What's New in 12.4.0.0 Release

The NetWitness 12.4.0.0 Release Notes describe new features, enhancements, security fixes, upgrade paths, fixed issues, known issues, end-of-life functionality, build numbers, and self-help resources.

Enhancements

The following sections are a complete list and description of enhancements to specific capabilities:

- Upgrade
- SASE Capability
- Investigate
- Respond
- Response Actions
- Insight
- User and Entity Behavior Analytics
- Endpoint
- Policy-based Centralized Content Management (CCM)
- Concentrator, Decoder, Log Collector, and Archiver Services
- Log Integrations
- Security

To locate the documents that are referred to in this section, see https://community.netwitness.com/t5/netwitness-platform-online/netwitness-platform-all-documents/ta-p/676246.

The Product Documentation section has links to the documentation for this release.

Upgrade

The following section describes the new enhancement for Upgrade:

Alma OS Migration

RedHat announced that CentOS Linux 7 will reach the end of life (EOL) on June 30, 2024. To address this change, NetWitness Platform is now integrated with the new version, AlmaLinux. When you upgrade to the NetWitness 12.4 version, you will be automatically migrated from CentOS 7.9 to AlmaLinux 8.9. The NetWitness Platform 12.4 upgrade process is easy and regular, like any other previous upgrades. You do not have to follow any specific procedure for upgrading to AlmaLinux OS. AlmaLinux provides several key benefits and new features:

- The upgrade to AlmaLinux is an inherently automated process with zero manual intervention.
- It comes with a pre-upgrade tool that helps administrators discover and mitigate issues before running the actual upgrade process.
- Saves time and administrative efforts.
- Retains control over installed applications.
- Preserves most of the configuration information.

NetWitness Platform streamlines the upgrade process, saves time and resources, and maintains control over installed applications and configurations when migrating from CentOS 7.9 to AlmaLinux 8.9.

SASE Capability

The following section describes the new enhancement for SASE:

NetWitness SASE Integrations

- **NetWitness SASE Integration with Palo Alto Networks** - Introduces NetWitness integration with Palo Alto Prisma SASE to provide complete network and logs visibility. With this custom technical integration, NetWitness users gain insight into behavior and communication among devices and services in remote and distributed networks across on-premises, hybrid, and cloud deployments. The NetWitness-Palo Alto SASE integration enables customers to leverage SASE flexibility and its inherent security advantages while retaining complete visibility for threat detection and response.
- **NetWitness SASE Integration with Symantec by Broadcom (Private Preview Mode)** - Introduces NetWitness integration with Symantec by Broadcom SASE to provide complete network and logs visibility. With this custom technical integration, NetWitness users gain insight into behavior and communication among devices and services in remote and distributed networks across on-premises, hybrid, and cloud deployments. The NetWitness-Broadcom SASE integration enables customers to leverage SASE flexibility and its inherent security advantages while retaining complete visibility for threat detection and response.

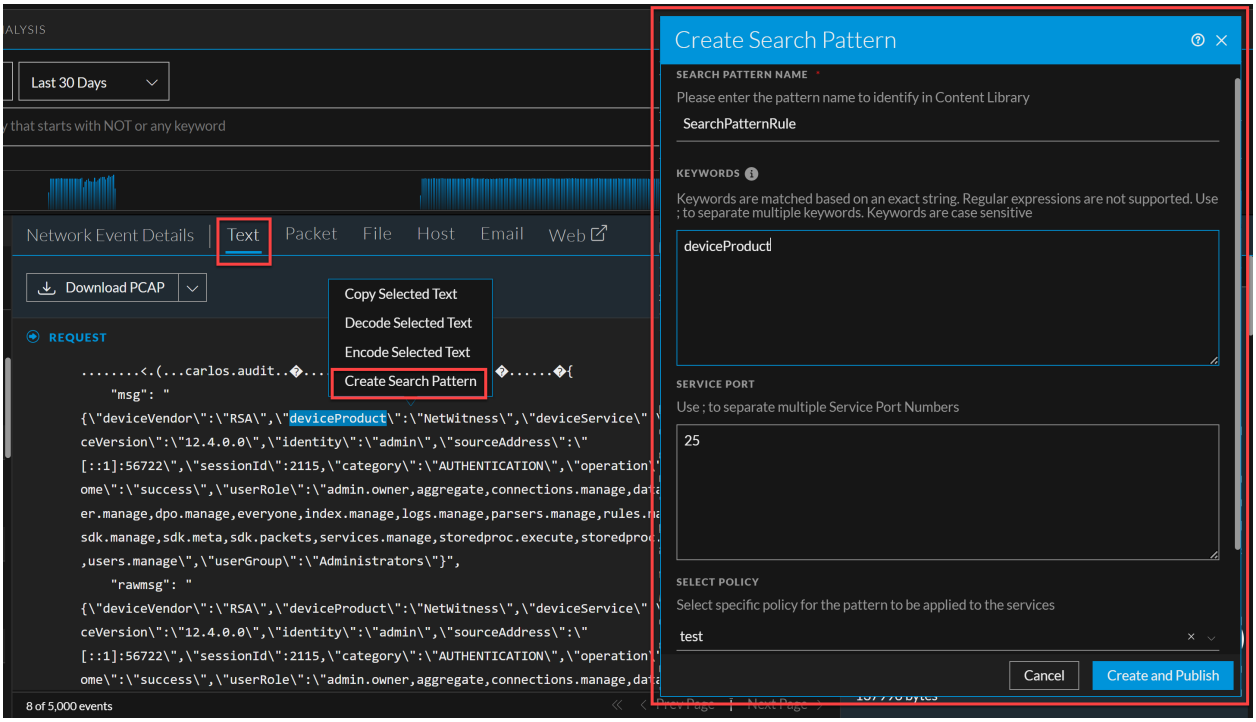
  Note: In 12.4 release, NetWitness SASE integration with Symantec by Broadcom is in Private Preview Mode.

For more information, see *Broadcom SASE Configuration Guide for 12.4* and *Palo Alto Prisma SASE Configuration Guide for 12.4*.

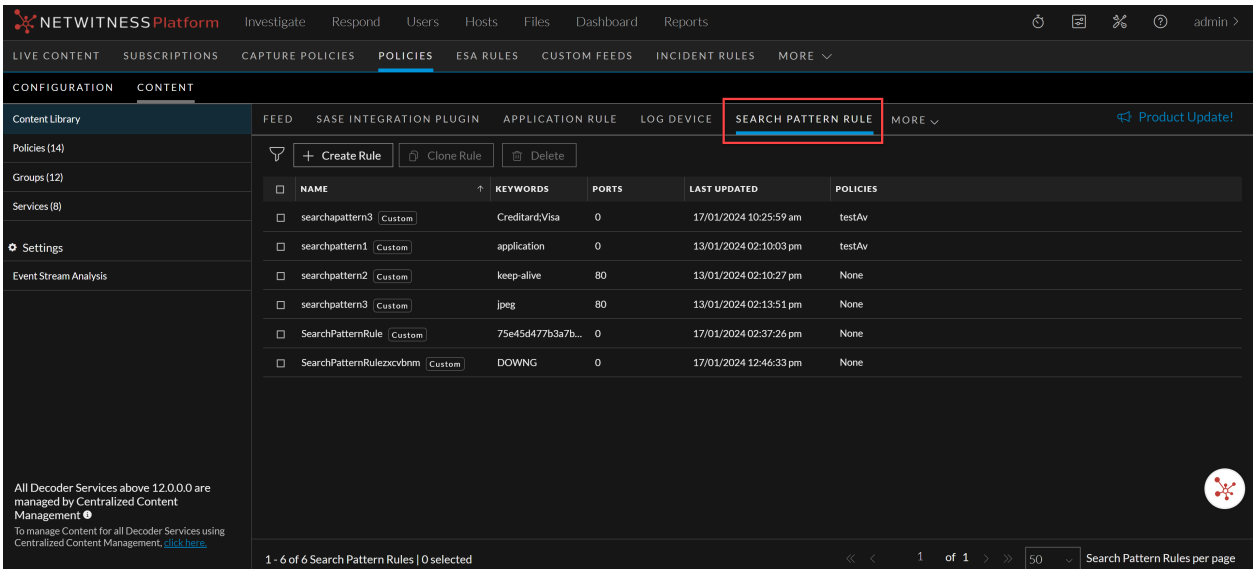
NetWitness SASE Hybrid Cloud Configuration

Administrators can now opt for a Hybrid Cloud model for SASE. The SASE Hybrid Cloud Configuration is a data-driven design. The SASE hybrid cloud provides more efficient and secure communications between the NetWitness platform components. The NetWitness Admin Server contains a script nw-create-cloud-hybrid, which will deploy the NetWitness Overlay Network and the defined NetWitness Nodes in their respective regions in the Google Cloud Platform (GCP). The NetWitness Peer-to-Peer Network (nw-ppn) provides secure, mutually authenticated, PKI-based communication between NetWitness components.

For more information, see *SASE Installation Guide for 12.4*.



Investigate

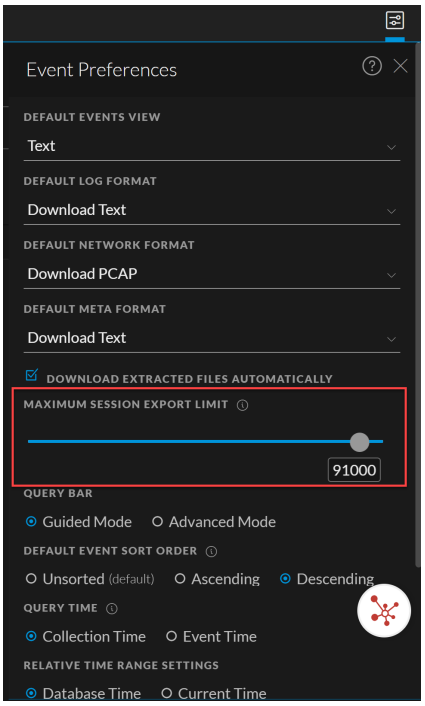


The following section describes the new enhancements for the Investigate component:

Interactive Network Parser Creation

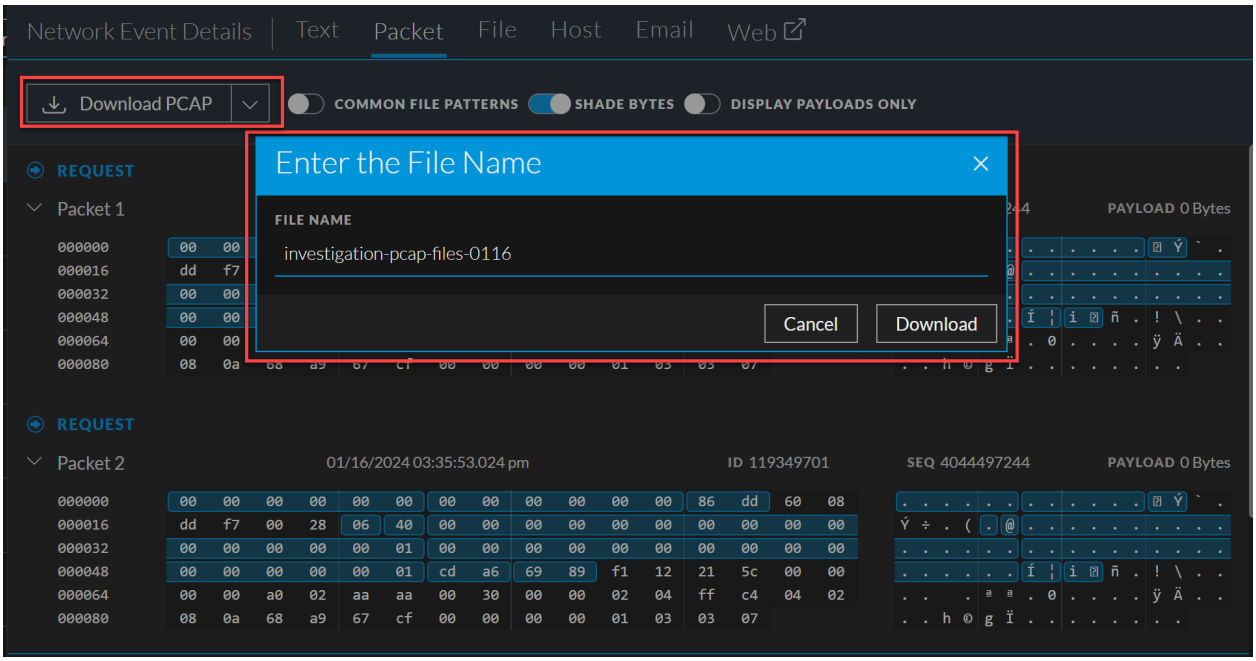
In the **Investigate** > **Events** view, users can convert the exact patterns selected or keywords found in the network traffic they review in text session reconstruction into a network parser. This streamlined process allows the user to generate meta to trigger an incident (e.g., a future detection) without understanding how to create the parser.

Users can also create a network parser using keywords from the **(Configure)** > **Policies** > **Content Library** > **More** > **Search Pattern Rule** view.



For more information, see **Create a Search Pattern in the Text Tab** topic in the *NetWitness Investigate User Guide* and **Manage Search Pattern Rule** topic in the *Policy-based Centralized Content Management Guide*.

Download More Sessions than Displayed in Events Table



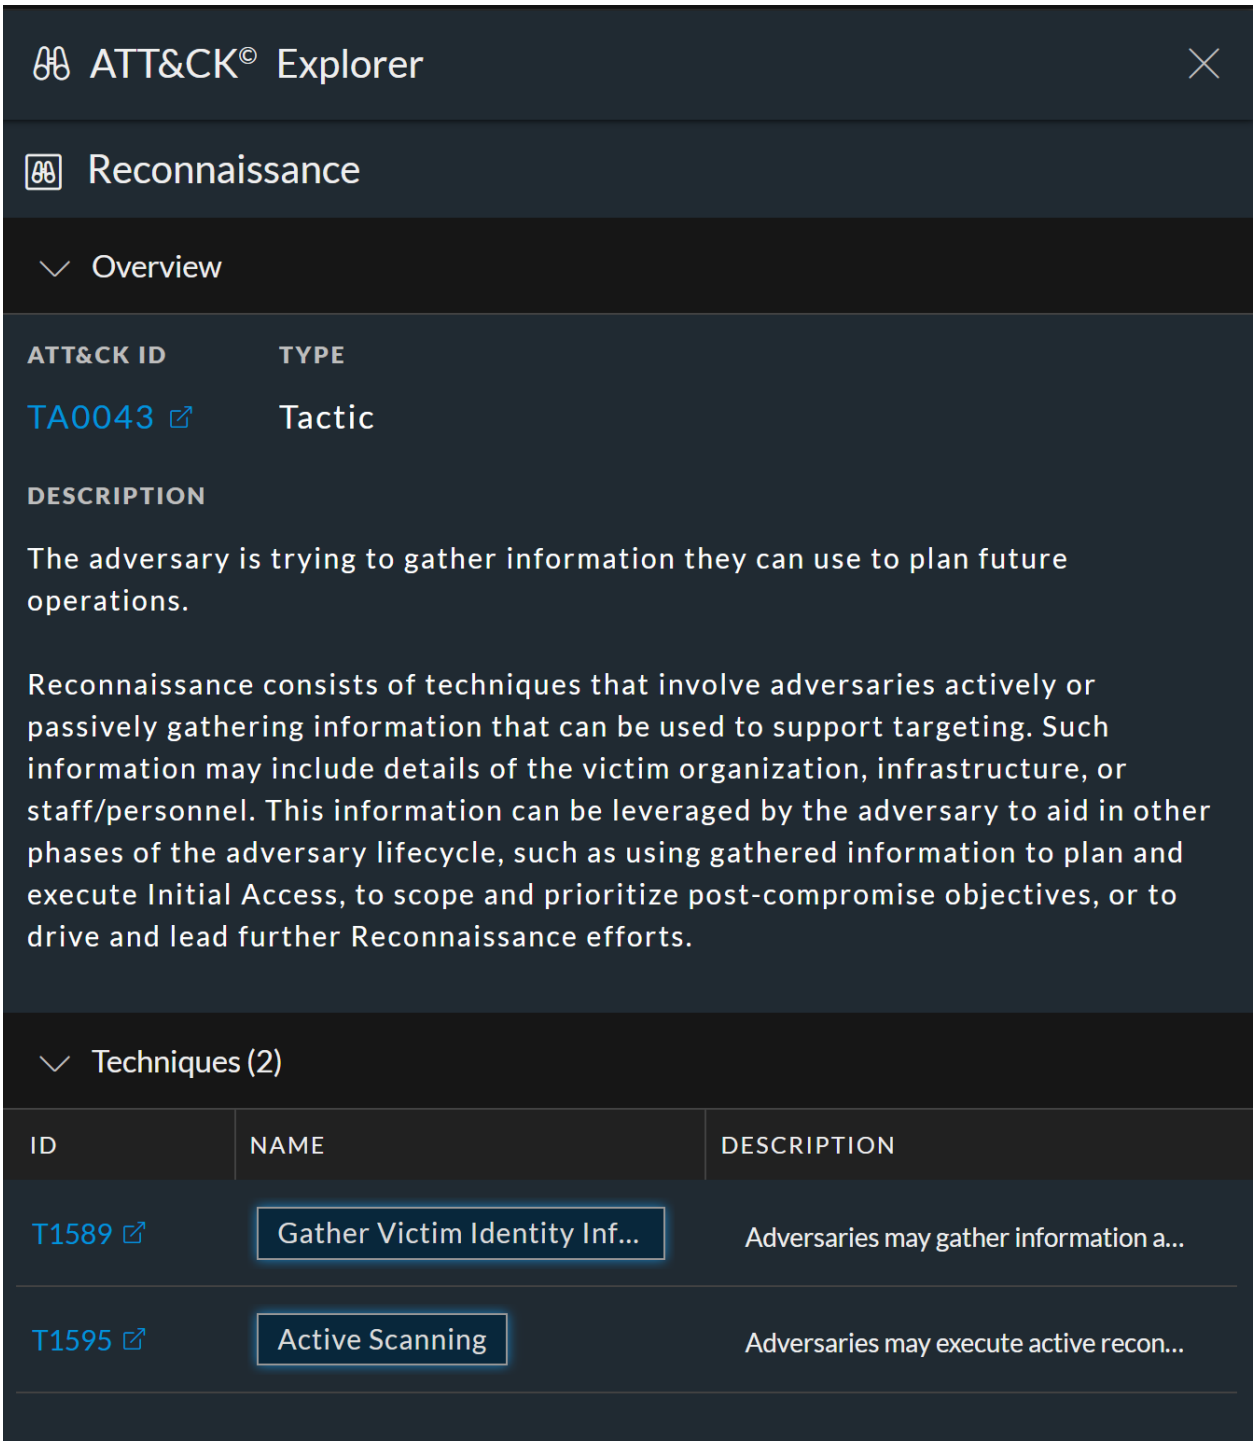
A new user preference, **Maximum Session Export Limit**, has been added to the **Events Preferences** panel in the **Investigate** > **Events** view. Analysts can use this setting to adjust the number of available sessions for exporting using the **Download All** menu options. This enhancement makes the number of exported sessions independent from the number of sessions displayed in the Events table.

For more information, see **Set User Preferences for the Events View** topic in the *NetWitness Investigate User Guide*.

Option to Download Files with Custom Names

Analysts can now use custom names when downloading event files from the **Events** panel view. Custom names make it easier to organize and manage downloaded event files, saving analysts time and effort.

For more information, see **Download Data in the Events View** topic in the *NetWitness Investigate User Guide*.

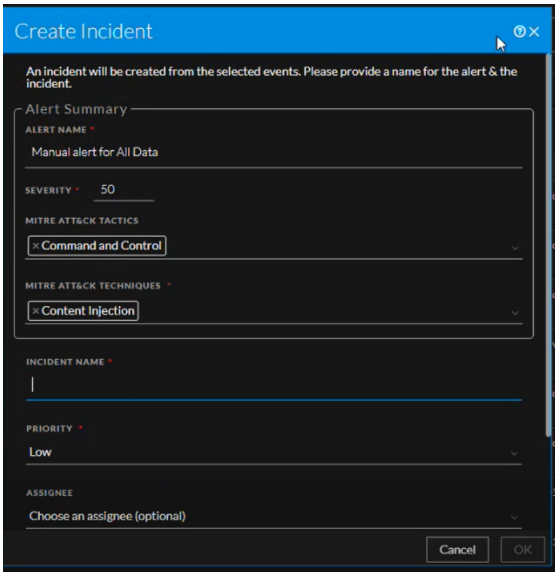


Respond

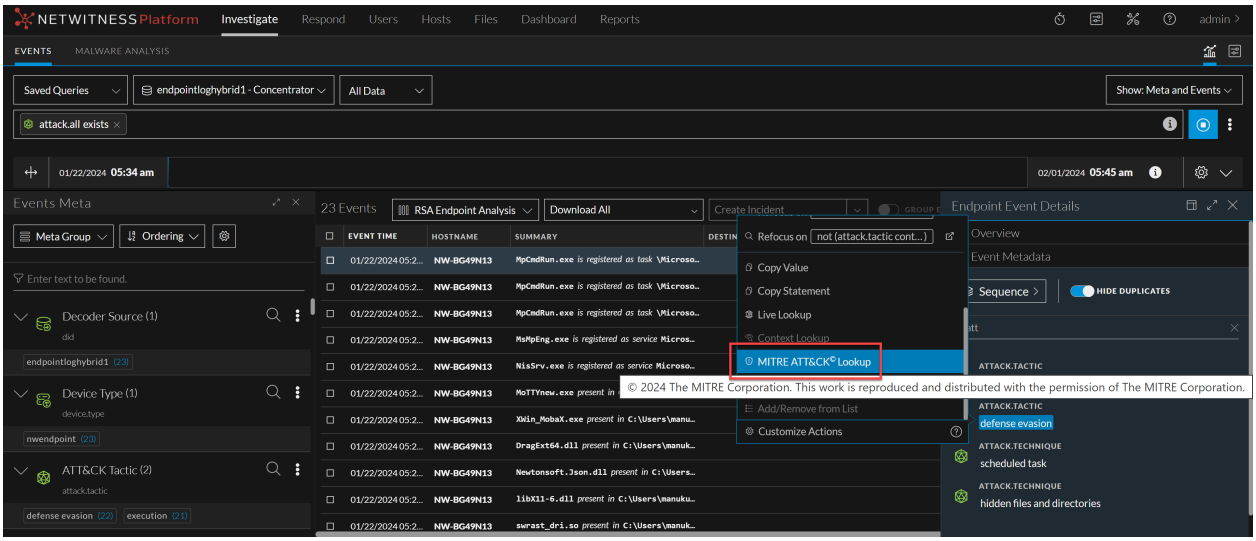
The following sections describes the new enhancements for the Respond component:

MITRE ATT&CK® Integration with NetWitness

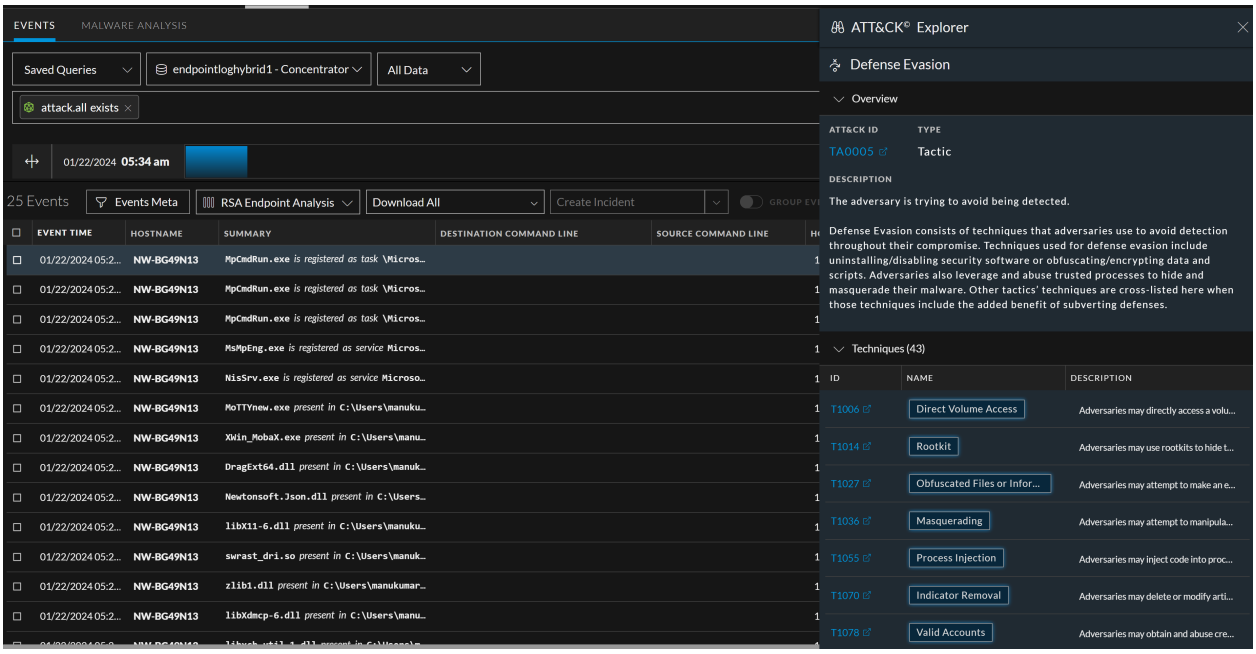
MITRE ATT&CK® is a curated knowledge base of adversary Techniques and Tactics. It provides an appropriate level of categorization for adversary action and specific ways of defending against it. Analysts can view the high-level list of specified tactics, techniques, and sub-techniques, along with their details, and learn how potential threats and vulnerabilities in their environment are associated with the MITRE ATT&CK framework.



The new **ATT&CK© Explorer** Panel provides information about the adversary tactics and techniques associated with the Incidents in the **Respond** view.



NetWitness Live is integrated with MITRE ATT&CK framework to help analysts to view the MITRE ATT&CK Tactics and Techniques associated with the **Application Rules** and **Event Stream Analysis Rules**. The Service Details Right panel (**(Configure)** > **Policies** > **Content** > **Content Library** > **Application Rule** or **Event Stream Analysis Rule** > click a row > Service Details Right panel) is enhanced to provide information about the MITRE ATT&CK Tactics and Techniques.

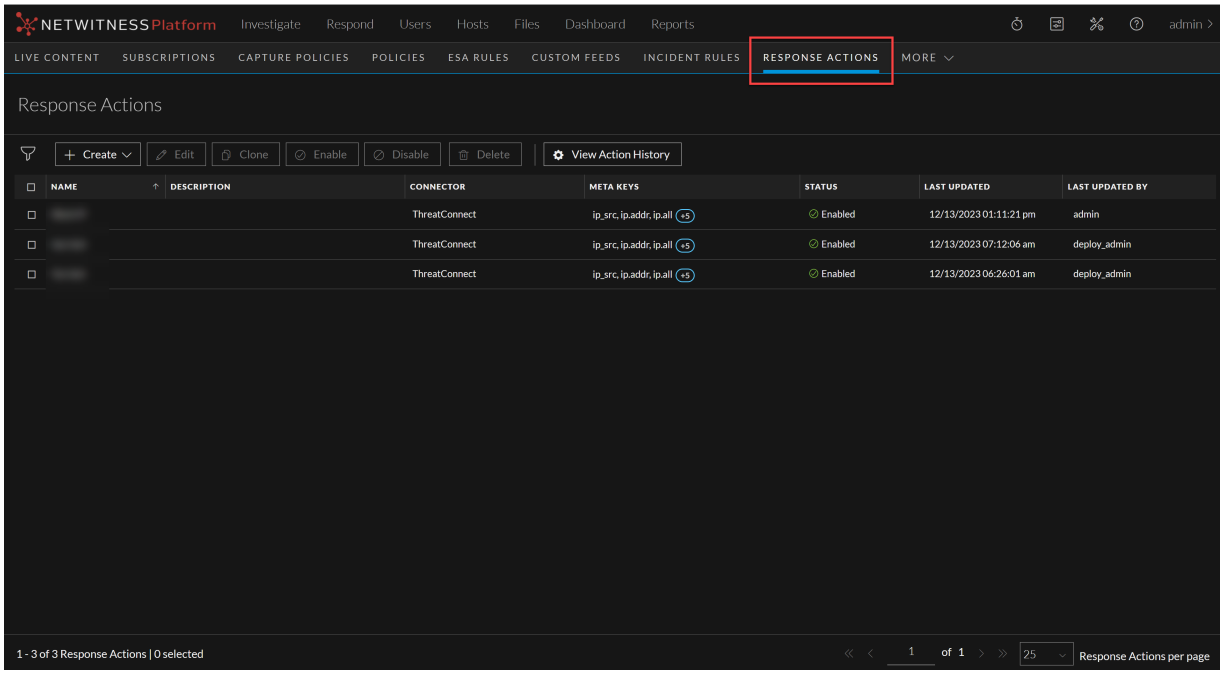


You can tag MITRE ATT&CK Tactics and Techniques while creating a custom **Application Rule** or **Event Stream Analysis Rule**.

You can also select the MITRE ATT&CK Tactics and Techniques while creating an incident from the **Investigate** > **Events** view.

With this, the **ATTACK.TACTIC** and **ATTACK.TECHNIQUE** metakeys in the **Events Metadata** panel has been enhanced with **MITRE ATT&CK© Lookup** integration to help you gain more information on the specific tactic and technique associated with the event.

The new **ATT&CK© Explorer** Panel is displayed when you click **MITRE ATT&CK© Lookup**.



For more information, see NetWitness Respond User Guide for 12.4, *NetWitness Investigate User Guide*, and *Policy-based Centralized Content Management Guide*.

Response Actions

Response Actions are the reactive operations performed on configured metas using a third-party tool or connector such as ThreatConnect after triaging an event. **Response Actions**, the new feature added in  **(CONFIGURE)** > **More** allows you to perform the following actions:

- Create and manage Response Actions for the supported metas available in **Respond**, **Investigate**, **Hosts**, and **Users** view.
- Perform Quick Actions on the configured meta and post the meta with additional parameters to the

connector for taking further actions.

For more information, see NetWitness Response Actions Configuration Guide for 12.4.

Insight

The following sections describes the new enhancements for the Insight component:

Whitelist Insight Alerts in Respond View

Administrators and analysts can now whitelist unwanted and recurring Insight alerts generated in the **Respond** > **Alerts** view. This enhancement provides the ability to select specific values, such as IP Address and Asset Type, and define a Whitelist condition to prevent unwanted alerts from being generated for these values. Using this enhancement, analysts can streamline the alert management process by excluding specific IP addresses or asset types that are known to be reliable and secure. This optimization minimizes unnecessary alerts generated on the **Respond** > **Alerts** view, reducing the time and effort required to review and analyze alerts.

For more information, see the **NetWitness Insight** section in the *NetWitness Documentation Portal*.

User and Entity Behavior Analytics

The following section describes the new enhancements for UEBA component:

Support for Cisco Adaptive Security Appliance (ASA) and Fortinet VPN Devices

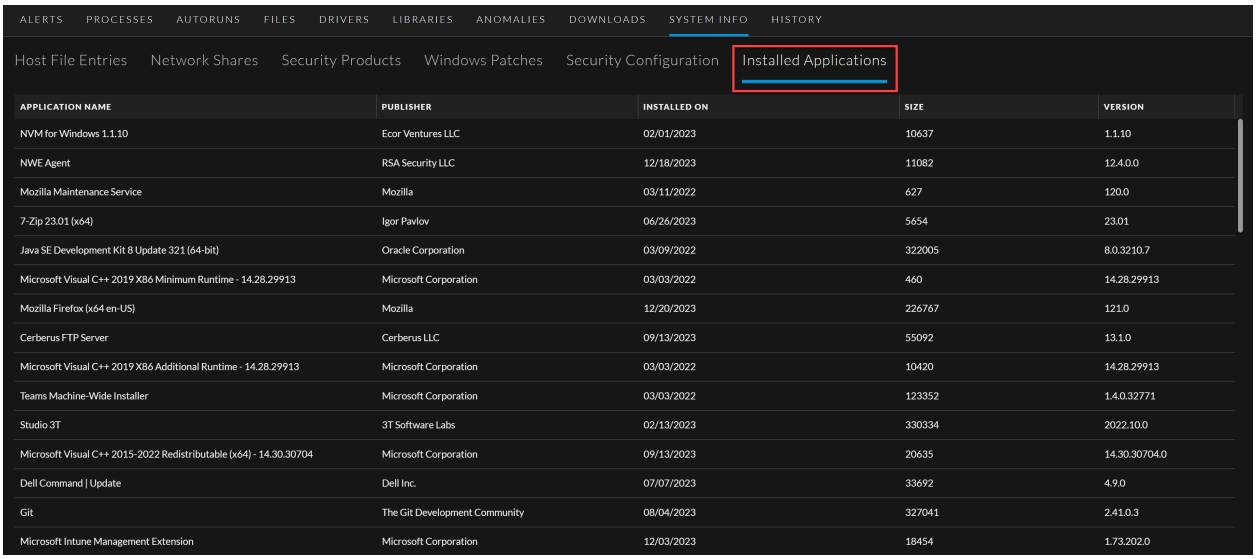
NetWitness UEBA has added support for the Cisco ASA and Fortinet VPN devices. With this enhancement, UEBA can now process Cisco ASA and Fortinet VPN logs, which helps to gather and analyze user activity information.

For more information, see the **UEBA Supported Sources by Schema** section in the *UEBA Configuration Guide*.

UEBA Performance Improvements

The following performance improvements are made for UEBA in the 12.4.0.0 version:

- Optimized the aggregation and accumulation models to generate and store models in parallel.
- Optimized the hourly score aggregation task to aggregate and score in parallel.



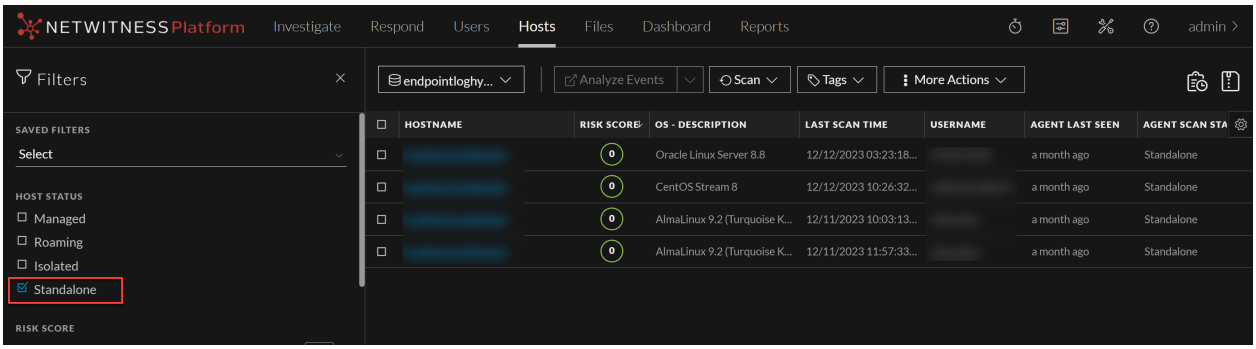
For more information on the supported scale, see the **Learning Period Per Scale for 12.4** topic in the *UEBA Configuration Guide*.

Endpoint

The following section describes the new enhancements for Endpoint component:

View Installed Applications

The **Hosts** details > **System Info** view has been enhanced to allow analysts to view the information about the various applications installed on a Windows machine.

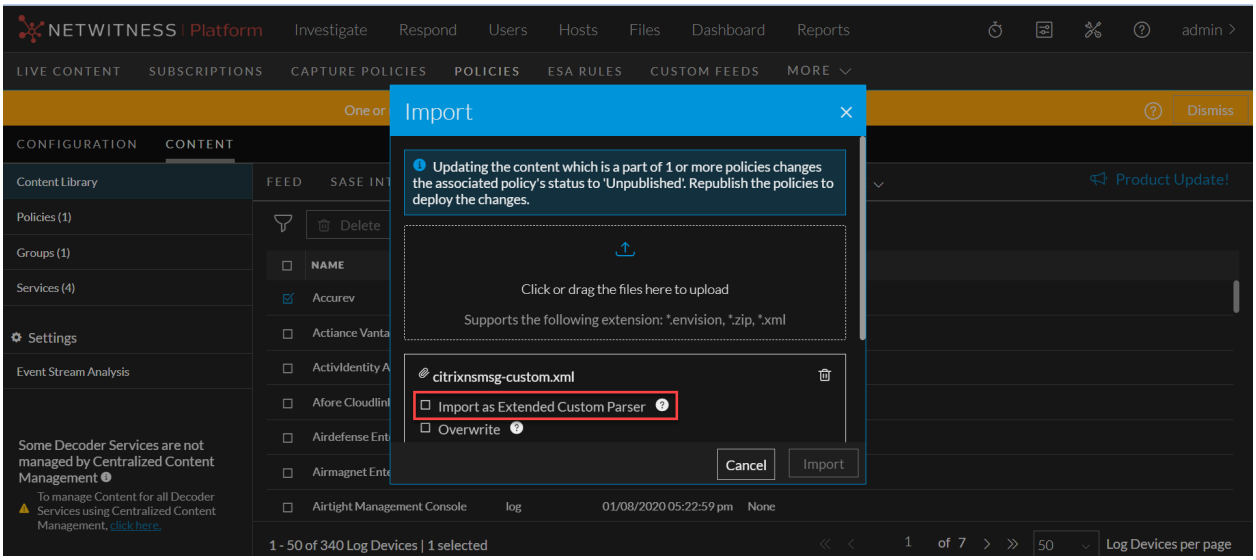


APPLICATION NAME	PUBLISHER	INSTALLED ON	SIZE	VERSION
NVM for Windows 1.1.10	Ecor Ventures LLC	02/01/2023	10637	1.1.10
NWE Agent	RSA Security LLC	12/18/2023	11082	12.4.0.0
Mozilla Maintenance Service	Mozilla	03/11/2022	627	120.0
7-Zip 23.01 (x64)	Igor Pavlov	06/26/2023	5654	23.01
Java SE Development Kit 8 Update 321 (64-bit)	Oracle Corporation	03/09/2022	322005	8.0.3210.7
Microsoft Visual C++ 2019 X86 Minimum Runtime - 14.28.29913	Microsoft Corporation	03/03/2022	460	14.28.29913
Mozilla Firefox (x64 en-US)	Mozilla	12/20/2023	226767	121.0
Cerberus FTP Server	Cerberus LLC	09/13/2023	55092	13.1.0
Microsoft Visual C++ 2019 X86 Additional Runtime - 14.28.29913	Microsoft Corporation	03/03/2022	10420	14.28.29913
Teams Machine-Wide Installer	Microsoft Corporation	03/03/2022	123352	1.4.0.32771
Studio 3T	3T Software Labs	02/13/2023	330334	2022.10.0
Microsoft Visual C++ 2015-2022 Redistributable (x64) - 14.30.30704	Microsoft Corporation	09/13/2023	20635	14.30.30704.0
Dell Command | Update	Dell Inc.	07/07/2023	33692	4.9.0
Git	The Git Development Community	08/04/2023	327041	2.41.0.3
Microsoft Intune Management Extension	Microsoft Corporation	12/03/2023	18454	1.73.202.0

For more information, see *NetWitness Endpoint User Guide for 12.4*.

Standalone Scan for Linux Agents

Administrators can execute offline or standalone scans on Linux hosts to perform threat analysis on the Air-gapped Linux machines.



For more information, see *NetWitness Endpoint User Guide for 12.4*.

Policy-based Centralized Content Management (CCM)

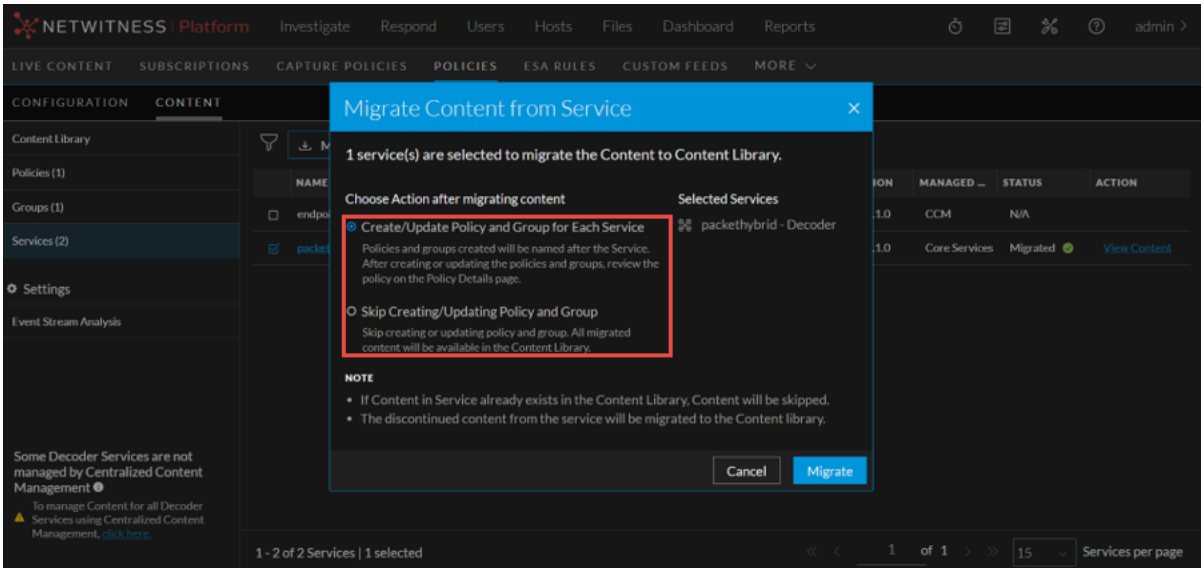
The following enhancements are made for CCM in 12.4.0.0 version:

Enhancements for Proper Functioning and Deployment of Custom Parsers into Services through CCM

Introduced the capability to import individual XML (Log Device content type) to Content Library. You can upload either the base parsers or extended parsers as a standalone XML file. While importing XML files, you can optionally associate it with its corresponding base parser, effectively treating it as an extension parser. To import a standalone XML as an extended parser, select **Import as Extended Custom Parser** in the **Import** screen.

The Content Library now displays base parsers and extension parsers as distinct items, providing a clear and organized view for users. This separation ensures that users can easily identify and manage both types of parsers within the library. Furthermore, when an extension parser is added to a policy, the corresponding base parser is automatically included in the policy as well. This streamlined integration simplifies the process for users, eliminating the need to manually link base and extension parsers when creating or editing policies.

For more information, see the **Import Content to Content Library** section in the *Policy-based Centralized Content Management Guide*.

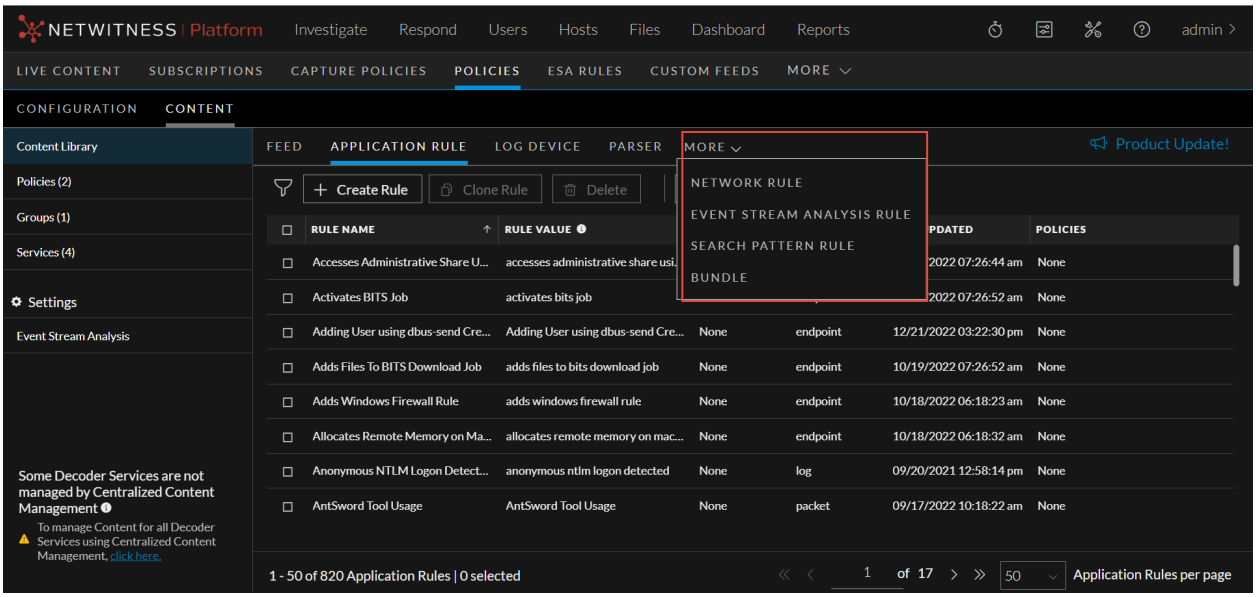


Enhancements during Removal of a Service from Group

While removing a service from the group, you can opt to either delete the content from service and then remove the service from the group or remove the service from the group without deleting the content.

For more information, see the **Edit a Group**, **Edit a Policy** and **Delete a Policy** sections in the *Policy-based Centralized Content Management Guide*.

Capability to Remigrate Content from Service



CCM is enhanced to re-migrate content from a service even if it is already migrated and/or assigned to Groups and Policies.While migrating content from a service already associated to a policy, you can optionally update the associated policy with migrated content. To update the existing policy and group for service after remigrating the service, the options available in the **Migrate Content from Service** page are updated to **Create/Update Policy and Group for Each Service** and **Skip Creating/Updating a Policy and Group**.

For more information, see the **Migrate Content from Service** section in the *Policy-based Centralized Content Management Guide*.

UI Enhancements

The **MORE** navigation menu is added to the CCM UI to view Bundles, Search Patterns, and Integrations by default. As you select the content type from the **MORE** menu, that content type appears on the left of the **MORE** menu.

Concentrator, Decoder, Log Collector, and Archiver Services

The following enhancements are made for Concentrator, Decoder, Log Collector, and Archiver Services in 12.4.0.0 version:

Capability to Deprecate the Use of IP Address for Basic Authentication

Netwitness has deprecated the use of IP address for Windows Collection Basic Authentication. Now, you must use the FQDN in the Event Source Address and add an entry of the same FQDN in '/etc/hosts' while configuring Basic Authentication.

New Utility to Stream Meta From Decoders to 3rd Party Tools

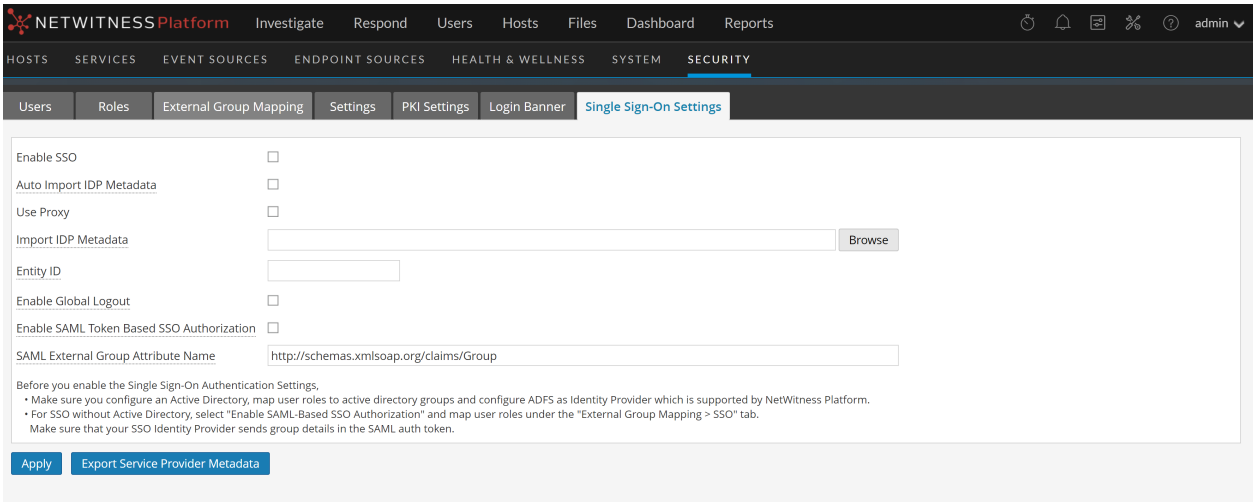
Introduced a beta utility to stream meta from network decoders to other 3rd party tools, making it easy to integrate NetWitness Platform with other products. All or a subset of meta data can be streamed to limit the amount sent to the 3rd party tool depending on the use case.

For more information, see Meta Export Installation and Configuration Guide.

Log Integrations

NetWitness Platform supports the integration of the following event sources to collect and parse logs. Unless specified, these services are supported on NetWitness Platform 12.2.0.0 or later.

- Palo Alto Prisma Access
- VMware vSphere
- DeepInspect
- GCP Windows VM Logs (via GCP Plugin)



Note: From 12.4 onwards, VMWare plugin is also available for the collection of VMWare events and tasks.

For more information on integrating the parser services, see NetWitness Platform Integrations Guide.

Security

Single Sign-On (SSO) Authentication Independent of Active Directory (AD) Configuration in NetWitness

Starting from NetWitness Platform version 12.4, NetWitness offers SSO that is independent of AD configuration in NetWitness. It allows user authorization by using the list of user groups embedded in the SAML authentication token received from ADFS and verifying them against user groups already set up in NetWitness. This eliminates the need for users to configure or rely on Active Directory settings within NetWitness for user authentication. NetWitness now supports both Azure ADFS and Microsoft ADFS.

For more information, see **Set Up Single Sign-On Authentication** topic in the *System Security and User Management Guide*.

Security Fixes

For more information on Security Fixes, see https://community.netwitness.com/t5/netwitness-platform-advisories/ct-p/netwitness-advisories#security.

Upgrade Paths

The following upgrade paths are supported for NetWitness 12.4.0.0

- NetWitness 12.3.1.0 to 12.4.0.0
- NetWitness 12.3.0.0 to 12.4.0.0

- NetWitness 12.2.0.1 to 12.4.0.0
- NetWitness 12.2.0.0 to 12.4.0.0

For more information on upgrading to 12.4.0.0, see Upgrade Guide for NetWitness 12.4.0.0

IMPORTANT: If you want to upgrade from 11.7.x or 11.7.x.x versions to 12.4.0.0 version, you must first upgrade to 12.2.0.0 or 12.3.0.0 version before upgrading to 12.4.

Product Version Life Cycle for NetWitness Platform

See for Product Version Life Cycle for NetWitness Platform a list of versions that reach End of Primary Support (EOPS).

What's New in Previous Releases (11.7 to 12.3.1.0)

The section provides new features and enhancements for all supported previous releases.

For more information, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-7-to-12-1-1/ta-p/695650.

Fixed Issues in 12.4.0.0 Release

This section lists issues fixed in 12.4.0.0 version.

For additional information on fixed issues, see the Fixed Version column in the NetWitness® Platform Known Issues list (https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872) on NetWitness Community Portal.

Policy-based Centralized Content Management (CCM) Fixes

Tracking Number	Description
ASOC-142018	The Log device contents published from CCM are not disabled when contents are deleted for a service.
ASOC-141524	The ESA rules could not be saved by editing or updating the ESA rule. NetWitness UI and SA logs showed a run time exception while saving the rule. Also, on troubleshooting, the **RSA OSINT Non-IP Threat Intel Feed** did not have a unique ID associated with the policy, and occurred in multiple documents in the content policy collections.

Known Issues in 12.4.0.0 Release

Issues that remain unresolved in this release are documented in the NetWitness® Platform Known Issues list on the NetWitness community portal: https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872

Build Numbers for 12.4.0.0 Components

The following table lists the build numbers for various components of NetWitness 12.4.0.0

Component	Version Number
NetWitness Admin Server	rsa-nw-admin-server-12.4.0.0-240117024246.5.165a1f70.el8.alma.noarch.rpm
NetWitness Advanced Analytics Content	rsa-nw-advanced-analytics-content-12.4.0.0-231212110357.5.9b3b362.el8.alma.noarch.rpm
NetWitness Advanced Analytics Server	rsa-nw-advanced-analytics-server-12.4.0.0-231212110325.5.9b3b362.el8.alma.noarch.rpm
NetWitness Appliance	rsa-nw-appliance-12.4.0.0-12866.5.1aefe557c.el8.x86_64.rpm
NetWitness Archiver	rsa-nw-archiver-12.4.0.0-12866.5.1aefe557c.el8.x86_64.rpm
NetWitness Audit Plugin	rsa-audit-plugins-12.4.0.0-4892.5.9d0750b41.el8.noarch.rpm
NetWitness Audit RT	rsa-audit-rt-12.4.0.0-4892.5.9d0750b41.el8.x86_64.rpm
NetWitness Bootstrap	rsa-nw-bootstrap-12.4.0.0-2401240926.5.a3d68ef.el8.noarch.rpm
NetWitness Broker	rsa-nw-broker-12.4.0.0-12866.5.1aefe557c.el8.x86_64.rpm
NetWitness Carlos RT	rsa-carlos-rt-12.4.0.0-2787.5.721a8daa7.el7.x86_64.rpm
NetWitness Cloud	rsa-nw-cloud-12.4.0.0-12867.5.957818c84.el8.x86_64.rpm

Getting Help with NetWitness Platform

Product Documentation

The following documentation is provided with this release.

Documentation	Location URL
NetWitness Platform Master Table of Contents	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation
NetWitness Platform 12.4.0.0 Product Documentation	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation
NetWitness Platform 12.4.0.0 Upgrade Guide	https://community.netwitness.com/t5/rsa-netwitness-platform-staged/upgrade-guide-for-12-4/ta-p/709308
NetWitness Analytics on Cloud	To learn more about new features and enhancements in NetWitness Analytics on Cloud releases, check the following What's New section: For UEBA Cloud, see https://docs.netwitness.com/netwitnessueba/release_information/whats_new/. For Insight, see https://docs.netwitness.com/netwitnessinsight/release-information/insight_whatsnew/.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com/
LiveUI	https://live.netwitness.com

NetWitness Educational Services

Sign up for access to NetWitness courses and additional resources on the NetWitness Educational Services and Training.

NetWitness Education Portal	https://netwitness.sabacloud.com/Saba/Web_spf/NA10P2PRD088/guestapp/home;spf-url=guest%2Fguestlearningcatalog
NetWitness Educational Services Course Catalog	https://community.netwitness.com/t5/netwitness-education-courses/tkb-p/netwitness-training
NetWitness Educational Services Training Schedule	https://community.netwitness.com/t5/netwitness-education-blog/netwitness-instructor-led-training-schedule/ba-p/655826
NetWitness Educational Services Support Contact	education.support@netwitness.com

Feedback on Product Documentation

You can send an email to feedbacknwdocs@netwitness.com to provide feedback on NetWitness Platform documentation.

Upgrade NetWitness Platform

This document provides information about the benefits and process of upgrading NetWitness Platform to 12.4. Ensure you go through the pre-requisites and pre-upgrade tasks before you upgrade NetWitness Platform. You can upgrade NetWitness Platform using four different options depending upon your Internet connectivity. After upgrading, you should also perform certain post upgrade tasks and post upgrade sanity checks listed in this guide to complete the upgrade process successfully. The instructions in this document apply to both physical and virtual hosts (including AWS, Azure Public Cloud, and Google Cloud Platform) unless stated to the contrary.

IMPORTANT: The versions 11.7.x, 12.0, and 12.1 reached the End of Life (EOL) on 31st December 2023. For more information, see https://community.netwitness.com/t5/product-life-cycle/product-version-life-cycle-for-rsa-netwitness-platform/ta-p/569875. If you want to upgrade from 11.7.x (Service packs) or 11.7.x.x (Patches) versions to 12.4.0.0 version, you must first upgrade to 12.2.0.0 or 12.3.0.0 version before upgrading to 12.4.

Note: NetWitness Platform now supports installing multiple servers of UEBA in your environment. For more information, see **Configure Multiple UEBA Servers** topic in the *NetWitness UEBA Configuration Guide*.

There are many exciting new features that you can enable after you have upgraded to 12.4. For a detailed description of the new features in this release, see the *Release Notes for NetWitness Platform 12.4*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. For more information on the new features released in the previous releases, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-x-to-12-x/ta-p/695650.

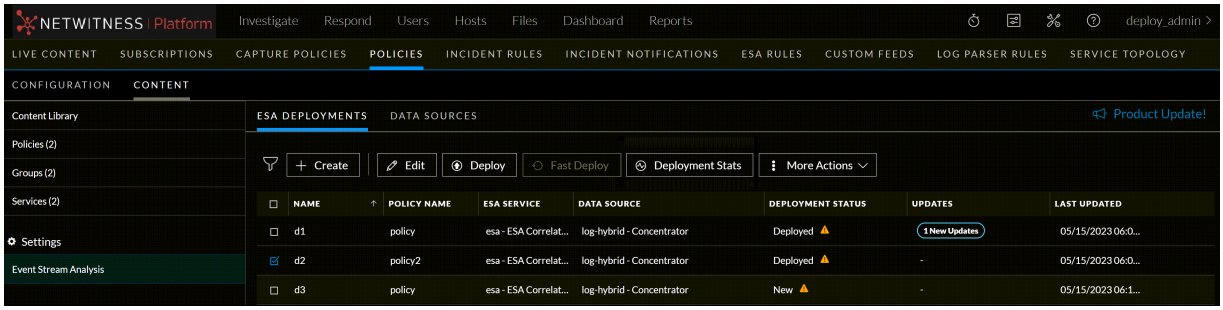
Upgrade Paths Supported for 12.4

The following upgrade paths are supported for NetWitness 12.4:

- NetWitness 12.3.1.0 to 12.4
- NetWitness 12.3.0.0 to 12.4
- NetWitness 12.2.0.1 to 12.4
- NetWitness 12.2.0.0 to 12.4

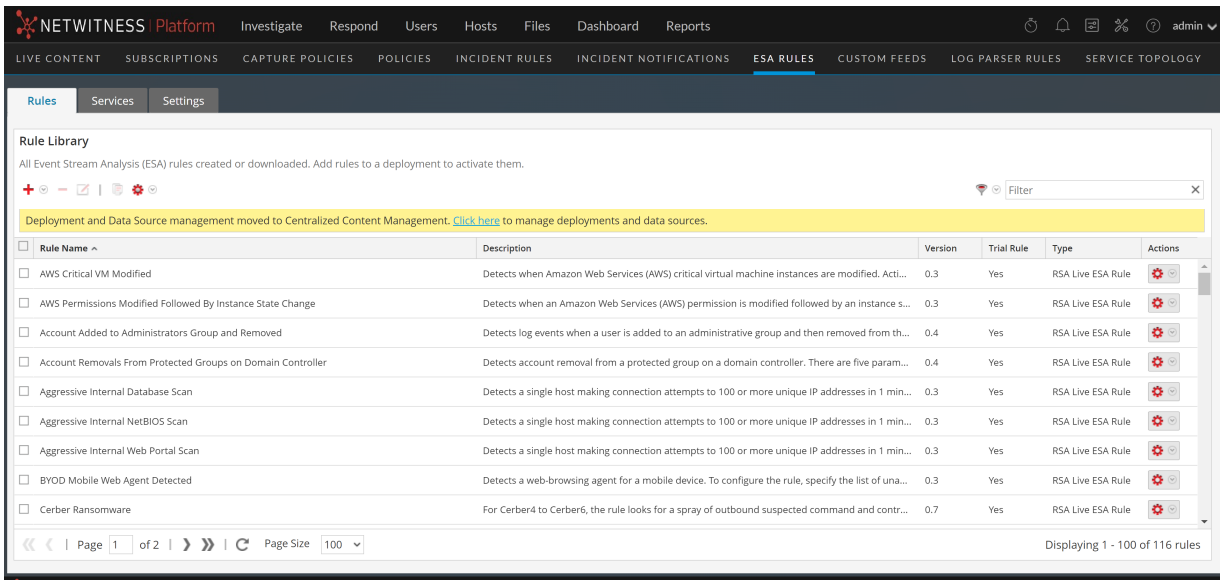
Running in Mixed Mode Environment

NetWitness Platform supports mixed mode during upgrade. Mixed mode occurs when some services are upgraded to the latest version and some services are still on the older versions.



For more information, see **Running in Mixed Mode** in the *NetWitness Hosts and Services Getting Started Guide*.

Note:
- If it takes a longer duration for upgrading all the hosts in your environment, contact NetWitness support to avoid encountering any issues.
- If you are running Endpoint Log Hybrid in mixed mode, make sure Endpoint Broker is on the same version as one of the Endpoint Servers.
- Mixed mode is not supported for ESA hosts in NetWitness Platform.



Upgrade Considerations for ESA Hosts

IMPORTANT: The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

- You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. Refer the following figure.

- You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figure.

- After upgrading to the 12.4 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4 version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events.
- You must upgrade the ESA hosts immediately after upgrading the Admin Server.

  For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Upgrade or Install Windows Legacy Collection

Refer to Windows Legacy Collection Guide for NetWitness for NetWitness Legacy Windows Collection Upgrade & Installation Instructions.

Note: After you upgrade or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Terminologies

Name	Description
AVX	Advanced Vector Extensions
VMX	Virtual Machine Extension
NFS	Network File System
BTRFS	B-Tree File System
DPDK	Data Plane Development Kit

Run Pre-Upgrade Checks

You must run the pre-upgrade checks before you upgrade to NetWitness Platform 12.4 to identify any issues that may result in upgrade failure.

Before you begin

You must first download the Standalone RPM using https://community.netwitness.com/t5/netwitness-platform-downloads/netwitness-platform-standalone-precheck-tool/ta-p/709096 and refer to the read me file for instructions on how to install the Standalone RPM and then run the pre-check.

To run the pre-upgrade checks:

1. SSH to Admin Server.
2. Using the Upgrade Precheck tool, run the following commands in sequence:
   a. `nw-precheck-tool-standalone os-migration-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the OS Migration Checklist.
   b. `nw-precheck-tool-standalone upgrade-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Upgrade Checklist.
   c. `nw-precheck-tool-standalone network-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Network Checklist.
   d. `nw-precheck-tool-standalone cert-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Certificate Checklist.

OS Migration Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the OS Migration checklist:

- **Version Check Probe**: Checks whether the NetWitness version of the system is the later version of 12.2.0.0 or not.
- **AVX / VMX Probe**: Checks if the AVX / VMX flags are enabled or not for the nodes that require them.
- **NFS Mount Probe**: Checks if NFS type mount point is active on any of the nodes.
- **Multiple kernel-devel Package Probe**: Checks if Decoder and PacketHybrid have multiple versions of kernel-devel package or not.
- **PF Ring Capture Device Probe**: Checks for PF_ring capture device on decoders and raises a warning to change PF_ring capture device to DPDK capture device.
- **BTRFS mount Probe**: Check if BTRFS partition is mounted.

  Note: LEAPP and Alma OS doesn't support BTRFS partition.
- **Disk space check**: Checks to ensure that enough disk is free in the / partition on each node.

- **Fips Mode Check**: Checks to ensure that the Fips mode is disabled (set to false) on all nodes.
- **Mountcheck probe**: Checks if all the partitions or file directories are mounted properly.

Upgrade Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the upgrade checklist:

- **Security Client File Check**: Ensures `security-client-amqp.yml` file is not present.
- **Node-0 NW Service-id Status Check**: Ensures all the service-id is intact with all the different services in Node 0.
- **Broker Service Trustpeer Symlink File Check**: Ensures Broker Service Trustpeer Symlink file `(/etc/netwitness/ng/broker/trustpeers/)` is not broken.
- **Node-0 NW Services Status Check**: Checks the status of all the services in Node 0.
- **Yum External Repo Check**: Ensures external repos are not available and not enabled.
- **Node-0 RPM DB Index Check**: Checks if the RPM DB is corrupted or not.
- **Salt Master Communication Check**: Verifies the salt communication from Node 0 to all the Nodes.
- **Node-0 Certificates Check**: Checks if any certificates are missing, expired, or invalid issuer type.
- **Mongo Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using Mongo client.
- **Rabbitmq Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using RabbitMQ.
- **(Component Hosts) Node X NW Service Status Check**: Verifies the status of services (Active or Inactive) on all the Node X.
- **(Component Hosts) Node X Certificates Check**: Checks the certificate expiry, missing, corrupted, and issuer mismatch in all the categories of Node X.
- **Provide Nodes CPU-Memory Info**: Provides CPU and Memory details of all the nodes along with the real-time available memory.
- **(Admin Server) Node 0 File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` on Node 0.
- **(Component Hosts) Node X File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` for ESA Primary and Endpoint Log Hybrid services on Node X.

- **Mongo File (ESAPrimary) Permission Mode Check**: Checks the ESA Primary node in the system or stack and verifies the permission mode of Mongo file.
- **Orchestration Server Normal Mode Check**: Checks if the orchestration service is running in normal or safe mode.
- **(Admin Server) Node 0 Init status Check**: Checks if there are any issues that might fail init process.
- **Fips Mode Check**: Checks to ensure that the Fips mode is disabled (set to false) before and after upgrade.
- **Node-X RPM DB Index Check**: Checks for the status of RPM DB on Node-X to make sure it is not corrupted.
- **Node-Z Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -Z.
- **Node-X Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -X.
- **Host Info Check Probe**: Checks if the required fields of information of all the hosts in the system (Host IP, Hostname, Installed Services, and Raw Version) are available.
- **Node-Z Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on Node-0.
- **Node-X Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on all Node-X.
- **Node-X Hardware Version Check Probe**: Checks for the hardware version of all reachable Node-X.
- **Node-Z Hardware Version Check Probe**: Checks for the hardware version of the Admin server.
- **PuppetCA Certificates Check Probe**: Checks if the stale puppet CA certificates are present in the location `/etc/pki/nw/trust/truststore.pem`.
- **AdminCertCheck Probe**: Verifies if the admin-certs across all the nodes are the same as the admin-certs on the Admin Server.
- **NTP Probe**: Checks all the nodes to ensure they are in sync with the NTP server.
- **StaleCerts Check Probe**: Checks the mongo and warns if there are any unused stale certificates in it.
- **NodeCertIDCheck Probe**: Checks the subject field of the node-cert and ensures that it is the same as the node-ID of the host.
- **Deploy Admin password expiry check Probe**: Verifies if the deploy_admin password is expired on Node-0.
- **File / Folder permission check**: This probe checks if the files / folders have the appropriate permissions.

Network Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the network checklist:

- **(Admin Server) Node 0 closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node 0.
- **(Component Hosts) Node X closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node X.

Certificate Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the Certificate checklist:

- **Node 0 Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-0.
- **Node X Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-X.
- **Node Certificates Validity Check on Node-0**: Checks the validity of node certificates in the location `/etc/pki/nw/service` on Node-0.
- **Root CA Certificates Validity Check**: Checks the validity of Root CA certificates in the location `/etc/pki/nw/ca`.

Prepare to Upgrade NetWitness Platform

Complete the following tasks to prepare for the upgrade to NetWitness Platform 12.4.

Task 1. (Important) Prepare to Upgrade AlmaLinux OS

Unsupported File System

Unmount and Remove BTRFS

BTRFS is a copy-on-write (CoW) filesystem for Linux that aims to implement advanced filesystem features while focusing on fault tolerance, repair, and easy administration. The BTRFS file system is deprecated from Red Hat Enterprise Linux 8, and AlmaLinux OS does not support the BTRFS file system. NetWitness does not use BTRFS by default, but in some categories like network decoder, network hybrid, etc., BTRFS module exists and is loaded. If BTRFS is mounted as a filesystem, perform the below steps to unmount the BTRFS partition manually (If BTRFS is not mounted, skip the below steps):

a. Relocate the data.

b. Unmount the BTRFS partition using the following command.

c. umount <btrfs partition path>. You can get the btrfs partition info from `/etc/fstab or df -hT` commands.

d. Remove the BTRFS partition from `/etc/fstab`.

e. Verify if the kernel moduleis still loaded using `lsmod | grep btrfs`. If the kernel module is still loaded , use `modprobe -r btrfs` to unload the btrfs kernel module.

f. Trigger/Retrigger the Upgrade.

For more information, refer the KB article “Upgrade to Alma OS when BTRFS file system is mounted.”

Unmount NFS

NFS type file systems active on the nodes cause the upgrade to fail for the nodes. You should manually unmount these mount points from the CLI of each node where it is found. Perform the below steps to unmount the NFS manually:

a. SSH to the nodes where NFS mount point is detected.

b. In each node, run `mount | grep 'type nfs'` and get the directory path of the NFS mount point.

> **Note:** Before unmounting NFS, you must stop the NetWitness services that rely upon NFS.
> For example: If Archiver and Warehouse Connector service is running on NFS, you must run the following commands to stop the services before unmounting NFS.
> `systemctl stop nwarchiver`
> `systemctl stop nwwarehouseconnector`

c. Execute umount <dir_path> from the terminal, where <dir_path> is the directory path from Step b.

d. Open `/etc/fstab` file in an editor of choice and comment out the line(s) that pertain to NFS mount point(s).

e. Run the NetWitness upgrade.

f. After upgrade has completed successfully, un-comment the respective entry from `/etc/fstab` and execute `mount -a` from the terminal to add the NFS mount point(s) back.

AVX/VMX CPU Instruction Set Check

AVX/VMX CPU flag needs to be enabled for NetWitness Platform 12.4. Run the command `salt '*' cmd.run "lscpu | grep -E 'avx|vmx'"` to check if AVX/VMX CPU instruction set is enabled. Refer the KB Article "Use AVX Instruction Set for MongoDB 5.0 Platform Support" for more information.

Note: For NetWitness hardware appliance, AVX/VMX CPU instruction set is enabled by default.

PF_RING to DPDK Migration Support

The decoder capture config will not be valid for customers using PF_RING capture (CentOS) and directly upgrading to 12.4 (AlmaLinux). First, they must migrate PF_RING devices to DPDK and then upgrade.

Refer to Migrate PF_RING Devices to DPDK for migration instructions.

Task 2. (Optional). Remove Legacy Package Repositories

You can free up the disk space by removing obsolete repositories from previous releases.

To remove the obsolete repositories:

1. Determine the version of the oldest NetWitness Platform host in your environment by using the NetWitness Repo tool. Do the following:

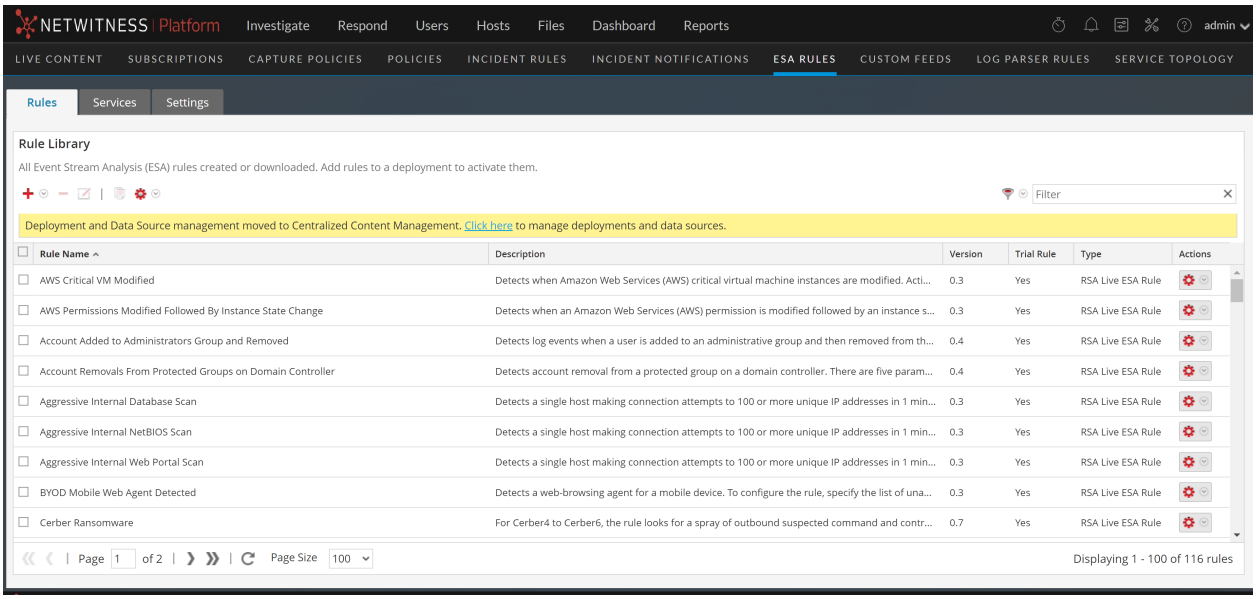
- SSH to the Admin Server as a `root` user.
- Run the following command.

  ```
  nw-repo-tool --list-obsolete
  ```

  After running this command, you will get a list of all the obsolete repositories.

2. Run the following command to remove all the obsolete repositories.

   ```
   nw-repo-tool --purge-obsolete
   ```



Task 3. Prepare ESA Deployments for Migration to 12.4

Before upgrading to 12.4, NetWitness recommends that all the ESA deployments maintain an error-free state. You must remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to 12.4. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4 version.

Manage ESA Deployments and Data Sources

You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. You must upgrade the ESA hosts immediately after upgrading the Admin Server.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

IMPORTANT: If there is any need to import ESA Rules and enrichments, NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rules are added.

Note: NetWitness recommends that all the deployments maintain an error-free state. You must remove any unnecessary or unused ESA deployments.

Task 4. Third-Party Package Removal

Any third-party packages installed on hosts out of the NetWitness repository are subjected to removal based on the Upgrade dependencies as part of OS migration.

Task 5. Single Sign-on (SSO): Enable SAML Response Signing in Microsoft Azure ADFS

The following configuration is only applicable to cases where the SAML response from Microsoft Azure ADFS was only encrypted by not signed. If your Microsoft Azure ADFS is already configured to sign and encrypt SAML responses, you can ignore this configuration and proceed with the upgrade process.

If you are not signing the SAML response, NetWitness recommends you to configure Microsoft Azure ADFS to encrypt and sign the SAML responses before upgrading your NetWitness Platform to version 12.4 for a successful Single Sign-on (SSO) login. To enable response signing in Active Directory Federation Service (AD FS), run the following command in ***powershell***:

```
Set-AdfsRelyingPartyTrust -TargetName <<relying-party-name>> -
SamlResponseSignature MessageAndAssertion
```

IMPORTANT: It is mandatory to configure Microsoft Azure ADFS to sign SAML responses before upgrading to version 12.4 of the NetWitness Platform. Without complying with these requirements, you may not be able to log in using SSO.

Task 6. (Optional). Disable STIG-based FIPS Kernel Controls

If you enabled STIG-based FIPS Kernel controls, you must disable them before initiating the NetWitness Platform upgrade process to avoid boot errors. To disable STIG-based FIPS Kernel controls, run the following commands:

```
manage-stig-controls --disable-control-groups 3 --host-all
grub2-mkconfig -o /boot/grub2/grub.cfg
```

After you upgrade NetWitness Platform, ensure that you enable STIG-based FIPS Kernel controls.

Note: STIG-based FIPS Kernel controls which require modifications to kernel boot options are not enabled by NetWitness out-of-the-box.

Task 7. (Optional). Verify Connection for Live Server

Note: This optional task is applicable to you only if you are upgrading NetWitness Platform through live.

Go to `admin/system/live services` and do a test connection to verify if you are able to connect to the live server as this is essential for the source-server from 12.x and above. This is an optional step and applicable only for customers who have configured live.

Task 8. Synchronize Time on Component Hosts with NW Server Host

Before you upgrade hosts, make sure that the time on each host is synchronized with the time on the NetWitness Server.

To synchronize the time, do one of the following:

1. Configure the NTP Server.

For more information, see **Configure NTP Servers** in the System Configuration Guide.

2. Perform the following steps:

a. SSH to the Admin Server host.

b. Run the following commands.

```
salt \* service.stop ntpd
salt \* cmd.run 'ntpdate nw-node-zero'
salt \* service.start ntpd
```

Perform Upgrade Tasks

IMPORTANT: You must run the pre-upgrade checks before performing the upgrade tasks. For more information on how to run the pre-upgrade checks, see Run Pre-Upgrade Checks

Upgrade the systems in your environment in the following order:

1. NW Server hosts
2. Analyst UI hosts
3. ESA Primary hosts
4. ESA Secondary hosts
5. Standalone Broker hosts
6. Concentrator hosts
7. Archiver hosts
8. Packet Decoder hosts
9. Log Decoder hosts
10. Log Collector / VLC hosts
11. The rest of your component hosts

IMPORTANT: NW Server, Analyst UI, and ESA Primary and Secondary hosts must all be upgraded on the same day. The rest of your component hosts can be upgraded on the same day or later. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. For more information, see "**Task 3. Prepare ESA Deployments for Migration to 12.4**" in the topic Prepare to Upgrade NetWitness Platform. Mixed mode is not supported for ESA hosts in NetWitness Platform. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

For information about all the host types in NetWitness, see the *NetWitness Hosts and Services Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to same version. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

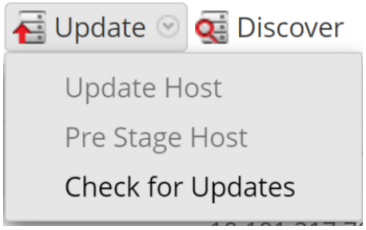
Note: For 12.4 version with Legacy Windows Log Collector, you should perform few additional post upgrade tasks. Refer to Legacy Windows Log Collection section in Perform Post Upgrade Tasks for these additional post upgrade tasks.

Select Upgrade Options

You can select one of the following upgrade options based on your Internet connectivity. They are listed in the order recommended by NetWitness Platform.

- Option 1: Upgrade NetWitness Platform using Live Services
- Option 2: Upgrade NetWitness Platform Offline
- Option 3: Upgrade NetWitness Platform using CLI (Offline)
- Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages

The following rules apply when you are upgrading hosts using any of the 4 upgrade methods:



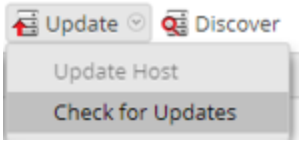
- You must upgrade the NW Server host first.
- You can only apply a version that is compatible with the existing host version.
- The NW Server, ESA primary, ESA secondary, and Analyst UI hosts must all be on the same NetWitness Platform version.

Option 1: Upgrade NetWitness Platform using Live Services

You can use this method if the NW Server host is connected to Live Services.

Caution: You must review your network policy before downloading the upgrade package which is around 11.7GB. If you have set up any policy that disallows file download beyond 10GB, the upgrade package download fails.

Note: You can pre-stage the upgrade repository using the **Pre Stage Host** feature. Refer the following figure. For more information, see Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages.



Prerequisites

1. The **Automatically download information about new upgrades every day** option is selected and is applied in **(Admin) > System > Updates**.
2. Updates are available. Go to **(Admin) > Hosts > Update > Check for Updates** to check for updates. The Host view displays the **Update Available** status.
3. 12.4 is available in the **Update Version** column.

To upgrade from 12.2.0.0, 12.2.0.1, 12.3.0.0, and 12.3.1.0 to 12.4:

1. Go to **(Admin) > Hosts**.
2. Select the NW Server (`nw-server`) host.
3. Check for the latest updates.

Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.

4. Select **12.4** from the **Update Version** column.

Note:
- If you want to view a dialog with the major features in the upgrade and information on the updates, click the information icon ( ) to the right of the upgrade version number.

- If you cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

5. Click **Update** > **Update Host** from the toolbar.
6. Click **Begin Update**.
7. Click **Reboot Host**.
8. Repeat steps 5 to 7 for other hosts.

Note: You can select multiple hosts to upgrade at the same time only after updating and rebooting the NW Server host. All ESA, Endpoint, and Malware Analysis hosts should be upgraded to the same version as that of the NW Server host.

Option 2: Upgrade NetWitness Platform Offline

You can manually upgrade NetWitness Platform by performing the following tasks.

Task 1. Populate Staging Folder (`/var/netwitness/common/update-stage/`) with Version Upgrade Files. Do the following.

1. Download the upgrade package `netwitness-12.4.0.0.zip` from NetWitness Community (https://community.netwitness.com/) > **Downloads** > **NetWitness Platform** > **Version 12.4** to a local directory:
   - If you are upgrading from 12.2.0.0, 12.2.0.1, 12.3.0.0, and 12.3.1.0, download `netwitness-12.4.0.0.zip`.

2. SSH to the NW Server host.
3. Upload `netwitness-12.4.0.0.zip` to `/var/netwitness/common/update-stage/` on the NW Server Host.
   For example:

   ```
   mv /var/netwitness/tmp/netwitness-12.4.0.0.zip
   /var/netwitness/common/update-stage/
   ```

Note: NetWitness Platform unzips the file automatically.

Task 2. Apply Upgrades from the Staging Area to Each Host. Do the following.

Caution: You must upgrade the NW Server host before upgrading any non-NW Server host.

1. Log in to NetWitness.
2. Go to  **(Admin) > Hosts**.

   Note: If you are already on the  **(Admin) > Hosts** page and the **Check for Updates** option (**Update** > **Check for Updates**) is grayed out, refresh the page from the browser to check for the updates.
3. Check for updates and wait for the upgrade packages to be copied, validated, and ready to be initialized.

   "Ready to initialize packages" is displayed if:

   - NetWitness Platform can access the upgrade package.
   - The package is complete and has no errors.

   Refer to Troubleshooting Version Installations and Updates for instructions on how to troubleshoot errors (for example, "Error deploying version <version-number>" and "Missing the following update package(s)," are displayed in the **Initiate Update Package for RSA NetWitness Platform** dialog.)
4. Click **Initialize Update**.

   It takes some time to initialize the packages because the files are large and need to be unzipped. The time varies depending on how the host is configured.
   After the initialization is successful, the **Status** column displays Update Available.
5. Click **Update** > **Update Hosts** from the toolbar.

6. Click **Begin Update** from the **Update Available** dialog.
   After the host is upgraded, it prompts you to reboot the host.
7. Click **Reboot Host** from the toolbar.

Option 3: Upgrade NetWitness Platform using CLI (Offline)

You can use this option if the NW Server host is not connected to Live Services.

Before you begin

Make sure that you have downloaded the following file from NetWitness Community (https://community.netwitness.com/) > **Products > NetWitness Platform** > **Downloads** to a local directory:

- If you are upgrading from 12.2.0.0, 12.2.0.1, 12.3.0.0, and 12.3.1.0 to 12.4, download:

  `netwitness-12.4.0.0.zip`

- If you are using external repository, you can update the external repository with the latest upgrade content. For more information, see External Repo Instructions for CLI upgrade.

To upgrade NW Server Hosts and component servers:

Note: If you copy and paste the commands from PDF to Linux SSH terminal, the characters do not work. However, you can copy the commands from the HTML page https://community.netwitness.com/t5/netwitness-platform-online/upgrade-tasks-for-12-1-1/ta-p/695018#Option3 and paste them to Linux SSH terminal.

1. Stage the 12.4.0.0 files to prepare them for the upgrade. Consider the following scenarios.
   - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:

     `/var/netwitness/tmp/upgrade/12.4.0.0/`
     Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:

     `unzip netwitness-12.4.0.0.zip -d /var/netwitness/tmp/upgrade/12.4.0.0`
     Make sure you remove the update zip file from the staging directory after it is extracted.

   - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
     `/var/netwitness/tmp/upgrade/`
     Then copy the NetWitness 12.4.0.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
     After this, run the below command to extract, validate, and initialize the 12.4.0.0 zip files:
     `[root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.4.0.0`
     Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

   Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

   IMPORTANT: After staging 12.4.0.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.4.0.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

2. Initialize the upgrade using the following command:
   `upgrade-cli-client --init --version 12.4.0.0 --stage-dir /var/netwitness/tmp/upgrade`
3. Upgrade the NW Server host, using the following command:
   `upgrade-cli-client --upgrade --version 12.4.0.0 --host-key <ID / display name / (hostname/ IP address)>`

   Note: Once the upgrade is triggered, NW Server will reboot automatically ~10 mins into the upgrade process. It will boot into the new kernel (4.18 for Alma Linux 8.9).

   Caution: Users are advised to wait until the UI is up and running, which may take up to an hour to complete. After 20 to 30 minutes of the migration, you can SSH and check if the OS is migrated. Once the OS migration is complete, it may take at least 30 minutes for the UI to appear as the NW Upgrade runs in the background.

   The above upgrade process can be tracked through a virtual console for VMs or remote console for servers with iDRACs.

   Once the OS is migrated and able to SSH to Admin Node, run the following command on the host to confirm successful OS migration:

   - `cat /etc/redhat-release`
   - `AlmaLinux release 8.9 (Midnight Oncilla)`

   Caution: After the OS migration, reinstall any third-party RPMs you have previously installed.
4. Once the orchestration-server is up, it will automatically trigger the NW Upgrade through chef to the desired NW Version. To check the progress of this, please SSH to the Admin Server and run the following command:

   - `orchestration-cli-client --check-admin-upgrade-status`

   Note: Run the above command only for NW Admin Server.
5. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
6. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 5 on the Warm Standby Server host.
7. Repeat steps 3 and 5 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

External Repo Instructions for CLI upgrade

For information about setting up an external repository, see **Appendix A. Set Up External Repo** in the *12.4Upgrade Guide for NetWitness Platform*. The following instructions assume that you already have an external repository set up. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Stage the 12.4.0.0 files to prepare them for the upgrade. Consider the following scenarios.
   - **If you are upgrading from 12.2.0.0**, **12.2.0.1**, **12.3.0.0**, and **12.3.1.0**, you only need to stage 12.4.0.0.
     - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:

       `/var/netwitness/tmp/upgrade/12.4.0.0/`
       Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:

       `unzip netwitness-12.4.0.0.zip -d /var/netwitness/tmp/upgrade/12.4.0.0`
       Make sure you remove the update zip file from the staging directory after it is extracted.
     - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
       `/var/netwitness/tmp/upgrade/`
       Then copy the NetWitness 12.4.0.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
       After this, run the below command to extract, validate, and initialize the 12.4.0.0 zip files:
       `[root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.4.0.0`
       Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

   Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

   IMPORTANT: After staging 12.4.0.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.4.0.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

2. Initialize the upgrade using the following command:
   `upgrade-cli-client --init --version 12.4.0.0 --stage-dir /var/netwitness/tmp/upgrade`

3. Upgrade the NW Server host, using the following command:
   `upgrade-cli-client --upgrade --version 12.4.0.0 --host-key <ID / display name / (hostname/ IP address)>`

   Note: Once the upgrade is triggered, NW Server will reboot automatically ~10 mins into the upgrade process. It will boot into the new kernel (4.18 for Alma Linux 8.9).

Caution: Users are advised to wait until the UI is up and running, which may take up to an hour to complete. After 20 to 30 minutes of the migration, you can SSH and check if the OS is migrated. Once the OS migration is complete, it may take at least 30 minutes for the UI to appear as the NW Upgrade runs in the background.

The above upgrade process can be tracked through a virtual console for VMs or remote console for servers with iDRACs.

Once the OS is migrated and able to SSH to Admin Node, run the following command on the host to confirm successful OS migration:

- `cat /etc/redhat-release`
- `AlmaLinux release 8.9 (Midnight Oncilla)`

Caution: After the OS migration, reinstall any third-party RPMs you have previously installed.

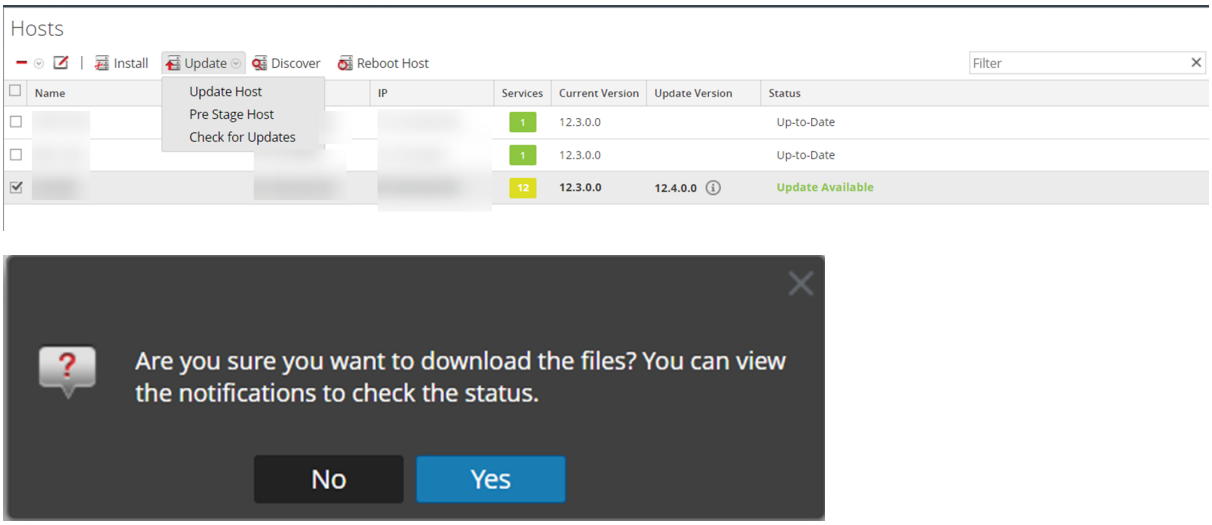
4. Once the orchestration-server is up, it will automatically trigger the NW Upgrade through chef to the desired NW Version. To check the progress of this, please SSH to the Admin Server and run the following command:
   - `orchestration-cli-client --check-admin-upgrade-status`

   Note: Run the above command only for NW Admin Server.
5. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
6. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 5 on the Warm Standby Server host.
7. Repeat steps 3 and 5 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages

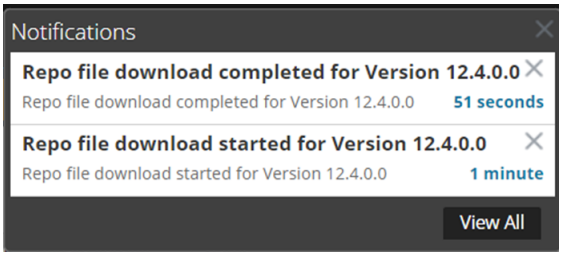
You can pre-stage the upgrade repository by downloading the required packages (.zip) without affecting the system. This minimizes the upgrade downtime and ensures the upgrade is completed within the planned time.



To pre-stage the upgrade repository and update the hosts:

1. Go to  **(Admin) > Hosts**.
2. Click **Update > Check for Updates** from the toolbar.

   All possible update versions will be displayed in the Versions drop-down list.



3. Click **Update** > **Pre Stage Host** and select the version in the update version column.

   A confirmation message for downloading the files is displayed.

4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.

   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.

Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.
7. Click **Initialize Update**.

   The initialization of the package will take some time as the files are large and will need to be unzipped.

IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.
9. After the initialization is completed successfully, click **Update** > **Update Host**.

   After the host is updated, you will be prompted to reboot the host.
10. Set up the host and reboot the host.

Perform Post Upgrade Tasks

This topic lists the tasks you must perform after upgrading NetWitness Platform. Complete the tasks that apply to the hosts in your environment.

- General
- Event Stream Analysis (ESA)
- Respond
- User and Entity Behavior Analytics
- Legacy Windows Log Collector

General

You must configure Jetty, restore the core services contents, and also start Network capture, Log capture, and aggregation after upgrading NetWitness Platform.

Configure Jetty

For Jetty Configuration and related information, see **Manage Custom Host Entries** topic in the System Maintenance Guide.

Make Sure Services Have Restarted and Are Capturing and Aggregating Data

Make sure that services have restarted and are capturing data (this depends on whether or not you have auto-start enabled).

If required, restart data capture and aggregation for the following services:

- Decoder
- Log Decoder
- Broker
- Concentrator
- Archiver

To Start Network Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Decoder** service.

3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Log Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Aggregation:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. For each **Concentrator**, **Broker**, and **Archiver** service:
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click 

3. For Event Stream Analysis (ESA):

   Note: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.6 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

   There are no required post-upgrade tasks for ESA. For ESA troubleshooting, see ESA Troubleshooting Information.

   If you want to add support for Endpoint, UEBA, and Live content rules, you must update the `multi-valued` and `single-valued` parameter meta keys on the ESA Correlation service to include all the required meta keys. It is not necessary to make these adjustments during the upgrade; you can make the adjustments later at a convenient time. For detailed information and instructions, see **Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys** in the ESA Configuration Guide.

Restore the Core Services Contents

Once you upgrade to 12.4, the Core services Contents such as Configuration files (.cfg), Feeds, Parsers, and Log Devices are copied to the **.tar** location of the respective components such as Decoder, Log Hybrid, Network Hybrid, and Log Decoder.

The following table lists the Core Services Contents paths and the **.tar** location of the respective components where the Core Services Contents are copied.

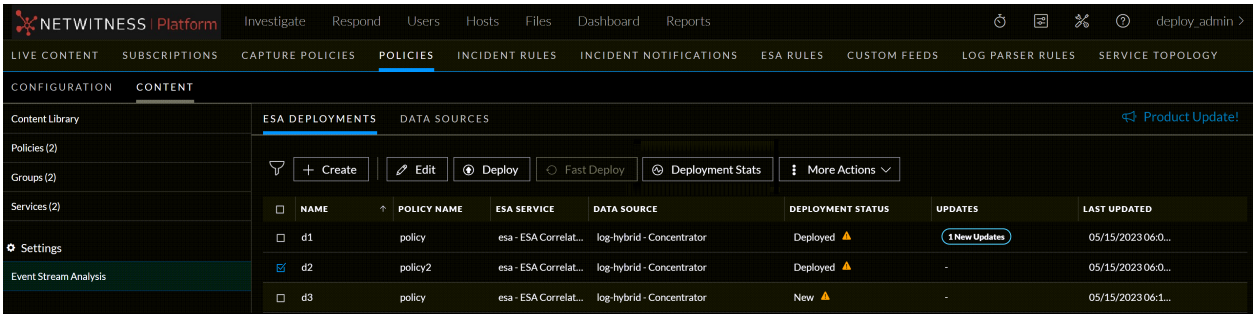
Core Services Contents Paths	Components	.tar location of the Components
/etc/netwitness/ng/feeds (Feeds)	Decoder	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/parsers (Parsers)	Log Hybrid	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar
/etc/netwitness/ng/envision/etc/devices (Log Devices)	Network Hybrid	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/NwDecoder.cfg (Configuration files (.cfg))	Log Decoder	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar

By default, CCM option is disabled. After upgrading to 12.4, if you enable CCM and encounter the loss of the Core Services Contents, you can use the backup tar files to recover the lost data. For more information, see https://community.netwitness.com/t5/netwitness-knowledge-base/automatic-backup-of-core-service-content-after-upgrading-core/ta-p/694527.

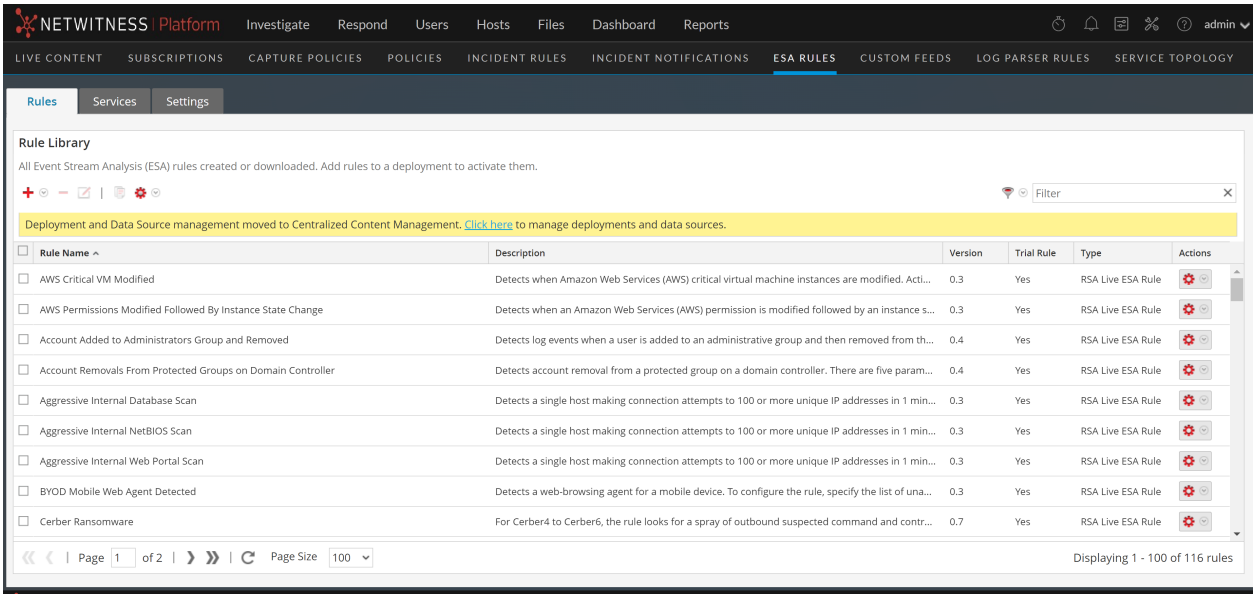
Event Stream Analysis (ESA)

After upgrading to the 12.4 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4 version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. Verify if all the ESA deployments are in a healthy state. For more information, see **View a Deployment** topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the **Role Permissions** topic in the *System Security and User Management Guide*.



The pre-upgrade and post-upgrade states of deployments are represented in the following table.



SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content. For more information, see **Merge Policy with ESA Content** topic in the *Live Services Management Guide*.

Manage ESA Deployments and Data Sources

You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

You must upgrade the ESA hosts immediately after upgrading the Admin Server.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Respond

The Primary ESA server must be upgraded to 12.4 before you can complete the following task.

Note: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to 12.4. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

(Conditional) Restore Any Respond Service Custom Keys in the custom_normalize_alerts.js and support new datasource

Note: If you did not manually customize the custom_normalize_alerts.js, you can skip this task. We attempt to automatically migrate the custom keys. However in case of failures, use this step to verify the custom data's integrity.

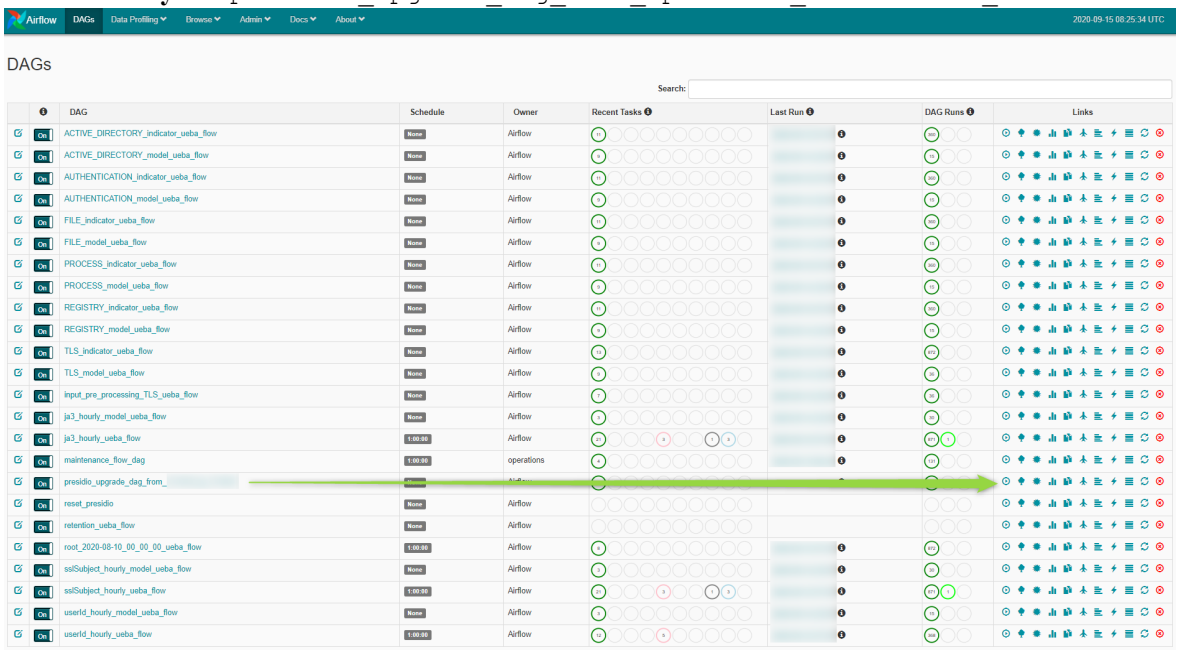
If you added custom keys in the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file for use in custom normailization, modify the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file and add the custom normalized keys from the automatic backup file. The backup file is located in `/var/netwitness/respond-server/scripts` and it is in the following format:

`custom_normalize_alerts.js.bak-<time of the backup>`

In case of automatic update of the script fails, add support for Netwitness Core and NetWitness Insight by updating the `custom_normalize_alerts.js` file manually to support these new sources in respond.

User and Entity Behavior Analytics

Complete the following tasks after upgrading UEBA to 12.4.



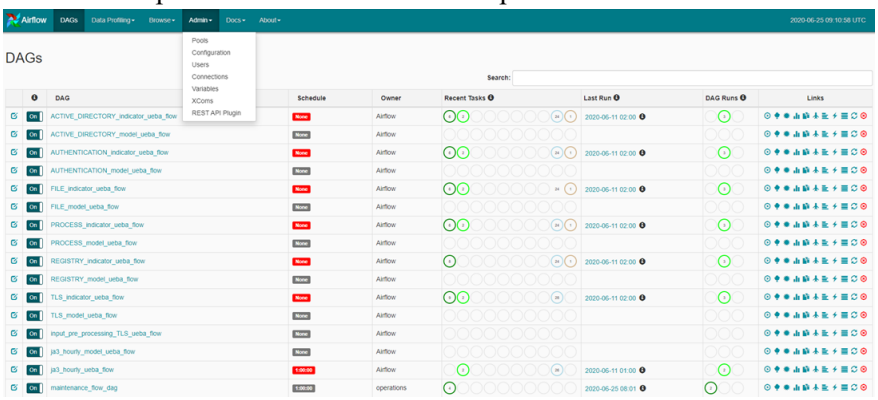
IMPORTANT: Before the upgrade, if you encountered and resolved the task failure issues, then after the upgrade, you must replace the `authentication.json` file before you run the post-upgrade tasks. The task failure issues in Airflow and their solutions are described in the 'Troubleshooting' topic of the *UEBA Configuration Guide*.

1. Update the UEBA configuration using the following command from the UEBA machine.
   - `source /etc/sysconfig/airflow`
   - `source $AIRFLOW_VENV/bin/activate`
   - `python /var/netwitness/presidio/airflow/venv39/lib/python3.9/site-packages/presidio_workflows-1.0-py3.9.egg/presidio/resources/rerun_ueba_server_config.py`
   - `deactivate`
2. (Optional) Update the UEBA processing schema, if needed.

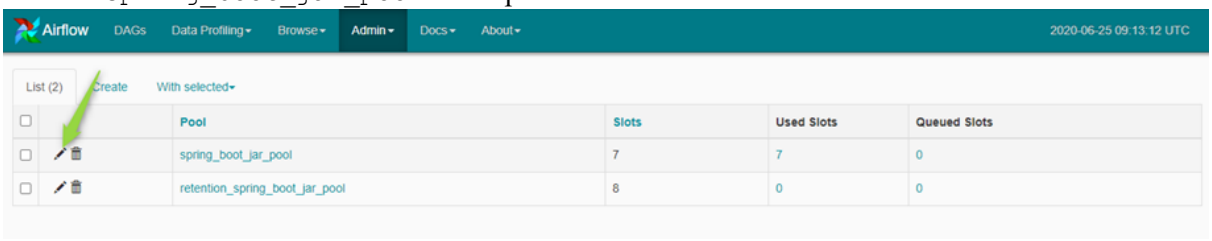
   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

   For more information, see the "reset-presidio script" section in the *UEBA Configuration Guide*.

3. Run the airflow upgrade DAG.
   - Go to Airflow main page `https://<UEBA-host-name>/admin`
   - Enter the admin username and password.
   - Click the **Play** in `presidio_upgrade_dag_from_<previous_version> to_12.4`.



> **Note:** A light green circle will appear next to the upgrade DAG row during the upgrade. If the upgrade process is completed successfully the light green circle changes to green. If the upgrade process fails, the light green circle changes to red.



4. Set the appropriate "Boot Jar Pools" slots:
   - **Physical Appliance**: Update the `spring_boot_jar_pool` slot value be 18.
   - **Virtual Appliance**: Update the `spring_boot_jar_pool` slot value to 22.
     To update the **Spring Boot Jar Pools** slots, go to the Airflow main page, tap the **Admin** tab at the top bar and tap **Pools**.

   a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
      User: admin
      Password: The environment deploy admin password.

b. Click on the pencil mark of the Pools to update the slot values.

5. Edit the `spring_boot_jar_pool` and update the slots amount to 22.

Legacy Windows Log Collector

Refresh Legacy Windows Log Collector Certificates with Updated SA Certificates

Post Upgrade Steps:

1. Execute the following command in SA:

   a. `wlc-cli-client --host-display-name` **`hostDisplayName`** `--service-display-name` **`serviceDisplayName`** `--host` **`WLChostIPAddress`** `--port 50101 --use-ssl false`

   Enter following information:

   i. **Legacy Windows Log Collector REST Username and Legacy Windows Log Collector REST Password**: Enter the admin credentials for the Legacy Windows Log Collector.

   ii. **Security Server Username and Security Server Password**: Enter admin credentials for NetWitness.

2. Restart the system.

Perform Sanity Checks After Upgrade

You must perform the following sanity checks after upgrading to NetWitness 12.4.

1. Go to (Admin) > **Services** view to verify that all the services are active (appearing in green) after upgrade.
2. Verify that the services are upgraded to match the host version. The service version in (Admin) > **Services** view must match the host version in (Admin) > **Hosts** view after upgrade.
3. In the (Admin) > **Services** view, do the following.
   - Select a Log Collector service and go to (actions) > **View** > **System** view to verify if the required logs collection is started. You should click the Collection drop-down option and go to the right collection protocol to check if the logs collection is started. If the required collection is not started, select Start next to the required collection protocol from the list to start the collection.
   - Select a Log Decoder service and go to (actions) > **View** > **System** view to verify if the Log Decoder is capturing the logs properly.
   - Select a Packet Decoder service and go to (actions) > **View** > **Config** view to check if the capture interface is configured under **Decoder Configuration** section. If the capture interface is not configured, you must select the required capture interface from the drop-down list to configure it. If the capture interface is already configured, go to the (actions) > **View** > **System** view of the Packet Decoder and check if the capture is started. If the capture is not started, click Start Capture to start the packet capture.
4. Go to (Admin) > **Services** > Select a Log Decoder or Packet Decoder service > (actions) > **View** > **Stats** > **General** view to analyze the current capture rate.
5. Verify that the Concentrators, Archivers, and Brokers are aggregating the data. Make sure that you can investigate from each Concentrator, Archiver, and Broker to validate that it is operational.
6. Go to **Respond** > **Alerts** view to verify if the alerts are triggering from different sources.
7. Go to (Admin) > **Health & Wellness** > **Alarms** view and verify if the SMS server is up and running.
8. Go to (Admin) > **Event Sources** > **Monitoring Policies** view and verify if the policies configured before upgrade are appearing.
9. Go to (Admin) > **Health & Wellness** > **New Health & Wellness** > **Pivot to Dashboard** > **Elastic** > **Dashboard** view and ensure the following.
   - The visualizations you created before upgrade still exist.

- The metric server is up and running.
- Alerts are generated properly for the monitors you have configured before upgrade.

Install the 12.4 Relay Server

IMPORTANT: Post upgrading EPLH from 12.2.x.x and 12.3.x.x versions to 12.4, you must re-install the relay server on EL 8 (Alma Linux) box since relay server is a standalone server.

Before you begin

- Make sure you have the EL 8 box.
- Perform the following tasks before installing the 12.4 Relay server:
  1. Upgrade NetWitness Platform XDR.
  2. Once the EPLH is upgraded, download the relay packager.
  3. Copy the packager to EL 8 box.
  4. Turn off the existing Relay server.
  5. Configure the IP address of EL 8 by re-using the IP address of the existing Relay server.

     Once you configure the IP address of EL 8, install the Relay server. For more information, see **(Optional) Installing and Configuring Relay Server** section in the Endpoint Configuration Guide. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: You must keep the security patches up to date on the Relay Server.

Upgrade Endpoint Agents

See **Upgrade Agents** in the Endpoint Agent Installation Guide for NetWitness Platform for instructions on how to upgrade the agents.

Troubleshoot Upgrade Issues

This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an upgrade or installation issue using the following troubleshooting solutions, contact Customer Support.

Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

- AlmaLinux OS Troubleshooting Information
- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Update Failed Error
- Missing Update Packages Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade

Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.

- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis
- Legacy Windows Log Collector

Problem	Unable to boot the appliance after upgrading
Wokaround	1. Manually modify the GRUB boot line to `FIPS=0` to get it to boot. 2. From here, disable FIPS using the following command: `manage-stig-controls --disable-control-groups 3 --host-all` 3. Verify the line `FIPS=1` is removed from `/boot/grub2/grub.cfg` • If not, run the following command:

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

4. Reboot.
5. Run the following command to enable FIPS:

   ```
   manage-stig-controls --enable-control-groups 3 --host-all
   ```

6. Reboot again.

AlmaLinux OS Troubleshooting Information

For better understanding, AlmaLinux OS Upgrade can be divided into 4 parts:

1. Running the precheck utility to ensure the health of the system and detect any upgrade issues. This can be done any time before the upgrade using the standalone precheck-tool rpm. (required only on NW Server)

   Logs are recorded here - `/var/log/netwitness/precheck-tool/checklist.log`

2. Initialization or init phase (happens only on NW Server)

   For any issues during init phase, check these logs.

   - salt minion logs - `/var/log/salt/minion`
   - deployment-upgrade logs - `/var/log/netwitness/deployment-upgrade/chef-solo.log`

   Note: Please perform the init only when you plan to do the actual upgrade. It is not recommended to perform an init without upgrading the system in the same change window.

3. OS Upgrade from CentOS to AlmaLinux

   As the first step of OS Upgrade, salt gets upgraded. You can execute the below command to see that salt is upgraded to version 3006:

   ```
   cat /var/log/yum.log | grep salt
   ```

   You can view similar to the below update where xxx represents the current datetime stamp:

   ```
   xxx Updated: salt-master-3006.2-0.x86_64
   xxx Updated: salt-api-3006.2-0.x86_64
   xxx Updated: salt-minion-3006.2-0.x86_64
   ```

   For any issues, with salt-upgrade, please check:

   - /var/log/netwitness/node-infra-server/node-infra-server.log
   - /var/log/salt/master
   - /var/log/salt/minion

   Once salt has been upgraded, the leapp process will begin.

   The logs can be viewed in `/var/log/salt/minion`:

   ```
   xxx [salt.loaded.ext.module.nw_platform:445 ][INFO ][139407] [1/5]
   Searching for leapp config for version: 12.4.0.0
   ```

```
xxx [salt.loaded.ext.module.nw_platform:453 ][INFO ][139407] [2/5]
Retrieving leapp config for version: 12.4.0.0

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'config/12.4.0.0-pre-upgrade.repo'

xxx [salt.loaded.ext.module.nw_platform:467 ][INFO ][139407] [3/5] Running
pre-requisites required to perform leapp upgrade

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate/actor.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate/libraries/netwitnessmigrate.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/addupgradebootentry.py'

xxx [salt.loaded.ext.module.nw_platform:500 ][INFO ][139407] [4/5] Running
leapp pre-upgrade

xxx [salt.loaded.ext.module.nw_platform:503 ][INFO ][139407] [5/5] Running
leapp upgrade
```

For any issues encountered during OS Upgrade, the logs below will be helpful in troubleshooting.

- `/var/log/salt/minion`
- If Preupgrade fails - `/var/log/leapp/leapp-preupgrade.log`
- If Leapp upgrade fails - `/var/log/leapp/leapp-upgrade.log`

If leapp fails, then `/var/log/leapp/leapp-report.txt` will provide you with details about inhibitors.

A few minutes after this log “Running leapp upgrade” in /var/log/salt/minion, the system will reboot and may take 20 to 30 minutes to return.

Once it is up, you can confirm the OS using the command cat `/etc/almalinux-release`. If it does not show Alma Linux release, please call Customer Support before taking any action.

Also, if you have triggered the upgrade through UI and see the status "`Performing OS Migration`" on any NodeX for more than an hour, please check the leapp logs and reach out to Customer Support.

4. NW Software upgrade to 12.4

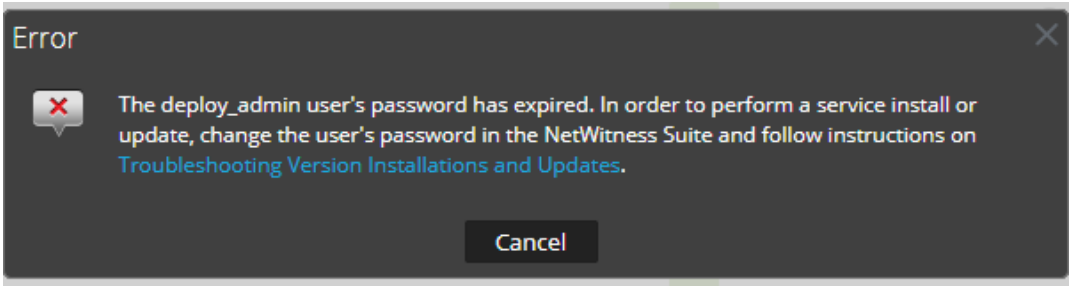
   Once the OS Migration has completed, The NW software upgrade begins and takes up to 30 min before the UI is functional.

   You can see these logs in `/var/log/salt/minion` when NW software upgrade starts:

```
xxx [salt.loaded.ext.module.nw_platform:276 ][INFO ][14035] Preparing node
for upgrade to 12.4.0.0

xxx [salt.loaded.ext.module.nw_platform:280 ][INFO ][14035] [1/2] Searching
for yum config for version: 12.4.0.0

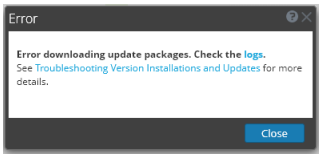
xxx [salt.loaded.ext.module.nw_platform:287 ][INFO ][14035] [2/2]
Retrieving yum config for version: 12.4.0.0
```



```
xxx [salt.fileclient :1333][INFO ][14035] Fetching file from saltenv
'base', ** done ** 'config/12.4.0.0-pre-upgrade.repo'

xxx [salt.loaded.ext.module.nw_platform:300][INFO ][14035] Upgrading chef
package

xxx [salt.loaded.ext.module.nw_platform:300][INFO ][14035] Upgrading rsa-
nw-config-management package
```

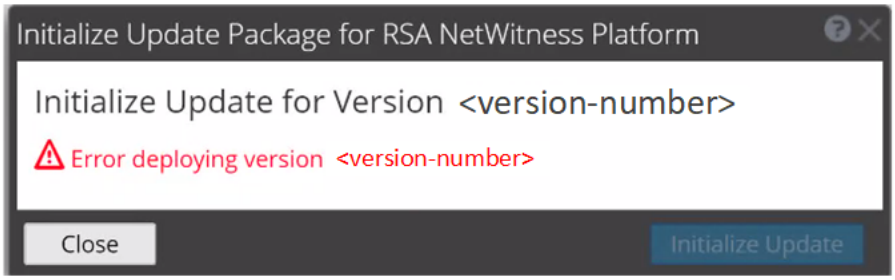


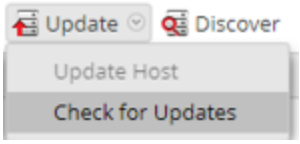
You can also refer to config management logs at `/var/log/netwitness/config-management/chef-solo.log` or UI logs `/var/netwitness/uax/logs/sa.log`

deploy_admin User Password Has Expired Error

Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password. Do the following.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.





Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

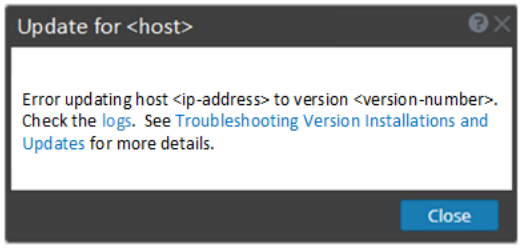
Error Message	If you are upgrading from NetWitness Platform 11.x.x.x to 11.6.x.x or later, offline UI upgrade fails with the Download error message.

Solution	1. In the Command Line Interface (CLI), do the following:
	a. SSH to NW Server.
	b. Run the following command:
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version <version number>`
	`For example:`
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version 11.6.0.0`
	2. After the NW Server is successfully updated, log in to the NW Server user interface and go to  **(Admin) > Hosts**, where you are prompted to reboot the host.
	3. Click **Reboot Host** from the toolbar.
	To upgrade all the other hosts directly from the user interface:
	1. Click **Begin Update** from the **Update Available** dialog.
	After the host is upgraded, it prompts you to reboot the host.
	2. Click **Reboot Host** from the toolbar.

Error Deploying Version <version-number> Missing Update Packages

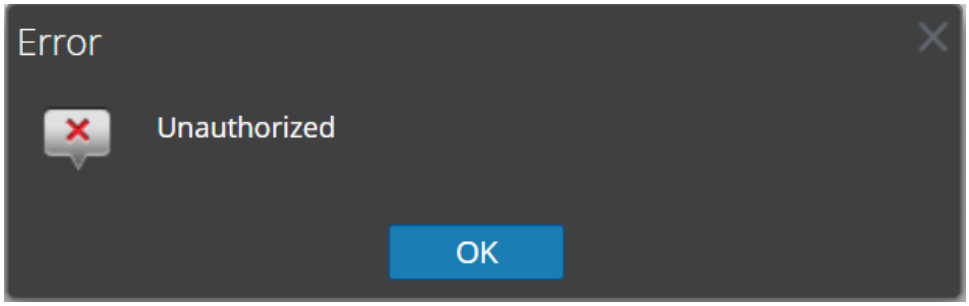
Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the **Hosts** view toolbar, select **Check for Updates** again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

Upgrade Failed Error



Error Message	You will receive an error in the error log similar to the following while trying to update to version 11.6 or later: `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

Solution	**To resolve the issue:**
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for "packages" section for the component you have custom build/rpm. For example, below shown is the package details for "concentrator" host that has custom build/rpm.
	`"concentrator": {`
	`"cookbook_name": "rsa-concentrator",`
	`"service_names": ["rsa-nw-concentrator"],`
	`"family": "launch",`
	`"default_port": xxxx, "description": "Concentrator",`
	`"packages":[{ "name": "rsa-nw-concentrator",`
	`"version" : "11.6.0.0-2003001075220.5.cecf24b.e.17.centos"`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.



External Repo Update Error

Error Message	You will receive an error similar to the following error while trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	Incorrect path specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	3. If you still cannot apply the update, gather the logs from **step 2** above and contact Customer Support.

Error Message	
Problem	When you select an update version and click **Update** > **Check for Updates**, the **Unauthorized** error message is displayed. As a result, the connection to the live service fails.
Solution	1. Make sure the Live test connection passes. 2. Update https://update.netwitness.com/RSA-netwitness in **(Admin)** > **System** > **Updates**.

	3. SSH to the Admin Server and backup `/etc/default/jetty`.
	4. Update the following entry at the end of the JAVA_OPTIONS in the `/etc/default/jetty`.
	`JAVA_OPTIONS="${JAVA_OPTIONS} -Drsa.nw.legacy.web.server.system.update.repo.url=https://update.netwitness.com/RSA-netwitness/ -Drsa.nw.legacy.system.update.auth.url=https://update.netwitness.com/authenticate "`
	5. Restart the jetty service. Run the following command.
	`service jetty restart`

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from NetWitness Link
Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from NetWitness Community in the **Initialize Update Package for NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages.

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 or later, the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error.
Solution	Do any of the following: • Update the non-NW Server host to 11.6.0.0 or later, or

	• Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You will receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	The above error occurs when you use CLI to reboot the host. You must use the User Interface to reboot the host.
Solution	Reboot the host in the **Host** View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 or later from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	**To resolve the issue:** 1. Check which database files are corrupted: Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks: • If the live charts db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database! • If the alert status db file is corrupted, the following logs are displayed:

Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading
record: null. Possible solution: use the recovery tool
[90030-196]
```

2. To resolve the live charts database file corruption, do the following:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   Note: Some live charts data may be lost on performing the above steps.
3. To resolve the alert status or report status database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.
   c. Restart the Reporting Engine service.

For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6 or later, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.
Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service

	is installed.
	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-<version number>-<Tag>/nwtools`
	For example:
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	1. SSH to Admin Server.
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`
	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the **Reset the Stable System Value** topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in the **Reset the Stable System Value** topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`
Cause	The decoder capture config will not be valid for customers using PF_RING capture (CentOS) and directly upgrading to 12.4 (AlmaLinux). First, they must migrate PF_RING devices to DPDK and then upgrade.
Solution	**To resolve the issue:** Refer to Migrate PF_RING Devices to DPDK for migration instructions.

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you will notice one of the following: • Audit logs are not getting forwarded to the configured Global Audit Setup. • The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0 or later.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Problem	When you install and orchestrate a fresh 12.4 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.4, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.4 core Node-X to the fresh-Installed 12.4 Admin Server (not upgraded from 12.0 or older versions to 12.4).
Cause	The 12.4 core Node-X uses a dedicated SA-server certificate instead of the common Node-0 node certificate under its trustpeers if it is orchestrated directly to an upgraded 12.4 Admin Server host.

Solution	1. Before you bootstrap and orchestrate the 12.4 core Node-X host, run the following commands.
	`mkdir -p /etc/netwitness/platform`
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	2. Perform this workaround only if you skip the above workaround (Workaround 1). Run the following commands after you bootstrap and orchestrate the 12.4 core Node-X host.
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	`nw-manage --refresh-host --host-key <core-node-x-salt-minion-uuid>`
	`systemctl restart <core-service-name>`
	Note:
	- Refer the file `/etc/salt/minion` to find `<core-node-x-salt-minion-uuid>`.

	- You must enter the core service name such as **nwarchiver** (Archiver), **nwdecoder** (Decoder), **nwlogcollector** (Log Collector), **nwappliance** (Appliance), **nwconcentrator** (Concentrator), **nwlogdecoder** (Log Decoder), **nwbroker** (Broker), **nwworkbench** (Workbench), and **nwwarehouseconnector** (Warehouse Connector) in `<core-service-name>`.

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

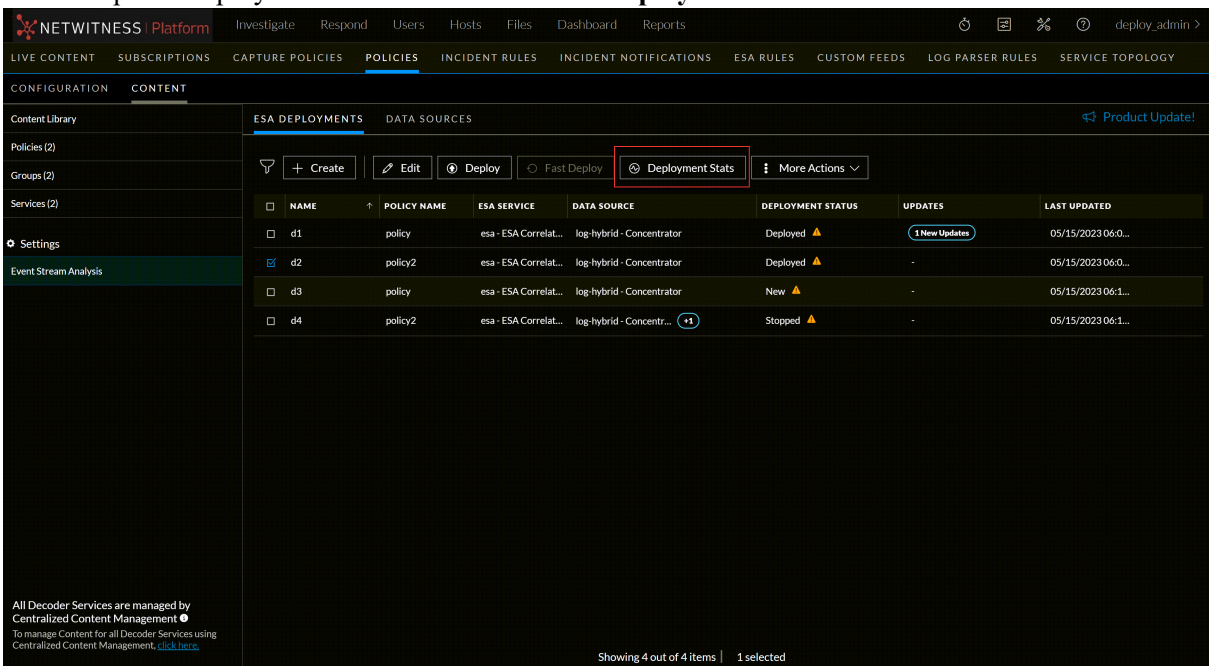
Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the **Add Additional Space for Large Reports** topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 12.4 or later, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	**To resolve the issue:** In the NetWitness user interface, 1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **Data Sources**. The **Data Sources** panel is displayed. 2. Select the data source and click **Edit Datasource** in the toolbar. The **Edit Datasource** dialog is displayed. 3. In the **Edit Datasource** dialog, do one of the following: • Select **Trusted Authentication**. • Select **Use Credentials** and enter the Username and Password. 4. Click **Test Connection** to make sure that it can communicate with the ESA service and then click **OK**. **Note:** Do the above procedure for all the configured data sources.

	5. Deploy all the deployments associated with the edited data sources in the **Data Sources** panel after you finish making changes to the data sources.

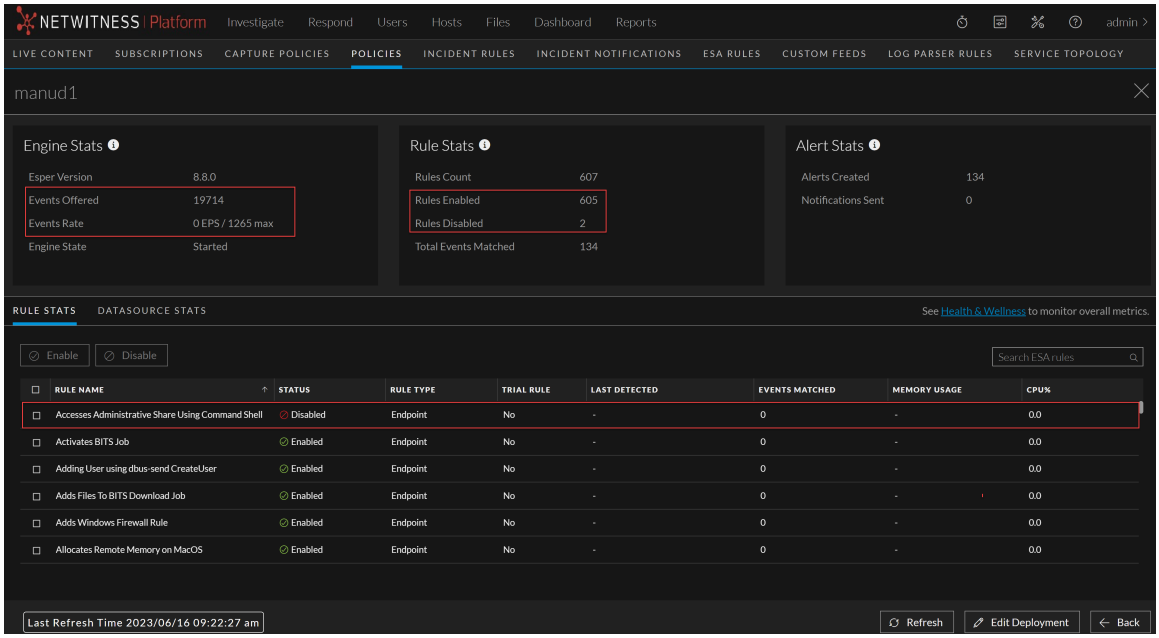
Legacy Windows Log Collector



Problem	• Legacy Windows Log Collector appears as inactive post upgrade of SA to 12.4 version and Legacy Windows Log Collector to 11.6.x or 11.7.x versions. • Legacy Windows Log Collector appears as inactive when the stack is upgraded to 12.4.
Cause	Certificate update in the SA node.
Solution	Refer Legacy Windows Log Collector section in the Perform Post Upgrade Tasks.

ESA Troubleshooting Information

ESA Rules are Not Creating Alerts



If you are not seeing any alerts, check the status of the ESA rule deployments.

1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **ESA Deployments**. The **ESA Deployment** panel is displayed.
2. Select required deployment from the list and click **Deployment Stats** tab.

3. Deployment Stats page is displayed, which shows the status of your ESA services and deployments.

4. For each ESA rule deployment:
   a. In the **Engine Stats** section, look at the **Events Offered** and the **Offered Rate**. They confirm that the data is being aggregated and analyzed properly. If you see 0 for Events Offered, nothing is coming in for the deployment.
   b. In the **Rule Stats** section, look at the **Rules Enabled** and **Rules Disabled**. If there are any disabled rules, look in the **Deployed Rule Stats** section below to view the details of the disabled rules. Disabled rules show a white circle. Enabled rules show a green circle.

5. If you notice any disabled rules that should be enabled:
   a. Go to  **(Configure) > ESA Rules > Rules** tab and redeploy the ESA rule deployments that contain disabled rules.
   b. Go back to the **Services** tab and check to see if the rules are still disabled. If the rules are still disabled, check the ESA Correlation service log files, which are located at `/var/log/netwitness/correlation-server/correlation-server.log`.

Note: To avoid unnecessary processing overhead, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text data values. During the upgrade to 11.4 or later, NetWitness Platform does not modify existing rules for the Ignore Case option. If an existing Rule Builder rule has the Ignore Case option selected for a meta key that no longer has the option available, an error occurs if you try to edit the statement and try to save it again without clearing the checkbox.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs that means there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, the new Endpoint, UEBA, and Live content rules will not work. Completing the **Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules** procedure in the *ESA Configuration Guide* should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst, checksum_
src, client_all, content, context, context_all, context_dst, context_src, dir_
path, dir_path_dst, dir_path_src, directory, directory_all, directory_dst,
directory_src, email_dst, email_src, feed_category, feed_desc, feed_name,
file_cat, file_cat_dst, file_cat_src, filename_dst, filename_src, filter,
function, host_all, host_dst, host_orig, host_src, host_state, ip_orig, ipv6_
orig, OS, param, param_dst, param_src, registry_key, registry_value, risk,
risk_info, risk_suspicious, risk_warning, threat_category, threat_desc,
threat_source, user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_target,
file_attributes, logon_type_desc, packets] are still MISSING from single-
valued
```

Use NetWitness Community Portal for Assistance

You can use NetWitness Community Portal to search for specific documents, find information related to End of Life of appliances, and read blogs.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com
LiveUI	https://live.netwitness.com

Feedback on Product Documentation

You can send an email to nwdocsfeedback@netwitness.com to provide feedback on NetWitness Platform documentation.

Virtual Deployment Overview

This document provides instructions on the installation and configuration of NetWitness 11.7.0.0 hosts running in a virtual environment.

Virtual hosts have the same functionality as the NetWitness Azure, AWS, and hardware hosts. NetWitness recommends that you perform the following tasks when you set up your virtual environment.

Before you can deploy NetWitness in virtual environment, you need to:

IMPORTANT: Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness Platform 11.x.

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Make sure that you have a NetWitness Throughput license.
- Review of the network architecture and port usage.

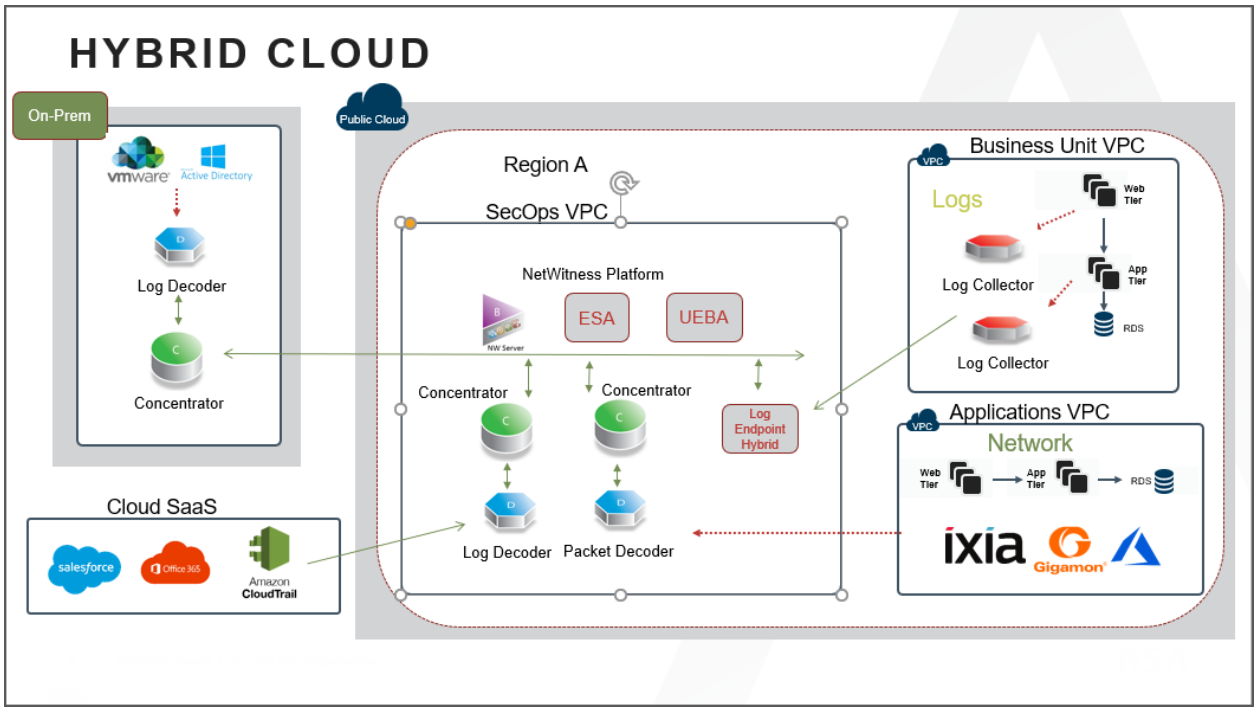
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

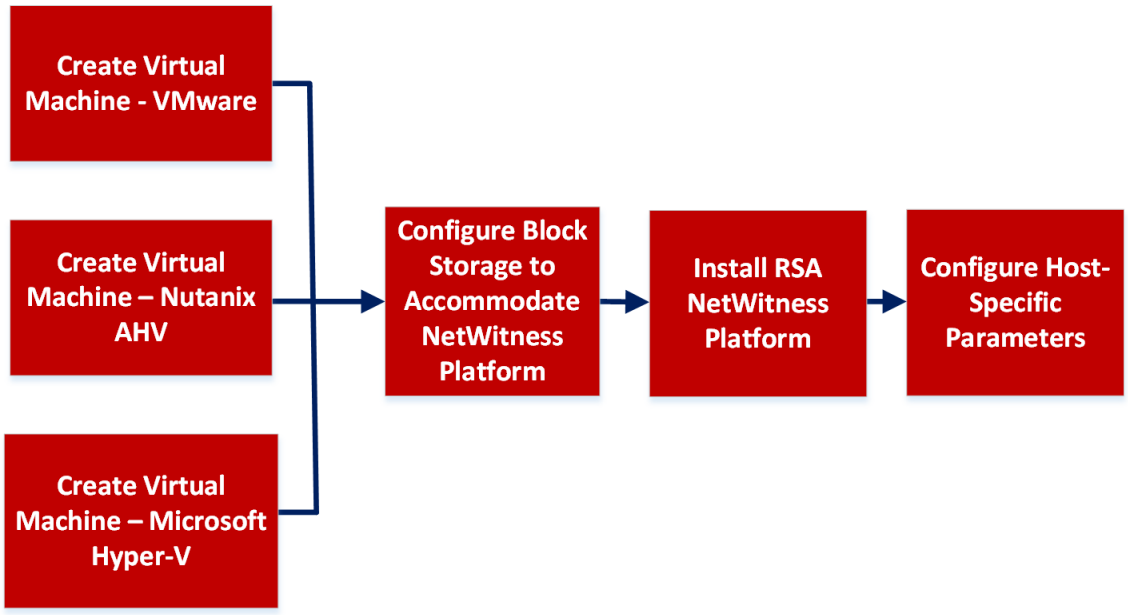
Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

For information on VMware concepts, refer to the VMware product documentation.

The virtual hosts are provided as an OVA. You need to deploy the OVA file as a virtual machine in your virtual infrastructure.

Installation Media

Installation media are in the form of OVA and VHDX packages, which are available for download and installation from Downloads (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads). As part of your order fulfillment, NetWitness gives you access to the OVA and VHDX.



Note: Currently, NetWitness Platform does not support Network Attached Storage (NAS) for Virtual deployments.

Install NetWitness Platform Virtual Host in Virtual Environment

Complete the following procedures according to their numbered sequence to install NetWitness in a virtual environment.

Work Flow:

This figure shows the high-level workflow mandatory for installing NetWitness Platform virtual host.

Note: When you configure databases to accommodate NetWitness Platform, the default database space allocation after you deploy databases from OVA or VHDX will not be adequate to support the NetWitness deployment. You must expand the datastores after initial deployment to avoid any issues. For more information, see Step 2. Configure Block Storage to Accommodate NetWitness Platform.

IMPORTANT: Review the ***Network Architecture and Ports*** topic in the ***Deployment Guide*** in the NetWitness help so that you can configure NetWitness services and your firewalls. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Prerequisites

Make sure that you have:

- A VMware ESX Server that meets the requirements described in the above section. Supported versions are 7.0, 6.7, 6.5, 6.0, and 5.5.
- Administrator rights to create the virtual machines on the VMware ESX Server.

Checklist

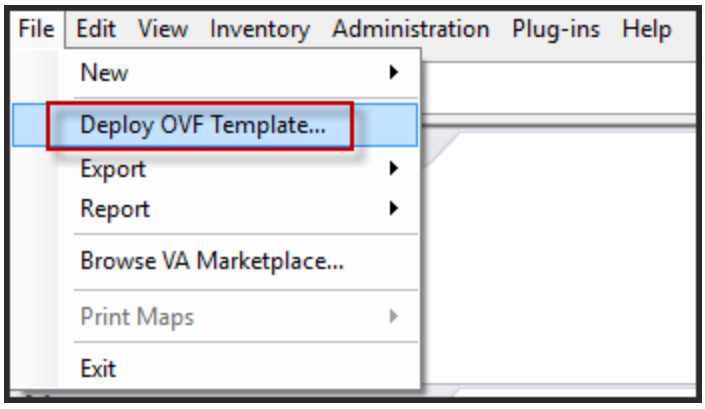
Step	Description	√
1.	Step 1a. Create Virtual Machine - VMware	
2.	Step 1b. Create Virtual Machine - Microsoft Hyper-V	
4.	Step 1c. Create Virtual Machine - Nutanix AHV	
3.	Step 2. Configure Block Storage to Accommodate NetWitness Platform	
5.	Step 3. Install NetWitness Platform	
6.	Step 4. Configure Host-Specific Parameters	
7.	Step 5. Post Installation Tasks	

Step 1a. Create Virtual Machine - VMware

Complete the following steps to deploy the OVA file on the vCenter Server or ESX Server using the vSphere client.

Prerequisites

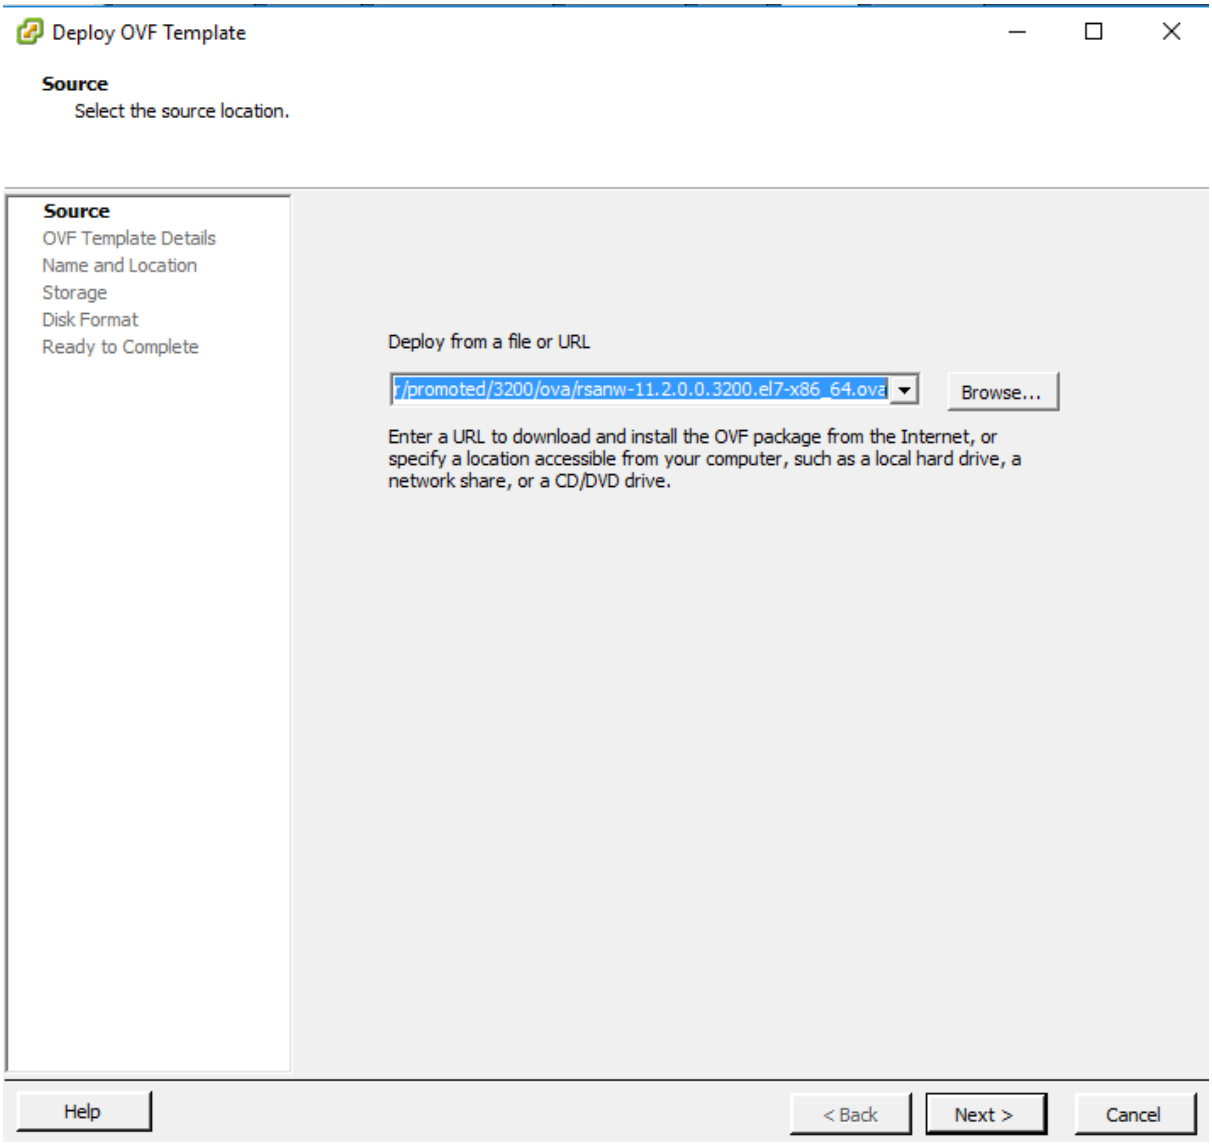
Make sure that you have:



- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, rsanw-11.7.0.0.xxxx.el7-x86_64.ova. (You download this package from Download Central (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads).)

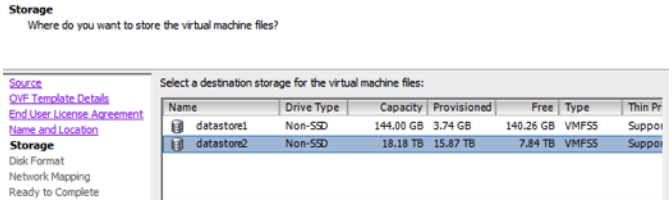
Procedure

Note: The following instructions illustrate an example of deploying an OVA host in the ESXi environment. The screens you see may be different from this example.



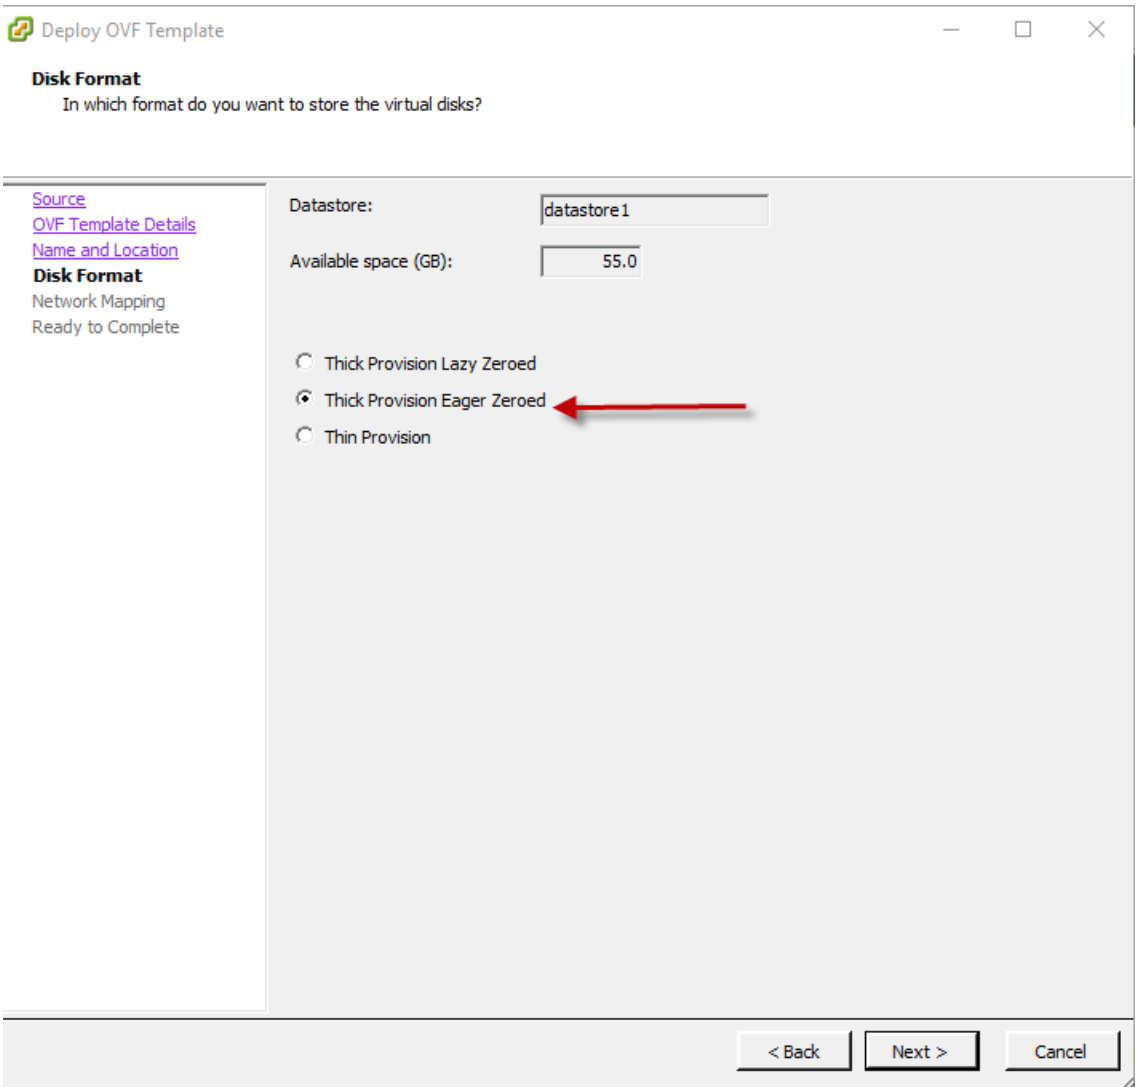
To deploy the OVA host:

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.



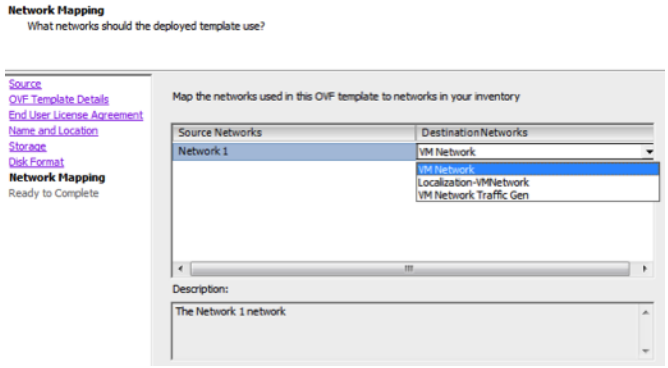
3. The Deploy OVF Template dialog is displayed. In the **Deploy OVF Template** dialog, select the OVF for the host that you want to deploy in the virtual environment (for example, **V11.7**

GOLD\\rsanw-11.7.0.0.xxxx.el7-x86_64.ova), and click **Next**.



4. The Name and Location dialog is displayed. The designated name does not reflect the server hostname. The name displayed is useful for inventory reference from within ESXi.
5. Make a note of the name, and click **Next**.

   Storage Options are displayed.



6. For Storage options, designate the datastore location for the virtual host and click **Next**.

Note: This location is for the host operating system (OS) exclusively. It does not have to be the same datastore needed to set up and configure additional volumes for the NetWitness databases on certain hosts (covered in the following sections).

7. Click **Next**.

   The Network Mapping options are displayed.

8. Select the **Network label** based on your requirement (For example, VM Network), and click **Next**.

Note: If you want to configure Network Mapping now, you can select options, but NetWitness recommends that you keep the default values and configure network mapping after you configure the OVA. You configure the OVA in Step 4: Configure Host-Specific Parameters.

A status window showing deployment status is displayed.

After the process is complete, the new OVA is presented in the designated resource pool visible on ESXi from within vSphere. At this point, the core virtual host is installed, but is still not configured.

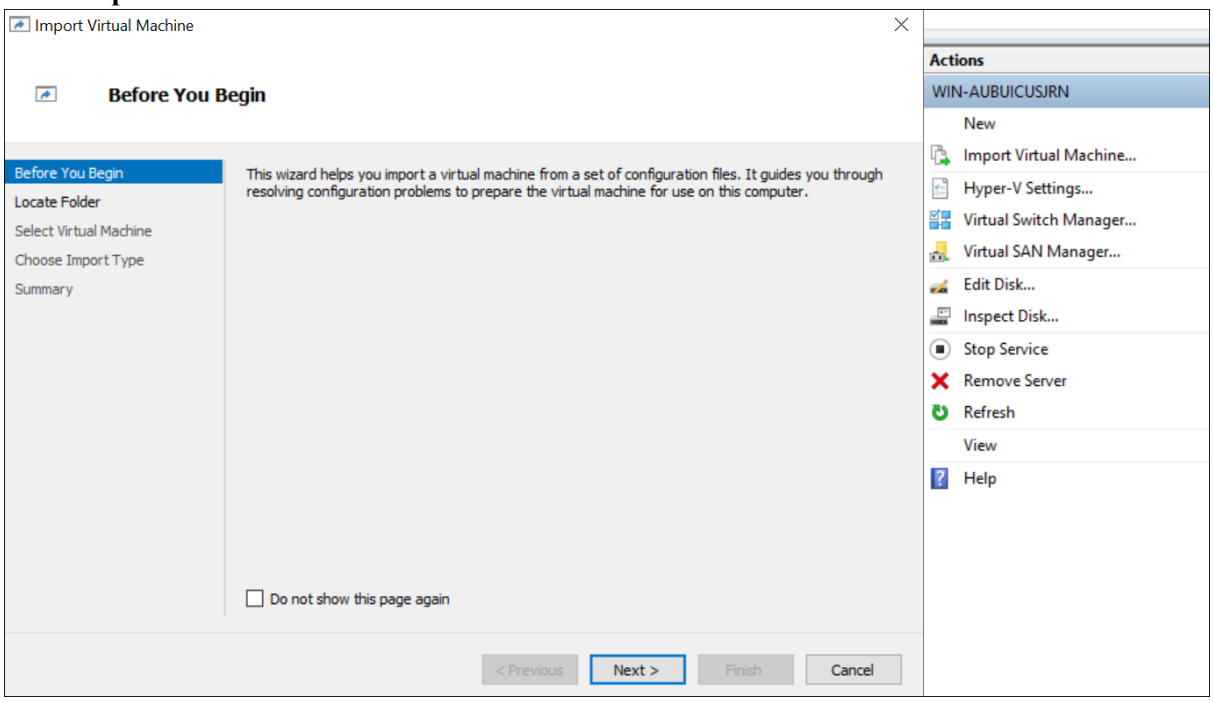
Step 1b. Create Virtual Machine - Microsoft Hyper-V

Complete the following steps according to their numbered sequence to deploy virtual host in Hyper-V.

Prerequisites

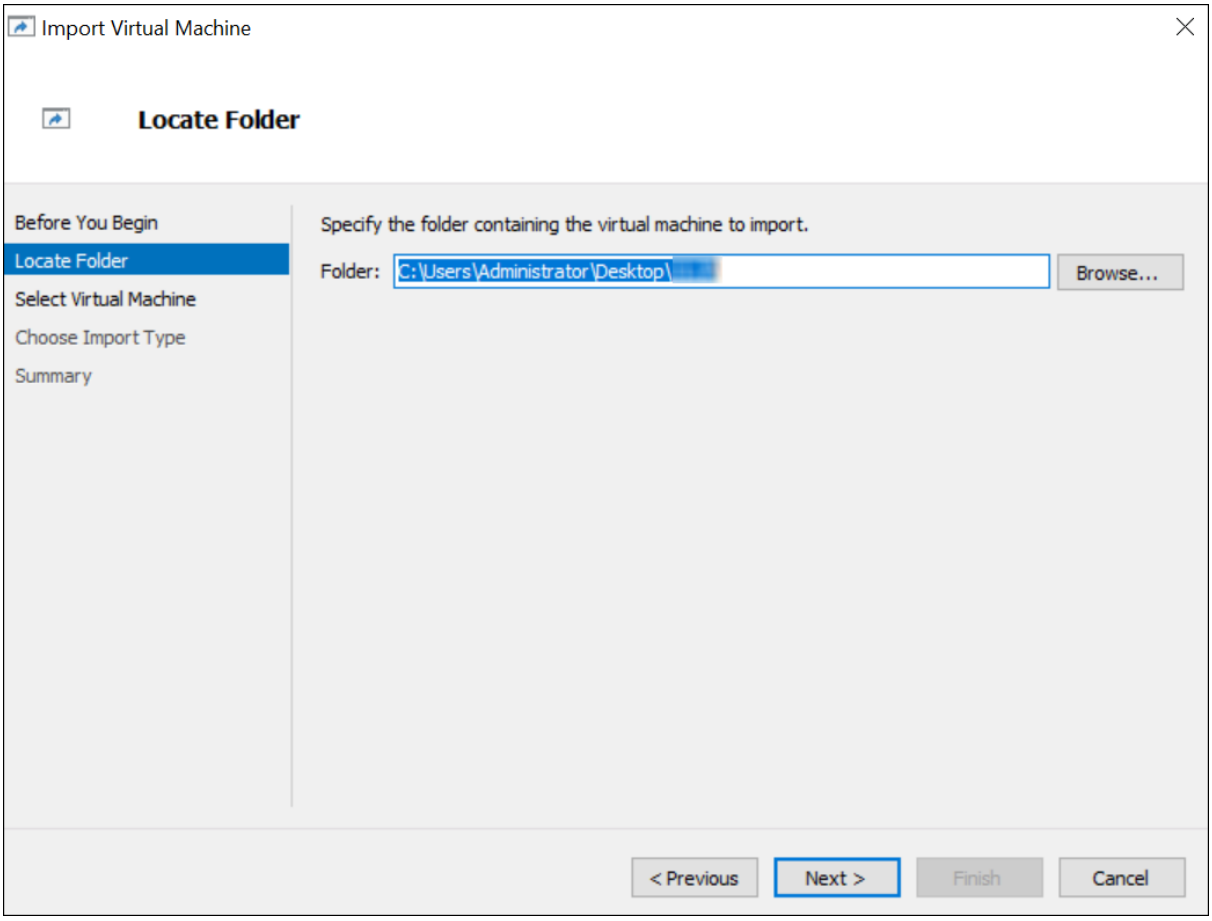
Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.



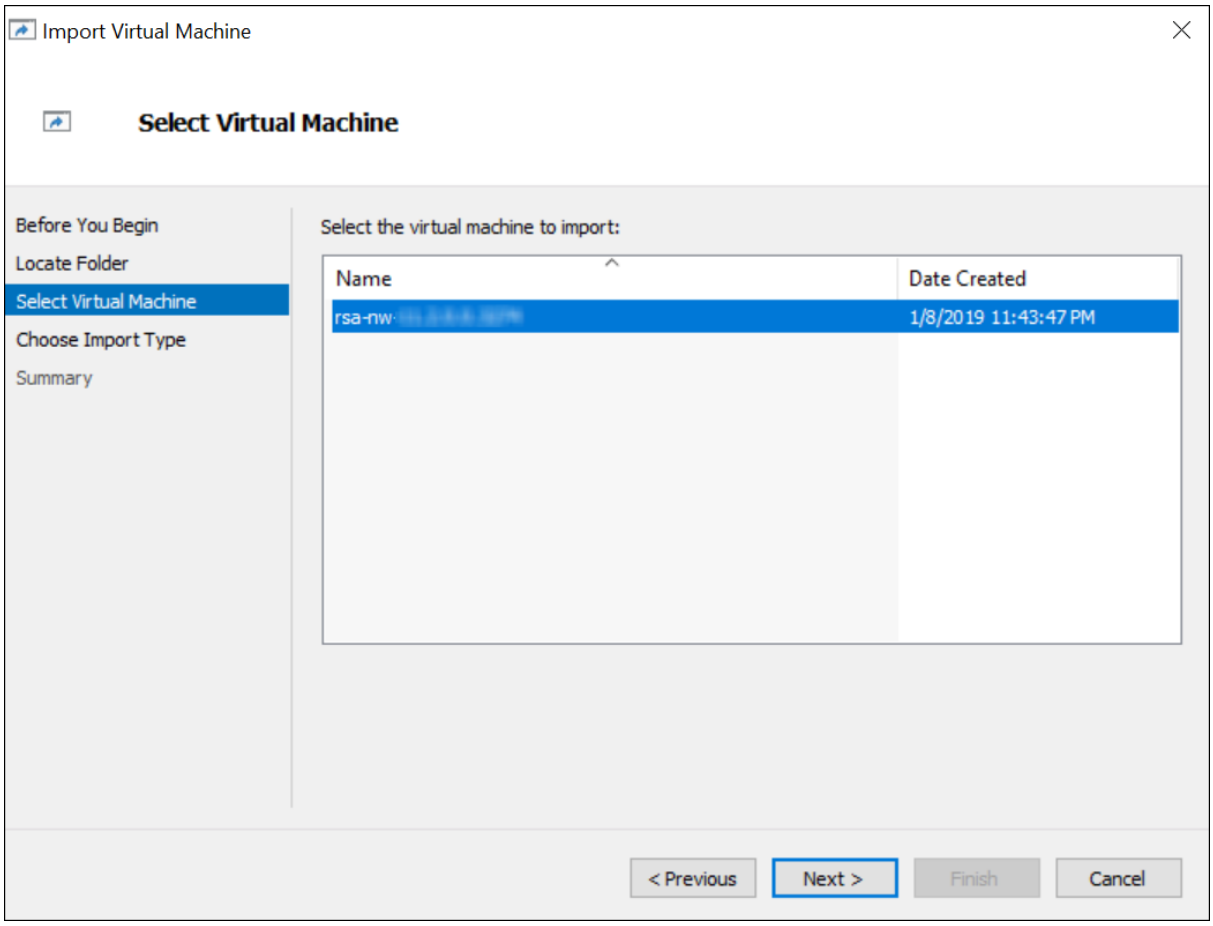
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, `rsa-nw-11.7.0.0.3274.zip`. (You download this package from Downloads https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads)

Procedure

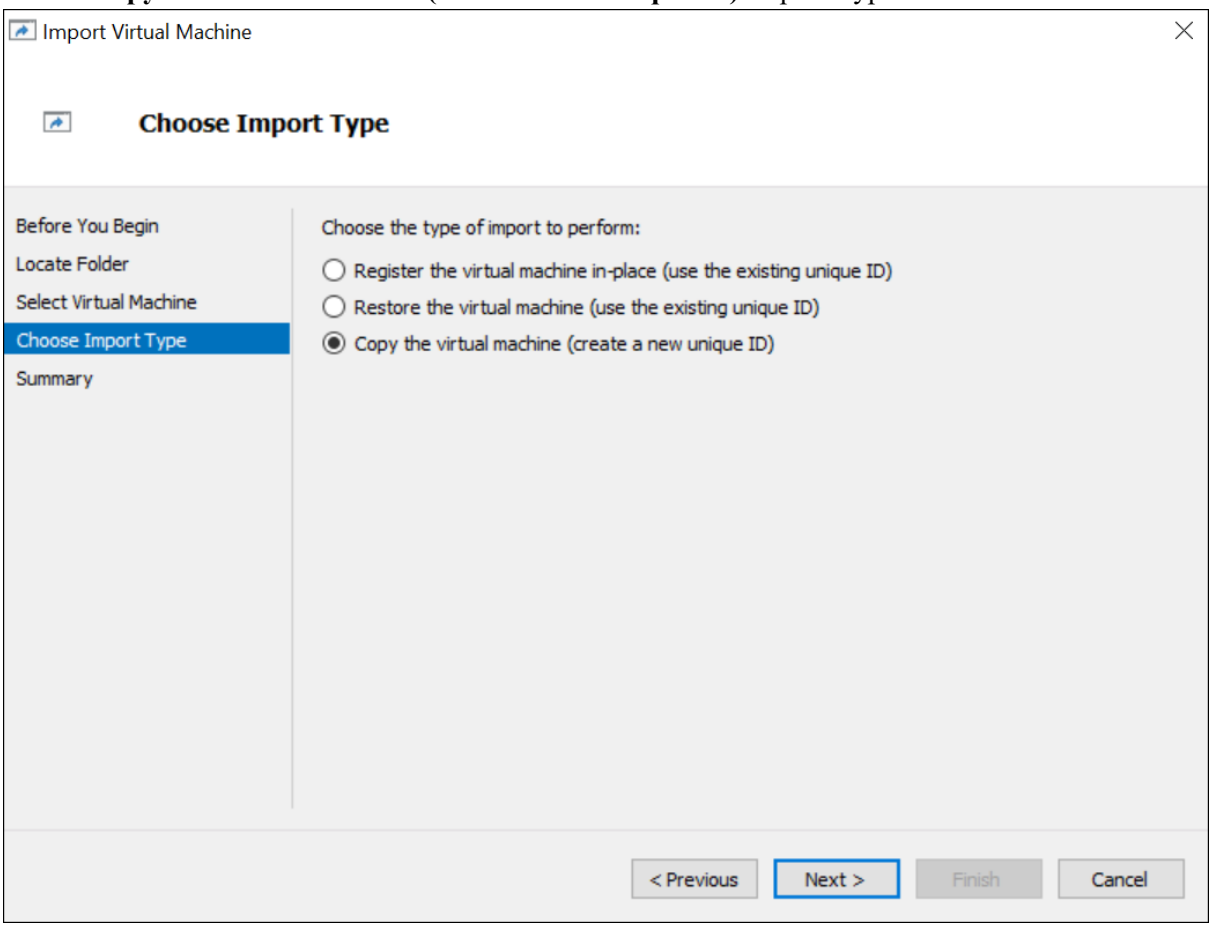


Note: The following instructions illustrate an example of deploying a VM in the Hyper-V environment. The screens you see may be different from this example.

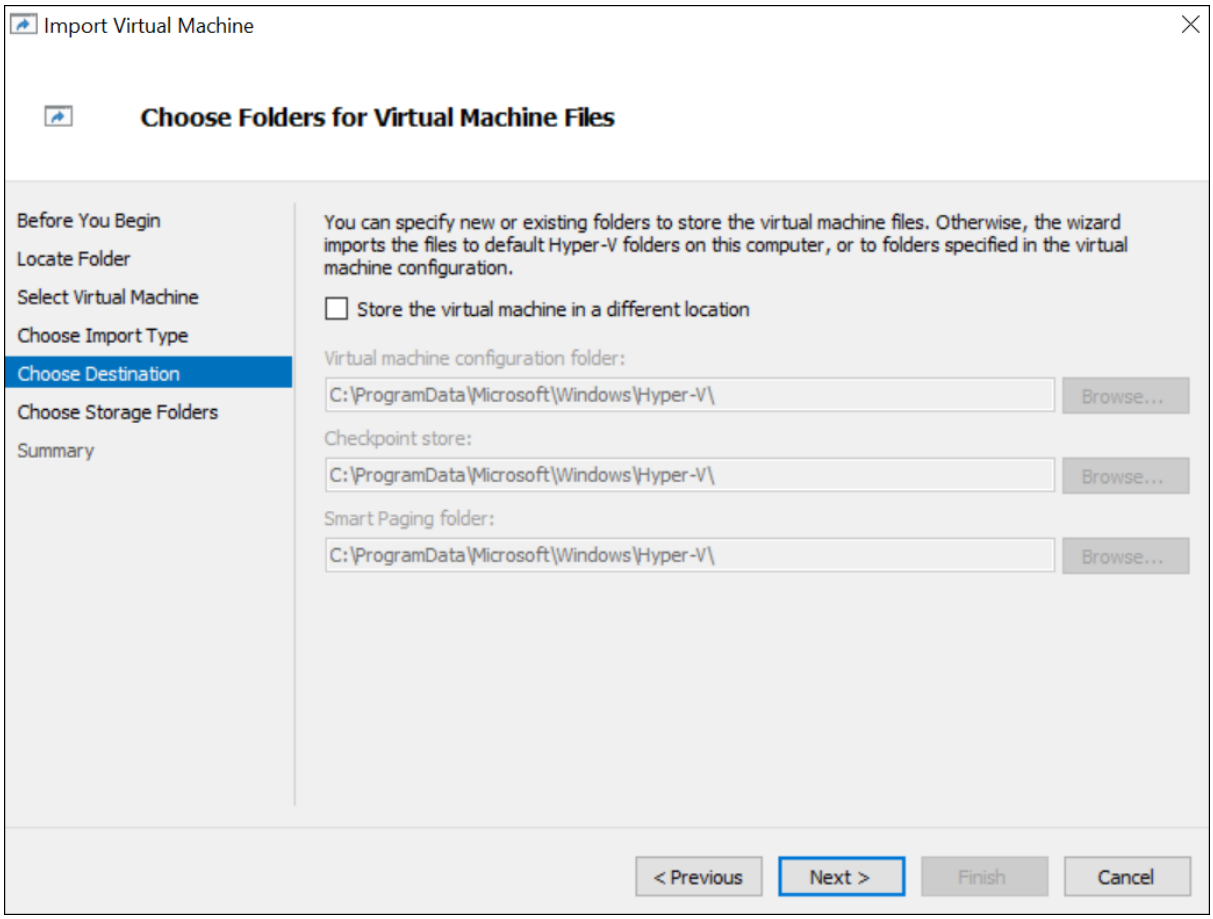
To deploy virtual host in Hyper-V.



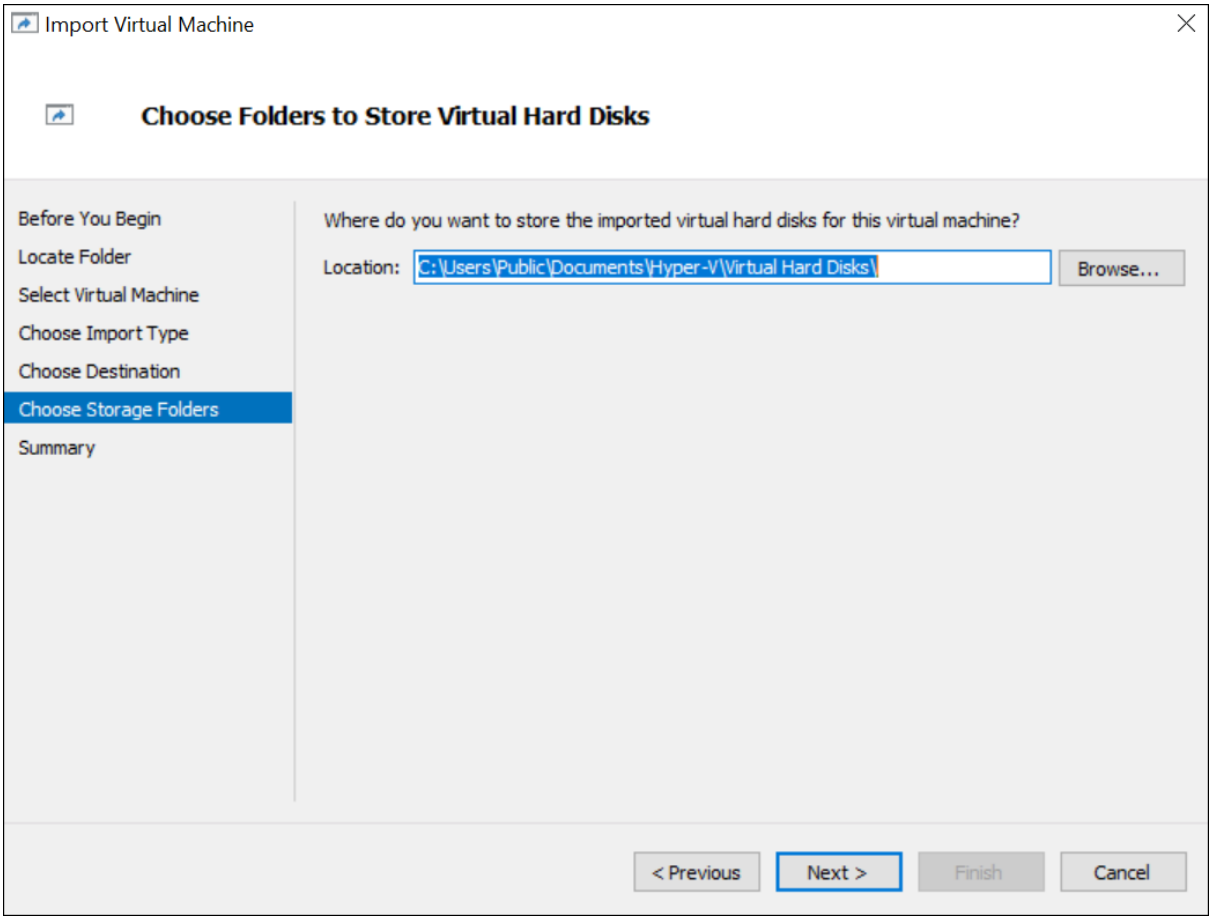
1. Log on to Hyper-V Manager.
2. Click **Import Virtual Machine** and Click **Next**.



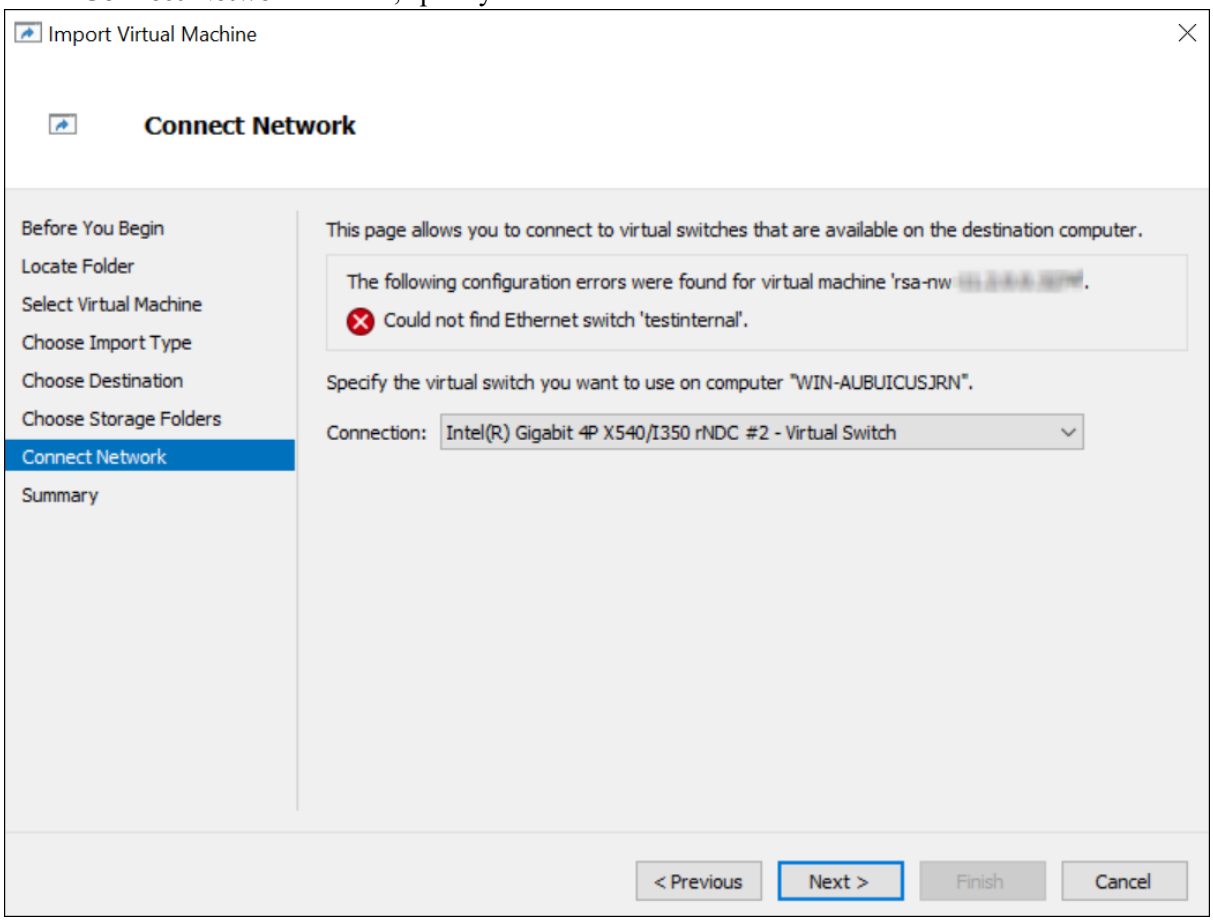
3. In the **Import Virtual Machine** dialog, specify the path where the zip file is extracted and Click **Next**.



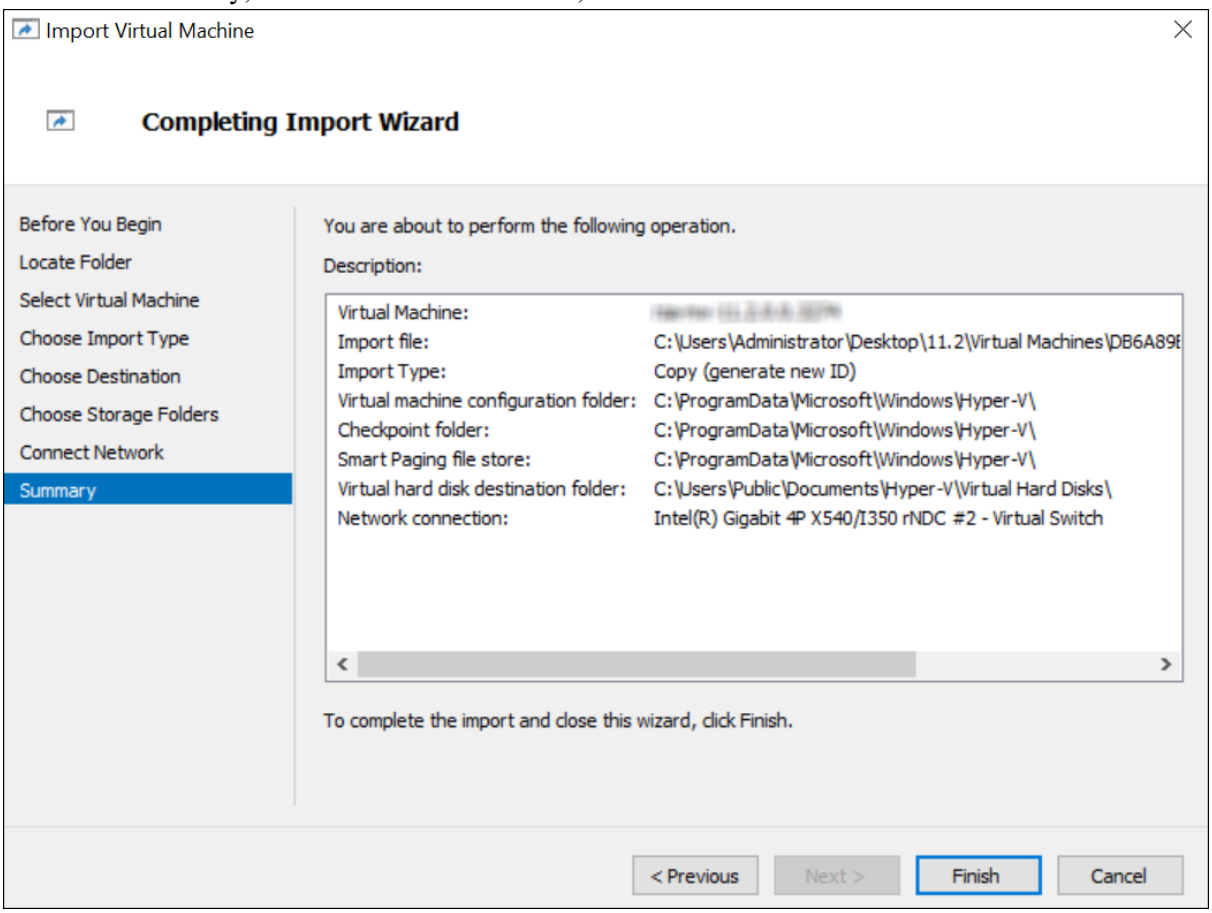
4. Select the Virtual Machine and Click **Next**.



5. Choose **copy the Virtual machine (create a new unique ID)** Import Type.



6. In the **Choose Destination** section, specify the new or existing folder to store the Virtual Machine files.



7. In the **Choose Storage Folder** section, specify the location where you want to store multiple Virtual Machine deployments.

8. In the **Connect Network** section, specify the Network name for the Virtual Machine to connect.

9. Check the Summary, if all the details are correct, click **Finish**.

Step 1c. Create Virtual Machine - Nutanix AHV

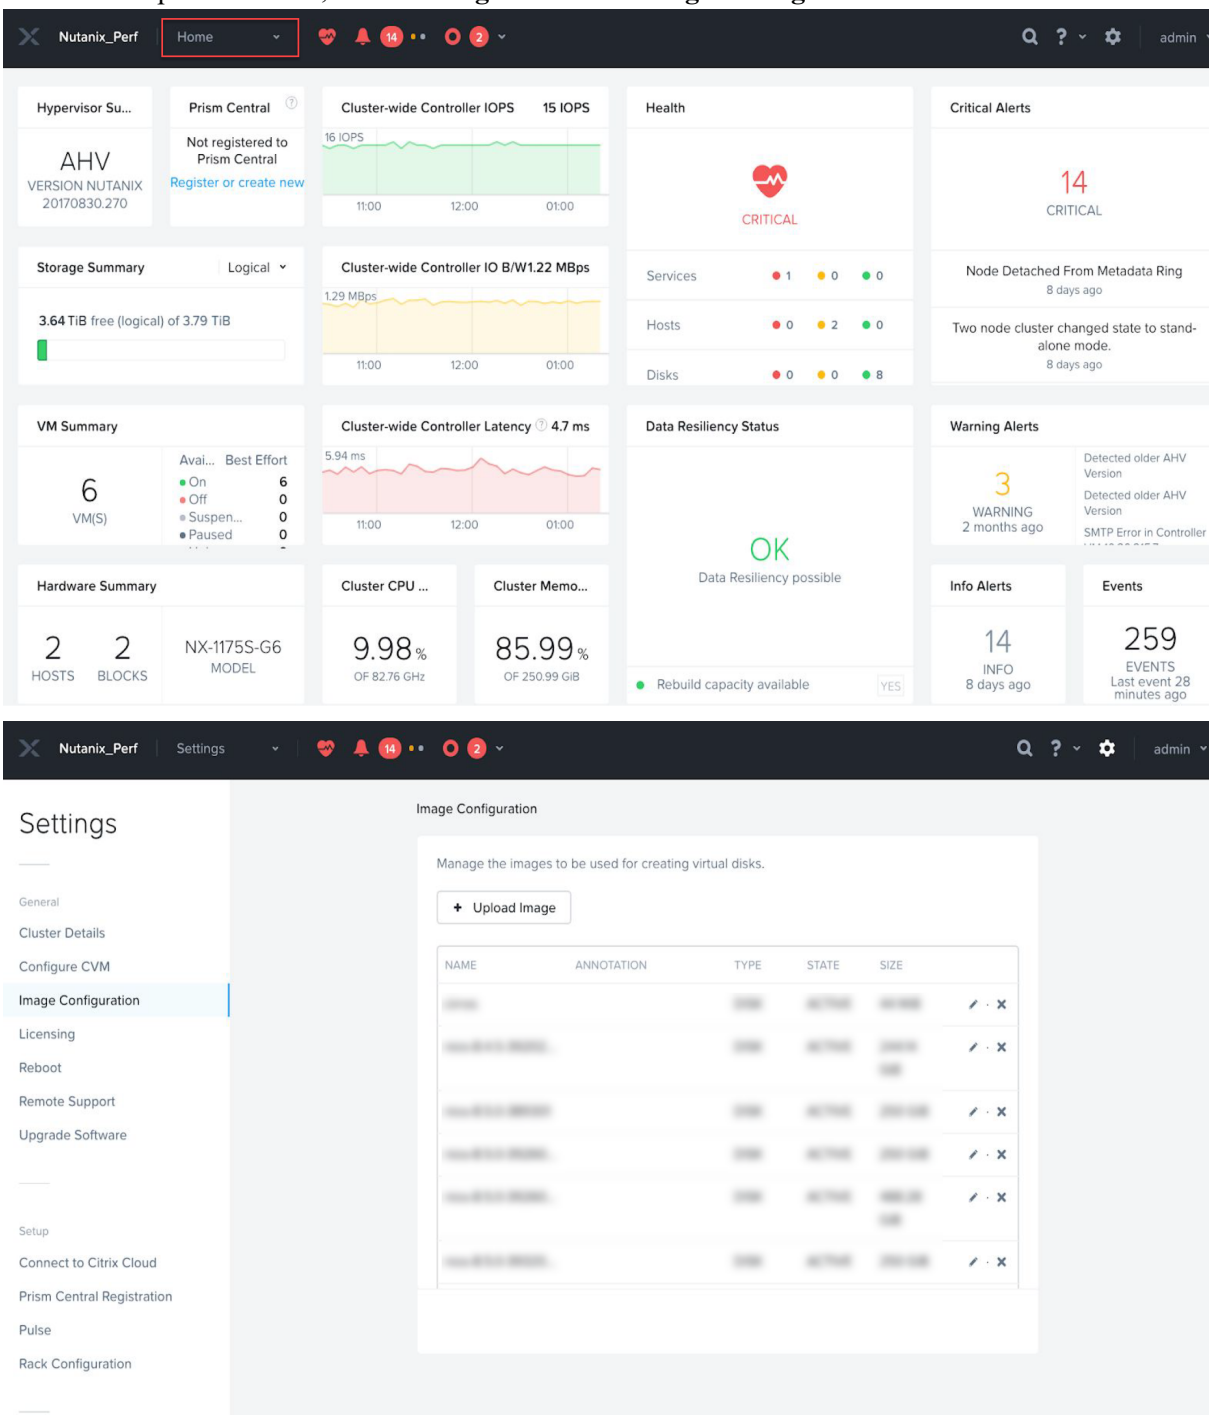
Nutanix AHV is an enterprise-ready hypervisor, offering integrated virtualization, app mobility, management, operational insights, and security. Complete the following steps according to their numbered sequence to deploy virtual host in Nutanix Acropolis Hypervisor (AHV).

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.

- The NetWitness 11.5 or later ISO file which is available for download from Downloads (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads).
- Administrative user account on Nutanix Prism.



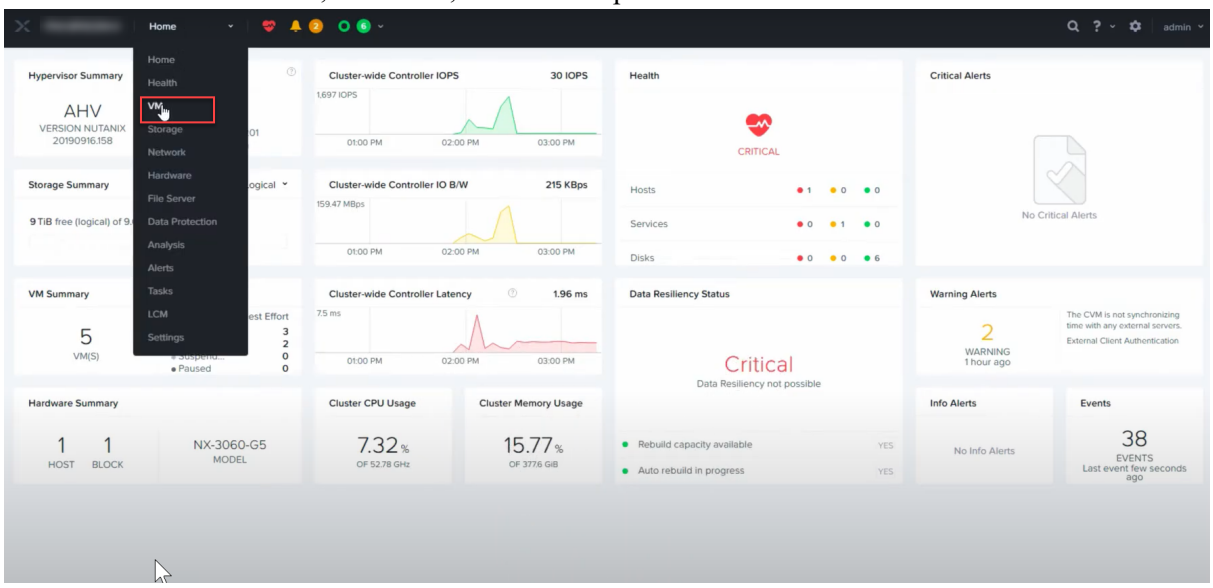
Procedure

Note: The following instructions illustrate an example of deploying a VM in the Nutanix AHV environment. The screens you see may be different from this example.

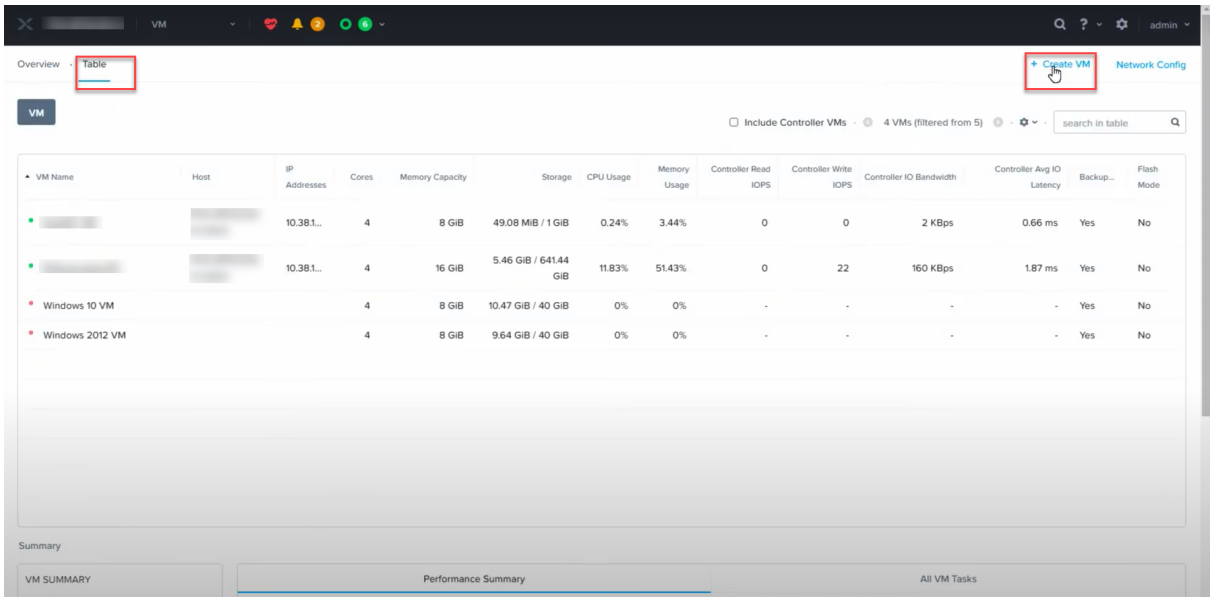
Create Image on Nutanix AHV

1. Log in to the Nutanix Prism GUI.

2. From the drop-down menu, click **Settings** and select **Image Configuration**.



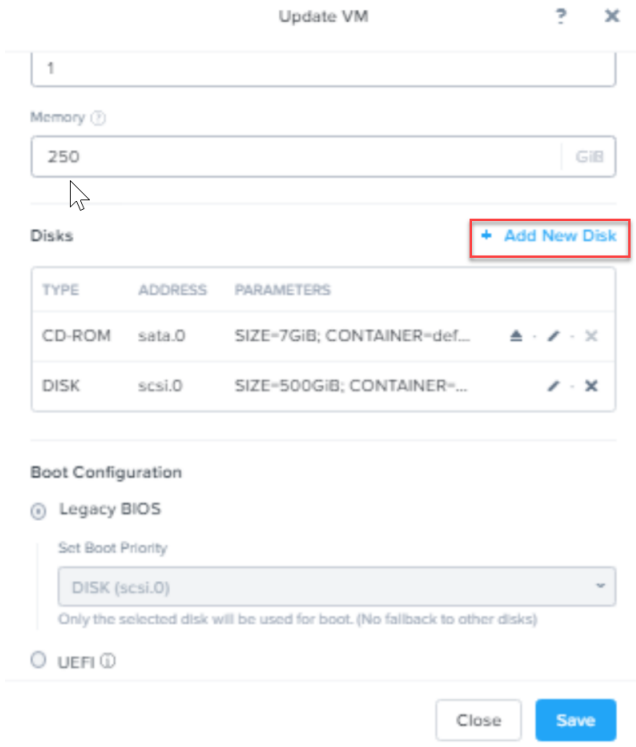
3. Click **Upload Image**.
4. In the **Create Image** dialog, select **Image Type** as **ISO**. Specify other details based on your requirements.
5. Select **Upload a file** and click **Choose File**.
6. Browse to the stored location of the NetWitness 11.5 or later ISO file and select it.

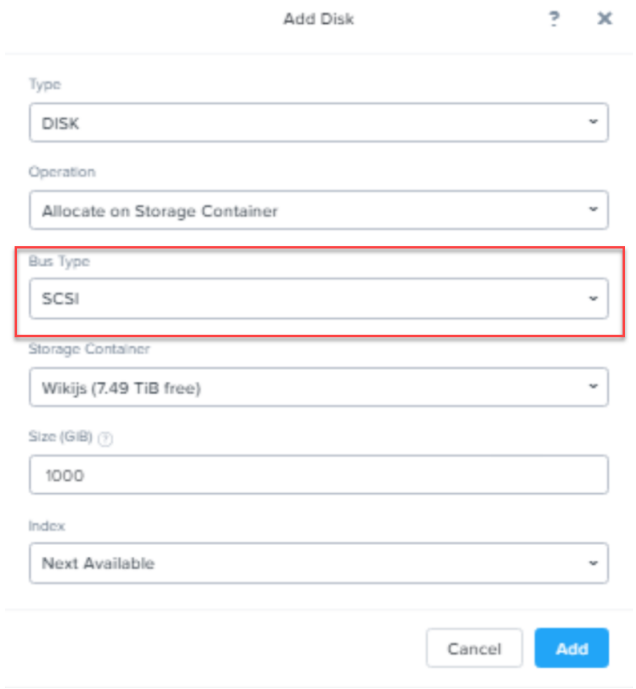


7. Click **Save**.

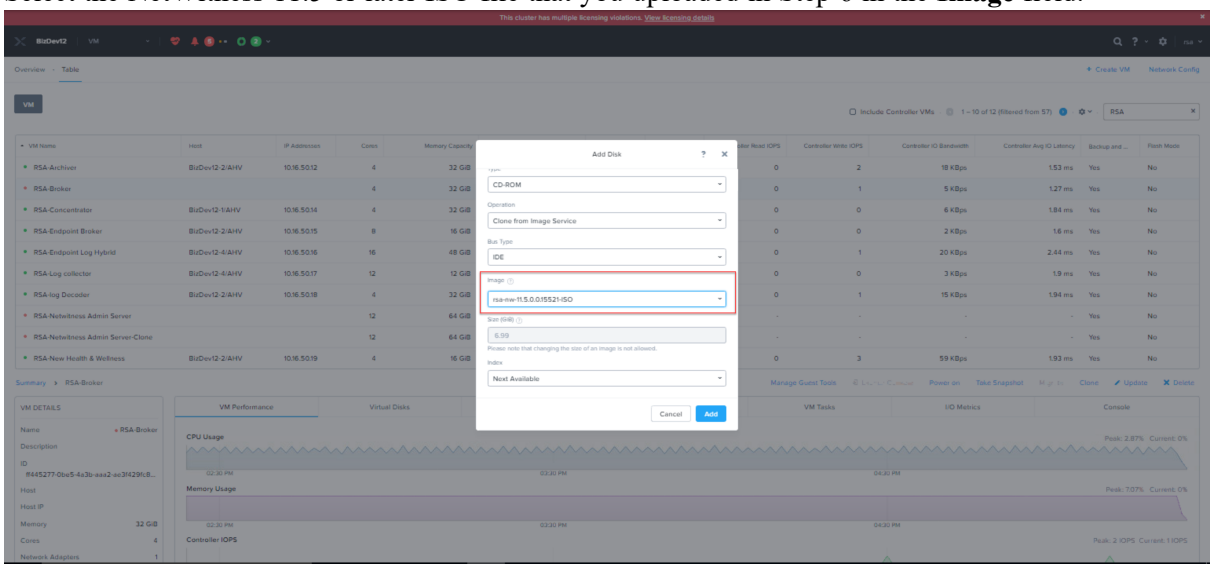
Create VM on Nutanix AHV

1. In the Nutanix Primis GUI, click **VM**, from the drop-down menu.





2. Go to the **Table** view and click **Create VM**.



3. In the **Create VM** dialog, enter the required details such as name, description, time zone, vCPU, cores per vCPU, etc. For more information, see Creating a VM (AHV) in the Prism Web Console Guide.

4. In the **Create VM** dialog, scroll down to the **Disks** section and click **Add New Disk**.

5. In the **Add Disk** dialog, do the following:
   a. Select **DISK** in the **Type** field and specify other details based on your requirement.
   b. Select **Allocate on Storage Container** in the **Operations** field.
   c. Select **SCSI** as **Bus Type**.
6. In the **Add Disk** dialog, select **CD-ROM** as the **Type**.
7. Select **Clone from Image Service** in the **Operations** field and **IDE** as **Bus Type**.
8. Select the NetWitness 11.5 or later ISO file that you uploaded in Step 6 in the **Image** field.

9. Select **Clone from Image Service** in the **Operations** field and **IDE** as **Bus Type**.
10. Click **Add** and enter other details such as adding network adapters, GPU, etc.
11. Click **Save**. You can now see your VM in the VM list.

IMPORTANT: Ensure that you eject the CD-ROM after installing the NetWitness Platform. Otherwise, every time you reboot the VM it will boot from CD-ROM.

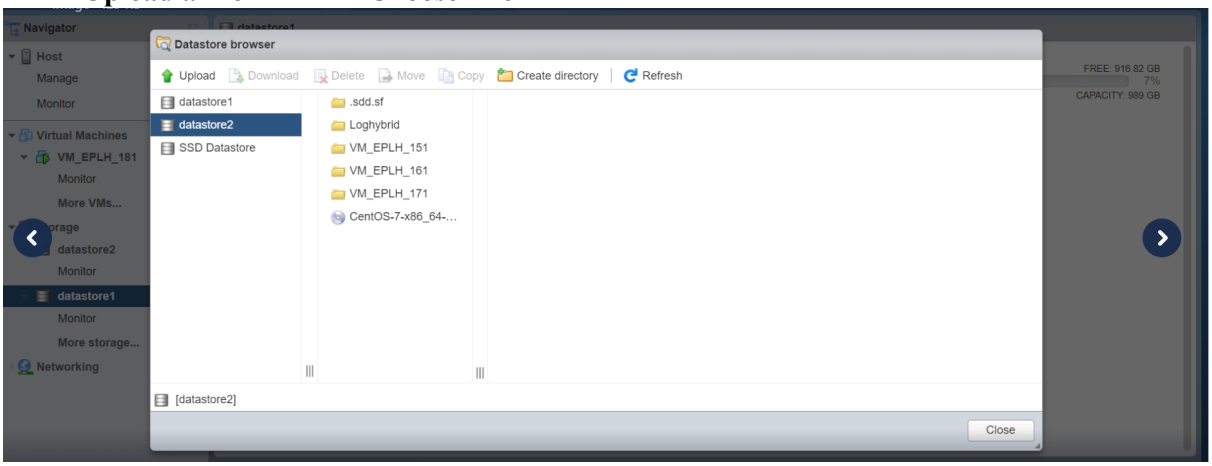
Step 1d. Create Virtual Machine in Esxi

Complete the following steps according to their numbered sequence to create the virtual machine in Esxi environment.

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.

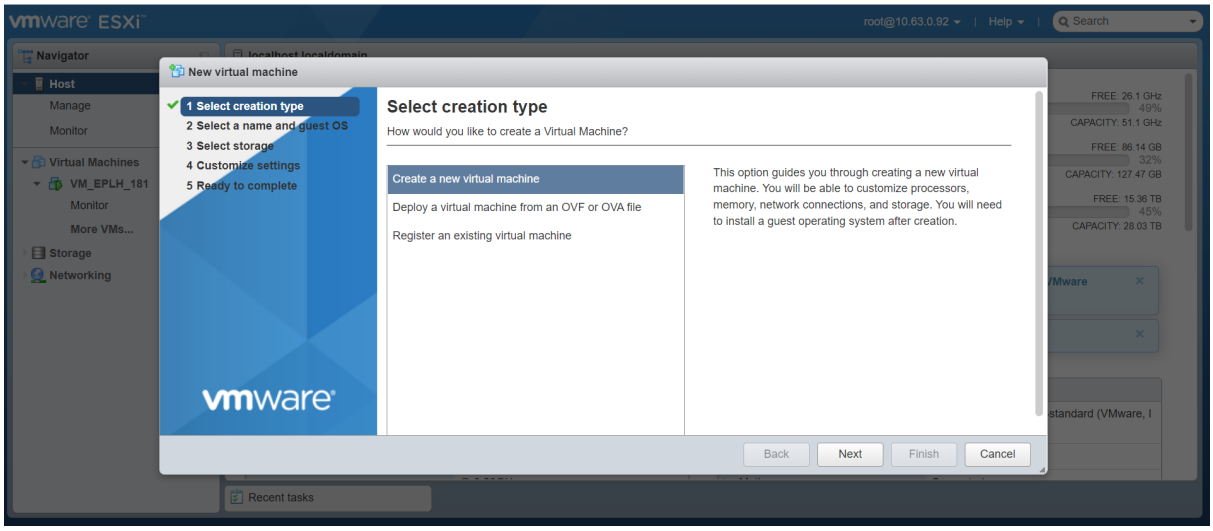


- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, `rsa-nw-11.7.0.0.3274.zip`. (You download this package from Downloads https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads)

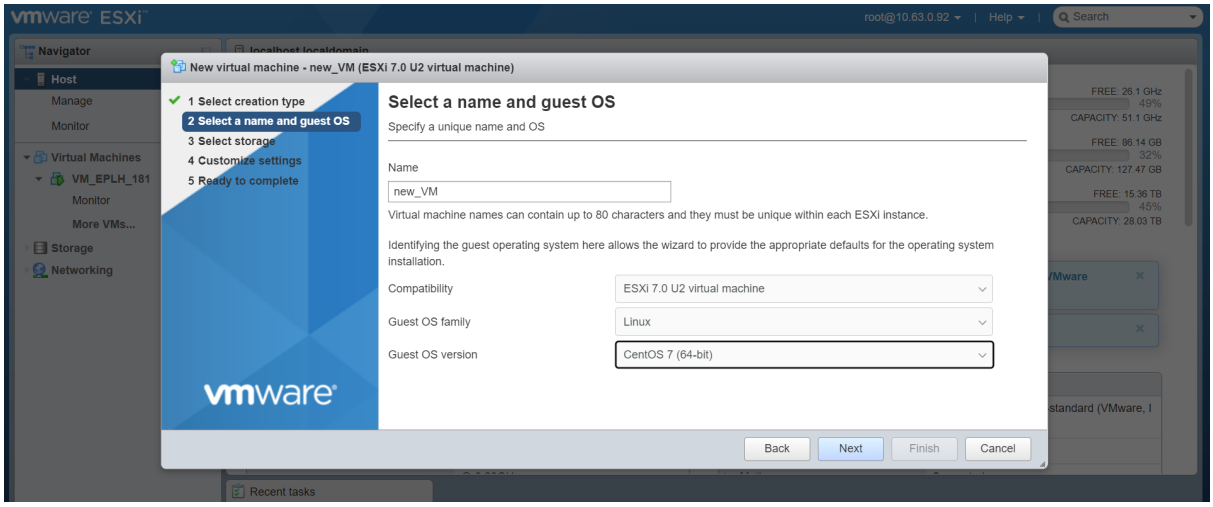
Procedure

Note: The following instructions illustrate an example of creating a VM in Esxi environment. The screens you see may be different from this example.

Create Image on Esxi

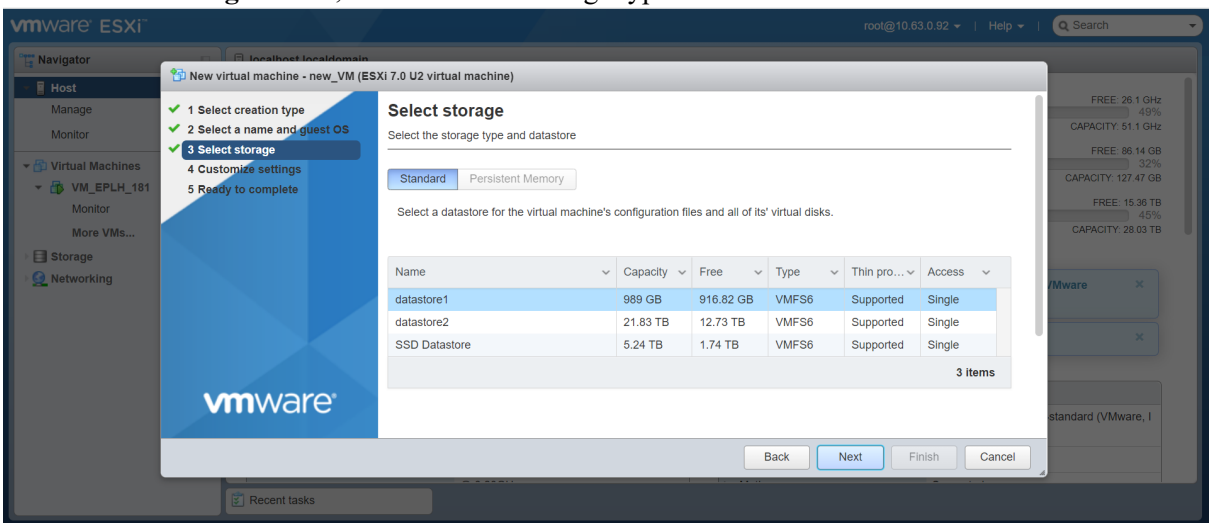


1. Log in to the Esxi GUI.
2. From the drop-down menu, click **Settings** and select **Image Configuration**.
3. Click **Upload Image**.
4. In the **Create Image** dialog, select **Image Type** as **ISO**. Specify other details based on your requirements.
5. Select **Upload a file** and click **Choose File**.

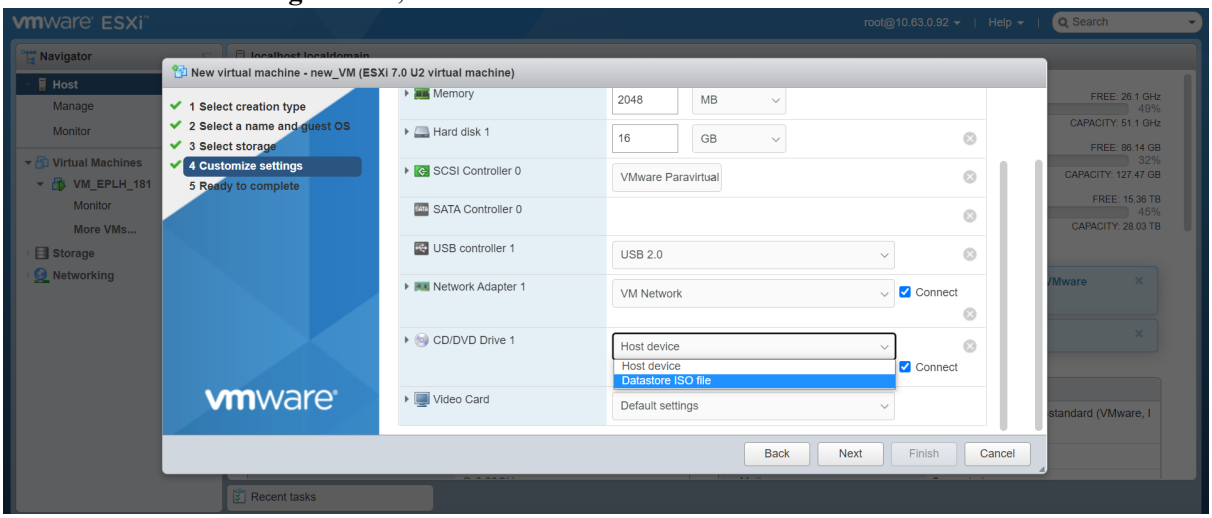


6. Browse to the stored location of the NetWitness 11.5 or later ISO file and select it.
7. Click **Save**.

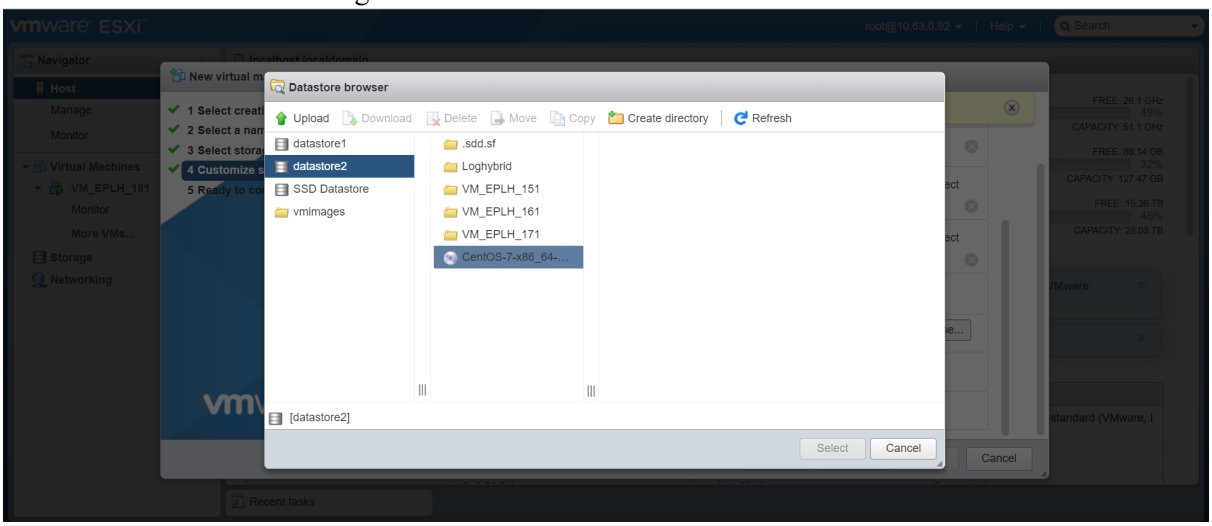
Create VM on Esxi



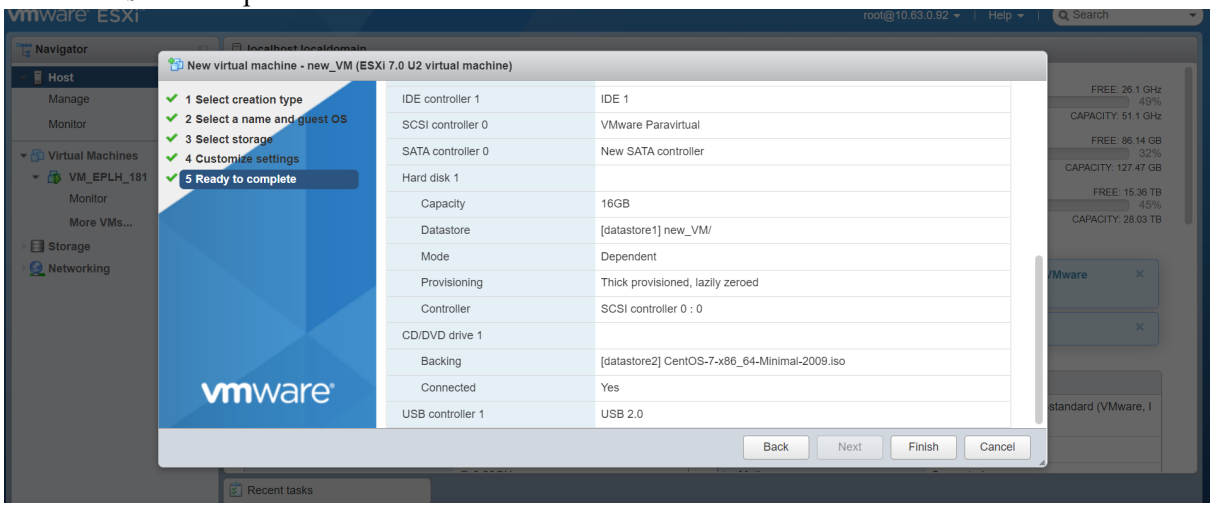
1. In the Esxi GUI, click **VM**, from the drop-down menu.
2. Go to the **Host** screen and click **Create a new virtual machine**



3. In the **Select a name and guest OS** screen, enter the required details such as name, compatibility, guest OS family, guest OS version and click **NEXT**.



4. In the **Select storage** screen, select the data storage type and click **Next**.



5. In the **Customize settings** screen, select **CD/DVD Drive 1** as **Datastore ISO file**.

6. Browse the mounted ISO image and click **Next**.

7. Click **Finish** to complete the installation.

Step 2. Configure Block Storage to Accommodate NetWitness Platform

When you deploy databases from OVA or VHDX, the initial database space allocation is not adequate for production environment. You need to add or expand the datastores volume after installation.

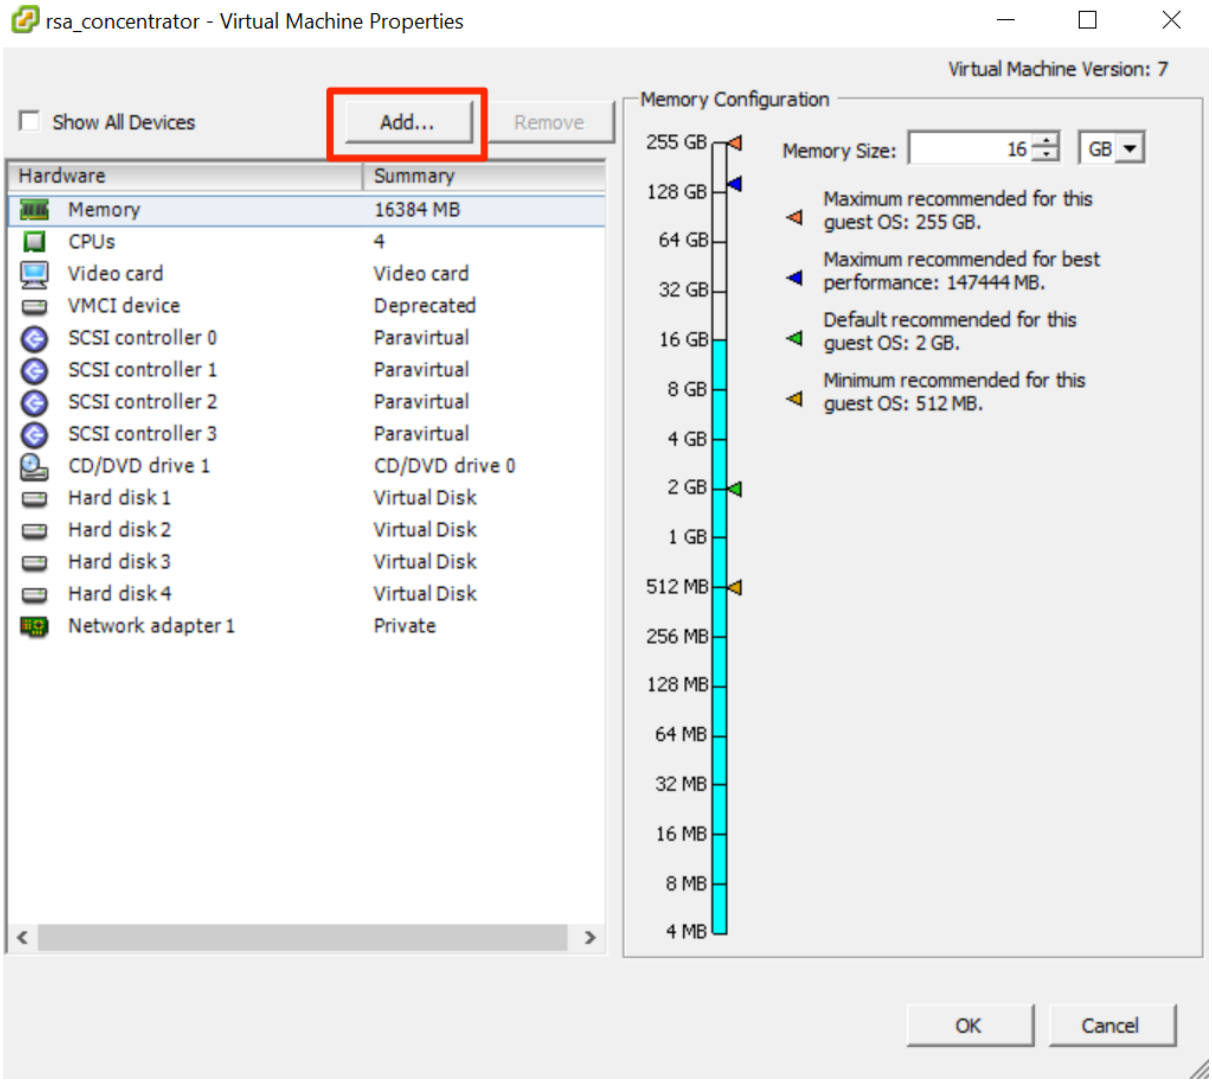
Task 1. Add New Disk

Get familiar with the NetWitness® Platform Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness Platform 11.x

Add New Disk

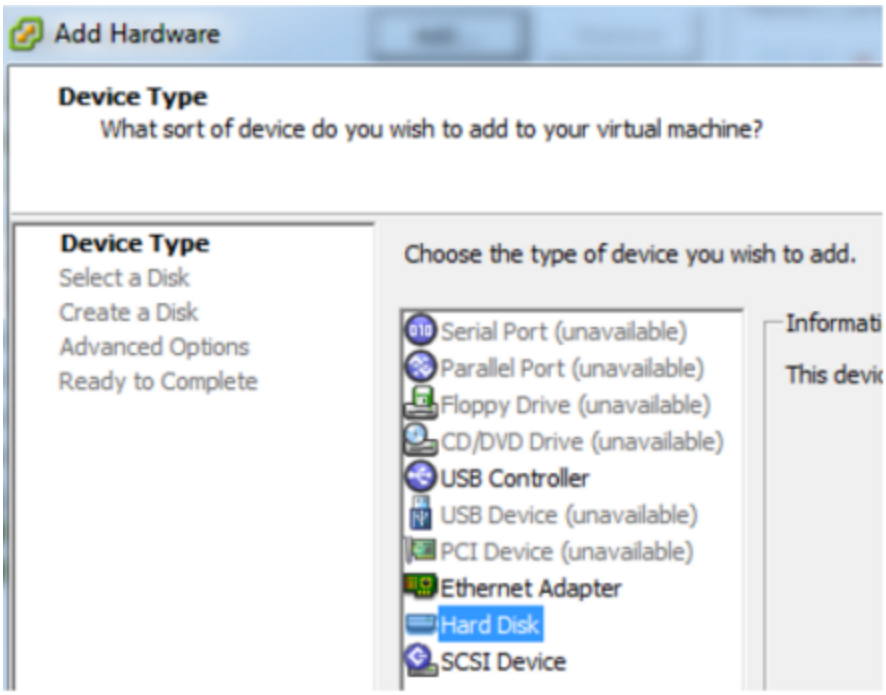
Add New Disk in VMware ESXi

Add New Disk in Hyper-V



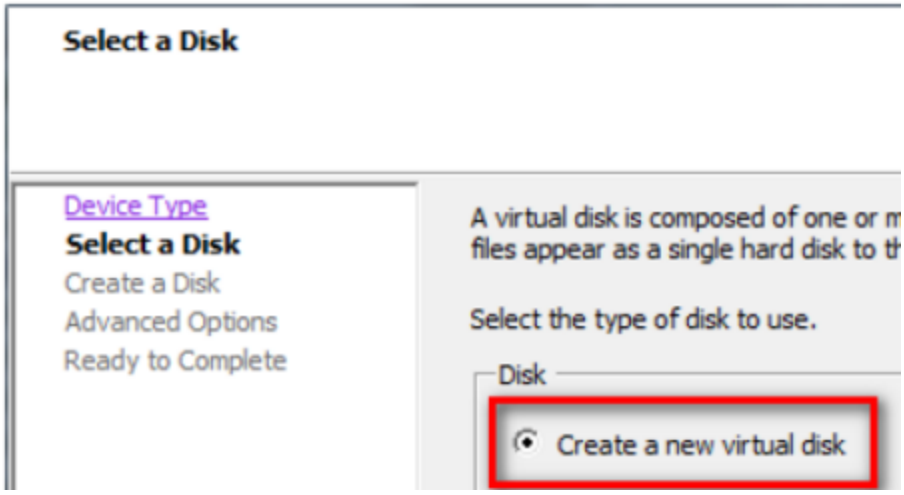
Add New Disk in Nutanix AHV

Add New Disk in VMware ESXi



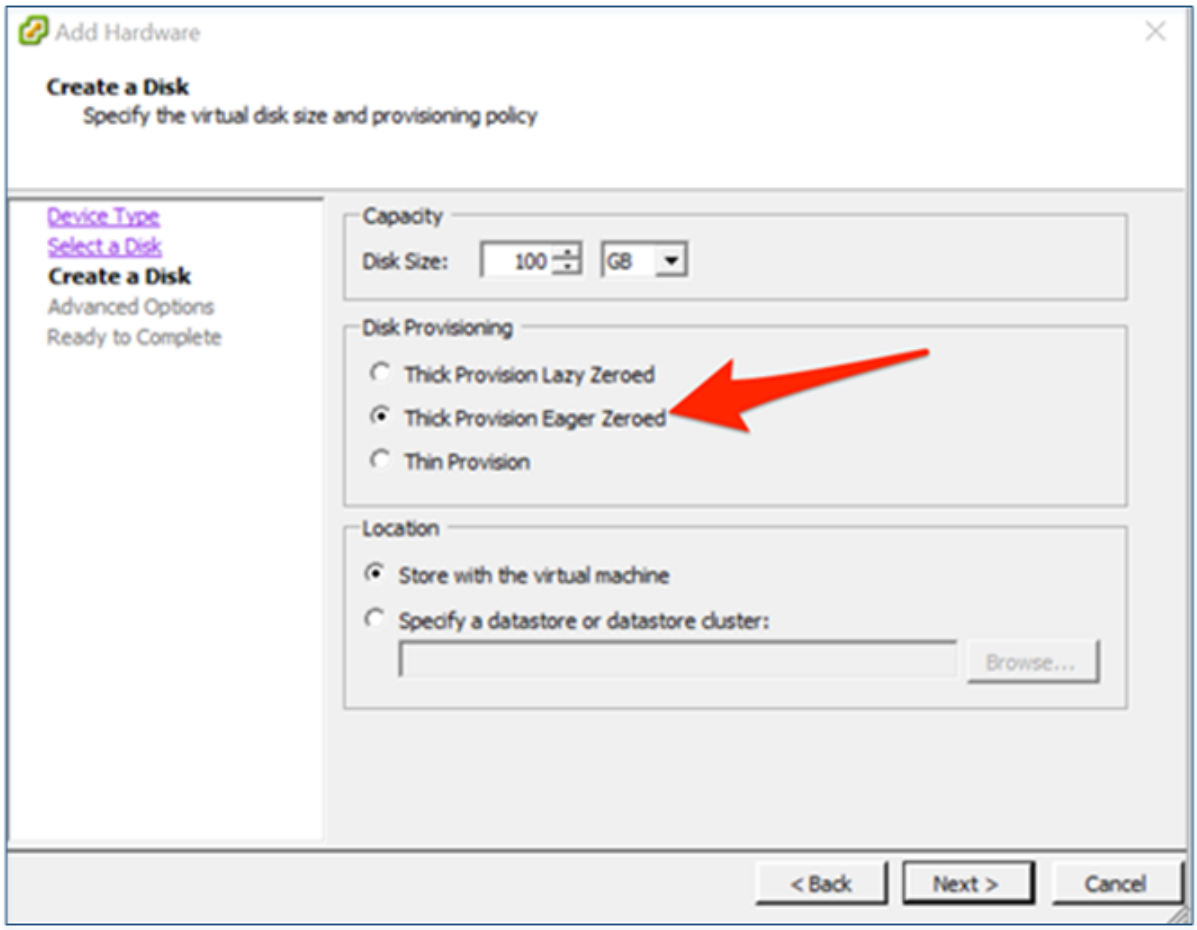
This procedure shows you how to add a new 100 GB disk on the same datastore.

Note: The procedure to add a disk on different datastore is similar to the procedure shown here.

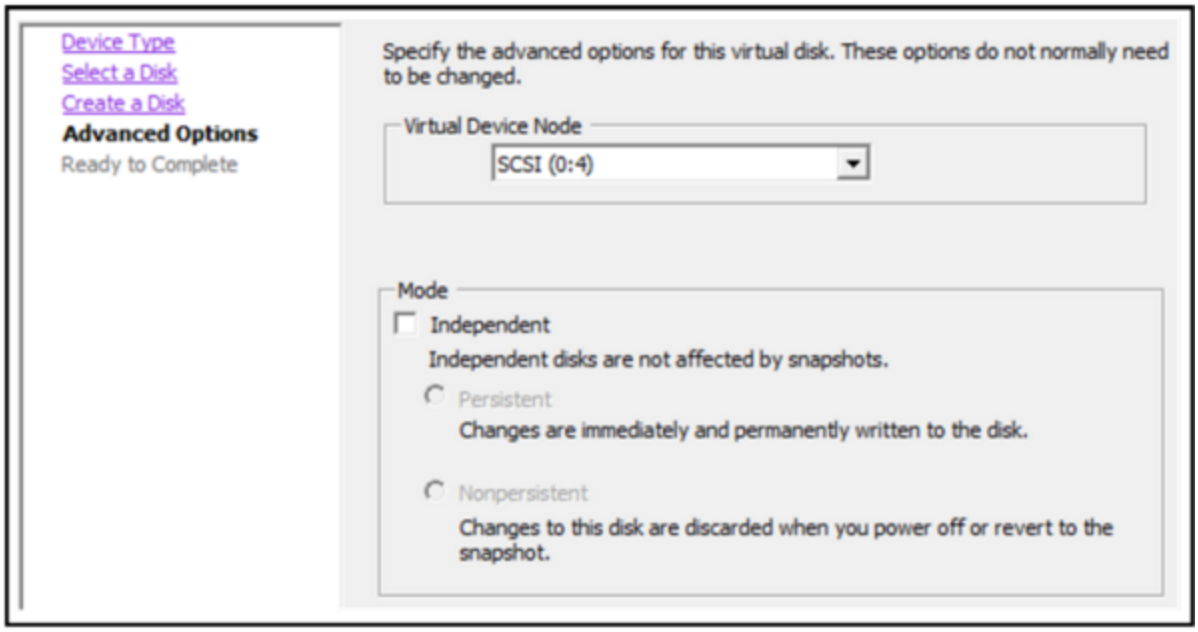


1. Shut down the machine, edit **Virtual Machine Properties**, click **Hardware** tab, and click **Add**.

2. Select **Hard Disk** as the device type.

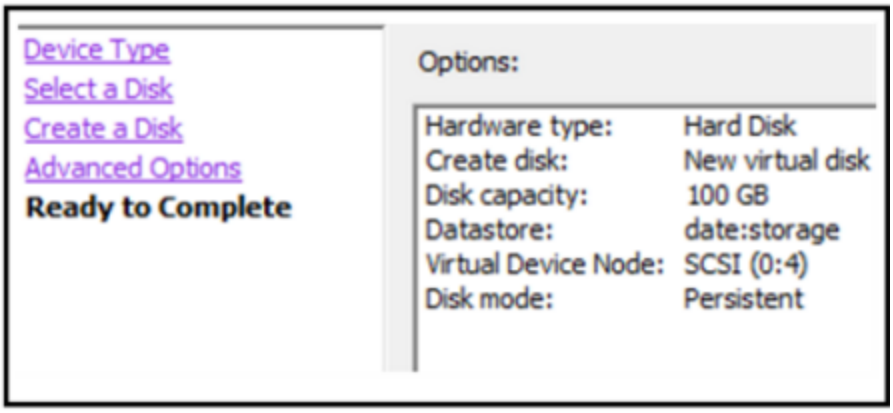


3. Select **Create a new virtual disk**.

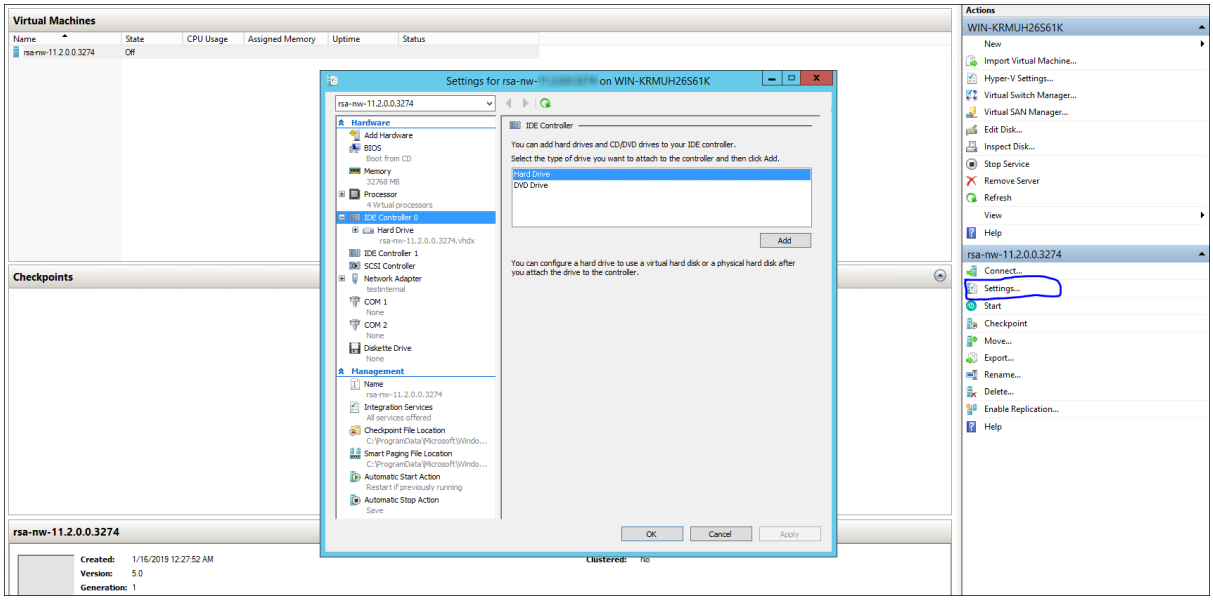


4. Choose the size of the new disk and where you want to create it (on the same datastore or a different datastore).

Note: Choose data provisioning based on your requirements

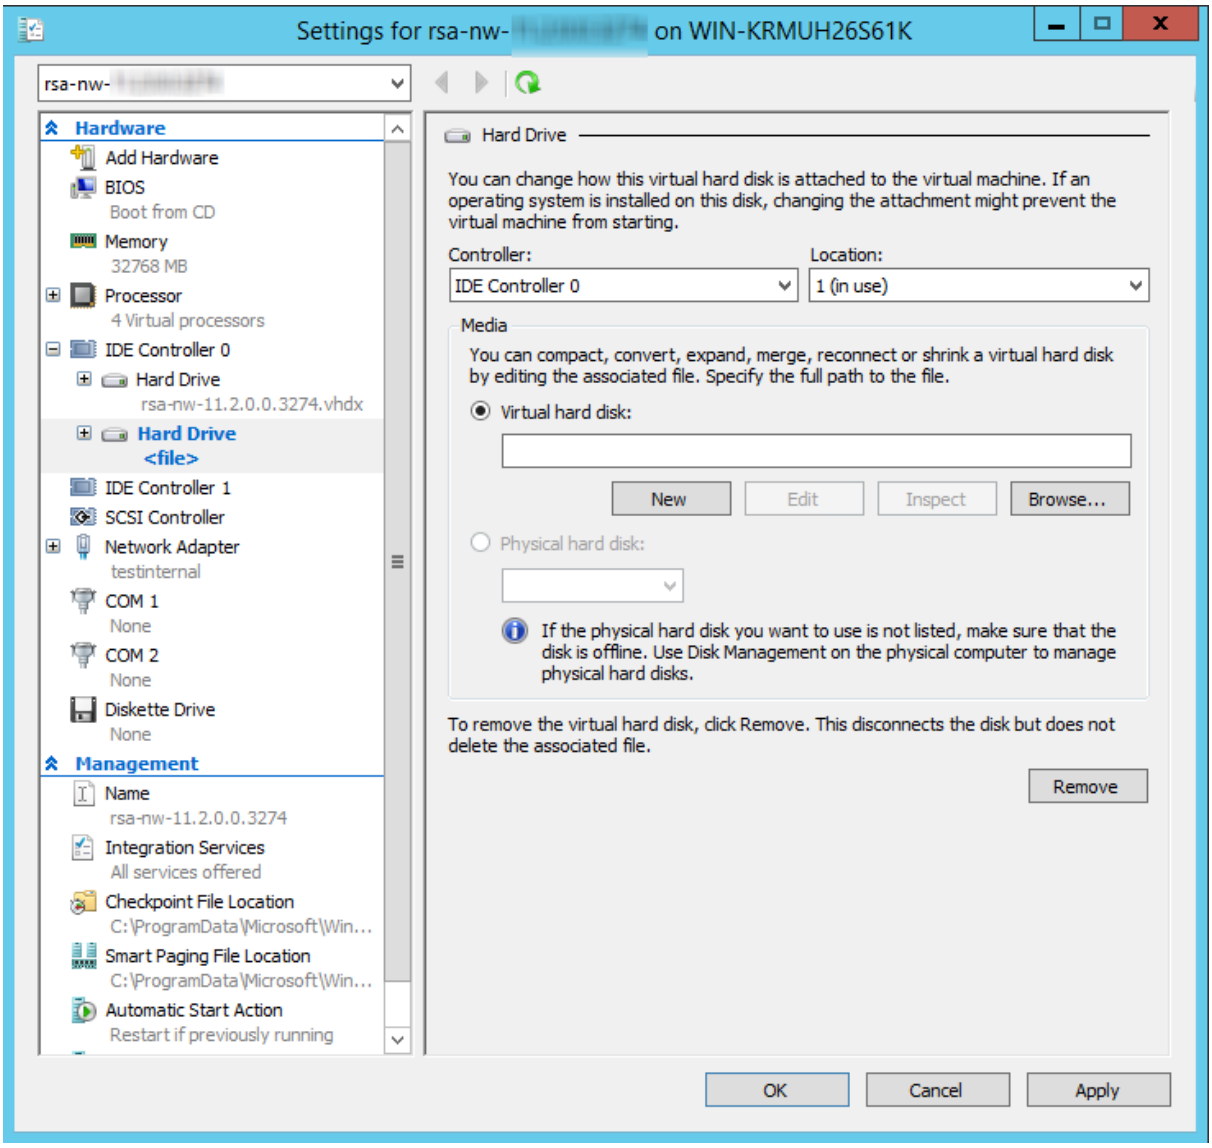


5. Approve the proposed Virtual Device Node.

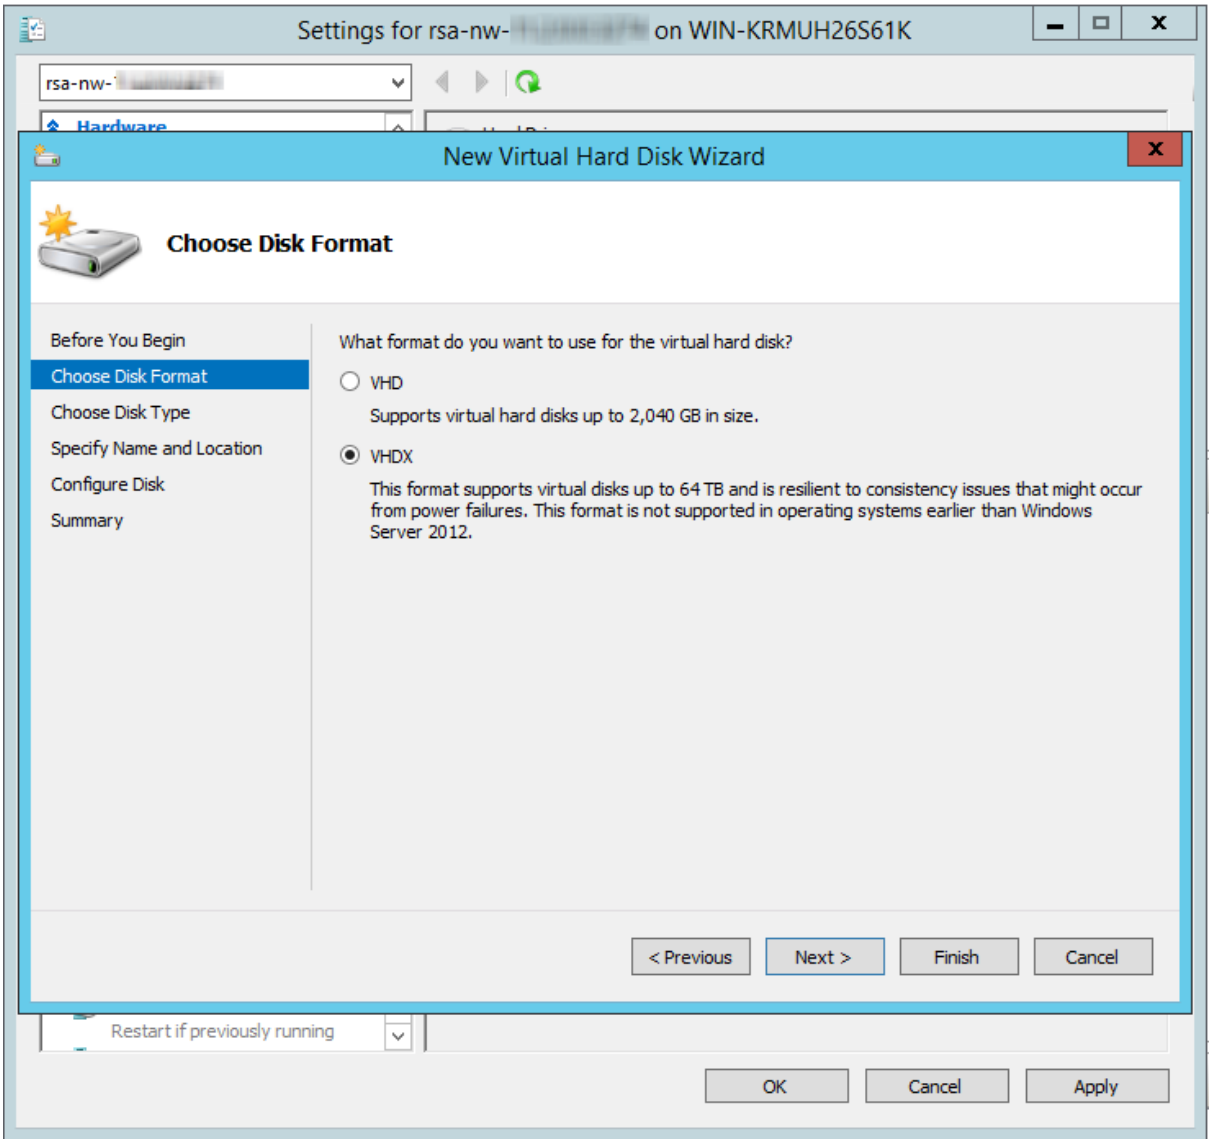


Note: The Virtual Device Node can vary, but it is pertinent to `/dev/sdX` mappings.

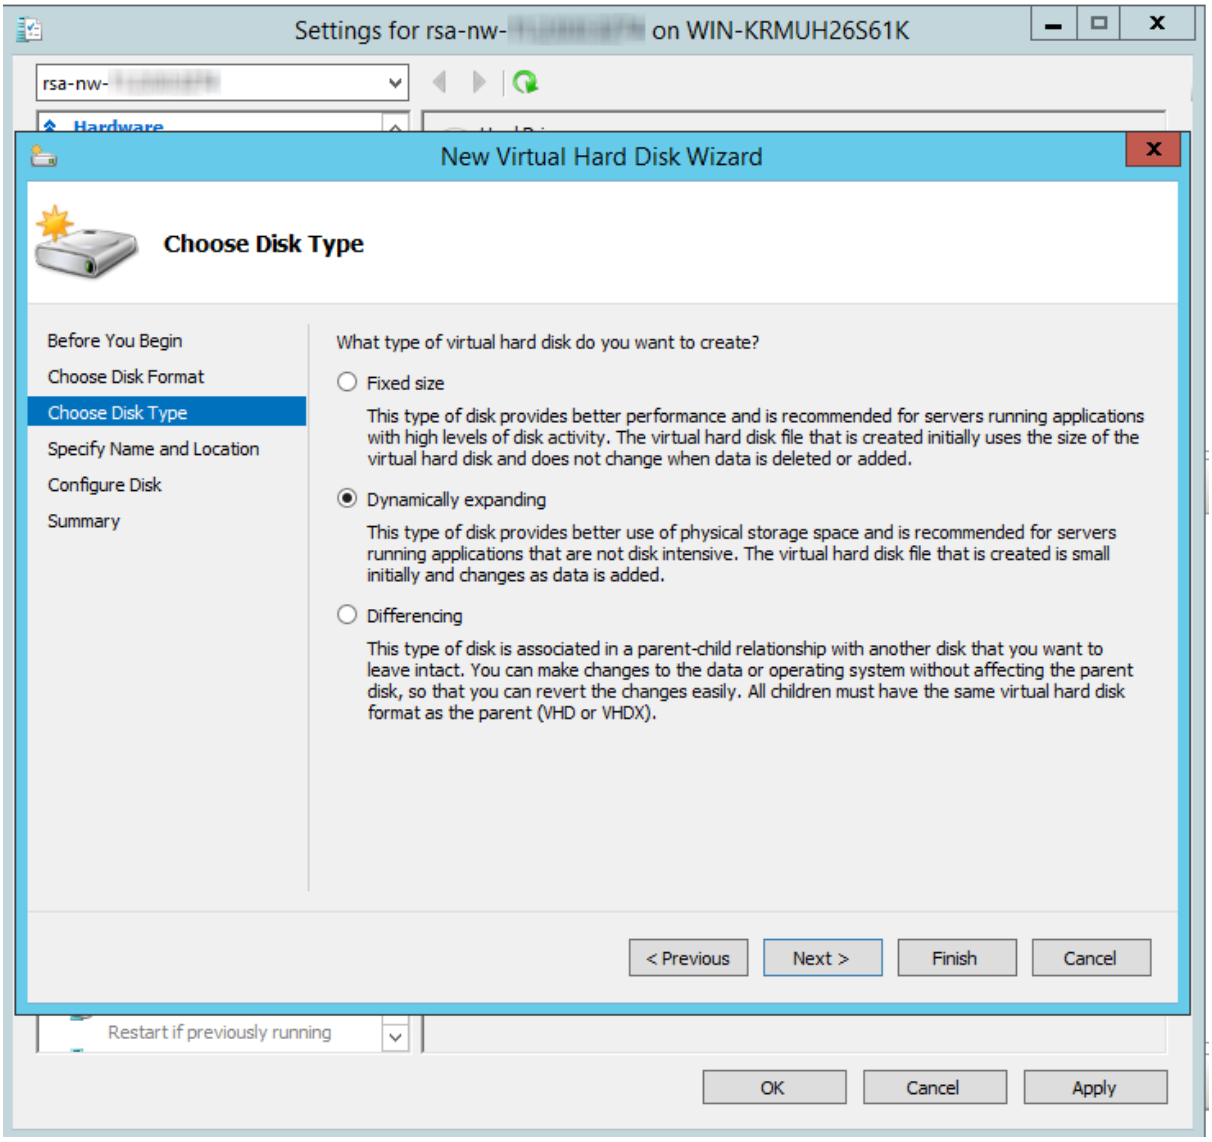
6. Confirm the settings.



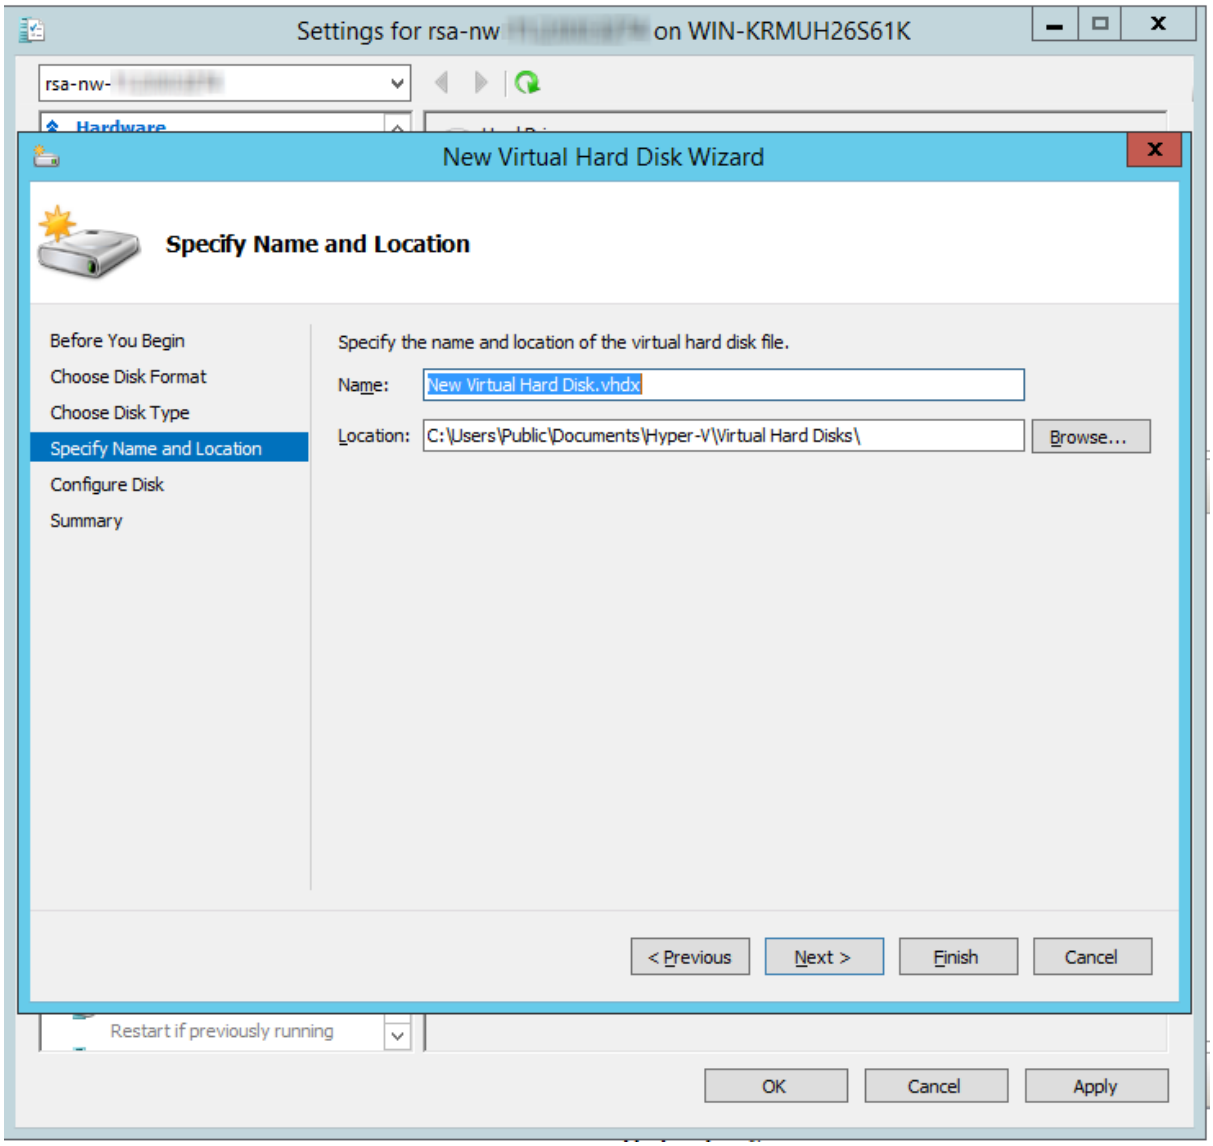
Add New Disk in Hyper-V



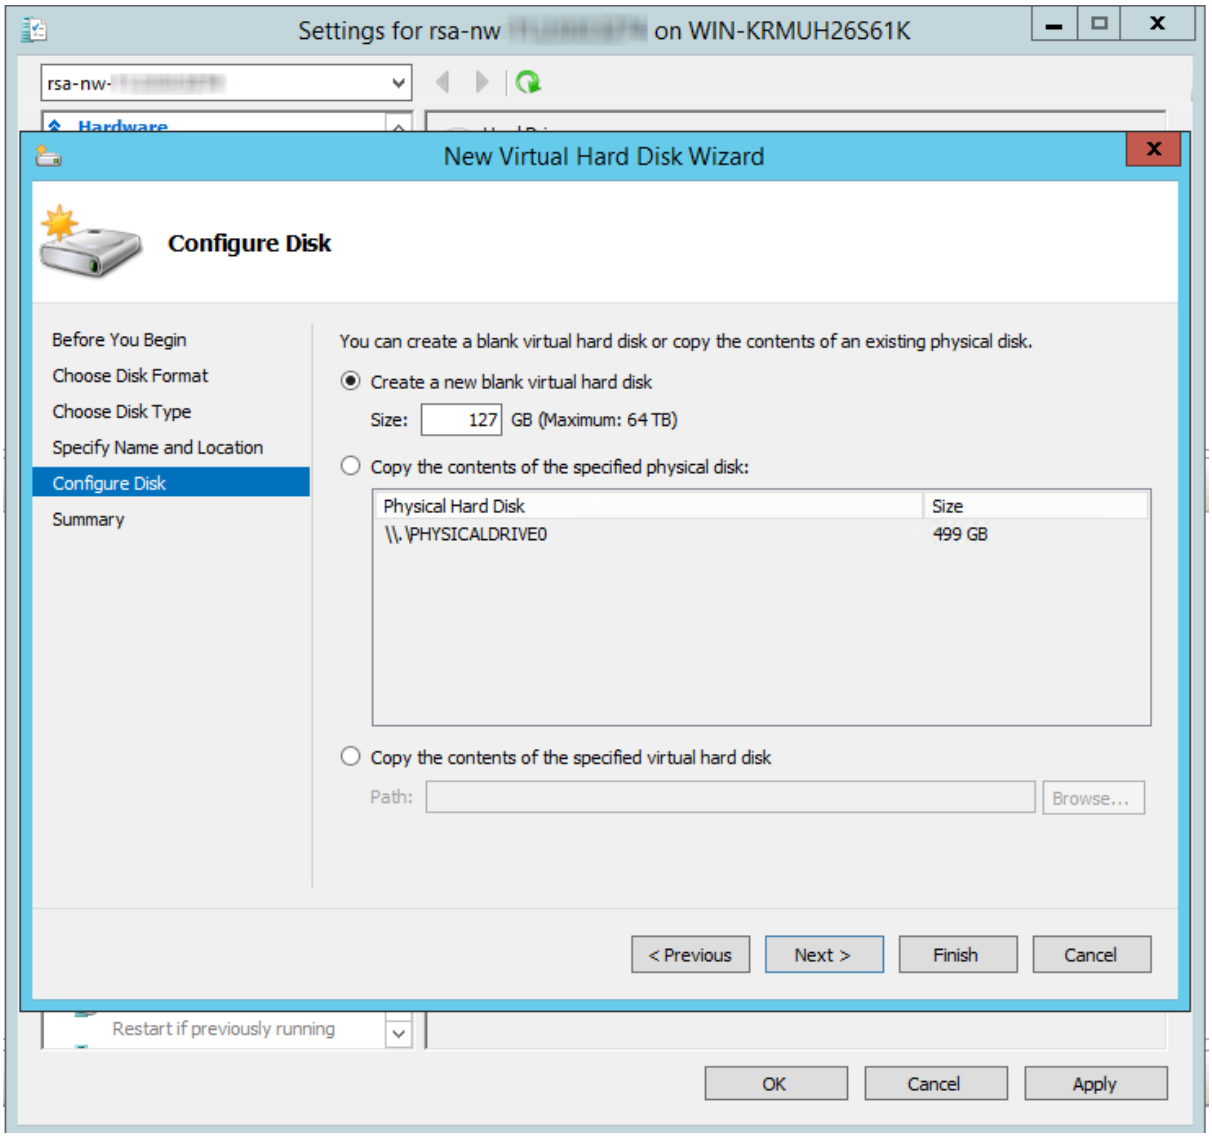
1. Shut down the VM and click **Settings and IDE Controller**, select the **Hard Drive** and click **Add**.



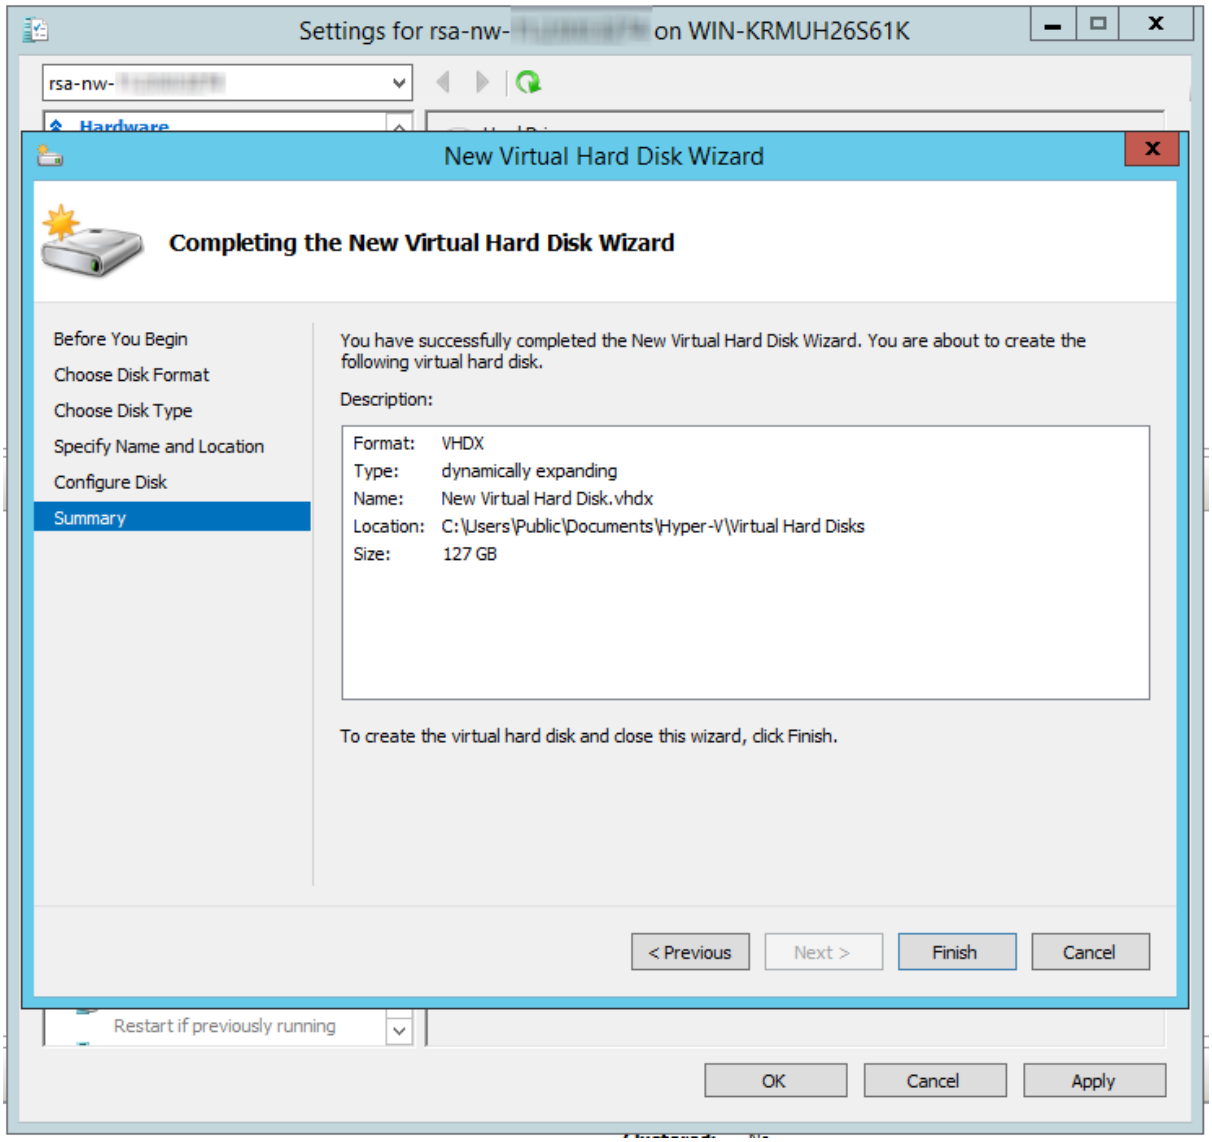
2. Select the New Virtual Hard disk.



3. Select **VHDX** as a disk format.



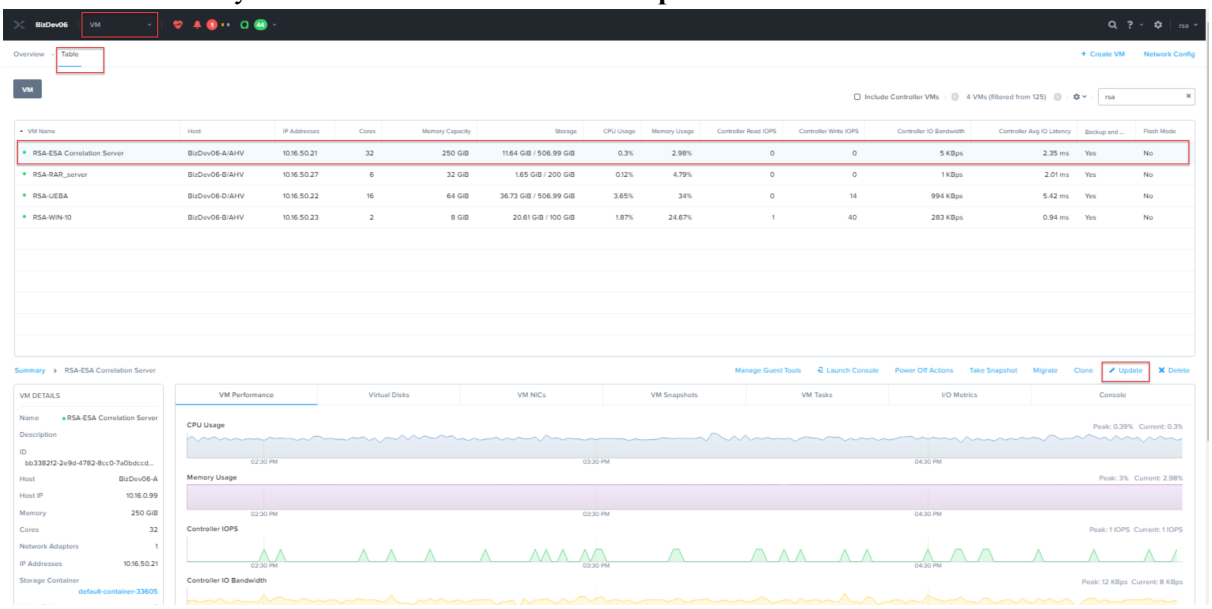
4. Select **Dynamically expanding** as a disk type.



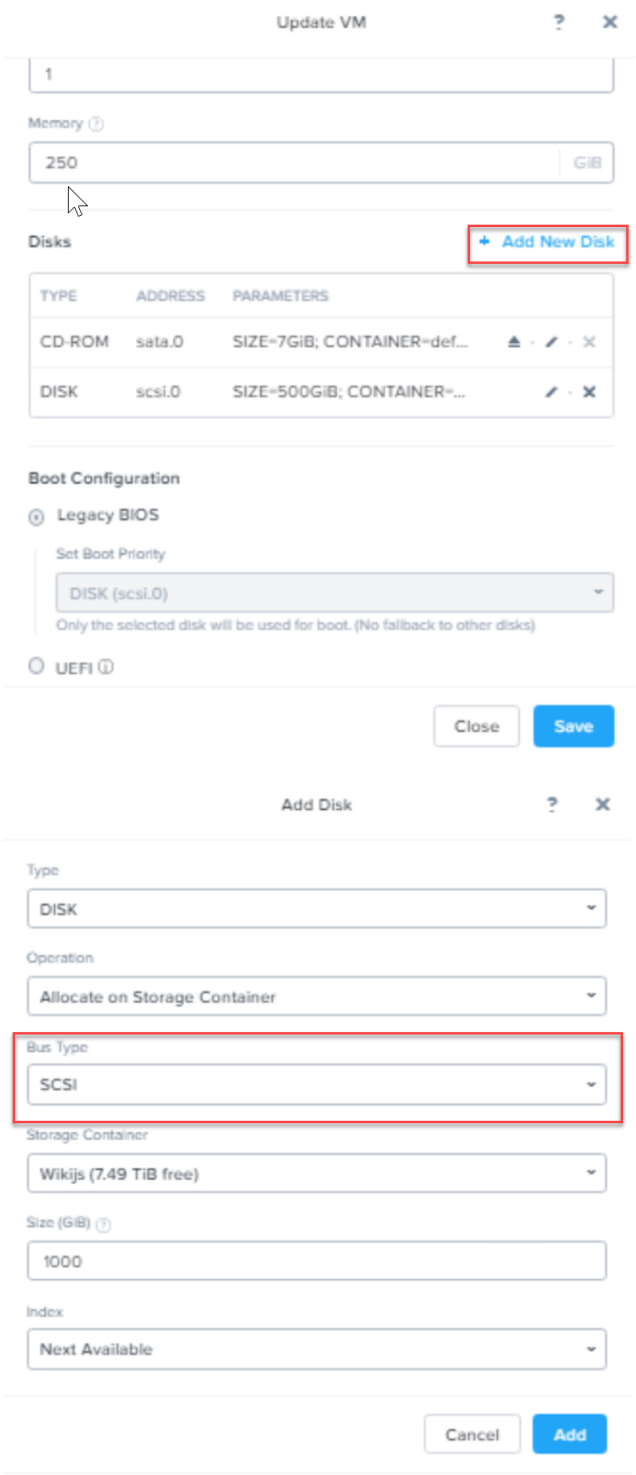
5. Specify the **Name** and **Location** of the virtual hard disk file.

6. Select **create a new blank virtual hard disk** and specify the size.

7. In the **Summary**, review the settings and click **Finish**.



Add New Disk in Nutanix AHV



Perform the following steps to add a new disk to your Nutanix AHV VM.

1. Log in to the Nutanix Prism GUI.
2. From the drop-down menu, click **VM** and select the **Table** view.

3. Select the VM that you want to add disk to and click **Update**.

4. In the **Update VM** dialog, scroll down to the **Disks** section and click **Add New Disk**.

5. In the **Add Disk** dialog, do the following:
   a. Select **DISK** in the **Type** field and specify other details based on your requirement.
   b. Select **Allocate on Storage Container** in the **Operations** field.

c. Select **SCSI** as **Bus Type**.

6. Click **Add**.
7. In the **Update VM** dialog, click **Save**.

Task 2. Add New Volume and Extend Existing File Systems

Following commands are commonly used for the file extension.

- `/dev/sdc` for extending `nw-home` or `/var/netwitness.`
- `/dev/sdd` for creating `/var/netwitness/xxxxxx`.
- `/dev/<>` for creating `/var/netwitness/xxxxxx/metadb`.
- `/dev/<>` for creating `/var/netwitness/xxxxx/sessiondb`.
- `/dev/sde` for creating `/var/netwitness/xxxxx/index`.

Note: The number of `/dev/<>` varies based on the retention days or the number of disks attached.

Admin Server

NetWitness recommended partition for AdminServer (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	2TB	SSD

Attach external disk for extension of `/var/netwitness/` (refer to the steps in attaching the disk) partition. Create an additional disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome .`

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

ESAPrimary/ESASecondary/Malware

NetWitness recommended partition for ESAPrimary/ESASecondary/Malware (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

Attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`.
6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Log Collector

NetWitness recommends the following partition for the LogCollector (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	500GB	HDD

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 500GB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 488G /dev/netwitness_vg00/nwhome`.
6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Log Decoder

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Log Decoder			
Persistent Datastores		Cache Datastore	
PacketDB	SessionDB	Meta DB	Index

100% as calculated by Sizing & Scoping Calculator	1 GB per 1000 EPS of traffic sustained provides 8 hours cache	20 GB per 1000 EPS of traffic sustained provides 8 hours cache	0.5 GB per 1000 EPS of traffic sustained provides 4 hours cache

Extending File Systems

Follow the below instructions to extend the file systems.

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome, attach other external disks for LogDecoder database partition. For extending `/var/netwitness` partition, follow these steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness/`

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Other partitions are also required. Create the following partitions on the logdecodersmall volume group.

Folder	LVM	Volume Group
`/var/netwitness/logdecoder`	`decoroot`	`logdecodersmall`
`/var/netwitness/logdecoder/index`	`index`	`logdecodersmall`
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
`/var/netwitness/logdecoder/sessiondb`	`sessiondb`	`logdecodersmall`

Follow these steps to create the partitions mentioned in the table above:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 logdecodersmall /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`.
5. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned.

The following partition should be on volume group LogDecoder.

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 logdecoder /dev/sde`.
4. `lvcreate -L <disk_size> -n packetdb logdecoder`.
5. `mkfs.xfs /dev/logdecoder/packetdb`.

NetWitness recommends below sizing partition for LogDecoder (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	10GB	HDD
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	30GB	HDD
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	3TB	HDD
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	370GB	HDD
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	18TB	HDD

Create each directory and mount the LVM on it in a serial manner, except /var/netwitness which will be already created.

Note: Create the folder `/var/netwitness/logdecoder` and mount on `/dev/logdecodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2
/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2
/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2
/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2
/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2
```

Concentrator

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Concentrator		
Persistent Datastores	Cache Datastores	
Meta DB	SessionDB Index	Index
Calculated as 10% of the PacketDB required for a 1:1 retention ratio	30 GB per 1TB of PacketDB for standard multi protocol network deployments as seen at typical internet gateways	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Log Concentrator		
Persistent Datastores	Cache Datastores	
Meta DB	SessionDB Index	Index
Calculated as 100% of the PacketDB required for a 1:1 retention ratio	3 GB per 1000 EPS of sustained traffic per day of retention	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Extending File Systems

Attach external disk for extension of `/var/netwitness/` partition, Create an external disk with suffix as `nwhome`, attach other external disks for Concentrator database partition.

For extending `/var/netwitness` partition follow below steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness/`.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk.
3. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

The following partitions are also required on volume group concentrator.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator
/var/netwitness/concentrator/sessiondb	sessiondb	concentrator
/var/netwitness/concentrator/metadb	metadb	concentrator

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 concentrator /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> concentrator`.
5. `mkfs.xfs /dev/concentrator/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned.

Below partition should be on volume group index.

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 index /dev/sde`.
4. `lvcreate -L <disk_size> -n index index`.
5. `mkfs.xfs /dev/index/index`.

NetWitness recommends below sizing partition for Concentrator (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/concentrator/root	/var/netwitness/concentrator	10GB	HDD
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	3TB	HDD
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	370GB	HDD
/dev/index/index	/var/netwitness/concentrator/index	2TB	HDD

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness` which will be already created.

Note: Create the folder `/var/netwitness/concentrator` and mount on `/dev/concentrator/root` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order.

```
/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2
/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2
/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2
/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2
```

Archiver

The following partition is required for the Archiver volume group.

Folder	LVM	Volume Group
`/var/netwitness/archiver`	`archiver`	`archiver`

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 archiver /dev/sde`.
4. `lvcreate -L <disk_size> -n archiver archiver`.
5. `mkfs.xfs /dev/archiver/archiver`.

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`, attach other external disks for Archiver database partition.

For extending `/var/netwitness` partition follow these steps:

Note: No other partition should reside on this volume, only to be used for /var/netwitness.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk.
3. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome.`

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

NetWitness recommends the following sizing partition for the Archiver (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/archiver/archiver	/var/netwitness/archiver	4TB	HDD

Create each directory and mount the LVM on it in a serial manner, except /var/netwitness which will be already created.

After that add the below entries in /etc/fstab in the same order.

```
/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2
```

Decoder

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Decoder			
Persistent Datastores		Cache Datstore	
PacketDB	SessionDB	Meta DB	Index
100% as calculated by Sizing & Scoping Calculator	6 GB per 100Mb/s of traffic sustained provides 4 hours cache	60 GB per 100Mb/s of traffic sustained provides 4 hours cache	3 GB per 100Mb/s of traffic sustained provides 4 hours cache

Extending File Systems

Attach an external disk for extension of /var/netwitness/ partition, create an external disk with suffix as nwhome, attach other external disks for decoder database partition. For extending /var/netwitness partition follow these steps:

Note: No other partition should reside on /var/netwitness/.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute lsblk and get the physical volume name, suppose if you had add attach one 2TB disk.
3. pvcreate /dev/sdc.
4. vgextend netwitness_vg00 /dev/sdc.
5. lvextend -L 1.9T /dev/netwitness_vg00/nwhome.

or,

lvextend -l +100%FREE /dev/netwitness_vg00/nwhome.

6. xfs_growfs /dev/mapper/netwitness_vg00-nwhome.

The following four partitions should be on the decodersmall volume group.

Folder	LVM	Volume Group
/var/netwitness/decoder	decoroot	decodersmall
/var/netwitness/decoder/index	index	decodersmall
/var/netwitness/decoder/metadb	metadb	decodersmall
/var/netwitness/decoder/sessiondb	sessiondb	decodersmall

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 decodersmall /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> decodersmall`.
5. `mkfs.xfs /dev/decodersmall/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned

The following partition should be on the decoder volume group.

Folder	LVM	Volume Group
/var/netwitness/decoder/packetdb	packetdb	decoder

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 decoder /dev/sde`.
4. `lvcreate -L <disk_size> -n packetdb decoder`.
5. `mkfs.xfs /dev/decoder/packetdb`.

NetWitness recommends the following sizing partition for the Decoder (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/decodersmall/decoroot	/var/netwitness/decoder	10GB	HDD
/dev/decodersmall/index	/var/netwitness/decoder/index	30GB	HDD
/dev/decodersmall/metadb	/var/netwitness/decoder/metadb	3TB	HDD
/dev/decodersmall/sessiondb	/var/netwitness/decoder/sessiondb	370GB	HDD
/dev/decoder/packetdb	/var/netwitness/decoder/packetdb	18TB	HDD

Create each directory and mount the LVM on it in serial manner, except /var/netwitness which will be already created.

Note: Create the folder `/var/netwitness/decoder` and mount on `/dev/decodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/decodersmall/decoroot /var/netwitness/decoder xfs noatime,nosuid 1
2
/dev/decodersmall/index /var/netwitness/decoder/index xfs
noatime,nosuid 1 2
/dev/decodersmall/metadb /var/netwitness/decoder/metadb xfs
noatime,nosuid 1 2
/dev/decodersmall/sessiondb /var/netwitness/decoder/sessiondb xfs
noatime,nosuid 1 2
/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs
noatime,nosuid 1 2
```

Endpoint Log Hybrid

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

EndPoint Log Decoder					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	120 GB	26GB	6Gb	NA	152GB
Concentrator	206GB	NA	6GB	4GB	216GB
MongoDB	NA	NA	NA	NA	13GB (12 GB tracking data, 1 GB scan data)

Note: The above Endpoint Log Hybrid sizing guidelines are for 20 K agents and 20 K events per day per agent with an event size of 1500 bytes.
The same sizing guidelines are applicable for scan data with 20 K sessions per day per agent except MongoDB as mentioned above.

Extending File Systems

For Endpoint Server, attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.

5. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

NetWitness recommended partition for Endpoint Server (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

For Mongo DB, attach external disk for extension of `/var/netwitness/mongo` partition, create an external disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.

2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.

3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc1`.

4. `vgextend hybrid /dev/sdc1`.

5. `lvextend -L 5.9T /dev/hybrid-vlmng`.

6. `xfs_growfs /dev/mapper/hybrid-vlmng`.

NetWitness recommended partition for Mongo DB (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/hybrid-vlmng`	`/var/netwitness/mongo`	6TB	HDD

For Log Decoder, Log Collector, and Concentrator see Log Decoder, Log Collector, and Concentrator.

UEBA

The following procedure attaches an external disk and extends the `/var/netwitness/` partition. You must use nwhome as the eternal disk suffix. This procedure illustrates how to add a 2TB disk.

Note: `/var/netwitness` is the only partition that can reside on this volume.

1. List the physical volume name.

`lsblk` (for example, `dev/mapper/sdc`).

2. Extend the `/var/netwitness/` partition.

```
pvcreate <pv_name>where pv_name is dev/mapper/sdc.
vgextend netwitness_vg00 /dev/mapper/sdc.
lvextend -L 1.9T /dev/mapper/netwitness_vg00/nwhome.
xfs_growfs /dev/mapper/netwitness_vg00-nwhome.
```

This partition is the NetWitness recommended partition for UEBA. You can change it based on retention days.

Task 3. Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

For more information on storage configurations using the REST API, see the "Configure Storage Using the REST API" topic in the *Storage Guide for NetWitness Platform*.

Step 3. Install NetWitness Platform

Complete the steps below to install NetWitness 12.1.

Note: Before installing the hosts make sure that the time on each host is synchronized with the time on the NetWitness Server.
To synchronize the time do one of the following:
- Configure the NTP Server. For more information, see"Configure NTP Servers" in the *System Configuration Guide*.
- Run the following commands on each hosts:
1. SSH to NW host.
2. Run the following commands.

```
systemctl stop ntpd
ntpdate nw-node-zero
systemctl start ndpd
```

This task installs:

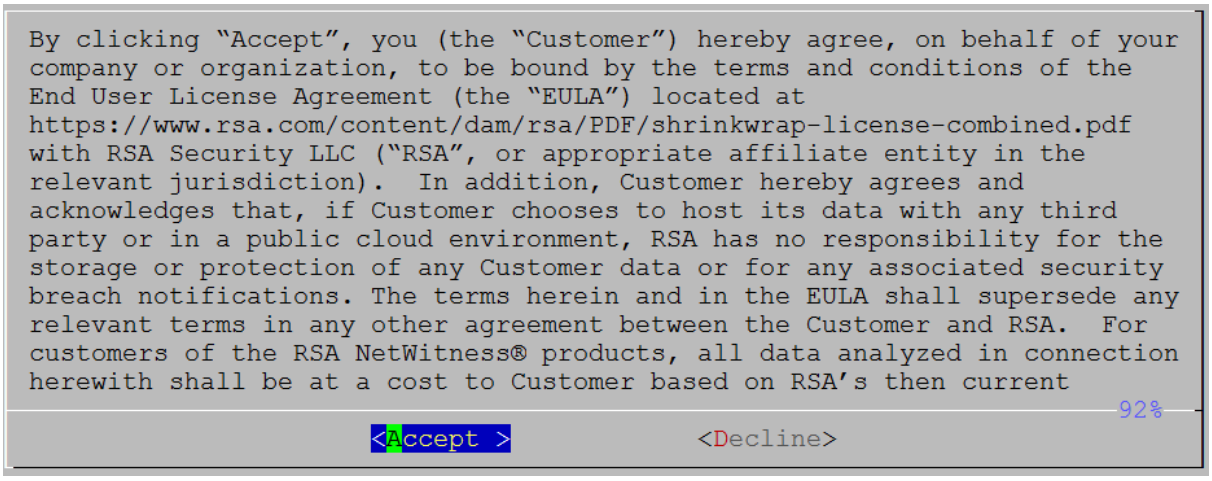
- The 12.1.0.0 NW Server environmental platform.
- The NW Server components (that is, Admin Server, Config Server, Orchestration Server, Integration Server, Broker, Investigate Server, Reporting Engine, Respond Server and Security server).
- A repository with the RPM files required to install the other functional components or services.

Prerequisites

Deploy your 12.1.0.0 environment:

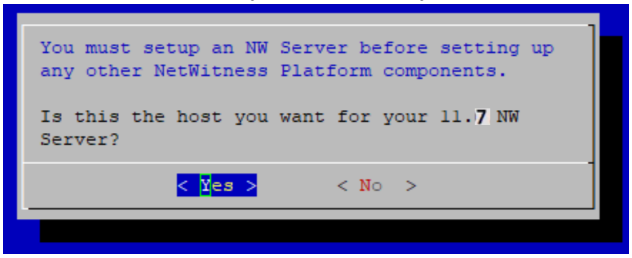
1. Add new VM.
2. Configure storage.
3. Set up firewalls.

Install NetWitness Platform



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

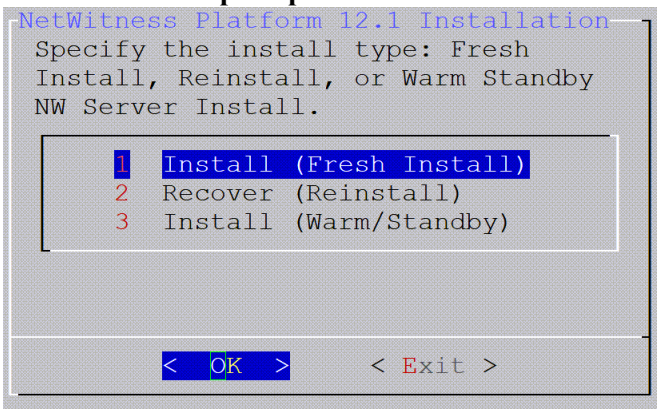
IMPORTANT: In NetWitness Platform version 11.6 or Later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.1 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.1 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

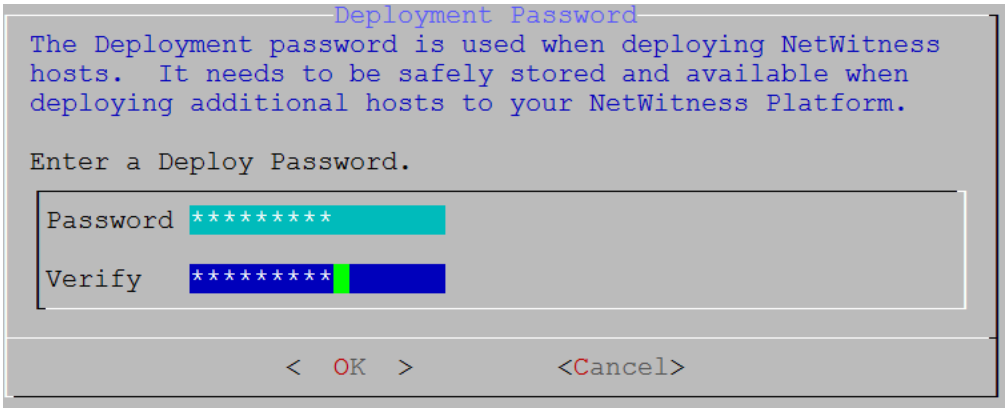
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

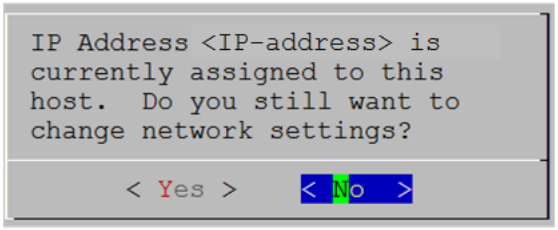


The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

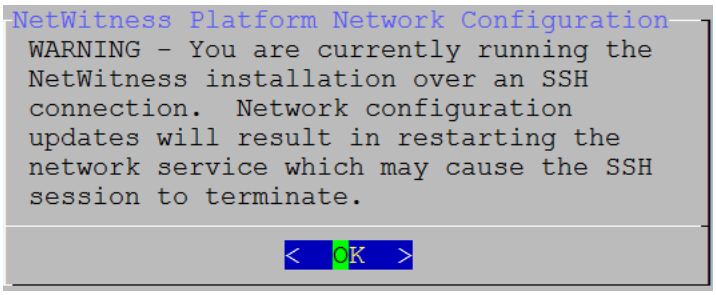
Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

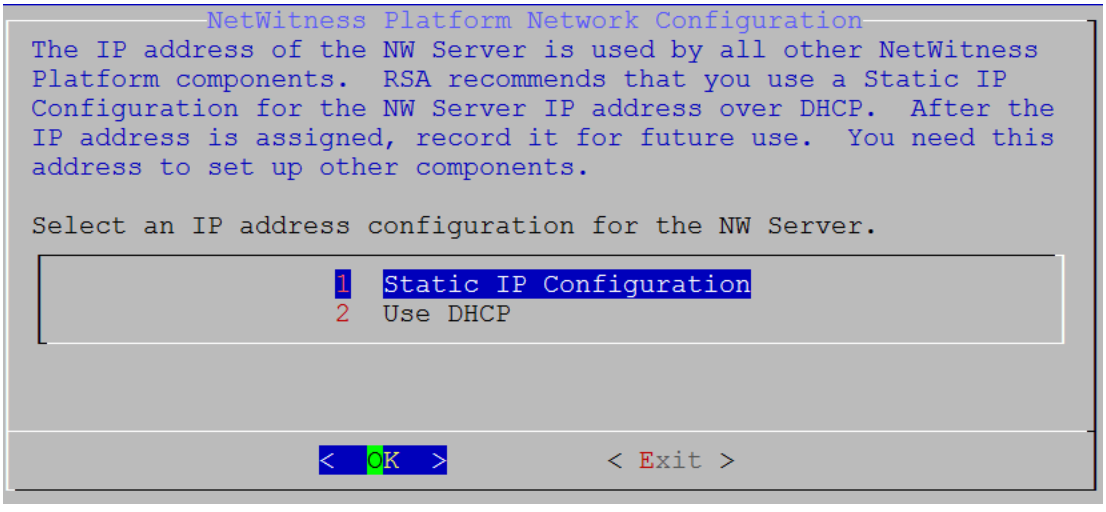
8. One of the following conditional prompts is displayed.



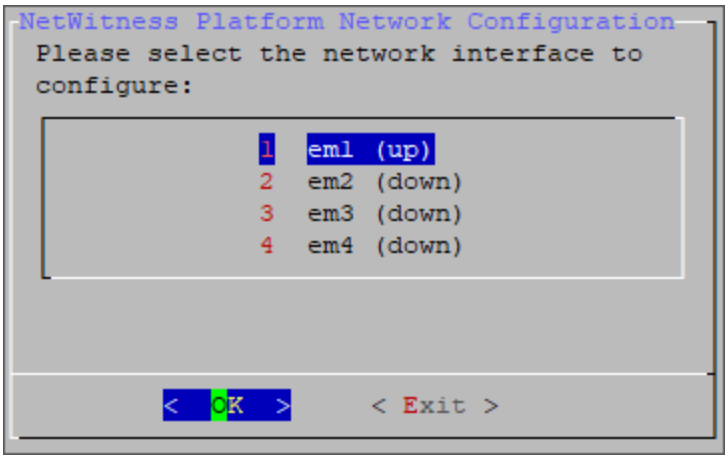
- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

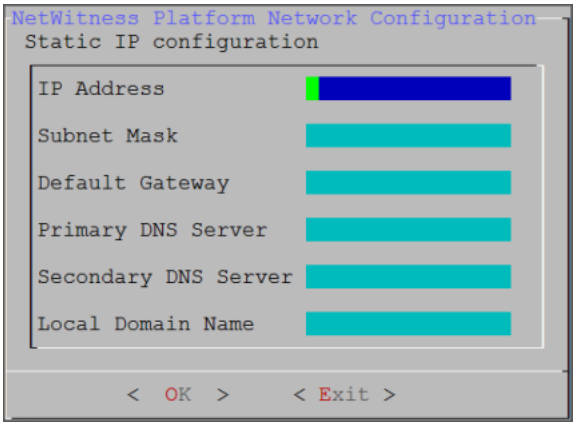


Note: If you connect directly from the host console, the following warning is not displayed.



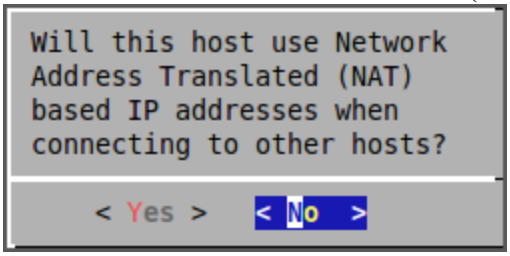
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
   The following **Static IP Configuration** prompt is displayed.

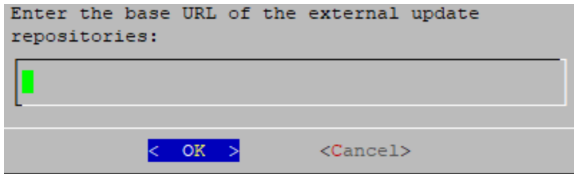
10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

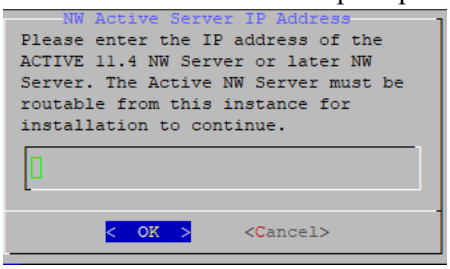
12. The **Update Repository** prompt is displayed.



For the NW Server:

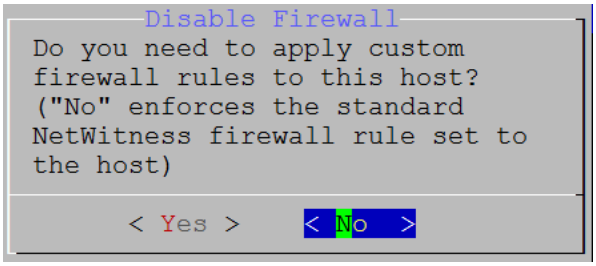
- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.1. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

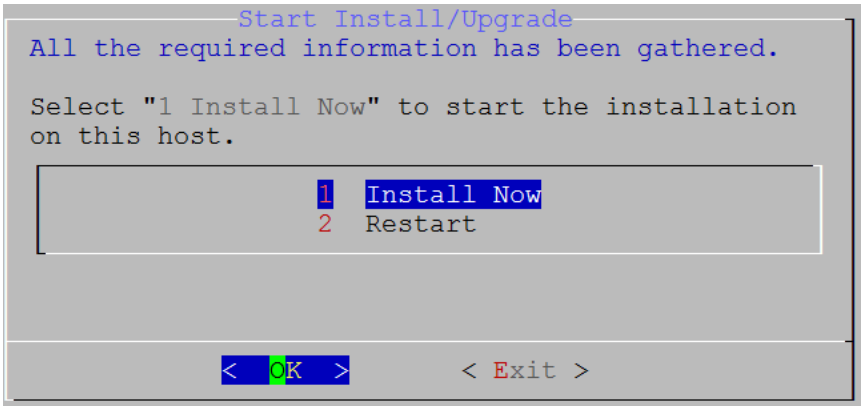
For component hosts:



- Select the same repo that you selected when you installed the NW Server host and follow the steps above.

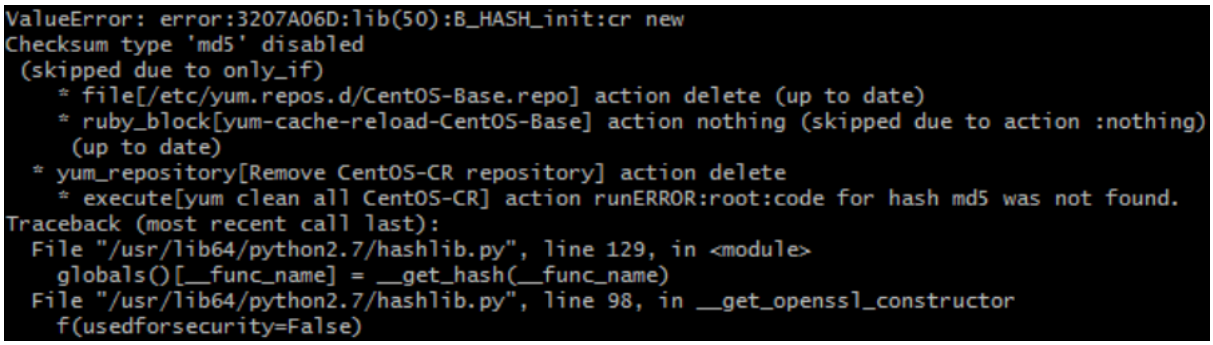
- The NW Server IP Address prompt is displayed.

  Type the NW Server IP address. Tab to **OK** and press **Enter**.



13. The Disable firewall prompt is displayed.

  Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
  To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
  If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.1.
  When **Installation complete** is displayed, you have installed 12.1 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.
    a. Log into NetWitness and go to (missing or bad snippet)> **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view and click .

The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.1* for instructions on how to set up a Warm Standby NW Server.

Step 4. Configure Host-Specific Parameters

Certain application-specific parameters are required to configure log ingest and packet capture in the Virtual Environment.

Configure Log Ingest in the Virtual Environment

Log ingest is easily accomplished by sending the logs to the IP address you have specified for the Decoder. The Decoder's management interface allows you to then select the proper interface to listen for traffic on if it has not already selected it by default.

Configure Packet Capture in the Virtual Environment

There are two options for capturing packets in a VMware environment. The first is setting your vSwitch in promiscuous mode and the second is to use a third-party Virtual Tap.

Set a vSwitch to Promiscuous Mode

The option of putting a switch whether virtual or physical into promiscuous mode, also described as a SPAN port (Cisco services) and port mirroring, is not without limitations. Whether virtual or physical, depending on the amount and type of traffic being copied, packet capture can easily lead to over subscription of the port, which equates to packet loss. Taps, being either physical or virtual, are designed and intended for loss less 100% capture of the intended traffic.

Promiscuous mode is disabled by default, and should not be turned on unless specifically required. Software running inside a virtual machine may be able to monitor any and all traffic moving across a vSwitch if it is allowed to enter promiscuous mode as well as causing packet loss due to over subscription of the port..

To configure a portgroup or virtual switch to allow promiscuous mode:

1. Log on to the ESXi/ESX host or vCenter Server using the vSphere Client.
2. Select the ESXi/ESX host in the inventory.

3. Select the **Configuration** tab.
4. In the **Hardware** section, click **Networking**.
5. Select **Properties** of the virtual switch for which you want to enable promiscuous mode.
6. Select the virtual switch or portgroup you want to modify, and click **Edit**.
7. Click the **Security** tab. In the **Promiscuous Mode** drop-down menu, select **Accept**.

Use of a Third-Party Virtual Tap

Installation methods of a virtual tap vary depending on the vendor. Please refer to the documentation from your vendor for installation instructions. Virtual taps are typically easy to integrate, and the user interface of the tap simplifies the selection and type of traffic to be copied.

Virtual taps encapsulate the captured traffic in a GRE tunnel. Depending on the type you choose, either of these scenarios may apply:

- An external host is required to terminate the tunnel, and the external host directs the traffic to the Decoder interface.
- The tunnel send traffic directly to the Decoder interface, where NetWitness handles the de-encapsulation of the traffic.

Step 5. Post Installation Tasks

This topic contains the tasks you complete after you install 12.1.

- Event Stream Analysis (ESA)
- NetWitness Endpoint
- NetWitness UEBA

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Event Stream Analysis (ESA)

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.7, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to (Admin) > **Services**, and in the Services view, select the ESA Correlation service and then select > **View** > **Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation** > **stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to **(Configure)** > **ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ( ).
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

NetWitness Endpoint

The tasks in this section only apply to customers that use the NetWitness Endpoint component of NetWitness Platform.

Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- **Single Endpoint Log Hybrid host** - Deploy NetWitness Server host, Endpoint Log Hybrid host, and ESA host or hosts.
- **Multiple Endpoint Log Hybrid hosts** - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker.

  Note: NetWitness recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

  Note: You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

Follow these steps to deploy an Endpoint Log Hybrid host.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform*

Configuring Multiple Endpoint Log Hybrids

Follow these steps to install another Endpoint Log Hybrid.

Step 1: Install additional Endpoint Log Hybrid

- To install a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 12.1*
- To install a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.0*

Step 2: Setup the Endpoint Log Hybrid

1. Create a directory

   `mkdir -p /etc/pki/nw/nwe-ca.`

2. Copy the following certificates from the first Endpoint Log Hybrid to the secondary Endpoint Log Hybrid:

`/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

`/etc/pki/nw/nwe-ca/nwerootca-key.pem`

Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

IMPORTANT: You must backup the `nwerootca-cert.pem` and `nwerootca-key.pem` certificate files after installing the first Endpoint Log Hybrid. This is an important pre-requisite for Endpoint recovery configuration. For more information, see **High Availability (Endpoint Recovery)** topic in the **NetWitness Endpoint User Guide for 12.3.1**.

Step 3: Switch to the NetWitness UI and add Hosts

- See Add Hosts to the Endpoint Log Hybrid: for more information.

Add Hosts to the Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

3. Select that host in the **Hosts** view (for example, **Endpoint**) and click 

.

   The Install Services dialog is displayed.

4. Select the **Endpoint Log Hybrid** category and click **Install**.
5. Make sure that the Endpoint Log Hybrid service is running.
6. Configure Endpoint Meta forwarding.

   See the *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.

7. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

8. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   Note: In 11.3 or later, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

9. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

   Note: You can migrate the Endpoint Agent from 4.4.0.x to 12.1. For more information, see the *NetWitness Endpoint 4.4.0.x to NetWitness Platform 12.1 Migration Guide*.

(Optional) Configure an Endpoint Service on an Existing Log Decoder Host

You can install an Endpoint service category on an existing Log Decoder host. For an overview of installing service categories on hosts, see "Hosts and Services Set Up Procedures" in the *Host and Services Getting Started Guide*. (missing or bad snippet)

- If you have an existing Endpoint Log Hybrid, you must copy certificates from that Endpoint Hybrid host to the Log Decoder before you install the Endpoint service category on the Log Decoder.
- If you do not have an Endpoint Log Hybrid host, you do not need to copy over the certificates before you install the Endpoint service category on the Log Decoder.

Do You Need to Install an Endpoint Service onto Separate Hardware

If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

Install an Endpoint Service Category on an Existing Log Decoder

To install an Endpoint service category on an existing Log Decoder if you have an existing Endpoint Log Hybrid:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the Log Decoder on which you are going to install the additional **Endpoint** service category.

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

3. Log into NetWitness Platform and click  **(Admin) > Hosts**.
4. Select the Log Decoder host in the **Hosts** view and click .

The Install Services dialog is displayed.

5. Select the **Endpoint** category and click **Install**.

To install an Endpoint service category on an existing Log Decoder if you do not have an existing Endpoint Log Hybrid:

1. Log into NetWitness Platform and click **(Admin) > Hosts**.
2. Select the Log Decoder host in the **Hosts** view and click Install.
   The Install Services dialog is displayed.
3. Select the **Endpoint** category and click **Install**.

NetWitness UEBA

The tasks in this section only apply to customers that use the UEBA component of NetWitness Platform.

Install UEBA

To set up NetWitness UEBA in NetWitness Platform 12.1, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform*.
   - A virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Log into NetWitness Platform and go to **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.
   The Install Services dialog is displayed.
5. Select the **UEBA** Host Type and click **Install**.
6. Make sure that the UEBA service is running.
7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.
   a. Define UEBA schemas:
   Choose schemas from the following list:

   AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

   Note: The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
   If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

   Note: The selected start date must contain events from all configured schemas.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.
   a. Log into NetWitness Platform.
   b. Go to (missing or bad snippet) **> Services**.
   c. Locate the data source service (Broker or Concentrator).
   Select that service, and select (Actions) > **View** > **Security**.
   d. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. Set the appropriate parallelism value:
   If the UEBA system runs on VM, update the airflow parallelism value to be 64 by running the following command:
   ```
   sed -i "s|parallelism = 256|parallelism = 64|g"
   /var/netwitness/presidio/airflow/airflow.cfg
   ```
5. Submit the following commands with the above parameters that you already defined.
   ```
   /opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -
   o <type> -t <startTime> -s <schemas> -v -e <argument>
   ```
   Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.

Argument	Variable	Description
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode.**
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Step 5. Post Installation Tasks.

6. If you are deploying a hot fix on 11.x.x.x version, you must do the following:
   a. Run the presidio-upgrade DAG.

b. Press the play sign next to the DAG and then click the trigger button.

7. Set the appropriate "Boot Jar Pools" slots:

- **Virtual Appliance**: If the UEBA system is running on VM and update the `spring_boot_jar_pool` and the `retention_spring_boot_jar_pool` slots values to 22.
  To update the “Spring Boot Jar Pools” slots, Go to the Airflow main page, tap the “Admin” tab at the top bar and tap “Pools”.

a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
   User: admin
   Password: The environment deploy admin password

b. Click on the pencil mark of the polls to update the slot values.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA 11.7, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

Deployment Options

NetWitness Platform has the following deployment options. See the *NetWitness Deployment Guide* for detailed instructions on how to deploy these options.

- **Analyst User Interface** - gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).
- **Group Aggregation** - configures multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.
- **New Health and Wellness Search** - New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.
- **Second Endpoint Server** - deploys a second Endpoint Server.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Event Stream Analysis

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Event Stream Analysis

For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

Appendix B. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Appendix C. Virtual Host Recommended System Requirements

The following tables list the vCPU, vRAM, and Read and Write IOPS recommended requirements for the virtual hosts based on the EPS or capture rate for each component.

- Storage allocation is covered in Step 3 “Configure Databases to Accommodate NetWitness”.
- vRAM and vCPU recommendations may vary depending on capture rates, configuration and content enabled.
- The recommendations were tested at ingest rates of up to 25,000 EPS for logs and two Gbps for packets, for non SSL.
- The vCPU specifications for all the components listed in the following tables are Intel Xeon CPU @2.59 Ghz.
- All ports are SSL tested at 15,000 EPS for logs and 1.5 Gbps for packets.

Note: The above recommended values might differ for 12.1.0.0 installation when you install and try the new features and enhancements.

IMPORTANT: The recommended configuration provided serves as a general reference and supports a standard deployment at the suggested data rates and specified architecture. However, the actual values may vary depending on the specific deployment and usage scenario.

Scenario One

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, and Archiver.
- The Packet Stream included a Network Decoder and Concentrator.
- Additional Packet Stream included a Network Hybrid with query load.
- The background load included hourly and daily reports.
- Charts were configured.

Note: Intel x86 64-bit chip architecture is 2.599 GHz or greater speed per core.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	6 cores	32 GB	50	75
5,000	8 cores	32 GB	100	100

EPS	CPU	Memory	Read IOPS	Write IOPS
7,500	10 cores	32 GB	150	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 cores	32 GB	50	150
100	4 cores	32 GB	50	250
250	4 cores	32 GB	50	350

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 cores	32 GB	300	1,800
5,000	4 cores	32 GB	400	2,350
7,500	6 cores	32 GB	500	4,500

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 cores	32 GB	50	1,350
100	4 cores	32 GB	100	1,700
250	4 cores	32 GB	150	2,100

Archiver

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 cores	32 GB	150	250
5,000	4 cores	32 GB	150	250
7,500	6 cores	32 GB	150	350

Event Stream Analysis

EPS	CPU	Memory	Read IOPS	Write IOPS
12000	8 cores	32 GB	40	40

Note: NetWitness recommends using Virtual Machine as a hybrid only for lower EPS rates. In case of high query load or high EPS, consider using Physical Appliance.

(For version 11.7.1 and Later) Log Hybrid

Rate (EPS)	vCPU	vRAM	Total IOPS	Read IOPS	Write IOPS
2500	10 Cores	48	2325	450 (Concentrator 400, Decoder 50)	1875 (Concentrator 1800, Decoder 75)
5000	12 Cores	64	3100	650 (Concentrator 500, Decoder 100)	2450 (Concentrator 2350, Decoder 100)

(For version 11.7.1 and Later) Network Hybrid

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	8 cores	48 GB	350 (Concentrator 300, Decoder 50)	1650 (Concentrator 1500, Decoder 150)

Mbps	CPU	Memory	Read IOPS	Write IOPS
100	8 cores	64 GB	550 (Concentrator 500, Decoder 50)	1950 (Concentrator 1700, Decoder 250)
250	8 cores	64 GB	850 (Concentrator 800, Decoder 50)	2450 (Concentrator 2100, Decoder 350)

Scenario Two

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, Warehouse Connector, and Archiver.
- The Packet Stream included a Network Decoder, Concentrator, and Warehouse Connector.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included reports, charts, alerts, investigation, and Respond.
- Alerts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	16 cores	50 GB	300	50
15,000	20 cores	60 GB	550	100

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	8 cores	40 GB	150	200
1,000	12 cores	50 GB	200	400
1,500	16 cores	75 GB	200	500

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	10 cores	50 GB	1,550 + 50	6,500
15,000	12 cores	60 GB	1,200 + 400	7,600

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	12 cores	50 GB	250	4,600
1,000	16 cores	50 GB	550	5,500
1,500	24 cores	75 GB	1,050	6,500

Warehouse Connector - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	8 cores	30 GB	50	50
15,000	10 cores	35 GB	50	50

Warehouse Connector - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	6 cores	32 GB	50	50
1,000	6 cores	32 GB	50	50
1,500	8 cores	40 GB	50	50

Archiver - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	12 cores	40 GB	1,300	700
15,000	14 cores	45 GB	1,200	900

ESA Correlation service with Context Hub

EPS	CPU	Memory	Read IOPS	Write IOPS
90,000	32 cores	250 GB	50	50

New Health and Wellness

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of Health and Wellness Metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

NetWitness Server and Co-Located Components

The NetWitness Server, Jetty, Broker, Respond, and Reporting Engine are in the same location.

CPU	Memory	Read IOPS	Write IOPS
12 cores	64 GB	100	350

Analyst UI

The NetWitness UI and the Broker, Investigate, Respond, and Reporting Engine services are in the same location.

CPU	Memory	Read IOPS	Write IOPS
8 cores	32 GB	100	350

Scenario Three

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder and Concentrator.
- The Packet stream included a Network Decoder and the Concentrator.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	32 cores	75 GB	1050	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	16 cores	75 GB	300	650

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	16 cores	75 GB	1,200 + 400	9,200

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	24 cores	75 GB	1250	7,050

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 cores	8 GB	50	50
30,000	8 cores	15 GB	100	100

Scenario Four

The requirements in these tables were calculated under the following conditions for Endpoint Log Hybrid.

- All the components were integrated.
- Endpoint Server is installed.
- The Log stream included a Log Decoder and Concentrator.

Endpoint Log Hybrid

The values provided below are qualified for NetWitness 12.3 for a dedicated Endpoint Log Hybrid with no other log sources configured.

Agents	CPU	Memory
<= 5K	16 core	32 GB

Agents	CPU	Memory
> 5K <= 10K	16 core	64 GB

Agents	CPU	Memory
> 10K <= 15K	32 core	96 GB

Considering the event size as 1KB, the rate of events per day per advanced agent is found to be 38K for the following test configurations.

- OPSWAT and YARA scan (with tracking events) on auto download of all the files < 1 MB.
- Auto scan on any new host.

If you have more than 15K agents in your virtual deployment, NetWitness recommends you to do one of the following:

- Scale resources such as CPU and RAM.
- Install a physical host (Series 6 Endpoint Log Hybrid).

For details on disk usage and storage, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform 12.3*.

Endpoint Broker

Agents	CPU	RAM
50000	4 cores	16 GB

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 cores	8 GB	50	50
30,000	8 cores	15 GB	100	100

Legacy Windows Collectors Sizing Guidelines

Refer to the *Legacy Windows Collection Update & Installation* for sizing guidelines for the Legacy Windows Collector.

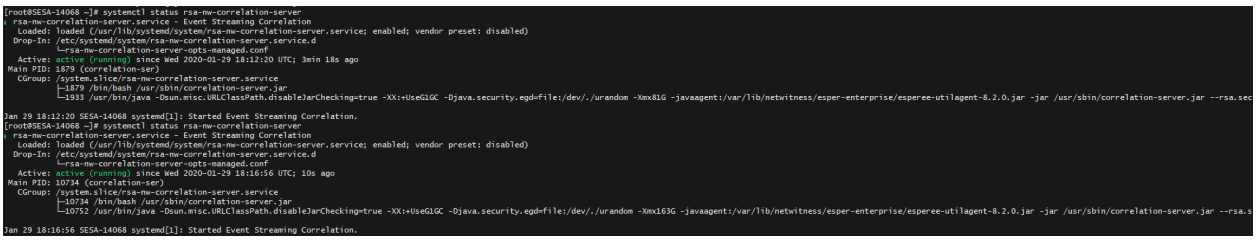
UEBA

CPU	Memory	Read IOPS	Write IOPS
16 cores	64 GB	500MB	500MB

Note: NetWitness recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends that you deploy UEBA on the physical host described under "NetWitness UEBA Host Hardware Specifications" in the Physical Host Installation Guide. Contact Customer Support for advice on choosing which host, virtual or physical, to use for UEBA.

Appendix D. Update the Virtual ESA Host Memory

ESA current memory is allocated to 65% of the available memory on the host. (For example, with 128 GB available memory, ESA memory will be 81 GB.)



To Update the Memory of the Virtual ESA Host:

1. Power down the virtual machine host and update the virtual host memory from x GB to y GB. (Example: x = 128 GB and y = 256 GB).
2. Power on the virtual machine host.
3. Log in to NetWitness Platform and go to  **(Admin) > Hosts**.
4. Select the ESA host where the memory is updated and click .
   The Install Services dialog is displayed.
5. Select ESA Primary or ESA Secondary on the host, depending on the ESA host category, and click **Install**.
   After the installation completes, the memory settings update automatically.

To Check ESA Memory:

On your ESA host, run the following command:

```
systemctl status rsa-nw-correlation-server
```

What Is NetWitness® Investigate?

NetWitness audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata. NetWitness Investigate provides the data analysis capabilities in NetWitness, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

About This Guide

This guide provides end-to-end guidelines for all members of the SOC team to configure NetWitness Investigate and to investigate log and network events. End-to-end guidelines for investigating endpoints and user entity behavior using NetWitness Investigate are provided in separate documents:

- *NetWitness Endpoint Quick Start Guide*
- *NetWitness UEBA Quick Start Guide*

Getting Help with NetWitness Platform

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

The following tasks can be performed in any sequence and are for the entire SOC team.

Description	References
	
View information about product updates, improvements, and known issues	*Release Notes*
Understand how NetWitness Investigate works	"How NetWitness Investigate Works" in the *NetWitness Investigate User Guide*

Setup, Installation, or Upgrade

No special setup, installation, or upgrade tasks are required for Investigate; it is part of NetWitness Platform for Logs and Network. However, setup is required for several components with which NetWitness Investigate works if you plan to do this type of analysis. These tasks are for the Administrator, and the SOC Manager may want to understand the setup.

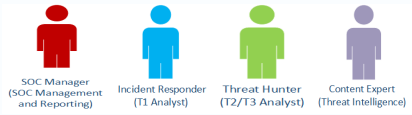
Description	References
	
Install and set up the Malware Analysis (standalone or service)	Malware Analysis Configuration Guide
Install and set up NetWitness Endpoint (standalone or service)	NetWitness Endpoint Quick Start Guide
Install and set up NetWitness UEBA (standalone or service)	NetWitness UEBA Quick Start Guide

System-Level Configuration

Administrators configure system-level preferences for NetWitness Investigate.The below-mentioned tasks are for the administrator, and the tasks can be performed in any sequence. SOC Managers should understand the possible configuration options.

Description	References
	
Configure role-based access control (RBAC) for analysts who will be using Investigate. These components have permissions related to investigate: investigate (Navigate view and Legacy Events view), investigate-server (Events view), Malware (Malware Analysis view), Endpoint-broker-server, and Endpoint-server.	"Role Permissions" in the System Security and User Management Guide
Configure Investigate to limit content available for different user roles (preQueries).	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide
Configure default settings and limits for NetWitness Investigate on a system level.	"Configure Investigation Settings" in the System Configuration Guide

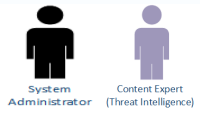
User Preference Configuration



The following tasks are for Threat Hunters, Content Experts, and Incident Responders, and SOC Managers. The tasks can be performed in any sequence.

Description	References
	
Configure Navigate view and Events view preferences.	"Configure the Navigate and Legacy Events View" in the *NetWitness Investigate User Guide*
Configure Event Analysis view preferences.	"Configure the Events View" in the *NetWitness Investigate User Guide*
Configure the Malware Analysis view preferences.	"Configure Malware Analysis" in the *Malware Analysis User Guide*

Investigation



Different types of investigation may be handled by analysts with different skill levels and goals.

- Incident Responders (T1 Analysts) typically pivot to Investigate from NetWitness Respond to find detailed information about an incident so that they can respond to and remediate incidents.
- Threat Hunters (T2/T3 Analysts) typically peruse events, metadata, and raw content so that they can recommend issues for remediation and remediate issues.
- Content Experts (Threat Intelligence) typically peruse events, metadata, raw content, user and host data, and UEBA data so that they can investigate new threat intelligence, evaluate and create new feeds, and create correlation rules to flag indicators of compromise.
- SOC Managers need to understand the use cases.

Description	References
	
Learn about practical use cases	"Sample Use Cases for NetWitness Investigate" in the *NetWitness Investigate User Guide*
Investigate metadata and raw events in logs and network traffic	"Beginning an Investigation" in the *NetWitness Investigate User Guide*
Investigate possible malware	Malware Analysis User Guide
Investigate endpoints	NetWitness Endpoint User Guide
Perform user and entity behavior analysis	NetWitness UEBA User Guide

Maintenance

The administrator can perform the following tasks in any sequence.

Description	References
	
Maintain the list of queries and analyze the query patterns of other users of the NetWitness Platform system.	"Maintaining Queries Using URL Integration" in the System Maintenance Guide

Description	References
Fine tune system-level configuration settings to improve performance or limit access to data.	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide "Configure Investigation Settings" in the System Configuration Guide

How NetWitness Investigate Works

NetWitness Investigate provides analysts the means to analyze events that have been captured by NetWitness. Using Investigate, analysts can examine packet, log, and endpoint data, and identify possible internal or external threats in their environment. There are several different views available to analysts to gain different perspectives into the data in their environment. A key element that all the views have in common is metadata.

Metadata, Meta Keys, Meta Values, and Meta Entities

NetWitness audits and monitors all data communications in an environment. One type of service--a Decoder--ingests, parses, and stores the original packets captured on the network, logs forwarded by a device, and endpoint events seen by the endpoint agent. The configured rules, parsers, and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs, packets, and endpoint data. Another type of service, called a Concentrator, indexes and stores the metadata, making it more efficient to search through all types of metadata.

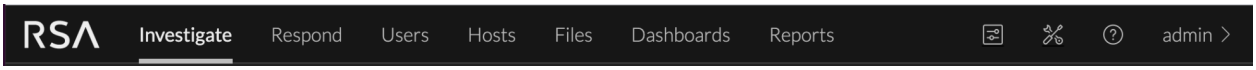
The metadata is created to give analysts valuable points of reference associated with the original data. This allows analysts to quickly get a sense of what has transpired without being required to examine every detail of an event. The metadata is in the form of a *meta key* and *meta values* for the key. For example, `ip.src` is a meta key, and an IP address (192.168.1.1) that is the source of the traffic is a meta value tagged as `ip.src`. When you view data in Investigate, you see the meta key `ip.src` and all of the IP addresses (meta values) that are tagged with that key. Some meta keys are built-in and others may be custom keys specific to your environment and defined by the administrator. All metadata, no matter the source of the data, is normalized into the Unified Data Model for NetWitness Platform to keep similar metadata concepts grouped together into like meta keys (see https://community.netwitness.com/t5/netwitness-platform-unified-data/tkb-p/netwitness-udm).

Meta entities are available in Version 11.1 and later. A *meta entity* is an alias that groups together the results from other meta keys. Meta entities organize similar meta keys into a single, easier to use, meta type. For example, the default Core database language includes distinct meta keys for IP source and IP destination. One of the built-in meta entities named `ip.all` represents the combined set of all IP sources and destinations. Some meta entities are already included by default, and the administrator can create custom meta entities. Analysts can use a meta entity in a query, a meta group, a column group, and a query profile. Parallel coordinates visualizations do not support meta entities. Administrators can use meta entities to define a query prefix to apply to a user role and a user as described in the *System Security and User Management Guide*. The *Decoder Configuration Guide* provides additional information about creating meta entities and how they can be used in rules.

Note: Meta entities need to be configured on all upstream Concentrators. If any Concentrator does not have a meta entity configured, that meta entity will be empty when you query the Broker.

Analysts usually query the Broker or Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder for raw logs or endpoint events or a full reconstruction of network events. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information about the event without having to query each Decoder. In some special cases, analysts may query a Decoder.

Triggers for an Investigation



These are a few examples of triggers for an investigation:

- You receive intelligence about a new active directory hack. Starting in the Events view, you use that intelligence to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its popularity. Starting in the Navigate view, you craft a query to look for an HTTP session using a specific user agent related to the malware that your SOC manager found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host. Starting in the Hosts view, you examine that host to find specific details.
- You are looking for the next zero day attack and start drilling into the network metadata in the Navigate view (or the Filter Events panel in the Events view) to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee who was just let go. Starting in the Users view you can filter for that username to make sure there is no longer any activity for that user and see if that user deviated from their typical behavior prior to being let go.
- A phishing attack detected has an associated attachment, and you want to know what devices in your environment have seen that file by searching for the file hash in the Files view.
- A malicious file has been automatically found in your environment, and you want to review the static and dynamic analysis done on that file along with how many systems it has been transmitted to or from. Starting in Investigate > Malware Analysis you can see the analysis results.

Workflow of an Investigation

Analysts can investigate data captured by NetWitness, and deep dive from information on a NetWitness dashboard, the Springboard (Version 11.5 and later), a NetWitness Respond incident or alert, a report created by the NetWitness Reporting Engine, or a third-party application. During the course of an investigation, analysts can move seamlessly between views: the Navigate view, the Events view, the Legacy Events view, the Hosts view, the Files view, the Users (Entities) view, and the Malware Analysis view. By default, the Navigate view and the Legacy Events view are disabled.

This figure illustrates the Version 11.5 menu, which is optimized for the analyst workflow with Users, Hosts, and Files moved to the top-level menu.

This figure illustrates the Version 12.0 menu, which is optimized with new NetWitness logo.

This figure illustrates the Version 12.1 menu, which is optimized with new NetWitness logo and renamed our product as NetWitness Platform XDR.

This figure illustrates the Version 12.3.1 menu, NetWitness has shortened the product name to NetWitness Platform.

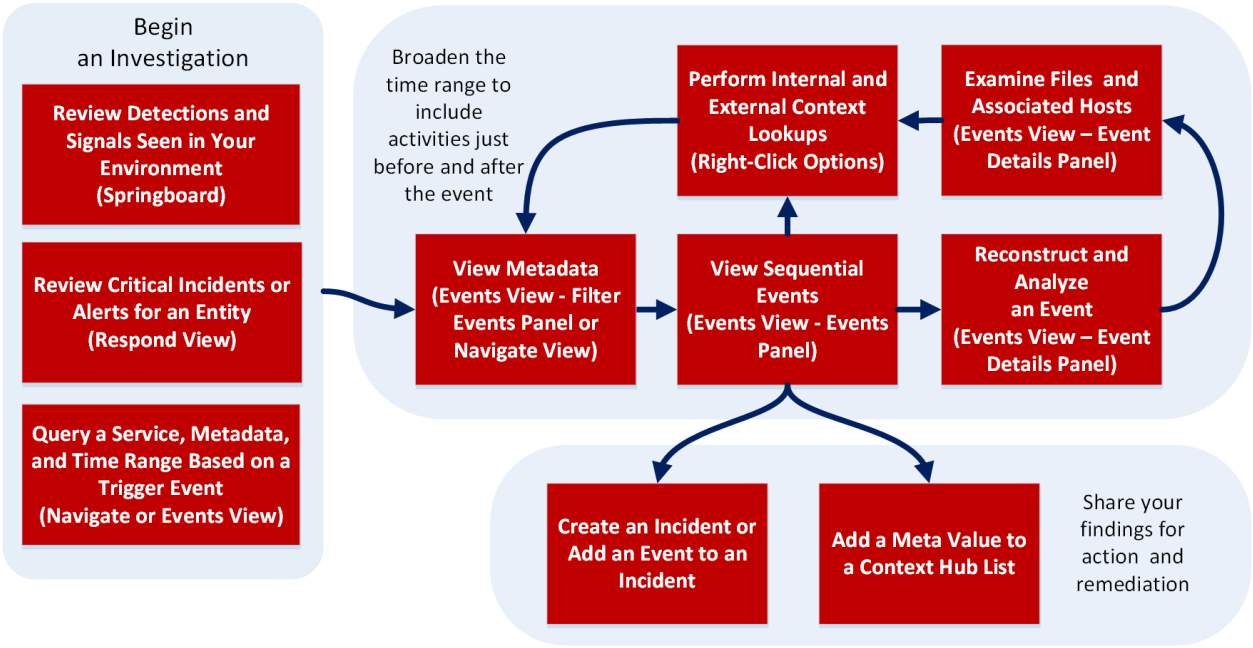
Note:
- The Files and Hosts views are available in Version 11.1 and later. Before Version 11.5, they were a submenu of Investigate.
- The Users view is available in Version 11.2 and later; in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.

