JSON configuration file, create a new action/edit an existing action and paste. A context menu action is defined by:

- Action: The title of the action in the context menu.
- Component: The NetWitness module in which the context menu is available.
- Meta key: The content to which the action applies.
- Definition: The definition of the action.

**Note:** All context menu actions created before you upgrade to 11.3, functions as configured.

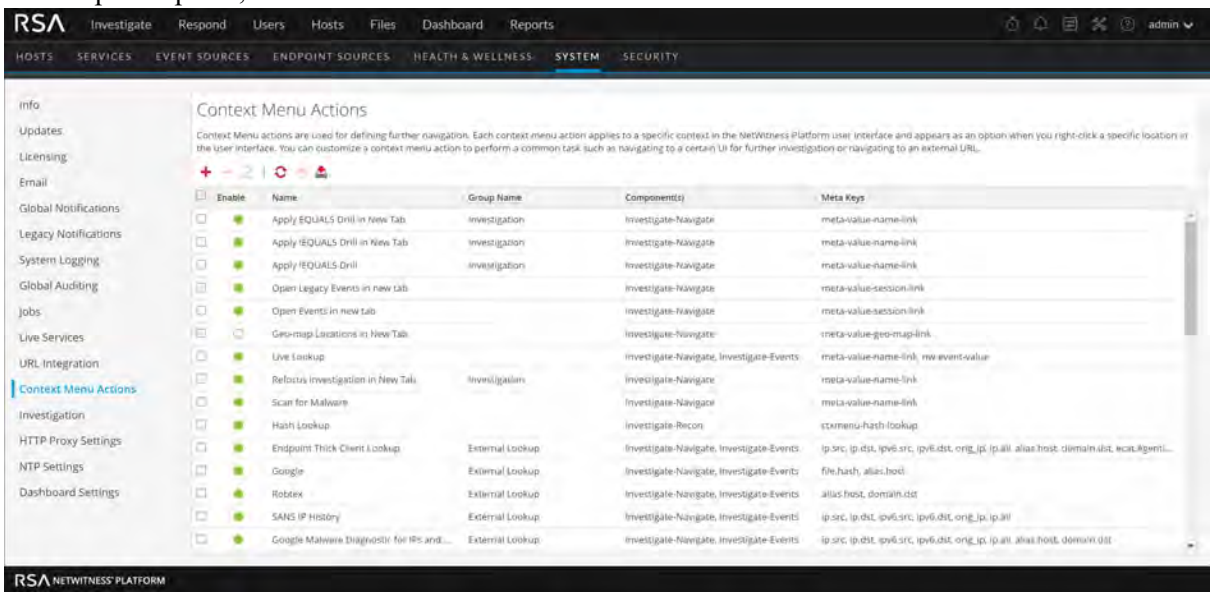
This is an example of a custom context menu action; the steps to create this example are provided as a procedure below.



## View Context Menu Actions in NetWitness

To view existing context actions in NetWitness both default and custom:

1. Go to **(Admin) > System.**
2. In the options panel, select **Context Menu Actions**.

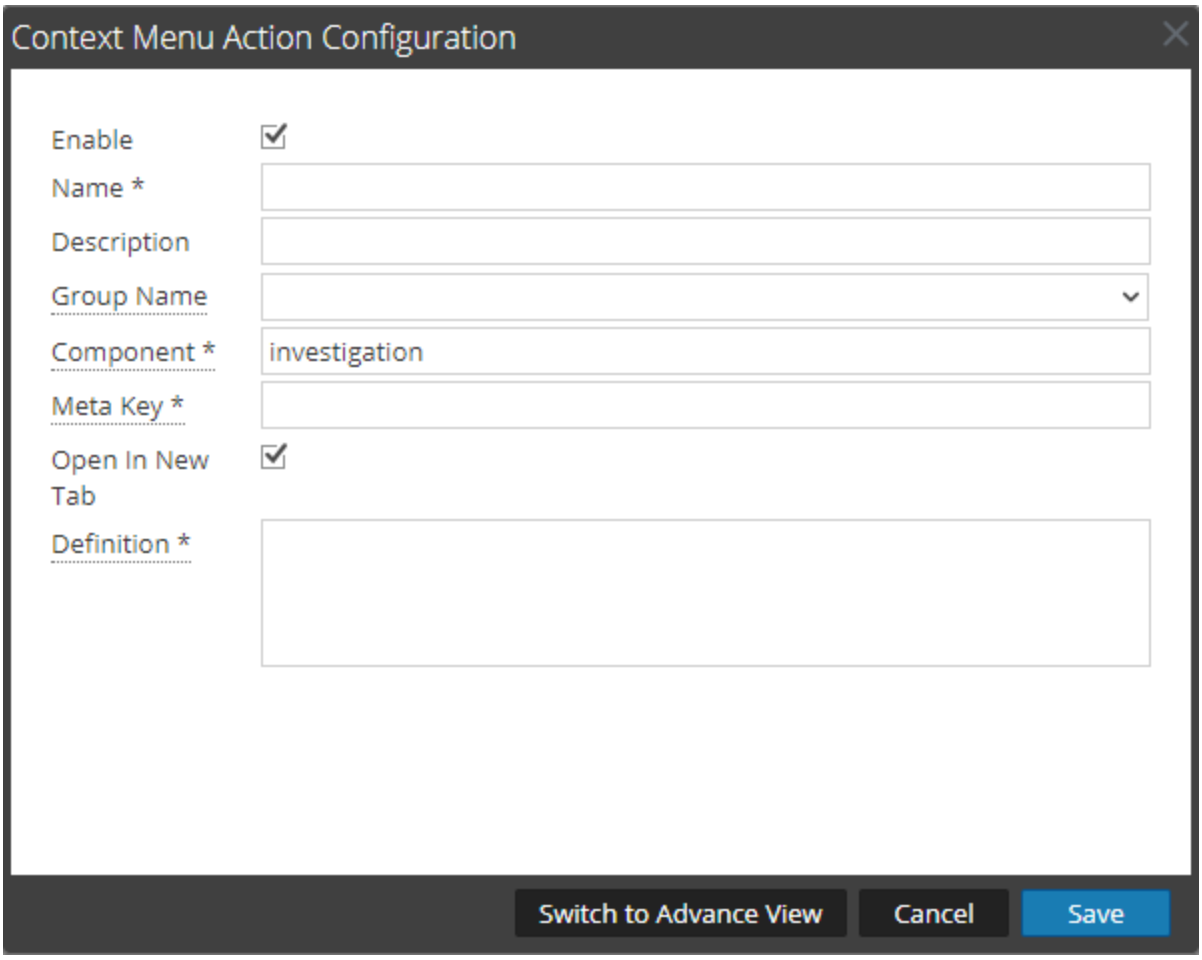


All the new actions which were available in NetWitness Suite 11.1 in the Investigate > Events tab can now be configured using the context menu actions. Details of the information in the Context Menu Action panel are provided in Context Menu Actions Panel.

## Add a Context Menu Action

To add a context menu action in NetWitness:

1. In the toolbar, click .
   The Context Menu Action Configuration dialog is displayed.



Fill the required fields:

a. Enable: Select Enable to enable this context menu action.

b. Name: Enter the name of the context menu action.

c. Description: Enter a description of the context menu action.

d. Group Name: Select the group name from the drop-down menu. The action appears under this group in Context menu.

e. Component: The name of the component under which action will appear in the user interface. For example. under Investigate, the Context menu action can appear under Investigate-Navigate, Investigate-Legacy Events, Investigate-Event Recon and Investigate-Events.

**Note:** The Investigate-Legacy Events option and related data is displayed only if the Enable Legacy Events checkbox is enabled under **(Admin)** > **System** > **Investigation** > **Legacy Events**.

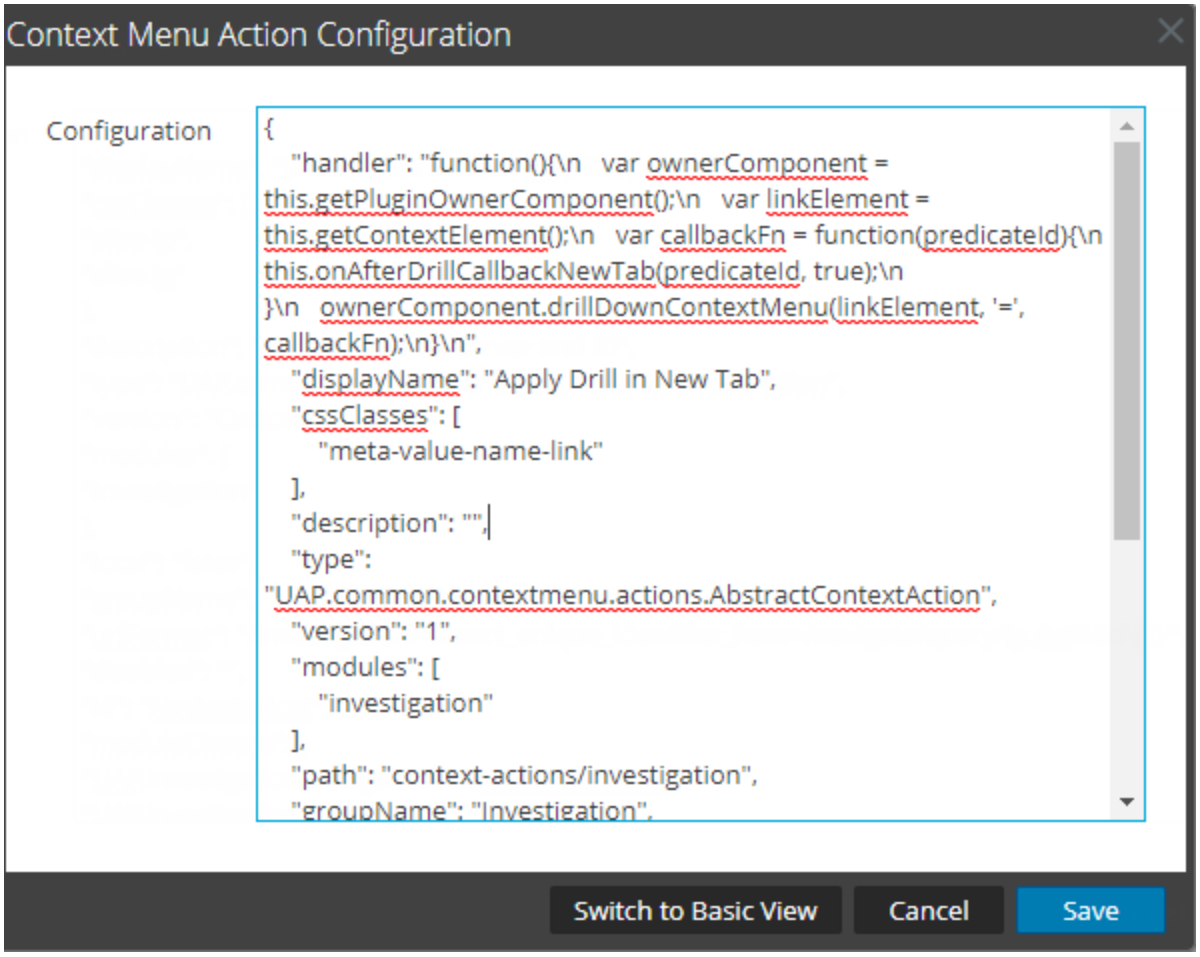
f. Meta Key: Enter the meta key separated by commas to further narrow-down scope for the context menu action. The action will appear on these meta key. Context menu actions have to be defined specifically for each meta key, the key references in a meta key do not inherit a context menu actions. For example, a context menu action created for ip.all are not created for ip.src as well. A

separate action has to be created for the sub-category or key reference of a meta.

g. Open in New Tab: Select this option to open the context menu action in a new tab.

h. Definition: Enter further action performed for this context menu action. For example, open a certain user interface or navigate to an external URL.

2. You can also type the CSS code to define the context menu action. The example procedure at the end of this topic provides step-by-step instructions that you can use to create a useful context menu action. Click **Switch to Advance View** to add the context menu action.



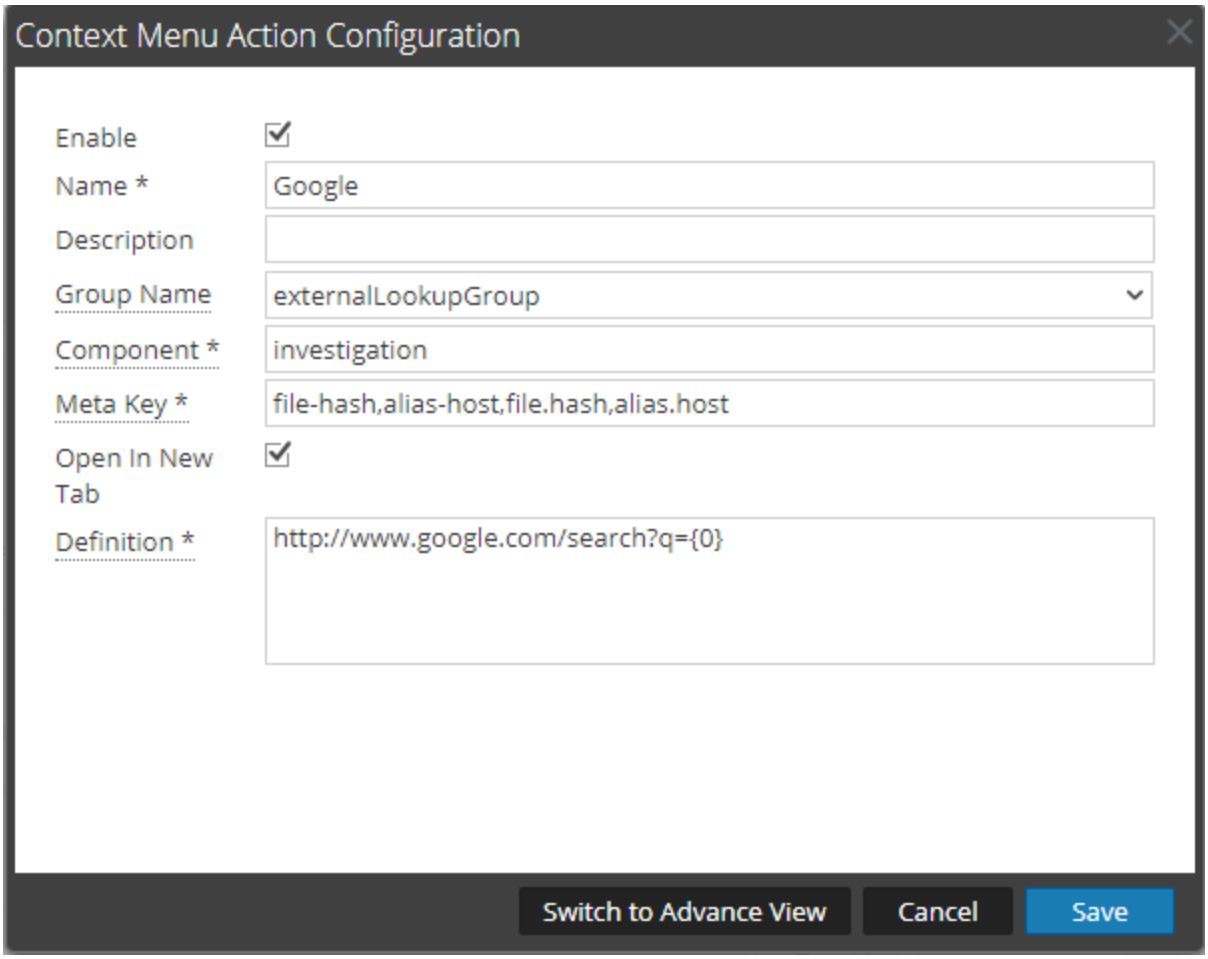
3. Click **OK.**
The new context menu action is created and added at the end of the list of context menu actions.

4. The context menu action becomes available in the configured location.

## Edit a Context Action

To edit a context action:

1. Select the row in the grid and either **double-click** the row or click .
The **Context Menu Action Configuration Dialog** is displayed.



2. Edit the **Configuration**.
3. To save the changes, click **OK**.

## Delete a Context Action

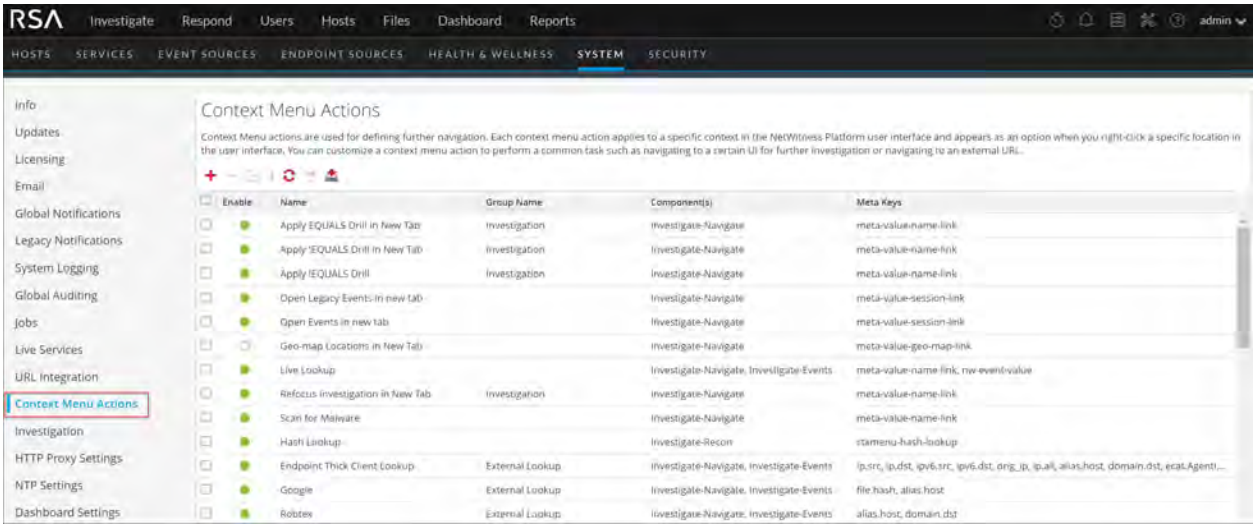
To remove a context menu action from NetWitness entirely:

1. Select the action.
2. Click .
   A dialog requests confirmation that you want to delete the context menu action.
3. Click **Yes**.
   The option is removed from the Context Menu Actions panel.

## Export Context Menu Actions

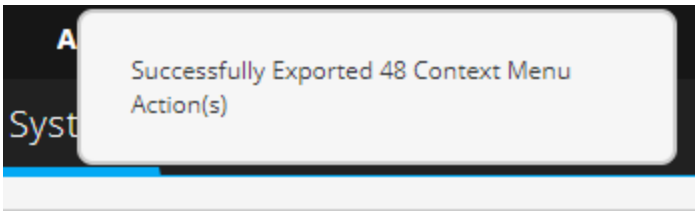
You can export context menu action to a zip file. The zip file contains the JSON files with each each JSON file mapping to a context menu action. To export the context menu action, follow these steps:

1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.



3. Click to select a context menu action to import. Click the header to select ALL the context menu actions.

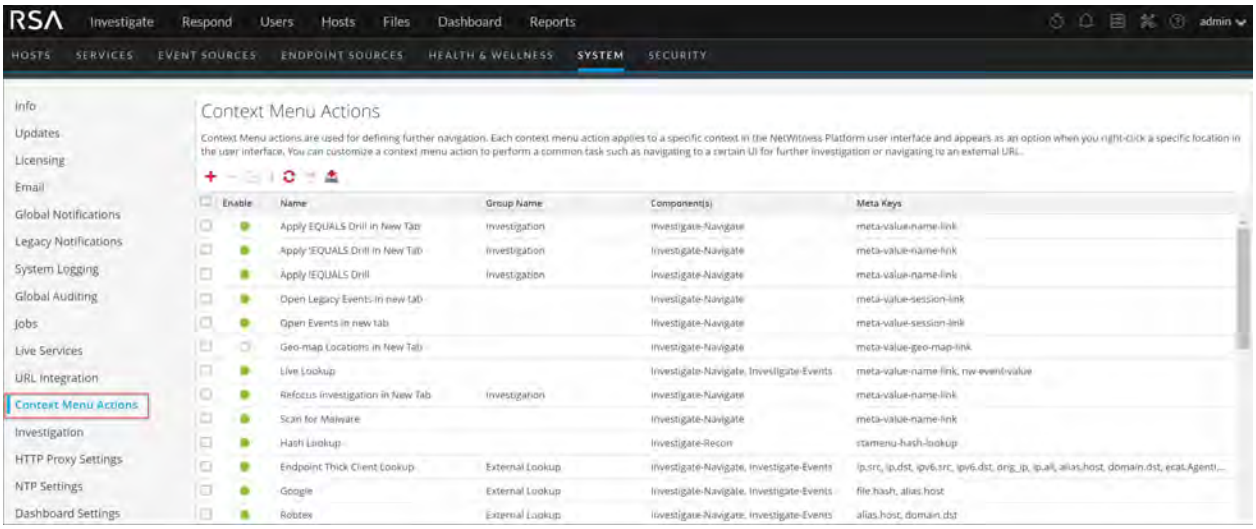
4. Click Export Action(s) under Context Menu Actions.
5. The success message confirming the actions uploaded successfully is displayed.



## Import Context Menu Actions

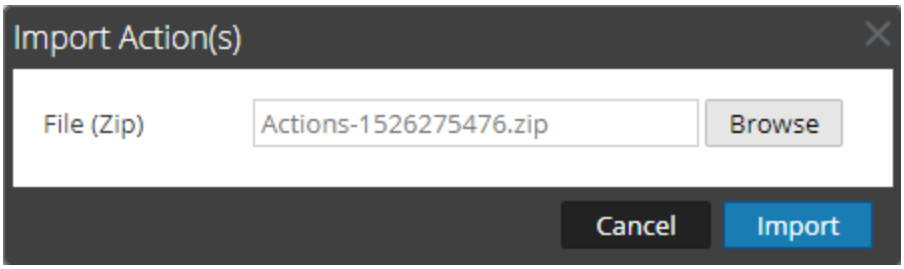
You can import ccontext actions in Context Menu Actions tab. These actions can then be edited or used as is for investigating context where applicable. Follow these steps to import a context menu action(s):

1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.



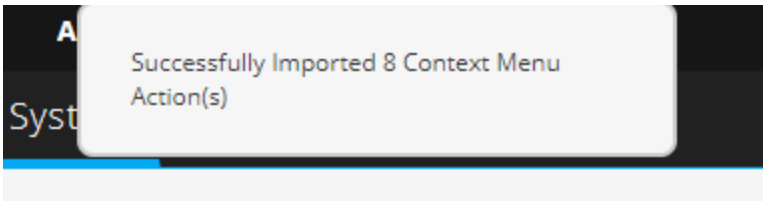
3. Click Import Action under Context Menu Actions.
4. In Import Action click **Browse** to locate and select the file. The zip file typically contains the json files containing context menu actions exported previously.

5. Select the Zip file and click **Open**.
6. Click **Import**



**Note:** There is no validation for an action for Events with a Javascript function.

7. The success message confirming the actions uploaded successfully are displayed.



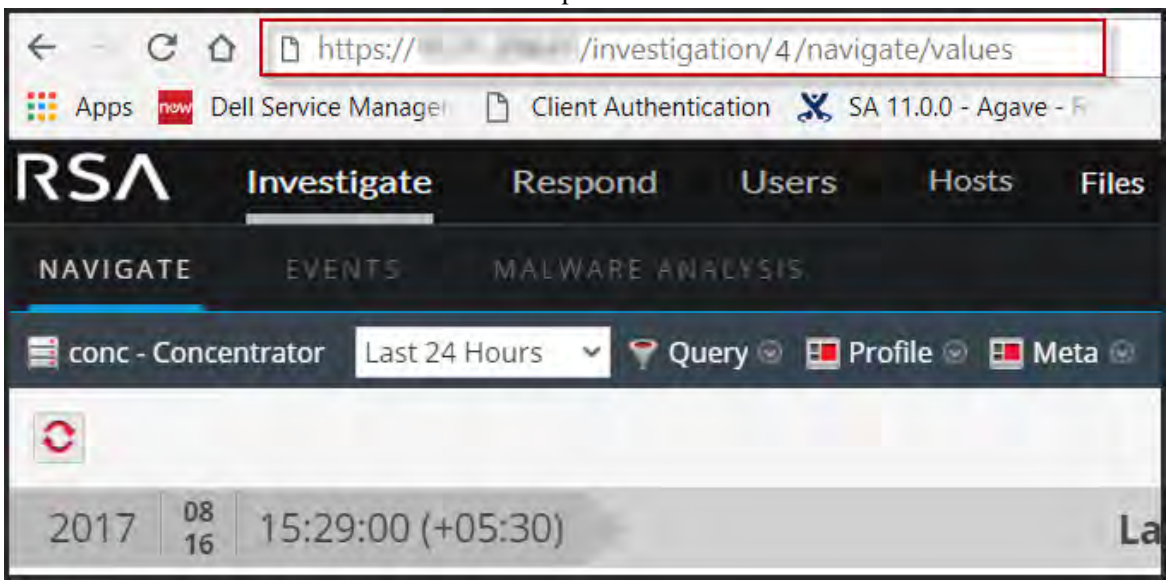
**Note:** If an error message is displayed, check the log files and try importing the context menu actions file again.

## Example Procedure: Context Menu Action to Investigate ip.dst from alias.ip

This example adds a context menu action that allows analysts to pivot from the `alias.ip` values (the IP addresses returned from a DNS request) to the `ip.dst` meta key. It helps analysts to locate any detected traffic to the IP address that was returned for a DNS query.

To implement the context menu action:

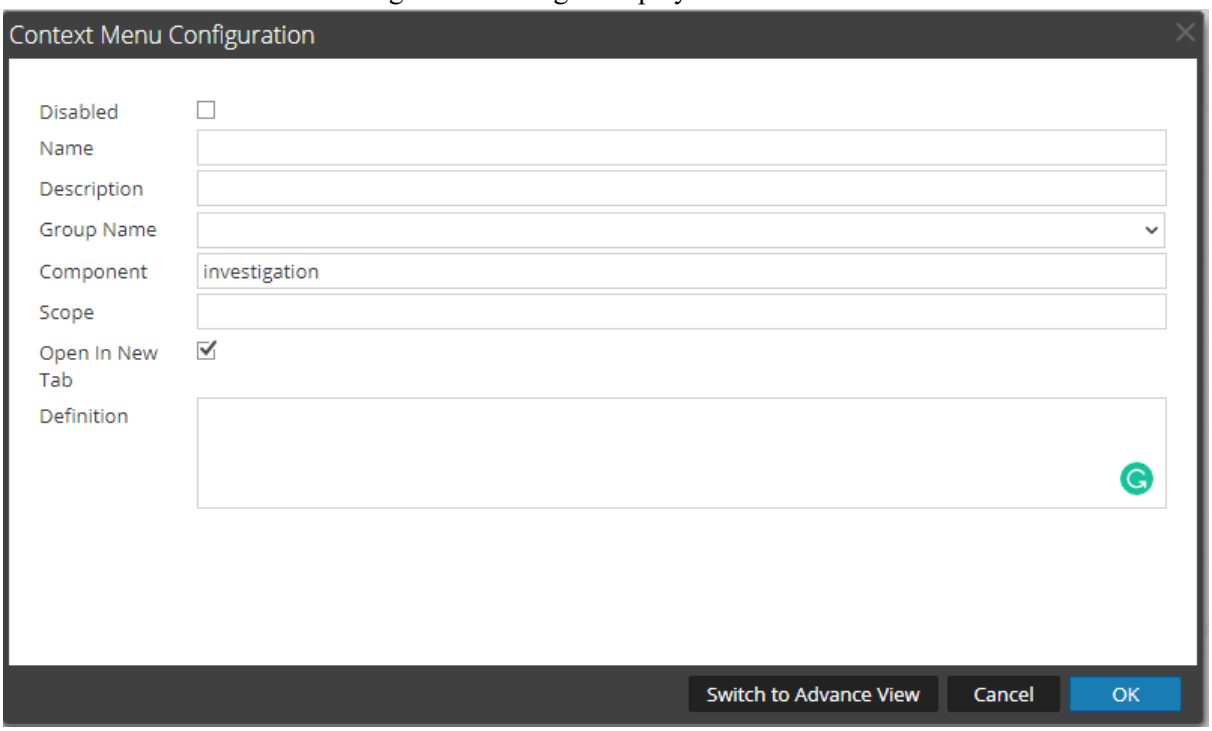
1. Determine the unique identifier for your NetWitness Server as follows:
   a. Log onto NetWitness , go to **Investigate > Navigate**, choose a service (for example, a Concentrator) to investigate, and wait for the values to load.
   b. Look for the URL and locate the number after `investigation`. In this example, the unique identifier for the action is 4. You need this unique identifier to add to the context menu action.



2. Go to **(Admin) > System > Context Menu Actions**

   In the toolbar, click .

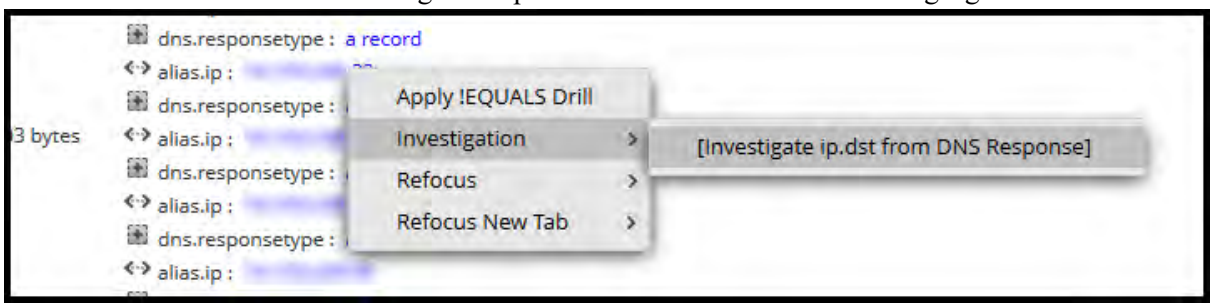
The Context Menu Action Configuration dialog is displayed.



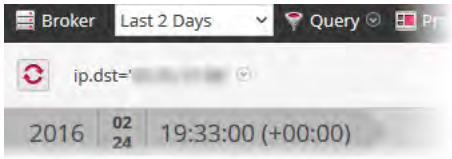
3. Copy the entire sample code block below and paste it in the window.

```
{
    "displayName": "[Investigate IP from DNS Response]",
    "cssClasses": [
        "alias-ip",
        "alias.ip"
    ],
    "description": "Update your NW server and ID",
    "type": "UAP.common.contextmenu.actions.URLContextAction",
    "version": "Custom",
    "modules": [
        "investigation"
    ],
    "local": "false",
    "groupName": "investigationGroup",
    "urlFormat": "/investigation/<insert_unique_identifier_
here>/navigate/query/ip.dst%3d'{0}'",
    "disabled": "",
    "id": "NavigateHost",
    "moduleClasses": [
        "UAP.investigation.navigate.view.NavigationPanel",
        "UAP.investigation.events.view.EventGrid"
    ],
    "openInNewTab": "true"
}
```

4. In the **urlFormat** line replace **<insert-unique_identifier_here>** with your unique identifier. The URL should look like this:
   `"/investigation/4/navigate/query/ip.dst%3d'{0}'"`
5. Click **OK**, and restart your browser.
6. To test the action, open an investigation in the Navigate view and right-click on the meta key `alias.ip`.
   The context menu with the Investigation option should look like the following figure.



7. Should produce a pivot like this.



8. If you are using this example for DNS traffic investigation, you may want to consider creating a meta group specific to DNS traffic as described in "Manage User-Defined Meta Groups" in the *NetWitness Investigate Guide*.

# Configure NTP Servers

This topic provides instructions on how to configure Network Time Protocol (NTP) servers. NTP is a protocol designed to synchronize host machine clocks over a network. For more information on NTP go to their home page (http://www.ntp.org/).

**Note:** NetWitness Server Core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.

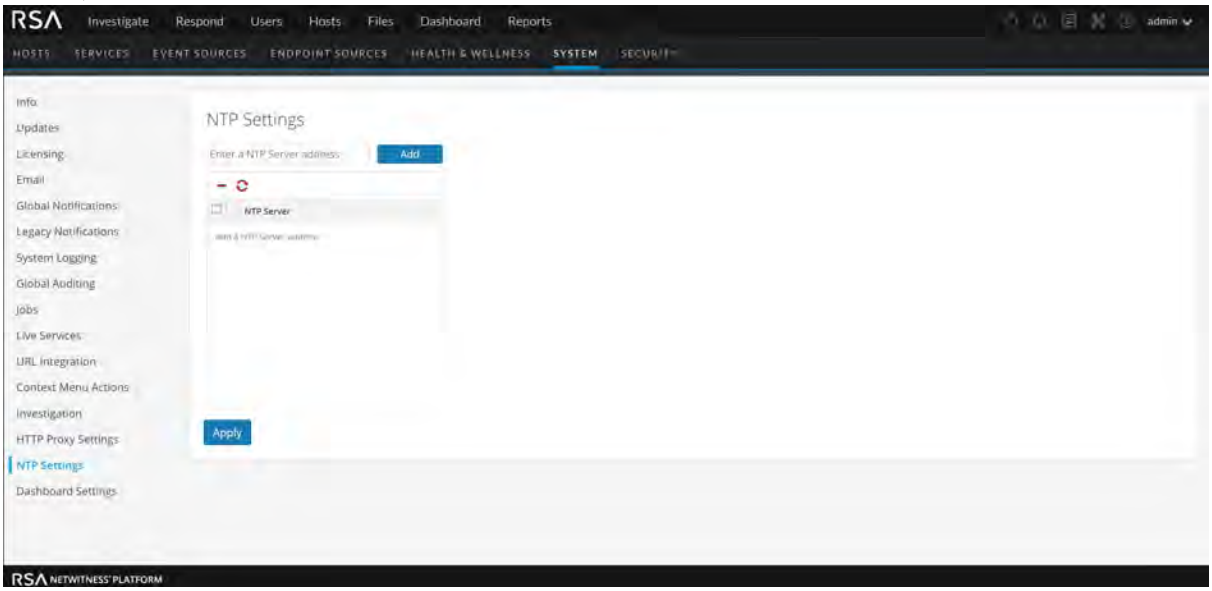
You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes. This topic contains the following procedures:

- Add an NTP Server
- Modify an NTP Server

## Add an NTP Server

To add an NTP server:

1. Go to **(Admin) > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Settings panel is displayed prompting you to enter the hostname (that is, the IP Address or FQDN) of an NTP server.



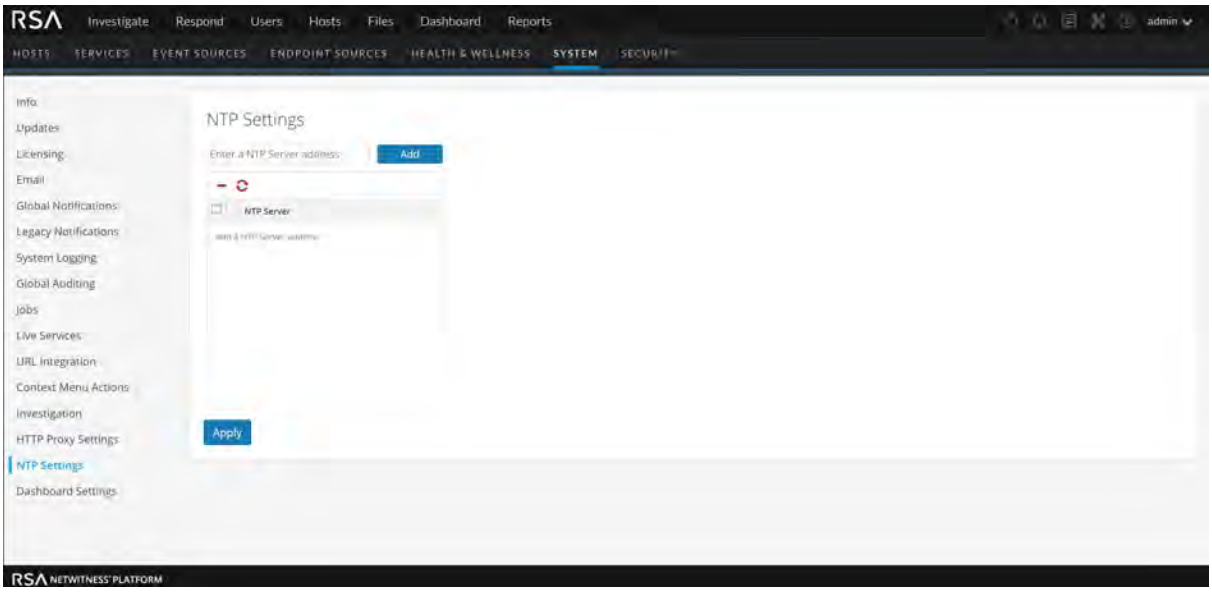
3. Enter the IP address or FQDN for an NTP server.
   If the hostname syntax is invalid, NetWitness disables the **Add** and **Apply** buttons and displays **Entered an invalid hostname**.
4. Click **Add**.
   - If the hostname syntax is valid and NetWitness can reach the server, it displays **Validating**.
   - If the hostname syntax is valid and NetWitness cannot reach a server, the following is displayed, where ***hostname*** is the hostname that you attempted to add: **The NTP server *hostname* is unreachable. Please verify the address or check your firewall settings.**
5. Click **Apply**.
   A dialog displays notification that the settings have been saved and requests confirmation that you want to apply the settings now.
6. Click **Yes**.
   The NTP server specified now ensures that your host machine clocks are synchronized. If you decide to configure multiple NTP servers and a server is down, NetWitness will fail over to next server configured.

For details of the parameters and descriptions, see NTP Settings Panel.

## Modify an NTP Server

To modify an existing NTP server:

1. Go to **(Admin) > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Setting panel is displayed.



3. Double-click the **NTP Server** hostname that you want to modify.
   The NTP Server textbox becomes editable and the Update and Cancel buttons are displayed.

4. Edit the hostname, click **Update**, and click **Apply.** (click **Cancel** before you click **Apply** to cancel the edit.)
   NetWitness changes the hostname according to your edits.

# Configure Proxy for NetWitness Platform

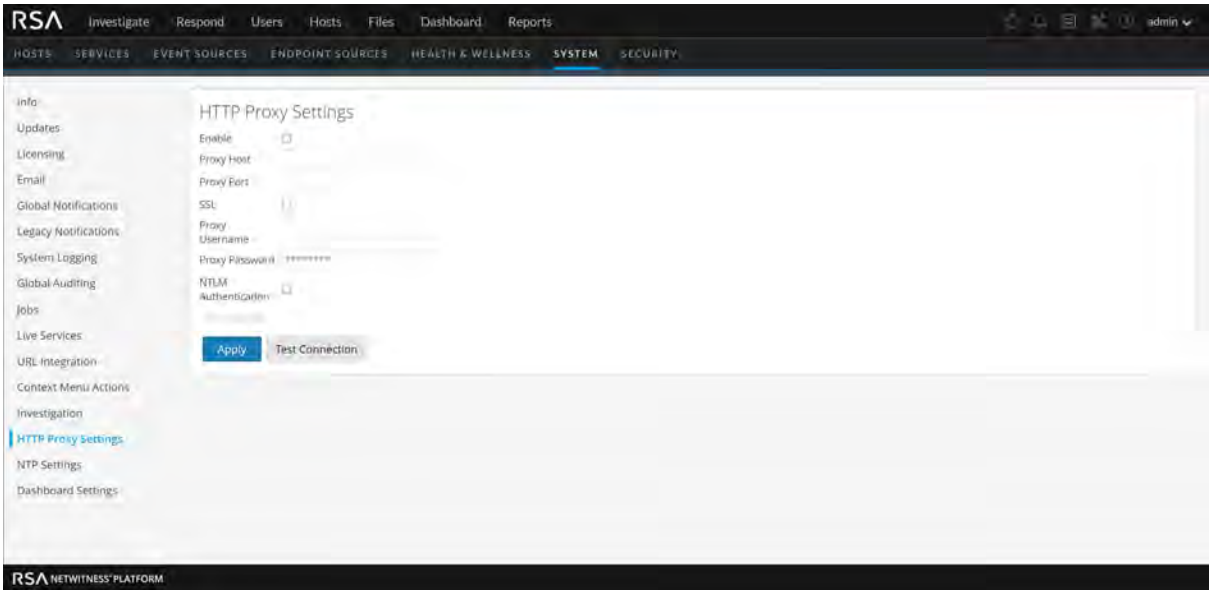
This topic provides a procedure for setting up a proxy that is used across NetWitness modules and services.

**Note:** Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

You can configure a proxy that is used across NetWitness modules and services in the System View > Advance Configuration panel. The Proxy Settings in the Advanced Configuration panel set up a proxy to be used wherever a proxy is needed in NetWitness. These settings override any proxy settings configured for an individual service or module, such as Malware Analysis or Live.

To configure a proxy for use across NetWitness modules:

1. Go to **(Admin) > System**.
2. In the options panel, select **HTTP Proxy Settings**. The HTTP Proxy Settings panel is displayed.



3. Click the **Enable** checkbox.

   The fields where you configure the proxy settings are activated.

4. Type the hostname for the proxy server and the port used for communications on the proxy server.
5. (Optional) Type the username and password that serve as credentials to access the proxy server if authentication is required.
6. (Optional) Enable **Use NTLM Authentication** and type the NTLM domain name.
7. (Optional) Enable **Use SSL** if communications use Secure Socket Layer. If you enable **Use SSL**, ensure that you import the required certificates for the services to retrieve information.

   You need to import certificates and add the certificate in the head node for all the specific services that communicate externally over a proxy. If there are any other service that communicates with

external resources over the internet, ensure that you add the certificates. For more on how to add the certificates, see Import Certificates for HTTPS Service

8. The proxy is immediately available for use throughout NetWitness modules and services, for example, Live and Malware Analysis.
9. To save and apply the configuration, click **Apply**.

## Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

1. SSH to the NW node and copy the CA certificate located in the following directory:
   */etc/pki/ca-trust/source/*
2. Execute the following command to update the certificates:
   `update-ca-trust`
3. Execute the following command to add the certificate to the java keystore:
   `keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head`
4. Restart the service on the NW node.

**Note:** Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

# Troubleshoot System Configuration

The topics in this section provide troubleshooting information for administrators who are configuring settings that apply across the system in NetWitness.

- Troubleshoot Global Audit Logging
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages
- Troubleshoot Global Notifications

# Troubleshoot Global Audit Logging

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Audit Logging in NetWitness. Look for explanations and solutions in this topic.

After you configure Global Audit Logging, you should test your audit logs to ensure that they show the audit events as defined in your audit logging template. If you cannot view the audit logs on your third-party syslog server or Log Decoder, or the audit logs do not appear as expected, look at the basic troubleshooting suggestions below. If you are still having issues, you can look at the advanced troubleshooting suggestions.

## Basic Troubleshooting

If you cannot view audit logs on a third-party syslog server or Log Decoder:

- Verify that RabbitMQ is up and running.
- Verify the syslog notification server configuration and make sure it is enabled.

  (This configuration is located at (Admin) > System > Global Notifications. Do not select Legacy Notifications.)
- Check the Global Audit Logging configuration.

Configure Global Audit Logging and Verify Global Audit Logs provide instructions. If you are sending audit logs to a Log Decoder:

- Ensure that the Log Decoder is aggregating on the Concentrator on the same host:
  (Admin) > Services > (Select Concentrator) > > View > Config.
- Verify that the latest CEF parser is deployed and enabled.
- Check the audit logging notification template. You must use a CEF template and all logs feeding into the Log Decoder must use a CEF template.

If you are sending audit logs to a third-party syslog server, Ensure that the destination port configured for the third-party syslog server is not blocked by a firewall.

## Advanced Troubleshooting

In order to use Global Audit Logging on your network, RabbitMQ must be functioning.

For centralized audit logging, each of the NetWitness services writes audit logs to rsyslog listening on port 50514 using UDP on the local host. The rsyslog plugin provided in the audit logging package adds additional information and uploads these logs to RabbitMQ. Logstash running on the NetWitness Server host aggregates audit logs from all of the NetWitness services, coverts them to the required format, and sends them to a third-party syslog server or Log Decoder for investigation. You configure the format of the global audit logs and the destination used by Logstash through the NetWitness user interface.

Define a Global Audit Logging Configuration provides instructions.

## Verify the Packages and Services on the Hosts

**NetWitness Host**

The following packages or services must be present on the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- logstash-5.6.4
- rsa-audit-plugins
- rabbitmq server

**Services on a Host other than the NetWitness Host**

The following packages or services must be present on each of the NetWitness hosts other than the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- rabbitmq server

**Log Decoder**

If you forward global audit logs to a Log Decoder, the following parser should be present and enabled:

- CEF

## Possible Issues

**What if I perform an action on a service but audit logs do not reach the configured third-party syslog server or Log Decoder?**

The possible causes could be one or all of the following:

- A service is not logging to the local syslog server.
- Audit logs are not getting uploaded to RabbitMQ from the local syslog.
- Audit logs are not aggregated on the NetWitness Server host.
- Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.

- The Log Decoder is not configured to receive global audit logs in CEF format:
  - Log Decoder capture is not turned on
  - CEF Parser is not present
  - CEF Parser is not enabled

## Possible Solutions

The following table provides possible solutions for the issues.

| Issue | Possible Solutions |
|---|---|
| A service is not logging to the local syslog server. | • Ensure that rsyslog is up and running.<br>You could use the following command:<br>`service rsyslog status`<br>• Ensure that rsyslog is listening on port 50514 using UDP.<br>You could use the following command:<br>`netstat -tulnp\|grep rsyslog`<br>• Ensure the application or component is sending audit logs to port 50514. Run the tcpdump utility on the local interface for port 50514.<br>You could use the following command:<br>`sudo tcpdump -i lo -A udp and port 50514`<br>See "Solution Examples" below to view the command outputs. |
| Audit logs are not getting uploaded to RabbitMQ from the local syslog. | • Ensure that the rsyslog plugin is up and running.<br>You could use the following command:<br>`ps -ef\|grep rsa_audit_onramp`<br>• Ensure the RabbitMQ server is up and running.<br>You could use the following command:<br>`service rabbitmq-server status`<br>See "Solution Examples" to view the command outputs. |
| Audit logs are not aggregated on the NetWitness Server host. | • Ensure Logstash is up and running.<br>You could use the following commands:<br>`ps -ef\|grep logstash`<br>`service logstash status`<br>• Ensure the RabbitMQ server is up and running.<br>You could use the following command:<br>`service rabbitmq-server status`<br>• Ensure the RabbitMQ server is listening on port 5672. |

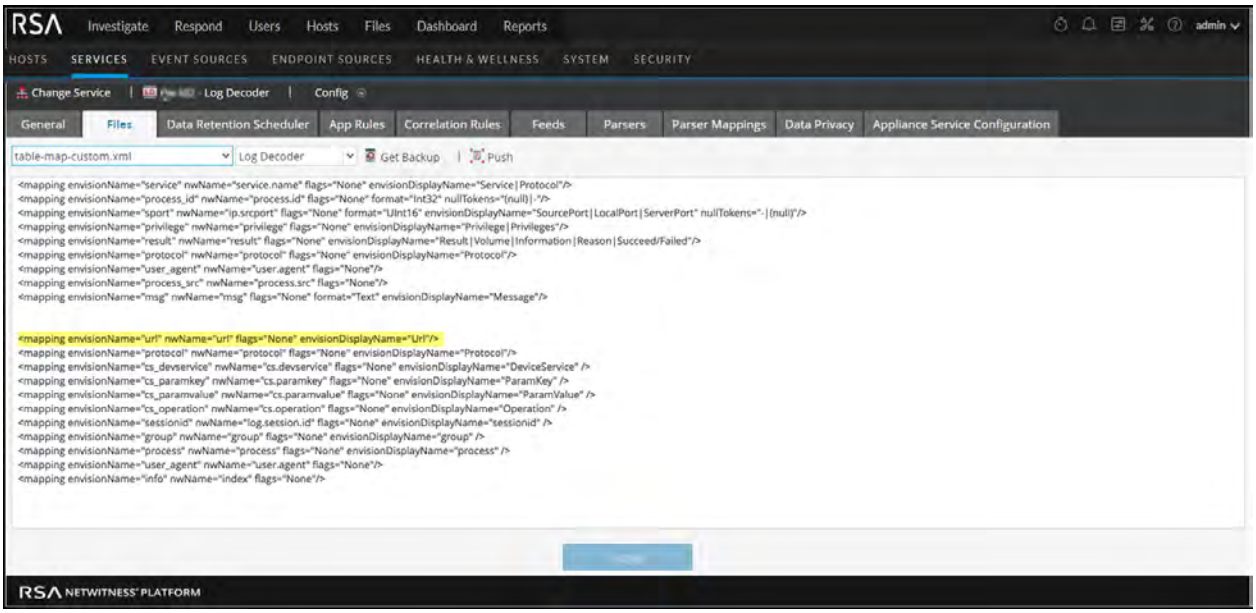
| Issue | Possible Solutions |
|---|---|
| | You could use the following command:<br>`netstat -tulnp\|grep 5672`<br>• Check for any errors generated at the Logstash level.<br>You could use the following command for the location of the log files:<br>`ls -l /var/log/logstash/logstash.*`<br>See "Solution Examples" to view the command outputs. |
| Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder. | • Ensure Logstash is up and running.<br>You could use the following commands:<br>`ps -ef\|grep logstash`<br>`service logstash status`<br>• Check for any errors generated at the Logstash level.<br>You could type the following command for the location of the log files:<br>`ls -l /var/log/logstash/logstash*`<br>See "Solution Examples" below to view the command outputs.<br>• Ensure that the destination service is up and running.<br>• Ensure that the destination service is listening on the correct port using the correct protocol.<br>• Ensure that the configured port on the destination host is not blocked. |
| Audit logs forwarded from the Logstash lead to parse failure at the Log Decoder. | • Ensure that you are using an appropriate notification template.<br>Audit Logs parsed by a Log Decoder must be in CEF format. The destination from which audit logs directly or indirectly make their way to the Log Decoder must also use a CEF Template.<br>• The Notification Template must follow the CEF standard.<br>Follow the steps in this guide to either use the default CEF template or create a custom CEF template following strict guidelines. Define a Template for Global Audit Logging provides additional information.<br>• Verify the Logstash configuration. |

**Why can't we see the custom metadata in Investigation?**

Usually, if a meta key is not visible in Investigation, it is not being indexed. If you need to use custom meta keys for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. Follow the "Maintain the Table Map Files" procedure to modify the **table-map-custom.xml** file on the Log Decoder.

Ensure that the custom meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. "Edit a Service Index File" provides additional information.

The following figure shows an example **table-map-custom.xml** file in NetWitness Server ( (Admin) > Services > (select the Log Decoder) > >View > Config) with a custom meta `url` example highlighted.

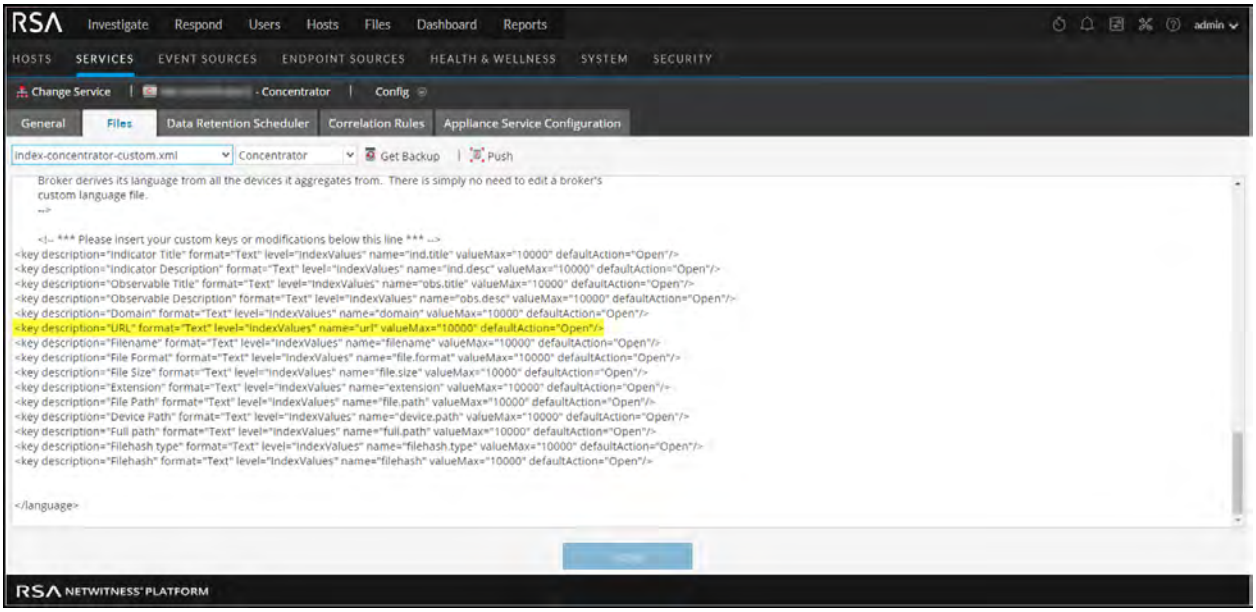


The `url` custom meta example is highlighted in the following code sample from the **table-map-custom.xml** file above:

```
<mapping envisionName="url" nwName="url" flags="None"
envisionDisplayName="Url"/>
<mapping envisionName="protocol" nwName="protocol" flags="None"
envisionDisplayName="Protocol"/><mapping envisionName="cs_devservice"
nwName="cs.devservice" flags="None" envisionDisplayName="DeviceService"
/><mapping envisionName="cs_paramkey" nwName="cs.paramkey" flags="None"
envisionDisplayName="ParamKey" /><mapping envisionName="cs_paramvalue"
nwName="cs.paramvalue" flags="None" envisionDisplayName="ParamValue"
/><mapping envisionName="cs_operation" nwName="cs.operation" flags="None"
envisionDisplayName="Operation" /><mapping envisionName="sessionid"
nwName="log.session.id" flags="None" envisionDisplayName="sessionid"
```

```
/><mapping envisionName="group" nwName="group" flags="None"
envisionDisplayName="group" /><mapping envisionName="process" nwName="process"
flags="None" envisionDisplayName="process" /><mapping envisionName="user_
agent" nwName="user.agent" flags="None"/><mapping envisionName="info"
nwName="index" flags="None"/>
```

The following figure shows an example **index-concentrator-custom.xml** file in NetWitness Server ( (Admin) > Services > (select the Concentrator) > > View > Config) with a custom meta `url` example highlighted.



The `url` custom meta example is highlighted in the following code sample from the **index-concentrator-custom.xml** file above:

```
<key description="Severity" level="IndexValues" name="severity"
valueMax="10000" format="Text"/><key description="Result" level="IndexValues"
name="result" format="Text"/><key level="IndexValues"  name="ip.srcport"
format="UInt16" description="SourcePort"/><key description="Process"
level="IndexValues" name="process" format="Text"/><key description="Process
ID" level="IndexValues" name="process_id" format="Text"/><key
description="Protocol" level="IndexValues" name="protocol" format="Text"/><key
description="UserAgent" level="IndexValues" name="user_agent"
format="Text"/><key description="DestinationAddress" level="IndexValues"
name="ip.dst" format="IPv4"/><key description="SourceProcessName"
level="IndexValues" name="process.src" format="Text"/><key
```

```
description="Username" level="IndexValues" name="username"
format="Text"/><key description="Info" level="IndexValues" name="index"
format="Text"/><key description="customdevservice" level="IndexValues"
name="cs.devservice"  format="Text"/>
<key description="url" level="IndexValues" name="url"  format="Text"/>
<key description="Custom Key" level="IndexValues" name="cs.paramkey"
format="Text"/><key description="Custom Value" level="IndexValues"
name="cs.paramvalue"  format="Text"/><key description="Operation"
level="IndexValues" name="cs.operation"  format="Text"/><key description="CS
Device Service" level="IndexValues" name="cs.device" format="Text"
valueMax="10000" defaultAction="Closed"/>
```

## Solution Examples

The following possible solution examples show the outputs of the example commands. See the above table for the complete listing of possible solutions.

**Ensure that rsyslog is up and running**

You can use the following command:

```
service rsyslog status
```

```
[root@NWAPPLIANCE22574 ~]# service rsyslog status
rsyslogd (pid  1293) is running...
[root@NWAPPLIANCE22574 ~]#
```

**Ensure that rsyslog is listening on port 50514 using UDP**

You can use the following command:

```
netstat -tulnp|grep rsyslog
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep rsyslog
udp        0      0 127.0.0.1:50514           0.0.0.0:*                           1293/rsyslogd
[root@NWAPPLIANCE22574 ~]#
```

**Ensure that the application or component is sending audit logs to port 50514**

The following figure shows the output of running the tcpdump utility on the local interface for port 50514.

You can use the following command:

```
sudo tcpdump -i lo -A udp and port 50514
```

```
[root@NWAPPLIANCE22574 ~]# sudo tcpdump -i lo -A udp and port 50514
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lo, link-type EN10MB (Ethernet), capture size 65535 bytes
08:54:46.536420 IP NWAPPLIANCE22574.34822 > NWAPPLIANCE22574.50514: UDP, length 593

```

**Ensure that the rsyslog plugin is up and running**

You can use the following command:

```
ps -ef|grep rsa_audit_onramp
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep rsa_audit_onramp
root      1636  1293  0 06:05 ?        00:00:03 /usr/sbin/rsa_audit_onramp --node_id=96b08193-a9d0-4a79-b362-87b56851f411
root     22248  6921  0 09:09 pts/0    00:00:00 grep rsa_audit_onramp
[root@NWAPPLIANCE22574 ~]#
```

**Ensure the RabbitMQ server is up and running**

You can use the following command:

```
service rabbitmq-server status
```

```
[root@NWAPPLIANCE22574 ~]# service rabbitmq-server status
Status of node sa@localhost ...
[{pid,1862},
 {running_applications,
     [{rabbitmq_federation_management,"RabbitMQ Federation Management",
         "3.4.2"},
      {rabbitmq_management,"RabbitMQ Management Console","3.4.2"},
      {rabbitmq_web_dispatch,"RabbitMQ Web Dispatcher","3.4.2"},
      {webmachine,"webmachine","1.10.3-rmq3.4.2-gite9359c7"},

 {memory,
```

**Ensure logstash is up and running**

You can use the following commands:

```
ps -ef | grep logstash
service logstash status
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep logstash
logstash  1583     1  0 06:05 ?        00:01:09 /usr/bin/java -Djava.io.tmpdir=/var/lib/logstash -Xmx500m -XX:+UseParNewGC -XX:+UseConcMarkSweepGC -Djava.awt.headless=true -XX:C
MSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -jar /opt/logstash/vendor/jar/jruby-complete-1.7.11.jar -I/opt/logstash/lib /opt/logstash/lib/logstash/runner
.rb agent --pluginpath /opt/logstash -f /etc/logstash/conf.d -l /var/log/logstash/logstash.log
root      8509  6921  0 09:31 pts/0    00:00:00 grep logstash
[root@NWAPPLIANCE22574 ~]# service logstash status
logstash is running
[root@NWAPPLIANCE22574 ~]#
```

**Ensure the RabbitMQ server is listening on port 5672**

For example, type the following command:

```
netstat -tulnp | grep 5672
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep 5672
tcp        0      0 127.0.0.1:5672              0.0.0.0:*                   LISTEN      1862/beam.smp
tcp        0      0 0.0.0.0:25672               0.0.0.0:*                   LISTEN      1862/beam.smp
[root@NWAPPLIANCE22574 ~]#
```

**Check for any errors generated at the Logstash level**

You can type the following command for the location of the log files:

```
ls -l /var/log/logstash/logstash.*
```

```
[root@NWAPPLIANCE22574 ~]# ls -l /var/log/logstash/logstash.*
-rw-r--r--. 1 root     root        0 Apr 24 06:05 /var/log/logstash/logstash.err
-rw-r--r--. 1 logstash logstash 1043 Apr 24 06:04 /var/log/logstash/logstash.log
-rw-r--r--. 1 root     root       57 Apr 24 06:12 /var/log/logstash/logstash.stdout
[root@NWAPPLIANCE22574 ~]#
```

See the Possible Solutions table above for the complete listing of issues and possible solutions.

## Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

This section provides troubleshooting information for issues identified by messages NetWitness displays in the NTP Settings panel and log files.

| Issue | Possible Solutions |
|---|---|
| Message | User Interface: **Unexpected error occurred. First check the logs then contact Customer Care to resolve error.**<br>**System Log:**<br>**Timestamp Level Message**<br>*yyyy-dd-mmThh:mm:ss:ms* ERROR<br>com.rsa.smc.sa.adm.exception.MCOAgent<br>Exception: No request sent, we did not discover any nodes |
| Possible Cause | Low level NetWitness configuration is in error or supporting service is not running. |
| Solution | Contact Customer Care. |
| Message | User Interface: **Specified an invalid Hostname syntax**. |
| Possible Cause | Tried to enter NTP server hostname that does not confirm to IP address or FQDN syntax. |
| Solution | Reenter hostname in using correct syntax. |
| Message | User Interface: **Specified NTP server that already exists.** |
| Possible Cause | Tried to enter NTP server hostname that is already defined in NetWitness. |
| Solution | Enter hostname for an NTP server not configured in NetWitness. |
| Message | User Interface: **Cannot reach NTP server *hostname***. Please verify the server address and your firewall settings. |
| Possible | The server address or firewall settings may be in error. |

| Issue | Possible Solutions |
|---|---|
| Cause | |
| Solution | Verify the server address and your firewall settings and correct them if required. |

## Troubleshoot Global Notifications

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Notifications in NetWitness.

| Issue | Possible Solution |
|---|---|
| **We are not receiving notifications** that were configured for a service, but the service log file does not show any errors. | For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification.<br><br>For example, when troubleshooting ESA rule notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`).<br>If the `integration-server.log` file shows a failure when the Integration-Server attempts to send a notification to the notification server, you should check the notification server configuration in the Global Notifications settings ( **(Admin) > System > Global Notifications > Servers** tab). |

# References

This topic provides reference materials that describe the user interface for configuring system settings in NetWitness and define parameters. Administrators use options in the Administration System view to configure system settings. Each panel is described in a separate topic.

# Global Audit Logging Configurations Panel

In the **Global Audit Logging Configurations** panel ( (Admin) > System > Global Auditing), you configure global audit logging by adding configurations that define how global audit logs are forwarded to external syslog systems. Global audit logs are forwarded to the selected Notification Server in your global audit logging configuration using the selected Notification Template.

Global Audit Logging provides auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location.

## Workflow

This workflow shows the necessary procedures to configure and verify Global Audit Logging.

Before you can define a Global Audit Logging configuration, you need to create a Syslog Notification Server on the Global Notifications > Server tab. The Syslog Notification Server is the destination that receives the global audit logs. Next, you need to select or define an Audit Logging template on the Global Notifications > Templates tab. The Audit Logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server. If you are consuming with a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

**Note:** You do not need to configure the Global Notifications > Output tab for Global Audit Logging.

After you add a Global Audit Logging configuration here, audit logs are forwarded to the selected Notification Server in the configuration. Verify your audit logs to ensure that they show the audit events as defined in your audit logging template.

## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Create a Syslog Notification Server. | Configure a Destination to Receive Global Audit Logs |
| Administrator | Choose an Audit Logging template. | Define a Template for Global Audit Logging |

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Global Audit Logging | Define a Global Audit Logging Configuration<br>For the complete procedure, see "Global Audit Logging - High-Level Procedure" in Configure Global Audit Logging. |
| Administrator | Verify Global Audit logs | Verify Global Audit Logs |

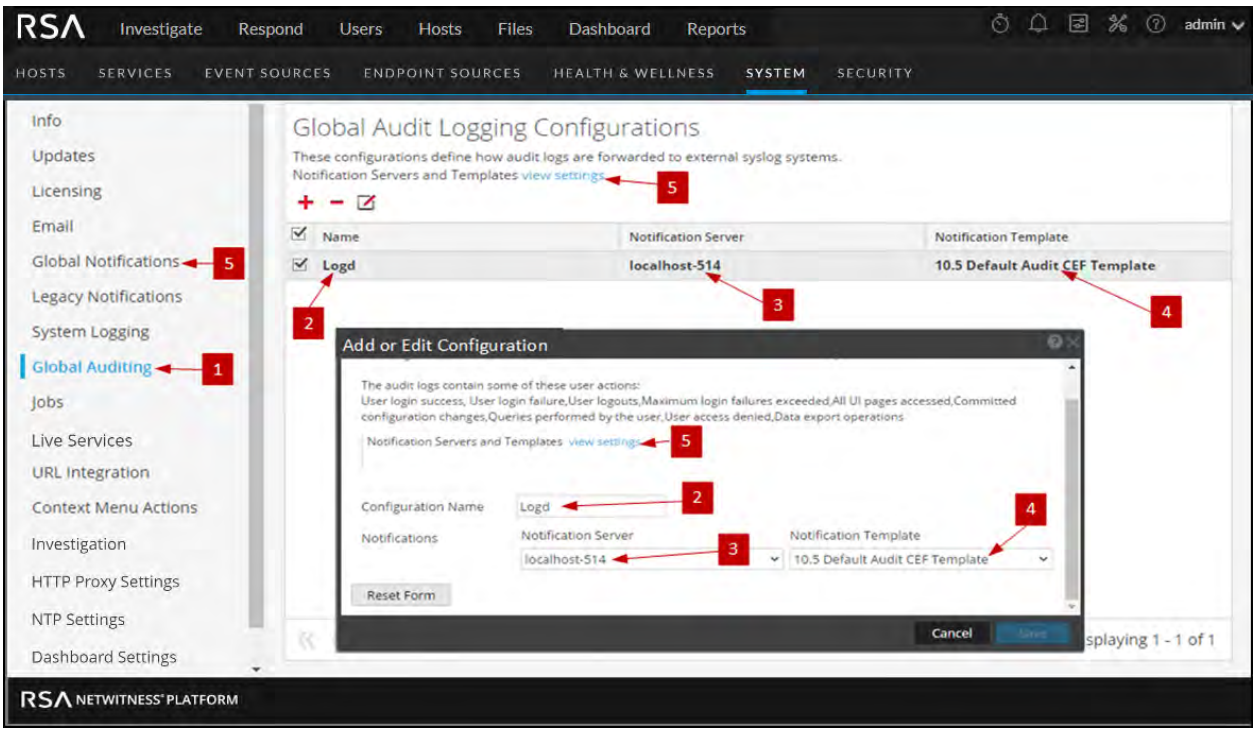
## Quick Look

The following example illustrates a Global Audit Logging configuration. The configuration defines how NetWitness forwards global audit logs to external syslog systems.



1 Displays the Global Audit Logging Configurations panel.
2 Name that identifies the Global Audit Logging configuration.

| | |
|---|---|
| 3 | Notification Server assigned to the Global Audit Logging configuration. |
| 4 | Notification Template assigned to the Global Audit Logging configuration. |
| 5 | Displays the Global Notifications panel where you set up Servers and Templates required to configure a Global Audit Logging configuration. |

## Toolbar

The following table describes the toolbar actions

| Icon | Description |
|---|---|
| | Adds a global audit logging configuration. |
|  | Deletes a global audit logging configuration. Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued. |
| | Edits a global audit logging configuration. You can change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You cannot change which NetWitness user actions are logged and sent in the global audit logs. |

## Configurations

The following table describes the listed configurations.

| Title | Description |
|---|---|
| | To select an individual configuration, select the checkbox next to the configuration.<br>To select all configurations, select the checkbox in the title bar of the table. |
| Name | Displays the name of the global auditing configuration. For example, you can name the configurations based on the destination of the global audit logs, such as HQ SA and My Syslog Server. |
| Notification Server | Displays the Syslog Notification Server selected as the destination for the global audit logs. If you want to forward global audit logs to a Log Decoder, create a Syslog type of Notification Server. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging. |

| Title | Description |
| --- | --- |
| Notification Template | Displays the Audit Logging Notification Template selected for the configuration. It defines the format and message fields of the audit log entries.<br>For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the available CEF meta keys.<br>For, third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available meta key variables. |

## Add New Configuration Dialog

In the NetWitness Administration System view Global Audit Logging Configurations panel, you can create multiple global audit logging configurations. These configurations are used to forward global audit logs to a central location to perform user audits.

Procedures related to global audit logging are described in Configure Global Audit Logging.

To access the **Add New Configuration** dialog:

1. Go to select **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, click .

   The **Add New Configuration** dialog is displayed.

   The Notifications section enables you to select a syslog notification server for the global audit logging configuration and a template to use for the global audit logs. The template defines the details of the global audit log entries.

### Features

The following table describes the features in the Add New Configuration and Edit Configuration dialogs.

| Feature | Description |
|---|---|
| Notifications Servers and Templates **view settings** link | Takes you to the Global Notifications panel where you can view or configure the notification server and template settings. A syslog notification server and an audit logging template are required before you can create a global audit configuration. |
| Configuration Name | Specifies the unique name used to identify the global audit logging configuration. |
| Notification Server | Specifies the syslog notification server to send the selected audit log information. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging. |
| Notification Template | Specifies the template to use for the global audit logging configuration.<br>The template should be an Audit Logging template.<br>For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions.<br>For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables. |
| **Reset Form** button | Clears the configuration settings in the dialog. |

## User Actions Logged

The following table provides examples of some of the user actions logged from NetWitness. These actions are the minimum user actions logged when applicable.

| User Action | Example |
|---|---|
| User login success | A user logs on with valid credentials. |
| User login failure | A user tries to log on using invalid credentials. |
| User logouts | A user logs out from NetWitness (Administration > Sign Out) or a user logs out due to a session timeout. |
| Max login failures exceeded | A user tries to log on using invalid credentials five times. Five (5) is the number of Max Login Failures defined in Administration Security view > Settings tab (Administration > Security > Settings tab). |
| All UI pages accessed | When a user accesses the Reporting module (Administration > Reports), it logs as `[REP] Reports`. When a user accesses the Administration System view (Administration > System), it logs as `[ADM] System`. |

| User Action | Example |
|---|---|
| Committed configuration changes | A user changes his or her password and or any security setting (Administration > Security > Settings tab). |
| Queries performed by the user | A user performs an investigation query. |
| User access denied | A user tries to access a module and does not have permissions to access it. |
| Data export operations | A user exports data from the Events view (Investigation > Events > Actions > Export). |

The following table shows examples of internal audit logs logged from NetWitness

| User Actions | Audit Log Examples |

For lists of message type being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

# Supported CEF Meta Keys

This topic describes the Common Event Format (CEF) meta keys that NetWitness global audit logging supports.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions and custom extensions in a (Key=Value) format from the meta key table below.
- Ensure that the extensions and custom extensions are in the `key=%{string}<space>key=%{string}` format.

For third-party syslog servers, you can define your own format (CEF or non-CEF).

