Result

Analysts can:

- Create NetWitness alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

What is NetWitness Endpoint?

NetWitness Endpoint is an endpoint detection and response tool that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster.

About this Guide

This guide provides end-to-end instructions to configure NetWitness Endpoint and to use Endpoint features.

NetWitness Platform Documentation in NetWitness Community Portal

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the a.

Use these links to view the NetWitness Platform 12.x documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 12.x versions: NetWitness Platform 12.x Documentation.
- PDF Guides provide the information for a specific version: NetWitness Platform 12.4 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

The following tasks can be performed in any sequence.

Description	References
	

Description	References
View information about product updates, improvements, and known issues.	*Release Notes*
Understand NetWitness Endpoint.	"Getting Started with NetWitness Platform" and "Investigate" in the *NetWitness Platform Getting Started Guide*

Setup and Installation

Fresh Installation

The following tasks must be performed in the sequence listed.

Description	References
	
Obtain a license for Endpoint Log Hybrid.	Licensing Management Guide
Review the supported hardware.	"Supported Hardware" in the *Physical Host Installation Guide*
Review the Endpoint architecture; plan your deployment based on the number of endpoints, distribution, and location of these endpoints; and choose one of the following deployments: • Single Endpoint server • Multiple Endpoint server	"NetWitness Endpoint Architecture" in the *Deployment Guide*
Configure the ports on your firewall.	"Network Architecture and Ports" in the *Deployment Guide*
Install NetWitness Server and other components. For a single Endpoint server deployment, you need to install - NetWitness Server, Endpoint Log Hybrid, and ESA. For a multiple Endpoint server, in addition to the above components, you need to install - Additional Endpoint Log Hybrid, NetWitness Broker along with Endpoint Broker installed on it.	- *Physical Host Installation Guide* for instructions on how to set up physical hosts - *Virtual Host Installation Guide* for instructions on how to set up virtual hosts

Introduction to Endpoint Investigation

NetWitness Investigate provides data analysis capabilities in NetWitness, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

Operating System	Scan Categories & Real-time events	Tracking Categories

Windows	file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, suspicious threads and removable device(USB) detection	• Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.
		• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.
		• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`, `Modifies Startup Folder Location`, `Modifies Winlogon Registry Settings`, `Registers Time Provider Dll`, `Registers Port Monitor Dll`, `Registers Netsh helper Dll`, `Registers AppInit Dll`, `Registers AppCert Dll`,
		• System event - Reports connection of removable devices(USB devices), IP change and boot events such as, `removableDeviceConnected`, `removableDeviceDisconnected`
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Windows platforms.
		  • Reports IPv4 and IPv6 connections.
		• Console event (for Windows 8 and later) - User input that is entered into a console application, such as `cmd.exe`, `powershell.exe`, is captured and reported with the context `console.local`.
		Commands executed by `cmd.exe`, `powershell.exe` as a result of inter-process communication through anonymous pipes are captured and reported with the context `console.remote`.

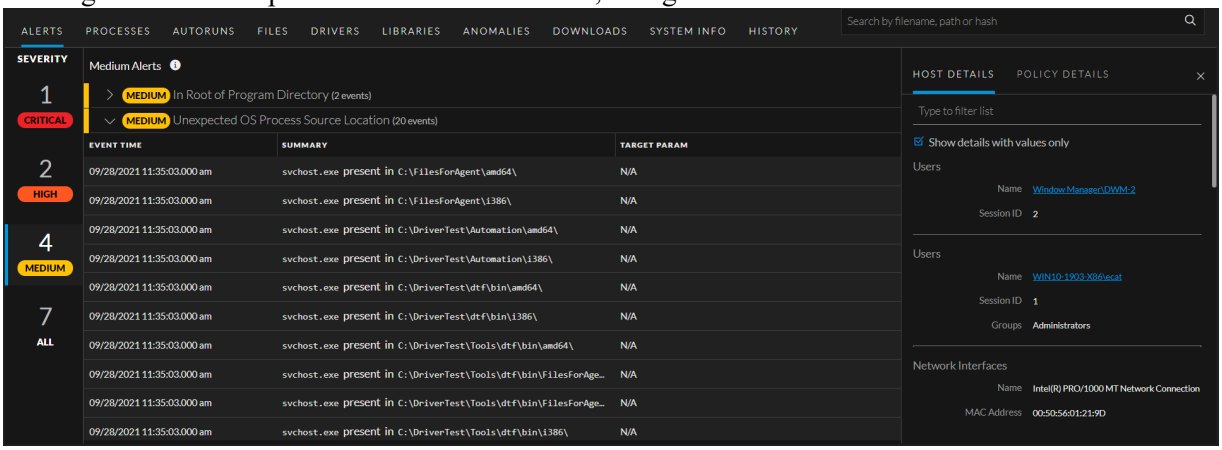
Operating System	Scan Categories & Real-time events	Tracking Categories
		For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`.
Linux	file, autrorun, loaded library, systemd, process, cron, initd, and machine	• Process event - Reports process related activities such as `createprocess`. • File event - Reports any file related activities by an executable, such as `writetoexecutable`.

Mac	file, daemon, process, task, dylib, autorun, and machine	• Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.
		• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Mac operating systems.
		  • Reports IPv4 and IPv6 connections.

For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

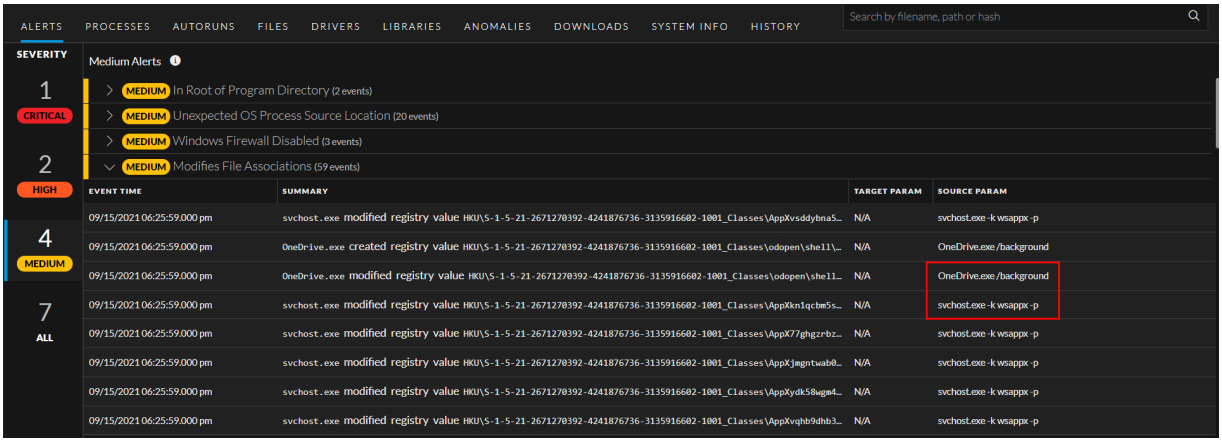
You can track Process events on Mac OS 14 after enabling audit control in your machine. For more information, see Introduction to Endpoint Agent Installation topic in *NetWitness Endpoint Agent Installation Guide for 12.3.1*.

Risk Score



Analysts can use the risk score to begin an investigation on hosts and files. NetWitness uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

Note: If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.



The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

  This figure is an example of a host with 1 Critical, 2 High and 4 Medium distinct alerts.

  All the distinct alert shown in the above example can be for the same file or different files. For example, Modifies File Associations alert is triggered for files, such as `svchost.exe` and `OneDrive.exe`.

  This figure is an example of a file with the Critical alert. The file can have a same alert name being triggered by two different hosts as shown below.

The risk score is reset when you perform any of the following actions:

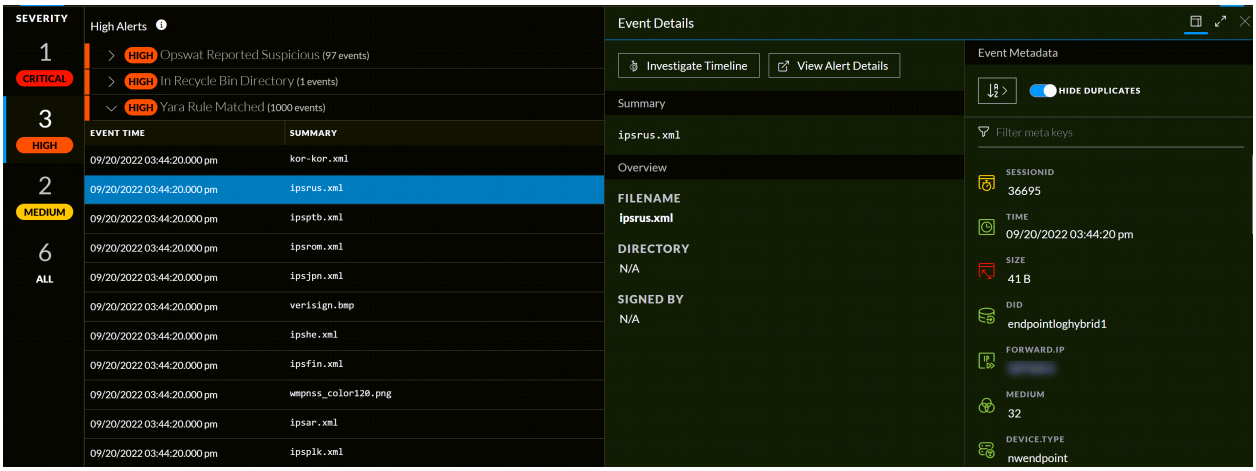
- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Besides the above factors, the risk score is reset when a file no longer matches Yara rules in the subsequent scans

Note: When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

Note: For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.



Note: For the accurate risk score calculation, the default multi-valued meta keys are required on the ESA Correlation service. For more information, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" section in the *ESA Configuration Guide*.

Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

Severity	Color	Risk Score Range
Critical	Red	100
High	Orange	70-99
Medium	Yellow	31-69
Low	Green	0-30

The following is an example of alerts contributing to the risk score:

In the above example, there are three distinct High alerts. For each alert type, associated events are displayed. The details of the events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

Global Risk Score - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

Local Risk Score - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or RSA.
Invalid	File hash format is invalid.

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide*.

Note: The File Reputation service supports maximum of 10 million files for a reputation of file hash.

File Status

To help analysts triage and focus on their investigation, NetWitness provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.

- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

For more information, see Changing File Status or Remediate.

Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB. For more information, see Changing File Status or Remediate.

Network Isolation

If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. By isolating the host, you can control the spread of an attack and analyze the malware behavior. When a host is isolated, the connection to the following IP addresses are allowed:

- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

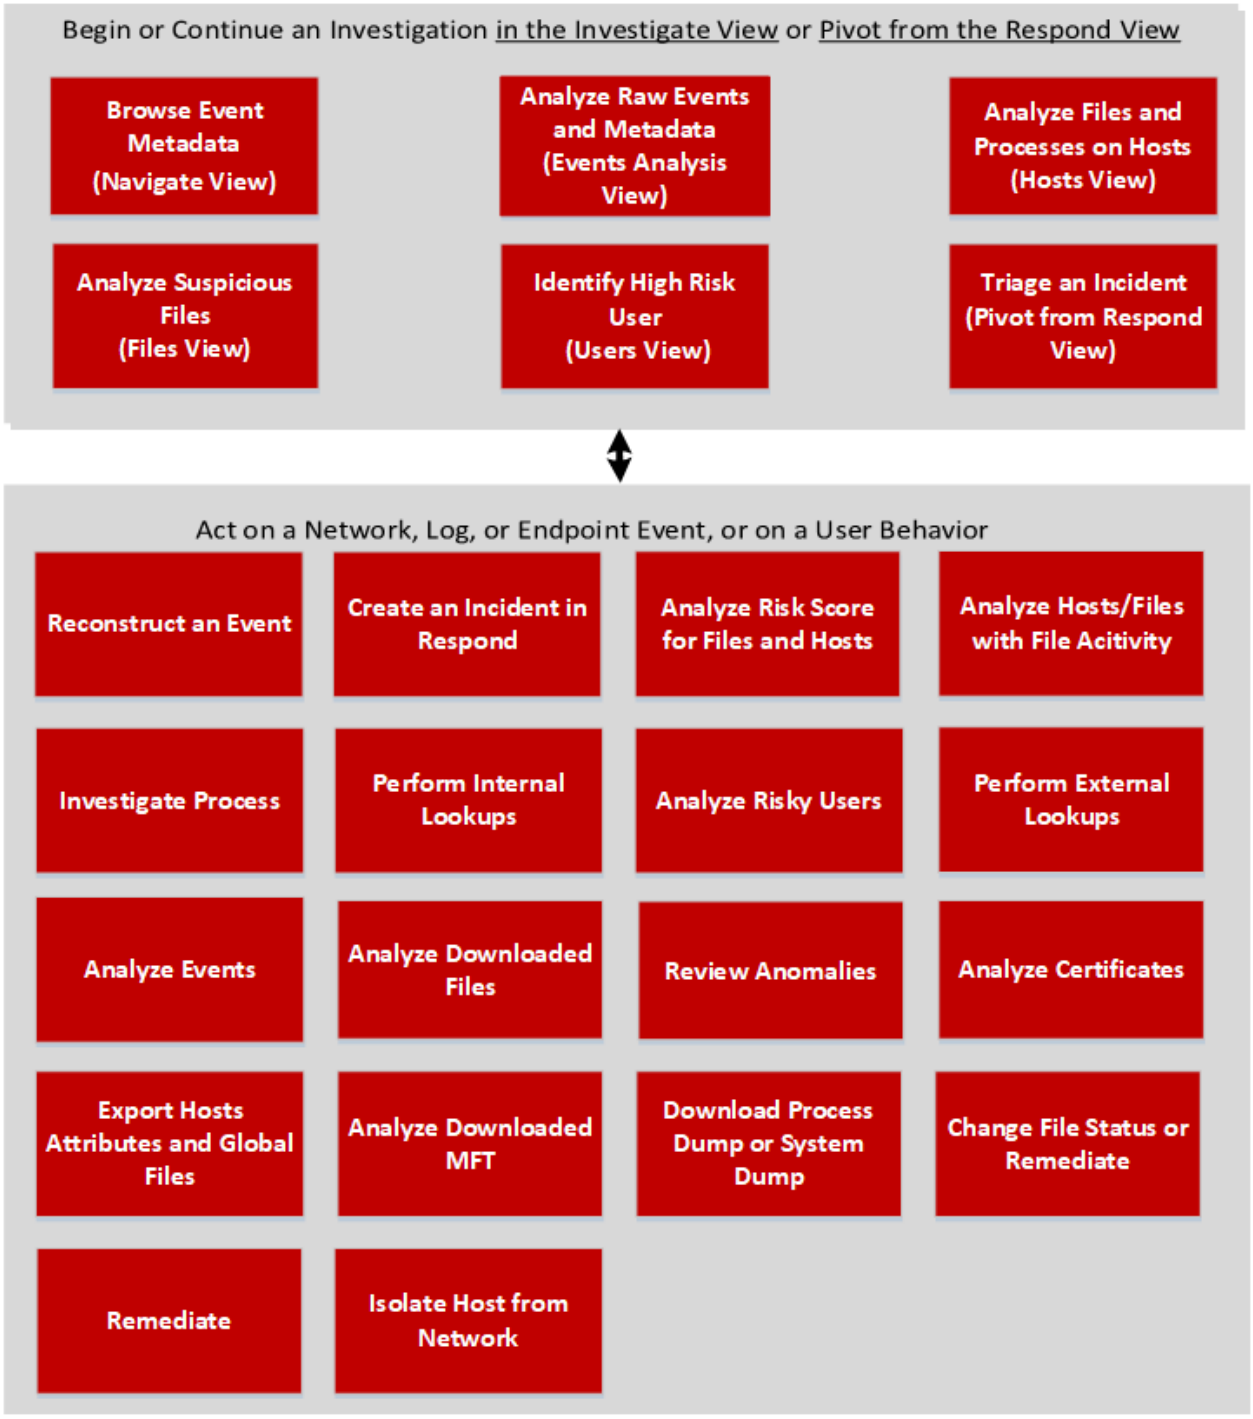
In the isolated state, all events are reported to the Endpoint Server retaining full visibility into activities on the host. You can continue investigation by requesting scans, downloading MFT, files, and so on. The following metadata is added to the network events:

- network.isolated - indicates that the host is isolated.
- network.connectallowed - indicates that the network connection is allowed as the IP address is included in the exclusion list.
- network.connectblocked - indicates that the network connection is blocked.

Note: If the agent is enabled for log or file collection, make sure that you add the Log Decoder IP addresses in the exclusion list while you isolate the host.

For more information, see Isolating Hosts from Network.

Focusing on Endpoint Analysis



This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**Files**). (See Investigating Files.)

Note: To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.

Begin or Continue an Investigation in the Investigate View or Pivot from the Respond View
Browse Event Metadata (Navigate View)
Analyze Raw Events and Metadata (Events Analysis View)
Analyze Files and Processes on Hosts (Hosts View)
Analyze Suspicious Files (Files View)

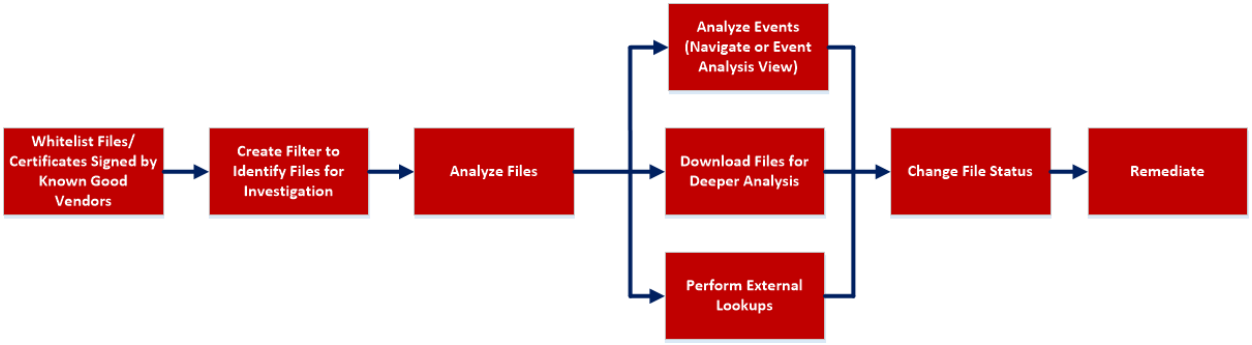
Isolate Host from Network



Investigating Files

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Files view provides a holistic view of all files in your NetWitness platform. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  Note: Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

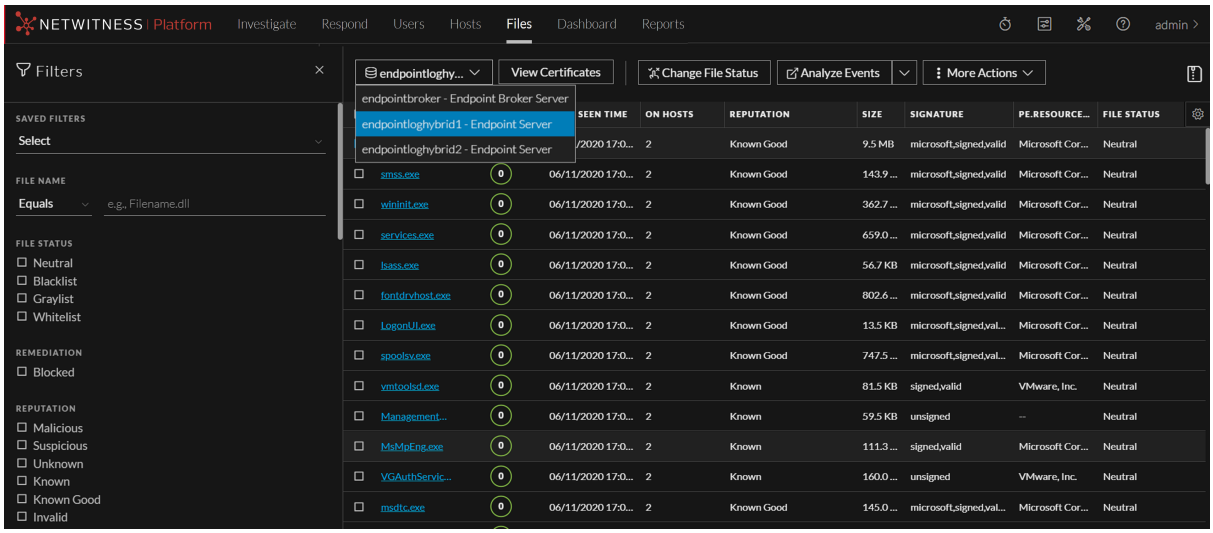
  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may require further investigation. You can also sort or filter using On Hosts column to narrow down the search during investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

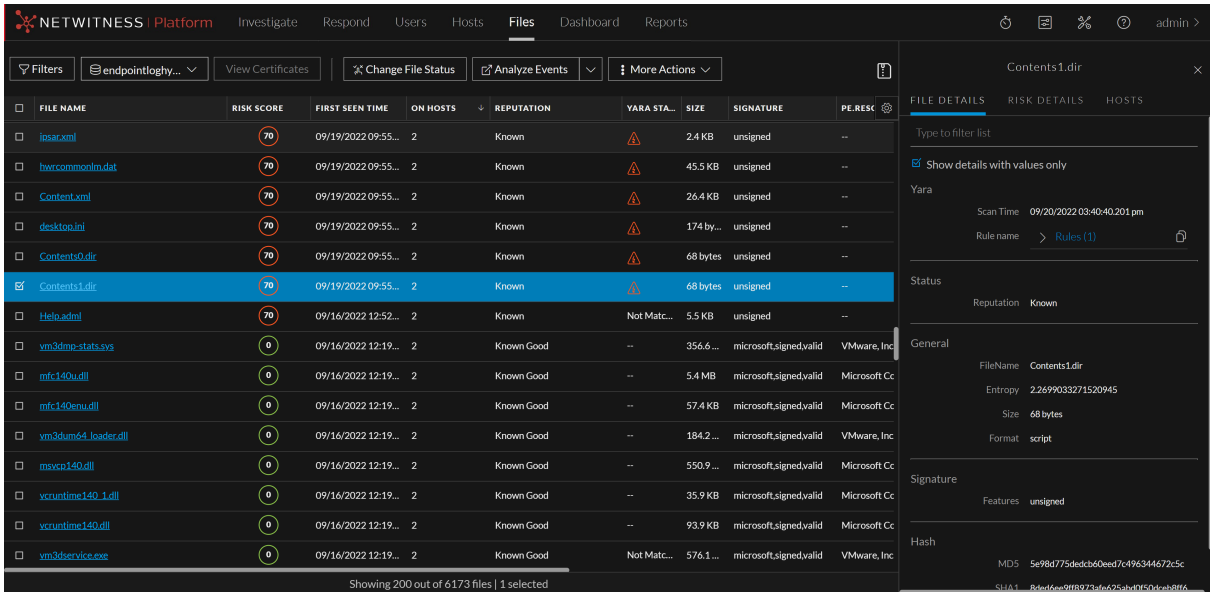
e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.



f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Events view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Investigate files using a rule-based detection technique. YARA helps to identify threats effectively using easy-to-create malware descriptions called YARA rules. For more information, see Analyze Files Using YARA.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

View Files



You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **Files**.
2. Select one of the following:

- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

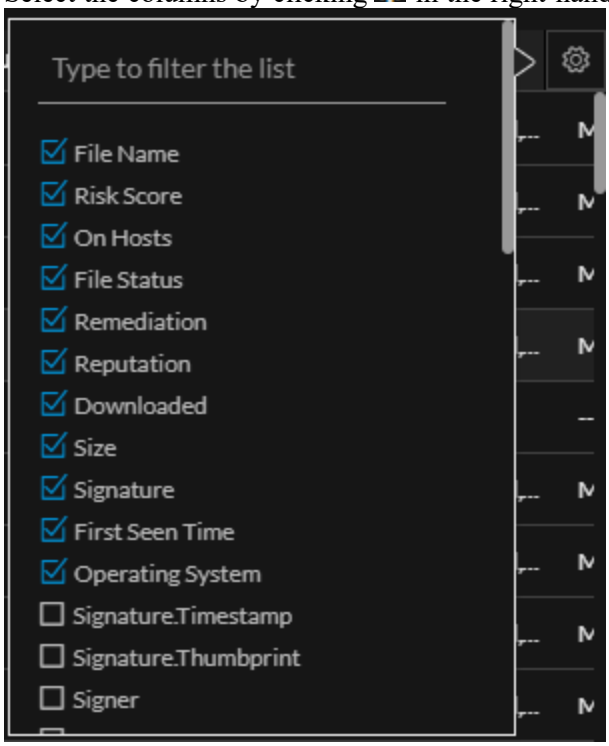
Filter Files

You can narrow down the investigation by filtering files using file name, on hosts, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), downloaded status, and YARA rules.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, File Status, On Host, and Reputation Status.

Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

Note: Special characters are not allowed in the filter name except underscore (_) and hyphen (-) while saving the filter.



For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

Analyze Files Using the Risk Score

Based on the Alert severity, the files can be analyzed using the following options:

- **View Alert Details**: This option allows you to analyze the files associated with **Critical** and **High** alerts. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the files associated with **Medium** alerts. For more information, see Investigating a Process.

To analyze files associated with Critical and High alerts using the risk score:

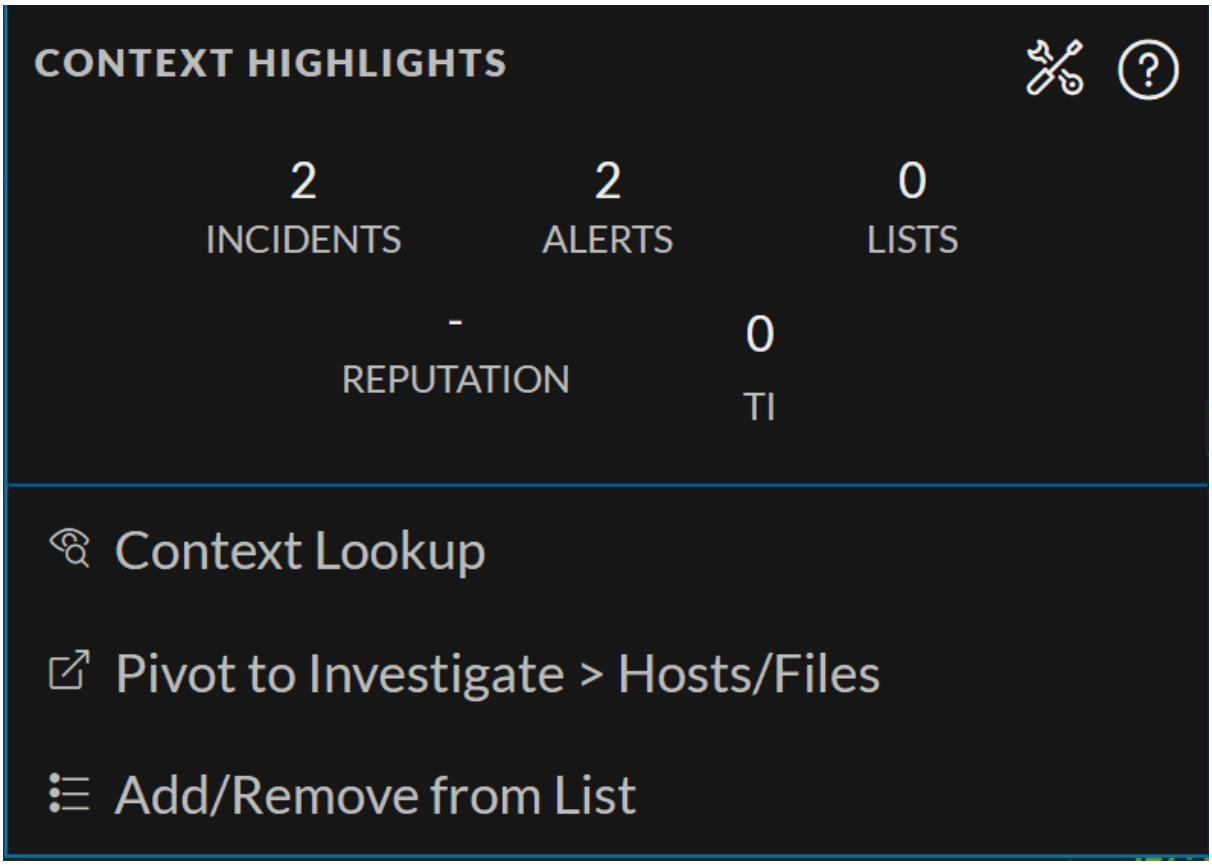
1. Go to **Files**.

   The **Files** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

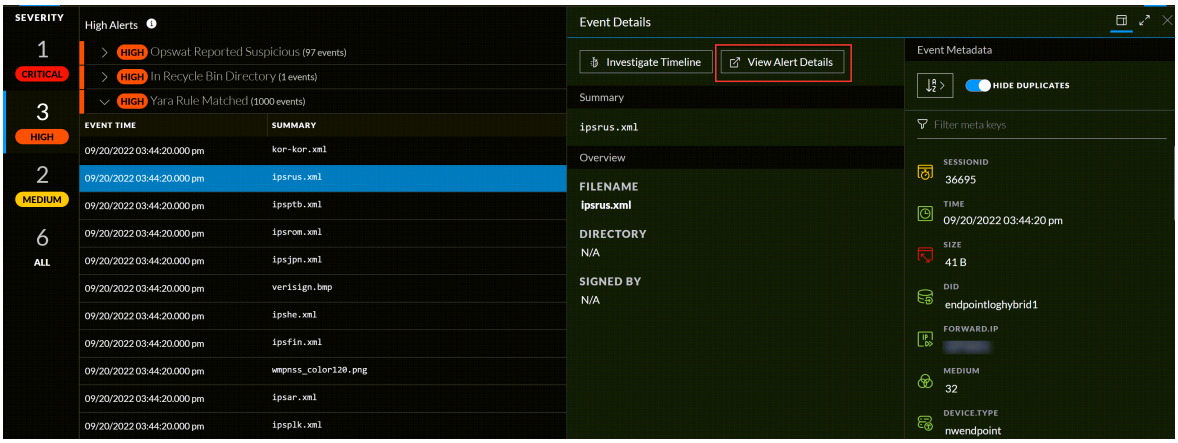
The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the alert severity, such as **Critical** or **High**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

   Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Files** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

To analyze files associated with Medium alerts using the risk score:

1. Go to **Files**.

   The **Files** view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.

3. Select the file and do any of the following.

   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

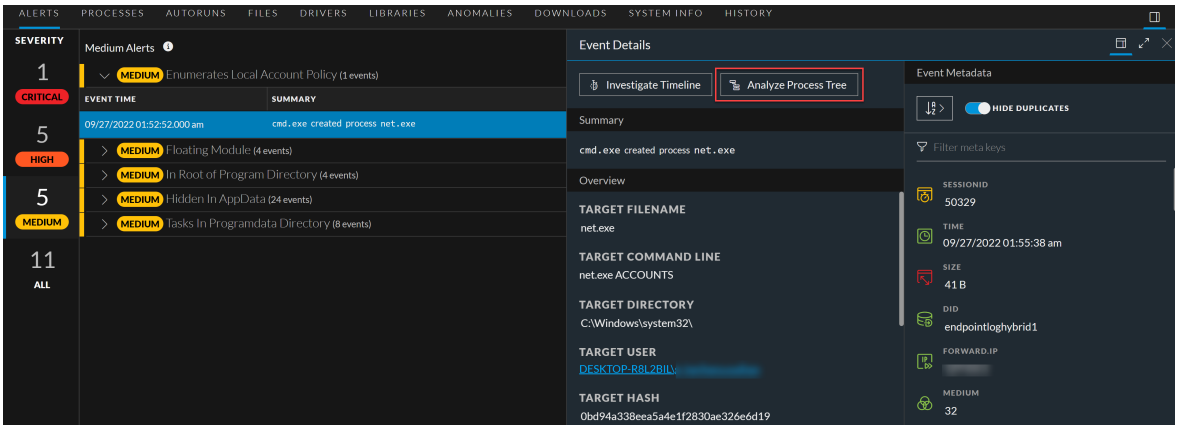
     The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.

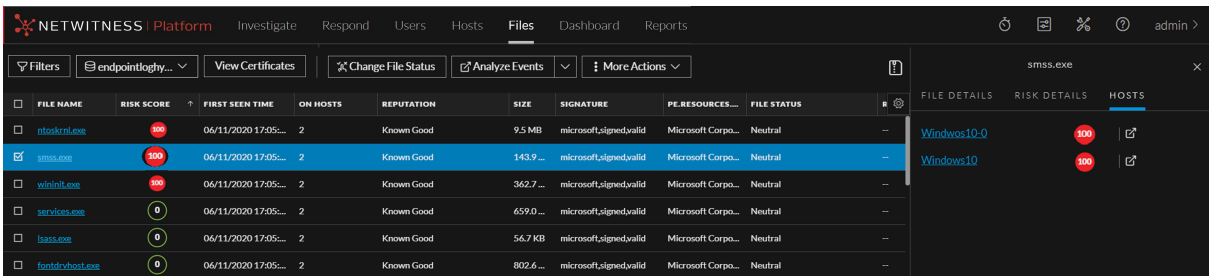
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Hosts with File Activity

To view the list of hosts on which a file exist, do the following:

Note: By default, the system detects the best data source for the On Hosts aggregation. To change the data source, in the Explore view, modify the investigate service ID under `endpoint/investigate`.

1. In the **Files** tab, click the row for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts along with the risk score are displayed.

3. Click the host name to open the host details.
4. Click  to analyze events on the host in the Events view. For more information, see Analyzing Events.

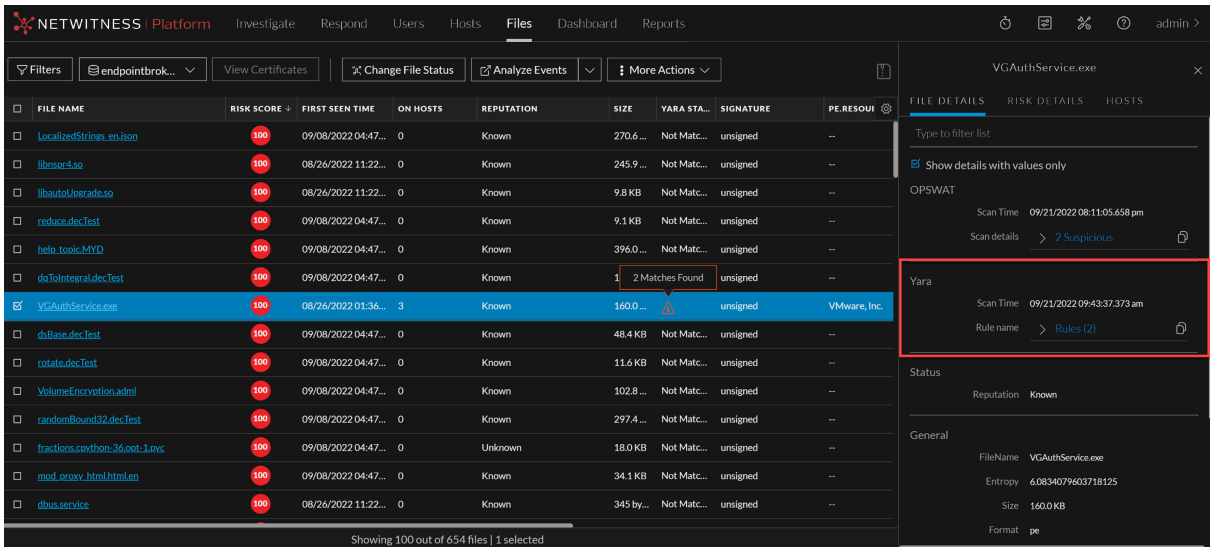
Analyze Files Using YARA

YARA helps analysts with rule-based detection capabilities in identifying and classifying malware. You can easily create malware descriptions using YARA rules. YARA scans can be performed at the Endpoint server level and Endpoint agent level.

Analyze Files at the Endpoint Server Level

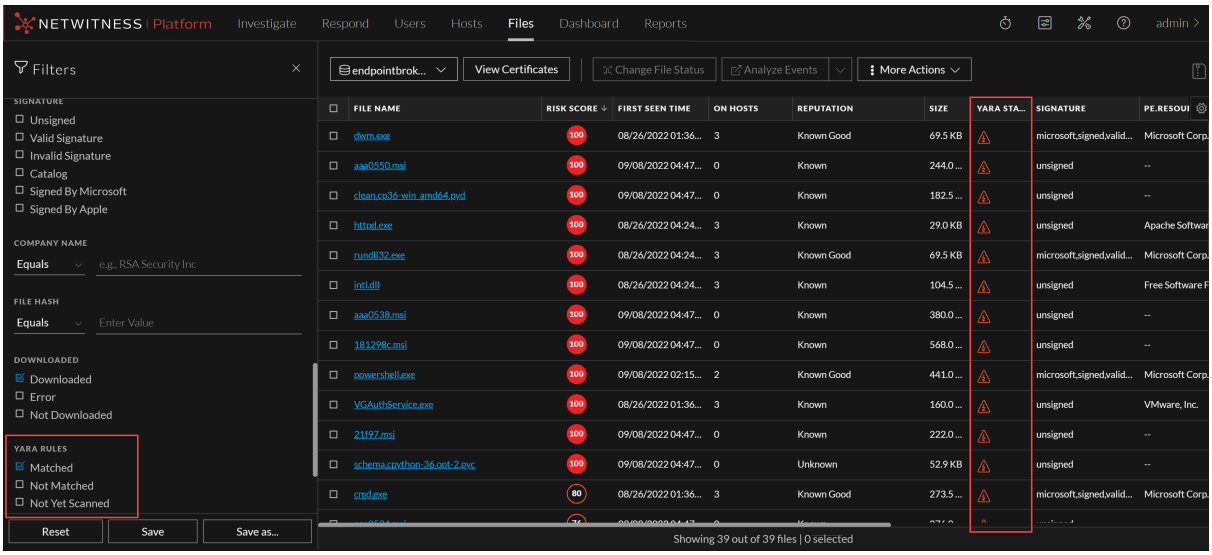
Administrators must enable and configure YARA on the Endpoint server. To learn more about enabling and configuring YARA, refer to NetWitness Endpoint Configuration Guide.

Files must be downloaded to the Endpoint server and YARA scans the downloaded files automatically. The scan results are displayed under **YARA STATUS** on the **Files** tab.



To analyze the scanned files,

1. Go to **Files**.
2. Select the Endpoint server from the server drop-down , to view files.
3. Select a file that is downloaded to the Endpoint server and do any of the following:
   - Click a row to view the YARA scan details associated with the file in the **File Details** panel.
   - If any file matches one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.
   - **YARA STATUS** field displays the status of the YARA scan. Following are the available statuses and their definitions



- **Matched** - The file matches with one or more YARA rules
- **Not Matched** - The file does not match with any of the YARA rules
- **Not Yet Scanned** - There is no scan performed for this file. Files will be scanned automatically once they have been downloaded. After the scan YARA status will be updated to either Matched or Not Matched

Note: When a file matches with a YARA rule, high severity alerts are triggered and, the file's risk score is updated. In the subsequent scans, If the same file doesn't match with a YARA rule, the risk score will be reset.

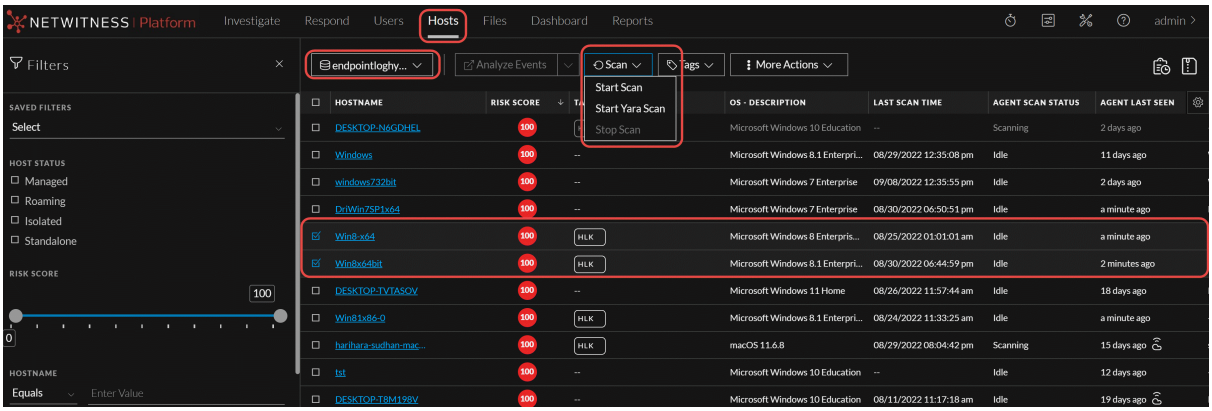
Note: If a downloaded file has an error, it will not be scanned by YARA and, the **Downloaded** column will display the file download status as **Error**.

4. On the **Filters** pane, scroll to the **YARA RULES** section. This section provides options to filter the files based on YARA scan status:
   - Select **Matched** to view the files that match YARA rules.
   - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the **YARA RULES** section.

For more information on investigating with YARA, see *NetWitness Investigate User Guide.*

Yara Scan at the Endpoint Agent Level

NetWitness Platform allows you to quickly perform YARA scan at the Endpoint Agent level. A snapshot of the YARA scan shall be available on the Endpoint server with the details such as:



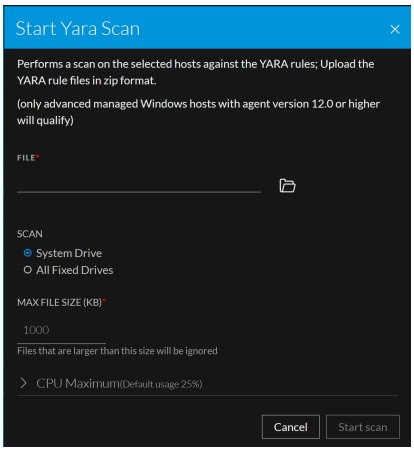
- List of files matching the YARA rules.
- List of YARA rules ran during the scan and the YARA rules status such as Loaded or Failed to load.

  Note: To perform Yara scan at the Endpoint agent level, the agent version must be higher than or equal to 12.1. This is applicable for the Advanced mode Windows Agents.

- YARA version associated with the agent.

To initiate YARA scan on the Endpoint Agent,

1. Click **Hosts**.
2. Select the Endpoint server from the server drop-down, to view hosts.
3. Select one or multiple hosts and click **Scan** > **Start Yara Scan**.



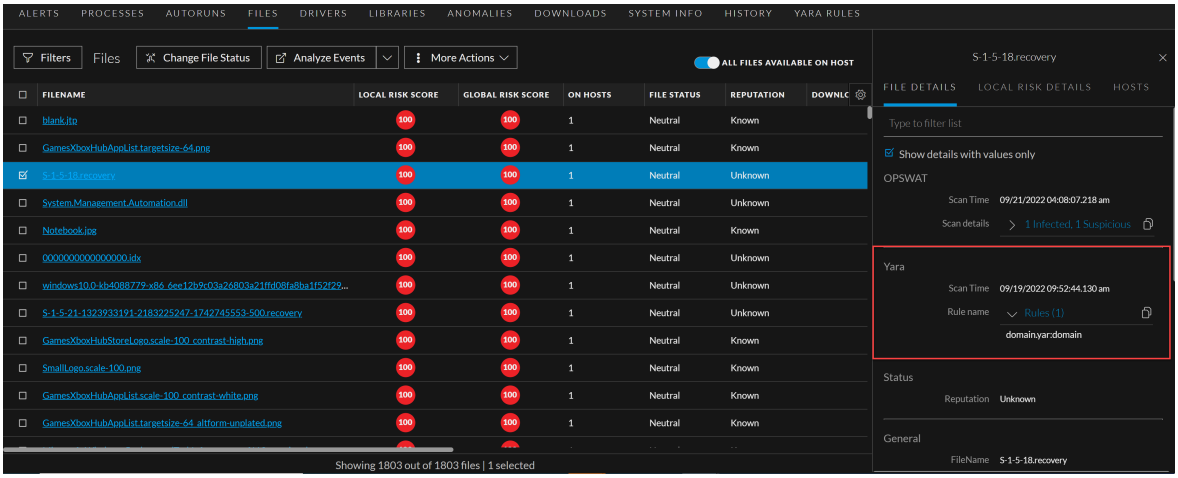
4. On **Start Yara Scan** pop-up,

   a. Click and upload the YARA rule zip file.

   b. Select **System Drive** (Default selection) or **All Fixed Drives**.

