

# Warehouse Connector Configuration Guide

for Version 11.0

## **Contact Information**

RSA Link at <https://community.rsa.com> contains a knowledgebase that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

## **Trademarks**

For a list of RSA trademarks, go to [www.emc.com/legal/emc-corporation-trademarks.htm#rsa](http://www.emc.com/legal/emc-corporation-trademarks.htm#rsa).

## **License Agreement**

This software and the associated documentation are proprietary and confidential to EMC, are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by EMC.

## **Third-Party Licenses**

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## **Note on Encryption Technologies**

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## **Distribution**

EMC believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

November 2017

## How Warehouse Connector Works

---

Warehouse Connector collects meta and events from Decoder and Log Decoder and writes them in AVRO format into a Hadoop-based distributed computing system. You can set up Warehouse Connector as a service on existing Log Decoders or Decoders.

The Warehouse Connector contains the following components:

- Data Source
- Destination
- Data Stream

### Data Source

A data source is the service from which the Warehouse Connector collects data to store in the destination. The supported data sources are Log Decoder and Decoder services. The Log Decoder collects log events and the Decoder collects packet and meta exclusively.

### Destination

Destination is the Hadoop-based distributed computing system that collects, manages, and enables reporting on security data. The following are the supported destinations:

- RSA NetWitness Warehouse (MapR) deployments
- HortonWorks Data Platform
- Any Hadoop-based distributed computing system that supports WebHDFS or NFS mounting of HDFS file systems.
  - Example: Commercial MapR M5 Enterprise Edition for Apache Hadoop

### Data Streams

A data stream is a logical connection between the data source and destination. You can have multiple streams for different subsets of data collected. You can setup streams to segregate data from multiple Decoder and Log Decoder services. You can create a stream with multiple data sources and a single destination or with a single data source and destination.

The Warehouse Connector does the following:

- Aggregates session and raw log data from Decoders and Log Decoders.
- Transfers the aggregated data into supported destinations like Hadoop based deployments.
- Serializes the aggregated data that includes both schema and data into AVRO format.

In addition the Warehouse Connector also supports the following:

## Meta Filters

Meta filters enables you to filter the meta keys that should be written into the Warehouse. For more information, see [Specify Meta Filters](#).

## Support for Multi-Valued Meta Keys

RSA NetWitness Warehouse supports multi-valued meta keys. The multi-valued meta keys is the meta field with the array type. You can use the meta keys library to determine the meta fields of type array and write HIVE queries with the correct syntax for arrays. By default, the following meta keys are treated as multi-valued and are defined in the file, **multivalue-bootstrap.xml** located at **/etc/netwitness/ng** in the Warehouse Connector:

- alias.host
- action
- username
- alias.ip
- alias.ipv6
- email
- device.group
- event.class

## Checksum Validation

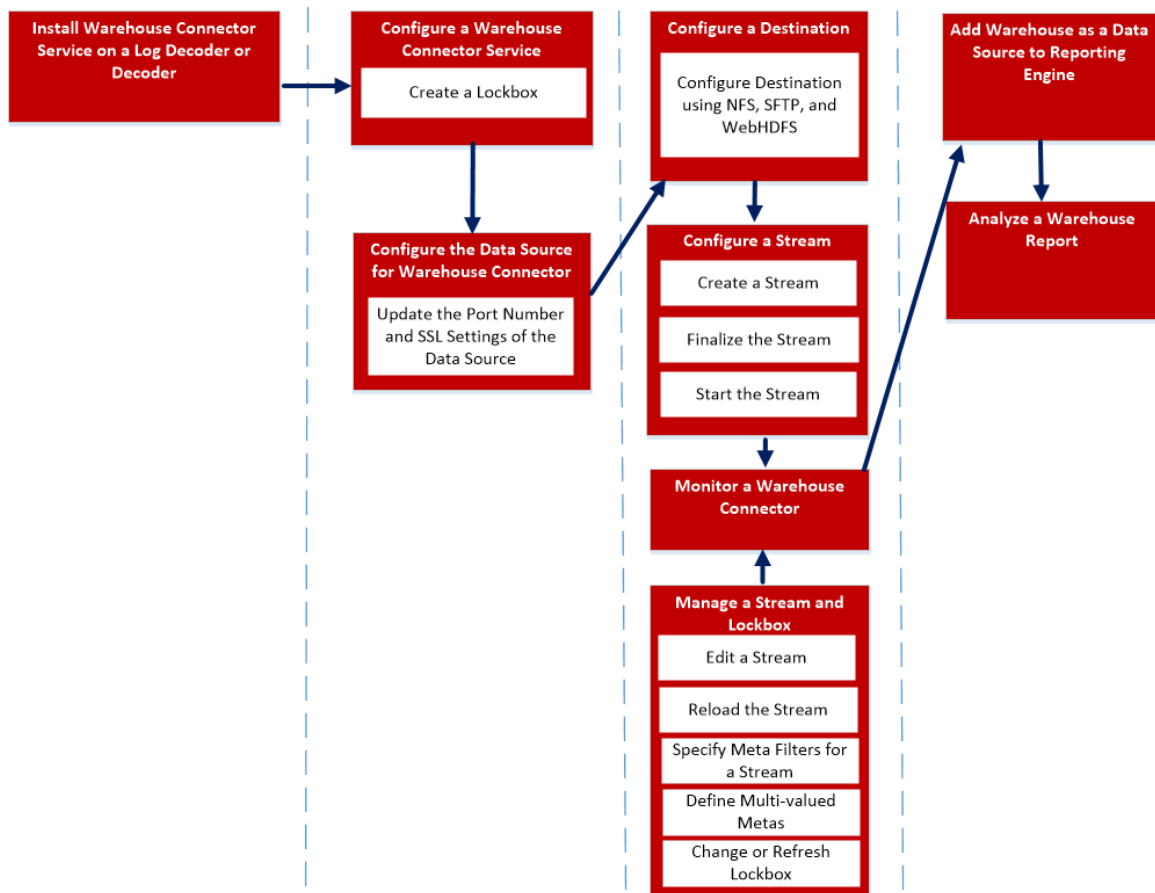

Warehouse Connector enables you to validate the file integrity of the AVRO files that are transferred from the Warehouse Connector to the data destinations. You need to enable checksum validation while you configure the Warehouse Connector.

## Lockbox Support

Lockbox provides an encrypted file that Warehouse Connector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector for the first time.

You can implement Warehouse Connector by setting up Warehouse Connector as a service on your existing Log Decoder or Decoder hosts.

The following is an overview of the entire process of installing and configuring the Warehouse Connector service on Log Decoder or Decoder, configuring the Warehouse Connector service on NetWitness, configuring data sources, destinations, streams for Warehouse Connector, and configuring alert notifications on NetWitness.

To install and configure the Warehouse Connector service, perform the following:

1. Install Warehouse Connector service on a Log Decoder or Decoder
2. Configure a Warehouse Connector service
3. Configure the Data Source for Warehouse Connector
4. Configure a Destination
5. Configure a Stream
6. Monitor a Warehouse Connector
7. Add Warehouse as a Data Source to Reporting Engine
8. Analyze a Warehouse Report
9. Manage a Stream and Lockbox

# Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid

---

To install (fresh install) the Warehouse Connector service on a Log Decoder or Decoder or Hybrid:

1. Log on to the Log Decoder or Decoder host.
2. Enter the following command on NetWitness Server:

```
warehouse-installer --help
```

The command line interface (CLI) usage descriptions are displayed.

**Note:** If you install Warehouse Connector on a host updated to a version beyond 11.0.0.0, you must specify the host version.

3. To get the host version, execute the following command:

```
upgrade-cli-client -list
```

4. Install Warehouse Connector service by executing either of the following commands:

```
warehouse-installer --host-addr 10.0.0.0 --version 11.0.0.2
```

```
warehouse-installer --host-id 5928b9d8-83be-4143-9602-fa936de5c41e
```

```
warehouse-installer --host-name NW11AdminServer
```

Where,

10.0.0.0 - IP address of the Host

11.0.0.2 - Host version

5928b9d8-83be-4143-9602-fa936de5c41e - Host ID

NW11AdminServer - Host name

The Warehouse Connector service is successfully installed on the Log Decoder or Decoder or Hybrid.

## Configure a Warehouse Connector Service

You can configure the Warehouse Connector service using the following procedure.

To set the Lockbox password:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.
4. In the Services Config view of Warehouse Connector, click the **Lockbox Settings** tab.

5. In the **Create New Lockbox** section, perform the following:
  - a. In the **Lockbox Password** field, enter the new lockbox password.

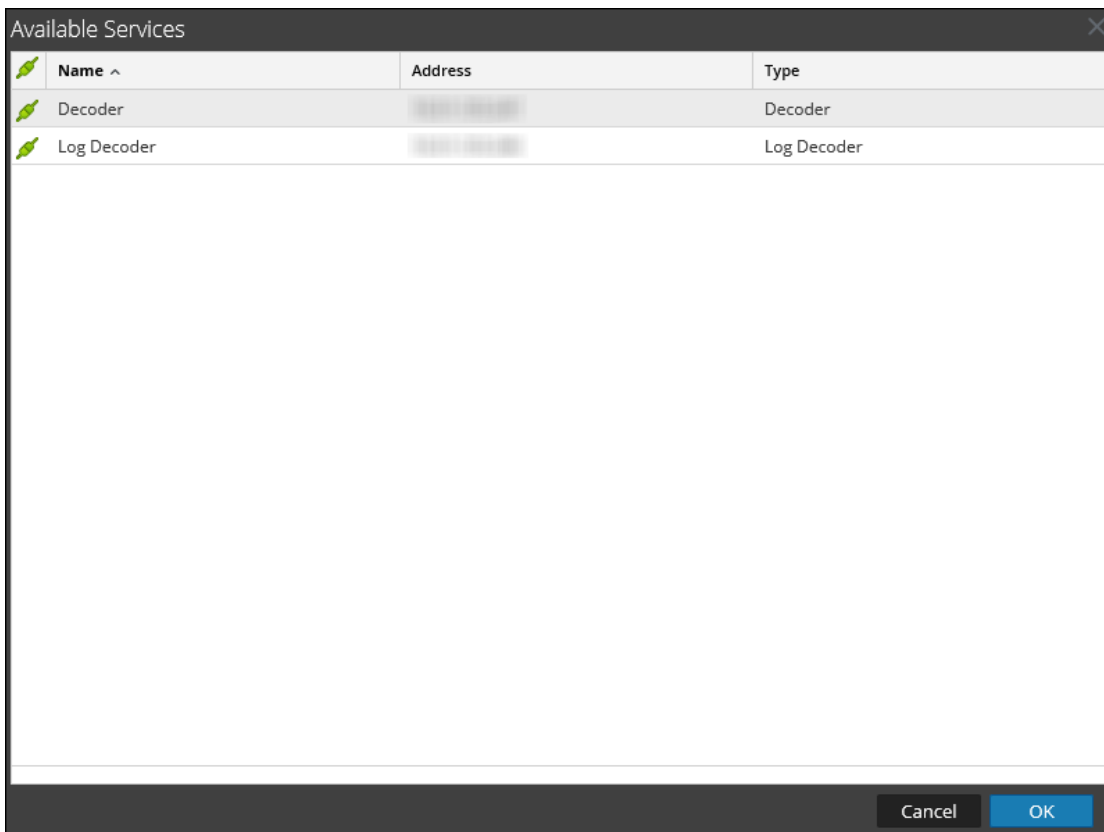

**Note:** The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

- b. In the **Confirm Lockbox Password** field, enter the added lockbox password to confirm.
- c. Click **Apply**.  
The Lockbox password is set.