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

## Supported Common Event Format (CEF) Meta Keys

The following table describes the CEF Syslog meta keys that NetWitness global audit logging supports. The Datetime and Hostname fields in the Syslog Prefix are not configurable and not included in the template, but they are prepended to every log message by default. The CEF Header is required to conform to the CEF standard and for any CEF parser. The Extensions and Custom Extensions are optional. The Default Audit CEF Template contains many of the fields in this table. You can add any of the Extensions and Custom Extensions listed to the global audit logging template that you define.

| CEF Field | String | Description | NW Meta Keys | Index in Log Decoder |
|---|---|---|---|---|
| **Syslog Prefix** | | | | |
| Datetime | Not Configurable | Syslog Header date time | event.time.str | Transient |
| Hostname | Not Configurable | Syslog Header hostname | alias.host | None |
| **CEF Header** | | The CEF Header fields are required to conform to the CEF standard and for any CEF parser. | | |
| CEF:Version | CEF:0 | CEF Header | --STATIC-- | N/A |
| DeviceVendor | %{deviceVendor} | The product vendor, RSA | - | N/A |
| DeviceProduct | %{deviceProduct} | The product family. This is always NetWitness Audit. | product | Transient |
| DeviceVersion | %{deviceVersion} | Host/Service version | version | Transient |

| CEF Field | String | Description | NW Meta Keys | Index in Log Decoder |
|---|---|---|---|---|
| Signature ID | %{category} | Identifier of the audit event. It specifies the the category of the audit event. | event.type | None |
| Name | %{operation} | Description of the event | event.desc | None |
| Severity | %{severity} | Severity of the audit event | severity | Transient |
| **Extensions** | | | | |
| deviceExternalId | %{deviceExternalId} | Unique ID of the host or service generating the audit event | hardware.id | Transient |
| deviceFacility | %{deviceFacility} | Syslog facility used when writing the event to syslog daemon. For example, authpriv. | cs.devfacility | Custom |
| deviceProcessName | %{deviceProcessName} | Name of the executable corresponding to dvcpid | process | None |
| dpt | %{destinationPort} | Destination Port | ip.dstport | None |
| dst | %{destinationAddress} | Destination IP Address | ip.dst | None |
| dvcpid | %{deviceProcessId} | ID of the process generating the event, which is the process ID of the NetWitness service | process.id | Transient |
| msg | %{text} | Free text, extra information, or actual description for the event | msg | Transient |
| outcome | %{outcome} | Outcome of the operation performed corresponding to the audit event | result | Transient |
| tpt | %{transportProtocol} | Network protocol used | protocol | Transient |
| userAgent | %{userAgent} | Browser detail of the user accessing the page | user.agent | Transient |
| rt | %{timestamp} | Time at which the event is reported | event.time | None |
| sourceServiceName | %{deviceService} | The service that is responsible for generating this event | service.name | Transient |

| CEF Field | String | Description | NW Meta Keys | Index in Log Decoder |
|---|---|---|---|---|
| spt | %{sourcePort} | Source Port | ip.srcport | Transient |
| userRole | %{userRole} | User role permissions assignment. For example: admin.owner, appliance.manage, connections.manage, everyone, logs.manage, services.manage, storedproc.execute, storedproc.manage, sys.manage, users.manage | user.role | Transient |
| src | %{sourceAddress} | Source IP Address | ip.src | None |
| suser | %{identity} | Identity of the logged on user responsible for generating the audit event | user.dst | None |
| **Custom Extensions** | | | | |
| params | %{parameters} | API and Operation parameters, which capture specific parameters about a query | index | Transient |
| paramKey | %{key} | A configuration item key. It is the config param for which the audit event is captured.<br>For example: /sys/config/stat.interval | obj.name | None |
| paramValue | %{value} | A configuration value. It is the value captured during the update. | no meta key | Custom |
| userGroup | %{userGroup} | Role assignment. For example: Administrators, Analysts, MalwareAnalysts, Malware_Analysts, Operators, PRIVILEGED_CONNECTION_AUTHORITY, SOC_Managers | group | None |

| CEF Field | String | Description | NW Meta Keys | Index in Log Decoder |
|---|---|---|---|---|
| referrerURL | %{referrer} | The parent URL that refers to the current URL | referer | None |
| sessionId | %{sessionId} | Session or connection identifier | log.session.id | Transient |
| remoteAddress | %{remoteAddress} | Ip address of the destination | ip.src | None |
| reasonForFailure | %{reasonForFailure} | reason for failure for the certain action performed | result | None |
| reason | %{reason} | Reason for certain action performed | result | None |
| addRole | %{Add.Role} | User role Assignment | user.role | Transient |
| id | %{id} | Incident id or host id | no meta key | Transient |
| arguments | %{arguments} | Value passes between programs or functions | index | Transient |
| uri | %{uri} | Directory | directory | None |
| user | %{User} | Name of the user from the source or destination | user.dst | None |
| accountProvider | %{AccountProvider} | Authentication account for the user. For example, PAM, and PKI. | index | Transient |
| file | %{file} | Name of the content file used for deployment | filename | File |
| deviceIDs | %{deviceIDs} | Device id for the particular service | hardware.id | Transient |
| role | %{Role} | User role assignment | user.role | Transient |
| account | %{Account} | user account | user.dst | None |
| addPermission | %{Add.Permission} | User role permission assignment | permissions | Transient |
| key | %{Key} | Name of a configuration/rule | obj.name | None |
| value | %{Value} | Value of a configuration change. For example, "Value":"HR12". In this example, hours format is changed to 12 hours. | no meta key | Custom |

| CEF Field | String | Description | NW Meta Keys | Index in Log Decoder |
|---|---|---|---|---|
| alert | %(alert} | Id of the alert, For example, id:5ce457afec6c0f02ffb85ace | alert | Transient |
| moduleSettings | %{ModuleSettings} | Message or name of a setting | index | Transient |
| incident | %{incident} | Id of the incident. For example, INC-313 | context | None |
| action | %{action} | Action performed by the user. For example, service.stop | action | None |
| notificationBinding | %{NotificationBinding} | Type of notification. For example, incident created, alert, incident removed | index | Transient |
| name | %{name} | name of a configuration or rule | alert | Transient |
| enabled | %{enabled} | Enable the rule | no meta key | Custom |
| disabled | %{disabled} | Disable the rule | no meta key | Custom |

**Note:** Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between a value and a tagname.

By default, all meta keys are not indexed. In the above table, the **Index in Log Decoder** column shows the state of the `flags` keyword (Transient, None, and Custom). If a key is set to `Transient`, it is parsed but not stored in the database. If it is set to `None`, it is indexed and stored in the database. A key listed as "Custom" does not exist in the table-map.xml file and, therefore, it is not stored or parsed at all.

For more information, see the following documentation:

- The "Maintain the Table Map Files" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides instructions for verifying and updating the table mappings.
- The "Edit a Service Index File" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides information on updating the custom index file on the Concentrator.

# Supported Global Audit Logging Meta Key Variables

This topic describes the meta key variables that NetWitness global audit logging supports.

NetWitness provides predefined global audit logging templates that you can use for your global audit logging configurations. For third-party syslog servers, you can define your own template format (CEF or non-CEF) using supported meta key variables.

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

## Supported Global Audit Logging Meta Key Variables

The following table describes the meta key variables that NetWitness global audit logging supports. Use these values to create a custom audit logging template for a third-party syslog server.

| Variable | Description |
|---|---|
| %{category} | Identifier of the audit event. It specifies the the category of the audit event. |
| %{destinationAddress} | Destination IP Address |
| %{destinationPort} | Destination Port |
| %{deviceExternalId} | Unique ID of the service generating the audit event |
| %{deviceFacility} | Syslog facility used when writing the event to syslog daemon. For example, authpriv. |
| %{deviceProcessId} | ID of the process generating the event, which is the process ID of the NetWitness service |
| %{deviceProcessName} | Name of the executable corresponding to dvcpid |
| %{deviceProduct} | The product family. This is always NetWitness Audit. |
| %{deviceService} | Service responsible for generating the event |
| %{deviceVendor} | The product vendor, RSA |
| %{deviceVersion} | Host/Service version |
| %{identity} | Identity of the logged on user responsible for generating the audit event |
| %{key} | A configuration item key. It is the config param for which the audit event is captured. |
| %{operation} | Description of the event |

| Variable | Description |
|---|---|
| %{outcome} | Outcome of the operation performed corresponding to the audit event |
| %{parameters} | API and Operation parameters, which capture specific parameters about a query |
| %{referrerUrl} | The parent URL that refers to the current URL |
| %{sessionId} | Session or connection identifier |
| %{severity} | Severity of the audit event |
| %{sourceAddress} | Source IP Address |
| %{sourcePort} | Source Port |
| %{sourceService} | The service that is responsible for generating this event |
| %{text} | Free text, extra information, or actual description for the event |
| %{timestamp} | Time at which the event is reported |
| %{transportProtocol} | Network protocol used |
| %{userAgent} | Browser detail of the user accessing the page |
| %{userGroup} | Role assignment |
| %{userRole} | User role permissions assignment |
| %{value} | A configuration value. It is the value captured during the update |

# Global Audit Logging Operation Reference

This topic lists message types being logged by the various NetWitness components. Most messages plainly state the operation being logged; when necessary the meaning of the message is explained.

After you create a global audit logging configuration, audit logs automatically go to the external syslog system in the format specified in the selected audit logging template. The message types being logged by the various NetWitness components are shown in the following tables.

## CARLOS

The following table lists the operations logged by CARLOS.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | SetProviderConfiguration | A new notification server (for example, SMTP server) was added or updated |
| 2 | SetInstanceConfiguration | A new notification type (for example, email destination) was added or updated |
| 3 | SetTemplateDefinition | A new template was added or updated |
| 4 | RemoveProviderConfiguration | A notification server was removed |
| 5 | RemoveInstanceConfiguration | A notification type was removed |
| 6 | RemoveTemplateDefinition | A template definition was removed |
| 7 | Commit | A configuration bean change was committed |
| 8 | Set | A JMX property value was set via NetWitness Explore view |

## ESA

The following table lists the operations logged by the Event Stream Analysis (ESA).

| Serial # | Operation Name | Meaning |
|---|---|---|
| 9 | SetSourceRequest | A concentrator was added or updated to ESA as source |
| 10 | RemoveSourceRequest | A concentrator was removed from ESA as source |
| 11 | SetEplModule | An EPL module was deployed or updated to ESA |
| 12 | RemoveEplModule | An EPL module was removed from ESA |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 13 | SetEnrichmentSourceRequest | An ESA enrichment source was added/updated |
| 14 | RemoveEnrichmentSourceRequest | An ESA enrichment source was removed |
| 15 | SetDatabaseReference | An enrichment database reference was made to ESA |
| 16 | UpdateEnrichmentData | Data rows added to an ESA enrichment source |
| 17 | SetEnrichmentConnection | A connection was made between an EPL module and an enrichment source |
| 18 | RemoveEnrichmentConnection | A connection between an EPL module and an enrichment source was removed |
| 19 | DisableTrialModule | ESA Trial rules were disabled |

## Investigation

The following table lists the operations logged by Investigations.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | VisualizePreferences | Operations related to Informer Visualization Request. |
| 2 | ParallelCoordinates | Operations related to Loading of Co-Ordinate View Navigation. |
| 3 | TimeLine | Operations related to Loading of Timeline View Navigation. |
| 4 | ExteralQuery | Operation when a Direct Query is fired via URL. |
| 5 | PrintView | Operations to open Investigation in Print View. |
| 6 | submitExtractFiles | Operation to submit a Request to Extract files from Sessions. |
| 7 | submitExtractLogs | Operation to submit a Request to Extract Logs from Sessions. |
| 8 | submitExtractPcap | Operation to submit a Request to Extract Sessions from Sessions. |
| 9 | DataScienceDrill | Operation to investigate from Data Science Report. |
| 10 | breadCrumbs | Operation to access the Query Breadcumbs. |
| 11 | Create | Operation when a new Investigation Query is being saved as a predicate to be used for URL Integration. |
| 12 | userPredicates | Operation to access Recent Queries of a user. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 13 | chartDefaultMetas | Operation to access last used Meta for generating Coordinate Chart. |
| 14 | defaultDevice | Operation to access the Default Investigation Device. |
| 15 | deleteDefaultDevice | Operation to delete the Default Investigation Device. |
| 16 | chartPreferences | Operation to edit an Investigation Navigation Chart Parameters such as Height. |
| 17 | devicePreferences | Operation to save the preferences about the Investigation Device such asTime Range, Profile, Meta Groups etc. |
| 18 | topValues | Operation to get the Top Values for Metas. Normally called from Top Values Dashlet. |
| 19 | MetaLanguages | Operation to read the Meta Languages from a Device. |
| 20 | MetaGroups | Operations related to Investigation Meta Groups. |
| 21 | DefaultMetaKeys | Operations related to Investigation Default Meta Keys. |
| 22 | UpdateDefaultMetaKeys | Operations to update Investigation Default Meta Keys. |
| 23 | UpdateMetaGroup | Operations to update Investigation Meta Groups. |
| 24 | ApplyMetaGroup | Operations to use Investigation Meta Groups. |
| 25 | DeactivateMetaGroup | Operations to reset Investigation Meta Groups in UI. |
| 26 | DeleteMetaGroup | Operations to remove Investigation Meta Group. |
| 27 | DeleteMetaGroups | Operations to remove multiple Investigation Meta Groups. |
| 28 | ImportMetaGroups | Operations to import Investigation Meta Groups. |
| 29 | ExportMetaGroup | Operations to export multiple Investigation Meta Groups. |
| 30 | GeoMap | Operation to access the Geo Map View of Investigation. |
| 31 | deleteEndpointCache | Operation to clear Reconstruction Cache of a Device. |
| 32 | delete | Operation to delete Alert Templates. |
| 33 | CustomColumnGroup | Operation to apply or read Custom Column Group. |
| 34 | Import | Operations related to Import of Column Group or Profiles. |
| 35 | Export | Operations related to Export of Column Group or Profiles. |
| 36 | SaveProfile | Operation to save an Investigation Profile. |
| 37 | ApplyProfile | Operation to apply an Investigation Profile. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 38 | DeactivateProfile | Operation to deactivate an Investigation Profile. |
| 39 | DeleteProfile | Operation to delete an Investigation Profile. |
| 40 | DeleteProfiles | Operation to delete multiple Investigation Profiles. |

## Reporting Engine

The following table lists the operations logged by the Reporting Engine.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | TEMPLATE | For all operations related to template |
| 2 | CHART | For all operations related to chart |
| 3 | REPORT | For all operations related to report |
| 4 | RULE | For all operations related to rule |
| 5 | IMAGE | For all operations related to Logo Images used in Reports. |
| 6 | LIST | For all operations related to list |
| 7 | ALERT | For all operations related to alert |
| 8 | CONFIG | For all operations related to configuration change |
| 9 | SCHEDULE | For all operations related to schedule |
| 10 | ROLE | For all operations related to role/authorization |
| 11 | BATCH_JOB | For all operations related to batch jobs |
| 12 | SCHEDULER | For all operations related to scheduler |
| 13 | QUERYPROCESSOR | For all operations related to queryprocessor |
| 14 | FORMATTER | For all operations related to formatter |
| 15 | OUTPUTACTION | For all operations related to outputaction |
| 16 | STATUSMANAGER | For all operations related to statusmanager |
| 17 | BATCH_RUNDEF | For all operations related to batch rundef |
| 18 | CHARTGROUP | For all operations related to chart group |
| 19 | REPORTGROUP | For all operations related to report group |
| 20 | RULEGROUP | For all operations related to rule group |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 21 | LISTGROUP | For all operations related to list group |
| 22 | DISKSPACE | For all operations related to disk space |

## Warehouse Connector

The following table lists the operations logged by the Warehouse Connector.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | LockBox Password Create | Operation to create LockBox Password. |
| 2 | LockBox Password Update | Operation to update LockBox Password. |
| 3 | LockBox Password Refresh | Operation to refresh LockBox Password. |
| 4 | Adding Stream | Operation to add a Stream. |
| 5 | Adding Source | Operation to add a Source. |
| 6 | Adding Destination | Operation to add a Destination. |
| 7 | Removing | Operation to remove a Source, Stream, or Destination. |
| 8 | Changing Password | Operation to change the Password. |
| 9 | Updating Source | Operation to update a Source. |
| 10 | Adding Source to Stream | Operation to add a Source to a Stream. |
| 11 | Deleting Source from Stream | Operation to delete a Source from a Stream. |
| 12 | Setting Destination to Stream | Operation to set a Destination to a Stream. |
| 13 | Finalizing Stream | Operation to finalize a Stream and initiate the aggregation. |
| 14 | Stopping Stream | Operation to stop a Stream. |
| 15 | Starting Stream | Operation to start a Stream. |
| 16 | Reloading Stream | Operation to reload a Stream. |

## Health & Wellness

The following table lists the operations logged by Health & Wellness.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | SavePolicyRequest | Operation while adding or modifying a Policy. |
| 2 | RemovePolicyRequest | Operation while removing a Policy. |

## NetWitness Core Services

The following table lists the operations logged by NetWitness Core Services.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | FILE-Command | Operation to list, retrieve and delete files from approved directories on this device. |
| 2 | SERVICE-Start | Service started |
| 3 | SERVICE-Stop | Service stopped |
| 4 | REDIRECT-Syslog | Operation for syslog forwarding. |
| 5 | ADD-Monitor | Issuing a filesystem monitor operation |
| 6 | DELETE-Monitor | Issuing a filesystem monitor deletion operation |
| 7 | SHUTDOWN-Service/shutdown.service | Shutting down appliance service |
| 8 | REBOOT-Service | Restarting appliance service |
| 9 | CONFIGURE-Network | Issuing Network Configuration change |
| 10 | SET-NTP | Issuing NTP set operation |
| 11 | STOP-NTP | Issuing NTP stop operation |
| 12 | NTP-Timesync | Issuing NTP time sync operation |
| 13 | SET-SNMP | Issuing SNMP set |
| 14 | UPGRADE/upgrade | Issuing upgrade operation |
| 15 | create.collection | Operation to create an empty collection. |
| 16 | restore | Issuing restore |
| 17 | session.aggregation | Issuing aggregation start/stop |
| 18 | add.device | Adding a device for aggregation |
| 19 | edit.device | Editing a device used for aggregation |
| 20 | delete.device | Deleting a device used for aggregation |
| 21 | capture.start | Starting capture operation |
| 22 | capture.stop | Stopping capture operation |
| 23 | select.interface | Selecting capture interface |
| 24 | export | Operation to export packets or sessions. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 25 | reload | Issuing a parser reload |
| 26 | schema | Issuing a schema request for loaded parsers |
| 27 | upload/file.upload | Issuing file upload |
| 28 | notify | Issuing feed notify |
| 29 | delete | Issuing file deletion |
| 30 | edit.config | Configuration change operation |
| 31 | parsers.transforms | Perform a language key transformation |
| 32 | data.reset | Data reset operation |
| 33 | timeout | REST request timeout |
| 34 | cancel | Cancel a running query |
| 35 | timeroll | Operation to delete the database files that exceed a given limit. |
| 36 | dump | Operation to dump information out of the database in nwd formatted files. |
| 37 | session.wipe | Issuing a session wipe operation |
| 38 | REPLACE-Rule | Issuing a rule replace operation |
| 39 | MERGE-Rule | Issuing a rule merge operation |
| 40 | ERASE-Rule | Issuing deletion of a set of all rules |
| 41 | ADD-Rule | Issuing a rule addition operation |
| 42 | DELETE-Rule | Issuing deletion of a set of rules |
| 43 | sdk.info | Issuing SDK summary info. |
| 44 | sdk.session | Issuing SDK session info. |
| 45 | sdk.language | Issuing SDK language |
| 46 | sdk.aliases | Issuing SDK alias request |
| 47 | sdk.transform | Issuing SDK transformation request |
| 48 | sdk.search | Issuing session content search request |
| 49 | sdk.cache | Operation related to session content cache |
| 50 | sdk.content | Issuing session content request |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 51 | check.authorization | Operation to check user roles for permissions to execute an operation. |
| 52 | close.connection | Issuing a connection close operation |
| 53 | handshake | Issuing an SSL handshake |
| 54 | logon/login | Operation to login from NW to the other services, mostly to privileged users. |
| 55 | STOREDPROCOP | Issuing file upload cancel/start |
| 56 | ADD-Task | Added scheduled task |
| 57 | DELETE-Task | Deleted scheduled task |
| 58 | logoff | Issuing logout operation |
| 59 | list.cacerts | Issuing list trusted CA certificate operation |
| 60 | delete.cacerts | Issuing delete trusted CA certificate operation |
| 61 | add.cacerts | Issuing addition of trusted CA certificate operation |
| 62 | restart.command | Issuing restart command line option |
| 63 | delete.file/file.delete | Operation to delete system configuration files. |
| 64 | update.file/file.update | Operation to update system configuration file. |
| 65 | create.file | Issuing file creation operation |
| 66 | query | Issue a database query |
| 67 | unlock | Issuing unlock user account operation |
| 68 | user.add | Operation to create user accounts on individual devices. |
| 69 | user.delete | Operation to delete a user on individual devices. |
| 70 | group.create | Operation to add a new group to the system. |
| 71 | user.remove | Remove a user account from a group |
| 72 | group.delete | Delete a group from the /users/groups tree |
| 73 | add.user | Issuing add user command to collection |
| 74 | delete.user | Issuing delete user command to collection |
| 75 | remove.user | Removing an user from collection |
| 76 | collection.open | Issuing an open command for a collection |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 77 | collection.close | Issuing a close command for a collection |
| 78 | collection.delete | Issuing collection deletion command |
| 79 | reingest.start | Operation to start reingesting of packet data in collection. |
| 80 | feed.notify | Issuing a feed notify command |
| 81 | collect | Issuing a collect command |
| 82 | collect.start | Issuing a data collection start |
| 83 | collection.global | Issuing import parser command |
| 84 | parser.reload | Issuing parser reload command |
| 85 | reingest | Operation to reingest packet data in collection. |
| 86 | collection.create | Issuing a create collection command |
| 87 | collection.restore | Issuing a restore collection command |
| 88 | collection.clone | Issuing a clone collection command |
| 89 | parser.reload | Issuing parser reload command |
| 90 | sdk.query | Performs a query against the meta database |
| 91 | sdk.msearch | Search for pattern matches in many sessions or packets |
| 92 | sdk.values | Performs a value count query and returns the matching values for a report |
| 93 | sdk.timeline | Returns the count of sessions/size/packets in discrete time intervals |

## Malware Analysis

The following table lists the operations logged by the Malware Analysis (MA) component.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | GetDashBoardSummaryRequest | Get dashboard analysis statistics |
| 2 | GetFileScoreSummaryRequest | Get aggregated file scores by score type and risk level |
| 3 | CountEventsAndFilesRequest | Get count of events and files over a time frame |
| 4 | GetAvVendorDetectionRequest | Get AV vendor analysis results |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 5 | GetAVVendorsRequest | Get list of AV Vendors supported |
| 6 | SetInstalledAVVendors | Request Update list of installed AV Vendors in config |
| 7 | CountEventByCriteriaRequest | Count events by criteria |
| 8 | FindEventByIdRequest | Get event by id |
| 9 | FindEventByCriteriaRequest | Get event by criteria |
| 10 | DeleteEventRequest | Delete event |
| 11 | CommentOnEventRequest | Add comment to event |
| 12 | ReSubmitEventRequest | Resubmit event for analysis |
| 13 | FindEventScoreByIdRequest | Get event score by event id |
| 14 | FindEventScoreByCriteriaRequest | Get event score by criteria |
| 15 | FindMetaByIdRequest | Get meta by id |
| 16 | FindMetaByCriteriaRequest | Get meta by criteria |
| 17 | FindMetaValueByCriteriaRequest | Get meta value by criteria |
| 18 | CountByDistinctMetaValueRequest | Count distinct meta values |
| 19 | CountByMetaNameAndValueWithDate RangeIntervalRequest | Count meta and values with interval for charting |
| 20 | CountByValueAndAverageOverallScore Request | Count meta and map to overall scores for events |
| 21 | CountByValueAndAverageGroupScore Request | Count meta and map to group scores for events |
| 22 | CountFileEntryByCriteriaRequest | Count files by criteria |
| 23 | FindFileEntryByIdRequest | Get file by id |
| 24 | FindFileEntryByCriteriaRequest | Get file by criteria |
| 25 | ReSubmitFileEntryRequest | Resubmit file for analysis |
| 26 | FileDownloadRequest | Download file from repository |
| 27 | FileUploadRequest | Upload file for analysis |
| 28 | FindFileScoreByIdRequest | Get file score by id |
| 29 | FindFileScoreByCriteriaRequest | Get file score by criteria |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 30 | FindHashValueByIdRequest | Get whitelist/blacklist Hash value by id |
| 31 | FindHashValueByCriteriaRequest | Get whitelist/blacklist Hash value by criteria |
| 32 | AddHashValueRequest | Add whitelist/blacklist Hash value |
| 33 | UpdateHashValueRequest | Update whitelist/blacklist Hash value |
| 34 | DeleteHashValueRequest | Delete whitelist/blacklist Hash value |
| 35 | FindHashValueByMd5Request | Find whitelist/blacklist Hash value by md5 |
| 36 | AddHashValueInFileRequest | Add File to repository as well as hash value |
| 37 | GetDefaultRulesRequest | Get default IOC Rules configuration |
| 38 | ResetToDefaultRulesRequest | Reset IOC Rules configuration to default |
| 39 | GetAllOverrideRulesRequest | Get IOC Rules user created override configuration |
| 40 | FindOverrideRuleByIdRequest | Find IOC override rule by id |
| 41 | AddOverrideRuleRequest | Add IOC override rule |
| 42 | UpdateOverrideRuleRequest | Update IOC override rule |
| 43 | DeleteOverrideRuleRequest | Delete IOC override rule |
| 44 | SubmitOnDemandNextGenRequest | Submit new ondemand nextgen scan |
| 45 | FindOnDemandJobEntryByIdRequest | Get ondemand job entity by id |
| 46 | FindOnDemandJobEntryByCriteria Request | Get ondemand job entity by criteria |
| 47 | GetOnDemandJobInfoRequest | Get ondemand job reference entity by id |
| 48 | GetOnDemandDefaultConfiguration | Request Get ondemand default configuration |
| 49 | CancelOnDemandJobRequest | Cancel ondemand job in progress |
| 50 | DeleteOnDemandJobRequest | Delete ondemand job |
| 51 | ReSubmitOnDemandJobRequest | Resubmit ondemand job |
| 52 | SubscriptionRequest | Subscribe to MA Cloud communication |
| 53 | UnSubscribeRequest | Unsubscribe from MA Cloud communication |
| 54 | GetTopEventInfluencesRequest | Get Top N event influences |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 55 | GetServerInfoRequest | Get server info, such as server time |
| 56 | DataResetRequest | Reset database |
| 57 | OnDemandJobStatusNotification | Report ondemandjob progress to subscribers |
| 58 | LicenseStatusNotification | Report license status - num samples analyzed |
| 59 | DataResetNotification | Report that data was reset |
| 60 | GetIocSummaryRequest | Get IOC rules aggregated by event/file scores |
| 61 | FindAlertTemplatesByCriteriaRequest | Get rabbitmq alert templates by criteria |
| 62 | SaveAlertTemplateRequest | Update alert template |
| 63 | DeleteAlertTemplateRequest | Delete alert template |
| 64 | GetJobStatusRequest | Get in progress job analysis thread status |
| 65 | GetEventTypeCountSummaryRequest | Get event analysis counts by date chart |
| 66 | Logon | Logon to the MA Service |
| 67 | Modified | Modifying config changes |
| 68 | GetNextGenSummaryRequest | Get nextgen dashboard summary statistics |

## NetWitness User Interface

The following table lists the operations logged by the NetWitness User Interface component.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | uploadTrialLicense | Upload Trial License |
| 2 | LicenseEntitle | Entitle License |
| 3 | LicenseDeactivation | Deactivate License |
| 4 | ExpiredLicense | License Expired |
| 5 | LicenseOutOfComplianceAcknowledgement | EULA Acknowledgement |
| 6 | resetLicense | Reset License |
| 7 | usageDateExport | License data usage - csv/pdf |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 8 | refreshLicense | Refresh LLS license |
| 9 | LicenseOutOfCompliance | Out of Compliance |
| 10 | OOTBEntitlementOutOfCompliance | OOTB Trial license Out of Compliance |
| 11 | OOTBEntitlementFirstLoginTimeModified | OOTB time modified |
| 12 | OOTBEntitlementFileDeleted | OOTB File deleted |
| 13 | OOTBEntitlementDataTampering | OOTB data tampering |
| 14 | uploadOfflineResponse | Upload offline response |
| 15 | offlineDownloadCapRequest | Download offline request |
| 16 | movePerpetualToThroughput | Move Appliance license to Throughput |
| 17 | moveThroughputToPerpetual | Mover Throughput to Appliance license |
| 18 | mapApplianceLicense | Map Service to Real license |
| 19 | delete | Operation to delete Alert Templates. |
| 20 | HttpRequest | Operation for Audit Logging of the accessed URL. |
| 21 | Page Accessed | Operation for Audit Logging of the accessed page. |
| 22 | Navigate | Operation to navigate to the accessed page. |
| 23 | Events | Operation to view the accessed event page. |
| 24 | Recon | Operation for Event Reconstruction requested. |
| 25 | Services | Operation while reading the list of available devices for investigation. |
| 26 | Service | Operation for a List of devices requested to be investigated. |
| 27 | Collections | Operation to view the list of collections requested. |
| 28 | Profiles | Operation to apply a Profile. |
| 29 | ColumnGroups | Operation to apply or read Column Group. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 30 | ParallelCoordinates | Operations related to Loading of co-ordinate view navigation. |
| 31 | Timeline | Operations related to loading of timeline view navigation. |
| 32 | PrintView | Operations to open investigation in print view. |
| 33 | Preferences | Operations related to Informer Request. |
| 34 | import | Operations related to Import of Column Group or Profiles. |
| 35 | export | Operations related to Export of Column Group or Profiles. |
| 36 | Predicate | Operations related to Queries (Predicates) used for Investigation. |
| 37 | Languages | Operation for Language requested from a Device. |
| 38 | CancelLanguageLoad | Operation for Language Load Canceled from Navigate Page. |
| 39 | summary | Operation for a summary requested from a Device. |
| 40 | languages | Operation for a language requested from a device. |
| 41 | aliases | Operation for meta aliases requested from a device. |
| 42 | query | Operation for SDK Query requested from a device. |
| 43 | msearch | Operation for a meta search requested from a device. |
| 44 | nodeListing | Node Listing for a node requested from a Device. |
| 45 | content | SDK Content call requested from a Device for downloading a PCAP or Log. |
| 46 | Export Files | File Listing Requested for a Session in File View or Extraction jobs. |
| 47 | packets | Packets requested for sessions in Packet View or Extraction Jobs. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 48 | deleteEndpointCache | Operation to clear reconstruction cache of a device. |
| 49 | Logon | Operation for user to sign in to NetWitness User Interface. |
| 50 | Logoff | Operation for user to sign out of NetWitness User Interface. |
| 51 | defaultDevice | Operation to access the Default SA UI Device. |
| 52 | deleteDefaultDevice | Operation to delete the Default investigation device. |
| 53 | submitExtractFiles | Operation to submit a request to Extract files from Sessions. |
| 54 | submitExtractLogs | Operation to submit a Request to Extract Logs from Sessions. |
| 55 | submitExtractPcap | Operation to submit a Request to Extract Sessions from Sessions. |
| 56 | MetaGroup | Operations related to SA UI Meta Groups. |
| 57 | ExternalQuery | Operation when a Direct Query is fired via URL. |
| 58 | GeoMap | Operation to access the Geo Map View of Investigation. |
| 59 | SaveProfile | Operation to save an Investigation Profile. |
| 60 | ApplyProfile | Operation to apply an Investigation Profile. |
| 61 | DeleteProfile | Operation to apply an Investigation Profile. |
| 62 | DeactivateProfile | Operation to apply an Investigation Profile. |
| 63 | VisualizePreferences | Operations related to Informer Visualization Request. |
| 64 | ExportMetaGroup | Operations to export multiple SA UI Meta Groups. |
| 65 | userPredicates | Operations to export multiple SA UI Meta Groups. |

| Serial # | Operation Name | Meaning |
|---|---|---|
| 66 | FileView | Operation for reconstruction request for File View. |
| 67 | resource.update | Operation when Live Subscription State changes. |

## Respond

The following table lists the operations logged by the Respond component.

| Serial # | Operation Name | Meaning |
|---|---|---|
| 1 | update | Update notification setting |
| 2 | update | Update integration settings configuration |
| 3 | delete | Delete Alerts |
| 4 | create | Create new incident |
| 5 | update | Update incident details |
| 6 | read | Read incident details |
| 7 | delete | Delete incidents |
| 8 | read | Read remediation tasks |
| 9 | delete | Delete Remediation tasks |
| 10 | update | Update remediation tasks |
| 11 | create | Create new rule |
| 12 | update | Update existing alert rule |
| 13 | reorder | Reorder priority of alert rules |

## Investigate Server

| Serial # | Operation name | Meaning |
|---|---|---|
| 1 | Aliases | Fetch aliases |
| 2 | BackgroundJob | Category for all background job |
| 3 | ColumnGroup | Category for all column group operation |

| Serial # | Operation name | Meaning |
|---|---|---|
| 4 | Count-query | Default Investigate |
| 5 | Countdistict-query | Default Investigate |
| 6 | Content | Default Session Content |
| 7 | Create | User entity |
| 8 | Create | User preferences |
| 9 | Create | Predicate |
| 10 | Delete | User preferences |
| 11 | Delete | Predicate |
| 12 | Extract-content | Extract Content from Session |
| 13 | Folders | Category for all folder operation |
| 14 | Files | SDK content request |
| 15 | InvestigateExport | Category for extraction invocation |
| 16 | Key-refs | Fetch meta keys |
| 17 | Languages | SDK language call |
| 18 | MetaGroup | Category for all meta group operation |
| 19 | Metakey | Category for all metakey operation |
| 20 | MailReconstruction | Category for all mail reconstruction operation |
| 21 | ParsingRequest | Category for all request parsing operation |
| 22 | PacketReconstruction | Category for all packet reconstruction operation |
| 23 | Predicate InvestigateIncidents | Category for all predicate operation |
| 24 | Query | SDK query |
| 25 | Reconstruction | Category for common shared reconstruction operation |
| 26 | ReconstructionCache | Category for reconstruction caching operation |
| 27 | ReconstructionStreaming | Category for reconstruction streaming operation |
| 28 | ReconstructDataSecurity | Category for reconstruction security operations (data-scrubbing) |
| 29 | Session-Meta | SDK query to get session meta |

| Serial # | Operation name | Meaning |
|---|---|---|
| 30 | Summary | SDK summary |
| 31 | Search-meta-value | Search meta-value based on field name |
| 32 | TextReconstruction | Category for all text reconstruction operation |
| 33 | Timeline | Timeline request |
| 34 | UserPreferences | Category for all user preferences operation |
| 35 | Update | User entity |
| 36 | Update | User preferences |
| 37 | Update | Profile group |
| 38 | Update | Predicate |
| 39 | Values | SDK values |
| 40 | Validate-query | Validate SDK query |

## Security Server

The following table lists the events logged by the Security Server.

| Log Category | Description |
|---|---|
| Create: | Add record for a role with new ID. |
| Create: | Add user record with new ID. |
| Update: | Update the user account with a new ID. |
| Authentication: | Logs events pertaining to user logins and logouts. |
| Authorization: | Logs events pertaining to user access checks and RBAC management. |
| UserAccount | Logs events pertaining to NetWitness domain account management. |
| ExternalProvider: | Tracks events pertaining with external account providers (for example, Active Directory). |

The following example shows an event logged by the Security Server:

```
2018-03-13 16:25:02,938 UserAccount{action=ExpirePassword, success=true,
identity=admin, parameters={id=Justin}}
```

## Admin Server

The following table lists the events logged by the Admin Server.

| Log Category | Description |
|---|---|
| Restore: | System operation to restore a data springboard. |

## Config Server

The following table lists the events logged by the Admin Server.

| Log Category | Description |
|---|---|
| newregistration: | Record the registration to config server that manages the collection storage. |

## Context Hub Server

The following table lists the events logged by the Admin Server.

| Log Category | Description |
|---|---|
| verifyconnection: | System operation to check if the connection is live. |
| addconnection | Create new connection to access data. |

## Local Audit Log Locations

NetWitness has global audit logging capabilities. When you configure global audit logging, audit logs from all NetWitness components collect in a centralized system, which converts them into the required format and forwards them to a third-party syslog server or a Log Decoder.

To view audit logs from the individual services, you can look at the local audit log locations.The following table shows the local directory paths of the audit logs for the NetWitness user interface and the various NetWitness services.

| Service/Module | Audit Log Location |
|---|---|
| NetWitness User Interface (NetWitness Web Server) | The NetWitness user interface sends audit logs to the following locations:<br>• `/var/lib/netwitness/uax/logs/audit/audit.log` (human-readable format)<br>• Syslog running on the local host (JSON format)<br><br>The NetWitness user interface uses the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/var/lib/netwitness/uax/logs/audit/audit.log`). |
| Core Services (Decoder, Log Decoder, Concentrator, Broker, and Archiver), Log Collector, Warehouse Connector, and Workbench | The Core services and similar services send audit logs to Syslog running on the local host.<br>Path: `/var/log/secure` (JSON format)<br>The Core services use the AUTHPRIV facility of syslog to write audit logs to syslog. |

| Service/Module | Audit Log Location |
|---|---|
| Reporting Engine,<br>Malware Analysis,<br>Respond,<br>ESA Correlation (11.3 and later),<br>and Event Stream Analysis<br>(11.2 and earlier) | These services send audit logs to the following locations:<br>• `<application-home-directory>/logs/audit/audit.log` (human-readable format)<br>• Syslog running on the local host (JSON format)<br><br>The following are the audit log locations of these services:<br>**Reporting Engine:**<br>`/var/netwitness/re-server/rsa/soc/reporting-engine/logs/audit/audit.log`<br>**Respond Server:**<br>`/var/log/netwitness/respond-server/respond-server.audit.log`<br>**Malware Analysis:**<br>`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`<br>**ESA Correlation (11.3 and later):**<br>`/var/log/netwitness/correlation-server/correlation-server.audit.log`<br>**Event Stream Analysis (11.2 and earlier):**<br>`/opt/rsa/esa/logs/audit/audit.log`<br>These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`<application-home-directory>/logs/audit/audit.log`). |
| Health & Wellness, Event Source Management (ESM), and Appliance and Service Grouping (ASG) | These Services send audit logs to the following locations:<br>• `/opt/rsa/sms/logs/audit/audit.log` (human-readable format)<br>• Syslog running on the local host (JSON format)<br><br>These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/opt/rsa/sms/logs/audit/audit.log`). |
| Aggregated Audit Logs | The aggregated audit logs from all the services are sent to the following locations:<br>• `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format)<br>• Syslog running on the local host (human-readable format) |

# Global Notifications Panel

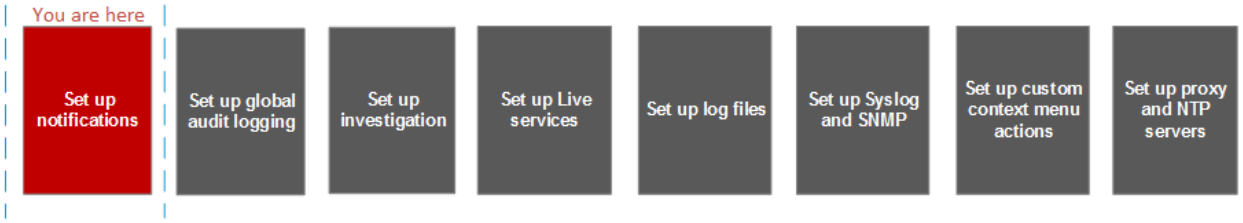
Global Notifications panel introduces the features for configuring notification settings. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

In the Global Notifications panel, you can configure the following global notification settings:

- Notification Outputs
- Notification Servers
- Templates

**Note:** ESA SNMP notifications are not supported for NetWitness 11.3 and later.

## WorkFlow



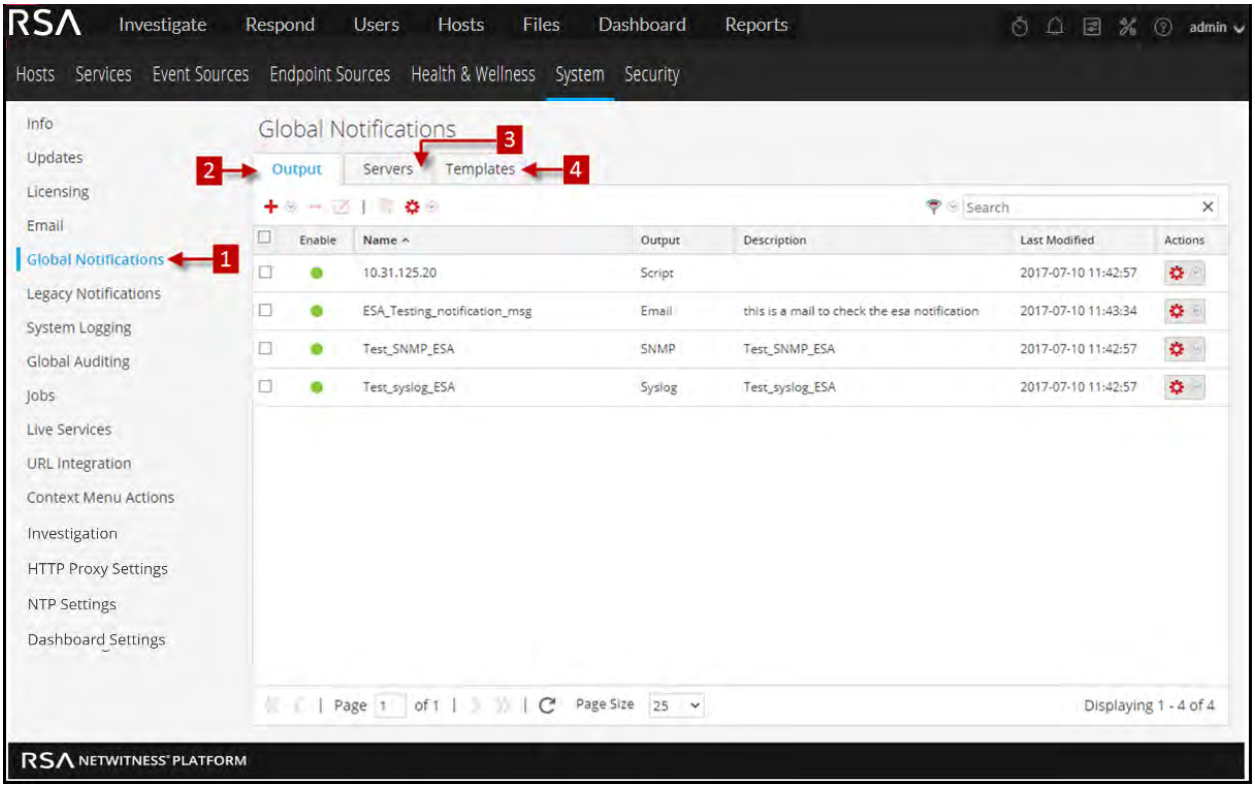
## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Notification Servers | Servers Tab |
| Administrator | Configure Notification Outputs | Output Tab |
| Administrator | Configure Notification Templates | Templates Tab |

## Related Topics

- Configure a Syslog Notification Server
- Configure Script as a Notification Server

## Quick Look



1 Displays the Global Notification Panel.
2 Displays the Output Tab
3 Displays the Servers Tab
4 Displays the Templates Tab

## Toolbar and Features

The Global Notifications panel has three tabs: Output, Servers, and Templates.

| Feature | Description |
|---|---|
| **Output tab** | This tab enables you to configure notification outputs. See Output Tab for more information. |
| **Servers tab** | This tab enables you to configure notification servers. See Servers Tab for more information. |
| **Templates tab** | This tab enables you to configure notification templates. See Templates Tab for more information. |

This table describes the columns in the grid for Notification Outputs and Notification Servers.

| Column | Description |
|---|---|
| | Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid. |
| **Enable** | Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled. |
| **Name** | A name that identifies or labels the configuration. |
| **Output** | The configuration output. The outputs are Email, SNMP, Syslog, and Script. |
| **Description** | A brief description about the configuration. |
| **Last Modified** | Shows the date and time of the last configuration change. |
| **Actions** | Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration. |

This table describes the columns in the grid for Notification Templates.

| Column | Description |
|---|---|
| | Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid. |
| **Name** | A name that identifies or labels the template. |
| **Template Type** | The type of template. The types are Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms. |
| **Description** | A brief description about the template. |
| **Actions** | Provides an Actions menu for the selected configuration with actions that can be taken on the template. The Actions menu enables you to delete, edit, duplicate, and export the template. |

## Global Notifications Panel Toolbar

The Global Notifications panel toolbar is at the top of the Output, Servers, and Templates tabs.

The following figure shows the toolbar on the Output and Servers tabs.

The following figure shows the toolbar on the Templates tab.

The following table describes the features of the Global Notifications panel toolbar.

| Feature | Description |
|---|---|
| <br>  | Adds a notification server on the Servers tab, adds a notification output (notification) on the Output tab, and adds a notification template on the Templates tab.<br>On the Servers and Output tabs, you can select to configure Email, SNMP, Syslog, and Script notification settings. |
|  | Removes a selected notification configuration.<br>You cannot delete notification servers and notification types that are associated with global audit log configurations.<br>If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.<br>You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete. |
| | Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit. |
| | Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate. |
|  | Displays the following options:<br>• **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.<br>• **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.<br>• **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export. |

| Feature | Description |
| --- | --- |
|  | Filters by Email, SNMP, Syslog, or Script. |
| | Searches configurations in the grid. |

# Define Notification Server Dialogs

This topic describes the Define Notification Server dialogs used to configure the settings of the various types of notification servers. You configure notification servers in the (Admin) > System > Global Notifications > Servers tab.

Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, and Global Audit Logging. Notification settings are called Notification Servers. In the Servers tab of the Administration System view Notifications panel, you can create multiple Notification Server configurations.

You can configure the following types of notification server settings in NetWitness:

- Email
- SNMP
- Syslog
- Script

For Global Audit Logging, you can only use Syslog Notification Servers.

Procedures related to notification servers are described in Configure Notification Servers.

To access the Define Notification Server dialogs:

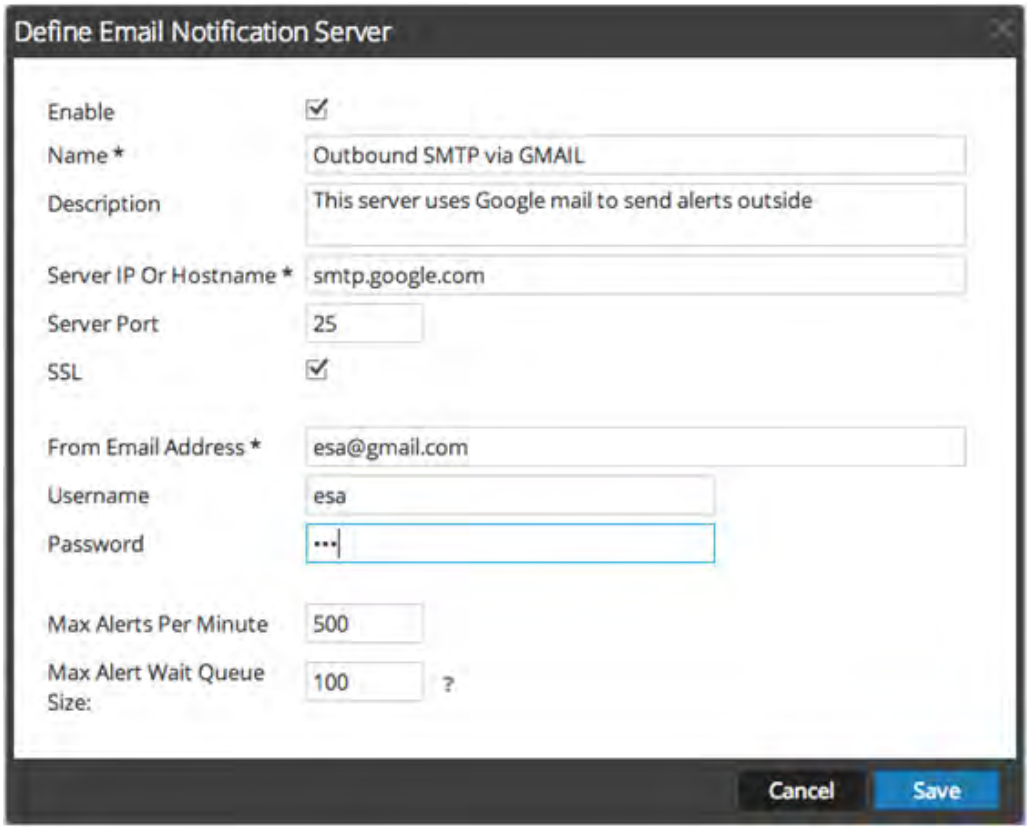
1. Go to **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications**.
3. In the **Notifications Servers** panel, click and then select a type of notification server (Email, SNMP, Syslog, or Script)
   The Define Notification Server dialog is displayed for your selection.

There are four notification server dialogs, which allow you to configure notification servers.

## Email

Email notification servers enable you to configure email server settings to send alert notifications.

The following figure shows the Define Email Notification Server dialog.



The following table lists the various parameters that you need to define for the email notification servers.

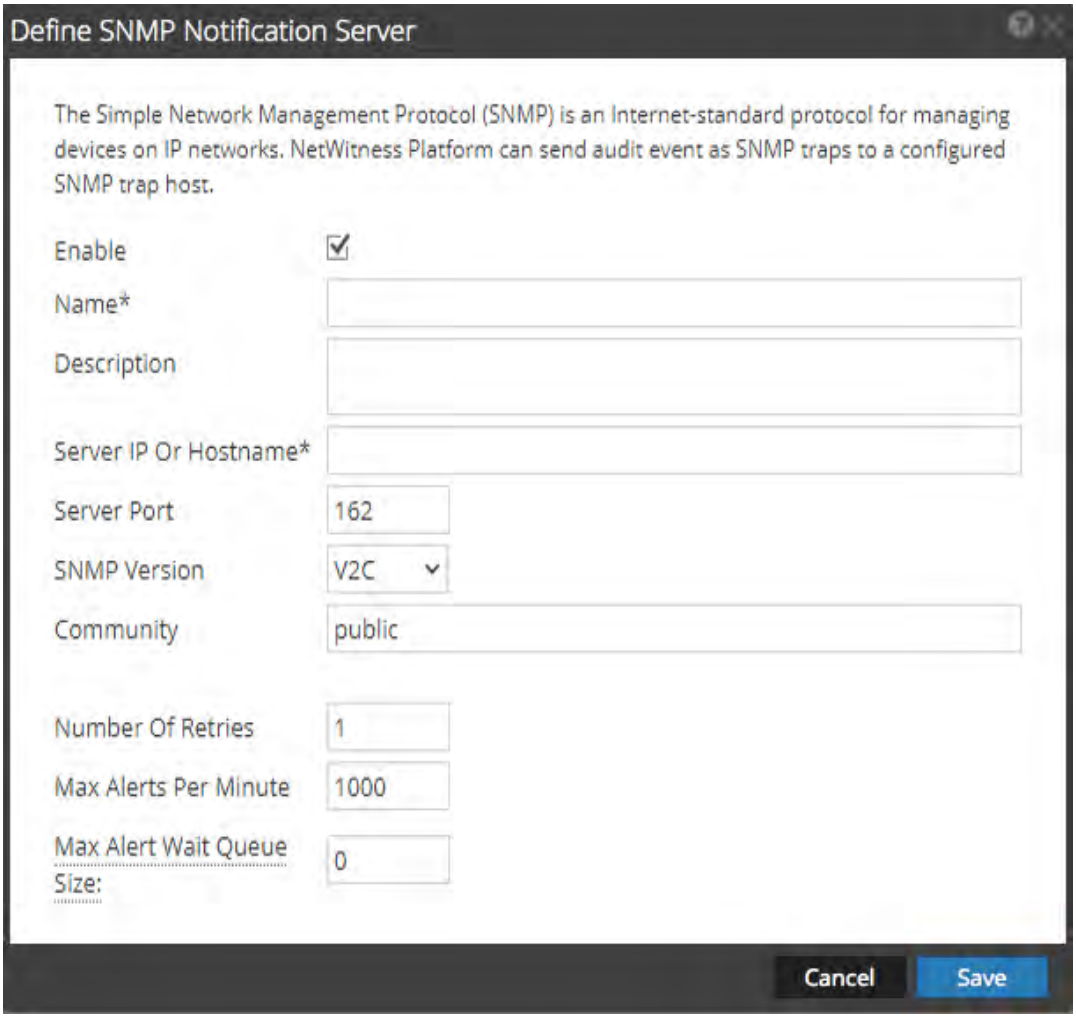
| Parameters | Description |
|---|---|
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the notification server. |
| Description | A brief description about the notification server. |
| Server IP Or Hostname | Hostname of the email server. For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN. |
| Server Port | The server port. |
| SSL | Select the option if you want the communication to happen through SSL. |
| From EMail Address | Email account from which you want to send email notifications. |
| Username | Username for logging into the email account if the SMTP server requires user authentication to relay emails successfully. |

| Parameters | Description |
|---|---|
| Password | User password for logging into the email account if the SMTP server requires user authentication to relay emails successfully. |
| Max Alerts Per Minute | Describes the maximum number of alerts per minute. |
| Max Alert Wait Queue Size | Describes the maximum number of alerts to be queued before they are dropped. |

## SNMP

SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

The following figure shows the Define SNMP Notification Server dialog.



The following table lists the various parameters that you need to define for the SNMP notification servers.

| Parameters | Description |
| --- | --- |
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the notification server. |
| Description | A brief description about the notification server. |
| Server IP Or Hostname | SNMP trap host IP address or hostname. |
| Server Port | Listening port number on the SNMP trap host. |

<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>SNMP Version</td><td>SNMP version. The following are the options:<ul><li>V1</li><li>V2C</li><li>V3<br>If you select SNMP Version 3 (v3), the following parameters are displayed:</li></ul>
<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>Notification Type</td><td>Based on the notification type a SNMP messages are sent each time an alert is generated.<br>The following notification types are supported:<ul><li>Inform - Inform is acknowledged trap. The sender gets an acknowledgement from the receiver.</li><li>Trap - Trap is unacknowledged notification</li></ul></td></tr>
<tr><td>Authoritative Engine ID (This optioin is availabe only for notification type TRAP)</td><td>An identifier which is used to identify the agents. Authoritative engine ID along with the username is used to uniquely identify the agent.</td></tr>
<tr><td>Security Level</td><td>Define the security level. The following are the options:<ul><li>Unauthenticated and Unencrypted</li><li>Authenticated and Unencrypted</li><li>Authenticated and Encrypted</li></ul></td></tr>
<tr><td>Auth Protocol ( This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)</td><td>Authentication protocol which is used to validate a user before providing an access to the server. The options are:<ul><li>SHA</li><li>MD5</li></ul></td></tr>
<tr><td>Auth Key ( This option is available only for security level Authenticated and</td><td>A password that you want to use for authentication.</td></tr>
</table></td></tr>
</table>

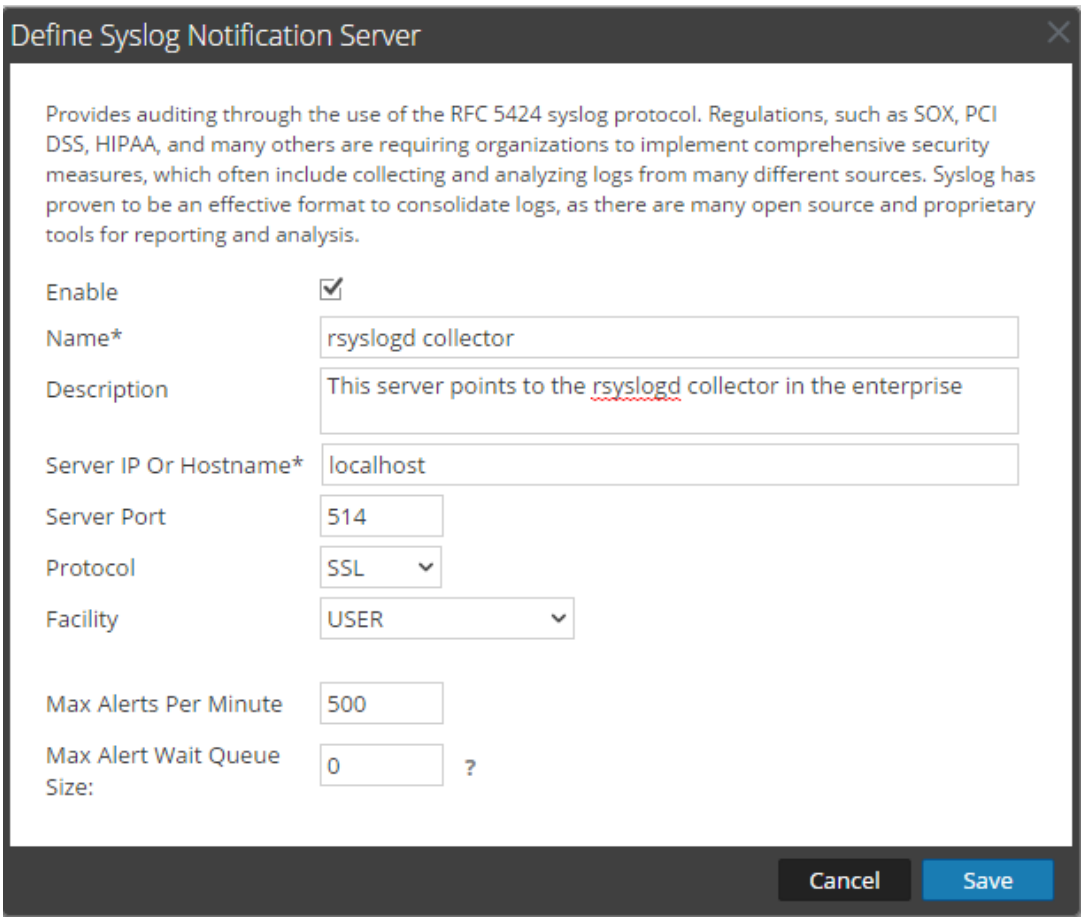
| Parameters | Description |
|---|---|
| | Unencrypted and Authenticated and Encrypted)<br>Privacy Protocol ( This option is available only for security level Authenticated and Encrypted) — Privacy protocol is an encryption technique for data communication.<br>Private Key ( This option is avaliable only for security level Authenticated and Encrypted) — A password that you want to use for encryption. |
| Community | Community string used to authenticate on the SNMP trap host. The default value is **public**. |
| Number of Retries | Number of retries for the trap. |
| Max Alerts Per Minute | Maximum number of alerts per minute. |
| Max Alert Wait Queue Size | Maximum number of alerts to be queued before they are dropped. |

## Syslog

Syslog notification servers allow you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

You cannot disable notification servers associated with global audit logging configurations.

The following figure shows the Define Syslog Notification Server dialog.



The following table lists the various parameters that you need to define for the Syslog notification servers.

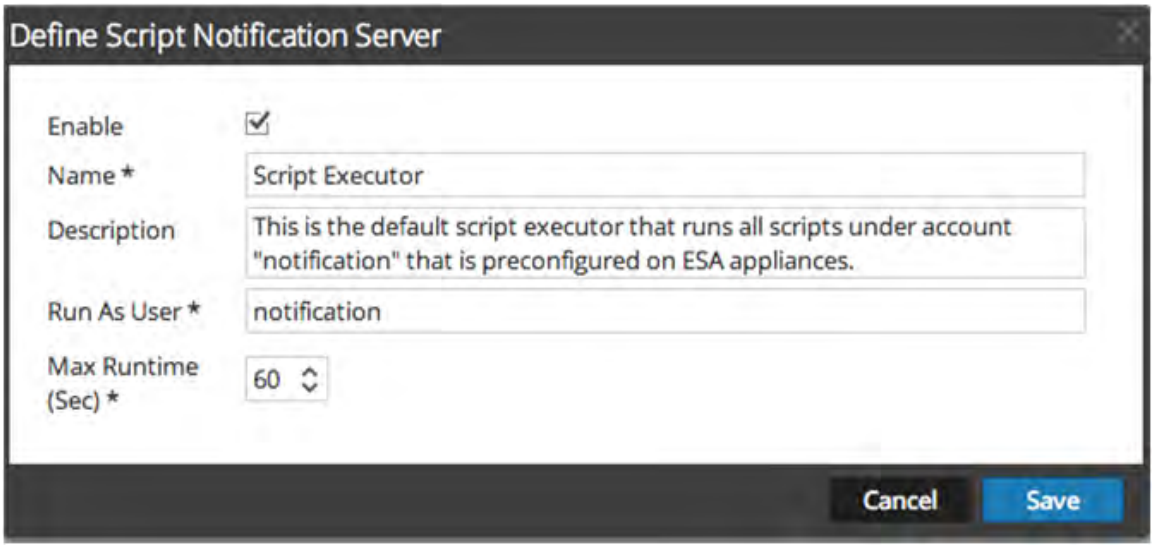
| Parameters | Description |
|---|---|
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the notification server. |
| Description | A brief description about the notification server. |
| Server IP Or Hostname | The hostname of the host where the target Syslog process is running. |
| Server Port | The port number where the target Syslog process is listening. |
| Protocol | The protocol to be used to transfer the Syslog files. |
| Facility | The designated Syslog facility to use for all outgoing messages.<br><br>It is used to specify what type of program is logging the message. Some possible values are KERN, USER, MAIL, and DAEMON. This lets the configuration file specify that messages from different facilities will be handled differently. |

| Parameters | Description |
|---|---|
| Max Alerts Per Minute | Maximum number of alerts per minute.<br>This field is not used for Global Audit Logging. |
| Max Alert Wait Queue Size | Maximum number of alerts to be queued before they are dropped.<br>This field is not used for Global Audit Logging. |

## Script

Script notification servers enable you to configure Script as a Notification Server.

The following figure shows the Define Script Notification Server dialog.



The following table lists the various parameters that you need to define for the Script notification servers.

| Parameters | Description |
|---|---|
| Enable | Select to enable the notification server. |
| Name | A name to identify or label the notification server. |
| Description | A brief description about the notification server. |
| Run As User | Name of the user identity under which the script is executed. The default user identity is **notification**.<br>For ESA, you cannot set this to anything else unless you have created the account on the ESA host. |
| Max Runtime (Sec) | The maximum time (in seconds) the script is allowed to run. |

# Define Notification Output Dialogs

This topic provides descriptions of the various notification output dialogs. You configure notification outputs in the (Admin) > System > Global Notifications > Output tab. Notifications are basically the destinations used for sending notifications. For ESA, notifications enable you to define how you want to receive the ESA alerts. The following are the different notifications supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

Procedures related to notifications are described in Configure Notification Outputs.

To access the Define Notification dialogs:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. On the **Output** tab, click and then select a notification output (Email, SNMP, Syslog, or Script) The Define Notification dialog is displayed for your selection.

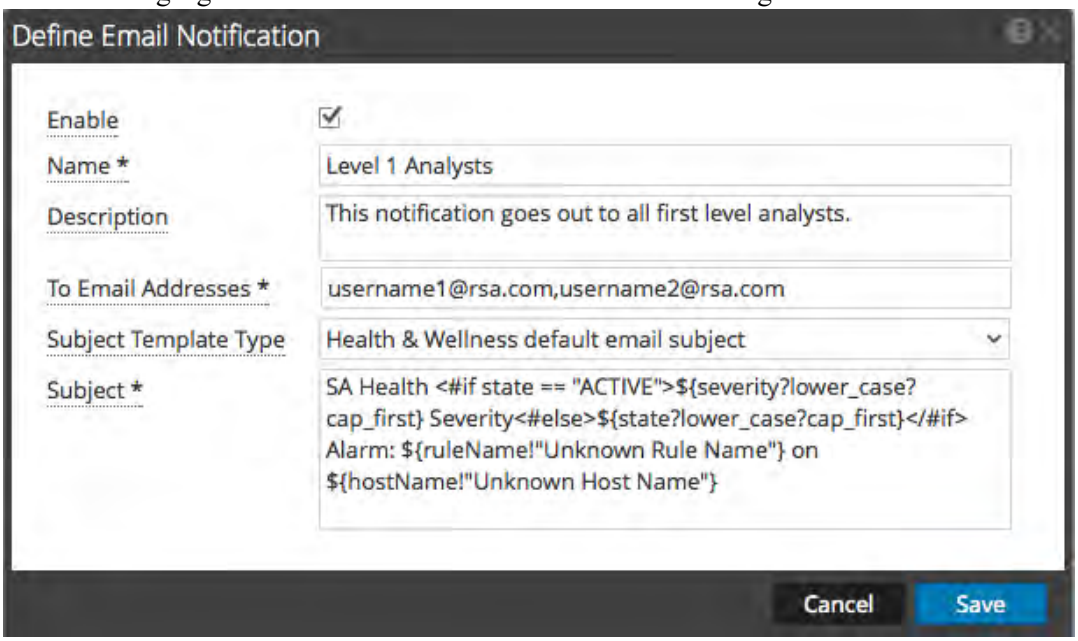
## Features

There are four notification dialogs, which allow you to configure notification outputs.

### Email

Email notifications enable you to define the destination email address to which you can send the alerts. It also enables you to add a custom description in the subject of the email and also to define multiple destination email addresses.

The following figure shows the Define Email Notification dialog.



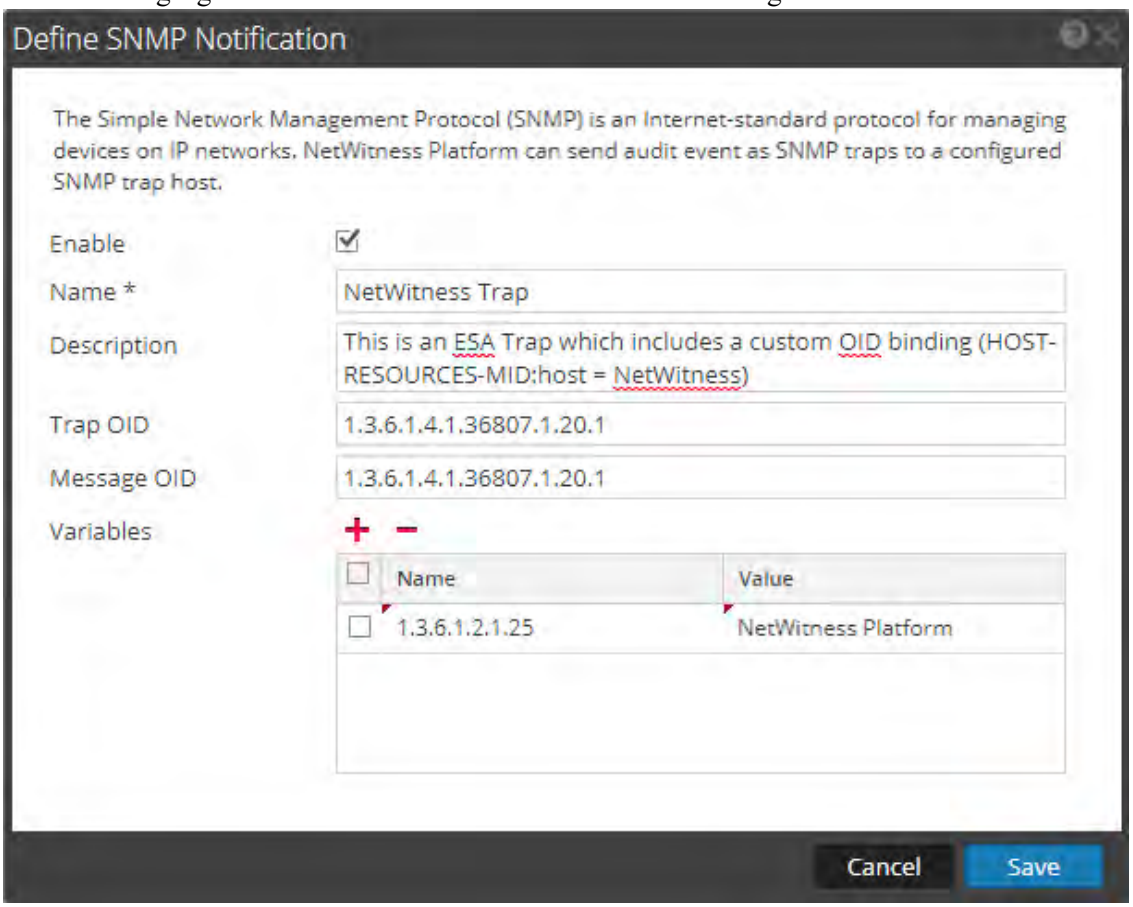
The following table lists the various parameters that you need to define for the email notifications.

| Parameter | Description |
|---|---|
| Enable | Select to enable the notification. |
| Name | A name to identify or label the notification. |
| Description | A brief description about the notification. |
| To Email Addresses | Describes the destination email address to which the alert needs to be sent.<br>**Note:** You can define multiple email addresses. |
| Subject Template Type | Lists available templates for creating a subject. When you choose a template, the Subject field is automatically filled in with the code for your chosen template. Example, for New Health and Wellness, you must select **New Health & Wellness default email subject**. |
| Subject | Custom description about the triggered alert. This information is automatically filled in if you choose one of the predefined templates from the Subject Template Type drop-down menu.<br>**Note:** To provide a custom subject, please refer to "Include the Default Email Subject Line" topic in the *System Maintenance Guide*. |

### SNMP

SNMP notifications enable you to define the SNMP settings to send alert notifications.

The following figure shows the Define SNMP Notification dialog.



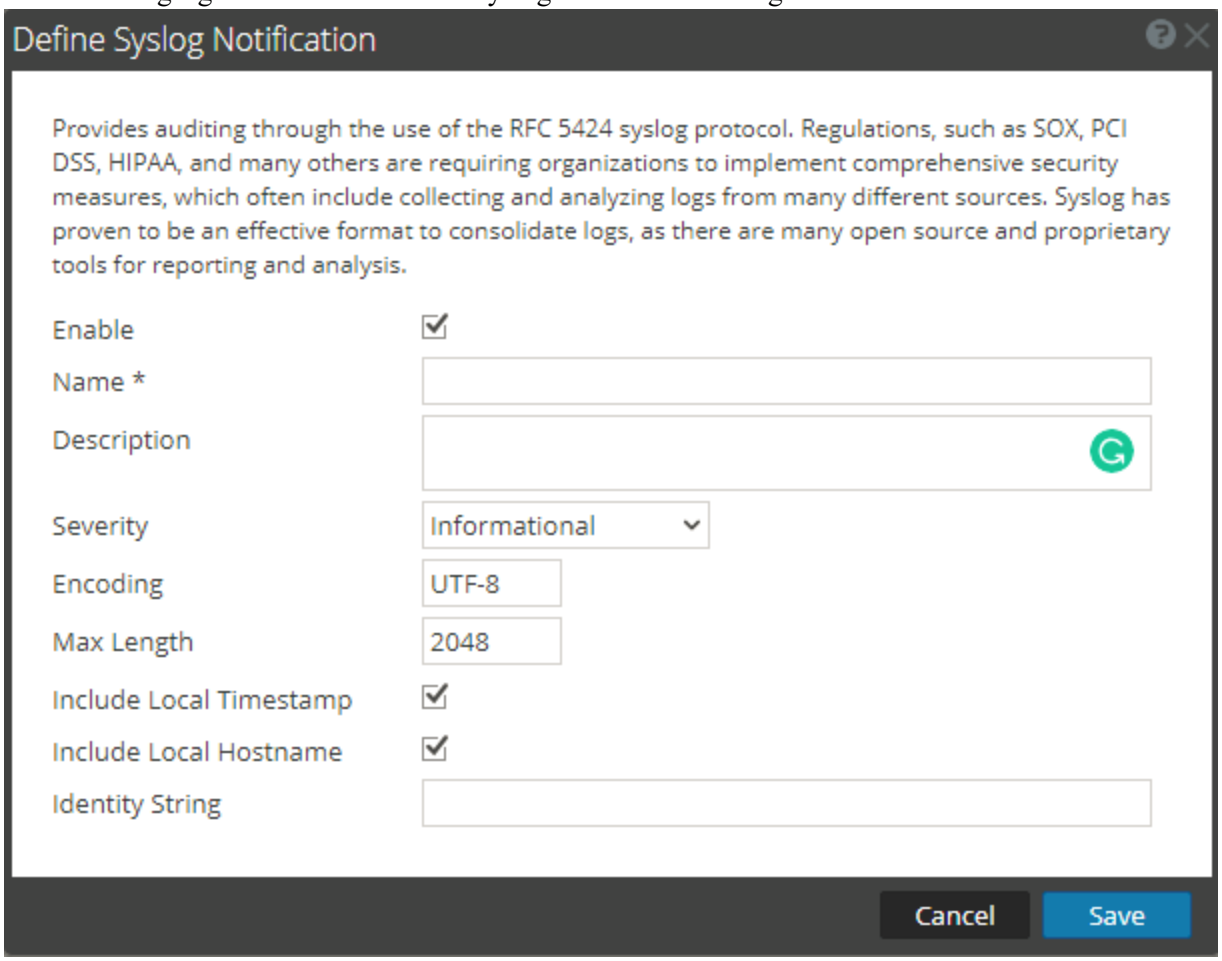
The following table lists the various parameters that you need to define for the SNMP notifications.

| Parameter | Description |
|---|---|
| Enable | Select to enable the notification. |
| Name | A name to identify or label the notification. |
| Description | A brief description about the notification. |
| Trap OID | The object ID for the SNMP trap on the trap host that receives the event. The default value is **1.3.6.1.4.1.36807.1.20.1**. This value is a hierarchical name that represents the system that generates the trap. 1.3.6.1.4.1 is the common prefix for all enterprises and 36807.1.20.1 identifies NetWitness. |
| Message OID | The message object identifier for the SNMP trap. |
| Variables | Additional information that should be included within the trap. It is a variable that is a name value pair. |

### Syslog

Syslog notifications enable you to define the Syslog settings to send alert notifications.

The following figure shows the Define Syslog Notification dialog.



The following table lists the various parameters that you need to define for the Syslog notifications.

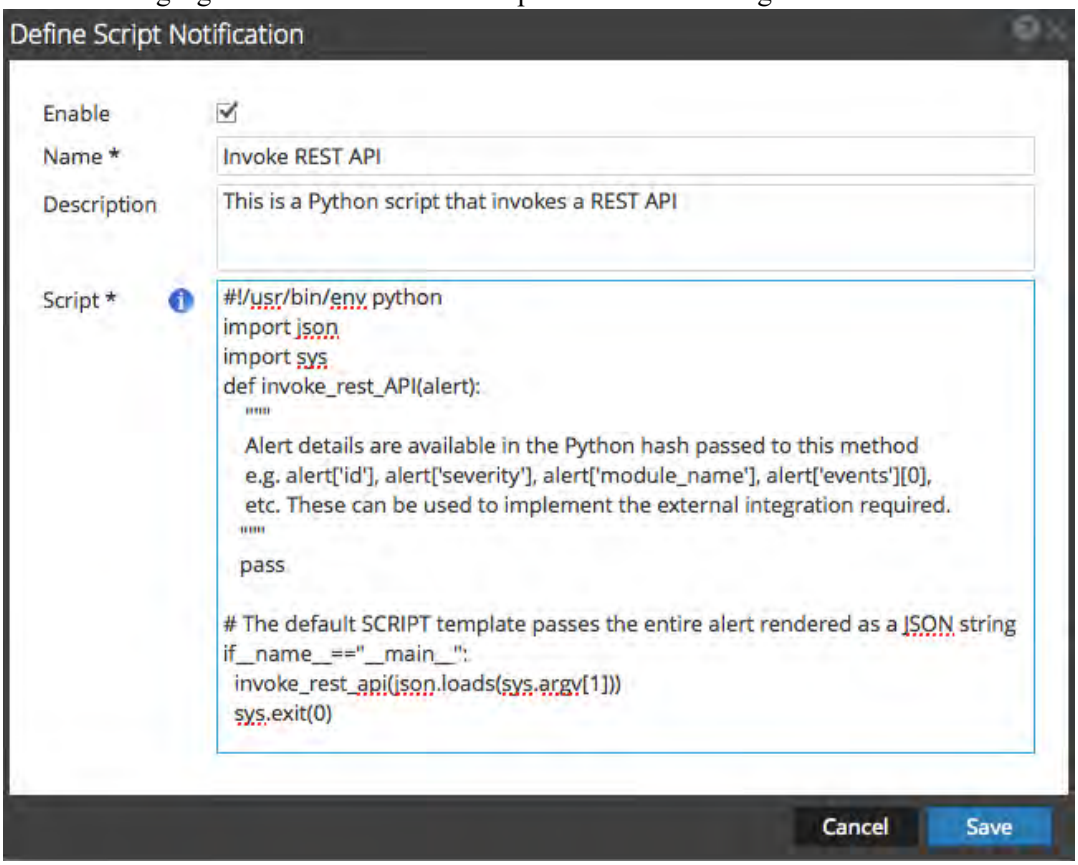
| Parameter | Description |
|---|---|
| Enable | Select to enable the notification. |
| Name | A name to identify or label the notification. |
| Description | A brief description about the notification. |
| Severity | Defines the severity of the alert. |
| Encoding | Defines the encoding format. In some environments where no regular character sets are used (for example, Japanese characters), this field will help selecting the right encoding of the characters. |
| Max Length | The maximum length of a Syslog message in bytes. The default value is **2048**.<br><br>Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected, which is found in Administration > System > Legacy Notifications. Legacy Notifications Configuration Panel provides additional information. |

| Parameter | Description |
|---|---|
| Include Local Timestamp | Select to include the local timestamp in messages. |
| Include Local Hostname | Select to include the local hostname in Syslog messages. |
| Identity String | An identity string to be prefixed to each Syslog alert. If the string is blank, no identity string is prefixed to the outgoing Syslog alerts. You can use this to identify the alerts from ESA. |

### Script

Script notifications enable you to define the Script that executes in response to the alert. You can use any script for ESA notifications.