The views are closely integrated to reduce the need to jump from one view to another. Each use case determines the starting point for your investigation; every situation is unique in terms of the types of information you are attempting to find. Many investigations start in one view, and end in a different view as you learn something and then need to follow that result to a different line of questioning. Experienced analysts frequently begin an investigation in the Navigate view or the Events view. Less experienced analysts can begin in the Dashboard, Respond view, or the Springboard (Version 11.5 and later), in which clickable incidents and alerts link to detailed information and analyses in the different views.

Go to...	Focus
Navigate view	The Navigate view (Version 11.5 and earlier) works well for providing a high-level vantage point of what has been seen in your environment for a specific time range by showing meta keys and meta values for log, endpoint, and network events. After drilling into meta values, go to the Events view to see the raw event (See Filter Results in the Navigate View.)

Go to...	Focus
Events view	The Events view (default Investigate view) is the workflow for analysts interacting with events, presenting different facets of the same data in adjacent panels. In Version 11.6, there is no need to go to the Navigate view to drill into meta values as the Filter Events Panel in the Events view provides this functionality. (See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.)

Go to...	Focus
Legacy Events view	The Legacy Events view was the original workflow for looking at event details in Version 11.0 to 11.3.x.x. The Legacy Events is replaced by the 11.4 and later Events view and it is hidden unless the administrator enables it. (See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.)



Go to...	Focus
Hosts view	The Hosts view option was moved to the main menu in Version 11.5. Hosts on which the NetWitness Endpoint agents are running are listed. For every host, you can view processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See the *NetWitness Endpoint User Guide*.)
Files view	The Files view option was moved to the main menu in Version 11.5. Unique files in your deployment, such as PE, Macho, and ELF, are listed. For each file, you can view details such as file name, reputation status, file status, risk score, signature, checksum, and others. (See the *NetWitness Endpoint User Guide*.)

Go to...	Focus
Malware Analysis view	If you are running a Malware Analysis appliance, you can scan files and see results of four types of analysis: network, static, community, and sandbox. If a file is malware, you can go to the Hosts view to see which hosts downloaded the file. (See the *Malware Analysis User Guide*.)

Go to...	Focus
Users view	The Users view (labeled as the Entities view in Version 11.4) was moved to the main menu in Version 11.5. It provides visibility into risky user behaviors across your enterprise using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior, and a timeline during which the behaviors occurred. NetWitness Platform users assigned the Administrators or UEBA Analysts role have access to this view. (See the *NetWitness UEBA User Guide*.)

Focus on Metadata, Query, and Time

The following figure depicts the workflow for an investigation with focus on metadata, a query, and time range.

Analysts use Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. Beginning in the Navigate view, Events view, or Legacy Events view:

1. Start by executing a query on a service for a specific time range, filter results to get a subset of events, reconstruct or analyze an event, and repeat the process to reconstruct or analyze another event. Built-in query profiles, meta groups, and column groups provide a good starting point. For example, you can choose the RSA Email Analysis query profile to see only metadata that is useful when investigating email risks.
2. When an event bears a closer look, view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you can run another query to gain further insight, which starts again at the beginning of the workflow.
3. If you notice suspicious activity or files on a specific host in the network, gather additional information about the host and files found on the host in the Hosts and Files view, or in a standalone NetWitness Endpoint server.
4. If you find a file or event that potentially contains malware, do a Malware Analysis scan of the file or open Malware Analysis and start a scan of the service on which the event was seen.

Here is one simple use case: If there is a concern regarding suspicious traffic with certain countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses. When suspect IP addresses are identified, looking at the addresses in the Navigate view or Events view with a broader time range can provide clues about what happened before and after the event being investigated.

Another use case is to investigate an alert to discover a malicious insider in the network who is exfiltrating intellectual property or other sensitive data from a specific IP address. The investigation begins with this meta value: `Upload without change request followed by download alert`. Start in the Navigate view or Events view by filtering the values to the IP address during the time range in which the alert was generated. Alerts metadata shows risk indicators as meta values, and you can click on different meta values to filter the events list and then reconstruct the event. Next extract files and examine the files to understand what happened. With this information, you can filter on the same IP address and broaden the time range to see activities before and after the event.

Focus on Respond View Incidents and Alerts

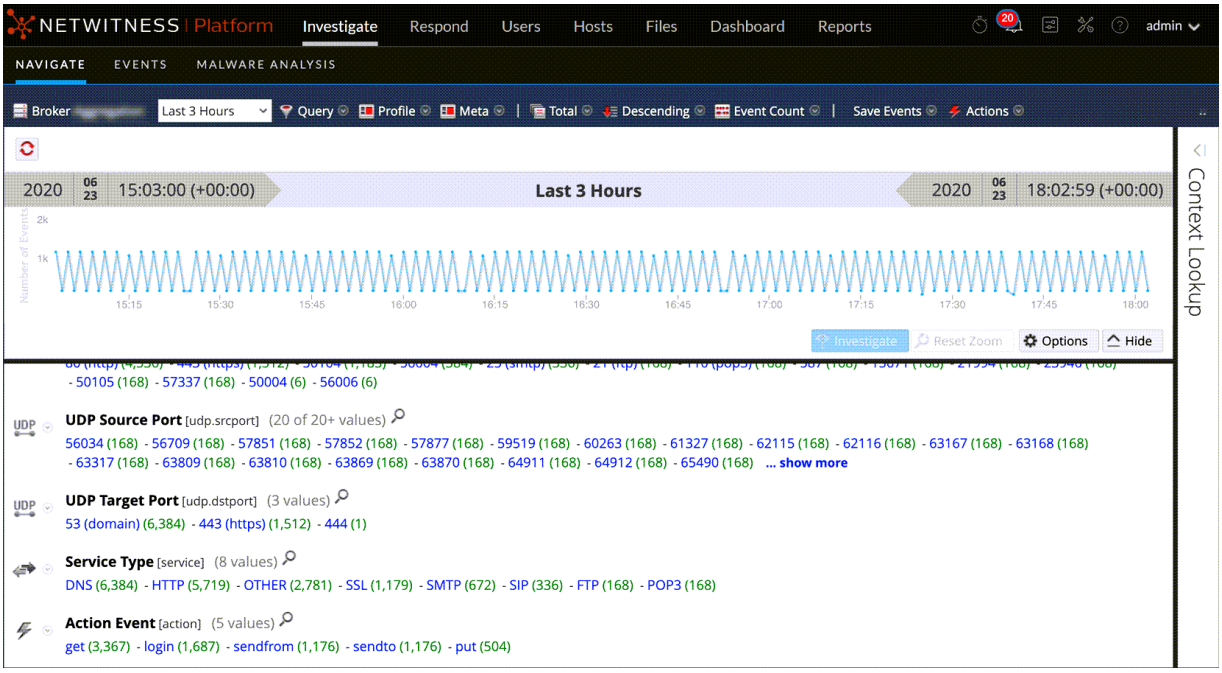
An analyst who is working on an incident or an alert in Respond can open the incident in Investigate to do a deeper analysis of the event or alert.

- The workflow to respond to an incident typically begins in the Respond view, where the analyst who is investigating an incident needs to gather intelligence about the incident in Investigate. Hover over an underlined entity in an incident or alert, such as an IP address, and select the action **Pivot to Investigate**. The Events view opens and is filtered for the selected entity. Defined meta keys are queried and the captured packets, logs, and endpoint events are displayed in the Events view.
- If you find events that are relevant to the incident, add the events to the incident in Respond. You can also create a new incident in Respond based on one or more events found in Investigate.
- From the Incident Details view Indicators panel in Respond, open the Events view to get a better understanding of an indicator event.

NetWitness Investigate Views

This section provides a brief description and example of the Navigate view, Events view, and Legacy Events view, as well as the context information, event details and reconstructions available in those views. Refer to the *Malware Analysis User Guide* for information about features and functions of the Malware Analysis view.

Navigate View



Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

The Navigate view provides the capability to drill into and query metadata for network, logs, and endpoint events on a Broker, Concentrator, or Decoder (though investigating a Decoder is not typical). For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The Navigate view also provides a sequential visualization of the data in a timeline. This figure illustrates the Navigate view.

- Each meta key listed displays the top 20 values based on how many events have those values.
- Drilling into the meta values by successive left or right clicking of values applies each clicked value as an additional filter to your query. As you drill, the subset of metadata seen grows smaller based on

the filters you have applied. For example, if you filter to only show HTTP (service=80), all the remaining metadata presented will be what is contained inside those HTTP events.

- With a smaller set of refined results, you can go to the Events view to examine further event details, or perform other lookups inside or outside the platform to gain further insight.

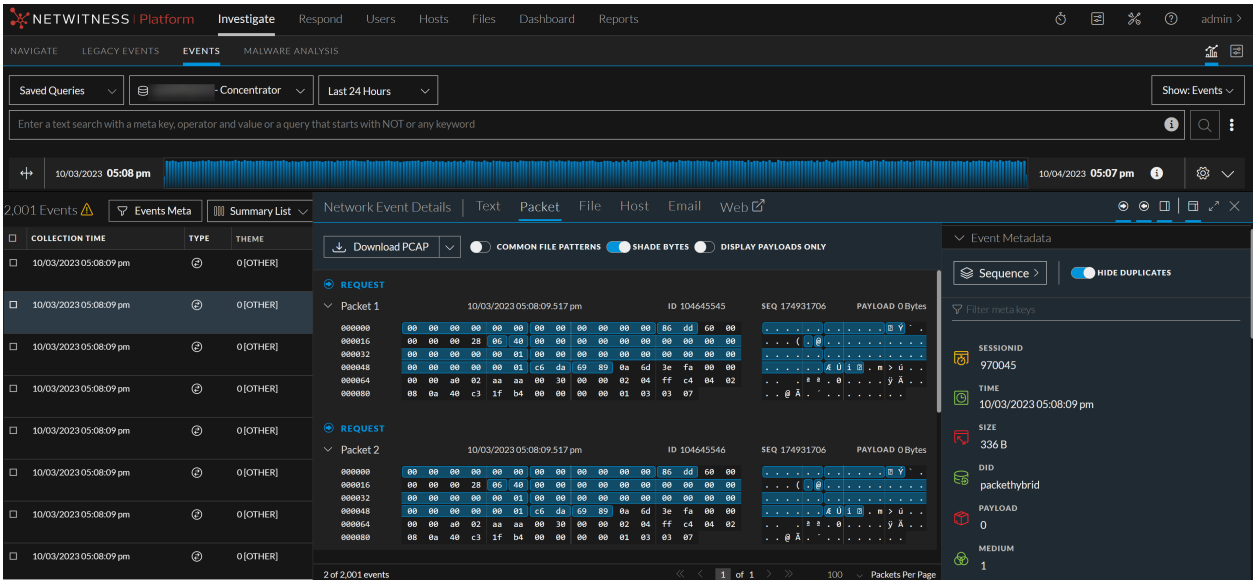
Events View

The Events provides the ability to view events sequentially, analyze raw event data and metadata, and (in Version 11.5) drill into metatdata as you can in the Navigate view.

- **In the Events panel**, Network, endpoint, and log events are listed in order by time. You can view the raw event, filter, sort, search, look at details and reconstructions, and download events. Clicking an event opens the Event Details panel for the event. Different reconstructions are available in the Events view (packets, text, files, email, and web) with helpful cues to identify points of interest, such as interesting bytes, file types, and encoded data.

- **In the Event Meta panel**, you can view related metadata for an event that is open in the Event Details panel. Analysts reviewing the metadata can change the order of the metadata to better track down what they are looking for. The items in the list of metadata can be grouped by the sequence they were generated or alphabetically.

- **In the Events Meta panel**, you can drill into meta values for the listed events with your actions reflected in the Events panel. When the Events Meta panel is expanded to the full width of the browser, you can drill into meta values to hunt for specific information before listing the events in the Events panel (comparable functionality to drilling into data in the Navigate view).
  (Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the



results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

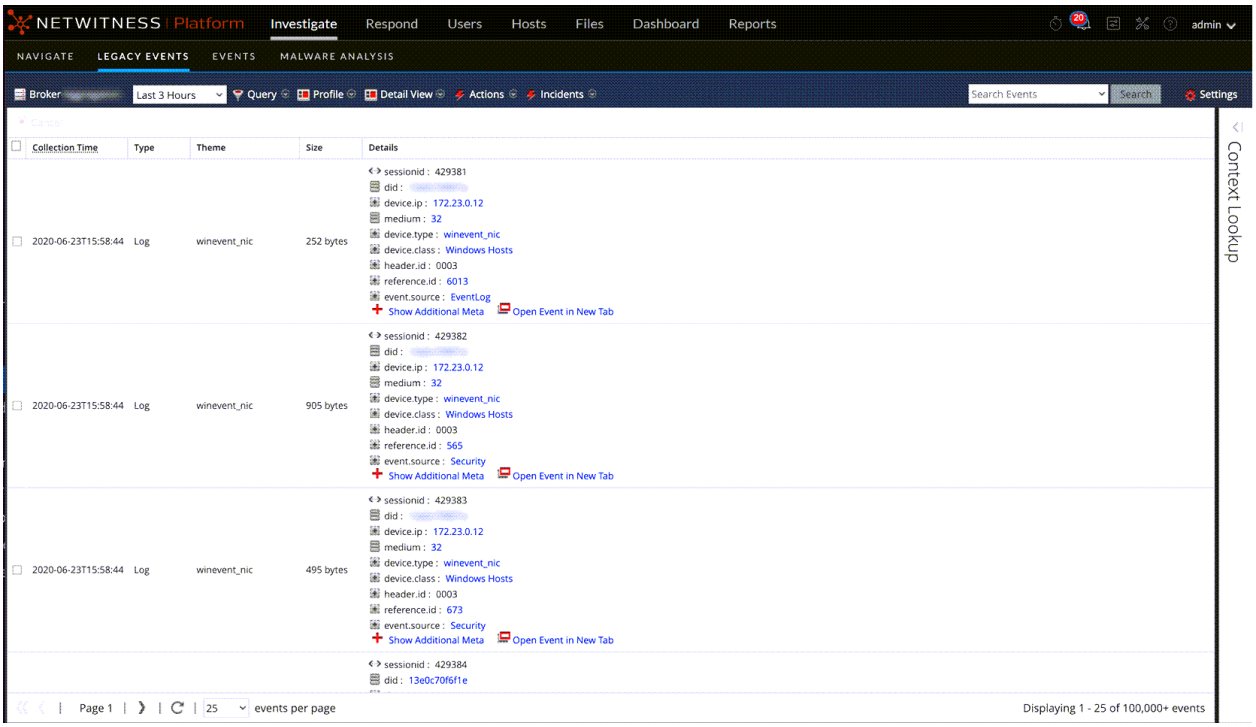
- **In the Event Details panel**, you can view details of a network, log, or endpoint event and safely reconstruct an event in a format similar to the original format. The tabs are Text, Packet, Files, Hosts, Users, Email, and Web.
- From various points in the Events view, you can pivot to standalone Endpoint, look up in Live, and do other internal lookups. External lookups allow you to search the internet for meta values with which you interacted, determine passive DNS information related to an IP address, check if a URL is blacklisted, and other third-party context integrations.
- If network data is enriched with endpoint data from an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility, host information for network events is also displayed in the Events view in the header and in the Hosts tab.

  Note: For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*.

- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, Threat Intelligence, and other sources where the value was mentioned.
- You can export different types of data. When viewing files, you can export files in a zip archive to your local file system. When viewing email reconstructions, you can download attachments. You can download logs from the text reconstruction, and export packets from the packet reconstruction. You can download multiple events from the Events list.
- (Version 11.6) To view the download jobs, click . Unlike the  icon in the **Legacy Events** and **Navigate** page, it does not open the Jobs tray. It opens the Jobs page where all jobs are listed. To display the Jobs tray, go to **Investigate** > **Navigate** (Version 11.5 and earlier) or **Investigate** > **Legacy Events** (Version 11.3 and earlier), and click the  (Jobs) icon.

This figure is an example of the Events view with a network event selected in the Events list, analyzed in the middle panel, and related metadata in the right panel.

This figure illustrates the Events view with the Events Meta panel open on the left side to filter the results set by drilling into meta values.

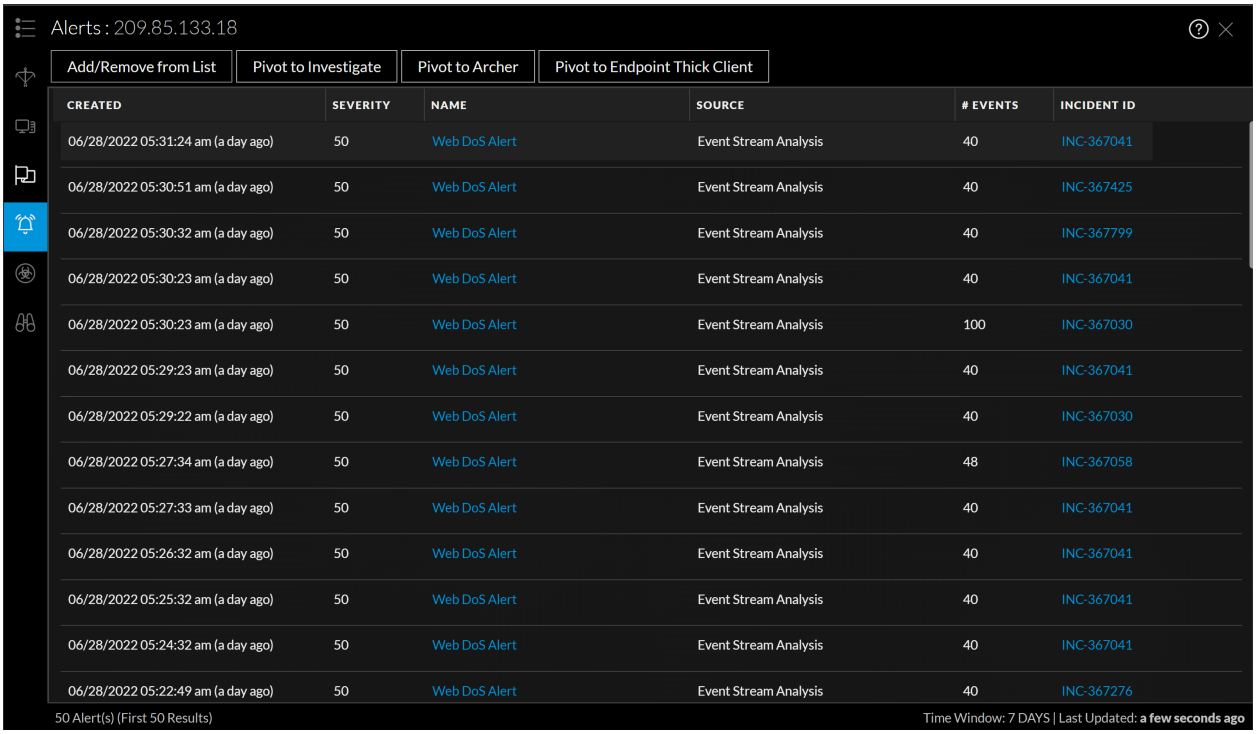


Legacy Events View

The Legacy Events view was the original user interface for analysts examining raw event data (11.0 to 11.3.x.x). The Legacy Events view is no longer needed in Version 11.4; it is hidden unless the administrator enables it as described under "Configure Investigation Settings" in the *System Configuration Guide*. When the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar. The Legacy Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely.

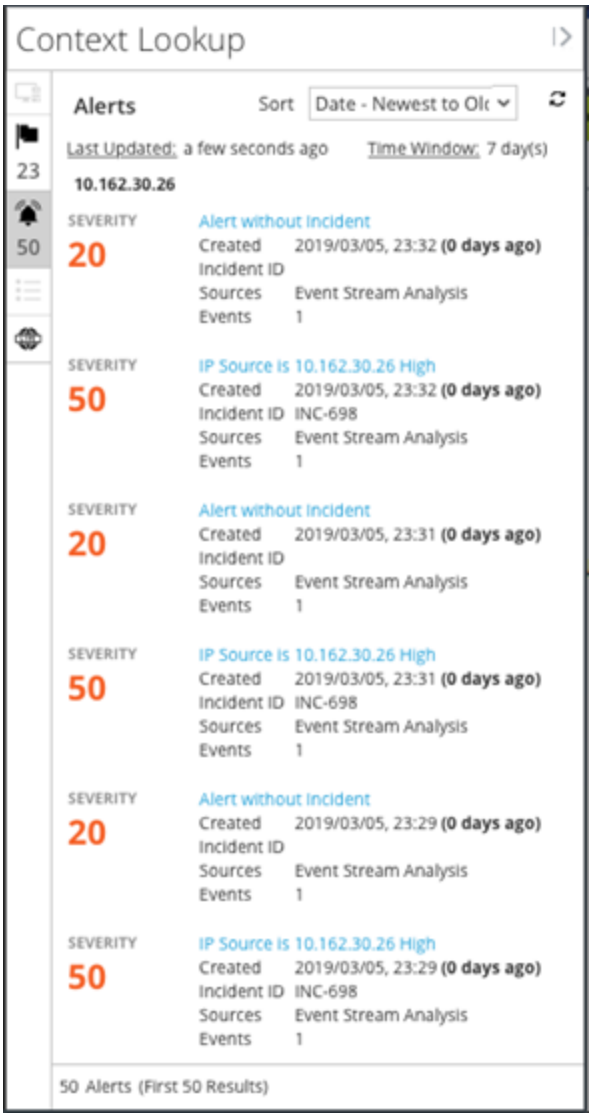
- You can open the Legacy Events view for a meta value that you see in the Navigate view.
- For analysts without sufficient privilege to navigate a service, the Legacy Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Core service without having to drill down through metadata first.
- The Legacy Events view presents event information in three standard forms, a simple list of events, a detailed listing of events, and a log view.
- For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- You can export events and associated files, and create an incident from an event.

This figure illustrates the Legacy Events view.



Contextual Information for an Event

In the Navigate view, Events view, and Legacy Events view, the Context Lookup panel shows details about elements associated with an event in the Context Hub for these meta types: IP Address, User, Host, Domain, MAC Address, Filename, and File hash. In addition, you can right-click all meta keys except time to see additional context.

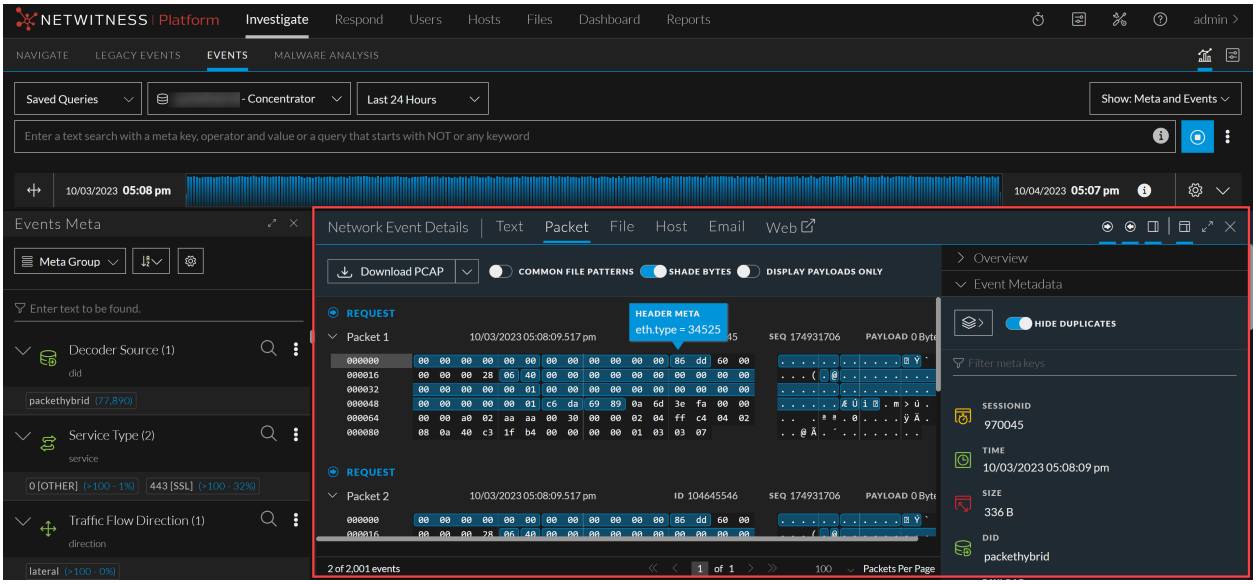


You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, NetWitness Endpoint IIOCs, and STIX data sources (namely File, TAXII Server, and REST Server). (See Look Up Additional Context for Results.)

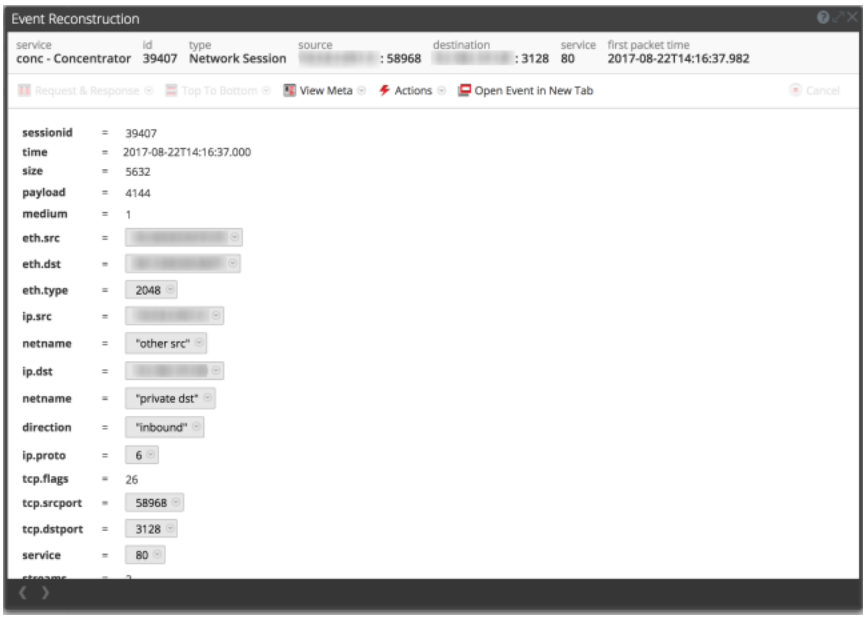
Note: Archer assets and active directory details are available in the Events view context lookup. Endpoint context lookup is available for NetWitness Endpoint 4.4.0.2 or later hosts, but not for the NetWitness Endpoint 11.1 or later hosts.

The following figure shows the Context Lookup panel, which opens to the right of the Events panel in the Events view.

The following figure shows the Context Lookup panel, which opens to the right of the Events list in the Legacy Events view.



Reconstruction and Event Analysis



When you discover an event that merits additional investigation, you can analyze it in a form that best suits the content of event. Some forms of analysis involve safely reconstructing the event in a form similar to its native form, for example, packets, text, email, and web content. The rendering of events restricts the use of dynamic or active code that may be contained in the event to limit adverse outcome to your system or browser. Using cache improves performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

Some network events are enriched with host data if you have an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility. For such an event, you can view the host details.

The Events view gives you the ability to interactively analyze an event, looking at raw data, meta keys, meta values. This figure is an example of a network event rendered as packets in the Events view.

The Event Reconstruction in the Legacy Events view presents the raw data and the meta keys and meta values for an event in a list form. This figure is an example of the Event Reconstruction.

Configuring NetWitness Investigate Views and Preferences

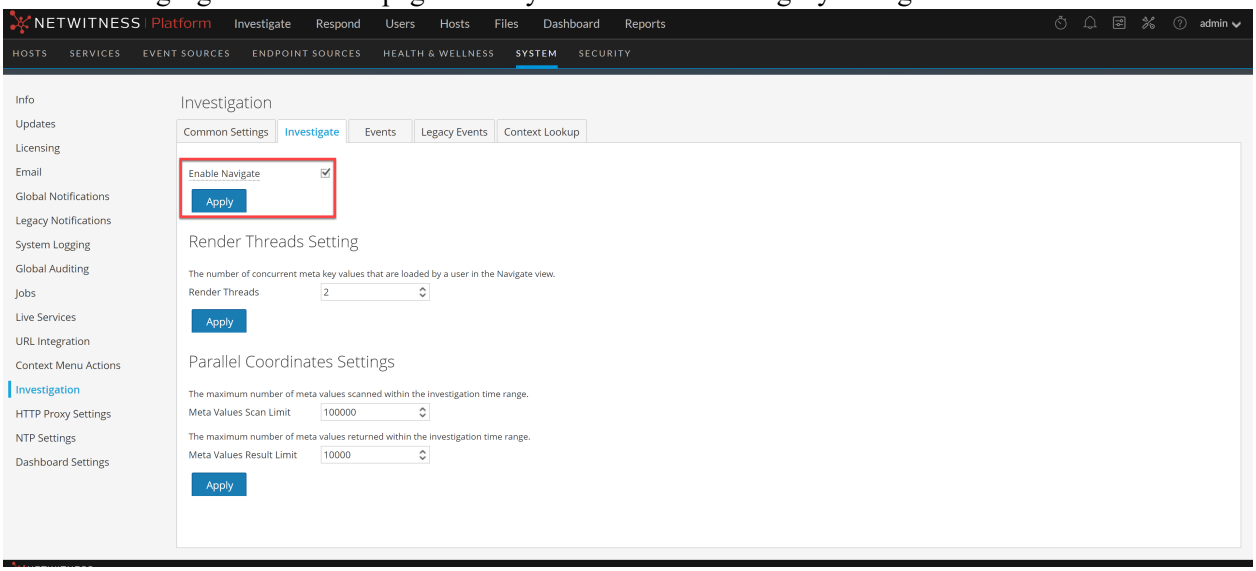
Analysts can configure some aspects of NetWitness Investigate views and behavior. You can customize the way that Investigate views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in the *System Security and User Management Guide*.

These topics provide details:

- Configure the Navigate View and Legacy Events View
- Configure the Events View

Configure the Navigate View and Legacy Events View



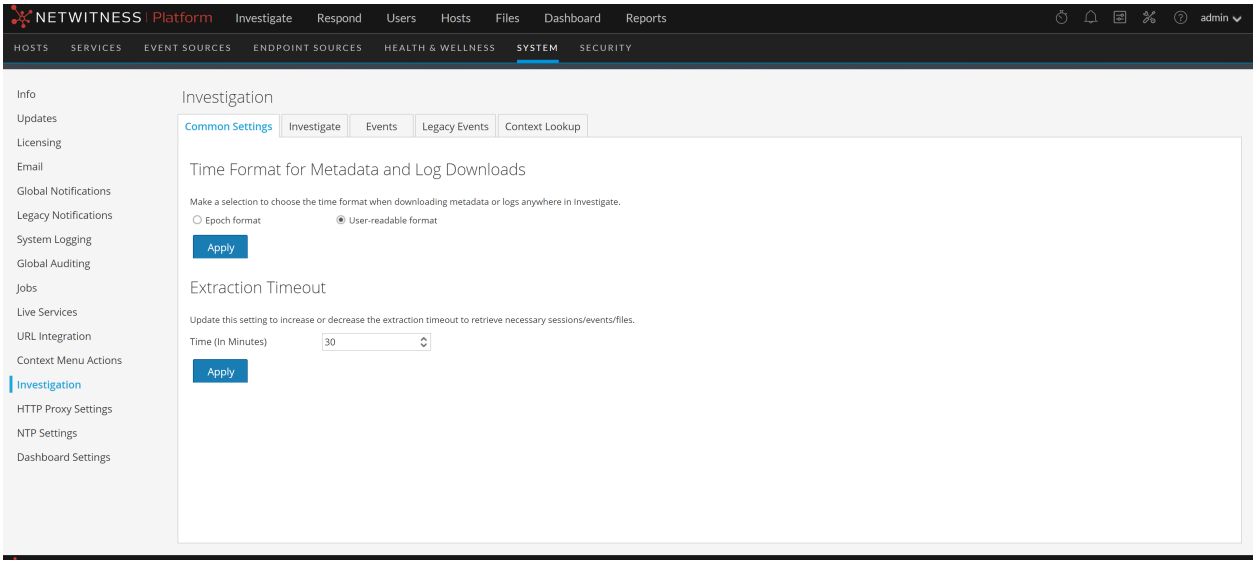
Analysts can set preferences that affect performance and behavior of NetWitness when using the Navigate view and Legacy Events view. Some of the same settings are available in two places in NetWitness, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog for the Navigate view and the Legacy Events view.
- Profiles > Preferences panel > Investigation tab.
- Navigate view and Legacy Events view Search Options drop-down.

By default, the legacy Navigate view is disabled. To enable the Navigate tab in Investigate:

1. Go to  **(Admin)** > **System**.
2. In the left-hand panel, click **Investigation**.
3. In the **Investigation** window, select the **Investigate** tab.
4. Select the **Enable Navigate** checkbox.
5. Click **Apply**.

The following figure shows the page where you can enable the legacy Navigate view.

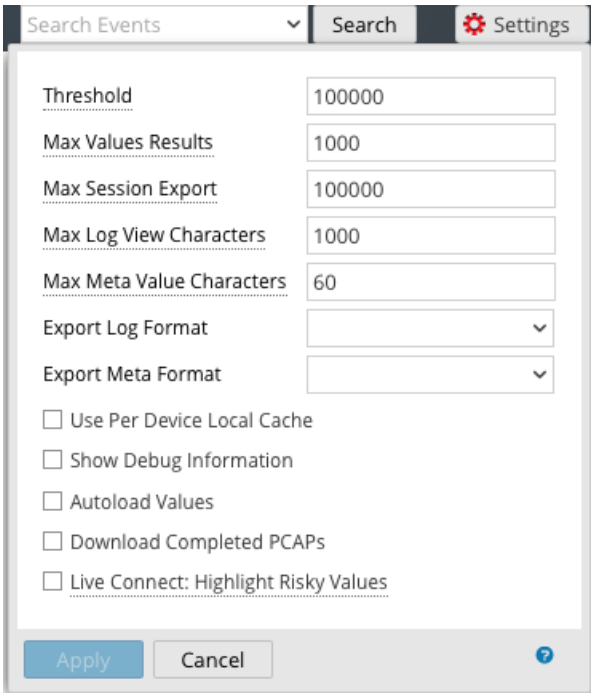


Configure Common Settings

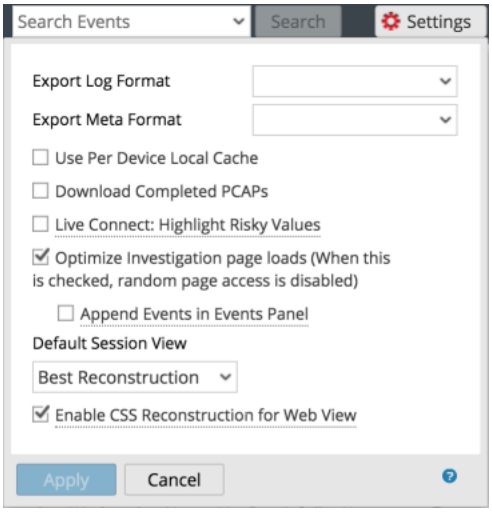
In version 11.5 and later, the **Common Settings** tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. You can set the time format used when downloading metadata and logs, and extraction timeout settings.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.5 Investigate views.



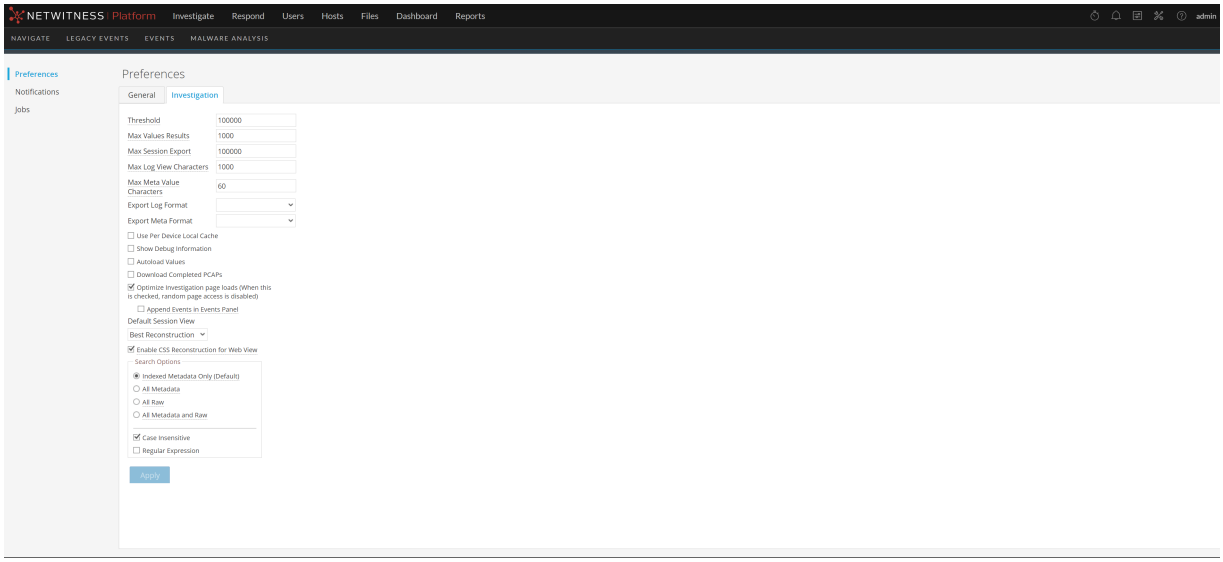
Go to  **(Admin) > System**, and in the options panel, select **Investigation**.
The Investigation Configuration panel is displayed.



Access the Navigate View and Legacy Events View Settings

To access the settings, do one of the following:

- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



- In the **Legacy Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Legacy Events view is displayed.

- In the top right corner of NetWitness, go to > , Profile, and in the **Preferences** panel click the **Investigation** tab.

The Investigation panel is displayed. The figure below illustrates the Investigation panel.

Calibrate Navigate View Value Loading Parameters

Several settings influence the performance of NetWitness when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:
   - **Threshold:** Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
   - **Max Values Results:** Set the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
   - **Max Session Export:** Specify the number of events that can be exported in a single PCAP or Log file.
   - **Max Log View Characters:** Set the maximum number of characters to be displayed on **Investigate > Events > Log Text**. The default value is **1000**.
   - **Max Meta Value characters:** Set the maximum number of characters in a meta value name displayed in the Navigate view Values panel. The default value is **60**.
   - **Show Debug Information:** If you want NetWitness to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
   - **Append Events in Events Panel:** This option affects paging in the Events view and is described below under "Calibrate Events View Retrieval and Default Reconstruction."

- **Autoload Values:** If you want NetWitness to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.

3. Click **Apply**.
   The settings become effective immediately and are visible the next time you load values.

Configure Navigate View and Legacy Events View Parameters

Several settings influence the performance of NetWitness when loading values in the Navigate view and the Legacy Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. You can set these parameters separately in the Navigate view and the Legacy Events view. When configured in one view, the setting does not automatically apply to the other view. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or the Legacy Events view.
2. Adjust the following parameters:
   - **Live Connect: Highlight Risky Values:** If you want NetWitness to highlight and display only IP addresses that are considered as risky by NetWitness community, check this option. When not selected, NetWitness displays all IP addresses. By default, this option is not selected (**Off**).
   - **Use Per Device Local Cache:** You can specify the use of locally cached data from the selected service. By default, this option is not selected **(Off)**. When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
   - **Download Completed PCAPs:** You can automate the downloading of extracted PCAPs in the Navigate view and Legacy Events view so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark. By default, this option is not selected (**Off**). If you are going to enable this option, ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.
   - **Live Connect: Highlight Risky Values:** If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
3. Click **Apply**.
   The settings become effective immediately.

Configure the Default Log Export Format

You can export logs from the Navigate view and the Legacy Events view as Text, XML, comma-separated values (CSV), and JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of logs. To select the format for exported logs:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Events view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure the Default Meta Value Export Format

You can export meta values from the Navigate view and Legacy Events view as Text, CSV, tab-separated values (TSV), and JSON. There is no built-in default value for the meta value export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of meta values. To select the format for exported meta values:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Eventsview.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

Note: If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.

Calibrate Legacy Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness retrieves events and reconstructs events in the Legacy Events view. To adjust these paramaters:

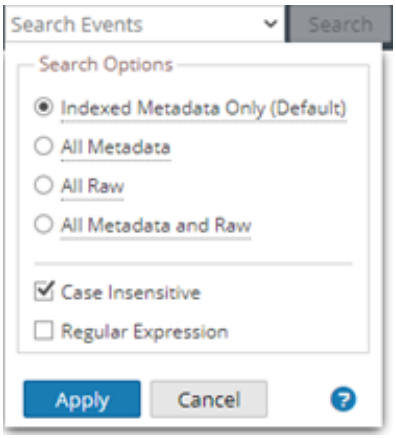
1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Legacy Events view.
2. Configure the following parameters.
   - **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible,and you cannot go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
   - **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Legacy Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.

3. Go to the **Preferences** panel > **Investigation** tab, or to the **Settings** dialog for the Navigate view (11.1) or the Legacy Events view (11.2 and later), and set the **Append Events in Events Panel** option. When this option is selected, the events displayed in the Events Panel are added incrementally. For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the **Optimize Investigation Page Loads** option is enabled.
4. To activate the changes immediately, click **Apply**.

Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes CSS styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

Note: The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically through the client side javascript is not rendered in the reconstruction because all client side javascript is removed for security purposes.



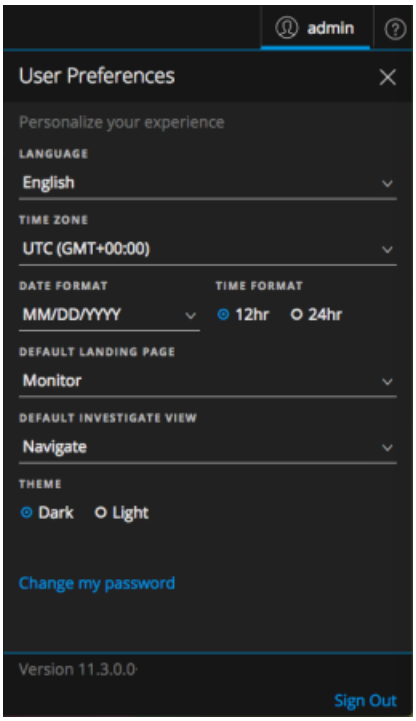
To enable or disable this option

1. Go to the **Preferences** panel > **Investigation** tab.
2. Select the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

Configure Search Options

You can configure search options to apply when you type a search string in the Search field. Edit the Search Options in the Profile > Preferences panel > Investigation tab or in the Navigate and Legacy Events view Search Options drop-down menu. To configure search options:

1. Go to the Search Options.
   The following figure illustrates the Search Options drop-down menu for Version 11.2 and later.



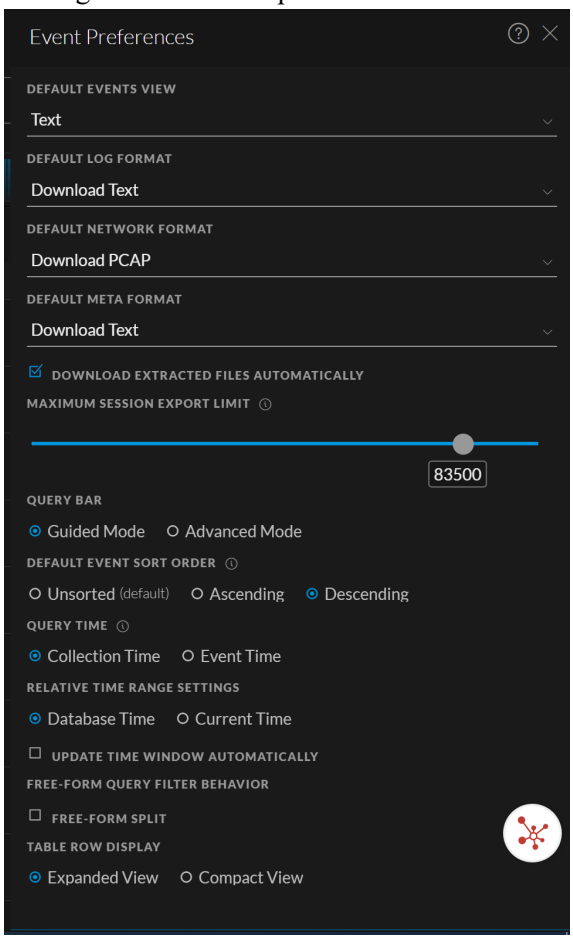
2. Select one or more search options to apply to the search. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information about each option.
3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

Configure the Events View

Analysts can set preferences that affect the behavior of NetWitness when using the **Investigate** > **Events** view. If the Events view is open; these two buttons give access to preferences dialogs: and . The User menu ( ) is focused on global user preferences such as time zone, while the Events preferences menu ( ) is focused on user preferences for behavior in the Events view. The rest of this section describes both sets of preferences.

Set the Default Investigate View

You can select the default view when you open Investigate: Navigate view, Events view, Hosts view, Files view, Entities view, or Malware Analysis view. The default Investigate view is set in the global User Preferences dialog (in the upper right corner of the NetWitness browser window, select). The global user preferences are described in detail in the *NetWitness Platform Getting Started Guide*.



Set User Preferences for the Events View

You can set your own preferences relevant to the Events view. The preferences selected persist per user and are available whenever the specific user logs in to the application.

To set default values for working in the Events view:

1. In the **Events** view, click .
   The Event Preferences dialog is displayed. Different versions of the dialog have some differences in

labeling and available options as shown in the following figure.

2. In the **Default Events View** field, select the default reconstruction type when you open an event in the Events panel: **Text**, **Packet**, **File**, (Version 11.5 and Later) **Host** or **Email** .
   If you have not selected a default analysis type, when you open an event, the default reconstruction type is the Packet analysis, except for log and endpoint events, which open to the Text analysis. If you select a default reconstruction type, the reconstruction type is the default reconstruction that you specified. In both cases, the default is the starting point, and if you change the type while you are working, the type you choose is used for the next reconstruction.
3. In the **Default Log Format** field, select the download format for exporting logs: **Download Log** (11.3) or **Download Text** (11.4), **Download XML**, **Download CSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**. These options are also available at the time of download in a drop-down menu.
4. In the **Default Packet Format** (11.3) or **Default Network Format** (11.4) field, select the default format for downloading packets. If you do not select a format here, the default download format is **Download PCAP**. These options are also available at the time of download in a drop-down menu:
   - **Download PCAP** to download the entire event as a packet capture (*.pcap) file
   - **Download All Payloads** (11.3) or **Download Payloads** (11.4) to download the payload as a *.payload file

- **Download Request Payload** to download the request payload as a *.payload1 file
- **Download Response Payload** to download the response payload as a *.payload2 file

5. (Version 11.4 and later) In the **Default Meta Format** field, select the download format for exporting metadata: **Download Text**, **Download CSV**, **Download TSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**.
6. (Version 12.4 and later) With the new preference, **Maximum Session Export Limit**, analysts can update this setting to adjust the number of sessions available for exporting using the **Download All** menu options. The default limit is set to **10,000**. However, analysts can increase or decrease this limit based on their requirements. The minimum limit allowed is **1,000**, and the maximum limit is **100,000**. This enhancement makes the number of exported sessions independent from the number of sessions displayed in the Events table.
7. If you want all extracted files to be downloaded automatically, select the **Download extracted files automatically** checkbox. You can go to the Jobs queue to view the extracted files.
8. (Version 11.5.1 and later) To change the preference for the time that is matched when you submit queries, select an option in the **Query Time** field.
   - When **Collection Time** is selected, the time of an event reflects when it was received and stored into the system. This is the default setting.
   - When **Event Time** is selected, the time of an event reflects the time at which the event actually occurred. A good case for using the event time is when investigating logs or endpoints and looking for events that occurred around the same time. Using Event Time filters out all network events.

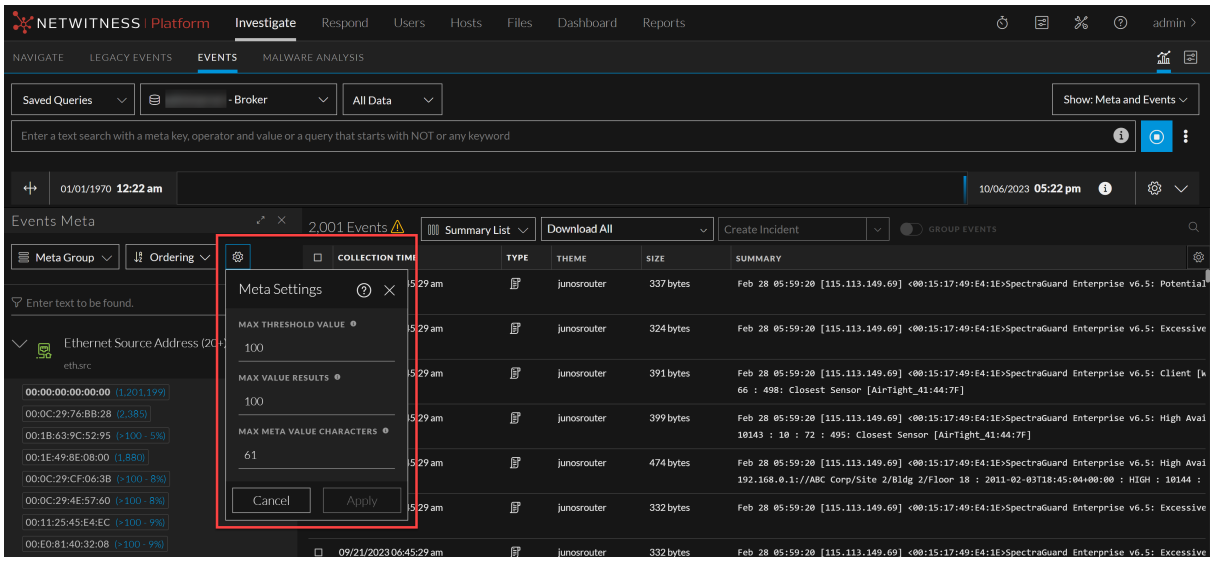
   Note: By default, the time range for a query is based on the time that the Decoder consumed the event, which is always not the same time that the event occured. To see the actual event time instead of the collection time in the Events view, select Event Time.

   Note: When you query with the event time preference enabled, you must use the collection time column and time zone column. This is to help you differentiate if the events are listed in a sequential order or not. This scenario occurs because there is no global standard to follow while logging the event times, which results in different events from different sources being in different time zones.
9. (Version 11.5.1 and later) Under **Relative Time Range Settings**, choose either **Database Time** or **Current Time**. The Events view can display results based on the relative time range, Last 2 hours or Last 30 Days, for example. The time range can be relative to the time when the event was received and stored into the system or the current time zone's clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.
   - When **Database Time** is selected, the time range is relative to the time of the last stored event.
   - When **Current Time** is selected, the time range is relative to the current time in the timezone set in user preferences.

Note: (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users.

10. (Version 11.4 and 11.5) Under **Time Format for Query**, choose either **Database Time** or **Current Time**. The Events view can display results based on the database time or the current clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.
    - When **Database Time** is selected, the end time for a query is based on the time that the event was stored.
    - When **Current Time** is selected, the query is executed with the current time in accordance with the timezone set in user preferences.
11. (Version 11.4 and later) To set the sort sequence by collection time for the events listed in the Events panel, select one option under **Default Event Sort Order**. After you have selected a preference, you can also interact with the table column headers to request the results again sorted differently as described in Use Columns and Column Groups in the Events List.
    - **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
    - **Ascending** (default for Version 11.4 and earlier): To put the events with the earliest collection time first in the list. The oldest events are displayed first if in ascending order.
    - **Descending**: To put the events with the latest collection time first in the list. The newest events are displayed first if in descending order. When investigating logs, you may want to change the sort sequence to see the latest collection time first.
      If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. When Unsorted is selected, the oldest portion of events is matched and then listed unsorted. if you changed the sort order preference after events were loaded, you must refresh the view to apply the new sort order.
12. (Version 11.3 and later) To automatically update the time range window in the query bar when the service is polled (at one minute intervals) and sends fresh results, select the **Update Time Window Automatically** checkbox. When the time range is updated, the  (Submit Query) button is activated and you can submit a query to get fresh results. To keep the time range window in the query bar synchronized with the current results, clear the checkbox (this is the default value
13. (Version 11.6 and later) If you have multiple rows of data and want to word wrap or unwrap the content of an event , choose either **Compact View** or **Expanded View**. Based on the selection you make the rows will appear compact or expanded.

14. (Version 11.7.1 and later) With the new preference, analysts can choose to split the free-form queries into multiple guided filters or a single free-form query. Analysts can switch the modes using the **Free Form Split** checkbox.



Configure Events View Meta Value Loading Parameters

From the 12.3 or later version, NetWitness introduces the new **Meta Settings** panel under the **Investigate** > **Events** view. This panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view. However, several settings influence NetWitness performance when values are loaded into the Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations.

Adjust Settings on the Events Meta Settings Panel

1. Log in to the NetWitness Platform.
2. Click **Events Meta** >  **(Meta Settings)**.

   The Meta Settings dialog is displayed.

3. Modify the following parameters:

   - **Max Threshold Value**: Set the threshold for the maximum number of sessions loaded for a meta key value in the Events panel. A higher threshold allows accurate counts for a value and also causes longer load times. The Max Threshold Value should be between **1-2147483647**. The default value is **100,000**.
   - **Max Value Results**: Set the maximum number of values to load in the Events view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The Max Value Results should be between **100-100000**. The default value is **1000**.
   - **Max Meta Value Characters**: Set the maximum number of characters in a meta value name displayed in the Events Meta panel. The Max Meta Value Characters should be between **60-512**. The default value is **60**.

4. Click **Apply**.

   The settings become effective immediately and are visible the next time you load values.

Beginning an Investigation

Based on the question you are attempting to answer, NetWitness Investigate offers different starting points: Navigate view (Version 11.5 and earlier), Events view, Legacy Events view (Version 11.3 and earlier), Hosts view, Files view, Users (Entities) view, and Malware Analysis view.

Specific user roles and permissions are required for a user to conduct investigations in NetWitness. If you cannot perform a task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Note:
- The Files and Hosts views are available in Version 11.1 and later (refer to the *NetWitness Endpoint Quick Start Guide* and *NetWitness Endpoint User Guide* for details). Before Version 11.5, these views were submenu of Investigate.
- The Users view is available in Version 11.2 and later (refer to the *NetWitness UEBA Quick Start Guide* and the *NetWitness UEBA User Guide* for details); in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.
- The 11.4 Events view is the default view for investigating events. The default workflow for analysts interacting with events is optimized to limit the need to transition from one view to another. By combining capabilities that were previously in two distinct workflows, known as Event Analysis and Events, the analyst has a single workflow for analyzing events. With the new functionality added to the Events view, the Legacy Events view is no longer needed. By default the previous workflow is not in the Investigate menu, but an administrator can re-enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

Focus on Metadata, Raw Events, and Event Analysis

To hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event, go to **Investigate > Navigate**, **Investigate > Events**, or **Investigate > Legacy Events**. You can investigate the metadata and raw events for a single Broker or Concentrator. In each of these views, you can execute a query and filter the results by narrowing the time range and querying metadata. These topics provide details about beginning an investigation:

- Begin an Investigation in the Events View
- Begin an Investigation in the Navigate or Legacy Events View

Focus on Hosts and Files

To hunt for information on hosts that have the Endpoint agent running, go to **Hosts** (Version 11.5) or **Investigate > Hosts** (Version 11.4). For every host, you can see processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. To begin an investigation by looking at files in your deployment, go to **Investigate > Files**. (See the *NetWitness Endpoint User Guide* for detailed information.)

Focus on Risky User and Entity Behavior

To discover, investigate, and monitor risky behaviors across all users and entities in your network environment, go to **Users** (Version 11.5), **Investigate > Entities** (Version 11.4), or NetWitness UEBA (User and Entity Behavior Analytics) . In versions 11.3 and earlier, the menu option is **Investigate > Users**. You can detect malicious and rogue users, pinpoint, high-risk behaviors, discover attacks, and investigate emerging security threats. (See the *UEBA User Guide for NetWitness Platform 12.3.1.0* for detailed information.)

Focus on Scanning Files for Malware

To scan files for potential malware, or set up a continuous scan of a service, go to **Investigate > Malware Analysis**. Scan results are expressed as four types of analysis: network, static, community, and sandbox with an indicator of compromise (IOC) rating. There are several other ways to begin working in Malware Analysis:

- You can begin Malware Analysis from the Malware Analysis dashlets in the Monitor view to quickly see the riskiest potential threats.
- You can right-click a meta key in the Navigate view, and select **Scan for Malware**.

See the *Malware Analysis User Guide* for detailed information.

Begin an Investigation in the Navigate or Legacy Events View

The Navigate view is the default view for Investigate unless you have selected a different view as your opening view. This user preference is set on the application level as described in Configuring NetWitness Investigate Views and Preferences. In the Navigate view and Legacy Events, you are hunting for events of interest based on a query. In the Navigate view you can also refine results by clicking on meta keys and meta values. When you find interesting events, you can take a closer look at the event in the other Investigate views.

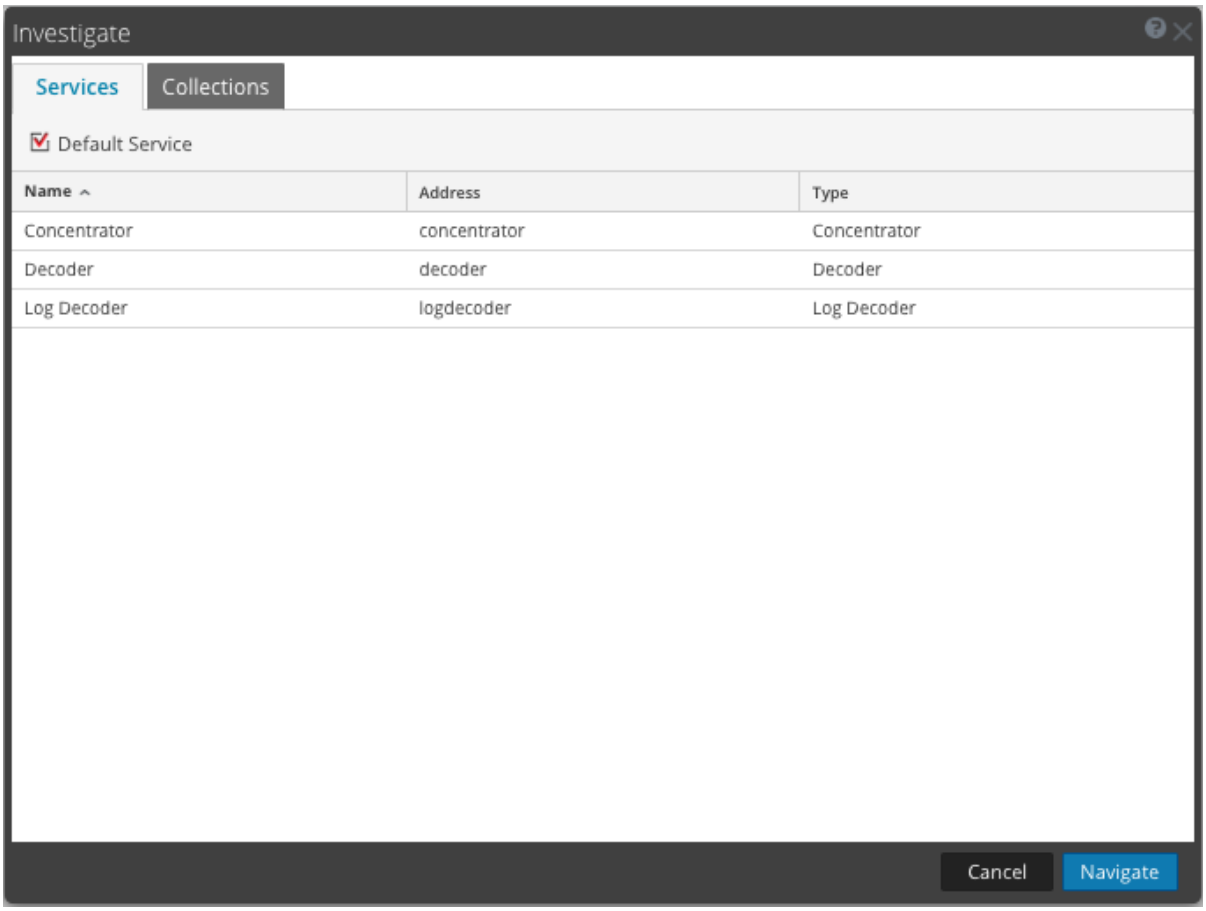
To begin an investigation in the Navigate view or Legacy Events view, a service must be specified.

- Investigate opens the Navigate view or the Legacy Events view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, Investigate presents a dialog for selecting the service or collection to investigate.
- When a service is selected manually or by default in the Navigate view or Legacy Events view, you can change the service or collection to investigate by selecting the service name in the toolbar. Investigate presents the dialog for selecting the service to investigate.

Note: The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Legacy Events view for log exports and enhanced search capabilities.

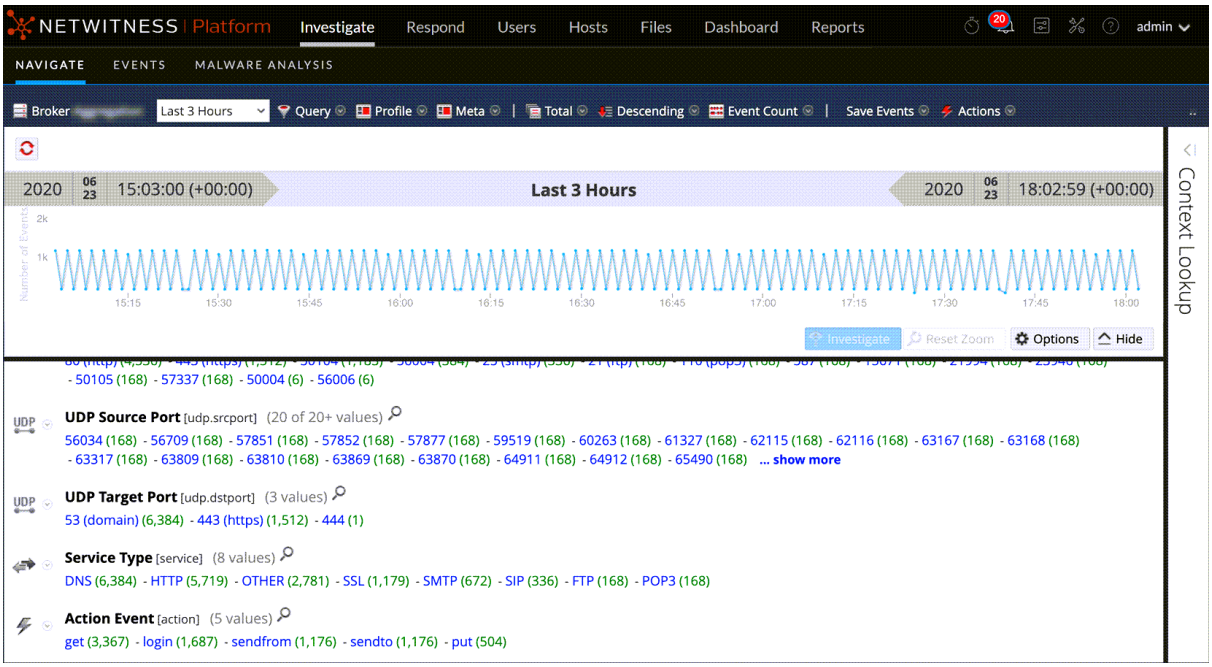
With a service or collection selected, Investigate is ready to load data for the service or collection. It is recommended that you also select a time range so that results load faster. Several settings in the Navigate view and Legacy Events view Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring NetWitness Investigate Views and Preferences).

Note: In the Legacy Events view data loads automatically. If you specified Autoload Values in the Navigate view preferences, Investigate populates the data automatically. Otherwise, you must select Load Values. Investigate populates the metadata in the Navigate view Values panel and results become visible almost immediately.



The rest of this topic provides instructions for beginning the investigation of data on a service.

Note: Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

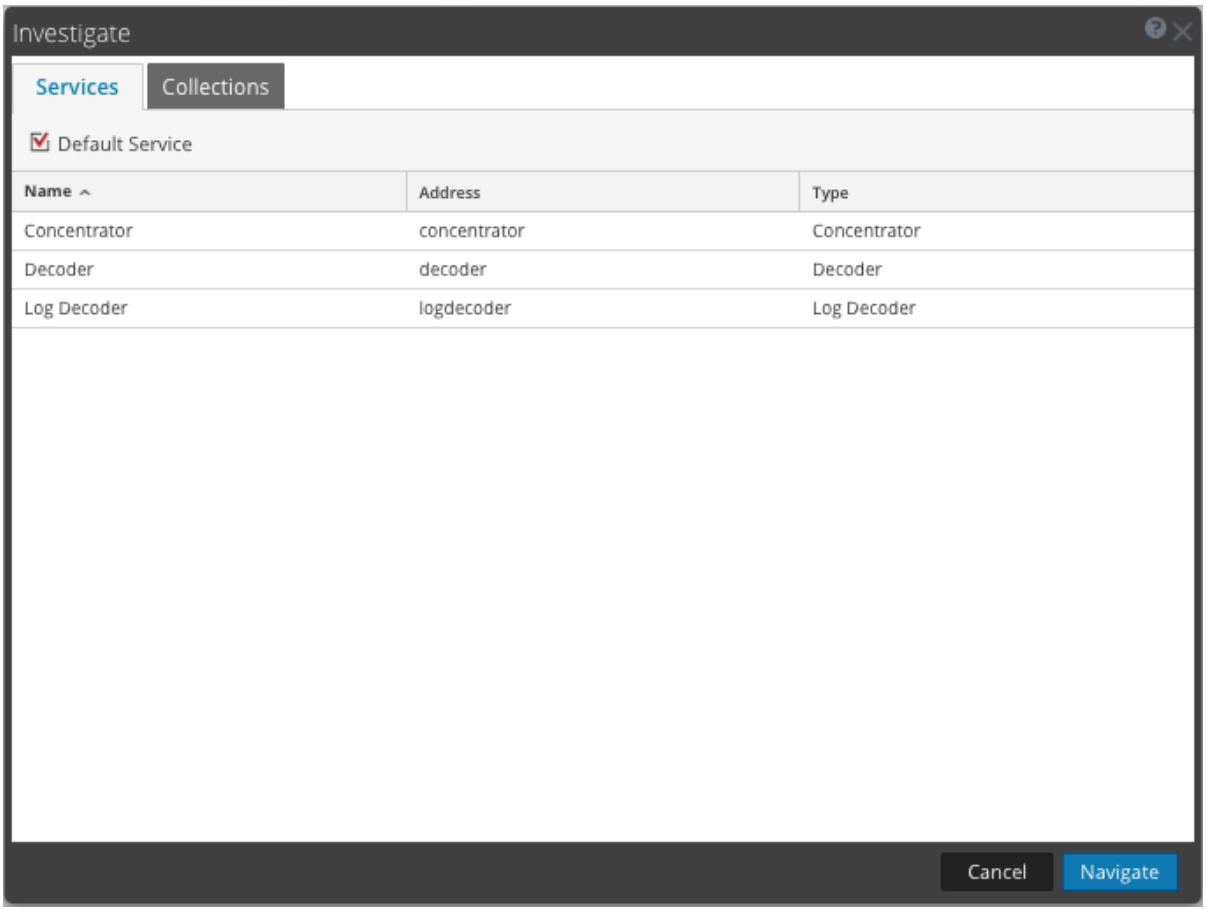


After loading data in the Navigate or the Legacy Events view, refine results, reconstruct and analyze events, then download and act upon results (see Refining the Results Set and Reconstructing and Analyzing Events and Downloading and Acting Upon Results).

Begin an Investigation (No Default Service)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.

2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The data loads automatically in the Legacy Events view. If you are working in the Navigate view, the resulting panel displays the activity for the selected service, but the data is not loaded automatically.
3. (Recommended) Select a specific time range so that results load faster.
4. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described Refining the Results Set. You can also modify options at any time during the investigation.
5. To load data in the Navigate view, click Load Values.
   The data for the selected service begins loading.



With the service selected and data loaded, you are ready to begin analyzing the data.

Set or Clear the Default Service

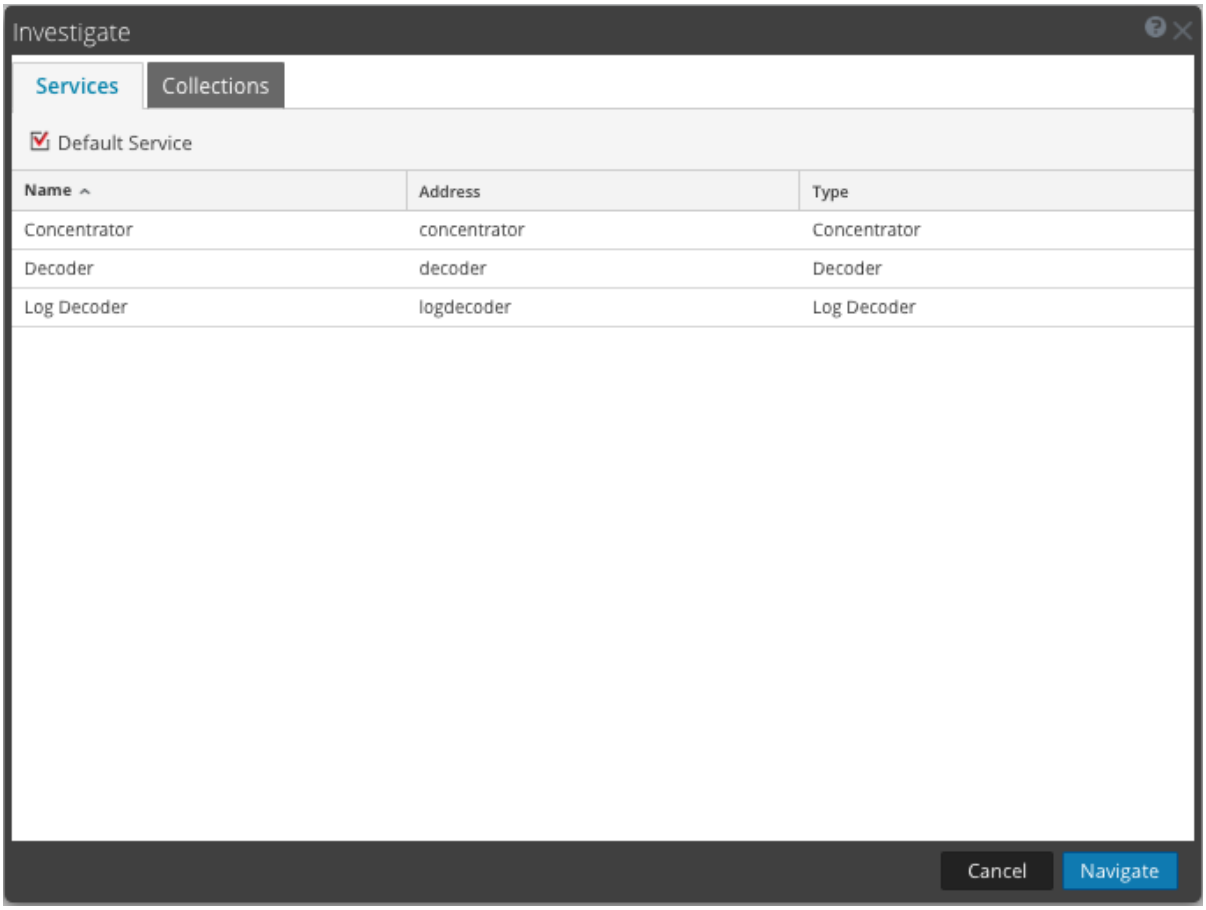
You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.

2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

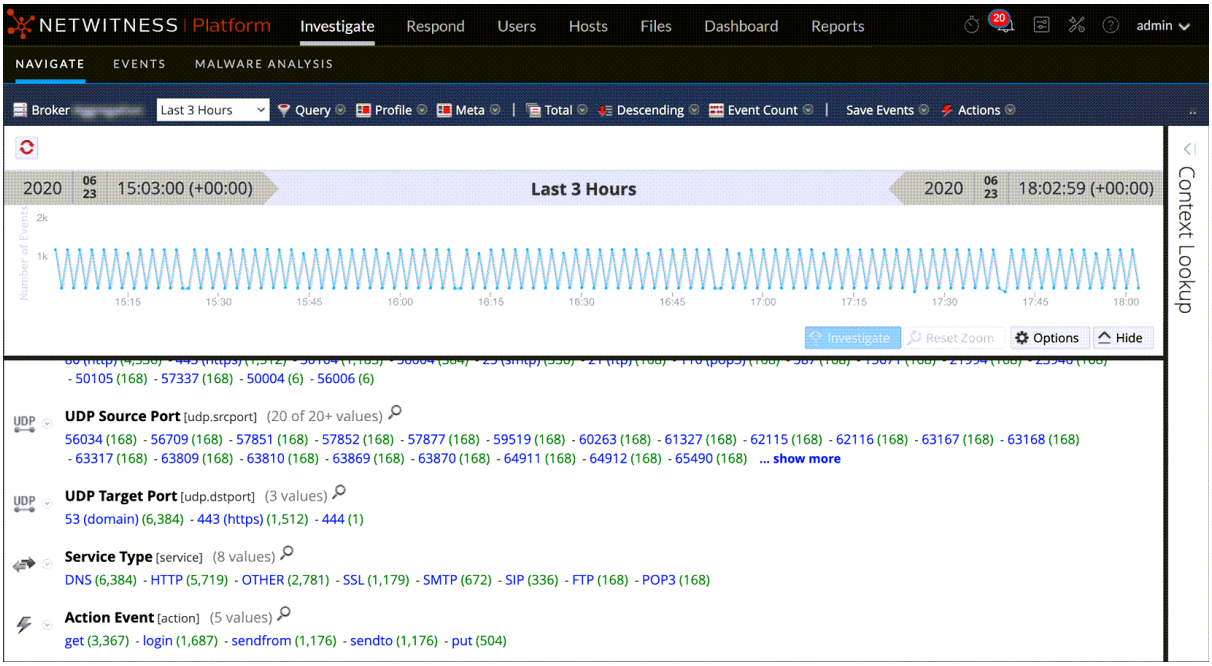
> **Note:** Clicking cancel does not cancel your selection of the default service. It closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and navigate to a different service.



Begin an Investigation (Default Service Specified)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3. In the Legacy Events view, the data is loaded automatically.

2. If you want to modify investigation options in the Navigate view before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options. With the service selected and data loaded you are ready to begin analyzing the data.



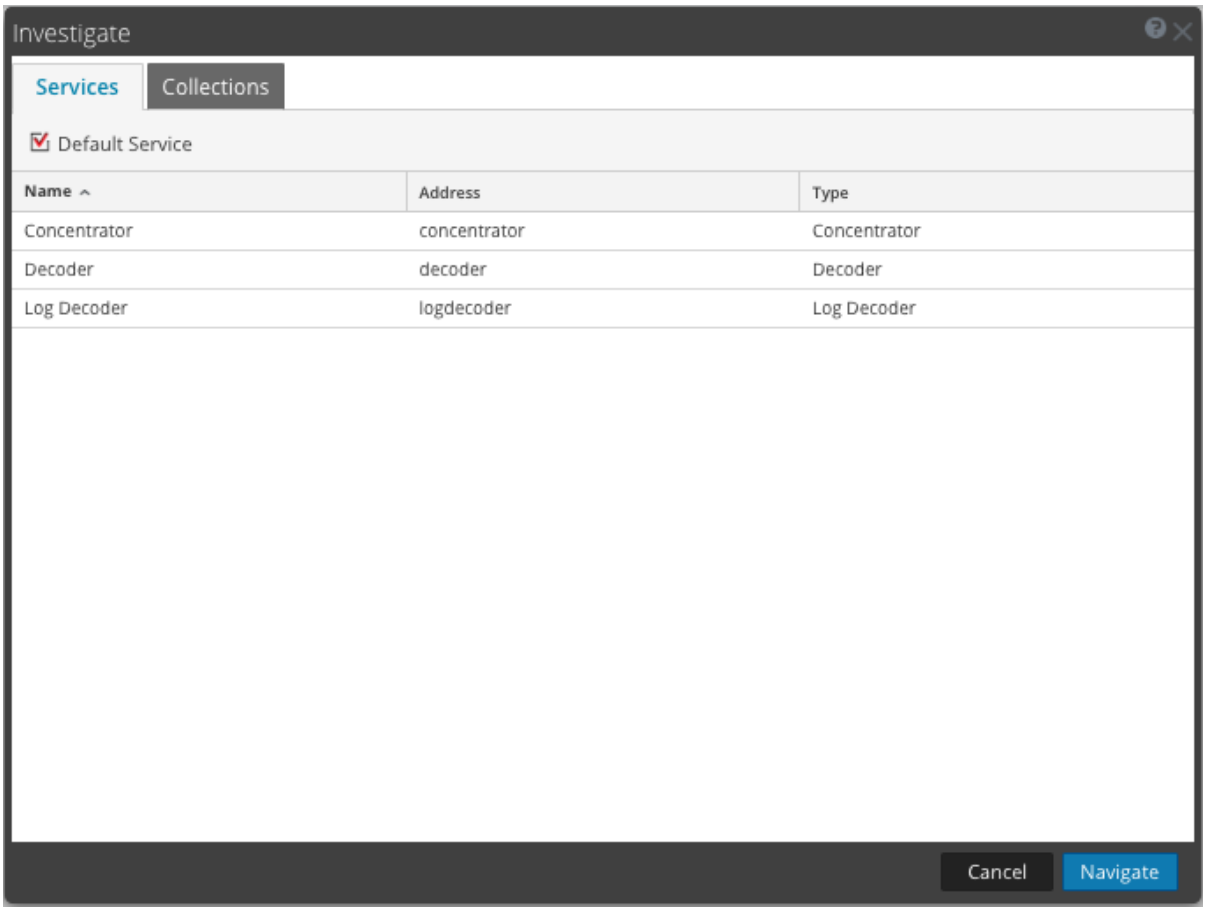
Change the Service or Collection to Investigate

1. In the Navigate view or the Legacy Events view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.

2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3. Otherwise, the Navigate view is displayed with the default service selected, and data ready to load. In the Events view the data is loaded automatically.

3. When ready, click Load Values.
   The values for the service begin loading in accordance with the selected options.

   With the service selected and data loaded you are ready to begin analyzing the data.



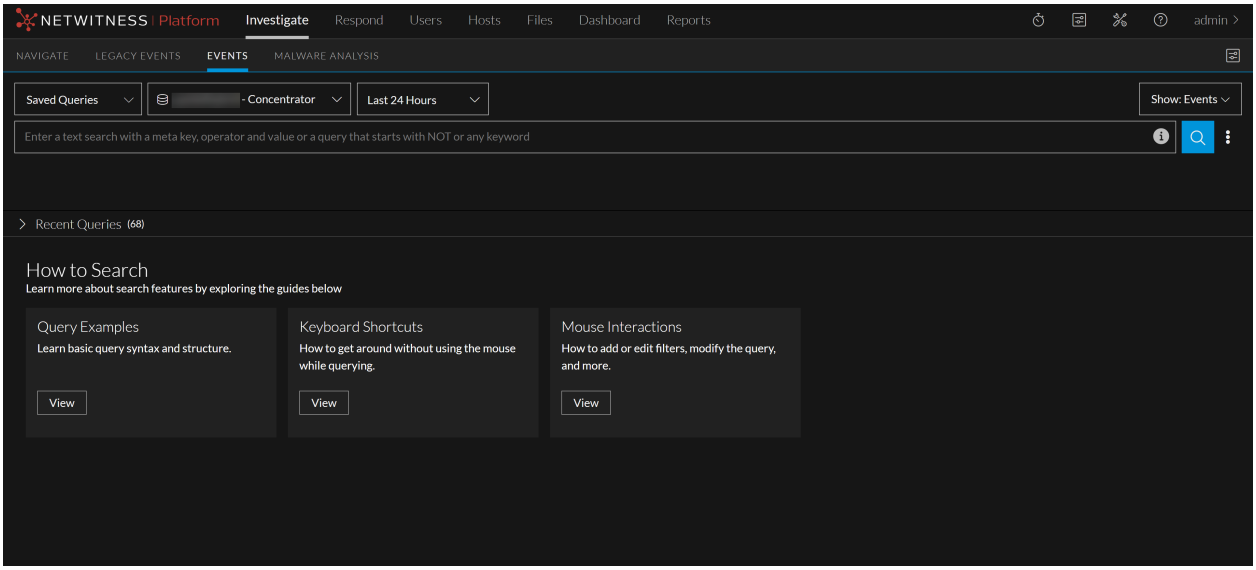
Investigate Workbench Restoration Collections

This procedure enables administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

Note: Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.

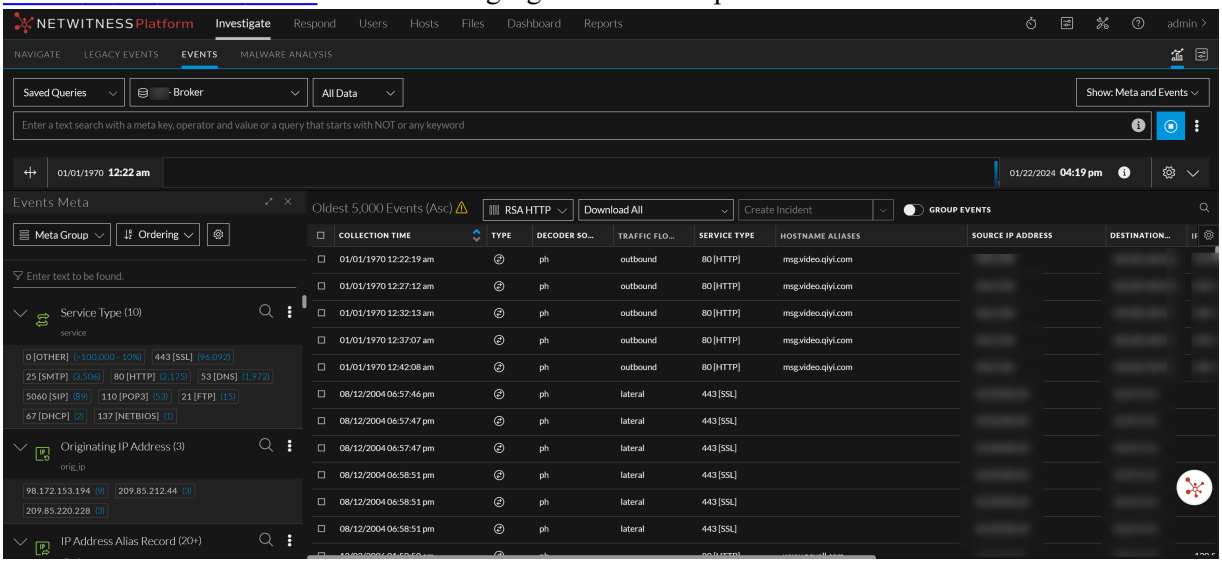


2. Select a workbench service and workbench name that you want to investigate.
3. Click **Navigate** to perform an investigation on the selected workbench service.
   Click **Cancel** to select a different workbench service to investigate.
   The Investigation view is displayed. With the collection selected and data loaded, you are ready to begin analyzing the data.

Begin an Investigation in the Events View

The Events view offers most of the features that are available in both the Navigate view and the Legacy Events view. Similar to the Navigate view, there is a view into meta keys and meta values for logs, endpoints, and packets. Like the Legacy Events view, an events list shows events listed in the order by time, and you can view the raw event, related metadata, and a reconstruction of an event. The Event reconstruction has some helpful cues to identify points of interest. See Reconstructing and Analyzing Events.

The following figure shows the initial Events view with some examples of queries and information about keyboard and mouse interaction. This figure depicts the initial view.

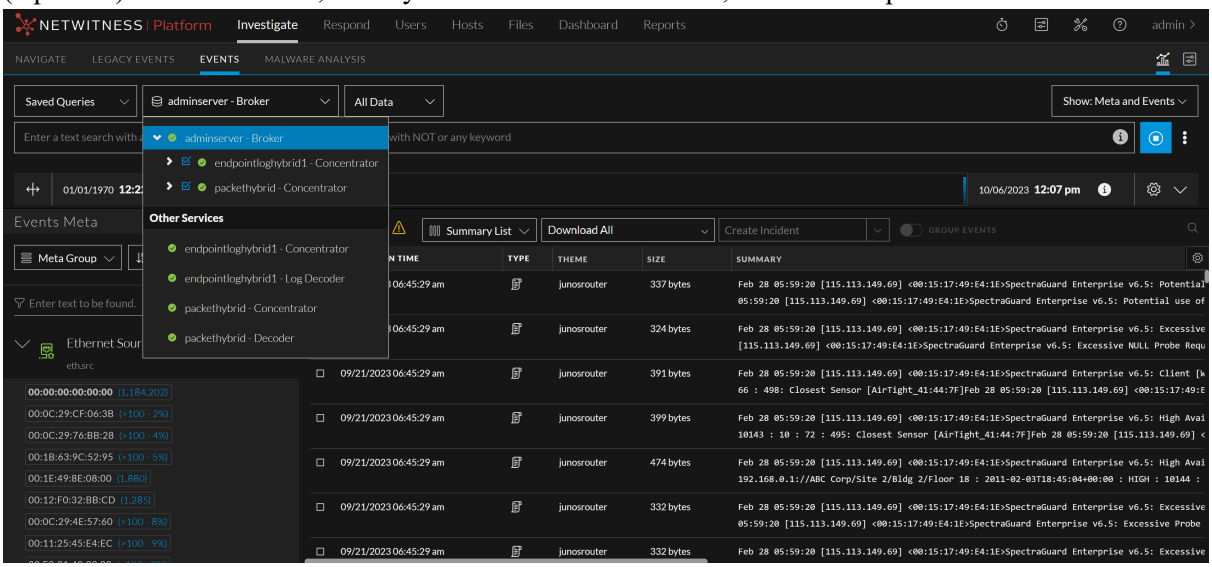


Access the Events View

Several ways to access the Events view are available in Version 11.1 and later.

- Go to **Investigate** > **Events** or select the **Investigate** option in the main menu if you have made the Events view your default Investigate view. The following procedure provides detailed steps.
- Hover over and click a count (the green number after a meta value) in the Navigate view. The Events view opens with the list of events for the selected drill point, and you can begin working as described in Analyze Events in the Events View.
- Hover over a count and control-click **Open Events in new tab**. The Events view opens in a new tab with the list of events for the selected drill point, and you can begin working as described in Analyze

Events in the Events View. The following figure is an example of the list of events.



To begin an investigation in the Events view using direct access:

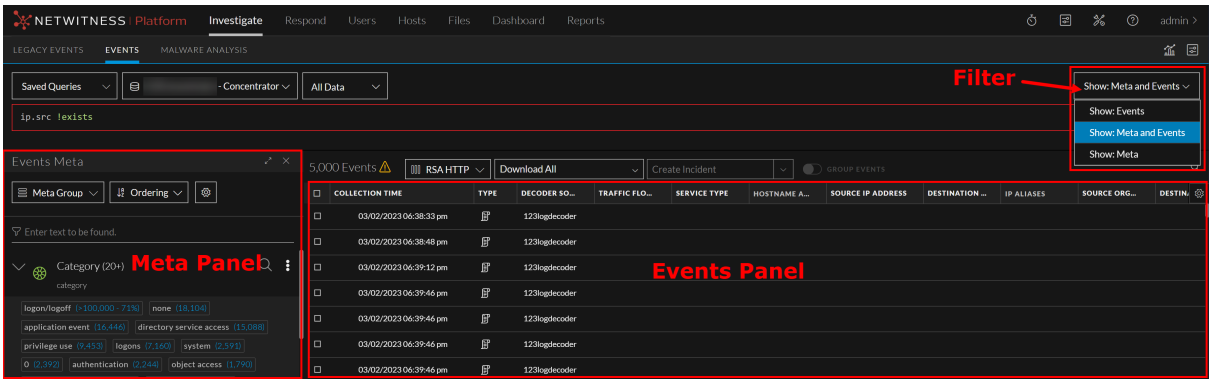
1. Go to **Investigate** > **Events**.
   The Events view opens with a service selected and no data displayed. A drop-down list offers a list of available services in alphabetical order. The **Select a service** field is populated with the first service in the list or the most recently selected service. By default the list of available services is retrieved every twelve hours and cached on the NetWitness server. If a service is added or removed from the NetWitness server before the next time to retrieve, the cache is updated with the latest list of services. An icon provides the status of the service.

   - and selected service name = The service is selected.
   - = Investigate is attempting to connect to the selected service.
   - = There was an error connecting to the selected service or there is no data in the selected service. In this state, the service selector control also turns red, and a tooltip explains why the connection attempt failed and advises you to choose another service.

2. (Optional) Select a service, usually a Broker or Concentrator, from the drop-down list.

The time range selector shows either the default time range of 24 hours, or the time range that you last selected for this service. The or Query Events button becomes active and you can create filters. If you launch a query without creating filters, the selected time is used.

3. (Optional) Edit the time range as described in Filter Results in the Events View.

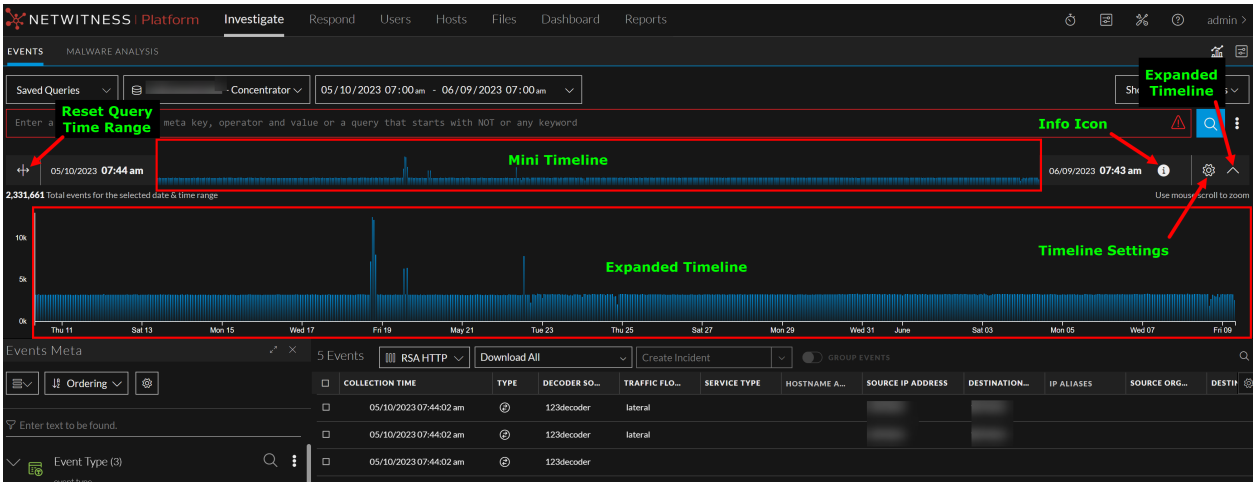


The selected time range is stored in your browser for this service; you can set different time ranges for different services.

4. Create a query that consists of one or more filters that contain a meta key, operator, and optional value. See Filter Results in the Events View for details on creating queries.

5. Select a **Query Results Panel** layout from the drop-down menu.

   For example, if you select, **Show: Meta and Events** option from the drop-down menu, the query results will be displayed in two separate panels, i.e., **Meta** and **Events**.



6. When ready to submit the query, click or **Query Events**.
   The Events view displays the data for the selected service, time range, and query, in accordance with permissions assigned to your role by the administrator. You are ready to begin analyzing the data. Refer to Examine Event Details in the Events View and Analyze Events in the Events View to learn how to work in the Events view.

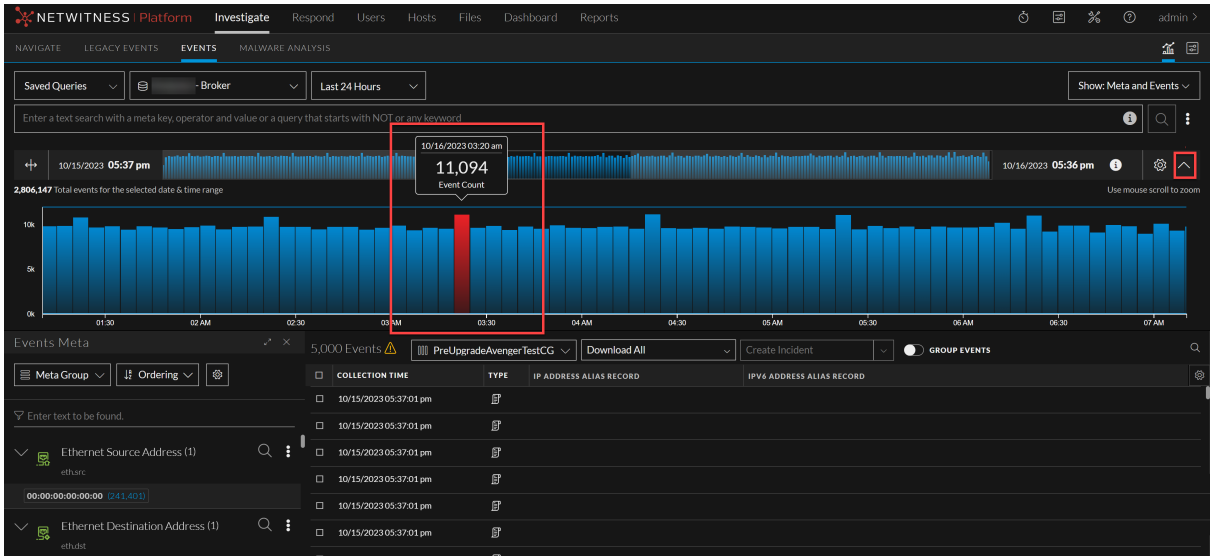
Investigate on Timeline

The timeline visualizes the events count that occurs at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a bar chart. This allows analysts to detect significant spikes that could indicate anomalies. Using the visual representation, analysts can conduct a more detailed investigation of the events that occurred during that specific period.

The timeline on Events View has been improved so that users can interact with it and gain more insights. With the enhanced timeline, you can now expand the timeline, zoom into the interested zone in the timeline, change the axis settings, or reset the query to the original requested form.

Note: The Mini Timeline is still not interactive. You should expand the timeline to interact and perform certain actions on the timeline.

Users can perform the following actions on the Expanded Timeline:



Expand the Timeline

The Expand Timeline feature helps you interact with the event's result based on your search query. The expanded timeline view shows the total number of events for the selected date and time range. On the expanded timeline, X-axis shows the Time and the Y-axis shows either the Total number of events that occurred or the File Size recorded by the services at a specific time on the timeline.

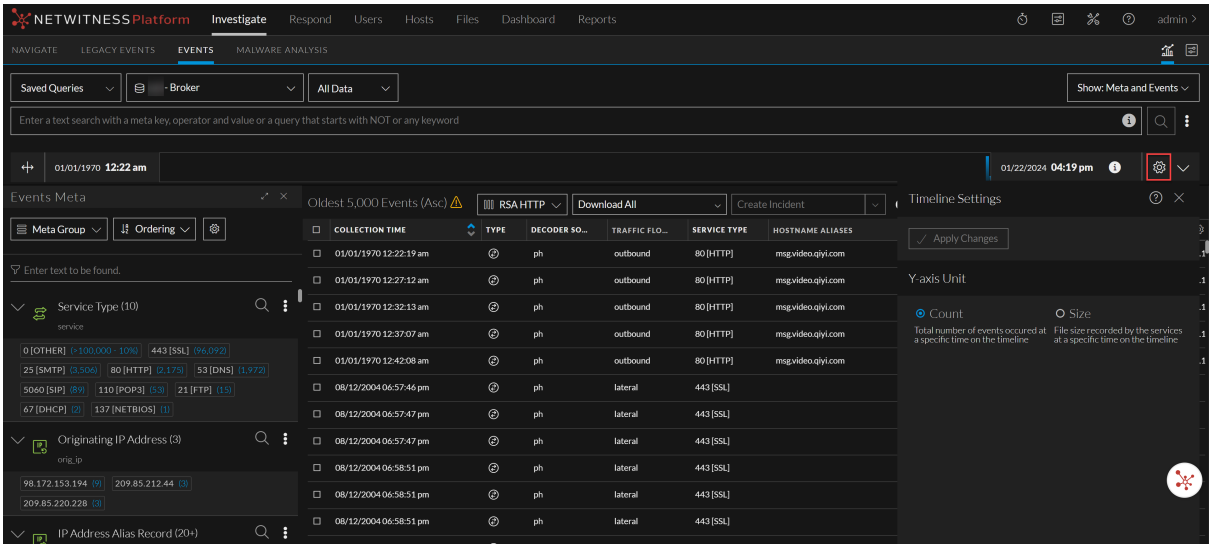
To Expand the Timeline

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Click  (Expand Timeline) to expand the timeline and see the specific or interested zone on the timeline.
4. Hover over any bar to know the event count and the time of the events created.

   The bar is highlighted in red to indicate that the tooltip information associated with it.

Use Timeline Settings

Analysts can use the Timeline Settings option to change the Y-axis data dimension (Count or Size) and view the data presented on the timeline.



Click the  (**info**) button to the right of the Mini Timeline to know the representation of the timeline's event data (like what information is shown on the Y-axis).

Note: To change the X-axis settings, you must change the Query Time options set within the Events Preferences panel. For more information on Query time, see Configure the Events View.

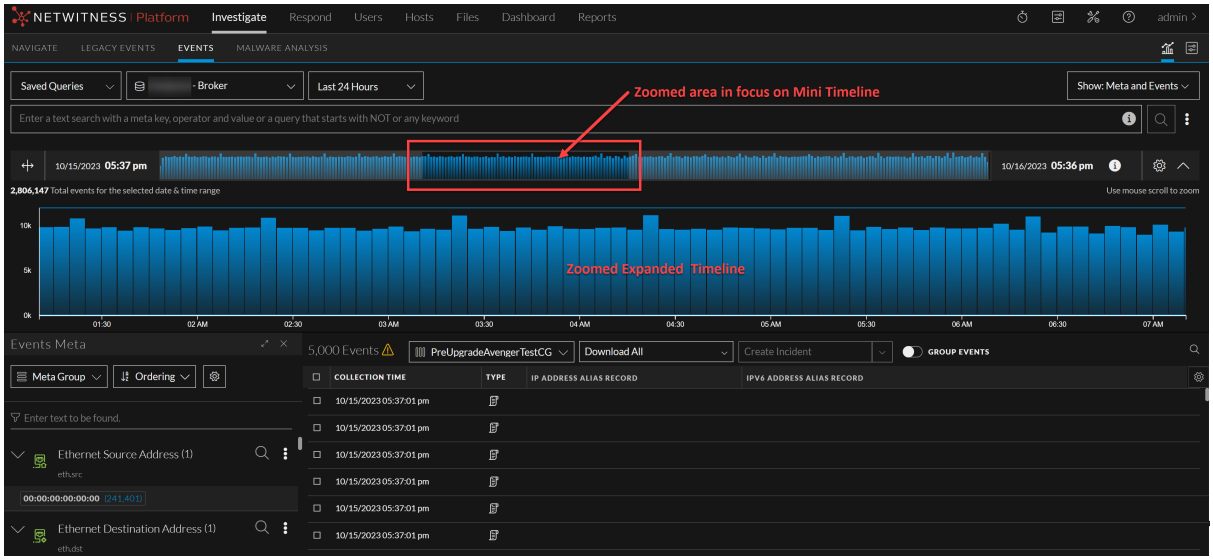
To change the Timeline Settings:

1. Click **Timeline Settings** ().

   The Timeline Settings dialog is displayed.

2. Select the Y-axis data dimension based on your preference:
   a. **Count**: Displays the total number of events that have occurred at a specific time on the timeline.
   b. **Size**: Displays the total size of the events recorded by services at a certain time on the timeline.
3. Click **Apply Changes**. The changes are reflected on the Timeline bar.
4. Click **X** to close the Timeline Settings.

Zoom the Timeline



The Zoom-in or Zoom-out feature within the timeline helps you focus on the events that occurred at a specific time from the query results.

To Zoom in or Zoom out the Timeline:

1. Place the cursor on the expanded timeline and use the scroll wheel on the mouse to zoom in or zoom out the timeline.

   The extent of the zoom-in area will be in focused mode on the Mini Timeline while the rest of the

area is masked with transparent white color.

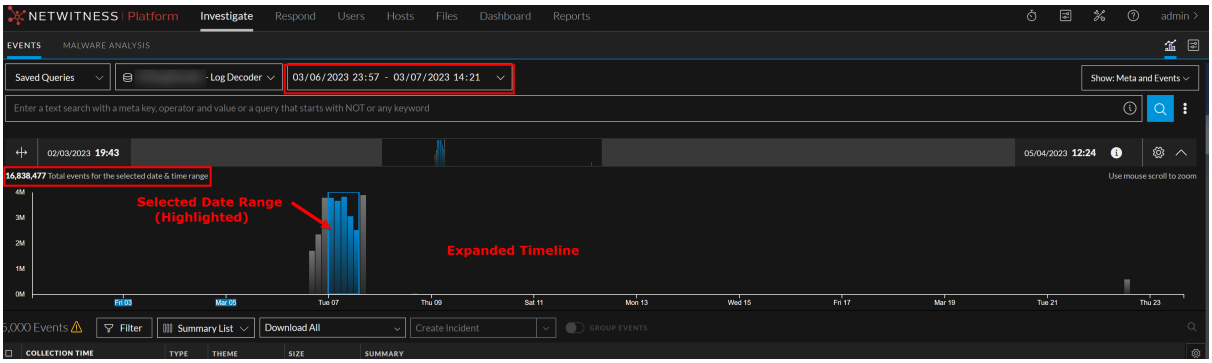
Pan the Timeline

The Pan feature within the timeline helps you move through the timeline while you are in zoomed mode, or a specific time range selection mode on the expanded timeline.

To Pan the Timeline:

1. Hover over any bar in the zoom-in area and **Right Click** + **drag right** or **left** to move through the timeline.

IMPORTANT: When you pan through the timeline, you will notice that the focus area will also change on the Mini Timeline and Expanded Timeline.



Time Range Selection

The Time Range Selection feature assists you in creating a new query depending on your selection of an interested area or focus area on the expanded timeline.

To Select Time Range on the Expanded Timeline:

1. While you are on the Expanded Timeline (with zoom-in or zoom-out mode), **Right Click** + **drag right** or **left** to select the date range of events that you want to focus on and analyze.

   The non-selected area on both Mini Timeline and Expanded Timeline are dimmed in Gray color. The events count of the selected date range will be displayed on the left side of the Expanded Timeline.

2. To modify the selection, you can click and drag the selection to the left or right. In addition, you can also click and drag the left or right ends of the selection box to increase or decrease the selected area.

   The Date Range of the query bar will be changed to reflect the selected date range of the events and the Search button will be highlighted to initiate the new query search.

3. If you further want to analyze the events in the selected time range, click the Search button to initiate a new query based on your selection of an interested area or focus area.

Reset the Query Time Range

The Reset Query Time Range feature helps in resetting the query to the originally requested state.

After an initial query, if you've zoomed or made a selection and want to get back to the original query state quickly, click the  (**Reset the Query Time Range**) button. This action will zoom out the timeline, remove any selections, and resets the Time Range on the query bar.

Refining the Results Set

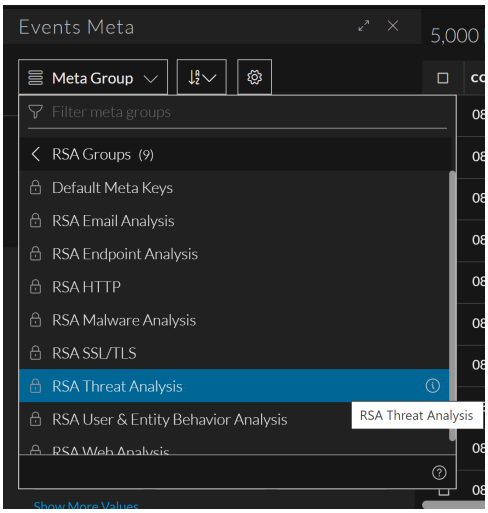
When conducting an investigation, results load faster and it is easier to find what you are looking for if you refine the results to get a smaller number of results. In addition, limiting the time range and submitting a good query gives you more relevant results to answer the question at hand. Use a combination of the methods described in the rest of this section to get the information you need quickly.

- Use Meta Groups to Focus on Relevant Meta Keys
- Use Columns and Column Groups in the Events List
- Use Saved Queries to Encapsulate Common Areas for Investigation
- Filter Results in the Events View
- Filter Results in the Navigate View
- Filter Results in the Legacy Events View
- Create a Query in the Navigate and Legacy Events Views
- Search for Text Patterns in the Navigate and Legacy Events Views
- View and Modify Queries Using URL Integration
- Create a Future Alert from Events View
- Generate Reports from Events View

Use Meta Groups to Focus on Relevant Meta Keys

A meta group combines selected meta keys and meta entities into a group to show only data in which the meta keys and meta entities were found. In the Navigate view and the Version 11.5 and later Events view, you can use meta groups to filter data displayed in the Navigate view (Values panel) and the Events view (Events Meta panel). The same shared meta groups are available for use in both views. Private meta groups created in the Events view are not available for use in the Navigate view or in query profiles in the Legacy Events view.

Note: In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Events Meta panel) in the Events view. The Events view (Events Meta panel) can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.



With a meta group in effect during an investigation, the information in the Values panel or the Filter Events panel shows only the meta keys in the selected group. When you open a Parallel Coordinates visualization in the Navigate view, the meta keys and meta entities in a group appear as axes from left to right. It may be useful to create two versions of each custom meta group; one for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups can be duplicated but cannot be edited or deleted. You can also create your own groups and edit a copy of a built-in group to create a custom group.

All groups in the Navigate view are shared and visible to all users of a service; you can export a group for import to any service, limited by the available meta keys for that service. In the Version 11.5 Events view Filter Events panel, you can create both shared and private custom meta groups; only the shared groups are visible and usable in the Navigate view.

Live Meta Groups

In 11.6 and later, NetWitness supports deploying the investigate content from live. The meta groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The content deployed from Live are marked by the live symbol (). The content is displayed in a folder structure. The groups are displayed as non-editable folders and sub-folders. The number inside **()** depicts the number of contents inside a folder and **>** symbol helps you to drill down inside the folder.

Built-In Meta Groups

NetWitness has built-in meta groups, prefixed with RSA, that are available immediately after installation. The built-in meta groups are useful to focus an investigation on common use cases and to support threat detection using the RSA Hunting Pack. You can copy these groups, give the copy a new name, then edit the copy. These are the built-in meta groups:

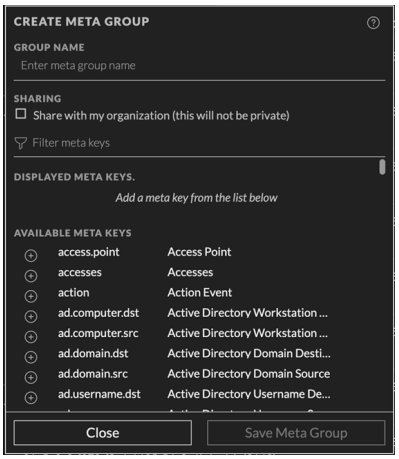
- RSA Email Analysis includes meta keys that outline email interactions.
- RSA Endpoint Analysis contains meta keys that provide insight on processes, files, users, and connections from NetWitness Endpoint (NWE) hosts.
- RSA Malware Analysis includes meta keys that mark indicators of compromise in files contained in events.
- RSA HTTP includes meta keys that provide insight into outbound web traffic.
- RSA SSL/TLS includes meta keys that focus on encrypted web traffic.
- RSA Threat Analysis includes meta keys that mark potential threats in the data set.
- RSA User & Entity Behavior Analysis includes meta keys that encompass all the meta keys to analyze user and entity behavior.
- RSA Web Analysis includes meta keys that mark anomalies in web traffic.

Default Meta Keys Group

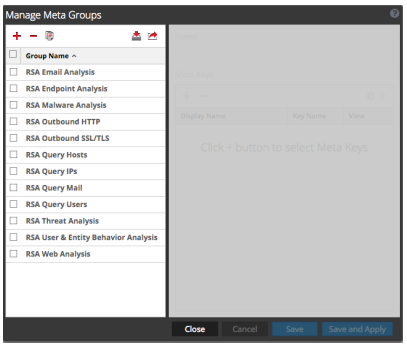
The Default Meta Keys meta group is a special type of built-in meta group that consists of all the meta keys for the currently selected service, returned in the order of appearance in the index file for the service. Unlike the other built-in meta groups, you cannot copy this group and you cannot see which keys are included when you view information in the Meta Group Details dialog; instead, a message in the Details dialog explains that the group includes all meta keys for the selected service The Default Meta Keys group is always at the top of the list in the Meta Groups menu.

The Default Meta Keys group is used to select meta keys shown in the Events Meta panel when no meta group has been selected and none exists in local storage. You can also select this group as you would any other group. When using the Default Meta Keys group in the Events Meta panel, only the first 30 meta keys with values are open and the remaining are closed.

Custom Meta Groups



You can create custom meta groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in meta groups after the service is restarted. Custom meta groups can be shared or private . Shared meta groups are available globally within your organization in the Navigate view and in the Events Meta panel. If you edit a shared custom meta group, your changes are applied globally. If you delete a shared custom meta group, the group is deleted and no longer available for all analysts. The Navigate view supports only shared groups. When you create custom meta group in the Events view, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.



Note: Private custom meta groups created in the Events view are not visible or usable in the Navigate view.

Icons identify the group type in the Meta Groups menu. These are examples of each type of custom meta group with the edit icon displayed at the end of the row.

While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Meta Group dialog and the (Navigate view) Manage Meta Groups dialog.

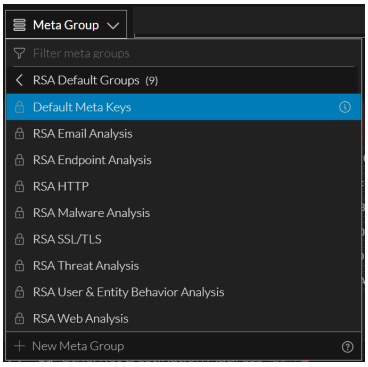
Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Copy and edit the copy of a built-in or custom meta group.

Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group.

The rest of this topic provides instructions for working with meta groups in the 11.5 Events view and the Navigate view.

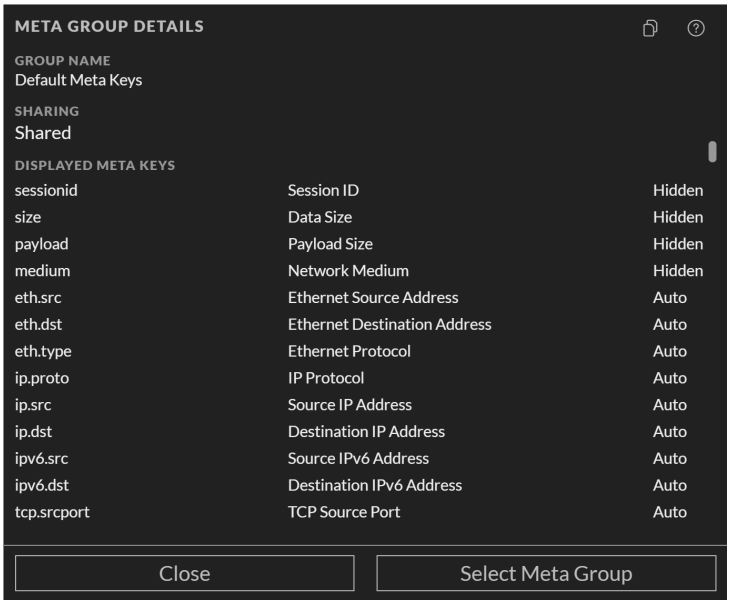
Work with Meta Groups in the Events View



After the upgrade to Version 11.5 or later, all of the existing meta groups -- both built-in and custom -- are available for filtering events in the Filter Events panel. The meta group selection persists between logins unless browser cache is cleared.

View the Meta Keys in a Meta Group

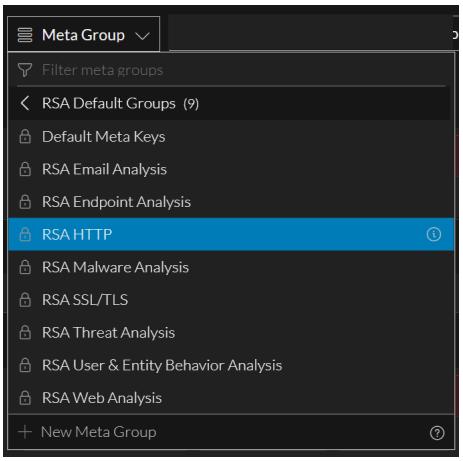
To view details of a meta group:



1. Go to **Investigate** > **Events** and click  to load events.
   The events for the default service and the default time range are loaded in the Events panel.
2. To display the Events Meta panel, click 

above the Events panel.
   The Events Meta panel opens to the left of the Events panel.
3. To display the Meta Groups menu, click the Meta Groups menu title. The menu title is either Meta Group: Default Meta Keys or Meta Group: <currently selected meta group>. If this is your first visit after logging in, the Default Meta Key group is selected; any subsequent visits use the meta group selected in the previous session. If the selected meta group from the previous session is deleted, the Default Meta Keys group is selected when you log in. When opened, the menu displays a list of built-in meta groups (RSA), shared custom meta groups, and your private custom meta groups. Above the list, visibility options and a filter make it easier to find a particular meta group.

4. (Optional) To filter the listed meta groups by name, type some text in the **Filter Meta Groups** field. The list is updated to show only the group names that contain the exact text.



5. Hover over the meta group name and click the information icon ( ) to see which meta keys are included in the group.
   The figure on the left shows the columns for the RSA HTTP meta group. The figure on the right shows the columns for the Default Meta Keys meta group.

6. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the meta group, click **Select Meta Group**.
      The dialog closes and the Filter Events panel is updated to reflect the meta keys in the selected meta group.

Select a Meta Group

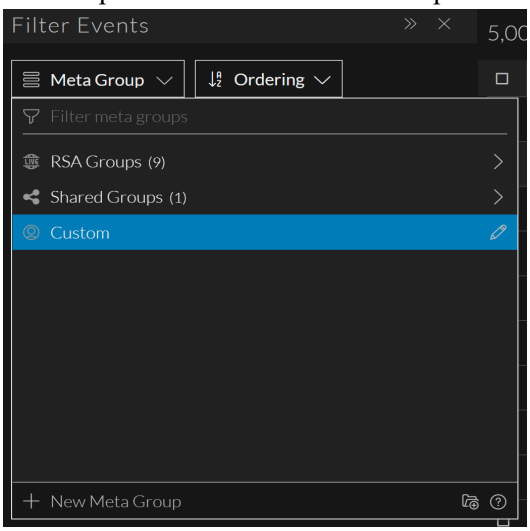
1. With the Events Meta panel open in the Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with a filtering option and a New Meta Group option. The list is sorted alphabetically and the name of the selected meta group is displayed in the menu label. This figure shows the menu after RSA HTTP was highlighted, but not selected.

2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. Begin typing text in the **Filter Meta Groups** field to search for a meta group name. As you type, the list is filtered to show only the meta group names that contain that string.
   When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
   The Events Meta panel is refreshed to include only meta keys in the selected meta group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view.

Note: If a meta key in a meta group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

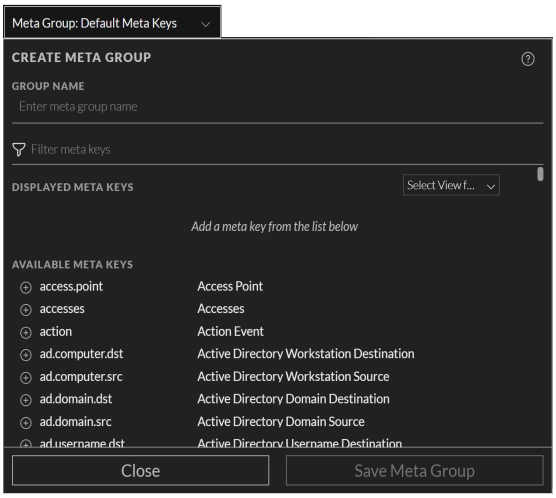
Create a Custom Meta Group

Custom meta groups must have a unique name up to 80 characters in length, and must have at least one meta key. If any other meta group has the name you type, whether shared or private, a message informs you that you need to use a different name. The Save Meta Group button is enabled when these criteria have been met. You can adjust the order of meta keys in a group by dragging keys in the Displayed Meta Keys list.



You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting).

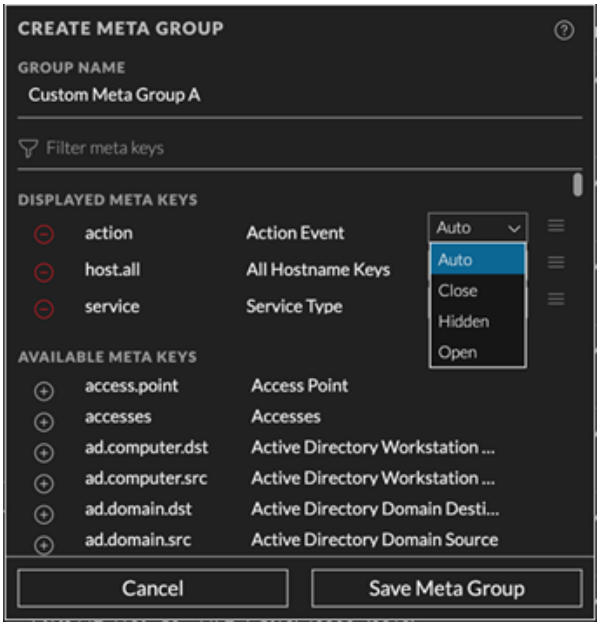
Note: You can also set the desired value for all meta keys at once. Make a note that changing the value of all meta keys might impact the performance.



- When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto.
- Open meta keys are listed in the Events Meta panel, and the values are loaded.
- Closed meta keys are listed in the Events Meta panel, but the meta values are not loaded until you open the meta key.

- Hidden meta keys are not listed in the Events Meta panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state.

1. With the Events Meta panel open in the 11.5 Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group and Folder icon option at the bottom.



2. Select + **New Meta Group**.
   The Create Meta Group dialog is displayed.

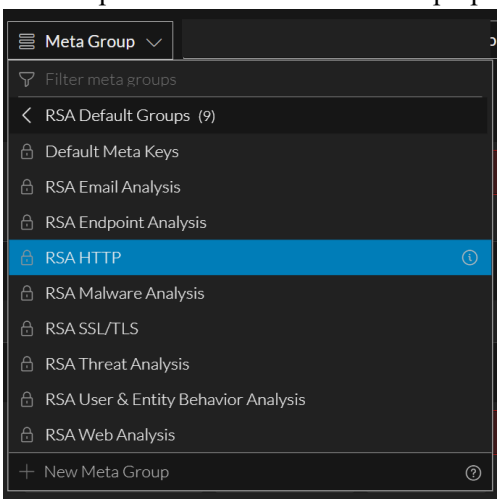
3. In the **Group Name** field, type a unique name (maximum length of 80 characters) for the new meta group, for example, **Custom Meta Group A**.
4. If you want to share the new meta group with your organization, set the **Share with my organization** option.

5. To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.
   b. When you see the meta key that you want to add, click the add icon that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) The maximum number of meta keys in a meta group is 500. If you attempt to add another meta key when 500 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

6. (Optional) Next to each meta key, choose the initial view for the meta key: **Open**, **Close**, **Hidden**, or **Auto**.
7. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the meta key that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom meta group, click **Cancel**.
   b. To create the group, click **Save Meta Group**.
   The new meta group is saved. If the new group is shared, it becomes available for all analysts. If

it is private, only you can use the meta group. The buttons change to Done and Select Meta Group.

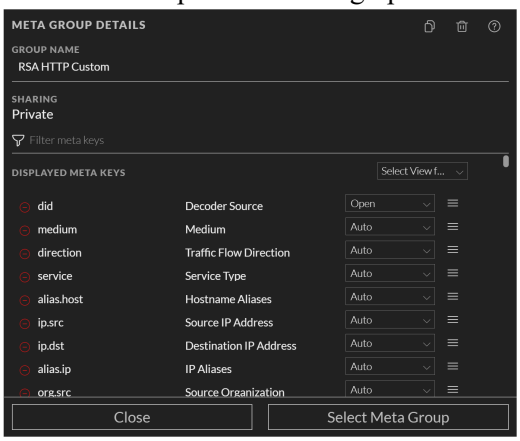
10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new meta group, click **Select Meta Group**.
    The new group is added to the Meta Groups menu (in alphabetical order), and if you clicked Select Meta Group, the Filter Events panel is updated to show the meta keys and values in the new meta group.



Delete a Custom Meta Group

You can delete any custom meta group, shared or private, that is not currently applied in the Events list and not used in a query profile. When you click the Delete button, a confirmation message allows you to confirm or cancel the deletion. If a meta group is being used in a query profile, the Delete button is disabled and a message identifies the query profile in which the meta group is used. The built-in meta groups are read only, and cannot be deleted.

Caution: When you delete a shared meta group, the effect is global and the group is no longer available to any analyst.

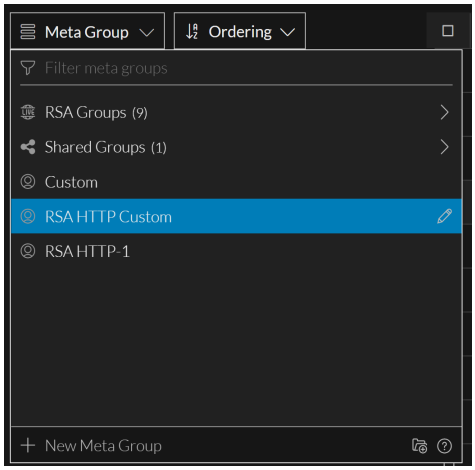


To delete a custom meta group

1. With the Events Meta panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group option at the bottom.

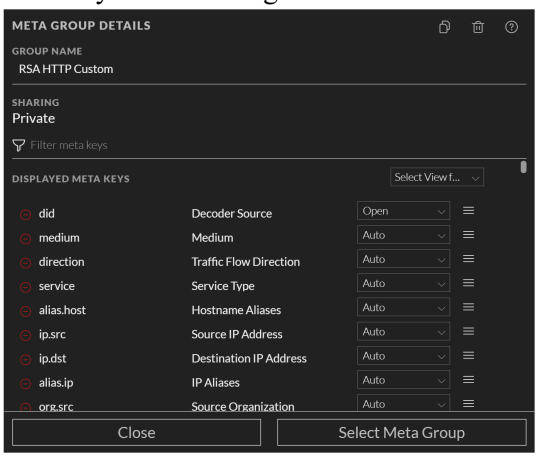
2. To delete a meta group, highlight a custom meta group and click the edit icon ( ) to the right of the name.

3. The Meta Group Details dialog opens with the details for the selected group displayed.



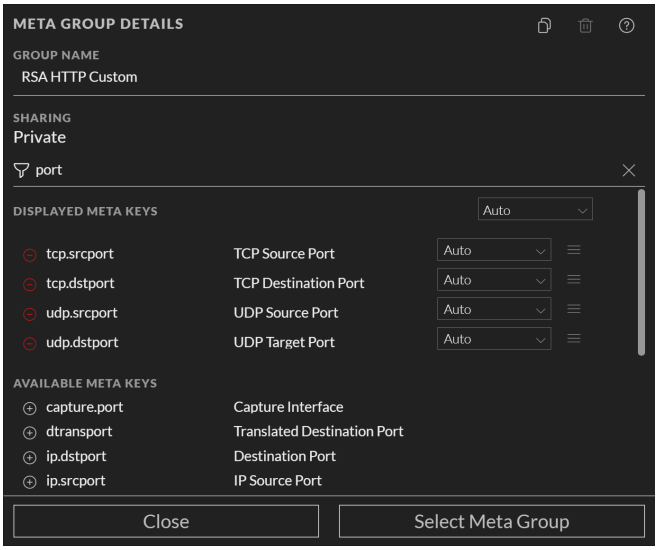
4. Click the delete group icon ( ).
   If the meta group is currently in effect, the following message is displayed: `This meta group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Meta Group**.
   The group is deleted and removed from the Meta Group menu. The meta group no longer appears anywhere for any analyst working in Investigate.

Edit a Custom Meta Group



You can edit a shared custom meta group, your own private meta group, a copy of a built-in meta group or a copy of live meta groups.

1. With the Events Meta panel open in the Events view, click the **Meta Group** menu title and highlight the meta group that you want edit. This figure shows private column group RSA HTTP Custom highlighted with the edit icon is displayed to the right.



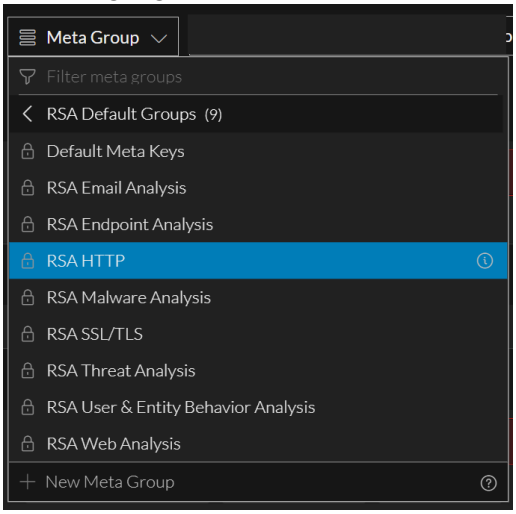
2. Click the edit icon ( ).
   The Meta Group Details dialog is displayed so that you can edit the location. You can add or delete

meta keys and rearrange the order of the meta keys in the list.

3. (Optional) In the **Group Name** field, edit the name and location of the meta group.
4. (Optional) To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key. For example, type **port** in the **Filter meta keys** field.

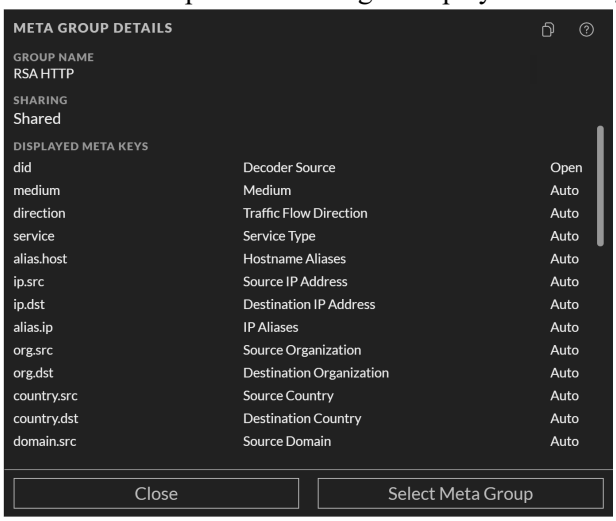
   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
5. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Displayed Meta Keys** list, or simply scroll through the list. When you see the meta key that you want to remove, click the remove icon () that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.

6. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
7. Do one of the following:
   a. To close the dialog without saving the changes to the custom meta group, click **Reset**.
   b. To save the edits to the meta group, click **Update Meta Group**.
   The updated meta group is saved, and the dialog is closed.



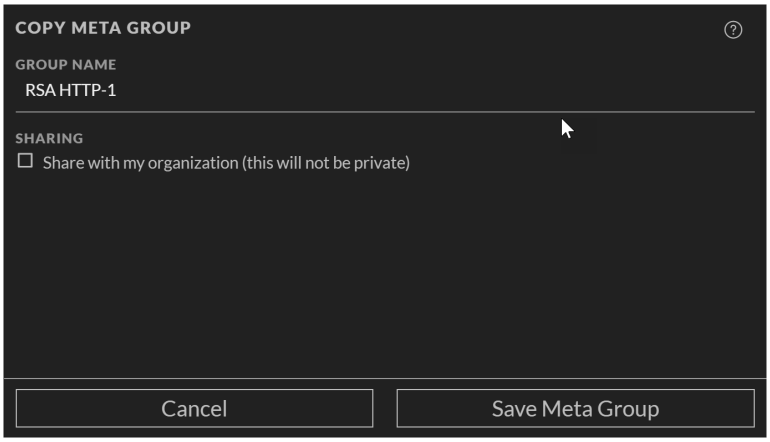
Copy a Meta Group (Version 11.5 and Later)

You can copy any meta group, built-in or custom, Live meta group, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a meta group, the same name is used with a number appended. For example, if you copy RSA HTTP twice, the first copy is named RSA HTTP-1, and a second copy is named RSA HTTP-2. After you copy the group, you can edit the copy to give it a new name and manage meta keys in the group.



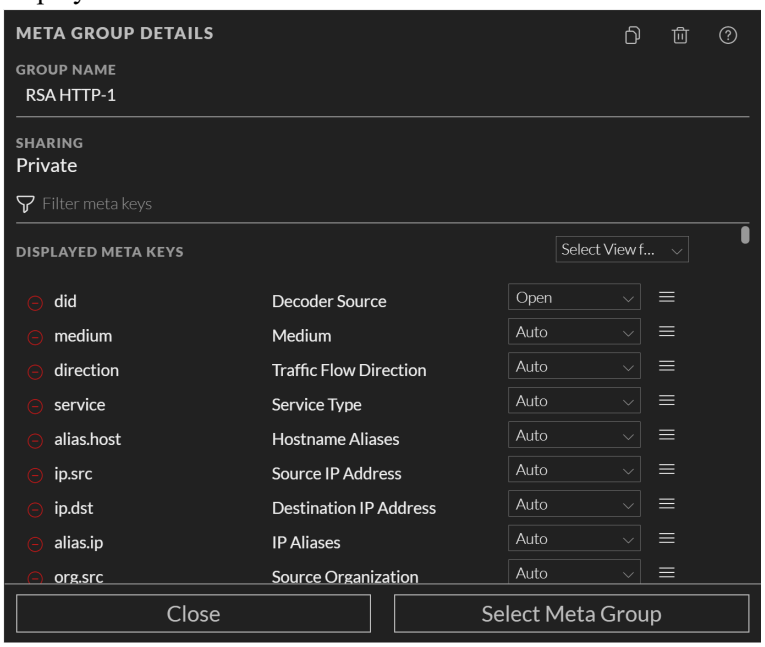
Note: Some meta groups created in the Legacy Events view may have more 500 meta keys, which is above the limit for meta groups in the Events view. If you copy a group with more than 500 meta keys, you must remove the excess meta keys when you edit the meta group.

To copy a meta group:



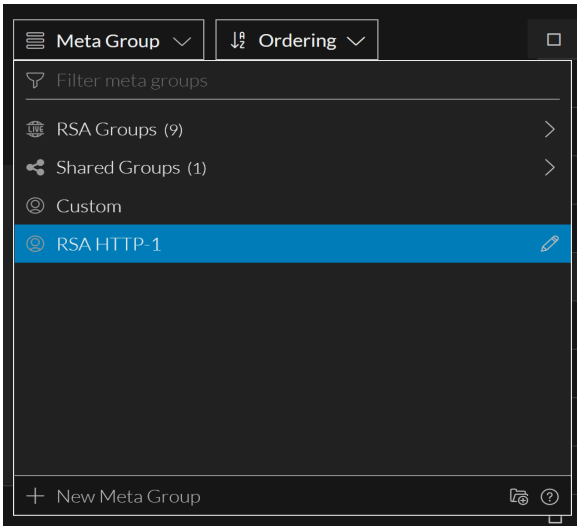
1. With the Events Meta panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders.
2. Highlight the meta group that you want copy.
   If you highlighted a built-in meta group, the information icon ( ) is displayed to the right. If you highlighted a custom meta group, the edit icon ( )is displayed to the right. This figure shows RSA HTTP highlighted.

3. Do one of the following:
   a. Click the information icon ( ).
   b. Click the edit icon ( ).
   The Meta Group Details dialog is displayed. This figure shows the dialog for a built-in group.



4. Click the Copy icon ( ).
   The Copy Meta Group dialog is displayed with a `-n` appended to the original meta group name.

5. (Optional) In the **Group Name** field, edit the name and location of the meta group.
6. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the meta group, click **Save Meta Group**.
   The copy of the meta group is saved, and the Meta Group Details dialog for the copied group is



displayed.

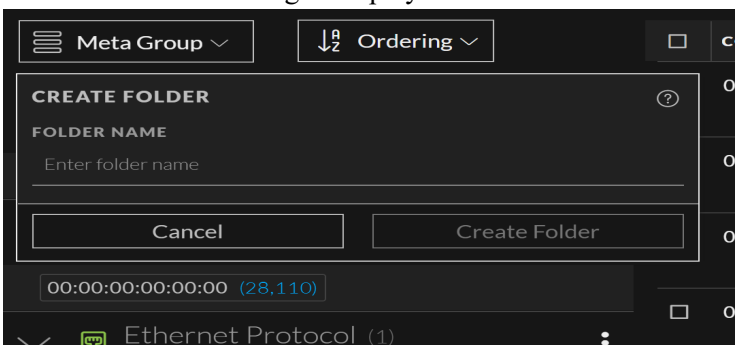
7. Do one of the following:

   a. To close the dialog without editing, click **Close**.

   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA HTTP meta group.

Meta Group Folders

Users can create editable Shared and Private group folders. The contents of a private group folder and their contents are displayed outside RSA Groups and Shared group folders. For example, the below image shows private content below the Shared Groups folder.

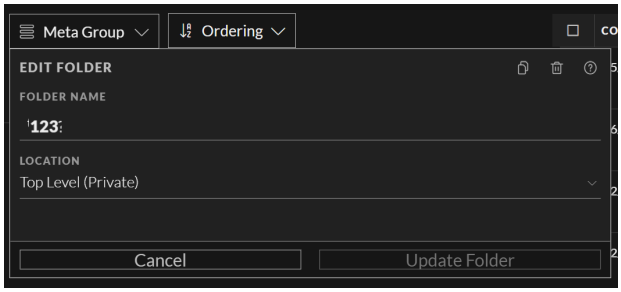


This section describes how to add, edit, import, export, copy, and delete custom meta groups and folders.

Create a Meta Group Folder

You can create meta group folders as shared and private folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Meta Groups menu title. The menu drops down to display a list of meta groups and folders.
2. Click .
   The Create Folder dialog is displayed.

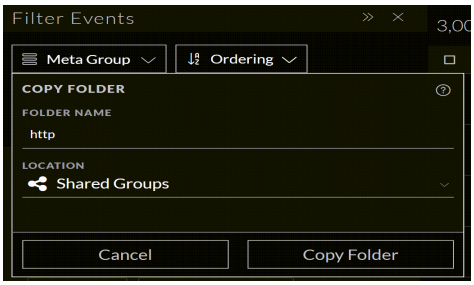


3. In the **Folder Name** field, type a unique name for the new meta group folder.
4. Click **Create Folder**.

Edit and Move Meta Group Folder

After you create a meta group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. With the Filter Events panel open in the 11.6 Events view, click the Meta Group menu title and highlight the meta group that you want edit.

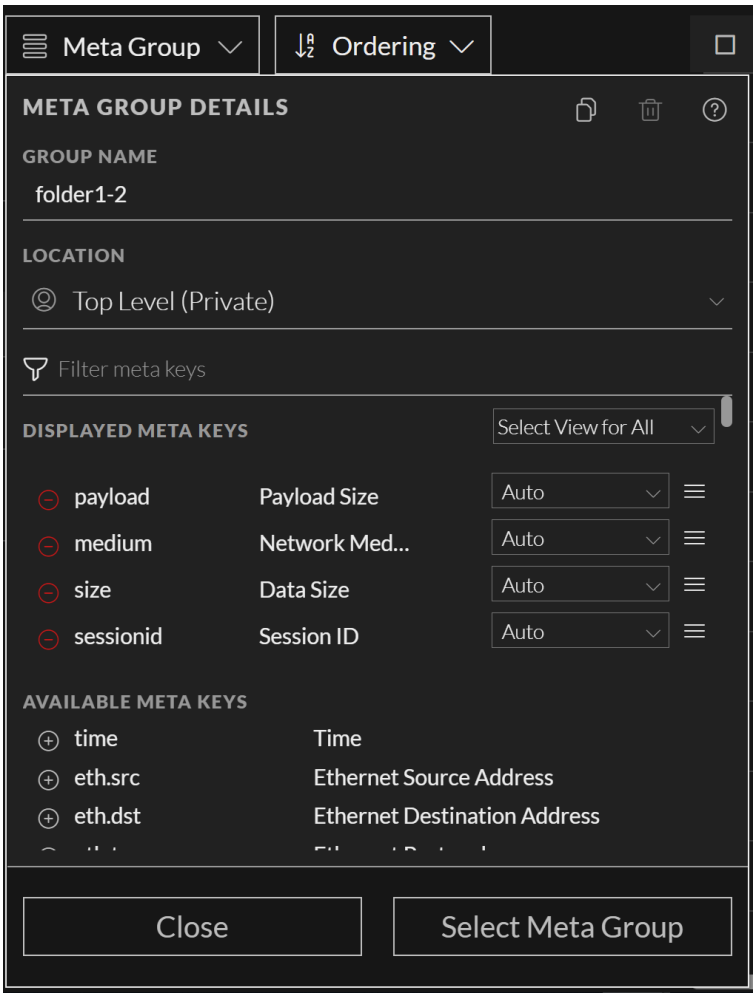


2. Click .
   The Edit Folder dialog is displayed.

3. In the **Folder Name** field, type a unique name for the meta group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Meta Group Folder

Users can copy any type of meta group folders namely - RSA , Shared and Private. However, by default for RSA groups copy folder will create a copy in the private section (root level) but can change the location of the folder to a shared folder or any other private folder. The meta group can be copied by clicking the clone icon ( ). After copying, the meta group folders are displayed selected location (Shared or Private category). You can hover over on the copied item to view a tooltip that indicates the path from which the meta group has been copied. In case you need to search for a specific meta group, you can type the name of the meta group in the filter field ( ) at the folder level and the meta group will be filtered from the selected folder.



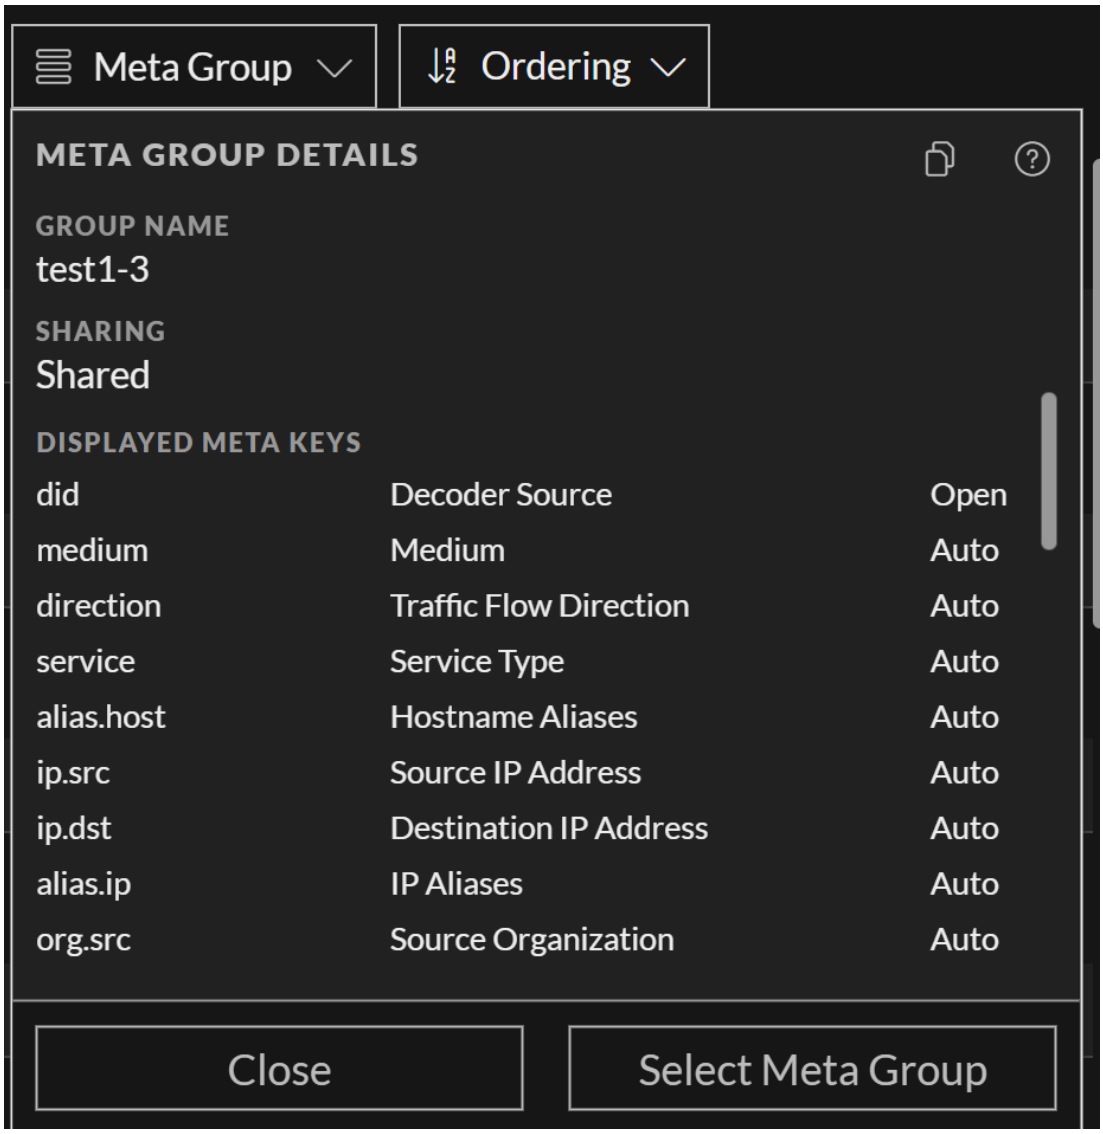
Copying Meta Group Private or Shared Folders

You can copy meta group folders from RSA groups to private and RSA groups to shared, private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

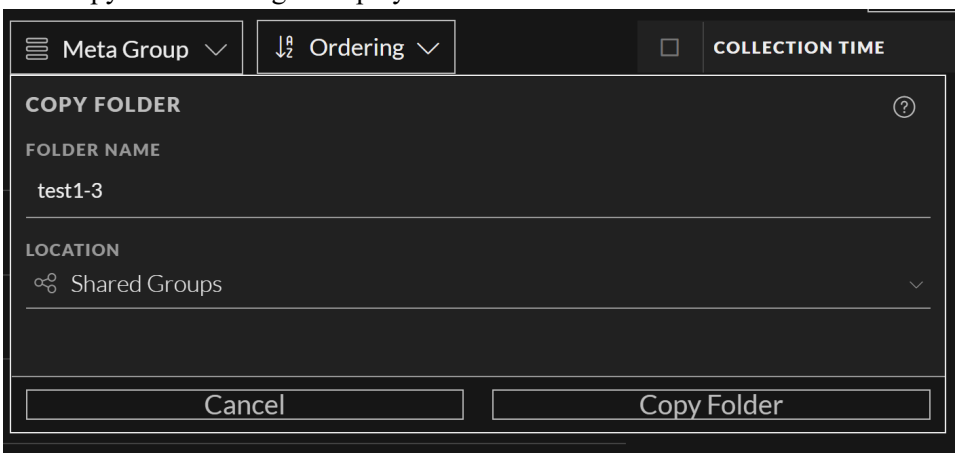
1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder you want to copy.

3. Click edit and then click copy .

The Copy Folder dialog is displayed.



4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be copied.
6. Click **Copy Folder**.

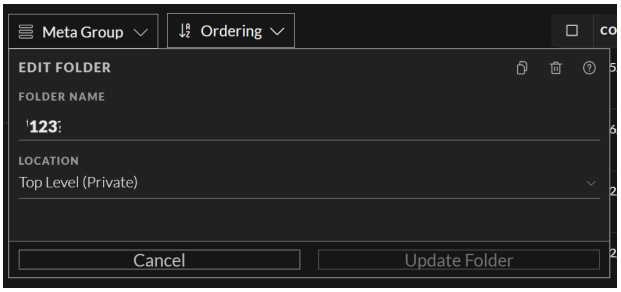


Copy Meta Group Folder Deployed from Live

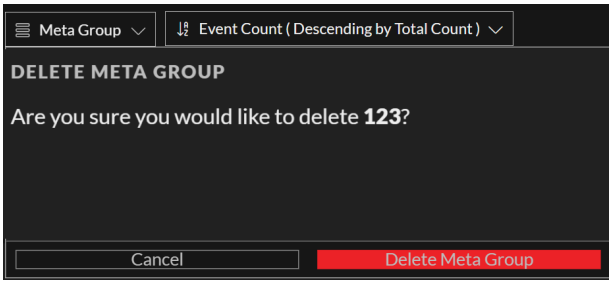
You can copy meta group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Events Meta panel open in the Events view, click Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Click on RSA groups and select a Live Meta Group folder you want to copy.
3. Click  and the click copy .

The Copy Folder dialog is displayed.



4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder and the first level contents are copied, sub-Folders are not copied. The copied Meta Group Folder and its contents are displayed as the original meta group name appended with a -n .

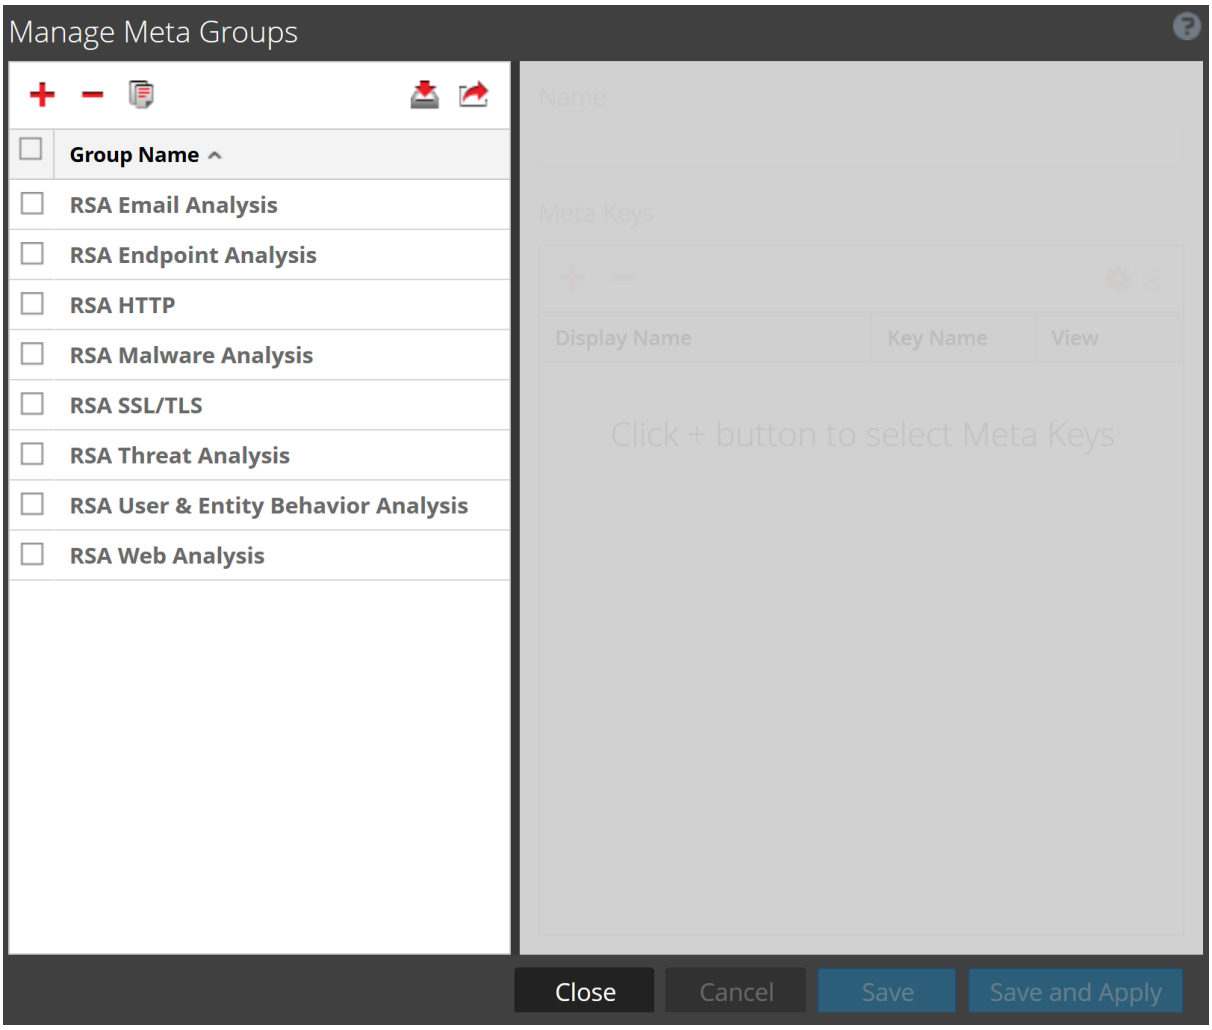


Delete Meta Group Folder

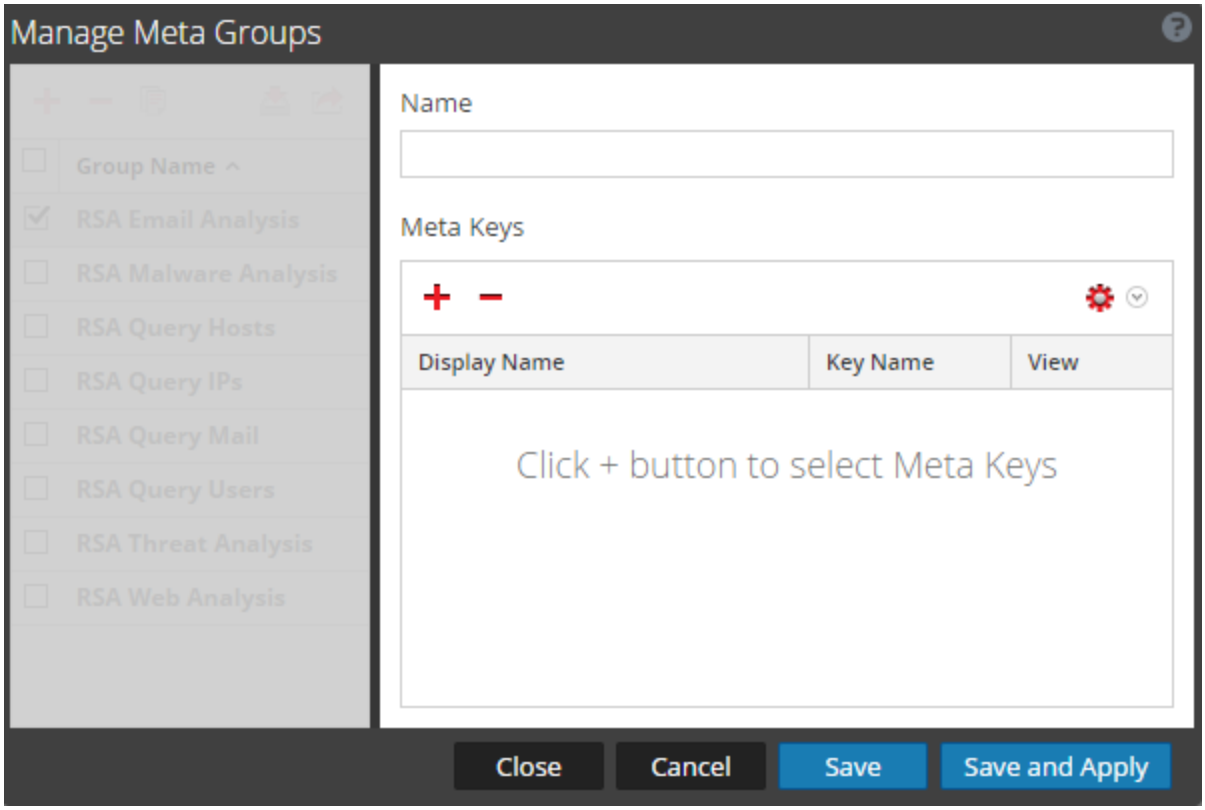
If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.



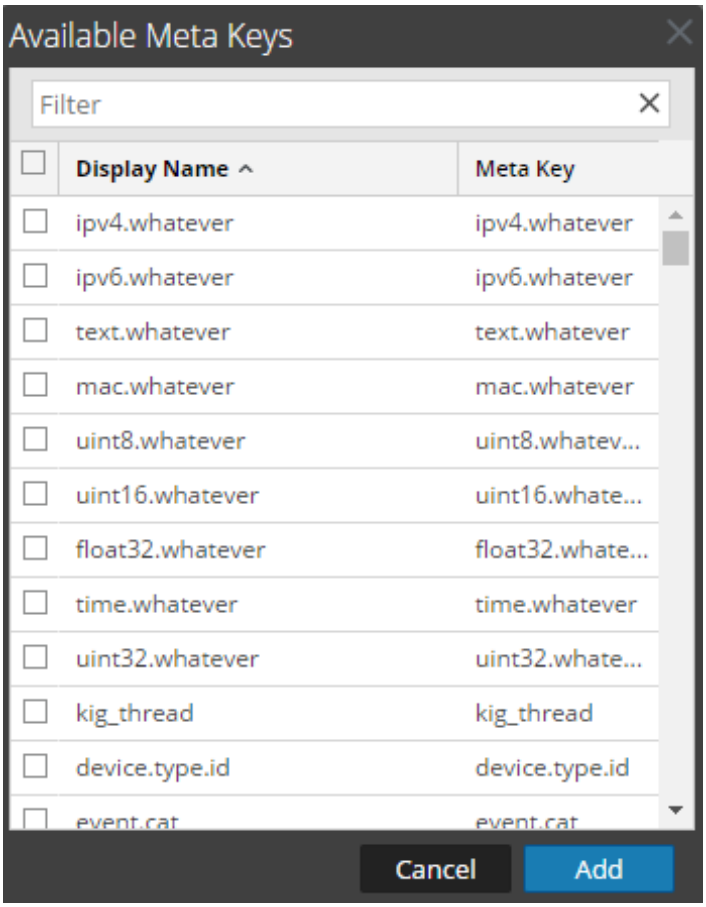
5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.



Work with Meta Groups in the Navigate View

Create a Meta Group and Add Meta Keys

1. While investigating a service in the **Navigate** view, select **Meta** > **Manage Meta Groups** in the toolbar.
   The Manage Meta Groups dialog is displayed. Initially only built-in groups are configured for a service and listed under Group Name. If other custom groups have been configured, they are also listed under Group Name.

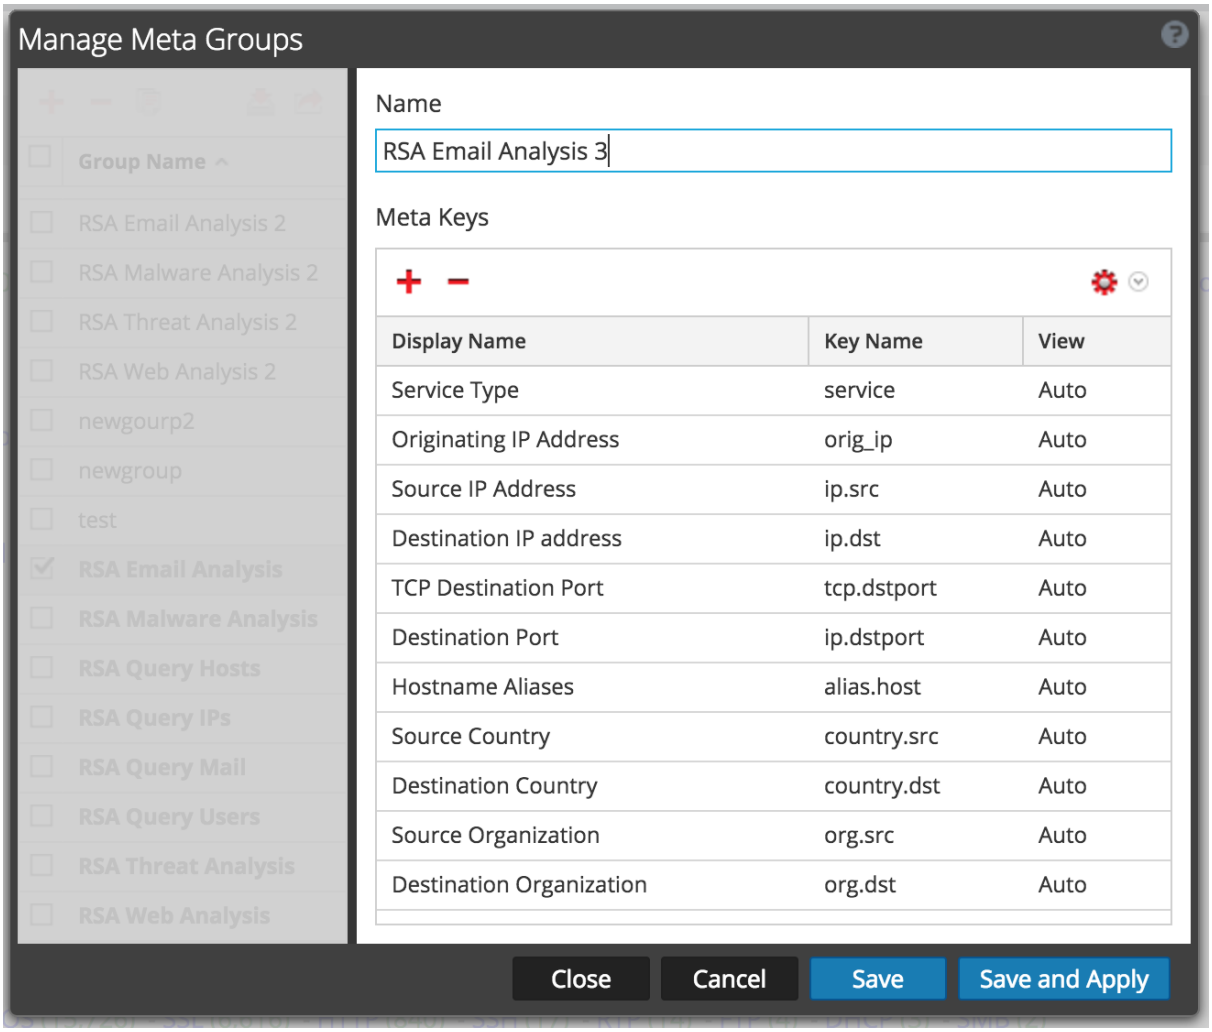


Manage Meta Groups
Group Name
RSA Email Analysis
RSA Endpoint Analysis
RSA HTTP
RSA Malware Analysis
RSA SSL/TLS
RSA Threat Analysis
RSA User & Entity Behavior Analysis
RSA Web Analysis
Name
Meta Keys
Display Name
Key Name
View
Click + button to select Meta Keys
Close
Cancel
Save
Save and Apply

2. In the toolbar at the top of the Meta Groups list, click +.
   The form to the right opens for editing.

3. Type a name for the new meta group in the **Name** field.

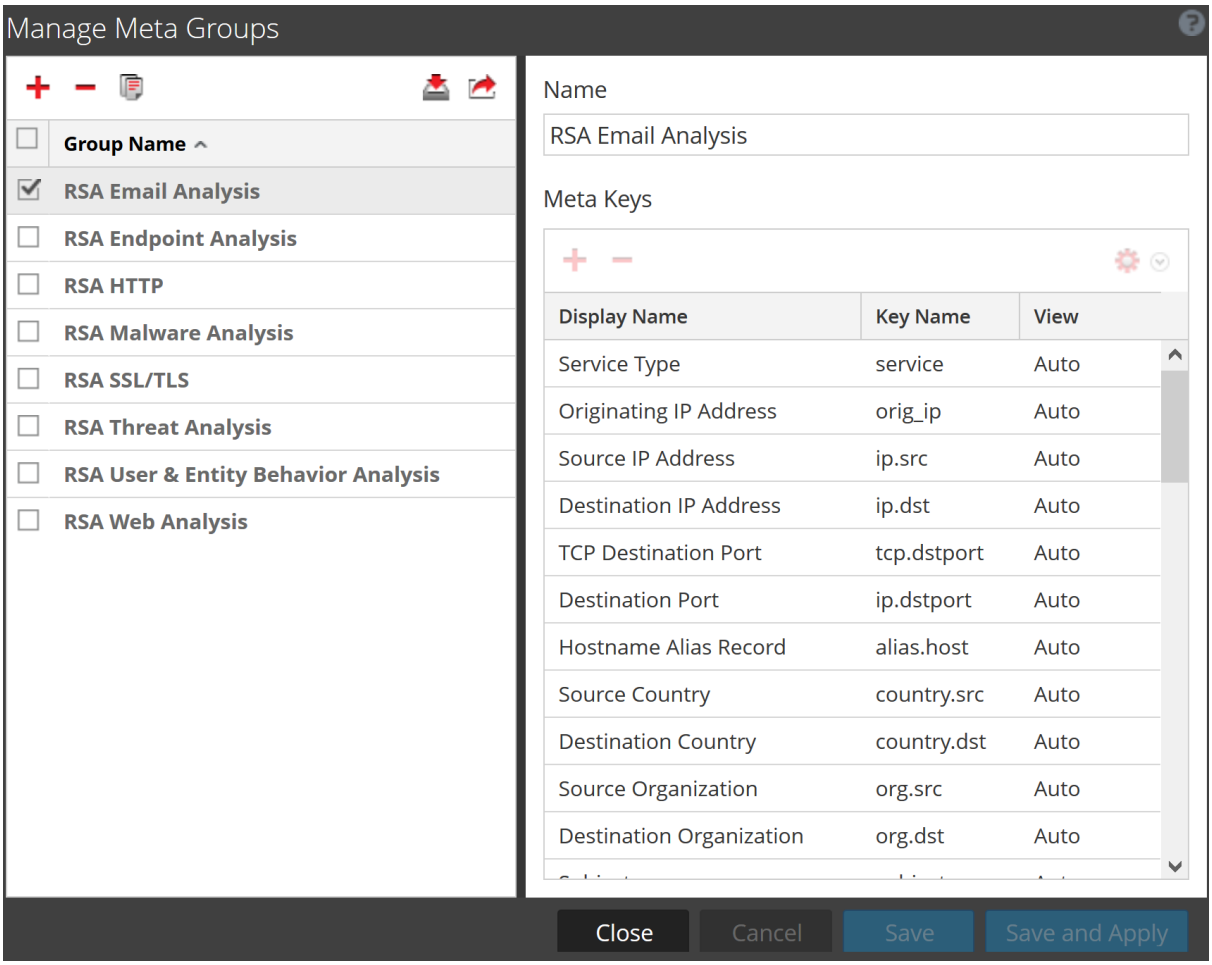
4. In the **Meta Keys** toolbar, click +.
   The Available Meta Keys dialog is displayed, with keys in alphabetical order.



5. To filter the list of meta keys, type a word or phrase in the **Filter** field and press **Enter**.
   The list displays matching meta keys based on a case-insensitive search. Delete the filter text and press **Enter** to remove the filter.
6. To select individual meta keys to include in the meta group, select the checkboxes. To select all meta keys, select the checkbox in the title bar and click **Add**.
   The selected meta keys are added to the meta keys list.
7. (Optional) If you want to change the order in which the meta keys load and are listed in an investigation, click and drag one or more meta keys to a new position.
8. To finish creating the meta group do one of the following:
   a. To save the meta group, click **Save**.
      The group is created and available for use.
   b. To save and apply the meta group to the current Investigation view, click **Save and Apply**.
      The group is created and applied immediately to the current Investigation view.
9. Click **Close**.

Copy and Edit a Meta Group

If you want to customize a built-in meta group, you need to duplicate the group and then edit the duplicate.



1. Select a built-in meta group from the Manage Meta Groups list and click .
   The form to the right opens for editing with all of the meta keys as they are in the built-in group.

2. Enter a name for the new group and continue editing as described in "Edit a Meta Group" below.

Edit a Custom Meta Group

1. Select a custom group from the **Meta Groups** list.
   The form to the right opens for editing.

2. (Optional) Edit the Name of the group.
3. (Optional) Add new meta keys, as described above in "Create a Meta Group and Add Meta Keys."
4. (Optional) To set the order for the keys, drag and drop one or more keys.
5. (Optional) To change the initial view of a meta key, click  and choose one of the possible views.
   When you modify the meta group, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
   The value for the initial view is displayed in the View column.
6. To save, the changes, click **Save**.
7. To apply the changes to the current Navigate view, click **Save and Apply**.

Delete a Meta Group

1. In the **Meta Groups** list, select the group to be removed.
2. Click −.
   A confirmation dialog provides an opportunity to cancel or complete the request.
3. Click **Yes**.
   The meta group is deleted. When you close the window, if the deleted group was the currently applied meta group, it is removed and the default meta keys are used to build the view.

Export a Meta Group

User-defined meta groups are created on individual services. To make meta groups available to another service, you must export them to your local file system. To export one or more meta groups:

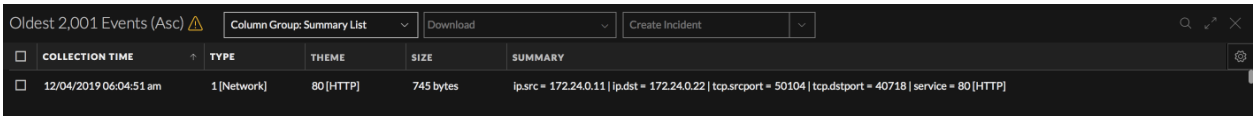
1. In the **Meta Groups** list, select one or more groups to be exported.
2. Click  .
   The selected groups are downloaded to your local file system as a **MetaGroups.jsn file**. Every download of meta groups has the same name with a numeral appended to avoid overwriting previous downloads.

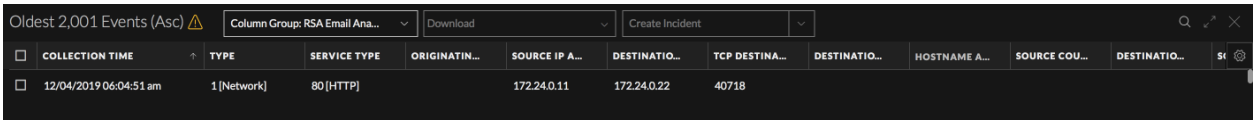
Import a Meta Group

To make user-defined meta groups from another service available to the currently investigated service, you must import the `MetaGroups.jsn` file from the local file system. When you import meta groups, an error message is displayed if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To import meta groups

1. In the **Meta Groups** list, select a file to import and click  .
   The selection dialog is displayed.

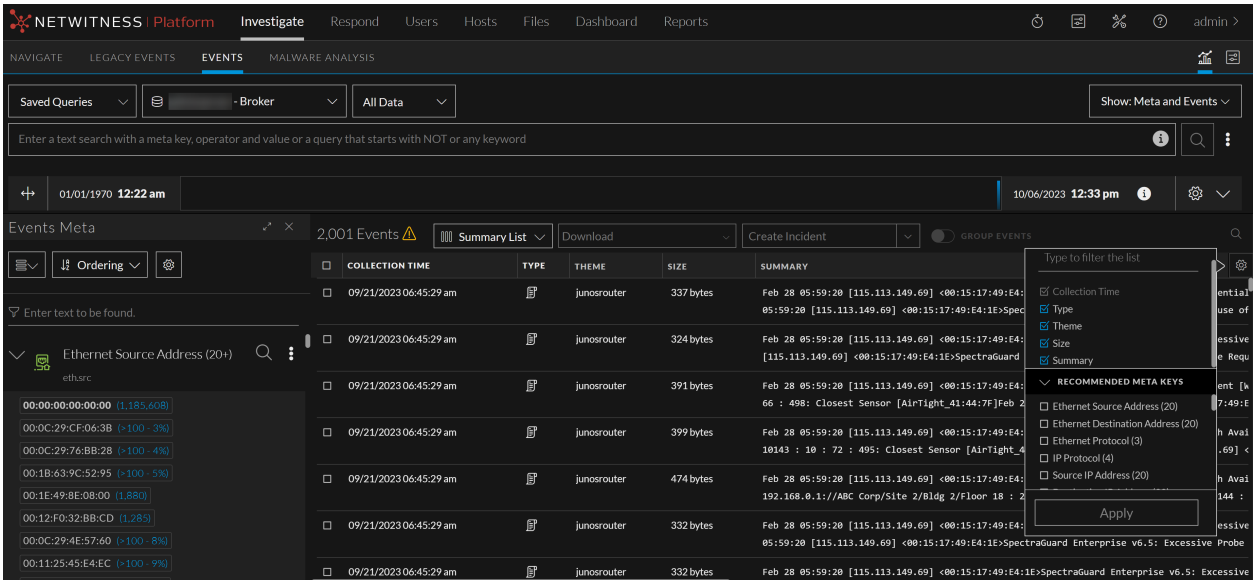




2. Click **Browse** and navigate to the directory on your local file system where the downloaded `MetaGroups.jsn` files are stored. Select a file and click **Open**.
   The filename is displayed in the Upload File field.

3. Click **Upload**.
   The upload process begins, and a message indicates that the upload was successful. The meta groups are added to Meta Group list. If the file is a duplicate of an existing meta group, a dialog tells you that the meta group already exists.

Use Columns and Column Groups in the Events List



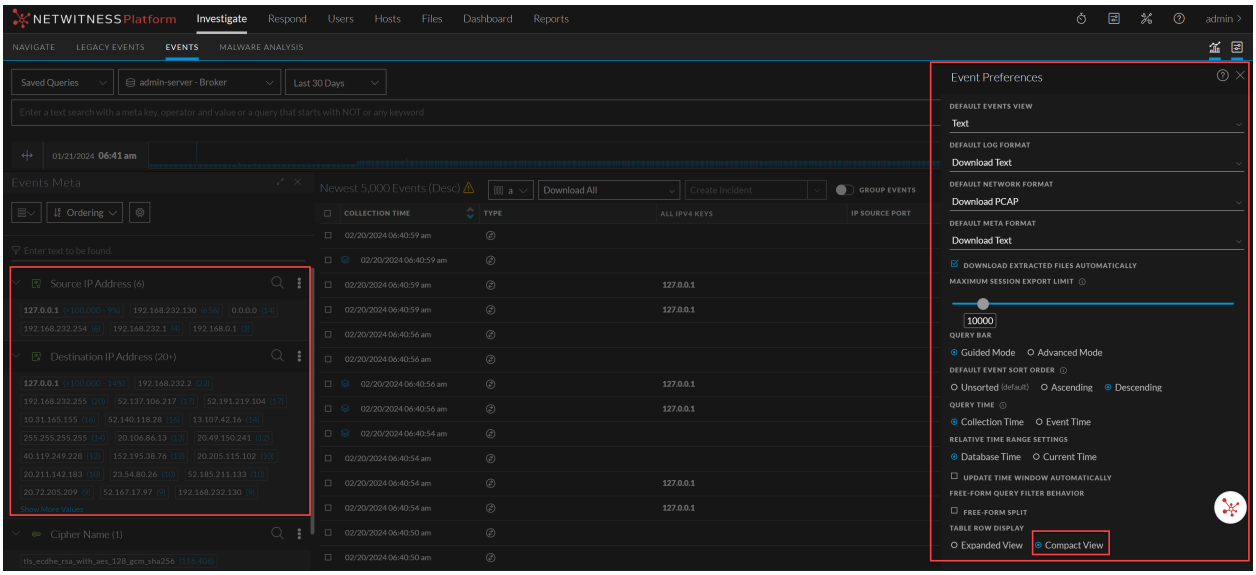
When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, compare these two figures showing the same set of events with different columns. The first figure has five columns, **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The second figure has many more columns that contain information useful when investigating email; you can scroll to the right to see the additional columns.

You can adjust the events list as you work, selecting different columns to be displayed, rearranging the order of the columns, changing the width of the columns, and choosing a column by which the list is sorted. Manual adjustments are easy to make if you know which meta keys are relevant. Manual adjustments apply only to the current session in Version 11.5; in Version 11.5.1, the column width is an exception. When you adjust the column width, it is preserved as a personal preference and is applied every time the column is used in the Events list, overriding any default column width.

In version 11.6, you can select additional columns with data for the meta keys that you are viewing. This will enable you to obtain all the relevant meta key information from the Filter Events panel however the recommendations can change based on the selected meta groups. The following figure displays the additional meta key information under the Recommended Meta Keys section.

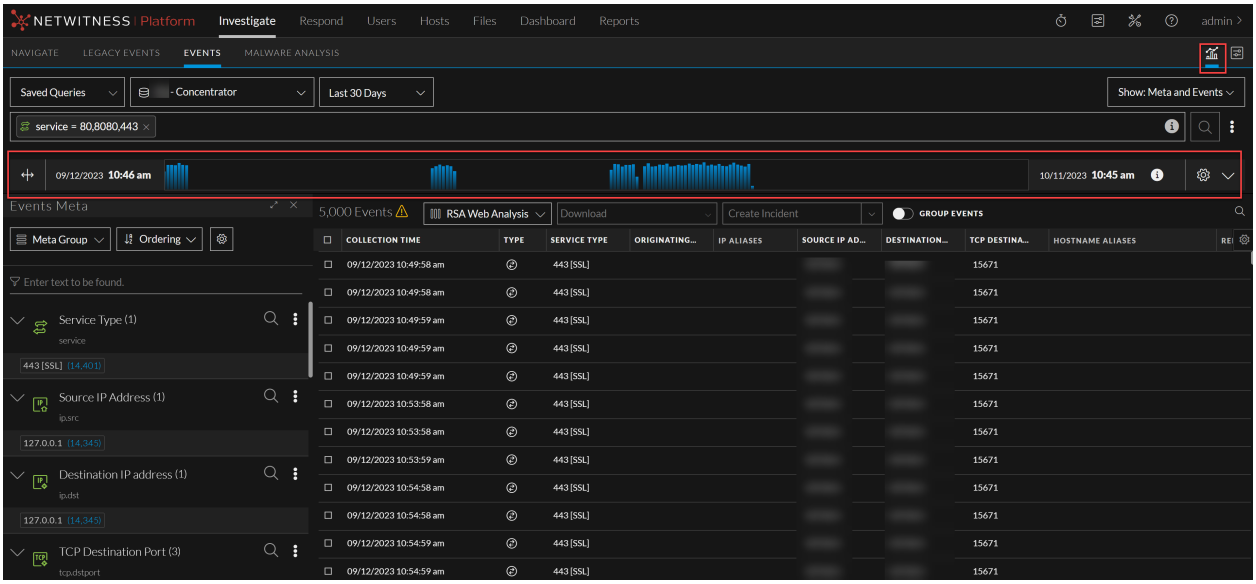
To improve your ability to see relevant meta keys quickly when looking at events in the Legacy Events view and the Events view, you can change the set of meta keys displayed by applying a column group. A column group defines the meta keys or meta entities that are displayed as columns, the position of the column in the Events list, and the default width of the column. A column group must have at least one column. Column groups are useful in themselves, and they become even more useful when you combine them with meta groups and preQueries to define query profiles (see Use Saved Queries to Encapsulate Common Areas for Investigation).

The same column groups are shared between the Legacy Events view and the Events view. When importing a column group, the imported group is limited to the available meta keys for the service being investigated. Private column groups created in the Events view are not available in the Legacy Events view or for use in Query Profiles in the Navigate view.



Note: In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Filter Events panel) in the Events view. The Events view Filter Events panel can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.

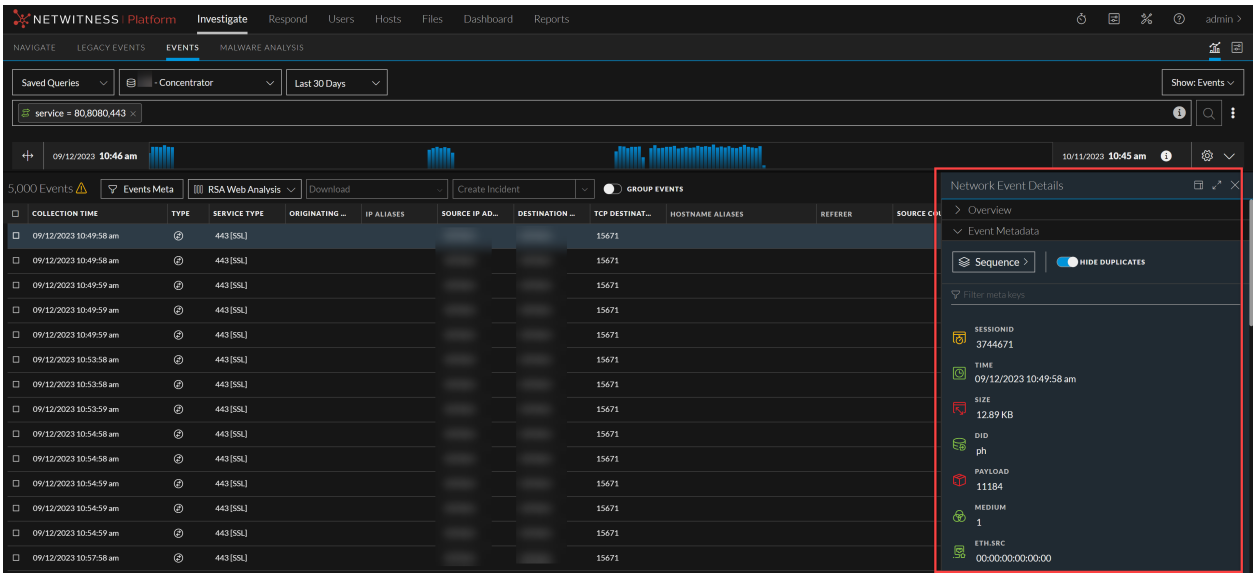
Large column groups can have a performance impact when loading data because the values for each meta key are loaded in the events list. To minimize impact on performance, the Events view has a fixed limit on the number of meta keys in a column group. The maximum number of meta keys in a column group is 40. (Because several default meta keys are included you may see a few more than 40 displayed on the screen.) Meta keys that are not in the selected column group are not loaded in the events list. By default we load all columns in the group, but only 15 are displayed by default.



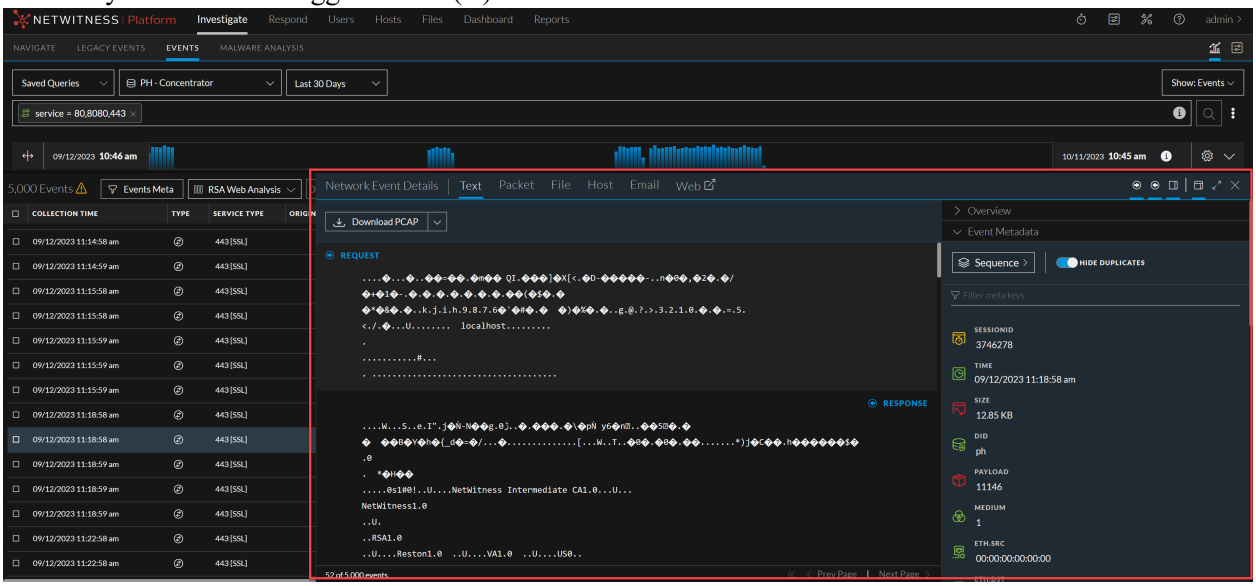
The Legacy Events view does not have a limit on the number of meta keys in a column group, and may have more than 40 meta keys in a column group. If you apply a column group with more than 40 meta keys that was created in the Legacy Events view, all columns are loaded in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

Note: All existing column groups, both built-in and custom, are available in the 11.4 Events view. The complete column group management functionality is available in the Legacy Events view, and all functionality except cloning, importing, and exporting column groups is available in the 11.4 Events view. In Version 11.5, cloning is also available in the Events view, but importing and exporting are not.

In 11.6.1, the **Investigate** > **Events Preferences** view has been added to make optimum use of the space to enable analysts to view maximum details related to the events they are analyzing.

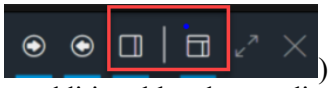


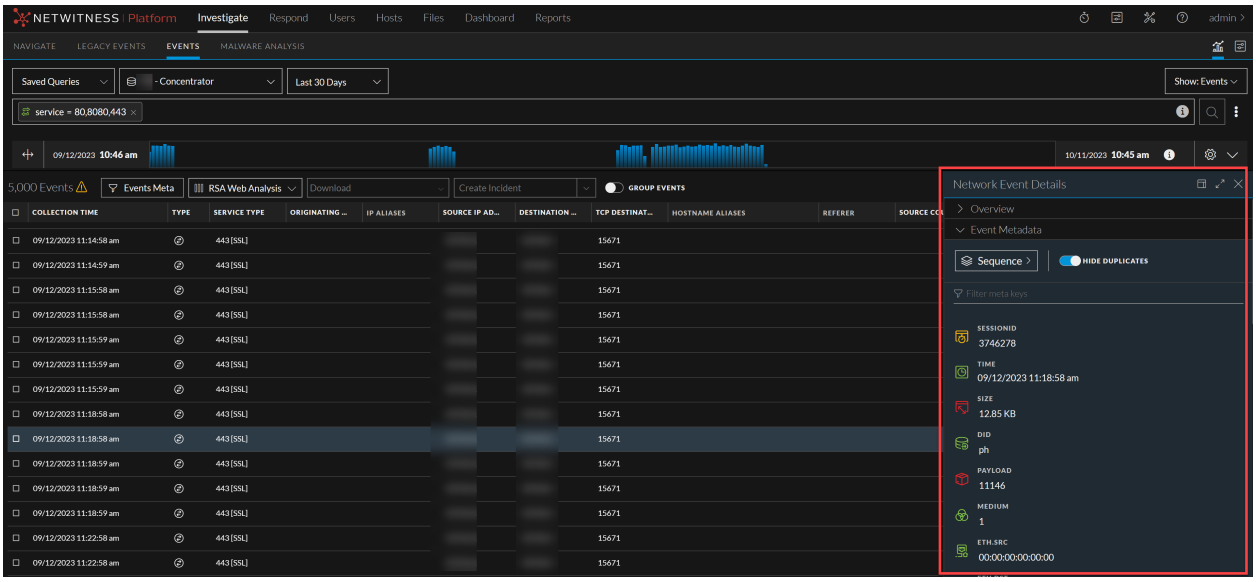
Additionally, an analyst can now view the time line details of an event by clicking the ▣ icon. When clicked the time line that displays the date and time range s displayed as shown in the image.



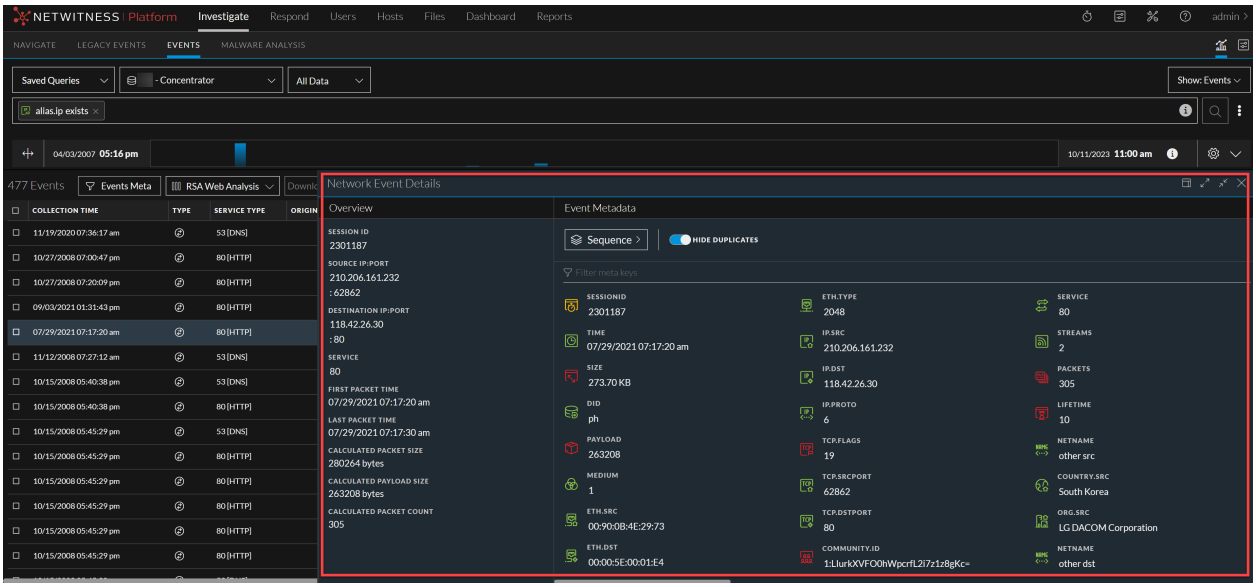
The **Investigate** > **Events** reconstruction panel has been modified to display an overlay that will contain an Overview tab and a Meta panel tab that can be expanded or collapsed. This will enable the analyst to view the headers and meta panel of the events optimally. The analysts can also toggle **Hide Duplicate Events** option and view only the relevant details of a selected event.

When an analyst navigates to this page the following view will be displayed.



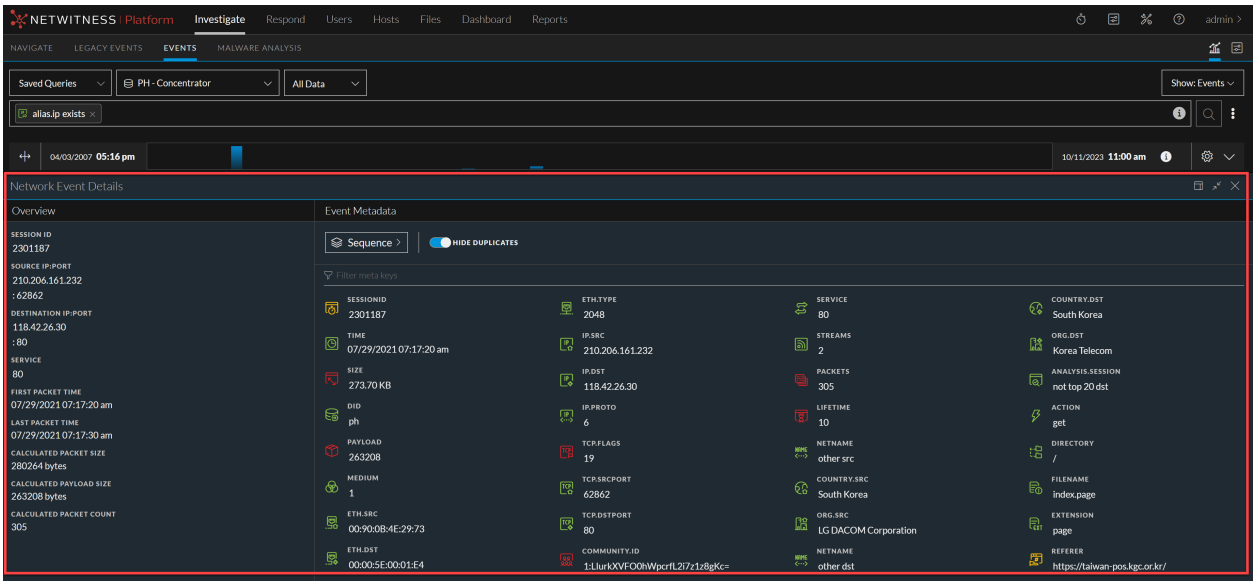


The analyst can use the toggle button ( ) to view the details related to the selected event.



The binocular icon is enabled only if an event payload is open for a search related to a selected event.

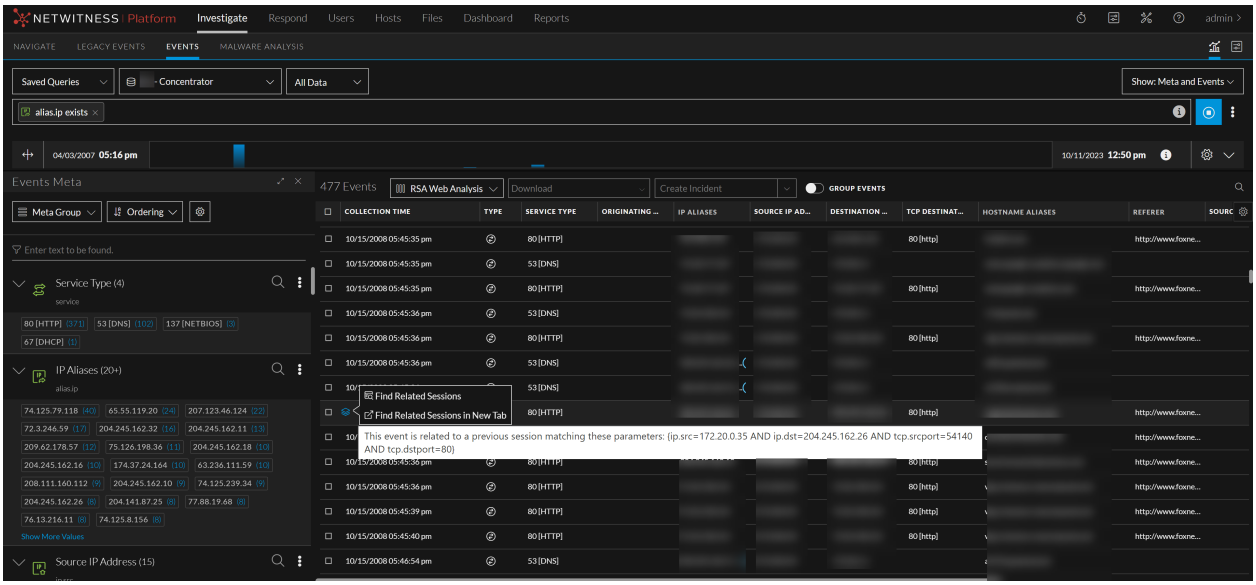
The Overview Tab displays all the headers related to a specific event and the Event Metadata Panel displays all the metadata related to the selected event.



In 11.7, when you open the meta panel to view the selected event details, all the available headers will be displayed. The meta panel contains Expand buttons (). When you click on an event, the meta panel is displayed. In case, there are no additional headers to display, an error related to the header error is displayed.

The analyst can use the expand option to broaden the meta panels in three different views. When the outward facing arrow is clicked, it expands all the details displayed under the Overview and Event Metadata panel are displayed.

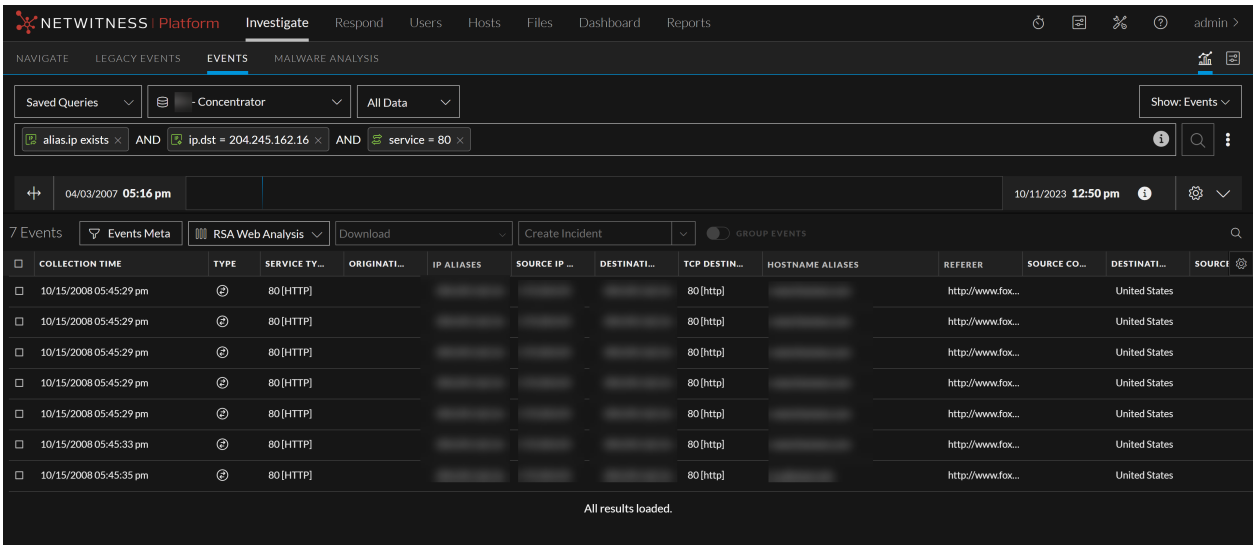
When clicked one more time, you can get an expanded view.



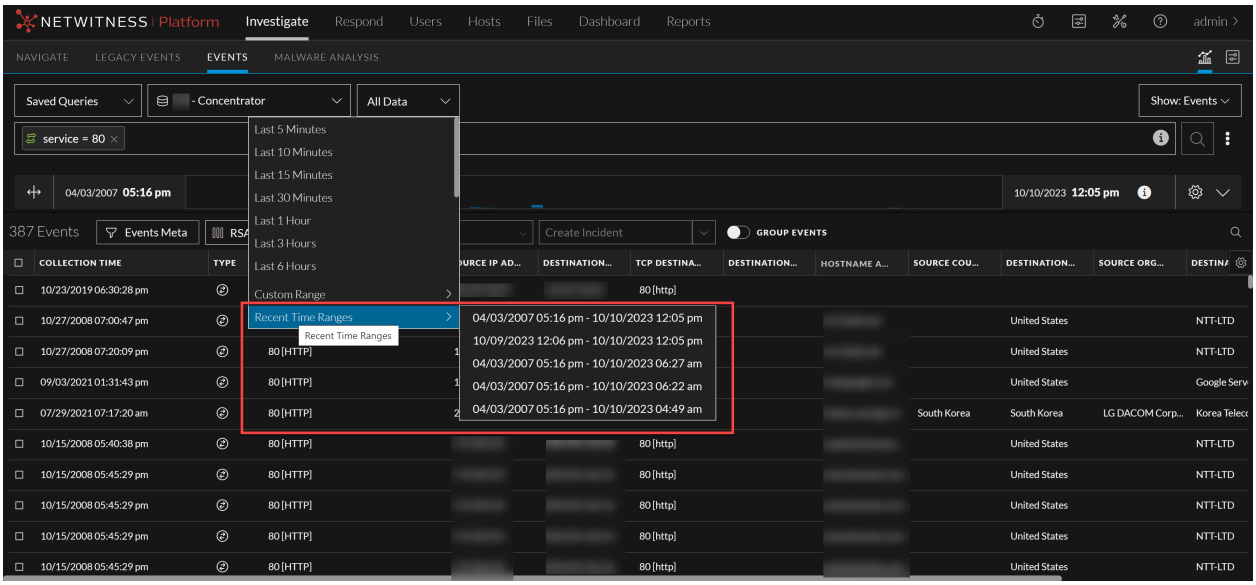
The analyst can revert the screen display by clicking the icon with the inward facing arrow , so that the window reverts to the earlier position. This helps the analyst to view the details of each event in an optimum manner.

The analysts can search for related sessions for a specific event as part of an investigation. The search for related sessions can be performed by navigating to the **Investigate** > **Events** page. You can click the icon and select either Find Related Sessions or Find Related Sessions in New Tab option from the drop-down.

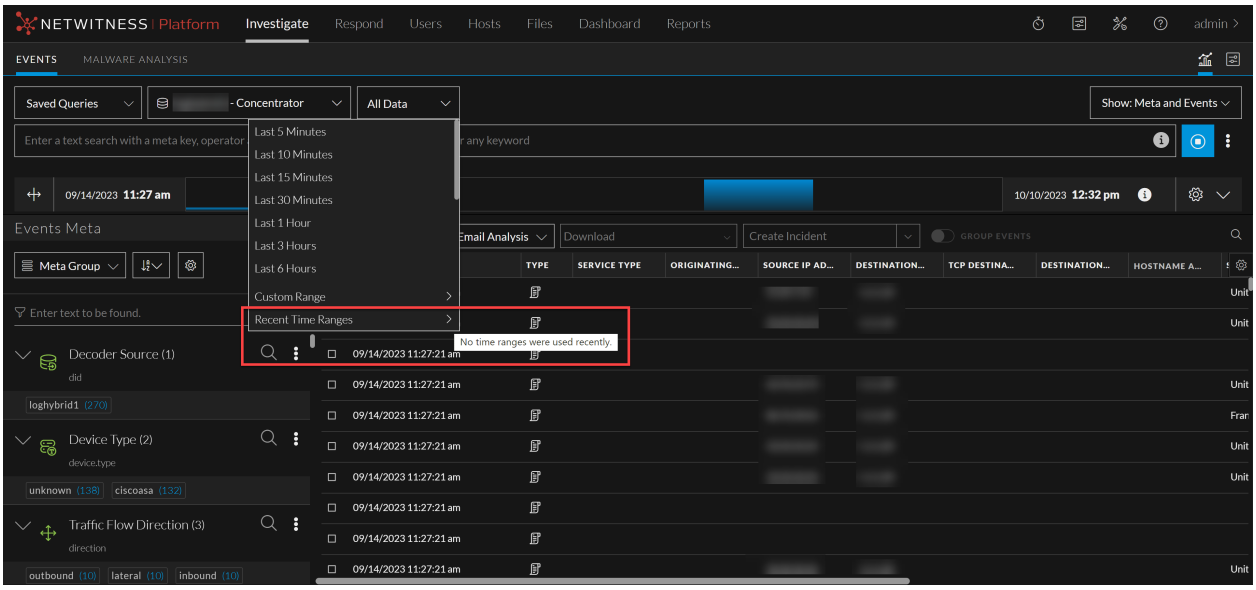
When you select the **Find Related Sessions** option, all the events that are matched by selected event's query will be displayed in the current window. And if you select the **Find Related Sessions in New Tab** option the results are displayed in a new tab. The analyst can further investigate on each of the related session.



The query is based on the information displayed in the hover over text of an event. For example, in the below image the event has two split sessions where one event is split into one another session.

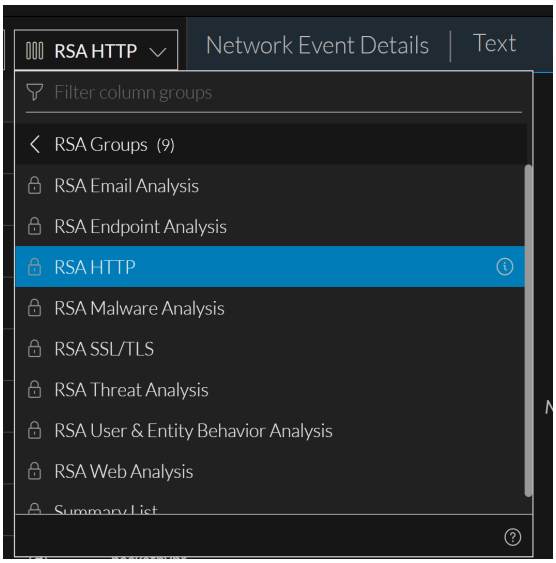


So, in this case when a search is done on these parameters, the related session for the following query is displayed.



The results are displayed in the following format:

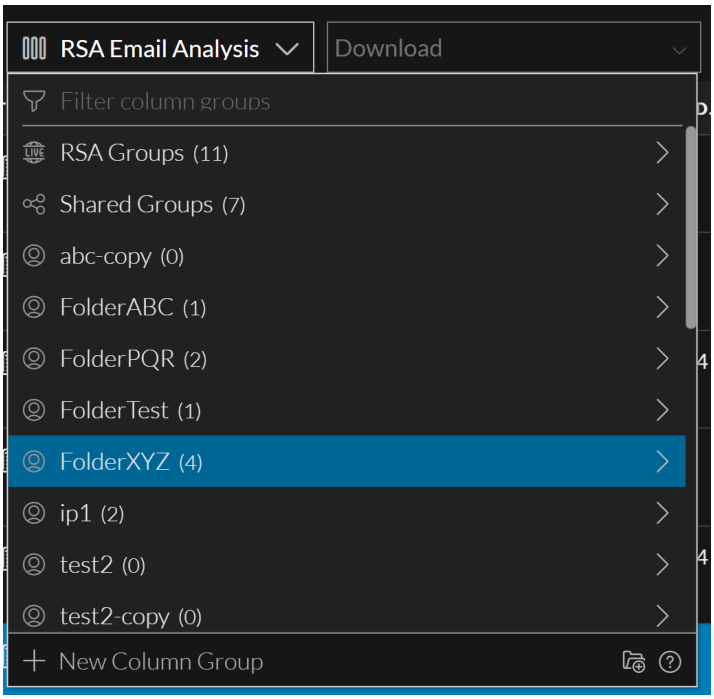
An analyst can view the last five time-ranges that were used recently, as the selection will be saved and displayed under the Recent Time Ranges section. The selection is saved separately for a user per service. For example, for Concentrator service, if you select Last 30 Days as the time-range, this will create an entry under the Recent Time Ranges section for Concentrator and when you select the same service in the next session, then the time range will be shown as below:

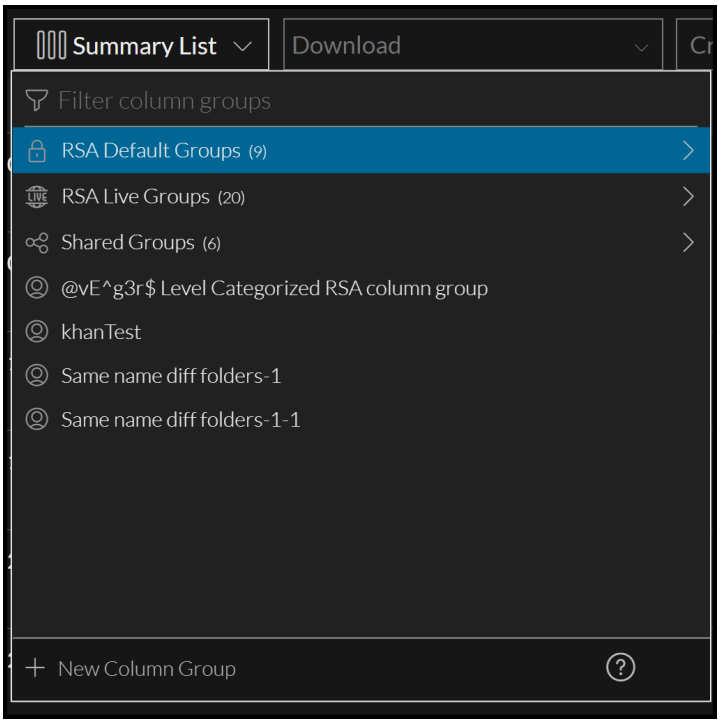


Now, if you select Concentrator service and if you have not viewed the details of the Concentrator recently, then the time range drop-down will not display any details as shown below:

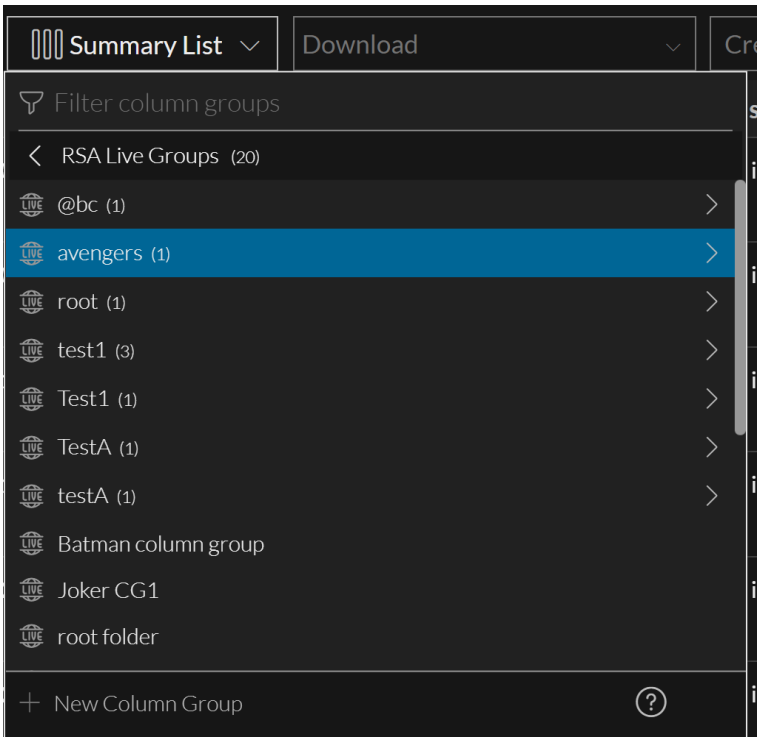
Built-In Column Groups

NetWitness Platform has built-in column groups that include useful meta keys for specific types of investigation. The built-in groups cannot be edited or deleted, but you can create a copy of the group and edit the copy. The column groups are listed in alphabetical order in the Column Group menu in a way that makes built-in groups distinguishable from custom groups that you imported or created.

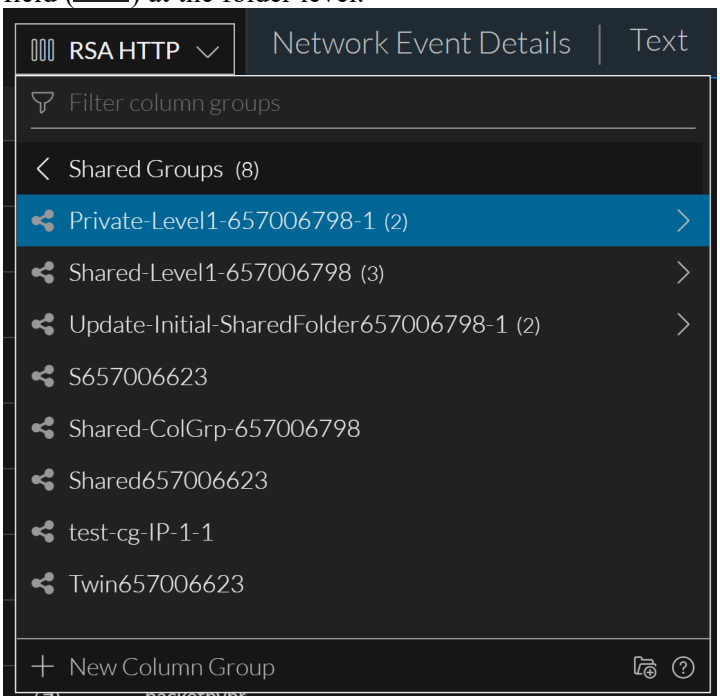




In the Legacy Events view, "RSA" precedes the name of built-in column groups. In the Events view (Version 11.4 and later), RSA precedes the name and the group is marked by the lock symbol ( ). This is an example of a selected built-in column group in the Column Groups menu. The information icon is displayed at the end of the row.



Live Column Groups



In 11.6 and later, NetWitness Platform supports deploying the investigate content from live and are marked by the live symbol ( ) . The column groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.

New Column Group

The column group can be copied by clicking the copy icon ( ). After copying, the copied column group is displayed under the selected location (Private folders or Shared groups). You can hover over on the cloned item to view a tool tip that displays the path from which the column group is cloned. In case you need to search for a specific column group, you can type the name of the column group in the filter field ( ) at the folder level.

These are the built-in column groups.

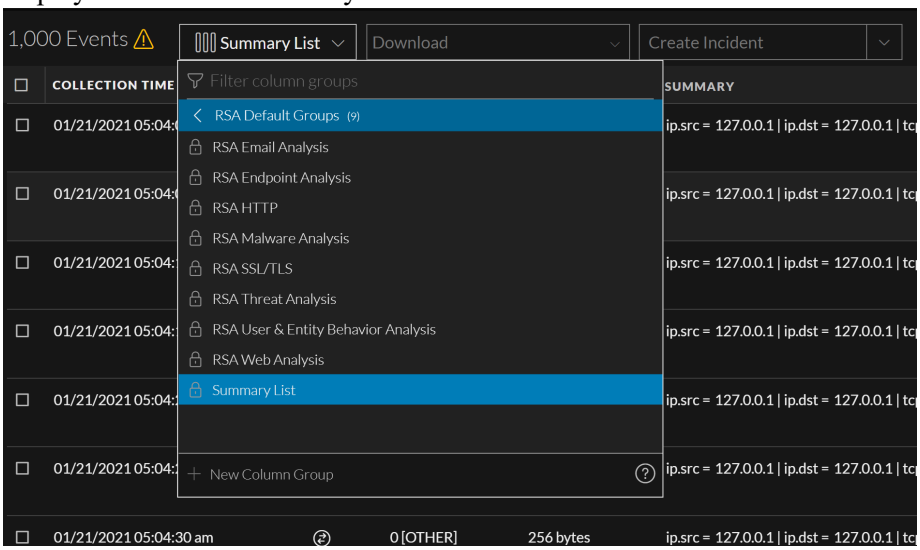
- **RSA Email Analysis**: Includes meta keys that are useful when investigating email-related metadata.
- **RSA Endpoint Analysis**: Includes meta keys that are useful when investigating endpoint-related metadata.
- **RSA Malware Analysis**: Includes meta keys that are useful when investigation potential malware.
- **RSA HTTP**: Includes meta keys that are useful when investigating HTTP related metadata.
- **RSA SSL/TLS**: Includes meta keys that are useful when investigating SSL/TTS analysis related metadata.
- **RSA Threat Analysis**: Includes meta keys that mark potential threats in the data set.
- **RSA User and Entity Behavior Analysis**: Includes meta keys that are useful when investigating UEBA data.
- **RSA Web Analysis**: Includes meta keys that mark anomalies in web traffic.
- **Summary List**: Includes meta keys that are useful in a general investigation. This is the default column group.

Custom Column Groups

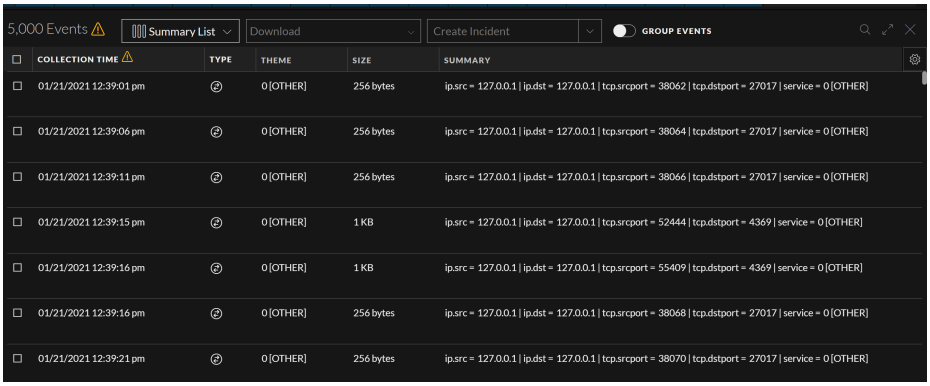
You can create custom column groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in column groups after the service is restarted.

Custom column groups are shared globally within your organization in Version 11.4. If you edit a shared custom column group, your changes are applied globally. If you delete a shared custom column group, the group is deleted and no longer available for all analysts. In Version 11.5 and later, you can create shared column groups as before, and can also create private column groups. When you create a group in Version 11.5, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.

Note: Private column groups created in the Events view are not visible or usable in the Legacy Events view.

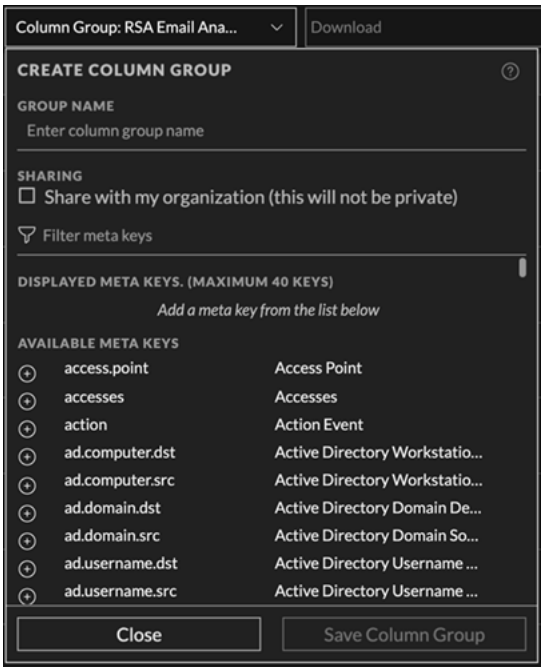


Icons identify the group type in the Column Group menu. These are examples of each type of custom column group with the edit icon displayed at the end of the row.

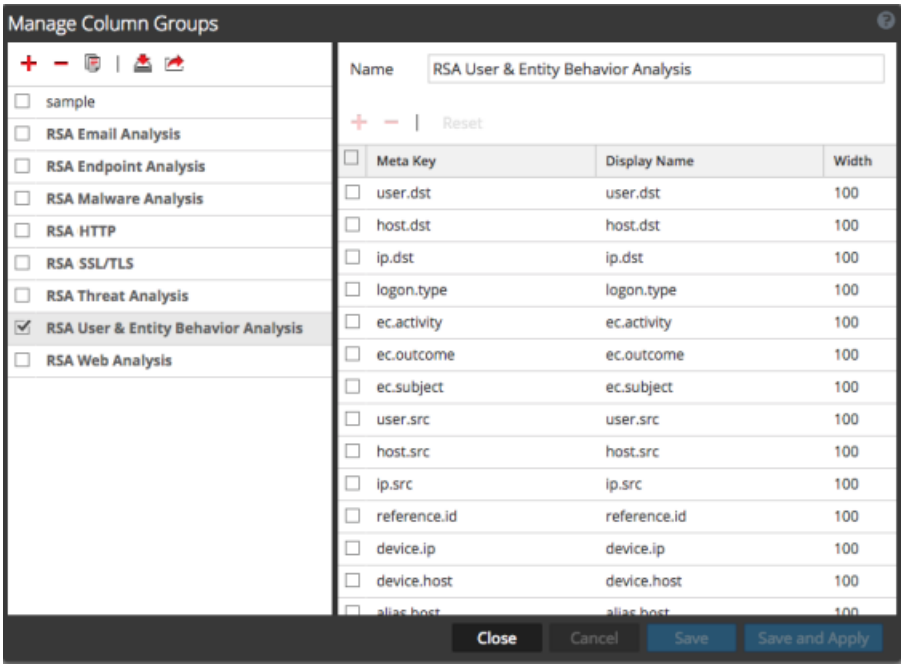


Filtering Folders

In case there are many folders, you can type the folder name and filter for a specific folder. The filtering is applicable to the current level folders and will not display folders available within a sub-folder. To search content within a sub-folder you need to navigate to the specific folder and filter.



Also, when you select a specific folder, the content of the selected folder is displayed and the filter field becomes empty and when you navigate back the last selected folder is displayed. In the following example, the folder selected is RSA Groups with the its content and the column group drop-down displays the filtered Summary List folder.



Dialogs for Managing Column Groups

While the functionality of column groups is similar in the Legacy Events view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Column Group dialog and the (Legacy Events view) Manage Column Groups dialog. The Version 11.5 and later dialog includes a Sharing option.

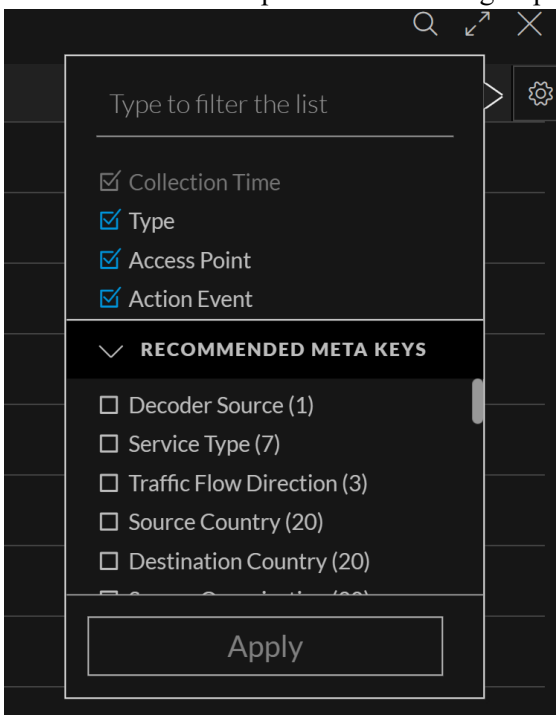
Using options in the Create Column Group dialog and the Column Group Details dialog, you can:

- See the details of a column group.
- Create, edit, and delete custom column groups.

Using options In the Manage Column Groups dialog, you can do all of above and these additional functions:

- Clone and edit the clone of a built-in or custom column group.
- Import and export a column group.

The rest of this topic provides instructions for working with column groups in the Version 11.4 and later Events view, the 11.3 and earlier Event Analysis view, and the Legacy Events view.



Work with Columns and Column Groups in the Events View

After the upgrade to Version 11.4, all of the existing column groups -- both built-in and custom -- are available for management in the Events view. Unless noted, the procedures in this section are for the Events view.

Manually Select Columns to Display and Adjust Column Order and Width

Note: The Column Selector was also available in the 11.3 Event Analysis view. If a column group includes a column for a meta key that your administrator has blacklisted (hidden), the data for that column cannot be displayed. The column is not available in the Column Selector and is not displayed in the Events panel.

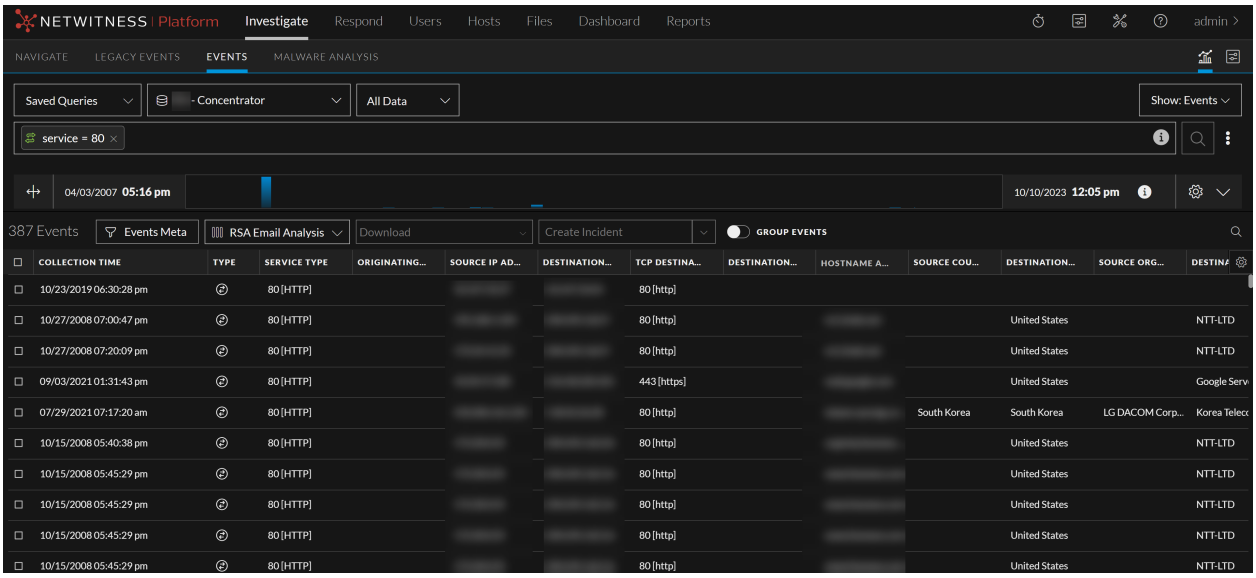
1. With the Events list open and a column group applied, click ⚙ to display the column selector.

2. Select the meta keys or enter the name of a meta key that you want to display in additional columns.
3. Deselect the meta keys that you do not want to display in a column.
   The data is redisplayed using the selected columns.
4. To change the width of the columns in the events list, hover the cursor over the column title and drag the column divider to the right or the left.

5. To rearrange the order of the columns across the top of the events list, hover the cursor over the column title and drag the column to the right or the left.
   The changes that you make in the events list are in effect during the current session and are not retained as part of the column group. The next time the column group is applied, the original composition and order of columns is applied.

Select a Column for Sorting Events in the Events Panel (Version 11.4)

Note: You can sort events in the Events panel after results have finished loading if all connected services are updated to 11.4. or later. Sorting by column is disabled when any connected service is running an earlier version of NetWitness Platform. Version 11.4.1 has more visible sorting toggles in the column heads and the ability to view results without sorting, but otherwise it functions the same as in Version 11.4.



You can change the order of the events list in the Events panel based on the value for a meta key in the event. Each column title represents a meta key, and the column is populated by the values found for the meta key in the displayed events. In Version 11.4, the events in the Events panel are sorted using the method selected in the Event Preferences dialog: Ascending or Descending. If no sort method is selected, the default order is ascending (see Configure the Events View). In Version 11.4.1, the events in the Events panel are sorted only when the sort preference in the Event Preferences dialog is selected and is either Ascending or Descending. The events are not sorted if you do not have a sort preference selected under Events Preferences or if you selected Unsorted.

Sortability of a column is based on the definition of the meta key in the Broker and Concentrator index files. Columns for meta keys that are indexed by value are sortable. If the meta key is not indexed, is indexed by meta key, or has multiple values in the same event, it is not sortable.

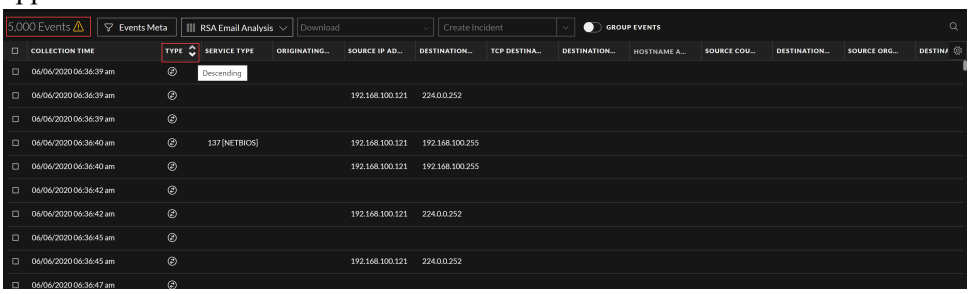
- These are some examples of keys that are indexed by value and sortable: `time`, `eth.type`, `city.src`, `ip.src`, `ipv6.dst`, and `ipv6.src`.
- Meta entities are not sortable. For example, the meta entity `ipv6.all` is not sortable because it includes `ipv6.dst` and `ipv6.src`, and a single event has both `ipv6.dst` and `ipv6.src`.
- These are some examples of multiple value keys, which cannot be sorted: `filename`, `filetype`, and `attachment`. A single event can have more than one file and therefore more than one value for `filename`, `filetype`, and `attachment`.
- These are some examples of meta keys that cannot be sorted because they are not indexed or not indexed at the values level: `password`, `query`, and `size`.

Sorting by Column (Version 11.4.1 and Later)

The initial view of the Events list with the sorting preference set to Unsorted and no column sorting has an event count in the title, with no indication of a sorting method applied to a column. If the event sorting preference is set to Ascending, the count label is "Oldest 1,000 Events." If the event sorting preference is set to Descending, the count label is "Newest 1,000 Events." In the figure below, the Ascending method is in effect, more than 2001 events matched the query, and only the oldest 2001 are displayed. Clicking the amber warning triangle displays an explanation. Refer to Configure the Events View for more information about the sorting preference.

When you move the mouse over a column title, sortable columns have a pair of arrows after the column title, one pointing up for ascending and one pointing down for descending ( ). You can choose one sort column and the direction of the sort. A blue up arrow ( ) indicates that ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A blue down arrow ( ) indicates that descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first.

- When a column has a blue arrow, you can click the white arrow to change the sort order. When you change the sort order, a blue progress bar is displayed in the Events list title bar to show progress. As sorting begins, there is a short segment on the left side of the window; as sorting progresses the blue color extends to the right across the entire title bar. The directional arrow does not change until the events are re-sorted in the chosen sort order.
- To change the column to unsorted, you can click the blue arrow. Both arrows are white now to show that the column is unsorted. This figure shows the Type column sorted in ascending order.



- If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.

Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

Note: The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold.

To change the sort order or the sort column

1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.
2. To sort the list based on a column, move the mouse over a sortable column and click one of the arrows ( ).
   The arrow turns blue and the events are reloaded in the selected order. If both arrows are white, the column is not being used to sort the events list. If one arrow is blue, the column is being used to sort the events list, and the sort order (Asc or Desc) is appended to the events count in the title bar. This figure shows a column sorted in ascending order. When a column is descending order, (Desc) is appended to the event count.

   a. Click a white arrow to sort the events list in that order.

   b. Click a blue arrow to return to unsorted order.

Sorting by Column (Version 11.4)

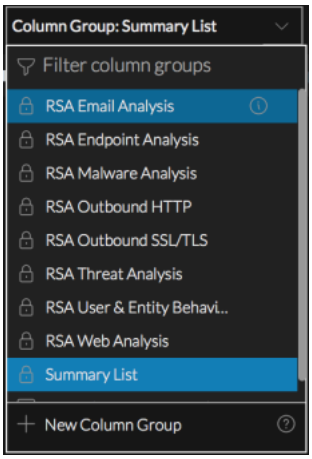
When you move the mouse over a column title, sortable columns have an up or down arrow (or) after the column title. You can choose one sort column and the direction of the sort. An up arrow indicates that Ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A down arrow indicates that Descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first. When you select a sort column, it is sorted in descending order by default, with events having a null value for the meta key first.

- A column that is being used to sort the events list has a bright white arrow indicating the direction that you can choose for sorting: click to change to Ascending or to change to Descending order. When you click to change to Ascending sort order, the directional arrow does not change until the events are re-sorted in ascending order. The same behavior applies when you click the to change to Descending order.
- If a sortable column is not being used to sort the events list, the arrow is dimmed. If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.
- If you click the arrow on a different column, the column is sorted in the same order as the previously active sort column. You can select a different sort order if desired.

Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

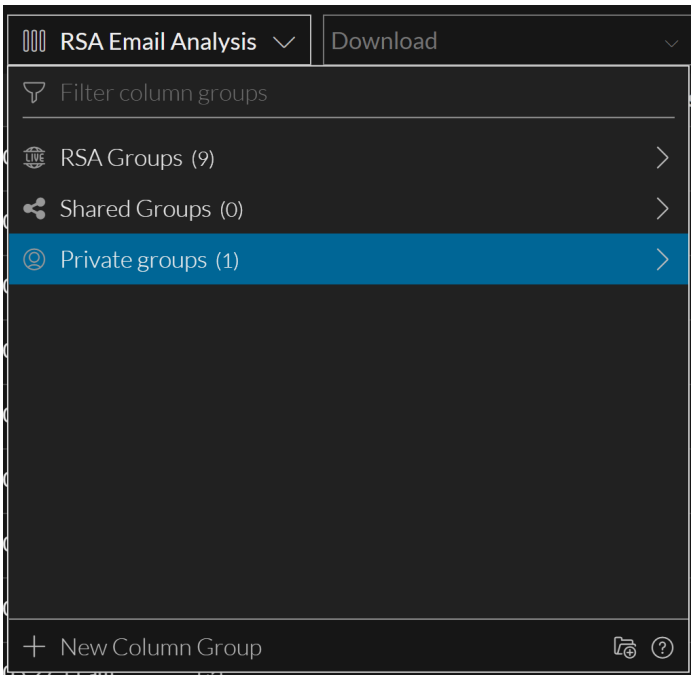
Note: The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold. If some of those events have the exact same time, they will not change order as you might expect when you reverse the sort order.

To change the sort order or the sort column:



1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.
2. To sort the list based on a column:
   a. Move the mouse over a sortable column and click the arrow (or).
      The events are sorted in the correct sort order. If you hover over the column title, you can see that the arrow is no longer dimmed. A column that is being used to sort the events list has a bright white arrow that you can click to change the sorting direction.
   b. To change the sort order, click to change to Ascending or to change to Descending order.
      The direction of the arrow changes and the events are reloaded in the selected order.

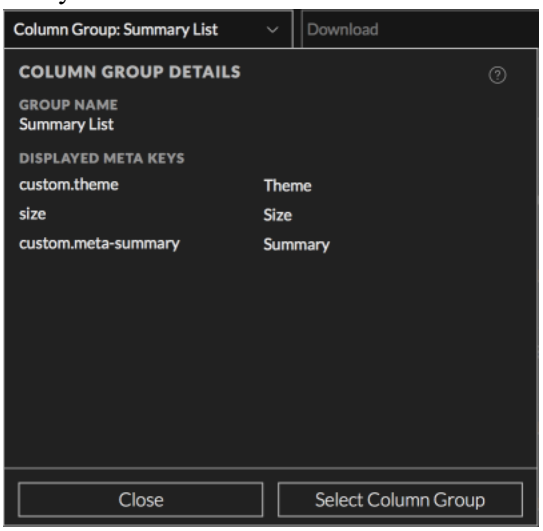
View the Meta Keys Included in a Column Group



To view details of a column group:

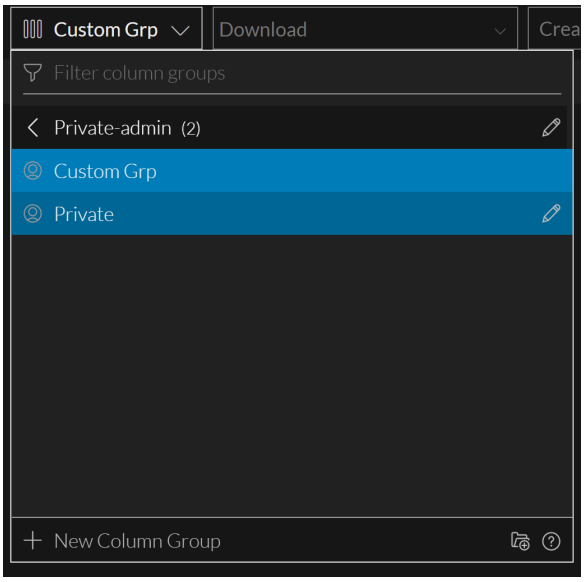
1. Go to **Investigate > Events** and click to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list.
2. To display the Column Groups menu, click the Column Groups menu title. The Column Group menu title includes the title of the currently selected column group. If this is your first visit after logging in, the Summary List group is selected; any subsequent visits use the column group selected in the previous session. When opened, the menu displays a list a list of built-in column groups (RSA), shared custom column groups, and your private custom column groups. The figure shows the Version 11.6 menu initially when Summary List is selected by default and all types of column groups are

visible: Private, Shared, and RSA.



3. (Optional) To control the types of column groups that are visible in the list, use any combination of the visibility options (blue = selected, black = not selected):
   Private = display private groups that only you can manage
   Shared = display shared groups that anyone in your organization can manage
   RSA = display built-in groups that only RSA can manage
   The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. The figure below shows private and shared visibility options selected.

4. Hover over the **Summary List** group and click the information icon ( ) to see which columns are included in the group.
   This figure shows the columns for the Summary List. The Collection Time and Type column are

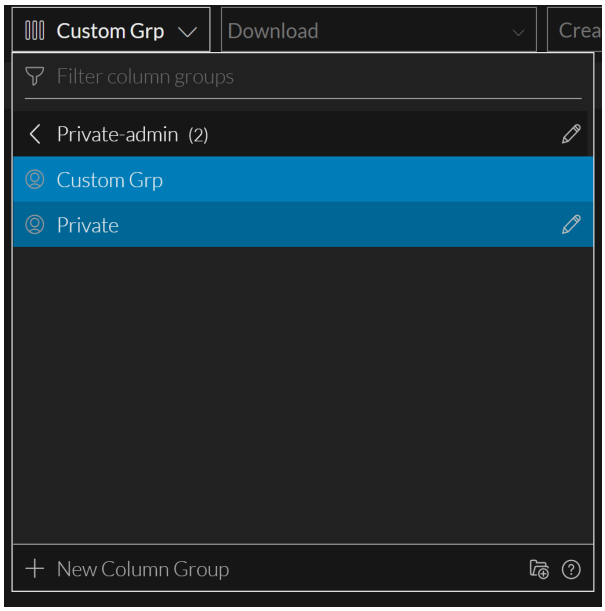


always the first two columns in the Events list, but are not listed in the Column Group Details dialog.

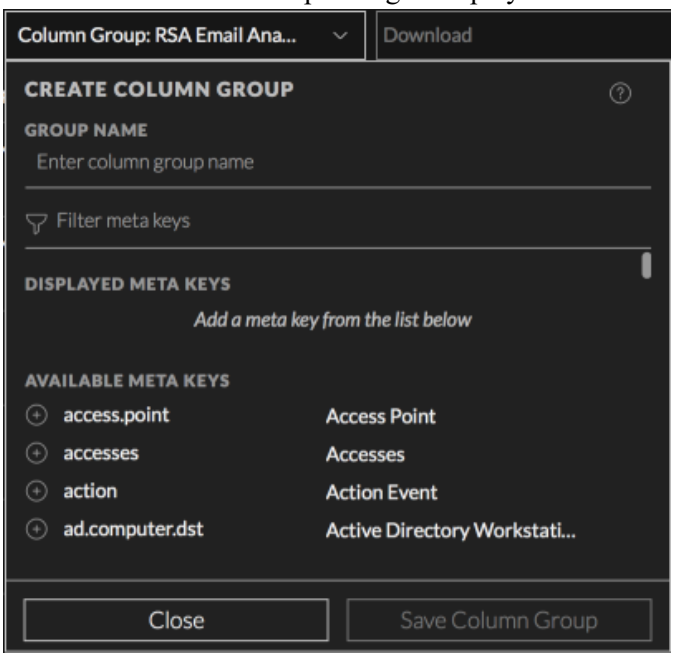
5. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the column group, click **Select Column Group**.
      The dialog closes and the Events list is updated to reflect the selected column group.

Select a Column Group

1. With the Events panel open in the 11.4 or later Events view, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with a filtering option and a New Column Group option. The list is sorted alphabetically and the selected column group is displayed in the menu label. The first option in the list is highlighted. The selected column group has a slightly different background color than the highlighted column group.
   The following figure shows the menu after RSA Endpoint Analysis was highlighted, but RSA Email Analysis is still selected.



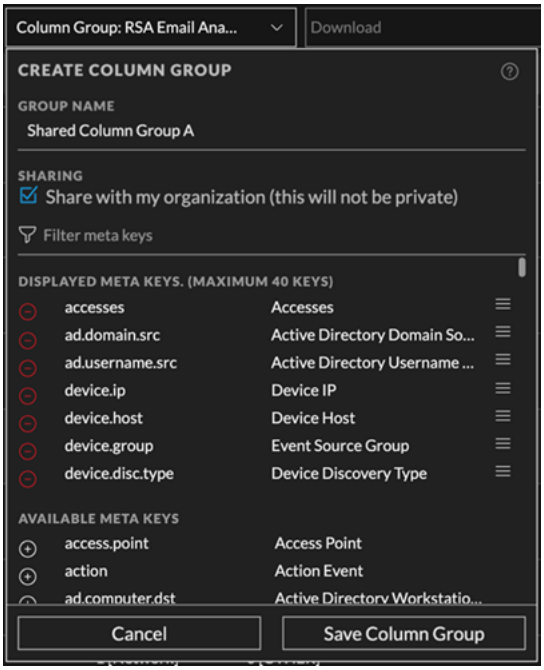
2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. (Version 11.5 and later) If you want to see only certain types of groups, use the visibility options (**Private**, **Shared**, and **RSA**) to hide one or two group types.
   c. Begin typing text in the **Filter column groups** field to search for a column group name. As you type, the list is filtered to show only the column group names that contain that string.
   When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
   The Events list is refreshed to include only columns in the selected column group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view. The order of the columns in the Events list reflects the order of the meta keys in the column group. A column group may contain more columns that are only visible when you scroll to the right. For optimal viewing, the first 15 columns are displayed by default when you select a column group.



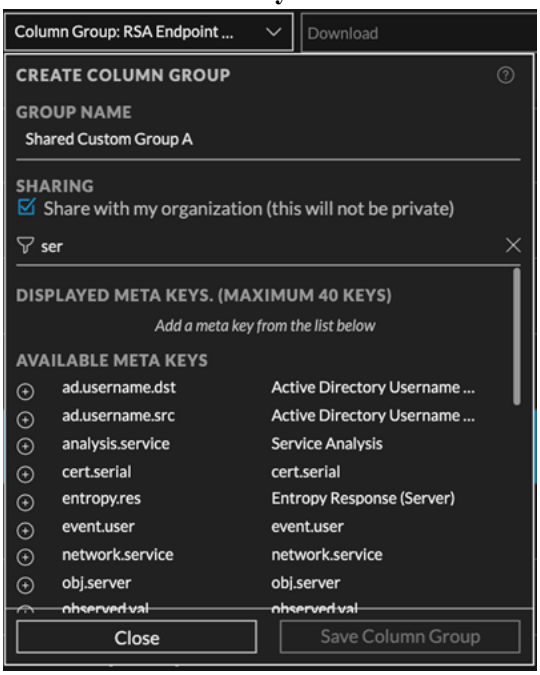
Note: If a meta key in a column group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

Create a Custom Column Group

1. Go to **Investigate > Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with the Visibility Options and Filter Column Groups field at the top and the **+ New Column Group** option at the bottom.

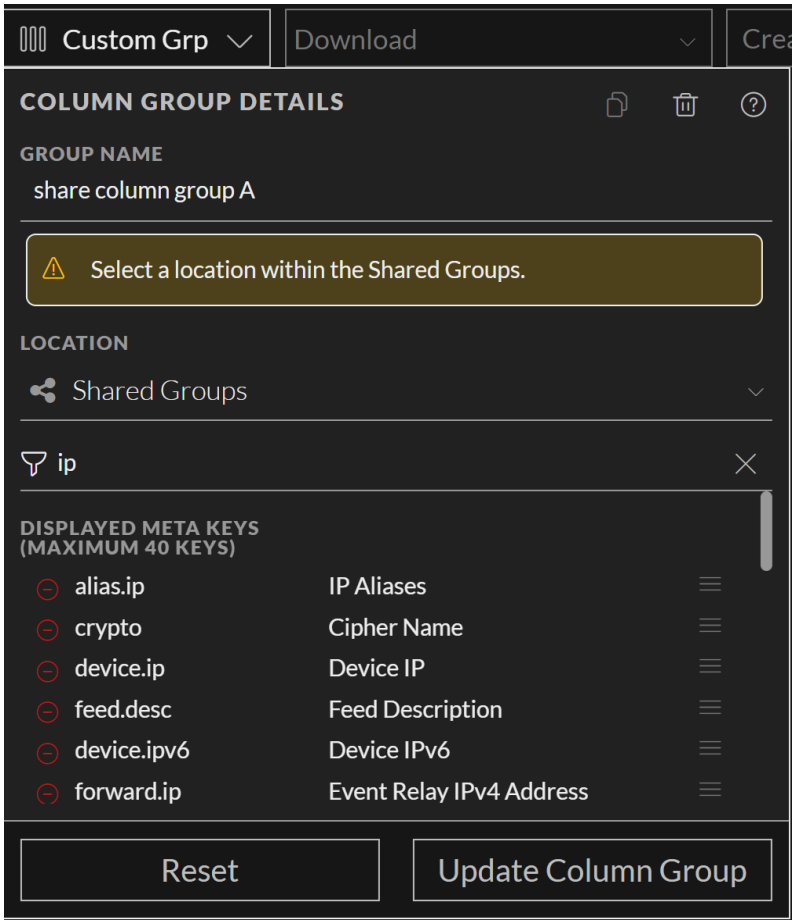


3. Select + **New Column Group**.
   The Create Column Group dialog is displayed. Version 11.5 includes the Sharing option.



4. In the **Group Name** field, type a unique name (maximum length of 256 characters) for the new column group, for example, **Custom Column Group A**.

5. (Version 11.5 and later) If you want to share the new column group with your organization, set the **Share with my organization** option.



6. To add a meta key to the column group, select and add each meta key as follows:

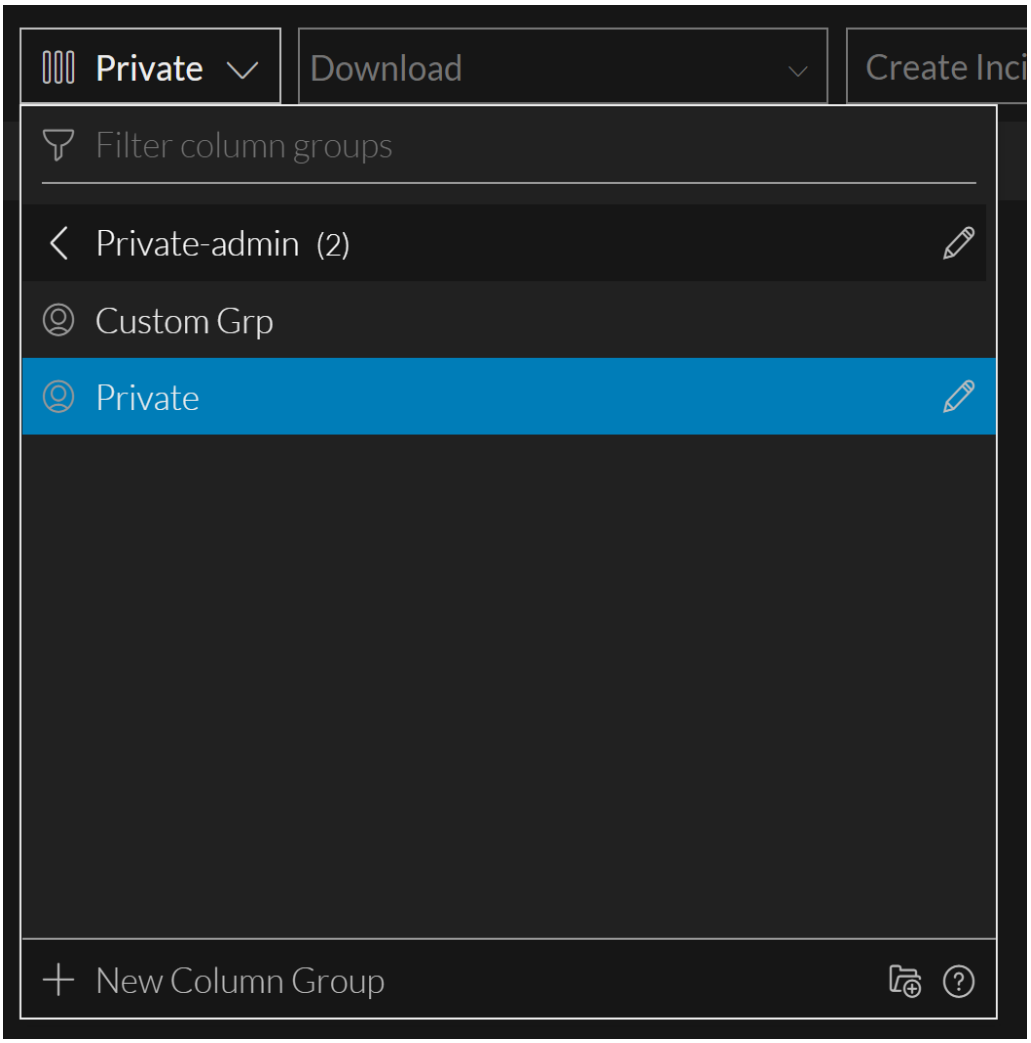
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.

   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using

the text you typed.) The maximum number of meta keys in a column group is 40. If you attempt to add another meta key when 40 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom column group, click **Cancel**.
   b. To create the group, click **Save Column Group**.
      The new column group is saved and becomes available for all analysts. The buttons change to Done and Select Column Group.

10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new column group, click **Select Column Group**.
    The new group is added to the Column Groups menu (in alphabetical order), and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.

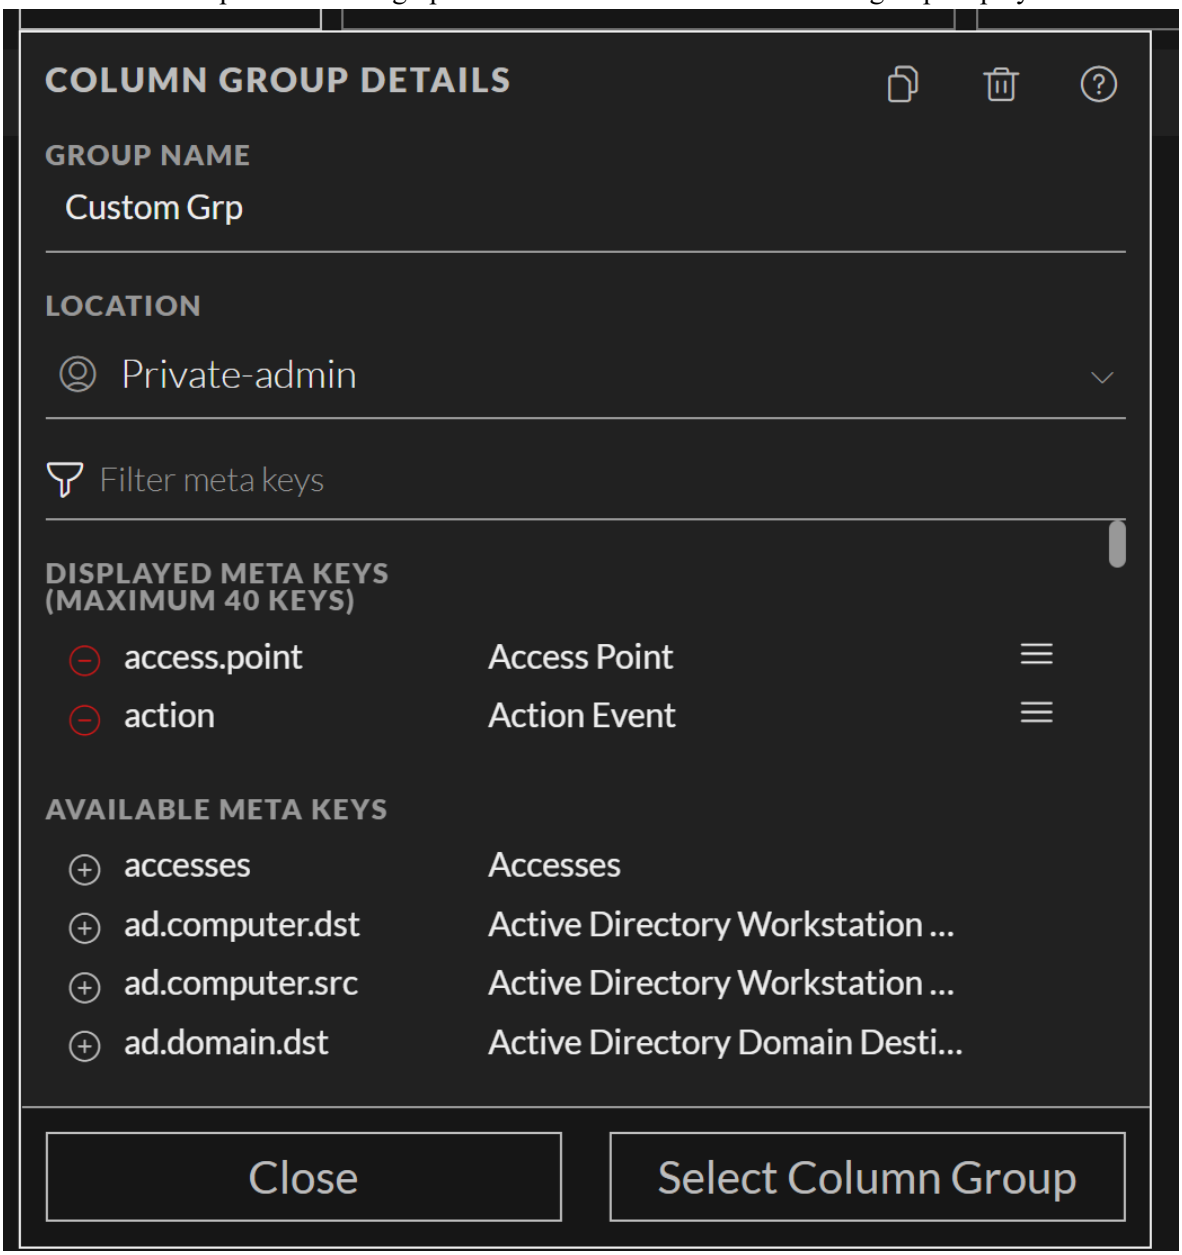


Delete a Custom Column Group

You can delete any custom column group that is not currently applied in the Events list and not part of a query profile. The built-in column groups are read only, and cannot be deleted. In Version 11.5 and later, a confirmation message allows you to confirm or cancel the deletion. When you delete a custom column group, it is removed from the Column Group menu.

Caution: When you delete a custom column group (Version 11.4) or a shared column group (Version 11.5), the effect is global and the group is no longer available to any analyst.

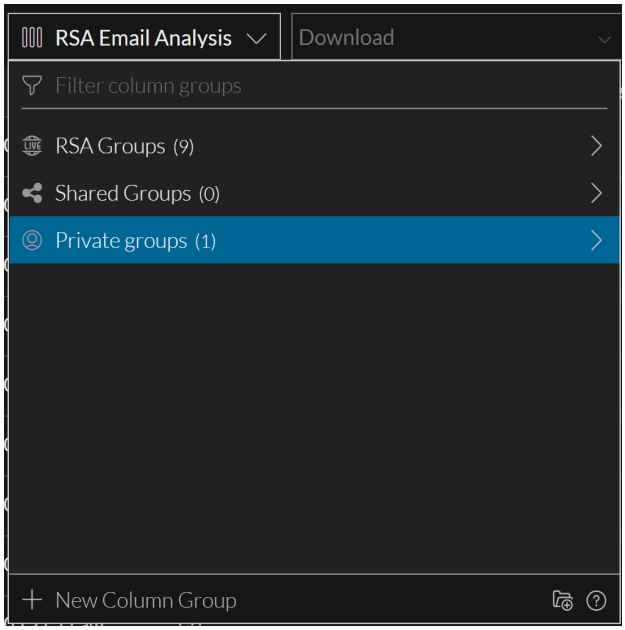
To delete a custom column group



1. Go to **Investigate** > **Events** and click  to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list. This figure shows the initial view with the Summary List column group selected. The label on the Column Group menu includes the name of the selected column group.

2. To delete a column group, highlight a custom column group as shown in the following figure and click the edit icon ( ) to the right of the name.

3. The Column Group Details dialog opens with the details for the selected group displayed.

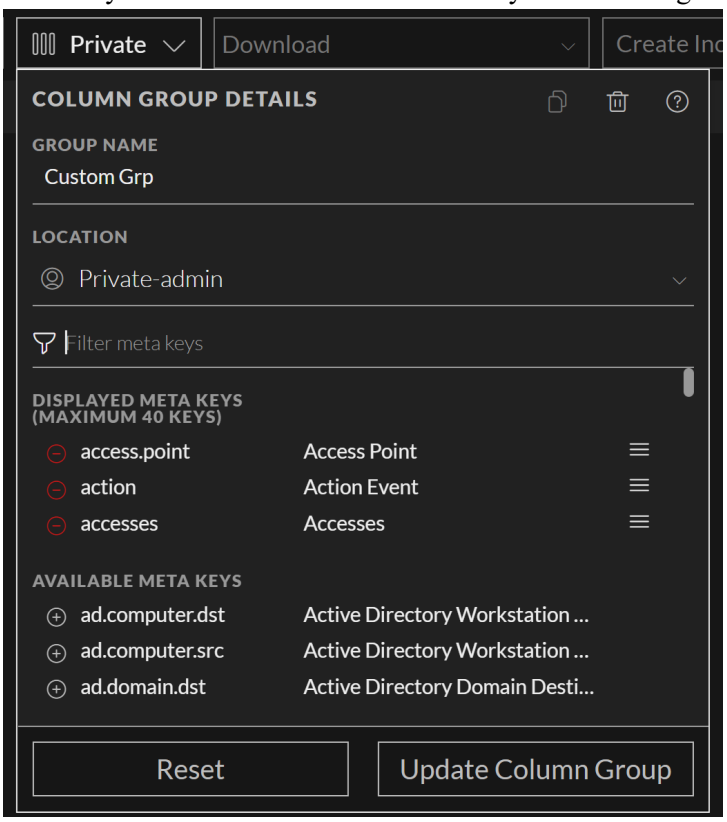


4. Click the delete group icon ( ).
   If the column group is currently in effect, the following message is displayed: `This column group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Column Group**.
   In Version 11.4, if the column group is not in effect and is not a built-in column group, there is no request for confirmation before the column is deleted.
   The group is deleted and removed from the Column Groups menu. The column group no longer appears anywhere for any analyst working in Investigate.

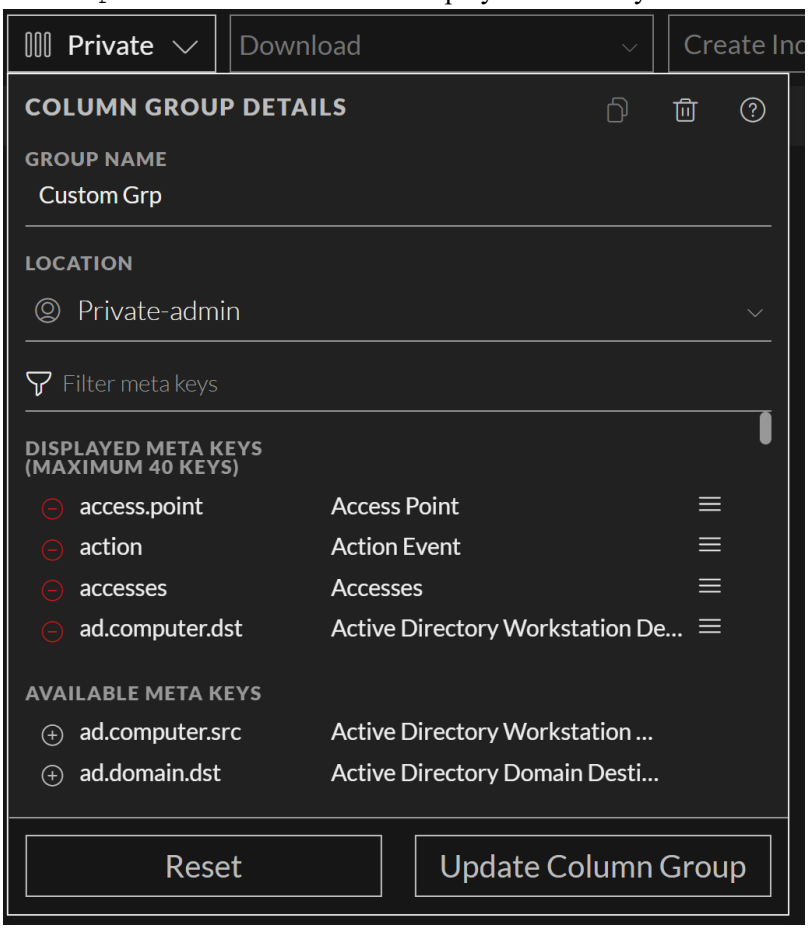
Edit a Custom Column Group

You can create a shared or private copy of any column group that is not open for editing. After you create the copy, you can edit the new group in the usual way.

1. Go to **Investigate> Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups.



3. Highlight the column group that you want edit. This figure shows a custom column group highlighted, with the edit icon displayed to the right.



4. Click the edit icon ().
   The Column Group Details dialog is displayed so that you can edit the Group Name and Displayed

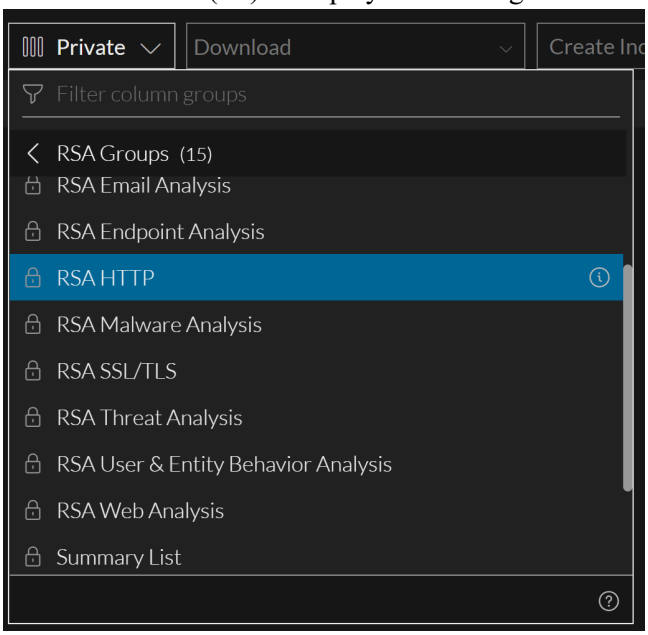
Meta Keys. You can add or delete meta keys and rearrange the order of the meta keys in the list.

5. (Optional) In the **Group Name** field, edit the name of the column group.
6. (Optional) To add a meta key to the column group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key.
   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) This figure shows the group name changed to Column Group C and

`ad.computer.dst` added to the Displayed Meta Keys list.

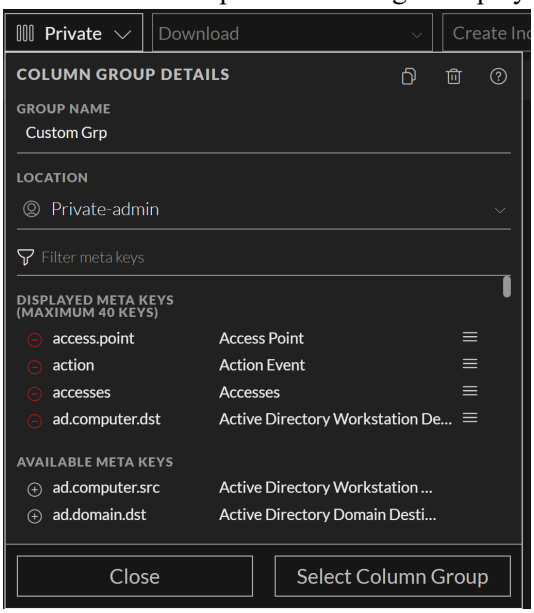
7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Displayed Meta Keys** list, or simply scroll through the list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without saving the changes to the custom column group, click **Reset**.
   b. To save the edits to the column group, click **Update Column Group**.
      The updated column group is saved globally for all analysts, and the buttons change to Done and Select Column Group.
10. Do one of the following:
    a. To close the dialog, click **Close**.

b. To close the dialog and select the updated column group, click **Select Column Group**.
The column group is updated, and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.



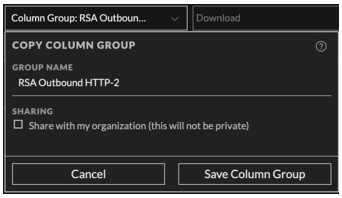
Create a Copy of a Column Group (Version 11.5 and Later)

You can copy any column group, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you create a copy of a column group, the same name is used with a number appended. For example, if you copy RSA HTTP, the first copy is named RSA HTTP-1, and a second copy of the same group is named RSA HTTP-2. After you create the copy, you can edit the new group to give it a new name and manage meta keys in the group.



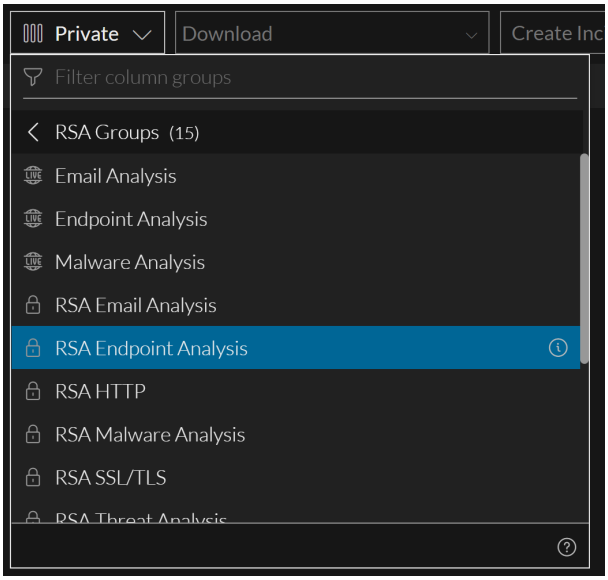
Note: Some column groups created in the Legacy Events view may have more the 40 columns, which is above the limit for column groups in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

To copy a column group:

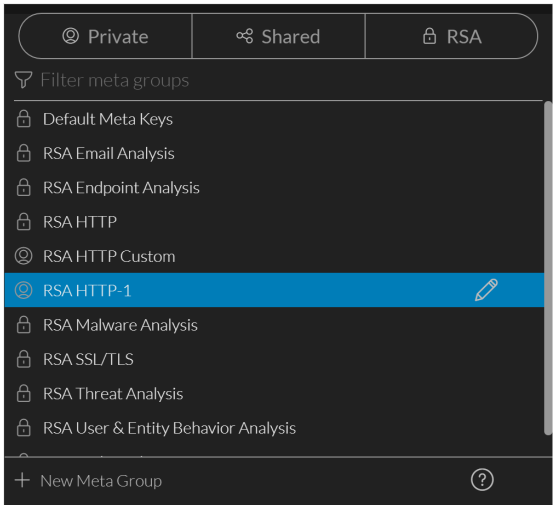


1. Go to **Investigate> Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
The menu drops down to display a list of column groups with the Filter Column Groups field at the top and the + New Column Group option at the bottom. The first group on the list is highlighted, and the selected group has a light blue background.
3. Highlight the column group that you want copy. This figure shows RSA HTTP highlighted. The information icon ( ) is displayed to the right.

4. Do one of the following:
   a. Click the information icon ( ).
   b. Click the edit icon ( ).
   The Column Group Details dialog is displayed. This figure shows the dialog for a built-in group.



5. Click the Copy icon ( ).
   The Copy Column Group dialog is displayed with a `-n` appended to the column group name. The following figure has -2 because it is the second copy of this column group.

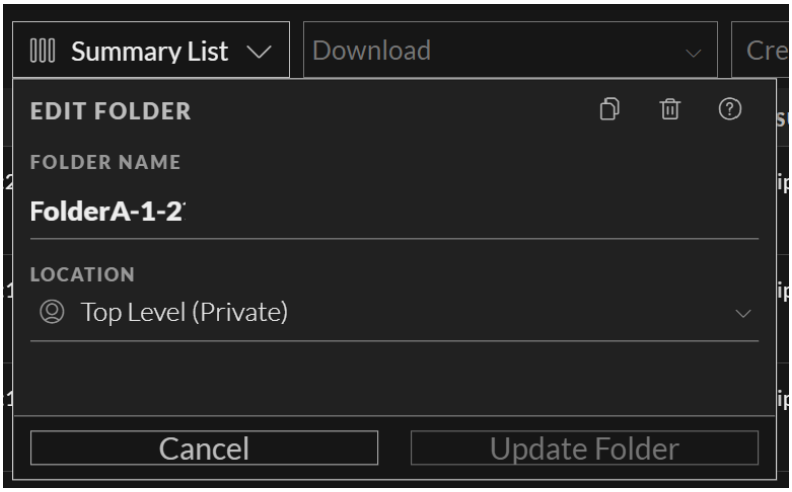


6. (Optional) In the **Group Name** field, edit the name of the column group.
7. If you want to share the new column group with your organization, set the **Share with my organization** option. By default the new group is private.
8. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the column group, click **Save Column Group**.
   The copy of the column group is saved, and the buttons change to Done and Select Column Group.
9. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the copy of the column group, click **Select Column Group**.
   The column group is copied, and if you clicked Select Column Group, the Events list is updated

to show the columns in the copy of the column group. The figure below has two copies of the RSA HTTP column group, one shared and one private.

1. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA HTTP meta group.

Create a Column Group Folder



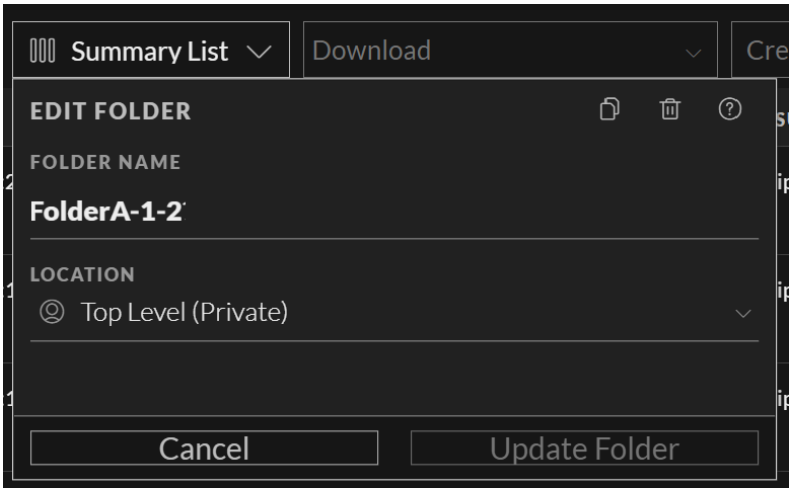
You can create custom column group folders which reside at the current level and are be added as a private or shared folder. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Column Groups menu title. The menu drops down to display a list of column groups and folders.
2. Click .
   The Create Folder dialog is displayed.
3. In the **Folder Name** field, type a unique name (maximum length of 255 characters) for the new meta group folder.
4. Click **Create Folder**.

Edit and Move Column Group Folder

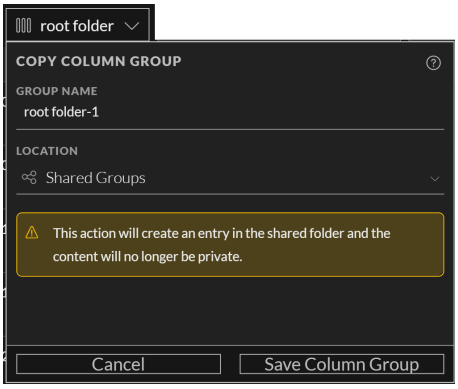
After you create a column group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. With the Filter Events panel open in the Events view, click the Column Group menu title and highlight the column group that you want edit.
2. Click .
   The Edit Folder dialog is displayed.



3. In the **Folder Name** field, type a unique name for the column group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Column Group Folder

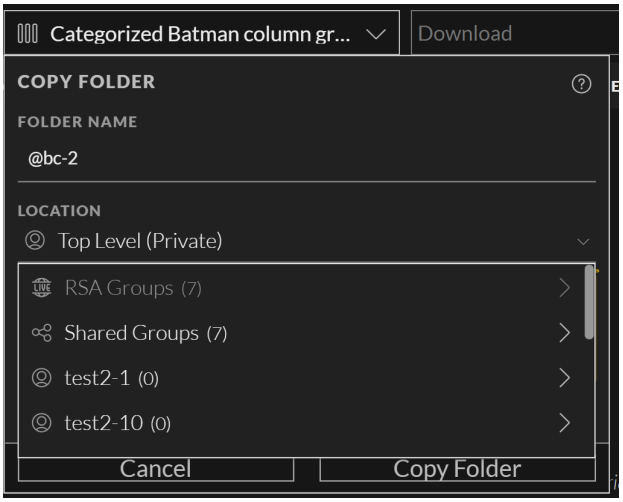


You can copy column group folders from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.

2. Select a folder you want to copy.
3. Click edit and the click copy .

The Copy Folder dialog is displayed.



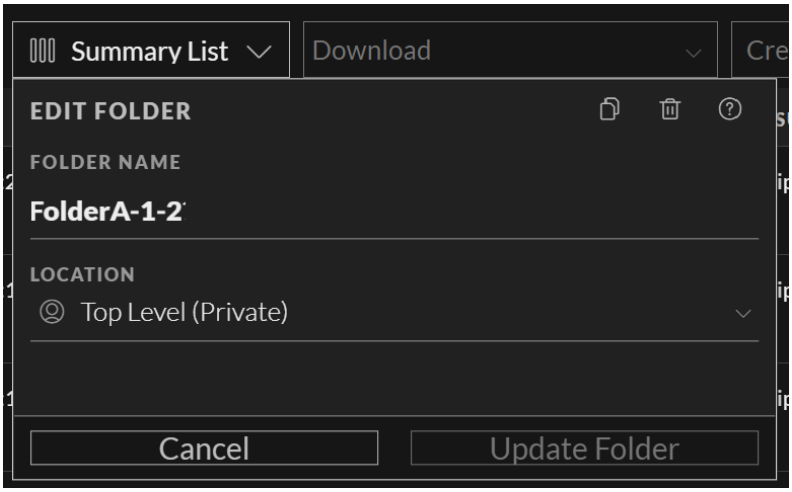
4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

Copy Group Folder Deployed from Live

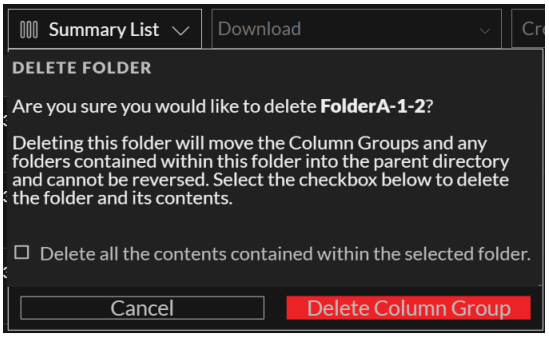
You can copy column group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Filter Events panel open in the Events view, click Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Click on a Live Column Group folder you want to copy.

3. Click 
   The Copy Folder dialog is displayed.



4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and appended with the 'copy' in the end.



Delete Column Group Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

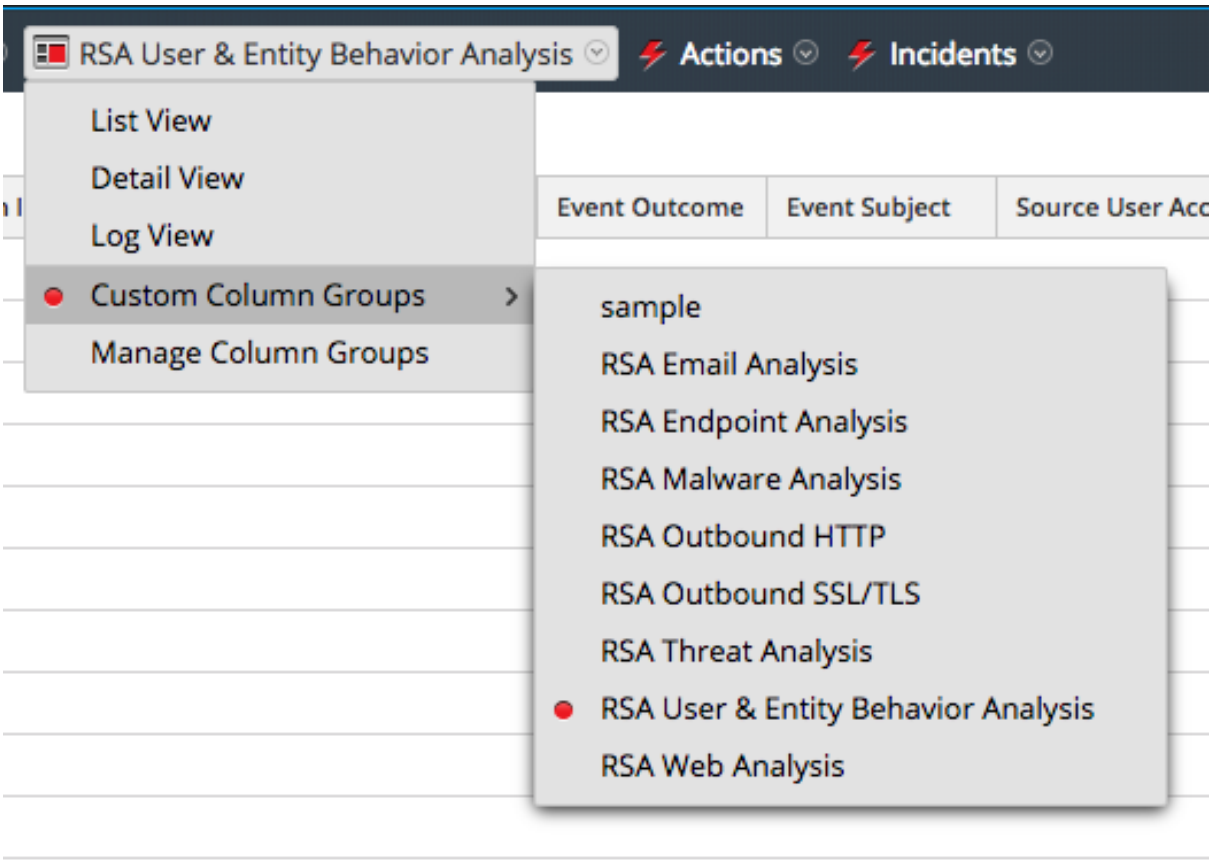
1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

Work with Column Groups in the Legacy Events View

This section includes procedures for working in the 11.4 Legacy Events view (and the 11.3 Events view). Three different forms of the events list with hard-coded columns are built in and labeled as follows: Detail View, List View, Log View. You can remove columns, rearrange the order, and change the width of a column. In addition the built-in or custom column groups are available; these give you more flexibility in choosing columns.

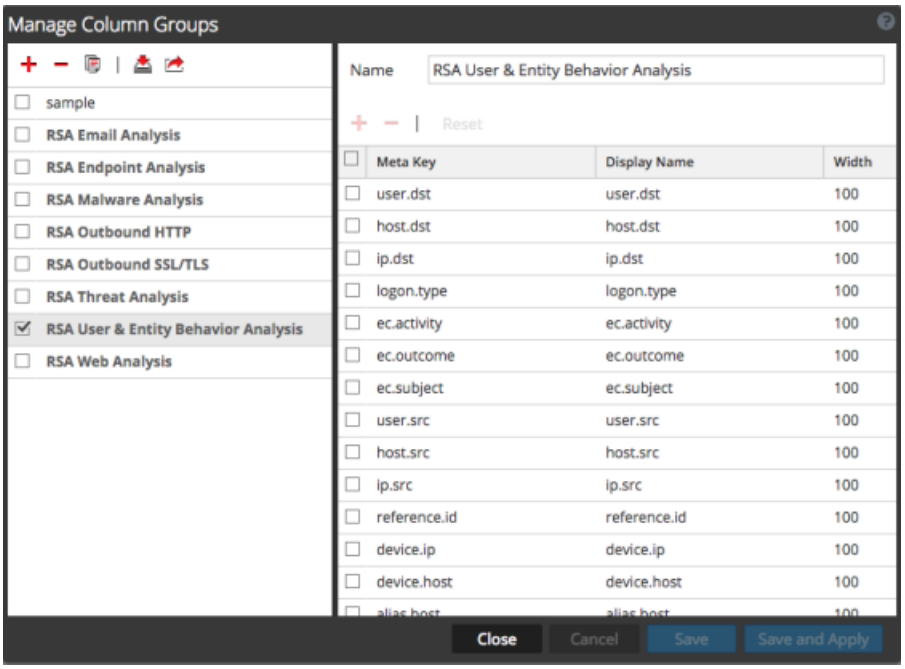


Column groups are shared globally, per service, across Investigate. Any changes you make to custom column groups are applied globally, affecting all analysts using the service. If you delete a column group, the column group is no longer available to anyone who is investigating the service.

Select a Column Group

Note: Investigate profiles can include custom column groups. If a custom column group is used in a profile and you are viewing events in the Legacy Events view using a custom column group, you cannot change the view type (Detail, List, or Log).

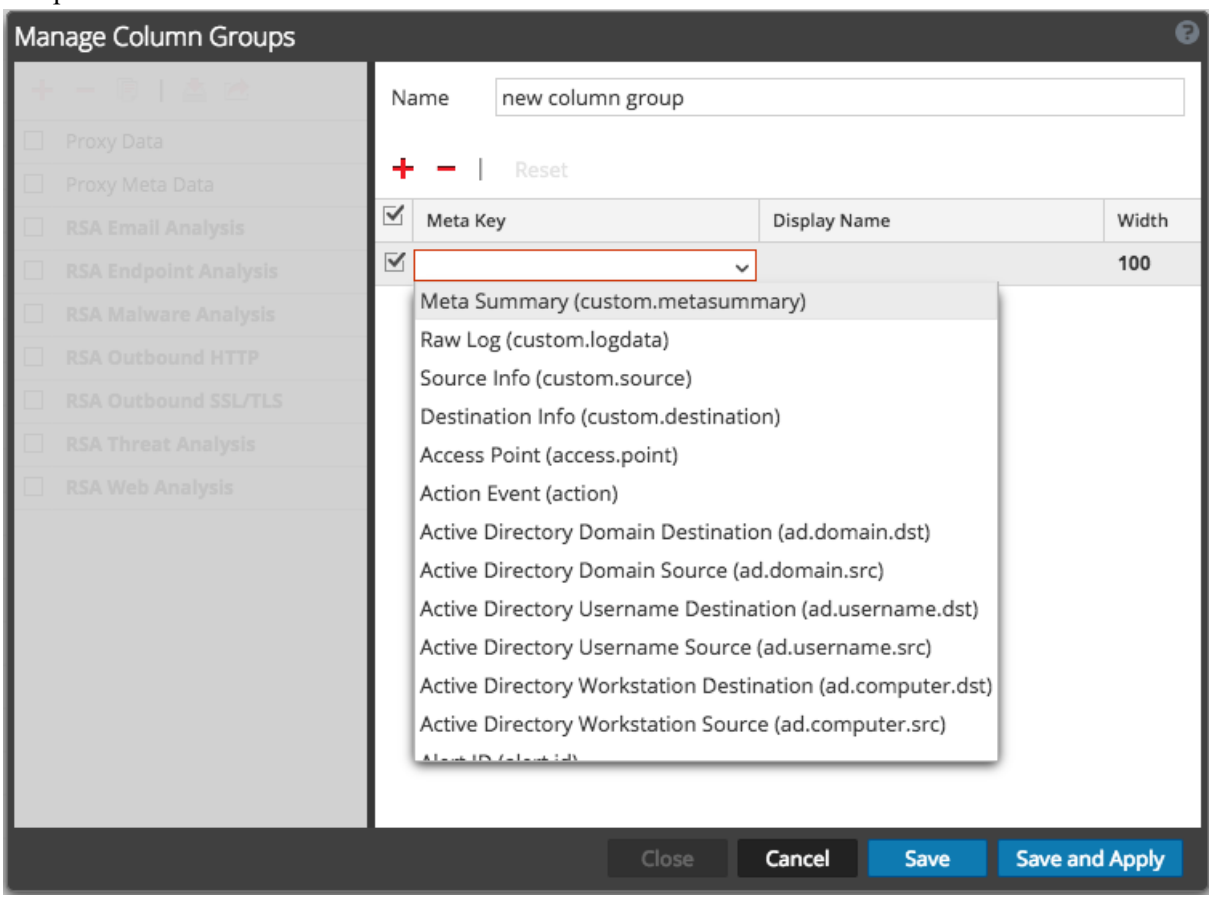
To select a column group:



1. With the Legacy Events view open, select **Custom Column Groups** in the **View** drop-down menu. The menu label reflects the selected option: Detail View, List View, Log View, or the currently selected column group.

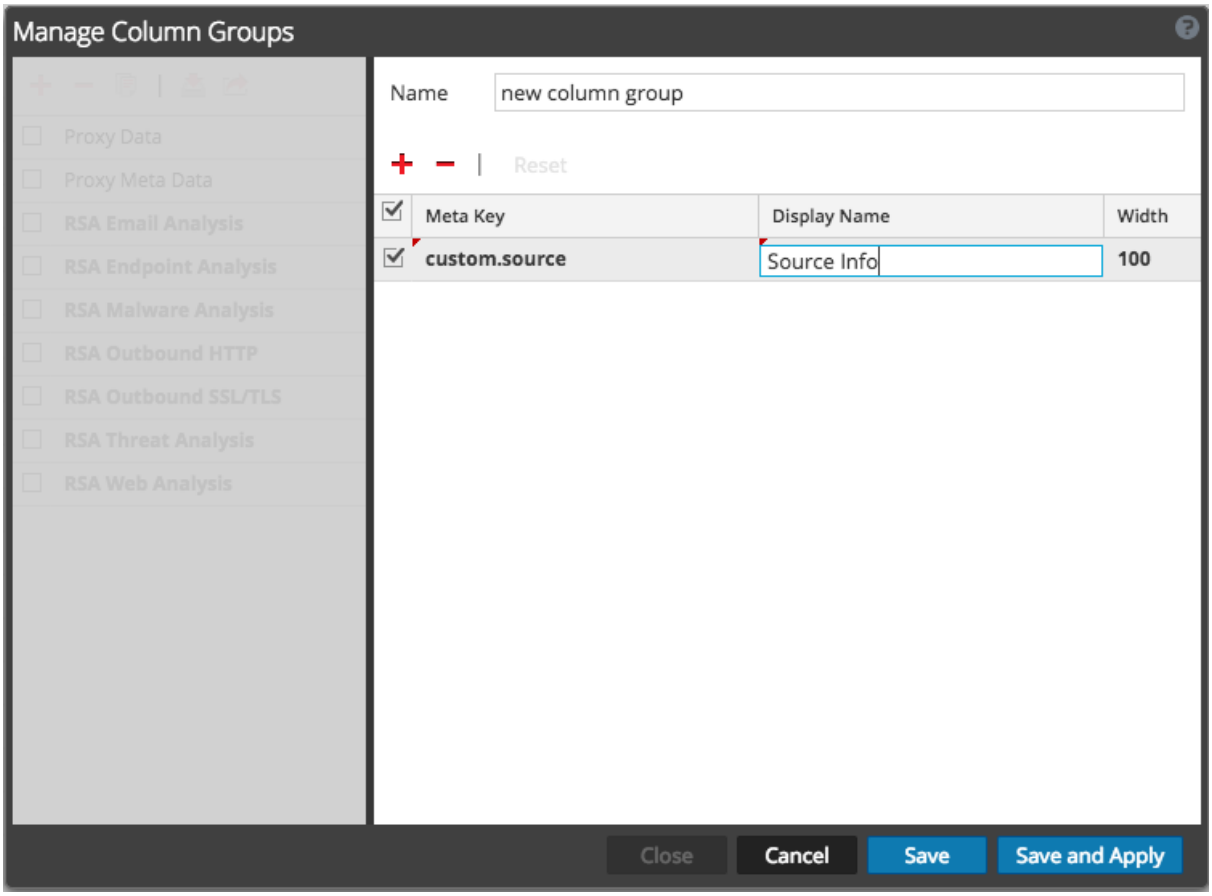
2. Select one of the column groups from the submenu.
   The Legacy Events view is refreshed to reflect the custom column group.

Create a Custom Column Group in the Legacy Events View



1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.
   The Manage Column Groups dialog is displayed.

3. To add a new column group in the column group panel, click + and type the name of the new group in the resulting field.
   The column definition panel opens on the right with the group name filled in. You can edit the group name.

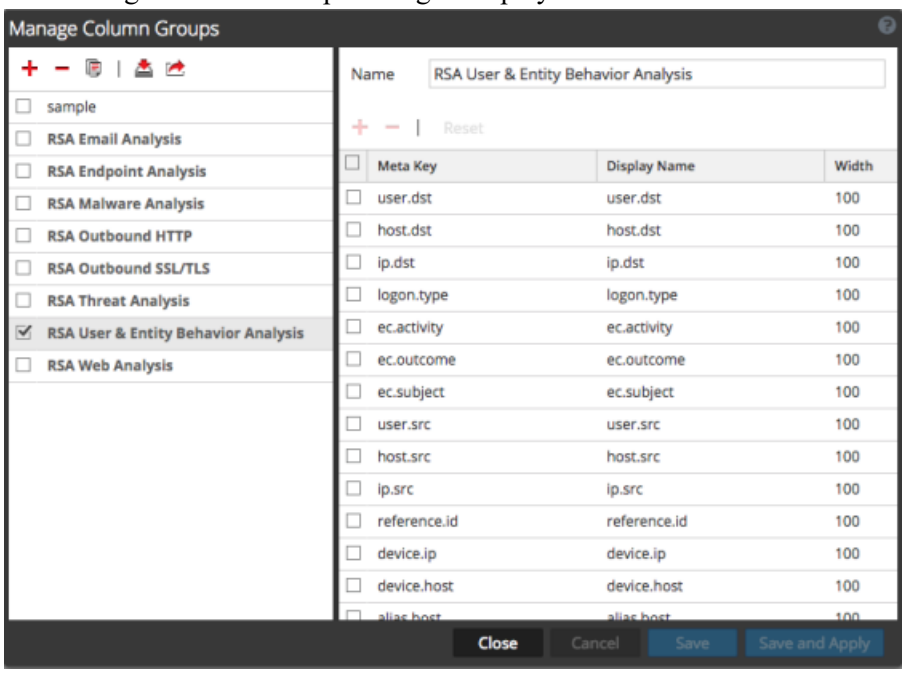


4. To add a column to the group, click +, and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.

5. (Optional) To delete a meta key from the column group, click −.
6. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

7. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

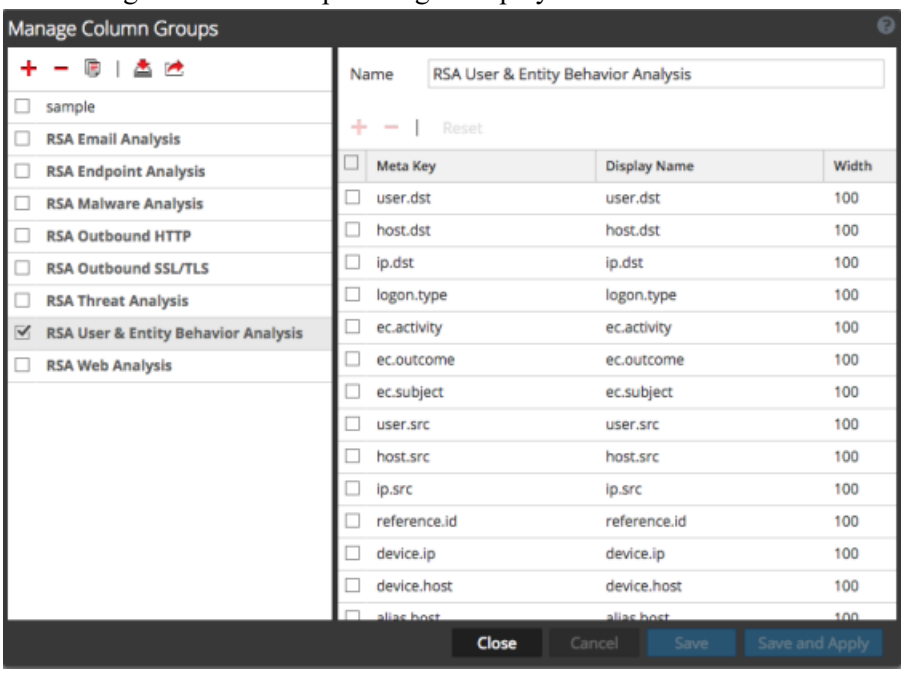


8. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
9. When ready to save, do one of the following:
   a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
   b. To save the edited column group without refreshing the Legacy Events view, click **Save**.

Delete a Column Group (Legacy Events View)

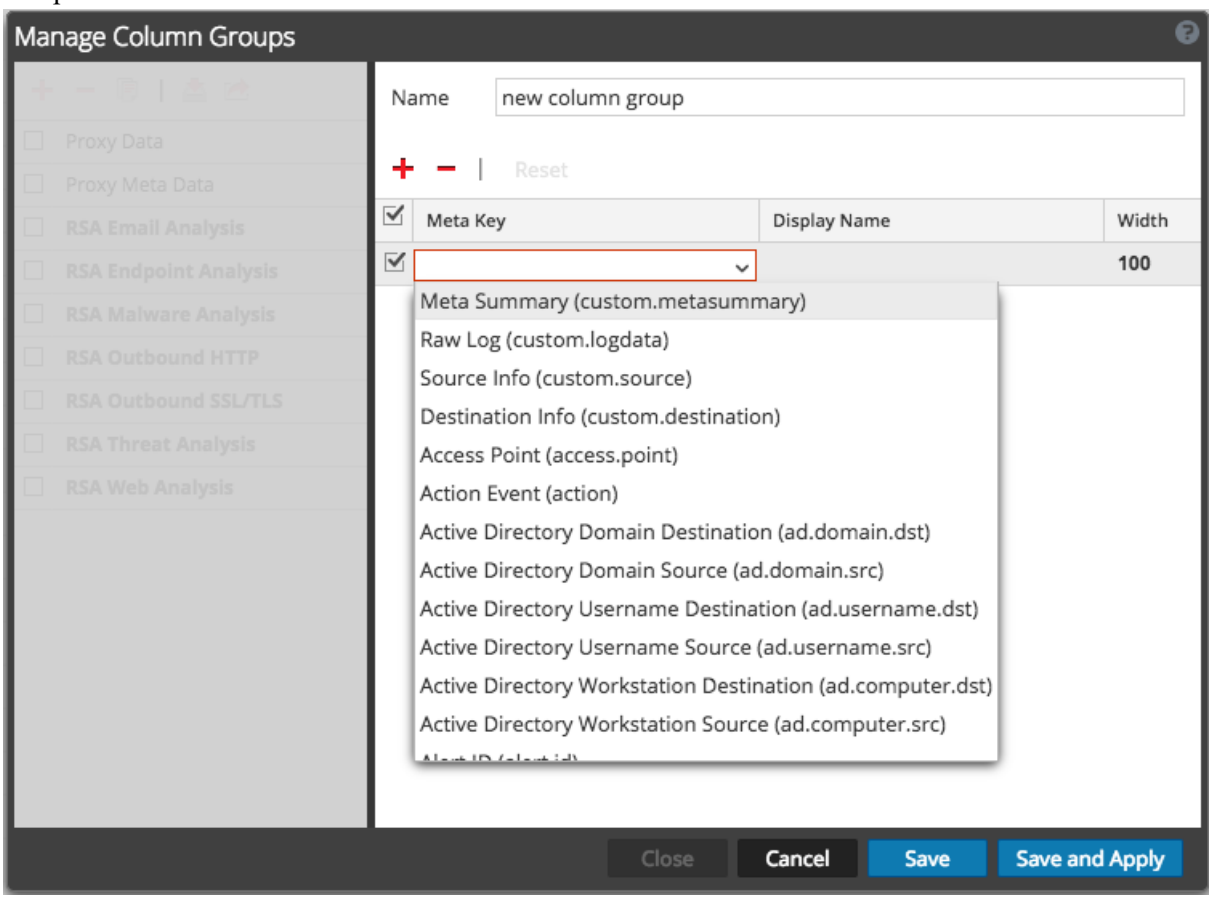
1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.



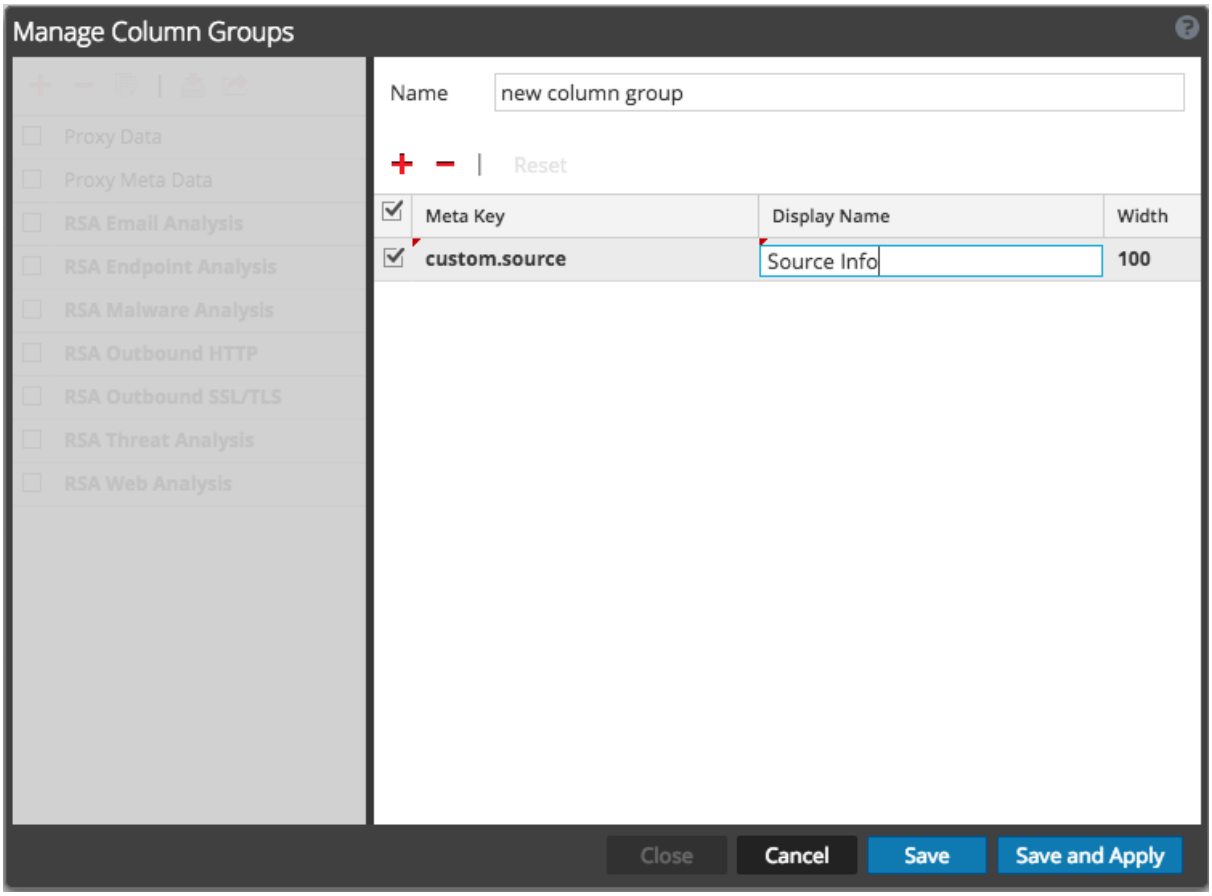
3. To delete a custom column group in the column group panel, select one or more custom column groups and click − in the toolbar.
   A confirmation request is displayed.
4. Do one of the following:
   a. To delete the column group and refresh the Legacy Events view, click **Yes**.
   b. If you decided not to delete the column group , click **No**.
      The selected column groups are deleted and no longer appear anywhere for this service in Investigate.

Edit a Column Group (Events View)



1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.



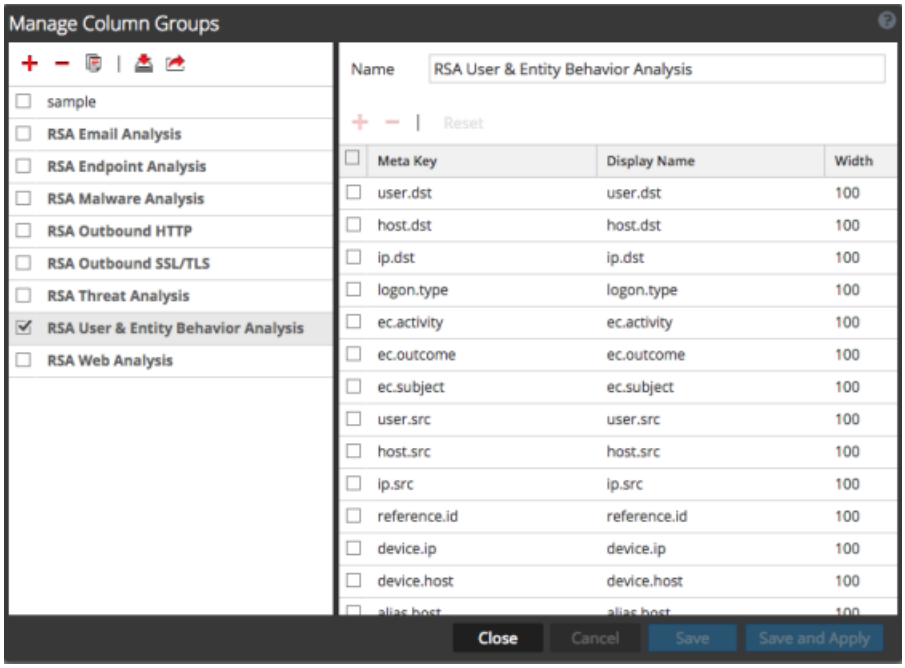
3. Do one of following:
   a. To edit a custom column group in the column group panel, select the checkbox before the name. The column definition panel opens on the right.
   b. To clone and edit a built-in column group or a custom column group, select the checkbox before the name and click the clone icon ( ).
   The column definition panel opens on the right.
4. (Conditional) If you are editing a clone of a group, type the new name of the group.
5. To add a column to the group, click , and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.

6. (Optional) To delete a meta key from the column group, click −.
7. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

8. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

9. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
10. When ready to save, do one of the following:
    a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
    b. To save the edited column group without refreshing the Legacy Events view, click **Save**.



Import and Export a Column Group (Legacy Events View)

You can export custom column groups for use by other members of your team, and other analysts can import column groups if you give them a copy of the exported file.

To export a column group

1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group. Each of these views is a differently formatted events list, and each column represents one

meta key.
The Manage Column Groups dialog is displayed.

3. To export a column group, select the checkbox before the name and click the Export option ( ).
   The column group is exported to your local file system as a .jsn file, for example, `CustomColumnGroupsExport.jsn`. If you export another group, the next file is named `CustomColumnGroupsExport-2.jsn` to differentiate.
4. To import a column group that you have available on your local file system, click the Import option ( ).
   The Import Column Groups dialog is displayed.
5. Browse your local drive to find the column group (jsn file), and click **Upload**.
   The column group is added to the list. If it has the same name as an existing column group, a message is displayed and the column group is not imported.

Use Saved Queries to Encapsulate Common Areas for Investigation

Saved Queries offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view. The same query profiles are shared between all views, and they are available in the Springboard for use in panels. Private saved query created in the Events view are only available in the Events view for the analyst who created them.

Each saved query specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

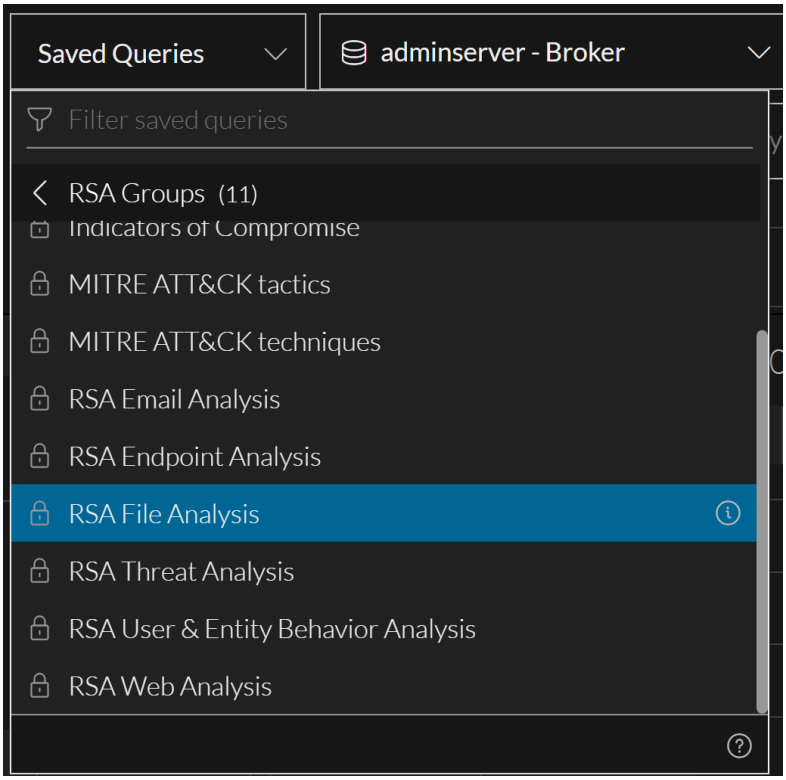
In a saved queries:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the saved query is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View).

Built-In Saved Queries

You cannot edit or delete built-in queries, but you can copy an existing profile and edit the copy in the Navigate view, the Legacy Events view, or the Events view. In the Navigate view, the built-in Queries names begin with the RSA prefix and are grouped under Default Queries. The Events view does not support grouping of saved queries. This figure is an example of a built-in query as listed in the Saved Queries menu.

NetWitness Platform has these built-in Queries:



- RSA Email Analysis
- RSA Endpoint Analysis
- RSA File Analysis
- RSA Threat Analysis
- RSA User & Entity Behavior Analysis
- RSA Web Analysis
- Behaviors of Compromise
- Enablers of Compromise
- Indicators of Compromise

- MITRE ATT&CK tactics
- MITRE ATT&CK techniques

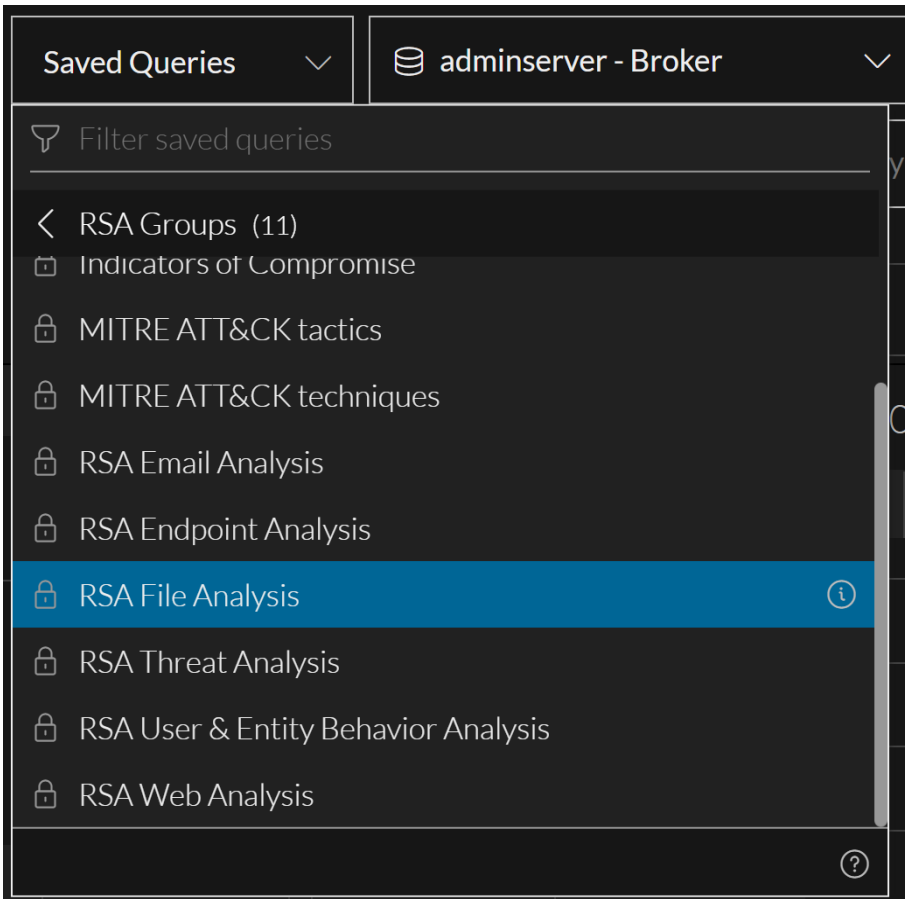
Built-in saved query make it easy for you to query a specific area of interest; for example, selecting the built-in RSA Email Analysis query automatically specifies the meta group, and column group, and pre-query conditions that are most useful for investigating email activity. As you become familiar with the meta keys, you can create your own custom saved queries.

Live Saved Queries

NetWitness supports deploying the investigate content from live and are marked by the live symbol ( ) under the save queries group drop down. The saved queries are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.

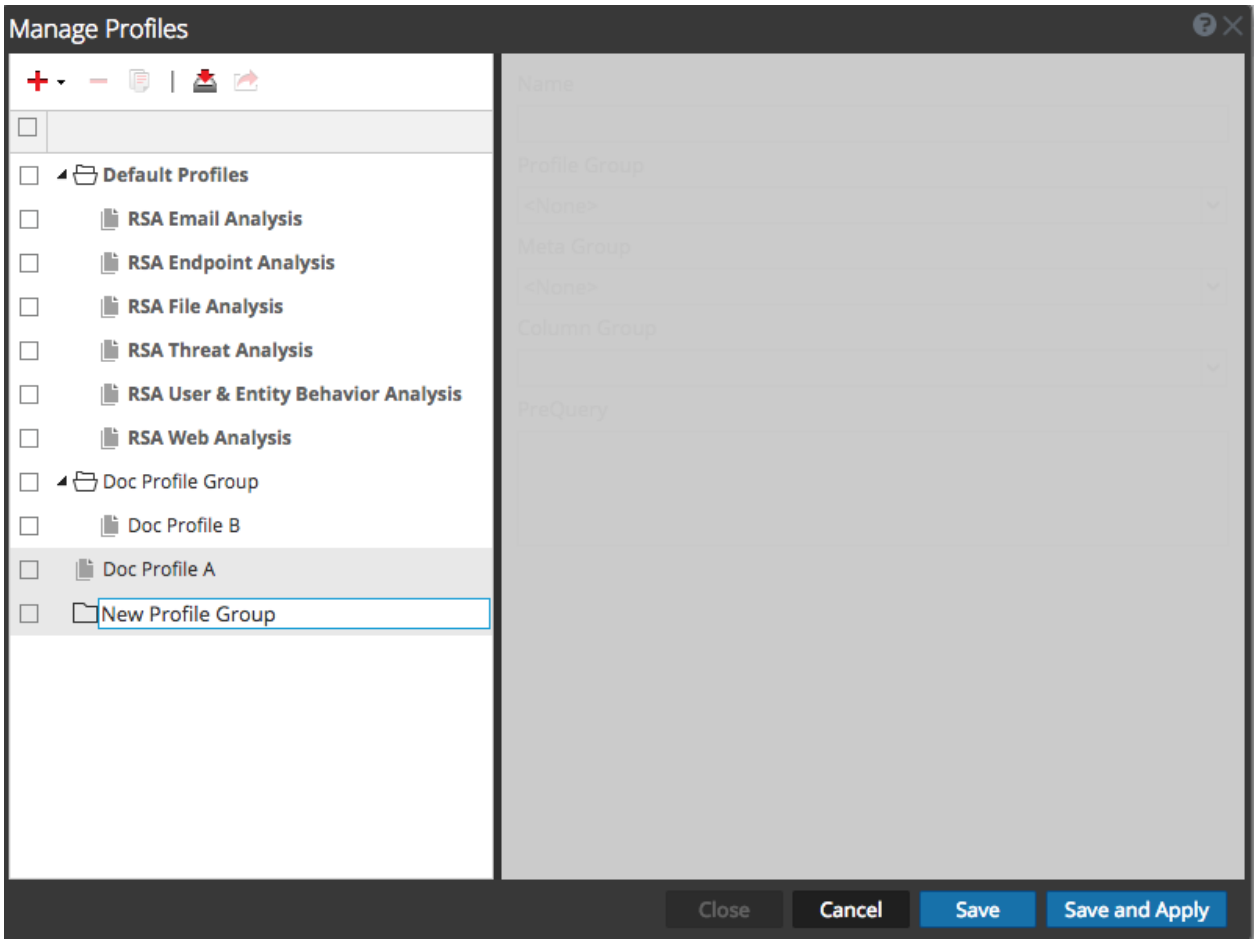
Custom Saved Queries

Custom saved queries are shared globally within your organization, you can create shared saved query as before, and can also create private saved query. If you edit a shared custom saved query, your changes are applied globally. If you delete a shared custom saved query profile, the query is deleted and no longer available for all analysts.



Note: If a Springboard panel is using a saved query as a filter, the profile can be edited, but cannot be deleted in the **Events** view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted saved query as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

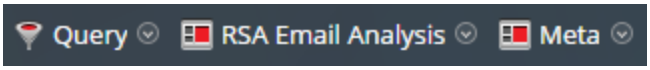
When you create a saved query, you can choose to share it or you can keep it private (default); you cannot change a shared saved query to private or a private saved query to shared. Private saved query are not visible or usable in the Navigate view, the Legacy Events view, or the Springboard. Icons identify the profile type in the Saved Queries menu. These are examples of a shared and a private custom saved query as listed in the Saved Queries menu, with the edit icon displayed at the end of the row.



Dialogs for Managing Saved Queries

The saved query are listed in alphabetical order in the Saved Queries menu in a way that makes built-in profiles distinguishable from custom profiles that you imported or created. While the functionality for managing saved queries is similar in the Navigate view, the Legacy Events view, and the Events view, the dialogs are different. The following figure illustrates the Saved Queries menu in the Version 12.3.1Events view. This menu lists the same queries that are available in the Navigate view and the Legacy Events view. You can create, copy, edit, delete, and apply profiles.

This is an example of the Manage Profiles dialog in the Navigate and Legacy Events views.



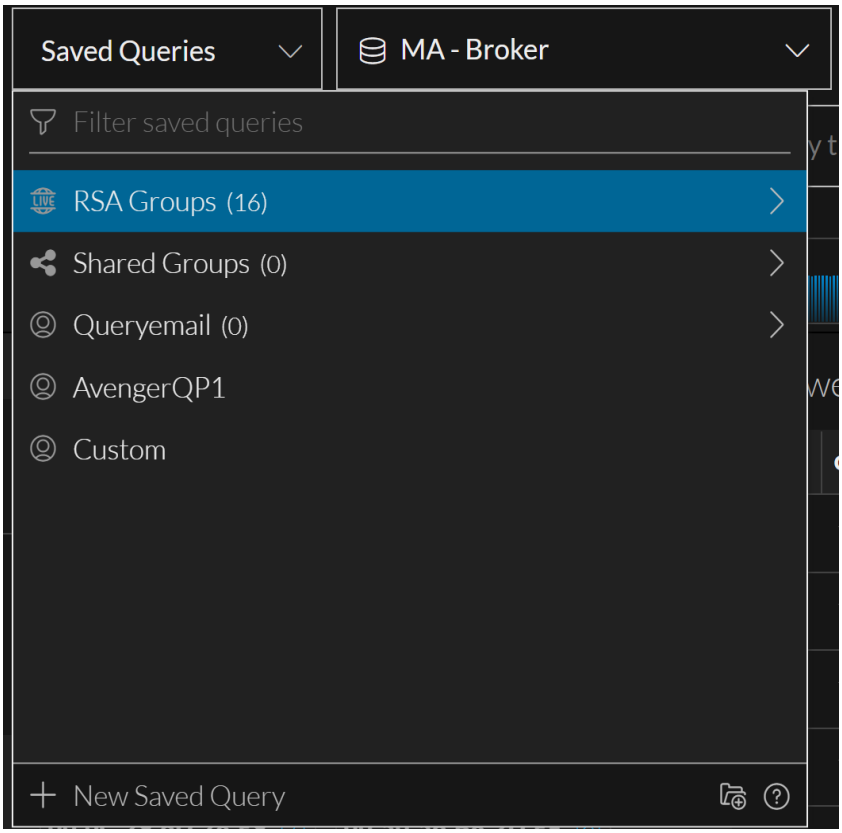
Note: Query profiles are available in the Navigate view, the Legacy Events view, and the Events view; in Version 11.4.1 and earlier, they are shared globally across users. If one user modifies or deletes a custom query profile it has an effect on what is available to the other users. In the Events view, use the Query Profiles menu to work with profiles. In the **Navigate** or **Legacy Events** view toolbar, select **Profile > Manage Profiles** to open the Manage Profiles dialog. In Version 11.5, custom profiles can be shared globally, but private custom profiles created in the Events view are not available in the Navigate view or the Legacy Events view.

From the Query Profiles menu (11.4 and later Events view):

- You can apply a query profile and use options in the menu to create (Create Query Profile dialog), copy, edit, and delete (Query Profile Details dialog) custom query profiles.
- Selecting a profile applies the meta group, column group, and pre-query condition, and these are visible in the Meta Group menu title, Column Group menu title, and the query bar.
- In Version 11.4, the Events view does not use meta groups or profile groups defined in other views. Version 11.5 allows you to use meta groups and to create private custom query profiles, in addition to the previously available shared custom query profiles.
- If a query profile created in the Legacy Events view uses the Log View, Detail View, or List View instead of a column group, the same profile in the Events view uses the Summary List column group.

From the Manage Profiles dialog (Navigate view and Legacy Events view):

- You can configure, add, delete, import, and export profiles and profile groups.
- You can organize your custom query profiles in profile groups (Version 11.2 and later). When upgrading to Version 11.4 from an earlier version, only profile groups that contain profiles are imported. The built-in query profiles are in the Default Profiles group, which cannot be edited. Analysts can create new query profile groups, which anyone can use.
- After creating profiles, you can edit a profile group to add profiles, remove profiles, or move profiles from one group to another. When you create a profile, it is not added to any profile group by default.
- Selecting a profile applies the meta group, column group, and pre-query condition, and the label of the Profile menu is replaced with the query profile name. The following figure illustrates the RSA Email Analysis query profile selected in the Navigate view or Legacy Events view.



View Saved Queries Details (Events View)

If you want to know which meta groups, column groups, and limiting filters (called pre-query conditions) define a saved query, you can view the details of the profile.