## Configure the Data Source for Warehouse Connector

To configure the data source:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.  
The Services Config view of Warehouse Connector is displayed.
4. On the **Sources and Destinations** tab, in the **Source Configuration** section, click .

5. In the **Available Services** dialog, select the Log Decoder or Decoder services that you want to add as a source to the Warehouse Connector service and click **OK**.  
The selected Log Decoder and Decoder services are listed in the **Source Configuration** section.

## Update the Port Number and SSL Settings of the Data Source

If there is change in the port number or SSL settings of the data sources used in the Warehouse Connector, you can directly update these details in Warehouse Connector, using the Explore view of the Warehouse Connector.

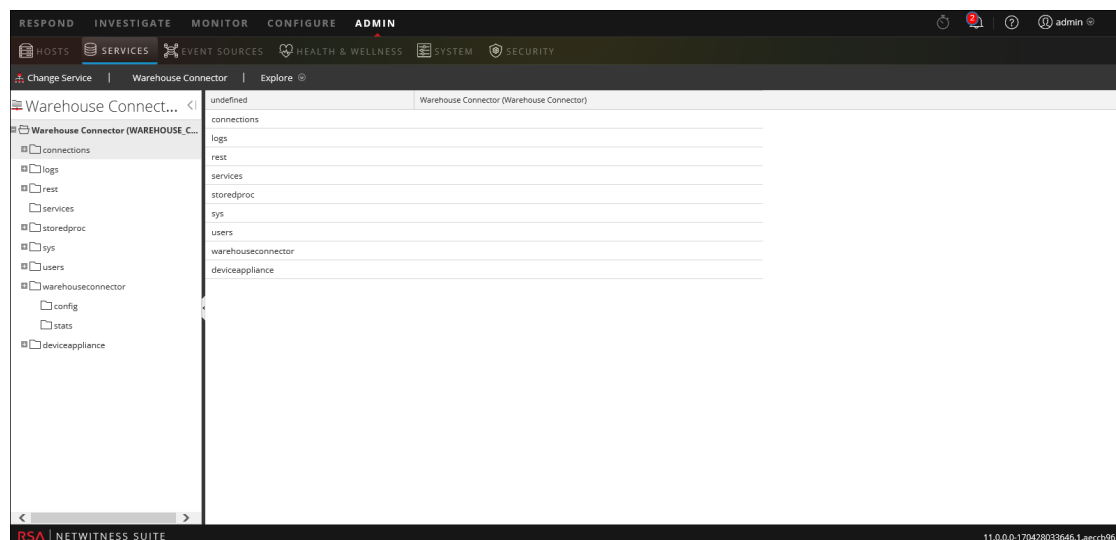

Make sure that:

- You have the updated port number or SSL settings of the data source.
- You stop the streams related to the data source that you want to update the port number or SSL settings.

To update the port number or SSL settings:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select  **> View > Explore**.

The Service Explore view of Warehouse Connector is displayed.

4. Navigate to **warehouseconnector/sources**, right-click the source, and click **Properties**. The Properties section of the source is displayed.

5. In the drop-down menu, select **update**. In the Parameters field, perform the following:

- To update the port number of the source, enter `port=<new_source_portnumber>` and click **Send**.

Parameters | `port=443` **Send**

- To update the SSL settings of the source, enter `ssl=<new_ssl_settings>` and click **Send**.

Parameters | `ssl=on` **Send**

**Note:** You can also update the port number and ssl settings simultaneously by adding space between the parameters.

Parameters | `port=443 ssl=on` **Send**

6. Restart the Warehouse Connector service.

7. Start the streams.

## Configure the Destination

---

You can configure the destination using NFS, SFTP, and WebHDFS.

You must configure the destination to which the Warehouse Connector service needs to write the collected data using NFS:

- RSA NetWitness Warehouse (MapR) deployments
- Commercial MapR M5 Enterprise Edition for Apache Hadoop deployments

You must configure the Warehouse Connector to write to a remote destination using Secure File Transfer Protocol (SFTP). The remote destination can be a remote server that is NFS mounted to the MapR cluster or it can be a remote staging server.

By default, in the remote destination the Warehouse Connector writes data in the following directory structure:

- `/<staging_folder>/rsasoc/v1/sessions/data/<year>/<month>/<day>/<hour>/`
- `/<staging_folder>/rsasoc/v1/logs/data/<year>/<month>/<day>/<hour>/`

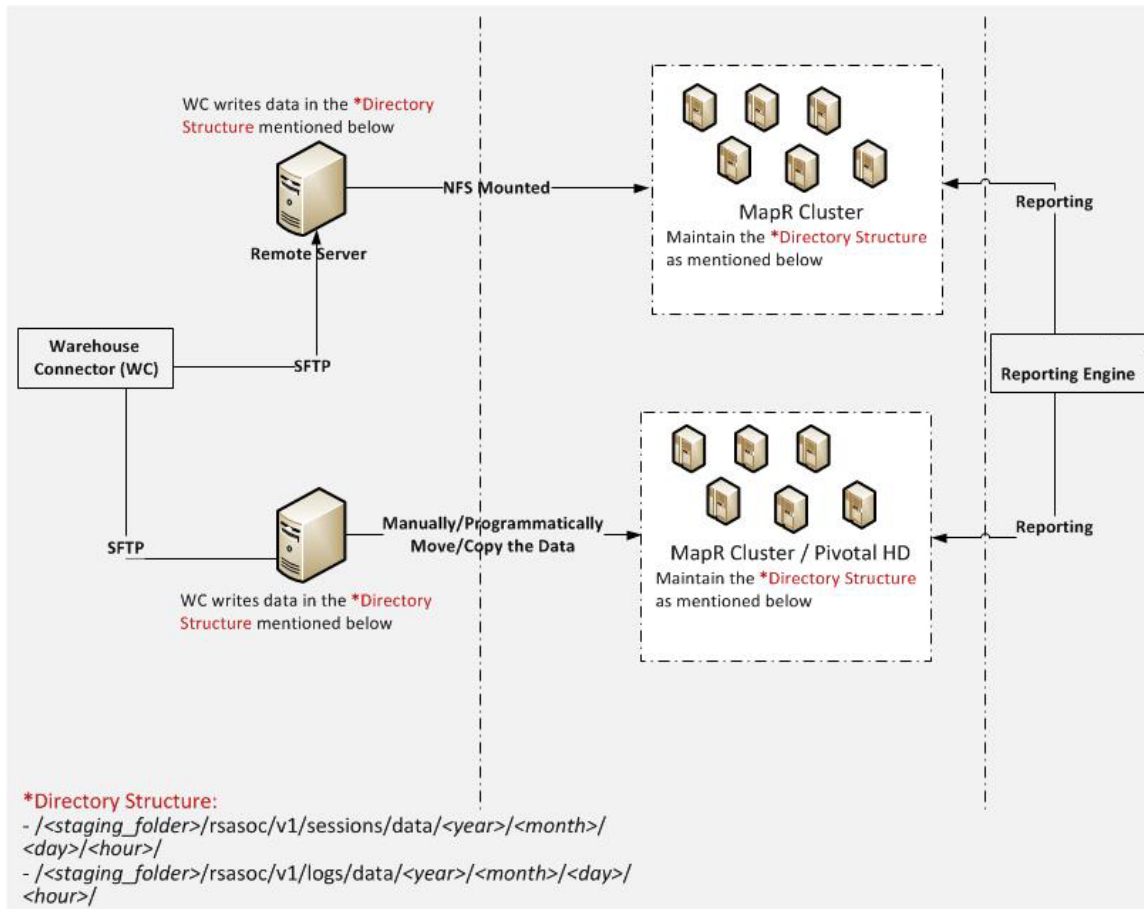

Where `<staging_folder>` is the folder on the remote server where the Warehouse Connector writes the data.

If you are using a remote staging server as the remote destination, you need to manually copy or move the directory structure to any of the following deployments:

- RSA NetWitness Warehouse (MapR)
- Commercial MapR M5 Enterprise Edition for Apache Hadoop
- HortonWorks HD

To generate reports from the data written by Warehouse Connector, make sure that in your Hadoop deployment you maintain a similar directory structure that is created by Warehouse Connector in the remote destinations.

The following illustration describes how you can use SFTP to write data from Warehouse Connector to a remote destination.

You must configure the Warehouse Connector service to write the collected data to a Hadoop-based distributed computing system that supports WebHDFS.

## Configure the Destination Using NFS

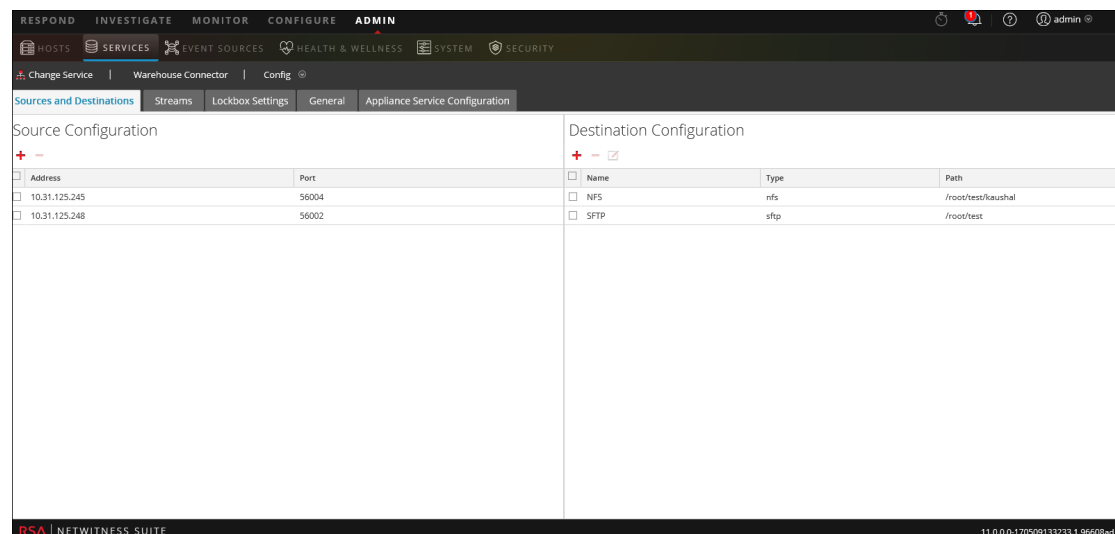

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Set up NFS on Warehouse Connector. For more information on how to set up NFS on Warehouse Connector, see the 'Configure Warehouse Connector to Write to Warehouse' in the *Warehouse (MapR) Configuration Guide*.

To configure the destination using NFS:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the Warehouse Connector service, and select  > **View > Config**.

The Services Config View of Warehouse Connector is displayed.