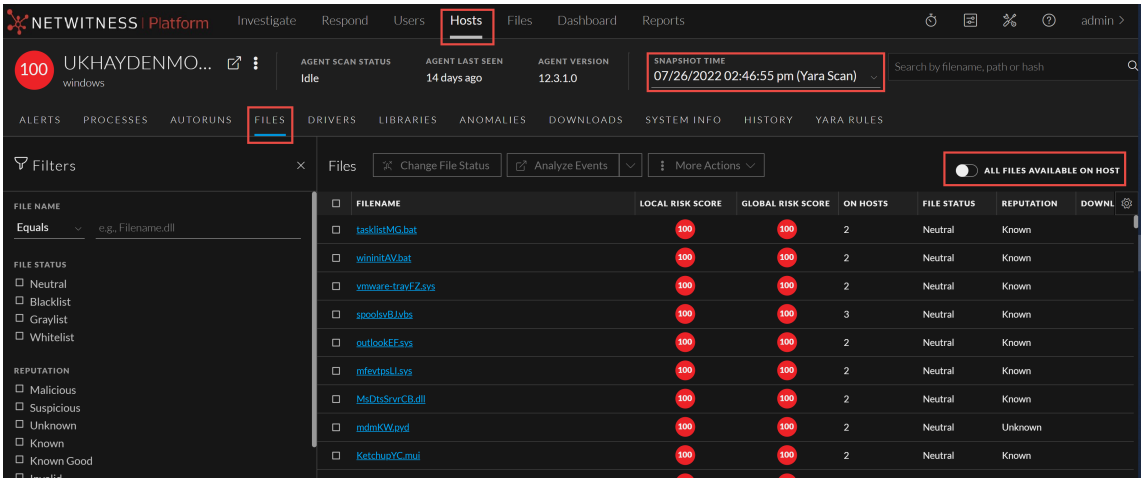
   c. Enter the Max File Size in Kilo Bites (KB).

   d. Select CPU Maximum.



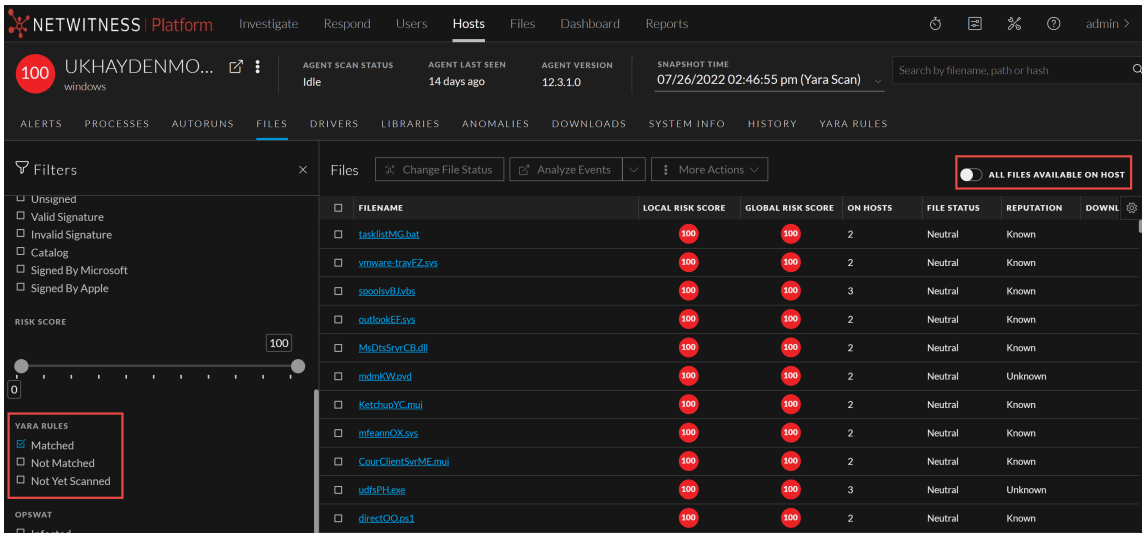
5. Click **Start scan**. See the command status In the **Host** > **History** tab.

To analyze the scanned hosts and files:

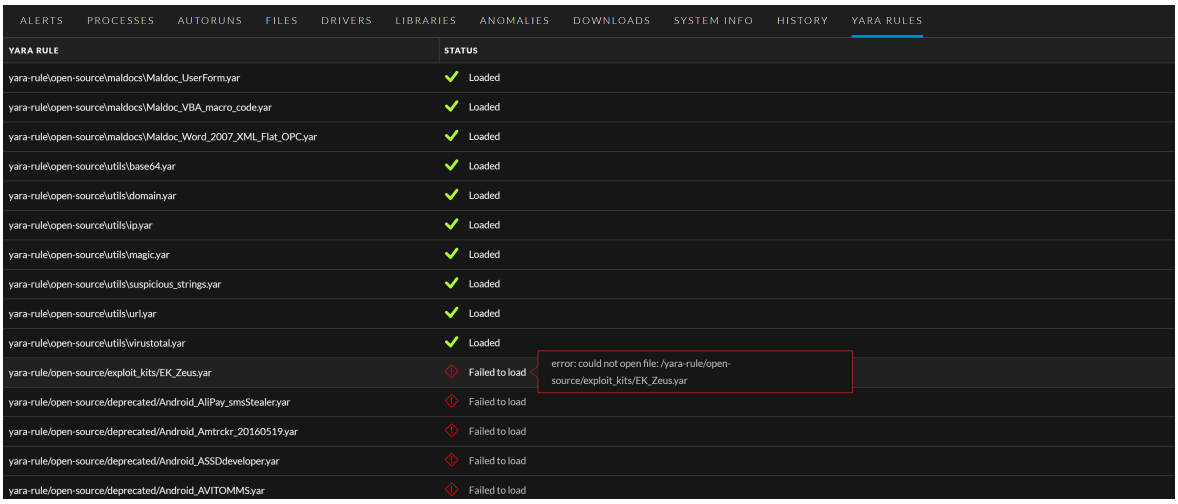


1. Log in to the NetWitness Platform.
2. Click **Hosts**.
3. Select the Endpoint server from the server drop-down to view hosts.
4. Select the **Host** and **YARA Snapshot Time**, and do any of the following:
   - In the Host details view, click **Files** and select a row to view the YARA scan details associated with the file in the **Details** panel.

If any file matches with one or more YARA rules, the **Details** panel displays the matching rule names besides scan time.



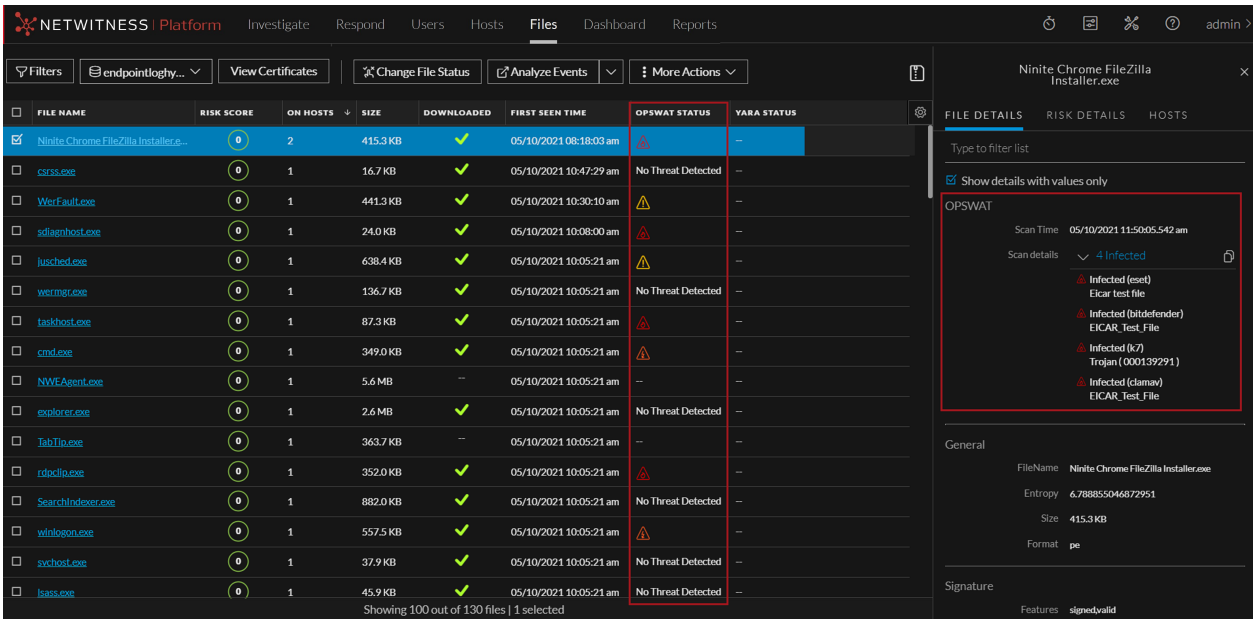
- Toggle the **All Files Available on Host** to view all the files irrespective of the snapshot selected.



Note: When a file matches with a YARA rule, high severity alerts are triggered and the file's risk score is updated.

- On the **Filters** pane, scroll to the **YARA Rules** section. This section provides options to filter the files based on YARA scan status: Select **Matched** to view the files that match YARA rules.
  - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the YARA rules section.

- In the Host details view, click the **YARA Rules** tab to know if the YARA rules used for the scan are successfully loaded or failed to load. If any of the YARA rules are failed to load, hover over  icon (Failed to load) to know the reason for failure.



- In the Host details view, click the **History** tab to view the command history.

Analyze Files Using OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. Administrators need to enable and configure OPSWAT on the Endpoint server. To learn more about enabling and configuring OPSWAT, see *NetWitness Endpoint Configuration Guide*.

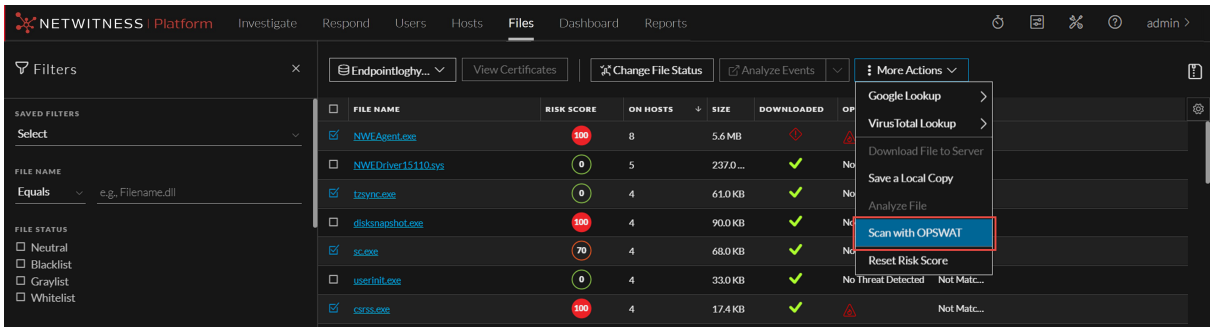
All downloaded files (executable) will automatically be sent to OPSWAT server for scanning once OPSWAT is enabled and configured on the endpoint servers.

Scan files with OPSWAT

Downloaded files are automatically sent to the OPSWAT server for scanning. However, you can also initiate the scan manually using options under the**More Actions** menu. Executable files with the following file extensions, ***pe***, ***script***, ***macro***, and ***elf*** are supported by this feature. The maximum file size limit is set to 10MB by default. You can increase or decrease it if required.

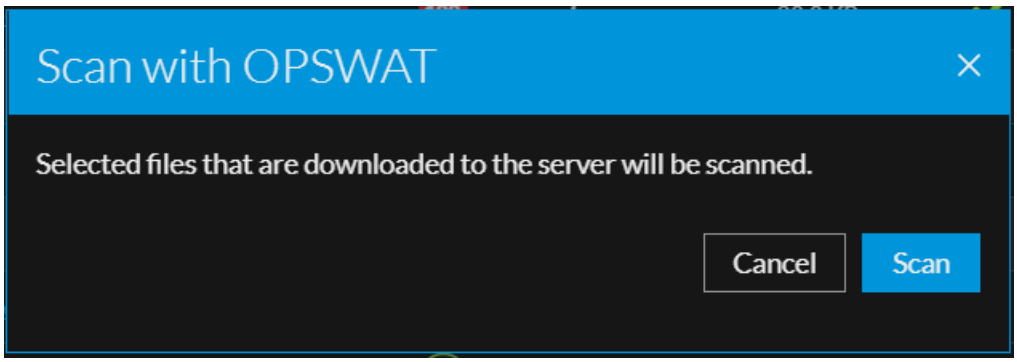
Automatic scan:

The endpoint server will automatically send all (executable) downloaded files to the OPSWAT server. The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab.



Manual Scan:

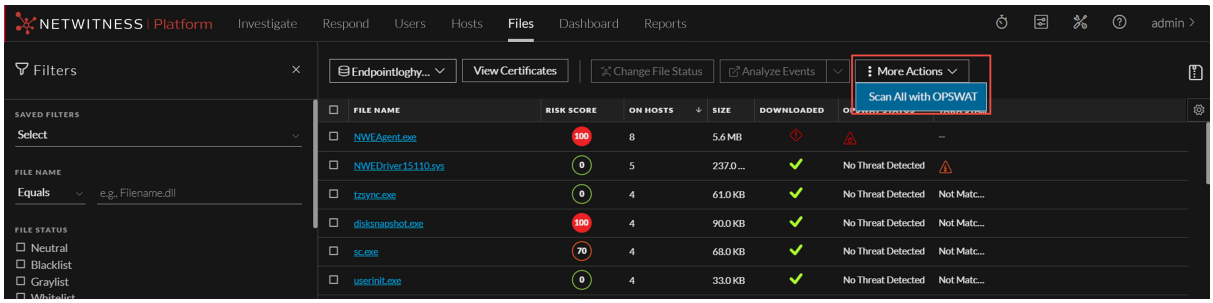
You can also manually initiate an OPSWAT scan using the options under the**More Actions** menu on the **Files** tab.



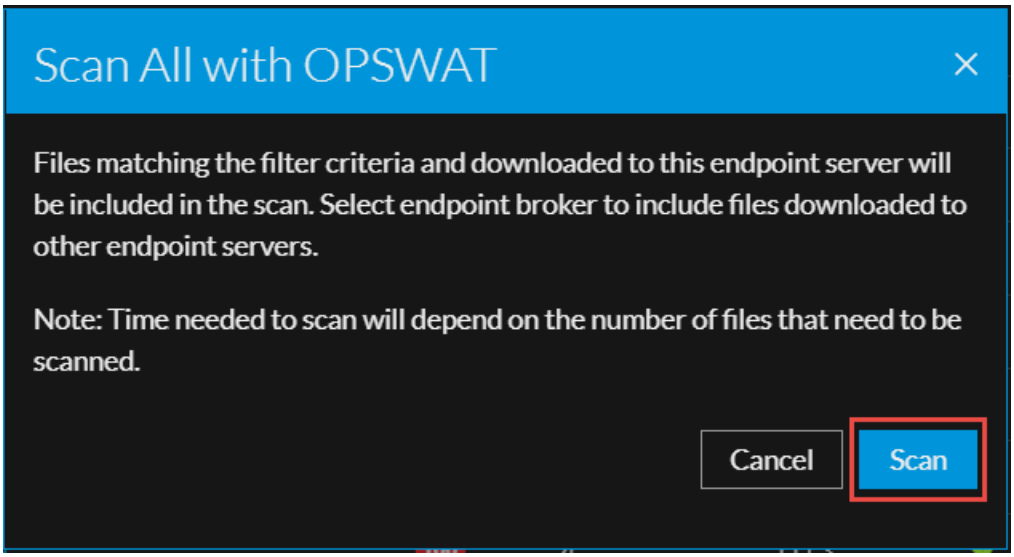
The **More Actions** menu provides the following options:

Manual Scan - Scan selected files

1. Select the files that need to be sent to the OPSWAT server for scanning.
2. Select **More Actions > Scan with OPSWAT**.



3. Click **Scan** on the confirmation pop-up.



Manual Scan - Scan all files

1. Select **More Actions > Scan All with OPSWAT**.

2. Click **Scan** on the confirmation pop-up.

View OPSWAT Scan Results

The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab as follows:

 - File is infected

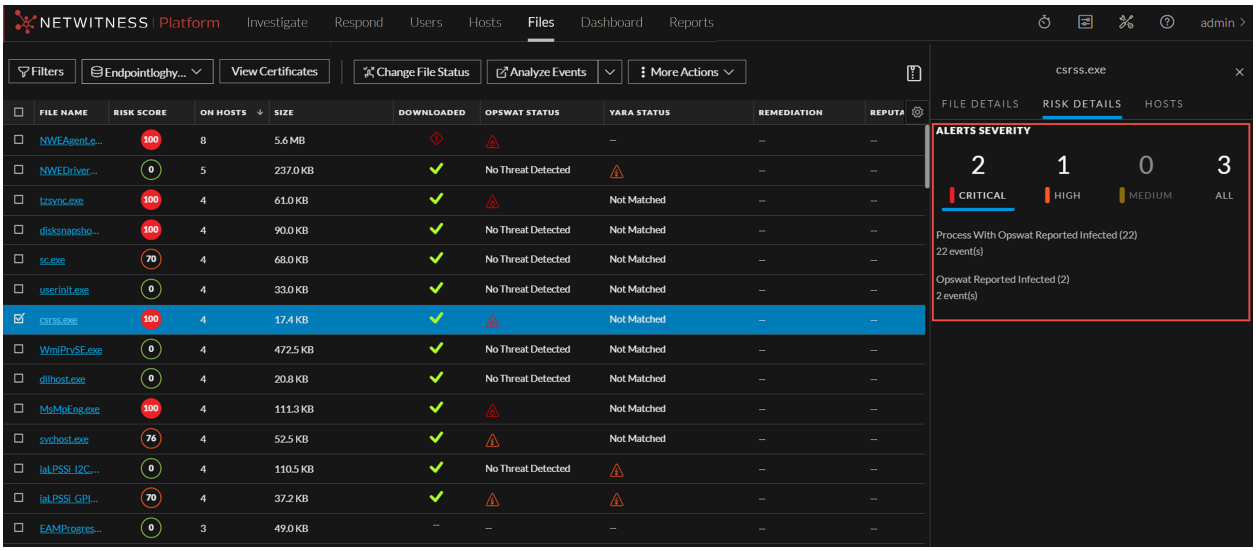
 - Suspicious file

 - Scan failed; see troubleshooting section for more information.

 - The file is clean as of the last scanned time.

 - Not yet scanned.

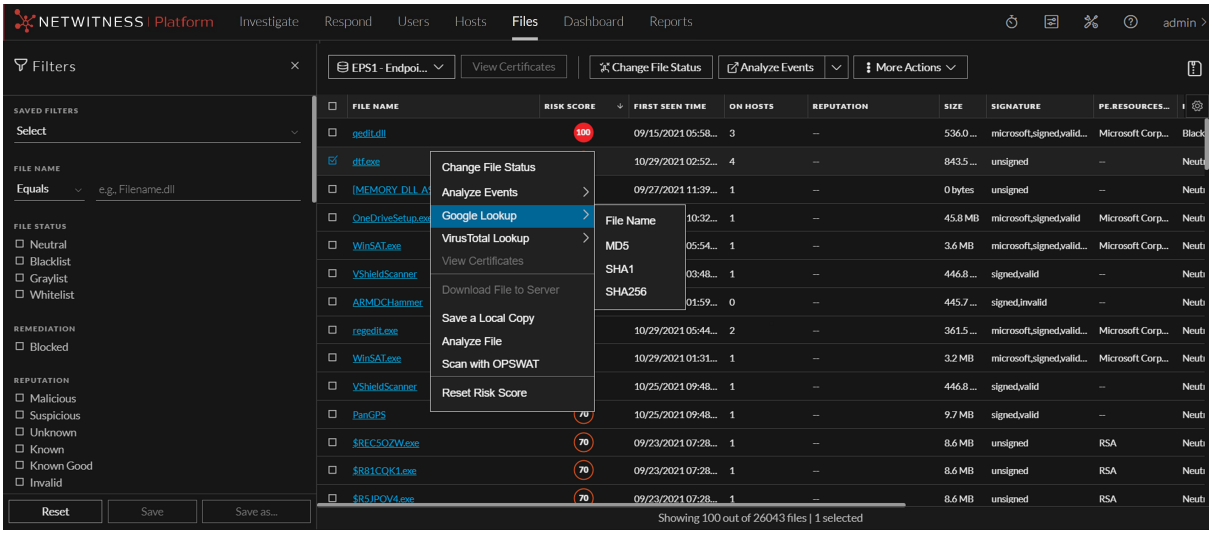
Click on a file to view scan results under the**FILE DETAILS** panel.



- **Scan Time**: States the last scanned time.
- **Scan details**: States whether a file is infected or suspicious or no threat detected, names of anti-malware engines that identified the threat.

Alerts and Impact on Risk scores

Alerts: Critical alerts will be triggered when OPSWAT finds a file as infected, and High severity alerts when a file is found suspicious.



Risk score: If a file is found infected or suspicious by OPSWAT, the risk score of that file and the corresponding host will be increased.

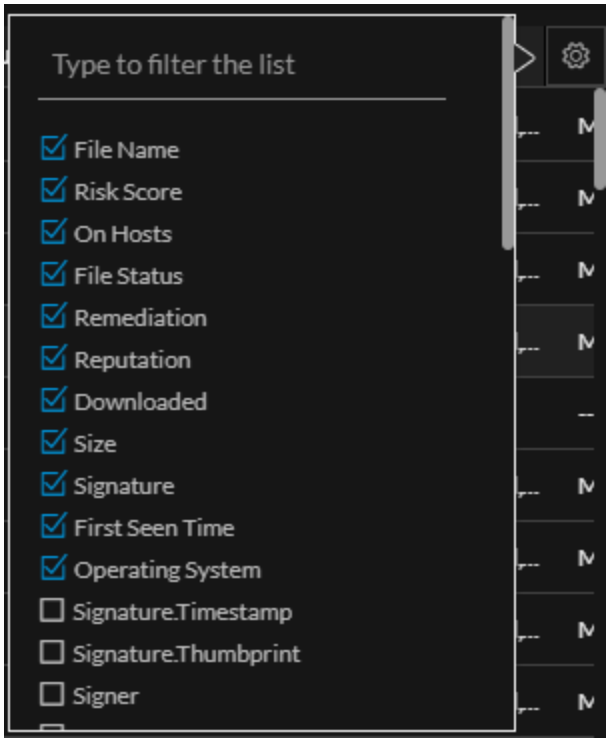
Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Files**.
2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.
3. Select one or more files, and right-click or in the **More Actions** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

   b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.



Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Set Files Preference

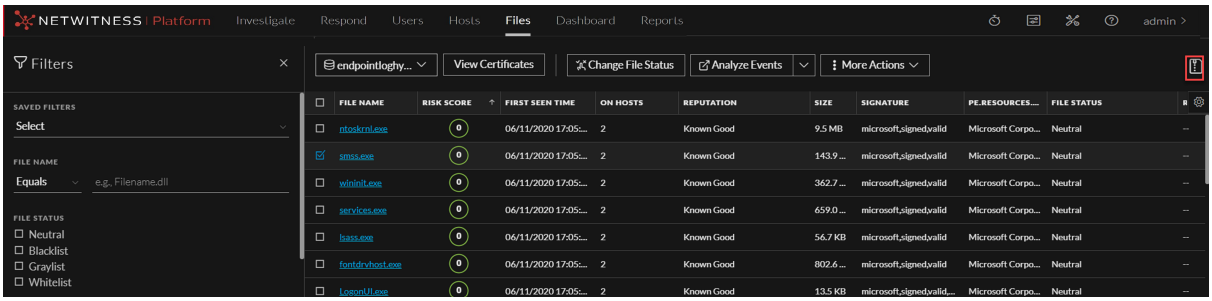
By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Files**.

2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Files view.



Export Global Files

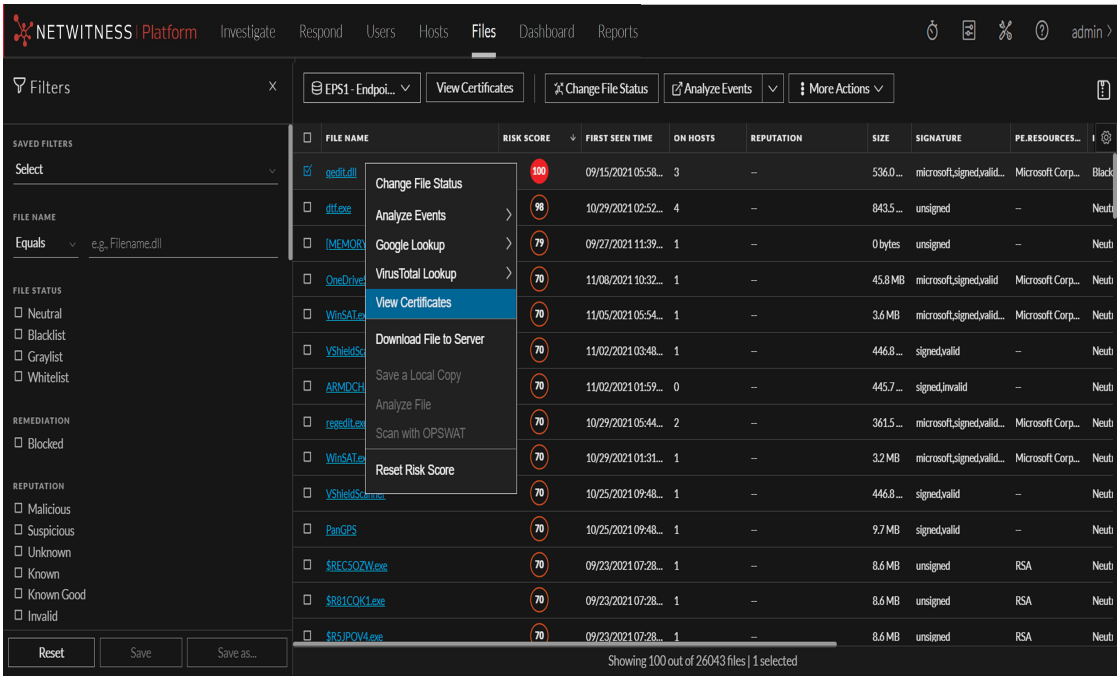
To extract the list of global files to a comma-separated values (csv) file:

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.

4. Click  to export the files to a csv file.

You can either save or open the CSV file.



Analyze Certificates

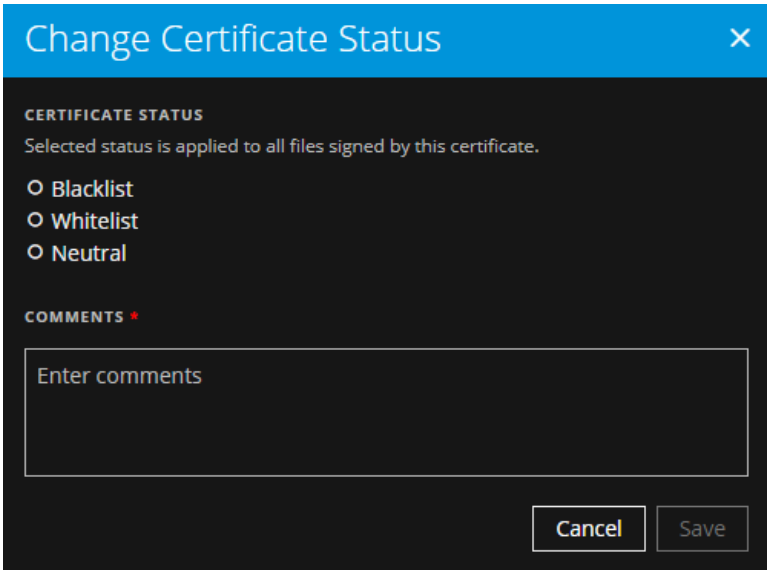
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:

- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.



Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.

2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

   Note: If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

3. Add a comment and click **Save**.
4. Click **< Files** to go to the Files view.

Note: In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Manage Blocked File Hashes

Blocked File Hashes view **Files** > **Manage** > **Blocked File Hashes** allows administrators and analysts to perform the following actions.

- View already blocked File Hashes in the deployment.
- Add new File Hash and block it.
- Delete and unblock the Blocked File Hashes.
- Import and block multiple File Hashes using the CSV file.

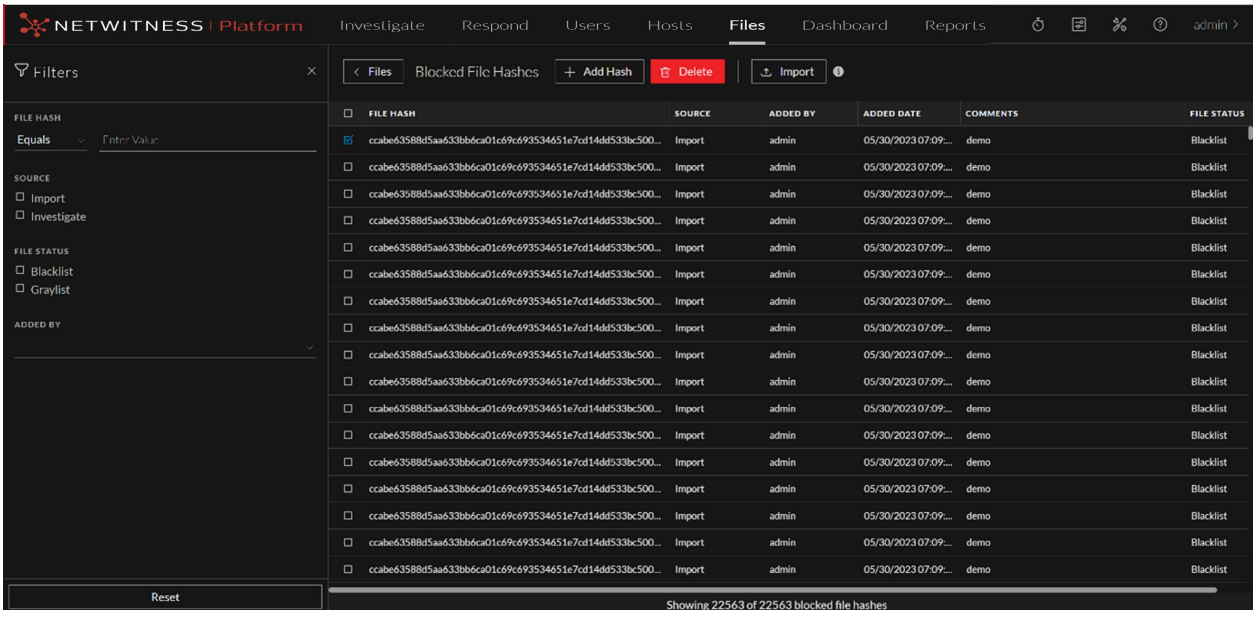
You can block up to a maximum of 50,000 file hashes.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- If the number of already blocked File Hashes is 0, and you import more than 50K File Hashes, only the first 50K File Hashes are blocked.

Note: Analysts must have the **contexthub-server.datasource.read** permission to access the **Blocked File Hashes** view.

Toolbar Actions

The table below lists the toolbar actions available in the **Blocked File Hashes** view.



Option	Description
+ Add Hash	Select this option to block a single File Hash.
Delete	Select this option to delete the blocked File Hashes.
Import	Select this option to import and block multiple File Hashes.
< Files	Select this option to return to the **Files** view.

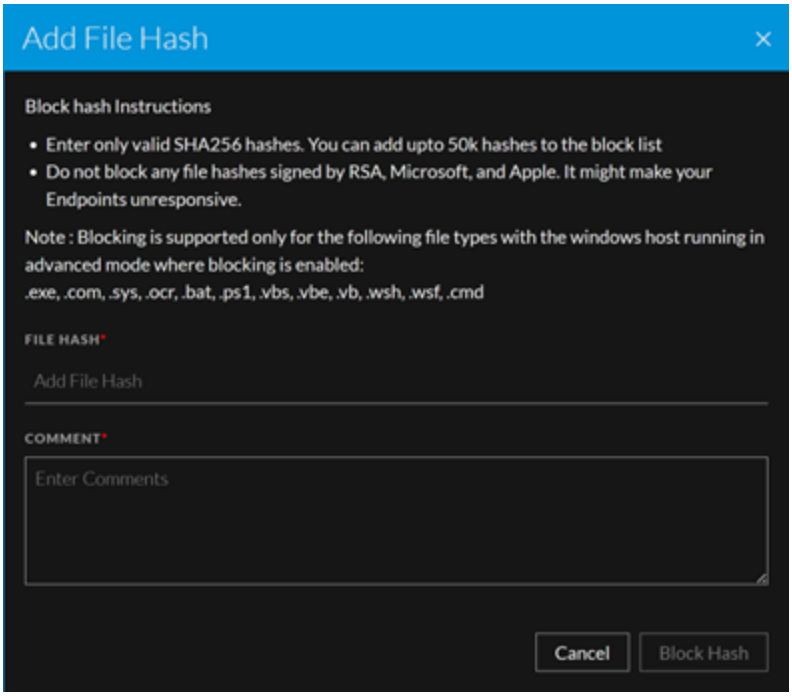
View Blocked File Hashes

You can view the File Hashes already blocked as part of NetWitness deployment in the **Blocked File Hashes** view.

To view the Blocked File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.
   The **Blocked File Hashes** view is displayed.

2. View the list of Blocked File Hashes in the **File Hash** column.



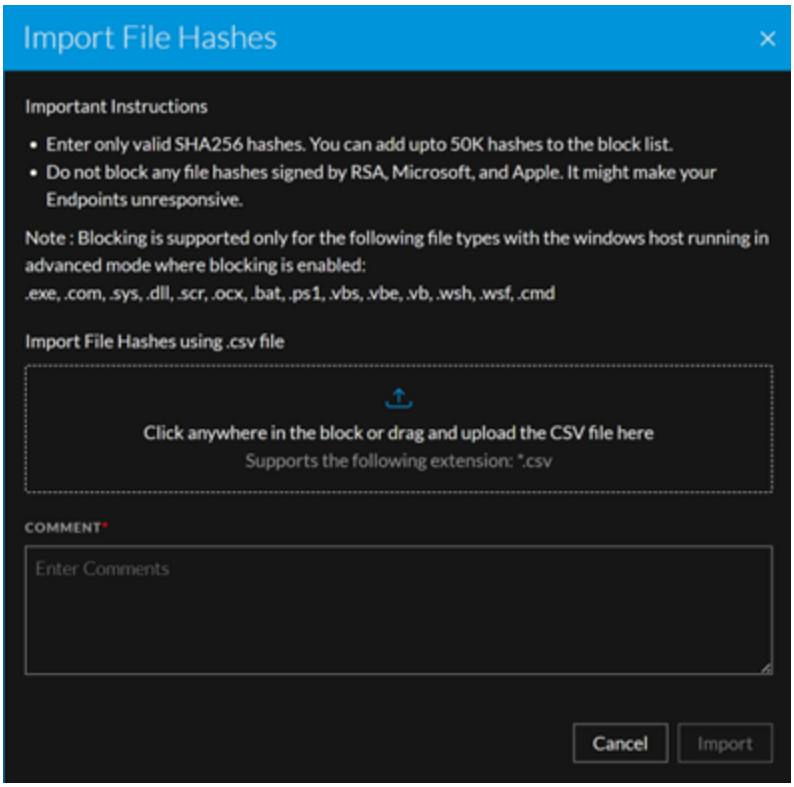
Add File Hash

You can add a new File Hash to the list of blocked hashes using the **Add Hash** option in the **Blocked File Hashes** view.

To block a new File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Add Hash**.

   The **Add File Hash** dialog is displayed.



2. Enter the **File Hash**.
3. Specify the reason for blocking the new File Hash in the **Comment** section.
4. Click **Block Hash**.

Import File Hashes

You can import and block the File Hashes in bulk using the **Import** option in the **Blocked File Hashes** view.

To import the File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Import**.
   The **Import File Hashes** dialog is displayed.

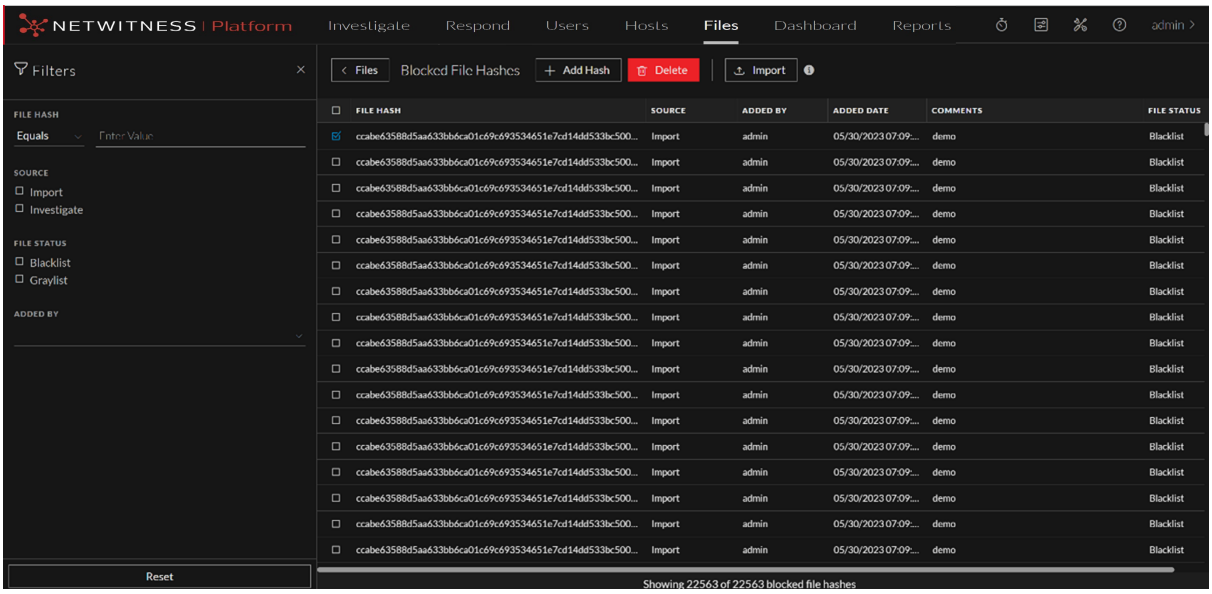
2. Under **Import File Hashes using .csv file**, do one of the following.
   - Click the block to upload the CSV file.
   - Drag and upload the CSV file in the block.
3. Specify the reason for blocking the File Hashes in the **Comment** section.
4. Click **Import**.

Note: Only the unique file hashes are imported during the Import process. If you import the .csv file with few existing blocked file hashes, the Blocked File Hashes List view is updated to reflect the corresponding changes. The duplicate file hashes are not accounted for the change in the total count of blocked file hashes.

Note: While updating the CSV file, make sure you enter each file hash value in separate rows under a single column and then upload the CSV file to block the file hashes. Refer the following figure.

	A	B	C	D	E	F	G
1	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
2	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
3	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
4	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
5	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
6	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
7	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2119						
8	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2120						
9	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2121						
10	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2122						

Note: Analysts must have the **contexthub-server.datasource.manage** permission to import the file hashes.



Delete File Hash

You can delete and unblock a blocked File Hash using the **Delete** option in the **Blocked File Hashes** view.

To delete a blocked File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.

   The **Blocked File Hashes** view is displayed.

2. Select the blocked File Hash and click **Delete**.

The **Delete Hash** confirmation dialog is displayed.

3. Click **Delete**.

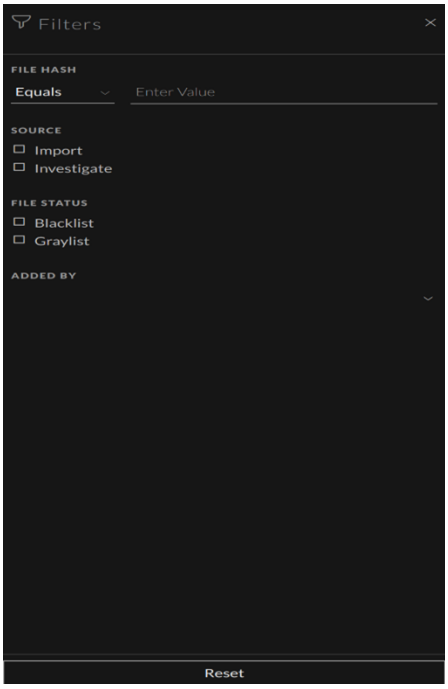
Blocked File Hashes List View

The Blocked File Hashes List view consists of a Filters panel and the Blocked File Hashes List.

Blocked File Hashes List

The Blocked File Hashes List displays all the Blocked File Hashes in the NetWitness Platform.

The following table describes the columns in the Blocked File Hashes List.



Columns	Description
	Allows you to select the required Blocked File Hash.
File Hash	Displays the list of Blocked File Hashes
Source	Displays the Source used for blocking the File Hashes. For Example: **Import** **Note:** When you upgrade to 12.3 or later versions from the versions older than 12.0, the **Source** column displays **Investigate** for all the File Hashes blocked in the previous deployment using the **Import** option. The **Source** column displays **Import** only for the File Hashes you block using the **Import** option in NetWitness Platform 12.3 or later versions. If you upgrade to 12.3 or later versions from 12.0 or later versions, the **Source** column displays **Import** for the File Hashes blocked in the previous deployment and the current deployment using the **Import** option.
Added By	Displays the name of the administrator or the analyst who blocked the File Hashes.
Added Date	Displays the date on which the File Hashes are blocked. For Example: 03/20/2023 10:00:00AM
Comment	Displays the comment provided by the administrator or the analyst while blocking the File Hashes.
File Status	Displays the file status of the Blocked File Hashes. For Example: **Blacklisted**.

Filter Blocked File Hashes

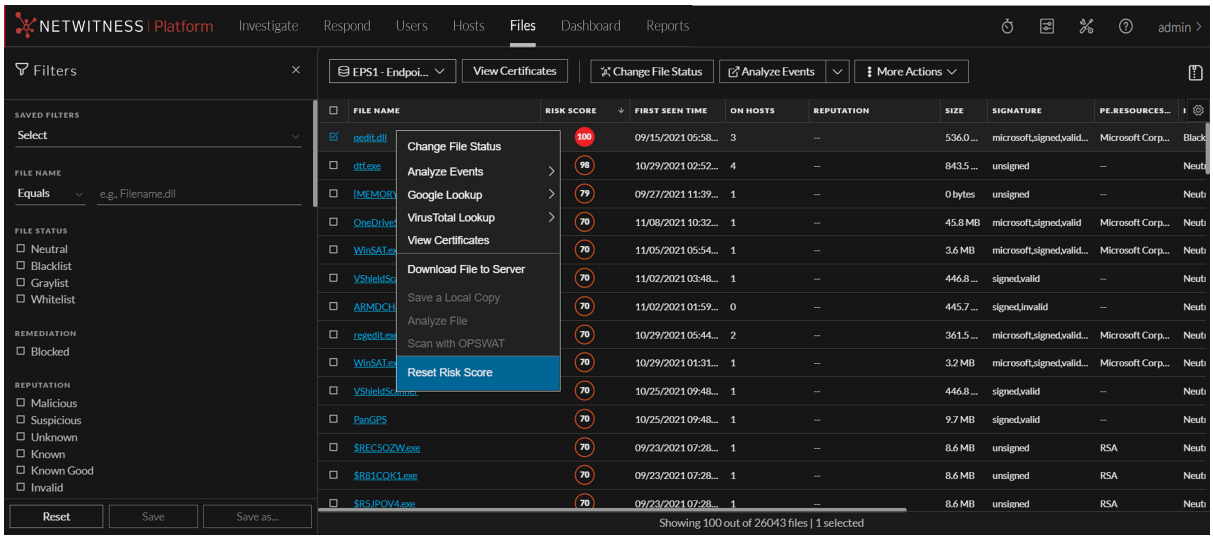
You can filter the Blocked File Hashes based on the following parameters.

- Value of the File Hash
- Source used for blocking the File Hashes

- File status of the Blocked File Hashes
- User who blocked the File Hashes

Click **Reset** to remove the filters applied.