To view the details:

1. Go to **Investigate** > **Events** and click **Saved Queries**.
   The Saved Queries menu opens with a list of available queries. This menu displays a list a list of built-in query queries (RSA), shared custom queries, and your private custom saved queries with visibility options and a filter field make it easier to find a particular query.

2. Hover over a saved query in the list and click the information icon ( ) to see the meta group, column group, and pre-query conditions configured for the query.
   This figure shows the details for the RSA Email Analysis profile, one of the built-in saved query. An icon identifies the type of meta group and column group (shared, private, or RSA).

3. Do one of the following:

   a. To close the dialog, click **Close**.

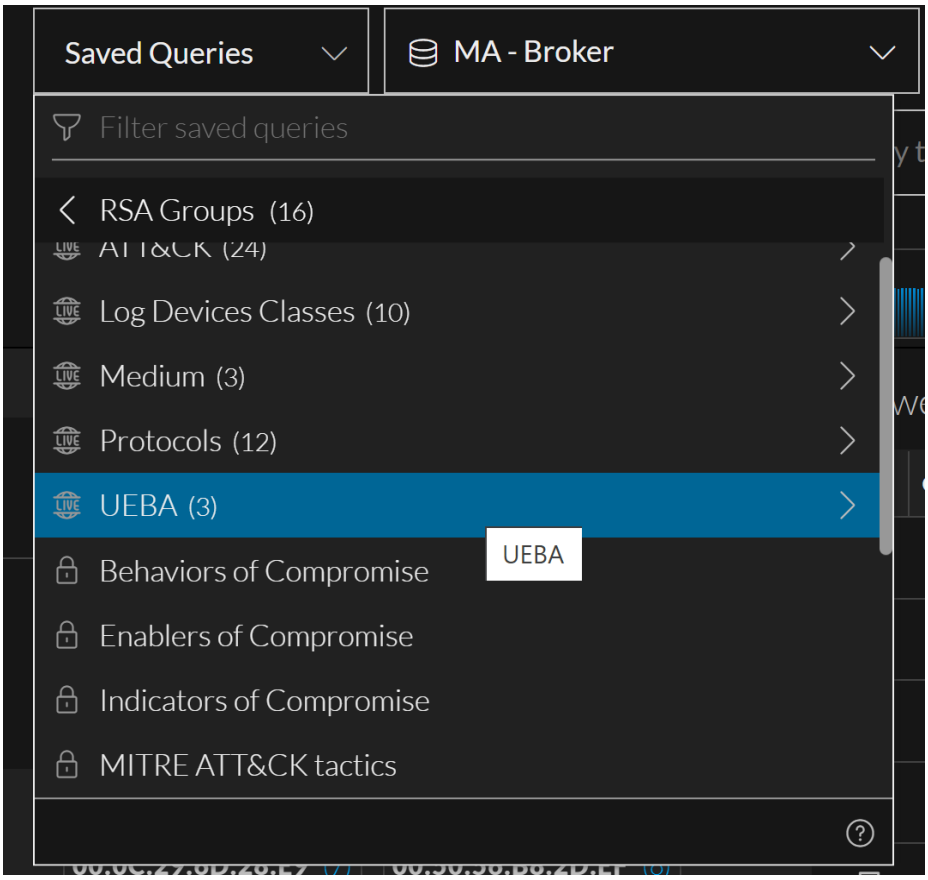
   b. If you want to apply the profile, click **Select Saved Query**.
      The dialog closes. The Events list is updated to reflect the selected saved query. If the profile uses a different column group, the query is re-executed with the pre-query conditions and column group for the selected profile. If only the pre-query conditions are different, existing filters in the query bar are removed and the pre-query conditions (for example, this filter: `service=24,25,109,110,995,143,220,993`) is added in the query bar, but the query is not submitted. The first 15 columns in the associated column group are used in the Events list.

      i. (Optional) Create additional filters in the query bar before executing the query (see Filter Results in the Events View).

      ii. (Optional) If you want to select different columns from the associated column group before executing the query, click above the Events list on the right.
      The Column Selection list is displayed and you can choose up to 40 columns to display (see

Use Columns and Column Groups in the Events List.

Apply a Saved Queries (Events View)

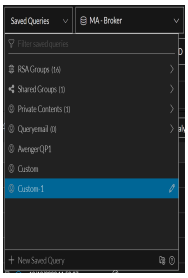


When a saved query is applied, there is no indication of it in the Saved Queries menu, but you can see if a column group or meta group is in effect. If pre-query conditions are applied, the filters are visible at the beginning of the query bar as shown in this figure:

Note: If you do not see enough results or the right results in the Events view, an applied profile may be limiting results with pre-query conditions.

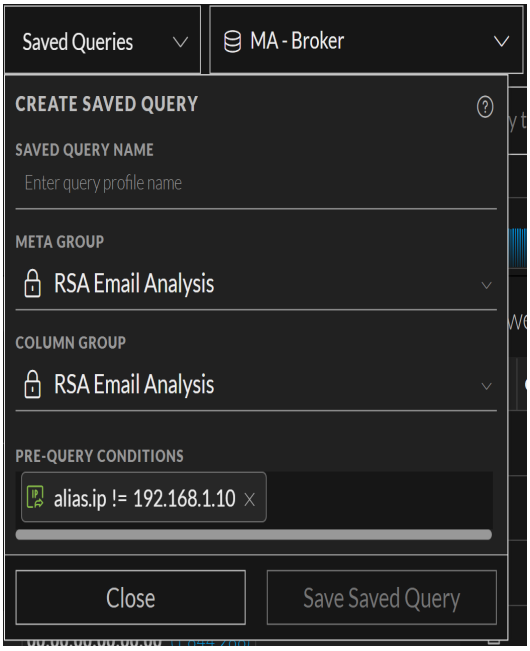
To apply a saved query:

1. Go to **Investigate** > **Events** and click **Saved Queries**.
   The Saved Queries menu opens with a list of available saved queries.



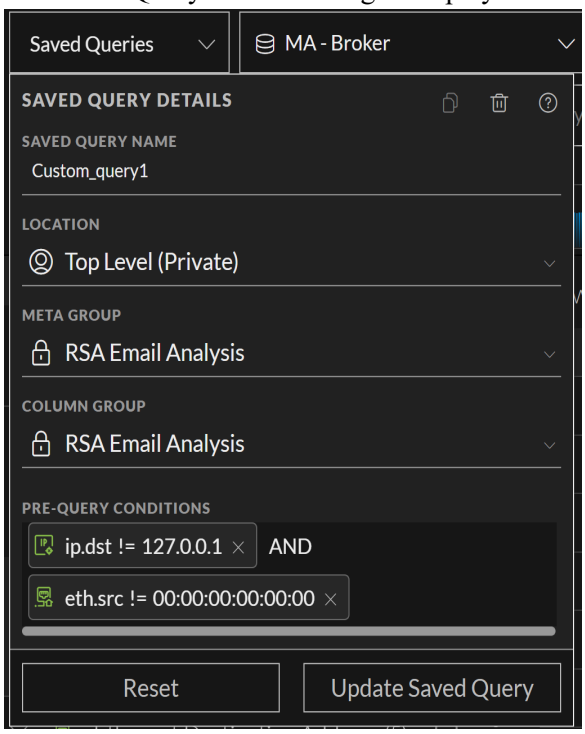
2. Use the Down and Up arrow keys or the mouse to highlight a saved query.
3. Click the highlighted query.
   The saved query settings are applied immediately. The Events list is updated to reflect the selected query. If the query uses a different column group the query is re-executed with the pre-query conditions and column group for the selected query. If only the pre-query conditions are different, existing filters in the query bar are removed and the pre-query conditions are added in the query bar. The button becomes active so that you can resubmit the query with the new pre-query conditions. You can add more filters as usual before or after resubmitting the query.

Create or Edit a Custom Saved Query (Events View)



To create or edit a custom saved query

1. Go to **Investigate** > **Events** and click **Saved Queries**.
   The Saved Queries menu opens with a list of available profiles.



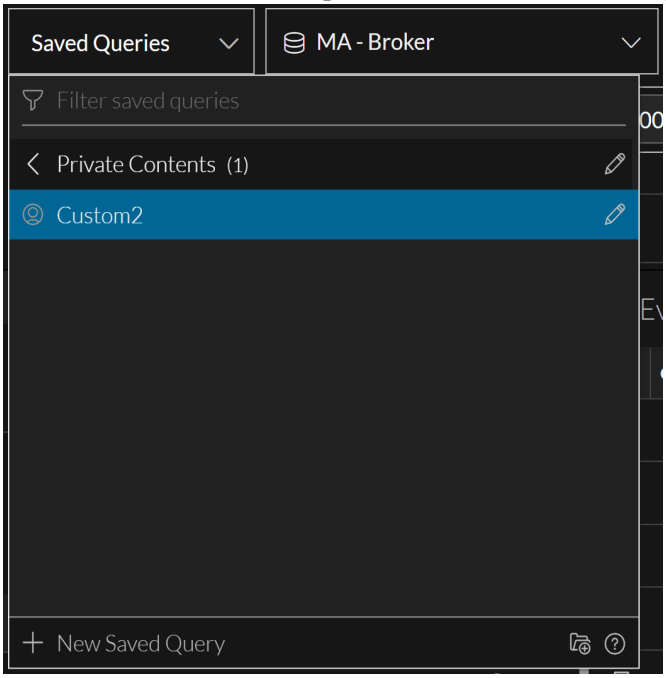
2. Do one of the following:

   a. To create a new saved query, click + **New Saved Query**.
   The Create Saved Query dialog is displayed. The Create Saved Query dialog shows a new empty query that includes the currently selected meta group, column group, and filter that you have currently typed in the Query bar as a pre-query condition.

   b. To edit an existing saved query, highlight a custom query in the menu, and click the edit ( ) icon.

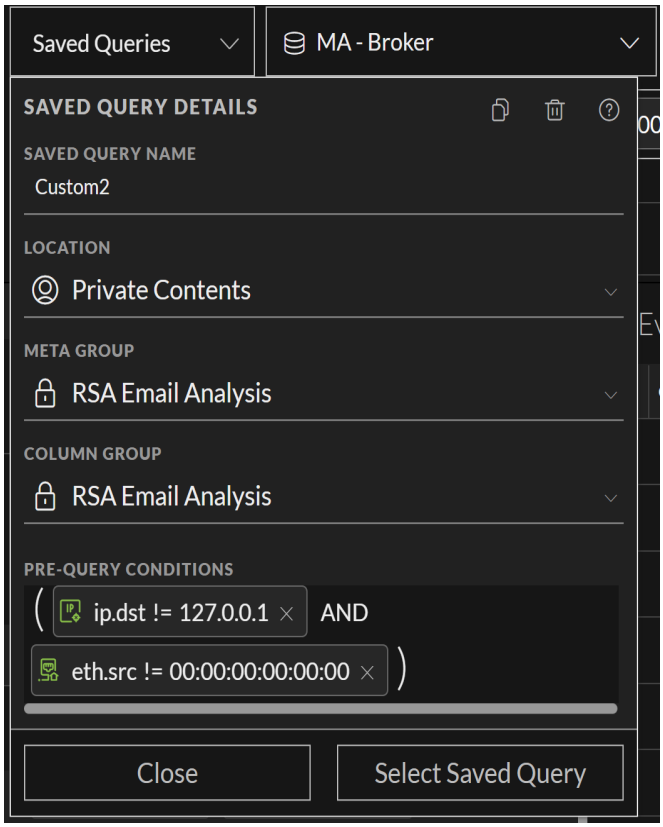
The Saved Query Details dialog is displayed.

3. In the **Save Query Name** field, type a unique query name that has no more than 80 characters.
   In the Create Saved Query dialog, the Save Saved Query button is activated.
4. Do one of the following
   a. If you want to share the new saved query with your organization, set the **Location** to Shared Groups from the drop-down menu.. You cannot change a saved query from shared to private after it is created.
   b. If you want to create a private saved query that only you can see and manage, leave the **Location** to Top Level (Private) . You cannot change a saved query from private to shared after it is created.
5. Select a meta group from the **Meta Group** drop-down list. If a shared group and a private group have the same name, the private group is listed before the shared group. In Version 11.5.1, an icon before the group name distinguishes private from shared.
6. Select a column group from the **Column Group** drop-down list. In Version 11.5, there can be shared or private groups and they can have the same name. In this case, the private group is listed before the shared group. In Version 11.5.1, an icon in front of the group name distinguishes private from shared.
7. In the **Pre-Query Conditions** field, check the default filters from the query bar and add or remove filters if you wish.
8. Click **Save Saved Query** or **Update Saved Query**.
   The new saved query is saved or the edited profile is updated with your changes.
9. To close the dialog, click **Close**.



Delete a Custom Saved Query (Events View)

Built-in saved queries are read only, and cannot be deleted, but you can delete any custom saved query. A confirmation message allows you to confirm or cancel the deletion. When you delete a shared saved query, the effect is global and the profile is no longer available to any analyst.



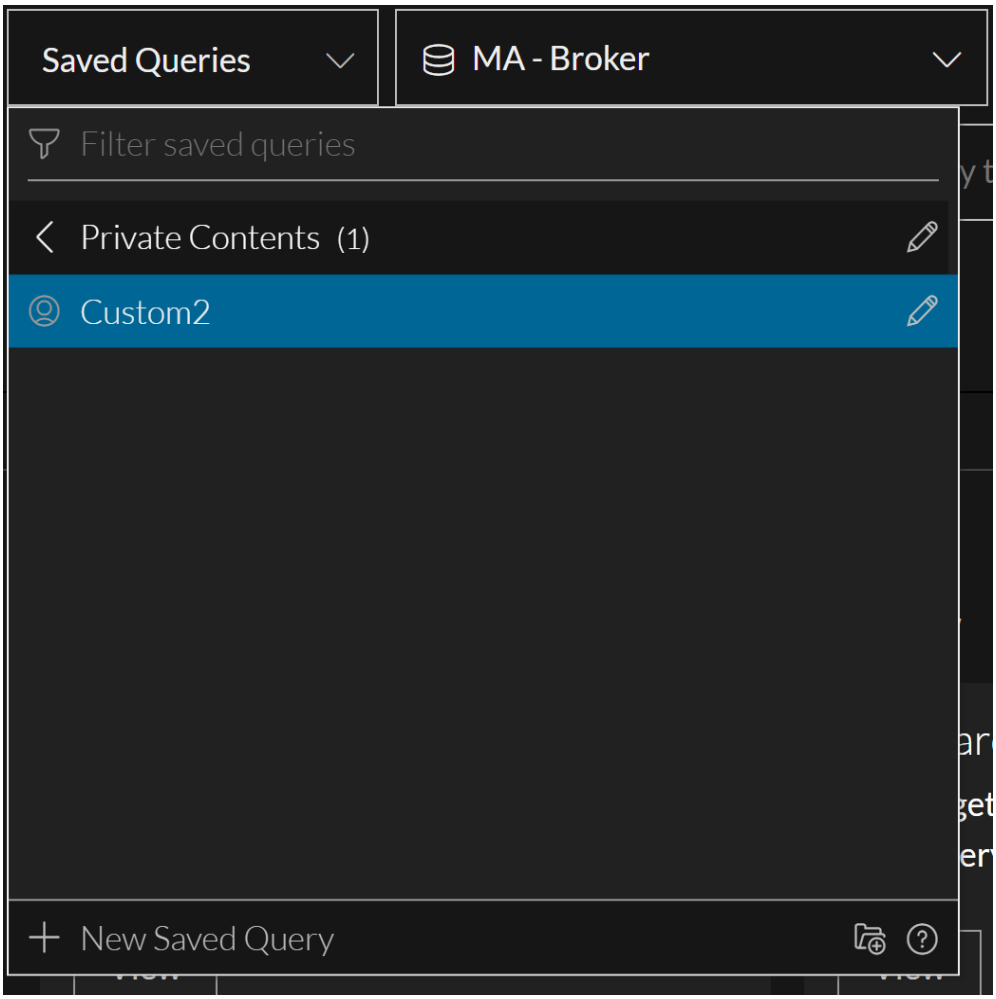
Note: If a Springboard panel is using a saved query as a filter, the query profile can be edited, but cannot be deleted in the Events view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted saved query profile as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

To delete a custom saved query

1. Go to **Investigate** > **Events** and click **Saved Queries**.
   The Saved Queries menu opens with a list of available queries.

2. Highlight a custom saved query that you want to delete, and click the edit ( )icon.
   The Saved Query Details dialog is displayed.

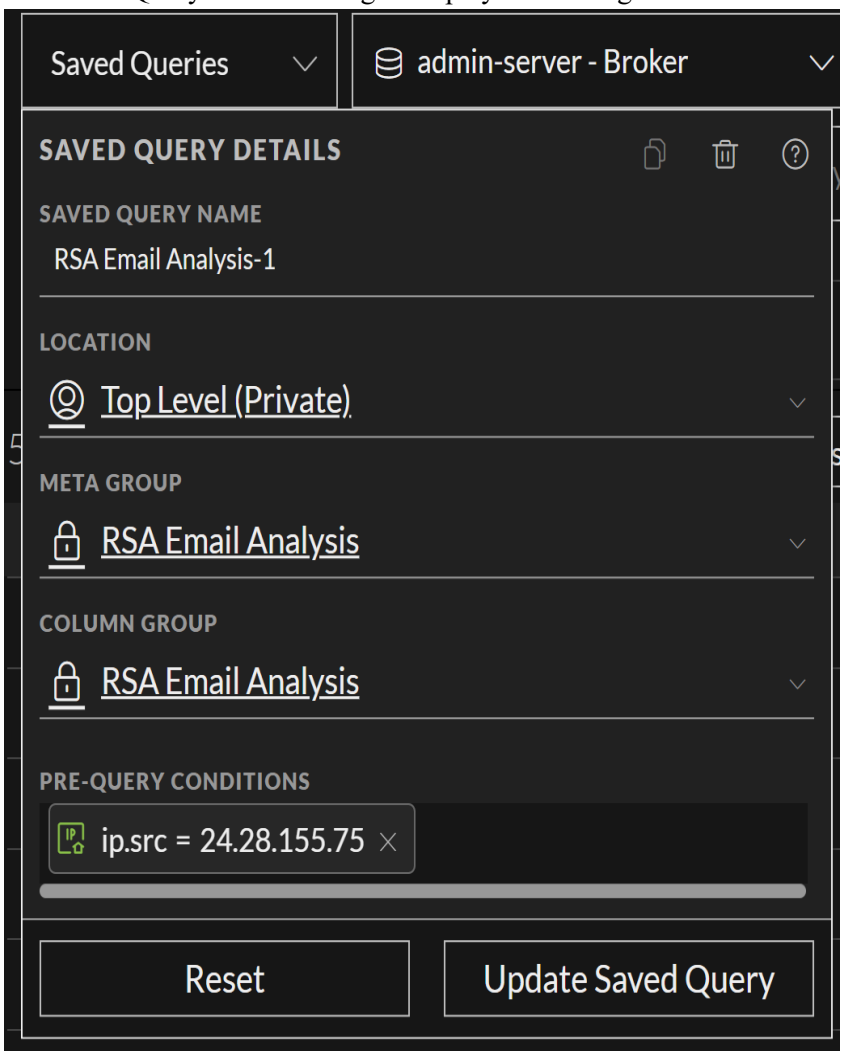
3. Click the delete icon ( ).
   A confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Saved Query**.
   The saved query is deleted and removed from the Saved Queries menu. The profile no longer appears anywhere for any analyst working in Investigate.



Copy a Saved Query

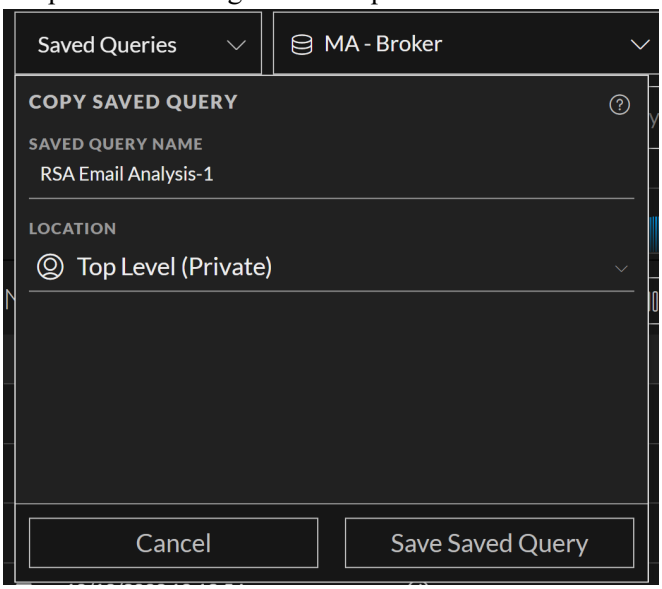
You can copy any saved query, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in profile. Also since you cannot change a custom profile from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a profile, the same name is used with a number appended. For example, if you copy RSA Email Analysis, the first copy is named RSA Email Analysis-1, and a second copy of the same profile is named RSA Email Analysis-2. After you create the copy, you can edit the new profile to give it a new name and edit the pre-query conditions, meta group, and column group in the profile.

Note: If you are making a shared copy of a private query profile that uses a private meta group or column group, a message notifies you that a shared copy of the meta group or column group is being created and used in the query profile. It may take a little longer to copy the query profile when a private meta group or column group has to be copied.



To copy a saved query profile

1. Go to **Investigate** > **Events** and click **Saved Queries**.
   The Saved Queries menu opens with a list of available queries.
2. Highlight the saved queries that you want copy. This figure shows Custom2 highlighted. The information icon ( ) is displayed to the right.

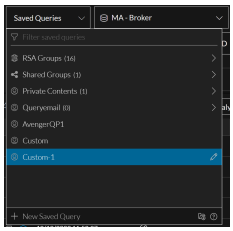


3. Do one of the following:
   a. Click the information icon ( ).
   b. For a custom profile, click the edit icon ( ).

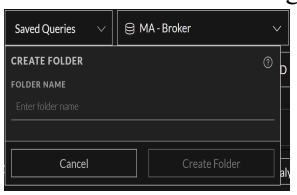
The Saved Query Details dialog is displayed. This figure shows the dialog for a built-in profile.

4. Click the Copy icon ( ).
   The Copy Saved Query dialog is displayed with a number appended to the query name to create a

unique name among all saved queries.



5. (Optional) In the **Saved Query Name** field, edit the name of the saved query.
6. If you want to share the new saved query with your organization, set the **Location** to Shared Groups from the drop-down menu. By default the new saved query is private. If the profile being copied has a private column group or meta group, a shared copy is created and used in the copy of the query.
7. Do one of the following:
   a. To close the dialog without copying the saved query, click **Cancel**.
   b. To save the clone of the saved query, click **Save Saved Query**.
   The clone is saved, and the Saved Query Details dialog for the cloned query is displayed.
8. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the new saved query, click **Select Saved Query**.
   The clone is added to the Saved Queries menu.

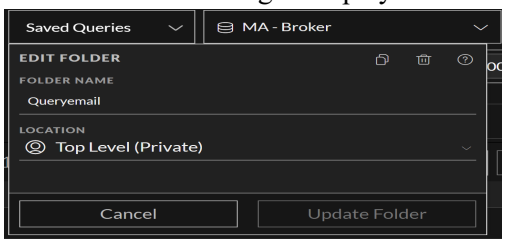


Create a Saved Query Folder

You can create saved query folders which reside at the top level and are be added as a private or shared folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. In the Events view, select the Saved Queries menu title. The menu drops down to display a list of meta groups and folders with the Filter Saved Queries field at the top and the  option at the bottom.

2. Click .
   The Create Folder dialog is displayed.

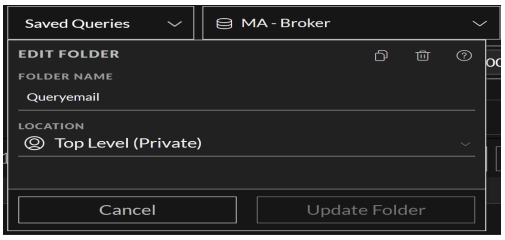


3. In the **Folder Name** field, type a unique name for the new saved query group folder.
4. Click **Create Folder**.

Edit and Move Saved Query Folder

After you create a saved query group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. In the Events view, select the Saved Queries menu title that you want edit.
2. Click .
   The Edit Folder dialog is displayed.



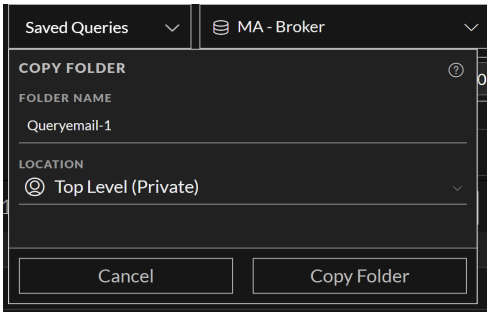
3. In the **Folder Name** field, type a unique name for the query profile folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Saved Queries Folder

You can copy saved queries folder from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except for the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. In the Events view, click the Saved Queries menu title. The menu drops down to display a list of saved queries and folders.
2. Select a folder you want to copy.
3. Click edit and then click .

The Copy Folder dialog is displayed.



4. In the **Folder Name** field, type a unique name (maximum length of 80 characters) for the new saved query group and folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

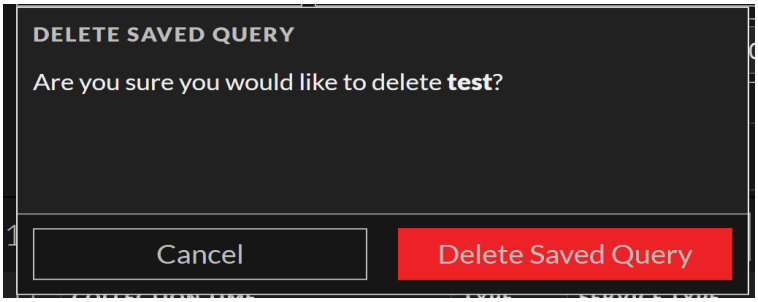
Copy Saved Queries Group Folder Deployed from Live

You can copy saved query group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. In the Events view, click Saved Queries Group menu title. The menu drops down to display a list of saved query groups and folders.
2. Click on a Live Saved Queries Group folder you want to copy.

3. Click 
   The Copy Folder dialog is displayed.

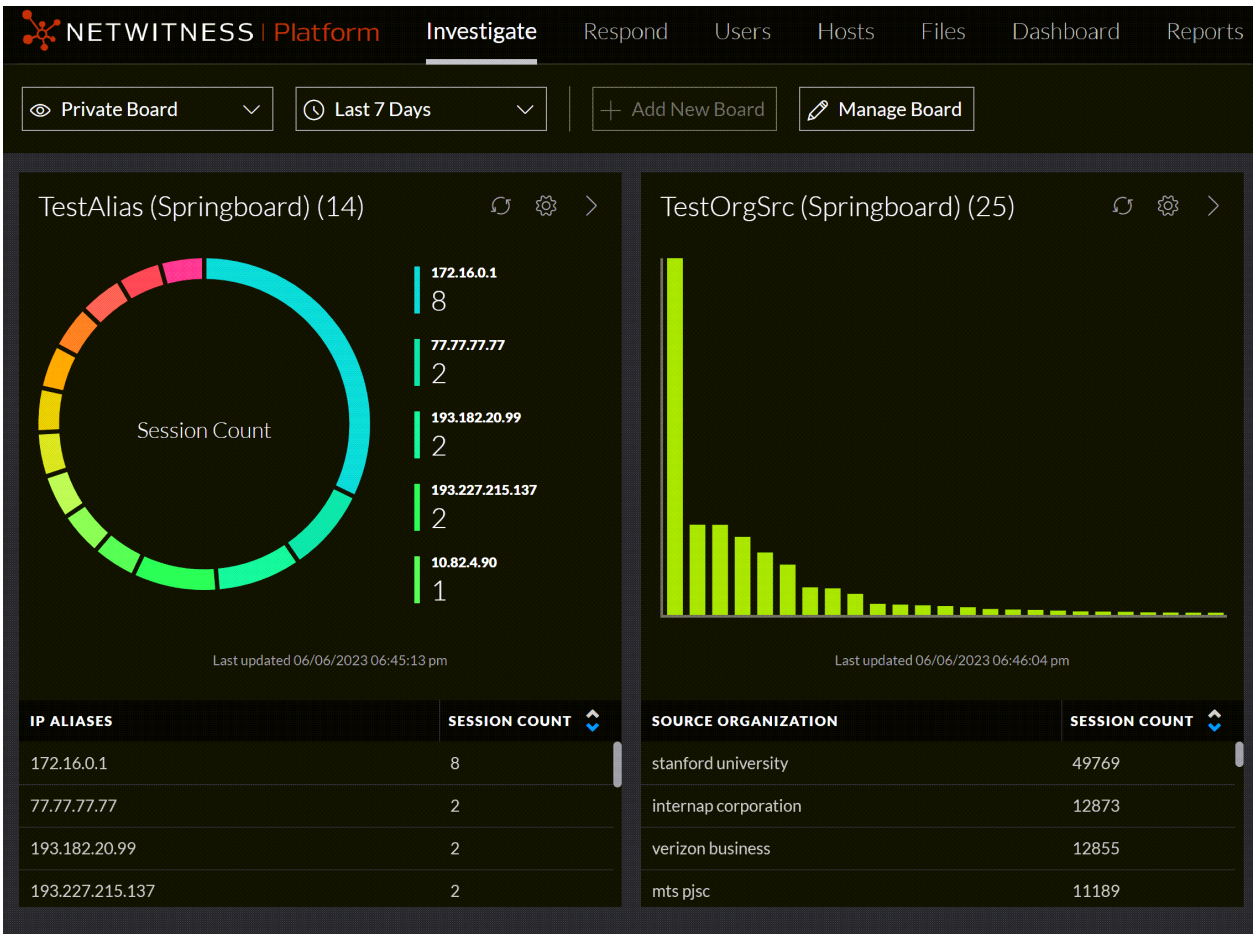
4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and its contents are displayed as the original meta group name appended with a -n.



Delete Saved Queries Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. In the Events view, click the Saved Queries menu title. The menu drops down to display a list of query profile groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

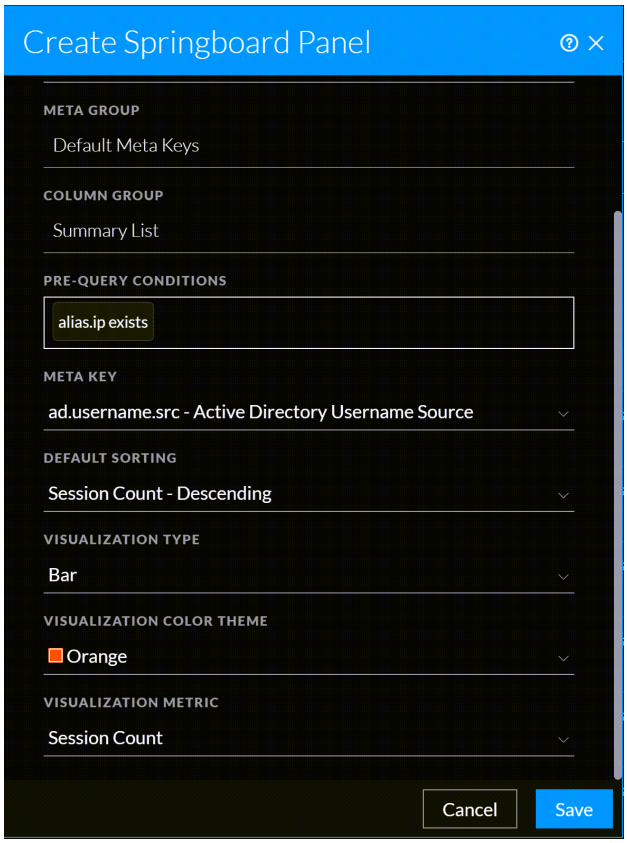


4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

Add Springboard Panels from Events View

(From 12.0 and later) Administrators and Analysts can now create a Springboard panel from **Investigate** > **Events** view. Analysts can add any number of filters on the query bar and convert them into Springboard panels with important system indicators for threat hunting and investigation.



IMPORTANT: Ensure that you create a custom private board first in order to add the Springboard panel.

Note: From 12.3 version and later, analysts can create panels with different colors using the **Visualization Color Theme** option. It allows analysts to visualize their data more effectively and helps them perform analysis and investigations more efficiently.

To add a Springboard panel from Events view

1. Go to **Investigate** > **Events**.
2. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.
3. Click > **Create Springboard Panel**.
   The Create Springboard Panel dialog is displayed.

4. Enter the following details:
   - **Name**: Enter a unique name for the panel. The name can include letters, numbers, spaces, and special characters, such as _ - ( ) [ ].

     Note: The query profile will be created with the same name as the Springboard panel.
   - **Meta Group**: It is selected by default.
   - **Column Group**: It is selected by default.
   - **Location**: It is the location where the query profile will be saved.
   - **Pre-Query Conditions**: Displayed based on the input criteria entered in the search query panel.
   - **Meta Key**: Select the appropriate meta key value from the drop-down list.

- **Default Sorting**: Select the appropriate sorting from the drop-down list.
- **Visualization Type**: Select the appropriate visualization type from the drop-down list.
- **Visualization Color Theme**: Select the appropriate visualization color theme from the drop-down list.

  Note: The **Multiple** color option is available only for the Donut chart.
- **Visualization Metric**: Select the appropriate visualization metric from the drop-down list.

5. Click **Save**.

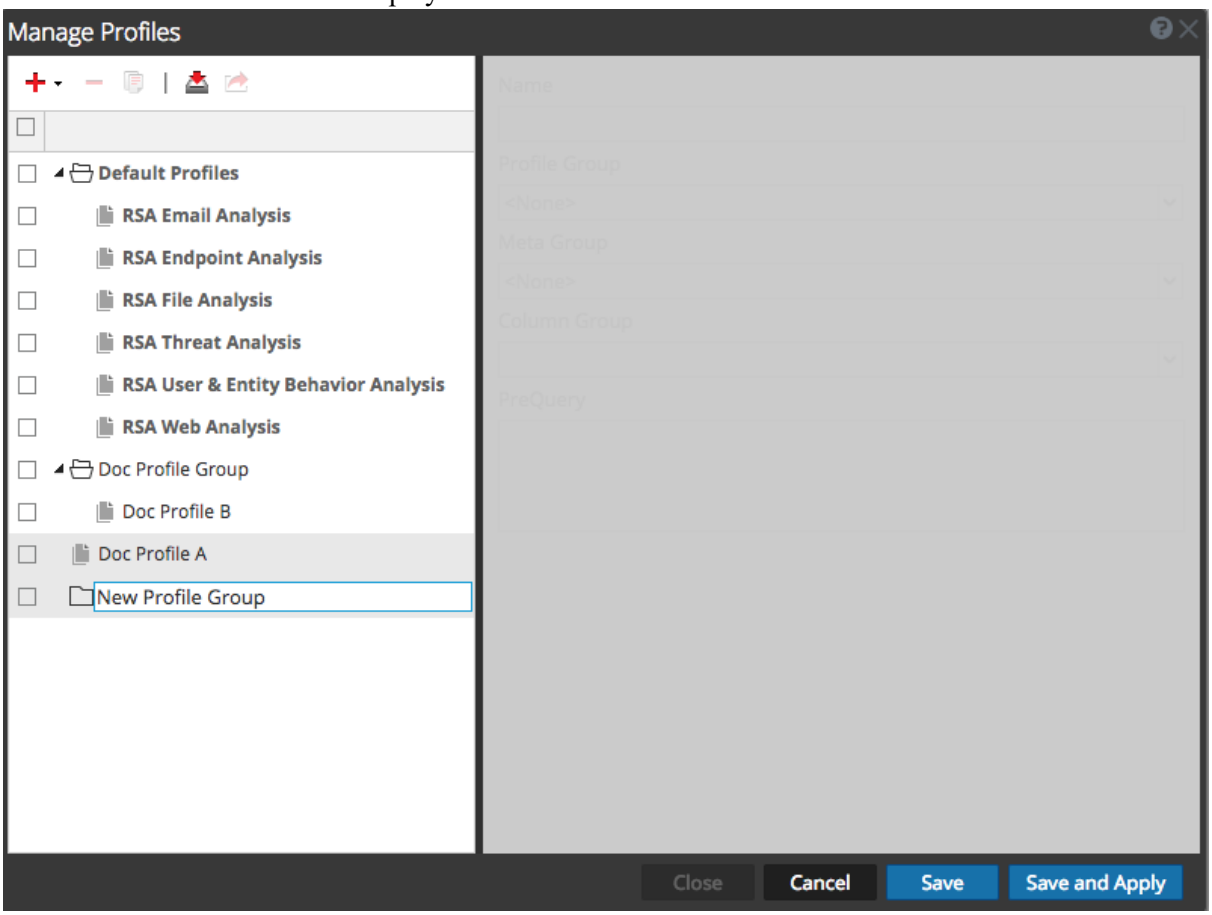
   The panel will be added successfully to the custom private board in the Springboard.

Navigate to the Manage Profiles Dialog (Navigate and Legacy Events Views)

1. Go to **Investigate** > **Navigate** or **Legacy Events**. (If the **Investigate** dialog is displayed, select a service and click **Navigate**.)
2. In the toolbar, select **Profile** > **Manage Profiles**.

The Manage Profiles dialog is displayed.

Create, Edit, or Delete a Profile Group (Navigate or Legacy Events View)



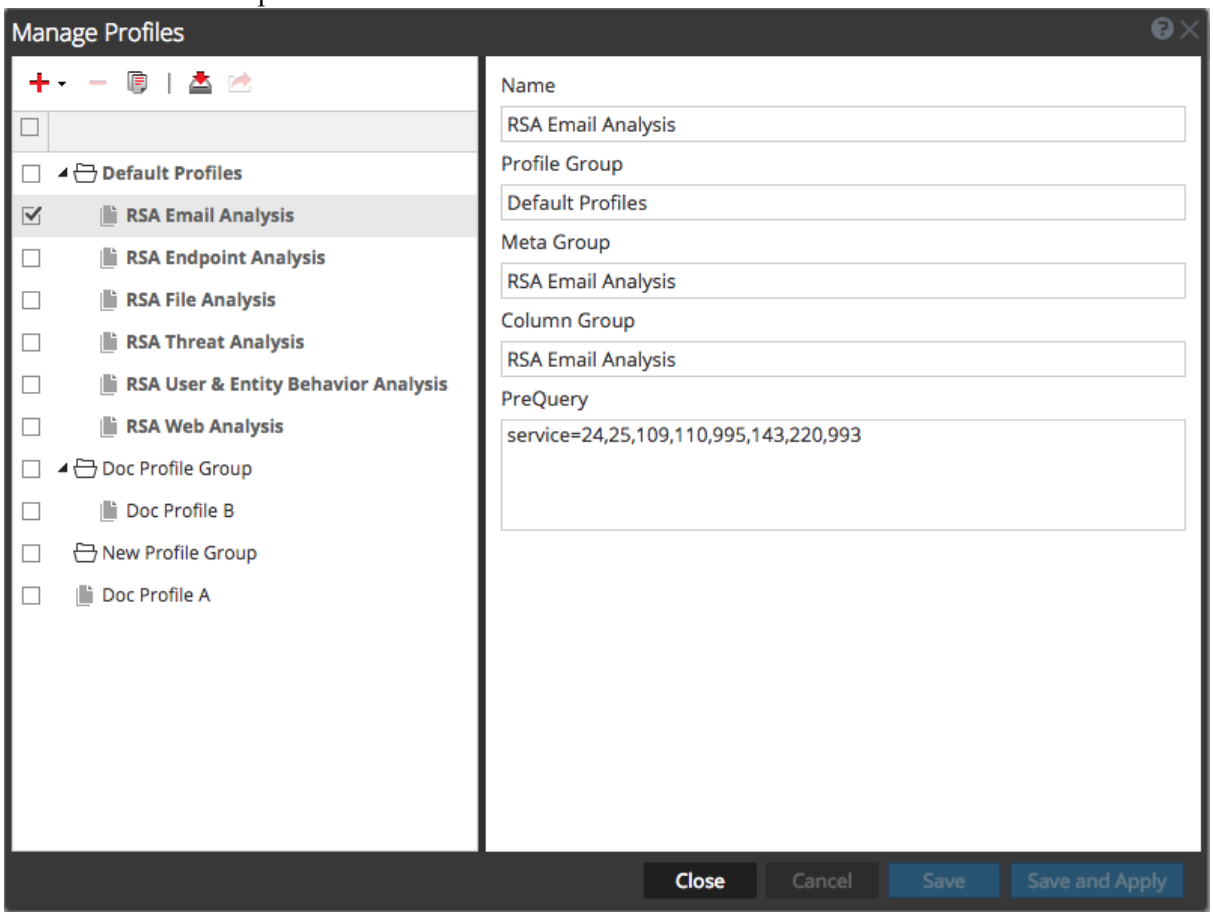
You can create a custom profile group to organize different profiles. Once created, the only edit you can make directly to a profile group is to edit the name of the profile group. To add or remove a profile in a group, edit the profile and assign it to a different profile group as described in Create and Edit Profiles (Navigate or Legacy Events View).

Note: If you migrated profile groups from Version 11.3, empty groups were not migrated.

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile group to edit, double-click the profile group.
   - To add a new profile group, click + and select **Add New Profile Group**.

Note: If you want to edit one of the built-in profile groups, click to make an editable copy.

A folder with a blank field is displayed at the bottom of the Profiles list in the left column.



2. To edit or enter the name of the profile group, double-click the Profile Group and type in the entry field. The name must be between 2 and 80 characters.
   The profile group name is applied to a new profile group or to the profile group you edited. The profile group is now available when configuring a profile.
3. To delete a profile group do one of the following:
   - If you want to delete a profile group but keep the profiles, click the checkbox to select the group, uncheck the profiles in the group, and click delete.
   - If you want to delete a profile group and the profiles that the group contains, click the checkbox to select the group, and leave the profiles that you want to delete checked.
     A dialog asks for confirmation that you want to delete the group. If you left the mark in the checkbox next to the profiles, the group and the profiles in the group are deleted. If you unchecked the profiles, only the profile group is deleted and the profiles are moved out of the group and available to add to another profile group.

Create and Edit Profiles (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile to edit, click the checkbox beside the name.
   - To add a new profile in Version 11.2 and later, click + or click the down arrow next to + and select **Add New Profile**.
   - To create a new profile in versions prior to 11.2, click +.

   Note: If you want to edit one of the built-in profiles, click to create a copy, and edit the copy.

   The definition of the profile is available to edit in the right panel. This figure illustrates the definition of one of the built-in profiles.

2. Edit or enter the profile name by typing in the **Name** field. The name must be between 2 and 80 characters.
3. (Optional for Version 11.2 and later) If you want to add the profile to a profile group, select a profile group from the **Profile Group** drop-down list.

If you select a profile group, the profile is added to the group when you save the changes. If you do not select a profile group, the profile is not part of a group.

4. Select a meta group from the **Meta Group** drop-down list. You can add custom meta groups as described in Use Meta Groups to Focus on Relevant Meta Keys. Private meta groups created in the Events view are not available in the Navigate view.
5. Select a column group for the **Column Group** drop-down list. You can add custom column groups as described in Use Columns and Column Groups in the Events List. Private column groups created in the Events view are not available in the Navigate view.
6. Type queries to filter results in the **PreQuery** field. PreQuery follows the same syntax as the Query builder. The PreQuery in the figure uses a meta group called **service = 24,25,109,110,995,143,220,993**.
7. Click **Save** to save the profile without using it, or click **Save and Apply** to save the profile and use it immediately.
   If you click **Save and Apply**, a confirmation dialog is displayed before applying the selected profile. For Version 11.2 and later, the PreQuery that you entered in the Manage Profiles dialog is displayed in the breadcrumb.

Delete a Profile (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, select a profile by clicking the checkbox beside the name.

   Note: You cannot delete any of the built-in profiles.

2. Click −.
   A prompt requests confirmation that you want to delete the profile, and the profile is deleted. The option name in the toolbar reverts to **Profile** to show that no profile is in effect.

Change the Active Profile (Navigate or Legacy Events View)

If you do not see enough results or the right results in the Navigate or Events views, you may have an active profile that is applying a PreQuery. If you do not want to use any profiles, you can click **Deactivate Profile** in the **Profile** drop-down menu.

To use a different profile:

1. In the **Navigate** or **Legacy Events** view toolbar, open the **Profiles** drop-down menu.
2. Hover over the **Profile** option to display a drop-down list of available profiles.
3. Select the profile you want to use.
   The profile settings are applied immediately.

If you want to change the active profile from the Manage Profile dialog:

1. In the **Navigate** or **Legacy Events** view toolbar, select **Profiles > Manage Profiles**.
   The Manage Profiles dialog is displayed.
2. Select a profile from the left panel and click **Save and Apply**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The profile settings are applied immediately.

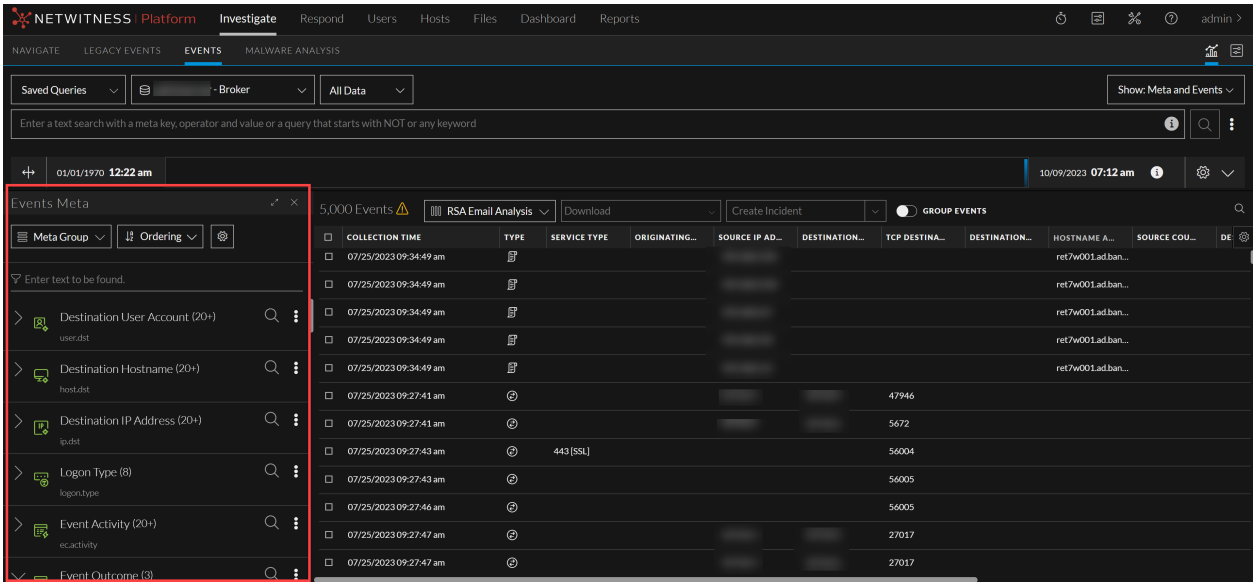
Import Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, you can upload or import .jsn files that have been downloaded from another service. When profile groups are exported and then imported, the grouping of profiles is maintained.

1. In the **Manage Profiles** dialog, click  in the left panel toolbar.
   The Profile Import dialog is displayed.
2. Click **Browse** or the **Upload File** field to select a file from your computer.
3. When the file is selected, click **Upload**.
   The profile is displayed in the left panel.

Download Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, profiles are downloaded as .jsn files.



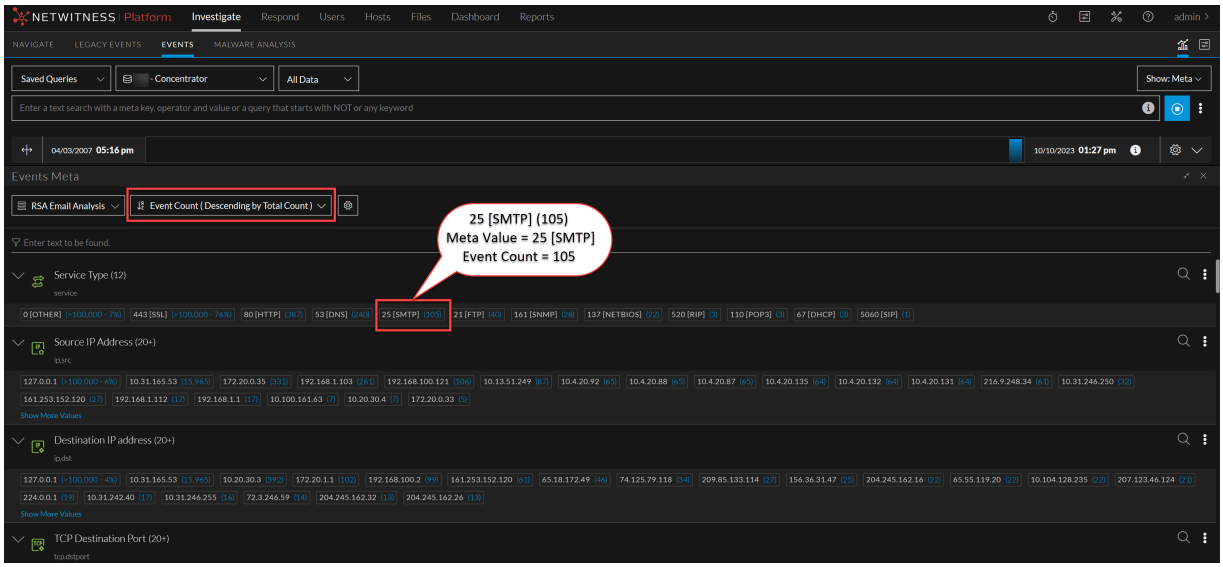
1. In the **Manage Profiles** dialog, select one or more profiles from the left panel.
2. In the left panel toolbar, click .
   The download begins immediately.

Drill into Metadata in the Events View

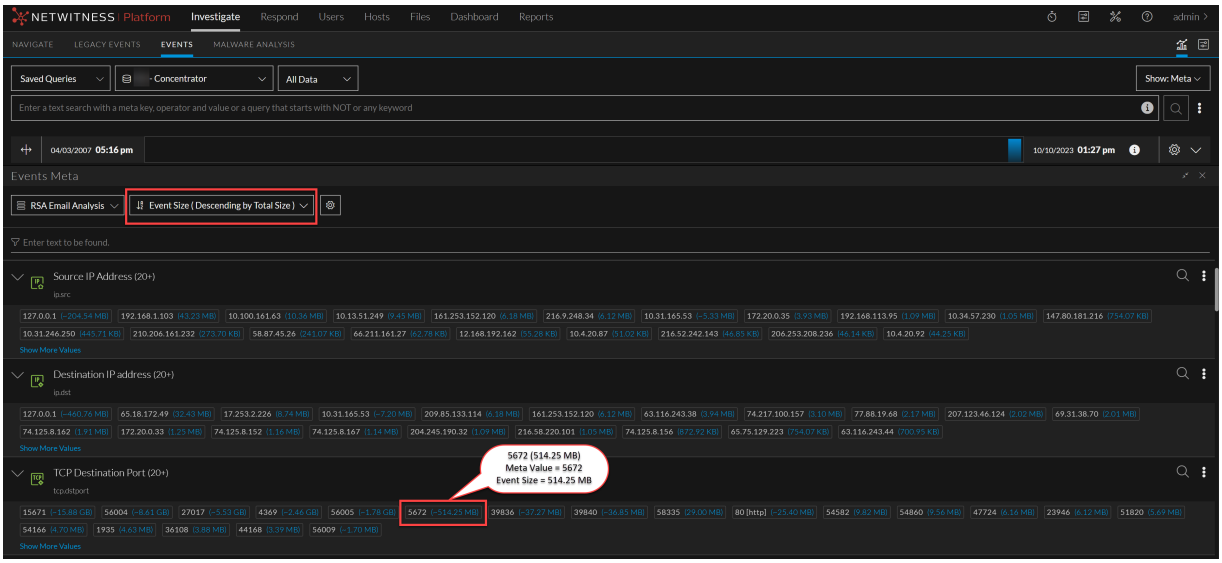
Note: This section applies to Version 11.5 and later. The feature is a beta feature that is enabled by default, and can be disabled by the system administrator as described in the *System Security and User Management Guide*.

When working in the Events view, the focus of an investigation is the smallest possible set of relevant events in sequential order. You can reduce the number of visible events loaded in the Events view using saved queries, column groups, meta groups, and queries. However, it is more efficient to limit the data set using the metadata indexed on the Concentrator before looking at the actual events stored on the Decoder or Log Decoder.

Beginning with Version 11.5, you can drill into the metadata in the Events Meta panel, without leaving the Events view. The list of meta keys and meta values shown is related to all events seen in the environment for the time range in the query. When you find the drill point of interest in the Events Meta panel, you can open the Events panel to see the sequential events. The set of events loaded in the Events view is smaller and loads faster. The flow of an investigation is smoother with less hopping between views. The following figure illustrates the panel, open to the left of the Events panel.



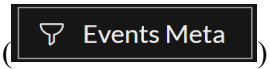
Note: There are two situations in which results in the Events Meta panel may not be as expected:
-In a mixed-mode environment with a Version 11.5 Broker and some Core services at NetWitness Platform Version 11.4 or earlier, a text filter is not supported in the Events Meta panel. If the query in the Events panel includes a text filter, the result set in the Events panel and Filter Events panel may be different.
-If the query in the Events view query builder has a logical `OR` or `&&`, the results in the Events view may be different from results for the same query in the Navigate view and Legacy Events view. In this situation, a set of parentheses automatically encloses the logical `OR` expression in the Navigate view and Legacy Events view, while parentheses have to be manually added in the Events view. If this occurs, you need to enclose the logical OR expression in an additional set of parentheses; select the two filters in the query bar, right-click one of them, and select **Wrap in parentheses** in the menu.



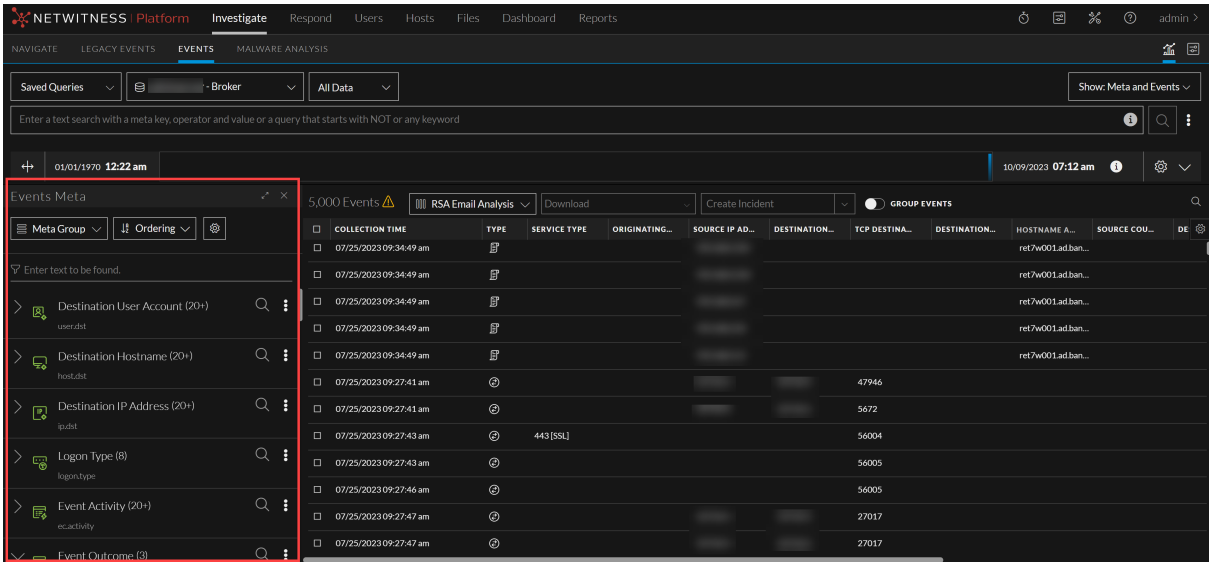
Note: (Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

Modes of Operation

The Events Meta panel has two modes of operation.



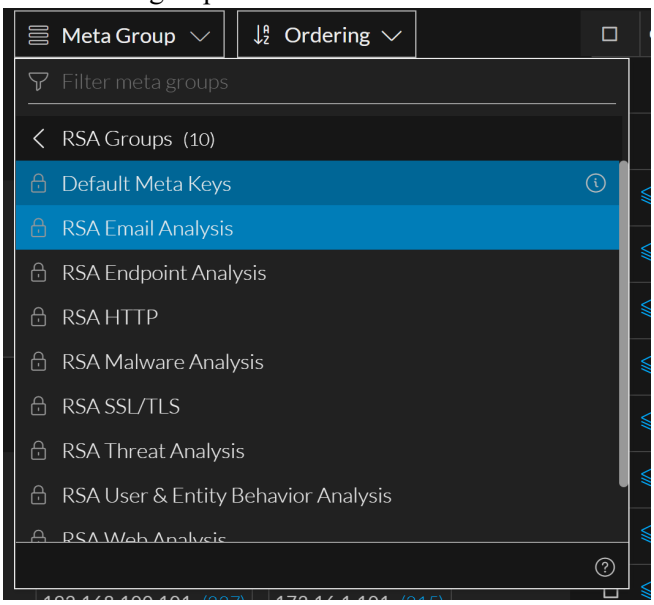
- The **narrow** Events Meta panel is part of a faceted search view into the data (shown above). Left- or right-clicking a meta value adds a new filter, automatically executes a new query, and displays matching events in the sequential list of events. When both panels are open, you can drill into the data in both the Events Meta panel and the Events panel . Each time you left-click a meta value in the Events Meta panel, an expression is appended to the query bar, and the query is executed by default. The query results show new metadata to filter by in the Filter Events panel and the resulting events that match the query in the Events panel. If you change the service or other query elements in the Events panel, you need to execute the query to reload the Events Meta panel.
- The **fully expanded** Events Meta panel uses the full width of the browser window to provide ample real estate to hunt through the metadata without the performance load of immediately submitting a query or viewing the sequential events. As you click a new meta value and drill into the meta values, each meta value is added to the query filter and executed in the Events Meta panel, so that the number of events seen is reduced. Because the Events panel is closed, the query in the Events panel is not updated and the query is not executed. When you collapse the Events Meta panel back to original size, the Events list opens and the query is executed. This is an example of the fully expanded panel.



View Metadata in the Events Meta Panel

To view metadata in the Events Meta Panel

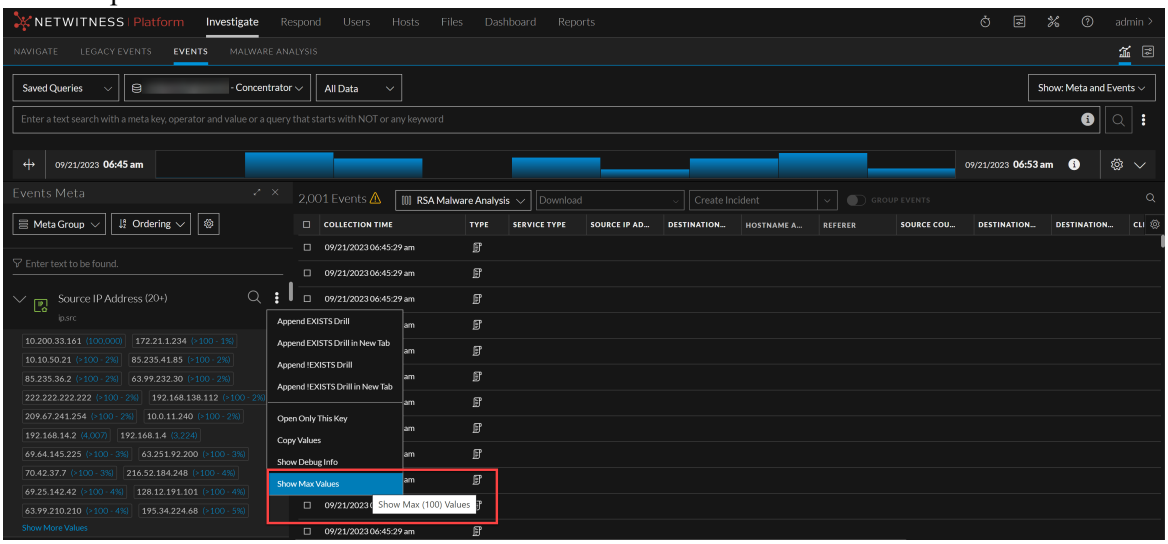
1. Go to **Investigate** > **Events**, select a service to investigate, and select a time range.
2. (Optional) Select a column group or a query profile.
3. Click  to load events in the Events panel.
   A query is executed in the Events panel and matching events are listed,
4. Click the Events Meta button (



) in the Events panel.
   The Events Meta panel opens to the left of the Events panel.

Note: (Version 11.6) By default, the Filter Events panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Filter Events panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.

The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. In Version 11.5.1, the meta group you selected previously is not stored in browser cache so it remains in effect until you change it. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups. Based on the contents of the index file for the service, the Filter Events panel is populated with the first 25 meta keys that have at least one meta value and are open. When using the Default Meta Keys group in the Filter Events panel, only the first 30 meta keys with values are open and the remaining are closed. Closed meta keys may be listed, but they do not count toward the 25 or 30 meta keys total. Meta keys with no values are listed at the bottom of the panel. You can expand, collapse, and close the panel using the standard panel controls (, , and ).

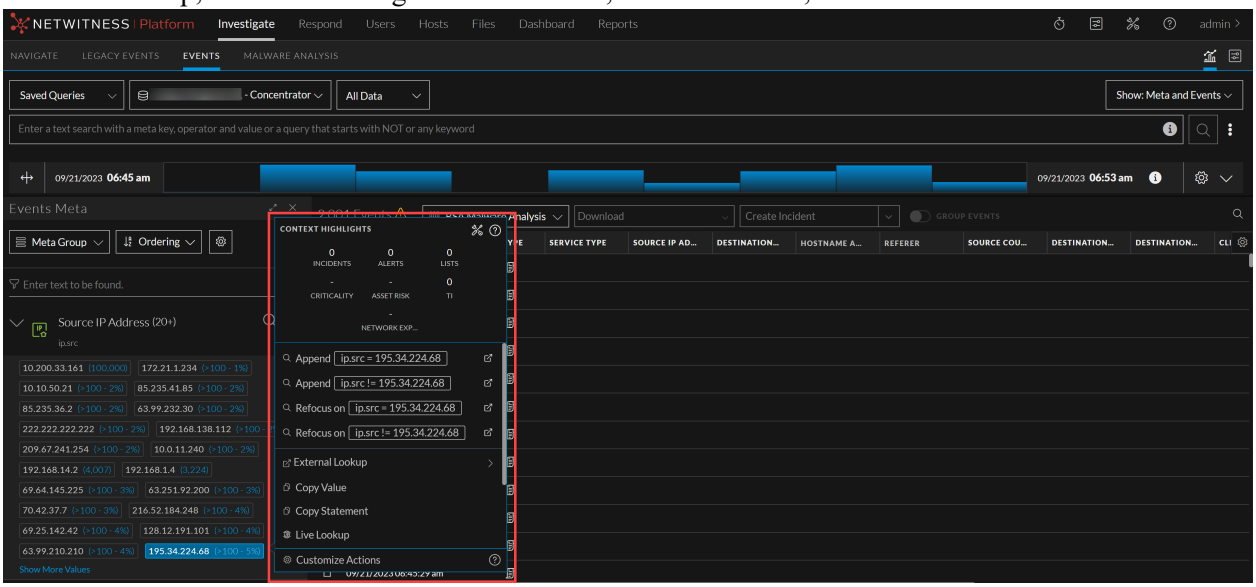


1. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA HTTP meta group.

Show Max Value of Meta Groups

In case all the values have not rendered and displayed, you can click Show Max Value to view all the values at once.

1. With the Filter Events panel open in the 11.6 Events view, click  and select the **Show Max Values** option.



2. The values that were not rendered earlier will begin to load and a maximum of 1000 results are displayed.

View the Context Lookup Panel in the Events Meta Panel

In the Events Meta panel, you can click a meta entity to open the context tooltip. The context tooltip is available only for the meta keys that are defined as an entity the Context Hub supports. The Context Hub service is pre-configured with default meta types and meta keys mapping. For information about mapping of the context hub meta values with investigation meta keys, see "Configure Meta Type Mapping for Context Hub" in the *Context Hub Configuration Guide*. The context tooltip includes the following two sections.

Context Highlights - The information in this section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.

You can also view other options like External Lookup, Copy Value, Copy Statement, Live Lookup, Context Lookup, Pivot to Investigate > Hosts/Files, Pivot to Archer, and Add/Remove from List.

Understand Visible Metadata

Each meta key has a list of meta values, with up to 20 values displayed by default. You can click **Show More Values** to incrementally add 20 meta values, up to a total of 1,000 meta values, which is a hard-coded limit to optimize performance. The meta key name and plain English name of each meta key found in the service, both populated and non-populated, are listed. For each meta value, you can see the number of events in the current results that contain the value (count) or the size of the events in the current results (size). For example, the following might be listed:

```
Action Event [action] (3)
get(3016) login (1346) put (501)
```

In this example, the meta key name is `action`, the English name is Action Event, and three meta values were found for this meta key. There were 3016 events containing `get`, 1346 events containing `login`, and 501 events containing `put`. The values are ordered so that the value with the largest count is listed first.

In the following example, the same meta key has the values ordered based on the event size in bytes. The smallest size is listed first:

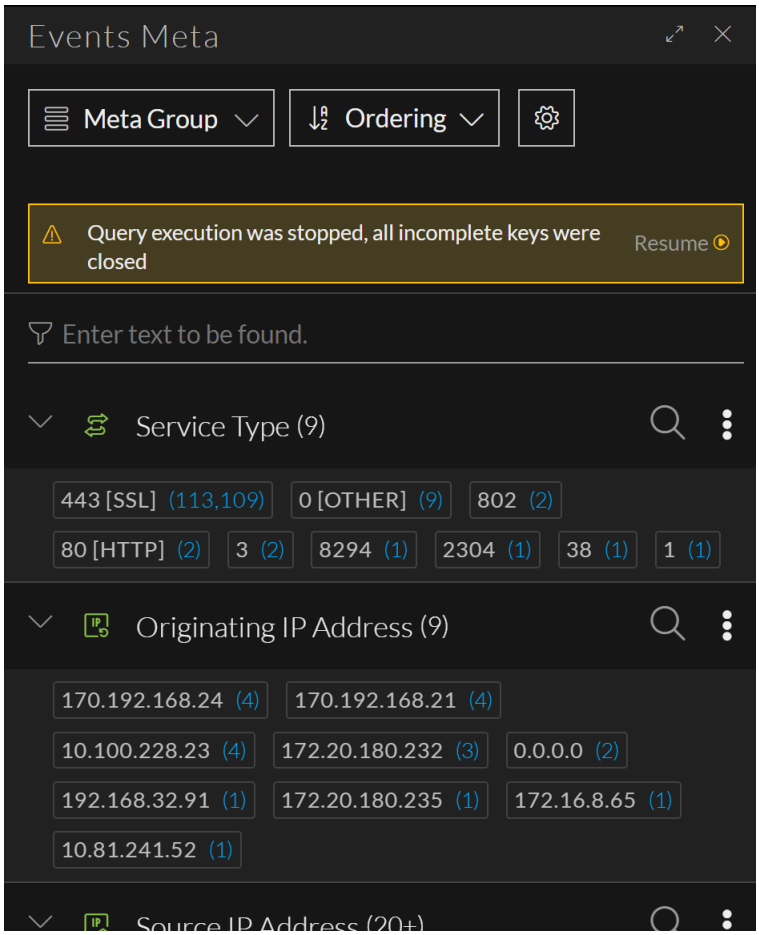
```
Action Event [action] (3)
login (13,034,588) put (21,848,760) get (1,409,079,256)
```

An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key.

- This meta key is indexed by value: Action Event [action] (40+). The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value.
- This meta key is indexed by meta key: Bytes Sent [bytes.src]. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that

are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value.

- This meta key is not indexed: 



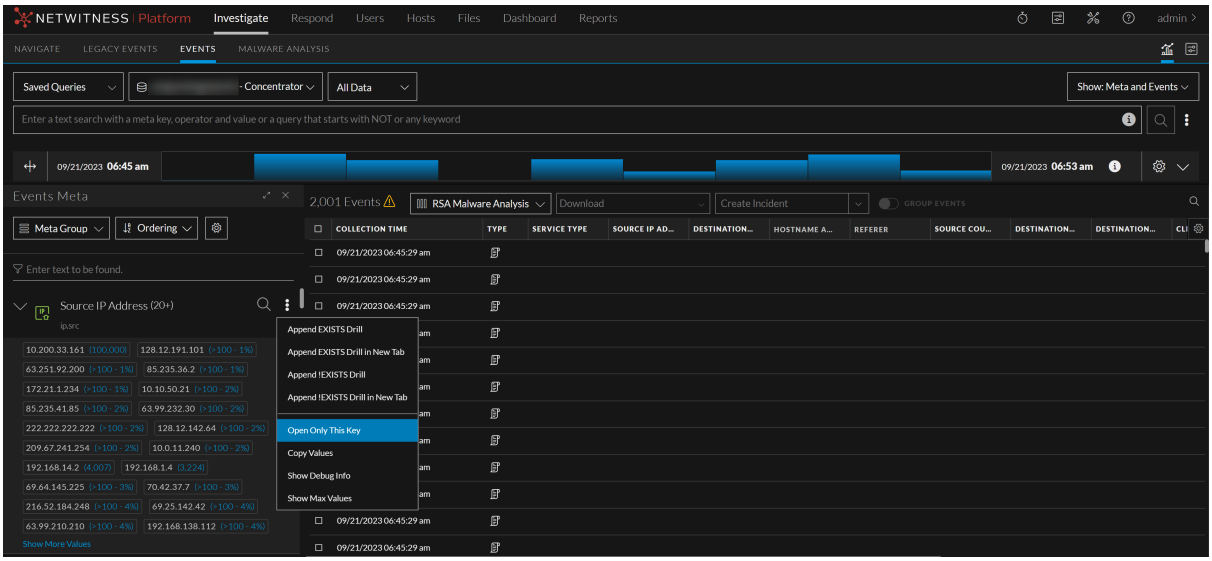
. Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key.
- For Version 11.5.1, a set of more than 200 meta key symbols replaces the three indexing method symbols to provide a visual indicator of the purpose of the meta key. The color of the meta key symbol identifies the indexing method using the same colors as before: green, yellow, and red. A tooltip also identifies the indexing method and provides a description of the icon. The icons are defined based on categories outlined in the Unified Data Model (https://community.netwitness.com/t5/netwitness-platform-unified-data/tkb-p/netwitness-udm). There is a generic icon for most categories that do not have specific meta keys and a default meta key icon to use when a new custom meta key is added.

If an error occurs while loading a meta key, the other meta keys load as usual and an error message is displayed in the meta key that did not load. When you execute a new query, some error messages disappear. Meta keys that have no values in the set of events are listed at the bottom of the panel.

Stop and Resume Metadata Loading

You can stop and resume loading of metadata in the Events Meta panel as the meta keys and values are loading. When loading a lot of metadata this can save time because you do not have to wait for all data to load. If you stop loading and still need to see more metadata, you can resume loading, then stop again when you see the data you want.

1. While data is loading in the Events Meta panel, click the Stop button () in the query bar.
   Meta keys stop loading, and keys that did not finish loading are closed. A message above the meta keys list informs about the status, and you can scroll down to find the last meta key to finish loading. In this example, Session Analysis finished loading; all the meta keys below remain closed.



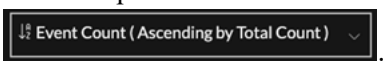
2. Do one of the following:
   a. To resume loading at the meta key where loading stopped, click **Resume**.
   b. If you want to review the values of specific meta keys that were not loaded, without resuming the query, click the meta key name to open any key.

Close All Except One Meta Key

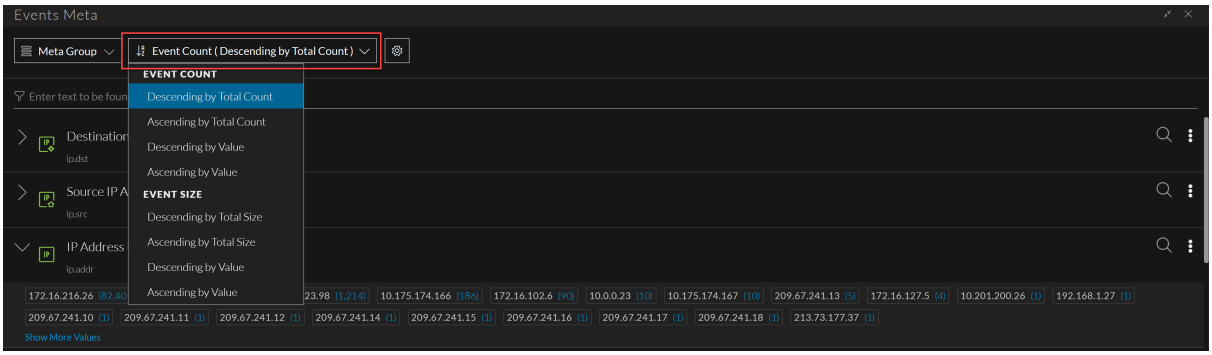
(Version 11.5.1 and Later) When the Events Meta panel is open, seeing many meta keys at the same time can be distracting.

To close all except one meta key

1. In the meta key row of an entry, click the Meta Key options button ( ).
   The Meta Key options are displayed.



2. Select **Open Only This Key**.
   All except the current meta key close. If the selected key is closed, it opens and data is loaded, while all other keys close.



Set the Ordering Method for Meta Values

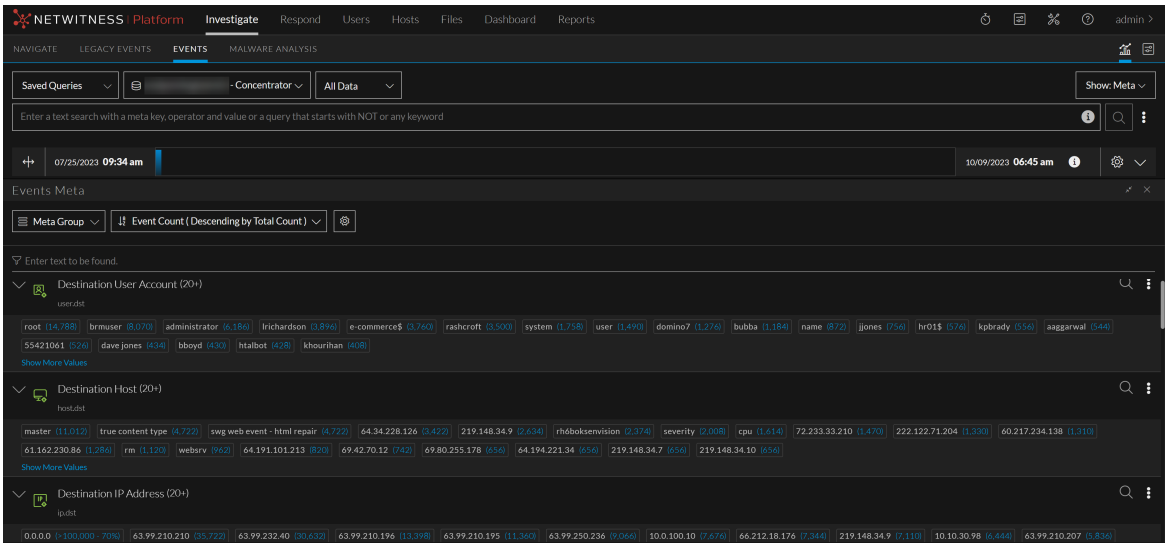
With the Events Meta panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering.

To use the ordering options

1. With the Events Meta panel open, click the ordering menu label, which is named according to the selected ordering option. This is an example of the menu label when ordering by event count in ascending order by total count: 

   .
   The Ordering menu is displayed. This figure shows the narrow version of the menu.

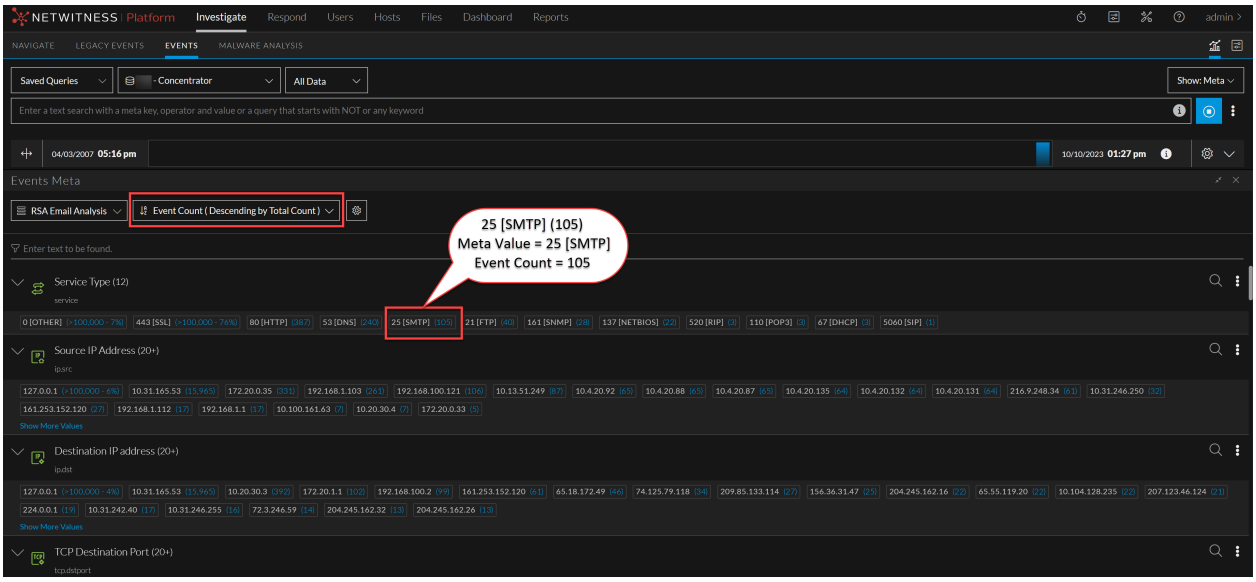
2. If you want to see the event count in parentheses after each value, select one of the following options. By default, the meta keys are displayed using the **Event Count** > **Descending by Total Count** method.



a. To order by total count of events in which the value was found, select either **Descending by Total Count** or **Ascending by Total Count**.

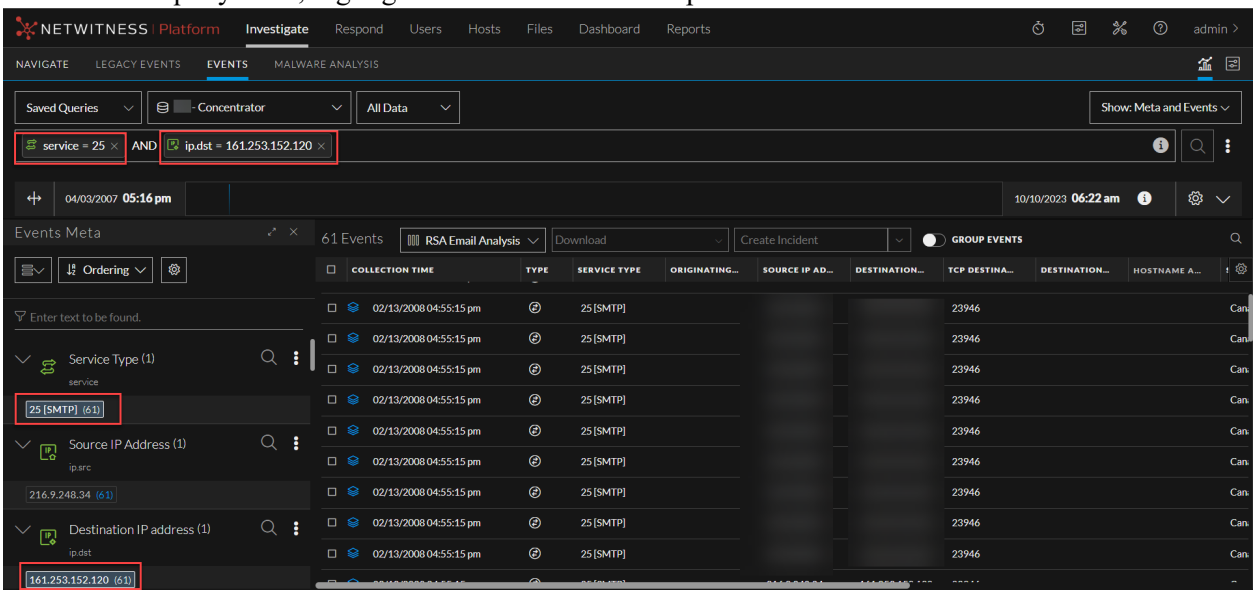
b. To order by the name of the value, select either **Ascending by Value** or **Descending by Value**.

3. If you want to see the size in bytes of the events in which the value was found, select one of the following options.



a. To order by total size of events in which the value was found, select either **Descending by Total Size** or **Ascending by Total Size**.

b. To order by the name of the value, select either **Ascending by Total Size** or **Descending by Total Size**.
Under each meta key in the Events Meta panel, the values are ordered according to your selection.



Drill into Meta Values

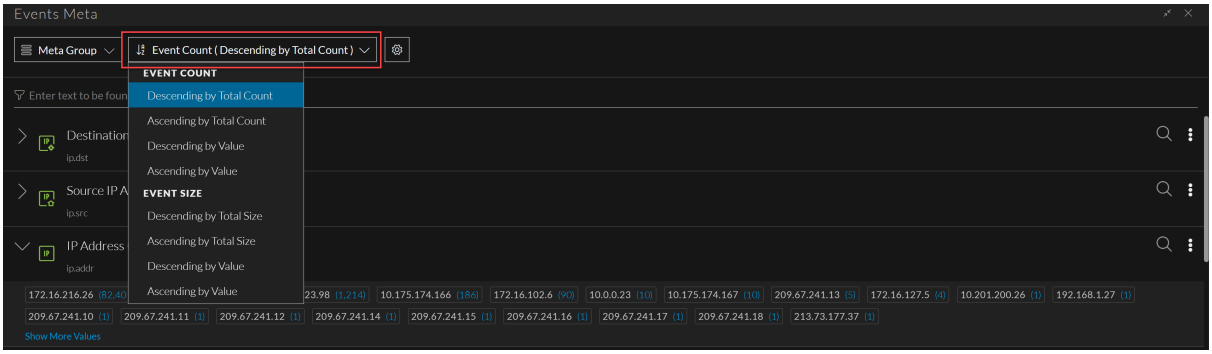
With the Events Meta panel open, you can drill into meta values to focus an investigation down to the smallest possible set of relevant events. Drilling in the fully expanded Events Meta panel adds filters to the query bar and refines the displayed metadata in the Events Meta panel, but does not execute the query in the Events panel. Drilling in the narrow panel, side by side with the Events panel, adds the filter to the query bar and executes the query in the Events panel and the Events Meta panel. This figure is an example of the fully expanded panel with some metadata loaded.

You can drill into metadata in the Events Meta panel to find relevant meta values. A simple query using the (=) operator highlights the meta value used in the Events Meta panel. This helps to associate the metadata with the filter added to the query. For example, the following figure shows the meta key value, related to the query filter, highlighted in the Meta Events panel.

To drill into meta values in the fully expanded Events Meta panel

1. Look for a meta value that is of interest, and click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
   The other service types are filtered out of the metadata in the Events Meta panel, but the query is not executed in the Events panel.

2. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Events Meta panel. With the Events panel closed, no query is executed there.
   b. (Version 11.5.1) Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Events Meta panel. With the Events panel closed, no query is executed there.
   c. (Version 11.5.1) Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Events Meta panel. With the Events panel closed, no query is executed there.
3. Repeat step 1 with another meta value, for example, **writetoexecutable** in the **Action Event [action]** meta key. Continue drilling into values until you find a set of events (drill point) that you want to see in sequential order.
4. To view the sequential events for the drill point, click  to shrink the Events Meta panel.
   The Events panel opens to the right, and the query is executed in the Events panel so that you can see the raw events in sequential order.

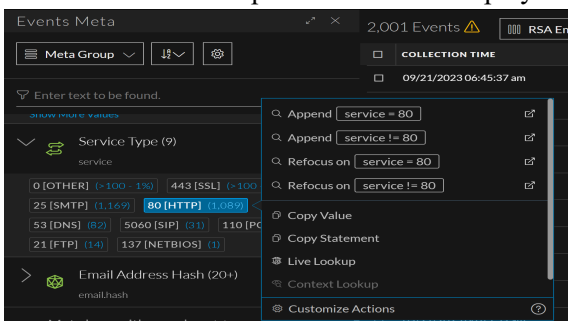


To drill into meta values in the narrow Events Meta panel

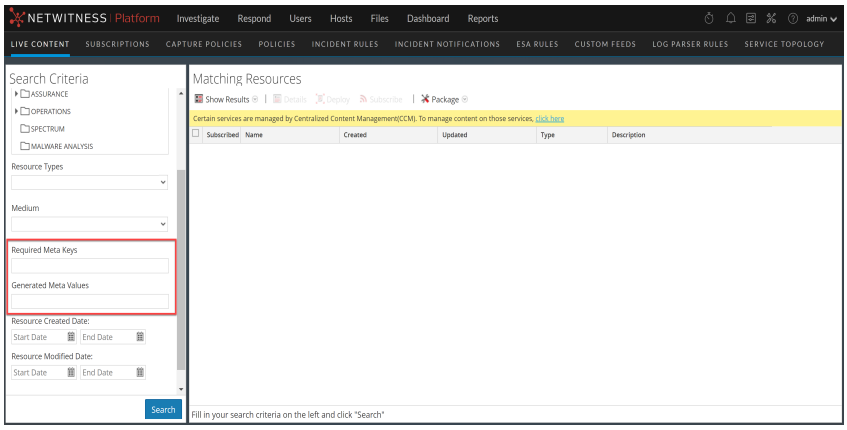
1. Look for a meta value that is of interest, and click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
   The filter is added as the last filter in the query bar, other service types are filtered out of the metadata in the Events Meta panel, and the query is executed in the Events panel.
2. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Events Meta panel and the data set showing in the Events panel.
   b. Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Events Meta panel, and the query is not executed in the Events panel until you click the query button.
   c. Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata, and the query is not executed in the Events panel until you click the query button.
3. Continue clicking values to refine the set of events (drill point). As you refine the set of events, examine and reconstruct the raw events for the same set in the Events panel.

Copy the Meta Values for a Meta Key

To copy all of the visible meta values for a meta key



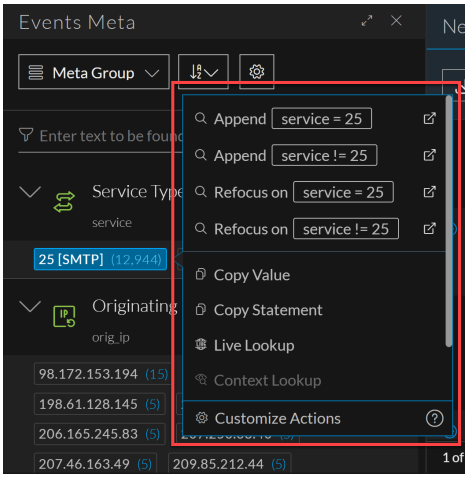
1. In the meta key row of an entry, click the Meta Key options button (⋮).
   The Meta Key options are displayed. Currently the only option is Copy Values.



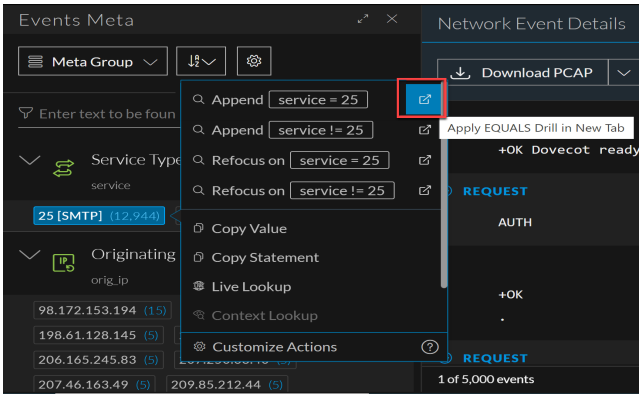
2. Click **Copy Values**.
   A comma-separated list of the values is copied to your local clipboard. This is an example of the clipboard contents: `"get", "login", "put"`.

View a Selected Meta Value in Live

1. Left or right-click a meta value, for example **SMB**.
   The Meta Value drop-down menu is displayed.

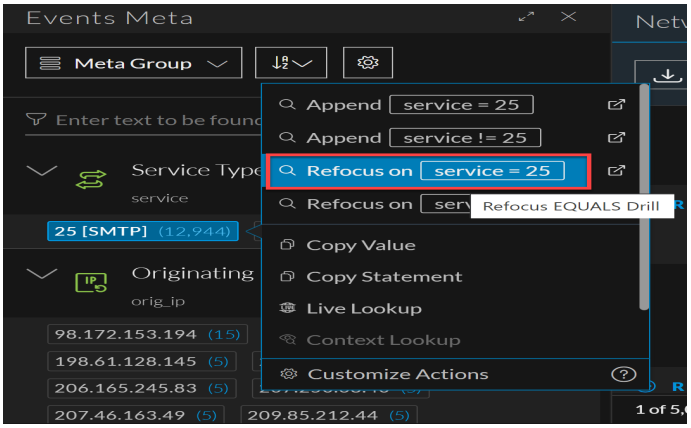


2. To look up the meta value, for example **success**, in Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Values field, and ready for a search.

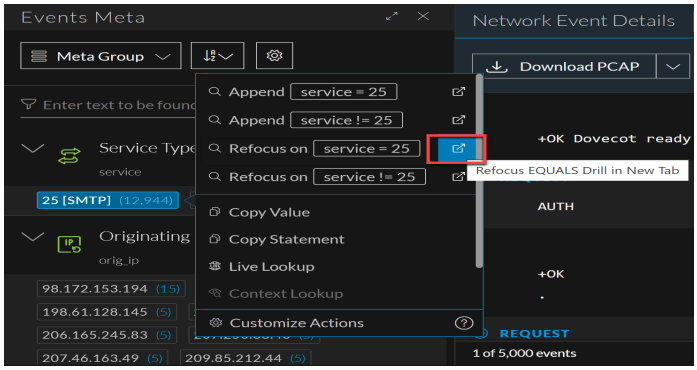


Append and Refocus the Investigation of a Meta Value in Unified Panel

For each value listed under a meta key, the focus is `<meta key> = <meta value>`. When you right-click a meta value, a context menu with different Append and refocus options is displayed. All of the append and refocus actions update the drill point in the Events panel, Events Meta panel and Meta Event panel.

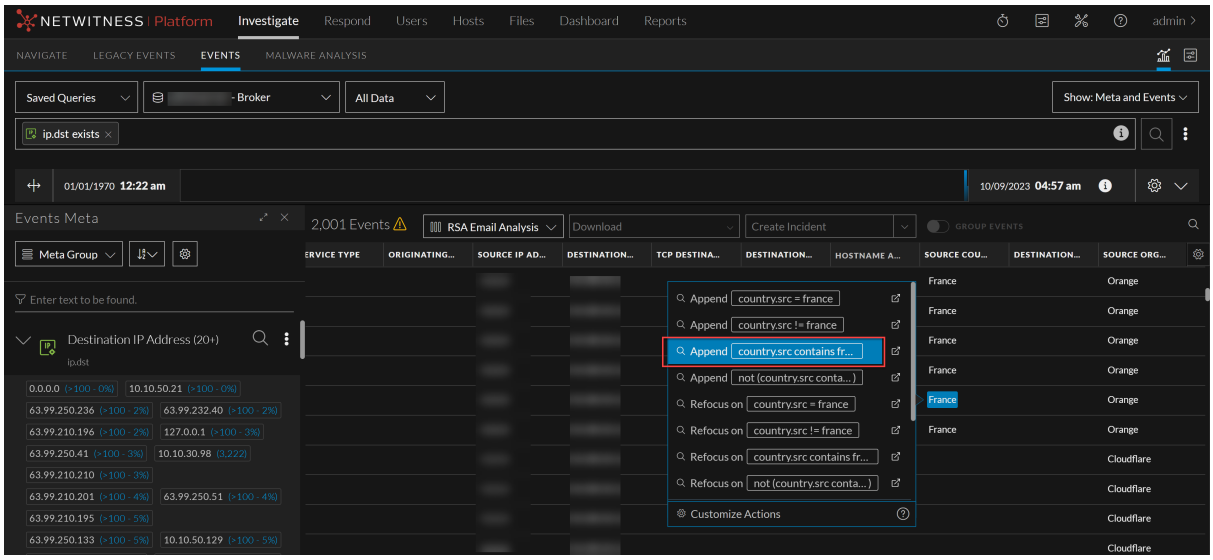


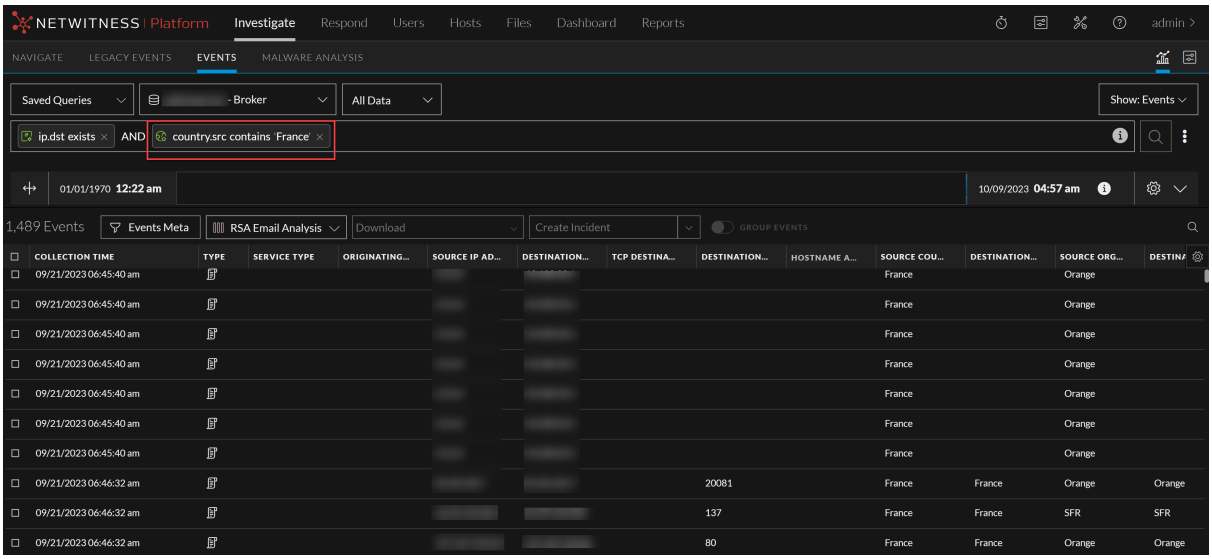
1. To append the key-value pair to the query with different operators (=, `!=`, `contains`), right-click a meta value (for example **SMTP** in the figure below) and select one of the **Apply <operator> Drill** options.



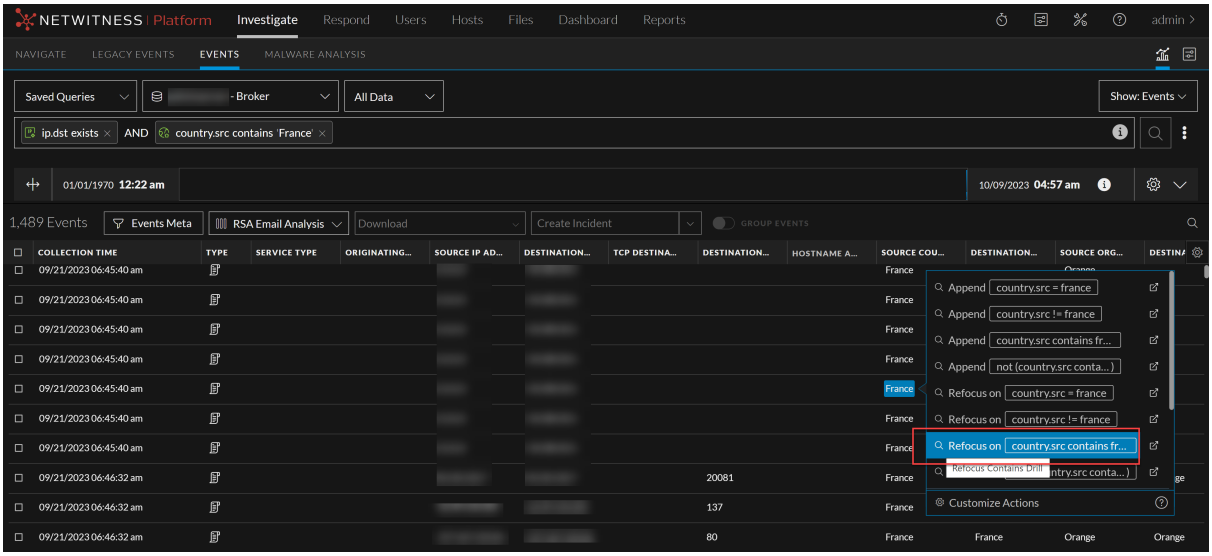
2. To append the key-value pair to the query or start the key-value pair over in a new browser tab, right-click a value and select one of the **Append New Tab** > **Append <operator> Drill in New Tab** or **Append <operator> Drill in New Tab** options.

3. To start the query over with the key-value pair and a different operator (=, `!=`, `contains`), right-click a value and select one of the **Refocus <operator> Drill** options.

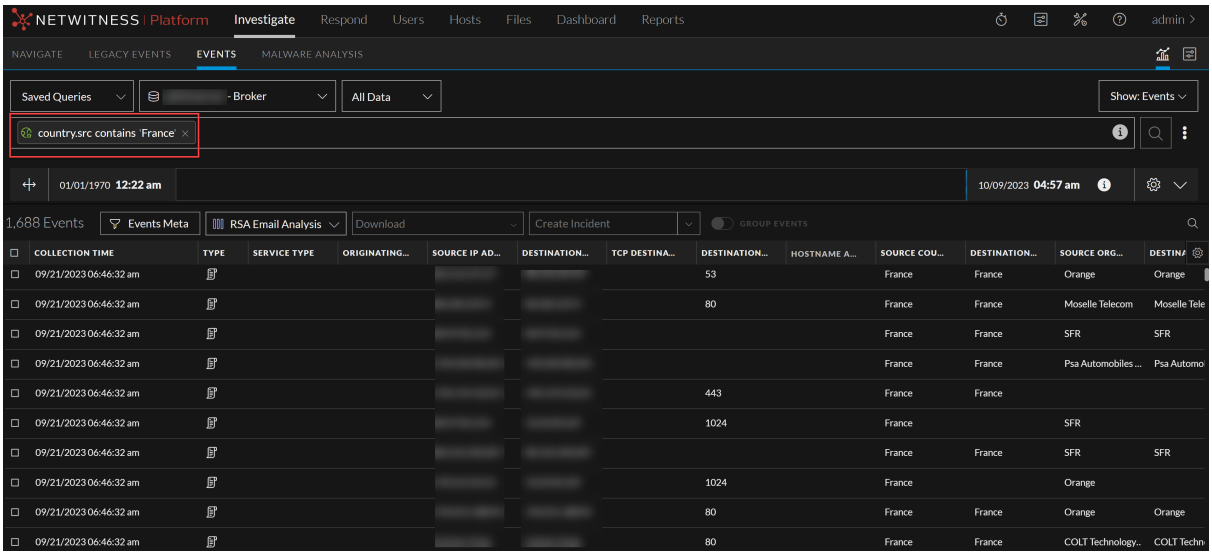




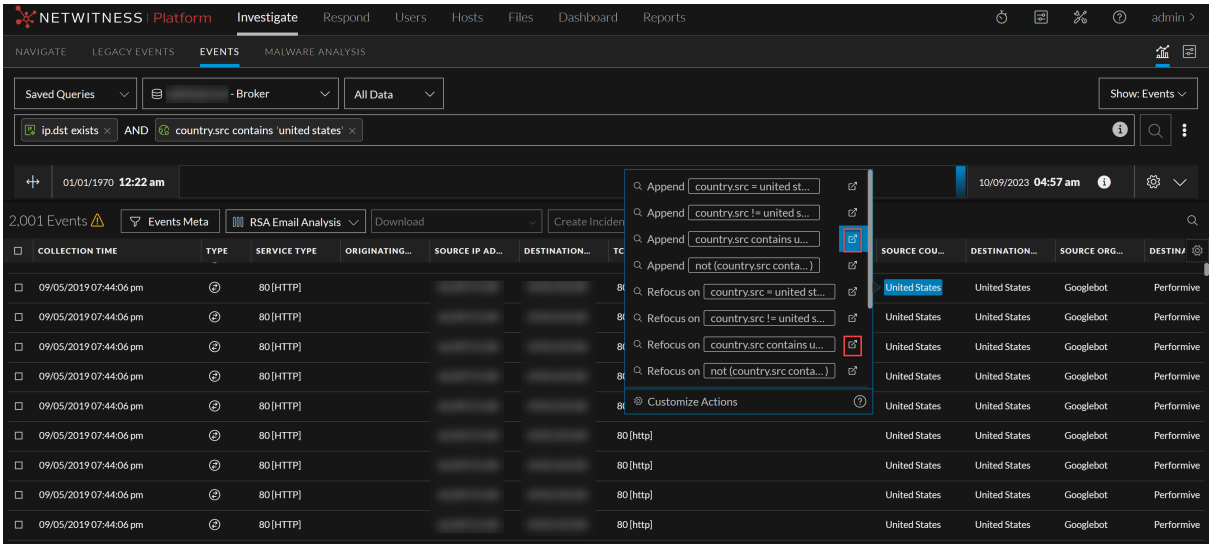
4. To append the key-value pair to the query or start the key-value pair over in a new browser tab, right-click a value and select one of the **Refocus New Tab** > **Refocus <operator> Drill in New Tab** or **Refocus <operator> Drill in New Tab** options.



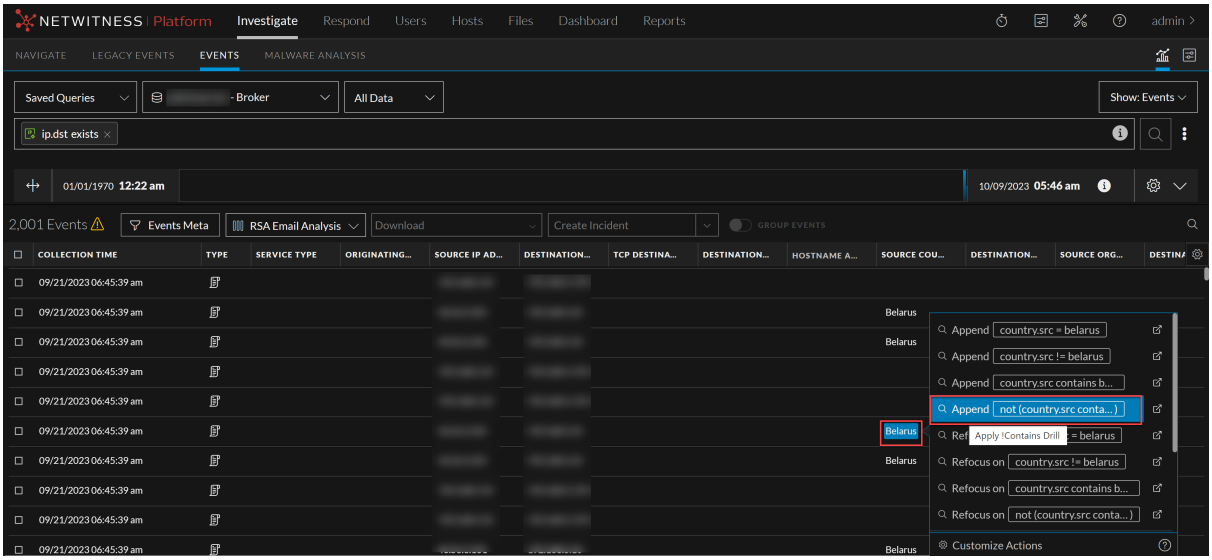
The drill is refocused according to your choice, and the new query is executed in the Events panel.



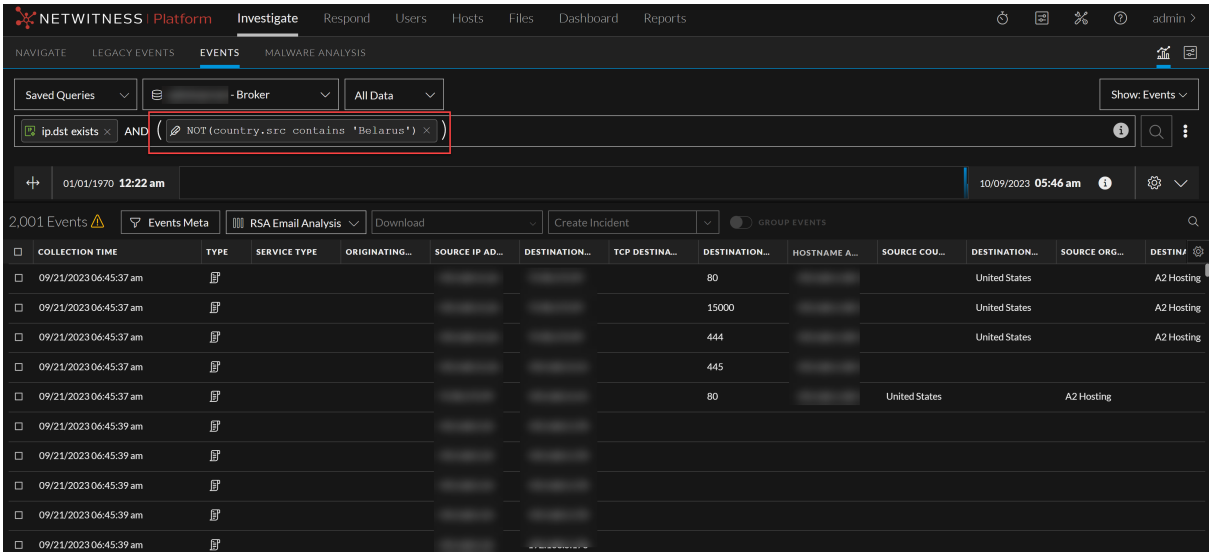
5. When you select a meta value using **Append** (*Meta* contains Meta value), the existing query is updated along with new query filters in the displayed search results.



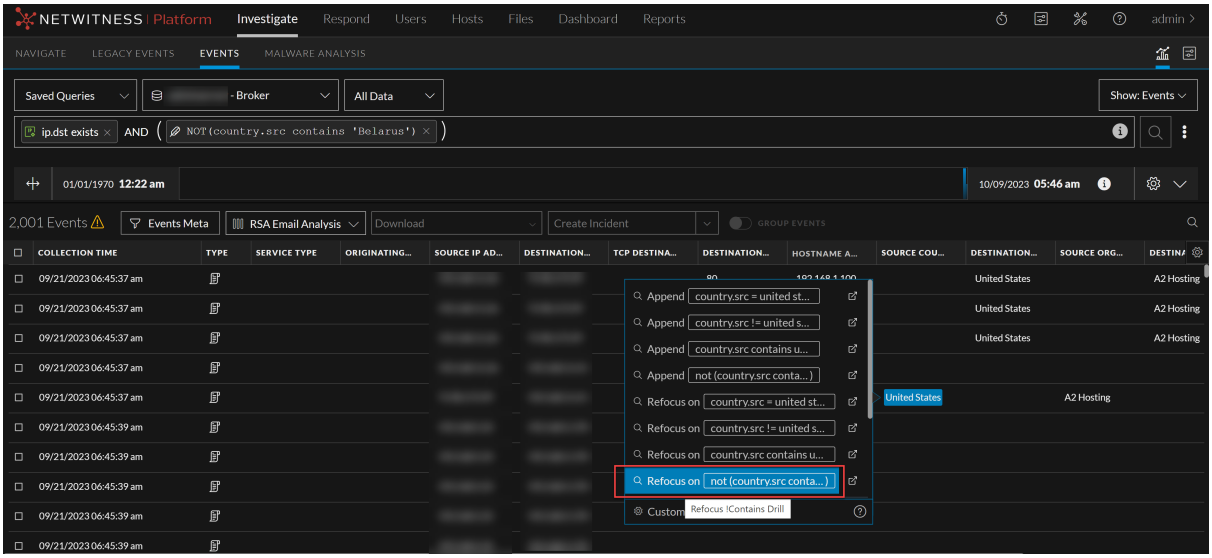
6. When you select a meta value using **Refocus** (*Meta* contains Meta value), the existing query is removed from the search result and the specified meta value results are displayed.



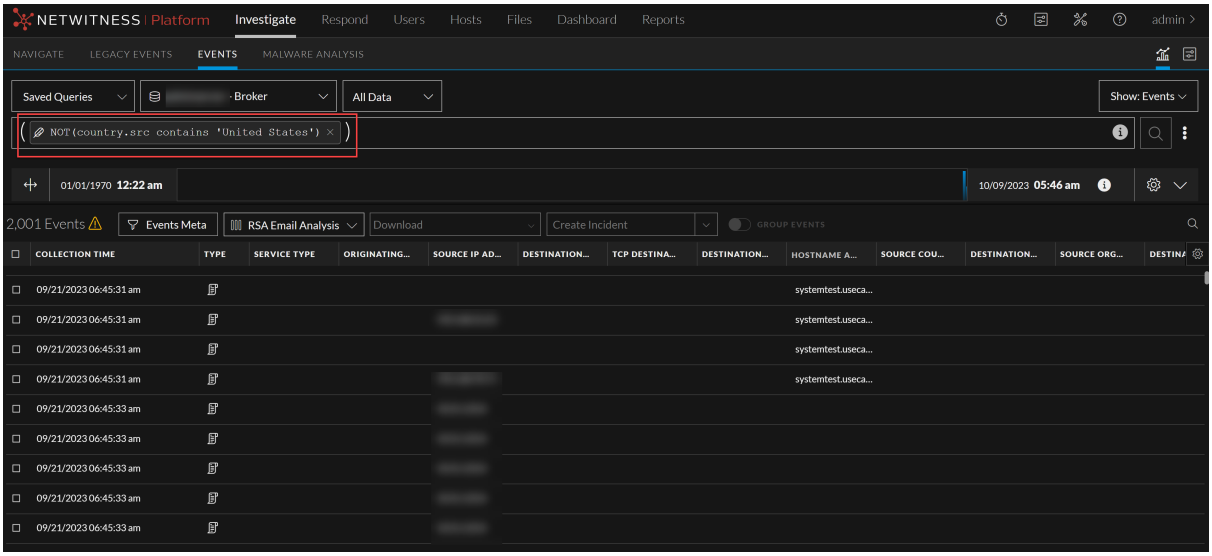
7. You can also Append and Refocus the meta values with Contains option using new tab option as shown below:



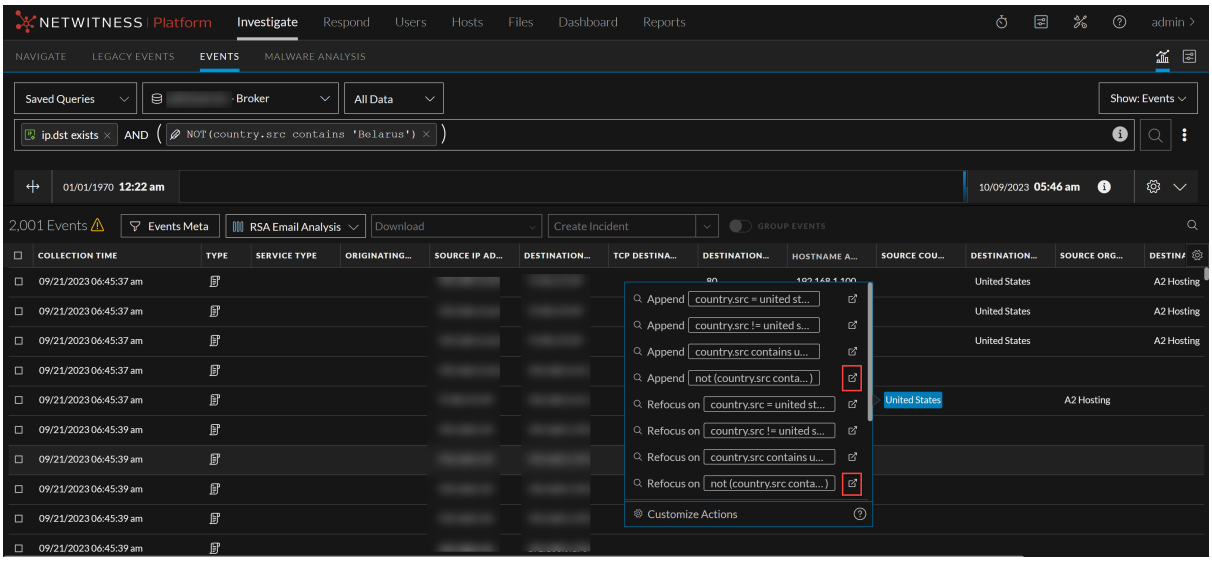
From 12.0 and later, Analysts can now exclude particular meta values while querying using the NOT (*meta* contains 'meta value') option available in the investigate unified panel. The specified meta value is removed from the query results when you use NOT(*meta* contains 'meta value') with **Append** or **Refocus** option on a specific meta value. This enhancement helps the analysts to view only the required data results in an optimized manner and conduct further investigation efficiently.



In the Events view, you can further investigate meta values in an event by left or right-clicking certain meta values and use the options in the drop-down menu.



1. When you select a meta value using **Append** NOT(*Meta* contains Meta value), the particular query is removed, and the new query filters will be appended, resulting in NOT containing meta values.



2. When you select a meta value using **Refocus** NOT(*Meta* contains 'Meta value'), the particular meta value is removed from the search query results.

3. You can also Append and Refocus the meta values with Not Contains option using new tab option as shown below:

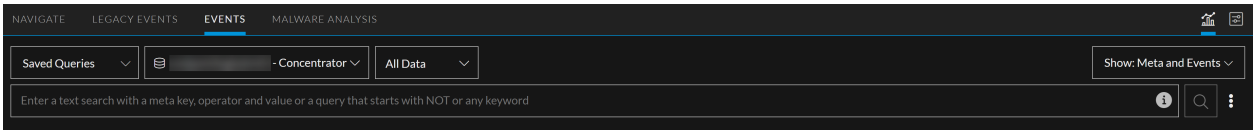
Filter Results in the Events View

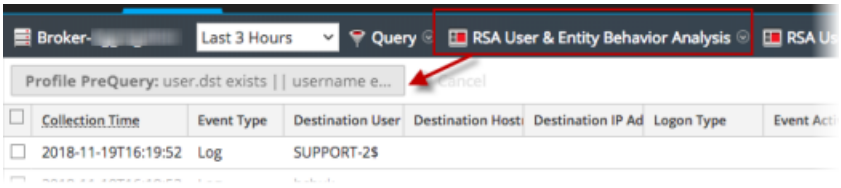
Filtering events in the Events view helps to narrow the focus of an investigation to a smaller, relevant set of events. You can filter events in the Events view using the Meta Events panel , the options in the query bar, and the options in the Events panel.

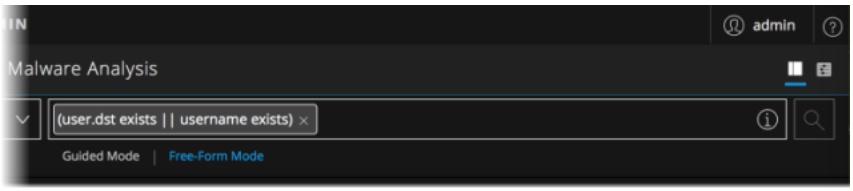


Initial Filter Using the Query Bar

When initially opening the Events view, the most basic filtering is to select a service, and time range and then query the service in the query bar. This returns a list of matching events in the Events panel. You can also select a query profile and build a query to look for events that contain certain meta keys, meta values, and text in the query bar.

This figure illustrates the Version 11.4 and earlier query bar with the options to select a query profile, service, and time range to filter events and load them in the Events panel. Two modes are available Guided Mode and Free-Form Mode.

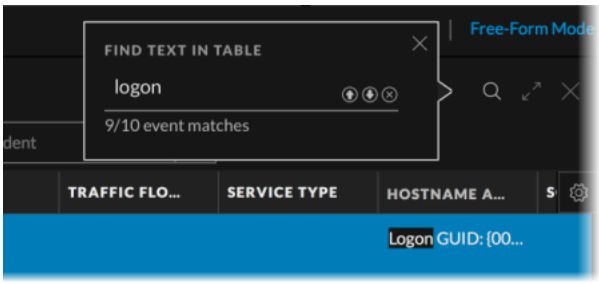




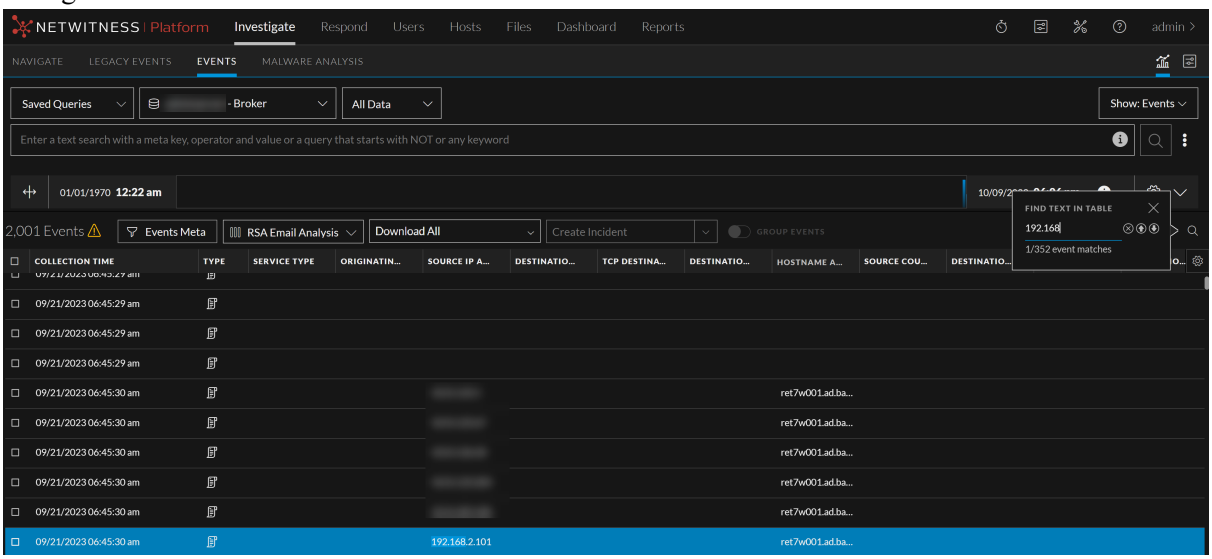
This figure illustrates the Version 11.4.1 and later query bar in which the Guided and Free-From Modes are no longer necessary. The simplified filter entry form allows you to use advanced auto-suggest options and also to enter a free-form query.

- The Query Profiles menu is available in Version 11.4 and later. You can encapsulate a query and a column group in a profile so that a useful combination of attributes is easily recalled and applied to a set of events in the Events panel (see Use Saved Queries to Encapsulate Common Areas for Investigation.)
- By default, the first service is automatically selected (unless you previously selected a service and the selected service is in browser cache). You can select a service as described in Begin an Investigation in the Events View
- If you do not select a time range, the default time range (24 hours) is used.
- The query builder field is an empty field to the right of the time range selector. This is where you build a query by creating filters. Clicking submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the (**Query Console**) > **Current Query** tab, shows detailed status of the current query (see Filter Results in the Events View below).
- When you go to the Events view from the Legacy Events view or the Navigate view, the service, time range, and any filters that were selected in the Legacy Events view or Navigate view are displayed in the query bar. The service, time range, and individual filters can be modified.

- If a profile is selected in the Legacy Events view when you right-click or double-click an event and go to the Events view, the filters from the profile (preQuery) are added to the query builder field as an editable filter. The following figures show a preQuery in the Legacy Events view, and the same query added as the first filter in the Events view.



Find a Text String in the Events Panel



With the Events panel open, you can search for a text string in the list of events. This search is similar to the CTRL-F search in a browser window. The search scans all text in every row of the table, visible columns only, to find matching text and highlights the matches. Columns that are not displayed are not searched. The search function is disabled if the Summary column is part of the table.

1. With events loaded in the Events panel, click  on the right side of the toolbar.

2. In the **Find Text in Table** dialog, start typing a text string.
   After you type two characters, exact matches of the text string without regard to case are highlighted in the Events panel. As you type more text, highlighted events are further refined. The following figure is an example of the results found after entering "192.168" in the Find Text in Table dialog. The text string was found in 352 events. The first event is highlighted in blue with the text string within the event also highlighted. Icons are available for navigating the search results and closing the

dialog.

3. To navigate through the search results, click the up and down arrows.
   - To view the next event that contains the text string and navigate downward through the search results, click the down arrow. If you click the down arrow when viewing the last result, the first result is highlighted.
   - To view the immediately prior event that contains the text string and navigate upward through the search results, click the up arrow. If you click the up arrow while viewing the first result, the last result is highlighted.
4. To close the search dialog, click X or press the ESCAPE key. The dialog also closes if you open a reconstruction, select a new column group, or execute a new query.

Refining the Results in the Events Panel

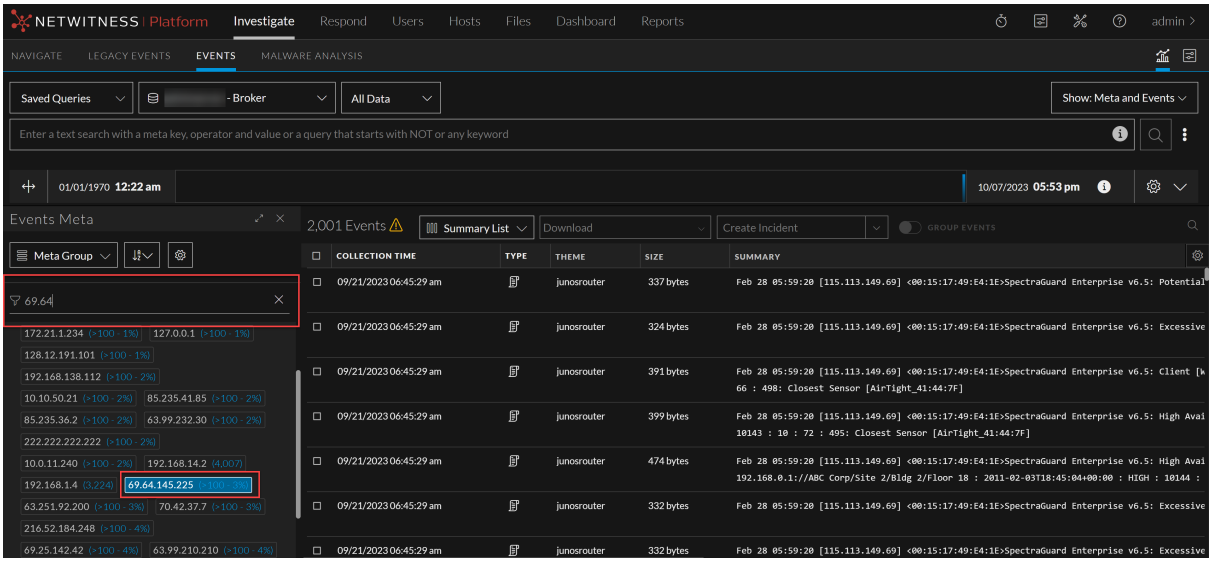
After the initial filter and query submission, you can continue to use the options in the query bar to refine results, with two added methods of filtering the results.

- In Version 11.4, you can use column groups to optimize the number or attributes (meta keys, meta groups, meta entities) you look at for a given event (see Use Columns and Column Groups in the Events List).
- In Version 11.5 and later, you can filter events by exploring meta keys and meta values in the results in the Events Meta panel, which is a Beta release feature. This allows you to pivot through the metadata as you can in the Navigate view, and offers the added convenience of immediately seeing the matching events in sequence in the Events panel based on your drill point. The administrator can enable or disable this feature as describe in the *System Configuration Guide*.

Filter Meta Information using Events Meta Panel

From version 12.3 and later, analysts can filter meta keys and meta values from the Events Meta panel using the newly added Filter option. This enhancement allows analysts to refine their search results by entering specific meta values or keys and helps analysts to investigate seamlessly rather than scrolling through a long list of metadata.

To Filter meta keys or meta values from the Events Meta Panel



1. Go to **Investigate** > **Events** and click  to load events.

   The events for the selected service and the selected time range are loaded in the Events panel.

2. To display the Events Meta panel, click **Filter** before the Events panel.

   The Events Meta panel opens to the left of the Events panel.

3. To filter the listed meta values or keys by name, type some text in the Filter field. The list is updated to show only the names that contain the exact text with the blue background highlighted.

Query Builder Concepts

In the query builder, you can reduce the number of events to an interesting set by creating three types of filters: simple, free-form, or text.

The basic syntax for each filter is as follows: `<meta key><operator><meta value>`. Here is an example: `direction = 'outbound'`.

In Version 11.4, when you type or paste a query in the query bar, the text is parsed into individual filters separated by the AND operator if the parsing engine determines that AND is needed. Earlier versions use only the AND operator between filters, and the logical operator is not visible.

- If you type `action = 'get' action = 'put'`, the result is two filters separated by AND.
- If you type `action = 'get' OR action = 'put'`, the result is two filters separated by OR.

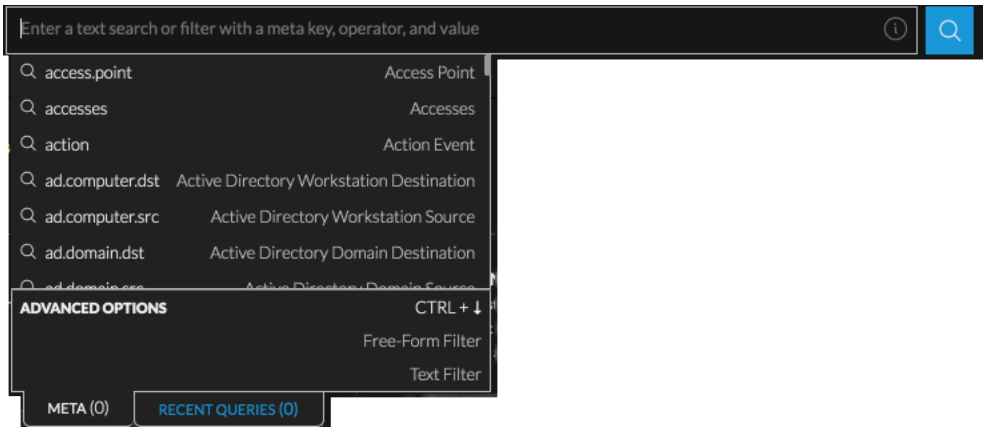
When typing or pasting a filter for `event.time`, use one of the following formats:

- `event.time = '2020-DEC-02 23:00:00'`
- `event.time = '2000-12-20 21:00:00.000'`
- `event.time = '2000-12-20 21:00:00'`

In Version 11.4, the parsing engine converts a longer string of text that you type or paste in the query bar into individual filters. Parts of the filter that are not parsable are converted to a free-form filter. In earlier versions, a long text string is added to the query bar as a single filter. Further enhancement in Version 11.4.1 provides the ability to keep typing text for any query, where you type a meta key and an operator or an operator and a value, as a free-from query. The free-from query is parsed as usual.

- If you type, `action = 'GET' OR action is 20 || action = 'PUT'` in the query bar the Free-Form option is used. Part of this text cannot be parsed so the result is three filters separated by OR. The following figures show the query bars of version 11.4 and version 11.6 respectively.

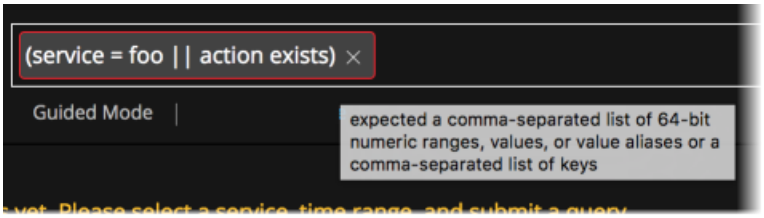
- In Version 11.4.1, If you type a meta key-operator-value sequence and you continue typing without pressing Enter, the Free-Form option is automatically used so that you can continue typing the query. For example, you can type `medium = 1 OR medium = 2` without pressing the Enter key before `OR`. The Free-Form option is highlighted while you type and when you press Enter at the end, a free-form filter is created in the query bar.
- Text filters (Version 11.4 and later) are text strings that do not contain spaces. You can search the data set for any exact match of indexed meta keys, not all meta keys. Here are some examples: `failed`, `login`, or `attempt`.



Note: In some cases, when you are typing a text filter that is close to matching a meta key and operator statement, the auto-suggest feature erroneously suggests a filter using the meta key and operator. The workaround is to begin typing the text and select Text Filter at the point where the auto-suggest feature turns the text into a meta key and operator. For example, there is meta key named `crypto`, and an operator named `contains`, and you want to create a text filter to search for `cryptocurrency`. As you type `c-r-y-p-t-o`, the next `c` in "currency" triggers the `contains` operator instead of continuing to type as a single word. To complete the text filter, right before typing that `c` in `currency`, which would trigger the `contain` operator, highlight the Text Filter option to let the system read the input as text filter.

In the query builder, each filter becomes an editable field. Filters line up from left to right, representing the sequence in which the filters were created. As more filters are added and exceed the length of a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

Guided Mode vs. Free-Form Mode



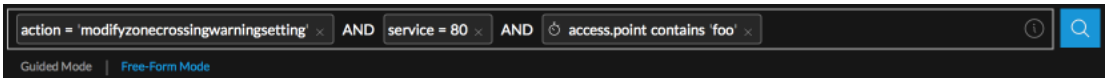
Note: Version 11.4 offered two modes for entering queries in the filter entry form: Guided Mode and Free-Form Mode. Beginning with Version 11.4.1, the powerful auto-completion features and suggested values of Guided Mode and the ability to type or paste a free-form query are fully integrated. References in this document that differentiate between Guided Mode and Free-Form Mode are for analysts using Version 11.4.0.x and earlier.

In Guided Mode, you are guided with suggestions for auto-completion that show valid meta keys and operators, and suggested values in the filter entry form. In version 11.4, you can type, paste, choose a recent query, or select from the drop-down menu. Earlier versions do not support pasting text and recent queries. This is an example of the 11.4 filter entry form.

As you create filters, the syntax of each filter is validated and invalid filters are marked by a red outline. If you hover the mouse over the filter, a message that explains the error is displayed.

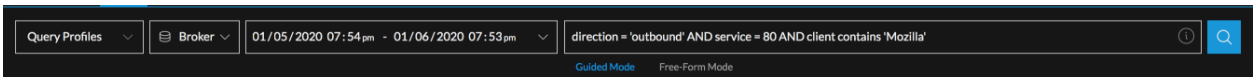
In Version 11.3 and later, free-form filters are validated on the server side, which may take additional time. If you submit the query before the server has returned filter validation results, the is replaced by a spinner. When server validation returns, a query with no invalid filters begins execution. If the query contains an invalid filter, execution is terminated and the invalid filter is outlined in red. This is an example of an invalid query.

In Free-Form Mode, you can type or paste a long text string. There is no auto-suggestion, and validation is performed on the server side when you submit the query. If an error is found, the query does not execute.



Note: The button has a different label in versions earlier than Version 11.3. It was previously named **Query Events**.

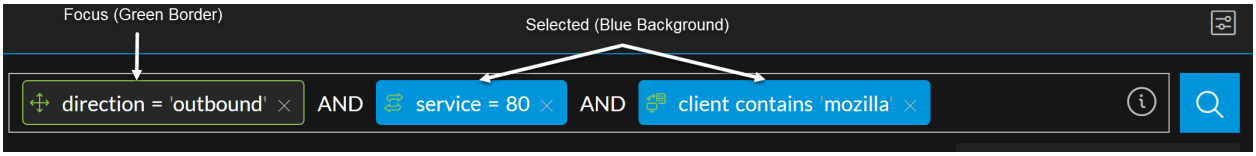
Clicking Guided Mode or Free-From Mode toggles between modes. If you selected Free-Form Mode the last time you logged in, this choice is stored in browser cache and is used until the browser cache is cleared.



- When you switch from Guided Mode to Free-Form Mode, filters that you created in Guided Mode are transformed to a text query in the Free-Form field.
- When you switch from Free-Form Mode to Guided Mode, the query you were typing is added to the query bar as individual simple filters, but it does not include auto-suggest options.

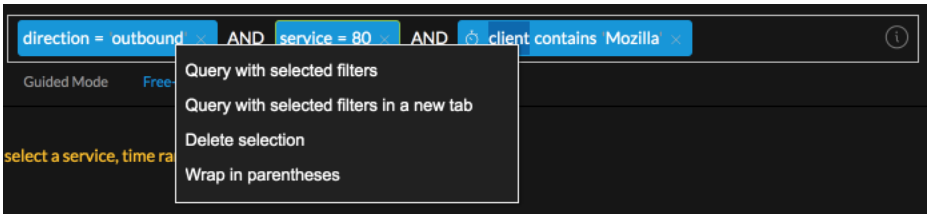
Note: Before Version 11.3, a Free-Form filter could not be edited in Guided Mode.

The following figure is an example of the query bar with the Guided Mode query builder with several filters.



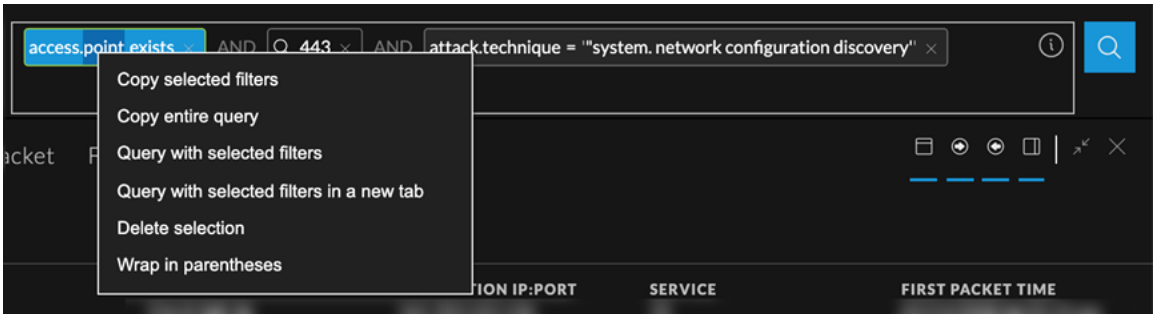
The following figure is an example of the Free-Form query builder in use.

Concepts for Editing Multiple Filters



As you work in the query builder, you can see when a filter has focus for editing (a green outline) and which filters are selected (blue background). This is useful because you can have multiple filters selected for right-click actions, but only one can be edited at a time. The figure below shows the green outline marking a filter that has focus and the blue background indicating that two filters are selected.

This figure illustrates the same set of filters with all filters selected (blue background) and one filter that has focus (blue background and green outline).



A right-click action from the drop-down menu applies to all selected filters as shown in this figure showing Version 11.4 options.

In Version 11.4.1, the menu has two new copy options as shown in the following figure. The options allow you to share the clipboard contents with other analysts or paste the contents to the query bar. You can:

- Select a single filter, right-click it, and then copy the entire query to the local clipboard.
- Select multiple filters, right-click one of them, then copy the selected filters.

These are a few basic concepts that explain how to work in the query builder:

- You can select multiple filters, but only one can have focus and the last selected filter is the one with active focus at any point in time.
- To select a filter and give it focus, click the filter. To deselect the filter and remove focus, click the filter again, press **Esc**, or click anywhere else on the page.
- To add a filter, click before or after an existing filter. To create a new filter before or after the filter in focus, press the right or left arrow key.
- To open a filter for editing, double-click the filter or click it and press **Enter**. To exit without saving changes and leave the filter in focus, press **Esc**.
- To delete a filter, click the filter and press **Delete** or click **X** on the filter.
- (Version 11.6) If a filter is awaiting user's input, it is highlighted with blue color .

- (Version 11.6) An invalid filter is highlighted with red color.

- You can hover over the filters in the query bar to display tooltip messages.

The Version 11.4 Query Builder

You can type; select meta keys, operators, and values from the drop-down menus; or paste a filter in the query bar. Added 11.4 features in the Guided Mode filter entry form are described in detail below.

Meta Keys Cached for Faster Loading

When the Events view opens, meta keys from all connected services are cached for faster data loading. These meta keys are available in user interface elements that have auto-suggest meta keys. (When you are building a column group or profile, if you are expecting to see a meta key and it is not displayed, select the service where the key was added to force a cache update. This usually occurs only when a meta key is not added to all concentrators.)

Text Filter

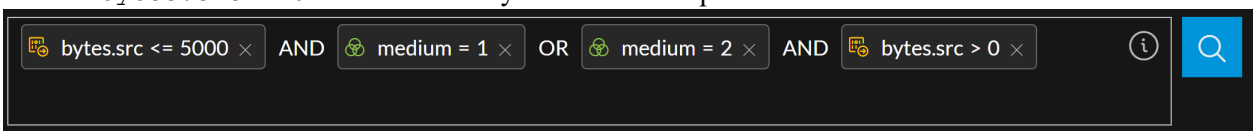
You can create a text filter to find a text string in the data set which is indicated with . You can use a text filter with no knowledge of meta keys that would contain the values. One text filter per query is supported. A text filter looks through indexed meta keys, not all meta keys.

Pasting Text Instead of Typing

When creating a filter, you can paste a meta key or value in the filter entry form. When you paste text into the filter entry form instead of typing the text, the text is parsed appropriately to create one or more filters. Any portion of the text that cannot be parsed is converted to a free-form filter.

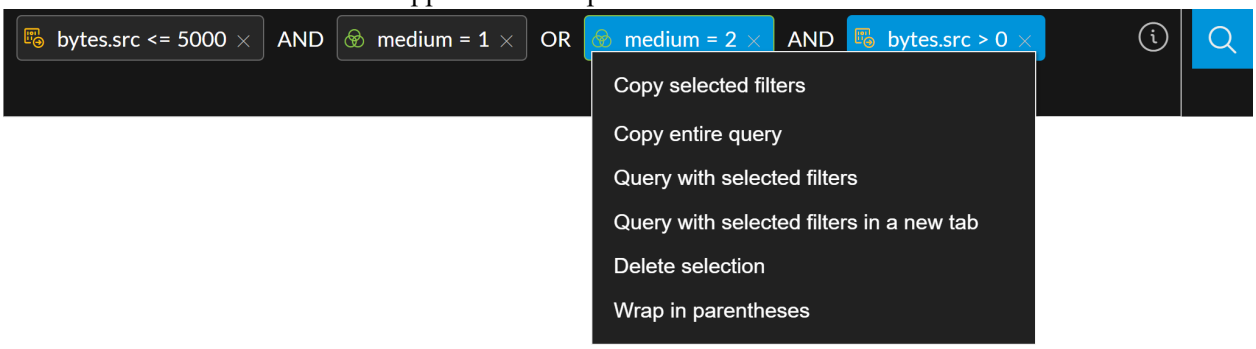
Select All Filters and Copy All Filters (Version 11.4.1)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Cmd-A for MacOS, Ctrl-A for Windows) and then copy the selection to the clipboard (Cmd-C for MacOS, Ctrl-C for Windows). The clipboard text is available to share with other analysts or to paste in the query bar using Cmd-V or Ctrl-V).



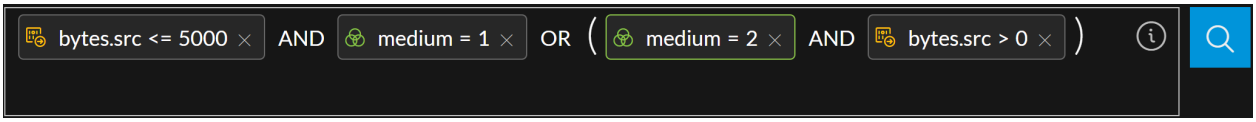
Use of Recent Queries

The filter entry form offers two methods of entering meta keys, operators, and values: the Meta tab and Recent Queries tab. The Meta tab is the same as the filter entry form for prior versions except that a count of matching results is given in the tab label and icons mark meta keys that are indexed by key, indexed by value, and not indexed. In the Recent Queries tab, up to 100 recent queries are displayed. The list is filtered as you type to show only queries that contain the typed text, and you can select a query from the list.



Use of Advanced Operators

Auto-suggest can parse the following advanced operators that you paste or type into the filter entry form: `<`, `>`, `<=`, `>=`, `OR`, `||`, `AND`, `&&`, `()`, `regex`, and `length`. The text is parsed as multiple filters. For example, if you type or paste `medium > 0 && medium <= 100`, the text is parsed as two simple filters with an explicit AND operator: `medium > 0 AND medium <= 100`. If you type or paste `bytes.src <= 5000 && medium = 1 || medium = 2 && bytes.src > 0`, four simple filters are created with `AND` and `OR` operators separating them: `bytes.src <= 5000 AND medium = 1 OR medium =`



`2 AND bytes.src > 0` to make as many valid filters as possible.

This filter is an example of a filter in which it would be useful to add parentheses. You can select `medium = 2` and `bytes.src > 0`, then right-click and select **Wrap in Parentheses** from the drop-down menu. Text filters are not supported inside parentheses.

The resulting query is `bytes.src <= 5000 AND medium = 1 OR (medium = 2 AND bytes.src > 0)`.

If you encounter errors while creating filters, look for tooltip messages and check the documentation.

Easy Use of AND/OR Operators

When you type `||` and `&&`, they are displayed as `OR` and `AND` in the query bar. You can change `OR` to `AND` and `AND` to `OR` by clicking the word. When you insert the cursor to add a filter, the `AND` operator is added before the cursor. When you delete a filter, orphaned `OR` and `AND` operators are removed. The operator for a text filter must be AND because text filters are always ANDed to a query.

Automatically Balanced Parentheses

When creating and editing filters in the query builder, parentheses pairs are automatically balanced as you type. If you type an open parenthesis in a filter that is open for editing or before a selected filter, the close parenthesis is added at the end of the filter. This works intuitively as you type so that you can add new filters on either side of the parenthesis and between parentheses when there are nested parentheses. Orphaned parentheses are automatically removed. If adding parentheses would create an invalid filter, the parentheses are not added. You can also right-click selected filters, and add parentheses using the Wrap in parentheses option. This option is only available when the result would be a valid filter.

Hints about Available Values

For properly indexed meta keys, the user interface provides hints about available values related to the time range of the query. Up to 100 suggested values are returned and, when you type text, the list of 100 values is filtered to include only relevant values. If no matching values are returned, a message advises "No suggestions found." (The suggested values are based solely on the time range; filters in the query do not filter the list of 100.)

CIDR Notation and Shorthand

When entering a value for an IP address in a filter, you can use CIDR notation to filter for addresses within a range.

The IPv4 CIDR block range is 0 to 32. For example `10.20.30.0/24` specifies `10.20.30.0` with a subnet mask of `255.255.255.0`, which will match an IP in the range `10.20.30.0` through `10.20.30.255`.

The IPv6 CIDR block range is 0 to 128, for example,
`1203.0fe1:fe82:b896:89b0:8a7c:99bf:323d/32` specifies
`1203:0fe1:0000:0000:0000:0000:0000:0000` through
`1203:0fe1:ffff:ffff:ffff:ffff:ffff:ffff`.

You can also use shorthand to remove groups of zeros or leading zeros in a group in IPv6 addresses, for example,

`1203:fe1::`

There must be no spaces between the IP address and the CIDR mask that you are using.

Ranges or Series of Values

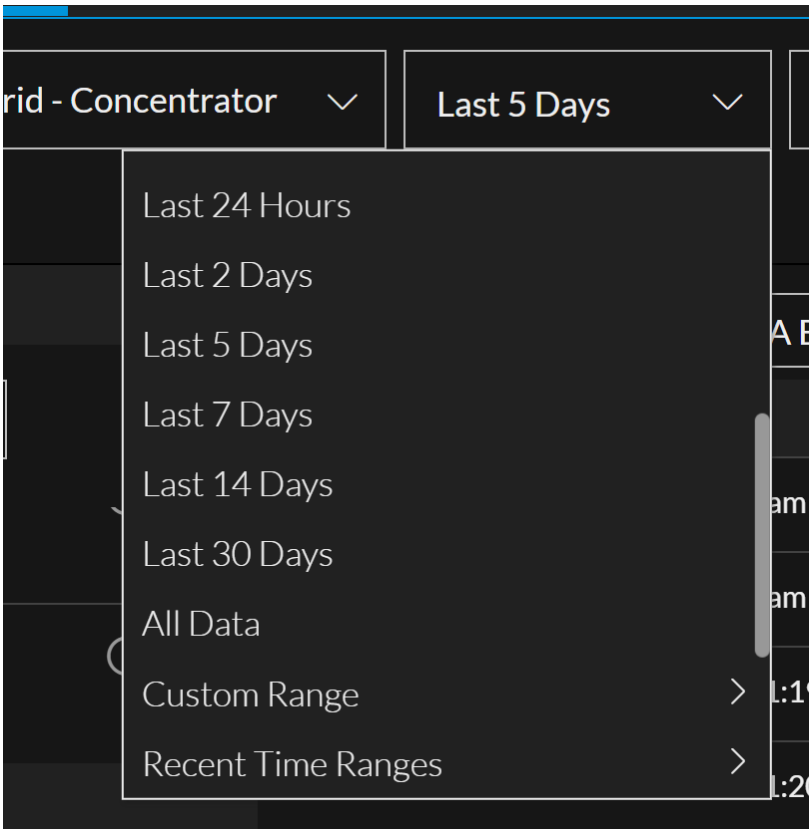
For meta keys that have numerical data, you can use a range of values, a series of values, or both to filter data. For example, this query has a comma-separated list, and two of the values in the series are ranges `src.port = 0-1023, 1024-1050, 65535`. If a comma is a part of a value, the value must be wrapped in quotes. For example, `get,post` is interpreted as two separate values, while `'get,post'` is interpreted as one value. A range of values must be a valid range of positive integers, separated by a dash (with our without a space before and after). The first number in the range must be smaller than the second. For example, `0-1023` and `0 - 1023` are valid ranges, but these are not valid ranges: `-10 - 50`, `50 - 10`, `50.8 - 60.2`, `50 - 70x`.

No Separating Space Required After Meta Key and Operator (Version 11.4.1)

Filters in the query bar need a space between the meta key and the operator, and between the operator and the value. Operators must be typed with a separating space in the filter entry form in order to use the auto-suggest functions for operators and values. To improve the user experience when typing a query, the filter entry form accepts operators typed with no separating space after the meta key. When you type an operator with no separating space, a value is auto-suggested as usual and a space is added between the meta key and the operator. When you type an operator and a value without a separating space, the space between them is automatically added.

Select a Time Range

The Time Range selector limits the events returned in the Events view to a specific time range. The time range is displayed in the format `Start Time - End Time`, showing the date, hours, and minutes in your current timezone based on timezone settings configured for your profile. In Version 11.3 and later, you can choose a time range relative to the current collection time or create a custom time range. The time and date format is based on preferences set for the Events view in the User Preferences dialog (select  > **Profile**).

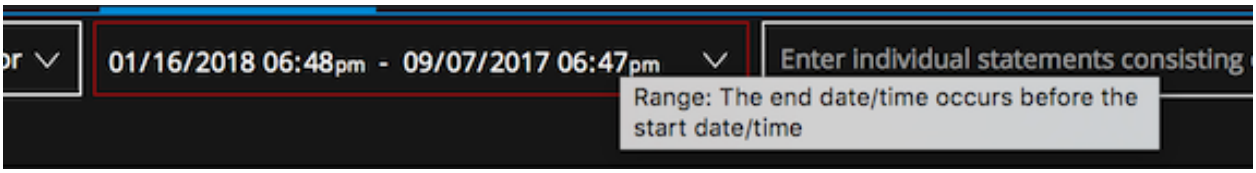


- By default, the date format is MM/DD/YYYY. You can change the format to DD/MM/YYYY, or YYYY/MM/DD in the User Preferences dialog.
- Start time and end time are in the format of HH:MM. Although seconds are not displayed, the value for start time always defaults to HH:MM:00 seconds, and the value for end time always defaults to HH:MM:59 seconds. As an example, a time range of 6:45 pm - 7:45 pm is interpreted as 06:45:00 - 07:45:59 pm.
- The default time range is the 24-hour clock; you can change it to 12-hour periods.

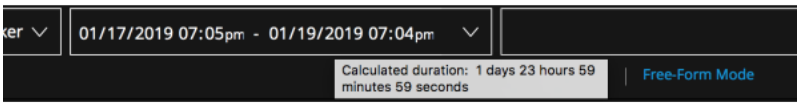
Note: By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. Your administrator can change the setting for time format in downloads to combine your user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible. Given this time: `04/13/2020 09:17:36 am` with timezone US/Pacific `(GMT-7:00`, this is an example of the time on the 12-hour clock as it appears in the user interface: `04/13/2020 09:17:36 am`. In the download, Epoch format would represent the time as `61547519856000`. If your administrator set the time format for downloads to the easily readable representation, the same time would be represented as follows: `04-13-2020T09:17:36AM-07:00`.

The time format for a query is based on preferences set for the Events view in the Event Preferences dialog (select ). The time format can be either database time or wall clock time. When Database Time is selected, the start and end time for a query is based on the time that the event was captured (collection time). When Wall Clock Time is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range. This and other Events view preferences are described in Configure the Events View.

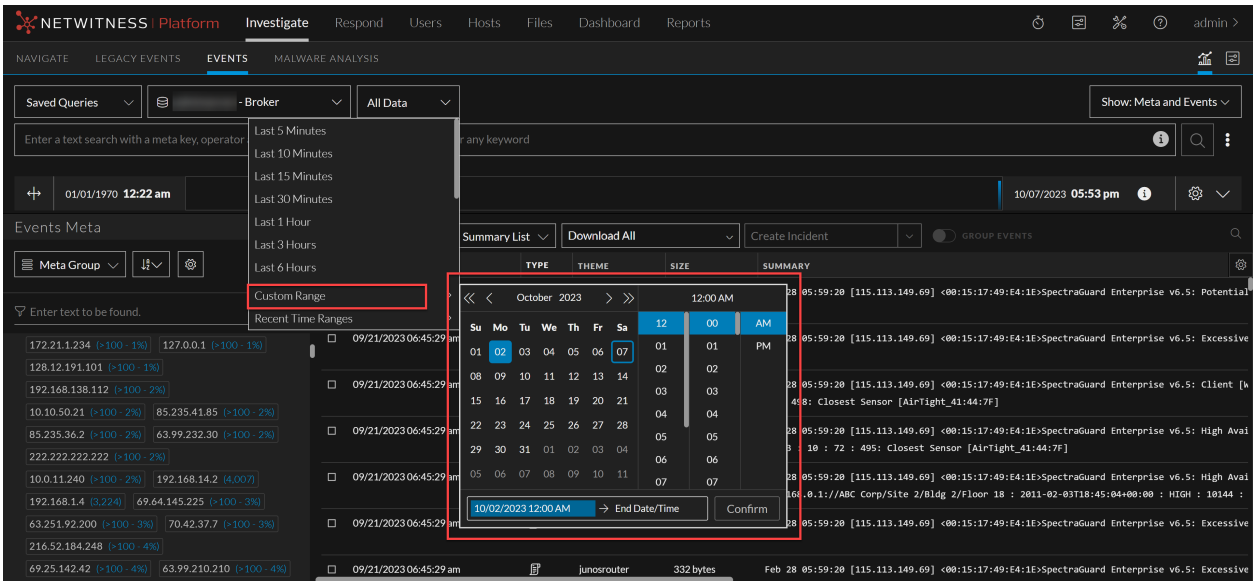
To edit the time range, do one of the following:



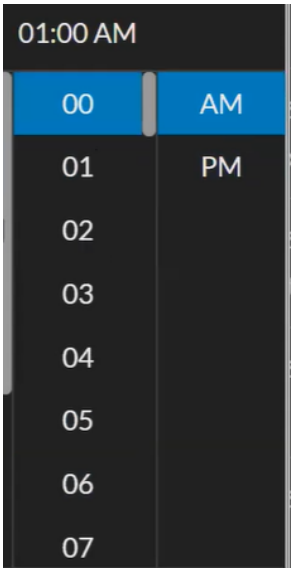
1. Click the drop-down arrow inside the **Time Range** selector and select a time range from the list. Options are in minutes, hours, days, or all data.



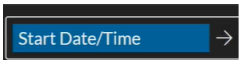
Edit the time range directly by clicking the year, month, day, hour, or minute displayed in the query bar. When a value is highlighted, type a new value for either the start or end time. If your time format preferences are set to 12-hour periods, click **am** or **pm** to toggle between the two options.



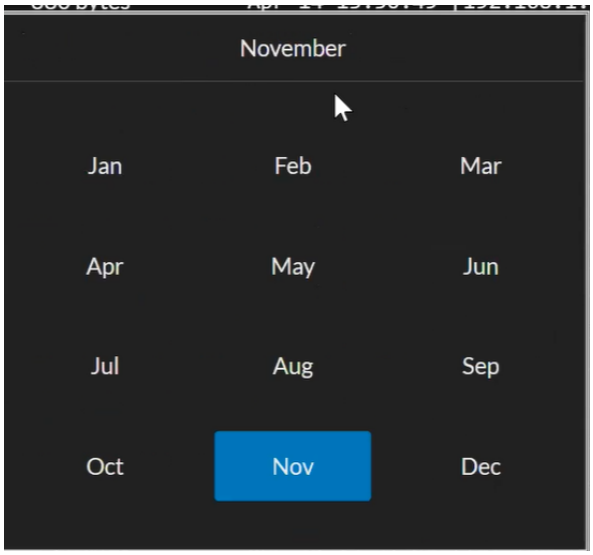
If the time range is invalid (for example, the start time is later than the end time), a red border appears around the Time Range selector. The button is disabled because the query is no longer possible, and a tool tip shows an error message explaining what you need to change. The following figure shows an invalid time range.



The selected time range is stored in your browser for the service being queried; you can set different time ranges for different services. A tool tip shows the calculated duration of the query. The following figure is an example of the tool tip.



In 12.0 and later, in addition to the existing options, the **Custom Range** option in Investigate Events view allows analyst to select a specific time, date, month, and year or a date range to run a query and filter events. On clicking the **Custom Range** option, a calendar view is displayed with a current day, time, and date details. This enhancement helps the analysts to select date and time quickly and avoid manual intervention therefore avoiding human errors (typos).



The analyst can use the following to navigate within the calendar:

- and to toggle between months.
- and to toggle between years.
- 

to select a specific time.
- 

to select the start date and time.

- 

to select the end date and time.
- 

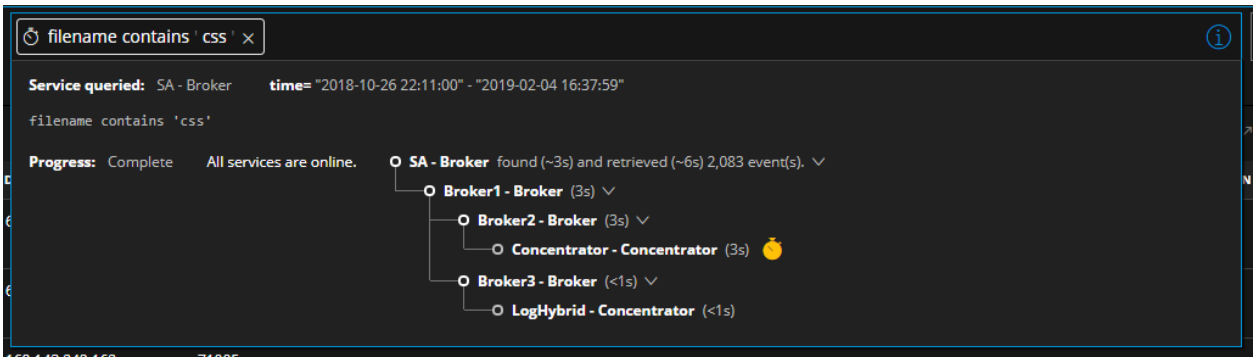
to select an year and the year range.
- Click **Confirm** to save the selection.

Submit a Query

The button on the right side of the query bar is active as needed to submit a query. In version 11.3 and earlier, when you click , all of the filters are ANDed to generate results and the button becomes inactive. In Version 11.4, because the query may contain other operators besides AND, the query is submitted as is. The button becomes active again in these conditions:

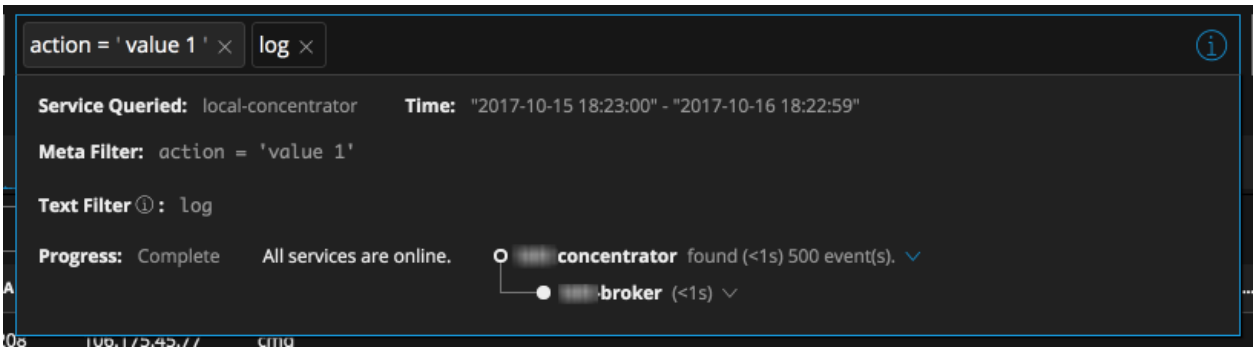
- If you change the service in the query bar or change the column group in the Events panel, a network call for data for a reconstruction in the Events panel continues to use the previous service, time range, and metadata filters until you submit the new query. The button becomes active as an indicator that the data in the view is stale.
- If more than a minute has passed and the original query's time range would no longer generate the same result set, the button becomes active as an indicator that results may be stale. In Version 11.3 and later, a setting in the Events view preferences determines this behavior by enabling or disabling the Update Relative Time Window Automatically option (see Configure the Events View.)

Cancel Execution of a Query



After you click to submit a query, the button changes to (the stop query option). The stop query option remains until all the events are loaded in the Events panel. To cancel the query, click .

If the query is canceled before all results have been returned, the following message is displayed at the end of results in the Events list: "Because the query was canceled, only partial results are displayed."

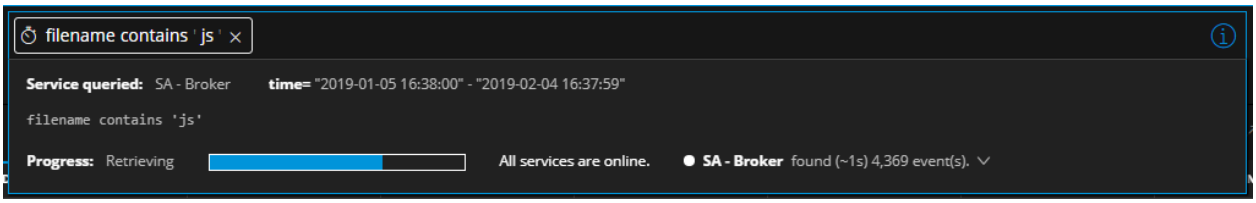


View Status of a Query

After a query is submitted, you can click **Query Console** icon ( ) > **Current Query** in the query bar to see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. The time range displayed in the Query console always shows each date as **YYYY-MM-DD**. Here is an example range from the Query Console: `"2014-09-20 20:57:00"-"2018-11-02 18:57:59"`.)

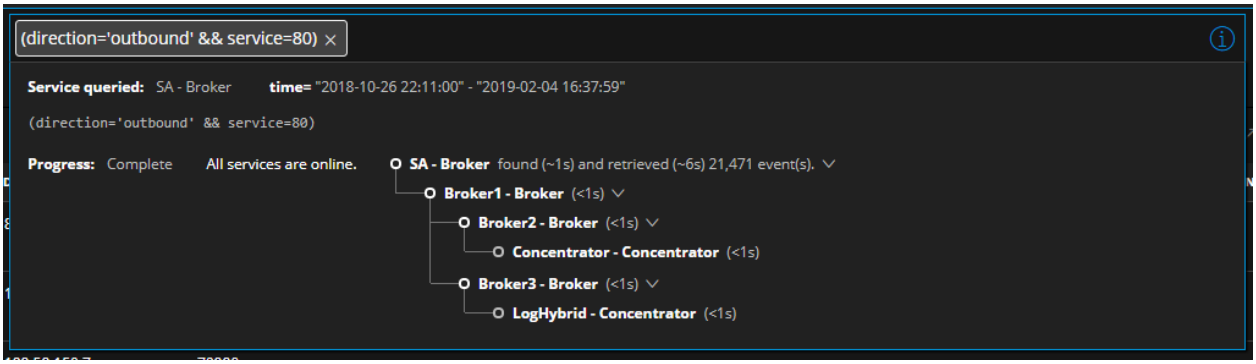
The following figure is an example of the Query Console for Version 11.3 when a query executes successfully and the slowest service is marked by an amber stopwatch.

The following figure is an example of the information in the Query Console for Version 11.4 after a query that includes a text filter executes. Notice that the query is shown in two fields, Meta Filter and Text Filter.



While a query is executing, a progress bar indicates the query's completion percentage at the bottom of the console. The status lets you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color of the query bar changes to amber if a non-fatal error occurs.

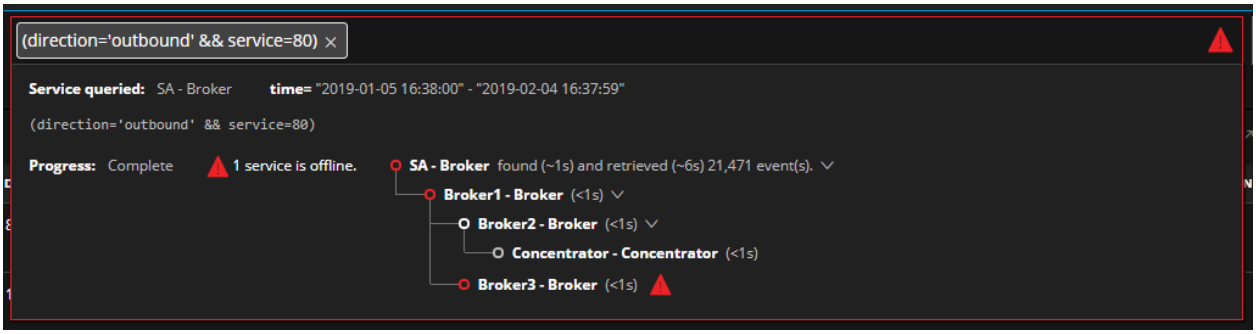
Icons provide additional information about individual services.



- An amber stopwatch marks the slowest service.
- An amber triangle indicates a warning was received.
- A red triangle shows that an error was received when trying to query the service.

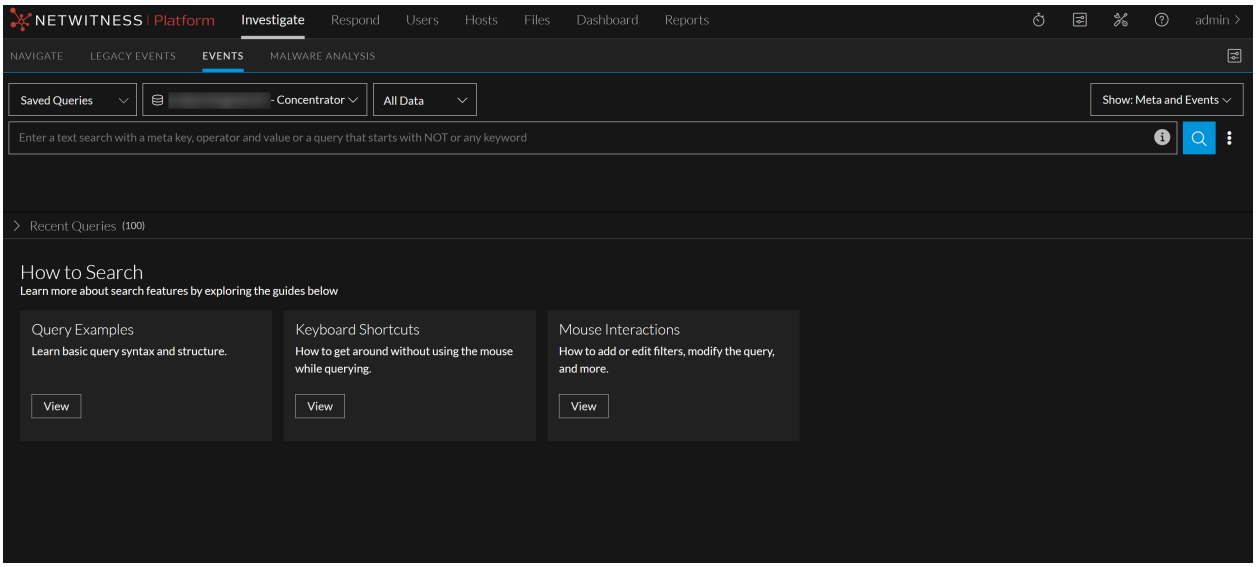
Executing and Reading the Index File to Find Events. The first stage of a query is complete when the queried services have found results. The query console provides a nested hierarchical listing of all the services being queried with indicators showing which are online or offline, and the time in seconds that the service took to find results.

Retrieving Events and Loading in the Events Panel. While the found events are being retrieved and loading in the Events panel, the progress bar shows a visual indicator and text description of what is happening. In the figure below, results were found and are being retrieved.

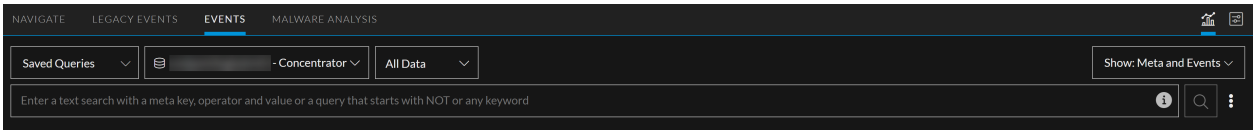


Request Complete. If there are no errors or warnings when loading is complete, the query console is outlined in blue and the button is disabled as an indicator that the data in the view is fresh. The following figure is an example of the query console for a completed query with no errors or warnings.

Errors and Warnings. A fatal error such as a syntax error in the query, or the queried service being offline, stops execution of the query. A red triangle is displayed in the upper right corner of the query console, and the console is outlined in red to indicate that the query failed. If the queried service is offline, only the queried service with no hierarchy of services is listed in the query console and marked by a red triangle.



A non-fatal error does not prevent a query from executing. The query is executed and events are loaded, but a red triangle is displayed in the upper right corner of the query console, and the console is outlined in red as a warning. The following figure shows the appearance of the query console when the queried service proxies to another service that is offline.



A warning does not prevent a query from executing. The query is executed and events are loaded, but an amber triangle is displayed in the upper right corner of the query console, and the console is outlined in amber.

Build a Query in Guided Mode

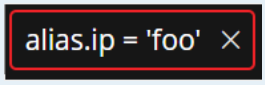
Guided Mode is the easiest way to create a query with features to help analysts enter valid queries. The following figure illustrates the initial Events view with Guided Mode in effect in the query bar.

This figure depicts the query bar in Version 12.3.1.

Keyboard Actions to Use in Guided Mode

In Guided Mode, the query builder allows entry, editing, and deletion of filters using the key strokes without having to use a pointer. Although you can use the pointer, you have the option to keep your fingers on the keyboard. This table identifies the available keyboard actions in Guided Mode when the cursor is located in the query bar; these do not apply to the service selector and time range.

Action	Keyboard Entry
Copy all filters (Version 11.4.1 and later)	With the cursor in the query bar, but not in a filter being edited, and all filters selected, press **Ctrl-C** (Windows OS) or **Cmd-C** (MacOS).



Action	Keyboard Entry
Delete characters in a filter	Selected characters: With characters selected in the query bar, press **Delete** or **Backspace**. Previous character (Version 11.4 and later): With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS). All characters (Version 11.4 and later): With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
Delete filters	Selected filters: With one or more filters selected do one of the following: • **Right-click > Delete selected filters** or **Delete selection** (11.4 and later). • Press **Delete**. • Press **Backspace**. Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Backspace** (Windows OS) or **Delete** (MacOS). The focused filter is deleted and focus moves to the left. Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The focused filter is deleted and the focus moves to the right.
Delete parentheses in a filter, do not delete the contents (Version 11.4 and later)	With a set of parentheses, but not the contents selected, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The selected parentheses are deleted, but the contents of the parentheses remain.
Delete parentheses and their contents in a filter (11.4 and later)	Selected parentheses: With a set of parentheses selected, do one of the following: • **Right-click > Delete selection**. • Press **Backspace** (Windows OS) or **Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the left. • Press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the right.
Deselect all filters	With a filter selected, press **Esc**.
Edit a selected filter	With a single filter selected, press **Enter**.
Insert a new filter at the beginning of the query bar, and open for editing (Version 11.4 and later)	With a filter selected, press **Home** (Windows OS) or **Fn** + **Left Arrow** (MacOS).

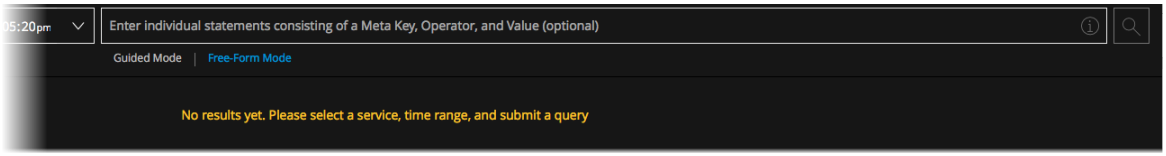
Action	Keyboard Entry
Insert a new filter at the end of the query bar, and open for editing (Version 11.4 and later)	With a filter selected, press **End** (Windows OS) or **Fn + Right Arrow** (MacOS).
Insert a new filter to the immediate left of the selected filter, and open for editing	With a filter selected, press **Shift + Left Arrow**.
Insert a new filter to the immediate right of the selected filter, and open for editing.	With a filter selected, press **Shift + Right Arrow**.
Insert a new filter to the immediate left of the selected filter	With a filter selected, press the **Left Arrow**.
Insert a new filter to the immediate right of the selected filter	With a filter selected, press the **Right Arrow**.
Open a new tab with the selected filters	With filters selected, **right-click > Query with selected filters in a new tab**.
Query with the selected filters	With filters selected, **right-click > Query with selected filters**.
Query with content of parentheses (Version 11.4 and later)	With parentheses selected: • To query with the selected parentheses contents, select one side of a parentheses set and **right-click > Query with selected filters**. • To query with the selected parentheses contents in a new browser tab, select one side of a parentheses set and **right-click > Query with selected filters in new tab**.
Select all filters in the query bar (Version 11.4.1 and later)	With the cursor in the query bar, but not in a filter being edited, press **Ctrl-A** (Windows OS) or **Cmd-A** (MacOS).
Select all filters to the left of the current filter	(Version 11.3.x and earlier) With a filter selected, press **Shift + Up Arrow**. (Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice.
Select all filters to the right of the current filter	(Version 11.3.x and earlier) With a filter selected, press **Shift + Down Arrow**. (Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice.
Select the filter to the immediate left if one exists	With no filter selected, press the **Left Arrow** key.

Action	Keyboard Entry
Select the filter to the immediate right if one exists	With no filter selected, press the **Right Arrow** key.
Submit a query.	With focus on the query bar and no pending filters, press **Enter**.

Visual Feedback in Guided Mode

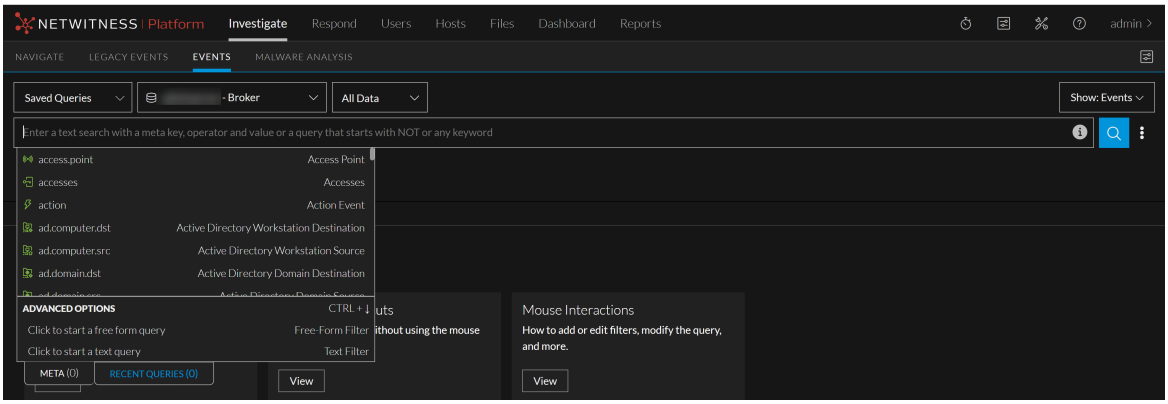
Guided Mode provides visual feedback during query construction. This table identifies and describes the possible feedback.

Feedback	Icon	Description
Blue background on a Filter		Indicates that a filter is selected.
Green circle between two filters		(Version 11.3 and earlier) A green circle indicates the location of the cursor between two existing filters. Clicking inserts a new filter at this location. (Version 11.4) A bold cursor indicates the insertion point.
Green filter outline		Marks the single filter that has focus and ready to edit. This is combined with the blue background, when multiple filters are selected and this filter has focus.
Red filter outline		Indicates that the filter is invalid. A tool tip that explains the error is displayed.



Feedback	Icon	Description
Index indicators in the Meta tab		(Version 11.4 and later) Indicate the index level of the meta keys in the Meta tab, which determines if you can use it in a filter:  This meta key is indexed by meta value and can be used in a filter.  This meta key is indexed by meta key, and can be used in a filter.  This meta key is not indexed, and not selectable for a filter. The `sessionID` meta key is a special case. Unlike other non-indexed meta keys, it is not configurable, but you can use it in a filter so it is marked by the key symbol. Supported operators are `exists`, `!exists`, `=`, and `!=`.
Query Events button		Used to submit a query, show the status of the query, and cancel a query. The button has three possible states:  Ready to submit a query using filters in the Query Builder.  Waiting for server validation to complete before executing the query.  The query is executing, click to cancel execution.
Slow Service icon		In the query console, marks the service that took the longest time to load results from the query.
Spinner in the Events list		Indicates that the query is currently being processed. The **Query Events** button is disabled while this occurs.

Feedback	Icon	Description
Stopwatch		(Version 11.5 or earlier) Indicates that the meta key/operator combination requires extra time to process. While the query is still executable, a more efficient meta key or operator is recommended.

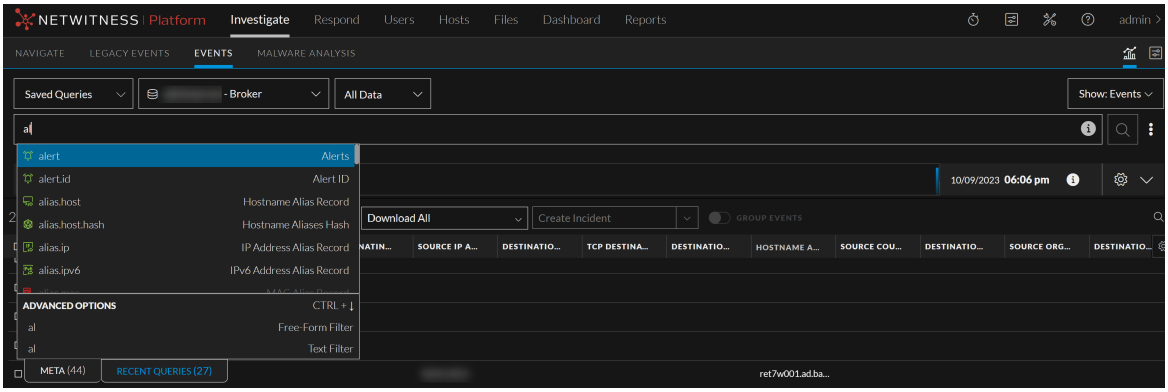


Add a Simple Filter in Guided Mode

To create a simple filter in Guided Mode:

1. Go to the **Events** view (Event Analysis view in Version 11.3 and earlier) and do one of the following:
   a. (Version 11.4.1 and later) Click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   b. (Version 11.4 and later) Select **Guided Mode**, click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   c. (Version 11.2 and later) Select **Guided Mode** and click in the query bar.
   d. (Version 11.1) Click in the empty query bar, or before or after an existing filter. This is an example of the empty query bar in Guided Mode before you begin entering a filter.

If the insertion point is between two filters, a green circle (Version 11.3 and earlier) or a bold cursor (Version 11.4 and later) marks the insertion point. If the insertion point is at the end of the query bar, the filter entry form opens with a blinking cursor at the entry point. A drop-down list displays the available meta keys passed from the service being investigated in alphabetical order. This figure shows the filter entry form of Version 12.3.1.



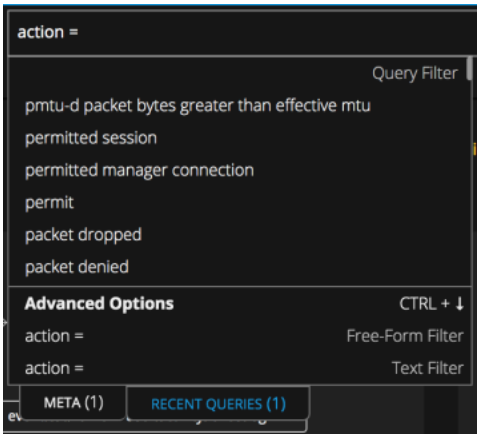
2. To select a meta key do one of the following:

   a. If there is only one option in the drop-down list, press **Enter**.

   b. If there are two or more options in the drop-down list, click a meta key or select a meta key using the up/down arrows, then press **Enter**.

   c. Start typing the meta key. As you type the meta key, the list is filtered to include only meta keys that contain the text you typed. The count next to the label on the Meta (0) tab increments to enumerate the indexed meta keys that match the typed text. Keys that are not indexed are disabled and not selectable and are not included in the count, for example, `alias.mac` in the figure below is not indexed and is dimmed. Click a meta key or select a meta key using the up/down arrow, then press **Enter**.

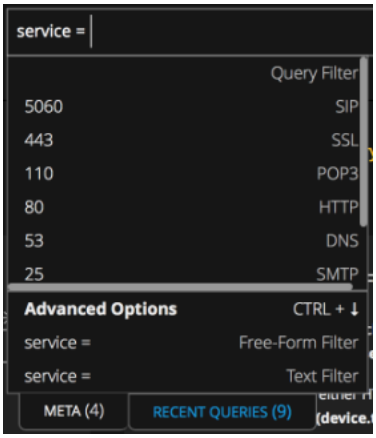
   d. To select a highlighted meta key, press **Enter**.
   The count on the Meta label changes to 1.



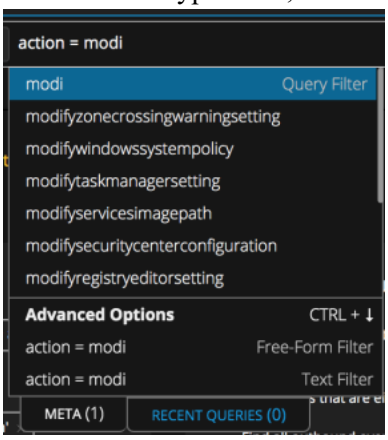
> **Note:** If no meta key in the drop-down list is selected, and the list has no meta keys to select, either the Free-Form Filter or the Text Filter option is highlighted based on the content already typed in the query bar.
> --If the text typed in the query bar includes some form of query syntax and other operators not yet supported by the user interface, the Free-Form Filter option is highlighted and you can create a free-form filter. In Version 11.3 and earlier, the `**`, `&&`, `||`, `()`, `AND`, `OR`, `comma`, `-`, `length`, and `regex` operators are not supported by the user interface. The Version 11.4 user interface supports these operators. If the Free-Form Filter is not highlighted, and the query bar has no text filter, the Text Filter is highlighted so you can create one.
> --If the first condition is true, and there is already one text filter, the Free-Form Filter option is highlighted so you can create a free-form filter.

   e. If you want to edit or delete the meta key, press **Backspace** or **Delete**.
   As you backspace and delete characters, the meta key drop-down list is filtered to include meta keys that contain those characters. To select a meta key, press **Enter**.
   The meta key is added to the filter entry form, and a list of valid operators for the selected meta key is displayed. Operations that require more time to process are marked by a (stopwatch

icon). This figure shows the stopwatch icon marking the `contains` operator.



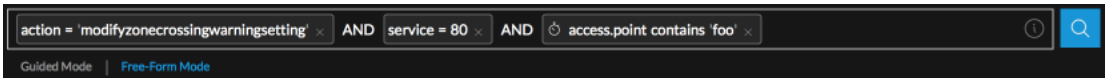
3. To select an operator, do one of the following:
   a. If there is only one option in the operators drop-down list, press **Enter** to select it.
   b. If there are two or more options in the operators drop-down list, click an operator or select one using the up/down arrows, then press **Enter**.
   c. Type the operator and press **Enter**. As you type, the operators drop-down list is filtered to show only operators that contain the typed text. Click an operator or select one using the up/down arrows, then press **Enter**.
   The operator is added to the filter entry form. In Version 11.4 and later, if the operator accepts a value, the suggested values drop-down list is displayed. Earlier versions leave the cursor in the filter entry form so that you can type a value.



4. (Optional) If the selected operator in the filter entry form accepts a value, do one of the following:
   a. In Version 11.3 and earlier, type the value and press **Enter**.
   b. In Version 11.4 and later, paste a value that you have copied from somewhere and press **Enter**.
   c. In Version 11.4 and later, begin typing in the **Query Filter** field.
   As you type, the meta value drop-down list is filtered to return up to 100 properly indexed values that begin with the typed text. The suggested values are based solely on the time range; filters in the query do not filter the list of 100. The auto-suggest function looks for matches in all events in the current data set, not just the (up to 10,000) downloaded events. If nothing in the list matches exactly, the text you typed in the Query Filter field is highlighted and this message tells you that

no suggestions were found. Some values, such as the integers for the `service` meta key, also display the definition of the service type.

If there is an exact match, that value is highlighted. In the following example, there is no exact match for the typed text, modi.



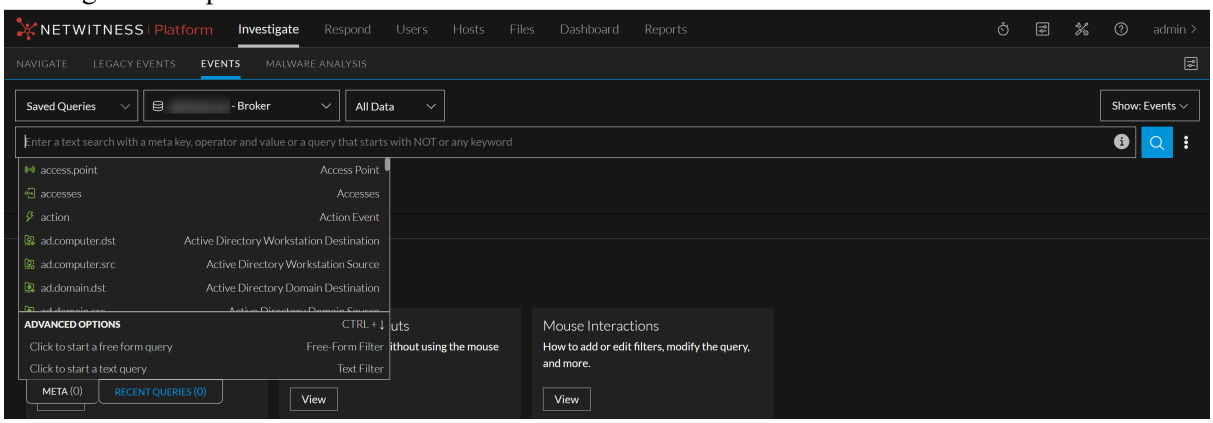
i. If the typed text is the value you want to use in the filter, press **Enter**.

ii. If you see the value that you want to query in the list and it is not highlighted, click the value or use the up/down arrows to highlight the value. Then press **Enter**.

iii. If you want to edit or delete the value, press **Backspace** or **Delete**.
As you backspace and delete a character, the meta value drop-down list is filtered to include values that begin with the remaining characters. To select a value, press **Enter**.
The value is added to the filter entry form.

5. To create the filter, press **Enter**. If you click anywhere outside the box before pressing **Enter**, the filter is not created.
The new filter is inserted, and the blinking cursor is refocused after the last filter, the meta keys drop-down list is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error. This figure shows a query being created with no errors.

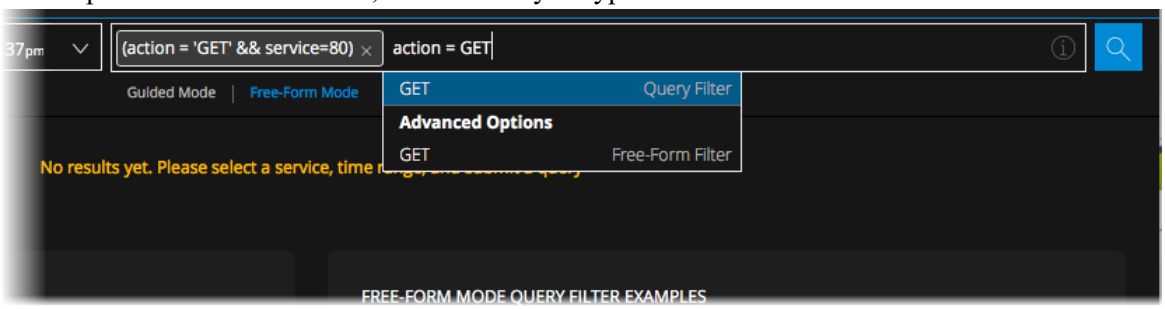
6. If the filters have no errors, you are ready to execute the query in the query bar. Click .
The results are returned and loaded in the Events panel. The first 10,000 events that match the query



begin loading in the Events panel. As the events are loaded, a status bar at the top tracks progress and you can scroll to the bottom of the list to see the completion status.

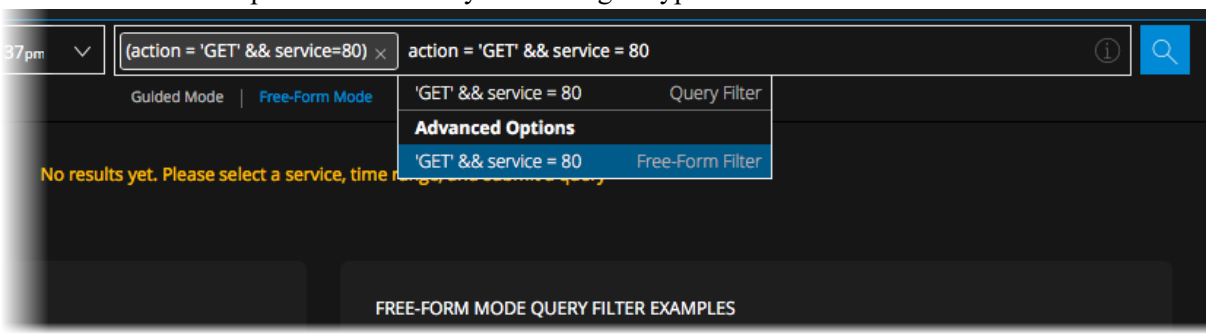
7. (Optional in Version 11.3 and later) If you want to see detailed status in the **Query Console** > **Current Query**, click the information icon .
8. (Optional in Version 11.3 and later) If you want to cancel the query before it finishes executing, click .
   The query stops executing and a notification that the query has been canceled is displayed.

Add a Free-Form Filter in Guided Mode (Version 11.3 and Later)



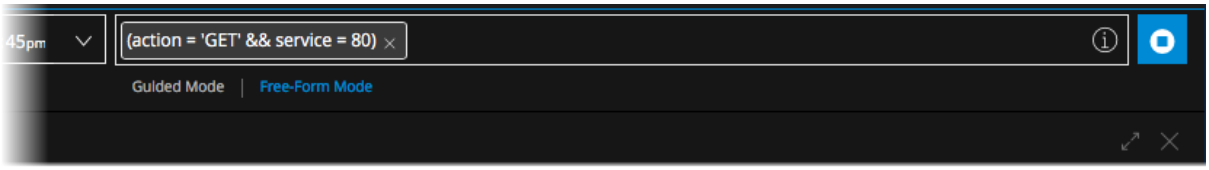
To filter the data displayed in the Events view using a free-form filter in Guided Mode:

1. Go to the **Events** view, select **Guided Mode** below the query bar, and click in the query builder field. (For Version 11.4.1, simply click in the query builder field.)
   If the insertion point is between two filters, a green circle or a bold cursor marks the insertion point. If the insertion point is at the end of the query bar, the filter entry field opens with a blinking cursor at the entry point. A drop-down menu lists available meta keys passed from the service being investigated in alphabetical order.



2. Do one of the following:
   a. Place the cursor in the **Free-Form Filter** field and begin typing the query.
   b. Begin typing the filter beginning with a meta key or with an open parenthesis. When entering and editing filters in the query builder, parentheses pairs are automatically balanced. If you type an open parenthesis, the other part of the pair is added to the filter.
      When no matching meta keys or operators are available in the drop-down menu, the Free-Form

Filter option becomes available, and the text you typed is available in the **Free-Form Filter** field.



3. Continue typing the entire expression and press **Enter**.
   (If you click anywhere outside the box before pressing **Enter**, the filter is not created.) This figure shows a free-form expression created by continuing to type after the value GET.

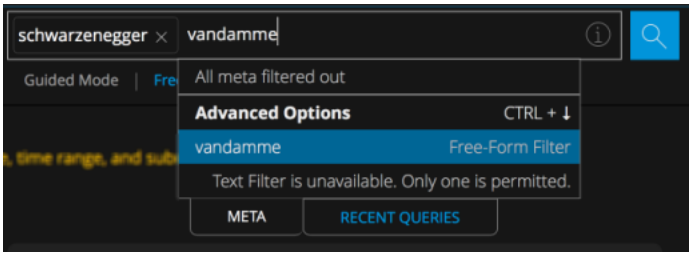
   The new filter is inserted, and the blinking cursor is refocused after the last filter, a new filter entry form is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error.

4. To execute the query, click . While the query is executing, the button changes to .

5. If you want to cancel the query before it finishes executing, click .

   If you do not cancel the query, you can click to view the status of query execution. When the query is finished executing, the Events panel displays appropriate results for the query.

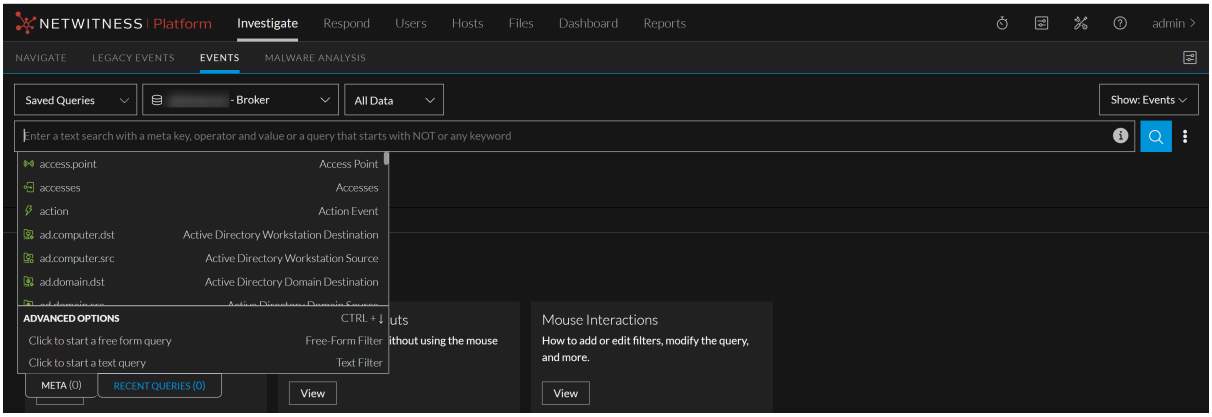
Add a Text Filter to Find a Value Anywhere in the Data Set



In Version 11.4 and later, the text filter allows you to find a specific value in the current data set (endpoint, logs, and network events). The text filter initiates a case-insensitive search against all the data for meta keys that are indexed by value. The text filter does not search for values that are indexed by meta key or not indexed so you not see all results. A message advises that `Results may be limited by a text filter, which matches only indexed meta keys. If you want to conduct a more exhaustive search against raw events, click here and choose the appropriate options in the Search Events drop-down menu.` Icons in the drop-down list indicate the index level of each meta key:

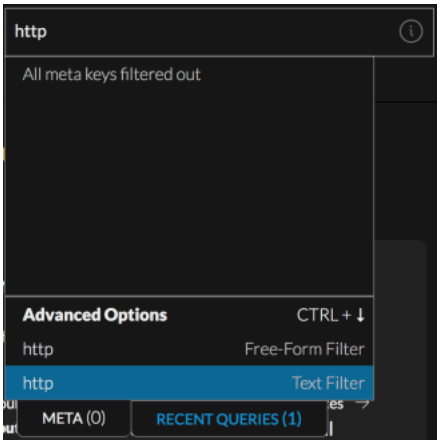
- filename.size - indexed by meta key
- filename.src - indexed by meta value
- float32.whatever - not indexed

Note: All services in the hierarchy being queried (Broker, Concentrators, and Decoders) must be at Version 11.3 or later. The text filter is not available in the drop-down menu when there are services below Version 11.3 in the hierarchy.

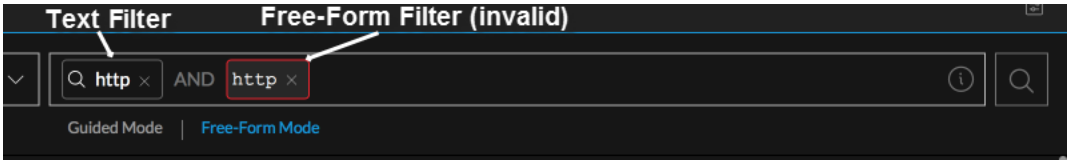


The text filter is useful when you have some idea of what you are looking for, but are not sure where to look (which meta key or service). As an example, if you are interested in looking for a file name, click in the query bar, type the complete text string, and click **Text Filter**. The text filter initiates a search against all the data in the index, within the services and time range being investigated, and returns exact matches to the text string.

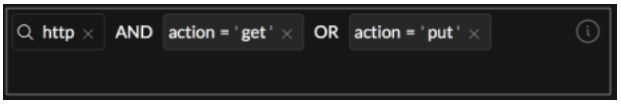
A query can include one text filter and any combination of simple and free-form filters. The operator for a text filter must be AND because it acts as a filter over the results of all the other filters in the entire query. If one text filter already exists in the query bar, the Text Filter option is disabled as shown in the figure below. Text filters are not supported inside parentheses.



To create a text filter:

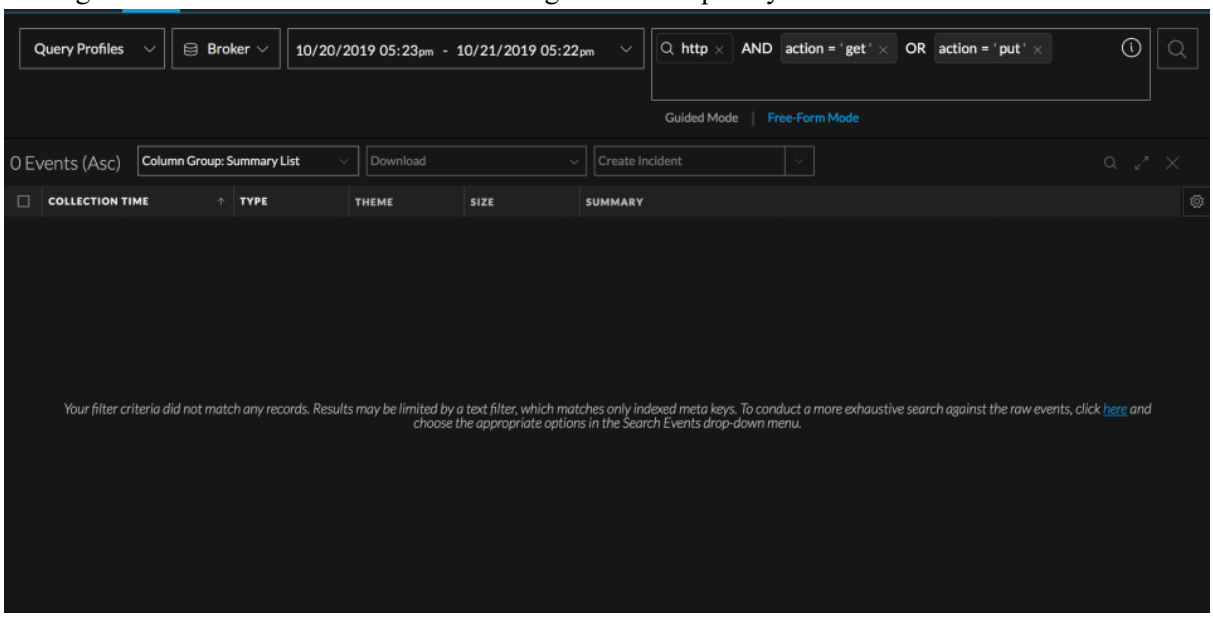


1. Go to the **Events** view and click in the query bar.
   The query entry form is displayed.

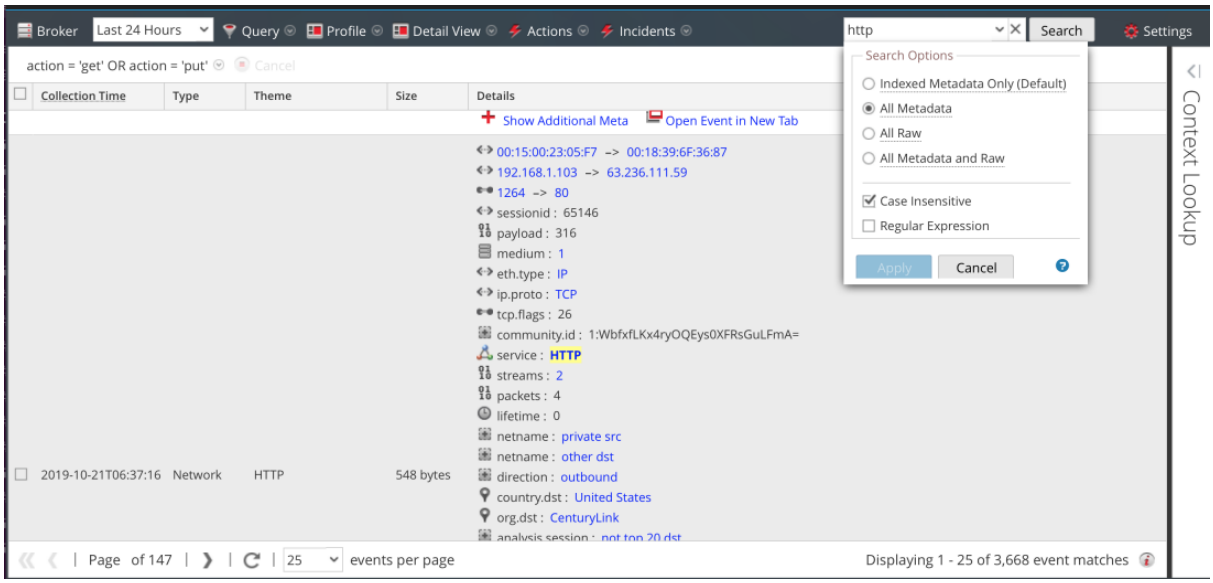


2. Type the text string that you want to find, for example, `http`.
   The text string is displayed in the meta key drop-down list under Advanced Options.

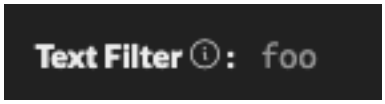
3. Click **Text Filter** under **Advanced Options**.
   The text filter is created in the query bar. The following figure illustrates the different appearance of a text search filter versus a free-form filter. The free-form filter is in a fixed-space font and outlined in red. The red outline indicates a syntax error because a valid expression is expected in a free-form filter. The text filter is marked by the search icon. No syntax requirements are applied to text search filters.



4. (Optional) Create additional simple or free-form filters in the query bar. There can be only one text filter in the query. This example was created by typing `http` as a text filter and then adding two more filters - `action = 'get' OR action = 'put'`



5. To submit the query, click .
   The results are displayed in the Events panel. This figure illustrates the Events panel with no results displayed and a message with instructions for improving results. Every time you use a text filter, this



message is at the bottom of the results offering a link to expand your search.

6. Click the **here** link in the message.
   A new browser tab opens with the query results displayed in the Legacy Events view, where you have additional options to improve the search. This figure shows the results for the same query when non-indexed metadata is included.

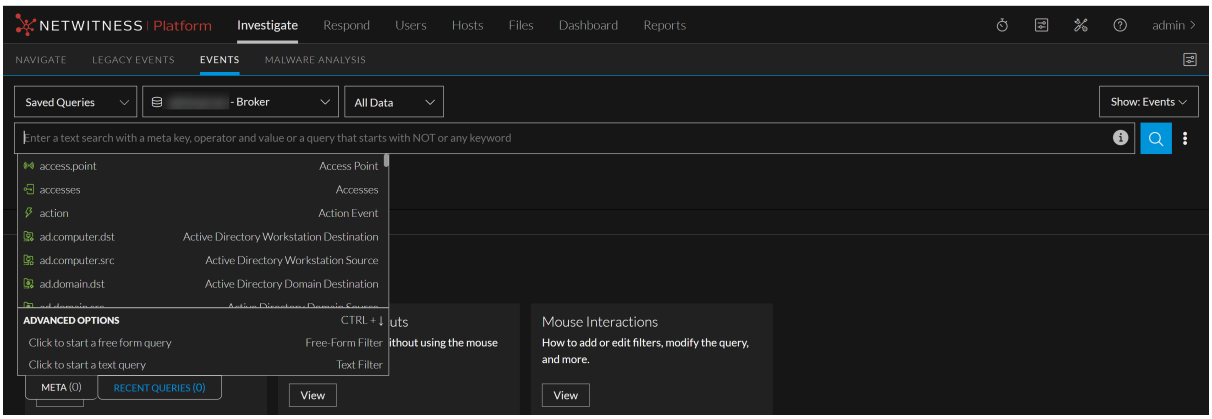
7. Click the Information icon  in the query console to view the status of the query. This figure shows a text filter in the query console.

Select All Filters and Copy All Filters in the Query Bar (Version 11.4.1 and Later)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Ctrl-A for Windows OS, Cmd-A for MacOS) and then copy the selection to the local clipboard (Ctrl-C for Windows OS, Cmd-C for MacOS).

To select all filters and copy them to the clipboard:

1. In the **Events** view > **Events** panel, click on a focused pill or in the query entry form, and press **Ctrl-A** for Windows OS or **Cmd-A** for MacOS.
   All filters in the query bar are selected.
2. To copy the selected filters to the clipboard, type **Ctrl-C** for Windows OS or **Cmd-C** for MacOS.
   You can share the clipboard with other analysts or paste the contents in the query bar.



Paste Text in the Query Bar

(Version 11.4 and Later) While creating a filter in the Events view query bar, you can paste instead of typing the complete text of a filter that you have copied from somewhere else. You can paste the text into an empty query bar or next to an existing filter in the query bar. Depending on the text you typed, the query parsing engine parses the information that you pasted and creates a new filter, which can be a simple filter, a free-form filter, or a text filter.

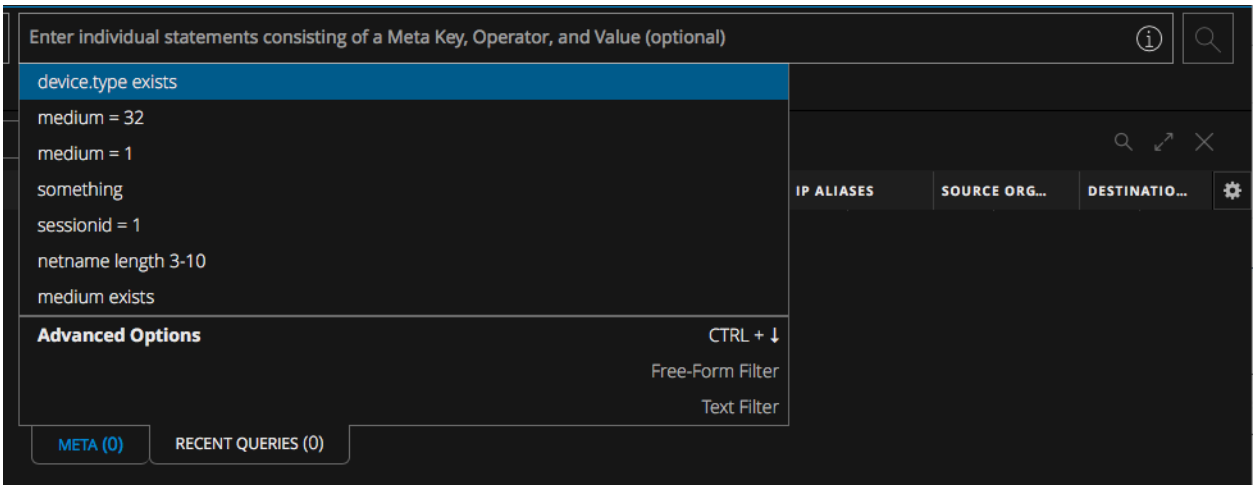
- A text string of this form is added as a new simple filter in the query bar: `<valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's'`.
- A text string of this form is added as two simple filters in the query bar: `<valid meta key> <valid operator> <optional value> && <valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's' && action exists`, which is converted to `alias.host contains 's' AND action exists`.
- A text string that contains unparsable text may be converted to a free-form filter. For example, using `NOT (device.ip = 10.10.10.10)` is unsupported for creation of a filter in Guided Mode, so this would be converted to a free-form filter. Free-form filters are validated by the server when they are submitted.
- Text that does not conform to the filter syntax is added as a free-form filter.

To create a filter by pasting text:

1. Go to the **Events** view > **Events** panel, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The query entry form is displayed.

2. Type **Ctrl-V** (Windows OS), **Cmd-V** (MacOS), or **right-click** and **Paste** to paste text that you have copied into the clipboard from somewhere else. Do one of the following:

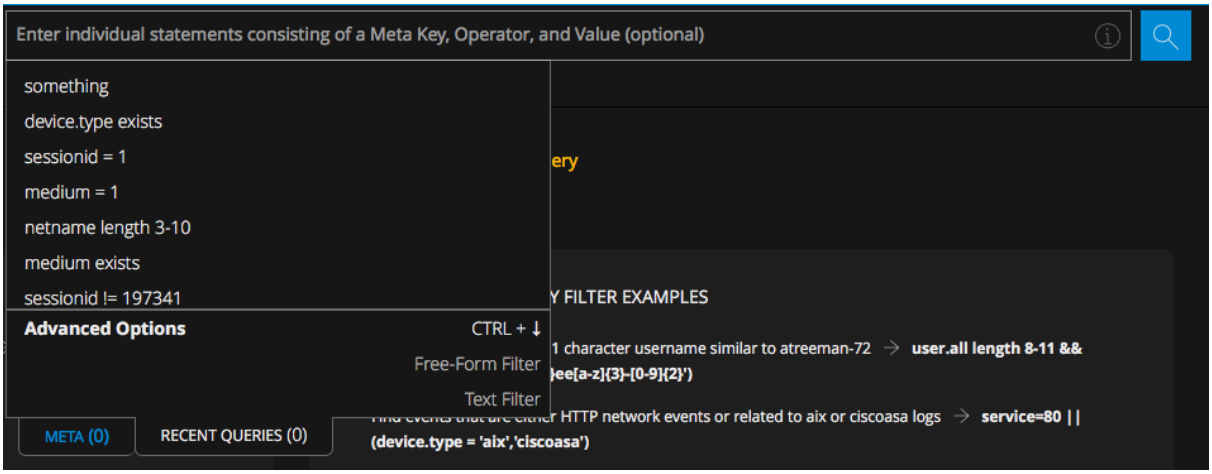
   a. If the text you pasted is a statement that can be parsed, one or more simple filters is created.
   If the text you pasted is a statement that cannot be parsed, a new free-form filter is created.
   If the text you pasted is not a statement and not a valid meta key, an invalid syntax error is displayed.
   If you pasted a valid meta key for a new filter you are building, the meta key is highlighted in the drop-down list, and you can continue creating a filter as usual by entering an operator and a value.
   After you select a valid meta key and a valid operator (for example, `city.dst =`) any text that you paste is treated as a text string if the meta key supports a text value, and one filter is created.
   If the meta key does not support a text value all of the text in the query bar is parsed as described in step a above.



3. Add more filters in the query bar if you wish, and then submit the query.
   The query is executed.

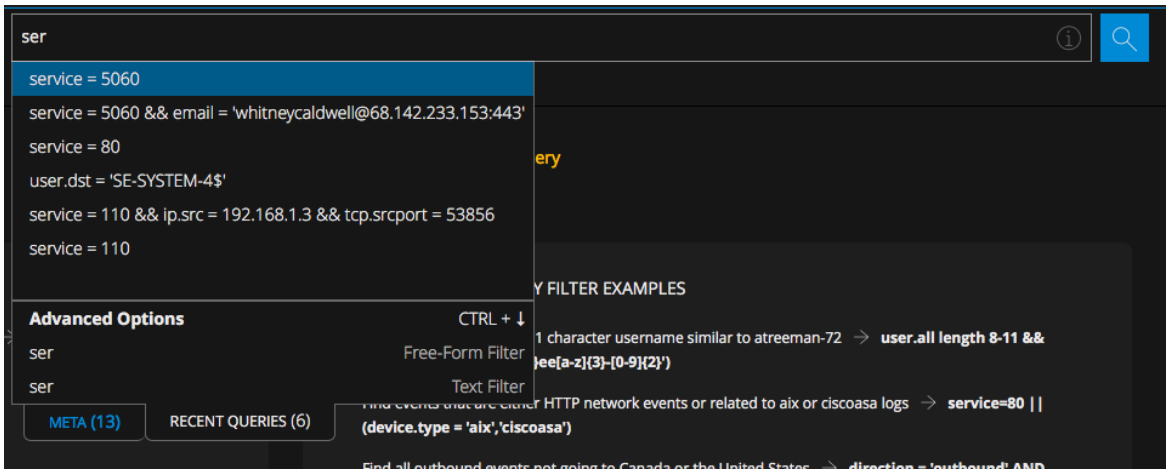
Insert a Filter Based on a Recent Query

(Version 11.4 and Later) In the Guided Mode query bar, you can insert a filter based on a recent query. When the Recent Queries tab is opened and nothing has been typed in the query bar, up to 100 of your most recently executed queries are displayed in a scrollable list. The list is sorted to show the most recent at the top, and the Recent Query count is set to 0. When you begin typing, the list is filtered to display up to 100 queries from the query history database that contain matching text, even if the matches are not in the most recent 100 queries. The Recent Query count changes to reflect the number of matching queries as you type.



The top entry in the list is highlighted by default. To select a recent query, you can move the highlighting up and down in the list using the up and down arrow or by mouse-over of a recent query. As you type the list is filtered and the highlighting moves back to the top of the list. Clicking a query, or pressing Enter while a query is highlighted, creates a new filter with the text of the selected query.

Whenever you submit a query, the list is sorted to add that query, now the most recent, at the top.



To create a filter based on a recent query

1. Go to the **Events** view, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The Meta Key drop-down list is displayed in the Meta tab.
2. Select the **Recent Queries** tab.
   The Recent Queries drop-down list is displayed with a count of 0.

3. To search for a recent query, do one of the following:
   a. Begin typing some text.
      As you type more characters or backspace to delete characters, the list is filtered to show recent queries that contain the text you typed. The count in the Recent Queries label increments to show the number of matching queries as you type.

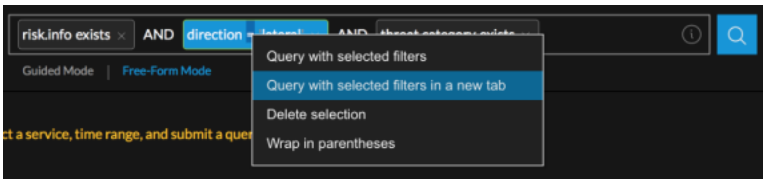
b. To select a query and add a new filter, continue to type and use the up and down arrows until the query you want to use as a new filter is highlighted.

c. With a query highlighted, press **Enter** or simply click a query that you see in the list.
The filter is added in the query bar.

4. Add more filters in the query bar if you wish, and then submit the query.
The query is executed and the list is sorted to add that query, now the most recent, at the top.

Edit a Filter in Guided Mode

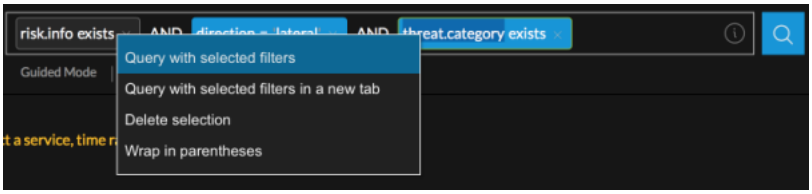
With a query in the Guided Mode query bar, you can edit a filter. To edit a filter:



1. Double-click the filter, or click the filter and press **Enter**.
2. Edit the filter. When finished editing, press **Enter** to update the filter.
3. If you want to execute the query again, click .
The Events panel displays results for the updated filter.

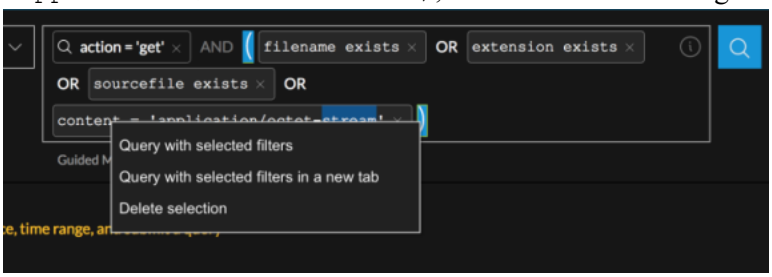
Query Using Selected Filters in Guided Mode

When you have one or more filters in the query bar in Guided Mode, you can refocus the query to include only selected filters, displaying results in the current browser tab or a new browser tab. Some filters include expressions with nested parentheses in Version 11.4, and you can refocus part of a filter that includes nested parentheses. To update the query using only selected filters, do one of the following:



1. Using a query that includes one or more simple filters, for example a query has three filters: `risk.info exists`, `direction ='lateral'`, and `threat.category exists`.

   a. Select `direction = 'lateral'`, right-click the filter and select **Query with selected filters in a new tab** in the drop-down menu.



A new tab opens with the results for the selected filter and the original query is left intact on the previous tab.

b. To query the selected filters in the same tab, select `direction = "lateral"` and `threat.category exists`. Then right-click and select **Query with selected filters** in the drop-down menu.

A query with only the selected filters is submitted and all remaining filters are removed.

2. (Version 11.4) For a query that includes a filter containing nested parentheses, for example: `action = 'get' AND (filename exists OR sourcefile exists OR content = 'application/octet-stream')`, do one of the following:

a. Select the close parenthesis after `'application/octet-stream'`, right-click, and select **Query with selected filters in a new tab**.
A new tab opens with results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`.

b. Select the same, right-click, and select **Query with selected filters**.
The results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')` are displayed in the current tab.

Delete a Filter and Delete Text or Parentheses in a Filter in Guided Mode

Some keystroke editing features became available in Version 11.4; these are labeled in the steps.

1. To delete a filter, do any of the following:

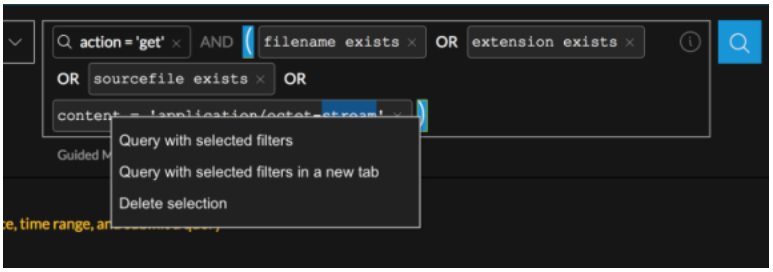
a. Click **X** in a filter.

b. Select the filter and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).

c. (Version 11.4 and later) Select the filter and press **Backspace** (Windows OS) or **Delete** (MacOS).

d. Right-click one or more filters and select **Delete selected filters** or **Delete selection** (Version 11.4 and later) in the drop-down menu.
The filter and the operator to the right or left of the filter is deleted, ensuring that no extraneous operators remain in the query bar.

2. (Version 11.4 and later) To delete characters in a filter or parentheses and contents in a filter, do any of the following:



a. To delete the previous character: With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS).

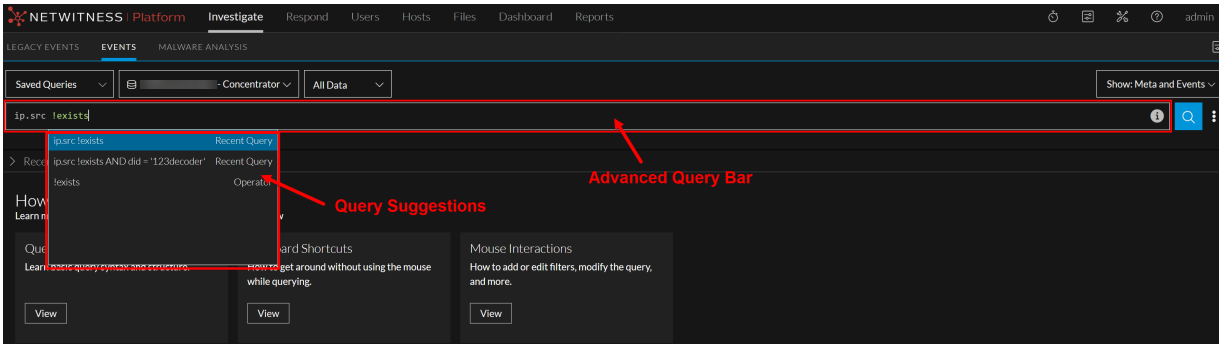
b. To delete all characters: With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).

c. To delete the selected characters: With characters selected in the query bar, press **Delete** or **Backspace**.

d. To delete parentheses, but not the characters inside the parentheses, select one of the parentheses and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).

e. To delete a set of parentheses and the contents, for example, `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`, select the parenthesis after `get`, right-click, and select **Delete selection**.

Everything except `action = 'get'` is deleted.



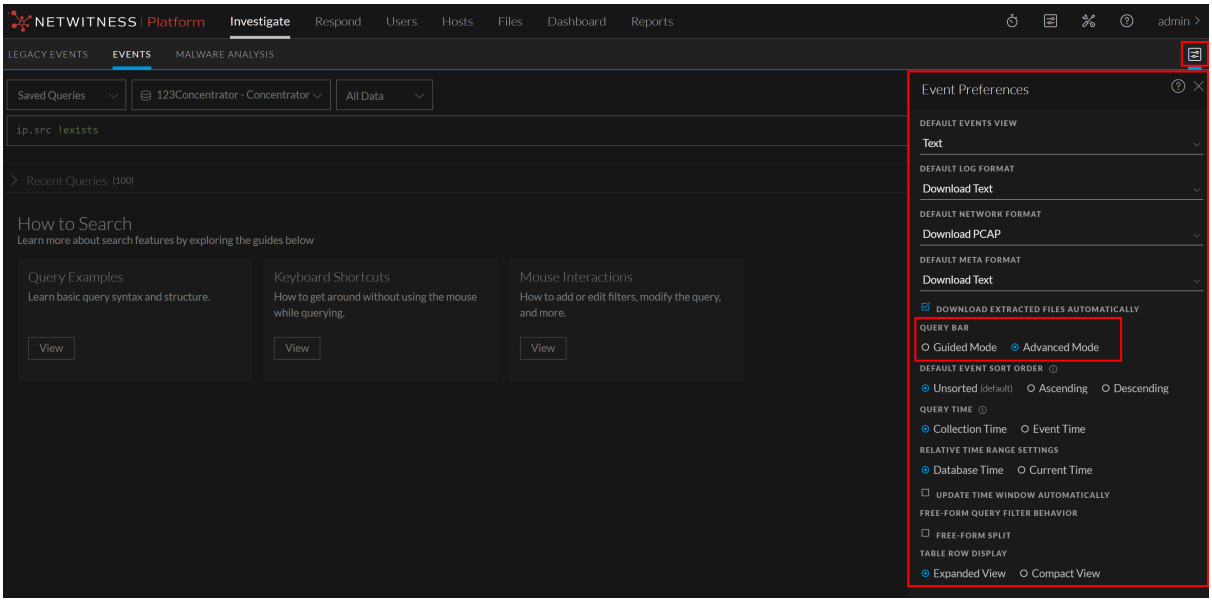
Create a Query in Advanced Mode

In addition to the Guided Mode query bar, NetWitness introduces the new Advanced Mode query bar in Version 12.3 to provide a seamless experience to the users while they write queries. Advanced Mode query bar provides a search bar with the ability to accept a query construction in text form just like an Integrated Development Environment (IDE), instead of the pill-based entry of Guided Mode.

Advanced users can now quickly construct a new query or modify the existing queries and get the list of matching events. While constructing queries, users can continue typing queries without pressing enter. Advanced Mode query bar also has other great features:

- **Syntax or error highlighting**: The syntax of each query is validated and a red outline marks invalid filters.
- **Auto suggestions**: Suggestions like a meta key, an alias for medium, an operator in a drop-down list to help in query construction.

- **Recent queries**: Displays recent queries.



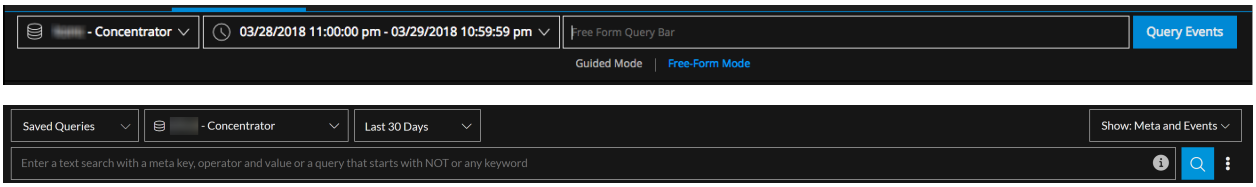
To enable the advanced query bar:

1. Go to **Investigate** and click ▣ (**Event Preferences**).

   The Event Preferences dialog is displayed.

2. Select **Advanced Mode** in the Event Preferences dialog.

   As you write or edit a query, the query bar provides suggestions. Press **Tab Key** or click on the highlighted suggestion to select a suggestion.



Note: Advanced Query Bar may not correct as many errors as Guided Query Bar while typing a query.

Create a Query in the Free-Form Mode

Free-Form Mode is used in Version 11.2, 11.3, and 11.4, but no longer available in Version 11.4.1.

Free-form queries are most useful when you have a long text string saved that you want to paste, or if you have one in mind that you want to enter quickly, and you know the meta keys, valid operators, and valid syntax for entering values. The following figure illustrates the initial Events view with the empty Free-Form query builder field. The first example is Version 11.2 and the second example is Version 12.3.1.

The blinking cursor indicates that you can enter a query. You can enter free text here. As more expressions are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

These are some examples of queries that you can enter in Free-Form mode:

To find events with an 8- to 11- character username similar to atreeman-72:
`user.all length 8-11 && (user.all regex '^a[a-z]{2}ee[a-z]{3}-[0-9]{2}')`

To find events that are either HTTP network events or related to aix or ciscoasa logs:
`service=80 || (device.type = 'aix','ciscoasa')`

To find all outbound events not going to Canada or the United States:
`direction = 'outbound' AND not(country.dst = 'united states' || country.dst = 'canada')`

If you have a submitted query in Guided Mode, the query is transformed into text when you click switch to Free-Form mode. This is an example of a query submitted in Guided Mode as two filters, `service = 80` and `direction = 'outbound'`, and then viewed in Free-Form mode.

The  button on the right side of the query builder is visible as needed to input a query. The query is applied when you click . At that time the query is validated to show syntax and logic errors.

Operations that require more processing time are not highlighted as they are in Guided Mode, but this table provides a summary of expensive operations for reference.

Index Method	Non-Text Value	Text Value	Regular Operations	Expensive Operations
By Key	✓		`exists`, `!exists`	`eq`, `!eq`
By Key		✓	`exists`, `!exists`	`eq`, `!eq`, `begins`, `ends`, `contains`
By Value	✓		`exists`, `!exists`, `eq`, `!eq`	no expensive operators

Index Method	Non-Text Value	Text Value	Regular Operations	Expensive Operations
By Value		✓	`exists`, `!exists`, `eq`, `!eq`, `begins`	`ends`, `contains`
By None	special case for `sessionid`		`exist`, `!exits`, `eq`, `!eq`	no expensive operators

Filter Results in the Navigate View

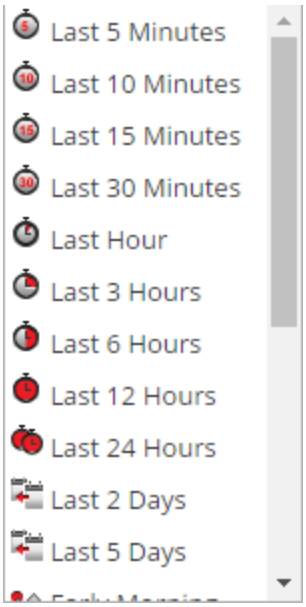
When conducting an investigation in the Navigate view, there are several methods available to refine the results displayed when meta key values are loaded in the Navigate view. The rest of this topic is focused on the basic methods of filtering data:

Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

- Set the Time Range
- Set the Quantification Method and Sort Sequence of Meta Key Results
- Manage and Apply Default Meta Keys in an Investigation
- Drill into Data in the Navigate View Time Chart
- Drill into Data in the Values Panel

Set the Time Range

When conducting an investigation in the Navigate view, the time range options limit the results returned. You can select:



- A time range relative to the collection- ranges relative to the collection are based on the last collection time for data.
- A time range relative to the calendar.
- A custom date range.
- All data.

The selected Date Range is shown in the Navigate view tool bar as the Time Range label. By default the label is **Last 3 Hours**. The Time Range displayed in the timeline banner shows the first and last timestamp for the date range being used for the metadata.

Note: Time range is based on the Time Zone configured in the Profile Preferences panel as described in "Setting User Preferences" in the *NetWitnessGetting Started Guide*.

To select a built-in time range

1. Click the **Time Range** option in the Navigate view toolbar. The default time range is for the **Last 3 Hours**, but a different value from the selection list, for example, **All Data** or **Last Hour,** may already be selected and used as the label in the options panel.
   The Time Range selection list is displayed.

2. Do one of the following:
   - If you want to see all data, select **All Data**.
   - If you want to set a time range in minutes, hours, or days that is relative to the collection, select a value such as **Last 10 minutes**, **Last 3 Hours**, or **Last 5 days**.
   - If you want to set a time range relative to today, select **Yesterday**, **This Week**(Version 11.1), **Last Week** (Version 11.1), **All Day**, or a part of the day such as **Early Morning**, **Morning**, **Afternoon**, or **Evening**.
   - If you want to set a unique date range, select **Custom** in the **Time Range** menu and follow the procedure below.
     The selected time range is applied to the current results in the Values panel.

To specify a custom time range

1. Select **Custom** in the **Time Range** menu.
   Date selection options are displayed in the toolbar.

2. Within the time **Start Date** and **End Date** fields, do the following to specify the date and time:
   a. Click a date from the calendar.
   b. (Optional) Select the time from the Hour and minute fields or click **Now**. The time selection defaults to the current time of day.

Note: The value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time is interpreted as "HH:MM:00 - HH:MM:59."

3. To apply the range, click **Go**.
   The selected time range is applied to the current results in the Values panel.

Set the Quantification Method and Sort Sequence of Meta Key Results

You can select the way results for each meta key are quantified and sequenced in the Navigate view.

Note: If meta entities (Version 11.1 and later) are used in meta groups, the results will show the top 20 values that matched any of the meta keys contained in the meta entity.

Each meta key section in the Navigate view contains an ordered list of values showing each meta key value (Value) and its count (Total). You can specify whether:

- The results in each meta key section are sorted based on Value or Total.
- The results are sorted in ascending or descending order.
- The values shown for each meta key are quantified by number of packets (Packet Count), number of sessions or logs (Quantify by Event Count) or by the size of events (Quantify by Event Size).

Note: If you have both a log decoder and a packet decoder for which you are viewing the metadata, the calculation of what is actually being counted is dependent on the type of key. If you select to Quantify by Packet Count and are looking at logs, the Navigate view output is the same output as if you had selected Quantify by Event Count (see Navigate View for details).

This image shows the `Event Type` meta key presented in order by **Total** in **Descending** order. The value with the greatest count of matches is presented first. The value `failure audit` has 71 matches and is listed first. The value `logon` has only one match and is presented last. The quantification method is **Event Count**.

This image shows the `Event Type` meta keys presented in order by **Value** in **Descending** order. The value names are presented in alphabetical order starting at the end of the alphabet. The value `success audit` is listed first. The value `connect` is presented last. The quantification method is **Event Count**.

To select the quantification method of meta key count and ordering of meta key results displayed in the Navigate view:

1. In the toolbar, select **Event Count**, **Event Size**, or **Packet Count** and choose one of the quantification options in the drop-down menu. The label for the menu displays the selected option.
   

   The current view is reloaded according to your selection.

2. In the toolbar, select **Total** or **Value** and choose one of the ordering methods in the drop-down menu. The label for the menu displays the selected option.

   The current view is reloaded according to your selection.

3. In the toolbar, select **Ascending** or **Descending** and choose one of the sort order options in the drop-down menu. The label for the menu displays the selected option.
   The current view is reloaded according to your selection.

Manage and Apply Default Meta Keys in an Investigation

When analysts are conducting an investigation of captured data in Investigate, a default set of meta keys is loaded and displayed in a default sequence in the Navigate view > Values panel. The default content and sequence is based on the meta keys for the service being investigated. Analysts can specify the meta keys to display during navigation by selecting the default meta keys or by selecting a user-defined group of meta keys, which provides great flexibility to define meta keys. This can help to drill down more directly to the desired data and to reduce the load time by preventing the loading of meta that is not of interest in the current investigation.

Note: In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.

If no custom meta groups are in effect, the Navigate view is displayed with the meta key visibility specified in the Default Meta Keys dialog. To optimize loading of meta keys in the Navigate view > Values panel, NetWitness does not open non-indexed meta keys by default. When you open a non-indexed meta key in the Values view, NetWitness begins loading values for that meta key. If the load time is excessive, the load of the meta key times out with a message. Title, values, and counts for non-indexed meta keys are not drillable in the Values panel. Additional labeling in Investigation identifies the non-indexed meta keys.

To select the meta keys to apply to your investigation, you can:

- Select the default meta keys.
- Select a set of meta keys, called a meta group.

Note: Investigate has built-in meta groups and user-defined meta groups. Once created, user-defined meta groups can be edited, deleted, exported for use on other services, and imported to the service you are investigating. All of these procedures are provided in a separate topic: Use Meta Groups to Focus on Relevant Meta Keys.

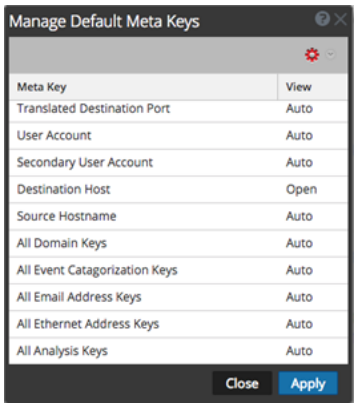
The Default Meta Keys dialog allows you to specify the default view and display sequence for meta keys during navigation in the Investigate > Navigate view for a specific service. For each key or for all keys, you can set the default view to:

- Hidden: Results for default meta key are hidden and are not available to load.
- Open: Results for default meta key are open with all values and counts displayed.
- Close: Results for default meta key are closed with only the meta name visible.

- Auto: The loading of default meta keys is controlled by the index level, which must be Indexed By Value.

When using the default meta keys, be aware that these can be modified for different services, and you may not be seeing the same set of default meta keys when navigating to a drill point on different services. If you do not see the expected data, you may need to change the initial view of the default meta keys.

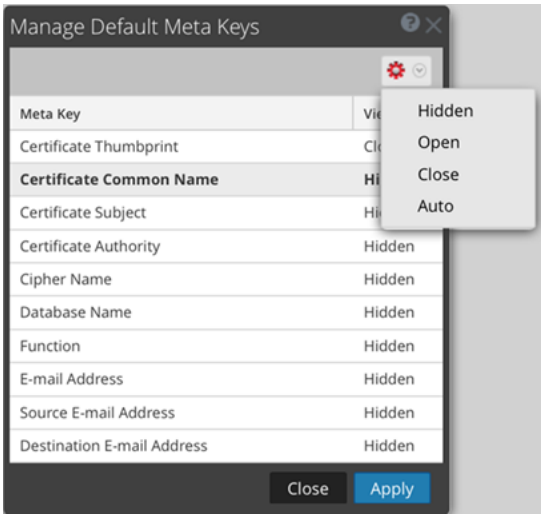
When you change the initial state of default meta keys from within the Navigate view, the change persists for that service. When new keys are added to the custom index file for a Core service (for example, `concentrator-custom-index.xml` or `decoder-custom-index.xml`), the new keys are added to the default meta keys list. The changes made in the Navigate view apply only to the current service.



To specify that the initial Navigate view opens using default meta keys

1. Go to **Investigate** > **Navigate**.
2. Select a service and select **Navigate**.
3. In the **Meta** menu, select **Use Default Meta Keys**.
   If an investigation is already in progress, the data is reloaded in the current view and an icon highlights the selected option. If no data is loaded yet, the default meta keys are used for the next load.

Configure Default Meta Keys



To configure the default view of default meta keys in the Navigate view:

1. In the **Navigate** view toolbar, select **Meta** > **Manage Default Meta Keys**.
   The Manage Default Meta Keys dialog is displayed with the list of available meta keys for the service.

2. (Optional) To change the order of the keys, select one or more keys, and drag the values up or down through the list of keys.
3. Do one of the following:
   - (Optional) To change the default view for all meta keys, make sure that no keys are selected and in the toolbar, select .

- (Optional) To change the default view for one or more keys, select the keys and in the toolbar, select .
  A drop-down menu of possible initial views for all default meta keys is displayed.

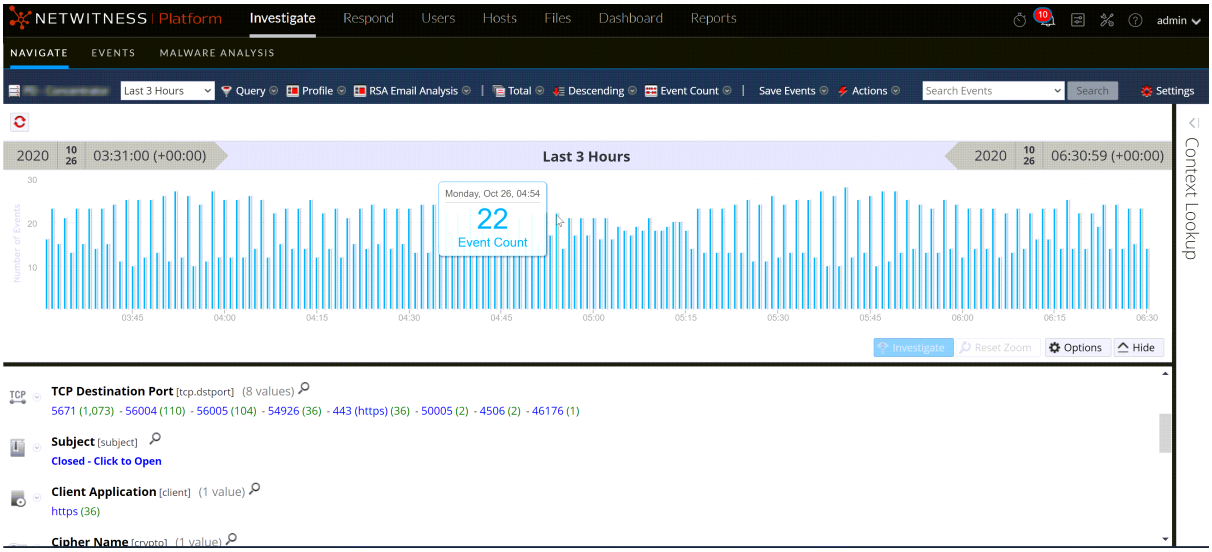
- (Optional) To revert to the default view for meta keys as specified in the service index file, make sure that no keys are selected and in the toolbar, select > **Auto**.
  When you modify the default view for a non-indexed meta key, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.

4. Select one of the views.
5. To save the changes, click **Apply**.
   The meta keys displayed in the Navigate view are set to your specifications. If the default meta keys are hidden, values for the meta keys are not shown in the investigation at all. If the default meta keys are closed, the values for the meta keys are not loaded by default, but you can load individual meta keys manually in the Navigate view.

Drill into Data in the Navigate View Time Chart

The Time Chart visualization allows analysts to visualize activity over time. You can zoom into the data by selecting a time window then selecting the Investigate option. You can then reset the navigation to the time range that was in effect before zooming.

1. Go to **Investigate > Navigate**.
   The Time Chart for the current drill point and selected time range is displayed. You can hover over the time chart to display total number of events occurred at a specific time.



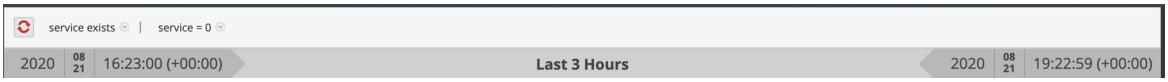
2. To highlight a period of time on the Time Chart, click over the desired time period and drag the mouse.
   The Time Chart is redrawn for the selected time range; however, the meta values are unchanged.
3. To drill into the data for the selected time range, click **Investigate**.
   The URL is updated to reflect the time range override, and the Investigation options panel is updated to reflect the custom time range. The Time Chart is redrawn and the meta values are loaded for the selected time range.
4. To reset the Time Chart to the original time range, click **Reset Zoom**.
   The URL is updated to reflect the original URL prior to zooming into the data, and the Investigation options panel is updated to reflect the time range selected before zoom. The Time Chart is redrawn for the selected time range and the meta values are loaded for that time range.

Drill into Data in the Values Panel

NetWitness displays the activity and values for the selected service in the Investigation > Navigate view. To investigate data, analysts drill into data by clicking on a meta key or a meta value, which is treaty as a query. In the Values panel, each query is added to the breadcrumb data in the Values panel. This results in a breadcrumb at the top with a crumb for each query. You can edit the breadcrumb to insert or remove a query.

To drill into a subset of the metadata

1. Begin an investigation so that metadata is displayed in the Navigate view.



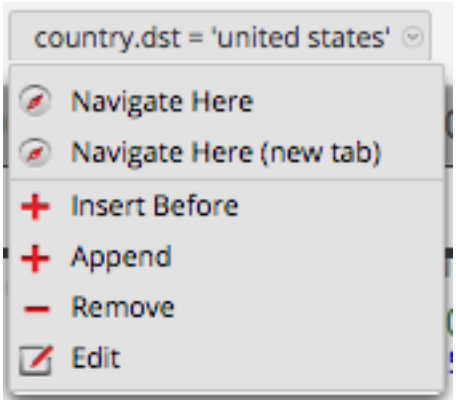
2. To drill down into the metadata, do any combination of the following:

   a. Click a **meta key**, for example, **Service Type**.

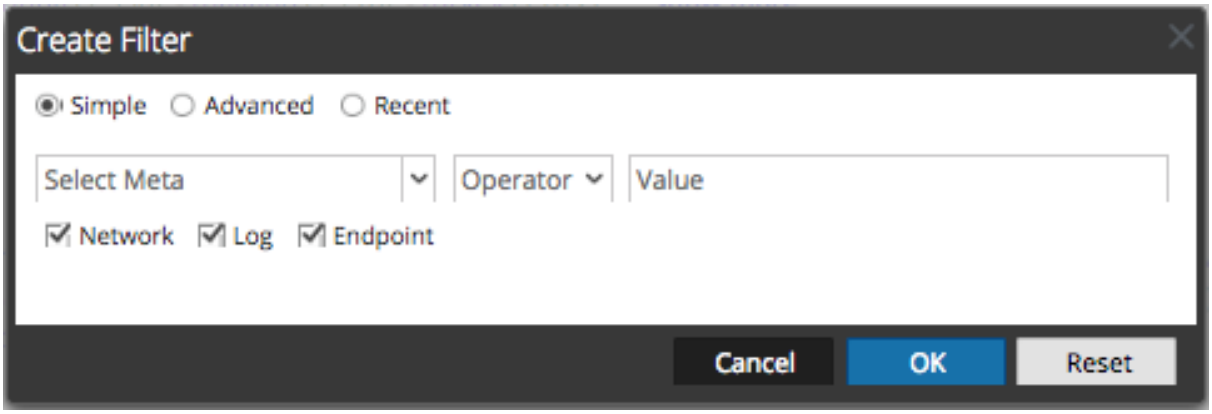
   b. Click a **meta value**, the blue text in the results. For example, **OTHER**.

   Each time you click a meta key or meta value, the investigation query pivots to a narrowed focal point, or drill point, in the data. At each drill point, the Values panel is updated and the new drill point is displayed in the breadcrumb. Below is an example of the first breadcrumb.

   This is an example of a long breadcrumb that does not fit in the toolbar. The last query that fits is followed by a drop-down menu that lists additional queries. To select a drill point within the overflow, click the overflow icon and a query in the drop-down list.



To add a query in the breadcrumb

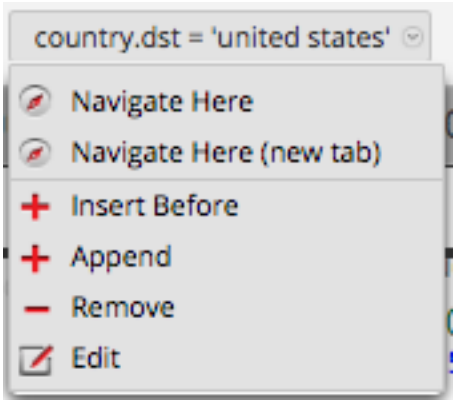


In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To add a query in the breadcrumb:

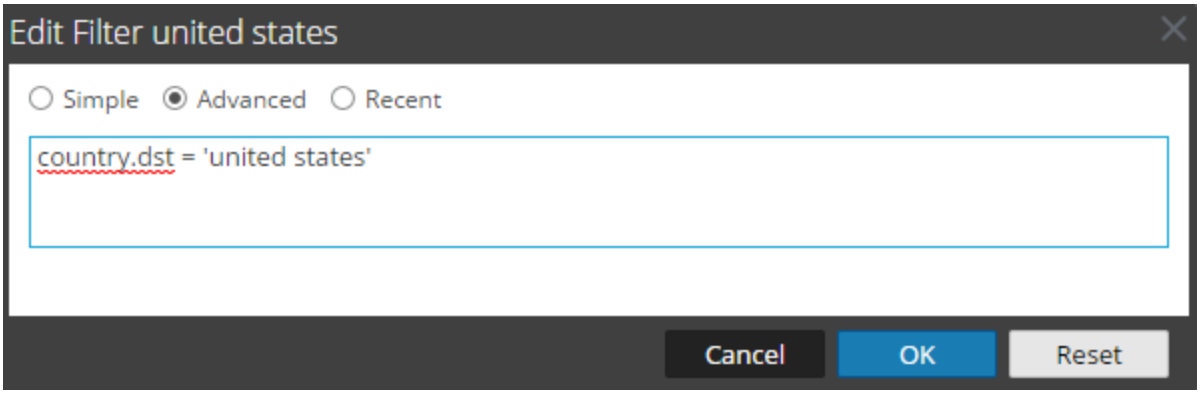
1. Click a crumb.
   The Breadcrumb menu is displayed.

2. To add a query in the breadcrumb, select **Append** or **Insert Before**.
   The Create Filter dialog is displayed.



3. Create the Query as described in Create a Query in the Navigate and Legacy Events Views.

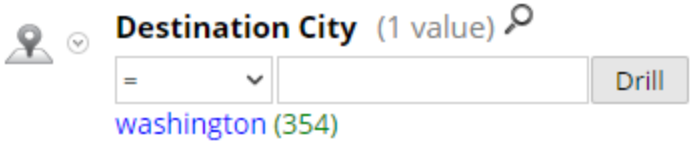
To edit a query in the breadcrumb:



In the breadcrumb, you can click any of the crumbs to display the Query menu. You can delete a crumb and edit a query in a crumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To work with queries in the breadcrumb:

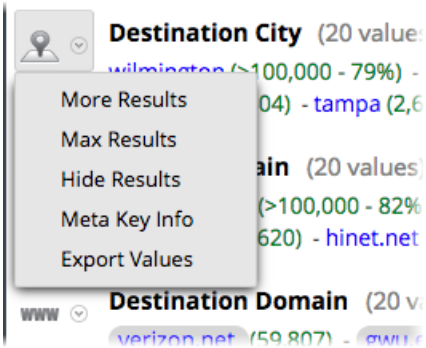
1. Click a crumb.
   The Breadcrumb menu is displayed.



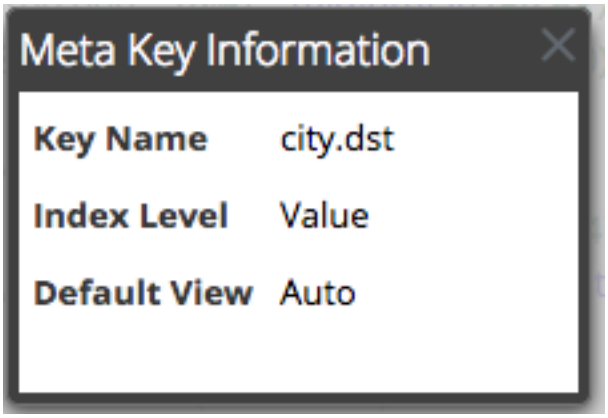
2. To edit a query in the breadcrumb, select **Edit**.
   The Create dialog is displayed with the selected query open for editing.

3. Edit the fields as described in Create a Query in the Navigate and Legacy Events Views.

To quick search within a meta key

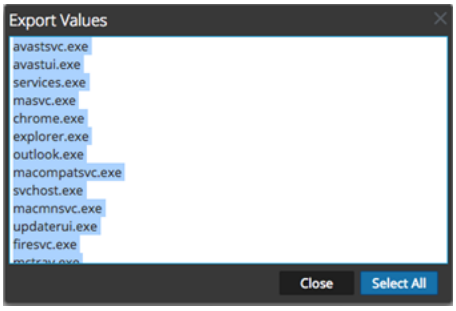


1. Move the mouse over a meta key section and click the magnifying glass.
   The Quick Search form, which contains a comparator and an optional operand for the search, is displayed.

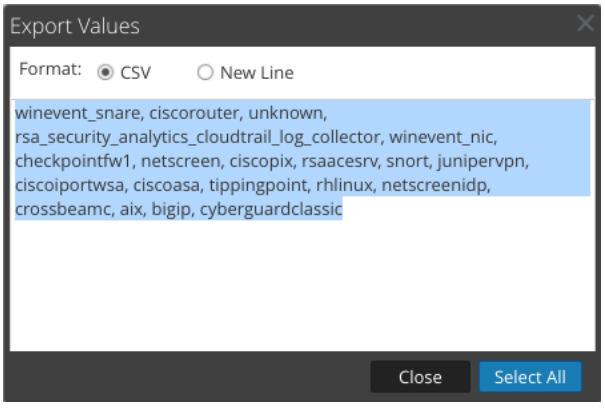


2. (Optional) If you want to close the search form, click the magnifying glass again.
3. Select the operation from the drop-down list on the left and type the text value to search for. Then click **Drill** to perform the execution.
   The metadata for that meta key is used to drill down in the current metadata.

To view meta key information and copy meta values for a meta key



1. To view the key name, index level set for displaying the meta key, and the default view set for the meta key, click the drop-down menu next to the meta key. This figure shows the drop-down menu for Version 11.1 and later.



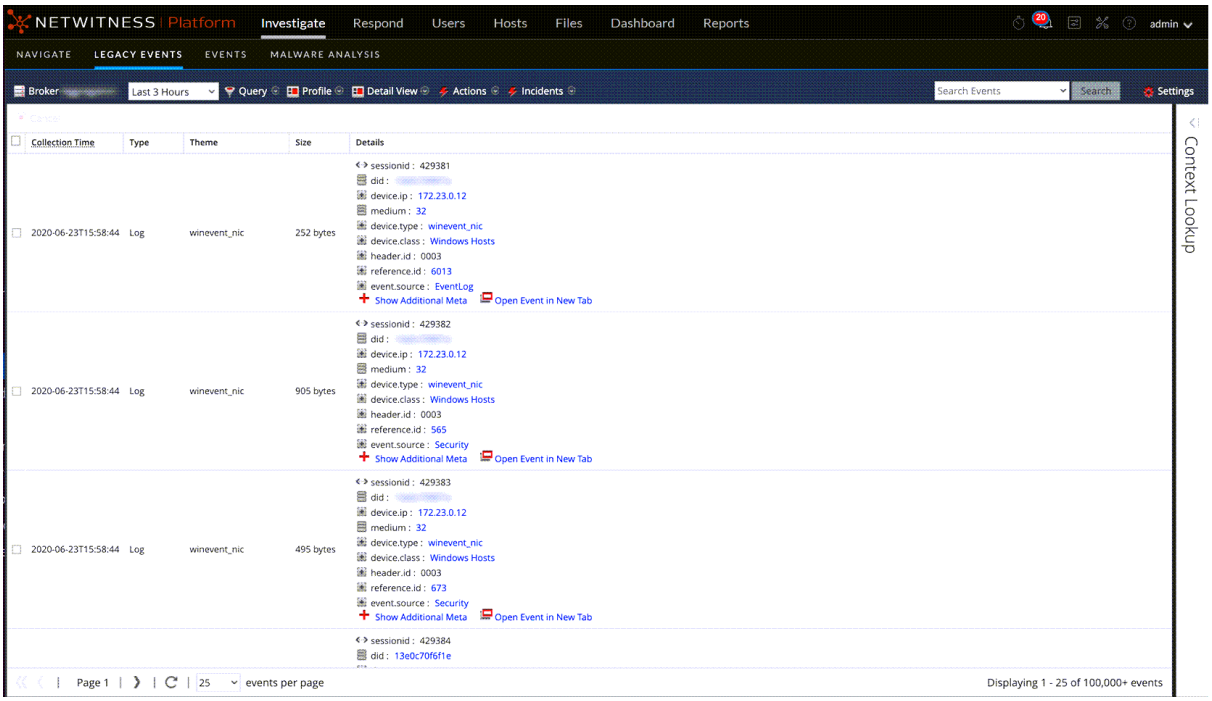
2. Select **Meta Key Info**.
   The Meta Key Info dialog is displayed.

3. When finished viewing, click ☒.
4. (Optional for Version 11.1 and later) To view meta values found for a meta key in a simple list that you can copy, click the drop-down menu next to the meta key.
   The Export Values dialog is displayed.
   The Version 11.1 dialog displays a list of values with one value per line.

   The Version 11.3 dialog allows you to select the method of separating values: either New Line or CSV.

5. Select the values that you want to copy, and click **Export Values**.
   The values are copied to the local clipboard and you can paste them into a file to save or share them.
6. To close the dialog, click **Close**.

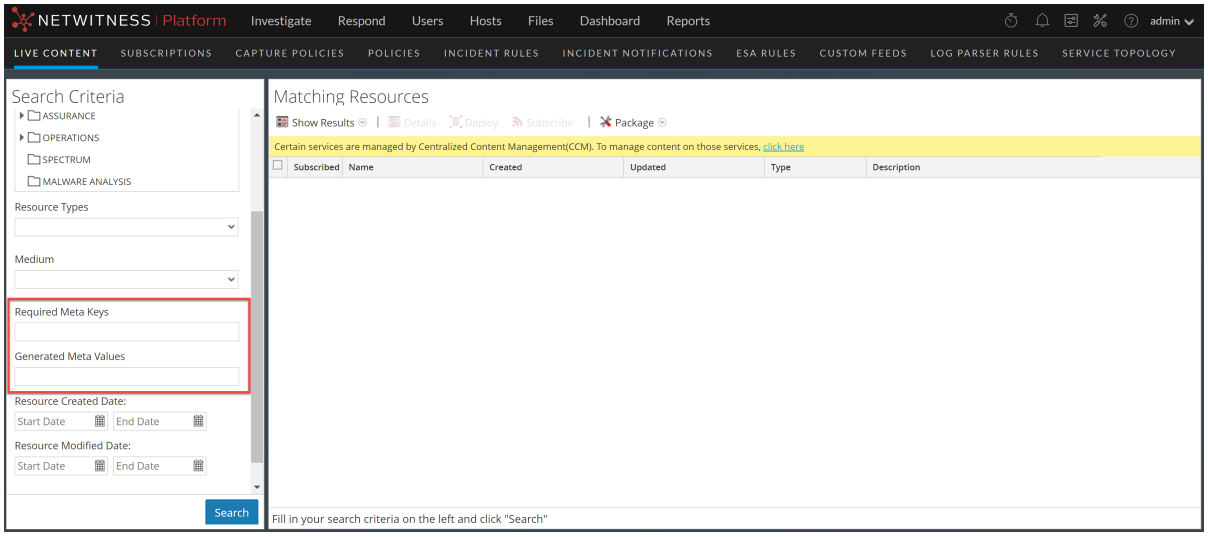
7. (Optional) If you want to hide the results for the meta key in the current drill point, click the drop-down menu next to the meta key and click **Hide Results**.



To display events associated with a meta value

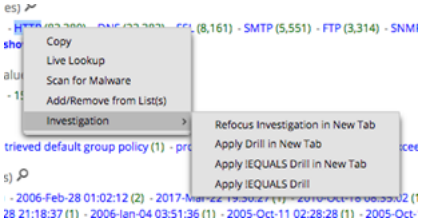
The Legacy Events view provides additional details for an event in two different views: Events List and Detail View.

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Click the count (the number in green) next to a blue meta value.
   The Events view corresponding to the current drill point is displayed.
   The operations that you can perform in the events view are described in Reconstructing and Analyzing Events.



To search for specific events associated with a meta value

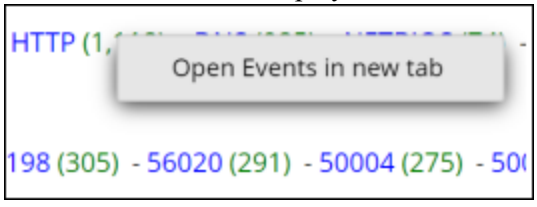
1. In the **Navigate** view, drill into metadata that is the focus of your investigation (click a meta value or add a query).
2. Type a search string in the Search box and press **Enter** or click **Search**.
   You can also select and set search mode preferences. See Search for Text Patterns in the Navigate and Legacy Events Views for detailed search information.
   The Events view opens in a new tab and shows the search results. If you do not see the search term highlighted, click **Show Additional Meta**. Your time range selection and drills (queries) carry forward to the Events view.



To view a selected meta value in RSA Live

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.
3. To look up the meta value in RSA Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Value(s) field, and ready for a search.

To refocus the investigation in a drill point:



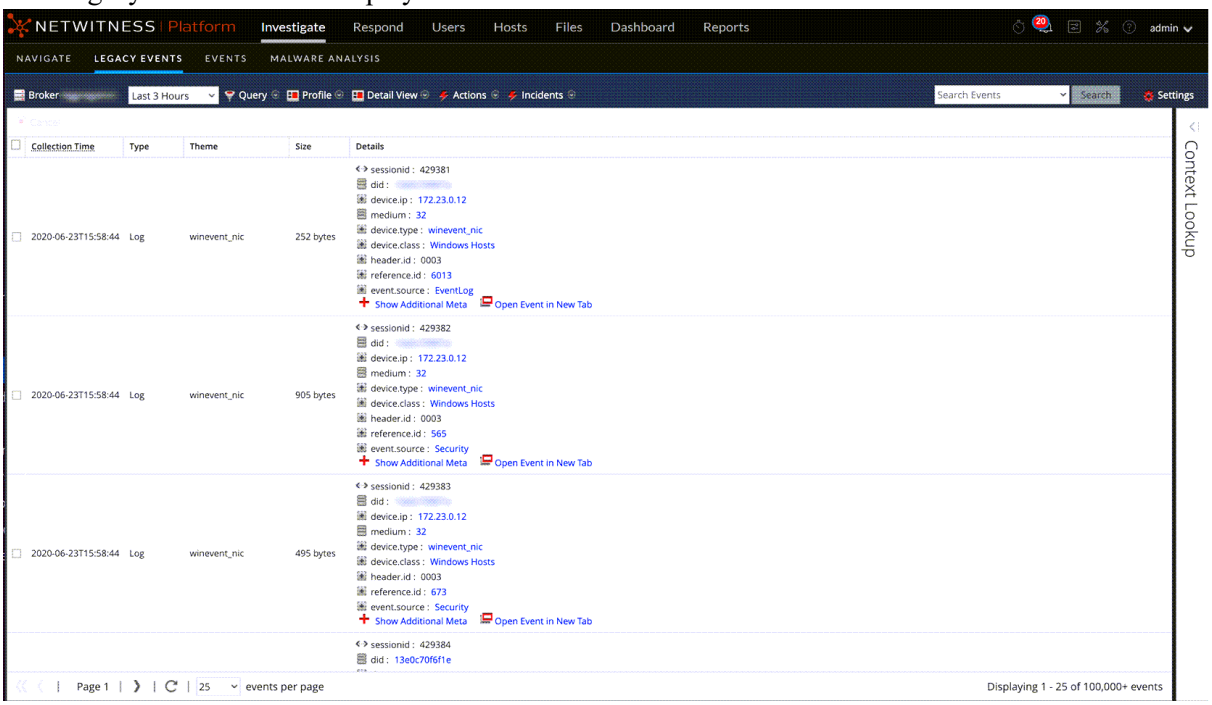
1. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.

2. Choose one of the refocus options.
   The drill is refocused according to your choice.

To look at a specific count in a new tab:

To view a count for a meta value in the Legacy Events view or the Events view, right-click a count for a meta value (the green number following the blue meta value).
The context menu is displayed.

Filter Results in the Legacy Events View



Analysts can filter events in the Legacy Events view by searching for events or selecting the service, setting the time range, and querying the metadata. If you opened the Legacy Events view from a Navigate view drill point, the view opens to the Detail view of events by default. Analysts who do not have permissions to use the Navigate view can query services directly from the Legacy Events view.

Note: When an Archiver is the currently selected service in the Legacy Events view and you are searching against a Broker or Concentrator, the search is slower than if searching against a Broker or Concentrator because the data on the Archiver is compressed and there is typically more data.

Filter Events Displayed in the Legacy Events View

To filter the data displayed in the Legacy Events view:

1. Go to **Investigate** > **Legacy Events**.
   The Legacy Events view is displayed.

2. To select a time range other than the default (**Last 3 Hours**), in the toolbar, click the time range field and select a value. For example, **Last Hour**.
   The Legacy Events view is refreshed with the selected time range.
3. Create a query as described in Create a Query in the Navigate and Legacy Events Views.
   The matching results for the query are displayed in the Detail View in the Legacy Events view. The breadcrumb reflects the query. In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, the results are refreshed.

Page Through Events in the Legacy Events View

Pagination controls allow more flexibility in paging through a list of Events in the List View, Logs View, or Details View. You can select the number of events to display per page, and your selection is saved across logins to the NetWitness application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the ❮ and ❮❮ controls are dimmed.

To use pagination controls:

1. With results displayed in the Legacy Events view, click the current number of events per page (**10**, **25**, **50**, **100**, or **200**), and select the new number of events per page from the drop-down menu.
2. To page forward or back, use the page control icons:
   Click ❯ to go to the next page.
   Click ❯❯ to go to the last page.
   Click ❮ to go the previous page.
   Click❮❮ to go to the first page.
3. To go to a specific page, type a page number in the page number field | 3 Page 3 |.

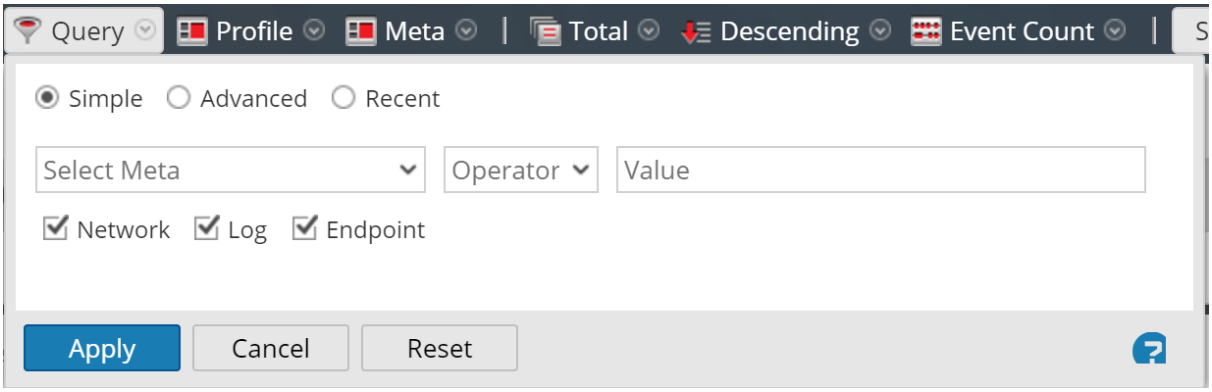
Create a Query in the Navigate and Legacy Events Views

In the Navigate view or the Legacy Events view, you can create a query using dialogs for that offer syntax help with drop-down lists of applicable meta keys or meta entities and operators.

When viewing the drop-down list, you can expand and collapse each meta group to view or hide the individual meta keys in that group. When you select a meta group, NetWitness generates the complex query equal to a query with all of the meta keys in that group ORed together. So if a meta group contains `ip.src` and `ip.dst`, the query generated is `ip.src = <value> OR ip.dst = <value>`. If the meta group contains meta keys that have different meta value types, the value input is disabled and the query uses `exists` statements. For example, a meta group that contains `ip.src`, `ip.dst`, and `alias.host` includes meta keys that have different value types; `ip.src` and `ip.dst` are ip addresses and `alias.host` is text. The generated query is `ip.src exists OR ip.dst exists OR alias.host exists`.

A basic query is in the following form:

```
<metakey> <operator> [<metavalue>]
```



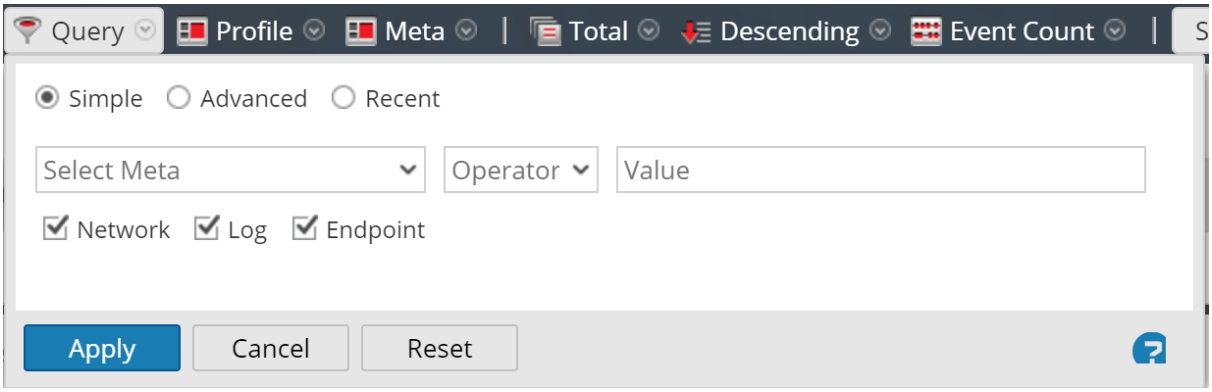
These are a few examples:

```
action exists
action = 'get'
alias.host = '10.25.55.115'
extension = 'exe'
orig_ip != "10.0.0.0" - "10.255.255.255"
```

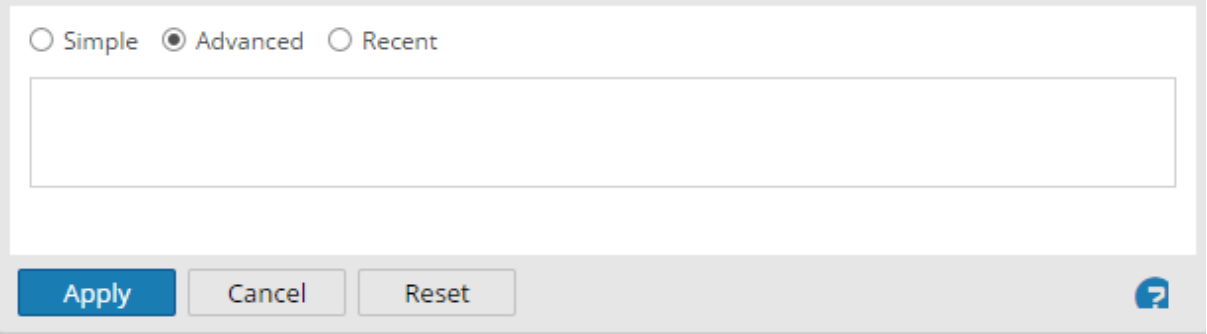
Create a Query Using the Basic Method

When you create a query using the basic method, drop-down lists of meta keys and operators are displayed.

1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

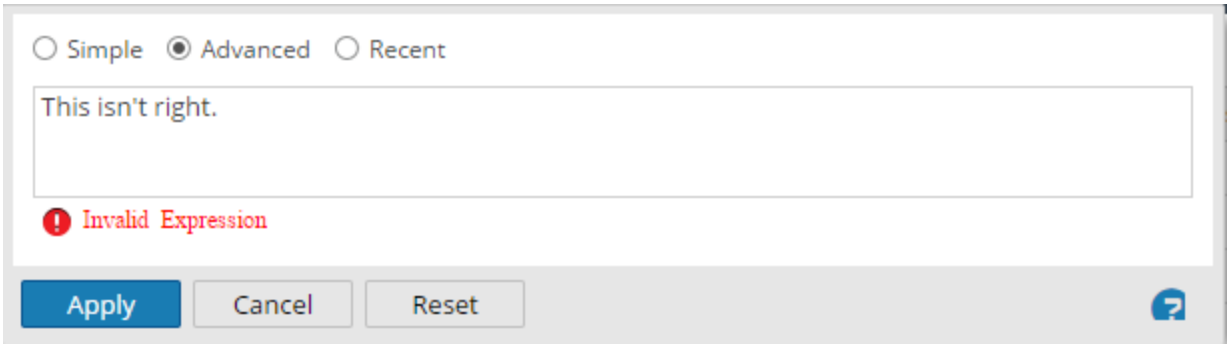


2. In the **Select Meta** field, click to display the drop-down list. The drop-down list has two sections: Meta Groups and All Meta.
3. Select a single meta key under **All Meta** or select a meta group under **Meta Groups**. You can also type in a meta key or meta group in the field.



4. In the **Operator** field, type an operator or click on the drop-down list to select a valid operator.
5. (Optional) If you selected an operator that requires a value, for example, =, in the third field type the value for the meta key.
6. In the Network, Log, and Endpoint checkboxes, choose the type of data to query. Do one of the following:
   a. To limit the query to packets select **Network** and de-select **Log** and **Endpoint**.
   b. To limit the query to logs, select **Log** and de-select **Network** and **Endpoint**.
   c. To limit the query to endpoint events, select **Endpoint** and de-select **Network** and **Log**.
   d. To apply the query to packets, logs, and endpoints, select **Network**, **Log**, and **Endpoint**.
7. Do one of the following:
   a. Click **Apply**.
   The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   b. Click **Cancel**.
   The window is closed and no changes are made to the view or current query.

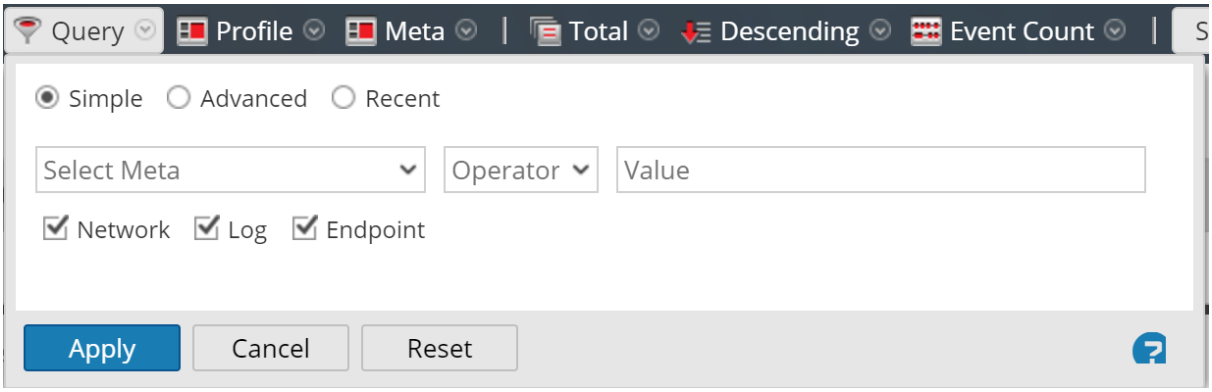
Create a Query Using the Advanced Method



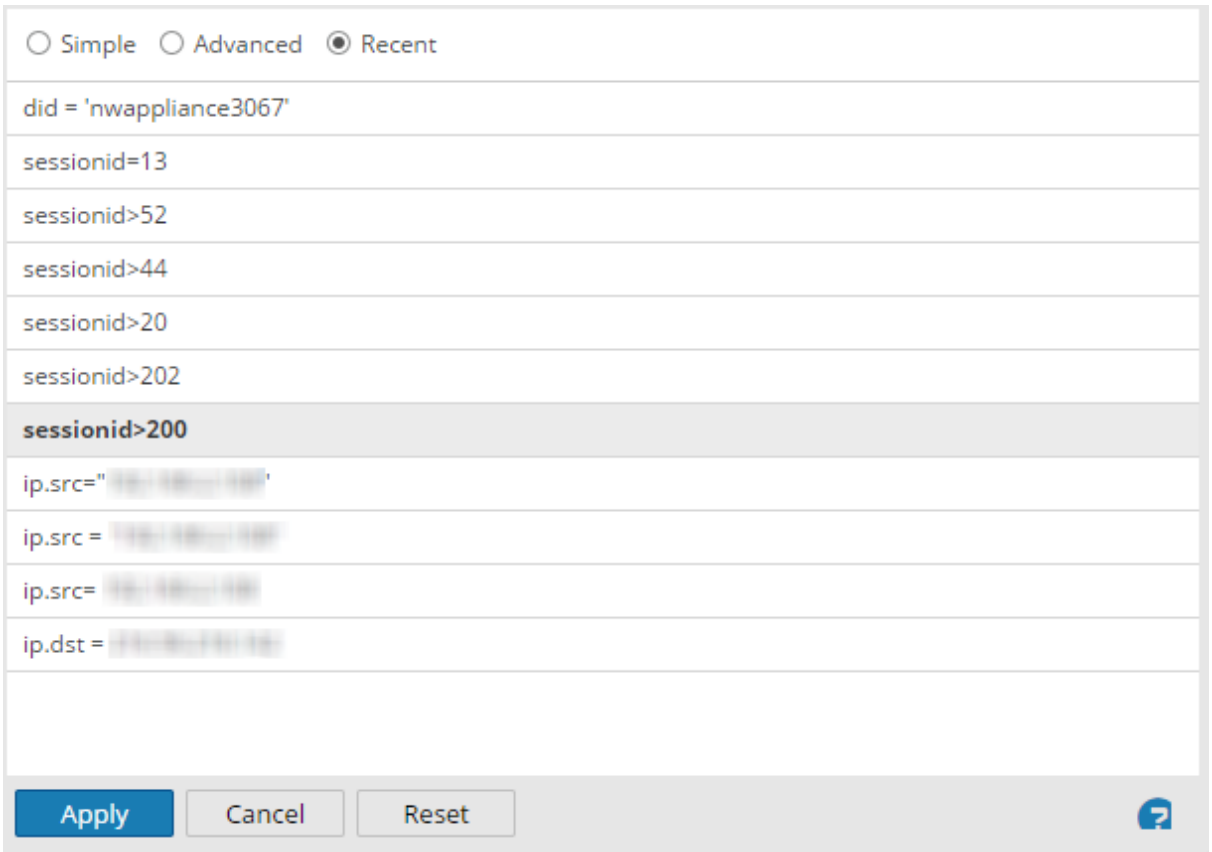
1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed.

2. Select **Advanced**.
   The advanced query field is displayed.

3. In the field, create a query, which can include the meta key, operator, and value. When you begin typing a meta key in the field a drop-down list of available meta keys for the selected service is displayed.
4. Select the meta key for your query.
   The display is updated. If the expression is not yet complete, the status indicates that the query is invalid.
5. Continue with an operator, from the drop-down list, then a value if necessary. The display is updated as you continue to enter the query. If you enter an operator, such as **exists** or **!exists**, which does not use the value field, the value field is disabled and the invalid status is cleared. If you enter an operator, such as =, which requires the value field, the invalid status remains until you enter a value. When the query is valid the invalid status is no longer displayed.



6. Do one of the following:
   - Click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.



Apply a Recent Query

You can view recent queries and select one to apply to the current service being investigated. To select a recent query:

1. In the **Navigate view** or the Events view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

2. Select the **Recent** option.
   The list of recent queries is displayed in the bottom portion of the dialog.

3. In the list of recent queries, click to select a query.
4. Do one of the following:
   - Double-click a query.
   - Select a query and click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

Search for Text Patterns in the Navigate and Legacy Events Views

You can search for text patterns within the current set of events in the Navigate view, the Events view, and the Legacy Events view. This section provides information about searching in the Navigate view and the Legacy Events view.

You can perform a keyword text search or do regex (Regular Expression) matching. In the Navigate view, you can click a meta value, such as HTTP, to drill into the data and then enter a search string in the Search field to search for events within that subset of data. The search opens a tab in the Legacy Events view, brings your drill and time range forward, and shows your search results. You can also drill into the data using queries before starting a search. To execute the search, enter a search string in the Search box, and press **Enter** or click **Search**.

Note: By default search results are only for exact matches found in indexed data. Only meta values shown as blue links in the Events Detail view are indexed. The regex option must be selected if the value contains a space. To broaden the search change the options in the Search Events drop-down menu.

Keyword Text Search

The text search provides these capabilities:

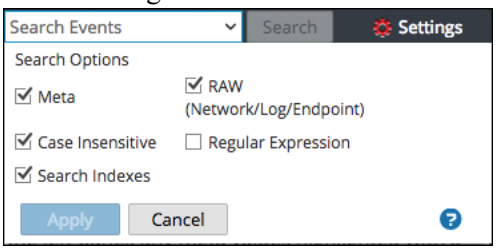
- Each white space delimited word is ANDed, so that every word must be found, but the order or location position in relation to the other words is irrelevant. For example, if you search on `Mark Albert`, both Mark and Albert must be found in the session, but they need not be together or in any specific order.
- The word OR is special. If you search `Mark OR Albert`, either Mark or Albert must be found in the session to match; both are not required.
- You can mix or match implicit ANDs and ORs together in the search string. The explicit OR has higher precedence than the implicit (whitespace) AND. The following examples make the same logical statement, which requires that both the terms cheese and dumplings be present in a match and one of toast or bread:

  ```
  cheese toast OR bread dumplings
  cheese AND (toast OR bread) AND dumplings
  ```

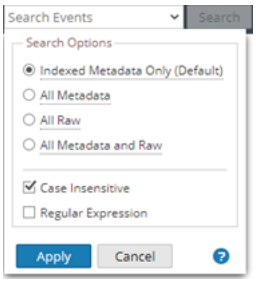
- You can exclude words from search results using the - operator. For example, searching for `cheese -toast` would return any result that has the word cheese, unless the word toast is also present.
- The keyword search can match metadata stored in the following patterns:
  - **IPv4 and IPv6 addresses**. Any term that can be recognized as an IP address is converted to the native metadata format so that it can be found in indexed metadata.
  - **IPv4 CIDR ranges**. You can use CIDR notation to locate IPv4 addresses within a range.

- **Timestamps**. Timestamps are matched against the native time metadata, and any additional time meta fields stored with the Time type.
- **Numbers**. The search function will attempt to automatically identify decimal search terms and match them against numeric meta data fields.

Options Controlling Search Behavior



To access the Search box and search options in the Navigate or Legacy Events view:



1. You can see the Search Events field in the toolbar.

> **Note:** If you cannot see the Search Events field in the toolbar, click  on the right side of the toolbar.

2. Click in the **Search Events** field to view the Search Options drop-down menu. In Version 11.2 and later, the menu options are slightly different. The first figure illustrates the menu for 11.1 and below; the second figure illustrates the menu for Version 11.2 and above.

The options selected in this box change how the search is executed. The default search mode is to search indexed metadata and raw data only.

> **Note:** Because the Index or Indexed Metadata Only (default) checkbox is selected by default, the search returns results based on data that is indexed. If you want to search for a complete set of metadata or raw data, select those checkboxes and clear the Index or Indexed Metadata Only (default) checkbox. This type of search takes longer, but it contains a more complete set of data.

The following table describes the Investigation search options.

Feature	Description
Indexed Metadata Only (default) checkbox (Version 11.2 and later) **Index** radio button (Version 11.1)	This search only returns results on indexed data. Searching the index is the fastest way to locate keywords within a large data set. The index search uses any relevant indexes present within your data collection. **Caution:** Substring matches are not located by index searches. If you require substring matches, clear this checkbox and use a non-index search mode.
All Metadata radio button (Version 11.2) **Meta** checkbox (Version 11.1)	Searches the metadata. Your keyword or regex pattern is matched against any parsed metadata.
All Raw radio button (Version 11.2 and later) **RAW** (Network/Log/Endpoint) checkbox (Version 11.1)	Searches the network, log, and endpoint event text. Every event is decoded and content is searched for matches on the keyword or regex pattern. If you select all data with no filters on an Archiver, execution time may be excessive and a warning may be displayed. **Caution:** Searching raw network sessions causes sessions to be decoded, which is very time intensive. You may want to disable raw searches when looking at network-only collections.
All Metadata and Raw radio button (Version 11.2)	Searches the metadata and the log or event text. This option is a combination of two options in Version 11.1: Meta and RAW (Network/Log/Endpoint), which you could select together. In Version 11.2, you can select only one radio button.
Case Insensitive	Ignores case when searching.
Regular Expression	Searches using a Perl regular expression, rather than text. By default executes a text search. To execute a regular expression search, select the Regular Expression option. **Caution:** - Regular expression searches can be very slow. - When combining regular expressions and index search options, the regular expression pattern is matched against unique index values instead of meta values. This produces results faster, but it is not an exhaustive search of all the metadata or raw data.
Apply	Sets the default search options to apply to a search in the Navigate and Legacy Events views. This also updates your Investigation preferences in your Profile (Profile > Preferences > Investigation tab). The preferences are saved and effective immediately. You can select search options to use for a particular search without changing your default search preferences.

Regular Expression Search Syntax

A regular expression search uses Perl regular expression syntax, which is documented in detail in http://perldoc.perl.org/perlre.html.

Raw Text Keyword Search

The Log Decoder has the capability to create a raw text index for unparsed log events. This functionality creates metadata items that form a full-text index on downstream services such as Concentrators and Archivers. When you enable the Search Indexes option in your search preferences, your search automatically uses the text index. Note that the text index produces meta items that have a coarse granularity. For example, the default text indexer configuration truncates text terms. By comparing the index matches against raw data, the search engine will find accurate results for your search. However, you can improve search times by disabling the raw search checkbox. If you do so, results will be returned faster, but you may see false positive hits in your search results.

Search Procedures

Search in the Navigate View

To search within the currently displayed data in the Navigate view:

1. Type a search string in the Search field and press **Enter** or click **Search**.
2. To clear the search box and return to the previous Navigate view with results unfiltered by the search, click the **X** in the search box.

Search in the Legacy Events View

To search within the currently displayed data in the Legacy Events view:

1. Type a search string in the Search box, and press **Enter** or click **Search**.
   The search results are displayed. Events that match the search criteria are displayed in the events list. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column.
2. If you want to narrow the search, change the query and time.
3. If you want to stop the search and return to the Legacy Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click **X** in the search box.

View and Modify Queries Using URL Integration

NetWitness Investigate includes an External URL Integration that facilitates integration with third-party products by allowing a search against the NetWitness architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigate view. This integration provides an internal presentation of the user's query.

URL Integration allows the user to identify the service either by the host id or by the service and port, as defined in NetWitness. If NetWitness is unable to resolve the service, the analyst is redirected to the Navigate view, showing the Service selection dialog. Once the service is selected, the Navigate view is loaded with the drill point, defined by the query.

Service Id Known

When the ID of the service to use for an investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<deviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- `<deviceId>` is the internal Service ID in the NetWitness instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the URL when accessing the Investigate view within NetWitness. This value changes based on the service being connected to for analysis.
- `<encoded query>` is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- `<start date>` and `<end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Host and Port Known

When the host and port of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<device host:port>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- <sa host: port> is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- <device host:port> is the host and port of a service defined in the NetWitness instance for the service to query against. NetWitness attempts to resolve the host and port as a service ID defined in NetWitness.
- <encoded query> is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- <start date> and <end date> define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm:ss>Z. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/concentrator:50105/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the deviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: `alias.host exists`
- `https://192.168.1.10/investigation/2/navigate/query/alias%2Ehost%20exists/date/2013-03-12T05:00:00Z/2013-03-12T06:00:00Z`

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: `service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)`
- Encoded Pivot Dissected:
  - `service=80 => service&3D80`
  - `ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `https://192.168.1.10/investigation/2/navigate/query/service%3D80%20%26%26%20%28ip%2Esrc%3D10%2E10%2E10%2E3%20%7C%7C%20ip%2Edst%3D10%2E10%2E10%2E3%29/date/2013-03-12T17:00:00Z/2013-03-12T17:10:00Z`

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

Create a Future Alert from Events View

From NetWitness Platform 12.3 or later, Administrators can create an alert rule from the **Investigate** > **Events** page for any suspicious activity. You can create rules with a flexible query that covers a wide set of events and system information from your network, including suspected breach activities and misconfigured servers. Once the rule is applied to a matched policy with services (Decoders), it generates alerts whenever a match occurs and helps analysts with further investigation.

Workflow

As you identify specific activities (user's accounts, IP addresses, and domains, etc) that indicate a threat, you can create an application rule for the specified meta value that can alert you when the behavior is detected. Once the alert rule is created, the rule will be applied to matching policies with services (Decoders) managed by CCM. The rule begins to monitor the incoming data stream for any new matches in real-time. If any condition is matched for the specified meta value, an alert is generated on the **Respond** page, and you can drill down into each alert to view specific policy violations and take necessary action.

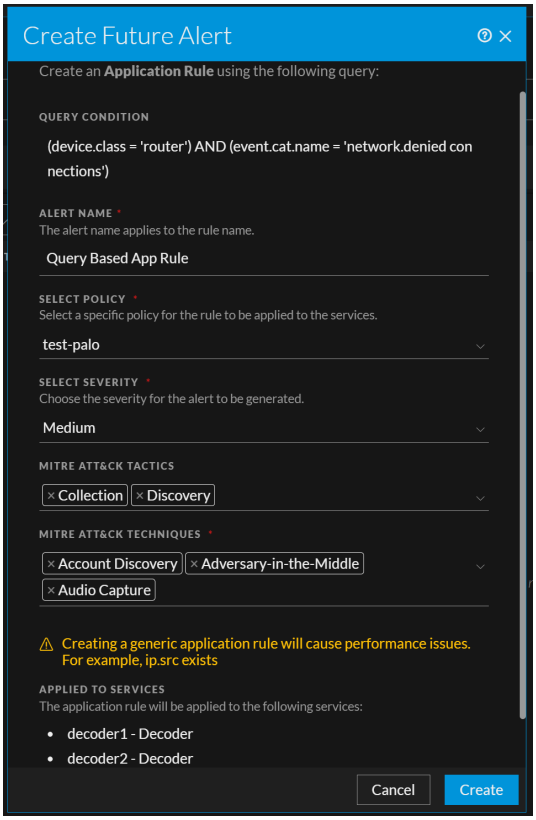
IMPORTANT: The **Create Alert** option will be enabled for users only if the Decoder services are managed by Policy-based Centralized Content Management and the user has the **investigate-server.alert.manage** permission enabled.

Prerequisites

- A query must be added before creating an alert rule.
- By default, only administrators are allowed to create alert rules. To enable access for analysts, they must contact their administrators.

Note: An administrator must enable **investigate-server.alert.manage** permission and **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the application rules.
For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Note:
- You cannot create an alert rule with a free-format query or text query.
- You cannot create an alert rule using invalid queries.
- To ensure your rules raise alerts efficiently and do not overload your Alerts list on the Respond page or cause system performance issues, NetWitness recommends you not to create a generic application rule. For example, **ip.src exists**



To create an Alert rule

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value. For example, (***device.class = 'router') AND (event.cat.name = 'network.denied connections'***)

Note: If the rule's query condition is not defined in the search bar, the **Create Alert** option will be disabled.

4. Click  > **Create Future Alert**.

   The **Create Future Alert** dialog is displayed.

5. Specify a descriptive Name to identify the alert or leave the default name that is automatically populated using the format **Query Based App Rule**.

   It is helpful in finding a rule created by analysts among many rules.

Note: The same name is applied to the application rule, and the rule name must be unique.

6. Select a specific policy for the application rule from the drop-down list.

IMPORTANT: If the policy has no associated groups, services, or services not managed by CCM, then no policy will be available. In such cases, you must contact your administrators.

Note:
- The rule that generates this alert is added to a list of existing rules available in the Content Policies library.
- The application rule will be applied to the services that match the policy criteria and will be shown on the UI. This information helps you to identify for how many services the application rule is applied.

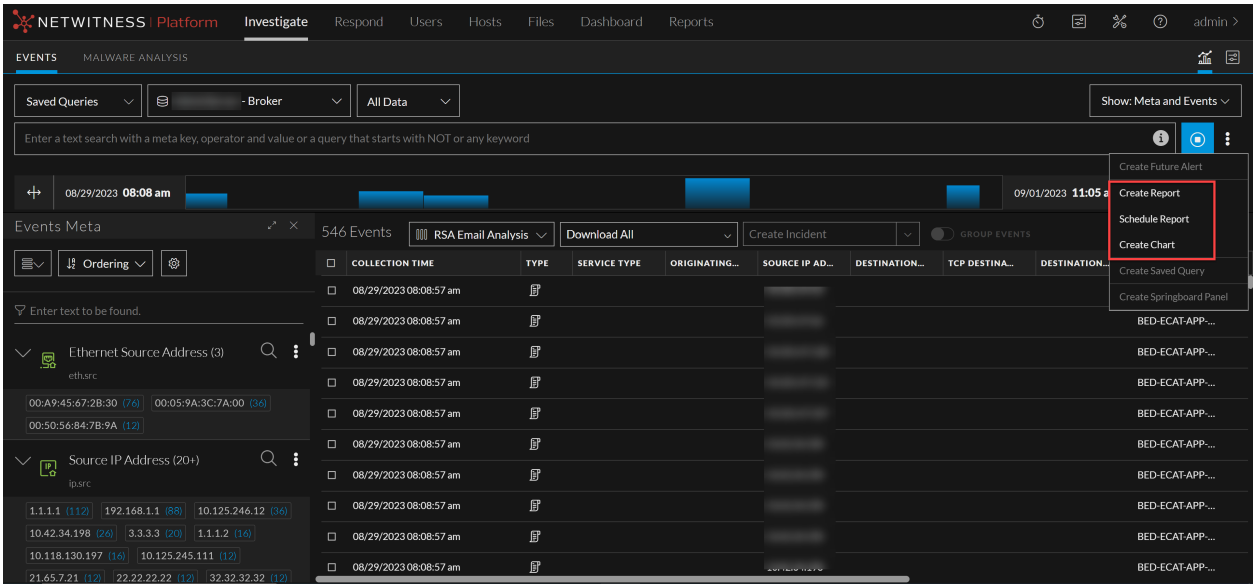
7. Select the severity for the alert to be generated from the drop-down menu. The options are listed below:
   - Low
   - Medium
   - High
   - Critical

   Note: Severity is selected by default as Low.
8. Select the tactics from the **MITRE ATT&CK Tactics** drop-down list. After selecting the tactics, you will be presented with the option to choose the appropriate techniques.
9. Select the techniques from the **MITRE ATT&CK Techniques** drop-down list.
10. Click **Create**.

    The message is displayed that the rule is created successfully.
11. From the success message, you can click the hyperlink "**click here**" to navigate to the policies page where the rule is applied.

    Note: If you want to modify the same rule properties. Contact your administrators.

Generate Reports from Events View



From NetWitness Platform 12.3 or later, administrators and analysts can directly create or schedule the reports from the **Investigate** > **Events** view. Administrators and analysts can create a simple or complex report and configure its execution properties by scheduling a report. Administrators and analysts can generate a report to capture details related to past, current, or predicted resource needs and schedule different time ranges to execute the same report. For example, depending on your requirement, you can schedule a report to run hourly, daily, weekly, or monthly. Additionally, administrators and analysts can configure charts for reports. Using this feature, administrators and analysts can create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key** options.

For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities, etc.

The reports can be used for multiple purposes, such as:

- Checking and assessing network security status.
- Identifying network security issues, threats, and vulnerabilities.
- Monitoring security incidents and malware activity.

Note:
• If the administrator has not configured the time zone, the reports follow the UTC time zone by default.
• If the administrator configures the time zone under the User Preferences panel, the report follows the administrator's configured time zone. For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
• By default, only administrators can create or schedule reports. Administrator must enable the appropriate permission for analysts to generate reports during the data source configuration. For more information, see Configure Data Source Permissions in the *NetWitness Reporting Configuration Guide*.
• A generated output report can contain up to 100 results in tabular format.
• Create and Schedule reports are available only for the users who have created them. Administrators can also give appropriate permissions to other roles to view the report under **Reports** > **Manage** > **Reports** > select the folder >  > **Permissions** > select the role > **Save**.
For more information, see Reports Permissions Dialog in the *NetWitness Reporting User Guide*.

For more information, see the following topics:

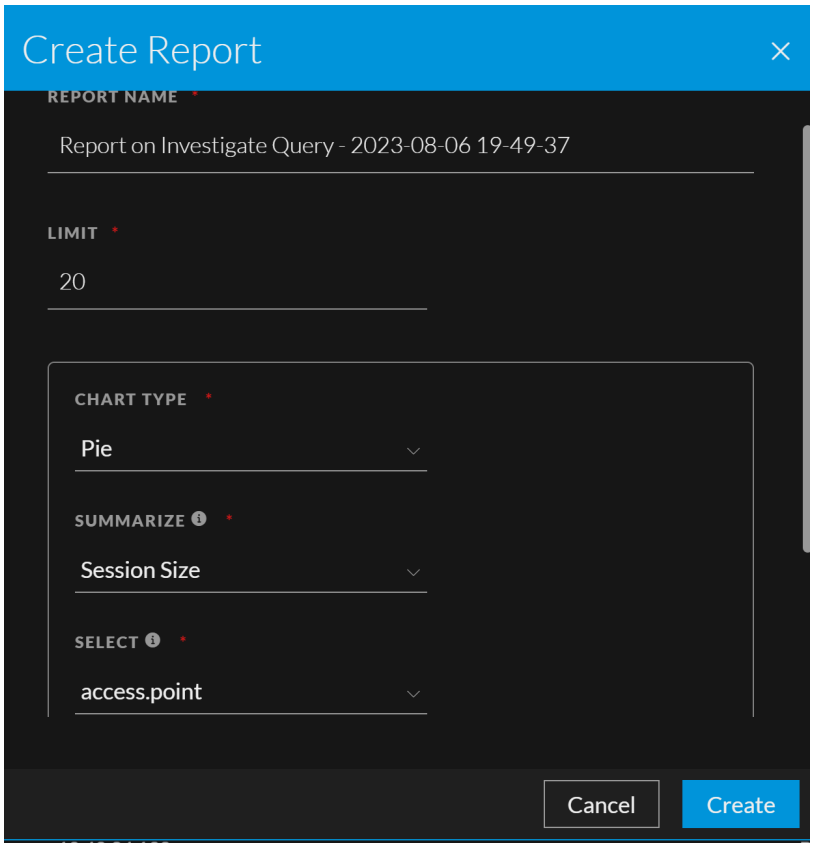
- Create a Report.
- Schedule a Report.
- Create a Chart

If you encounter any problems while generating the reports, see **Investigate Events Reporting Issues** section under Troubleshooting NetWitness Investigate.

Create a Report

The Create Report dialog enables you to create a report instantly. Administrators and analysts must select a data source, time range, and a query on the filter to create a report. Additionally, administrators and analysts can configure charts for reports. Using this feature, administrators and analysts can create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**.

Note: For Instant report generation, you can select the time range required from the **Time Range** drop-down list next to **Service** selection. For example, Last 30 Minutes.



To create a Report

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.

   Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click  > **Create Report**.

   The **Create Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Investigate Query - 2023-02-25 10-16-09**.

   Note:
   • You can customize the report name as per the requirement, and the name must be unique to create a report.
   • The report name must not have special characters such as / \ : * ? ” < > |.

6. In the **Limit** field, by default, the number of records is **20**. Specify the number of records to be generated that range from 1 to 100.
7. In the **Chart Type** section, do the following:
   a. Select the type of chart to be rendered and visualize your data. The options are listed below:
      - Tabular(Default)
      - Pie
      - Area
      - Bar
      - Bubble
      - Column
      - Line
      - Step line
      - Step Area
      - Spline Area
      - Spine

      Note:
      - Based on the chart type selection, **Summarize** and **Meta Key** options are enabled.
      - For the **Tabular** option, **Summarize** and **Meta Key** options will not be enabled.

   b. Summarize : Select one of these in-built aggregate meta options (Events, Sessions, or Packets) to obtain the desired summarized meta values.
      - **Event Count**: The total number of events that have occurred at a specific time.
      - **Session Size**: The total size of the events recorded by services at a certain time.
      - **Packet Count**: The total number of packets that have been transmitted or received.

   c. Meta Key: Select the meta value from the drop-down menu.

      Note: You can select only one meta value at a time.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

8. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

9. Click **Create**.

   The success message is displayed on the screen.

Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

10. To view the report, do one of the following:

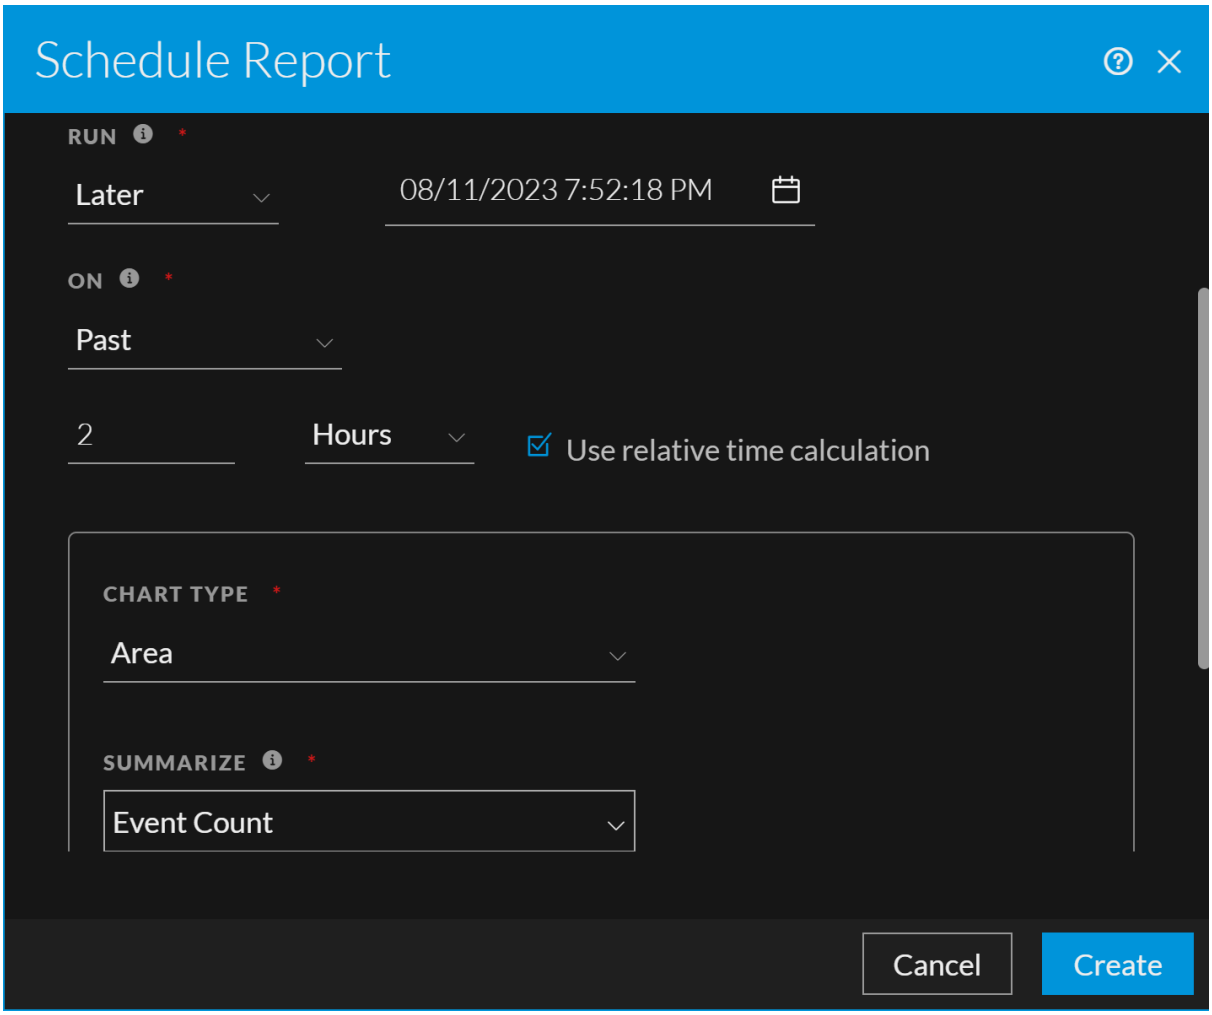
    - On the success message banner, click the hyperlink **click here** to directly open the report in the reports tab.
    - Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Schedule a Report

The Schedule Report dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, administrators and analysts must configure the scheduling options on the Schedule Report Dialog. Additionally, administrators and analysts can configure charts for reports. Using this feature, administrators and analysts can create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**.

Note: The report will only include data from the selected time interval. You can change the interval starting with the next recurrence.



To create a Schedule Report

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.

   Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click  > **Schedule Report**.

   The **Schedule Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Investigate Query - 2023-04-25 10-18-26**.

Note:
• You can customize the report name as per the requirement, and the name must be unique to schedule a report.
• The scheduling time will be displayed based on the user's time zone selected from admin User Preferences.
For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
• The name must not have special characters such as / \ : * ? " < > |.
• If you schedule a report for a query filter, and the generated report contains a rule that did not return any values. In that case, it indicates that no data for that particular query is available.

6. In the **Limit** field, by default, the number of records is **20**. Specify the number of records to be generated that range from 1 to 100.
7. Specify the following parameters to configure the Schedule.

   Depending on the type of run schedule, select one of the following:

Field	Description
Run	Time interval to use for running the scheduled job: • **Later**: If you select a **Later** run schedule, you must provide a value for the day and time in the respective field provided. • **Hourly**: If you select an **Hourly** run schedule, you must specify the minutes in the **At** Minute field. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: If you select a **Daily** run schedule, you must enter a value in the **At** field. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Weekly**: If you select a **Weekly** run schedule, you must enter a value in the **At** field and select the weekdays. **Note:** The report runs on the day of the week that the schedule begins. For example, if you schedule the report to first run on Monday, the report runs on Monday every week. • **Monthly**: If you select a **Monthly** run schedule, you must provide a value for the day and **At** field. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.

Field	Description

ON	• **Past**: If you select the **Past** option, you can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. For example, if you want to schedule the report to start three days before the current date, do the following actions:
	  • Select **Past** in the **ON** field.
	  • Enter **3** in the field and select **Days** from the drop-down list.
	  This field appears only if you select **Later** in the **Run** field.
	  Note:
	  • This field appears if you select Later, Hourly, Daily, Weekly, and Monthly in the Run field.
	  • For Hourly, the maximum value allowed is 168 (24 hours x 7 days) which is counted as total hours.
	• **Range(specific)**: If you select Range(specific) option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report for a specific date and time range from 02/01/2023 12:00:00 AM to 02/15/2023 12:00:00 AM. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later in the Run field.
	• **Range(generic)**: If you select **Range(generic)** option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report daily for a time range, from 04:00 to 10:00. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.

Field	Description
	Note: While scheduling a report, if you select the **Past** option or **Range(specific)/Range (generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
Use relative time calculation	• By default, the **Use relative time calculation** option is enabled, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today. • You can deselect the option and schedule a report. For example, if you schedule a report to run over the past 3 hours, it will take the past 3 hours, excluding the current time. If the current time is 6:30 P.M., the events occurred from when the report was scheduled or between 3 P.M. and 6 P.M. today.

8. In the **Chart Type** section, do the following:

a. Select the type of chart to be rendered and visualize your data. The options are listed below:

- Tabular(Default)
- Pie
- Area
- Bar
- Bubble
- Column
- Line
- Step line
- Step Area
- Spline Area
- Spine

Note:
- Based on the chart type selection, Summarize and Meta Key options are enabled.
- For the Tabular option, Summarize and Meta Key options will not be enabled.

b. Summarize : Select one of these in-built aggregate meta options (Events, Sessions, or Packets) to obtain the desired summarized meta values.

- **Event Count**: The total number of events that have occurred at a specific time.
- **Session Size**: The total size of the events recorded by services at a certain time.
- **Packet Count**: The total number of packets that have been transmitted or received.

c. Meta Key: Select the meta value from the drop-down menu.

Note: You can select only one meta value at a time.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

9. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

10. Click **Create**.

    The success message is displayed on the screen.

    Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

11. To view the report, do one of the following:

- On the success message banner, click the hyperlink **click here** to navigate to the reports tab and open the generated report.
- Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

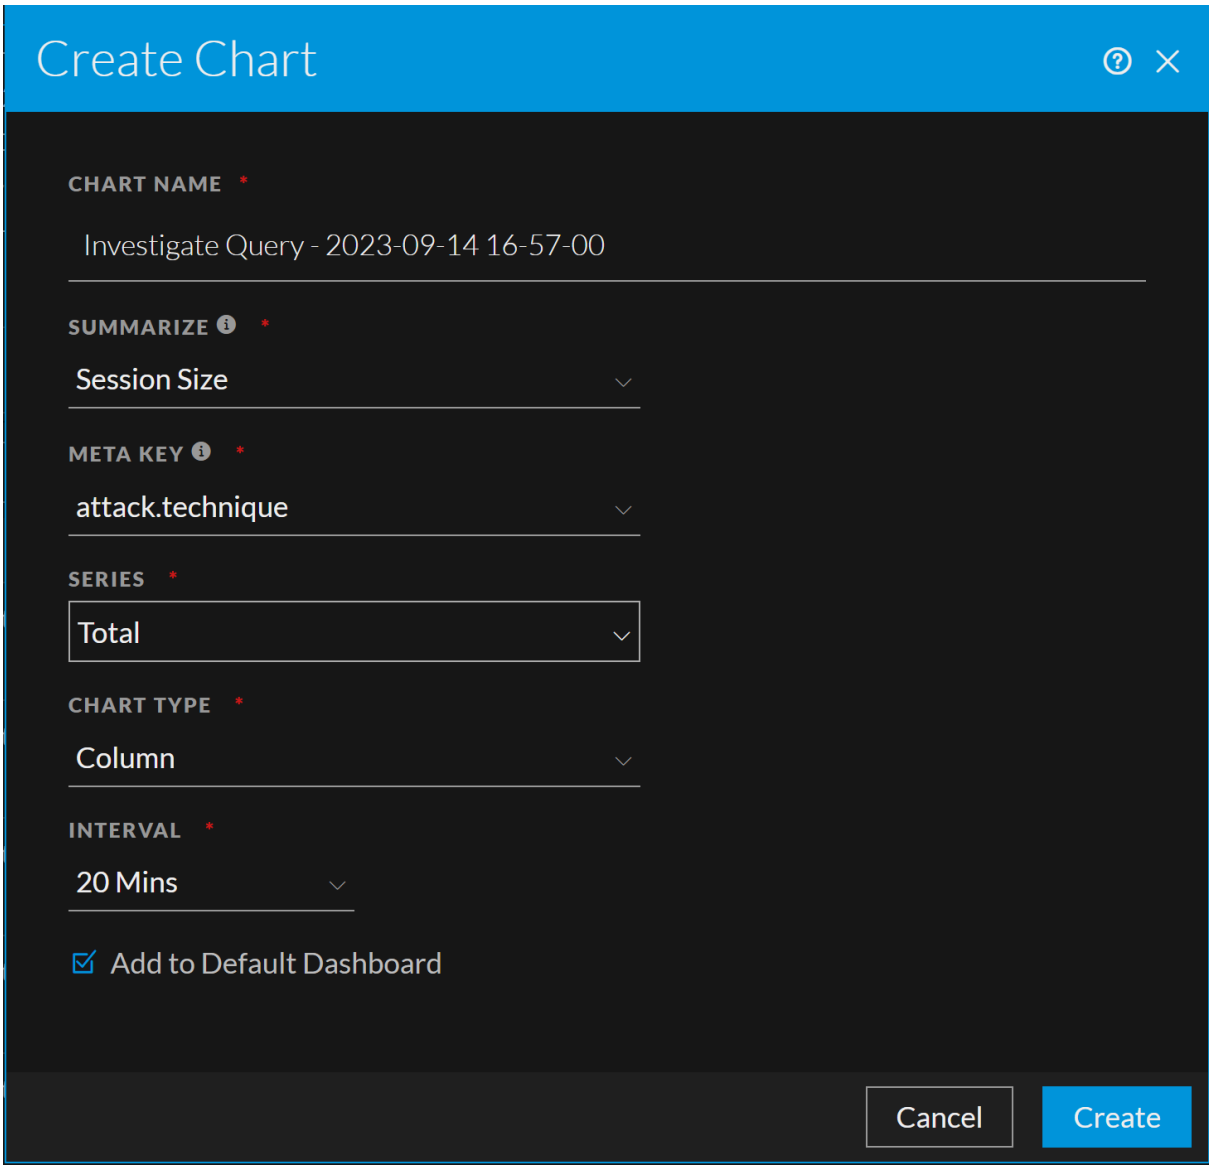
Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Create a Chart

From NetWitness Platform 12.3.1 or later, Administrators and analysts can create charts based on the real-time data from the **Investigate** > **Events** page. This enhancement enables them to create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**. It provides an all-in-one solution for tracking trends for analysts. Additionally, analysts can add these real-time charts to their Default dashboard, allowing them to track critical data seamlessly within the organization.

Prerequisites

By default, only administrators can create charts. Administrator must enable the appropriate permission for analysts to generate charts during the data source configuration. For more information, see Configure Data Source Permissions in the *NetWitness Reporting Configuration Guide*.



Note: If any error found while creating the chart. There could be a server offline issue. In that case, check the **respond-server.log**, **investigate-server.log**, and **sa.log** for more information and resolve the issue.

IMPORTANT: Whenever an administrator shares a copy of the default dashboard with an analyst, the administrator must also provide the following permissions (**rules** and **charts**) for the analyst to view the real-time chart. For more information, see the topics Rules Permissions Dialog and Chart Permissions Dialog.

To Create a Chart from Events View

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Click **Search**.
4. Click  > **Create Chart**.

   The **Create Chart** dialog is displayed.

5. The default chart name with a time stamp will be displayed initially. For example, **Investigate Query - 2023-09-04 03-20-22**.

Note:
• You can customize the report name as per the requirement, and the name must be unique to create a report.
• The report name must not have special characters such as / \ : * ? ” < > |.

6. Select one of these in-built aggregate meta options (Events, Sessions, or Packets) from the **Summarize** drop-down menu to obtain the desired summarized meta values.

- **Event Count**: The total number of events that have occurred at a specific time.
- **Session Size**: The total size of the events recorded by services at a certain time.
- **Packet Count**: The total number of packets that have been transmitted or received.

7. Select the meta value from the **Meta Key** drop-down menu.

   Note: You can select only one meta value at a time.

8. Select the **Series** option for the chart to be displayed from the drop-down menu:

   - **Total**: The chart displays a total for each aggregate value for the selected time.
   - **Value**: The chart displays the change in values for the selected time.

   Note: The option will only be available if you select the **Add to Default Dashboard** checkbox.

IMPORTANT:
- In the reporting chart view, the rendered chart is displayed using the default settings for the chart. This means that the chart will use the default time range (3 hours), Series with default option (chart values over time), items to plot (5), and chart type (line).
- In the default dashboard view, the chart is displayed using the configured values. This means that the chart will use the default time range (Past 24 hours), Series, and Interval options that have been specified for the chart.

9. Select the type of chart to be rendered and visualize your data from the **Chart Type** drop-down menu:

   Note:
   - The option will only be available if you select the **Add to Default Dashboard** checkbox.
   - By default, column type chart is selected.
   - Based on the **Series** options selected, charts will be displayed accordingly.
     - For **Total** option: only **Pie** and **Column** charts are enabled.
     - For **Value** option: **Area**, **Column**, **Line**, **Step Line**, **Step Area**, **Spline Area**, and **Spline** charts are enabled.

10. Select the time range from the **Interval** drop-down menu:

    The available interval ranges from 10 minutes to 180 minutes, with a 10-minute gap between each interval.

    Note: By default, the number of records (Top) displayed on each chart is **15**.

11. (Optional) Select the **Add to Default Dashboard** checkbox to add a chart under the **Dashboard** > **Default Dashboard** view.

    Note: After creating the chart, you can perform additional settings in the default dashboard view.

12. Click **Create**.

    The success message is displayed on the screen.

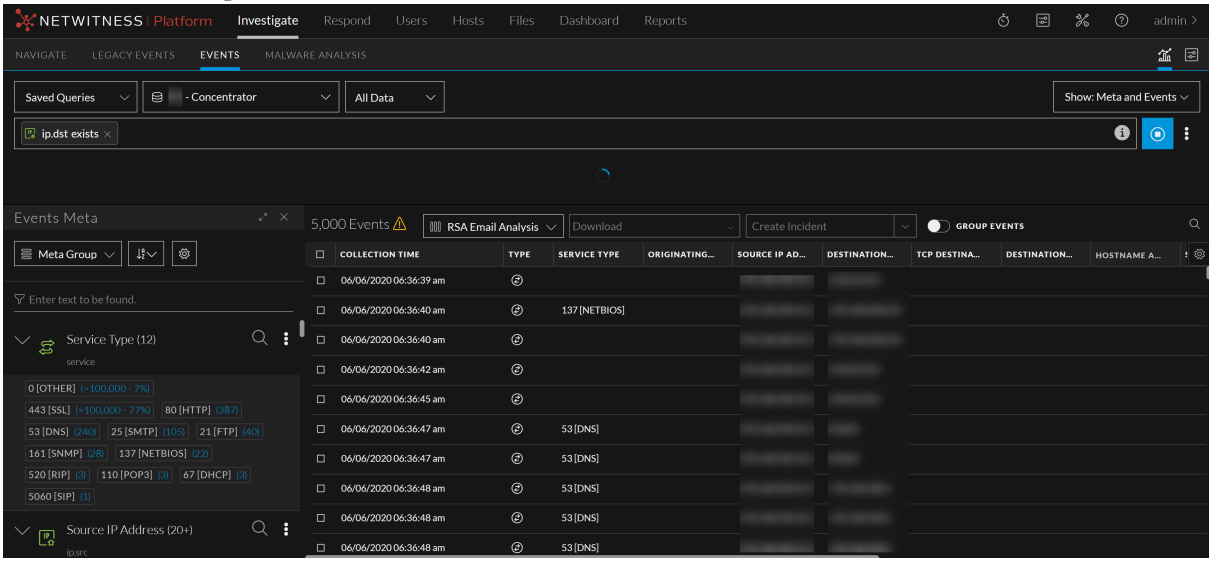
13. To view the report, do one of the following:

    - **For reporting chart view**: Click the hyperlink **View Chart** on the success message displayed. This will navigate to the **Manage** > **Rules** page. Click **Charts** > **Investigate Chart** folder and view the generated chart.
    - **For default dashboard view**: Click the hyperlink **View Chart** on the success message displayed to directly open the chart in the **Dashboard** > **Default Dashboard** page.

Reconstructing and Analyzing Events

Having refined events in the Navigate view or in the Events list as described in Refining the Results Set, your next step is to learn more about the events by reconstructing them, looking at attachments, and viewing additional context in third-party lookups or internal lookups.

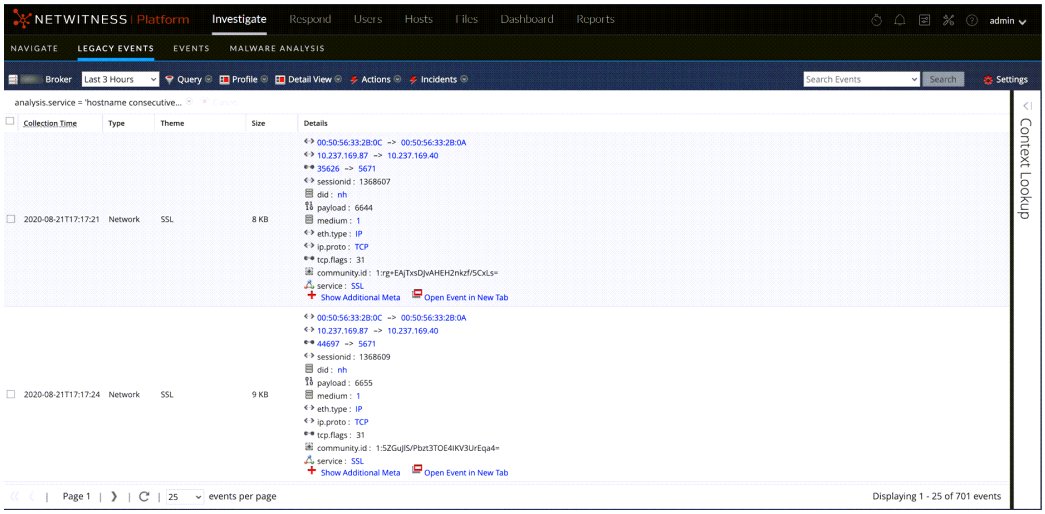
Reconstructions are done in the Events view or the Legacy Events view. If you are starting from the Navigate view, you need to go to the Events view or the Legacy Events view to see a reconstruction.