4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, select NFS from the **Type** drop-down list.
6. In the **Name** field, enter a unique symbolic name for the destination.

**Note:** The **Name** field does not support spaces or special characters except underscore (\_).

7. In the **Local Mount Path** field, enter the locally mounted directory for HDFS where you want the Warehouse Connector to write the data.

For example:

If **/saw** is the local mount point for HDFS that you have configured while mounting the mapr NFS cluster on the host where you have installed the Warehouse Connector service to write to RSA NetWitness Warehouse (MapR), create a directory named **Ionsaw01** under **/saw** and the corresponding Local Mount Path for the destination would be **/saw/Ionsaw01**.

For more information, see the **Mount the Warehouse on the Warehouse Connector** topic in the *Warehouse (MapR) Configuration Guide*.

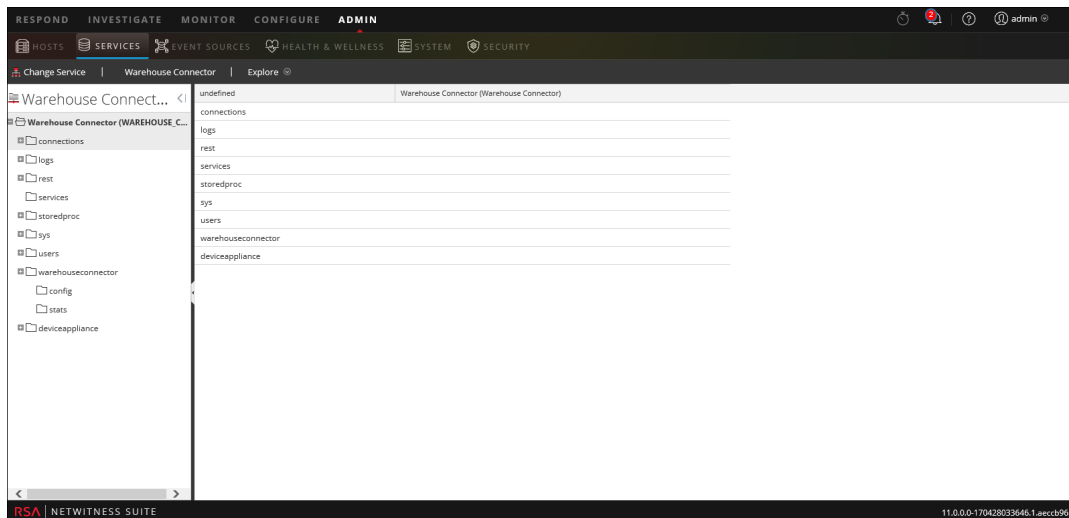

The **/saw** mount point implies to **/** as the root path for HDFS. The Warehouse Connector writes the data to **/Ionsaw01** in HDFS.

8. Click **Save**.
9. (Optional) If you want to enable checksum validation, perform the following:
  - a. In the main menu, select **ADMIN > Services**.

- b. In the Services view, select the added Warehouse Connector service, and select  > **View > Explore**.

The Explore view of Warehouse Connector is displayed.

- c. In the options panel, navigate to **warehouseconnector/destinations/nfs/config**.
- d. Set the parameter **isChecksumValidationRequired** to **1**.

- e. Restart the respective stream.

## Configure the Destination Using SFTP

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- For the SFTP destination type, the destination host should be listed in the `/root/.ssh/known_hosts` file used by the ssh service (for example, sshd) running on the Warehouse Connector.

## Add Destination from Warehouse Connector Host

To add the destination host to the `/root/.ssh/known_hosts` file, from the Warehouse Connector host, initiate a secure connection to the destination host:

1. Login to the Warehouse Connector.
2. Enter `ssh root@<SAWIP>` or `ssh username@<SAWIP>`.
3. Select **Yes** and enter the password.
4. Add the host key in the `/root/.ssh/known_hosts` file

**Note:** After you upgrade Warehouse Connector to 11.0, you must make sure that the destination host is listed in the `/root/.ssh/known_hosts` file used by the ssh service (i.e. sshd) running on the Warehouse Connector. If you do not perform this action, the streams configured with SFTP in Warehouse Connector will not start.

- If you want to use SFTP to write data into the destination using SSH key-based access, you need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node. For more information, see **Configure SSH Keys** below.

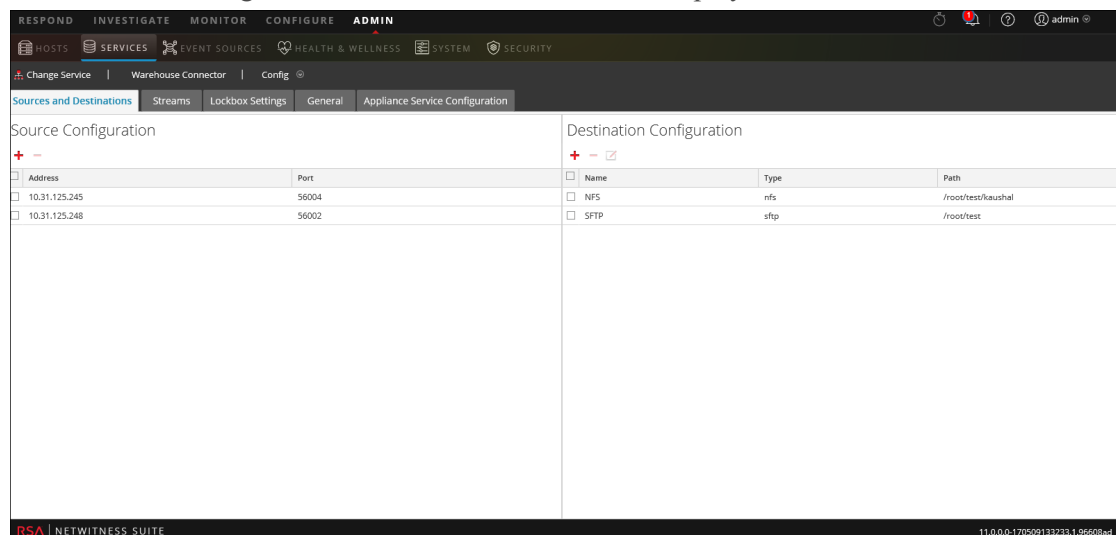

**Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between warehouse connector and the warehouse nodes.

## Configure Warehouse Connector to Write to a Remote Destination

To configure the destination:

1. Log on to NetWitness
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, select **SFTP** from the **Type** drop-down list.

The 'Add Destination' dialog box is shown with the following fields:

- Type \***: SFTP (selected from a dropdown menu)
- Name \***: (empty text field)
- Host \***: (empty text field)
- Port \***: 22 (selected from a dropdown menu)
- Username \***: (empty text field)
- Password/Passphrase**: (masked with asterisks)
- Remote Path \***: (empty text field)

At the bottom of the dialog are 'Cancel' and 'Save' buttons.

6. In the **Name** field, enter a unique symbolic name for the destination.

**Note:** The **Name** field does not support spaces or special characters except underscore (\_).

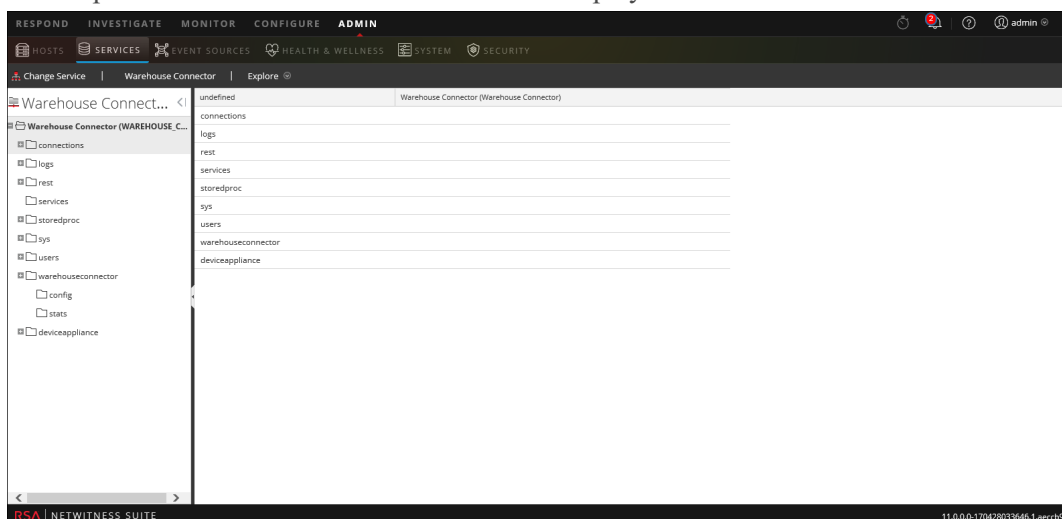

7. In the **Host** field, enter the remote server IP address.
8. In the **Port** field, retain the default port, **22**.
9. In the **Username** field, enter the SSH username.

**Note:** In the case of HortonWorks HD, ensure that the username is `gpadmin` and for password based access the password for `gpadmin` should be used. For passphrase-based access, the passphrase used to generate the keys for `gpadmin` user should be used.

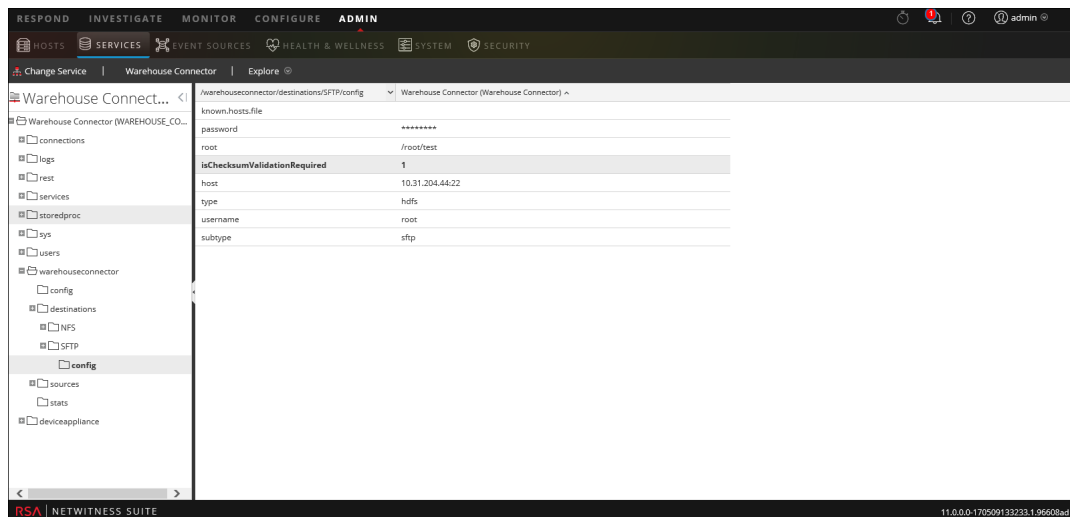

10. In the **Password/Passphrase** field, enter one of the following:
  - SSH password - If you are using SFTP to write data into the destination using password-based access.
  - SSH passphrase - If you are using SFTP to write data into the destination using SSH key-based access.
11. In the **Remote Path** field, enter the path of the directory present on the SFTP server.
12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:
  - a. In the main menu, select **ADMIN > Services**.