Resetting Risk Score of Files



You can reset the risk score for a file in these situations:

- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

To reset the risk score of a file:

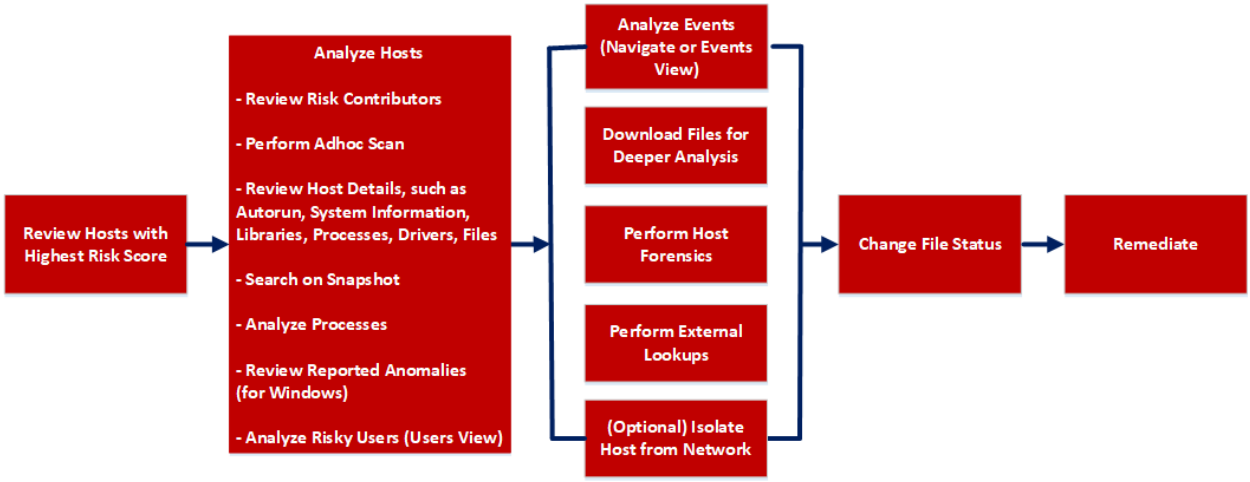
1. Go to **Files**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more files and do one of the following:

- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.



Investigating Hosts

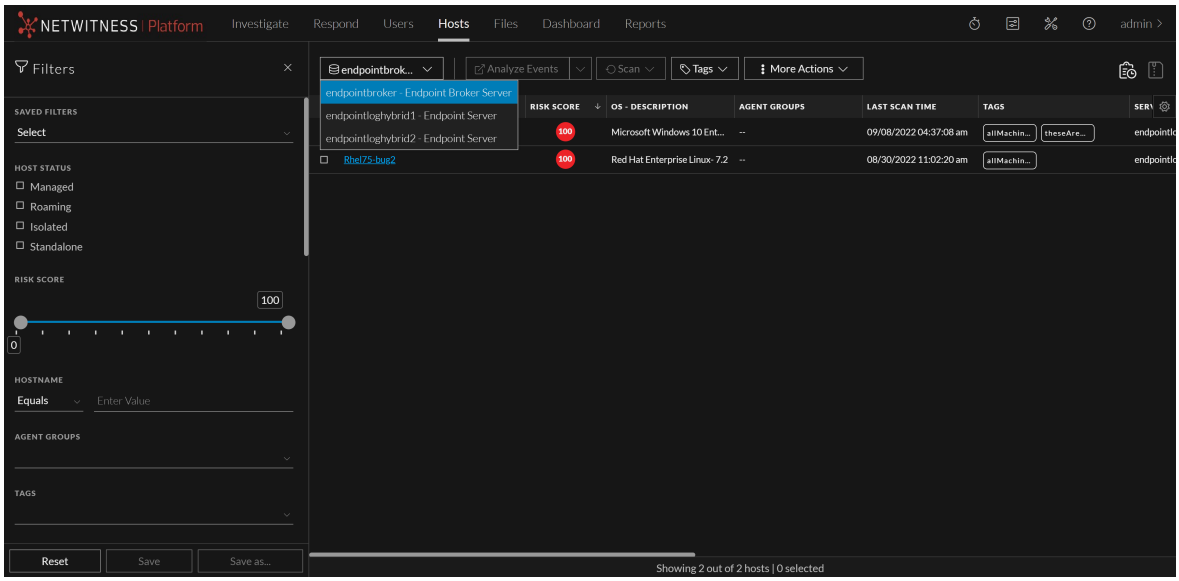
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Events view. For more information, see Analyzing Events.
- Review hosts for rare files in the **On Hosts** column. If a file is present on 100 hosts, it can be legitimate. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Filter to exclude hosts on host status, risk score, hostname, and so on. For more information, see Filter Hosts.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.



- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Download MFT, process, or system dump to the server for forensic investigation. For more information, see Performing Host Forensics.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.
- (Optional) If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. For more information, see Isolating Hosts from Network.

View Hosts

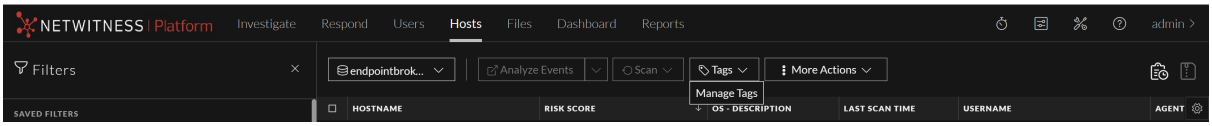
You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **Hosts**.
2. Select from the following:

- **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.
- **Endpoint Server** to view hosts on a specific Endpoint server.

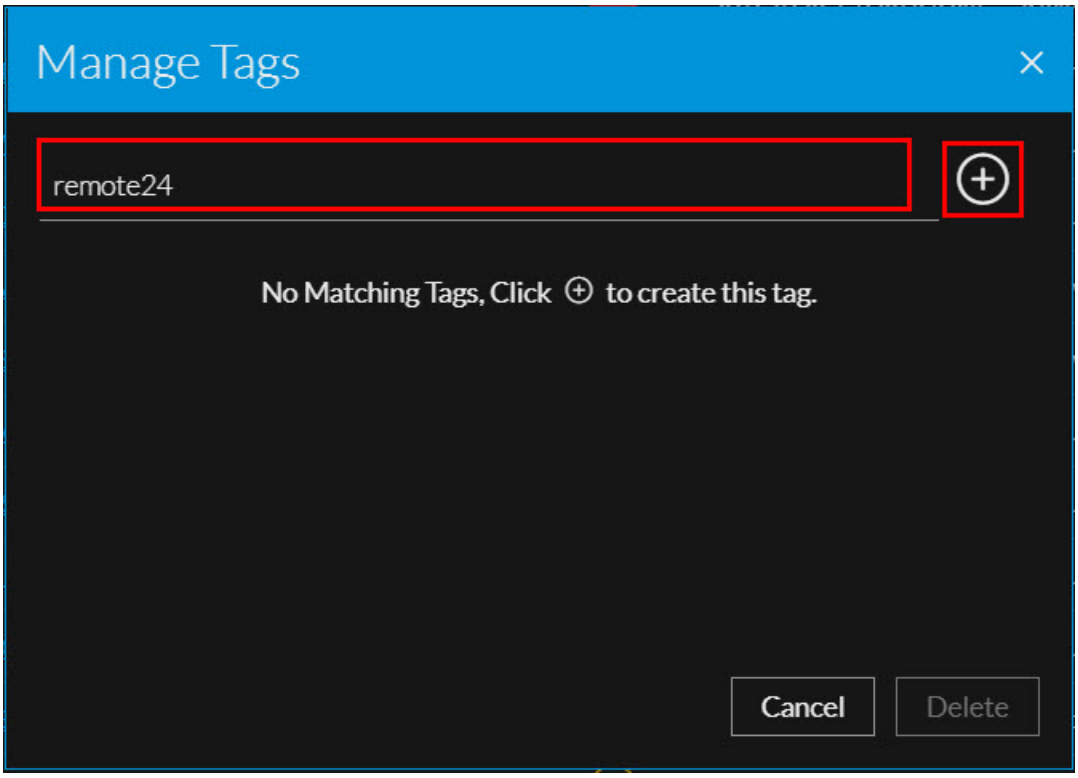
3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

Manage Hosts Using Tags



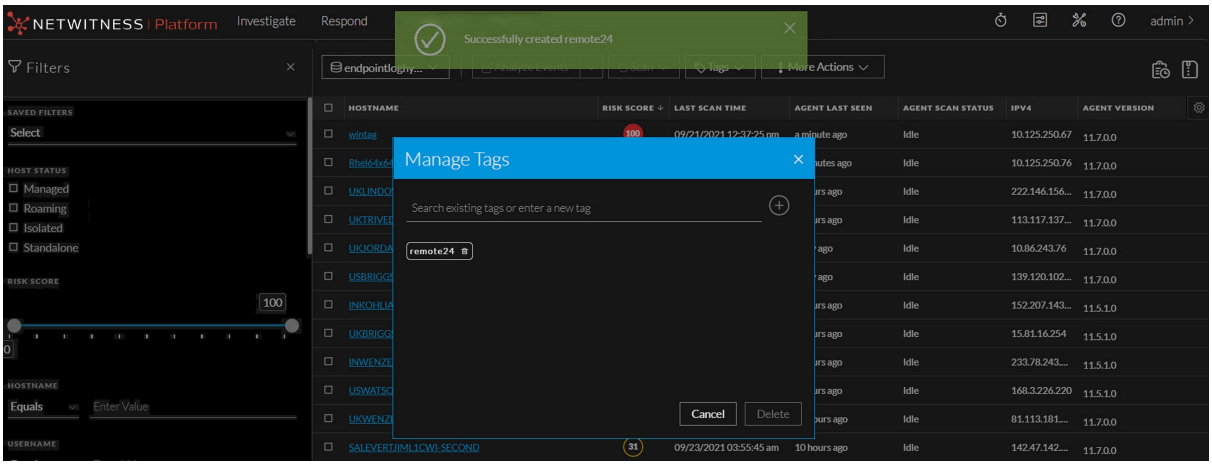
From version 11.7 and later, NetWitness Platform allows you to create Tags to manage the hosts effectively. Tags are custom texts that you can create and assign to hosts for identifying them. A tag can contain alphabets, numbers and special characters(Except \ **' , [ ] "** and **space**). You can use these tags to create host groups. You can also filter hosts by tags using the filters pane on the Hosts screen.

Manage Tags



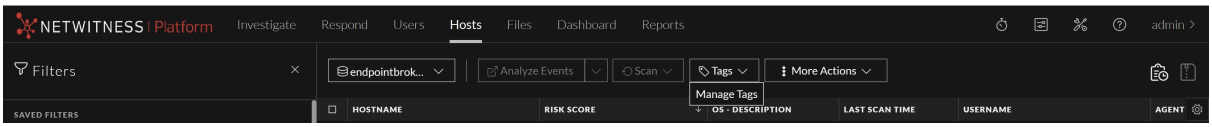
The Manage Tags option allows you to create and delete tags without selecting any hosts.

To Create Tags:

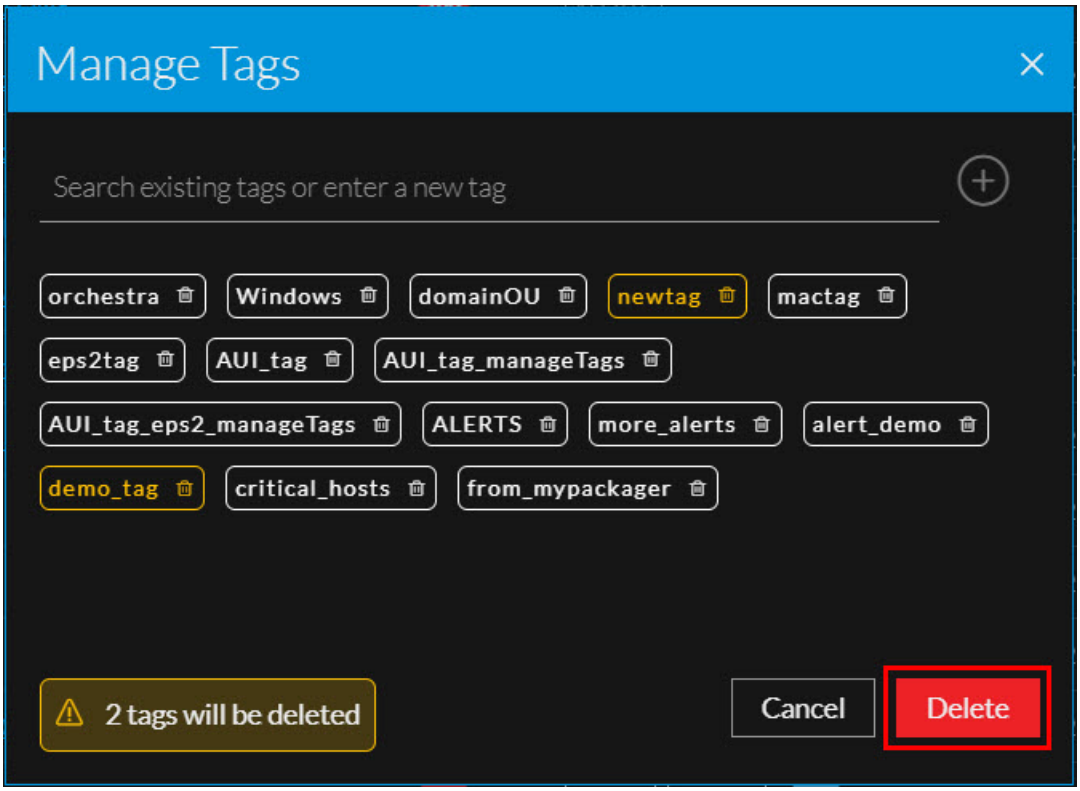


1. Click **Tags > Manage Tags** on the Hosts tab.

2. Enter a valid tag in the text field on the **Manage Tags** pop-up and click ⊕.

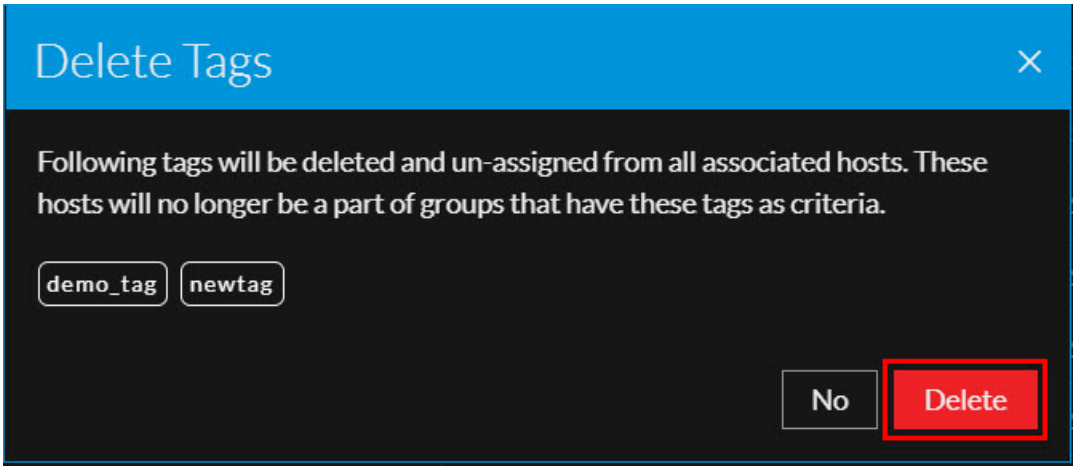


- The tag is created, and a success message will appear.



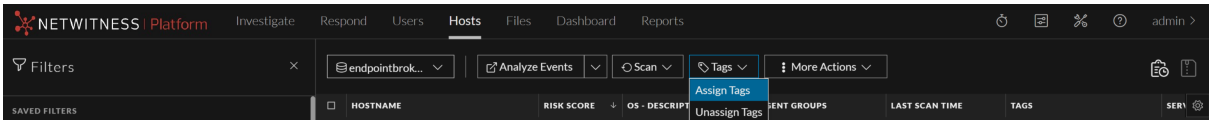
3. Repeat step 2 to create more tags.

To Delete Tags:



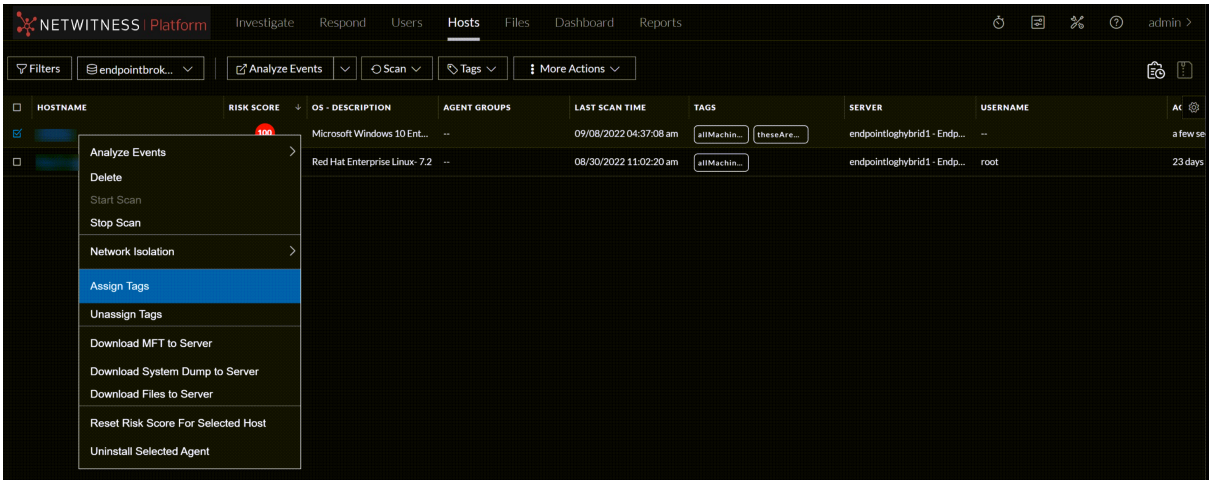
1. Click **Tags > Manage Tags** on the Hosts tab.

2. Select the tags that you want to delete and click **Delete** on the **Manage Tags** pop-up.



3. Click **Delete** on the **Delete Tags** confirmation pop-up.

Note: The tags you deleted will also be unassigned from all associated hosts. If the associated hosts are a part of groups created using these tags as one of the criteria, then the hosts will no longer be a part of those groups. Refer What happens next after unassigning or deleting tags from hosts? for more information.

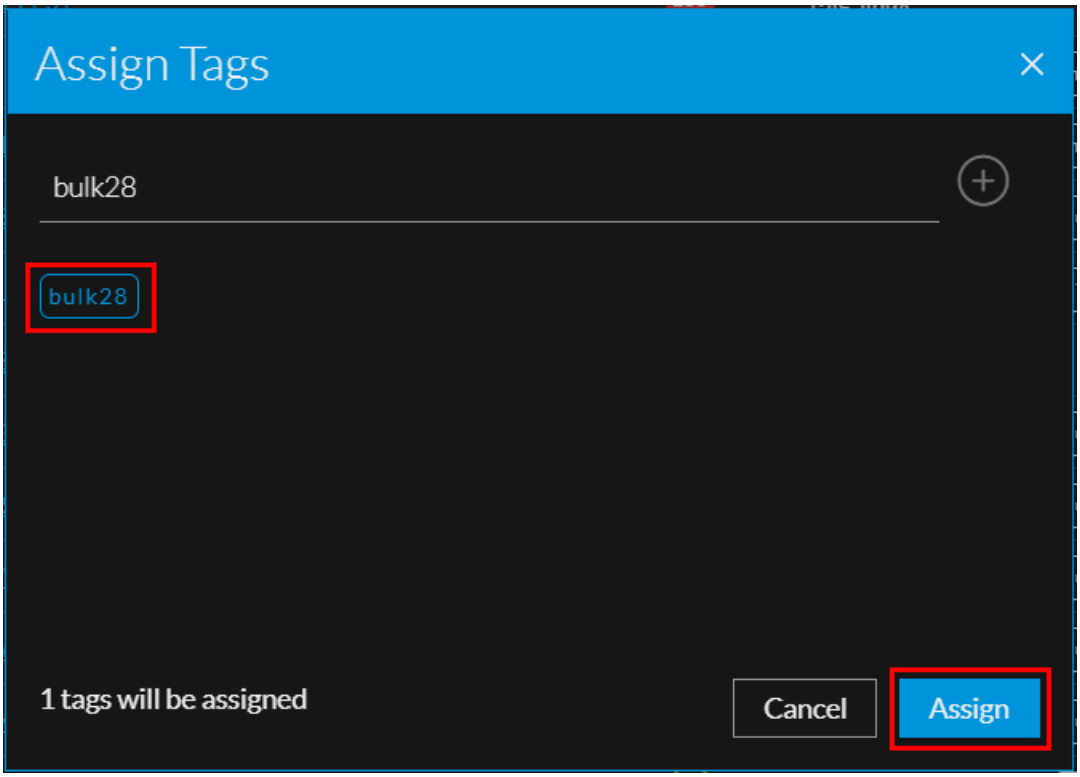


Assign tags

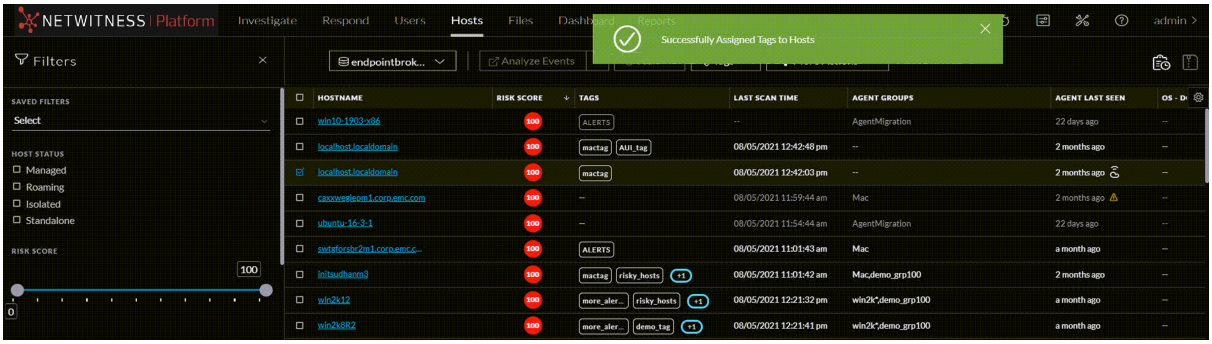
1. Select one or more hosts on the Hosts tab.
2. Do one of the following.
   - Select **Tags > Assign Tags** from the menu.

   - Select a host, right click and select **Assign Tags**.

     The **Assign Tags** pop-up will appear and shows all the existing tags.