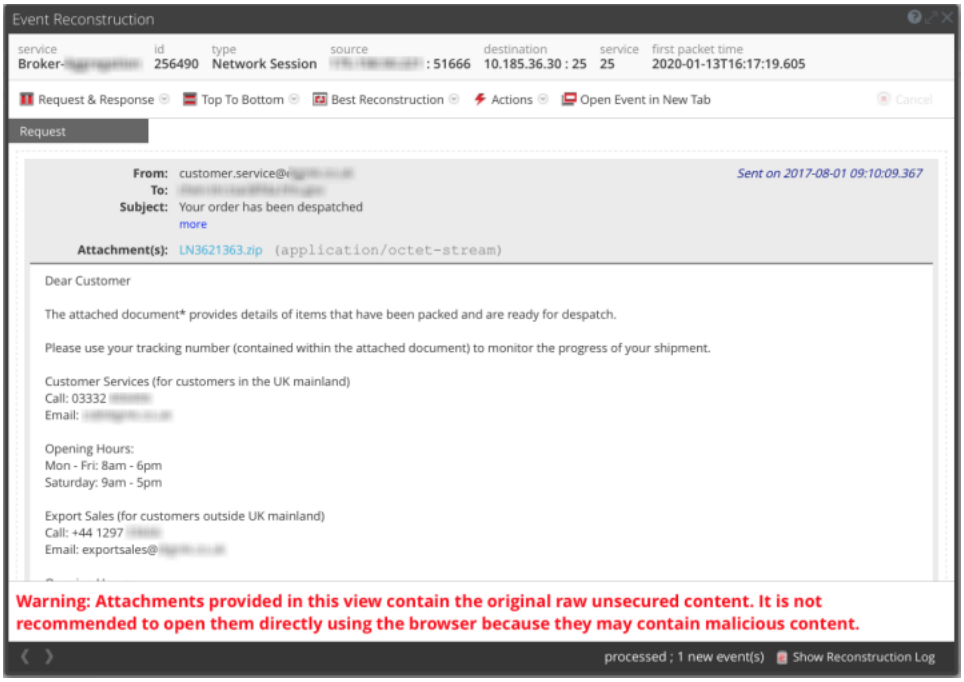
Note: The Legacy Events view is disabled by default. The administrator can enable the view as described in "Configure Investigation Settings" in the *System Configuration Guide*.

To display events in the Events view, do one of the following:

1. Go to **Investigate** > **Events**.
2. Go to **Investigate > Navigate** (Version 11.5 and earlier), right-click the meta count for a meta value (the meta count is in green text). When the context menu is displayed, select **Open Events in new tab**.



The Events view opens with a list of events for the selected meta value.



For detailed information about the types of reconstruction and analysis that you can use in this view, see Examine Event Details in the Events View.

To display an event in the Legacy Events view, do one of the following:

1. To open the Legacy Events view using the default query for the default service, go to **Investigate** > **Legacy Events**.(This option is available only if the administrator has enabled the view.)
2. To view events for a specific meta value in the Legacy Events view, go to **Investigate > Navigate** and when events are loaded in the Values panel, click a meta count (the meta count is in green text). You can also right-click the meta count for a meta value. When the context menu is displayed, click **Open Legacy Events in new tab**.
   The Legacy Events view displays the events for the selected meta value. The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. This figure is an example of the Detail view. You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. You can extract files, export events, export logs, and open the Event Reconstruction panel by double-clicking an event. See Downloading and Acting Upon Results for detailed information about these capabilities.
   NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.

3. To view a reconstruction of the first event in the list, double-click the event.
   The reconstruction opens in a pop-up window in front of the Events list.

Examine Event Details in the Events View

When you find an interesting session in the **Navigate** view or the **Events** view > **Filter Events** panel, you can see the list of sequential events for the session in the **Events** view > **Events** panel. Clicking an event in the list opens the Network Event Details panel for that type of event: Network Event Details, Log Event Details, or Endpoint Event Details. Within the Event Details panel, you can select a tab that shows an event reconstruction (text, packet, file, email, and web) or (Version 11.5 or later) the tab that shows host information for network events that are enriched with endpoint data.

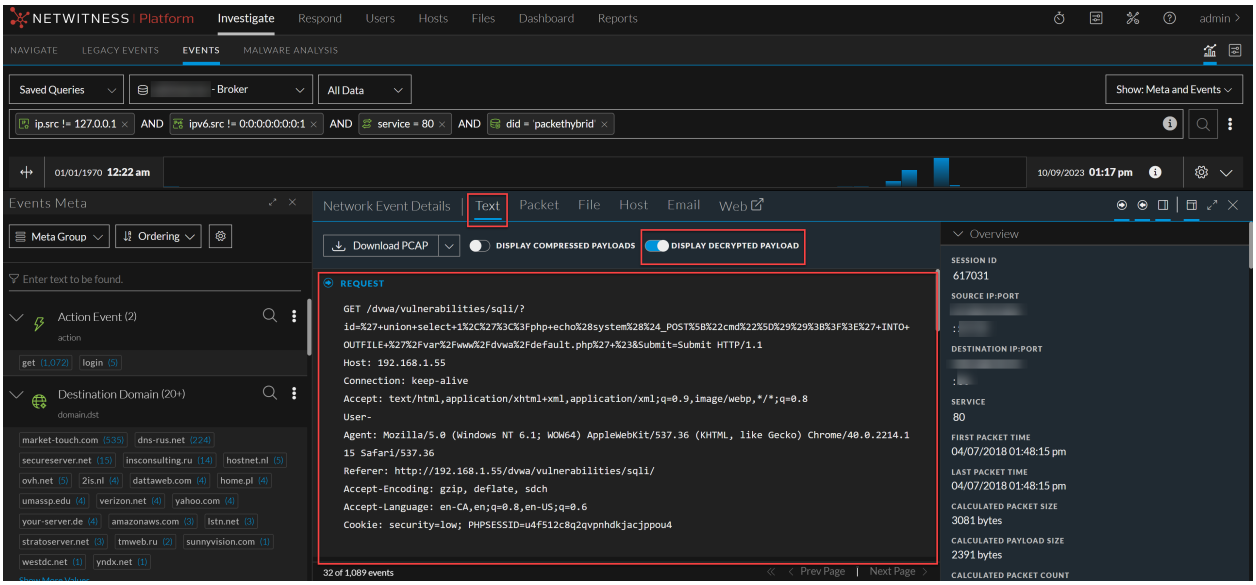
Note: (Version 11.5 or Later) For expanded network visibility of existing network events in your network (packet) deployment. Network events are enriched with endpoint data namely the host and process that triggered the network event and other details such as user name, risk score, reputation, and so on.
You can view endpoint data in the following ways:
- (Quick View) **Investigate** > **Events** - Event Summary Header
- (Detailed View) **Investigate** > **Events** > **Host**

For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

Note: For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

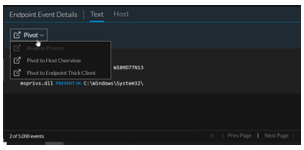
Event Details for Each Event Type

Within the Event Details panel, different tabs are available per event type as shown in the following table. Procedures for working in the Event Details panel are provided in Analyze Events in the Events View.



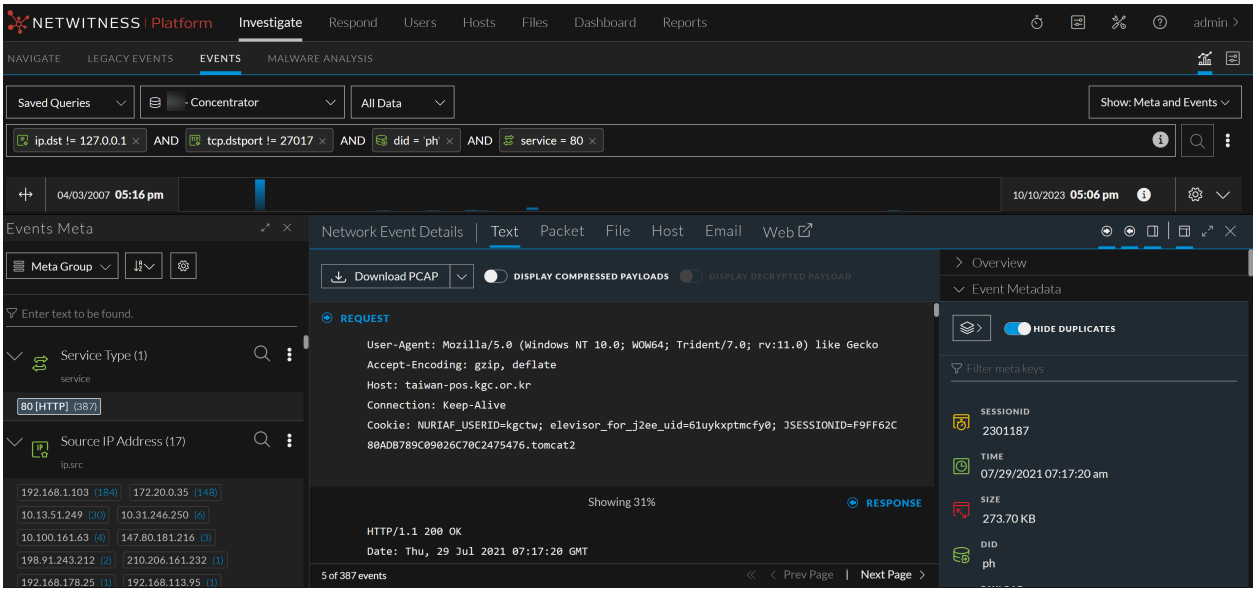
Action	Network Event	Log Event	Endpoint Event
View the text reconstruction (default unless last selected overrides)	✓	✓	✓
View the file reconstruction	✓		
(Version 11.5 or Later) View the host Information for an Endpoint Agent configured with expanded network visibility (see Host Information.	✓		
View the packet reconstruction	✓		
View the email reconstruction	✓		
View the web reconstruction in the Legacy Events view (see Reconstruct an Event in the Legacy Events View)	✓		

Each tab has settings to enhance your analysis. If you change a setting, the setting is preserved between browser refreshes and logins within the same browser. These are the preserved settings:

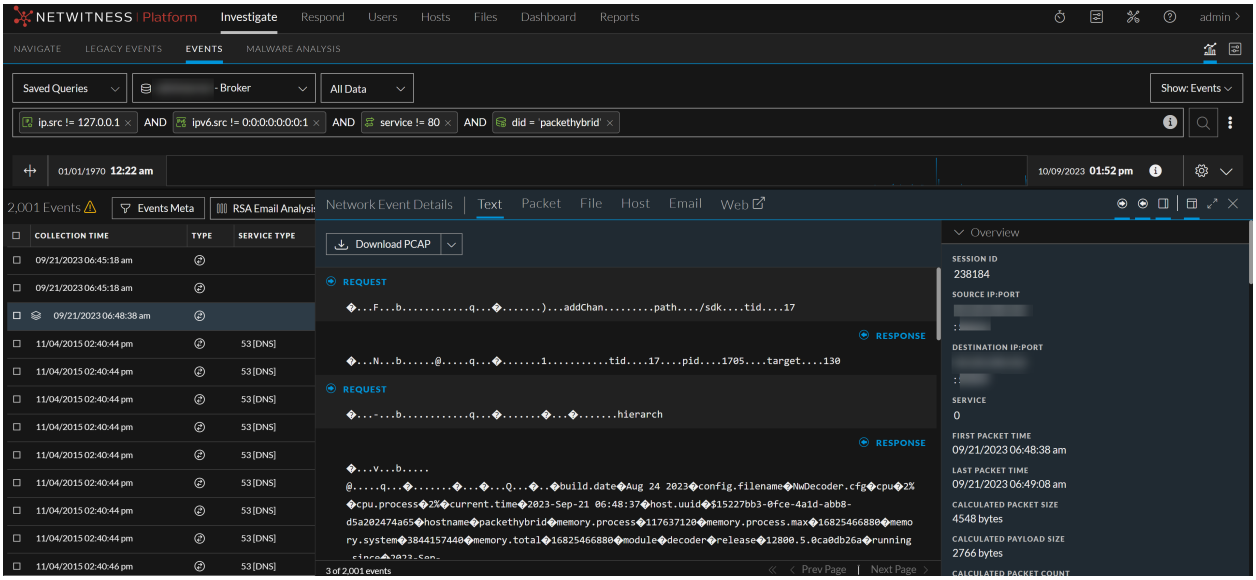


- The currently selected reconstruction: Text, Packet, File, (Version 11.5 and later) **Host**, or Email.
- Whether the Event Meta panel is open or closed.
- Whether the Event header is open or closed.
- Whether the Request or Response, or both are displayed.
- Whether packet payloads are displayed without the headers in the packet reconstruction.
- Whether shaded bytes are displayed in the packet reconstruction.
- Whether other common file types are highlighted in the packet reconstruction.
- The number of packets per page in the packet reconstruction.
- Whether compressed or uncompressed text is displayed in the text reconstruction.

Text Reconstruction

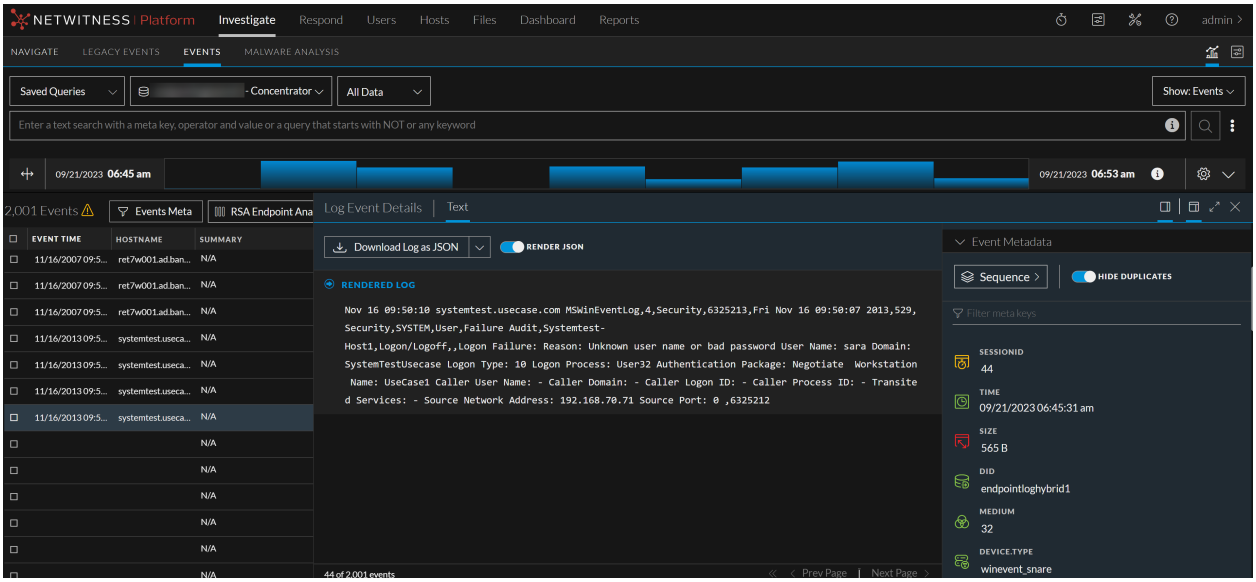


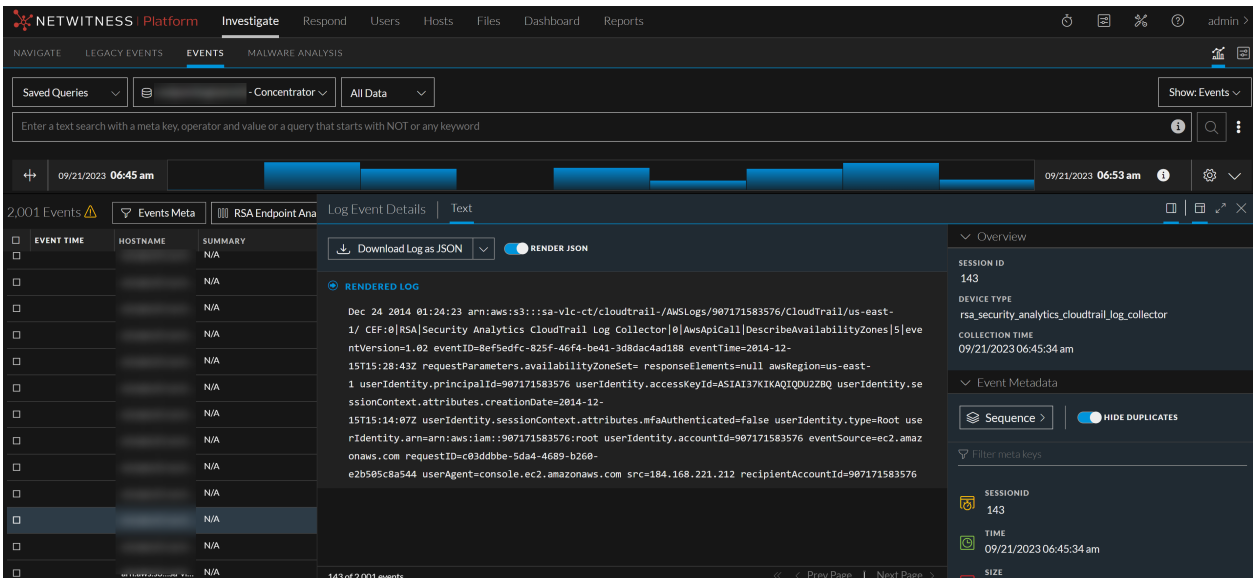
In 12.0 and later, analysts can directly view an encrypted data in a decrypted format by switching on a toggle option **Display Decrypted Payload**. However, the data can be displayed in the decrypted format only if a Decoder service in the **Events** > **Text** tab, has a TLS key available. This feature enables the analyst to focus on the important data in less time and perform investigations on the selected events with optimum accuracy and quality.



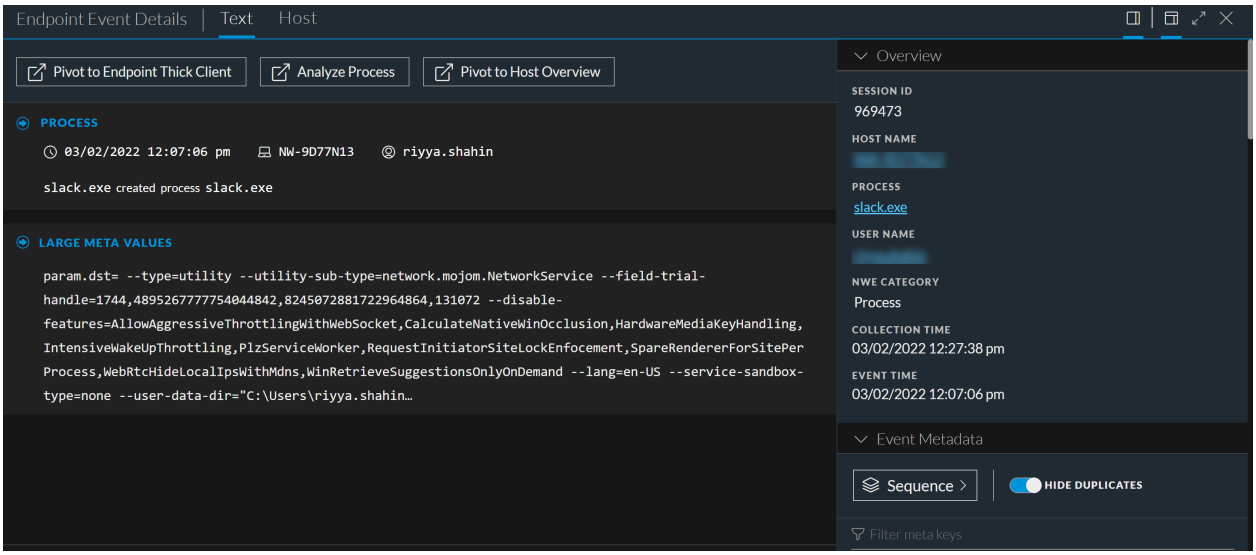
For Endpoint Events Details, the Pivot options available under Text analysis page has been replaced with a Pivot drop down menu that contains the three options to perform further investigation.

You can view all types of events (network events, log events, and endpoint events) in their original text format in the Text tab. The text reconstruction for some network events can be quite large. To ensure the best rendering, an excessively large payload is truncated to fit. If a single reconstructed request or response in the reconstructed event exceeds the maximum number of bytes, the header indicates what percentage of bytes is shown. Pagination controls add flexibility when paging through the reconstructed text of an event. This figure illustrates a single response that has been truncated because it exceeds the maximum number of bytes.





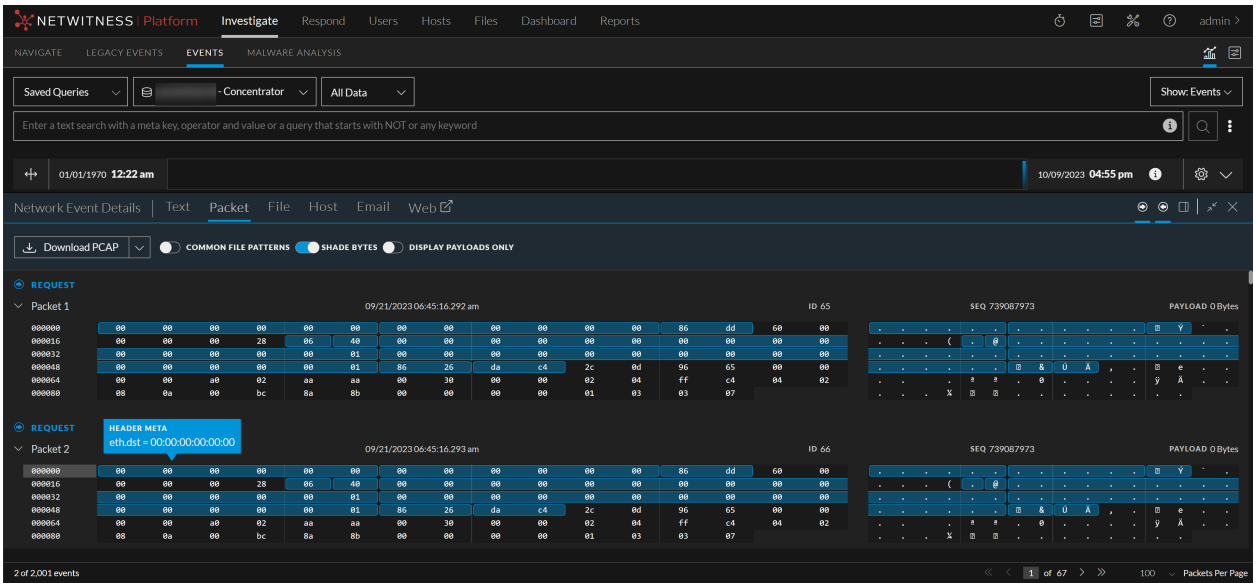
Note: Version 11.1 handles large payloads differently; the payload for a single event is limited to 2500 packets. When the packet limit is reached, a warning in the footer advises the limit has been reached and provides the total number of packets in the event. For Version 11.1, the Show More option is still available for messages that are truncated; however, the entire text of the message is not visible without downloading the raw payload.



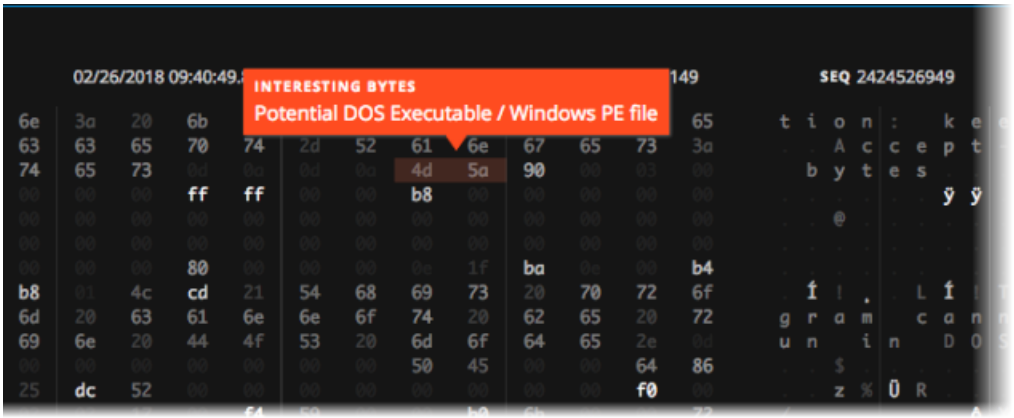
In the text reconstruction, network events, log events, and endpoint events are presented differently.

- For network events, the reconstruction provides the direction of the packet (Request or Response) and contents of each packet in text format. If you are reconstructing a network event, the text reconstruction is scrollable. When you scroll, the text identification information and the Request and Response labels remain visible rather than scrolling out of view.
- Log events and endpoint events have no request or response; only the raw event is displayed in the Text tab. Endpoint events include additional information relevant to an endpoint event.
- (Version 11.5.1) Log events that contain JSON snippets are rendered in an easily readable JSON tree view with nested indentations if the RenderJSON option is enabled.

For each type of event (network, log, or endpoint), there are differences in the Overview panel and the options for downloading the event. Below is an example of the text reconstruction for each type of event: a network event, a log event, and an endpoint event.



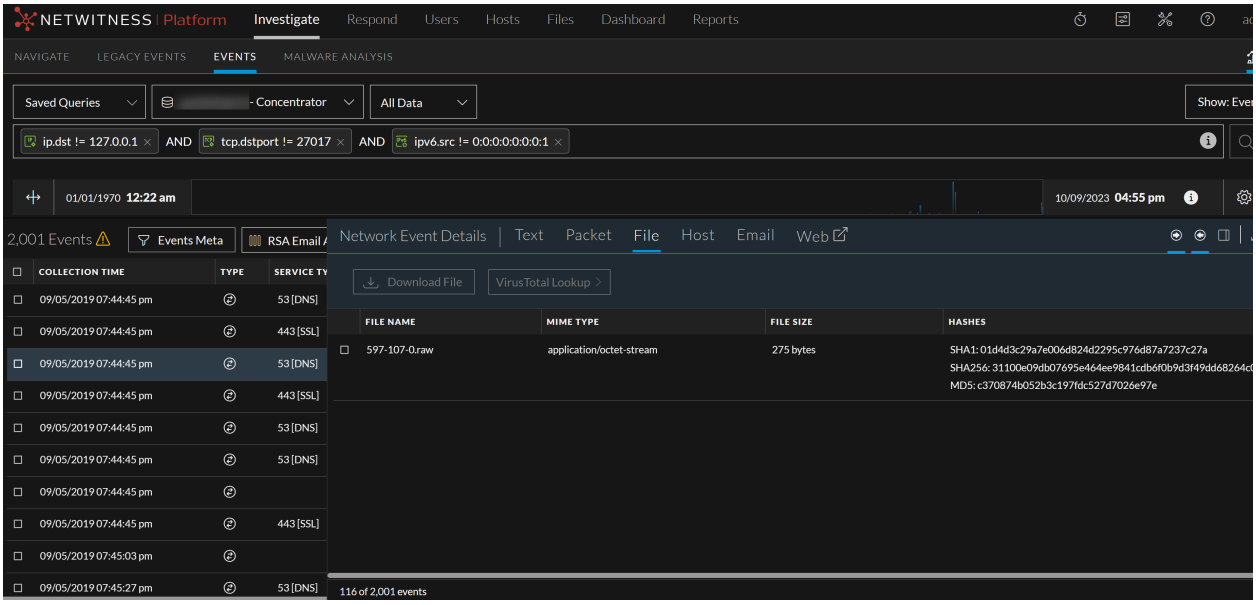
Note: The calculated packet count, calculated packet size, and calculated payload size in the Event header may be different than the same statistics in the Event Meta panel because the metadata is sometimes written before event parsing completes and may include packet duplicates.



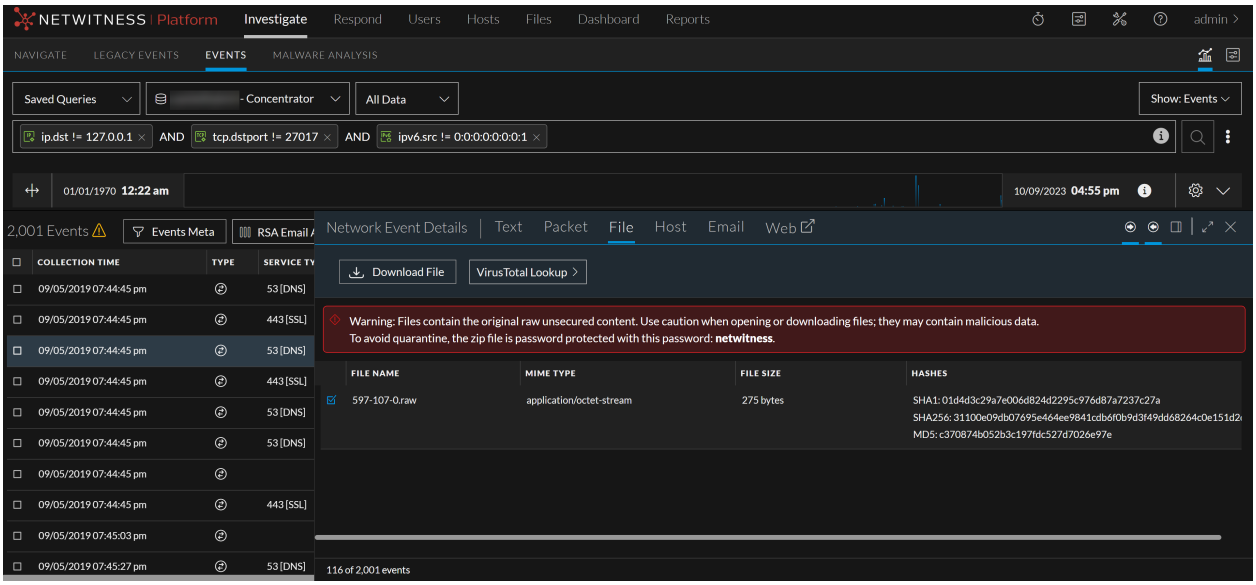
Packet Reconstruction

The packet reconstruction is for network events. The panel is scrollable, and the packet identification information and the Request and Response labels remain visible rather than scrolling out of view. In the Packet tab, the headings provide the direction of the packet (Request or Response), the packet number, the packet start time, the packet ID and the sequence, and the payload size. All packets begin with a header, and some packets have a footer. Pagination controls add flexibility when paging through packets.

The metadata in the hexadecimal and ASCII data is highlighted in blue; when you place the cursor over the highlighted metadata, the meta key/meta value information is displayed in a hover box.



Common file signatures are highlighted with an orange background. When you place the cursor over the highlighted text, the description of the file type is displayed in a hover box.



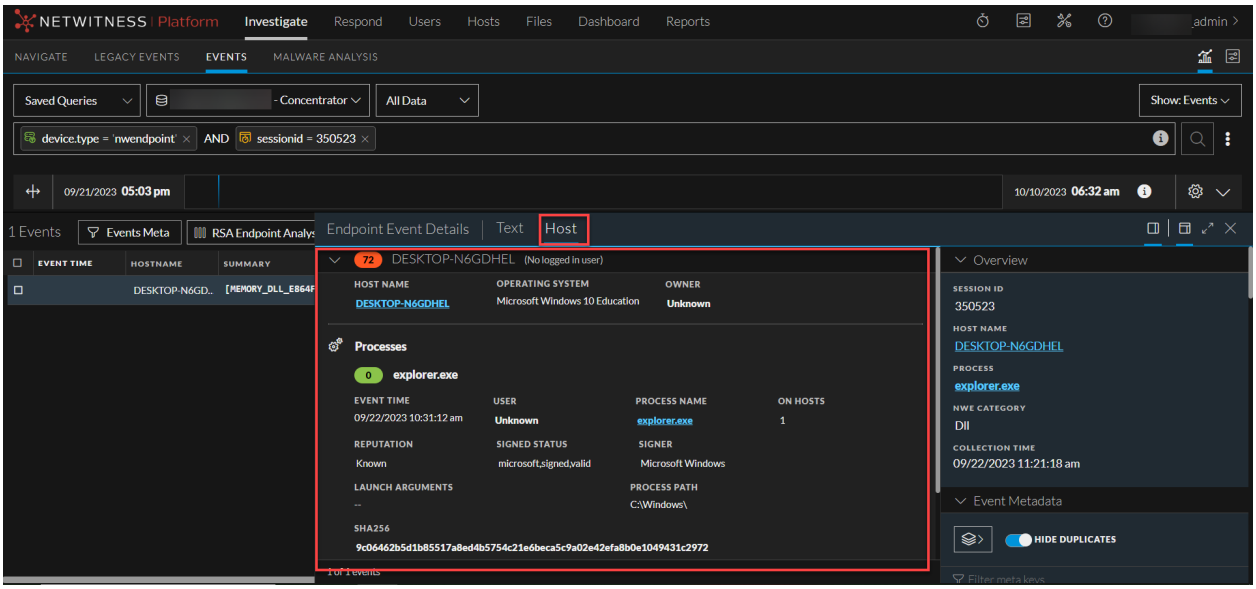
File Reconstruction

The file reconstruction shows a list of files associated with the selected network event. This is an example of the file reconstruction.

You can select one or more files, or all files, to export to your local file system. When files are selected, The Download File options becomes active and reflects the number of files selected.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

Host Information



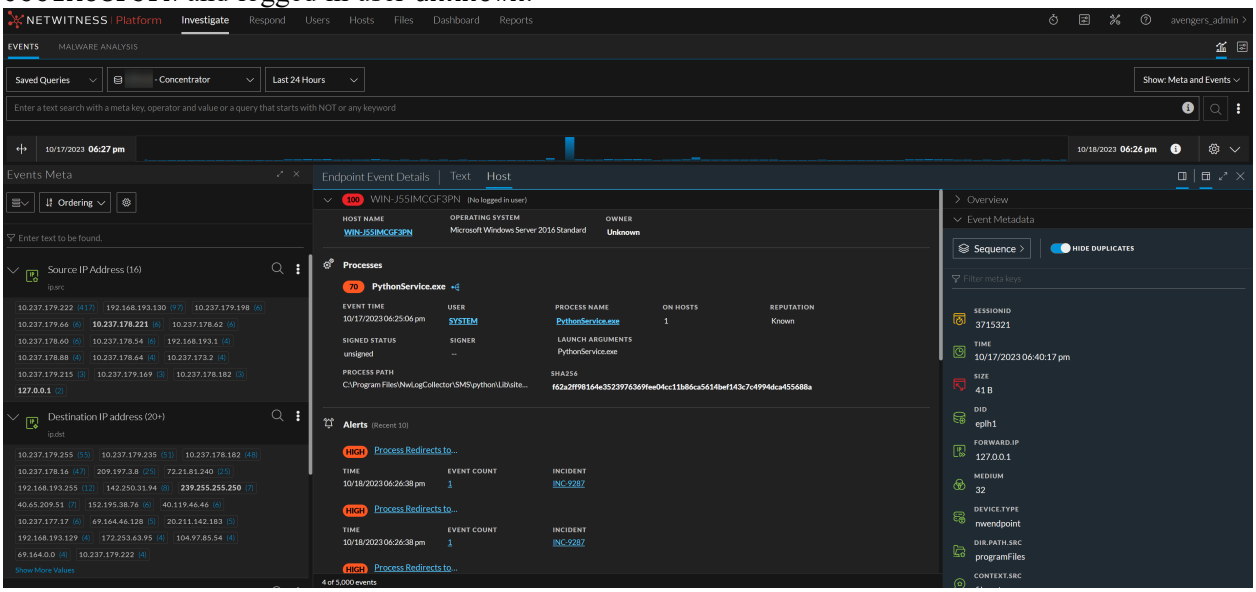
Host information is displayed for network and endpoint events with the endpoint data.

You can filter the events in the Events view using the Events Filter panel (version 11.5 and later). For more information, see Filter Results in the Events View.

Note: Endpoint data is displayed only if you have an Endpoint deployment, and the Endpoint agents are configured for expanded network visibility. For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

Note: For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

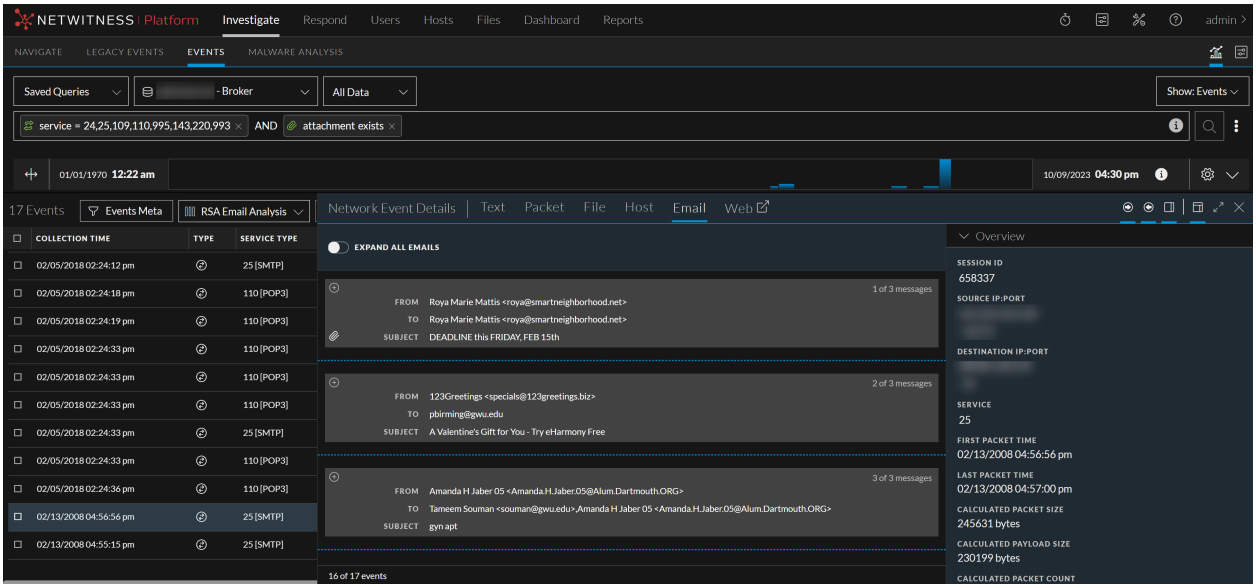
Below is the example of the host information.



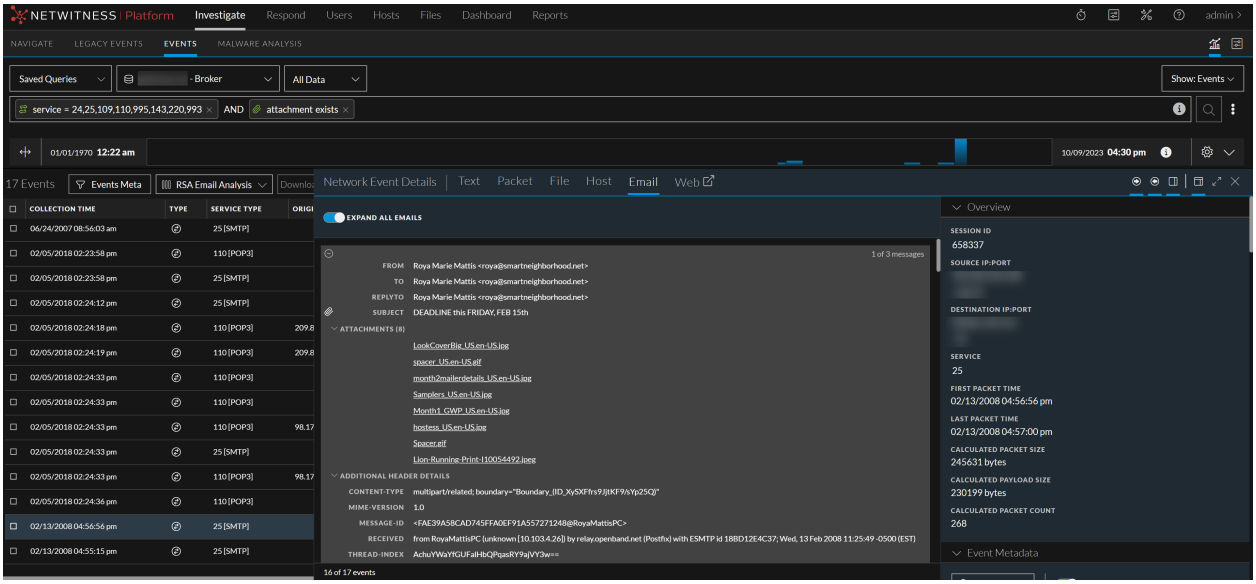
- The hosts with the closest matching process are listed in the order of event time.
- By default, the first host is expanded, and you can view additional information such as:
  - Host details – This provides details on the host's operating system and the owner (logged in user) associated with the host.
    - To investigate on the host name, click the **Host name** link highlighted in blue. For more information, see "Investigating Hosts" in the *NetWitness Endpoint User Guide*.
    - To investigate alerts associated with the user, click the **owner** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*
  - Process details – This provides details like risk score, process name, reputation, event time, on hosts, signed status, process ID, signer, user, launch arguments, SHA256, and path.
    - Click  to open the process tree. By default, the process tree will open the process details of last 14 days. The icon to open the process tree does not appear when the process tree is not available.
    - To investigate on the process, click the **process** link highlighted in blue. For more information, see "Investigating Files" in the *NetWitness Endpoint User Guide*.
    - To investigate alerts associated with the user, click the **user** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*.
  - Alert details – It displays the recent ten alerts associated with the host. These alerts can be from endpoint, network, and log events. You can click **View All** to open the host details page. The host details page lists all the alerts that contribute to the risk score. You can click on the alert name to open the alert details. For information on how to review an alert, see “Reviewing Alerts” in the *Net Witness Respond User Guide*. This section provides the following details.

- Severity – Displays the severity of the alert.
- Time – Date and time when the alert was triggered.
- Event Count – It displays the number of events that triggered the alert. To view the events associated with the alert, click the **EVENT COUNT** link highlighted in blue. The **EVENT COUNT** link is available only when the events are from the same source.
- Incident – Lists the incidents associated with the respective alerts. To view the details and respond to an incident, click the **INCIDENT** link highlighted in blue. For more information, see "Responding to Incidents" in the *NetWitness Respond User Guide*.

You can hover over the meta values of the host name, process, user, owner, and SHA256 to view additional information about the specific metadata. For more information on context look up, see Look Up Additional Context for Results.



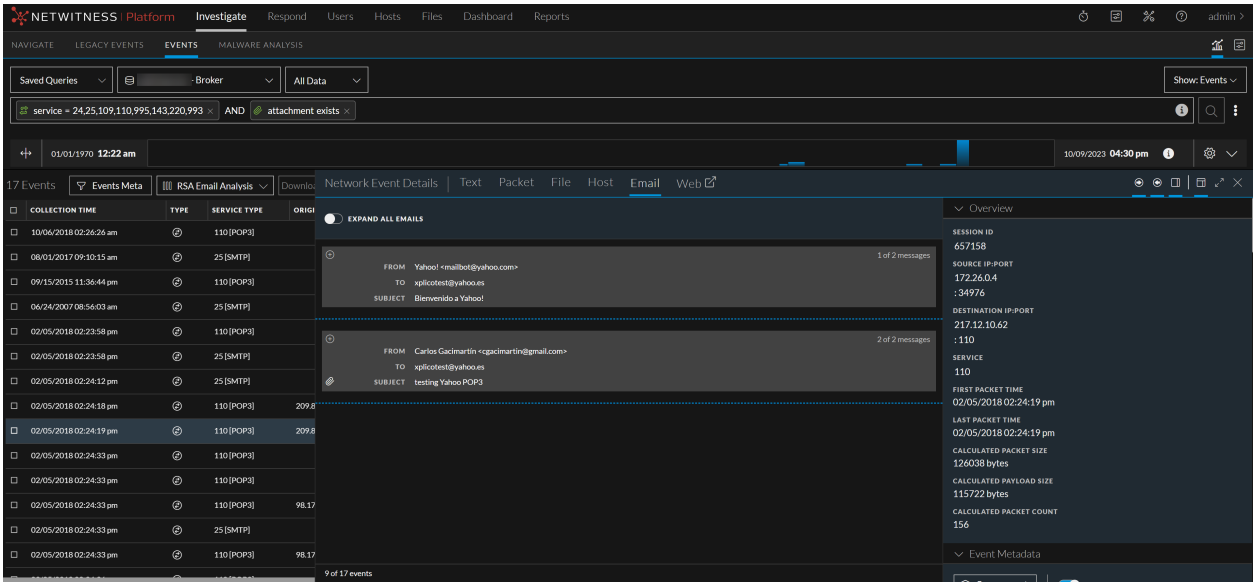
Below is an example of the Host Information tab with a single host, process, and user associated with the selected network event. The `PythonService.exe` is the process associated with the host `WIN-J55IMCGF3PN` and logged in user `unknown`.



Note: You may see multiple hosts and processes triggered for the selected network event; in such cases, the host from where the event is triggered first is listed first and then the other hosts where a similar event is triggered.
For example, if `10.63.0.240` IP address is assigned to Host1, and User1 is logged in to the machine and accessed `www.nyu.edu/` using Chrome. Meanwhile Host1 is powered off (within a span of 30 minutes), and the same IP address is assigned to Host2. The user logged in is User2 and accesses `www.nyu.edu/` using Internet Explorer. In this case, network events for the endpoint data are as follows:
- Hostname - `Host1`, `Host2`
- Process - `chrome.exe`, `iexplore.exe`
- User - `User1`, `User2`

Email Reconstruction

In 11.7 and later, if the analysts need to review all email contents in a single session, then they can click on the Expand All Emails toggle button by navigating to **Investigate** > **Events** > **Email** view.



When the Expand All Emails toggle button switched on, the email content is displayed in an expanded form.

When the Expand All Emails toggle button is switched off, the email content is displayed in a collapsed form. If there are no emails to display the toggle button is disabled.

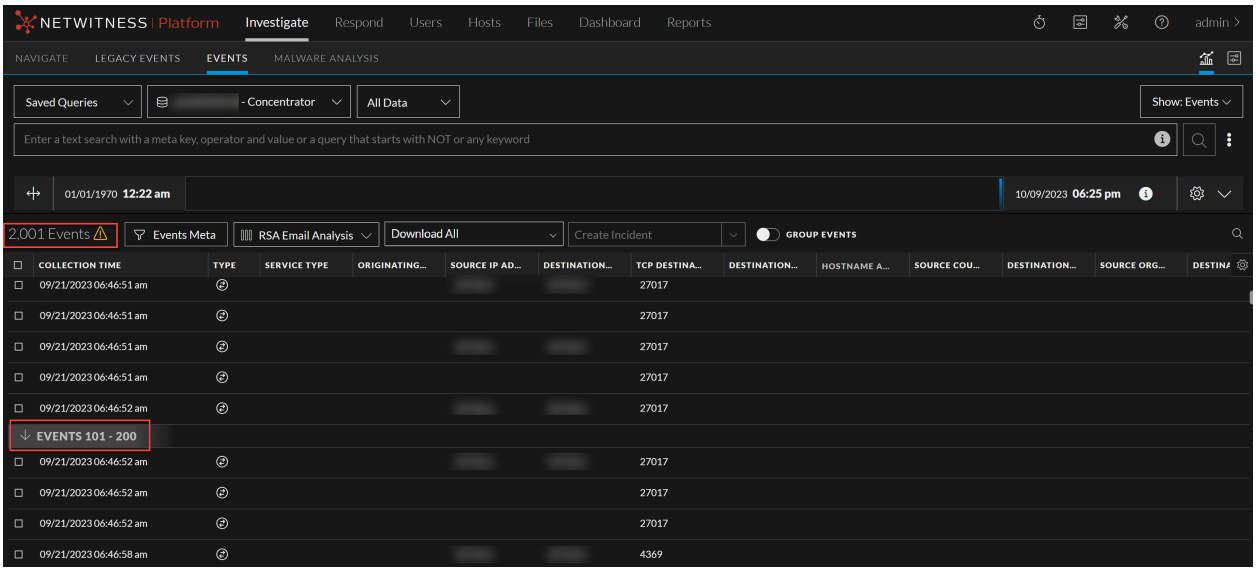
The email reconstruction shows a list of emails associated with the selected network event. This is an example of the email reconstruction.

- By default, a single email is expanded and multiple emails are collapsed.
- If an email contains attachments, you can download attachments as described in Download Data in the Events View.

  Caution: When you download and open attachments from an email, they may contain malicious data.

  An external link in an email cannot be accessed. Clicking an external link displays a **Link Address** pop-up window that provides the actual link.
- When an email body is too long, **Showing %** is displayed in the beginning of the email. To view the remaining content, click **Show Remaining %** at the bottom of the email.
- If an event contains a web email supported by the `alias.host` metadata of `mail.google.com`, `mail.live.com`, or `mail.yahoo.com`, a message is displayed with a link to view the reconstruction for the associated session in the Event Reconstruction page. If not, a "*No Email reconstruction is available for this event*" message is displayed.

Analyze Events in the Events View



Note: In Version 11.4, the Event Analysis view was renamed as the Events view, replacing the Legacy Events view as the default view analyzing events. Information regarding Events view features prior to version 11.4 also applies to the 11.3 and earlier Event Analysis view.
The Legacy Events view is disabled by default, but the administrator can enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

After a query is submitted in the Events view, the Events panel opens with a list of sequential events. The events listed here meet two conditions:

- They match the submitted query.
- They include a value for one or more meta keys required by the selected column group. If you change the column group while viewing the Events list, the original query with the new column group is resubmitted. Unsubmitted query changes made to service, time range, or filter, are ignored.

How Results Are Loaded and Sorted

There is a configurable limit on the number of events that can be loaded; the default value is 5,000. Administrators can configure the limit as described in the *System Configuration Guide*. The events begin loading into the Events panel; a progress bar at the top of the list tracks progress while events are loaded. Events with the earliest collection time are loaded first and a row number indicator of the form " EVENTS xxx - xxx" is inserted in the list after every group of 100 events as shown in the following figure.

A spinner is displayed while the events are loaded. If that count is greater than or equal to the threshold, a message under the spinner advises that fact and directs you to the Query Console for more details. As data begins loading, the message is removed and the spinner remains until all events are loaded. When all events have loaded, one of these messages is added to the bottom of the list:

- "All events loaded."
- "Reached the 5,000 event limit. Consider refining your query."
- "Retrieved 4,000 of 5,000 events prior to query cancellation."

A message at the top of the list indicates the total number of events loaded, if the 5,000 event limit has been reached, and the sorting method in effect:

- The message when fewer than 5,000 events are listed is: "xx,xxx Events"
- The message when more than 5,000 events are listed is: "Oldest 10,000 Events (Asc)"

If the number of events that match the query exceeds the limit of 5,000 events, the newest or oldest 5,000 events in the time window are loaded in ascending order. The portion of events loaded is based on the sort order. For example, if 300,000 events match your query and the sort sequence is set to Ascending, the oldest 5,000 events are loaded by default. You can change this by changing the sort order to Descending and the newest 5,000 events are loaded. Ascending sort, which loads the oldest events first is usually the best setting for investigating network events. If you want to view the newest 5,000 events in the time window, you can change the Default Event Sort Order to Descending in the Event Preferences dialog.

The sorting method for the list is configured in the Event Preferences dialog (see Configure the Events View). Any change in the setting goes into effect the next time you submit a query. The Default Event Sort Order from the Events Preferences dialog is saved in the database and persists after logging out and logging back in.

- **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
- **Ascending** (default for Version 11.4 and earlier): To list the events with the earliest collection time first. The earliest collection time first is well suited to most investigations. When investigating logs, you may want to change the sort sequence to latest collection time first.
- **Descending**: To list the events with the latest collection time first. The latest collection time first is often useful for investigating logs.

Actions to Refine the Events List

When the results are loaded in the Events panel, you can take the actions to refine the list:

- Select a column for sorting events (Use Columns and Column Groups in the Events List).
- Select a set of meta keys (column group) that help with a specific type of investigation (Use Columns and Column Groups in the Events List).
- Apply a query profile (Use Saved Queries to Encapsulate Common Areas for Investigation).
- (Version 11.5) Filter events by pivoting through the metadata Drill into Metadata in the Events View.

Actions to Analyze Events

The rest of this section has procedures for working in the Events view and adjust reconstructions to bring interesting data into focus.

- You can download events and create an incident in Respond.
- Clicking an event in the Events panel opens the Event Details panel to a tab that shows an event reconstruction (text, packet, file, email, and web) or the tab that shows host information for network events that are enriched with endpoint data (Version 11.5).
- The Events panel and the Event Details panel can be open at the same time.
- Within the Packet tab and the Text tab, you can use additional features to adjust the way the reconstruction is displayed and bring interesting data into focus.

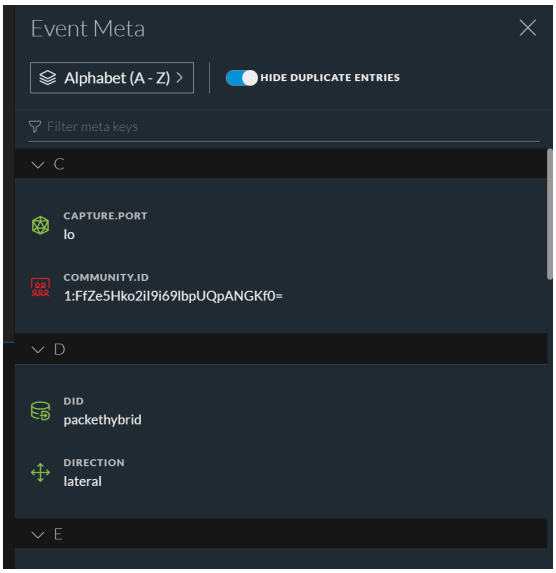
Select the Analysis Type for an Event

To select the analysis type for an event, with an event open in the Event Details panel, click one of the tabs: **Text**, **File**, **Host** , **Packet**, **Email**, or **Web**.

- If you chose **Hosts**, the host information from extended endpoint data is displayed.
- If you chose **File**, **Text**, **Packet**, or **Email**, the reconstruction is displayed.
- If you chose **Web**, the reconstruction of the single event opens in a new tab. This is the same reconstruction of a session used in the Legacy Events view (see Reconstruct an Event in the Legacy Events View).

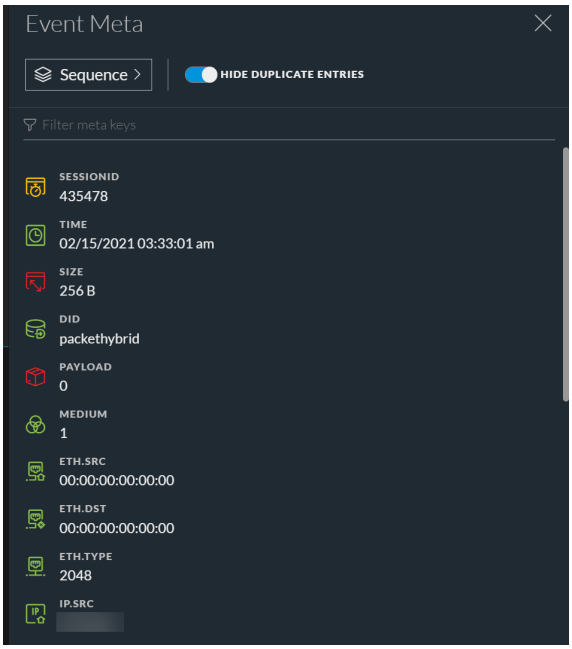
Note: The packet reconstruction is only available for network events.

Adjust the Display of Requests and Responses



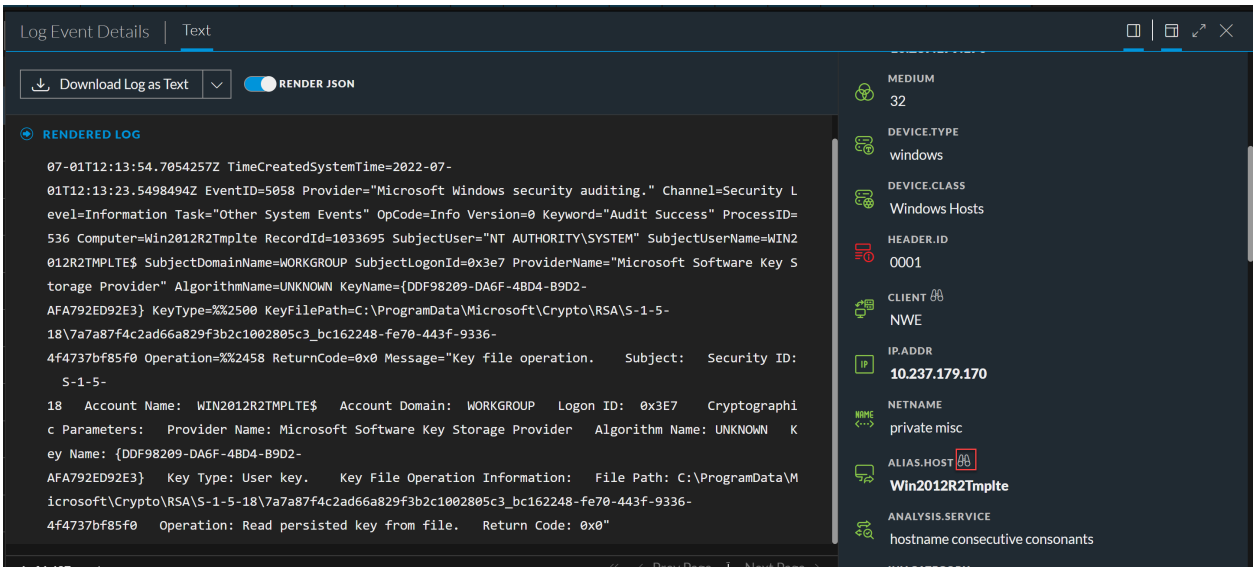
For analysis types that have requests and responses, you can select which side of the conversation to show, Request , Response , or both, click one or both of the direction icons. The reconstruction is refreshed with the selected information.

Note: If you do not see any data, you may have deselected both Request and Response. You must select one of the two to see data displayed.

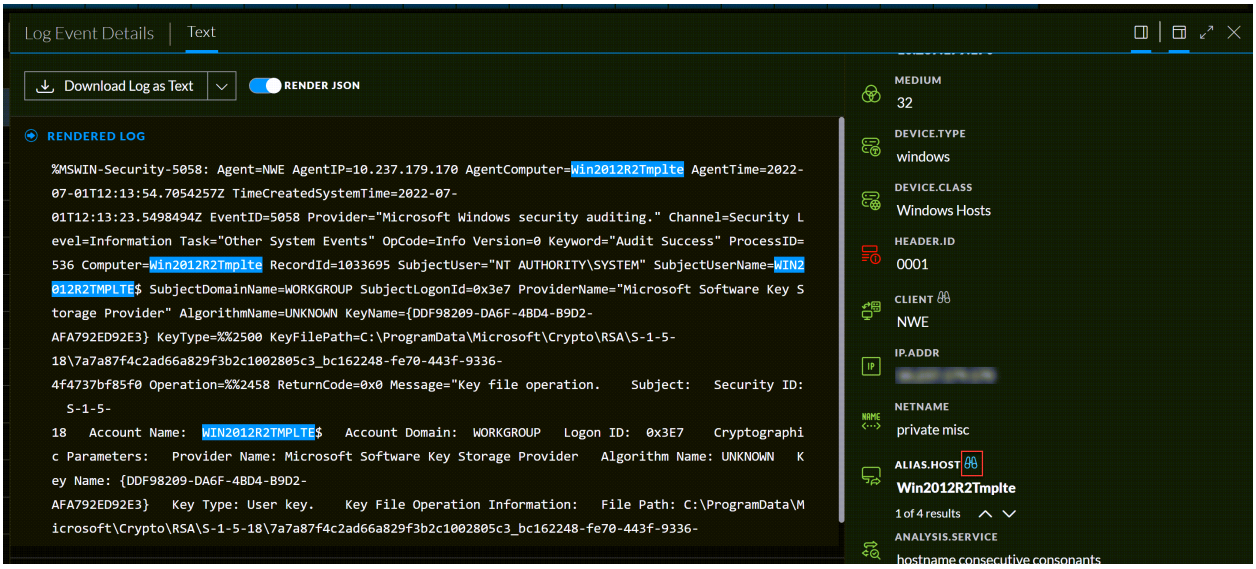


View Associated Metadata for an Event

When examining events in the Text tab, Packet tab, or Filetab, you can click  to show the associated metadata in an adjacent panel, the Event Meta panel. You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically."



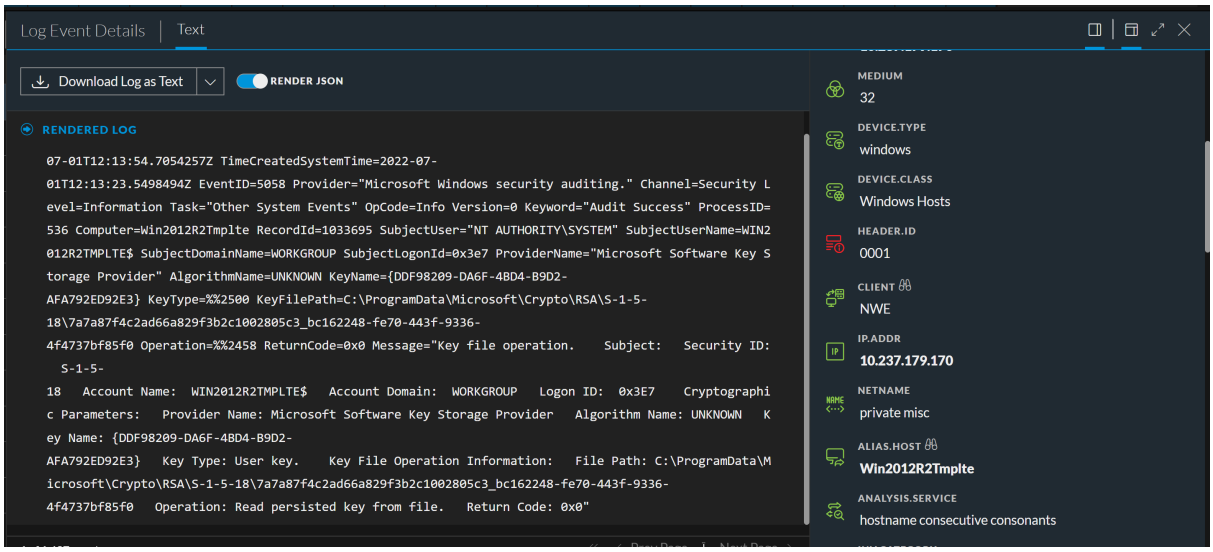
You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically.



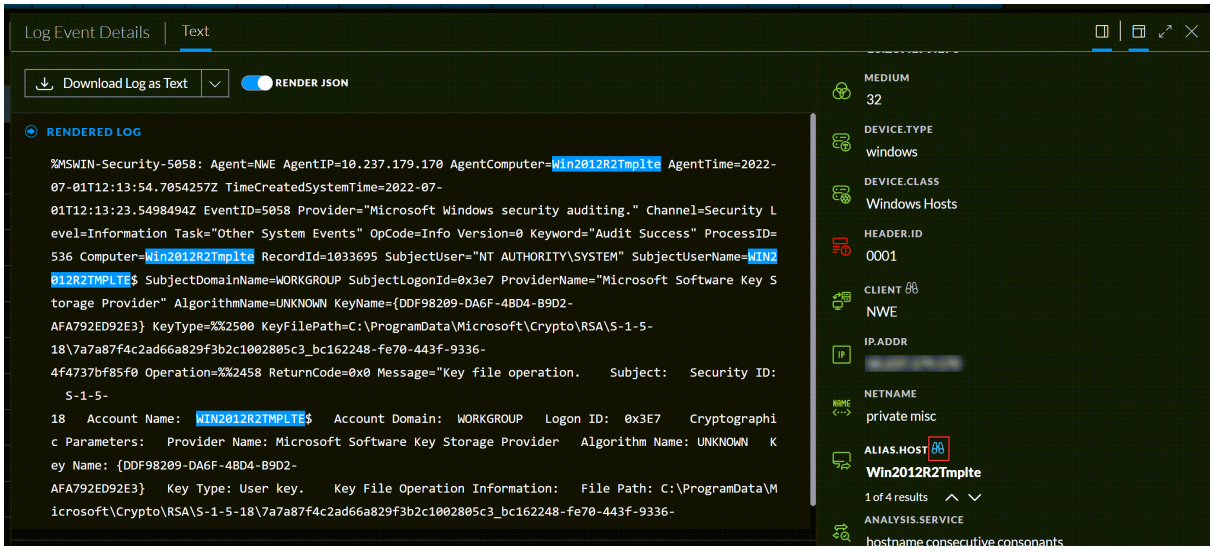
This figure illustrates the same metadata presented in the sequence in which it was generated.

From 12.0 and later, the meta key and meta value pairings now display a binocular icon while viewing a text reconstruction in the Event Meta panel, indicating the search option. This enhancement helps the analysts to visually see directly the indication (binocular icon) rather than going through the list of all metadata to figure out which ones may be searched. This figure is an example of binocular icon marking a searchable meta key.

Clicking the icon triggers a search for the meta key or meta value pair (case-insensitive) in the Text tab and each instance is highlighted. This is an example of binoculars with a blue background after clicking a searchable meta key/ meta value combination.



In the Event Meta panel, the highlighted row has a count of the results and up and down arrows that you can use to quickly find each result in the Text tab. You can view each highlighted location of the data that triggered generation of the meta key, going forward to view the next, and back to view the previous.



Only meta keys that have relevant values inside the RAW text are searchable. You can search only one meta key at a time. If the value is currently hidden due to truncation of a text entry with more than 3000 characters, the text entry is expanded to reveal the found meta value.

To search the raw text for meta values that triggered a meta key

1. Open a network event in the Text tab and click  to open the Event Meta panel.

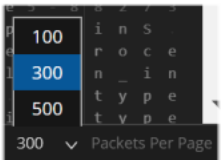
2. Search for the meta key/meta value pairs in the list until you see a binoculars icon next to a meta key.
3. To search for the value in the raw text, click a row that has the binoculars icon, indicating it is searchable.
   If no relevant occurrence of the value is in the text, the value that you are searching for is highlighted in the Event Meta panel and nothing is highlighted in the Text tab.
   If one or more relevant instances of the value is found in the Text tab, each occurrence is highlighted. The value that you are searching for is highlighted in the Event Meta panel and the up/down arrows for scrolling are visible.

4. To remove the highlighting, click the same meta key/meta value pair in the Event Meta panel, click a different meta key/meta value pair in the Event Meta panel, or close the Event Meta panel.
   The highlighting is removed from the raw text.

Note: When a meta value is more than 255 characters, you can hover over that meta key to view the complete value.

Show or Hide the Event Header

To hide the Event Header in the Packet tab, Text tab, or File tab, providing more vertical space for the data, click . Clicking the icon again shows the Event Header.



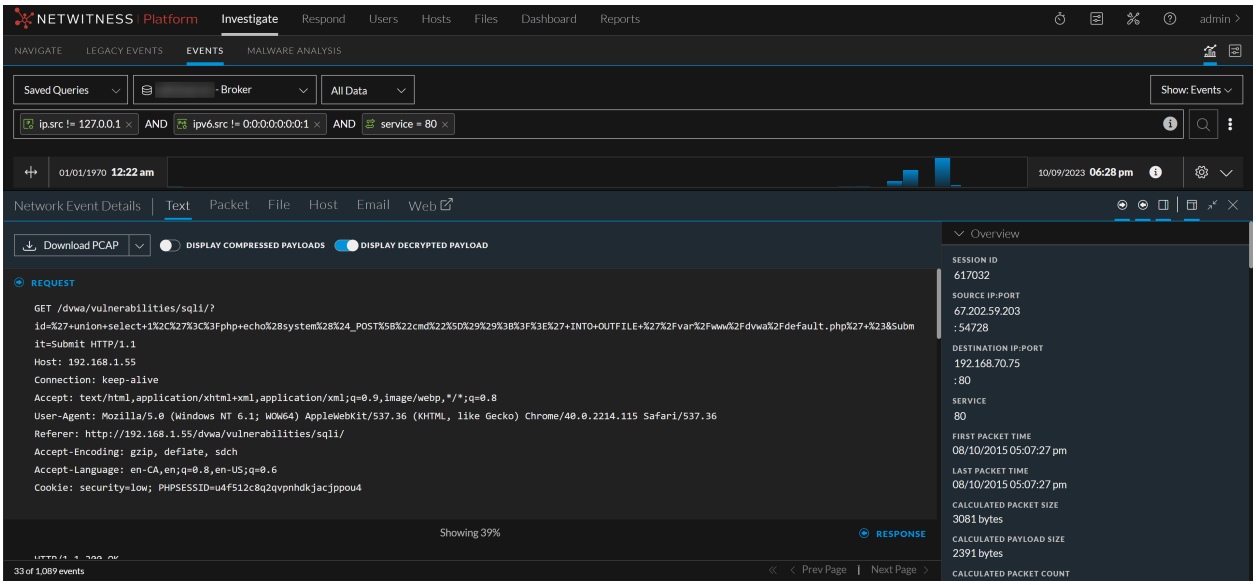
Page Through Events in the Packet and Text Tabs

Pagination controls allow more flexibility in paging through a list of packets or text. In the Packet tab, you can select the number of packets to display per page, and your selection is saved across logins to the NetWitness Platform application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the  and  controls are dimmed.

Note: Pagination controls are available in Version 11.2 and later of the Text tab. When in the Text tab, you must navigate manually to the last page before the last page control icon is available.

To use pagination controls

1. With an event open in the Events view, click the current number of packets per page (**50, 100**, **300**, or **500**), and select the new number of packets per page from the drop-down menu.



2. To page forward or back, use the page control icons:
   Click  to go to the next page.
   Click  to go to the last page.
   Click  to go the previous page.
   Click to go to the first page.

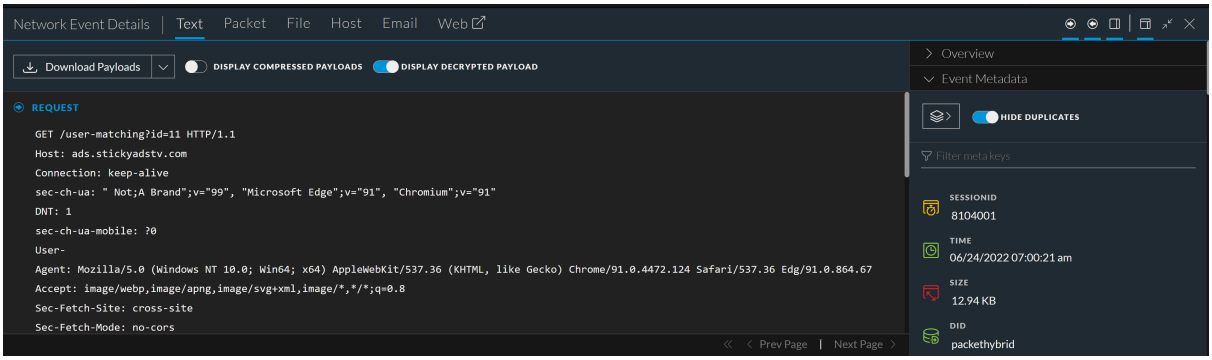
3. To go to a specific page, type a page number in the page number field .

Expand Truncated Text Entries in the Text Tab

A reconstruction of a network event in the Text tab may include requests and responses of many hundred thousands of characters, and scrolling through a long entry that is not of interest can waste time. To save time, text entries that have more than 6000 characters are truncated to show only the first 2000 characters. This example shows an entry that has more than 2000 characters, and a message in the header indicates the percentage of total characters that is being displayed.

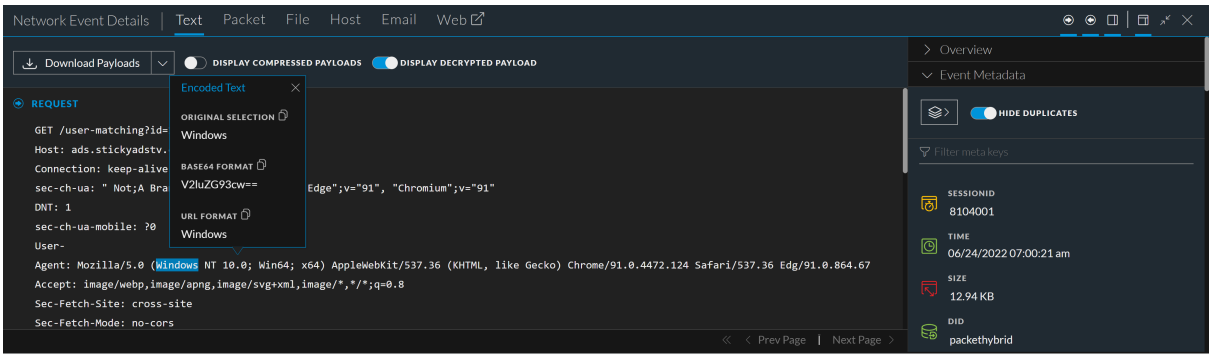
You can see that 46% of the characters (the first 2000) are displayed, and click **Show Remaining 54%** to reveal the rest of the entry.

If you search for metadata seen in the Event Meta panel while text is truncated in the Text tab, the truncated text is searched. If the metadata exists inside hidden text, the text entry expands to reveal the text with the found metadata.



Perform URL and Base64 Encoding and Decoding in the Text Tab

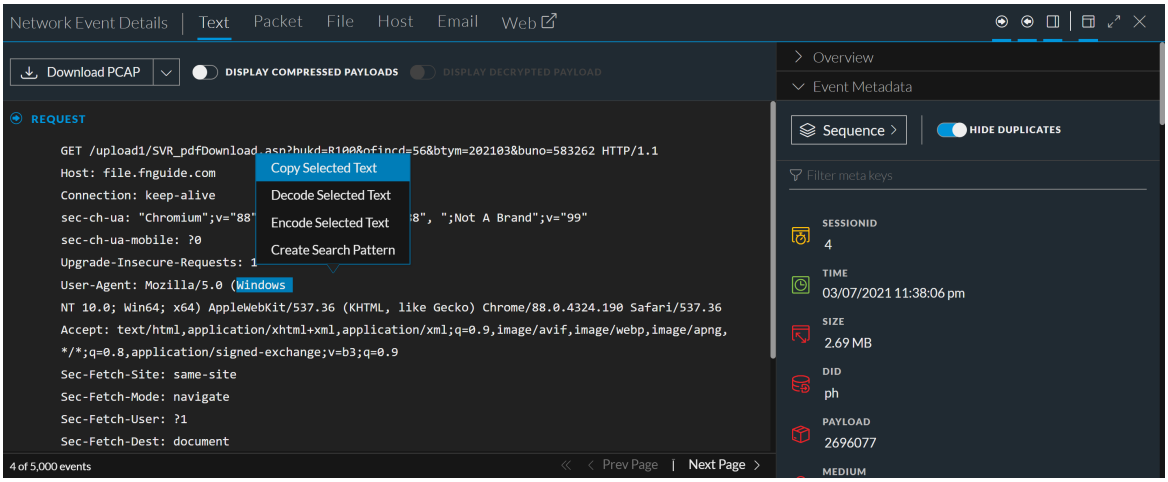
If a network session being reconstructed in the Text tab contains Base64 or URL encoded strings, you can decode a string to better understand the session. If the session contains decoded strings for Base64 or URL, you can view a string in its encoded form in order to search for additional instances of the encoded text in other sessions.



When viewing any network session that contains encoded text in the Text tab, you can select a subset of the text within a single Request or Response to view in either encoded or decoded form. Depending on the content loaded on the Decoder, there may be additional metadata outlining that Base64 or URL encoded data is contained within the session.

To perform encoding and decoding in the Text tab

1. In the **Events view**, go to the Text reconstruction of a session that contains encoded or decoded content.
2. To view some decoded text in encoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.



3. Click **Encode Selected Text**.
   The encoded text is displayed in a hover box, which remains in place until you click ✕, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.

   When a longer text is selected, the hover box is scrollable and large enough to fit the entire selected text and the decoded text.
4. If the session contains encoded text that you want to see in decoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.
5. Click **Decode Selected Text.**
   The decoded text is displayed in a hover box, which remains in place until you click ✕, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different tab in the Event Details panel.

6. If you want to copy some text from the text reconstruction, do one of the following:
   a. Drag to select some text, right-click, and select **Copy Selected Text** from the pop-up menu.

   b. Drag to select some text, then select either **Decode Selected Text** or **Encode Selected Text**.
   Select the desired text and type **Control-C**.
   The selected text is copied to the clipboard and available to paste in a query.

7. When finished, click ✕ to close the hover box.

Create a Search Pattern in the Text Tab

From NetWitness Platform version 12.4 or later, administrators and analysts can create search pattern rules to find sensitive data on their networks. These rules use keywords to identify patterns and they are matched based on an exact keyword string. Once a pattern is applied to a matched policy with services (Decoders), it will search for that pattern in network traffic. Upon successful detection of a match, two important metadata will be generated (**found** and **match**).

- **found**: If a match (a keyword) is identified in a stream, the name of the search pattern rule will be added as the found metadata.
- **match**: If a keyword is detected as a match, the specific keyword that is identified will be added as a match meta.

Analysts can use this metadata to investigate further and determine if the sensitive data is being used maliciously. Additionally, analysts can gain real-time visibility into their network traffic, proactively monitoring it for potential threats.

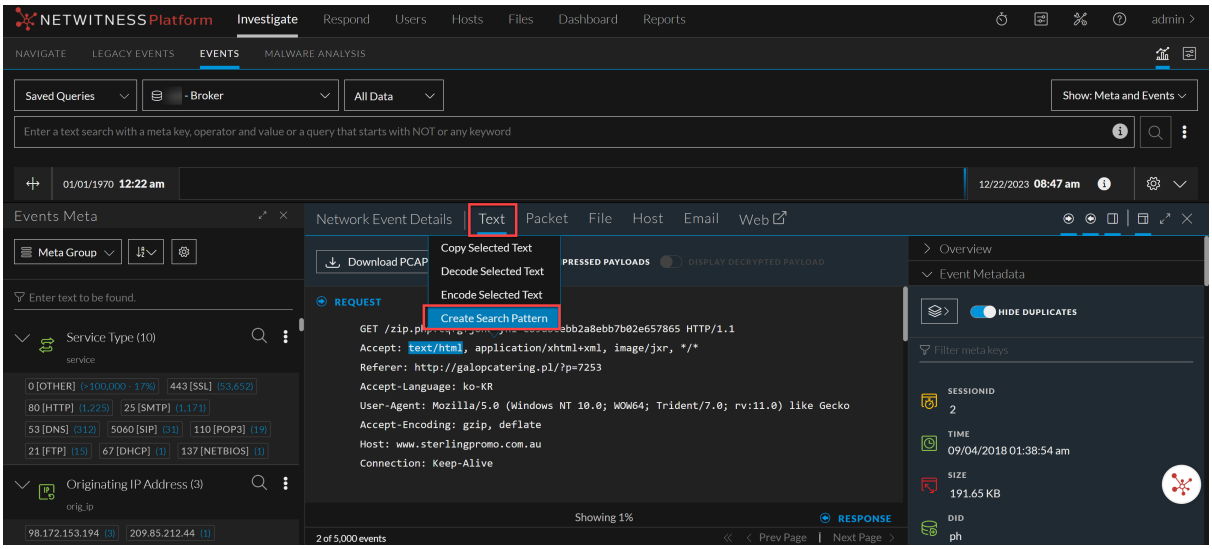
Here is an example of search pattern that can be used to find sensitive data in networks:

Keywords: Keywords are words or phrases that are often associated with sensitive data. For example, the keyword **credit card** could be used to find network traffic that contains credit card numbers.

For example, in an environment, if you have four Decoders with CCM enabled and published to the policy. However, only three of these decoders have the search parser enabled, while one decoder doesn't have it enabled. As a result, only the three decoders with enabled search parser will generate found and match meta keys.

Prerequisites

- By default, only administrators are allowed to create search patterns. To enable access for analysts, they must contact their administrators.
- To generate the meta keys **found** and **match**, you need to enable the **Search Parser** (found and match), which is disabled by default. To do this, navigate to **(Admin)**> **Services** > select **Decoder** service > > **Config** > **General** > under **Parser Configuration** section, enable the **Search Parser**.

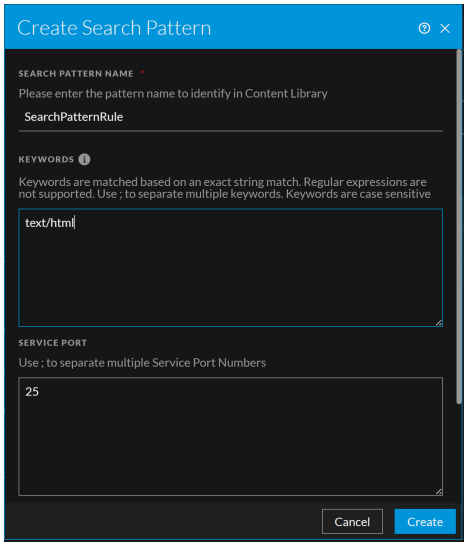


Note: Creating a generic pattern rule will cause performance issues.

Note: An administrator must enable **investigate-server.searchpatternrule.manage** permission and **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the search pattern rules. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

IMPORTANT: A user can add and publish a search pattern rule to a policy only if two conditions are met:
- The Decoder services are managed by Policy-based Centralized Content Management.
- The user has the **investigate-server.searchpatternrule.manage** permission enabled.

To Create a Search Pattern in the Text Tab



1. Log in to the NetWitness platform.
2. Go to **Investigate** > **Events**.
3. Go to the Text reconstruction of a session that contains network events.

4. Select a subset of the text or raw bytes and select **Create Search Pattern** from the pop-up menu.

Note: Non-ASCII characters (for example, é, €, ★ , etc.) are not supported. Only ASCII characters can be selected or entered when creating a search pattern.

The Create Search Pattern dialog is displayed.

5. Enter the pattern name to identify them on the Content Library page. The name must be unique and can contain a maximum of 256 characters. Use only letters, and numbers.

   Note: Search Pattern names cannot contain spaces.

6. Enter one or more keywords in the Keywords field. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.

   Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting a regular expression match.

7. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**.

   The port numbers must be between **1** and 65535.

8. Select a specific policy from the drop-down menu for the pattern to be applied.

   IMPORTANT: If the policy has no associated groups and services, or services not managed by CCM, then no policy will be available. In such cases, you have the option to **Create** only the pattern and then navigate to **Content Library** > **Policies** page and create a policy and apply to them.

   Note:
   - The option to **Create and Publish** the pattern is only available if you have selected a policy from the drop-down menu.
   - You can remove a selected policy from the **Policy** drop-down menu using the **X** option.

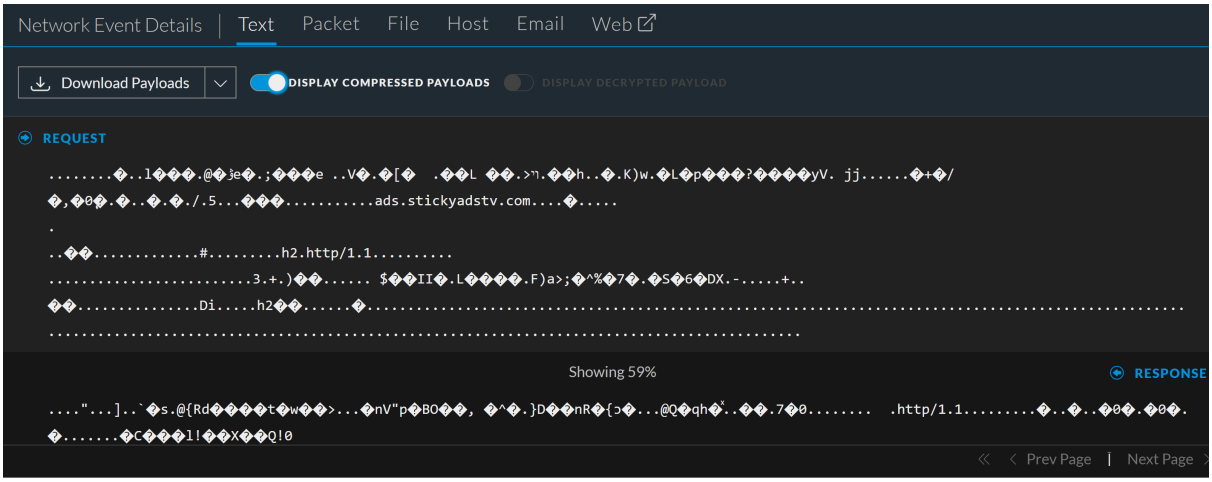
9. Click **Create and Publish**.

   The message is displayed that the pattern is created successfully.

10. From the Success message, you can click the hyperlink **Content Library** and then navigate to the **More** > **Search Pattern Rule** tab, where the pattern is created.

    If you want to modify the same search pattern properties. Contact your administrators.

View Decompressed Text in an HTTP Network Session in the Text Tab

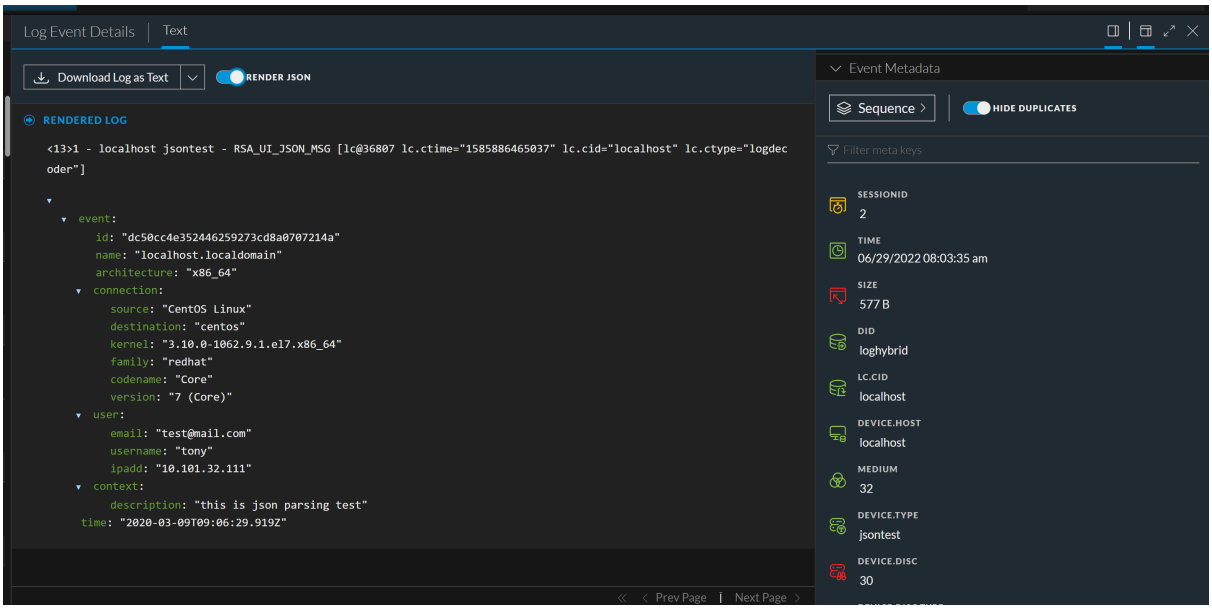


When the content of an HTTP network session is compressed and you are viewing the Text tab, NetWitness displays decompressed content by default. This helps you to determine if there are any patterns and view the readable characters. You can switch between a compressed and decompressed view of compressed text.

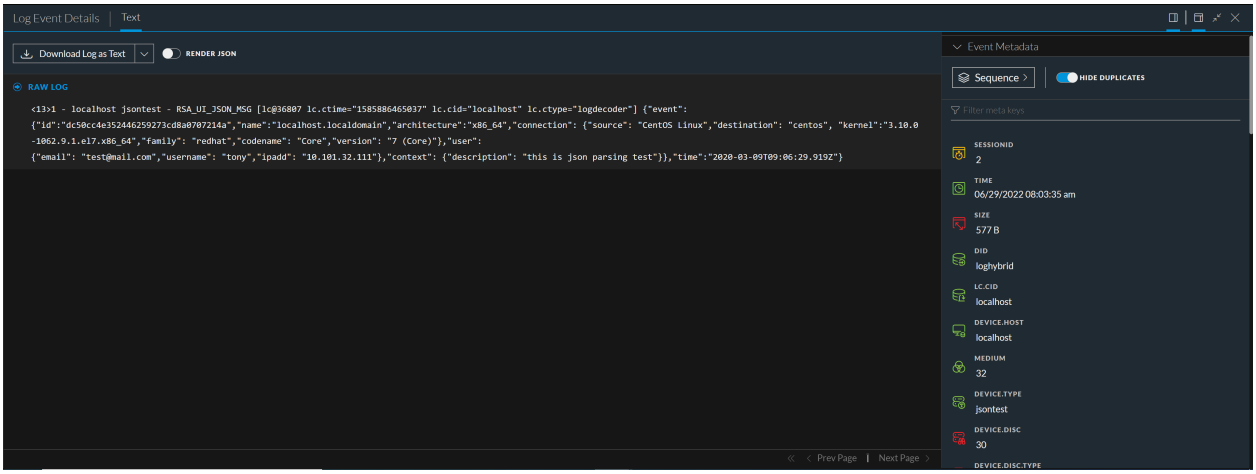
The toggle for changing between compressed and decompressed text is only displayed in the Text tab, and is enabled only if there is compressed text content.

1. Open the Text tab of an HTTP session that contains compressed content.
   By default the session is reconstructed with the text decompressed, and above the reconstruction, is the **Display Compressed Payloads** toggle switch.

2. To view the same text in its compressed form, click the toggle switch.
   The view changes so that the compressed text is no longer readable, and the switch indicates the Display Compressed Packets is on.



3. To return to the view of decompressed text, click the switch again.

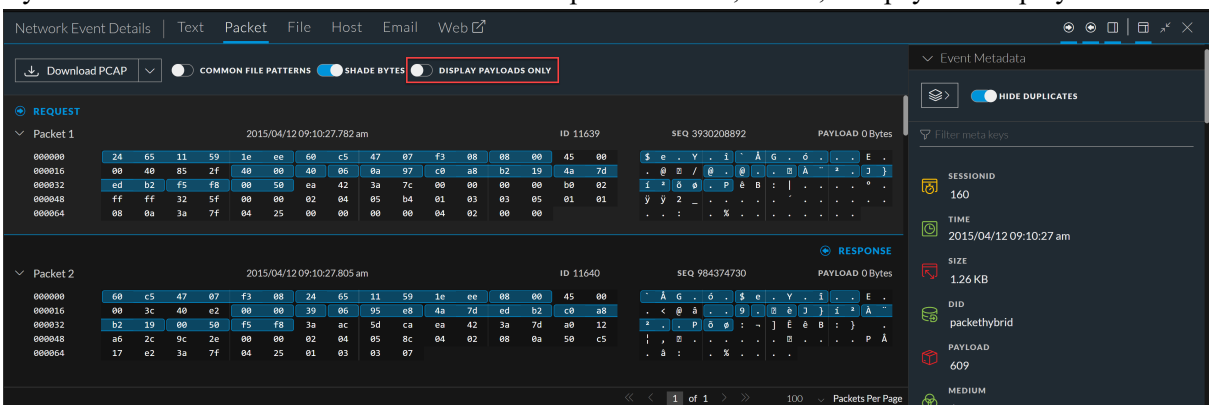


View a JSON String in Tree Format in the Text Tab

(From Version 11.5.1) You can view a text reconstruction of a log event in easy-to-read JSON format instead of the raw block format using the Render JSON toggle switch. By default, the switch is enabled, and JSON snippets in a log event are detected and displayed in fully expanded tree format. Invalid JSON snippets are presented as raw text. If you change the setting of the switch, your setting persists in local storage.

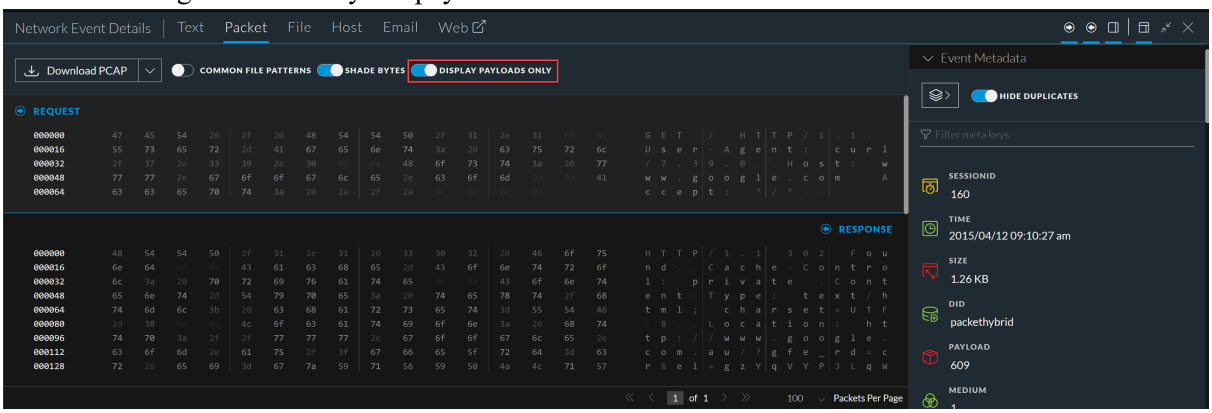
1. In the **Events** view, open a log event in Text tab.
   If the raw log contains JSON strings and the Render JSON switch is enabled, all JSON strings found are rendered in tree format.

2. If you prefer to see the log as raw text, click the Render JSON switch.
   The log is rendered as a single block of text without the nested indentation. The setting persists until you change it and will be in the same state when you log in again.



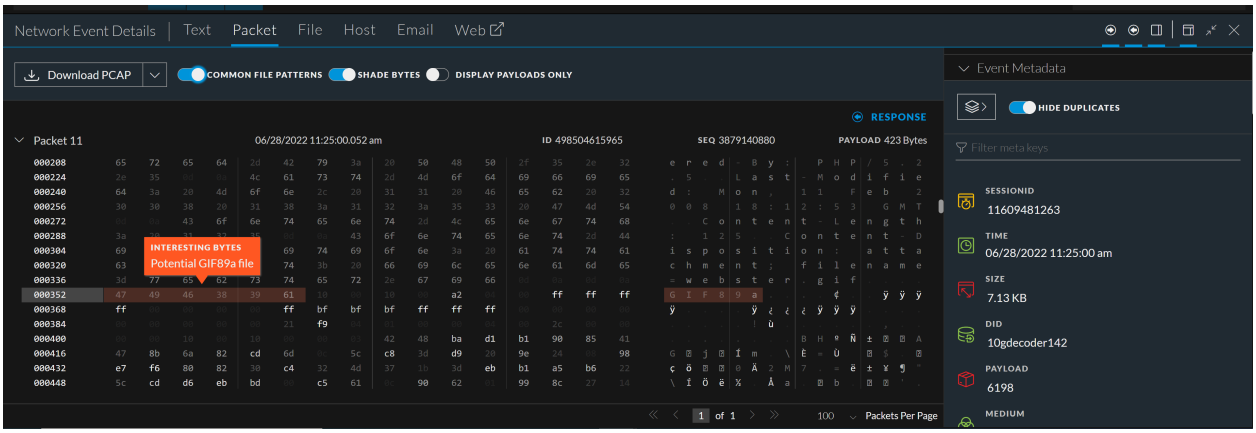
Use the Payload Only Option in the Packet Tab

When viewing a reconstruction of a network session in the Packet panel, you can hide the header and footer bytes. The view changes so that only the payload is visible and contiguous same-side packets are concatenated together to make the payload more readable and understandable. This setting persists until you change it or refresh the browser.



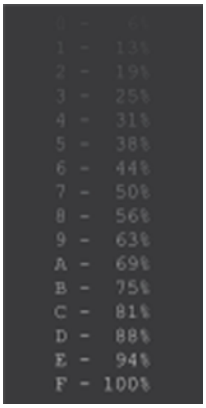
- With the Display Payloads Only option off, the number of packets, packet header, packet footer, and payload are displayed.
- With the Display Payloads Only option on, no packet header and footer bytes are displayed. Only the packet content of 16 hexadecimal bytes per line and the corresponding ASCII per line is displayed.

1. In the **Events** view, go to the Packet tab of a network session.
   By default the session is reconstructed with the packet header, footer, and payload displayed.



2. To change the view to show only the payload for each packet, click the **Display Payloads Only** toggle switch.

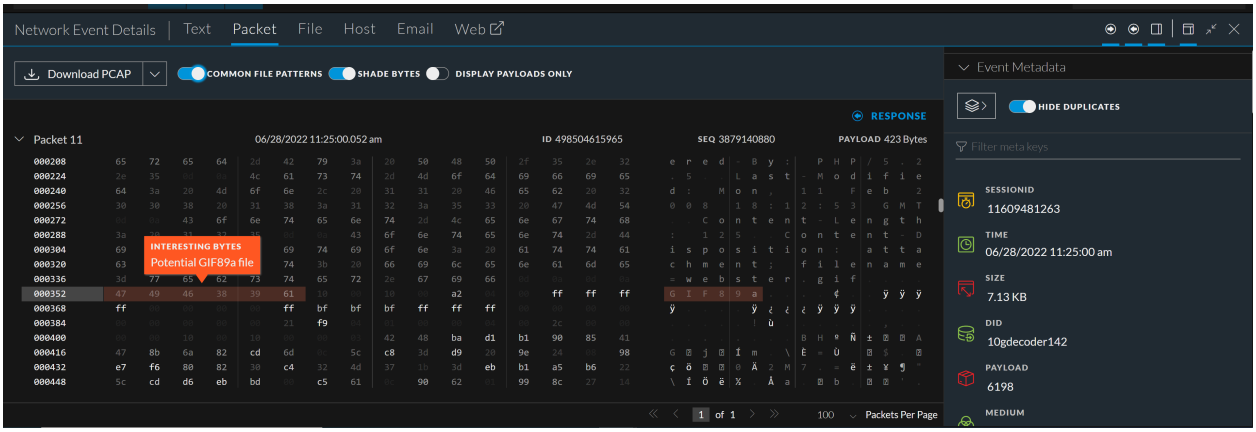
The view changes so that only the payload is visible.



View Highlighted Bytes in the Packet Tab

When you open a reconstruction in the Packet tab, the significant header bytes in each packet are highlighted in blue, and the payload bytes are distinguished using shading to help you understand the contents of the packet. This figure shows the default appearance of the packet reconstruction with highlighting and byte shading.

The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. Bytes near the lower range are more transparent, and bytes near 255 are more opaque. Both hexadecimal and ASCII bytes are shaded. This is an example of the shading applied to each hexadecimal byte.



The Shade Bytes switch controls the shading of bytes. When you set Shade Bytes on or off, your setting persists until you change it or refresh the browser.

Highlight Common File Types in the Packet Tab

In the Packet tab, analysts can show or hide highlighting of certain common file types based on the file signature. When the Common File Patterns feature is turned on, the magic number bytes in the file signature are highlighted in the payload and you can hover over the highlighting to see the potential type of file. In this example, `42 4d` is highlighted in the hexadecimal payload and `BM` is highlighted in the ASCII payload. When you hover over the highlighted bytes, the potential file type associated with the magic number is provided in a hover box.

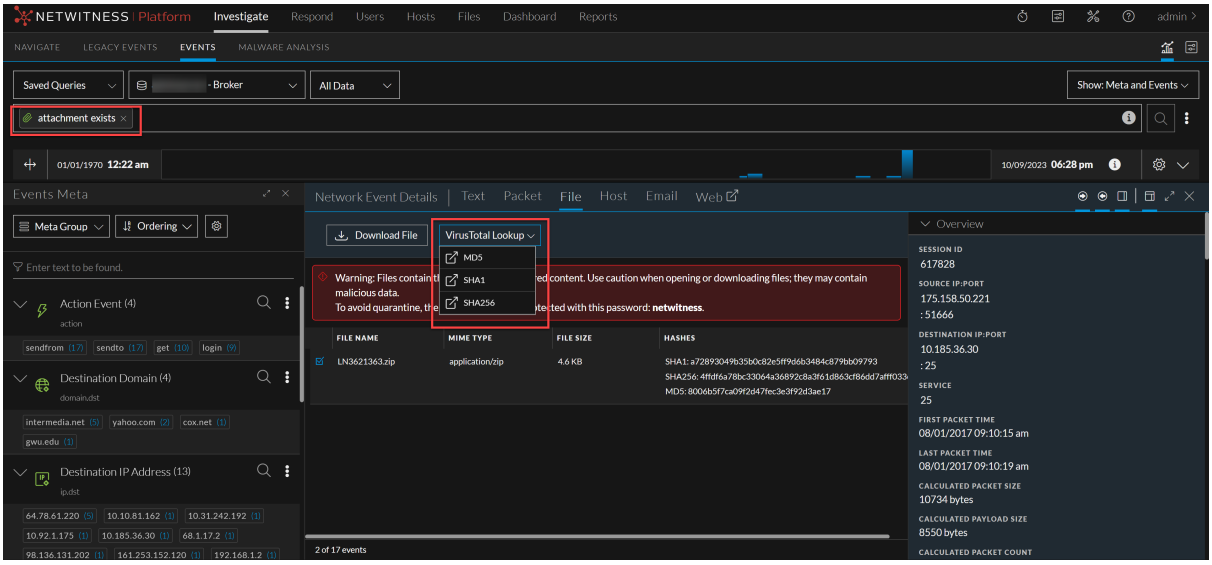
To view common file signatures in the Packet tab:

1. With a reconstruction open in the Packet tab, turn on the **Common File Patterns** option.
   If there is more then one highlight in view, all are shown.
2. To view the hover box, place the cursor over the highlighting.

These are the file types and corresponding magic numbers that are highlighted if present in the payload:

File Type	Hexadecimal Signature	ASCII Encoding
DOS Executable / Windows PE	4D 5A	MZ
Portable Network Graphics (PNG)	89 50 4E 47 0D 0A 1A 0A	PNG
JPEG	FF D8 FF	JPEG
JPEG/JFIF	4A 46 49 46	JFIF
JPEG/Exif	45 78 69 66	Exif
GIF	47 49 46 38 37 61	GIF87a
GIF	47 49 46 38 39 61	GIF89a
Non-portable Executable	5A 4D	ZM

File Type	Hexadecimal Signature	ASCII Encoding
BMP	42 4D	BM
PDF	25 50 44 46	%PDF
Old Office Document (doc, xls, ppt, msg, and other)	D0 CF 11 E0 A1 B1 1A E1	ÐÏ.à¡±.á
ZIP file formats and formats based on it, such as JAR, ODF, OOXML	50 4B	PK..
7-Zip File Format (7z)	37 7A BC AF 27 1C	7z¼¯'
Java Class File, Mach-O Fat Binary	CA FE BA BE	Êþº¾
Postscript	25 21 50 53	%!PS
Unix/Linux Shell script	23 21	#!
Executable and Linkable Format (ELF) executables	7F 45 4C 46	.ELF



Launch a VirusTotal Lookup for a File

(From Version 12.3 and later) In the Events view, while analyzing a file, you can search VirusTotal with hashes (MD5, SHA1, and SHA56) to get more information about the file. It helps determine if a file is malicious from multiple antivirus vendors.

To launch the search

1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. In the **Events** view, go to the file reconstruction of an event that contains files.

4. Select a file and click the **VirusTotal Lookup** to perform a search on **MD5**, **SHA1**, or **SHA256**.

Note: You can only select one file at a time for VirusTotal Lookup.

Reconstruct an Event in the Legacy Events View

When viewing a list of events in Legacy Events view, you can safely create a reconstruction of the event in a readable form that matches the original. By default, the initial view of a reconstructed event is the most suitable format (Best Reconstruction); for example, web content is reconstructed as a web page; an IM conversation is displayed with both parts of the conversation. Each user can select a different default reconstruction in the Profile > Preferences view.

You can also open a reconstruction from the Navigate view if you know the Event ID of the event.

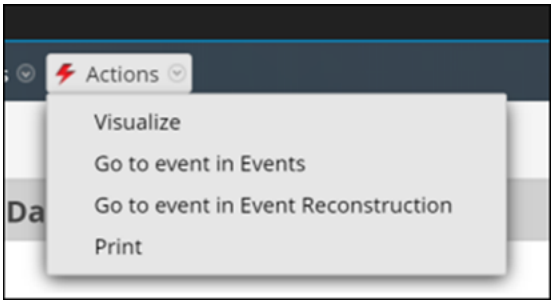
In the reconstruction, you can:

- Select event information to view. Possible values are: request data, response data, both request and response data.
- Select the reconstruction type: details, text, hex, packets, web, mail, or IM.
- Export raw logs.
- Export the event as a PCAP file.
- Extract any files available in the event.
- Extract all the meta data associated with the event.

  Caution: Be careful when clicking a link to a file in the Reconstruction. If your system has an application associated with the file, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

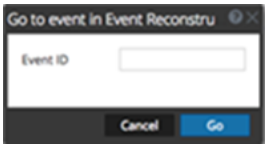
- Display the event in a separate window or tab (depending on your browser configuration).
- If you are viewing the reconstruction as a preview in the current view, you can page forward to the next event and back to the previous using the navigation buttons in the bottom left corner.

IMPORTANT: In legacy web reconstruction, HTTP2 sessions only support web reconstructions, not text reconstructions. However, to view text reconstructions for HTTP2 sessions, you can check on the **Events** page.



Note: Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation (as described in the *System Configuration Guide*). When analysts reconstruct sessions, two situations can affect performance and results.
- Some large events contain many thousands of source packets. Reconstructing these sessions can degrade application performance.
- In some cases, the reconstruction cache can present incorrect content; for this reason, NetWitness cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

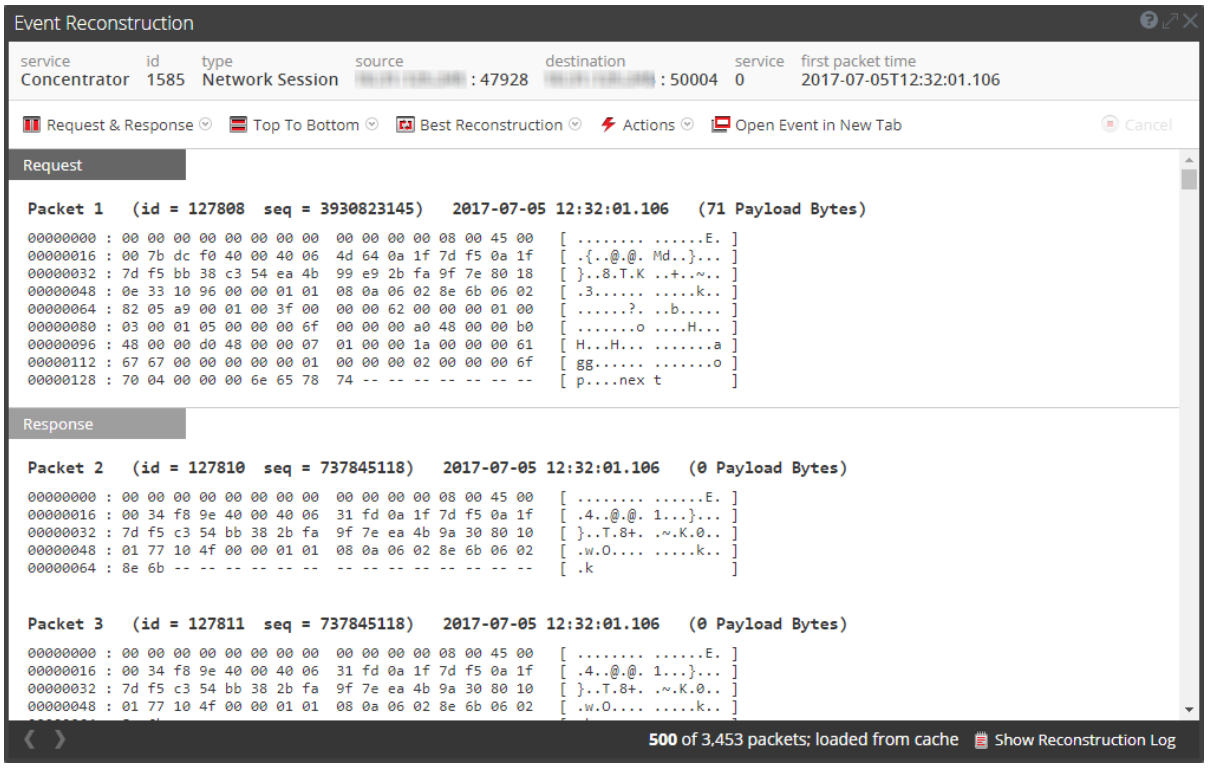
Reconstruct an Event Using an Event ID



You can reconstruct an event directly from the Navigate view given a known Event ID. You can use this option without executing a query as you usually do when beginning an investigation. A service and time range must be selected to be able to jump directly to an event using just its `eventid`.

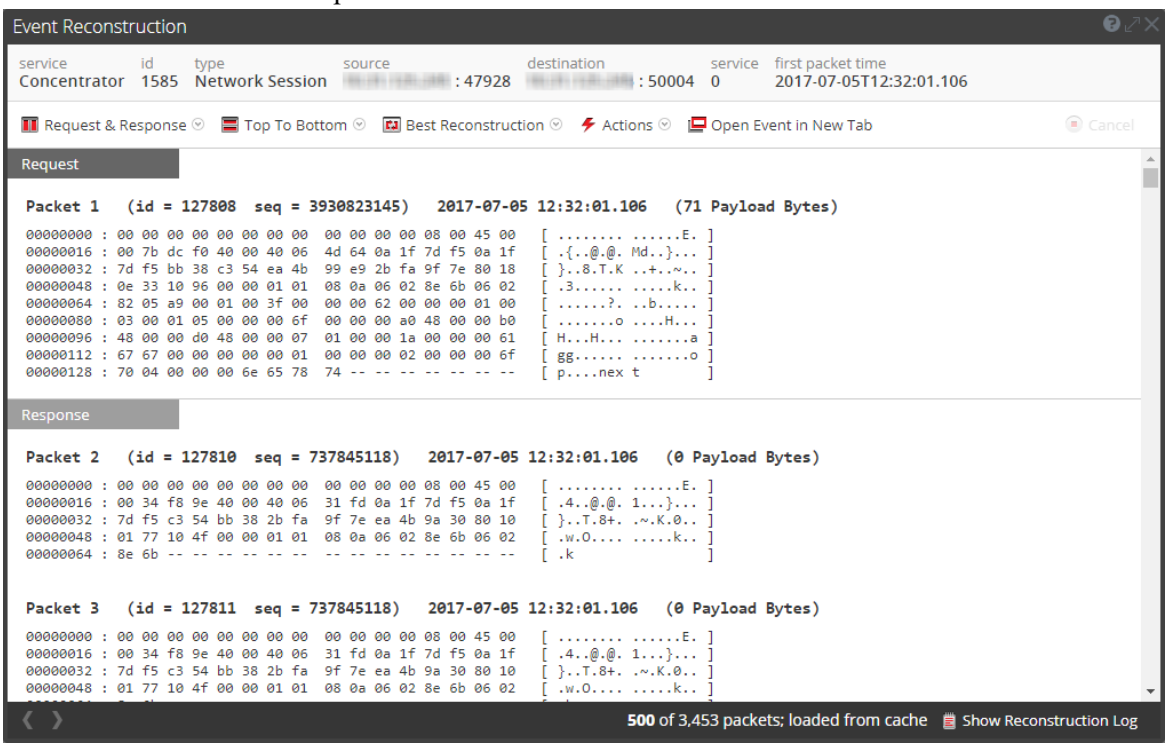
To view a reconstruction or event analysis directly from the Navigate view:

1. Go to **Investigate** > **Navigate** and select **Actions > Go to event in Events** or **Go to event in Event Reconstruction**.



The Go to event dialog is displayed. There are two dialogs, one for Events and one for Legacy Event reconstruction. Both ask for the Event ID.

2. In the **Event ID** field, type the ID and click **Go**.
   The specified event is reconstructed in the legacy Event Reconstruction view or the Events view.



Reconstruct an Event from a Drill Point in the Navigate View

1. Click the count (the green number following a value) for a value in the Navigate view to open a drill point in the **Events** view.
2. To show all meta data, click + Show Additional Meta .
3. To open an event reconstruction in the Legacy Events view, select an event to reconstruct and select **Actions > View Event > Preview Inline**.
   The Event Reconstruction opens in a popup window in the same view. By default, NetWitness displays the best reconstruction for the event determined by the event content or the reconstruction that you have selected in the Default Session View setting for Investigation. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view side-by-side results, export an event, open an email attachment, extract files, and open the event in a new tab. The toolbar options vary depending on the type of event being reconstructed (network event, log event, or endpoint event). This is an example of the reconstruction for a network event.

4. To preview a reconstruction of the next event, click  in the lower left corner of the reconstruction or to preview a reconstruction of the previous event, click .
5. To open an event reconstruction in a new tab, do one of the following:
   a. In the **Legacy Events** view, select an event to reconstruct and select **Actions > View Event > Open in New Tab**.
   b. In the **Event Reconstruction** toolbar of previewed reconstruction, click **Open Event in New Tab** in the toolbar.

The Event Reconstruction opens in a new tab.

View Side by Side or Top to Bottom

To select the way requests and responses for an event are displayed:

1. In the **Event Reconstruction** toolbar, click **Top to Bottom** or **Side by Side**.
2. In the drop-down menu, select the information you want to see in the event: **Side by Side** or **Top to Bottom.**
   The reconstruction is refreshed with the selected information.

Select Event Information to View

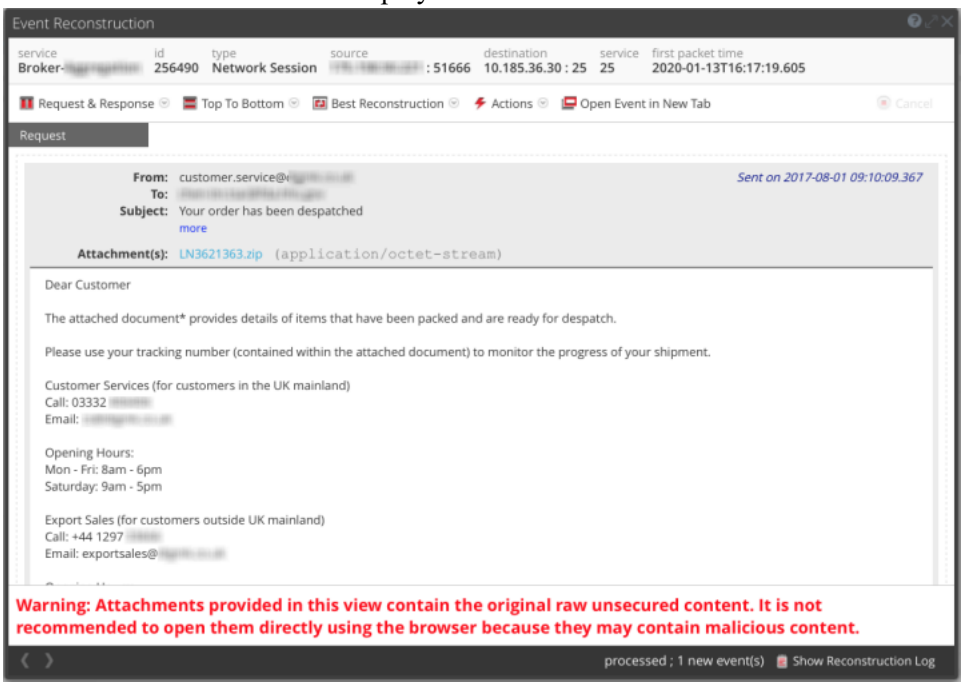
To select what event information to view:

1. In the **Event Reconstruction** toolbar, click **Request & Response**.
2. In the drop-down menu, select the information you want to see in the event: **Request & Response**, **Request**, or **Response**.
   The reconstruction is refreshed with the selected information.

Select Event Reconstruction Type

To select the reconstruction type for an event:

1. In the **Event Reconstruction** toolbar, click **Best Reconstruction**.
2. In the drop-down menu, select the reconstruction type to view: **meta**, **text**, **hex**, **packets**, **web**, **mail**, or **files**.
   The reconstruction is refreshed with the selected reconstruction type.



Open or Download an Email Attachment

When viewing a reconstruction of an email that has attachments, you can open supported file types or download the files to the local system.

Caution: Be careful when selecting file attachments. If your system has an application associated with the file attachments, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

To open or download email attachments:

1. In the **Event Reconstruction** toolbar, select the **View** drop-down and select **View Mail**.
   The Event Reconstruction is displayed.

2. In the **Event Reconstruction** section of the email, click the Attachment.
   If the file type is supported by the browser, the attachment will open in a new tab.
   If the file type is not supported, the Download dialog is displayed so that you can download the attachment.

Export an Event as a PCAP File

The PCAP export option downloads the sessions for the current time range and drill point to a PCAP file. To export an event as a pcap file:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Export PCAP**.
3. A confirmation dialog is displayed.
4. Click **OK**.
   The job is scheduled and when complete the PCAP is downloaded to the local file system. In the Profile > Jobs tab, you can download the PCAP.

Extract Files from a Reconstructed Event

The Extract Files option extracts and downloads the files associated with the event. To extract files:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Extract Files**.
   The File Extraction dialog is displayed.
3. Select the types of files to extract, and click **OK**.
4. The job is scheduled and when complete the selected file types are downloaded to the local file system. In the Profile > Jobs tab, you can download the files.

Look Up Additional Context for Results

The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

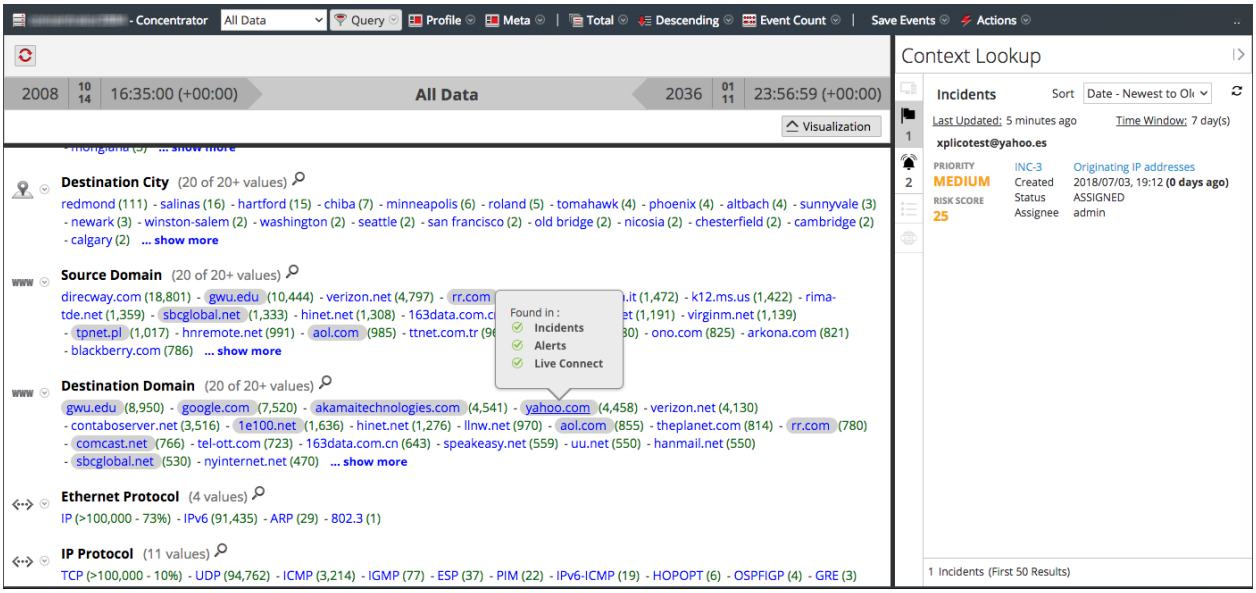
To enable viewing of contextual information, your administrator must add the Context Hub service in NetWitness Platform and configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*. Analysts also need a role with the permission `Context Lookup` as described in **Role Permissions** and **Manage Users with Roles and Permissions** in the *System Security and User Management Guide*.

When the Context Hub service is enabled and configured, NetWitness provides enrichment data from NetWitness Respond, custom lists, and NetWitness Endpoint directly in the Navigate view, Events view, and Legacy Events view. A visual cue highlights meta values for which enrichment data is available in the Investigate views, and you can click on the highlighted value to look up the contextual information and intelligence. You can look up details and intelligence about elements associated with an event in the Context Hub. These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name, or a file hash. The data from configured sources, such as NetWitness Endpoint, can help you understand what is happening. In Version 11.5 and later, you can add STIX data sources and view related data using context lookup; associated elements are IP address, file name, file hash, domain name, and URL.

In addition, you can add lists and list values for Context Hub enrichment; you can view lists, edit meta values in an existing list, or create a new list. When you add meta values to a list, you can investigate the meta values using the context lookup option.

For an analyst to manage lists in Investigate, the administrator must:

- Enable the Context Hub service.
- Assign an analyst role with permission `Manage List from Investigation` to the user who will perform Context Lookup from Investigation views.
- Configure appropriate roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.



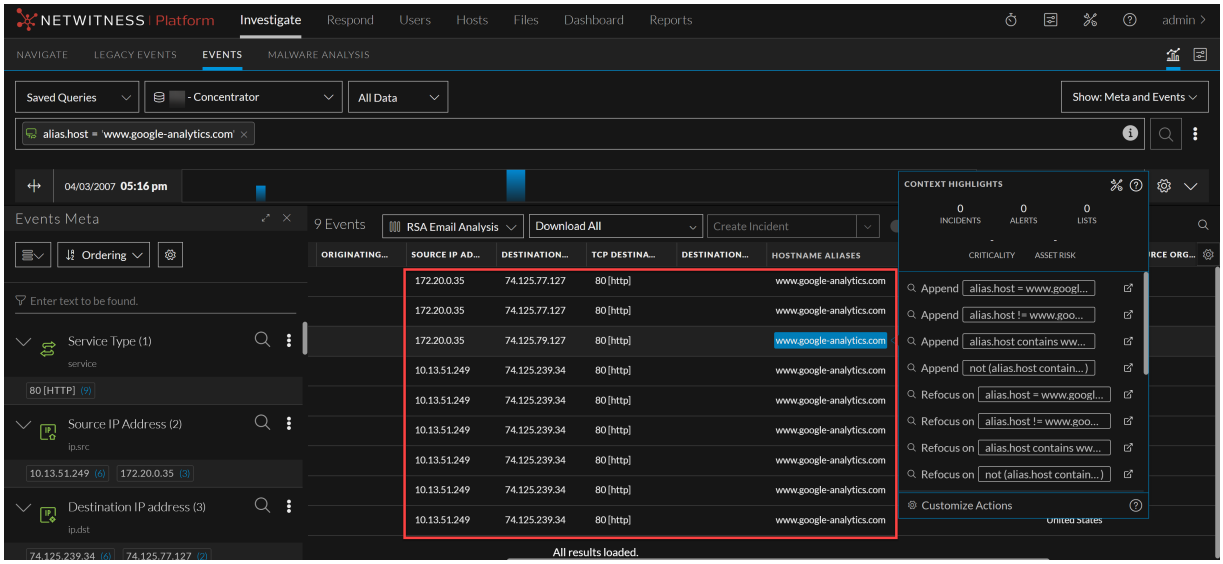
In Version 11.6 and later, you can add REST API data sources and view related data using context lookup. Also, Administrators can now configure specific Context Hub sources (For example, specific lists, Respond, Endpoint, and so on) for context highlighting during investigation. If context highlighting is disabled for a Context Hub source, analysts will see results from all the data sources when opening the Context Panel for a meta value, but the values are not highlighted in the Investigation views. In the View Context:

- No data is shown if the meta values is not highlighted.
- If there are entities common across different data sources, the meta values for those entities are underlined for all the data sources, but the data is shown only for the data source on which context highlighting is enabled.

Open the Context Lookup Panel

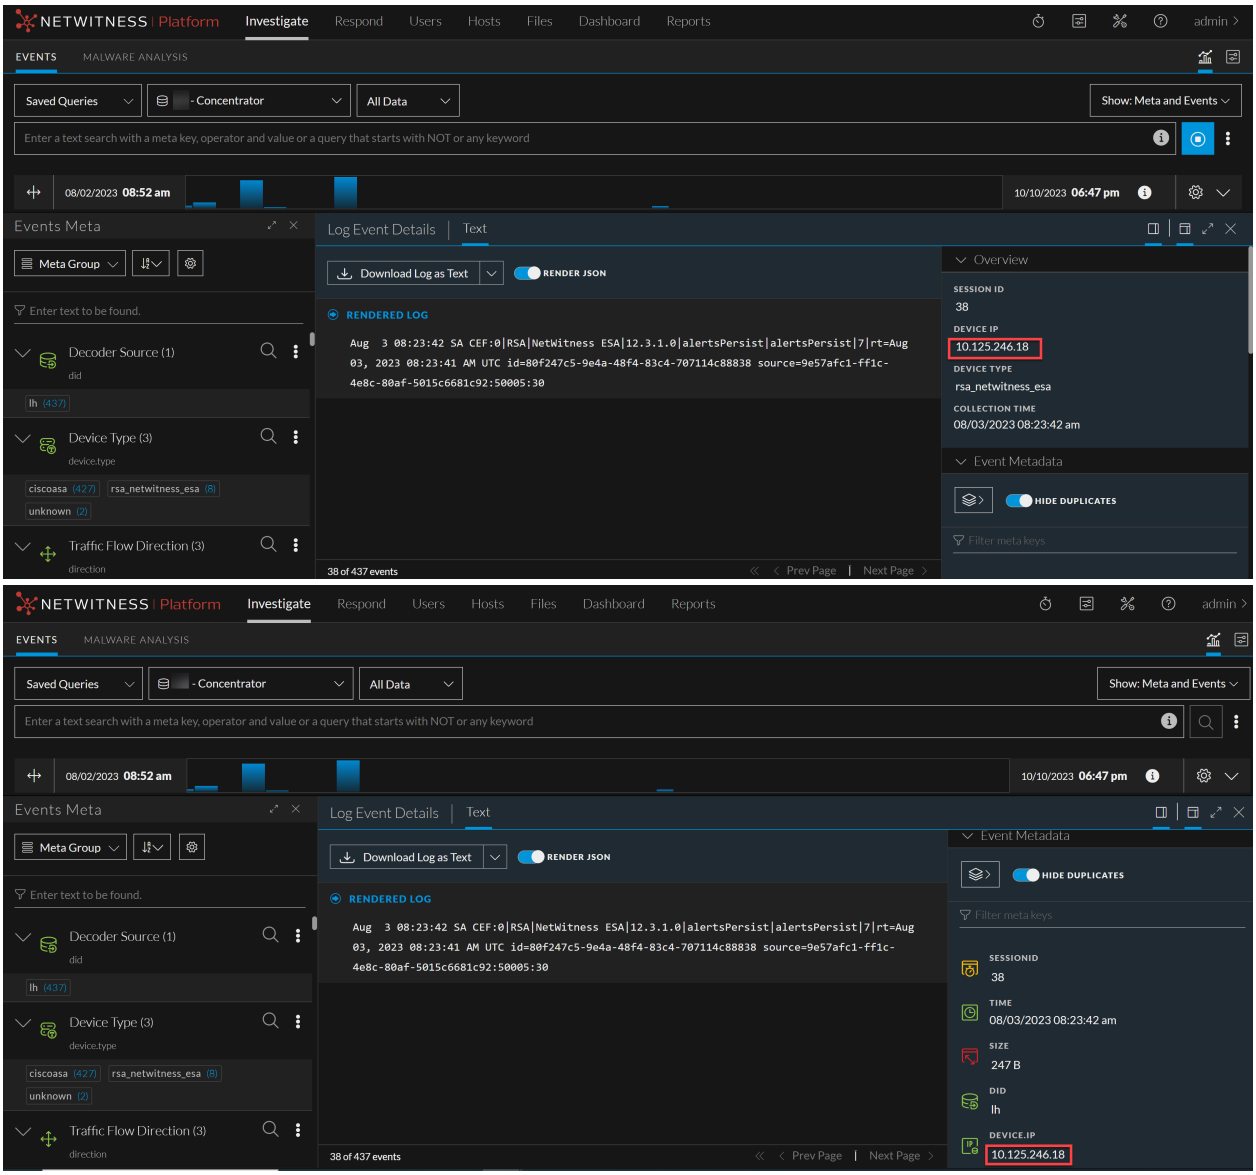
In the Context Lookup panel, you can view and explore individual data sources for further investigation. For a detailed description of the information displayed for each data source, see Context Lookup Panel.

In the Navigate view and Legacy Events view, entities that have associated context data available are highlighted with a gray background; hovering over an entity displays a hover box giving a summary of the available data. When you right-click the entity, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by right-clicking on another entity, and the Context Lookup panel is updated with that entity's information.



Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Users** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

In the Events view, you can see underlined entities in the Events panel, the Event Header, or the Event Meta panel. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

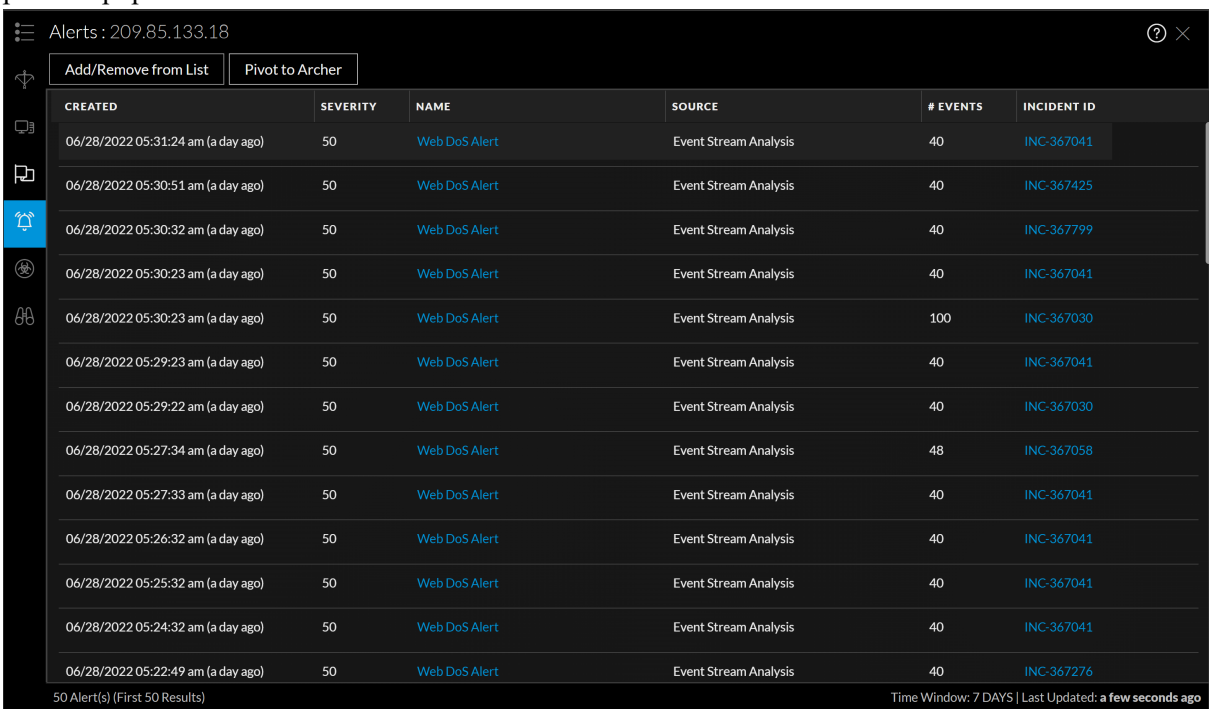


The following figure shows underlined entities in the Events panel with the context tooltip open. The context tooltip has two sections: Context Highlights and Actions.

- The information in the Context Highlights section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, and STIX. Depending on your data, you may be able to click these items for more information.
- The **Actions** section lists the available actions. In the example, the Add/Remove from List, Pivot to

Investigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.

The following figures shows bolded entities in the Overview and the Event Meta panel.



When you click **Context Lookup** in the context tooltip, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by using the View Context option on another entity, and the Context Lookup panel is updated with that entity's information.

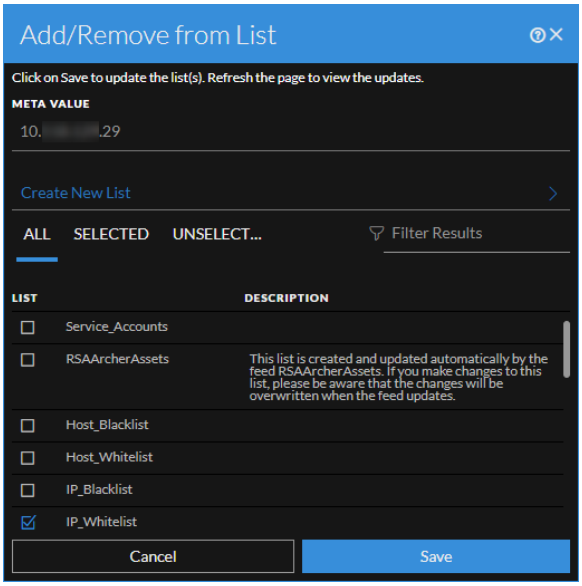
You can also take any available action in the Actions section.

To view information in the Context Lookup panel in the Events view

1. In the Events view, left or right-click an underlined entity.
   A context tooltip displays a list of the context data available for the selected meta value.
2. Click **Context Lookup** in the context tooltip to open the Context Lookup panel.
   The Context Lookup panel opens from the right side of the browser window. The Context Lookup

panel is populated with the information from the Context Hub as it becomes available.

3. To perform actions on an entity, select one of the available actions in the context tooltip: Add /Remove from List, Pivot to Archer. For more information, see Pivot to Archer (Events View), and Add an Entity to a Whitelist.



Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the Archer configuration is enabled and configured properly.

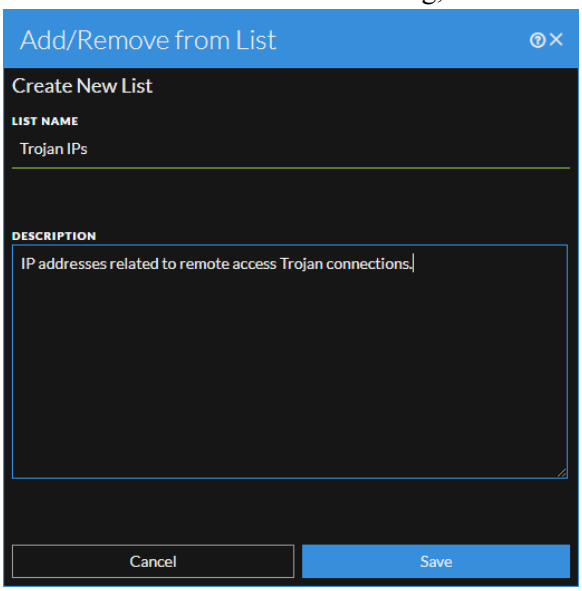
Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.

2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.

3. Select one or more lists and click **Save**.
   The entity is added to the selected lists.



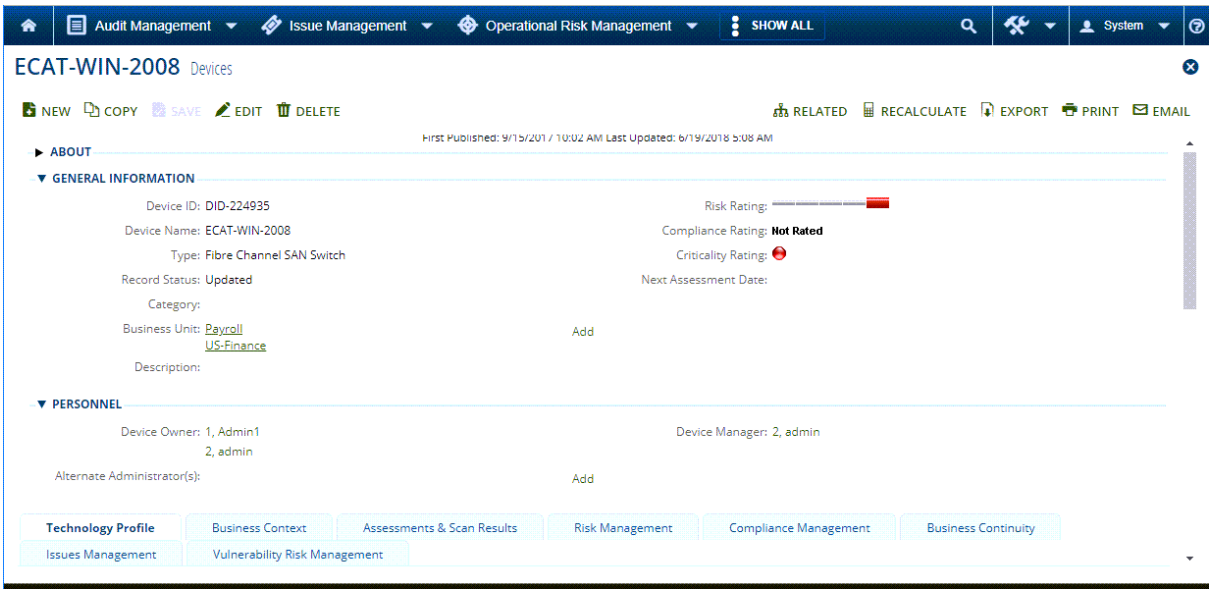
Create a List (Events View)

You can create lists in Context Hub from the Events view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in the Context Hub

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.

3. In the Add/Remove from List dialog, click **Create New List**.

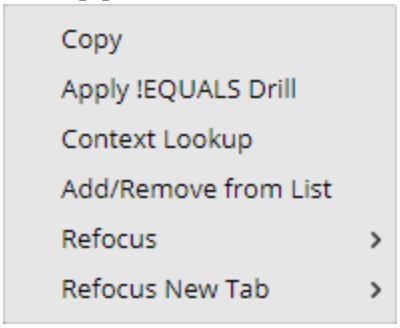


4. Type a unique **List NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

Pivot to Archer (Events View)

For viewing more details about the device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity (IP address, host, and Mac address).
2. In the **Actions** section of the context tooltip, select **Pivot to Archer**.
3. The device details page in **Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

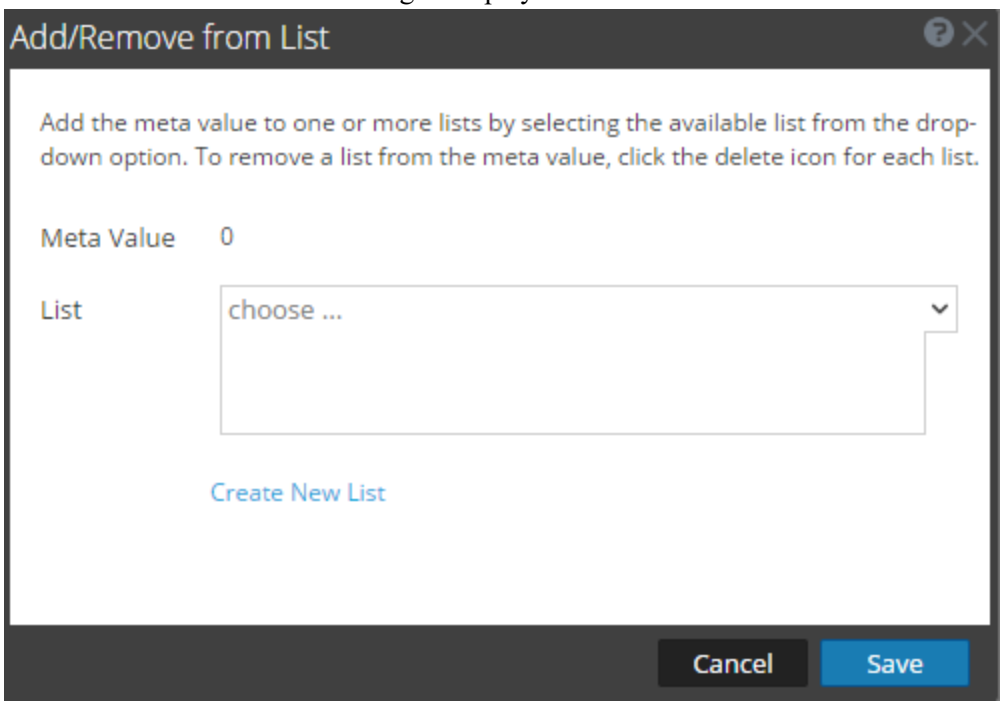


Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *Archer Integration Guide*.

View the Context Lookup Panel in the Navigate View or Legacy Events View

1. Hover over different meta values to see the data sources for which data is available.
   A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.
2. Right-click a meta value, and click **Context Lookup** in the drop-down menu to open the Context Lookup panel.



The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.

3. To perform actions from the Context Lookup panel, right-click an entity such as IP address.
   The following options are available: Open Link in New Tab, Query in Investigate, Copy Link, Paste, Google Lookup, Virus Total Lookup, and Query in Endpoint.
4. To close the Context Lookup panel, click ☒ in the panel.

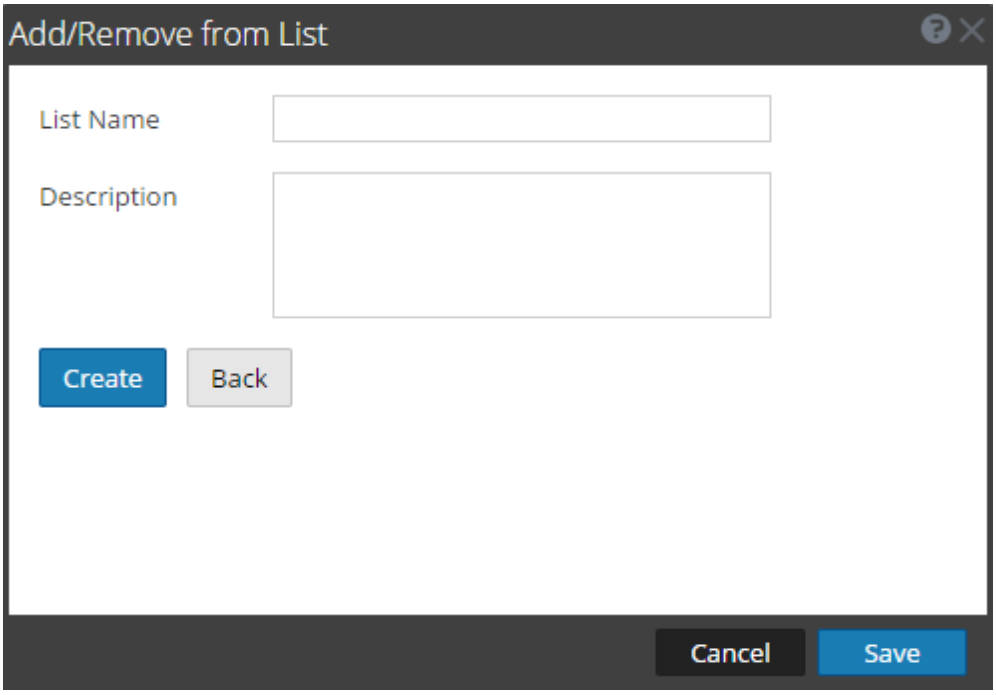
Add Meta Values to an Existing List (Navigate and Legacy Events Views)

To add a meta value to an existing list in Context Hub

1. While investigating a service in the **Navigate** view or the **Legacy Events** view, right-click a meta value (for example, values under Source IP, Destination IP, or Username) and select **Add/Remove from List** in the context menu.
   The Add/Remove from List dialog is displayed.

2. In the **List** field, select one or more lists from the drop-down option to which the meta value must be added.
3. Click **Save**.
   The meta value is added to the selected lists.

Remove a Meta Value from a Context Hub List (Navigate and Legacy Events Views)



To remove a meta value from list

1. In the **Add/Remove from List** dialog, in the **List** field, view the lists which include the meta value.
2. Click the delete icon (x) for each list that should not include the meta value.
3. Click **Save**.
   The meta value is removed from the deleted list.

Create a New List (Navigate and Legacy Events Views)

To create a Context Hub list in Investigate

1. In the **Add/Remove from List** dialog, click **Create New List**.

2. In the **List Name** field, enter an unique name for the list.
3. In the **Description** field, enter the description of the list.
4. Click **Create** to create the list.
5. Click **Save** to add the meta value to the created list.
   These lists are considered as data sources for retrieving context information.

Launch a Lookup of a Meta Key

When you have found data of interest in the Navigate view, the Events view, or the Legacy Events view, you can do internal lookups to NetWitness Endpoint and RSA Live, as well as external lookups of meta values in community resources such as SANS IP History and ThreatExpert Search.

Analysts can use the external lookups to save time during investigations. The external lookups are available by right-clicking one of the these meta keys: IP address (`ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip`), `host (alias-host, domain.dst)`, `client`, and `file-hash`.

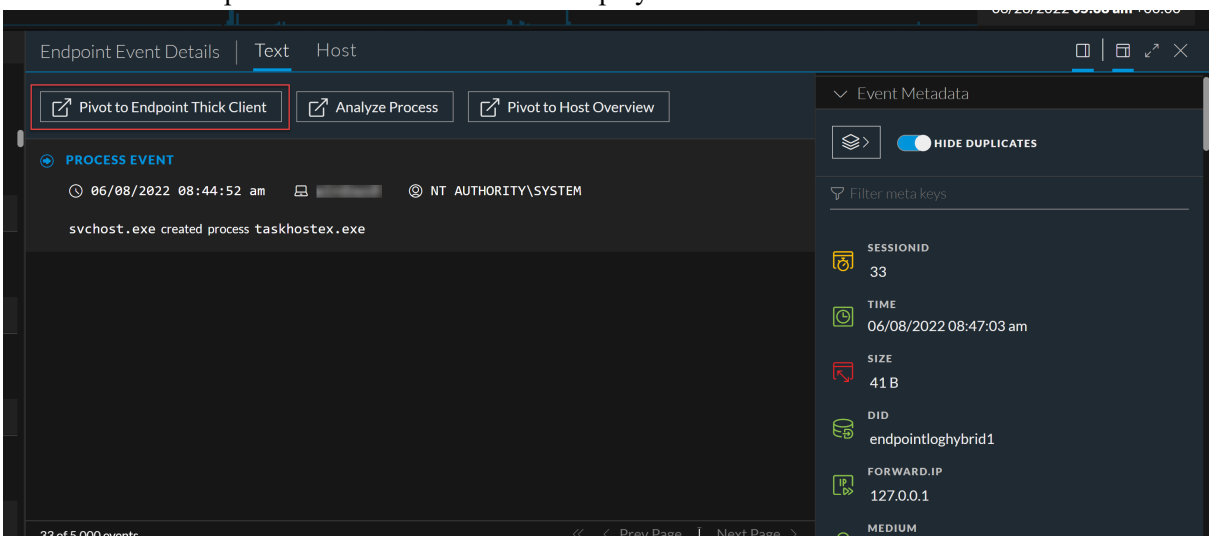
For all `ip` and `host` meta keys, the following lookups are built in to NetWitness:

- Google Malware: Opens a Google Malware search in a new tab.
- SANS IP History: Opens a SANS IP History search in a new tab.
- McAfee SiteAdvisor: Opens a McAfee SiteAdvisor search in a new tab.
- Endpoint Thick Client Lookup: Opens a search in the NetWitness Endpoint Thick Client in a new tab.
- BFK Passive DNS Collection: Opens a BFK Passive DNS collection search in a new tab.
- CentralOps Whois for IPs and Hostnames: Opens a CentralOps Whois search for IPs and hostnames in a new tab.
- Malwaredomainlist.com Search: Opens a Malwaredomainlist.com search in a new tab
- Robtex IP Search: Opens a RobtexIP search in a new tab.
- ThreatExpert Search: Opens a ThreatExpert search in a new tab
- IPVoidSearch: Opens a UrlVoid Search in a new tab n a new tab

For the `file-hash` and `alias-host` meta keys, the Google lookup opens a Google search in a new tab.

For the `client` meta key, the NetWitness Endpoint Lookup option opens an Endpoint Thick Client in a new tab if the client is installed on the same system on which the browser is being used.

Administrators can add additional external lookups and other custom actions as described in "Add Custom Context Menu Actions" in the *System Configuration Guide*.



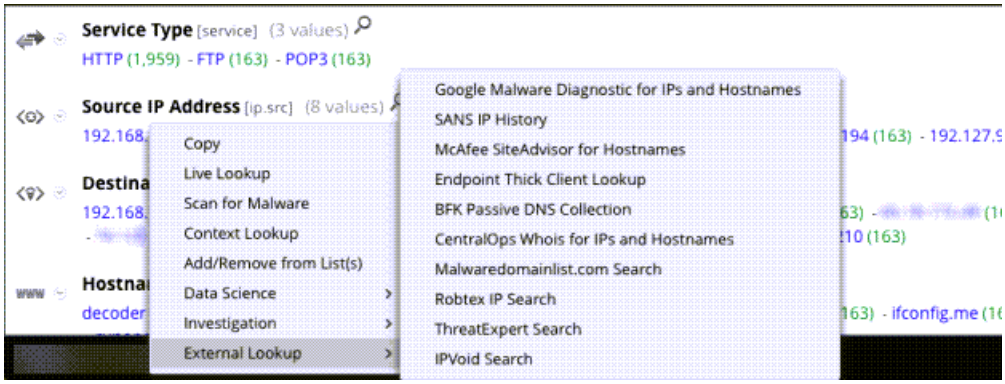
Launch an Endpoint Thick Client Lookup in the Events View

When viewing an endpoint event in the Text panel, you can pivot to analyze the same event in NetWitness Endpoint.

Note: Version 4.4.0.x of the NetWitness Endpoint (NWE) thick client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE thick client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

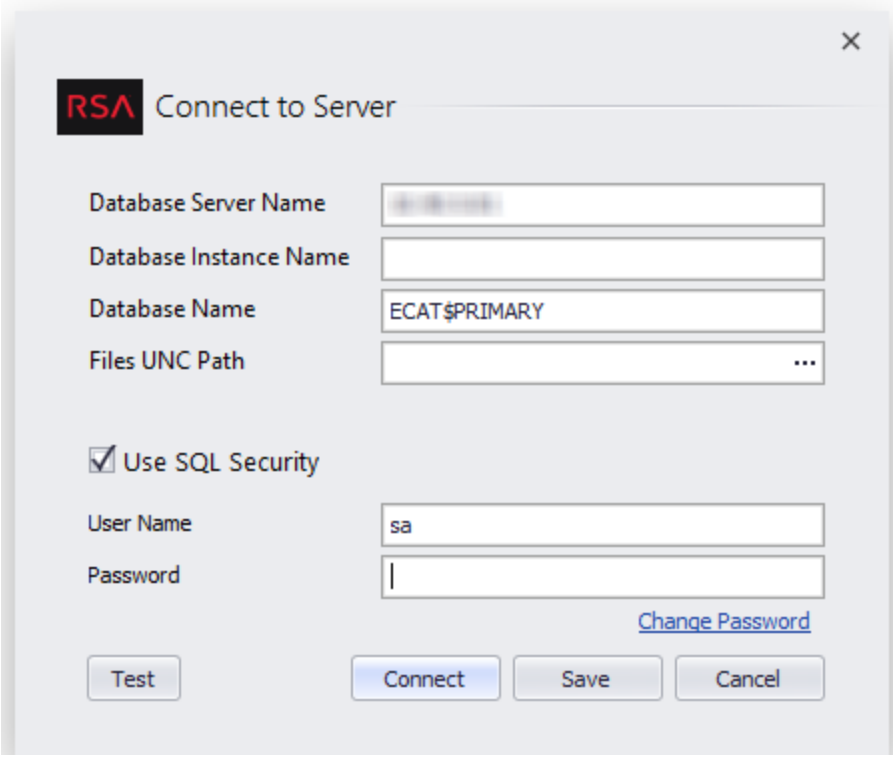
To open an event in NetWitness Endpoint:

1. Starting from the Navigate view:
   a. In the **Query** drop-down, select **Advanced**, and enter one of the following queries:
   `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Values panel.
   b. Right-click an event, and select **Events** in the menu.
2. (Version 11.1 and later) Go to **Investigate > Events**. In the **Query** drop-down, select **Advanced**, and enter one of the following queries: `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Events panel.
3. Select an event.
   The Events view opens with the selected event displayed in the Text view.



4. In the Event Header click **Pivot to Endpoint.**
   A new browser tab with the url `ecatui://<id>` opens and the NWE Thick Client is launched. If the NetWitness Endpoint Thick Client is not installed, no data is displayed and the following message is displayed: `Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`

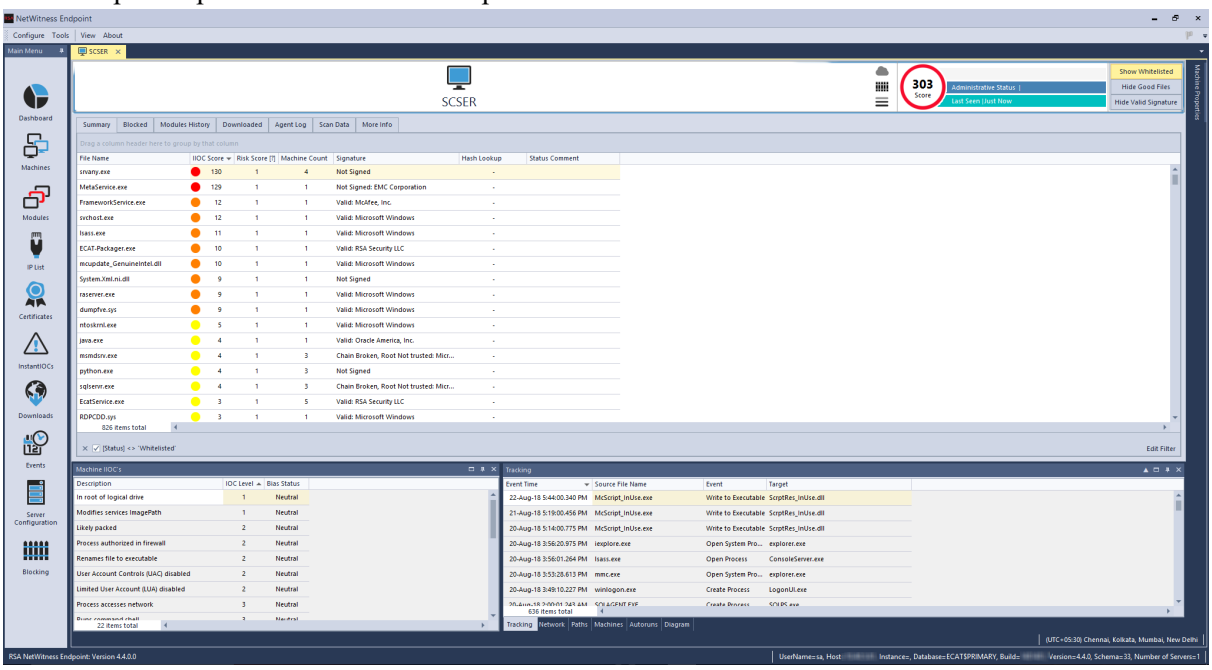
Launch an Endpoint Thick Client Lookup in the Navigate View



To launch an Endpoint Thick Client lookup of data from the Navigate view:

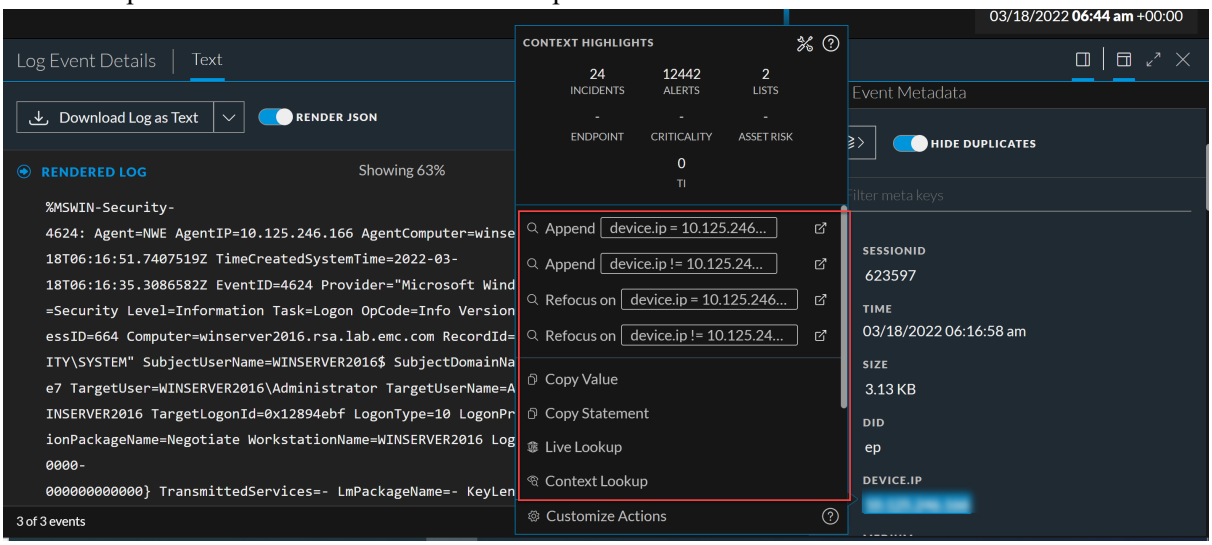
1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.

2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select **Endpoint Thick Client Lookup**.
   The Connect to Server dialog is displayed.

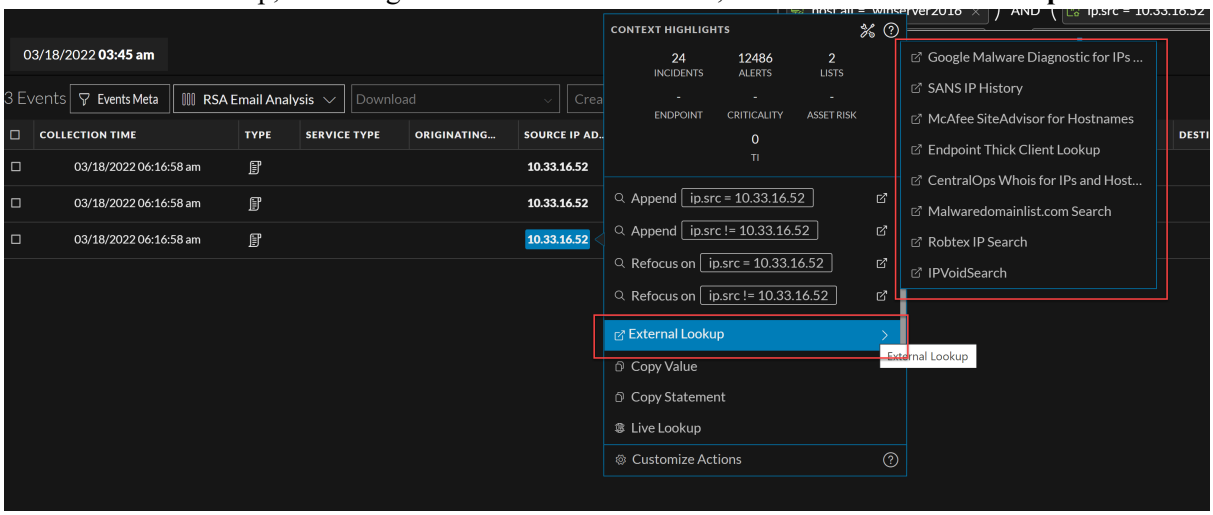
4. Enter the user name and password required to log in to the Endpoint Thick Client, and click **Connect.**



The drill point opens in NetWitness Endpoint.

Perform Lookups of Meta Values in Events

In the Events view, you can further investigate meta values in an event by left or right-clicking certain meta values and using the options in a drop-down menu. To perform internal, external and VirusTotal lookups:

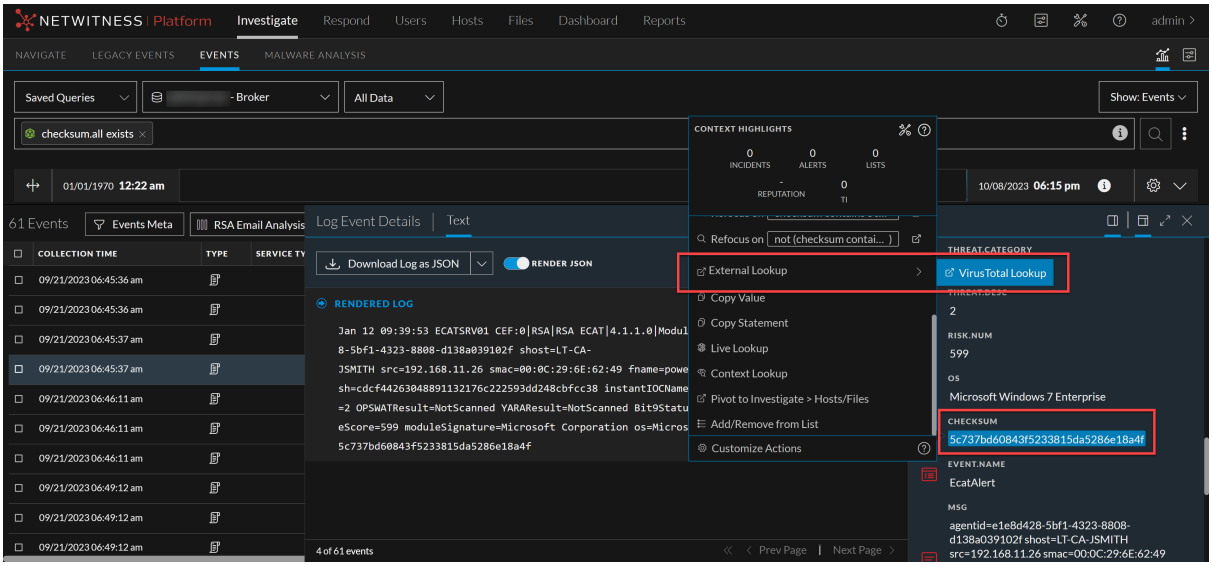


1. In the Events view, left or right-click a meta value in the Events List, the Event Meta panel, or the Overview panel. Some meta values have a drop-down menu.

2. Select one of the following internal lookups:

- **Copy Value**: Copies the meta value to the clipboard.
- **Refocus Investigation in New tab**: Launches the another investigation in a new tab with the focus on the selected meta value.
- **Apply Drill in New Tab**: Applies the drill and launches it in a new tab to drill the data in Navigate view.
- **Apply !EQUALS Drill in New Tab**: Applies (!EQUALS) to the meta and launches a new tab, effectively excluding the meta value from the results.
- **Hosts Lookup**: Looks up the value in the Investigate > Hosts view.
- **Endpoint Thick Client Lookup**: Analyzes the meta value in the Endpoint Thick Client (for clients which have Endpoint Agent).
- **Live Lookup**: Looks up a meta value on Live for further analysis.

3. For an external lookup, left or right-click on a selected meta, and click **External Lookup**.

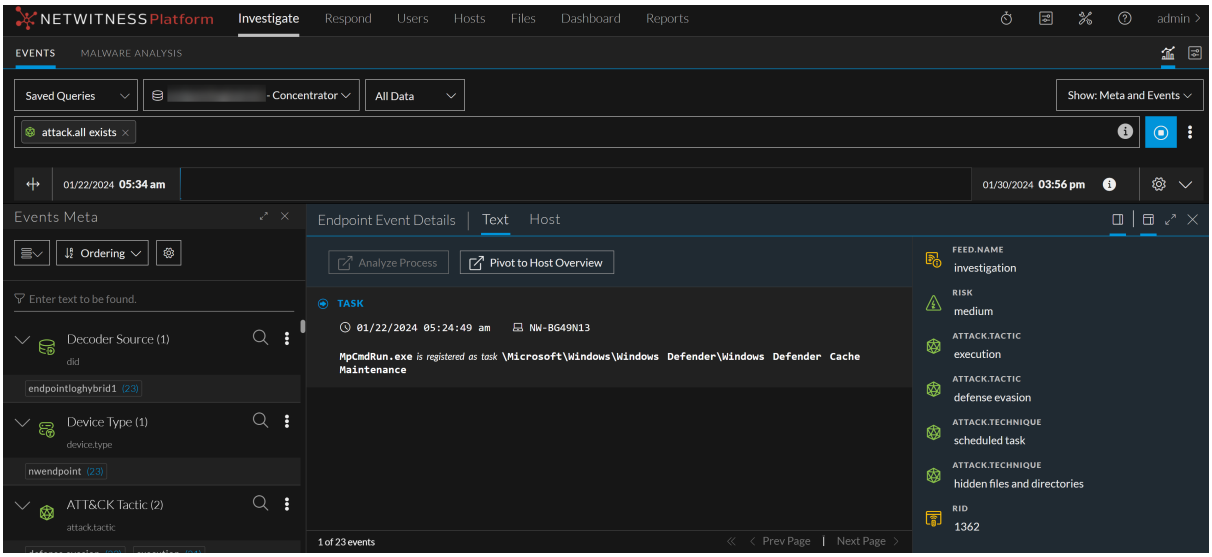


4. In the submenu select one of the available external lookups:
   - **Google**: Looks up a meta value on Google.com
   - **SANS IP History**: Looks up a meta value on SANS IP History, domain = http://isc.sans.org/ipinfo.html?ip=ipaddress
   - **CentralOps Whois for IPs and Hostnames**: Looks up a meta value on CentralOps Whois for IPs and Hostnames, domain = http://centralops.net/co/DomainDossier.aspx?addr=domain&dom_whois=true&dom_dns=true&net_whois=true
   - **Robtex IP Search**: Looks up a meta value on Robtext IP Search, domain = https://www.robtex.com/cidr/domain.ipaddress
   - **IPVoid**: Looks up a meta value on IPVoid, domain = http://www.ipvoid.com/scan/domain/
   - **URLVoid**: Looks up a meta value on URLVoid, domain = http://www.urlvoid.com/scan/ipaddress/
   - **ThreatExpert Search**: Looks up an IP meta value on ThreatExpert Search, domain = http://www.threatexpert.com/reports.aspx?find=IP address

5. For a VirusTotal Lookup:
   - In the Events view, left or right-click a meta value having checksum in the Events List, Meta Events Panel or the Event Meta panel.

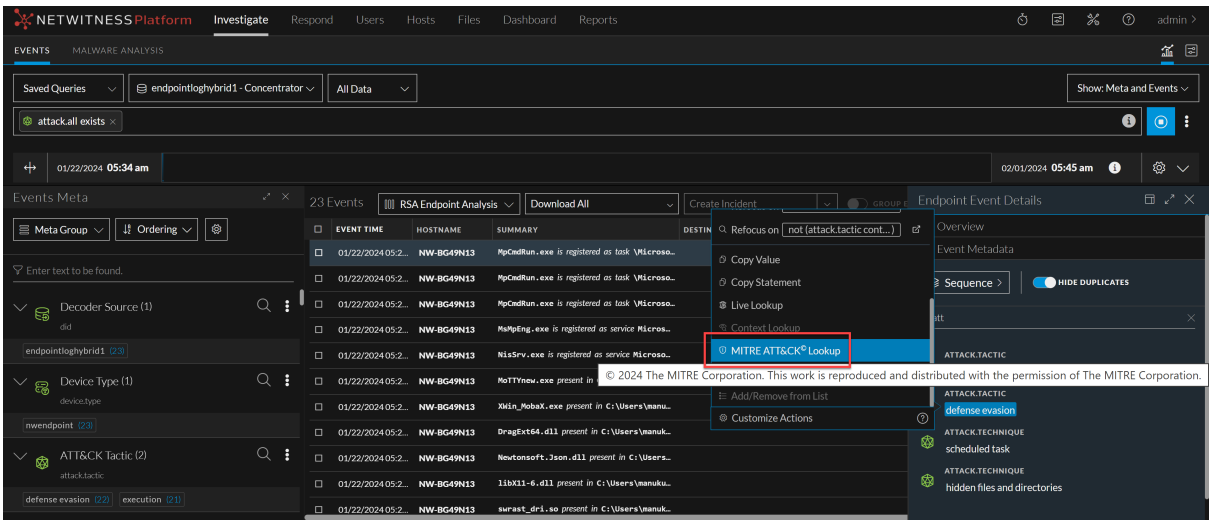
     The Context Highlights dialog is displayed.
   - Click **External Lookup** > **VirusTotal Lookup**.

     This looks up the hash value on the VirusTotal for rapid lookup and analysis.



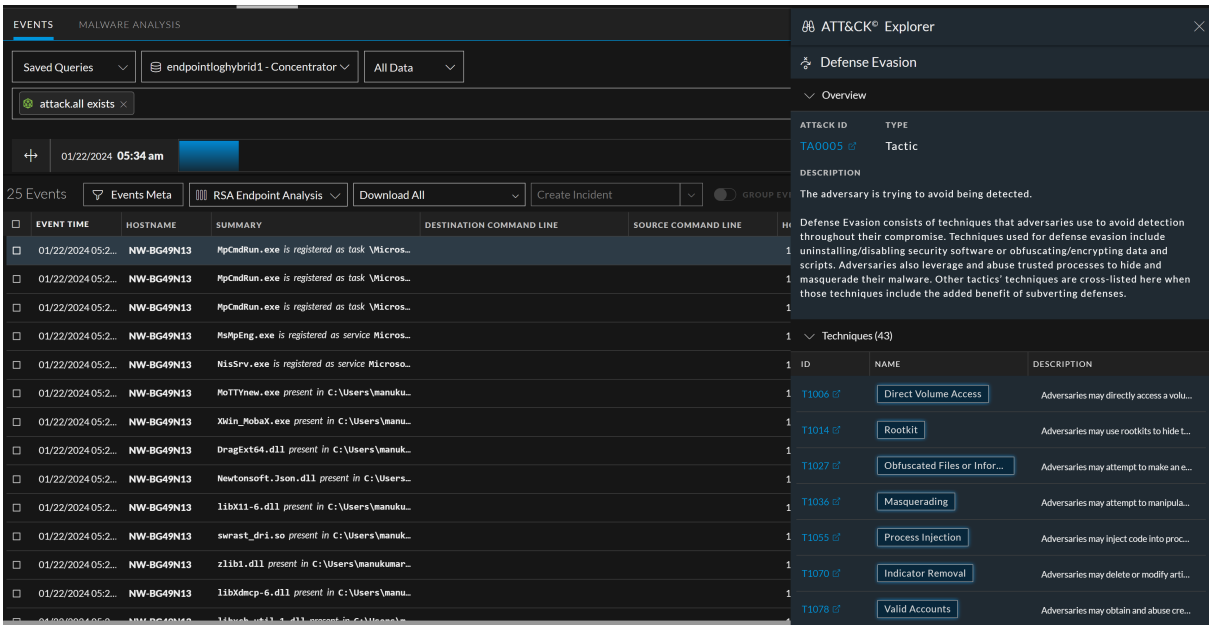
MITRE ATT&CK© Lookup in Events Reconstruction View

With the 12.4 version, the **ATTACK.TACTIC** and **ATTACK.TECHNIQUE** meta keys in the **Event Metadata** panel and Event Reconstruction view will now include the **MITRE ATT&CK© Lookup** option for analysts to obtain more information regarding the MITRE Tactic and Technique associated with a particular event.



IMPORTANT: Both MITRE ATT&CK® and ATT&CK® are registered trademarks of the MITRE Corporation. © 2024 The MITRE Corporation. This work is reproduced and distributed with the permission of The MITRE Corporation.

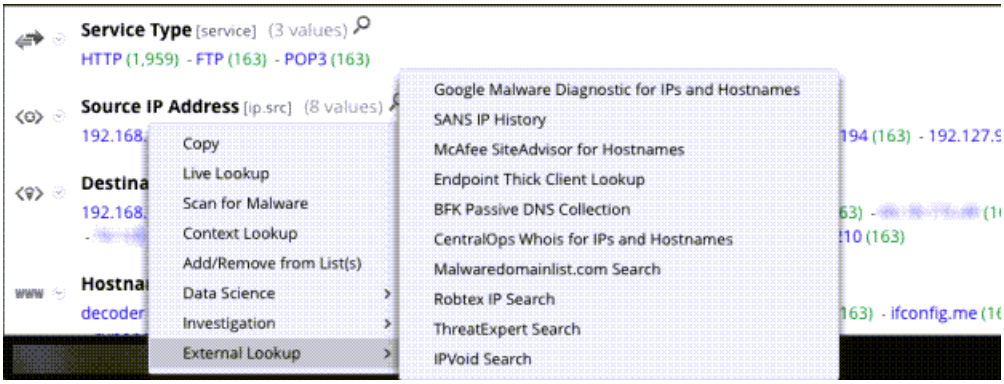
To perform MITRE ATT&CK© Lookup on Meta keys



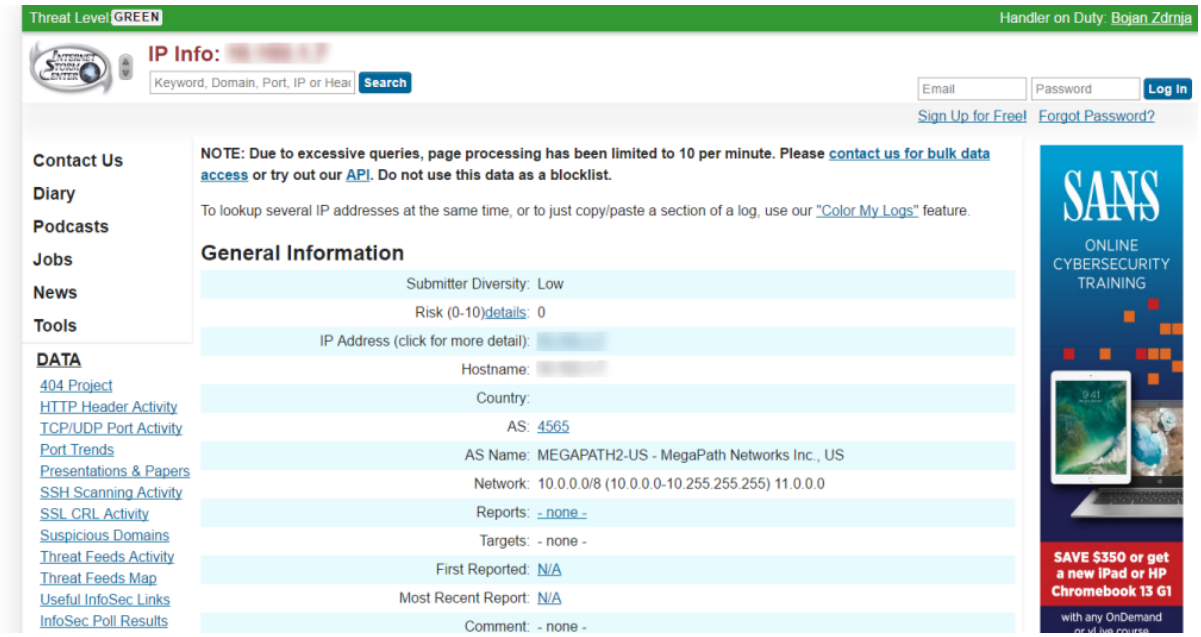
1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key. For example, (**attack.all exists**).
4. Click an event in the **Events** panel to open the Events Reconstruction panel.
5. In the **Event Metadata** panel, left or right-click either an **ATTACK.TACTIC** or **ATTACK.TECHNIQUE** meta keys.

6. Click the **MITRE ATT&CK© Lookup** option to open the **ATT&CK© Explorer** panel.

The **ATT&CK© Explorer** panel opens from the right side of the browser window. The **ATT&CK© Explorer** panel is populated with the information from the MITRE ATT&CK as it becomes available.



For more information on the **ATT&CK© Explorer** panel, see the topic **ATT&CK© Explorer Panel** in the *NetWitness Respond User Guide.*



Launch Other External Lookups from the Navigate View

To launch an external lookup of data from the Navigate view (other than NetWitness Endpoint Thick Client Lookup):

1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.

3. Select one of the lookup options.
   The selected meta value opens in the selected lookup, for example, if you selected SANS IP History, the drill point information is displayed in SANS Internet Storm Center.

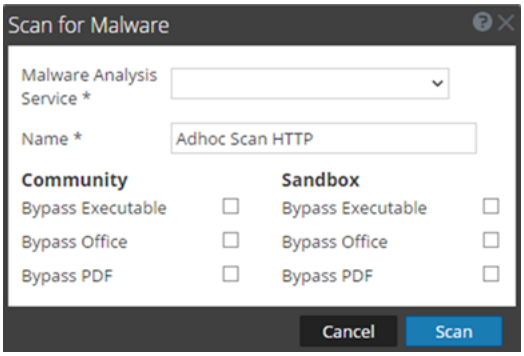
Launch a Malware Analysis Scan from the Navigate View



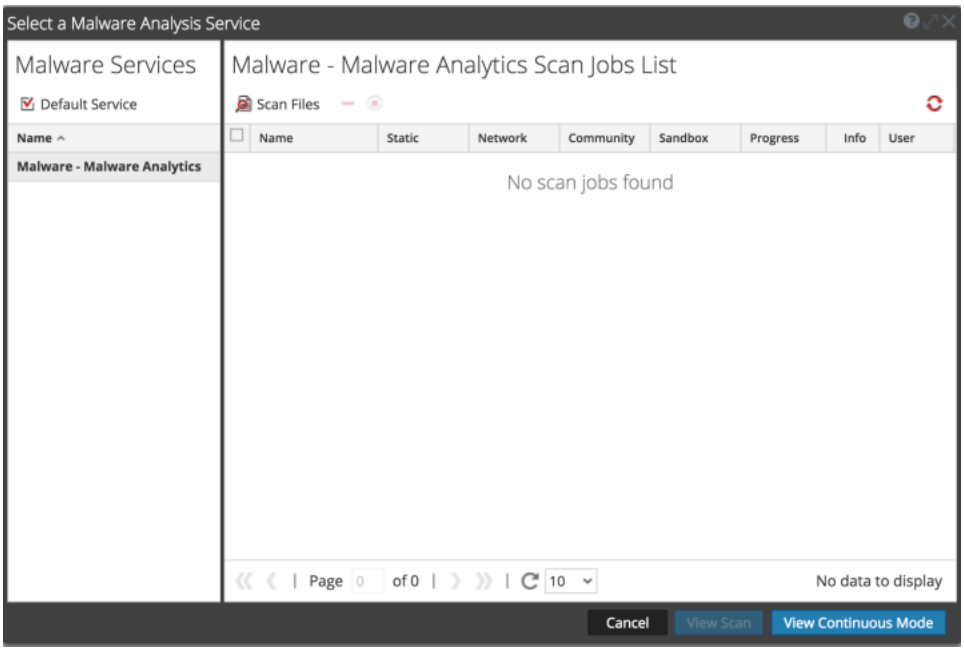
From within Investigate, analysts can launch an on-demand Malware Analysis scan by selecting a service and meta value, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis.

To launch a Malware Analysis scan of data from the **Investigate** > **Navigate** view:

1. Right-click a meta value (for example, OTHER, DNS, or FTP) and select **Scan for Malware** in the context menu.

   The Scan for Malware dialog is displayed with a suggested name for the on-demand scan and no service selected.

2. In the Scan for Malware dialog, select a service to perform the scan, edit the name, and select the types of files to bypass under community and sandbox.



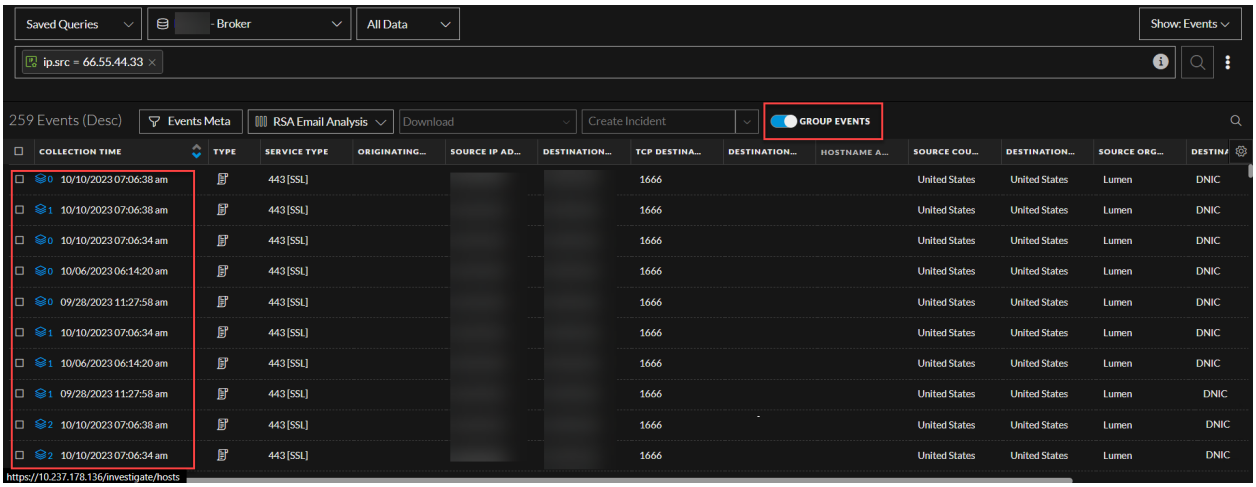
3. Click **Scan**.

   The scan request is added to the Scan Jobs List dashlet and the Jobs Tray. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.

4. To view the jobs, do one of the following:

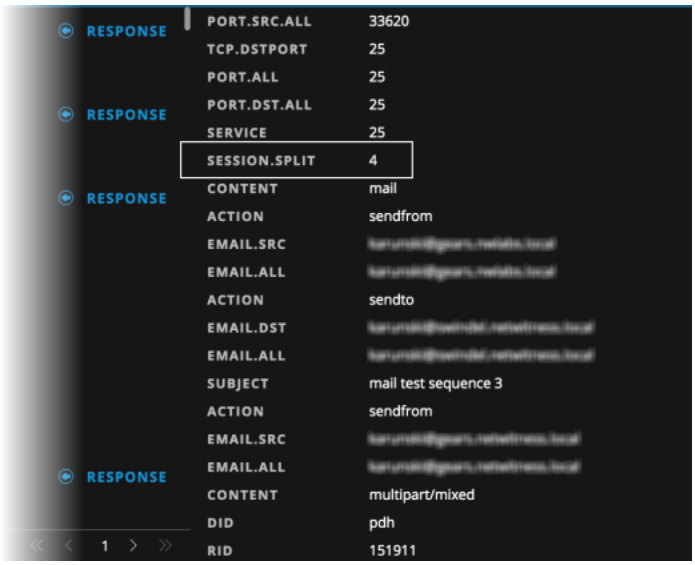
   a. Go to the Scan Jobs List in the Malware Analysis view or in the Unified dashboard. Double-click a scan to view the scan.

b. To view the job in the Jobs tray, click  in the NetWitness toolbar. When the job is complete, scroll to the left and click **View**.



The Malware Summary of Events for the selected scan is displayed. The scan is also added to the list of available scans in the dialog for selecting scans in the **Investigation** > **Malware** tab.

Group Events from Split and Related Sessions in the Events and Legacy Events Views



In the Events view listing of events, events from split and related sessions are listed in the order they were parsed; for this reason, they are not always listed together in the Events list. In Version 11.4.1 and later, the Group Events option allows you to change the order in which the events are listed so that you can more easily detect relationships in the captured data. When events are grouped, we refer to the first event as the leading event.

The user interface is designed to help you identify grouped events. Solid row lines delineate different groups of related events while dotted lines depict the events that are part of the same related group. In a group of events, the leading event is first and subsequent events are nested under the leading event with indentation and relationship icons for subsequent events. The numbers next to the relationship icon distinguish the session split count.

If the leading event is not included in the current data set, the subsequent events are still grouped together under the first subsequent event. Only the leading event or the first subsequent event, in the case of no leading event, is sorted; indented events are not sorted. Hovering over the subsequent event marker () displays a tool tip explaining the relationship. The following figure is an example of related events as they are displayed in the Events list.

If events are related based on session fragments, when you select a subsequent event and open the reconstruction, you can see the `session.split` meta key in the Event Meta panel.

Split Network Session

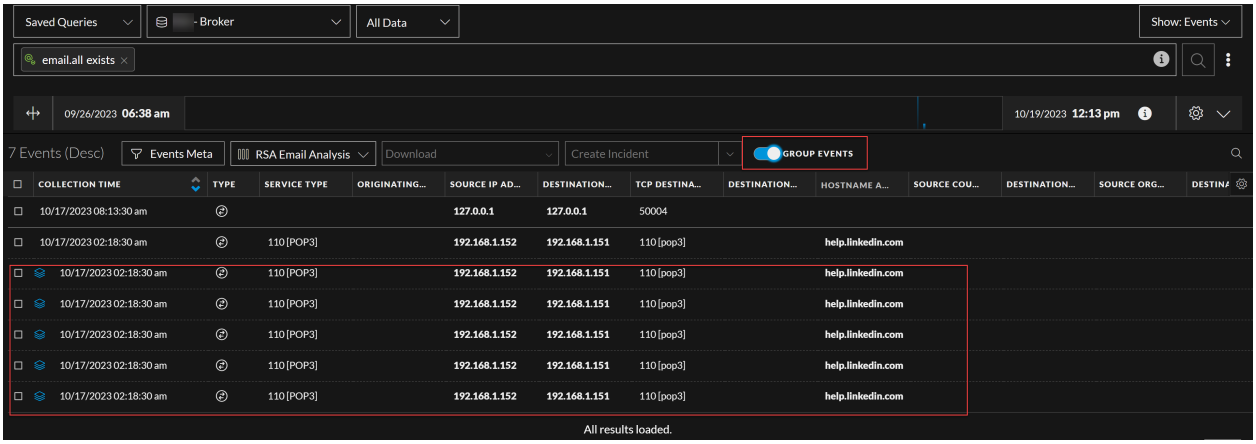
If you see a tool tip like this, the listed events are part of a split network session:
`The event is part of a split session (session.split: #) matching these parameters: ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND tcp.dstport=1234.`

The reason for the split is one of the following:

- The original event was split into sub-parts by creating additional events for each transaction inside the original event.
- The original session was split as it was ingested into the Network Decoder because the size was larger than the Assembler Maximum Size (default=32 MB).
- The original session was split as it was ingested into the Network Decoder because the time was longer than the Assembler Timeout Session (default=60 sec).

Session Size and Time Split

Network Decoders are configured with a default session size (`assembler.size.max`) and a session timeout (`assembler.timeout.session`). The configuration is described in "Configure Session Split Timeouts" in the *Decoder Configuration Guide*. When a session exceeds either limit, the Network Decoder splits the session, and all subsequent packets become part of a new session, fragmenting the actual network session across multiple Network Decoder sessions. To process session fragments with the context that they are fragments of the larger network session and to improve association of source and destination addresses, ports, and application protocols, Network Decoders parse contextual fragments and highlight session fragments.



Note: In the Legacy Events view, you can find session fragments and export all packets viewed in the Events list to a single PCAP as described in Find and Combine Fragments in the Legacy Events View.

The Network Decoder completes session parsing before splitting the session based on the configured maximum session size (default = 32 MB) or the configured timeout (default = 60 seconds). When parsing is complete, the parsed results include the proper address directionality and application protocol, which are propagated to each subsequent session fragment to ensure consistency with the logical network session they represent.

Transaction Handling Split

Administrators can configure a Network Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers that are designed to create transactions. The configuration is described in "Configure Transaction Handling on a Decoder" in the *Decoder Configuration Guide*. The Decoder service configuration node has a parameter that controls the behavior of the Network Decoder when a parser defines a transaction within a network session: `/decoder/parsers/config/parser.transaction.mode`. If the mode is set to `split`, a large session with multiple application-level transactions is split when a parser generates an application-level transaction such as an email. An example of this is a large session containing multiple emails. For each email (transaction), a new session item (split session) is created, network meta items are copied into the new session, and meta items marked in the transaction are copied from the original session to the new session.

Transactions require a parser update to function, and initially they only support SMTP and HTTP pipelining use cases. This is an example of the reconstruction of an email that is separated based on the individual emails inside the original event. Each transaction highlights a single email and the metadata associated with the transaction is only related to that email. To provide this functionality, the original packets are stored on the Network Decoder as usual for a network event, but the new related transaction events are created on the Concentrator. As a result, analysts see visual queues in the user interface, and they also have the ability to query to find only specific emails or attributes of emails that were previously all bundled together. To eliminate the original event from the query results, the `session.split` meta key has been indexed. When there are transaction splits, the original event does not have that meta key associated with it while all the related transactional events do.

Session Fragments Highlighting

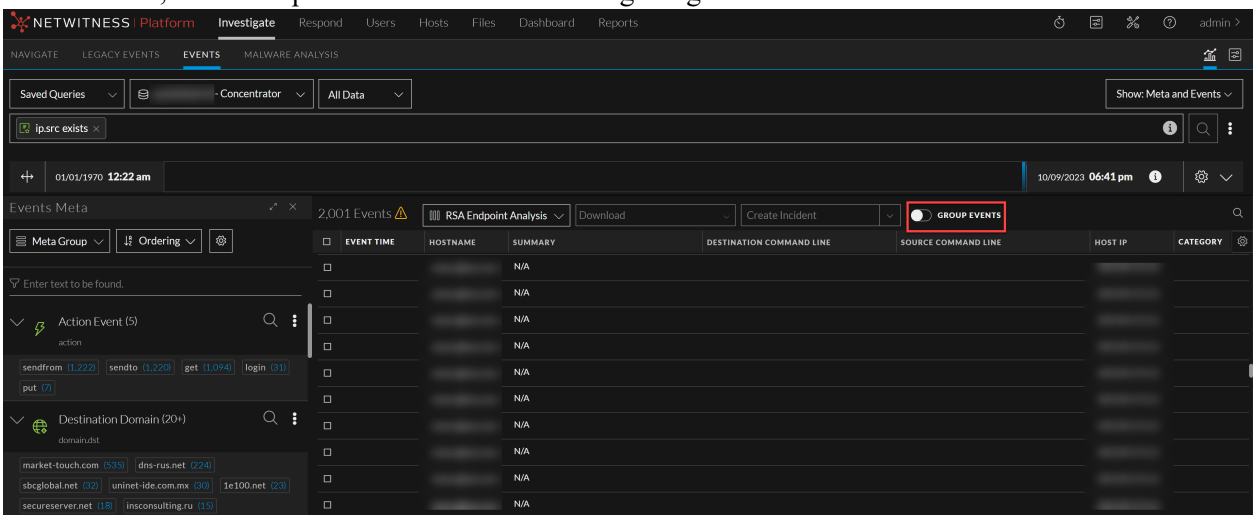
Both types of session fragments have an additional meta key: `session.split`. The earliest fragment is session 0 and sessions with a later time stamp are incrementally numbered 1, 2, 3, and so on. The `session.split` meta key indicates the number of preceding sessions fragments; however, it does not always indicate that there are subsequent session fragments, even with a value of 0. It is also possible for the first fragment of the session to not have `session.split` metadata if the session is parsed before exceeding the maximum session size.

Transaction splits start with a `session.split` value of 1. When viewing sessions, the `session.split` meta key clearly identifies sessions that are fragments in the Events view and the Legacy Events view (Events List view and the Events Detail view).

If this was a session size and timeout split, you can view the session fragments and determine the maximum session size or session timeout necessary for parsing to combine the split sessions into one again. For example, if you have four fragments at 32 MB, you need to configure your test Decoder (usually a virtual machine set up separately from the production service) with a maximum session size greater than 128 MB. The steps are the same to find all fragments based on a session timeout.

Related Network Session

If you see a tool tip like this, separate events processed by the Network Decoder share a set of four values that identify the IP source, IP destination, source port, and destination port:



```
The event is related to a previous session matching these parameters:
ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND
tcp.dstport=1234"Second category: Related Network Session
```

In this case, the Network Decoder has not inserted a split, and there is no `session.split` metadata associated to any of the events. The reason these events grouped together is to highlight the events that are worthy of scrutiny based on a pattern. Each event has the same source IP address, the same destination IP address, the same source port, and the same destination port. The grouping of related events does not occur if any of the four meta keys is obfuscated for data privacy reasons.

These are the combinations of meta keys that must match to categorize an event as a Related Network Session:

- `ip.dst`, `ip.src`, `tcp.dstport`, `tcp.srcport`
- `ip.dst`, `ip.src`, `upd.dstport`, `udp.srcport`
- `ipv6.dst`, `ipv6.src`, `tcp.dstport`, `tcp.srcport`
- `ipv6.dst`, `ipv6.src`, `upd.dstport`, `udp.srcport`

In Version 11.6, the group events option that retrieves events from logs, network and endpoints is disabled when data privacy is enabled. For example, if the `'ip.src'` is blacklisted or restricted by the administrator, then the option shown in the following image is disabled.

This option is disabled if one or more of the following 12 metas are restricted:

`'sessionid'`

`'nwe.callback_id'`

`'medium'`

`'session.split'`

`'ip.dst'`

`'ip.src'`

`'ipv6.src'`

`'ipv6.dst'`

`'tcp.dstport'`

`'tcp.srcport'`

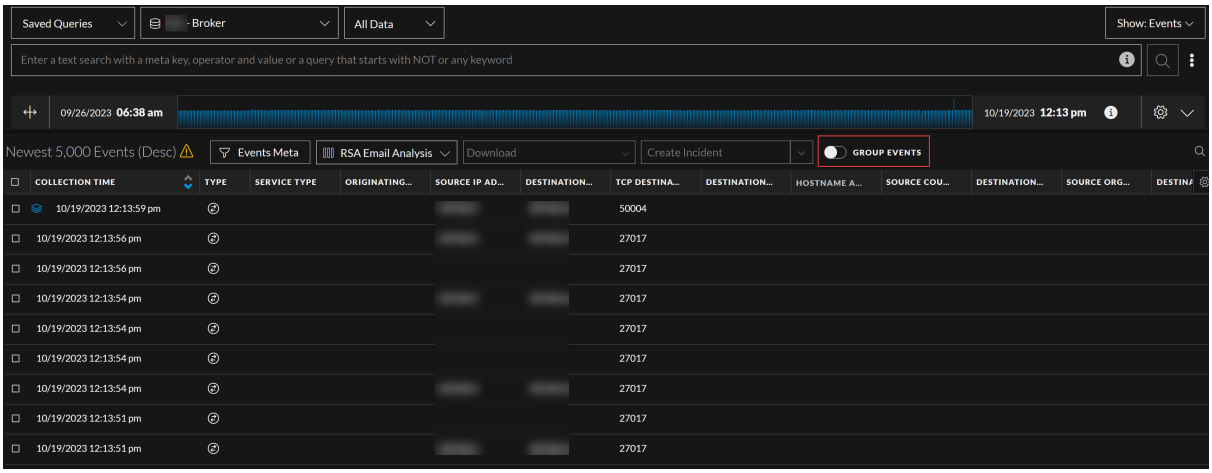
`'udp.dstport',`

`'udp.srcport'`

Use Cases for Viewing Events from Split and Related Network Sessions

These are examples of practical use cases for viewing events from split sessions:

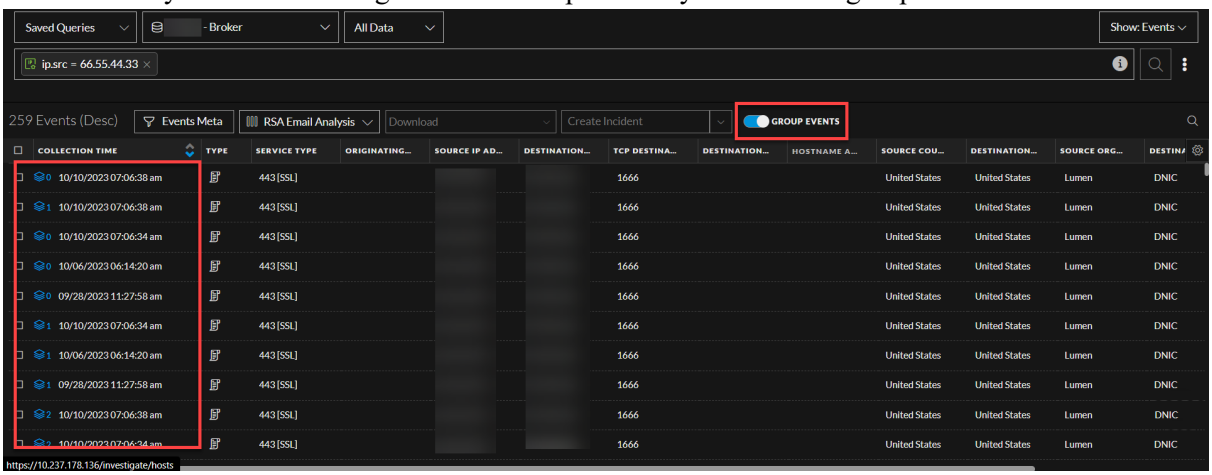
- A Network Decoder that is inline with a proxy server receives a lot of email connections that get bundled into a single session based on event time as NetWitness sees them. The single session has multiple meta values for `subject`, `email.src`, `email.dst`, and other meta keys relevant to email, which are difficult to map together correctly. Seeing the session organized as leading and subsequent events, gives the analyst a clear idea of the details of each email.



- An analyst is attempting to understand what IP address out of all the metadata associated with a session resulted in the generated metadata or an alert, but the IP address is not in the output. For example, a feed that is parsing for an indicator of compromise may have many triggers in a session that has many IP addresses. By viewing the complete event organized as leading and subsequent events, the analyst can understand which IP triggered the alert.
- An analyst wants to know which file was deleted from which directory versus which file was read out in which directory, but the session encompasses multiple files and directories. For example, an HTTP connection with commands: `directory /keep/`, `directory /temp/`, `filename foo.txt`, `filename me.doc`, `action delete`, and `action read`. Viewing the leading and subsequent events tells the analyst that `/temp/me.doc` was deleted and `/keep/foo.txt` was read. Now the analyst or analytics can form an opinion about how bad these actions really were.
- An analyst is attempting to retrieve a large file related to an event that triggered a suspicous alert. However, the file that was transferred was so large that the network decoder split it into 100 separate sessions. When viewing this group related split sessions, the analyst can download a PCAP of the sessions, then extract the original file by either running it through a Decoder with larger assembler settings or a third-party tool.

Show and Hide Relationships in the Events List

For both types of related events, you can see the relationship of events in the Events view Events list. When the Events list is first displayed, you can tell if set of results includes related events by looking at the Group Events switch at the top of the Events list. If the results do not include related events, the switch is dimmed as shown in the following figure.

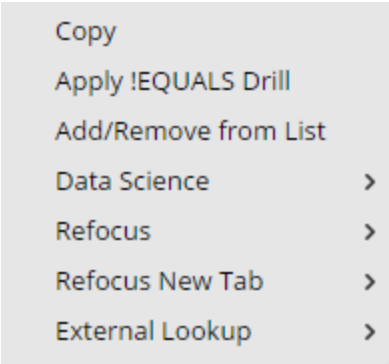


To look for related events in the Events list

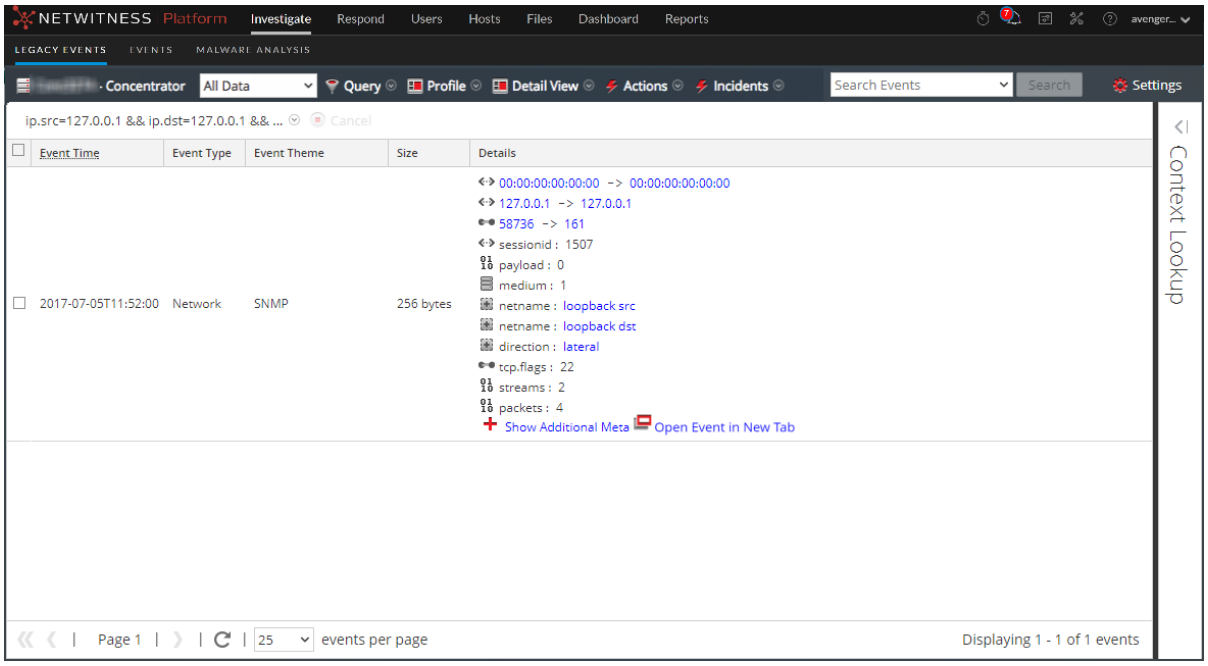
1. Go to **Investigate** > **Events** and submit a query.
   If the results include related events, the Group Events switch is active, but not enabled. The figure below illustrates a set of results that include split sessions, and the Group Events switch is disabled. The related events are not nested.

2. Click the **Group Events** switch.
   Related subsequent events are nested below the leading event. The subsequent events are indented

and marked by an icon. Clicking on the icon explains why the event is grouped.



Find and Combine Fragments in the Legacy Events View



From within the Legacy Events view, you can find fragments of a session using the Refocus > Find Session Fragments context menu option. NetWitness composes a query using the source and destination addresses and ports of the selected session and displays all sessions that match that query within the current time window.

To find session fragments

1. In the **Legacy Events** view, right-click any of the source and destination address and port values: `ip.src`, `ip.dst`, `ipv6.src`, `ipv6.dst`, `tcp.srcport`, `tcp.dstport`, `udp.srcport`, and `udp.dstport`) as well as `session.split` values.
   The context menu is displayed.

2. Select **Refocus > Find Session Fragments** or **Refocus New Tab > Find Session Fragments**.
   NetWitness repopulates the Events list with session fragments for a single session within the current time range. Depending on the option you selected, the refocus replaces the current view or opens in a new tab. (All data is used in these examples but is not recommended on production systems).

3. If necessary, adjust the time range to include any session fragments that may precede or follow the current time window. You can tell that the time range needs to be expanded if the fragments occur near the time boundary, especially if the first visible fragment does not have a split value of 0 (or none). Alternately, inspecting the packets of the last visible session may lead you to believe that the session continues. Here is an example:

   a. If you are looking at fragments that are obviously not the first fragment, for example, 1, 2, 3, and 4 in time range 10:30 to 10:35, there should be a fragment 0. You can increase the time range to start earlier (for this example, 10:25) to find the additional fragment.

   b. If the session size of last fragment is close to maximum session size (12 MB in this example), look for additional fragments by increasing the time window to include a later time (for this example, 10:40).
   When all of the session fragments of a network session are included within a single Events list, the list can span multiple pages.

4. (Optional) To export the packets for every session fragment to a single PCAP file, select **Actions** > **Export All PCAP**.
   A message informs you that the PCAP is being downloaded. When download is complete, PCAP file includes the entire network session that was fragmented.

Visualize Metadata as Parallel Coordinates

Analysts can use the parallel coordinates visualization in the Navigate view to focus the investigation on combinations of meta keys and meta entities, and values that may indicate events are abnormal and worth investigation. The parallel coordinates chart is a way of visualizing the current drill point in Investigate to examine more than two meta keys simultaneously. Visualizing multiple meta keys simultaneously can help in identifying security issues associated with multivariate patterns and comparisons, such as when individual meta keys and values may not be of concern, but combining them together may bring an abnormal pattern or relationship to light. Meta groups (see Use Meta Groups to Focus on Relevant Meta Keys) can be used effectively to define a collection of meta keys that you want to visualize as parallel coordinates.

Best Practices for Effective Parallel Coordinates Charts

To create effective parallel coordinates charts, follow these recommendations:

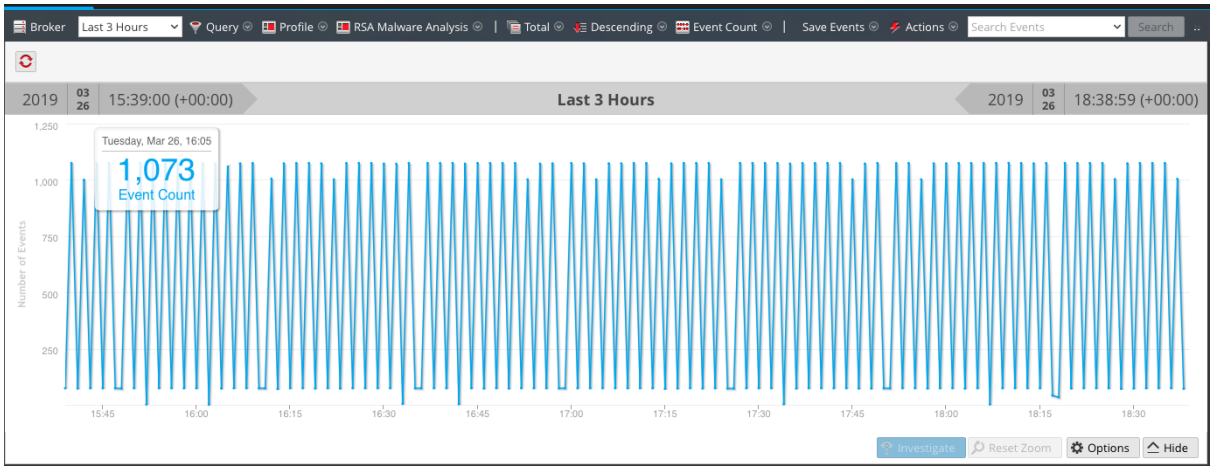
- Use the RSA built-in meta groups that are included in a new installation.
- Start from a drill point rather than attempting to visualize all data.
- Limit the time range if necessary.
- Choose the smallest useful set of meta keys to display as axes.
- Specify the sequence of axes to highlight anomalies between the meta values as you follow a line across the chart.
- When you can identify a useful set of meta keys and sequence, create a custom meta group to use for future investigations. For example, you can create a custom meta group for Windows executable file types.
- Reuse and share custom meta groups by importing and exporting groups as `.jsn` files.
- It may be useful to create two versions of each custom meta group. One for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Note: When you import meta groups, an error message is displayed if any group is already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To help build better parallel coordinates charts, several optimizations are included in NetWitness.

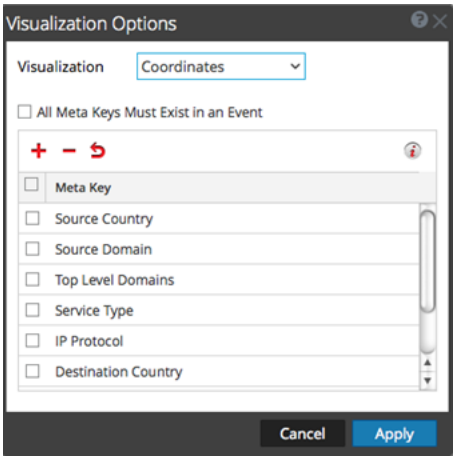
- Analysts can specify that only sessions in which all meta keys exist are rendered in the chart.
- The administrator can increase the number of meta values rendered in the Parallel Coordinates Settings in the ADMIN > System > Investigation panel > Navigate tab.

RSA Meta Groups for Parallel Coordinates Use Cases



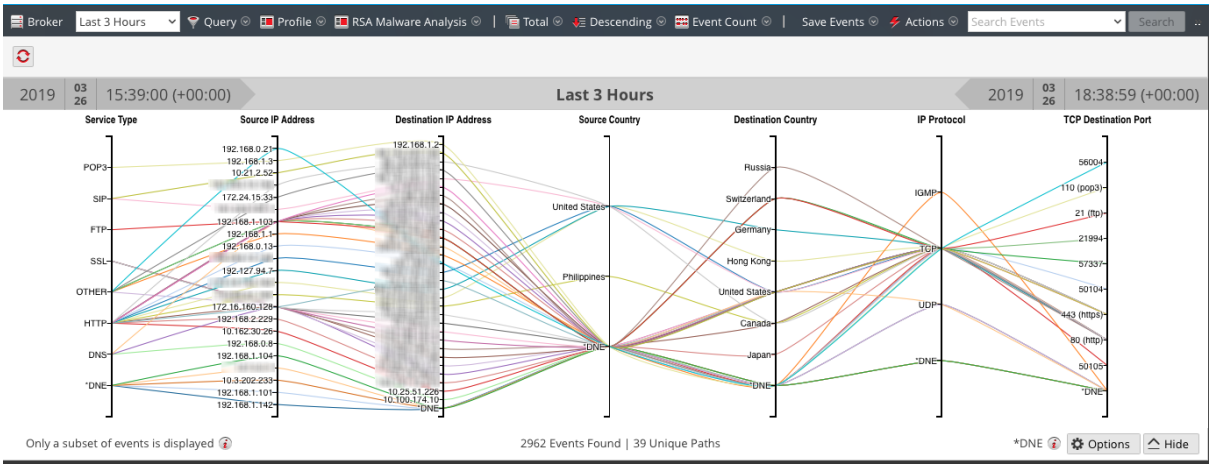
A set of predefined meta groups is included with NetWitness. If you want to get the latest version, you can import the meta groups file, `MetaGroups_ootb_w_query.jsn`, in the Manage Meta Groups dialog. Some of the targeted activities that lend themselves well to Parallel Coordinates visualizations are:

- Botnet Beaconing
- Covert Channels
- Email Analysis
- Encrypted Sessions
- Endpoint Analysis
- File Analysis
- Malware Analysis
- HTTP
- SSL/TLS
- SQL Injection Attacks
- Threat Analysis
- Web Analysis



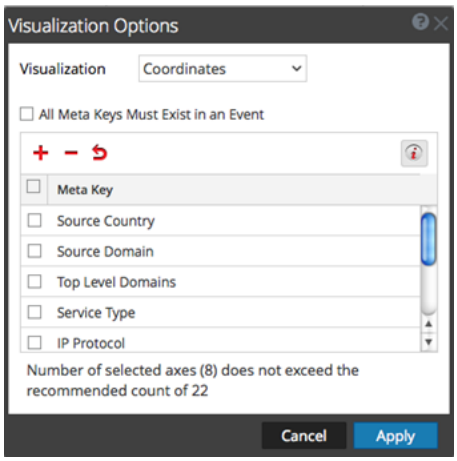
View a Parallel Coordinates Visualization

From an investigation in the Investigate > Navigate view:

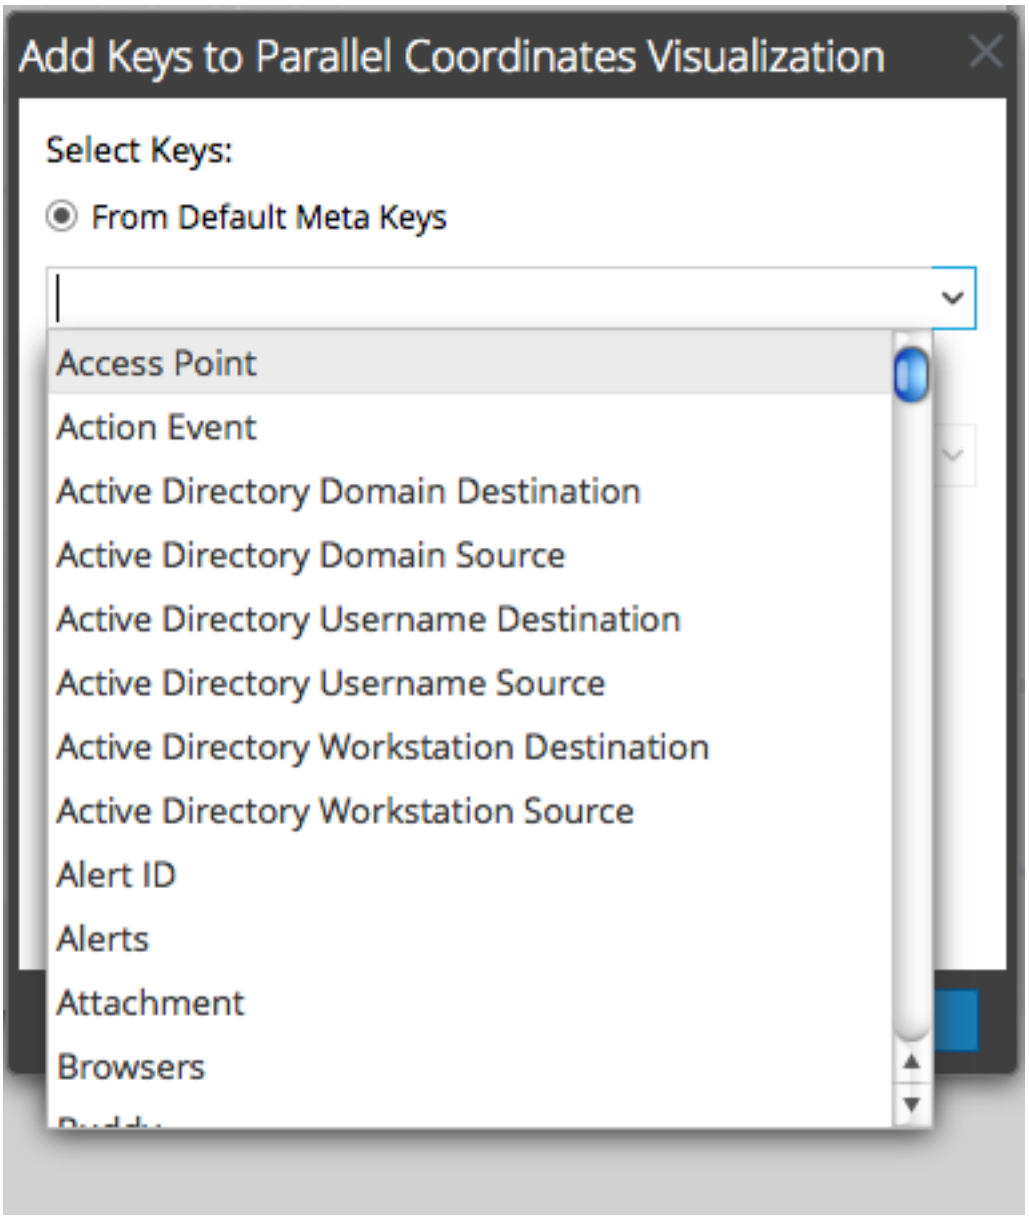


1. If the Visualization panel above the Values panel is closed, select **Visualization**.
2. In the toolbar, select **Meta** > **Use Meta Group > RSA Malware Analysis**.
3. A default visualization for the current drill point is displayed as a timeline.

4. In the **Visualization** panel, select **Options**.
   The Visualization Options dialog is displayed.
5. In the **Visualization** drop-down list, select **Coordinates** and click **Apply**.

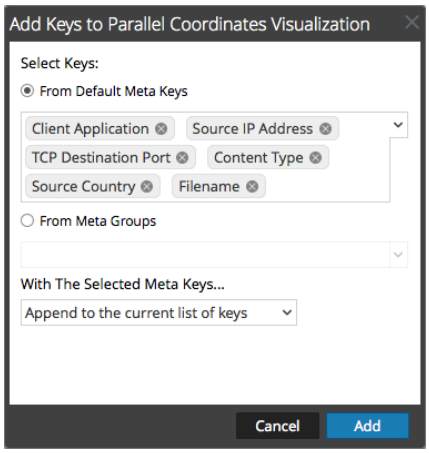


The visualization is loaded. In this example, 2962 events are found and 39 unique paths are visualized.

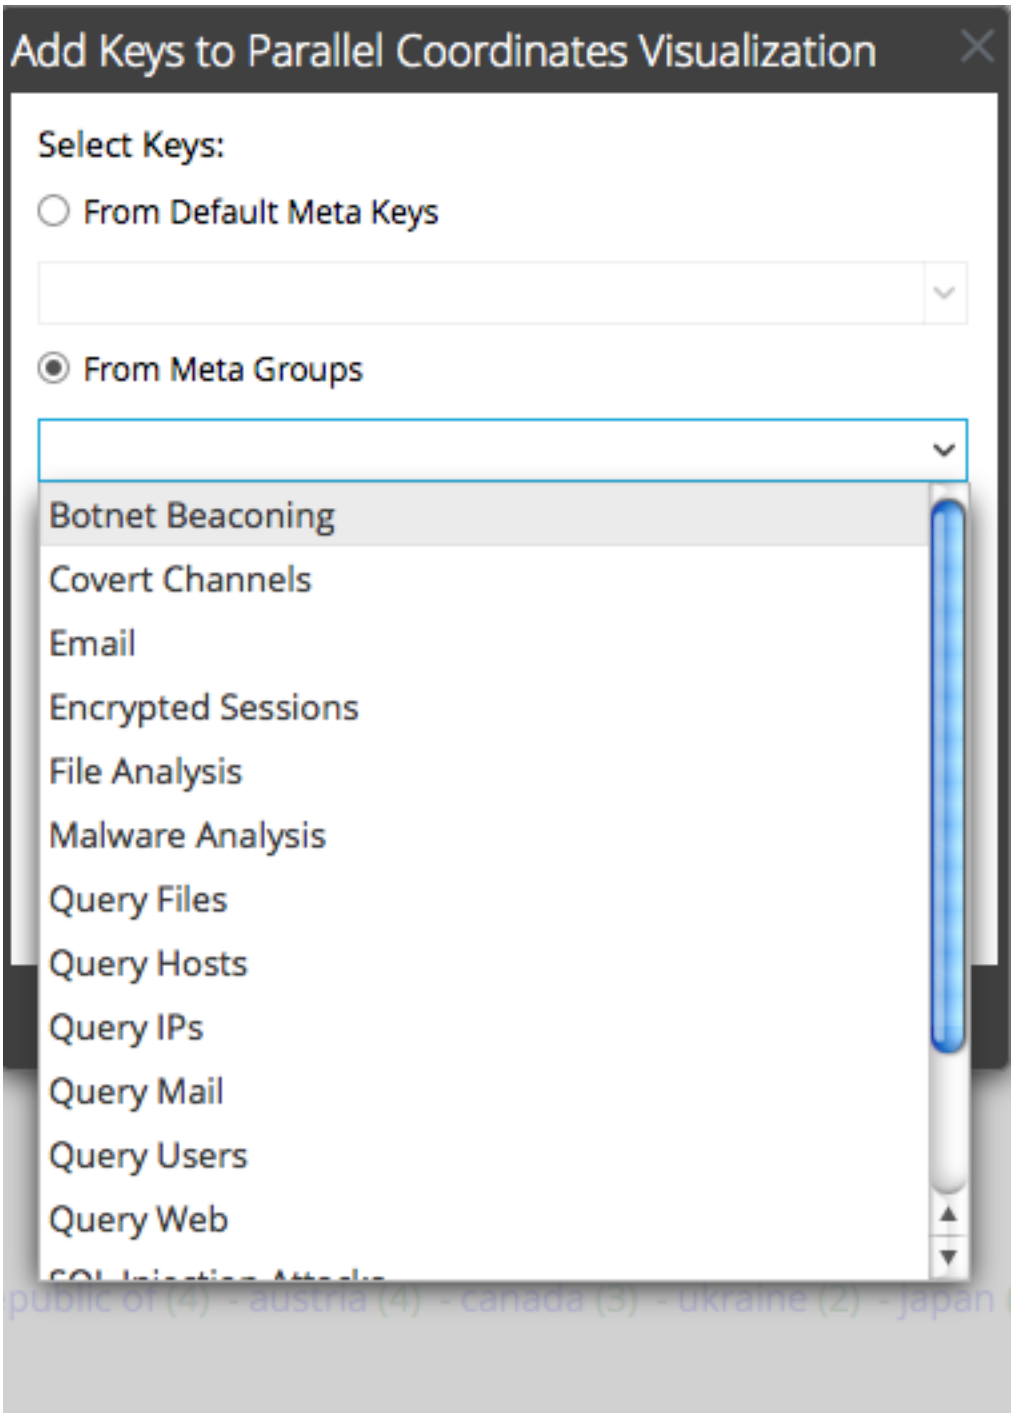


Select Meta Keys for a Parallel Coordinates Visualization

With a Parallel Coordinates visualization open, do the following:

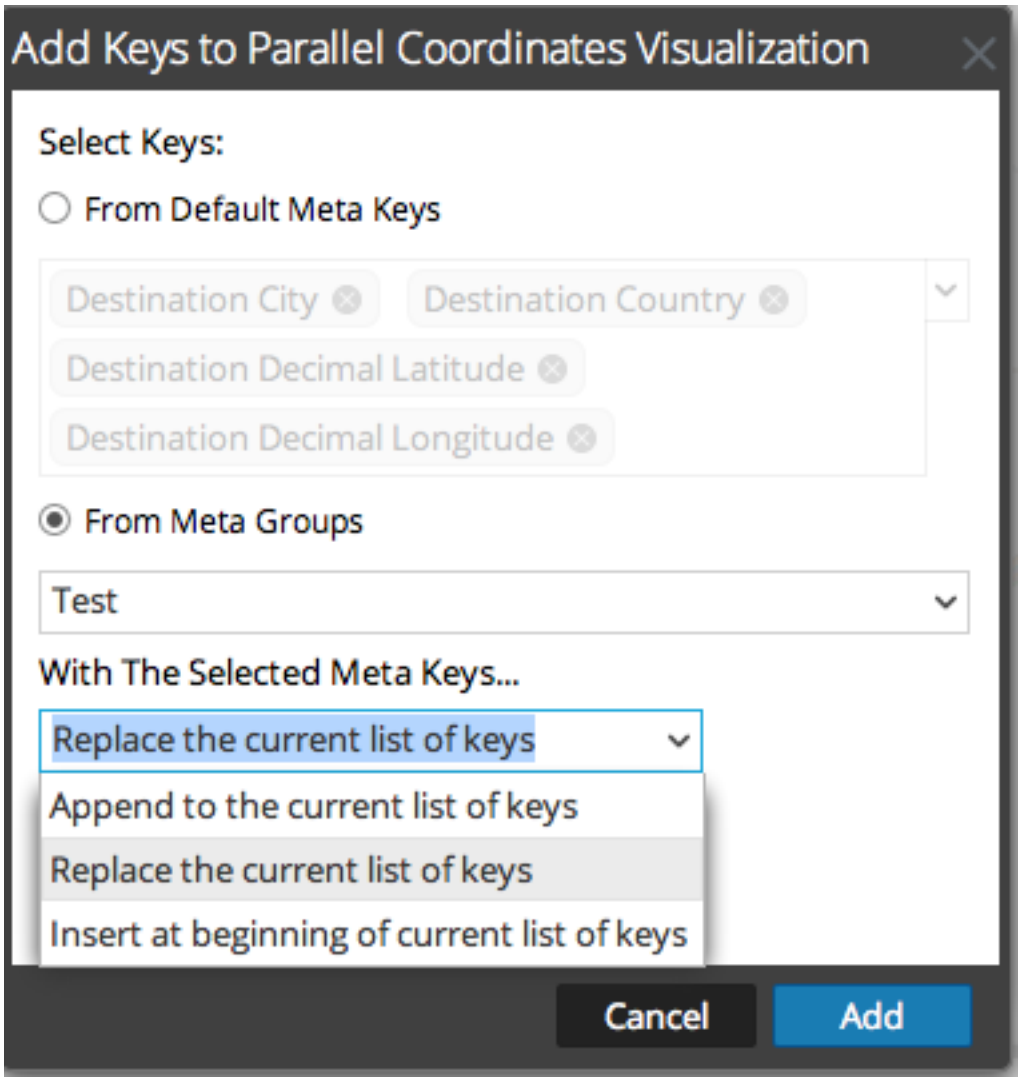


1. In the Visualization panel, select **Options**.
   The Visualization Options dialog is displayed. In the toolbar, click  to display the recommended number of axes for a readable visualization. When a recommended count of keys is displayed, the count changes based on the browser size. If you make the browser window larger, the recommended count is increased.



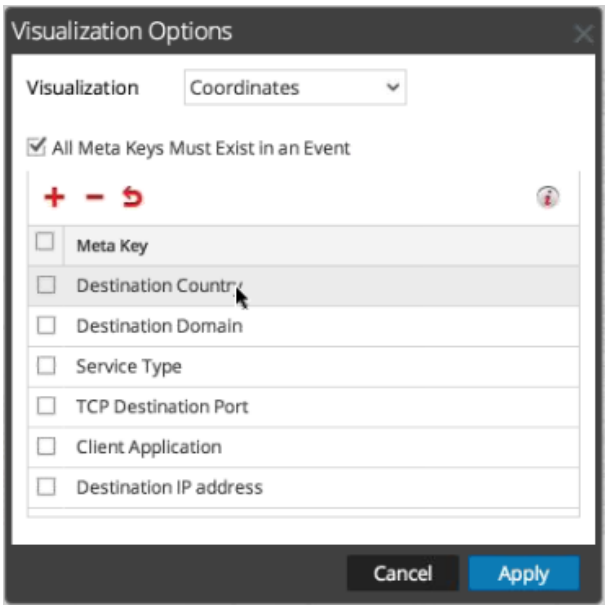
2. If you want to change the sequence of the meta keys, drag meta keys up or down to the desired sequence.
3. If you want to delete any meta keys, click in the selection box, and click .
   The meta keys are removed, but the change has not been applied.
4. If you want to revert to the previous state, click .
   Any meta keys you have deleted are restored and any changes that you made are removed.
5. If you want to select individual meta keys, click , select **From Default keys**, and in the drop-down list, select the meta keys.

The selected keys are listed.

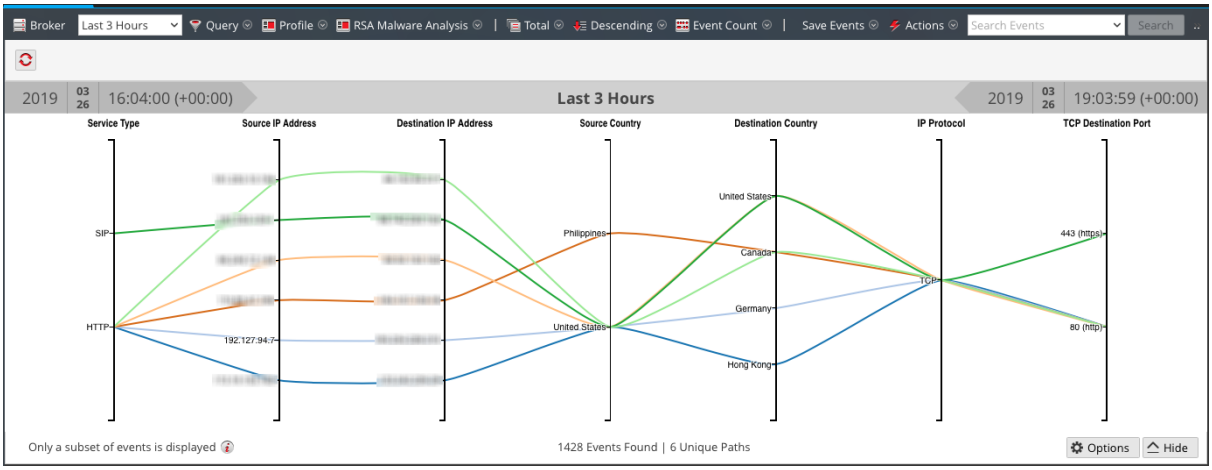


6. If you want to add all the keys in a meta group, you cannot add individual meta keys. Select **From Meta Groups**, and select a group from the drop-down list.

The selected meta groups are listed in the field.



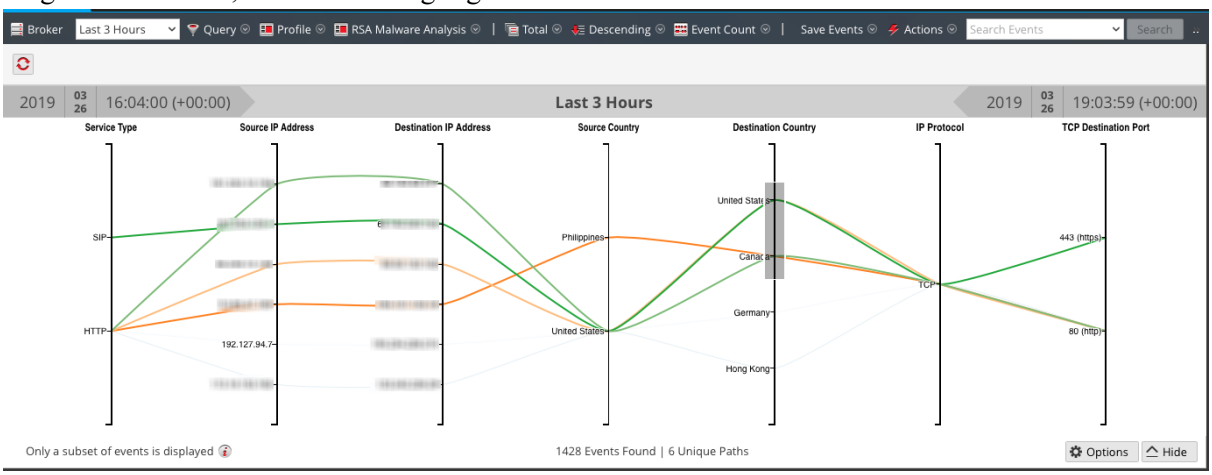
7. Select the method of adding the keys or groups: **Replace the current list of keys**, **Append to the current list of keys** (at the end), or **Insert at the beginning of current list of keys.**



8. To complete the procedure, click **Add**.
   The Visualization Options dialog is displayed with the meta keys or groups you selected.
9. To display the new visualization chart, click **Apply**

Optimize a Parallel Coordinates Visualization

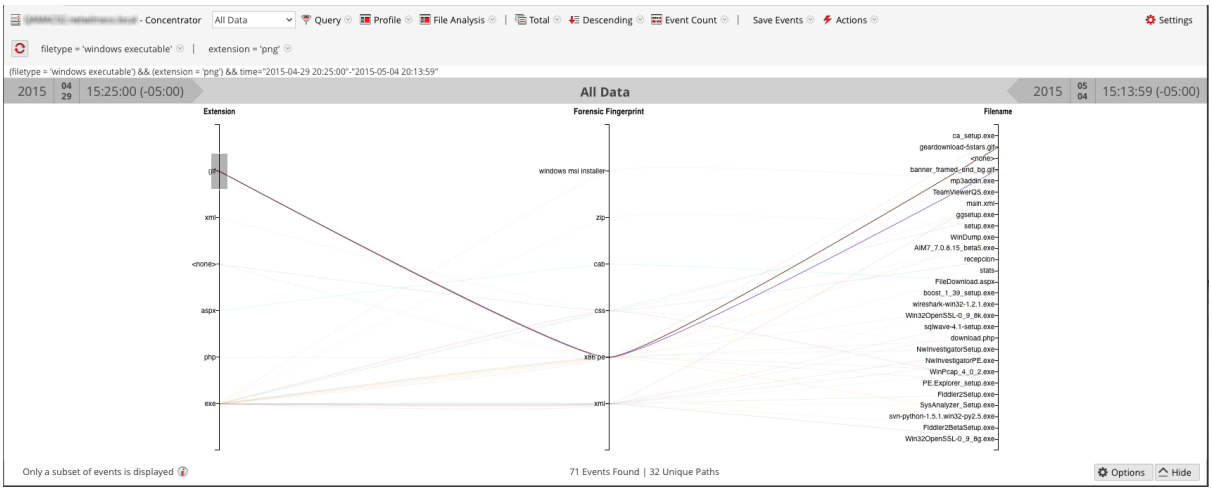
1. To optimize the visualization by removing events in which not all meta keys exist, select **Options.**



2. In the Visualization Options dialog, select **All Meta Keys Must Exist in an Event**. Click **Apply**. The resulting graph is more readable and useful and has fewer unique paths.

3. If you want to highlight a small set of points to see the path of the line from right to left, click on an axis. The cursor changes to cross hairs, which you can drag to select one or more values. When you

let go of the mouse, the lines are highlighted.



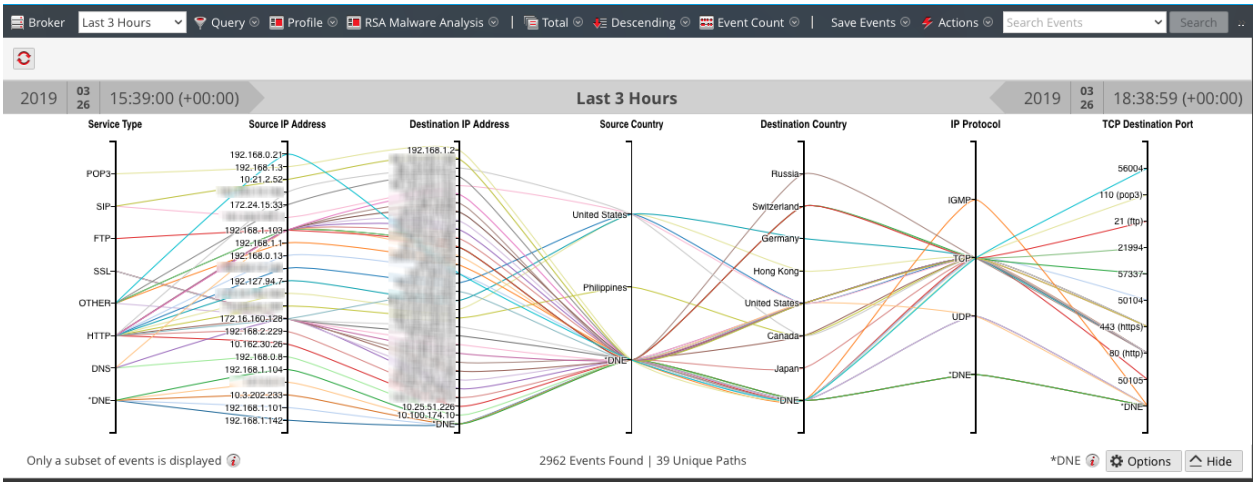
4. If you want to enlarge the visualization, drag the bottom edge of the panel down and drag the right edge of the browser window wider.

Sample Use Case

Below is an example of a parallel coordinates visualization of meta keys representing file metadata in a session. There are three meta keys or axes from left to right: Extensions, Forensic Fingerprint, and Filename with values listed along each axis. Values on the Extension axis show the file extension, and values on the Forensic fingerprint axis are windows executables. Normally the file type matches the expected forensics fingerprint; however, it is abnormal for a `gif` file type to be combined with the Windows executable fingerprint. The `gif` file type is selected to highlight the correlations of that file type, `x86pe` , and two filenames in the third axis so that an analyst can quickly identify the files that merit investigation.

To reach this view:

1. Order by Value and Sort in Ascending order.
2. Apply two filters (file type = 'windows executable' and extension = 'gif') in the Navigate view to limit the amount of data.
3. Configure a parallel coordinates chart by choosing three axes: `file extension`, `forensic fingerprint`, and `filename`.



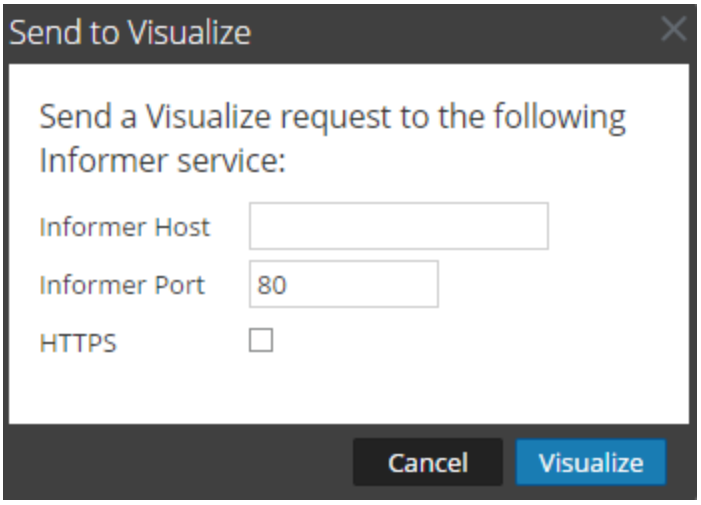
Sample Visualization of a Large Data Set

This example of a parallel coordinates visualization applied to a larger set of data illustrates several messages that help analysts to understand what has been charted.

- To create a chart, NetWitness begins scanning meta values and returning results. A typical time range could have up to 10,000,000 meta values. When the number of meta values returned reaches the Meta Values Result Limit, the chart is rendered even if NetWitness has not scanned a number of meta values equal to the Meta Values Scan Limit.
- There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart.The administrator configures parallel coordinates limits as part of the Investigation settings In the ADMIN > System view.

With a larger set of data, the parallel coordinates chart takes longer to process than the smaller set of data and meta keys. To preserve performance, NetWitness renders the meta values from the Values panel below until the limits set by the Administrator are reached. An informational message tells you: **Only a subset of events is displayed.**

Of all the data visualized for 2962 events, there were only 39 unique parallel coordinates paths. Some events are included though they do not include some of the meta keys; these are labeled **DNE** because the metadata does not exist in the event.



Visualize the Current Drill Point in Informer

This topic provides instructions for sending a drill point in the Navigate view to an Informer visualization.

Informer must be installed in your network and accessible by the service being investigated. You need to supply the host name and the port used on the Informer host to communicate with NetWitness.

To display a visualization in Informer of the current drill point:

1. With a drill point open in the Navigate view, click **Actions > Visualize**.
   The Send to Visualize dialog is displayed.

2. Type the Informer hostname or IP address, and verify the NetWitness server port used to communicate with the Informer host.
3. (Optional) Select the HTTPS option if the Informer host uses secured communications.
4. Click **Visualize**.
   The visualization is displayed in a new tab.

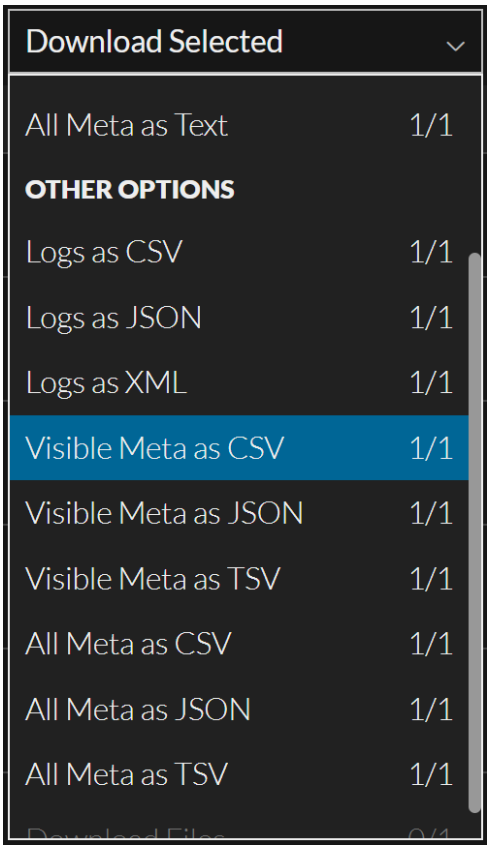
Downloading and Acting Upon Results

When working in Investigate, you may want to extract and shared data with other analysts, incident responders, SOC managers, and others. The topics in this section provide instructions for downloading results and creating incidents that appear in the Respond view:

- Download Data in the Events View
- Export or Print a Drill Point in the Navigate View
- Export Events in the Legacy Events View
- Add Events to an Incident in the Events View
- Add Events to an Incident in the Legacy Events View

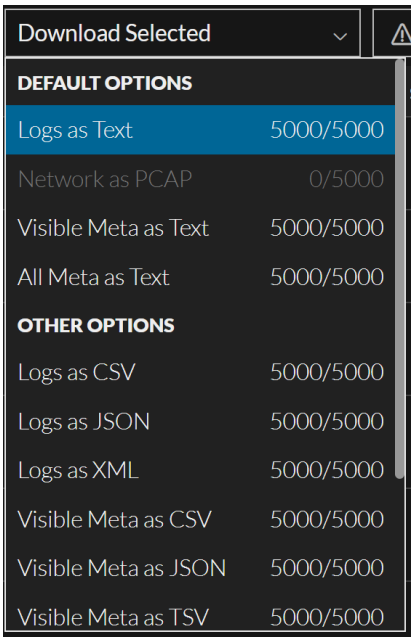
Download Data in the Events View

In the Events view, you can download data from the Events panel and from a reconstruction. The Events panel download available in Version 11.4 and later is a bulk download of log and network events for all event types.



- Version 11.4.1 has the added capability to download visible metadata for all event types. From within a reconstruction, you can download events, logs, and files.
- Version 11.5 has the added capability to download metadata for all event types in the Events panel and in the event reconstructions.
- Version 12.4 has the added capability to enter the required name to download events, logs, and files. for all event types in the Events panel and in the event reconstructions.

Note: The information that you can view and download is managed by Role-Based Access Controls (RBAC) that your administrator has implemented. When RBAC is configured to prevent downloads of certain data, events for which you do not have download permission may appear to download successfully, but they are 0 byte in size. When RBAC is configured to prevent reconstruction of certain events, the reconstruction is disabled from the Events panel, but the bulk download button is still enabled.

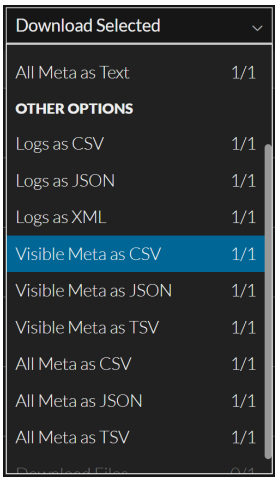


Download Events or Metadata in the Events Panel

After submitting a query, you can download logs, network events, visible metadata (Version 11.4.1), or all metadata (Version 11.5) for events in your preferred format, directly from the Events panel. The preferences are set in the Event Preferences dialog and any changes made there are reflected inside the **Download** menu. See Configure the Events View for more information ab-out preferences.

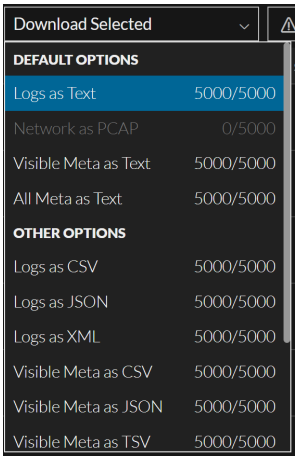
In the Events panel, you can select events individually or select all events returned by your search. The selection checkboxes appear only if you have permission to download the events. All checkboxes are deselected when a new query is submitted. When you select events and click **Download Selected**, the Download menu is displayed. The number of events selected for each event type is displayed next to each option in the format `Events of this type selected/ Total number of events selected`. If an event type has no events selected, the corresponding download option is disabled and the number of events selected is displayed as `0 / Total number of events selected` as shown in the following figure.

If the Select All checkbox is selected in the Events list, the Download Selected options are available. In addition to the options that download all logs or network events.



The difference between the All Meta options and the Visible Meta options are as follows:

- In Version 11.4.1 and later, visible metadata for the selected events is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**) or the format that you select under **Other Options** in the **Download** menu at the time of download. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. The visible columns are determined by the selected column group and the Column Selector. For additional information about selecting columns, see Use Columns and Column Groups in the Events List. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded. When you use one of the Download Visible Meta options; the downloaded metadata is sorted in order of collection time rather than the current sort order in the Events panel.
- All metadata for the selected events is downloaded in the default format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**) or the format that you select under **Other Options** in the **Download Selected** menu at the time of download. The resulting download includes all metadata for the events selected, regardless of what columns are visible in the Events list. For example, if an event has 40 meta keys in the meta database, even if the column group in the Events list has 20 columns with 10 columns visible, all 40 meta keys for that event are included in the downloaded file.

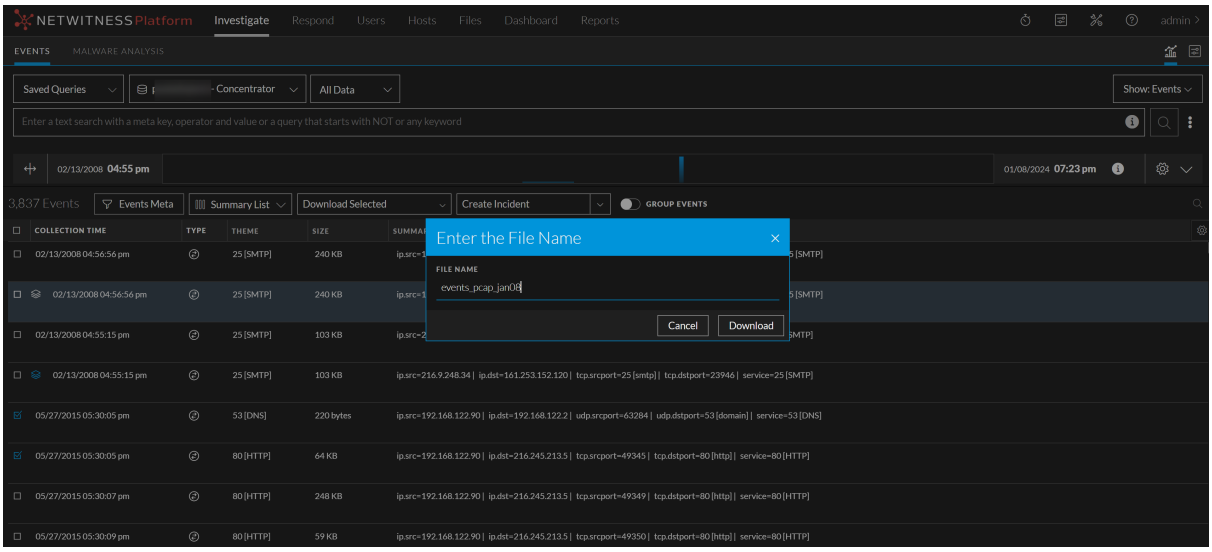


Note: When you select all events for download, only the events in the current result set are downloaded. If you canceled the query before all results were returned, only the events that were loaded are downloaded.

To download event data for one event, multiple events, or all events in the Events panel

1. Do one of the following:
   a. To select events individually, select the checkbox next to each event you want to download, and click the downward arrow on the **Download Selected** menu button to see the options.

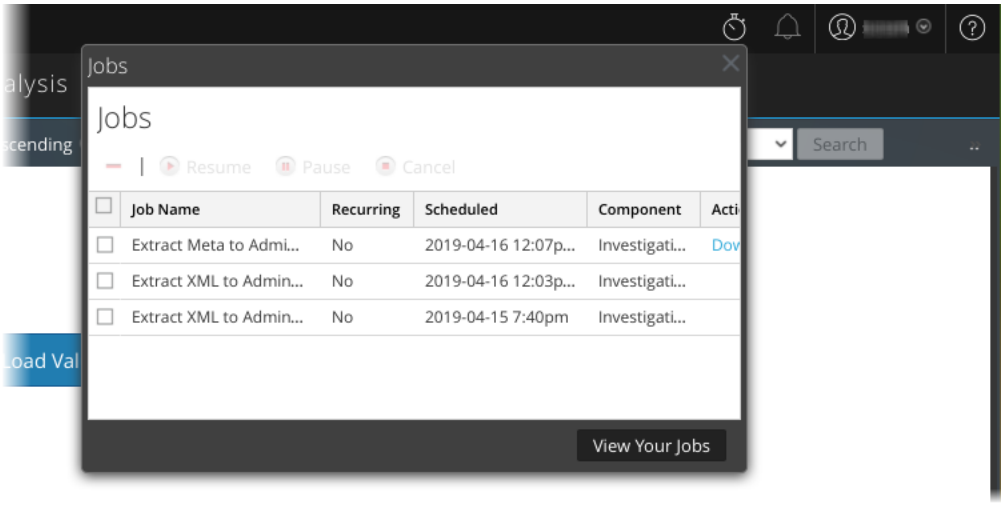
b. To select all events displayed in the Events panel, select the checkbox at the top of the Events panel and click the **Download Selected** menu button.



c. To download all available events, click the **Download All** button from the menu. The number of events available for downloading depends on the value set for the **Maximum Sessions to Export** option in the Events Preferences panel. The maximum events you can download is **100000**.

2. Review the **Default Options** in effect in the top section of the menu. If you do not want to use the default format, you can choose a different format from the **Other Options** section of the menu.

   - Logs are downloaded in the preferred format that you selected in the Events Preference menu (**Logs as Text**, **Logs as CSV**, **Logs as JSON**, or **Logs as XML**). If you want to choose a different format for this download, select one of the formats from **Other Options**.
   - Network events are downloaded as a PCAP. When downloading multiple network events in the Events panel, the format is always PCAP. The preferred format that you specified in the Events Preference menu (**Network as PCAP**, **Network as Payloads**, **Network as Request Payload**, or **Network as Response Payload**) is ignored in this menu. Your preferred format applies only to downloading a single network event in the network reconstruction panel.
   - Visible metadata is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded.
   - All metadata is downloaded in the format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event includes all metadata, not just the visible columns.

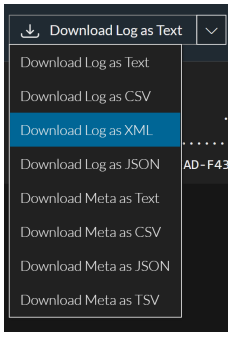


3. Click the **Download Selected** option.

4. (From version 12.4 or later) A dialog box is displayed to enter the file name. By default, the file name is initially displayed with a time stamp in the following format: `investigation-yyyy-mmm-dd-hh-mm-ss` (Example, **investigation-2024-Jan-08-22-33-54**). Enter the required file name and click **Download**.

The download begins immediately within the browser window if the **Download extracted files automatically** preference is set (**Events** view >). If the preference is not set, the download job for the selected events is added to the Jobs tray, where you can download the events.
If the download fails, a message provides feedback regarding why the download failed. The download button is re-enabled and any selected events remain selected. These are examples of reasons for a failed download: timeout after X minutes, connection failed, event limit reached, and permission denied.

5. To display the Jobs tray, go to **Investigate > Navigate** or **Investigate > Legacy Events**, and click the Jobs icon, which looks like a stop watch.
The jobs are displayed in the Jobs tray.



Download a Log in the Text Reconstruction

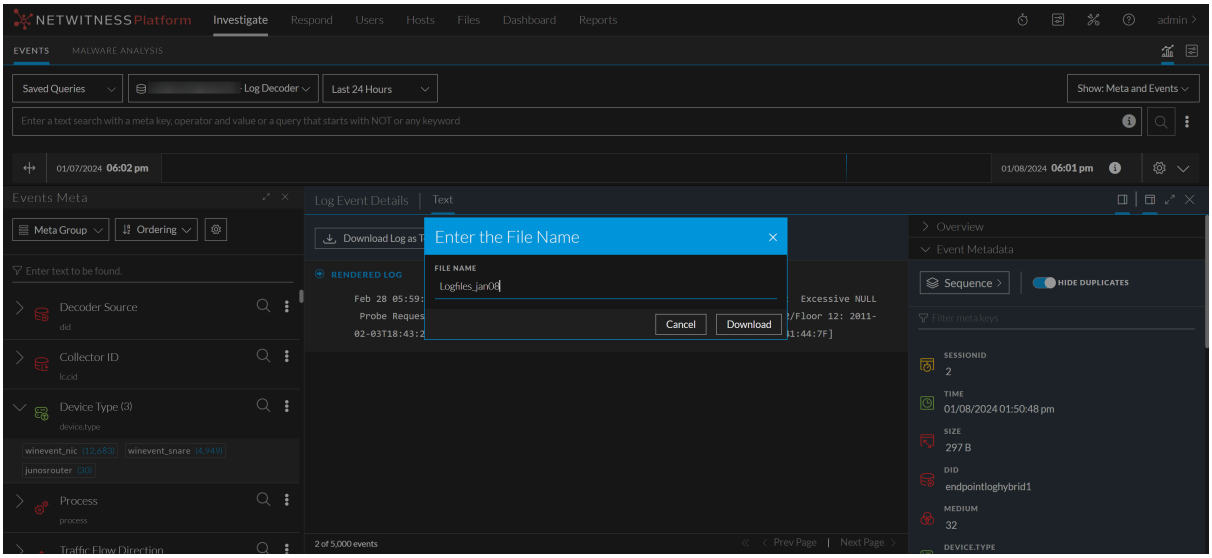
When viewing a text reconstruction of a log event, you can download a log file in the following formats using options in the Download Log menu:

- Raw log (log) using the **Download Log as Text** option.
- Comma-separated values (CSV) using the **Download Log as CSV** option.
- Extensible Markup Language (XML) using the **Download Log as XML** option.
- JavaScript Object Notation (JSON) using the **Download Log as JSON** option.

In Version 11.5 and later, you can also download the metadata for the log using one of these options:

Download Meta as Text, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

Note: For endpoint events, the **Download Log as Text** option applies only to events that have at least one meta value exceeding 256 characters. For an endpoint event, the raw log is populated only when the meta value exceeds 256 characters. Long-running or historically downloaded files are not downloadable. For example, meta values like launch arguments can exceed 256 characters. In this case, 256 characters are available as a meta value while the full value is available in the raw log to view.

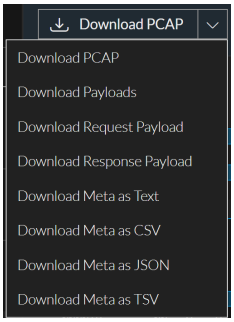


Note: Some formats do not have time stamps or the device IP where the event was generated, so a log downloaded in CSV, XML, or JSON format has an extra value called `timestamp` along with the raw log content. The additional information inside the log is in this form: `Log timestamp="1490824512" source="10.12.35.65".`

To download the log or the metadata for a log

In the text reconstruction of a log event, do one of the following:

1. To download the log as a raw log (the default format), click **Download Log as Text**.
2. To download the log in one of the other formats, click the downward arrow on the **Download Log as Text** button, then select one of the file formats for the downloaded log.
3. To download the metadata for the log, click the downward arrow on the **Download Log as Text** label, then select **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**).



4. (From version 12.4 or later) A dialog box is displayed to enter the file name. By default, the file name is initially displayed with a time stamp in the following format: `investigation-yyyy-mmm-dd-hh-mm-ss` (Example, **investigation-2024-Jan-08-22-33-54**). Enter the required file name and click **Download**.

The log file or the metadata for the log is downloaded to your local file system in the format specified. If you initiate a download and move away from the view while the log is being extracted and before the log starts to download, the log is not downloaded in your browser. A message notifies you that you can find the downloaded log in the job queue.

Download Network Event Data in the Text or Packet Reconstruction

When viewing a packet reconstruction or a text reconstruction of a network event, you can export network data files for further analysis. In Version 11.5 and later, you can also download metadata for the reconstructed event.

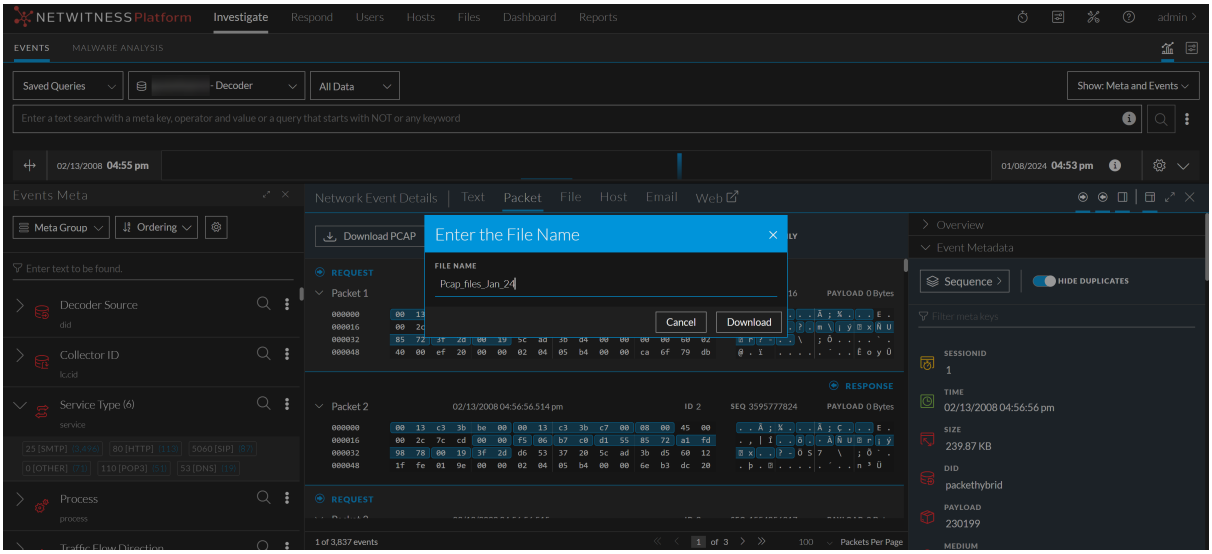
The download includes events for the current time range and drill point. You can download the data in these formats:

- The entire event as a packet capture (`*.pcap`) file using the **Download PCAP** option.
- The payload as a `*.payload` file using the **Download Payloads** option.
- The request payload as a `*.payload1` file using the **Download Request Payload** option.

- The response payload as a `*.payload2` file using the **Download Response Payload** option.
- The metadata for the event using one of these options: **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

The label on the download menu button is one of these formats, based on the setting selected in the Event Preferences dialog. If the event does not have that type of data, the menu button is dimmed. You can click the downward arrow on the menu button to see which options are available. For example, if an event has a request payload, but no response payload, the Download Response Payload label is dimmed. You can click the downward arrow on the button and select **Download Request Payload** for this download. After selecting a valid format, clicking the button executes the download.

The network data is downloaded directly into your browser if the download is quick. If the download takes longer due to network factors or file size, the file is downloaded in the background and the task is tracked in the Jobs queue. In this case, you can check your jobs in the queue and get the file when the download is complete.



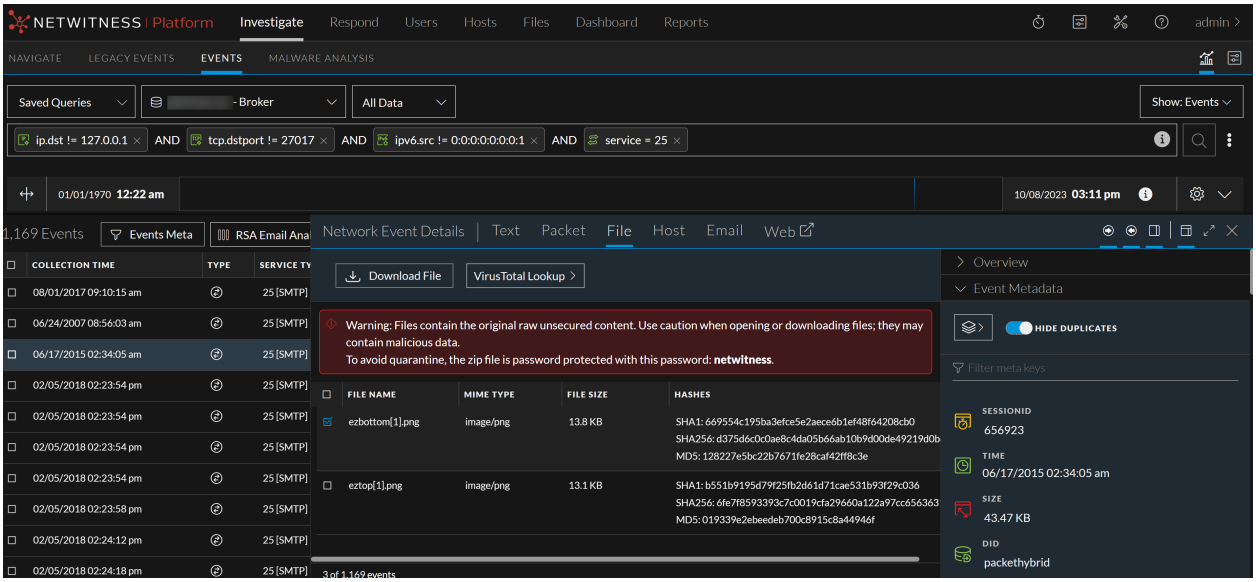
Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded document in the job queue.

To export an event as a network data file or to download the metadata for the event

Go to the packet reconstruction of a network event and do one of the following:

1. To download the event as a PCAP file (the system-defined default format) or in the user-defined default format, click the **Download <format>** button. The label is the same as the download option set in the Events Preferences dialog.
2. To download the event in one of the other formats, click the downward arrow on the button, and select one of the file formats for the downloaded event data.
3. To download the metadata for the event, click the downward arrow on the button, and select one of the file formats for the downloaded metadata.
4. (From version 12.4 or later) A dialog box is displayed to enter the file name. By default, the file name is initially displayed with a time stamp in the following format: `investigation-yyyy-mmm-dd-hh-mm-ss` (Example, **investigation-2024-Jan-08-22-33-54**). Enter the required file name and

click **Download**.



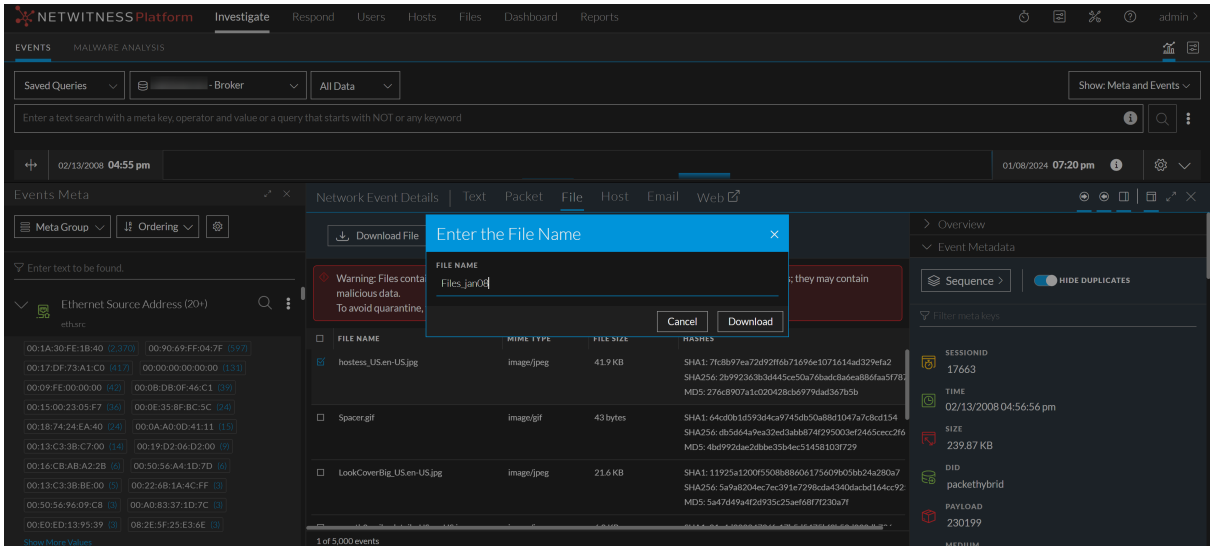
The network data file is downloaded to your local file system in the format specified or the metadata for the event is downloaded in the format specified.

Download Files from a Network Event in the File Reconstruction

When viewing reconstructed network events that contain files in the file reconstruction, you can select one or more files, or all files, to download to your local file system.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded file in the job queue.

When files are selected, the Download Files button becomes active and reflects the number of files selected.



Clicking Download Files exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To export files in a reconstructed event

1. In the **Events** view, go to the file reconstruction of an event that contains files.
2. Click one or more files that you want to extract, and click **Download File** or **Download Files**.
3. (From version 12.4 or later) A dialog box is displayed to enter the file name. By default, the file name is initially displayed with a time stamp in the following format: `investigation-yyyy-mmm-dd-hh-mm-ss` (Example, **investigation-2024-Jan-08-22-33-54**). Enter the required file name and click **Download**.

The job is scheduled and when complete the selected file are downloaded, in the form of a password-protected zip archive, to the local file system.

4. To open the archive on your local file system, enter the following password when prompted: `netwitness`.

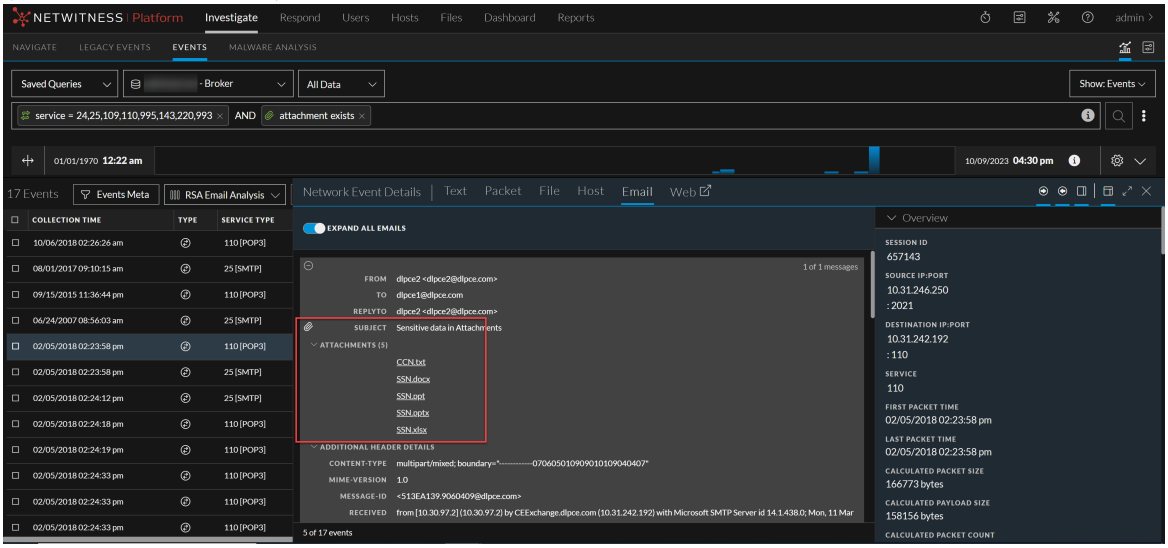
Download Attachments from an Email Reconstruction

When viewing an email reconstruction that contains attachments, you can select one or more attachments, or all attachments (Version 11.4.1.x), to download to your local file system. This feature exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

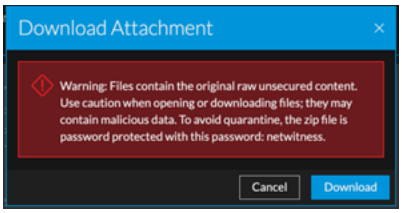
When downloading files from an email reconstruction, the filename is of the form `<service-name>_SID<n>_EMAIL`, for example, `Broker-_SID34_EMAIL.zip`. This is the password to open the zip archive: netwitness. The exported archive is named using the following convention:

`<service-ID or host name>_SID<n>_EMAIL.zip`



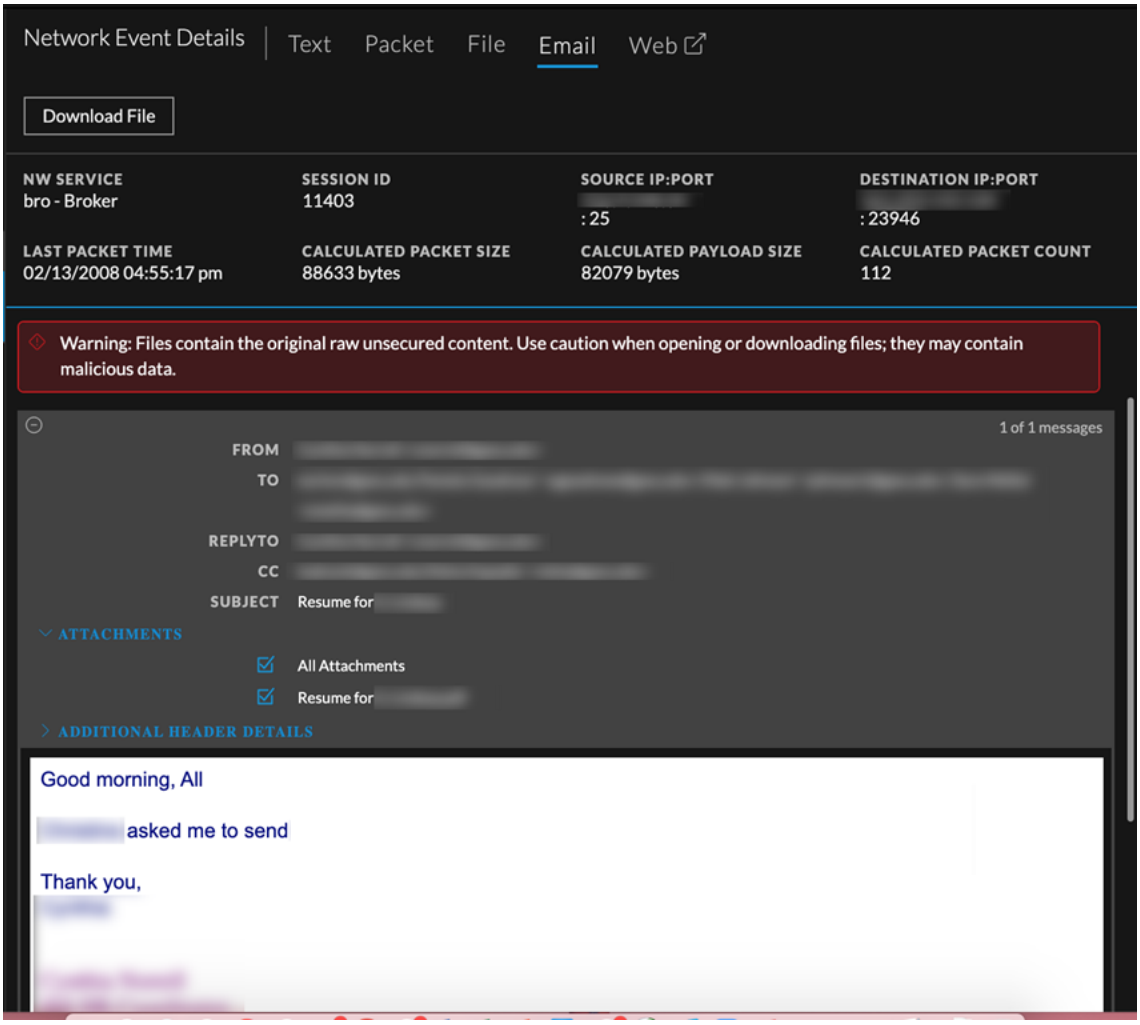
where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `EMAIL` is the type of reconstruction from which the files were downloaded.



Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To download email attachments:



1. Go to the **Events** view and open an email reconstruction by clicking an event that contains an email with attachments.
2. Expand the **Attachments** drop-down list and do one of the following:
   a. (Version 11.5 and later) Click a link to an attachment.

A dialog warns you that downloaded email attachments may contain malicious data and asks you to cancel or confirm the download. If you want to complete the download, click **Download**. Otherwise, click **Cancel** to cancel the download.

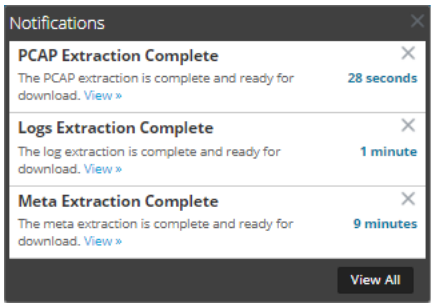
b. (Version 11.4.1.x) Select one or more attachments or **All Attachments**.

A warning message is displayed in the reconstruction. Click the **Download File** or **Download Files** button. The attachments are downloaded with no additional opportunity to cancel.

Export or Print a Drill Point in the Navigate View

In NetWitness Investigate, when the data for a drill point is displayed in the Navigate view, you can:

- Extract files from a session and choose the type of files to extract: archives, audio BitTorrent, documents, executable, images, other, video, and web.
- Export the drill point as a packet capture (PCAP) file, a log file, or a metadata file.
- Print the drill point.



The details being exported are affected by both the time range and drill point at the time of exporting.

Note: When you export the drill point as a log file, only the log sessions are exported. The job queue message refers to the total number of sessions in the drill point rather than the number of logs. For example, if the drill point has 505 sessions and only five log sessions, the job queue message states that NetWitness is extracting logs for 505 sessions.

To export a drill point from the Navigate view

1. Conduct an investigation until you reach the desired drill point.
2. For Version 11.0, In the toolbar, select **Actions > Export** and select one of the export options: **PCAP**, **Logs**, or **Meta**.
   The drill point is extracted, and a message advises that the job is scheduled. You can check the jobs page for the status.
3. For Version 11.1, in the toolbar, select **Save Events** > and select one of the export options: **PCAP**, **Logs**, **Files**, or **Meta**.
   A dialog gives you an opportunity to edit the default filename for the file. The default filename is in the form `investigation-Feb-21-15-44-33`. When you are exporting a PCAP, the file is exported with no choice of formats. If you are using one of the other export options, a dialog is displayed.
4. In the dialog, select:
   - The export log format: **Text**, **XML**, **CSV**, or **JSON**.
   - The file types to export: Archives, Audio, BitTorrent, Documents, Executables, Images, Other, Video, and Web.
   - The Meta format: **Text**, **CSV**, **TSV**, **JSON**.

5. When the scheduled file extraction is complete, it is displayed in the Job Notifications tray.

6. Click the **View** link in the Jobs tray and download the specific extraction file requested.

To print the current drill point

In the Navigate view, you can display the contents of the current drill point in printer friendly format in the browser window.

To display the current drill point in a print view:

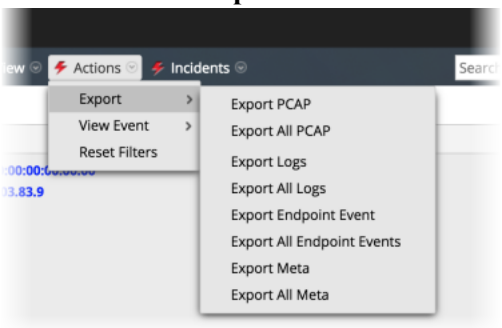
1. With a drill point open in the **Navigate** view, select **Actions** > **Print** in the toolbar.
   A new tab is created with the print view of the current drill point.

2. Use the print option in your browser to send the printable view to the printer.

Export Events in the Legacy Events View

In the Legacy Events view, the Actions menu has an option to export events from the event being viewed to an archive.

Note: You can only export files that you have permission to view or access.



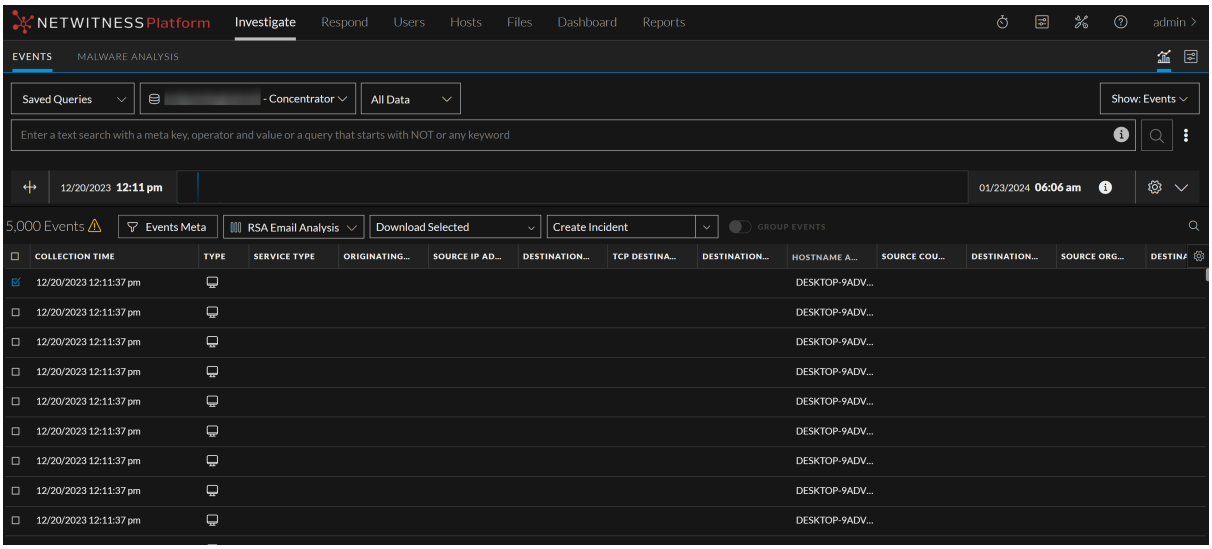
The export function queries the service for all sessions inside the selected time range and drill point to extract the content of each session. The details being exported are affected by both the time range and drill point at the time of exporting. In the File Extraction dialog, you can choose to export:

- PCAPs
- Logs
- NetWitness Endpoint events
- Meta values

The format of the exported archive: ZIP or GZIP file. After you send the request, a job is scheduled and you can track the job in in the Jobs tray. If there is an error retrieving the log or PCAP from the service, an error notification is displayed.

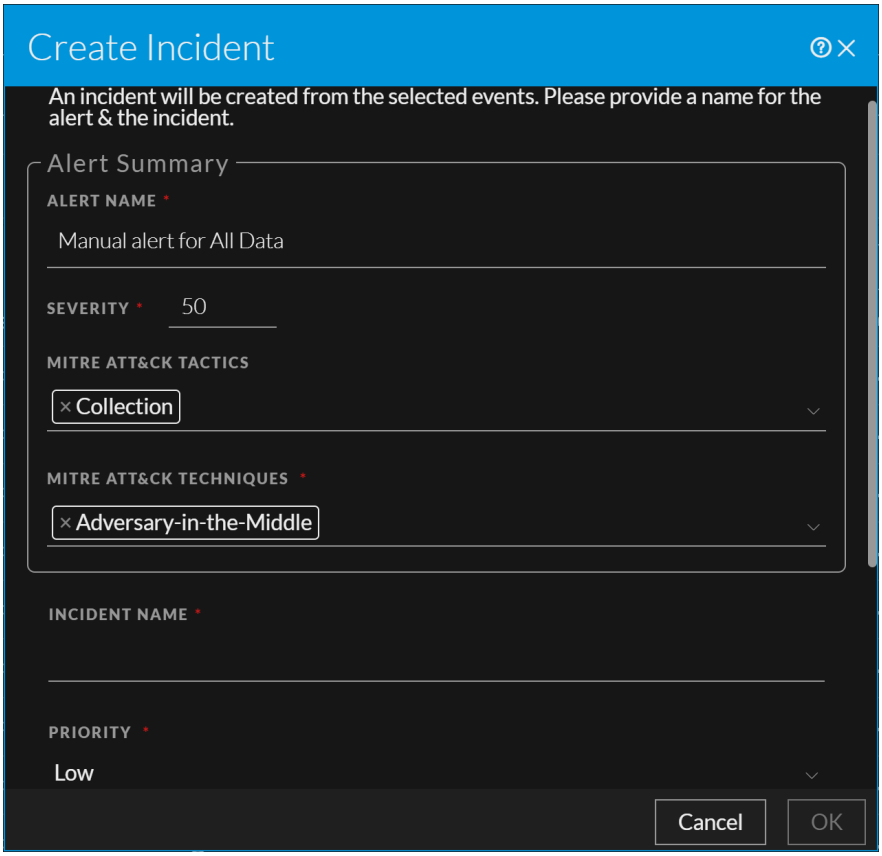
To extract files from an event

1. While in the **Event view**, click an event.
2. Click **Actions** > **Export.**.



3. Select the export option.
   A message informs you that the PCAP is being downloaded.

Add Events to an Incident in the Events View



When conducting an investigation in the Events view, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the `respond-server.incident.manage` and `investigate-server.incident.manage` roles and permissions. For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate** > **Events**.
2. In the **Events** view, select one or more events.

3. Click **Create Incident.**
   The Create Incident dialog is displayed. Complete the information in the Create Incident dialog.

   a. Select the severity. The alert summary field is a pre-defined value which is auto-populated but can be edited if required.

   b. Select the tactics from the **MITRE ATT&CK Tactics** drop-down list. After selecting the tactics, you will be presented with the option to choose the appropriate techniques.

   c. Select the techniques from the **MITRE ATT&CK Techniques** drop-down list.

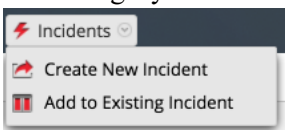
   d. Type a name for the incident in the **Incident Name** field.

   e. From the **Priority** drop-down list, select a priority for the incident. For example, an incident may be critical, high, medium, or low priority.

   f. Select an assignee for the incident from the drop-down list. This list includes the built-in users that have access to Investigate as well as any custom users that have been added to your system. For example, this list might include users for admin, analyst, dpo, operator, and users for incident responders.

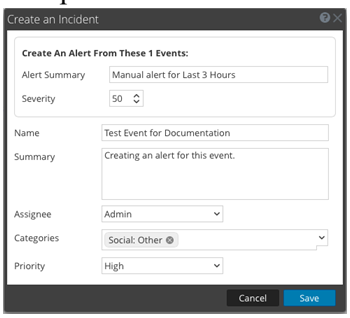
   g. From the Categories drop-down list, select one or more categories of events that apply to this incident.

   h. Click **OK**.
   An incident is created with the selected event in Investigate.



4. To add one or more events to an existing incident, select one or more events, and then click **Add to Incident**.
5. In the Add to Incident dialog, select the alert summary and severity, and select one or more open and existing incidents to which the incidents will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **OK**. The event is added to the selected incidents and updated in Respond.

Add Events to an Incident in the Legacy Events View



When conducting an investigation in the Legacy Events, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the required roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate** > **Legacy Events**.
2. In the Legacy Events view, select one or more events, and then **Incidents > Create New Incident**.

3. Complete the information in the Create an Incident dialog.

   a. Select the severity, an integer between 1 and 100, with 100 being the most severe.
   b. Type a name for the incident and describe the incident in the **Summary** field.
   c. Select an assignee for the incident from the drop-down list. This list includes the built-in roles that have access to Respond as well as any custom roles that have been added to your system. For example, this list might include roles for admin, analyst, dpo, operator and roles for incident responders.
   d. From the **Categories** drop-down list, select one of more categories of alerts that apply to this incident.
   e. From the **Priorities** drop-down list, select a category for the incident. For example, an incident may be critical, high, medium, or low priority.
   f. Click **Save**.
   The new incident is created and is available immediately in the incident queues for the selected role in Respond.

4. To add one or more events to an incident, select one or more events, and then **Incidents** > **Add to Existing Incident**.
5. In the Add Events to an Incident dialog, select the severity, and select one or more incidents to which the events will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **Add to Incident**.
   The events are added to the selected incidents and updated in Respond.

Troubleshooting NetWitness Investigate

This section provides information about possible issues when using NetWitness Investigate.

Navigate View and Legacy Events View Issues

Behavior	A meta key that normally returns values in the Navigate view returns values, but has a `Not Indexed` message following the meta key name. For example, the in this figure the Service Type meta key is followed by the message: `Service Type[service] Not Indexed`. 
Issue	When you first set up the environment or very rarely after performing a data reset on the broker due to other issues, you see meta keys as Not Indexed when they are indexed at meta key or meta values level.
Explanation	To fix the issue on a Broker, log out of NetWitness Platform and then log in again. Valid sessions will be displayed.

Message	`Not indexed; will experience longer than usual load times.` in the Manage Meta Groups dialog.
Issue	Meta keys in the Manage Meta Groups dialog are marked by a red exclamation point, and the error message is displayed. This can occur when investigating a Broker or Decoder while adding a meta group with meta keys that are not indexed in the index file or the custom index file for the service. For a Broker, it could mean that the Broker has not begun aggregating data from a Concentrator. In this case the Broker will not have the contents of the custom index file from the aggregate services and the keys will not be indexed. For a Decoder, it means that the meta keys are not indexed in the Decoder index or custom index file.
Explanation	To fix the issue on a Broker, log out, log in, and restart the Broker service so that it can aggregate the meta key information from connected Concentrators. To fix the issue on a Decoder, edit the custom index file to index the meta keys, log out, log in, and restart the Decoder service.

Behavior	When downloaded from the Event Reconstruction view, logs and metadata are always in text format irrespective of the format selected in the Legacy Events view.

Issue	When you download metadata or a log in the Event Reconstruction view, the format that you selected in the Legacy Events view is not used. The exported data is always in text format.
Explanation	Download metadata and logs from the Legacy Events view if you want to use a format other than text format.

Events View Issues

Message	`Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`
Issue	When you click **Pivot to Endpoint** in the Events view, no data is displayed and the message is displayed.
Explanation	Version 4.4 of the NetWitness Endpoint Thick Client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the `index-concentrator-custom.xml` file on the Concentrator. The NWE Thick Client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

Behavior	Download jobs are in a Waiting state or Failed state in the Jobs tray during and after upgrading the software to Version 11.4.
Issue	If you had download jobs running while your administrator was upgrading the software, you may see a job in a Waiting state while the upgrade is in progress and then in a Failed state after the upgrade is complete. You cannot resume or cancel the failed job.
Explanation	To delete the failed jobs, select the failed jobs in the Jobs tray and click .

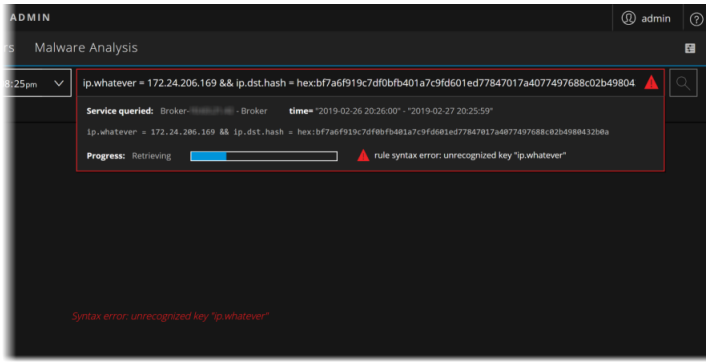
Message	Event counts in the Filter Events panel and the Events panel may sometimes differ when showing results for the same query.
Issue	The Filter Events panel uses only index data to produce counts of events, which is less accurate than the Events panel. The Events panel results are filtered for exact matches on data retrieved from the meta database, which takes longer to process.
Explanation	At worst the difference is in false positives in the Filter Events panel, not false negatives; so you will not miss an event.

Message	`Event Analysis requires all core services to be NetWitness 11.1. Connecting prior versions of services to the 11.1 NetWitness Server results in limited functionality (see "Investigate in Mixed Mode" in the *Physical Host Upgrade Guide*).`
Issue	When attempting to investigate a service that has not been updated to Version 11.1 in the Event Analysis view, the informational message is displayed.
Explanation	When an analyst opens the Event Analysis view in mixed mode (that is, some services are upgraded to 11.1 and later, and some are still on 11.0.0.x or 10.6.x), Role-Based Access (RBAC) is not applied uniformly. This affects viewing and downloading content, and validation of filters in the interactive breadcrumb. You will see this informational message when you open Events. As you select a service, services that are not up to date are displayed in a red box, with the message that the service is not up to date. When your administrator has upgraded all connected services to 11.1 and later, these features work as expected.

Message	`Forbidden. You cannot access the requested page.`
Issue	When attempting to access the Events view, the view opens with the message.
Explanation	Your administrator has prevented access to the Events view using role and permissions.

Behavior	If you can download an event in the Events view, but get a 0-byte file, the administrator may have restricted access to the content.
Issue	Role-Based Access Controls applied by your administrator allowed you to download an event for which you did not have permission; therefore, the file download was empty.
Explanation	If you believe you should have access to the event, contact your administrator.

Message	`Insufficient permissions for the requested data.`
Issue	While attempting to access an event in the Events view, the message is displayed.
Explanation	You have entered an event ID for an event that you do not have permission to view. The administrator may have placed some restrictions to limit access by role and permissions.



Message	`Invalid session ID: <<eventId>>`
Issue	No `sessionId` matches the `sessionId` that you queried.
Explanation	The reason for an invalid session ID can vary. Perhaps you edited the session ID manually, and no such session exists. Another case may be when you query a Broker, and the aggregated data has not been refreshed, you may see this error for a session that no longer exists.

Behavior	Investigation Profiles and built-in column groups are not present in 11.1 Event Analysis.
Issue	Post upgrade to NetWitness v11.1, the default column groups - Endpoint Analysis, Outbound SSL and Outbound HTTP are not added under column groups. Also, a few of the Investigation Profiles are missing post upgrade.
Explanation	It is observed that this issue occurs only when you have created a custom column group with the name which is same as one of the new 11.1 OOTB custom column group name. For example, if you create a custom column group in 11.0 with name **RSA Endpoint Analysis** then after upgrade to 11.1. Due to the same name already existing in 11.1, OOTB column groups and built-in profiles will not be available in the UI. To fix this, change the name of custom column group to something other than one of the OOTB column groups and restart the jetty server by using the following command on the NetWitness server: `systemctl restart jetty`

Message	`Memory limit of <XXXXXX> GB reached, controlled by setting max.query.memory`
Issue	The query that you submitted failed because the result set was too large, and the memory limit set by `max.query.memory` was reached.
Explanation	To avoid this error, try to further limit results by narrowing the time range, adding filters, and decreasing the number of columns in the column group. You can also ask an administrator to limit the number of events returned.

Behavior	No text data was generated during content reconstruction. This could mean that the event data was corrupt or invalid, or that an administrator has disabled the transmission of raw endpoint events in the Endpoint server configuration. Check the other reconstruction views.
Issue	When you reconstruct an event as text in the Events view, no data is displayed and the message is displayed.
Explanation	If you do not see the raw text in other Events views or Legacy Events view reconstructions, and you believe the data is not corrupted or invalid, your administrator has likely disabled transmission of raw endpoint events on the NetWitness Endpoint server. Contact your administrator for additional information.

Message	`Rule Syntax error: Unrecognized key "<meta key or meta entity name>"` `Syntax error: Unrecognized key "<meta key or meta entity name>"`
Issue	While querying a service, the matching events are not listed and the message is displayed in the query console and the Events view.

	
Explanation	The query you entered is querying a meta entity that is not configured properly. All upstream devices connected to the Broker being queries should have the same entity configuration. This error indicates that the Broker is operating with mismatched entity definitions. Ask your administrator to review the configuration described in "Index Customization" in the *Core Database Tuning Guide*.

Message	`Selected Column Group is no longer available. The default summary column group has been selected instead.`
Issue	If you had set a preferred column group before the 11.4 upgrade, on your first visit to the Events view, the flash message is displayed even when the column group is available or is the default group (summary). This issue was resolved in Version 11.4.1.
Explanation	This is a one-time occurrence. If you reload the Events view, the message is not displayed.

Message	`Session is unavailable for viewing.`
Issue	While querying an event ID, the reconstruction is not displayed and the message is displayed.
Explanation	The query you entered is trying to look at restricted data, for example, if you are allowed to see only log data and you are using a link to network data .

Message	`The query on channel <channel-number> was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`
Issue	If you continually get this timeout message, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time.
Explanation	If there are no messages indicating any specific warnings, ask your administrator to increase the Core Query Timeout from 5 minutes to 10 minutes as described in the *System Security and User Management Guide*.

Message	`The session id is too large to be handled:<<eventId>`
Issue	The session id that you typed in, or got from the Legacy Events view or Navigate view is too large.
Explanation	If you manually typed the sessionId or edited a sessionId in the Events view, you may have created an integer that is too large for Events to process.

Behavior	When reconstructing network events with a large number of packets (>250) in the Events view > Packets panel, with the option to display only payloads enabled and the packets per page setting higher than the default (100), the current browser tab may become unresponsive for up to 45 seconds as it is working to render the payloads.
Issue	Depending on the amount of resources (memory and CPU) on the client machine and the number of packets in the event there may be a performance lag when displaying only payloads in packet reconstruction.
Explanation	To limit the amount of data processed in a reconstruction of a single event, change the Packets per Page setting in the footer to a lower value. 

Behavior	When working in the Version 11.4 Events view, the Query Profile drop-down menu and Column Group drop-down menu do not function.
Issue	You do not have permission to read columns groups and profiles. The default column group , Summary List, is applied to the Events list, and you cannot change the column group, create a column group, or delete a column group.
Explanation	This occurs only when the administrator has created a custom role for you instead of assigning the default Analyst role. Ask your administrator to enable column group read and profile read permission for your role.

Issue	No matching Endpoint data available on **Investigate** > **Events** view > **Host** tab.
Explanation	The Endpoint data may not be available due to any of the following: • **No Endpoint Deployment** – You must install Endpoint Log Hybrid, see "NetWitness Endpoint" in the *Physical Host Installation Guide*. • **Endpoint data is not captured for the host associated with the selected network event-** Make sure that NetWitness Endpoint Agent is installed, and expanded network visibility is configured to track the network events. To enable expanded network visibility, see "Creating Groups and Policies" in the *NetWitness Endpoint Configuration Guide*. **Note:** For Expanded Network Visibility to work, ensure the service user account

	used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*. • **Concentrators or Endpoint services are offline or very slow** – You must check the status (online or offline) of the services on Health and Wellness. If the service is online, you must check the Endpoint server logs and (Endpoint) Concentrator logs for details. • **Endpoint data is rolled over for the host associated with the selected network event** - The Endpoint data may be rolled over due to data retention period configured. You must configure the data retention period to retain the endpoint data for a longer period. For more information, see "Configure Data Retention" in the *Data Privacy Management Guide*.

Investigate Events Reporting Issues

Reporting Engine Service Unavailable

Message	I see the following error message while generating a report: `The Reporting Engine service may be offline or inaccessible. Try starting the service.`
Issue	This scenario occurs if the reporting engine service becomes offline or inaccessible due to the following reasons: • The administrator might have turned off the service. • The server on which the service is installed is not accessible. **Note:** The offline service will be shown (circle with red) indicator.
Explanation	To fix the issue, you need to perform the following actions: 1. Go to  (Admin) > **Services**. 2. In the **Services** list, select the Reporting Engine Service. 3. Click  > **Start**.

Insufficient Permissions

Message	I see the following error message while generating a report: `You do not have the required permissions to generate a report. Contact your administrator to request access.`
Issue	This scenario occurs when an analyst tries to create or schedule a report without the required permissions.

	Note: By default, only administrators will have access.
Explanation	To fix the issue, analysts must contact their administrators to request access permissions. Once the permissions are provided, the analysts can try generating the report later. For more information, see Configure Data Source Permissions in the *NetWitness Reporting Configuration Guide*.

Unsupported Custom Columns

Message	I see the following error message while generating a report: `The following custom columns are not supported to generate a report. Remove them and try again.` • `<column name 1>` • `<column name 2>`
Issue	This scenario occurs because the Reporting Engine Service does not support a few custom columns for generating the report on the **Investigate** > **Events** page.
Explanation	Perform the following actions to remove the custom columns from the list. 1. In the **Events** view, click the ( ) **Settings** icon. An available list of custom columns is displayed in a pop-up window. 2. Unselect the unsupported custom columns from the list and try generating a new report.

Datasource is not Configured or Unavailable

Message	I see the following error message while generating a report: `The datasource <service name> is not configured in the Reporting Engine. Add the datasource and try again.`
Issue	This scenario occurs when you select a datasource that is not configured in the Reporting Engine. **Note:** When the name of the datasource on the Investigate page differs from the name on the reporting page, an error message is displayed.
Explanation	To fix the issue, perform the following steps: 1. Go to (Admin) > **Services**. 2. In the **Services** list, select the Reporting Engine service. 3. Click > **View** > **Config**.

The Services Config View of Reporting Engine is displayed.

4. Select the **Sources** tab.
5. Click  and select **Available Services**.

   The Available Services dialog is displayed.
6. Select the required service (for example, Log Decoder) and click **OK**.

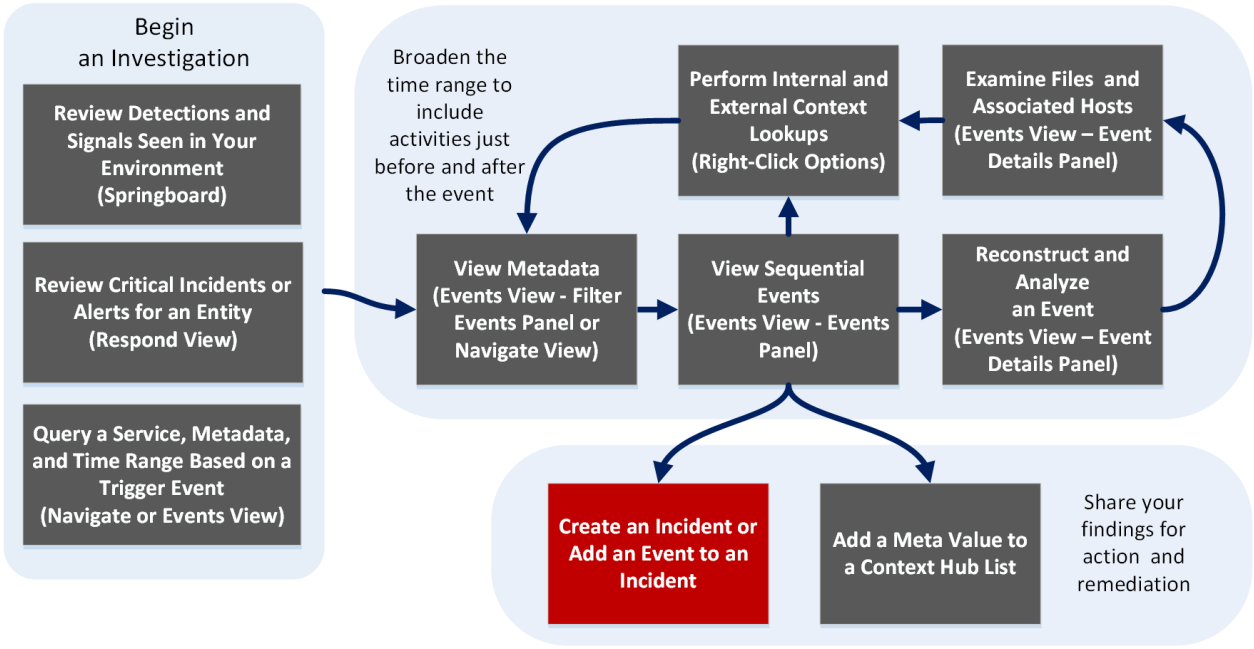
   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.
7. Enter the Username and Password for the service.
8. Click **OK**.

   The selected service is listed in the Aggregate Services pane.

Investigate Reference Materials

This section provides is intended to help you understand the purpose and application of NetWitness Investigate views. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.



- Investigate View

- Create Chart Dialog from Events View
- Timeline Settings Panel

- Create Search Pattern Dialog
- Settings Dialogs for Investigate Views

Add Events to an Incident Dialog

In the Add Events to an Incident dialog, analysts can add alerts to an existing incident so that incident responders look at the associated events as part of an incident response. To access this dialog while investigating a service in the Events view and the Legacy Events view, see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Incident Responder	review critical incidents or alerts	*NetWitness Respond User Guide*

Quick Look

The following figure is an example of the Add Events to an Incident dialog in the Legacy Events. The table describes the information and options in the Add Events to an Incident dialog .

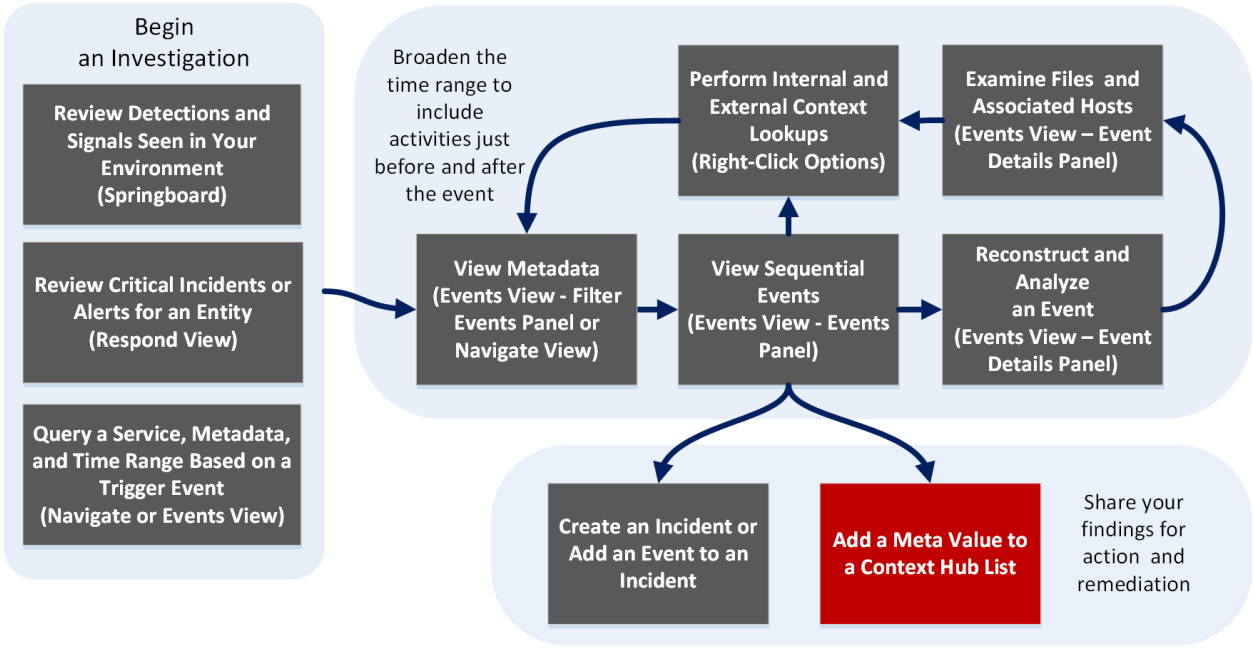
Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Search	Allows you to search for an existing event.
ID	The ID of the incident. You can sort IDs in ascending or descending order.
Name	The incident name. You can sort the Name in ascending or descending order.
Date Created	Displays the date and time the incident was created. You can sort the dates in ascending or descending order.
Priority	Displays the priority of the incident: either low or critical.
Cancel	Closes the dialog without saving changes.
Add to Incident	Adds the alerts to the incident. A dialog confirms that alerts are successfully added

The following figure is an example of the Add to Incident dialog in the Events view. The table describes the information and options in the Add to Incident dialog.

Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident.
Severity	The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
MITRE ATT&CK Tactics	Displays the type of tactics associated with the incident. For example: **Credential Access**. The tactic Credential Access tries to steal account names and passwords.
MITRE ATT&CK Techniques	Displays the type of techniques and sub-techniques associated with the tactics.
Search Open Incidents	Allows you to search for an existing incidents.
ID	The ID of the incident.
Name	The incident name.

Feature	Description
Created	Displays the date and time the incident was created.
Assignee	Displays the team member currently assigned to the incident
Cancel	Closes the dialog without saving changes.
OK	Adds the alerts to the incident. A confirmation message is displayed after the incident is successfully added

Add/Remove from List Dialog



The Add/Remove from List dialog allows you to add an entity or meta value to an existing Context Hub list, remove an entity or meta value, or create a new Context Hub list containing the entity or meta value. When you look up an IP address or other entity and you find it suspicious or interesting, you can add it to a list that has been added as a data source. An example of a commonly used list is a white list or black list. This improves the visibility of the suspicious IP addresses and reduces false positives that do not need further investigation.

You can add entities or meta values to more than one list. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connection IP addresses related to remote access. If a list is not available, you can create a list.

The dialog is available in NetWitness Investigate and in NetWitness Respond. When working in Investigate, in the Navigate view, Legacy Events view, or Events view, you can add meta values for the `Source IP`, `Destination IP`, or `Username` meta keys to an existing context hub list or you can create a new list containing the meta values. When you add meta values to a list, you can look up additional context on those meta values.

- To display the dialog in the Navigate view or the Legacy Events view, right-click a meta value under `Source IP`, `Destination IP`, or `Username`) and select **Add/Remove from List** in the context menu.
- To display the dialog in the Events view, hover over a value and select **Add/Remove from List** in the Actions section of the context tooltip.

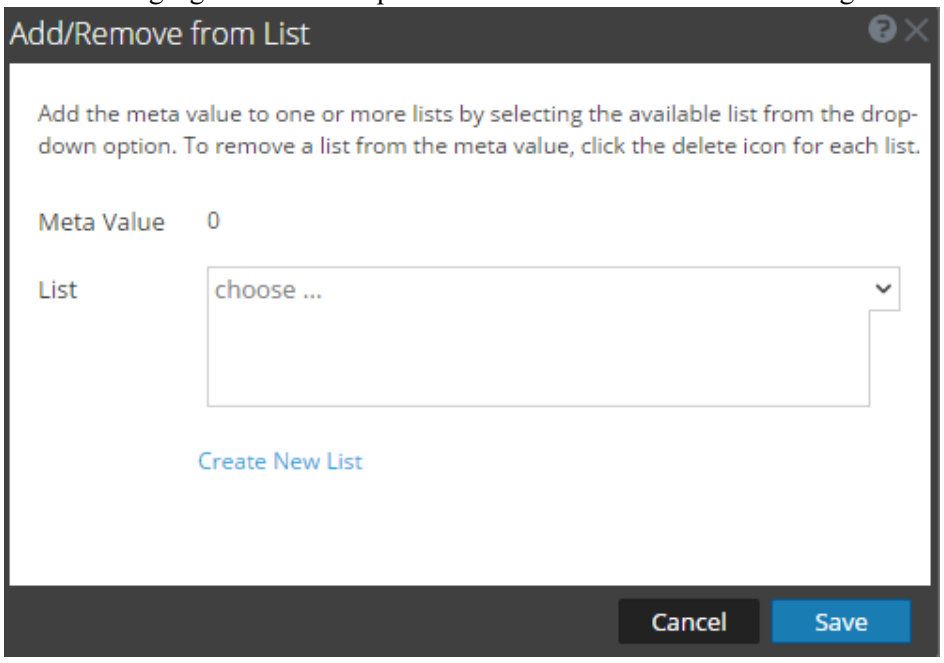
Quick Look in the Events View

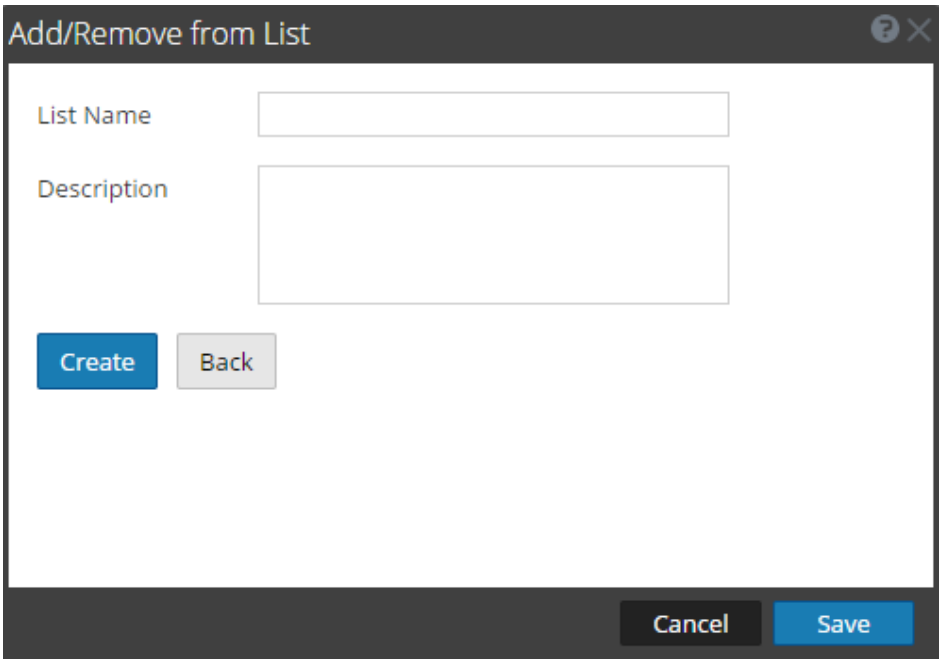
The following is an example of the **Add/Remove from List** dialog in the Events view.

1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.



The following table shows the options in the Add/Remove from List dialog.

Option	Description
Meta Value	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.



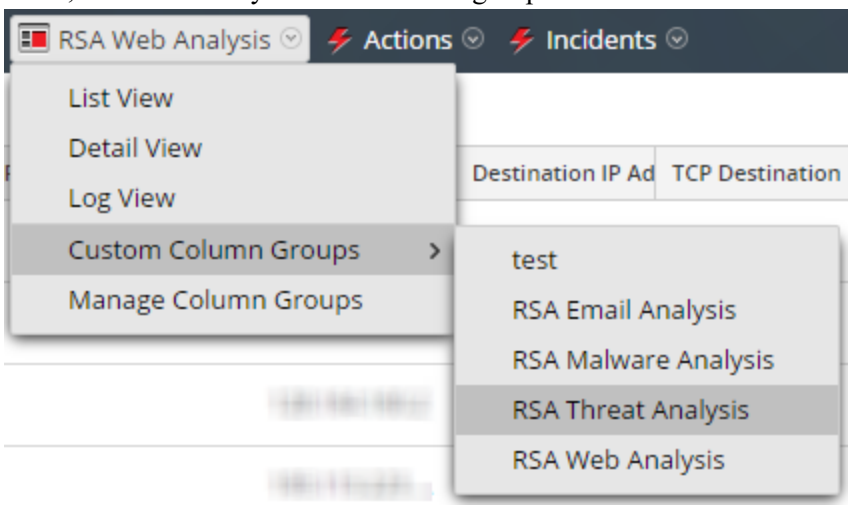
Option	Description
Create New List	Displays a dialog to create a new list using the selected meta value.
All	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
Selected	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)
Unselected	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
List	Displays the name of all the lists.
Description	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

Quick Look in the Navigate and Legacy Events Views

The following figure is an example of the Add/Remove from List dialog when initially opened.

The following figure shows the dialog when you select Create New List.

The following table describes the features of the Add/Remove from List and Create New List dialogs.



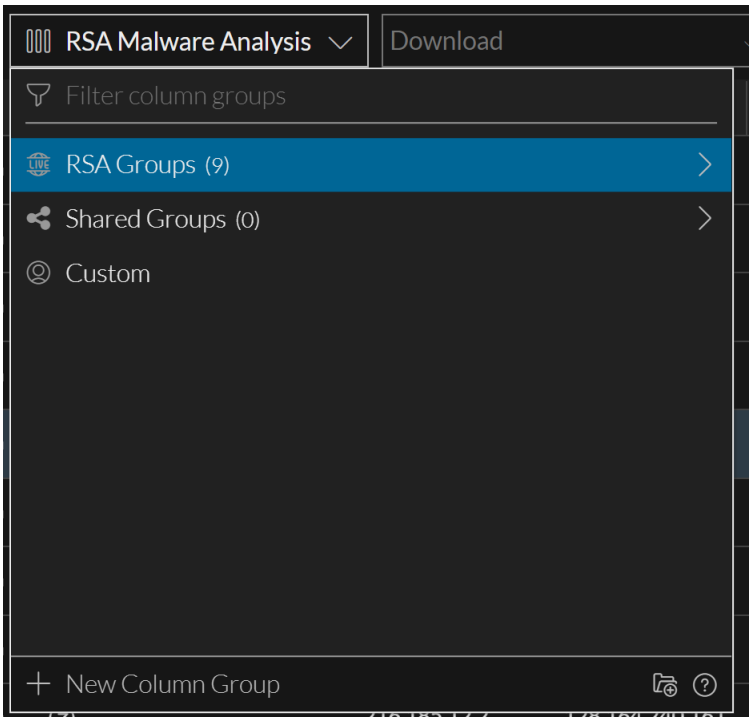
Feature	Description
Meta Value	The selected meta value to be added to the existing or new list.
List	The list to which the selected meta value must be added. A drop-down menu provides a list of available lists to which you can add the meta value.
Create New List	Opens a new dialog in which you can create a new list for the selected meta value.
List Name	The name of the new list.
Description	The description of the new list.
Create	Creates a new list after entering the required fields.
Back	In the new list mode, cancels the new list creation and returns to the original dialog.
Cancel	Cancels the addition of the meta value to a list and closes the dialog.
Save	Saves the changes made to the lists and closes the dialog.

Column Groups Dialogs

Column groups allow you to format the events list to include only the relevant meta keys in the Events view and Legacy Events view (see Use Columns and Column Groups in the Events List). When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, the default column group includes columns for **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The NetWitness Email Analysis list has only that contain information useful when investigating email.

The column group definition includes the meta keys to use as column titles, the position of the column in the list, and the default width of the column. You can add, delete, import, export, and edit column groups. At fresh installation, built-in column groups are available. The built-in column groups are prefixed with NetWitness and can be duplicated but cannot be edited or deleted. You can also create custom column groups.

- The Create Column Group dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group > New Column Group** in the **Events** view toolbar.
- The Column Group Details dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group** in the **Events** view toolbar, then click the edit icon ( ) next to a custom column group name.
- The Manage Column Groups dialog is for the Legacy Events view (Version 11.4) , and the Events view (Version 11.4 and earlier). The Manage Column Groups dialog has these features that are not yet available in the Create Column Group dialog: set column width, import, and export. To access this dialog, go to **Investigate > Legacy Events** and in the **View** drop-down list select **Manage Column Groups**. The **View** option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.



After column groups are defined, you can use them in other Investigate views. In the Navigate view, Query Profiles allow you to select a column group to use when the profile is applied. In the Events view and the Legacy Events view, you can select a column group to apply to the Events panel.