- b. In the Services view, select the added Warehouse Connector service, and select  **> View > Explore**.

The Explore view of Warehouse Connector is displayed.

- c. In the options panel, navigate to **warehouseconnector/destinations/sftp/config**.
- d. Set the parameter `isChecksumValidationRequired` to **1**.

- e. Restart the respective stream.

## Configure SSH Keys

To configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node:

1. Generate SSH keys on the Warehouse Connector at the default location. Perform the following:

- a. Log on to the Warehouse Connector.
- b. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 ssh-keygen -t dsa
```

- c. The command prompts you to enter the file in which to save the generated key.

Enter file in which to save the key (/root/.ssh/id\_dsa):

- d. Enter the file in which you want to save the key and press ENTER.

The command prompts you to enter and confirm the passphrase.

**Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you do not set the **passphrase**. Then, the below steps e, f, g, and h are not applicable.

Enter passphrase (empty for no passphrase):

Enter same passphrase again:

The public key is generated and is saved in the location that you provided.

- e. Change the directory by entering the following command:

```
cd /root/.ssh/
```

- f. Move the generated key to the below location:

```
mv id_dsa id_dsa.old
```

- g. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -out id_dsa
```

The command prompts you to enter and confirm the passphrase.

- h. Enter the encryption passphrase.

- i. Run the following command to change the file permission:

```
chmod 600 id_dsa
```

2. Append the generated public key to the remote Warehouse host or Hadoop node's authorized keys list located at: `~/.ssh/authorized_keys`

**Note:** Make sure that you copy the public keys to the Hadoop node and while copying the public key ensure that you provide the login details of the user using which the WebHDFS destination would be added.

You can now securely communicate between Warehouse Connector and Warehouse nodes or Hadoop nodes.

## Configure the Destination Using WebHDFS

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Added the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the file in the host on which the Warehouse Connector service is installed.
- If you want Kerberos authentication between the warehouse connector and the warehouse cluster, make sure that you perform the following:
  - Kerberos Key Distribution Center (KDC) Server is configured in your network environment and the Kerberos Keytab file is copied to the host on which you have installed Warehouse Connector.
  - Kerberos authentication is enabled in the warehouse cluster.
- If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between the Warehouse Connector and the warehouse nodes. You need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or hadoop node. For more information, see 'Configure SSH Keys' in [Configure the Destination Using SFTP](#).

## Configure Warehouse Connector to Write to a Remote Destination

To configure the destination:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .

5. In the **Add Destination** dialog, select **WebHDFS** from the drop-down list.

**Add Destination**

Type \* WebHDFS

Name \*

Hadoop IP \*

Hadoop Port \*

Username \*

Hadoop Path \*

Kerberos Authentication ☐

Cancel Save

6. In the **Name** field, enter a unique symbolic name for the destination.

**Note:** The **Name** field does not support spaces or special characters except underscore (\_).

7. In the **Hadoop IP** field, enter the namenode IP address of the warehouse cluster.
8. In the **Hadoop Port** field, enter the base port that is used by the namenode web user interface.
9. In the **Username** field, enter the owner of the directory in the warehouse to which Warehouse Connector should write the data.
10. In the **Hadoop Path** field, enter the path of the directory in the warehouse to which Warehouse Connector should write the data.
11. Select the **Kerberos Authentication** checkbox, if you want the warehouse connector to securely communicate with the warehouse using Kerberos authentication.

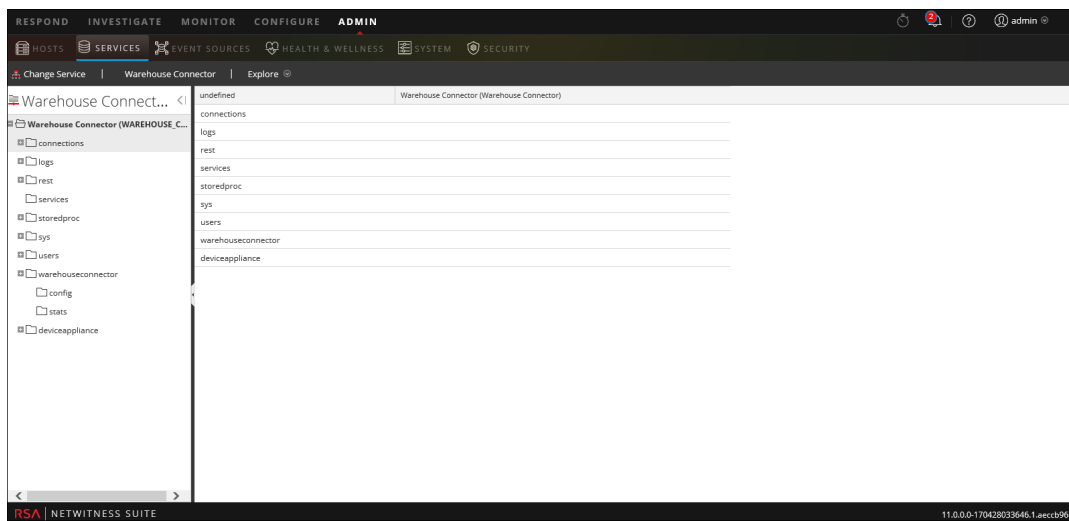

The 'Add Destination' dialog box contains the following fields and controls:

- Type \***: A dropdown menu with 'WebHDFS' selected.
- Name \***: A text input field.
- Hadoop IP \***: A text input field.
- Hadoop Port \***: A text input field with a spinner icon on the right.
- Username \***: A text input field.
- Hadoop Path \***: A text input field.
- Kerberos Authentication**: A checkbox that is checked.
- Kerberos Principal \***: A text input field.
- Kerberos Keytab File Path \***: A text input field.

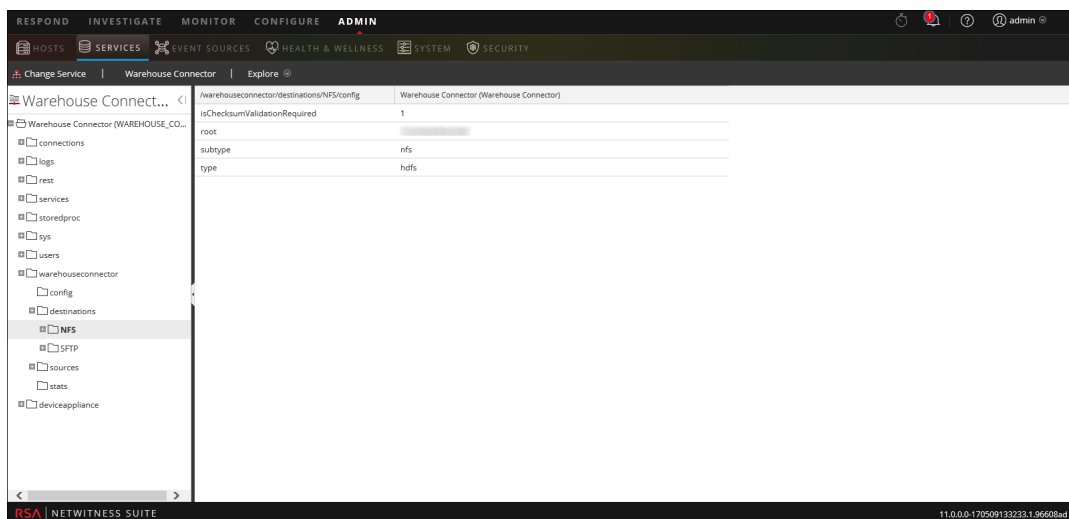

At the bottom right, there are two buttons: 'Cancel' and 'Save'.

Perform the following:

- a. In the **Kerberos Principal** field, enter the KDC Principal used for Kerberos authentication.
  - b. In the **Kerberos Keytab File Path** field, enter the path of the Kerberos Keytab file in the Warehouse Connector.
12. Click **Save**.
  13. (Optional) If you want to enable checksum validation, perform the following:
    - a. In the main menu, select **ADMIN > Services**.
    - b. In the Services view, select the added Warehouse Connector service and select  **> View > Explore**.  
The Explore view of Warehouse Connector is displayed.

- c. In the options panel, navigate to **warehouseconnector/destinations/webhdfs/config**.
- d. Set the parameter **isChecksumValidationRequired** to **1**.

- e. Restart the respective stream.

## Configure a Stream

---

You can configure the data stream to define the data source and destination combinations.

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Configured the data source from which the Warehouse Connector service needs to collect data. For more information, see [Configure the Data Source for Warehouse Connector](#).
- Configured the destination to which the Warehouse Connector service needs to write the collected data. For more information, see [Configure the Destination](#).

### **To configure the stream:**

1. Create a stream
2. Finalize the stream
3. Start the stream

## Create a Stream

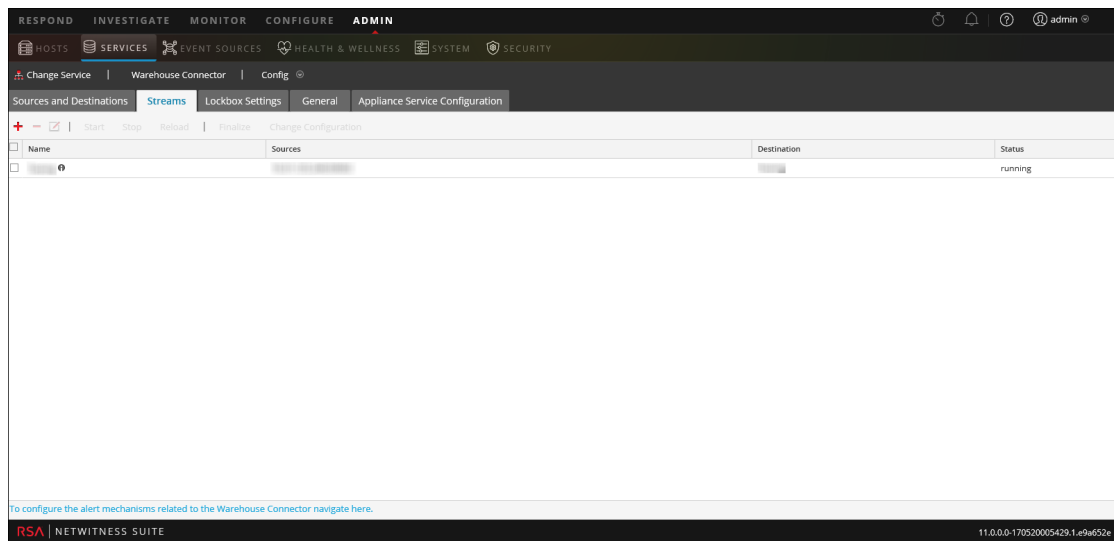

To create a stream:

1. In the main menu, select **ADMIN > Services**.

2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

3. Click the **Streams** tab.

4. On the **Streams** tab, click **+**.

**Add Stream**

Stream Name \*

Select Destination \* Choose Destination ...

Select Source \*

<input type="checkbox"/>	Name	Address	Port	Session ID
<input type="checkbox"/>			56004	Enter Session
<input type="checkbox"/>			56002	Enter Session

Cancel Save

5. In the **Add Stream** dialog, perform the following:

- a. In the **Stream Name** field, enter a name for the stream.