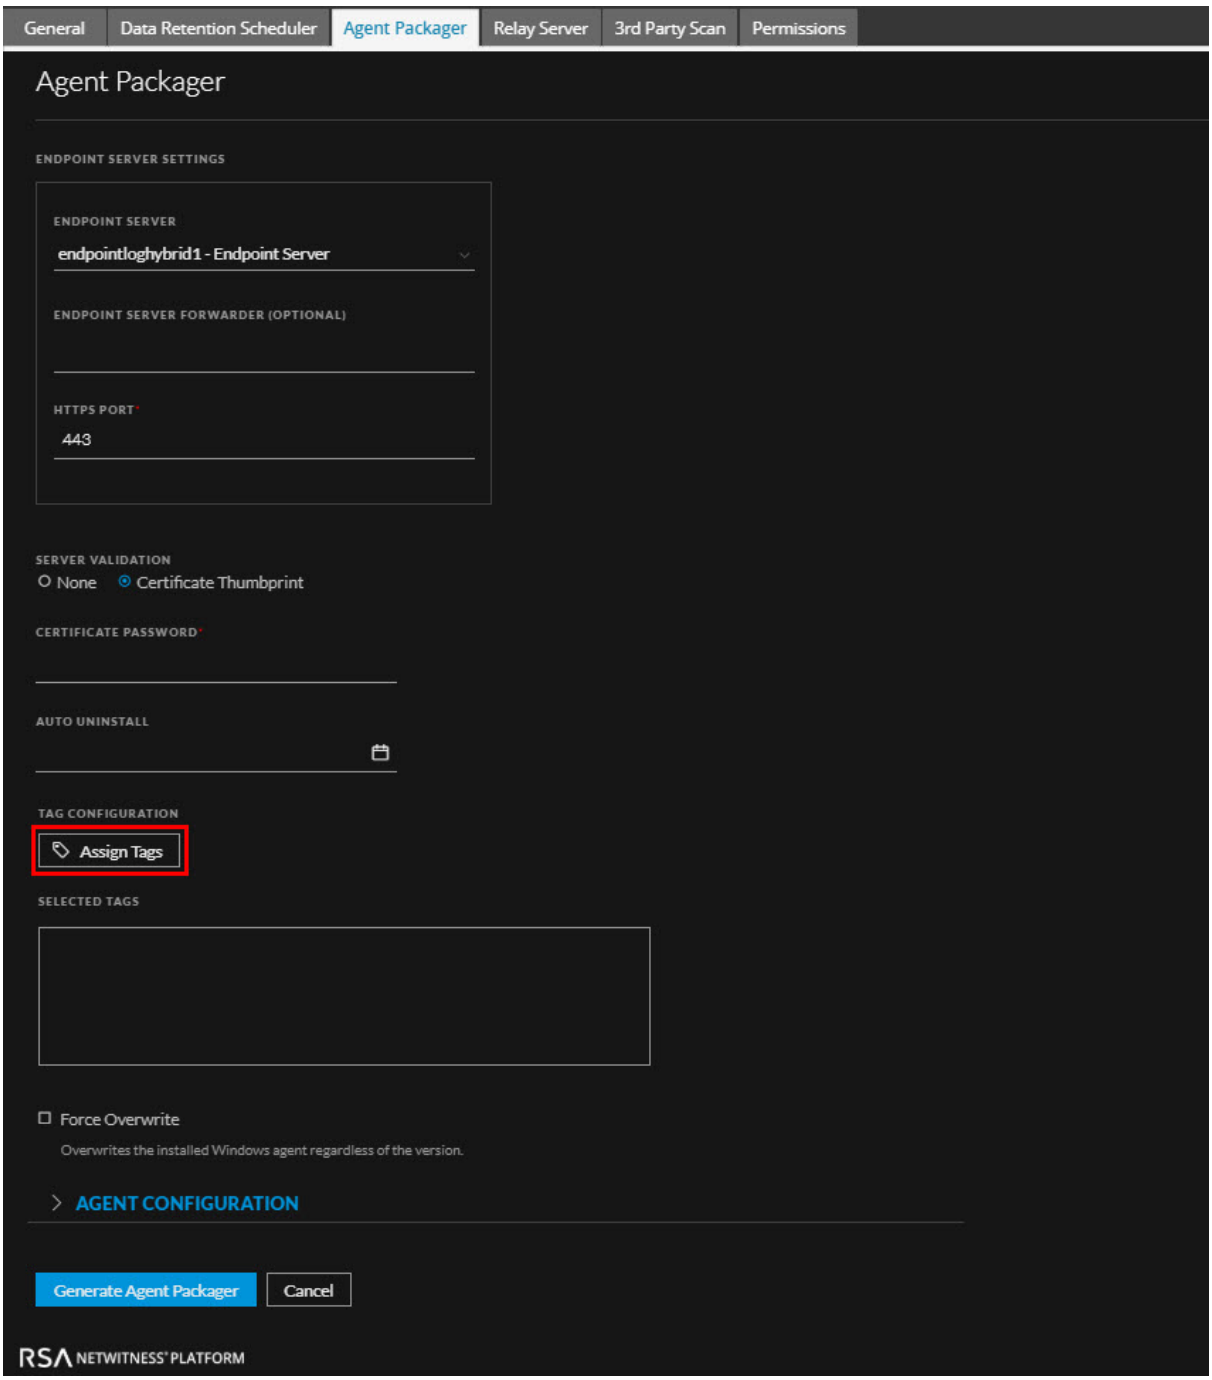


3. Do one of the following.

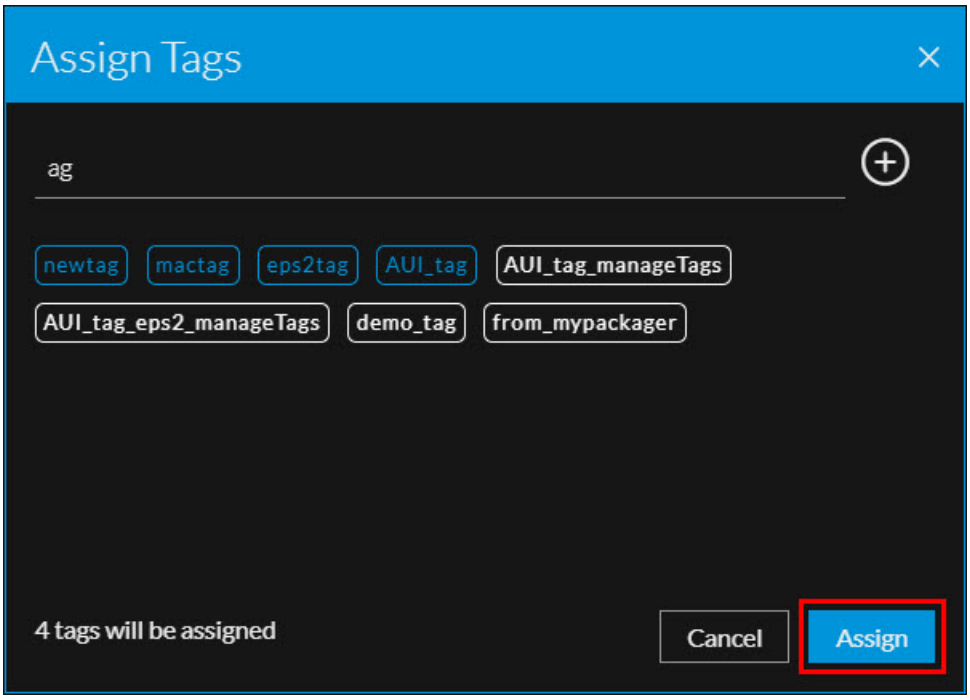


- Enter a valid tag and click  to create it. The newly created tag is selected by default.

- Search for an existing tag using the text field and select it if required.



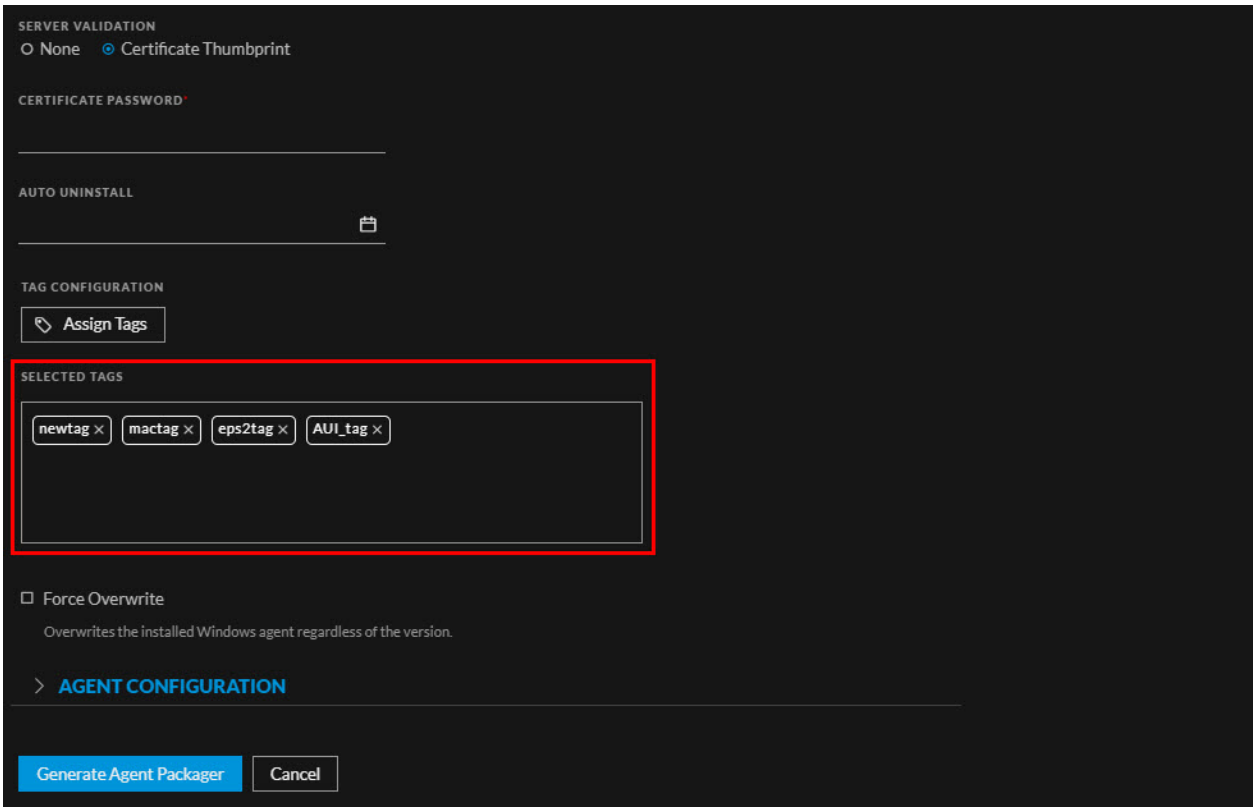
4. Click **Assign**. These tags will be assigned to the selected hosts.



Create and Assign Tags When Generating the Agent Packager

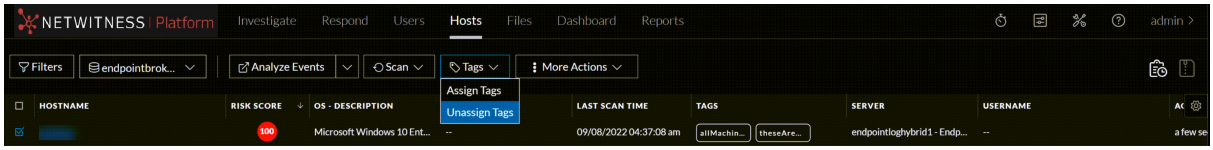
You can add tags to the hosts while installing the Endpoint agents. When generating the agent packager on the Agent Packager tab, you can either create new tags or select already existing tags. These tags will automatically be assigned to the host in which the agent will be installed.

1. Click **Assign Tags** under **TAG CONFIGURATION** on the **Agent Packager** tab.

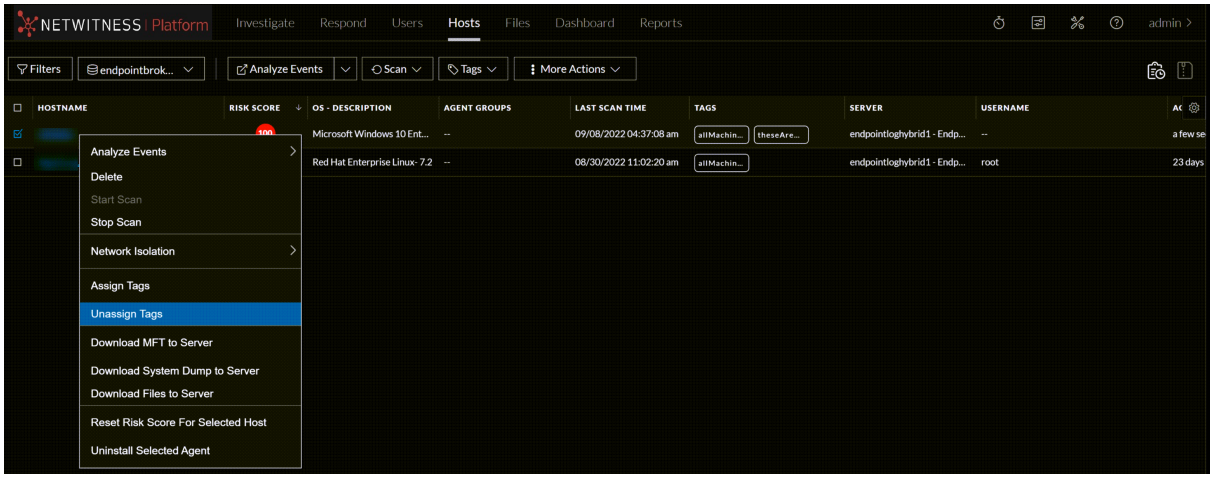


2. On the **Assign Tags** pop-up, do one of the following.
   - Search for an existing tag using the text field and click **Assign**.

- Enter a new tag in the text field and click  to add it to the selection. Click **Assign**.

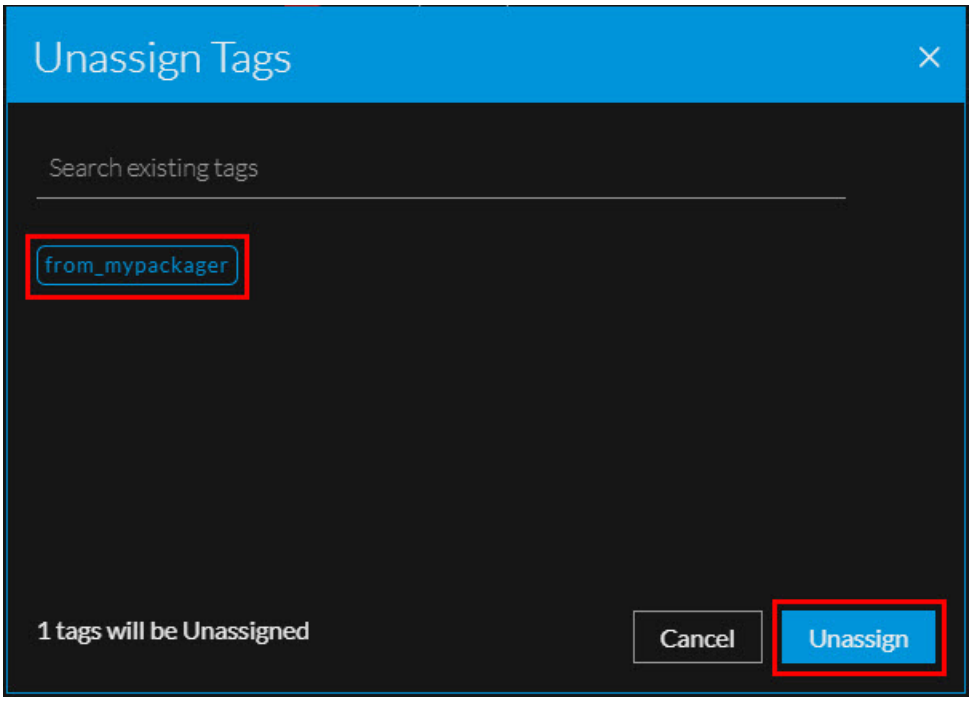


3. Assigned tags will appear under **SELECTED TAGS**.



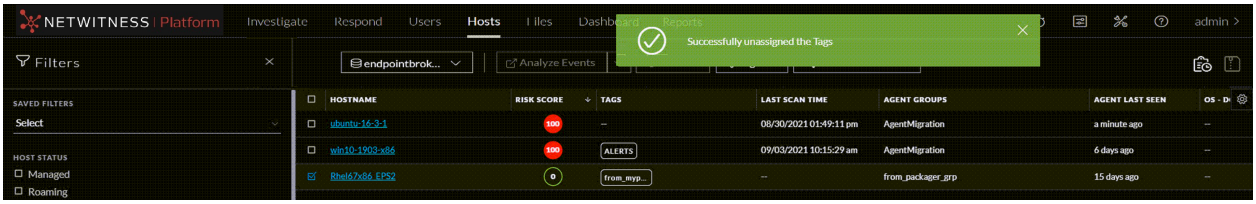
Note: The tags added while generating the Agent Packager are applicable only to the newly installed agents and not to the manually upgraded agents.

Unassign tags



1. Select one or more hosts on the **Hosts** tab.
2. Do one of the following.
   - Select **Tags > Unassign Tags** from the menu.

   - Right click a host and select **Unassign Tags**. The **Unassign Tags** pop-up will appear and show all the tag assigned to the selected hosts.



3. Search for the tags you want to unassign, select them and click **Unassign**.

4. Click **Unassign** on the confirmation pop-up.

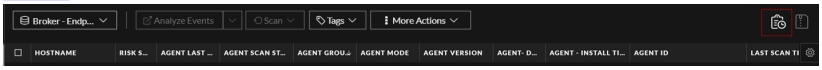
5. These tags will be Unassigned from the selected hosts.

What happens next after unassigning or deleting tags from hosts?

Unassigning/deleting tags from hosts will immediately initiate group & policy evaluation. For example, if a host is a part of the group created using only the unassigned/deleted tag as criteria, the host will no longer be a part of that group. Refer to the following scenarios to understand more.

Example Scenario 1: Assume you create a group with a couple of tags as grouping criteria, all the hosts with these tags assigned will be a part of the group. And, if you delete these two tags(or unassigning from the hosts), the hosts may no longer be a part of this group.

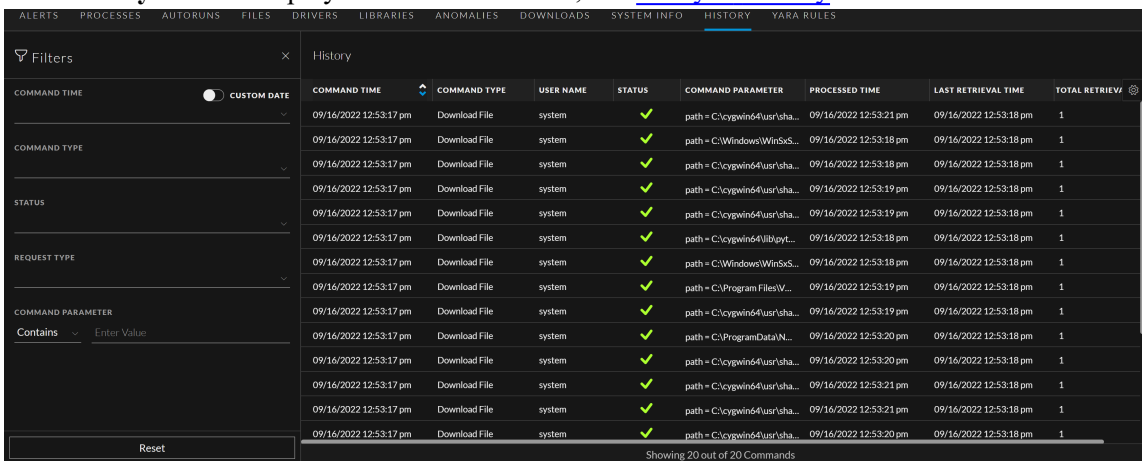
Example Scenario 2: Assume you create a group with a couple of tags and IP addresses as grouping criteria; all the hosts assigned with these tags and IP addresses will be a part of the group. And, if you delete(or unassigning from the hosts) the tags alone, the hosts may still be a part of this group as they are still grouped using the IP addresses.



View Agent History

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

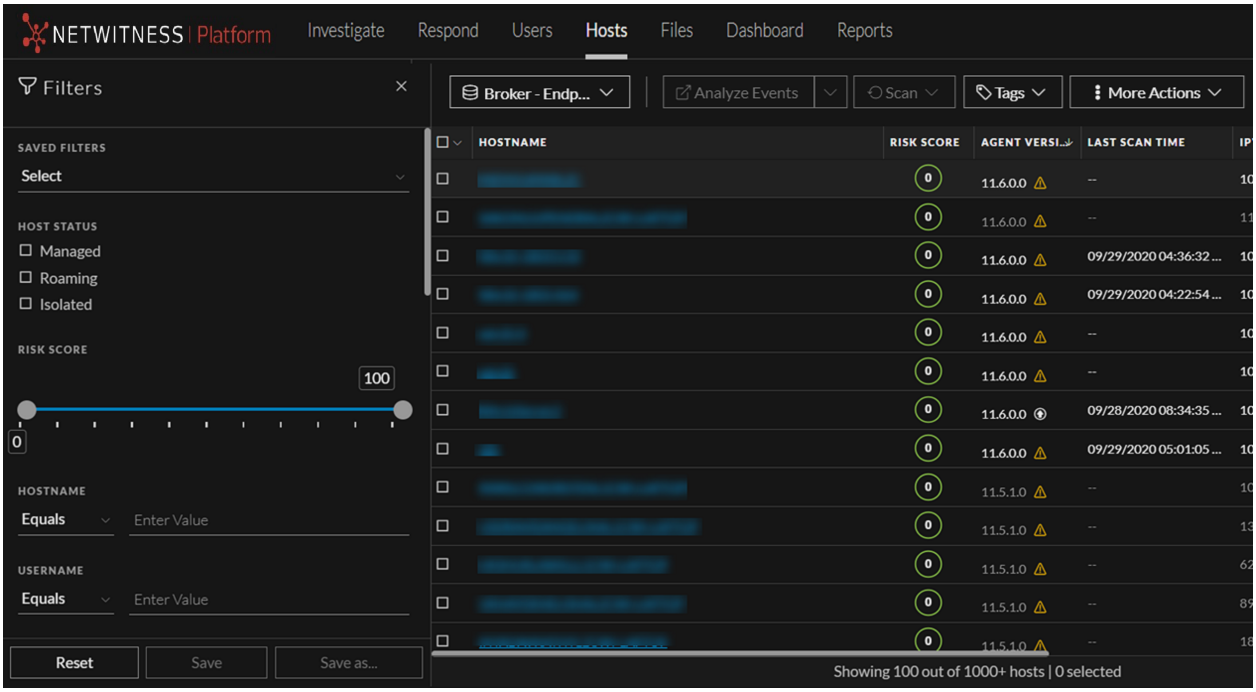


1. Go to **Hosts**.
2. Do any one of the following,

- To view all commands, click . You can also filter commands, for more information see Filter Hosts.