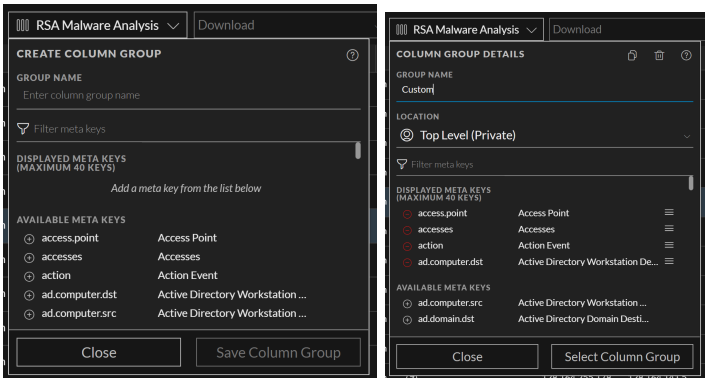
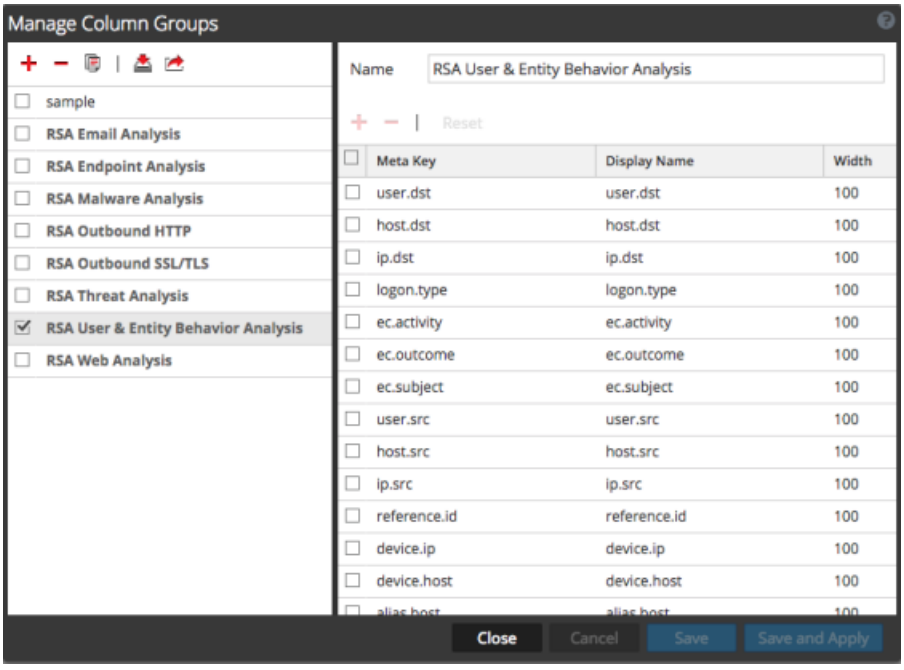
Quick Look - Column Group Menu, Create Column Group Dialog, and Column Group Details Dialog



This section introduces the Column Group Menu, Create Column dialog, and the Column Group Details dialog. The following figure is example of the Column Group menu. The table describes the options.

Feature	Description
Visibility Options	(Version 11.5 and later) Control the types of column groups that are visible in the list, using any combination of the visibility options (blue = selected, black = not selected): **Private** = display private groups that only you can manage **Shared** = display shared groups that anyone in your organization can manage **RSA** = display built-in groups that only RSA can manage The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty.

Feature	Description
Filter Column Groups	Filters the list of column groups as you type text so that only group names that contain that text are displayed.
Column Group List	The list of column groups consists of custom and built-in groups, which are distinguished by the icons that precede the name. In Version 11.5 and later, custom groups can be shared or private. The RSA column groups are built-in column groups. The icons distinguish the private custom groups, shared custom groups, and built-in groups.
New Column Group	Displays the Create Column Group dialog, where you can create a custom column group.



The Create Column Group dialog, shown in the figure on the left, allows you to define a custom column group. The figure on the right illustrates the Column Group Details dialog, in which you can edit a custom column group. The table describes the fields and options in the dialogs.

Feature	Description
	Deletes the custom column group in the Column Group Details dialog. This action is irreversible and applies globally; the column group is no longer available to anyone who is using it on this service.
Group Name	Displays the name of the column group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom column group.
Sharing	In Version 11.5 and later, you can create column groups that are shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared.
Filter Meta Keys	Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed.
Displayed Meta Keys	Displays a scrollable list of meta keys that are selected for use in the custom column group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list , and drag meta keys up or down to change the order in this list ().

Feature	Description
Available Meta Keys	Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking ⊕ next to the meta key name adds it to the Displayed Meta Keys list.
Close button	Closes the dialog.
Save Column Group	For the Create Column Group dialog only, saves the new column group.
Reset	For the Column Group Details dialog only, reverts the edited column group to the last saved state.
Update Column Group	For the Column Group Details dialog only, applies changes to an edited column group.
Select Column Group	Applies the column group.

Quick Look - Manage Column Groups Dialog

The Manage Column Groups dialog has two panels: Groups and Settings. At the bottom of this dialog are four buttons: Close, Cancel, Save, and Save and Apply.

The left panel is the Groups panel. This is where you can add, delete, import, or export column groups. At the top of the panel is a toolbar. Below the toolbar is a list of added column groups, where you can select one or more groups.

The following table lists the actions in the toolbar.

Action	Description
	Adds a column group. Clicking this button highlights the Settings panel on the right, where you can name the column group and add or delete meta keys. At least one meta key is required to add a group.
	Deletes a column group. A confirmation dialog is displayed before the selected group is deleted. OOTB column groups cannot be deleted.
	Creates a copy of the selected column group.
	Displays the Import Column Groups dialog, where you can select a file to upload.
	Exports one or more selected groups to your local file system.

The right panel is the Settings panel. This is where you can create and edit column groups. This panel contains the Name field, a toolbar, and a list. The following table describes the features of the Settings panel.

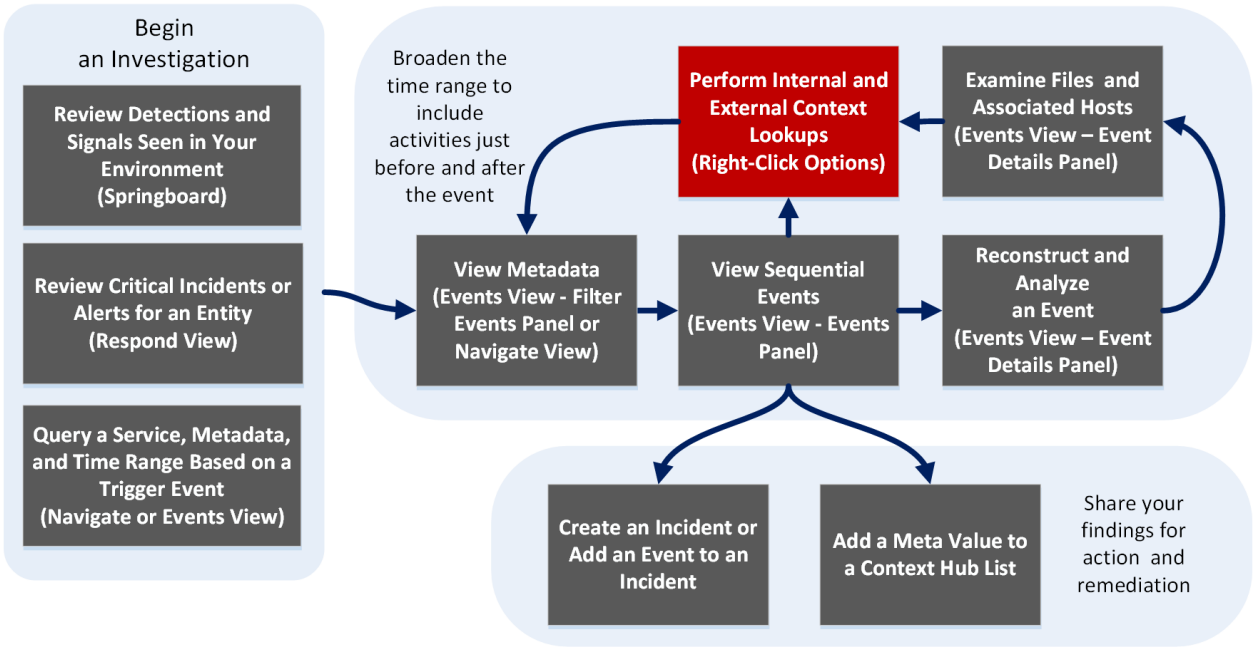
Feature	Description
Name	The name of the selected column group.
	Adds a new row to the list of meta keys, where you can open a drop-down menu to select a new meta key.
	Deletes one or more selected meta keys. Displays a confirmation dialog before deleting.
Reset	Returns the column group to its most recently saved settings.
Meta Key	Lists the meta keys added to the selected column group.
Display Name	Lists the names of the meta keys as they are displayed in the Navigate, Events, and Event Analysis views.
Width	Specifies the width of each meta key's column. The width can be set between **10** and **1000**. The default width is **100**.

The following table provides descriptions of the action buttons.

Feature	Description
Close	Closes the dialog without saving.
Cancel	Cancels all unsaved changes.

Feature	Description
Save	Saves all changes without closing the dialog.
Save and Apply	Saves and applies all changes immediately, closing the dialog.

Context Lookup Panel



After an administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view, Legacy Events view, and Events view (Version 11.2 and later). The Context Hub service is pre-configured with a default meta type and meta key mapping. For information about mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

The Context Lookup panel is displayed on the right side of the Navigate view, Legacy Events view, or Events view. Meta values that have been added to a Context Hub list are highlighted in gray in the Navigate view or Legacy Events view results. In the Events view, they are marked by an underscore. When you right-click a highlighted value and select **Context Lookup** in the resulting context menu, the lookup results are displayed in the Context Lookup panel for configured sources for the selected meta value. You can select a source in the Context Lookup panel icon bar to view the contextual information.

There are some differences between the appearance and contents of the Context Lookup panel when open in the Navigate view or Events view and when open in the Events view.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Investigate > Events** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Incident Responder	review critical incidents or alerts	*NetWitness Respond User Guide*

Quick Look (in the Navigate and Legacy Events Views)

The following figure is an example of the Context Lookup panel as it appears in the Navigate view. Controls and features are described in the table.

Feature	Description
Source Options Bar	Displays the icons for the available sources: Endpoint, Incidents, Alerts, and Lists.
Source Name	Displays the source name based on the selected icon: • Endpoint • Incidents • Alerts • Lists
Sort	Provides a drop-down of sort options for the listed context information. Possible sort options are Severity - High to Low, Severity Low to High, Date - Oldest to Newest. and Date - Newest to Oldest. The sorting options vary by source type.
	Refreshes the lookup results.

Feature	Description
<n items> (First <n> Results)	The footer provides a count of results currently displayed and the total number of results. For example, 5 Alerts (First 50 Results).

Incidents

Incidents are displayed based on time first (Newest to Oldest) and then priority status. The following information is displayed for incident lookups:

- Incident Name and ID
- Priority status of the incidents
- Risk Score value of the incidents
- Date when the incident was created
- Status of the incident
- Assignee for the incident
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*.
- Sort: This drop-down field provides options to change the sorting of result based on time or priority.

Alerts

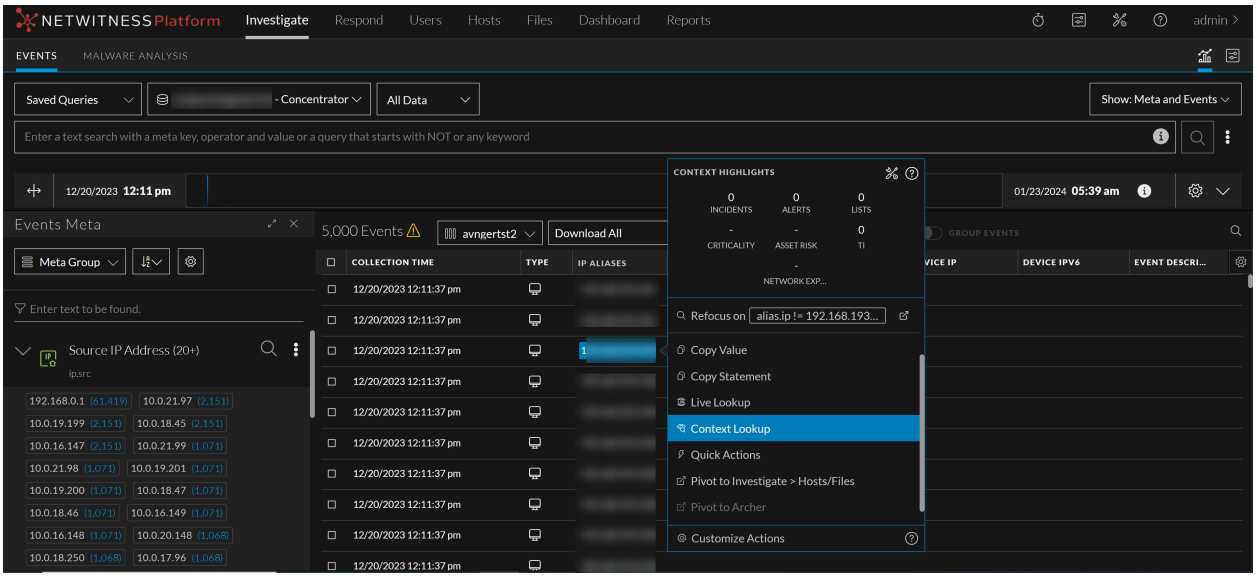
Alerts are displayed based on the Severity. ;The following information is displayed for alert lookups:

- Alert Name
- Severity value of the alerts
- Date when the alert was created
- Incident ID: This is the ID of the incident that the alert is associated with (If any).
- Sources: Event source name
- Number of events associated with the alert.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*
- Sort: This drop-down field provides option to change the sorting of result based on time or priority.

Lists

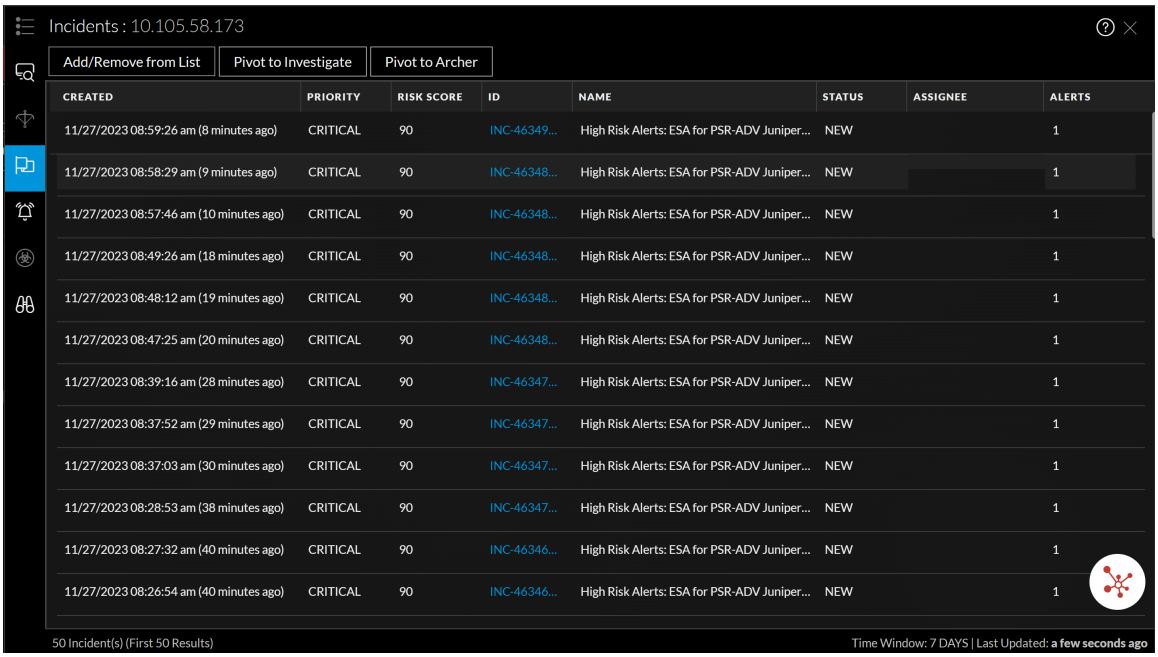
The following information is displayed for list lookups.

- List Name (user defined)
- Description of the list (user defined)
- Header
- Value
- Owner who created the list
- Created Date
- Last Updated Date



Endpoint

The following information is displayed for Endpoint lookups.

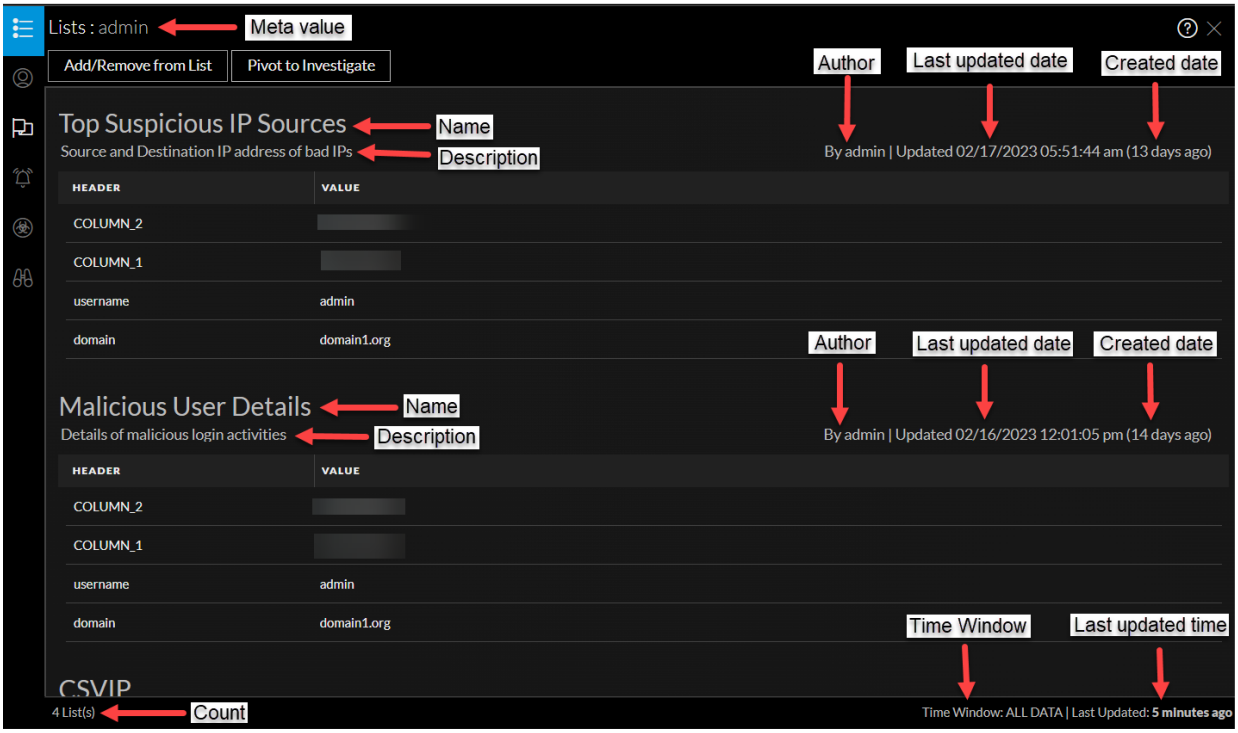


- Machine name and IP address of the machine.
  By clicking on the IP or Endpoint machine name, you will be navigated to Endpoint UI to perform further investigation.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Machine Score: A machine IIOC score is aggregated based on the module scores.
- Number of modules: Number of active files for the selected machine.
- Last Updated: Indicates when the scan results were last updated in Endpoint database.
- Last Login User
- Machine MAC Address
- Operating System Version
- Admin Notes (if any)
- Admin Status (if any)
- Top Suspicious Modules (Modules that have an IIOC score > 500). This is based on the value set for "Minimum IIOC Score" field in the Configure Endpoint window. The default value for "Minimum IIOC Score" is 500.
- Machine IIOC Levels

Quick Look in the Events View

The following figure is an example of the Context Lookup panel as it appears in the Events view.

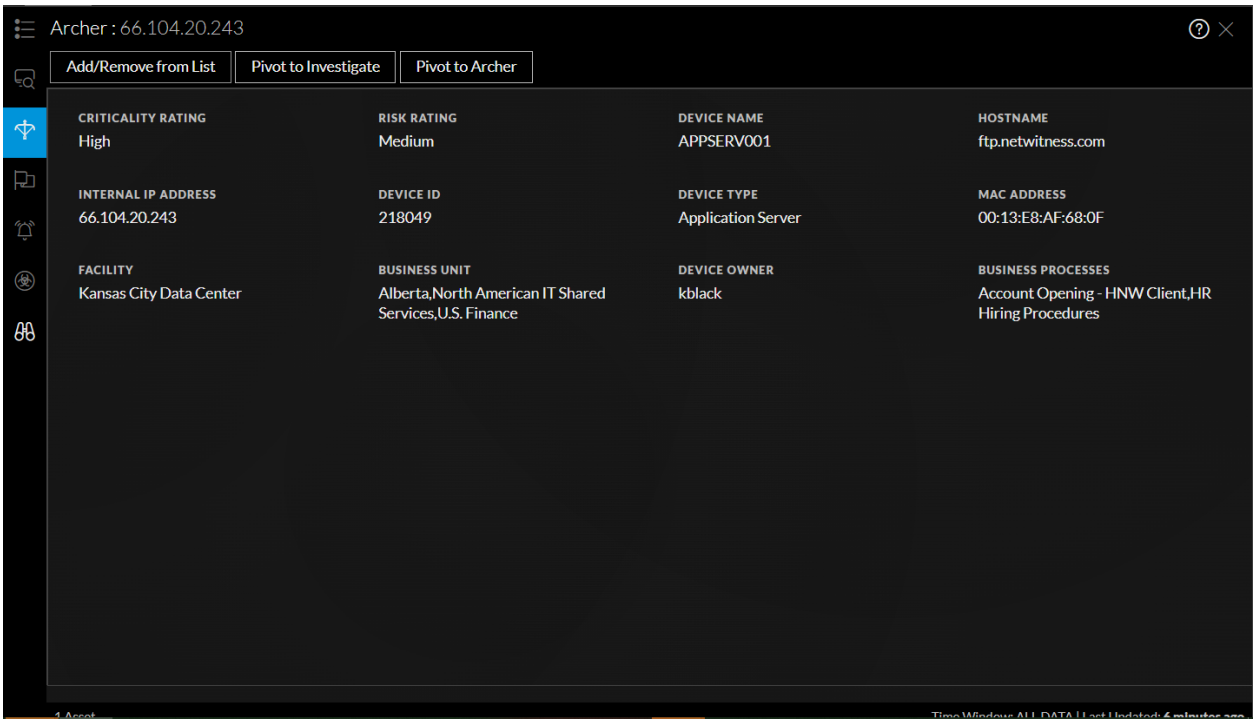
The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Incidents, Alerts, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.



The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
 (Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities
 (Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
 (Active Directory)	Displays all user information for the selected user.	User
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (File Reputation)	Displays file reputation status for Filehash entities.	Filehash entities
 TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. Navigate to  (Admin) > System > Investigation > Context Lookup.
 REST API	Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity.	All entities

Lists Tab

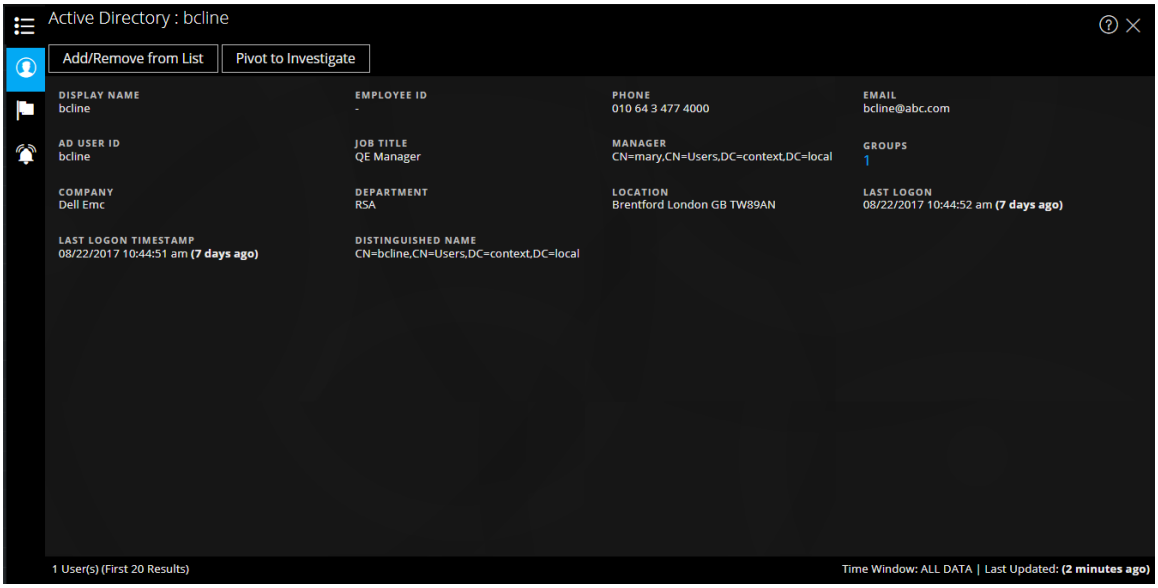


The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.

Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Header	Displays the metas available for the list.
Value	Displays the values for each meta in the list.
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modified.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.

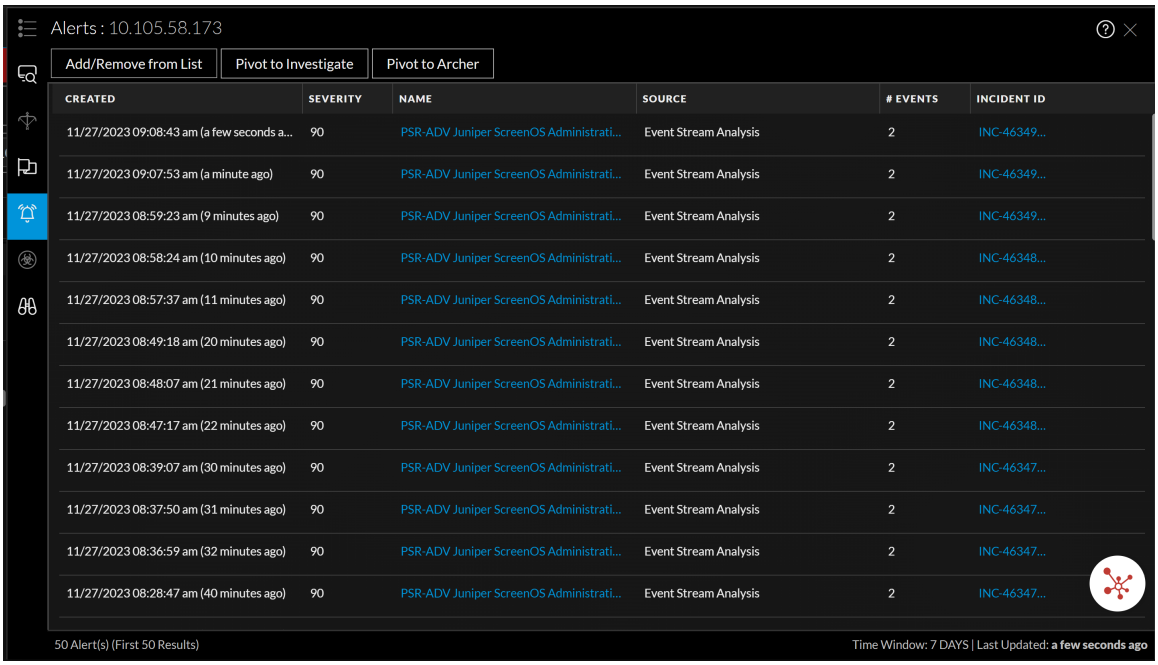
Field	Description
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:



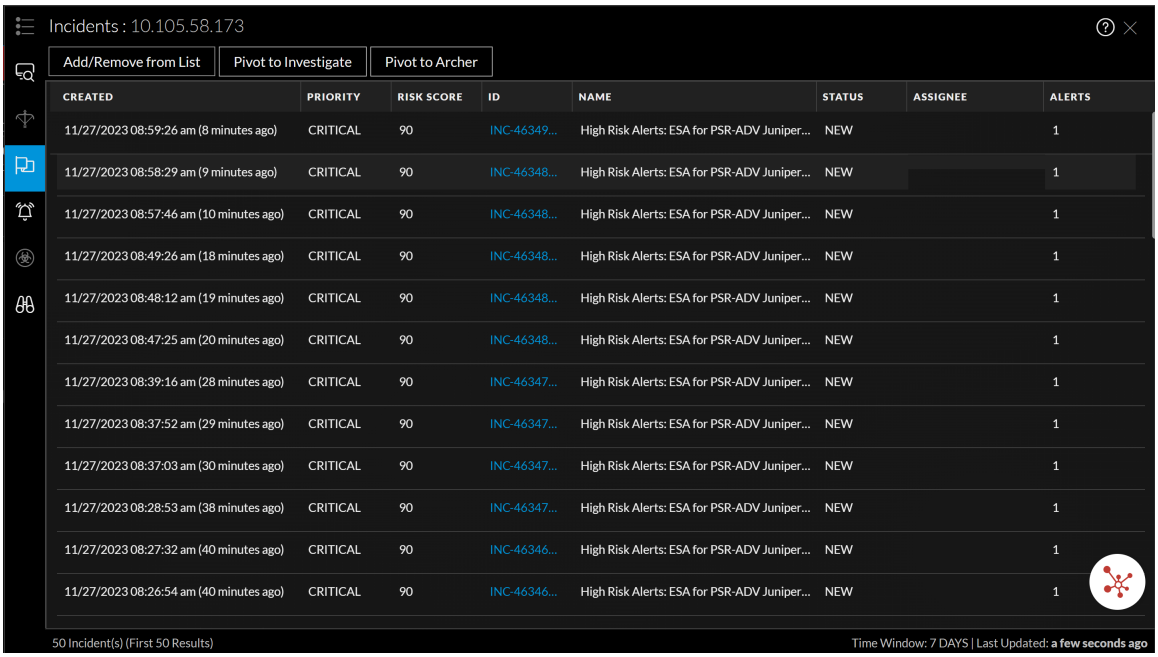
- userPrincipalName
- Domain\UserName
- sAMAccountName

The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

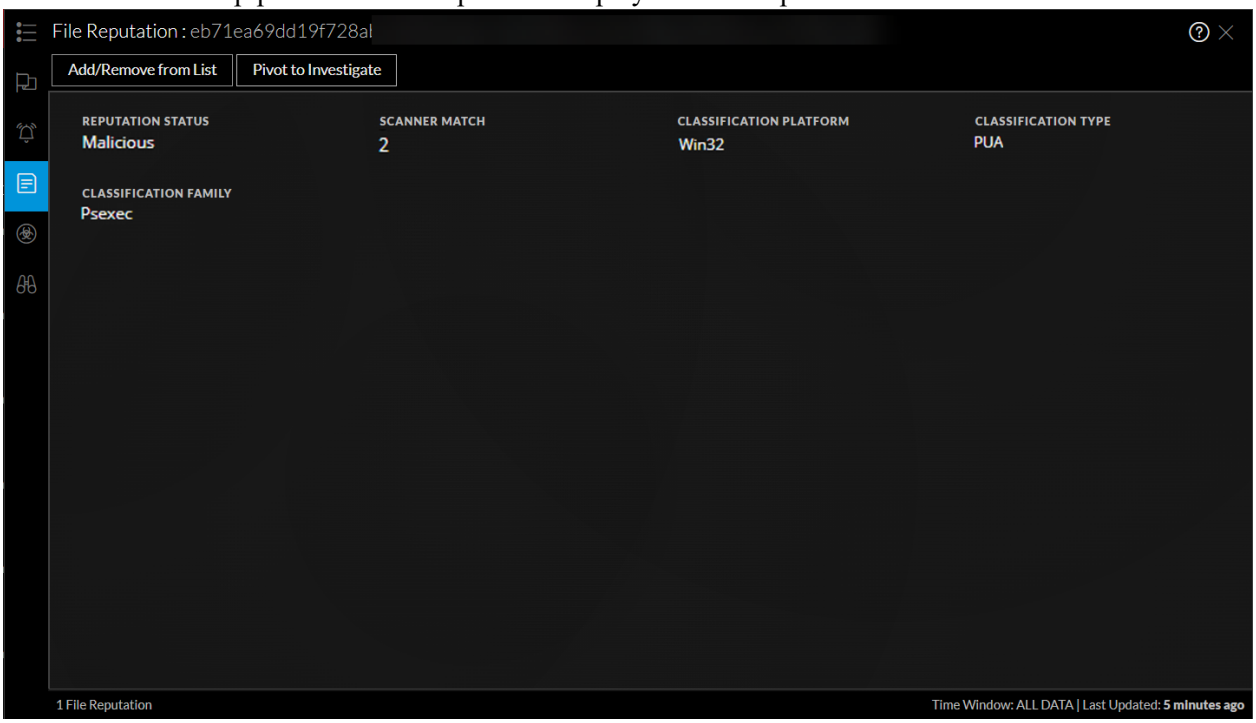


The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

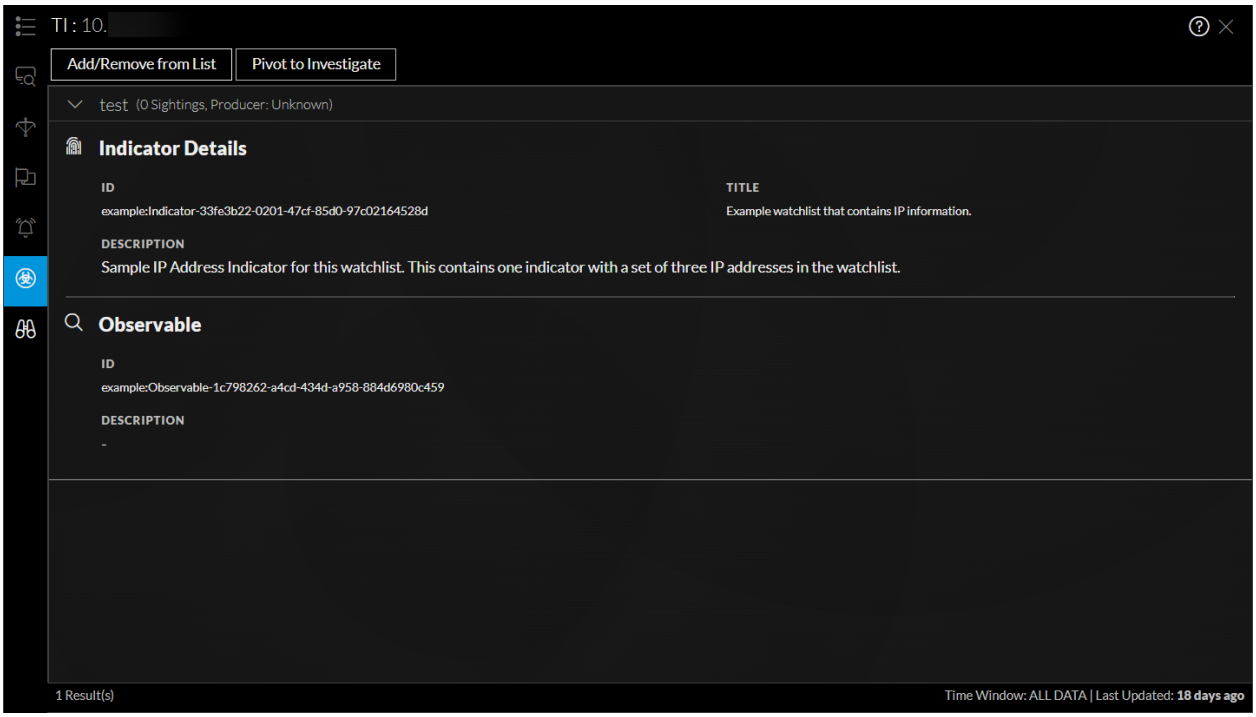
The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.



The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

File Reputation Tab

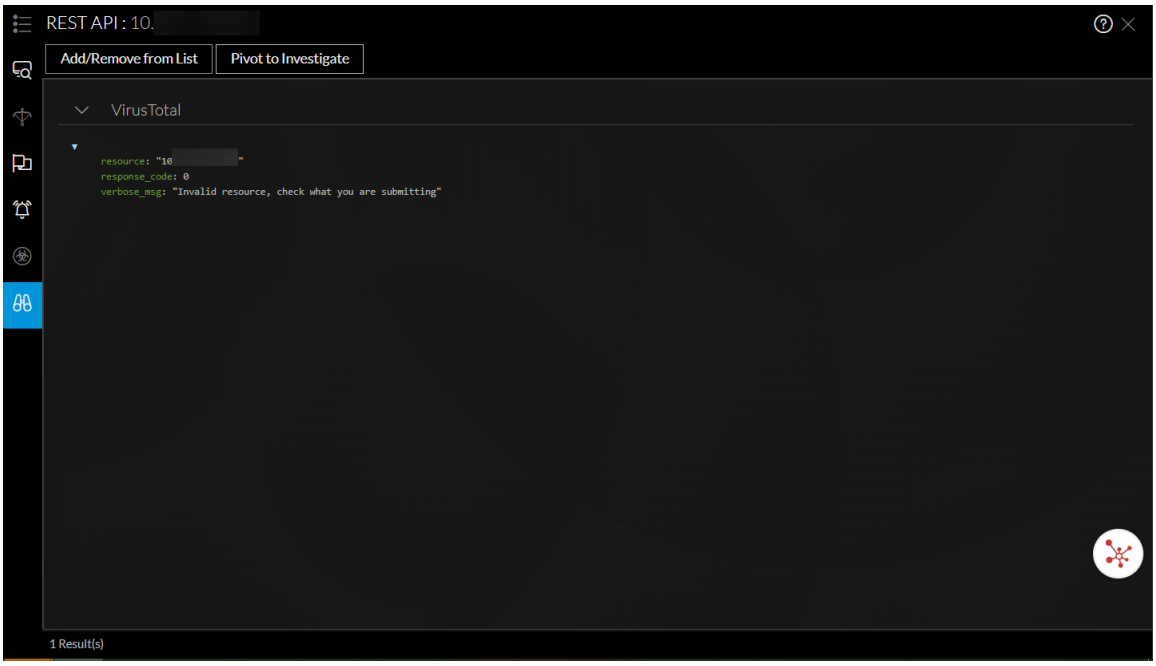


The Context Lookup panel for File Reputation displays the file reputation status of a file.

Field	Description
Reputation Status	Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*.
Scanner Match	Number of scanners that detected malware or suspicious activity in the last scan.
Classification Platform	Classification for the queried filehash based on the platform. For example, the platform can be Win 32.
Classification Type	Classification for the queried filehash based on the type.
Classification Family	Classification for the queried filehash based on the malware family name.

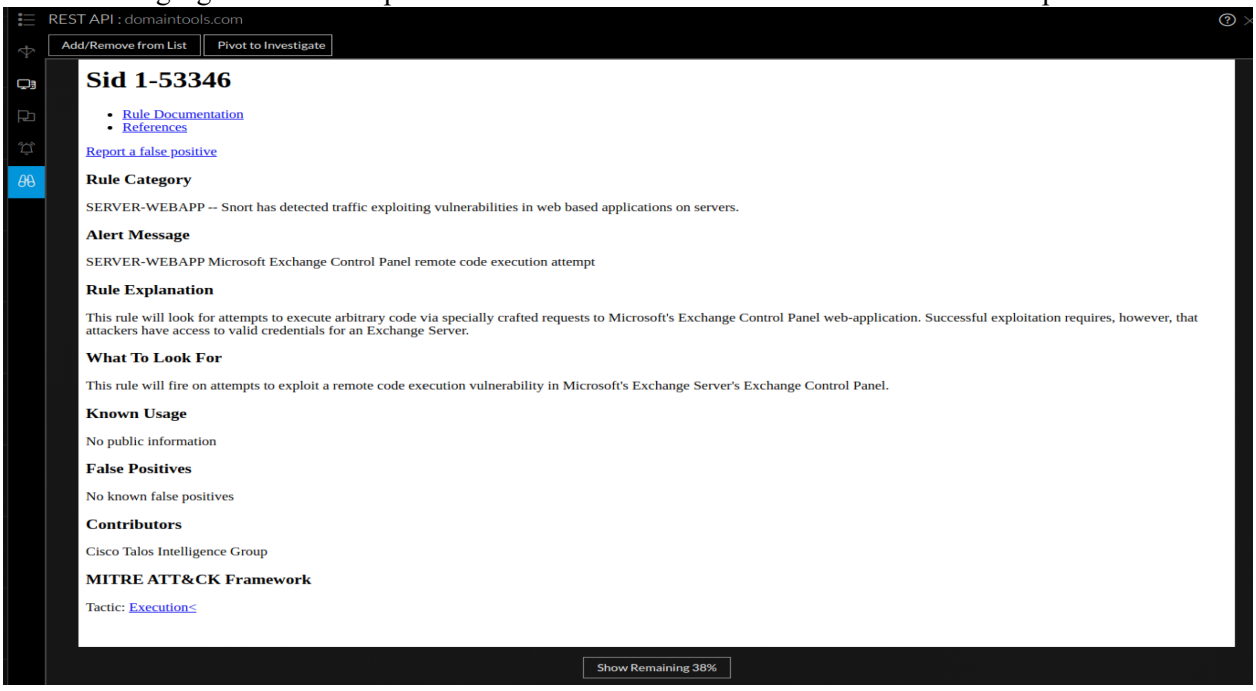
TI Tab

The following figure is an example of a Context Panel for TI, and the table describes the information displayed.



Field	Description
Data Source name	Displays the STIX data source name from where the data is retrieved.
Timestamp	The time when the event was created.
Indicator Details	Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity. ID: Displays the ID of the selected indicator. Produced by: Displays the user role who requested for the STIX data. Description: Displays details about the selected IP address which are being watch listed.
Observable	Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs). ID: Displays the ID of the selected observable.
(Optional) SightingsREST	Sightings Title: Displays the name of the sighting source. Confidence: Displays the criticality of the sighting. Reference: Displays the reference URL of the sighting source.

REST API Tab

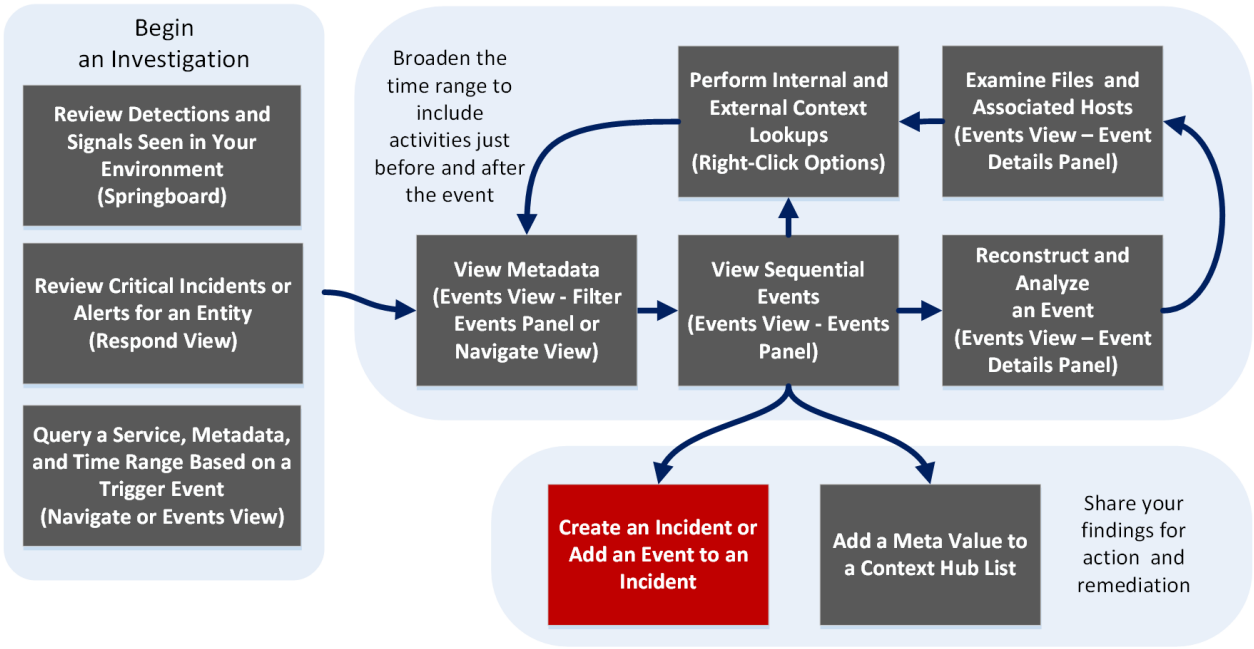


The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

Note: For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:



Create an Incident Dialog

In the Create an Incident dialog, analysts can create an incident from selected events in the Events view. The incident is then available to incident responders working in Respond.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, select **Incidents** > **Create New Incident** from the toolbar.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*

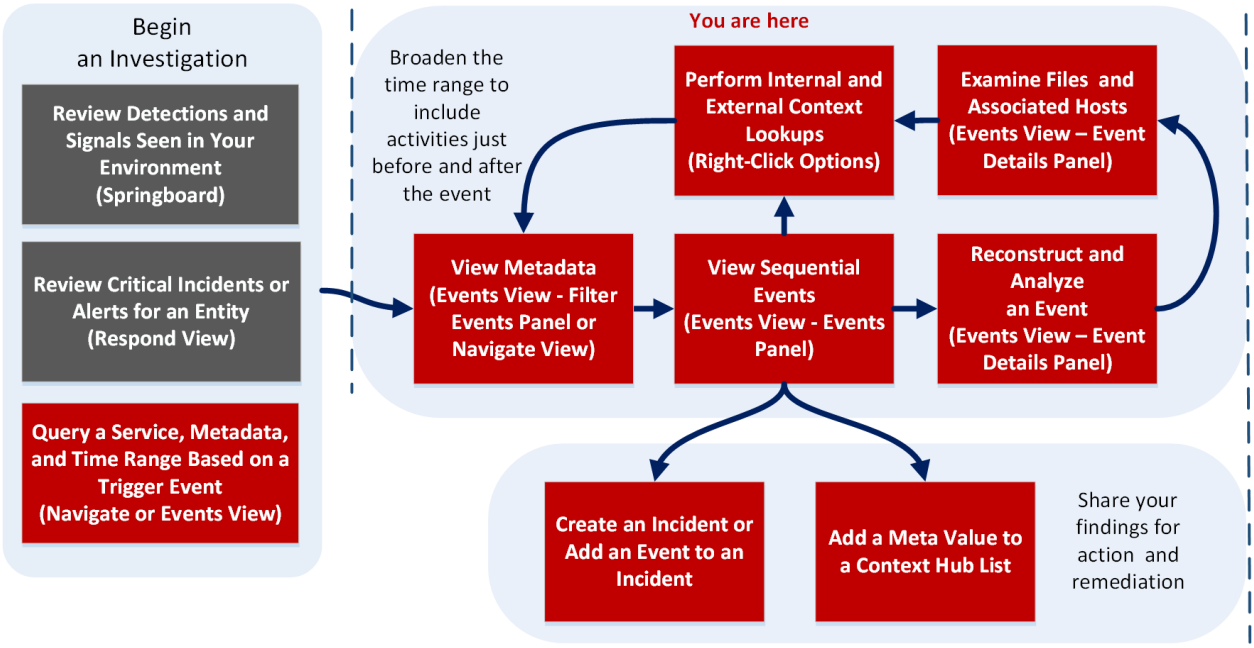
Quick Look

The following figure is an example of the Create an Incident Dialog from the Legacy Events, and the features are described in the table.

Feature	Description
Create Summary from These Events	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Name	(Required) Specifies a name to identify the incident. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Summary	(Optional) Specifies a description for the incident. A good summary clearly identifies the incident for other analysts and responders.
Assignee	(Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents.
Categories	(Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social.
Priority	Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list.
Cancel	Closes the dialog without saving changes.
Save	Saves the incident and closes the dialog. A message confirms that the incident was created successfully.

The following figure is an example of the Create an Incident Dialog in the Events view. The table describes the information and options in the Add to Incident dialog.

Feature	Description
Alert Name	(Required) Specifies a name to identify the alert. In the example, the name is Manuel alert for All Data . You can provide a name that clearly identifies the nature of events that will be added to this incident.
Severity	The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
MITRE ATT&CK Tactics	Displays the type of tactics associated with the alert. For example: **Credential Access**. The tactic Credential Access tries to steal account names and passwords.
MITRE ATT&CK Techniques	Displays the type of techniques and sub-techniques associated with the tactics.
Incident Name	(Required) Specifies a name to identify the incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Priority	Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list.
Assignee	(Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents.



Feature	Description
Categories	(Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social.
Cancel	Closes the dialog without saving changes.
Ok	Saves the incident and closes the dialog. A message confirms that the incident was created successfully.

Events View

In the Events view analysts can view a sequential list of network, log and endpoint events, select an event for reconstruction and analysis, and view the raw event and metadata with interactive features that enhance the ability to see meaningful patterns in the data. In Version 11.5 and later, you can drill into metadata for the listed events. The Events view offers packet, file, host, text, log, and email reconstruction. When you open a web reconstruction of an event, the same web reconstruction used in the Legacy Events view is displayed.

Workflow

The following figure is a high-level workflow illustrating the tasks you can do in NetWitness Investigate, with the Events view tasks highlighted in red.

What do you want to do?

User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Incident Responder	review critical incidents or alerts	*NetWitness Respond User Guide*

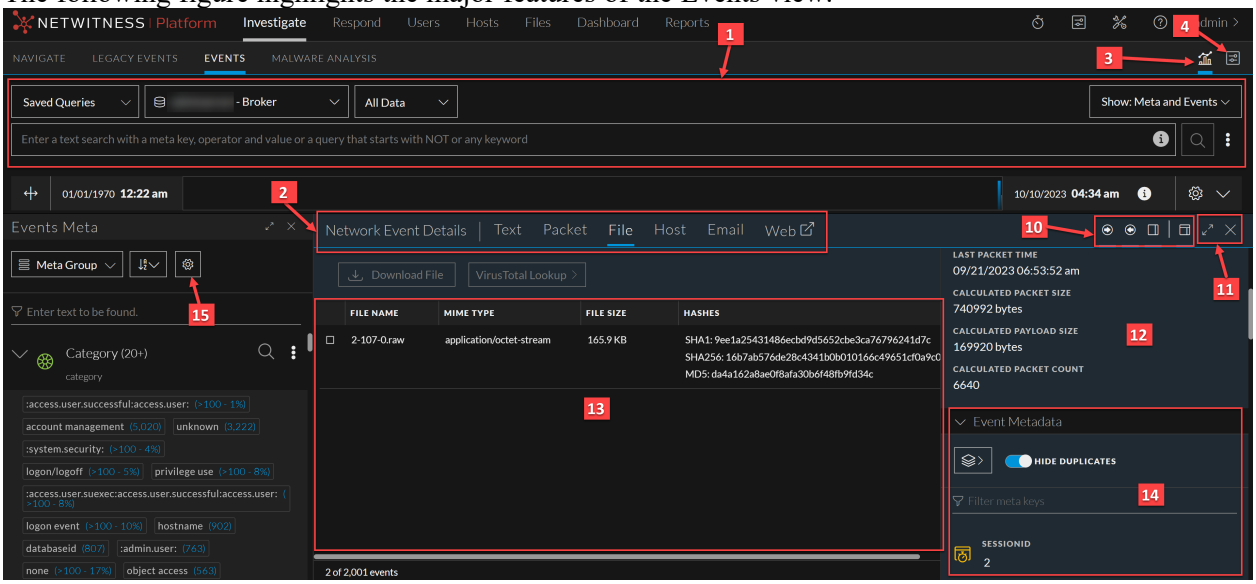
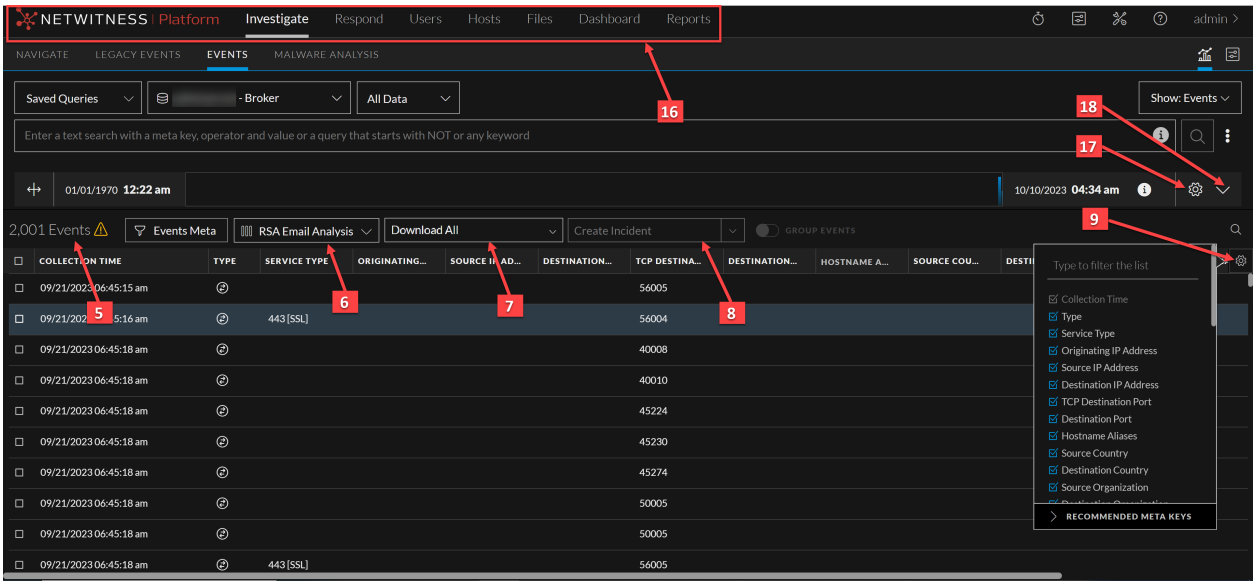
- Events View - Text Tab
- Events View - File Tab
- Events View - Email Tab
- Events View - Host Tab

Quick Look



There are multiple access points to this view, which are described in Begin an Investigation in the Events View. If you access the Events view from the Respond view, you can see the analysis for a selected event in an incident. The options are a subset of the options available when you open an event from within the Investigate view. To get complete functionality and examine other events, you can go to the Event view directly (INVESTIGATE > Event).



The Events view lists events in ascending order by time in the Events panel. The events displayed can be results for the drill point in the Navigate view or Legacy Events view, or results for a query entered in the Events view query bar.

Input fields for a query are displayed so that you can select a service and time range, and type an optional query. When you submit a query, the service being investigated counts the results up to a limit of 10,000 events, and 10,000 network, log, and endpoint events are loaded in the Events panel. Different columns are displayed, depending on the selected column group. You can rearrange and resize the columns, choose a built-in or custom column group, and choose individual columns that you want to see. When you find an event of interest, clicking the event opens the reconstruction in a new panel (Packet, Text , or File).

Note: For versions earlier than 11.3, the first 100 events are loaded. You can scroll through the list and click **Show Next 100 Events** at the bottom of the list. If the next page contains fewer than 100 events, the button changes to reflect the number of remaining events.

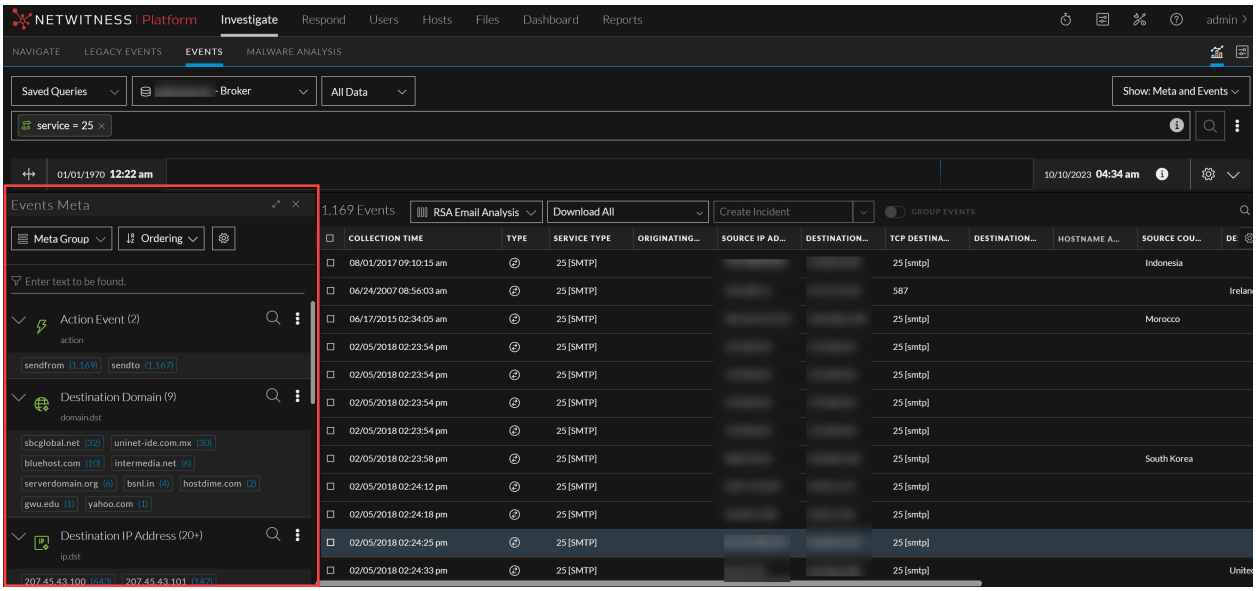
The following figure highlights the major features of the Events view.

1	**Query Bar**: When a service is selected, displays the service selector, time range selector, and the queries you have entered. You can select a service as described in Begin an Investigation in the Events View and refine the query as described in Filter Results in the Events View. Clicking submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the ( ) > **Query Console** **Current Query** tab, detailed status of the current query is provided (see Events View below).
2	The type of event being analyzed and the type of reconstruction are reflected in the heading. • These are the event types: **Network Event Details**, **Log Event Details**, or **Endpoint Event Details**. • The types of analysis available for the event type are Text, Packet, File, Host, Email, and Web. Network events can use all types of analysis: text, packet, file, and email (Version 11.4.1 and later). Log and endpoint events use only text analysis. The email (Version 11.4.0.x and earlier) type and web type open the current event as an email or web reconstruction in the Events view. For details, see Examine Event Details in the Events View.
3	Reopens the Events panel if you have closed it. For details, see Analyze Events in the Events View.
4	Sets preferences for the Event view (see Configure the Events View).
5	The Events panel title. • In Version 11.3 and later, the Events panel title is slightly different than the title in prior versions, and a row number indicator has been added. The title lists the number of events and sort order; for example, **40,000 Events (Asc)** means that 40,000 events were found and they are listed in ascending order by time. If more than 10,000 events are found, only the oldest 10,000 events are displayed in ascending order, and an amber triangle highlights the fact that not all events were loaded. This may indicate that you need to refine the query. For more information about refining the events listed here, see Filter Results in the Events View.

	• Versions prior to 11.3 simply list the number of events found, and you can load 100 of them at a time. In Version 11.4 and later, clicking  opens the Find Text in Table dialog.
6	The Column Group drop-down lists built-in and custom column groups that you can apply to the Events panel. Built-in column groups are sometimes updated between one version and the next. Some examples of built-in column groups are Email, Endpoint Analysis, Malware Analysis, Outbound HTTP, Outbound SSL/TLS, and Summary List. Summary List is the default column group. For details, see Use Columns and Column Groups in the Events List.
7	The Download All drop-down menu lists the available options for downloading event data. The options are Log, Visible Meta, and Network (see Downloading and Acting Upon Results. You can change the preferred format of the event type data in the Event Preferences dialog (see Configure the Events View).
8	The Create Incident button enables you to create incidents from events. The Add to Incident button enables you to add selected events to an open and existing incident (see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View).
9	Displays the column selection settings to select the individual columns displayed in the Events panel. For details, see Use Columns and Column Groups in the Events List.
10	Controls to show or hide the Overview panel, show or hide requests and responses, and open the Event Meta panel. For details, see Analyze Events in the Events View.
11	Controls to change the size of the panel and close the panel. For details, see Analyze Events in the Events View.
12	The Overview panel provides summary information about the event you are currently analyzing. The selected event is highlighted in the Events panel with a blue background. The summary information is different for the different event types (packet, log, and endpoint). In Version 11.5, the redundant NW Service is removed.
13	The event data for the event you are currently analyzing.
14	The Event Meta panel is redesigned in Version 11.5, but has the same functions as in Version 11.4. The Event Meta panel lists the meta keys and values found in the data. This data can be sorted in two ways - Alphabets or Sequence. Some metadata are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Analyze Events in the Events View). • For a packet, the data is called a payload and is displayed in the form of a request and response. • For a log event, the data is a line of text from the raw log. • For an endpoint event, the event data is relevant to data from the NetWitness Endpoint agents running on hosts in the network. It may be a single process, driver, DLL, file (executable), service, or autorun, and information related to logged-in users. (See the *NetWitness Endpoint User Guide* for complete information about endpoint event data.)
15	The Version 12.3 introduces new Meta Settings panel. This panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view.
16	The Version 11.5 main menu for NetWitness Platform has relocated Hosts, Files, and Users (Entities) options for easier access.
17	The Version 12.3 introduces new Timeline Settings panel. Analysts can use the Timeline Settings option to change the Y-axis data dimension (Count or Size) and view the data

presented on the timeline. Click the (info) button to the right of the Mini Timeline to know the representation of the timeline's event data (like what information is shown on the Y-axis).

18 The Expand Timeline feature helps you interact with the event's result based on your search query. The expanded timeline view shows the total number of events for the selected date and time range. On the expanded timeline, X-axis shows the Time and the Y-axis shows either the Total number of events that occurred or the File Size recorded by the services at a specific time on the timeline.

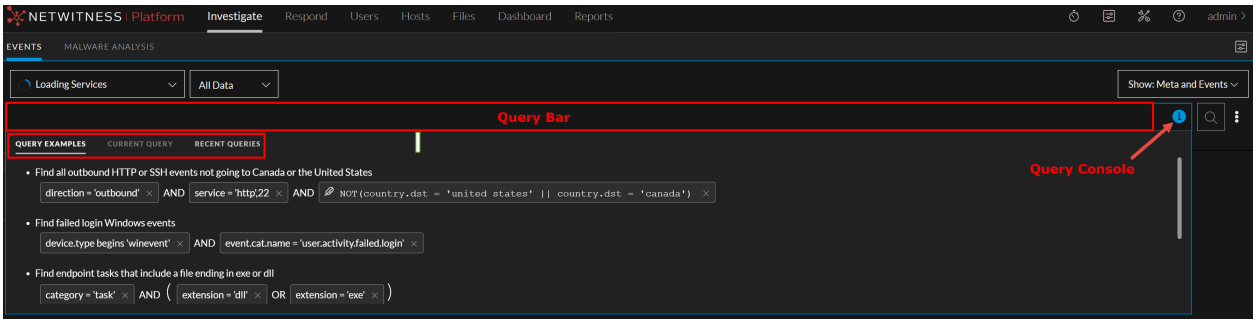


Events Meta Panel

The Events Meta panel is a feature added from Version 11.5. Clicking the Events Meta button (

) in the Events panel, opens the panel to provide a view of meta keys and meta values found in the data set. (Version 11.6) By default, the Events Meta panel is open in the Events view. The user preference (open, closed, or fully expanded) is saved across sessions and logins. See Drill into Metadata in the Events View for more information about drilling into metadata.

Note: (Version 11.6) By default, the Events Meta panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Events Meta panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.



Meta Groups Menu

With the Events Meta panel open, you can select a meta group to define the meta keys displayed in the Filter Events panel.The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups.

Ordering Menu	With the Filter Events panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering: • By default, the meta keys are displayed using the Event Count > Descending by Total Count method. When showing the event count for each value, you can order by Descending by Total Count, Ascending by Total Count, Ascending by Value, and Descending by Value. • When you prefer to see the size of the event that contains the value, you can use one of the four Event Size ordering options: Descending by Total Size, Ascending by Total Size, Ascending by Value, and Descending by Value.
Meta Key options button (⋮)	The Meta Key options button offers actions that you can take on an individual meta key. In Version 11.5, the only action is to copy all of the visible meta values for a meta key.
Meta Key List	An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key. • This meta key is indexed by value: Action Event [action] (40+). The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value. • This meta key is indexed by meta key: Bytes Sent [bytes.src]. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value. • This meta key is not indexed: MAC Alias Record [alias.mac]. Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key.
Meta Settings	This Meta Settings panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view.

Query Console

Clicking  (the console icon) opens the query console, where Query Examples, Current query, and Recent Query details are provided.

Query Examples

In the **Query Console** > **Query Examples** tab, you can see the example query list to help you understand the query construction.

Current Query

In the **Query Console** > **Current Query** tab, you can see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. A progress bar indicates the query's completion percentage at the bottom of the console. The statuses let you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color changes if a non-fatal error occurs. View Status of a Query provides additional details on this subject.

Several messages that may be displayed in the query console require additional explanation.

Message: Maximum value limit (`valueMax`) of %1% reached on meta key %2% in index slice %3%

Explanation: The `valueMax` property on the specified meta key has been reached in the index being queried. An administrator configures this inside the index files available in `ADMIN > Services > [Service Name] > Files > index-[service type].xml` or `index-[service type]-custom.xml`. As an example, the statement below from the index file states the meta key called `client` has a limit of 250,000 values by default.

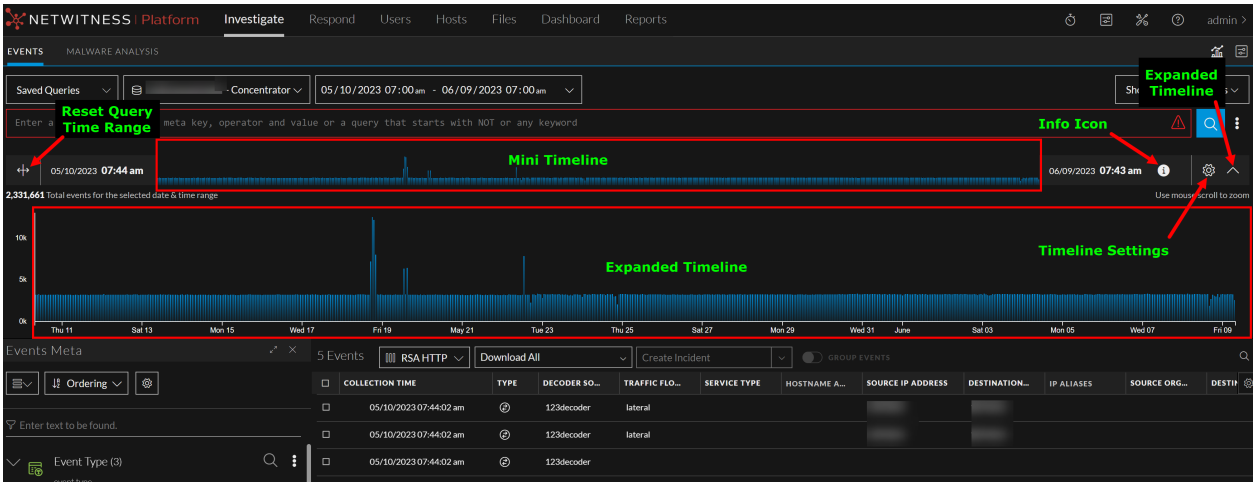
```
<key description="Client Application" level="IndexValues" name="client"
format="Text" valueMax="250000" />
```

Message: The query on channel %2% was auto-canceled by the system for exceeding time usage limits. Check timeout values.

The server has a per-operation limit on execution time, and the requested operation exceeded the limit. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.

Memory limit of %1% reached, controlled by setting max.query.memory

The server has a per-operation limit on memory utilization, and the requested operation exceeded the limit. The limit is related to the amount of memory in the server, which an administrator can adjust in (Admin) **Admin > Services > [Service Name] > sdk > config**. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.



Recent Queries

In the **Query Console** > **Recent Queries** tab, up to 100 recent queries are displayed. Use the scroll wheel on the mouse to move through the recent query list. You can click on  at the start of the query to select that query and directly insert it into the query bar.

When you select a recent query, the query is displayed as per your preferences set to the query bar (Guided or Advanced Mode). Click  to initiate the selected query.

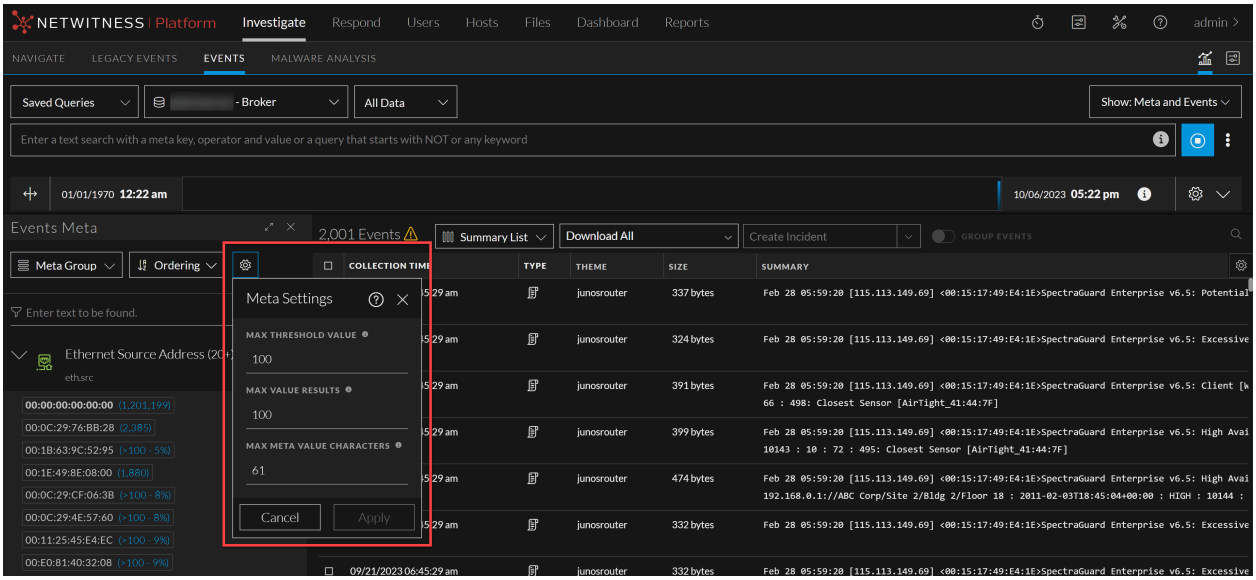
Timeline

The timeline visualizes the events count that occurs at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a bar chart.

The following are some key features of the timeline:

- The start time and end time are displayed on either side of the timeline to depict the matching events over the duration of the query. The timezone is also displayed on the right side of the timeline by showing the offset from UTC.
- The section of the timeline that matches the event data is highlighted. The data is highlighted up to the specified threshold. If the data is not sorted using time, the entire timeline is highlighted. Also, if the data is not sorted in a specific order, it might highlight the individual bars in the timeline as events are not ordered using time.
- The query results that exceed the threshold are displayed in grey color. If events are sorted using time, the threshold highlight shifts from left (ascending) to right (descending) depending on your sort preference.
- Hover over the timeline to display the total number of events that occurred in the queried time duration. You can hover over the individual bars in the timeline to get the total number of events that occurred at a specific time.
- When you sort the events, the timeline does not refresh. You must run the query again to refresh the timeline.

- All capabilities of the timeline work when user is querying using the collection time (`time`) or when the preference is set to use the event time (`event.time`).



For more information, see *Investigate on Timeline* topic in Begin an Investigation in the Events View.

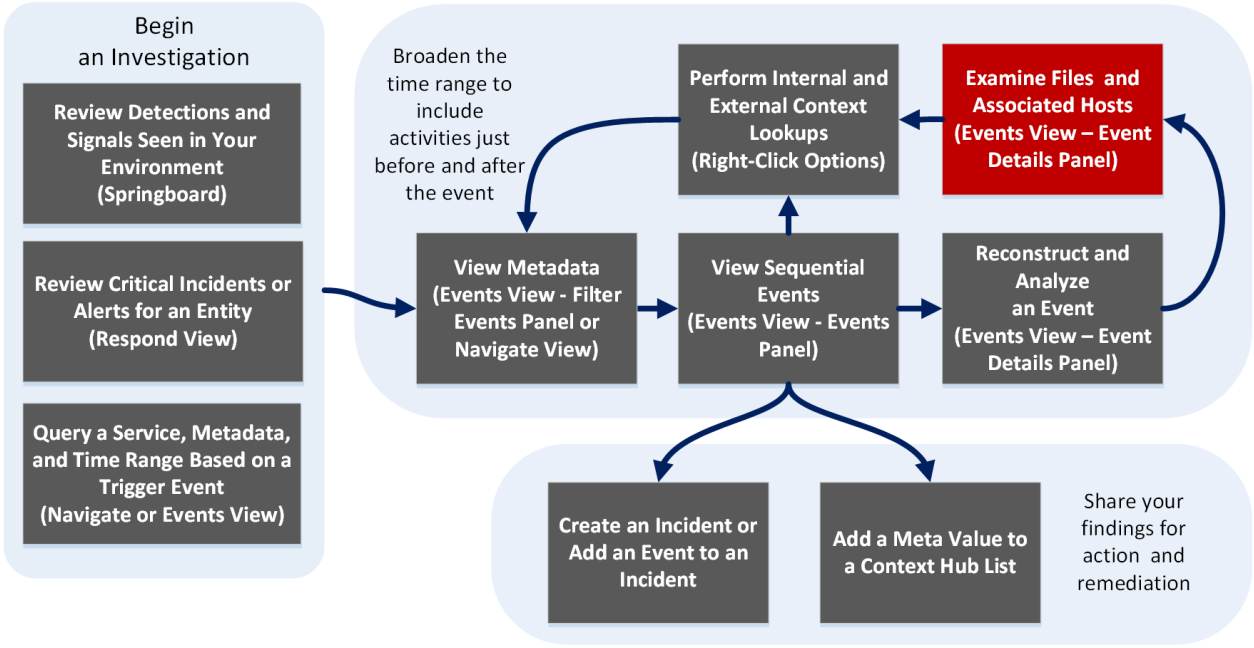
Meta Settings Panel

From the 12.3 or later version, NetWitness introduces the new **Meta Settings** panel under the **Investigate** > **Events** view. This panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view.

Quick Look - Meta Settings Panel

This is an example of the Meta Settings dialog.

The following table describes the fields in the Meta Settings Panel .



Feature	Description
Max Threshold Value	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The Max Threshold Value should be between **1-2147483647**. The default value is **100,000**.
Max Value Results	Sets the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key menu for an open meta key. The Max Value Results should be between **100-100000**. The default value is **1000**.
Max Meta Value Characters	Set the maximum number of characters in a meta value name displayed in the Events Meta panel. The Max Meta Value Characters should be between **60-512**. The default value is **60**
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.

Feature	Description
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.
X	Closes the Meta Settings dialog.

Events View - Email Tab

The Email tab is in the Event Details panel. Here you can view a list of email received and associated attachments for an event.

Workflow

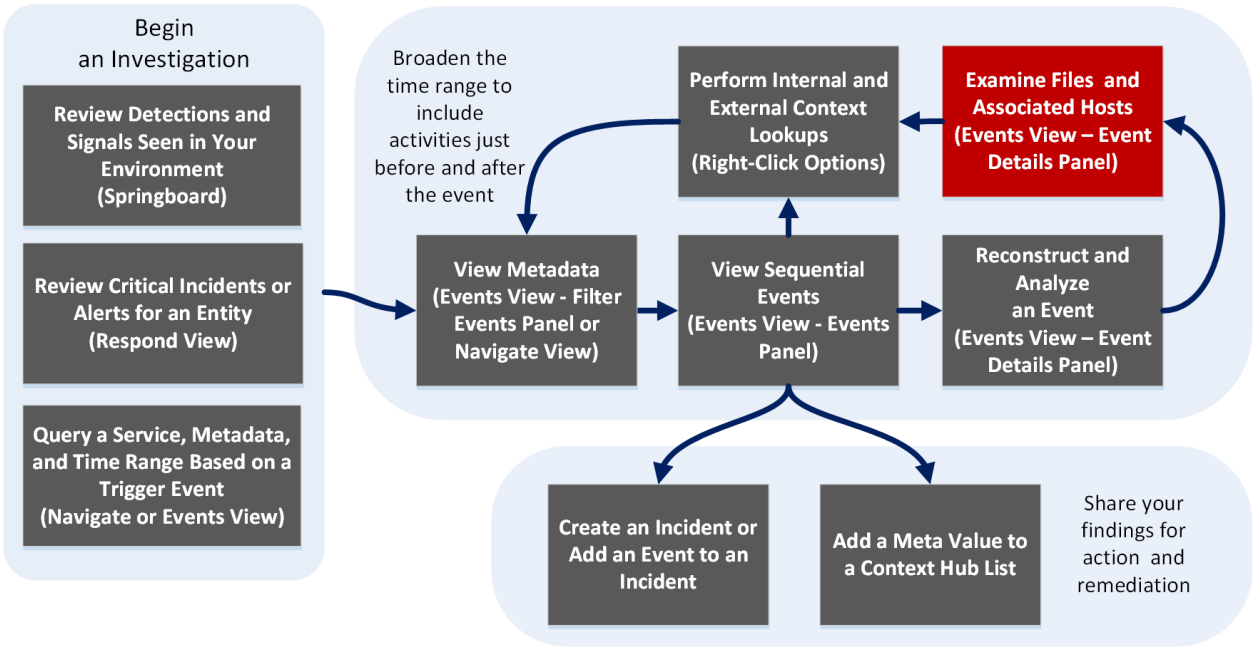
Quick Look

The Email panel displays a list of emails associated with a network event. When an analyst opens the email, the email reconstruction is displayed along with the associated attachments and additional header details, if any.
The following figure is an example of an email reconstruction.



The following table describes all the fields within an email.

Field	Description
From	Displays the email address of the sender of the email.
To	Displays the email addresses of the recipients of the email.
CC (Carbon Copy)	Displays email addresses of additional recipients of the email. The field is displayed only if the sent email has any value and the email addresses are visible to the recipient.
BCC	Displays email addresses of additional recipients privately. This field is displayed only if the sent email has any value and the email addresses are not visible to the recipient.
Reply to	Displays the address designated to receive replies, the sender address.
Subject	Displays the subject of the email.
Attachments	Displays any files shared by the sender that can be downloaded by the recipient. This field is displayed only if email contains attachments. See Download Data in the Events View for details about downloading email attachments.
Additional Header Details	Provides additional details of the email event such as Received, Sender, Message-ID and others.

Events View - File Tab

The File tab is in the Event Details panel. Here you can safely view a list of files and download one or more files in an event.

- Events View - Text Tab
- Events View - File Tab
- Events View - Email Tab
- Events View - Host Tab

Quick Look

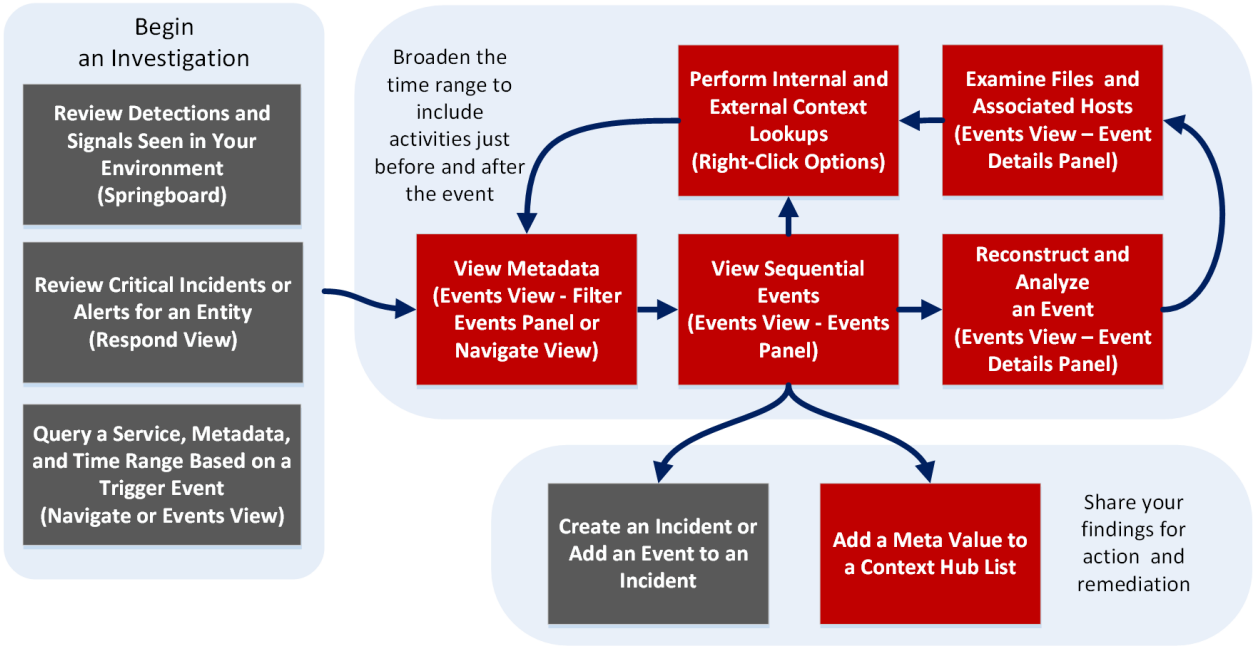
Only network events can be analyzed in the Packet panel. The Packet panel lists each packet in the event. The list of packets is scrollable. When you scroll, the packet or text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.

In Version 11.1 and later, you can use pagination controls to go backward and forward through the pages, go to a specific page, and select the number of packets to display per page (50, 100, 300, or 500).

Each packet is displayed with shading and highlighting to help identify common file patterns: significant header and payload bytes, hexadecimal and ascii bytes, and common file signatures. In addition, you can adjust the request/response display, and display or hide the packet summary.

Below is an example of the Packet panel (formerly known as Packet Analysis) with labels to identify features. For details and examples of each feature, see Analyze Events in the Events View.



1	Options for exporting a network event. You can export a PCAP, all payloads, request payloads, or response payloads for deeper analysis and to share with others.
2	The option to identify common file signatures is disabled by default and you can enable them . Common file signatures are highlighted in orange; hovering over the highlight reveals the file type.
3	The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting.
4	The option to display payloads only hides the packet headers, leaving more space for the payload.
5	The Overview panel information.
6	Significant bytes are highlighted in a blue background; as you move the cursor over the highlighting the meta data is displayed in a hover box.
7	(Version 11.1 and later) Packet pagination controls allow more flexibility in paging through a list of packets. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed. ⟪ - Go to the first page ⟨ - Go to the previous page 1 of 206 - Go to a specific page ⟩ - Go to the next page ⟫ - Go to the last page - Select the number of packets per page. If you are reconstructing large packets, lowering this limit can improve performance.

Events View - Text Tab

The Text tab is in the Event Details panel. Here you can safely view and analyze the raw text payload of an event. The Text reconstruction includes features that can show decompressed or compressed text, expand truncated entries, perform URL and Base64 encoding and decoding, and download network events, logs, and endpoint events. The text reconstruction is available for all types of events: network, log, and endpoint.

- Navigate View
- Legacy Events View

Quick Look

The Investigate dialog has two tabs: Services and Collections.

Note: Collections are also known as workbench collections. You can only view workbench collections that you have created, and only administrators can create a workbench collection.

The Services tab includes a list of services available for investigation, and three buttons. All features are described in the following table.

Feature	Description
Default Service	Clicking this button sets or clears the default service to investigate. When a service has been set as the default service, the word (Default) is appended to the service name.
Name	The name of the service.
Address	The IP address of the service.
Type	The type of service.
Cancel	Closes the dialog.
Navigate	Opens the selected service in the Navigate or Legacy Events view.

The Collections tab has two buttons and two panels: Workbench and Collections.

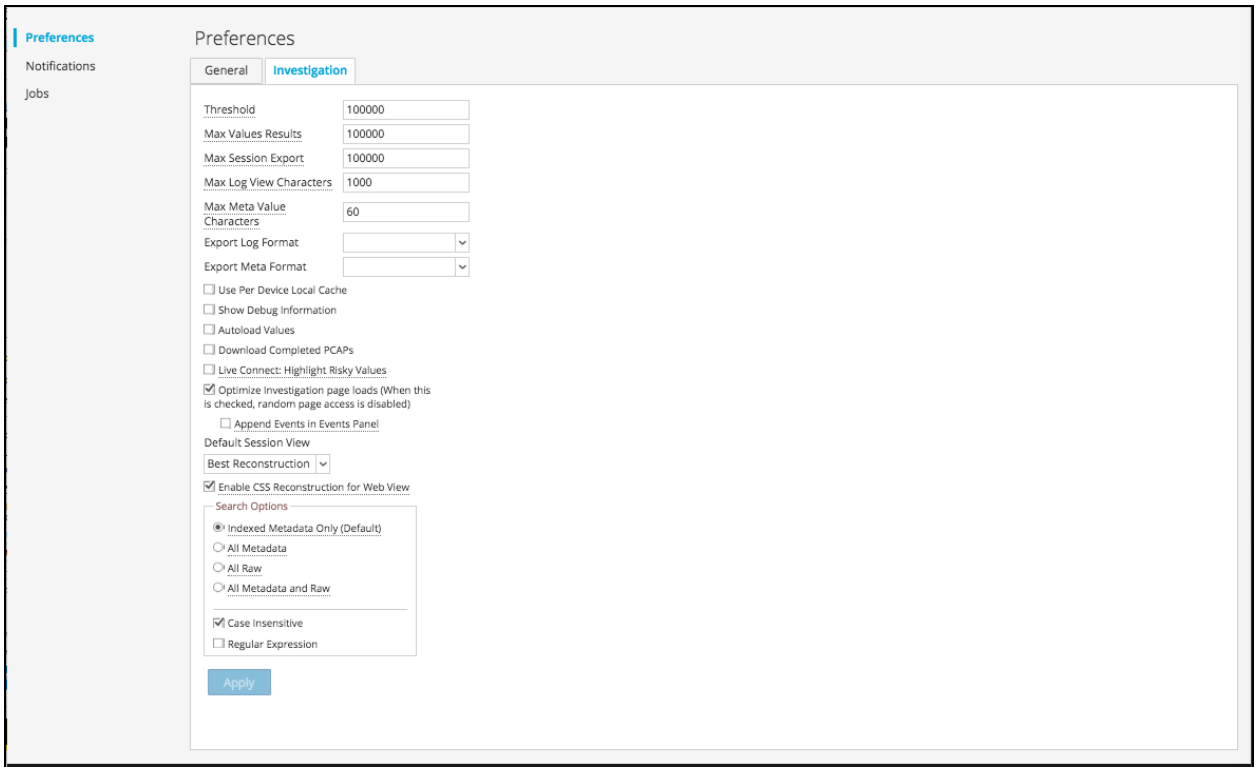
The Workbench panel lists available Workbench services by name. After a Workbench service is selected, you can select a collection from the Collections panel.

The Collections panel lists available collections to investigate. After a collection is selected, you can click Navigate to view the collection.

The following table describes the features of the Collections panel.

Feature	Description
Name	The name of the collection.
Type	The type of collection.
Size	The size of the collection.
Data Type	The type of data within the collection.
Date Created	The date the collection was created.

Investigation Tab - User Preferences Panel



In the Profile view > Preferences panel > Investigation tab, users can set several preferences that affect the performance and behavior of NetWitness when analyzing data, viewing events, and reconstructing events in NetWitness Investigate. To access this tab, select > Profile from the Navigate view or the Legacy Events view. When the Profile view is displayed, select **Preferences > Investigation**. You can change user preferences at any time when you are working in NetWitness.

Related Topics

- How NetWitness Investigate Works
- Navigate View
- Legacy Events View

Quick Look

This figure is an example of the Investigation tab, and the following table describes the preferences that affect Investigate. There are slight differences between the 11.1 search settings and later versions of the search settings and these are explained in Search for Text Patterns in the Navigate and Legacy Events Views.

Feature	Description
Threshold	This setting controls the count shown for a meta key value in the Navigate view during the load. A higher threshold allows more accurate counts for a value. However, a higher threshold causes longer load times. When the threshold is reached, NetWitness displays the count and the percentage of time used to reach the count in comparison to the time necessary to load all sessions with that value. For example, **(>100000 - 18%)** indicates that the threshold was set at 100000 and this load took only 18% of the time it would have taken with no threshold set. The default value is **100000**.
Max Values Results	This setting controls the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open meta key. The default value is **1000**.
Max Session Export	This setting controls the maximum number of sessions that can be exported. The default value is **100000**.
Max Log View Characters	This setting controls the maximum number of characters to be displayed on **Investigate > Legacy Events > Log Text**. The default value is **1000**.
Export Log Format	This setting specifies the default format for exporting logs from Investigate. Available options are **Text**, **XML**, **CSV**, and **JSON**. There is no default value for the log export format. If you do not select a format for logs here, NetWitness displays a selection dialog when you invoke export of logs. When you select one of the options from the Export Log Format drop-down menu and click Apply, the setting goes into effect immediately.
Export Meta Format	This setting specifies the default format for exporting meta values from Investigate. Available options are Text, XML, CSV, and JSON. There is no default value for the meta export format. If you do not select a format for exporting meta values here, NetWitness displays a selection dialog when you invoke export of meta values. When you select one of the options from the Export Meta Format drop-down menu and click Apply, the setting goes into effect immediately. **Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.
Use Per Device Local Cache	Allows you to specify the use of locally cached data from the selected service. By default, this checkbox is cleared (Off), which means that Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the option is set, Investigate uses the data from local cache.
Show Debug Information	When this option is set, NetWitness displays the `where` clause beneath the breadcrumb in the Navigate view. For each meta value load, the load time is displayed. If the service is a Broker, the elapsed time for each aggregated service is reported. The default value is **Off.**

Feature	Description
Append Events in Events Panel	When this option is set, the events displayed in the **Events Panel** are added incrementally rather than overwriting the currently displayed events. Each time you click the next page icon, the additional events are appended to the previous events; 1 -25, then 1 -50, then 1 -75 and so on. **Note:** This option is available only if the Optimize Investigation Page Loads option is enabled.
Autoload Values	When this option is set, the service values are automatically loaded in the Navigate view. When not set, NetWitness displays a **Load Values** button, allowing the user the opportunity to modify the options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP format.
Live Connect: Highlight Risky Values	If you want NetWitness Platform to highlight and display only IP addresses that are considered to be risky by the NetWitness community, set this option. When not enabled, NetWitness Platform displays all IP addresses. By default, this option is cleared (Off).
Optimize Investigation Page Loads	This option is enabled by default (checked) and controls how the Legacy Events view retrieves events. When enabled, results are returned as quickly as possible, but you cannot go to a specific page in the event list. Clearing the checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). Being able to go to any page in the list costs additional overhead to determine the events in advance.
Default Session View	This setting selects the default reconstruction type for the initial reconstruction view. By default events are reconstructed using the reconstruction type most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for stylesheets and images used in the target event. The option is enabled by default. Clear the checkbox if there are problems viewing specific websites. **Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and stylesheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript does not render in the reconstruction because all client side javascript is removed for security purposes.

Feature	Description
Search Options	This setting specifies the default search options to apply to a search in the Navigate and Legacy Events views. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information.
Apply	Saves your preferences and puts them into effect immediately.

Investigate View

The Investigate view is the primary entry point to NetWitness Investigate. In Version 11.5, several of the Investigate submenus are moved to the main menu for easier access. Prior to Version 11.5, the Investigate view had six submenus, which opened different views that allow you to analyze events from different perspectives. The submenus that remain under Investigate are: Navigate, Legacy Events, Events (formerly Event Analysis), and Malware Analysis. The Hosts, Files, and Users views (formerly Entitites) are available from the main menus to improve the workflow for analysts.

Note: In Version 11.4 and later, the Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

How NetWitness Investigate Works provides an introduction to all of the capabilities available in the Investigate view.

Legacy Event Reconstruction View

The Event Reconstruction view is deprecated in favor of the Events view. The Legacy Events view provides a reconstruction of a selected event from the Legacy Events view. By default, NetWitness displays the best reconstruction for the event determined by the event content, or the default reconstruction that you have selected in the Default Session View setting for Investigate. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view top-to-bottom or side-by-side results, select request and response views, export an event, export meta values, extract files, open an email attachment, and open the event in a new tab.

To access this view, do one of the following:

- In any Legacy Events view, double-click an event.
- In the Legacy Events view with Detail View selected, right-click **Events** at the end of the event, and select **Event Reconstruction**.
- In the Event Reconstruction toolbar of previewed reconstruction, click **Open Event in New Tab**.
- In the Navigate view, select **Actions** > **Go to event in Event Reconstruction**, and enter an event ID.

- Events View

Quick Look

This figure is an example of the Event Reconstruction view. The following table describes the toolbar options.

Feature	Description
Request & Response	Displays a drop-down menu for selecting whether the view displays: • Request & Response • Request • Response
Organization	Displays a drop-down menu for selecting whether the information is displayed top to bottom or side by side.
Reconstruction View	Displays a drop-down menu for selecting what information is displayed. By default, Best Reconstruction is selected. Other options are: • View Meta • View Text • View Hex • View Packets • View Web • View Mail • View Files
Actions	Displays a drop-down menu with the actions available in the Event Reconstruction view (Export PCAP, Extract Files, and Export Meta).

Feature	Description
Open Event in New Tab	Opens the event in a new browser tab.
Event Analysis	Open the event in the Event Analysis view.

Beneath the toolbar is a list of meta keys and values. Some of the keys offer a drop-down menu with available actions.

The bar at the bottom of the view offers several options.

Feature	Description
	Displays the previous event.
	Displays the next event.
Show Reconstruction Log	Displays the reconstruction log at the bottom of the view. Once you click this button, it changes to Hide Reconstruction Log.

Legacy Events View

The Legacy Events view is deprecated in favor of the Events view. In the Legacy Events view a list of events associated with a session is available; this view is optimized for viewing raw events in sequence by time. You can display the events list in several forms, filter events, search for events, and open a reconstruction of an event.

There are two ways to display the Legacy Events view:

- Go to **Investigate** > **Legacy Events.** NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Legacy Events view displays events on the selected service, with the oldest events first.
- From within the **Navigate** view, double-click an event. The Legacy Events view displays the events on the selected service based on the drill point in the Navigate view.

Note: The Legacy Events view was the original Events view (11.0 to 11.3.x.x). The Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

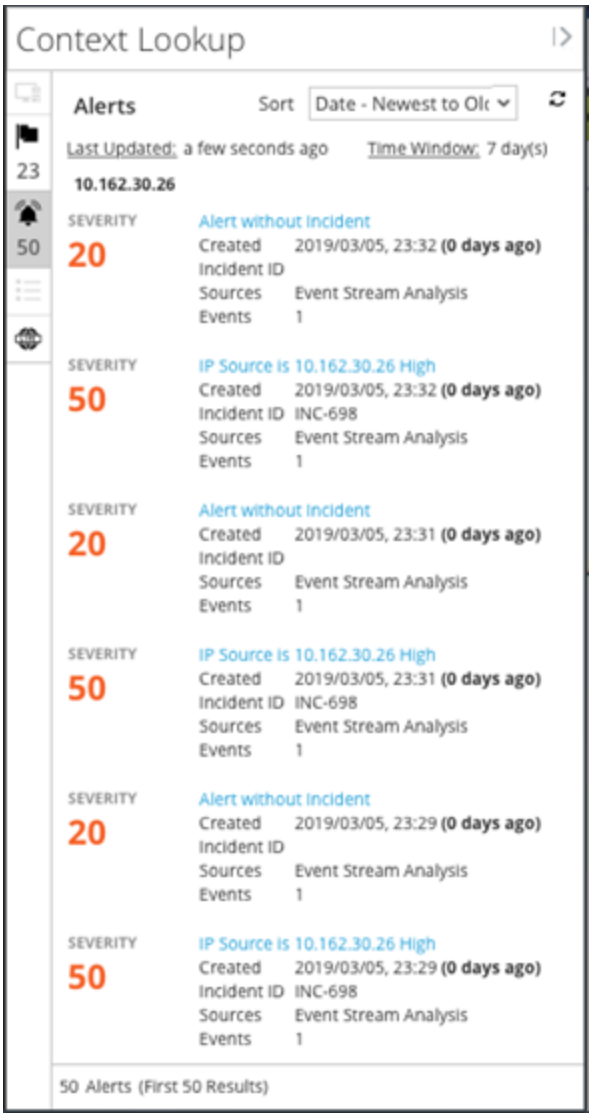
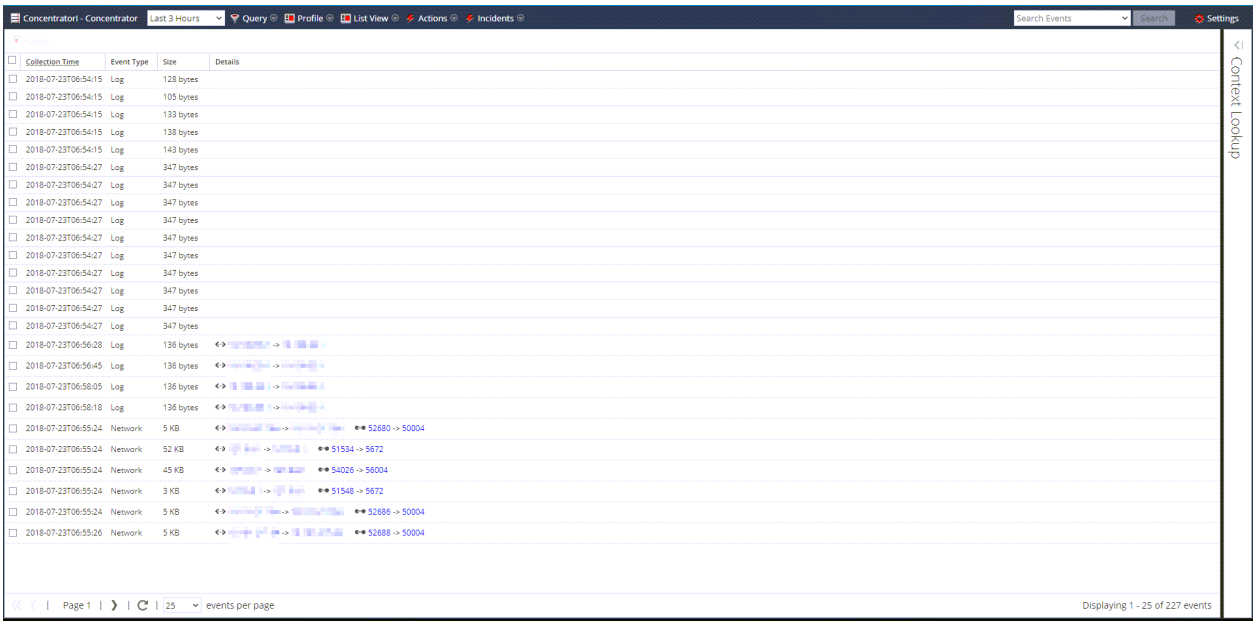
- Filter Results in the Legacy Events View
- Downloading and Acting Upon Results



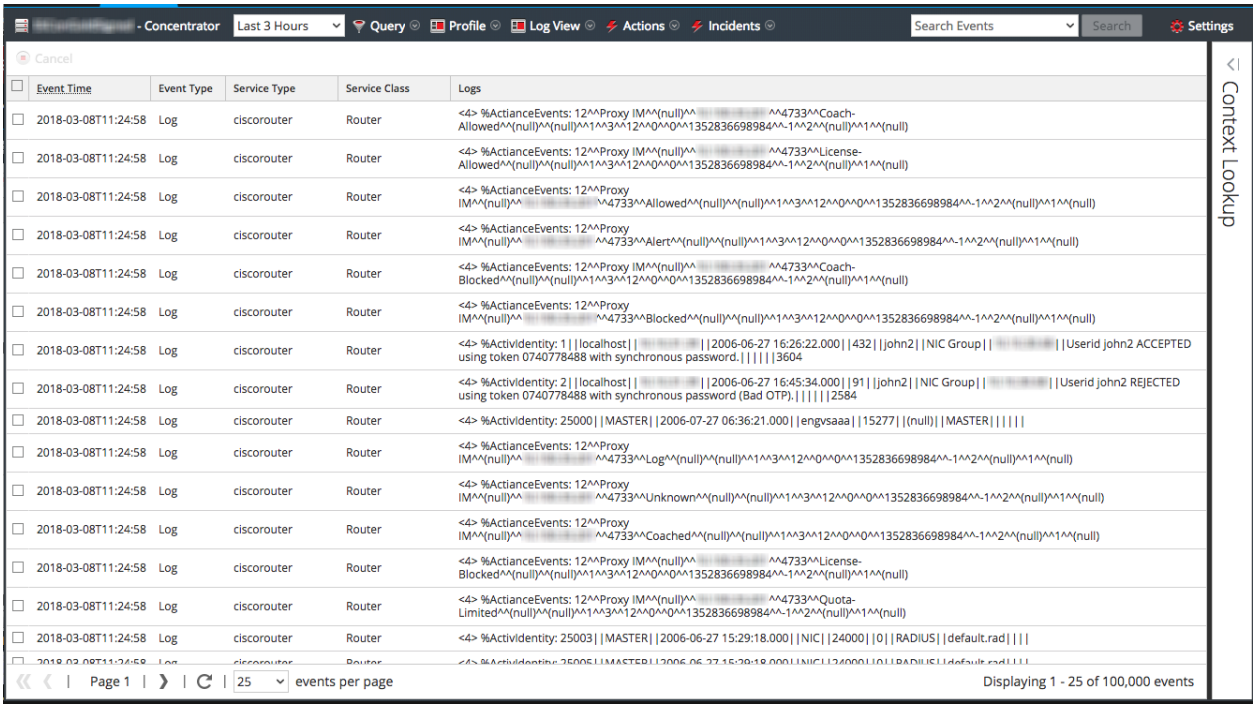
Quick Look

The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. The List view and Detail view provide more information for each event including the timestamp, event type, event theme, and size.

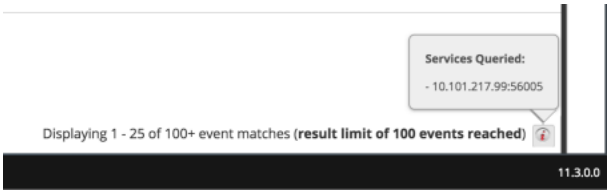


- The List View shows corresponding source and destination address and port information for events in summary form in a grid.
- The Detail View shows all metadata collected for the event in a paged view.
- The Log View is optimized for viewing log and endpoint information, and provides more information for each log including the timestamp, event type, service type, service class, and the logs.

You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. From any view type in Legacy Events view, you can extract files; export network events, endpoint events, logs, and meta values, and open the Event Reconstruction panel. In the Detail View you can also open the event in the Events view.



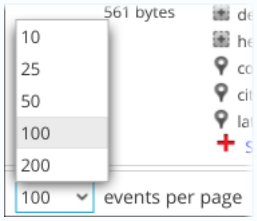
The following figure is an example of events in the Detail View. The Context Lookup panel is visible only if the Context Hub service is configured.



The following figure is an example of events in the List View.

The following figure is an example of the Log View.

The following figure shows the information added to the footer for Version 11.3 and later.



Detailed Description

The Legacy Events view has a toolbar at the top with the following options.

Feature	Description
Select Service	Displays the selected service name next to the icon. Opens the Investigate dialog, in which you can select a service for which the event list is displayed.
Time Range	Displays a drop-down menu for selecting the time range to apply to the event list. You can choose one of the standard options or specify a custom time range.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data (see Create a Query in the Navigate and Legacy Events Views).
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. The menu options include built-in (Default) profiles and custom profiles, as well as an option to manage profiles. Each profile can include a meta group, a column group, and a beginning query that is applied to the Navigate view (meta groups and queries) and the Legacy Events view (column groups and queries) as you investigate events. (see Use Saved Queries to Encapsulate Common Areas for Investigation).
View Type Drop-down	Displays a drop-down menu for selecting the event view type. • Detail View shows events in a paged format with detailed information for each event. • List view shows the events in table form with a summary of each event in a separate row. • Log View shows a log-oriented events grid with a summary of each log in a separate row. • Custom Column Groups displays the event list using a column group selected from a drop-down list of custom column groups. • Manage Column Groups displays the dialog for creating and editing custom column groups.
Actions	Displays a drop-down menu with actions in the Legacy Events view: • Export an events as PCAP files, export logs, export endpoint events, or export meta values. • View an event reconstruction in a popup window or in a new tab. • Reset all filters in the Legacy Events view.
Incidents	Create a new incident in Respond and add the selected events, or add selected events to an existing incident in Respond.

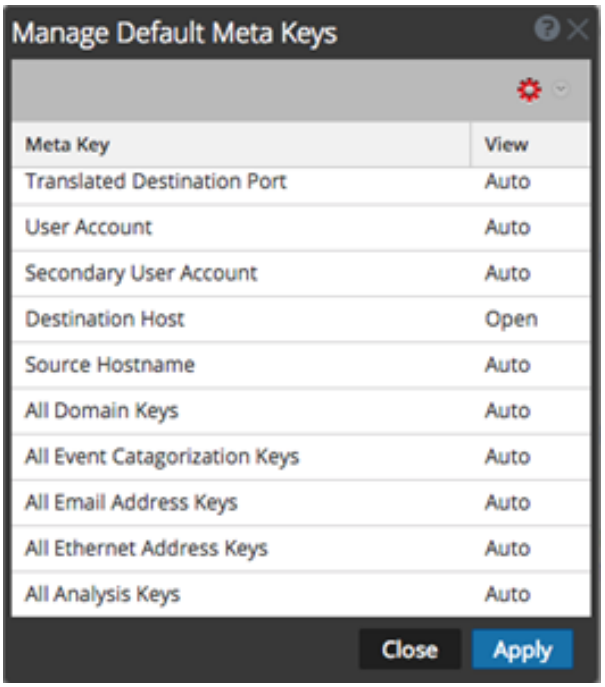
Feature	Description
Search	Displays the Search Events options, which allow you to specify the export log and export meta value format with additional options explained in Search for Text Patterns in the Navigate and Legacy Events Views.
Settings	Displays the Investigation settings for the Legacy Events view (which are also available in the Profile view) so that you can change Investigation settings without navigating away from the Legacy Events view. When you change a setting In the Legacy Events view, the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View).

Other features of the Legacy Events view are described in this table.

Feature	Description
Show Additional Meta (in the Detail View of an event)	Displays the rest of the metadata for the event.
Event Analysis (in the Detail View of an event)	Opens the selected event in the Events view.
 (in the footer)	Pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the « and ‹ controls are dimmed. « - Go to the first page ‹ - Go to the previous page 3 Page 3 - Go to a specific page › - Go to the next page » - Go to the last page  - Select the number of packets per page When you select a number of events per page, the setting is saved in browser cache so that you do not have to select your preferred number of events each time you log in. The setting applies to all views: Log View, List View, and Details View.

Feature	Description
Displaying 1-100 of 100,000 events (in the footer) Displaying 1-25 of 100+ event matches (result limit of 100 events reached) (in the footer)	Displays the count of events displayed versus the total number of matching events. In Version 11.3 and later, the footer includes a notification if the results limit configured by the administrator has been reached to let you know that more results are available but not viewable. To view the additional results, you need to refine the filter to get fewer results. Clicking the information icon in the footer displays the IP address and connecting port number for all services queried.

Manage Default Meta Keys Dialog



In the Manage Default Meta Keys dialog, analysts can specify the meta keys to be displayed in the Navigate view > Values panel (see Manage and Apply Default Meta Keys in an Investigation. This can help you find the desired data more quickly and prevents the loading of meta keys that are not of interest. To access this dialog, in the **Navigate** view toolbar, select **Meta** > **Manage Default Meta Keys**.

Related Topics

- How NetWitness Investigate Works
- Use Meta Groups to Focus on Relevant Meta Keys

Quick Look

The following figure illustrates the Manage Default Meta Keys dialog, which has a list of meta keys, toolbar, Close button, and Apply button. In the list, you can view, sort, and manage default meta keys. If you click and drag meta keys, you can rearrange their order. The following table describes columns in the list.

Column	Description
Meta Key	This column displays the meta keys available for the service. In Version 11.1 and later, default meta entities are also included, for example All Domain Keys and All Email Address Keys.

Column	Description
View	This column displays the type of view assigned to each meta key. By clicking on the view in each row, you can assign the meta key a different default view. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default, and can be opened manually. • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. When you modify the default meta keys for a non-indexed meta key, you cannot set the key to **Open**. If you change the default view for a group of meta keys to **Open** and some of the meta keys are non-indexed, the non-indexed meta keys revert to **Auto**. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are **Closed** until opened manually.

The following table describes the toolbar options and buttons.

Feature	Description
	Displays a drop-down menu that allows you change the default view of all the meta keys. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default. • Hidden: The values of this meta key are hidden by default. • Open: The values of this meta key are displayed by default.
Close	Closes the dialog. Any unsaved changes are lost.
Apply	Applies the changes, and they become effective immediately.

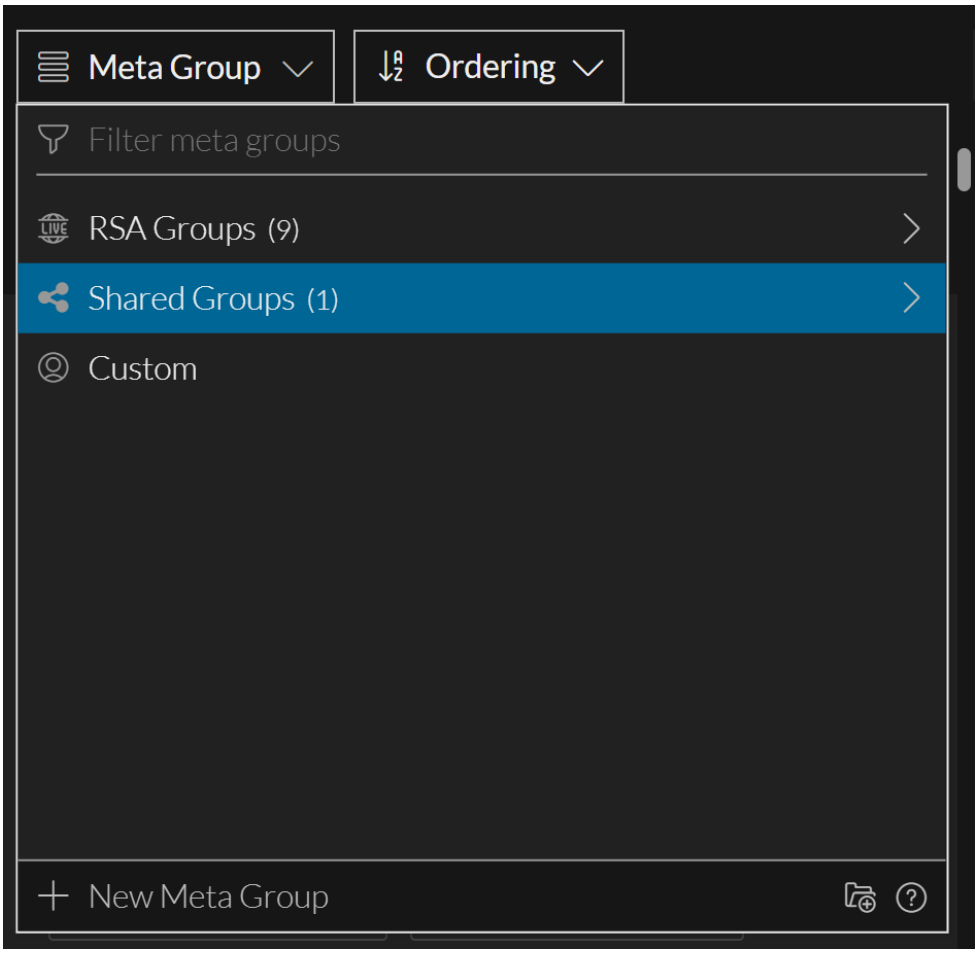
Meta Groups Dialogs

You can use meta groups to filter data displayed in an investigation. A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can create your own groups and you can duplicate and edit a built-in group to create a custom group. With a meta group in effect during an investigation, the information in the Navigate view and Events view includes only the meta keys in the selected group.

While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different.

Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Clone and edit the clone of a built-in or custom meta group.



Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group. Refer to Use Meta Groups to Focus on Relevant Meta Keys for detailed information.

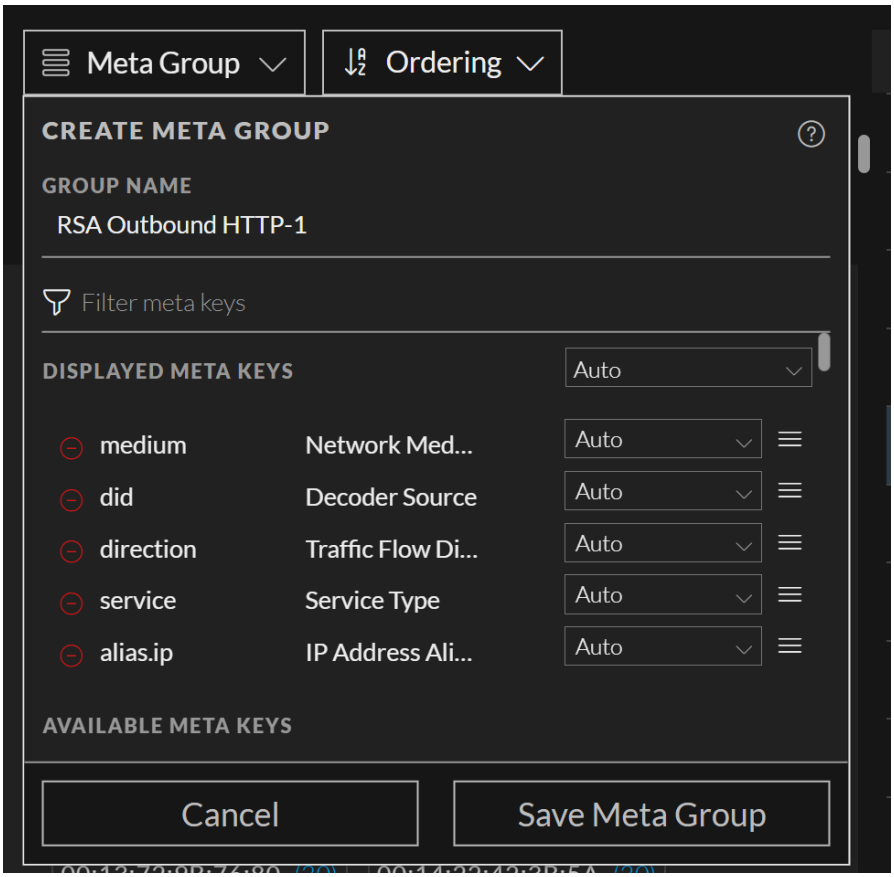
Quick Look - Meta Groups Menu, Create Meta Group Dialog, and Meta Group Details Dialog

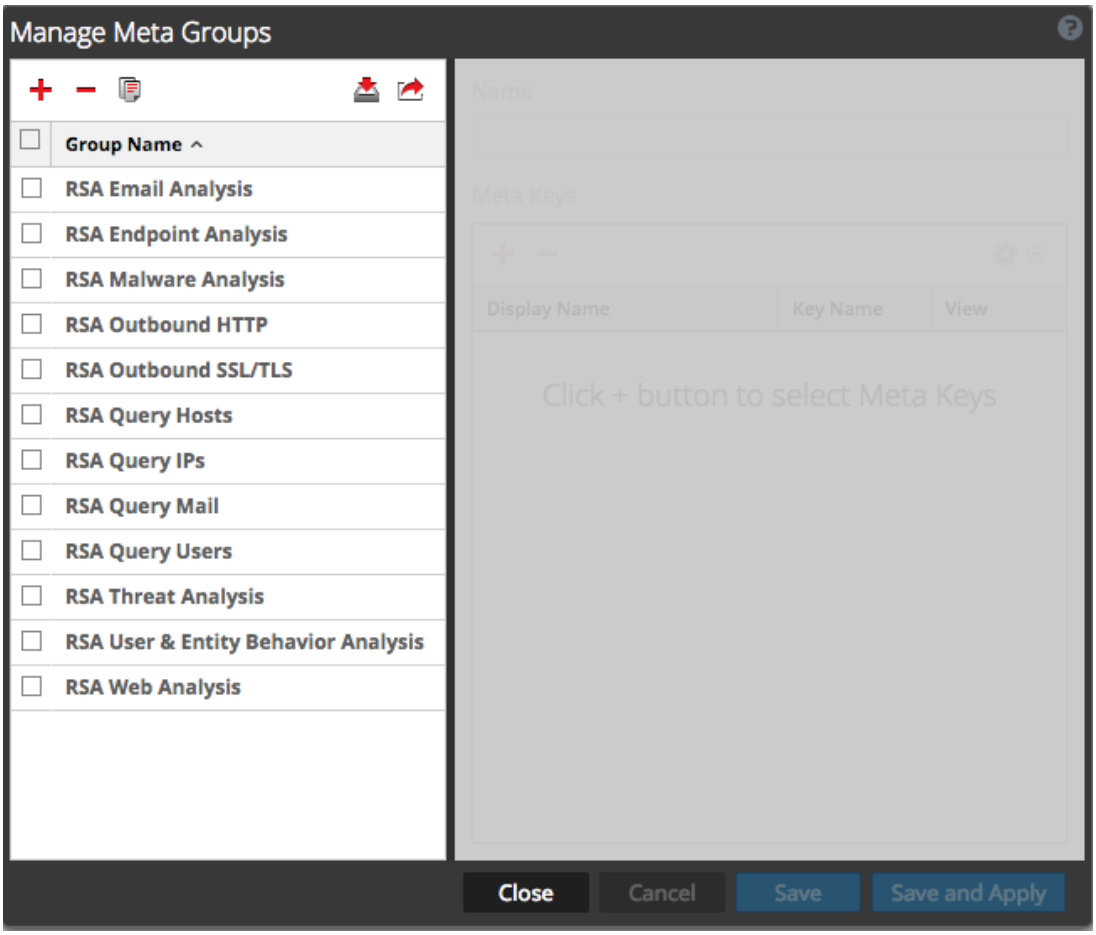


This section introduces the Meta Groups Menu, Create Meta Group dialog, and the Meta Group Details dialog. The following figure is an example of the Meta Group menu. The table describes the options.

Feature	Description
Visibility Options	Control the types of meta groups that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all meta group types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter Meta Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. Private = display private groups that only you can manage Shared = display shared groups that anyone in your organization can manage RSA = display built-in groups that only RSA can manage
Filter Meta Groups	Filters the list of meta groups as you type text so that only group names that contain the typed text are displayed.
Meta Group List	The list of meta groups consists of custom and built-in groups. Custom meta groups can be shared or private. The RSA meta groups are built-in meta groups; you cannot edit or delete these, but you can make a copy and edit the copy. Icons preceding the meta group name distinguish the private groups, shared groups, and built-in groups.

Feature	Description
New Meta Group	Displays the Create Meta Group dialog, where you can create a custom meta group.

The Create Meta Group dialog, shown in the figure on the left, allows you to define a custom meta group. The figure on the right illustrates the Meta Group Details dialog, in which you can edit a custom meta group. The table describes the fields and options in the dialogs.



Feature	Description
	Creates a copy of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group.
	Deletes the custom meta group that you are currently editing. This action is irreversible and applies globally. If the meta group is a shared group, it is no longer available to anyone.
Group Name	Displays the name of the meta group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom meta group.
Sharing	Specifies whether the meta group is shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared.

Feature	Description
Filter Meta Keys	Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed.
Displayed Meta Keys	Displays a scrollable list of meta keys that are selected for use in the custom meta group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list, and drag meta keys up or down to change the order in this list ( ). Drag and Drop is disabled when text is typed in the Filter Meta Keys field. For each displayed meta key you can choose:
Available Meta Keys	Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking next to the meta key name adds it to the Displayed Meta Keys list. You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting).
Initial View Option	For each meta key, you can set the initial view option: -When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto. -Open meta keys are listed in the Filter Events panel, and the values are loaded. -Closed meta keys are listed in the Filter Events panel, but the meta values are not loaded until you open the meta key. -Hidden meta keys are not listed in the Filter Events panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state.
	Allows you to drag and drop meta keys in the Displayed Meta Keys list so that you can see the data in the order you prefer.
Close button	Closes the dialog.
Save Meta Group	For the Create Meta Group dialog only, saves the new meta group.
Reset	For the Meta Group Details dialog only reverts the edited meta group to the last saved state.
Update Meta Group	For the Meta Group Details dialog only, applies changes to an edited meta group.
Select Meta Group	Applies the meta group. The Filter Events panel is refreshed to display only the meta keys in the selected meta group.

Quick Look - Manage Meta Groups Dialog

The following figure is an example of the Manage Meta Groups dialog.

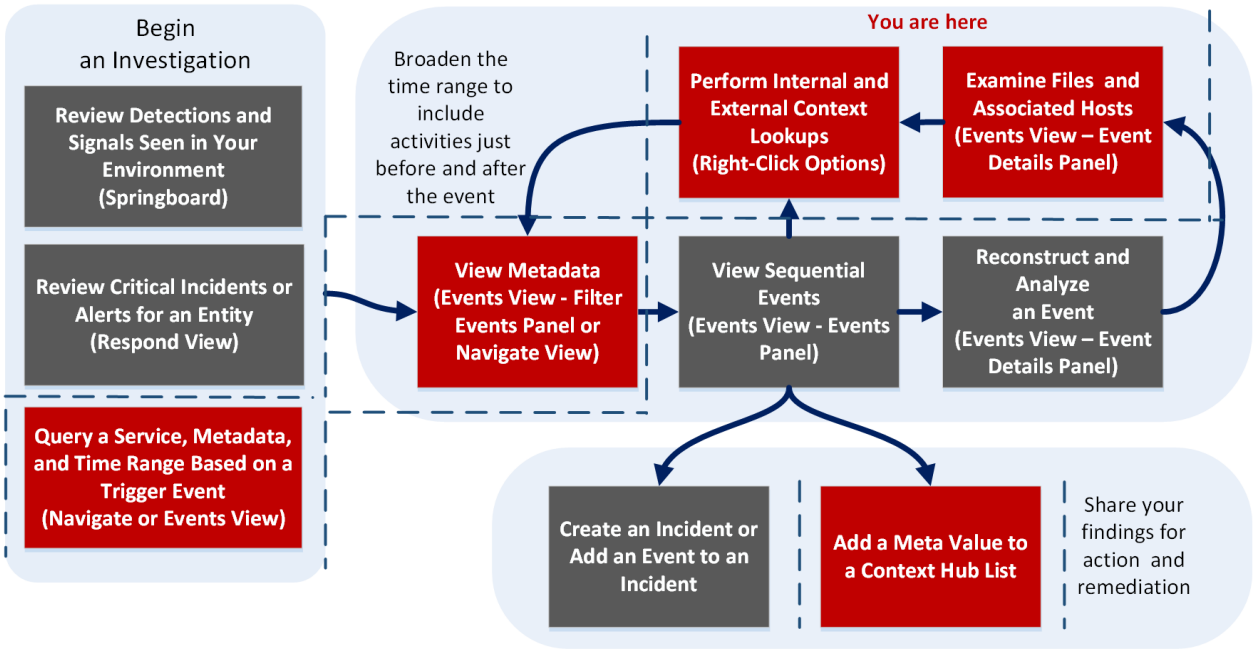
The Meta Groups panel is on the left side of the Manage Meta Groups dialog. This is where you can add, delete, import, and export meta groups. The following table describes the features of the Meta Groups panel.

Feature	Description
	Adds a meta group using the Settings panel on the right side of the Manage Meta Groups dialog.
	Deletes the selected meta group. A confirmation dialog is displayed before the meta group is deleted.
	Creates a copy of the selected meta group.
	Displays the Meta Group Import dialog, where you can upload a file.
	Exports the selected meta group to your computer.
Group Name	Lists all meta group names.

The Settings panel is on the right side of the Manage Meta Groups dialog. This is where you create and edit meta groups. Below the Name field is the Meta Keys list. The following table describes the features of the Settings panel.

Feature	Description
Name	Displays the name of the selected meta group.
	Displays the Available Meta Keys dialog, where you can select meta keys to add to the group.
	Deletes the selected meta keys.
	Displays a drop-down menu, where you can select the view for all meta keys. There are four options based on the possible values for the `defaultAction` property used to define a key in the custom index file for the service: • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. • Close: The values of this meta key are closed by default, and can be opened manually. • Auto: Reverts to the default view for meta keys as specified in the service index file.
Display Name	Indicates the name that is displayed for the key in Investigate views, and is defined by the `description` property for the key in the custom index file for the service..
Key Name	Indicates the `name` of the meta key as defined in the custom index file for the service.
View	Indicates the view to which the meta key is set. You can change: • Change the view for all meta keys by clicking  in the View column header, then selecting a view from the drop-down menu. • Change the view for a single meta key by clicking a single meta key in the View column, then  and selecting a view from the drop-down menu.

The following table describes the buttons at the bottom of the dialog.



Feature	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and immediately applies all changes.

Navigate View

The Navigate view (**Investigate** > **Navigate**) displays event metadata--the meta keys and meta values--that were found in captured data for the selected service. The data is filtered and displayed in accordance with the options you set for profile, time range, meta group, and query. You can also drill into the data by clicking meta keys and meta values.

Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

Workflow

In the Navigate view, you can:

- View metadata for events in the Values panel.
- Visualize events in a timeline or parallel coordinates chart.
- Save events, go to an event using the event ID, visualize an event, and print an event.
- View additional contextual data for meta keys and values.
- Open a drill point or an event in the Legacy Events or the Events view.

- Events View

Quick Look

This figure illustrates the Version 11.5 Navigate view.

The Navigate view consists of these features:

- Toolbar
- Pause/reload button and breadcrumb
- Time banner
- Optional debug information.
- Collapsible Visualization panel
- Values panel
- Context Lookup panel
- Context menus

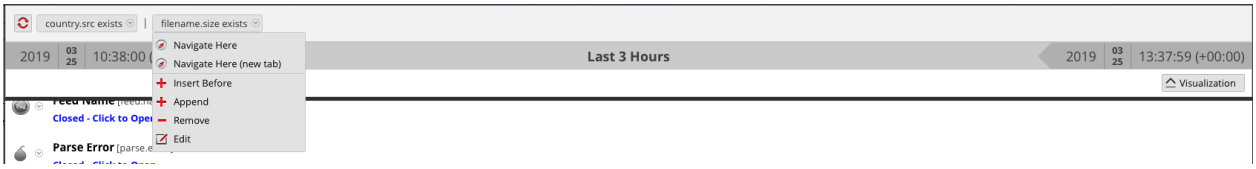
Toolbar

The following figure is an example of the toolbar. The toolbar provides a way to:

- Change the service being investigated.
- Control the range of data displayed: You can select use profiles, set a time range, use meta groups, and create queries to apply to the data.
- Set the quantification method and sorting method for data in the Values panel.

- Perform actions on the results. You can export and print results, open an event for which you have an event ID in the Legacy Events view or Events view, and pass a query to Informer.
- Configure Investigate settings without navigating away from the Investigate views.

Some of the toolbar options are labeled with the default value or the selected value rather than displaying the name of the option. For example, the time range option in the example above is labeled **Last 5 Minutes** to reflect the currently selected value. These are the toolbar options.



Option	Description
	Displays the selected service name next to the icon. Clicking the icon opens the Investigate a Service dialog, in which you can select a service to investigate and set the default service to investigate (see Begin an Investigation in the Navigate or Legacy Events View). Changing the service does not cause a reload of the data.
Time Range	Displays the Time Range options; the currently selected option is displayed in the toolbar (see Filter Results in the Navigate View). Possible choices are: • All Data • Last 5, 10, 15, or 30 Minutes • Last Hour, Last 3, 6, 12, or 24 Hours • Last 2 or 5 Days • Early Morning • Morning • Afternoon • Evening • All Day • Yesterday • This Week • Last Week • Custom **Note:** If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time will be interpreted as `HH:MM:00 - HH:MM:59`. Seconds display in this format in Investigate functions.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data. See Query Dialog for a description of the dialog.

Option	Description
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries), the Legacy Events view, and the Events view (column groups and queries). See Use Saved Queries to Encapsulate Common Areas for Investigation for more information.
Meta	Displays the Meta Group menu. You can use Default Meta Keys or a custom Meta Group. You also have the option to make changes to both group types (see Use Meta Groups to Focus on Relevant Meta Keys).
Sort Field	Displays the Sort Field menu; the currently selected option is displayed in the toolbar. The menu has two options: Order by Total and Order by Value. The Sort Field is a complement to the Sort Order option; the data for each meta key is ordered based on the total (green number) or the meta value (blue text) (see Filter Results in the Navigate View).
Sort Order	Displays the Sort Order menu; the currently selected option is displayed in the toolbar. The menu has two options: Sort in Ascending Order and Sort in Descending. The Sort Order is a complement to the Sort Field option; the selected sort field for each meta key is ordered in ascending or descending order (see Filter Results in the Navigate View).
Quantification Method	Displays the Quantification Method menu; the currently selected option is displayed in the toolbar. The Quantification Method only applies to the meta key results in the Values panel. It does not apply to the timeline. The drop-down menu contains three options for calculating the quantity (green number in parentheses) for a meta value: Quantify by Event Count, Quantify by Event Size, and Quantify by Packet Count (see Filter Results in the Navigate View). These are applied differently depending on the type of data in view. For packet data: • Quantify by Event Count shows the number of sessions. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of packets. For log data: • Quantify by Event Count shows the number of logs. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of logs.
Save Events	Displays the Save Events menu, in which you can use options to: extract files associated with an event, export the current drill point as a PCAP file, and export the current drill point as a log file (see Export a Drill Point).

Option	Description
Actions	The Actions menu includes actions that you can perform in the Navigate view (see Refining the Results Set). In Version 11.1 and later, the options are Visualize, Go to event in Event Reconstruction, Go to event in Events view, and Print).
Search Events	Enables you to search for text patterns within the current set of events. If you click in the Search field, it shows a drop-down menu with search options. If you click Apply, it saves the selected options and also updates the search options in the Legacy Events view and the Investigations profile (see Search for Text Patterns in the Navigate and Legacy Events Views).
Settings	Displays the settings for the Navigate view (which are also editable in the Profile view) so that you can change Investigate settings without navigating away from the Navigate view. When you change a setting In the Navigate view the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View).

Pause/Reload Button and Breadcrumb

The breadcrumb tracks each query as you drill down through the metadata for the service. The following figure is an example of the breadcrumb.

Each query is listed with a drop-down menu in a pipe separated string. The last point is the current point, also called the tip. The icon in front of the breadcrumb allows you to pause the loading of meta values and to reload meta values. The breadcrumb does not include the service name and appears only if a query is in effect. If too many drill points exist for display, the overflow is shown as double angle brackets, >>, at the end of the breadcrumb. Each drop-down menu in the breadcrumb is the same, with slight variation based on the position of the crumb.

The following table describes the controls and menu options in the breadcrumb.

Feature	Description
Pause	Pause and Reload button. Controls the loading of data in the view. It has three possible functions: pause loading, continue loading, and reload.
Navigate Here	Opens the selected drill point in the current Values panel.
Navigate Here (new tab)	Opens the selected drill point in a new tab.
Insert Before	Inserts a query before the current drill point. The Create Filter dialog opens and you can define a custom query to insert in the breadcrumb (see Create a Query in the Navigate and Legacy Events Views).

Feature	Description
Append	Appends a query after the current drill point. The Create Filter dialog opens and you can define a custom query to append to the end of the breadcrumb (see Create a Query in the Navigate and Legacy Events Views).
Remove	Removes the selected drill point from the breadcrumb.
Edit	Opens the selected drill point in the Create Filter dialog so that you can edit the query.
>>	Clicking the angle brackets displays a drop-down menu of the breadcrumb overflow.

(Optional) Debug Information

If you have activated the Show Debug Information setting and the service you are navigating is a Broker, NetWitness, displays the debug information beneath the breadcrumb.

The debug information is the `where` clause from the current query. The only time there is no `where` clause is when the time range is all data and there are no drill points. If the Broker has at least one aggregate service that is offline, the debug information also lists the offline service.

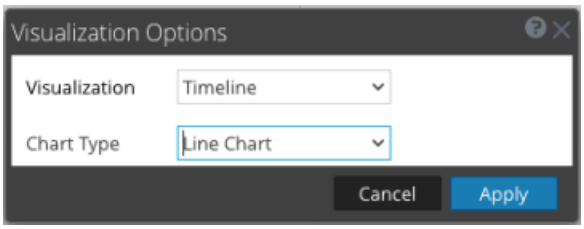
For example:

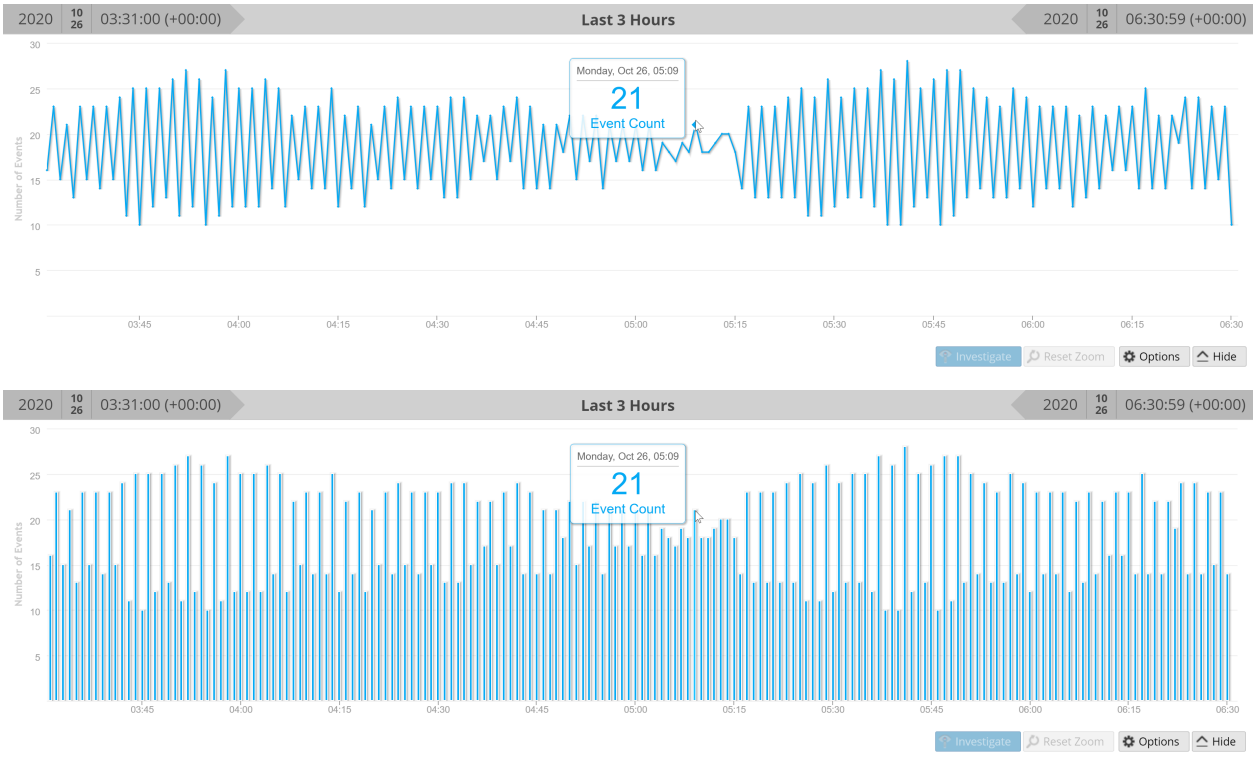
```
(attachment exists)&&(tcp.dstport = '80')&&(risk.info exists)$$time='2014-05-
04 18:50:00"-"2014-05-09 18:59:59(attachment exists) && (tcp.dstport = '80')
&& (risk.info exists) && time="2014-05-04 18:50:00"-"2014-05-09 18:50:59"
```

In addition, the time taken to load is displayed at the end of each meta key in the Values panel.

Time Banner

Just below the breadcrumb and debug information (if present), the time banner shows the time range used to create the chart. The following figure is an example of the time banner.



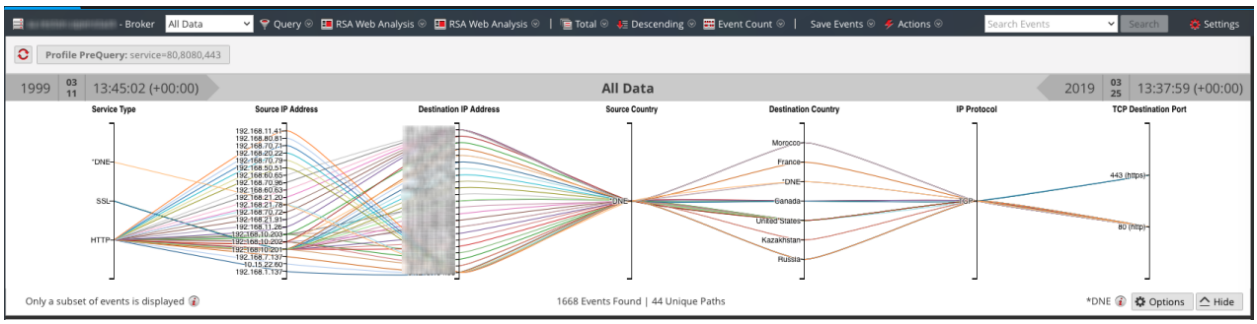


Visualizations

At the top of the Navigate view is a visualization of the current drill point. You can use this to drill into data from the Visualization panel (see Filter Results in the Navigate View). You can show or hide the visualization, and choose one of thevisualization options: Timeline or Coordinates. The Visualization opens initially to the last saved Visualization.

Timeline Chart

The timeline is the count of the number of events that occur at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a line chart or a bar chart based on your choice in the Options menu. The second figure illustrates a line chart and third figure illustrates a bar chart.



The timeline displays activity for the specified service and time range, as a line chart or a bar chart based on your choice in the Options menu.

Feature	Description
Number of Events (Timeline)	The Y axis of the chart based on thousands of events.
Time Line (Timeline)	The X axis of the chart based on the time the events occurred.
Event point (Timeline)	If you want to explore a specific section, simply select the range from the chart. The new time range will be reflected in the chart.
Investigate (Timeline)	Displays the meta values for the selected subset.
Reset Zoom (Timeline)	To return to the original time range, click Reset Zoom.

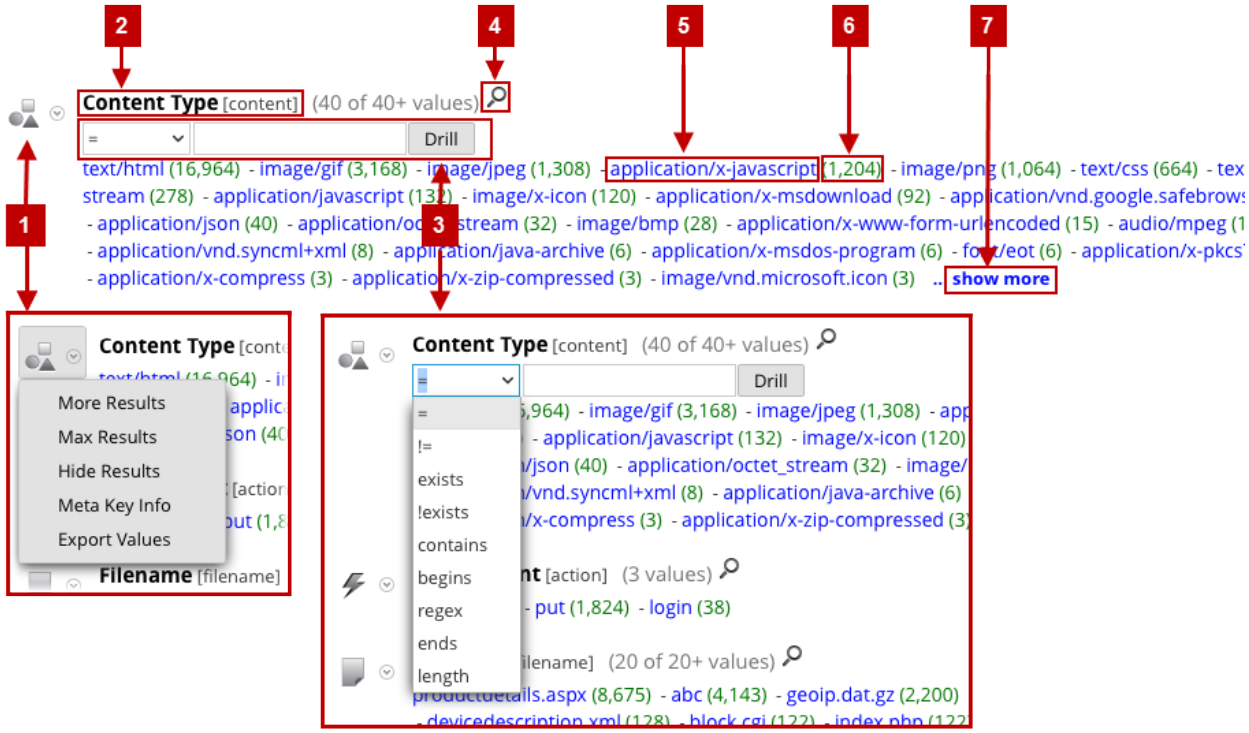
Feature	Description
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Hide	Collapses the chart.

Parallel Coordinates Chart

The Parallel Coordinates chart is one of the choices in the Options menu for visualizing the current drill point. With Coordinates selected in the Visualization Options dialog, you can select the meta data to be displayed (see Visualize Metadata as Parallel Coordinates). An easy way to view a useful Parallel Coordinates chart is to choose a profile group as shown in the following figure.

Feature	Description
Axes	Each axis is a meta key. The number of meta keys affects the load time for the chart. All meta keys are loaded, but it there the number of events per meta key is limited.
Lines	Lines represent events and they connect values on the axes to show the correlation between multiple meta keys.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Only a subset of events is displayed.	This message is a notification that not all events in the values panel are drawn in the chart. Removing axes or filtering the data in the Values panel can help to display all events.
Events Found | Unique Paths	Displays the total number of events charted versus the number of unique paths charted. Setting the All Meta Keys Must Exist in an Event option redraws the chart so that it is more targeted and legible.
DNE	Indicates that there is no values for this meta key in the event.

In the Visualization Options dialog for Coordinates, you can select the meta keys to chart.



Feature	Description
Visualization selection	Displays a drop-down list of visualization types: Timeline and Coordinates
All Meta Keys Must Exist in an Event	Limits the data represented in the visualization to only those events that include all selected meta keys. This can result in a cleaner, more targeted visualization.
	Displays the Add Keys to Parallel Coordinates Visualization dialog so that you can add axes to the visualization. This is useful if you are looking for relationships between the default meta keys and some additional ones.
	Deletes the selected keys so that they do not appear as axes in the visualization. This can help to make the visualization less cluttered and allow for more data points to be included in the visualization.
	Reverts to the default meta keys for visualization, which consist of all meta keys in the current drill point.
	Controls the display of additional information about the number of selected axes versus the recommended count. This helps to make you aware of possible performance improvements by removing axes.
Axes	Lists the meta keys selected as axes in the visualization.
Cancel	Cancels any changes made to the visualization options.
Apply	Saves the changes made to the visualization options and applies to the current visualization.

In the Add Keys to Parallel Coordinates Visualization dialog, you can select the meta keys or meta groups to use as axes the Parallel Coordinates visualization.

Feature	Description
Visualization selection	Select Keys: Two options for selecting meta keys are: • From Default Meta Keys • From Meta Groups Each option offers a drop-down list from which to select.
With the Selected Meta Keys...	The options for the method of adding meta keys allow you to: • Replace the current list of keys • Append to the current list of keys • Insert at beginning of the current list of keys
Cancel	Closes the dialog and does not add any keys.
Add	Closes the dialog and adds the selected keys as specified.

Values Panel

The major feature of the Navigate view is the Values panel, which presents meta keys and meta values found in the service being investigated. Procedures for analyzing data in the Values panel are provided in Filter Results in the Navigate View.

Note: Title, values, and counts for non-indexed meta keys are not drillable; the Values and counts are shown in black.

1 The meta keys in the Values panel have drop-down menus, which offer actions that can apply to that meta key. You can use these to change the way the results for the meta key are displayed in the current view. Changes made to meta keys are displayed in the current view and persist until you refresh the page or select a new service in the Navigate view toolbar. See Drill into Data in the Values Panel

Refresh reverts to the current view of meta keys as defined in the Manage Default Meta Keys dialog (see Manage and Apply Default Meta Keys in an Investigation). If you have never made modifications in the Manage Default Meta Keys dialog, NetWitness, a refresh restores the default meta keys from the core service.

- More Results
- Max Results
- Hide Results
- Meta Key Info

	• Export Value
2	The name of the meta key for which values are listed. In Version 11.3 and later, the user friendly name of the meta key is displayed with the index file name of the meta key following in brackets. For example **Content Type [content]** gives the user friendly name of the `content` meta key with the index file name in parentheses. For meta groups, the name of the group is given in plain English with the meta group name following in parentheses. This is an example of a meta group name as it would appear in the Values panel: **All User Keys [users.all]**.
3 and 4	Clicking 🔎 on an indexed meta key opens the Search dialog in which you can enter a filter for the current meta key. The search function is not available for non-indexed meta keys, and is based on the actual meta value rather than the alias. Drilling in the Search dialog using aliases is not supported. NOTE: Check with your administrator to obtain a list of aliases used for a meta key in Investigation. When an alias is used, this search dialog does not provide results. Instead, you must query the meta key using the Right-click query capability or the Query dialog.
5	The meta value associated with the found meta key. These are listed in order by meta value name or by the count of events in which the meta value was found, according to your preference.
6	The number of events that include the meta value.
7	The number or values rendered is specified by the Render Threads value in the Investigation Preference settings. In the example above, the meta key is **Content Type**, and 40 of 40+ values are currently displayed. You can display additional values by clicking **...show more**. The number of instances found for a particular meta in the session.

Values Panel Loading Behavior

The default view is for the last 3 hours of collection, using the default meta keys and non-indexed meta keys closed. The meta keys within the meta groups are displayed in the order that NetWitness queries the keys. As the data loads into the Values panel, NetWitness is optimized to show partial results, loading progress, and service status as the data loads.

The loading behavior is determined by several configuration settings. The highest level settings are configured by the administrator for each user. These are:

- The maximum amount of time allowed for this user to run a query (Query Timeout).
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of results loaded. Any session that does not show a percentage is accurate and was processed to completion. If there is a percentage, that reflects how much processing was completed. The percentage displayed is estimated by extrapolating from the value at the time processing finished, considering the amount of work remaining. Larger percentages are generally more accurate because they require less extrapolating
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Note: The values for non-indexed meta keys take longer to load in the Values panel. To optimize loading, NetWitness does not open non-indexed meta keys by default. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

When you have launched an investigation of a service, NetWitness displays results in the Values panel.

1. NetWitness loads meta keys and meta values in the Values panel. For each meta key load, the stages of load are:
   a. **Waiting to Be Loaded** or **Closed**. If Closed, no data for that key is loaded.
   b. **Loading**
      i. **Loading progress**: NetWitness is receiving and displaying progress messages.
      ii. **Partial results**: NetWitness is receiving values messages and partial results are displayed in the Values panel.
   c. **Load Complete**: All results are finished loading.
2. As each meta key load is completed, and final values are displayed, the next meta key is started. The number or values rendered for each meta key is specified by the Render Threads value in the Investigation Preference settings. Loading continues until all keys to be loaded have finished.
3. If **Show Debug Information** is active and the service you are navigating is a 10.4 or later Broker, NetWitness displays load time information beneath the values for each meta key and displays additional load details for the aggregated services. NetWitness also displays the debug information beneath the breadcrumb.

Iterative results

Iterative results provide feedback on the status of queries within the interfaces to provide additional context for how long the data load will take and if any service data is missing. For example, if you are querying a Broker that is aggregating from two Concentrators, NetWitness starts displaying the results from the first Concentrator as soon as it is available, even if the second Concentrator is still waiting for results.

Iterative results also include a notification that service data is missing because the service is unreachable.

Partial results

When partial values from the Core service are returned but not completed, a message at the end of the meta key listing shows the progress of values loaded. For example, Currently looking at 38 ip.src values 71% indicates that loading of values for the meta key is 71% complete.

Debug Information

If the Show Debug Information setting is in effect, a field at the end of the values displays the status for the different systems against which you are querying within NetWitness. For example, when you are querying against a 10.4 broker pulling from multiple concentrators, NetWitness displays the status of the query on each of the Concentrators, which provides insight into the relative speed of data loading from each of the Concentrators. Each service that participated in the query is listed with the total elapsed time for the query.

Each service that participated in the query is listed with the total elasped time for the query. In the example above, two services returned in 3.207 seconds, localhost:50005 took 2 seconds to return the results. In addition, the where clause of the query is displayed below the breadcrumb. You can copy this syntax directly into an application rule or Reporting where clause of a rule.

Load Complete

For each meta key, there is a list of values (blue text) and counts (green text) found in the current drill point. When you click a value to drill down into a subset of the currently selected data, the display is updated and the new drill point is recorded in the breadcrumb. You can specify the sorting and quantification methods for the values list using the option in the toolbar.

Query Dialog

In the Navigate view or Legacy Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. To access this dialog in the **Navigate** or **Legacy Events** view toolbar, select **Query**.

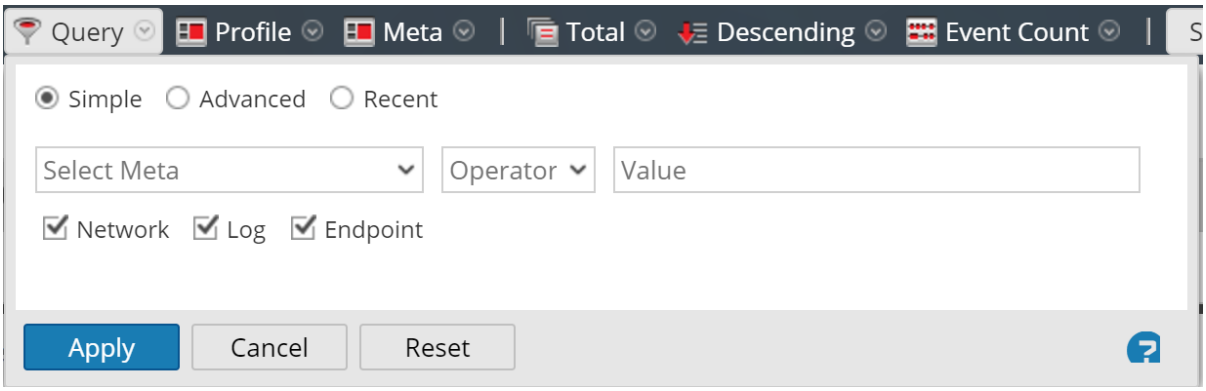
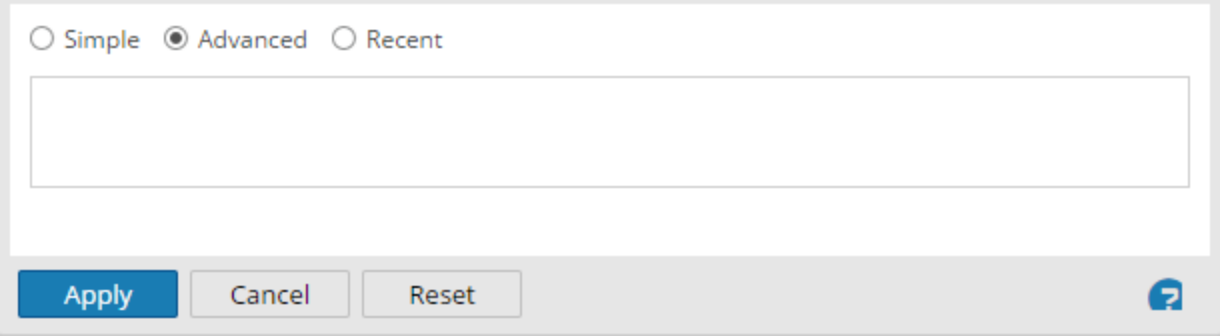
Quick Look

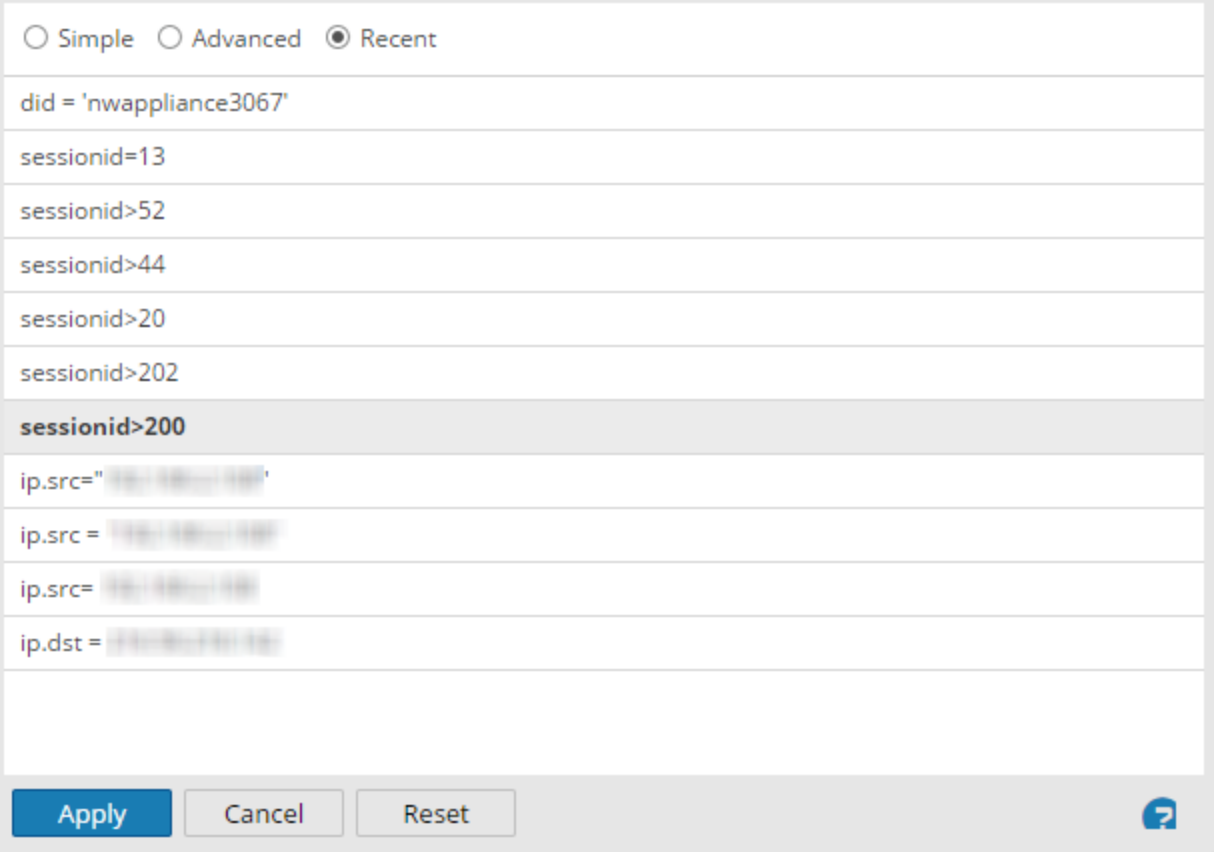


The Query dialog has three views:



- Simple
- Advanced
- Recent

In the Simple view, you can create a query using the options displayed in the dialog. In the Advanced view, you can create a query without guidance. In the Recent view, you can select a query from a drop-down list of recent queries.



Simple View

Advanced View

Recent View

The following table describes features of the Query dialogs.

Feature	Description
Select Meta	Displays a drop-down list of meta groups.
Operator	Displays a drop-down list of operators (=,NetWitness!=,NetWitnessexists,NetWitness!exists)

Feature	Description
Value	Allows you to enter a value to complete the query.
Network	Limits the query to packets if Log is not selected.
Log	Limits the query to logs if Network is not selected.
Query box	Allows you to enter a query in the Advanced view. When you begin typing, a drop-down list of available meta keys for the service is displayed, then a drop-down of operators is displayed as you type. If the expression currently entered in the query box is invalid, a warning appears near the box. When the query is valid, the warning is removed.
Query list	Allows you to select a query from a list of recent queries in the Recent view. Double-clicking a query automatically applies it.
Apply	Applies the new query to the current Investigation view.
Cancel	Closes the dialog without applying changes.
Reset	Resets all fields.

Saved Queries Dialogs

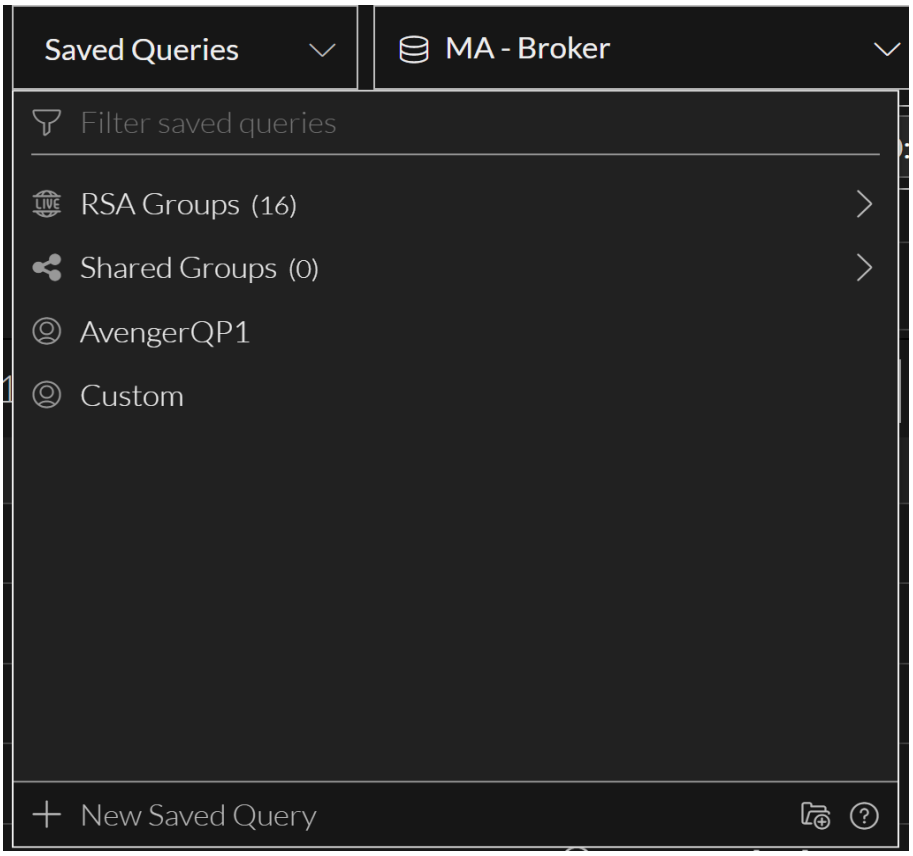
Saved Queries offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view (see Use Saved Queries to Encapsulate Common Areas for Investigation). The same saved queries are shared between all views, and they are available in the Springboard (Version 11.5) for use in panels. Private saved query created in the Events view are only available in the Events view for the analyst who created them.

Each saved query specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

In a saved query:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the saved query is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View)

You can manage query profiles in the Manage Profiles dialog, the Create Saved Query dialog and the Saved Query Details dialog.



- The Manage Profiles dialog is for the Navigate view, the Legacy Events view (Version 11.4 and later) , and the Events view (Version 11.3 and earlier). To access this dialog, select **Profile** > **Manage Profiles** in the **Navigate** or **Legacy Events** view toolbar.
- The Create Saved Query dialog is for the Events view. To access this dialog, select **Saved Queries** > **New Saved Query** in the **Events** view query bar.
- The Saved Query Details dialog is for the Events view. To access this dialog, select **Saved Queries** in the **Events** view query bar, then click the edit icon () next to a custom saved query name.

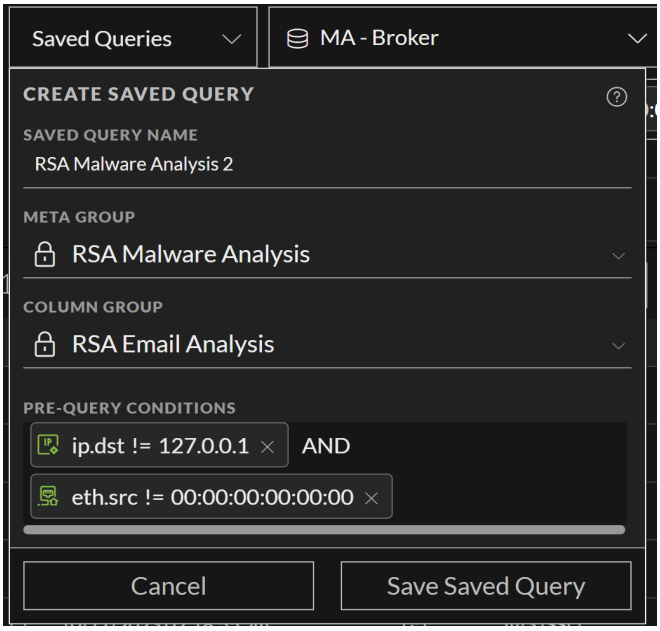
Quick Look - Saved Queries Menu, Create Saved Query Dialog, and Saved Query Details Dialog

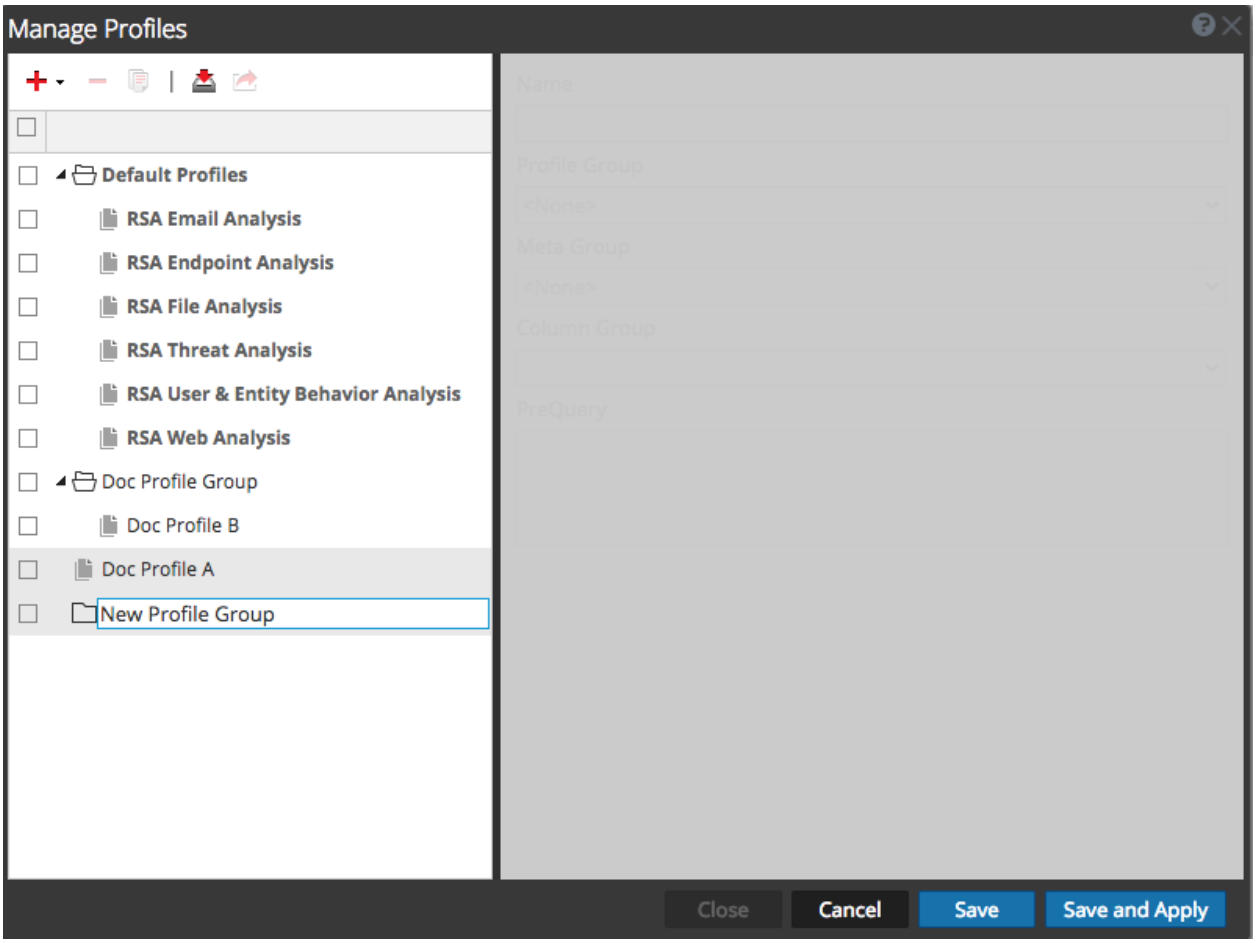


This section introduces the Saved Queries menu, Create Saved Query dialog, and the Saved Query Details dialog. The following figure is an example of the Saved Queries menu and the table describes the options. The example on the left has built-in saved query highlighted so that the information icon is visible.

Feature	Description
Visibility Options	Control the types of saved queries that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all query types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter saved queries field. If the visibility option is hiding built-in saved queries (which include "RSA" in the name) and you search for a name that contains "RSA," the list is empty. Private = display private groups that only you can manage Shared = display shared groups that anyone in your organization can manage RSA = display built-in groups that only RSA can manage
Filter saved queries	Filters the list of saved queries as you type text so that only saved query profile names that contain that text are displayed.

Feature	Description
Saved Query List	The list of queries consists of custom and built-in saved queries, which are distinguished by the icons that precede the name. In the example, RSA Email Analysis-1 and RSA Email Analysis-2 are custom saved queries. The RSA Email Analysis is a built-in saved query.
New Saved Query	Displays the Create Saved Query dialog, where you can create a custom query.

The Create Saved Query dialog, shown in the figure on the left, allows you to define a custom saved query. The figure illustrates the Saved Query Details dialog, in which you can edit a custom saved query. The table describes the fields and options in the dialogs.



Feature	Description
	Creates a clone of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group.

Feature	Description
	Deletes the custom profile in the Saved Query Details dialog. This action is irreversible and applies globally; the profile is no longer available to anyone who is using the profiles on this service.
Saved Query Name	Displays the name of the query profile. The name must be unique and contain fewer than 64 characters. You can edit the name in a custom query.
Column Group	Displays a drop-down menu listing available column groups, with the currently selected column group from the Events list already selected. You can change the column group in a custom query.
Pre-Query Conditions	Defines a limiting filter for results in the Events view. If you had a query active in the query bar when you began to create the new saved query, the active query is added to the pre-Query field. In a custom query, you can delete the prepopulated pre-query condition and type additional text for a text search or additional filters in the Pre-Query Conditions field. This is an example of a pre-query condition: `'service=80,25,110'`.
Close button	Closes the dialog.
Save Saved Query	For the Create Saved Query dialog only, saves the new query.
Reset	For the Saved Query Details dialog only, reverts the edited query to the last saved state.

Feature	Description
Update Saved Query	For the Saved Query Details dialog only, applies changes to an edited query.
Select Saved Query	Applies the saved query.

Quick Look - Manage Profiles Dialog

This is an example of the Manage Profiles dialog showing several profile groups.

The Profile panel on the left side of the dialog displays available profiles and allows you to add, delete, import, and export profiles. The following table describes the fields in the Profile panel.

Field	Description
+	Adds a new profile using the Settings panel on the right side of the Manage Profiles dialog.

Field	Description
	Deletes the selected profile. A confirmation dialog is displayed before the profile is deleted.
	Creates a copy of the selected profile.
	Displays the Profile Import dialog, where you can upload a file.
	Exports the selected profile to your computer.
Profile Name	Lists all profile names.

The Settings panel on the right side of the dialog offers options to configure profiles. It can only be used when one profile is selected. The following table describes the fields in the Settings panel.

Feature	Description
Name	Displays the name of the profile.
Meta Group	Displays a drop-down menu listing available meta groups.
Column Group	Displays a drop-down menu listing available column groups. The OOTB column groups and these three groups are available by default: • List View • Detail View • Log View
PreQuery	Defines a limiting query for filtering Investigate results. This query is used when the associated profile is activated and the preQuery applies to any queries used in the Navigate and Events views. This is an example of a preQuery: `'service=80,25,110'`.

The following table describes the buttons.

Field	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and applies all changes immediately.

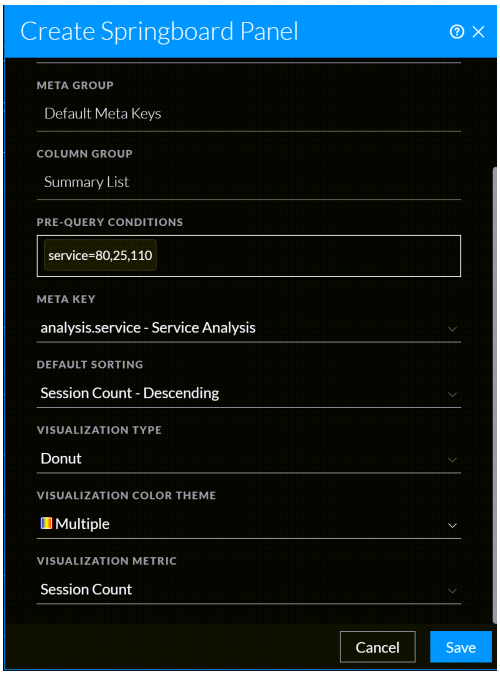
Create Springboard Panel Dialog

In the Create Springboard Panel dialog, you can create a Springboard panel from selected query in the Events view. You can add any number of filters in the query search bar and convert them into Springboard panels. The Springboard panels are then available to analysts for detection and monitor the results.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Create Springboard Panel** from the toolbar.

IMPORTANT: Ensure that you first create a custom private board in Springboard.

What do you want to do?



User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Threat Hunter	query a service, metadata, and time range*	Begin an Investigation in the Events View

Related Topics

- Managing the Springboard

Quick Look - Create Springboard Panel Dialog

This is an example of the Create Springboard dialog.

The following table describes the fields in the Create Springboard Dialog view.

Feature	Description
Name	(Required) Specifies a name to identify the panel. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Meta Group	Displays the currently selected meta group from the filter query already selected.
Column Group	Displays the currently selected column group from the filter query already selected.
Location	Displays the location where the defined query is saved.
Pre-Query Conditions	Defines a limiting filter for results in the Events view. If you had a query active in the query bar when you began to create the new Springboard panel, the active query is added to the pre-Query field. This is an example of a pre-query condition: `'service=80,25,110'`.
Meta Key	Displays a drop-down listing meta keys available for the service.
Default Sorting	Displays a drop-down listing sorting options.
Visualization Type	Displays a drop-down listing Visualization type options: • **Donut** • **Bar**

Feature	Description
Visualization Color Theme	Displays a drop-down listing different color theme options: • **Blue** • **Teal** • **Orange** • **Fuchsia** • **Purple** • **Lime** • **Multiple** **Note:** The **Multiple** color option is available only for the Donut chart.
Visualization Metric	Displays a drop-down listing available Visualization metric options.
Cancel	Closes the dialog without applying changes.
Save	Saves the changes.

Create Future Alert Dialog

In the **Create Future Alert** dialog, Administrators and Analysts can create an application rule from the **Investigate** > **Events** page for any suspicious activity. You can create rules with a flexible query that covers a wide set of events and system information from your network, including suspected breach activities and misconfigured servers. Once the rule is applied to a matched policy with services (Decoders), it generates alerts whenever a match occurs and helps analysts with further investigation.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Create Future Alert** from the toolbar.

IMPORTANT: The **Create Alert** option will be enabled for users only if the Decoder services are managed by Policy-based Centralized Content Management and the user has the **investigate-server.alert.manage** permission enabled.

Note: An administrator must enable **investigate-server.alert.manage** permission and **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the application rules.
For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Quick Look - Create Future Alert Dialog

This is an example of the Create Future Alert Dialog.

The following table describes the fields in the Create Future Alert view.

Feature	Description
Alert Name	Specify a descriptive Name to identify the alert or leave the default name automatically populated using **Query Based App Rule** format.
Select Policy	Displays a drop-down list of available policies for selection.

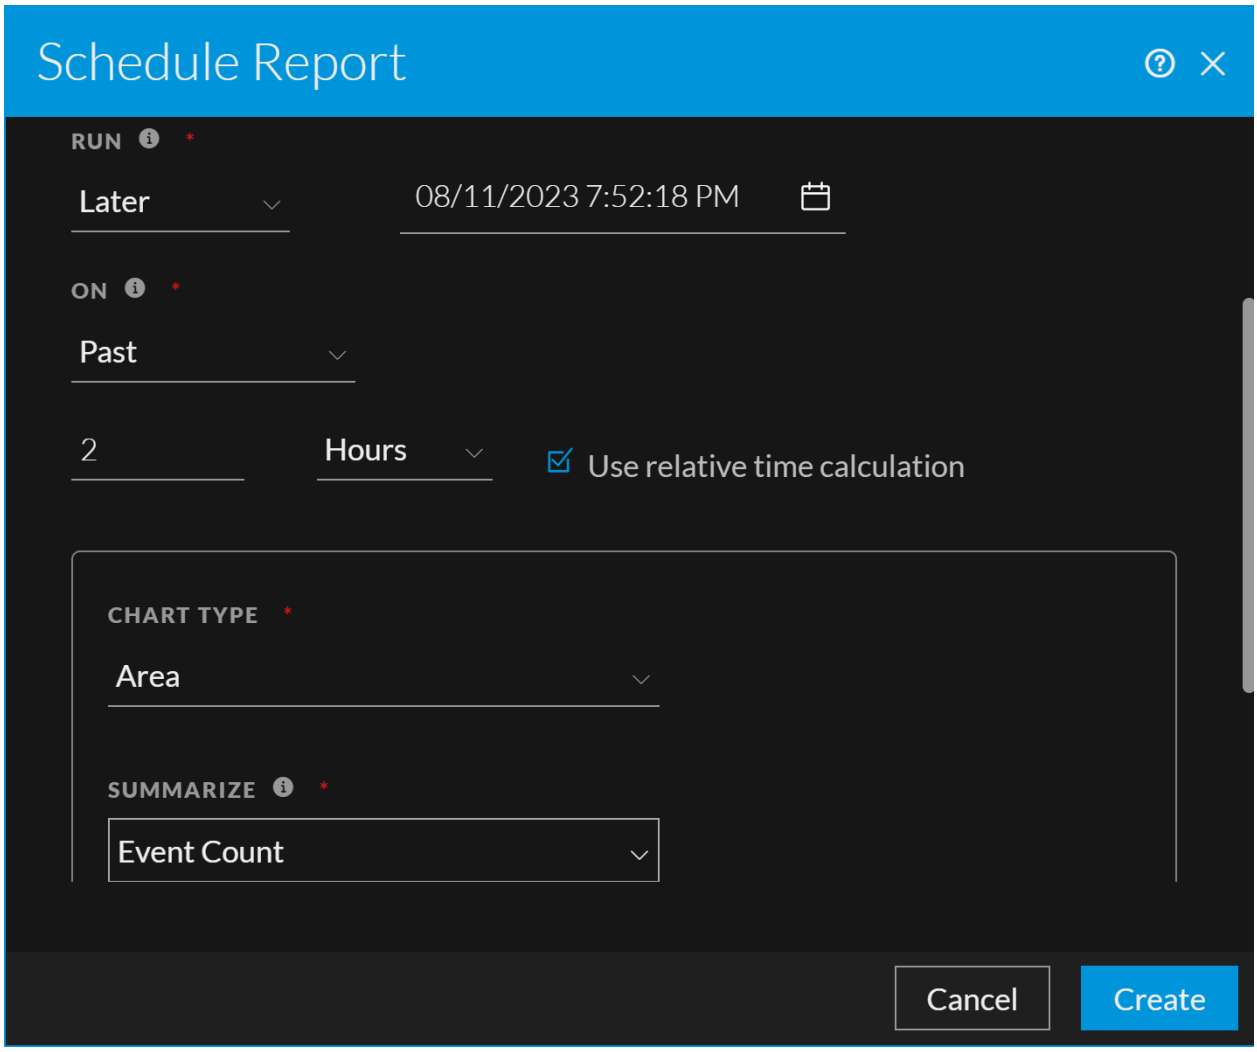
Feature	Description
Select Severity	Displays the level of severity for the alert to be generated. The options are listed below: • Low • Medium • High • Critical **Note:** By default, Low is selected as severity.
MITRE ATT&CK Tactics	Displays the type of tactic associated with the alert. For example: **Credential Access**. The tactic Credential Access tries to steal account names and passwords.
MITRE ATT&CK Techniques	Displays the type of techniques and sub-techniques associated with the tactics.
Create	Creates the Application rule and closes the dialog. A message confirms that the application rule was created successfully.
Cancel	Closes the dialog without applying changes.

Schedule Report Dialog from Events View

The **Schedule Report** dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule report dialog.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Schedule Report** from the toolbar. Additionally, administrators and analysts can configure charts for reports. Using this feature, administrators and analysts can create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**.

What do you want to do?



User Role	I want to ...	Show me how
Administrator / Analysts	Schedule Report	Generate Reports from Events View

Related Topics

- Use Saved Queries to Encapsulate Common Areas for Investigation
- Generate Reports from Events View

Quick Look - Schedule Report Dialog

This is an example of the Schedule Report Dialog.

The following table describes the fields in the **Schedule Report Dialog** view.

Feature	Description
Report Name	Specifies a name to identify the panel. In the example, the name is **Report on Investigate Query - 2023-04-25 10-18-26**. You can provide a name that clearly identifies the nature of events that will be added to this report.

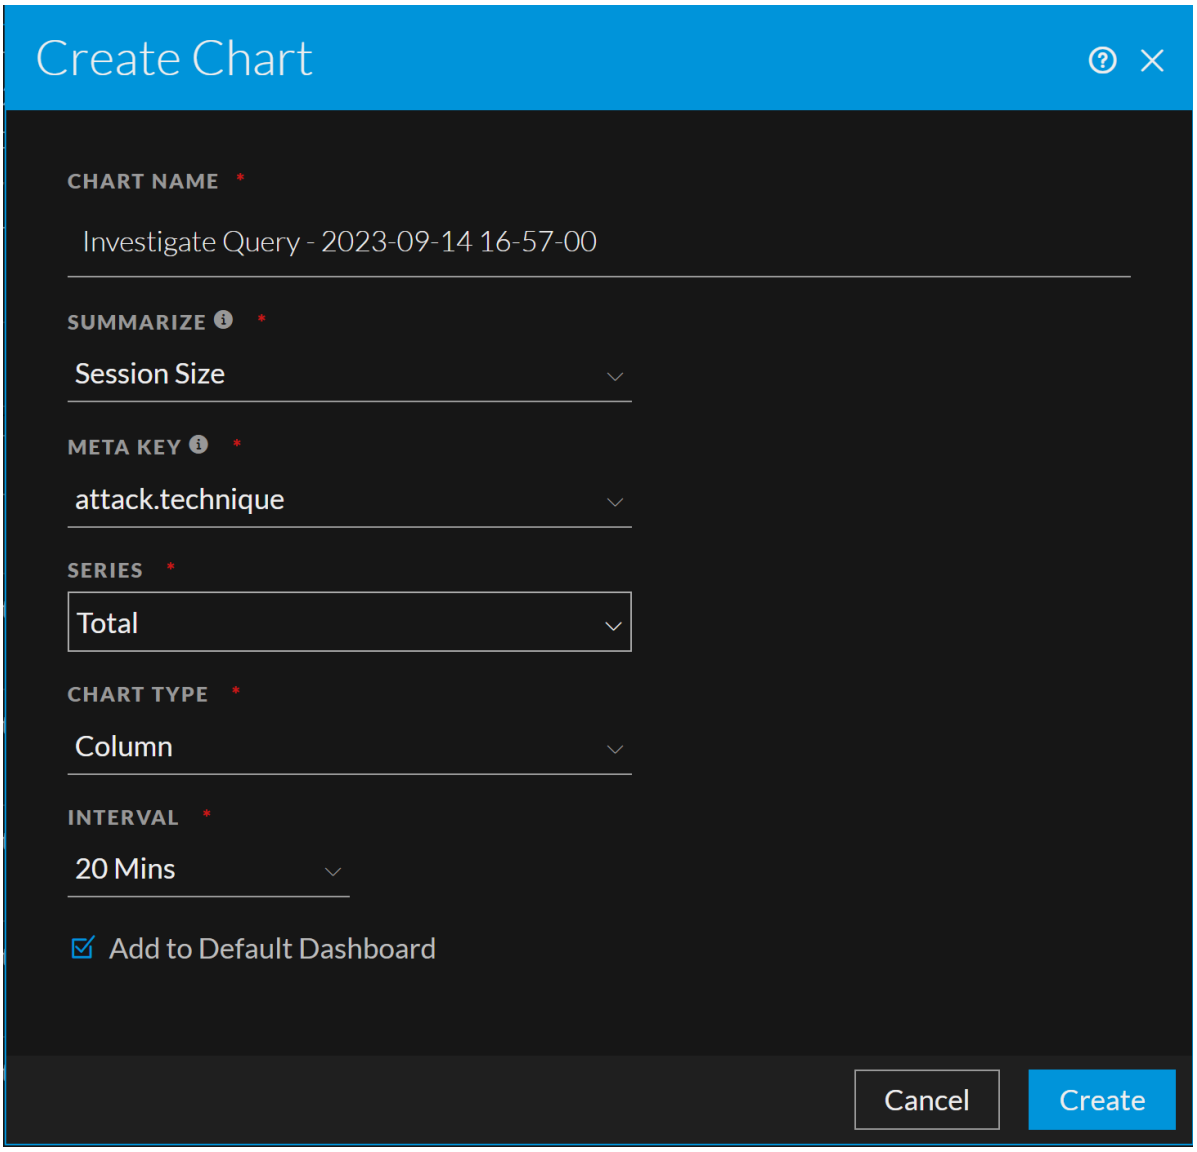
Feature	Description
Limit	A selection list for the maximum number of results to be displayed in the generated output. By default, the limit is 20 and you can specify a maximum number of 100 results.
Run	Time interval to use for running the scheduled job: • **Later**: Runs on specific date and time. • **Hourly**: Runs on a designated repeating interval. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: Runs daily at a designated time. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Monthly**: Runs on a monthly basis at a designated time and day of the month. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.
ON	Set the frequency, duration, and time for running the report: • **Past**: You can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. • **Range(specific)**: You can schedule the report for a specific date and time range. **Note:** This field appears only if you select Later in the Run field. • **Range(generic)**: You can schedule the report for a generic date and time. **Note:** This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.
Use relative time calculation	The Use relative time calculation option is enabled by default, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today.

Feature	Description
Chart Type	Displays a drop-down listing chart type options: • Tabular(Default) • Pie • Area • Bar • Bubble • Column • Line • Step line • Step Area • Spline Area • Spine
Summarize	Displays a drop-down listing different in-built aggregate meta options to obtain the desired summarized meta values: • **Event Count**: The total number of events that have occurred at a specific time. • **Session size**: The total size of the events recorded by services at a certain time. • **Packet Count**: The total number of packets that have been transmitted or received.
Meta Key	Displays a drop-down listing different meta key options. **Note:** You can select only one meta value at a time.
Email Output Action	Specify email addresses to send the report to, separated by commas.
Create	Creates the report and closes the dialog. A message confirms that the report was scheduled successfully.
Cancel	Closes the dialog without applying changes.

Create Chart Dialog from Events View

Administrators and analysts can create charts based on the real-time data from the **Investigate** > **Events** page. This enhancement enables them to create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**. It provides an all-in-one solution for tracking trends for analysts. Additionally, analysts can add these real-time charts to their Default dashboard, allowing them to track critical data seamlessly within the organization.

What do you want to do?



User Role	I want to ...	Show me how

Quick Look - Create Chart Dialog from Events View

This is an example of the Create Chart Dialog from Events View

Feature	Description
Chart Name	Specifies a name to identify the chart. In the example, the name is **Investigate Query - 2023-09-14 16-57-00**. You can provide a name that clearly identifies the nature of events that will be added to this chart.
Summarize	Displays a drop-down listing different in-built aggregate meta options to obtain the desired summarized meta values: • **Event Count**: The total number of events that have occurred at a specific time. • **Session size**: The total size of the events recorded by services at a certain time. • **Packet Count**: The total number of packets that have been transmitted or received.
Meta Key	Displays a drop-down listing different meta key options. **Note:** You can select only one meta value at a time.
Series	Displays a drop-down listing different Series options for the chart. • **Total**: The chart displays a total for each aggregate value for the selected time. • **Value**: The chart displays the change in values for the selected time. **Note:** The option will only be available if you select the **Add to Default Dashboard** checkbox.

Feature	Description
Chart Type	Displays a drop-down listing chart type options: • Tabular(Default) • Pie • Area • Bar • Bubble • Column • Line • Step line • Step Area • Spline Area • Spine **Note:** - The option will only be available if you select the **Add to Default Dashboard** checkbox. - By default, column type chart is selected. - Based on the **Series** options selected, charts will be displayed accordingly. - For **Total** option: only **Pie** and **Column** charts are enabled. - For **Value** option: **Area**, **Column**, **Line**, **Step Line**, **Step Area**, **Spline Area**, and **Spline** charts are enabled.
Interval	Displays a drop-down listing time range options. The available interval ranges from 10 minutes to 180 minutes, with a 10-minute gap between each interval. **Note:** By default, the number of records (Top) displayed on each chart is **15**.
Add to Default Dashboard	Displays a checkbox option to add the chart under the **Dashboard** > **Default Dashboard** view.
Create	Creates the chart and closes the dialog. A message confirms that the chart was scheduled successfully.
Cancel	Closes the dialog without applying changes

Timeline Settings Panel

Analysts can use the **Timeline Settings** option to change the values based on the Spike Y-axis (Count and Size) and view the data presented on the timeline. This allows analysts to detect significant spikes that could indicate anomalies. Using the visual representation, analysts can conduct a more detailed investigation of the events that occurred during that specific period.

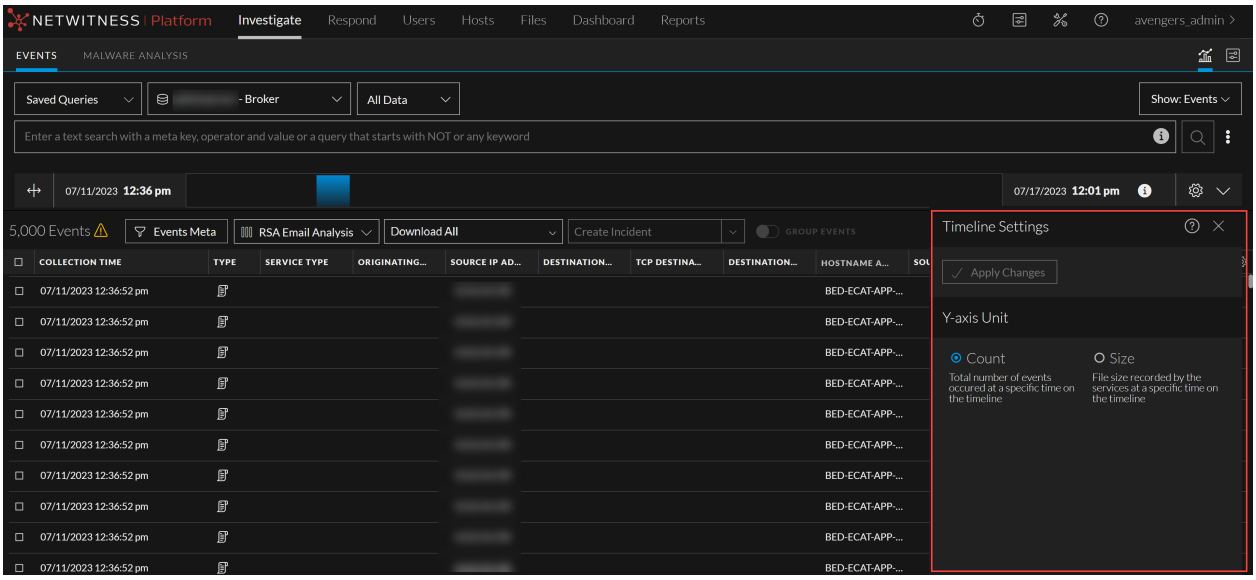
For more information on Timeline, see the section **Investigate on Timeline** in the topic Begin an Investigation in the Events View.

Note: To change the X-axis settings, you must change the Query Time options set within the Events Preferences panel. For more information on Query time, see Configure the Events View.

What do you want to do?

User Role	I want to ...	Show me how
Analysts	Configure Timeline Settings	Begin an Investigation in the Events View

To change the Timeline Settings



1. Log in to the NetWitness Platform.
2. Go to **Investigate** > **Events**.
3. Click () **Timeline Settings**.
4. Select the Spike (Y-axis) based on your preference:
   - **Count**: Displays the total number of events that have occurred at a specific time on the timeline.
   - **Size**: Displays the total size of the events recorded by services at a certain time on the timeline.
5. Click **Apply Changes**. The changes are reflected on the Timeline bar.
6. Click **X** to close the Timeline Settings.

This is an example of the Timeline Settings Panel.

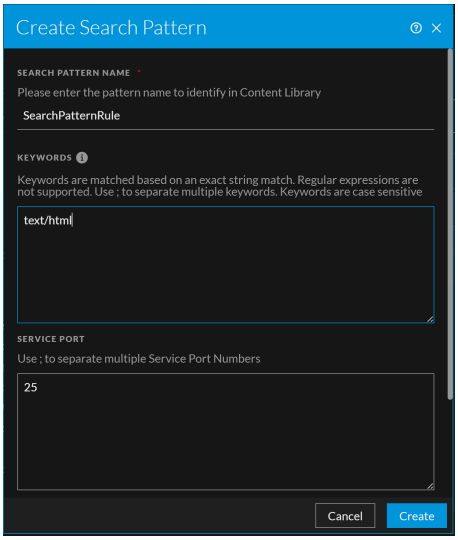
The following table describes the fields in the **Timeline Settings** Panel.

Feature	Description
Count	Displays the total number of events that have occurred at a specific time on the timeline.
Size	Displays the total size of the events recorded by services at a certain time on the timeline.
Apply Changes	Applies the changes and the changes are reflected on the timeline bar.
X	Closes the dialog without applying changes

Create Search Pattern Dialog

Administrators and analysts can create search patterns to find sensitive data on their networks. These rules use keywords to identify patterns and they are matched based on an exact keyword string. Once a pattern is applied to a matched policy with services (Decoders), it will search for that pattern in the network traffic. Upon successful detection of a match, two important metadata will be generated (**found** and **match**). Analysts can use this metadata to investigate further and determine if the sensitive data is being used maliciously.

What do you want to do?



User Role	I want to ...	Show me how
Administrators / Analysts	Create Search Pattern	Analyze Events in the Events View

Related Topics

Quick Look - Create Search Pattern Dialog

This is an example of the Create Search Pattern Dialog

The following table describes the fields in the Create Search Pattern view.

Feature	Description
Search Pattern Name	Specify a descriptive Name to identify the search pattern or leave the default name automatically populated using **Search Pattern Rule** format.

Feature	Description
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**. The port numbers must be between **1** and **65535**.
Select Policy	Displays a drop-down list of available policies for selection.
Create	Creates the search pattern and closes the dialog. A message confirms that the search pattern was created successfully.
Create and Publish	Creates the search pattern and deploys the search pattern rule to a available policy containing Decoder services.
Cancel	Closes the dialog without applying changes.

Settings Dialogs for Investigate Views

NetWitnessVersion 11.0 has two settings dialogs, one for the Navigate view and one for the Legacy Events view. With the addition of the settings dialog for the Events view in Version 11.1, Investigate has three settings dialogs.

The settings in these dialogs are a subset of the Investigation settings made in the Profiles > Preferences panel > Investigation. Analysts can save time by editing these settings within the Investigate view. If you change a setting here, the same setting is changed in the Profiles view, and if you change a setting in the Profiles view, the same setting is changed here.

To access this dialog, go to the **Navigate** or **Legacy Events** view, and select the **Settings** option in the toolbar.

The settings in the Events view have no corresponding settings in the Profiles > Preferences panel.

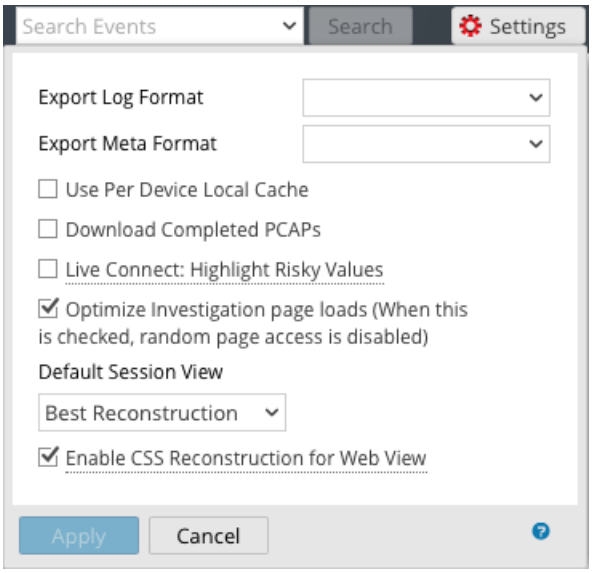
Quick Look

This is a quick look at the settings dialog for the Navigate view, Legacy Events view, and Events view.

Navigate View Settings Dialog

The following figure illustrates the Navigate view Settings dialog. The settings that influence performance when loading values in the Values panel have default values based on common usage, and individual analysts can adjust these settings for their own investigations. The following table describes the features.

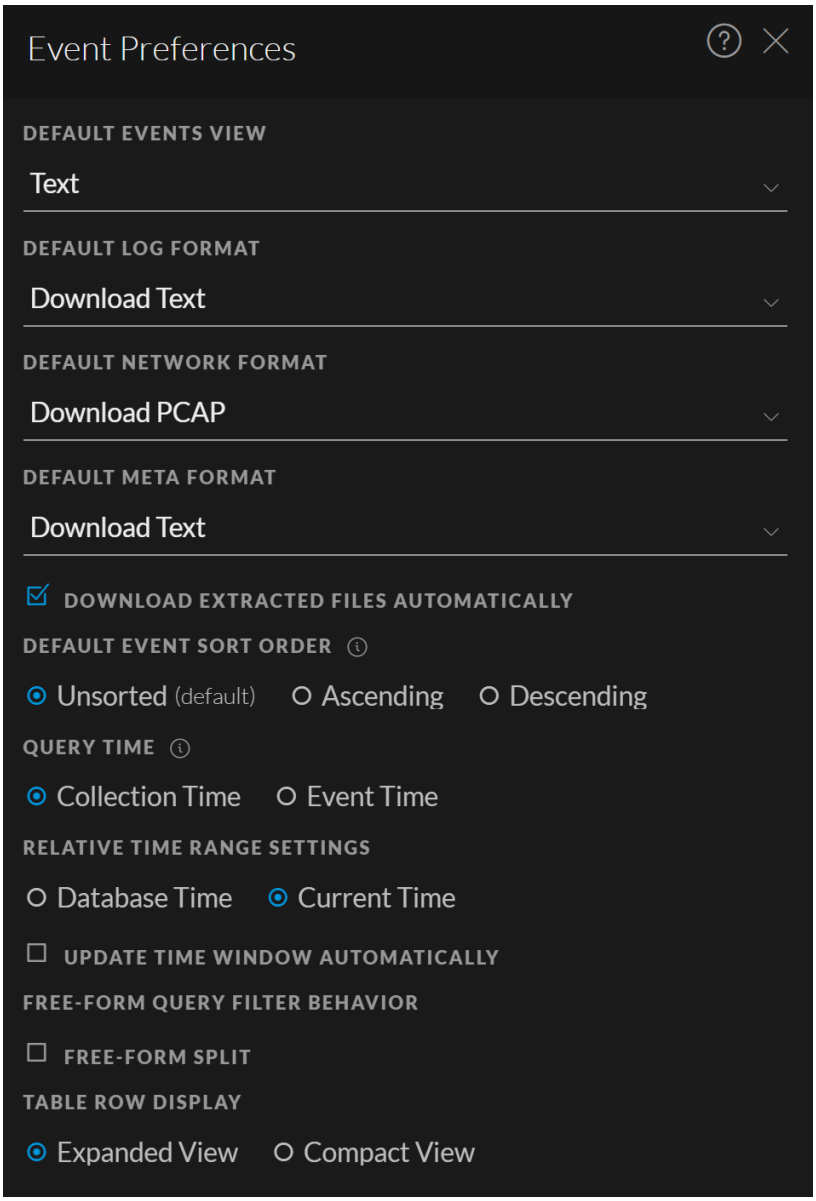


Feature	Description
Threshold	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
Max Values Results	Sets the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key menu for an open meta key. The default value is **1000**.
Max Session Export	Sets the maximum number of sessions that can be exported. The default value is **100000**.
Export Log Format	Sets the file format of exported logs. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.

Feature	Description
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format. **Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.
Use Per Device Local Cache	When the checkbox is cleared, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the checkbox is selected, Investigate uses the data from local cache.
Show Debug Information	This option controls the display of the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker. When the checkbox is selected, the debug information is displayed. The default value is **Off** (checkbox cleared).
Autoload Values	This option controls automatic loading of values for the selected service in the Navigate view. When the checkbox is selected, values are automatically loaded when you select a service to investigate. When the checkbox is cleared, Investigate displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form. When the checkbox is selected, the option is enabled. The default setting is disabled (checkbox is cleared).
Live Connect: Highlight Risky IPs	If the checkbox for this option is cleared, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the checkbox is selected, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is disabled (checkbox cleared).
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Legacy Events View Settings Dialog

The following figure is an example of the Settings dialog for the Legacy Events view, and the table describes the features.



Feature	Description
Export Log Format	Sets the file format of exported logs. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.
Live Connect: Highlight Risky IPs	When the checkbox is selected, Investigate uses a filter to fetch only IP addresses that are considered as risky by RSA community. When the checkbox is cleared, NetWitness displays all IP addresses. By default, this option is disabled (checkbox cleared).

Feature	Description
Optimize Investigation page loads	Sets a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Clearing this checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is enabled (checkbox selected).
Append Events in Event Panel	This option affects paging in the Legacy Events panel and in prior releases was located in the Navigate view settings dialog. When the checkbox is selected, the next group of events is appended to the already displayed events. When cleared, the previous page of events is replaced by the next page. The default value is Off (checkbox cleared).
Default Session View	Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Clear the checkbox to disable this option if there are problems viewing specific websites.
Apply	Applies the settings immediately and they are visible the next time you view events. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Events View Preferences Dialog

Beginning with Version 11.1, the Events view has user preferences that you can configure in the Events view > Event Preferences dialog. These settings persist so that they are applied each time you log in and go to the Events view. The following figures are examples of the dialog for Version 11.3 and Version 11.6. The table below describes the options.

Feature	Description
Default Events View	Selects the default event analysis view that is displayed every time you open the Events view. For example, if you select File, the File Analysis panel is highlighted and displayed every time you investigate an event in the Events view. These are following options: • **Text** : View and analyze the raw text payload of an event. • **Packet** : View and interactively analyze the packets and payload of an event. • **File** : View a list of files and download one or more files in an event.

Feature	Description
Default Log Format	Selects the default format for downloading logs: • **Download Log** or **Download Text**: Raw log (log) format. • **Download CSV**: Comma-separated values (CSV) format. • **Download XML**: The Extensible Markup Language (XML) format. • **Download JSON**: The JavaScript Object Notation (JSON) format.
Default Packet Format or Default Network Format	Selects the default format for downloading packets. • **Download PCAP**: To download the entire event as a packet capture (*.pcap) file. • **Download All Payloads** or **Download Payloads**: To download the payload as a *.payload file. • **Download Request Payload**: To download the request payload as a *.payload1 file. • **Download Response Payload**: To download the response payload as a *.payload2 file.
Default Meta Format	Selects the default format for downloading metadata: • **Download CSV**: Comma-separated values (CSV) format. • **Download JSON**: The JavaScript Object Notation (JSON) format. • **Download Text**: Plain text format. • **Download TSV**: Tab-separated values (TSV) format.
Time Format for Query	The Events view can display results based on the database time or the current clock time. **Note:** (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users. When **Database Time** is selected, the start and end time for a query is based on the time that the event was captured (collection time). When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range.

Feature	Description
Event Sort Order (Version 11.4 and Later)	Sets the sort sequence by collection time for the events listed in the Events panel. If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. A change to this setting becomes effective the next time you submit a query. **Unsorted**: Default sorting method for Version 11.4.1. To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order. **Ascending**: Default sorting method for Version 11.4. To put the events with the earliest collection time first in the list. **Descending**: To put the events with the latest collection time first in the list. When investigating logs, you may want to change the sort sequence to latest collection time first.
Download Extracted Files Automatically	Enables the automatic download of files if they are in the selected default format in the **Default Log Format** and **Default Packet format** fields set in the Event Preferences dialog. Select the checkbox to enable downloading the selected format automatically to local file system. Otherwise, the download job goes to the job queue, and you can download it manually.
Update Time Window Automatically	(Version 11.3 and later) Enables automatic update of the time range window in the query bar when the service is polled (at one minute intervals) so that fresh results are sent. The default setting is disabled. When the checkbox is selected, as the time range is updated, the  (Submit Query) button is activated so you can click to get the fresh results. When the checkbox is cleared, the automatic update is disabled keeping the time range window in the breadcrumb synchronized with the current results.

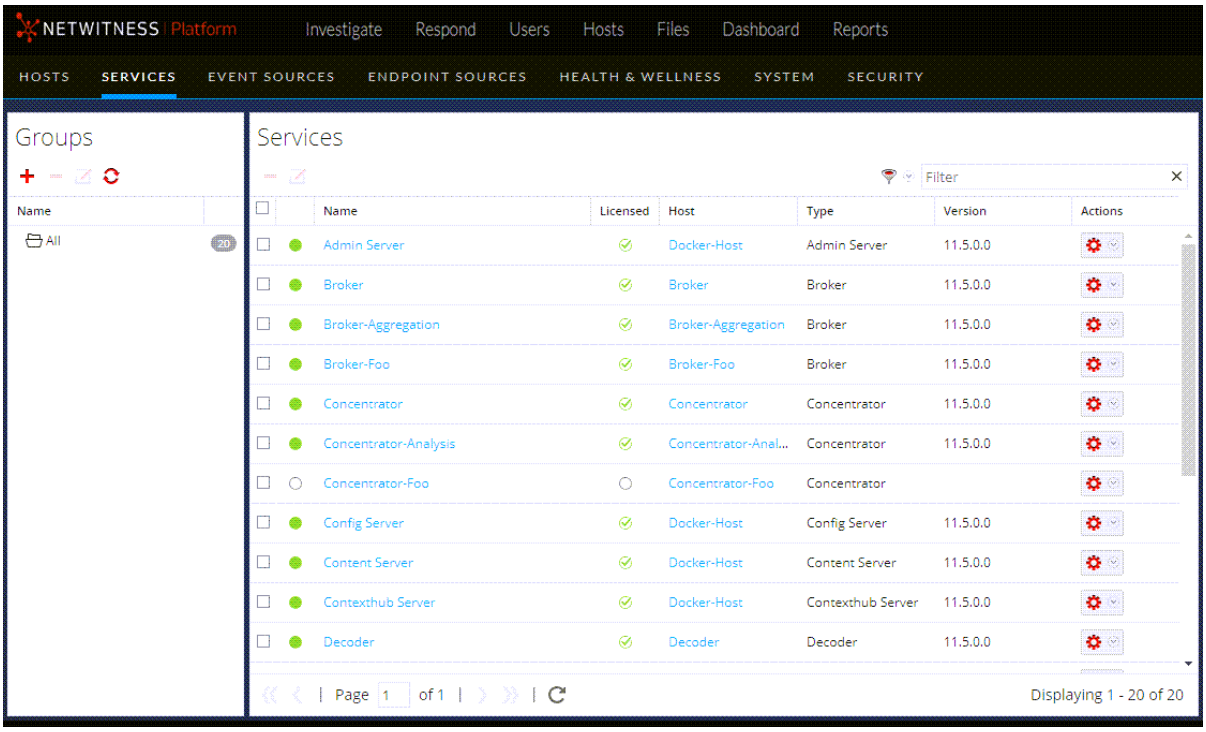
Decoder and Log Decoder Quick Setup

A basic NetWitness network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Network Decoder or Log Decoder. The basic network may include both types of Decoders. Network Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

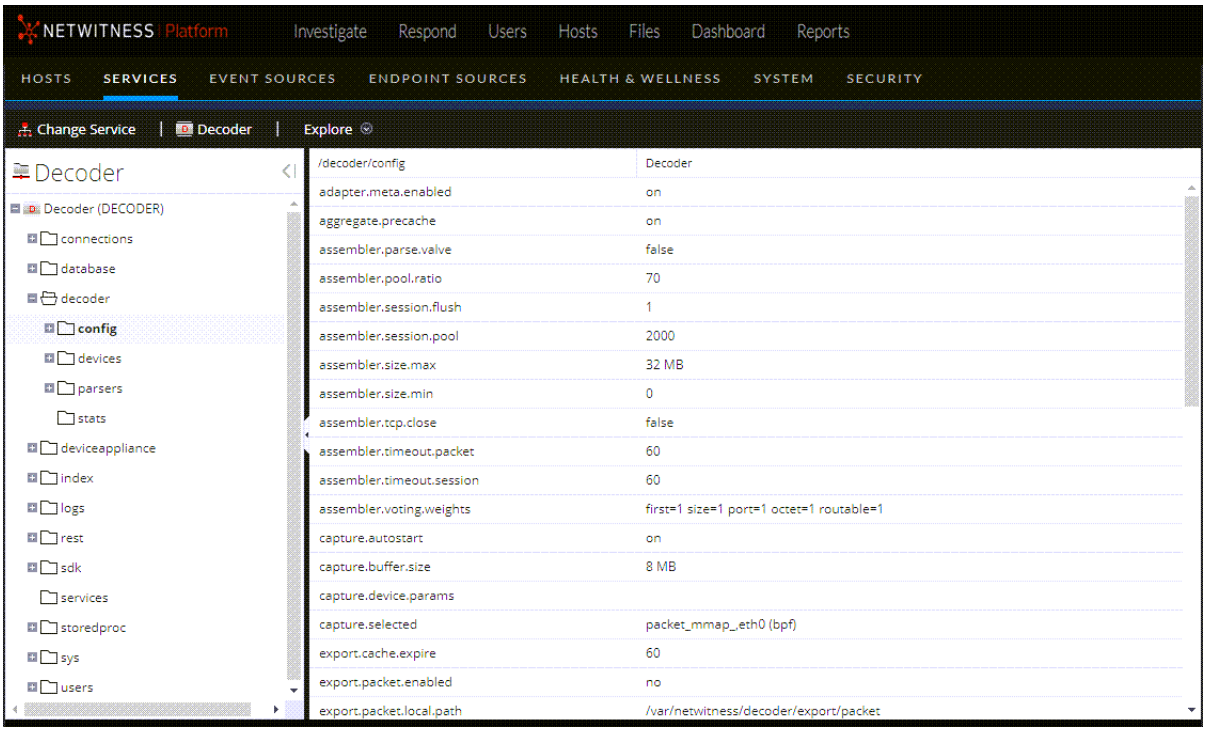
Adding a Decoder makes it visible and available for use with NetWitness Administration, Live Services, and Investigate. To add a service in NetWitness, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:



1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

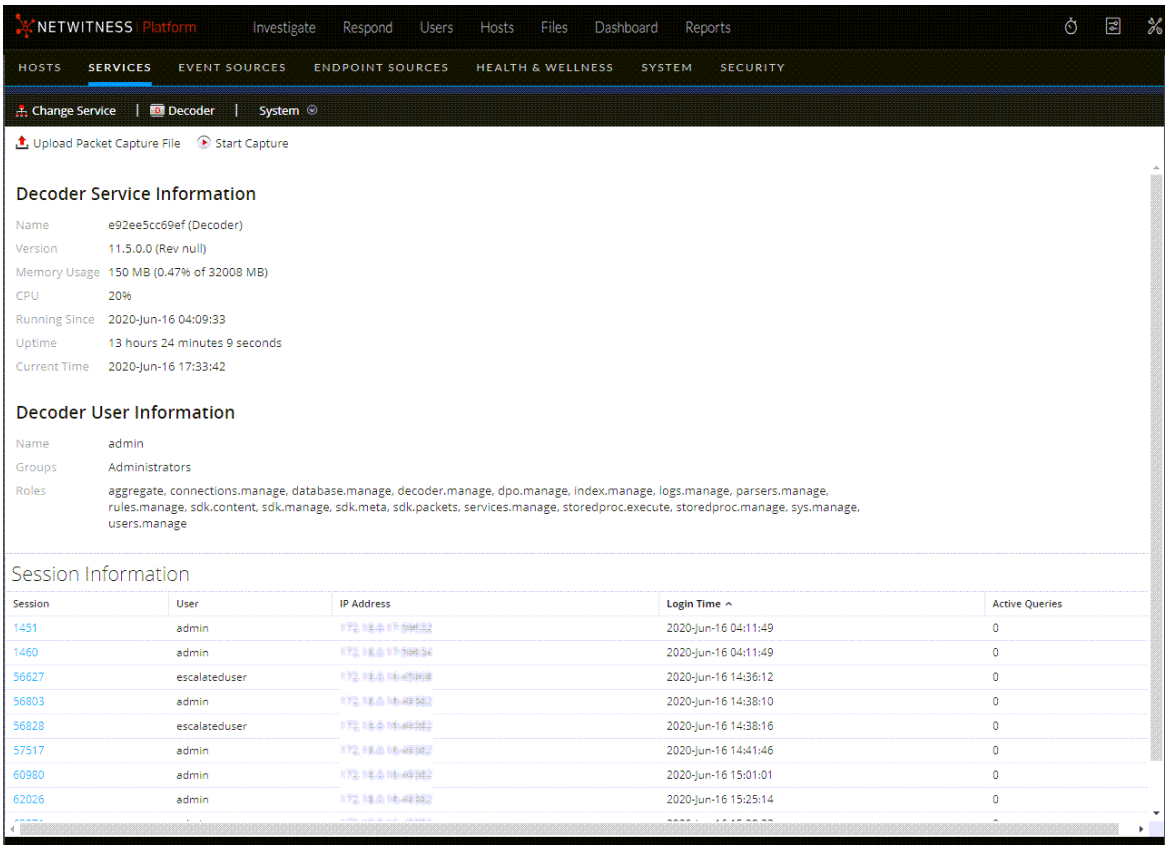


Basic configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness user interface. For the most part, configuration is performed in the Administration Services view ( (Admin) > Services).

Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and  **> View > System**. In the toolbar click .

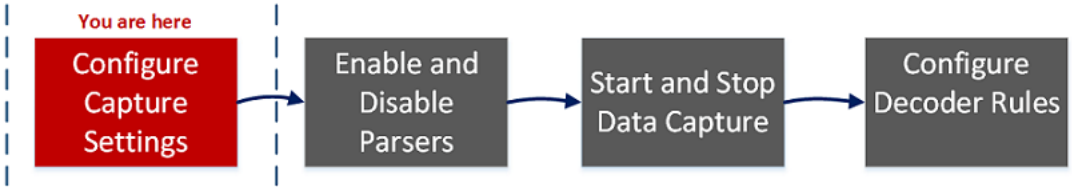
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder Configure Common Settings on a Decoder and or Decoder and Log Decoder Additional Procedures

Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.



Configuration Step	Description
Configure Capture Settings	When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart.
Enable and Disable Parsers and Log Parsers	View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled.
Start and Stop Data Capture	When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually.

Configuration Step	Description
Configure Decoder Rules	Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out. By default, no capture rules are defined when you first configure NetWitness. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax).

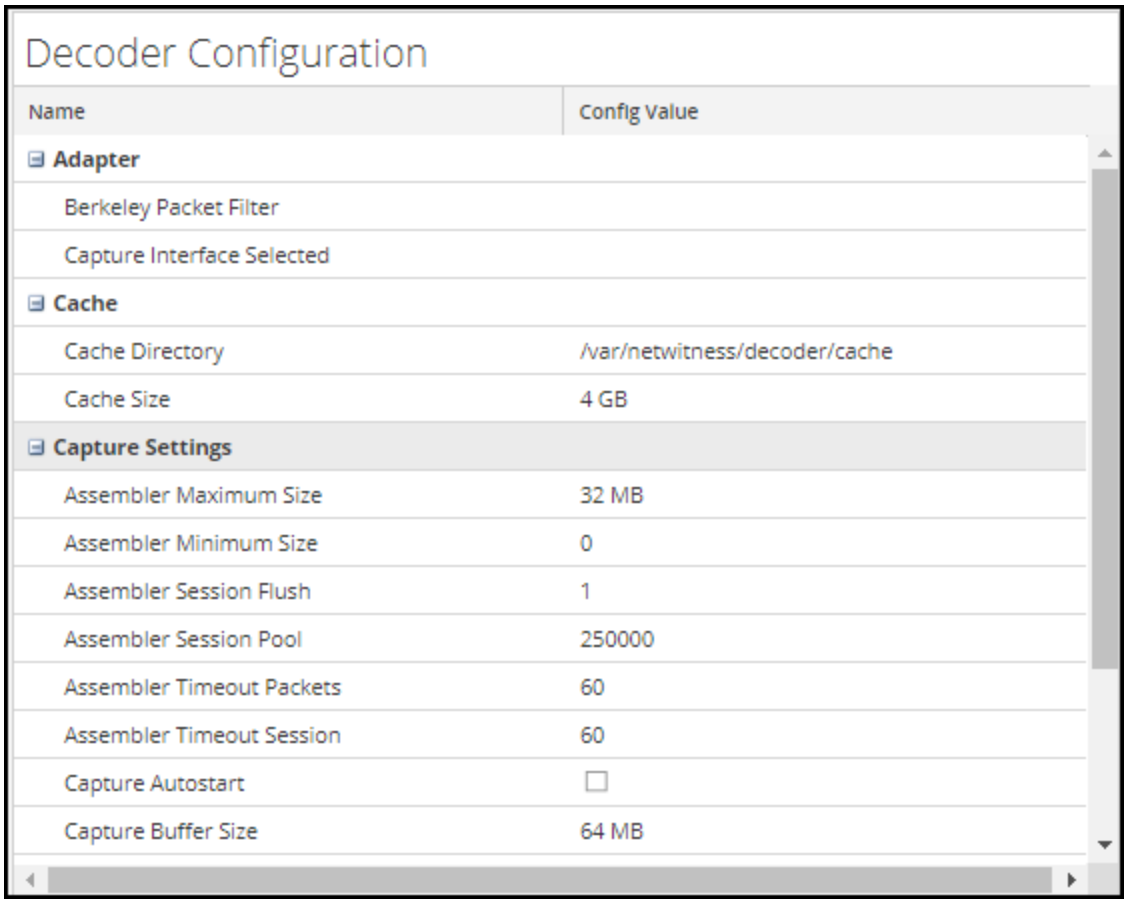
Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.

Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

Select a Network Adapter

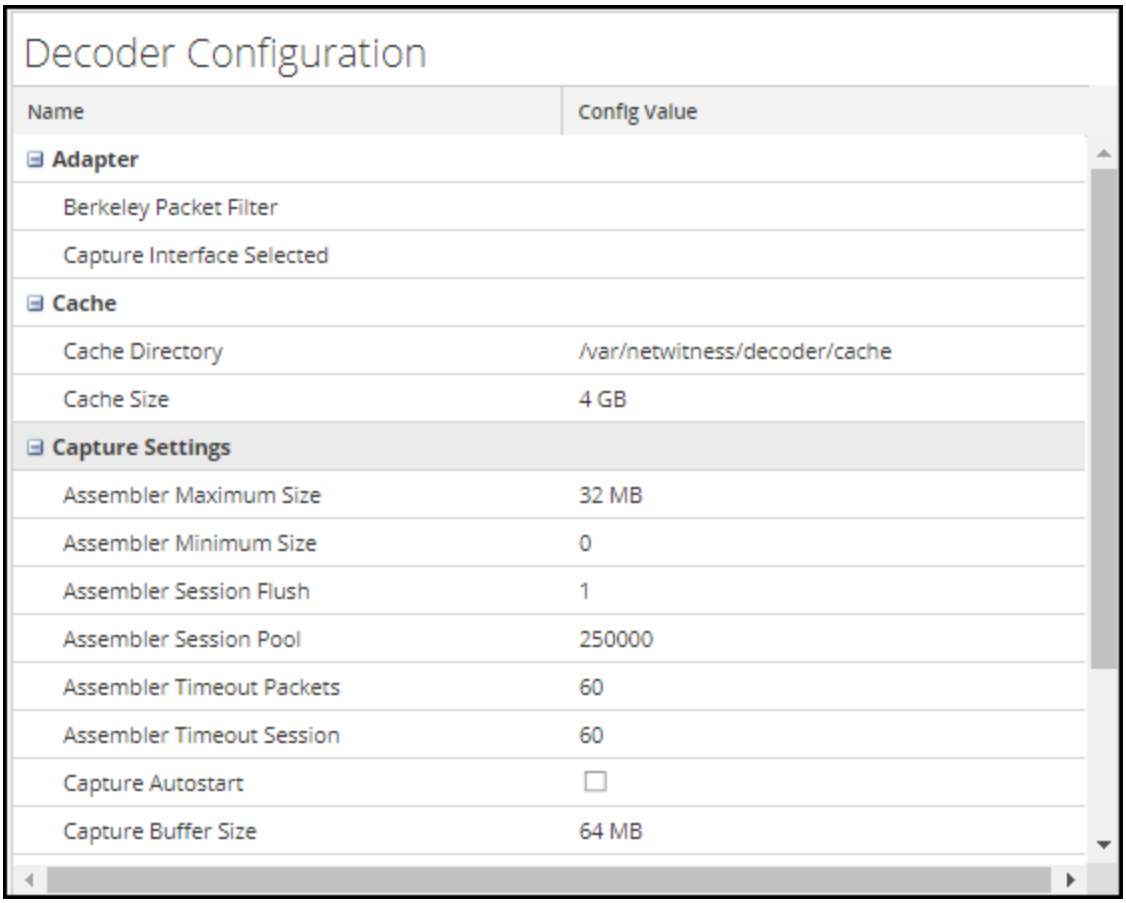


The table below describes the Network Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

Adapter Parameter	Description
Berkeley Packet Filter	Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

Adapter Parameter	Description
Capture Interface Selected	Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports: • `packet_mmap_,1,lo (bpf)` • `packet_mmap_,2,eth2 (bpf)` • `packet_mmap_,3,eth3 (bpf)` • `packet_mmap_,4,eth4 (bpf)` • `packet_mmap_,5,eth5 (bpf)` • `packet_mmap_,8,ALL (bpf)` There are three wireless capture services available: • `packet_netmon_ (Microsoft Netmon)` • `packet_mac80211_ (Linux mac80211)` • `packet_airport_ (Mac OS X AirPort)`
Capture Interface Selected for Log Decoder	The following capture service is available: • `log_events,Log Events`

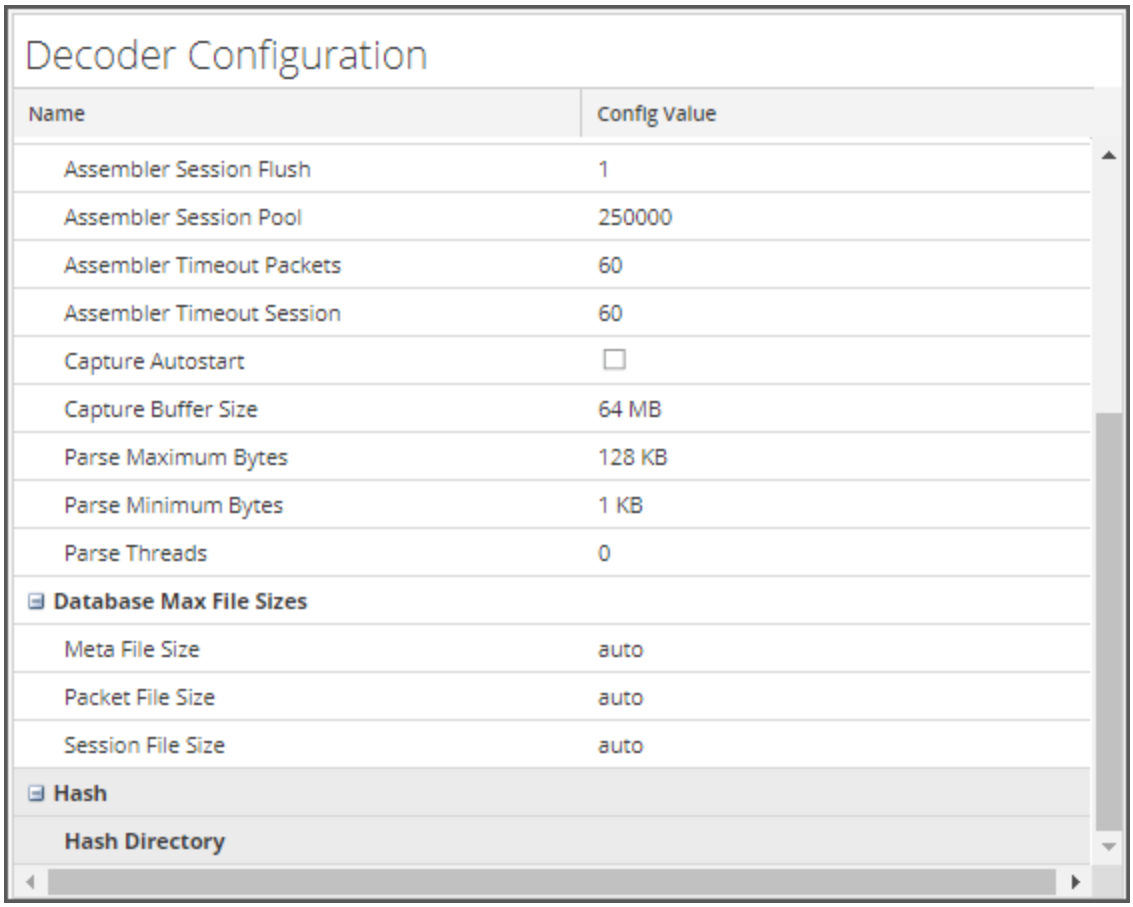
To configure the network adapter on a Decoder:



1. Go to  (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure a Decoder to Begin Capturing Data Automatically



1. Go to (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure Optional Capture Settings

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select the Decoder and > **View** > **Config**.
   The Services Config view is displayed with the General tab open.

3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

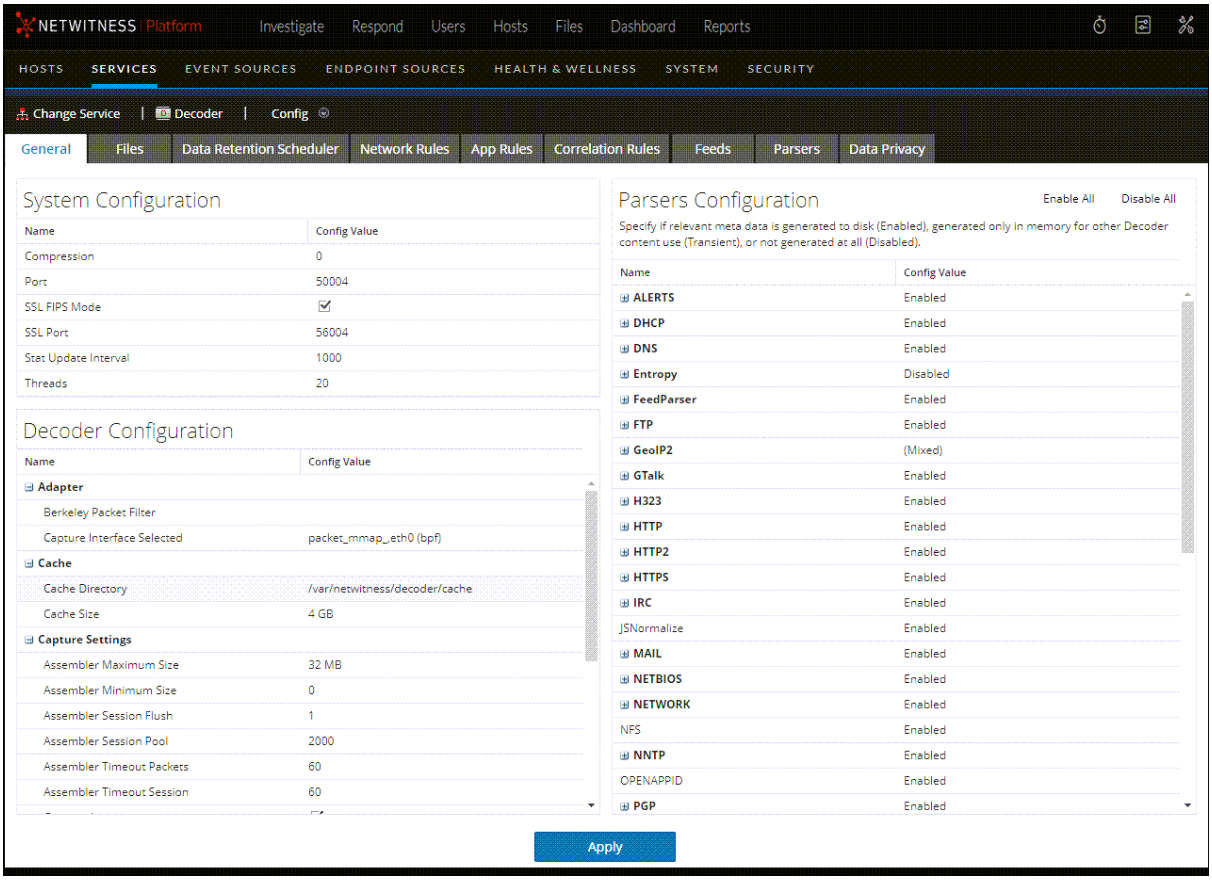
(Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available(`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```



For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

To add a system-level Berkeley Packet Filter:

1. Go to  (Admin) **> Services.**

2. In the Administration Services view, select a Decoder service and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.
4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800 2020-May-01 19:03:08 warning Decoder Failed to parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  `not (net 10.21.0.0/16)`
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  `not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  `not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Combine both IP and HOST:
  `not (host 192.168.1.10) and not (host api.wxbug.net)`
- Drop all port 53 traffic, both TCP & UDP:
  `not (port 53)`
- Drop only UDP port 53 traffic:
  `not (udp port 53)`
- Drop all IP protocol 50 (IPSEC) traffic:
  `not (ip proto 50)`
- Drop all traffic on TCP ports 133 through 135.
  `not (tcp portrange 133-135)`

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  `not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  `not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`

Caution: The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness software.

Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `alias.ip` becomes `host` if a single host or `net` if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used: http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters: http://biot.com/capstats/bpf.html

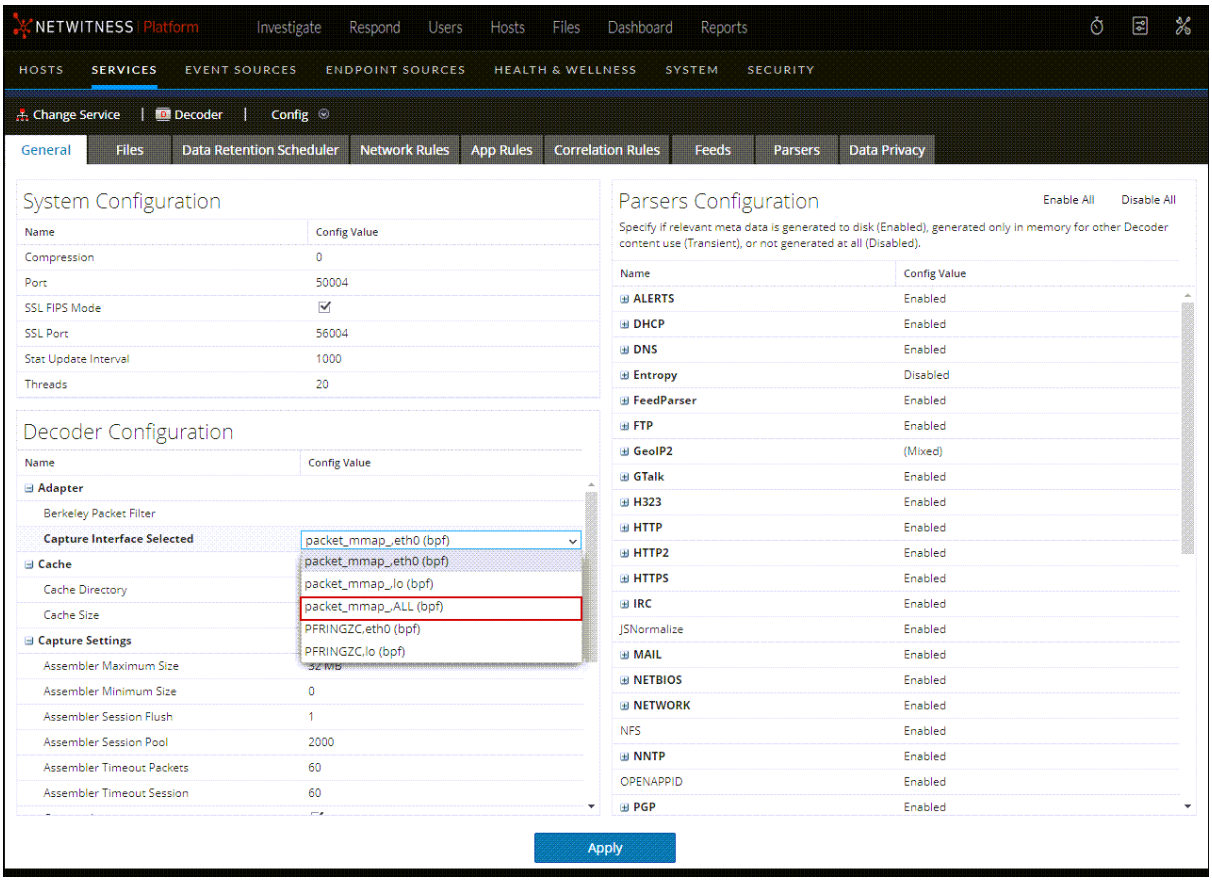
Caution: If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

(Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

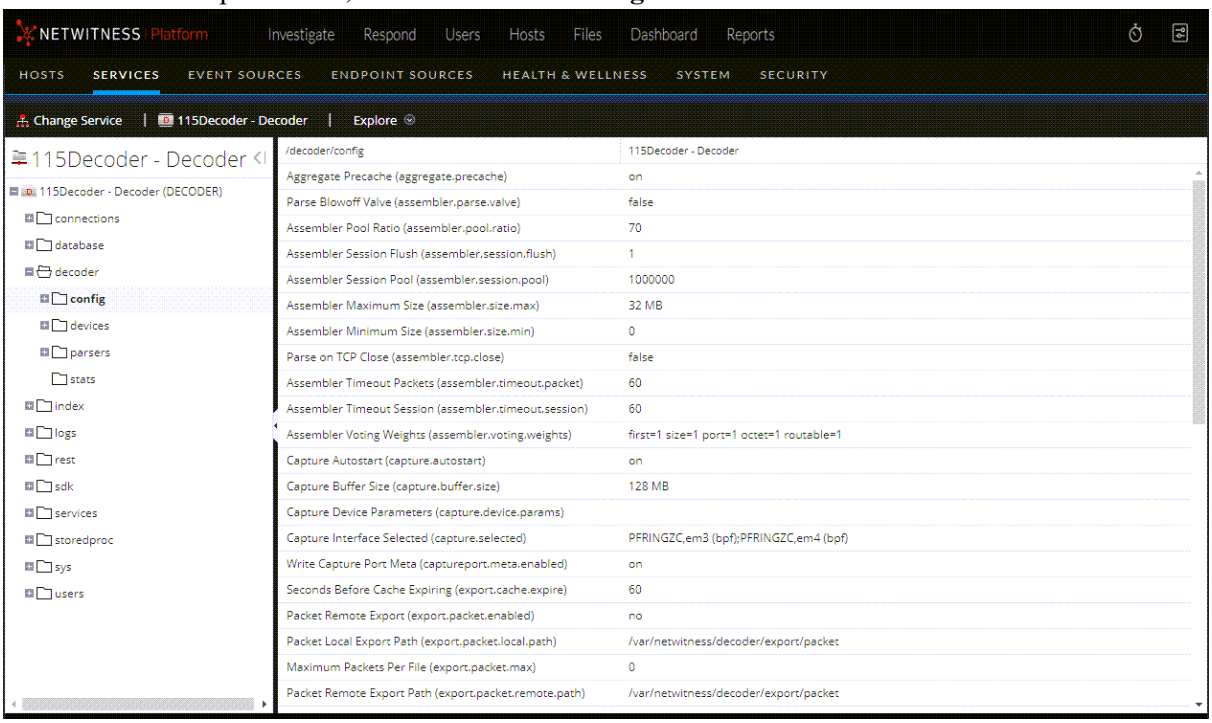
You can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.



For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

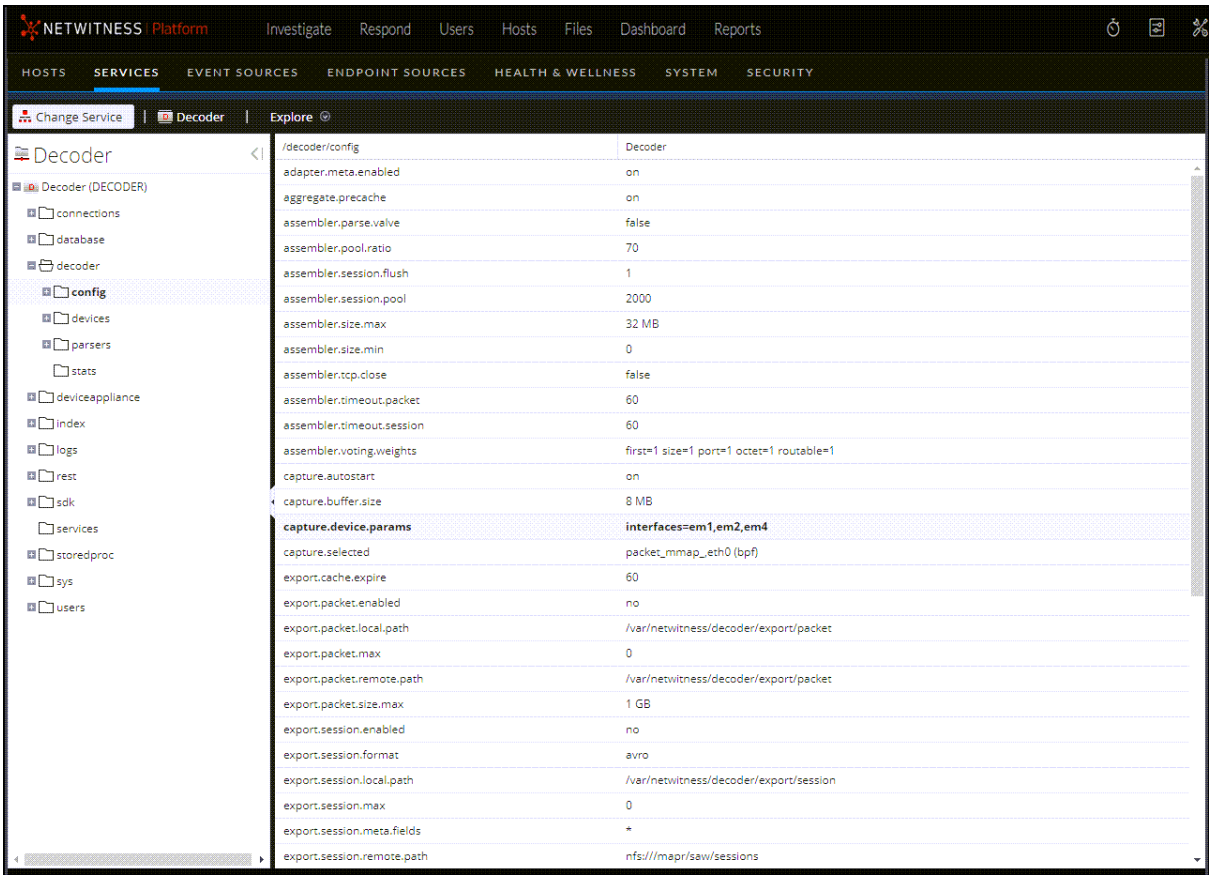
Note: Decoder automatically performs decapsulation of Virtual Extensible LAN (VXLAN) protocol from network traffic on UDP-4789 so that parsing can take place on the decapsulated Ethernet frames. During the decapsulation, the VXLAN ID is extracted and stored in the VXLAN meta key. By default, the VXLAN ID extraction is enabled. To disable, navigate to the `VlanGre` parser in the Parser Configuration settings. Click the drop-down list for `vlan` in the **Config Value** column and select **Disabled**. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

Note: Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.



To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. Go to (Admin) > **Services**, select the Decoder service and > **View > Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.



3. Click **Apply**, and then restart the Decoder service.

4. Go to (Admin) > **Services**, select the Decoder service, and click > **Config** > **Explore**.
5. In the Services Explore view, select **decoder** > **config**.

6. Click in the values column next to `capture.device.params`, type **`interfaces=em1,em2,em4`**, and press **Enter**.

The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

(Optional) Configure Meta-Only Decoders

You can configure Decoders so that packets and logs can be processed, and then dropped before they are written to disk. This is called a Meta-Only Decoder, which uses the Meta-Only license, and can save storage space (however, analysts cannot reconstruct events in Investigate if you use this option). The configuration option `/decoder/config/packet.write.disabled` controls this feature. If this option is set to `true`, all packets are dropped after parsing, so they are never written to the database. This applies to both Log and Network Decoders. The ingested logs and packets flow through the system normally so that parsing and other operations are not impacted. The default setting is `false`, which preserves the normal behavior of writing packets to disk.

Note: You must purchase the Meta-Only license before you can realize the full benefit of using this option. For information about purchasing licenses, see the *Licensing Management Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

To configure a Meta-Only Decoder where packets and logs are parsed and not written to disk:

1. Go to  (Admin) > **Services** and select a Decoder.
2. Click  > **View** > **Explore**, and in the left panel, expand **decoder** and click **config**.
3. In the right pane, go to `packet.write.disabled`, and change the value from `false` to `true`.

Note: You can make this configuration update while capture is running, but the update does not take affect until capture is restarted.

For an example of how to use the Meta-Only license to apply centrally-managed capture policies across your Network Decoders, see (Optional) Configure Selective Network Data Collection

(Optional) Configure Selective Network Data Collection

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. Administrators can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.

Note: Administrators can use this feature to create policies for metadata-only while using the cost-effective Meta-Only license, without having to pay for additional storage or throughput licensing. To use this license, work with your NetWitness Customer Support Representative to purchase the license, and then enable the functionality as described in (Optional) Configure Meta-Only Decoders.

The administrator can choose to deploy predefined policies that capture:

- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols are available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally-managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

Here are some example use cases and how an administrator would deploy these.

Use Case 1: Predefined Policy for Internal Assets

To gain further visibility into internal lateral traffic going East-West through the environment, a Network Decoder is deployed in the interior of the network to capture this traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, the predefined "Capture Meta Only – All Protocols" policy can be applied to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required of the solution. In this situation, the only steps you must complete is to choose the predefined policy, edit it, and then enable it by assigning it to the appropriate internal services (Decoders). For an example of how to set up this policy, see Use Predefined Policies.

Use Case 2: Custom Policy for DMZ Assets

To protect the public-facing web servers, a Network Decoder is deployed into the demilitarized zone (DMZ). The network communications between these web servers and other network devices are a subset of the base protocols. To make sure you can harvest forensic evidence for any communications related to these high-value assets, you would want to do full packet capture on HTTP, SMTP, FTP, and DNS protocols. You still want visibility into any other traffic these servers are engaged in, so you would prefer metadata generated for all other protocols. The suggested steps to create this custom policy would have you choose the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols" and then clone it to adjust it to the protocols aligned with the DMZ scenario. During the clone process, the name and description can be updated to identify the new purpose of the policy. The define policy step allows all the base protocol rules inside the policy except HTTP, SMTP, FTP, and DNS to be altered from "Collect All" to "Collect Meta Only" to achieve the desired policy. The last steps are assigning the policy to the appropriate DMZ services (Decoders). For an example of how to set up this policy, see Create New Policies from Predefined Ones.

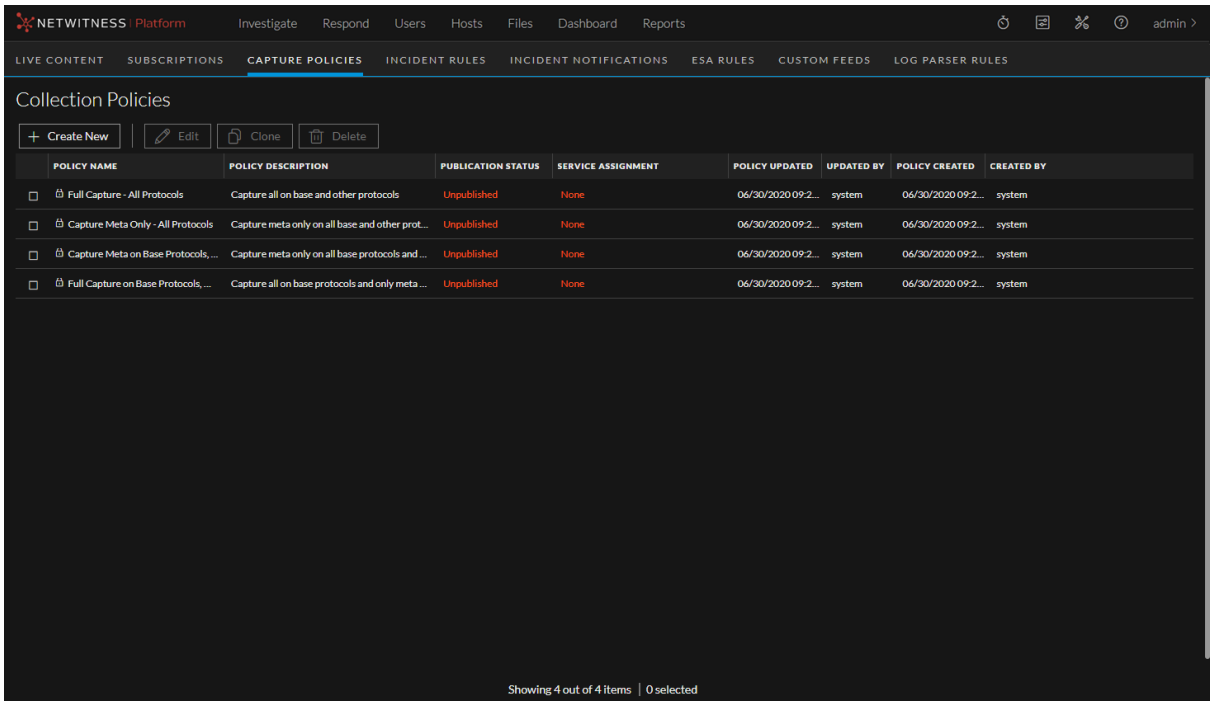
Note: When a Decoder is being managed by a selective collection policy, it is possible that the Decoder specifications in the policy could be overwritten if the Decoder configuration is edited outside of the policy. To try and avoid this situation, the following warning message is displayed at the top of the Parsers section of the Decoder Configuration page: `This Decoder is being managed by the following capture policy: <policy-name>. Some parsers are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`
Another warning message is displayed at the top of the Application Rule section: `This Decoder is being managed by the following capture policy: <policy-name>. Some application rules are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`

The following sections describe configuring and using selective network data collection.

- Use Predefined Policies
- Create New Policies from Predefined Ones
- Create Custom Policies
- Unpublish Policies
- Delete Policies
- Supported Protocols for Selective Network Data Collection

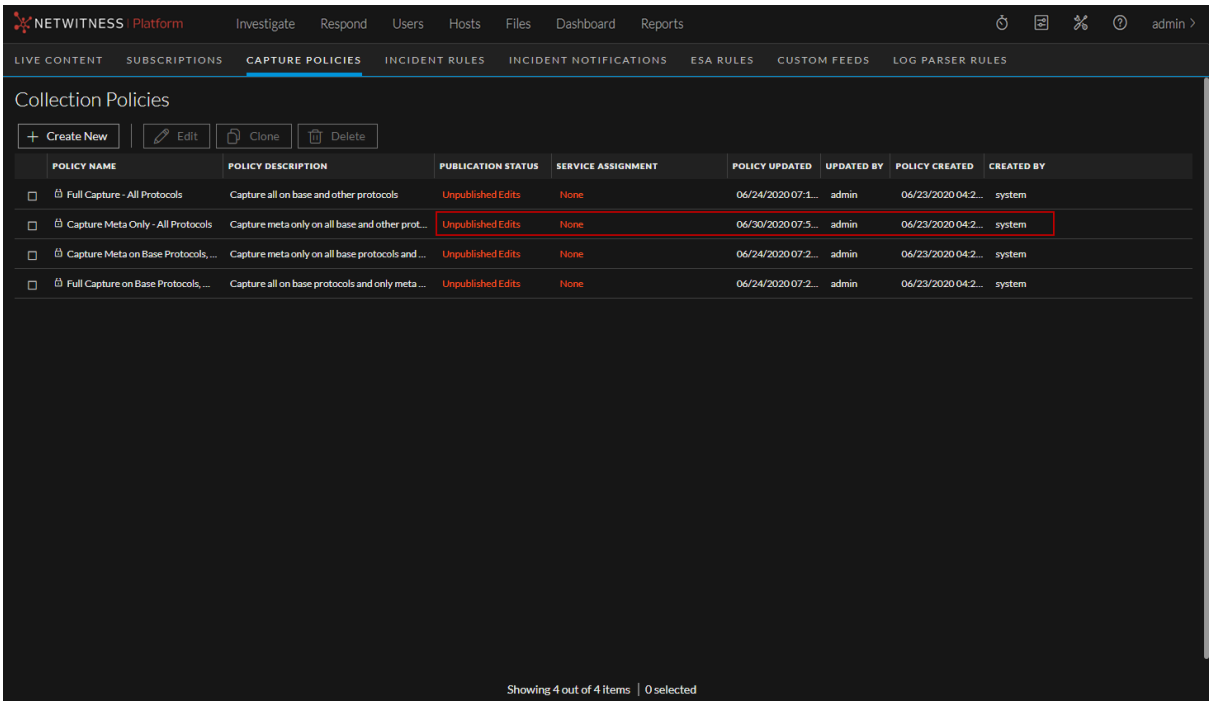
For detailed information about the Selective Collection user interface, see:

- Services Config View - Capture Policies Tab
- Services Config View - Edit Capture Policies Wizard



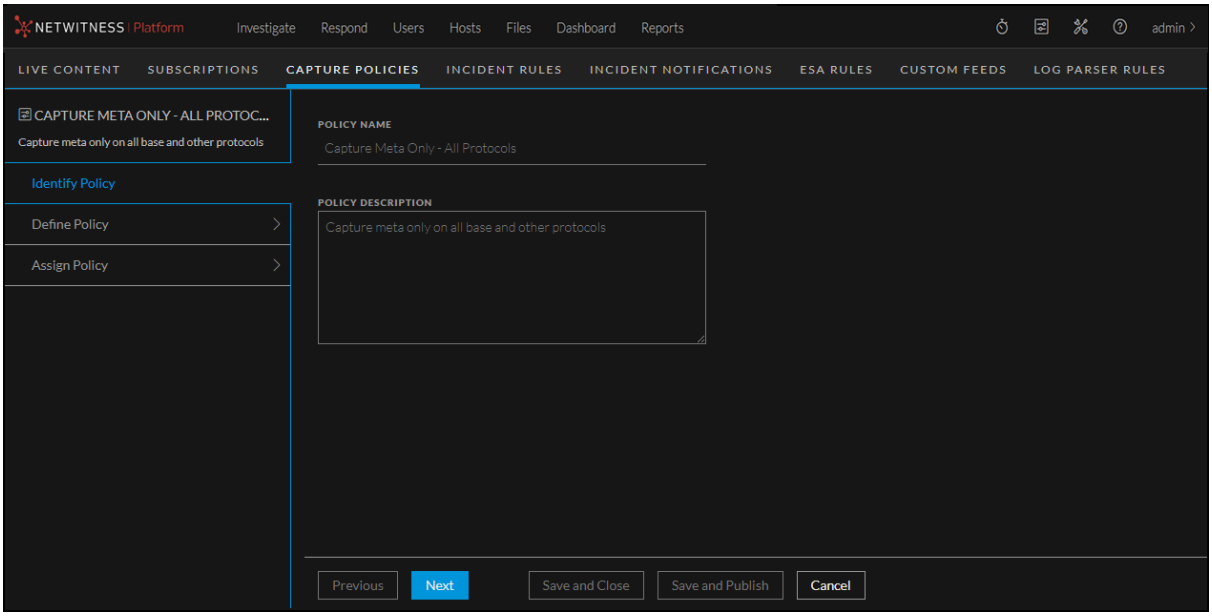
Use Predefined Policies

This procedure describes how to use the predefined policies. You can use this procedure to configure a policy for internal assets. For example, as described in Use Case 1: Predefined Policy for Internal Assets , to gain further visibility into internal lateral traffic going East-West through the environment, you could deploy a Network Decoder in the interior of your network to capture the traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, use the predefined "Capture Meta Only – All Protocols" policy to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required for this solution.

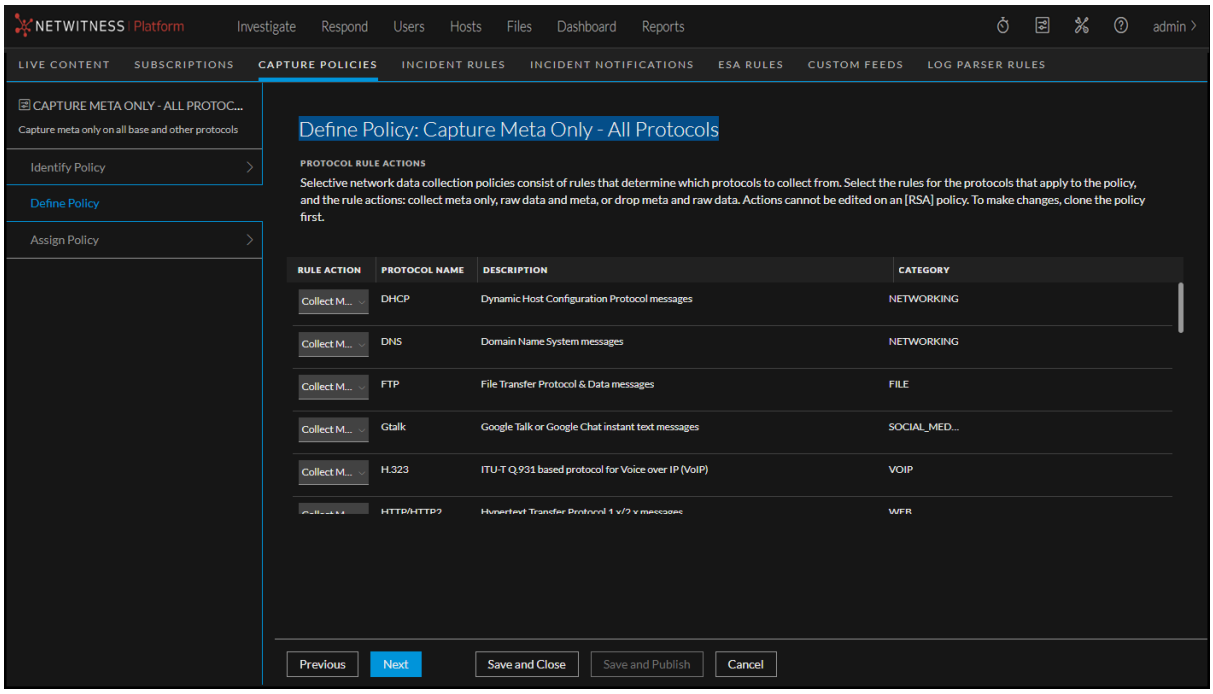


In this situation, the only steps you must complete is to select the "Capture Meta Only – All Protocols" predefined policy to edit it, enable it by assigning it to the appropriate Decoders, and then publish the policy to start collecting the data.

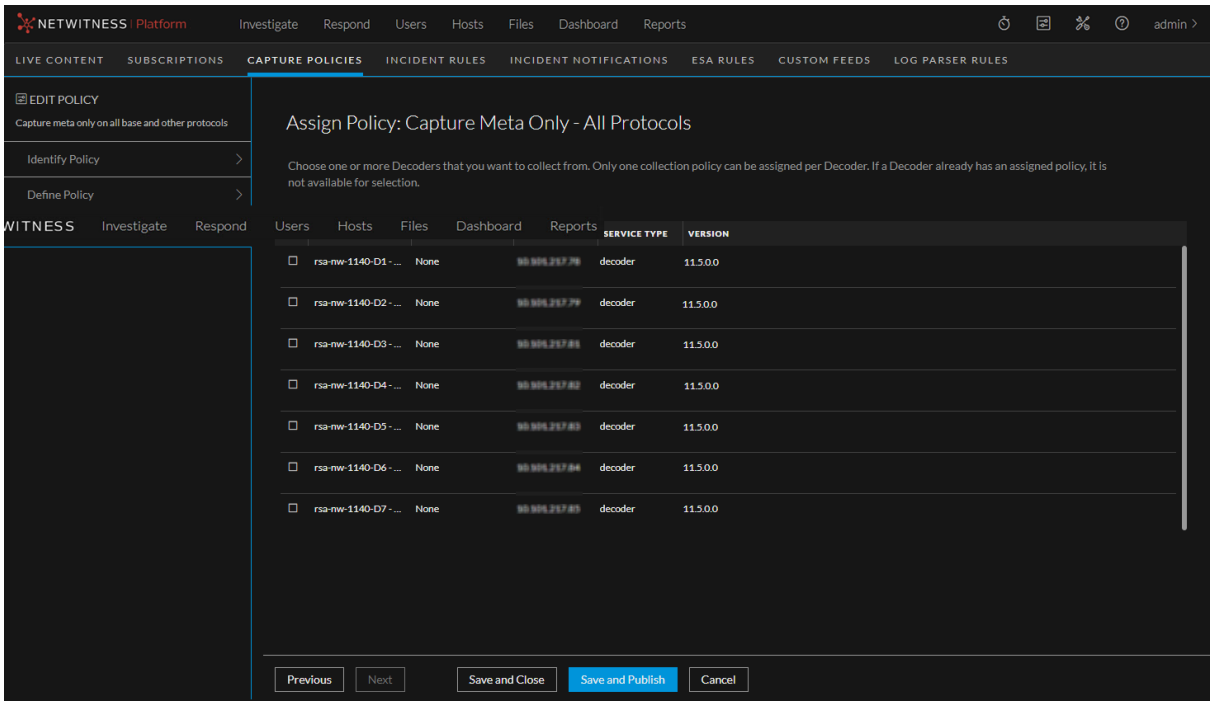
To work with a predefined policy:



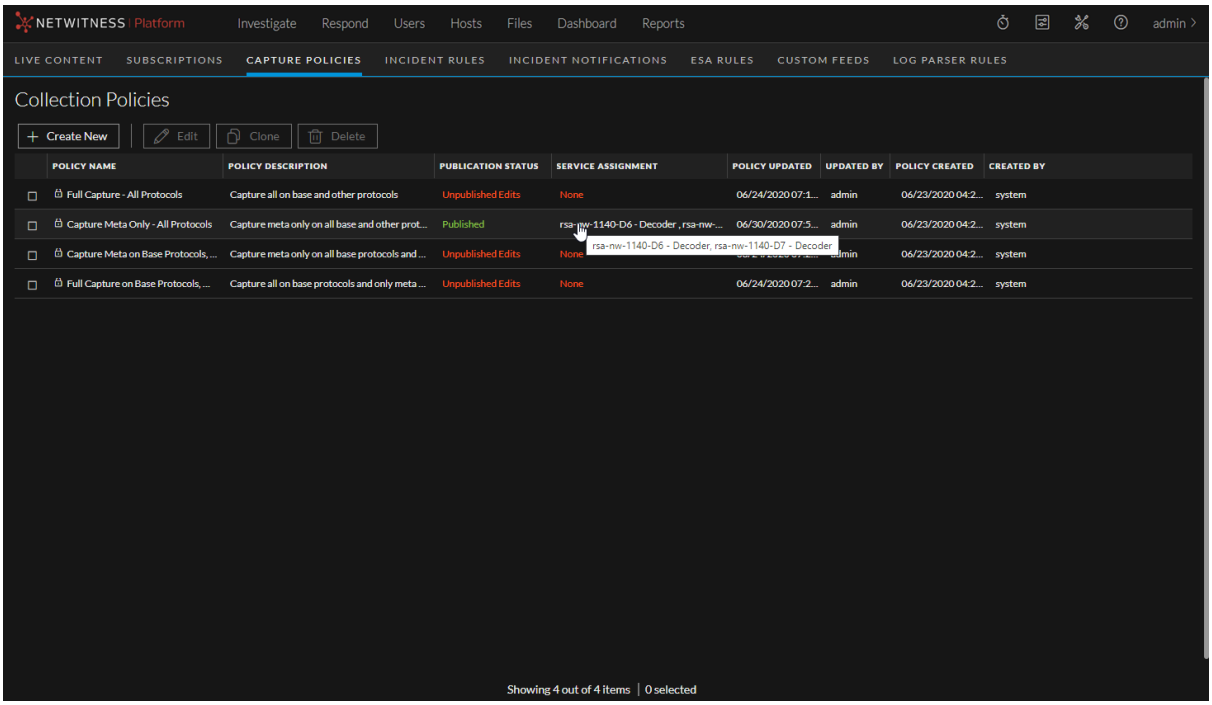
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



Notice that the PUBLICATION STATUS column lists each of the predefined policies with the status of **Unpublished**. The only way to edit a predefined policy is to assign Decoders to apply the policy. If changes are made to the Decoder assignments but are not published, the status changes to **Unpublished Edits**, the date the change was made is displayed in the POLICY UPDATED column, and the user name of the person who made the change is displayed in the UPDATED BY column. In predefined policies, the CREATED BY field is always **system**.
The following figure shows the statuses of the policies.



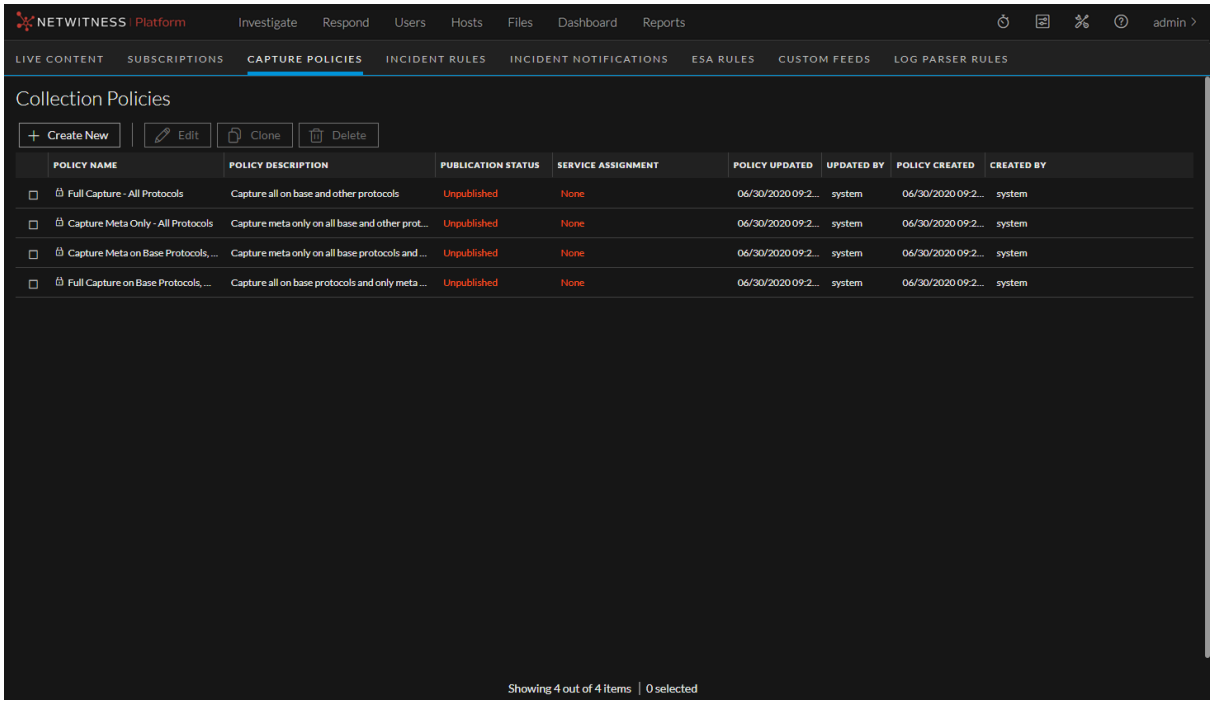
2. Select **Capture Meta Only - All Protocols**, and then click **Edit**.
The editing view is displayed with the **Identify Policy** option active.



3. Because this is a predefined policy, you cannot change the policy name or description. Click **Next**.
The Define Policy: Capture Meta Only - All Protocols page is displayed.

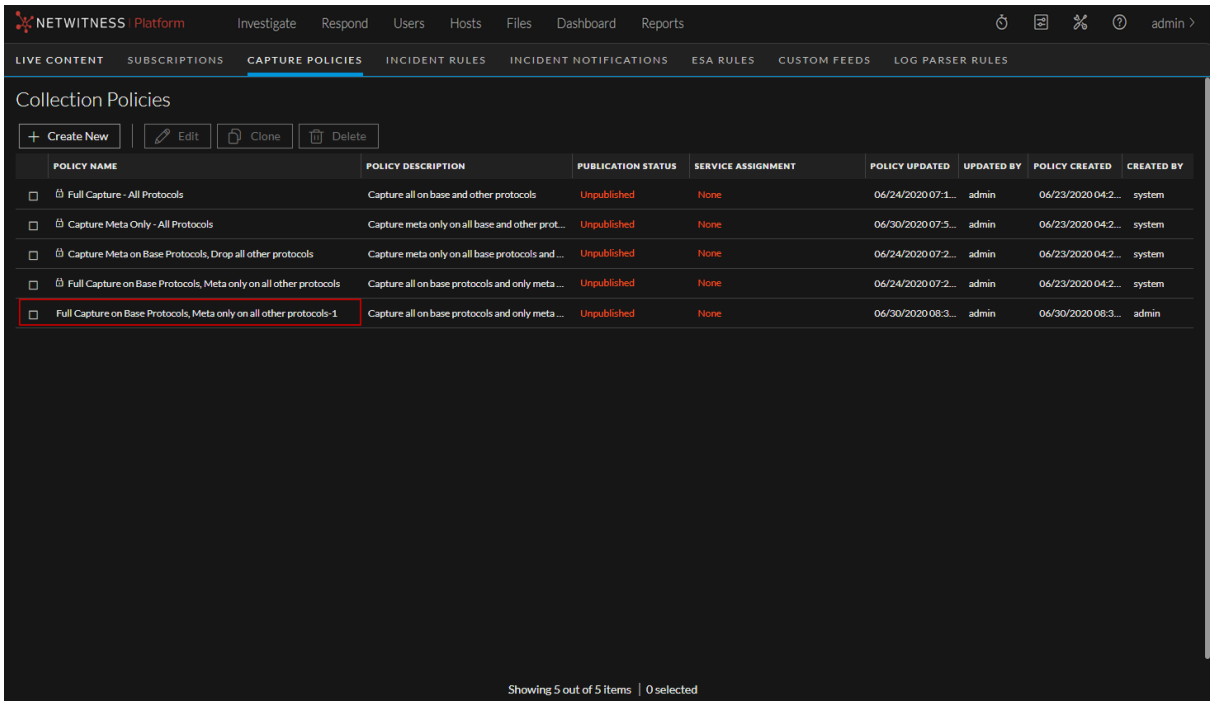
4. Because this is a predefined policy, you cannot edit this page. Review the rules on this page to understand the actions that will be enabled when you publish this policy. Click **Next**.
   The Assign Policy page is displayed.

5. Select the Decoders that you want to collect from, and then click **Save and Publish**.
   The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available. When the status moves to **Published**, all the services are displayed in the Service Assignment column. You can hover over the names of the Decoders to see their full names, as shown in the following figure.



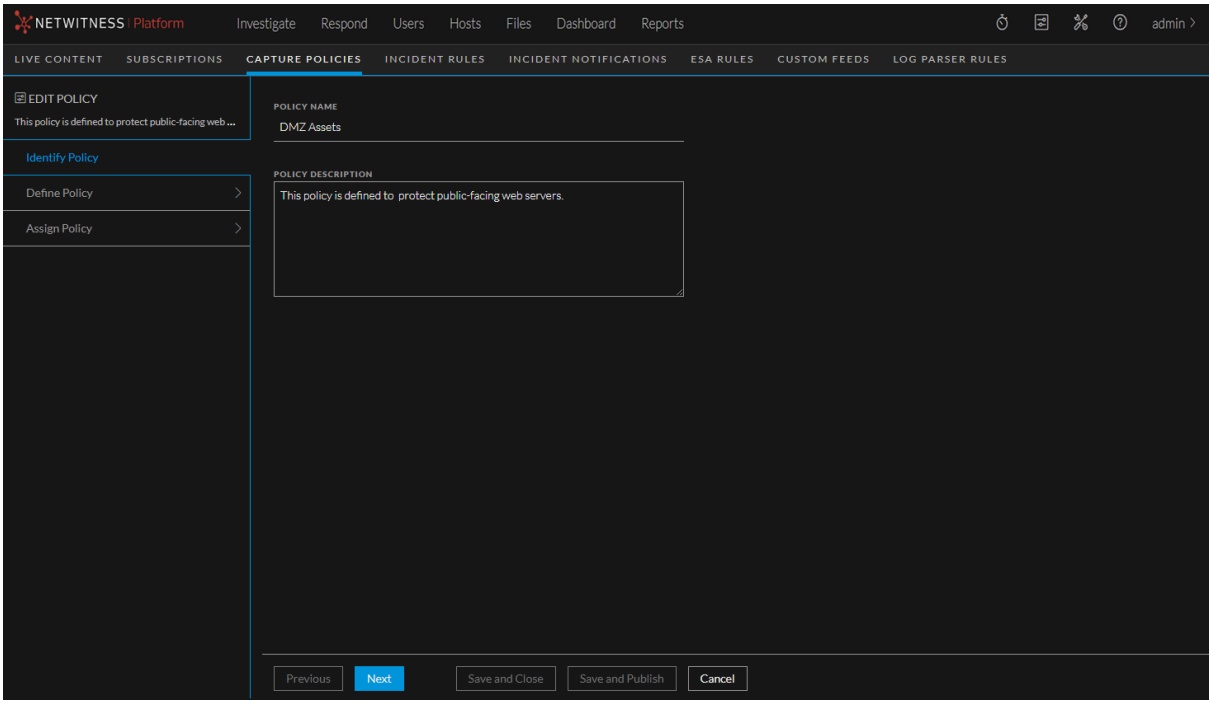
Create New Policies from Predefined Ones

This procedure describes the steps for creating a new policy from a predefined one, and provides an example of how you might use this policy.



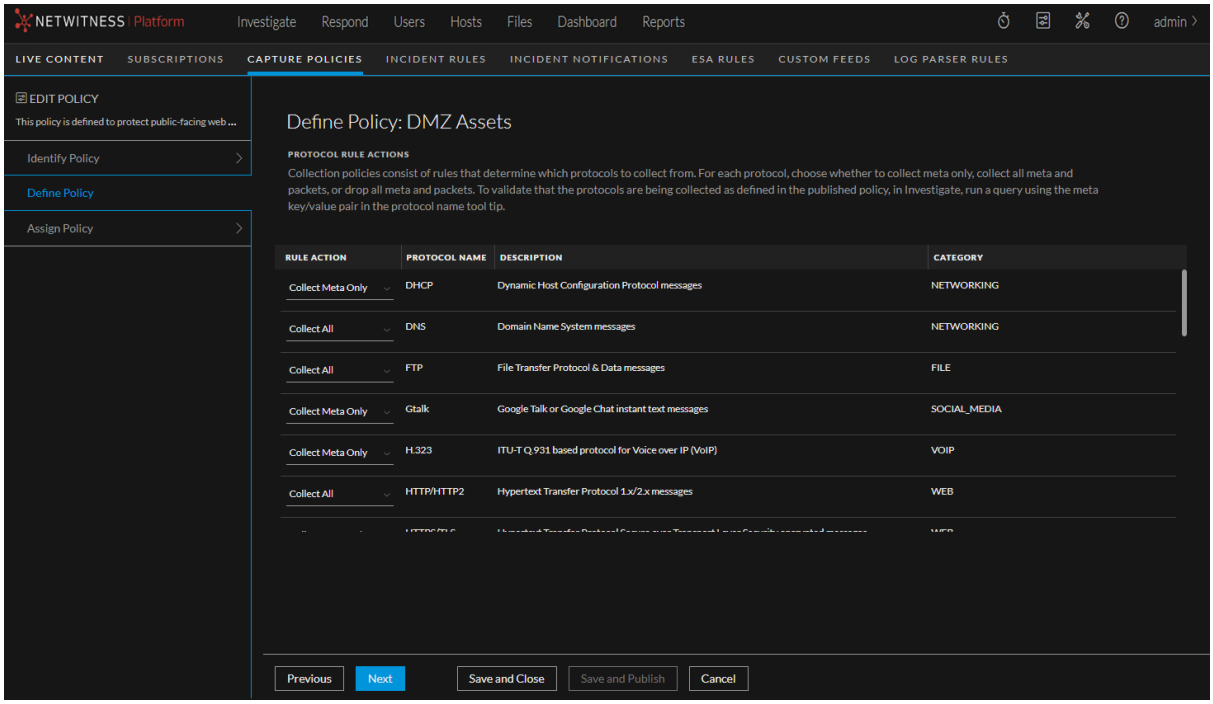
For example, as described in Use Case 2: Custom Policy for DMZ Assets , suppose a Network Decoder has been deployed into the demilitarized zone (DMZ) to protect public-facing web servers. The network communications between these web servers and other network devices are a subset of the base protocols. To make sure they can harvest forensic evidence for any communications related to these high value assets, you would want to get full packet capture on HTTP, SMTP, FTP, and DNS protocols. To provide visibility into any other traffic these servers are engaged in, you would want to generate metadata for all other protocols.

To configure a policy that would achieve the results described here, you would select the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols," clone it, and then edit it to align the protocols with the DMZ scenario. During the clone process, you can update the name and description to identify the new purpose of the policy. In the step where you define the policy, you can change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from "Collect All" to "Collect Meta Only" to achieve the desired results. The last steps assign the policy to the appropriate DMZ Decoders.

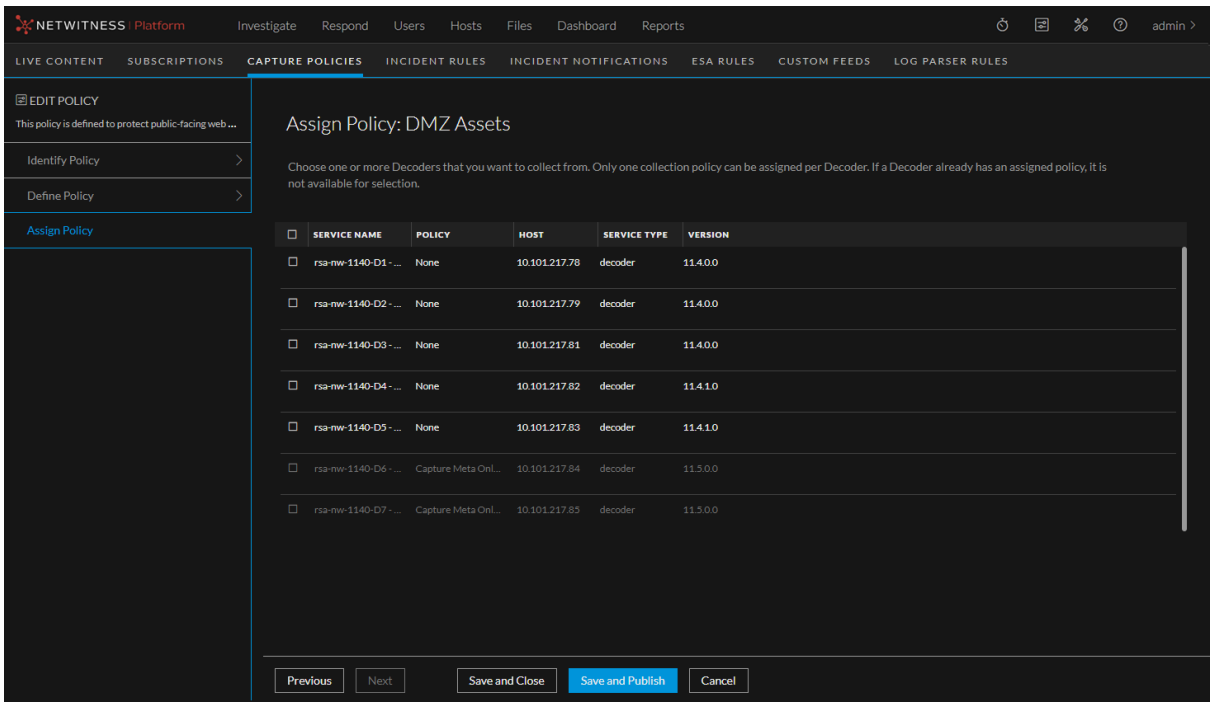


1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

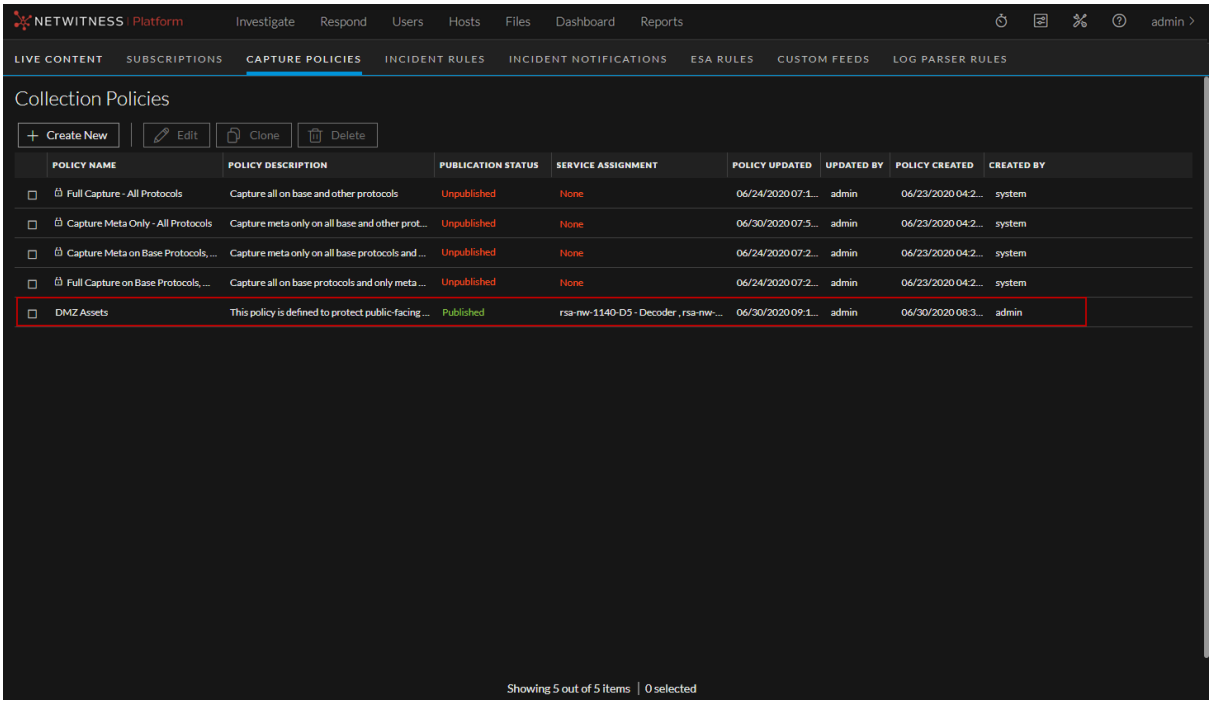
2. Select **Full Capture on Base Protocols, Meta only on all other protocols** and then click **Clone**. The Collection Policies view is displayed with the cloned policy at the bottom of the list, identified by appending -1 to the policy name.



3. Select the cloned policy and click **Edit**.
   The editing view is displayed with the **Identify Policy** option active.
   In this example, we are naming this policy "DMZ Assets" and providing the description "This policy is defined to protect public-facing web servers."

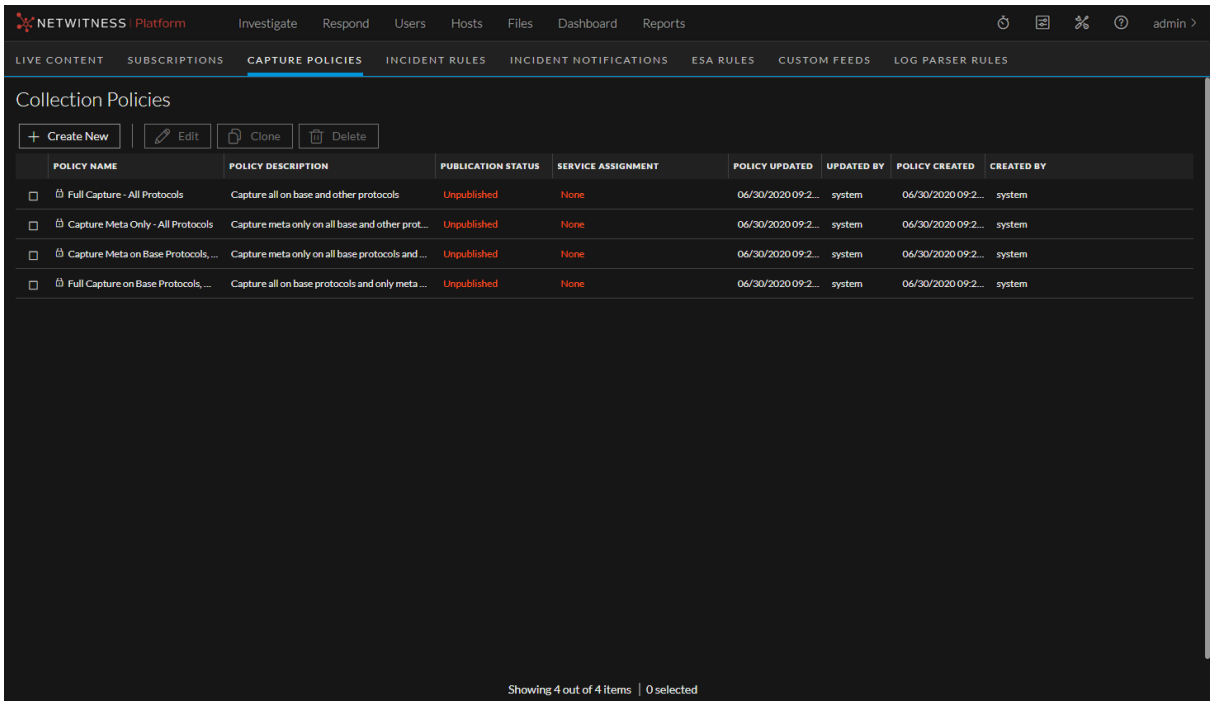


4. Click **Next**. The Define Policy view is displayed, with a list of rules you can use to define the policy. You can select the following options for rule actions:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

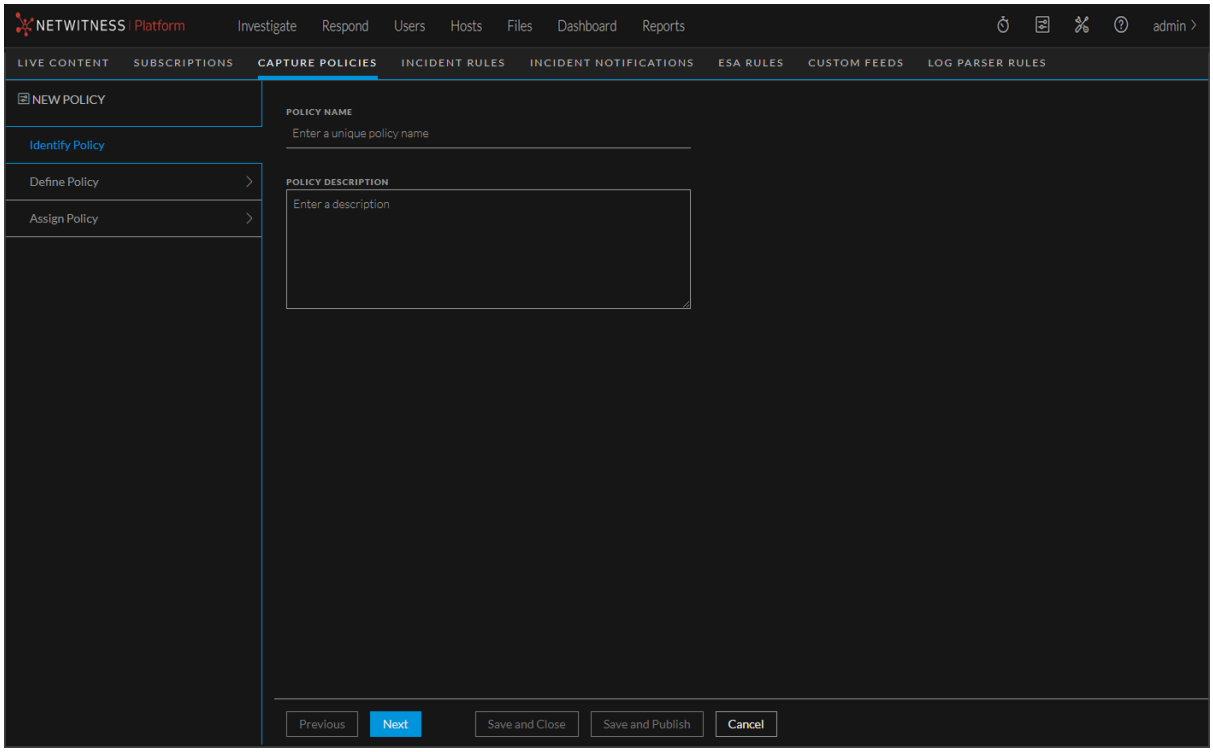


To collect the targeted data for the DMZ Assets policy, we are going to change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from **Collect All** to **Collect Meta Only**, as shown below.

5. Click **Next**.
   The Assign Policy page is displayed.

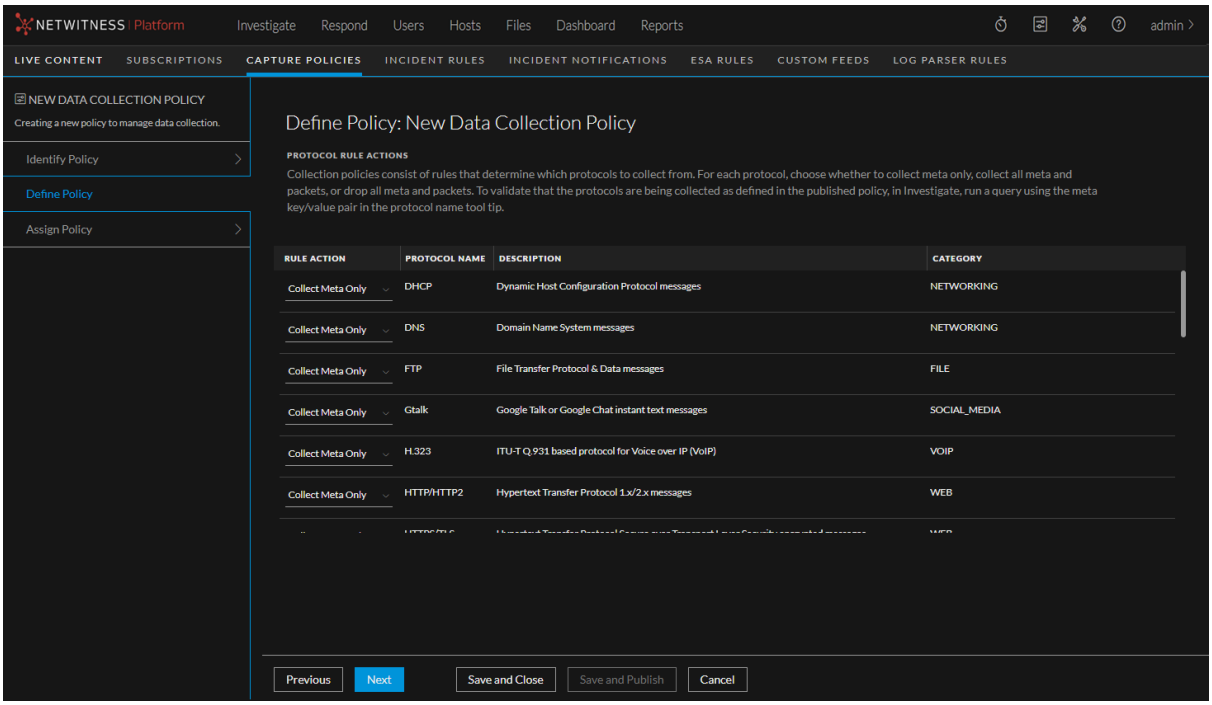


6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.
   Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



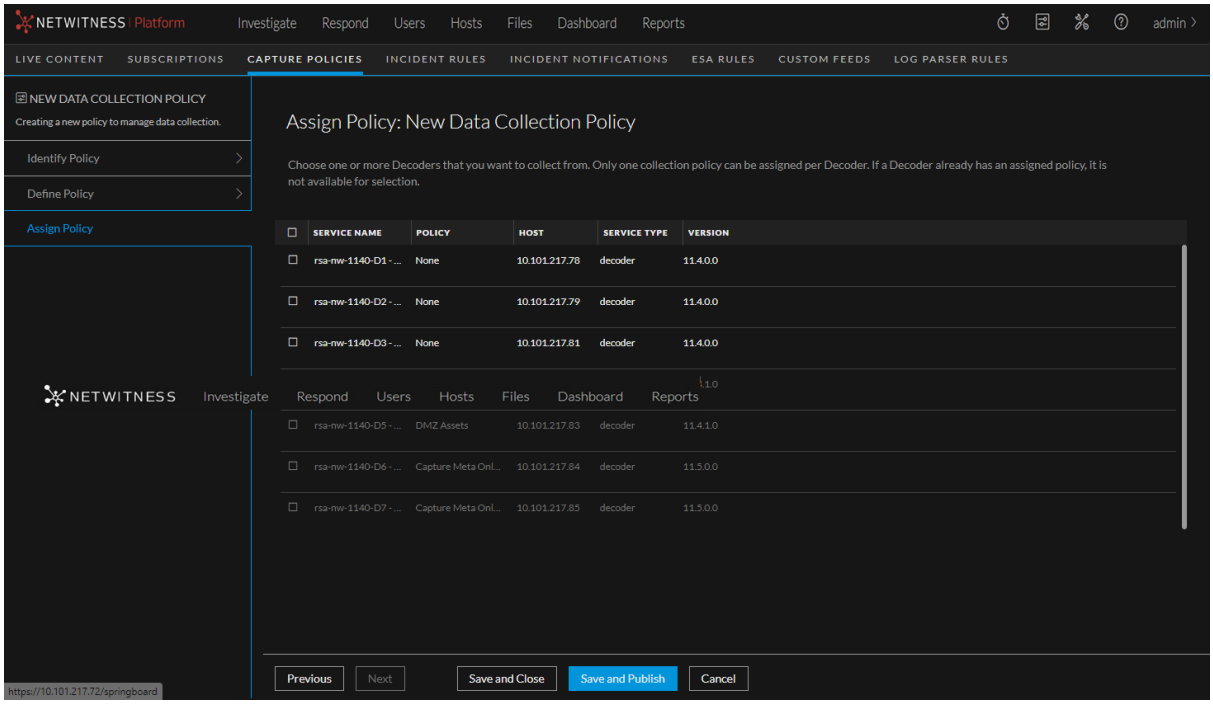
Create Custom Policies

You can create a custom Selective Network Decoder policy, where you can select specific protocols on which to collect data, as well as the rules that apply to them.

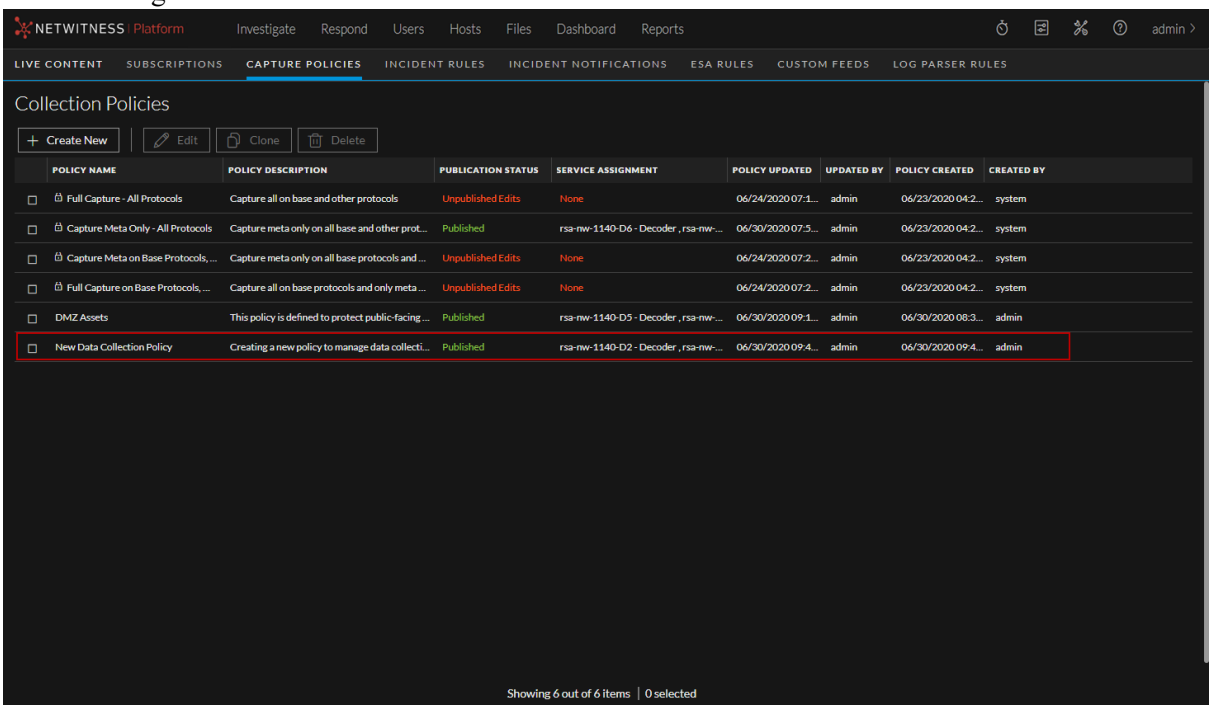


1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

2. Click **Create New**.
   The editing view is displayed with the **Identify Policy** option active.



3. Enter a name and description for your policy, and then click **Next**.
   The Define Policy view is displayed.

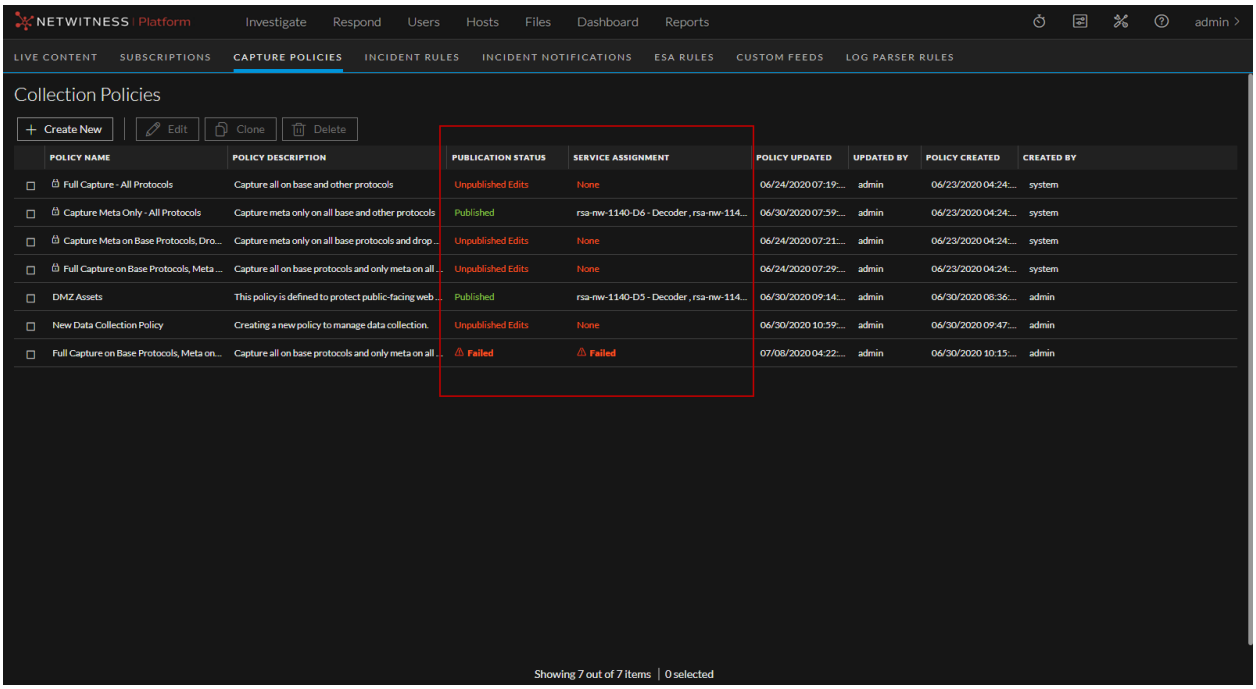


4. Define the actions for each of the protocols. The options for **RULE ACTION** are:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

5. Click **Next**.
   The Assign Policy view is displayed.

6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.

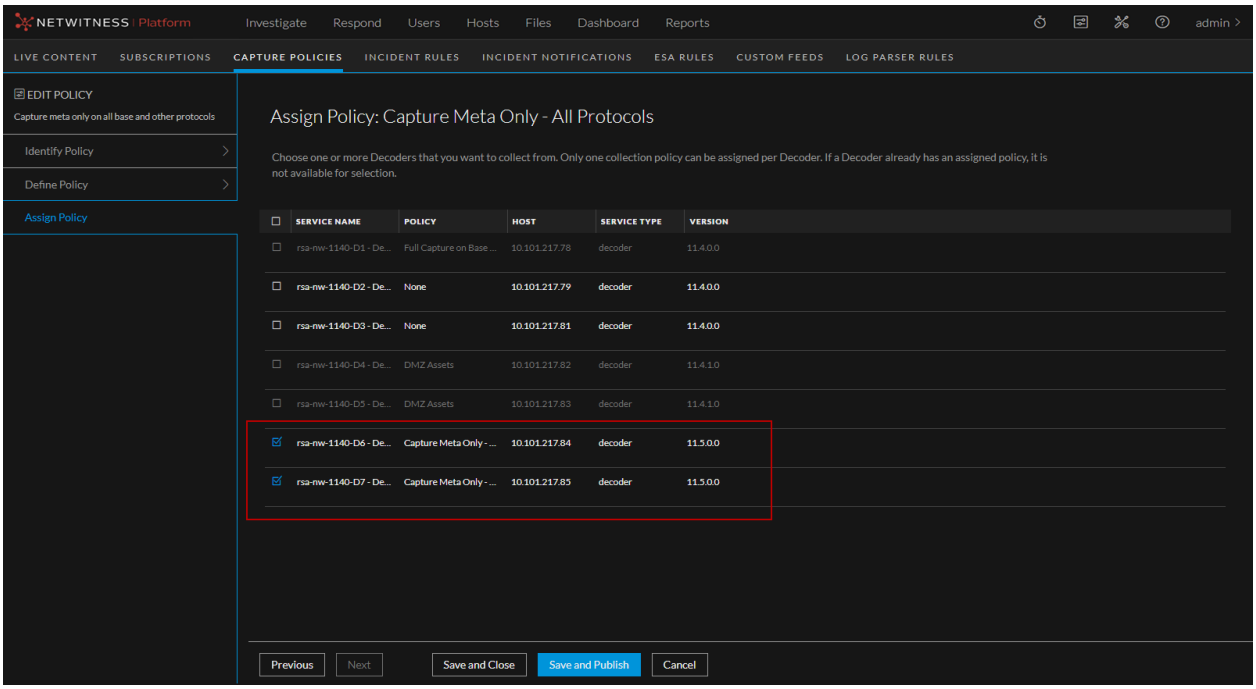
Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



Verify Published Policies

When a policy has been published, the policy is applied to the Decoders that were designated in the policy assignment step. The Decoders that are assigned to the policy start collecting the data defined in the policy. There are a few ways to validate the policy is functioning as expected.

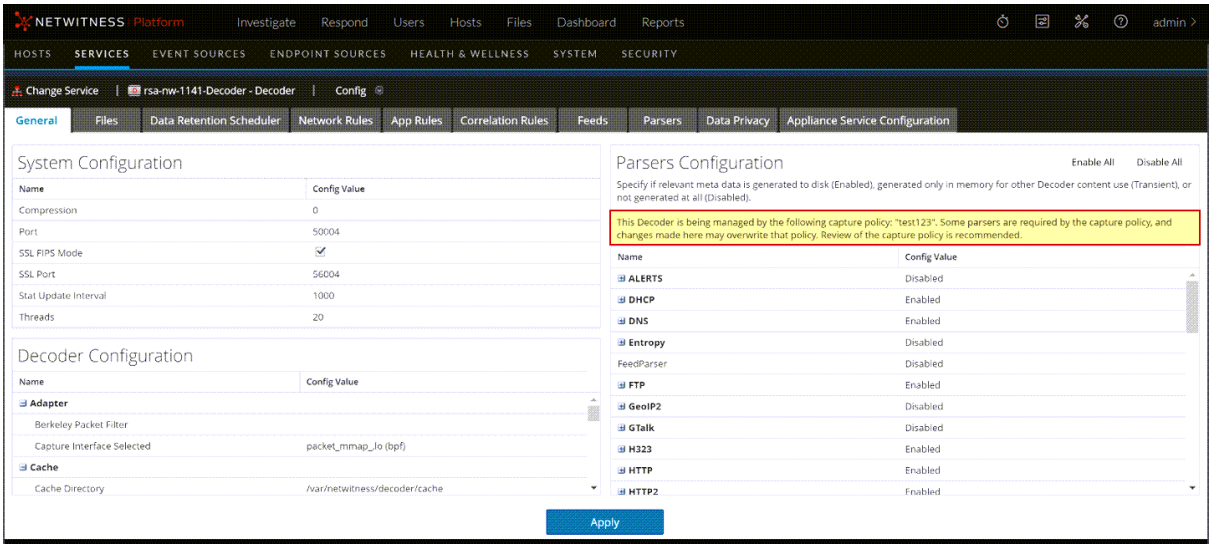
View Publication Status



Publication status is indicated in the Capture Polices view in the PUBLICATION STATUS column. You can also see which Decoders are assigned to the policy in the SERVICE ASSIGNMENT COLUMN.

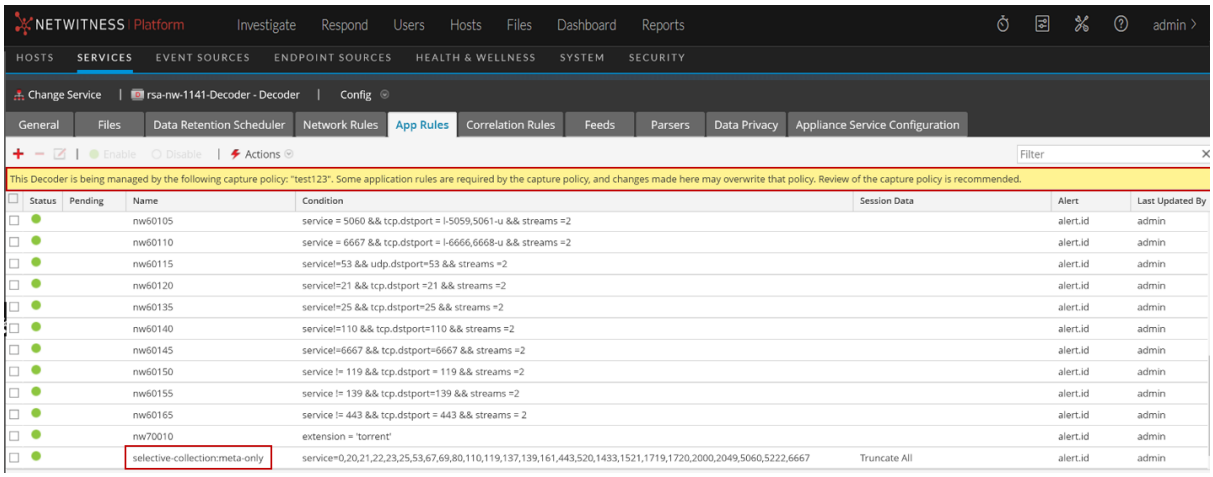
The publication statuses are:

- **Unpublished** - the rule actions of the policy have been defined and Decoders may have been assigned to the policy, but the policy has not been deployed to any Decoders.
- **Unpublished Edits** - policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders).
- **Published** - the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as Published, so even if not all of the Decoders are available (and the publication status is not Published), data will begin to be collected on the Decoders that are available.
- **Failed** - policies that failed to execute, for example, if a Decoder is offline or a system is down.



You can also select a published policy, and then click **Edit** to verify the Decoders that are assigned to the policy.

Verify Policies in Admin > Services

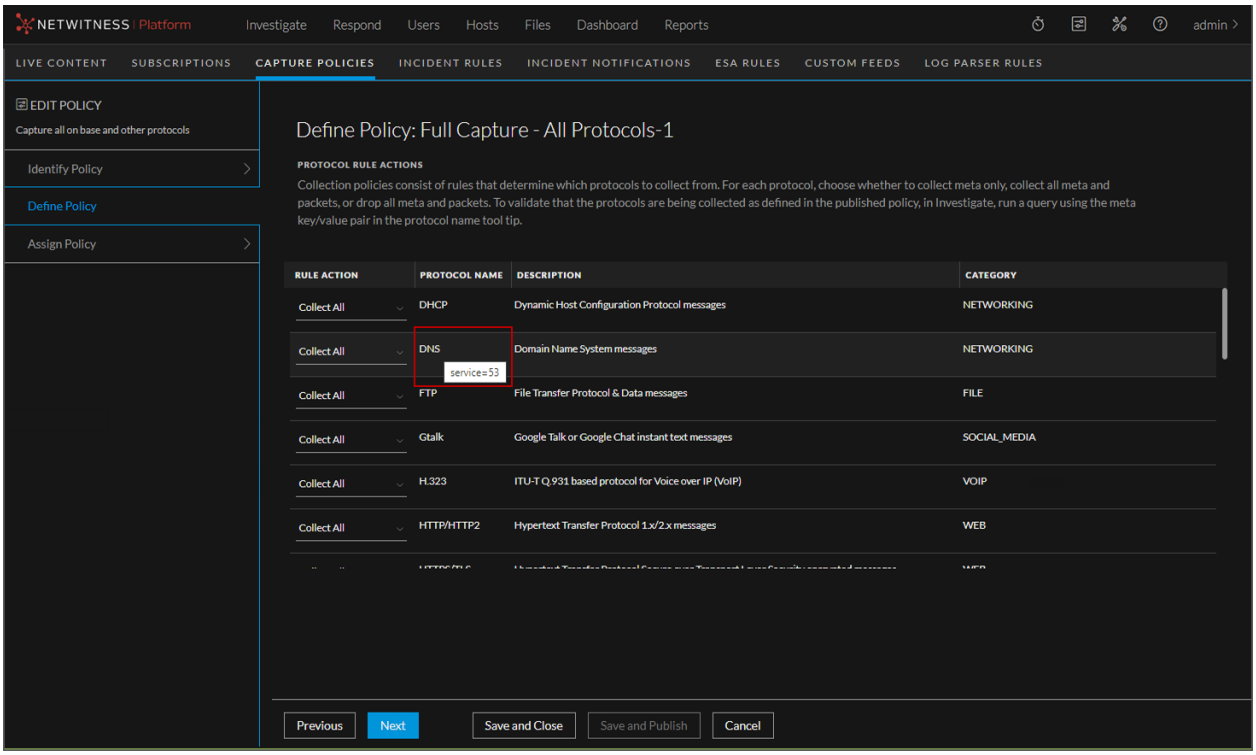


1. As an administrator, log in to the NetWitness user interface to view the Decoders that have been assigned to the policy.

2. Go to  (Admin) > **Services** > **<decoder name>** >  **(Actions)** > **View** > **Config**. On the General tab, in the right panel, there is a list of parsers that are installed on the Decoder by default. If a policy is administering this Decoder and requires any of those parsers to function, a message is displayed as shown below.

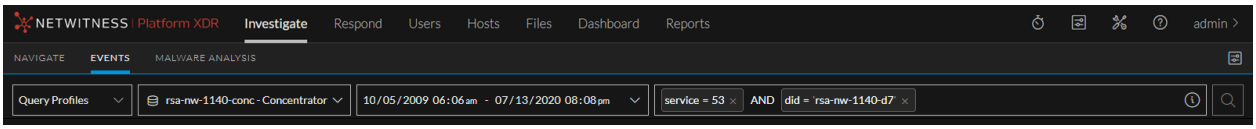
3. On the **App Rules** tab, a similar message indicates that some of the rules are required for the policy to function. You can search for "selective collection" to find the specific rules required, as the rule names contain that information.

> **Note:** In Investigate, you must have the **Alert** session option selected for the selective collection policy to be displayed.



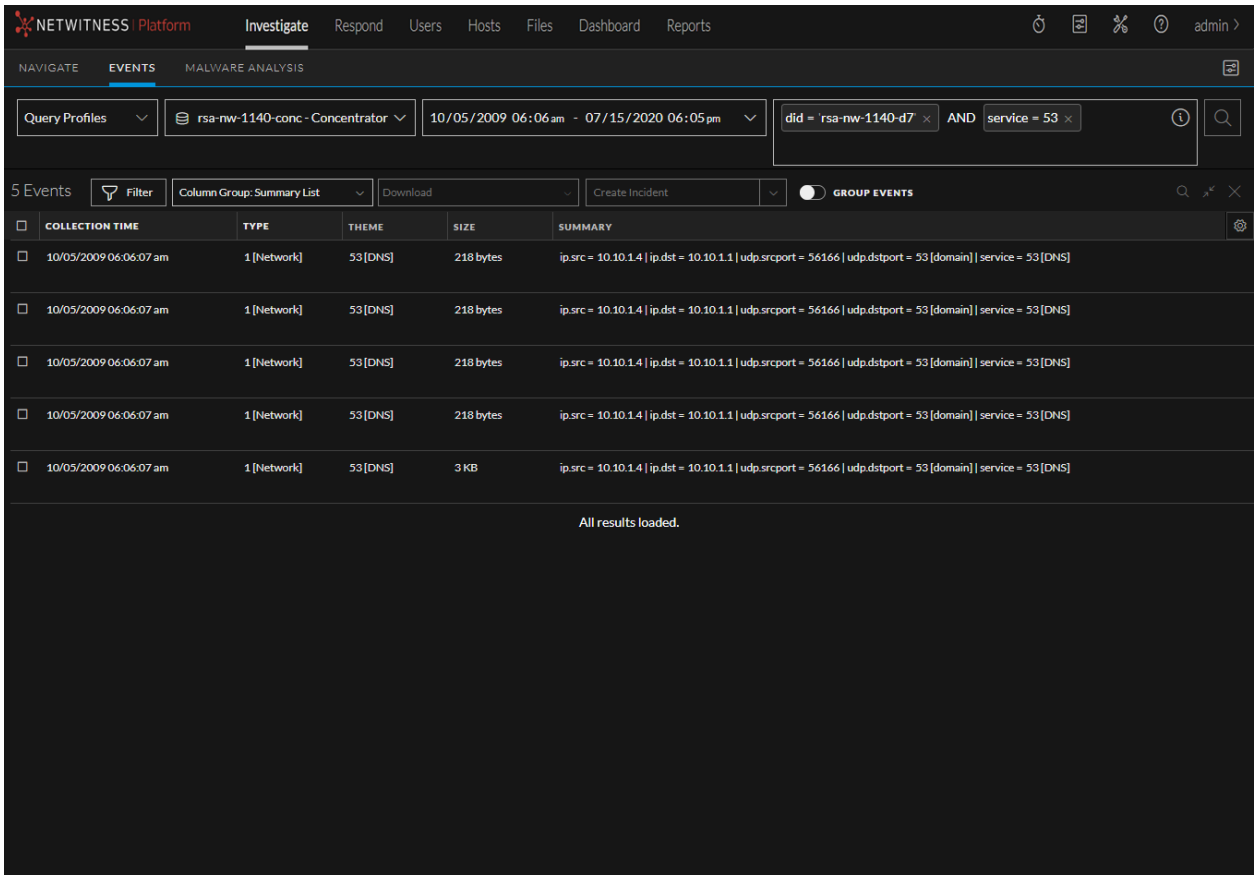
By default, the selective collection rules are added to the bottom of the rule set when the policy is applied. However, an administrator can directly affect the policy by altering the selective policy rules or by moving conflicting rules (rules with the same services) above the selective collection rules. In both cases, those changes take effect when they are saved locally on the individual Decoders, until the next time the policy is published from the central configuration page, when that policy will override changes made individually on the Decoders.

> **Note:** There currently is no feedback in the centralized configuration page denoting that the configuration related to the policy has been altered locally on the Decoders. To avoid this situation, manage all the policy rules from the centralized configuration page. If that is not possible, as additional application rules outside of collection policies may be required, follow standard security practices, including separation of duties, to limit people who need access to alter application rules and general parsers.

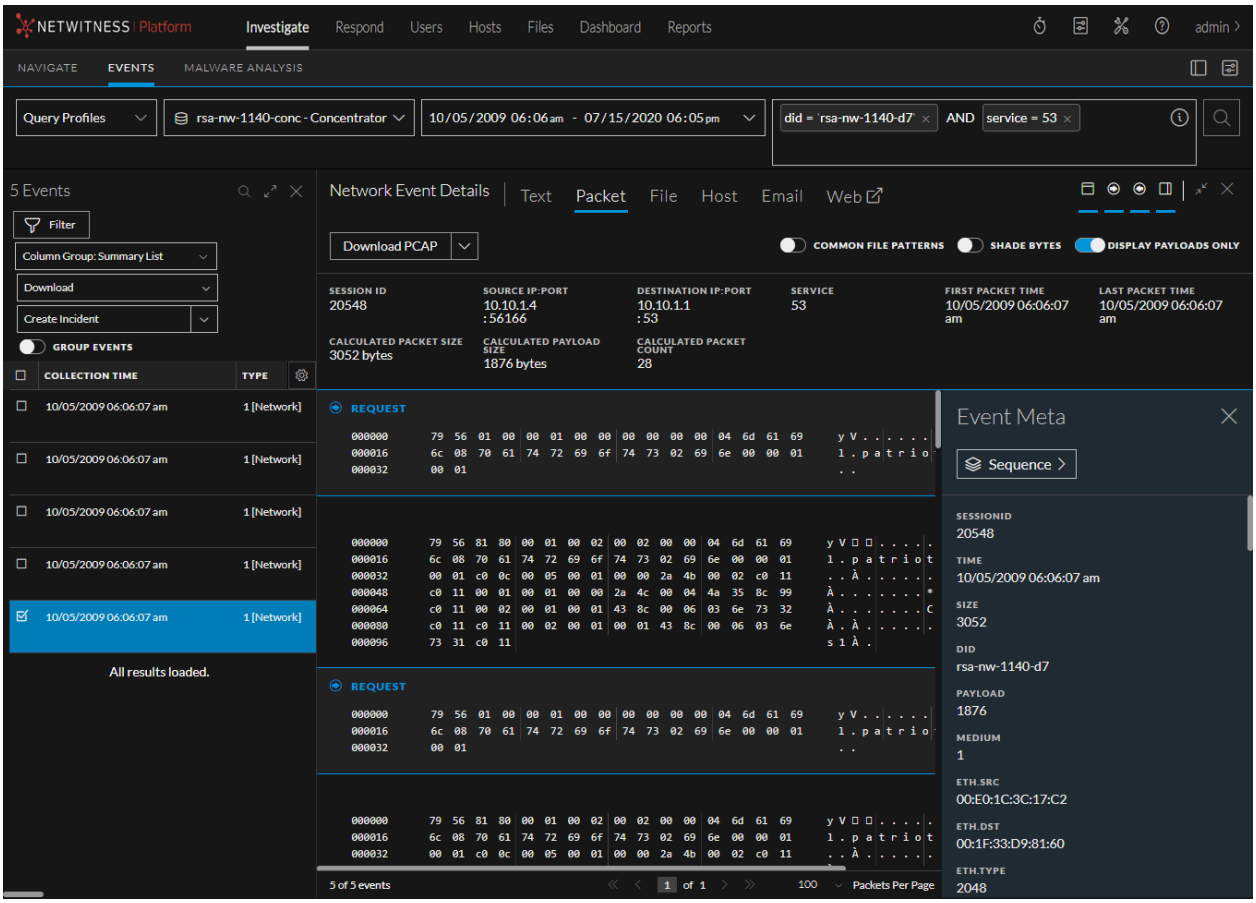


Verify Policies in the Investigate View

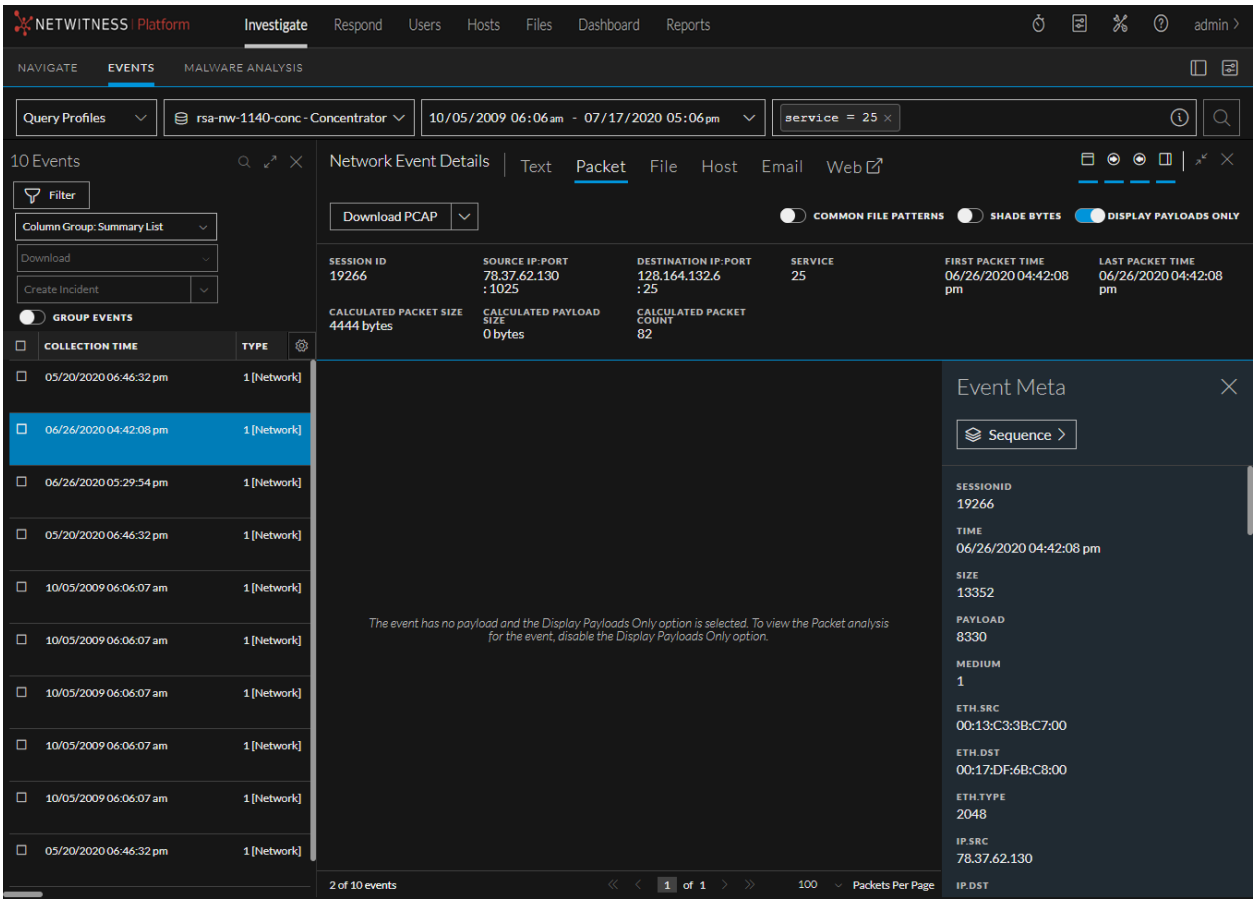
You can further verify that the policy is working as expected (the protocols are being collected as published) in the Investigate view. In the centralized configuration page for selective collection, the administrator can get a translation of what the query parameter would be for each individual protocol when viewing the rules inside the policy.