The following figure shows the Define Script Notification dialog.



The following table lists the various parameters that you need to define for the Script notifications.

| Parameter | Description |
|---|---|
| Enable | Select to enable the notification. |
| Name | A name to identify or label the notification. |

| Parameter | Description |
| --- | --- |
| Description | A brief description about the notification. |
| Script | Defines the script. |

## Define Notification Template Dialog

In the Global Notifications panel, you can configure global notification settings for Notification Servers, Notification Outputs, and Notification Templates. On the Templates tab, you configure the templates for various notifications. The notification template defines the format and message fields of the notifications.

You can select a default template and use it or modify a default template based on your requirement. You can also use one of the following template types and create a template:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms (11.5 and later)

These notification templates are created in an HTML, FreeMarker (FTL) format, a combination of both HTML and FTL, or Common Event Format (CEF) format:

- Email (SMTP) notification output type is created in both HTML and FTL formats.
- SNMP and Script notification output types are created in FTL format.
- Syslog notification output type is created in CEF format.

You need to have a good understanding of HTML, FTL, and CEF formats to successfully configure your own notification template. Click on the respective links to understand the specific formats.

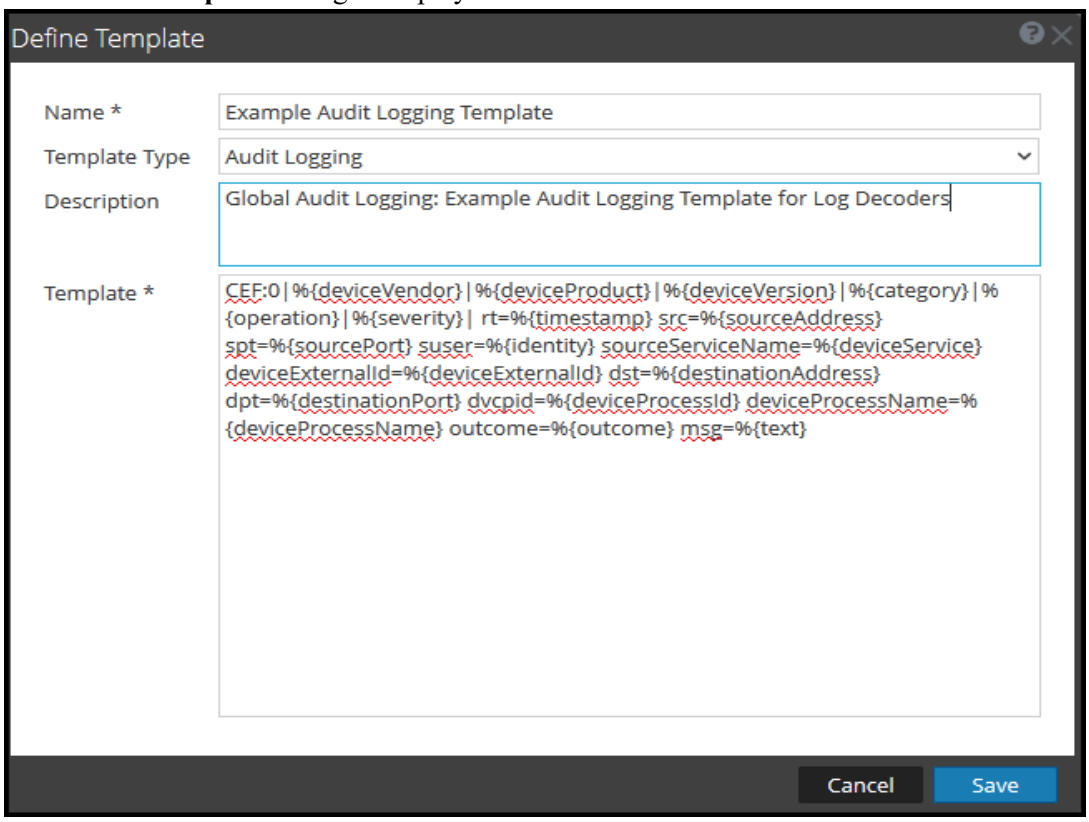
- HTML format, Introduction to HTML.
- FTL format, Overall structure - Apache FreeMarker Manual.
- CEF format, Freemarker Tips & Tricks in NetWitness.

Procedures related to notification templates are described in Configure Templates for Notifications.

To access the Define Template dialog:

1. Go to **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications > Template Tab**.
3. In the **Notifications Configurations** panel, click , or select a configuration and click to modify.

The **Define Template** dialog is displayed.



The following table describes the features in the Define Template dialog.

| Field | Description |
|---|---|
| Name | Type a unique name for the notification template. |
| Template Type | Select the type of template that you want to create:<br>• **Audit Logging**: Use this template for Global Audit Logging.<br>• **Event Stream Analysis**: Use this template type for ESA alert notifications.<br>• **Event Source Monitoring**: Use this template type for ESM notifications.<br>• **Health Alarms**: Use this template type for Health and Wellness notifications.<br>• **New Health and Wellness Alarms**: Use this template type for New Health and Wellness notifications. |
| Description | Add a description for the template. For example, if you create a notification template for Log Decoders to use for Global Audit Logging, you could mention that information in the description. |

| Field | Description |
|---|---|
| Template | Specify mandatory **CEF:** prefix when you create a template in CEF format. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging. To define a template for Event Stream Analysis (ESA), see Define a Template for ESA Alert Notifications.<br>**Note:** Use Key references available in default notification templates. |

Below is an example of a defined SMTP (email) template and output.

# Output Tab

In the **Global Notifications** panel, in the **Output** tab ( (Admin) > System > Global Notifications > Output), you configure notification outputs. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

**Notification Output** configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

Notifications are the destinations configured for the alert notifications that are sent by ESA service. You can configure the following as destinations using the Output tab:

- Email
- SNMP
- Syslog
- Script

**Note:** You do not need to configure the Output tab for Global Audit Logging. For detailed steps, see Configure Global Audit Logging.

## Workflow

This workflow shows the necessary procedures to configure and verify the output for Global Notifications. You can perform the following:

- Configure the Email settings as notification.
- Configure SNMP settings as notification.
- Configure Syslog settings as notification.
- Configure a Script as notification.

## What do you want to do?

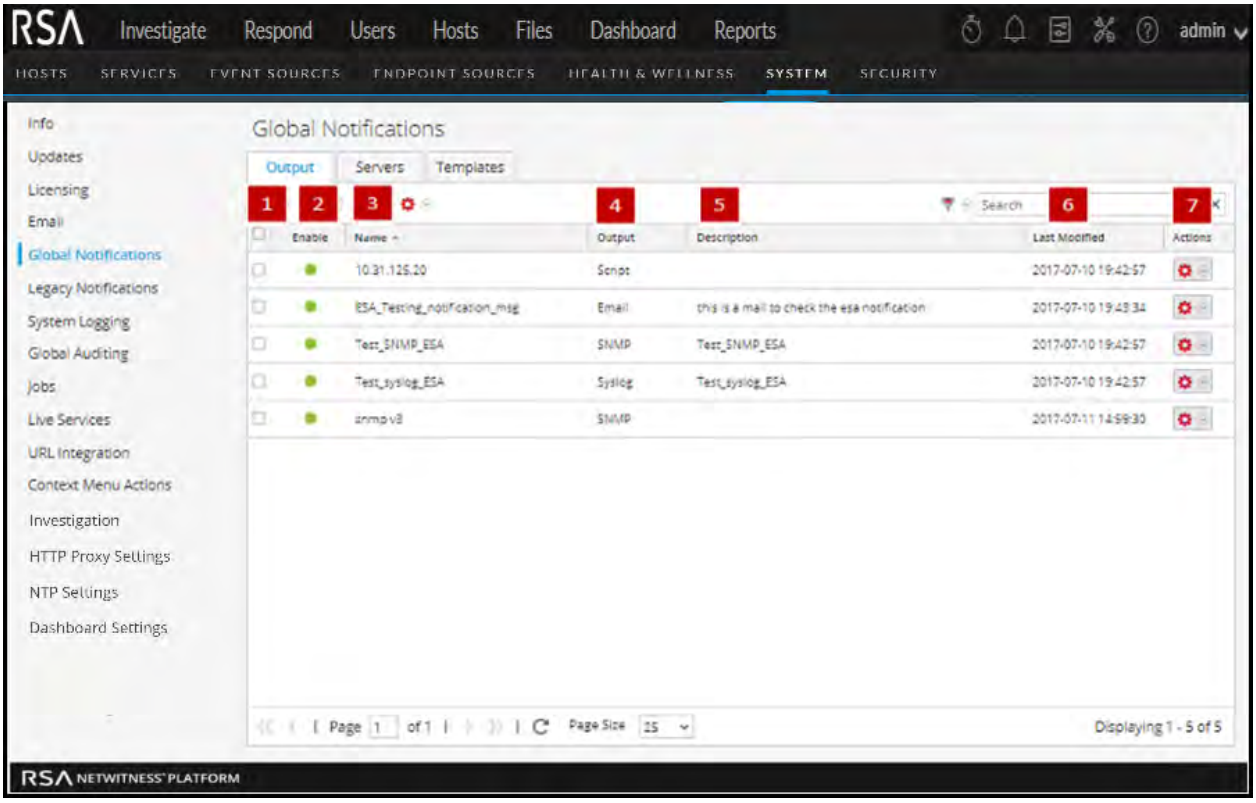
| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Define notification outputs. | Configure Notification Outputs |

## Related Topics

- Notification Outputs Overview
- Configure Email as a Notification
- Configure Script as a Notification
- Configure SNMP as a Notification
- Configure Syslog as a Notification

## Quick Look

The following example illustrates Global Notification Outputs configuration.



| | |
|---|---|
| 1 | Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid. |
| 2 | Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled. |
| 3 | Identifies or labels the configuration. |
| 4 | Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script. |
| 5 | Describes the configuration. |
| 6 | Shows the date and time of the last configuration change. |
| 7 | Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the |

configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:

1 Adds a notification output

2 Configures Email, SNMP, Syslog, and Script notification settings.

3 Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.

4 Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.

5 Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.

6 Displays the following options:

- **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.
- **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
- **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.

7 Filters by Email, SNMP, Syslog, or Script.

8 Searches configurations in the grid.

# Servers Tab

Servers Tab describes the components of the Global Notifications > Servers tab. This tab enables you to configure notification servers. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

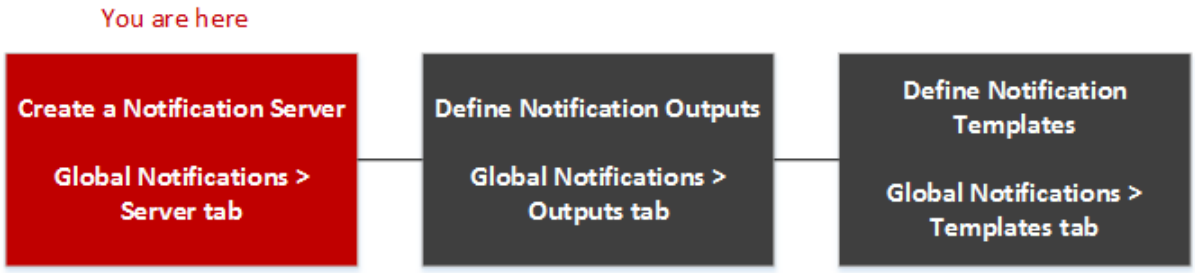
Configure **Notification Servers** in the Servers tab. On the Servers tab, add the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

Event Stream Analysis can send notifications to users through email, SNMP, or Syslog when an alert is triggered on the ESA service. These alert notification senders are called Notification Servers. You can configure multiple notification settings and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

## Workflow

The workflow shows the necessary procedures to configure and verify the Servers for Global Notifications. You can perform the following:

- Configure the Email settings as a notification server.
- Configure SNMP settings as a notification server.
- Configure Syslog settings as a notification server.
- Configure a Script as a notification server.



## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Define notification Servers | Configure Notification Servers |

## Related Topics

- Notification Servers Overview

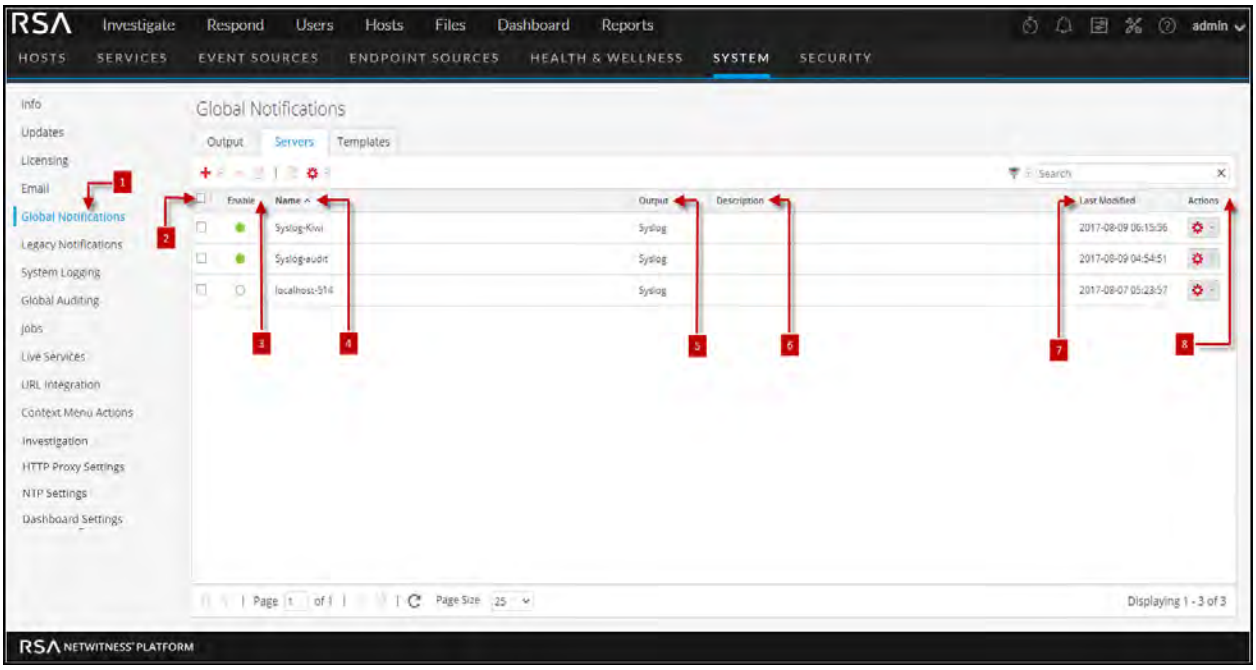
- Configure a Syslog Notification Server

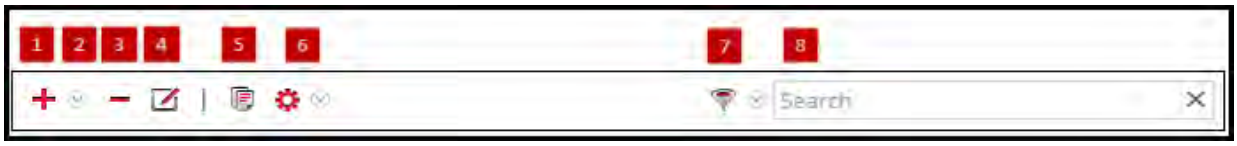
## Quick Look

The following example illustrates Global Notification Servers configuration.



| | |
|---|---|
| 1 | Displays the Server Tab Panel. |
| 2 | Selects a row for an action in the toolbar. Selecting the checkbox in the column title selects or deselects all rows in the grid. |
| 3 | Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled. |
| 4 | Identifies or labels the configuration. |
| 5 | Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script. |
| 6 | Describes the configuration. |
| 7 | Shows the date and time of the last configuration change. |
| 8 | Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration. |

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:



1 Adds a notification output

2 Configures Email, SNMP, Syslog, and Script notification settings.

3 Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.

4 Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.

5 Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.

6 Displays the following options:

- **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.
- **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
- **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.

7 Filters by Email, SNMP, Syslog, or Script.

8 Searches configurations in the grid.

# Templates Tab

The Notification Templates tab enables to configure notification templates. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification templates define the format and message fields of the notifications.

Select a default template or configure templates for Email, SNMP, Syslog, and Script, depending on the template type. For Event Stream Analysis (ESA) templates, configure Email, SNMP, Syslog, and Script. For Audit Logging templates, configure Syslog.

Event Stream Analysis templates are not specific to any type of alert notifications, that is, the same template can be used for all types of notifications.

1 Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.

2 Identifies or labels the templates

3 Choose a Template Type

4 Describes the templates

5 Provides an Actions menu for the selected templates with actions that can be taken on the Templates. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

# HTTP Proxy Settings Panel

HTTP Proxy Settings Panel introduces the proxy support features of the (Admin) > System > HTTP Proxy Settings panel.

**Note:** Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

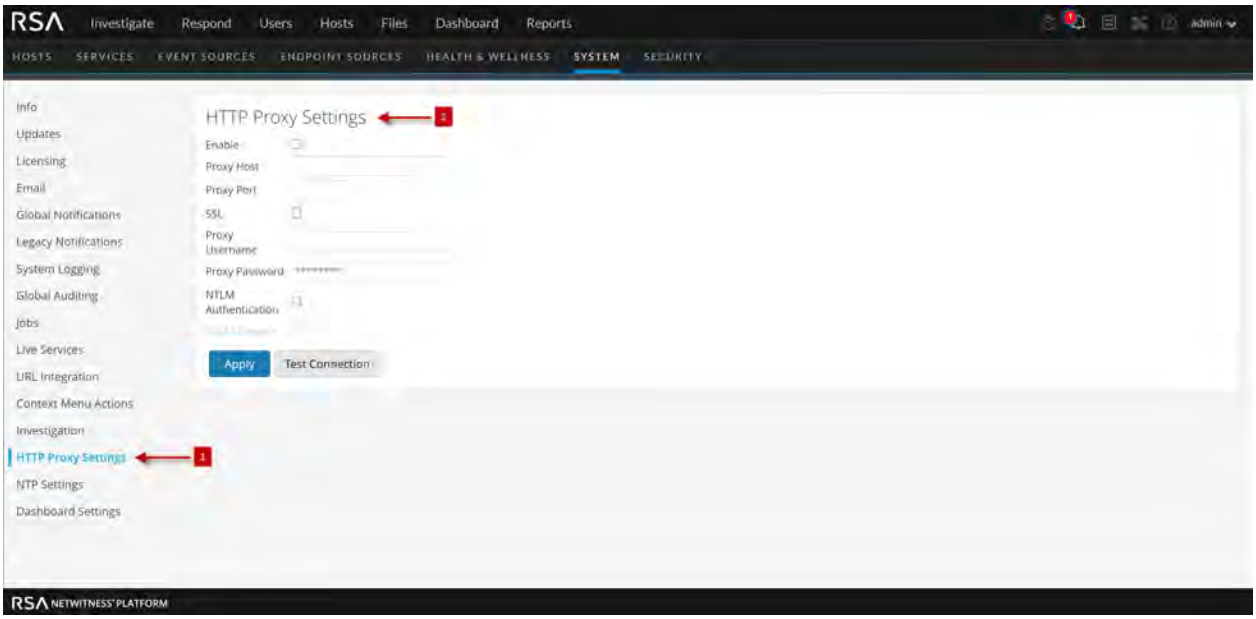
The HTTP Proxy Settings panel provides a user interface for configuring a proxy for use across NetWitness modules and services. The Proxy Settings set up a proxy to be used wherever a proxy is needed in NetWitness. The settings in this panel override any proxy settings configured for an individual service such as Malware Analysis or Live.

## Related topics

"Configure Proxy for NetWitness Platform" in Additional Procedures

## Quick Look

The following example illustrates an HTTP Proxy Settings Panel.



1 Displays the HTTP Proxy Settings Panel.
2 Allows the user to configure HTTP Proxy Sittings.

This table describes the features in the HTTP Proxy Settings section.

| Feature | Description |
|---|---|
| **Enable** | Enable the system proxy configuration for use in NetWitness. |

| Feature | Description |
|---|---|
| **Proxy Host** | The hostname for the proxy host. |
| **Proxy Port** | The port used for communication on the proxy host. |
| **SSL** | (Optional) Enable communication using SSL. |
| **Proxy Username** | (Optional) The user name used to log on to the proxy host if the proxy requires authentication. |
| **Proxy Password** | (Optional) The user password used to log on to the proxy host if the proxy requires authentication. |
| **NTLM Authentication** | Use NT LAN Manager authentication and session security protocols. |
| **NTLM Domain** | The name of NTLM domain. |
| **Apply** | Applies any changes made, and they become effective immediately. |

# Email Configuration Panel

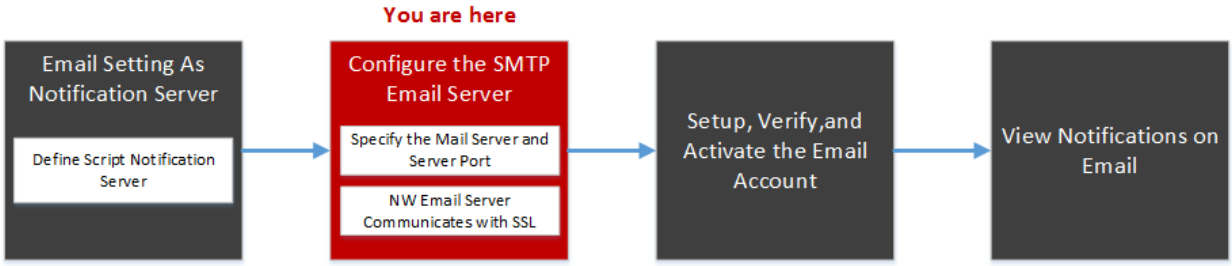
The Email Configuration Panel provides information about email configuration settings in the (Admin) > System > Email Configuration panel. NetWitness sends notifications to users vwith email about various system events. To be able to configure these email notifications, first configure the SMTP email server (See Configure Email Servers and Notification Accounts).

The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

## Workflow

This workflow shows the necessary procedures to configure and verify Email Panel.



## What do you want to do?

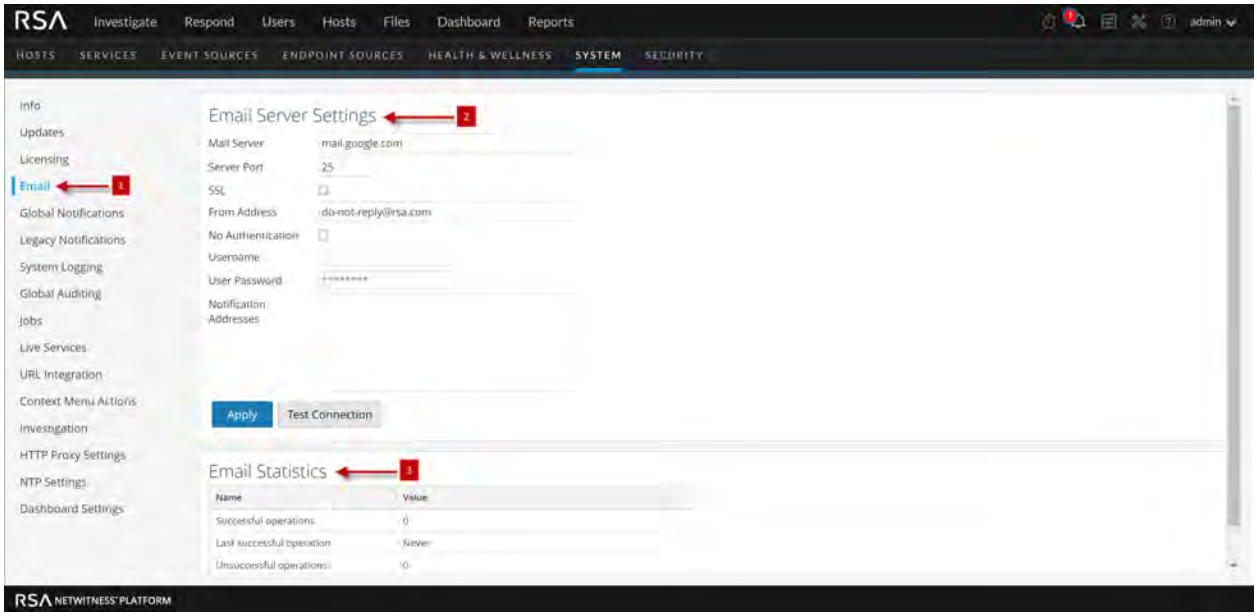
| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure the SMTP Email Server | Configure Email Servers and Notification Accounts |
| Administrator | Email Setting as Notification Server | Configure the Email Settings as Notification Server |
| Administrator | Setup, Verify and Activate the Email Account | Receive Notification on Email |

## Related Topics

- Configure the Email Settings as Notification Server
- Configure Email as a Notification
- Configure Email Servers and Notification Accounts

## Quick Look

The following example illustrates an Email configuration. The configuration defines how events are notified on Email.



1 Displays the Email Configuration Panel.
2 Allows the user to configure Email Server sittings.
3 Provides feedback on Email operations.

The **Email Configuration** panel has two sections: **Email Server Settings** and **Email Statistics**.

### Email Server Settings

In the **Email Server Settings** section, you configure the following parameters.

| Feature | Description |
|---|---|
| **Mail server** | The email server name. The default value is **mail.google.com**. |
| **Server port** | The server port used to send and receive emails. The default value is **25**. |
| **Use SSL** | The preference for SSL use in communications between the email server and NetWitness. The default value is to not use SSL (unchecked). |
| **From address** | The address that appears in all emails from NetWitness. The default from address for emails is **do-not-reply@rsa.com**. |
| **Username** | The username to access the email server. The default value is **blank**. |

| Feature | Description |
|---|---|
| **User password** | The user password to access the email server. The default value is **blank**. |
| **Test connection** | Tests the connection to the email server. |
| **Apply** | Applies the email configuration to this instance of NetWitness. |

## Email Statistics

The Email Statistics section provides feedback on the number of successful and failed email operations as well as the time of the last successful and unsuccessful email operation. For each statistic the name of the statistic and the value is displayed.

# Investigation Configuration Panel

The (Admin) > System > Investigation Configuration panel provides the user interface for administrators to configure the system-wide settings that NetWitness Investigate uses when analyzing data and reconstructing an event.

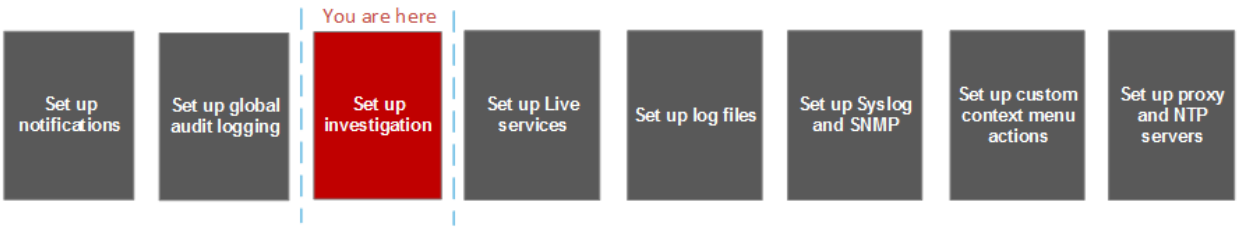
The settings allow an administrator to manage application performance for Investigate. As analysts analyze and reconstruct sessions that they are investigating, performance can be affected by operations that involve loading, searching, visualizing, and reconstructing large amounts of data.

**Note:** Analysts can also set individual preferences for Investigate in the Profiles view and in the Navigate, Legacy Events, and Events views.

To access the Investigation Configuration panel:

1. Go to **(Admin) > System.**
2. In the options panel, select **Investigation.**

## Workflow



## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Navigate, Legacy Events, and Events view settings | Configure Investigation Settings |
| Administrator | Map Context Hub Meta Types | Configure Investigation Settings |
| Administrator | Clear reconstruction cache for services | Configure Investigation Settings |

## Related Topics

- Standard Procedures

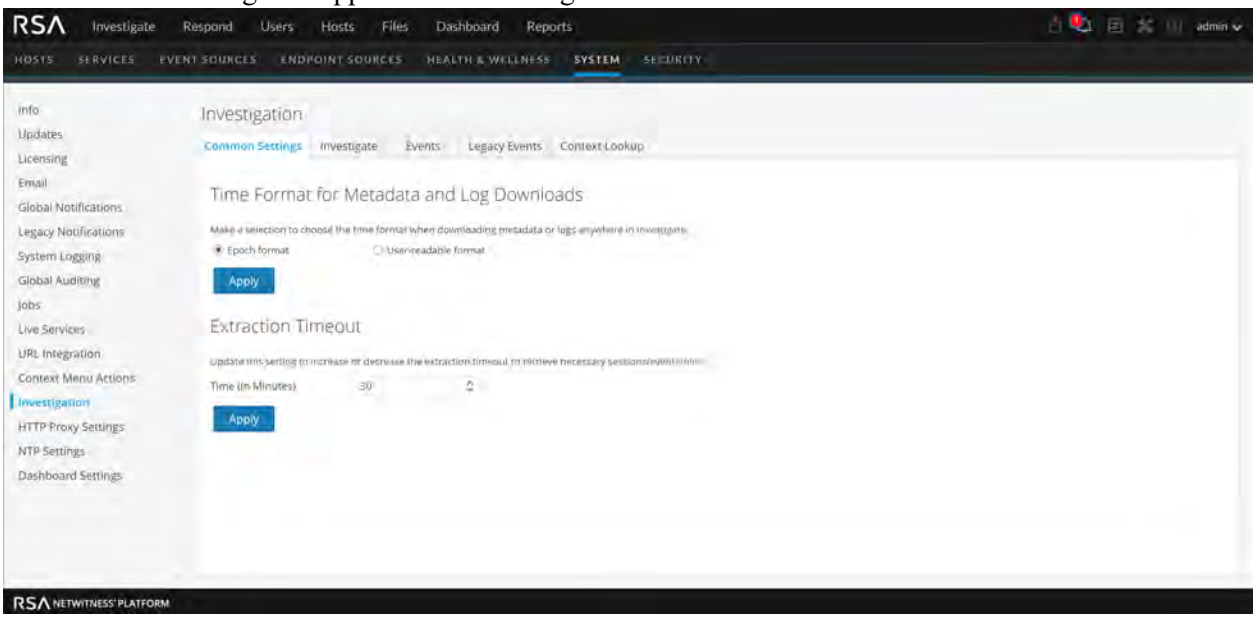
## Quick Look

The Investigation Configuration panel has four tabs: Common Settings (Version 11.5 and later), Navigate, Events, Legacy Events, and Context Lookup.

Though most fields in the tabs have a selection list with specific increments through the range of possible values, you can enter a value within the allowed range manually. An invalid entry is signaled by the field highlighted in red. When valid values are selected, clicking Apply in a given section puts the changes into effect immediately.

### Common Settings Tab

The Common Settings tab applies to all Investigate views.



The following table describes the options in this tab.

| Parameter | Description |
|---|---|
| **Time Format for Metadata and Log Downloads** | |
| Epoch format | Use the Epoch format in downloads from Investigate (default value). These are Epoch representations of `2020-04-13 09:34AM`:<br>• 12-hour representation = `61547519856000`<br>• 24-hour representation = `61547519976000` |

| Parameter | Description |
|---|---|
| User-readable format | Use a user-readable time in downloads from Investigate. The downloads use a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.<br>Examples of 12-Hour Format<br>`04-13-2020T09:17:36AM-07:00`<br>`13-04-2020T09:17:36AM-07:00`<br>`2020-13-13T09:17:36AM-07:00`<br>Examples of 24-Hour Format<br>`04-13-2020T09:19:14-07:00`<br>`13-04-2020T09:19:14-07:00`<br>`2020-04-13T09:19:14-07:00` |
| **Extraction Timeout** | |
| Time (In Minutes) | Use this to set the time limit before the session expires when downloading the logs from the service. |

## Investigate Tab

The Investigate tab has two sections: Render Threads Setting and Parallel Coordinates Settings. The following figure shows the Navigate tab.

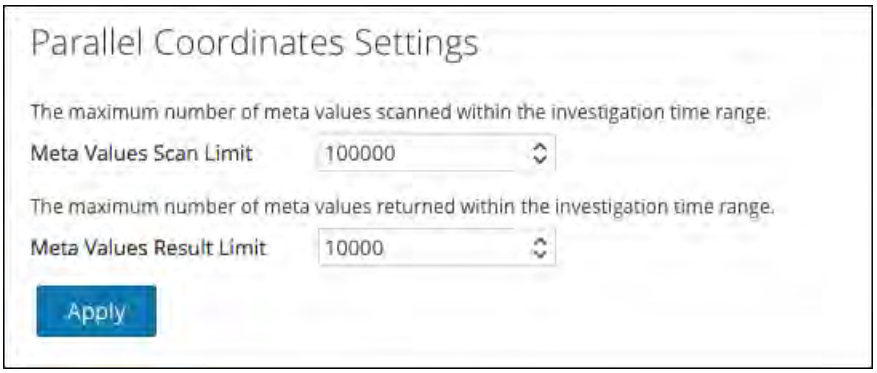
### Render Threads Setting

The Render Threads Setting is a selectable value between 1 and 20, which defines the number of concurrent (Values) loads in the Navigate view. The default value is 1.

### Parallel Coordinates Settings

The Parallel Coordinates Settings apply to the Parallel Coordinates visualization in the Navigate view. There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness the administrator can configure parallel coordinates limits here.

**Note:** For better performance, recommended settings are **Meta Values Scan Limit: 100000** and **Meta Values Result Limit: 1000-10000**.

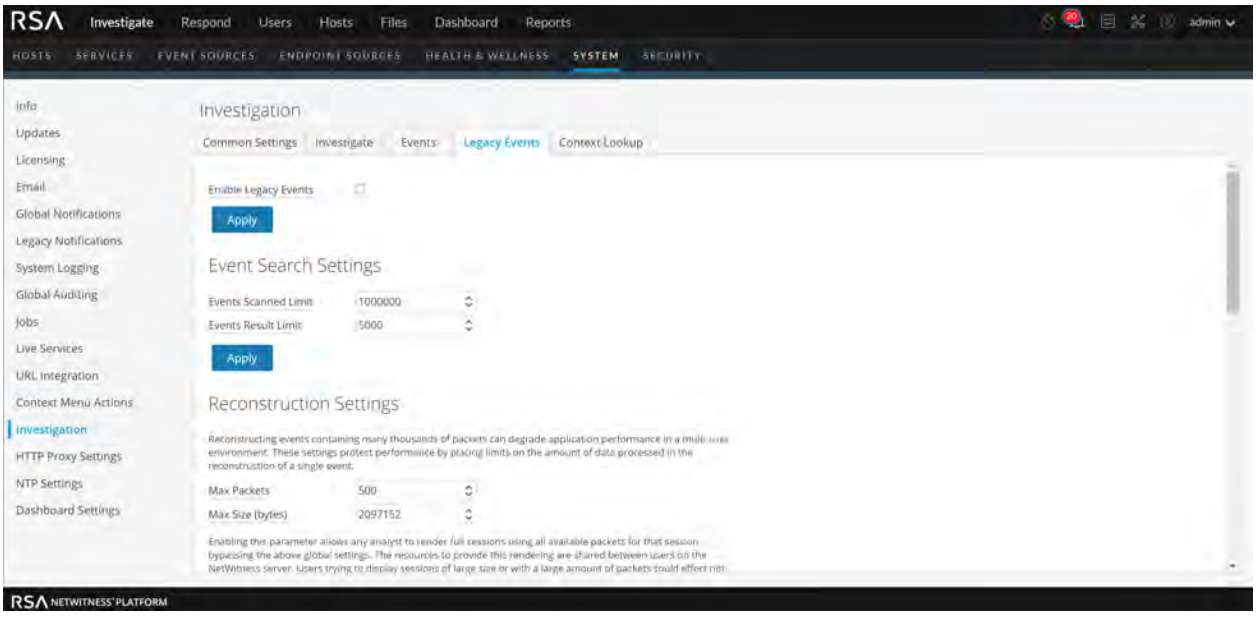


The following table describes the Parallel Coordinates Settings.

| Parameter | Description |
|---|---|
| Meta Values Scan Limit | The maximum number of meta values scanned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 1,000 to 10,000,000. The default value is 100,000. |
| Meta Values Result Limit | The maximum number of meta values returned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 100 to 1,000,000,000. The default value is 10,000. |

## Legacy Events Tab

The Events tab provides configurable settings that affect the investigation of events. This tab has five sections: Enable Legacy Events, Event Search Settings, Reconstruction Settings, Web View Reconstruction Settings, and Reconstruction Cache Settings. The following figure shows the Events tab.

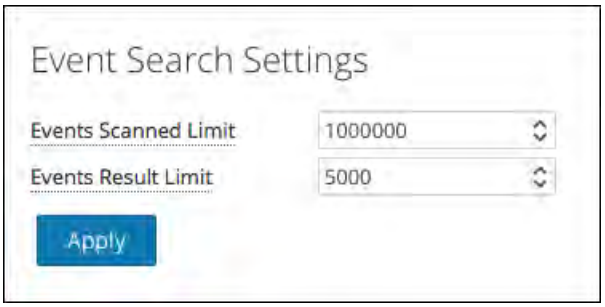


## Enable Legacy Events

The Enable Legacy Events checkbox helps to enable and view the legacy events tab and view the classic events page on the UI. By default, this option is disabled.

## Event Search Settings

The Event Search Settings help to limit the number of events scanned when searching in the Events view.



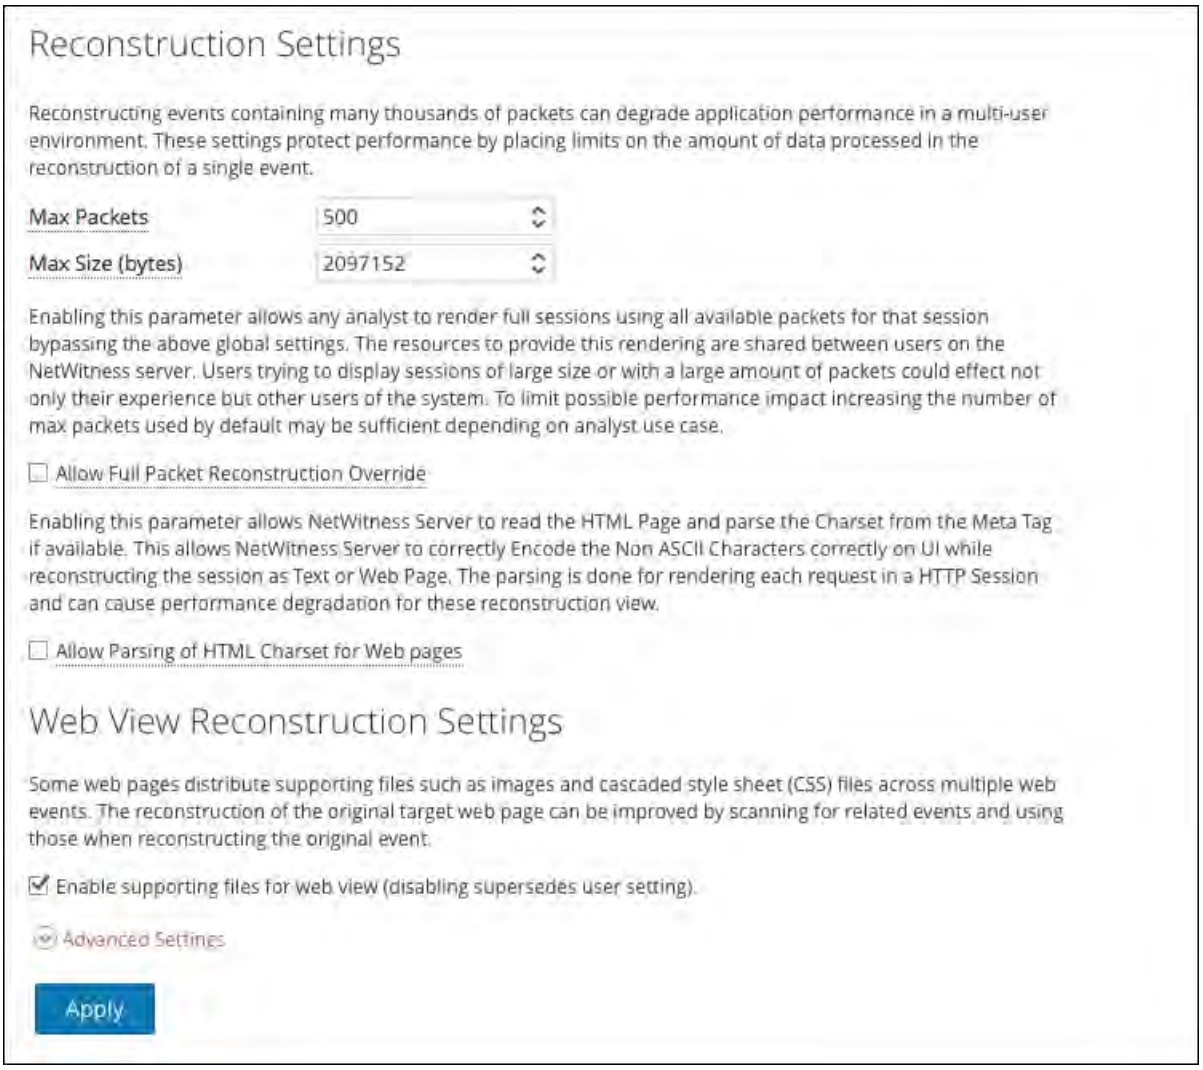
The following table describes the Event Search Settings.

| Parameter | Description |
|---|---|
| Events Scanned Limit | The maximum number of events to scan when searching in the Events view. The actual number of events scanned may be slightly greater than the limit set here. |
| Events Result Limit | The maximum number of results to return when searching in the Events view. The actual number of results returned may be slightly greater than the limit here. |

## Reconstruction Settings

As analysts reconstruct sessions that they are investigating, some events can be very large and contain many thousands of source packets. Reconstructing these sessions, especially in a multi-user environment, can degrade application performance. The Reconstruction Settings allow an administrator to limit the number of packets and the size of a single event during reconstruction.

**Note:** An override to the Reconstruction Settings section is configurable for web views (under Web View Reconstruction Settings).



The following table describes the Reconstruction Settings features.

| Parameter | Description |
|---|---|
| Maximum number of packets for a single event | This setting protects performance by placing a limit on the number of packets processed for a single event reconstruction.<br><br>Possible values are in the range from 100 to 10,000 packets, using manual entry or increments of 100 from the selection list. The default value is 100 packets. |
| Maximum size, in bytes of a single event | This setting protects performance by placing a limit on the maximum size, in bytes, of a single event reconstruction.<br>Possible values are in the range from 102,400 to 104,857,600 bytes, using manual entry or increments of 10,240 from the selection list. The default value is 2,097,152 bytes. |

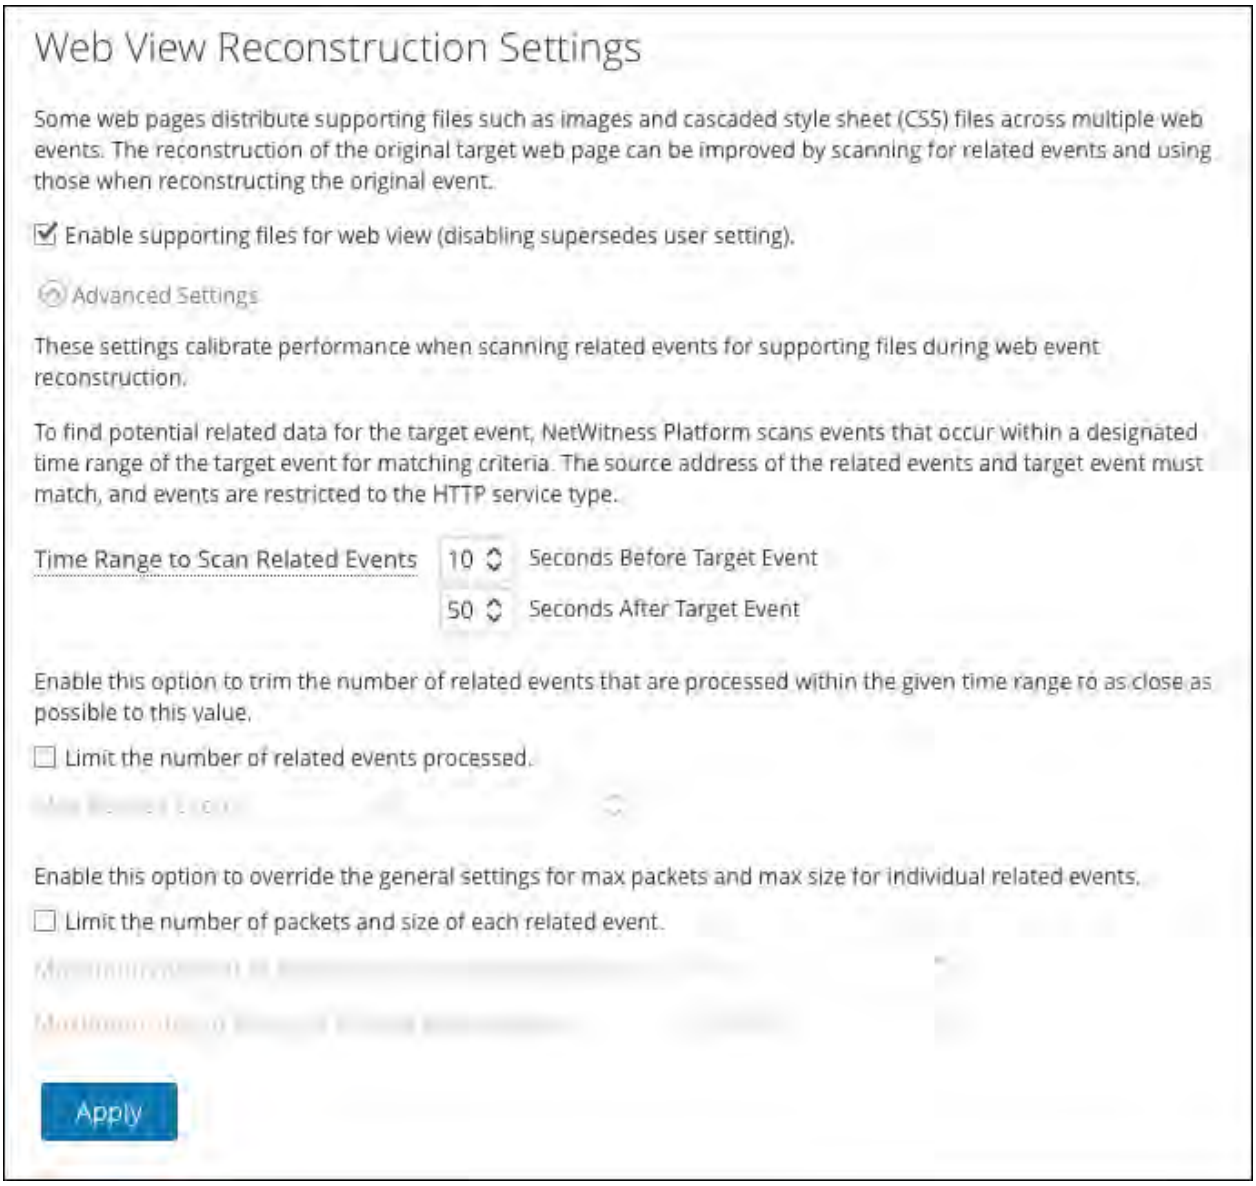
| Parameter | Description |
|---|---|
| Allow Full Packet Reconstruction Override | When this checkbox is selected, the analysts is provided with a Use More Packets button in the Reconstruction Panel. This enables the NW Server to regenerate events using all the packets available in the Event. |
| Allow Parsing of HTML Charset for Web pages | This option allows the NetWitness Server to identify the web page encoding defined in the HTML meta tag instead of the HTTP header. The default setting is disabled. |

### Web View Reconstruction Settings

The Web View Reconstruction Settings allow an administrator to configure settings that improve the reconstruction of a web view by scanning and reconstructing related events that contain the same supporting files. When NetWitness is reconstructing a web view that spans multiple events, it is possible to improve the reconstruction of the target event by scanning and reconstructing related events that contain the same supporting files, such as images and cascaded style sheet (CSS) files.

- The only related events scanned are HTTP service type events with the same source address as the target event, and a time stamp within a specified time range before and after the target event.
- The maximum number of related events to scan is configurable.

Clicking on the Advanced Settings option displays all configurable settings in this section.



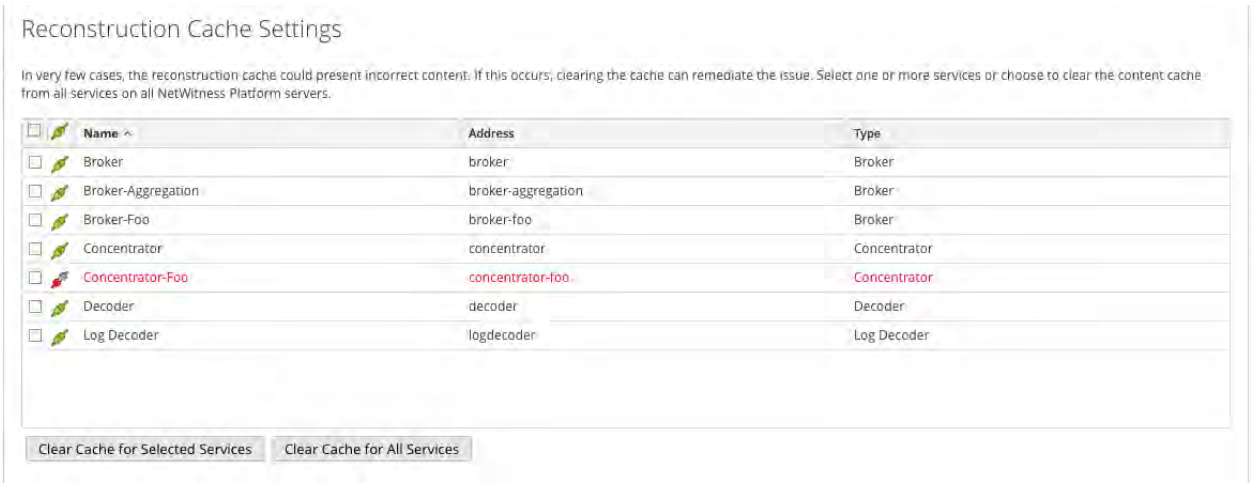
The following table describes the Web View Reconstruction Settings.

| Parameter | Description |
|---|---|
| Enable supporting files for web view | This option determines how web views that have related data in other sessions are reconstructed. The default setting is enabled.<br><br>When enabled, supporting files from related events can be used in the reconstruction of web views. Additional settings for calibrating the performance are enabled in this section, and Analysts have the option to enable CSS use in reconstructions.<br><br>When disabled, supporting files from related events are not used and the setting for analysts to enable CSS use in reconstructions is disabled. |

| Parameter | Description |
|---|---|
| Time Range to Scan Related Events | Available when **Enable supporting files for web view** is checked. Configures the time range within which NetWitness scans related events that are of the service type HTTP and have the same source address as the target event. This is a value between 0 and 60.<br>• Seconds Before Target Event<br>• Seconds After Target Event |
| Limit the number of related events processed | Allows configuration of the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event. By default, this is disabled. When enabled, the Maximum Related Events field becomes active. |
| Max Related Events | When **Limit the number of events processed** is enabled, this field specifies the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event.<br><br>This is a selectable value between 10 and 1,000, using an increment of 100. The default value is 100. |
| Limit the number of packets and size of each related event | Overrides the general settings for the maximum number of packets and maximum size (in bytes) for individual related events. |
| Maximum Number of Packets for a Single Related Event | Possible values are in the range from 100 to 10,000 packets, using increments of 100 from the selection list. The default value is 100 packets. |
| Maximum Size, in Bytes, of a Single Related Event | Possible values are in the range from 102,400 to 104,857,600 bytes, using increments of 10,240 from the selection list. The default value is 524,288 bytes. |

### Reconstruction Cache Settings

In some cases, the reconstruction cache can present incorrect content; for this reason NetWitness removes reconstructions that are older than a day from the cache. The cache is cleaned every day at midnight. Between the daily cache cleanings, certain actions may result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

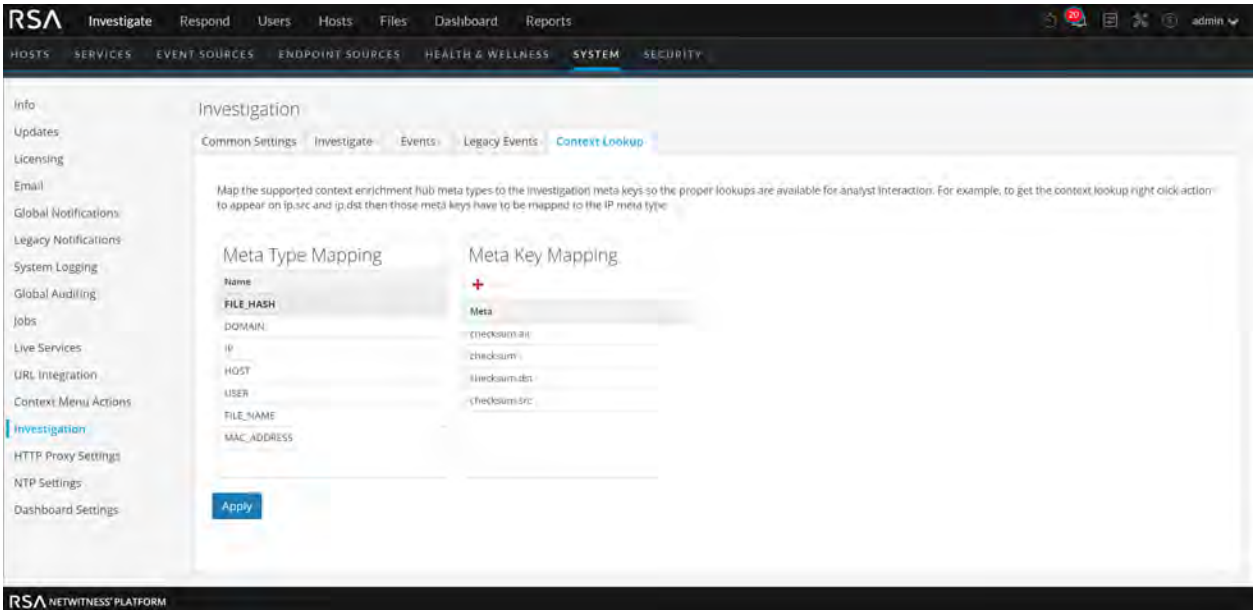


The following table describes the Reconstruction Cache Settings features.

| Feature | Description |
|---|---|
| Selection box | Selection box in individual rows and in the title bar allow selection of one or more, or all services that need to have cache cleared manually. |
| Clear Cache for Selected Services | Clears the reconstruction cache for each selected service. |
| Clear Cache for All Services | Clears the reconstruction cache for all services. |

## Context Lookup Tab

Procedures associated with this panel are provided in "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*. The following figure shows the Context Lookup tab.



The Context Lookup tab enables the administrator to configure the Investigate meta keys and meta type mapping. The administrator can add or remove meta keys found in Investigate to the list of meta types supported by Context Hub service. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

**Caution:** For the Context Lookup to work correctly in the Respond and Investigate views, this is the best practice: When mapping meta keys in the (Admin) > SYSTEM > Investigation > Context Lookup tab, add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB. For example, `ip.address` is a meta key and `ip_address` is not a meta key (it is a field in the MongoDB).

The following table describes the features of the Context Lookup tab.

| Feature | Description |
|---|---|
| + | Adds a meta key to the selected meta type supported by Context Hub. |
| − | Deletes the meta key from the selected meta type. |
| Apply | Saves the changes made to the Context Lookup tab. |

## Events Tab

The following figure shows the Event tab.

The Events tab provides configurable settings that affect the number of events displayed in the Events panel. This tab has two sections: Events Panel Settings and Event Limit per User Role.

| Feature | Description |
|---|---|
| Event Limit Default | Specifies the maximum number of events loaded in the Events panel when a query is submitted. Possible values are integers between 100 and 40,000, and the default value is 5,000 events. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment. |
| Event Limit Per User Role | Specifies the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000, but it can be greater than the Event Limit Default. |
| Apply | Each setting has an Apply button, which saves the change. The change becomes effective immediately, and applies to any new queries submitted by users. |

# Live Services Configuration Panel

Live Services Configuration Panel introduces the features for setting up your Live account and the CMS server connection.

Live Account consists of two sections, namely RSA Live Status and Download Live Feedback Activity Log. **Sign In** by entering your Live Account credentials to access the Live Services. To activate your Live account for NetWitness, please contact RSA Customer Care. When you have confirmation that your Live account has been set up, you can configure the CMS server connection as described in Configure Live Services Settings

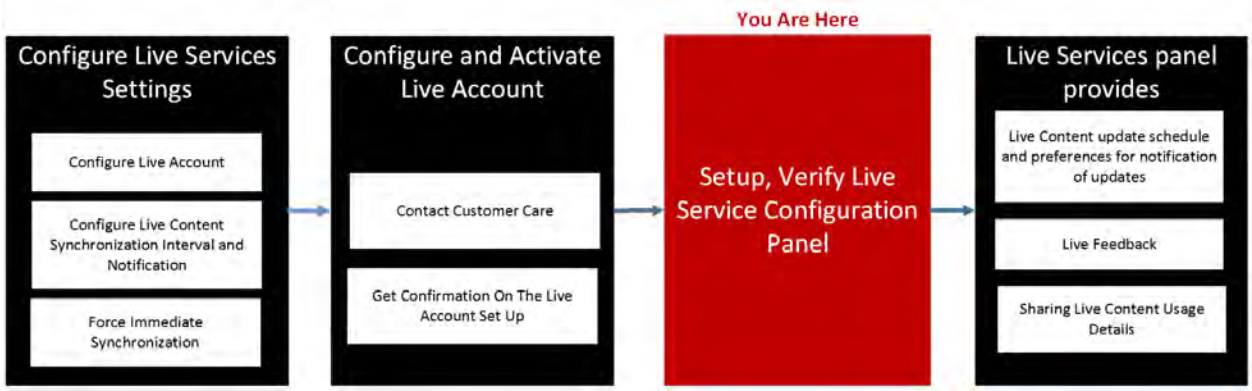
The Live Services panel provides the user interface for:

- The Live account
- The Live Content update schedule and preferences for notification of updates
- Participation in Live Feedback
- Sharing Live Content Usage Details

For information on Live Feedback, see Live Feedback Overview

For information on Analyst Behaviors and Data Sharing, see the "NetWitness Platform Feedback and Data Sharing topic in the *Live Services Management Guide*.

## Workflow



## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Live Account, CMS Server Connection | Configure the Email Settings as Notification Server |
| Administrator | Upload Data to RSA for Live Feedback | Upload Data to RSA for Live Feedback |

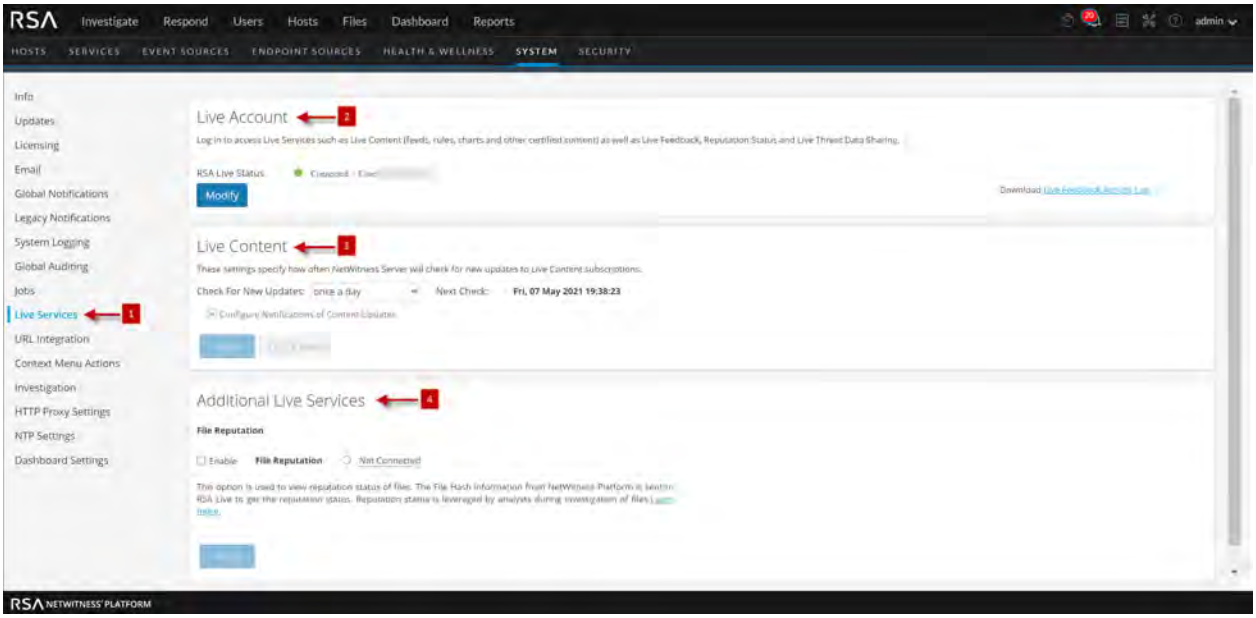
| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Setup, Verify Live Service Configuration Panel | Live Services Configuration Panel |
| Administrator | Overview On Live Feedback | Live Feedback Overview |

## Related Topics

- Live Feedback Overview
- Configure Live Services Settings
- Upload Data to RSA for Live Feedback
- *Live Services Management Guide*

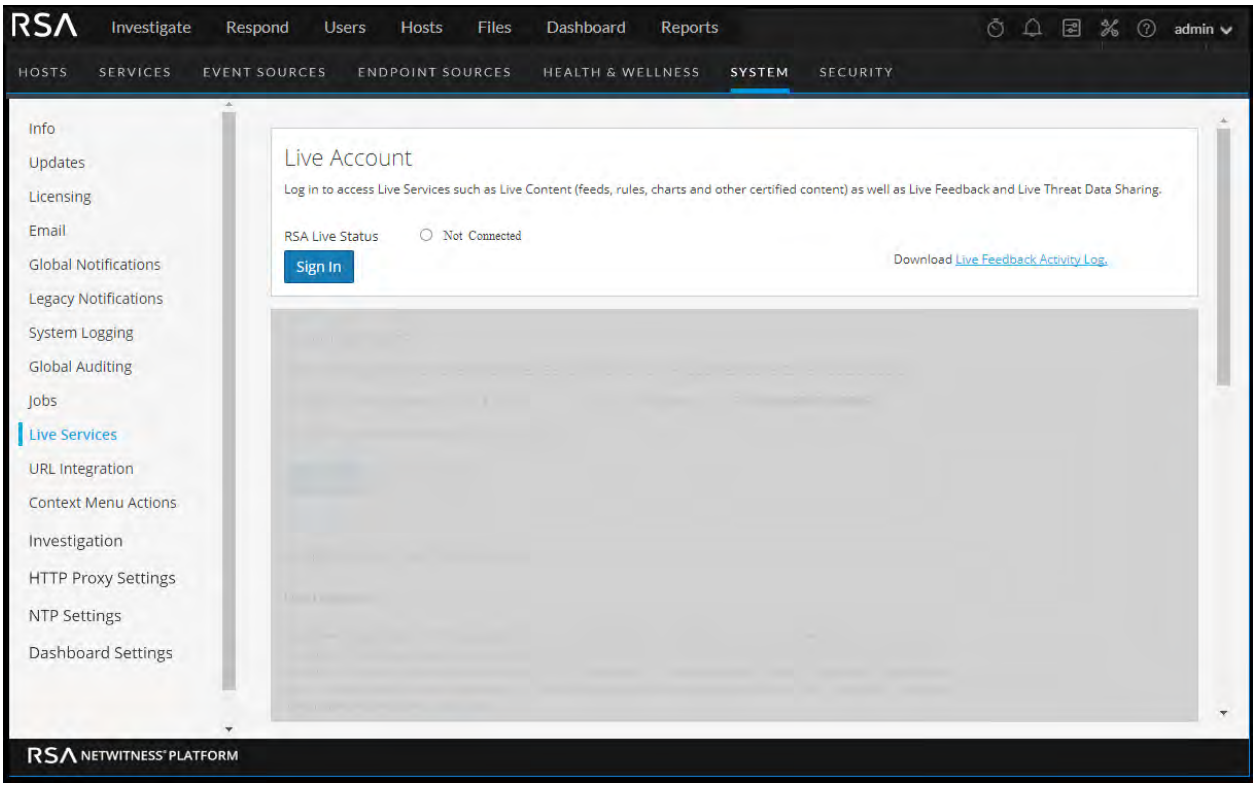
## Live Services Quick Look

You access this view in the **(Admin) > System > Live Services**.



1 Displays the Live Services Configuration Panel.
2 Enter Live Account Credentials with the help of Customer Care.
3 Provides updates on Live Content.
4 Additional Live Services provide Live feedback.

**Note:** If you are not signed in with your Live Account credentials, a masked screen is displayed as shown here.



The Live Configuration panel has three sections: Live Account, Live Content, and Additional Live Services.

## Live Account Section

In the **Live Account** section, you must enter the Live credentials. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the RSA Content Management System. This information is provided by Customer Care.

The following table describes the Live Account section features.

| Feature | Description |
|---|---|
| **Host** | The Live URL for the Content Management System. The default value points to the RSA CMS at **cms.netwitness.com**. |
| **Port** | The communications port for Live to send requests to the Content Management System. The default value for this field is **443**, which is the communications port on the Content Management System. |
| **SSL** | Allows the user to communicate via SSL. |
| **Username** | The Live account user name as provided by RSA Customer Care. |
| **Password** | The Live account user password as provided by RSA Customer Care. |
| **Test connection** | Tests if the connection is successful or not. |

| Feature | Description |
| --- | --- |
| **Apply** | Saves and applies the configuration. |

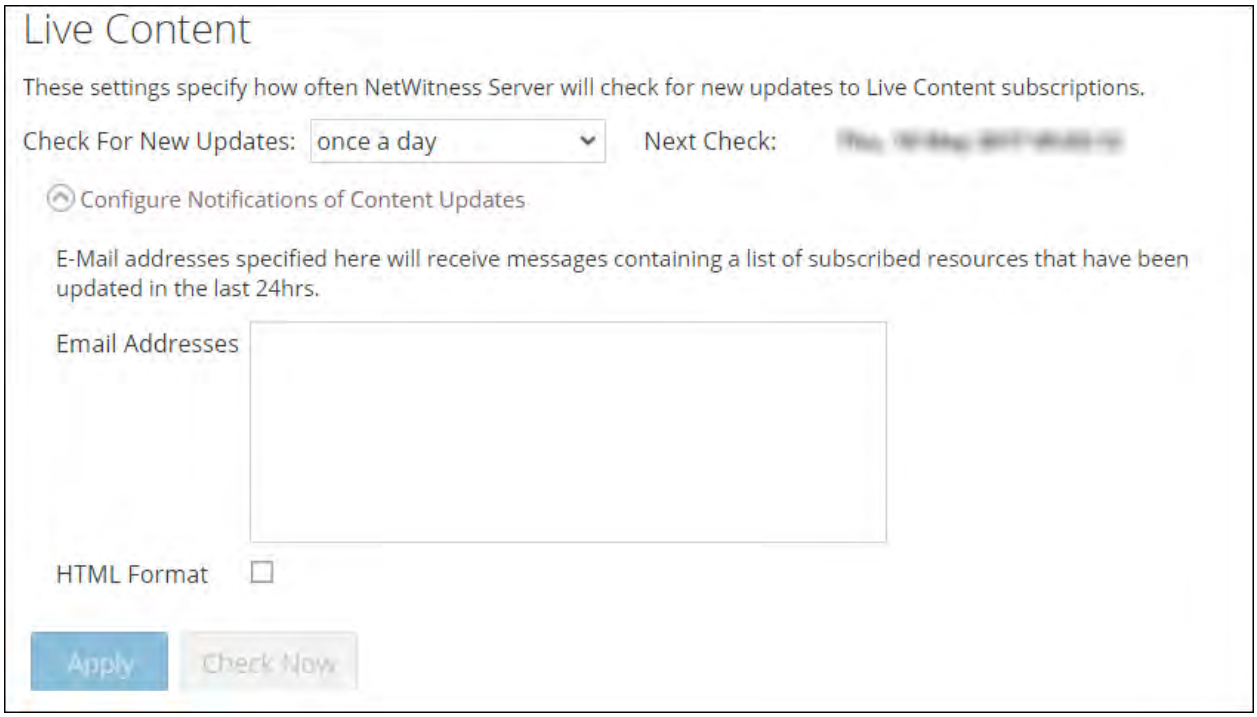
The Live Account section provides an option to download and share the Live Feedback historical data by clicking Live Feedback Activity Log.

For more information about how to download historical data, see Upload Data to RSA for Live Feedback

## Live Content Section

You can configure the Live Content Synchronization interval and notification at which NetWitness checks for new updates to Live Content:

Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



The following table describes the Live Content features.

| Feature | Description |
|---|---|
| **Check for new updates** | This setting dictates how often NetWitness checks for new updates to Live Subscriptions and synchronizes subscribed resources and tags:<br>• once a day<br>• twice a day<br>• four times a day<br>• every hour<br>• every other hour<br>• every half hour<br>The default value for this setting is once a day. |
| **Next Check** | Displays the time and date of the next scheduled Live synchronization based on the configured interval for checking. |
| **Email Addresses** | Email addresses specified here receive messages containing a list of subscribed resources that have been updated in the last 24 hours. |
| **HTML format** | Specifies the format of email messages.<br>• Set = HTML<br>• Cleared = text |
| **Check Now** | Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness.<br>**Caution:** Use this feature with caution because synchronization can cause a parser reload if a Lua Parser or Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions. |
| **Apply** | Applies the changed configuration to the subscription synchronization behavior. The changes become effective immediately. The **Next Live synchronization is scheduled for** field is updated if the time changed. |

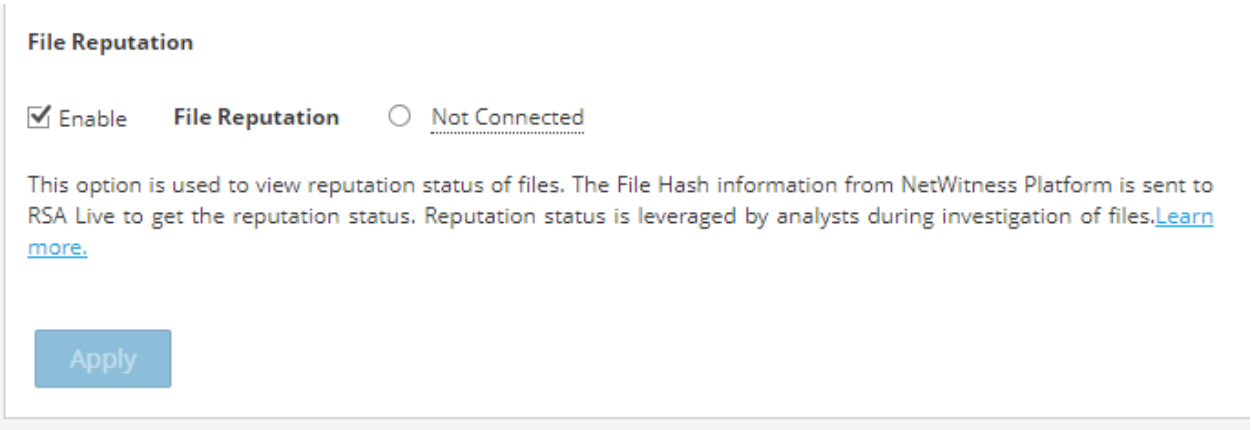
## Force Immediate Synchronization

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

**Caution:** Synchronization can cause a parser reload if a Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

## Additional Live Services



**Note:** Click on Learn more to know more about the data RSA is collecting. For more information, see Live Feedback Overview

The following tables describes the Additional Live Services features.

| Feature | Description |
|---|---|
| Live Feedback | Lists the types of data RSA is collecting:<br>• Product Name<br>• Product Version<br>• Product Instance<br>• Activation Key<br>• Details of each Component such as:<br>  • ID<br>  • Name<br>  • Version<br>  • Instance ID<br>• Metrics for each component |
| Additional Feedback Insights | Enables NetWitness to send anonymous, technical data about the content usage metrics to RSA. This option is enabled by default. |

## About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

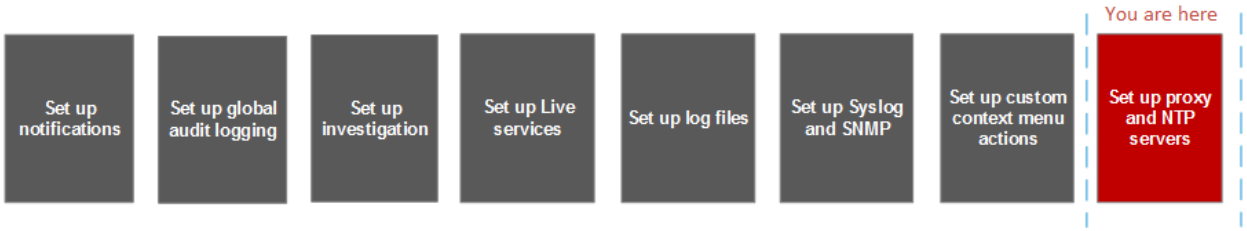
# NTP Settings Panel

NTP setting panel is a protocol designed to synchronize the host machine clocks over a network. For more information on NTP see the home page (http://www.ntp.org/).