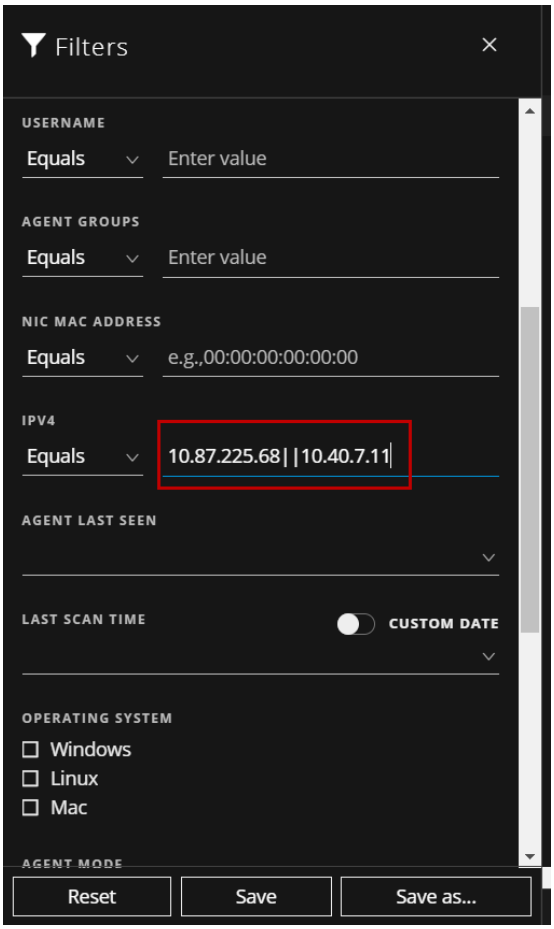
The Agent History view is displayed. For more details, see Analyze History.

- To view commands specific to a particular host:
  - Click the host for which you want to view the commands.
  - In the Host details view, click **History** tab. You can also filter commands, for more information see Filter Host Details.
    The **History** view is displayed. For more details, see Analyze History.



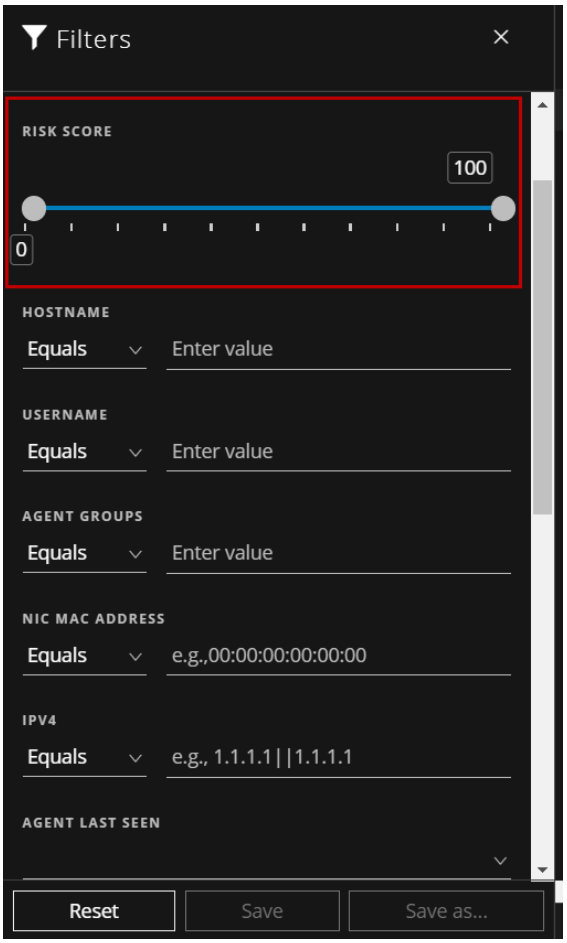
Filter Hosts

You can filter hosts on agent version, agent ID, agent mode, agent upgrade, agent last seen, last scan time, operating system, hostname, username, Mac address, risk score, IPV4, driver error code, security configurations, agent groups, and host status - managed, roaming, and isolated.



In the **Host** view > click , to filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

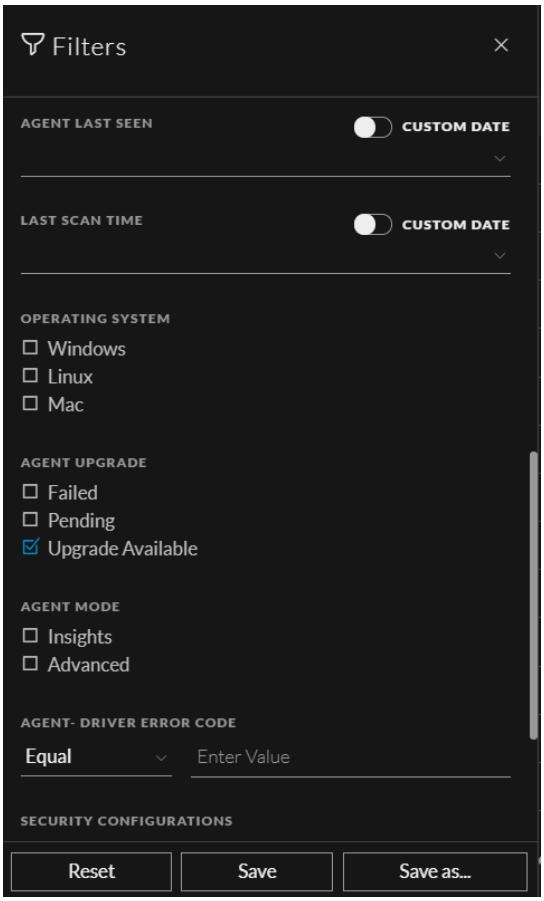
Note: While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.



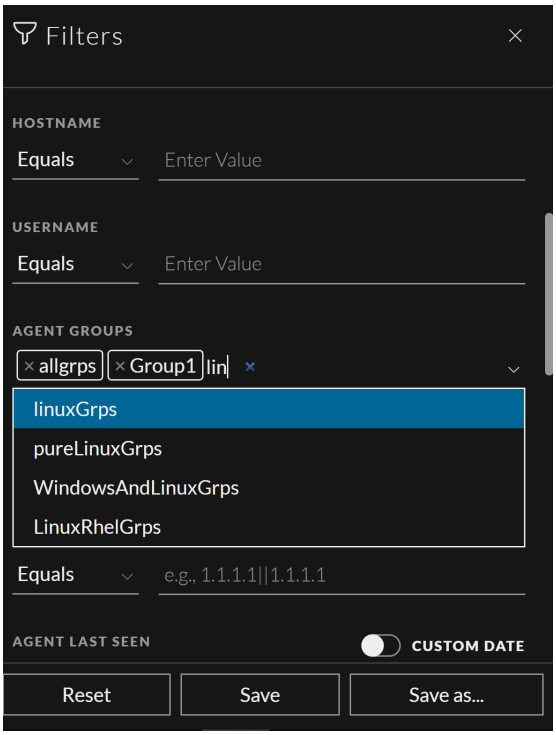
To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

For example, using `Equals` operator for multiple IPV4 values with a separator `||`.

To filter on the agent last seen or last scan time, select the option from the drop-down list. If you select 3 Hours ago for the Last Scan Time, the result displays hosts that were last scanned 3 hours ago or earlier.

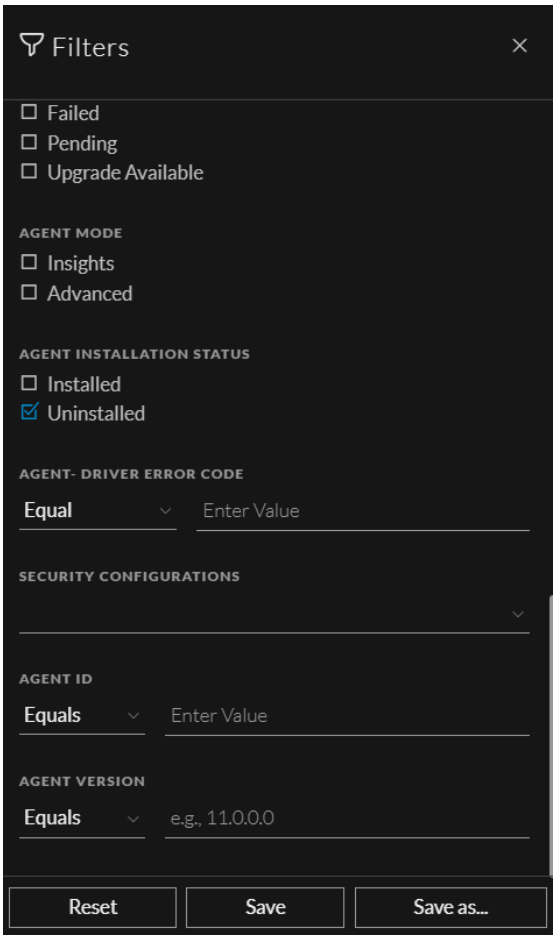


To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



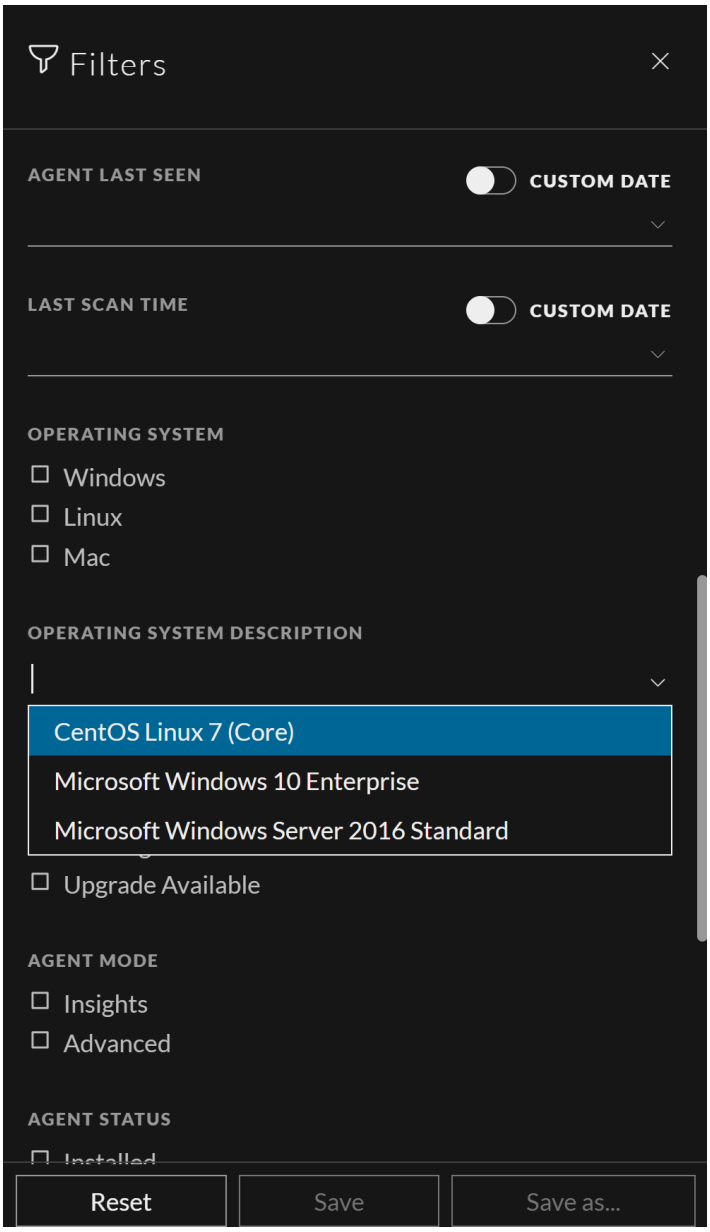
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.



To filter the agents based on the upgrade status, select one of the upgrade statuses. For example, select the **Upgrade Available** checkbox to get the list of agents available for an upgrade.

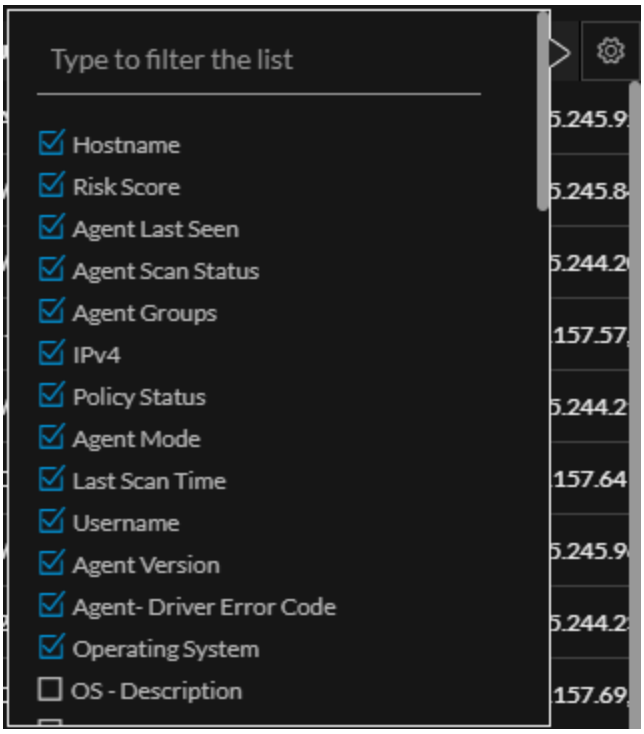
To filter the agents based on single or multiple agent groups, select a group from the drop-down list. You can also search the name of the groups from this list.



To filter the agents based on the installation status, select one of the installation statuses. For example, select the **Uninstalled** checkbox to get the list of agents for which the uninstall is initiated or successfully completed.

You can also filter the commands on command type, status, host name, request type, command parameter and command time (In which you can filter by custom date range), by clicking .

In 12.3 and later versions, you can filter the hosts on specific versions of Windows, Mac, and Linux using the **Operating System Description** field.



For Example: **CentOS Linux 7 (Core)**, **Microsoft Windows 10 Enterprise**, and **Microsoft Windows Server 2016 Standard**. Refer the following figure.

Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

You can either choose to perform a quick scan or a full system scan.

Quick scan - Scans all executable files that are loaded in memory. Both Insights and Advanced agents support quick scan.

Full System Scan - Scans all fixed drives or the system drive You can perform a full system scan only on advanced agents that are in version 11.6 or later. Native executables are included in the full system scan, by default

When hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

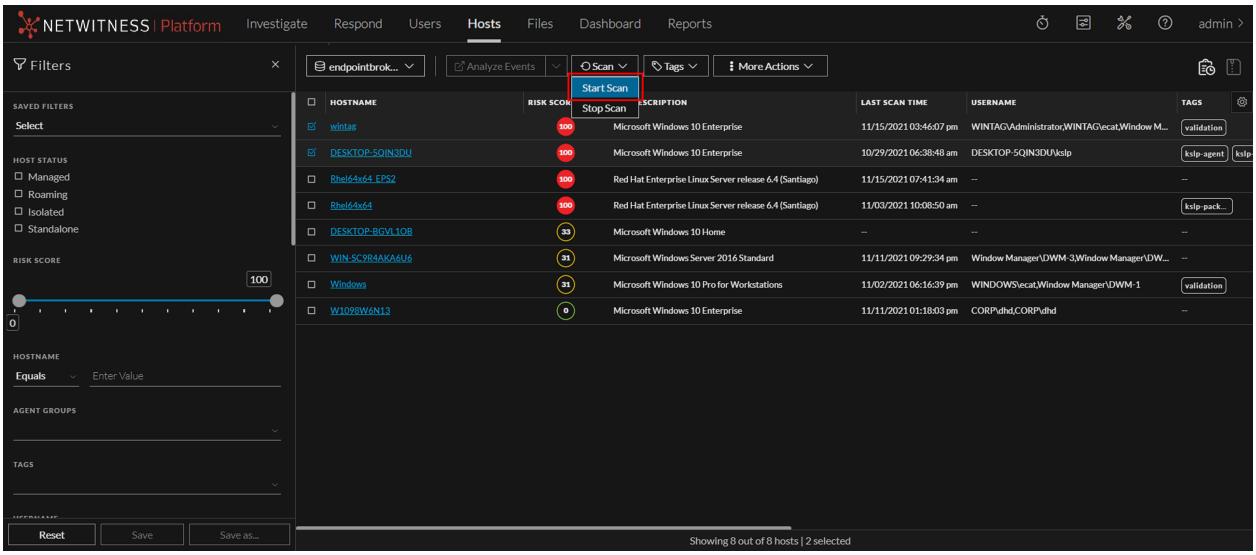
- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To perform a Quick Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time, and do one of the following:

- Click **Scan > Start Scan** from the menu (Or)
- Right-click and select **Start Scan** from the context menu

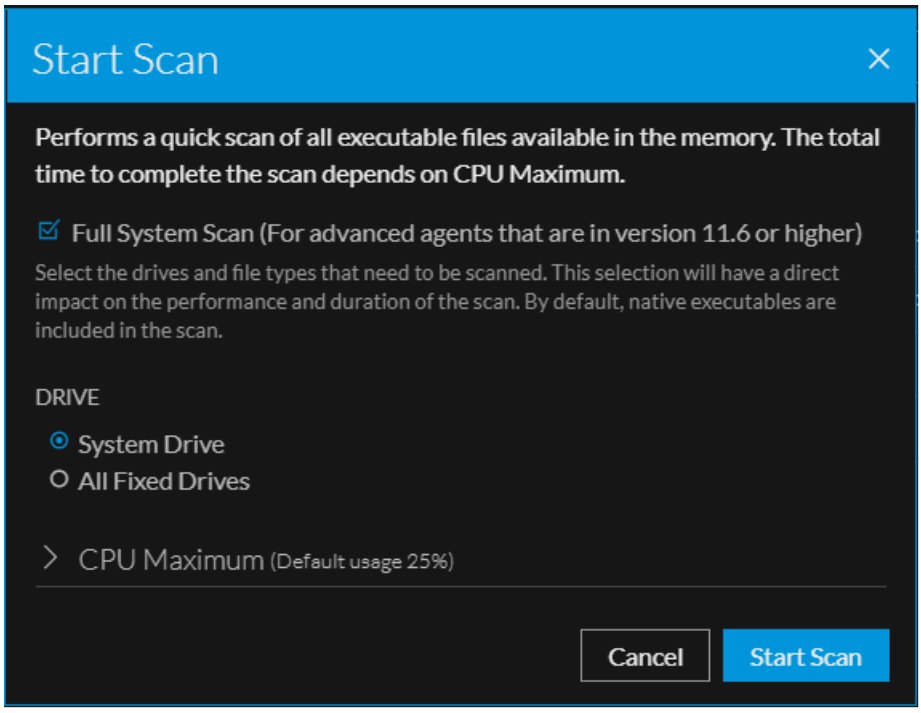
3. Click **Start Scan** on the pop-up. Quick scan is initiated for executable modules loaded in memory.



The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Pending	Scan request is sent to the server, and the agent will receive the request the next time it communicates with the server.
Cancel	Stop request is sent to the server, and the agent will receive the request the next time it communicates with the server.

Note: By default, the scan utilizes 25% of the CPU. You can click CPU Maximum and select a value from 5% to 100%. Increasing the CPU Maximum limit reduces the scan time but could lead to more CPU usage.



To perform a Full System Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:
   - Click **Scan > Start Scan** from the menu bar (Or)
   - Right-click and select **Start Scan** from the context menu

1. From the **Start Scan** pop-up, select **Full System Scan (Only on advanced agents that are 11.6 or higher.)**

2. Select **System Drive**(Default selection) or **All Fixed Drives**
3. Click **Start Scan** on the pop-up.

Note: An Endpoint server supports up to 10k Full System Scans in a rollover period.

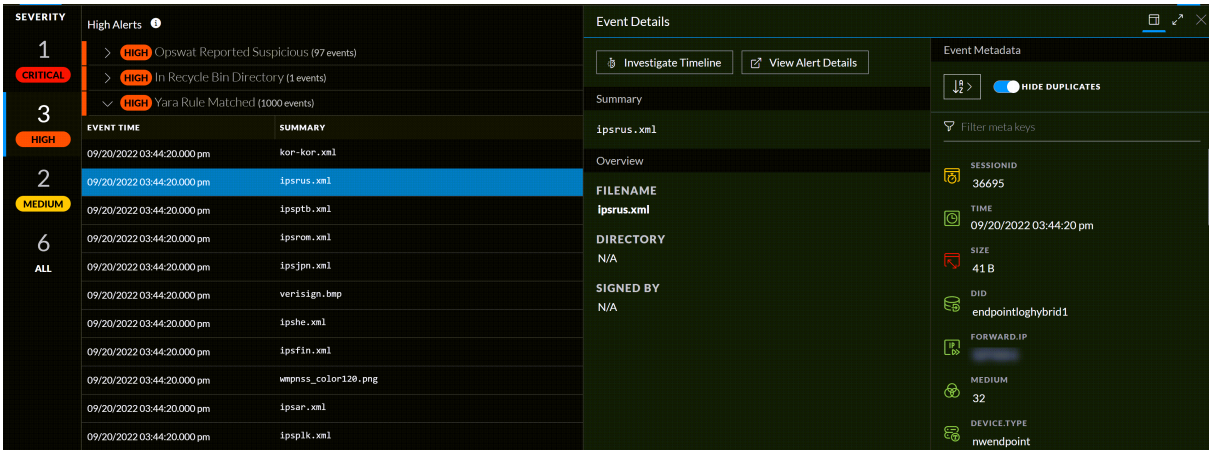
Analyze Hosts Using the Risk Score

You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

Based on the severity of the alert triggered by the host, you can analyze the host using the following options:

- **View Alert Details**: This option allows you to analyze the host when Critical and High alerts are triggered. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the host when Medium alerts are triggered. For more information, see Investigating a Process.