**Note:** The **Stream Name** field does not support spaces or special characters except underscore (\_).

- b. In the **Select Destination** drop-down menu, select a destination from the list of destinations added to the Warehouse Connector.
- c. In the **Select Source** field, select sources from the list of sources displayed.
- d. In the **Session ID** column, enter the last session id.

If you provide any session id, the Warehouse Connector will start the aggregation from that session, whereas if this is left blank, the aggregation will start from the current session.

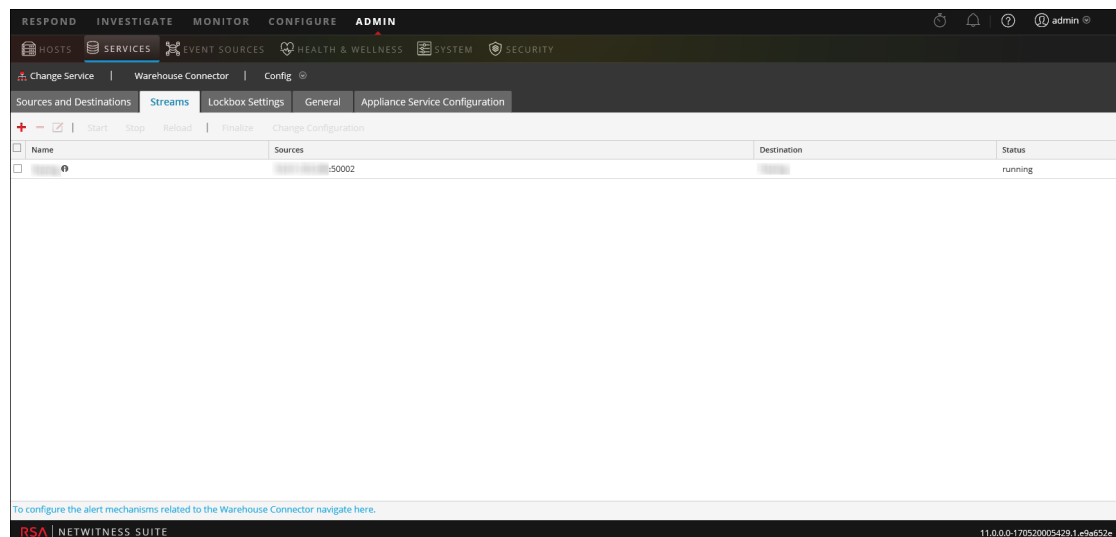

- e. Click **Save**.

## Finalize the Stream

Make sure that you have created a stream.

To finalize the stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.  
The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.

4. Click **Finalize**.

## Start the Stream

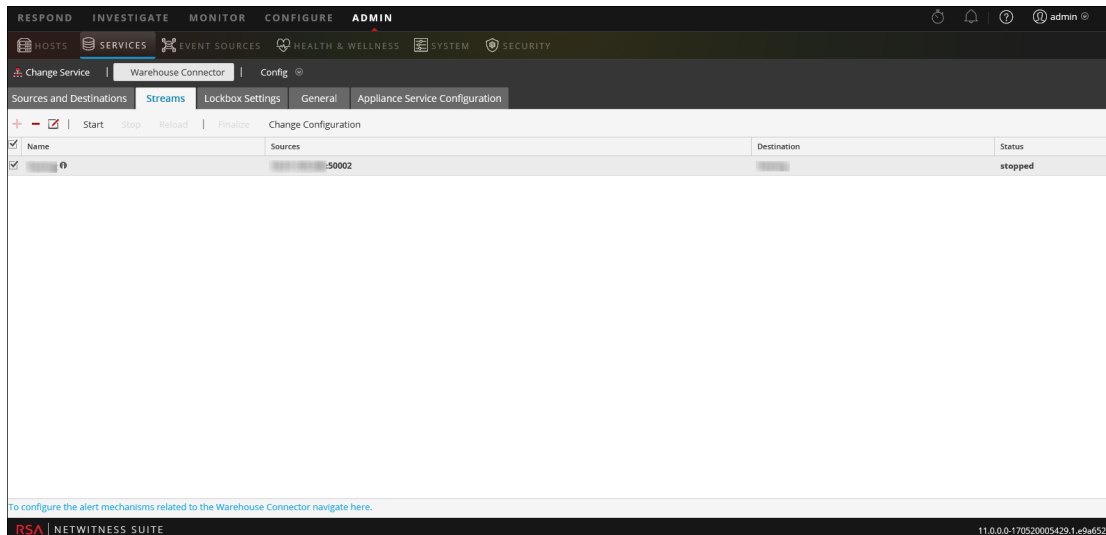

**Note:** If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the `Maximum Message Hold Count` parameter to `800000`. For more information, see [General Tab Settings](#).

To start the stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

3. On the **Streams** tab, select the stream that you have created.

4. Click **Start**.

## Monitor a Warehouse Connector

---

By monitoring a Warehouse Connector, you can automatically generate notifications when critical thresholds concerning Warehouse Connector and its storage have been met.

To monitor a Warehouse Connector:

1. In the main menu, select **ADMIN > Services**.

2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

3. Click the **Streams** tab.
4. At the bottom of the **Streams** tab, click **To configure the alert mechanisms related to the Warehouse Connector navigate here**.

The Warehouse Connector Monitoring page is displayed.

**Caution:** This page is deprecated and will be removed in a future release.

5. In the **Source or Destination Status** section, select the number of minutes or hours in the **Notify After Failing For** field.  
You will receive a notification if the source or destination connection fails for the defined number of minutes or hours.
6. In the **Stream Status** section, perform the following:
  - a. In the **Notify Stopped For** field, define the number of minutes or hours after which you would like to receive a notification when the stream goes offline.
  - b. In the **Disk Is** field, define the limit on the percentage of disk usage after which you would like to receive a notification.
  - c. In the **Source is Behind** field, define the number of sessions. A notification is raised if the source goes behind the defined number of sessions.
  - d. In the **Rejected Folder Size is** field, define the limit on the percentage of folder usage after which would like to receive a notification.
  - e. In the **Number Of Files in Permanent Failure Folder** field, define the limit on the number of files in the permanent failure folder after which you would like to receive a notification.

7. In the **Notification Type** field, perform the following:
  - a. Click **Configure email or distribution list** to configure email so that you can receive notifications in NetWitness. For more information, see the **Configure Email Server and Notification Account** topic in the *System Configuration* guide.
  - b. Click **Configure Syslog and SNMP Trap servers** to configure audit logs. For more information, see the **Configure Syslog and SNMP Settings** topic in the *System Configuration* guide.
  - c. Select the following notification mechanisms as per your requirement:
    - **NetWitness Console** - To get notifications on the NetWitness UI notification toolbar.
    - **Email** - To get email notifications.
    - **Syslog Notification** - To generate syslog events.
    - **SNMP Trap Notifications** - To get audit events as SNMP traps.

## Add Warehouse as a Data Source to Reporting Engine

---

You must add Warehouse as a data source to Reporting Engine to make this data source available to reports and alerts against this Reporting Engine. For more information, see **Add Warehouse as a Data Source to Reporting Engine** topic in the *Reporting Engine Configuration Guide*.

## Analyze a Warehouse Report

---

The Warehouse modules provide analysts with reports of early indicators of compromise. The following Warehouse reports can be analyzed in NetWitness:

- Suspicious Domains report
- Suspicious DNS Activity report
- Host Profile report

For more information, see **Step 4. Analyze a Warehouse Report** topic in the *Warehouse Guide*.

## View the Warehouse Connector Service

While the information displayed in the Services System view is the same for all types of core services, several options in the toolbar are relevant only for Warehouse Connector.

To access this view:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select a Warehouse Connector and select  > **View > System**. The Systems view for the selected Warehouse Connector is displayed.

The following is an example of toolbar options for Warehouse Connectors.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the *Hosts and Services Getting Started Guide*.

## Troubleshoot the Warehouse Connector

The following information suggests the possible issues that NetWitness users may encounter when adding a Warehouse service to the Reporting Engine as a data source for reporting in NetWitness. Look for explanations and solutions in this section.

While adding a Warehouse service to the Reporting Engine as a data source for reporting, you may observe some of the errors listed in this document. Information is provided on how to troubleshoot the errors and add the data source successfully.

The following figure shows the New Service dialog.

The image shows a 'New Service' dialog box with a dark header bar containing a question mark icon and a close button. The dialog contains several fields and checkboxes. The 'Source Type' dropdown is set to 'WAREHOUSE'. The 'Warehouse Source' dropdown is set to 'HiveServer2'. The 'Name' field contains 'PDH2.0-DCA'. The 'HDFS Path' field contains '/'. The 'Advanced' checkbox is unchecked. The 'Host' field is empty. The 'Port' field contains '10000'. The 'Username' field contains 'gpadmin'. The 'Password' field contains '\*\*\*\*\*'. The 'Kerberos Authentication' checkbox is checked. The 'Server Principal', 'User Principal', and 'Kerberos Keytab File' fields are empty. The 'Enable Jobs' checkbox is unchecked. At the bottom left is a 'Test Connection' button. At the bottom right are 'Cancel' and 'Save' buttons.

Source Type *	WAREHOUSE
Warehouse Source *	HiveServer2
Name *	PDH2.0-DCA
HDFS Path *	/
Advanced	<input type="checkbox"/>
Host *	
Port *	10000
Username *	gpadmin
Password	*****
Kerberos Authentication	<input checked="" type="checkbox"/>
Server Principal *	
User Principal *	
Kerberos Keytab File *	
Enable Jobs	<input type="checkbox"/>

Test Connection

Cancel Save

For more information, see the **Add Warehouse as a Data Source to Reporting Engine** topic in the *Reporting Engine Configuration Guide*.