**Note:** NetWitness core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.

You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes.

## Workflow



## What you need to do?

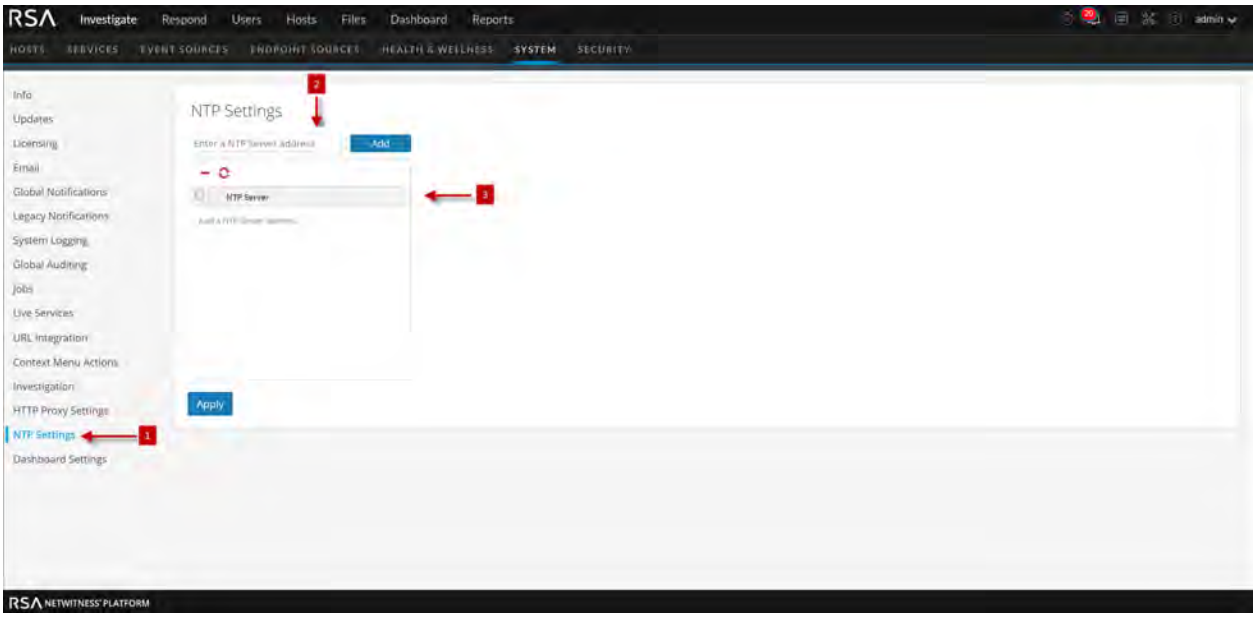
| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Add or Modify an NTP Server | Configure NTP Servers |

## Related Topics

- Configure NTP Servers
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

## Quick Look

The following example illustrates an NTP setting panel. The panel defines how to add NTP server to NTP setting panel.



1 Displays the NTP setting panel.
2 Enter the NTP Server IP Address or hostname.
3 Click on an existing hostname.

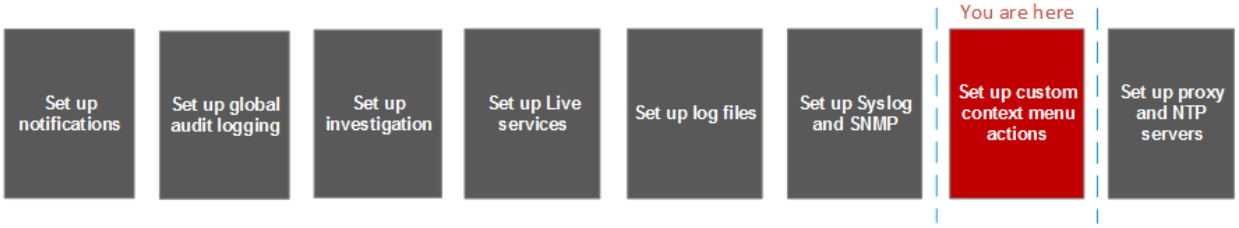
The following table describes the settings in the NTP Settings panel.

| Setting | Description |
|---|---|
| **Add** | Enter the NTP Server IP Address or hostname to add the NTP server to NetWitness. |
|  | Delete the selected NTP server. |
| | Synchronizes the selected NTP server. |
| | Selects the NTP server that you want to delete or synchronize. |
| NTP Server | NTP Server IP Address or hostname. If you click on an existing hostname, NetWitness makes the hostname editable and displays the following command buttons:<br>• **Update** - Applies your edits.<br>• **Cancel** - Cancels your edits. |
| **Apply** | Applies the NTP server settings and synchronizes host machine clocks to NTP. |

# Context Menu Actions Panel

In the Context Menu Actions panel, Administrators can view built-in context menu actions, and add, edit, or delete custom context menu actions that appear as options in a context menu.

## Workflow

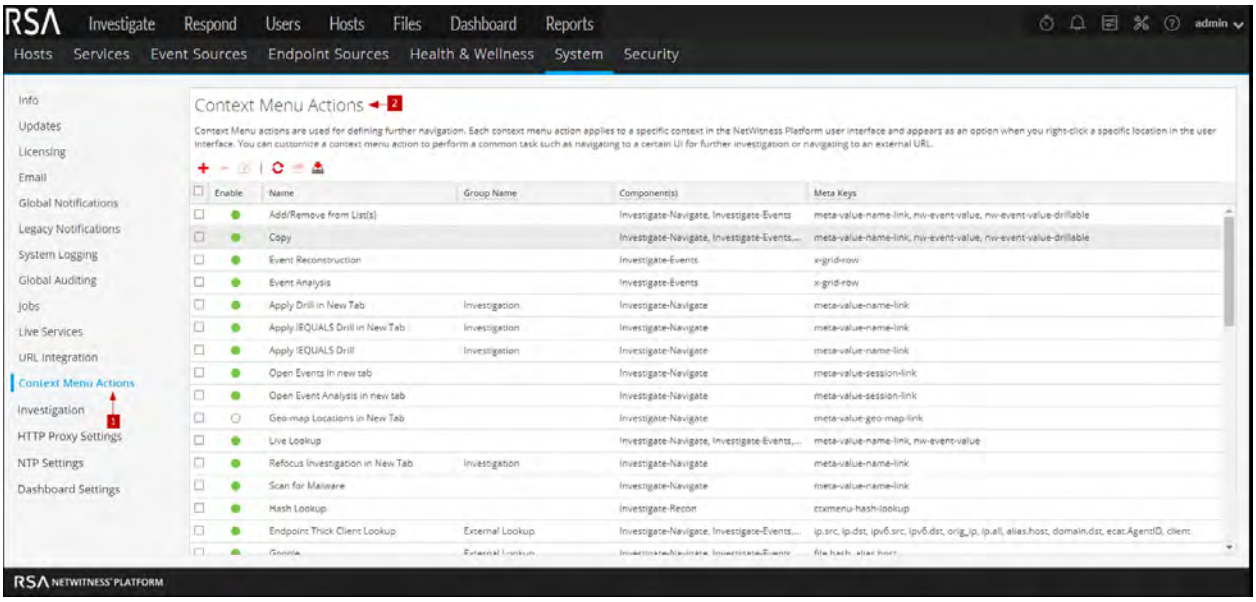


## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Custom Context Menu Actions panel | Add Custom Context Menu Actions. |

## Quick Look

The following figure is an example of the Context Menu Actions panel.



1 Displays the Context Menu Actions Panel.
2 Toolbar allows you to Add, Edit, Delete Context Menu Actions.

The Context Menu Actions panel has a list and a toolbar. The following table describes the toolbar options and grid features.

| Features | Description |
|---|---|
| | Displays the Context Menu Configuration dialog, in which you can create a new context action. |
| | Refreshes the list. |
|  | Deletes the selected context actions. NetWitness does not request confirmation that you want to delete the action. The selected actions are immediately deleted with no opportunity to cancel. |
| | Displays the Edit Context Action dialog, in which you can edit an existing context action. |
| **Visibility** | Displays whether the context menu action is enabled or disabled. |
| **Action Name** | The name of the context menu action as it appears on the meta when a user right-clicks to initiate action. |
| **Action Group** | The action group under which this context menu action is grouped. |
| **Component** | The UI component to which the Action Name and Action Group belong. |
| **Meta Keys** | The names of the modules in which the context action is available. Currently all built-in context menu actions are for the Investigation module.<br>When creating a context menu action, the parameter is `modules`.<br>Here is a line of sample code:<br>`"modules": [`<br>`"investigation"`<br>`],` |

## CSS Classes and Examples

CSS classes can be meta keys and non-meta keys.

### Meta Key CSS Classes

One type of CSS class that you can add is meta keys. For meta keys that have a period, change the period to a dash when defining a CSS class. For example, the meta key `alias.host` becomes the CSS class `alias-host`. The meta key `ip.src` becomes the CSS class `ip-src`.

### Non-Meta Key CSS Classes

Built-in non-meta key CSS Classes are also available. The classes in the following table define actions and the part of the user interface where the action is available.

| CSS Class | Type | Description |
|---|---|---|
| meta-value-session-link | Action | Open on meta session count number |
| meta-value-name-link | Action | Open on meta value name |
| nw-event-value | Action | Use for reconstruction context actions on meta value |
| UAP.investigation.navigate.view. NavigationPanel | User interface | Applies to Navigate view |
| UAP.investigation.events.view. EventGrid | User interface | Applies to Event View |
| UAP.investigation.reconstruction.view. content.ReconstructedEventDataGrid | User interface | Applies to Event Reconstruction View |

## Example

This is a commented example of a context menu action to validate the user agent from the Client Application (client) meta key. The comments are removed automatically once applied in the Administration System view. The new menu item is displayed after restarting the browser.

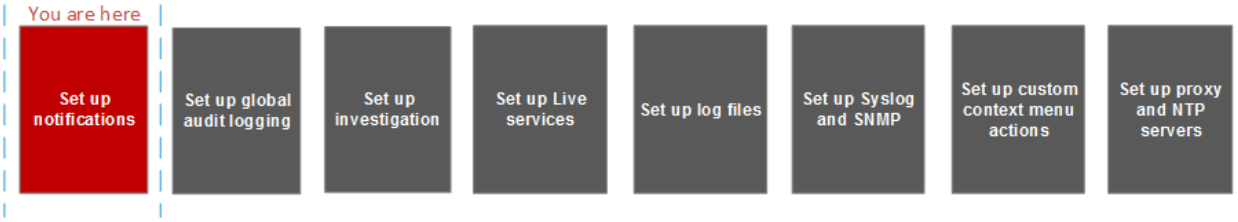
```
{
     "displayName": "User Agent String Lookup”, <!-- What name shows up in NW
UI -->
     "cssClasses": [
         “client”  <!-- What meta key to launch from -->
     ],
     "description": "",
     "type": "UAP.common.contextmenu.actions.URLContextAction",
     "version": "1",
     "modules": [
         "investigation"
     ],
     "local": "false",
     "groupName": "externalLookupGroup”, <!-- What group to show link in.
Remove line to show in main list -->
     "urlFormat": "http://www.useragentstring.com/?uas={0}&getText=all”, <!-- The {0}
gets replaced with whatever was right clicked on -->
     "disabled": "",
     "id": "UserAgentStringAction",
    "moduleClasses": [
         "UAP.investigation.navigate.view.NavigationPanel”, <-- Enabled in
Navigate pane-->
        “UAP.investigation.events.view.EventGrid” <-- Enabled in Event View
pane -->
     ],
     "openInNewTab": "true",
     "order": "15"
 }
```

# Legacy Notifications Configuration Panel

The Legacy Notifications Configuration panel provides the ability to configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Procedures related to these settings are described in Configure Syslog and SNMP Settings.

## Workflow



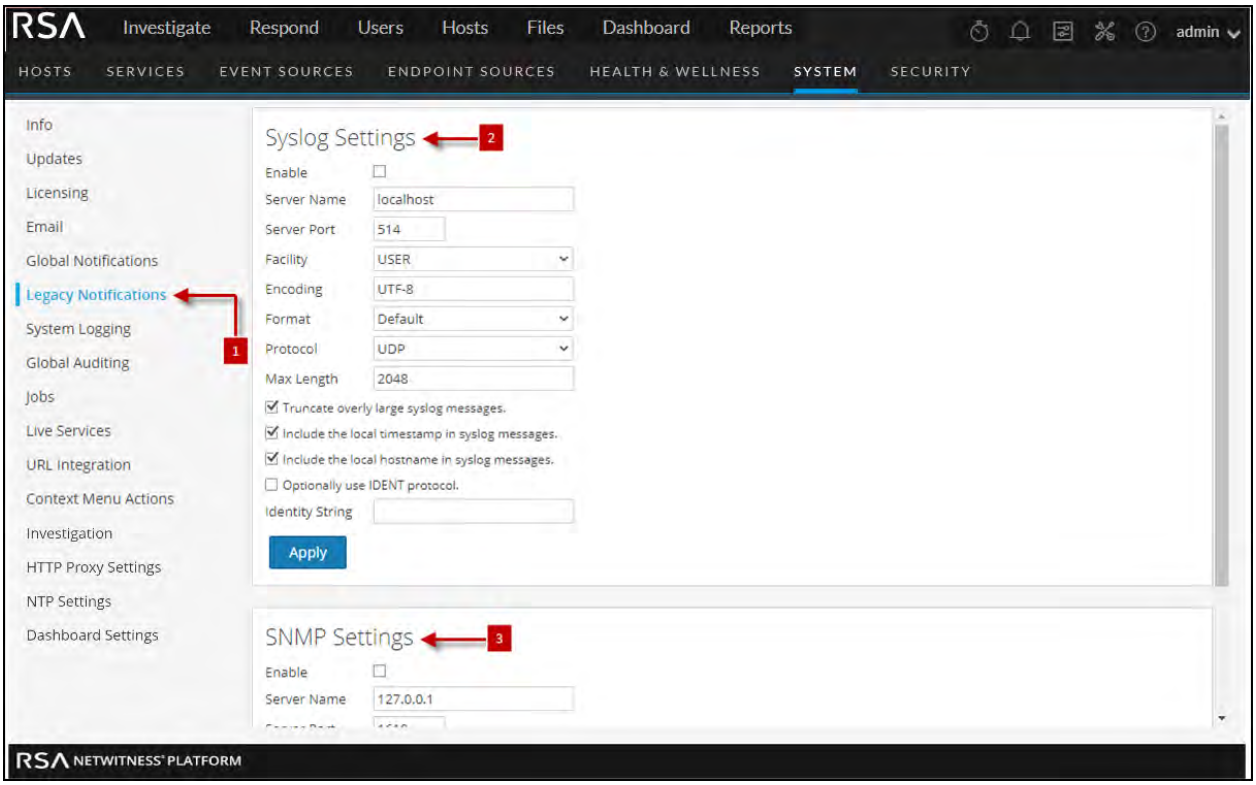
## What do you want to do?

| Role | I want to ... | Show me how |
|---|---|---|
| Administrator | Configure Syslog Settings | Configure Syslog and SNMP Settings |
| Administrator | Configure SNMP Settings | Configure Syslog and SNMP Settings |

## Related Topics

- Configure Syslog and SNMP Settings

## Quick Look



1. Displays the Legacy Notification Configuration Panel.
2. Allows the user to configure syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.
3. Allows the user to configure SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

The Legacy Notifications Configuration Panel consists of two sections: Syslog Settings and SNMP Settings.

### Syslog Settings

The following table describes the available options for configuring syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

| Feature | Description |
|---|---|
| **Enable** | Enables the syslog settings configured here. |
| **Server Name** | Specifies the host where the target syslog process is running. |
| **Server port** | Specifies the port where the target syslog process is listening. |

| Feature | Description |
|---|---|
| **Facility** | Specifies the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, FTP, LOCAL1 through LOCAL7. |
| **Encoding** | Specifies the encoding to use for text in syslog messages, for example, UTF-8. |
| **Format** | Specifies the message format. Possible values are: Default, PCI DSS, or SEC. |
| **Protocol** | Specifies the communications protocol used when sending syslogs: UDP or TCP. By default, the UDP protocol is selected. |
| **Max length** | Specifies the maximum length in bytes of any syslog message. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected. |
| **Truncate overly large syslog messages** | When checked, any messages exceeding the maximum length are truncated. |
| **Include the local timestamp in syslog messages** | When checked, NetWitness includes the local timestamp in messages. |
| **Include the local hostname in syslog messages** | When checked, NetWitness includes the local hostname in syslog messages. |
| **Optionally use IDENT protocol** | When checked, NetWitness prepends the identity string to outgoing syslog alerts. |
| **Identity string** | This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that sends the syslog message. |
| **Apply** | Applies the syslog configuration settings. |

## SNMP Settings

The following table describes the available options for configuring SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

| Feature | Description |
|---|---|
| **Enable** | Enables the SNMP settings configured here. |
| **Server Name** | Specifies the SNMP trap host. |
| **Server port** | Specifies the listening port on the SNMP trap host |
| **SNMP version** | Specifies the SNMP version, **v1** or **v2c**. |

| Feature | Description |
|---|---|
| **Trap OID** | Specifies the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**. |
| **Community** | Specifies the community string used to authenticate on the SNMP trap host, the default value is **public**. |
| **Enable** | Enables SNMP notifications as configured here. |
| **Apply** | Applies the SNMP configuration settings. |

# RESTful API

The RESTful API that ships with NetWitness Platform is a way to programmatically communicate with the NetWitness architecture. It must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, on a Concentrator, the default port is **50005**, and the REST API is on port **50105**), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`. For information about how to perform these tasks, see Access the RESTful API in NetWitness Platform.

The API is based on HTTP and is quite easy to use. The acceptable output formats are:

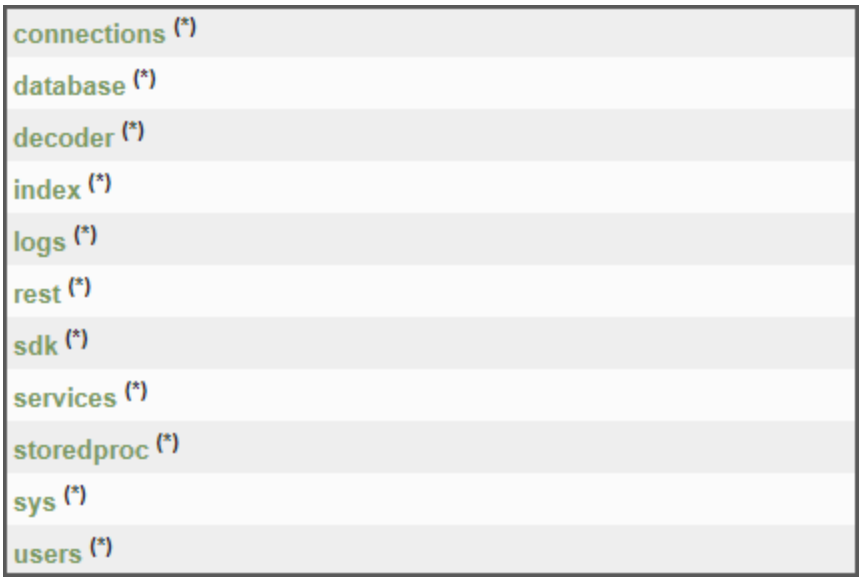
- text/plain
- text/xml
- text/html
- application/json

The content type that is returned can be controlled through the **HTTP Accept** header. It is possible to set the parameter **force-content-type** to one of the previous values.

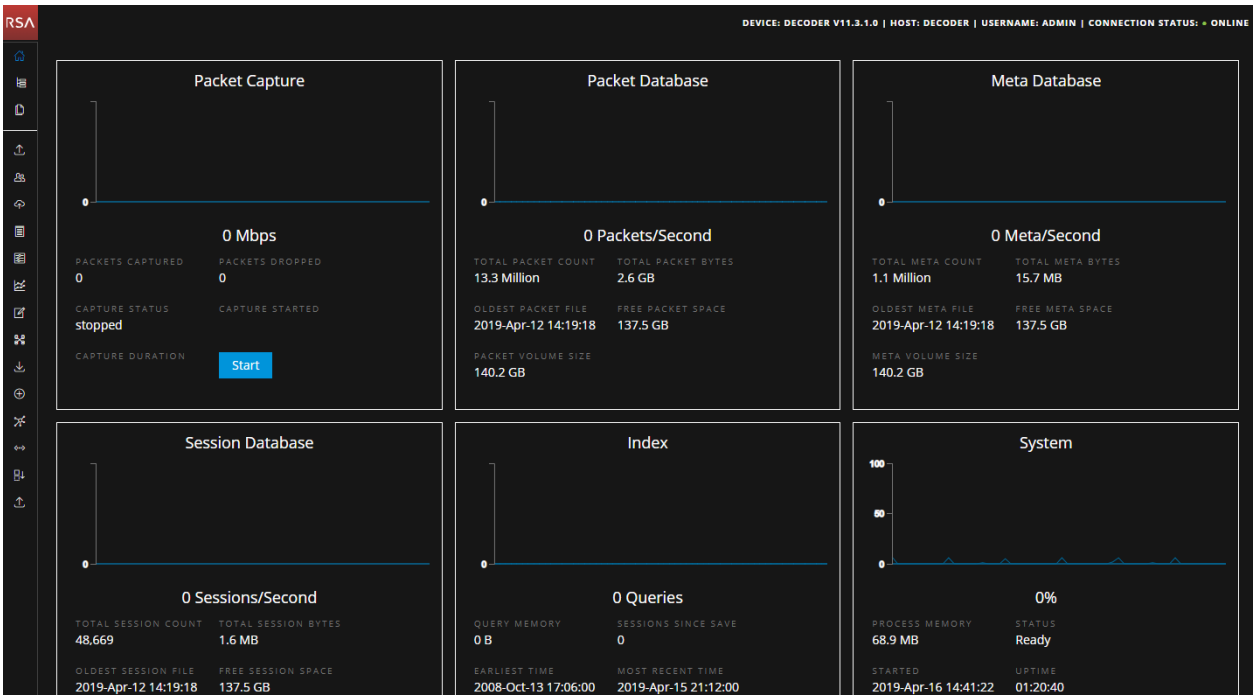
The easiest way to begin is to point a browser to the REST port (for details about how to perform these tasks, see Access the RESTful API in NetWitness Platform):

`PATH: http://<hostname or IP>:<REST port>`

This command performs the default operation of `ls`, and returns a listing for the root node tree used by NetWitness:



The user interface that is shown above is enabled by default in all Version 10 and 11 deployments. The user interface with the dark background (shown below) is available in Version 11.3.1 and later, and must be enabled if you want to use it.



To enable the user interface with the dark background, set `/rest/config/Enable WebSockets Interface (allow.websockets)` to `true` and restart the service. You can change the user interface back to the light background by setting this parameter to `false` and restarting the service.

# Usage

The REST API accepts commands by using URL parameters and by POSTing application/json.

The special content type, `application/x-netwitness-string-params`, passes parameters, as plain text, in the format:

```
param1=value1 param2="value \"2\""
```

**Note:** Quotes, as part of the value, must be preceded by the backslash \ character. Any character can be escaped in this manner, including the backslash itself \\.

The format of the URL consists of the following components:

```
http://<hostname or IP>:<port>/[node1][/node2][…]?msg=<message name>
[&param1=value1][&param2=value2][…]
```

## Usage example: the "/logs" Node

The /logs node supports several different messages:

- **ls**–Returns a list of child nodes. It supports the parameters depth and options.
- **mon**–Monitor this node (and possibly descendants) for changes. However, this message is not supported by the REST API because it requires a persistent connection and pipe that cannot be done via REST. Monitoring currently requires the full NetWitness SDK library.
- **pull**–This command pulls logs from the service. It supports two parameters: **count**, which controls how many logs to return, and **id2**, which controls the ending log ID to return. **id2** is optional and when it is not provided, the last log written is returned.
- **info**–Returns detailed node information.
- **help**–The parameters are covered in more detail in Find More Details.
- **count**–A simple command to return the number of child nodes.
- **stopMon**–Stop monitoring the node from a previous mon command (also not supported by REST).
- **download**–A more complicated command to download a large number of log messages with several parameters to control log types and text matching capabilities. Like the **mon** command, this requires more than a simple request/response, which is not supported by the REST node interface.
- **timeroll**–Any log entries that exceed a given age are deleted.

To get a full list of NetWitness messages and parameters, use the help message:

```
http://localhost:50106/logs?msg=help&force-content-type=text/plain
```

This command returns:

```
description: A container node for other node types
security.roles: everyone,logs.manage
message.list: The list of supported messages for this node
ls: [depth:<uint32>] [options:<string>] [exclude:<string>]
mon: [depth:<uint32>]
pull: [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
info:
help: [msg:<string>] [op:<string>] [format:<string>]
count:
stopMon:
download: [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-
time>] op:<string> [logTypes:<string>] [match:<string>] [regex:<string>]
[timeFormat:<string>] [batchSize:<uint32>]
timeRoll: [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>]
[days:<uint32>] [date:<string>]
debugGen: [count:<uint32>]
```

## Example Syntax

To view the last 100 logs:

```
http://hostname:50105/logs?msg=pull
```

To view the logs in XML format:

```
http://hostname:50105/logs?msg=pull&force-content-type=text/xml
```

To see the last 10 logs in plain text:

```
http://hostname:50105/logs?msg=pull&count=10&force-content-type=text/plain
```

## Find More Details

For more detailed information about a message (for example the pull message), request help specific to just that message. The **help** message displayed above uses the parameter name **msg**, but in the URL below, **message** is used, an alias for the help **msg** parameter to avoid conflicts with the REST API **msg**.

```
http://localhost:50106/logs?msg=help&message=pull&force-content-
type=text/plain
```

Returns this text:

```
pull:
        Downloads N log entries security.roles: logs.manage
        parameters: id1 - <uint64, optional> The first log id
        number to retrieve, this is mutually exclusive with
        id2 id2 - <uint64, optional> The last log id number
        that will be sent, defaults to most recent log message
        when id1 or id2 is not sent count - <uint32, optional,
        {range:1 to 10000}> The number of logs to pull
        timeFormat - <string, optional, {enum-
        one:posix|simple}> The time format used in each log
        message, default is posix time (seconds since 1970)
```

# Access the RESTful API in NetWitness Platform

This topic describes how to enable the REST API in NetWitness Platform. The REST API must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, **50105** for a Concentrator), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`.

**Note:** By default, the REST interface accepts **BOTH** SSL and Non-SSL connections on the REST port. By setting `/sys/config/ssl` to on, **ONLY** SSL connections will be accepted on the REST port.

To enable the REST port:

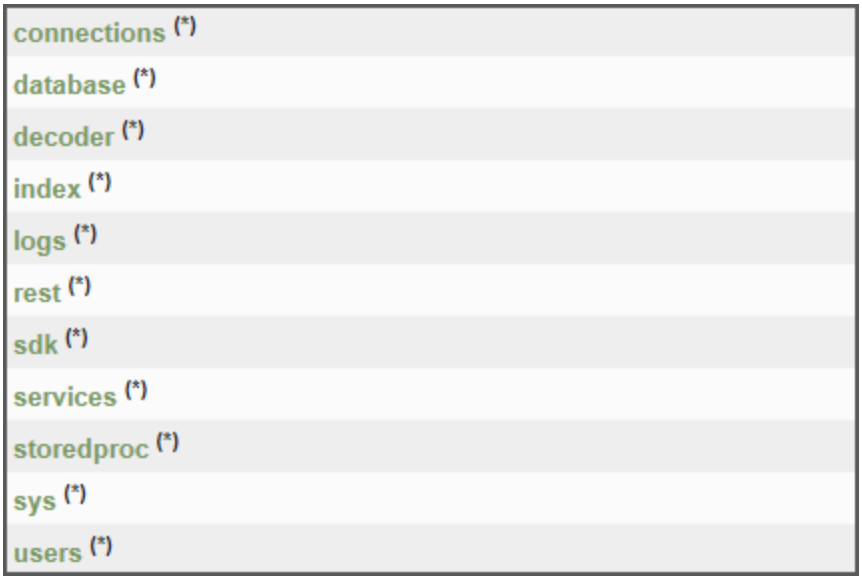
1. In the NetWitness web user interface, go to (Admin) > **Services** and select a service, for example, a Concentrator.
2. In the **Host** column, click on the host name. The Hosts page opens, and the IP address of the host is displayed in the **Host** column. Make a note of the IP address.

   **Note:** If the IP address listed in the Host column is the same as the IP address of the NetWitness web UI, the API is not available for that service.

3. Go to (Admin) > **Services**, select the service, and then select **View** > **Config**. Under **System Configuration**, note the port number. You will use this port number as a basis for accessing the API, but you must add 100 to it. For example, if the port number is listed as **50005**, you would enter `50105`.
4. In the browser, type the IP address of the service and append the port number to the IP address as shown here:
   `http://<hostname or IP address>:<port>`

   **Note:** The URL is HTTP, and not HTTPS.

5. In the Authentication dialog, enter the user name and password and click **Log in**. The root node tree used by NetWitness is displayed:



## (Optional) Configure Custom SSL Certificate for the REST Interface

**IMPORTANT:** As a security best practice, using self-signed certificates is not recommended.

**Note:** In version 11.6, custom certificates are not supported on Log Collector.

By default, NetWitness Platform provides certificates for all the NetWitness Platform Core Services. For example, Decoder uses the `/etc/netwitness/ng/decoder_cert.pem` certificate.

You can provide your own custom certificate (preferably issued by a certification authority) for the REST ports. The custom certificates must be in the OpenSSL PEM format. Perform the following steps to configure the custom certificates:

1. Rename the custom certificate to `<service name>_rest_cert.pem` and upload it to `/etc/netwitness/ng/`. For example, `decoder_rest_cert.pem`.
2. Rename the private key to `<service>_rest_key.pem` and upload it to `/etc/netwitness/ng`. For example, `decoder_rest_key.pem`.

**Note:** You can combine the certificate and the private key in a single file and name it as `<service>_rest_cert.pem`. For example, `decoder_rest_cert.pem`.

If custom certificates are not detected, the default NetWitness Platform certificates are used.

# Packets

You can retrieve a **pcap** file using the REST service.

`http://<hostname>:<port>/sdk/packets`

If you point a browser to this URL, the web page lets you enter a list of session IDs or a time range. When you click **Submit**, it generates a **pcap** based on the supplied criteria.

Programmatically, using HTTP GET or POST, submit either a **sessions** parameter with a comma-separated list of session IDs and session ranges (#-#) or a **time1** and **time2** parameter. Times must be in the format **YYYY-MM-DD HH:MM:SS**, for example: **2010-Apr-20 09:00:00**.

**Note:** Since the list of sessions can get quite long, this API accepts the content-type `application/x-netwitness-string-params` for a **POST** command.

## Importing Packets

You can import packets to a DECODER using the REST service.

`http://<hostname>:<port>/decoder/import`

If you point a browser to this URL, the web page lets you select a **pcap** file for upload. It also accepts pcap files POSTed to this URL.

REST begins processing incoming data immediately after the HTTP header is parsed. This means import of a **pcap** file occurs quickly and allows for large transfers. There is still a limit, but it is much larger (GBs) and is based on how well the import process can keep up with the client POST coming in. If the client posts a huge pcap (many GBs), it is still possible to overfill the current buffer. Any pcap that is 4 GBs or less should be able to process without issue.

**Note:** The DECODER cannot be concurrently importing or capturing, or an error results.

# Parser/Feed Upload

You can upload Parsers and Feeds using the REST service.

`http://<hostname>:<port>/decoder/parsers/upload`

If you point a browser to this URL, the web page lets you select a parser or feed file for upload.

You can also force a reload by selecting the toggle or providing the parameter `reload=1` on the URL.

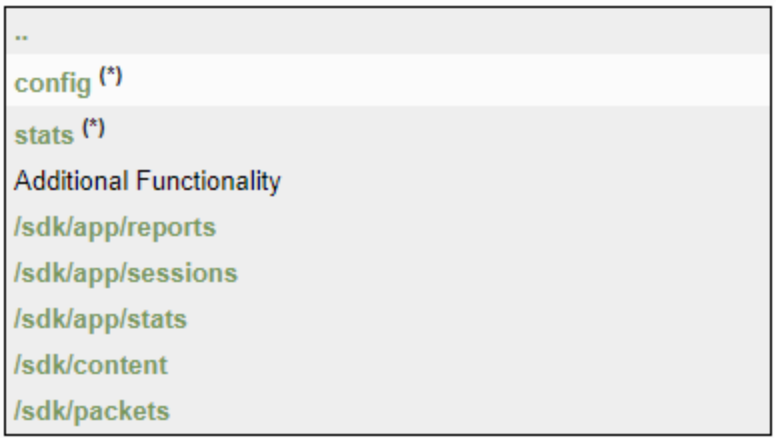
# Statistics Graph

The REST interface has a built-in statistics graphing tool, which helps you monitor performance for a service during a specified time period. You can use this tool to collect and graph single or multiple statistics from a host during a specific time range. You can also graph real-time statistics.

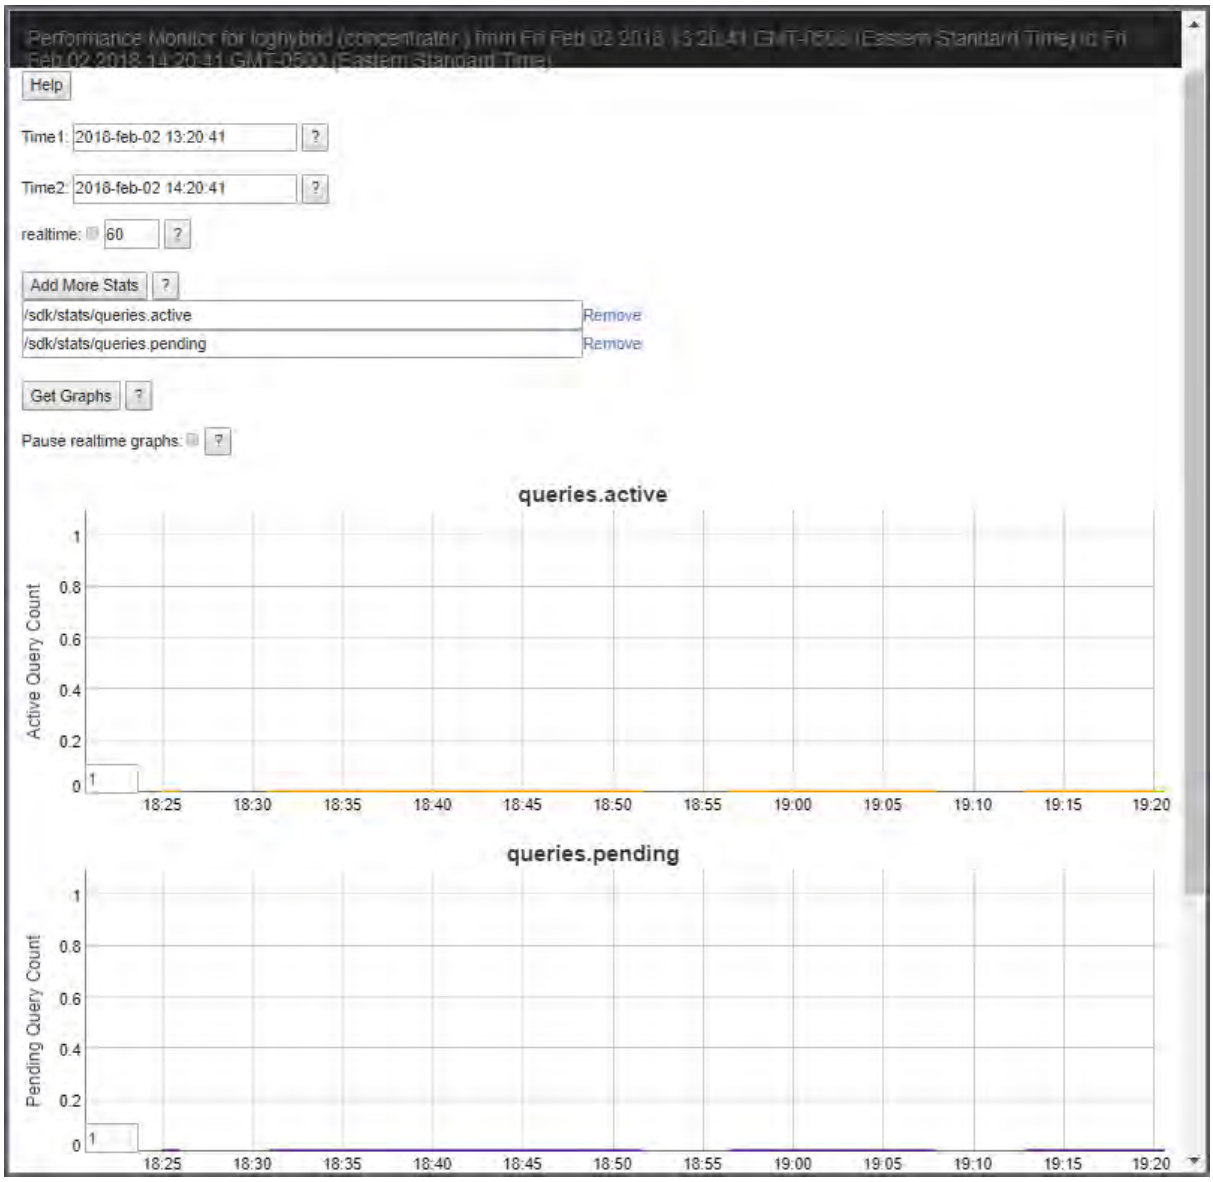
To access the statistical graphing tool:

1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)

   The options for additional functionality are displayed:



2. Click `sdk/app/stats`. The Performance Monitor window opens, and statistical graphs are displayed at the bottom of the page.



Click the Help buttons for detailed information about this page and the fields it contains.

# SDK Commands

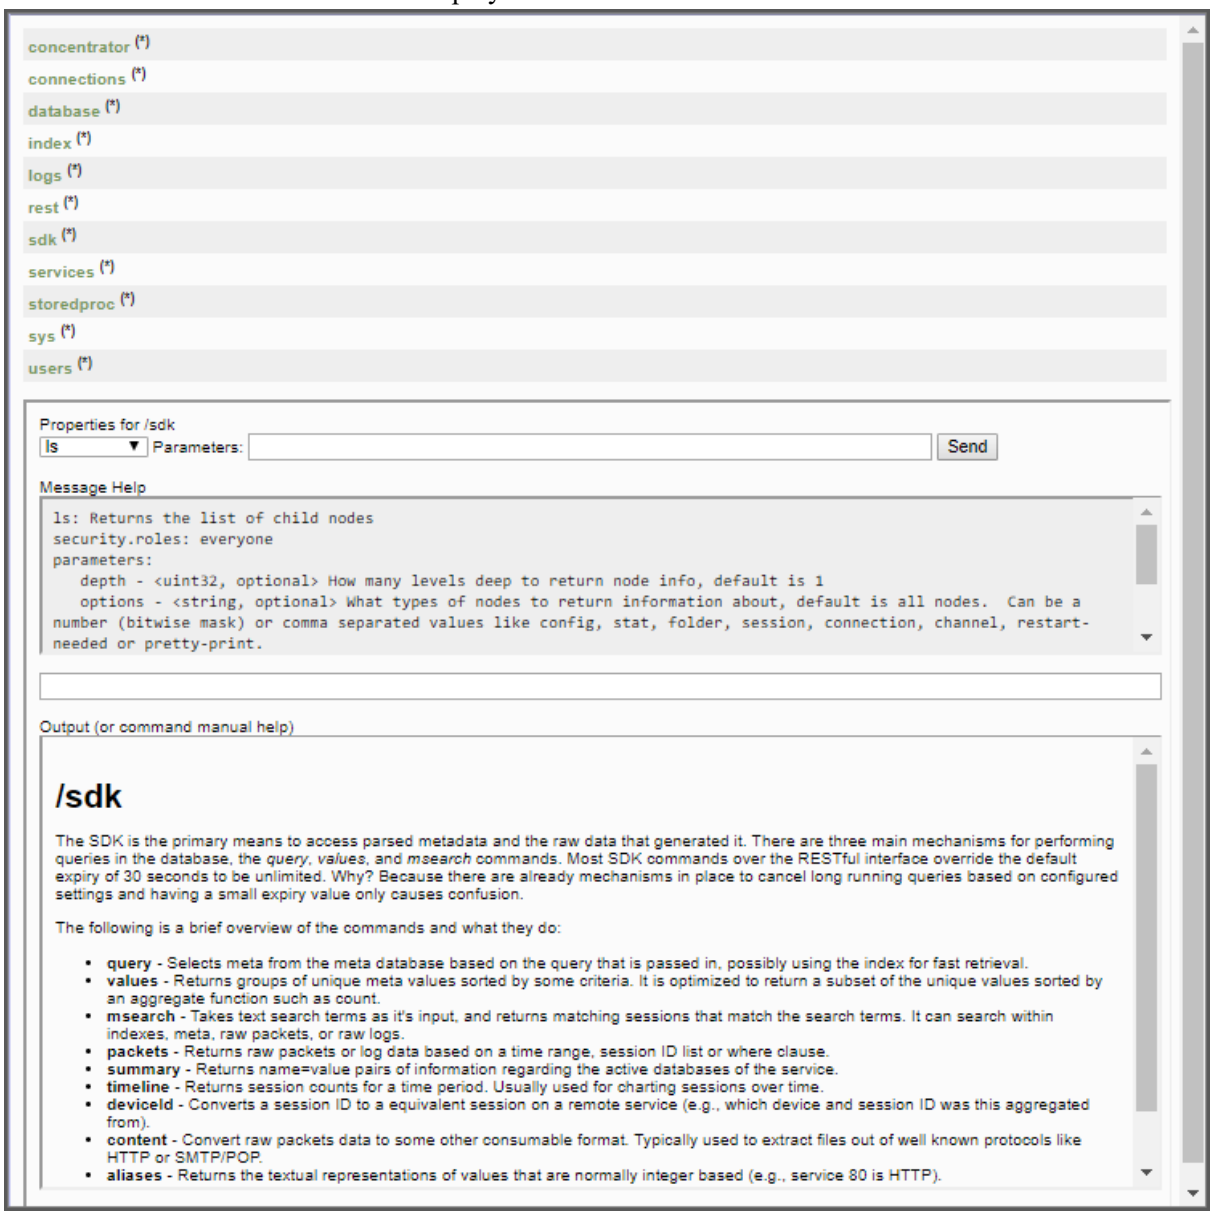
All queries on the system are performed by commands sent to the **/sdk** node.

The **/sdk** node has built-in help documentation for each message. To view the help for each command, click on the asterisk (*) beside the sdk node and then choose one of the messages from the drop-down menu. The documentation for the message is displayed in the Output window at the bottom of the screen.

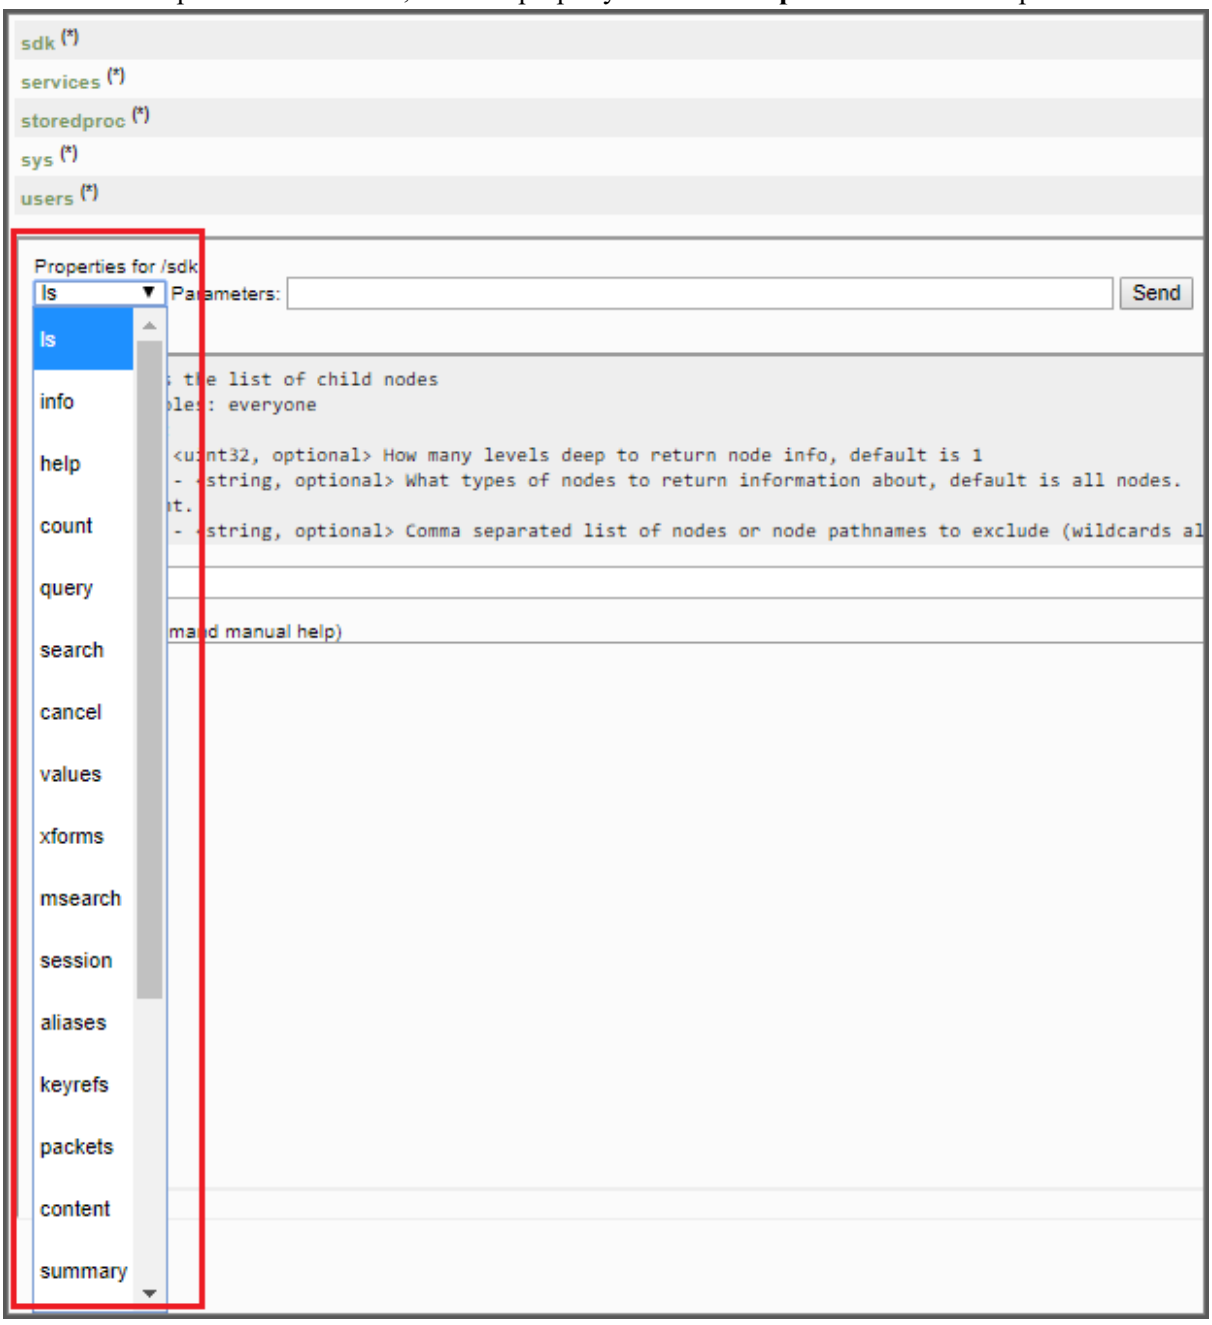
To access the help:

1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)
2. Click the asterisk (*) next to sdk.

Information about the **/sdk** node is displayed.



3. To find more specific information, select a property from the **Properties for /sdk** drop-down menu:



The help for the property that you selected is displayed in the Output section:

## SDK Commands Further Reference

This guide should be used in conjunction with the SDK documentation, which explains the format of queries and results. This document primarily focuses on how to send queries and parameters via the REST API, not how the queries themselves are formatted. The *Core Database Tuning Guide* explains those concepts in detail. Go to the Master Table of Contents for NetWitness Logs & Packets 11.x to find all NetWitness Platform 11.x documents. All metadata returned via REST is encoded as **UTF-8**.

There is another parameter specific to the REST API called **expiry**. This parameter can be set to the number of seconds to wait for a response before the system returns a timeout error. The default is 30 seconds, which is sufficient for most requests. For queries, the standard SDK sets an infinite timeout. If you set **expiry** to zero (`&expiry=0`), this removes the timeout for that request. It is probably a good idea to set a larger timeout for queries and other requests that may take longer than 30 seconds during normal operations.

# Introduction

This release of RSA NetWitness Platform Language Pack includes the support for French, Japanese, German, and Latin American Spanish languages on the RSA NetWitness Platform user interface.

To set up the language pack do the following:

1. Install the Language Pack on NetWitness Platform.
2. Set the Language for NetWitness Platform UI.

## Install the Language Pack

**Note:** You must have NetWitness Platform 11.7.x to install the language pack.

To install the language pack:

1. Ensure your deployment is on 11.7.x. For more information, see *RSA NetWitness Platform 11.7 Online Documentation*
2. Download the Language pack from **RSA Link** > **Downloads** > **netwitness-i18n-11.7.zip** and unzip the language pack.
3. On the NetWitness Admin server, run the following command:
   `rpm -Uvh rsa-nw-ui-i18n-11.7.0.0-2201100530.5.0161a31.el7.noarch.rpm`
4. On the NetWitness Admin server, run the following command:
   `rpm -Uvh security-analytics-l10n-11.7.0.1-220110070706.5.69220ba.noarch.rpm`
5. Reboot the NetWitness Admin server host.

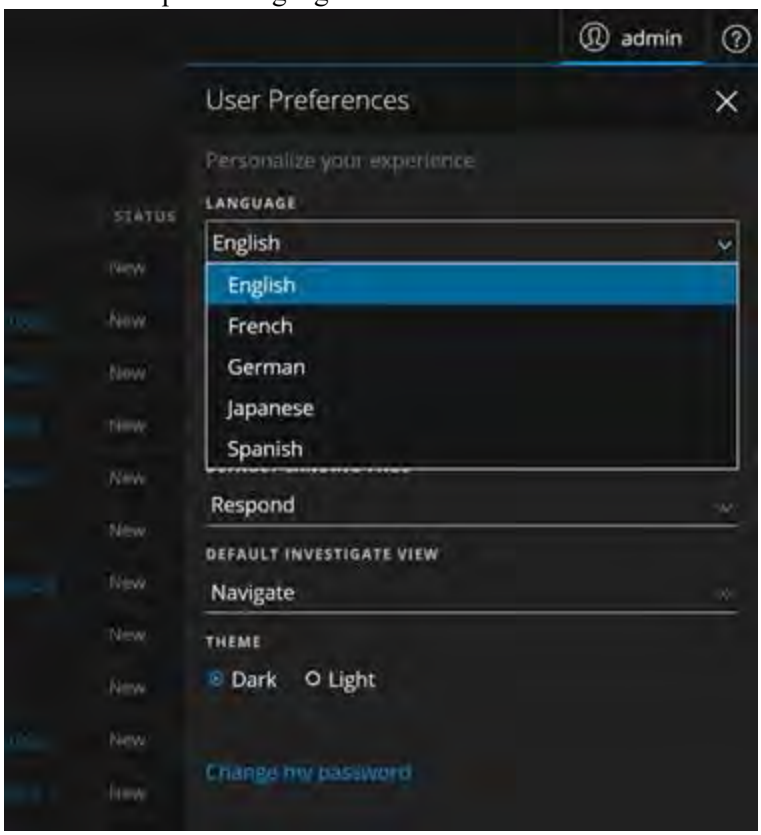
## Set the Language

You can set the language in User Preferences dialog.

1. In the upper right corner of the NetWitness Platform browser window, select .

**Note:** You must access the User Preferences dialog only from the Respond view and the Investigate views: Event Analysis, Hosts, Files, and Users.

2. Select the required language.



3. Click **Apply**.
   Any selections that you make become effective on all views.

# Getting Help with NetWitness Platform

## Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Ask it** fields in NetWitness Community to find specific information here: https://community.netwitness.com/
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the Guides.
- See also RSA NetWitness® Platform Blog Posts.
- If you need further assistance, contact RSA NetWitness Support.

## Contact RSA NetWitness Support

If you contact RSA NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the RSA NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

| | |
|---|---|
| NetWitness Community | https://community.netwitness.com/<br>In the main menu, click **My Cases**. |
| International Contacts (How to Contact RSA NetWitness Support) | https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897 |
| Community | https://community.netwitness.com/t5/support/ct-p/support |

# Product Documentation

The following documentation is provided with this release.

| Documentation | Location URL |
|---|---|
| RSA NetWitness Platform 11.x Master Table of Contents | https://community.netwitness.com/t5/netwitness-platform-online/netwitness-platform-all-documents/ta-p/676246 |
| RSA NetWitness Platform 11.7 Product Documentation | https://community.netwitness.com/ |
| RSA NetWitness Platform 11.7 Upgrade Guide | https://community.netwitness.com/t5/netwitness-platform-online/upgrade-guide-for-11-7/ta-p/652427 |

## Feedback on Product Documentation

You can send an email to nwdocsfeedback@rsa.com to provide feedback on RSA NetWitness Platform documentation.

# Revision History and Build Numbers

## Revision History

| Revision | Date | Description |
|---|---|---|

# NetWitness Core Database Introduction

This topic provides an overview of the NetWitness Platform Core database. The NetWitness Platform Core services contain a proprietary database developed specifically for use within the NetWitness Platform products. It bears little resemblance to traditional relational databases, and is not based on any off-the-shelf database technology. As such, many users find that there is a steep learning curve to understanding how the Core database works, and how to make best use of it. The purpose of this guide is to help NetWitness Platform users understand the database and use it to its fullest potential.

As a System Administrator, you can use this information to help plan your NetWitness Platform deployment, and to tune it for best performance. As an Analyst, you can use this guide to structure your analysis in ways that will return reports faster. As a Content Developer, you can use this guide to help write content that will be processed efficiently by the database system.

## NetWitness Platform Products Covered by this Guide

This guide covers the capabilities of NetWitness Platform. The following NetWitness Platform components contain the Core database:

- Concentrator
- Archiver
- Decoder
- Log Decoder
- Workbench

## Frequently Used Terms

Definitions for terms that are used throughout this document are presented here. The terms are listed in the order in which they enter the NetWitness Platform system:

- **Packet DB** : The packet database contains the raw captured data. On a Decoder, the packet database contains packets as captured from the network. Log Decoders use the packet database to store raw logs. The raw data stored in the packet database is accessible by a Packet ID, however, this ID is typically never visible to the end user.
- **Packet ID** : A number used to uniquely identify a packet or log in a packet database.
- **Meta DB** : The meta database contains items of information that are extracted by a Decoder or Log Decoder from the raw data stream. Parsers, rules, or feeds can generate meta items.
- **Meta ID** : A number used to uniquely identify a meta item in the meta database.
- **Meta Key** : A name used to classify the type of each meta item. Common meta keys include ip.src, time, or service.
- **Meta Value** : Each meta item contains a value. The value is what each parser, feed, or rule generates.

- **Session DB** : The session database contains information that ties the packet and meta items together into sessions.
- **Session** : On a packet Decoder, a session represents a single logical network stream. For example, a TCP/IP connection is one session. On a Log Decoder, each log event is one session. Each session contains the references to all the Packet IDs and Meta IDs that refer to the session.
- **Session ID** : A number used to uniquely identify sessions in the Session DB.
- **Index** : The index is a collection of files that provides a way to look up Session IDs using Meta Values.
- **Core Database** : This refers to the combination of the Packet, Meta, Session, and Index.

For syntax definitions, this document uses EBNF grammar definitions.

## NetWitness Core Database History

NetWitness (now RSA) developed the Core database for use in packet capture systems. Early in the history of NetWitness, developers identified that existing database technologies would not be able to keep up with the high ingest rate inherent in full packet capture. Contemporary database technologies were not anywhere close to being able to keep up with capturing the number of sessions received every second, much less sorting every packet. Likewise, the volume of data meant that packet storage would need to be discarded and reused just as quickly as it was consumed. This was also a weakness of databases at the time. Thus, NetWitness created a database consisting of the packet, session, and meta databases.

In order to provide the analytical capabilities of NetWitness Investigator, a meta index was added to the NetWitness database. The index shared the same design goals as the original databases. It was designed to sustain a very high insert rate into a high number of very large indices.

The index has evolved considerably over the years. Early versions of the index were only capable of providing summary estimates about how many unique meta values were present in the meta database. Other versions have had great challenges in meeting acceptable query performance. For example, NetWitness 9.0 more frequently measured report times in minutes rather than seconds. The current version of the index is derived from the NetWitness 9.0 index, but has evolved considerably in order to meet performance expectations and to add new features.

## Core Database Strengths and Weaknesses

**Strengths:**

- High sustained insert rates, without needing down time for bulk inserts.
- Decent query performance simultaneous with high insert rates.
- Automatic cleanup and rollover of old data with minimal fragmentation.
- Extremely high number of meta value indices: more than 100 enabled by default on a Concentrator.
- Ability to scale to Petabyte database sizes and Terabyte index sizes within a single node.

- Using meta key-value pairs, it is very flexible for storing arbitrary meta items within a session. Thus a session can be used to represent nearly any kind of data record.

**Weaknesses:**

- The query functionality is limited and low level.
- The packet, meta, and session DB schema is fixed, and all customization is done through custom meta keys and values.
- The database provides no transaction atomicity guarantees as you might expect to find in a SQL database.

# Basic Database Configuration

This topic covers basic database configuration settings of NetWitness Core services. For information on how to configure the Core services by editing configuration files, see "Service Configuration Settings" in the *Host and Services Getting Started Guide* .

This document assumes that the reader has some familiarity with adjusting the configuration of a NetWitness Core service. To use this document, you should be familiar with one of the mechanisms for modifying the configuration tree of Core services. Examples of such mechanisms include the Explorer view of the Administration pages within the NetWitness Platform user interface, or the REST interface accessible on each service through a web browser.

## Find Help within the Core Service

Each configuration item within a Core service has a built-in help description of what the item does. You can view this help information by hovering your mouse over the configuration item in the Explorer view. Each configuration item also indicates whether it can be changed without restarting or if a restart of the service is needed for the change to take effect.

Developers using the REST API can retrieve the help text for each configuration item by sending the `help` message to the configuration node path.

## Packet, Meta, and Session Storage

Each of the packet, meta, and session databases are configured through the `/database/config` folder on each NetWitness Core service. Each database has a configurable parameter to specify where the Core service stores data. Packet, meta, and session databases follow a predictable pattern for all of their configuration entries. Configuration items for the packet database start with the prefix `packet` , meta database configuration starts with the prefix `meta` , and the session database configuration items start with the prefix `session` .

## Index Storage

The index configuration is stored in the `/index/config` folder on each Core service.

**Topics**

- Tiered Database Storage
- Manifests

## Tiered Database Storage

This topic describes tiered database storage and provides recommendations for Hot, Warm, and Cold tier storage.

Starting with version 10.4, the Archiver service has the capability to be configured to use tiered storage. The concept of tiered storage is to put the most recent data on a Hot tier, which is the fastest storage available on the Archiver.

All services use the Hot tier by default.

The next tier is known as Warm and is typically cheaper and slower storage, such as a network-attached storage (NAS). The Warm tier contains older data; how old depends upon how much storage is allocated on the Hot tier and the average ingest rate. When the Hot tier reaches max utilization, the natural progression is to move the oldest data from the Hot tier to the Warm tier. When configured correctly, this happens automatically and is invisible to the end user. Queries and data access happen automatically no matter what tier (Hot or Warm) the data resides on. However, there can be a performance impact when accessing data on the Warm tier as compared to the Hot tier, because access times on the Warm tier are typically slower.

In addition to Hot and Warm, there is also a Cold tier. The Cold tier is only used as a staging area for offline backup. NetWitness Core services do not access data on the Cold tier. NetWitness Core services move the oldest data to the Cold tier and consider it abandoned (the service no longer accesses the data). This data can then be backed up to long-term storage like tape for possible restoration months or even years later, depending on requirements. The backing up and subsequent removal of data on the Cold tier must be handled outside of NetWitness Core services via scripts or other processes.

If the Cold tier becomes full because external processes are not removing data in a timely manner, this causes the NetWitness Core service to eventually stop the ingestion of new data until the problem is corrected.

When moving data to the Cold tier, RSA recommends that the directory remain on the same mount point as where it is being moved from. Therefore, if the files are coming from the Warm tier, it is far better for performance reasons to set the Cold tier directory on the same file system. The reason for this is that the service attempts to simply move the file and directory to the Cold tier, which is a nearly instantaneous operation on the same file system. If the move fails, the fallback is to copy the data to the Cold tier, which takes more processing time and causes additional I/O contention on the tier from which it is being copied.

## Archiver

The tiers of storage capabilities are used by the Archiver. You can configure Archiver to only use Hot storage (the default), Hot and Warm, or all three (Hot, Warm and Cold). All services must use Hot, you cannot configure a service to only use Warm. Data flows from Hot to Warm and finally to Cold. You can also skip Warm and go from Hot to Cold. If Cold (offline) storage is not configured, the oldest data is deleted on the last configured tier, which has been the standard operating procedure.

The typical Archiver deployment sets all the databases to unlimited size (packet.dir, meta.dir, session.dir, index.dir, and optionally the Warm tier variants), which means that the size specifier is left off or set to zero. This lets the databases and index grow unbounded. Instead of each database managing their own size and rolling out only when each individual database exceeds their configured size, Archiver rolls out everything together using the `/index sizeRoll` command. This enables the databases and index to roll out in unison. For more information on sizeRoll, see "Asynchronous Rollover" in Rollover .

Archiver is typically configured to place the index, session, meta, and packet (log) DB on the same volume, instead of multiple volumes like a Concentrator or Decoder. Although this can potentially cause more I/O contention when concurrent reads happen across multiple databases, it also maximizes overall retention. Because all databases are on the same volume, they are configured to roll out together, which minimizes orphaning of data. Decoder and Concentrator are configured for maximum I/O speed, but can suffer from estimates on the proper volume sizing.

For example, if the session DB is too large, it may have enough storage for six months of retention, whereas the meta DB and index only have retention for four months. Because the session, meta DB, and index are intricately tied together, the shortest retention period for all three define the overall retention period (in this case, four months). Retention of individual databases is mostly affected by factors beyond our control, such as traffic captured, meta generated (parsers, feeds, rules) and filtering. The databases are easily resized by a simple configuration change, but this usually also involves changes at the hardware and file system level to adjust partitions, which complicates dynamic resizing. Archiver avoids these problems by using a single volume for everything, with the trade-off of somewhat slower I/O speed.

## Manifests

This topic describes manifest files and provides an example manifest for a meta DB file. It also describes manifest searching and provides an example manifest search.

Manifest files are created with every session, meta, and packet (log) DB file and index slice directory. A manifest file is a file that describes several key pieces of information about the data to which it refers. Manifest files are written as a JSON record. Manifest files travel with the data they represent from tier to tier. If the data they represent is deleted, the manifest file is also deleted, except in the following special case. If the service has `/database/config/manifest.dir` configured to a valid directory, at the point when the manifest data is deleted, a copy of the manifest file is placed into the directory pointed at by `manifest.dir` (the directory is created if it does not exist). This enables a NetWitness Platform feature called historical manifest searching.

The intention of this process is to keep historical manifest files for years, in one location for offline querying. As you might imagine from a service running for many years, this can potentially generate hundreds of thousands of files. This should not be a concern however, as the service automatically compresses files into a single archive in order to save space when they grow too numerous. Manifest files are very small and compress well.

Example manifest ( `meta-000000023.nwmdb.manifest` ) for a meta DB file:

```
{
    "filename" : "meta-000000023.nwmdb",
    "size" : 185153768,
    "fileTime" : 1403903940,
    "id1" : 150814110,
    "id2" : 159341086,
    "session1" : 4023382,
    "session2" : 4250442,
    "time1" : 1403903879,
    "time2" : 1404739851
}
```

```
filename  = The filename for the db file the manifest represents
size      = The size in bytes of the db file
fileTime  = The time the file was created
id1       = The starting id in the file (for this example, the starting meta
ID)
id2       = The last id in the file (for this example, the last meta ID)
session1  = The starting session ID of the first meta in the file
session2  = The last session ID of the last meta in the file
time1     = The POSIX time of the first "time" meta found in the file
time2     = The POSIX time of the last "time" meta found in the file
```

In this example manifest, the most important fields are `fileTime` , `time1` and `time2` . All three fields are written in POSIX time. `time1` and `time2` are the starting and stopping times of the meta recorded in the meta DB file `meta-000000023.nwmdb` . In particular, `fileTime` is always the time in which the file was created (not last modified). `time1` and `time2` are representative of the min and max range of the parsed data within the meta DB file. When doing historical searches by time, `time1` and `time2` are preferred over `fileTime` , when they are present. Manifest files for the other databases and index contain some different fields, but all have enough information to perform time based queries.

## Search Historical Manifests

When manifests are collected in the directory pointed to by `manifest.dir` , it is assumed that the data they refer to was copied to the Cold tier and eventually backed up to offline storage. Because the historical manifests are still accessible by the service, this allows time-based queries to be performed on offline data, in order to determine what data needs to be restored for a given time range.

You can search manifests using the `/database manifest` command:

```
manifest: If a manifest directory is defined, it will allow operations on the
manifest files (such as a time based query) for database files in cold
storage.
security.roles: database.manage
parameters:
   op - <string, optional, {enum-one:query|compress}> The operation to perform
(defaults to query)
   time1 - <date-time, optional> The beginning time (UTC) for matching offline
database files
   time2 - <date-time, optional> The ending time (UTC) for matching offline
```

```
database files
   timeFormat - <string, optional, {enum-one:posix|simple}> Specify the time
format that is returned (posix, simple), default is posix
```

Example search:

```
/database manifest time1="2014-04-20 11:00:00" time2="2014-04-11
11:20:00" timeFormat=simple
```

The search returns all manifests that match the query:

```
[ filename=meta-000001691.nwmdb size=4843826176 fileTime="2014-Apr-20
11:06:34" id1=301555027452 id2=301733101896 session1=15352020201
session2=15361024200 time1="2014-Apr-20 11:05:34" time2="2014-Apr-20 11:16:34"
compression=gzip ]
[ filename=session-000001865.nwsdb size=268439552 fileTime="2014-Apr-20
11:06:35" id1=14674145801 id2=14682041000 metaId1=288217522208
metaId2=288370660984 packetId1=11733872441 packetId2=11741745303 ]
[ filename=session-000001866.nwsdb size=268439552 fileTime="2014-Apr-20
11:18:31" id1=14682041001 id2=14689936200 metaId1=288370660985
metaId2=288520616949 packetId1=11741745304 packetId2=11749618589 ]
```

The returned results can be used to correlate which files should be restored from backup for the given time range. For versions 10.4 and later, a service called Workbench can be used to take the restored files and provide a query interface over the restored data using one or more collections.

Setup of the Workbench service is beyond the scope of this document. For more information, see "Configure Data Backup and Restore" in the *Archiver Configuration Guide* .

# Advanced Database Configuration

This topic explains the advanced configuration options of the NetWitness Core database.

The configuration options of the NetWitness Core database may change from one release to the next. However, many of the configuration items do not change frequently and are documented here. This is not an exhaustive list, since new features are added in every release, and they may require new configuration items. For the most up-to-date documentation, refer to the built-in help functionality of the NetWitness Core service.

**Topics**

- Database Configuration Nodes
- Index Configuration Nodes
- SDK Configuration Nodes
- Per-User Configuration Nodes
- Scheduler
- Rollover
- Snort Rules and Configuration

## Database Configuration Nodes

This topic describes database configuration nodes. The following database configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

### packet.dir,meta.dir,session.dir

This is the primary configuration entry for each database (also known as the Hot tier). It controls where in the file system the respective databases are stored. This configuration entry understands a complex syntax for specifying many directories as storage locations.

Configuration syntax:

```
config-value = directory, { ";" , directory } ;
directory    = path, [ ( "=" | "==" ) , size ] ;
path         = ? linux filesystem path ? ;
size         = number size_unit ;
size_unit    = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
number       = ? decimal number ? ;
```

Example:

```
/var/lib/netwitness/decoder/packetdb=10
t;/var/lib/netwitness/decoder0/packetdb=20.5 t
```

The size values are optional. If set, they indicate the maximum total size of files stored there before databases roll over. If the size is not present, the database does not automatically roll over, but its size can be managed using other mechanisms.

The use of = or == is significant. The default behavior of the databases is to automatically create directories specified when the Core service starts. However, this behavior can be overridden by using the == syntax. If == is used, the service does not create any directories. If the directories do not exist when the service starts, the service does not successfully start processing. This gives the service resilience against file systems that are missing or unmounted when the host boots.

If you modify the size of a directory in use, the size takes effect immediately, as long as it is larger. If the size is smaller, it is ignored if it is more than 10 percent smaller than the existing size. This prevents an accidental mistype that causes a enormous loss of data. For example, if the packet database was configured for `12 TB` and someone mistyped it as `12 GB`, the database would end up deleting over 11 TBs of data in order to shrink it down to just 12 GB. Instead, the database ignores the `12 GB` setting and logs a warning, so that the error can be caught quickly. Of course, if the size specified is actually correct and more than a 10 percent difference from the existing size, the only recourse for it to take effect is to restart the service. When it starts back up, it assumes the size is correct and adjusts the database to the new size by rolling out the oldest data until the new size is reached. If you actually do want to adjust the size downward and by more than 10 percent without restarting the service, you need to modify the size multiple times, each time adjusting it by less than 10 percent. Watch the service logs to know when the database has adjusted to the new size, as it only adjusts the total database size when the latest file being written has been closed.

If new directories get added or deleted (semicolon separated), they do not take effect until the service restarts.

## packet.dir.warm, meta.dir.warm, session.dir.warm

These settings are optional and are used for Warm tier storage on an Archiver. By default, they are blank and unused. If configured, they follow the same format and behavior as `packet.dir`, `meta.dir`, and `session.dir` (see _ `packet.dir`, `meta.dir`, and `session.dir` _ above). When configured, the oldest file on the Hot tier moves to the Warm tier when no available space remains in the Hot tier.

## packet.dir.cold, meta.dir.cold, session.dir.cold

These settings are optional and are used to move files from either a Hot or Warm tier storage system to the Cold tier directory specified. Specifically, this setting is nothing more than a directory, there are no size specifiers. However, the defined path name has a few special format specifiers that you can use to name the directory with the date of the data in it.

```
%y   = The year of the data being moved to the cold tier
%m   = The month of the data being moved to the cold tier
```

```
%d   = The day of the data being moved to the cold tier
%h   = The hour of the data being moved to the cold tier
%##r = A block of time within a day. So %12r would create two blocks, 00 and
01\. 00 for all data in the AM, 01 for all PM data
```

Example setting:

```
packet.dir.cold = /var/lib/netwitness/archiver/database1/alldata/cold-
storage-%y-%m-%d-%8r
```

For the setting above, if a log database file was about to be moved to cold storage and it was created on `2014-03-02 15:00:00` , it would be moved to the following directory on the Cold tier:

```
/var/lib/netwitness/archiver/database1/alldata/cold-storage-2014-03-02-01
```

The last number `01` needs some explanation. The `%8r` specifier breaks the hours of the day into 24 / 8 = 3 parts. The first eight hours of the day would be block `00` , so 12 a.m. to 8 a.m. The next eight hours are from 8 a.m. to 4 p.m. and are assigned block `01` . Since the data being moved to cold storage was created at 3 p.m., it falls into block `01` . The `%r` format specifier is useful for backing up files with a granularity somewhere between a day `%d` and a single hour `%h` . The Cold storage directory is created on demand and is defined by the data being moved when the format specifiers are used.

The ability to add a date to the path of the data is just a convenience added for backup and restore. It is a way of tagging the data with a date in the path.

## packet.file.size , meta.file.size , session.file.size

This controls the size of the files created with each database. It is normally not necessary to change these values as the default values typically work well. This setting takes effect immediately for subsequent files.

## packet.files , meta.files , session.files

This setting controls the number of files held open by the database. You can increase this value to improve performance: however, the operating system has an overall limit on the number of files that service can keep open. If this limit is exceeded, an error is reported and the service does not function. This setting takes effect immediately.

In versions 10.6 and later, the default value for packet.files, meta.files, and session.files is `auto` and the service manages the number of open files based on this criteria:

1. Number of collections
2. Amount of system memory

When set to `auto` , the number is dynamic and you can view it in the logs when it changes. RSA recommends that you leave this value as `auto` and do not change it to a specific number.

### packet.free.space.min , meta.free.space.min , session.free.space.min

This setting provides a safety limit on the minimum free space that exists on the paths specified by the packet.dir, meta.dir, and session.dir directories, respectively. This setting is used to prevent the service from running out of space in the event that other programs have filled up the space that should be dedicated to each of the databases. This setting takes effect immediately.