For example, in  (Configure) > **Capture Policies** > **<select a policy>** > **Edit** > **Define Policy**, if you hover over the DNS protocol name, `service=53` is displayed.

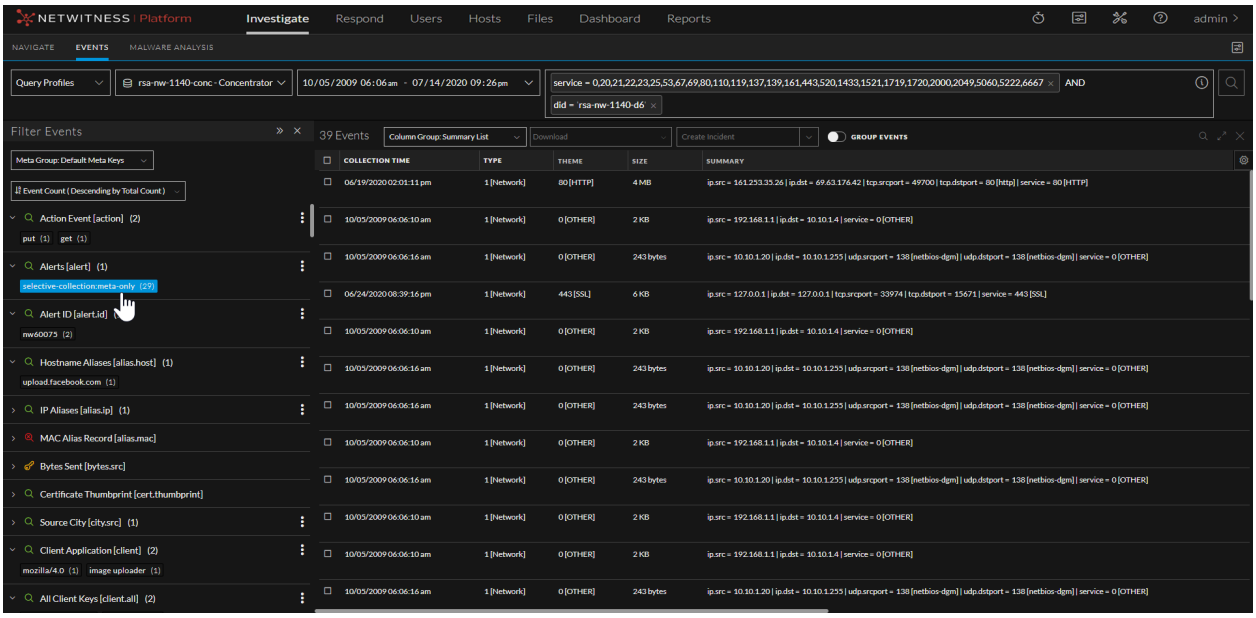


To determine if the appropriate action has been taken for DNS traffic, in **Investigate** > **Events** you can add the query parameter (for example, `service=53`) as a filter in the query bar and run the query against the Broker or Concentrator the Network Decoder is associated with for the time the policy has been active on the Network Decoder. To make sure you are only seeing the traffic from the Decoders that you want, you can add the Decoder Source, or `did` meta key as another filter in the query bar.



After running the query, if there are any related results, those events are displayed in the table (unless you applied an action to drop them).

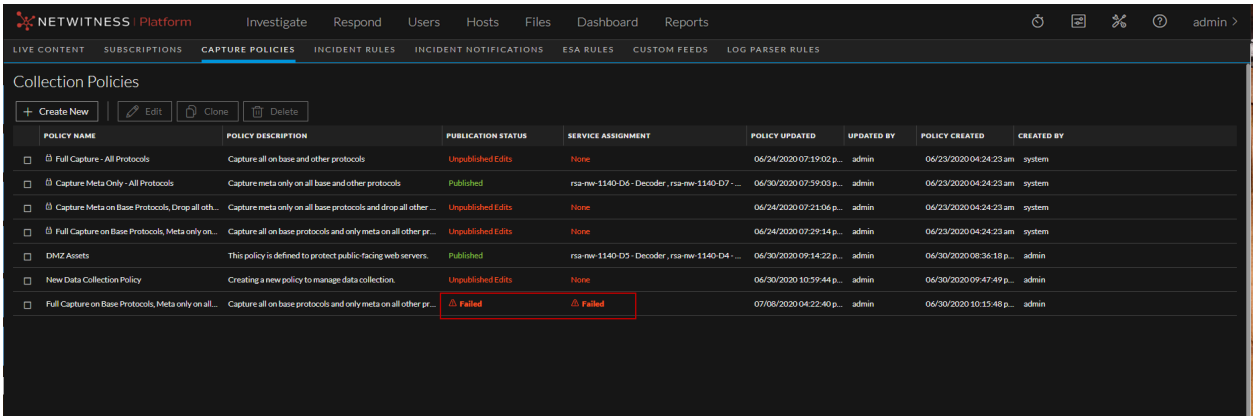
If you chose the action to `collect all` you can click on one of the events and review the metadata and the payload information for that packet session.



If you chose the action to `collect meta only`, you can click on one of the events and review the metadata, however, a message would be displayed instead of the packet payloads, as shown in the following figure.

To expedite this process, you can also take the application rules from one of the Network Decoders the policy is applied to and use it as the filter in the **Investigate** > **Events** query bar.

The following figure shows an entire `collect meta only` configuration by using the application rule shown here, created on the Decoder (in Verify Policies in Admin > Services):
`(service=0,20,21,22,23,25,53,67,69,80,110,119,137,139,161,443,520,1433,1521,1719,1720,2000,2049,5060,5222,6667) truncate`:



Note: If the findings do not align with what is expected from the policy, make sure that there are not other rules on the individual Decoders that might be conflicting with the selective collection policy rules. In addition, make sure when checking in Investigate that you are looking at only the traffic associated with the Decoders related to the policy.

Troubleshooting Policy Deployments That Fail

Policy deployment can fail for the following reasons:

- A Decoder service assigned to the policy is not running
- A Decoder host system is down when you try to deploy the policy

When a policy deployment fails, the Failed icon is displayed in the PUBLICATION STATUS and SERVICE ASSIGNMENT columns as shown in the following figure.

Use the following options to research publication failures:

Check the status of the Decoders

Check to see if the Decoder system is down, or if the Decoder service has stopped capturing data.

1. Select the policy, click **Edit**, and go to the Assign Policy page to determine which Decoders are assigned to the policy,
2. Go to  (Admin) > **Services**, select the Decoder, click  > **View** > **System** to investigate the status of the Decoder.

Review the content-server.log file

You can review the content in this file to troubleshoot errors. This file is located in the following directory on the NW Server host:

```
/var/log/netwitness/content-server/content-server.log
```

The following example shows a content-server log snippet that is displayed when publishing a policy fails:

```
2020-07-08 16:22:45,287 [ nioEventLoopGroup-2-2]
INFO     DataAccess|Finished publishing policy 'Full Capture on Base
Protocols, Meta only on all other protocols-1' outcome:FAILED
```

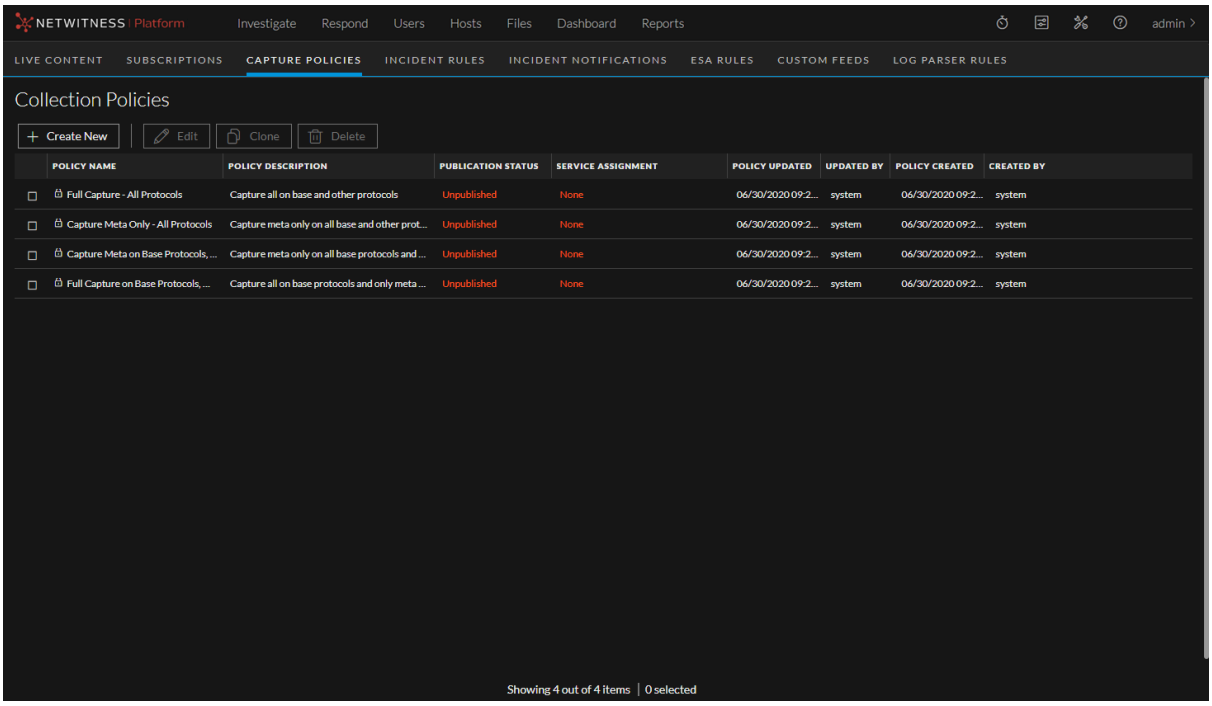
This is an example of a content server log snippet for successfully publishing a policy:

```
2020-06-23 17:40:50,373 [ nioEventLoopGroup-2-7]
INFO     DataAccess|Finished publishing policy 'Policy 1' outcome:SUCCESS
```

Review `/var/log/messages` on Decoder Systems

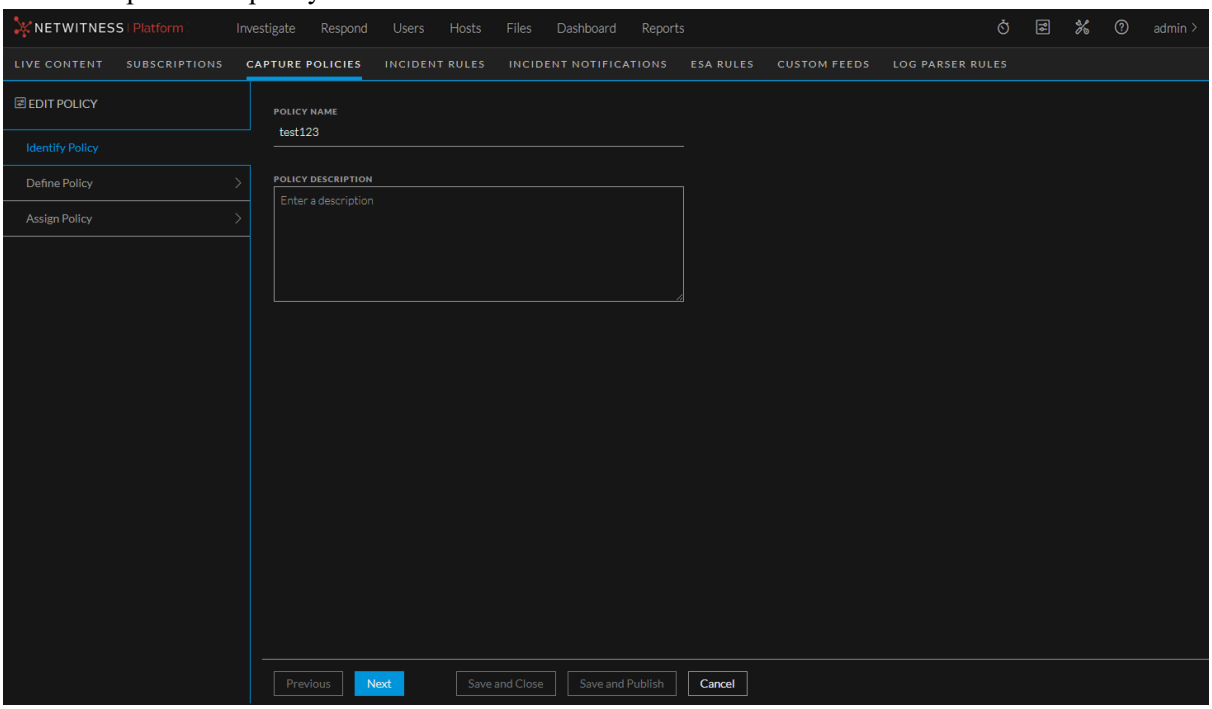
You can view publication status in `/var/log/messages` on a Decoder system.

The following is an example of successful publication in `/var/log/messages`:



```
Jun 15 18:35:17 rsa-nw-1141-Decoder-1 NwDecoder[8260]: [Rules] [audit] User
admin (session 26182, 10.237.169.43:55380) has added application rule
'selective-collection:meta-only' at position 38
```

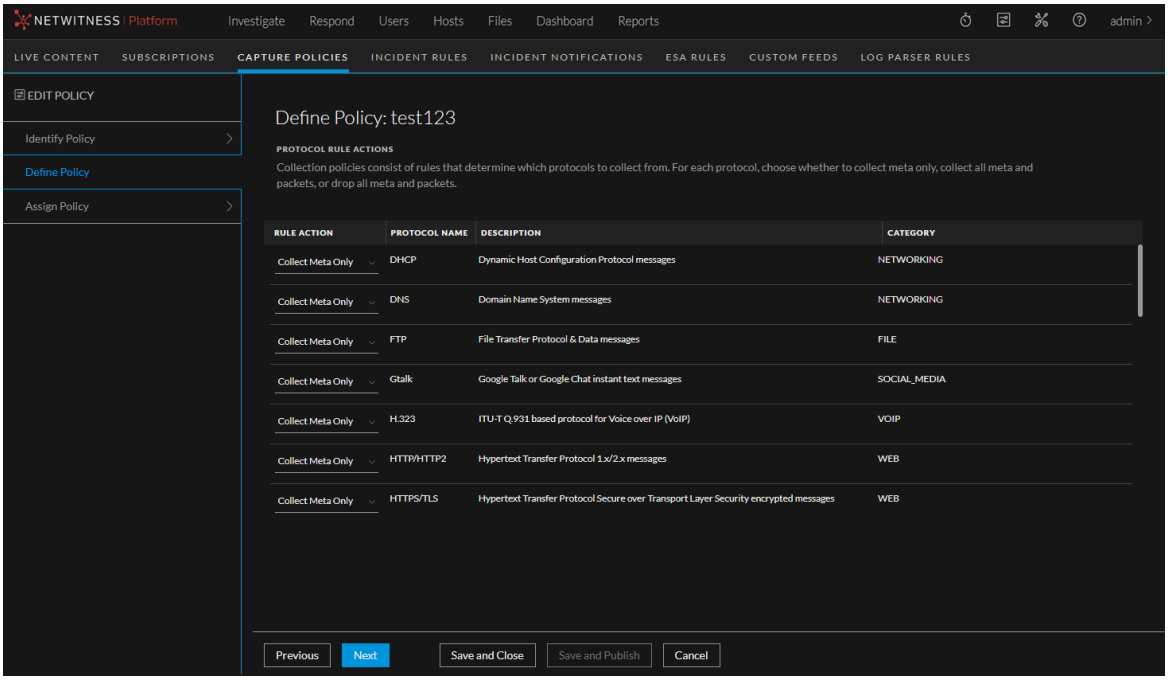
Unpublish Policies



You can unpublish a policy by unassigning the Network Decoders from the policy, which preserves the policy but makes it inactive so that the data it defines is not being collected. You can then change or remove a portion of policy, or remove the entire policy from the Decoders to which they are assigned.

To unpublish a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select the published policy and click **Edit**.

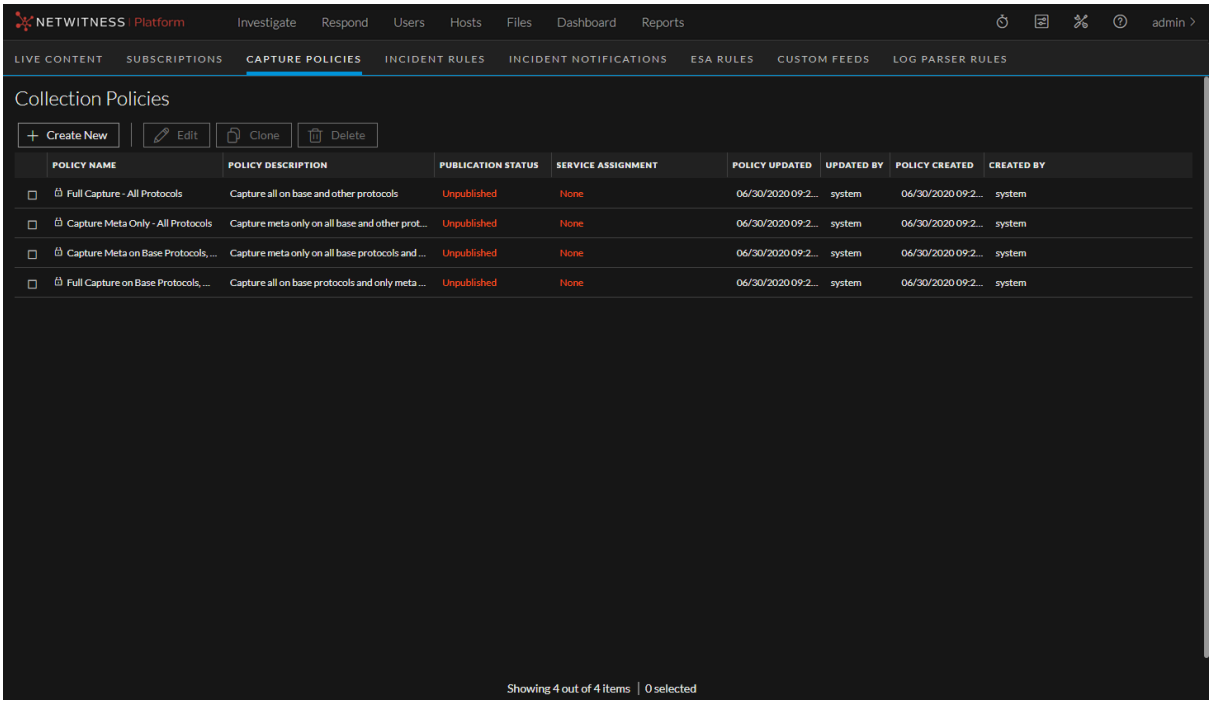
   a. To change the name or description of the policy, update the policy name or description in the Identify Policy view.

b. To change the protocols that are collected, click **Next** and then edit the rule actions in the Define Policy view.

c. To unassign or reassign Decoders to this policy, click **Next**.

- To fully unpublish this policy, deselect all the Decoders and then click **Save and Publish**.
- To change the Decoders that are assigned to this policy, select or deselect the Decoders as needed and then click **Save and Publish.**

When the changes to the policy status have been completed and the Decoders updated, the policy status is displayed in green text as **Published** on the Collection Policies tab. If you unassigned all the Decoders without assigning any new ones, the publication status is **Unpublished Edits**.



Delete Policies

You can only delete customized policies. Predefined policies can be unpublished, but cannot be deleted. You can only delete one policy at a time. When you delete a policy, any Decoders that were assigned to the policy immediately stop applying the rules in the policy.

For information about how to unpublish a policy, see Unpublish Policies.

To delete a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

2. Select a customized policy and click **Delete**.
   The policy is removed from the system.

Caution: If you delete a policy that is published to Decoders, a warning is displayed. If you click **Accept** in the warning, that policy is removed from the Decoders, the collection status is changed, and the policy is deleted.

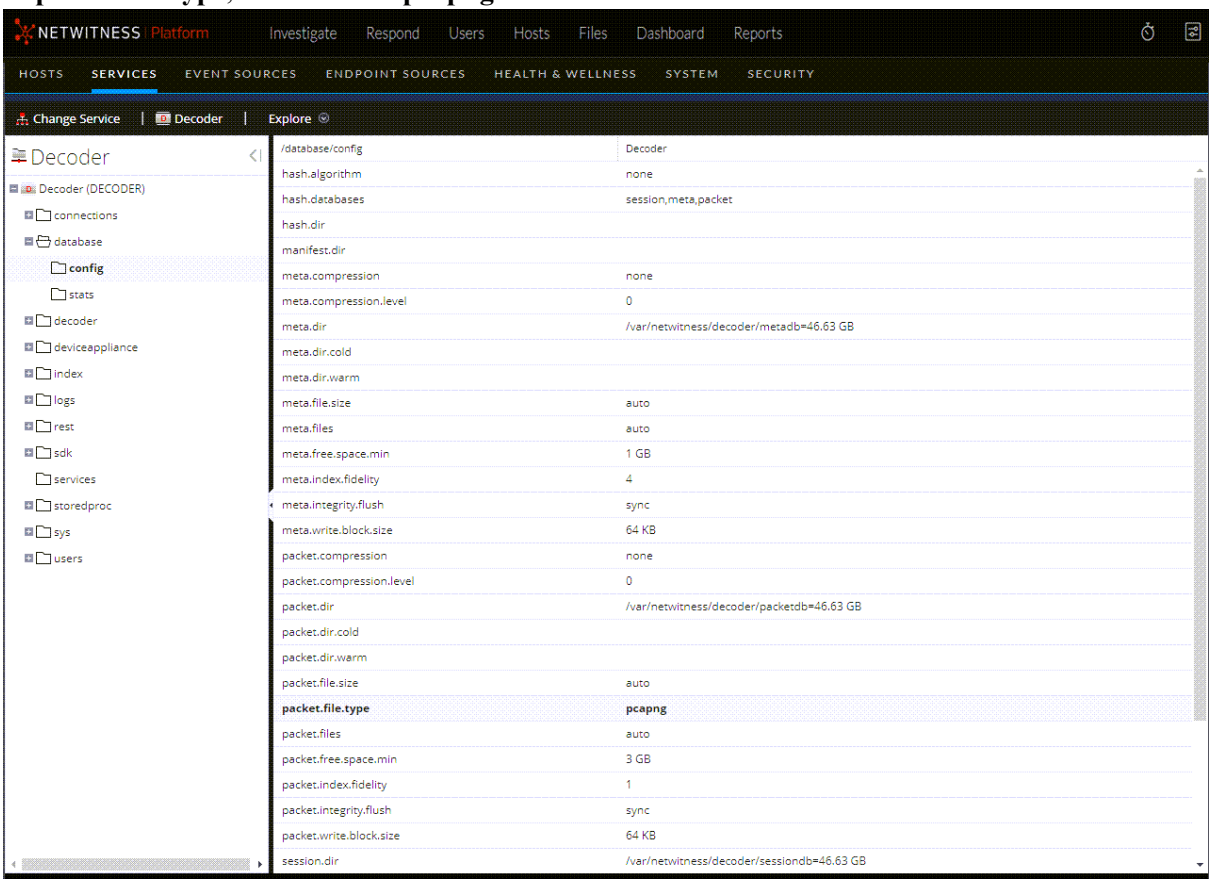
Supported Protocols for Selective Network Data Collection

The protocols in this list are supported for selective network data collection. These protocols have descriptive tool tips in the user interface. You can choose how to handle each of these protocols individually by dropping, capturing metadata only, or capturing all data related to them. There is also an additional rule for each policy that handles all other unidentified protocols not included in this list. The policies apply the collect or drop actions based on protocol characteristics, regardless of the port that they are captured on.

Category	Protocol	Description
Database	TNS	Transparent Network Substrate Oracle database networking protocol messages
	TDS	Tabular Data Stream for SQL server communications
Email	SMTP	Simple Mail Transport Protocol messages

Category	Protocol	Description
	POP3	Post Office Protocol v3 messages (Email clients use to retrieve mail from server)
File	SMB	Server Message Block (or CIFS) network communication protocol file sharing communications
	NFS	Network File System protocol messages
	FTP	File Transfer Protocol messages
	TFTP	Trivial File Transfer Protocol messages
Networking	SNMP	Simple Network Management Protocol messages
	DNS	Domain Name System messages
	DHCP	Dynamic Host Configuration Protocol messages
	NETBIOS	Network Basic Input/Output System networking protocol messages
Remote Access	SSH	Secure Shell secure remote connections
	TELNET	Teletype network remote interface protocol messages
	SCCP	Cisco Skinny Client Control Protocol terminal control protocol messages
Routing	RIP	Routing Information Protocol distance-vector routing protocol messages
Social Media	GTalk	Google Talk or Google Chat instant text messages
	IRC	Internet Relay Chat protocol text messages
	NNTP	Network News Transfer Protocol for Usenet news articles
VoIP	RTP	Real-time Transport Protocol audio and video streaming protocol messages
	SIP	Session Initiation Protocol text-based messaging application control protocol messages
	H323	ITU-T Q.931 based protocol for Voice over IP (VoIP)
Web	HTTP/HTTP2	HyperText Transfer Protocol 1.x/2.x messages
	HTTPS/TLS	HyperText Transfer Protocol Secure over Transport Layer Security or Secure Sockets Layer encrypted messages

Note: When selective network data collection is set up to collect metadata only for the HTTPS/TLS protocol, it truncates the traffic after the SSL/TLS handshake to ensure that all the certificates and other details are retained for analysis purposes while the encrypted packet payloads are dropped.



(Optional) Configure a Decoder to Write Standard pcap-formatted Files

To provide a more open database format, the Network Decoder can write standard pcap-formatted files. You can enable pcapng-formatted database files with the configuration node:
`/database/config/packet.file.type = 'pcapng' or 'netwitness'`

Note: This capability is enabled by default if you install 11.2 or later. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the NetWitness nwdb files).

To enable writing standard pcap-formatted files:

1. Go to (Admin) > **Services**, select a Network Decoder service, and then select > **View > Explore**.
2. Go to **database** > **config**.
3. In **packet.file.type**, the default is **pcapng**.

4. To change the packet file type to NetWitness formatting, type **netwitness** and press **Enter**. This change will take effect immediately on the next packet file that is created.

Note: In the pcapng database file format, the data is in clear text, and is not obfuscated by our proprietary format, which can improve security.

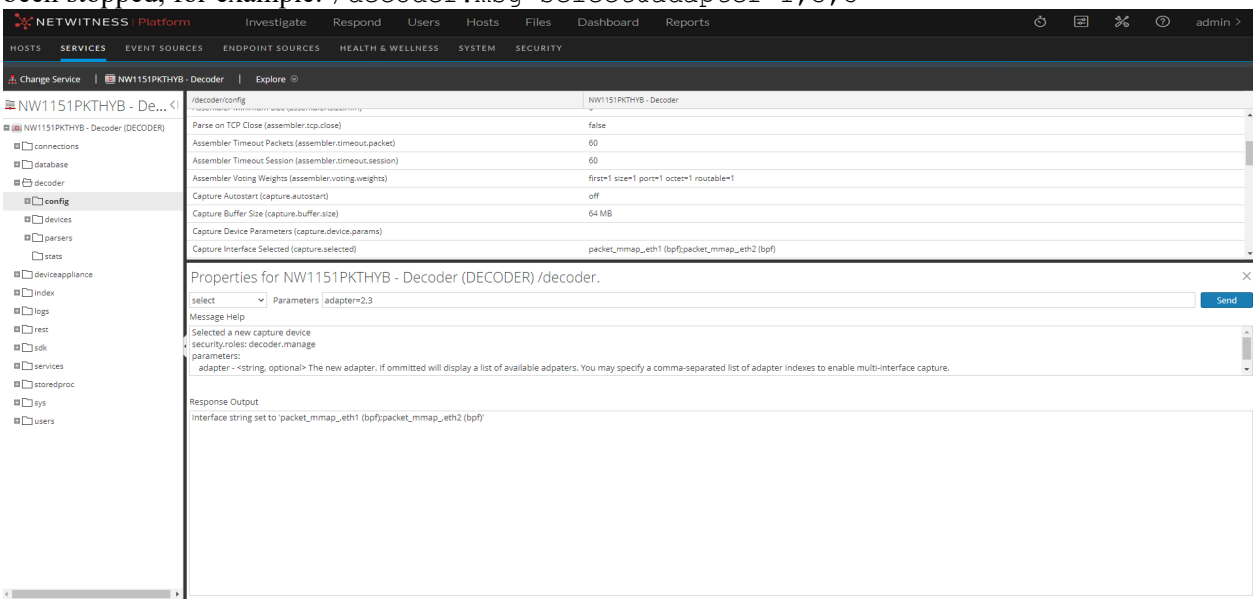
Caution: Please do not touch any files in the packet database directories! You must not read or edit any `pcapng` file in the packet database directories, as they are always in use while Decoder is running. Decoder always expects full and exclusive access to those files, and other processes reading those files prevent normal Decoder operation. The proper way to access the `pcapng` files is to set up a cold storage directory. This allows Decoder to copy `pcapng` files to the cold storage directory before deletion. At that point, you are responsible for managing the `pcapng` files, including making sure that the cold storage volume never fills up. Keep in mind that copying the `pcapng` files to cold storage requires a non-trivial amount of I/O and could interfere with packet capture. Cold storage for `pcapng` is not supported at 10G speeds.

(Optional) Multiple Adapter Packet Capture

Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs), or multiple ports on multiple interfaces, while leveraging the same network rules, application rules, and parsers for each NIC. The benefit of capturing from multiple physical NICs is that this method multi-threads the capture process for each adapter interface, which also multi-threads network rule evaluation.

For example, prior to 11.5, defining `capture.selected=PFRINGZC, em3` along with `capture.device.params=device=zc:em3,zc:em4` allocated a single thread for the Network Decoder to capture any traffic that came into either `em3` or `em4` interfaces. This also meant that all network rules were evaluated in a single thread.

However, in 11.5, configuring `capture.selected=PFRINGZC,em3; PFRINGZC,em4` allocates two threads for the Network Decoder to capture the traffic collected on either `em3` or `em4`, which provides more resources to the capture pipeline.



In this topic, the term "adapter" refers to a capture device within the Decoder. An adapter's name consists of the device (for example, the software API that the Decoder uses to interact with an adapter), and an interface (the physical device). A device can have multiple interfaces, and an interface can be compatible with multiple devices.

Configure Multiple Adapter Packet Capture

Note: Changes to capture device configuration do not take effect until service restart.

You can define multiple adapter packet capture for Decoders in the config setting `/decoder/config/capture.selected`. It accepts a semi-colon separated list of adapters, for example: `bpf,en5 (bpf);null_device,Null Capture`. This setting can be edited while capture is running, however, the changes do not take effect until the service has been restarted.

You can use the `/decoder?msg=select` command to select one or more adapters after capture has been stopped, for example: `/decoder?msg=select&adapter=1,3,5`

Note: As of 11.5, this configuration is not yet available in the `decoder` > `config` page. Use the `decoder` > `explore` page or the REST API. You can the Explore view by selecting a Decoder in the user interface and going to  (actions)> **View** > **Explore**. You can access the REST API by opening a browser and specifying the IP address of the host, for example, `https://<decoder-ip-address>:50106`.

Per Interface Configuration

The `/device/config/device.capture.params` configuration is a global configuration setting, and is applied to every interface when capture is started.

There is also a configuration setting for individual interfaces, which is `/decoder/devices/<devicename>/<interfacename>/config`. Currently, the only option available in this configuration setting is `capture.params`. Any value in this setting will override the global configuration setting.

Stat Nodes

As with configuration, there are per-interface stats and aggregate stats (similar to the global configuration). When there is a single device configured, these stat nodes function as in previous versions. When there is more than one device configured, the stat settings `/decoder/stats/capture.device` and `/decoder/stats/capture.selected` read `multi`.

Per-Interface Stats

The stats for each interface can be found in:
`/decoder/devices/<devicename>/<interfacename>/stats`

The captured stats are:

- capture.avg.size
- capture.dropped
- capture.filtered
- capture.header.bytes
- capture.kept
- capture.payload.bytes
- capture.received
- capture.total.bytes
- pool.packet.captured

Aggregate Stats

The capture stats under /decoder/stats represent an aggregate of the individual interface stats.

In the following table, for example, capture.avg.size is the maximum average size among all the interfaces, where capture.dropped is the total captures that were dropped for all the interfaces.

capture.rate	SUM
capture.avg.size	MAX
capture.dropped	SUM
capture.filtered	SUM
capture.header.bytes	SUM
capture.kept	SUM
capture.payload.bytes	SUM
capture.received	SUM
capture.total.bytes	SUM
pool.packet.captured	MIN

Pool Stats

All the network packet and session pool pages are tracked in /decoder/stats/pool/.

The stats under /decoder/stats/pool represents the total number of capture pages configured in Decoder. These include packet pool and session pool pages.

capture.port Meta Key

Each session is given a capture.port meta key which identifies the adapter from which the packets in the session were captured. This meta key can optionally be turned off with the /decoder/config/captureport.meta.enabled option. This meta key is on by default for Network Decoders, and is off by default for Log Decoders.

IMPORTANT: The `capture.port` meta key does not work with the `packet_mmap_,ALL` adapter. You must specify individual ports while using `capture.port`. The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For more information, see (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces.

Note: If you turn the `capture.port` meta key off, you must perform a capture restart for the change to take affect since this is a configuration change.

Special Devices

The nwimport device is for handling PCAP imports while simultaneously capturing network data. For more information on PCAP imports, see Upload a Packet Capture File.

`nwimport`: This device is not selectable but does have stat and config nodes. The config node for `nwimport` is ignored.

`Packet arrived out of order` Message

This message means that the Decoder is seeing old packets. This can be a side-effect of running import while capture is running. This message is usually suppressed at the beginning of import and then unsuppressed at the end. However, packets can still be in the state of being processed even after the upload of the imported file has completed. This means that this warning can be unsuppressed before the processing of the imported packets is completed, which results in displaying this message.

For information about updating Decoder configurations, see the *RESTful API User Guide for NetWitness Platform*. For information about stopping and restarting capture, see Configure Capture Settings. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Multi-Assembler Modes

The process that reassembles captured packets into streams is known as the Assembler. You can customize the Assembler operation to suit the packet capture configuration. It works in two modes (`on` and `off`) that are configured using the `/decoder/config/assembler.threading.enabled` variable. The value of `assembler.threading.enabled` only takes effect if multi-adapter packet capture is enabled.

Note: If you change the value of `assembler.threading.enabled`, you must perform a capture restart.

OFF Mode: If assembler threading is `off`, then one Assembler is used to assemble all packets captured from all interfaces. Packets from a stream may appear on any capture interface and the single assembler will put them back together.

- Assembler threading must be `off` to allow assembler to reconstruct streams that are capture across multiple capture interfaces.
- When assembler threading is `off`, the single Assembler instance may limit the maximum packet rate that the Decoder can process.

ON Mode: If assembler threading is `on`, there will be a separate Assembler for each capture interface. Each Assembler will only reassemble the packets it receives from it's capture interface.

- This mode of operation enables higher throughput because each Assembler instance operates on a dedicated processor.
- Each logical stream of packets must be ingested by one interface only. For example, the streams on each capture interface could come from different networks.

For compatibility with previous releases, the Multi Assembler mode is `off` by default.

When importing packets, the imported packets are fed to one of the existing assemblers, or the single Assembler instance when Assembler threading is `off`. Importing packets does not create a separate Assembler process.

(Optional) Internet Content Adaptation Protocol Capture

Internet Content Adaptation Protocol (ICAP) is a service protocol that encapsulates HTTP messages into ICAP Messages and forwards them to an ICAP server for processing.

NwDecoder supports capturing ICAP Messages and converting the HTTP requests and responses into packets. The capture device is named `icap`, `ICAP Server`, and can be used simultaneously with other capture devices (i.e., packet capture).

ICAP Capture Options

The capture options are specified on Decoder in the configuration node `/decoder/config/capture.params`

You must restart the capture before any changes take effect.

- `reqmod=<bool>` - By default, the Decoder will process both `REQMOD` and `RESPMOD` messages. Since the `RESPMOD` contains both the request and response, it may be advantageous for Decoder to ignore `REQMOD` messages and only process `RESPMOD`. If you set the `reqmod=false`, the Decoder will generate a request packet and response packets from a single `RESPMOD` message. The default behavior is equivalent to `reqmod=true`

- `client_ip=<string>` - You can configure some ICAP Clients to include the originating IP address in the ICAP headers. The name of the header with this information can vary, so you can use this setting to specify the name of the client IP header. For example, `client_ip=X-Client-IP` would configure the Decoder to extract the IP from the `X-Client-IP` header. Ignoring this setting will disable searching for the header.

(Optional) Data Plane Development Kit Packet Capture

The NetWitness Decoder supports capturing packets through the Data Plane Development Kit, also known as DPDK. DPDK is a set of libraries and drivers that support applications that work on directly on packets. DPDK's web site, www.dpdk.org, provides more information.

Advantages

The Decoder can use the DPDK to ingest packets from Ethernet interfaces. It is an alternative to existing packet capture options built into the Decoder. DPDK offers these advantages:

- It is entirely open source, with no binary-only driver components, unlike PF_RING.
- It is directly supported by multiple vendors, including our main vendor, Intel.
- Since the kernel-level interface is in the mainline Linux kernel, there are no separate driver packages to compile and distribute.
- DPDK devices are completely separate from the Linux network stack, which avoids unintentional interaction between Linux networking and packet capture.
- DPDK is capable of capturing at greater than 10G, unlike the `packet_mmap`.

How it Works

DPDK completely detaches the Ethernet interface from the Linux kernel. It does this by doing the following:

- It uses a Linux User I/O driver mechanism to expose the raw PCI-Express device to normal Linux programs. This means that it can take the raw memory space mapped to the PCI device and expose it, so that a normal Linux program can directly manipulate the hardware. There are a couple of drivers built into the Linux mainline kernel that can accomplish this. Decoder is designed to use `vfio_pci_generic`.

  Note: Only one driver can be attached to an Ethernet interface at a time. When `vfio_pci_generic` is attached to an interface, the Linux network driver for that interface is detached.

- The DPDK provides its own user-space implementation of the hardware drivers for a wide variety of Ethernet cards. When a DPDK application like Decoder is loaded, it can attach directly to the PCI device and manipulate it using DPDK-specific library functions. When a device is attached to DPDK, the Decoder can see it and automatically sets the device up with the DPDK Capture Device option.

Migrate PF_RING Devices to DPDK

For configurations using multiple adapter packet capture (available in 11.5 and later), you must use the manual procedure outlined in Manually Move a Capture Interface to DPDK . For example, the migration (`dpdk migrate`) does not support a Decoder when capture is configured with: `capture.interface=PFRINGZC,em3; PFRINGZC,em4;packet_mmap,em2`.

For configurations prior to 11.5, the procedure that uses the devices parameter to capture from multiple `PF_RING`-supported interfaces (for example, `ixgbe` and `i40e`) will be converted to using DPDK, along with the multiple adapter packet capture, so that one capture thread is used per interface.

For example, the migration will work if configured as follows:

- For multi-interface capture: `capture.interface=PFRINGZC,em3` along with `capture.device.params=device=zc:em3,zc:em4`
- For single interface capture: `capture.interface=PFRINGZC,em3`

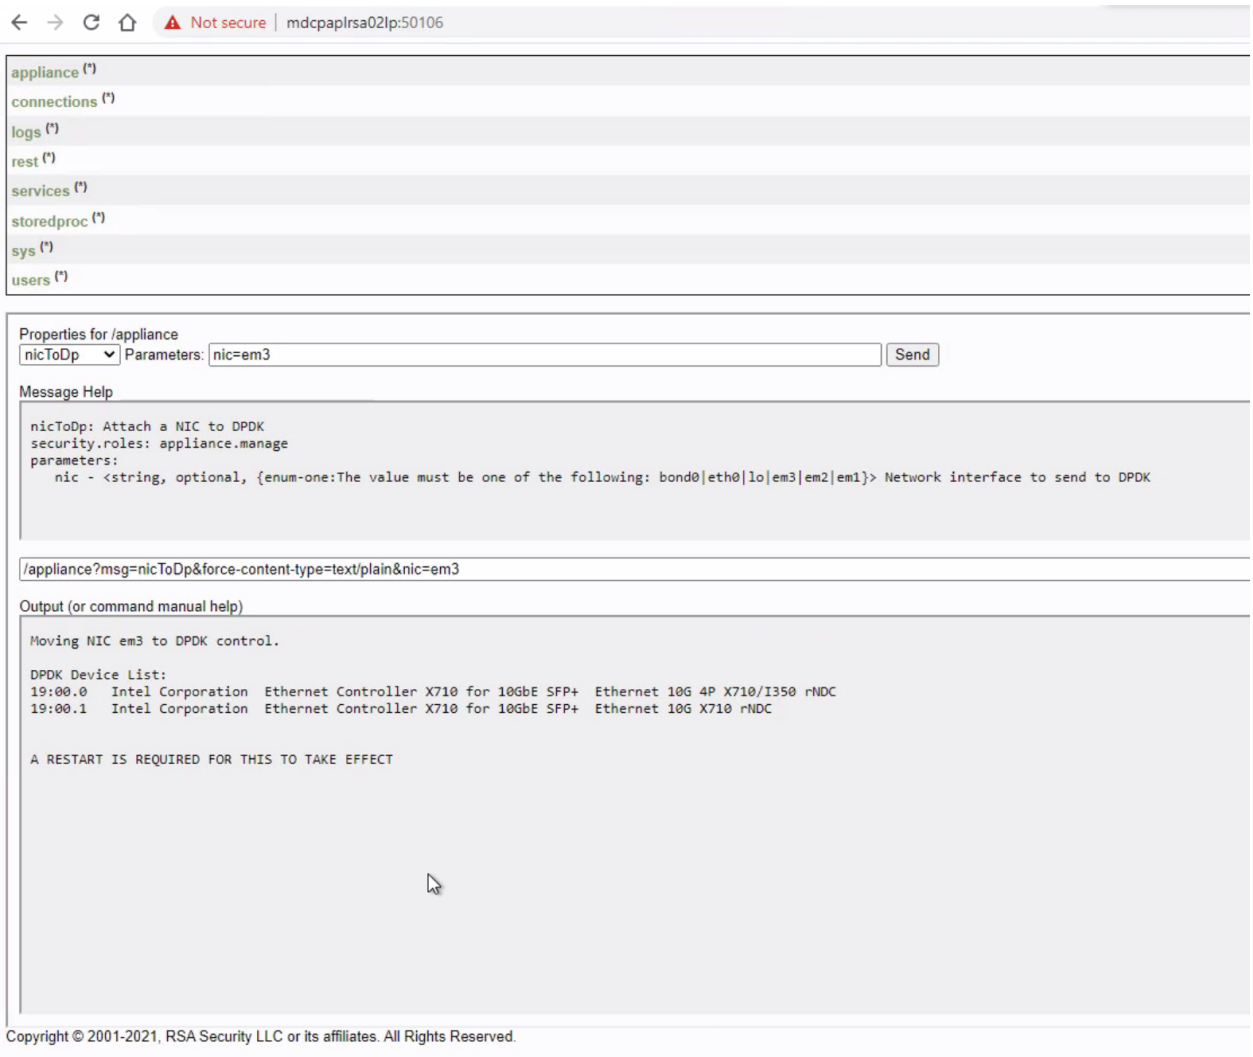
Note: `dpdk migrate` only functions with `PFRINGZC`, not `mmap` interfaces.

If you are using `PF_RING` to capture packets on your Decoder, you can use the Decoder's `dpdk migrate` command to migrate your existing PF_RING capture devices to DPDK. This command uses your currently-selected capture device configuration to determine which network interfaces are moved to DPDK control.

1. Go to  (Admin) > Services and select a Decoder.
2. Click  > **View** > **Explore**, right-click **decoder** and select **Properties**.
3. From the command drop-down list, select the `dpdk` command, type the parameter `migrate`, and click **Send**.

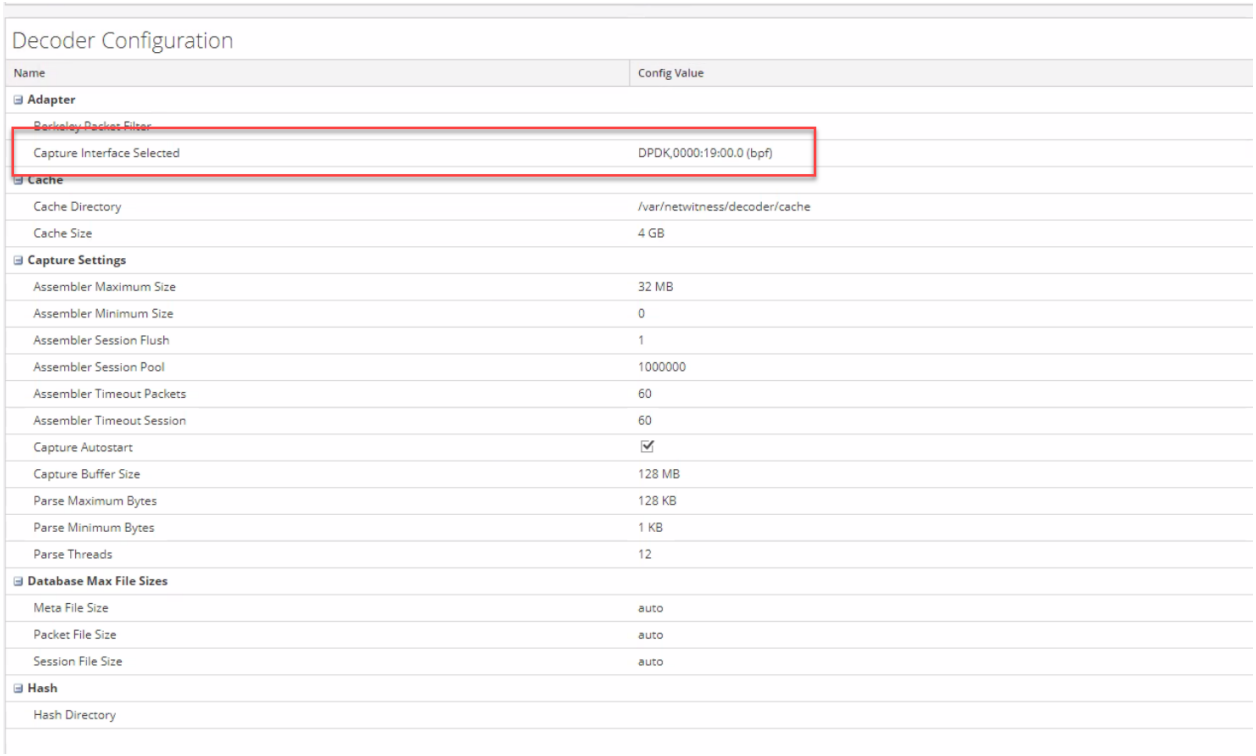
4. In the command output window, the changes that will be made on the Decoder to perform the migration are displayed. If everything looks correct for the migration, add the parameter `commit=1` to the command after `migrate` to actually make the changes on the Decoder.

1. At the reboot prompt, reboot the host to make the driver loading changes.
2. (Optional) Run the `/decoder/devices/<devicename>/msg=prune` command to remove configuration options for devices and interfaces that no longer exist after the migration.



> **Note:** The `prune` command removes only the undetected interface folders. Also, it ignores the `interfaces`, `stats`, `nwimport`, and `flow_events` folders available in `/decoder/devices/`.

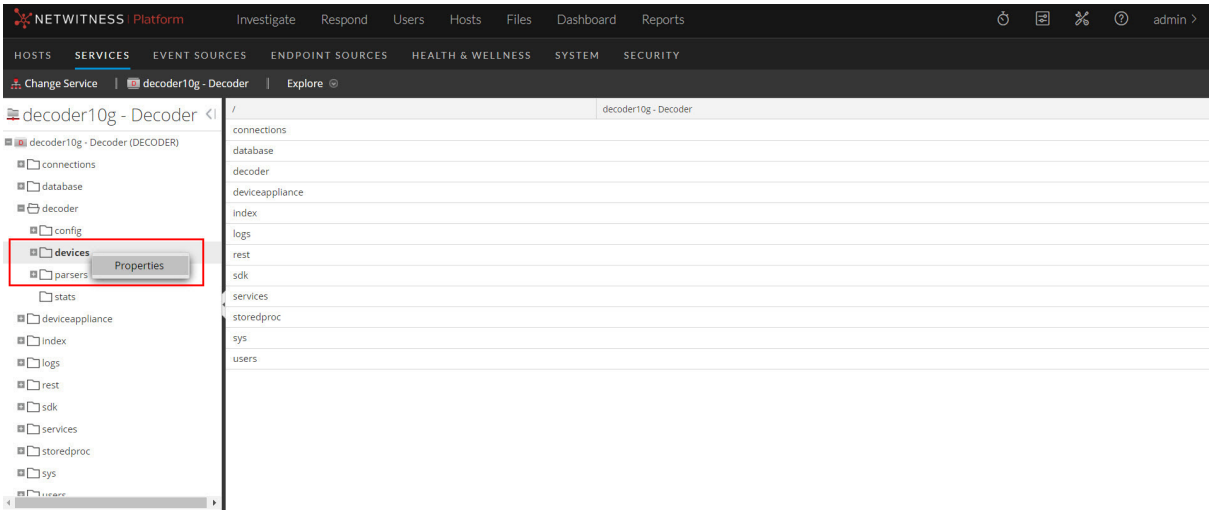
Manually Move a Capture Interface to DPDK



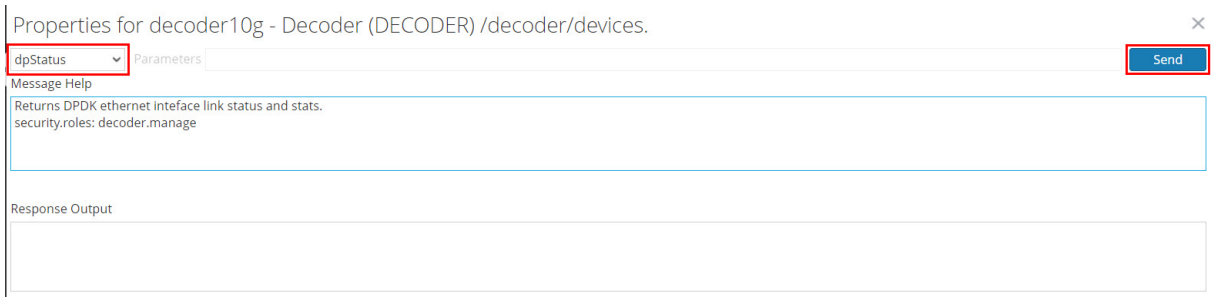
1. Run the new host service command `/appliance/nicToDp`, that converts a named network interface and sends it to DPDK.
   For example, if you provide `nicToDp` an interface name like `p1p1` it detaches it and sets it up for DPDK to use. It does the following:
   a. Identifies the PCI address of the named interface.

   > **Note:** From this point on, the Ethernet interface is identified by its PCI address alone, which is a physical characteristic based on where the Ethernet interface is installed in the computer.

   b. Creates configuration files that describe which PCI addresses DPDK is allowed to use.
   c. Sets up a systemd unit that binds the configured PCI addresses to DPDK instead of to the default Linux drivers on the next system reboot. The following figure shows a successful command.

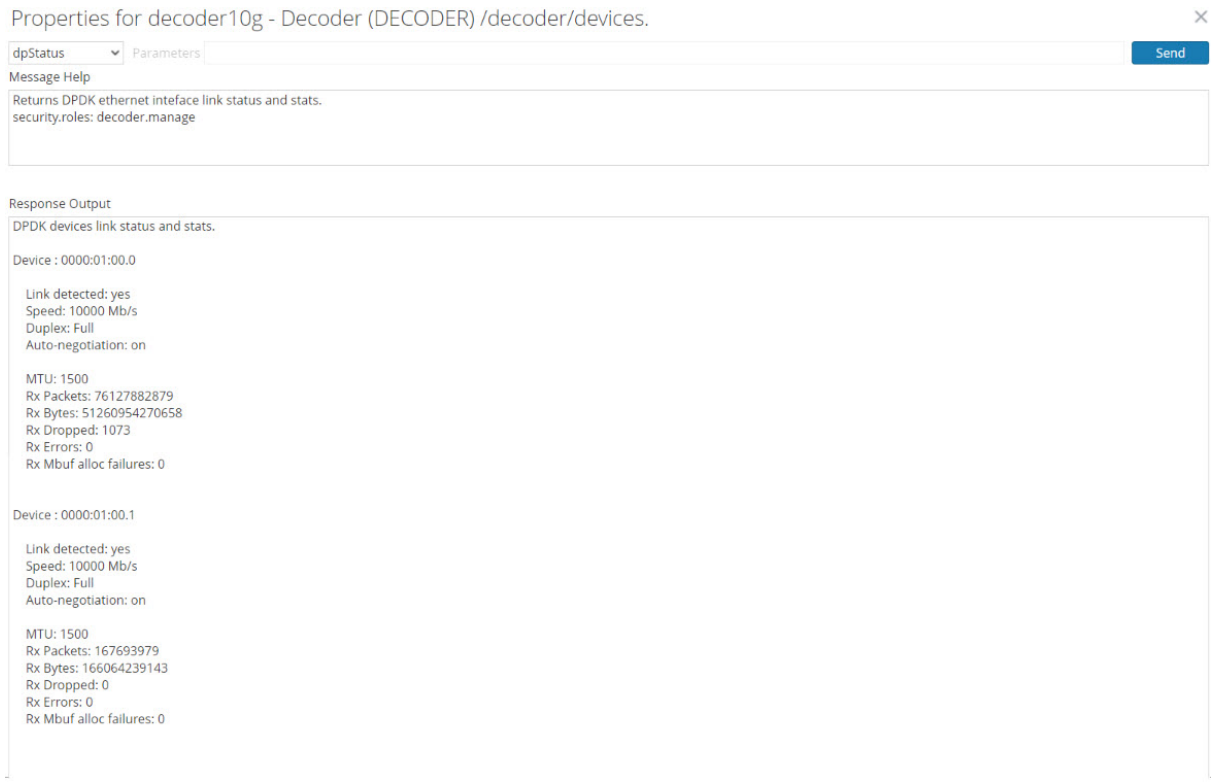


2. Reboot the Decoder host. The reboot accomplishes the following:
   a. Ensures that live capture on the interfaces stops before the network driver is unloaded.
   b. Binds the `vfio_pci_generic` driver to the configured interfaces.
   c. Pre-allocates some Huge Page memory for each interface, as required by the DPDK libraries.
3. After the reboot, the Decoder does not start capturing, since the network interface it had been using to capture has been moved to DPDK. Change the Decoder's capture configuration to select the DPDK device that is now available. For information about how to change the capture configuration, see Configure Capture Settings.
4. Restart the service. The following figure shows the Decoder configuration after a restart.



Check the device status and stats of DPDK interfaces

When you capture using DPDK interfaces, the link status and stats of the DPDK can be obtained using the command `/decoder/devices dpStatus`. The traditional commands like `ethtool` or `ifconfig`, which are used for other capture interfaces, will not fetch the link status and stats of DPDK devices.



1. Go to (Admin) > **Services**.
2. In the Administration Services view, select the Decoder and **View > Explore**.
3. Navigate to **decoder > devices**, right click on **devices** and select **Properties**.

4. Select **dpStatus** from the drop-down and click **Send**.

The link status and stats of DPDK devices are displayed in the **Response Output** section.

Check link status and stats from NwConsole

Run `/decoder/devices dpStatus` on NwConsole. Sample output when capture is in **Start** state:

```
[localhost:56004] /> send /decoder/devices dpStatus
DPDK devices link status and stats.

Device : 0000:01:00.0

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 416843663
    Rx Bytes: 281110914127
    Rx Dropped: 314
    Rx Errors: 0
    Rx Mbuf alloc failures: 0

Device : 0000:01:00.1

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 597764
    Rx Bytes: 373053232
    Rx Dropped: 0
    Rx Errors: 0
    Rx Mbuf alloc failures: 0
```

Sample ouput when the capture is in **Stop** state:

```
Device : 0000:01:00.0
Link detected: no
Device : 0000:01:00.1
Link detected: no
```

Utilizing Receive Side Scaling with DPDK

Receive Side Scaling (RSS) efficiently distributes the network receive processing across multiple CPUs in a multi-processor system. RSS ensures that the processing associated with a given connection stays on the assigned CPU.

IMPORTANT: Receive Side Scaling is supported on DPDK devices using the ixgbe or i40e device drivers only.

Advantages

When RSS is enabled, the DPDK capture devices split the incoming packet stream into multiple queues providing following benefits:

- Each queue is processed with a dedicated capture worker thread. As there are more threads processing the capture work, it allows more CPU time available for Berkeley Packet Filters (BPF) rule and network rule evaluation.

- Each capture worker thread can feed multiple assemble worker threads simultaneously which allows more CPU time available for assembly.
- Each CPU thread processes only a fraction of the packet stream. However, the total number of packets processed from all queues working in parallel increases the overall output (packets processed per second) of Decoder.

Configuring Receive Side Scaling

To enable RSS in a DPDK controlled NIC, set the `/decoder/devices/DPDK/(PCI_ID)/config/rss` value to a value greater than `1`. The typical values of RSS must be a small power of 2, for example, `4` or `8`. This value determines the number of CPU threads to be allotted for packet processing during the next capture. Similarly, if assembler threading is enabled, a matching number of assembler threads will be created to process the packets on each incoming queue.

For example, the following sample configuration will utilize a total of eight threads (four capture threads + four assembler threads) for multi-adapter packet capture with DPDK and multi-assembler threading turned on. This is the maximum recommended value for an eight core Decoder CPU.

`assembler.threading.enabled` set to `on` or `true`

```
/decoder/devices/DPDK/0000:01:00.1/config/rss=2
/decoder/devices/DPDK/0000:01:00.0/config/rss=2
```

To minimize packet drops, it is recommended that you keep the total number of capture and assembler threads less than the number of cores per CPU.

How it Works

When RSS is enabled, Decoder utilizes the RSS hardware acceleration on the capture NIC to apply a symmetric RSS hash function. The hash function sends packets from both directions of a given stream to the same queue. It enables the packets received on that queue to be processed by a dedicated assembler thread. This eliminates the need for Decoder to merge streams from different RSS queues and reassemble the streams. Hence, it is recommended that you enable multi-threaded assembly when using RSS. To enable, set `/decoder/config/assembler.threading.enabled` to `true` or `on`.

Configure the Decoder Capture Failover in Load Balance Deployments

The DPDK capture in the decoder service provides the ability for load balancers to failover and avoid data loss when decoder capture is off or when the service is shut down due to maintenance activity. When the decoder capture is stopped, the DPDK capture interface link status is down. This provides the ability for the traffic ingestion physical load balancers (for example, Keysight Ixia, Gigamon) which monitor interface links to switch to a different decoder and avoid data loss.

Configuration Failover on DPDK Capture Interfaces

Refer to the (Optional) Data Plane Development Kit Packet Capture *topic for instructions to configure DPDK capture on the decoder*.

- You can migrate existing PF_RING devices to DPDK

  (Or)

- Manually move capture interfaces to DPDK

Disable Wake On LAN (WOL) in BIOS settings

Some load balancers monitor interface link status through NIC link lights. You must disable WOL as the interface will not be down if WOL is enabled. To disable WOL in the BIOS, follow the BIOS instructions.

Example: f2 -> Device Settings -> "Integrated NIC 1" (capture interfaces) -> "NIC Configuration" -> "Wake on LAN" = Disabled

Note: When you restart the device and if capture does not auto-start, the lights on the capture interface are on. But if you turn on capture and turn it off again the lights will be off.

(Optional) Remove DPDK on Capture Interfaces

In case you need to revert DPDK on capture interfaces you can use the Appliance service `dpToNic` command.

- If you run this command without arguments, it lists the ethernet devices controlled by DPDK.
  - **Example:** /appliance dpToNic

    DPDK Device List:

    82:00.1 Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection Ethernet Server Adapter X520-2
- If you specify an ethernet interface using the 'eth' parameter, it removes the interface from DPDK so that when the system reboots it will be treated as a normal Linux network interface.
  - Example: /appliance dpToNic eth=82:00.1

    Detaching PCI Device 82:00.1 from DPDK.

    DPDK Device List: A RESTART IS REQUIRED FOR THIS TO TAKE EFFECT

Validate Link Status

- On Capture Start
  - During the decoder capture start, the service logs DPDK interface link status
    - [DPDK] eth dev 0000:05:00.0 link is up
  - On the upstream traffic ingest Load Balancer, the link status would be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status
- On Capture Stop
  - During the decoder capture stop, the service logs that capture is stopped on DPDK interfaces
    - [Thread] Stopped thread: Capture Work (DPDK, 0000:05:00.0) id: 31214
  - On the upstream traffic ingest Load Balancer, the link status would not be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status.

DPDK Interface Configuration and Statistics

- The `dpdk-devbind --status` command displays the status of DPDK and other known network interfaces. It displays the PCI domain, bus, slot, and function, along with a text description of the device.
  - Example: `dpdk-devbind --status`
    - 0000:01:00.0 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
    - 0000:01:00.1 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
- The default MTU is 2048. If you need to adjust the MTU for capture, add the `snaplen` parameter to `/decoder/config/capture.device.params` .
- VLAN offload is disabled.
- The DPDK interface capture stats are updated under /decoder/devices/dpdk/
  - Example: /decoder/devices/DPDK/0000:01:00.1/stats/
    - Received packets (Rx packets) - capture.received
    - Received bytes (Rx bytes) - capture.total.bytes
    - Received dropped (Rx dropped) - capture.dropped

For information on checking device status and stats of DPDK interfaces, refer to Check the device status and stats of DPDK interfaces

(Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

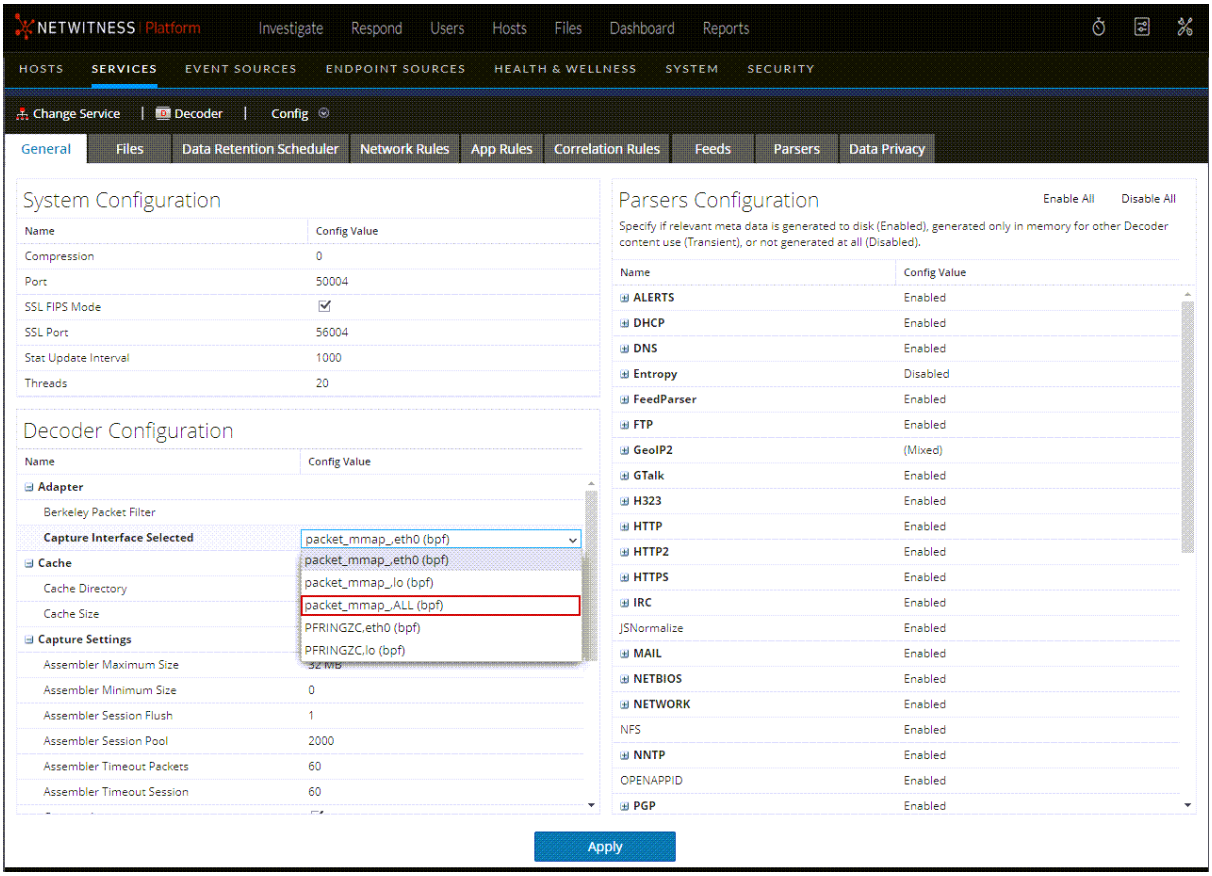
When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even interfaces that are not configured to do VLAN fixup will have the feature enabled.
- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual

interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

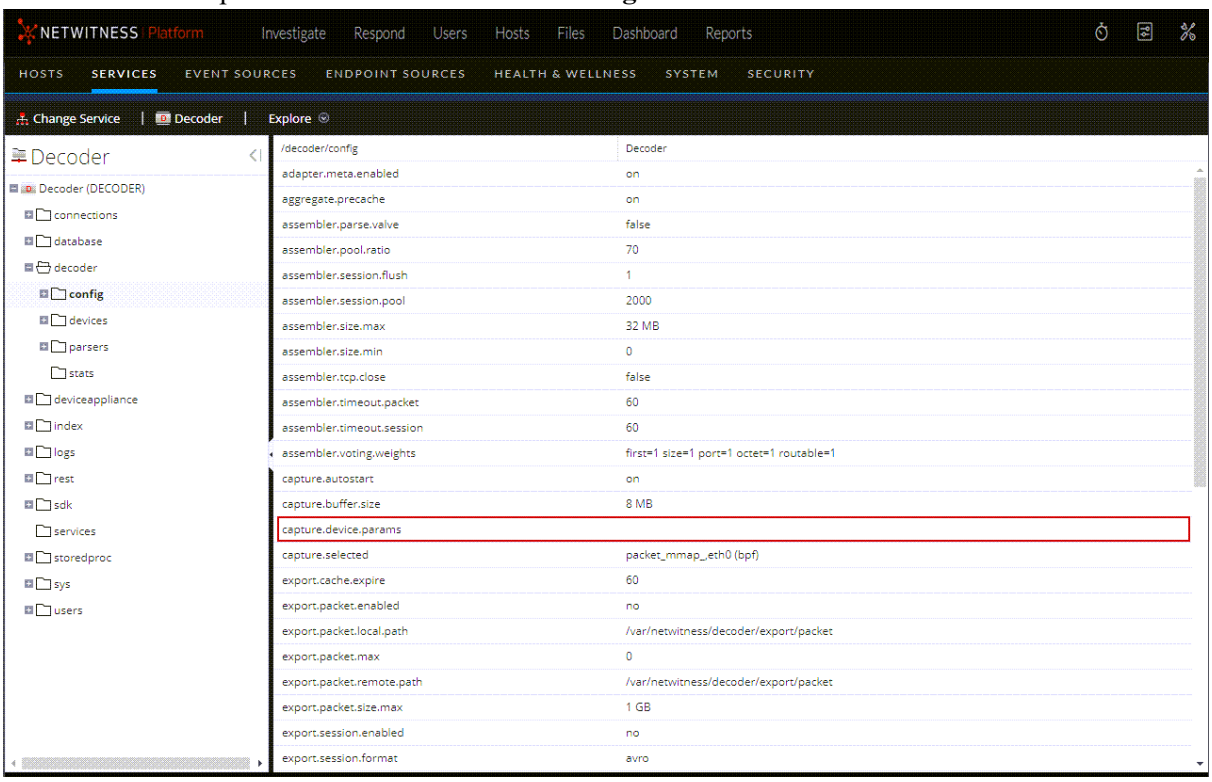
After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.



These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed to delineate whitespace. For more information about how to use quotes for whitespace, see the "Connecting to a Service" topic in the *NwConsole User Guide for NetWitness Platform*.
`name1="value1" name2="value2"`.

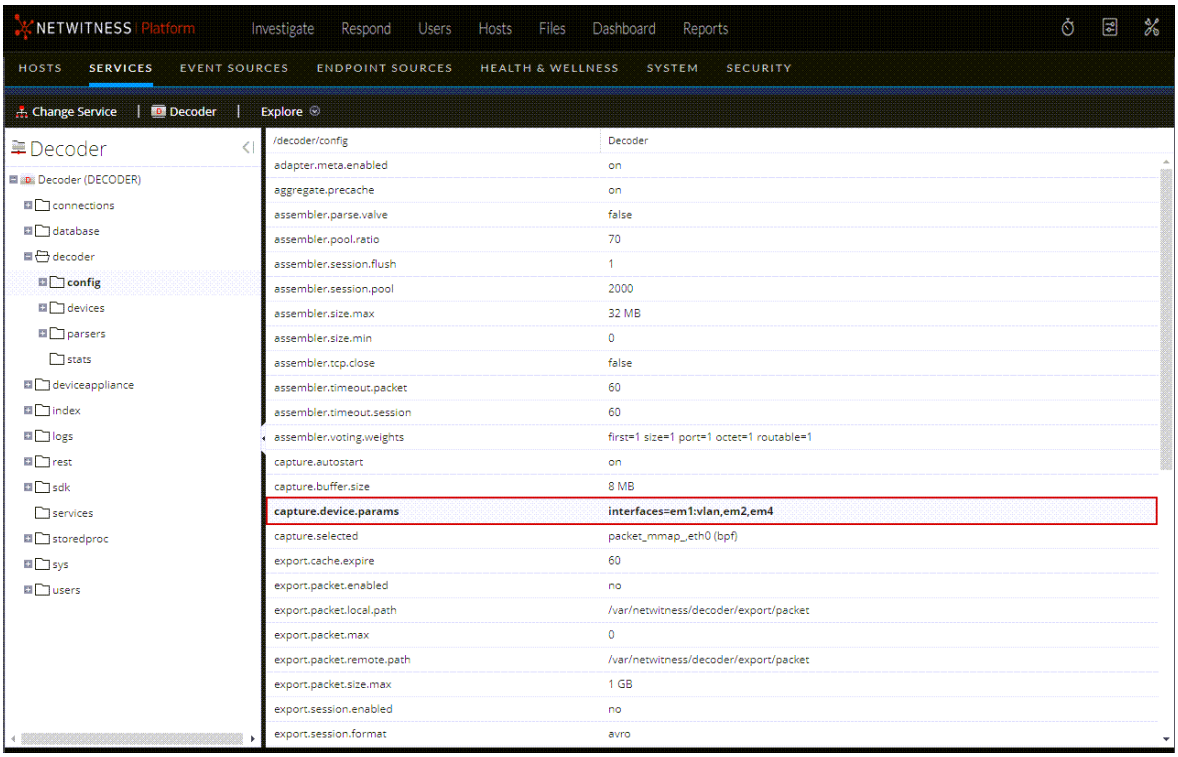
Parameter	Value	Effect
`capture.device.params`	`vlan-fix=true`	VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`.
`capture.device.params`	`interfaces=eth0:vlan,eth1`	VLAN fixup performed on traffic capture on `eth0` interface only
`capture.device.params`	`interfaces=eth0:vlan,eth1 vlan-fix=true`	VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting.

To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:



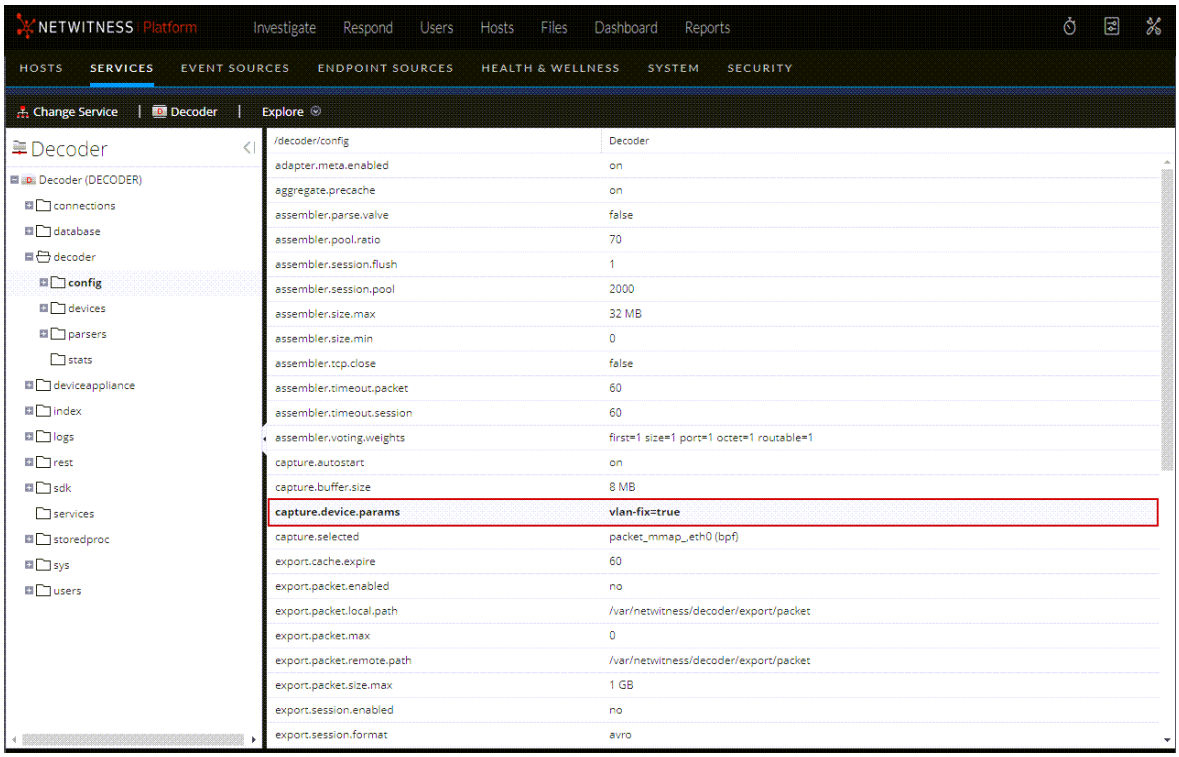
1. Go to  (Admin) , select the Decoder service and  **> View > Config.**

2. In the **Decoder Configuration** panel, set **Capture Interface Selected** to the `packet_mmap_,ALL` adapter.



3. To go to the **Explore** view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, and do one of the following:

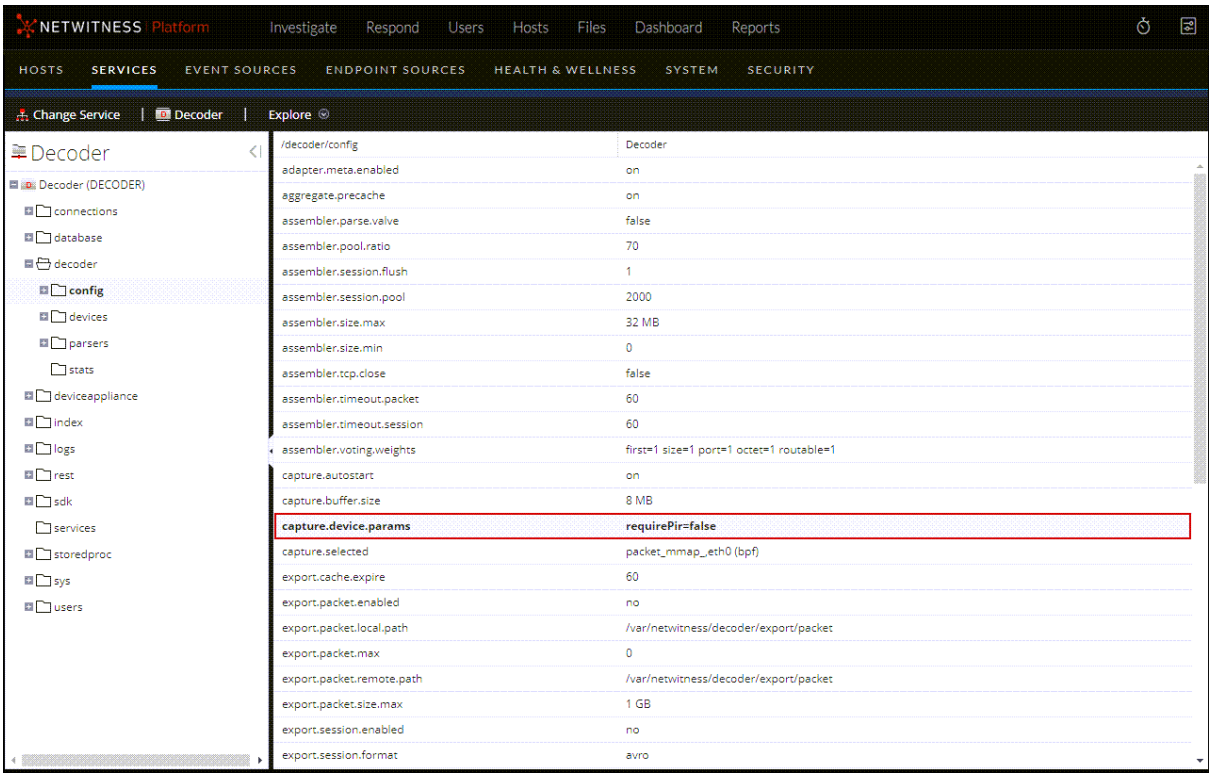
   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**.
     For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`

The change goes into effect after restarting capture; only traffic on `em1` has the VLAN tags preserved.

- To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
  `vlan-fix=true`

VLAN tags are preserved on all capture interfaces.

6. Select Start Capture (Start Capture). The change takes affect after capture is restarted.



(Optional) Process Raw Syslog Data without Priority Field

You have the option to process raw syslog data that does not contain a valid priority (`PRI`) field.

To configure a Log Decoder to process syslog without a Priority field:

1. Go to (Admin) > **Services**, select the Log Decoder service and > **View > System**.
2. Select Stop Capture (Stop Capture).
3. From the drop-down menu, where System is shown, select **Explore**.
4. Select **decoder** > **config**.
5. In the `capture.device.params` field, add the following text, and then click **Enter** to save the changes:

   `requirePri=false`

6. From the drop-down menu, where Explore is shown, select **System**.
7. Select Start Capture (Start Capture). The change takes affect after capture is restarted.

(Optional) Configure Decoder to Support OpenAppID

The NetWitness Decoder can identify applications using the OpenAppID detectors. OpenAppID from Cisco is an application-layer network security plug-in for Snort (an open source network intrusion detection system). It is a set of open source Lua libraries (detectors) that identifies applications in the network traffic.

When Network Decoder detects an application with an OpenAppID detector, the `appid` meta is created. The value of the `appid` meta helps in identifying the application as it is the application's entry in the `appMapping.data` file. The `appMapping.data` file is part of the OpenAppID distribution and contains metadata of the application detectors.

Note: By default, all detectors are disabled to avoid any negative impact on the performance.

To configure the OpenAppID detectors:

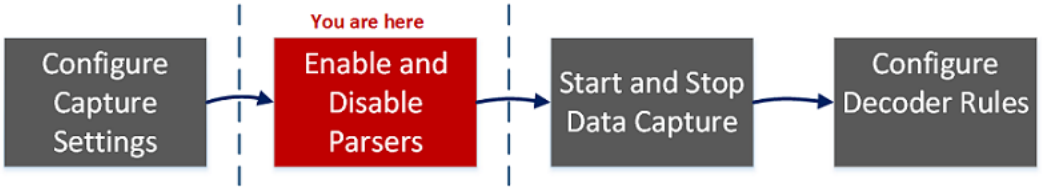
IMPORTANT: Ensure that you enable only the required OpenAppID detectors. Enabling all the OpenAppID detectors can reduce the performance. Before you enable any detector, understand your application detection requirements and enable only the specific detectors. For example, enabling the `service_*` detector or any other detector that attempts to match short generic patterns can cause severe impact on the performance.

1. Download the OpenAppID source package (`snort-openappid.tar.gz`) from the Snort Downloads (https://www.snort.org/downloads) page.
2. Upload the OpenAppID source package to the network decoder (`http://<networkdecoder>:50104/decoder/parsers/upload`), which can be accessed using the REST interface.
   Once uploaded, decoder will extract the package to an appropriate folder. The default folder is `/etc/netwitness/ng/odp`.
3. To enable detectors, modify the `/decoder/parsers/config/openappid.enabled` file with a combination of detector filenames or wildcards, separated by commas. For example, `client_*, payload_slashdot.lua, payload_reddit.lua`.
   The following table describes the detector group filenames and their functions. You can extract the complete set of detectors from the OpenAppID source package (`snort-openappid.tar.gz`) or it can be viewed on the Decoder file system at `/etc/netwitness/ng/odp/lua`.

Detector Group Filename	Description
`client_*`	Detectors for client applications (for example, Facebook, MacAppStore).
`content_group*`	Detectors for a specific type of network attribute such as protocol, port, or service (for example, port_services which contains many services identified by their common ports).
`payload_*`	Detectors for the host based traffic (for example, Hulu, Reddit).
`service_*`	Detectors for service applications (for example, Minecraft, VNC).
`ssl_host_group_*`	Detectors for SSL hosts logically grouped together (for example, 334 which contains many ecommerce websites).

4. Ensure that you specify the detector filenames correctly. If you specify an incorrect filename, the detector will not load. The following table lists some good and bad file naming conventions and their status on subsequent loading.

Detector Group Filename	Status
`client_9P.lua`	loaded
`client_9p.lua`	not loaded (Linux only)
`client_9P`	not loaded
`client_9P*`	loaded
`client_`	loaded



Detector Group Filename	Status
9P.*	
lient_ 9P.lua	not loaded
lient_ 9P.*	not loaded
*lient_ 9P.lua	loaded

5. Once the required detectors are enabled, reload the parser to load the detectors. The following example message will confirm that the detectors and enabled successfully.
```
2020-May-14 17:03:37 [OpenAppID] 59 detectors loaded out of 59
```

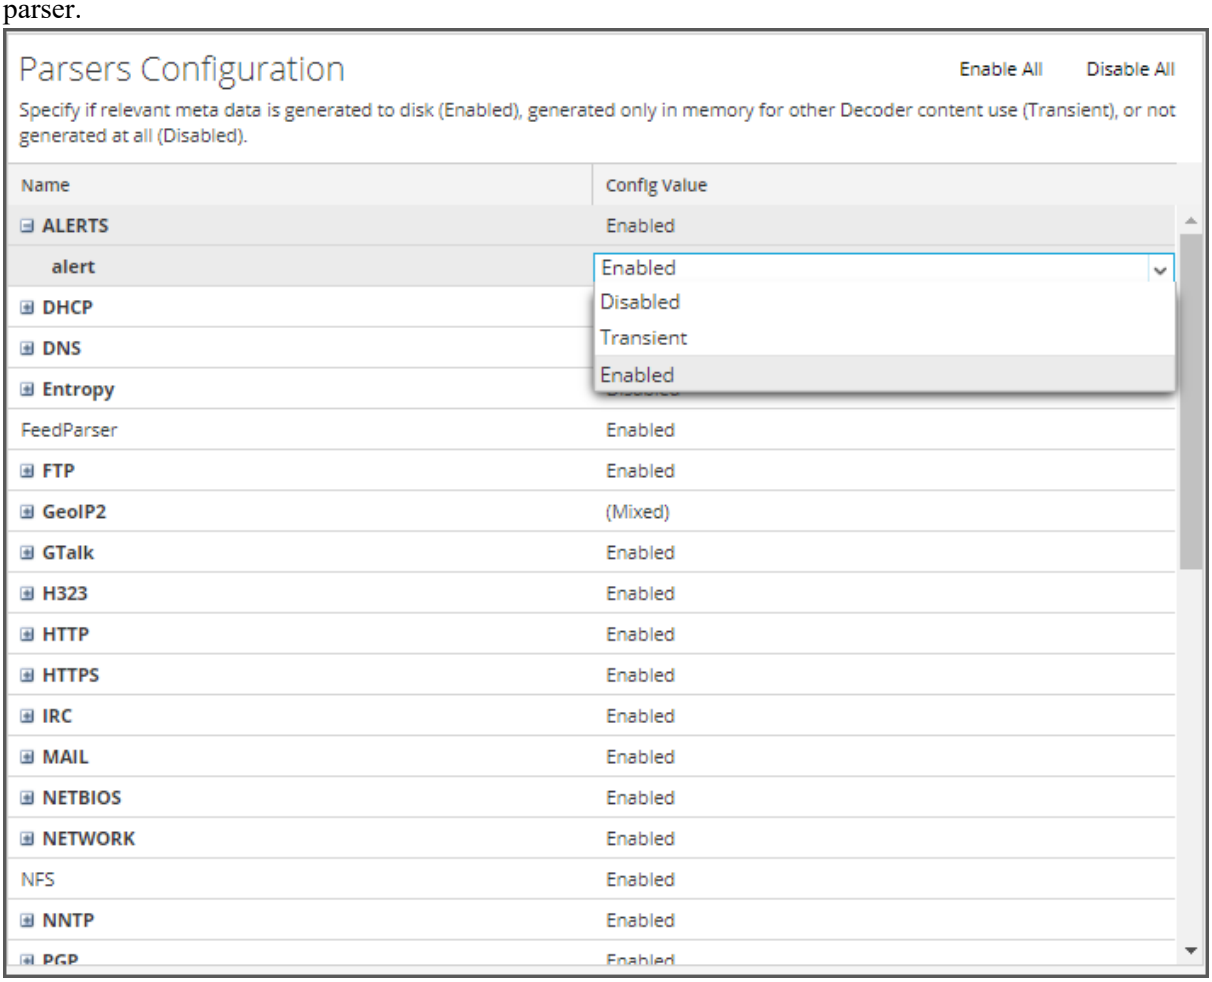
Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

You must only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention.
- Not having extra (unnecessary) log parsers deployed reduces the potential for mis-identification of messages.



The Parsers Configuration panel provides options to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

Option	Description
Enable All **Disable All**	These options provide a way to quickly select either all parsers or no parsers.
Name	The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create.
Config Value	A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**. • When **Enabled**, the Decoder is using the parser to filter traffic. • When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*). • When **Disabled**, the Decoder is not using the parser. If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create.

Note: For a Log Decoder, you must have previously deployed log parsers from Live. See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

To enable or disable a parser, or to view the status for each parser:

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and **>View** > **Config**.
3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.

4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.

When you click **Apply**, note that all parsers are reloaded into NetWitness. The status for each parser is updated, based on your selections.

(Optional) Decoder Parser Utilization Insights

To make insights on parser usage more accessible and useful, NwDecoder and NwLogDecoder were updated to expose the `/decoder/parsers/definitions` folder and a number of stats within the parsers that give some detail on utilization. Previously, the folder, parser folders within, and curated parser stats were gatekept by `detailed.stats`.

The parser stats that were exposed were the following:

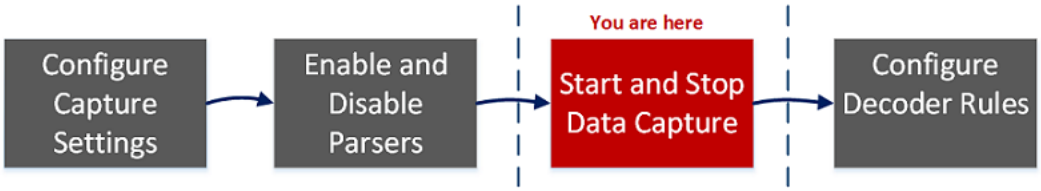
- Memory usage.
- Callbacks for metas, ports, and tokens.
- Callback counts for metas, ports, and tokens.

Configuration and Usage

In addition to being stored in the original statdb when configured to do so (default), the newly exposed stats are being stored in a separate database in the same logical volume (`decodersmall`) as the original stats database, `parsestatdb`. The content of parsestatdb is limited to the parser folders stored in `/decoder/parsers/definitions` at this time.

By default, `parsestatdb` is configured for 10 GB and the decodersmall volume was extended by 10 GB to accommodate the new directory.

For all intents and purposes, parsestatdb works the same as the original statdb in terms of functionality, just with some usage items specific to it + a new config item that controls how often to update the newly exposed stats (applicable to original statdb as well):



- `/decoder/parsers/config/parser.stat.dir`: Specifies where curated parser `statdb` files should be located. When you modify the size, the change takes effect immediately. However, when you add or remove directories, the changes take effect when the service restarts.
- `/decoder/parsers/config/parser.stat.compression`: Enable to compress parser stats as they are written to the database. Compression types available are none, gzip, bzip2, lzma and zstd. Change takes effect immediately.
- `/decoder/parsers/config/parser.stat.exclude`: A comma separated list of stat pathnames to be excluded from the parse stat db (meta and CPU stats not included at this time). The following wildcards are permitted: ? match any single character, * match zero or more characters to delimiter /, ** match zero or more characters including delimiter. Change takes effect immediately.
- `/decoder/parsers/config/parser.stat.interval`: Determines how often (in milliseconds) detailed parser statistic nodes are updated. Cannot be faster than sys stat updates. Change takes effect immediately.
- `/decoder/parsers statHist`: Retrieve historical stats from the stats db. Do not send time1/time2 to get bounding times about stats db. Supported wildcards are ? to match any single char, * to match zero or more characters, not including slash /, ** to match zero or more characters including slash /.
- `/decoder reset`: new parameter added to reset just parsestatdb that only applies to Decoders.

Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

Note: The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.

To start and stop capture:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service, and select **> View > System**.
3. In the toolbar, click **Start Capture**.

   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.

   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.

   Packet or log capture ceases, and the option to upload a file to the service is again available.

Note: When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (`/decoder stop`), passing the parameters `flush=false` before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the **Services Config view** > **Rules** tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Core Services must follow.

By default, no rules are defined when you first install NetWitness. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on Network Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness services, simplifying the deployment and configuration of multiple services.

Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

Rule and Query Guidelines

All queries and rule conditions in NetWitness Core services must follow these guidelines:

All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

Note: The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`

Rule Name	Condition
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Invalid Rules

NetWitness uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness logs indicating the error.

Note: NetWitness 11.x does not support parsing of legacy syntax rules (as version 10.6 did). After you update to NetWitness 11.x, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness generates a Health and Wellness alert to indicate that you need to fix the rules.

General Syntax Guidelines

- All text values must quote literal values. Example: `user = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it using double quotes. Example: `user = "User's"`

The following are valid syntax rules:

- All time values should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- Everything else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key.

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=ioc name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=ioc
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

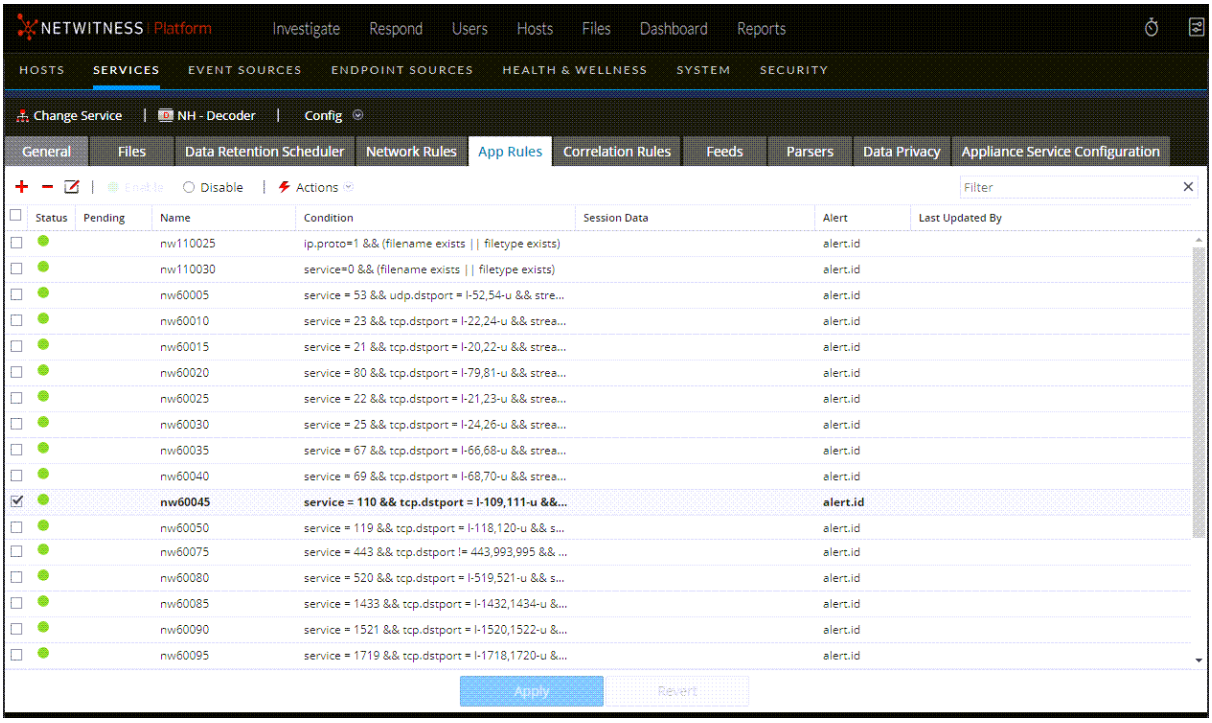
Left Operand Format	Operator	Right Operand Format	Description
any	=	compatible with left operand	Equality operator. You can use values or meta keys on the right side of the equality operator.
any	!=	compatible with left operand	Inequality operator. You can use values or meta keys on the right side of the inequality operator.
any	<	compatible with left operand	Less than operator. You can use values or meta keys on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
any	`<=`	compatible with left operand	Less than or equal to operator. You can use values or meta keys on the right side of this operator.
any	`>`	compatible with left operand	Greater than operator. You can use values or meta keys on the right side of this operator.
any	`>=`	compatible with left operand	Greater than or equal to operator. You can use values or meta keys on the right side of this operator.
text	`contains`	text	Find values that contain the right operand. You can use meta keys or values on the right side of this operator.
text	`begins`	text	Find values that begin with the right operand. You can use meta keys or values on the right side of this operator.
text	`ends`	text	Find values that end with the right operand. You can use meta keys or values on the right side of this operator.
text	`length`	integer	Find strings of a certain length. You can use meta keys or values on the right side of this operator.
any	`count`	integer	Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator.
any	`ucount` and `unique`	integer	Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with five unique values and three of the same value, the `ucount` is six.
N/A	`exists`	any	Finds any values for the meta key. You can use meta keys or values on the right side of this operator.
N/A	`!exists`	any	Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator.
text	`regex`	text	Finds values matching a regular expression. You can use values on the right side of this operator.

The following table summarizes other syntax elements used in rules.

Syntax element	Description
*	Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic.
u	Upper bound of a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be: `tcp.port = 40000-u`
l	Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be: `tcp.port = l-40000`
- (dash)	Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be: `tcp.port = 25-443`
, (comma)	Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax: `tcp.port = 1-10,25,110,143-225,40000-u`
( )	Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1: `(alias.ip=192.168.1.1 && tcp.port=80) || (alias.ip=10.10.10.1 && tcp.port=443)`
~	Logical NOT operator, a negation of an expression.
&&	Logical AND operator, a conjunction of two expressions.
||	Logical OR operator, a disjunction of two expressions.

Configure Capture Rules



The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file

- Push rules to another service
- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

To configure rules in the Rules tabs

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder service and > **View** > **Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The rules list for the selected rule type is displayed.

Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.
- Until changes are applied, you can discard edits to the list and revert to the unedited rules.

- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

To add a rule in any Rules tab, do one of the following:

- Click  .
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click .
   The selected rules are removed from the list, but still exist on the service.

To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click  or double-click the rule row.
   The Rule Editor dialog for that type of rule is displayed.

To disable a rule:

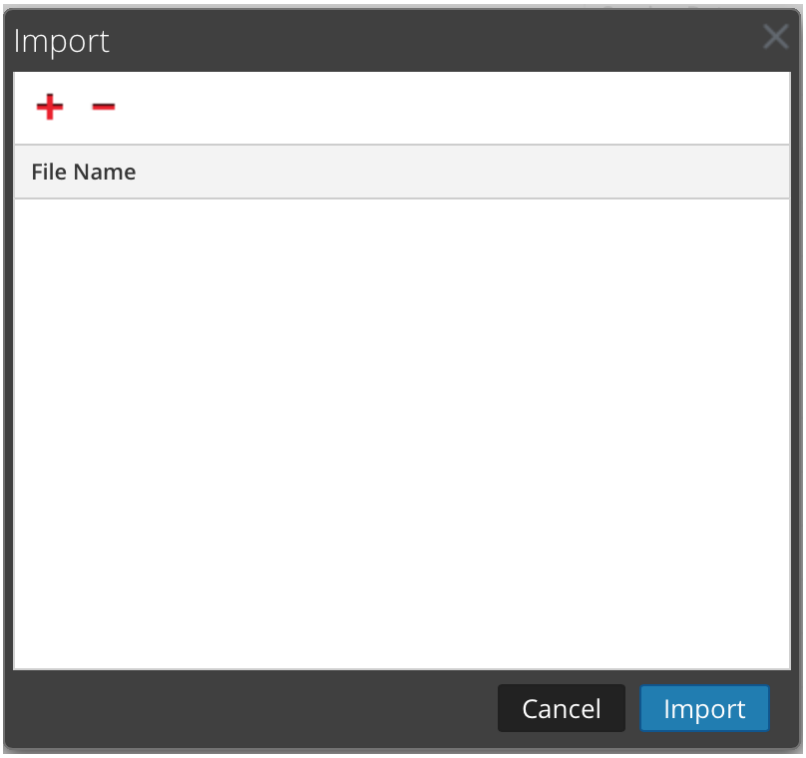
1. From any Rules tab, select the rules to disable.
2. Click 

   .
   The status changes to disabled in the rules list, but the rule is still enabled on the service.

To enable a rule:

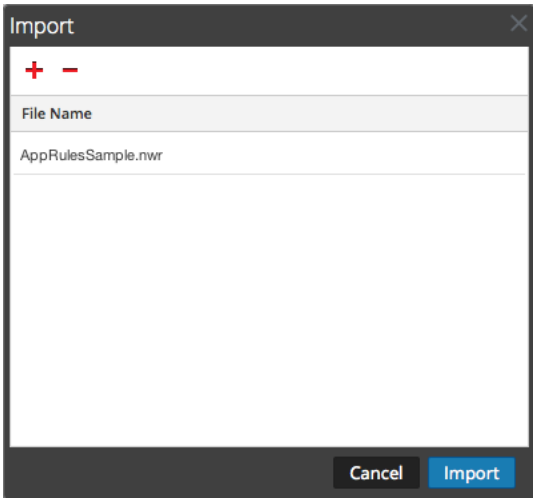
1. From any Rules tab, select the rules to enable.
2. Click 

   .
   The status changes to enabled in the rules list, but the rule is still disabled on the service.



Import Rules from a File and Export Rules

You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.



When you attempt to import a group of rules, NetWitness Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

To import rules to a service:

1. From any Rules tab, select Actions > Import .
   The Import dialog is displayed.

2. Click + .
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.

4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.
6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

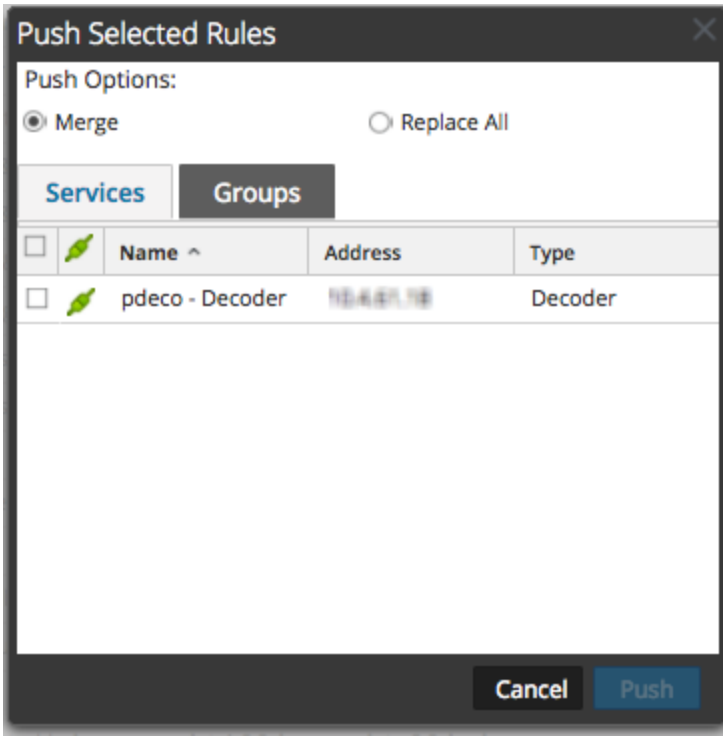
To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 

 > Export > Selection. (**Export > All** exports all rules in the rules list even if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.

     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

Push Rules to Other Services

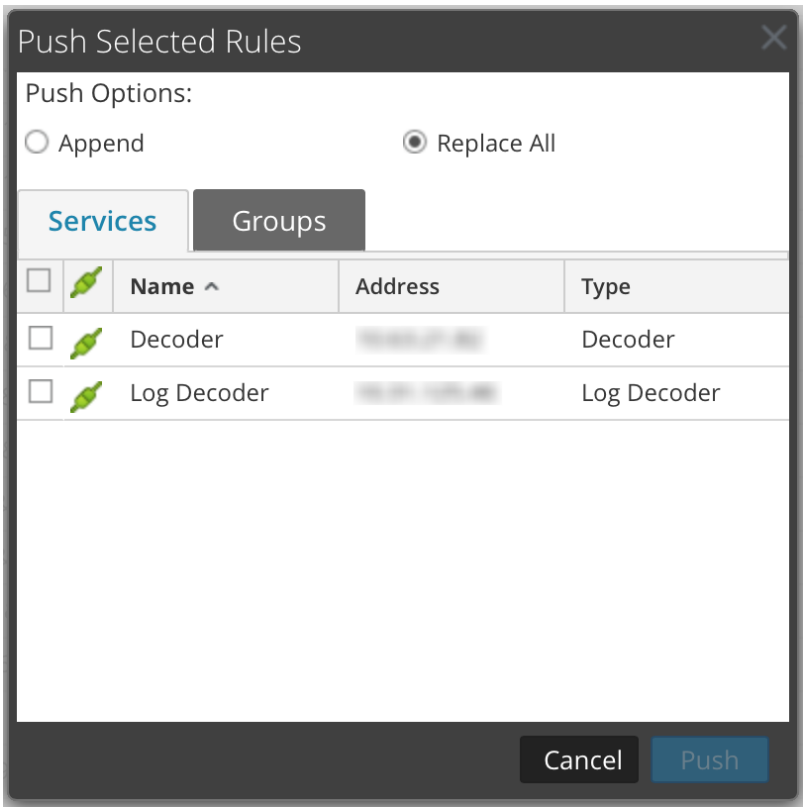


You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
   - Select 

 > Push > Selection.



- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.

3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

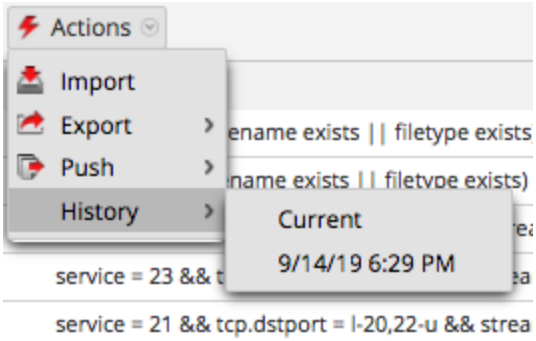
To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions **> Push > All**.
   (**Push > All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.

2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:



- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

Restore a Rule Snapshot from History

NetWitness keeps the last ten snapshots of rules applied to a service.

To restore a rules snapshot from history:

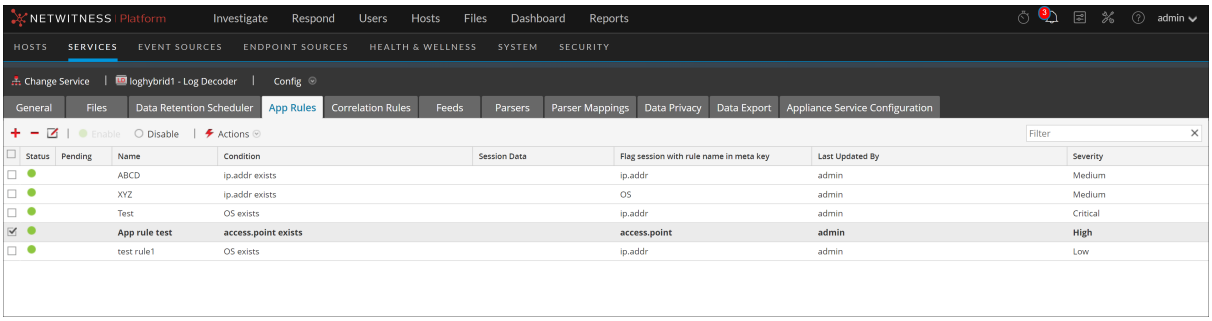
1. Select Actions > **History**.
   A submenu of snapshots is displayed.

2. Select the snapshot time from the submenu.
   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.
3. To apply the rules to the service, click **Apply**.
   The rules are applied to the service.

Configure Application Rules

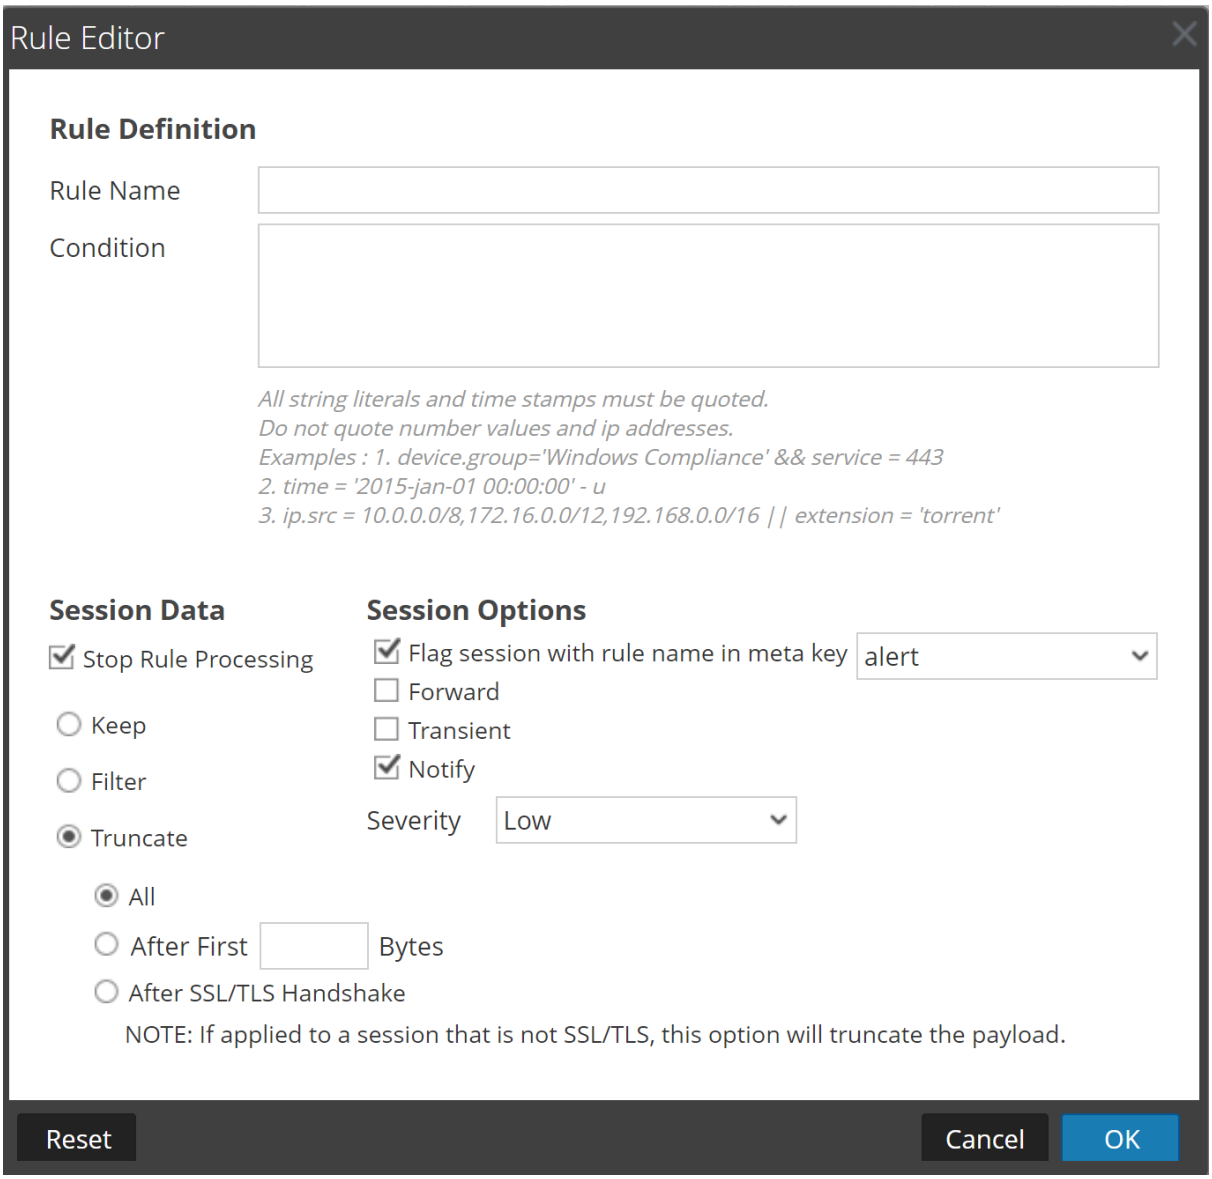
Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:



- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate All

To retain email to and from a specific e-mail address, create a rule as follows:



- Rule Name: Retain Email Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Keep

To add or edit an application rule

1. Go to  (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and  > **View** > **Config**.
   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.

4. Do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
5. The Rule Editor Dialog is displayed with application rule parameters.

a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.

b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.

   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.

d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:

- **Keep**: The packet payload and associated meta are saved when they match the rule.
- **Filter**: The packet is not saved when it matches the rule.
- **Truncate**: Select a truncate option to execute when a packet matches the rule. The example uses the **All** option.
- **Truncate All** to save the packet headers and associated metadata, and do not save the packet payload.
- **Truncate After First <n> Bytes** to save the packet headers and associated metadata, and do not save the packet payload after the specified first <n> bytes, where <n> is a number of bytes.
- **Truncate SSL/TLS Handshake** to truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.

e. In the **Session Options** section, do any of the following:

- Enable the **Flag session with rule name in meta key** and select the metadata for the alert from the drop-down list, which generates a custom alert when metadata matches the rule. This is mandatory.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.
- Enable the **Notify** option to choose the **Severity** level from the drop-down menu for the application rule created. The available options are listed below:
  - Low
  - Medium
  - High
  - Critical

  Note: Severity is selected by default as **Low**.

6. To save the rule and add it to the grid, click **OK**.

   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.

7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.

NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Monitor Application Rules

The Decoder and Log Decoder keep track of how many times each application rule matches a session. These stats can be viewed by connecting to the Decoder or Log Decoder Explore view and viewing the properties on the `/decoder/config/rules/application` folder. Then, send the command "`statdump`" to that folder. The output of this message is a listing of the number of times each application rule is hit. The listing is ordered in the same order as the contents of the rule definitions in the `/decoder/config/rules/application` folder. For example, on a system with three application rules:

```
0001: hits=6543 loaded=true
0002: hits=9294 loaded=true
0003: hits=43 loaded=true
```

The hit counters for the application rules are reset whenever the parsers are reloaded.

Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

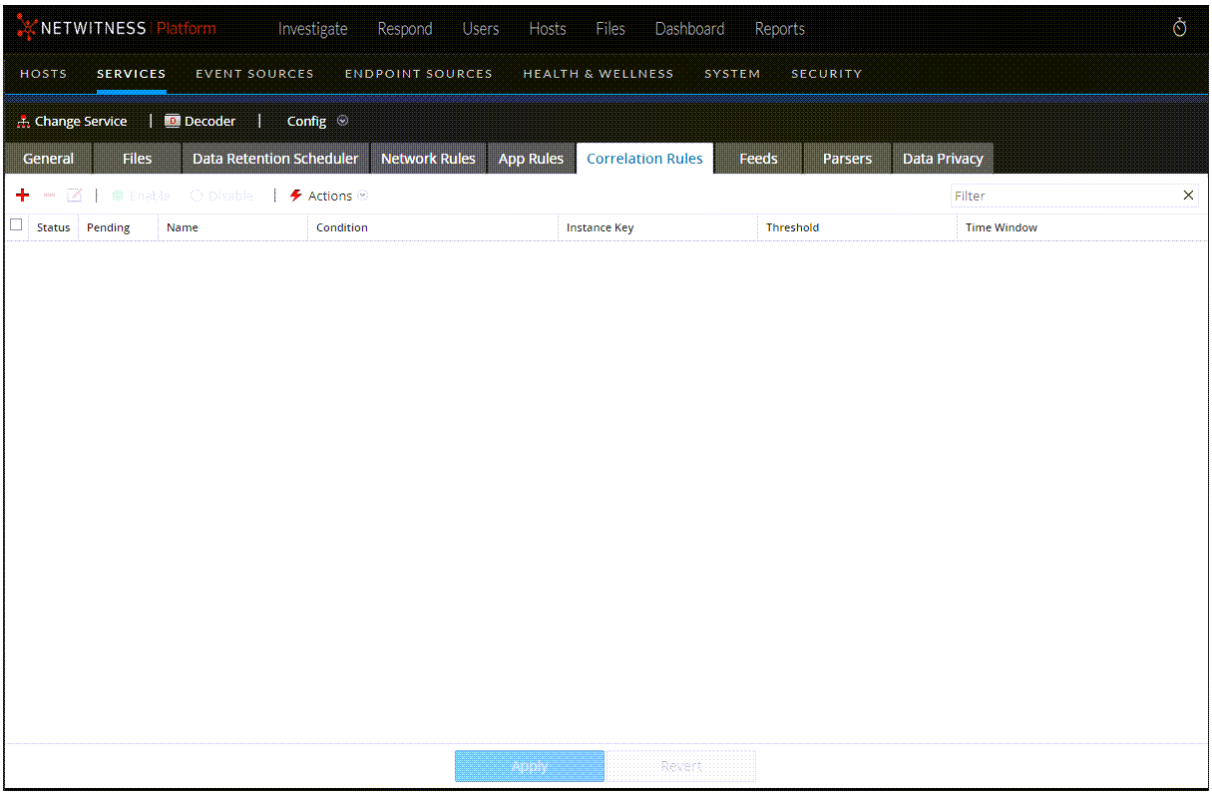
The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where `port.dst` exists, if there is any combination of ip.src and ip.dst where the count of unique instances of `port.dst > 5` within one minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `port.dst exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(port.dst)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within five minutes, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv4 Potential Brute Force 10
- Rule: action=`'login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

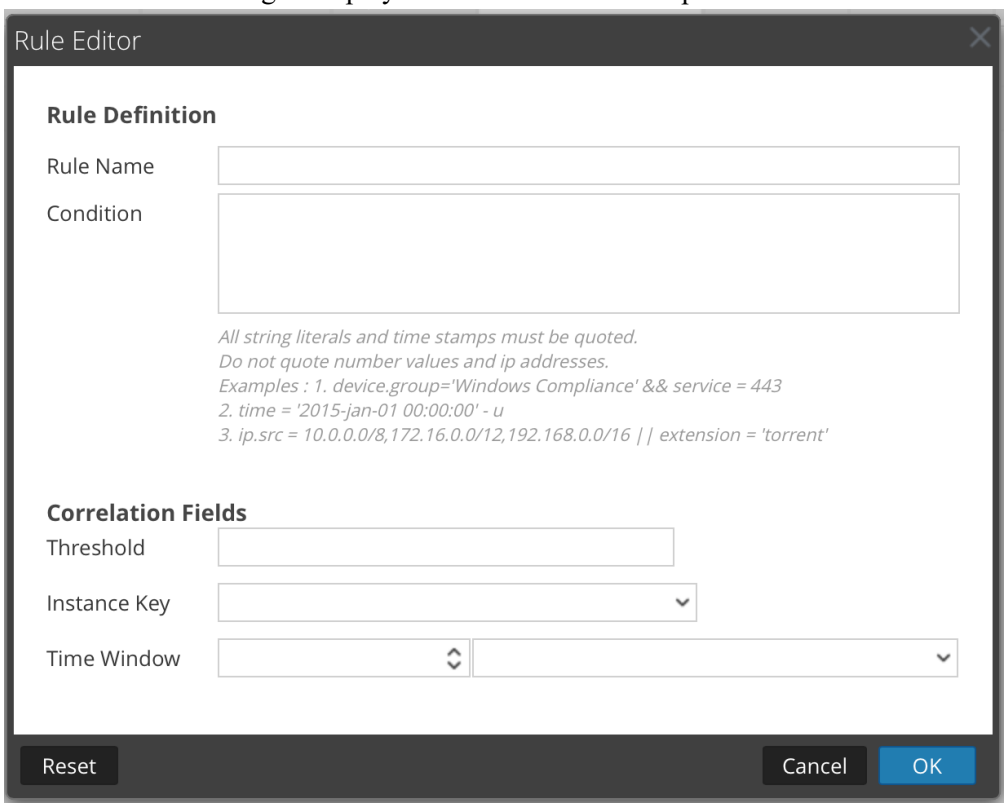


Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `port.dst`. We are counting unique instances of `port.dst` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

Invalid use case: In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

To add or edit a correlation rule

1. Go to  (Admin) > **Services**, select a service, and click  > **View** > **Config**.
   The Service Config view for the selected service is displayed.



2. Select the **Correlation Rules** tab.

3. In the **Correlation Rules** tab, do one of the following:

   - If adding a new rule, click .

- If editing a rule, select the rule from the rules grid and click .
  The Rule Editor dialog is displayed with correlation rule parameters.

4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - `u_count(associated_key)` = the count of unique values of the specified key
   - `sum(associated_key)` = the values of the specified key
   - `count` = number of sessions (no associated key is specified)
7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).

8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to Network Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

Note: Because network rules are applied on the packet level, you must specify both the source and destination meta keys in the rule condition. This is because the packet flow can occur on both sides at the packet level, while the directions are still not determined. For example, if you want to filter traffic on port 553 and port 55553, the condition should be written as follows:
`port.src=553 || port.dst=553 || port.src=55553 || port.dst=55553`
You must also specify both the source and destination meta keys in the conditions for `ip.src` and `ip.dst`. Specifying only source or destination in the condition will not work as expected.

Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness supports for use in network rule conditions.

Meta Key	Description
`eth.addr`	Ethernet source or destination address. Commonly known as the MAC address.
`eth.dst`	Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value (s).
`eth.src`	Same as Ethernet destination except that it focuses on the source address.
`eth.type`	Ethernet frame type.
`hdlc.type`	Frame type of the HDLC frame.
`alias.ip`	IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.dst`	Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.proto`	IPv4 protocol field.
`ip.src`	Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`alias.ipv6`	IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation.

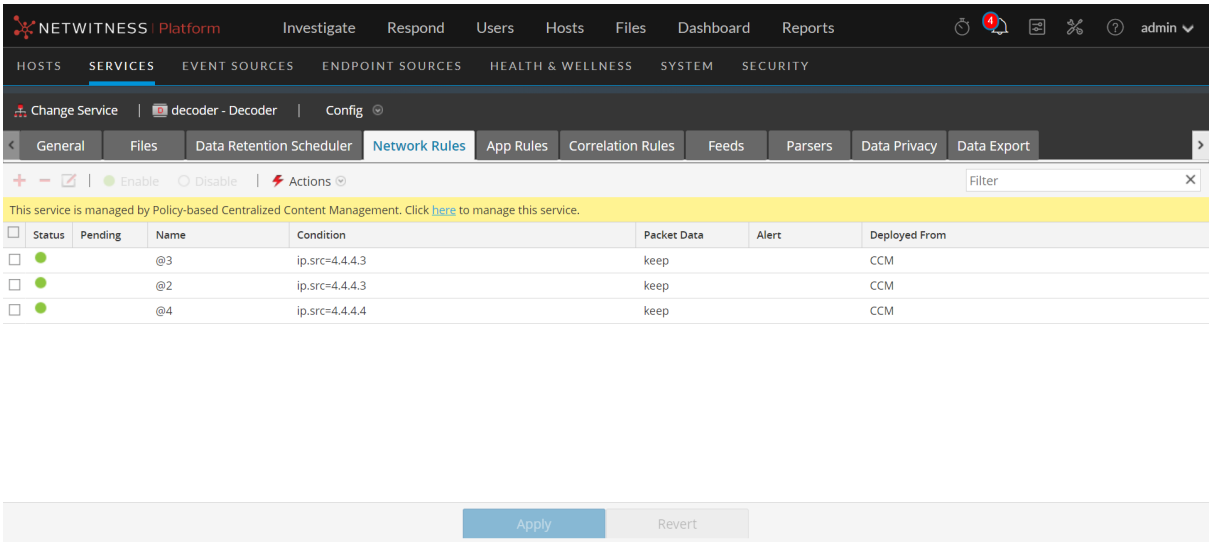
Meta Key	Description
ipv6.dst	Destination IPv6 address in hex format.
ip.proto	IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field.
ipv6.src	Source IPv6 address in hex format.
port.dst	Destination TCP port.
tcp.port	TCP source or destination port.
port.src	Source TCP port.
port.dst	Destination UDP port.
udp.port	UDP source or destination port.
port.src	Source UDP port.

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

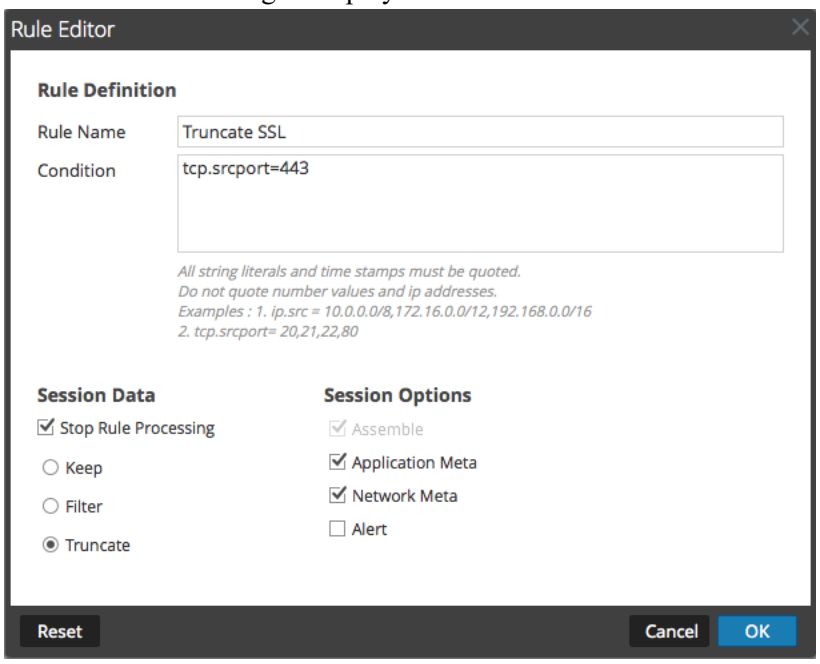
- Rule Name: Truncate SSL
- Condition: `port.src=443`
- Rule Action: Truncate

To filter subnet traffic, create a rule as follows:



- Rule Name: Subnet Filter
- Condition: `alias.ip=192.168.2.0/24`
- Rule Action: Filter

Meta entities, which provide a way to work with several meta keys at the same time, can be used in application rules, but are not supported in network rules as the metadata available are too limited. For more information on meta entities, see the *Core Database Tuning Guide*.



To add or edit a network rule:

1. Go to  (Admin) > **Services**, select a Decoder service, and  **> View > Config**.
   The Services Config view for the selected service is displayed.

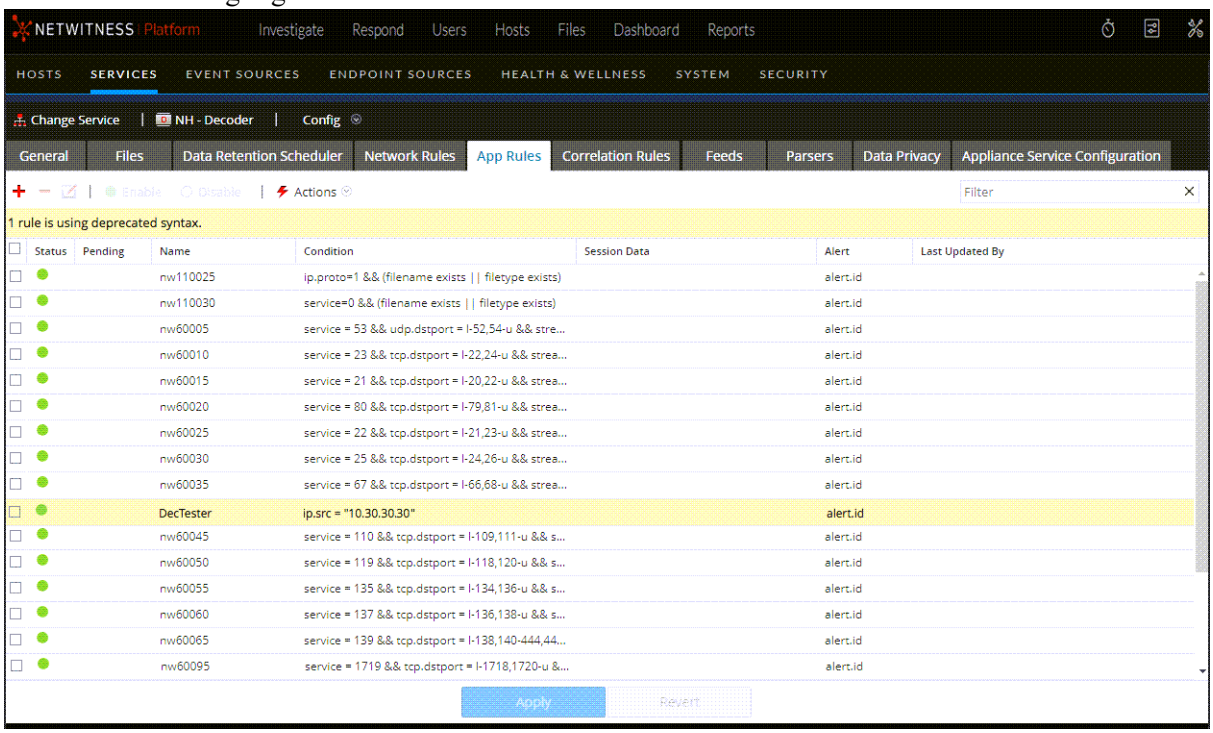
2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.

3. In the **Network Rules** tab, do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
     The Rule Editor dialog is displayed.

4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta values from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to

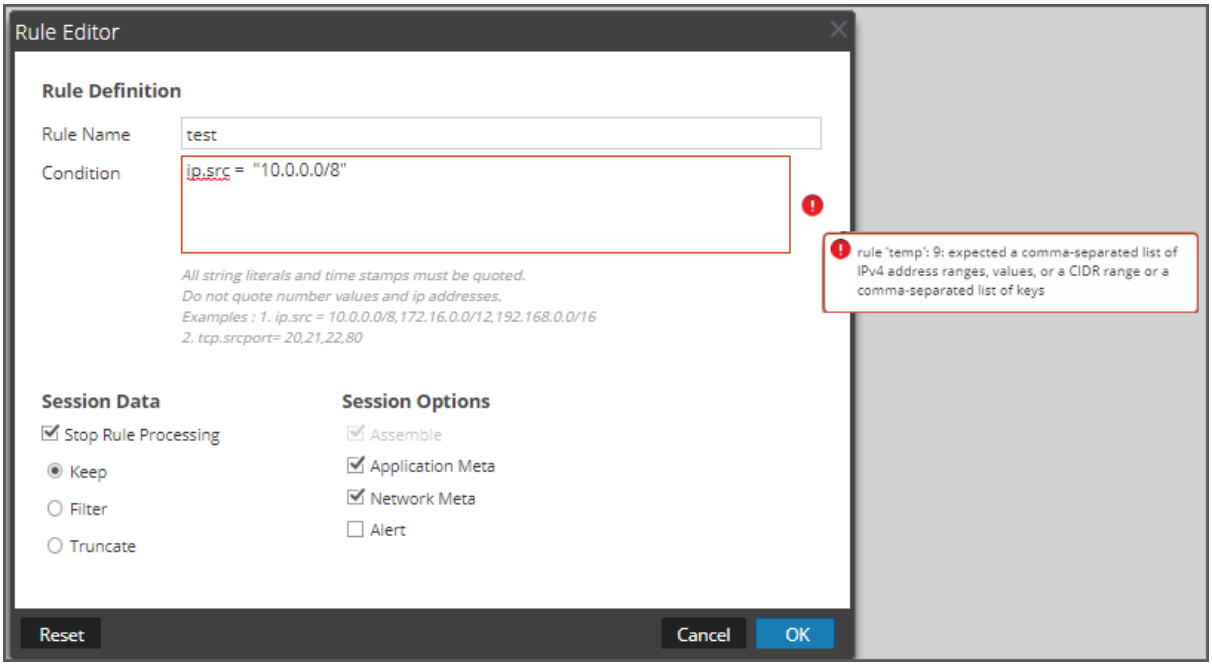
truncate all SSL from the source port, **`tcp.srcport=443`**.

All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness supports for use in network rule conditions.



6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated metadata are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.
8. In the **Session Options** section, select all options that apply of these four.
   - **Assemble**: The assembler assembles the packet chain when it matches the rule.
   - **Network Meta:** The packet generates network metadata when it matches the rule.
   - **Application Meta**: The packet generates application metadata when it matches the rule.
   - **Alert**: The packet generates a custom alert when metadata matches the rule.
9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Fix Rules with Invalid Syntax



After an update to NetWitness 11.x, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness must follow.

To correct rules with invalid syntax:

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.

4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule.

5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`
6. Do one of the following:
   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all NetWitness APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1 alert=ioc name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian federation\"" name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string, params`, `binary`, and `params-binary`.

Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=ioc
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_
Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command, use the `replace` command.

```
send /decoder/config/rules/application replace --file-
data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-
stream" --data-binary @<pathname> -X POST
"http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge
1="rule=\"ip.src=192.168.0.1\" name=first keep"
2="rule=\"ip.src=192.168.1.1\" name=second alert=ioc"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D
%22ip.src%3D192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168
.1.1%22%20name%3Dsecond%20alert%3Dioc&3=rule%3D%22ip.src%3D192.168.2.1%22%20n
ame%3Dthird%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

Note: Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

```
0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep
0002 : rule="ip.src=192.168.1.1" name=second alert=ioc
0003 : rule="ip.src=192.168.2.1" name=third filter
```

And you want to merge the following four rules:

```
rule="ip.src=192.168.3.1" name=third keep
rule="ip.dst=192.168.4.1" name=NewRule filter order=0
rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
rule="service=80,443" name=web filter order=3
```

Use any method to push your rules and this is what you end up with:

```
0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1
0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2
0003 : rule="service=80,443" name=web filter order=3
0004 : rule="ip.src=192.168.1.1" name=second alert=ioc order=4
0005 : rule="ip.src=192.168.3.1" name=third keep order=5
0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6
```

Are there any surprises here? This is how each rule was processed.

```
1. rule="ip.src=192.168.3.1" name=third keep
```

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

```
2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0
```

This rule is new and had `order=0` in it, which means insert at the very top.

```
3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
```

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

```
4. rule="service=80,443" name=web filter order=3
```

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a NetWitness Rule File :

```
send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string
```

This is an example of the `replace` command using Numbered Parameters :

```
send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=ioc"
```

clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

delete Command

The `delete` command deletes one or more rules on the service.

```
delete atPos <uint32> count <uint32, optional>
```

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

```
validate rule <string>
```

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

Configure Parsers and Feeds

Parsers and feeds are responsible for analyzing the packets and logs when captured or imported in Decoders. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

See the following sections for details about configuring parsers and feeds.

- Configure Parsers
- Configure Feeds

Configure Parsers

NetWitness has a set of native parsers that are defined by the system, and also provides the option to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

There are also several types of custom configurable parsers:

- GeoIP2 – This parser associates IP addresses with geographical locations. For new installations and upgrades, the GeoIP2 parser is enabled by default. For more information on these parsers, see GeoIP2 Parsers.
- Search – This parser is user-configured to generate metadata by scanning for pre-defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- Log – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- Snort® – This parser supports the payload detection capabilities of Snort IDS rules. Snort rules and configuration are added to the `parsers/snort` directory for Investigation and Decoder (see Decoder Snort Detection).

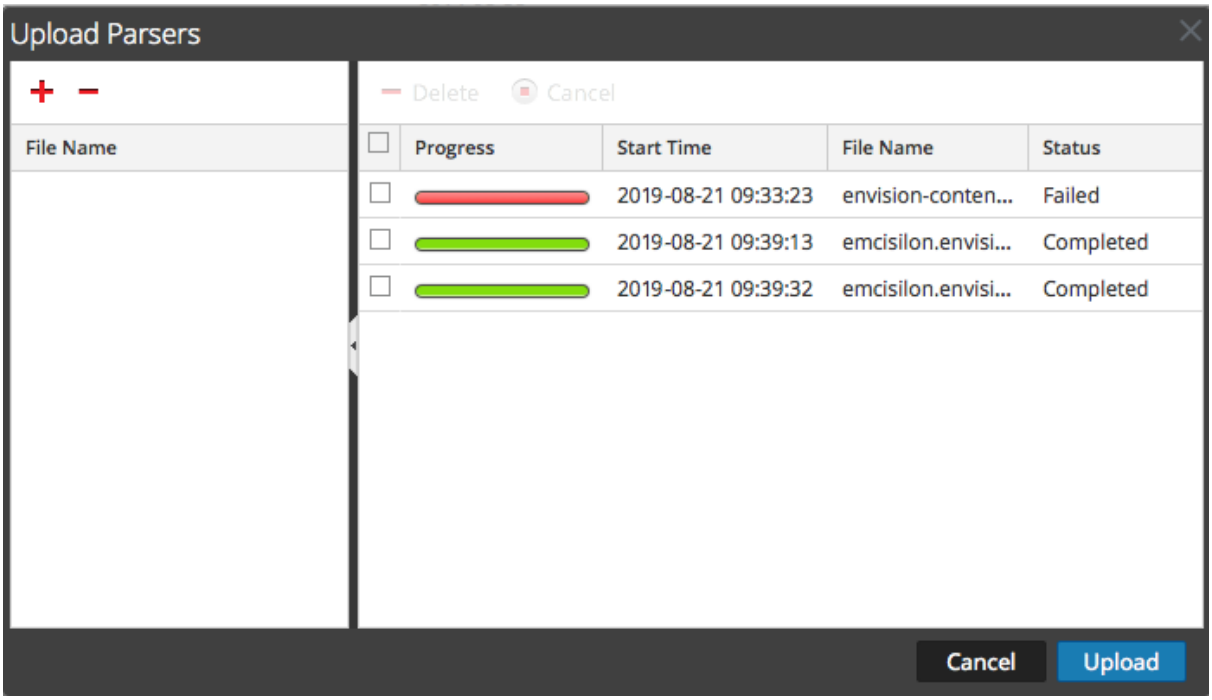
In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

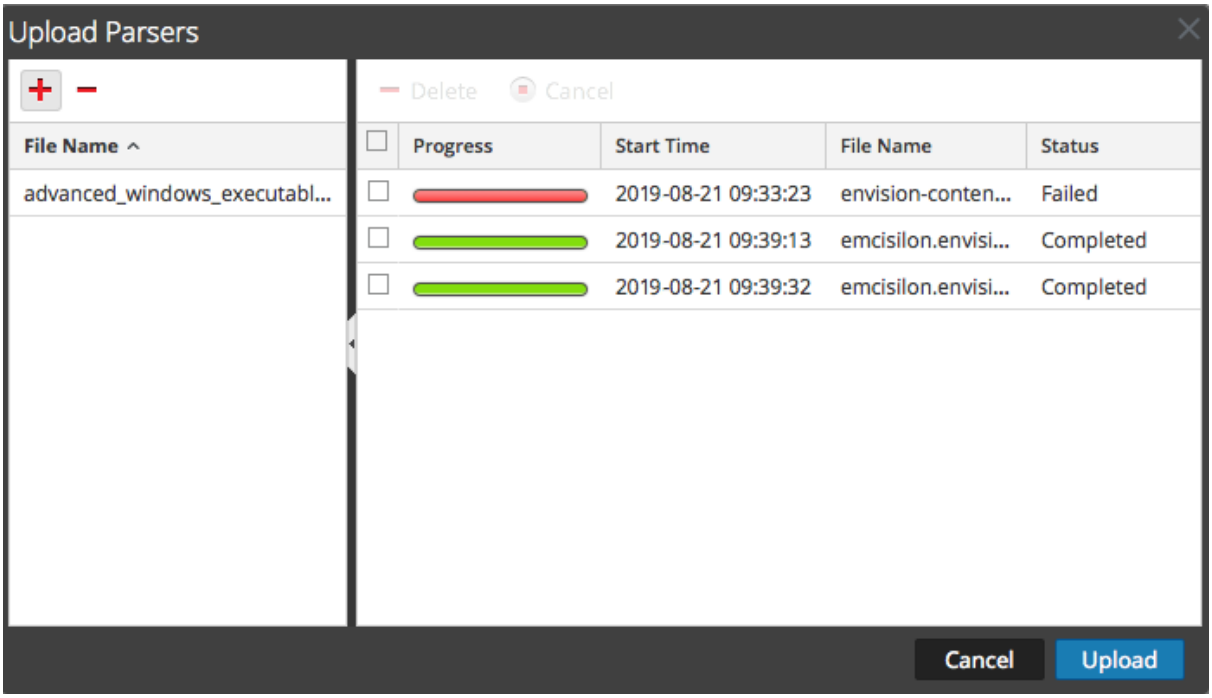
In addition, you can download parsers using NetWitness Live Services.

Upload and Delete Custom Parsers



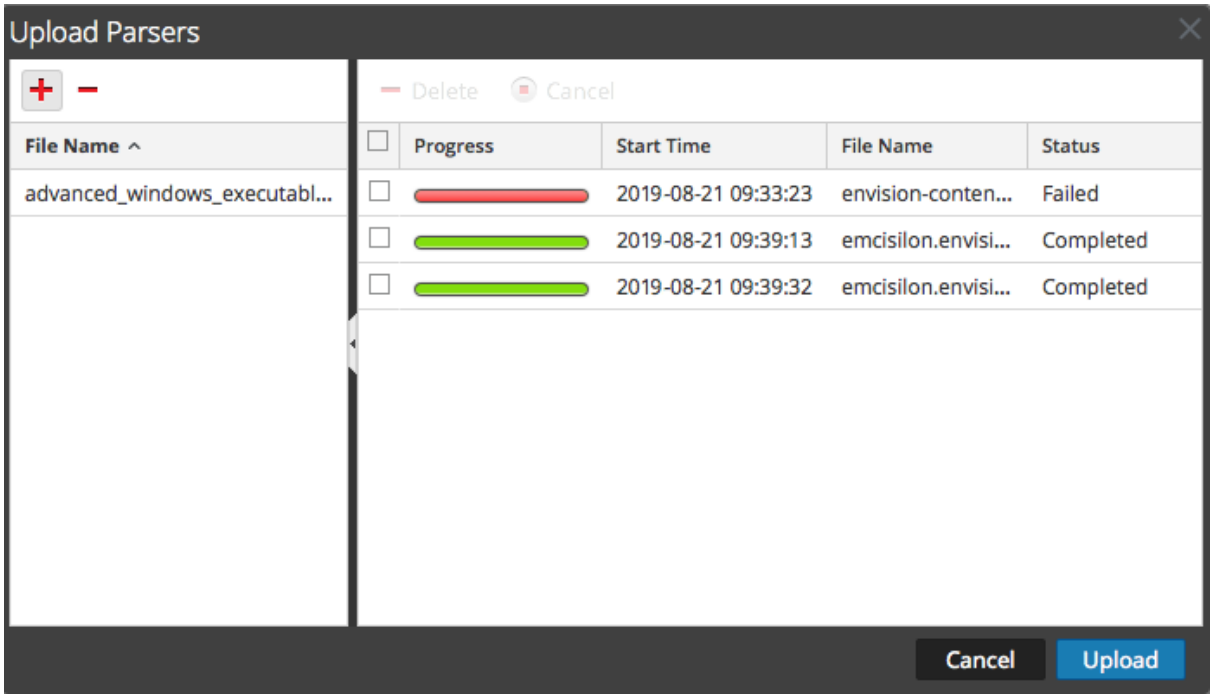
NetWitness has the ability to upload parsers from your local system and delete these parsers.

Upload Parsers to a Decoder or Log Decoder



The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

1. Go to  (Admin) > **Services**, select a service, and click  **> View > Config.**
   The Config view for the selected service is displayed.
2. Click the **Parsers** tab.



3. Click Upload.
   The Upload Parsers dialog is displayed.

4. Click .
   A file selection dialog is displayed.
5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.
   The dialog closes, and the selected files are displayed in the File list.

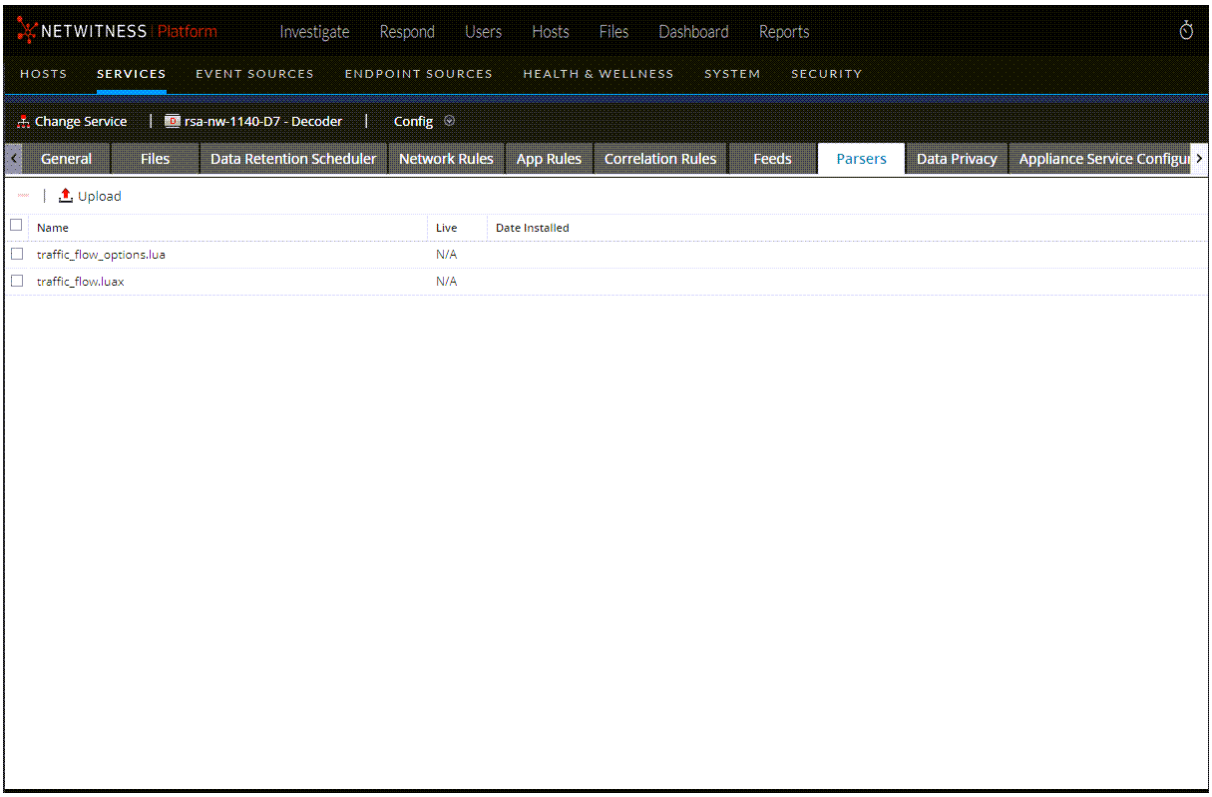
6. Click **Upload**.
   The Upload Job grid shows the progress of the upload jobs with each job representing a file being uploaded.

7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click .



Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to (Admin) > **Services**, select a Decoder, and > **View** > **Config.**
   The Services Config view for the selected service is displayed.
2. Click the **Parsers** tab.

3. In the **Parsers** tab, select one or more parsers to delete.
4. Click −.
   A dialog requests confirmation that you want to delete the parsers.
5. If you want to delete the parsers, click **Yes**.
   The parsers are removed from the Decoder immediately.

Enable and Configure the Entropy Parser

Beginning with NetWitness 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may be worthy of investigation.

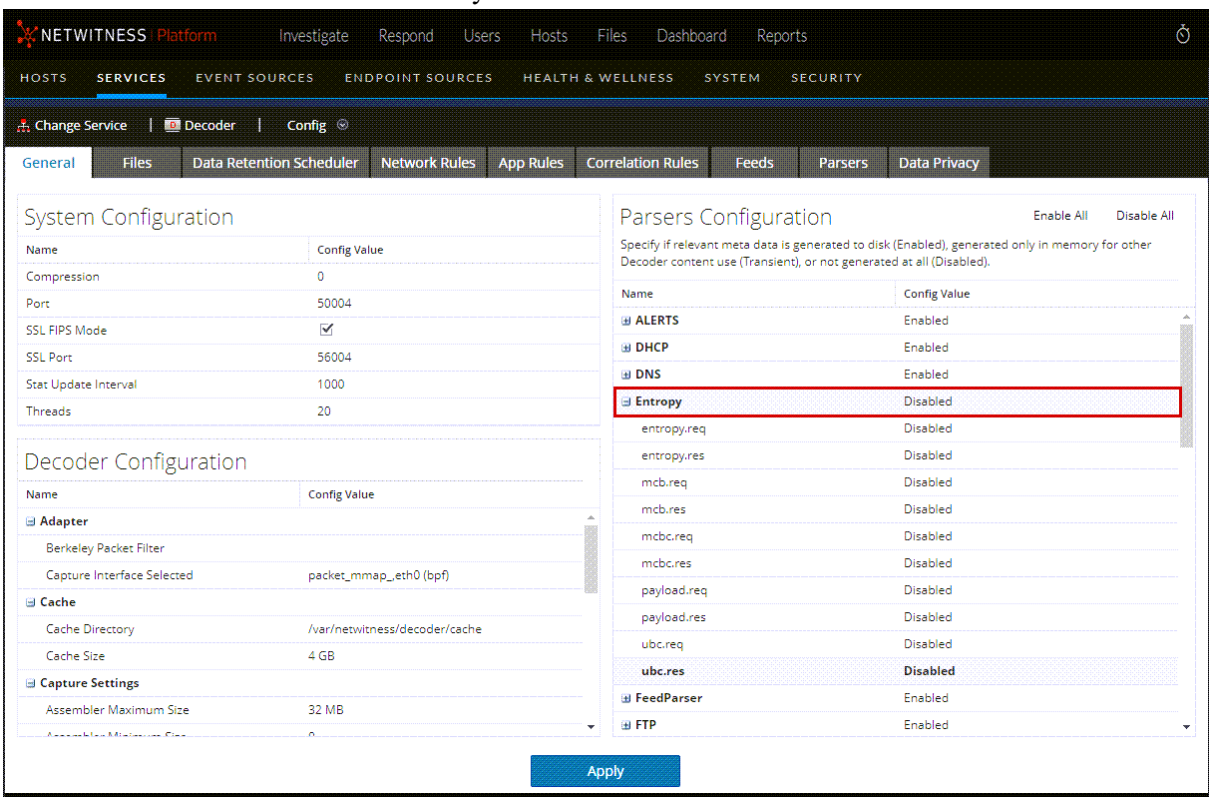
The parser creates meta keys, based on statistics collected by the native NetWitness parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

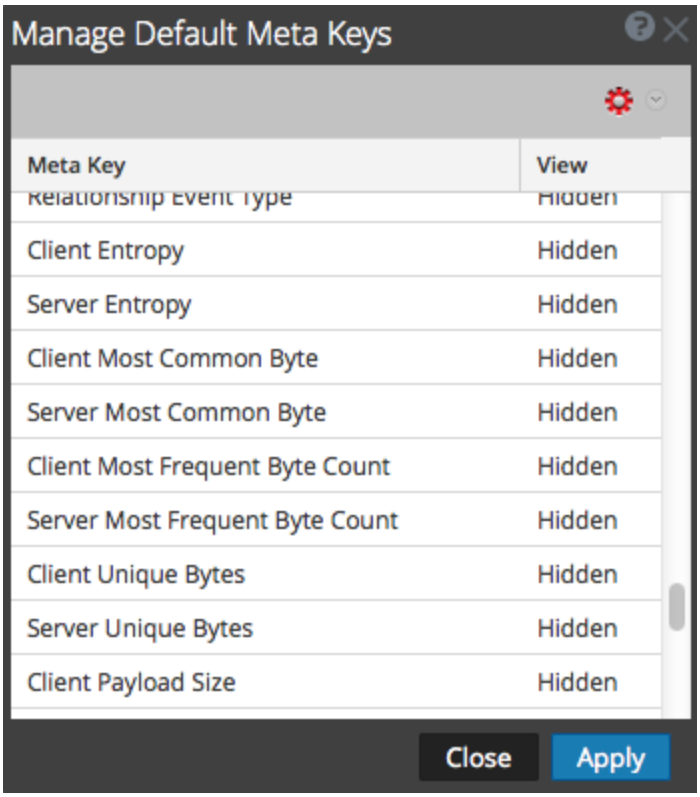
However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

NetWitness does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.



These are the new meta keys generated by the Entropy parser by default:

- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.



To enable and configure the Entropy parser on a Decoder:

1. Go to  (Admin) > **Services**, select a Decoder service and click  **View > Config**.
   The Services Config view for the selected Decoder is displayed.
2. The Entropy parser is disabled by default. Click the drop-down list for **Entropy** in the **Config Value** column, and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list

and select **Disabled** next to the meta key.

3. Click **Apply**.
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.
4. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below in Entropy Parser Configuration in the Concentrator Custom Index File.
5. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.

Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

```
<!-- This section is commented out because it's only used by the Entropy
parser which is disabled by default. To enable this part of the language, copy
to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note
that depending on how the Entropy parser is configured, the entropy.req and
entropy.res format might be a Float32 instead of a UInt16. So make sure to
change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring
this for interesting sessions based on payload byte analysis of the packets.
By default, to make indexing easier, the normal Float32 value for entropy.req
and entropy.res is multiplied by 10k and stored in a UInt16 (thus giving 4
digits of precision, 0 to 10,000). However, if you define the entropy.* fields
in the Decoder language to be Float32, it will store it as a float with a
range of 0.0 to 1.0. Take care to change the language everywhere if you decide
to keep it as a Float32. We do not recommend indexing as a Float32 because of
the high unique counts due to minute changes in precision. -->

<!--

<key description="Entropy Request (Client)" format="UInt16" level="IndexNone"
name="entropy.req" valueMax="10001"/>

<key description="Entropy Response (Server)" format="UInt16" level="IndexNone"
name="entropy.res" valueMax="10001"/>

-->
```

```
<!-- The most common byte is simply which byte for each side (0 thru 255) was
seen the most -->

<!--

<!-- The payload size metrics are the payload sizes of each session side at
the time of parsing. However, in order to keep indexing from having high
unique counts (bad for performance), the two payload size metas below are
indexed in buckets. -->

<!--

<key description="Payload Size Request" format="UInt32" level="IndexNone"
bucket="true" name="payload.req" valueMax="500000"/>

<key description="Payload Size Response" format="UInt32" level="IndexNone"
bucket="true" name="payload.res" valueMax="500000"/>

-->
```

Flex Parsers

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non-internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser. A parser node can have an optional **declaration** node and any number of **match** nodes.

Topics

- Arithmetic Functions
- Common Parser Operations
- General Functions
- Logging Functions
- Nodes
- Payload Functions
- Regex
- String Functions

Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

Language Definition

The following table provides language definitions.

Node Name	Attribute Name	Description
`and`		Performs bitwise AND between two numbers.
	`name`	Variable to AND result into.
	`value`	Number to AND into result.
`or`		Performs bitwise OR between two numbers.
	`name`	Variable to OR result into.
	`value`	Number to OR into result.
`increment`		Performs ADDITION of two numbers.
	`name`	Variable containing the initial value AND to receive ADDITION results.
	`value`	Number to ADD to initial value.
`decrement`		Performs SUBTRACTION of two numbers.
	`name`	Variable containing initial value AND to receive SUBTRACTION results.
	`value`	Number to SUBTRACT from initial value.
`divide`		Performs DIVISION of two numbers.
	`name`	Variable containing the initial value AND to receive DIVISION results.
	`value`	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
`modulo`		Performs MODULO of two numbers.
	`name`	Variable containing the initial value AND to receive MODULO results.

Node Name	Attribute Name	Description
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
multiply		Performs MULTIPLICATION of two numbers.
	name	Variable containing the initial value AND to receive MULTIPLICATION results.
	value	Number by which to MULTIPLY the initial value.
shiftleft		Performs a binary shift left.
	name	Variable containing the initial value AND to receive shift results.
	value	Number of bits to shift by.
shiftright		Performs a binary shift right.
	name	Variable containing the inital value AND to receive shift results.
	value	Number of bits to shift by.

Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
               <if name="state" equal="1" />
                    <identify />
               </if>
          </match>
     </parser>
```

```
</parsers>
```

Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens" service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
```

```
     </parser>
</parsers>
```

Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001 Microsoft
               Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

General Functions

This topic defines language for the flex parser general functions.

General Functions Language Definition

Node Name	Attribute Name	Description
apptype		Gets the currently defined service type for the current session.
	name	A number variable to receive the current service type.
identify		Marks the session with the parser's service type if the service type has not already been identified.
assign		Assigns a value to a variable.
	name	The unique identifier assigned to the item in the declaration section.
	value	Optional. If specified, the action defined in the match is only applied when the declaration matches the given value.
getmeta		Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback.
	name	The variable to receive the value of the meta key that generated the callback.
gettoken		Returns the current matched token.
	name	A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string.
end		This terminates the execution of the current **match** section.
if		Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the **declaration** section.
	equal notequal less lessequal greater greaterequal and or	The operation value to compare. If true, any sub-actions are executed.
register		Adds metadata to the session.

Node Name	Attribute Name	Description
	name	The unique identifier of a meta variable to be created, as defined in the **declaration** section.
	value	The value of the metadata to be created.
while		Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the declaration section.
	equal notequal less lessequal greater greaterequal and or	Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables.
call		Executes the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared.
	value	The name of the match element, or a string variable containing the name of a match element. • If the match element name is specified, the parser will not load if the named matched element doesn't exist. • If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element. • If no **match** element can be found matching the string value, no action is taken.

Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

Language Definition

Node Name	Attribute Name	Description
`failure`		Logs a message to the system log with the log level **Failure.**
	`value`	A string to include as the log message.
`warning`		Logs a message to the system log with the log level **Warning.**
	`value`	A string to include as the log message.
`info`		Logs a message to the system log with the log level **Info**.
	`value`	A string to include as the log message.
`debug`		Logs a message to the system log with the log level **Debug.**
	`value`	A string to include as the log message.

Nodes

This topic defines language for the flex parser nodes.

Nodes Language Definition

Node Name	Attribute Name	Description
`parsers`		The root node in each definition file.
	`xmins:xsi`	Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance
	`xsi:noNamespaceSchemaLocation`	Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd
`parser`		The node that defines a single parser definition. This node must be directly under the `parsers` node. There can be more than one per file.
	`name`	The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z].
	`desc`	Provides a friendly description of what the parser does.
	`service`	The unique number assigned to the session when identified.
`declaration`		Delineates the definition. Each of these definitions can have an associated `match` entry.

Node Name	Attribute Name	Description
token		Specifies a definition for identifying a token somewhere in the session protocol. This defines a match callback when the specified tokens are encountered in a session payload. The read position is set to the byte immediately following the matched token.
	name	This is a unique identifier for the declaration.
	value	This is the exact token value to be identified.
	options	Options specify that the token should start on a new line or at an end of a line (linestart or linestop).
meta-callback		Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (for example, 80 for HTTP).
	name	Name of the match element to be executed when a callback occurs. (String)
	key	Name of the meta key that generates callbacks. (String)
	format	The data type of the meta key that will generate the meta.
	apptype	The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional)
number		Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values.
	name	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
`string`		Defines a numeric variable that can be referenced elsewhere within the parser definition.
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
port		Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	This is the port number to identify.
`session`		Defines a `match` callback for session begin/end events. These events only occur if a token for the parser is encountered in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	Specifies that processing takes place at the beginning of a new session or at the end of a session (`begin` or `end`).
`stream`		Defines a `match` callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream.
	`name`	This is a unique identifier for the declaration

Node Name	Attribute Name	Description
	`value`	Specifies that processing takes place at the beginning or at the end of a stream (`begin` or `end`).
`function`		Defines a `match` section that can be used as a generic function. No callbacks are associated with this declaration.
	`name`	This is a unique identifier for the declaration.
`meta`		Defines the type of data that the parser will create.
	`key`	Specifies the key name. The key needs to be 1-16 bytes in size.
	`format`	Specifies the variant type (for example, **`Text`**, **`IPv4`**, **`UInt32`**). Refer to the SDK documentation for a full list.
`pattern`		Defines a regular expression variable for use by the `regex` function
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
	`value` (optional)	Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **`scope attribute`** is set to `constant`.
`match`		The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element: • General • Arithmetic • String • Payload

Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

Language Definition

Node Name	Attribute Name	Description
`find`		Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute.
	`name`	A `number` variable to receive the offset from the `read` position where the match begins.
	`value`	A string to find.
	`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`install-decoder`		To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead.
	`type`	The type of decoder to install. Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate.
	`offset`	Offset from the current read position to begin decoding.
	`length`	The maximum payload length to decode.
`isdecoding`		Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters.

Node Name	Attribute Name	Description
`move`		Moves the `read` position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the `read` position is updated and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`value`	The number of bytes to move the `read` position.
	`direction` (optional)	The direction to move the current read position. Can be `forward` (default) or **`reverse.`**
`packetid`		Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined.
	`name`	A number variable to receive the current packet id.
`payload-position`		Returns the current read position. This is a zero based index into the stream payload.
	`name`	A number variable to receive the current read position.
`read`		Reads a specified number of bytes starting at the `read` position into a variable. If there is sufficient data in the stream, the `read` position is updated, the data read assigned, and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`name`	The name of a `string` or `number` variable to receive stream data. If a `number` variable is provided, the bytes read are interpreted as a single unsigned numeric value.
	`length`	The number of bytes to read from a stream.
	`endianess` (optional)	The byte ordering to use when reading into a number variable. Can be `big` (default) or `little`. The attribute is invalid when reading into a `string` variable.

Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

Language Definition

Attribute Name	Description
`name`	A `number` variable to receive the offset from the `read` position where the match begins.
`value`	A regular expression to find.
`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`found` (optional)	The name of a `string` variable to receive a matched string.

String Functions

This topic provides language definitions for the flex parser string functions.

String Functions Language Definition

Node Name	Attribute Name	Description
`append`		Attaches a number or string to the end of a `string` variable.
	`name`	The unique identifier of a string variable to which the specified value is to be attached.
	`value`	A number or string to attach.
`find`		Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute.
	`name`	A `number` variable to receive the zero-based position, where the provided value string was found in the **in** string.
	`value`	A string to find.
	`in`	A string to search.
	`length` (optional)	A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched.
`length`		Assigns the length of a string to a `number` variable.
	`name`	A `number` variable to receive the length of the specified string.
	`value`	A string value whose length is to be determined.
`regex`		Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance.
	`name`	A number variable to receive the zero-based position, where the provided regular expression matched in the in string.
	`value`	A regular expression to be searched for.

Node Name	Attribute Name	Description
	in	A string to search.
	length (optional)	A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched.
	found (optional)	The name of a string variable to receive the matched string.
substring		At least one of the optional attributes from and length must be specified.
	name	The unique identifier of a string variable to receive the extracted value.
	value	A string value from which to extract a substring.
	from (optional)	The zero-based position from which to begin the substring. If not specified, it defaults to zero.
	length (optional)	The number of characters to extract. If not specified, it defaults to the remaining length of the string.
tolower		Converts a string to all lowercase letters.
	name	The name of a string variable to process.
toupper		Converts a string to all uppercase letters.
	name	The name of a string variable to process.
urldecode		Decodes a string containing url-encoded characters.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
base64decode		Decodes a base-64 encoded string.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
uudecode		Decode a uuencoded string.
	name	A string variable to receive the decoded string.
	value	A uuencoded string. The header and trailing lines should not be included.
quotedprintabledecode		Decode a Quoted-printable encoded string.
	name	A string variable to receive the decoded string.
	value	A quoted-printable encoded string.

Node Name	Attribute Name	Description
convert-ebcdic		Convert an EBCDIC string to its ASCII equivalent.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.

GeoIP2 Parsers

This topic describes the GeoIP2 parser for Decoders. This parser converts IP addresses into geographic locations, such as the country name and city where the IP address is typically found.

Note: In version 11.3 and later, the native GeoIP2 parser replaces the GeoIP parser (which has been permanently removed). The GeoIP2 parser provides the same basic functionality as the GeoIP parser as well as many enhancements. For example, it converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4.

Available in NetWitness version 11.2 or later, the GeoIP2 Parser is enabled by default for upgrades and new installations. The GeoIP2 parser provides the latest Maxmind GeoIP package and supports IPv6 addresses as well as IPv4.

To edit the GeoIP2 parser configuration:

1. Go to  (Admin) > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon () and select **View** > **Config**. In the Parsers Configuration panel, select **GeoIP2** to view and update configuration options.
4. Define the IP addresses to lookup. The GeoIP2 parser enables the following IP addresses by default: `ip.src`, `ip.dst`, `ipv6.src`, and `ipv6.dst`. You can update options by using `parsers.options` to remove or add new IP addresses. For example, you can edit `parsers.options` and pass a comma-separated list of IP addresses to use as follows:
   `GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst,alias.ip"`
   This adds a new IP address to lookup called `ip.addr`. However, since `alias.ip` does not end in `.src` or `.dst`, the parser will elect to place the GeoIP2 metadata generated in meta keys without a `.src` or `.dst` suffix. So, you would see country, city, and so on, after the `alias.ip` metadata.
5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Note: The list you pass for `alias.ip` replaces the default list. So, if you pass `alias.ip=ip.src`, it generates only GeoIP2 metadata for `ip.src`, and generates no metadata for other IP addresses.

Note: `parsers.options` is used for passing options to multiple parsers. So if you add GeoIP2 to it, you should not delete any other options being passed to other parsers (like Entropy).

The following table provides the full list of metadata that the GeoIP2 parser can potentially generate and indicates which metadata is or is not enabled by default:

Enabled by Default	Not Enabled
country, country.src, country.dst	latdec, latdec.src, latdec.dst
	longdec, longdec.src, longdec.dst
domain, domain.src, domain.dst	isp, isp.src, isp.dst
org, org.src, org.dst	city, city.src, city.dst

You can enable the other metadata using the standard parser configurations.

Note: By disabling some metadata by default, the GeoIP2 parser does not work the same as the GeoIP parser (which did not, by default, disable any metadata it generated). If you need any of the disabled metadata, you need to enable them (once only) for each Decoder, after upgrading to 11.2 or later. Keep in mind that the `isp` and `org` meta keys usually produce an equivalent value to `domain`.

Lua Parsers

There are a number of Lua parsers available from Live. See NetWitness Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

HTTP Parsers

The HTTP parser is a native parser that is used for Decoders to parse both requests and responses in HTTP messages. In version 11.4 and later, the HTTP parser provides a decompression option.

The decompression option mimics the decompression option in the Lua HTTP parser and is controlled by the `'decompression'` option for the HTTP parser. Parser options are set in the `/decoder/parsers/config/parsers.options` configuration node. To set an option on the HTTP parser, you append an `HTTP=""` clause to the `parsers.options` field so that HTTP can understand the `'decompression'` option.

For example, you could add `HTTP="decompression=true"` to the parser option list to enable decompression of all HTTP compressed bodies.

You can use the following values in the `'decompression'` field.

Value	Description	Example Entry in parsers.options
`true`	Decompress all bodies	`HTTP="decompress=true"`
`false`	Do not decompress. This is the default.	`HTTP="decompress=false"`
`1`	Decompress `application/*` content	`HTTP="decompress=1"`
`2`	Decompress `audio/*` content	`HTTP="decompress=2"`
`4`	Decompress `font/*` content	`HTTP="decompress=4"`
`8`	Decompress `image/*` content	`HTTP="decompress=8"`
`16`	Decompress `message/*` content	`HTTP="decompress=16"`
`32`	Decompress `model/*` content	`HTTP="decompress=32"`
`64`	Decompress `text/*` content	`HTTP="decompress=64"`
`128`	Decompress `video/*` content	`HTTP="decompress=128"`

The numeric values can be combined by addition to search for multiple types of content. For example, if you want to decompress application and text content, use `1 + 64 = 65`, which becomes `HTTP="decompress=65"`.

To set the decompression option:

1. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP="decompress=<option from table>"`.

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Visibility into HTTP/2 Sessions

You can search for metadata items derived from headers and data in the HTTP/2 stream to gain visibility into HTTP/2 sessions. The HTTP/2 parser supports demultiplexing interleaved streams and extracts the application payload for detections in other parsers looking at the tokens in the payload.

To turn on header parsing and decompression for HTTP/2 sessions:

1. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append any option shared below:
   a. For header only parsing.
   Append `HTTP2="headers=true"`
   b. For header parsing and header extraction to other parsers (example: HTTP_lua).
   Append `HTTP2="headers=true extract=headers"`
   c. For header parsing, header extraction and data decompression (example: gzip and brotli encodings).
   Append `HTTP2="headers=true extract=all"`

   Note: On enabling data decompression with `extract=all` the capture rate reduces by 10%.
4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Note: On content reconstruction HTTP/2 compressed streams are automatically detected and decompressed.

To avoid duplicate meta from HTTP/2 parser when Lua parser HTTP_lua is enabled:

1. Disable the HTTP/2 parser.

   To disable parser refer to the topic: Enable and Disable Parsers and Log Parsers
2. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
3. Expand **decoder** > **parsers** and select **config**.
4. Make sure to append `HTTP2="headers=true extract=headers"` or `HTTP2="headers=true extract=all"` in **parsers.options**.

   Note: On enabling data decompression with `extract=all` the capture rate reduces by 10%.

5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

This would make HTTP/2 force enabled but with meta generation disabled, thus avoiding duplicate meta generation.

Decoder Snort Detection

Snort is a free and open-source intrusion prevention system that uses a rule-based language to detect malicious network traffic. The NetWitness Platform Decoder offers compatibility with Snort detection rules, sometimes referred to as Snort signatures. NetWitness supports importing existing Snort rules into the Decoder, extending the known threats that can be detected. There are many sources for Snort rules, as it is an open source solution. In most cases, the behavior of Snort rules in the Decoder is the same as the rules in other network analysis tools. However, the Decoder does not have coverage for all Snort rule options. The topics in this section highlight NetWitness Platform Decoder-specific details of how to set up Snort parsers, how Snort rules are handled, and explain cases where Decoder might differ in behavior from Snort.

Using Snort Rules in Decoders

The Snort Detection engine is implemented as a built-in native parser in Decoders. The parser's identifier is `Snort`, and can be found in the Decoder Parsers Configuration page along with the other native parsers enabled by default. The Snort parser reads files from the directory `/etc/netwitness/ng/parsers/snort`. All files in this directory are read during the Decoder service restart. Files that end in the extension `.conf` are treated as configuration files. The format for configuration files matches the configuration file format for Snort, although not all configuration directives are supported. Further details are in Configuration Directives . Files that end in the extension `.rules` are treated as Snort rules files. A rules file can contain one or more rules, and the Snort directory can contain more than one rules file. The rule file format is the same as for Snort itself. The Snort rule files can be loaded into the Decoder by any of the following methods:

1. The Decoder service starts.
2. The `reload` message is sent to the `/decoder/parsers` folder. This allows for rules to be reloaded while capture is running.

However, note the following:

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however, there are rule options that are not supported by Decoders which are not fully parsed. For more information, see Snort Parser Capabilities .

Note: NetWitness recommends that the maximum number of Snort rules in use per Decoder is 1,000.

Initial Decoder Snort Configuration

Follow these steps to set up an initial configuration of Snort on a Decoder.

1. Edit the `snort.conf` file in the `/etc/netwitness/ng/parsers/snort` directory, and configure it according to the instructions in Configuration Directives , which describes the details of the variables inside the configuration file. If the variables `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` are not defined, they default to the value of `any`.
   A sample `snort.conf` file is shown below, but depending on where the Decoder is placed in the network, and which threats need to be captured, you might need to alter the configuration.
   For example, you can be more specific about the internal subnets by defining `ipvar HOME_NET [192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12]`. However, if the Decoder is capturing

traffic on a DMZ, those subnets might not be accurate.
Also, if `HOME_NET` has been defined, and the `EXTERNAL_NET` has also been narrowed down to `ipvar EXTERNAL_NET !$HOME_NET`, then you may miss lateral movement traffic (for example, `192.168/16` to `192.168/16`) within your environment. In general we suggest you align this configuration file with how you configure the `traffic_flow` configuration for the corresponding Traffic Flow Lua parser.

An example `snort.conf` file that is a good starting point:

```
#Configure the network addresses you are protecting
ipvar HOME_NET any
#Configure the network addresses external to your environment
ipvar EXTERNAL_NET any
#Configure any specific network ports
portvar HTTP_PORTS any
```

2. Generate or upload a Snort rules file into the same directory (`/etc/netwitness/ng/parsers/snort`). Read the Snort documentation at https://www.snort.org/#documents for details on how to construct rules. There are many free community-generated Snort rules available as well, that can be uploaded from https://www.snort.org/downloads/#rule-downloads. Several other sites publish Snort signatures as responses to new threats that are found. The basic rule structure and supported sections are mentioned in Rule Sections.

   Note: Only the Snort V2.x rules are supported. There are some rule options that are not supported, which are described in Snort Parser Capabilities .

3. Make sure the Snort configuration and rules files do not cause any errors when initialized by the Decoder by running the service restart command on the Decoder.
   The reload will check in the Snort rules without restarting, but does not log any messages about whether there are any issues with the rules or configuration.

   a. In the NetWitness user interface, go to  (Admin) > **Services** > **Decoder** >  > **View** > **System**.

   b. Select **Shutdown Service** and confirm. (The Decoder will automatically restart.)

   c. Go to > **Services** > **Decoder** >  > **View** > **Logs**.

   d. Search for Snort to validate that the rules files loaded.
      The log will indicate if the rules files are loaded completely (`full`), partially (`partial`), or if any rules railed to load (`failed`).
      The following are example log entries, using `mysnort.rules`, with two fully supported rules in the file. If any of the rules are marked partial or failure, examine the rules to determine why the load was not successful.

```
Loaded mysnort.rules, full 2, partial 0, failures 0
Loaded 2 snort rules, 2 small tokens, 0 with pcres, 0 partial, 0
unsupported
```

      When you search for Snort, you can find details on configuration variables and warning messages

if they are not defined. The following is an example log entry for a `snort.conf` file that is not fully populated with the minimal IP and port variables.

```
Undefined snort ip variables (will default to any): EXTERNAL_NET, HOME_
NET
Undefined snort port variables (will default to any): HTTPS_PORTS
```

e. Alternatively, you can perform the service restart and review of the logs from the Decoder console:

```
systemctl restart nwdecoder
tail -f /var/log/messages | grep -i snort
```

4. Import or capture network traffic that is known to trigger the Snort rules to validate they are functioning.
5. Validate that the Snort rules are getting triggered by the network traffic or by sample uploaded PCAPs. The Snort statistics can be used to track which rules have been evaluated, compared to generated metadata. For more information, see Rule Statistics . The default metadata generated by Snort rules are: `sig.id`, `sig.name`, `threat.category`, `threat.source`, and `risk.num`. The mapping of Snort rule information to NetWitness Platform metadata, and how to change it, is described in Snort Parser Output.

Snort Parser Output

When a Snort rule matches a session, it produces meta items. The meta items generated may change depending on the configuration of the Snort parser. Snort parser meta key usage has been updated with a new option for the Snort parser. The option, `Snort="udm=true"` (set to true by default), uses the Aligned Unified Data Model (UDM) key set. For information about UDM, see https://community.netwitness.com/t5/netwitness-platform-unified-data/introduction-to-the-rsa-netwitness-platform-unified-data-model/ta-p/565620. By default, the Aligned UDM key set is used.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

The following keys are generated in the Aligned Unified Data Mode:

- `sig.id` with the value of the rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `sig.name` with the value of the rule's `msg` field
- `risk.num` with the value of the rule's priority

The following keys are generated in Legacy Key Mode:

- `alert.id` with the value of rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `risk.info`, `risk.suspicious`, or `risk.warning` depending on the priority of the rule. The value of the risk meta is the rule's `msg` field.

If you want to use the legacy key set which contains keys that are consistent with previous releases for Snort parser meta keys, follow these steps.

1. In the NetWitness User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder and then click ⚙ > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In the right panel, in `parser.options`, add `Snort="udm=false"`.

Rule Statistics

The Snort parser maintains counters to monitor the activity of each rule. These counters can be retrieved using the running `snrtStat` on the Decoder's `/decoder/parsers` node, which can be accessed through the NwConsole utility or the REST interface. The statistics reported for each rule are:

- `evaluations`: This counts the number of times the rule was evaluated. A rule can be evaluated once for each stream in a session. Typically a rule will only match one side of a session, and will be evaluated, at most, once. The `content` strings determine if a rule will be evaluated in a session. A `content` pattern must match somewhere in the session in order for it to be evaluated.
- `hits`: This counts the number of times a rule matched and the corresponding alert meta item was created.

To review the Snort statistics when using the Decoder console:

1. Log in to the console locally or remotely
2. Type the command `NwConsole`
3. Log in to `localhost:50004 <admin> <netwitness>` (change login credentials accordingly)
4. Enter `/decoder/parsers snrtStat`

The output is a JSON structure listing the number of evaluations and hits performed, along with the options evaluated, for each Snort ID.

Configuration Directives

Decoder supports a limited number of configuration directives.

Variable Definitions

Decoder supports definitions of variables that hold the value of IP ranges using `ipvar` or Port ranges using `portvar`. For example, Snort rules usually make use of `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` variables. These have to be defined in your configuration file. If they are undefined, they default to the special value `any`.

ruletype

The definition of additional rule types is supported. However, only rules that have a base rule type of `alert` are supported. Rule type definitions follow the same definition format as Snort configuration.

Other Configuration Entries

config detection: debug

Adding this configuration line turns on debug messages that are generated as the rule is being processed. These debug messages are generally emitted only emitted when a rule matches a session by one of the content patterns, but then fails to match other options within the rule. This is useful for debugging complex filters in Snort rules, to determine why they may not be matching as expected.

config nopcre

Adding this configuration line turns off the PCRE (regular expression) capability.

config classification

Classification configuration influences how meta is generated when a rule matches a session. Meta output from Snort rule matches is described in Snort Parser Output.

Snort Parser Capabilities

The general format of a Snort rule is that it contains a rule header and rule options. The rule header consists of the rule action, protocol type, source-destination criteria (IP addresses, ports), and the direction of traffic. The rule options consist of the message (`msg`) which describe what the rule has detected, the references related to the threat or where the rule was generated, the classification of the rule, the unique signature (`rule`) identifier, and a long list of attributes (for example, `flow`, `content`, `pcre`) to define how the traffic is identified. The specific details on which header and rule options are supported are outlined in the remainder of this section.

Rule Sections

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions, or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. The Decoder only uses rules with alert actions.
Protocols	The Decoder supports the current Snort protocol keywords (`tcp`, `udp`, `icmp`, `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.

Section	Description
Direction Operator	The directional operator supports the from-to (‘->’) and bidirectional (‘<>’) values. The to-from (‘<-’) value is invalid and causes the rule to fail to load.

Content

The Snort `content` statement makes up the bulk of the Snort pattern detection capability. For best performance, Decoder strives to map `content` patterns to the Token Parser used by most NetWitness parsers. Therefore, the `content` strings are the main mechanism to activate the rule matching engine on a session for a particular rule. If the rule does not have any content patterns, it is effectively unsupported. The Snort parser allows for very short strings patterns in content, but be aware that a rule that contains only very short content may have to be evaluated for every session, which will make the Snort Engine run much more slowly.

The Snort parser supports most forms of `content` statements, including the following modifiers. All modifiers effect the last `content` pattern declared in the rule.

Option	Description
`nocase`	Case-insensitive pattern matching is used.
`offset`	This option is applied to the distance of the token from the beginning of the packet. If the number of bytes between the offset point and the start of the token is **less** than this value, it is not a match.
`depth`	This option is applied to the distance of the token from the current offset position, or the beginning of the packet if no offset is set. If the number of bytes between the 'offset' point and the beginning of the token is **greater** than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **less** than this value, the token is not a match.
`within`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **greater** than this value, the token is not a match.

These content modifiers are supported if the Snort parser is used in conjuction with AppHTTP native parser:

Option	Description
`http_client_body`	The token must appear in the body of an HTTP request.
`http_cookie`	The token must appear in an HTTP cookie header.
`http_header`	The token must appear any where in in an HTTP request or response header.

Option	Description
`http_method`	The token must appear in the HTTP method field. The detection engine does not currently restrict the method tokens, such as `GET` or `POST`, to the HTTP method field, so these matches will work even if `AppHTTP` is turned off.
`http_uri`	The token must appear in the **normalized** HTTP header. Non-normalized header matches are not supported.

Further detail on the HTTP related modifiers is described below in HTTP Parsing.

Flow

The flow directive verifies that the rule is only applied to the client or server stream. It supports the following options.

Option	Description
`to_client`	Limits the rule to only matching on a stream that a Decoder has defined as Server.
`from_server`	Synonym for `to_client`.
`from_client`	Limits the rule to only matching on a stream that a Decoder has defined as Client.

Fast Pattern

The Snort parser uses `content` tagged with `fast_pattern` to indicate tokens that should always be used as tokens in the Decoder's token scanner. Decoder supports the `fast_pattern` and `fast_pattern:only` directives, but it does not support the `fast_pattern:offset,length` directive.

PCRE

The Snort parser implements `pcre` regex matching using the same libpcre library as other tools. It supports most of the flags documented for the `pcre` tag, with a few minor exceptions as described later in this document.

HTTP Parsing

The Snort parser relies on the native HTTP parser to notify it when HTTP is being parsed. The HTTP parser feeds information to the Snort engine to let it know which regions of the session should be used to evaluate the `http content` flags. The `pcre` implementation has option flags analogous to the `http content` options, and these are supported as well. If the native HTTP parser is disabled, then these features are also disabled in the Snort parser.

File Data

The Snort parser supports the `file_data` tag for HTTP response bodies only. This functionality relies on the native HTTP parser being enabled. If the Native HTTP parser has the decompression feature turned on, the Snort parser also uses decompressed responses to implement rule matching inside of `file_data` regions. You can enable the HTTP decompression feature by adding the token `HTTP="decompress=true"` to the configuration field `/decoder/config/parsers.options`.

The Decoder has a Javascript normalization parser that functions similarly to the `normalize_javascript` feature in Snort's HTTP preprocessor. It also affects data presented to Snort rules using `file_data`. To enable the Javascript normalization parser, add the token `JSNormalize="unescape=true"` to the configuration field `/decoder/config/parsers.options`.

The Snort parser emulates the `file_data` behavior in the same way as Snort. Directives that appear after `file_data` are implicitly evaluated whenever a content match is found inside of a `file_data` region. Because of this, `file_data` has side effects on other statements that appear after it in a rule.

Binary (byte) Directives

The Snort parser supports the `byte_test`, `byte_extract` and `byte_jump` directives.

The detection engine supports most options on these directives:

- The options for extracting the value, such as the offset, the little endian / big endian options, and relative options are supported. The relative flag causes the extraction of the byte value to occur relative to the DOE (Detection Offset End) pointer.
- `byte_jump` and `byte_extract` support the `align` and `multiplier` options to manipulate the extracted value.

The '`byte_extract` directive stores values in variable names that can be used to substitute a number into a few specific locations elsewhere in the rule. These locations are supported:

- The `value` field in a subsequent `byte_test`
- The value of a `within` statement on a subsequent content pattern
- The value of a `distance` statement on a subsequent content declaration.

The `byte_jump` option explicitly moves the DOE (Detection Offset End) pointer for use by subsequent directives, like `byte_test`, content marked with distance or within, or PCRE patterns marked as relative.

There are some less common byte operations that are not supported:

- The byte options do not support the `string` option for converting text into a binary value
- The byte options do not support the `bitmask` option.
- The byte options do not support the `dce` option.

Default option / fallback

When the Snort parser encounters rule options it does not yet support, it skips those options and assumes they did not prevent the rule from matching. In such cases it relies on the implementation of options it does support, such as the content or pcre statements, to determine if the rule matches. This behavior means that the Snort parser is more likely to fail in the `false-positive` direction rather than the `false-negative` direction when using features that Decoder does not yet support.

Packet Scanning/Scoping

Depending on how the rule is formed, it may be intended to match content entirely within single packets, or it may be intended to match data that spans multiple packets. The Snort parser attempts to handle both cases. Rule statements that are implicitly packet-scoped may be evaluated for every packet available in a session at parse time, and the Snort parser correctly scopes such rules so they only match if the elements of the rule match in a single packet. Conversely, if the rule uses a feature that implies reassembly and reconstruction, such as `file_data`, the Snort parser will allow the rule to be evaluated for the reconstructed portion of the stream that the rule references. This allows the Snort parser to emulate the various buffers that the Snort product provides.

Known Limitations for Snort Parser

Decoder Token Match Limits

The Snort Parser is activated by token scanning in Decoder, and therefore is subject to the same limitations on matches as all Decoder parsers. Configuration items such as `parse.bytes.min`, `parse.bytes.max`, timeouts, and size limits all apply to the Snort parser. The Decoder configuration guide describes these parameters in great detail. The Snort parser is implemented on top of reassembled sessions only so that features that require an assembled session can be supported.

Flow Bits

Flow bit directives, which start with the keyword `flowbits`, are currently mostly ignored by the Snort detection engine. Statements in rules that test flow bits currently always pass. However, the detection engine will honor flowbit directives that specify `noalert`. Rules marked as `noalert` never generate meta, even if they match.

DCE Preprocessor

The Snort parser does not currently implement any DCE preprocessors, so any features that rely on the DCE preprocessor are not implemented.

Thresholds and Filters

The Snort parser implements the `threshold` filters option only. It does not yet implement the `detection_filter` filter.

Raw Byte Scanning

The Snort parser does not currently allow rules to individually bypass the normalization or decoding using tags like `rawbytes`.

IPv6

The Snort rule parser does not currently allow rules to utilize IPv6 addresses as part of their header.

Note: Only the Snort V2.x rules are supported.

Performance Considerations

The performance of the Snort parser is dependent entirely on the rules that are being evaluated. Therefore it will vary greatly from one installation to another.

Content Tokens

Content tokens form the main entry point into the Snort engine. Hence they are the main factor affecting rules performance. The more times that a content string is found in the packet stream, the more work the Snort parser performs, and the more CPU time it uses. Therefore, it's important to use content tokens that are long, unique, and unlikely to appear in random data. Short tokens will spuriously activate the Snort parser, wasting CPU time.

Negation

Statements like `content` and `pcre` support negation, meaning they only allow the rule to match if a content string is not found or if a regex doesn't match. These are usually detrimental to performance because they still tend to contain strings that will activate rule evaluation, yet will often fail since they are intended to filter out patterns. For example, a negated `pcre` search still has to be evaluated if it is negated, and if it is used to filter out common text. it will produce lots of CPU activity on traffic that does not actually match the Snort rule.

Search Parser

The Search Parser is a custom parser used to generate metadata by scanning for predefined keywords. You can configure the parser by editing the **search.xml** file.

Caution: The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. Currently, NetWitness supports only keyword searches (Search a stream for a specific set of words).

Search Methods

The Search parser uses case-sensitive keyword search method (search a stream for one or more exact, case-sensitive matches from a list of strings).

Syntax

For sample syntax, refer to the following image:

```
<search_config>
    <Maxrecon>SOME_INTEGER_GREATER_THAN_0</Maxrecon>
    <Maxsearch>0</Maxsearch>
    <search>
        <name>SOME_ALPHANUMERIC_NAME</name>
        <Services>LIST_OF_SERVICE_INTEGERS_SEPARATED_BY_SEMICOLONS</Services>
        <Keywords>LIST_OF_KEYWORDS_SEPARATED_BY_SEMICOLONS</Keywords>
        <MatchLimit>1</MatchLimit>
    </search>
    <search>
        <name>SOME_ALPHANUMERIC_NAME</name>
        <Services>LIST_OF_SERVICE_INTEGERS_SEPARATED_BY_SEMICOLONS</Services>
        <Keywords>LIST_OF_KEYWORDS_SEPARATED_BY_SEMICOLONS</Keywords>
        <MatchLimit>1</MatchLimit>
    </search>
    …
</search_config>
```

Note: The search name parameter should be alpha numeric with no spaces.

Wireless LAN Configuration

One of the files available for editing in the Services Config view > Files tab is **wlan-config.xml**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's "Per Packet Information" (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan-config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

Troubleshooting Parsers

This topic provides guidance for troubleshooting issues related to parsers.

Lua Parser Errors

Lua parsers occasionally generate errors. If a parser enters a state where it generates multiple errors, these errors can hinder performance. Beginning with 11.4, a new option is available for Lua parsers that instructs the Decoder to automatically disable the parser after a configurable number of errors.

The value is set on the `/decoder/parsers/config/parsers.options` configuration node as shown in the following example:

```
Entropy="log2=true" GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst" error_
parser="errorMax=5" addy_parser="errorMax=10"
```

This configuration node enables you to set options for different parsers. In this example, the Lua parser `error_parser` is configured with a maximum error count of 5, and the `addy_parser` to 10. The `errorMax` setting has a valid range of values from 0 (meaning the feature is disabled) to 65,535, and takes effect when parsers are loaded or reloaded.

To disable a Lua parser after a defined number of errors:

1. Go to **ADMIN** > **Services**, select a Decoder and then select  > **View** > **Explore**.
2. In the left panel, expand **decoder** > **parsers**, and select **config**.
3. In **parsers.options**, add the following command, where `<any_parser>` is the Lua parser for which you want to limit errors, and `<n>` is the number of errors to which the parser is limited:
   `<any_parser>="errorMax=<n>"`

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Results of Automatically Disabling a Parser

When a parser is automatically disabled, a log message is generated (per parser thread) and states that the parser has been disabled, as shown in the following example:

```
(W) 2019-Apr-25 16:25:33 [Parse] Lua parser 'error_parser' has been disabled
because it exceeded the configured error threshold (5)
```

If detailed statistics for parsers are enabled, the text of the last error is populated in the parser's detailed statistics under `/decoder/parsers/definitions/<parser-name>`. Also, a new attribute has been added to the XML returned by the `/decoder/parsers?msg=schema` call. When the parser is in an error state, the attribute `error` is set to `1` and the `enabled` attribute is set to `0`. When the parser is reset, the values are reset to `0` and `1` respectively.

Resetting the Parser

If a parser is disabled because it has exceeded the error threshold, it can be reset by reloading the parser. This causes the statistics to reset so that if the faulty parser is still in place, it will function again until the error threshold is met.

Configure Feeds

NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even Active Directory (AD) information such as physical location or logical department.

You can use the Live module in NetWitness to obtain feeds from outside sources. "Live Content in NetWitness" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

Custom Feed Definition File Structure

The NetWitness Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

Feed filenames in RSA NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
```

```
    </LanguageKeys>

    <Fields>
    <Field index="1" type="index" key="alias.host" />
    <Field index="4" type="value" key="threat.desc" />
    <Field index="2" type="value" key="threat.source" />
    <Field index="3" type="value" key="threat.category" />
    </Fields>
    </FlatFileFeed>

  </FDF>
```

Define Multiple Values in a Single Field

The information in this section applies to NetWitness version 11.3.1 and later.

Custom feeds support multiple values in a single field. This allows feeds to generate multiple values of the same meta.

For example:

```
<Fields>

     <Field index="1" type="index" key="lc.cid" />

     <Field index="2" type="value" key="user" separator=";" openchar="("
     closechar=")"/>

</Fields>
```

The second field is defined to accept multiple values in the corresponding CSV file. The following is an example of the defined values:

```
clc1,(bob;tom;sam) clc12,susan clc123,doris
```

This definition means that when we see the `lc.id` with a value of `cic1`, three `username` meta values are generated with the values of `bob`, `tom` and `sam`.

The separator in the field definition for a multi-value field **must** be different than the separator for the feed file itself. Escaping the separator character in field values is **not** supported.

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (`.xml`) file.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
(Define Feed Tab) Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to update the `.csv` or `.xml` file persistently and store it in a location accessible by NetWitness, so NetWitness downloads a file at regular intervals and pushes it to the downstream devices.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed tab) **Name**	The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed. **Note:** You can use special characters to define the name of the custom feed.
(Define Feed tab) **File**/ **Browse**	This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`.
(Advanced Options tab) **XML Feed File**	The name of the feed definition file. For example, `dynamic_dns.xml`.
(Advanced Options tab) **Separator**	The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file. For example, a comma.
(Advanced Options tab) **Comment**	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of 0 indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation.

NetWitness Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the `user` meta key is chosen, the index column of the `.csv` file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on.
(DEFINE VALUES) **Key**	The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute.

Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
```

```
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv6.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv6" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with `range="cidr"`. Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab. One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to Custom Feed Definition File Structure

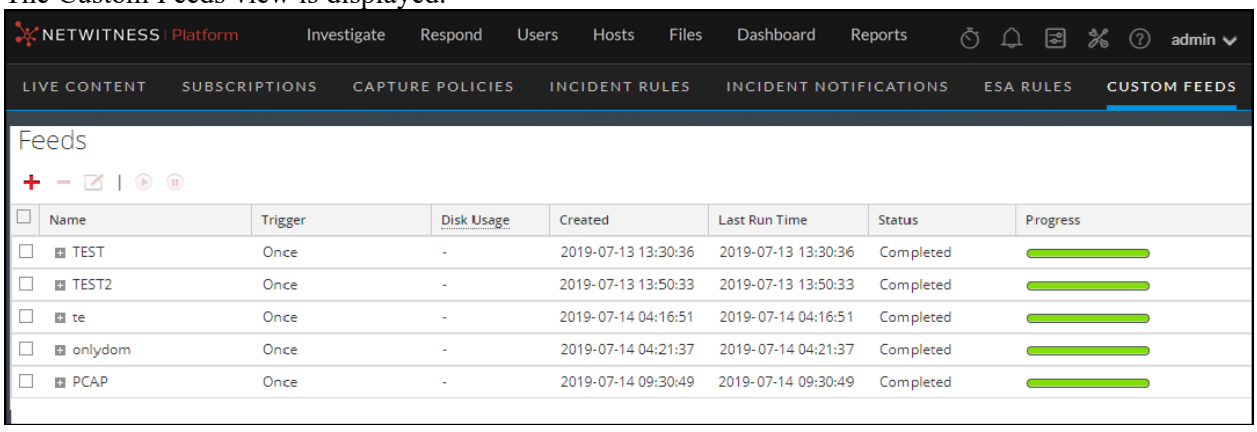
Create a Custom Feed

You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv` or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

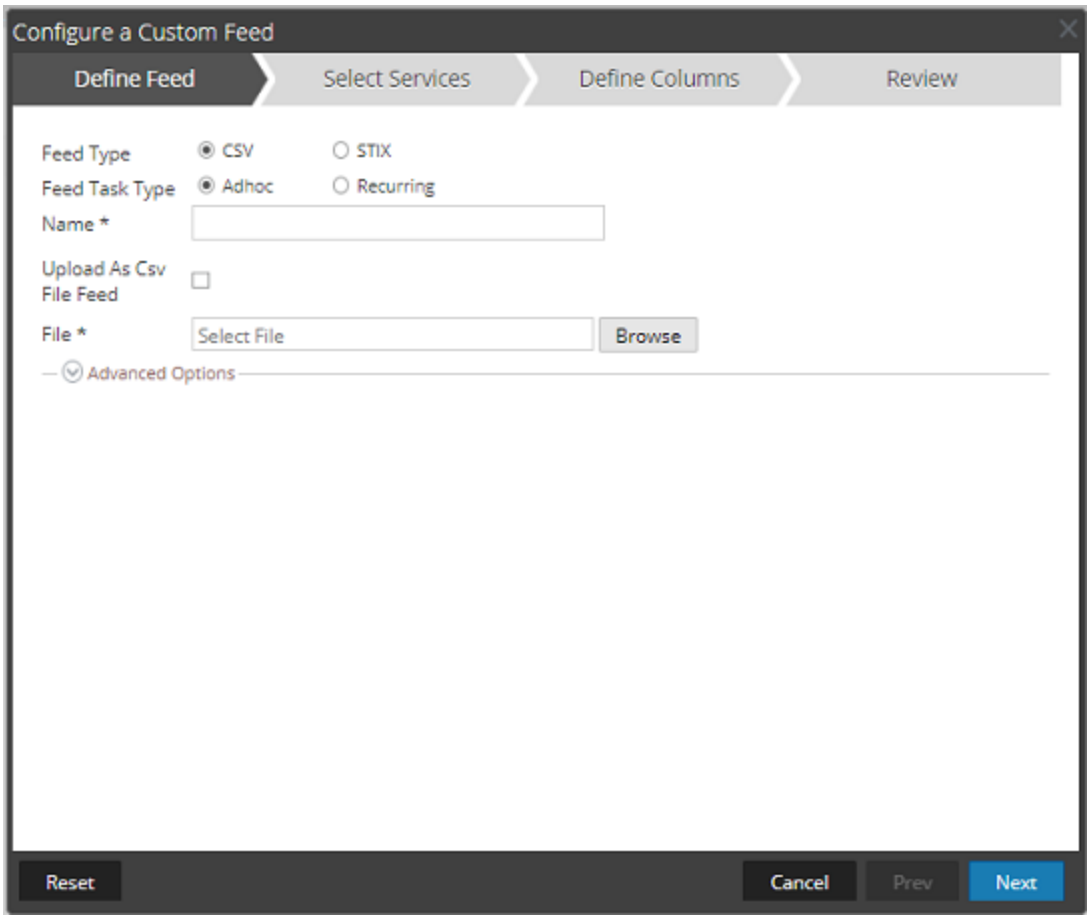
Note: For information about STIX and creating a STIX custom feed, see "Create a STIX Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.



The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

Note: When you create a source and destination-based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address. To resolve this issue, create two different feeds using IP addresses and you can use CIDR in these feeds.

To create a custom feed:

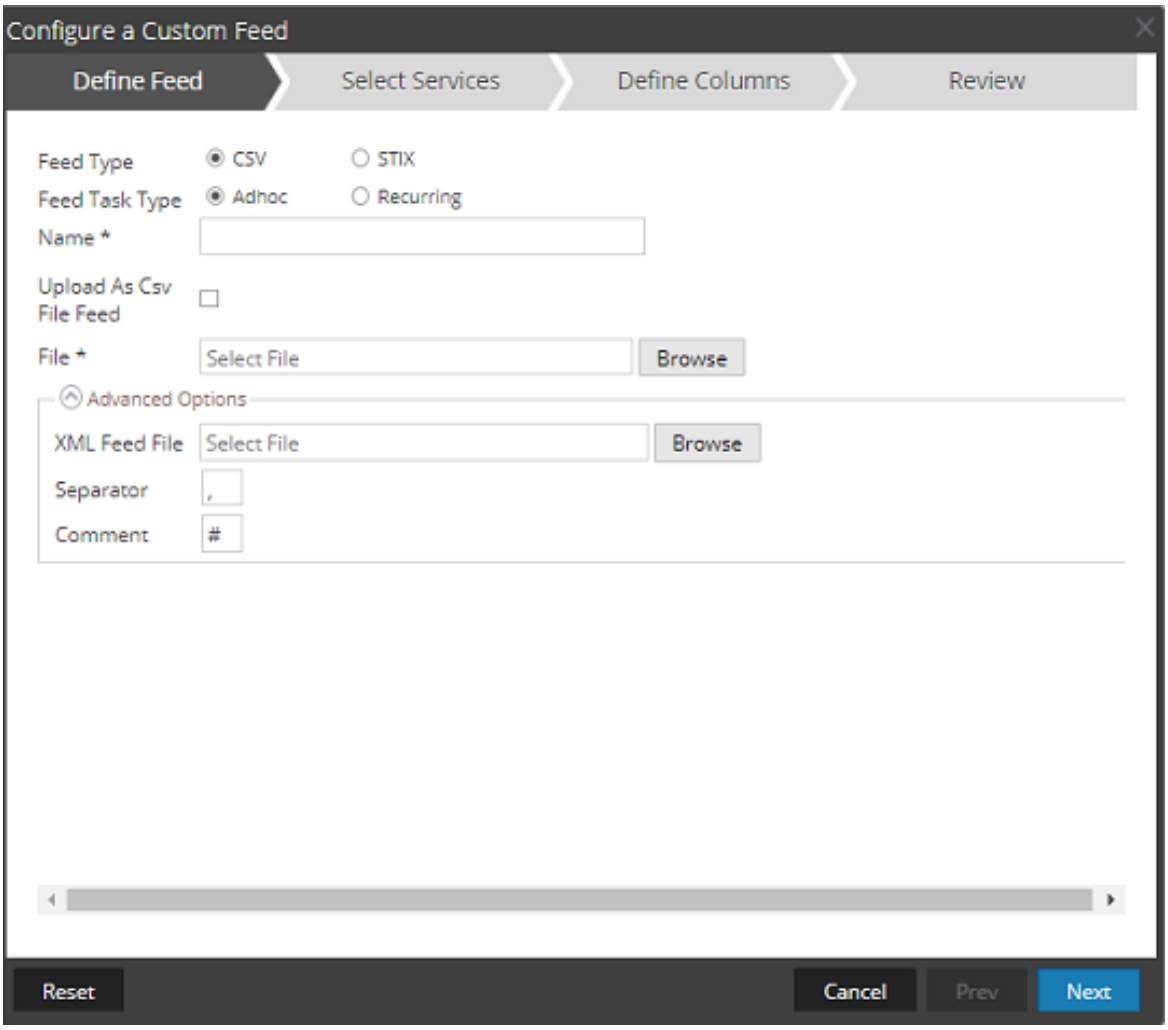


1. Go to **Configure > Custom Feeds.**

   The Custom Feeds view is displayed.

2. In the **Feeds** panel, click + > **Custom Feed** > **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



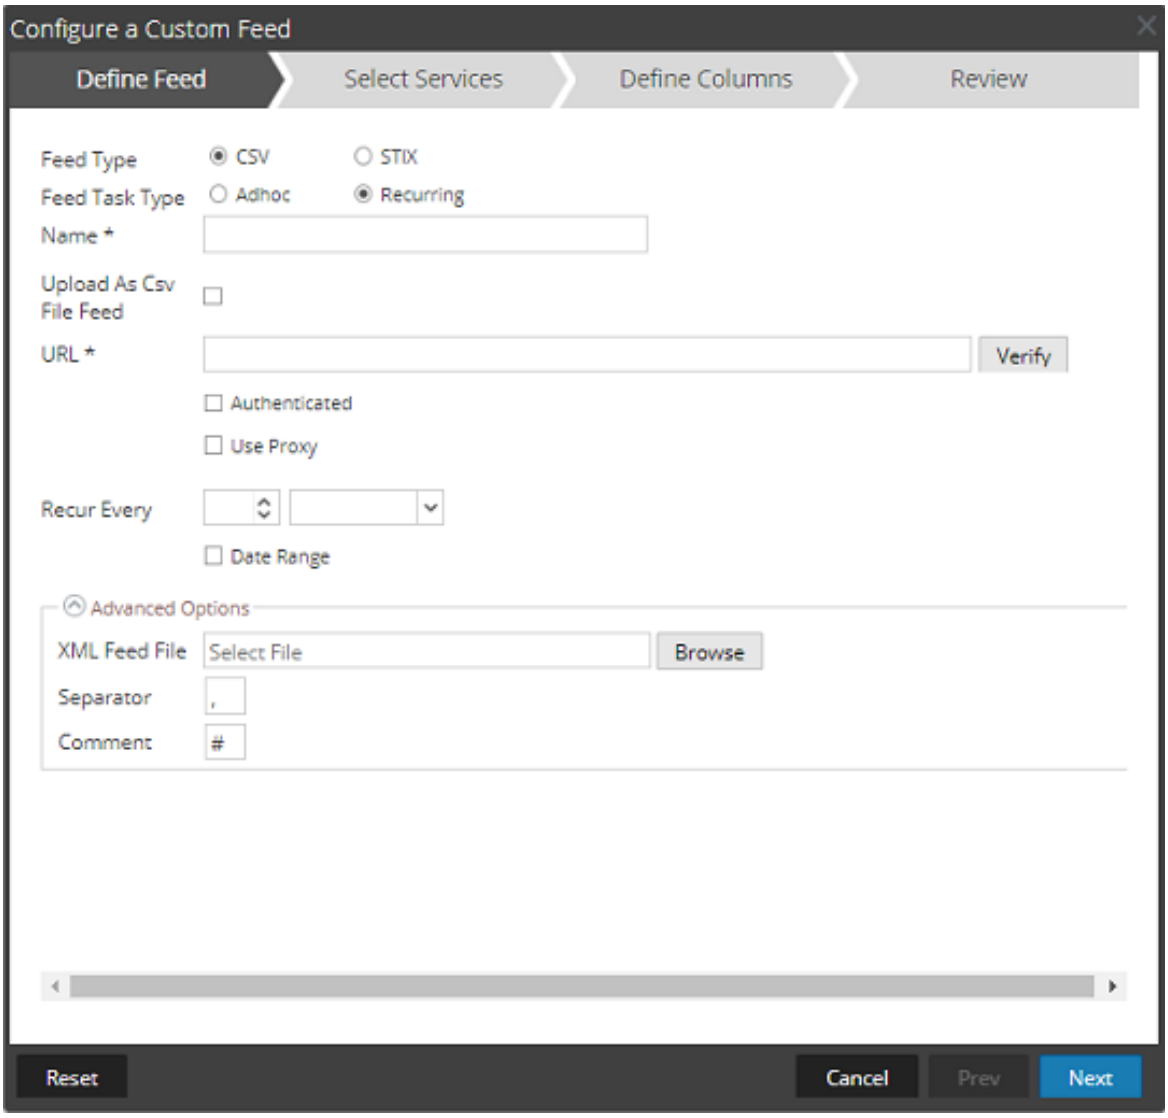
3. Select the Feed Type: **CSV** or **STIX**.
4. To define a feed based on a `.csv` formatted feed data file, select **CSV** (which is the default) in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a CsvFileFeed file, select the **Upload as Csv File Feed** checkbox, type the feed **Name**, select a .csv content file from the local file system, and click **Next**. If you do not select the checkbox, the .csv file will be a FlatFileFeed file.

      Note: When you select the Upload as Csv File Feed checkbox, the XML feed options under Advanced are unavailable.

   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      Note: Ensure that the Upload as Csv File Feed checkbox is deselected.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the separator (default is comma), specify the comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

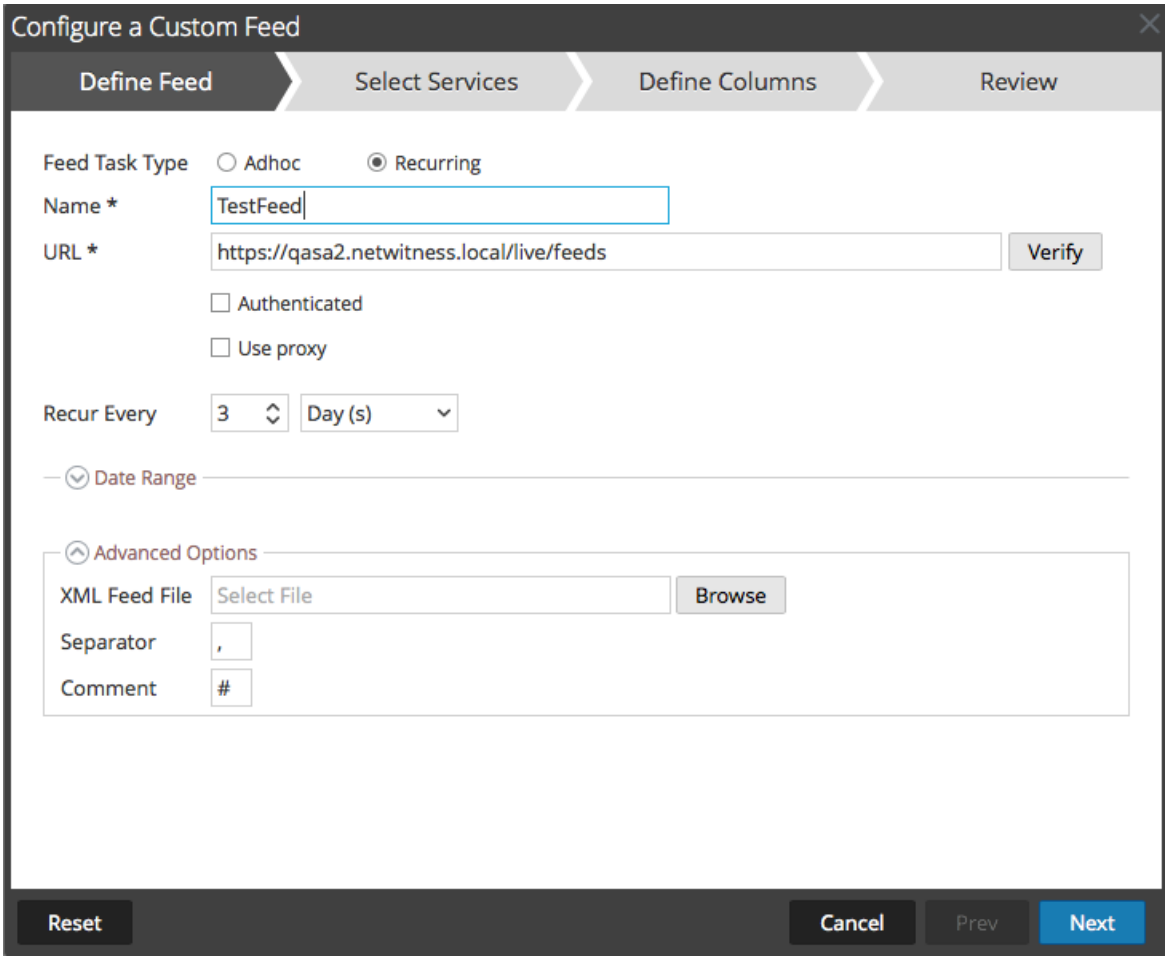
6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range:

   a. In the Define Feed form, select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.

b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**. NetWitness verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.
NetWitness provides your user name and password for authentication to the URL.

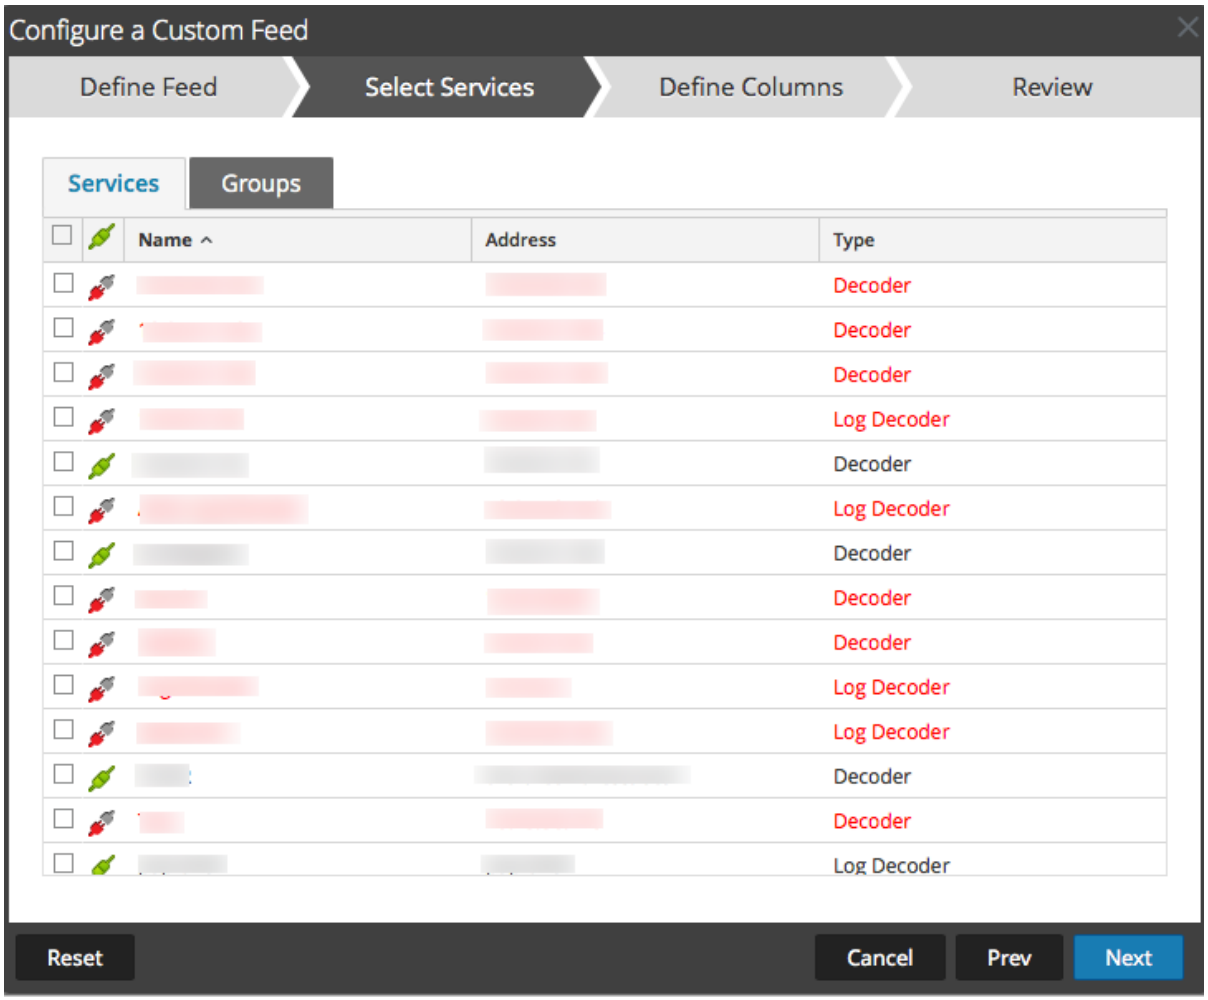


d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not set.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.

- Specify recurrence every week, and select the days of the week.

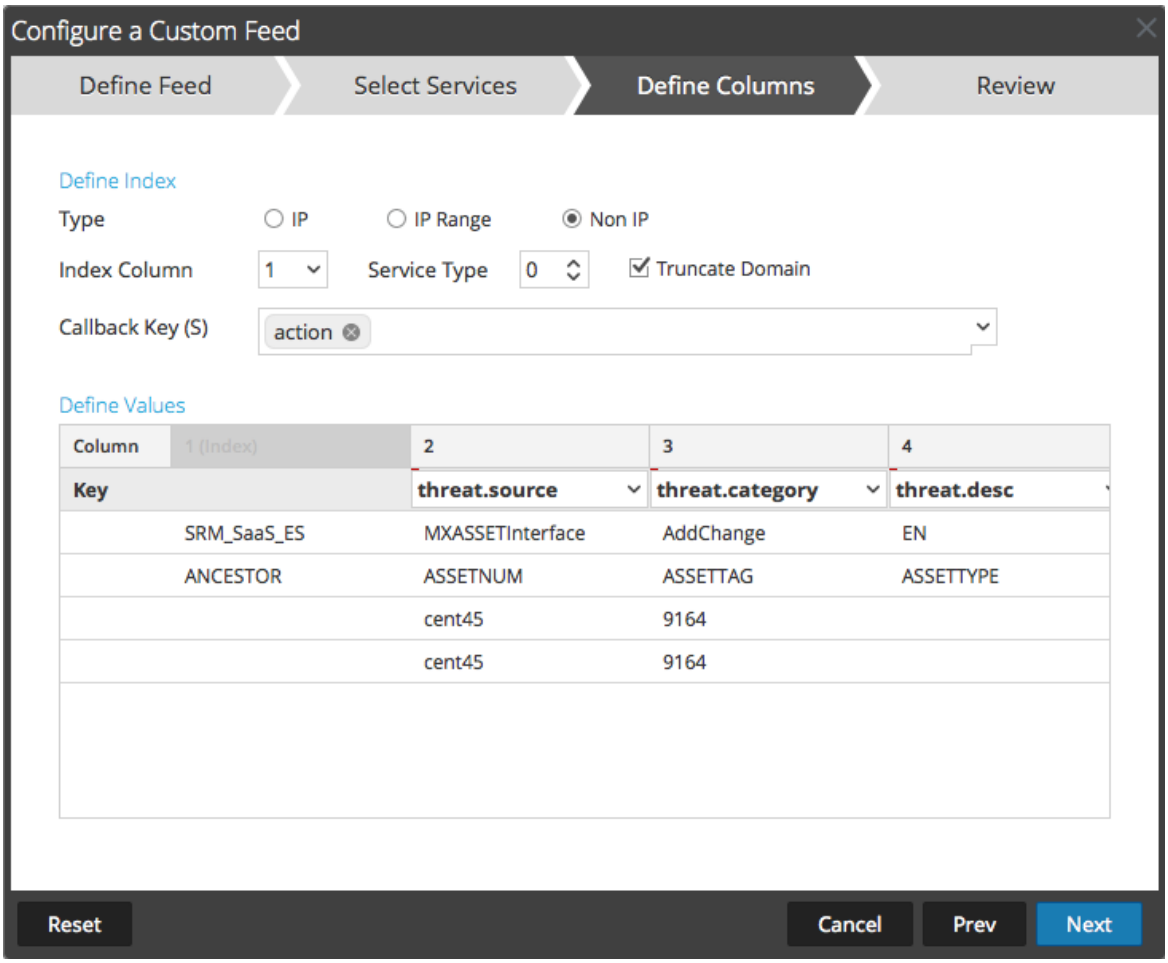


f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

7. (Conditional) If you want to define a feed based on an XML feed file:

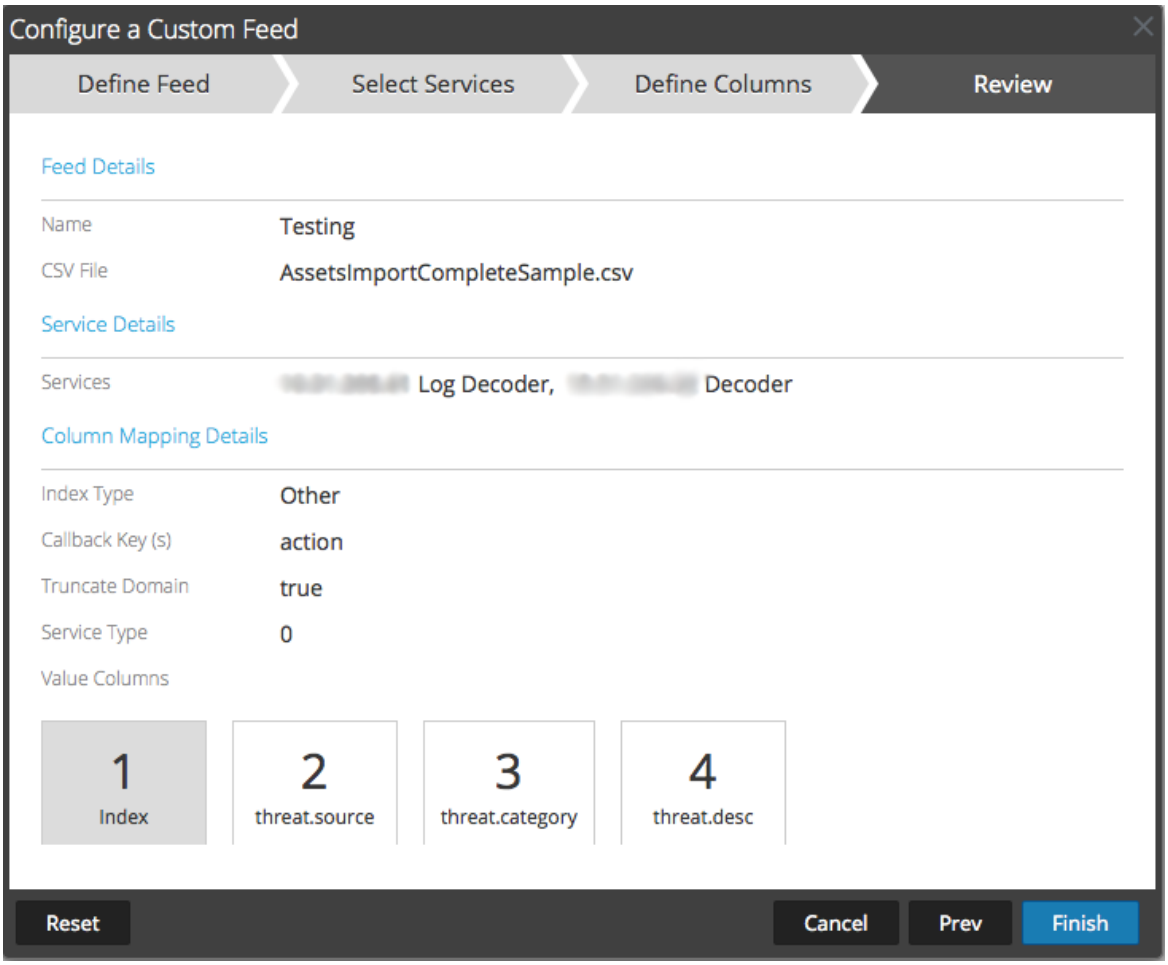
   a. Type the feed **Name**, select **Advanced Options**. The Advanced Options fields are displayed.

   b. Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**. The Select Services form is displayed.



8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns form is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



d. Select the language key to apply to the data in each column from the drop-down list. The meta keys displayed in the drop-down list is based on the meta keys available for the service define values. You can also add other meta keys based on advanced expertise.

e. Click **Next**.

The Review form is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

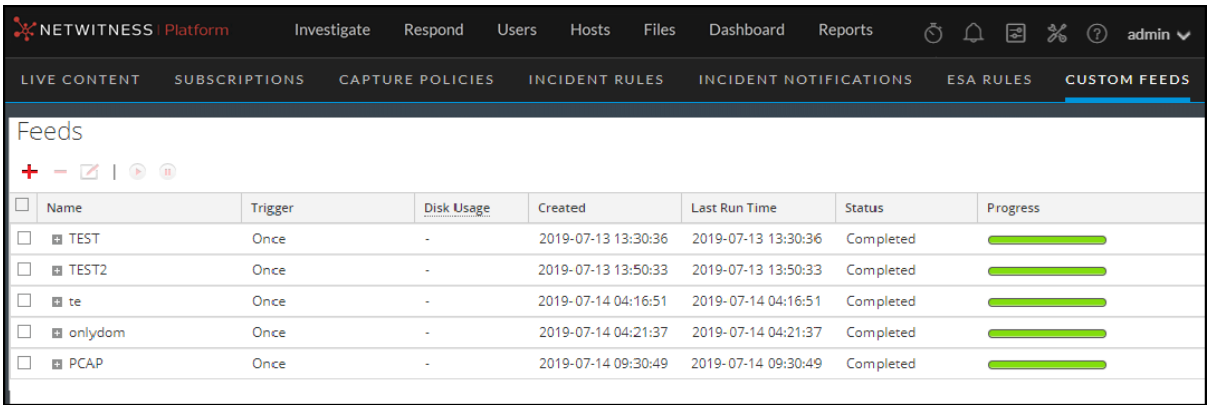
You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness. NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Caution: If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.x, you must re-configure the STIX recurring feed.

In NetWitness, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The property values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

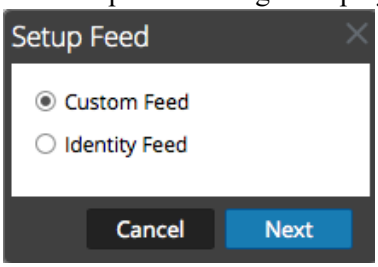
The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.



Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

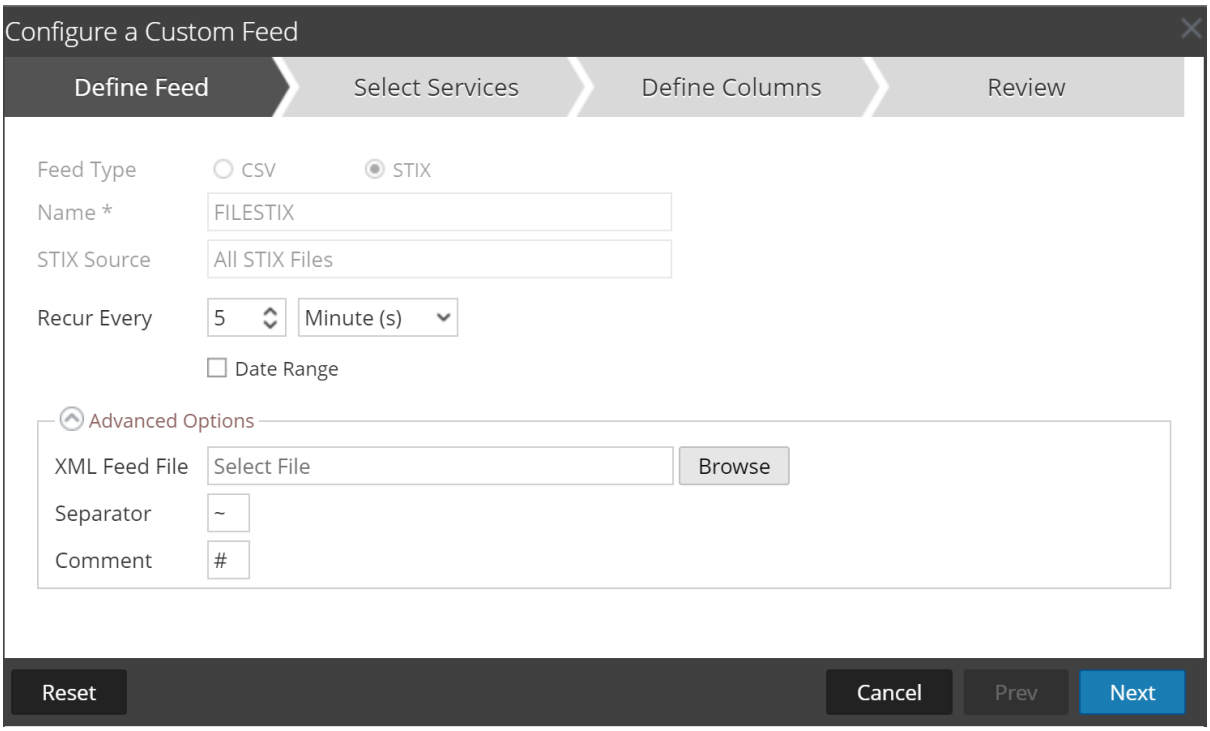
The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

To create a STIX custom feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, click .

The Setup Feed dialog is displayed.

3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

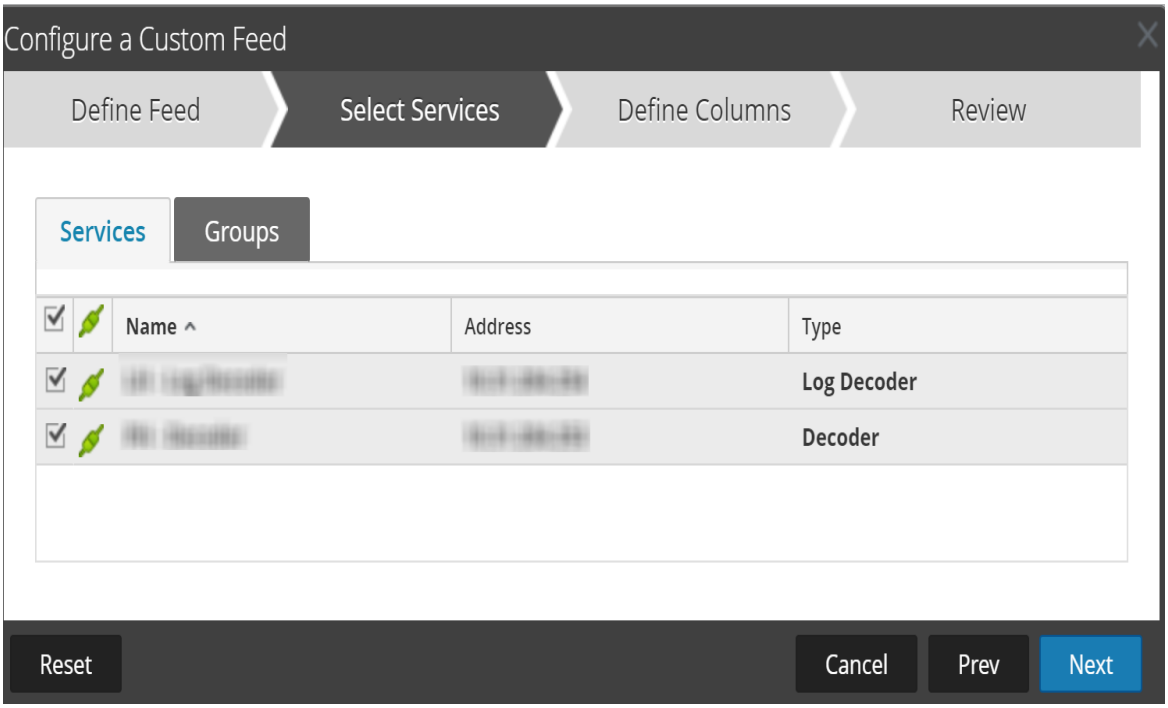
   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   Note: NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

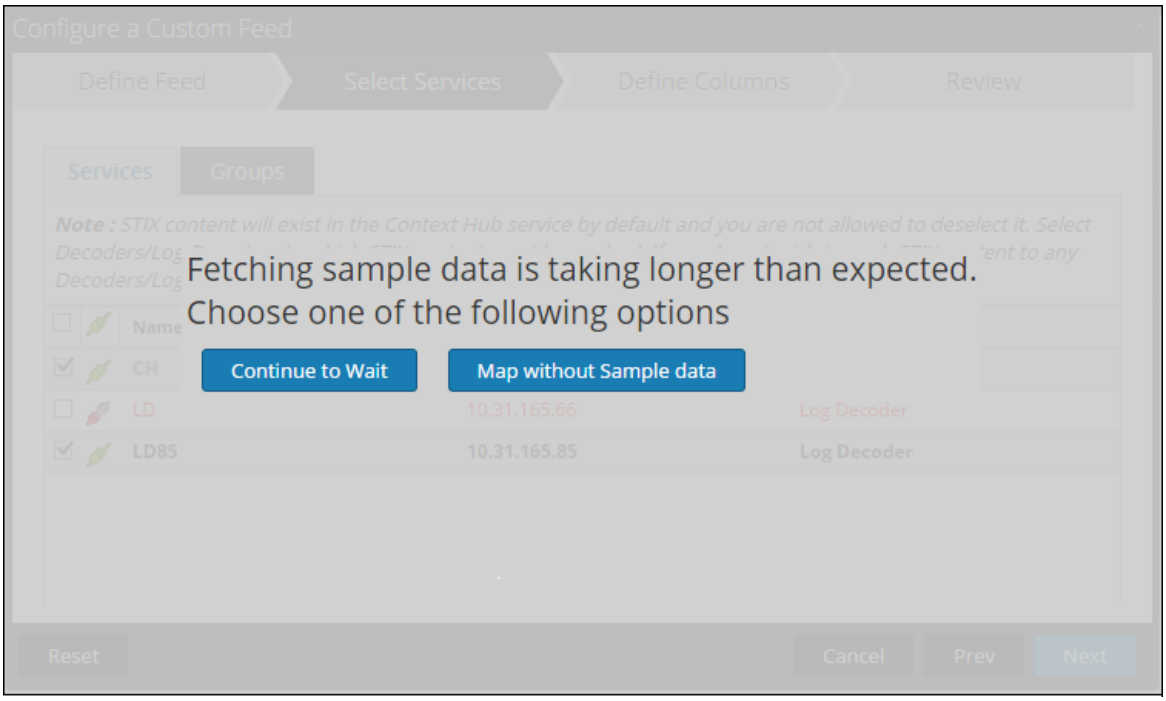
   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.



5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.

   a. **XML Feed file**: Browse and select an XML feed file from the local file system.

   b. **Separator**: Choose a separator (default is comma).



c. **Comment**: Specify the comment characters used in the feed data file (default is #).

6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

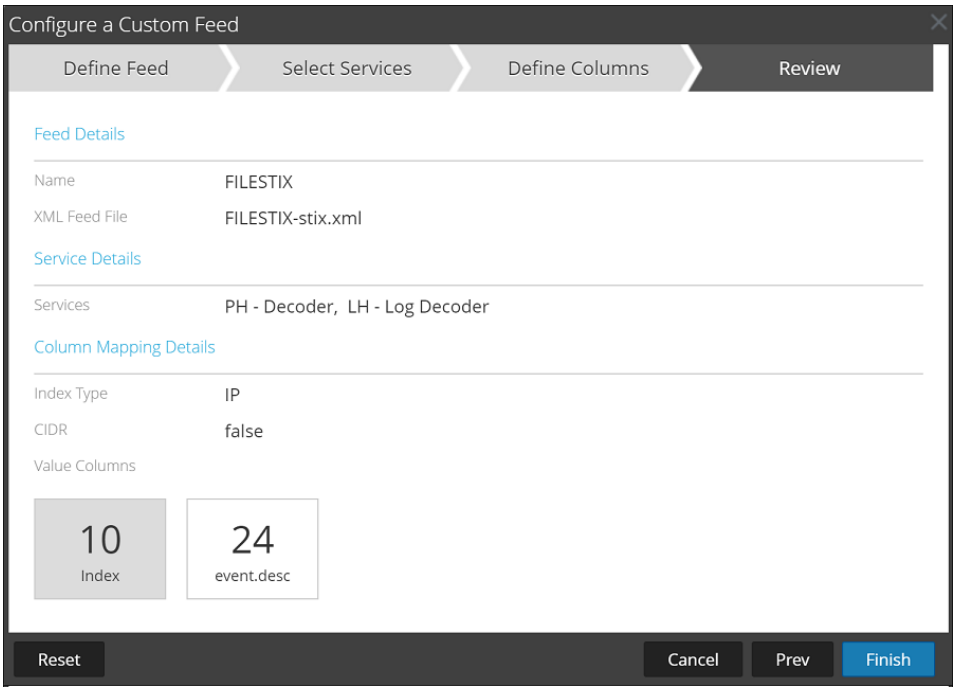
8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

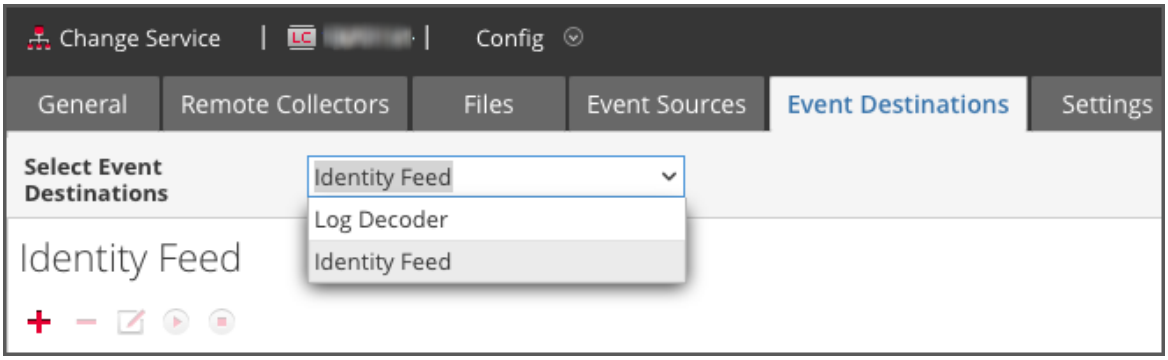
e. Click **Next**.

   The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, the feed and corresponding token file are listed in the Feed grid, and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

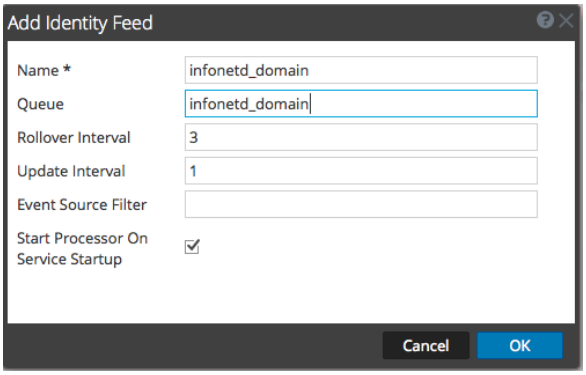
Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.



Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled



To create an identity feed:

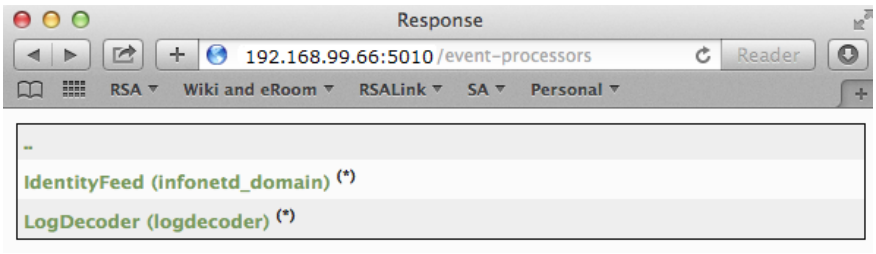
1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.

   The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.

a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

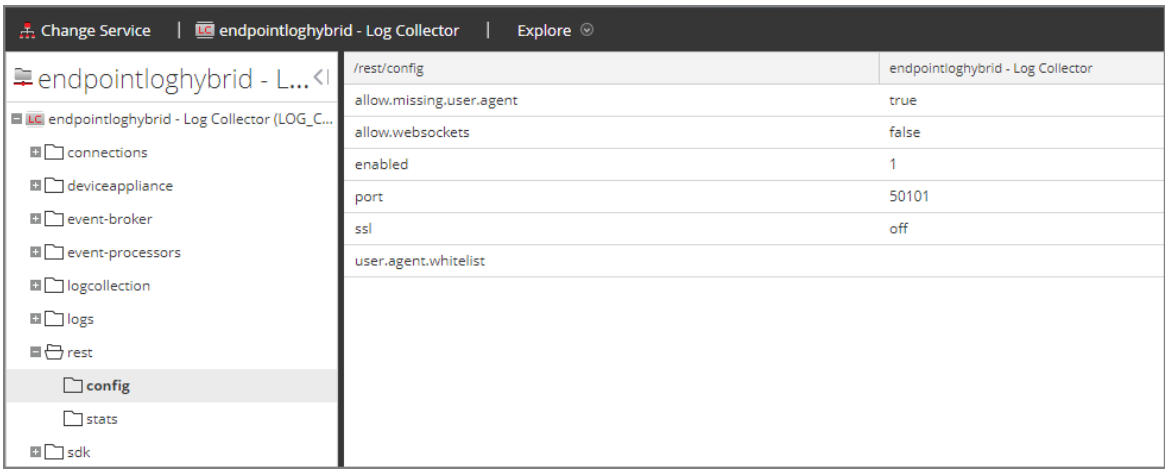


b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

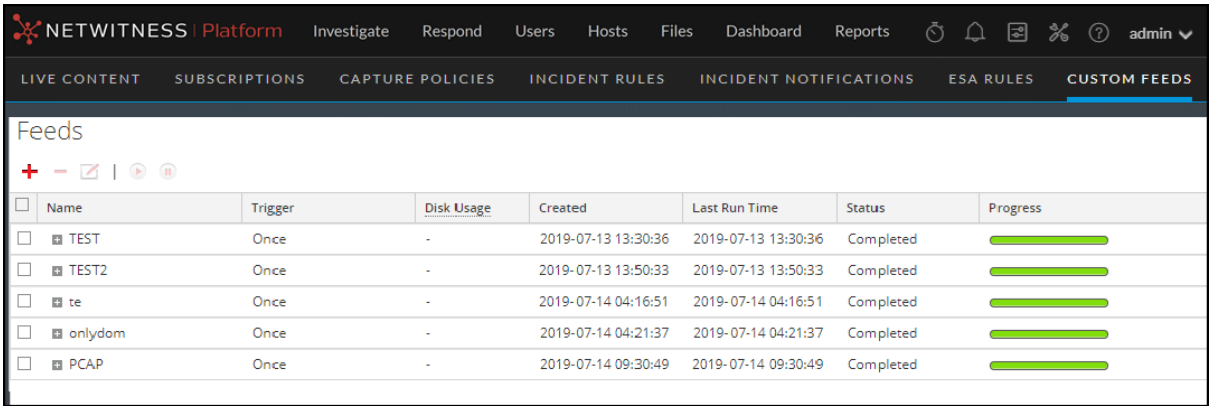


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to  **(Admin) > Services > <*Log Collector being setup*>**  **> View > Explore**.

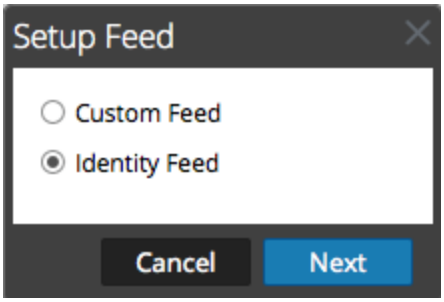
e. In the left pane, expand **rest > config**.



For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

Note: If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

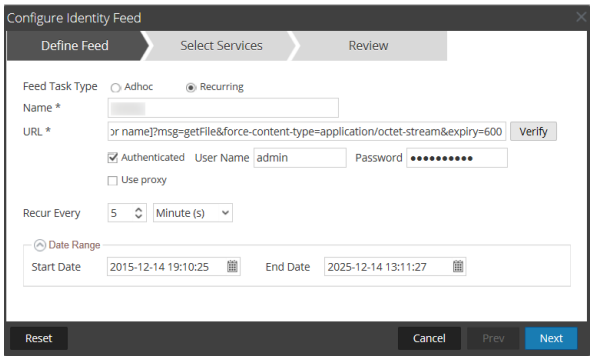


3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.

4. In the toolbar, click .

The Setup Feed dialog is displayed.



5. Make sure **Identity Feed** is selected and click **Next**.

The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.

Note: NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

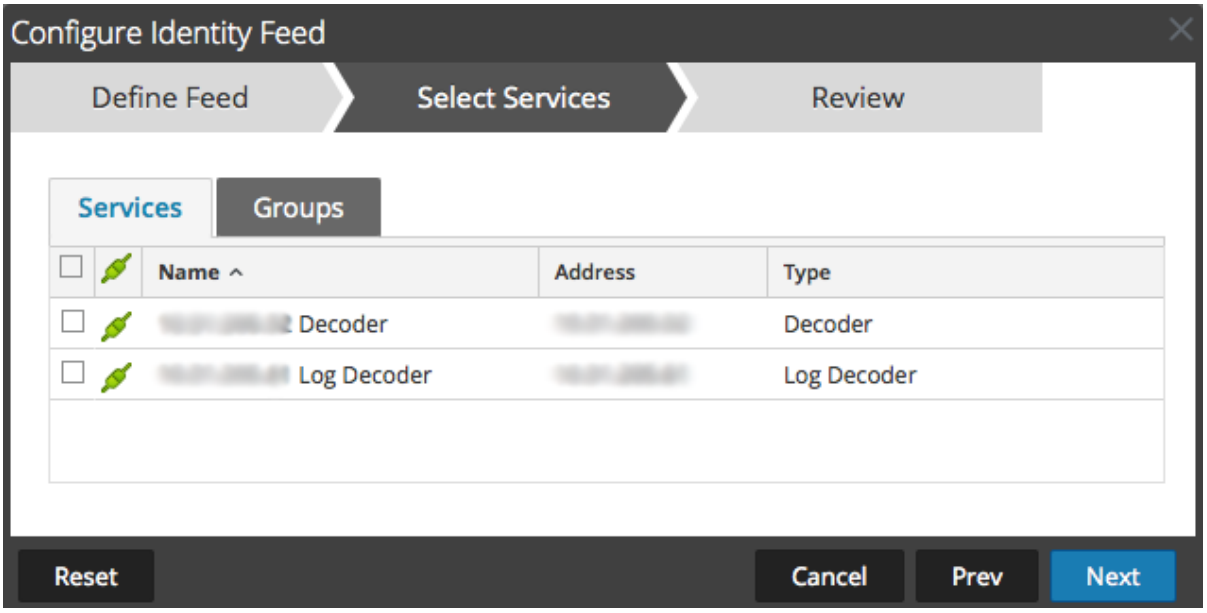
```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

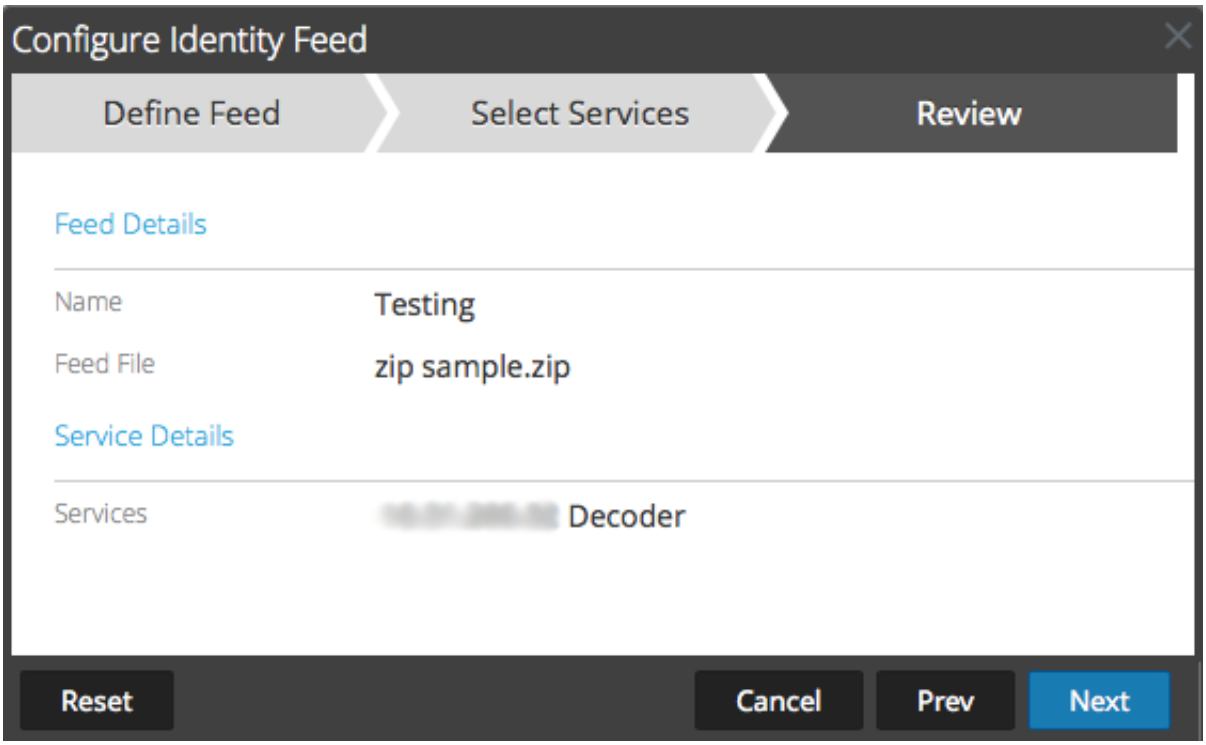
9. To define the recurrence interval, do one of the following:



- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.



11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.

13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

    The Review dialog is displayed.

Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

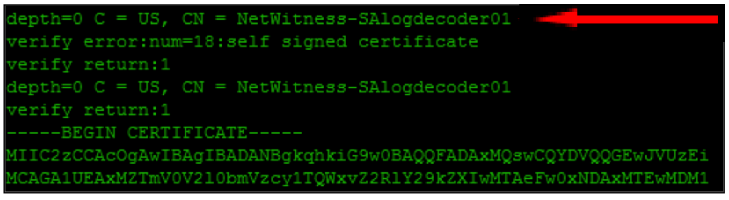
3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.



1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

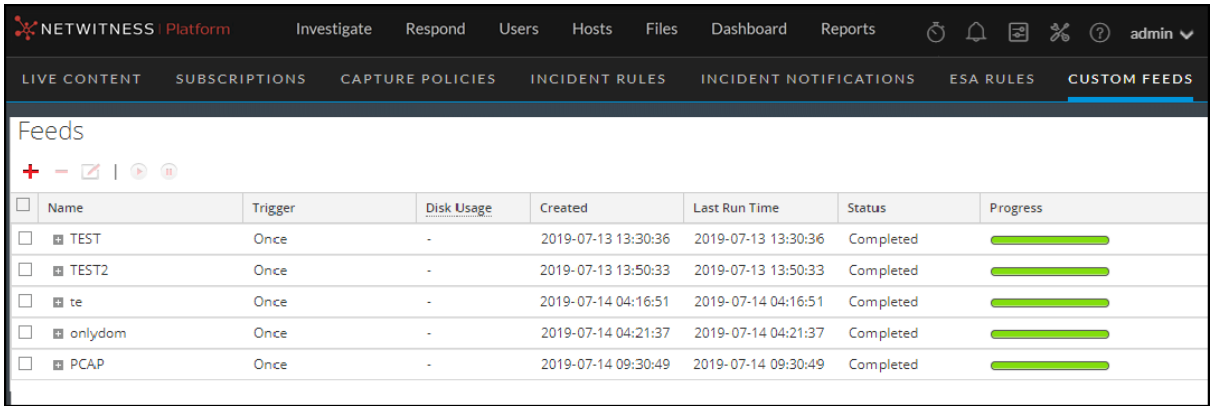
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

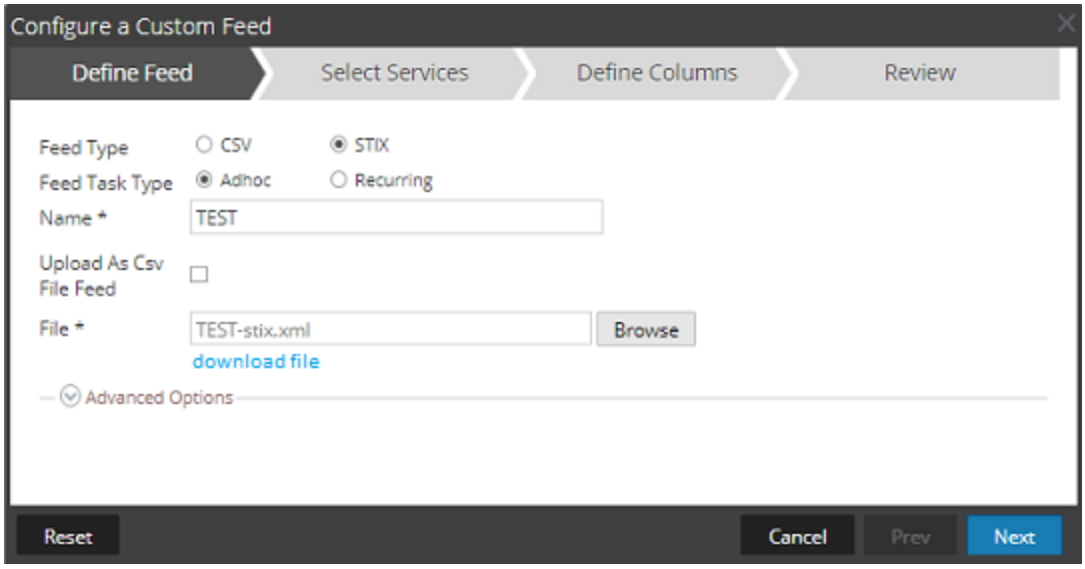
5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.



Edit, Upload, or Remove a Feed

You can upload a feed, edit an existing feed, or remove a feed.

To edit an existing feed:



1. Go to (Configure) > **Custom Feeds**.

   The Feeds view is displayed.

2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.

3. If you want to edit the feed file:

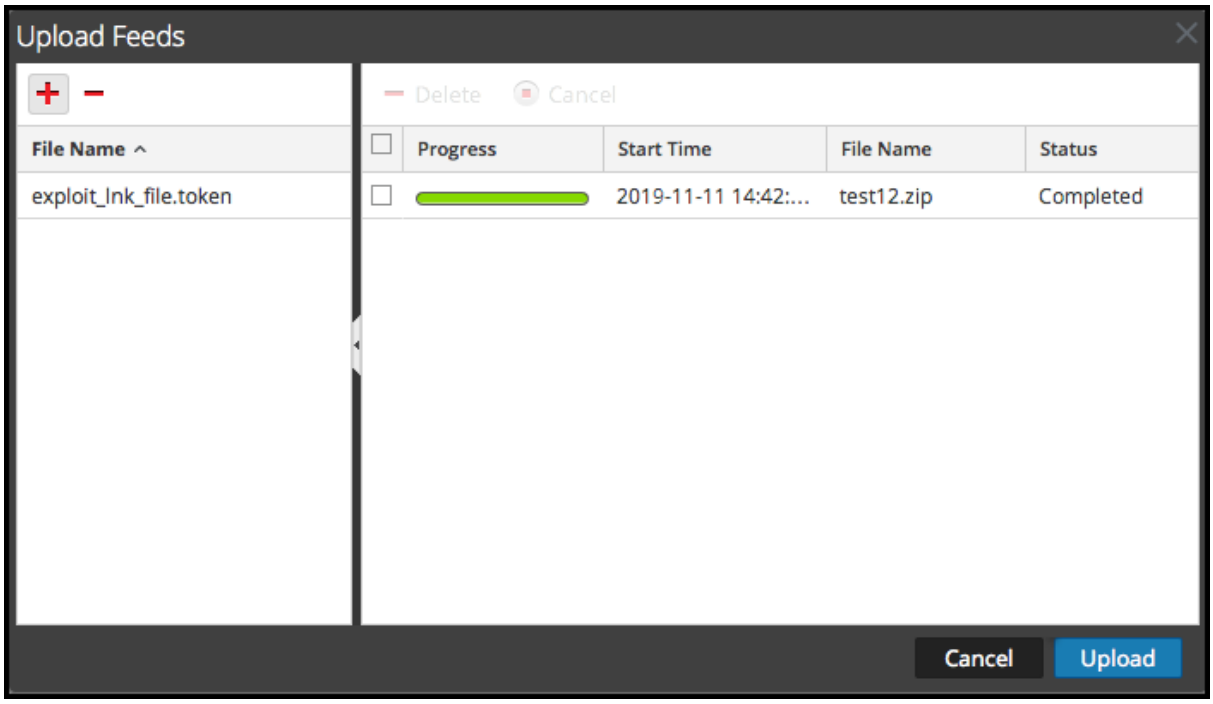
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

b. Edit and save the file.

c. In the **Define Feed** tab, browse for and open the edited file.

4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous form (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.



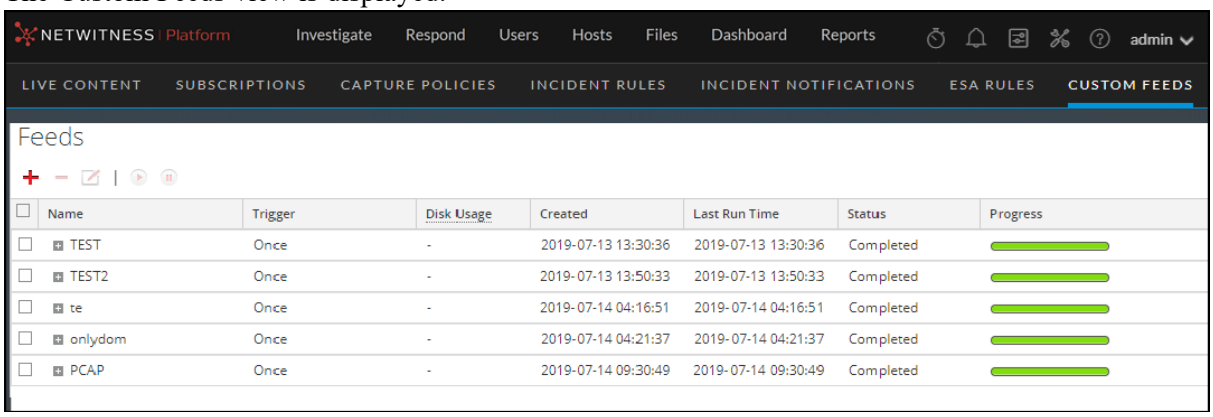
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

To upload a feed to a Decoder or Log Decoder:

1. Go to  (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and click  **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click .

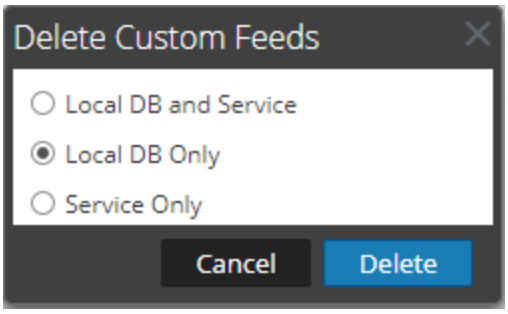
   The Upload Feeds dialog is displayed.



5. In the **File** grid, click + and select a feed file. Supported files are *.feed, *.token, and *.filter.
6. Select the feed file from the **File** list and click **Upload**.

   The Upload Job list is updated to show the progress and status of the uploaded feed.

To remove a feed:



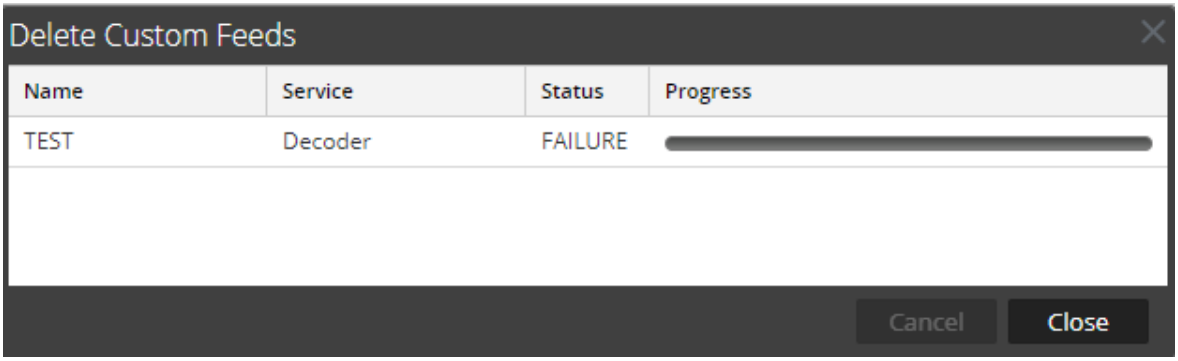
1. Go to (Configure) > **Custom Feeds**.

   The Custom Feeds view is displayed.

2. In the toolbar, select a feed and click −.

   The Delete Custom Feeds dialog is displayed.

You can select one of the following options to delete the feed:



- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer be seen on the NetWitness user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again.

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.

Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys using a custom feed in the Log Decoder, and highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema. You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data.

Here is an example of creating a custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

Note: Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta key in the Decoder.

Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to  (Admin) > **Services** .
2. Select a Log Decoder service and click  > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
 name = Name of the key (max is 16 chars)
```

3. Restart the Log Decoder service. In the Services view, click > **Restart**.

Note: Following are the NetWitness reserved keywords. Do not use these keywords as custom meta keys as it can cause display error in the NetWitness user interface due to CSS conflicts referencing to the same keywords.

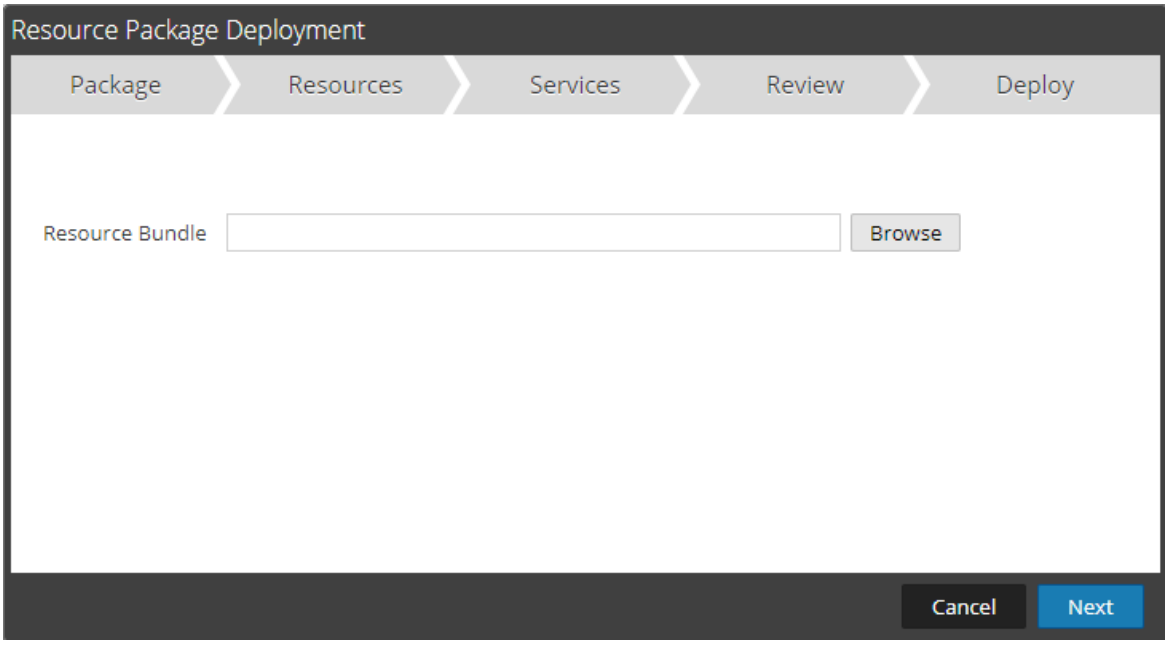
Deploy a Log Decoder Feed in Live

To deploy the feed in the live environment:

1. Go to  (Configure) > **Live Content**
2. Select a group of resources, or a previously created resource package. To select a resource or group of resources:
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).
   b. In the **Matching Resources** panel, select **Show Results > Grid**.

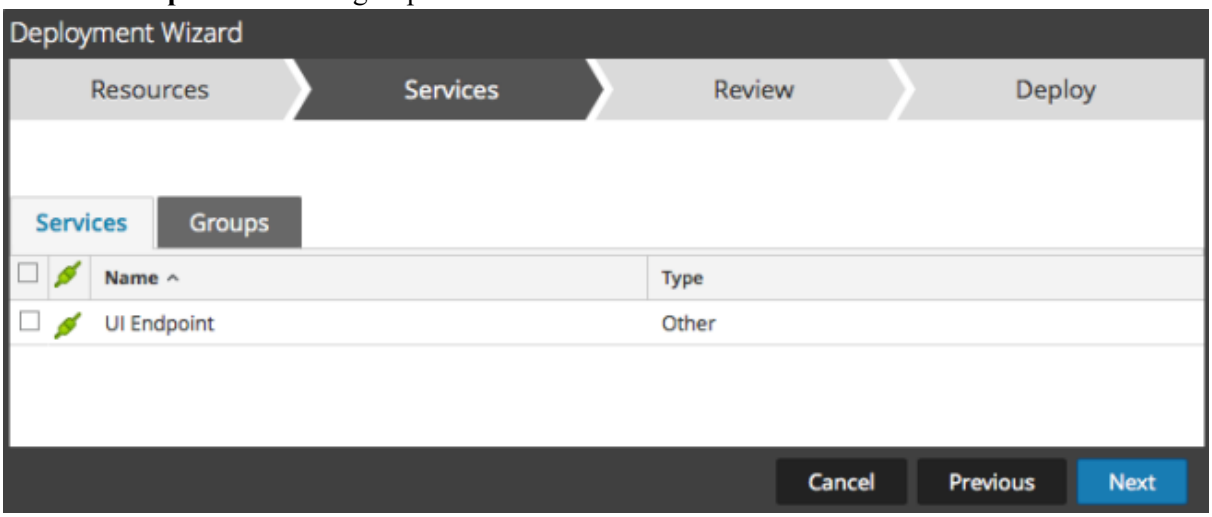


c. Select the checkbox to the left of the resources that you want to deploy.

d. In the Matching Resources toolbar, click Deploy.

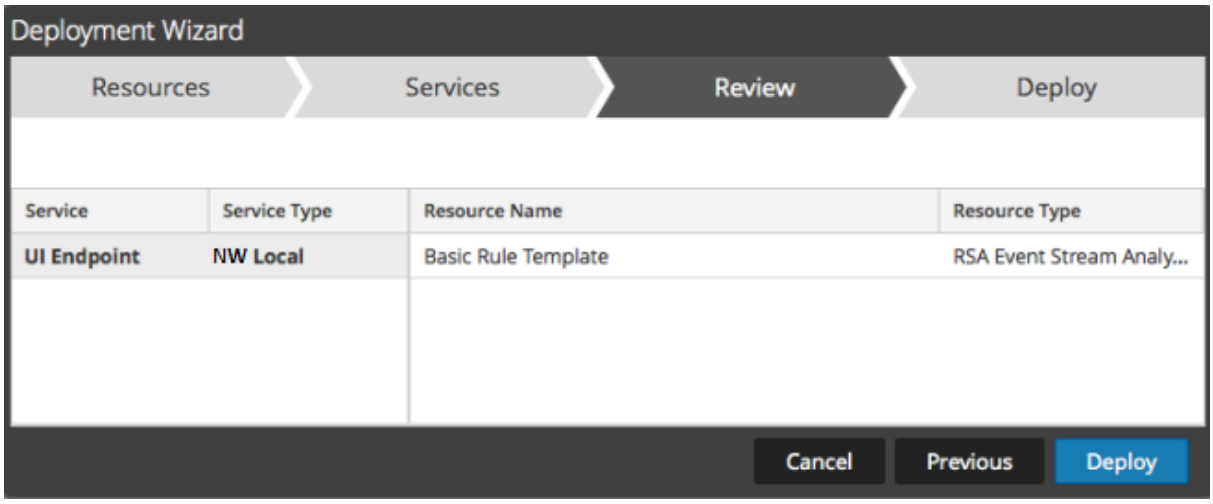
3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** :
The Package page of the Resource Package Deployment wizard is displayed.



b. Click **Browse** and select a package from your network.

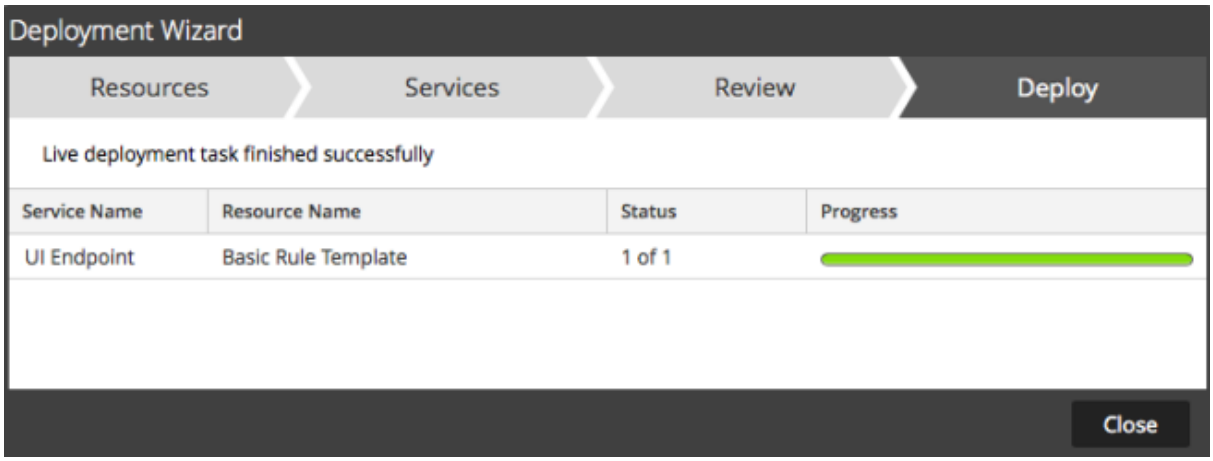
c. Click **Open.**
At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.



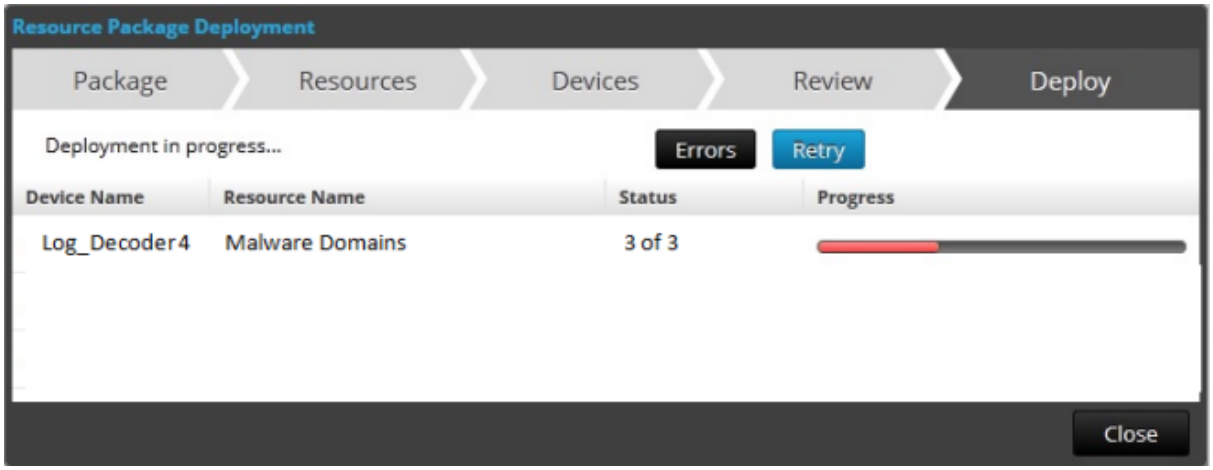
3. Click **Next**.
The **Services** page is displayed. It has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the (Admin) > Services view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.
Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.
Use the **Groups** tab to select groups of services.



5. Click **Next**.
The **Review** page is displayed.



Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you click to review the errors and retry the deployment.

7. Click **Close**.

> **Note:** The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. Select **alias.host** as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

Add the Custom Meta Key Entry in the Concentrator Custom Index file

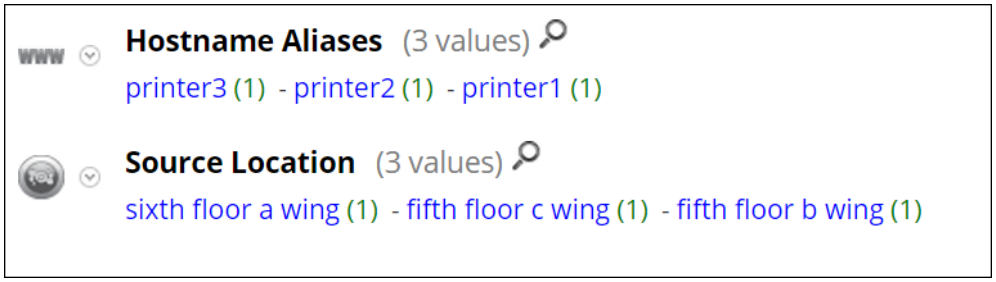
To add the custom meta key entry in the Concentrator custom index file:

1. Go to (Admin) > **Services** > **Concentrator**.
2. Click > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
 <Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
   <!-- Reserved Meta key for Feed -->
   <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
  </Language>
```

4. To restart the Concentrator service, in the Services view, click > **Restart**.

> **Note:** In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the Broker. If you have not indexed the meta key in the Concentrator, the Broker does not display the meta key in Investigate.



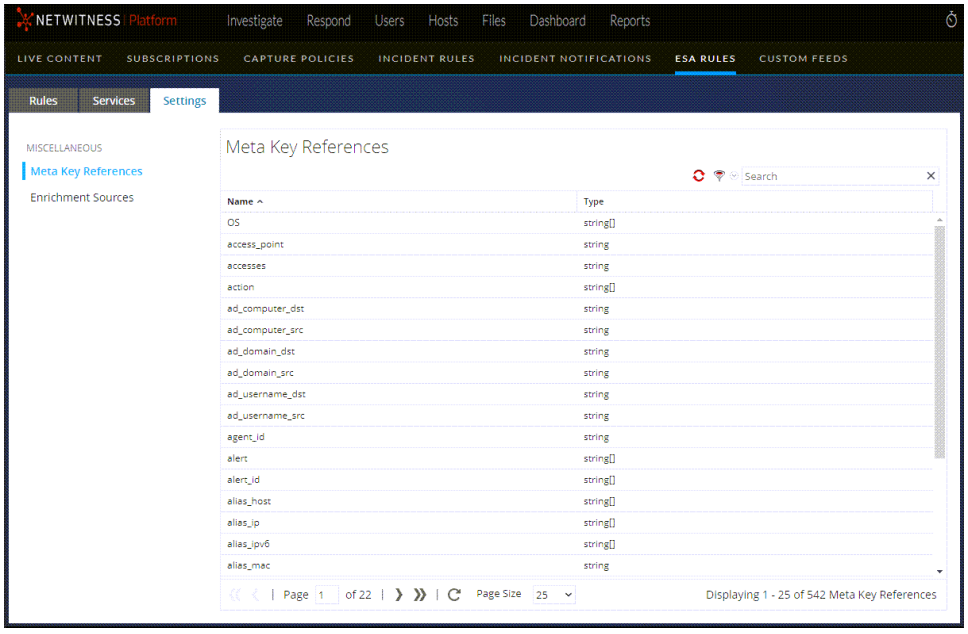
Investigate a Custom Meta Key

> **Note:** You have to log out and log back in to the NetWitness User Interface in order to view the custom meta key in Investigate.

To investigate a custom meta key:

1. Go to **Investigate**.
   The Investigate dialog, which provides services, is displayed.

2. Select a Concentrator service, and click **Navigate**.



Additional Procedures

The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine, and ESA configured.

Verify the Custom Meta Keys on ESA

After you add custom meta keys on the Concentrator, you can verify that your meta keys are updated on ESA.

1. Go to (Configure) > **ESA RULES** > **Settings** tab.

2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).

3. Verify that the custom meta keys appear on ESA. If you do not see the meta keys, you may need to restart the Concentrator.

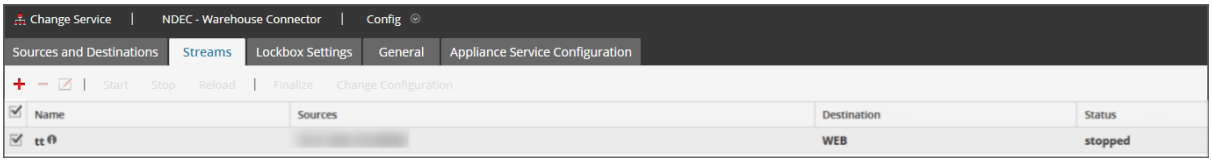
Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**
   The Archiver schema is updated with the custom meta key.



Update the Schema in Warehouse Connector

If you want to configure the Warehouse Connector with custom metadata and use it in a Warehouse Connector report then you need to update the Warehouse Connector schema in the Reporting Engine.

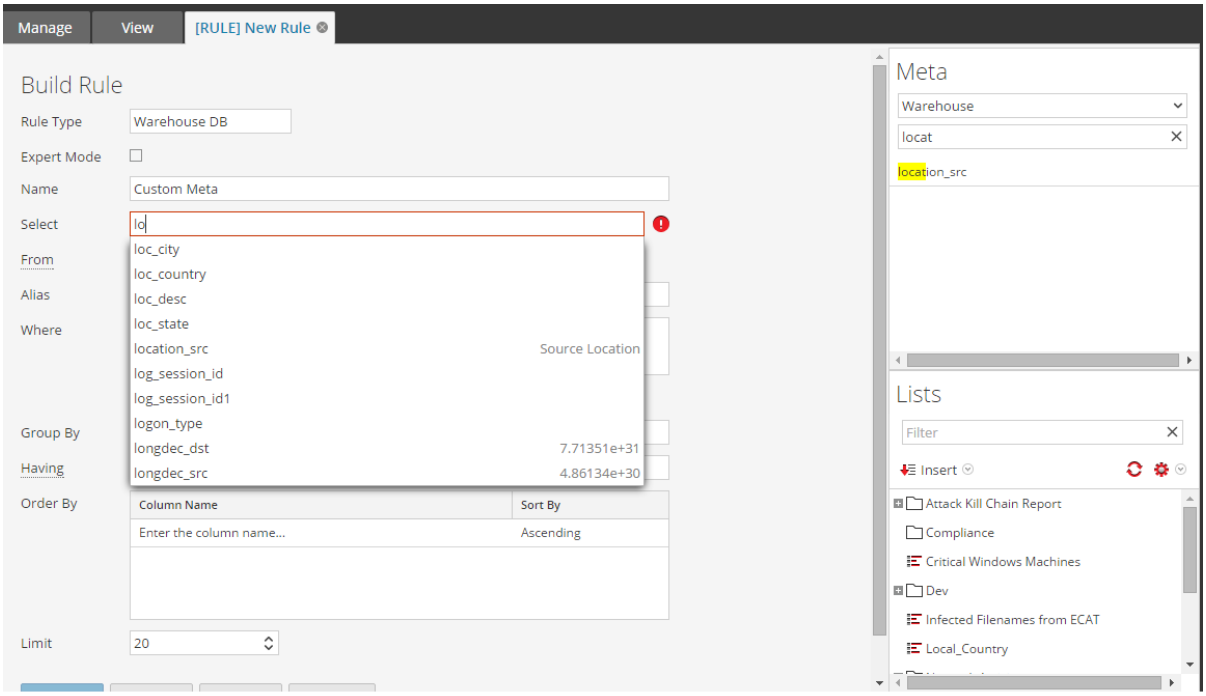
If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse Connector schema in the Reporting Engine:

1. Go to (Admin) > **Services** > **Warehouse Connector**.
2. Click > **View** > **Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. Select the stream and then click **Reload**.
   The Warehouse Connector pulls the schema from the downstream devices (Log Decoder/Decoder).

For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

Update the Schema in Reporting Engine



To update the schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Reporting Engine.**
2. Click > **Restart.**

Note: Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Monitor** > **Reports** > **Rules**.
2. In the toolbar, click .
3. Select **Warehouse DB**.
4. In the **Build Rule** tab, search for the custom meta from the right panel.
   The custom meta key is displayed.

or Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

Topics

- Configure High Speed Packet Capture Capability (Version 11.6 and Later)
- Configure a Log Decoder to Accept Protobuf
- Configure Session Split Timeouts
- Configure Syslog Forwarding to Destination
- Configure Transaction Handling on a Decoder
- Configure Data Export
- Decrypt Incoming Packets (TLS 1.2)
- Decrypt Incoming Packets TLS 1.3
- Edit Decoder System Configuration
- Enable CPU Usage Statistics for Installed Content
- Enable Parser Mappings
- Enable or Disable Lua and Flex Parsing Systems
- Map IP Address to Service Type for Log Parsing
- Map an IP Address to a Time Zone
- Obtain Log Files from a Pre-11.0 Log Decoder
- Upload a Log File to a Log Decoder
- Upload a Packet Capture File
- Troubleshooting Packet Drops (11.x and above)

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.
- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
   a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
   b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.
   c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.
   d. Ensure that you enable the multi-thread assembly while using this mode.

   For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.
      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```
   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.

- You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.
- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

IMPORTANT: If you perform the database stagger operation from the UI Explore page, it takes a long time to complete the operation based on the data and results in a timeout. NetWitness recommends that you use the RESTful API or NwConsole to perform the database stagger operation.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

```
1: packet_mmap_,eth0
2: DPDK,0000:41:00.0
3: DPDK,0000:41:00.1
```

c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.

d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:

   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.

8. The following configuration parameters are deprecated and no longer necessary.

   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.

- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
   a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
   b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.

c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.

d. Ensure that you enable the multi-thread assembly while using this mode.

For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.
7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be

handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.

- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

IMPORTANT: If you perform the database stagger operation from the UI Explore page, it takes a long time to complete the operation based on the data and results in a timeout. NetWitness recommends that you use the RESTful API or NwConsole to perform the database stagger operation.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.

- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.

2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of

the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.

- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

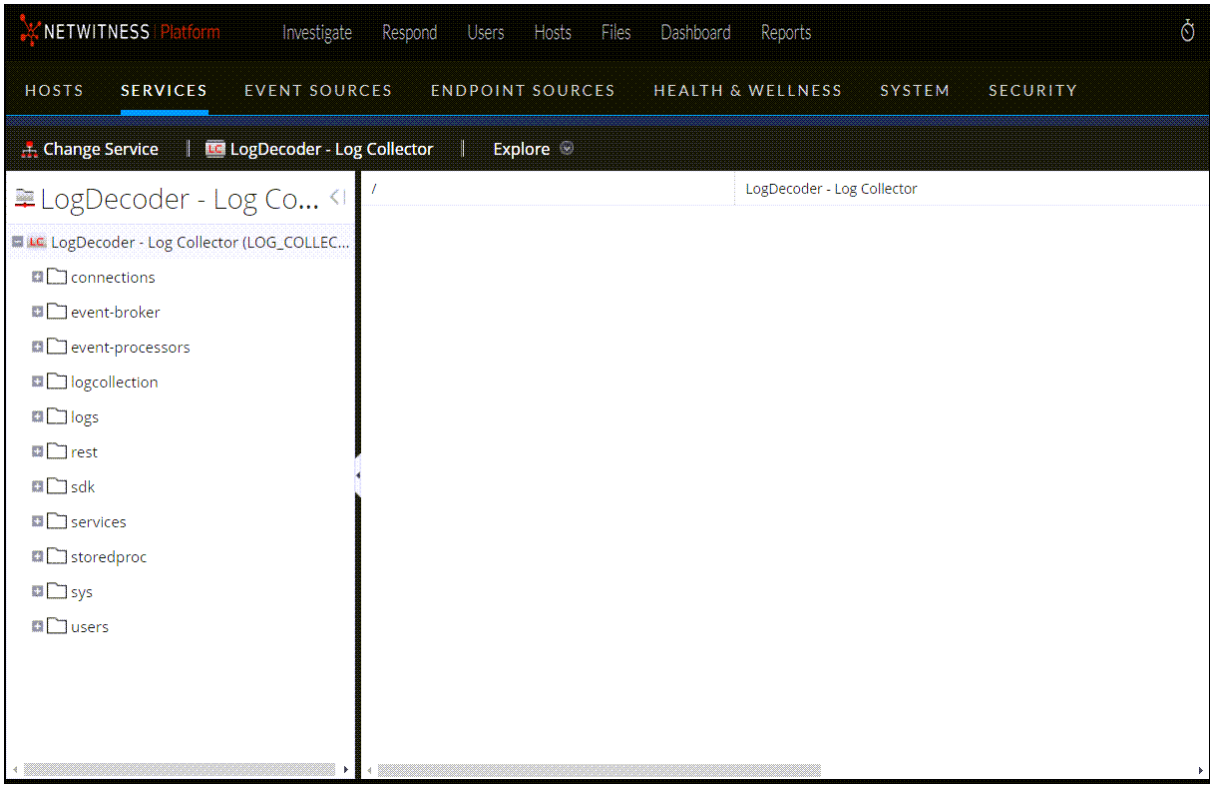
- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

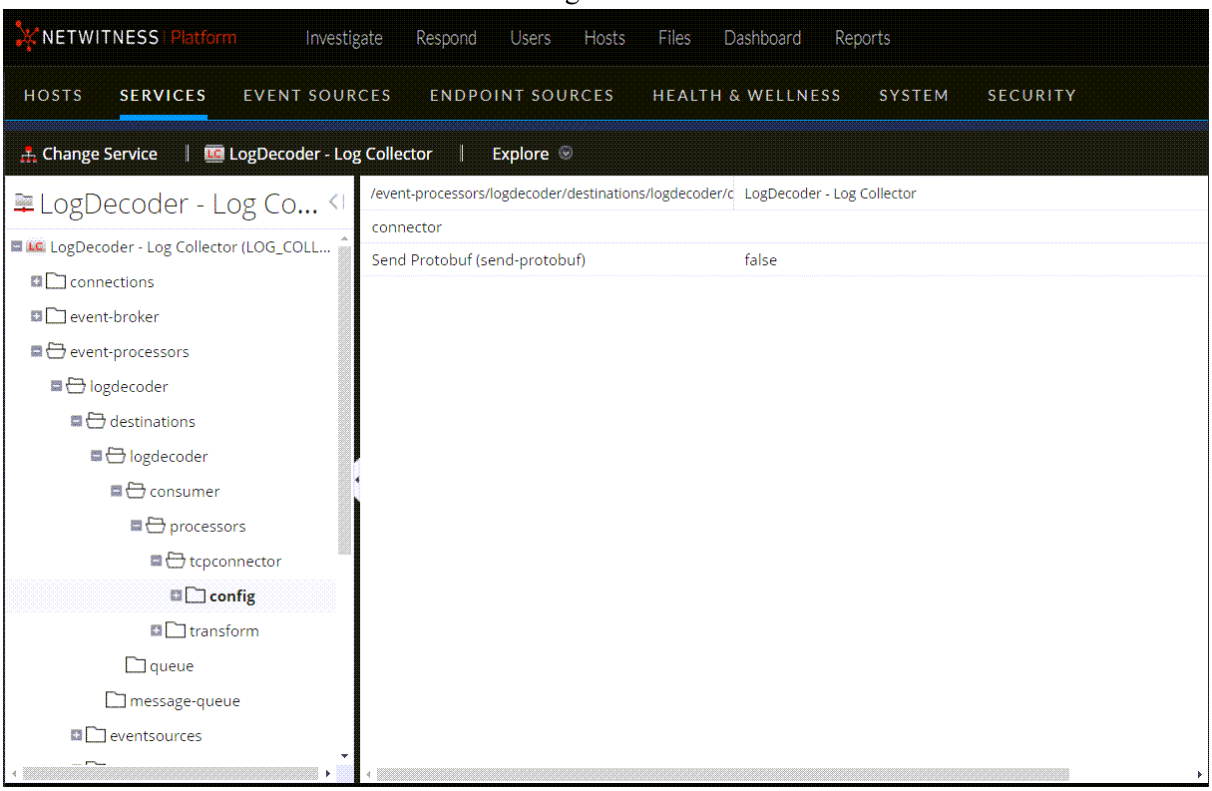
The following considerations are recommended while running the Decoder in the NDR mode:



- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder with a Log Collector service to accept logs in protobuf (Protocol Buffer) format.



To import a log file to a Log Decoder:

1. Go to **(Admin) > Services**.
2. Select a Log Decoder with a Log Collector service in the **Service** list, and select **> View > Explore**.
   The Explore view for the Log Decoder -Log Collector is displayed.

3. Navigate to **`event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`**

Your screen should look similar to the following.

4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.size.max`) or has been inactive for a period of time, the session is split. NetWitness has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

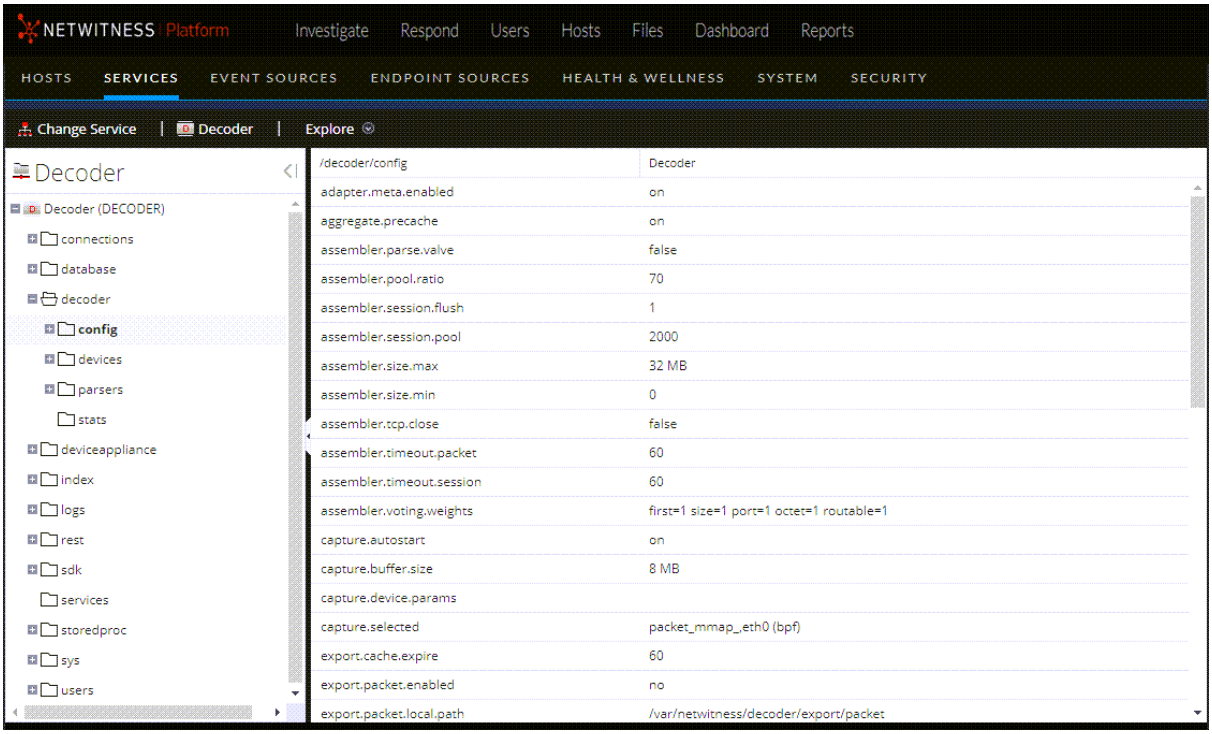
There are two timeout settings in a Network Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

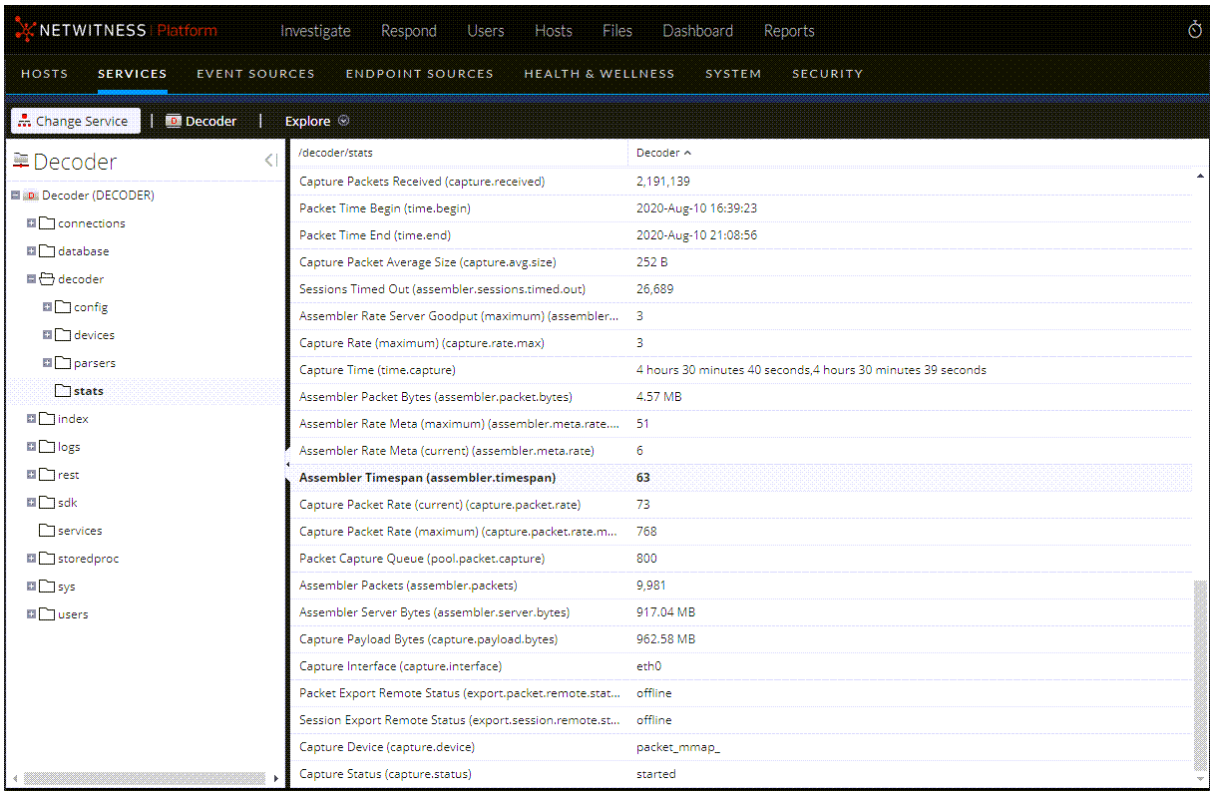
You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.



If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.



To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the  (Admin) > **Services** view, select the Decoder service and  **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.

3. Click in the **Value** column next to the parameter and set these two parameters :
   `/decoder/config/assembler.session.flush = 0`
   `/decoder/config/assembler.timeout.session = 0`
4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** >

stats.

Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver.

Note: No configuration is necessary to collect Syslog messages on the Log Decoder.

NetWitness forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

Note: You must configure Syslog Forwarding using the steps defined in this topic using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness to forward the messages:

   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.

   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.

   c. In the **Properties** view, specify the **add** command with the following parameters:

   `rule=<query> name=<name>`

   Example 1: `rule=* name=receiver1`

   Example 2: `rule="device.type='winevent_nic'" name=receiver`)

   d. Click **Send**.

NetWitnesscreates the `name=receiver1 rule=* order=<n>` rule. NetWitness inserts the order number (for example, `order=49`) based on when you set up the rule.

e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

or

```
rule=* name=receiver1 forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the * rule. It creates a transient alert meta with the value "receiver1" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

a. In the **Services** view, select a Log Decoder, and  **> View > Explore**.

b. Syslog forwarding destinations are defined in the configuration node.

```
/decoder/config/logs.forwarding.destination
```

This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.

```
name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]
```

The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.

The host is an IPv4 address, IPv6 address, or host name.

The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

Example forwarding destination:

```
gears=tls:gears.netwitness.local:6514
```

Example forwarding over tcp to blackout on port 514 with z-connector headers:

```
fwdrule=tcp:blackout.netwitness.local:514:retainsource
```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:

TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`

UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`

TCP Connections: `receiver1=tcp:receiver1.netwitness.local:514`

Note:
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

Configure Transaction Handling on a Decoder

Administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

Caution: Use caution when enabling this feature when you are above the standard ingest rate supported by the Network Decoder as it may start to cause backups with aggregation and dropped packets.

Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `off` (transactions off)
- `meta` (transactions represented as meta items)
- `split` (transactions split sessions)

Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

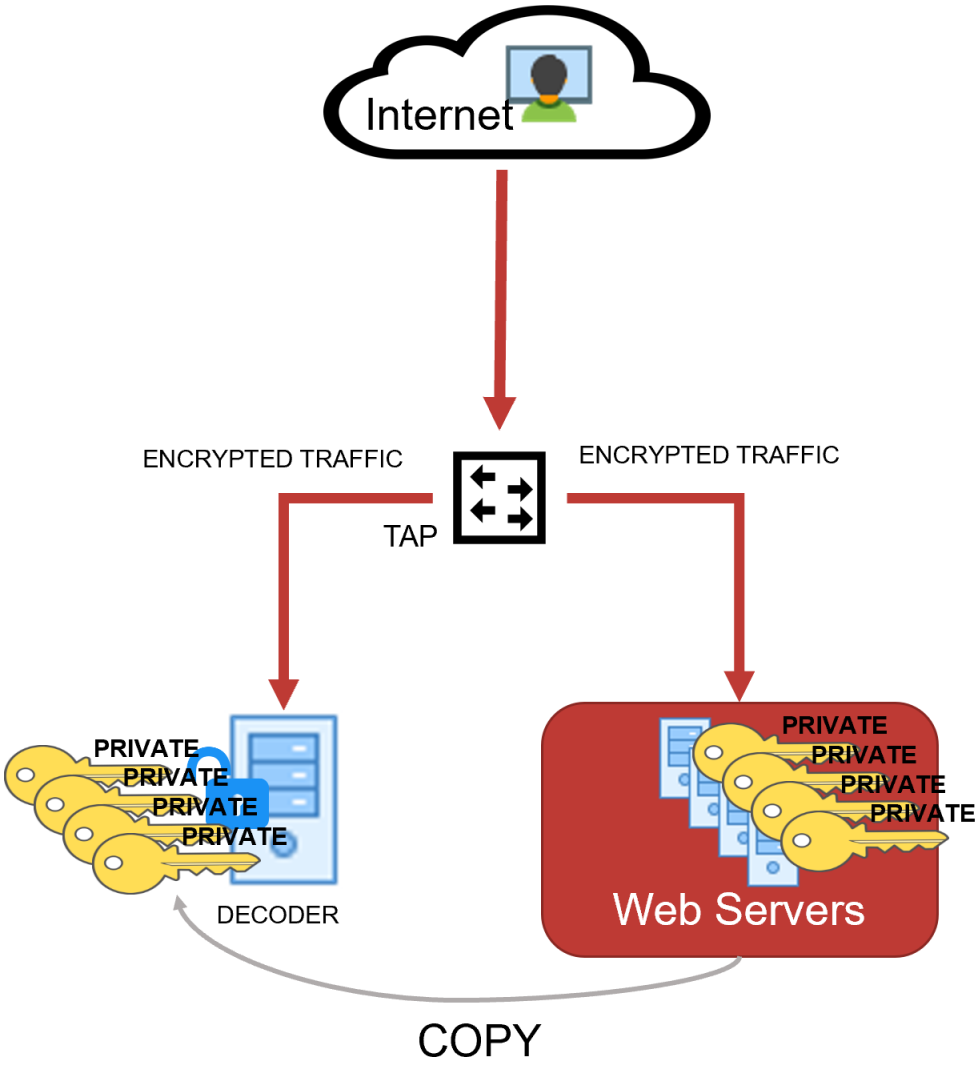
The following meta items are duplicated into the split session from the session that was parsed:

- `time`
- `medium`
- `eth.src`
- `eth.dst`
- `eth.type`
- `ip.proto`
- `ip.src`
- `ip.dst`
- `ipv6.src`
- `ipv6.dst`
- `ip.proto`
- `port.src`
- `port.dst`
- `tcp.flags`
- `udp.srcport`
- `udp.dstport`
- `service`
- `udp.srcport`
- `udp.srcport`
- `tls.premaster`

Configure Data Export

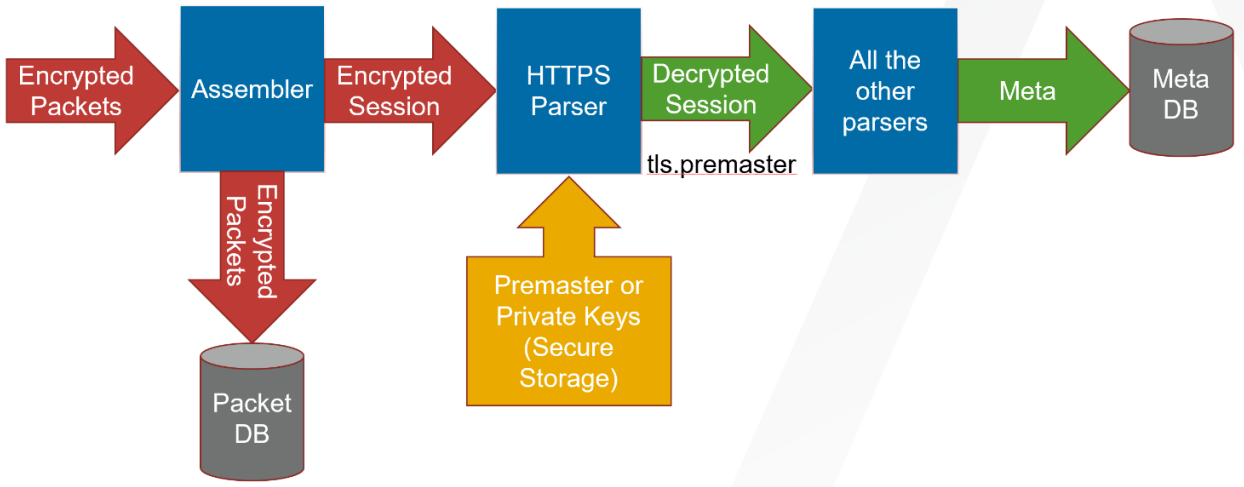
This exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object. To enable data export you must configure the export connector through Logstash.

To configure the data export:



1. Go to  **(Admin) > Services** and select a Decoder or Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration view, select the **Data Export** tab.
4. In the Data Export list, click the name of the host.

The Event Source tab is displayed with export connector typespec selected.



For more information on configuring export connector, see Configure Logstash Event Sources in NetWitness.

Decrypt Incoming Packets (TLS 1.2)

Administrators can configure a Network Decoder to decrypt incoming network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.2 or earlier and certain cipher suites, which are described in Supported Cipher Suites . The following figure illustrates the supported configuration of a Network Decoder deployed as a passive network device where it captures network traffic for managed servers. The Network Decoder is able to decrypt the traffic by using private keys uploaded to it from the managed servers .

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system has been able to decrypt them. As the Decoder parses the encrypted traffic, it uses any private keys that have been uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta key, defined as `tls.premaster`, which contains the decryption key for that particular session. Whether the traffic is decrypted or not, the metadata `service` is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number. The following figure shows the basic progression through the NetWitness platform as the packets are being decrypted and the session metadata is generated.

Follow the steps below to configure the Network Decoder to natively decrypt this network traffic.

- Step 1: Validate That The Network Decoder Captures Encrypted Traffic
- Step 2: Obtain Private Keys from Managed Servers
- Step 3: Validate That The Private Key Cipher Suite is Supported
- Step 4: Confirm HTTPS Parser is Enabled on Decoders
- Step 5: Upload the Supported Private Keys to Decoders
- Step 6: Reload HTTPS Parser on Decoders
- Step 7: View Decrypted Sessions

Note: Currently, you cannot review the decypted payloads directly in the in the user interface. However, you can review them using the RESTful API interface and the NwConsole. However, the Decoders being able to decrypt traffic enables them to detect and generate potentially malicious communications that would otherwise not be detected.

See Troubleshooting for resolving any issues you might encounter while performing these steps.

Step 1: Validate That The Network Decoder Captures Encrypted Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```

Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Obtain Private Keys from Managed Servers

Private keys are the asymmetric keys generated by services that accept TLS traffic. They are normally stored in PEM files. These keys are used during the TLS handshake to encrypt the premaster symmetric key that is used for the rest of the payload encryption.

Note: The method to export private keys from web servers (from which to decrypt traffic) varies depending on the product. Refer to the product documentation for instructions for exporting private keys.

Extracting Certificates for the Decoder SSL Decryption

Extracting the proper key materials from popular servers is required to leverage the Decoder built-in decryption capability. The following are a few examples to extract private keys and certificates from popular servers like Apache, Microsoft IIS, and Exchange.

Note: These procedures can also be used as references to extract keys from other servers as well.

Extract private key from Apache

The private key file location would be referenced in the main Apache configuration file, which is `httpd.conf` or `apache2.conf`. The config directive `SSLCertificateKeyFile` will specify the path on your server where private keys are stored.

If Apache is using OpenSSL default certificates and keys, then locate private keys (which are usually saved to the folder /usr/local/ssl by default). You can run the command openssl version –a to find OPENSSLDIR where your server is saving the keys.

If the private key is password protected, then it can be extracted using the below command with the password.

```
openssl rsa -in yourcertificate.pem -out serverkey.pem
```

Validate the located private key using the following command.

```
openssl rsa -in serverkey.pem -check -noout
```

Extract Private Key and Certificate from Windows Servers

Windows servers provide the interface to extract certificates and private keys in PKCS12 format files (.pfx format). It is recommended to use password protection while exporting private keys.

After exporting keys to the pfx file, you can use the OpenSSL tool to extract private keys as PEM files and upload them to Decoder.

Step 2 (a): Extract PKCS12 file from Internet Information Services (IIS)

There are multiple ways to extract certificates from IIS and the following are few examples.

Using IIS Manager App

- Open Internet Information Services Manager App.
- Under IIS > Navigate to Select Certificates > Select Features view > Select the required web or application server certificate.
- Right-click the certificate and select the Export option. In the export wizard, select the file path to save the pfx file (PKCS12 format)
- Example: C:\ServerCerts\servercrt.pfx.
- Enter the password and confirm the password in the export.
- This would create password protected pfx file which contains a private key and associated certificate.

Using Microsoft Management Console (MMC)

- Open Microsoft Management Console (MMC).
- In the Console Root expand Certificates (Local Computer).
- If the Certificates folder is not available then navigate to File > Add Snap In > Add Certificates.
- Locate your server certificate, it is located in the Web Server or Personal sub-folders.
- Right-click the certificate, identified by the Common Name, select Export, and follow the wizard. Use password to protect the pfx file.
- This would create password protected pfx file which contains a private key and associated certificate.

Step 2 (b): Extract PKCS12 file from Exchange Servers

Refer the Export a Certificate from an Exchange Server document for information on how to extract the pfx file from the Exchange server.

Step 2 (c): Extract Private Key From a pfx File Using OpenSSL

OpenSSL tool provides API to export keys in PEM format.

1. Extract private key in PEM format, at the openssl prompt use the password to decrypt the pfx file.
   ```
   openssl pkcs12 -in servercrt.pfx -nocerts -nodes -out serverkey.pem
   ```
2. Validate the private key generated
   ```
   openssl rsa -in serverkey.pem -check -noout
   ```
3. Extract cert in PEM format to validate compatibility with private key
   ```
   openssl pkcs12 -in servercrt.pfx -nokeys -out serverkey.crt
   ```
4. Validate private key and certificate modulus. The modulus should be the same for both the private key and its certificate.
   ```
   openssl rsa -noout -modulus -in serverkey.pem
   openssl x509 -noout -modulus -in serverkey.crt
   ```

Recommendations

Once private keys are extracted from servers and imported to Decoder, it is recommended to secure or delete the extracted PEM file of the private key (serverkey.pem) generated by the above OpenSSL commands.

Step 3: Validate That The Private Key Cipher Suite is Supported

As a passive collection device, the Network Decoder can only decrypt ciphers that use the RSA key exchange. The list of supported keys, and whether the keys are FIPS compliant, are listed in Supported Cipher Suites and Unsupported Cipher Suites . If you are expecting to decrypt less-secure channels of communication, you might need to disable FIPS. However, this is a system change to the entire Decoder, not just the parsing of captured traffic, so take caution before disabling FIPS. If you require more-secure cipher suites for the managed server communications, search for "SSL decrypt" in our third party partner integrations section at NetWitness Community (https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions).

Note: If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS-compliant.

Supported Cipher Suites

The following table lists which cipher-suites are supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_GCM_SHA384	AES256-GCM-SHA384	[0x9d]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_256_CBC_SHA256	AES256-SHA256	[0x3d]	TLSv1.2	Kx=RSA	Compliant

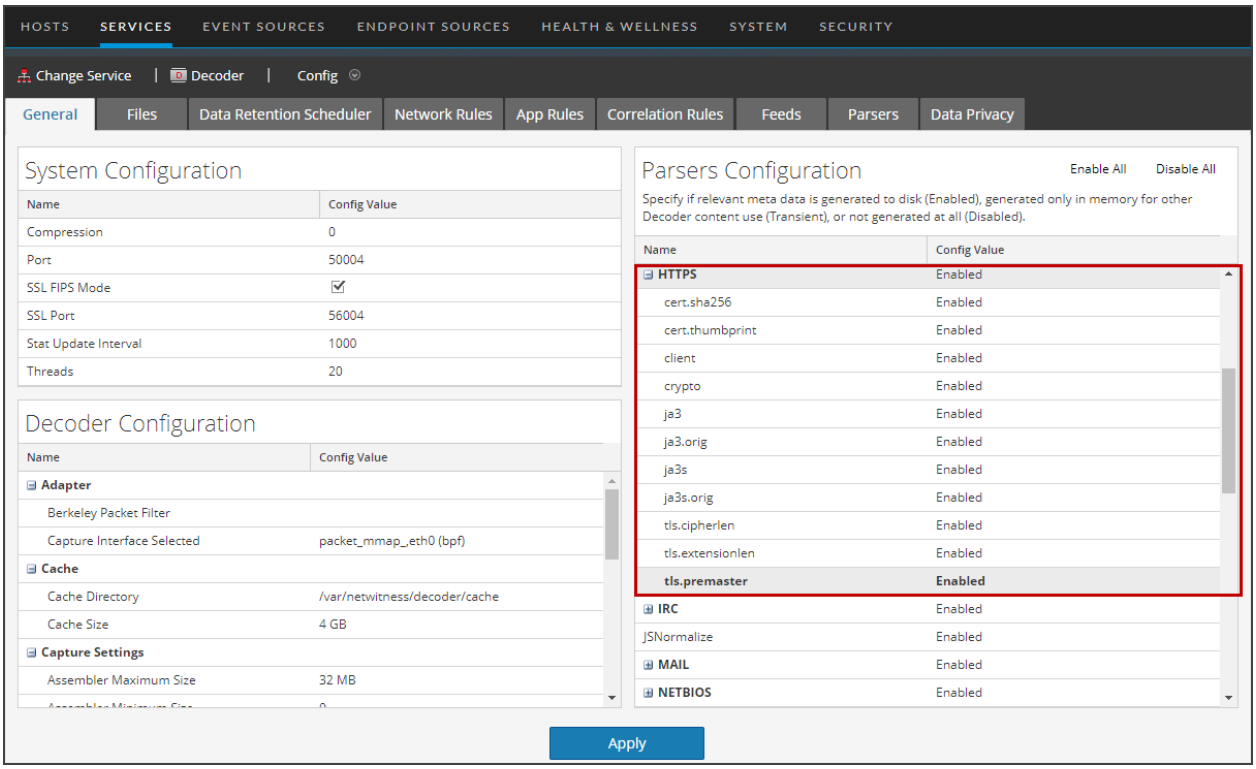
Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_CBC_SHA	AES256-SHA	[0x35]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_CAMELLIA_256_CBC_SHA	CAMELLIA256-SHA	[0x84]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_3DES_EDE_CBC_SHA	DES-CBC3-SHA	[0x0a]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_GCM_SHA256	AES128-GCM-SHA256	[0x9c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA256	AES128-SHA256	[0x3c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA	AES128-SHA	[0x2f]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_SEED_CBC_SHA	SEED-SHA	[0x96]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_CAMELLIA_128_CBC_SHA	CAMELLIA128-SHA	[0x41]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_IDEA_CBC_SHA	IDEA-CBC-SHA	[0x07]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_RC4_128_SHA	RC4-SHA	[0x05]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_DES_CBC_SHA	DES-CBC-SHA	[0x09]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA	EXP-DES-CBC-SHA	[0x08]	SSLv3	Kx=DES	Non-Compliant

Unsupported Cipher Suites

The following table lists which cipher-suites are not supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	ECDHE-RSA-AES256-GCM-SHA384	[0xc030]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	ECDHE-ECDSA-AES256-GCM-SHA384	[0xc02c]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	ECDHE-RSA-AES256-SHA384	[0xc028]	TLSv1.2	Kx=ECDH	Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	ECDHE-ECDSA-AES256-SHA384	[0xc024]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA	ECDHE-RSA-AES256-SHA	[0xc014]	SSLv3	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	ECDHE-ECDSA-AES256-SHA	[0xc00a]	SSLv3	Kx=ECDH	Compliant
TLS_DHE_DSS_WITH_AES_256_GCM_SHA384	DHE-DSS-AES256-GCM-SHA384	[0xa3]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_GCM_SHA384	DHE-RSA-AES256-GCM-SHA384	[0x9f]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256	DHE-RSA-AES256-SHA256	[0x6b]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA256	DHE-DSS-AES256-SHA256	[0x6a]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA	DHE-RSA-AES256-SHA	[0x39]	SSLv3	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA	DHE-DSS-AES256-SHA	[0x38]	SSLv3	Kx=DH	Compliant
TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA	DHE-RSA-CAMELLIA256-SHA	[0x88]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_DSS_WITH_CAMELLIA_256_CBC_SHA	DHE-DSS-CAMELLIA256-SHA	[0x87]	SSLv3	Kx=DH	Non-Compliant
TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384	ECDH-RSA-AES256-GCM-SHA384	[0xc032]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384	ECDH-ECDSA-AES256-GCM-SHA384	[0xc02e]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384	ECDH-RSA-AES256-SHA384	[0xc02a]	TLSv1.2	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384	ECDH-ECDSA-AES256-SHA384	[0xc026]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA	ECDH-RSA-AES256-SHA	[0xc00f]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA	ECDH-ECDSA-AES256-SHA	[0xc005]	SSLv3	Kx=ECDH/ECDSA	Compliant



Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
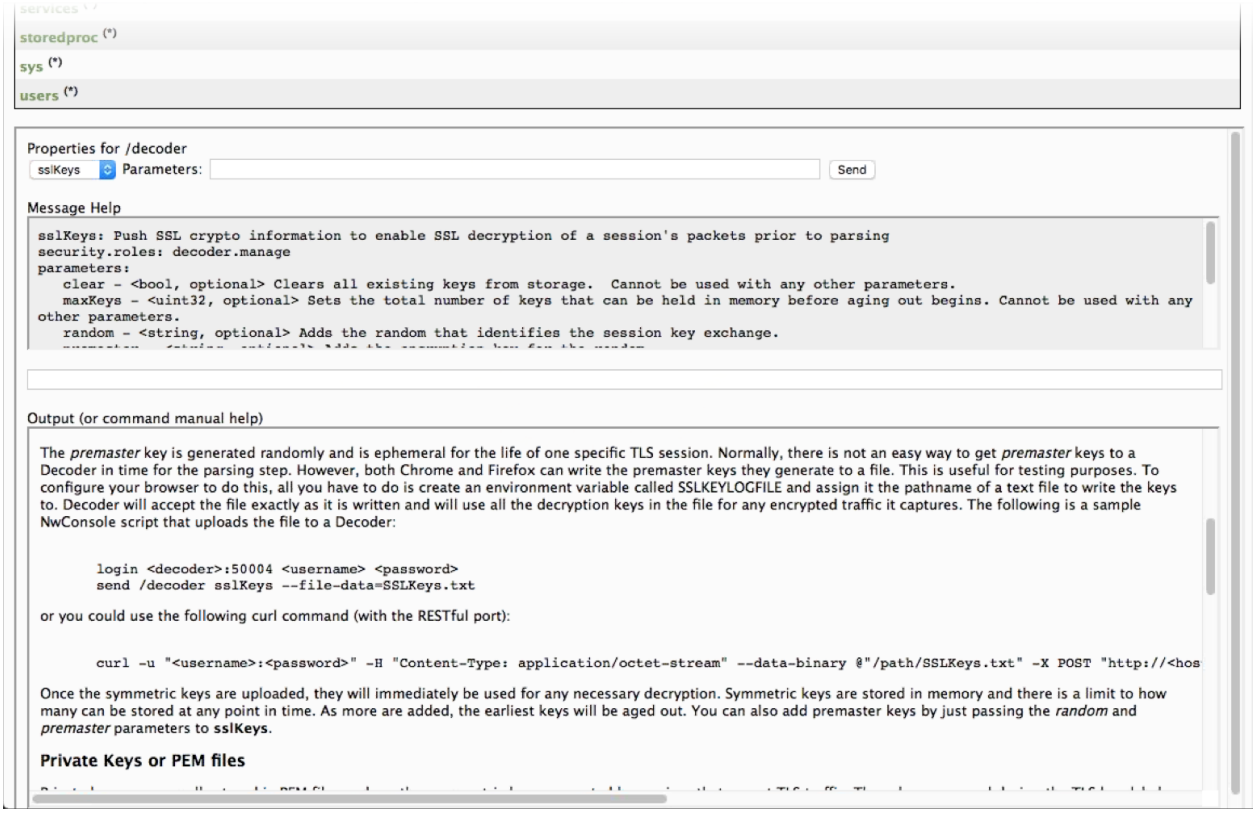
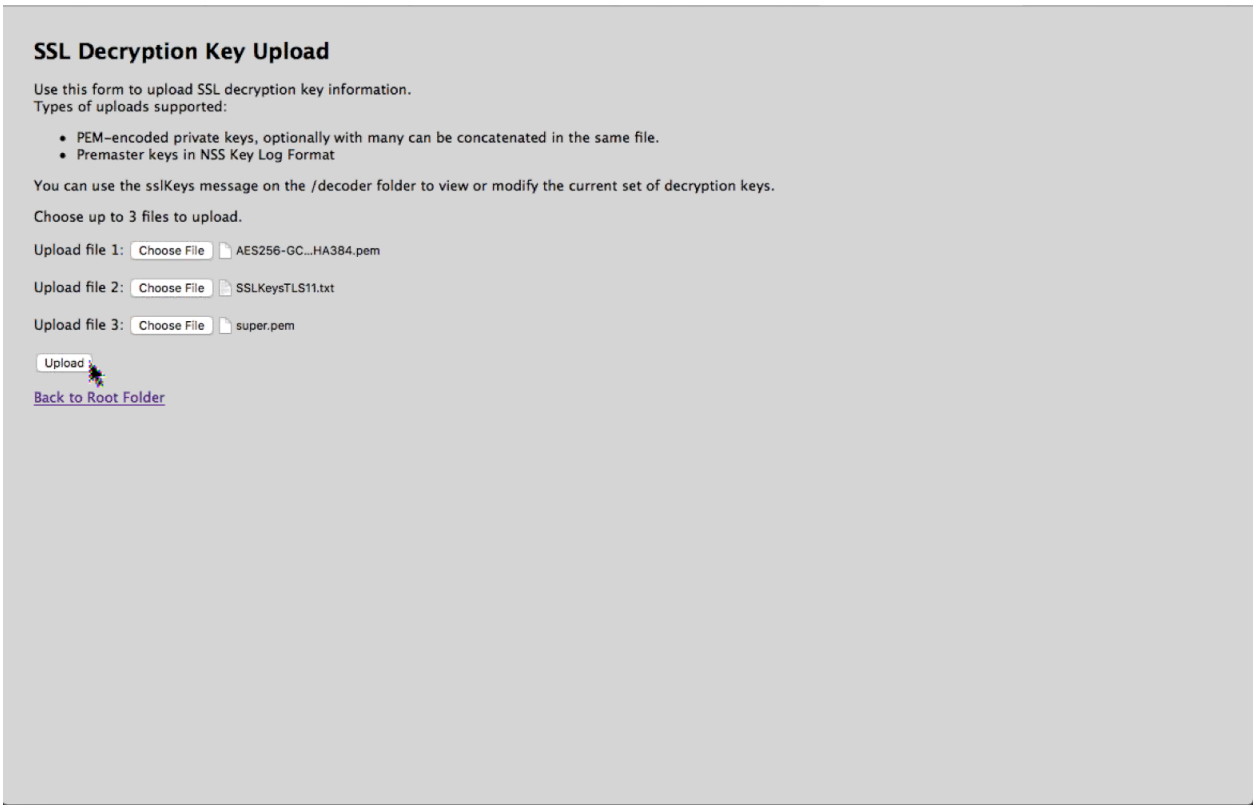
TLS_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA	EXP-EDH-DSS-DES-CBC-SHA	[0x11]	SSLv3	Kx=DSS	Non-Compliant

Step 4: Confirm HTTPS Parser is Enabled on Decoders



The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in (Admin) > **Services** > **Decoder** > **Config** > Parsers Configuration panel as shown in the following figure.