Error	Possible Solutions
Could not open connection to HiveServer	<ul style="list-style-type: none"> <li>Ensure that the HiveServer2 is running on the Host.</li> <li>Check if the port provided can be accessible from the Reporting Engine server.</li> </ul>
No Schema found in HDFS path	<p>Ensure that meta avro data file(s) are available in the HDFS path (&lt;<b>HDFS Path</b>&gt;/rsasoc/v1/sessions/meta) mentioned.</p> <p>The following figure shows an example of the command to check the files in hdfs.</p> <pre>[root@NWAPPLIANCE: ~]# hadoop fs -lsr /testdata/rsasoc/v1/sessions/meta 14/12/09 10:31:59 INFO util.NativeCodeLoader: Loaded the native-hadoop library 14/12/09 10:31:59 INFO security.JniBasedUnixGroupsMapping: Using JniBasedUnixGroupsMapping for Group resolution -rwxr-xr-x  3 root root      3076 2013-08-28 01:09 /testdata/rsasoc/v1/sessions/meta/nwdev-testing.avro</pre>
Could not open connection to HiveServer, GSS initiate failed	<p>GSS initiate failed errors will be observed only in the case of Kerberos enabled Hive.</p> <p>Ensure that the proper keytab file is provided and it should have read options for the rsasoc user (user on which the Reporting Engine Server runs).</p> <p>Ensure that the system time is synchronized between KDC, Hadoop (HortonWorks) server, and the Reporting Engine system.</p>

## Manage a Stream and Lockbox

You can manage a stream using the following procedures:

- Edit a Stream
- Reload the Stream
- Specify meta filters for a Stream
- Define multi-valued metas

### Edit a Stream

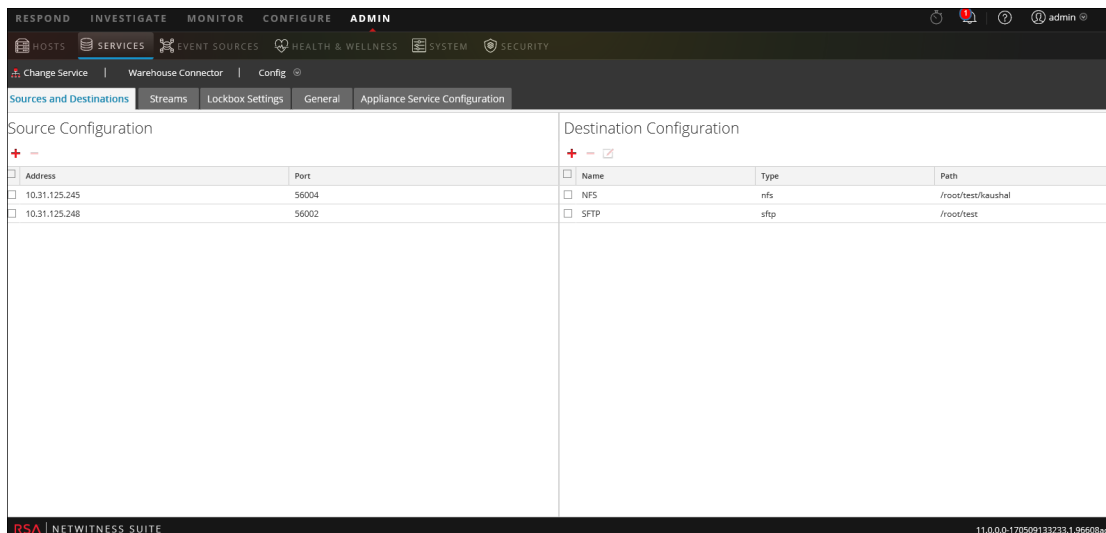

You can edit a stream to perform the following:

- Add more data sources to the stream.
- Delete existing data sources from the stream.

To edit a stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

3. On the **Streams** tab, click .
4. In the **Edit Stream** dialog, you can perform the following:

- On the **Available Sources** tab, you can select the available data sources to add to the stream and click **Save**.

**Edit Stream**

Stream Name

Destination

**Available Sources** **Current Sources**

<input type="checkbox"/>	Name	Address	Port	Session ID
<input type="checkbox"/>	<input type="text"/> :50004	<input type="text"/>	50004	Enter Session

**Cancel** **Save**

- On the **Current Sources** tab, you can delete an existing data source from the stream.

Select the data source and click .

The 'Edit Stream' dialog box contains the following elements:

- Stream Name** and **Destination** text input fields.
- Two tabs: **Available Sources** and **Current Sources** (the active tab).
- A red minus icon in the 'Current Sources' tab.
- A yellow warning box with the text: **At least one source is required**.
- A table with the following structure:
 

<input type="checkbox"/>	Name	Address	Port
<input type="checkbox"/>	...:50002	...	50002
- Cancel** and **Save** buttons at the bottom right.

## Reload the Stream

When you reload the stream, the Warehouse Connector updates the schema file for the stream. You should reload the stream whenever you add a new custom meta to the Log Decoder or Decoder.

To reload the stream:

- In the main menu, select **ADMIN > Services**.
- In the Services view, select the added Warehouse Connector service and select  **> View > Config**.  
The Services Config view of Warehouse Connector is displayed.
- On the **Streams** tab, select the stream that you want to reload.
- Click **Reload**.

## Specify Meta Filters for a Stream

You need to specify the filter for each stream in the `export.session.meta.fields` parameter in the Explore view of the Warehouse Connector.

The following table lists the values that you can provide as a filter:

Values	Description
<code>*</code>	All the collected metas are written to SAW.
<code>*, meta1, meta2</code>	All the metas except the defined metas are written to SAW. For example, <b>Filter:</b> <code>*, ip.src</code> All the metas except <code>ip.src</code> is written to SAW.
<code>meta1, meta2, meta3</code>	Only the defined metas are written to SAW.

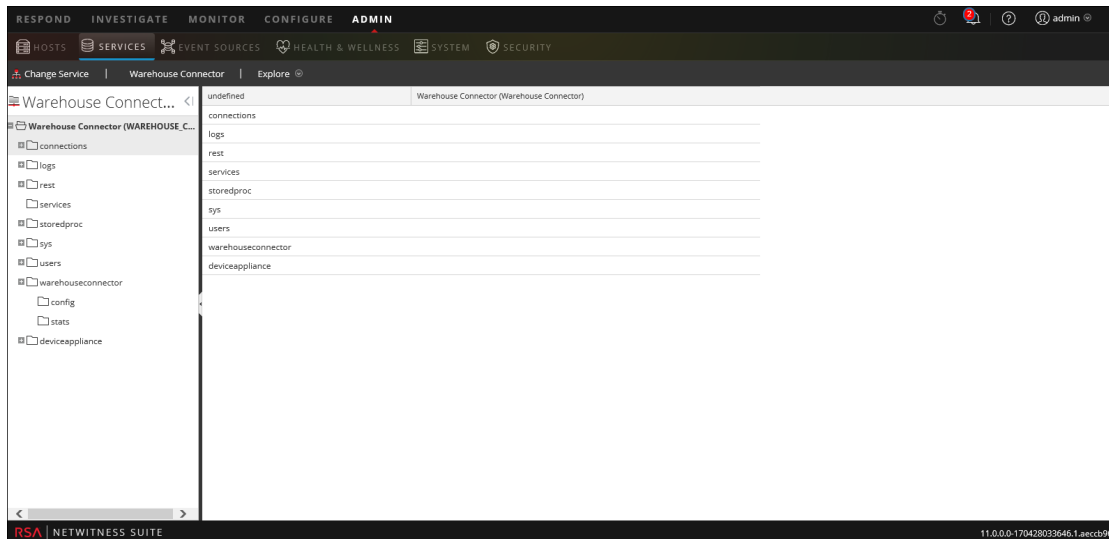

**Note:** By default, the following metas are written to Warehouse even if you specify them in the filter:

- `ng_source`
- `unique_id`
- `time`

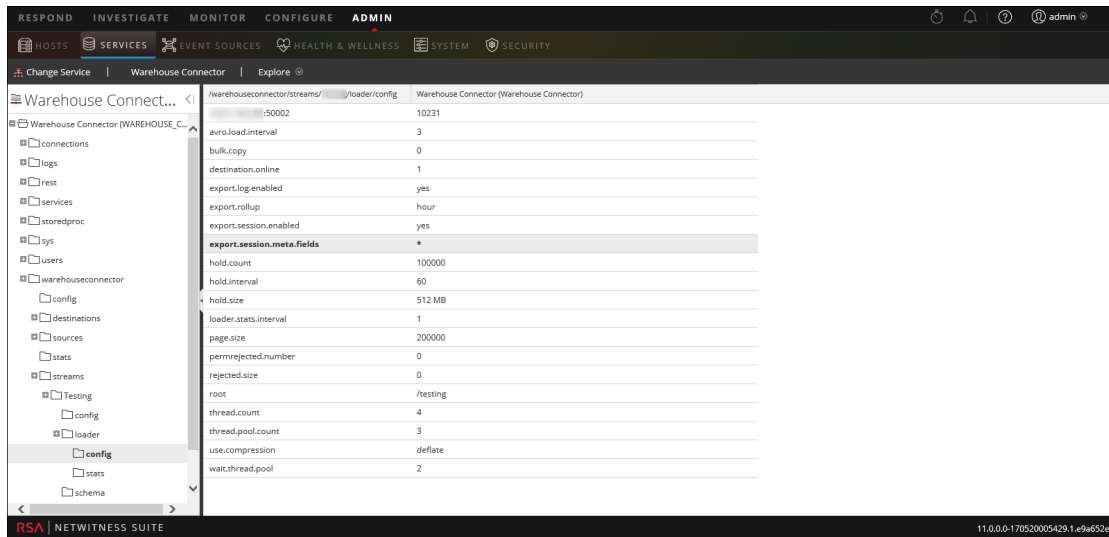

To specify meta filters for a Stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select a Warehouse Connector services and select  > **View > Explore**.

The Explore view of the Warehouse Connector service is displayed.

3. In the options panel, select **warehouseconnector > streams > <stream\_name> > loader > config**.
4. In the `export.session.meta.fields` parameter, enter the filter.

5. Restart the stream.

## Define Multi-valued Metas

You can also define an existing meta or a custom meta to be treated as multi-valued meta.

To define multi-valued metas:

**Caution:** Defining an existing meta to be treated as multi-valued may change the data type of the meta and cause the associated reports to fail.

1. Create a new file with the filename **multivalue-users.xml** in the **/etc/netwitness/ng** directory.
2. Add the following entries:

```
<?xml version="1.0" encoding="utf-8"?>

<Netwitness>
  <MultiValueMetas>
    <Meta>NEWMETANAME</Meta>
  </MultiValueMetas>
</Netwitness>
```

Where *NEWMETANAME* is the existing meta or a custom meta to be treated as multi-valued meta.

**Caution:** Make sure that you do not add metas that are by default treated as non multi-value.

3. Restart the stream.

## Manage a Lockbox

You can manage a lockbox using the following procedures:

- Change the Lockbox password
- Refresh the Lockbox

To change the Lockbox password:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

The screenshot displays the NetWitness Admin console interface for configuring the Warehouse Connector. The top navigation bar includes tabs for RESPOND, INVESTIGATE, MONITOR, CONFIGURE, and ADMIN. Below this, a sub-navigation bar shows options like Change Service, Warehouse Connector, and Config. The Config tab is selected, leading to the 'Sources and Destinations' configuration page. This page is split into two panels: 'Source Configuration' and 'Destination Configuration'. The 'Source Configuration' panel contains a table with columns for Address and Port, listing two sources: 10.31.125.245 on port 56004 and 10.31.125.248 on port 56002. The 'Destination Configuration' panel contains a table with columns for Name, Type, and Path, listing two destinations: NFS on /root/test/kaushal and SFTP on /root/test. The bottom of the screen shows the RSA NetWitness Suite logo and version information.

4. Click the **Lockbox Settings** tab.

5. In the **Change Lockbox Password** section, perform the following:

- a. In the **Current Lockbox Password** field, enter the current lockbox password.
- b. In the **New Lockbox Password** field, enter the new lockbox password.

**Note:** The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

- c. In the **Confirm New Lockbox Password** field, enter the new lockbox password to confirm.
- d. Click **Apply**.