### packet.index.fidelity , meta.index.fidelity

This setting controls how frequently packet ID locations and meta ID locations are indexed. This setting can be increased to reduce the amount of space needed by each packet or meta nwindex file, but increasing the setting reduces the speed at which individual packets or meta items can be located. This setting takes effect immediately.

The session database does not have a fidelity setting because it does not generate index files.

### packet.integrity.flush , meta.integrity.flush , session.integrity.flush

This setting controls whether the database forces a sync operation on the file system when it is finished writing a file. The default value is `sync` , which means when a file is closed there will be a significant delay while the data writes to non-volatile storage. It may be necessary to set this to `normal` in order to achieve higher sustained write rates, especially on a Decoder. This setting takes effect on the next file created. Therefore, it is expected that at least one more sync will happen if the value was just changed to `normal` .

If packet drops are occurring and packet.integrity.flush is set to `sync` , set it to `normal` and monitor. Keep the session and meta flush settings on `sync` . If packet drops are still problematic, then set all three to `normal` and monitor.

### packet.write.block.size , meta.write.block.size , session.write.block.size

The block size represents how much data is allocated at a time within each database file. Larger block sizes can provide higher throughput and compression ratios, and can improve the rate at which items can be retrieved from the database sequentially. However, larger block sizes have a detrimental impact on random read speed for compressed packet and meta items. This setting takes effect immediately.

### packet.compression , meta.compression

These parameters control whether the databases compress data. Compression reduces the amount of storage needed by each database, but it can have a major detrimental impact on the speed at which items are written to the database, and the speed at which items are retrieved from the database. Changes take effect immediately on the next file creation. Make a note that you can not compress the `pcapng` packet db format.

As of version 10.4, the valid values for this parameter are `gzip` , `bzip2` , `lzma` , or `none` . `gzip` is the preferred algorithm when compression is used, because it provides a good balance between performance and space savings. Both `bzip2` and `lzma` can achieve better space savings, but the tradeoff in speed is substantial and likely should only be considered for low ingest speeds and when storage space is at a premium.

### packet.compression.level , meta.compression.level

You can use these settings to further refine how the compression algorithms behave. They have no effect when compression is disabled. The valid values are between 0–9\. The default value of zero means let the software pick the best setting for speed and compression. The values between 1 and 9 are used as a sliding scale between performance (1) and compression (9). The value of 9 typically gives you the best compression for a given algorithm, but the worst performance. Somewhere in the middle is usually the best setting, which is what zero picks.

### hash.algorithm

This setting controls how the database files are hashed. The default value is `none` , so no hashing is performed. The valid values are `none` , `sha256` , `sha1` , or `md5` . Database files can be hashed to provide evidence that they have not been tampered with since they were closed. Hashing is time intensive and affects ingest performance when enabled. This change takes effect immediately.

### hash.databases

This setting controls which databases are hashed. Valid values are `session` , `meta` , and `packet` and are comma separated when hashing multiple databases. This change takes effect immediately.

### hash.dir

This setting is normally empty, which means the hash file is created in the same directory as the database file that was hashed. If this setting is defined, the hash file is written to the directory specified instead. This could be some form of write-once storage for resilience against hash tampering.

Hash files are small XML files containing the hex encoded hash along with metadata about the database file that was hashed.

## Index Configuration Nodes

This topic describes index configuration nodes. The following index configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

### index.dir

The `index.dir` setting controls where the files used by the index are stored. This setting supports the same syntax as the `packet.dir` , `meta.dir` , and `session.dir` settings.

### index.dir.warm

The Warm tier storage for index slices. This setting supports the same syntax as `packet.dir.warm` , `meta.dir.warm` , and `ession.dir.warm` .

### index.dir.cold

The Cold tier storage for index slices. This setting supports the same syntax as `packet.dir.cold` , `meta.dir.cold` , and `session.dir.cold` .

### index.slices.open

This setting controls the number of index slices held open by the index. Index slices are opened automatically as needed by queries. When queries complete, the index engine may hold the slices open so that subsequent queries execute faster. The most recently created slices are the slices that will be held open, since they are mostly likely to be used by queries.

If queries against the index require the index to open slices, then they will execute slower than if the slices were already open. Therefore, this parameter should be tuned such that most queries executed against the index will work on open slices. However, each open index slice consumes some resources, such as file handles and memory. If there are too many index slices open, the overall performance of the service can suffer.

You should set this parameter so that the open index slices will cover most of the time ranges that most queries will need. For example, if most queries are over the past two weeks, and there are index slices created every 8 hours, then there are 14 days x 3 slices per day, or 42 slices created over the past two weeks. Thus, you could set index.slices.open to 42 so that only slices that are likely to be used are held open.

If this parameter is set to 0, then all slices are held open until the next index save. In this scenario, the only thing limiting the number of slices open in the process is the number of slices in the index.

### page.compression

Deprecated. Versions of the NetWitness Core index between 9.8 and 10.2 supported two different index compression algorithms, and you can choose between them using this setting. As of 10.3, the only recommended value is the default of `huffhybrid` .

### save.session.count

This setting controls how often the index is automatically saved when new sessions are inserted. If the value of save.session.count is greater than 0, any time more than `save.session.count` sessions are added to the index, the index automatically saves itself. If the `save.session.count` is set to 0, this feature is disabled and the index will not automatically save itself when new sessions are added to the index.

`save.session.count` can be used to implement an automatic save pattern that is based on the volume of data that enters the index. This is useful because it allows a lightly loaded system to generate save points less often.

For more information on the topic of index saves, see the section in this guide on Optimization Techniques .

### reindex.enable

This setting controls the operation of the background reindexer .

## SDK Configuration Nodes

This topic describes the SDK configuration nodes that affect the database. There are some additional configuration items in each Core service that affect the database, but do not actually affect how the database stores or retrieves data. These settings exist in the `/sdk/config` folder.

### max.concurrent.queries

This setting controls how many query operations are allowed on the database simultaneously. Allowing more simultaneous query operations can improve overall responsiveness for more users, but if the query load of the Core service is very I/O bound, having a high max.concurrent.queries value can have a detrimental effect. The recommended value is near the number of cores on the system, including hyper threading. Thus, for an appliance with 16 cores, the value should be somewhere close to 32\. Subtract a few for aggregation threads and general system response threads. Subtract a few more if this is a hybrid system (for example, both a Decoder and Concentrator running on the same appliance). There is no magic number, but somewhere between 16 and 32 should work well.

### max.pending.queries

This setting controls the backlog size for the query engine of the database. Larger values allow the database to queue more operations for execution. A queued query does not make progress on its execution, so it may be more useful to make the system produce errors when the queue is full, rather than allowing the queue to grow very large. However, on a system that is primarily performing batch operations such as reports, there may be no detrimental effect to having a large queue.

### cache.window.minutes

This setting controls a feature of the query engine that is intended to improve query responsiveness when there are a large number of simultaneous users. For more information on cache window, see Optimization Techniques .

### max.where.clause.cache

The where clause cache controls how much memory can be consumed by query operations that need to produce a large temporary data set to evaluate sorting or counting. If the where clause cache size is overflowed, the query still works, but it is much slower. If the where clause cache is too large, it is possible for queries to allocate so much memory that the service would be forced into swap or run out of memory. Thus, this value multiplied by the max.concurrent.queries should always be much less than the size of physical RAM. This setting understands sizes in the form of a number followed by a unit, for example `1.5 GB`.

### max.unique.values

The maximum unique values limits how much memory can be consumed by the SDK Values function. SDK Values produces a sorted list of unique values. In order to produce accurate results, it may need to merge together large numbers of unique values from many slices. This merged set of values must be held in memory, so this parameter exists to put a limit on how much memory the merged value set can consume. The default value will limit memory usage to approximately 1/10th of total RAM.

### query.level.1.minutes, query.level.2.minutes, query.level.3.minutes

These settings are available in 10.4 and earlier versions.

In versions 10.4 and earlier, the Core database supports three query priority levels. Each user is assigned to one of the priority levels. Therefore, there are up to three groups of users that can be defined for the purposes of performance tuning. These settings control how long each user level is allowed to execute the queries. For example, lower privileged users may have a lower value so that they are not able to use all the resources of the Core service with long-running queries.

### query.timeout

This setting is available in 10.5 and later versions.

Query levels have been replaced in versions 10.5 and later with per user account query timeouts. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, there is a new config node under each account called `query.timeout`, which is the maximum amount of time in minutes that each query can run. Setting this value to zero means no query timeout will be enforced by the Core service.

### max.where.clause.sessions

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. The value of 0 disables this limit.

The number of sessions needed to fully process a query is equal to the number of sessions that match the WHERE clause of the query, assuming that all terms in the where clause have a suitable index. If there are terms in the where clause that are not indexed, the database has to read more sessions and meta, and reaches this limit sooner.

### max.query.groups

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on the number of unique groups collected in a single query. For example, if a query has a group by clause with multiple metas that have high unique value counts, the amount of memory needed for that query could easily outpace the amount of RAM available on the server. Thus, this limit exists to prevent out-of-memory conditions from happening.

Setting a value of 0 disables this limit.

### packet.read.throttle

This is a decoder-only setting that affects the access to the packets database. When packet.read.throttle is set to a value greater than 0, the decoder attempts to throttle packet reads when it detects packet contention on the packet database. Higher numbers provide more throttling. Changes takes effect immediately.

### cache.dir , cache.size

All NetWitness Platform Core services maintain a small file cache of raw content extracted from the device. These parameters control the location (cache.dir) and size (cache.size) of this cache.

### pin.cache.dir , pin.cache.size

All NetWitness Platform Core services provide a separate file cache of raw content that is marked (or pinned) for long-term retention. These parameters control the location (pin.cache.dir) and size (pin.cache.size) of this cache. You can configure the maximum size of the pinned cache at `/sdk/config/pin.cache.size`. The default size is zero that prevents pinning of new sessions once storage decreases below 100 MB. If you configure it with a non-zero value, then it will reduce the cached files when the total size exceeds the configured size by deleting the oldest pinned sessions.

### parallel.values

This setting is available in 10.5 and later versions.

This setting allows SDK-values operations to be executed in parallel. If this is set to 0, it will disable parallel execution. If it is set to a value greater than 0, it represents the number of threads created when each SDK-values operation is executed. The maximum value is the number of logical CPUs available when the process started.

Setting a higher value for parallel.values is useful when there are small numbers of simultaneous users, since it will allow for more complex Investigations to be executed more quickly. If there are many simultaneous users, it is better to use a low value here, since there will be many independent SDK-values operations executed simultaneously.

### parallel.query

This setting is available in 10.5 and later versions.

This configuration is similar to the parallel.values setting in that the maximum value is the number of logical CPUs. Setting parallel.query to a specific value should take into account the number of simultaneous users to maximize CPU utilization without consistently exceeding available resources.

Setting a higher value for parallel.query is useful when there are small numbers of simultaneous users and queries, since it will allow more complex queries to be executed more quickly. If there are many simultaneous users and queries, it is better to use a low value, since there will be many independent SDK-query operations executed simultaneously.

Query operations are limited by the meta database read rate, so setting parallel.query to a value higher than 4 is unlikely to produce dramatically better results than the default value of 0\. The best number to use for parallel.query will depend on the type of storage attached. Experiment with different values of parallel.query to determine the best results for your storage system.

## Per-User Configuration Nodes

This topic describes the per-user configuration nodes. There are settings that influence the actions users are allowed to perform on the database. These settings are stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the settings apply.

### query.prefix

A query prefix applies a filter to every query operation that the user performs. This is implemented by taking the `query.prefix` values and appending it the the where clause of each query using the logical && (and) operator. For more information on Where Clauses, see Queries .

### query.level

This setting is available in 10.4 and earlier versions.

The query.level setting assigns the query level that the users have for every query they perform. These influence whether their queries are limited by the query.level.1.minutes, query.level.2.minutes, or query.level.3.minutes.

### query.timeout

This setting is available in 10.5 and later versions.

The query.timeout setting assigns the maximum amount of time in minutes that a user can run each query. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, this setting is stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the setting applies. When this value is set to zero, the Core service does not enforce the query timeout.

### session.threshold

The session.threshold setting assigns a maximum session threshold for the user. If set, this threshold value is assigned to all values calls that the user performs. A detailed discussion of both the values call and thresholds is covered in this guide.

## Scheduler

This topic provides a brief introduction to the scheduler and explains how to schedule commands. All NetWitness Core services come with a built-in scheduler found under `/sys/config/scheduler`. To use the scheduler, you add the command you want to run periodically using one of two messages:

`/sys/config/scheduler addInter` - Add a command to run at the specified interval (every N hours, minutes or seconds)

or

`/sys/config/scheduler addMil` - Add a command to run at the specified time of day or even specific days of the week

### Example

For example, suppose that you have a use case to delete all packet data that is greater than seven days old. Since you cannot configure the packet.dir setting to rollout data based on a time interval, you need to schedule the `/database timeRoll` command to run every so often. For this example, create a timeRoll to run every 20 minutes:

```
addIter minutes=20 pathname=/database msg=timeRoll params="type=packet days=7"
```

This command adds a scheduled task (it is persisted between restarts of the service) to run every 20 minutes, on the `/database` node, and ages out all packet data older than seven days. The `params` parameter is used to pass all the parameters to the command specified (in this case `timeRoll`). Notice how it quotes all the embedded parameters ( `type` and `days` ) so they are not interpreted as parameters to be passed to the outer `addIter` command. If the parameters inside `params` need to use quotes, you must escape the inner quotes with a backslash. You can rewrite it with embedded quotes, which does not alter the command in any way:

```
addIter minutes="20" pathname="/database" msg="timeRoll"
params="type=\"packet\" days=\"7\""
```

This command works identically to the original, but demonstrates how to escape complicated parameter passing. Additional useful scheduler commands are:

`/sys/config/scheduler print` - Print all scheduled commands (you can also see them by doing an `ls` on the scheduler node).

`/sys/config/scheduler delSched` - Delete a scheduled command by passing in the identifier shown in the `print` (or `ls` ) command.

This is a brief introduction to the scheduler. For more information on command parameters, send the `help` message to the scheduler node and pass in the command name via the `msg` parameter. For more information, see the "Services Explore View" topic in the *Host and Services Getting Started Guide* .

# Rollover

This topic describes the two rollover mechanisms. The database operates as a first-in, first-out (FIFO) queue. New data is always appended to the database, and the oldest data is automatically removed as needed. Data that is in the middle of the database is immutable, meaning it cannot be modified.

There are two mechanisms to for rollover: synchronous and asynchronous.

## Synchronous Rollover

Synchronous rollover refers to rollover settings that are applied in response to a write operation on the database. That means data is removed from the database in direct response to the need to write new data. Synchronous rollover is configured by setting size values on the configuration for `packet.dir` , `meta.dir` , `session.dir` , and `index.dir` .

Synchronous rollover on the packet, meta, and session databases can occur within any write operation. Synchronous rollover on the index occurs when the index is saved.

## Asynchronous Rollover

Asynchronous rollover refers to database file removal that occurs when an explicit rollover command is issued to the database. Most commonly this type of rollover is scheduled to run periodically using the built-in scheduler of the Core service. The user can also explicitly request it.

The asynchronous rollover command is the `sizeRoll` message present on the `/index` and `/database` nodes of the configuration tree. The message on the `/database` node does size rollover on packet, meta, and session databases only, while the message on the `/index` node can do simultaneous rollover on both the index and the packet, meta, and session databases.

The `sizeRoll` command has the following parameter syntax:

```
size-roll-params    = {type-param, space}, (max-size-param | min-free-param |
max-percent-param), {max-size-warm-param, space}
type-param          = "type=", {type-flag} , { ",", type-flag } ;
type-flag           = "packet" | "meta" | "session" ;
max-size-param      = "maxSize=", number, {space}, unit ;
max-percent-param   = "maxPercent=", number, {space}, unit ;
min-free-param      = "minFree=", number, {space}, unit ;
max-size-warm-param = "maxSizeWarm=", number, {space}, unit ;
unit                = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
```

```
number              = ? decimal number ? ;
percentage          = ? number between 0 and 100 ? ;
```

The `type` parameter controls the databases to consider for removing the oldest data based on total size or space remaining. If type is not specified on the `/index` sizeRoll, only the index is considered for rollover operations.

The `maxSize` parameter sets a current maximum size of the database or index. If the database is larger than this size, oldest data is deleted first (or moved to the Warm or Cold tier, depending on the configuration) until total size is less than `maxSize` . The `sizeRoll` operation determines which data is oldest out of all the databases and the index based on session IDs. Sessions or index entries with lowest session IDs are deleted first, possibly including removing meta and packet databases that are orphaned by removing entries from the session database. The index data is rolled out if the sessions that it refers to are removed.

The `maxSizeWarm` parameter sets a current maximum size on the *Warm* tier, but otherwise behaves identically to the `maxSize` parameter. When data is rolled out on the Warm tier, it is moved to the Cold tier (if configured) or deleted.

The `maxPercent` parameter sets a maximum percentage of all the volumes of all databases passed in `type` parameter combined. When exceeded, oldest data is deleted first until total size is less than maxPercent of total volumes.

The `minFree` parameter sets a minimum allowed free space on the volumes before oldest data is deleted.

Each call to the sizeRoll operation provides a single pass through the database to delete files. When the operation completes, the current size utilization of the database will have met the criteria specified by the `maxSize` , `maxPercent` , or `minFree` parameters and the optional `maxSizeWarm` . Therefore, this operation can be scheduled periodically to ensure that the database can continue to operate uninterrupted.

## Example

The following example shows a typical sizeRoll scheduler entry for an Archiver:

```
pathname=/index minutes=5 msg=sizeRoll params="type=meta,session,packet
maxSize=25TB maxSizeWarm=150TB"
```

This scheduler entry specifies that every five minutes the database ensures that the max size of the meta, session, packet, and index does not exceed 25 terabytes on the Hot tier and does not exceed 150 terabytes on the Warm tier.

# Snort Rules and Configuration

Snort® rules and configuration are added to the parsers/snort directory for Investigator and Decoder. Decoder supports the payload detection capabilities of Snort rules. The rules files must have the extension `.rules` and the configuration files must have the extension `.conf` . The Decoder implementation of Snort rules is centered on using the content strings defined in a Snort rule as a token. Once a token is matched, the rule header and additional rule options can be evaluated. Currently, rules that do not define any content (via `content` or `uricontent` rule options) are not supported.

## Configuration

The configuration files are loaded prior to loading rules.

| Variable Definitions | Description |
|---|---|
| `ipvar` | The full language for defining IP Address variables is supported, including lists, CIDR, and negation. |
| `portvar` | The full language for defining IP Address variables is supported, including lists, ranges, and negation. |
| `var` | Not supported; use `ipvar` or `portvar` . |

| Action Definitions | Description |
|---|---|
| `ruletype` | The definition of additional `ruletype` s is supported. However, only rules that have a base rule type of **alert** are supported. |

| General Configuration | Description |
|---|---|
| `nopcre` | This configuration option disables all rules with **pcres**. |

### Meta key usage

Starting with the 11.3 release, an attempt has been made to align better the Snort parser's meta key usage with that of other parsers. As of the 11.3 release, the default mode operation continues to write to the legacy key set (consistent with previous releases). To use the aligned key set, set the `udm` option to `true` for the Snort parser in the `parser.options` configuration node. Refer to the **General options** section, below, for a description of how the two modes differ.

## Rules

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however,there are rule options that are not supported by Decoder that are not fully parsed.

Snort rules are parsed and loaded when PCS is loaded (any import/capture in Investigator, initial capture start and parser reload in Decoder).

| Section | Description |
|---|---|
| Header | The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met. |
| Actions | The specified action or a rule must be defined (either one of the native Snort actions or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. Decoder only utilizes rules with alert actions. |
| Protocols | Decoder supports the current Snort protocol keywords ( `tcp` , `udp` , `icmp` , `ip` ). |
| IP Addresses | The full language for defining IP addresses is supported, including lists, CIDR, and negation. |
| Port Numbers | The full language for defining port numbers is supported, including lists, ranges and negation. |
| Direction Operator | The directional operator supports the from-to ( `->` ) and bidirectional ( `<>` ) values. The to-from ( `<-` ) value is invalid and will cause the rule to fail to load. |

### General options

Snort rule general options can result in different meta keys being written depending on whether the Snort parser is in legacy mode or not.

Aligned key mode:

| Option | Description |
|---|---|
| `msg` | If the rule matches, the `msg` value is added as `sig.name` meta. |
| `sid` | If the rule matches, the `sig.id` value is added as meta. |
| `classtype` | If the rule matches, the `classtype` name is added as `threat.cat` meta. |

| Option | Description |
|---|---|
| `priority` | If the rule matches and it has a `priority` option, it is used for the value of the `risk.num` meta. |

Legacy key mode:

| Option | Description |
|---|---|
| `msg` | If the rule matches, the `msg` value is added as `risk.info` , `risk.warning` , or `risk.suspicious` meta, depending on rule priority. |
| `sid` | If the rule matches, the `sid` value is added as meta. |
| `classtype` | If the rule matches, the `classtype` name is added as `threat.cat` meta. |
| `priority` | If the rule matches and it has a `priority` option, it is used to determine the type of risk meta associated with the `msg` value. |

## Payload options

Decoder supports the following payload rule options:

| Option | Description |
|---|---|
| `content` | The `content` option creates a token for Decoder to match. Only tokens of three or more bytes are accepted. It is also important to note that Decoder differs from Snort in that rules are evaluated across the payload of the reconstructed stream and not just a single packet. This can result in differences in rules matches between Snort and Decoder, especially when considering positional options. |
| `nocase` | Currently not supported. This option is ignored and case-sensitive matching is used. |
| `depth` | This option is applied to the distance of the token from the beginning of the stream. If the token position is greater than this value, it is not a match. |
| `offset` | This option is applied to the distance of the token from the beginning of the stream. If the token position is less than this value, it is not a match. |
| `distance` | This option is applied to the distance of the token from the end of the previous token match. If the relative token position is less than this value, it is not a match. |
| `within` | This option is applied to the distance of the token from the end of the previous token match. If the relative token position is greater than this value, it is not a match. |

| Option | Description |
|---|---|
| `http_uri` | Any token that hits is verified to fall within an `http_uri` as indicated by the HTTP parser. No URI normalization is applied. |
| `uricontent` | There is no URI normalization applied. Otherwise, this is equivalent to the content option with the `http_uri` modifier. |
| `pcre` | Currently, PCREs are only applied to URIs and must specify the U option. |

### Non-payload options

| Option | Description |
|---|---|
| `flow` | Verifies that the rule is only applied to the client or server stream. |
| `to_client` | Limits the rule to only matching on a stream that Decoder has defined as Server. |
| `from_server` | Synonym for `to_client` . |
| `from_client` | Limits the rule to only matching on a stream that Decoder has defined as Client. |
| `flowbits` | Maintains state per session and are reset at the end of each session. |
| `set` | When the rule matches, the specified flowbit is set. |
| `unset` | When the rule matches, the specified flowbit is cleared. |
| `toggle` | When the rule matches, the specified flowbit is flipped. |
| `isset` | When the rule is evaluated, the specified flowbit state must be set for the rule to match. |
| `isnotset` | When the rule is evaluated, the specified flowbit state must not be set for the rule to match. |
| `noalert` | Prevents the rule from generating meta data if it matches. |

# Queries

This topic covers the database query syntax. There are three main mechanisms for performing queries in the database, the `query` , `values` , and `msearch` calls on the `/sdk` folder on each Core service.

The `query` call returns meta items from the meta database, possibly using the index for fast retrieval.

The `values` call returns groups of unique meta values sorted by some criteria. It is optimized to return a subset of the unique values sorted by an aggregate function such as count.

The `msearch` call takes text search terms as it's input, and returns matching sessions that match the search terms. It can search within indexes, meta, raw packets, or raw logs.

## `query` Syntax

The `query` message has the following syntax:

```
query-params     = size-param, space, query-param, {space, start-meta-param},
{space, end-meta-param}, {space, search-param} ;
size-param       = "size=", ? integer between 0 and 1,677,721 ? ;
query-param      = "query=", query-string ;
start-meta-param = "id1=", metaid ;
end-meta-param   = "id2=", metaid ;
search-param     = "search=", search-string ;
metaid           = ? any meta ID from the meta database ? ;
```

The `id1` , `id2` , and `size` parameters form a paging mechanism for returning a large number of results from the database. Their usage mostly benefits developers who are writing applications directly against the NetWitness Core database. Normally, results are returned in the order of oldest to newest data (higher meta IDs are always more recent). In order to return results from most recent to oldest, reverse the IDs such that `id1` is larger than `id2` . This has a slight performance penalty, because the where clause must be completely evaluated before processing in reverse order can begin.

When size is left off or set to zero, the system streams back all results without paging. For the RESTful interface, this results in the full response to be returned with chunked-encoding. The native protocol returns the results over multiple messages.

The `query` parameter is a `query` command string with its own NetWitness-specific syntax:

```
query-string      = select-clause {, where-clause} {, group-by-clause {,
order-by-clause } } ;
select-clause     = "select ",  ( "*" | meta-or-aggregate {, meta-or-
aggregate} ) ;
```

```
where-clause      = " where ",  { where-criteria } ;
meta-or-entity    = (meta_key | entity) ;
meta-or-aggregate = meta-or-entity | aggregate_func, "(", meta-or-entity, ")"
;
aggregate_func    = "sum" | "count" | "min" | "max" | "avg" | "distinct" |
"first" | "last" | "len" | "avglen" | "countdistinct" ;
group-by-clause   = " group by ", meta-key-list
meta-key-list     = meta-or-entity {, meta-key-list}
order-by-clause   = " order by ", order-by-column
order-by-column   = meta-or-aggregate { "asc" | "desc" } {, order-by-column}
```

The `select` clause allows you to specify either `*` to return all the meta in all the sessions that match the where clause, or a set of meta field names and aggregate functions to select a subset of the meta with each session.

The `select` clause may contain entity names in the place of meta key names. If an entity name is in the select clause, meta items returned by the query will have their key name set to the entity name, rather than their actual meta key name stored in the session. Thus, the names of the meta items returned in the query will match the names of the metas in the select clause. For example, if there is an entity `ip` that consists of `ip.dst` and `ip.src` , then a query containing `select ip` will only return `ip` fields, with nothing to distiguish `ip.dst` meta items from `ip.src` meta items in the result set.

The `select` clause may contain renamed meta key names. Any fields appearing in the result set as a result of a renamed key in the `select` clause will be returned with the meta key name matching the name used in the `select` clause. For example, if the key `port_src` is used to rename `tcp.srcport` , then a query containing `select port_src` will only return `port_src` fields, even if the underlying meta had type `tcp.srcport` .

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. Doing so causes discrepancies in the results returned to Brokers. The reason for the discrepancies is that Concentrators cannot return only one of the key values of a renamed meta key pair and still preserve the correctness of the result set for the requested size. Hence, the Concentrator omits renamed meta key pair results to preserve the correctness of the result set, which causes the Broker to pull the result from the next Concentrator and advance the IDs that are returned.

Example: `select ip.proto,ipv6.proto` cannot be combined with `size=10` (a paging query) `size=10 flags=0 threshold=0 query="select time,ip.src,ip.dst, ip.proto,ipv6.proto,eth.type,size,payload,lifetime,client,did`

The aggregate functions have the following effect on the query result set.

| Function | Result |
|---|---|
| `sum` | Add all meta values together; only works on numbers |
| `count` | The total number of meta fields that would have been returned |

| Function | Result |
|---|---|
| min | The minimum value seen |
| max | The maximum value seen |
| avg | The average value for the number |
| distinct | Returns a list of all unique values seen |
| countdistinct | Returns the number of unique values seen. countdistinct is equivalent to the number of metas that would have been returned by the distinct function. |
| first | Returns the first value seen |
| last | Returns the last value seen |
| len | Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For example, the word "NetWitness" returns a length of 10. All IPv4 fields, like ip.src , return 4 bytes. |
| avglen | Returns a single value which is the average value returned from the len function. The result is always a float64 value. |

## where Clauses

The where clause is a filter specification that allows you to select sessions out of the collection by using the index.

Syntax:

```
where-criteria    = criteria-or-group, { space, logical-op, space, criteria-
or-group } ;
criteria-or-group = criteria | group ;
criteria          = (meta-key | entity), ( unary-op | binary-op meta-value-
ranges ) ;
group             = ["~"], "(" where-clause ")" ;
logical-op        = "&&" | "||" ;
unary-op          = "exists" | "!exists" ;
binary-op         = "=" | "!=" | "<" | ">" | ">=" | "<=" | "begins" |
"contains" | "ends" | "regex" ;
meta-value-ranges = meta-value-range, { ",", meta-value-range } ;
meta-value-range  = (meta-value | "l" ), [ "-", ( meta-value | "u" ) ] ;
```

```
meta-value          = number | quoted-value | ip-address | mac-address |
relative-time ;
number              = ? any numeric value ? | ( '"' text '"' )
quoted-value        = ( '"' text '"' ) | ( '"' date-time '"' ) ;
relative-time       = "rtp(" , time-boundary , "," ,  positive-integer , time-
unit, ")" ;
time-boundary       = "earliest" | "latest" | "now" ;
positive-integer    = ? any non-negative integral number ?
time-unit           = "s" | "m" | "h" ;
```

When specifying rule criteria, the `meta-value` part of the clause is expected to match the type of the meta specified by the `meta-key` . For example, if the key is `ip.src` the `meta-value` should be an IPv4 address. Entity names are allowed in any location where a meta-key name is required.

Queries using a `meta-key` name will match meta items corresponding both to the `meta-key` name as well as to the names of any "renames" specified for the key. See "Key Renaming" under the Index Customization topic for details on key renaming.

## Query Operators

The following table describes the function of each operator.

| Operator | Function |
|---|---|
| = | Match sessions containing the meta value exactly. If a range of values is specified, any of the values is considered a match. |
| != | Matches all sessions that would not match the same clause as if it were written with the = operator. |
| < | For numeric values, matches sessions containing meta with the numeric value less than the right side. If the right side is a range, the first value in the range is considered. If multiple ranges are specified, the behavior is undefined. For text metas, a lexicographical comparison is performed. |
| <= | Same behavior as < , but sessions containing meta that equals the value exactly are also considered matches. |
| > | Similar to the < operator, but matches sessions where the numeric value is greater than the right side. If the right side is a range, the last value in the range is considered for the comparison. |
| >= | Same behavior as > , but sessions containing meta that equals the value exactly are also considered matches. |
| begins | Matches sessions that contain text meta value that starts with the same characters as the right side. |

| Operator | Function |
|---|---|
| `ends` | Matches sessions that contain text meta that ends with the same characters as the right side. |
| `contains` | Matches sessions that contain text meta that contains the substring given on the right side. |
| `regex` | Matches sessions that contain text meta that matches the regex given on the right side. The regex parsing is handled by boost::regex. |
| `exists` | Matches sessions that contain any meta value with the given meta key. |
| `!exists` | Matches sessions that do not contain any meta value with the given meta key. |
| `length` | Matches sessions that contain text meta values of a certain length. The expression on the right side must be a non-negative number. |

## Text Values

The system expects quoted text values. Unless it can be parsed as a time (see below), a quoted value is interpreted as text.

> It is also important to quote any text value that may contain – so that it is not interpreted as a range.

For text values, the backslash character `\` is used as an escape value. This character is used when you need to search for a value containing quote characters. If you need to search for a backslash character, then the backslash itself must be escaped, as `\\` . Note that if you are wrapping the query parameters within another language, such as the parameter fields of the REST interface, you may need to add additional escape levels as required by whatever API or interface you are using to interact with the core service.

## IP Addresses

IP addresses can be expressed using standard text representations for IPv4 and IPv6 addresses. In addition, the query can use CIDR notation to express a range of addresses. If CIDR notation is used, it is expanded to the equivalent value range.

## MAC Addresses

A MAC address can be specified using standard MAC address notation: `aa:bb:cc:dd:ee:ff`

## Numeric Values

In a where clause, you can specify numeric search values. Numbers should not be surrounded by quotes.

## Bucketed Numeric Indexes

Meta keys indexed with bucketing can be used like any other numeric search value. Under most situations such searches will return sessions that have a meta value that exactly matches the requested search criteria.

Special behavior is invoked for queries that select only `sessionid` , for example a query of the form `select sessionid where size = 2048` . Selecting `sessionid` explicitly bypasses all meta database read operations, and only returns index information. If selecting `sessionid` only, and if the numeric value specified is exactly equal to one of the bucket values, then the system will return all sessions that match somewhere in the bucket, rather than an exact match. For example, the search term `size = 2048` will match all sessions in the 2 KB bucket, which is the range from 2048 to 3171 bytes. However, if the search values does not match a bucket values, then the system will return only matches for the exact byte value. For example, the search term `size = 2049` will only match sessions with a size meta value exactly 2049. In this mode of operation, specifying a non-bucket value in a where clause is slower than searching within a bucket value. The 'where' clause parameter to the `values` API also invokes this optimization.

Using bucketed values in other forms of `query` does not invoke special behavior. The same is true for the `msearch` API. For those APIs, the use of a bucketed index in the where clause is evaluated accurately, without special meaning applied to bucket values. To search within an entire bucket using these APIs, specify the bucket range explicitly. For example `size=2048-3171` .

More information on how to tell if an index is bucketing is in the topic Index Customization .

## Numeric Value Aliases

For numeric values, aliases specified in the index can be used in a query as a quoted string in place of where a literal numeric value would be used; e.g.,

```
select * where service = "NFS"
```

Numeric value aliases can be used anywhere a numeric literal might be used: as a single value, as the beginning or end of a range, or in a comma-delimited list of values (and/or ranges).

Refer to the topic Index Customization for details of how value aliases can be specified in the index.

## Date and Time Expressions

In NetWitness Platform, dates are represented using Unix epoch time, which is the number of seconds since Jan 1, 1970 UTC. In queries, you can express the time as this number of seconds, or you can use the string representation. The string representation for the date and time is `"YYYY-mmm-DD HH:MM:SS"` . A three-letter abbreviation represents the month. You can also express the Month as a two-digit number, 01-12.

Time values must be quoted.

All times specified in queries are expected to be in UTC.

## Relative Time Points

Relative time points allow a where clause to reference a value at some fixed offset relative to the earliest or latest time metas seen in the collection. It can also be used to reference a point in time relative the the current time.

A relative time point expression has the syntax `rtp(boundary, duration)` .

The boundary is either `earliest` , `latest` , or `now` .

The duration is an expression of hours, minutes, or seconds. For example, `24h` , `60m` , or `60s` . When the boundary is `earliest` , the duration represents the amount of time **after** the earliest time present in the collection. If the boundary is `latest` , the duration represents the amount of time **before** the earliest time present in the collection. If the boundary is `now` , the duration represents the amount **before** the current time.

When the boundary is `now` , the system clock of the Core service host is used to determine what time it is.

Boundary can be represented as 0 seconds if you wish to specify the relative time point with no duration offset. This is most useful in the case of the `now` boundary, since it is possible that the highest, latest, time observed in the collection may be much earlier than the current time.

Relative time points can only be used in SDK operations, where there is a collection from which to get the boundaries for earliest and latest time metas.

Relative time points only work on indexed meta types. The default indexed meta types are `time` and `event.time` .

Examples:

```
Last 90m of collection time:
time = rtp(latest, 90m) - u

First 2 days of event time:
event.time = l - rtp(earliest, 48h)

Events added in the last hour:
time = rtp(now, 60m) - rtp(now,0s)
```

## Special Range Values

Ranges are normally expressed with the syntax * `smallest` * - * `largest` *, but there are some special placeholder values you can use in range expressions. You can use the letter `l` to represent the lower-bound of the all meta values as the start of the range, and `u` to represent the upper bound. The bounds are determined by looking at the smallest or largest meta value found in the index out of all the meta values that have already entered the index.

If you use the `l` or `u` tag, it should be unquoted.

For example, the expression `time = "2014-may-20 11:57:00" - u` would match all time from that 2014-may-20 11:57:00 to the most recent time found in the collection.

Notice that it is easy to confuse a range expression with a text string. Make sure that text values that contain − are quoted, and that hyphens within range expressions are not within quoted text.

## `group by` Clause (since 10.5)

The query API has the ability to generate aggregate groups from the results of a query call. This is done using a `group by` clause on the query. When `group by` is specified, the result set for the query is subdivided into groups. Each group of results is uniquely identified by the meta values indicated in the group by clause.

For example, consider the query `select count(ip.dst)` . This query returns a count of all ip.dst metas in the database. However, if you add a `group by` clause, like this: `select count(ip.dst) group by ip.src` , the query returns a count of the ip.dst metas found for each unique ip.src.

As of version 10.5, you can utilize up to 6 meta fields in a `group by` clause.

The `group by` clause shares some of the same functionality as the `values` call, but it offers significantly more advanced groups at the expense of longer query times. Producing the results of a grouped query involves reading the meta from the meta database for all sessions that match the `where` clause, while a values call can produce its aggregates by reading the index only.

The contents of each group returned by the query are defined by the `select` clause. The `select` clause can contain any of the aggregate functions or meta fields selected. If multiple aggregates are selected, the result of the aggregate function is defined for each group. If nonaggregate fields are selected, the meta fields are returned in batches for each group.

The result set of a `group by` query is encoded with the following rules:

1. All meta items associated with a group are delivered with the same group number.
2. The first meta items returned to the group identify the group key. For example, if the `group by` clause specifies `group by ip.src` , then the first meta item of each group will be an `ip.src` .
3. The normal, nonaggregate meta items are returned after the `group key` , but they all will have the same group number as the group key metas.
4. The aggregate result meta fields for each group are returned next.
5. All fields within a group are returned together. Different group results will not be interleaved.

If one of the `group by` meta items is missing from one of the sessions matched by the `where` clause, that meta field is treated as a NULL for the purposes of that group. When the results for that group are returned, the NULL-valued parts of the group key will be omitted from the group's results, since the database has no concept of NULL.

The semantics of a `group by` query differ from a SQL-like database in terms of what meta fields are returned. SQL databases require you to select the `group by` columns explicitly in the `select` clause if you want them to be returned in the result set. The NetWitness Core database always implicitly returns the group columns first.

A query with a `group by` clause honors the result set `size` parameter if one is provided. However, due to the nature of the grouping, it puts an additional burden on the caller to page and reform groups if a fixed-size result set is requested. For this reason, you should not specify an explicit result size when making a `group by` call. By not specifying an explicit size, the entire result set will be delivered as partial results.

`group by` clauses allow results to be grouped by an entity definition.

The following table describes the database honors configuration parameters that limit I/O or memory impact of a group by query.

| Parameter | Function |
|---|---|
| /sdk/config/max.query.groups | This is the limit on how many groups can be held in memory to calculate aggregates. This parameter allows you to limit the overall memory usage of the query. |
| /sdk/config/max.where.clause.sessions | This is the limit on how many sessions from the where clause can be processed in a query. This parameter allows you to set a limit on the number of sessions that have to be read from the meta and session databases to resolve a query. |

### order by Clause (since 10.5)

An order by clause can be added to a query that contains a group by clause. The order by clause causes the set of grouped results to be returned in sorted order.

An order by consists of a set of items to sort by in ascending or descending order. Sorting can be performed on any data field that will be returned in the result set. This includes meta specified by the select clause, aggregate function results specified by the select clause, or group by meta fields.

The order by clause can sort over many columns. There is no limit on the number of order by columns allowed in the query; but a practical limit exists in that each of the order by columns must refer to something returned by the select clause or group by clause. The multiple column sort is imposed lexicographically, meaning that if two groups have equal values for the first column, then they are sorted by the second columns. If they are equal in the second column, they are sorted by the third column, and so on for however many order by columns are provided. Groups that do not contain any of the metas referenced by the order by clause are sorted first in the result set in the case of an ascending sort, and last in the case of a descending sort.

The NetWitness Core database is unique in that the groups of results returned by a query may each have many values for a selection. For example, it is possible to select all meta items that match a meta type and organize them into groups, and it is possible to use the distinct() function to return groups of distinct meta values. If an order by clause references one of the fields in the group that has multiple values, the sorting order is applied as follows:

1. Within each group, the fields with multiple matching values are ordered by the ordering clause
2. All the groups are sorted by comparing the first occurrence of the ordered field found within each group

The order by clause is only available in queries that have a group by clause, since groups are required to organize the meta fields into distinct records. If you wish to sort an arbitrary query as if there were no grouping applied, use group by sessionid . This ensures that results are returned in groups of distinct sessions or events.

group by clauses are naturally returned in ascending group key order; but, an order by clause can be used to return groups in a different order.

If an order by column does not specify asc or desc , the default ordering is ascending.

Examples:

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
desc
select countdistinct(ip.dst),sum(size) GROUP BY ip.src ORDER BY sum(size)
desc, countdistinct(ip.dst)
select sum(size) GROUP BY ip.src, ip.dst ORDER BY ip.dst desc
select user.dst,time GROUP BY sessionid ORDER BY user.dst
select * GROUP BY sessionid ORDER BY time
```

## `search` parameter

The `query` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` clause in the `query` parameter. This means that the `query` and `search` parameters work together. Use the `query` parameter to specify the `select` clause, the `group by` clause, or the `order by` clause. Any `where` clause criteria specified in the `query` parameter are combined with the search filter as if they were joined with an `AND` operation.

Searches through the `query` API are always done against indexed meta, in case-insensitive mode. It has the same behavior as specifying flags `si,sm,ci` to the `msearch` API.

## `values` call

The index provides a low-level `values` function to access the unique meta values that have been stored in the index. This function allows developers to perform more advanced operations on groups of unique meta values.

The `values` call parameter syntax:

```
values-params          = field-name-param, space, where-param, space, size-
param, {space, flags-param} {space, start-meta-param}, {space, end-meta-
param}, {space, threshold-param}, {space, aggregate-func-param}, {space,
aggregate-field-param}, {space, min-param}, {space, max-param}, {space,
search-param} ;
field-name-param       = "fieldName=", (meta-key | entity) ;
where-param            = "where=", where-clause ;
```

```
size-param            = "size=", ? integer between 1 and 1,677,721 ? ;
start-meta-param      = ? same as query message ?
end-meta-param        = ? same as query message ?
flags-param           = "flags=", {values-flag, {"," values-flag} } ;
values-flag           = "sessions" | "size" | "packets" | "sort-total" |
"sort-value" | "order-ascending" | "order-descending" ;
threshold-flag        = "threshold=", ? non-negative integer ? ;
aggregate-func-param  = "aggregateFunction=", { aggregate-func-flag } ;
aggregate-func-flag   = "count" | "sum" ;
aggregate-field-param = "aggregateFieldName=", ( meta-key | entity ) ;
min-param             = "min=", meta-value ;
max-param             = "max=", meta-value ;
search-param          = "search=", search-string ;
```

The `values` call provides the function of returning a set of unique meta values for a given meta key. For each unique value, the `values` call can provide an aggregate total count. The function used to generate the total is controlled by the flags parameter.

## Parameters

The following table describes the function of each parameter.

| Parameter | Function |
|---|---|
| `fieldName` | This is the meta key name for which you retrieve unique values. For example, if `fieldName` is `ip.src` , this function returns the unique source IP values in the collection. Entities can be used for the field name, in which case the result is defined as the combined set of field values for all the referenced meta keys. If the `fieldName` refers to a key with rename references, the result is defined as the combined set of field values for the given meta key name plus all of the references' meta keys. |
| `where` | This is a `where` clause which filters the set of sessions for which the unique values are returned. For example, if the `fieldName` is `ip.src` , and the `where` clause is `ip.src = 192.168.0.0/16` , only values in the range of `192.168.0.0` to `192.168.255.255` are returned. For information on the `where` clause syntax, see *Where Clauses* . |
| `size` | The size of the set of unique values to return. This function is optimized to return a small subset of the possible unique values in the database. |

| Parameter | Function |
|---|---|
| `id1` , `id2` | These optional parameters limit the scope of the search for unique values to a specific region of the meta database and the index. Setting the `id1` and `id2` parameters to a limited range of the meta database is very important to running searches quickly on large collections. |
| `flags` | Flags control how the values are sorted and totaled. Flags are described in the following Values Flags section. |
| `threshold` | Setting the `threshold` parameter allows the `values` call to short-cut collection of the total associated with each value once the threshold is reached. By providing a threshold, the caller can reduce the amount of index and meta items that must be retrieved from the database. If the `threshold` parameter is omitted or set to 0, this optimization is not used. |
| `aggregateFunction` | Optional parameter used to change the default behavior from counting sessions, packets, or size to counting or summing the numeric field defined by `aggregateFieldName` . Both parameters must be specified when either is defined. Pass either `sum` or `count` to specify which behavior to perform. |
| `aggregateFieldName` | The meta field on which to perform the `aggregateFunction` . Both `aggregateFunction` and `aggregateFieldName` parameters must be specified when the `aggregate` flag is set. Performing a `values` call using one of the aggregate functions can be significantly slower than a `values` call that collects totals of sessions, packets, or size. The reason for this is that each session that matches the `where` clause must be retrieved from the meta database. This scan causes a large portion of the query to be I/O bound on the meta DB volumes. The time taken to run an aggregate `values` call is linearly proportional to the number of sessions that match the `where` clause. |
| `min` , `max` | The minimum and maximum value that should be returned from the call. These parameters are used to iterate (or page) over an extremely large number of values, typically more values than could be returned from a single call. Primarily used in conjuction with the flags `sort-value,sort-ascending` such that the highest value returned would be used in a subsequent call as the `min` parameter value. The values are exclusive. If `min="rsa"` was specified and `rsa` was a valid value, `rsa` would not be returned; instead, the next highest value would be returned. |
| `search` | Text search pattern to be used to further refine the `where` parameter |

## `values` Flags

The `flags` parameter controls how the values call operates. There are three groups of flags that correspond to the different modes of operation as shown in the following table.

| Flag | Description |
|---|---|
| `sessions` , `size` , `packets` | The `values` call allows you to specify one of these flags to determine how the total for each value is calculated. If the flag is `sessions` , the `values` call returns a count of sessions that contain each value. If the flag is `size` , the `values` call totals the size of all sessions that contain each unique value, and reports the total size for each unique value. If the flag is `packets` , the values call totals the number of packets in all sessions that contain each unique value, and then reports that total for each unique value. |
| `sort-total` , `sort-value` | These flags control how results are sorted. If the flag is `sort-total` , the result set is sorted in order of the totals collected. If the flag is `sort-value` , the results are returned in order of the sorting order of the values. |
| `order-ascending` , `order-descending` | These flags control the sort order of the result set. For example, if sorting by total in descending order, the values with the greatest total are returned first. |
| `suggest` | Enables suggestion mode for the values API. All other flags are ignored if this flag is set |
| `database-scan` | Make the values call bypass the index and instead collect unique values as if where traversing the meta database. This mode is slow on most cases, but it can be fast if the where clause matches very few sessions. |
| `ignore-cache` , `clear-cache` | These flags control result set caching on the set of values returned by this call. Normally these should not be used. |

## `values` Call Example

The `values` call is used extensively by the Navigation view in NetWitness Platform. The default view generates calls that look like this:

```
/sdk/values id1=198564099173 id2=1542925695937 size=20 flags=sessions,sort-
total,order-descending threshold=100000 fieldName=ip.src where="time=\"2014-
May-20 13:12:00\"-\"2014-May-21 13:11:59\""
```

In this example, the Navigation view requests unique values for `ip.src` . It requests unique values of `ip.src` in the time range given. It asks for the count of sessions that match each `ip.src` , and the results are the top 20 `ip.src` values when sorted by the number total count of sessions in descending order. In addition, the Navigation view has a meta ID range in order to provide an optimization hint to the query engine.

## Values call and bucketing mode

When a values call is executed with a `fieldName` parameter that specifies a bucketed indexed meta, the system will only return the bucket values present within the rest of the criteria. This has the side effect of producing counts and totals that represent all sessions within each returned bucket. This is useful because it summarizes size meta into groups that represent human-readable ranges like 1 MB, 2 MB, and so one.

When the number of sessions scanned by the values call drops below 1000 sessions, the values call operates in meta-scanning mode, and at that point it returns exact values for numeric value indexes, regardless of the bucketing setting on the index.

## Suggestion Mode

The `values` call has an additional execution mode that is used to provide suggested search values. In this mode of operation, the `values` call only identifies unique values stored with the given meta key name. It provides these results within milliseconds. To achieve this it does not provide any session counts, it will not utilize any other sort flags. The suggestion mode does utilize the `where` parameter to refine suggestions, but it only utilizes the time range clause if provided. Other portions of the `where` clause are not utilized to refine suggestion.

Suggestion mode is enabled by setting the `suggest` flag in the `flags` parameter.

Suggestion mode gives special meaning to the `min` parameter. The `min` parameter can contain the starting point for the suggested values. The return values of `suggest` mode will only include values that start with the text provided in the `min` parameter.

### `search` parameter

The `values` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` parameter. This means that the `where` and `search` parameters work together. Any `where` parameter specified is combined with the search filter as if they were joined with an `AND` operation.

Searches through the `values` API are always done against indexed meta, in case-insensitive mode.

The `values` API only operates on index entries for most requests, in order to provide fast totals over a large numbers of events. When the search parameter operates over in-exact indexes, such as N-Gram indexes, it may include sessions with near matches instead of narrowing the search to exact matches.

## `msearch` Call

The index provides a low-level `msearch` function to perform text searches against all meta types. This type of search does not require users to define their queries in terms of known meta types. Instead, it searches all parts of the database for matches. `msearch` is used by the Events view text search. See the "Filter and Search Results in the Events View" topic in the *Investigation and Malware Analysis Guide* for detail on the accepted search forms and examples.

`msearch` parameters:

```
msearch-params  = search-param, {space, where-param}, {space, limit-param},
{space, size-param}, {space, flags-param};
search-param    = "search=", ? free-form search string ? ;
where-param     = "where=", ? optional where clause ? ;
limit-param     = "limit=", ? optional session scan limit ? ;
size-param     = "size=", ? optional result count limit ? ;
flags           = "flags=", {msearch-flag, {"," msearch-flag} };
msearch-flag    = "sp" | "sm" | "si" | "ci" | "regex" ;
```

The `msearch` algorithm works as follows:

1. A set of sessions is identified from the index by finding the intersection of three sets:
   - (Set 1) All sessions in the database
   - (Set 2) Sessions that match the `where` clause parameter
   - (Set 3) If the `si` flag is specified, sessions that indexed values that match the search string parameter.
2. If the search specifies the `sm` parameter, all meta items from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The meta items will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Broker, the meta items may be read from the Concentrator nearest to the broker, but if the search is performed on an Archiver the meta items will be read from the Archiver itself.
3. If the search specifies the `sp` parameter, all raw packet or log entries from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The packets will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Concentrator, the packet data will be read from the Decoder, but if the search is performed on an Archiver, the packet data will be read from the Archiver itself.
4. Matches from step 2 and step 3 are returned as they are found, up to the point where the `limit` parameter is reached or the `size` count is reached, whichever occurs first. The `limit` parameter specifies the maximum number of sessions for which meta and packet data will be scanned. If `limit` is not specified, the entire set of sessions determined in step 1 is scanned. The `size` parameter specifies the maximum number of results that will be returned. In practice, the `size` parameter acts more as a suggestion. It is possible that slightly more results than specified will be returned, but fewer results will never be returned. If the `size` parameter is not specified, all results matching the search will be returned.

## `msearch` Flags

| Flag | Description |
|---|---|
| `sp` | Scans raw packet data |
| `sm` | Scans all meta data |
| `si` | Does index lookups for all search parameters before scanning meta |
| `ci` | Performs a case insensitive search. Returned results are case-preserving. |
| `regex` | Treats the search parameter as a regular expression. Only a single regular expression can be specified, but the regular expression may be arbitrarily complex. |

## `msearch` Index Search Mode

Using the index search mode, specified by using the `si` flag, causes results to be returned significantly faster than any other mode. The main limitation of this mode is that it only returns matches on text terms that match value-indexed meta values.

- The `si` parameter must be combined with the `sm` flag. The `si` parameter implies the search only matches indexed meta.
- The `si` parameter can be used with regex searches, however only text indexed values will match. IP addresses and numbers will not match the regex.

## Text Search Syntax

The search parameter given to `msearch` is composed of 1 or more words, separated by whitespace. For example, searching for `foo` returns sessions that contain the word foo.

If multiple terms are provided for the search, they are implicitly considered to be an AND operation. For example, searching for `foo bar` returns sessions that contain both foo AND bar. Sessions that contain only foo or only bar are filtered out. If you want to search for sessions containing any of two or more terms, you must explicitly separate the terms with the word OR. For example, searching for `foo OR bar` returns sessions that contain either foo or bar.

## Search Syntax And Index Modes

The searches given to the `msearch` command are interpreted according to the index level on all the indexes. `msearch` works on the value-indexed keys in the index. Search terms provided to `msearch` will find values that are an exact match to values that were indexed.

As of version 11.1, there are new index modes available that allow `msearch` to locate text that is not an exact match to the search input. `msearch` supports wildcard searches on the word meta index, if the word meta index has the ngram option enabled. For details on the ngram option, see the topic Index Customization.

The wildcard search allows the use of the `*` and `?` characters as wildcards in search terms. The `*` can stand for 0 or more characters, while the `?` may stand for any single character. To search for those characters in an N-gram enabled index, you may escape them with a backslash character.

If the word index has the 'edge' N-gram option enabled, then it can be used to locate searches that end in a wildcard. This means it is only useful for finding text that begins with a known prefix.

If the word index has the 'all' N-gram option enabled, then wildcards may appear anywhere in the search term.

This table summarizes the relationship between word index level, and the types of searches that `msearch` will locate.

| Search input | Non-indexed | IndexValues | IndexValues with Edge N-grams | IndexValues with All N-grams |
|---|---|---|---|---|
| "foo" | no match | "foo" | words starting with "foo" | words containing "foo" |
| "foo*" | no match | literal "foo*" | words starting with "foo" | words starting with "foo" |
| "*foo" | no match | literal "*foo" | no match | words ending with "foo" |
| "*foo*" | no match | literal "*foo*" | words staring with foo | words containing "foo" |
| "foo*" | no match | literal "foo*" | literal "foo*" | literal "foo*" |

### `msearch` Tips

- Always use the `where` clause to specify a time range for the search.
- To search for IP address ranges, specify them in the `where` clause.
- Use the `limit` parameter when not using the index search mode. Without it, there will be an extremely large amount of data read by the meta and packet databases.

## Stored Procedures

The `query` and `values` calls provide more low-level search functionality. For more advanced use cases, server-side stored procedures exist.

## Use of Quotes in Query Syntax

The query parser does not care whether you use single or double quotes within a query statement. A single- or double-quoted value is treated as text meta.

The query parser attempts to make sense of whatever you put in the statement. It is not very strict about what it will accept.

For example:

`reference.id=4752`

This clause identifies sessions that have a `reference.id` meta value that has a *numeric* value of 4752.

`reference.id='4752'` or `reference.id="4752"`

This clause identifies sessions that have a `reference.id` meta value that has a *string* value of `4752` .

However, the query engine implicitly compares numbers and strings that look like numbers as equal when the values are semantically the same. So it works with either syntax.

For most efficient performance, however, it is always a good idea to construct the queries such that the query syntax matches the data types generated by the parser.

For example, if the parser is creating `reference.id` as a numeric data type (such as `uint32` or `uint64` ), then use the numeric syntax.

If the parser is creating `reference.id` as a text data type, then use the string syntax.

## `hierarch` Call

The `hierarch` call returns information about the hierarchy of devices attached to the collection represented in this database.

A hierarchy consists of this device, plus any devices that this device is connected to. For each device, the contents of the `/sys/stats` folder is returned. This information includes the device name, it's UUID, and it's version information.

The hierarchy command returns it's information as a MessagePack object, which may be translated into different representations depending on what API you are using to access the Core service. For example, using the REST API it is translated to a JSON object.

For devices that connect to upstream devices, such as a Broker or Concentrator, the hierarchy message will contain a `devices` member. The `devices` member is an array that holds the contents of the `hierarch` message as executed on each upstream device. In this way, the `hierarch` message forms a hierarchical directory of all services that the device connects to, both directly and indirectly.

# Index Customization

This topic describes how to use the custom index file to customize the index. Each NetWitness NextGen service is installed with a default index configuration that is intended to cover the index needs for most users of the product. However, it is possible to index new meta keys in order to use the index with custom content that generated custom meta.

## Index Configuration File Locations

The index customization is accomplished by making changes to the custom index file. The location of this file is **/etc/netwitness/ng/index-<servicename>-custom.xml** , where **<servicename>** corresponds to the name of the product that you are customizing. For example, the Concentrator custom index file is /etc/netwitness/ng/index-concentrator-custom.xml.

Concentrator products also include a file that describes the default index configuration: **/etc/netwitness/ng/index-concentrator.xml** . This file is useful as a template to show how the custom index file is formatted.

If you make customizations to the index in the custom index file, those customizations override any conflict with the default index configuration.

You can make changes to the custom index file while the service is running. When the service receives an index save command, the changes to the custom index file are read and applied to the index.

Changes to the index can only be applied to new incoming data. Data cannot be retroactively reindexed with a new custom index configuration, except by Rebuilding the Index .

## Index configuration entries

The custom index file is an XML document. The root element of this document is the `language` element, and inside there are elements for each meta key to describe each custom index. Each element of the custom index configuration looks like this:

```
<key name="did" description="Decoder Source" level="IndexValues" format="Text"
valueMax="100"  />
```

Definitions for each attribute in this element:

| Attribute | Description |
|---|---|
| name | The name of the meta key that will be indexed |
| description | A human-readable description for the meta type |
| level | The type of index that will be created for this meta key |
| valueMax | The maximum unique values that will be stored for this key per slice |
| format | The format of the data held by all meta items with this meta key name |

| Attribute | Description |
|---|---|
| bucket | Enable size bucketing |
| ngrams | Enable ngram generation |
| threshold | Threshold for approximate value merging on ngram indexes |
| defaultAction | Default Navigate view action for this key: Open, Closed, Auto, Hidden |

The next few sections examine these parameters in greater detail.

## Meta names

The meta name used by the index refers to the meta key name present within every meta item in the meta database. These meta names are generated by the Decoders when parsing. Parsers can choose to generate meta with any meta key name. Therefore, the custom index allows you to choose which of the meta items generated by the Decoder are indexed.

Meta key names can be 16 characters long, and contain only letters or the '.' character.

## Data Types

When the Decoder generates meta items, it assigns a data type. Each parser can choose the data type of the meta it generates. However, there are recommended and standard data types for each of the default meta keys. For example, ip.src and ip.dst are stored as the IPv4 meta type, and alias.host is stored as the Text meta type. Each parser must agree on the data format for each meta key generated by the Decoder.

When adding a custom index to the Concentrator, the data type of the custom index must match the format of the data generated by the Decoder. If the types do not match, the Concentrator attempts to convert the meta generated into the type specified for the custom index. However, these conversions sometimes fail, and the resulting index can produce undefined results.

Likewise, when many Decoders and Concentrators work together as part of a NetWitness installation, they must all agree on the types for each meta key. Conflicts of meta types between NetWitness NextGen services can lead to undefined behavior.

The following table shows the metadata types supported by the NetWitness NextGen services.

| Type | Size in bytes | Description |
|---|---|---|
| Int8 | 1 | Signed 8-bit integer |
| UInt8 | 1 | Unsigned 8-bit integer |
| Int16 | 2 | Signed 16-bit integer |
| UInt16 | 2 | Unsigned 16-bit integer |
| Int32 | 4 | Signed 32-bit integer |
| UInt32 | 4 | Unsigned 32-bit integer |
| Int64 | 8 | Signed 64-bit integer |

| Type | Size in bytes | Description |
|---|---|---|
| UInt64 | 8 | Unsigned 64-bit integer |
| UInt128 | 16 | Unsigned 128-bit integer |
| Float32 | 4 | 32-bit floating point number, single precision |
| Float64 | 8 | 64-bit floating point number, double precision |
| TimeT | 8 | Unix epoc timestamp |
| Binary | 1-255 | Arbitrary binary data |
| Text | 1-255 | UTF-8 Encoded text data |
| IPv4 | 4 | IPv4 address bytes |
| IPv6 | 16 | IPv6 address bytes |
| MAC | 6 | MAC Address bytes |

When defining a custom index, it is important to use the best data type for the meta. For example, never store IP addresses as Text, since the Text representation takes more bytes than the IPv4 representation.

## Index Levels

There are three levels, or types, of indexing: IndexNone, IndexKeys, and IndexValues.

**IndexNone**

This type of custom index is not really an index at all. Custom index entries with the IndexNone level exist only to define and document the meta key. IndexNone entries can be used in custom Decoder indices to enforce a specific data type for a meta key across all the parsers on a Decoder.

**IndexKeys**

This type of custom index indicates that the index only keeps track of sessions that contain meta items with this meta key name. However, it does not index any unique values in the meta database for the meta key.

Key-level indices take much less storage space, memory, and CPU time to manage, but they require a lot more work from the query engine when you perform query or values operations using them.

If used in a where clause, a meta key indexed at the key level can only be used to resolve operations such as exists or !exists.

**IndexValues**

This type of custom index keeps sessions that contain each individual unique value for the meta key. This type of index is also known as a "full index".

This type of index is needed for efficient processing of most where clauses, and for use of this meta key as the fieldName parameter of a values call.

## Value Max

Value max is a parameter that can have a very significant impact on the accuracy and performance of a Value-level index.

As a Decoder parses packets or logs, it is allowed to create meta of any type with any value. Usually, these meta items are created from data copied directly out of the packet or log. Therefore, anyone can create unique meta values in response to nearly any event.

The performance of the index is directly dependent on the number of unique values it has found for each meta key. As the number of unique values increases, the rate at which new meta is indexed can decrease, and the speed with which queries are completed decreases. Since any person can influence the creation of unique meta values, it is possible for any person to affect the performance of the index.

The value max parameter limits the number of unique values that can enter the index. Therefore, a malicious user cannot flood the system with a large number of unique values in an attempt to make the NetWitness system not work.

It is important to set a value max on any meta key that may have its value influenced directly by incoming packets or logs.

The value max applies only to values added since the last index save operation.

The limit for how high value max can be set varies from version to version and on the amount of RAM available to the NetWitness NextGen service. As of 10.3, the recommended ceiling for value max is 5,000,000 for any meta key. If there are a lot of custom indices, then the value max may have to be lower.

## maxLength

The max length parameter is used exclusively on the `word` meta type. The meaning of the `maxLength` parameter depends on whether the index is storing N-grams, as indicated by the `ngrams` parameter. The default and recommended value for `maxLength` is 5.

### Max Length without N-Grams

If N-Gram support is turned off, then the `maxLength` parameter indicates that search terms need to be truncated so that they will match truncated values in the index and meta database. If this is the case, the `maxLength`**must** be less than or equal to the corresponding setting for **/decoder/parsers/config/token.max.length** on the Log Decoder service that is generating `word` token metas. The index will use the `maxLength` to properly interpret search terms fed into the `msearch` SDK function.

### Max Length with N-Grams

If N-Gram support is turned on, by setting `ngrams="Edge"` or `ngrams="All"` , then the maxLength parameter controls the maximum length of N-Grams extracted from the meta item. In this scenario, the maxLength does not have to match the length of `word` meta items generated on the Log Decoder.

## minLength

The minimum length parameter is used exclusively on the `word` meta type. It only has an effect when N-grams are generated. It indicates the smallest length N-gram that will be extracted from the `word` meta items. The default and recommended minimum N-Gram length is 3, which means that searches against the `word` index must have at least 3 characters.

## ngrams

The `ngrams` parameter is used exclusively on the `word` meta type. N-gram indexes extract information that allow for fast lookup of searches that only match part of the word. For example they allow for finding 'ball' inside the word 'basketball'. If set to the value of `all` , then the index will create entries for all N-grams within the word meta values. The minimum value of N is specified by `minLength` , and the maximum value of N is specified by `maxLength` .

The `ngrams` parameter also supports the value `edge` , which indicates the index will only store N-grams that appear at the beginning of a word. Edge N-grams are useful for type-ahead search matching, and take less space than storing all N-grams. However they are not useful to locate matches inside the word or at the end of the word.

The `ngrams` parameter supports the `` `allvalue` `` value for the text format meta keys. It means that the index for a meta key will store `` `all` `` N-grams within the meta values and also `` `IndexValues` `` limited by ValueMax.

This index type enhances the search capability on overflowed index values due to Value Max limits. The N-grams index provides the ability to search any meta value and the Values index provides the ability to retrieve top N available values.

The `` `minLength` `` parameter specifies the minimum value of N, the `` `maxLength` `` parameter specifies the maximum value of N, and the `` `ValueMax` `` parameter specifies maximum unique values. The following are some guidelines to follow while using these parameters:

- It is recommended to set `minLength=3` and `maxLength=3` for compact index storage of N-grams and also use ValueMax to limit value index storage. When compared to Text format keys indexed by IndexValues and ValueMax=0 (unlimited) this N-gram index configuration provides better search functionality with compact index storage and memory usage.
- The `contains` operation in queries runs faster for meta keys indexed with this Ngram index type when compared to IndexValues.
- As the index type uses both N-grams and IndexValues for the same meta key, it increases the index memory and the index storage usage for the meta key and eventually reduces index retention. Hence it is recommended to choose this index type `only` for desired meta keys to consider storage and index retention.
- When you switch to this N-gram type and if the new behavior is required on the whole index, you must perform a re-index.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of 'all' or 'allvalue' N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

**Note:** Note: When you switch from ngrams 'allvalue' or 'all' to IndexValues, then you may need to consider re-index as index slices created before the configuration change would be ngram indexes and the values call would return ngrams.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of `all` N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

In the default index configuration, only the `word` meta key has N-gram indexing enabled. This meta key is used to index text tokens extracted from unparsed logs on the Log Decoder.

The N-gram index mode supports a 'threshold' tunable parameter that controls the precision of the index. The threshold is used to merge similar index values together depending on how closely the set of indexed sessions matches. Values greater than 0 and less than or equal to 1.0 are accepted. A value of 1.0 means that the index will only merge values if they were found in the same set of sessions. Higher values mean that the index will merge fewer values, at the expense of requiring more time to create the index during aggregation. Lower values mean the index will merge more values together, at the expense of longer search execution time due to more database access. The threshold parameter does **not** affect search accuracy.

## Numeric Bucketing

Indexes on meta formats that are unsigned integers, specifically UInt32 and UInt64, can make use of size bucketing to improve performance.

Size bucketing rounds down the size values in the index to their nearest traditional byte unit of information. Enabling this option on a numeric index reduces the number of unique values to track in the index, which improves aggregation and query performance.

The bucketing option is enabled by the boolean parameter `bucket` on the key element. `bucket` may have the value `0` , for off or `1` for on. The default is `0` .

Examples of bucket number values:

| Raw Value | Value Stored in Index | Explanation |
|---|---|---|
| 0 - 1,023 | 0 - 1,023 | Values 0-1023 are stored unmodified |
| 1,024 - 1,048,575 | 1 KB, 2 KB, 3 KB ... 1,023 KB | Values under 1 MB are stored in 1 KB buckets |
| 1,048,576 - 1,073,741,823 | 1 MB, 2 MB, 3 MB ... 1,023 MB | Values under 1 GB are stored in 1 MB buckets |
| 1,073,741,824 - 1,099,511,627,775 | 1 GB, 2 GB, 3 GB ... 1,023 GB | Values under 1 TB are stored in 1 GB buckets |

## Key Value Aliases

Value aliases can be specified for keys. Value aliases are text representations that correspond to specific values for a key. These text representations may be easier to remember and more convenient to display. Aliases can be used in the rule/query language (see Queries) and are accessible via the SDK.

Value aliases are specified using the `aliases` and `alias` elements:

```
<key description="Service Type" format="UInt32" level="IndexValues"
```

```
name="service" valueMax="75" defaultAction="Open">
        <aliases>
                <alias format="$alias" value="0">OTHER</alias>
                <alias format="$alias" value="20">FTPD</alias>
                <alias format="$alias" value="21">FTP</alias>
                <alias format="$alias" value="22">SSH</alias>
                <alias format="$alias" value="23">TELNET</alias>
                <alias format="$alias" value="25">SMTP</alias>
                ⋮
        </aliases>
</key>
```

## Key Renaming

The index language supports the concept of key renaming. This feature is used to provide backwards compatibility for new key names to deprecate and replace old key names. A renaming is achieved by adding `rename` elements to the key. This has the effect of indicating the parent key renames the key in the rename element. For example, the key definition below defines a new key named `port_src` that renames the key `tcp.srcport` .