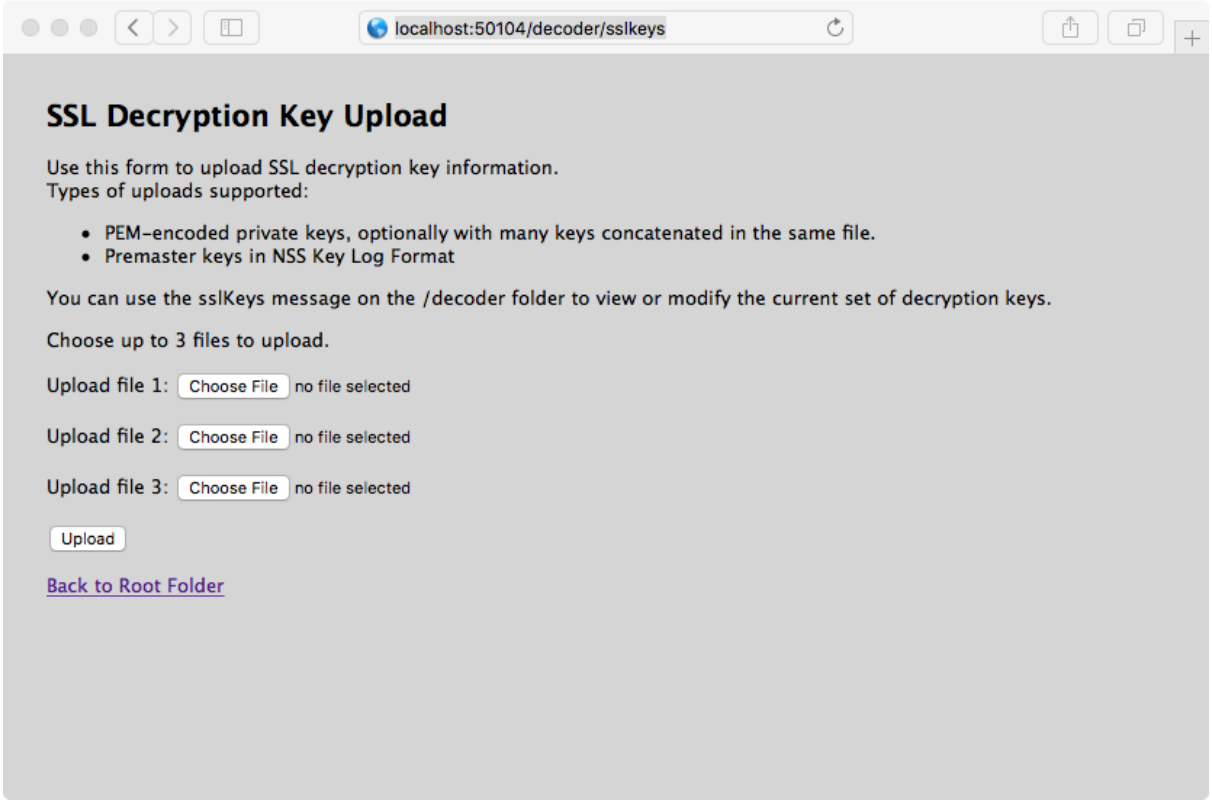


Step 5: Upload the Supported Private Keys to Decoders

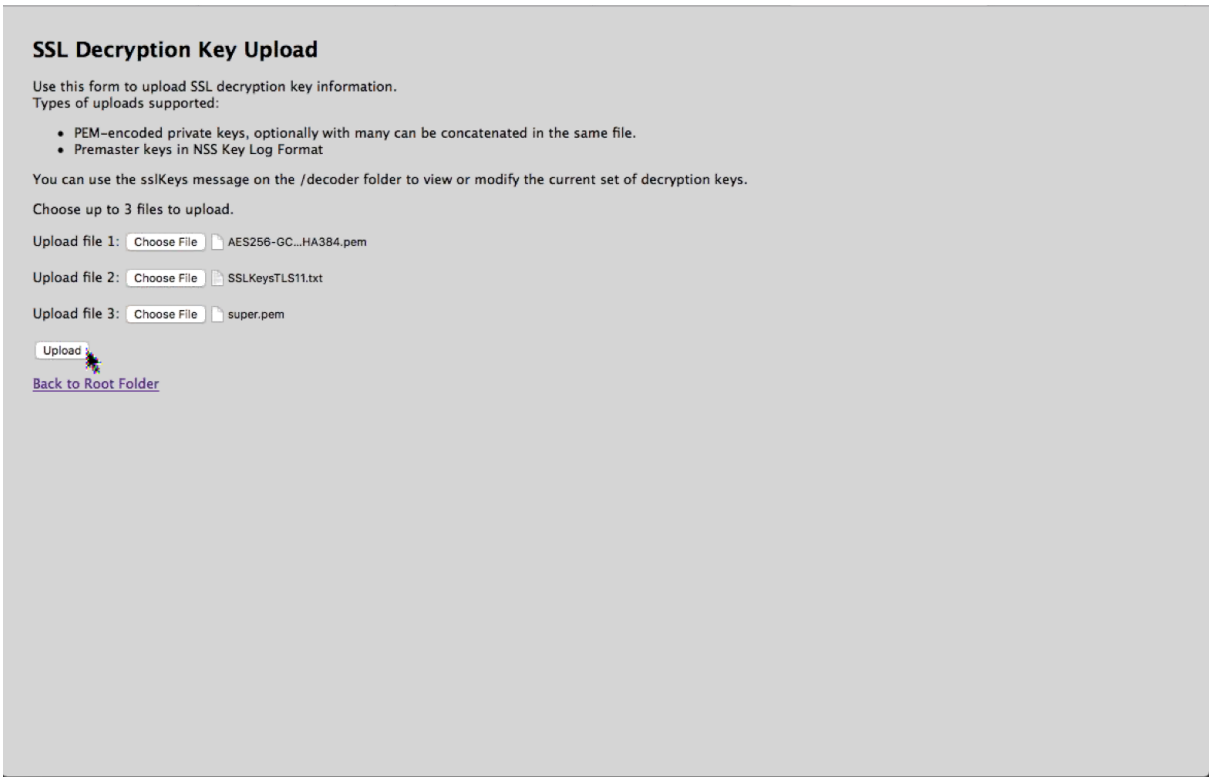
The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The RESTful interface form at the path `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.



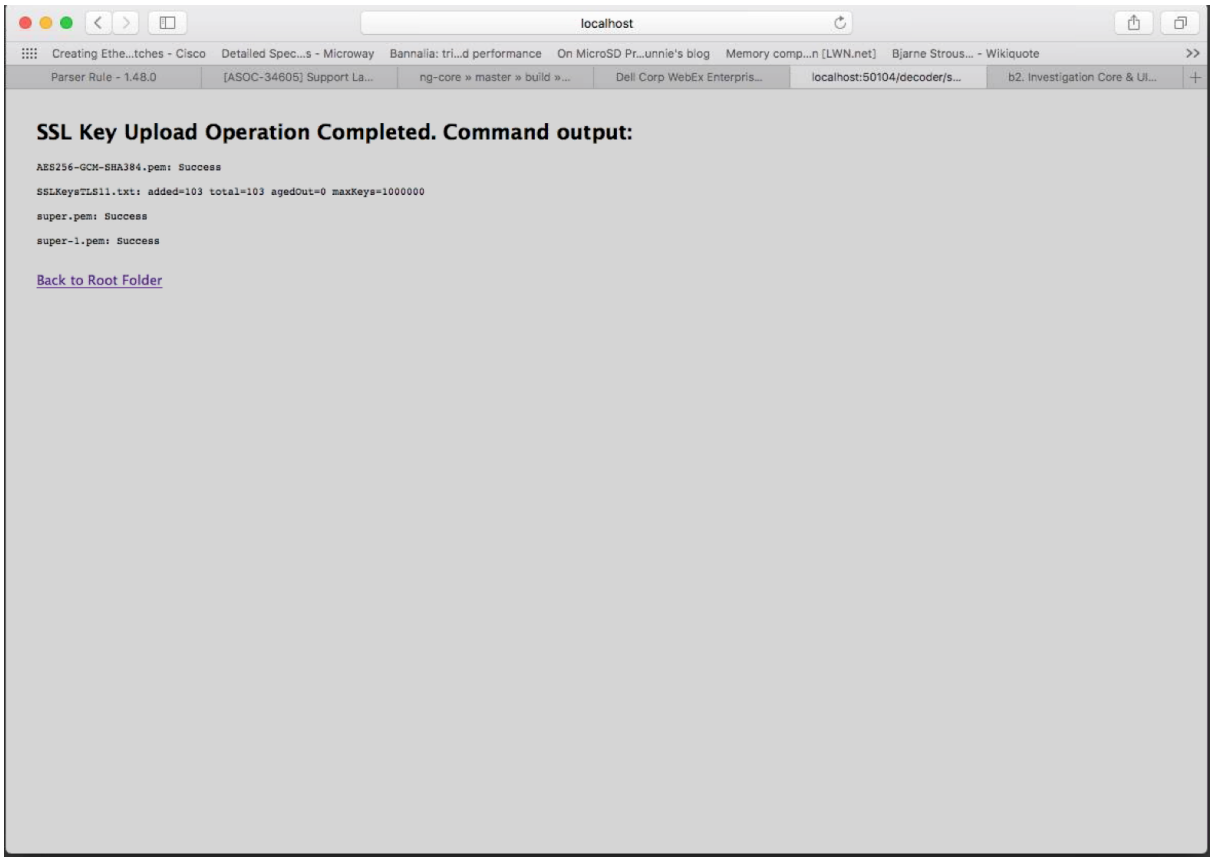
Upload Multiple Premaster and Private Keys



Note: As of 11.5, uploading premaster keys is not officially supported yet for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.



2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on your local file system.
3. (Optional) Repeat for **Upload File 2** and **Upload File 3**.

4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
`clear`	Removes all premaster keys from memory. Does not delete any PEM files installed on the system.
`maxKeys`	Changes the maximum number of premaster keys that are stored in memory.
`listPems`	Returns a list of all installed private key PEM files.
`deletePem`	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
`random`	The random hash used to identify the premaster key.
`premaster`	The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first.

Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

Name	Description
`added`	The number of premaster keys just added during this command.
`total`	The total number of premaster keys loaded in memory.
`agedOut`	The total number of premaster keys that were removed during this command; this is not a lifetime stat.
`maxKeys`	The current maximum allowed premaster keys

Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called `SSLKEYLOGFILE` and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

Private Keys or PEM Files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

Note: Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

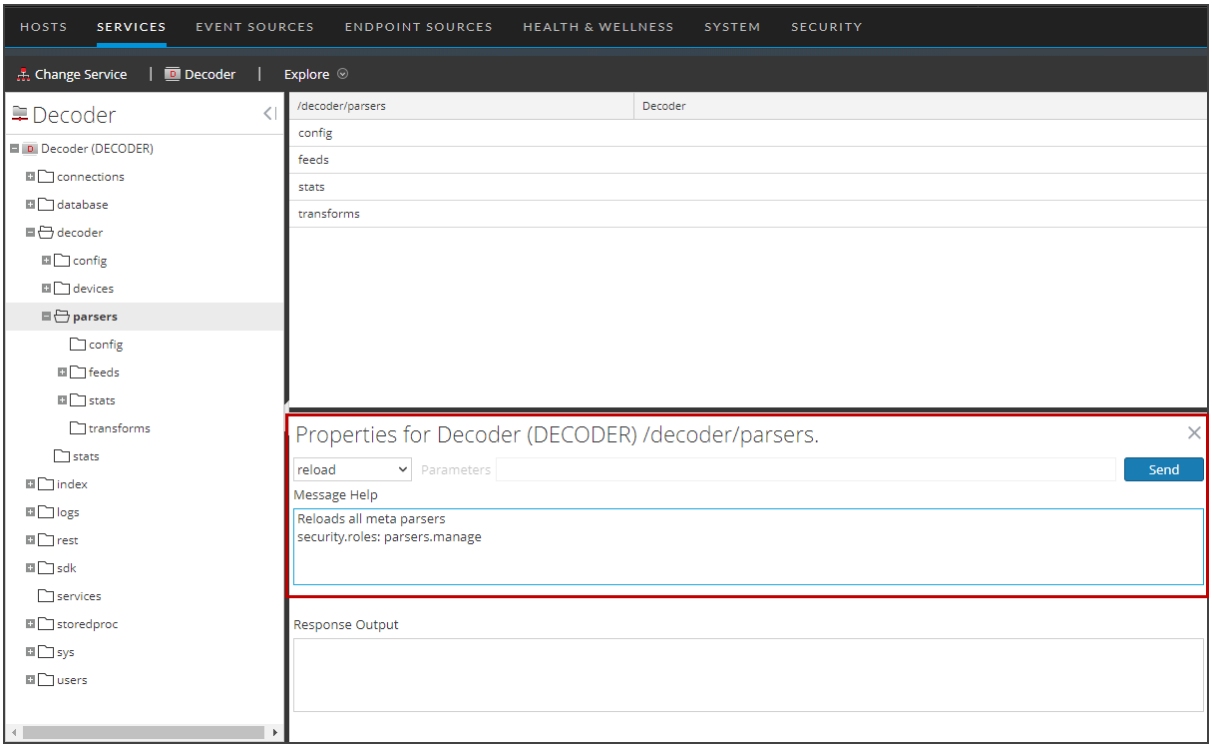
These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```



Step 6: Reload HTTPS Parser on Decoders

After uploading the private keys, you must issue a parser reload command so that the newly-installed key becomes visible to the HTTPS parser. All TLS handshakes that use that private key are now able to be decrypted by the Decoder.

To issue a parser reload command:

1. Go to  (Admin) > **Services** and select the Decoder.
2. Click  > **View** > **Explore** > **decoder**, right-click **parsers** and select **Properties**.

3. In the Properties for Decoder (DECODER) /decoder/parsers pane, select reload from the drop-down menu and click **Send**.

Step 7: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, `tls.premaster` metadata is associated with the session that has the premaster key required for decrypting that session. The session will also have crypto metadata denoting the cipher suite, with crypto formated as `tls.premaster`.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

Alternatively, you can use the NetWitness Investigator thick client to decrypt and display the network sessions, as it can communicate to a Concentrator or have PCAPs and private keys loaded locally.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the `tls.premaster` metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

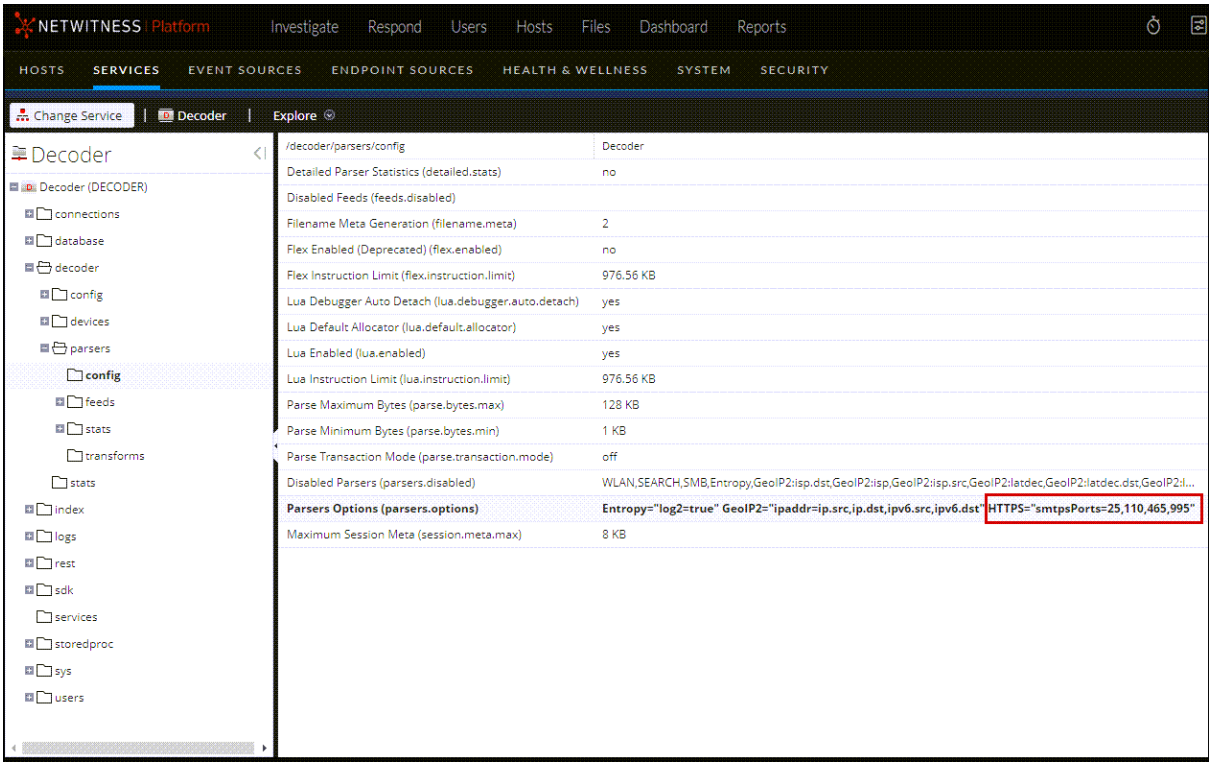
If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate that your private key is using an acceptable cipher-suite.
2. Make sure your Network Decoder is capturing the traffic matching the server for which you have the private key. To check, you can upload the private key and PCAP into Wireshark and see if it is able to decrypt it.

Decryption of Secure SMTP

In version 11.3, NetWitness supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a .csv list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality.

Note: The .csv list must include all the destination ports of a session. If a destination port is not in the list, the search for STARTTLS will not be started.



The STARTTLS search is limited to the first 1024 bytes of the session's payload, to prevent performance degradation. If STARTTLS is found, the parser uses the next client packet with payload as the start of a TLS negotiation.

To add an HTTPS parser option for secure SMTP decryption:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Log Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, enter an HTTPS parser option in the following format that provides a .csv list of the destination ports of the session where the STARTTLS command is searched:

   `HTTPS="smtpsPorts=<port#1,port#2,port#n>"`

The following image shows an example of an HTTPS parser option for secure SMTP decryption.

Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

Note: Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted, a Decoder can process traffic at 3 Gbps .

Parser Name	Description
SYSTEM	Session Details
NETWORK	Network Layer
ALERTS	Alerts
GeoIP	Geographic data based on ip.src and ip.dst
GeoIP2	Geographic data by default based on IPv4 (`ip.src`, `ip.dst`) and IPv6 (`ipv6.src`, `ipv6.dst`) meta keys
HTTP	Hyper Text Transport Protocol (HTTP)
HTTP_Lua	Hyper Text Transport Protocol (HTTP) Lua
FTP	File Transfer Protocol (FTP)
TELNET	TELNET Protocol
SMTP	Simple Mail Transport Protocol (SMTP)
POP3	Post Office Protocol (POP3)
NNTP	Network News Transport Protocol (NNTP)
DNS	Domain Name Service (DNS)
HTTPS	Secure Socket Layer (SSL) Protocol
MAIL	Standard E-Mail Format (RFC822)
VCARD	Extracts VCARD fullname and email information
PGP	Identifies PGP blocks within network traffic
SMIME	Identifies SMIME blocks within network traffic
SSH	Secure Shell (SSH)
TFTP	Trivial File Transfer Protocol (TFTP)
DHCP	Dynamic Host Configuration Protocol (DHCP and BOOTP)
NETBIOS	Extracts NETBIOS computer name information.
SNMP	Simple Network Management Protocol (SNMP)
NFS	Network File System (NFS) protocol
RIP	Routing Information Protocol (RIP).
TDS	MSSQL and Sybase database protocol (TDS)

Parser Name	Description
TNS	Oracle database protocol (TNS)
IRC	Internet Relay Chat (IRC) protocol
RTP	Real Time Protocol (RTP) for audio/video
SIP	Session Initiation Protocol (SIP)
H323	H.323 Teleconferencing protocol
SCCP	Cisco Skinny Client Control Protocol
GTalk	Google Talk (GTalk)
VlanGre	Vlan ID and GRE/EtherIP tunnel addresses
BITTORRENT	BitTorrent File Sharing Protocol
FIX	Financial Information eXchange Protocol
GNUTELLA	Gnutella file sharing protocol
IMAP	Internet Message Access Protocol
MSRPC	Microsoft Remote Procedure Call protocol
RDP	Remote Desktop Protocol
SHELL	Command Shell Identification
TLSv1	TLSv1
SearchEngines	A parser that extracts search terms
FeedParser	External Feed Parser

TLS Certificate Hashing

The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists, such as the one from sslbl.abuse.ch.

The TLS Certificate hashing feature is disabled by default. To enable TLS Certificate hashing:

1. Go to  **(Admin)** > **Services**, select a Network Decoder service and  > **View > Explore.**
2. Select **decoder** > **parsers** > **config**.
3. In the values column next to `parsers.options`, type `HTTPS="cert.sha1=true"`.
   When this option is enabled, the SHA-1 is stored as a text value in the `cert.thumbprint` meta key.

4. The change takes effect on parser reload. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**

The SHA-256 hash of the certificate can be enabled by adding the parser option:

```
HTTPS="cert.sha256=true"
```

to a Network Decoder's `/decoder/parsers/config/parsers.options` configuration.

When this option is enabled, SHA-256 is stored as a text value in the meta keys:

```
cert.sha256
cert.thumbprint
```

JA3 and JA3S TLS Fingerprints

The Network Decoder can produce the JA3 value of TLS clients and the JA3S value of TLS servers that are observed in a Network session. The values that are produced conform to the values generated by the open source JA3 tools (https://github.com/salesforce/ja3). The JA3 features are disabled by default.

To enable JA3 features:

1. In the NetWitness Platform User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, add `HTTPS="ja3=true ja3s=true"`.
5. In the left panel, right click on **parsers** and select **properties**.
6. In the right panel, in the lower pane, set the value in the first drop down to **Reload**.
7. Click **Send**.

JA3 and JA3S can be enabled independently using these options. When enabled, the JA3 is stored as a text value in the meta key `ja3`. The JA3S is stored as a text value in the meta key `ja3s`.

Additional meta keys are activated using a mechanism similar to the JA3S and JA3S meta items. For example, `ja3.orig` is enabled by adding `ja3.orig=true` to the HTTPS parser options. This is also true for `ja3s.orig`, `tls.extensionlen`, and `tls.cipherlen`.

`ja3.orig`, `tls.extensionlen`, and `tls.cipherlen` are only created if JA3 is enabled.

`ja3s.orig` is only created if JA3S is enabled.

Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder

In previous versions, ingesting encrypted and decrypted traffic streams of the same session to a Decoder causes packets from both the sessions to mix on the Decoder as reassembly is performed by the same thread. It cause session parsing and content extraction inaccuracies.

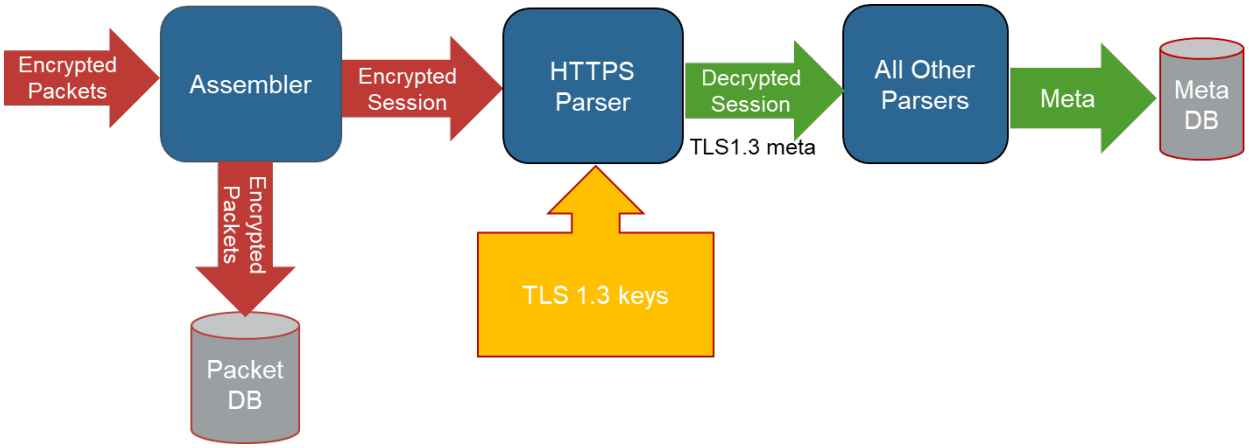
In NetWitness 11.6, using multi-adapter capture and multi-thread assembler features, you can configure the Decoder to receive encrypted and decrypted streams on separate adapters. The multi-thread assembler feature allows decoder to assemble packets from its corresponding capture work thread. It keeps the packets from encrypted and decrypted sessions separate during assembly and avoid inaccuracies in session parsing and content extraction.

To configure the Decoder for the simultaneous ingestion of the encrypted and decrypted traffic streams:

1. Configure Decoder to capture from multiple adapters simultaneously, see (Optional) Multiple Adapter Packet Capture.
2. Set `/decoder/config/assembler.threading.enabled=on` to enable multi-thread assembler.
3. Restart the Decoder service.

Community ID

The Network Decoder generates Community ID flow hash values that are compatible with the Community ID specification defined by `https://github.com/corelight/community-id-spec`.



The Community ID is written to a text-formatted meta key named `community`.

The Community ID is generated on sessions containing TCP over IPv4, TCP over IPv6, UDP over IPV4, and UDP over IPV6.

Decrypt Incoming Packets TLS 1.3

Administrators can configure a Network Decoder to decrypt incoming TLS 1.3 network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.3 or earlier.

For TLS 1.2 and earlier protocols refer Decrypt Incoming Packets (TLS 1.2)

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system can decrypt them. As the Decoder parses the encrypted traffic, it uses TLS 1.3 keys that have been pushed or uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta keys, defined as `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early` which contains the decryption keys for that particular session. Whether the traffic is decrypted or not, the metadata service is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number.

TLS 1.3 Keys and Cipher suites

According to RFC 8446 the TLS 1.3 protocol doesn't support Private key based decryption and it only support a set of ephemeral symmetric keys also called as key secrets for the life of one specific TLS 1.3 session. The TLS 1.3 session also encrypts handshake, all the TLS records after Server Hello are encrypted , and at each stage a corresponding key is used for the encryption ex: client handshake, server handshake, client application and server application etc.. . So in order for decrypting a TLS 1.3 session all the required session keys `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early`(optional) are needed to be available.

Cipher Suites

TLS 1.3 protocol recommends to support only strong and advanced Cipher suites. The Network Decoder supports all the advertised cipher suites from RFC-8446, however on integration with Thirdparty key forwarder the supported cipher suites might be limited to list supported by Thirdparty server. Example only GCM ciphers are supported etc..

The following is list of cipher suited supported in Network Decoder

- TLS_AES_128_GCM_SHA256
- TLS_AES_256_GCM_SHA384
- TLS_CHACHA20_POLY1305_SHA256
- TLS_AES_128_CCM_SHA256
- TLS_AES_128_CCM_8_SHA256

Steps to configure Network Decoder to decrypt TLS 1.3 traffic

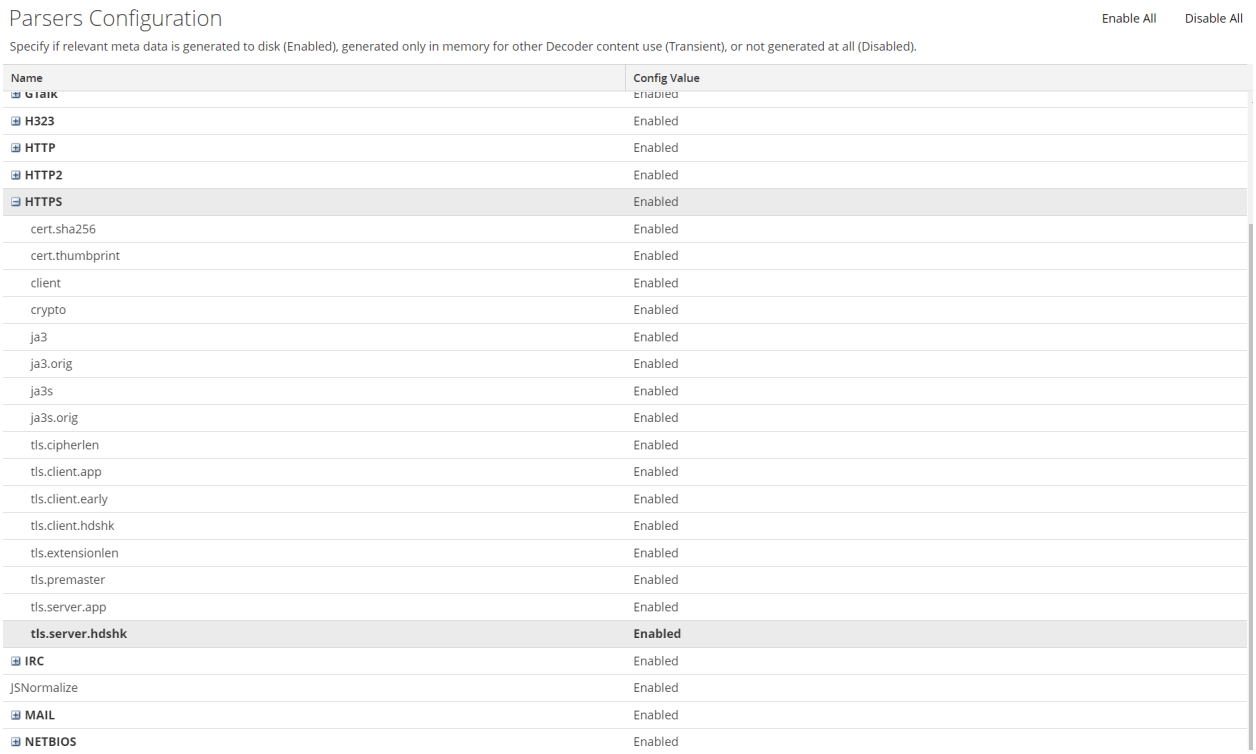
- Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic
- Step 2: Confirm HTTPS Parser is Enabled on Decoders
- Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder
- Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption
- Step 5: Validate TLS 1.3 keys are received on Decoder
- Step 6: View Decrypted Sessions

Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```



Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Confirm HTTPS Parser is Enabled on Decoders

The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in **Admin > Services > Decoder > Config** > Parsers Configuration panel as shown in the following figure.

If TLS_Lua parser is enabled then meta version: TLS 1.3 is registered for TLS 1.3 encrypted traffic.

Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder

TLS 1.3 protocol only support ephemeral keys which are unique per session and Network Decoder need to receive those keys in time for parsing step.

Network Decoder provides `sslKeys` API which can receive the keys forwarded or injected to Decoder on RESTful interface.

A Thirdparty TLS 1.3 key forwarder which acts as Man-In-The-Middle (MITM) gateway for TLS 1.3 may intercept SSL handshake and forward the TLS 1.3 keys to Network Decoder.

Example: F5 BIG-IP Local Traffic Manager.

Option 1: Configure F5 BIG-IP Local Traffic Manager (LTM)

If you are using BIG-IP LTM in your environment for application traffic management, load balancing etc.. and if you would like to decrypt and analyze TLS 1.3 traffic handled by BIG-IP LTM, then refer the following section to Configure F5 BIG-IP LTM and forward keys to Network Decoder.

For more information refer: F5 BIG IP - Netwitness Perfect Forward Secrecy Inspection Visibility

Option 2: Using sslKeys API

If you are using other Man-In-The-Middle (MITM) gateway which can intercept TLS 1.3 handshake and forward the keys, then you can refer the following information and parameters to send keys to `sslKeys` API on Network Decoder.

The `sslKeys` API is used to push SSL crypto information to enable SSL decryption of a session's packets prior to parsing.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
clear	Removes all premaster and TLS 1.3 keys from memory. Will not delete any PEM files installed on the system.
maxKeys	Changes the maximum number of premaster and TLS 1.3 keys that will be stored in memory.
counts	Returns key counts for sslKeys. Cannot be used with any other parameters.
listPems	Returns a list of all installed private key PEM files.
deletePem	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
random	The random hash used to identify the premaster key or TLS 1.3 keys.
premaster	The premaster key that will be installed for the previous random parameter. They must show up in pairs and random must be first.
CETS	The TLS 1.3 client early traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CHTS	The TLS 1.3 client handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
SHTS	The TLS 1.3 server handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CTS0	The TLS 1.3 client traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.
STS0	The TLS 1.3 server traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.

Usage:

The Client random and TLS 1.3 keys can be passed as parameters to `sslKeys`, ex:

- Using Native port 56004:
  - `/decoder sslKeys random=`<value> `CETS=`<value> `CHTS=`<value> `SHTS=`<value> `CTS0=`<value> `STS0=`<value>
- Using RESTful port 50104:
  - `/decoder?msg=sslKeys&random=`<value>`&CETS=`<value>`&CHTS=`<value>`&SHTS=`<value>`&CTS0=`<value>`&STS0=`<value>
- Replace <value> with base64 encoded TLS 1.3 key value in the above cases.

Note: For most of the sessions the CETS (CLIENT_EARLY_TRAFFIC_SECRET) key may not be generated or used by TLS clients and it is normal. However, if the other keys (handshake and application keys) are not generated and not available then TLS 1.3 decryption will NOT be successful.

Return Values

Most commands return name/value pairs of statistics about the premaster and TLS 1.3 keys in memory. The statistics are listed in the following table.

Parameter	Description
added	The number of premaster and TLS 1.3 keys just added during this command.
total	The total number of premaster and TLS 1.3 keys loaded in memory.
agedOut	The total number of premaster and TLS 1.3 keys that were removed during this command (this is not a lifetime stat).
maxKeys	The current maximum allowed premaster and TLS 1.3 keys.
premaster	The total number of premaster keys loaded in memory.
tls13	The total number of TLS 1.3 keys loaded in memory.

Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption

Note: Uploading TLS 1.3 keys is not supported for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

The `sslKeys` command provides a way to upload TLS 1.3 keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. Now, all TLS handshakes that use the TLS 1.3 keys and will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the *Master Table of Contents* to find all NetWitness Platform 11.x documents.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure:

   `/decoder/sslkeys`.

2. Click **Choose File** Next to **Upload File 1**, and locate the TLS 1.3 keys file that you want to upload on your local file system.

3. Click **Upload**. The files are uploaded to the Decoder and results are displayed in the form.

TLS 1.3 Keys

Similar to `premaster` key, capturing TLS 1.3 keys and uploading to Decoder in time for parsing is not an easy way. However, well known browsers like Chrome , Firefox and IE can write the TLS 1.3 keys they generate to a file and this is useful for testing purposes. To configure your browser to do this, create an environment variable called SSLKEYLOGFILE and set with a pathname to text file to write the keys. Decoder will accept the file exactly as it is written and will use all the decryption keys in the file for any encrypted traffic it captures.

The following is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

Optionally the parameters can be passed in as list in the upload file, ex:

```
send /decoder sslKeys --file-data=SSLKeys.txt --file-format=params-list
```

or you could use the following curl command (with the RESTful port):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

Once the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more are added, the earliest keys will be aged out. You can also add available TLS 1.3 keys by just passing the `random`, `CETS` , `CHTS` , `SHTS` , `CTS0` and `STS0` parameters to `sslKeys`.

Note: For most of the sessions the CLIENT_EARLY_TRAFFIC_SECRET key may not be generated or used by TLS clients and it is normal. However, if handshake and application keys are not generated and not available then TLS 1.3 decryption wouldn't be successful.

Step 5: Validate TLS 1.3 keys are received on Decoder

It is advised to validate if Decoder is receiving keys to Decrypt TLS 1.3 sessions. As Decryption wouldn’t be successful if the keys are not available.

The following are few ways:

1. Decoder generates the following TLS 1.3 meta per session

`tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early`

2. The `sslKeys` API provides an option to display current key stats using counts=true .

Example: `/decoder sslKeys counts=true`

```
premasterKeys: 478
tls13Keys: 341
total: 819
maxKeys: 1000000
```

Step 6: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, the `tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early` metadata is associated with the session that has the TLS 1.3 keys required for decrypting that session. The session will also have crypto metadata denoting the cipher suite.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching TLS 1.3 keys used for decrypting is written to the TLS 1.3 meta, analysts can view the unencrypted packets using the TLS 1.3 meta keys.

Option 1 : Using Event Analysis UI

Starting 12.0 the Event Analysis View support Displaying Decrypted and Encrypted Payloads of TLS sessions when TLS keys meta are registered.

Option 2 : Using RESTful API on Decoder service

The Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the TLS 1.3 metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate if Decoder is receiving TLS 1.3 keys. Refer #Step 5 listed above.
2. Validate that your TLS 1.3 session key is using an acceptable cipher-suite.
3. Make sure your Network Decoder is capturing the traffic matching the server for which you have the TLS 1.3 keys. To check, you can upload the TLS 1.3 keys and PCAP into Wireshark and see if it is able to decrypt it.

Additional Features

The following features which are supported in TLS 1.2 are also supported in TLS 1.3 decryption.

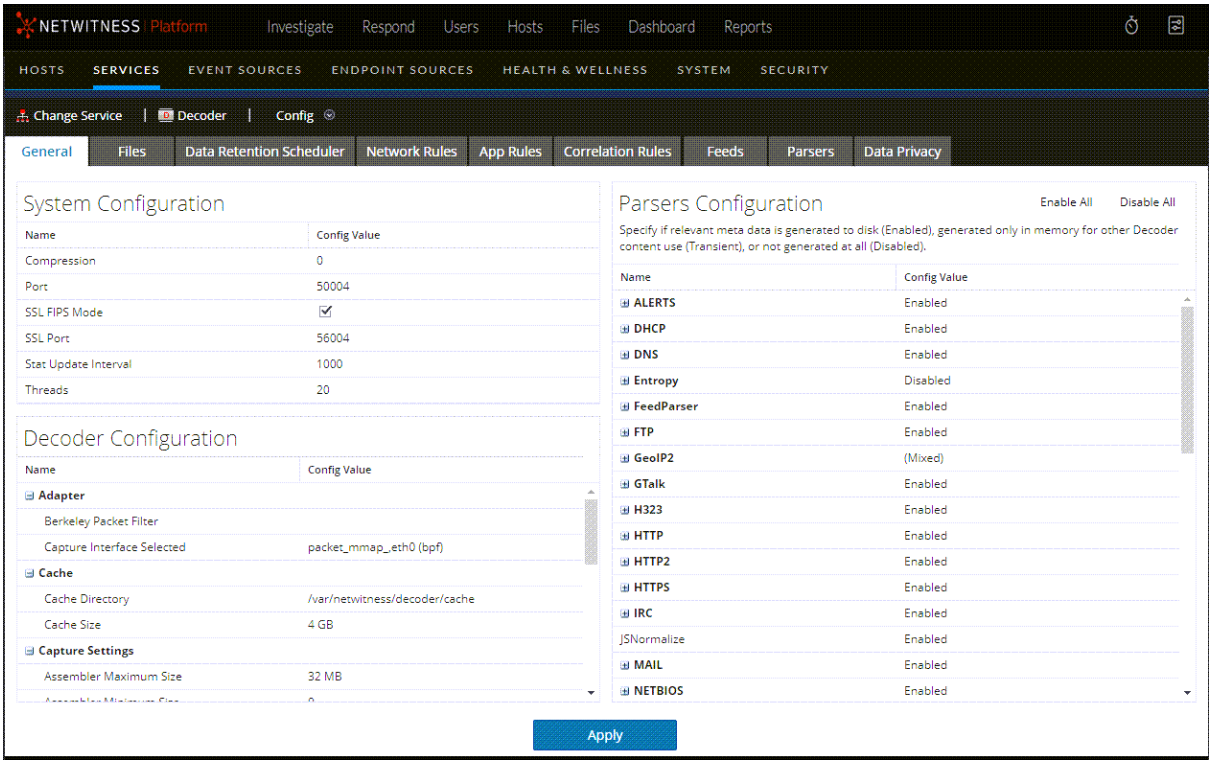
1. TLS Certificate Hashing
2. JA3 and JA3S TLS Fingerprints
3. Performance Considerations

For more details refer Decrypt Incoming Packets (TLS 1.2)

Edit Decoder System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an NetWitness Customer Support technician advises you to change them.

System Configuration



Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

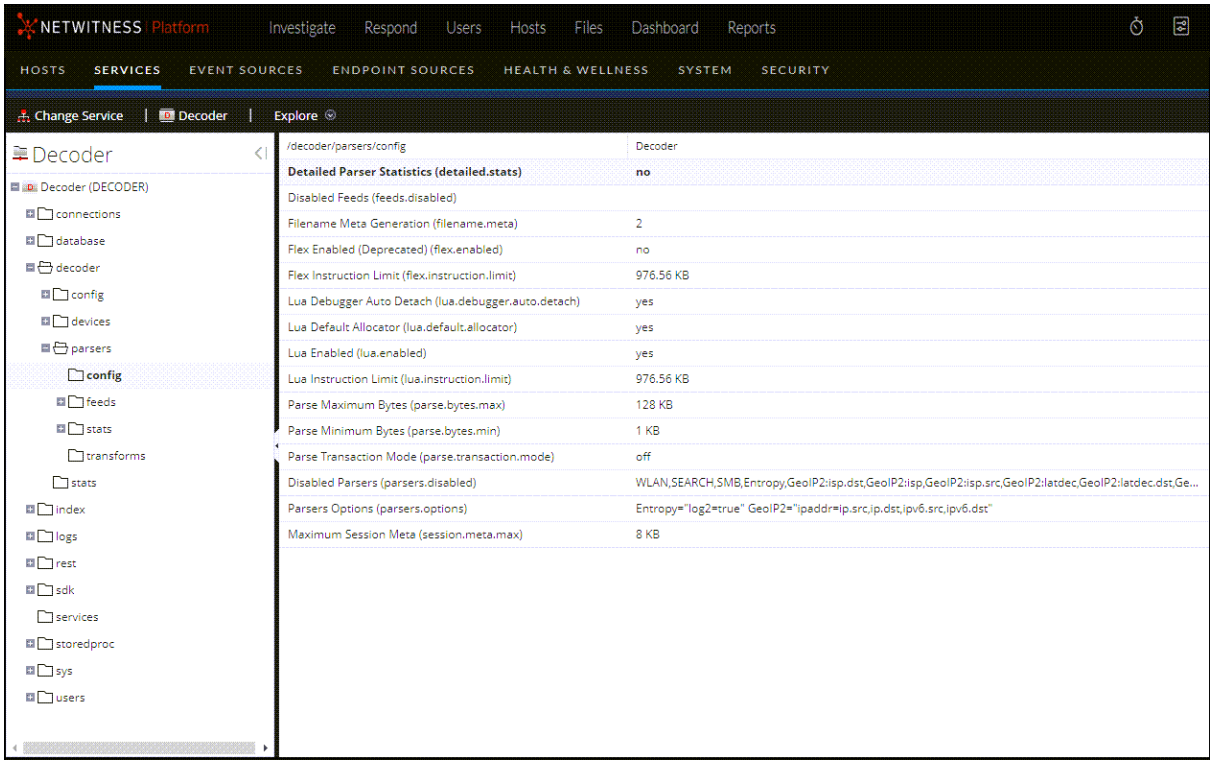
One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to  **(Admin) > Services**.

2. Select a Decoder or Log Decoder service, and select  **> View > Config**.
   The Services Config view for the service is displayed with the General tab open.

3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.



Enable CPU Usage Statistics for Installed Content

The Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explore view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
   The Explore view for the Decoder is displayed.
3. Open `/decoder/parsers/config/` and in the right pane, select the `detailed.stats` parameter.

4. Change the value to **yes**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explore view, the new statistic is visible.

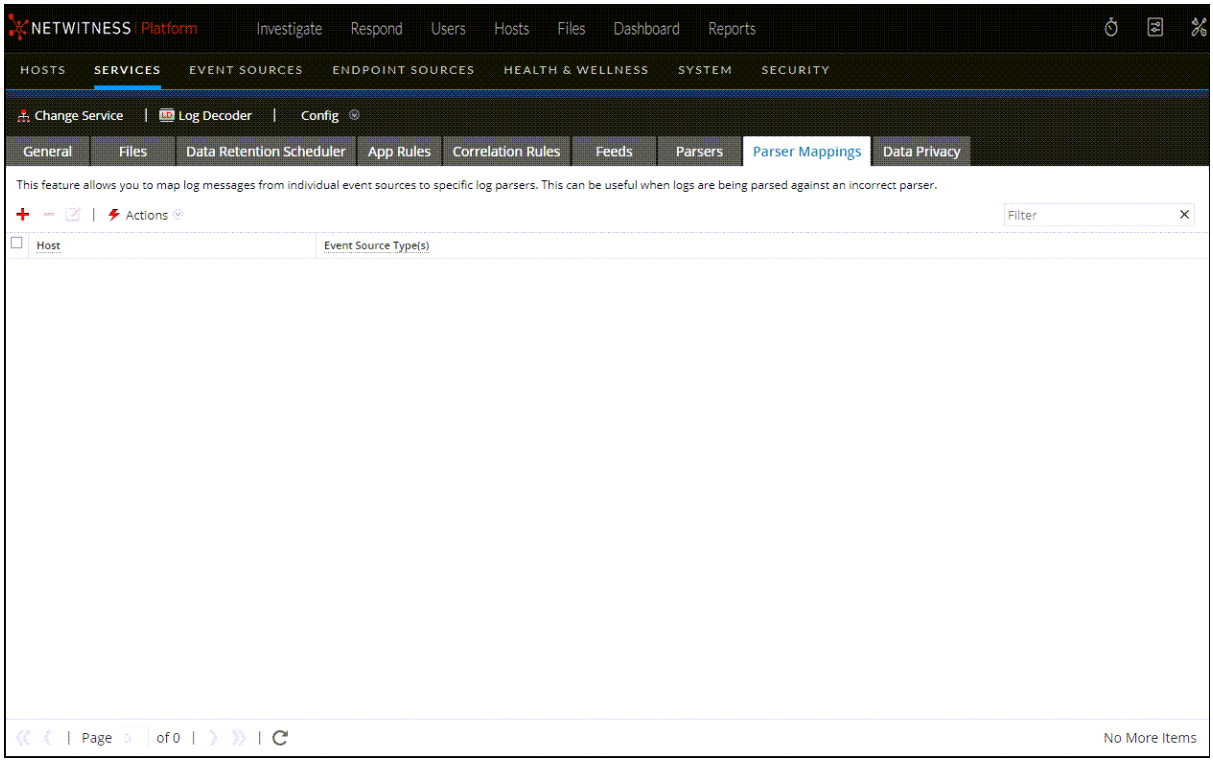
Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.



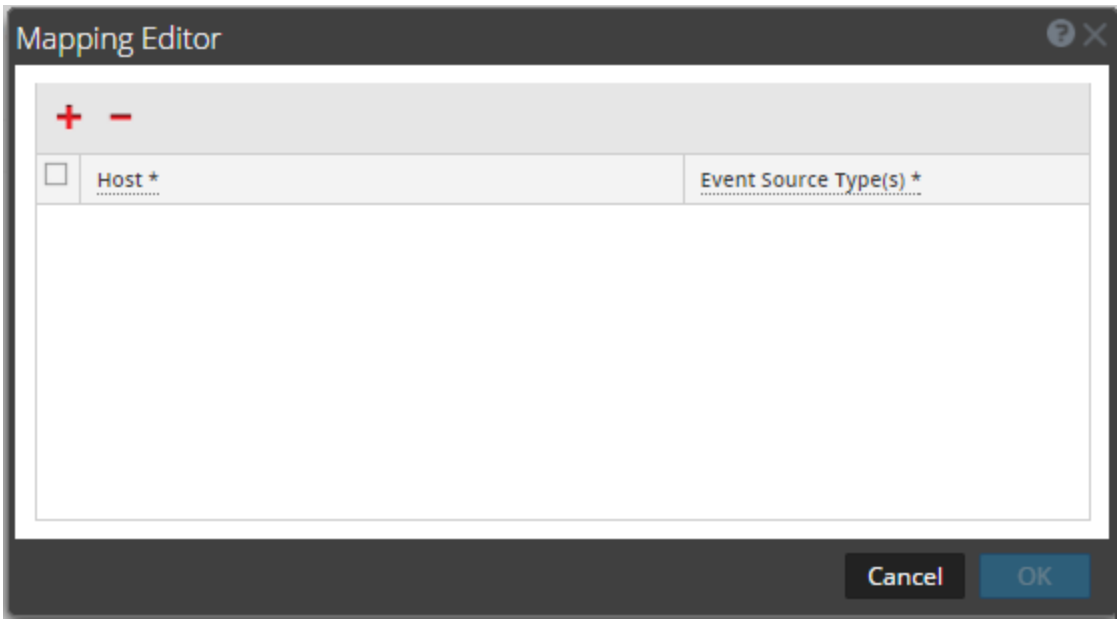
Note: You can also enable parser mapping functions by navigating to  (Admin) **> Event Sources > Discovery.**

Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

1. Go to  **(Admin) > Services** and select a Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration page, select the **Parser Mappings** tab.

The Parser Mappings tab is displayed in the Services Config view.



Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to (Admin) > **Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.

   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click .

   The Mapping Editor is displayed.

5. Any of the following mappings can be defined:
   - **One Host and One Event Source Type**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Sources(**s) field, enter the event source type.

     For example: `apache`
   - **One Host and One or More Event Source Types**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`
   - **One Host, One Log Collector, and One Event Source Type**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache`
   - **One Host, One Log Collector ID, and One or More Event Source Types**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`

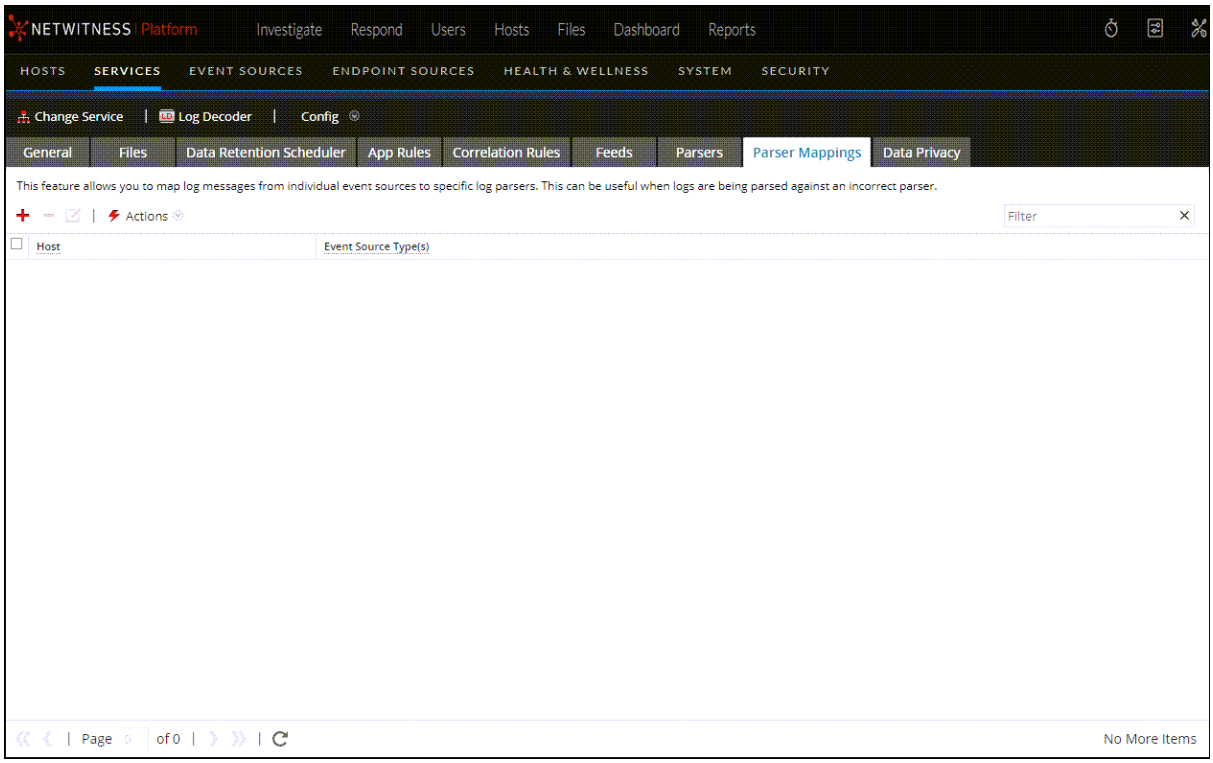
Note: The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

6. Click **OK**.

   The Parser Mapping is added.

7. To cancel the parser mappings selection, click **Cancel**.

Read IP to Event Source Type Mappings



To read an IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Services Config view is displayed.

3. Select the **Parsers Mapping** tab.

   The mappings are displayed.

Edit IP to Event Source Type Mappings

To edit IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.

   Note: You can only edit one mapping at a time.
5. Click .
6. In the **Event Source(s)** field, modify the event source(s).

   Note: The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

Delete IP to Event Source Type Mappings

To delete IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .

   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

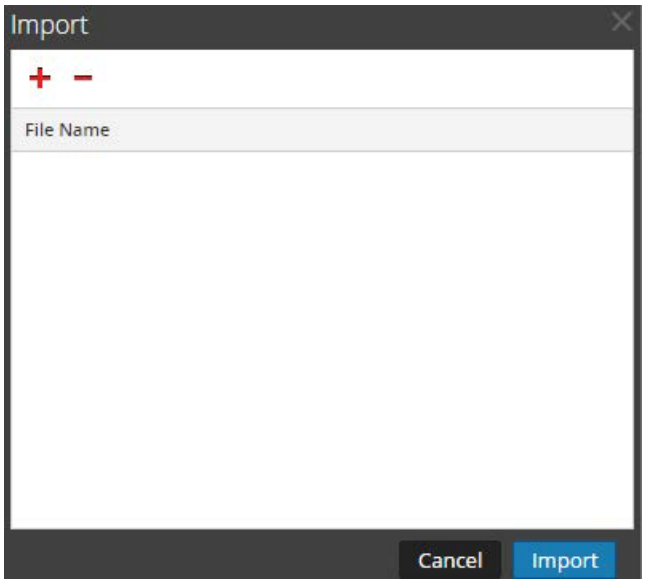
Sort the Hostname or Event Source Type

To sort the hostname or event source type:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.

Event Source Types are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.



Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions > Import**.

   The Import dialog is displayed.

5. Click .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

Note: You can only import one .csv file at a time.

Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.

5. Select **Actions > Export > Selection**.

   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

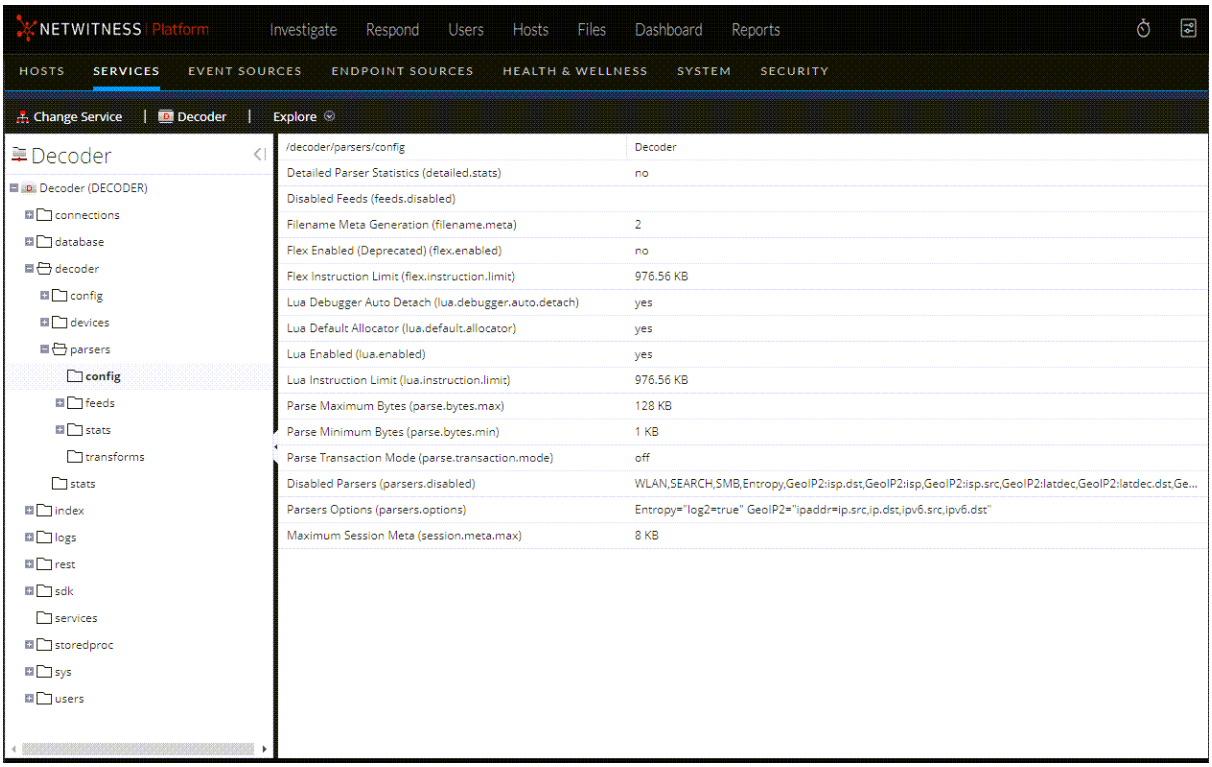
1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.

The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.



The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of NetWitness Customer Care or for troubleshooting purposes.

In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **(Admin) > Services.**
2. Select a Decoder or Log Decoder and **> View > Explore.**
   The Services Explore view for the selected service is displayed.
3. In the Node list, navigate to and select **`/decoder/parsers/config`**.

4. In the values panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.
   - To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
   - To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

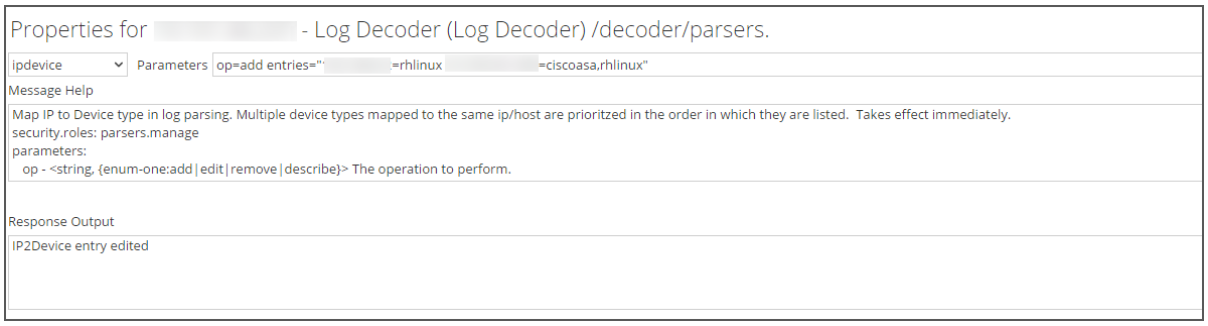
Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

If you map an IP address to its services, the Log Decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.



Map an IP Address to a Service Type

To map an IP address to a service type, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select  **> View > Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters:

   `op=add/remove entries="`***`ipaddress`***`=`***`service`***`"`

   for example, `op=add entries="10.100.201.300=ciscoasa"`
5. Click **Send**.

IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="`***`address`***`=`***`service type`***`"`

- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="`***`address`***`"`

- `describe`: This operation returns the values currently in the ipdevice map.

Map an IP Address to a Time Zone

This topic discusses NetWitness support for Event Time.

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Timestamp consideration for log files:

- Some logs are in UTC format.
- Some logs that are not in UTC include a timezone offset value to adjust the time accordingly.
- For logs that use local time, with no offset provided, you can create a source mapping to manually adjust times for logs from that event source.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: `America/Anguilla`
- POSIX format: `AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45`
- Offset by Minutes format: `= -500`

NetWitness maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

To map an IP address to a time zone, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:

   `op=add entries="`***`ipaddress`***`=`***`timezone`***`"`

   for example: `op=add entries="10.10.10.10=Africa/Addis Ababa"`
5. Click **Send**.

tzinfo Command

You can view the strings that can be used to specify the time zone by using the `tzinfo` command.

To view the time zone strings, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.

4. In the **Properties** view, specify the `tzinfo` command with the following parameters:

   `op=tznames`

5. Click **Send**.

The list of time zone strings is returned in the **Response Output** text box.

iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="address=time zone"`

- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="address"`

- `describe`: This operation returns the values currently in the iptmzone map.

Examples

The following examples provide instances for mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**

  `op=add entries="10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga"`

- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=remove entries="10.5.245.9"`

- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=add entries="2001:DB8:85A3::8A2E:370:7334=America/Anguilla"`

- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format, enter the following string in the **iptmzone** command and click **Send**.

  ```
  op=add entries="10.168.0.2=America/Anguilla
  2001:DB8:85A3::8A2E:370:7334=0500 nwappliance21=EST5EDT,M3.2.0/2,M11.1.0"
  ```

Change the Date format

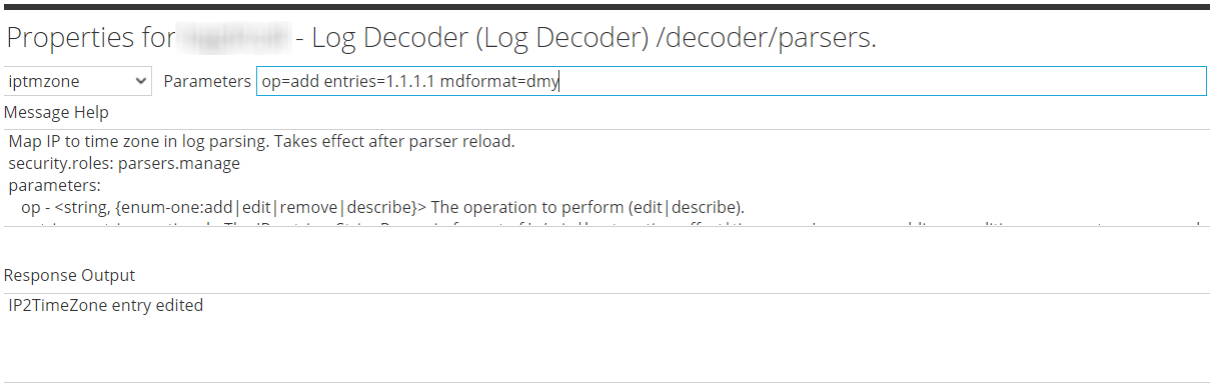
The Log Decoder parsing engine uses the `event.time` meta key to keep track of the time an event occurs for incoming log messages. You can use the `mdformat` for the **iptmzone** command to change the date format. The Log Decoder currently has the ability to change the dates in the logs to have the following format:

```
mdy or dmy (month/day/year or day/month/year)
```

Notes:

- Event time metadata in a parser does not account for `dmy` and `mdy`.
- Currently, there is no functionality to detect this scenario and adjust parsing automatically.

To change the date format, do the following:



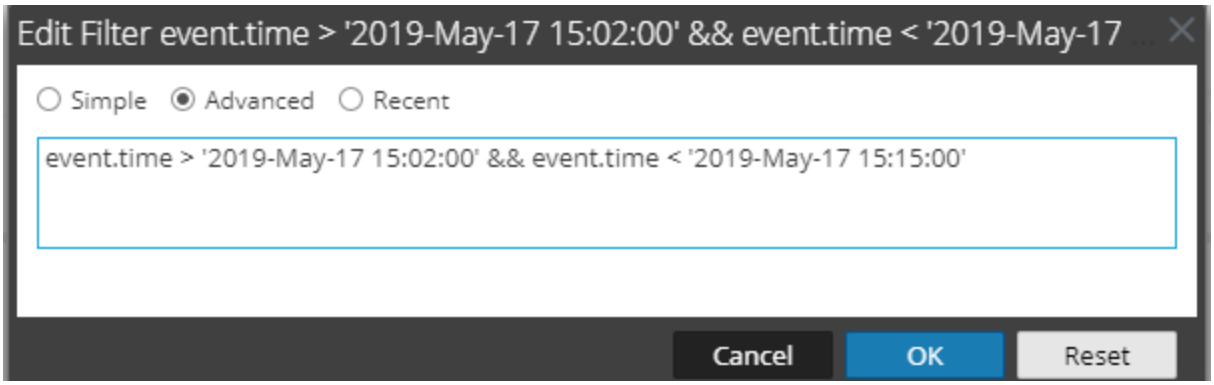
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select; **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, select **iptmzone** from the drop-down list, and specify the command with the following parameters:

   `op=add entries="<ipaddress>" mdformat=[dmy | mdy | none]`

   for example: `op=add entries="1.1.1.1" mdformat=dmy`

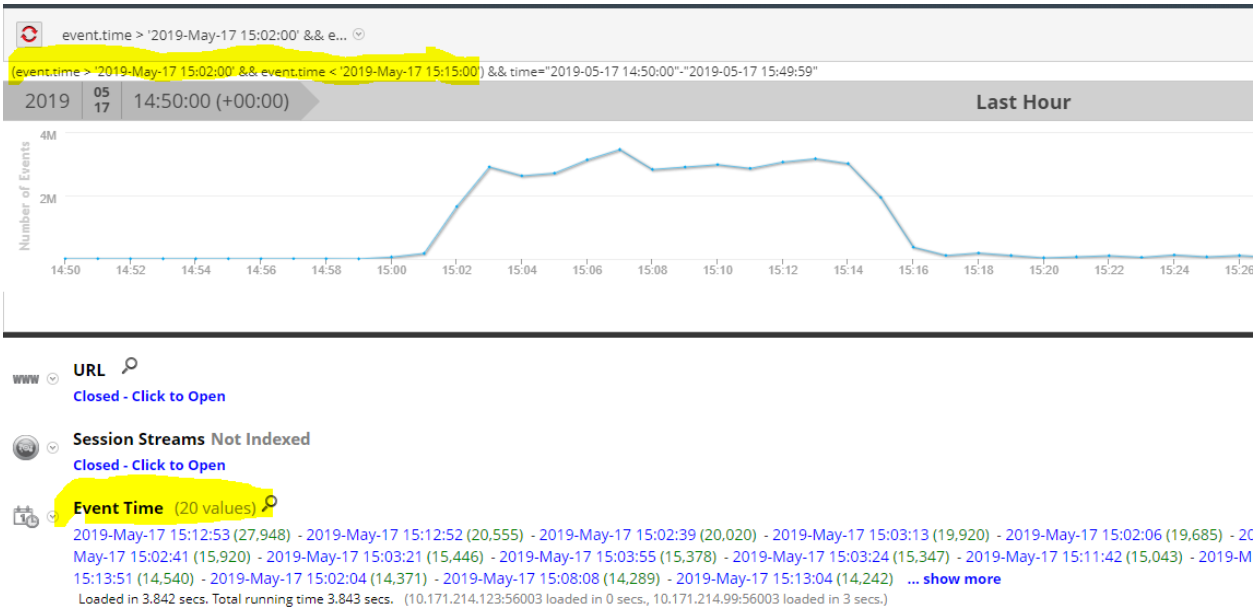
   Where:

   - `ipaddress` is the Device IP address, and
   - `mdformat` can be **dmy**, **mdy**, or **none**.



5. Click **Send**.

NetWitness maps the IP address along with the date format in the Log Decoder. Event time meta items are updated according to their respective mappings.



Event Time Filter Example

If you want to see logs that have an event time between 3:02 PM and 3:15 PM on May 17, 2019, create the following filter:

Note: The query builder may tell you "invalid expression," but that is a validation error in the User Interface. The query works because even though this is a text (string) search, the system actually compares the ASCII values. So, for example the expression **A < B** would be true.

Below is a sample of the event meta values returned from the query:

Missing Year Support

If there is no year associated with a format string, the parser attempts to populate the year heuristically. In most cases, the value is populated based on the current year. The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

The following are the various other scenarios:

1. Latent log during transition to new year.
2. Logs from forward time zones (or skewed clocks) just before new year transition.
3. Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year.

Latent log during transition to new year

If the day is more than 31 days into the future, the year is decremented.

For example,

The message date is Dec-31. The current date is 2018-Jan-1. The temporary assigned date, 2018-Dec-31, will be more than 31 days into the future.

This will cause the year component to be decremented to 2017, resulting in a reasonable message time.

Logs from forward time zones (or skewed clocks) just before new year transition

If the day is more than 334 days into the past, the year is incremented.

For example,

The message date is Jan-1. The current date is 2017-Dec-31. The temporary assigned date, 2017-Jan-1, will be more than 334 days into the past.

This will cause the year component to be incremented to 2018, resulting in a reasonable message time.

Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year

If the day (Feb 29) is invalid (say, the assigned year is NOT a leap year), the relative position to the current time cannot be calculated. To do this, the year is decremented in an attempt get a valid time stamp.

Because the position of the leap day relative to the transition to the new year, along with the expectation that no logs would be received this far into the future, we do not ever make an attempt to increment the year to produce a valid time stamp.

After the year is decremented, the same logic is then followed (refer to statement 1 and 2). If the result is still an invalid day. The parser throws and a valid message time cannot be parsed.

Limitations

Note: Currently, there is no mechanism to assign a year to the import of logs.

As this pertains to leap days, if you find the correct leap year, an inconsistent data would result. For example, if a set of messages is two years old and during a leap year, only a single day would remain which is accurate. Because of the heuristic described above, the remaining set of messages would have time stamps one year too.

For data consistency, usually you cannot find valid leap years beyond 1 month and less than 11 months.

Examples

The following examples provide instances for logs with year and logs without year:

- If the log is with year, event time is generated as below:

```
%emcavamar: 1704^^2017-04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_
Proxy^^Internal server error^
<MESSAGE
     id1="1:01"
     id2="1"
     eventcategory="1605020000"
     functions="&lt;@msg:*PARMVAL($MSG)&gt;&lt;@event_time:*EVNTTIME
     ($MSG,'%W-%G-%F %H:%U:%O',fld2,fld3)&gt;"
     content="&lt;fld1&gt;^^&lt;fld2&gt;^^&lt;fld3&gt;^^&lt;fld4&gt;^^
     &lt;&lt;event-source NodeID=&quot;&lt;hostname&gt;&quot;
     ProgramName=&quot;&lt;fld8&gt;&quot;/&gt;^^&lt;fld9&gt;^^&lt;cate
     gory&gt;^^&lt;severity&gt;^^&lt;event_
     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

- If the log is without year, event time is still generated, The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

```
%emcavamar: 1704^^04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_

```

Obtain Log Files from a Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

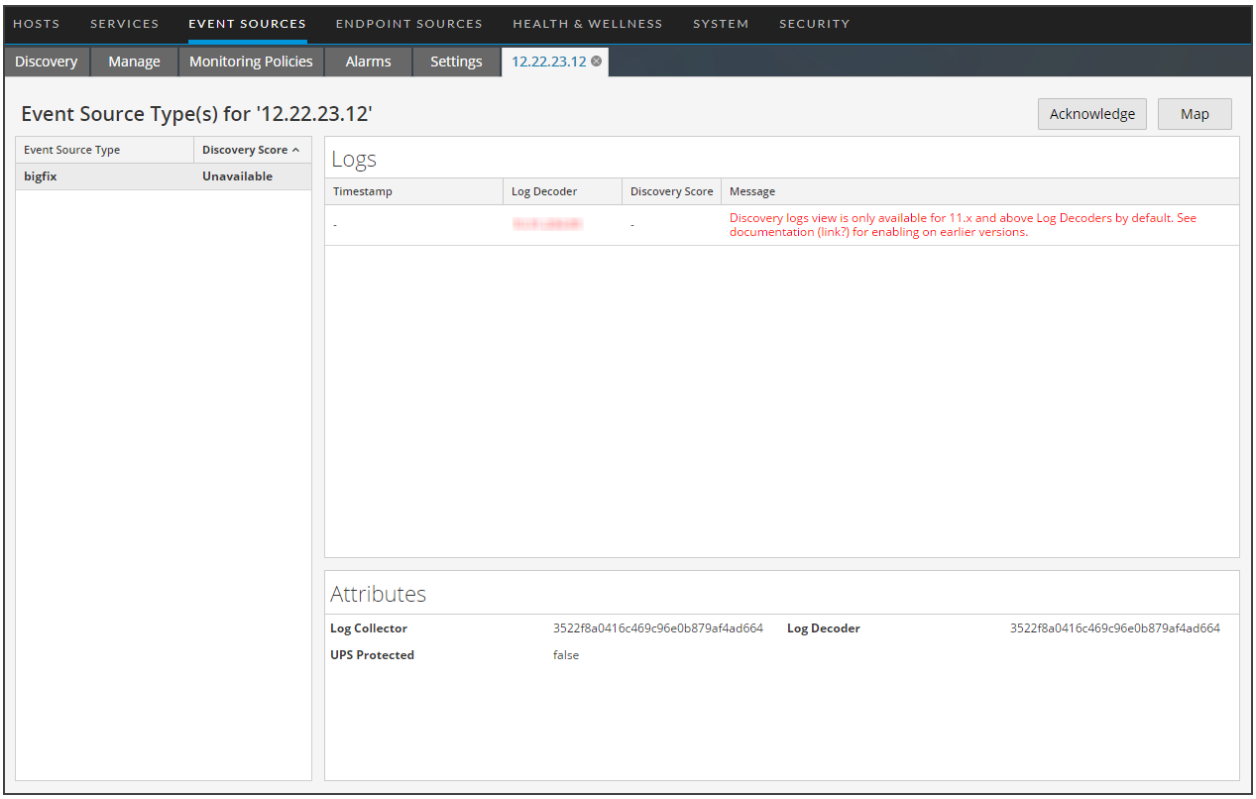
1. Go to  (Admin) > **Services** > select a **Log Decoder**, then select  > **View** > **Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
valueMax="100000" defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.
5. Restart the Log Decoder service as follows.

   Select Log Decoder service > **Explore** > **decoder** > **Properties** > **reset**. You select **reset** from a drop down menu.

Click **Send** after you select reset.



This is an example of the **index-logdecoder-custom.xml** file.

Note: Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.

Note: Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.

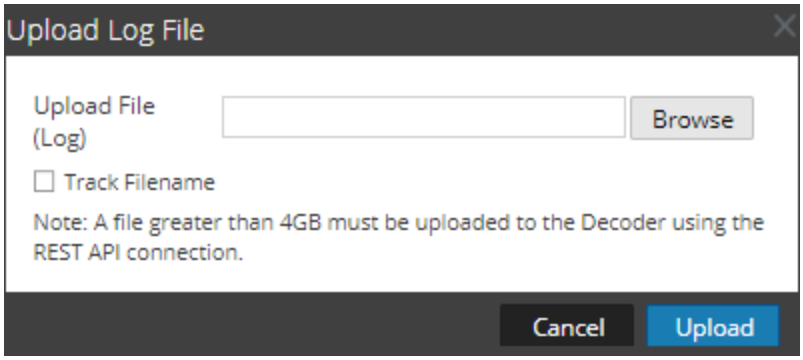
Upload a Log File to a Log Decoder



There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring, for example, when the Log Decoder is capturing logs.

To import a log file to a Log Decoder:

1. Go to **(Admin)** **Services**.
2. Select a Log Decoder in the **Service** grid, and select **> View > System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.

4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.
7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

To select and upload a packet capture file:

1. Go to **(Admin)** > **Services**.

   The Administration Services view is displayed.

2. Select the Decoder name, and **> View > System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.

4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File (pcap, pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

Simultaneous Import and Capture

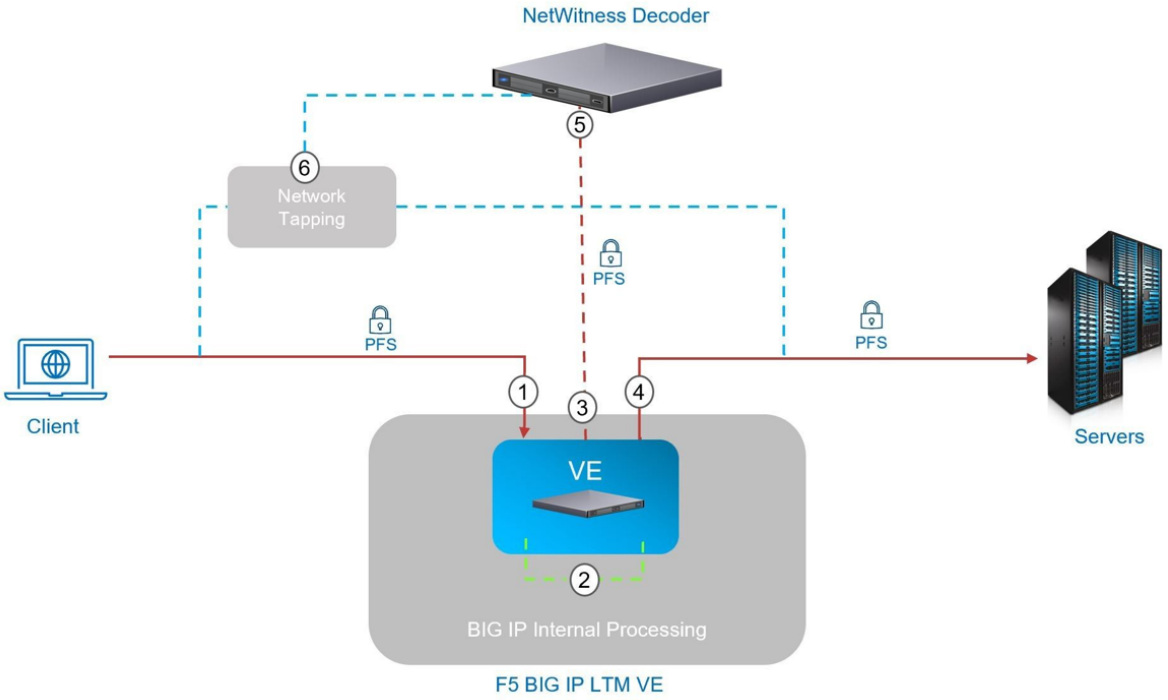
You can import or upload PCAPs while the capture is running using RESTful API. Make a note of the following points before you start importing during capture:

- The source file metadata is not created for imported PCAPs when the capture is running. If capture is stopped, the source file metadata is created as in older versions.
- The NWD files can be imported, but not while the capture is running. If you attempt to import an NWD file while the capture is running, the Decoder returns an error. An active import will block starting/stopping of import and capture.
- The file tracking meta is not created during the simultaneous import and capture.

F5 BIG IP - NetWitness Perfect Forward Secrecy Inspection Visibility

This topic discusses Perfect Forward Secrecy (PFS) Inspection Visibility with F5 BIG-IP Local Traffic Manager (LTM) and NetWitness Decoder integration.

NetWitness Decoder allows administrators to receive session keys from PFS sessions and decrypt each session traffic. It can receive session keys through its RESTful port, the PFS encrypted traffic through its capture interface, and supports the traffic decryption for inspection.



This solution utilizes functionality in iRule to extract session keys and deliver them to NetWitness Decoder via a sideband connection.

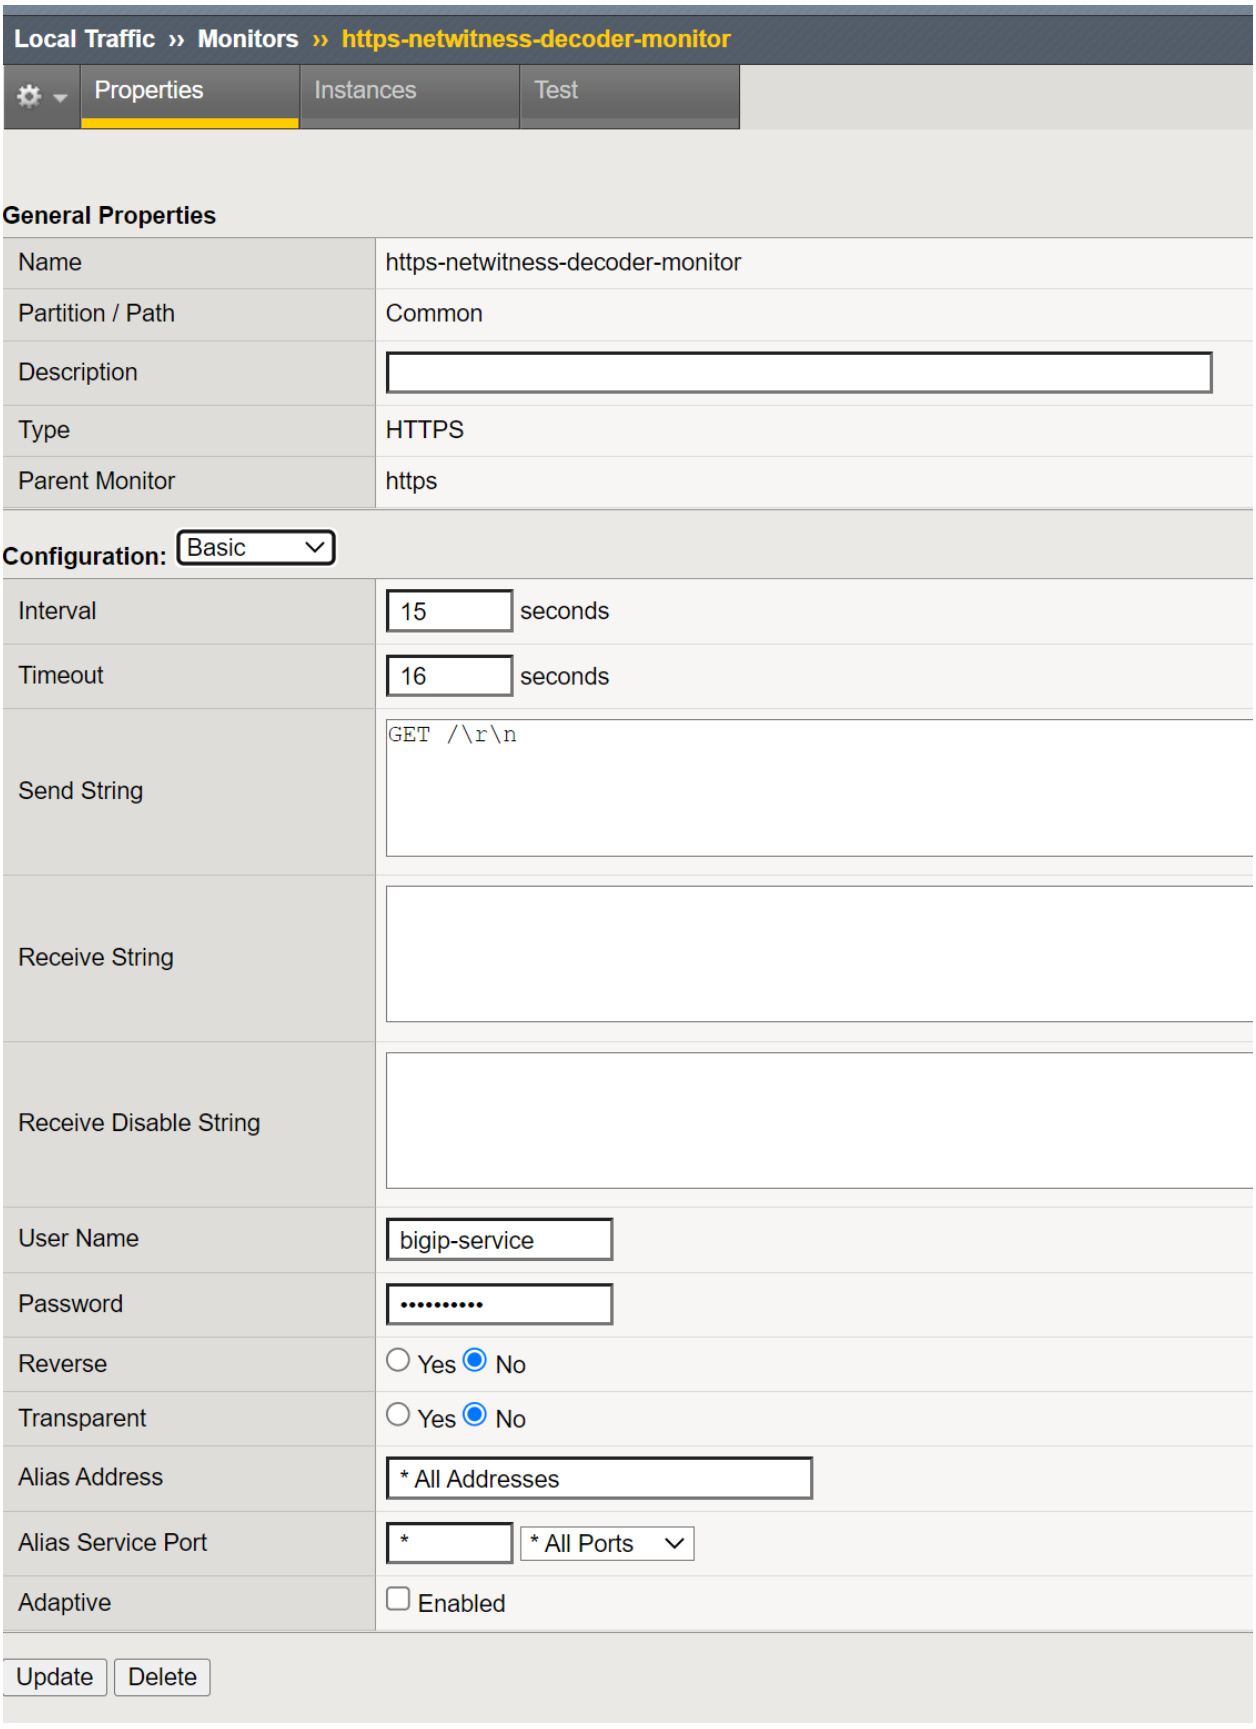
Prerequisites

A few prerequisites need to be considered in your environment for the integration of BIG-IP LTM and NetWitness Decoder.

- Deploy and Configure BIG IP LTM External Virtual Server (version 15.1.5 and above)
  - Configure Client SSL Profile with TLS 1.3 enabled.
  - Configure Server SSL Profile with TLS 1.3 enabled.
- Deploy and Configure NetWitness Decoder
  - Allow NetWitness Decoder RESTful port (default 50104) in your Network Firewall to receive keys from BIG-IP LTM.
    - NetWitness Decoder receives keys via HTTPS on RESTful port.
  - Create an Administrator account on the Decoder Device with role permissions `security.roles: decoder.manage` to forward TLS keys to Decoder.
    - Example name: bigip-service
  - Consider deploying NetWitness Decoder close to BIG-IP LTM so that it's feasible to mirror the encrypted traffic via TAP or Switch and avoid Network Latency in receiving TLS keys.

Deployment

1. A client connects to BIG-IP LTM using TLS with PFS cipher. The External Virtual Server has `clientssl` profile to decrypt traffic for inspection.
2. While inspecting the traffic an `iRule` on External Virtual Server collects the session keys and makes a `sideband` connection to Internal Virtual Server with the NetWitness Decoder as a `pool member`. The Internal Virtual Server has a `serverssl` profile to ensure traffic between BIG-IP LTM and NetWitness Decoder is protected since session keys are forwarded.
3. The Internal Virtual Server has a `HTTP profile` applied to manage the key transfer via HTTPS between BIG-IP LTM and NetWitness Decoder. `Oneconnect` profile is utilized and session keys will be sent on existing connections if available to reduce the connection setup overhead with NetWitness Decoder.
4. The External Virtual Server also has a `serverssl` profile to re-encrypt the traffic back to server pool.
5. The NetWitness Decoder receives the TLS keys from BIG-IP LTM on its RESTful port and decrypts the traffic ingested.
6. The Payload is not sent from BIG-IP LTM to NetWitness Decoder, this is received either from port mirroring configurations or a Network TAP infrastructure as shown above.



BIG-IP LTM Configurations

The BIG-IP configuration objects required include the following:

- HTTPS Monitor for monitoring NetWitness Decoder Node and Pool status (e.g online, offline etc…)
- Node and Pool objects for NetWitness Decoder.
- HTTP profile for managing key transfer to NetWitness Decoder via HTTPS.
- Server SSL profile for HTTPS sideband connection to NetWitness Decoder.
- Internal Virtual Server for receiving session keys and sideband communication with NetWitness Decoder.
- iRule: for session keys copying and sideband communication with Internal Virtual Server.

HTTPS Monitor

- Configure HTTPS monitor for NetWitness Decoder.
- Set the User Name and Password of the Administrator account created on Decoder device for BIG-IP transactions. Example Configuration using bigip-service account.

Delete

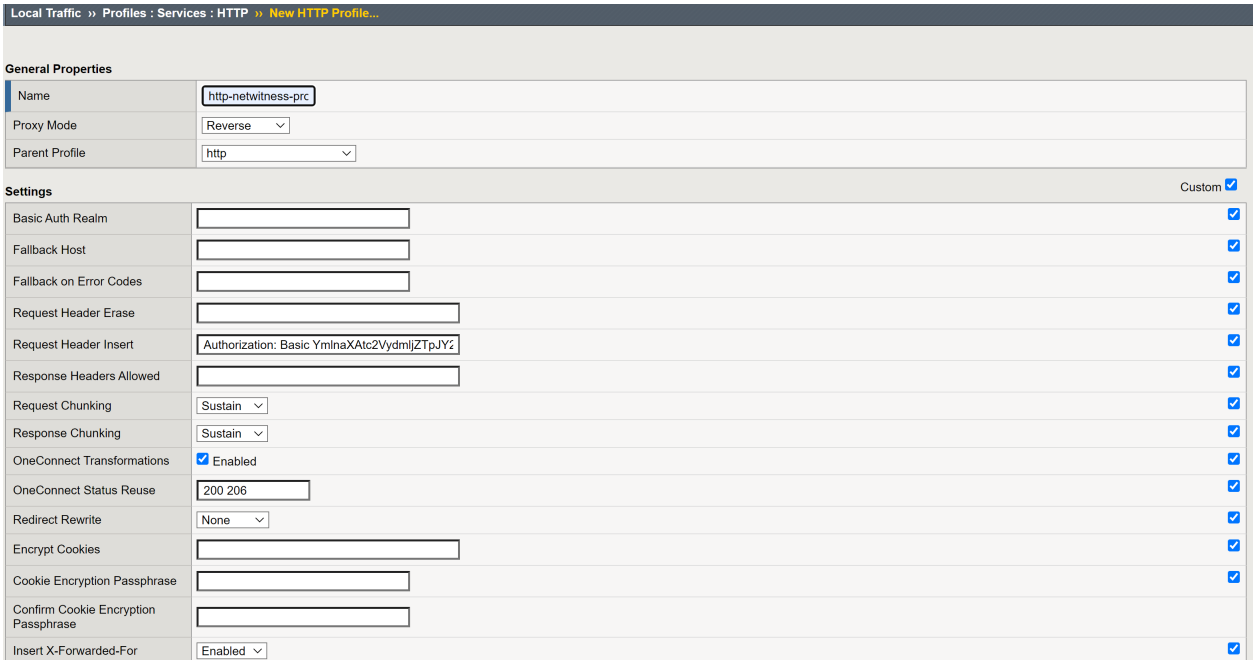
```
ltm monitor https /Common/https-netwitness-decoder-monitor
{
adaptive disabled
defaults-from /Common/https
destination *.50104
interval 15
ip-dscp 0
password <encrypted-bigip-service-account-password>
recv none
recv-disable none
send "GET /\r\n"
ssl-profile /Common/serverssl-secure
time-until-up 0
timeout 16
username bigip-service
}
```

Pool & Node

Configure Pool and Node objects.

- Select **Health Monitors** `https-NetWitness-decoder-monitor`
- Add **New Node** with the following:
  - Set **Node Name** example: `node-NetWitness-decoder`
  - **Address**: <Decoder IP Address >, **Service Port**: 50104 HTTPS and then click **Add**.
- Click **Finished** to create Pool with a Node.

```
ltm pool /Common/pool-netwitness-decoder-https {
members {
/Common/node-netwitness-decoder:50104 {
address 10.10.10.140
}
}
monitor /Common/https-netwitness-decoder-monitor
}
```



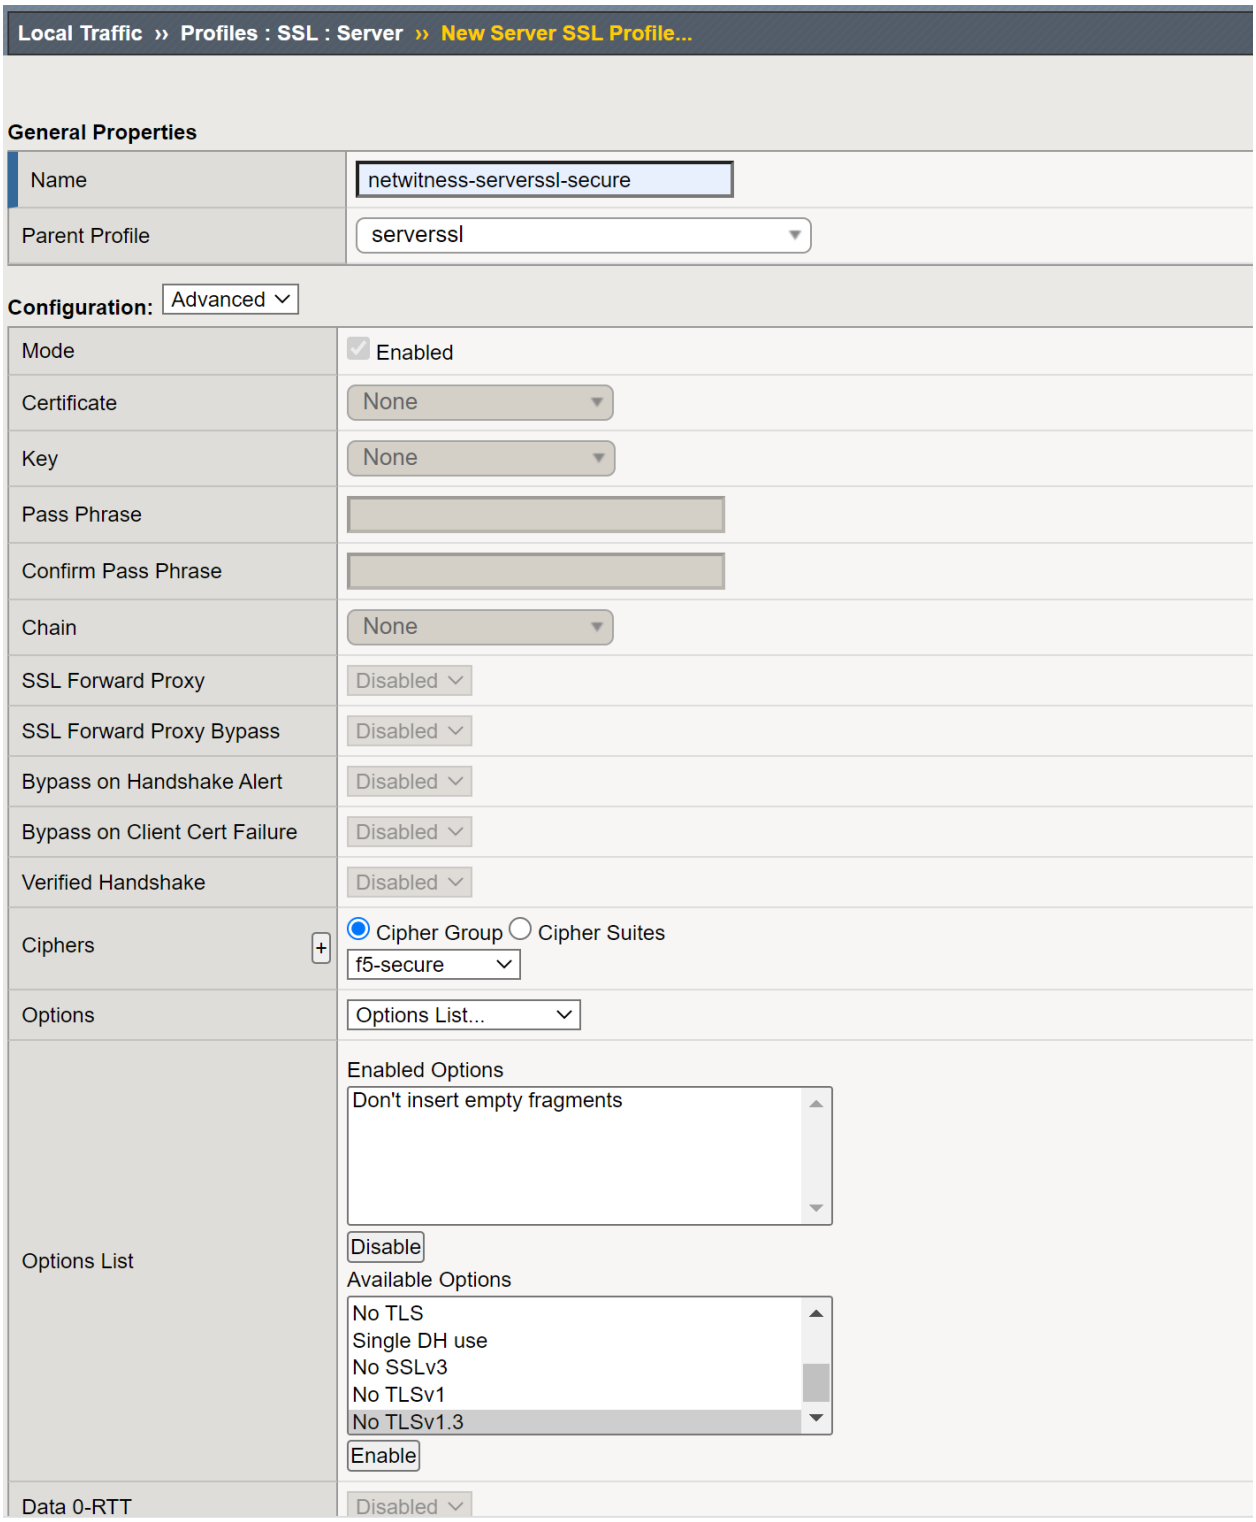
HTTP Profile

- Configure HTTP Profile **Name** `http-NetWitness-profile` to authenticate NetWitness Decoder device and send TLS keys.
- Set **Parent Profile** as **http**
- Check the **Custom** check box to edit the Settings.
- Set **Request Header Insert** field with basic Authorization header string
  - `"Authorization: Basic <Base64 encoded stirng (username:password)>"`
  - Example: `"Authorization: Basic YmlnaXAtc2VydmljZTpJY2FuU2VleW91QDEyMyE="`

  - Where
    - username - Administrator account on Decoder device (example: bigip-service)
    - password - The account password

- Set **Insert X-Forwarded-For** as **Enabled** , this would add X-Forwarded-For header with the original Client IP of the session.

Rest of the other configurations can remain as default values.



```
ltm profile http /Common/http-NetWitness-profile {
accept-xff disabled
app-service none
basic-auth-realm none
defaults-from /Common/http
encrypt-cookies none

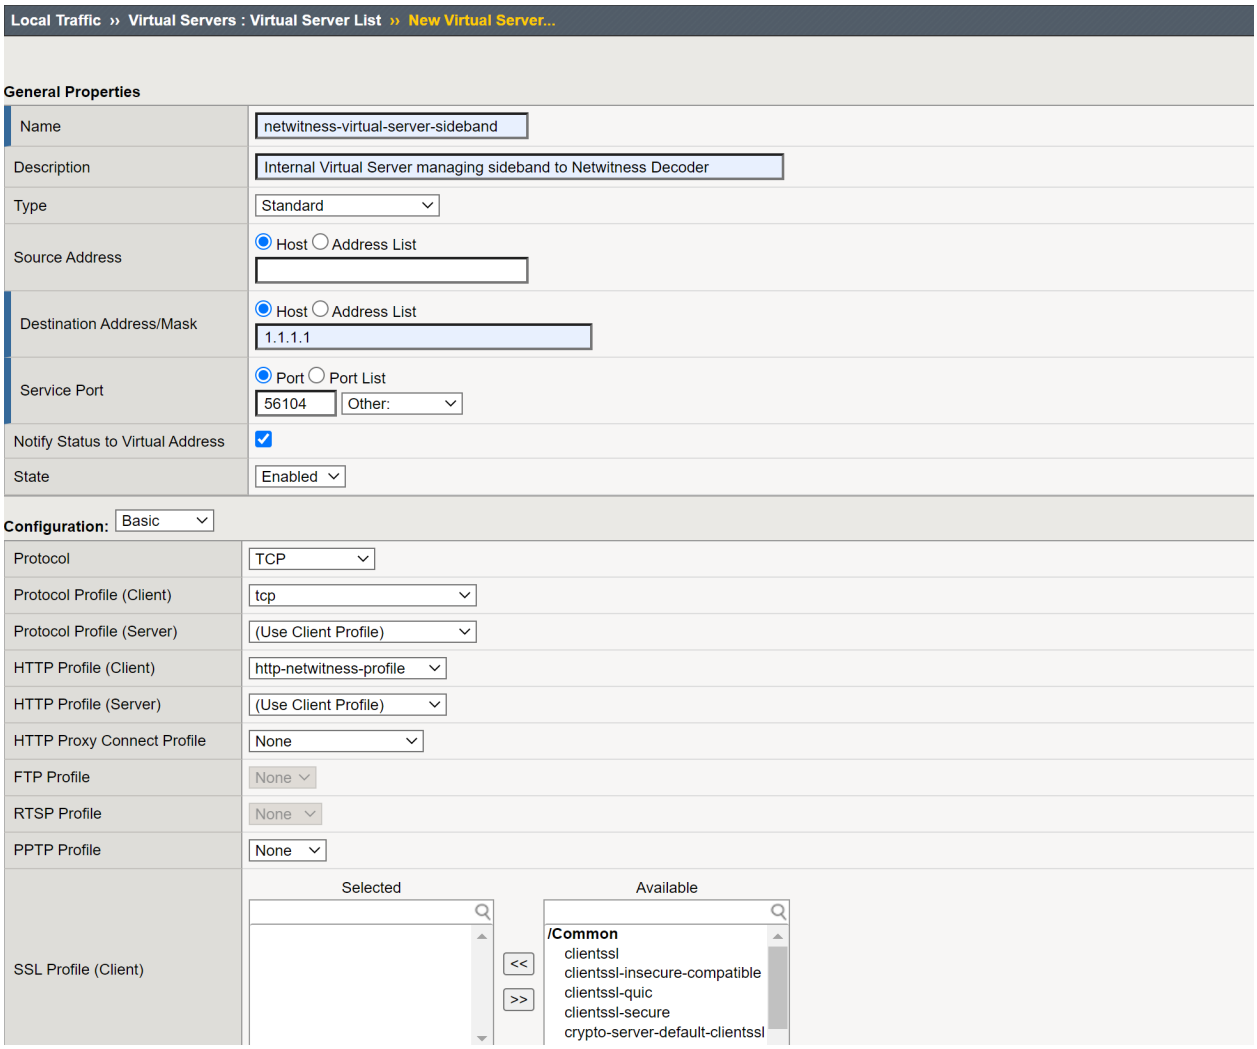
via-response preserve
xff-alternative-names none
}
```

Server SSL Profile

1. Set server-ssl profile **Name** `NetWitness-serverssl-secure`
2. Select **Advanced** from **Configuration**.
3. Set **f5-secure** from **Ciphers > Cipher Group**.
4. (Optional) **Disable** `no-TLS1.3` in options which enables TLS 1.3 between BIG-IP and NetWitness Decoder.
5. Click **Update** to create `server-ssl` profile.



```
ltm profile server-ssl /Common/NetWitness-serverssl-secure {
app-service none
cipher-group /Common/f5-secure
ciphers none
```

```
defaults-from /Common/serverssl
options { no-ssl }
renegotiation disabled
}
```

Internal Virtual Server

1. Create an Internal Virtual server to manage sideband connection to NetWitness Decoder and forward keys.
2. Set **Name** as `NetWitness-virtual-server-sideband` and add **Description** for virtual server.
3. Let the Source Address be blank, and it would default to 0.0.0.0.
4. Set **Destination Address/Mask** to 1.1.1.1; this is a non-routable IP address and is used internally.
5. Set **Service Port** to 56104 , a virtual non-routable port used internally.
6. Select **HTTP Profile (Client)** `http-NetWitness-profile` that was created earlier. By default, Server inherit Client profile.
7. Select **SSL Profile (Server)** `NetWitness-serverssl-secure` which was created earlier. This would be used by the Pool `pool-NetWitness-decoder-https` when connecting to NetWitness Decoder.
8. Select **Source Address Translation** Auto-Map.
9. Select **OneConnect Profile** oneconnect.
10. Select **Default Pool** `pool-NetWitness-decoder-https` which was created earlier.
11. Click **Finished** to create Internal Virtual Server.

```
ltm virtual /Common/NetWitness-virtual-server-sideband {
description "Internal Virtual Server managing sideband to NetWitness
Decoder"
destination /Common/1.1.1.1:56104
ip-protocol tcp
mask 255.255.255.255
pool /Common/pool-NetWitness-decoder-https
profiles {
/Common/http-NetWitness-profile { }
/Common/NetWitness-serverssl-secure {
context serverside
}
/Common/oneconnect { }
/Common/tcp { }
}
```

```
serverssl-use-sni disabled
source 0.0.0.0/0
source-address-translation {
type automap
}
translate-address enabled
translate-port enabled
}
```

iRule Session keys copying and Sideband communication

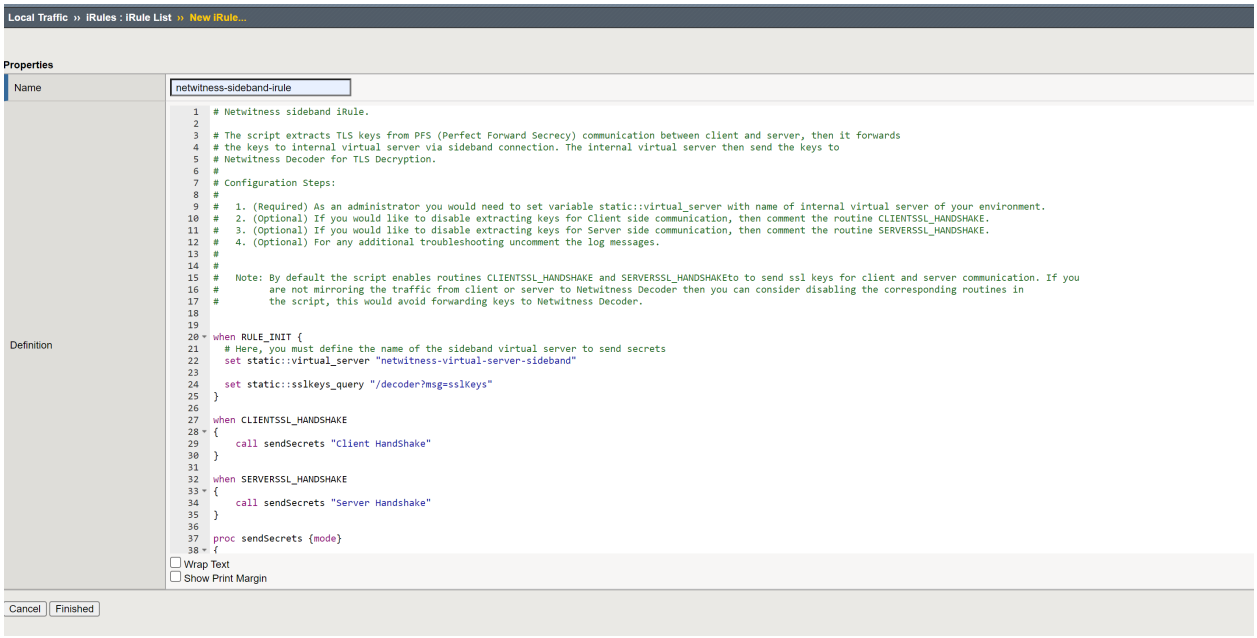
Configuration

1. Configure and add the following `netwitness-sideband-irule` **iRule** in your **External Virtual Server**, as an Administrator
2. Set **variable** `static::virtual_server` in `RULE_INIT` with name of **Internal Virtual Server** of your environment.
   - Example `set static::virtual_server "NetWitness-virtual-server-sideband"`
3. (Optional) If you would like to disable extracting keys for Client side communication, then comment the routine CLIENTSSL_HANDSHAKE.
4. (Optional) If you would like to disable extracting keys for Server side communication, then comment the routine SERVERSSL_HANDSHAKE.
5. (Optional) For any additional troubleshooting uncomment the log messages.

iRule `NetWitness-sideband-irule`

```
# NetWitness sideband iRule.

# The script extracts TLS keys from PFS (Perfect Forward Secrecy) communication between client and server, then it forwards
# the keys to internal virtual server via sideband connection. The internal virtual server then send the keys to
# NetWitness Decoder for TLS Decryption.
#
# Configuration Steps:
#
#   1. (Required) As an administrator you would need to set variable static::virtual_server with name of internal virtual server of your environment.
#   2. (Optional) If you would like to disable extracting keys for Client side communication, then comment the routine CLIENTSSL_HANDSHAKE.
```



```
# 3. (Optional) If you would like to disable extracting keys for Server side communication, then comment the routine SERVERSSL_HANDSHAKE.
# 4. (Optional) For any additional troubleshooting uncomment the log messages.
#
#
# Note: By default the script enables routines CLIENTSSL_HANDSHAKE and SERVERSSL_ HANDSHAKEto to send ssl keys for client and server communication. If you
#       are not mirroring the traffic from client or server to NetWitness Decoder then you can consider disabling the corresponding routines in
#       the script, this would avoid forwarding keys to NetWitness Decoder.
when RULE_INIT {
# Here, you must define the name of the sideband virtual server to send secrets
set static::virtual_server "NetWitness-virtual-server-sideband"
set static::sslkeys_query "/decoder?msg=sslKeys"
}
when CLIENTSSL_HANDSHAKE
{
call sendSecrets "Client HandShake"
}
when SERVERSSL_HANDSHAKE
{
call sendSecrets "Server Handshake"
}

Troubleshooting Packet Drops (11.x and above)

Packet drops can occur if there is backup happening at Packet Pool or Session Pool on the Decoder, and eventually, Decoder runs out of free capture pages resulting in drops.

Quick configuration Checks to avoid packet drops

The Decoder would log warning messages when it encounters packet drops. These logs contain possible reasons for drops, and you can solve some of the drop symptoms through simple configuration checks.

To check and tune the configuration:

In most cases, the decoder configuration parameters would be different from the default configuration or with the hardware deployed. So, make sure to check the following and fix configuration issues.

1. When `/var/log/messages` logs show drops with reason "check capture configuration, packet sizes".
   - NwDecoder[15913]: [Packet] [warning] **Packet drops encountered, packet capture** (737626/737628): **check capture configuration, packet sizes and rates**
   - For 10G decoder run

     `/decoder reconfig op=10g update=1`

     Or

     Explore view | /decoder | properties | select reconfig | op=10g update=1 | send
   - For normal decoder run

     `/decoder reconfig update=1`

     Or

     Explore view | /decoder | properties | select reconfig | update=1 | send
   - The Decoder service needs to be restarted for changes to be effective.
   - Monitor decoder for drops
2. When `/var/log/messages` logs show drops with reason "check packet database configuration, iostats, packet and content calls"
   - NwDecoder[74030]: [Packet] [warning] **Packet drops encountered, packet write** (717957/723314): **check packet database configuration, iostats, packet and content calls**
   - Packet drops encountered (884632/884642): **check session & meta database configuration, iostats and sdk activity**.
   - For 10G decoder run
     - `/database reconfig op=10g update=1`

       Or

- Explore view | /database | properties | select reconfig | op=10g update=1 | send

- For normal decoder run
  - `/database reconfig update=1`

    Or
  - Explore view | /database | properties | select reconfig | update=1 | send
- The Decoder service needs to be restarted for changes to be effective.
- If we are still seeing drops, then a few more changes are required. There could be i/o bound waits for database writes on the Decoder.
  - Set `/database/config/packet.integrity.flush=normal`
  - Set `/database/config/session.integrity.flush=normal`
  - Set `/database/config/meta.integrity.flush=normal`
- Monitor decoder for drops.

3. As of NetWitness Platform version 11.3.1.1, `sosreport` retrieves service and database reconfig information as well as what settings were active when the `sosreport` was retrieved. This information can be used for cross-checking purposes and can be found in the `..../sos_commands/rsa_nw_rest` directory (service-reconfig, database-reconfig, ls<service>).

Information required to troubleshoot packet drops

- Monitor Packet Drops Tool Output (Highly recommended)
- This can be accessed through REST port `http://<decoder>:50104/sdk/app/packetdrops`
- By default, the tool looks for drops in last 24 hrs and also provides options to search drops based on time ranges.
- Enable detailed stats on decoder `REST /decoder/parsers/config/detailed.stats=yes`

What if the REST port is inaccessible?

- Enable detailed stats on decoder

  `/decoder/parsers/config/detailed.stats=yes`
- Wait for new drops and then collect `sosreport`. The `sosreport` on Decoder would collect few stats db files.
- These files can be copied to your local decoder `/var/netwitness/decoder/statdb` and restart Decoder.
- Access packet drops tool on your local Decoder.

How do I troubleshoot packet drops?

The packet drops tool would help narrow down the possible cause for drops. There could be various cases involved that need verification.

The following sections describe how to use the Packet drops tool and analyze its results.

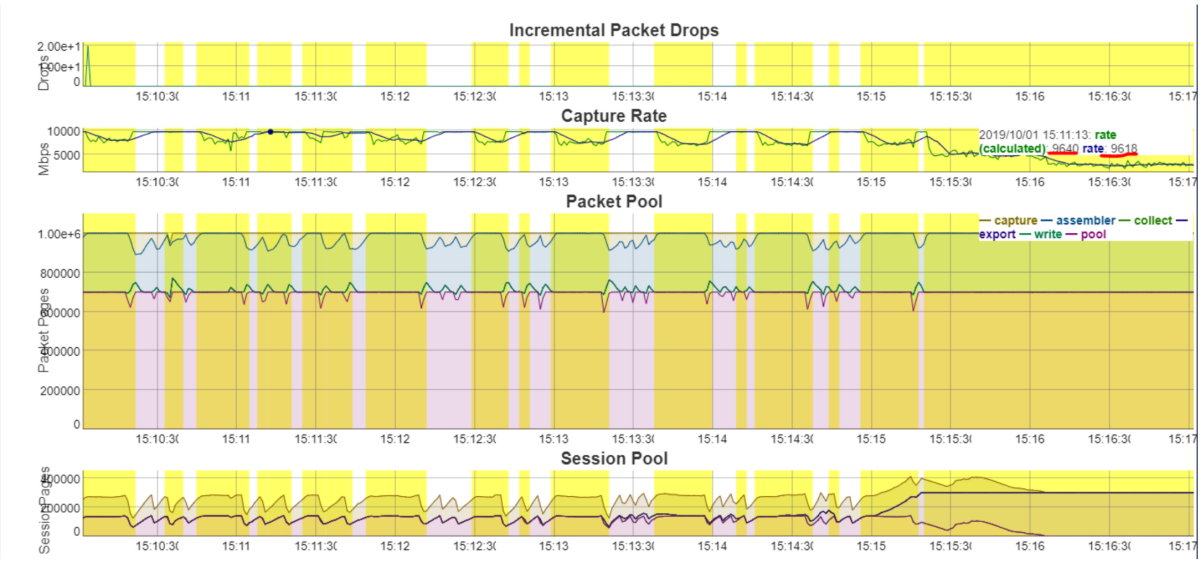
Navigate to the Packet drops tool using the REST interface

- The tool would search drop instances and list them with links.
- Start investigating the latest drop instances where the drop count is high.
- Look at other drop instances and find the pattern for drops.

Introduction to Drops tool Charts

- Incremental Packet Drops - Displays packet drops count at that instance of time
- Capture - Displays traffic ingestion rates Capture.rate in Mbps and Calculated capture rate (instantaneous rate) in Mbps.
- Packet Pool - Displays graphs for the following packet pool stats:
  - capture - /decoder/stats/pool.packet.capture → Number of free packet pages available for capture
  - assembler - /decoder/stats/pool.packet.assembler → Number of packet pages waiting to be assembled.
  - write - /decoder/stats/pool.packet.write → Number of packet pages waiting to be updated to Packet Database.
  - pool - /decoder/stats/assembler.packet.pages → Number of packet pages held in the assembler
  - export - /decoder/stats/pool.packet.export → Number of packet pages waiting to be exported
- Session Pool
  - This displays graphs for following session pool stats
  - parse - /decoder/parsers/stats/pool.session.parse → Number sessions waiting to be parsed.
  - write - /decoder/stats/pool.session.write → Number of session pages waiting to be written.
  - correlate - /decoder/stats/pool.session.correlate → Number of session pages waiting to be correlated.
  - queue.sessions.total - /decoder/parsers/stats/queue.sessions.total → The total number sessions in parse threads and queues.
  - export - /decoder/stats/pool.session.export Number of session pages waiting to be exported.

When packet drops occur, the chart shows that instance of time in yellow.



Symptoms Checklist

We recommend following the symptom checks in the order listed below, and this helps to troubleshoot all the symptoms associated with current packet drops.

Symptom 1: Higher traffic ingestion rates for the content deployed would cause packet drops

If the traffic ingestion rate -(capture) > 8 Gbps for the content (higher number of parsers) deployed on Decoder, this would cause packet drops.

ex: Below screenshot shows capture rate > 8 Gbps (9.6 Gbps)

Resolution:

Consider the following options:

- Split the traffic ingestion into multiple decoders so that the ingestion rate would be ~4-5 Gbps

  Or

- Start with baseline supported 10G content and then add parsers one by one until no drops are observed.
  - Refer Parsing and Content Considerations section on Configure High Speed Packet Capture Capability (Version 11.6 and Later)

Symptom 2: Packet Database Write backup would cause packet drops

Packet Pool Write - write (pool.packet.write), if write backup increases, then packet write delays would be causing the drops

ex: Below screenshot displays, there are many packet pages (471K) waiting on the write queue.

Decoder logs would throw warnings like the below:

- NwDecoder[74030]: [Packet] [warning] **Packet drops encountered, packet write** (717957/723314): **check packet database configuration, iostats, packet and content calls**

Top -Hp <Decoder PID> would display decoder packet write thread waiting on Disk.

iotop tool can show Disk i/o activity: rpm is available here and can be installed: `http://mirror.centos.org/centos/7/os/x86_64/Packages/iotop-0.6-4.el7.noarch.rpm`

Example iotop results where decoder packet write thread is blocked on IO 99% of decoder IO time and its throughput is just ~400KB/s

```
iotop -o -d 2
```

```
Total DISK READ :       0.00 B/s | Total DISK WRITE :     463.05 K/s
Actual DISK READ:       0.00 B/s | Actual DISK WRITE:       0.00 B/s
  TID  PRIO  USER     DISK READ  DISK WRITE  SWAPIN     IO>    COMMAND
 3373 be/4 root        0.00 B/s  431.79 K/s  0.00 % 99.99 % NwDecoder [Packet Write Wo]
 3374 be/4 root        0.00 B/s   31.26 K/s  0.00 % 99.99 % NwDecoder [Session Write W]
```

Resolution:

- Make sure database configuration tuning is applied as suggested in the section To check and tune the configuration:

- Check I/O stats on the Decoder using the command "`iostat -mNx 1`". Refer to How do you get statistics on I/O performance?
  - If % `iowait` is > 10% then decoder packet db writes have higher i/o waits
  - If % util for packetdb goes greater than 95 and wMB/s < 1000 , then Disk write throughput is low and the Disk where packetdb exists needs to be replaced.
  - If `iotop` is installed the disk io activity can be monitored through 'iotop –o –d 2'
  - For a 10G decoder we recommend packet db disk write throughput to be 1300 MB/s (~10Gbps) for better write performance.
- Lot of Content calls to extract packets or content can cause packet write issue.
  - Check drops tool logs or `/var/log/messages` or sosreport logs for SDK-Content Calls.
  - You can also use NwConsole **topQuery** command on messages logs to identify Content calls.
  - Set `/decoder/sdk/config/packet.read.throttle=100` (a higher value) so that packet write would get preference.
  - Check service invoking SDK-Content calls and reduce the content calls.
- Kernel and Driver compatibility issues
  - Check if the firmware is updated according to Kernel version. If not update firmware.

How do you get statistics on I/O performance?

1. The command you want to run for near real time statistics on I/O usage is "`iostat -N -x -m 1`". For detailed information on the output of iostat, type "`man iostat`". If the columns do not line up, you can leave off the `-N` option, but you should probably run it once so you can see what disk groups correspond to which databases.

2. In the above sample output, you can see the session and meta DBs (last two lines) are reading in about 30 MB/s combined. You can also see that `sdd` corresponds to those two databases, since the numbers combined roughly add up. The important takeaway is the last column, %util. This means: Percentage of CPU time during which I/O requests were issued to the device (bandwidth utilization for the device). Device saturation occurs when this value is close to 100%. Therefore, the disks are currently saturated with read requests and the databases are currently I/O bound. When measuring performance of the SA Core services, it's important to know if the software is I/O bound. This would be the limiting factor for increasing performance as the current hardware is running at capacity.
3. To determine which physical volume the index is on, run "`vgdisplay -v index`". In the above example, it's /dev/sde. To see a list of volumes, run "`vgdisplay -s`".
4. Run "`ls -l /dev/mapper`" to see the drive mappings.

Symptom: Session Database Write backup would cause packet drops

Session Pool Write - write (pool.session.write), if session write backup increases, then session write delays would be causing the drops

ex: Below screenshot displays there are many session pages (198K) waiting on session write queue

Decoder logs would also throw warnings like below:

- Packet drops encountered (884632/884642): **check session & meta database configuration, iostats and sdk activity**.

Top -Hp <Decoder PID> would display decoder packet write thread waiting on Disk.

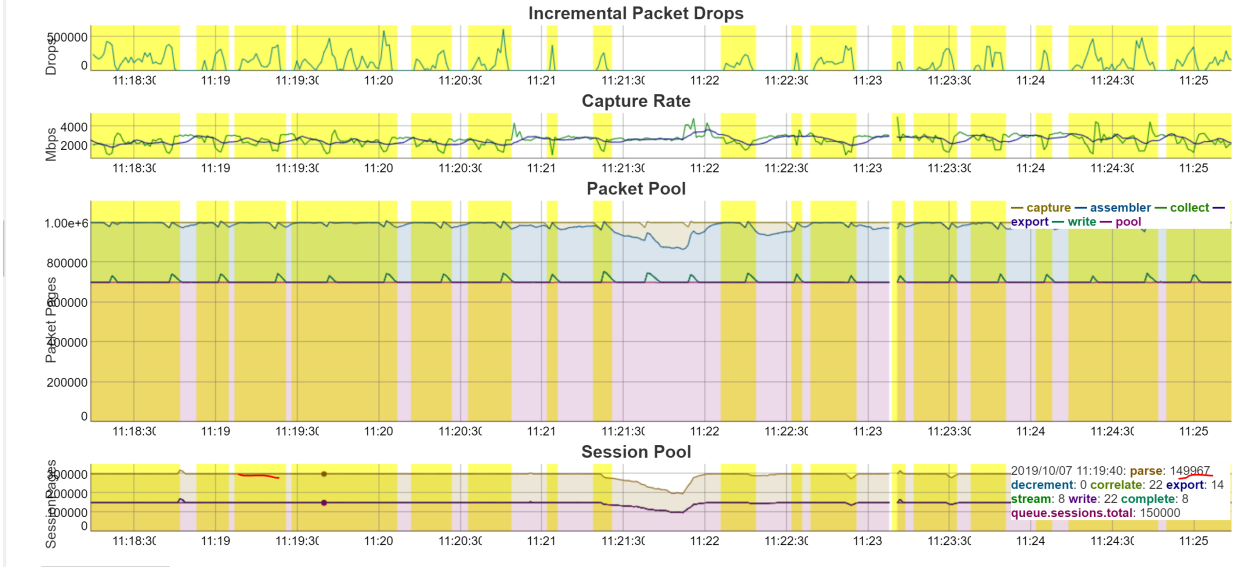
iotop tool can show Disk i/o activity: rpm is available here and can be installed: `http://mirror.centos.org/centos/7/os/x86_64/Packages/iotop-0.6-4.el7.noarch.rpm`

Example iotop results where decoder session write thread is blocked on IO 99% of decoder IO time and its throughput is just ~30KB/s

iotop –o –d 2

```
Total DISK READ :       0.00 B/s | Total DISK WRITE :     463.05 K/s
Actual DISK READ:       0.00 B/s | Actual DISK WRITE:       0.00 B/s
  TID  PRIO  USER     DISK READ  DISK WRITE  SWAPIN     IO>    COMMAND
 3373 be/4 root        0.00 B/s  431.79 K/s  0.00 % 99.99 % NwDecoder [Packet Write Wo]
 3374 be/4 root        0.00 B/s   31.26 K/s  0.00 % 99.99 % NwDecoder [Session Write W]
```

Resolution:

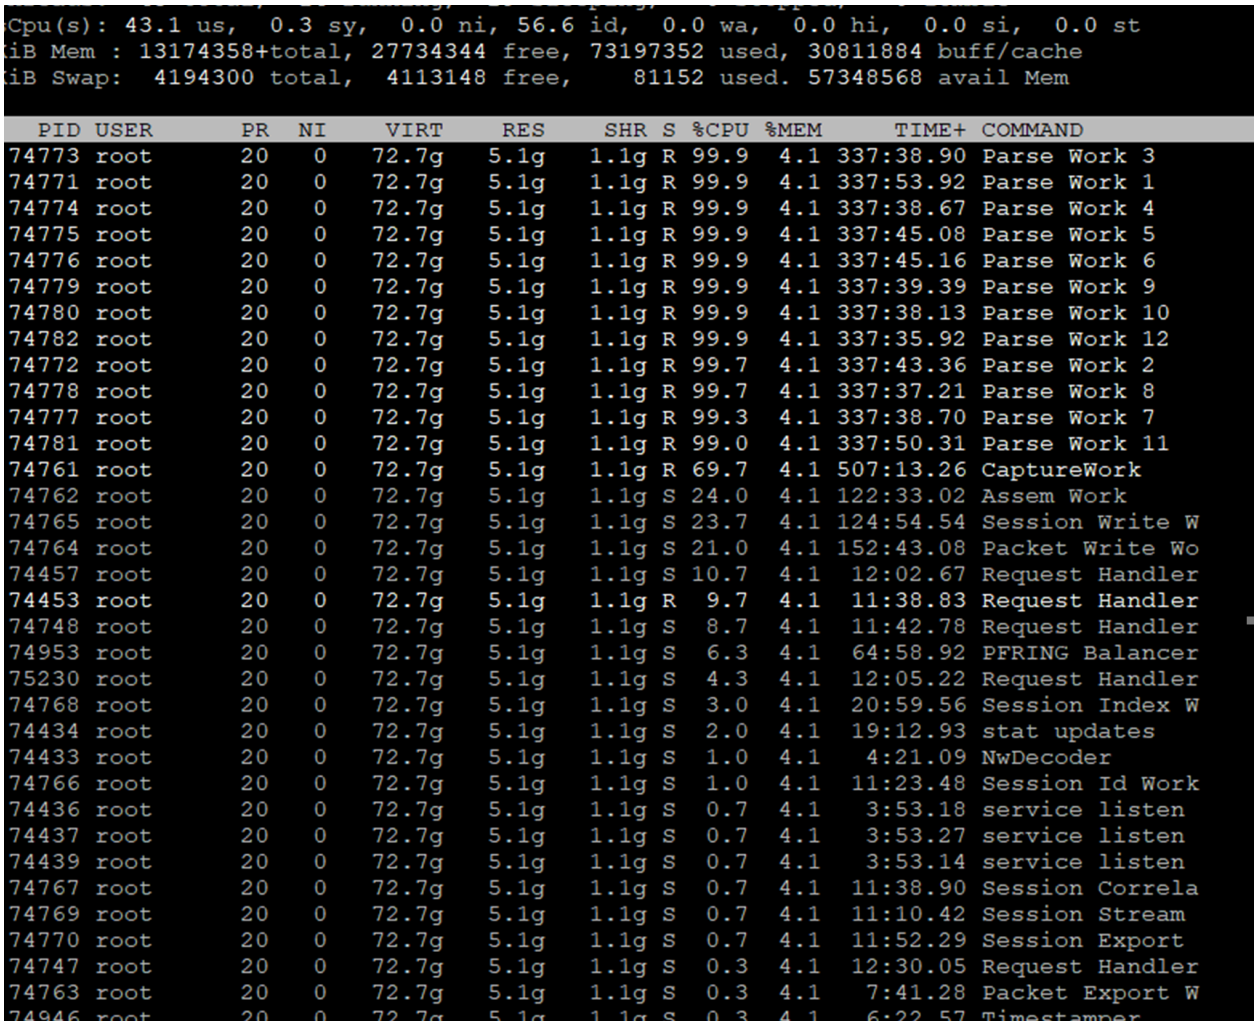


- Make sure database configuration tuning is applied as suggested in section To check and tune the configuration:
- Aggressive aggregators from Decoder
  - Check aggregators using `/decoder whoAgg` or Explore `/decoder | properties | select whoAgg | send`
  - Many aggregators with nice disabled (false) in their configuration can cause session pool backup.
    - For Archiver and Warehouse Connectors nice should be enabled (true).
    - For Concentrator nice should be disabled (false).
  - If there is one device aggregating from Decoder then it would mostly be Concentrator, don't enable nice on Concentrator.

  - If there is an Archiver or Warehouse Connector then set `aggregate.nice=true` On Warehouse Connectors and Archivers aggregating from Decoder.
- Check I/O stats on the Decoder using command "`iostat -mNx 1`". Refer to How do you get statistics on I/O performance?
  - If % `iowait` is > 10% then decoder session db and metadb writes have higher i/o waits
  - If % util for `sessiondb` or `metadb` goes greater than 95 and wMB/s < 1000 , then Disk write throughput is low and the Disk where `sessiondb` and `metadb` exists needs to be replaced.
  - If `iotop` is installed the disk io activity can be monitored through '`iotop -o -d 2`'
  - For a 10G decoder we recommend `sessiondb` and `metadb` write throughput to be 1300 MB/s (~10Gbps) for better session write performance.
- Lot of Content calls to extract meta or content can cause session write issue.
  - Check drops tool logs or `/var/log/messages` or `sosreport logs` for SDK-Content Calls
  - You can also use NwConsole **topQuery** command on messages logs to identify Content calls.
  - Set `/decoder/sdk/config/packet.read.throttle=100` (a higher value) so that packet write would get preference.
  - Check service invoking SDK-Content calls and reduce the content calls.
- Kernel and Driver compatibility issues
  - Check if the firmware is updated according to the Kernel version. If not, update firmware.

Symptom: Session Pool Parsing delays causes packet drops (Parsing issues)

Session Pool Parse - parse (pool.session.parse): If session parse backup increases, then sessions would be queued on assembler and would be causing the drops.

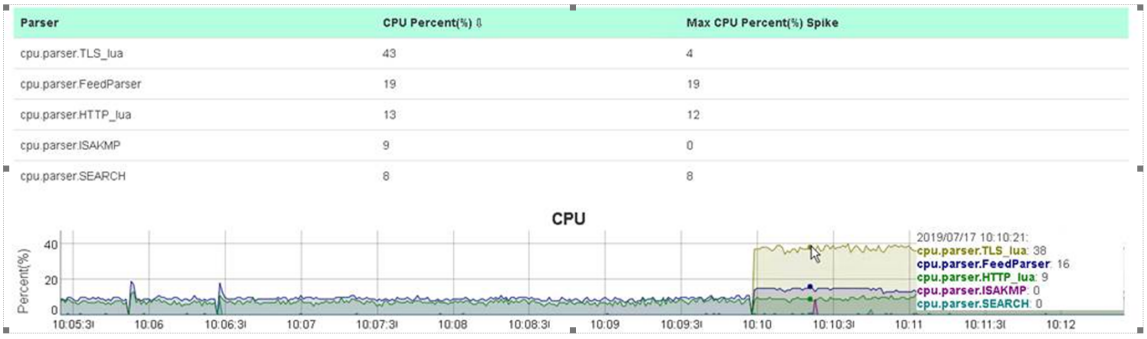


ex: Below screenshot displays there are many sessions waiting to be parsed - Session Pool | parse stat.

Decoder logs would throw warnings like the below:

NwDecoder[42946]: [Packet] [warning] Packet drops encountered, packet assemble (910178/910179): **check session pool (following log), line and session rates**

top -Hp <Decoder pid> would display decoder Parse Work (Parser Threads) are so busy with high CPU usage.



```

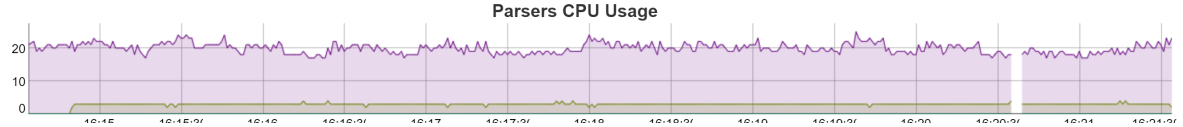
Resolution:

- Enable parser detailed stats on decoder `/decoder/parsers/config/detailed.stats=yes`, wait for new drop instance.
- Click on 

to analyse parsing activity.
- Click on Top Parsers CPU usage, this displays top 5 parsers using higher cpu usages.
  - Try to disable the parsers which are using high CPU usage and wouldn't be parsing the larger percentage of traffic and monitor decoder for drops due to parsing.
    - For ex: parser like TLS_lua , TLD_Lua has higher CPU usage than HTTP_lua (which parsers larger percent of traffic).

Parser	CPU Percent(%) ⇩	Max CPU Percent(%) Spike
cpu.parser.TLS_lua	43	4
cpu.parser.FeedParser	19	19
cpu.parser.HTTP_lua	13	12
cpu.parser.ISAKMP	9	0
cpu.parser.SEARCH	8	8

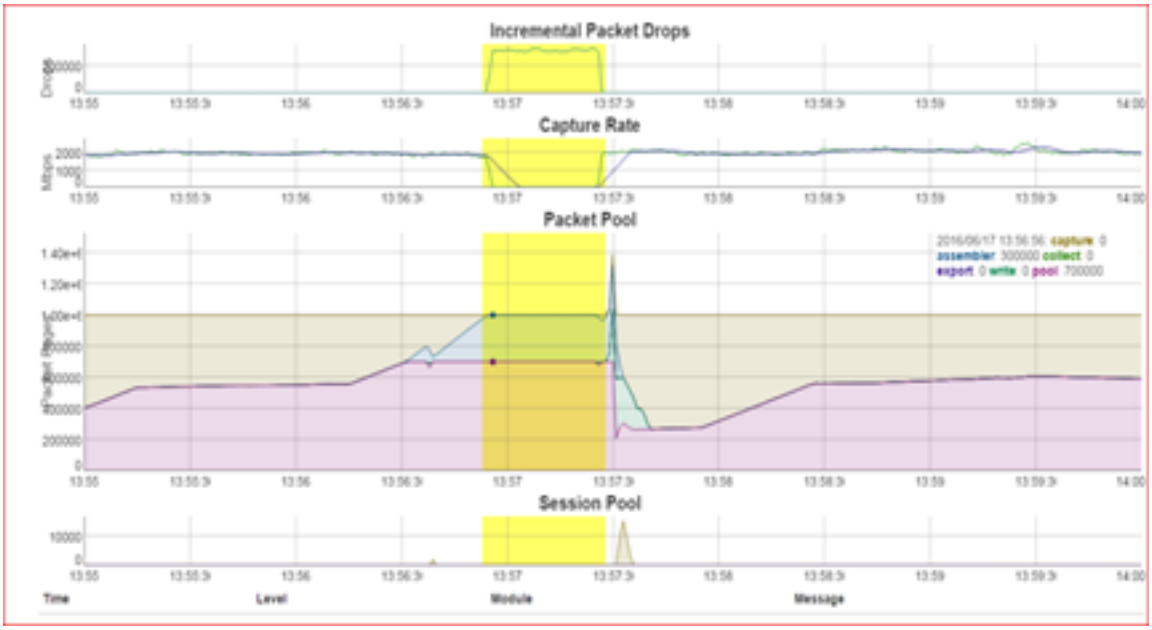
- Repeat the above step till packet drops are reduced or resolved
- Notify parser Content owner (Customer - if it is their custom content or NetWitness Content team if it is NetWitness parser) so that a fix may be provided for parser issue.



- Click Top Parsers Token Callback counts, this displays top 5 parsers having higher token callback counts during the drop window.
- Try to disable the parsers which are using high Token Callback count and wouldn't be parsing the larger percentage of traffic. Monitor decoder for drops due to parsing.

Top Parsers TokenCallback count

Parser	TokenCallbacks Count ⇩	Max TokenCallbacks Count Spike
TLS_lua	66656555	314517
HTTP_lua	14169879	151699
china_chopper	10648606	116502
rekaf	10604218	115998
Form_Data_lua	8871783	97752



- For ex: parser like TLS_lua has higher Token Callback count than HTTP_lua (which parsers larger percent of traffic)

- Click Top Parsers Meta Callback counts, this displays top 5 parsers having higher meta callback counts during drop window.
- The parsers which displays higher Token Callback count and does not generate much meta and wouldn't parse larger percent of traffic, needs to be disabled.
  - Disable such parsers and monitor Decoder.
- Click Top Parsers Memory Usage, high Lua memory usage (>1 Gb per parser) or memory spike can cause packet drops.
  - Disable Lua Parsers which are using higher memory usage > 1 Gb and monitor Decoder for drops.
- Complex App rules including "regex" or "contains" are CPU intensive
  - Check Parsers CPU Usage graph, if there is high CPU usage for cpu.app.rules stat, then check the app rules configured and tune them.

Symptom: Session Parsing stuck can cause packet drops

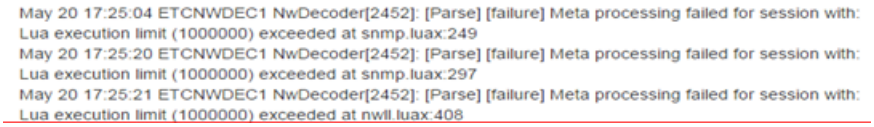
Session parsing got stuck at a parser would show symptom of graph like below where queue.sessions.total =1 on Session pool.

Decoder would log warning message like:

NwDecoder[42946]: [Packet] [warning] Packet drops encountered, packet assemble (910178/910179): **check session pool (following log), line and session rates**.

Resolution:

- Enable parser detailed stats on decoder `/decoder/parsers/config/detailed.stats=yes`, wait for new drop instance.
- Click on Analyse Parser Stats to analyse parsing activity.
- Click on Top Parsers CPU usage, this displays top 5 parsers using higher cpu usages.
  - The parser which shows CPU usage when Session Pool `queue.sessions.total =1` would be the one got stuck or looping.
  - Disable the parser and monitor for drops . Notify parser Content owner to get the fix.



Symptom: Lua Parser Warnings can cause packet drop issues

A lua parser which throws warnings and errors can affect the parse thread and its cpu cycles, hence if there is any lua parser which is throwing warnings then it needs to be fixed.

Resolution:

- Identify and disable the lua parser throwing errors or warnings and monitor decoder.
- Create a content ticket so that content owners can provide a fix or workaround.

ex: Lua Parser throwing parse failure for execution limits exceeding.

Decoder and Log Decoder References

This is a collection of references, which provide information about the user interface for Decoders and Log Decoders in NetWitness, with references to the procedures that describe the work you can do in that part of the user interface.

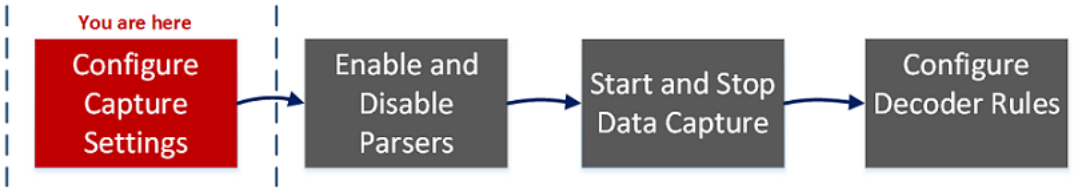
Services Config View - Capture Policies Tab

In the Capture Policies tab ((Configure) > **Capture Policies**, administrators can configure selective network data collection policies.

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of Decoder resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. You can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected. The administrator can choose to deploy predefined policies that capture:



- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols is available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

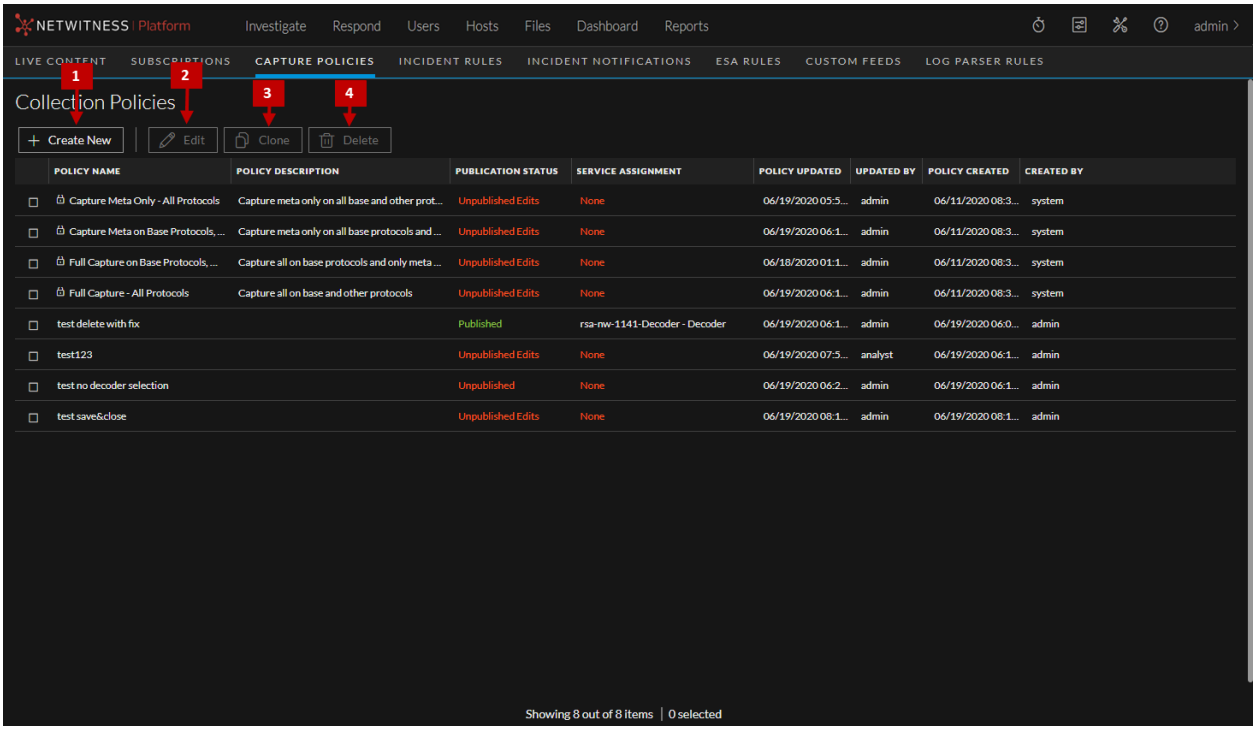
Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	use predefined selective collection policies*	(Optional) Configure Selective Network Data Collection
Administrator	create new policies from predefined ones*	(Optional) Configure Selective Network Data Collection

User Role	I want to...	Documentation
Administrator	create custom policies*	(Optional) Configure Selective Network Data Collection
Administrator	verify policies	(Optional) Configure Selective Network Data Collection
Administrator	unpublish policies*	(Optional) Configure Selective Network Data Collection
Administrator	delete policies*	(Optional) Configure Selective Network Data Collection



*You can complete these tasks here.

Related Topics

- Services Config View - Edit Capture Policies Wizard

Quick Look

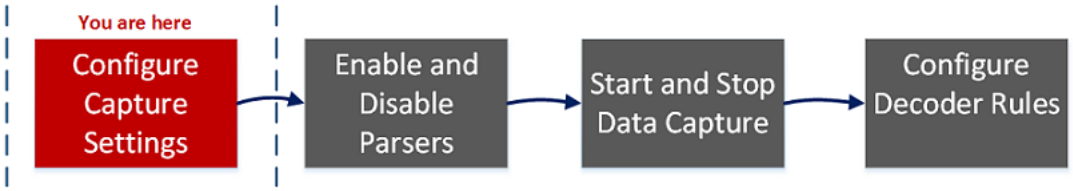
This is an example of the Capture Policies tab.

1 Create New - Provides a wizard to create a new policy.
2 Edit - Provides a wizard to edit an existing custom policy.
3 Clone - Selects an existing policy (predefined or custom) and copies it to create a new policy.
4 Delete - Removes policies.

The following table describes the contents of the Capture Policies tab.

Column	Description
Policy Name	The name of the policy (not editable for predefined policies).
Policy Description	The description of the policy (not editable for predefined policies).
Publication Status	• **Unpublished**: policies that have not been deployed to Decoders yet. • **Unpublished Edits**: policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders). • **Published**: policies which have been deployed to Decoders. • **Failed**: policies that failed to execute, for example, if a Decoder is offline or a system is down. For information about how to troubleshoot failed policies, see "Troubleshooting Policy Deployments That Fail" in (Optional) Configure Selective Network Data Collection.
Service Assignment	Identity of the Decoder or service on which the policy is run.
Policy Updated	Date the policy was edited.
Updated By	Role of the person who updated the policy.
Policy Created	Date on which the policy was created.
Created By	Role of the person who created the policy.

Services Config View - Edit Capture Policies Wizard



In the Edit Policies view ((Configure) > **Capture Policies** > **Edit**, administrators can configure selective network data collection policies. The panels for creating a new policy and editing an existing policy are the same except that in the editing wizard, the definitions of the existing policy are displayed.

You can edit existing policies to customize them for your environment. A base set of protocols are available for alterations, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it.

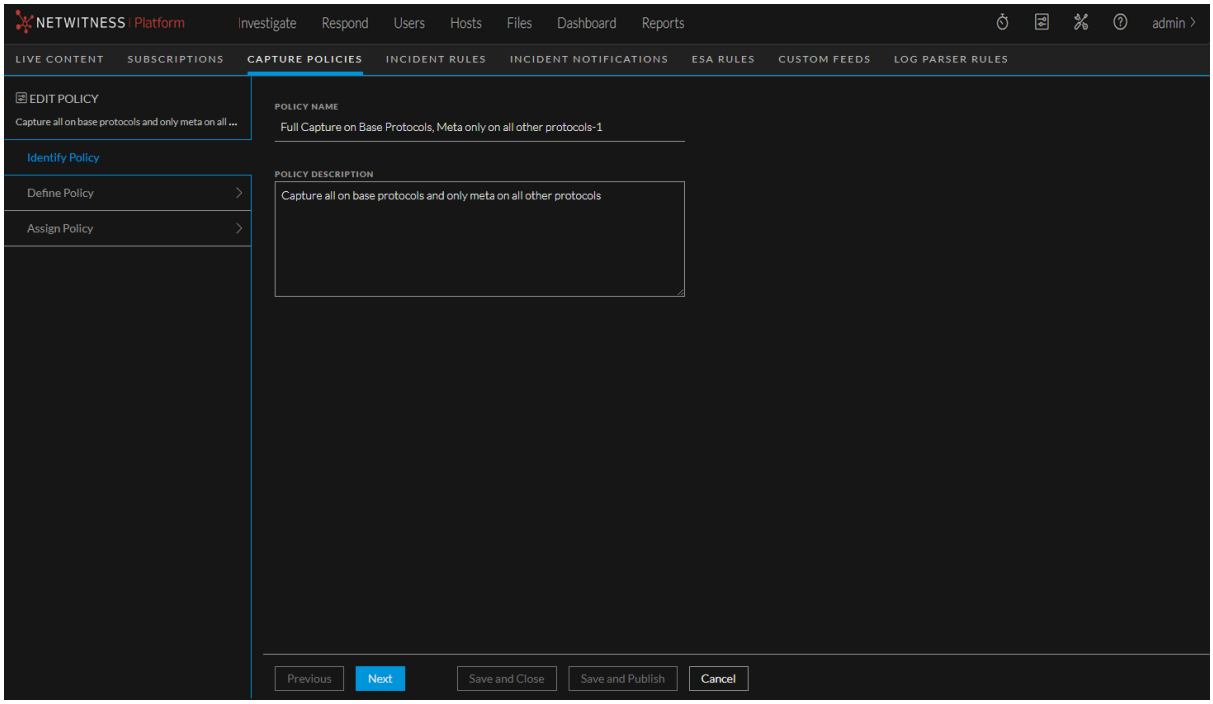
Note: A set of predefined policies are available immediately. The only way you can edit a predefined policy is by assigning Decoders to the policy to collect the targeted data.

Workflow

The following figure shows the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	create new policies from predefined ones*	(Optional) Configure Selective Network Data Collection
Administrator	create custom policies*	(Optional) Configure Selective Network Data Collection
Administrator	unpublish policies*	(Optional) Configure Selective Network Data Collection
Administrator	delete policies*	(Optional) Configure Selective Network Data Collection



*You can complete these tasks here.

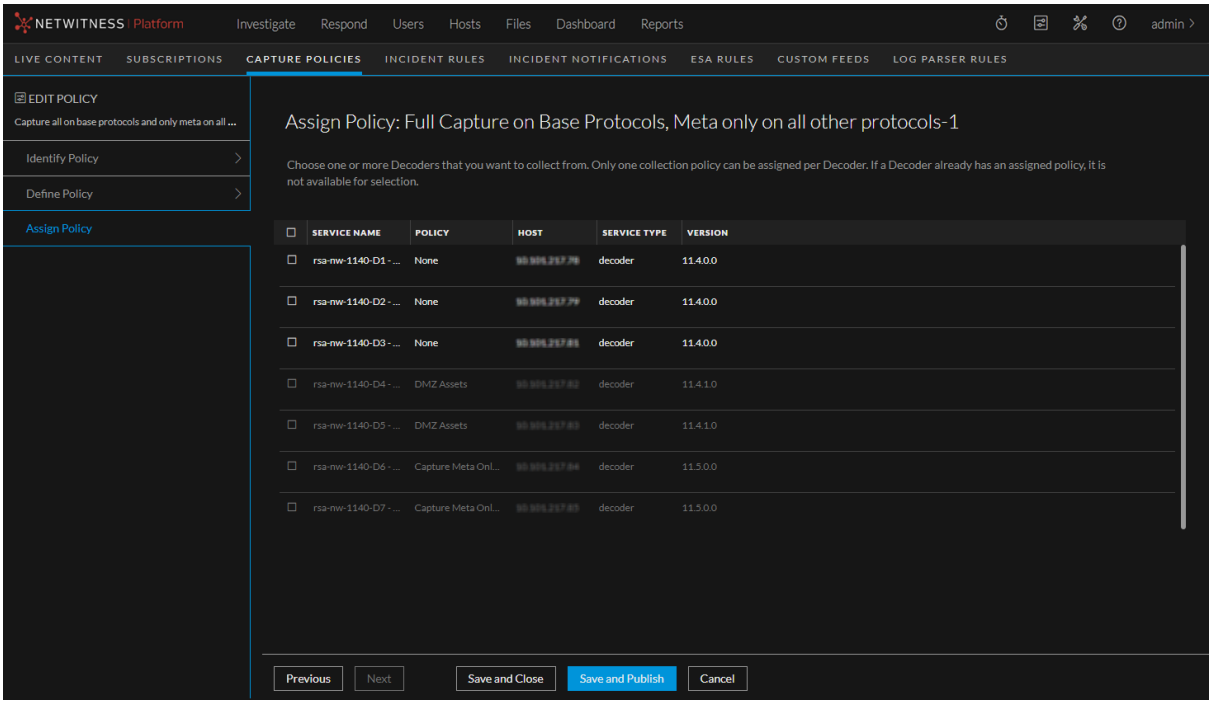
- Services Config View - Capture Policies Tab

Quick Look

1. To access the Edit Policy wizard, go to (Configure) > **Capture Policies**, select a policy, and click **Edit**.
   The Identify Policy page is displayed, where you can change the name and description of the policy.

2. To view the Define Policy page, click **Next**.



In the Define Policy page, you can define rule actions for the protocols for which you are interested in collecting data. The rule actions are:

- **Collect Meta Only**: Collect metadata
- **Drop All**: Drop metadata and network packets
- **Collect All**: Collect metadata and network packets

You can click **Save and Close** to save your policy without deploying it on Decoders. The following table describes the actions of the buttons on this page.

Button	Description
Previous	Go to the previous page of the wizard
Next	Keep updates from the current page and go to the next page of the wizard.
Save and Close	Save the policy definitions without publishing the policy.
Save and Publish	Save the policy definitions and publish the policy to Decoders to begin data collection.
Cancel	Cancel the definitions and return to the Capture Policies tab.

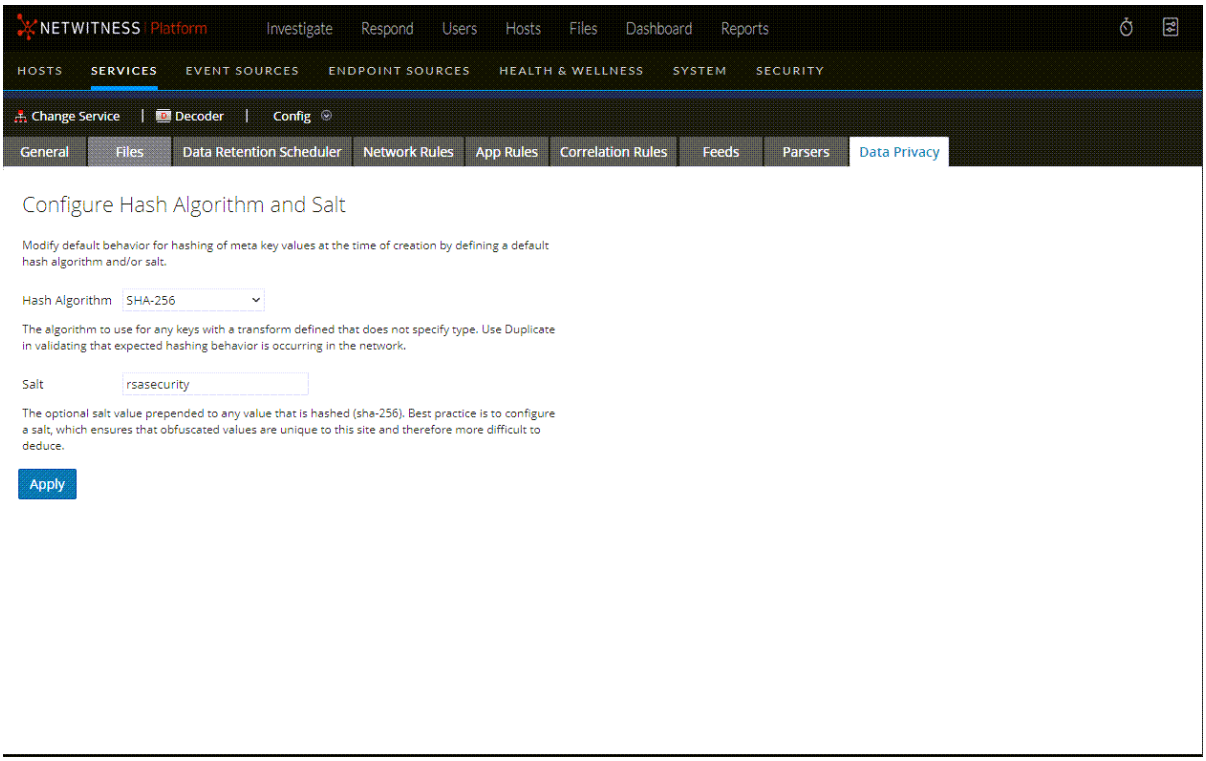
3. Click Next to go to the Assign Policy page.

This is where you assign the policy to Decoders to capture the data. The following table describes the columns in this page.

Column	Description
Service Name	The name of a service. For 11.5, Decoder is the only available service.
Policy	The policy that a Decoder is assigned to.
Host	The IP address or name of the host system for the Decoder.
Service Type	The type of service the policy is published to. For 11.5, the service type is **decoder**.
Version	The version of NetWitness Platform that is installed on the service host.

Services Config View - Data Privacy Tab

In the Data Privacy tab (**(Admin) > Services > Select a Decoder or Log Decoder >** > **Config > Data Privacy tab)**, administrators can configure data privacy parameters for certain Core services. For the Decoder and Log Decoder, you can set the default hash algorithm and salt.



What do you want to do?

User Role	I want to ...	Documentation
Administrator	configure hash algorithm and salt	"Configure the Hash Algorithm and Salt" in the *Data Privacy Management Guide.* (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

The Data Privacy tab has the Configure Hash Algorithm and Salt configuration settings. The following table describes the parameters in this tab.

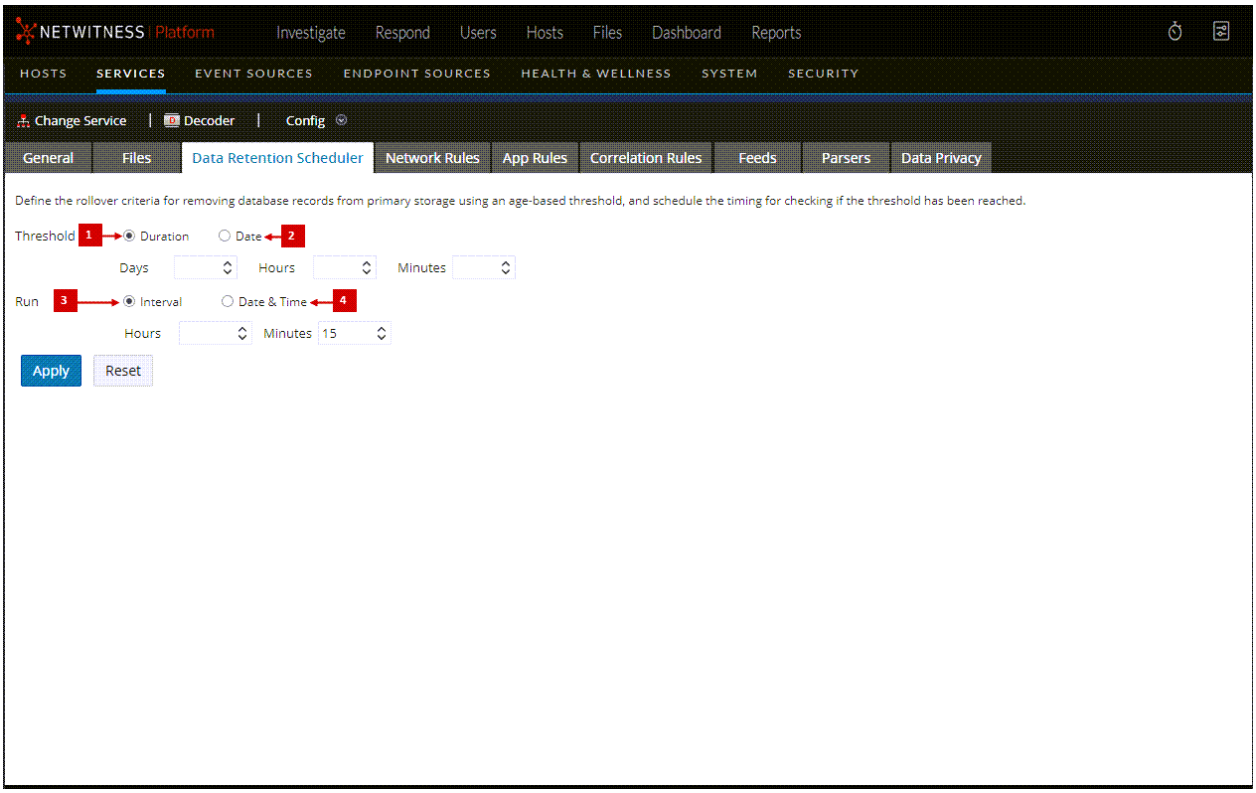
Parameter	Description
Hash Algorithm	Displays a drop-down list of hash algorithms to use for any keys with a transform that does not specify algorithm type. Possible values are SHA-256 and Duplicate. Duplicate is a special algorithm available for administrators to use when validating that expected hashing behavior is occurring in the network.
Salt	Indicates the optional salt value prepended to any value that is hashed. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. Configuring a value ensures that obfuscated values are unique to this site and therefore more difficult to deduce. For more information on this field, see "Configure Data Obfuscation" in the *Data Privacy Management* guide.
Apply	Applies any changes.

Services Config View - Data Retention Scheduler

In the Data Retention Scheduler tab, you can set the rollover criteria for removing database records from primary storage using an age-based threshold. You can also schedule the timing to check whether the threshold is reached.

To access the Data Retention Scheduler tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Data Retention** tab.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Schedule the timing to see if the threshold is reached.	Configure Transaction Handling on a Decoder

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup

Quick Look

This is an example of the Data Retention Scheduler tab.

1. **Threshold Duration**: Removes database files older than the selected number of days, minutes, or hours.
2. **Threshold Date**: Removes database files older than the selected UTC date (YYYY-MM-DD-HH:MM:SS) that are not compatible with minutes, hours, or days parameters.
3. **Run Interval**: Indicates the number of hours between executions.
4. **Run Date and Time**: Defines which days of the week to execute the scheduler, as well as time of execution in HH:MM:SS format for the local time of the service.

Services Config View - Feeds Tab

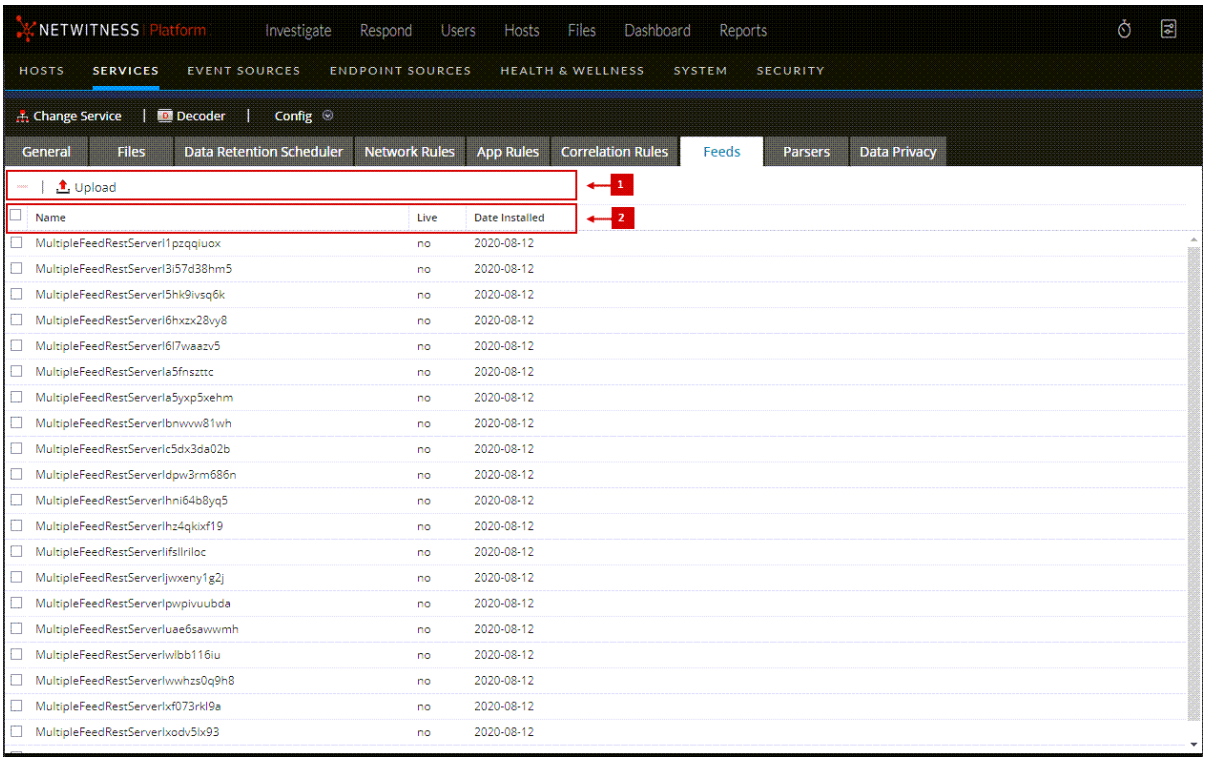
Feeds and parsers are Lua programs loaded and compiled when either processing capture files in NetWitness Investigate or capturing data with Decoders. Most commonly, they are used for static meta extraction and service identification.

Note: Pre-11.0 versions of NetWitness used FLEXPARSE programs in addition to Lua programs; Flexparsers are deprecated in NetWitness 11.0. Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

NetWitness uses feeds to create metadata based on externally defined meta values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data can identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

Feeds can be added, removed, and updated while a Decoder is running without affecting capture. The Feeds tab (**(Admin) > Services >** select a Decoder or Log Decoder service and click **> View > Config > Feeds tab**) provides a user interface for managing feeds on Decoders.

What do you want to do?



User Role	I want to...	Documentation
Administrator	configure feeds	Configure Parsers and Feeds
Administrator	enable and disable parsers	Enable and Disable Parsers and Log Parsers

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup
- Upload Feeds Dialog

Quick Look

This is an example of the Feeds tab.

1 Feeds Tab Toolbar - Provides options to work with feeds in the grid
2 Feed List - Lists all feeds that are currently deployed on the Decoder

Feeds Tab Toolbar

Feature	Description
Upload	Displays the Upload Feeds dialog.
−	Deletes the selected feeds.

Feeds List

The Feeds list provides a listing of all currently deployed feeds for the Decoder.

Column	Description
Name	The name of the feed or the feed file.
Live	Indicates if the feed originated from Live. Possible values are **Yes**, **No**, or **N/A**. • **Yes** = Installed through Live • **No** = Installed through NetWitness • **N/A** = The feed has no attributes file created by NetWitness to track the installation date. The feed may have been installed manually, not through NetWitness or Live Services. Manually installed feeds still function properly.

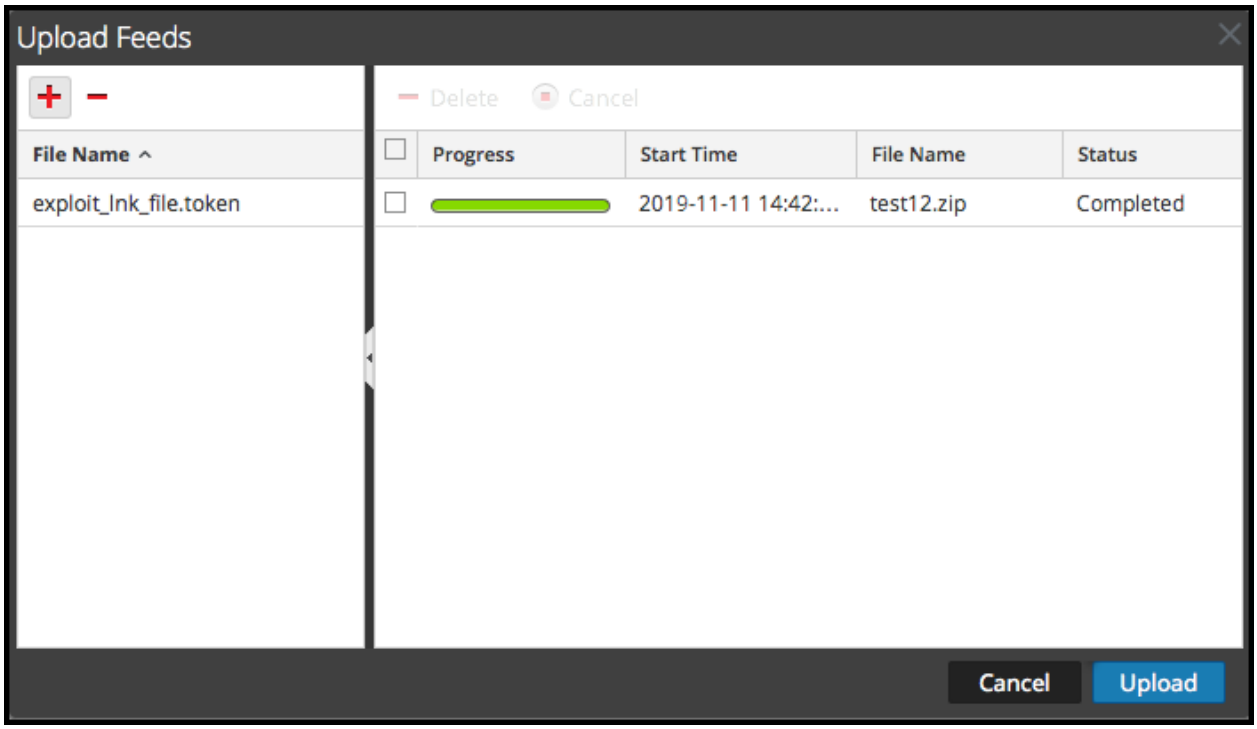
Column	Description
Date Installed	The date the feed was pushed to the service.

Upload Feeds Dialog

This topic describes the features of the Upload Feeds dialog in the Services Config view > Feeds tab.

The **Upload** option in the Services Config view > Feeds tab displays the Upload Feeds Dialog, in which you can manage the uploading of feeds to a Decoder or Log Decoder.

What do you want to do?



User Role	I want to...	Documentation
Administrator	prepare a list of feeds for upload	Edit, Upload, or Remove a Feed
Administrator	view and delete upload jobs	Edit, Upload, or Remove a Feed

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the Upload Feeds dialog.

File List

The File list is the place to prepare a list of feeds for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking **Upload** starts the upload process.

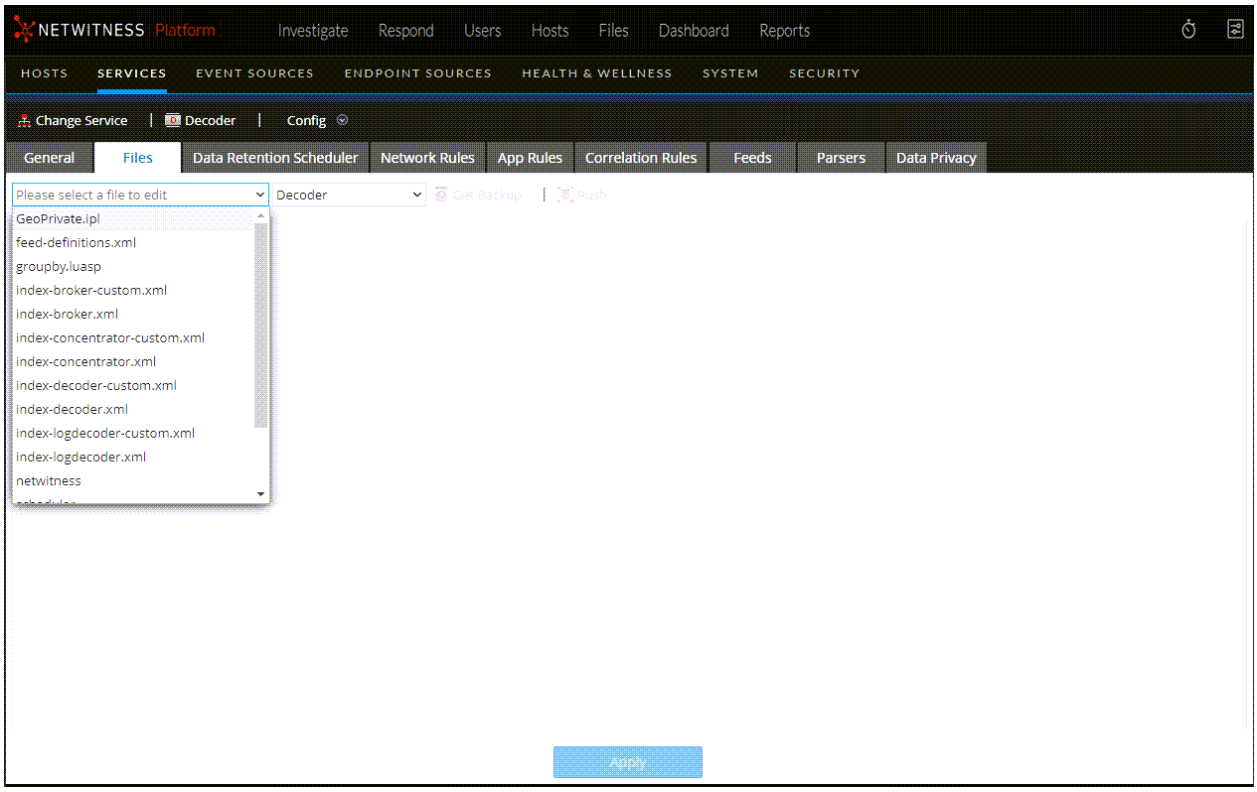
Feature	Description
	Opens a view of the directory structure where you can select files to add to the File list.
	Deletes the selected files from the File list.
File Name	Lists the feed files you have added from a file system in preparation for uploading to a Decoder. When you click **Upload**, the files listed here are uploaded.

Upload Job List

The Upload Job list provides a view of upload jobs started by clicking **Upload**.

Feature/Column	Description
Delete	Deletes an upload job.
Progress	Displays progress of an upload job.
Start Time	Displays the start time of an upload job.
File Name	Lists filename of the feed being uploaded.
Status	Displays the status of upload job.

Upload Feeds Dialog Buttons



Feature	Description
Cancel	Closes the Upload Feed dialog.
Upload	Starts uploading the feed files listed in the File list. Each feed is listed in a separate row in the Upload job list.

Services Config View - Files Tab

The Decoder and Log Decoder configuration files are visible and editable in the (Admin) > Services > Config view > Files tab. "Edit Core Services Configuration Files" in the *Hosts and Services Getting Started Guide* provides general instructions for editing files. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

Like other Core services, both the Decoder and Log Decoder have an index file, and may also have a crashreporter, netwitness, and scheduler. The Decoder and Log Decoder index files are named **`index-decoder-custom.xml`** and **`index-logdecoder-custom.xml`.**

Note: `Table-map.xml` and `table-map-custom.xml` are available only for Log Decoders with log content installed.

What do you want to do?

User Role	I want to...	Documentation
Administrator	obtain log files from pre-11.0 Log Decoder	Obtain Log Files from a Pre-11.0 Log Decoder

User Role	I want to...	Documentation
Administrator	edit files and parsers	• Feed Definitions File • Flex Parsers • GeoIP2 Parsers • Lua Parsers • Decoder Snort Detection • Search Parser • Wireless LAN Configuration

Related Topics

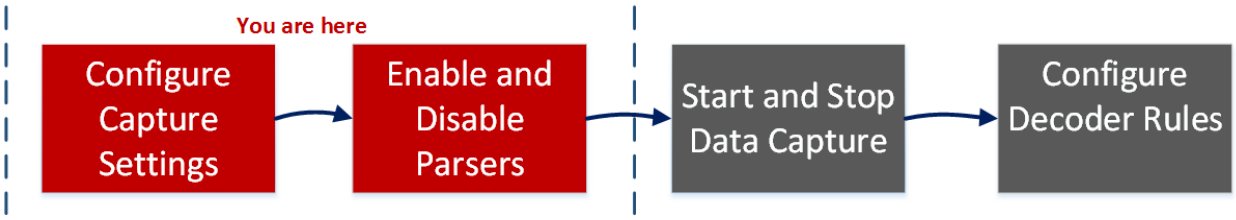
Quick Look



Filename	Description
`GeoPrivate.ipl`	This fixed parser takes the IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display.
`feed-definitions.xml`	Used to create custom feeds, this is the XML schema used by the Decoder to define a **feed** message when it creates a **.feed** file.
`traffic_flow_options.lua`	Used to provide directionality information. Update this file with environment-specific internal and external subnets for the Lua parser to create proper directionality in metadata. The parser is described in Content for NetWitness Platform.
`search.xml`	This is the Search Parser configuration file. The Search Parser is a custom parser, used to generate metadata by scanning for pre-defined keywords.
`wlan-config.xml`	This is the wireless LAN configuration file (9/9/2009). This file controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder.

Services Config View - General Tab

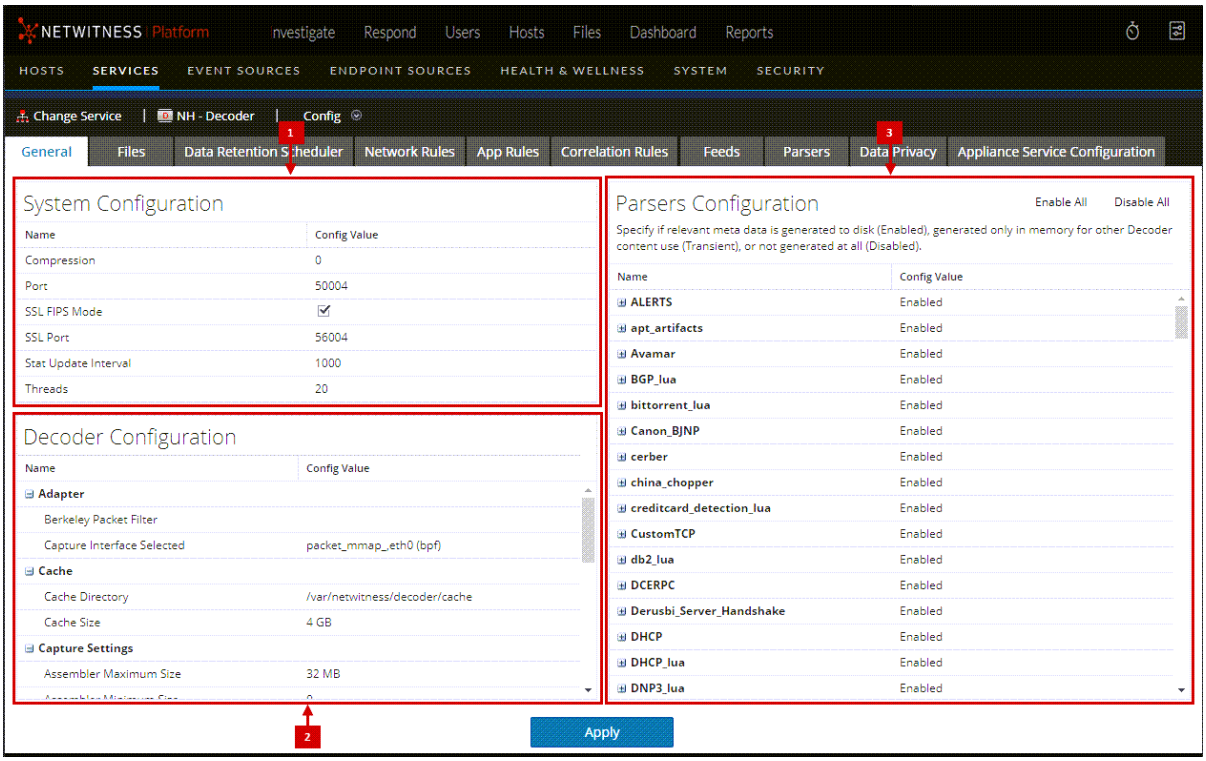
The General tab for a Decoder in the Services Config view provides a way to manage basic service configuration, configure data capture, and select the parsers that are applied to the captured data. To access the General tab, go to **Admin > Services >** select a Decoder or Log Decoder and click **> View > Config > General tab**.

Workflow

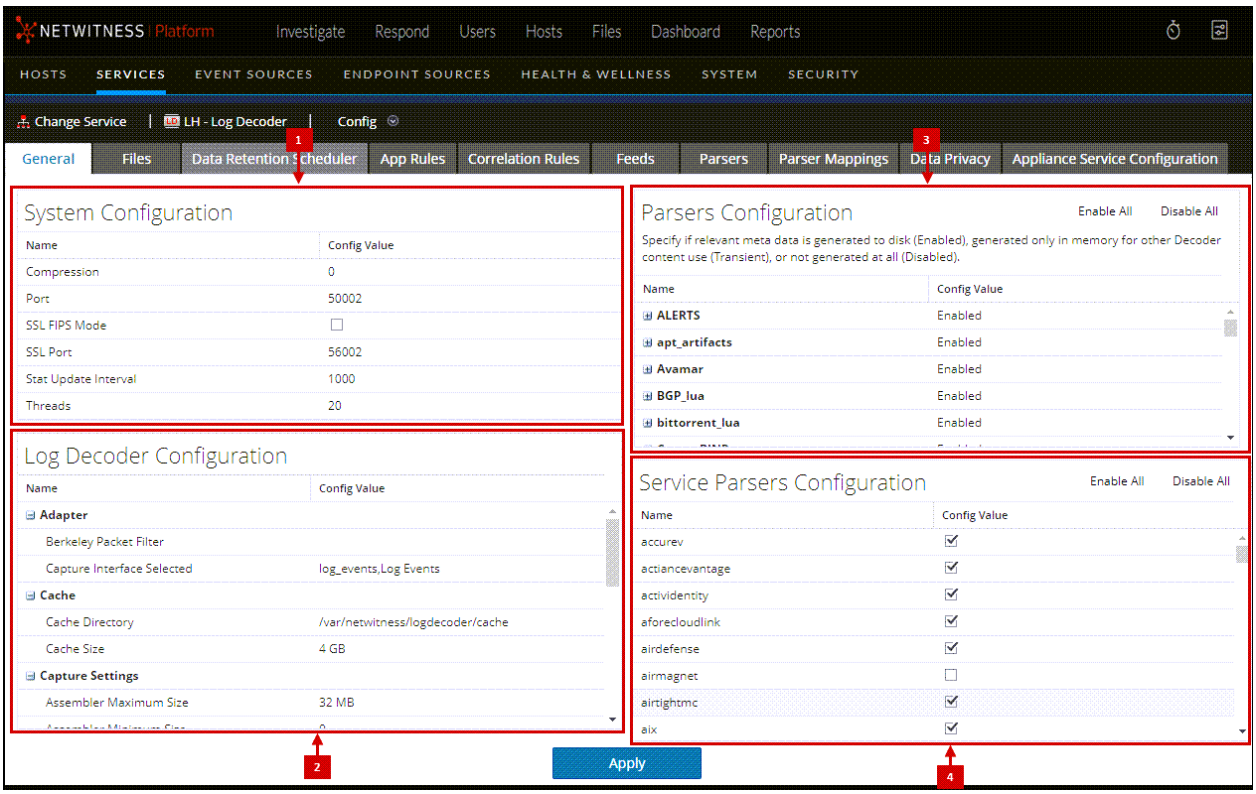
The following figure depicts common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings*	Configure Capture Settings
Administrator	manage parsers and log parsers*	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules	Configure Decoder Rules



*You can complete these tasks here.

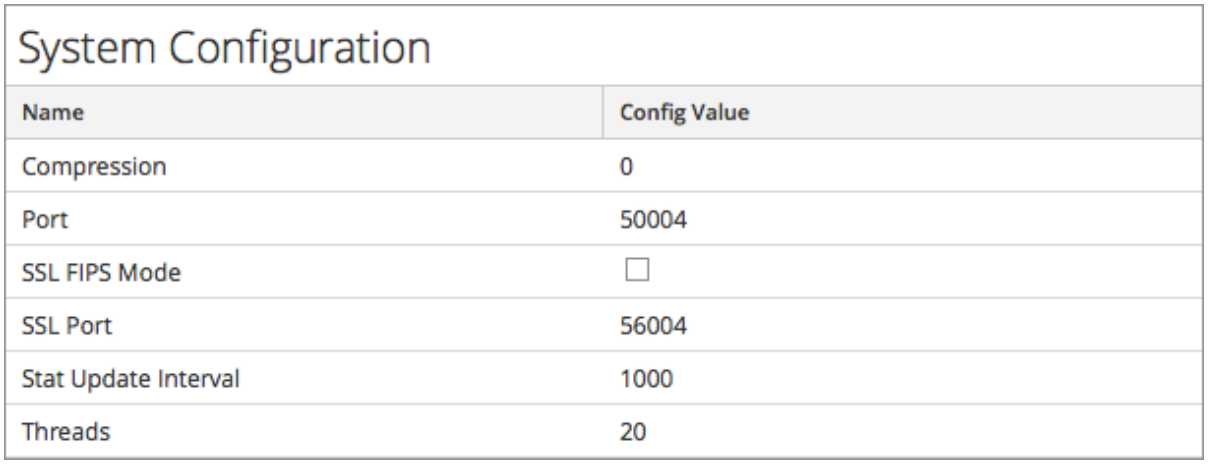


Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Configure Parsers and Feeds

Quick Look

The first figure is an example of the General tab for a Decoder. The second is the General tab for a Log Decoder.



1 System Configuration - Manages service configuration for a Decoder or a Log Decoder.

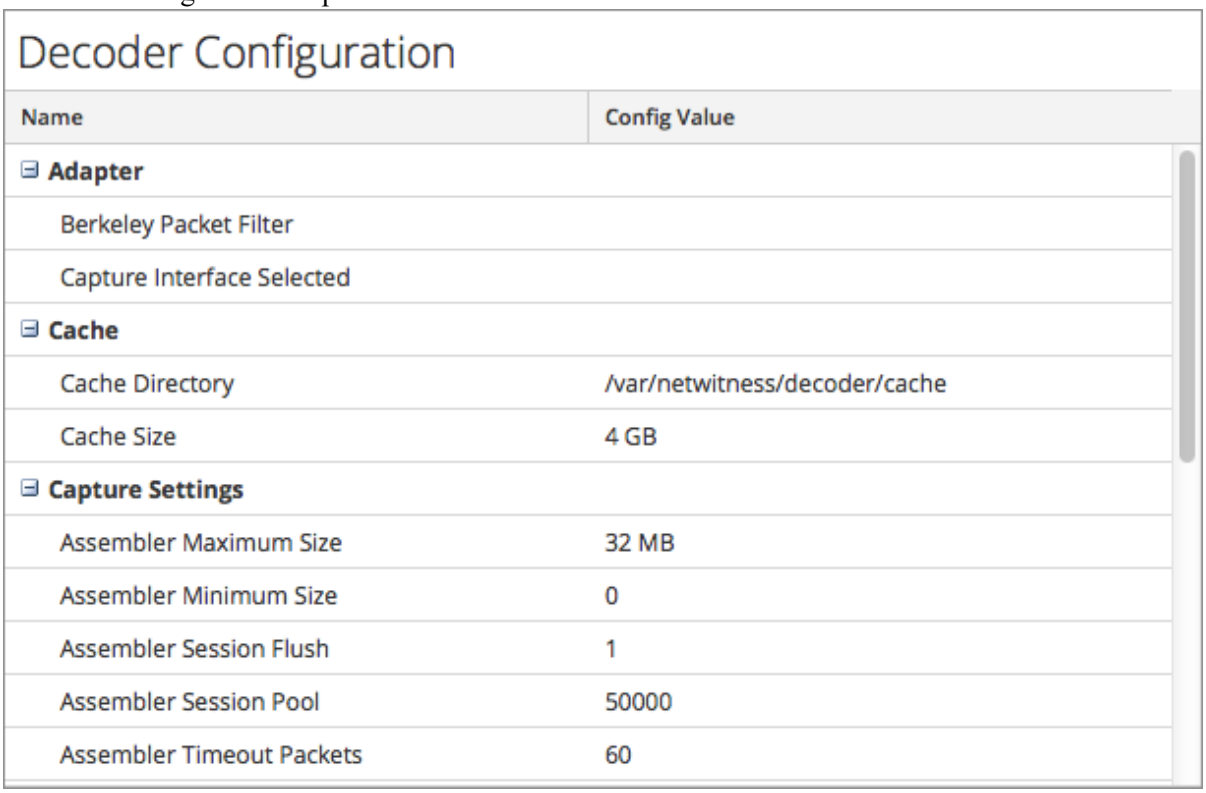
2 Decoder Configuration or Log Decoder Configuration - Lets you view and edit service configuration parameters for a Decoder or Log Decoder.

3 Parsers Configuration - Lets you select parsers to use on the Decoder or Log Decoder.
4 Service Parsers Configuration (Log Decoders only) - Lets you select service parsers to use on the Log Decoder.

System Configuration Section

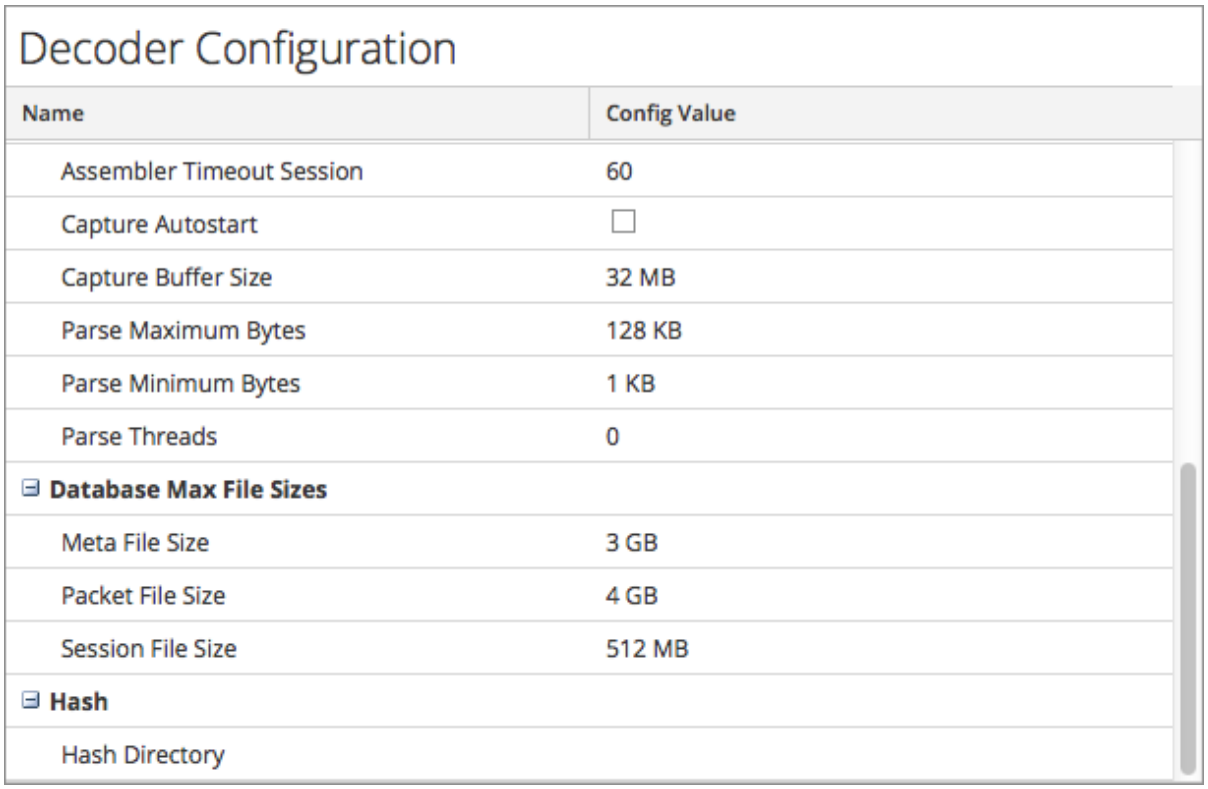
The System Configuration section manages service configuration for a Decoder. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

System Configuration



Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

The System Configuration section has these parameters.



Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. A change takes effect on service restart.

Decoder Configuration Section

The Decoder Configuration section provides a way to view and edit service configuration parameters for a Decoder or Log Decoder. When a service is first added, default values are in effect. You can edit these values to manage traffic capture.

Scrolling to the bottom of the section reveals these additional Decoder Configuration parameters.

Adapter Section

Adapter parameters configure the network interface for capture as described in Configure Capture Settings.

Cache Section

Cache parameters configure the cache directory and size for session cache files. The following table describes the cache settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Cache Parameter	Description
Cache Directory	The directory where session cache files are stored. The default value is `/var/netwitness/decoder/cache`. Change takes effect immediately.
Cache Size	The maximum size, in Megabytes (MB), that all files in the cache directory can attain before the oldest files are deleted. Once the threshold is reached, the cache size is reduced by 10%. The default value is **4 GB**. Change takes effect immediately.

Capture Settings Section

The Capture Settings section provides a way to configure operational capture settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

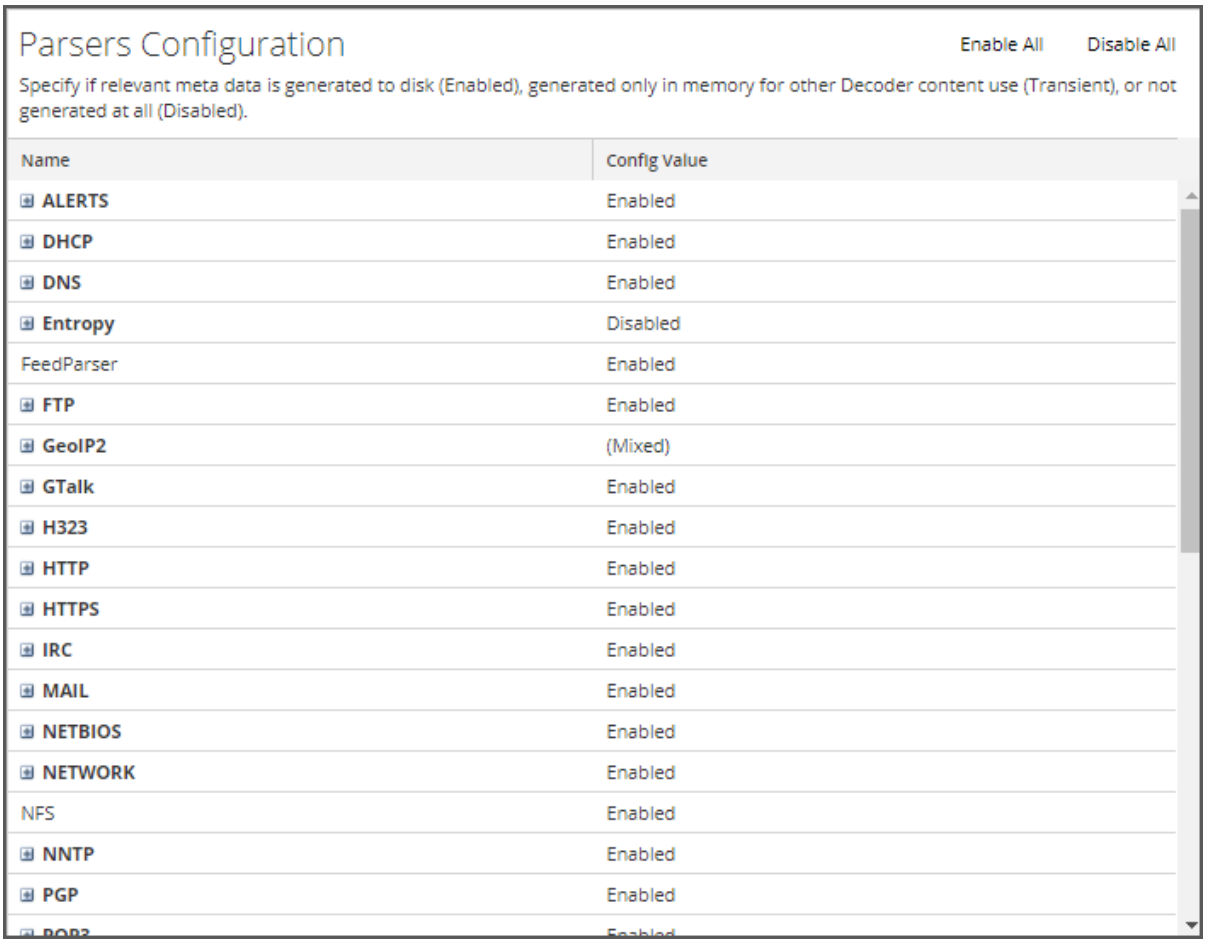
Capture Settings Parameter	Description
Assembler Maximum Size	Specifies the maximum size in bytes that a session's packet data size can attain. The default value is **32 MB**. Change takes effect immediately.
Assembler Minimum Size	Specifies the minimum size in bytes that a session must have in order to generate metadata. A value of **0** means every session has metadata generated. The default value is **0.** Change takes effect immediately.
Assembler Session Flush	Specifies whether a session is removed from the assembler when the session's last chain is removed from the assembler. The default value is **1**. • **2** = if the first packet of a session times out of assembler, the session is removed from assembler after parsing is complete. Any subsequent packets for this session create a new session in assembler. • **1** = If the last chain of a session times out of assembler, the session is removed from assembler. Any subsequent packets for this session create a new session in assembler. • **0** = If the last chain of a session times out of assembler, the session is left in assembler until it times out. Any subsequent packets for this session are filtered Change takes effect on service restart.
Assembles Session Pool	Specifies the number of entries in the session pool. The default value is **350000**. Change takes effect on service restart.
Assembler Timeout Packets	Specifies the number of seconds before a packet or chain is timed out. T default value is **60**. Change takes effect immediately.
Assembler Timeout Session	Specifies the number of seconds before a session is timed out. Default value is **60**. Change takes effect immediately.
Capture Autostart	Specifies whether capture begins automatically each time Decoder is started. When checked, the value = yes. When unchecked, the value = no. The default value is **no**. Change takes effect immediately.
Capture Buffer Size	The capture memory buffer allocation in Megabytes. Default value is **64 MB**. Change takes effect on service restart.
Parse Maximum Bytes	The maximum number of bytes to scan a stream for additional tokens. When the first token is found, the stream is scanned up to the set number of bytes, but no further. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **128 KB**. Change takes effect immediately.
Parse Minimum Bytes	The minimum number of bytes to scan a stream for the first token. If no token is found within the set number of bytes, scanning is terminated. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **1 KB**. Change takes effect immediately.

Capture Settings Parameter	Description
Parse Threads	The number of parse threads to use for session parsing. A value of **0** means let the server decide. The default value is **0**. Change takes effect on service restart.

Database Max File Sizes Section

The Database Max File Sizes section controls the maximum file size for various databases. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

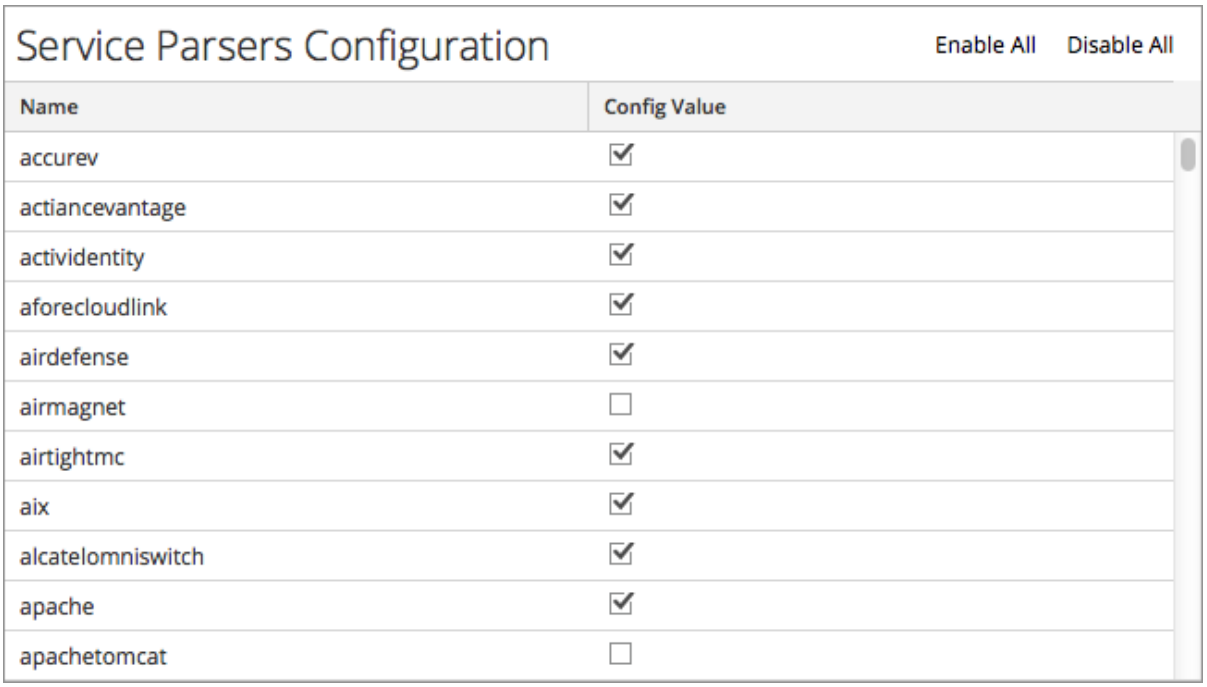
File Size Parameter	Description
Meta File Size	The maximum size of meta database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Packet File Size	The maximum size of packet database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Session File Size	The maximum size of session database files in Megabytes. The default value is **100 MB**. Change takes effect on service restart.



Hash Section

The Hash section settings control data base file hashing options. There is a small performance penalty when hashing.

Hash Parameter	Description
Hash Directory	The server directory where all hash files are written. If empty, each hash file is written to the same directory as the file being hashed. The default value is blank. Change takes effect on service restart.



Parsers Configuration Panel

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. See Enable and Disable Parsers and Log Parsers for detailed information and procedures.

Service Parsers Configuration Section for Log Decoder

The Service Parsers Configuration section provides a way to select Service parsers to use on the Log Decoder.

Service Parsers Configuration
Enable All
Disable All
Name
Config Value

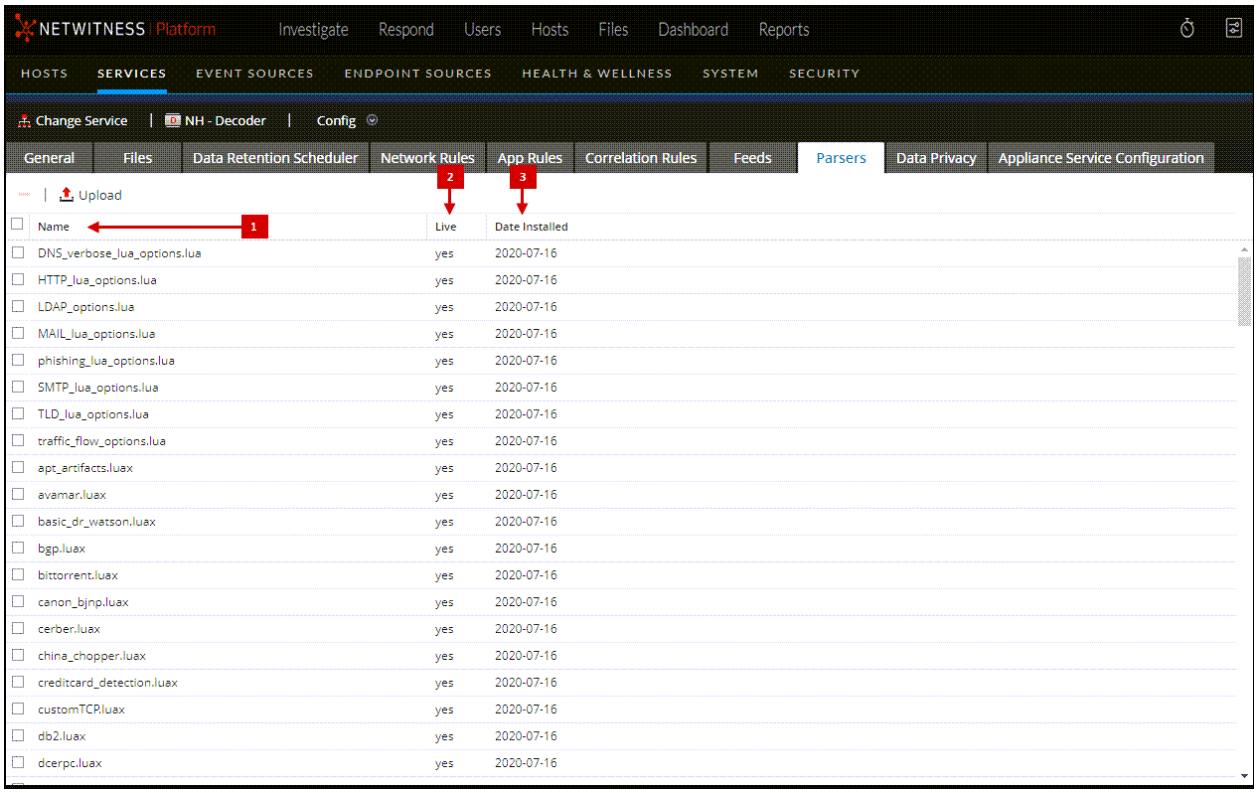
Services Config View - Parsers Tab

In the Services Config View > Parsers tab, you can view deployed parsers on a Decoder or Log Decoder, upload parsers, and delete deployed parsers. Parsers can be added and removed while a Decoder or Log Decoder is running without affecting capture.

To access the Parsers tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Parsers** tab.

What do you want to do?



User Role	I want to...	Documentation
Administrator	View deployed parsers.	Enable and Disable Parsers and Log Parsers
Administrator	Upload parsers to a Decoder or Log Decoder.	Enable and Disable Parsers and Log Parsers

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Upload and Delete Custom Parsers

Quick Look

This is an example of the Parsers tab. The Parsers grid lists all parsers that are currently deployed on the Decoder.

1 **Name**: The name of the parser or the parser file.

2 **Live**: Indicates if the parser originated from Live. Possible values are **Yes**, **No**, or **N/A**.

- **Yes** = Installed through Live Services.
- **No** = Installed through NetWitness.
- **N/A** = The parser has no attributes file created by NetWitness to track the installation date. The parser may have been installed manually, not through NetWitness or Live Services.

3 **Date Installed**: The date the parser was pushed to the service.

Parsers Tab Toolbar

The Parsers Tab toolbar has options to work with parsers in the grid.

Feature	Description
Upload	Enables you to upload parsers to a Decoder or Log Decoder.
−	Requests confirmation that you want to delete the selected parsers. You can select **No** to cancel the deletion, or select **Yes** to delete the selected parsers.

Services Config View - Parser Mappings Tab

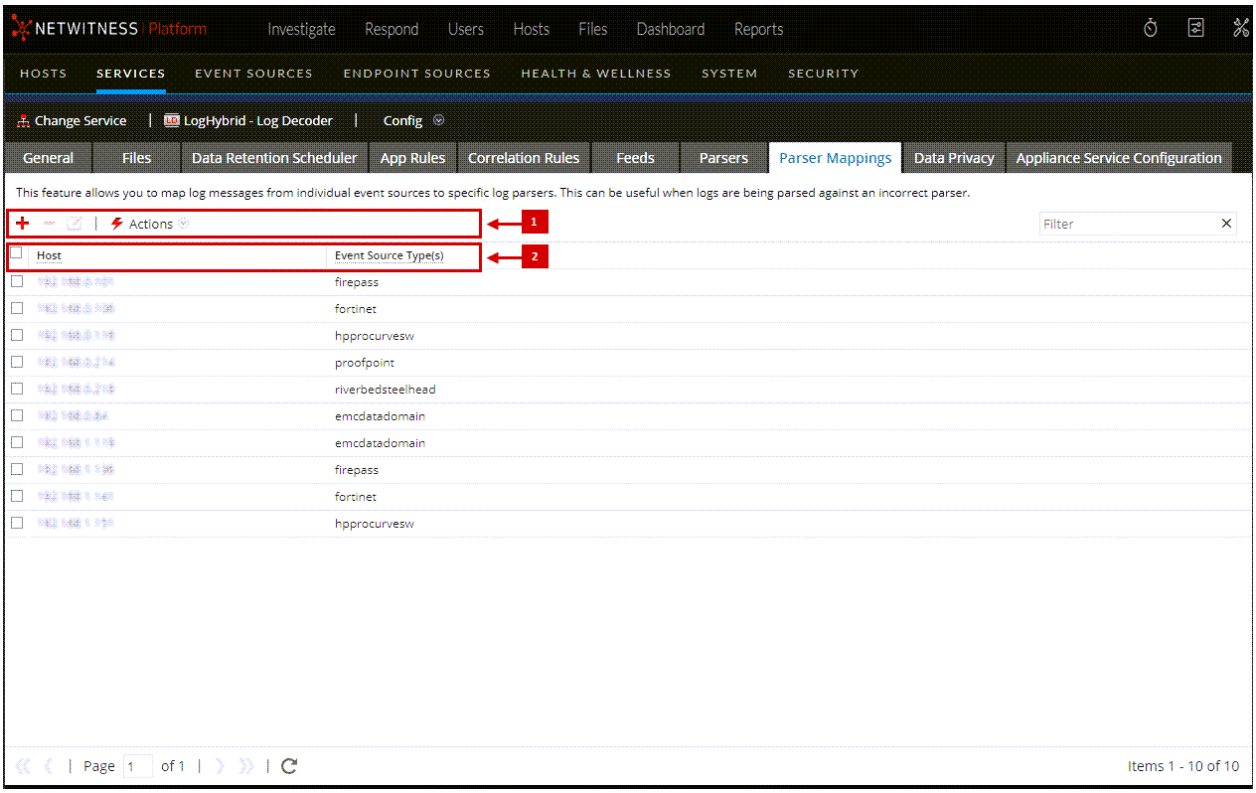
This topic provides a description of the configurable options for a Log Decoder in the Parser Mappings tab.

In the Parser Mappings Administrators can configure log parser mappings for Log Decoder services. To access the Parser Mappings tab, go to  (Admin) > **Services** > select a Log Decoder service and click  > **View** > **Config** > **Parser Mappings** tab.

Note: You can also configure log parser mappings for Log Decoder services by navigating to **Admin > Services > Event Sources > Discovery**.

This feature is intended to track a subset of event sources that is parsing against the wrong parser.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Manage IPs for Event Source Mapping.	Enable Parser Mappings

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the tab.

1 Parser Mappings Toolbar - Provides options to work with parser mappings in the list
2 Parser Mappings List - Lists all parsers that are currently mapped on the Log Decoder

Parser Mappings Toolbar

The Parser Mappings toolbar has options to work with parser mappings in the grid.

Feature	Description
	Add a parser mapping.
	Delete the selected parser mapping.
	Edit a parser mapping.
	Refresh the list of parser mappings.
	Display the Actions menu. • **Import** - Import a parser mapping to a file. • **Export** - Save a parser mapping to a file.

Parser Mappings List

The Parser Mappings list displays all parsers that are currently mapped on the Log Decoder.

Parameter	Description
Host	Displays the IP address of the host.
Event Source	Displays the event sources that are parsing incorrectly.

Parser Mappings Editor Dialog

The Parser Mappings Editor dialog allows you to update an IP to event source mapping.

To access the Parser Mappings Editor dialog, in the Services Config view for a Log Decoder, select the Parser Mappings tab.

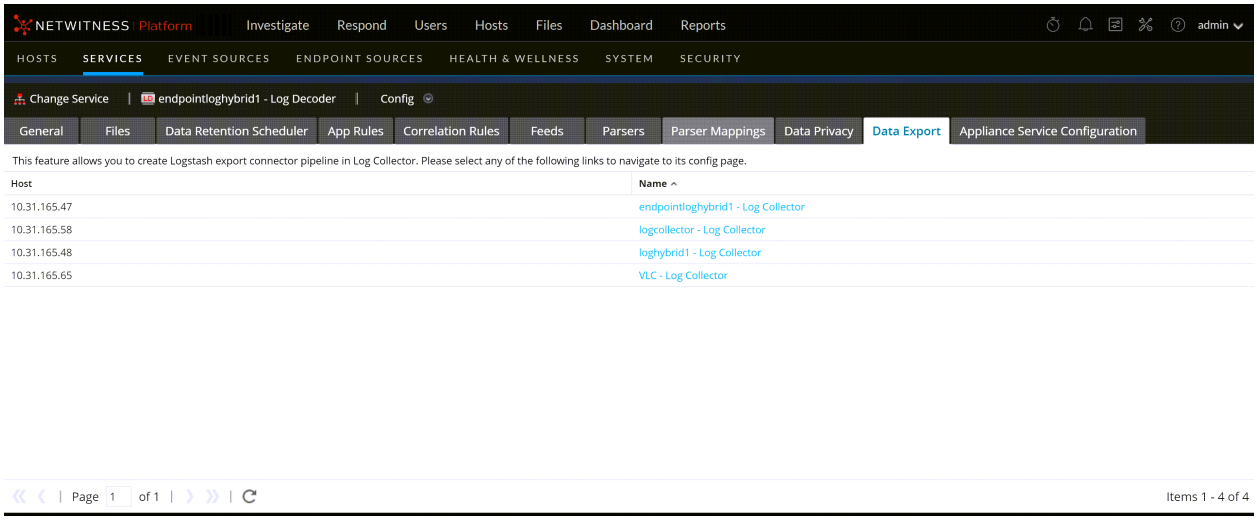
Data Export Tab

The Data Export tab (**Admin** > **Services** > select a Decoder or Log Decoder and click > **View** > **Config** > **Data Export** tab) exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object by configuring the export connector through Logstash.

Prerequisites

Make sure you have log collector service to configure Logstash in the UI.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Configure Export Connector	Configure Logstash Event Sources in NetWitness

Related Topics

- Decoder and Log Decoder Quick Setup

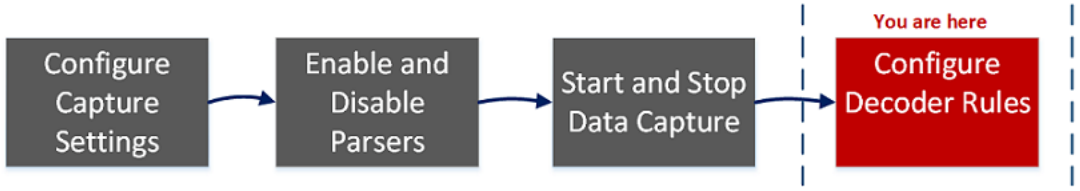
Quick Look

The following figure shows an Data Export tab.

The data export list displays all the Log Collectors in your deployment.



Parameter	Description
Host	Displays the IP address of the host.
Name	Displays the name of the Log Collector.

Services Config View - Rules Tabs

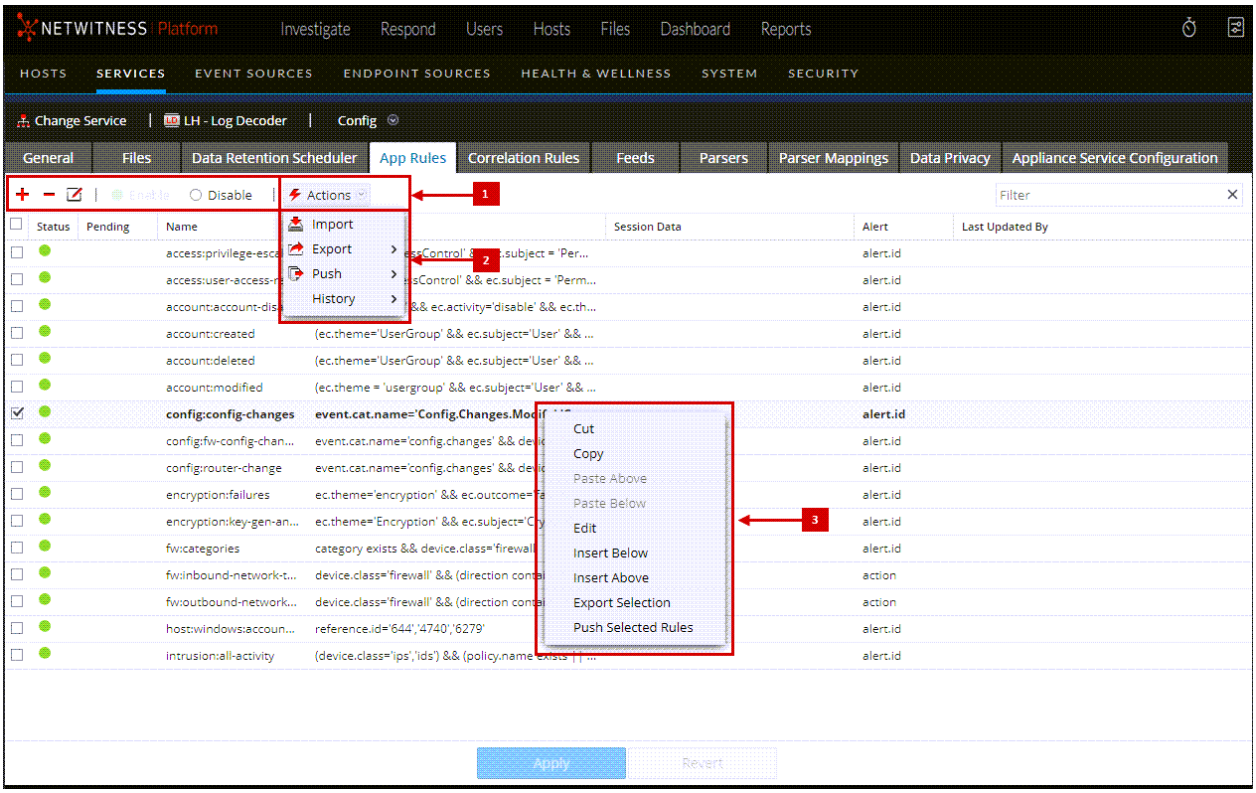
The Rules tabs in the Services Config view (**(Admin) > Services >** select a service and click **> View > Config**) enable you to define and manage capture rules. Each type of rule has a list with slightly different columns and different parameters in the Rule Editor dialog. Application and correlation rules apply to both Decoders and Log Decoders. Network rules apply only to Network Decoders.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules*	Configure Decoder Rules
Administrator	import, export, or push a rule*	Configure Decoder Rules
Administrator	enable or disable a rule*	Configure Decoder Rules
Administrator	add, edit, or delete a rule*	Configure Decoder Rules



*You can complete these tasks here.

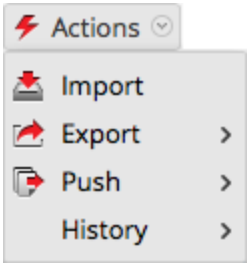
Quick Look

This is an example of the App Rules tab.

1 Rules Tab Toolbar - Provides options to work with rules in the list
2 Rules Actions Menu - Provide options to manage sets of rules
3 Rules List Context Actions - Displays the Rules List Context Menu

Rules Tab Toolbar

The toolbar is the same for all Config view > Rules tabs.



Feature	Description
Actions	Displays the **Actions** menu.
+	Adds a new rule to a service.
−	Deletes a rule from a service.
	Allows rule modification.
Disable	Disables a rule (without deleting the rule).
Enable	Enables (reactivates) a rule.

Feature	Description
Filter	The input field for a search string. NetWitness filters the rules dynamically as you type a search string. Clicking **x** clears the input field, restoring the unfiltered view.
Apply	Saves the changes made to rules and applies the configured rules to a service. Until you apply changes, it is possible to reload the rules as they were before current modifications.
Revert	Discards unsaved changes to the list and reverts to the unedited rules.

Rules Actions Menu

The Actions menu has options that help to manage sets of rules.

Option	Description
Import	Imports a set of rules into the user interface so that it can be applied to a service. You can edit the rules before applying.
Export	Saves selected rules or all rules to an .nwr file on the client machine.

Push	Allows rules to be applied to other services (Decoders or Log Decoders) or Decoders belonging to a service group. When pushing, the rules can either be merged (update existing rules and append new ones) or replaced.
	• **Push > All.** Pushes all rules to other services. All rules on the target services are removed and replaced with all of the rules on the source service.
	• **Push > Selection.** Pushes selected rules to other services. You have two options:
	  • **Replace.** Deletes all rules on the target services and replaces them with the selected rules from the source service.
	  • **Merge.** Merges the selected rules with the existing rules on the target services

History	Displays the last ten snapshots of rules applied through NetWitness. You can select and apply (restore) a snapshot to the Decoder at anytime.

Rules List Context Actions

Within a rules list, right-clicking a row displays the Rules list context menu.

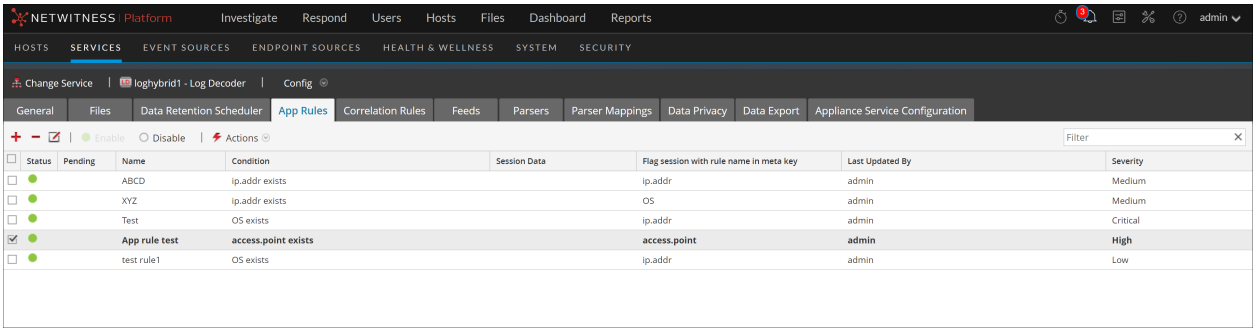
Option	Description
Cut	Deletes the current rule.

Option	Description
Copy	Copies the current rule.
Paste Above	Pastes the copied rule above the current rule.
Paste Below	Pastes the copied rule below the current rule.
Edit	Edits the current rule.
Insert Below	Inserts imported rules below the current rule.
Insert Above	Inserts imported rules above the current rule.
Export Selection	Exports the selected rules.
Push Selected Rules	Pushes the selected rules to other services.

App Rules Tab

The App Rules tab (**(Admin) > Services >** select a Decoder or Log Decoder and click > **View > Config > App Rules tab**) enables you to manage application rules. NetWitness applies application rules at the session level.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add or edit application rules	Configure Application Rules

Related Topics

- Decoder and Log Decoder Quick Setup

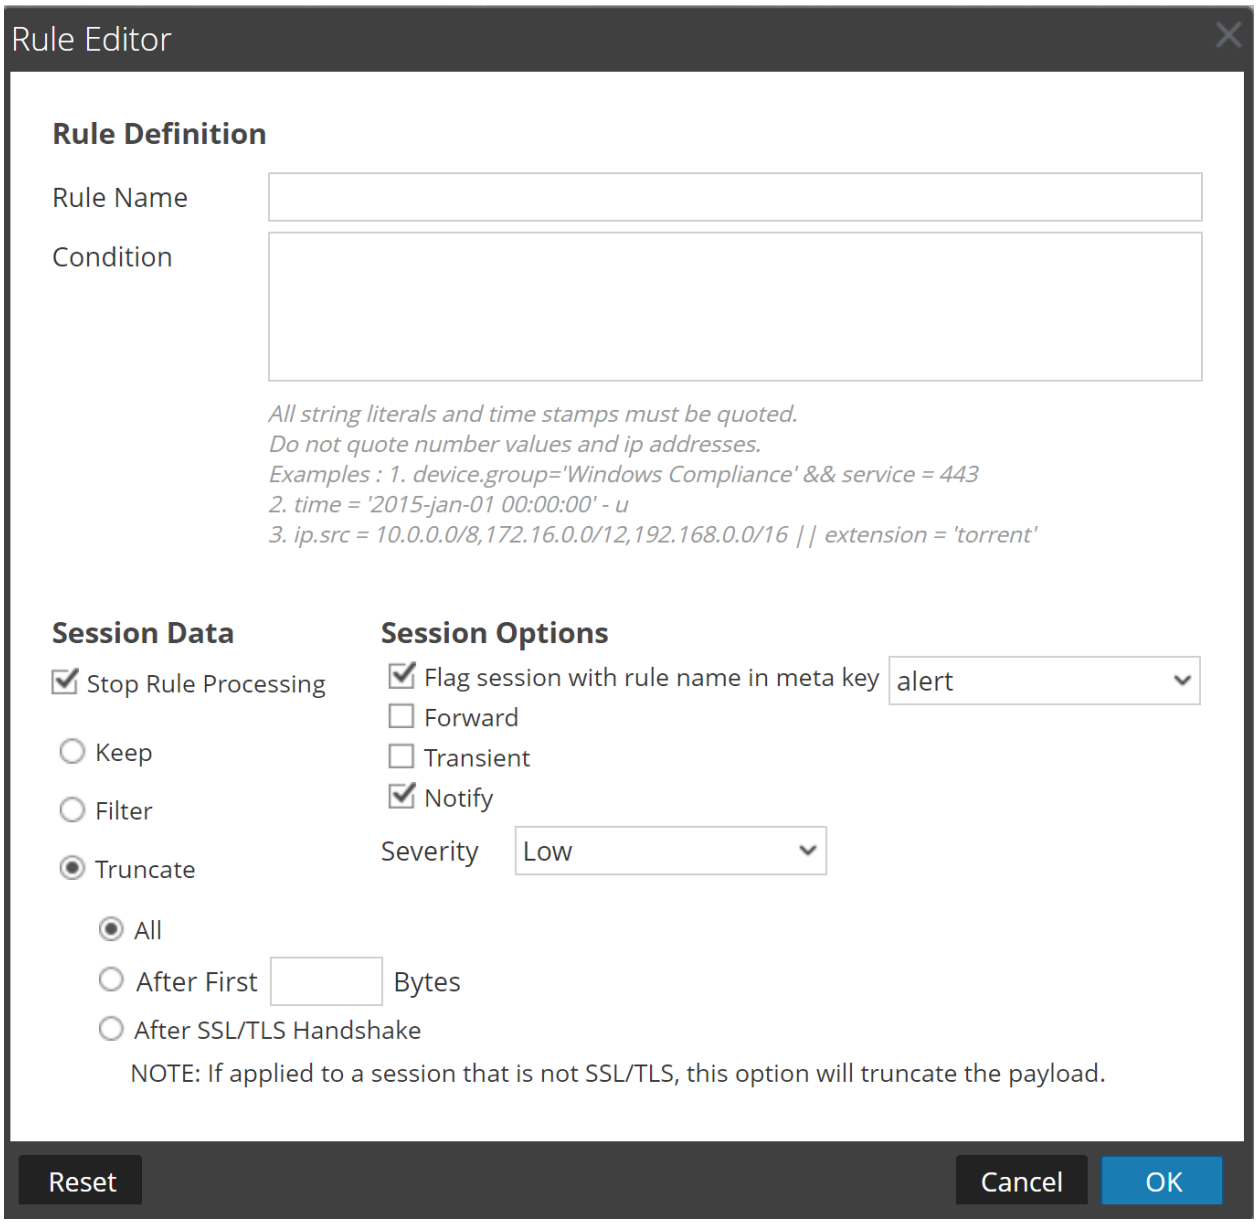
Quick Look

The following figure shows an App Rules tab and the table describes the columns.



Column	Description
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.

Column	Description
Session Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.
Flag session with rule name in meta key	This column displays the name of the custom alert that the Decoder generates when metadata matches the rule.
Last Updated By	This column displays the user ID of the user who as last updated the rule.
Severity	This column displays the severity of the rule. The available options are **Low**, **Medium**, **High** and **Critical**.

Rule Editor Dialog

The following figure shows the Rule Editor dialog for an application rule.

The Rule Editor dialog provides the fields and options needed to define an application rule.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

The following table describes the Session Data actions and options.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved in accordance with the session action. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated metadata are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	**Truncate All** – truncates all session payload bytes. The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained. This is the default truncation option. **Truncate After First <n> Bytes** – truncates the session payload bytes after the specified first <n> bytes, where <n> is an integer. The packet payload is not saved after <n> bytes when it matches the rule, but packet headers and associated metadata are retained. **Truncate SSL/TLS After Handshake** – truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.
Flag session with rule name in meta key	If checked, generates a custom alert when metadata matches the rule. You can select the metadata of the alert in the drop-down list.
Forward	Enables the performance of syslog forwarding when the log matches the rule.
Transient	Prevents the alert metadata that is created from being written to the disk.
Notify	Enable the option to select the **Severity** level for the application rule. The available options are **Low**, **Medium**, **High**, and **Critical**.

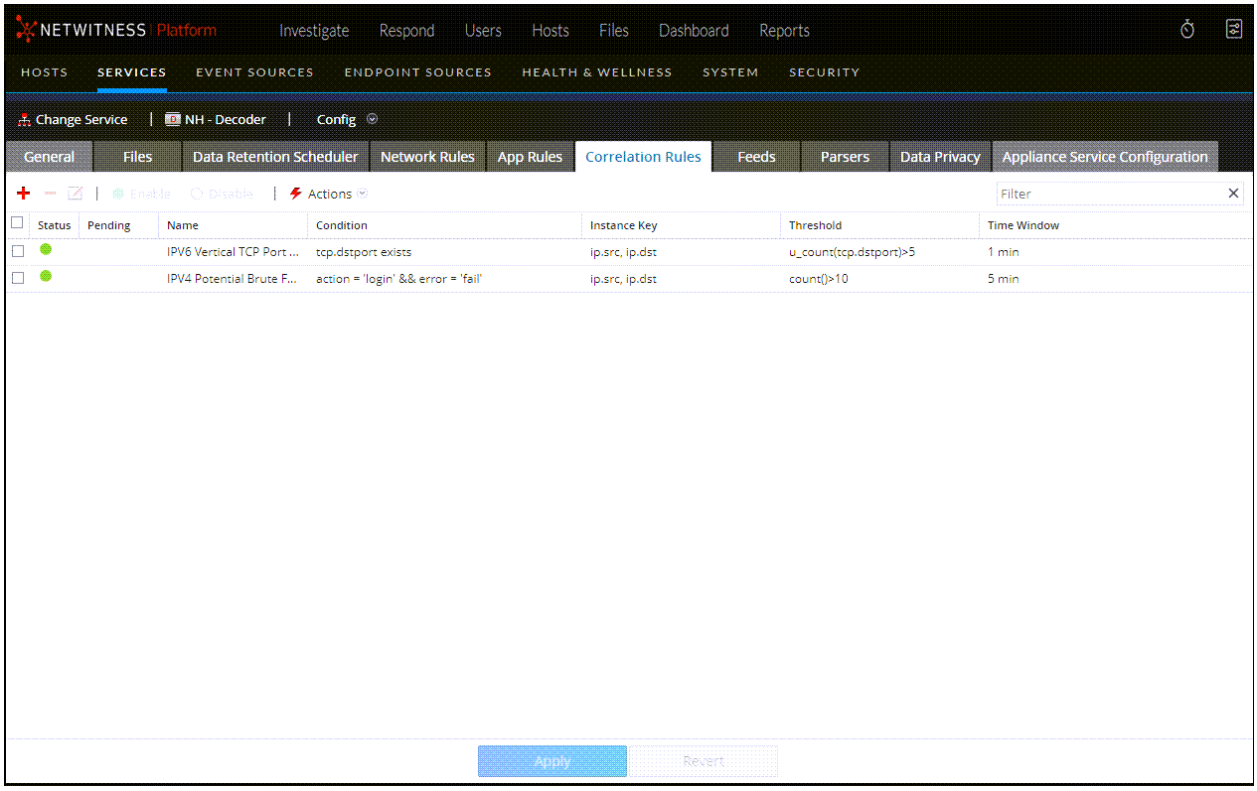
The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Correlation Rules Tab

The Correlation Rules tab (**(Admin) >** select a service and click **> View > Config > Correlation Rules tab**) enables you to manage correlation rules. Basic correlation rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add or edit a correlation rule	Configure Correlation Rules

Related Topics

Quick Look

The following figure shows the Correlation Rules tab.

The following figure shows the Rule Editor dialog for a correlation rule.

The following table describes the Correlation Rules tab columns.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the descriptive name for the rule.
Condition	This is the definition of the condition that triggers an action when matched. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
Instance Key	This is the target indicator to base the event upon. It can be a single primary key, such as ip.src or a compound primary key such as `ip.src,ip.dst`.
Threshold	This is the minimum number of occurrences required to trigger a correlation session and can include a associated key that identifies the meta type that were are counting to determine if the condition is satisfied. The correlation engine cannot use IPv4 or IPv6 as an associated meta type. Use one of these three arguments: • `u_count(associated_key)` = the count of unique values of the specified key. A key is required. • `sum(associated_key)` = the values of the specified key. a key is required. • `count()` = number of sessions, no associated key used. If included, it is ignored.
Time Window	This is the duration in hours, minutes, or seconds within which the threshold must be reached to trigger a correlation session.

Column	Description
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

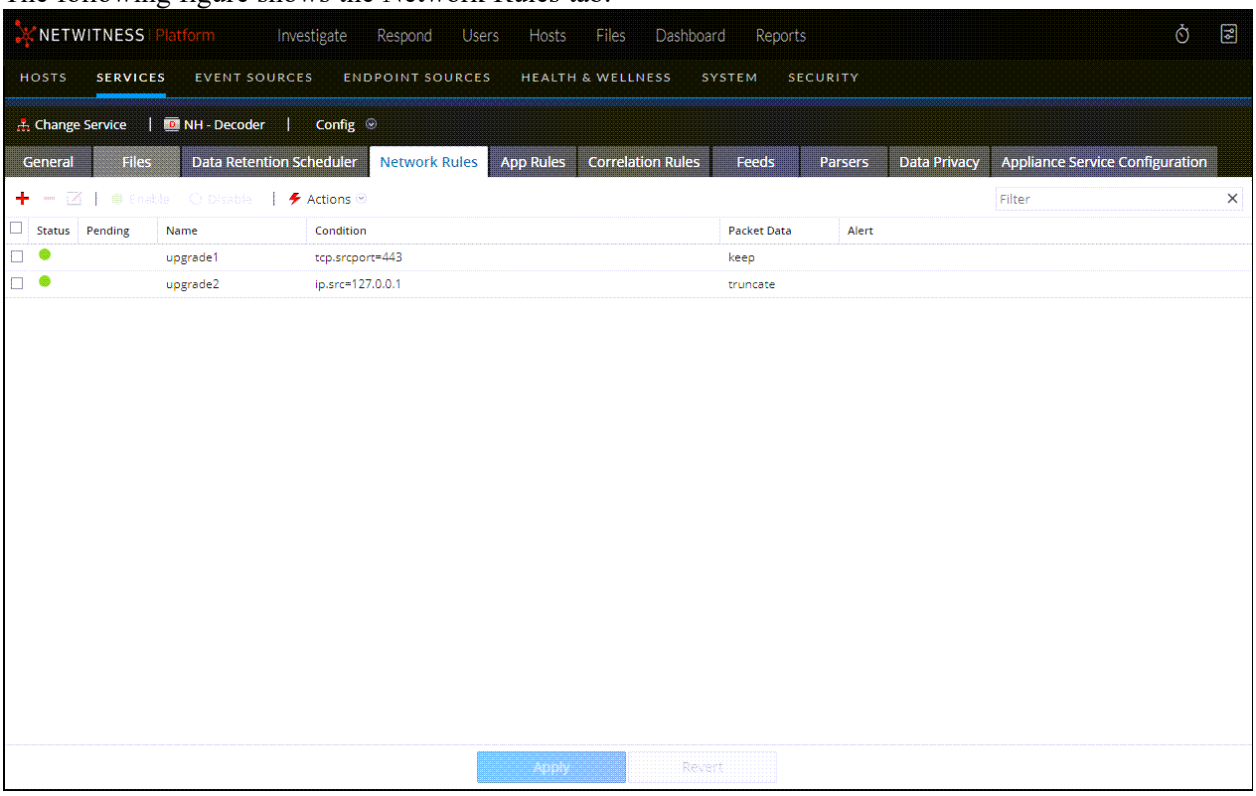
The **Rule Editor** dialog provides the fields and options needed to define a network rule. The fields correspond exactly to the grid columns.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor Dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor Dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Network Rules Tab

The Network Rules tab (**(Admin) > Services >** select a Decoder and click **> View > Config > Network Rules tab**) enables you to manage network rules. NetWitness applies network rules at the packet level. Network rules consist of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules apply only to Network Decoders.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add, edit, or fix network rules	Configure Network Rules

Alert	This column indicates whether the Decoder generates a custom alert when metadata matches the rule. Possible values are **Enabled** or **Disabled**.

The **Rule Editor** dialog provides the fields and options needed to define a network rule.

The following table describes the Rule Definition fields.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. This section also describes the meta keys that NetWitness supports for use in network rule conditions.

The following table describes the Session Data actions.

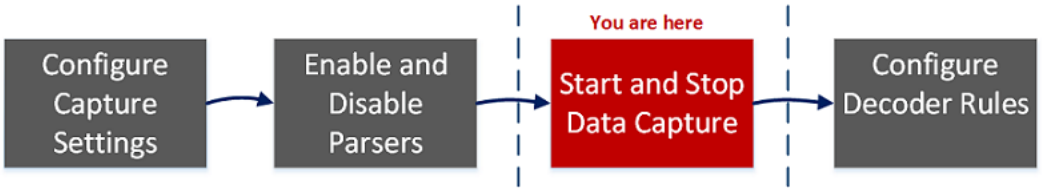
Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved as indicated. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated meta are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.

The following table describes the session options.

Action	Description
Assemble	If checked, the assembler assembles the packet chain when it matches the rule.
Network Meta	The packet generates network metadata when it matches the rule.
Application Meta	The packet generates application metadata when it matches the rule.
Alert	The packet generates a custom alert when metadata matches the rule.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.



Services System View - Decoders

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

To reach the Services System view, go to **(Admin) > Services >** select a Decoder or Log Decoder > > **View** > **System**.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture*	Start and Stop Data Capture
Administrator	upload packet capture and log files*	Upload a Log File to a Log Decoder Upload a Packet Capture File
Administrator	reset log stats, perform host tasks, shutdown the service, shutdown the appliance service, and reboot the host*	*Hosts and Services Getting Started Guide*
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

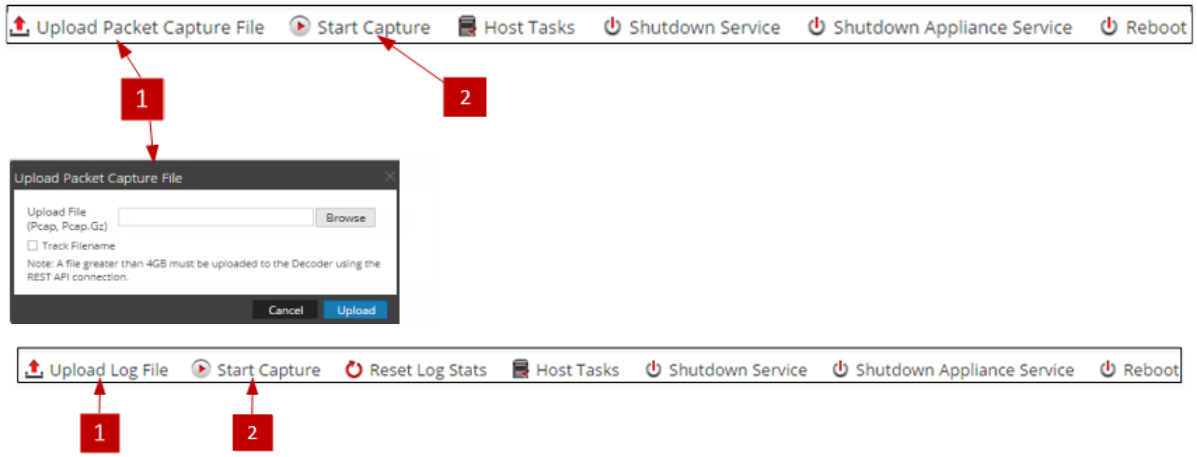
Quick Look

This is an example of the Services System view for a Decoder.



This is an example of the Services System view for a Log Decoder.

Service Info Toolbar

These two toolbars illustrate the options specific to Decoders and Log Decoders.

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see Upload a Packet Capture File. **Note:** This option does not apply to Log Decoders.
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see Upload a Log File to a Log Decoder.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

The Basics

This guide describes the basic requirements of a NetWitness deployment and outlines optional scenarios to address the needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on NetWitness Community Link. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

There are many factors you must consider before you deploy NetWitness. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors:

- The size of your enterprise (that is, the number of locations and people that will use NetWitness)
- The volume of network data and logs you need to process
- The performance each NetWitness user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness
  - RSA Physical Hosts (software running on hardware supplied by RSA)
  - Software Only provided by NetWitness:
    - On-Premises (On-Prem) Virtual Hosts
      See the *NetWitness Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *NetWitness AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *NetWitness Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.
      - Google Cloud Platform (GCP)
        See the *NetWitness Google Cloud Platform Installation Guide* for detailed instructions on how to deploy virtual hosts in Google Cloud.

Basic Deployment

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

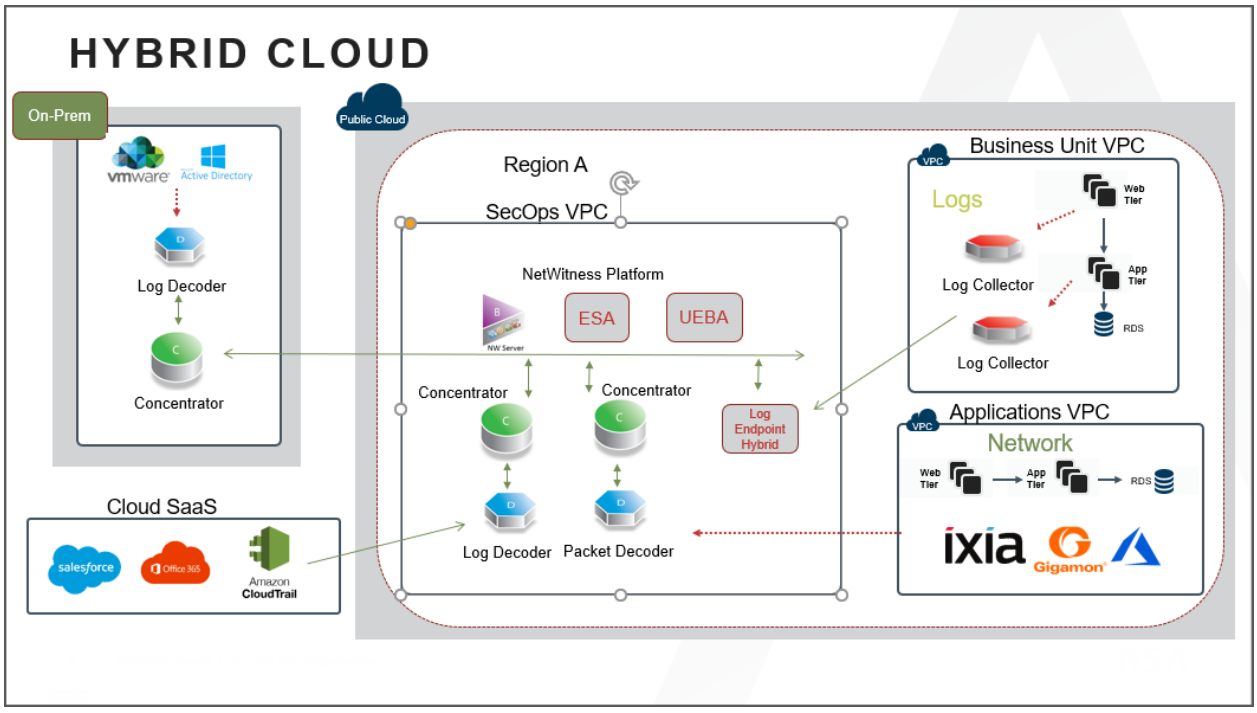
- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the NetWitness Hardware Setup Guides and the *NetWitness Physical Host Installation Guide*.
  2. Set up licensing for NetWitness as described in the *NetWitness Licensing Guide*.
  3. Configure individual physical hosts and services as described in *NetWitness Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *NetWitness Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *NetWitness AWS Installation Guide*.
- For Azure, follow the instructions in the *NetWitness Azure Installation Guide*.
- For Google Cloud, follow the instructions in the *NetWitness Google Cloud Platform Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagrams

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log, and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Deployment Optional Setup Procedures

You can deploy NetWitness with the following options.

Analyst User Interface
Group Aggregation
New Health and Wellness Search
Hybrid Categories on Series 6 (R640) Hardware
NW Server Deployment on ESA Hardware
Second Endpoint Server
Warm Standby NW Server

Analyst User Interface

The Analyst User Interface (UI) gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).

You can have can have multiple Analyst UI instances provisioned in the same manner as the other NW component hosts.

Features and Limitations

Each Analyst UI host:

- Can be deployed to specific organizational groups. For example: the Americas, EMEA, APAC, Tier 1 Analysts, Tier 3 Analysts.
- If Analyst UI hosts are deployed regionally, you have the capability of querying those regional brokers directly (less latency), instead of than having to route through the Primary UI.
- Helps distribute load off the Primary UI.
- Has its own Reporting Engine (RE).
- If it becomes unavailable for any planned or unplanned reason, it will not affect the Primary UI or any other Analyst UI instances.
- Provides the same pre-query filter verification, Data Privacy protection, and RBAC functionality as the Primary UI.
- Points back to the primary NW Server for authentication and configuration.
- Does not have access to any administrative functions. All administration functions take place on the Primary UI.
- Does not allow you to create or manage Content (that is, ESA rules, app rules, feeds). All Content creation and management takes place on the Primary UI.

Use Case

Large environments that include Geo distribution with a single data center and multiple NW Servers require Analyst UI instances in all their NetWitness locations or managed entities.

For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary user Interface (Primary UI).

Deployment

You must install the **Analyst UI** service category on a dedicated host and you install it in the same manner as any component service category on a host.

See the "Task 2 - Install 11.7 on Other Component Hosts" in the NetWitness Platform Installation Guides for instructions on how to install any component service. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

After you provision the Analyst UI host (that is after you run the nwsetup-tui for the component host designated for the Analyst UI), complete the following steps to install the Analyst UI service category on the provisioned host.

1. Log in to **NetWitness** and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **Analyst UI**) and click 

   .
   The **Install Services** dialog is displayed.

4. Select **Analyst UI** in **Category** and click **Install**.

5. Configure NetWitness Platform for each Analyst UI instance.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   a. Make sure that each Analyst UI instance is connected to the correct local Reporting Engine and has the appropriate Investigation parameters set. The *Getting Started Guide for NetWitness Platform* describes the default Analyst UI Dashboard and how you manage dashboards.

   Note: You must add data sources to each Reporting Engine instance to execute Reports and Charts on an Analyst UI. See "Configure the Data Sources" in the*Reporting Engine Configuration Guide for NetWitness Platform* for instructions.

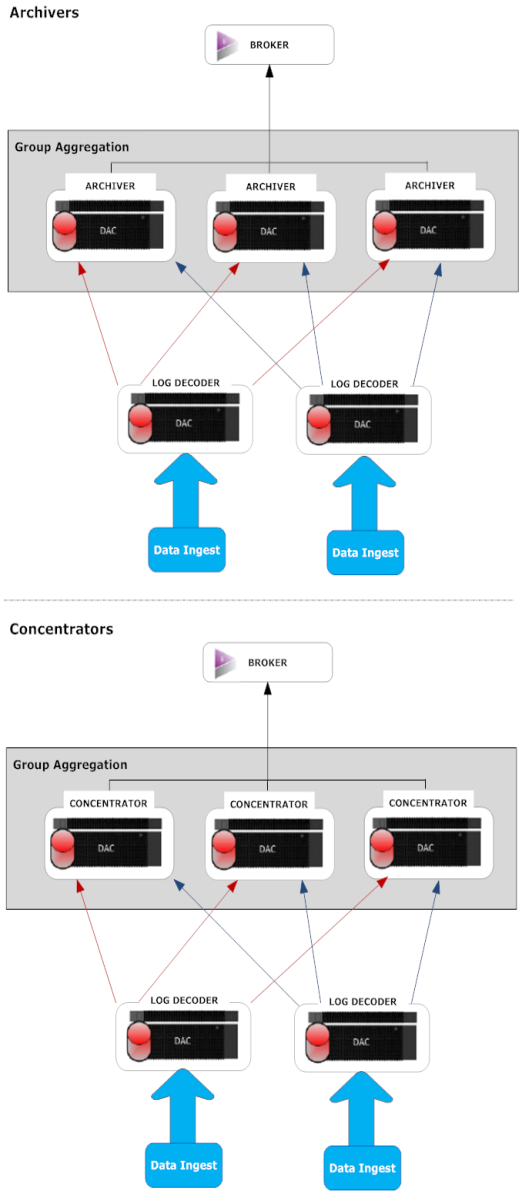
b. Configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization. "Configure Analyst UI for Respond Server Alert Normalization" in the *NetWitness Respond Configuration Guide for NetWitness Platform* tells you how to configure Respond Server alert normalization for the Analyst UI.

Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

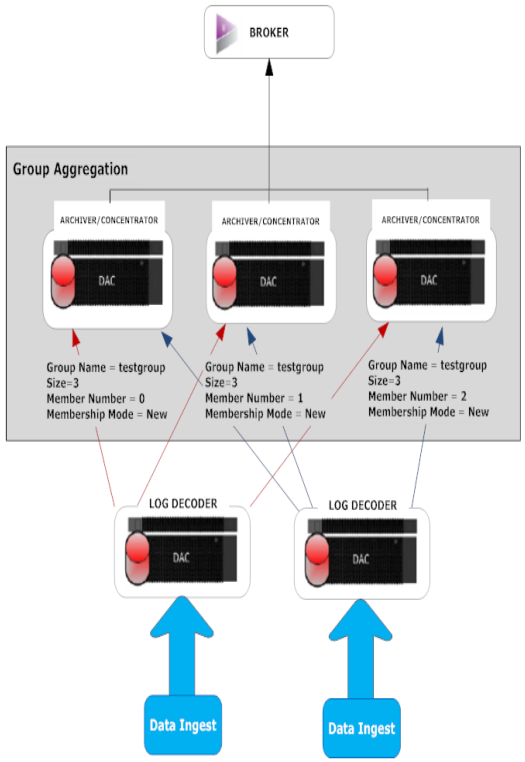
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



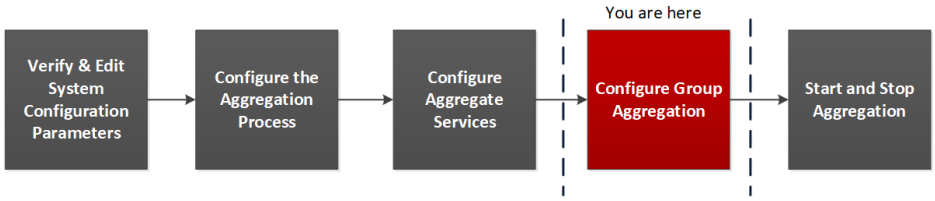
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

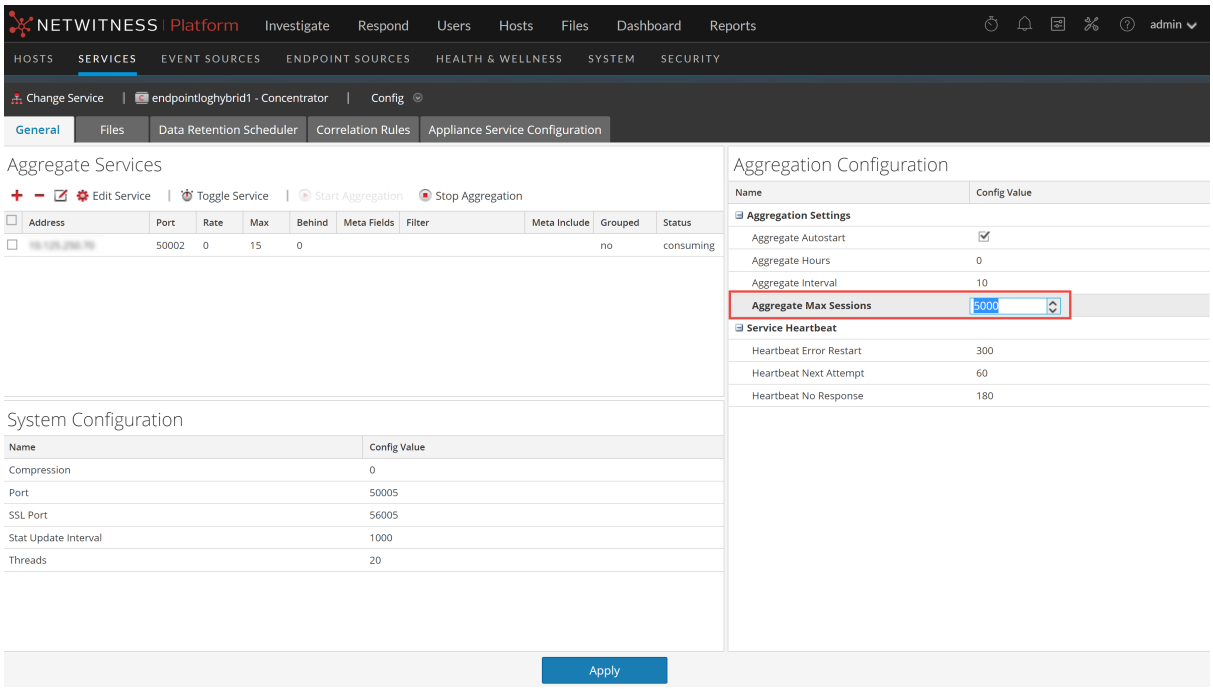
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

New Health and Wellness

New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.

System Requirements

The following tables list the memory, disk, and CPU recommended for the New Health and Wellness based on the size of the deployment.

Note: The recommended values might differ when you install and try the new features and enhancements.

Caution: If the New Health and Wellness node is on a different subnet, you must open the respective NetWitness Platform hosts port. For more information, see "New Health and Wellness on Different Subnet" section in the Network Architecture and Ports.

Standalone Virtual Host

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of New Health and Wellness metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

Physical Host

Deployment Size	Memory	CPU	DISK per day
Small (~5-10 hosts / 20-40 services)	16 GB	15%	1.5 GB
Medium (~150-200 hosts / 300- 400 services)	18 GB	15%	29 GB
Large (~250-300 hosts / 500-600 services)	22 GB	15%	44 GB

Based on the resources available, you can deploy the 11.7 New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)

- Physical host:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts in your deployment to start sending metrics to monitor New Health and Wellness. After you deploy New Health and Wellness , see the "Monitor New Health and Wellness " topic in the *System Maintenance Guide* for instructions on how to configure and use this feature.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@netwitness.com.

After you provision the New Health and Wellness host, complete the following steps to install the **New Health and Wellness** service category on the provisioned host.

1. Log in to NetWitness and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   Note: If you are not installing New Health and Wellness on a standalone virtual host ignore step 2.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
3. Select that host on which New Health and Wellness should be installed in the **Hosts** view (for example, **New Health and Wellness**) and click 

.

The **Install Services** dialog is displayed.

4. Select **New Health and Wellness** in **Category** and click **Install**.
5. Refresh all hosts to write to elastic search.
   a. SSH to the NW Server host.
   b. Run the following commands.
      `nw-manage --refresh-host --host-all`
      This may take few minutes for the changes to take effect based on the number of hosts in your deployment.

Note: (For Standalone Virtual host only) After you review your initial datastore configuration, you may determine that you need to add a new volume. For information on adding a new volume see “Add New Volume and Extend Existing File Systems” topic in the *Virtual Host Installation Guide*.

Note: After you have installed New Health and Wellness, for some reason, if you want to uninstall New Health and Wellness, you must refer to "Uninstall New Health and Wellness" in the *Upgrade guide*.

Hybrid Categories on Series 6 (R640) Hardware

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.

NW Server Deployment on ESA Hardware

You now have the option to deploy the NW Server host on Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.

Note: You can install the NW Server on ESA hardware, but you cannot co-locate any ESA services (categories) with the NW Server on this hardware.

Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - For a virtual host, complete steps 1 to 6 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

     Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   ```
   mkdir -p /etc/pki/nw/nwe-ca
   ```

   Note: You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   ```
   /etc/pki/nw/nwe-ca/nwerootca-cert.pem
   /etc/pki/nw/nwe-ca/nwerootca-key.pem
   ```
5. nstall Endpoint on the host.
   a. Log in to NetWitness Platform and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

      Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

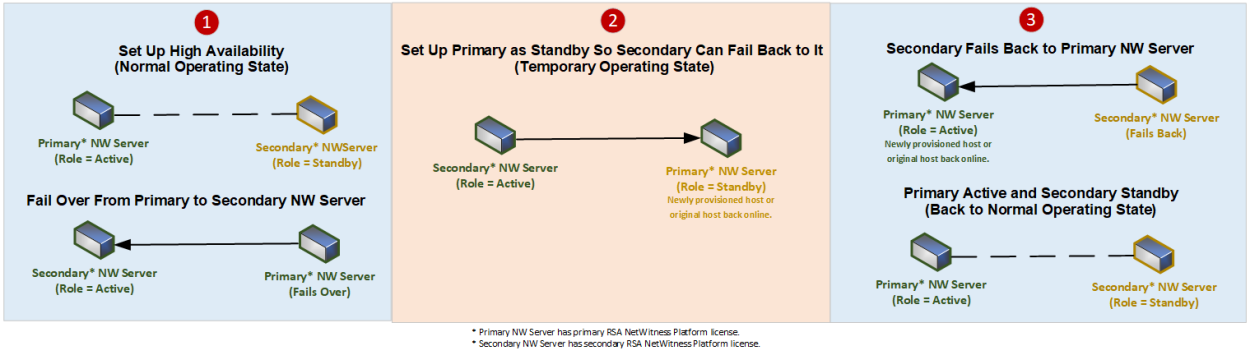
   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 

.
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

Warm Standby NW Server Host

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server host to increase reliability.



A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

In version 11.5 and later, we support a secondary NW Server that has a different IP address from the primary NW Server. Having the same IP address for both the primary NW Server and secondary NW Server is no longer necessary.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.

Note: When you set up the secondary NW Server, follow the same administrative procedures, for example, for upgrade and maintenance, as the procedures for the primary active NW Server.

Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability:

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact NetWitness Customer Support to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

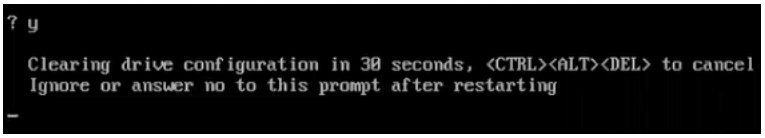
Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact NetWitness Customer Support to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

Set Up Secondary NW Server in Standby Role

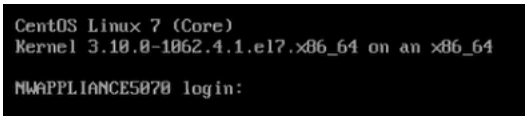
1. Before you install a secondary NW Server host for the standby role, make sure that:
   a. The primary NW Server is running 11.7.
   b. All component hosts are running 11.7
      If you are:
      - Installing NetWitness Platform 11.7, follow the instructions in the *NetWitness Platform Physical Host Installation Guide for Version 11.7*.
      - Updating from 11.x to 11.7, follow the instructions in *NetWitness Platform Update Guide for Version 11.x to 11.7*.
        Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
      See the *NetWitness Platform Build Stick Instructions* for more information.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *NetWitnessBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to NetWitness Platform 11.7** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install NetWitness Platform 11.7** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

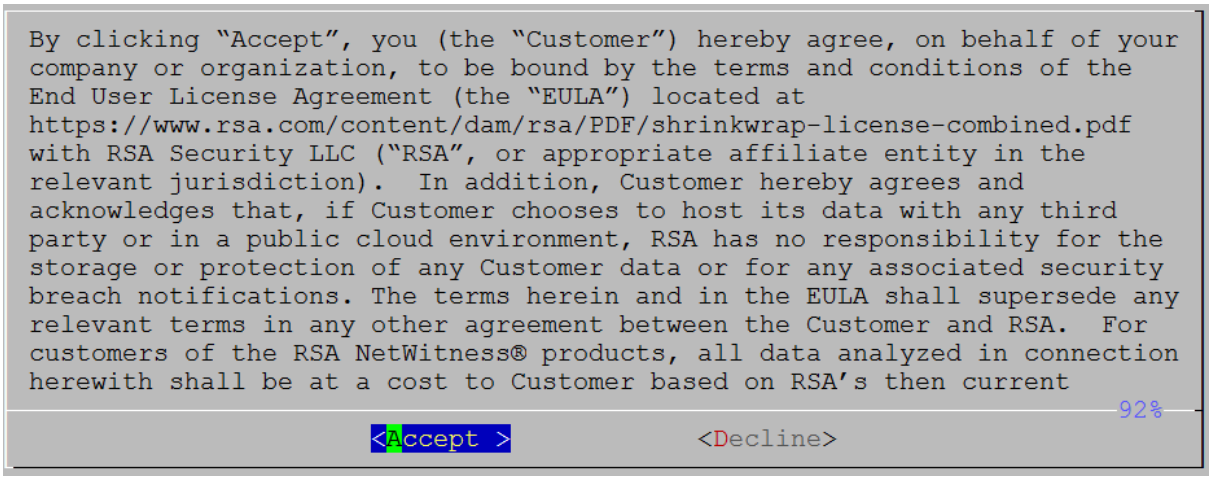


Caution: You must respond y or Y to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

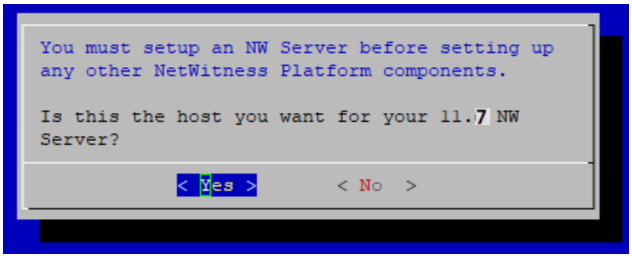
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.

The system displays the all installation tasks it is performing. This can take a minute or so.After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



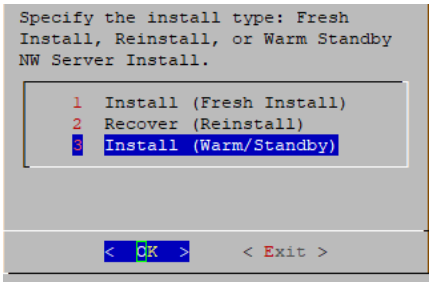
f. Log in to the host with the `root` credentials.



2. Run the `nwsetup-tui` command.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

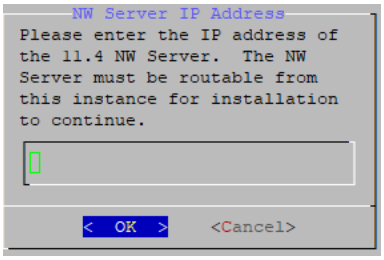
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



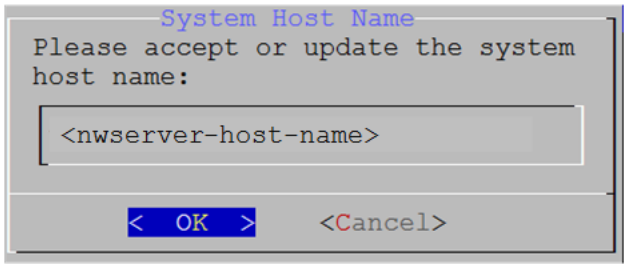
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Recover** prompt is displayed.



5. Tab to **3 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.



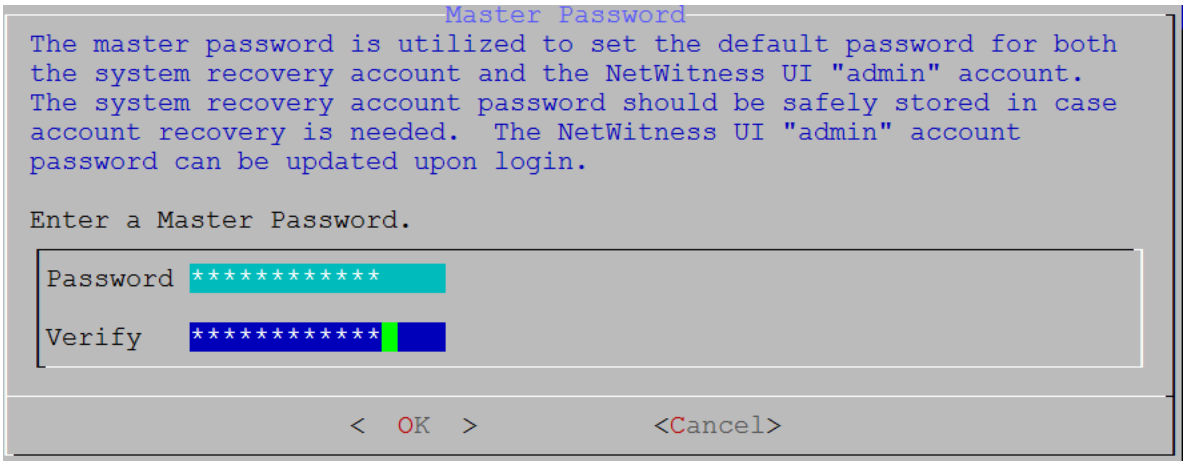
6. Tab to:

   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

     The NW Active Server IP Address prompt is displayed.

7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed

Caution: If you include "." in a host name, the host name must also include a valid domain name.



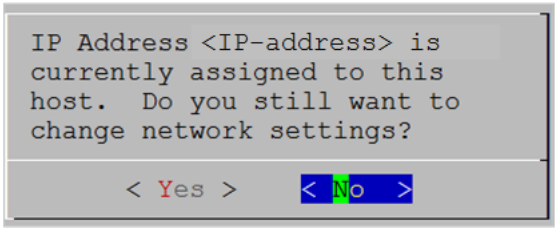
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   Note: You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : .< > -



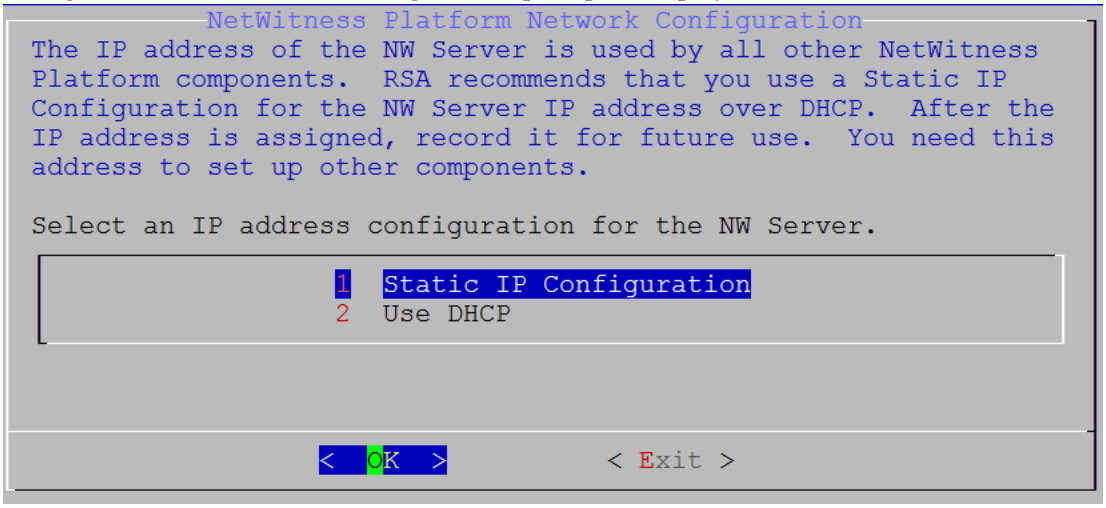
9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.

10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

    - If the Setup program finds a valid IP Address for this host, the following prompt is displayed.

      Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

    - If you are using an SSH connection, the following warning is displayed.



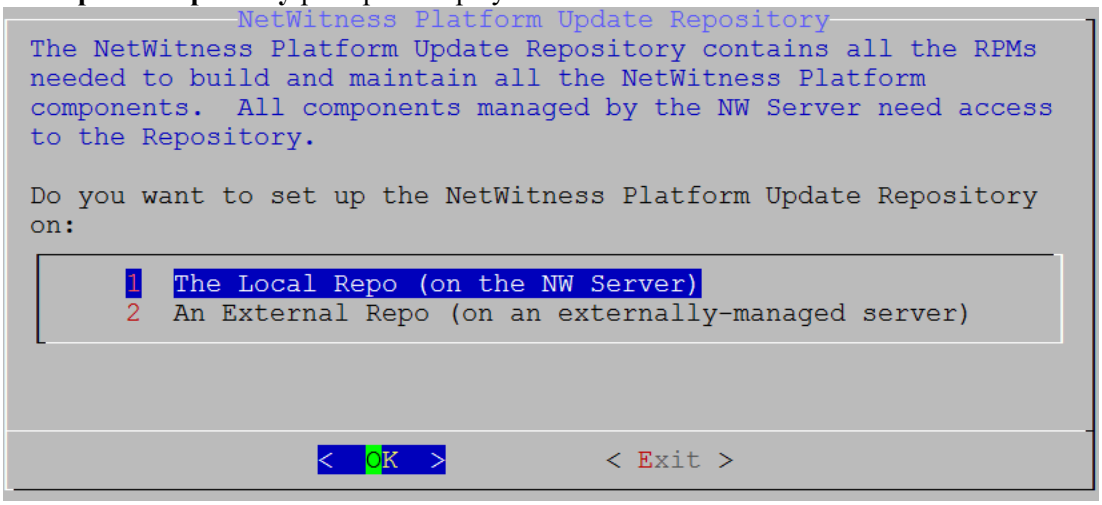
> **Note:** If you connect directly from the host console, the following warning will not be displayed.

      Press **Enter** to close warning prompt.

    - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

    - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.

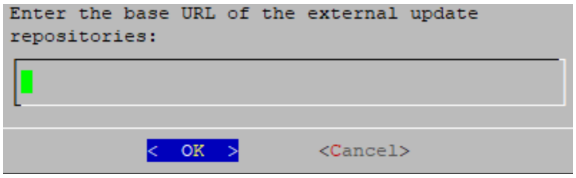


12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.

13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

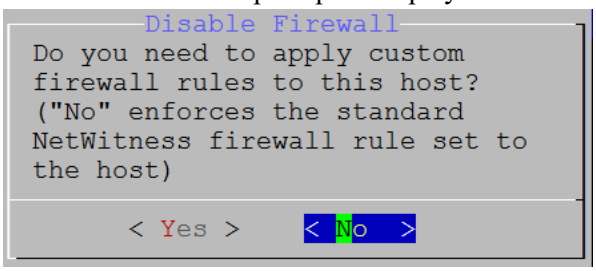
    The **Update Repository** prompt is displayed.



14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

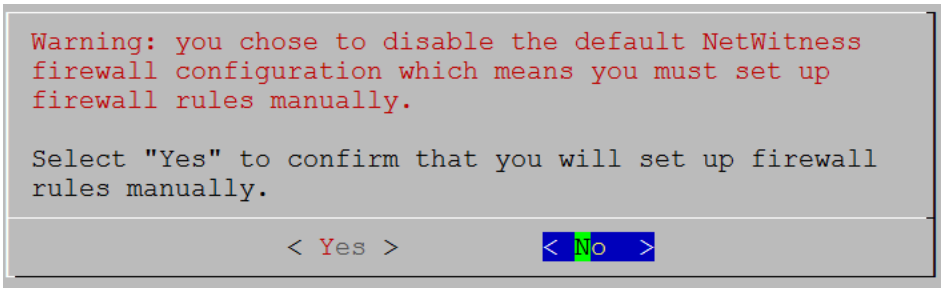
    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7
    - .0.0. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in the *Physical Host Installation Guide* for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



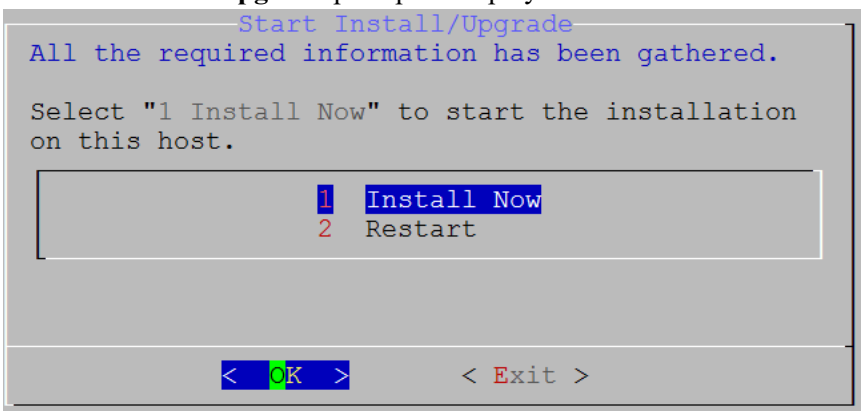
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

See "Set Up an External Repository with NetWitness and OS Updates" under "Hosts and Services Procedures" in the *NetWitness Platform Hosts and Services Getting Started Guide* for instructions.



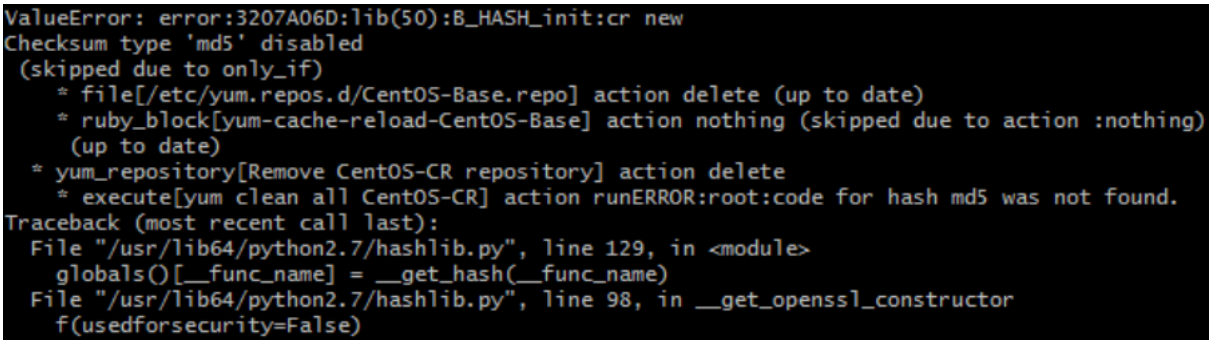
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The Disable firewall prompt is displayed.



15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



The **Start Install/Upgrade** prompt is displayed.

16. Press **Enter** to install 11.7 on the NW Server.
    When **Installation complete** is displayed, you have installed the 11.7 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

17. License the secondary NW Server.

    a. Log in to the secondary NW Server User Interface, click  (Admin) > **System** > **Info**, and note the **License Server ID** under **Version Information**.

    b. SSH to the primary NW Server.

    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID**).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.

```
# Hostid of the backup server, if in fail over configuration.
#backup-hostid:
```

    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.

```
# Hostid of the backup server, if in fail over configuration.
backup-hostid: "000c2918c80d"
```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>
```

Note: If the Warm Standby server becomes active, and if it will be accessed by any NW host with a NAT IP address, the NAT IP address must be added to the command:
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>-p<warm-standby-NAT-admin-server-ip>
```

This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.
Usage:
schedule-standby-admin-data-sync command [options]
```

```
Commands:

-h, --help                  Display Help
-d, --daily                 Schedule daily data
                            synchronization
-w, --weekly                Schedule weekly data
                            synchronization
-c, --custom <crontab       Schedule custom data
formatted>                  synchronization
                            i.e. to schedule for
                            midnight on 1st and
                            10th of the month:
                            '0 0 1,10 * *'
-i, --standby-ip <IP        (required) IP
address>                    address of standby
                            NW Server
-p, --standy-ip-public <NAT (optional) NAT-based
IP address>                 IP address of
                            standby NW Server
-v, --verbose               Enable verbose
                            output
```

Fail Over Primary NW Server to Secondary NW Server with Same IP Address

Initially, the primary NW Server fails over to the secondary NW Server. When the primary NW Server is back up, the secondary NW Server fails over to the primary NW Server, and that is referred to as a fail-back. When it is possible for the secondary NW Server to have the same IP address as the primary NW Server after failover, complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:

```
nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search
```

You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the `nw-failover` script with the `--make-active` argument:
   ```
   nw-failover --make-active
   ```
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      ```
      nw-failover --make-standby
      ```
   c. Shut down the primary NW Server.

   Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.
4. Validate that the component hosts have connected to the new active NW Server by running the following command on the new active NW Server:
   ```
   nw-manage --check-hosts-status
   ```

   Note: Do not continue to the next step until all component hosts have successfully connected to the new active NW Server. Rerun `nw-manage --check-hosts-status` as needed to continue verification.
5. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: If the primary NW Server is going to remain online, you must update its IP address so that it no longer conflicts with the Warm Standby NW Server IP address when it is changed. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

6. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Fail Over Primary NW Server to Secondary NW Server with Different IP Address

If your secondary NW Server will maintain a different IP address from your primary NW Server after a fail-over event, for example, if the secondary NW Server is located in a different data center from the primary NW Server, follow these steps to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:
`nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search`
You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the failover script:
   `nw-failover --make-active`
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      `nw-failover --make-standby`
   c. Shut down the primary NW Server.

      Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.

4. If you are running in a mixed-version environment, log in to each component host that is still on a version prior to 11.7 and execute the following:
   - `netconfig --update-dns --dns <active-nw-server-ip-address>`
   - `sed -Ei 's/^master:.*/master: <active-nw-server-ip-address>/g' /etc/salt/minion`
   - `systemctl restart salt-minion`

   Note: If you have a component host that uses a NAT IP address to reach the NW Server, substitute the `<NAT-IP-address>` for the `<active-nw-server-ip-address>` in both bullet items above.

5. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Note: If the secondary NW Server had any custom certificates, you must re-apply them after failover. For information about how to re-apply custom certificates, see "(Optional) Use a Custom Server Certificate" in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: After upgrading the NW Server host or a component host to 11.7 or later version, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, NetWitness recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

Note: While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

SSO

Update Configuration for Single Sign-On

Note: You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.
   d. Log in to admin server using the `login` command.
   e. Enter the admin username and password.
   f. Execute the following commands:
      - `cd /rsa/security/authentication/web/saml/sso-enabled`
      - `set false`
      - `logout`
      - `exit`

- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.
3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

Reporting Engine

Update Configuration for Reporting Engine

Note: You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to  (Admin) > **Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.

4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

UCF

To enable UCF to communicate with NetWitness Platform:

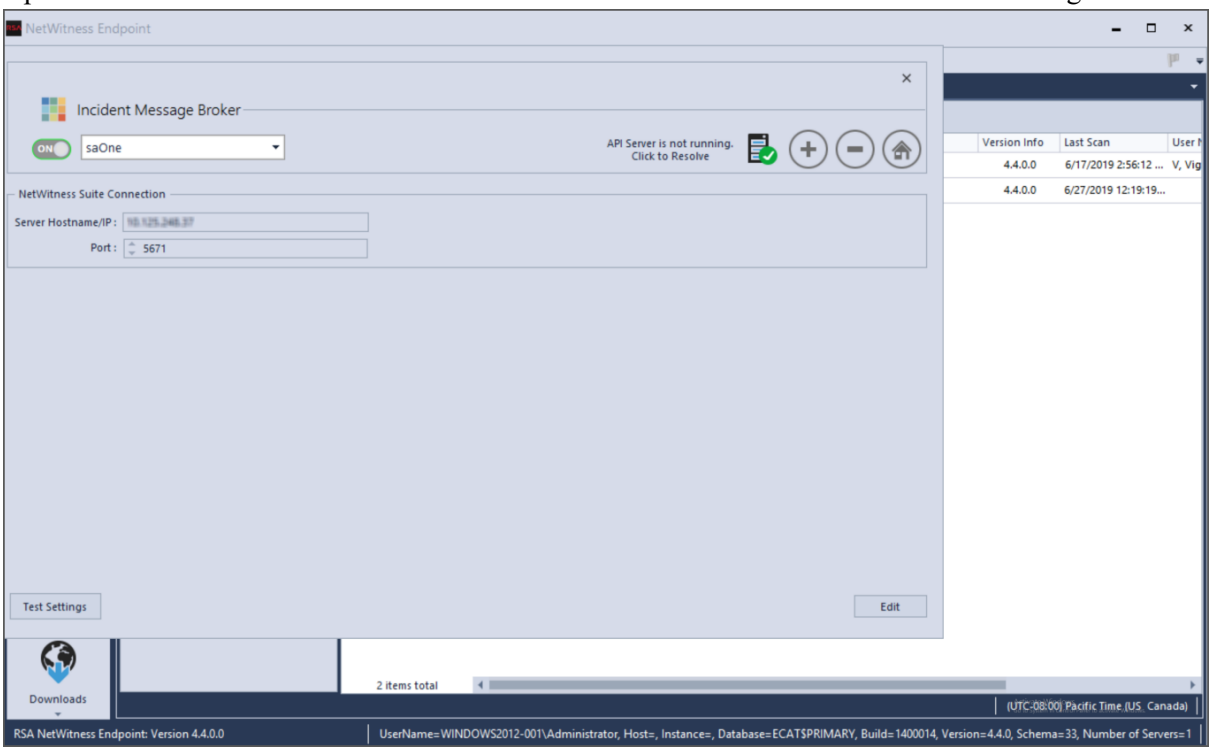
1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   Note: Do not change any other setting.

PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ECAT

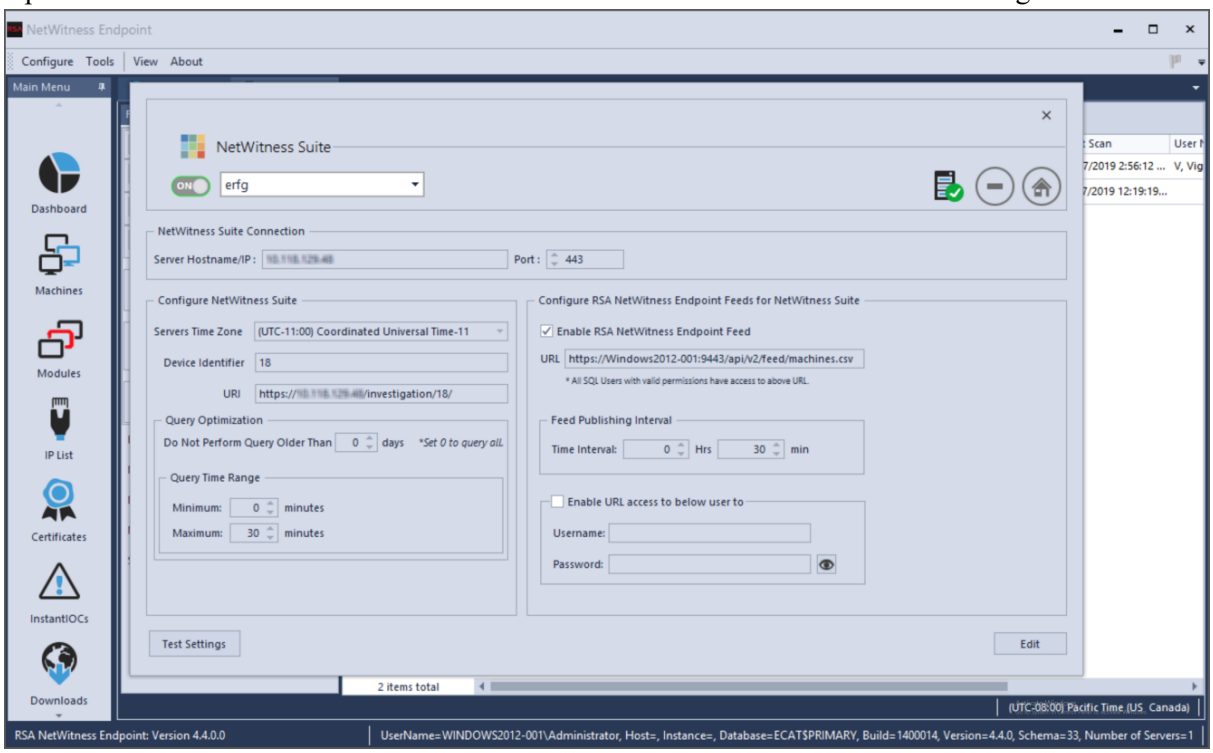


Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

Incident Message Broker

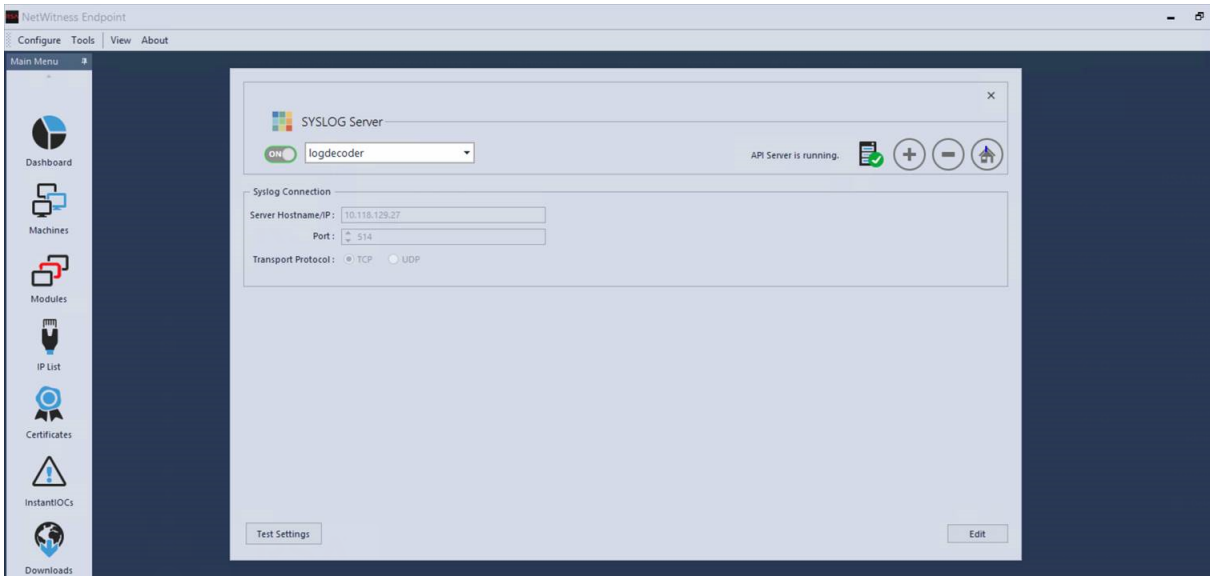
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.



2. Update the server Hostname and IP Address to the current active server and test the settings.

NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

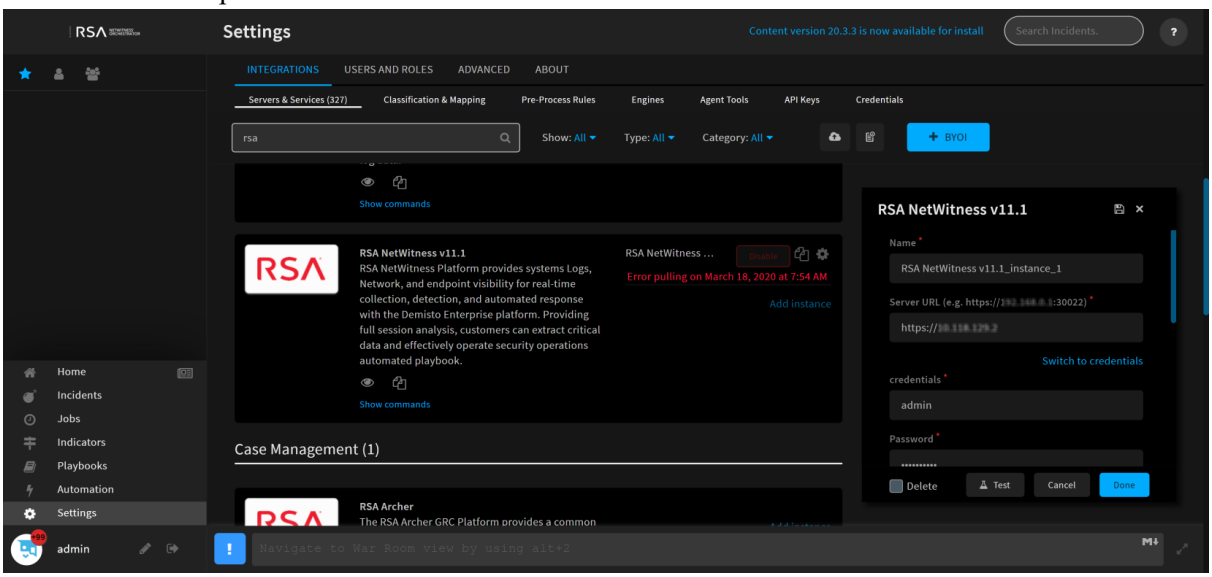


2. Update the server Hostname and IP address to the current active server and test settings.

Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

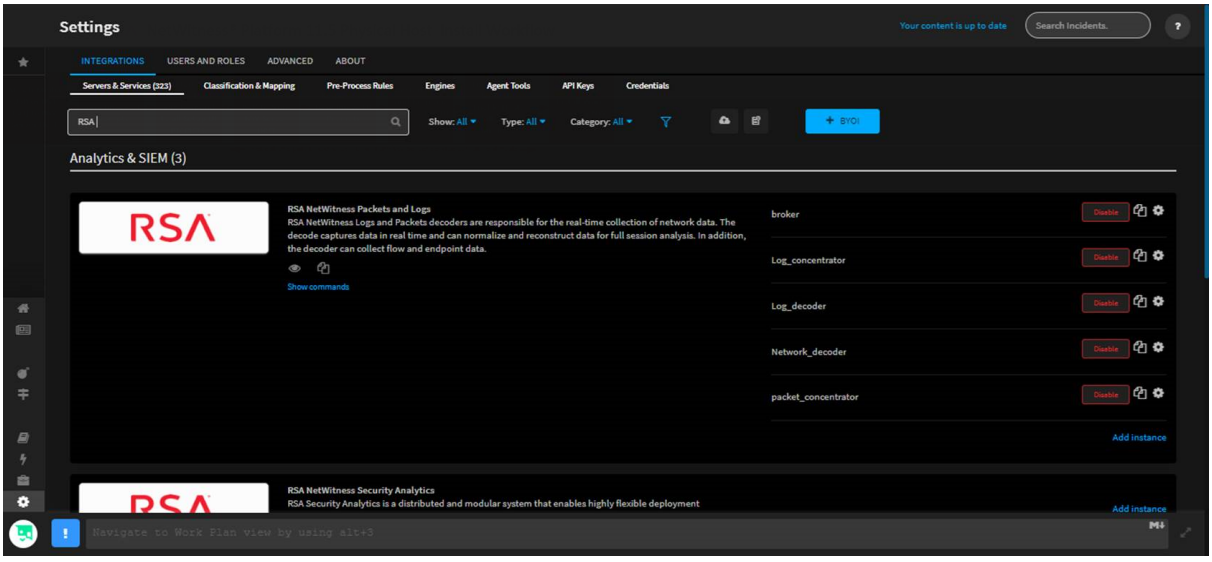
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.



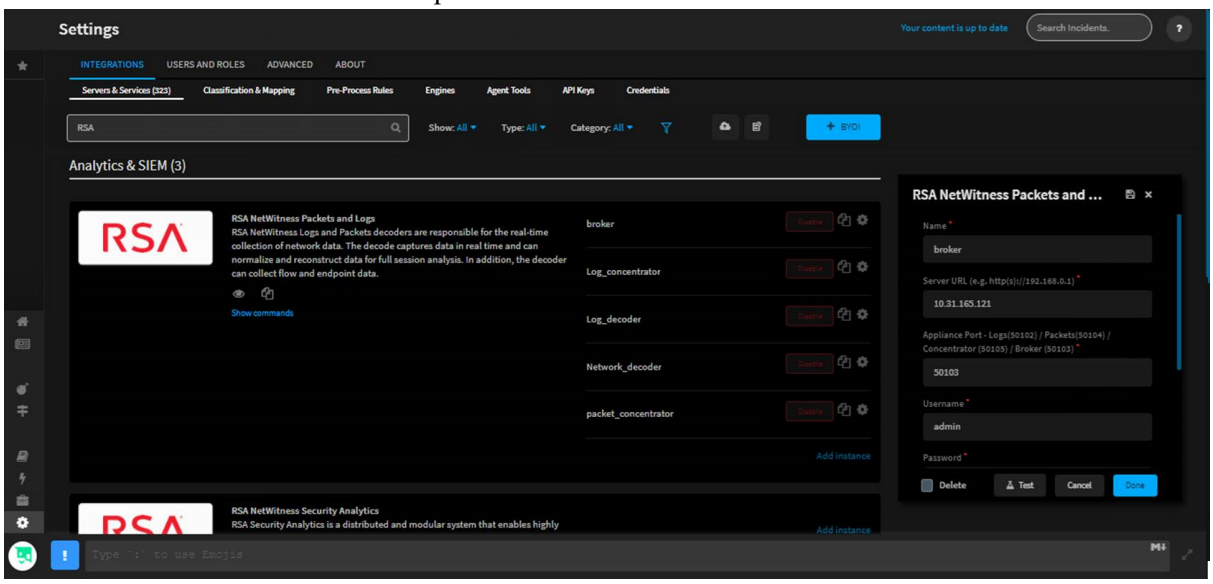
2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

RSA NetWitness Orchestrator (By Demisto)

Update the Current Active NW Server to Fetch Respond Incidents and Alerts



1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



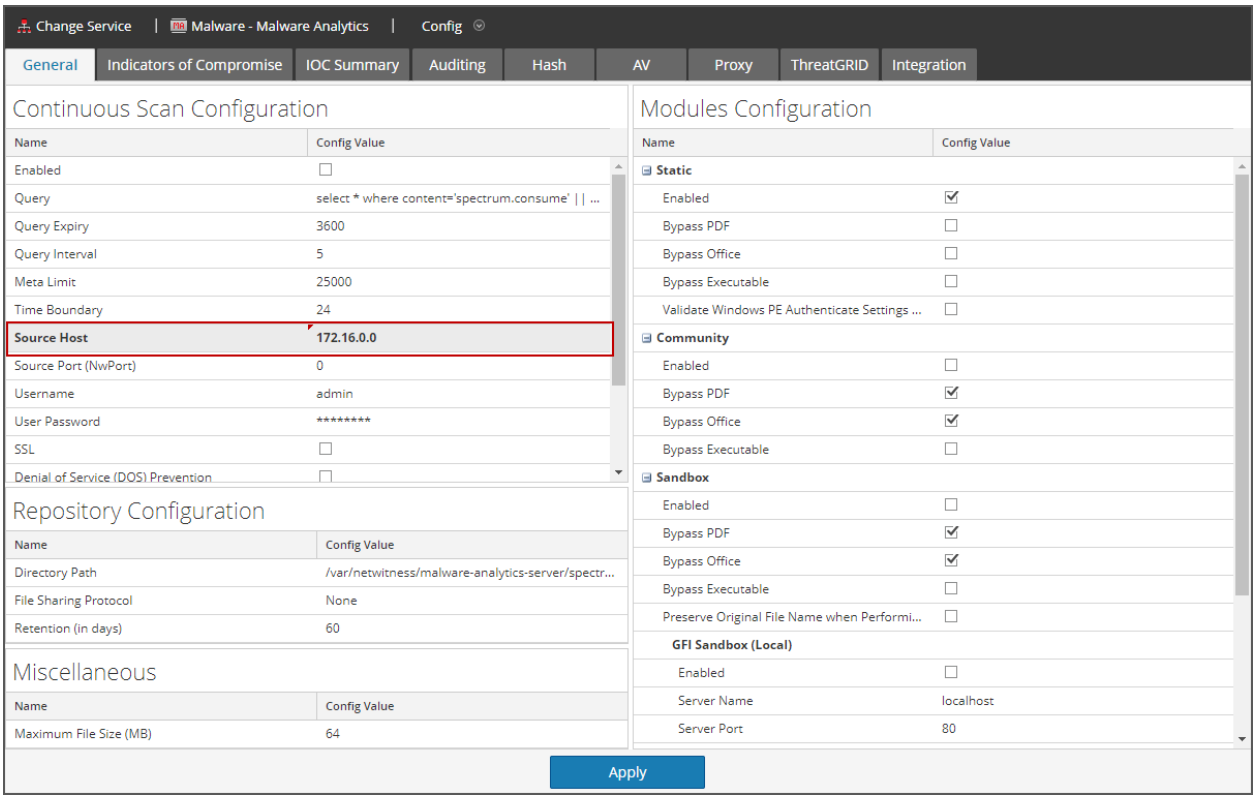
Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.

2. Enter the new IP address of the component host in **Server URL** and click **Done**.

Audit Logging



If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.

Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Note: If you added any content to the `/etc/hosts` file on the primary server, the contents of that file are available under `/var/netwitness/standby-data/unmanaged/etc` on the failover server. You can manually copy those files to the `/etc/hosts` file on the failover server after the failover is complete.

Fail Back Secondary NW Server to Primary NW Server

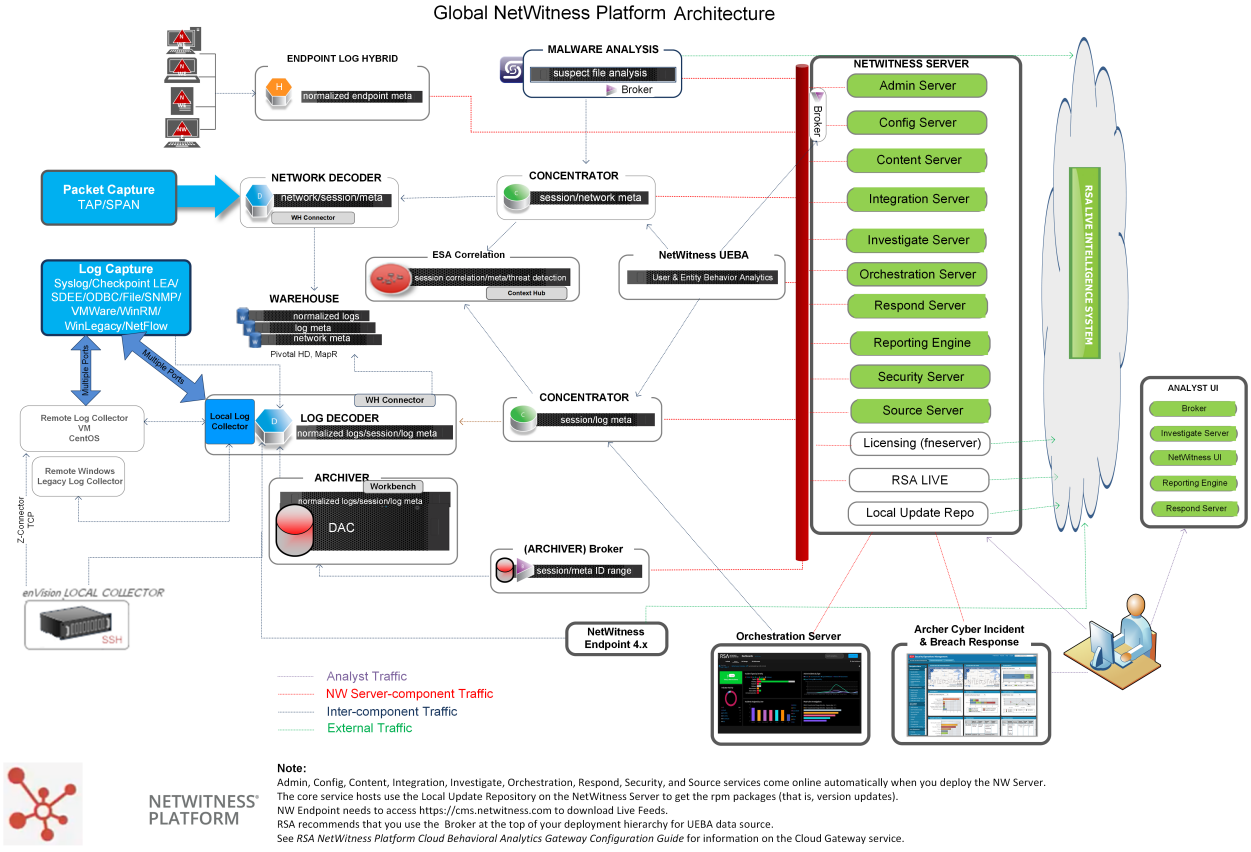
After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

Note: The secondary SA becomes active in case of a fail over. You should re-run the `schedule-standby-admin-data-sync` from the secondary SA before failing back to the primary SA.

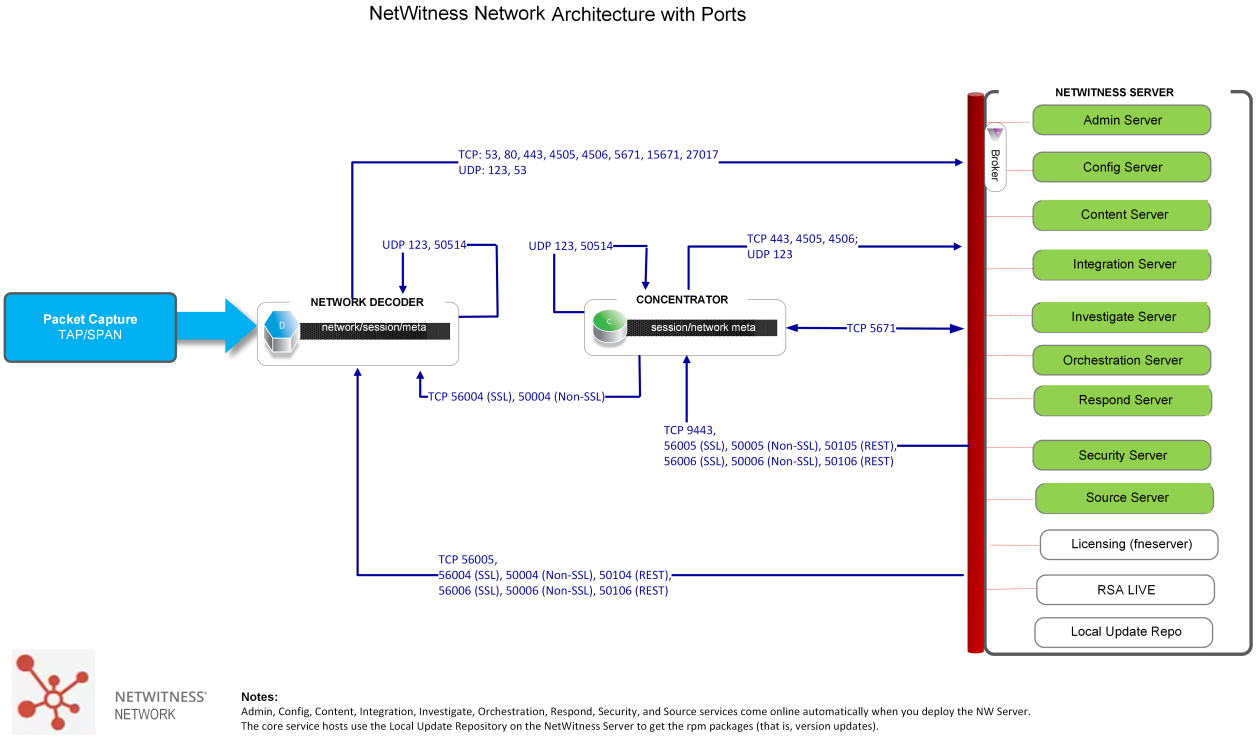
IMPORTANT: When you install and orchestrate a fresh 12.1 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.1, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.1 core Node-X to the fresh-Installed 12.1 Admin Server (not upgraded from 12.0 or older versions to 12.1). For more information, refer **Orchestration**topic in **Appendix C. Troubleshooting Version Installations and Upgrades** section in the *NetWitness 12.1 Upgrade Guide*.

Network Architecture and Ports



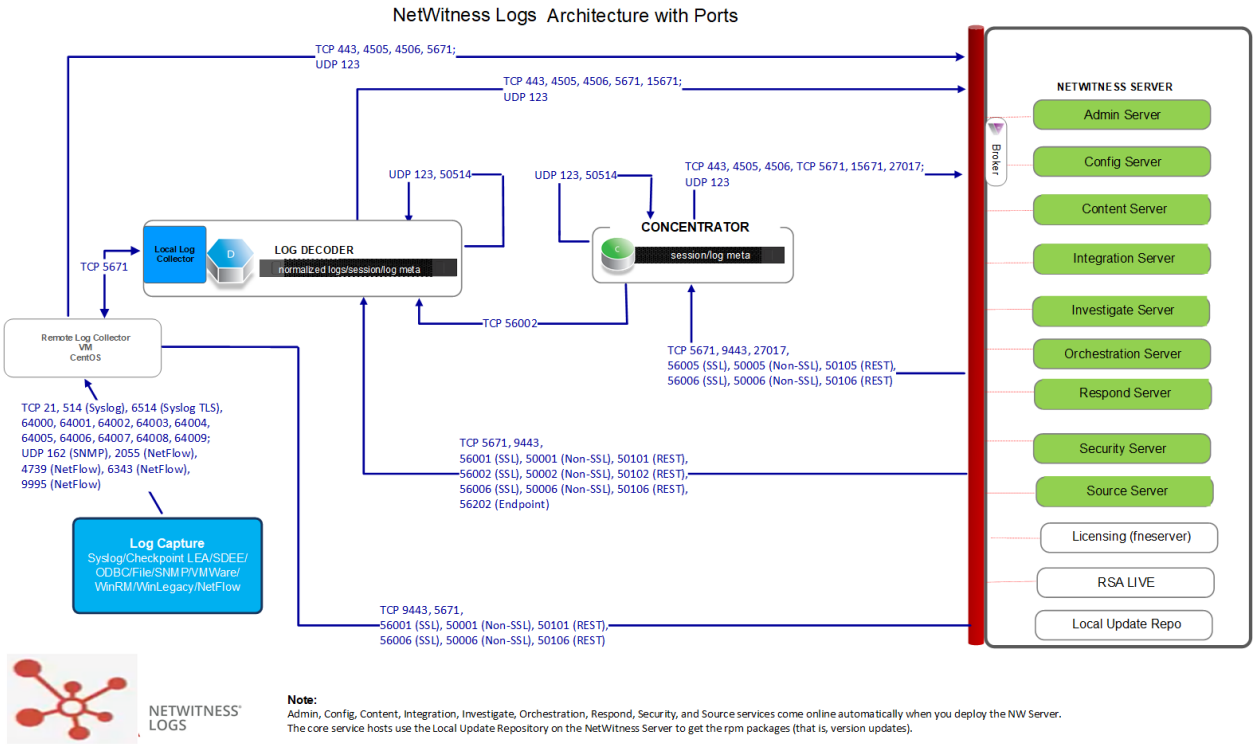
Refer to the following diagrams and port tables to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.



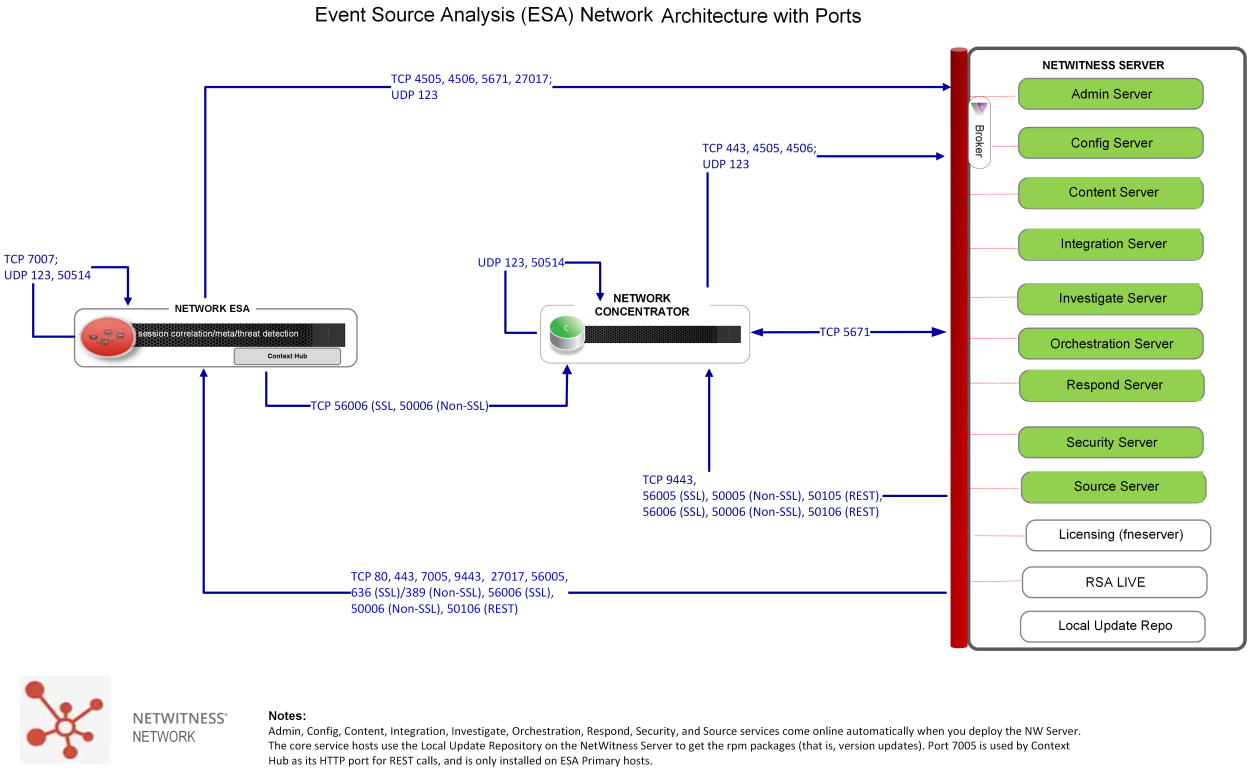
NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.