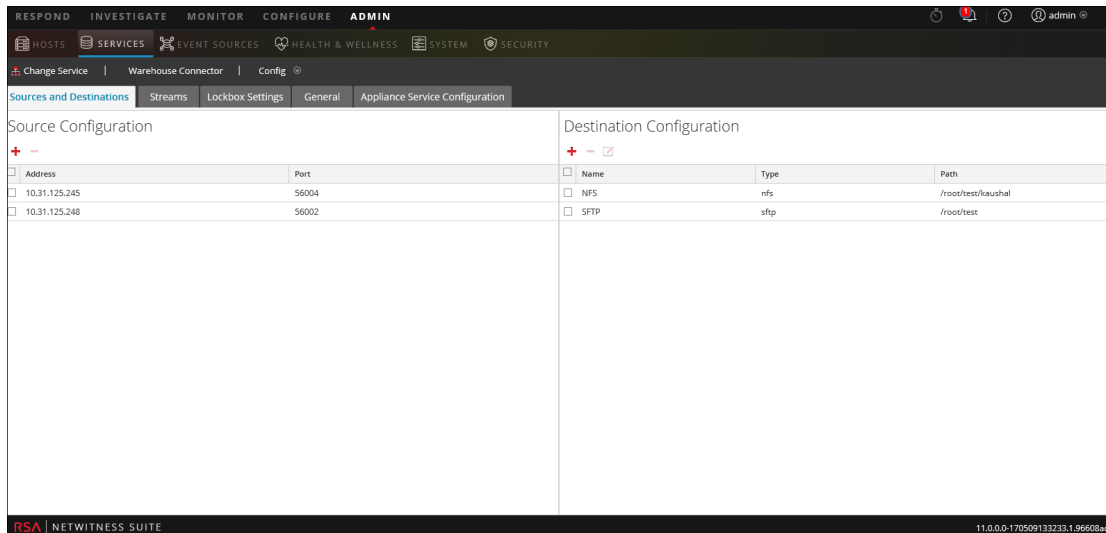

The Lockbox password is successfully changed.

To refresh the Lockbox:

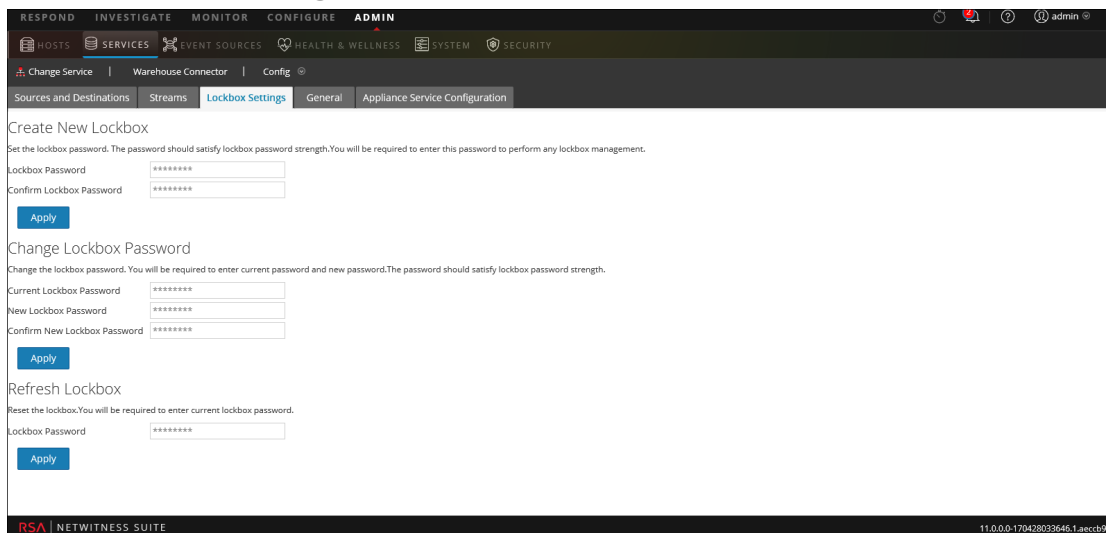

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.

The Services Config view of Warehouse Connector is displayed.

4. Click the **Lockbox Settings** tab.

5. In the **Refresh Lockbox** section, enter the current lockbox password in the **Lockbox Password** field.
6. Click **Apply**.  
The Lockbox is reset.

## Warehouse Connector Configuration References

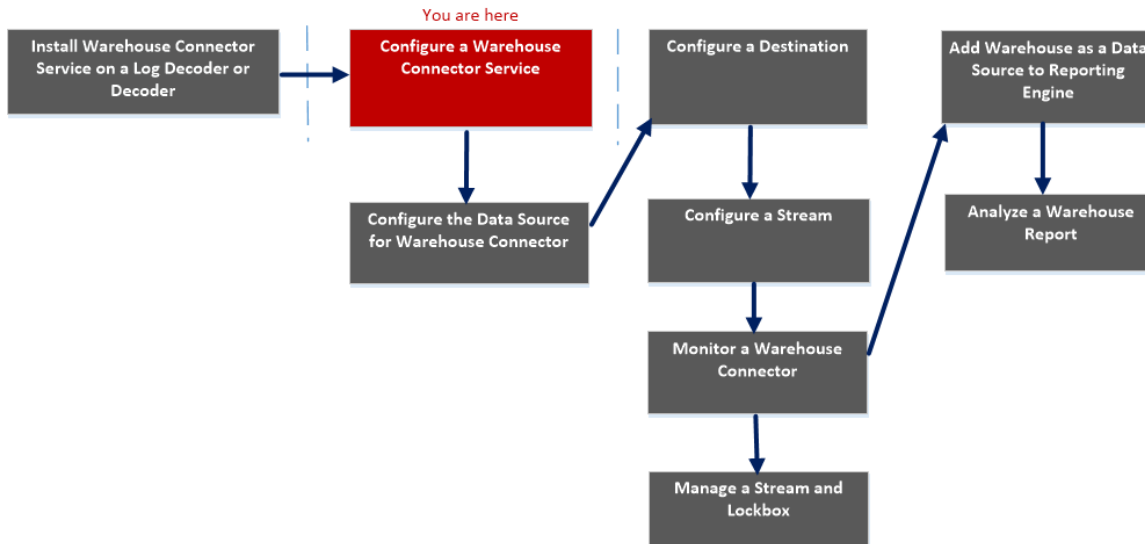

---

This section contains descriptions of the user interface as well as other reference information.

## General Tab Settings

The General tab displays the general configuration settings for Warehouse Connector service.

## Workflow

## What do you want to do?

Role	I want to...	Refer to...

## Quick View

The following figure shows the General tab on the Warehouse Connector Services Config view.

The General tab displays the system configuration parameters for the Warehouse Connector service.

When you add a Warehouse Connector service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

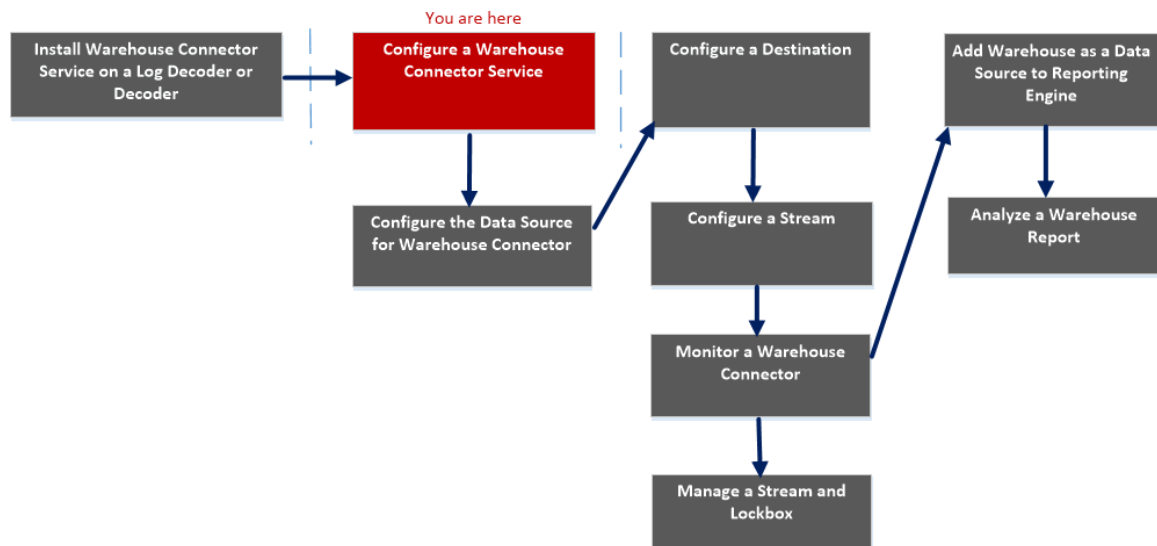

The following table describes the System Configuration parameters:

Name	Config Value
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. <b>Note:</b> If you change the port number, ensure that you restart the service.
SSL	If enabled, all the data transferred in the network will be encrypted using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

## Appliance Service Configuration Tab Settings

The Appliance Service Configuration tab displays the appliance configuration settings for Warehouse Connector service. For more information, see the **Appliance Service Configuration** topic in the *Hosts and Services Getting Started Guide*.

## Quick View

The following figure shows the Sources and Destinations tab on the Warehouse Connector Services Config view.

The Sources and Destinations tab includes the following two sections:

- 1 Source Configuration
- 2 Destination Configuration

## Source Configuration

The Source Configuration section allows you to configure the data sources from which the Warehouse Connector service needs to collect data.

The following is an example of the Source Configuration section.

Source Configuration	
+ -	
<input type="checkbox"/> Address	Port
<input type="checkbox"/> [REDACTED]	56004
<input type="checkbox"/> [REDACTED]	56002

The Source Configuration section allows you to perform the following:

Features	Description
	Add the data source.
	Delete the data source.

## Destination Configuration

The Destination Configuration section allows you to configure the destination to which the Warehouse Connector service needs to write the collected data.

Destination Configuration			
+ - 			
<input type="checkbox"/> Name	Type	Path	
<input type="checkbox"/> NFS	nfs	/root/test/[REDACTED]	
<input type="checkbox"/> SFTP	sftp	/root/test	

The Destination Configuration section allows you to perform the following:

Features	Description
	Add the destination.

Features	Description
	Delete the destination.
	Edit the destination. <div><b>Note:</b> You can only edit the SFTP destination type.</div>

## Add Stream Dialog

You can configure and add a stream to a Warehouse Connector in this dialog

### Workflow

## Related Topics

- [Configure a Stream](#)

## Quick View

The following figure is an example with the important features labeled.

A screenshot of the 'Add Stream' dialog box. It contains three main sections: 'Stream Name \*' with a text input field, 'Select Destination \*' with a dropdown menu showing 'Choose Destination ...', and 'Select Source \*' with a table. The table has columns for 'Name', 'Address', 'Port', and 'Session ID'. There are two rows of data, each with a checkbox in the 'Name' column. The first row has '56004' in the 'Port' column and 'Enter Session' in the 'Session ID' column. The second row has '56002' in the 'Port' column and 'Enter Session' in the 'Session ID' column. At the bottom of the dialog are 'Cancel' and 'Save' buttons.

- 1 In the main menu, select **ADMIN > Services**.
- 2 In the **Services** view, select a Warehouse Connector service and select  > **View > Config**.
- 3 In the **Streams** tab, click  to view the add stream dialog.