```
<key name="port_src" description="Source Port" format="UInt16"
level="IndexValues">
        <rename name="tcp.srcport"/>
</key>
```

The rename element indicates to the database that uses of the parent key, in this case `port_src` , will include both meta items with type port_src and meta items with type tcp.srcport. Thus, new meta items can be added to the database and queried using `port_src` , and such queries will return information that was previously stored in tcp.srcport as well.

The rename element accepts a single attribute, `name` , that refers to a previously defined key.

Keys referred by rename elements must have the same type as the parent key.

Keys referred by rename elements must have the same index level as the parent key.

If a key is redefined in a custom index file, and the redefined key contains rename elements, then those rename elements replace any previously defined rename elements.

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. For more information, see the Queries topic.

# Entities

The index configuration is used to define entities. Entities provide a convenient way to work with several meta keys at the same time. An entity definition is an alias that groups together the results from other meta keys. You can use an entity definition anywhere you would use a normal meta name. The primary use for entities is to organize similar meta types into a single, easier to use, meta type. For example, the default NextGen database language includes distinct meta types for IP source and IP destination. You could define an entity that represents the combined set of all IP sources and destinations using an `entity` element:

```
<entity name="ip.all" description="any ip entity">
       <keyref name="ip.src"/>
       <keyref name="ip.dst"/>
</entity>
```

The `entity` element accepts the following attributes:

| Name | Description |
|---|---|
| name | (Required) The name of the entity |
| description | (Optional) A description of the entity |
| defaultAction | (Optional) Navigate view action for this entity: Open, Closed, Auto, Hidden |

Entity definitions create new entries in the NextGen service language. Since they are returned in the SDK `language` call, they can be used by older client applications that are not directly aware of the concept of entities.

Each entity definition must contain one or more `keyref` elements. The keyref element only allows a single `name` attribute that must refer to a real meta `key` element defined somewhere else in the device's language. The `keyref` is also allowed to refer to meta types defined in the default language.

Meta entities can be utilized in application rules, but are not supported in network rules as meta available is too limited.

## Entity Definition Rules

- All the keys referenced by an entity must have the same data type
- All the keys referenced by an entity must have the same index level
- An entity name cannot conflict with any existing meta type
- Keyrefs must refer to meta key names that are defined earlier in the index configuration

## Entities in Brokers

Brokers will inherit entity definitions from up-stream devices, in the same way that meta key definitions are inherited. If the upstream devices attached to the broker do not all have the same set of entities defined, the Broker will log a warning. All upstream devices should have the same entity configuration. A broker operating with mismatched entity definitions may produce undefined behavior.

# Rebuilding the Index

Under normal operation, changes made to the index configuration for a service are only applied to new data that enters the collection. Rebuilding the index over all the data in the collection is a time-consuming process because it requires all of the meta database storage to be read from disk.

In version 11.0 and later, it is possible to rebuild the index while the service is online. Version 11.0 services rebuild indexes in the background whenever the service detects that part of the session and meta databases is unindexed.

## Activating the Background Reindexer

The background reindexer is activated whenever the service starts. During startup, the indexer checks for gaps between sessions that are indexed and sessions that are present in the session and meta database. If any gaps are found, the background reindexer begins reindexing the session and meta database on the service.

Examples of events that may activate the background reindexer:

1. A power failure or crash occurred, rendering the last slice of the index corrupt. The corrupt data is deleted at startup, leaving a gap in the index.
2. Index data is forcibly deleted, either by doing an index reset or deleting files from the filesystem.

## Controlling the Background Reindexer

The operation of the background indexer is controlled by the configuration node `/index/config/reindex.enable` . If `reindex.enable` is set to true, the next time the service starts the reindexer will operate. If `reindex.enable` is set to false, the reindexer will not start the next time the service starts, but will continue to operate until the service is restarted.

## Background Reindexing Algorithm

The operation of the background indexer is as follows:

1. The index examines the ranges of sessions that are present in the index and compares them to the ranges of sessions that have valid meta data. Any discrepancies between the two are considered gaps.
2. The gaps in the index are subdivided into slices based on the current value of `/index/config/save.session.count` .
3. For each slice that is missing, a temporary index is created in one of the directories specified by `/index/config/index.dir` . The slices are reindexed in reverse numerical order. Thus, the most recently collected sessions are indexed first.
4. Once the slice is completely reindexed, it is moved into its valid location in the online index. If the reindexed slice belongs on the warm tier, it is moved to the warm tier.
5. The newly indexed data appears as part of the collection.

## Background indexer status

The stat node `/index/stats/updater.state` indicates the current state of the background reindexer. This node will say `running`, `not running`, or `failed`. If the status is `failed`, check the service log for more diagnostic information.

## Effects on Aggregation

Services that perform aggregation utilize the index to keep track of sessions that have already been aggregated. If the index does not have enough information to begin aggregation, aggregation will be offline until enough slices have been reindexed. During this time the aggregation status for the upstream device will indicate that it is waiting on aggregation.

## Forcing A Reindex

To force the index on a service to be rebuilt:

1. Ensure that `/index/config/reindex.enable` is true.
2. Reset the index by using the `reset` message on the service. For example: `/concentrator/reset index=1` will restart the service and delete all the index files.
3. Wait for the service to restart. Background reindexing will start.
4. The most recently collected data will be available for queries as soon as the index slice representing those sessions has been reindexed.

# Optimization Techniques

This topic describes optimization techniques for the NetWitness Core database. The NetWitness Core database is set up to work with a wide variety of work loads by default. However, like any database technology, its performance can be very sensitive to both the nature of the data being ingested, and the nature of the searches that the user performs against the database.

## Thresholds

Thresholds are a useful optimization that can have a dramatic effect on how fast results are returned to the NetWitness Platform Navigate view. Thresholds are applied to the `values` call. For more information about the `values` call, see Queries .

The threshold defines a limit to how much of the database is retrieved from disk in order to produce a count. For most queries, the number of sessions that match the `where` clause is very large. For example, selecting all the log events for just one hour running at 30,000 events per second matches 108,000,000 sessions.

RSA introduced the threshold feature based on the observation that most cases where a count of sessions is required do not have to have results that are accurate down to the very last session. For example, when looking at the top 20 IP addresses present over the past hour, it is not very important if the report indicates that an IP value matched 10,000,000 or 10,000,001 sessions exactly. The estimate is good enough. In these scenarios, we can make an estimate for the value of the count returned when our count exceeds the threshold parameter. When the threshold is reached, the remaining count is estimated, and the results are sorted based on the estimated counts, if necessary.

## Complex `where` Clauses

The amount of time it takes for the NetWitness Core database to produce a result is dependent on the complexity of the query. Queries that align directly with the indexes present on the meta can be resolved quickly, but it is very easy to write queries that cannot be resolved quickly. Sometimes, queries that cannot be returned quickly can be processed by the Core database and the index differently to produce much more satisfying results for the customer.

It is useful to know the relative *cost* of each part of the `where` clause. A clause with a high cost takes longer to execute. In the following table, the query operations are ordered in terms of their relative cost, from lowest to highest.

| Operation | Cost |
|---|---|
| exists, !exists | Constant |
| = , != | Logarithmic in terms of the number of unique values for the meta key, linear in terms of the number of unique elements that match a range expression |
| < , > , <= , >= | Logarithmic in terms of unique value lookup, but more likely to be linear since the expression matches a large range of values |
| `begins` , `ends` , `contains` | Linear in terms of the number of unique values for the meta key |

| Operation | Cost |
|---|---|
| regex | Linear in terms of the number of unique values for the meta key with a high per-value cost |

### AND and OR

When constructing a where clause, keep in mind that constructing many terms using the AND operator can have a beneficial affect on the performance of a query. Any time that multiple criteria can be used to filter down the set of sessions matching the where clause, there is less work for the query to do. Likewise, each OR clause creates a larger set of sessions to process for each query.

As a general rule of thumb, the more AND clauses in the query, the faster it completes, but the more OR clauses in the query, the slower it completes.

## Use Case: Match a Large Subnet

It is common for users to construct queries that attempt to include or exclude a large subnet. This type of query is common because the users are trying to include or exclude some large portion of their internal network from their investigation.

### Starting with NetWitness 11.4, all /8, /16, and /24 IPv4 subnets get their own index entries. So, no special action is needed to help optimize these queries.

For versions of NetWitness 11.3 and earlier, it is slower for the query engine to resolve this query using the ip.src or ip.dst indices alone. The issue arises from the fact that a where clause such as this:

```
ip.src = 10.0.0.0/23
```

Actually must be interpreted as:

```
ip.src = 10.0.0.0 || ip.src = 10.0.0.1 || ip.src = 10.0.0.2 || ... || ip.src =
10.0.1.255
```

Thus, the index could have to create a where clause with 512 terms.

The solution to this problem is to use the Decoder to tag common networks of interest using application rules. For example, you could create meta items with an application rule that looks like this:

```
name=internal rule="ip.src = 10.0.0.0/23" order=3 alert=network
```

This rule creates meta items in the meta key network with the value internal for any IP address in the 10.0.0.0/23 network.

The where clause could be expressed as:

```
network = "internal"
```

Assuming there is a value-level index on the network meta data, the index does not have to expand this query into anything more complex, and the sessions matching the desired subnet are matched very quickly.

## Use Case: Substring Matching

Using the operators `begins` , `ends` , `contains` , and `regex` in a `where` clause can be very slow if there are a large number of unique values for the meta key. Each of these operators is evaluated independently against each unique value. For example, if the operator is `regex` , the `regex` must be run independently against each unique value.

To work around this, the most effective strategy is to reorganize the meta items such that the user does not have to use a substring match.

For example, consider if the users are attempting to find the host name within a URL somewhere in the session. The users might write a `where` clause such as:

```
url contains 'www.rsa.com'
```

In this scenario, it is likely that the `url` meta key contains one unique value for every session that was captured by the Decoder, and therefore has a huge number of unique values. In this case, the contains operation is slow.

The best approach is to identify the part of meta data they are attempting to match, and move the matching into the content parser.

For example, if there is meta data being generated for each URL, a parser could also break down the URL into its constituent components. For example, if the Decoder generates URL meta data with the value `http://www.rsa.com/netwitness` , it could also generate `alias.host` meta data with the value `www.rsa.com` . Queries could be performed using:

```
alias.host = 'www.rsa.com'
```

Since the substring operator is no longer needed, the query is much faster.

# Index Saves

The Core index is subdivided by save points, also known as slices. When the index is saved, all the data in the index is flushed to disk, and that portion of the index is marked as read-only. Saves serve two functions:

- Each save point represents a place where the index could be recovered in the case of a power failure.
- Periodically saving can ensure that the portion of the index that is actively being updated does not grow larger than RAM.

Save points have the effect of partitioning the index into independent, non-overlapping segments. When a query must cross over multiple save points, it must re-execute parts of the query and merge the results together. This ultimately makes the query take longer to complete.

By default, for installations of versions 10.5 and later, a save is performed on the Core index every time 600,000,000 sessions are added to the database. This interval is set by the index configuration parameter `save.session.count` . For more information, see Index Configuration Nodes .

Older versions of NetWitness Platform, or systems that have been upgraded from versions prior to 10.5, use a time-based save schedule that saves the index every 8 hours. You can see the current save interval by using the scheduler editor in the NetWitness Admin UI for the service. The default entry looks like this:

```
hours=8 pathname=/index msg=save
```

By adjusting the interval, you can control how often saves are created.

### Affects of Increasing the Save Interval

By increasing the save interval, save points are created less frequently, and therefore fewer save points exist. This has a positive effect on query performance, because it becomes less likely that queries traverse slices, and when slices do have to be traversed, there are not as many to traverse.

There are downsides to increasing the save interval though. First, the Concentrator is more likely to hit the `valueMax` limit set on any of the indices. Second, the recovery time in the event of a forced shutdown or power failure is increased. And third, the aggregation rate may suffer if the index slice grows too large to fit in memory.

### Affects of Decreasing the Save Interval

By decreasing the save interval, it is possible to avoid hitting the `valueMax` limits while maintaining a full value index for meta data that contains a large number of unique values. Decreasing the save interval does have a detrimental impact on query performance, since more slices are created.

## Working with `valueMax`

The `valueMax` limitation can be frustrating to customers who want to index all possible unique meta. Unfortunately that is not possible in the general case. Meta keys exist that can have arbitrary random data from anywhere on the Internet, and all unique values cannot be indexed.

However, it is possible to work around some of the limitations of `valueMax` by using key level indices instead of value indices. Key level indices are not influenced by `valueMax` .

It is possible to use the Navigate view on a meta key indexed at the key level. The database uses value level indices in the `where` clause where possible, but meta database scanning is used to resolve unique values for the `values` call. This approach works well when the `where` clause provides an effective filter to limit search scope to a small number of sessions, perhaps less than 10,000 sessions.

In cases where the `valueMax` is reached, the users can perform a database scan on their queries to ensure no relevant values were dropped. This feature is accessible in the Investigator 9.8 client via the right-click menu on the Navigation view. Although the meta database scan takes a long time, it reassures the customer that they are not missing anything in their reports.

## Parallelize Workloads

When the customer is using a lot of reports, ensure that they are making full use of the parallel executing options within Reporting Engine. Likewise, ensure that the number of `max.concurrent.queries` is appropriate for the hardware.

The NetWitness Platform Navigate view has the ability to run the components of its output in parallel, which can have a significant impact on the perceived performance of the NetWitness Core service.

# Index Rebuild

In rare cases, a Core service might benefit from an index rebuild. Examples:

- The NetWitness Core service has index slices created by a very old version of the product and has not rolled out any data in more than six months.
- The index was configured incorrectly, and the customer wants to re-index all meta with a new index configuration.
- The traffic load into the Core service was very light, and the save interval was large, causing more slices than needed to be generated.

In these cases, an index rebuild may provide performance improvements. To do so, you must send the message `reset` with the parameter `index=1` to the `/decoder` folder on a Decoder, the `/concentrator` folder on a Concentrator, or the `/archiver` folder on an Archiver.

Be aware that a full reindex takes days to complete on a fully loaded Concentrator, and possibly weeks on a full Archiver.

# Scaling Retention

There are several ways to improve the retention of the NetWitness Core database. Retention refers to the period of time that is covered by data stored in the database.

The first step in analyzing retention is to determine which part of the database is the limiting factor in terms of retention. The packet, meta, and session databases provide the `packet.oldest.file.time` , `meta.oldest.file.time` , and `session.oldest.file.time` stats in the `/database/stats` folder to show the age of the oldest file in the database. The index provides the `/index/stats/time.begin` stat to show the oldest session time stored in the index.

## Increasing Packet and Meta Retention

The primary mechanism for increasing retention on these databases is adding more storage. If adding more storage to the NetWitness Core service is not possible, then it may be necessary to use the compression options on the packet and meta database to reduce the amount of data each database writes.

If meta retention is a concern, you may want to remove unneeded content from the Decoder generating meta. Many parsers generate meta that the customer does not need to store long term.

## Increasing Index Retention

Usually the index has longer retention than the databases, but with a complex custom index the index retention may be shorter. Usually the easiest course of action is to remove unneeded value-level indices from the custom config, or perhaps override some of the default value-level indices with key-level indices.

It is also possible to scale the index by adding additional index storage. However, the index storage should be extended using solid-state drives only.

## Scaling Horizontally

Starting in version 10.3, Concentrators and Archivers have the ability to be clustered using group aggregation. Group aggregation allows a single Decoder to feed sessions to multiple Concentrators or Archivers in a load-balanced manner. Group aggregation enables the query and aggregation workload to be split among an arbitrarily large pool of hardware.

For more information, see the "Group Aggregation" topic in the *Deployment Guide* .

## Grouping Workloads

The NetWitness Core database works much better when all the users of the system are working within the same region of the database. Since the database is fed data from the Decoder with a first-in-first-out scheme, data in the database typically is clustered together according to the time it was captured and stored. Therefore, the database works better when all users are working on the same time period of data.

It is not always possible for all users to be working on the same time period simultaneously. The NetWitness Core database can handle that use case, but it is slow to do so because it must alternate between having different periods of time in RAM. It is not possible to have all of the time periods in RAM at the same time. Typically less than 1 percent of the database and less than 10 percent of the index fits in RAM.

To make NetWitness Platform work for the customer, it is important to get the customer to organize their users into groups that tend to work on the same time ranges. For example, users who do daily monitoring over the most recent data may be one user group. Perhaps there is another user group that does queries further back in time as part of an investigation. And perhaps another set of users do reports over large periods of time. Attempting to serve all the groups from a single database can lead to frustration and long wait times for results to be produced. However, if the different use cases can be spread to different Concentrator hardware, the perceived performance can be much better. In this case, it may be beneficial to utilize more Concentrator services with less RAM and CPU power rather than a single large and expensive Concentrator intended to meet all needs.

## Cache Window

Consider this sequence of events:

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:02 a.m. to 9:02 a.m.

Notice that even though both users were looking at time ranges that were close together, the work done by the Concentrator to produce reports for Kevin could not be re-sent to Scott, since the time ranges are slightly different. The Concentrator had to re-calculate most of the reports for Scott.

The setting `cache.window.minutes` on the `/sdk` node allows you to optimize this situation. When a user logs in, the point in time representing the most recent data for the collection only moves forward in increments of the the number of minutes in this setting.

For example, assume the `/sdk/config/cache.window.minutes` is 10\. Re-evaluating the above action changes the sequence of events.

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
5. At 9:10 a.m., user "scott" re-loads the reports for the last one hour of collection time.
6. The Concentrator retrieves reports for the time range 8:10 a.m. to 9:10 a.m.

The report returned in step 3 falls in the cache window, so it is returned instantaneously. This gives Scott the impression that the Concentrator is very fast.

Thus, larger `cache.window` settings improve perceived performance, at the cost of introducing small delays until the latest data is available to search.

## Time Limits

When a query is running on the NetWitness Core database for a very long time, the Core service dedicates more and more CPU time and RAM to that query in order to get it to complete faster. This can have a detrimental impact on other queries and aggregation. In order to prevent lower privileged users from using more than their share of the Core service resources, it is a good idea to put time limits on the queries run by normal users.

## Query Priority

Some calls in `/sdk` support a `queryPriority` parameter. This parameter is used when the query execution pool is full and other queries are waiting to be executed. Those waiting queries are executed as resources become available and in the order of their priority. The `queryPriority` parameter uses the same scale as the Linux `nice` command. When the `queryPriority` parameter is passed to a query on a downstream device (ie. Broker, Concentrator), it is passed along with other parameters to the upstream devices (ie. Decoder, Log Decoder).

If this parameter is not passed, the calls will default to the current user's `query.priority` setting. See Per-User Configuration Nodes .

This parameter can be used on the following calls: `language` , `msearch` , `packets` , `query` , `timeline` and `values` .

All queries and rule conditions in RSA NetWitness Core services must follow these guidelines:

**All string literals, value aliases, and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.**

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

The space on the right and the left of an operator is optional. For example, you can use `service=80` or `service = 80`.

# Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness Platform, see **WHERE Clauses** in the Queries .

| Rule Name | Condition |
|---|---|
| ComplianceDevices | `device.group='PCI Devices' \|\| device.group='HIPPA Devices'` |
| HighValueWindows | `device.group='Windows Compliance'` |
| MediumValueWindows | `device.type='winevent_nic' && msg.id='security_4624_security'` |
| LowValueWinLogs | `device.type='winevent_nic' && msg.id='security_4648_security'` |
| LowValueProxyLogs | `device.class='proxy' && msg.id='antivirus_license_expired'` |
| GeneralWindows | `device.type='winevent_nic'` |

## Correcting invalid rules

Since version 11.0, NetWitness Platform has been using a parser for rules and queries that strictly defines valid syntax. When a Core service encounters invalid syntax, it writes a warning in the NetWitness Platform logs indicating the error.

NetWitness Platform 11.0 and later do not support parsing of legacy syntax rules (as Security Analytics 10.6 did).

After you update to NetWitness Platform 11.0 (or later), rules with invalid syntax are highlighted in the user interface. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See "Fix Rules with Invalid Syntax" in the *Decoder and Log Decoder Configuration Guide* .

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, introduced in 10.6, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness Platform generates a Health and Wellness alert to indicate that you need to fix the rules.

## Valid Syntax with the Modern Parser

- All text types must quote literal values. Example: `username = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it (using a backslash) or use a different starting quote character. Both of the following examples are valid: `username = "User's"`, `username = 'User\'s'`

The following are valid syntax rules using the modern parser:

- To use a backslash in a literal string, escape it using an extra backslash: `\\`
- All time types should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time types that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- **Everything** else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

# Appendix A: Statistics

This topic describes statistics used to monitor system operation. The Core services provide a very large number of statistics for monitoring the operation of the system. Some of them are useful for monitoring performance, while some of them exist for monitoring the operation of the system or for debugging purposes.

## Statistics in /database/stats

The following table shows the meaning of the statistics in **/database/stats** .

| Statistic | Meaning |
|---|---|
| `meta.bytes` , `packet.bytes` , `session.bytes` | The total size of data (in bytes) stored in each database |
| `meta.first.id` , `packet.first.id` , `session.first.id` | The first meta ID, packet ID, and session ID, respectively, stored in the database |
| `meta.last.id` , `packet.last.id` , `session.last.id` | The last meta ID, packet ID, and session ID, respectively, stored in the database |
| `meta.oldest.file.time` , `packet.oldest.file.time` , `session.oldest.file.time` | The creation date of the oldest file in each database |
| `meta.rate` , `packet.rate` , `session.rate` | The count of the number of meta, packet, and session objects added to each database over the last second |
| `meta.total` , `packet.total` , `session.total` | The total number of meta, packet, and session objects within each database |
| `meta.volume.bytes` , `packet.volume.bytes` , `session.volume.bytes` | The approximate total volume size (in bytes) for all directories used by each database |
| `meta.free.space` , `packet.free.space` , `session.free.space` | The approximate total unused space (in bytes) across all directories used by each database |

## Statistics in /index/stats

The following table shows the meaning of the statistics in **/index/stats** .

| Statistic | Meaning |
|---|---|
| `checkpoint.page` , `checkpoint.summary` | The last objects stored the last time an index save was created (debugging) |

| Statistic | Meaning |
|---|---|
| index.bytes | An approximate measure of how much disk space is required by index files |
| index.last.load.time | The timestamp when the current index configuration was loaded from the index configuration files |
| memory.used | An approximate measure of how much memory is occupied by the index |
| page.first.id, summary.first.id | The first page and summary object stored in the index (debugging) |
| page.last.id, summary.last.id | The last page and summary object stored in the index (debugging) |
| page.total, summary.total | Number of pages and summaries in the index (debugging) |
| session.first.id | The ID of the first session indexed |
| session.last.id | The ID of the last session indexed |
| sessions.since.save | The number of sessions currently held by the current index slice |
| values.added | The number of unique values added to the current index slice |
| slices.total | The number of slices in the index |
| time.begin | The oldest time meta indexed |
| time.end | The most recent time meta indexed |
| updater.state | The status of background reindexer |

## Statistics in /sdk/stats

The following table shows the meaning of the statistics in **/sdk/stats**

| Statistic | Meaning |
|---|---|
| cache.window.time.begin | The beginning of the current time enforced by cache.window.minutes |
| cache.window.time.end | The end of the current time enforced by cache.window.minutes |
| queries.active | The number of queries currently executing in the index |
| queries.queued | The number of queries waiting for execution |
| values.calls | The number of calls made to the "values" function since the process was started |

| Statistic | Meaning |
|---|---|
| values.calls.cached | The number of calls made to the "values" function that were resolved by the values call result cache |

## Per-query Statistics

SDK operations, such as query and values, provide information about their execution status in /sdk/config/stats/queries/<handleid> , where <handleid> is a unique identifier for the query operation.

The following table shows the meaning of per-query statistics.

| Statistic | Meaning |
|---|---|
| channel.path | This stat provides a link to the connection channel over which the operation is communicating. This channel is used to communicate results back to the client. |
| query.type | The type of operation being performed, such as queries or values |
| query | The complete set of parameters given to the query |
| query.progress | The percentage of the query execution that has completed |
| query.status | A message describing what stage of the query execution is currently occurring |
| running.since | The time at which the query began execution |
| user | The user name that executed the query |

# Appendix B: Index Inspect

The NetWitness Core database index has a built-in debugging feature called `inspect` that provides detailed information about the composition of its indexes. The index inspect feature is located at `/index/inspect` in every Core service configuration tree. Services that do not actually have an index, like Broker, do not have the `/index/inspect` feature.

## Parameters

**Options**

Type: String This parameter may be set to the value `all-slices` to collect inspect information about every slice in the index. If it is not set, information on the current, most recently created slice is returned.

Collecting information on all slices may take a very long time to complete if there are many index slices.

## Response

Inspect returns many rows of key value pairs that represent the state of the index.

### Slice Summary

The first row returned for every slice is a summary with the following values.

| | |
|---|---|
| `session1` | The first session ID indexed in the slice |
| `session2` | The last session ID indexed in the slice |
| `meta1` | The first meta ID in the first session indexed in the slice |
| `meta2` | The last meta ID in the last session indexed in the slice |

### Per-Index Summary

There will be per-index summary rows returned for each index. Only value-level indexes are reported.

| | |
|---|---|
| `key` | The meta key name for the index |
| `pathname` | The path on disk to this index |
| `values` | The number of unique values stored in this index |
| `summaries` | The number of summary entries occupied by this index in the summary.db file |
| `pages` | The number of page entries occupied by this index in the page.db file |
| `sessions` | The number of sessions that had a value that was inserted into this index |
| `size` | The cumulative "size" meta values for all sessions that inserted a value into this index |

| | |
|---|---|
| packets | The cumulative count of packets for all sessions that inserted a value into this index |
| summary1 | The first summary ID used by this index |
| summary2 | The last summary ID used by this index |
| session1 | The first session ID referenced by this index |
| session2 | The last session ID referenced by this index |

## Slice Summary Footer

The last row in each inspect report contains cumulative statistics for all the indexes in the slice.

| | |
|---|---|
| totalKeys | The number of indexed meta types |
| totalValues | The number of unique values tracked by all indices in this slice |
| totalMemory | An approximate total of the memory needed to open this index slice |

# Decoder and Log Decoder Quick Setup

A basic NetWitness network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Network Decoder or Log Decoder. The basic network may include both types of Decoders. Network Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

Adding a Decoder makes it visible and available for use with NetWitness Administration, Live Services, and Investigate. To add a service in NetWitness, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:

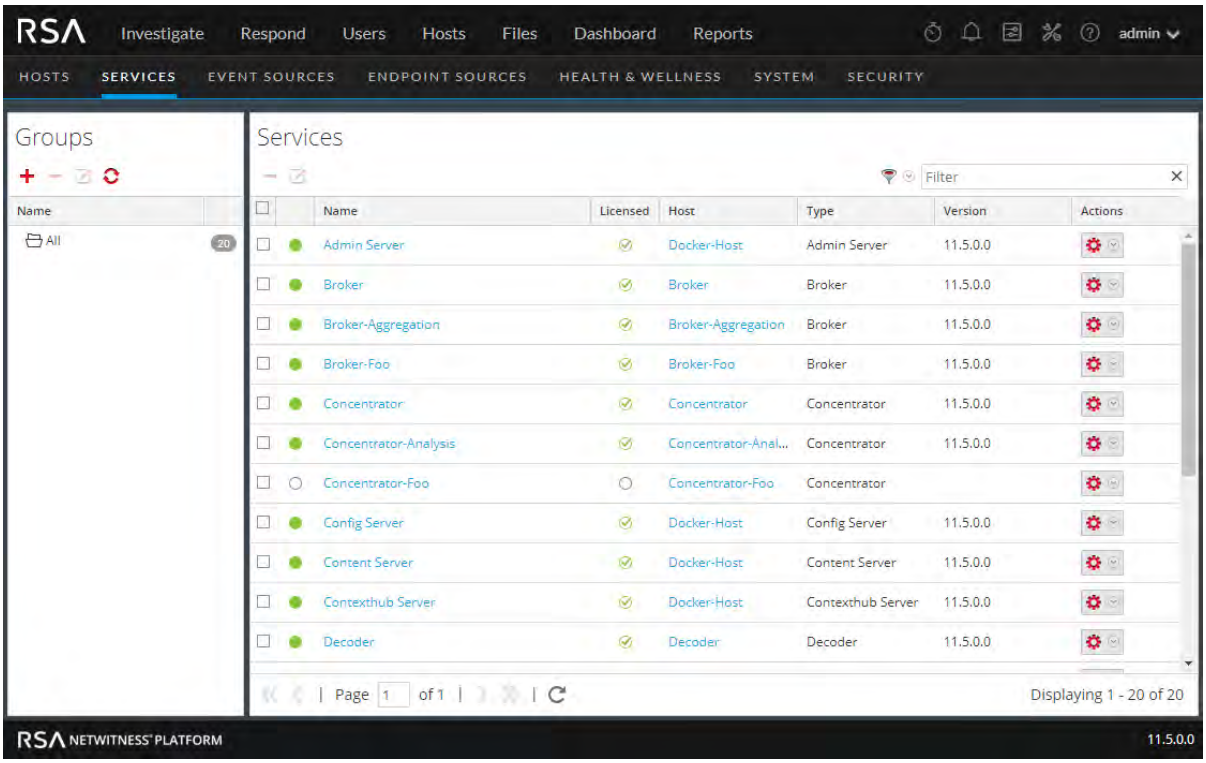
1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

**Note:** A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

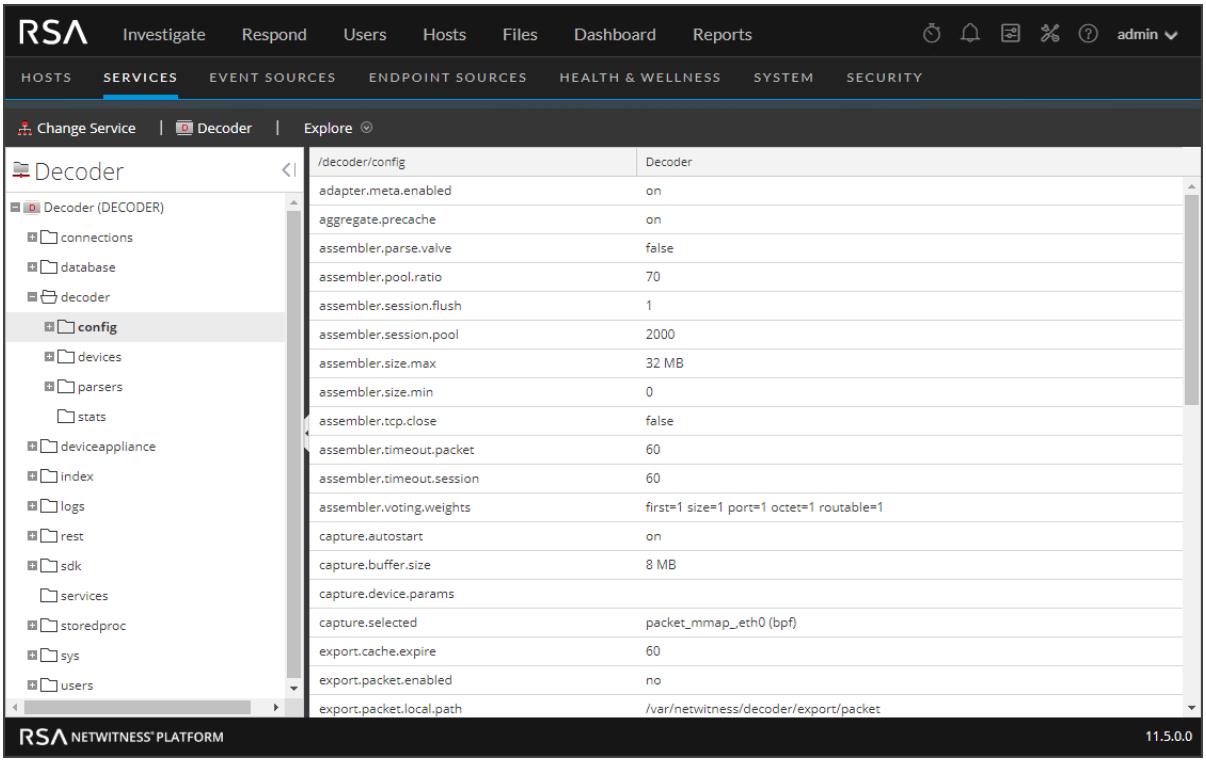
Basic configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness user interface. For the most part, configuration is performed in the Administration Services view ( (Admin) > Services).



Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



## Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and **> View > System**. In the toolbar click .

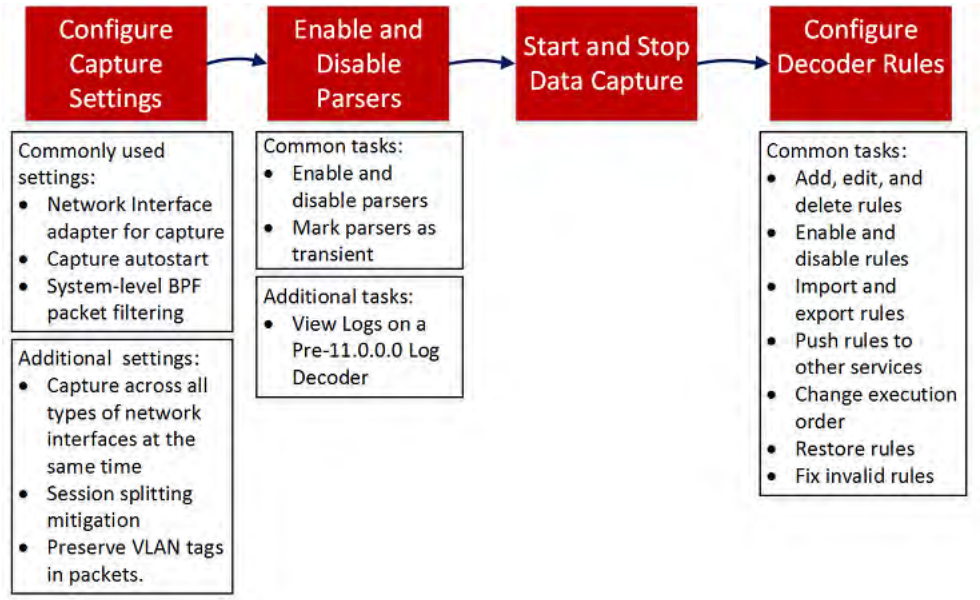
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder Configure Common Settings on a Decoder and Decoder and Log Decoder Additional Procedures

# Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

**Note:** A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.



| Configuration Step | Description |
|---|---|
| Configure Capture Settings | When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart. |
| Enable and Disable Parsers and Log Parsers | View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled. |
| Start and Stop Data Capture | When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually. |

| Configuration Step | Description |
| --- | --- |
| Configure Decoder Rules | Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out.<br><br>By default, no capture rules are defined when you first configure NetWitness. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax). |

# Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.

Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

## Select a Network Adapter

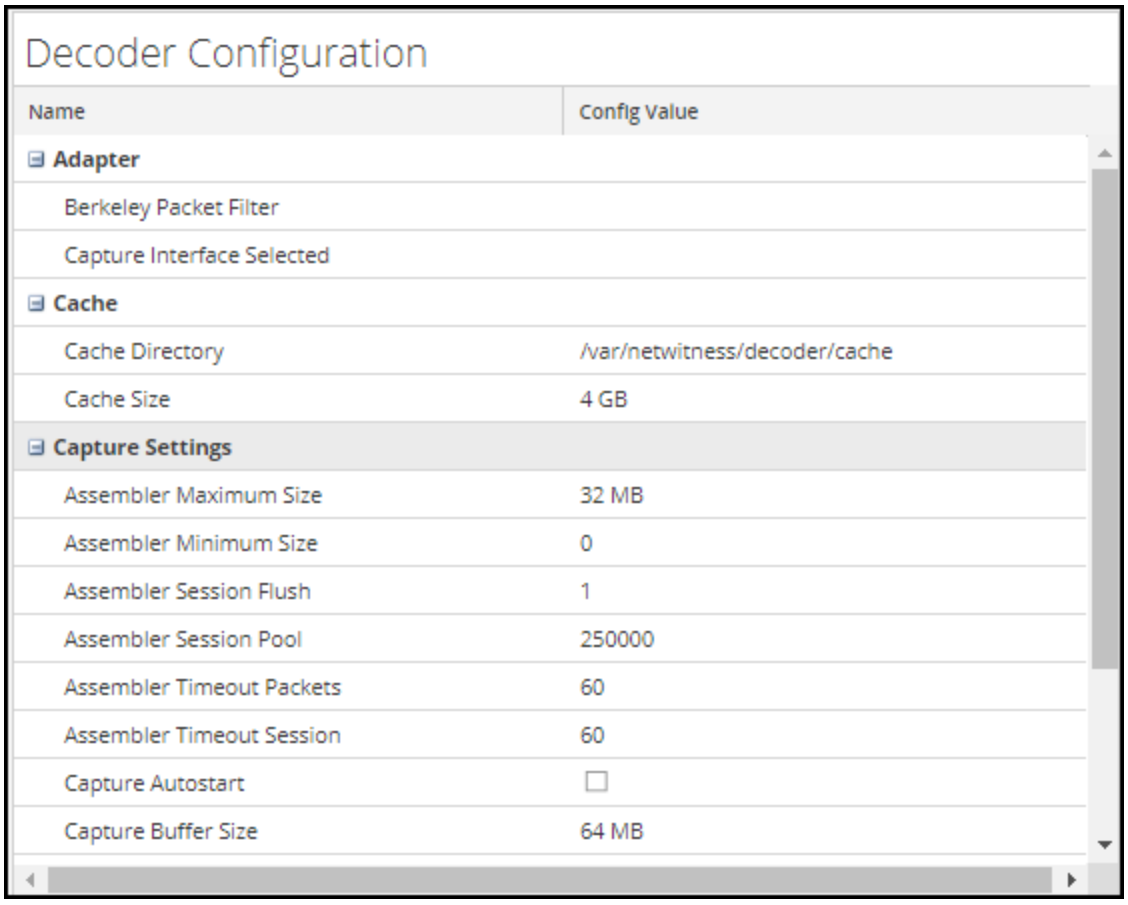
The table below describes the Network Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

| Adapter Parameter | Description |
|---|---|
| **Berkeley Packet Filter** | Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets). |

| Adapter Parameter | Description |
|---|---|
| **Capture Interface Selected** | Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports:<br>• `packet_mmap_,1,lo (bpf)`<br>• `packet_mmap_,2,eth2 (bpf)`<br>• `packet_mmap_,3,eth3 (bpf)`<br>• `packet_mmap_,4,eth4 (bpf)`<br>• `packet_mmap_,5,eth5 (bpf)`<br>• `packet_mmap_,8,ALL (bpf)`<br>There are three wireless capture services available:<br>• `packet_netmon_ (Microsoft Netmon)`<br>• `packet_mac80211_ (Linux mac80211)`<br>• `packet_airport_ (Mac OS X AirPort)` |
| **Capture Interface Selected for Log Decoder** | The following capture service is available:<br>• `log_events,Log Events` |

### To configure the network adapter on a Decoder:

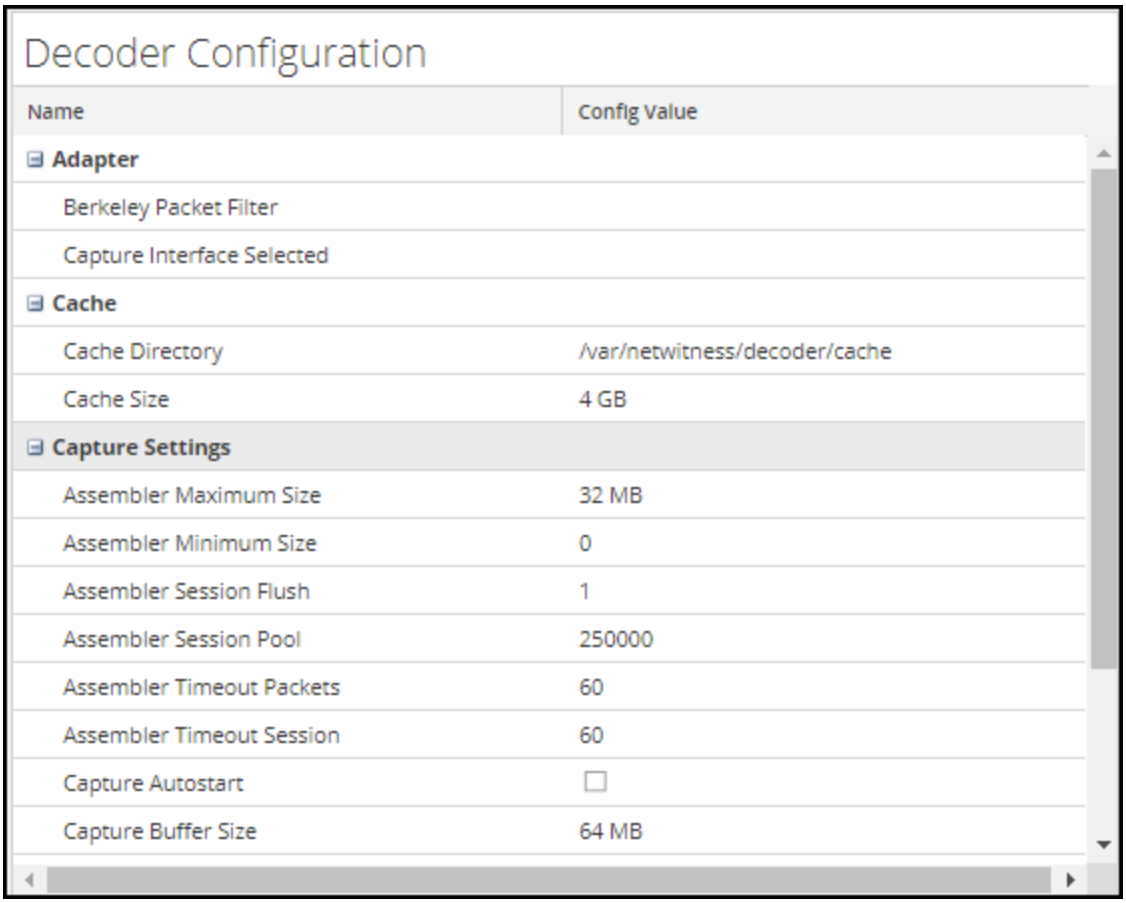
1. Go to (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.



3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

## Configure a Decoder to Begin Capturing Data Automatically

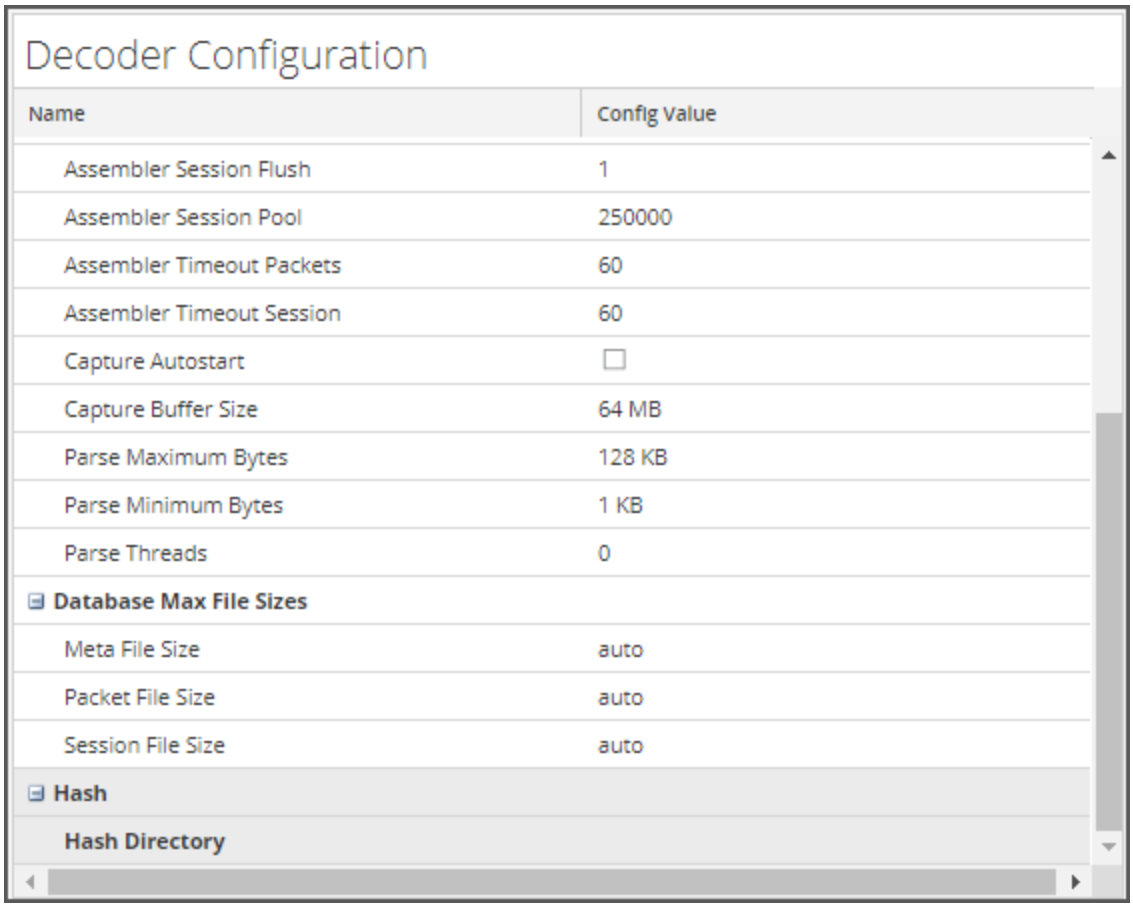
1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select the Decoder and > **View** > **Config.**
   The Services Config view is displayed with the General tab open.



3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

## Configure Optional Capture Settings

1. Go to (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config**.
   The Services Config view is displayed with the General tab open.



3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

## (Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available(`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```

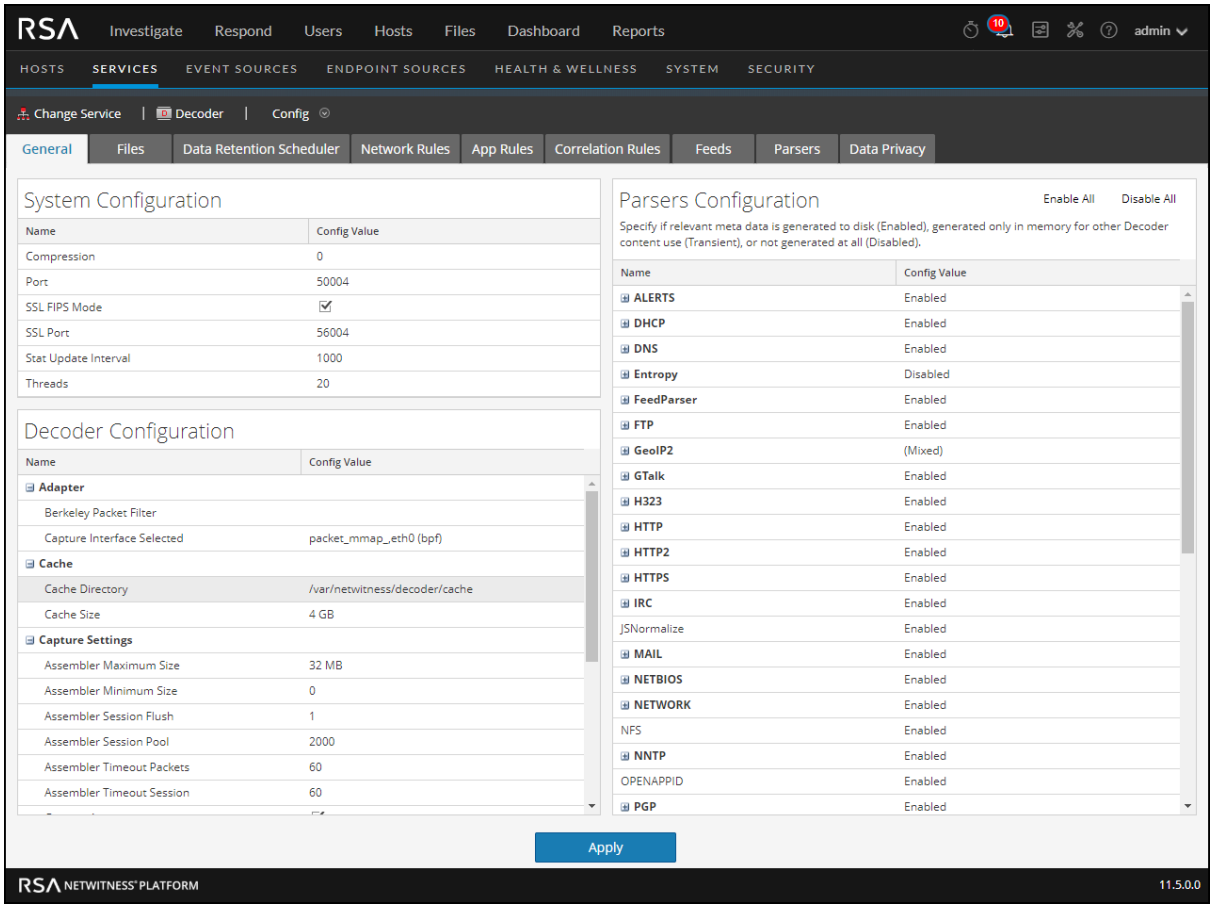
For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

### To add a system-level Berkeley Packet Filter:

1. Go to (Admin) **> Services.**

2. In the Administration Services view, select a Decoder service and **> View > Config.**
   The Services Config view is displayed with the General tab open.



3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.
4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800 2020-May-01 19:03:08 warning Decoder Failed to parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

## Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  `not (net 10.21.0.0/16)`
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  `not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  `not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Combine both IP and HOST:
  `not (host 192.168.1.10) and not (host api.wxbug.net)`
- Drop all port 53 traffic, both TCP & UDP:
  `not (port 53)`
- Drop only UDP port 53 traffic:
  `not (udp port 53)`
- Drop all IP protocol 50 (IPSEC) traffic:
  `not (ip proto 50)`
- Drop all traffic on TCP ports 133 through 135.
  `not (tcp portrange 133-135)`

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  **`not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`**
- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  **`not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`**

**Caution:** The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness software.

## Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

### Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `alias.ip` becomes `host` if a single host or `net` if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used: http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters: http://biot.com/capstats/bpf.html

**Caution:** If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

## (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

You can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.

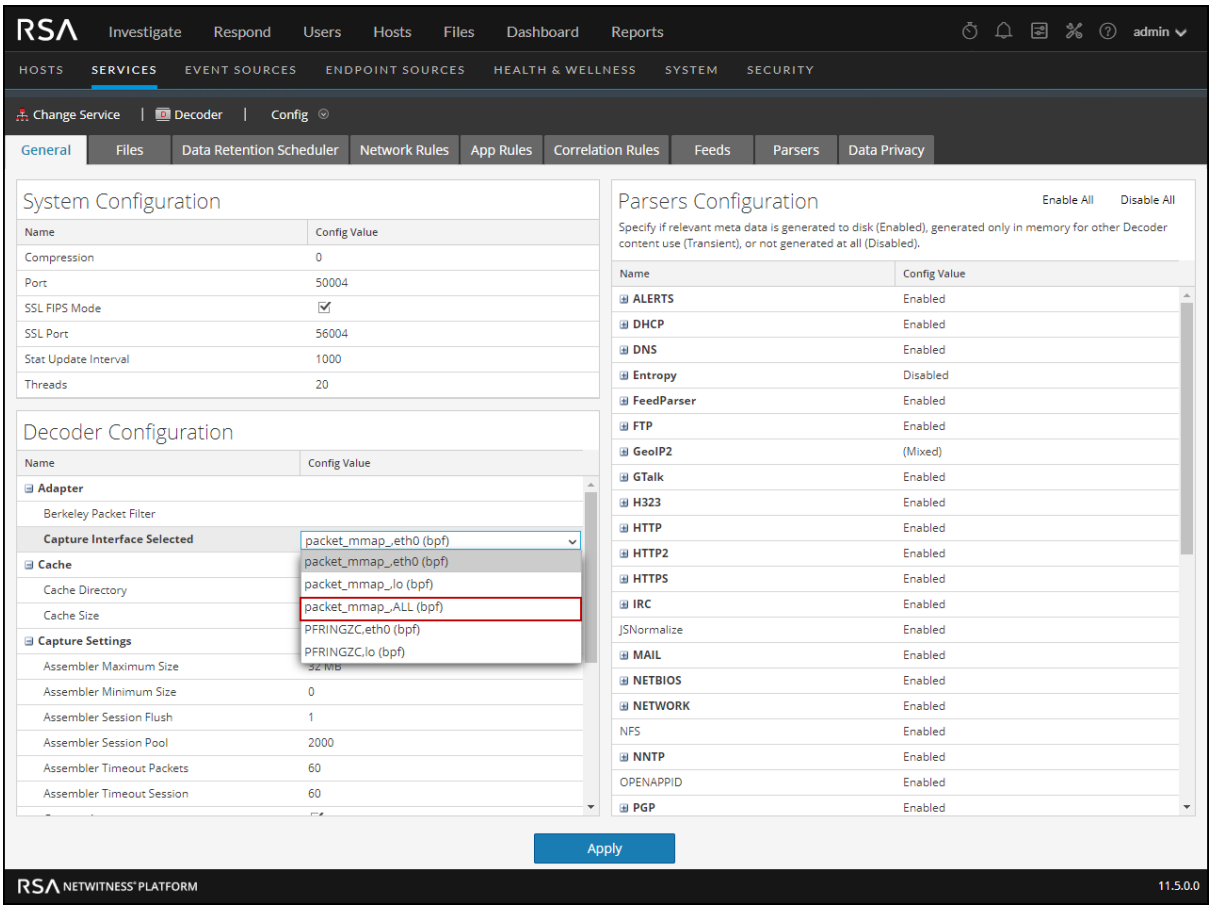
For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

**Note:** Decoder automatically performs decapsulation of Virtual Extensible LAN (VXLAN) protocol from network traffic on UDP-4789 so that parsing can take place on the decapsulated Ethernet frames. During the decapsulation, the VXLAN ID is extracted and stored in the VXLAN meta key. By default, the VXLAN ID extraction is enabled. To disable, navigate to the `VlanGre` parser in the Parser Configuration settings. Click the drop-down list for `vlan` in the **Config Value** column and select **Disabled**. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

**Note:** Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.

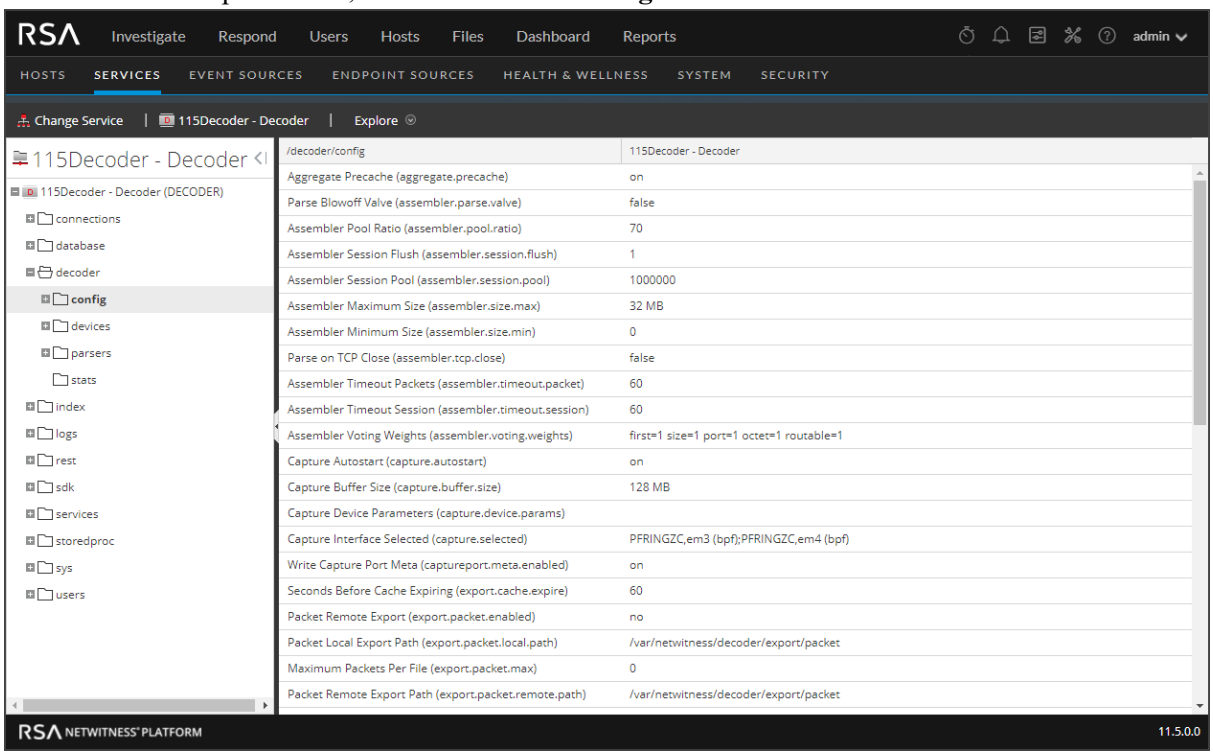
### To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. Go to (Admin) > **Services**, select the Decoder service and > **View > Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.

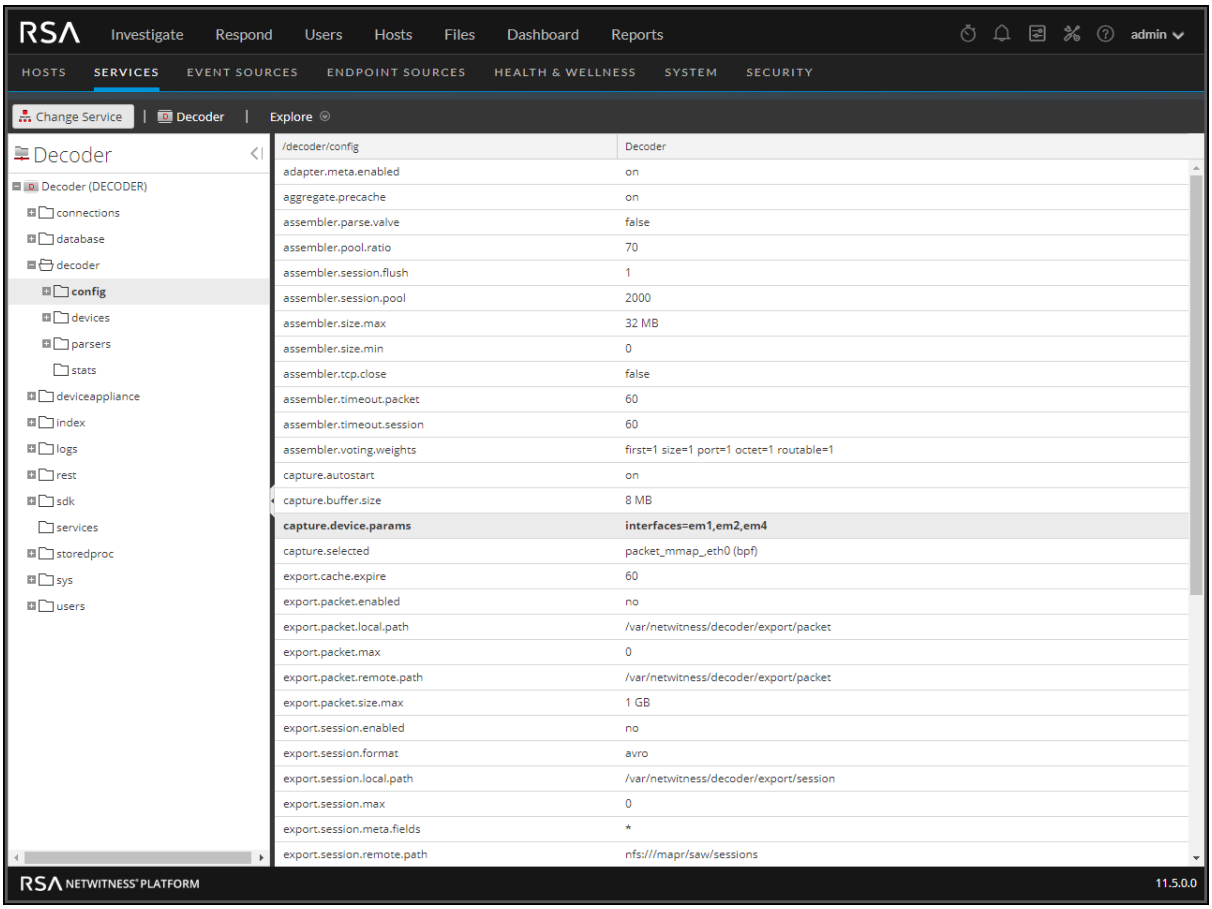


3. Click **Apply**, and then restart the Decoder service.

4. Go to (Admin) > **Services**, select the Decoder service, and click > **Config** > **Explore**.
5. In the Services Explore view, select **decoder** > **config**.



6. Click in the values column next to `capture.device.params`, type **`interfaces=em1,em2,em4`**, and press **Enter**.



The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

## (Optional) Configure Meta-Only Decoders

You can configure Decoders so that packets and logs can be processed, and then dropped before they are written to disk. This is called a Meta-Only Decoder, which uses the Meta-Only license, and can save storage space (however, analysts cannot reconstruct events in Investigate if you use this option). The configuration option `/decoder/config/packet.write.disabled` controls this feature. If this option is set to `true`, all packets are dropped after parsing, so they are never written to the database. This applies to both Log and Network Decoders. The ingested logs and packets flow through the system normally so that parsing and other operations are not impacted. The default setting is `false`, which preserves the normal behavior of writing packets to disk.

**Note:** You must purchase the Meta-Only license before you can realize the full benefit of using this option. For information about purchasing licenses, see the *Licensing Management Guide for RSA NetWitness Platform*. Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.

To configure a Meta-Only Decoder where packets and logs are parsed and not written to disk:

1. Go to (Admin) > **Services** and select a Decoder.
2. Click > **View** > **Explore**, and in the left panel, expand **decoder** and click **config**.

3. In the right pane, go to `packet.write.disabled`, and change the value from `false` to `true`.

**Note:** You can make this configuration update while capture is running, but the update does not take affect until capture is restarted.

For an example of how to use the Meta-Only license to apply centrally-managed capture policies across your Network Decoders, see (Optional) Configure Selective Network Data Collection

## (Optional) Configure Selective Network Data Collection

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. Administrators can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.

**Note:** Administrators can use this feature to create policies for metadata-only while using the cost-effective Meta-Only license, without having to pay for additional storage or throughput licensing. To use this license, work with your RSA Customer Support Representative to purchase the license, and then enable the functionality as described in (Optional) Configure Meta-Only Decoders.

The administrator can choose to deploy predefined policies that capture:

- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols are available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally-managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

Here are some example use cases and how an administrator would deploy these.

### Use Case 1: Predefined Policy for Internal Assets

To gain further visibility into internal lateral traffic going East-West through the environment, a Network Decoder is deployed in the interior of the network to capture this traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, the predefined "Capture Meta Only – All Protocols" policy can be applied to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required of the solution. In this situation, the only steps you must complete is to choose the predefined policy, edit it, and then enable it by assigning it to the appropriate internal services (Decoders). For an example of how to set up this policy, see Use Predefined Policies.

### Use Case 2: Custom Policy for DMZ Assets

To protect the public-facing web servers, a Network Decoder is deployed into the demilitarized zone (DMZ). The network communications between these web servers and other network devices are a subset of the base protocols. To make sure you can harvest forensic evidence for any communications related to these high-value assets, you would want to do full packet capture on HTTP, SMTP, FTP, and DNS protocols. You still want visibility into any other traffic these servers are engaged in, so you would prefer metadata generated for all other protocols. The suggested steps to create this custom policy would have you choose the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols" and then clone it to adjust it to the protocols aligned with the DMZ scenario. During the clone process, the name and description can be updated to identify the new purpose of the policy. The define policy step allows all the base protocol rules inside the policy except HTTP, SMTP, FTP, and DNS to be altered from "Collect All" to "Collect Meta Only" to achieve the desired policy. The last steps are assigning the policy to the appropriate DMZ services (Decoders). For an example of how to set up this policy, see Create New Policies from Predefined Ones.

**Note:** When a Decoder is being managed by a selective collection policy, it is possible that the Decoder specifications in the policy could be overwritten if the Decoder configuration is edited outside of the policy. To try and avoid this situation, the following warning message is displayed at the top of the Parsers section of the Decoder Configuration page: `This Decoder is being managed by the following capture policy: <policy-name>. Some parsers are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`
Another warning message is displayed at the top of the Application Rule section: `This Decoder is being managed by the following capture policy: <policy-name>. Some application rules are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`

The following sections describe configuring and using selective network data collection.

- Use Predefined Policies
- Create New Policies from Predefined Ones
- Create Custom Policies
- Unpublish Policies
- Delete Policies
- Supported Protocols for Selective Network Data Collection

For detailed information about the Selective Collection user interface, see:

- Services Config View - Capture Policies Tab
- Services Config View - Edit Capture Policies Wizard

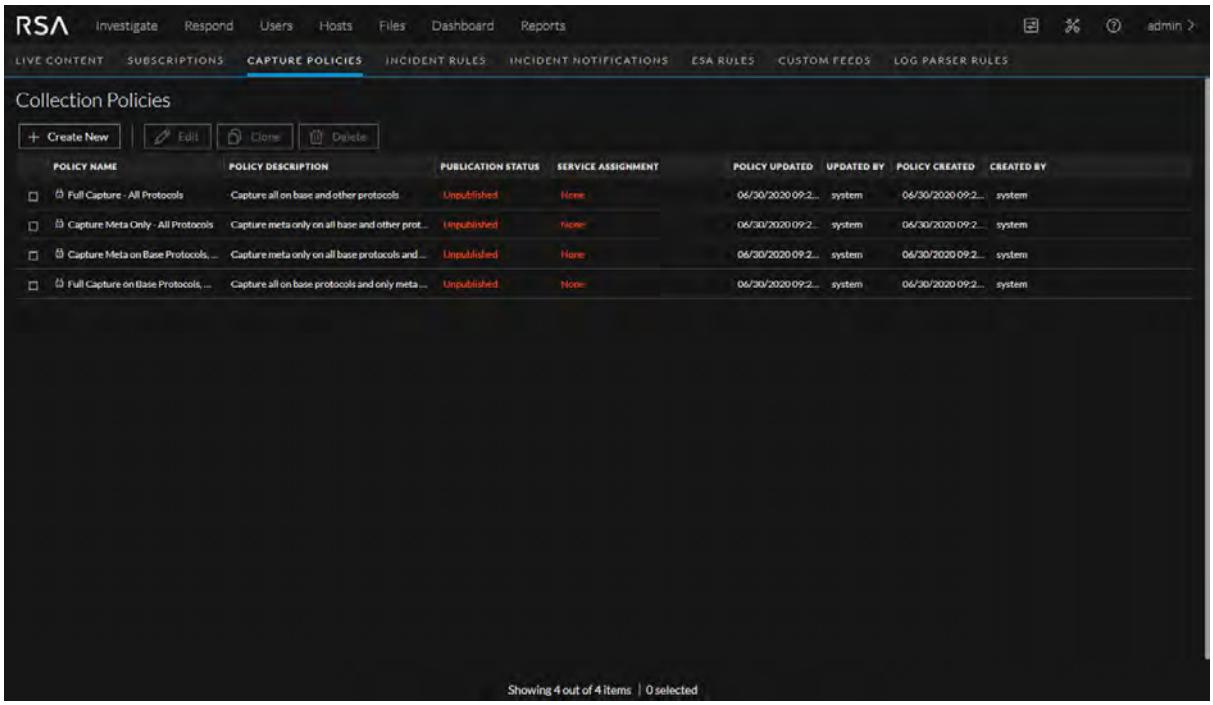
## Use Predefined Policies

This procedure describes how to use the predefined policies. You can use this procedure to configure a policy for internal assets. For example, as described in Use Case 1: Predefined Policy for Internal Assets , to gain further visibility into internal lateral traffic going East-West through the environment, you could deploy a Network Decoder in the interior of your network to capture the traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, use the predefined "Capture Meta Only – All Protocols" policy to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required for this solution.

In this situation, the only steps you must complete is to select the "Capture Meta Only – All Protocols" predefined policy to edit it, enable it by assigning it to the appropriate Decoders, and then publish the policy to start collecting the data.

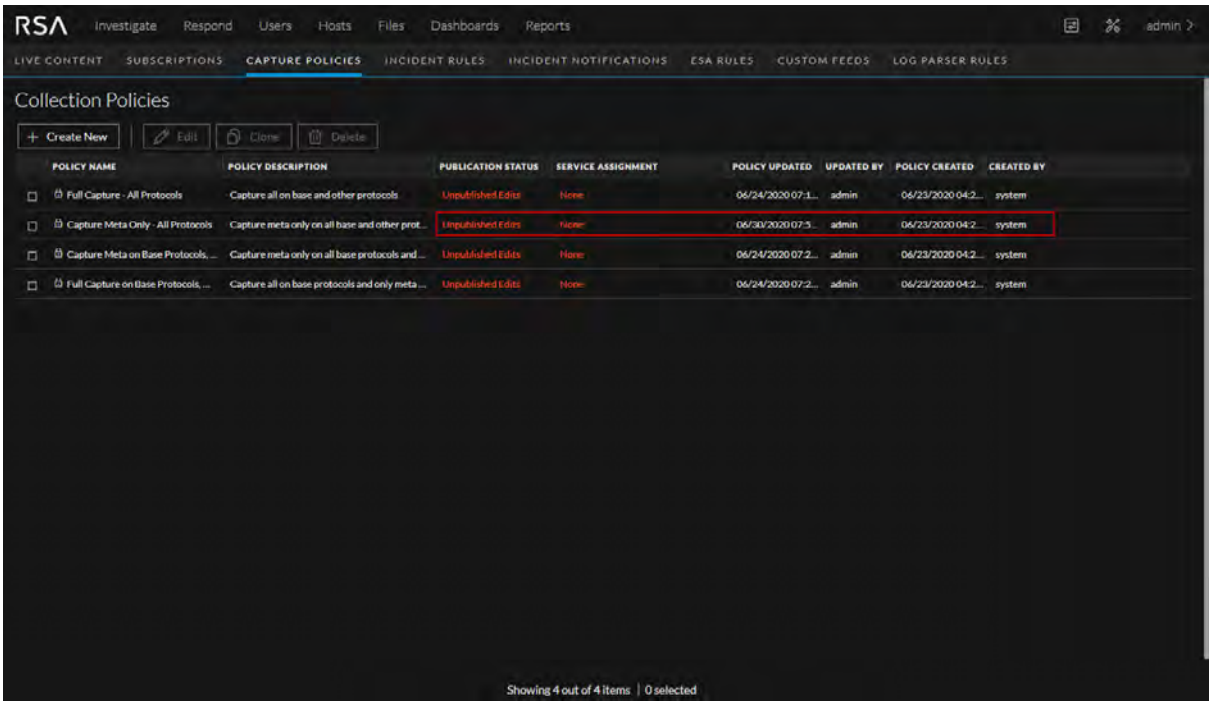
To work with a predefined policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

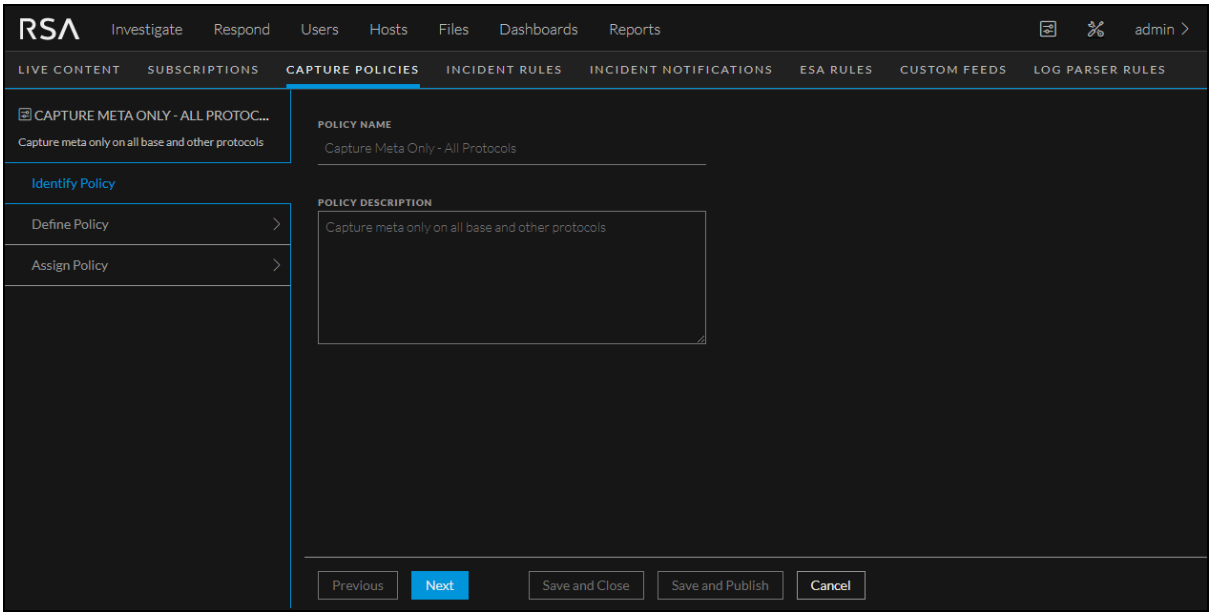


Notice that the PUBLICATION STATUS column lists each of the predefined policies with the status of **Unpublished**. The only way to edit a predefined policy is to assign Decoders to apply the policy. If changes are made to the Decoder assignments but are not published, the status changes to **Unpublished Edits**, the date the change was made is displayed in the POLICY UPDATED column, and the user name of the person who made the change is displayed in the UPDATED BY column. In predefined policies, the CREATED BY field is always **system**.

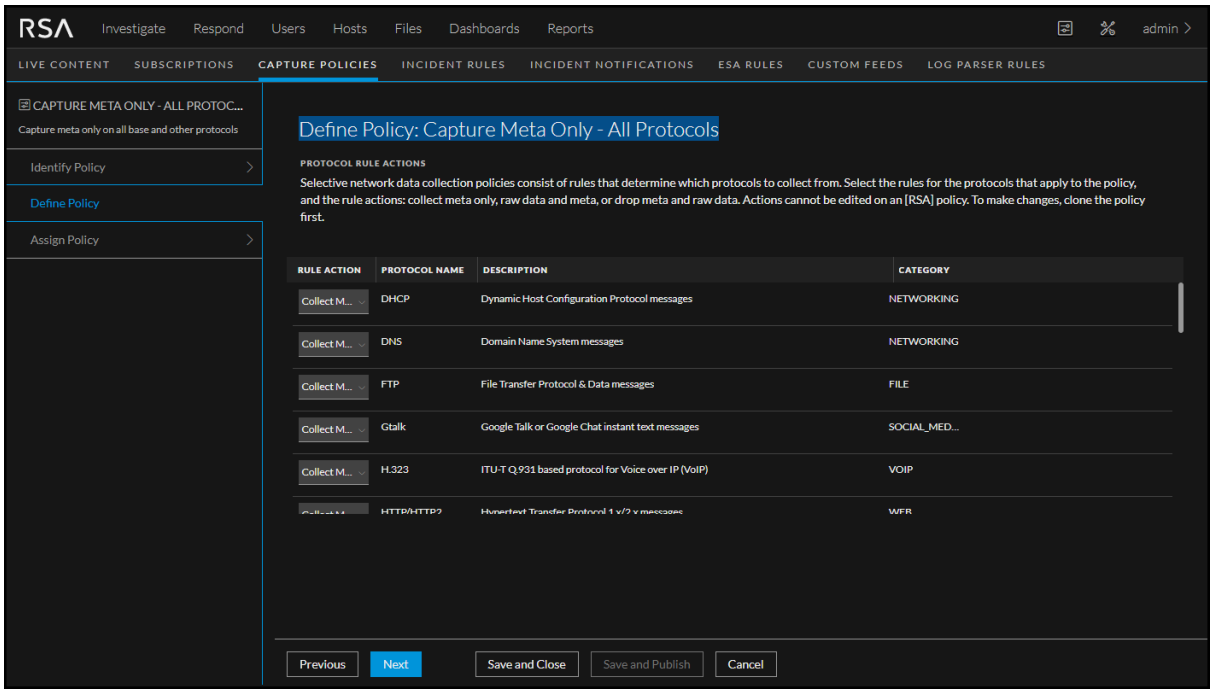
The following figure shows the statuses of the policies.



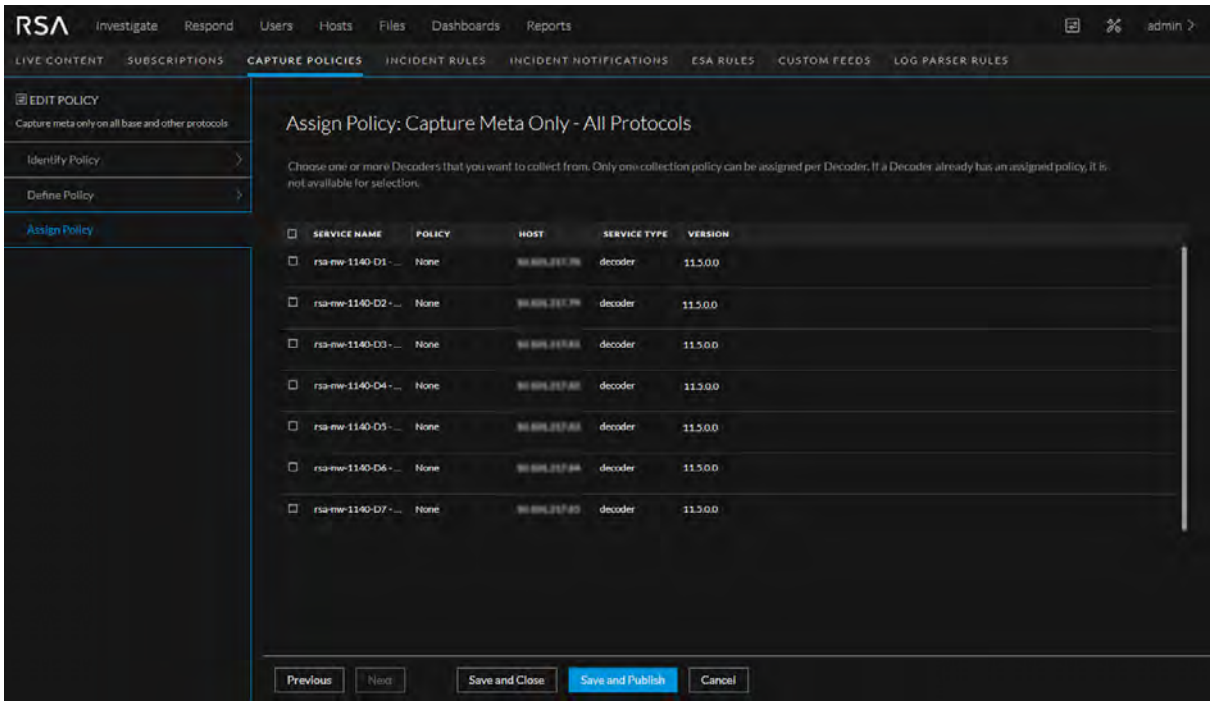
2. Select **Capture Meta Only - All Protocols**, and then click **Edit**.
   The editing view is displayed with the **Identify Policy** option active.



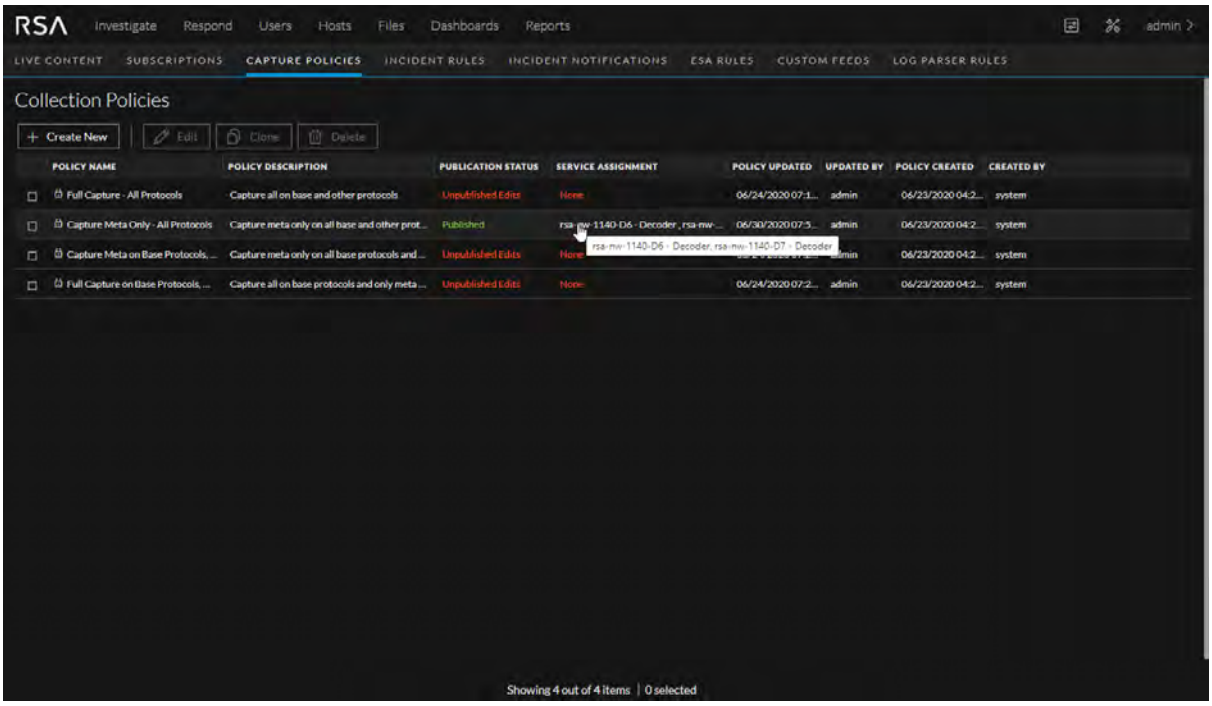
3. Because this is a predefined policy, you cannot change the policy name or description. Click **Next**.
   The Define Policy: Capture Meta Only - All Protocols page is displayed.



4. Because this is a predefined policy, you cannot edit this page. Review the rules on this page to understand the actions that will be enabled when you publish this policy. Click **Next**.
   The Assign Policy page is displayed.



5. Select the Decoders that you want to collect from, and then click **Save and Publish**.
   The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available. When the status moves to **Published**, all the services are displayed in the Service Assignment column. You can hover over the names of the Decoders to see their full names, as shown in the following figure.



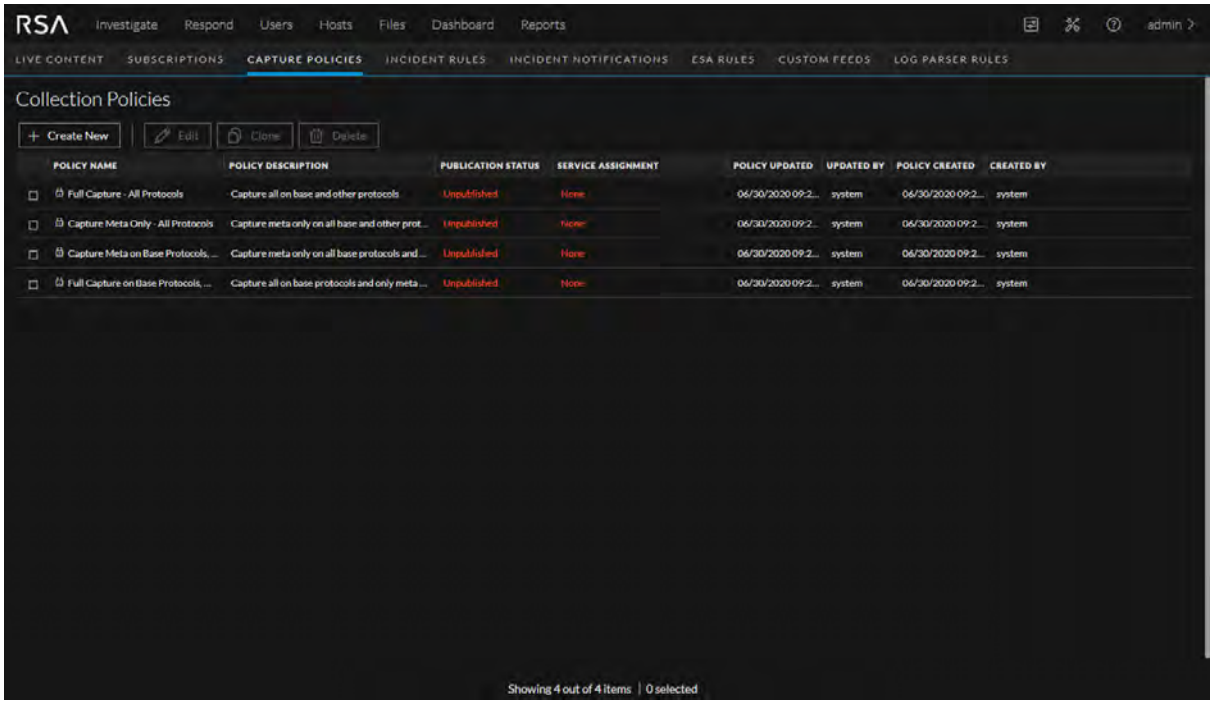
## Create New Policies from Predefined Ones

This procedure describes the steps for creating a new policy from a predefined one, and provides an example of how you might use this policy.

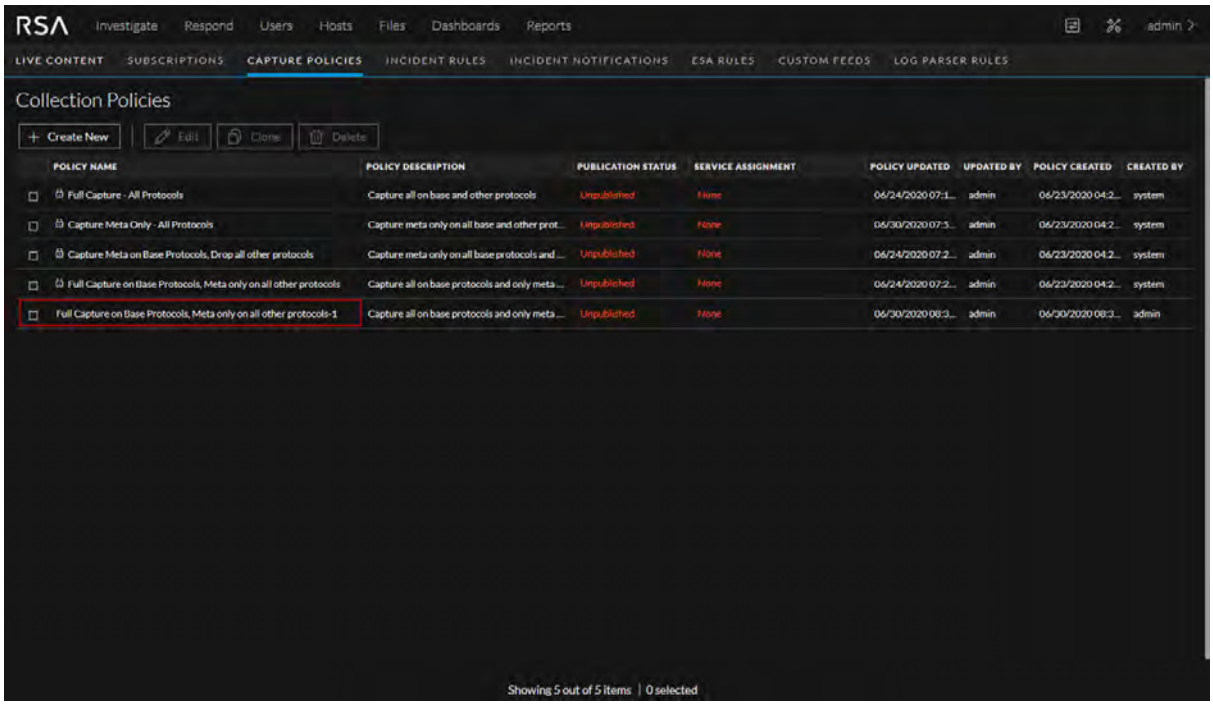
For example, as described in Use Case 2: Custom Policy for DMZ Assets , suppose a Network Decoder has been deployed into the demilitarized zone (DMZ) to protect public-facing web servers. The network communications between these web servers and other network devices are a subset of the base protocols. To make sure they can harvest forensic evidence for any communications related to these high value assets, you would want to get full packet capture on HTTP, SMTP, FTP, and DNS protocols. To provide visibility into any other traffic these servers are engaged in, you would want to generate metadata for all other protocols.

To configure a policy that would achieve the results described here, you would select the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols," clone it, and then edit it to align the protocols with the DMZ scenario. During the clone process, you can update the name and description to identify the new purpose of the policy. In the step where you define the policy, you can change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from "Collect All" to "Collect Meta Only" to achieve the desired results. The last steps assign the policy to the appropriate DMZ Decoders.

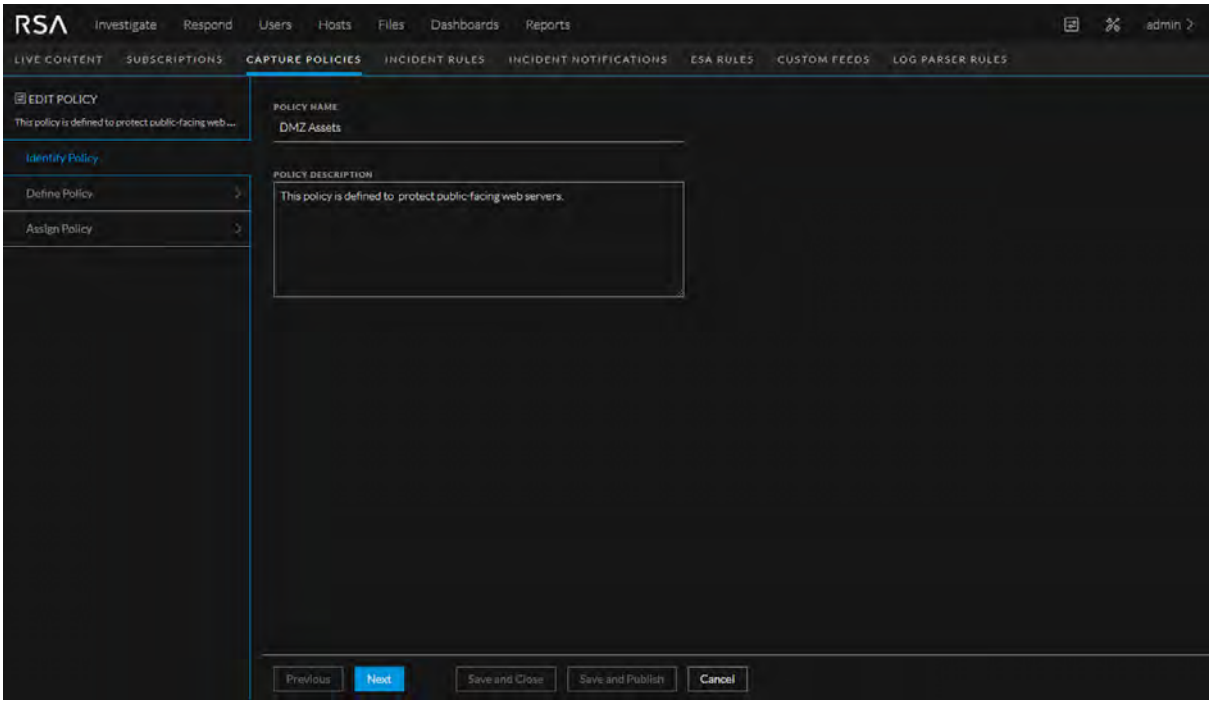
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select **Full Capture on Base Protocols, Meta only on all other protocols** and then click **Clone**. The Collection Policies view is displayed with the cloned policy at the bottom of the list, identified by appending -1 to the policy name.

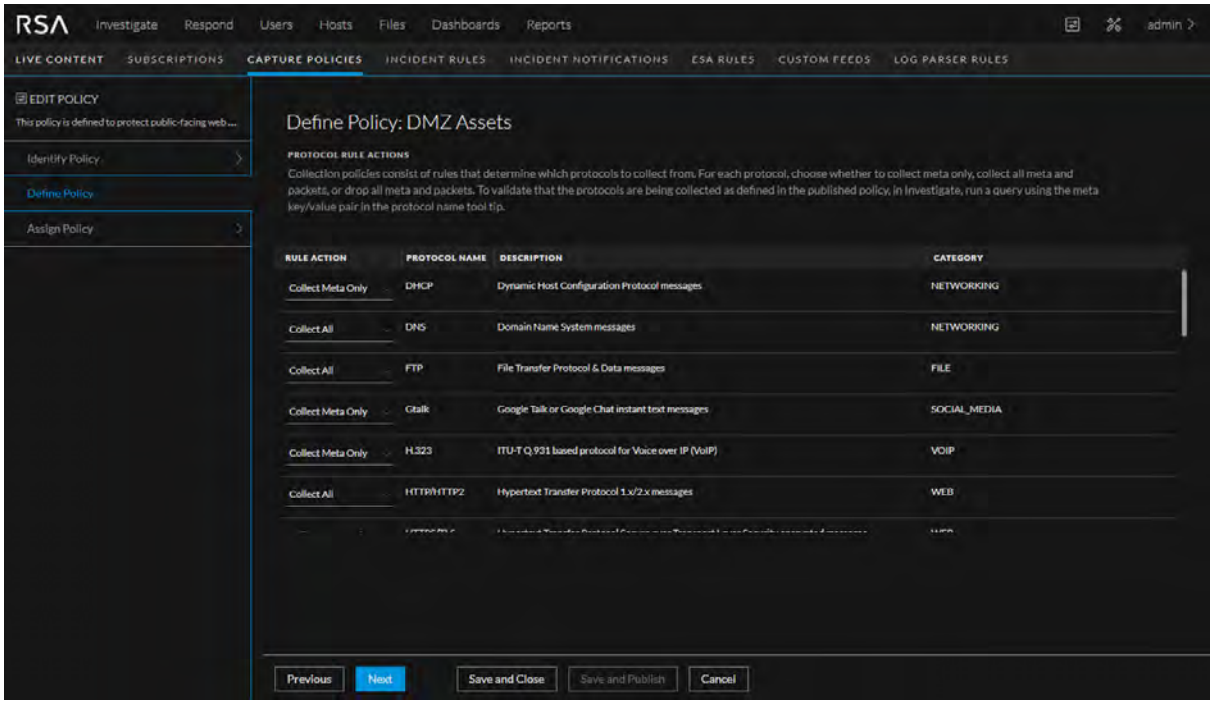


3. Select the cloned policy and click **Edit**.
   The editing view is displayed with the **Identify Policy** option active.
   In this example, we are naming this policy "DMZ Assets" and providing the description "This policy is defined to protect public-facing web servers."

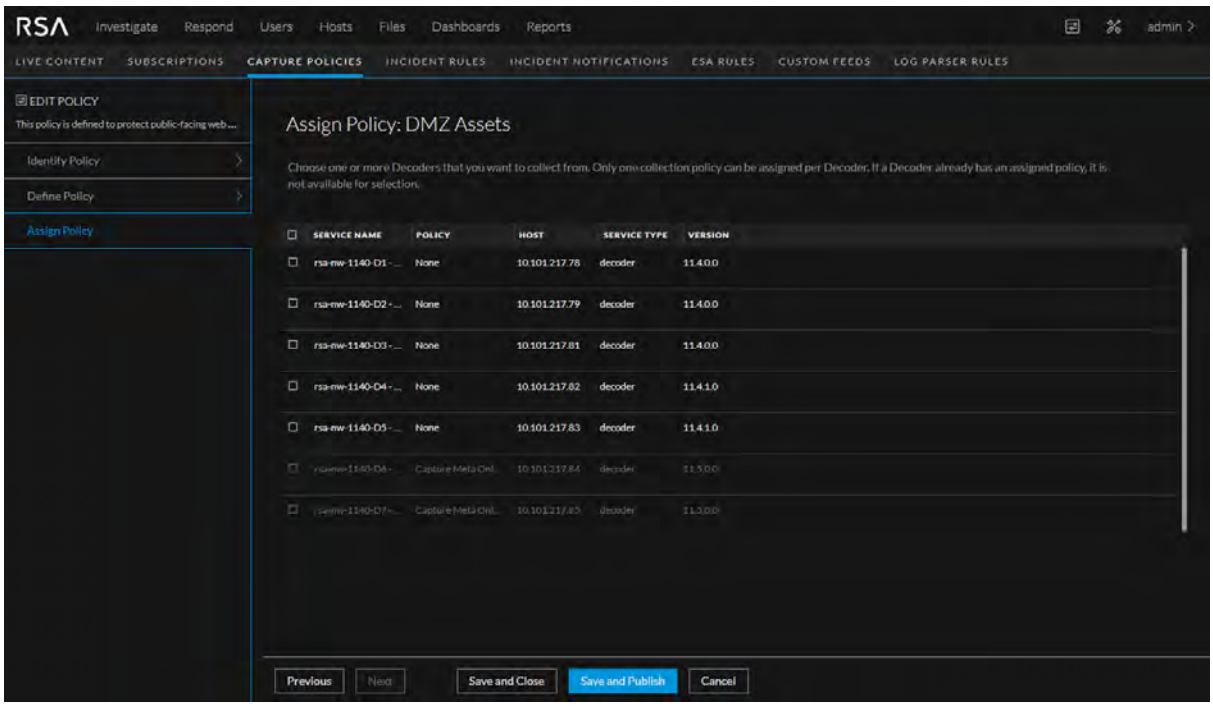


4. Click **Next**. The Define Policy view is displayed, with a list of rules you can use to define the policy. You can select the following options for rule actions:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

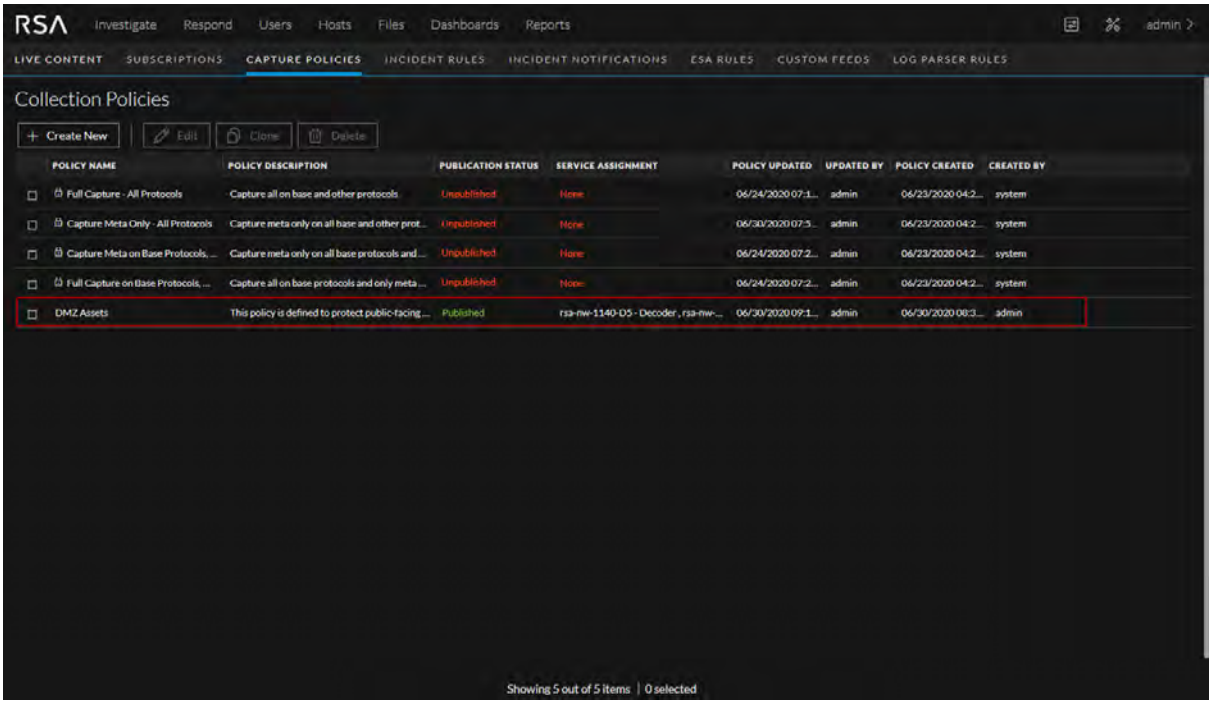
To collect the targeted data for the DMZ Assets policy, we are going to change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from **Collect All** to **Collect Meta Only**, as shown below.



5. Click **Next**.
   The Assign Policy page is displayed.



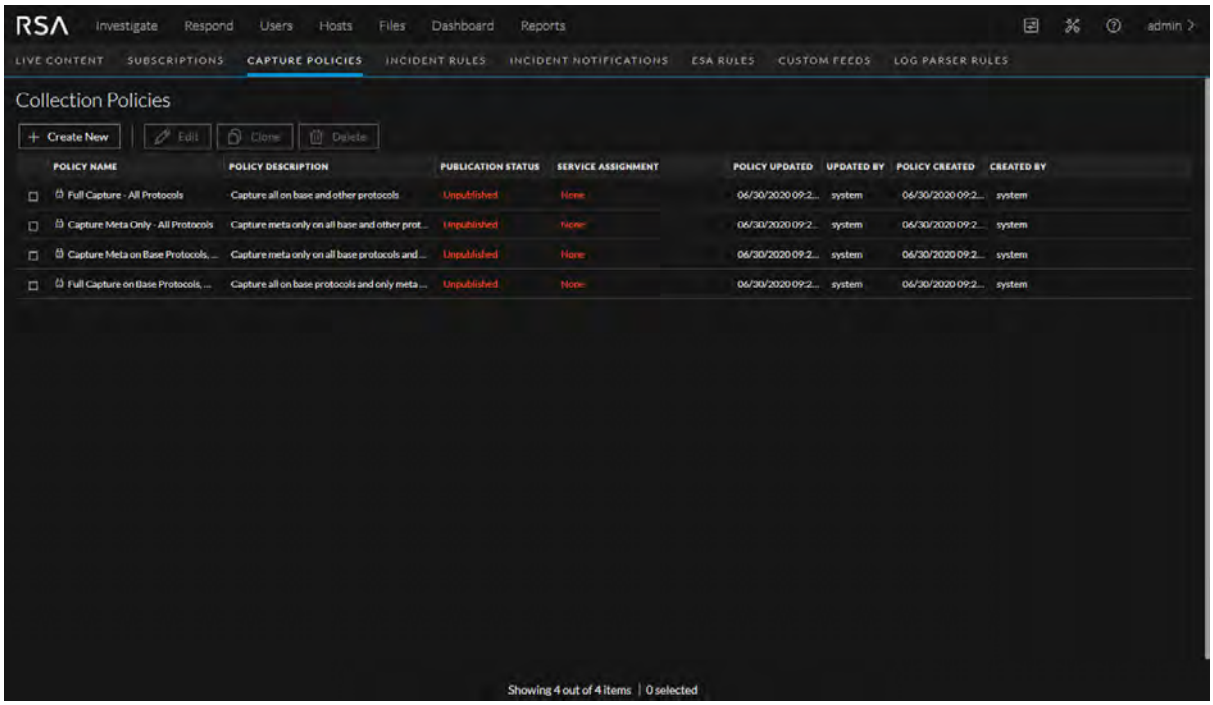
6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.
Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



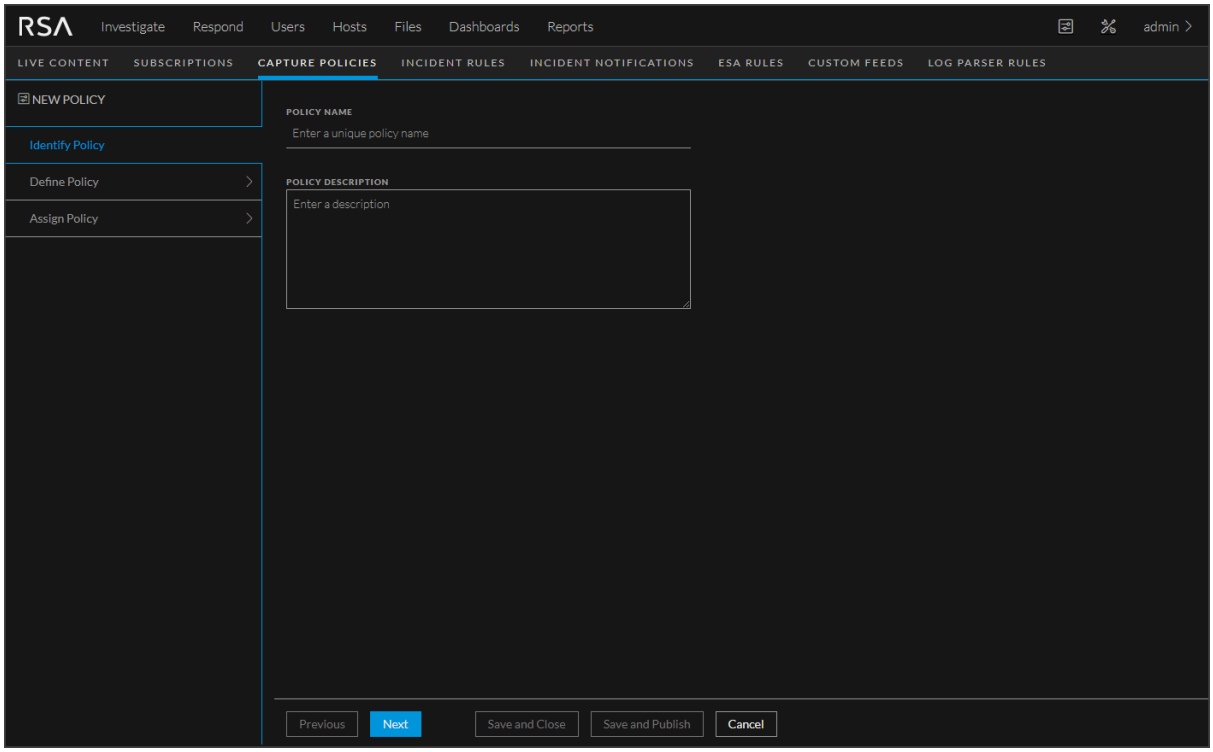
## Create Custom Policies

You can create a custom Selective Network Decoder policy, where you can select specific protocols on which to collect data, as well as the rules that apply to them.

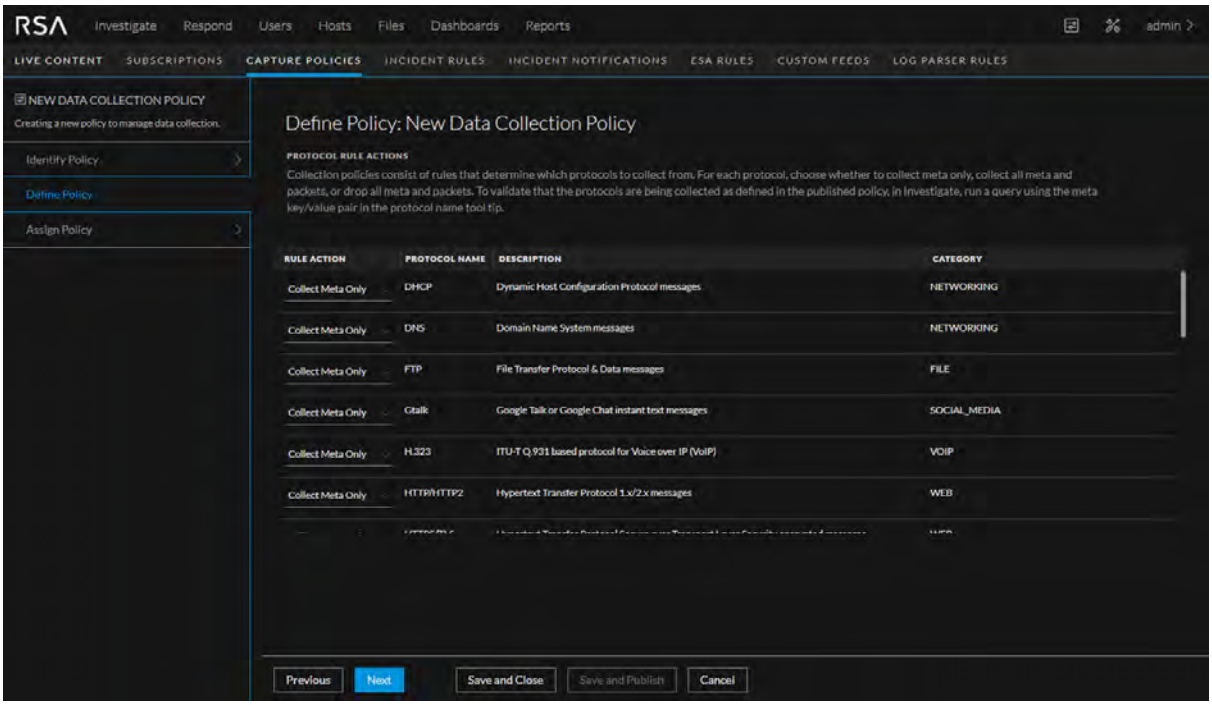
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Click **Create New**.
   The editing view is displayed with the **Identify Policy** option active.

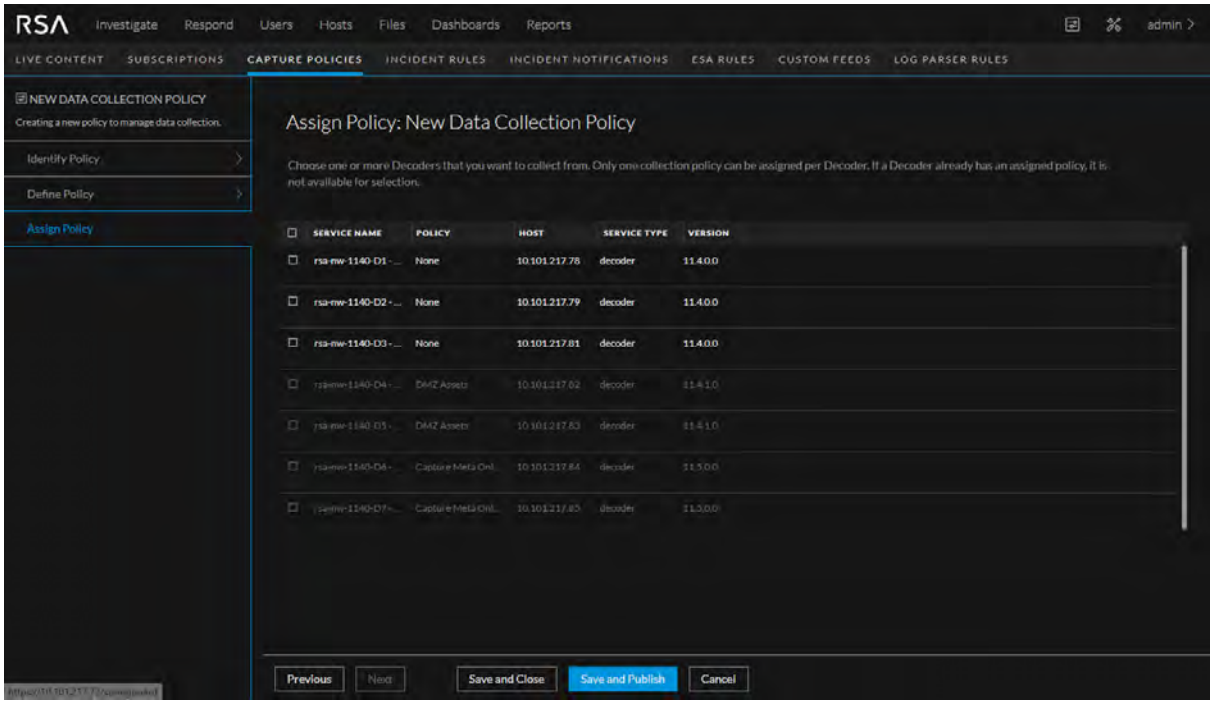


3. Enter a name and description for your policy, and then click **Next**.
   The Define Policy view is displayed.



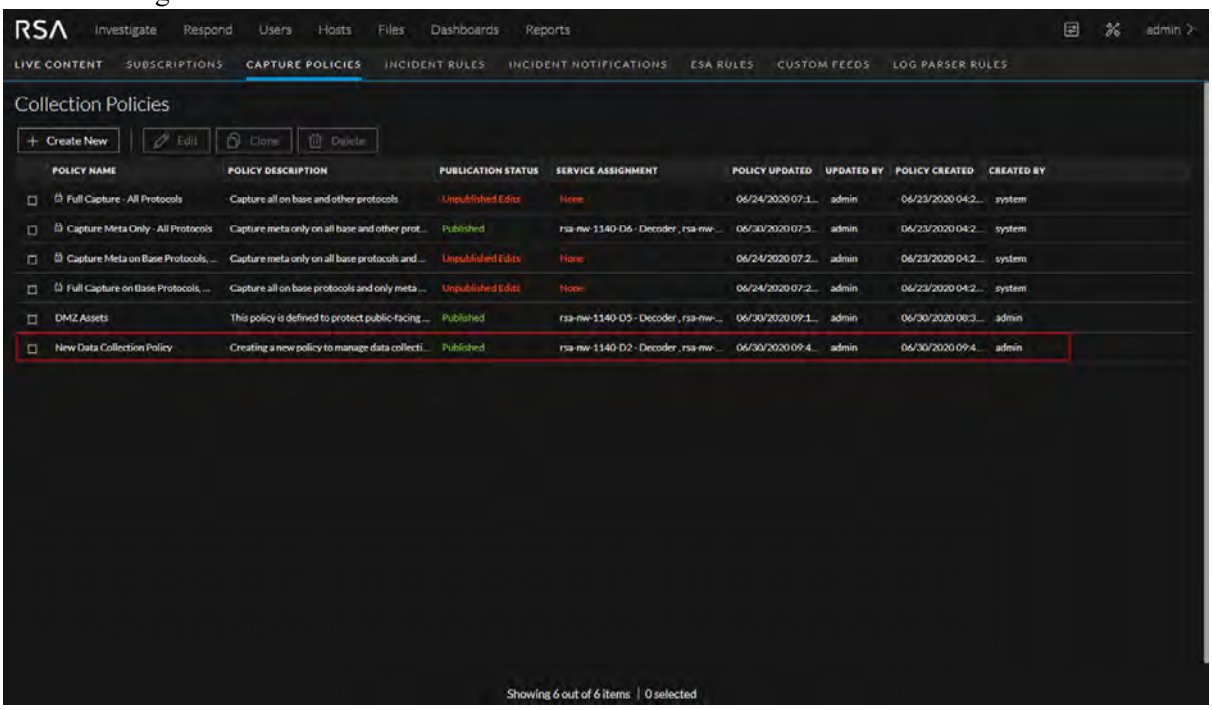
4. Define the actions for each of the protocols. The options for **RULE ACTION** are:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

5. Click **Next**.
   The Assign Policy view is displayed.



6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.

Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.

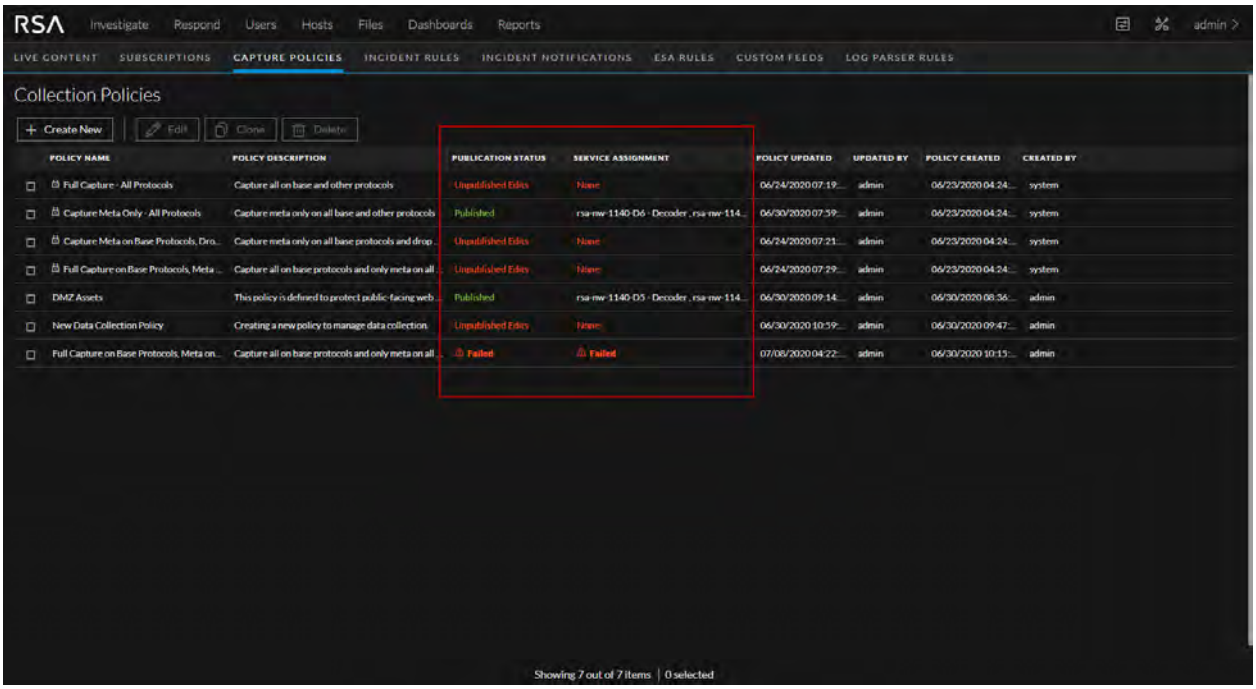


## Verify Published Policies

When a policy has been published, the policy is applied to the Decoders that were designated in the policy assignment step. The Decoders that are assigned to the policy start collecting the data defined in the policy. There are a few ways to validate the policy is functioning as expected.

### View Publication Status

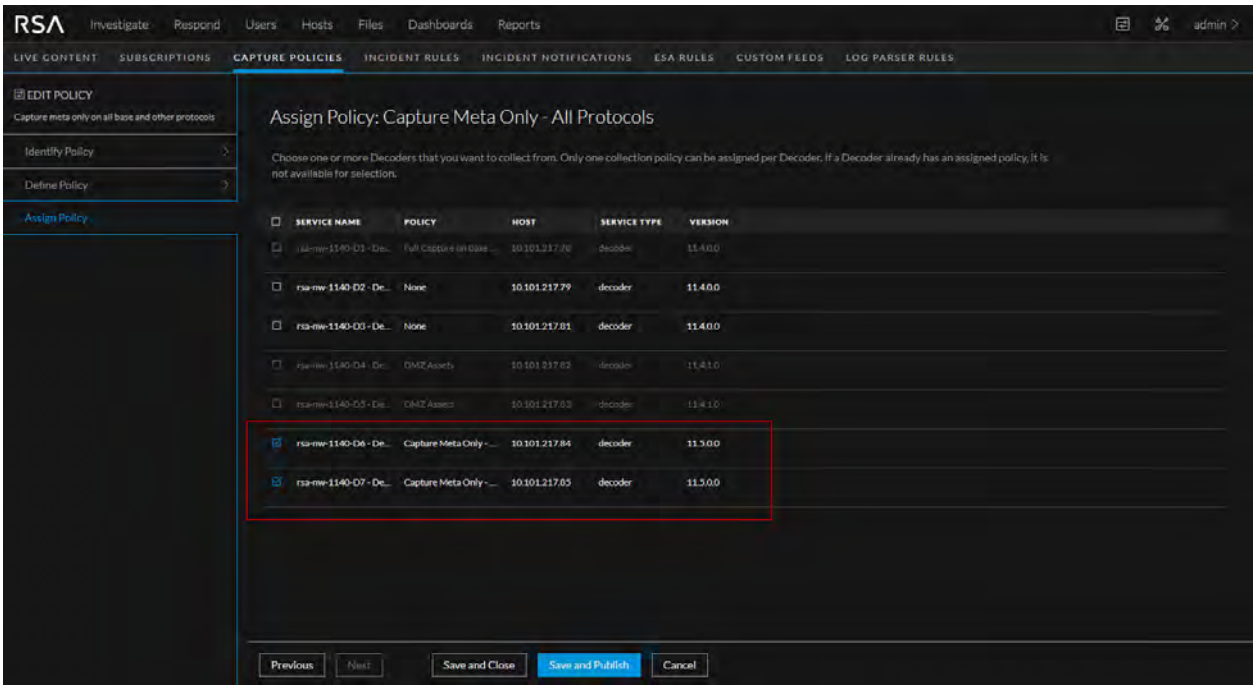
Publication status is indicated in the Capture Polices view in the PUBLICATION STATUS column. You can also see which Decoders are assigned to the policy in the SERVICE ASSIGNMENT COLUMN.



The publication statuses are:

- **Unpublished** - the rule actions of the policy have been defined and Decoders may have been assigned to the policy, but the policy has not been deployed to any Decoders.
- **Unpublished Edits** - policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders).
- **Published** - the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as Published, so even if not all of the Decoders are available (and the publication status is not Published), data will begin to be collected on the Decoders that are available.
- **Failed** - policies that failed to execute, for example, if a Decoder is offline or a system is down.

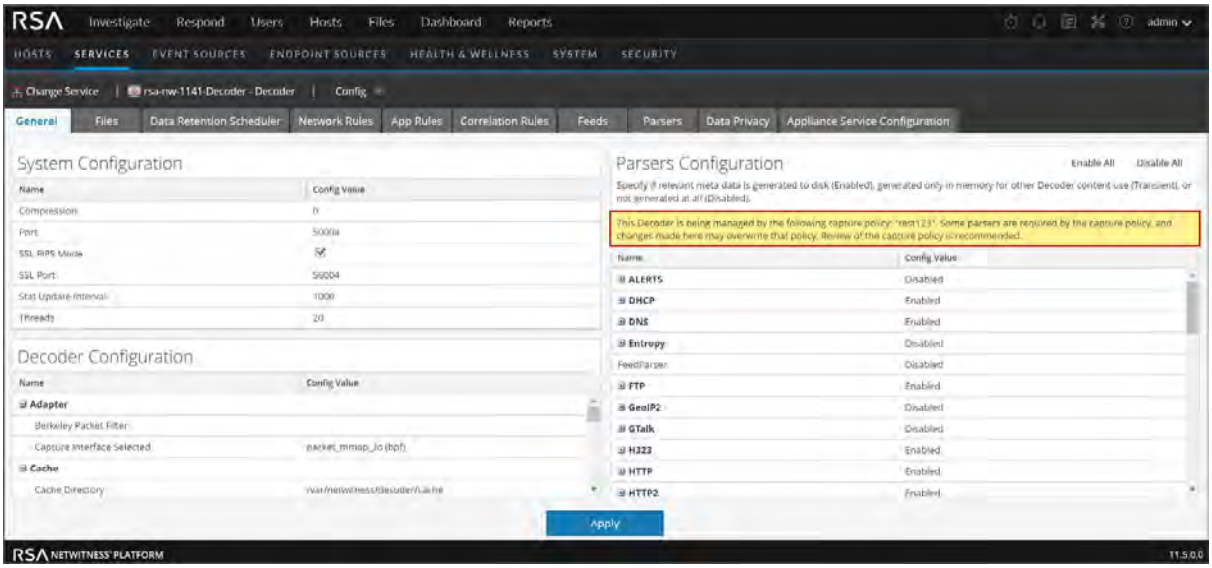
You can also select a published policy, and then click **Edit** to verify the Decoders that are assigned to the policy.



## Verify Policies in Admin > Services

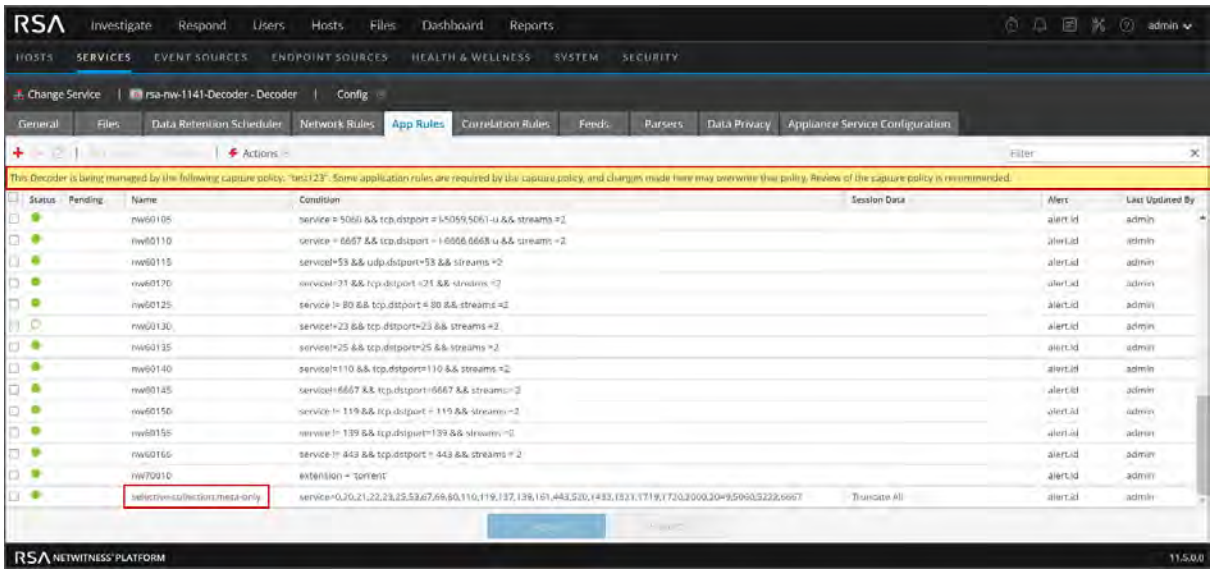
1. As an administrator, log in to the NetWitness user interface to view the Decoders that have been assigned to the policy.

2. Go to (Admin) > **Services** > **<decoder name>** > **(Actions)** > **View** > **Config**. On the General tab, in the right panel, there is a list of parsers that are installed on the Decoder by default. If a policy is administering this Decoder and requires any of those parsers to function, a message is displayed as shown below.



3. On the **App Rules** tab, a similar message indicates that some of the rules are required for the policy to function. You can search for "selective collection" to find the specific rules required, as the rule names contain that information.

> **Note:** In Investigate, you must have the **Alert** session option selected for the selective collection policy to be displayed.



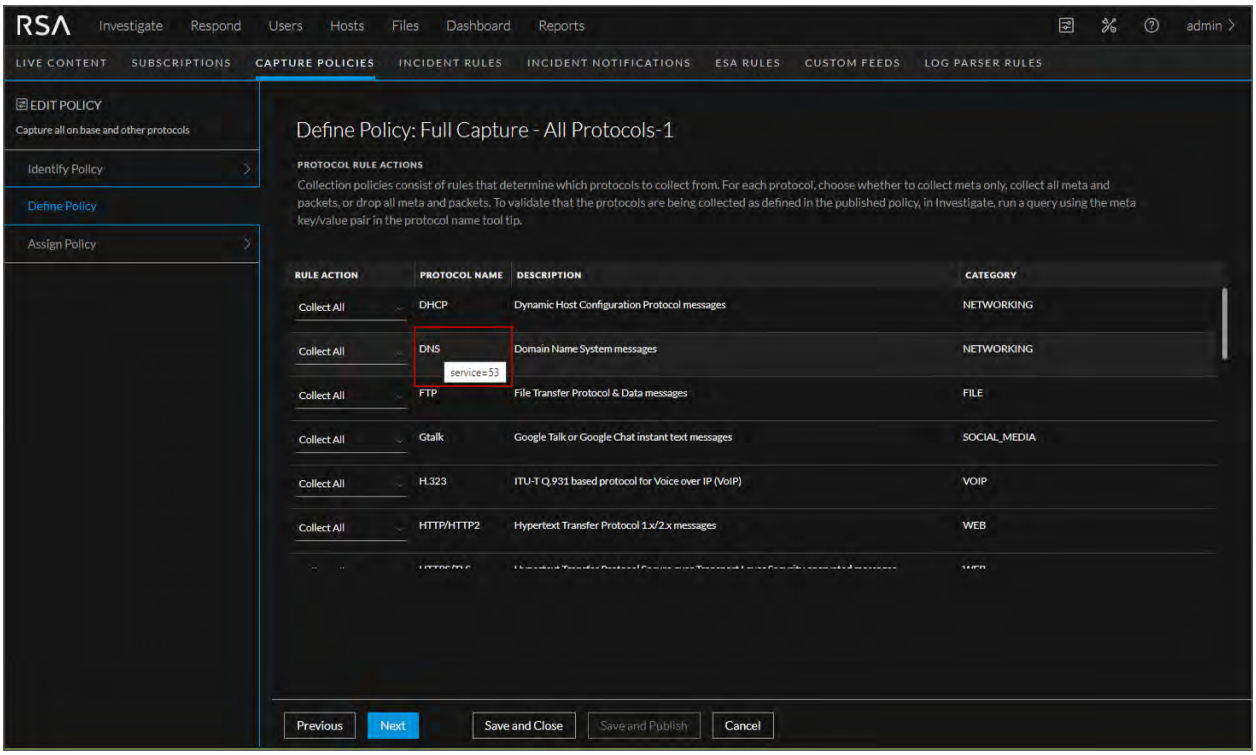
By default, the selective collection rules are added to the bottom of the rule set when the policy is applied. However, an administrator can directly affect the policy by altering the selective policy rules or by moving conflicting rules (rules with the same services) above the selective collection rules. In both cases, those changes take effect when they are saved locally on the individual Decoders, until the next time the policy is published from the central configuration page, when that policy will override changes made individually on the Decoders.

> **Note:** There currently is no feedback in the centralized configuration page denoting that the configuration related to the policy has been altered locally on the Decoders. To avoid this situation, manage all the policy rules from the centralized configuration page. If that is not possible, as additional application rules outside of collection policies may be required, follow standard security practices, including separation of duties, to limit people who need access to alter application rules and general parsers.

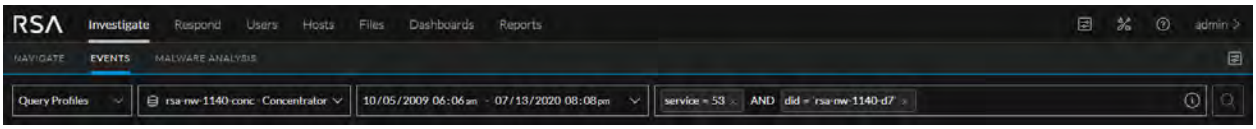
## Verify Policies in the Investigate View

You can further verify that the policy is working as expected (the protocols are being collected as published) in the Investigate view. In the centralized configuration page for selective collection, the administrator can get a translation of what the query parameter would be for each individual protocol when viewing the rules inside the policy.

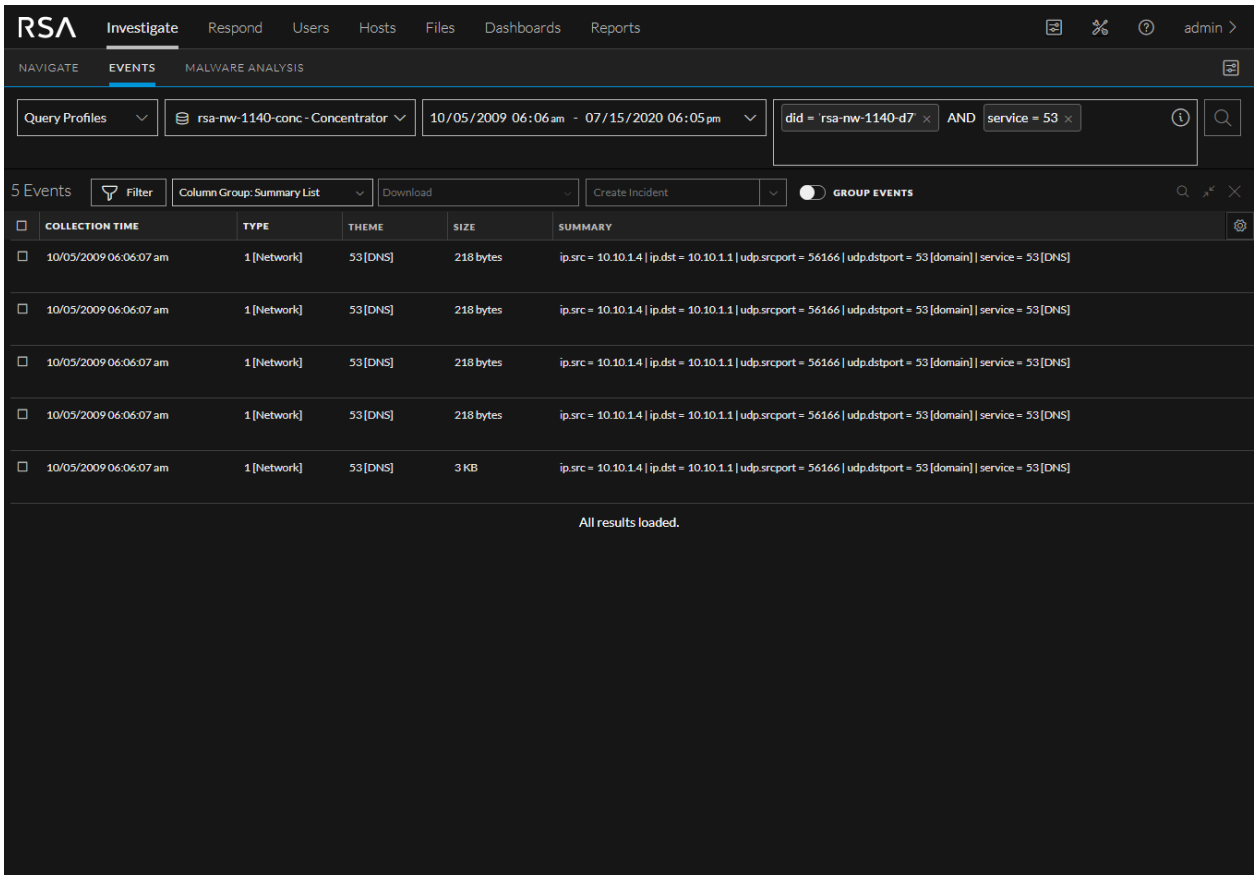
For example, in (Configure) > **Capture Policies** > **<select a policy>** > **Edit** > **Define Policy**, if you hover over the DNS protocol name, `service=53` is displayed.



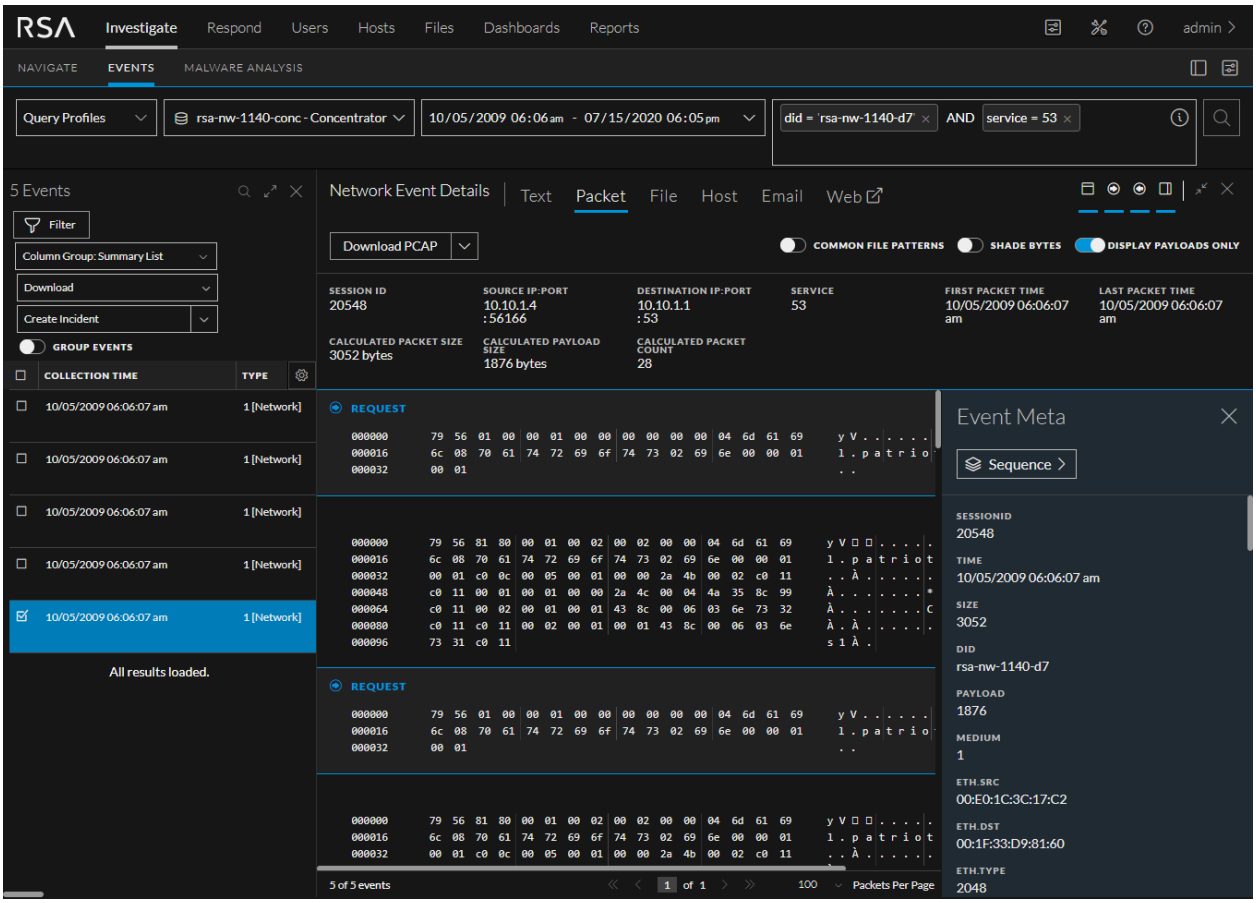
To determine if the appropriate action has been taken for DNS traffic, in **Investigate** > **Events** you can add the query parameter (for example, `service=53`) as a filter in the query bar and run the query against the Broker or Concentrator the Network Decoder is associated with for the time the policy has been active on the Network Decoder. To make sure you are only seeing the traffic from the Decoders that you want, you can add the Decoder Source, or `did` meta key as another filter in the query bar.



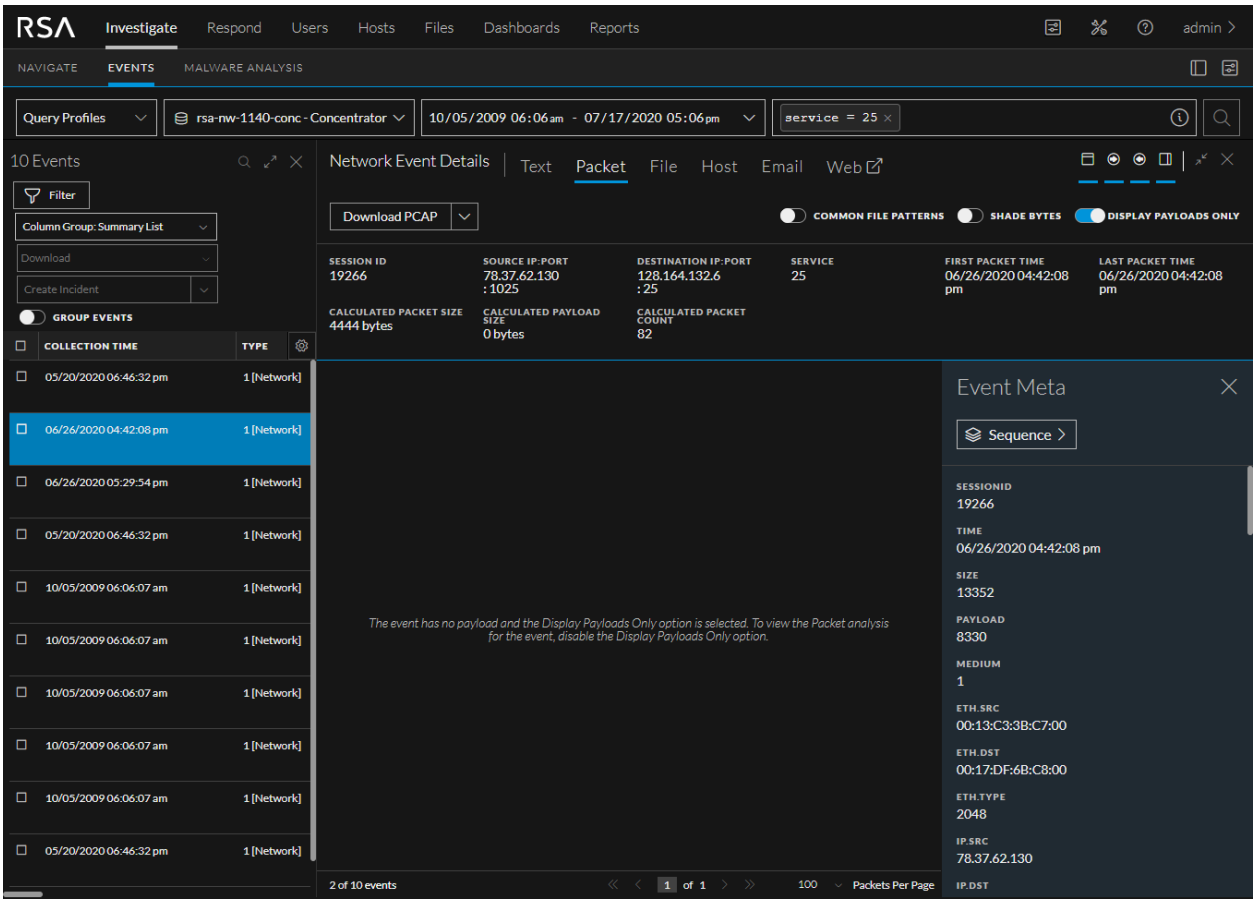
After running the query, if there are any related results, those events are displayed in the table (unless you applied an action to drop them).



If you chose the action to `collect all` you can click on one of the events and review the metadata and the payload information for that packet session.

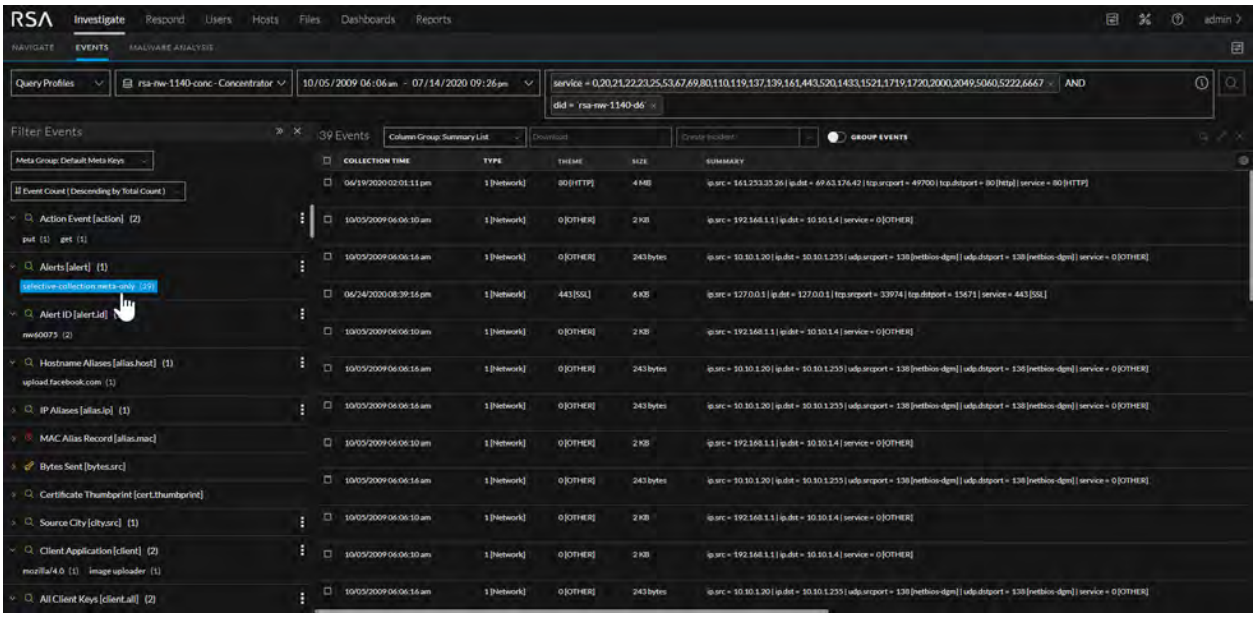


If you chose the action to `collect meta only`, you can click on one of the events and review the metadata, however, a message would be displayed instead of the packet payloads, as shown in the following figure.



To expedite this process, you can also take the application rules from one of the Network Decoders the policy is applied to and use it as the filter in the **Investigate** > **Events** query bar.

The following figure shows an entire `collect meta only` configuration by using the application rule shown here, created on the Decoder (in Verify Policies in Admin > Services):
`(service=0,20,21,22,23,25,53,67,69,80,110,119,137,139,161,443,520,1433,1521,1719,1720,2000,2049,5060,5222,6667) truncate`:



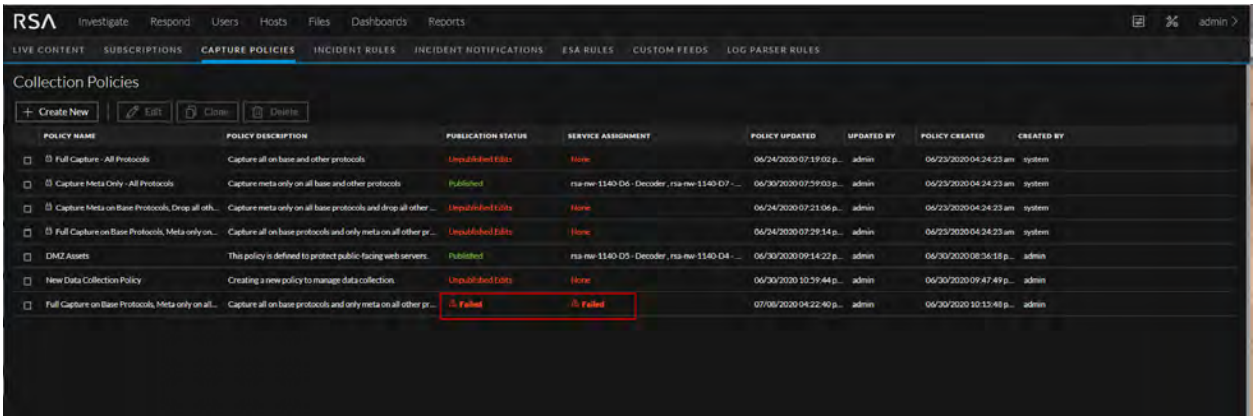
**Note:** If the findings do not align with what is expected from the policy, make sure that there are not other rules on the individual Decoders that might be conflicting with the selective collection policy rules. In addition, make sure when checking in Investigate that you are looking at only the traffic associated with the Decoders related to the policy.

## Troubleshooting Policy Deployments That Fail

Policy deployment can fail for the following reasons:

- A Decoder service assigned to the policy is not running
- A Decoder host system is down when you try to deploy the policy

When a policy deployment fails, the Failed icon is displayed in the PUBLICATION STATUS and SERVICE ASSIGNMENT columns as shown in the following figure.



Use the following options to research publication failures:

### Check the status of the Decoders

Check to see if the Decoder system is down, or if the Decoder service has stopped capturing data.

1. Select the policy, click **Edit**, and go to the Assign Policy page to determine which Decoders are assigned to the policy,
2. Go to (Admin) > **Services**, select the Decoder, click > **View** > **System** to investigate the status of the Decoder.

### Review the content-server.log file

You can review the content in this file to troubleshoot errors. This file is located in the following directory on the NW Server host:

```
/var/log/netwitness/content-server/content-server.log
```

The following example shows a content-server log snippet that is displayed when publishing a policy fails:

```
2020-07-08 16:22:45,287 [ nioEventLoopGroup-2-2]
INFO     DataAccess|Finished publishing policy 'Full Capture on Base
Protocols, Meta only on all other protocols-1' outcome:FAILED
```

This is an example of a content server log snippet for successfully publishing a policy:

```
2020-06-23 17:40:50,373 [ nioEventLoopGroup-2-7]
INFO     DataAccess|Finished publishing policy 'Policy 1' outcome:SUCCESS
```

### Review `/var/log/messages` on Decoder Systems

You can view publication status in `/var/log/messages` on a Decoder system.

The following is an example of successful publication in `/var/log/messages`:

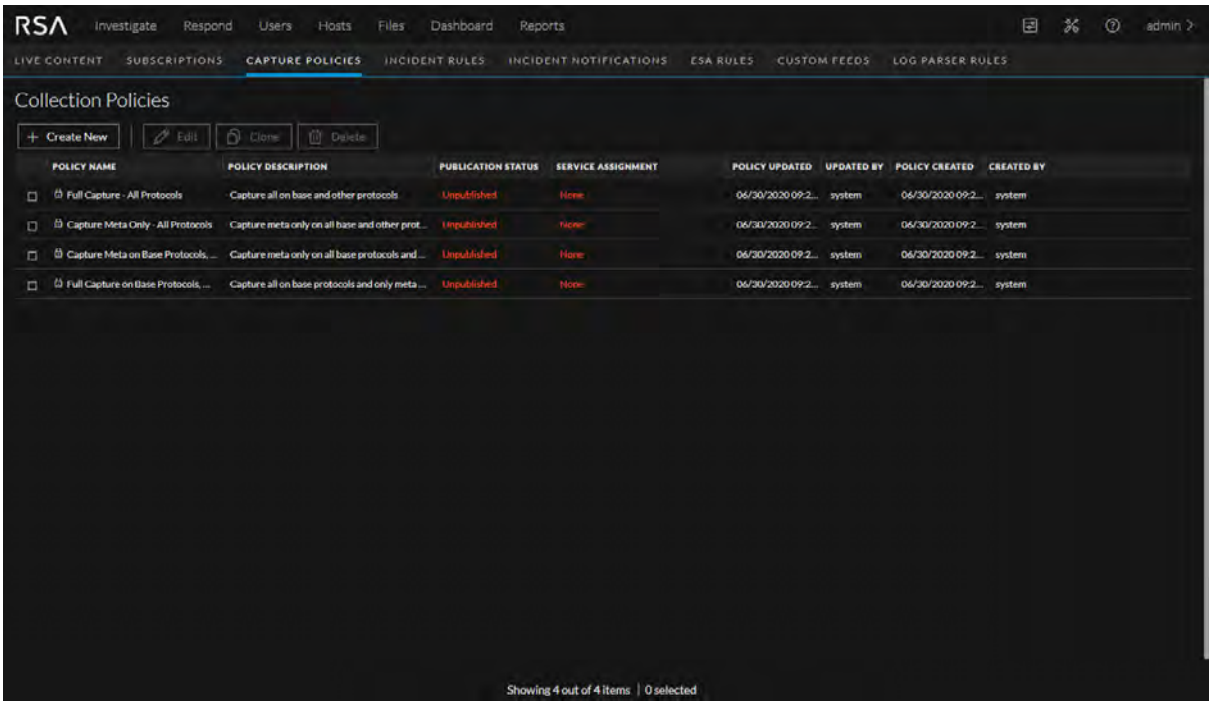
```
Jun 15 18:35:17 rsa-nw-1141-Decoder-1 NwDecoder[8260]: [Rules] [audit] User
admin (session 26182, 10.237.169.43:55380) has added application rule
'selective-collection:meta-only' at position 38
```

## Unpublish Policies

You can unpublish a policy by unassigning the Network Decoders from the policy, which preserves the policy but makes it inactive so that the data it defines is not being collected. You can then change or remove a portion of policy, or remove the entire policy from the Decoders to which they are assigned.

### To unpublish a policy:

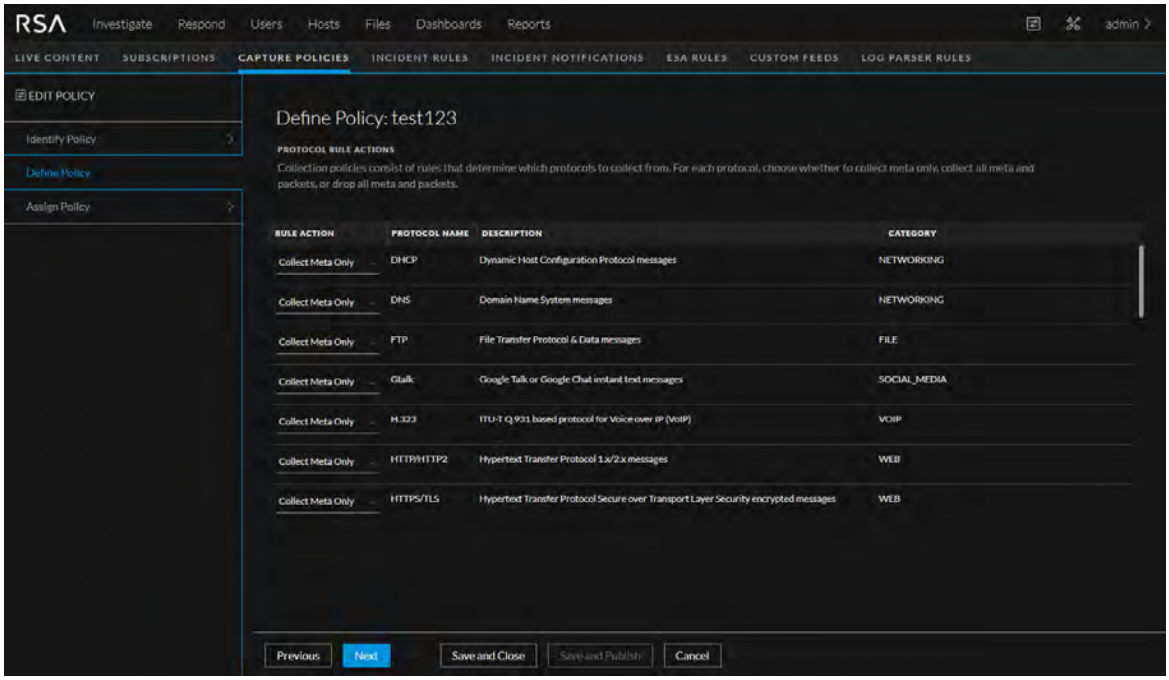
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select the published policy and click **Edit**.

   a. To change the name or description of the policy, update the policy name or description in the Identify Policy view.

b. To change the protocols that are collected, click **Next** and then edit the rule actions in the Define Policy view.



c. To unassign or reassign Decoders to this policy, click **Next**.

- To fully unpublish this policy, deselect all the Decoders and then click **Save and Publish**.
- To change the Decoders that are assigned to this policy, select or deselect the Decoders as needed and then click **Save and Publish.**

When the changes to the policy status have been completed and the Decoders updated, the policy status is displayed in green text as **Published** on the Collection Policies tab. If you unassigned all the Decoders without assigning any new ones, the publication status is **Unpublished Edits**.

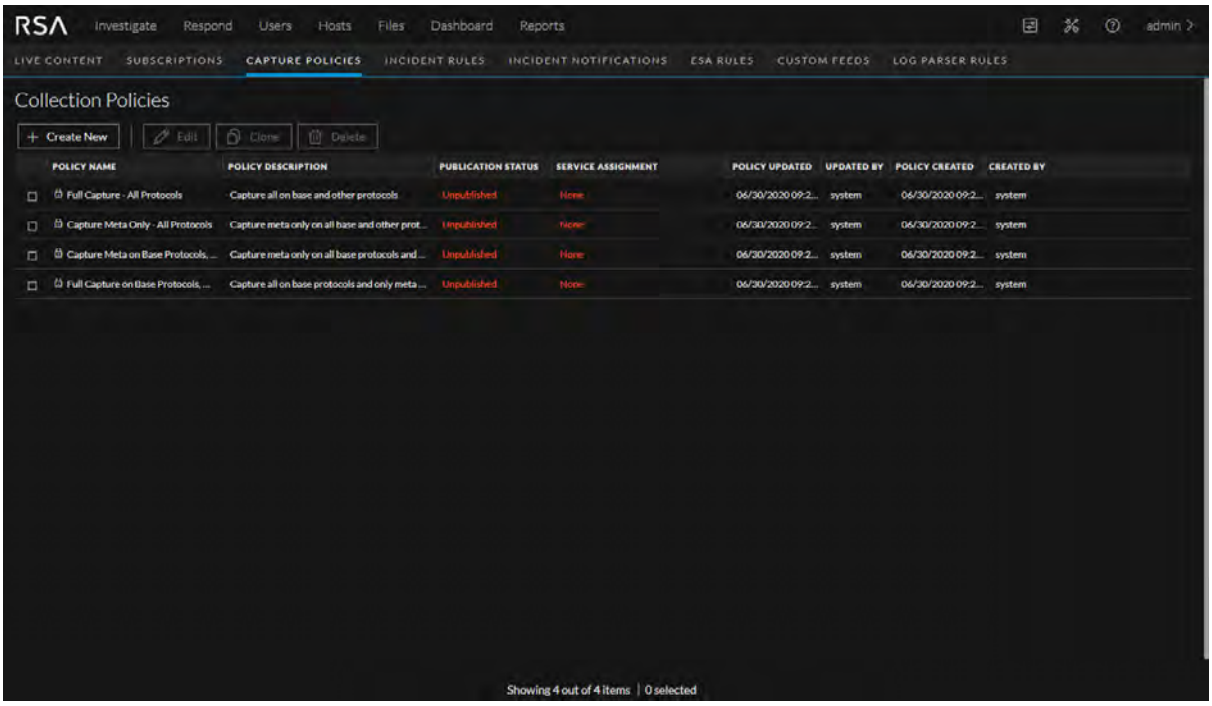
## Delete Policies

You can only delete customized policies. Predefined policies can be unpublished, but cannot be deleted. You can only delete one policy at a time. When you delete a policy, any Decoders that were assigned to the policy immediately stop applying the rules in the policy.

For information about how to unpublish a policy, see Unpublish Policies.

### To delete a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select a customized policy and click **Delete**.
   The policy is removed from the system.

**Caution:** If you delete a policy that is published to Decoders, a warning is displayed. If you click **Accept** in the warning, that policy is removed from the Decoders, the collection status is changed, and the policy is deleted.

## Supported Protocols for Selective Network Data Collection

The protocols in this list are supported for selective network data collection. These protocols have descriptive tool tips in the user interface. You can choose how to handle each of these protocols individually by dropping, capturing metadata only, or capturing all data related to them. There is also an additional rule for each policy that handles all other unidentified protocols not included in this list. The policies apply the collect or drop actions based on protocol characteristics, regardless of the port that they are captured on.

| Category | Protocol | Description |
|---|---|---|
| Database | TNS | Transparent Network Substrate Oracle database networking protocol messages |
| | TDS | Tabular Data Stream for SQL server communications |
| Email | SMTP | Simple Mail Transport Protocol messages |

| Category | Protocol | Description |
|---|---|---|
| | POP3 | Post Office Protocol v3 messages (Email clients use to retrieve mail from server) |
| File | SMB | Server Message Block (or CIFS) network communication protocol file sharing communications |
| | NFS | Network File System protocol messages |
| | FTP | File Transfer Protocol messages |
| | TFTP | Trivial File Transfer Protocol messages |
| Networking | SNMP | Simple Network Management Protocol messages |
| | DNS | Domain Name System messages |
| | DHCP | Dynamic Host Configuration Protocol messages |
| | NETBIOS | Network Basic Input/Output System networking protocol messages |
| Remote Access | SSH | Secure Shell secure remote connections |
| | TELNET | Teletype network remote interface protocol messages |
| | SCCP | Cisco Skinny Client Control Protocol terminal control protocol messages |
| Routing | RIP | Routing Information Protocol distance-vector routing protocol messages |
| Social Media | GTalk | Google Talk or Google Chat instant text messages |
| | IRC | Internet Relay Chat protocol text messages |
| | NNTP | Network News Transfer Protocol for Usenet news articles |
| VoIP | RTP | Real-time Transport Protocol audio and video streaming protocol messages |
| | SIP | Session Initiation Protocol text-based messaging application control protocol messages |
| | H323 | ITU-T Q.931 based protocol for Voice over IP (VoIP) |
| Web | HTTP/HTTP2 | HyperText Transfer Protocol 1.x/2.x messages |
| | HTTPS/TLS | HyperText Transfer Protocol Secure over Transport Layer Security or Secure Sockets Layer encrypted messages |

**Note:** When selective network data collection is set up to collect metadata only for the HTTPS/TLS protocol, it truncates the traffic after the SSL/TLS handshake to ensure that all the certificates and other details are retained for analysis purposes while the encrypted packet payloads are dropped.

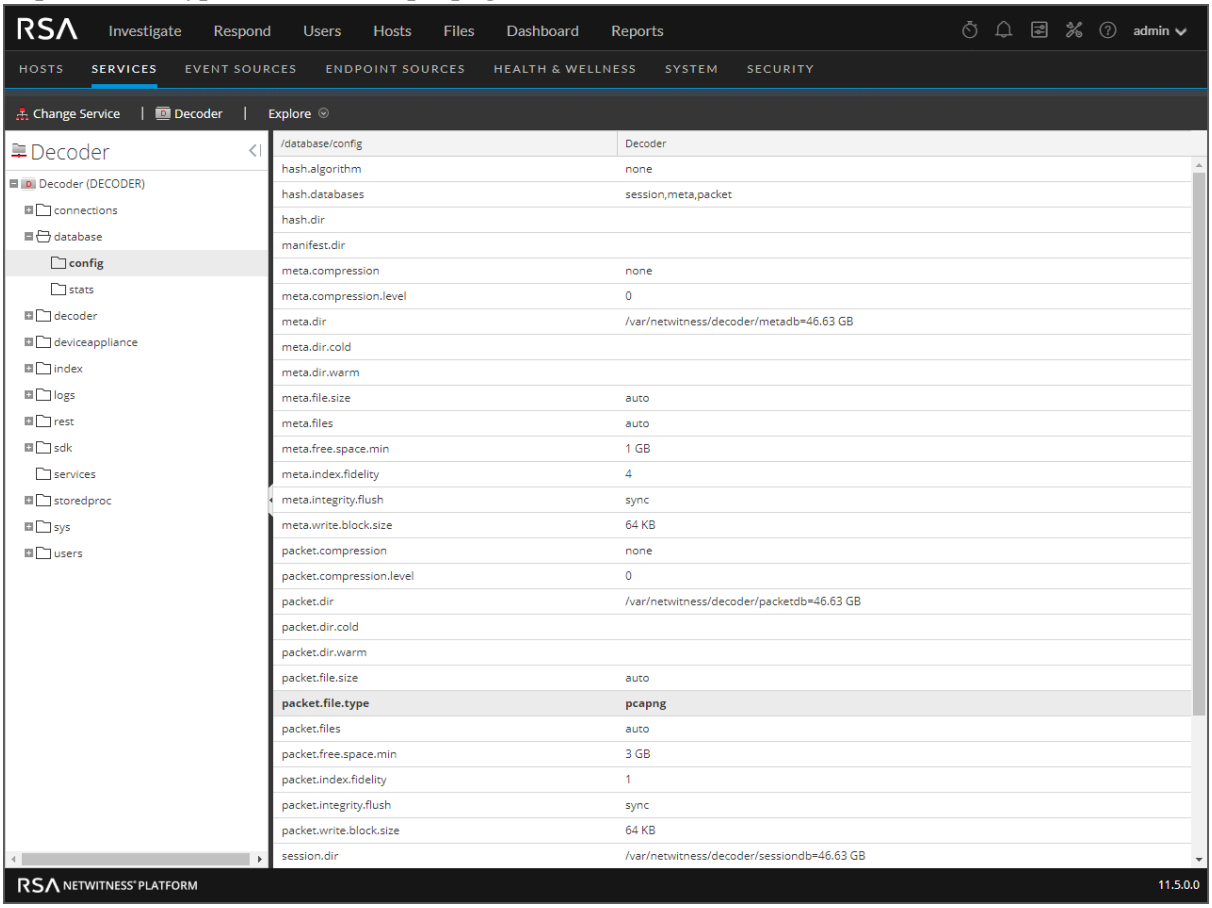
## (Optional) Configure a Decoder to Write Standard pcap-formatted Files

To provide a more open database format, the Network Decoder can write standard pcap-formatted files. You can enable pcapng-formatted database files with the configuration node:
`/database/config/packet.file.type = 'pcapng' or 'netwitness'`

**Note:** This capability is enabled by default if you install 11.2 or later. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the NetWitness nwdb files).

To enable writing standard pcap-formatted files:

1. Go to (Admin) > **Services**, select a Network Decoder service, and then select > **View > Explore**.
2. Go to **database** > **config**.
3. In **packet.file.type**, the default is **pcapng**.



4. To change the packet file type to NetWitness formatting, type **netwitness** and press **Enter**. This change will take effect immediately on the next packet file that is created.

**Note:** In the pcapng database file format, the data is in clear text, and is not obfuscated by our proprietary format, which can improve security.

**Caution:** Please do not touch any files in the packet database directories! You must not read or edit any `pcapng` file in the packet database directories, as they are always in use while Decoder is running. Decoder always expects full and exclusive access to those files, and other processes reading those files prevent normal Decoder operation. The proper way to access the `pcapng` files is to set up a cold storage directory. This allows Decoder to copy `pcapng` files to the cold storage directory before deletion. At that point, you are responsible for managing the `pcapng` files, including making sure that the cold storage volume never fills up. Keep in mind that copying the `pcapng` files to cold storage requires a non-trivial amount of I/O and could interfere with packet capture. Cold storage for `pcapng` is not supported at 10G speeds.

## (Optional) Multiple Adapter Packet Capture

Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs), or multiple ports on multiple interfaces, while leveraging the same network rules, application rules, and parsers for each NIC. The benefit of capturing from multiple physical NICs is that this method multi-threads the capture process for each adapter interface, which also multi-threads network rule evaluation.

For example, prior to 11.5, defining `capture.selected=PFRINGZC, em3` along with `capture.device.params=device=zc:em3,zc:em4` allocated a single thread for the Network Decoder to capture any traffic that came into either `em3` or `em4` interfaces. This also meant that all network rules were evaluated in a single thread.

However, in 11.5, configuring `capture.selected=PFRINGZC,em3; PFRINGZC,em4` allocates two threads for the Network Decoder to capture the traffic collected on either `em3` or `em4`, which provides more resources to the capture pipeline.

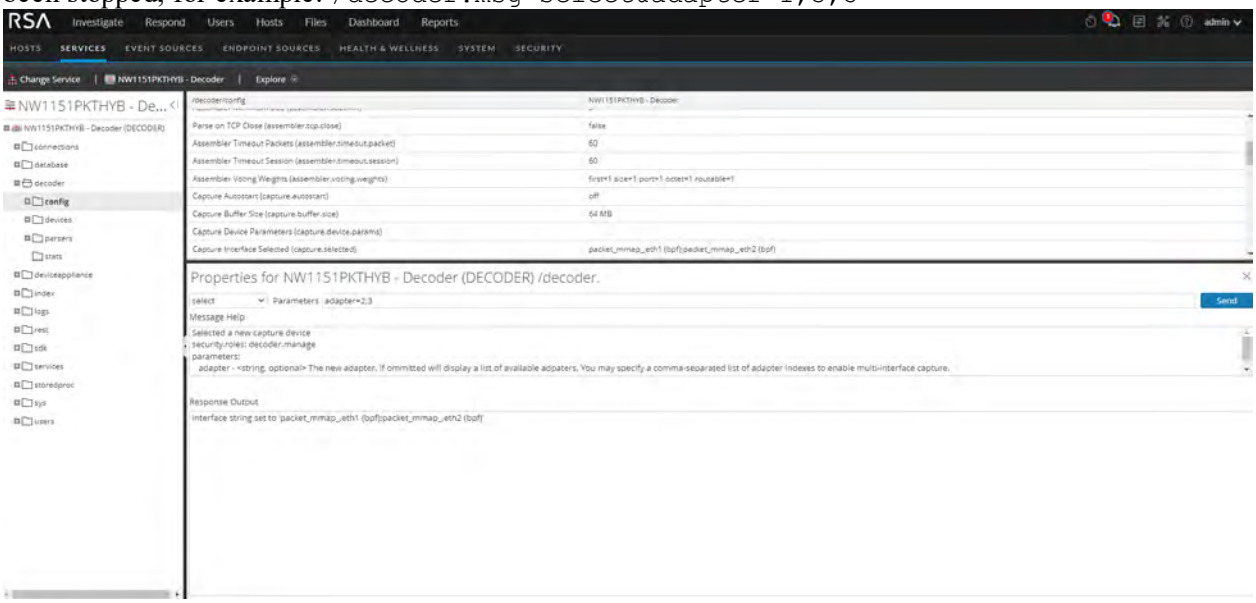
In this topic, the term "adapter" refers to a capture device within the Decoder. An adapter's name consists of the device (for example, the software API that the Decoder uses to interact with an adapter), and an interface (the physical device). A device can have multiple interfaces, and an interface can be compatible with multiple devices.

### Configure Multiple Adapter Packet Capture

**Note:** Changes to capture device configuration do not take effect until service restart.

You can define multiple adapter packet capture for Decoders in the config setting `/decoder/config/capture.selected`. It accepts a semi-colon separated list of adapters, for example: `bpf,en5 (bpf);null_device,Null Capture`. This setting can be edited while capture is running, however, the changes do not take effect until the service has been restarted.

You can use the `/decoder?msg=select` command to select one or more adapters after capture has been stopped, for example: `/decoder?msg=select&adapter=1,3,5`



**Note:** As of 11.5, this configuration is not yet available in the `decoder` > `config` page. Use the `decoder` > `explore` page or the REST API. You can the Explore view by selecting a Decoder in the user interface and going to (actions)> **View** > **Explore**. You can access the REST API by opening a browser and specifying the IP address of the host, for example, `https://<decoder-ip-address>:50106`.

### Per Interface Configuration

The `/device/config/device.capture.params` configuration is a global configuration setting, and is applied to every interface when capture is started.

There is also a configuration setting for individual interfaces, which is `/decoder/devices/<devicename>/<interfacename>/config`. Currently, the only option available in this configuration setting is `capture.params`. Any value in this setting will override the global configuration setting.

## Stat Nodes

As with configuration, there are per-interface stats and aggregate stats (similar to the global configuration). When there is a single device configured, these stat nodes function as in previous versions. When there is more than one device configured, the stat settings `/decoder/stats/capture.device` and `/decoder/stats/capture.selected` read `multi`.

### Per-Interface Stats

The stats for each interface can be found in:
`/decoder/devices/<devicename>/<interfacename>/stats`

The captured stats are:

- capture.avg.size
- capture.dropped
- capture.filtered
- capture.header.bytes
- capture.kept
- capture.payload.bytes
- capture.received
- capture.total.bytes
- pool.packet.captured

### Aggregate Stats

The capture stats under /decoder/stats represent an aggregate of the individual interface stats.

In the following table, for example, capture.avg.size is the maximum average size among all the interfaces, where capture.dropped is the total captures that were dropped for all the interfaces.

| | |
|---|---|
| capture.rate | SUM |
| capture.avg.size | MAX |
| capture.dropped | SUM |
| capture.filtered | SUM |
| capture.header.bytes | SUM |
| capture.kept | SUM |
| capture.payload.bytes | SUM |
| capture.received | SUM |
| capture.total.bytes | SUM |
| pool.packet.captured | MIN |

### Pool Stats

All the network packet and session pool pages are tracked in /decoder/stats/pool/.

The stats under /decoder/stats/pool represents the total number of capture pages configured in Decoder. These include packet pool and session pool pages.

## capture.port Meta Key

Each session is given a capture.port meta key which identifies the adapter from which the packets in the session were captured. This meta key can optionally be turned off with the /decoder/config/captureport.meta.enabled option. This meta key is on by default for Network Decoders, and is off by default for Log Decoders.

**IMPORTANT:** The `capture.port` meta key does not work with the `packet_mmap_,ALL` adapter. You must specify individual ports while using `capture.port`. The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For more information, see (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces.

**Note:** If you turn the `capture.port` meta key off, you must perform a capture restart for the change to take affect since this is a configuration change.

## Special Devices

The nwimport device is for handling PCAP imports while simultaneously capturing network data. For more information on PCAP imports, see Upload a Packet Capture File.

`nwimport`: This device is not selectable but does have stat and config nodes. The config node for `nwimport` is ignored.

### `Packet arrived out of order` Message

This message means that the Decoder is seeing old packets. This can be a side-effect of running import while capture is running. This message is usually suppressed at the beginning of import and then unsuppressed at the end. However, packets can still be in the state of being processed even after the upload of the imported file has completed. This means that this warning can be unsuppressed before the processing of the imported packets is completed, which results in displaying this message.

For information about updating Decoder configurations, see the *RESTful API User Guide for RSA NetWitness Platform*. For information about stopping and restarting capture, see Configure Capture Settings. Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.

## Multi-Assembler Modes

The process that reassembles captured packets into streams is known as the Assembler. You can customize the Assembler operation to suit the packet capture configuration. It works in two modes (`on` and `off`) that are configured using the `/decoder/config/assembler.threading.enabled` variable. The value of `assembler.threading.enabled` only takes effect if multi-adapter packet capture is enabled.

**Note:** If you change the value of `assembler.threading.enabled`, you must perform a capture restart.

**OFF Mode:** If assembler threading is `off`, then one Assembler is used to assemble all packets captured from all interfaces. Packets from a stream may appear on any capture interface and the single assembler will put them back together.

- Assembler threading must be `off` to allow assembler to reconstruct streams that are capture across multiple capture interfaces.
- When assembler threading is `off`, the single Assembler instance may limit the maximum packet rate that the Decoder can process.

**ON Mode:** If assembler threading is `on`, there will be a separate Assembler for each capture interface. Each Assembler will only reassemble the packets it receives from it's capture interface.

- This mode of operation enables higher throughput because each Assembler instance operates on a dedicated processor.
- Each logical stream of packets must be ingested by one interface only. For example, the streams on each capture interface could come from different networks.

For compatibility with previous releases, the Multi Assembler mode is `off` by default.

When importing packets, the imported packets are fed to one of the existing assemblers, or the single Assembler instance when Assembler threading is `off`. Importing packets does not create a separate Assembler process.

## (Optional) Data Plane Development Kit Packet Capture

The NetWitness Decoder supports capturing packets through the Data Plane Development Kit, also known as DPDK. DPDK is a set of libraries and drivers that support applications that work on directly on packets. DPDK's web site, www.dpdk.org, provides more information.

### Advantages

The Decoder can use the DPDK to ingest packets from Ethernet interfaces. It is an alternative to existing packet capture options built into the Decoder. DPDK offers these advantages:

- It is entirely open source, with no binary-only driver components, unlike PF_RING.
- It is directly supported by multiple vendors, including our main vendor, Intel.
- Since the kernel-level interface is in the mainline Linux kernel, there are no separate driver packages to compile and distribute.
- DPDK devices are completely separate from the Linux network stack, which avoids unintentional interaction between Linux networking and packet capture.
- DPDK is capable of capturing at greater than 10G, unlike the `packet_mmap`.

### How it Works

DPDK completely detaches the Ethernet interface from the Linux kernel. It does this by doing the following:

- It uses a Linux User I/O driver mechanism to expose the raw PCI-Express device to normal Linux programs. This means that it can take the raw memory space mapped to the PCI device and expose it, so that a normal Linux program can directly manipulate the hardware. There are a couple of drivers built into the Linux mainline kernel that can accomplish this. Decoder is designed to use `vfio_pci_generic`.

  **Note:** Only one driver can be attached to an Ethernet interface at a time. When `vfio_pci_generic` is attached to an interface, the Linux network driver for that interface is detached.

- The DPDK provides its own user-space implementation of the hardware drivers for a wide variety of Ethernet cards. When a DPDK application like Decoder is loaded, it can attach directly to the PCI device and manipulate it using DPDK-specific library functions. When a device is attached to DPDK, the Decoder can see it and automatically sets the device up with the DPDK Capture Device option.

## Migrate PF_RING Devices to DPDK

For configurations using multiple adapter packet capture (available in 11.5 and later), you must use the manual procedure outlined in Manually Move a Capture Interface to DPDK . For example, the migration (`dpdk migrate`) does not support a Decoder when capture is configured with: `capture.interface=PFRINGZC,em3; PFRINGZC,em4;packet_mmap,em2`.

For configurations prior to 11.5, the procedure that uses the devices parameter to capture from multiple `PF_RING`-supported interfaces (for example, `ixgbe` and `i40e`) will be converted to using DPDK, along with the multiple adapter packet capture, so that one capture thread is used per interface.

For example, the migration will work if configured as follows:

- For multi-interface capture: `capture.interface=PFRINGZC,em3` along with `capture.device.params=device=zc:em3,zc:em4`
- For single interface capture: `capture.interface=PFRINGZC,em3`

**Note:** `dpdk migrate` only functions with `PFRINGZC`, not `mmap` interfaces.

If you are using `PF_RING` to capture packets on your Decoder, you can use the Decoder's `dpdk migrate` command to migrate your existing PF_RING capture devices to DPDK. This command uses your currently-selected capture device configuration to determine which network interfaces are moved to DPDK control.

1. Go to (Admin) > Services and select a Decoder.
2. Click > **View** > **Explore**, right-click **decoder** and select **Properties**.
3. From the command drop-down list, select the `dpdk` command, type the parameter `migrate`, and click **Send**.

4. In the command output window, the changes that will be made on the Decoder to perform the migration are displayed. If everything looks correct for the migration, add the parameter `commit=1` to the command after `migrate` to actually make the changes on the Decoder.

5. At the reboot prompt, reboot the host to make the driver loading changes.
6. (Optional) Run the `/decoder/devices/<devicename>/msg=prune` command to remove configuration options for devices and interfaces that no longer exist after the migration.

   **Note:** The `prune` command removes only the undetected interface folders. Also, it ignores the `interfaces`, `stats`, `nwimport`, and `flow_events` folders available in `/decoder/devices/`.

## Manually Move a Capture Interface to DPDK

1. Run the new host service command `/appliance/nicToDp`, that converts a named network interface and sends it to DPDK.
   For example, if you provide `nicToDp` an interface name like `p1p1` it detaches it and sets it up for DPDK to use. It does the following:
   a. Identifies the PCI address of the named interface.

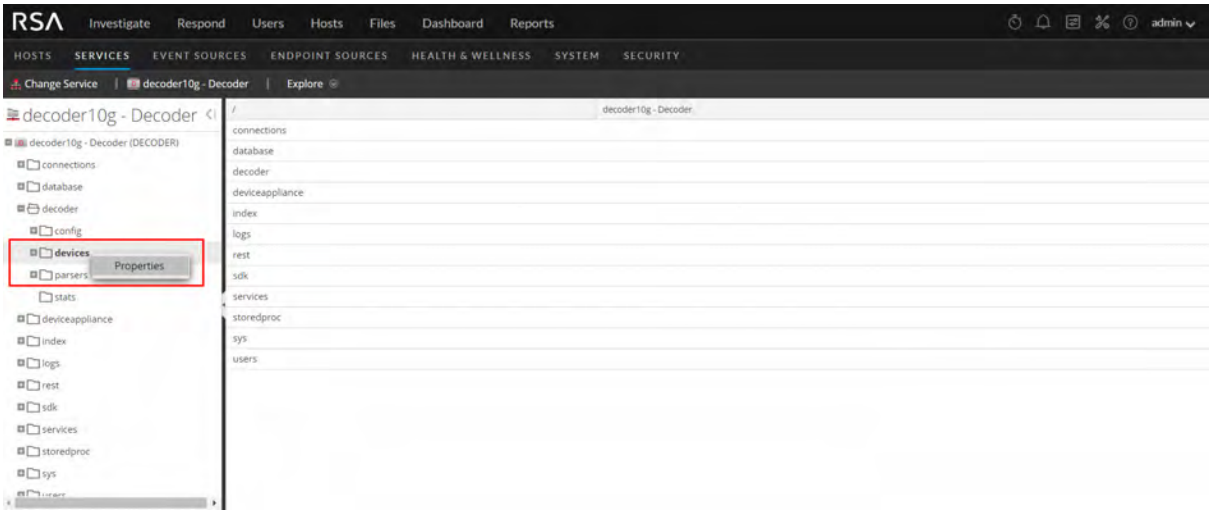
      **Note:** From this point on, the Ethernet interface is identified by its PCI address alone, which is a physical characteristic based on where the Ethernet interface is installed in the computer.

   b. Creates configuration files that describe which PCI addresses DPDK is allowed to use.
   c. Sets up a systemd unit that binds the configured PCI addresses to DPDK instead of to the default Linux drivers on the next system reboot. The following figure shows a successful command.
2. Reboot the Decoder host. The reboot accomplishes the following:
   a. Ensures that live capture on the interfaces stops before the network driver is unloaded.
   b. Binds the `vfio_pci_generic` driver to the configured interfaces.
   c. Pre-allocates some Huge Page memory for each interface, as required by the DPDK libraries.
3. After the reboot, the Decoder does not start capturing, since the network interface it had been using to capture has been moved to DPDK. Change the Decoder's capture configuration to select the DPDK device that is now available. For information about how to change the capture configuration, see Configure Capture Settings.
4. Restart the service. The following figure shows the Decoder configuration after a restart.

## Check the device status and stats of DPDK interfaces

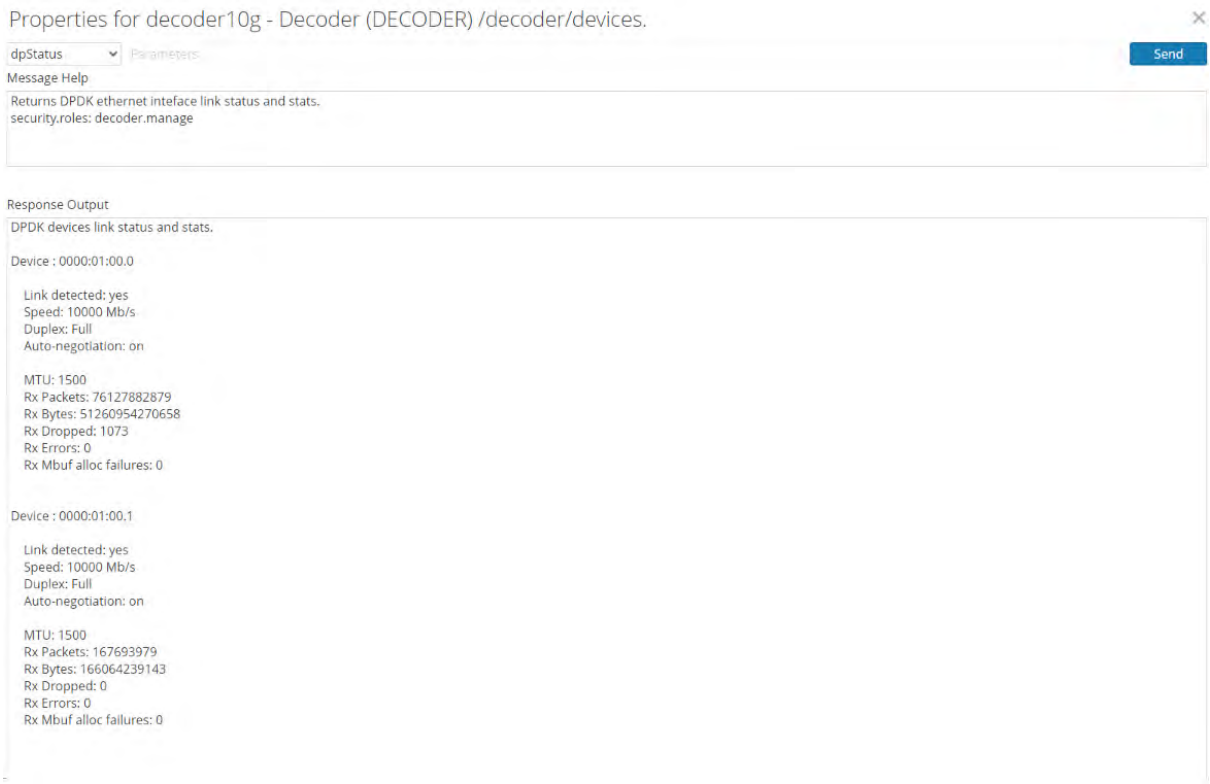
When you capture using DPDK interfaces, the link status and stats of the DPDK can be obtained using the command `/decoder/devices dpStatus`. The traditional commands like `ethtool` or `ifconfig`, which are used for other capture interfaces, will not fetch the link status and stats of DPDK devices.

1. Go to (Admin) > **Services**.
2. In the Administration Services view, select the Decoder and **View > Explore**.
3. Navigate to **decoder > devices**, right click on **devices** and select **Properties**.



4. Select **dpStatus** from the drop-down and click **Send**.

The link status and stats of DPDK devices are displayed in the **Response Output** section.



### Check link status and stats from NwConsole

Run `/decoder/devices dpStatus` on NwConsole. Sample output when capture is in **Start** state:

Sample ouput when the capture is in **Stop** state:

```
Device : 0000:01:00.0
Link detected: no
Device : 0000:01:00.1
Link detected: no
```

## Utilizing Receive Side Scaling with DPDK

Receive Side Scaling (RSS) efficiently distributes the network receive processing across multiple CPUs in a multi-processor system. RSS ensures that the processing associated with a given connection stays on the assigned CPU.

**IMPORTANT:** Receive Side Scaling is supported on DPDK devices using the ixgbe or i40e device drivers only.

### Advantages

When RSS is enabled, the DPDK capture devices split the incoming packet stream into multiple queues providing following benefits:

- Each queue is processed with a dedicated capture worker thread. As there are more threads processing the capture work, it allows more CPU time available for Berkeley Packet Filters (BPF) rule and network rule evaluation.
- Each capture worker thread can feed multiple assemble worker threads simultaneously which allows more CPU time available for assembly.
- Each CPU thread processes only a fraction of the packet stream. However, the total number of packets processed from all queues working in parallel increases the overall output (packets processed per second) of Decoder.

### Configuring Receive Side Scaling

To enable RSS in a DPDK controlled NIC, set the `/decoder/devices/DPDK/(PCI_ID)/config/rss` value to a value greater than `1`. The typical values of RSS must be a small power of 2, for example, `4` or `8`. This value determines the number of CPU threads to be allotted for packet processing during the next capture. Similarly, if assembler threading is enabled, a matching number of assembler threads will be created to process the packets on each incoming queue.

For example, the following sample configuration will utilize a total of eight threads (four capture threads + four assembler threads) for multi-adapter packet capture with DPDK and multi-assembler threading turned on. This is the maximum recommended value for an eight core Decoder CPU.

`assembler.threading.enabled` set to `on` or `true`

`/decoder/devices/DPDK/0000:01:00.1/config/rss=2`

`/decoder/devices/DPDK/0000:01:00.0/config/rss=2`

To minimize packet drops, it is recommended that you keep the total number of capture and assembler threads less than the number of cores per CPU.

### How it Works

When RSS is enabled, Decoder utilizes the RSS hardware acceleration on the capture NIC to apply a symmetric RSS hash function. The hash function sends packets from both directions of a given stream to the same queue. It enables the packets received on that queue to be processed by a dedicated assembler thread. This eliminates the need for Decoder to merge streams from different RSS queues and reassemble the streams. Hence, it is recommended that you enable multi-threaded assembly when using RSS. To enable, set `/decoder/config/assembler.threading.enabled` to `true` or `on`.

## Configure the Decoder Capture Failover in Load Balance Deployments

The DPDK capture in the decoder service provides the ability for load balancers to failover and avoid data loss when decoder capture is off or when the service is shut down due to maintenance activity. When the decoder capture is stopped, the DPDK capture interface link status is downhis provides the ability for the traffic ingestion physical load balancers (for example, IXIA, GigaMon) which monitor interface links to switch to a different decoder and avoid data loss.

### Configuration Failover on DPDK Capture Interfaces

*Refer to the* (Optional) Data Plane Development Kit Packet Capture *topic for instructions to configure DPDK capture on the decoder.*

- You can migrate existing PF_RING devices to DPDK

  (Or)

- Manually move capture interfaces to DPDK

### Disable Wake On LAN (WOL) in BIOS settings

Some load balancers monitor interface link status through NIC link lights. You must disable WOL as the interface will not be down if WOL is enabled. To disable WOL in the BIOS, follow the BIOS instructions.

**Example:** f2 -> Device Settings -> "Integrated NIC 1" (capture interfaces) -> "NIC Configuration" -> "Wake on LAN" = Disabled

**Note:** When you restart the device and if capture does not auto-start, the lights on the capture interface are on. But if you turn on capture and turn it off again the lights will be off.

### (Optional) Remove DPDK on Capture Interfaces

In case you need to revert DPDK on capture interfaces you can use the Appliance service `dpToNic` command.

- If you run this command without arguments, it lists the ethernet devices controlled by DPDK.
  - **Example:** /appliance dpToNic

    DPDK Device List:

    82:00.1 Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection Ethernet Server Adapter X520-2
- If you specify an ethernet interface using the 'eth' parameter, it removes the interface from DPDK so that when the system reboots it will be treated as a normal Linux network interface.
  - Example: /appliance dpToNic eth=82:00.1

    Detaching PCI Device 82:00.1 from DPDK.

    DPDK Device List: A RESTART IS REQUIRED FOR THIS TO TAKE EFFECT

### Validate Link Status

- On Capture Start
  - During the decoder capture start, the service logs DPDK interface link status
    - [DPDK] eth dev 0000:05:00.0 link is up
  - On the upstream traffic ingest Load Balancer, the link status would be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status

- On Capture Stop
  - During the decoder capture stop, the service logs that capture is stopped on DPDK interfaces
    - [Thread] Stopped thread: Capture Work (DPDK, 0000:05:00.0) id: 31214
  - On the upstream traffic ingest Load Balancer, the link status would not be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status.

### DPDK Interface Configuration and Statistics

- The `dpdk-devbind --status` command displays the status of DPDK and other known network interfaces. It displays the PCI domain, bus, slot, and function, along with a text description of the device.
  - Example: `dpdk-devbind --status`
    - 0000:01:00.0 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
    - 0000:01:00.1 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
- The default MTU is 2048. If you need to adjust the MTU for capture, add the `snaplen` parameter to `/decoder/config/capture.device.params` .
- VLAN offload is disabled.
- The DPDK interface capture stats are updated under /decoder/devices/dpdk/
  - Example: /decoder/devices/DPDK/0000:01:00.1/stats/
    - Received packets (Rx packets) - capture.received
    - Received bytes (Rx bytes) - capture.total.bytes
    - Received dropped (Rx dropped) - capture.dropped

## (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even

interfaces that are not configured to do VLAN fixup will have the feature enabled.

- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.

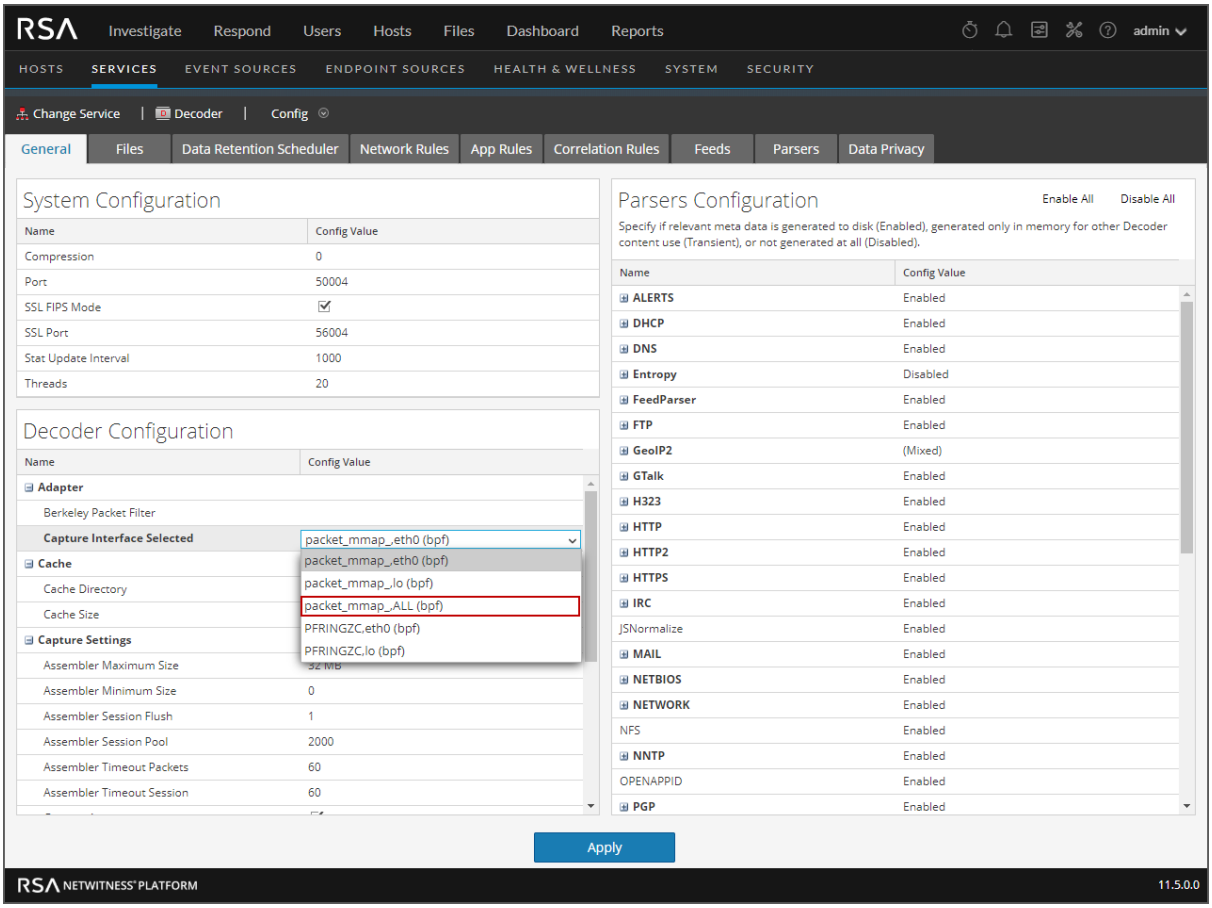
These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed to delineate whitespace. For more information about how to use quotes for whitespace, see the "Connecting to a Service" topic in the *NwConsole User Guide for RSA NetWitness Platform*.
`name1="value1" name2="value2"`.

| Parameter | Value | Effect |
|---|---|---|
| `capture.device.params` | `vlan-fix=true` | VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`. |
| `capture.device.params` | `interfaces=eth0:vlan,eth1` | VLAN fixup performed on traffic capture on `eth0` interface only |
| `capture.device.params` | `interfaces=eth0:vlan,eth1`<br>`vlan-fix=true` | VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting. |

### To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:

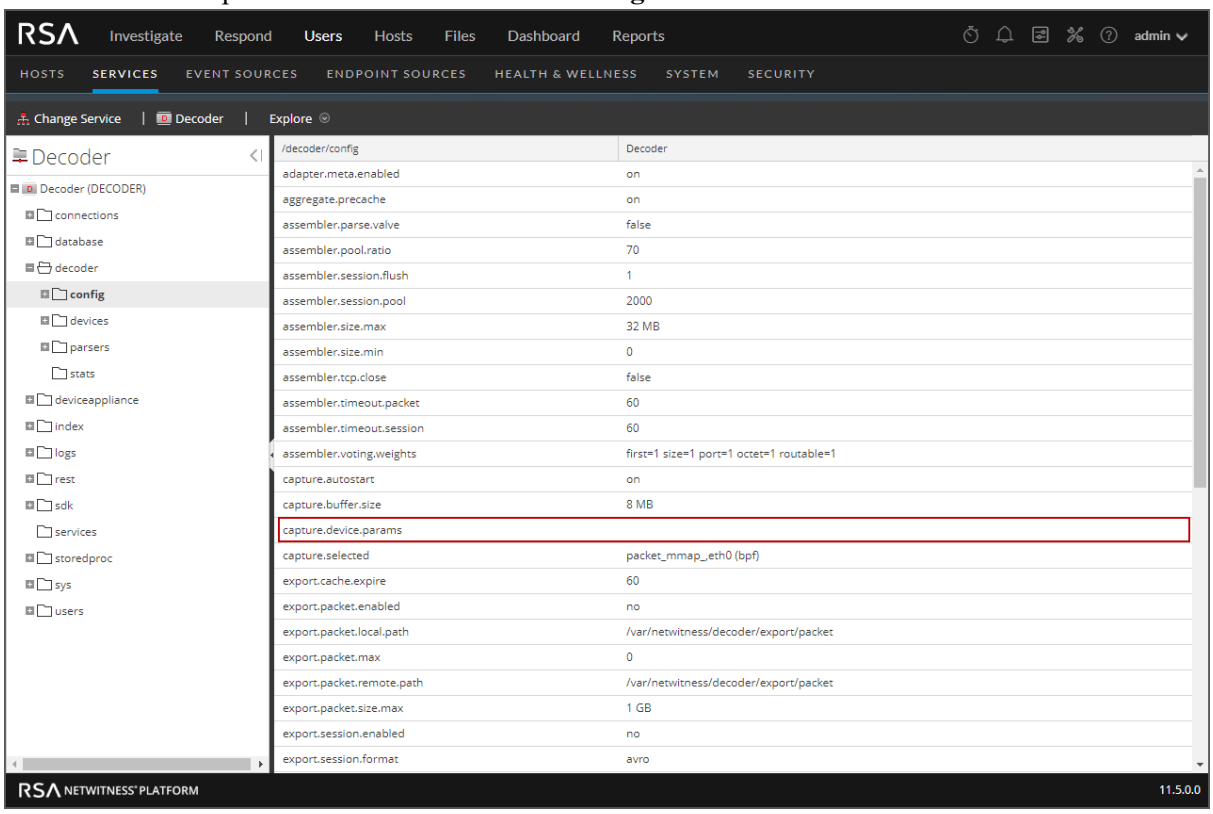
1. Go to (Admin) , select the Decoder service and **> View > Config.**

2. In the **Decoder Configuration** panel, set **Capture Interface Selected** to the `packet_mmap_,ALL` adapter.



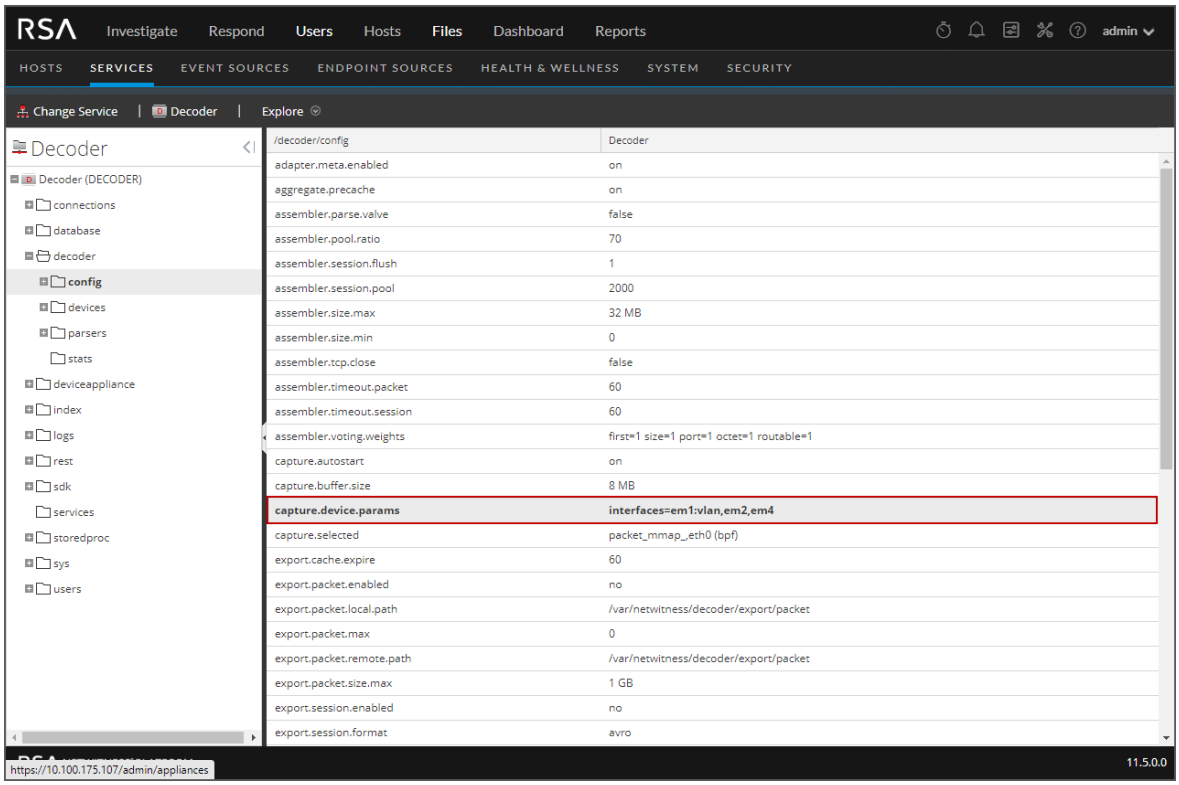
3. To go to the **Explore** view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view select **decoder** > **config**.



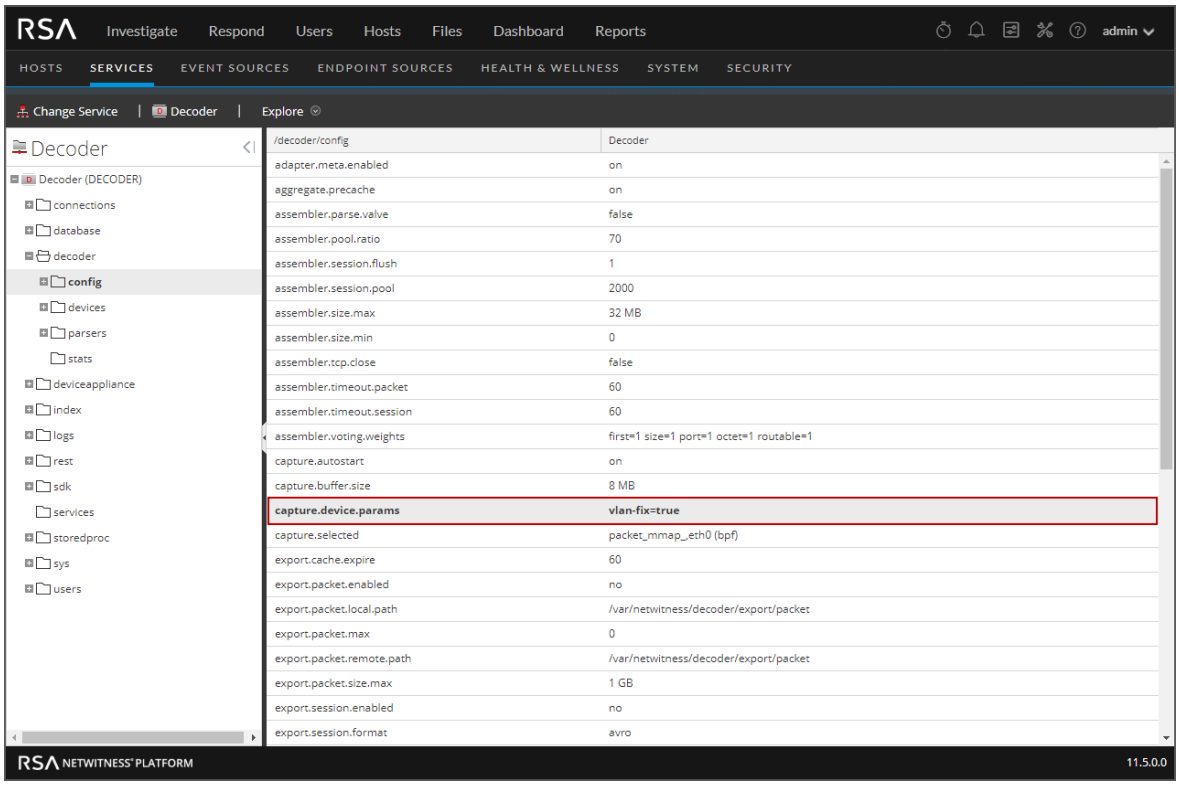
5. Click in the values column next to `capture.device.params`, and do one of the following:

   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**.
     For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`



The change goes into effect after restarting capture; only traffic on `em1` has the VLAN tags preserved.

- To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
  **`vlan-fix=true`**



VLAN tags are preserved on all capture interfaces.

6. Select Start Capture ( Start Capture ). The change takes affect after capture is restarted.

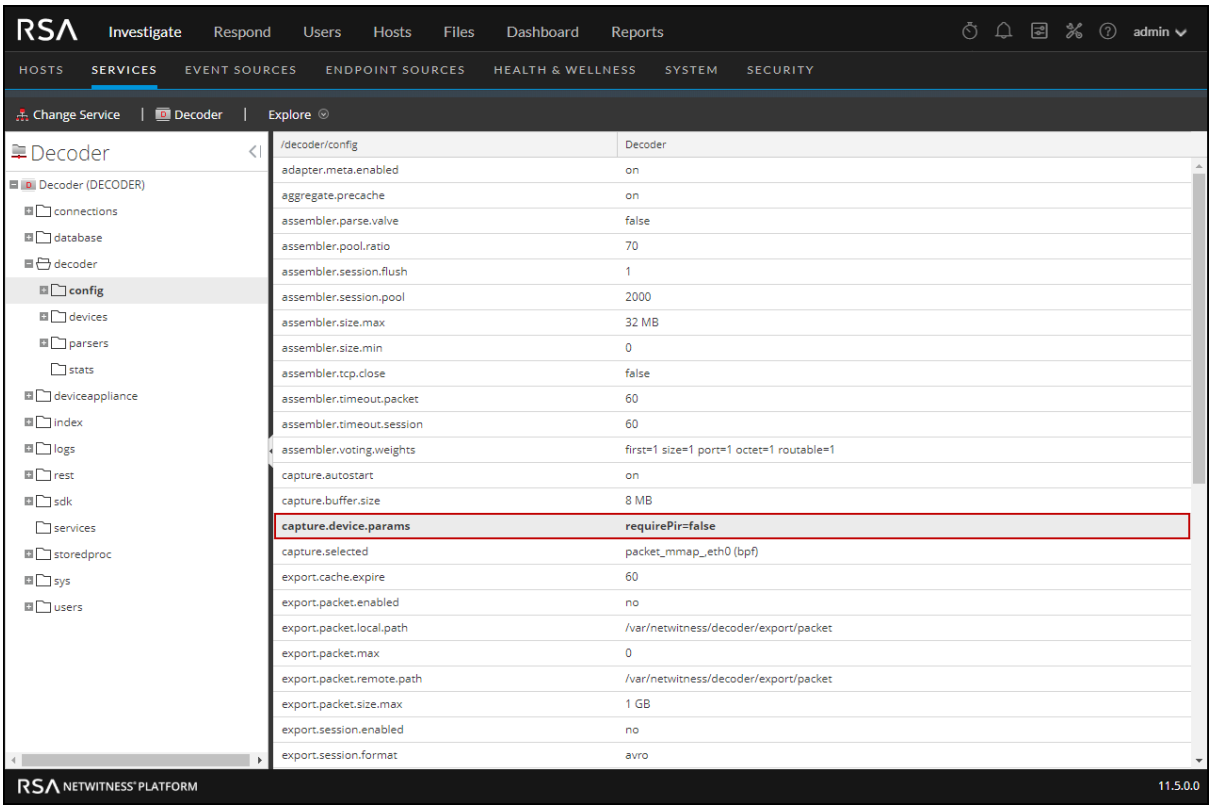
## (Optional) Process Raw Syslog Data without Priority Field

You have the option to process raw syslog data that does not contain a valid priority (`PRI`) field.

### To configure a Log Decoder to process syslog without a Priority field:

1. Go to (Admin) > **Services**, select the Log Decoder service and > **View > System**.
2. Select Stop Capture ( Stop Capture ).
3. From the drop-down menu, where System is shown, select **Explore**.
4. Select **decoder** > **config**.
5. In the `capture.device.params` field, add the following text, and then click **Enter** to save the changes:

   `requirePri=false`



6. From the drop-down menu, where Explore is shown, select **System**.
7. Select Start Capture ( Start Capture ). The change takes affect after capture is restarted.

## (Optional) Configure Decoder to Support OpenAppID

The NetWitness Decoder can identify applications using the OpenAppID detectors. OpenAppID from Cisco is an application-layer network security plug-in for Snort (an open source network intrusion detection system). It is a set of open source Lua libraries (detectors) that identifies applications in the network traffic.

When Network Decoder detects an application with an OpenAppID detector, the `appid` meta is created. The value of the `appid` meta helps in identifying the application as it is the application's entry in the `appMapping.data` file. The `appMapping.data` file is part of the OpenAppID distribution and contains metadata of the application detectors.

**Note:** By default, all detectors are disabled to avoid any negative impact on the performance.

### To configure the OpenAppID detectors:

**IMPORTANT:** Ensure that you enable only the required OpenAppID detectors. Enabling all the OpenAppID detectors can reduce the performance. Before you enable any detector, understand your application detection requirements and enable only the specific detectors. For example, enabling the `service_*` detector or any other detector that attempts to match short generic patterns can cause severe impact on the performance.

1. Download the OpenAppID source package (`snort-openappid.tar.gz`) from the Snort Downloads (https://www.snort.org/downloads) page.
2. Upload the OpenAppID source package to the network decoder (`http://<networkdecoder>:50104/decoder/parsers/upload`), which can be accessed using the REST interface.
   Once uploaded, decoder will extract the package to an appropriate folder. The default folder is `/etc/netwitness/ng/odp`.
3. To enable detectors, modify the `/decoder/parsers/config/openappid.enabled` file with a combination of detector filenames or wildcards, separated by commas. For example, `client_*, payload_slashdot.lua, payload_reddit.lua`.
   The following table describes the detector group filenames and their functions. You can extract the complete set of detectors from the OpenAppID source package (`snort-openappid.tar.gz`) or it can be viewed on the Decoder file system at `/etc/netwitness/ng/odp/lua`.

| Detector Group Filename | Description |
|---|---|
| `client_*` | Detectors for client applications (for example, Facebook, MacAppStore). |
| `content_group*` | Detectors for a specific type of network attribute such as protocol, port, or service (for example, port_services which contains many services identified by their common ports). |
| `payload_*` | Detectors for the host based traffic (for example, Hulu, Reddit). |
| `service_*` | Detectors for service applications (for example, Minecraft, VNC). |
| `ssl_host_group_*` | Detectors for SSL hosts logically grouped together (for example, 334 which contains many ecommerce websites). |

4. Ensure that you specify the detector filenames correctly. If you specify an incorrect filename, the detector will not load. The following table lists some good and bad file naming conventions and their status on subsequent loading.

| Detector Group Filename | Status |
|---|---|
| `client_9P.lua` | loaded |
| `client_9p.lua` | not loaded (Linux only) |
| `client_9P` | not loaded |
| `client_` | loaded |

| Detector Group Filename | Status |
|---|---|
| 9P* | |
| client_9P.* | loaded |
| lient_9P.lua | not loaded |
| lient_9P.* | not loaded |
| *lient_9P.lua | loaded |

5. Once the required detectors are enabled, reload the parser to load the detectors. The following example message will confirm that the detectors and enabled successfully.
```
2020-May-14 17:03:37 [OpenAppID] 59 detectors loaded out of 59
```

# Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

You should only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention.
- Not having extra (unnecessary) log parsers deployed reduces the potential for mis-identification of messages.

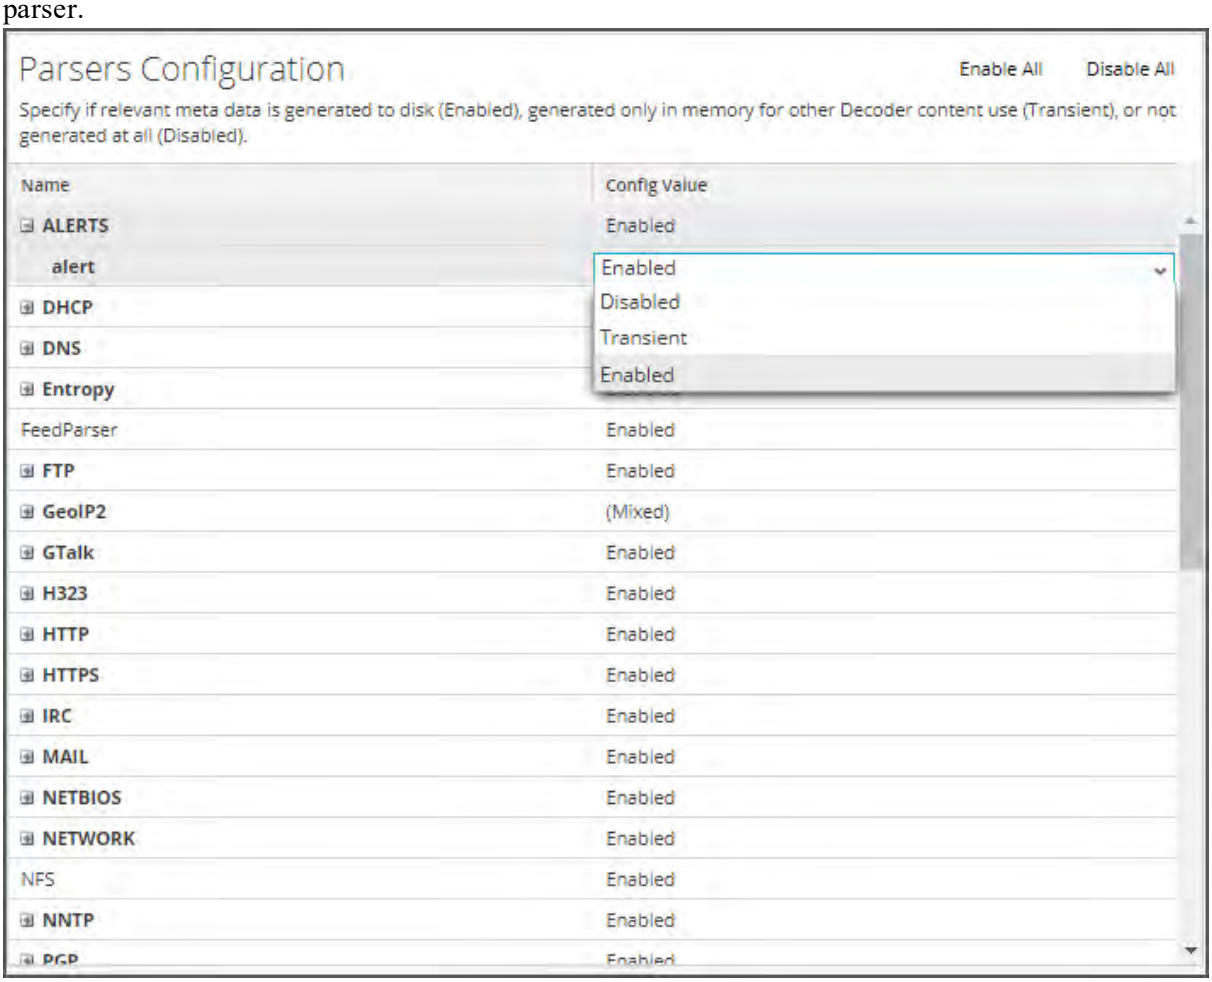
The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

| Option | Description |
|---|---|
| **Enable All**<br>**Disable All** | These options provide a way to quickly select either all parsers or no parsers. |
| **Name** | The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create. |
| **Config Value** | A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**.<br>• When **Enabled**, the Decoder is using the parser to filter traffic.<br>• When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*).<br>• When **Disabled**, the Decoder is not using the parser.<br>If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create. |

**Note:** For a Log Decoder, you must have previously deployed log parsers from Live. See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the Master Table of Contents to find all RSA NetWitness Platform 11.x documents.

### To enable or disable a parser, or to view the status for each parser:

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and **>View** > **Config**.
3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.



4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.

When you click **Apply**, note that all parsers are reloaded into NetWitness. The status for each parser is updated, based on your selections.

# Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

**Note:** The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.

### To start and stop capture:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service, and select > **View** > **System**.
3. In the toolbar, click **Start Capture**.

   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.

   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.

   Packet or log capture ceases, and the option to upload a file to the service is again available.

**Note:** When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (`/decoder stop`), passing the parameters `flush=false` before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

# Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the **Services Config view** > **Rules** tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Core Services must follow.

By default, no rules are defined when you first install NetWitness. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on Network Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness services, simplifying the deployment and configuration of multiple services.

## Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

## Rule and Query Guidelines

All queries and rule conditions in RSA NetWitness Core services must follow these guidelines:

**All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.**

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

**Note:** The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

## Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

| Rule Name | Condition |
|---|---|
| ComplianceDevices | `device.group='PCI Devices' \|\| device.group='HIPPA Devices'` |
| HighValueWindows | `device.group='Windows Compliance'` |
| MediumValueWindows | `device.type='winevent_nic' && msg.id='security_4624_security'` |

| Rule Name | Condition |
|---|---|
| LowValueWinLogs | `device.type='winevent_nic' && msg.id='security_4648_security'` |
| LowValueProxyLogs | `device.class='proxy' && msg.id='antivirus_license_expired'` |
| GeneralWindows | `device.type='winevent_nic'` |

## Invalid Rules

NetWitness uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness logs indicating the error.

**Note:** NetWitness 11.x does not support parsing of legacy syntax rules (as version 10.6 did). After you update to NetWitness 11.x, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness generates a Health and Wellness alert to indicate that you need to fix the rules.

## General Syntax Guidelines

- All text values must quote literal values. Example: `user = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it using double quotes. Example: `user = "User's"`

The following are valid syntax rules:

- All time values should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- Everything else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

# Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key.

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=ioc name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=ioc
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

| Left Operand Format | Operator | Right Operand Format | Description |
|---|---|---|---|
| any | = | compatible with left operand | Equality operator. You can use values or meta keys on the right side of the equality operator. |
| any | != | compatible with left operand | Inequality operator. You can use values or meta keys on the right side of the inequality operator. |
| any | < | compatible with left operand | Less than operator. You can use values or meta keys on the right side of this operator. |

| Left Operand Format | Operator | Right Operand Format | Description |
|---|---|---|---|
| any | `<=` | compatible with left operand | Less than or equal to operator. You can use values or meta keys on the right side of this operator. |
| any | `>` | compatible with left operand | Greater than operator. You can use values or meta keys on the right side of this operator. |
| any | `>=` | compatible with left operand | Greater than or equal to operator. You can use values or meta keys on the right side of this operator. |
| text | `contains` | text | Find values that contain the right operand. You can use meta keys or values on the right side of this operator. |
| text | `begins` | text | Find values that begin with the right operand. You can use meta keys or values on the right side of this operator. |
| text | `ends` | text | Find values that end with the right operand. You can use meta keys or values on the right side of this operator. |
| text | `length` | integer | Find strings of a certain length. You can use meta keys or values on the right side of this operator. |
| any | `count` | integer | Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator. |
| any | `ucount` and `unique` | integer | Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with five unique values and three of the same value, the `ucount` is six. |
| N/A | `exists` | any | Finds any values for the meta key. You can use meta keys or values on the right side of this operator. |
| N/A | `!exists` | any | Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator. |
| text | `regex` | text | Finds values matching a regular expression. You can use values on the right side of this operator. |

The following table summarizes other syntax elements used in rules.

| Syntax element | Description |
|---|---|
| * | Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic. |
| u | Upper bound of a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be:<br>`tcp.port = 40000-u` |
| l | Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be:<br>`tcp.port = l-40000` |
| - (dash) | Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be:<br>`tcp.port = 25-443` |
| , (comma) | Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax:<br>`tcp.port = 1-10,25,110,143-225,40000-u` |
| ( ) | Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1:<br>`(alias.ip=192.168.1.1 && tcp.port=80) \|\| (alias.ip=10.10.10.1 && tcp.port=443)` |
| ~ | Logical NOT operator, a negation of an expression. |
| && | Logical AND operator, a conjunction of two expressions. |
| \|\| | Logical OR operator, a disjunction of two expressions. |

## Configure Capture Rules

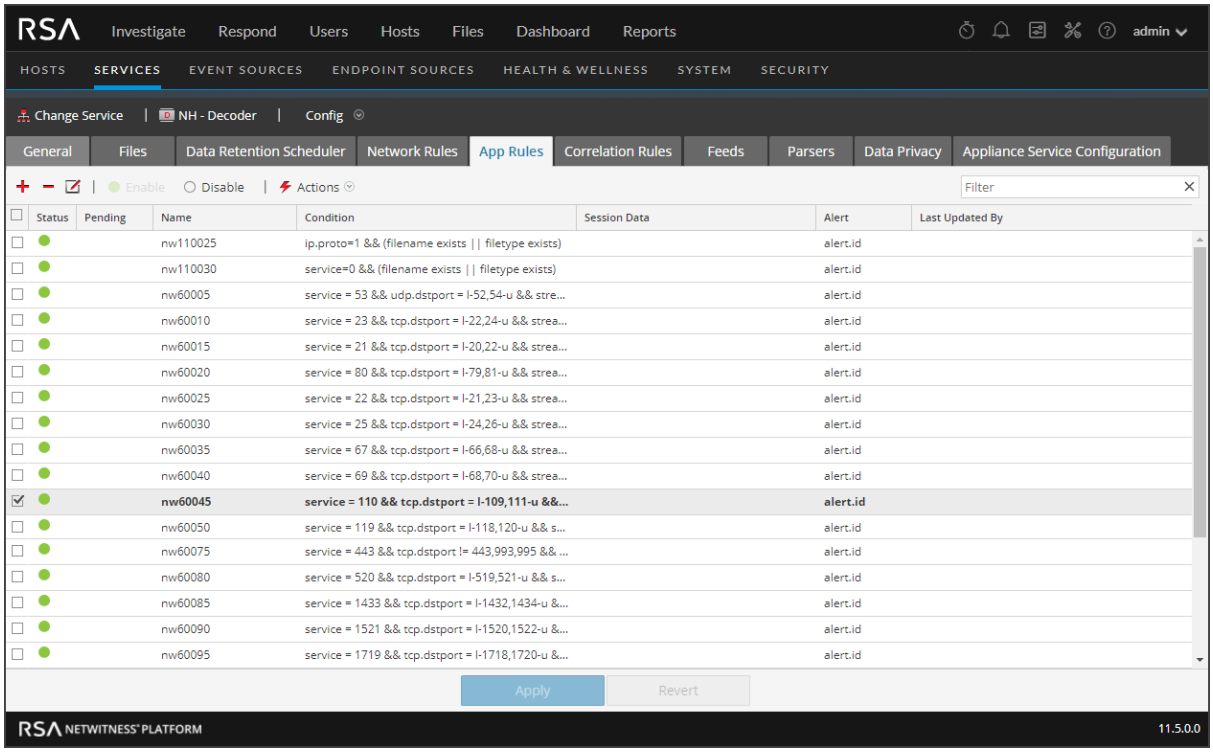
The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file

- Push rules to another service
- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

### To configure rules in the Rules tabs

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder service and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The rules list for the selected rule type is displayed.



Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.

- Until changes are applied, you can discard edits to the list and revert to the unedited rules.
- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

### To add a rule in any Rules tab, do one of the following:

- Click .
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

### To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click  .
   The selected rules are removed from the list, but still exist on the service.

### To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click or double-click the rule row.
   The Rule Editor dialog for that type of rule is displayed.

### To disable a rule:

1. From any Rules tab, select the rules to disable.
2. Click 
   .
   The status changes to disabled in the rules list, but the rule is still enabled on the service.

### To enable a rule:

1. From any Rules tab, select the rules to enable.
2. Click 
   .
   The status changes to enabled in the rules list, but the rule is still disabled on the service.

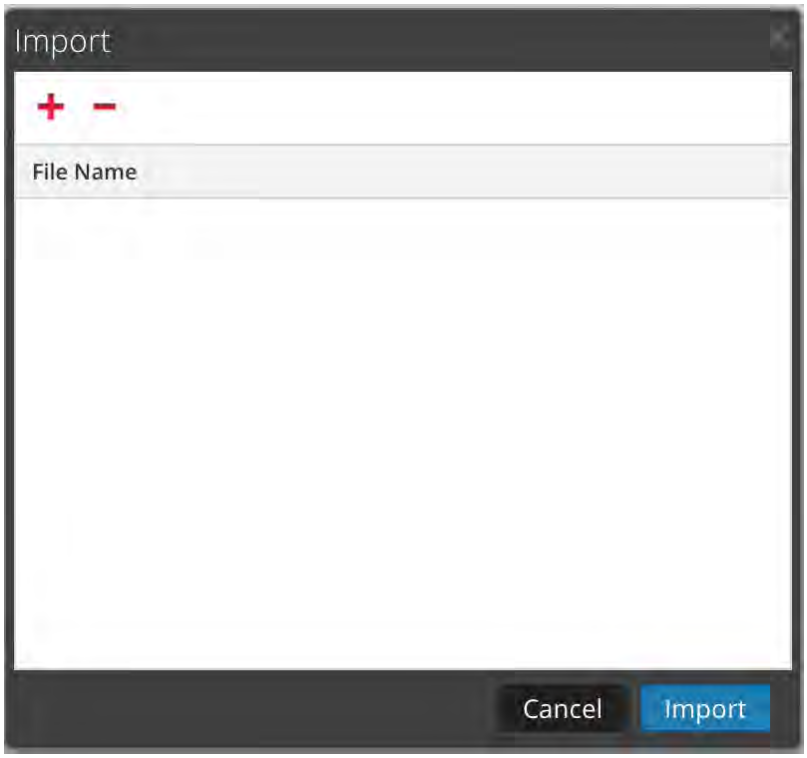
## Import Rules from a File and Export Rules

You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.

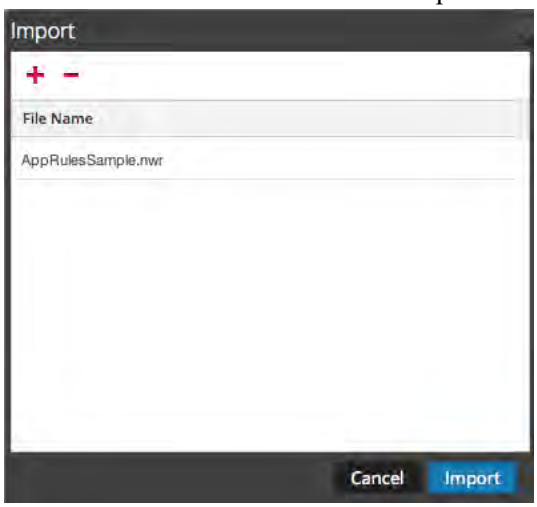
When you attempt to import a group of rules, NetWitness Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

### To import rules to a service:

1. From any Rules tab, select Actions > Import.
   The Import dialog is displayed.



2. Click +.
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.



4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.
6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

### To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 
 **> Export > Selection**. (**Export > All** exports all rules in the rules list even if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.

     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

## Push Rules to Other Services

You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

### To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