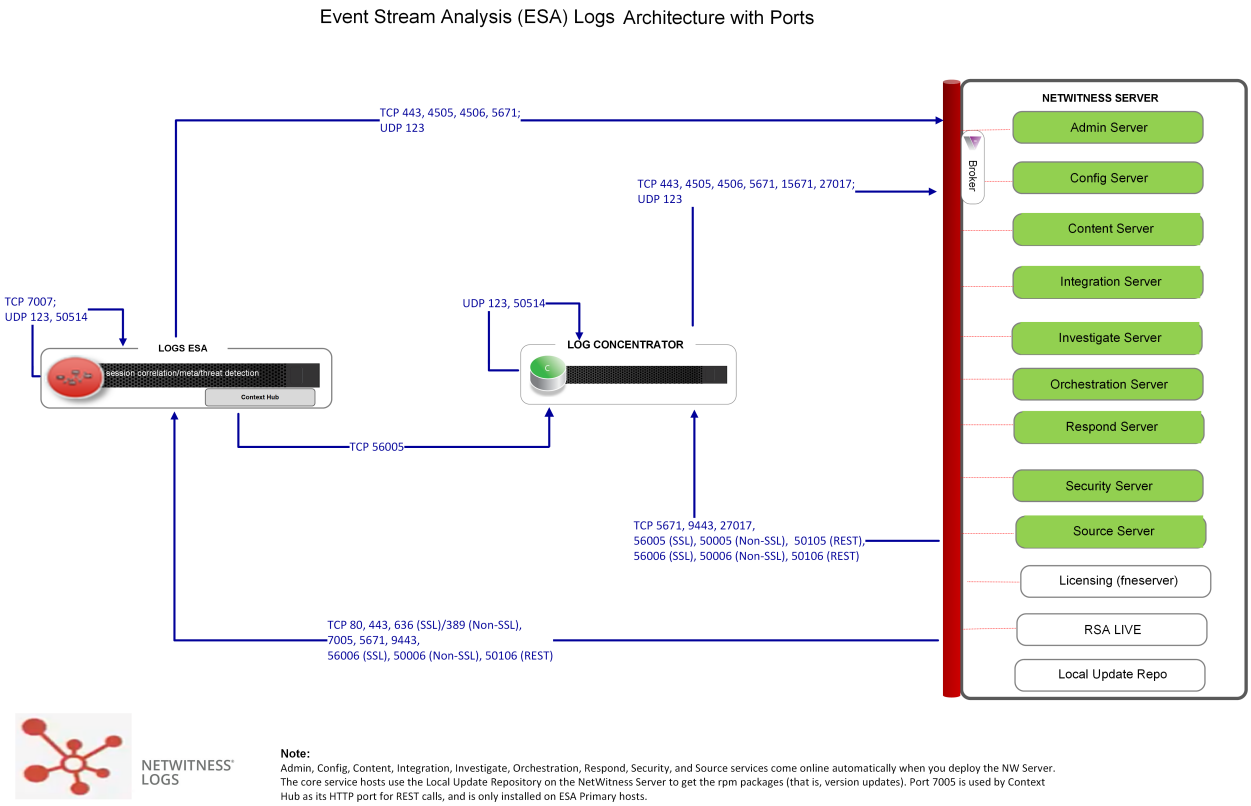
Note: NetWitness core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.

NetWitness Network (Packets) Architecture Diagram with Ports



NetWitness Logs Architecture Diagram with Ports

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).



Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.

Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.

NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

Note: The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

Source Host	Destination Host	Ports
NW Server	ESA Primary	**TCP:** 22, 5671, 7005 **UDP:**123
NW Server	ESA	**TCP:** 22, 5671 **UDP**: 123
NW Server	Network Decoder	**TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Broker	**TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Concentrator (Network & Logs)	**TCP:** 22, 5671, 50005 (Non-SSL), 50006 (Non-SSL), 50105 (REST), 50106 (REST), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Network Hybrid	**TCP:** 22, 5671, 50004 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50105 (REST), 50106 (REST), 56004 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Decoder	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Hybrid	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123

Source Host	Destination Host	Ports
NW Server	Log Hybrid - Retention	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Endpoint Log Hybrid	**TCP:** 22, 5671, 7050, 7054, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL), 56202 (Endpoint) **UDP:** 123
NW Server	VLC	**TCP:** 22, 5671, 50001 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50106 (REST), 56001 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Archiver	**TCP:** 22, 514, 5671, 6514, 50006(Non-SSL), 50007 (Non-SSL), 50008 (Non-SSL), 50106 (REST), 50107 (REST), 50108 (REST), 56006 (SSL), 56007 (SSL), 56008 (SSL) **UDP:** 123, 514
NW Server	Malware	**TCP:** 22, 5671, 5432, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST), 56003 (SSL), 56006 (SSL), 60007 **UDP:** 123
NW Server	UEBA	**TCP:** 22, 15671, 5671, 443 **UDP:** 123
ESA	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 123, 53
ESA	Active Directory	**TCP:** 389 (Non-SSL), 636 (SSL)
ESA	Archer	**TCP:** 80 (Non-SSL), 443 (SSL),
ESA Secondary	ESA Primary	**TCP:** 27017
ESA Primary or Secondary	Concentrator	**TCP:** 50005 (Non-SSL), 56005 (SSL)
Network Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123

Source Host	Destination Host	Ports
Concentrator (Network & Logs)	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Network Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Log Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Log Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017, 444 **UDP:** 53, 123

Comprehensive List of NetWitness Host, Service, and iDRAC Ports

Note: For ports used in event collection through the NetWitness Logs, see the *Log Collection Configuration Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

This section contains the port specifications for the following hosts:

NW Server Host	iDRAC Ports
Analyst UI Host	Log Collector Host
Archiver Host	Log Decoder Host
Broker Host	Log Hybrid Host
Concentrator Host	Log Hybrid - Retention
Endpoint Log Hybrid Host	Malware Host
Endpoint Relay Server	Network Decoder Host
Event Stream Analysis Host	Network Hybrid Host
New Health & Wellness	UEBA Host

NW Server Host (Primary and Warm Standby NW Server Host)

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH Primary to Standby NW Server sy nchronization port.
NW Hosts	NW Server	TCP 444	Node-infra-server check
NW Hosts	NW Server	TCP 53 UDP 53	DNS
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 443	RSA Update Repository
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	cms.netwitness.com	TCP 443	Live Content Management System (CMS) Library
NW Server	download.rsasecurity.com	TCP 443	RSA Licensing
NW Server	rsasecurity.subscribenet.com	TCP 443	RSA Licensing
NW Server	update.netwitness.com	TCP 443	Netwitness Software Updates

Source Host	Destination Host	Destination Ports	Comments
NW Server	NFS Server	TCP 111, 2049, UDP 111, 2049	iDRAC Installations
NW Server	NW Hosts	UDP 123	NTP
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations
NW Hosts	NW Server	TCP 444	nw-node-infra service failover check

Analyst UI Host

Source Host	Destination Host	Destination Ports	Comments
Analyst UI	NW Server	TCP 7006	The Content Server is listening on this port.
Analyst UI	NW Server	TCP 7009	The Admin Server is listening on this port.
Analyst UI	NW Server	TCP 7012	The Integration Server is listening on this port.
Analyst UI	NW Server	TCP 7015	The Source Server is listening on this port.
Analyst UI	NW Server	TCP 7016	The License Server is listening on this port.
NW Hosts	Analyst UI	TCP 5671	RabbitMQ-amqp
Analyst UI	NW Server	UDP 123	NTP
Analyst UI	NW Server	TCP 444	nw-node-infra service failover check

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 50007 (Non-SSL), 56007 (SSL), 50107 (REST)	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Archiver	NW Server	TCP 444	nw-node-infra service failover check

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Broker	Concentrator	TCP 50005 (Non-SSL), 56005	Concentrator Application Port
Broker	NW Server	TCP 15671	RabbitMQ Management UI
Broker	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Endpoint Broker	NW Server	TCP 443	RSA Update Repository
Broker	NW Server	TCP 444	nw-node-infra service failover check

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Concentrator	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL)	Log Decoder Application Port
Concentrator	Network Decoder	TCP 56004, 50004 (Non-SSL)	Network Application Port
Concentrator	NW Server	TCP 15671	RabbitMQ Management UI
Concentrator	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports
Malware	Concentrator	TCP TCP 50005 (Non-SSL), 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Concentrator	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Endpoint Log Hybrid	TCP 443 UDP 444	NGINX HTTPS NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid.
Endpoint Agent	Log Decoder or Virtual Log Collector	TCP 514 (Syslog) UDP 514 (Syslog) TLS 6514	Windows Log Collection
Endpoint Log Hybrid	Log Decoder (External)	TCP 50102 (REST) 56202 (Protobuf SSL) 50202 (Protobuf)	To forward meta to an external Log Decoder
Endpoint Log Hybrid	NW Server	TCP 443	RSA Update Repository
NW Server	Endpoint Log Hybrid	TCP 7050	UI web traffic
Endpoint Log Hybrid	NW Server	TCP 5671	Message Bus
Endpoint Log Hybrid	NW Server	TCP 27017	MongoDB
NW Server	Endpoint Log Hybrid	TCP 7054	UI web traffic
NW Server	NFS Server	TCP 111, 2049 UDP 111, 2049	iDRAC Installations
NW Server	Endpoint Log Hybrid	TCP 50001 (Non-SSL), 56001 (SSL), 50101(REST)	Log Collector application ports
NW Server	Endpoint Log Hybrid	TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST)	Log Decoder application ports
Admin Workstation	Endpoint Log Hybrid	TCP 15671	RabbitMQ Management UI

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI
Endpoint Log Hybrid	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Relay Server

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Relay Server	TCP 443	To forward host data to the Relay Server
Endpoint Log Hybrid	Relay Server	TCP 443	Pull host data from the Relay Server

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port
ESA Primary and Secondary	NW Server	TCP 444	nw-node-infra service failover check

New Health and Wellness

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	New Health and Wellness	TCP 22	SSH
Admin Workstation	New Health and Wellness	TCP 5601	Kibana UI
NW Hosts	New Health and Wellness	TCP 9200	Elasticsearch REST API Port
NW Server	New Health and Wellness	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	New Health and Wellness	TCP 15671	RabbitMQ Management UI
NW Server	New Health and Wellness	TCP 7018	Metrics Server Launch Port
NW Server	New Health and Wellness	TCP 7020	Node Infra Server Launch Port

New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform hosts port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and LogHybrid host is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

Source Host	Destination Host	Destination Ports	Comments
New Health and Wellness	Log Decoder	50002(Non-SSL),56002 (SSL)	Log Decoder Application Ports
New Health and Wellness	Log Collector	50001(Non-SSL),56001 (SSL)	Log Collector Application Ports
New Health and Wellness	Concentrator	50005(Non-SSL)/56005 (SSL)	Concentrator Application Ports

iDRAC Ports

Port	Function	Comments
22*	SSH	Default, configurable port through which iDRAC listens for connections
443*	HTTP	Default, configurable port through which iDRAC listens for connections
5900*	Virtual Console keyboard and mouse redirection, Virtual Media, Virtual Folders, and Remote File Share.	Default, configurable port through which iDRAC listens for connections
111, 2049	TCP	NetWitness Platform hosts to NFS Server
111, 2049	UDP	NetWitness Platform hosts to NFS Server

Log Collector Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Collector	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Collector	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Collector	TCP 514 (Syslog) UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)"	Log Collection Ports

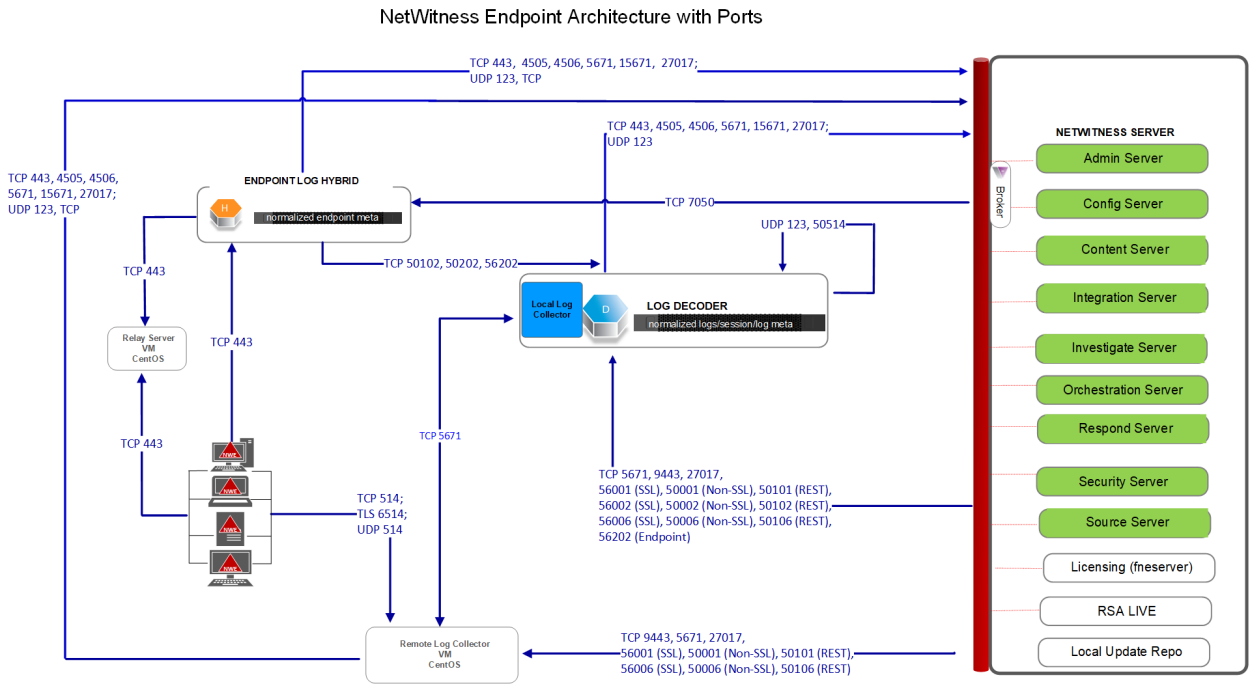
NetWitness Endpoint Architecture



NetWitness Endpoint Architecture

NetWitness Endpoint 4.4 Integration with NetWitness Platform

NetWitness Endpoint Architecture with Ports

For more information on the services running on Endpoint Log Hybrid, see *NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.netwitness.com/t5/netwitness-knowledge-base/how-to-add-custom-firewall-rules-after-nwsetup-tui-has-completed/ta-p/5900) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select  (Admin) > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
   ```
   vi /etc/sysconfig/iptables
   ```
   b. Restart `iptables` with the following command string.
   ```
   systemctl restart iptables
   ```
   c. Verify the change with the following command string.
   ```
   iptables -L -n
   ```
   The following is an example of what is displayed for a correct change.
   ```
   ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
   EndpointNginxPort */ ctstate NEW
   ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
   ```
   semanage port -a -t http_port_t -p udp 555
   ```
   If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
   ```
   semanage port -l | grep http_port_t
   ```
   The following is an example of what is displayed for a correct change.
   ```
   http_port_t udp 555, 444
   ```
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
   ```
   vi /etc/nginx/nginx.conf
   ```
   b. Search for the following string.
   ```
   listen 444 udp;
   ```
   c. Replace `444` with `555`.

d. Restart nginx with the following command string.
```
systemctl restart nginx
```

4. Verify that agents are communicating over the new port.

a. Run the following command string.
```
tcpdump -i eth0 port 555
```

b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
```
09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP,
length 20
09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP,
length 1
```
Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your NetWitness devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

NetWitness Endpoint

Note: The information in this topic applies to NetWitness Version 11.1 and later.

About NetWitness Endpoint

NetWitness Platform provides an endpoint detection and response solution that continuously monitors the behavior of all endpoints in and outside the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster. During investigation, the analyst can use the visual indication of threat level to assess the risk of endpoints.

As part of this solution, NetWitness introduces **Endpoint Log Hybrid** that:

- Collects and manages endpoint (host) data from Windows, Mac, and Linux hosts.
- Collect log files and Windows logs from Windows hosts.
- Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.

Analysts can:

- Perform instant scans for detailed insights of the host behavior at any point in time.
- Analyze the scope of the attack across hosts and network through integrated metadata.
- Quickly triage and focus their investigation by managing suspect and legitimate files.
- Perform multiple checks of file legitimacy to determine if a file is malicious, including checking file certificates and hashes.
- Blacklist malicious files and then block them across all hosts in the network to prevent future execution of this file on any host.
- Download Files, Master File Table (MFT), system dump, and process dump for forensic investigation.
- Isolate host from the network to safely investigate possible threats within the host.

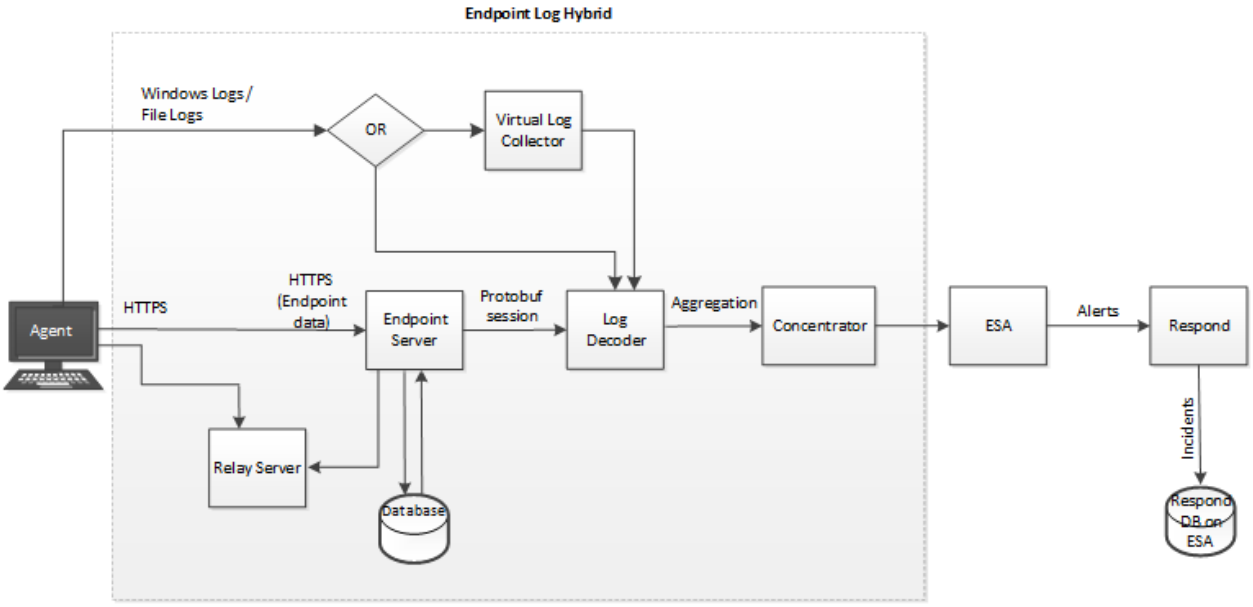
Endpoint Log Hybrid receives data from the Endpoint Agents. The following services run on the Endpoint Log Hybrid:

- **Endpoint Server**: Manages data received and stores it in a database. It parses the events, generates metadata, and forwards it to the Log Decoder through protobuf. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves up to 6 Endpoint Log Hybrid hosts. Multiple Endpoint Log Hybrids are required to share certificates by copying them from the primary Endpoint Log Hybrid to the secondary Endpoint Log Hybrid using the `SCP` command.

  Note: You may need to install your Endpoint Server on separate hardware from your Log Decoder. If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

  If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

  If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.



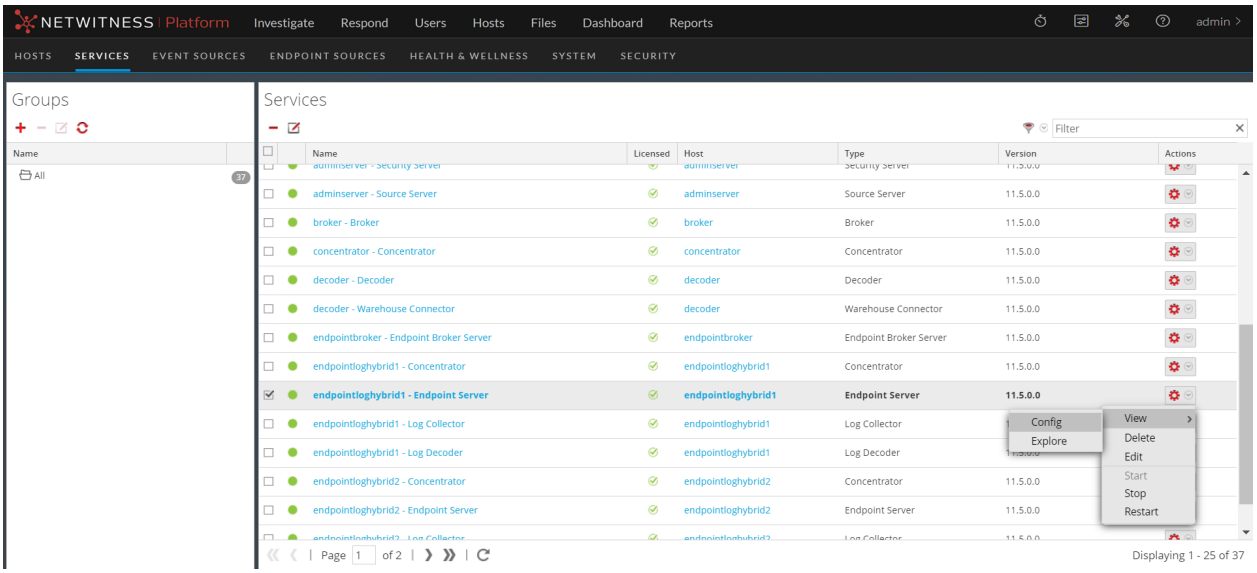
- **Log Decoder**: Captures data from the Endpoint Server and processes the metadata.
- **Concentrator**: Aggregates metadata from the Log Decoder and makes it available for all upstream components like Investigate, Reporting Engine, Respond, and Event Stream Analysis similar to NetWitness Decoder and Concentrator.
- **Log Collector**: Collects logs from all event sources that are supported for the log collection in the NetWitness Platform.

In addition to the above services, the Endpoint Log Hybrid leverages the following services:

- **Event Stream Analysis (ESA)**: Creates alerts from ESA rules for Endpoint data.
- **Endpoint Broker**: Provides a consolidated view of all Endpoint servers in a multiple Endpoint Log Hybrid deployment.

Endpoint Agent Data Flow

The following figure shows the endpoint data flow from the agent to the NetWitness:



The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all the NetWitness services.

Basic configuration involves:

- Installing agents on hosts
- Deploying the ESA rules from the Endpoint Rule Bundle
- Creating groups and policies
- Configuring Endpoint metadata forwarding and retention policies
- Defining health and wellness policies to monitor Endpoint Server
- Installing and configuring Relay Server

You can configure the required settings in the NetWitness user interface under Administration Services Config view (**(Admin) > Services > Endpoint Server > Config**).

Agent Modes

Note: The information in this topic applies to NetWitness Version 11.3 and later.

In NetWitness 11.3 and later, the Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information on policy configuration, see the *NetWitness Endpoint Configuration Guide*. You can have both Insights and Advanced agents in a single deployment.

There is no license required for the Insights agent. However, you must procure a license for an Advanced agent. For more information on licensing, see the *Licensing Management Guide*.

The following table list the features supported for Insights and Advanced agents:

Feature	Insights Agent	Advanced Agent
Full System Scan	No	Yes (agent version 11.6.1 or higher)
Scan data - Processes, Autoruns, Files, Drivers, Libraries, and System Information	Yes - Windows, Mac, and Linux	Yes - Windows, Mac, and Linux
Tracking data - Process, File, Registry, Network, and Console	No	Yes - Windows and Mac Registry and Console events are applicable only for Windows.
Expanded network visibility	Yes - Windows	Yes - Windows
Anomaly detection - Image Hooks, Kernel Hooks, Registry Discrepancies, and Suspicious Threads	No	Yes - Windows
Windows log collection	Yes	Yes
File log collection	Yes - Windows	Yes - Windows
Threat detection content - ESA, Application Rules	Yes	Yes
Analysis of downloaded file	Yes	Yes
File status - Whitelist, Blacklist, Graylist, and Neutral	Yes	Yes
File remediate (Block)	No	Yes - Windows
Process visualization	No	Yes
Live connect	Yes	Yes

Feature	Insights Agent	Advanced Agent
File reputation service (Third-party lookup)	Yes	Yes
Risk score for hosts	No	Yes
MFT, process dump, and system dump download	No	Yes - Windows
Automatic file download	Yes	Yes
Automatic Memory DLL Download	No	Yes
Manual file download	No	Yes
Network isolation	No	Yes - Windows
Relay server	Yes	Yes

Endpoint Log Hybrid Configuration

This topic provides the high-level tasks required to configure the Endpoint Log Hybrid.

Tasks	Description
Install the Endpoint Log Hybrid	For a physical host: See *Install Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Install Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Configure one or more Endpoint Log Hybrids	For a physical host: See *Configuring Multiple Endpoint Log Hybrids* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Configuring Multiple Endpoint Log Hybrids* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Add hosts to the Endpoint Log Hybrid	For a physical host: See *Add Hosts to the Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Add Hosts to the Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Deploy Application and ESA Rules	See Deploying Endpoint Application Rules and ESA Correlation Rules.

Tasks	Description
Configuring Metadata Forwarding	Similar to logs and packets, you can view Endpoint metadata in the Navigate and Events view. You can also generate reports and alerts for the Endpoint data. By default, the Endpoint Meta option is disabled. The agent must be installed with the Endpoint Meta option enabled to forward metadata.
Install Agents on Hosts	The Endpoint agent installer is generated using the Packager tab under **(Admin) > Services > Config > Endpoint Server** from the NetWitness user interface. The Packager is a zip file that contains executables and configuration files for generating agent installer for Linux, Mac, and Windows operating systems. You can install only one version of the agent on a host. If you have a previous version of an agent installed (for example, 4.4), uninstall this agent to install the 12.4.0.0 agent. After the agent is installed, it appears on the **Hosts** view. By default, the Endpoint data is posted for the first time. To collect subsequent Endpoint data, you have to either schedule a scan or perform ad hoc scan. It retrieves data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host. **Note:** If a Windows host has proxy setup enabled and configured, the Endpoint agent communicates to the Endpoint server through proxy. If a host has both Automatic (Auto detect and Setup Script) and Manual proxy settings enabled and configured, the order of precedence is as follows: 1. Manual proxy setup 2. Automatic proxy setup - Use setup script 3. Automatic proxy setup - Automatically detect settings

Tasks	Description
Install and Configure the Relay Server	See (Optional) Installing and Configuring Relay Server.
3rd Party Scan	Configure 3rd party scans like YARA and OPSWAT. See Configure YARA and Configure OPSWAT
Permissions	Grant or Revoke role permissions for the selected Endpoint Server. See Manage Role Permissions at Endpoint Server Level
Manage Groups and Policies	To efficiently manage and update endpoint agent configurations, you can group the agents, and manage their behavior using policies.
Enable Reputation Status	Reputation Status is enabled by default in an NetWitness Platform 11.3 and later deployment and displays information about the file. For troubleshooting, see the *Live Services Guide*.
Risk Score	Risk Score is calculated and obtained from NetWitness Respond for hosts and files. For more information, see the *NetWitness Respond Configuration Guide*.
Configuring Data Retention Policy	Define data retention policies to optimally store and manage the Endpoint data based on the age of the Endpoint data or the storage size. By default, 30 days of agent data is retained.
Managing Inactive Agents	By default, agents (including all the collected Endpoint data) that have not communicated with the Endpoint Server for 90 days will be automatically deleted.
Configure Retention Policy for Downloaded Files	Define retention policy to optimally store and manage the downloaded data such as system dump, process dump, files, and MFT. By default, 90 days of data is retained.
Investigate Endpoint data	You can investigate the Endpoint data in the **Hosts** and **Files** views. For more information, see the *NetWitness Endpoint User Guide*.

Deploying Endpoint Application Rules and ESA Correlation Rules

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The existing IIOCs from NetWitness Endpoint 4.4.0.x are now available as OOTB Endpoint Application rules tagged as Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File. Application rules for Endpoint are automatically available on installation of NetWitness 11.3 and later.

For Endpoint risk score, every Application rule must have an ESA rule that generates alerts used for the risk score calculation. A set of OOTB ESA rules are available as Endpoint Rule Bundle. You must specify the Endpoint data sources (Concentrators) and deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

If the Application rule key value matches with ESA rule then an alert is triggered which is used to compute the risk score and an incident is raised when risk score exceeds the defined threshold limit.

Note: If you are upgrading from an existing Endpoint Log Hybrid to 11.3 or later, you must deploy the Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see the *Live Services Management Guide*.

You can view the application rules that are deployed in  **(Admin) >Services > Endpoint Log Hybrid - Log Decoder** > **Config** > **App Rules** and application rules that were triggered in **Investigate** > **Navigate**> **Endpoint Log Hybrid - Concentrator** > **App rules**.

The Endpoint ESA rules generate alerts with the severity; Critical, High, and Medium. You can view the alerts on:

- Risk Details tab - You can view Critical, High and Medium alerts for a host or file on **Hosts** > **Risk Details** or **Files** > **Risk Details**.
- Respond view : You can view only critical and high severity alerts on **NetWitness Respond** > **Alerts**.

Custom Endpoint Rule for Risk Scoring

If you have custom IIOCs in NetWitness Endpoint 4.4.0.x, you need to create these custom Endpoint rules. Once you have created your custom Application rule, you must create the custom ESA Rule for risk score calculation and update the RiskConfig file in MongoDB.

To create a custom Endpoint rule, perform the following tasks:

1. Add a custom Application Rule: For more information on creating a custom Application Rule, see *Create an Application Rule* topic in the **Live Services Management Guide**.
2. Add a custom ESA Rule: For more information on creating a custom ESA Rule, see *Create an ESA Rule* topic in the **Live Services Management Guide**.
3. Add the rule to RiskConfig

ESA Rule Parameters

The following table describes the fields that define an ESA rule.

Fields	Description
id	The name of the ESA Rule. For example, In Encrypted Directory.
key	The metakey on which an alert would be generated. For example, alert is generated on analysis.file metakey for In Encrypted Directory rule.
value	Specify the value. The value must exactly match with the App rule name. For example, in encrypted directory.
title	The name of the alert. For example, In Encrypted Directory.
type	Specify the type of rule. For custom endpoint rule, the type must be ENDPOINT.
enabled	The status of the rule. Specify true, if the rule should be considered for risk scoring.
description	The description of the rule.
severity	The severity of the rule; critical, high or medium.

Add the rule to RiskConfig

After you create the custom Application rule and the ESA rule, you must update the RiskConfig in mongoDB.

To update the riskconfig file, perform the following:

1. SSH to Admin Server.
2. Create a JavaScript file (For example, `in-encrypteddirectory- rule.js)` with the custom ESA rule definition in the below format.

```
db.risk_rule.insertMany(
[ {
"name" : "In Encrypted Directory",
"enabled" : true,
"handler" : "Default",
"entities" : {

},
"metas" : {
"File" : [
```

```
{
"meta" : "checksum_src",
"name" : "filename_src",
"weight" : NumberInt(100)
}
],
"Host" : [
{
"meta" : "agent_id",
"name" : "alias_host",
"weight" : NumberInt(100)
}
]
},
"_class" : "com.rsa.asoc.respond.pipeline.risk.rules.AlertScoringRule"
} ]
)
```

The following table describes the fields that define a rule.

Field	Description
name	The name of the ESA rule.
enabled	The flag to enable or disable risk scoring. Specify true to enable risk scoring.
handler	The value of this should be Default.
entities	The value of this should be empty.
metas > Files > meta	The metakey for a file for which score should be calculated.
metas > Files > name	The name of the metakey of the file identity.
metas > Files > weight	By default the weight value is 100.
metas > Host > meta	The metakey for a host for which score should be calculated.
metas > Host > name >	The name of the metakey of the host identity.
metas > Host > weight	By default the weight value is 100.
_class	This is used for internal purpose, do not change.

3. Insert the new rule into the riskconfig file on mongoDB using following command:

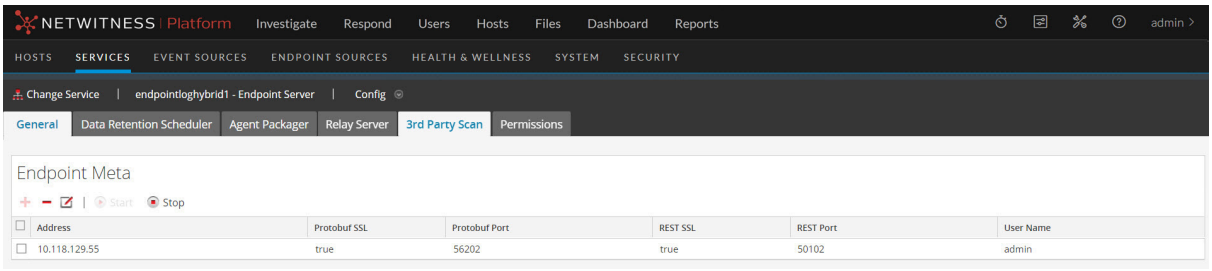
```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> in-encrypted-directory-rule.js
```

4. Confirm if ESA rule is updated successfully in the riskconfig, using following command

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> --eval "db.risk_rule.find({ "name": /.*In
Encrypted Directory.*/i })"
```

5. Restart the Respond server for the changes to take effect.

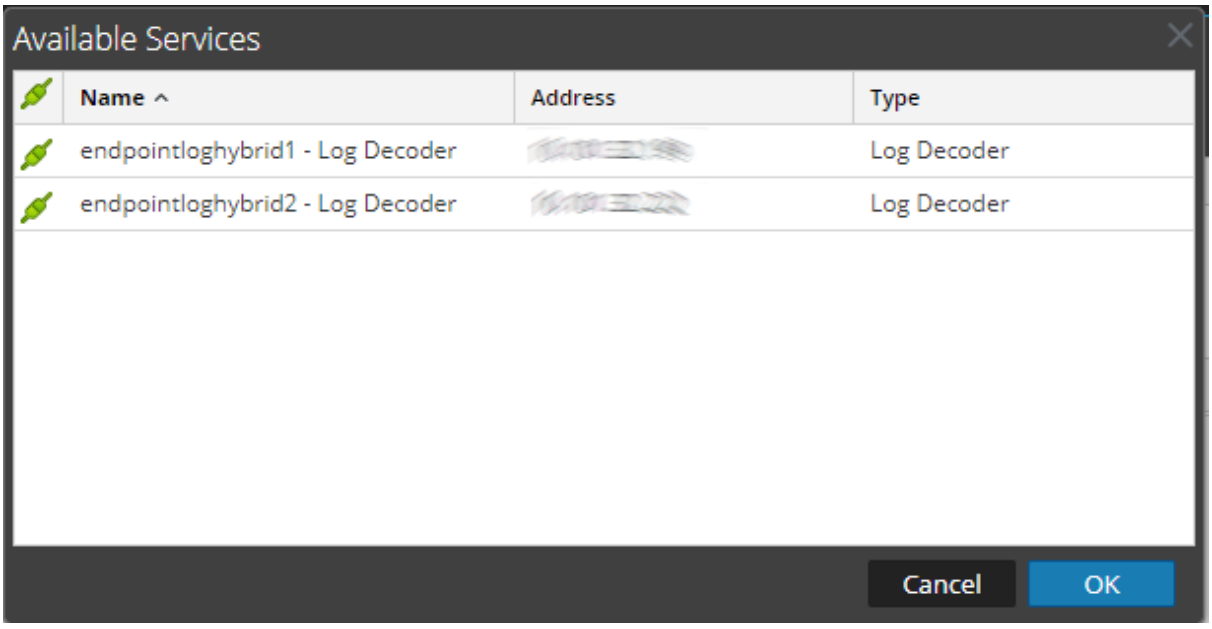
```
service rsa-nw-respond-server restart
```



After you create a custom Endpoint rule and update the risk configuration file, whenever an event is generated for the new rule (For example, In Encrypted Directory) an alert will be generated and the risk score is calculated for the host and file.

Configuring Metadata Forwarding

To view the metadata, you must enable the metadata forwarding while installing the Endpoint Log Hybrid. The Endpoint metadata is displayed in the NetWitness Investigate (**Navigate** and **Events** views) similar to Logs and Packets. For information on metadata mappings, see Endpoint Metadata Mappings.



To configure metadata forwarding:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

5. Click in the toolbar.

   The Available Services dialog is displayed.

6. Select a Log Decoder service and click **OK**.

   The Add Service dialog is displayed.

Note: You can add only one Log Decoder service.

7. Enter the administrator credentials for authentication.
8. (Optional) If you enable Raw Data, a brief summary of the session is forwarded along with the metadata.
9. (Optional) If you have enabled SSL on the REST port in the Log Decoder, select the **REST SSL** option. By default, the REST port for non-SSL is 50102.
10. Select the **Protobuf SSL** option to enable SSL on Protobuf. By default, the Protobuf port is 50202.
11. Click **Save**.

After configuring the metadata forwarding, make sure to:

- Start the capture on the Log Decoder
- Start the aggregation on the Concentrator
- Add the Log Decoder as a service in the **Concentrator**

Start Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Start
   The Endpoint Server starts forwarding the metadata to the Log Decoder.

Stop Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Stop.
   The Endpoint Server stops forwarding the metadata to the Log Decoder.

Remove Metadata Forwarding

Note: Make sure you stop the service, before removing the metadata forwarding.

1. In the Endpoint Meta config view, select the service.
2. Click −.
3. Click **Apply**.

Endpoint Metadata Mappings

You can view the default metadata mappings or modify the metadata mappings for endpoints.

JSON Schema for Metadata Mappings

All metadata mappings is configured using the JSON schema. The following is a sample JSON schema:

```
{
"metaKeyPairs" : [
     {
     "metaKeyPairsCategory" : "",
     "keyPairs" : [
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          },
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
```

```
            }
        ]
        }
]
}
```

The following APIs are used to view or modify the metadata mappings:

- `get-default` - Returns the default configurations for the endpoint metadata mappings.
- `get-custom` - Returns the custom configurations for the endpoint metadata mappings.
- `set-custom` – Helps customize the endpoint metadata mappings.

View the Metadata Mappings

To view the endpoint metadata mappings:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following command:
   `connect --host <IP address> --port <number>`

Note: The default port is 7050.

4. Run the following commands:

```
cd endpoint/meta
cd get-default
invoke
```

The following screen shows the default metadata mappings:

```
    {
      "endpointJpath" : "users/sessionType",
      "metaName" : "logon_type",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "hostFileEntries/hosts",
      "metaName" : "dhost",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "securityConfigurations",
      "metaName" : "event_state",
      "type" : "text",
      "enabled" : true
    }
  ]
},
{
  "metaKeyPairsCategory" : "MACHINE_IDENTITY",
  "keyPairs" : [
    {
      "endpointJpath" : "_id",
      "metaName" : "agent.id",
      "type" : "text",
      "enabled" : true
    },
```

To disable a default metadata mapping:

Enter the same endpointJpath value and set the enabled parameter to `false`.

For example, if the endpointJpath is `Category` and enabled parameter is `true`, enter the same endpointJpath and set the enable parameter to `false`.

```
{
  "metaKeyPairsCategory" : "COMMON",
  "keyPairs" : [
    {
      "endpointJpath" : "Category",
      "metaName" : "category",
      "type" : "text",
      "enabled" : true
    },
```

Note: Do not modify the metaKeyPairsCategory in the schema; “COMMON”, “COMMON_MACHINE”, “COMMON_MACHINE_FOR_EVENTS”.

To change the metadata name or metadata type:

Enter the same endpointJpath value and specify values for the metaName and type.

Note: The metaName must exist in the table-map.xml of the Log Decoder, index-concentrator.xml or index-concentrator-custom.xml file of the Concentrator, for the metaName to appear on the Investigate view.

Add or Modify Metadata Mappings

To add or modify the metadata mappings, run the `set-custom` API. The metaKeyPairs configuration provided in the JSON file should match the JSON schema of the default configuration received through the `get-default` API.

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following commands:

   ```
   connect --service endpoint-server
   ```

   Note: The default port number is 7050.

4. Run the following commands:

   ```
   cd endpoint/meta
   cd set-custom
   invoke --file <json file>
   ```

You can add new metaKeys by adding entries to the file that will be uploaded using the `set-custom` API. The following example shows how to add a new metadata mapping:

View the Custom Metadata Mappings

To view the custom metadata mappings, run the `get-custom` API, and then invoke commands.

Note: The `get-custom` API will return values only if the metadata mappings are modified using the `set-custom` API.

Endpoint Sources

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Endpoint agents deployed in your environment may be large in number and geographically distributed. To efficiently manage and update configurations automatically, agents can be organized into smaller subsets called **Groups**.

Groups

Groups can be created based on Machine OU, IP address (IPv4 and IPv6), host names, operating system type, and operating system description. You can create groups based on your requirements. For example, you can group all agents running on Windows 2016 Server and IP ranging from 10.40.10.1 to 10.40.10.200. For more information on creating groups, see Creating Groups and Policies.

Note: All agents that are not part of any group use the default policy settings.

Policies

To manage the behavior of agents in a group, you can apply a set of rules called **Policies**. The NetWitness supports three types of policies for endpoints: **Agent Endpoint**, **Agent File Logs**, and **Agent Windows Logs** policies. The following default policies are available on installation.

Note: NetWitness recommends that you review these default policies before deploying agents.

- Default Agent Endpoint (EDR) Policy
- Default Windows Log Policy
- Default File Log Policy

You can either assign the default policies to a group, modify the default policy, or create custom policies based on your organizational requirements.

Note: You cannot edit the default policy for Windows Logs nor for File Logs.

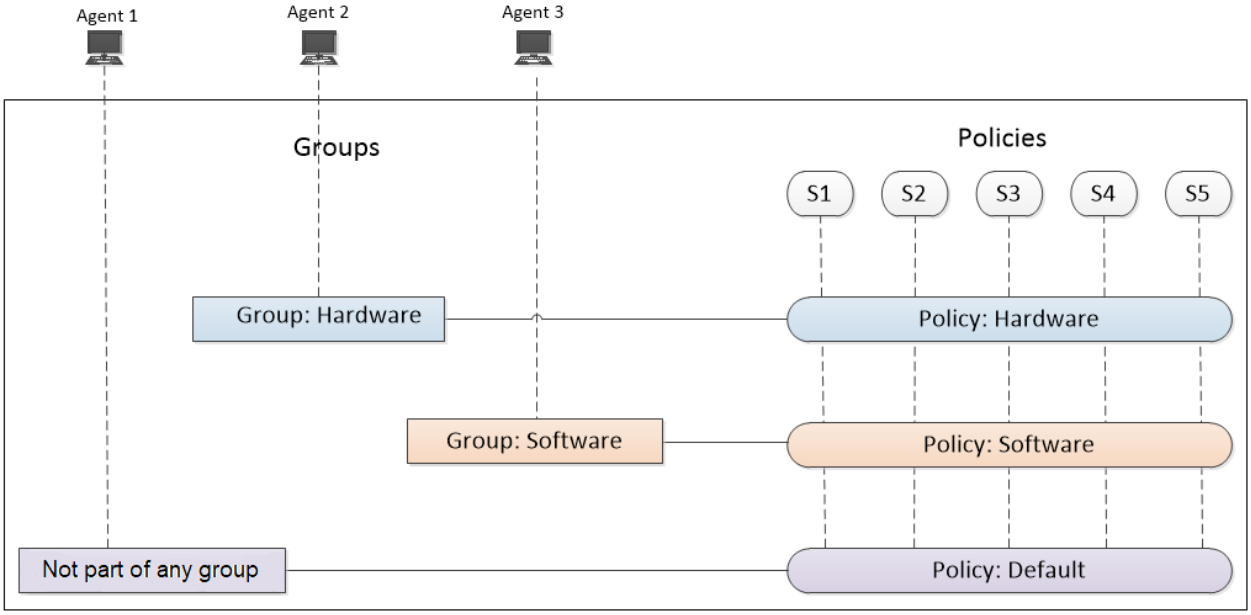
You can do the following through a policy:

- Define the agent mode - Insights or Advanced
- Configure scan schedule and settings
- Configure automatic file download
- Configure endpoint settings, such as which Endpoint server the agents should communicate, port details, and beacon intervals
- Configure response actions such as blocking
- Configure Windows and File Log collection

For example, you can create a policy to schedule scan and enable blocking. For more information on creating policies, see Create an EDR Policy, Create a File Log Policy, or Create a Windows Log Policy.

Group Ranking

When a group is created, a rank is associated with every group based on the creation order. If an agent belongs to multiple groups, to handle conflicting configurations, you can reorder the groups to change the ranking, and the policy associated with the highest ranked group takes precedence.

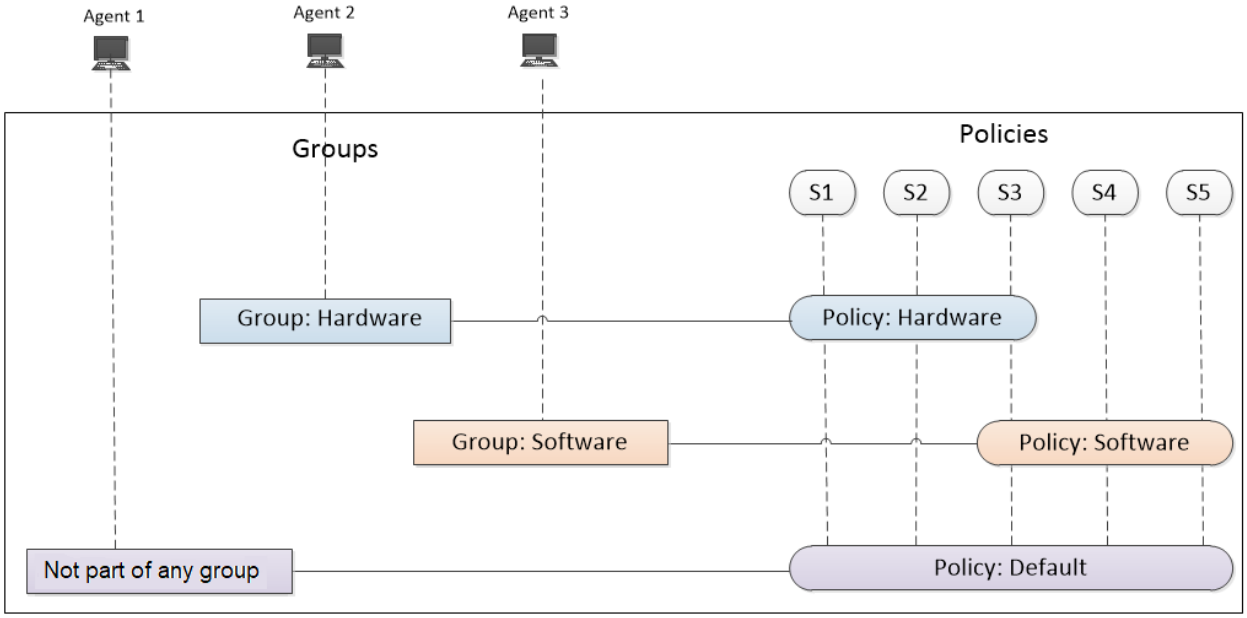


Example 1

A **Server** group contains 100 hosts with a default Agent Endpoint policy. Amongst these, if 20 hosts require further investigations, analyst can:

1. Create a temporary group with a static list of these 20 hosts.
2. Create or apply any policy to this group that will not impact any other hosts.
3. Edit the ranking for the new group, moving to the top of the Ranking list (making sure it is above the existing Server group).
4. After investigation is done, delete this group. The hosts are revalidated and assigned to the appropriate group based on the ranking.

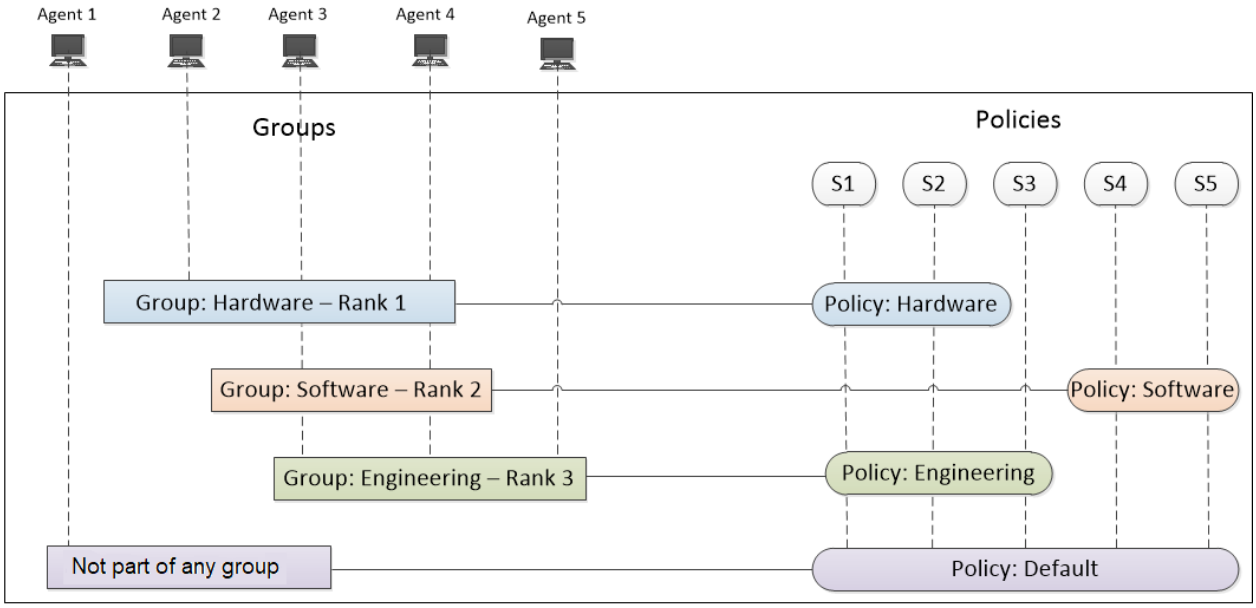
Example 2



Case 1:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

Each agent is a part of a unique group that is associated with a policy, where each policy has all settings S1, S2, S3, S4, and S5 defined. For example, Agent 2 is a part of the group Hardware, where all settings in the policy Hardware are applicable.



Case 2:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

In the policy Hardware, S4 and S5 settings are not defined, and hence the agent 2 inherits settings S4 and S5 from the default policy.

Case 3:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

- Agent 2 is a part of the highest ranked group Hardware, and with the policy Hardware. The agent 2 inherits settings S3, S4, and S5 from the default policy as they are not defined in the policy Hardware.

- Agent 3 is a part of Hardware, Software, and Engineering groups, and with the policy Software. The agent considers the settings S4 and S5 from the policy Software, and the remaining undefined settings are inherited as follows:
  - S1 and S2 from the policy Hardware, which is associated with the highest ranked group.
  - S3 from the policy Engineering, which is the next ranked group.
- Agent 4 is a part of Hardware, Software, and Engineering groups, and with the policy Engineering.
  - Though settings S1 and S2 are defined in policy Engineering, the agent 4 considers the settings S1 and S2 from the policy Hardware as it is associated with the highest ranked group.
  - S4 and S5 from the policy Software, which is the associated with the next highest ranked group.
  - S3 from the policy Engineering.

The following are some of the key points:

- If an agent is not assigned to any group, default policies are applied.
- A policy can be assigned to multiple groups. However, a group can only have one policy of each type (Agent Endpoint and Agent Windows Logs).
- An agent can belong to multiple groups. The policy is derived based on the ranking of the group as shown in the above example (case 3).
- If all settings are defined in a single policy, and it is the highest ranked policy for an agent, no policy settings from other ranked groups are inherited (case 1).
- If there are any undefined settings in the policy, the settings from the default policy is considered as shown in the example above (case 2 and 3).
- If an agent falls into more than one group, its complete set of policy attributes is determined as follows:
  - It takes all settings from the highest ranked policy that applies.
  - Any settings that are not set in the highest ranked policy are taken from the next highest ranked policy that applies.
  - If there are still unset attributes, they are taken from the default policy.
  - If there are any conflicts, the higher ranked policy wins.

Example 3

Assume the following:

- Agent A belongs to below two groups, **Production Servers** and **All Windows Hosts**.
- The Production Servers group has the **Schedule scan set and no blocking** policy assigned, and it has the following settings:
  - Schedule Scan : Enabled
  - Effective Date: 2019-03-08

  - Start Time: 09:00
  - Scan Frequency: Every 1 week
  - CPU Maximum: 45 %
  - Virtual Machine Maximum: 20 %
  - Blocking: Disabled
- The All Windows Hosts group has the **EDR for All Windows** policy applied, which has the following settings:
  - Scan Master Boot Record: Disabled
  - Blocking: Enabled
- The **Production Servers** group is ranked higher than the **All Windows Hosts** group for EDR policies. Keep in mind that ranking only applies to policies of the same source type: that is, all EDR policies are ranked, and all Windows Logs policies are ranked separately.

Agent A gets its final policy configuration as per the ranking of the groups (and associated policies) to which it belongs:

- The agent uses the schedule set in the **Schedule scan set and no blocking** policy.
- Scan Master Boot Record is disabled, because that is set in the **EDR for All Windows** policy.
- Blocking is disabled: since there is a conflict, the value in the higher ranked policy is used.
- All other attributes are set based on values in the Default EDR policy.
- Note that if you wanted Blocking to be enabled, you could change the group ranking so that All Windows Hosts is higher than Production Servers: in this case, Production Servers would win the conflict, and Blocking would be enabled for Agent A.

Default Agent Endpoint (EDR) Policy

When an agent is installed, it operates in an Insights mode until a policy is assigned. The following are the default EDR policy settings:

Settings	Fields	Default Value
Scan Schedule	Run Scheduled Scan	Disabled
	Effective Date	Current date
	Scan Frequency	Every week
	Start Time	09:00 (this is 9 AM)
	CPU Maximum	25%
	Virtual Machine Maximum	10%

Settings	Fields	Default Value
Agent Mode	Monitoring mode	Advanced
Scan Settings	Scan Master Boot Record	Disabled
	Auto Scan New Systems When Added	Disabled
File Download Settings	Automatic File Download	Enabled
	Automatic Memory DLL Download	Enabled
	Signature	Exclude All Signed
	File Size Limit	1 MB
Response Action Settings	Blocking	Disabled
	Network Isolation	Disabled
Endpoint Server Settings	Endpoint Server	The agent considers the default Endpoint Server that is configured during packager generation.
	Server Alias (Optional)	
	HTTPS Port	443
	HTTPS Beacon Interval	15 Minutes
	UDP Port	444
	UDP Beacon Interval	30 Seconds

Default Windows Log Policy

The following are the default Windows Log policy settings:

Settings	Fields	Default Value
Windows Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

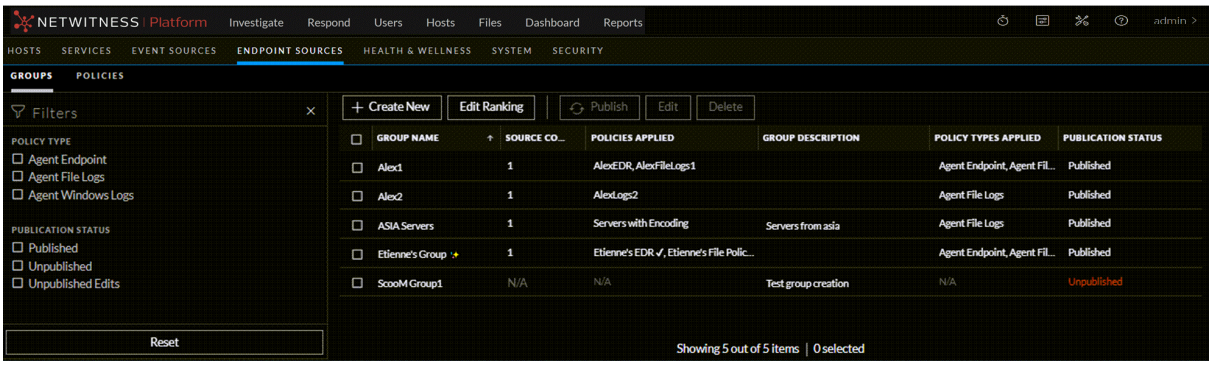
Default File Log Policy

The following are the default File Log policy settings:

Settings	Fields	Default Value
File Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

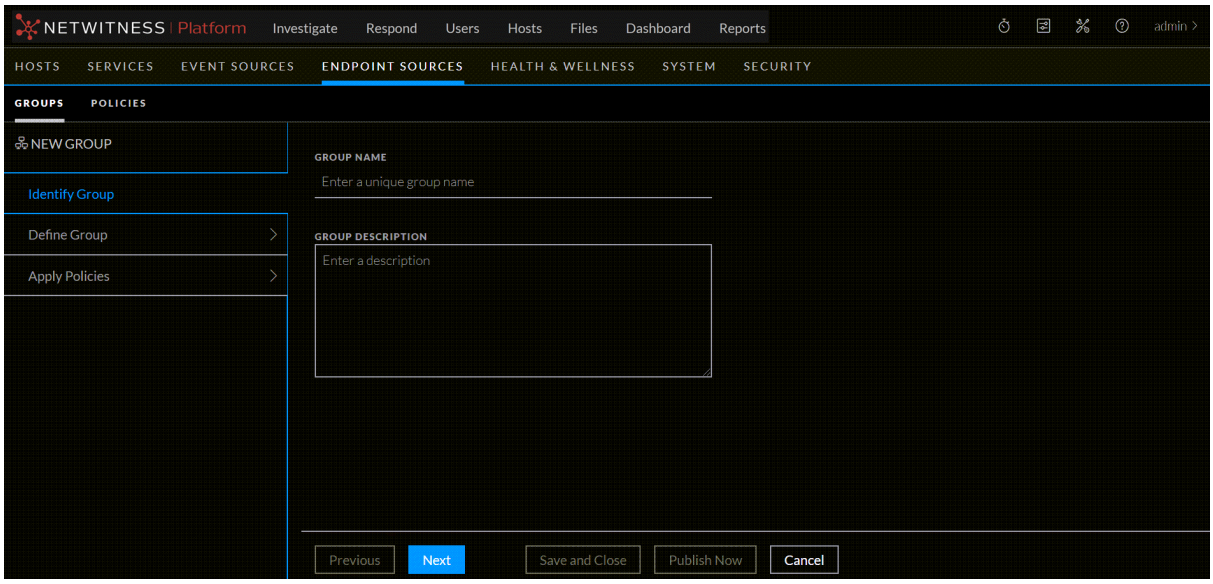
Creating Groups and Policies

Note: The information in this topic applies to NetWitness Version 11.3 and later.



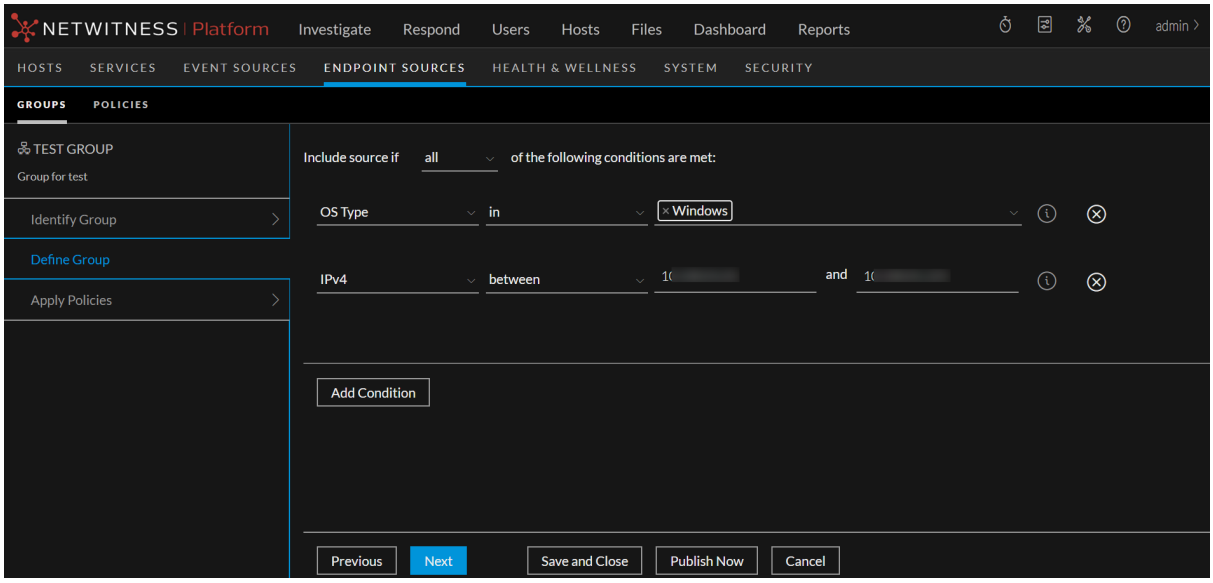
The following sections provide instructions on how to create groups and policies.

- Groups: Create a Group
- Policies:
  - Construct a Policy
  - Create an EDR Policy
  - Create a Windows Log Policy
  - Create a File Log Policy
  - Replace Windows SFTP Agents



Create a Group

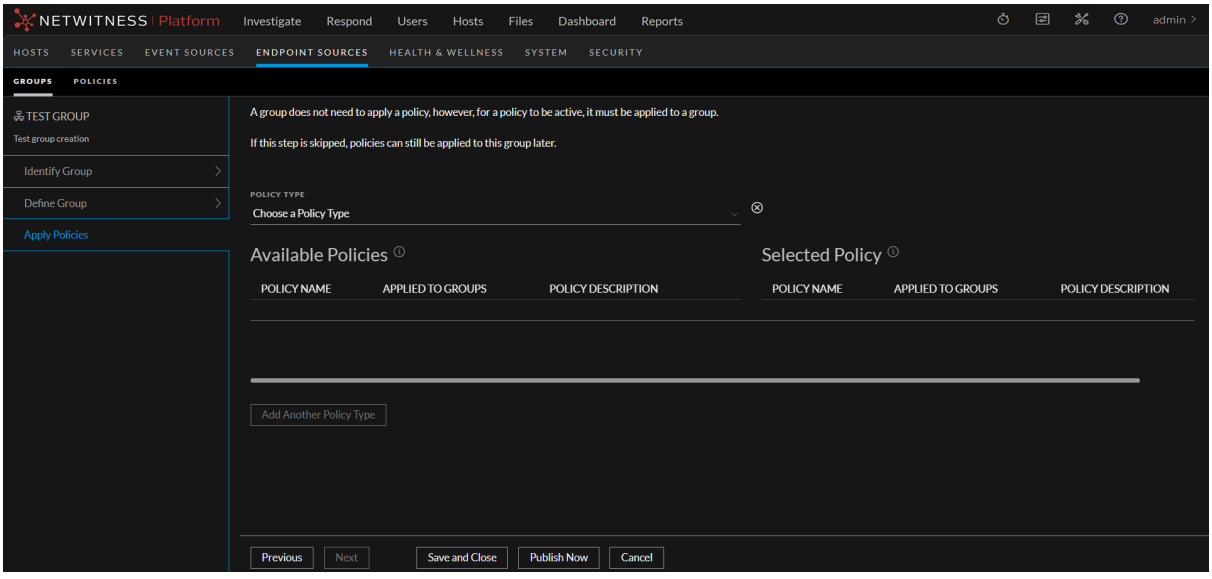
To create a group:



1. Go to **(Admin) > Endpoint Sources** view.
2. In the left panel, select the **Groups** tab.

3. In the toolbar, click **Create New**.
4. In the **New Group** panel, enter a group name and group description, and click **Next**.

5. Specify the logical statements that define the condition for an agent to be included in the group. Each logical statement consists of: parameter, operator, and values to match.



- In the **Include source if ___ of the conditions are met** field, select either **all** or **any**.
- For each logical statement, select the required options:

Item	Description
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU, Tag, and Subnet. • OS Type, OS Description, Host Name: The value you enter should reference hardware or virtual machines that are running endpoint agents. • IPv4 or IPv6: Enter valid IP addresses as either ranges or as a set of IP addresses to include or exclude. • Machine OU: Enter a valid Machine OU(Organizational Unit) name. • Tag: Enter a valid tag that already exists. • Subnet: Enter a valid Subnet mask. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP addresses separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.

6. Continue adding conditions until you have completely specified the new group. After you have added all conditions, click **Next** to proceed.
7. (Optional) Click **Apply Policies** and select the source type from the drop-down list.

   Policies with the selected source type are displayed below **Available Policies**.

   Select a policy by clicking . Skip this step if you want to apply a policy to the group at a later time.

Note: You can attach only one policy per source type to a group. That is, you cannot attach more than one Agent Endpoint policy to a single group, nor more than one Agent Windows Logs policy.

For more information on creating policies, see Create an EDR Policy, Create a Windows Log Policy, or Create a File Log Policy.

8. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Groups view. The publication status is displayed as **Unpublished** in the Groups view.

     Note: You can select an unpublished group and click **Publish** to publish a group.
   - Click **Publish Now** to publish the group.

Construct a Policy

When you create a policy, you should keep in mind the way groups and Agents can inherit values from other policies. The simplest way to construct a policy is to set values for all of the available settings for that policy type. If you do this, you can assign the policy to one or more groups, and all of the agents in those groups can receive the settings defined in the policy itself.

However, you do not need to set all possible available settings within a single policy. In the Group Ranking section, there are examples that show where values can come from, based on the ranking order.

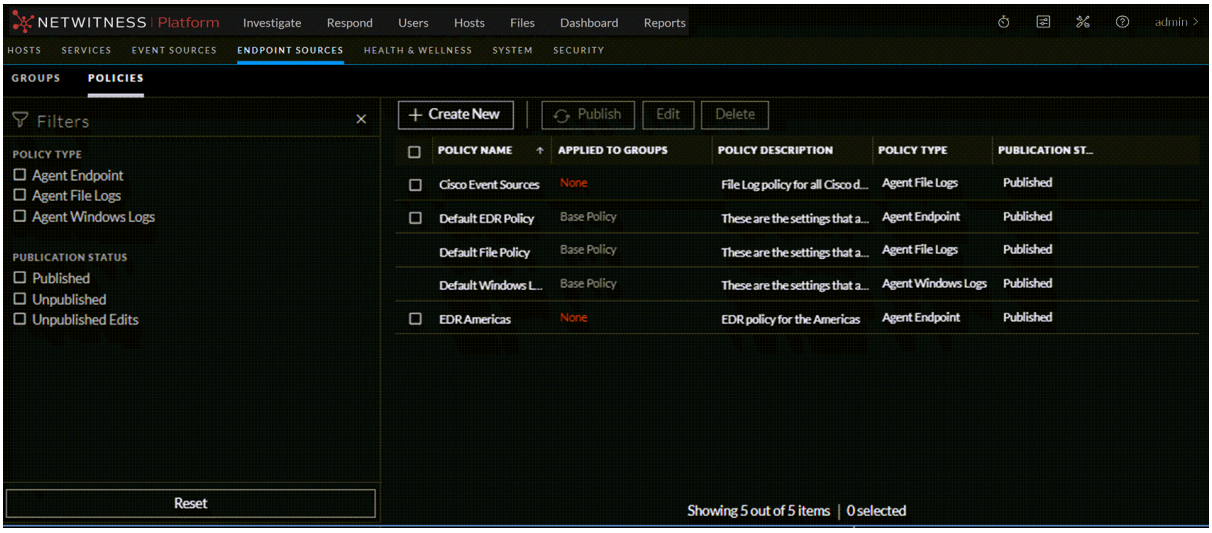
Note: Remember that a group can have no more than one of each policy type assigned to it: it can be assigned 0 or 1 Agent Endpoint, Agent File Logs, and Agent Windows Logs policies.

If an agent is only a member of one group, that agent's settings are as follows:

- If a value is set in the policy assigned to the group, that value is used.
- If a value is not set in the policy assigned to the group, the value set in the default policy is used.

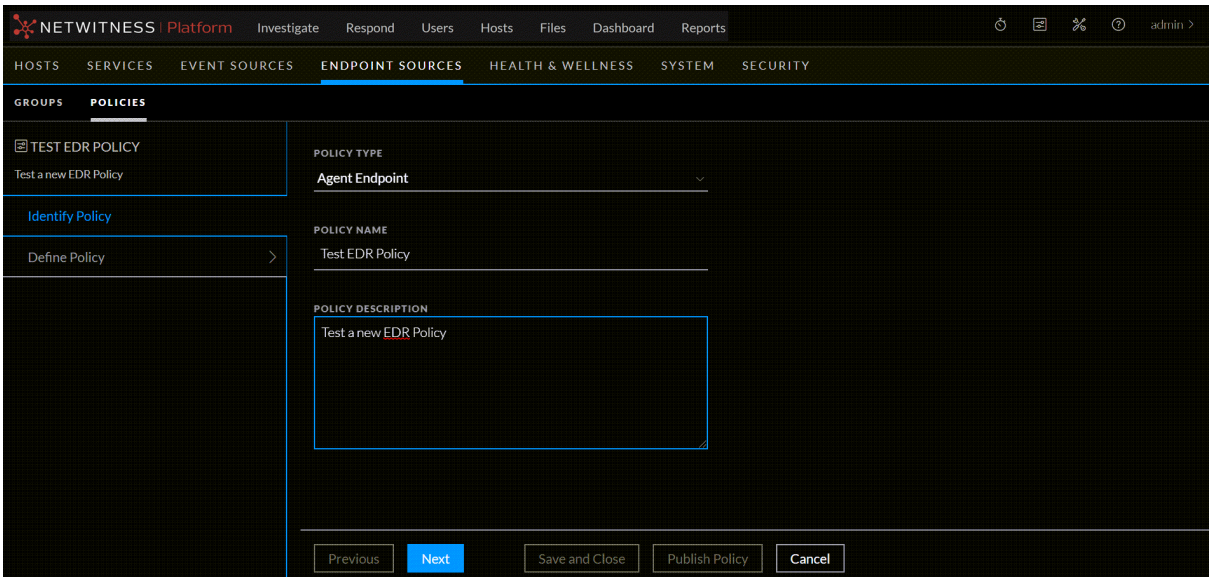
For agents that are members of multiple groups, it is a bit more complicated. For these agents, the settings are evaluated from highest priority member group (as set on the Edit Rankings page) to the lowest priority member group. If a parameter is set in a higher group, it is not overwritten, event if the same parameter is also set in a lower group. For example, assume an Agent is part of three groups:

- If a value is set in the highest ranked policy, the agent uses that value.
- If a value is not set in the highest ranked policy, but is set in the second-highest-ranked policy, the agent uses the value from the second-highest-ranked policy.
- If a value is not set in either the first- or second-highest ranked policy, but is set in the third-highest-ranked policy, the agent uses the value from the third-highest-ranked policy.
- If a value is set in the highest-ranked policy and either or both of the other policies, the value is taken from the highest-ranked policy.
- If a value is not set in any of the three policies assigned to the agent, the agent uses the value set in the default policy.



Create an EDR Policy

While creating a policy, note the following:

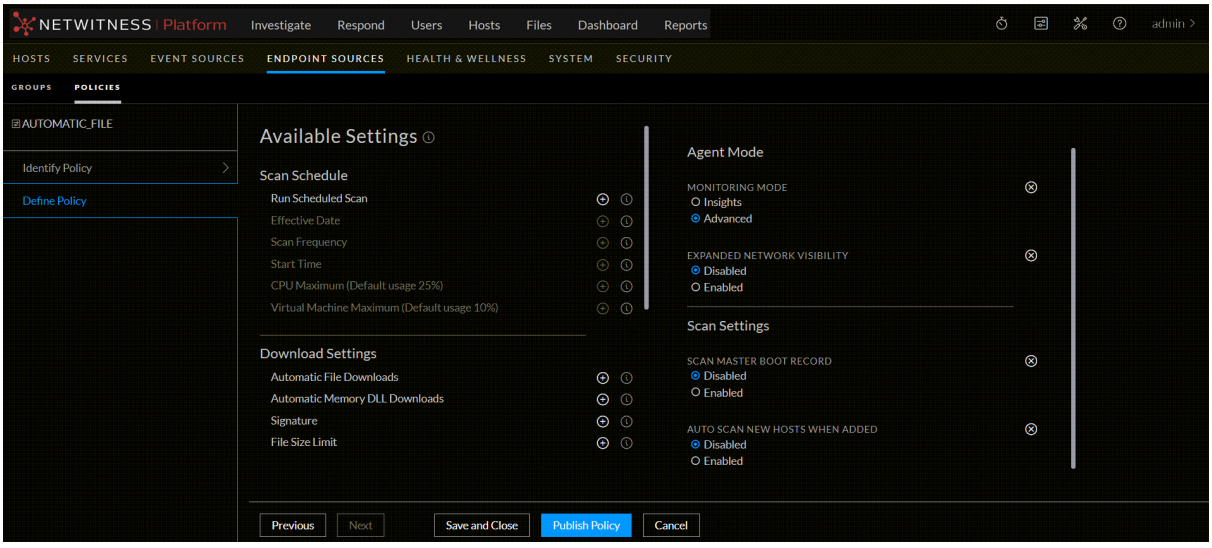


- Whenever you choose a setting, it is added to the **Selected Settings** panel.
- To clear any of your selected settings, click  to remove that setting.
- At any point in the wizard, you can choose **Save and Close**, so that you can return to complete the policy at a later time.

To create an EDR policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.

3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Endpoint** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings. For details, see Define Policy Panel for Agent Endpoint Policy.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

- In the Scan Schedule category, enable **Run Scheduled Scan** to configure the scan, and set any of the available parameters based on your needs. For more details, see Define Policy Panel for Agent Endpoint Policy.
- In the **Agent Mode** category, you can set the following:
  - Select the monitoring mode of the agent - Insights or Advanced.
  - Select **Expanded Network Visibility**:

    ### Prerequisite

    Note: For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*.

    - To enable network tracking and monitoring on Windows hosts in Insights mode.

    Note: Reports UDP connections for Windows 10 version 1803 in Insights mode.

    - To optimize the frequency of agents sending network events for both Insights and Advanced modes.
    - The endpoint agents should have the **Expanded Network Visibility** option enabled for enriched network events from NetWitness Platform packet deployment with endpoint data. In the **Events** View > **Hosts** tab, the endpoint data related to the network event selected will be automatically displayed if it exists. For more information, see "Host Information" in the *Investigate User Guide*.

    Note: For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service is enabled.
- In the Scan Settings category, you can enable either or both of the following actions:
  - Enable **Scan Master Boot Record** to include Master Boot Record (MBR) details in scheduled scans.
  - Enable **Auto Scan New Systems When Added** to automatically queue a scan for any host that does not have any snapshot data
- In the Download Settings category, you can set the following:
  - Enable **Automatic File Downloads** to automatically download files based on the Signature and file size. By default this option is enabled.
  - Enable **Automatic Memory DLL Downloads** to automatically download all the memory DLLs that are detected during a scan. By default this option is enabled.
  - Select the **Signature** type to limit the download of files based on the signature (not available for Linux systems).

- Specify the **File Size Limit** to limit the download of files based on the file size. The file size limit should be between 1 KB - 10 MB.

- In the Response Action Settings category you can enable or disable the following actions:
  - Enable **Blocking** to prevent the execution of a malicious file on any host.
  - Enable **Network Isolation** to provide an option to isolate a compromised host during investigation.
- In the Endpoint Server Settings, configure your server:
  - Add the Endpoint server that the agent will communicate from the drop-down list.

    Note: If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
  - (Optional) Enter an alternative hostname or IP address.
  - Enter the HTTPS port used for communication.
  - Specify the HTTPS beacon interval.
  - Enter the UDP port used for communication.
  - Specify the UDP beacon interval.
  - **Advanced Setting** - For NetWitness Support staff only.

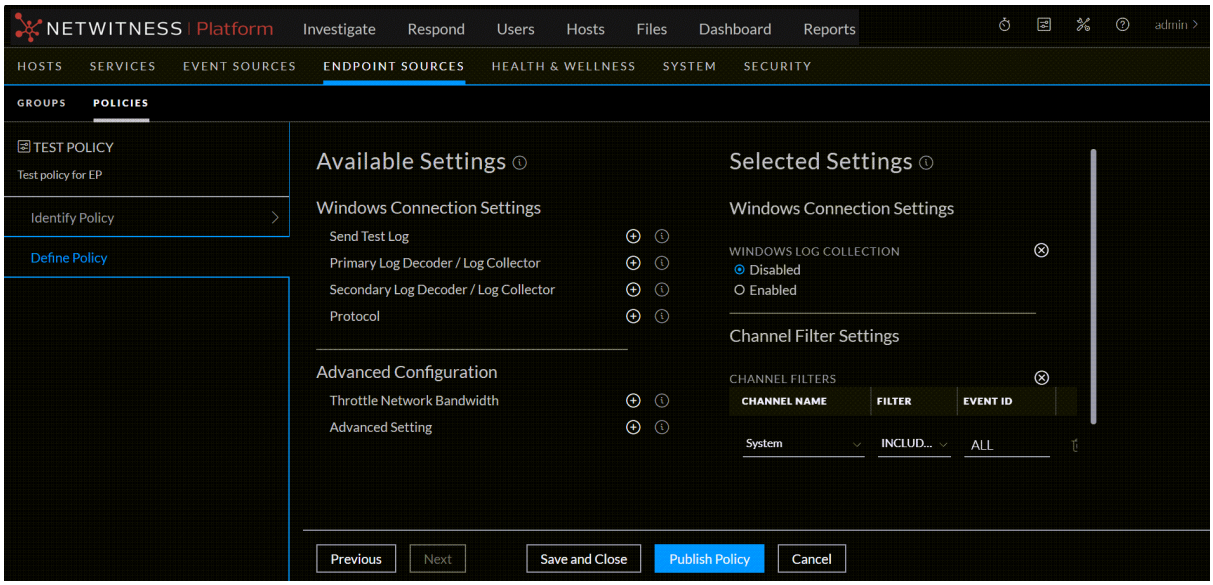
    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a Windows Log Policy

To create a Windows Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Windows Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting it is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

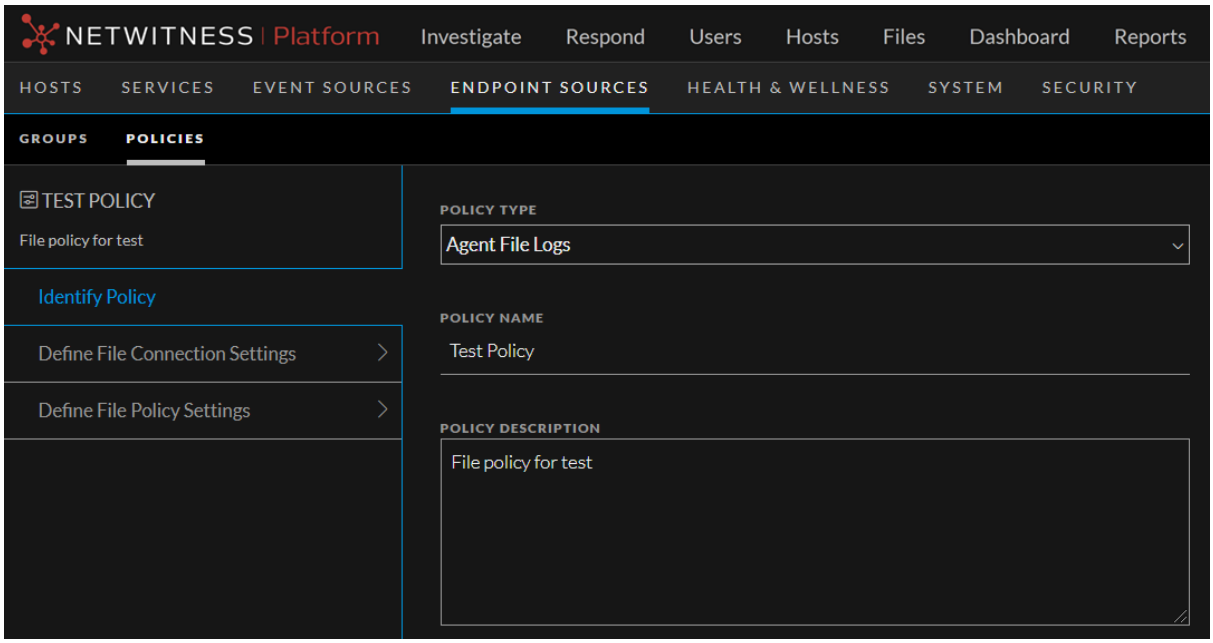
- Select **Windows Log Collection** to enable Windows Log collection. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TLS.
- Add **Channel Filters** and select the channels from which the logs are collected from the drop-down list. You can add or remove a channel filter and specify individual Event IDs.

- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.



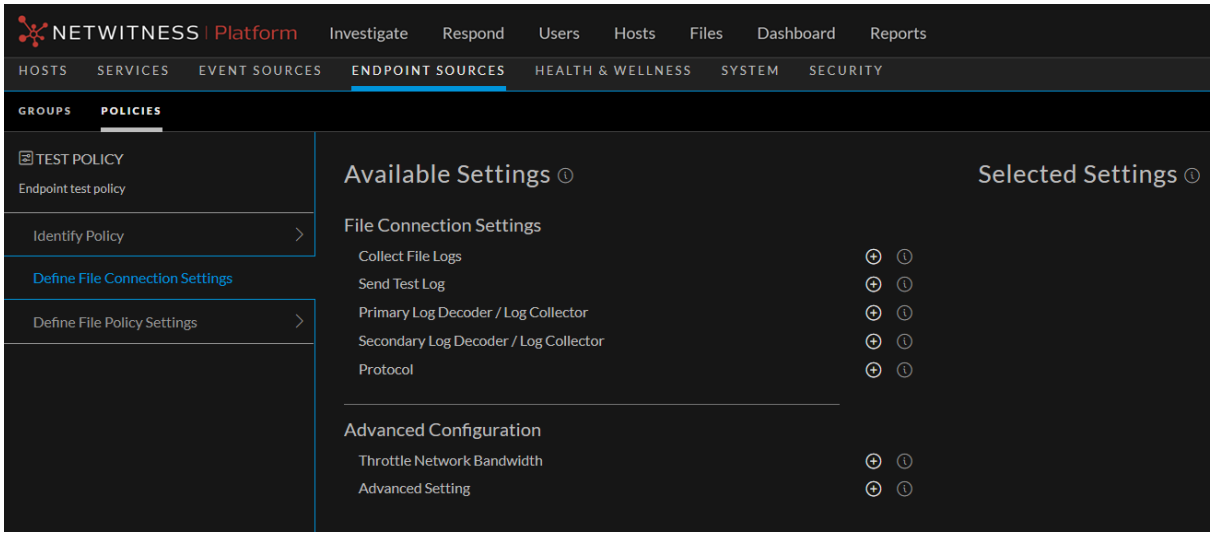
7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a File Log Policy

Note: You cannot create File Log policies while the system is in mixed mode. Until all Endpoint servers are updated to 11.4, the Agent File Logs options on the policy create, assign policy, and edit ranking pages are disabled.

To create a File Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

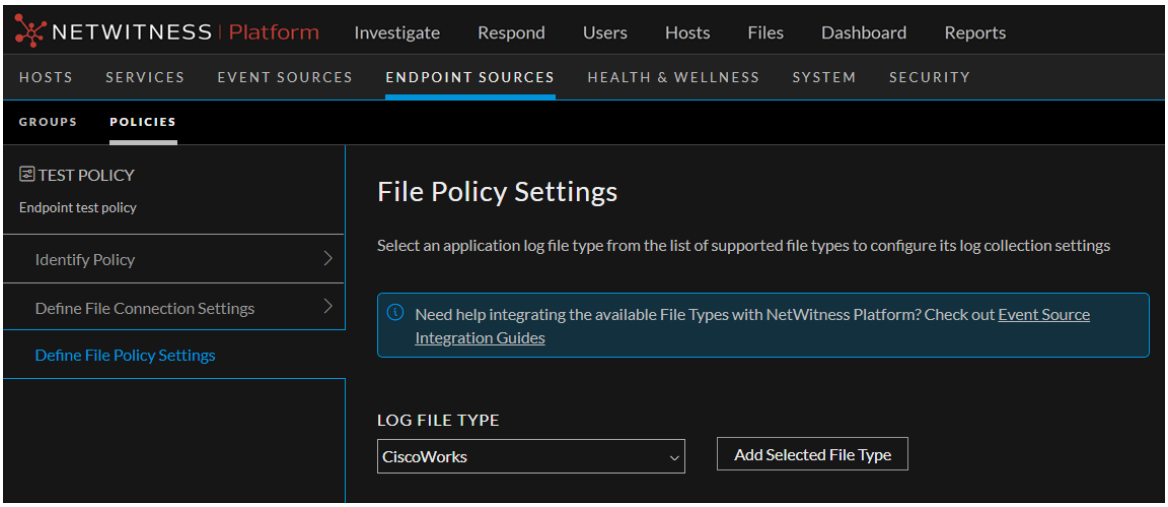


- Select **Agent File Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- Enable **Collect File Logs** to collect file logs on endpoints assigned to this policy. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward file logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward file logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.
- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Click **Next**, and add the file type or types for the policy.
   a. Select a log file type from the list, then click **Add Selected File Type** to configure its log collection settings.

   For a list of currently supported event source types, see Endpoint Sources - Policies.

   b. Choose values for the available parameters.

- **Collect Logs**: Select **Enable** or **Disable**.
- **On First Connect**: Choose whether or not to collect older, historical data, or just new data. The default setting is to collect new data only.

  Note: New data is data that is collected starting from when you configure log collection for the specified event source.

- (Optional) **Log File Path**: Add a path for where the log files are stored. This is only necessary if the log files are not stored in the standard directory for the selected event source type. To add a path, click **Add Path** and enter a pathname.

  Note: This can be a Universal Naming Convention (UNC) pathname. (`\\host-name\share-name\file-path`).

  Click **Add Path** again to add another path. You can add as many paths as you like.

- **Exclusion Filters**: You can enter a newline-separated list of exclusion filters, which specify log files from which NetWitness should not be collecting data.

  Note: The filter needs to be entered as a valid regex string, or the system will not allow you to save it.

- Advanced Settings: note that most users do not need to set these parameters.
  - **Source Alias**: For most installations, this value is not needed. Use this to specify a unique event source name, in the case you have multiple event sources of the same type, for example two IBM WebSphere MQ event sources in the same NetWitness installation.
  - **File Encoding**: Select a type of file encoding. You can choose from a wide variety of encodings. The default value is **UTF-8/ASCII**.

For more details on the available parameters, see Panels for Log File Policy.

c. You can add more file types to the policy. After you have added all your file types, proceed to the next step.

8. Do one of the following:

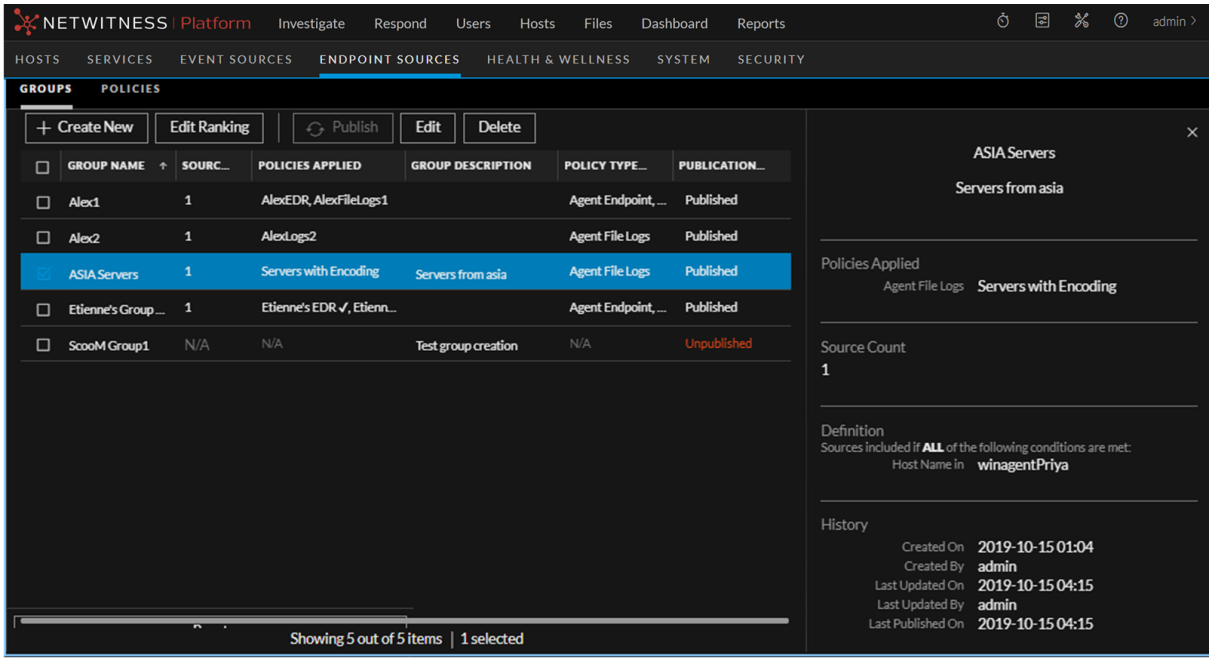
- Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
- Click **Publish Policy** to publish the policy.

Replace Windows SFTP Agents

Note that you might want to replace the SFTP Agent for Windows with the NetWitness Endpoint Agent for collection from file event sources. If so, perform the following procedure:

1. Using the File Collection Policy wizard (as described below), configure file collection for your event sources.
2. Verify that collection is working.
3. On each of your event sources, stop the SFTP service.

Managing Groups



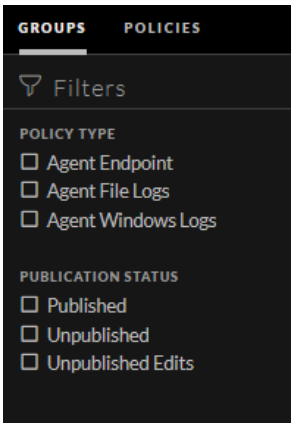
Note: The information in this topic applies to NetWitness Version 11.3 and later.

You can view group details, edit group details, filter endpoint groups, delete groups, and edit group ranking. For details on how to create groups, see Create a Group.

View Group Details

To view properties of the selected group:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Groups** tab. The details, such as group name, source count, policies applied, group descriptions, source type applied, and publication status are displayed. For more details on these columns, see Endpoint Sources - Groups.
3. Click the row to view the properties in the right-panel.



Filter Endpoint Groups

The Filters Panel allows you to filter the list of displayed groups, based on the one of the following source type:

- Agent Endpoint
- Agent Windows Logs

Additionally, you can sort based on publication status:

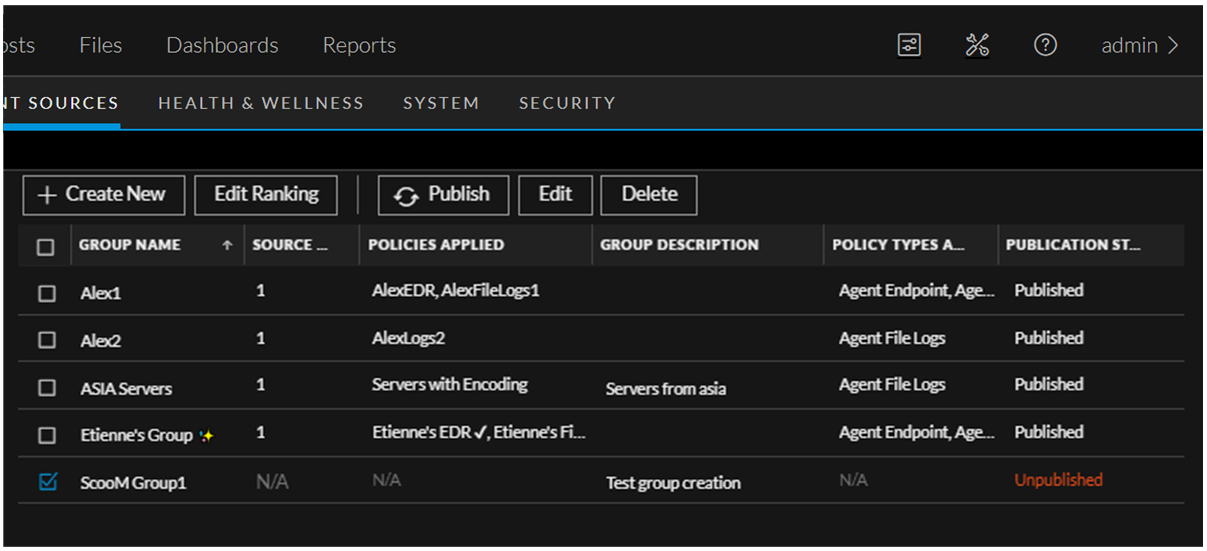
- Published - Groups that are published to use.
- Unpublished - Groups that are saved but not published.
- Unpublished Edits - Groups that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filter criteria.

Edit a Group



You can edit the properties of the group at any point in time. To edit properties of a group:

1. Go to **(Admin) > Endpoint Sources**.
2. Select a group and click **Edit**.
3. Edit the group details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Groups view. The group will be listed under the **Unpublished Edits** category.
   - Click **Publish Now** to publish the changes.

Delete a Group

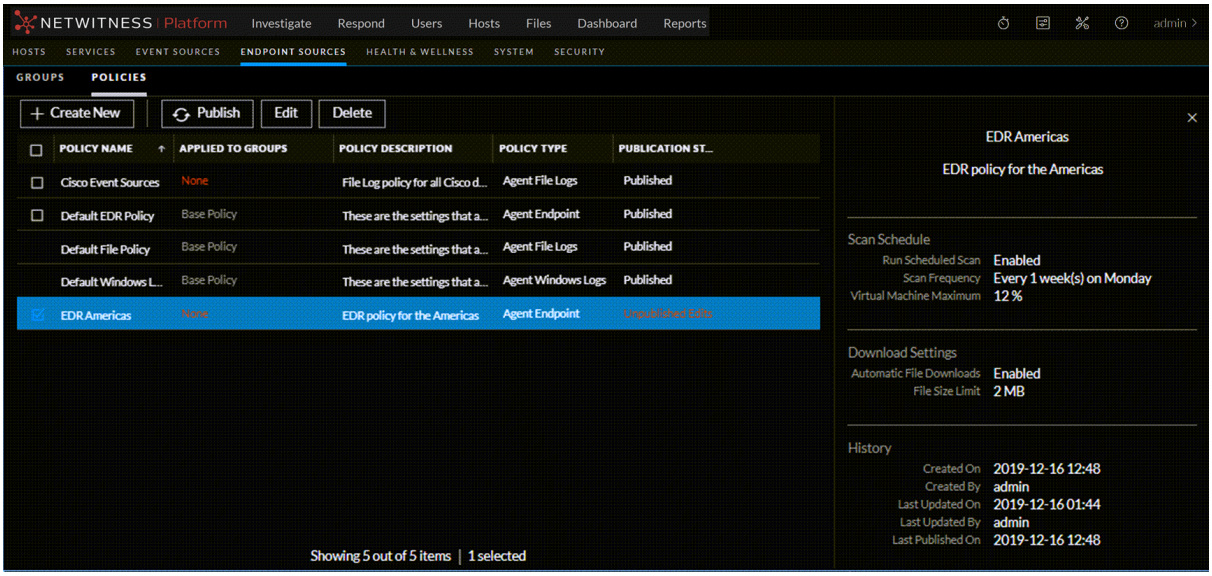
To delete a group:

1. Go to **(Admin) > Endpoint Sources**.
2. The **Groups** tab and available groups are displayed.

3. Select one or more groups and click **Delete**.
4. Click **Delete**. The confirmation message is displayed.
5. In the Delete Groups dialog, click **Delete Group(s)** to permanently delete the selected groups.

Managing Policies

Note: The information in this topic applies to NetWitness version 11.3 and later. Policies are not applicable on standalone agents.



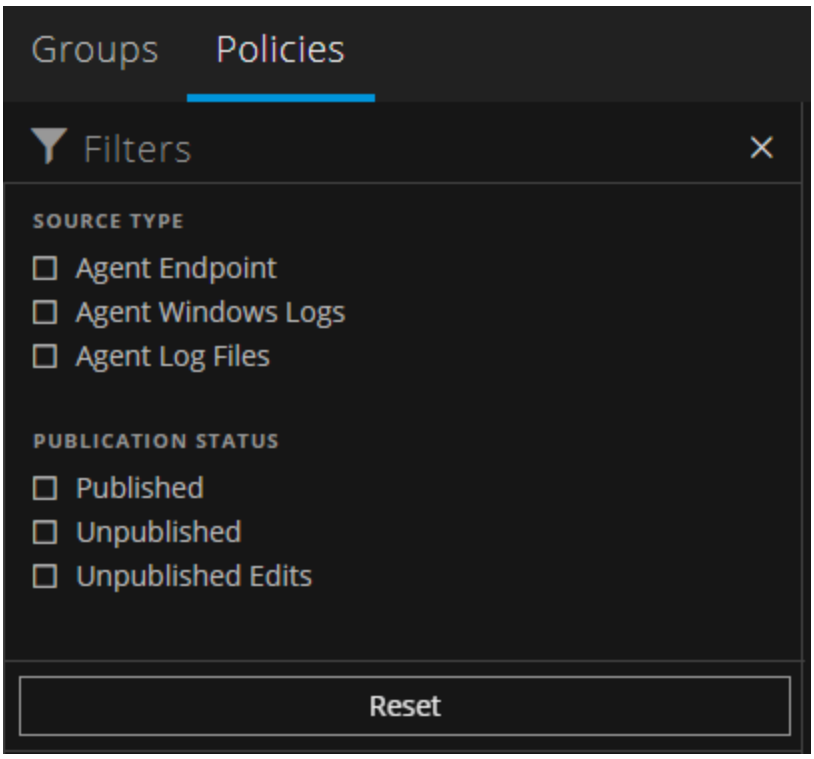
You can view, edit, filter, and delete policies, as detailed in the following sections:

- View Policy Details
- Filter Policies
- Edit a Policy
- Delete a Policy
- Conflict Resolution

View Policy Details

To view properties of the selected policy:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Policies** tab. The details, such as policy name, applied to groups, policy description, source type, and publication status are displayed. For more details on these columns, see Endpoint Sources - Policies.
3. Click the row to view details about selected policy in right pane.



Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the source type. You can filter on any combination of the following:

- Agent Endpoint
- Agent File Logs
- Agent Windows Logs

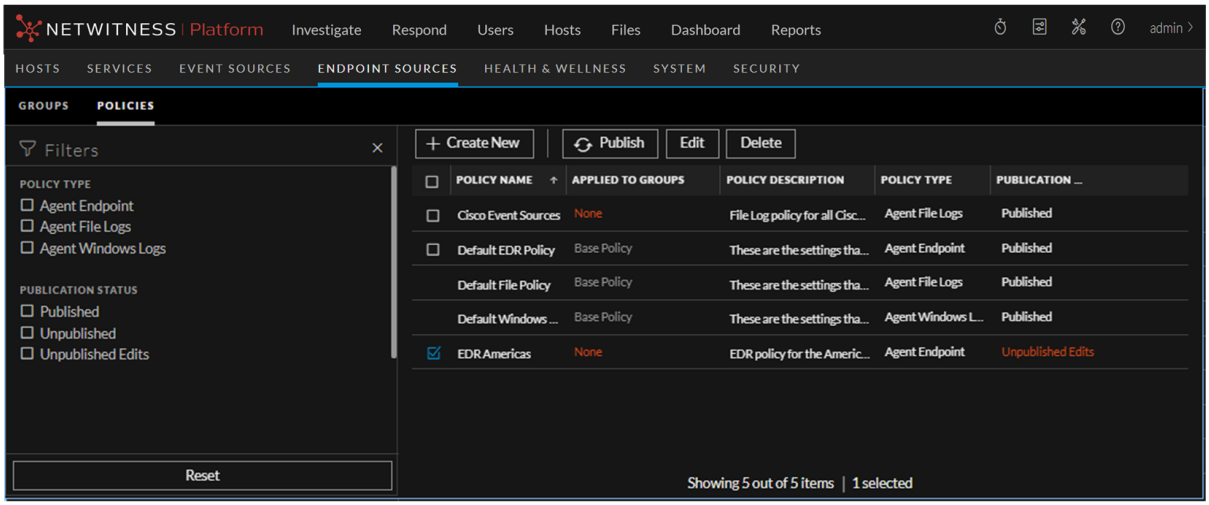
Additionally, you can filter based on publication status:

- Published: Policies that are published to use.
- Unpublished: Policies that are saved but not published.
- Unpublished Edits: Policies that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filtering criteria.



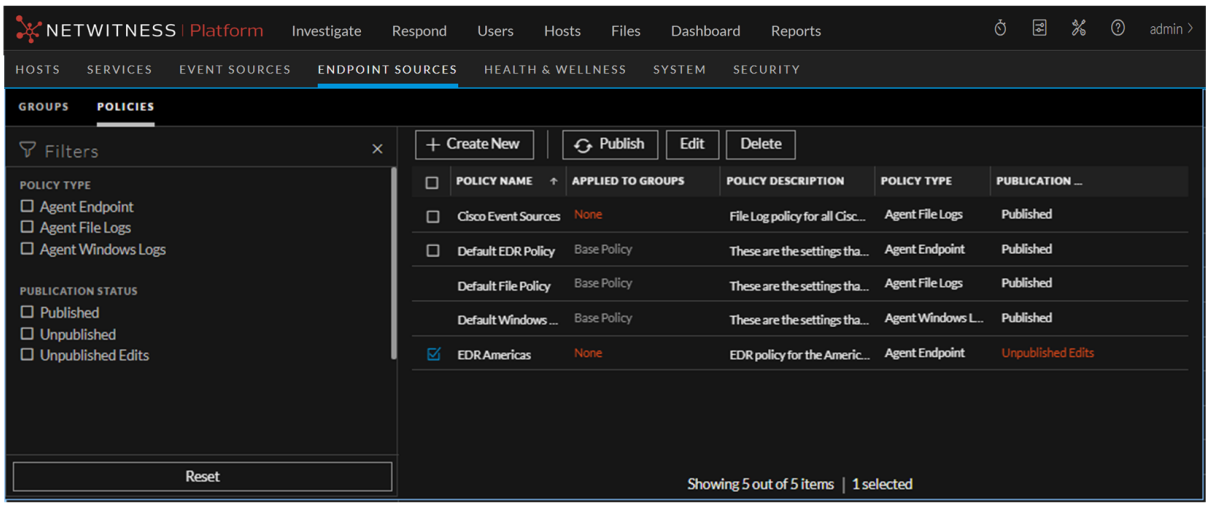
Edit a Policy

You can edit the settings of the default Agent Endpoint and custom policies. The default Agent Windows Log policy cannot be edited.

Note: For the default EDR policy, you cannot edit the source type, policy name, and policy description. However, you can edit the details in the Define Policy panel.

To edit a policy:

1. Go to **(Admin) > Endpoint Sources**, and select the **Policies** tab.
2. Select a policy and click **Edit**.



3. Edit the policy details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Policies view. The policy will be listed under the **Unpublished Edits** category.
   - Click **Publish Policy** to publish the changes.

Delete a Policy

To delete a policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click the **Policy** tab. The available policies are displayed.

3. Select one or more policies and click **Delete**.

   The confirmation message is displayed.

4. In the Delete Policies dialog, click **Delete Policy(ies)** to permanently delete the selected policies.

Conflict Resolution

An endpoint can be in more than one group, and can thus have more than one Agent Endpoint, Agent File Logs, or Windows Logs policy applied to it. In this case, there may be conflicting settings that could be applied to the endpoint.

For example, an endpoint that is in two Groups could have two, different File Log policies applied to it. In this case, some of the settings could have conflicting values. The value that is actually applied to the endpoint is determined by the highest-ranked policy that contains a value for that setting.

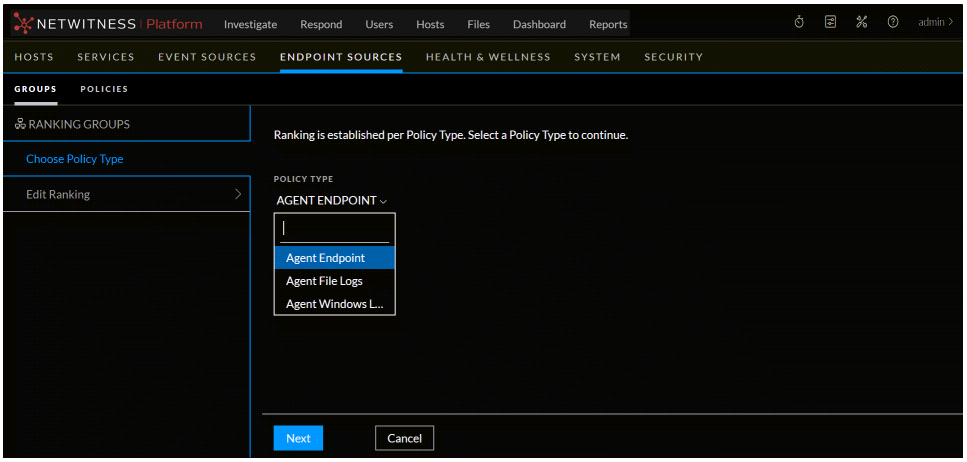
For example, assume there is an endpoint that has 2 Agent File Log policies applied to it:

- LF Policy One: Log File Type is webgateway, and **File Encoding** is set to UTF-8
- LF Policy Two: Log File Type is webgateway, and **File Encoding** is set to Local Encoding

How NetWitness assumes the webgateway logs are encoded is dependent upon which policy is ranked higher:

- If Policy One is ranked higher than Policy Two, NetWitness treats the logs as having UTF-8 encoding.
- If Policy Two is ranked higher than Policy One, NetWitness treats the logs as having Local Encoding.

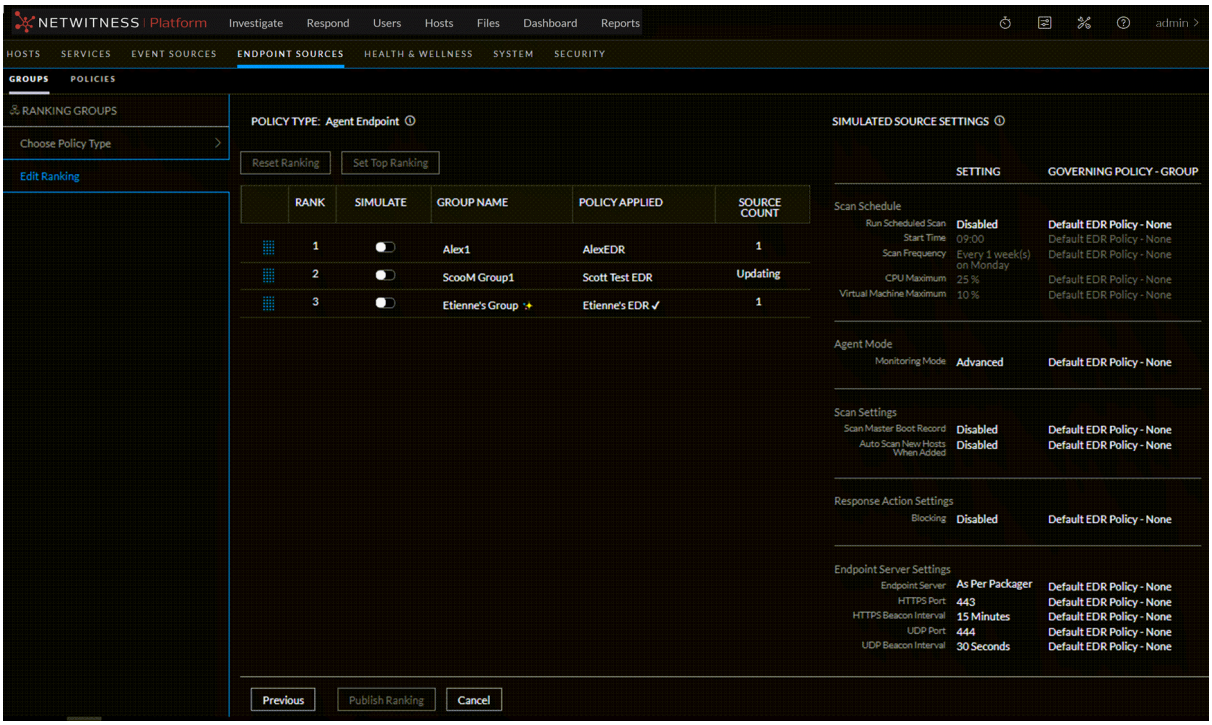
For an example using EDR policies, see Simulation Examples, which shows how you can preview the settings that would be applied before actually changing any policy rankings.



Change Policy Ordering for Groups

An endpoint agent can be included in multiple groups. And these groups can have different policies applied to them. In this case, you can edit the ordering or ranking of policies, to specify a hierarchy for your policies.

Edit Ranking



To edit the ordering or ranking of a group:

1. Go to  **(Admin) > Endpoint Sources**.
2. Select the Groups tab and click **Edit Ranking**.
3. Select one of the following source type for the drop-down list:
   - **Agent Endpoint** to rank the groups associated with Agent Endpoint type policies.
   - **Agent Windows Logs** to rank the groups associated with Agent Windows Log type policies
   - **Agent Log Files** to rank the groups associated with agents that are using File Collection.

4. Click **Next**.

   The Ranking view is displayed:

You can simulate your policy settings and how they affect the endpoints within their groups. This gives you the ability to preview how your changes to the ranking will affect the policy settings applied to each hypothetical agent.

5. You can manipulate the sliders to simulate different options. You can select the slider in the **Simulate** column for each group into which a hypothetical agent would fall, and drag it to the right to simulate turning on that policy.

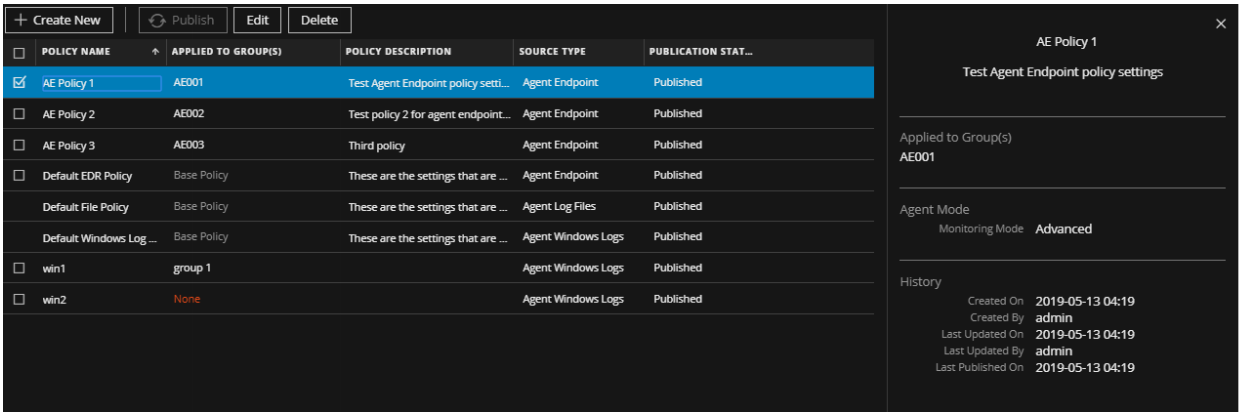
   This image shows all policies being simulated:

6. Reorder your groups as necessary.
   a. Select anywhere within a group's row.
   b. Drag the group up or down to change the priority. Priority decreases from top to bottom.
   c. Repeat moving groups until they are ordered as you prefer.

   Note: To move any group to the top, select the group and click **Set Top Ranking**.

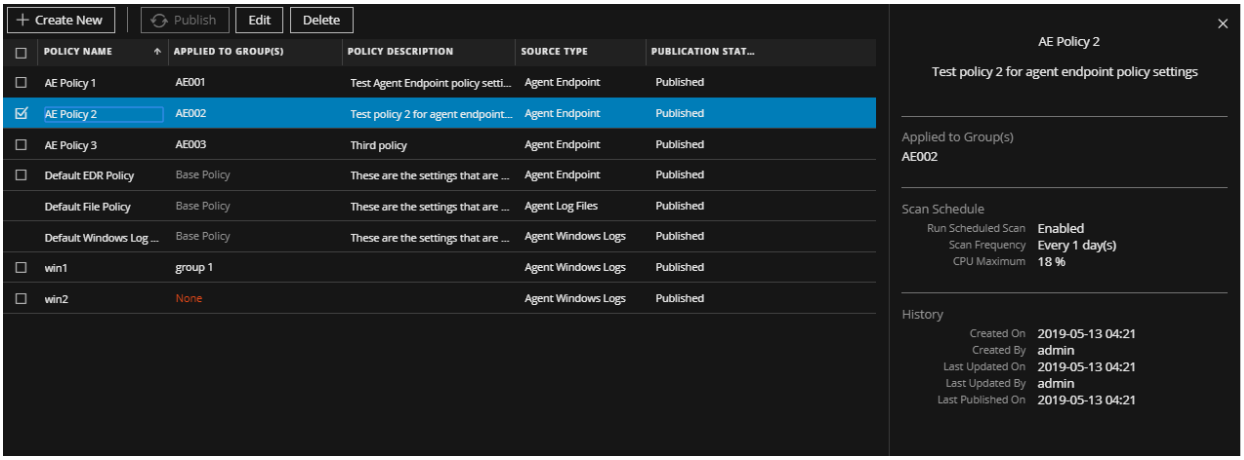
7. As you change the rankings for your groups, you can preview how the policy settings would change based on your new rankings. For example, assume each of the following scenarios:
   - If you have a hypothetical agent that belongs in group 1, simulate only group 1 to see which policies would affect that agent.
   - If you have a hypothetical agent that belongs in group 1 and group 2, simulate both group 1 and group 2 to see how policies would be applied for that agent.
8. After you have specified the optimal ranking order, you can publish the new ranking.

Simulation Examples



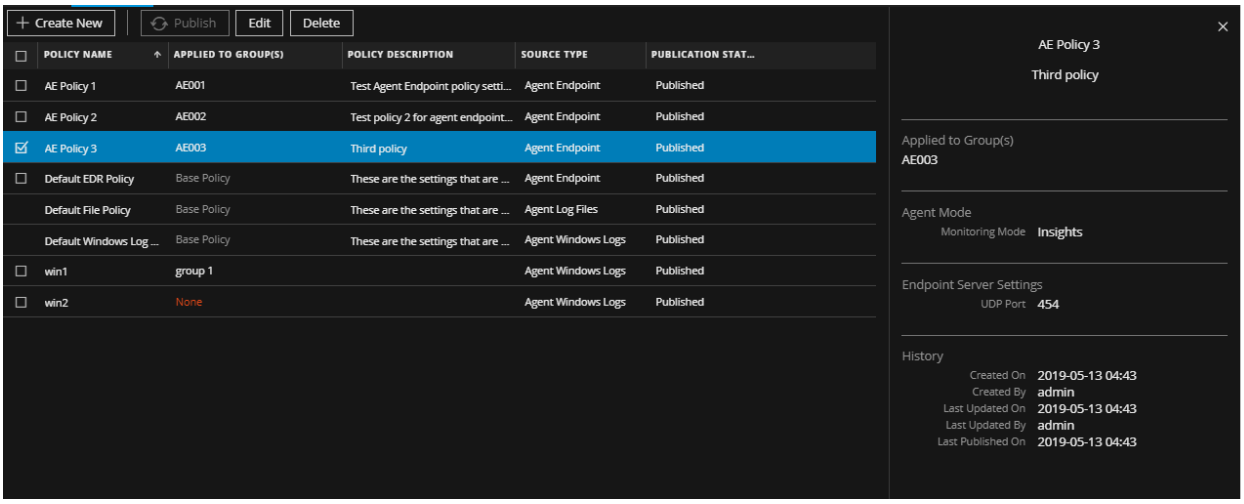
This section contains simulation examples for Agent Endpoint policies and Agent Log policies. Note that Windows policies have the same behavior as Agent Endpoint policies.

Agent Endpoint Policies Examples



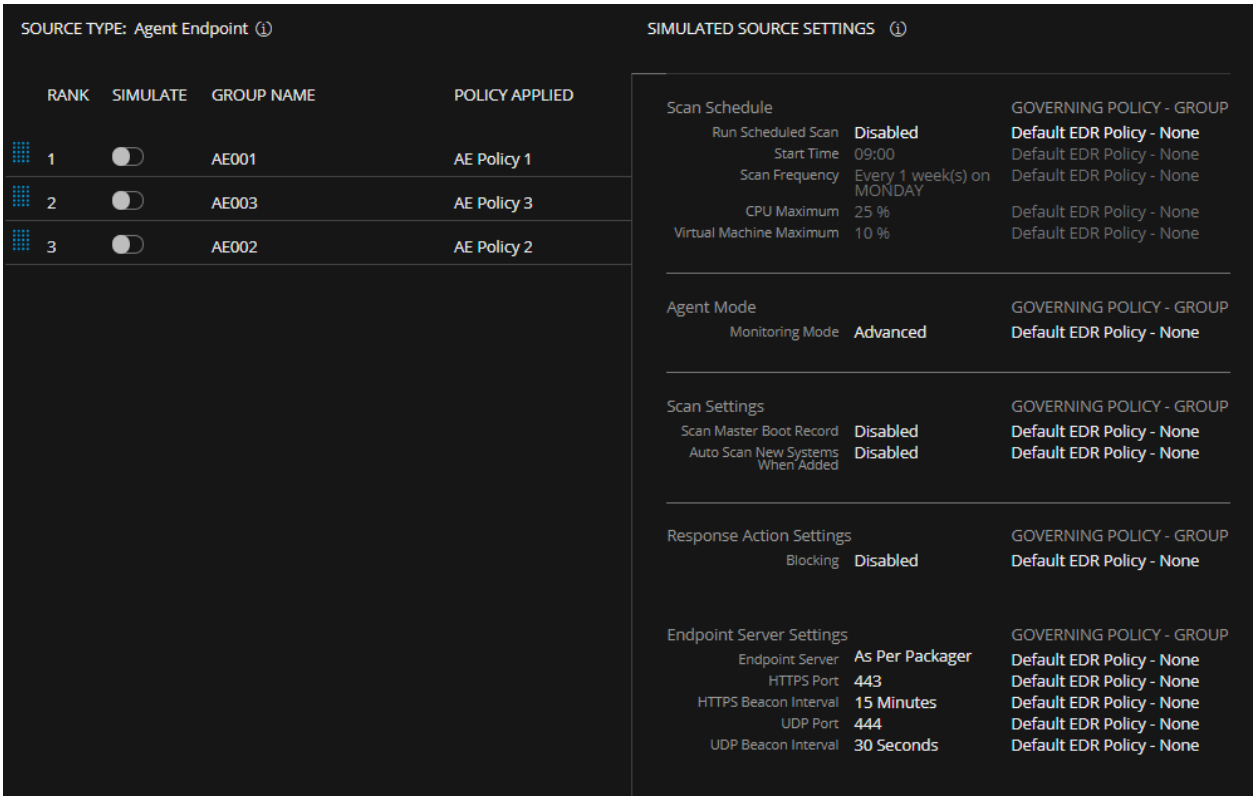
The **Simulated Source Settings** panel shows each individual policy setting, along with the governing policy for each setting.

Examine **AE Policy 1**, **AE Policy 2** and **AE Policy 3** to see which values are set in those policies.

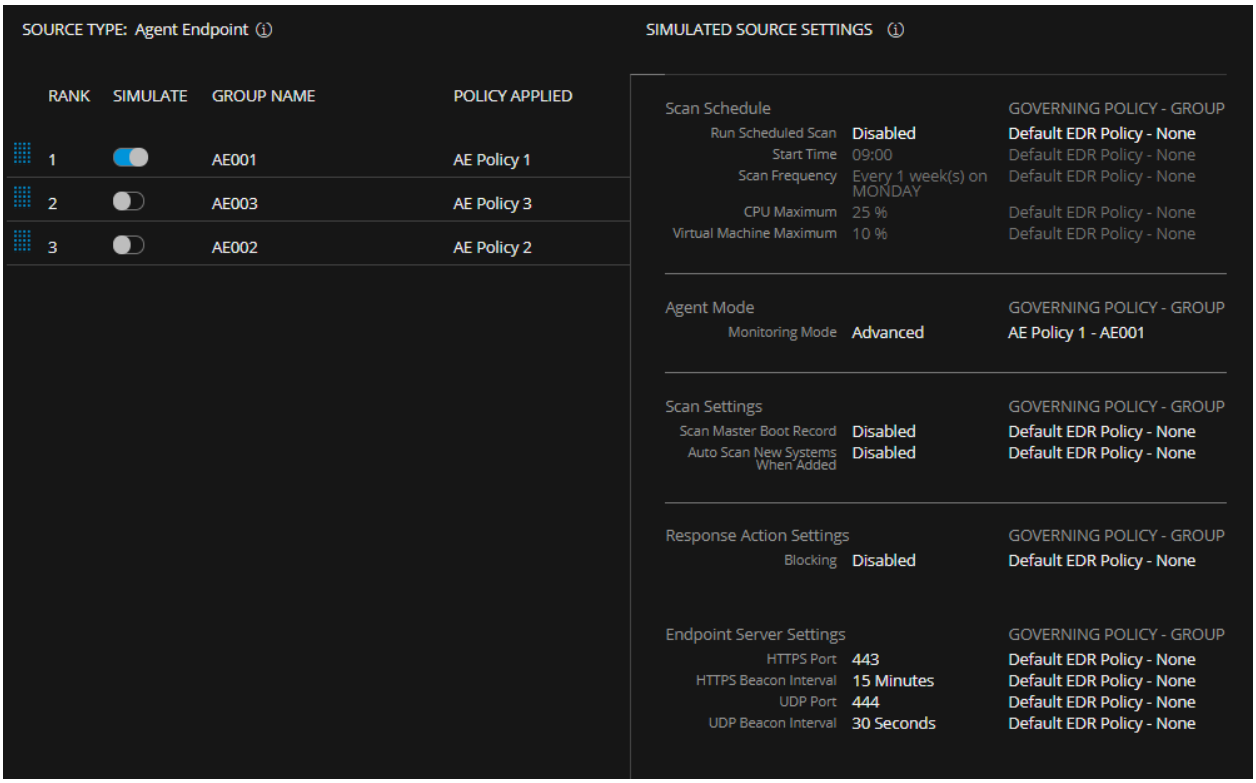


AE Policy 1 has Agent Mode set:

AE Policy 2 has a scan schedule set, as well as limiting the CPU maximum to 18%:



AE Policy 3 has Agent Mode set (to **Insights**), and sets the UDP Port to **454**:



No Settings Applied

When none of the policies are simulated, you can see that the Default EDR Policy governs all behavior.

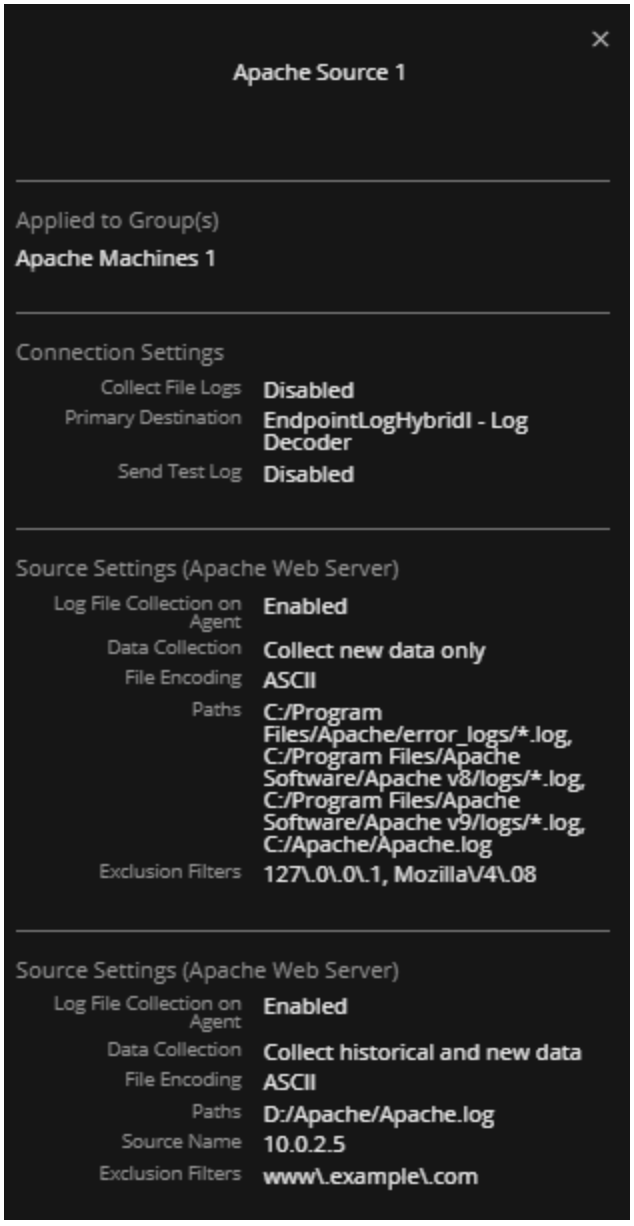
Simulate a Single Policy

When you select the AE001 Group, you can see that the values set in AE Policy 1 govern the behavior Agent Mode, as well as the Default EDR Policy being used for all unset parameters.

Simulate Multiple Policies

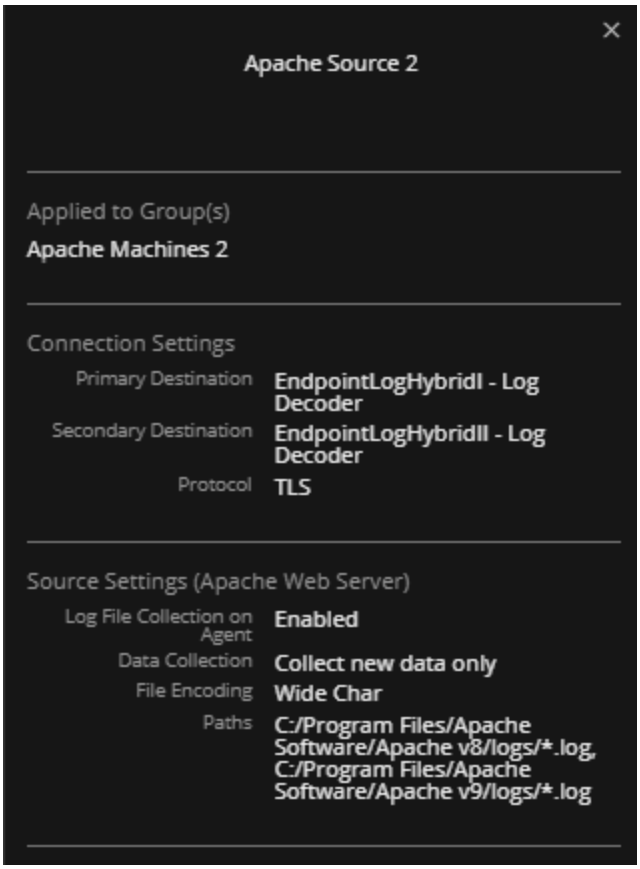
When you select multiple groups and policies, you can see the effects of each policy, based on the current ranking.

You can see that Agent Mode is set to **Insights**: this is because **AE Policy 3** is ranked above **AE Policy 1**, so the higher ranked policy's setting is used. None of the other parameters are set in more than a single policy, so for those, each policy's setting is used. Since **AE Policy 1** only has Agent Mode set—and **AE Policy 3** ranks higher and sets a different value—**AE Policy 1** does not govern any of the EDR settings. And finally, for parameters not set in any of the simulated policies, the Default EDR Policy settings are used.



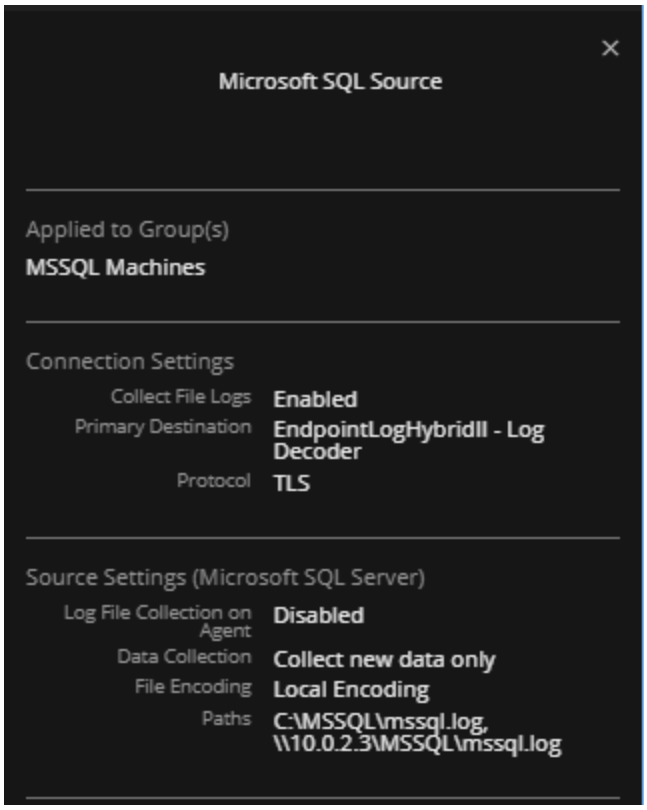
File Log Policies Simulation Example

The collection of parameter values into a complete policy works a bit differently for File Log policies than for EDR or Windows policies. To determine which values are applied from which policies, note the following:



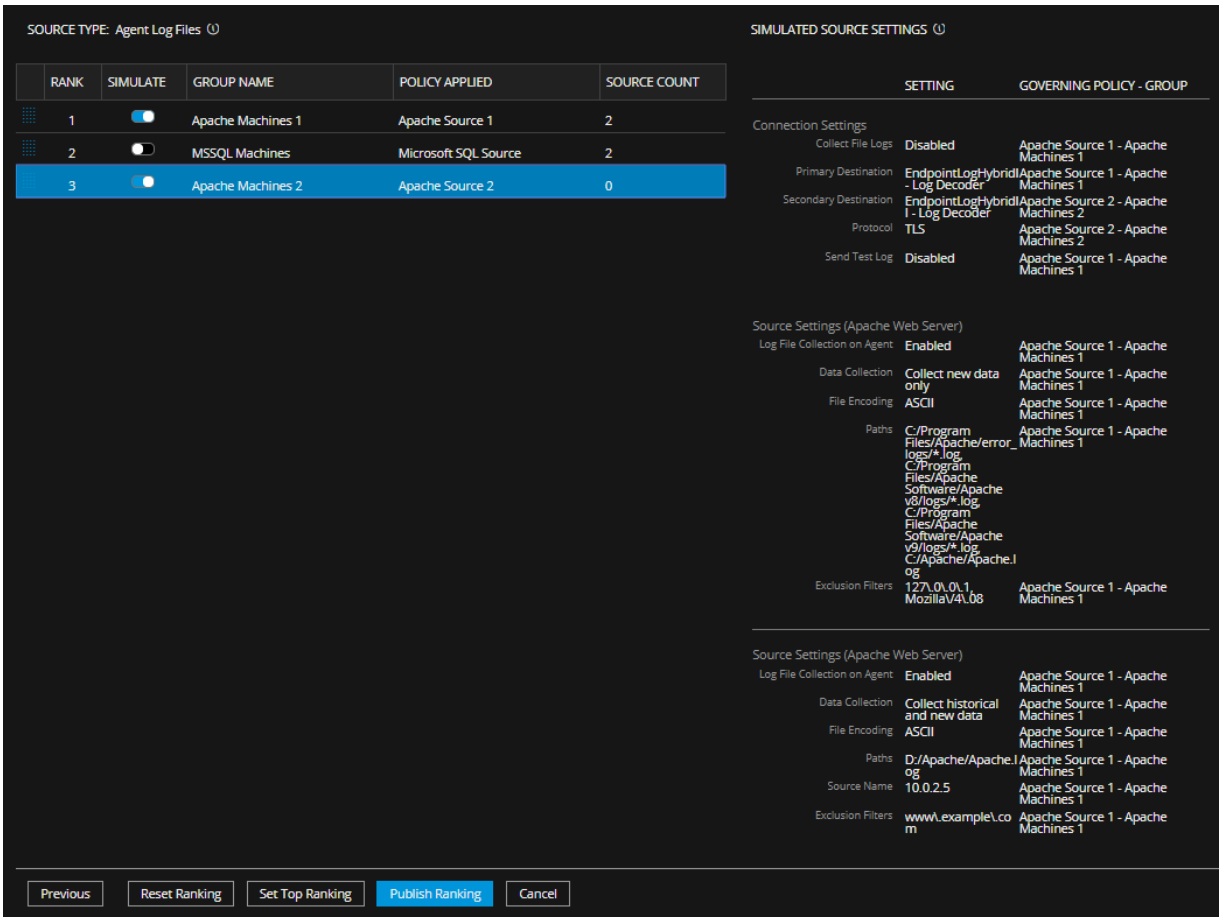
- Each event source type acts as a separate setting. That is, if a policy has values for both Apache and Access Manager, for example, each of those event source types is treated as a separate set of values.
- When an endpoint inherits values, it might not only get values from the highest ranked policy that has a value set. It might, for example, inherit Apache values from one policy, and Access Manager settings from another.
- If you consider a set of File Log policies that all include settings for the same event sources, then they behave the same as EDR and Windows policies.

Consider the following example, where there are three log file policies—two with Apache source types and one with MS SQL event source type.

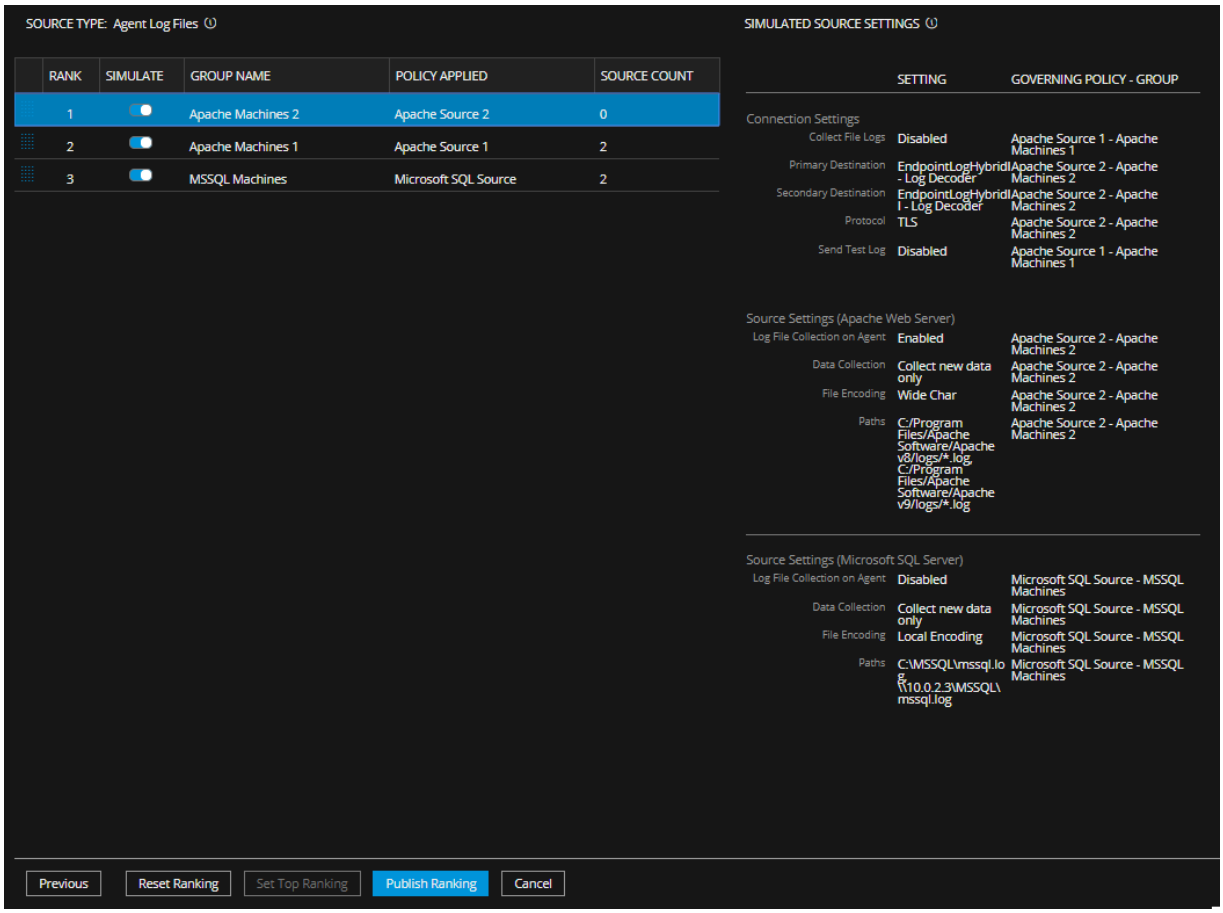


- File policy **Apache Source 1**:

- File policy **Apache Source 2**:



- File policy **Microsoft SQL Source**:



Examine two of the possible ranking orders:

- Simulate policies 1: **Apache Source 1**, 2: **Apache Source 2**. Note that in this case, the MS SQL policy is not simulated.

In this case, all Apache settings for the group are inherited from the **Apache Source 1** policy.

- Move the **Apache Source 2** policy higher than **Apache Source 1** policy, and add the **Microsoft SQL Source** policy. Simulate policies 1: **Apache Source 2**, 2: **Microsoft SQL Source**, 3: **Apache Source 1**.

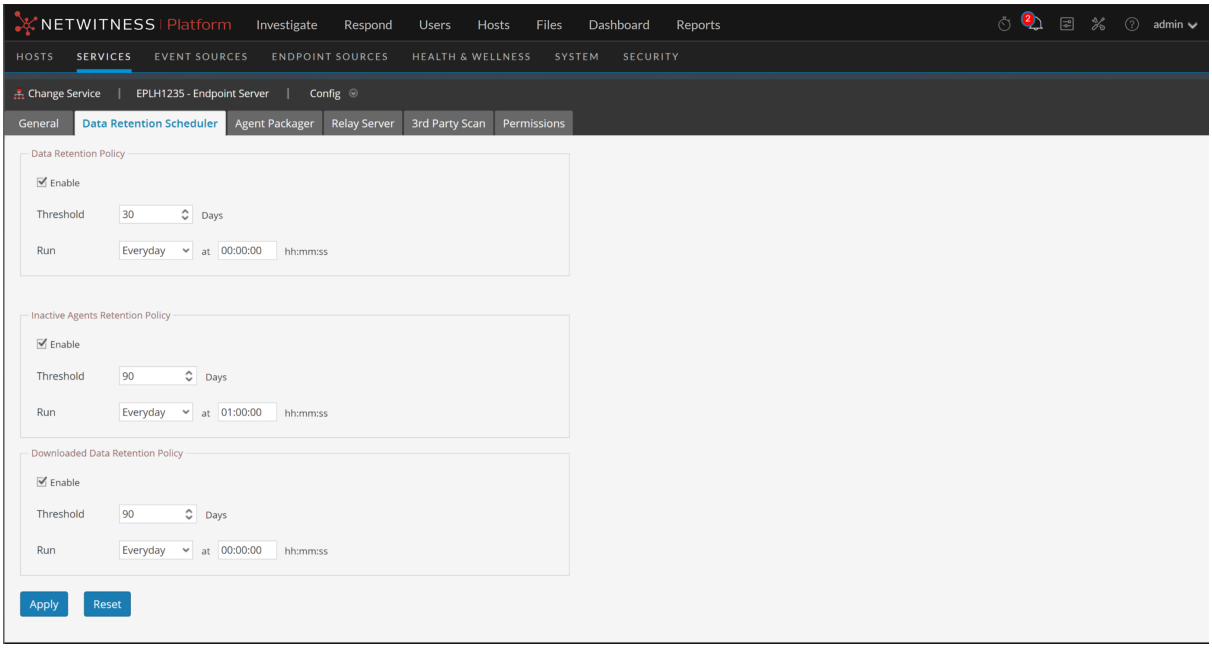
In this case, all Apache settings for the group are inherited from the **Apache Source 2** policy, and groups also get the MS SQL settings.

So, the Apache settings are inherited from the highest ranked Apache policy **only**, but the source settings as a whole are **combined** to include settings from each event source type.

The SIMULATE Slider

The slider has two positions:

- On: 
- Off: 



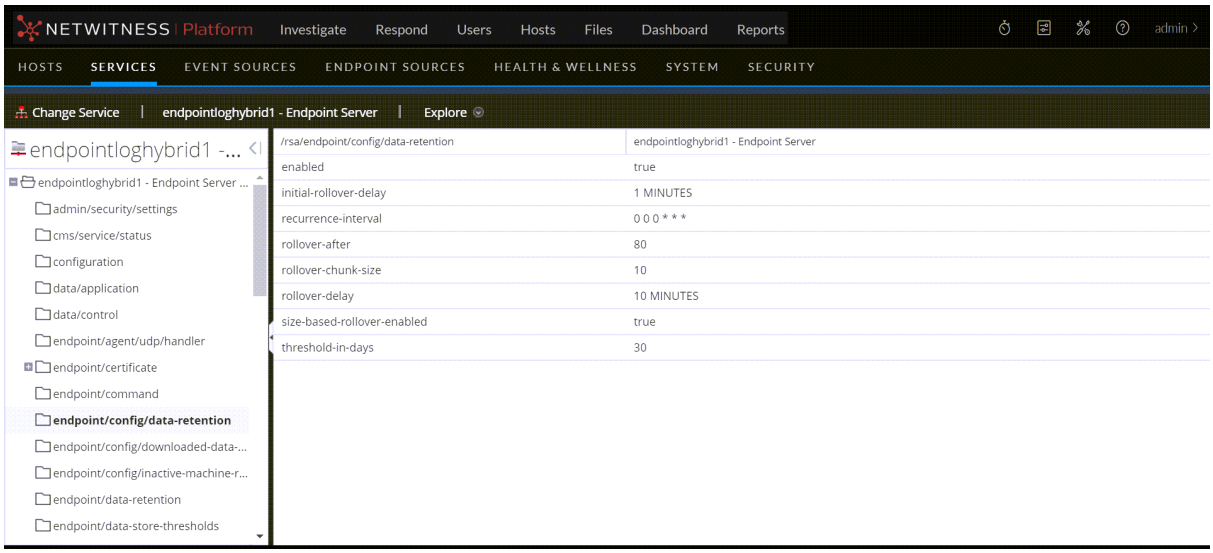
If the simulate slider is ON for a policy, that policy's values are factored into the complete set of governing settings. If the slider is OFF for a policy, the setting for that policy have no effect on the list of the governing settings.

Configuring Data Retention Policy

An administrator can configure the retention policies to retain the Endpoint data based on the age or the storage size. By default, days and size-based retention policies are enabled.

To change the configuration for age-based retention:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

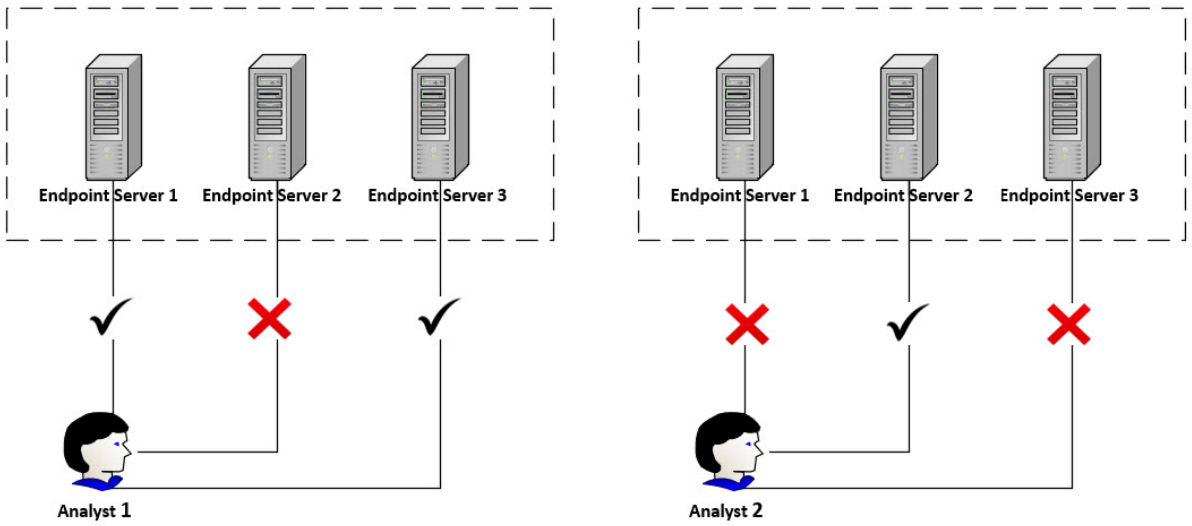


5. In the **Data Retention Policy** panel, by default, the **Threshold** is set to 30 days, and **Run** to Everyday. This means only 30 days of Endpoint data is retained and the older data is deleted from the database.
6. Click **Apply**.

To change the configuration for size-based retention:

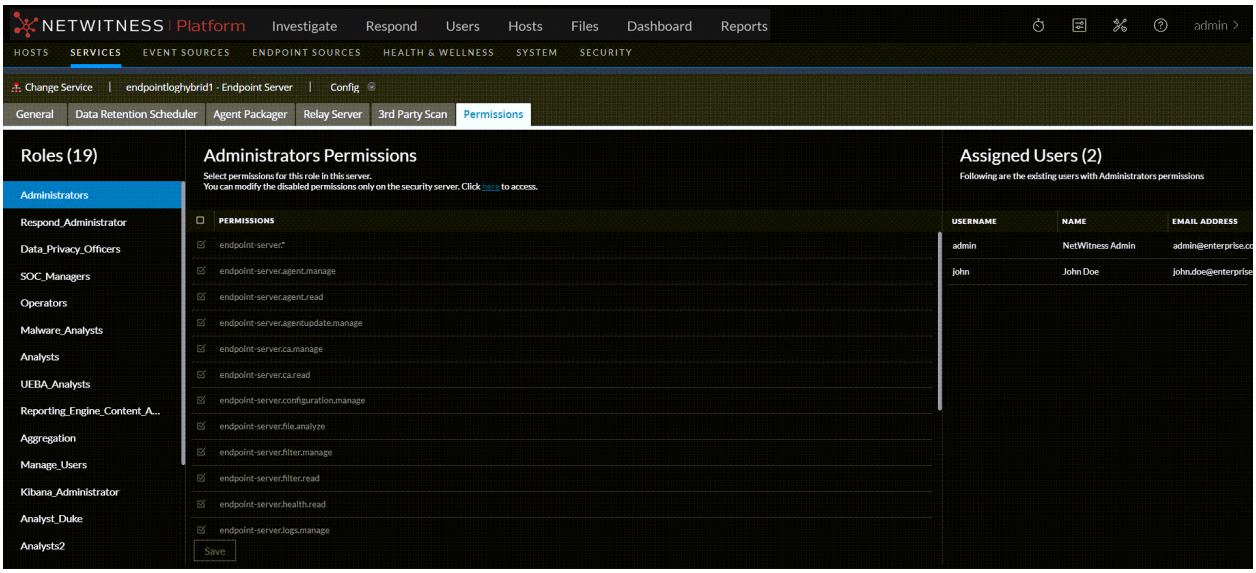
By default, for the size-based retention, the `rollover-after` value is set to 80 and `rollover-chunk-size` is set to 10. This means that when the storage size exceeds 80 percent of the space allocated for the disk partition, 10 percent of the older Endpoint data is deleted from the database. However, you can change these values as follows:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View > Explore**. The Explore view is displayed:



4. In the left panel, select **endpoint/config/data-retention**.
5. Edit the configurations based on your requirements.

Manage Role Permissions at Endpoint Server Level

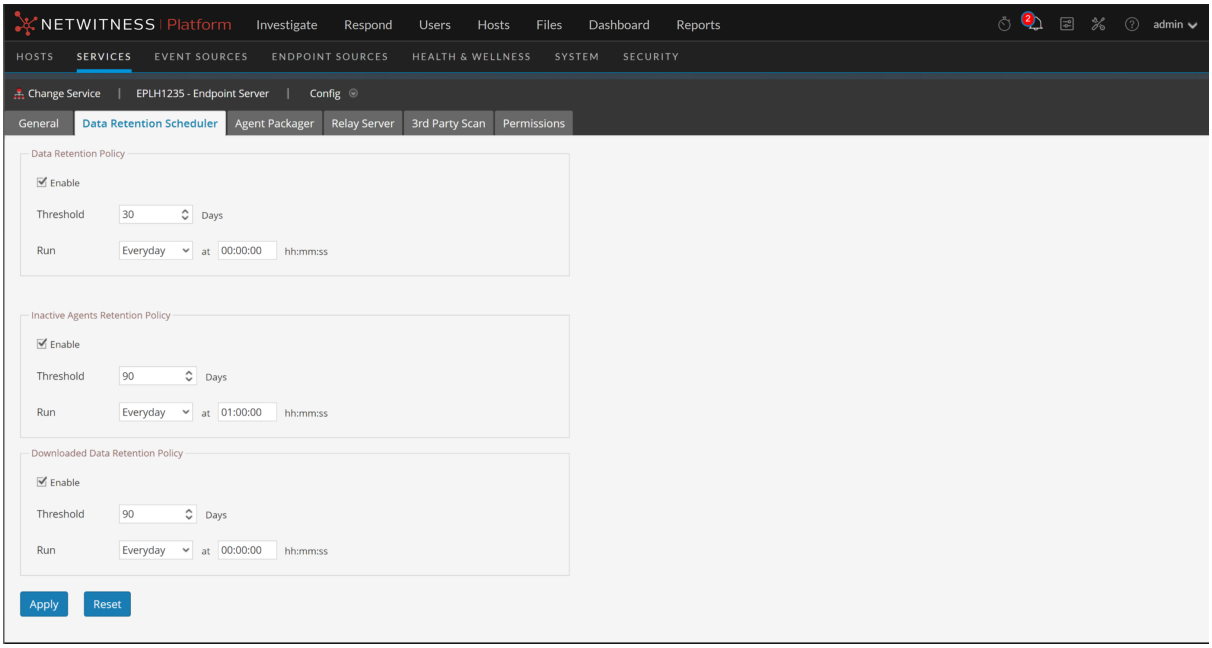


NetWitness Platform version 11.7 and later provides more flexibility for managing RBAC (Role-Based Access Control). This enhancement enables you to grant/revoke access for any role at individual endpoint server levels in an environment rather than all. On the **admin > Config** view for any endpoint server, you can navigate to the **Permissions** tab and manage a significant number of permissions for the selected endpoint server. A new permission called **endpoint-server.file.analyze** lets the user perform file analysis activities(Analyze Files, Save a Local Copy and Initiate OPSWAT Scans), allowing more flexible options to manage user permissions. Refer to Manage Users with Roles and Permissions on the *System Security and User Management Guide* for more information.

The following illustrations show how you can set permissions at the endpoint server level for an analyst.

To configure permissions at the endpoint server level:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Navigate to **Permissions** tab.
5. Select a role from the **Roles** pane on the left. (For more information on managing roles, refer (Optional) Add a Role and Assign Permissions in *System Security and User Management Guide*.)
6. Select the permissions from the **PERMISSIONS** section (Center pane).
7. Click **Save**. The **Assigned Users** pane on the right shows the list of users assigned with the selected role and permissions.
8. Repeat steps **5 – 7** if you want to modify permissions to any role. Make sure you save the changes before navigating out of the current role.



Note: Some of the permissions on the Permissions tab are disabled, and you can modify them only on the Security server (Admin > Security). All other permissions listed here are editable on both the Security server and the Permissions tab. For more information on managing permissions and on the NetWitness Platform, see *System Security and User Management Guide*.

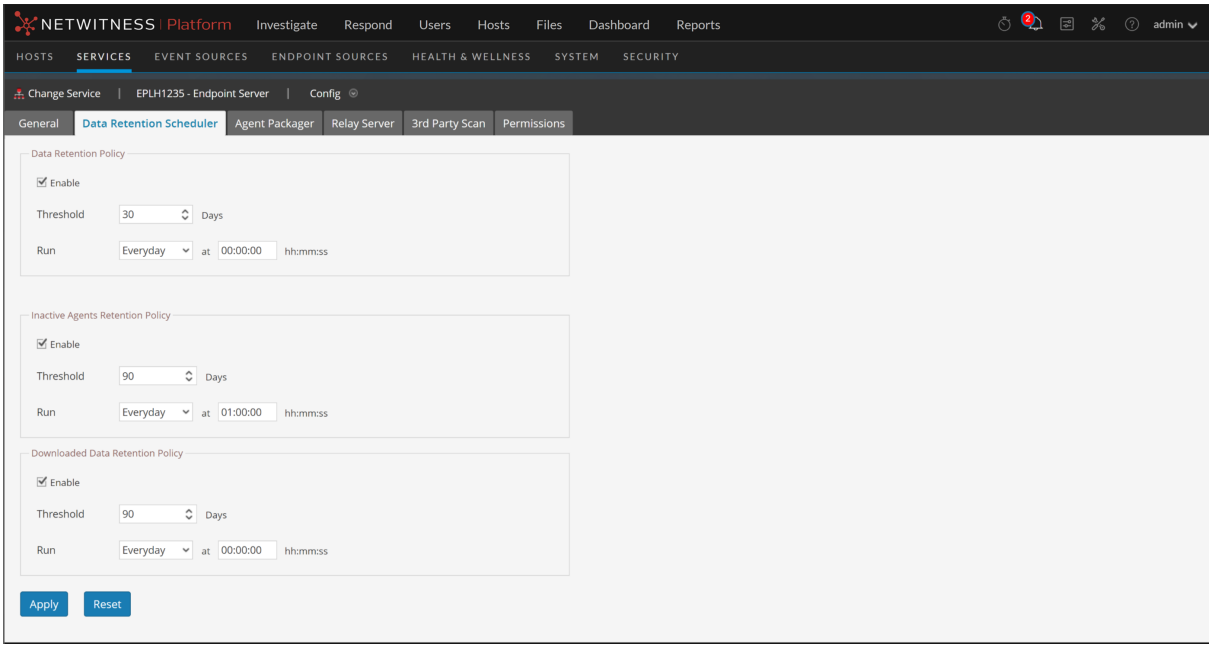
Managing Inactive Agents

An administrator can configure the inactive agent retention policy to delete data of agents that are inactive, from the Endpoint Server. On deletion, the Endpoint Server stops collecting data from these agents. By default, this option is enabled.

To configure the inactive agent retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Inactive Agents Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to Everyday. This means that the data of agents that have not communicated with the Endpoint server for 90 days is deleted from the database.
6. Click **Apply**.



Note: The Inactive Agents Retention Policy is not applicable for NetWitness Endpoint 4.4.0.2 or later agents.

Configure Retention Policy for Downloaded Files

An administrator can configure the retention policy to delete the downloaded files from the Endpoint server based on the number of days. By default, this option is enabled.

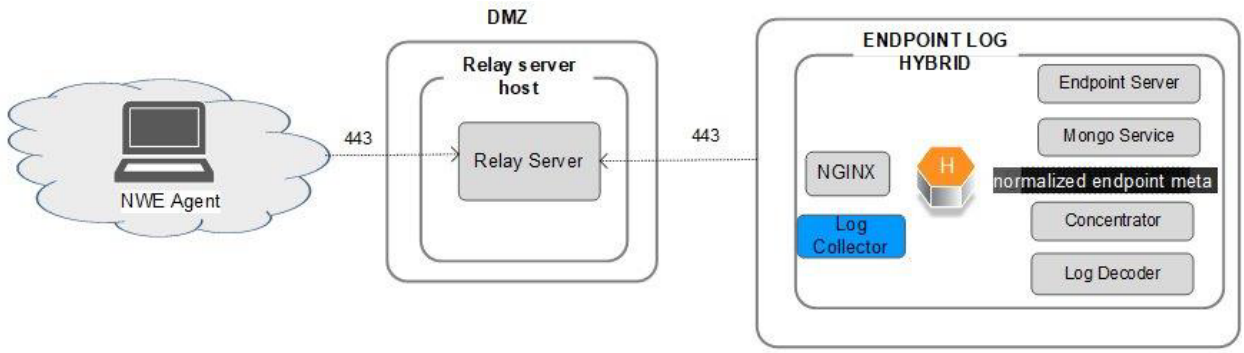
To configure the retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Downloaded Data Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to every day. This means only 90 days of data is retained and the older data is deleted from the Endpoint server.
6. Click **Apply**.

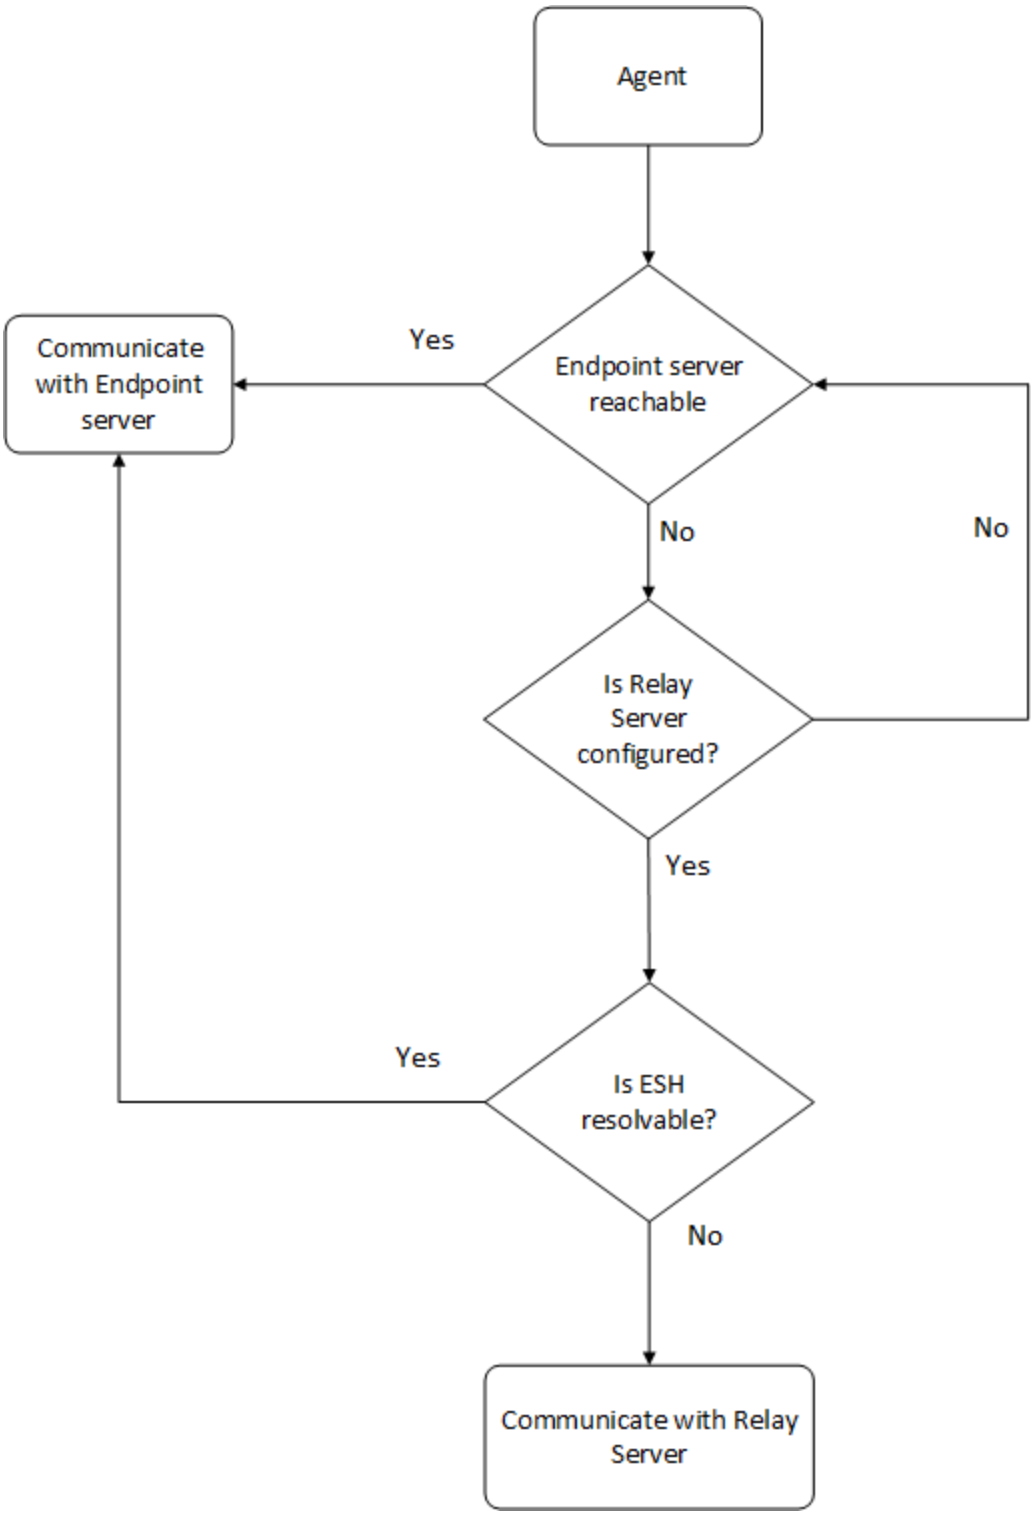
(Optional) Installing and Configuring Relay Server

Note: The information in this topic applies to NetWitness Version 11.3.1 and later.



Relay Server (referred to as RAR in NetWitness Endpoints) extends NetWitness Platform's visibility into endpoints when they are outside the corporate network. The Relay Server deployed in a cloud or DMZ relays the endpoint data between the hosts and the Endpoint Server. The hosts that are outside the corporate network send the endpoint data to the configured Relay Server and the corresponding Endpoint server pulls the data.

Note: If you have Windows hosts that are outside the corporate network, the log data is not sent to the Relay Server.



You can configure a Relay Server on the Endpoint Server Config view. Once the Relay Server is configured, the policy for the host is automatically updated and you can view the Relay Server settings on the **Host Details** view > **Policy Details** panel.

You can configure a single Relay Server with one or more Endpoint servers. In this case, the Relay Server ensures that the endpoint data reaches the Endpoint Server configured in the policy.

The following describes the architecture of the Relay Server.

The following flowchart explains how the host switches to the Relay Server.

Agent
Endpoint server reachable
Yes
Communicate with Endpoint server
No
No
Is Relay Server configured?
Yes
Yes
Is ESH resolvable?
No
Communicate with Relay Server

Installing the Relay Server

The Relay Server installer contains binaries, certificates, configuration files, and the installation script required to install the Relay Server.

IMPORTANT:
- The Relay Server version must match with the corresponding NetWitness Endpoint Server version. If you plan to upgrade a Relay Server to a newer version, first upgrade the Endpoint Server, then download the Relay Server installer, and run the installer script.
- Operating System updates and general system hardening on the Relay Server must be managed by the customer according to standard best practices. The Relay server package does not contain OS updates and the operating system will not be updated as part of the standard NetWitness update process.
- Do NOT run the nwsetup-tui script to install the Relay Server. Follow the instructions in this document only as Relay Server is an independent server and not part of NetWitness UI (Admin > Hosts).

Installation Media

The Relay Server can be installed only on EL 8 or NetWitness Platform 12.4.0.0 base image which is available for download from Downloads page (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads). Also, make sure that the Relay server host is connected to internet to download the required dependencies.
For more information on deploying Relay Server host on a:

- DMZ - see "Step 1a. Deploy the Virtual Host to create VM" in the *Virtual Host Installation Guide*.
- Cloud
  - see "Step 1. Deploy NW Server Host" in the *Azure Installation Guide*.
  - see "AWS Deployment" in the *AWS Installation Guide*.

Relay Server Host System Requirements

Agents	RAM	CPU Cores	Disk	Ideal Beacon Interval
20000	32 GB	4 cores	200GB	5 min

To install the Relay Server:

1. Log in to NetWitness Platform.
2. Click  **(Admin) > Services**.
3. Select the **Endpoint Server** service and click  > **View** > **Config** > **Relay Server** tab.
4. In the **Download Installer** section, enter the installer password and click **Download** to download the Relay Server installer file (**RelayInstaller.zip**).

5. Copy the Relay Server installer file (**RelayInstaller.zip**) to the Relay Server host.
6. Unzip the **RelayInstaller.zip** file on the Relay Server host. For example:

   ```
   /home/RelayInstaller.zip
   unzip <installer path>
   ```

7. Set up the execution permission using the following command:

   ```
   chmod +x install.sh
   ```

8. Run the installer script using the following command:

   ```
   ./install.sh
   ```

   The **All necessary RPMs will be installed without further** prompts is displayed.
9. Enter **Y** to continue the installation.

   The password prompt is displayed.
10. Enter the password.

    Note: Make sure you enter the same password you set while downloading the Relay Server installer.

    Note: In case if you are re-installing the Relay Server host. **Do you wish to update the list** prompt is displayed.
    - Enter **Y** to update the Endpoint server IPs.

    Enter the Endpoint Server IPs prompt is displayed.
11. Enter all the Endpoint server IPs you plan to configure with the Relay server with comma separated.

If the Relay Server installation is successful, you can check the status of the services:

- Check if the Relay Server is up and running:

  ```
  systemctl status rsa-nw-relay-server
  ```

- Check if Ngnix is running:

  ```
  systemctl status ngnix
  ```

You can also update Endpoint Server IPs without installing the Relay Server.

To update Endpoint Server IPs without installing the Relay Server:

1. Run the following command:

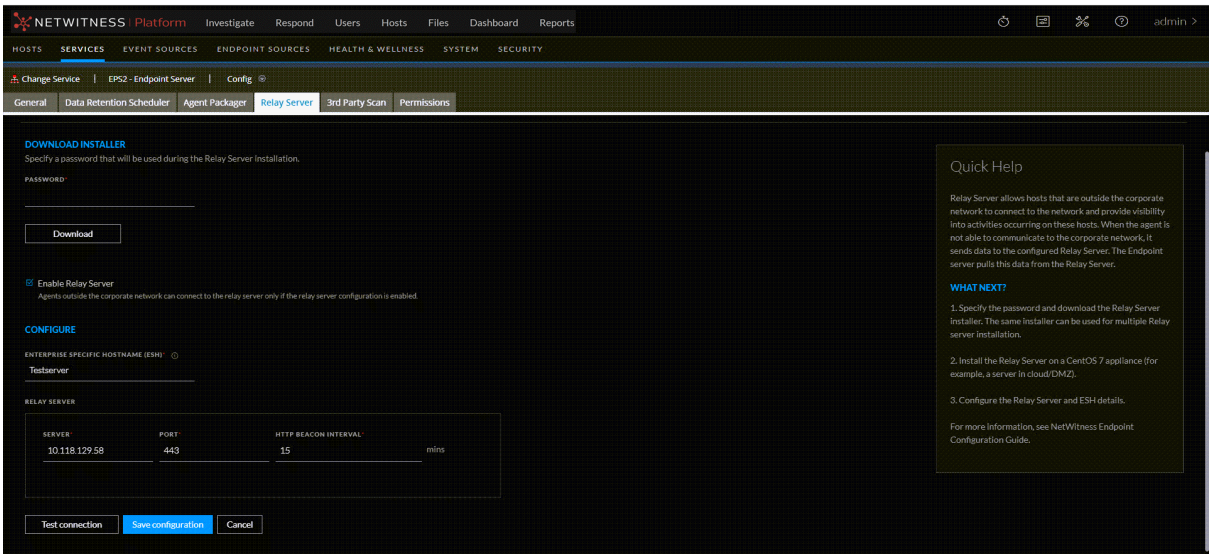
   ```
   bash /var/netwitness/relay-configure-allowed-hosts.sh
   ```

   The list of all the configured Endpoint server IPs is displayed and **Do you wish to update the list** prompt is displayed.
2. Enter **Y** to update the list of Endpoint server IPs.

   Enter the Endpoint Server IPs prompt is displayed.
3. Enter a comma-separated list of all the Endpoint Server IPs to update.

   The list of updated IPs is displayed.

Configuring the Relay Server



Make sure you have installed the Relay Server.

Note: During Relay Server host installation, firewalld is configured to allow incoming connections only on TCP ports 443 and 22.

To configure the Relay Server:

1. Log in to NetWitness Platform.
2. Click **(Admin) > Services**.
3. Select the **Endpoint Server** service and click > **View** > **Config** > **Relay Server** tab.

   The Relay Server tab is displayed.

4. Select the **Enable Relay Server** check box to enable the Relay Server configuration.

   Note: To disable the Relay Server, clear the **Enable Relay Server** check box.

   Caution: Before you disable the Relay Server configuration, if the hosts will be always roaming make sure to migrate these hosts to an alternate Endpoint server configured with a different Relay server. Else these hosts will not be able to connect back to the corporate network. When you disable the configuration, the Relay Server settings are removed from the EDR policy.

5. In the **Configure** section:

a. Enter the ESH.

IMPORTANT: This should a hostname that can only be resolved on the corporate internal DNS and not on public internet DNS (ex: 1.1.1.1 or 8.8.8.8). It is used to determine if the host running the Endpoint agent client is connected to the internal network (physically on premise or through VPN).

b. Specify the Relay **Server**, **Port** and **HTTP Beacon Interval**.

IMPORTANT: The Relay Server needs to be a hostname that can be resolved correctly on both internal DNS (with the internal IP) and public DNS (with the public IP)

6. Click **Test Connection** to check if the Relay Server is reachable.
7. Click **Save Configuration** to save the configuration.

Note: Before you modify the Relay Server configuration, perform any one of the following:
- Make sure that the hosts are inside the corporate network so that the policy with the Relay Server configuration is applied.
- If hosts will always be roaming, then migrate these hosts to an alternate Endpoint server configured with a different Relay Server.

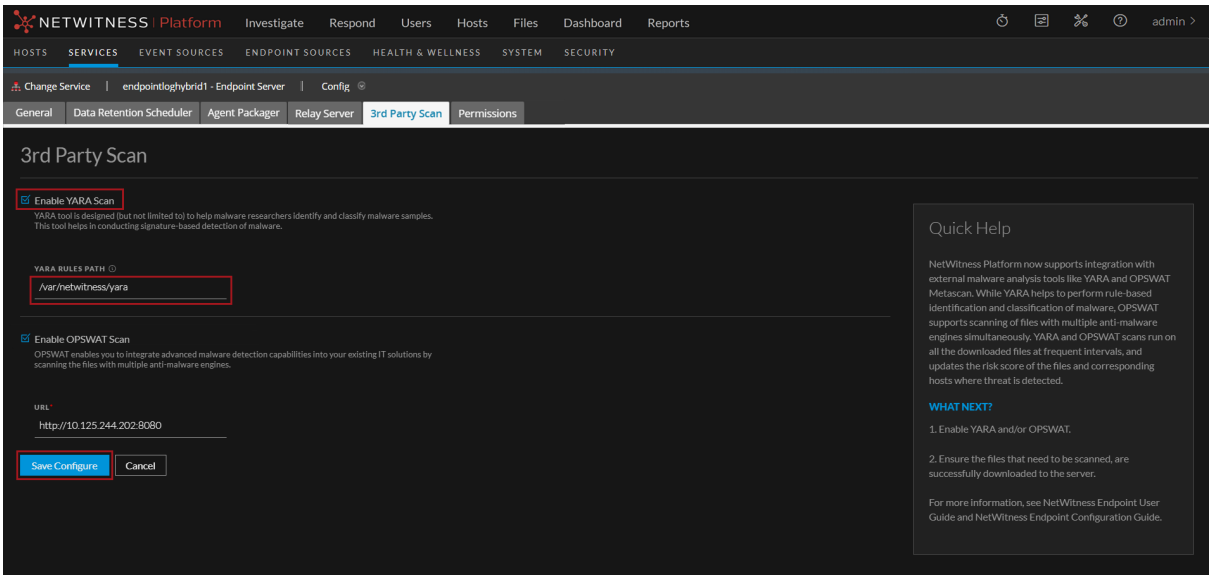
IMPORTANT: You must change the root password after you deploy the Relay Server host.

Note: If you encounter test connection failure between Endpoint server and relay server, see **Relay Server Issues** section in the Troubleshooting topic.

Configure YARA

YARA helps analysts in identifying and classifying malware in a simple and effective manner. By default YARA is disabled, administrators can configure and enable YARA. You are required to provide YARA rule files and specify the path where these rule files are stored. Ensure that the Endpoint server and YARA rules directory are in the same appliance.

Note: The YARA rules directory should have the permission as 'netwitness'.



Note: For new installations, YARA will be included as part of the orchestration. If you are upgrading to NetWitness Platform 11.6 or later, YARA is included automatically. In case of an upgrade, deploy the following Yara App rules from Live-

- Yara Rule Matched
- Process with Matched Yara Rule

IMPORTANT: Ensure that YARA is configured and YARA RULES PATH is same across all the Endpoint servers.

To change the configuration for YARA:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click  and select **View** > **Config**.
4. Click the **3rd Party Scan** tab.

5. Select **Enable YARA Scan.**

6. In **YARA RULES PATH**, specify the directory path where the YARA rule files are stored.

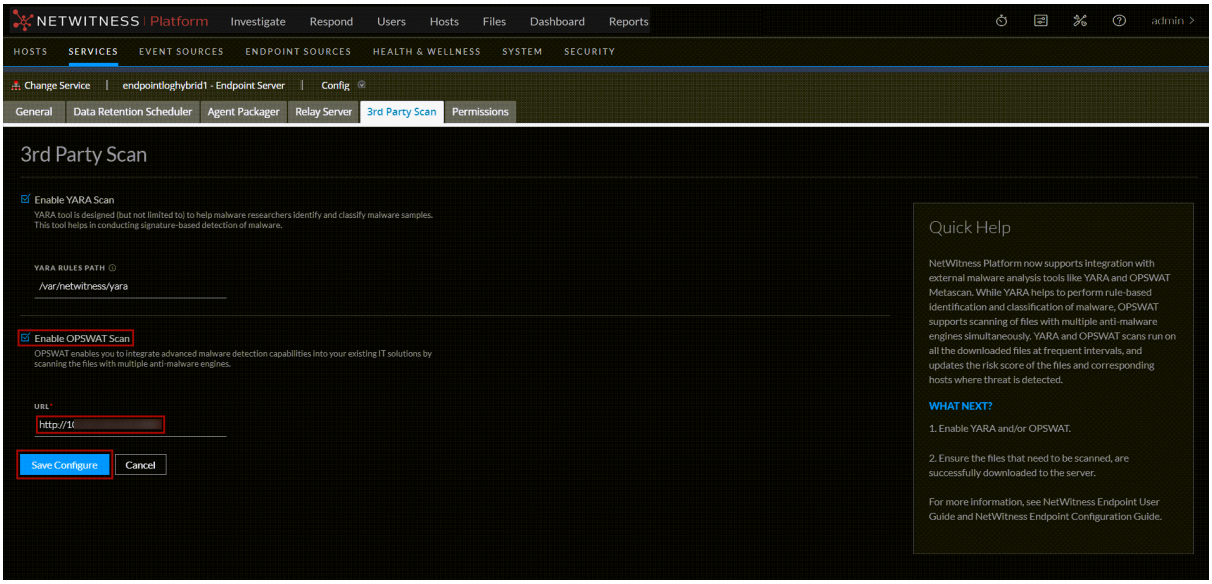
   Note: You can add any number of YARA rule files in this directory. Each rule file can have more than one rule. All downloaded files are scanned by all the YARA rule files.

7. Click **Save Configure**.

Configure OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. OPSWAT is disabled by default. As an administrator, you can enable and configure OPSWAT on the endpoint servers.

Note: You need to deploy the following OPSWAT app rules from Live services to log decoder for successful configuration of OPSWAT on endpoint servers:



- opswat reported infected
- opswat reported suspicious
- process with opswat reported suspicious
- process with opswat reported infected

IMPORTANT: Ensure that OPSWAT is configured in all endpoint servers and the configuration parameters are consistent across all endpoint servers.

To enable and configure OPSWAT:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Click the **3rd Party Scan** tab.
5. Select **Enable OPSWAT Scan**.
6. Enter the URL.

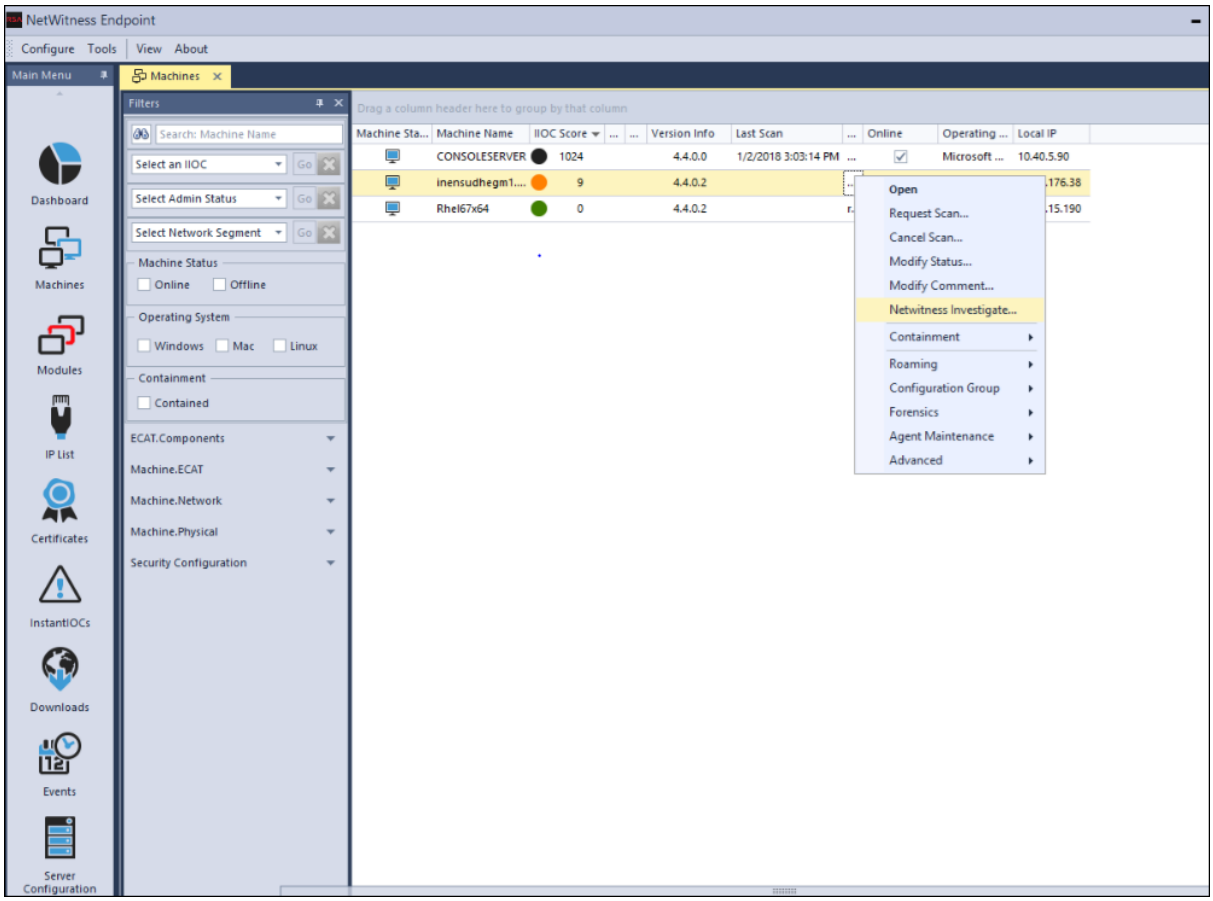
7. Click **Save Configure.**

Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

You can configure the Endpoint Metadata for the NetWitness Endpoint 4.4.0.2 by integrating the Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder. You can view the Endpoint metadata in the **Investigate > Navigate** and **Events** views. This integration includes the following steps:

- Enable Metadata Forwarding
- Enable Machines to Forward Metadata

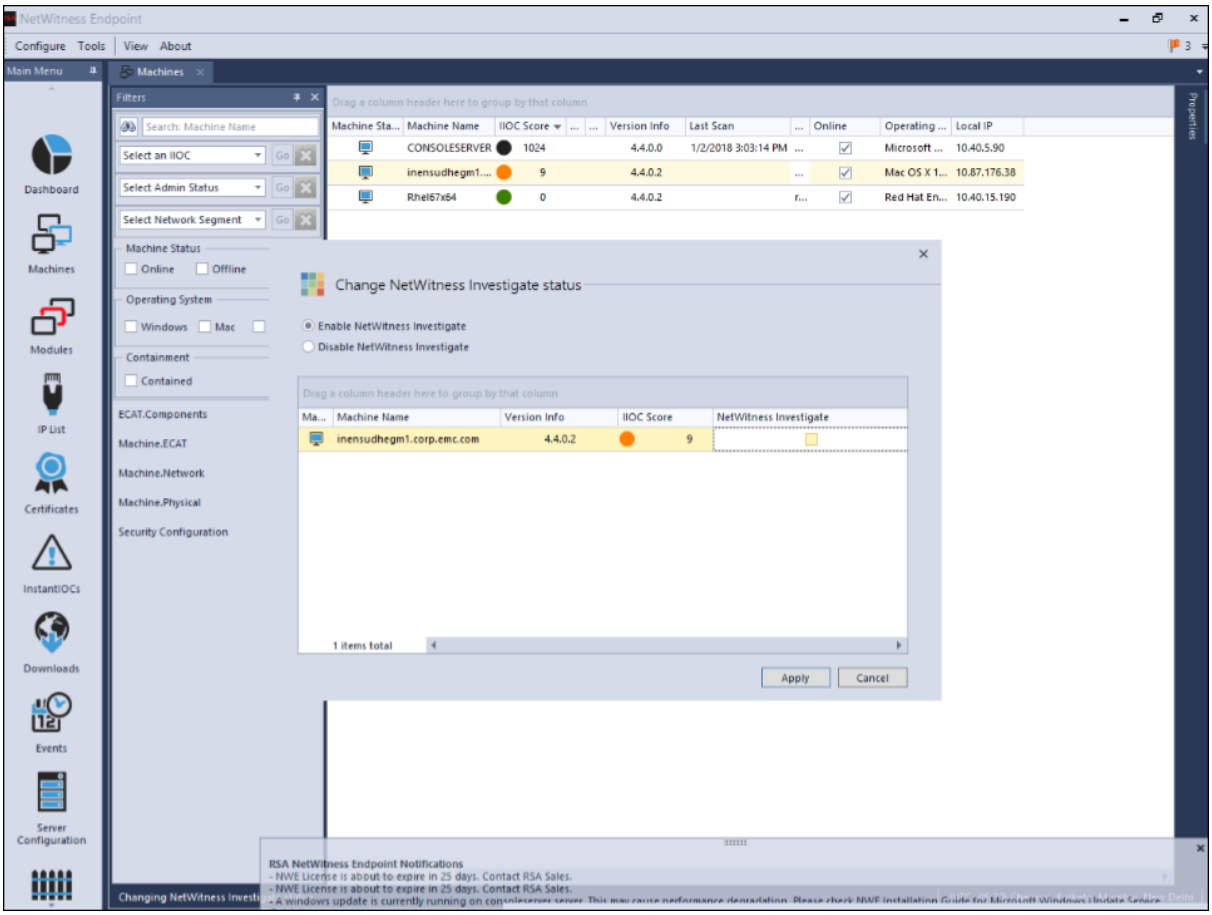
Enable Metadata Forwarding



To enable the Metadata Integrator service for the selected NetWitness Endpoint 4.4.0.2 agents, run the following command:

```
ConsoleServer.exe /nw-investigate enable
```

Enable Machines to Forward Metadata



After you enable the Metadata Forwarding using any one of the above options, perform the following to enable the machines to forward metadata to the Log Decoder.

1. Open the NetWitness Endpoint 4.4.0.2 user interface.
2. Click **Machines** from the left panel. The list of available machines are displayed.

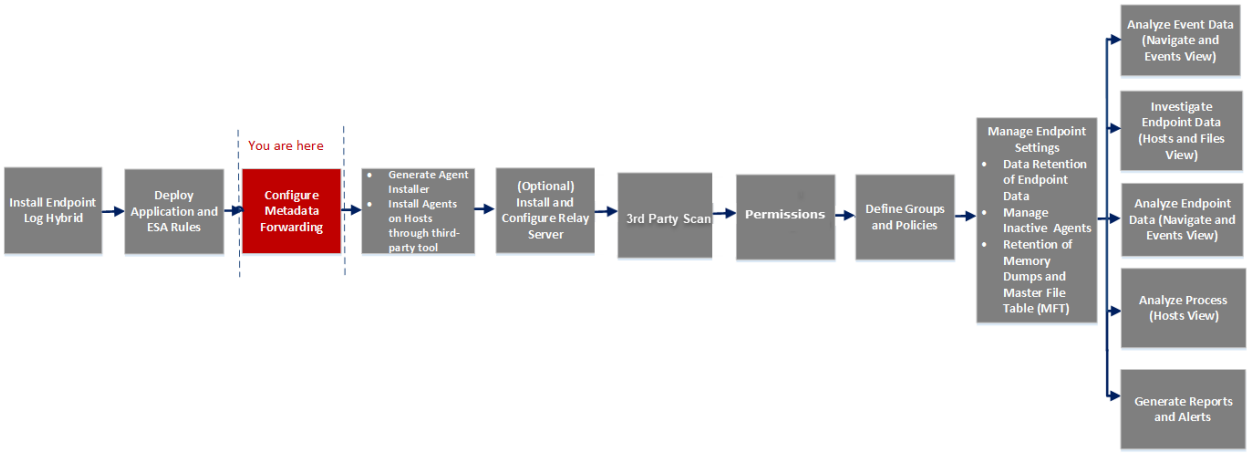
3. Select machines for which you want to forward metadata to the NetWitness Endpoint Server.
4. Right-click and select the **NetWitness Investigate** option.

   The Change NetWitness Investigate Status dialog is displayed.

5. Select the **Enable NetWitness Investigate** option.
6. Click **Apply**.
7. To verify if the **Enable NetWitness Investigate** option is enabled, repeat step 4.

Endpoint References

This section is intended to help you understand the purpose of the Services Config View for the Endpoint Server. For each configuration, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition, it includes workflow and Quick Look sections to highlight important features in the user interface.



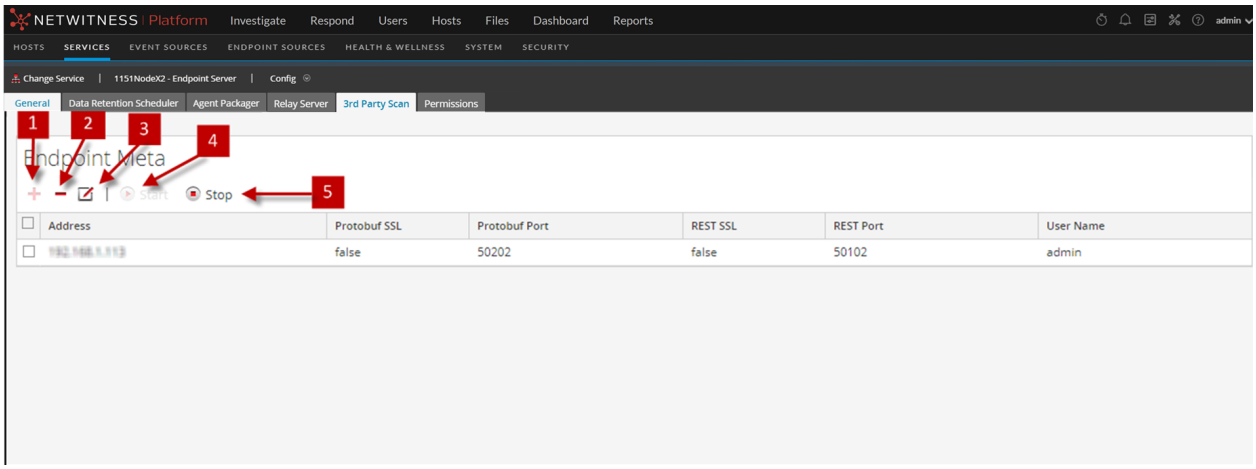
You can view the complete service nodes in tree form in the Services Explore view. For more information, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents*	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents*	Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

*You can perform this task in the current view

Quick Look

The following figure is an example of the General tab.

1 Click + to view the Available Services dialog.

2 Click − to delete the added service.

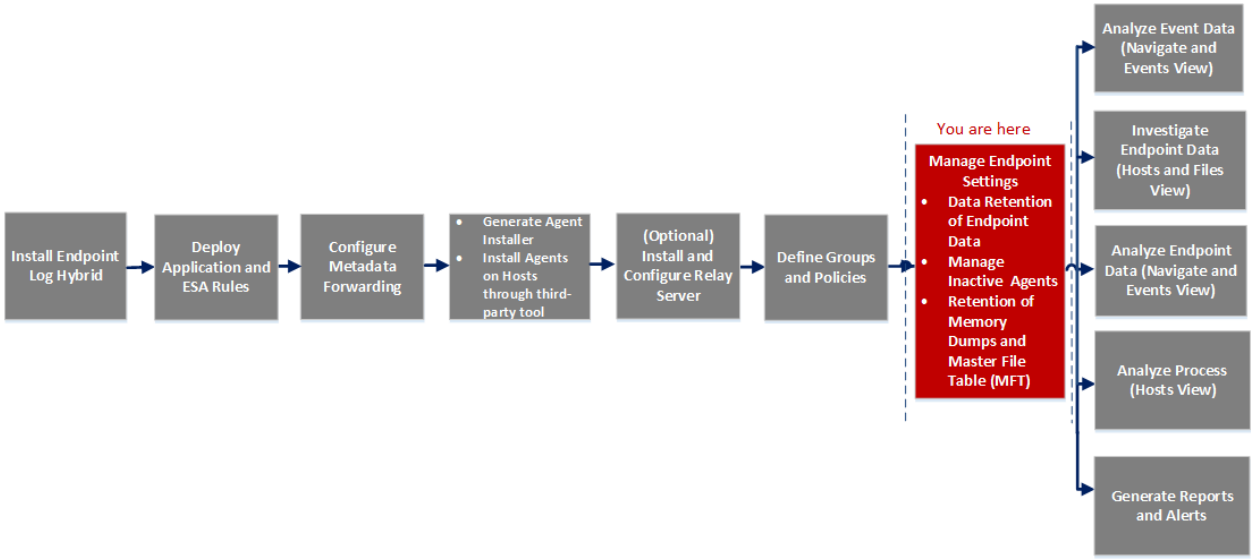
3 Click to edit the information for the added service.

4 Click Start to start the Endpoint metadata forwarding.

5 Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL).
User Name	Displays the user name.
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.



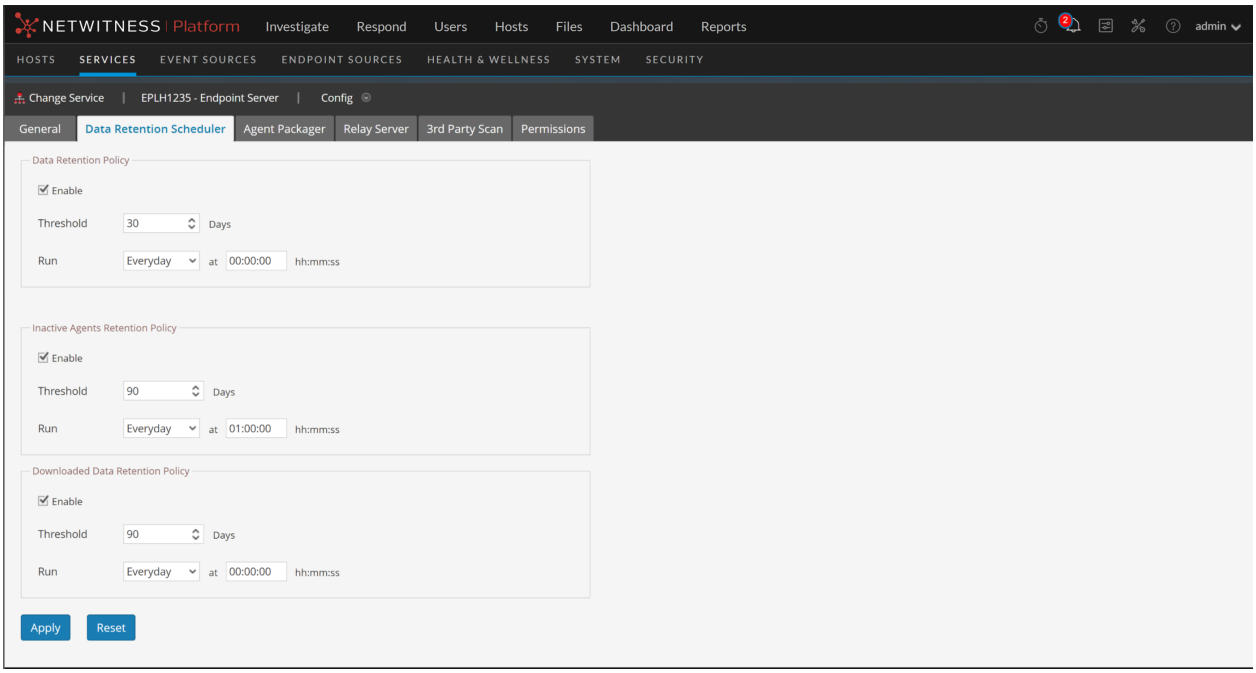
Data Retention Scheduler Tab

In the **Data Retention Scheduler** tab, you can configure data retention, inactive agents, and downloaded data retention policies for multiple endpoint servers. To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

Repeat the above steps to configure data retention settings for multiple endpoint servers.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Retention Policy*	Configuring Data Retention Policy
Administrator	Configure Inactive Agents Policy*	Managing Inactive Agents
Administrator	Configure Downloaded Data Retention Policy*	Configure Retention Policy for Downloaded Files

*You can perform this task in the current view

Quick Look

The following figure is an example of the Data Retention Scheduler tab.

Features

The following table lists the fields for **Data Retention Policy**.

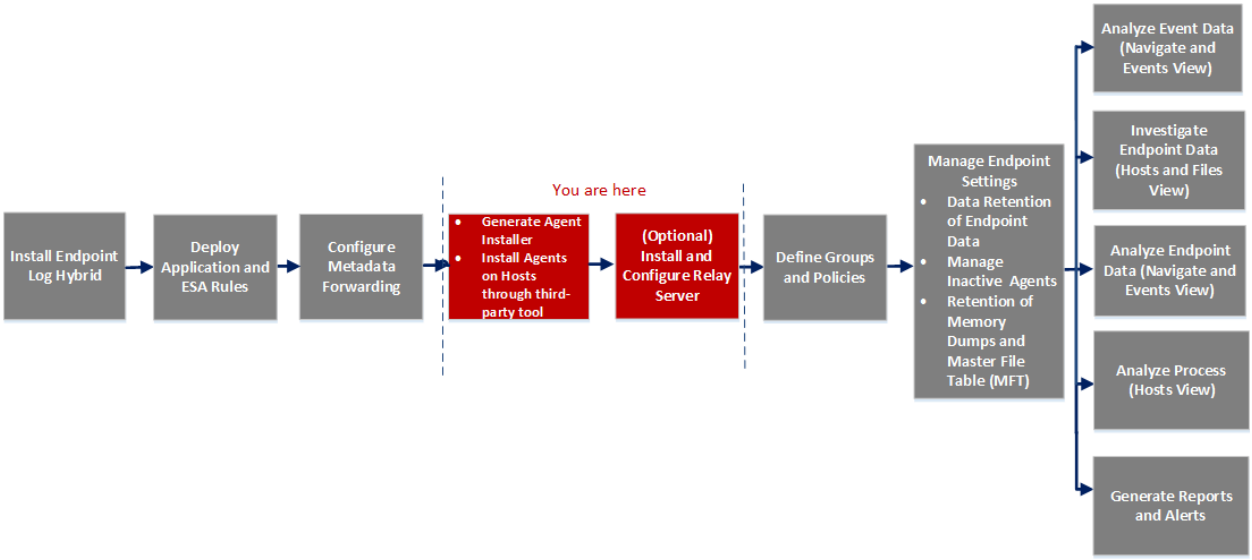
Field	Description
Enable	Enables the configuration for the Data Retention Policy. By default, this option is enabled.
Threshold	Displays the number of days the Endpoint data is retained in the database. By default, the Threshold is set to 30 days. The data older than 30 days is deleted from the database.
Run	Displays the schedule for running the data retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the data retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for **Inactive Agents Retention Policy**.

Fields	Description
Enable	Enables the configuration for the Inactive Agents Retention Policy. By default, this option is enabled.

Fields	Description
Threshold	Displays the number of days the inactive agents are retained in the Endpoint Server. By default, the threshold value is 90 days.
Run	Displays the schedule for running the inactive agents retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the inactive agents retention policy and applies the new settings immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for **Downloaded Data Retention Policy**.



Fields	Description
Enable	Enables the configuration for the Downloaded Data Retention Policy. By default, this option is enabled. **Note:** The downloaded data can be Files, Process Dump, System Dump, and MFT.
Threshold	Displays the number of days the downloaded data is retained in the Endpoint Server. By default, the Threshold is set to 90 days. The data older than 90 days is deleted from the Endpoint Server.
Run	Displays the schedule for running the retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

Agent Packager Tab

In the **Agent Packager** tab, you can generate an agent packager and agent installer. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Packager** tab.

Workflow

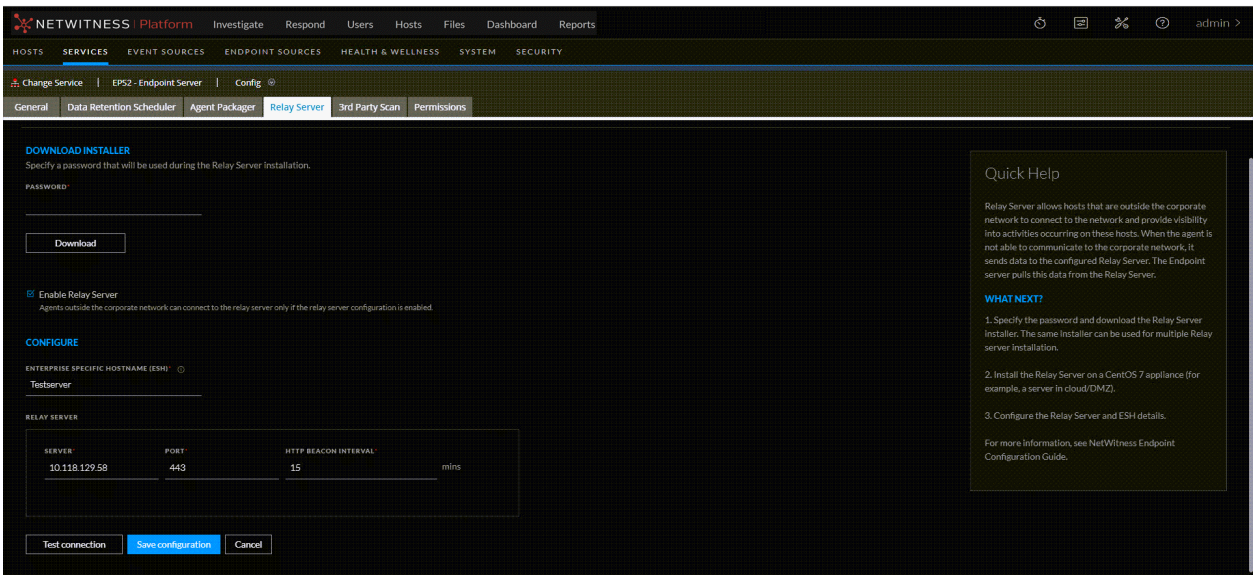
Relay Server Tab

In the **Relay Server** tab, you can download and configure Relay Server . To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Relay Server** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Install Relay Server*	(Optional) Installing and Configuring Relay Server
Administrator	Configure Relay Server*	(Optional) Installing and Configuring Relay Server

* You can perform this task in the current view.

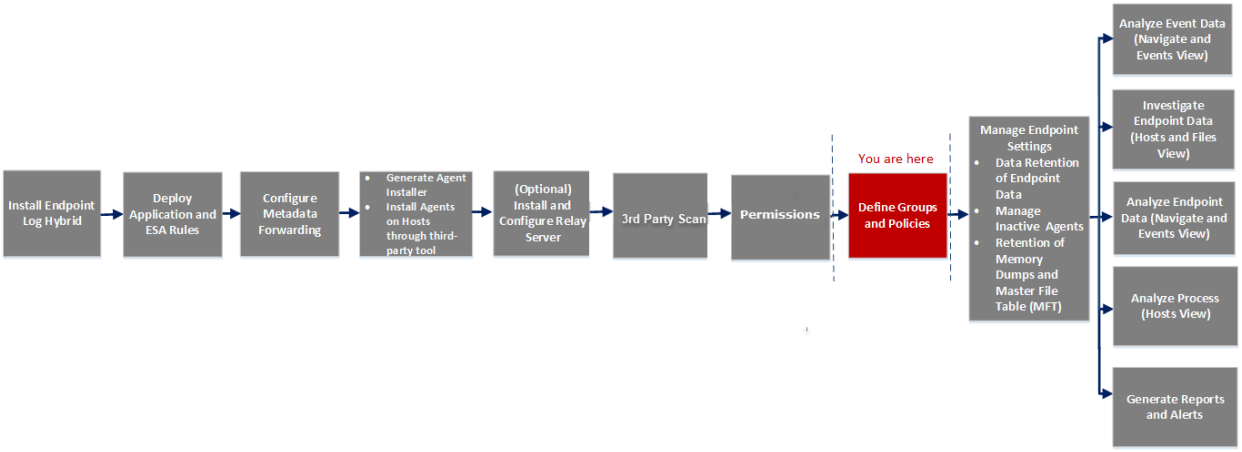
Quick Look

The following figure is an example of the Relay Server tab.

Features

The following table lists the fields for Relay Server tab.

Field	Description
Download Installer	
Password	Enter the relay server installation password. For example, netwitness. Password must be minimum of 3 characters and can contain alphanumeric and special characters. **Note:** You must provide the same password when prompted during Relay Server installation.
Download	Click to download the Relay Server installer.
Enterprise Specific Hostname (ESH)	Enter the hostname which can be resolved only within the corporate network.
Enable Relay Server	Check Enable Relay Server for Agents outside the corporate network to connect to the configured relay server. By default, this option is disabled.
Configure	
Server	Hostname or IP of the Relay Server.
Port	Port number. For example, 443.
HTTP Beacon Interval	Enter the Interval value ranges from 60 – 1440 minutes.
Test Connection	Click test connection to check if the relay server is reachable by the agents.



Field	Description
Save Configuration	Saves the relay server configuration.
Cancel	Cancel the unsaved changes.

Endpoint Sources - Groups

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how

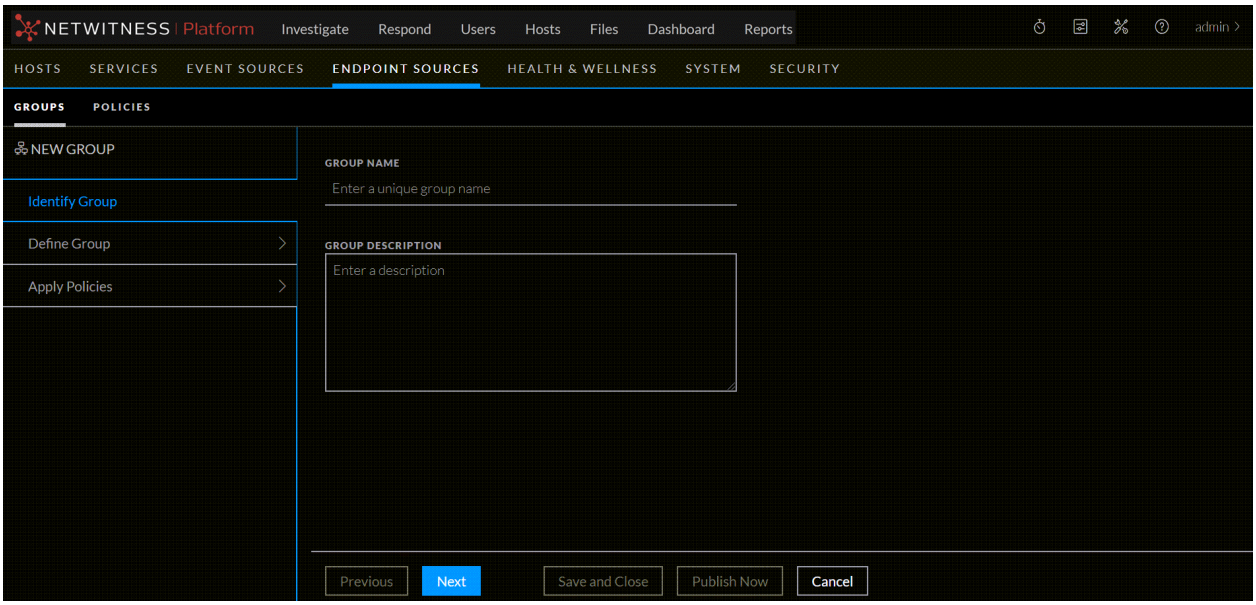
Quick Look

Below is an example of the Groups tab:

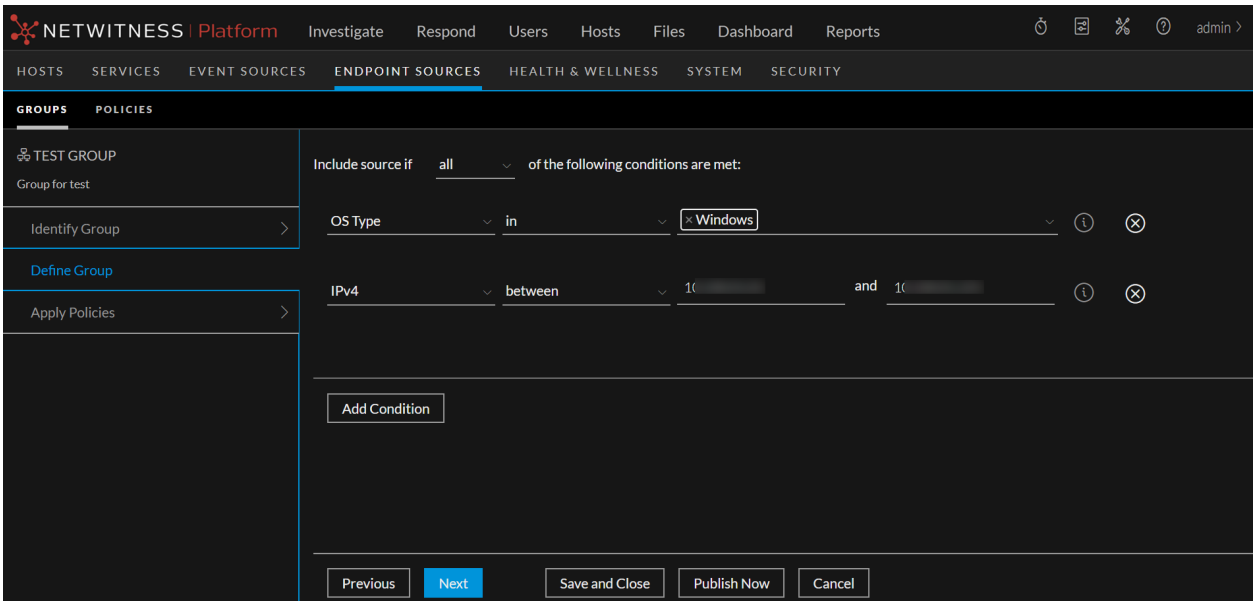


1 **Toolbar**

- **Create New**: Lets you create a new group. For more information, see Create a Group
- **Edit Ranking**: Lets you edit the ranking of groups. For more information, see Managing Groups
- **Publish**: Publishes the selected group or groups.
- **Edit**: Lets you edit the details of an existing group. For more information, see Edit a Group.
- **Delete**: Deletes the selected group or groups permanently. For more information, see Delete a Group.

2	**Filter Pane** • **Filters**: You can filter groups based on Policy Type and Publication Status. To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar. • **Reset**: Removes the currently applied filter criteria. For more information, see Filter Endpoint Groups.
3	**Groups List Pane** • **Group name**: Name of the group. • **Source Count**: Number of hosts that are currently members of the group. • **Policies applied**: Lists the policies applied to this group. • **Group description**: Description of the group. • **Policy Types Applied:** Type of policies applied to the group: Agent Endpoint, Agent File Logs, Agent Windows Logs, or any combination of these. • **Publication Status**: Status of the group - Published or Unpublished. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.
4	**Group Details Pane** Displays the properties of the selected group. **Note:** Click the row to view the Properties panel for a group.

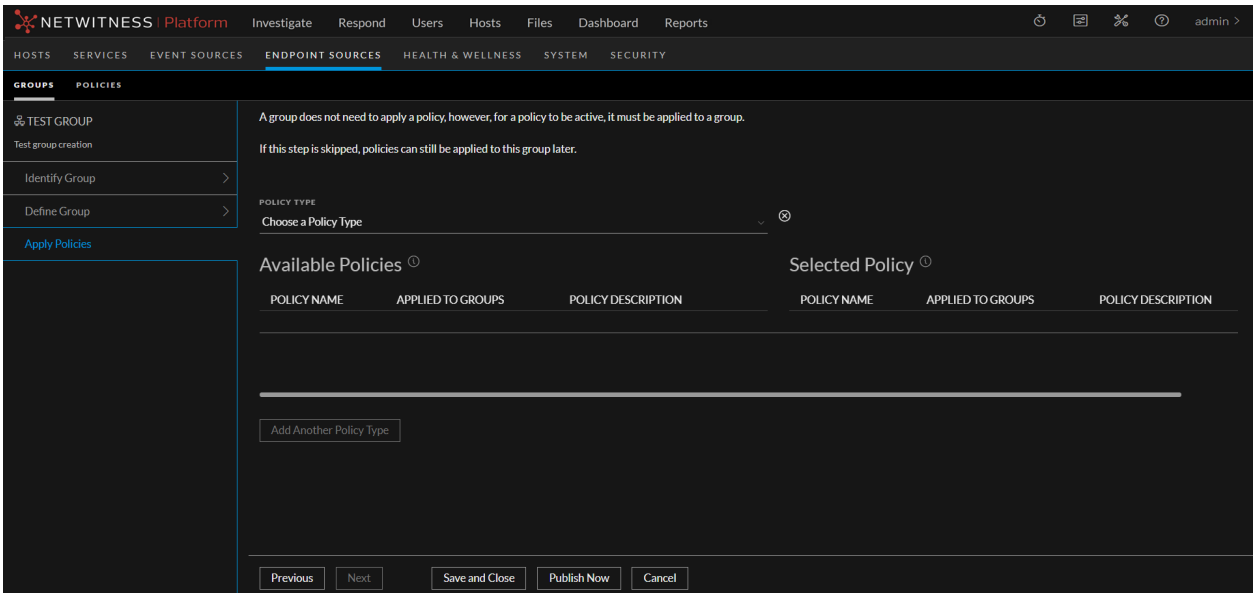
Create Group



Below is an example of the Create Group dialog. The table describes the information and options in the Create Group dialog.

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description	Description of the group and should not exceed 8000 characters.

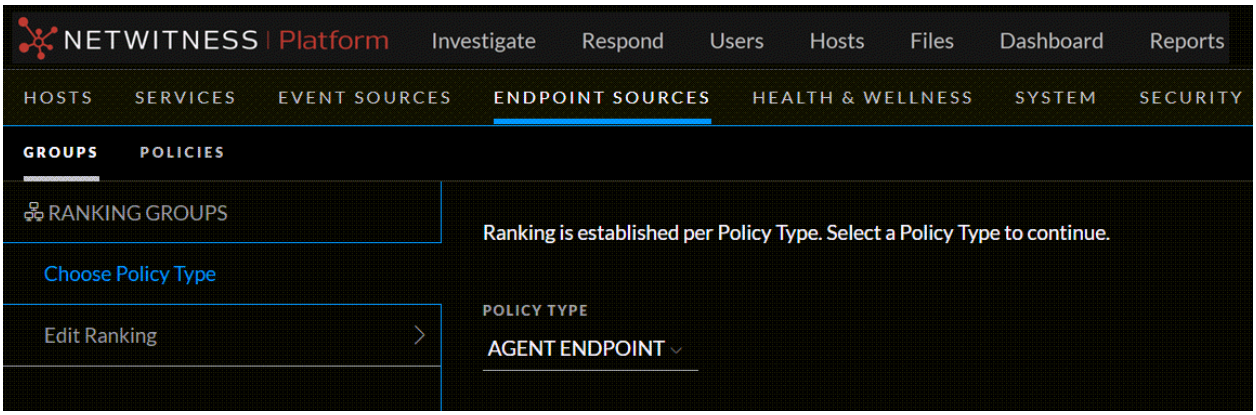
Define Group



Below is an example of Define Group panel. The table describes the information and options in the Define Group panel:

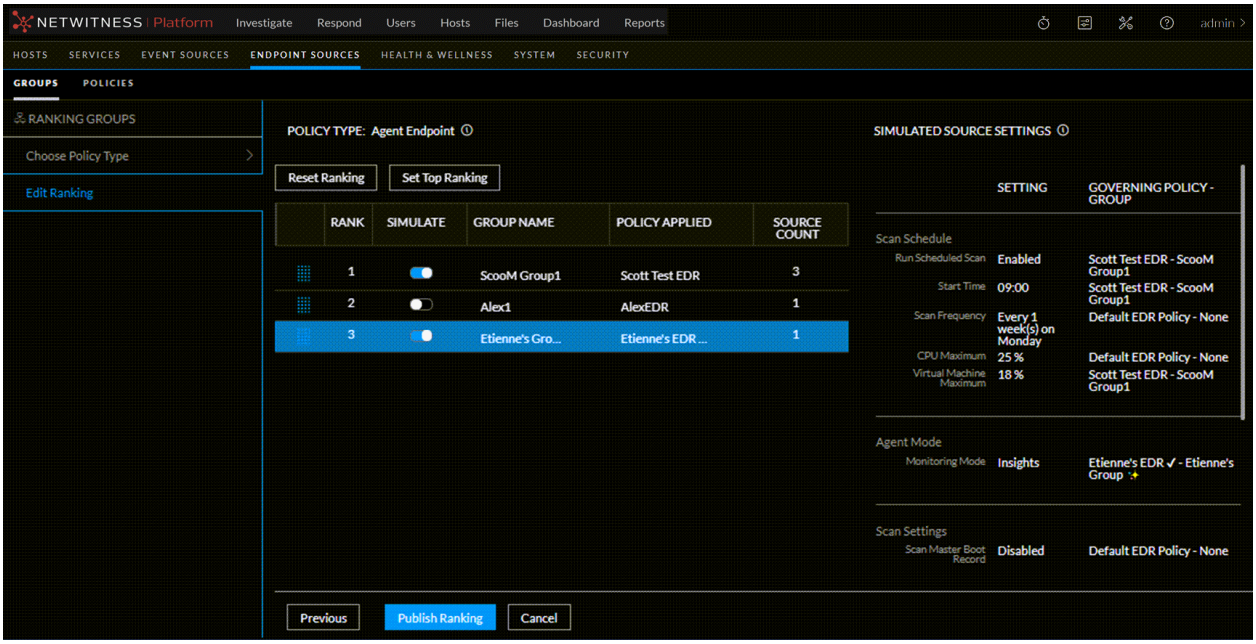
Field	Description
Include source if ...of the conditions are met	Defines the conditions for an agent to be included in the group. Available options are all or any.
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU, Tag, and Subnet. • OS Type - Type of operating system. Available options are: Windows, Linux, and MacOS. • OS Description - Description of the operating system. The description should not exceed 256 characters. Available operators are: is equal to, contains, start with, and ends with. For example, Microsoft Windows 10 Enterprise. • Host name - Name of the host. The host name can contain only alphanumeric characters. Available operators are: is equal to, contains, start with, ends with, and in. For example, DESKTOP-QQPDNG3. • IPv4 and IPv6 - IP address. Available operators are: between, in, not in, and between. For example, 10.40.15.220. • Machine OU - Name of the Machine OU. Available operators are: **is equal to**, **contains**. For example, OU=Win10, OU=Contractors, DC=corp, DC=com • Tag - Name of the tag that already exists. Available operators are: **is equal to**, **contains**, and **in**. • Subnet - The value of the Subnet Mask. Available operator is: **in**. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.
Add condition	Lets you add another condition.

Apply Policies



Below is an example of Apply Policies panel. The table describes the information and options in the Apply Policies panel:

Field	Description
Source Type	Defines the source type for the group. Available options are Agent Endpoint and Agent Windows Logs.
Available Policies	List the available policies associated with the source type.
Selected Policies	List the policies selected.
Add Another Source Type	Lets you add another source type.
Save and Close	Saves the settings and closes the Create Group dialog.
Publish Now	Publishes the created group.



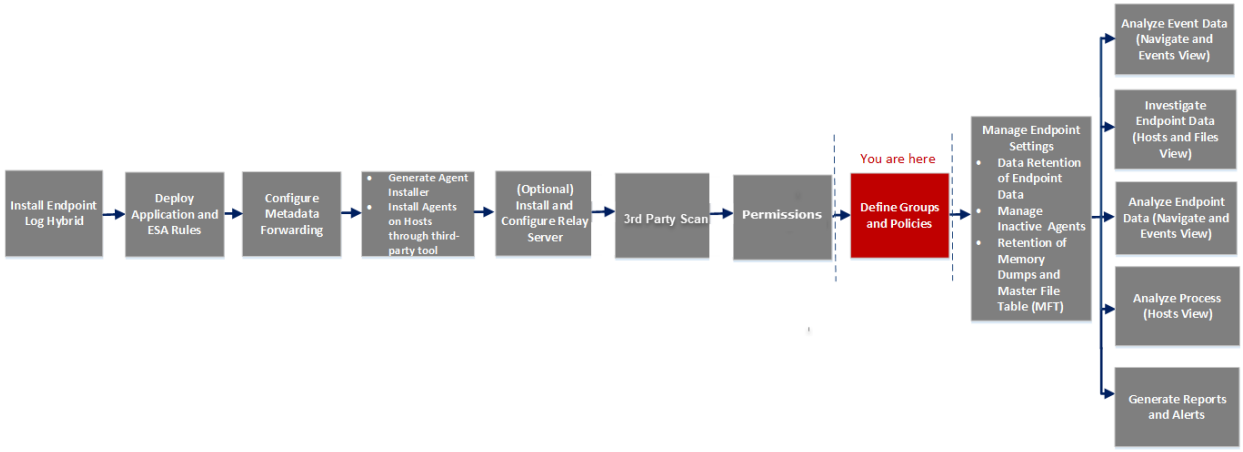
Ranking Groups

Below is an example of the Ranking Groups dialog. The table describes the information and options in the Ranking Groups dialog.

Field	Description
Source Type	Establishes ranking for the source type. Available options are Agent Endpoint and Agent Windows Logs.

Below is an example of the Edit Ranking panel.

From this panel, you can do the following:



- Drag the group up or down to change the priority. Priority decreases from top to bottom.
- Turn the Simulate slider on or off, to simulate your policy settings and how they affect the endpoints within their groups. For more details, see Simulation Examples.
- Use the available buttons to perform actions:
  - **Reset Ranking**: Resets the ranking to the original order.
  - **Set Top Ranking**: Moves the selected group to the top.
  - **Previous**: Navigates to the Choose Source Type panel.
  - **Publish Ranking**: Lets you edit the details of an existing group. For more information, see Edit a Group.
  - **Cancel**: Discards the changes and returns to the Groups tab.

Endpoint Sources - Policies

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups	Create a Group
Administrator	edit groups	Edit a Group
Administrator	edit ranking	Managing Groups
Administrator	delete groups	Delete a Group
Administrator	view default policies*	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy*	Create an EDR Policy
Administrator	create a Windows Log policy*	Create a Windows Log Policy
Administrator	create a File Log policy*	Create a File Log Policy
Administrator	edit policies*	Edit a Policy
Administrator	delete policies*	Delete a Policy

Quick Look

Below is an example of the Policies tab:

1 **Toolbar**

- **Create New**: Lets you create a new policy. For more information, see Managing Policies.
- **Publish**: Publishes the selected policy.
- **Edit**: Lets you edit the details of an existing policy. For more information, see Edit a Policy.
- **Delete**: Deletes the selected policies permanently. For more information, see Delete a Policy.

2 **Filter Panel**

- **Filters**: You can filter policies based on Policy Type and Publication Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

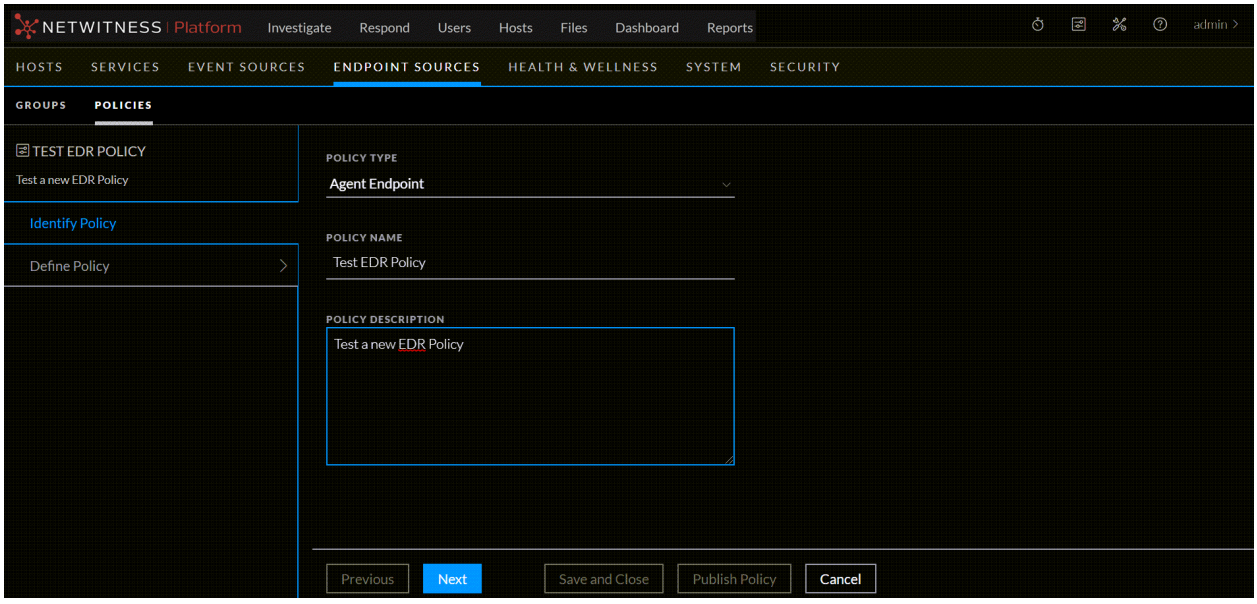
For more information, see Filter Policies.

3 **Policies List Panel**

Policy View. Displays the policy details:

- **Policy name**: Name of the policy.
- **Applied to groups**: Lists the group to which this policy is applied.
- **Policy description**: Displays the first portion of the description.
- **Policy type**: Displays the policy type: Agent Endpoint, Agent File Logs, or Agent Windows Logs.
- **Publication Status**: Status of the policy: Published or Unpublished.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



4 **Policy Details Panel**

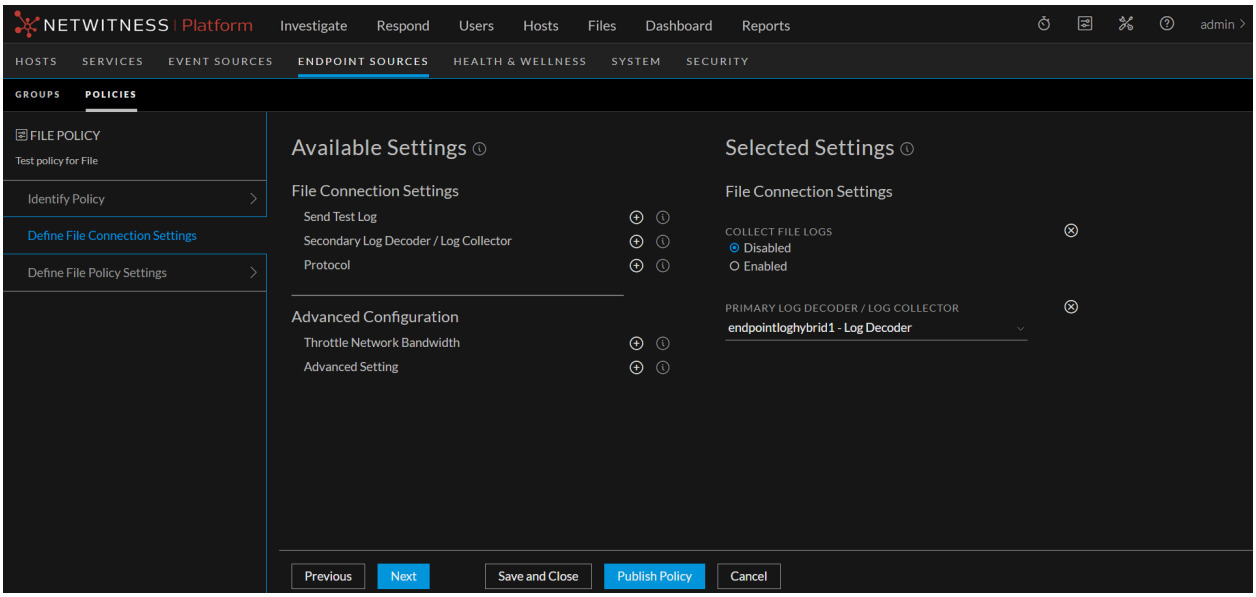
Displays the properties of the selected policy.

Note: To view the Properties panel for a policy, click the Policy Name.

Create Policy

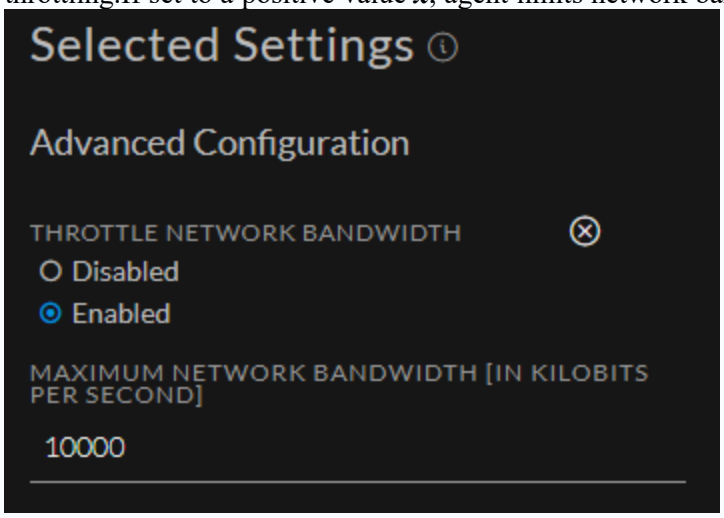
Below is an example of the Create Policy dialog. The table describes the information and options in the Create Policy dialog.

Field	Description
Policy Type	Displays the type for the policy. Available options are Agent Endpoint, Agent File Logs, and Agent Windows Logs.



Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description	Description of the policy. Description should not exceed 8000 characters.

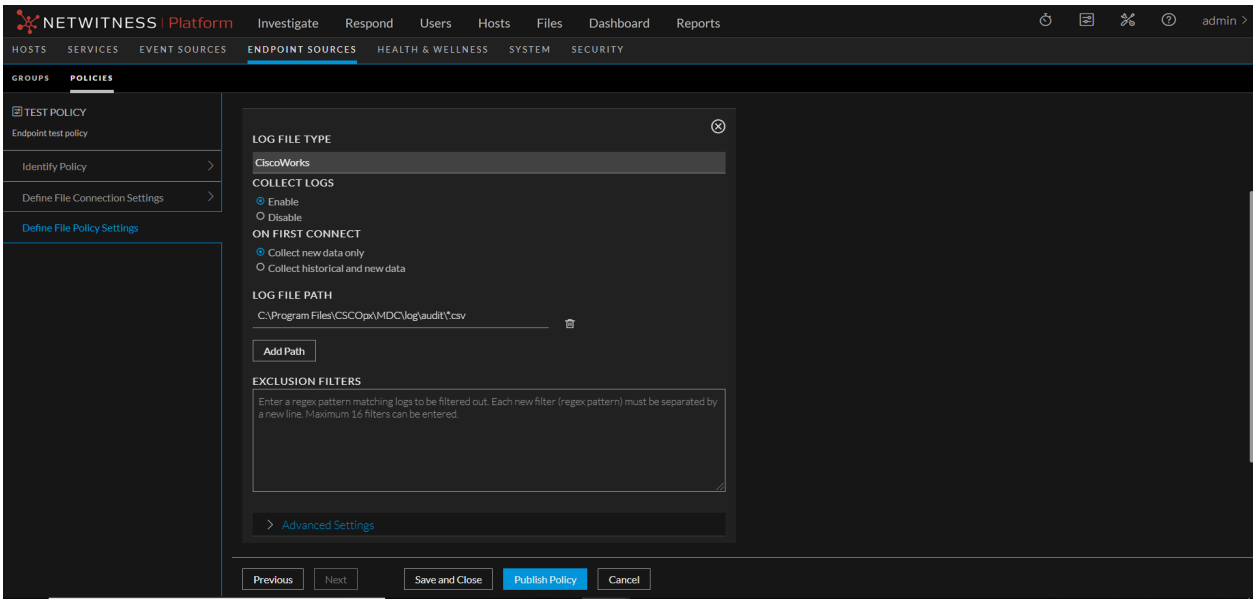
Panels for Log File Policy



There are two panels for defining the parameters for an Agent Log File Policy: **Define Connection Settings** and **Define File Policy Settings**.

Define Connection Settings

Below is an example of Define Connection Settings panel. The table describes the information and available options.



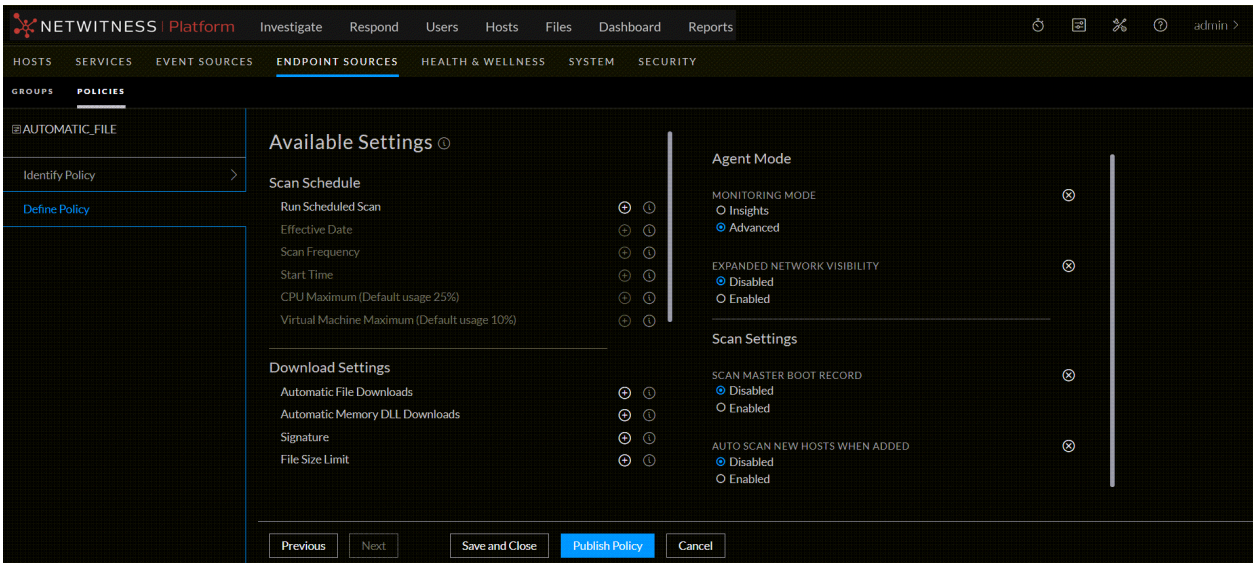
Field	Description
Collect File Logs	If enabled, the log file collection capability of the agent is activated. Logs are collected and forwarded to the NetWitness as they are generated. If disabled, no defined event source logs are collected. **Note:** This option must be enabled for any file event sources to be collected.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Field	Description
Primary Log Decoder / Log Collector	The primary Log Decoder or Log Collector to which the collected file logs will be forwarded.
Secondary Log Decoder / Log Collector	If the primary Log Decoder or Log Collector is not reachable, collected file logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** The NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select the transport protocol that is used to forward the collected file logs to the NetWitness servers. The following options are available: • SSL: Recommended, but also the most resource-intensive option. • TCP: Sends the logs in clear text over a reliable TCP connection. May be acceptable within a corporate network. • UDP: Sends the log in clear text over a non-guaranteed UDP connection. This is the least resource intensive option. **Note:** Resource intensity is dependent upon the Log Decoder, since there is only a single connection per agent.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.If not set, Agent does not do any network throttling.If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 

Field	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

Define File Policy Settings

Field	Description
Log File Type	From the drop-down menu, select the type of event source to be monitored. The list of available event source is based on all the event source types defined on your NetWitness. You can add event source types using the Live Services module. For details, see "Find and Deploy Live Resources" in the *Live Services Management Guide*.
Collect Logs	If enabled, log files for this file type instance are collected and forwarded to the NetWitness. File collection must be enabled on each source applying this policy for these specific logs to be collected.
On First Connect	Determines whether the NetWitness Agent collects all logs or only newly created logs located in the specified paths upon initial collection. In both cases, new logs are collected. **Note:** Historical logs cannot be collected after an agent has begun collecting logs.



Field	Description
Log File Path	One or more paths to be used by the agent to locate the log files. Represents the location of the log files to be read. **Note:** The Path value cannot end at a directory—the final portion of the path must represent a file name or set of files (using wildcard characters). You can use wildcards for both files and directories. Each source is limited to entry of 16 paths. This setting must include a path and a file spec. For example: `C:\Program Files\apache-tomcat-*\logs\*.log`. In this case, the file spec is all files with a ".log" extension in the specified path. If you cannot use wildcards to specify multiple files, you can add additional paths to accommodate the differences in path locations on a specific endpoint agent. This might be due to installation locations or version information. Only the paths with valid locations and files on the specific endpoint agent are used, and the others are ignored. For many event source types, there is a default path. If so, you only need to enter a path if the log files are not stored in the standard directory for that event source type. **Note:** This can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). For more details about UNC paths, see Endpoint Sources - Policies below.
Exclusion Filters	An optional list of regex patterns which can be used to filter out any logs that match the patterns. Each separate filter should be entered on a new line. Each source is limited to 16 exclusion filters. **Note:** Each filter needs to be entered as a valid regex string, or the system does not allow you to save it.
Advanced Settings	

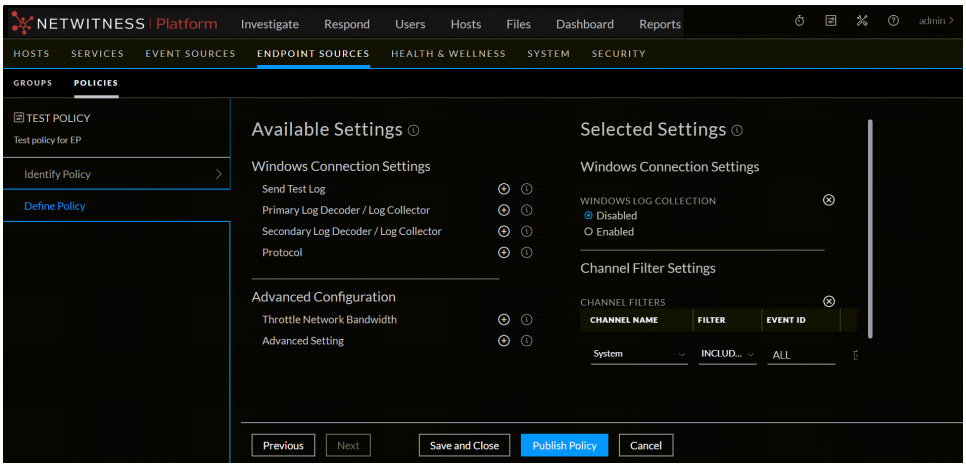
Field	Description
Source Alias	Optionally, enter a hostname, IPv4 or IPv6 address to identify individual sources. This is recommended when there are two or more sources of the same type on the same server: For example, a server that runs two instances of Apache web server. **Note:** This value only rarely needs to be entered. One example is if you have more than one Web Server, and they are running different Apache servers. Note the following: • If you enter a value for this parameter, the event source is applicable to a single Endpoint server. • This optional address or hostname is included in the meta for any logs originating from this source. This can be used by analysts to assist in identifying the source. • Set a value for this parameter if two sources of the same event source type are configured in the same policy. • This setting is not commonly needed: it is only useful if the policy is only applied to a single endpoint.
File Encoding	Specifies the type of character encoding of the log files. If **Local Encoding** is selected, the NetWitness Agent uses the default encoding of the Windows machine upon which it is running. This setting must match the encoding of the log files, or they will not be processed correctly. **Note:** UTF-8/ASCII is recommended (and the default). UTF-8 is a super-set of ASCII Note that all logs are re-encoded to UTF-8 before being sent to the NetWitness.

For a list of the currently supported types, see Currently Supported File Log Event Source Types.

Define Policy Panel for Agent Endpoint Policy

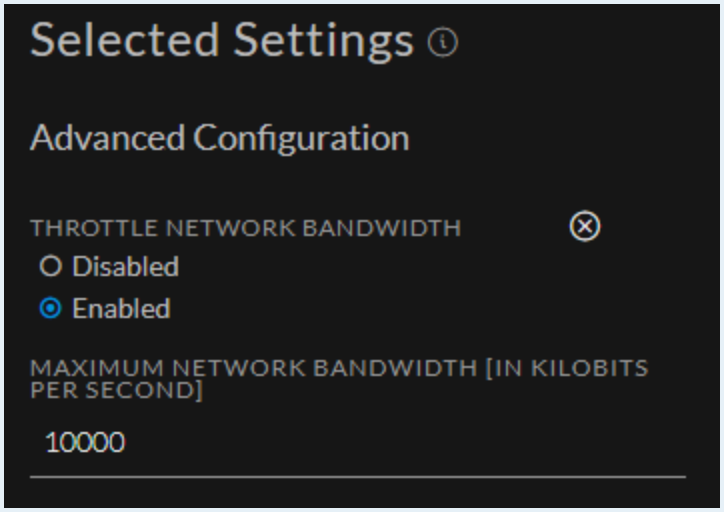
Below is an example of Define policy panel. The table describes the information and options for Agent Endpoint policy:

Settings	Description
	Scan Schedule
Run Scheduled Scan	Run a scheduled scan if you want to receive regular snapshots from a host. Scan snapshots provide detailed information about processes and files loaded on the memory. By default, this option is disabled. You can also run a manual scan from the **Hosts** view. **Note:** The following scan schedule options are available only when the scan schedule is enabled. The values entered are specific to the agent time zone.
Effective Date	Date when the policy takes effect. If you do not want this policy to take effect as soon as it is applied to a group and published, set an effective date that is in the future. By default, this is set to the current date.
Scan Frequency	Determines how often the scheduled scan runs on a host. By default, this is set to every week. Every network is different and the frequency should balance the needs of the analysts for current data, availability to review the data, and how systems deal with the load of the generated data. Select Days or Weeks: • Days: Select the number of days of the scan frequency. You can set a schedule to scan every n days, where n is 1, 2, 3, 4, 5, 6, 10, 15, or 20. For example, to scan every third day, select 3. • Weeks: Select after how many weeks the policy scan should be initiated and on which day of the week the policy scan should initiate. For example, to scan every other Wednesday, choose 2 and W.
Start Time	Time when the scheduled scan starts to run on a host. By default, this is set to 9:00. This is the local host time, meaning that scans across a global network will not run all at once. Note that the time is in 24 hour format. To set a time of 7:30 PM, select 19:30.



Settings	Description
CPU Maximum	Amount of CPU the agent can use to run scheduled scans on physical hosts. By default, the value is set at 25%. Increasing the CPU maximum increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum CPU usage by the created policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Note that the higher the percentage, the less CPU is available for other tasks on the host.
Virtual Machine Maximum	Amount of CPU the agent can use to run scheduled scans on virtual machines. By default, the value is set at 10%. Increasing the virtual machine maximum value increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum Virtual Machine usage by the policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Keep in mind that the higher the percentage, the less CPU is available for other tasks running on the virtual machine.
Agent Mode	
Monitoring mode	Allows you to specify whether an agent should operate in Insights (free) or Advanced mode (license). By default, it is set to Advanced.
(Version 11.5 and Later) Expanded Network Visibility	Enables network tracking and monitoring on Windows hosts in Insights mode. **Note:** For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service should be enabled. It also optimizes the frequency of agents sending network events for network packet correlation for both Insights and Advanced modes. By default, this option is disabled.
Scan Settings	
Scan Master Boot Record	Includes Master Boot Record (MBR) details in scheduled scans. By default, this option is disabled. This can help to identify when an operating system boot sequence is compromised. However, not all modifications to the MBR are malicious, as they could be made to provide encryption or enforce licensing of certain legitimate software.
Auto Scan New Systems When Added	Automatically scans when a new host is added. By default, this option is disabled. If this option is disabled, no snapshot data is displayed in the **Hosts** view until a manual or scheduled scan is run on these hosts. Existing hosts will not be affected. **Note:** Enabling this option on a new deployment when this policy is applied to a large number of hosts may result in a large number of simultaneous scans that cause performance degradation.
Download Settings	
Automatic File Download	Automatically download the files to the NetWitness Endpoint Server based on the file size and signature. If a file is present on multiple hosts or multiple Endpoint Servers, only one instance of the file is downloaded. By default this option is enabled.

Settings	Description
Automatic Memory DLL Downloads	From version 11.6.1 and higher, all memory DLLs that are detected during a scan, will be automatically downloaded regardless of the file size. This option is enabled by default.
Signature	Limits the download of files based on the signature. The options are : • Exclude All Signed - Downloads all the unsigned files to the NetWitness Endpoint Server and exclude all the signed files. • Exclude only Microsoft and Apple signed - Downloads all the unsigned files and exclude the files signed by Microsoft and Apple. • Include All- Downloads all the signed and unsigned files. **Note:** . In case of Linux, **Exclude all signed** and Exclude **Microsoft and Apple** signed options will download the files that are not part of any installed RPMs or files which are part of RPM but the hashes does not match with RPM.
File Size Limit	Limits the download of files based on the file size. The File size should be between 1 KB and 10 MB. By default, file size lesser than or equal to 1 MB are downloaded automatically.
Response Action Settings	
Blocking	Allows an analyst to prevent the execution of a malicious file on any host running an Advanced mode agent. By default, this option is disabled. File blocking will not be enforced if it is disabled by policy, which might be desirable to ensure that there are no performance side effects on systems where CPU or IO performance is critical. **Note:** Blocking is only supported on Windows agent (in Advanced mode) with NetWitness version 11.3 and later.
Network Isolation	Allows an analyst to block hosts that are compromised from connecting to the network. This controls the spread of an attack and help analyze the malware behavior after the network isolation. All attempted network connections are monitored and reported to the Endpoint Server. By default, this option is disabled. **Note:** Network isolation is only supported on Windows agent (in Advanced mode) with NetWitness version 11.4 and later.
Endpoint Server Setting	
Endpoint Server	Displays all available Endpoint servers in the deployed. **Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
Server Alias (Optional)	The optional server alias allows you to enter an alternative hostname or IP address on which the server can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server.



Settings	Description
HTTPS Port	Port number used for HTTPS communication. By default, the port is set to 443. If you want to change this port, make sure that it matches the server configuration. If you enter the wrong port, the agents can no longer communicate with the Endpoint server and the system will be non-functional.
HTTPS Beacon Interval	Determines how often an agent can communicate with the Endpoint server over HTTPS. By default, the value is set to 15 minutes. The default method of beaconing is UDP. Beaconing is used as a method of keep-alive to know if a host is online and to allow hosts to respond faster than the fallback HTTPS beacon time.
UDP Port	Port number used for UDP communication. By default, the port is set to 444. If you want to change this port, make sure that it matches the server configuration. Entering the wrong port results in loss of functionality and effects performance.
UDP Beacon Interval	Determines how often an agent can communicate with the Endpoint server over UDP. By default, the value is set to 30 seconds.

Define Policy Panel for Windows Logs Policy

The table describes the information and options for Agent Windows Logs policy:

Settings	Description
Windows Log Collection	If enabled, logs from the Windows hosts are collected and forwarded to the NetWitness Platform. By default, this option is disabled.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Settings	Description
Primary Log Decoder / Log collector	Primary NetWitness Log Decoder or Log Collector to which the collected Windows logs are forwarded.
(Optional) Secondary Log Decoder / Log collector	If the primary Log Decoder or Log Collector is not reachable, the collected Windows logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select whether TLS, TCP, or UDP transport protocol is used to forward the collected Windows logs to the NetWitness Platform servers. By default, the protocol is TCP.
Channel Filters	Configure which Windows Log events to collect by selecting a channel, filter condition, and the relevant event IDs. You can either select common channels, such as Security or System from the drop-down list, or create custom channels by entering the channel name. By default, all events are collected from a selected channel. To collect a subset of events from that channel replace 'ALL' with the relevant Event IDs. Select **INCLUDE** if only events with the listed Event IDs should be collected or select **EXCLUDE** to collect all events except for these events.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second. • If not set, Agent does not do any network throttling. • If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 

Settings	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

Troubleshooting

This section provides information about possible issues when using NetWitness Endpoint.

Agent Communication Issues

Issue	Agent **Last Seen Time** column is not updated in the UI.
Explanation	The issue could be due to any one of the following: • Agent is inactive • Agent data is not processed if the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy** due to which all the agent data including agent last seen time is not updated.
Resolution	See the resolution for these statistics in the Health and Wellness Issues section.

Issue	Agent is unable to communicate with the Endpoint Server.
Explanation	This could be due to one of the following reasons: • Agent is inactive. • Endpoint Server settings is incorrect in the agent packager or policy configuration, or not available for communication. • Endpoint Server or Nginx Server is not running . • Firewall or IP table rules are blocking the connection between the host and Endpoint Server.
Resolution	• Check if the Endpoint Server and Nginx Server are reachable. • If the Endpoint Server settings are incorrect, uninstall the agent, download the agent packager, and reinstall the agent. • Update firewall or IP table rules, if required.

Issue	Agent takes a long time to scan.
Explanation	Sometimes, the NetWitness Endpoint scan takes a long time to complete. This is because of the CPU usage by other antivirus programs (such as Windows Defender, McAfee, Norton, and so on) that may be installed on the agent machines.
Resolution	It is recommended to whitelist the `<service.exe>` (name provided in the packager, by default, the service name is `NWEAgent.exe`) file in the antivirus suite.

Issue	You want to change the responsiveness of the Agent.

Explanation	Depending on your installation, you can adjust Beaconing intervals to change how responsive your agents are.
Resolution	If resources are not a concern, you can lower the HTTPS Beacon Interval and UDP Beacon Intervals. If resources are a concern and responsiveness of the agent is not, you can increase these intervals.

Issue	Agent is unable to generate network tracking events in Insights mode.
Explanation	Verify that Windows Management Instrumentation (WMI) service is running.
Resolution	• Run `Services.msc` and look for Windows Management Instrumentation (WMI) service. • Go to properties and change the **Startup type** to Automatic.

Packager Issues

Message	`Failed to load the client certificate.`
Issue	Incorrect certificate password.
Explanation	While generating the agent installer, the certificate password does not match with the one provided while downloading the agent packager from the UI.
Resolution	Specify the correct certificate password.

Health and Wellness Issues

Endpoint Issues

Behavior	The health check of the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy**.
Issue	Endpoint Server service or required resources are not available or not in a usable state. This could be due to one of the following reasons: • Unable to forward Endpoint meta data to the Log Decoder. • Endpoint Log Hybrid disk usage reaches the specified limit. • Mongo DB is down or excessive read and write errors during processing.
Resolution	• For Log Decoder issue, see Log Decoder Issues section. • For disk usage and Mongo DB issues, see Disk Usage and Mongo Issues section.

Disk Usage and Mongo Issues

Behavior	The health check of the **Data.Application.Connection-Health Application**, **Data Store Disk Usage** or **Data Persistence** for Endpoint Server shows Unhealthy.
Issue	• **Data.Application.Connection-Health Application** or **Data Persistence** shows Unhealthy, if Mongo service is down or fails due to authentication. • **Data Store Disk Usage** shows **Unhealthy**, if Endpoint Server Mongo storage size has exceeded the threshold. By default, the server automatically delete the old data when it reaches 80% of the disk space.
Resolution	• For **Data.Application.Connection-Health Application** or **Data Persistence** issue, you must check the Endpoint server logs (`/var/log/netwitness/endpoint-server/endpoint-server.log`) and Mongo logs (`/var/log/mongodb/mongod.log`), and: ◦ If the issue is due to authentication, you must reissue the certificate. For more information, see "Service Certificate Reissue" section in the *System Maintenance Guide*. ◦ If the issue is due to Mongo service is down, you must restart the Mongo. • For **Data Store Disk Usage** issue, you must increase the storage or configure data retention settings to clear the old data. For more information, see Configuring Data Retention Policy.

Log Decoder Issues

Behavior	Endpoint metadata is not available in the **Investigate > Navigate** or **Events** view.
Issue	The health check of the **Log Decoder Buffer** and **Meta Forward** shows **Unhealthy** in the Health and Wellness.
Explanation	The issue could be due to any of the following reasons: • Log Decoder capture is not started. • Concentrator aggregation is not started. • Log Decoder connection issue. • Log Decoder buffer usage is beyond the specified limit.
Resolution	Make sure that: • Capture is enabled on the Log Decoder. • Aggregation is enabled on the Concentrator. • Meta forwarding is configured properly.

	Note: Make sure **Capture Autostart** is enabled in the Service Config view for Log Decoder and **Aggregate Autostart** is enabled in the Service Config view for Concentrator.

File Log Policy Issues

Invalid Policy or Bad Connection Issues

Issue	Policies can be invalid for a variety of reasons. Some examples: • No sources found if the policy is enabled. • Invalid or missing typespec file • No destination is reachable for a file log policy event source type Additionally, if capture is stopped on the destination Log Decoder, Endpoint Agents will send an error to the Endpoint Server saying that they failed to connect. Also, if there is a lot of data to be processed for Agents collecting File data (when File Policy is enabled) , there is a possibility that Log Decoder buffer becomes full. If this happens, the Log Decoder cannot process any requests from the Agents communicating via EPS.
Explanation	The system is dynamic in nature, which means its state can change: event sources can lose their connection, typespec files can be altered or deleted, and other changes can occur that can invalidate a previously valid policy.
Resolution	To help identify the specific issue, check the log file on the Endpoint Server that reports the error: `/var/log/netwitness/endpoint-server/endpoint-server.audit.log` Relevant errors will be listed as **FileLogError** in the log file. If you experience this issue, you can do the following: 1. Try to identify and target higher-value data, thus limiting the total amount of data being processed. 2. Enable throttling in the File policy to smooth out the peaks in usage. 3. If you really do need to process more data on a regular basis, consider server-side hardware upgrades.

Reset File Collection Bookmarks

Issue	If the system is not configured correctly, NetWitness might collect logs and not be able to parse them. Or, files might get sent, but for some reason, not make it to the Log Decoder (for example if communication is via UDP and there is a network connectivity issue).

	In these and other cases, you can reprocess these "missing" log files.
Explanation	For whatever reason, you may need to reprocess logs from the beginning of the file.
Resolution	Reset bookmarks for an event source type using the procedure described here: Reset File Collection Bookmarks.

Missing Log Collectors and Event Sources in the User Interface

Issue	Some log collectors or event sources seem to be missing from the list of available items.
Explanation	The Filter drop-down menus (types, log collectors, and log decoders) only show values that are in the event sources database, rather than all possible values. For example, if you have a log collector that has not yet collected any logs, then it is missing from the list.
Resolution	Collect logs from a specific log collector and event source, and then they should appear as items in the appropriate menu.

Relay Server Issues

Test Connection Issues

Issue	Relay Server test connection failed.

Resolution	1. Check if the hostname or IP and port of the Relay Server are correct.
	2. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command:
	`/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command:
	`systemctl status rsa-nw-relay-server`

Issue	Test fails when installing relay server in cloud, using CentOS 7 configuration

Resolution	1. Check if you have entered the suggested port numbers.
	2. If you have entered any other port number than the suggested one
	3. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command: `/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command: `systemctl status rsa-nw-relay-server`

Issue	Relay Server installer generation fails with an error message ‘Unable to download the installer. Retry after sometime’.
Explanation	Dependencies of the Relay Server are not resolved or downloaded completely.
Resolution	You must retry the download after 5-10 minutes. If the download still fails even after all dependencies are downloaded in the Endpoint Server, contact the NetWitness Customer Support. **Note:** You can check ‘Finished downloading all Relay Server dependencies’ message in the Endpoint Server logs at `/var/log/netwitness/endpoint-server/endpoint-server.log`, to see if the dependencies are downloaded. If the download fails due to yum related issues, then you must clean yum repo using the command `yum clean all` and restart the Endpoint Server.

Issue	After the removal of DNSMasq in 12.1 and later versions, test connection fails between the Endpoint server and relay server.
Resolution	For the test connection to succeed, perform the following.

	1. SSH to Endpoint server. 2. Edit the `/etc/nginx/conf.d/relay.conf` file and go to `resolver nw-node-zero ipv6=off;` line. 3. Replace `nw-node-zero` with the nameserver IP or hostname. 4. Run the following command to restart nginx service. `systemctl restart nginx` 5. Try **Test Connection** again.

Installation Issues

Issue	Relay Server installation fails due to missing or corrupted dependencies.
Resolution	Re-download the installer dependencies, perform the following: 1. Go to **(Admin) > Endpoint Server** service > select > **View** > **Explore**. 2. In the Endpoint server configuration, make sure **endpoint.relay.installer.download-on-restart** boolean is set to true (by default it is true). 3. Restart the Endpoint server using the following command: `systemctl restart rsa-nw-endpoint-server` Fresh dependencies will be downloaded to the local directory in the Endpoint Server. This may take few minutes. 4. Download the Relay Installer. 5. Run the Relay Server Installation Script. For more information, see (Optional) Installing and Configuring Relay Server.

YARA Issues

Issue	Failure in saving YARA configuration.
Explanation	The rule-folder path is under some Linux user home-directory such as /root or /home/user1.
Resolution	Choose other paths such as /var or /tmp etc. or change the owner of the directory to 'netwitness' user.

OPSWAT Issues

Files can not be scheduled for scan

Issue	Some files cannot be scheduled for the scan. See Endpoint Configuration Guide > Troubleshooting
Explanation	The issue could be due to any one of the following: 1. One of the endpoint servers is either down or not responsive. 2. OPSWAT is not configured in one or more of the endpoint servers.
Resolution	1. Ensure all the endpoint servers are up and running. 2. Ensure OPSWAT is configured in all the endpoint servers.

OPSWAT not configured on all endpoint servers

Issue	OPSWAT is not configured on appropriate Endpoint servers.
Explanation	The issue could be due to any one of the following: 1. OPSWAT is not configured in any of the endpoint servers. 2. One or more endpoint servers are down.
Resolution	1. Ensure OPSWAT is configured in all the endpoint servers. 2. Ensure all the endpoint servers are functioning.

OPSWAT scan results not getting updated

Issue	OPSWAT scan is scheduled successfully, but no results are getting updated.
Explanation	The issue could be due to any one of the following: 1. Either you have selected unsupported file extensions, or some files are larger than the configured file size limit. 2. OPSWAT server is either down or not responsive.
Resolution	1. Ensure only the files with supported extensions are selected, and file size has not exceeded the configured maximum file size. 2. Contact OPSWAT support for additional information.

Appendices

Reset File Collection Bookmarks

In cases where issues have caused logs to be lost, or not correctly sent to the Log Decoder, you can resend messages in log files by resetting the bookmarks for those log files.

Note: For security reasons, NetWitness does not allow resetting bookmarks from the agents. Rather, you must do so from an Endpoint Server.

The following procedure describes how to reset bookmarks for file collection logs.

Note: Currently, you can reset bookmarks for all sources or just one specific source, by providing a list in a JSON file.

Construct a JSON File to Identify Agents and Event Source Types for Reset

First, you need to construct a JSON file using the following structure:

```
{

     "agentIds": [],
     "sourceType" : ""

}
```

where:

- `agentIds`: a list of the IDs for one or more Endpoint Agents: these are the individual agents on which the source log files reside.
- `sourceType`: this is a list of the file event source type or types for which you want the log file bookmarks to be reset.

For details on finding agent IDs and source types, see How to Find Agent IDs and Source Types below.

For example, the following source code snippet could be used to delete bookmarks for **all** sources on 3 agents:

```
{

     "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
        88AD4B2C-192B-B50E-A125-C05B801301AA"
        "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
     "sourceType": "ALL"

}
```

Similarly, the following source code snippet could be used to delete bookmarks for **apache** sources on 3 agents:

```
{
```

```
    "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
       88AD4B2C-192B-B50E-A125-C05B801301AA"
       "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
    "sourceType": "apache"

}
```

Reset Bookmarks

Perform the following steps to reset the bookmarks that you specified in a JSON-formatted file:

1. SSH to the NetWitness Admin Server.
2. Run `nw-shell` command. for details about using the NetWitness shell, see the *Shell User Guide*, available in NetWitness Link.
3. After nw-shell starts, connect to an Endpoint Server service, using the following command:

   `connect --service endpoint-server.`*`serviceID`*

   where *serviceID* is identifier for the Endpoint Server that hosts the agents you are changing. See How to Find Endpoint Service IDs for details on how to retrieve the service ID.
4. Change to the directory where the reset command resides:

   `cd endpoint/command/reset-bookmark`
5. Login with an administrator account.
   a. Type the login command:

      `login`

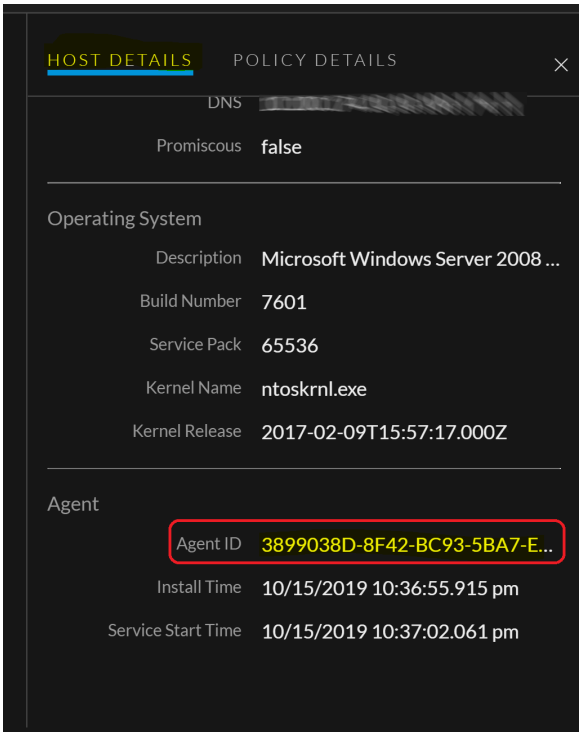
   b. Enter the user name for your admin account.

   c. Enter the password for your admin account.
6. Run the reset command: you need to provide the JSON path and filename that you created earlier.

   `invoke --file <path and filename for JSON>`

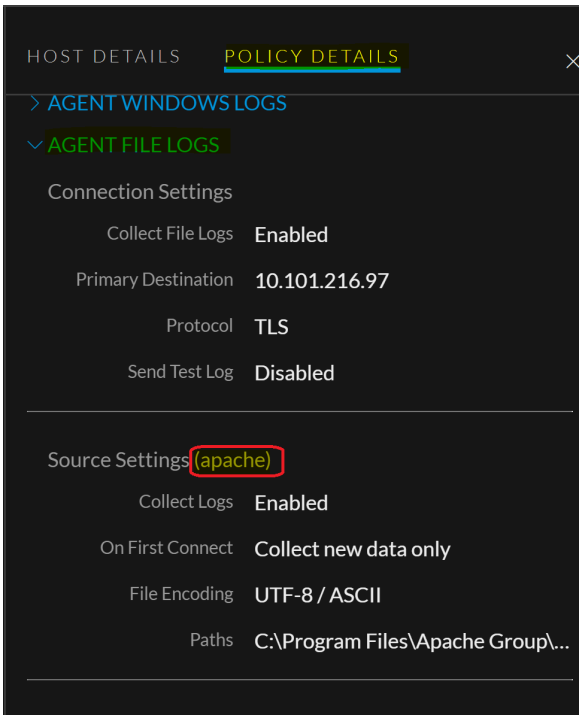
   For example:

   `invoke --file /tmp/test.json`



The bookmarks for each log file identified in your JSON file are reset. The following image shows an example NetWitness Shell session:

```
[root@SA ~]# nw-shell
RSA Netwitness Shell. Version: 5.15.0-SNAPSHOT



offline » connect --service endpoint-server.38909c2f-7a9b-415a-b567-f49a19cf250e
INFO: Connected to endpoint-server (38909c2f-7a9b-415a-b567-f49a19cf250e)
endpoint-server:Folder:/rsa » cd endpoint/command/reset-bookmark
endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » login
user: admin
password: **********
admin@endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » invoke --file /tmp/test.json
```

How to Find Agent IDs and Source Types

To find the Agent IDs for agents, go to **Hosts** > ***<select an Agent>***, then click the **Host Details** panel, and scroll down to the **Agent** section, where the Agent ID is shown:

To find the source types, go to **Hosts** > ***<select an Agent>***, then click the **Policy Details** panel, expand Agent File Logs, view the Source Settings for the source type name to use:

How to Find Endpoint Service IDs

You can retrieve the service ID for an Endpoint Server by using SSH to connect to it.

To retrieve the service ID for an Endpoint Server:

1. SSH to the NetWitness Endpoint Server for which you need to retrieve the ID. The IP address is available under  **(Admin) > Hosts**. The IP address for each host is listed in the **Host** column of the table.
2. View the file that contains the ID by running the following command:

   ```
   cat /etc/netwitness/endpoint-server/service-id
   ```

   It returns the Endpoint Server ID, for example:

   ```
   38909c2f-7a9b-415a-b567-f49a19cf250e
   ```

Currently Supported File Log Event Source Types

The following event source types are currently supported:

Apache Tomcat	Apache Web Server	CA Siteminder
CiscoWorks	CiscoWorks	Citrix XenMobile Device Manager
Courion Password Courier	EMC NetWorker	EMC Symmetrix
GlobalSCAPE EFT Server	IBM TAM WebSEAL	IBM WebSphere
IBM WebSphere MQ	JBoss Application Server	Kaspersky Anti-Virus
McAfee Endpoint	Microsoft DHCP	Microsoft Exchange
Microsoft Exchange 2007	Microsoft Exchange 2010	Microsoft Exchange 2013
Microsoft Exchange 2016	Microsoft Exchange SMTP	Microsoft Forefront Threat Management Gateway
Microsoft IAS (TVM)	Microsoft ISA	Microsoft ISA 2006
Microsoft ISA PF	Microsoft SQL Server	MSIAS
Oracle Access Management	Oracle iPlanet Web Server	Oracle WebLogic
Oracle WebLogic Audit Recorder	Perforce	Perforce AL
Perforce P4D	Rapid7 NeXpose	RIM Blackberry Enterprise Server
RSA Access Manager	RSA ACE Server	RSA ACE Server
RSA ACE Server AM	RSA ACE Server AMX	RSA Adaptive Auth (Hosted)
RSA Certificate Manager	RSA Federated Identity Manager	SAP ERP Central Component
Steel-Belted Radius Accounting	Steel-Belted Radius Authentication	SunOne LDAP Directory Server
Trend Micro IMSS	Trend Micro IWSS	Trend Micro IWSS Audit
VMware View	Windows DNS Debug Logs	MicrosoftIIS (W3C Format)

Specify UNC (Universal Naming Convention) Paths

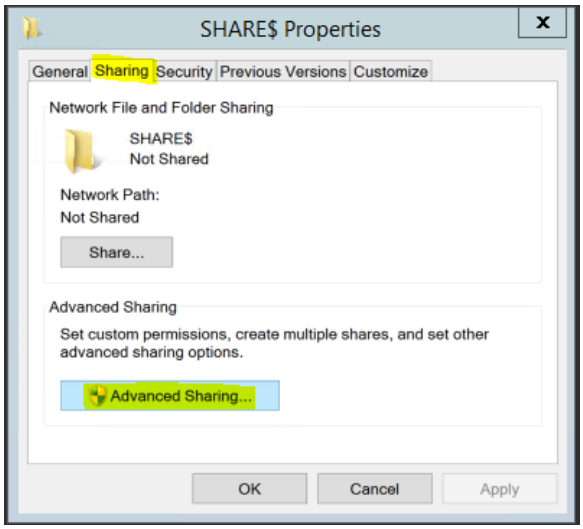
During configuration of a Log File Policy, you can specify the log file path. You can set one or more paths to be used by the agent to locate the log files. The path can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). This topic describes how to specify a UNC path.

Secure the UNC Path Location

When you use a UNC path to collect log data on a remote system, make sure that you secure the UNC path location. One solution that works with minimal risk in a Windows domain environment is to do the following:

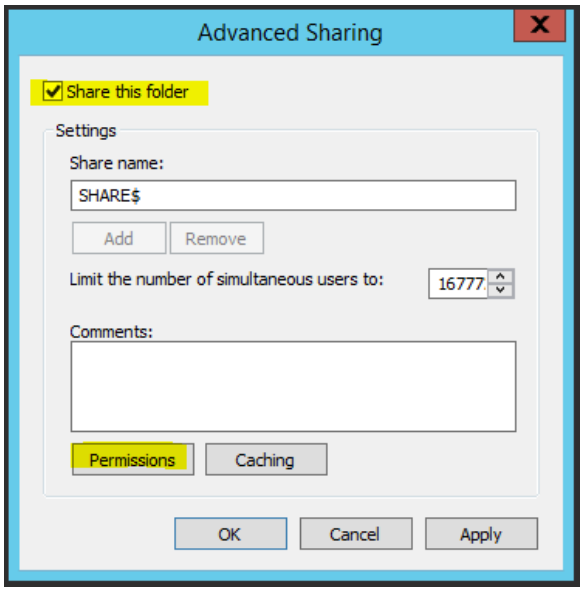
1. Create a share on the directory on the computer where the log data exists in isolation.
2. Name the share to something like **LOGDATA$** for example. (Shares can be hidden from curious browsers by adding a "$" to the end of the share name).
3. Remove all the default share permissions except local admin so it can be changed.
4. Add a share permission for the agent computer system. This allows any user on the agent system to access the shared location. On the agent system collecting the remote log data, nothing else should be required to properly collect the log data from the UNC path.

Note: You may not be able to view the UNC directory contents from file explorer. Seek advice from your IT or security group for additional guidence to setting up and securing a UNC directory share.



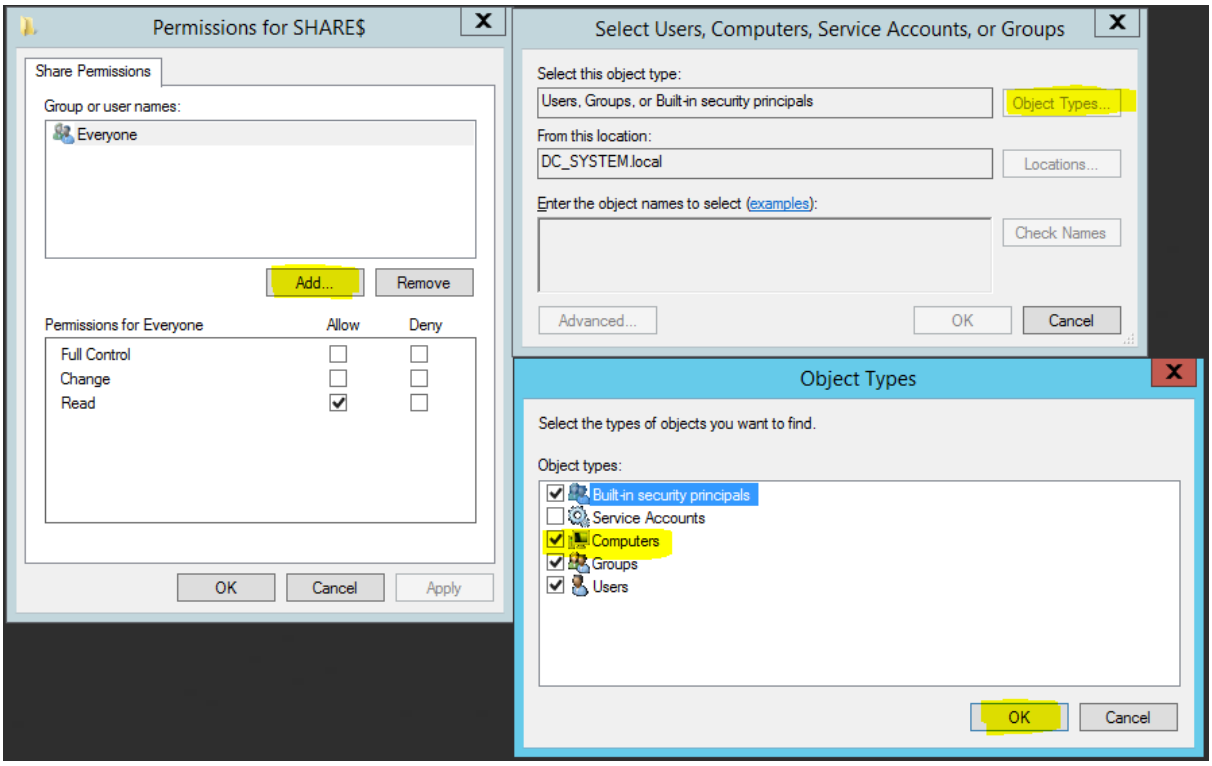
The following procedures describe how to:

- Share a folder between machines in a domain, and
- Share a folder between machines in a Workgroup

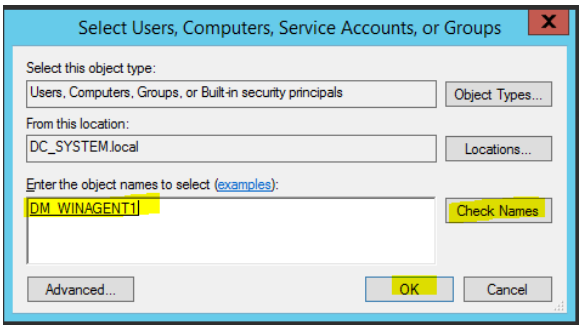


Share a folder between machines in a domain

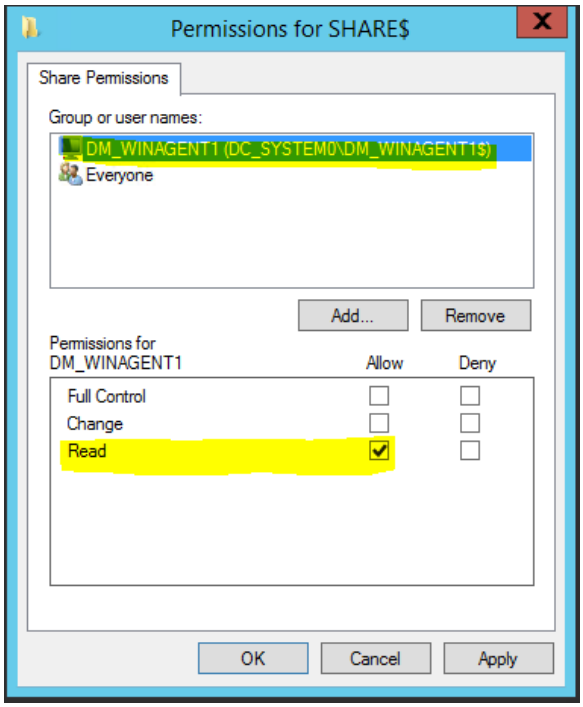
This procedure describes how to share a folder between Windows machines that are both in the same domain.



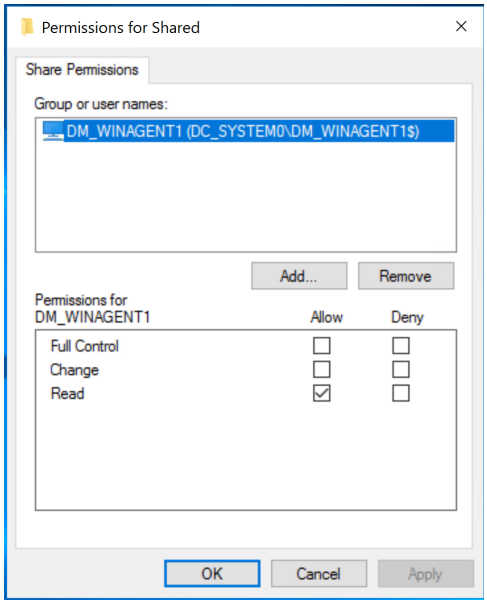
1. Log on to a Domain member machine that contains the logs folder you want to collect using an agent.
2. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.



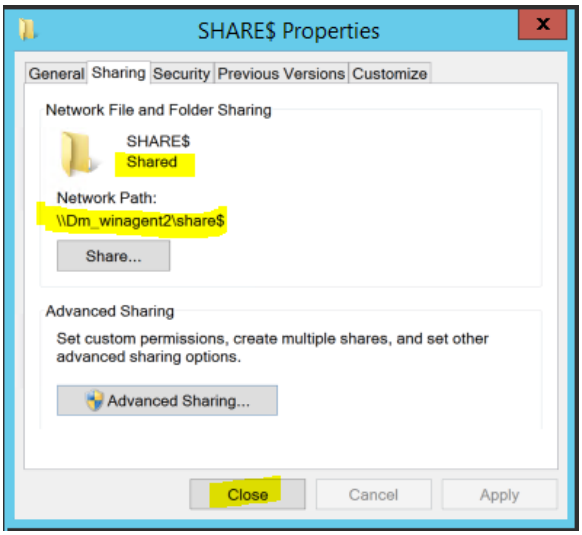
3. Click Advanced Sharing, select Share this folder, and then click Permissions.



4. Click **Add**, and then on the next window click **Object Types**, check **Computers**, hit **OK**.

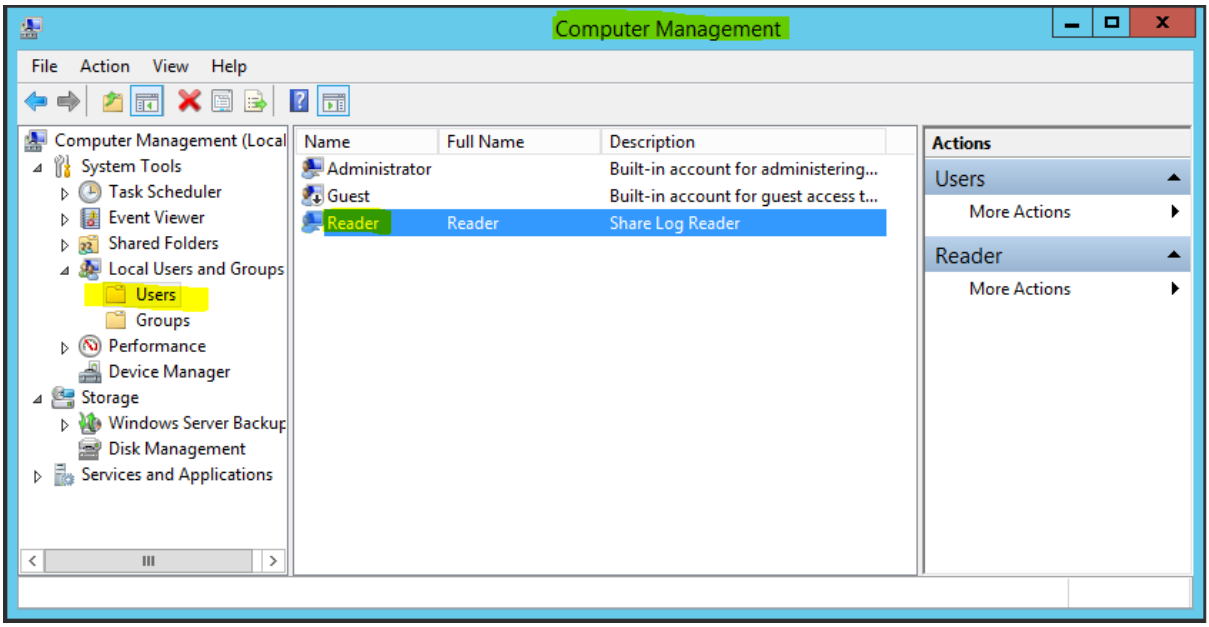


5. Search for the Agent computer name as shown below and click **OK**.

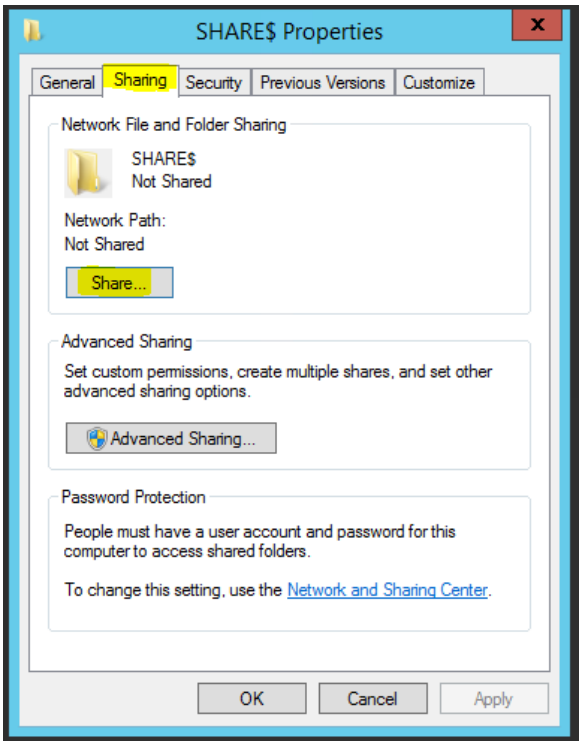


6. In the Permissions screen, provide **Read** permission to the agent, click **Apply**, and then click **OK**.

7. Remove **Everyone** from the Share Permissions list.

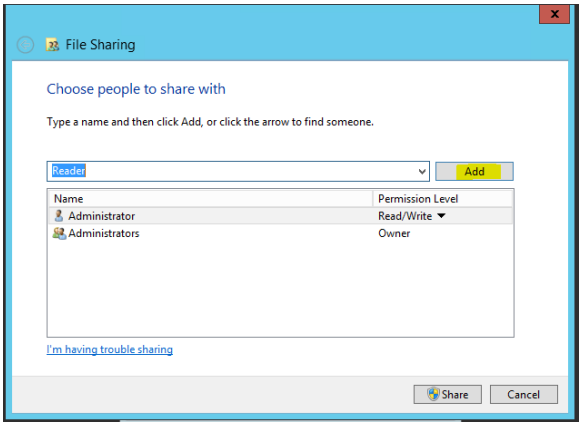


8. Verify that now the **SHARE$** folder status is correct, and note the network path so that you can enter it later, when you configure the policy that will use this shared folder.

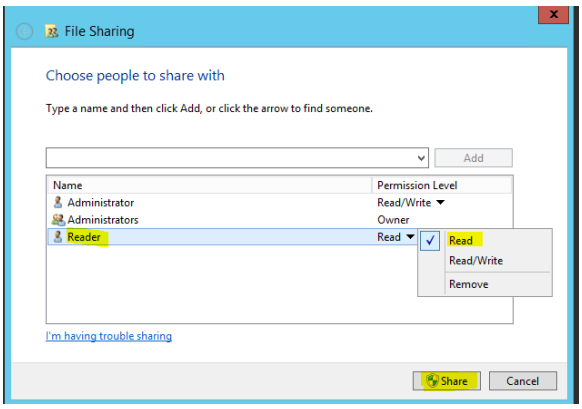


Share a folder between machines in a Workgroup

This procedure describes how to share a folder between Windows machines that are both in the same Workgroup.



1. Log on to a workgroup machine that contains the logs folder you want to collect using an agent.
2. Create a non-admin user for log collection: **Reader** in this example.



3. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.
4. Click the **Sharing** tab, then click **Share**.

5. Choose the newly-created user and click **Add**.

6. Select the **Read** permission and click **Share**.

7. Log onto the Agent to add credentials, so that the system can read logs from the shared folder.
   a. Download the `psexec` tool from the Microsoft web site.
   b. Run the following command:

      ```
      psexec -i -s cmd.exe
      ```

      A new command window opens, running as **system**.
   c. In the command window, run the following command to cache credentials for the newly-created user to access logs on shared folder from a workgroup machine:

      ```
      net use \\hostname of machine with logs\Share$
      ```

      For example:

      ```
      net use \\WGWINAGENT2\Share$
      ```
   d. Provide the username and password for the non-admin user created earlier (in step 2).

This command adds credentials to read logs from the shared folder on the workgroup machine.

NetWitness Endpoint Integration

NetWitness customers who are using NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness 11.x in several different ways.

Note: In Version 11.2 and later, the following components are rebranded:
- NetWitness Suite to NetWitness Platform
- Packet Decoder to Network Decoder

Integration Options

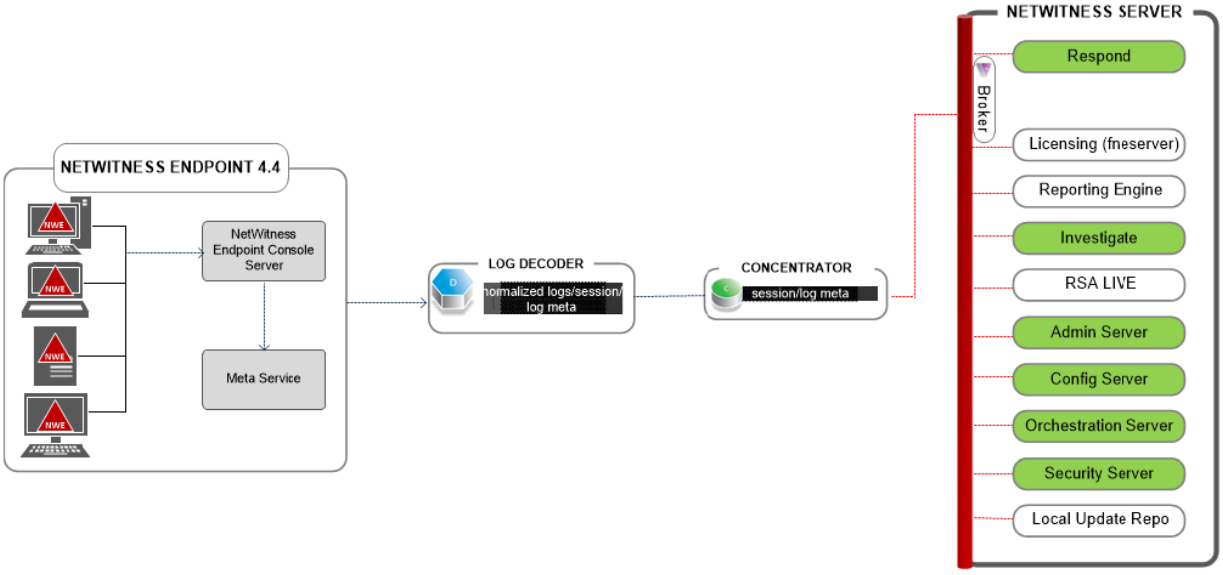
Integration Methods

The following are the NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 or later directly to a Log Decoder

Endpoint alerts into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond.

Contextual data from Endpoint through a NetWitness Live recurring feed. This integration can enrich the session displayed in NetWitness Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.



NetWitness Endpoint alerts through Syslog (CEF) into NetWitness Log Decoders. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness ecosystem.

(For Version 11.1 and later) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets.

Note: For information on NetWitness Endpoint 4.4.0.x integration with NetWitness, see *NetWitness Endpoint Configuration Guide*.

NetWitness Endpoint Metadata Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.

Built-in NetWitness Endpoint Lookup

With the NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness, the built-in NetWitness Endpoint Lookup from NetWitness Investigation and NetWitness Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

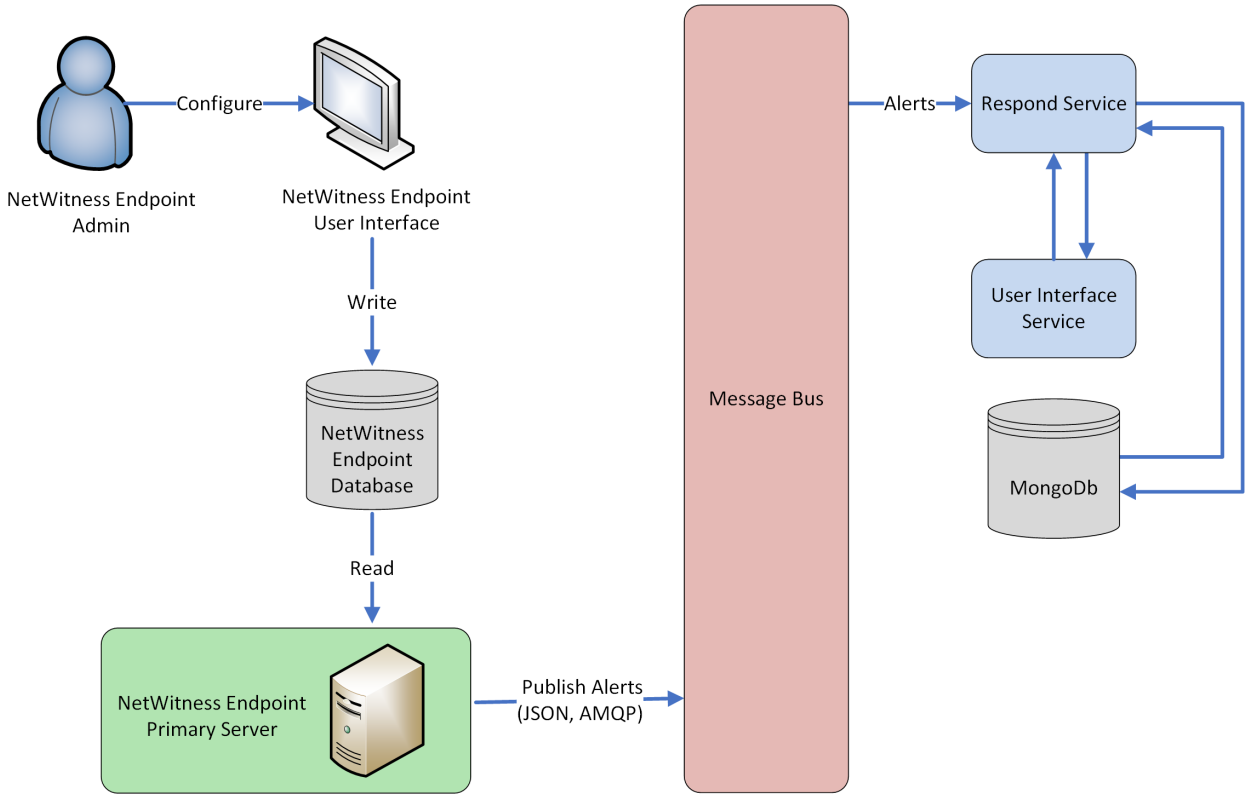
Note: The exception occurs if you customize NetWitness by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the  **(Admin)** > System view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.



Each of these alert types can be sent to NetWitness.

Configure NetWitness Endpoint Alerts to Respond

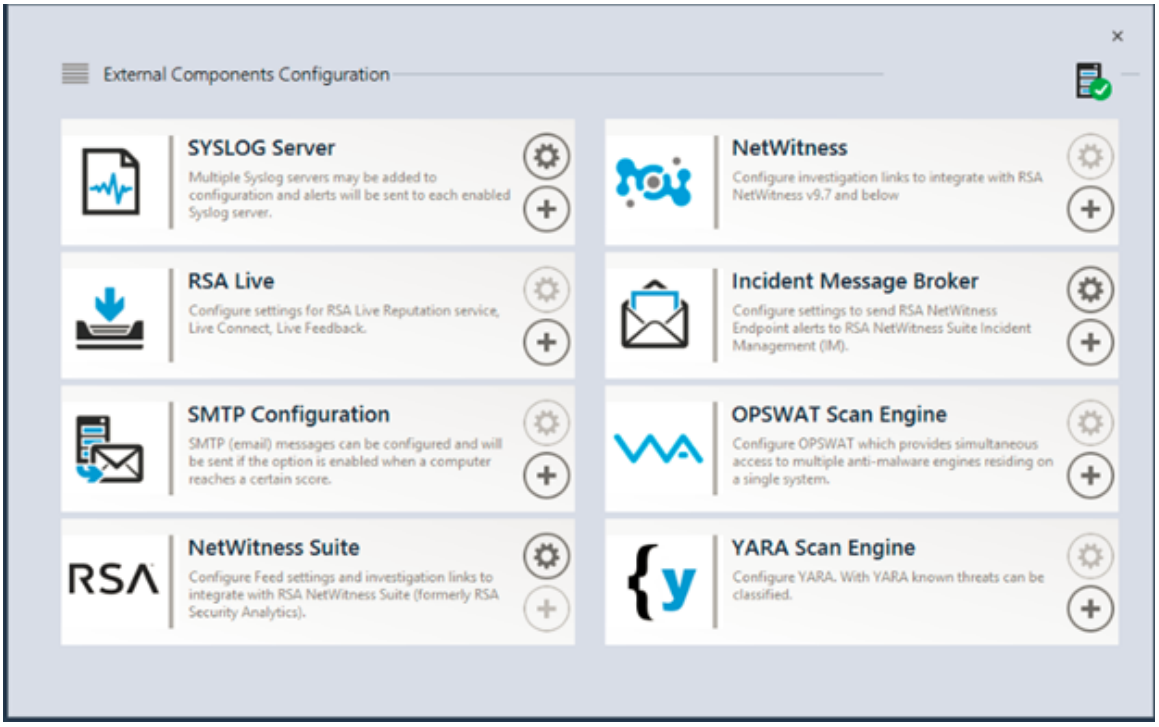
This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness and displayed in the **Respond > Alerts** view.

Note: NetWitness supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness and its display in the **Respond > Alerts** view.

Prerequisites

Ensure that you have the following:



- The Respond service is installed and running on NetWitness.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts to Respond to the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **(Configure) > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

Note: In NetWitness 11.0 and 11.1, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      c:\client.cer
      ```

      Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

      ```
      PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
      "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
      "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
      TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
      Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
      DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
      Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
      (5); Export-Certificate –Cert (Get-ChildItem –Path
      Cert:\LocalMachine\My\ -DnsName ecat) –FilePath C:\Client.cer
      ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:

   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure NetWitness Endpoint data in NetWitness to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness ecosystem.

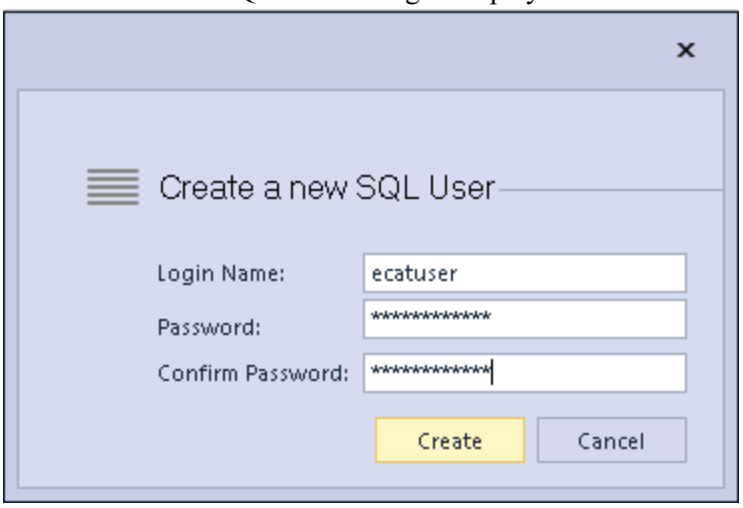
Administrators can configure NetWitness to consume system scan contextual data from NetWitness Endpoint through a NetWitness Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness ingest devices (Decoder and Log Decoder).

Prerequisites

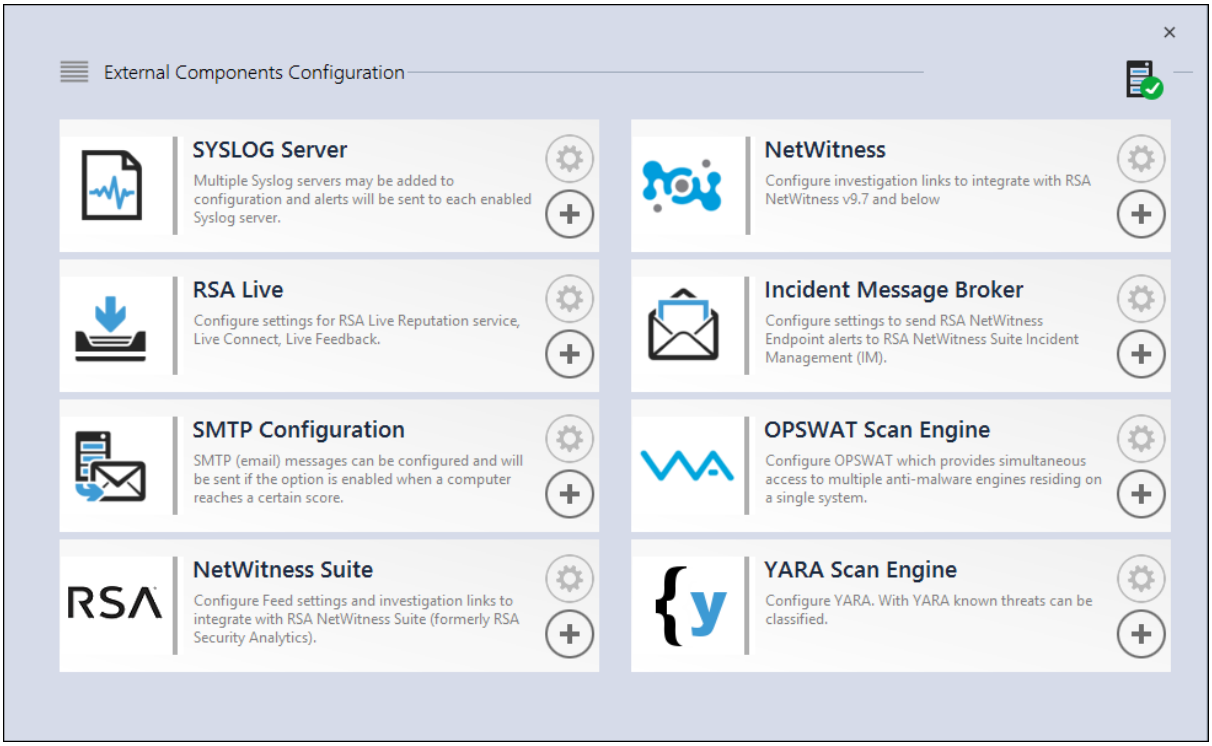
- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 NetWitness Decoder and Concentrator connected to the NetWitness Server in the network.



To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:

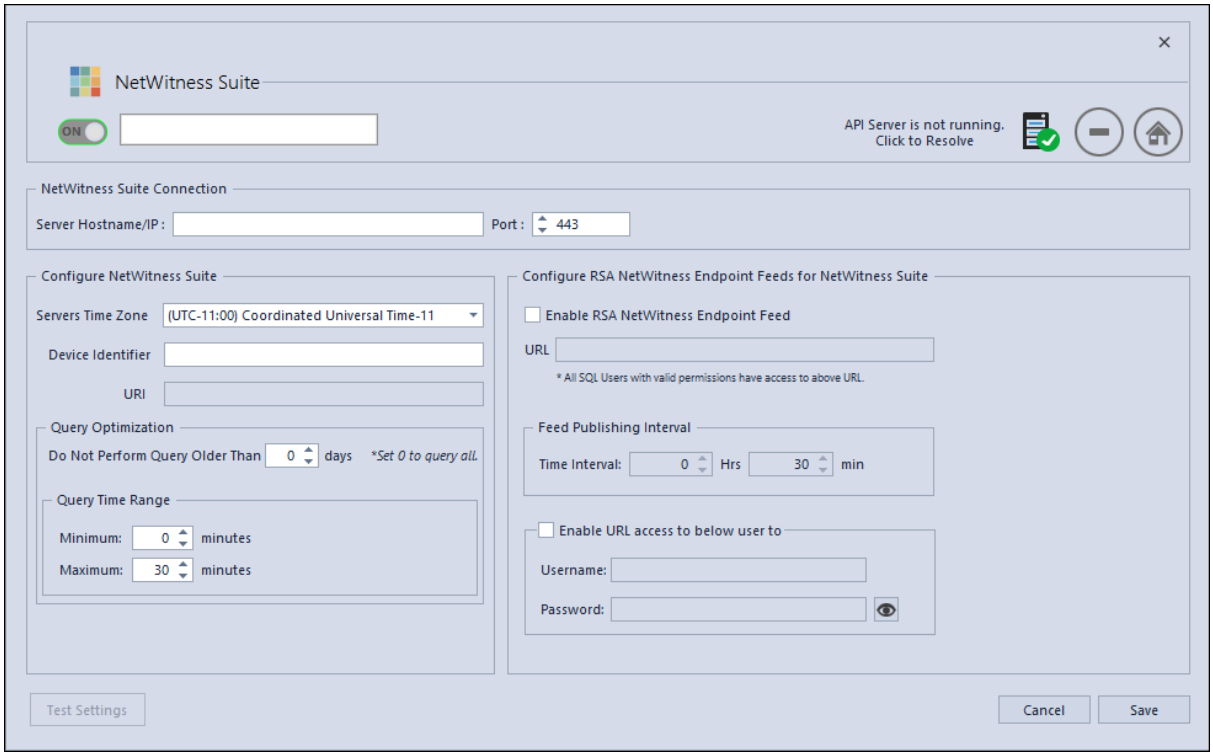
1. Enable the NetWitness Endpoint Feed for NetWitness in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness trust store.
3. Configure the NetWitness Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Live.

Enable the NetWitness Endpoint Feed for NetWitness



1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select  **(Configure) > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

The Create a new SQL User dialog is displayed.



c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.

3. In NetWitness, click +.
   The NetWitness dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the name to identify the NetWitness component.
5. In the **NetWitness Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness concentrator device ID.

   Note: You can find the Device Identifier in NetWitness when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness, so that a query does not overload the NetWitness Server.
9. In the **Configure NetWitness Endpoint Feeds for NetWitness** panel, perform the following:
   a. Select **Enable NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`NweCA.cer`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA.cer`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     `scp NweCA.cer root@<sa-machine>:.`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     `scp EcatCA.cer root@<sa-machine>:.`
6. To import the NetWitness Endpoint Endpoint CA certificate into the NetWitness Trusted store, navigate to java directory. Enter the following commands:
   - For NetWitness Endpoint fresh installation:
     `keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`
   - For NetWitness Endpoint upgraded from previous version:
     `keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`

   When prompted for certificate update confirmation, enter **Yes**.
7. Create a file `jetty.user` in the `/etc/default` directory and add the following text.
   `JAVA_OPTIONS="${JAVA_OPTIONS} -Djdk.security.allowNonCaAnchor=true"`
8. On the NetWitness host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit**`/etc/hosts.user`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:

     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts.user`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:

     `<ip-address-ecat-cs> ecatserverexported`
9. SSH to ADMIN Server and run the following command.
   `nw-manage --refresh-host --host-all`
10. To restart NetWitness, enter the following command:
    service jetty restart

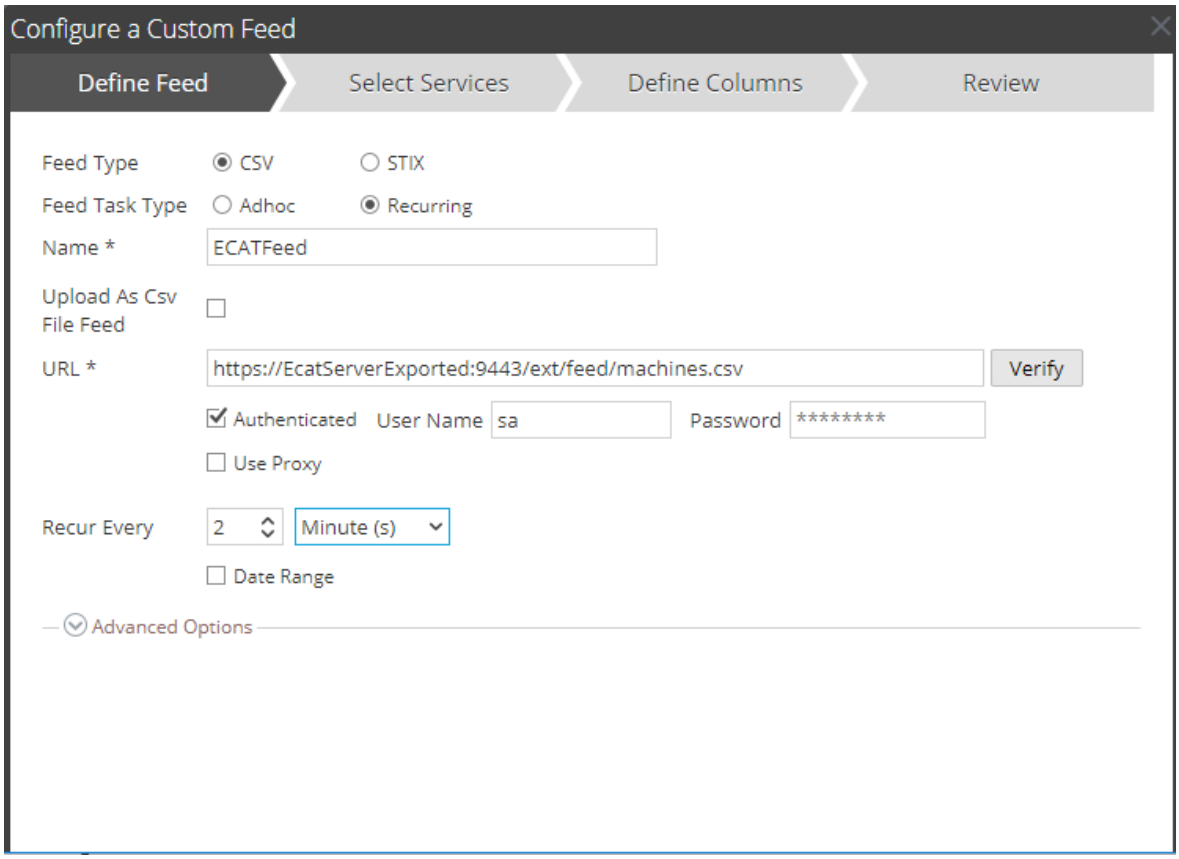
Configure the NetWitness Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
2. Select a **Concentrator** from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in

the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name matches the column name of the CSV file that NetWitness uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

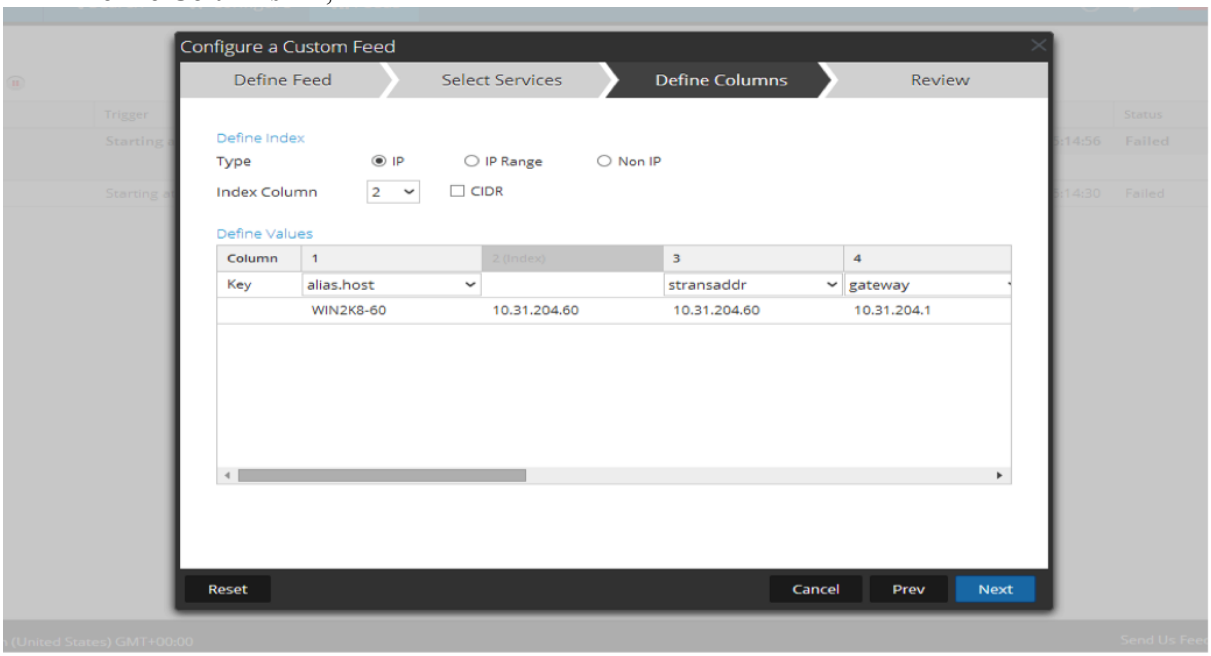


Configure the Recurring Custom Feed Task in NetWitness

1. Log on to NetWitness and go to  **(Configure) > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.
   e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:
      - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`**.
      - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`**.

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

g. Click **Verify** to check if NetWitness can reach the web resource.

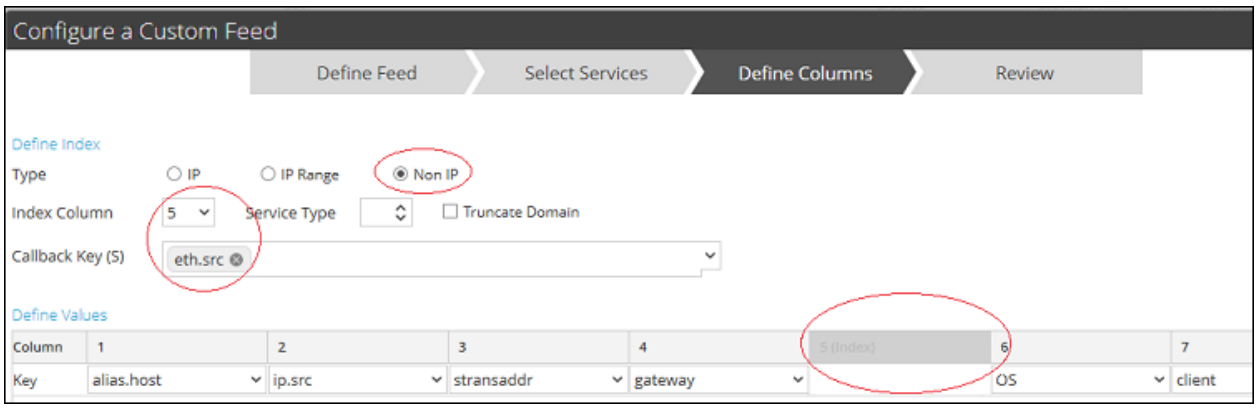


.

h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.



The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.

Result

When viewing feed data in NetWitness, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of NetWitness Endpoint data in NetWitness to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine.

For NetWitness networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness reporting on NetWitness Endpoint events, and NetWitness alerting of NetWitness Endpoint events.

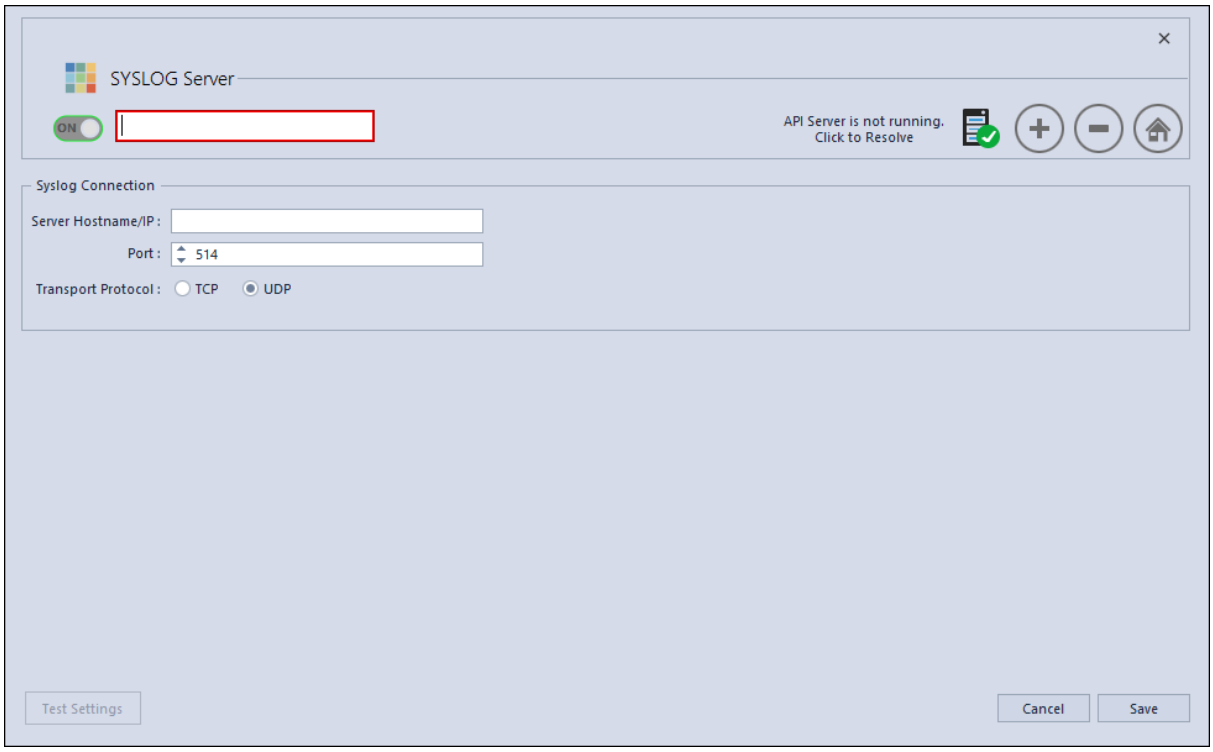
Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later NetWitness Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

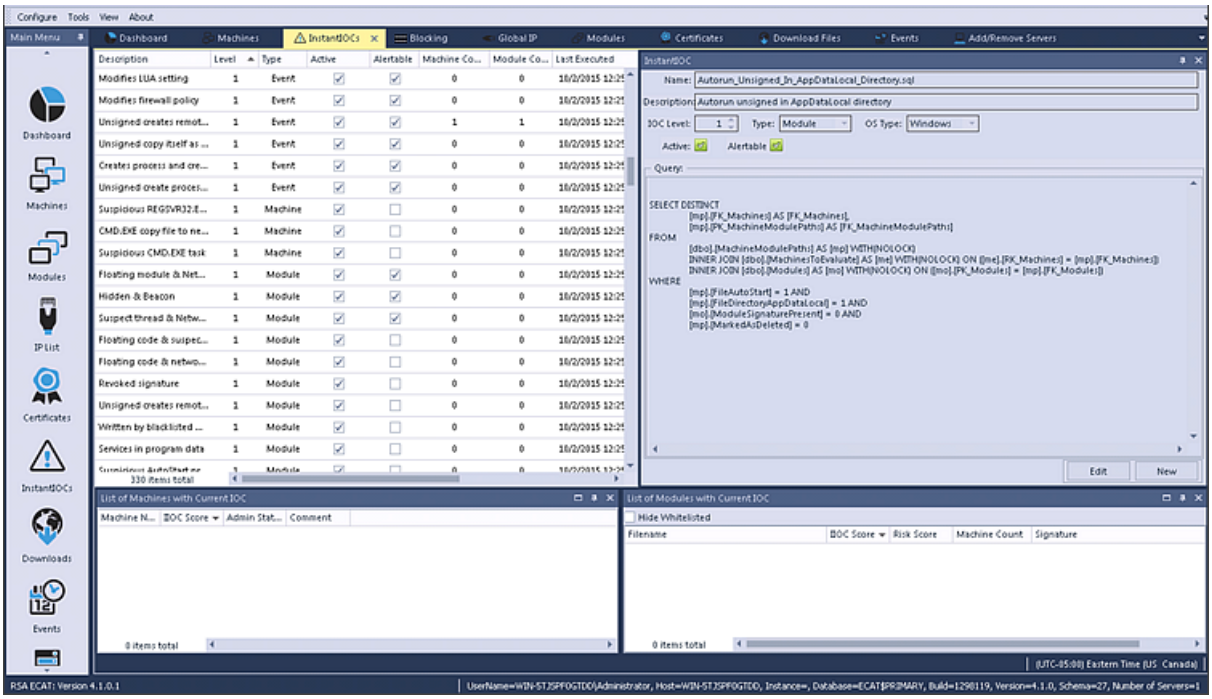


Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness.

Configure NetWitness Endpoint to Send Syslog Output to NetWitness

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:



1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click .
   The SYSLOG Server dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the NetWitness Log Decoder
   Port = 514
   Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.

When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Edit the Table Mapping in table-map-custom.xml

In the default NetWitness table-map.xml provided by NetWitness, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
agentid	client	No
CEF Header Hostname Field	alias.host	No
CEF Header Product Version	version	No
CEF Header Product Name	Product	Yes
CEF Header Severity	severity	Yes

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
CEF Header Signature ID	event.type	No
CEF Header Signature Name	event.desc	No
destinationDnsDomain	ddomain	Yes
deviceDnsDomain	domain	Yes
dhost	host.dst	No
dst	ip.dst	No
end	endtime	Yes
fileHash	checksum	No
fname	filename	No
fsize	filename.size	No
gatewayip	gateway	Yes
instantIOCLevel	threat.desc	No
instantIOCName	threat.category	No
machineOU	dn	No
machineScore	risk.num	No
md5sum	checksum	No
os	OS	No
port	ip.dstport	No
protocol	protocol	Yes
Raw Message	msg	Yes
remoteip	stransaddr	Yes
rt	alias.host	No
sha256sum	checksum	No
shost	host.src	No
smac	eth.src	No
src	ip.src	No
start	starttime	No
suser	user.dst	No
timezone	timezone	No

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
totalreceived	rbytes	Yes
totalsent	bytes.src	No
useragent	user.agent	No
userOU	org	Yes

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness you need to add them to `table-map-custom.xml`, and set the flags to `None`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
moduleScore	cs.modulescore	Yes
moduleSignature	cs.modulesign	Yes
Target module	cs.targetmodule	Yes
YARA result	cs.yararesult	Yes
Source module	cs.sourcemodule	Yes
OPSWATResult	cs.opswatresult	Yes
ReputationResult	cs.represult	Yes

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

Note: Restart the Log Decoder or reload the log parsers for the changes to take effect.

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
    1. Select a **Concentrator** from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.

3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.
5. To add the Concentrator as a data source in the Reporting Engine, in the  **(Admin) > Services** view, select the **Reporting Engine** and Select **View> Config > Sources.**
   NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

Example

Note: The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>
 <key description="Severity" format="Text" level="IndexValues" name="severity"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Dns Domain" format="Text" level="IndexValues"
name="ddomain" valueMax="250000" defaultAction="Open"/>
 <key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Host" format="Text" level="IndexValues" name="host.dst"
valueMax="250000" defaultAction="Open"/>
 <key description="End Time" format="TimeT" level="IndexValues" name="endtime"
valueMax="250000" defaultAction="Open"/>
 <key description="Checksum" format="Text" level="IndexValues" name="checksum"
valueMax="250000" defaultAction="Open"/>
 <key description="Filename Size" format="Int32" level="IndexValues"
name="filename.size" valueMax="250000" defaultAction="Open"/>
 <key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
 <key description="Domain OU" format="Text" level="IndexValues" name="dn"
valueMax="250000" defaultAction="Open"/>
 <key description="Risk Number" format="Float64" level="IndexValues" name="risk.num"
valueMax="250000" defaultAction="Open"/>