The following table describes the fields in the Add Stream dialog:

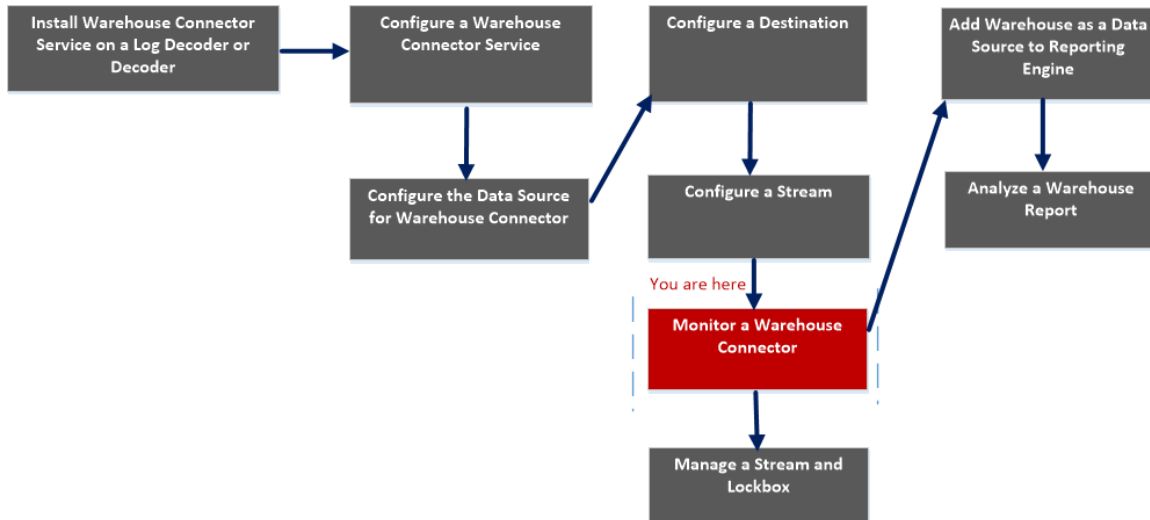

Parameter	Description
Stream Name	Type the name of the stream. The stream name may only contain alphanumeric characters and underscores. It cannot exceed 20 characters in length.
Select Destination	Select a destination from the drop-down list.

Parameter	Description
Select Source	Select a source from the grid at the bottom section of the dialog.
Name	The name of the source.
Address	The address of the source.
Port	The port of the source.
Session ID	The session ID of the source.

## Streams Configuration

The Streams tab for a Warehouse Connector in the Services Config view provides a way to manage stream configuration.

### Workflow

## Related topics

[Configure a Stream](#)

## Quick View

The following figure shows the Streams tab on the Warehouse Connector Services Config view.

The Streams tab allows you to perform the following:

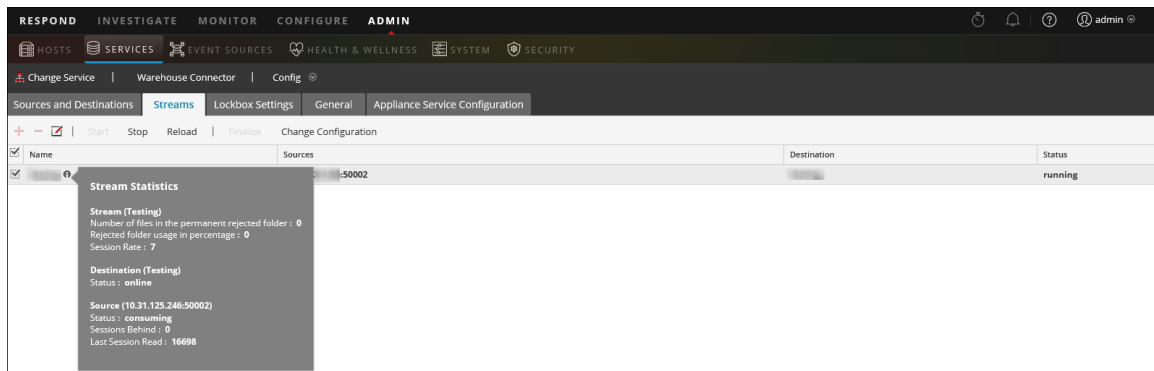

Features	Description
	Add a stream.
	Delete a stream.
	Edit the stream.
<b>Start</b>	Start the stream.
<b>Stop</b>	Stop the stream.
<b>Finalize</b>	Finalize the stream.
<b>Reload</b>	<p>Reload the stream.</p> <p>If you have added a new meta or if a new meta is added as part of content update to any of the sources, Log Decoder or Decoder, you need to reload the stream for the meta to be visible in the schema for the Reporting Engine.</p> <p>Reloading a stream does not have any impact on the data, but only the new meta list is fetched from the sources.</p>

The following table describes the fields in the Streams tab:

Parameter	Description
Name	Name of the stream.
Sources	The sources associated with the stream.
Destination	The destinations associated with the stream.
Status	Status of the stream.

## Stream Statistics

You can view the statistics of a configured stream. Click the  icon next to the name of the stream.

The following parameters are displayed in the Stream Statistics:

Section	Parameter	Description
<b>Stream</b>		
	Number of files in the permanent rejected folder	Determines the number of files in the permanent rejected folder (named, <b>permfail</b> ) in the Warehouse Connector. The permanent rejected folder contains the files that Warehouse Connector failed to write to the destination.
	Rejected folder usage in percentage	Determines the disk usage of the rejected folder.
	Session Rate	Determines the rate at which the session is processed by the Warehouse Connector for the source.
<b>Destination</b>		
	Status	Indicates the status of the destination.
<b>Source</b>		
	Status	Indicate the status of the source.
	Sessions Behind	Determines that number of sessions that needs to be processed by the Warehouse Connector.

Section	Parameter	Description
	Last Session read	Determines the last session id processed by the Warehouse Connector.

## Change Stream Configuration

You can change configuration of a stream in runtime. In the **Streams** tab, click **Change Configuration** to change the configuration of the selected stream.

Change Configuration :

Stream Configuration

Name	Config Value
<b>Aggregation Configuration</b>	
Aggregate max sessions	1000
Aggregation Interval	10
<b>Loader Settings</b>	
Compress files on disk.	deflate
Export Rollup Interval	hour
Maximum Message Hold Count	100000
Maximum Message Hold Interval (Seconds)	60
Maximum Message Hold Size	512 MB
Page Size	200000
Remote Export Path	/
Session Meta Fields Exported	*
Session Remote Export	<input checked="" type="checkbox"/>
<b>Stream Settings</b>	
Auto Startup	<input type="checkbox"/>

Close
Apply

You can change the following parameters of the Stream Configuration:

**Note:** If you change the value of any parameter in stream configuration, make sure that you restart the stream.

After upgrading, if the values of Maximum Message Hold Count, Maximum Message Hold Interval and Maximum Message Hold Size are 3000000, 60 and 128 respectively, ensure that you assign the following values to the streams:

- Maximum Message Hold Count - 2400000
- Maximum Message Hold Interval - 600
- Maximum Message Hold Size - 512

You can assign these values by modifying the existing Stream configuration.

Section	Parameter	Description
Aggregation Configuration		
	Aggregate max sessions	Determines the maximum number of sessions in a response for an aggregation request from the Warehouse Connector to the source .
	Aggregation Interval	Determines the time between the responses from the source.
Loader Settings		
	Compress files on disk	<p>Enable to compress files on disk.</p> <p>Supported values:</p> <ul style="list-style-type: none"><li>• Deflate - Provides smaller compressed files and good performance while generating reports.</li><li>• Off</li></ul> <p>By default, the parameter is set to <b>deflate</b>.</p>

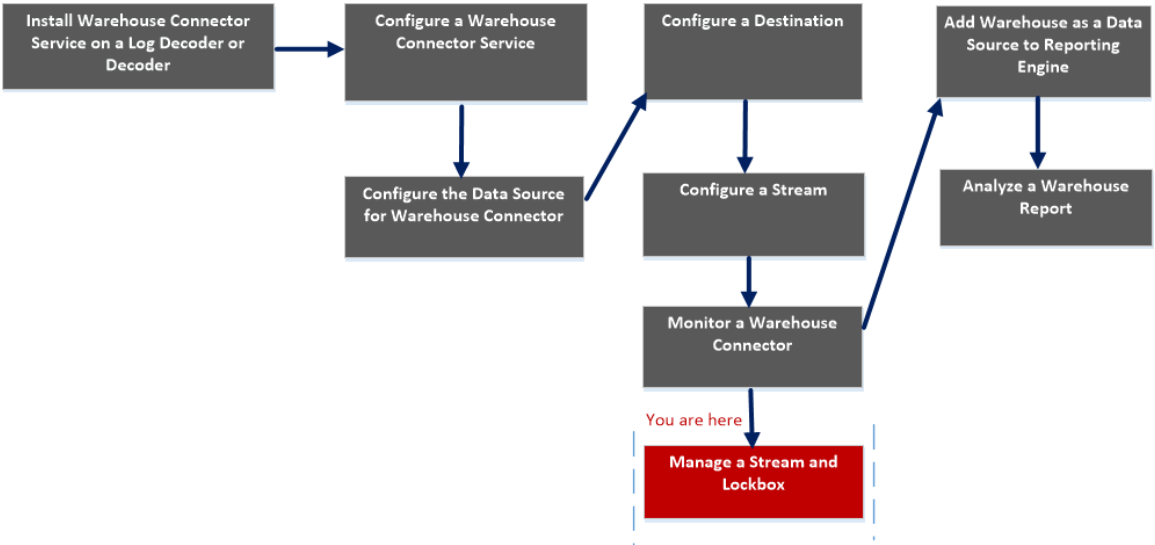

Section	Parameter	Description								
	Export Rollup Interval	<p>Determines the roll-up interval for export files and also the directory structure the Warehouse Connector writes to the destination.</p> <p>For example:</p> <p>If the parameter is set to:</p> <table><thead><tr><th>Value</th><th>Directory Structure</th></tr></thead><tbody><tr><td>hour</td><td>/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}</td></tr><tr><td>minute</td><td>/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}/{minute}</td></tr><tr><td>day</td><td>/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}</td></tr></tbody></table> <p>If you change the value of the parameter, ensure that you restart the stream.</p> <p>Recommended value is <b>hour</b>.</p>	Value	Directory Structure	hour	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}	minute	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}/{minute}	day	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}
Value	Directory Structure									
hour	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}									
minute	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}/{hour}/{minute}									
day	/rsasoc/v1/[logs   sessions]/data/{year}/{month}/{day}									
	Maximum Message Hold Count	<p>Determines the maximum number of sessions to store in the memory before processing.</p> <div><p><b>Note:</b> If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the parameter to 800000.</p></div>								
	Maximum Message Hold Interval (Seconds)	Determines the maximum time (in seconds) to hold the sessions in memory before processing.								
	Maximum Message Hold Size	Determines the maximum size for the sessions to store in the memory before processing.								

Section	Parameter	Description
	Remote Export Path	Determines the remote local mount point for HDFS (nfs://) and the location to export the data.
	Page Size	
Stream Settings		
	Auto Startup	Enable to automatically start the stream whenever the Warehouse connector process is restarted. By default, the parameter is set to <b>off</b> .