To analyze the hosts (which trigger Critical or High alerts) using the risk score:



1. Go to **Hosts**.

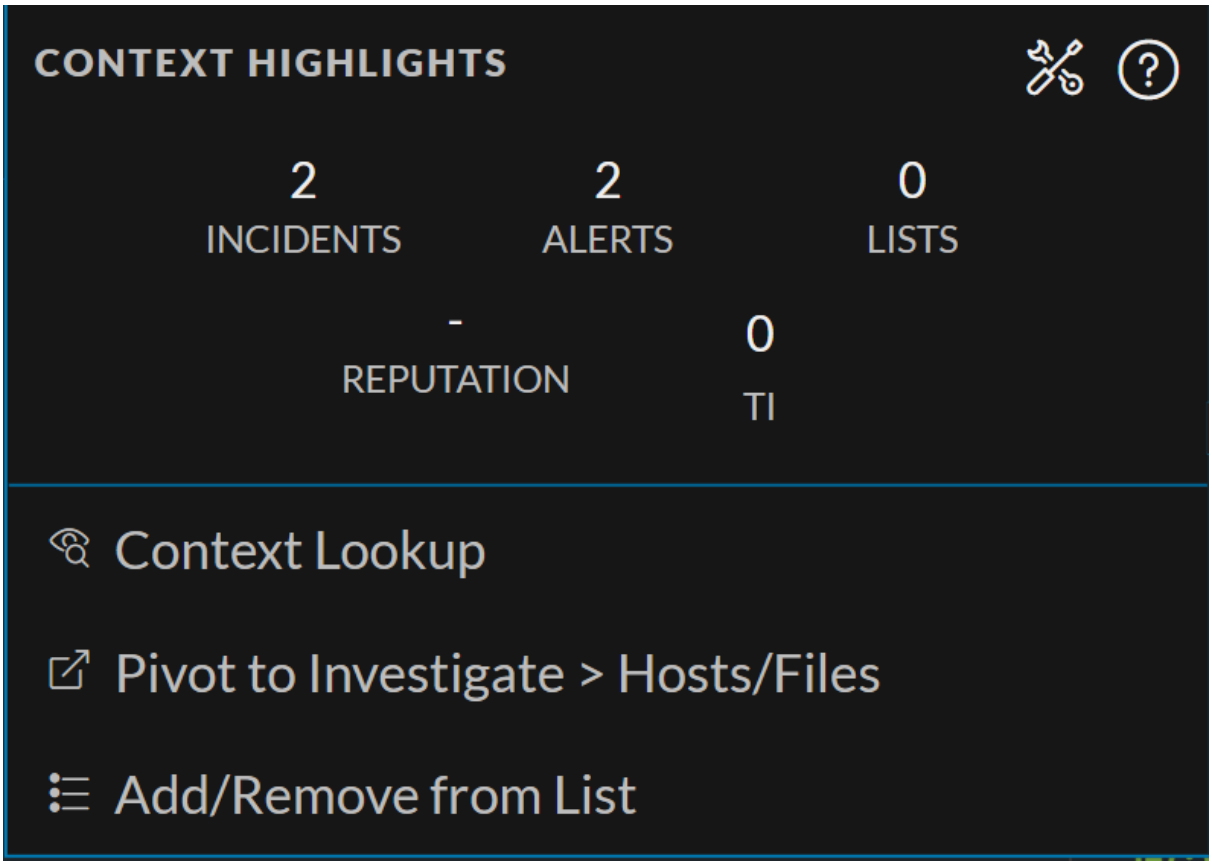
   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.

3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the alert severity such as **Critical** or **High**.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.

7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Hosts** view to view context lookups for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

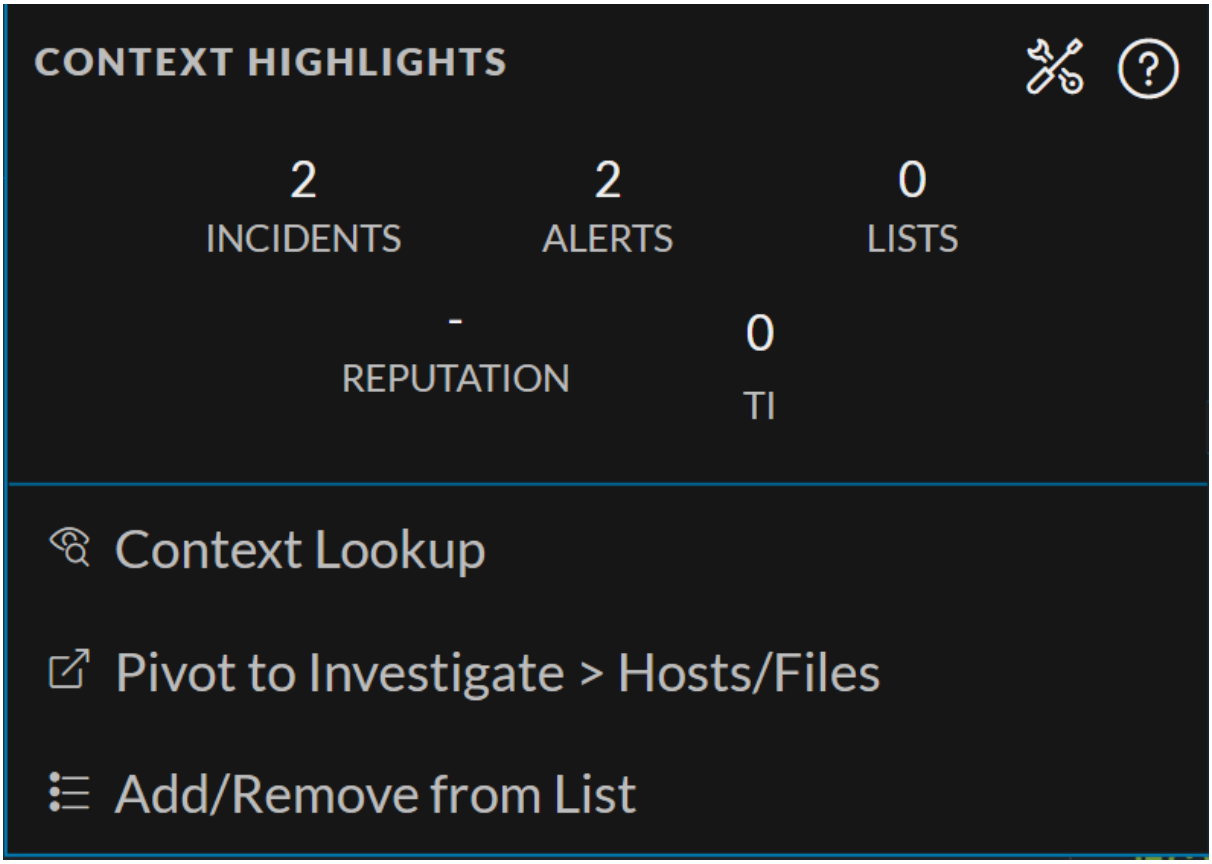
To analyze the hosts (which trigger Medium alerts) using the risk score:

1. Go to **Hosts**.

   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.
3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

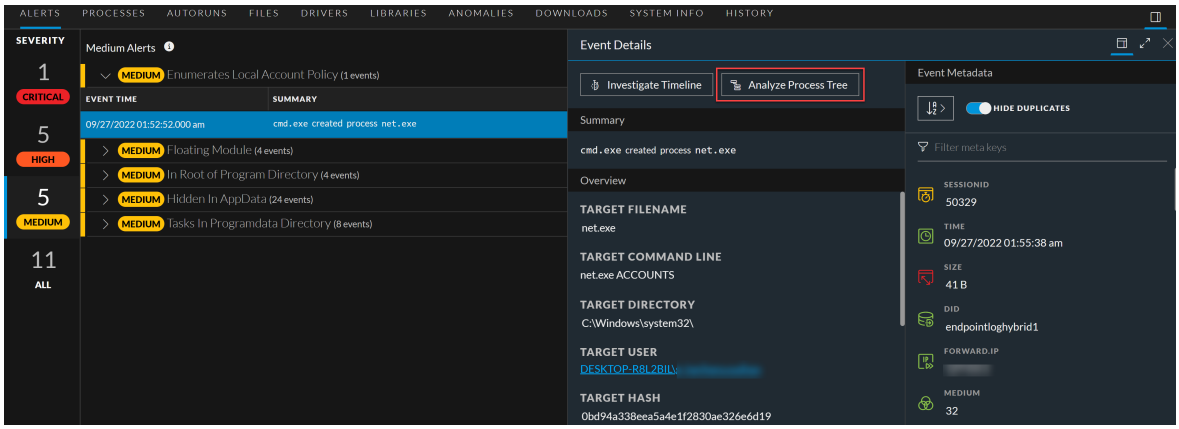
     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.



Note: For each alert, only the latest 1000 events are displayed.

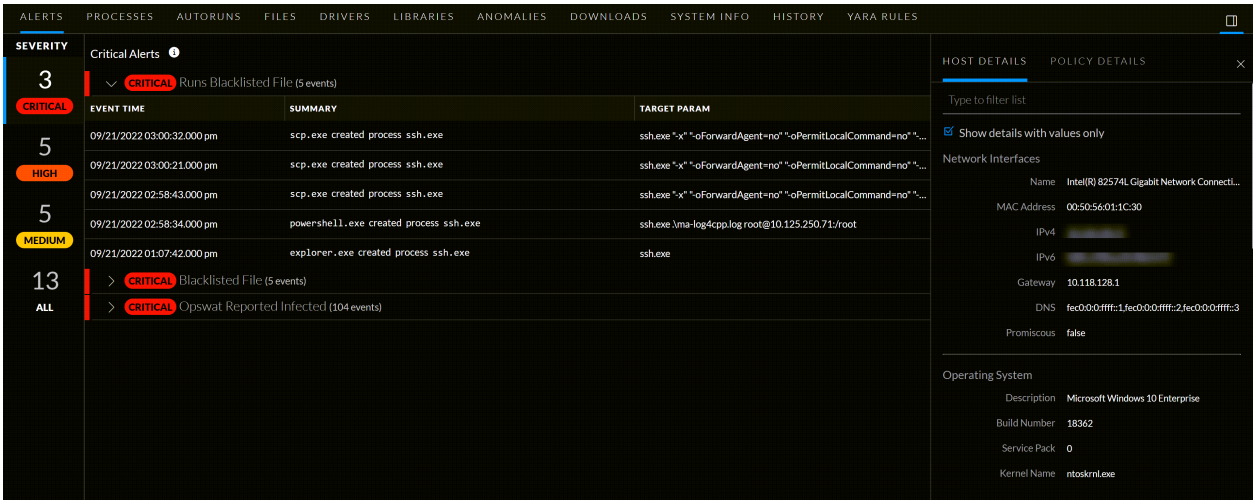
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
    - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
    - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information, such as Network interface, operating system, hardware and others.
- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.

Filter Host Details

In the Processes, Autoruns, Files, Drivers, Libraries, and Anomalies tabs, you can filter the processes or files on file status, reputation, file or process name, signature, and risk score. Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

In the **Host** view > **Files** tab, you can filter the files available on host, and files deleted from host. The result of files deleted from host depends on the data retention policy configured in the **Endpoint Config** view > **Data Retention Scheduler** tab. By default, data retention policy is configured for 30 days, this means only 30 days of deleted files are stored in the Endpoint server. These filter options are disabled if **All Files Available on Host** toggle is disabled.

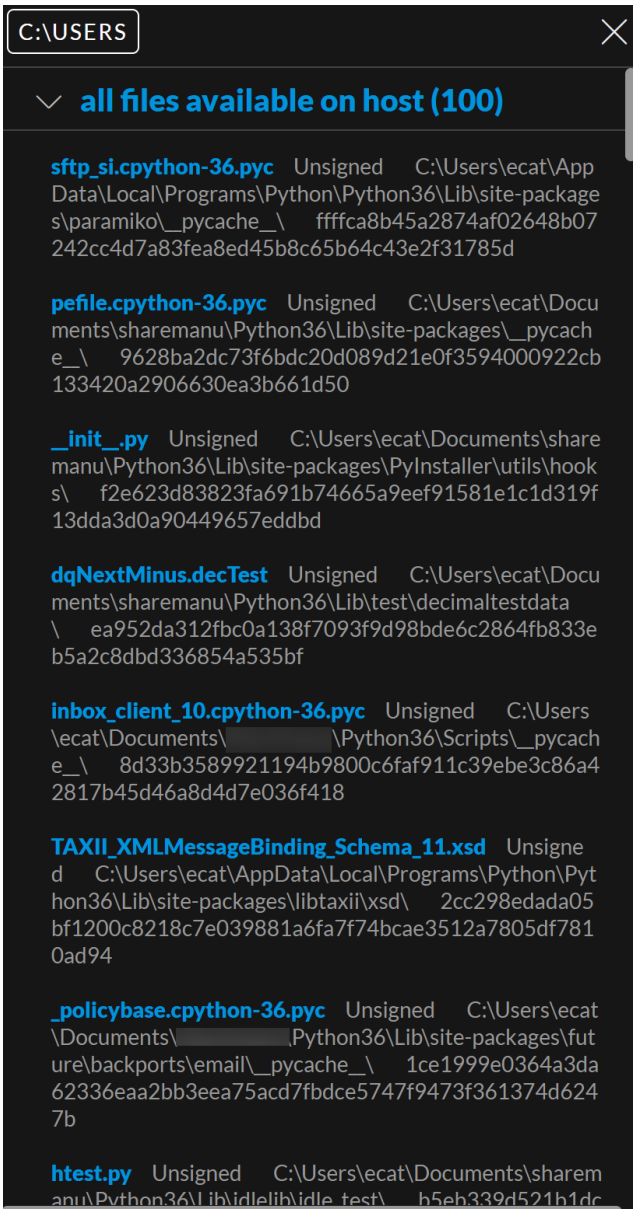
In the **Host** view > **History** tab, you can filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters).The filter is added to the **Saved Filters** panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Search Files on Host

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.



Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

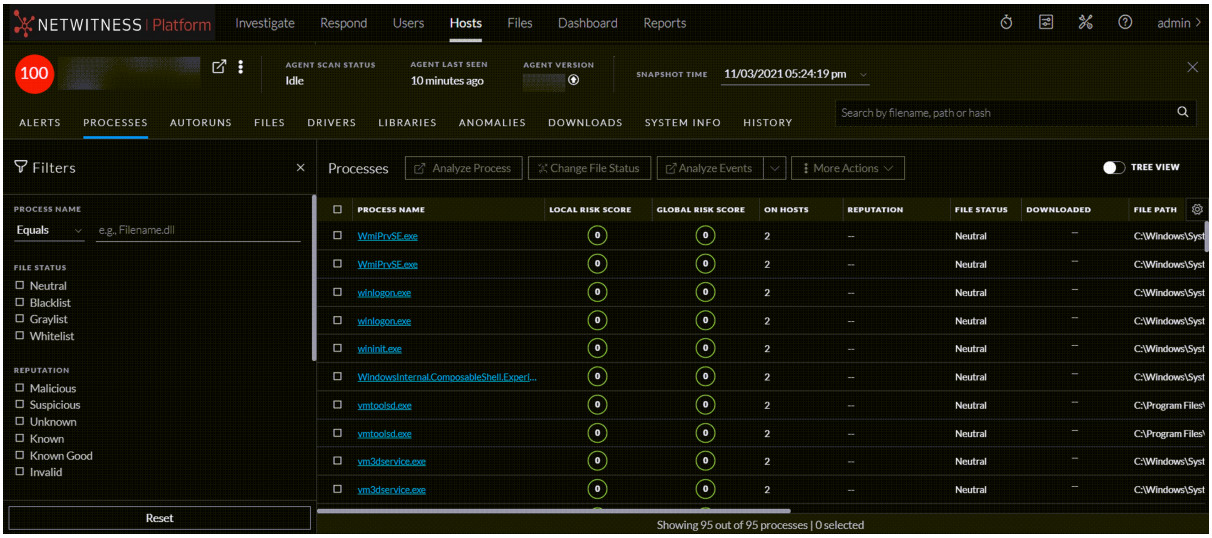
The result displays the matching files present on the host in **All Files Available on Host** category and in the respective **snapshot** category with the details, such as file name, signature information,and checksum. In addition, the **snapshot** category displays the system interaction, for example, ran as process, library, autorun, service, task, or driver. To view more details, click the **filename** or **system interaction** link.

Example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Alerts** tab, enter the file path `C:\Users` in the search box.

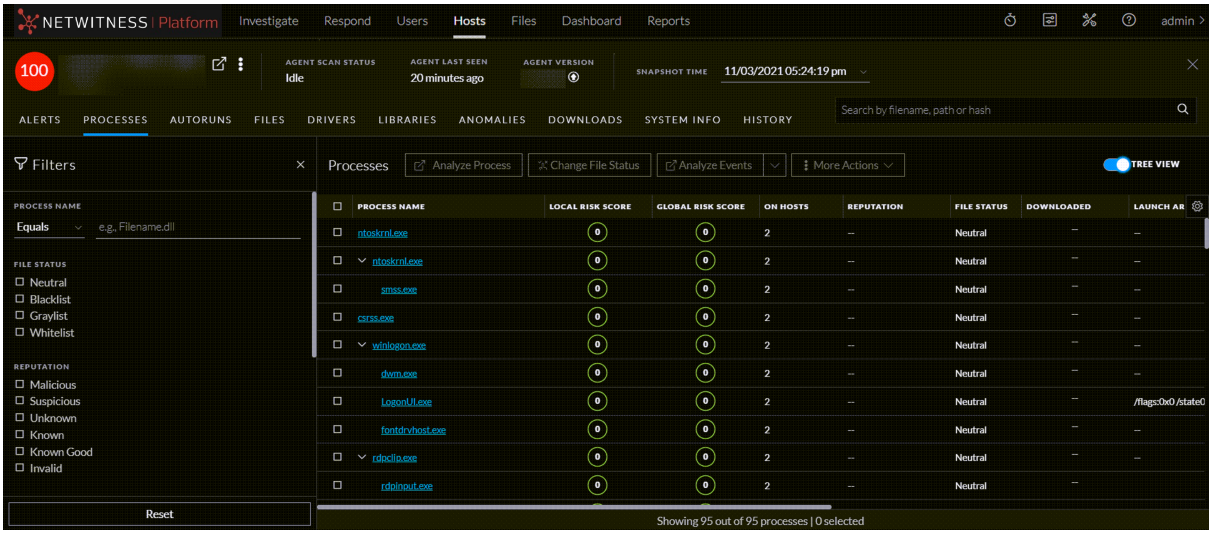
   The search displays a maximum of 100 results of the executables in this folder. In this example, there are some unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

This file is run as a Process.



4. To view details of this file, click **Process** in the result.

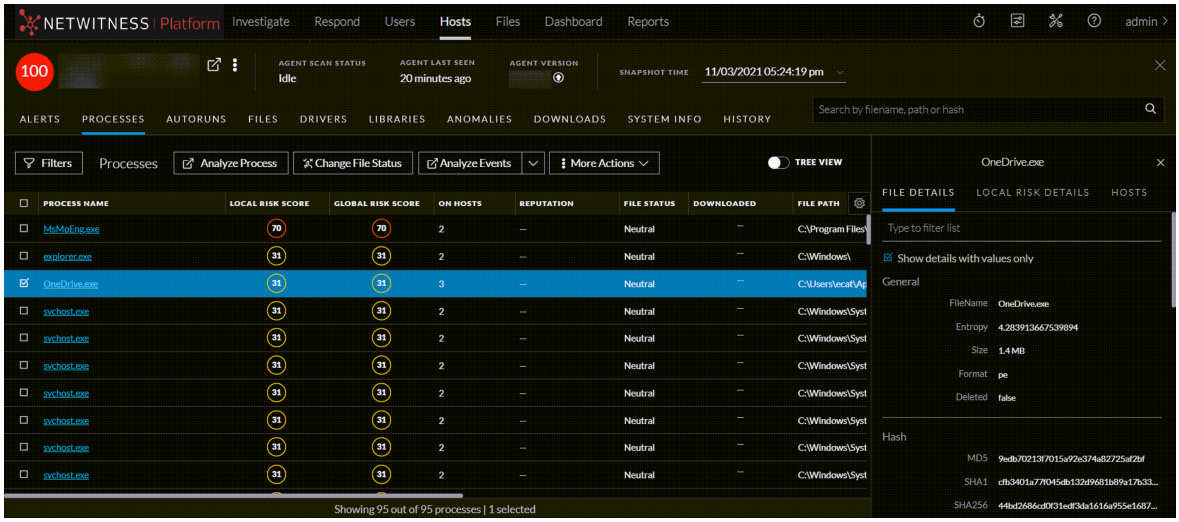
   This opens the **Process** tab where you can view the process details.



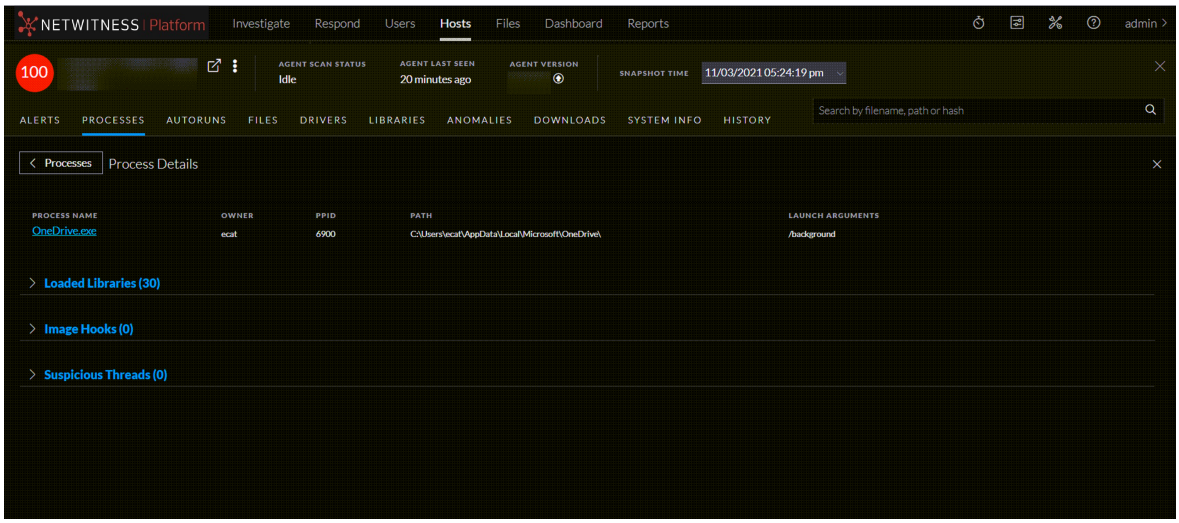
Analyze Processes

To analyze the process:

1. In the **Hosts** details, select the **Processes** tab.



To view the process tree, click the toggle switch. The following is an example of the tree view:



2. In the **Processes** Tab, do one of the following:

- Click a row to view the properties of a process in the right panel.

- Click the process name to view the process details of a specific process.

When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

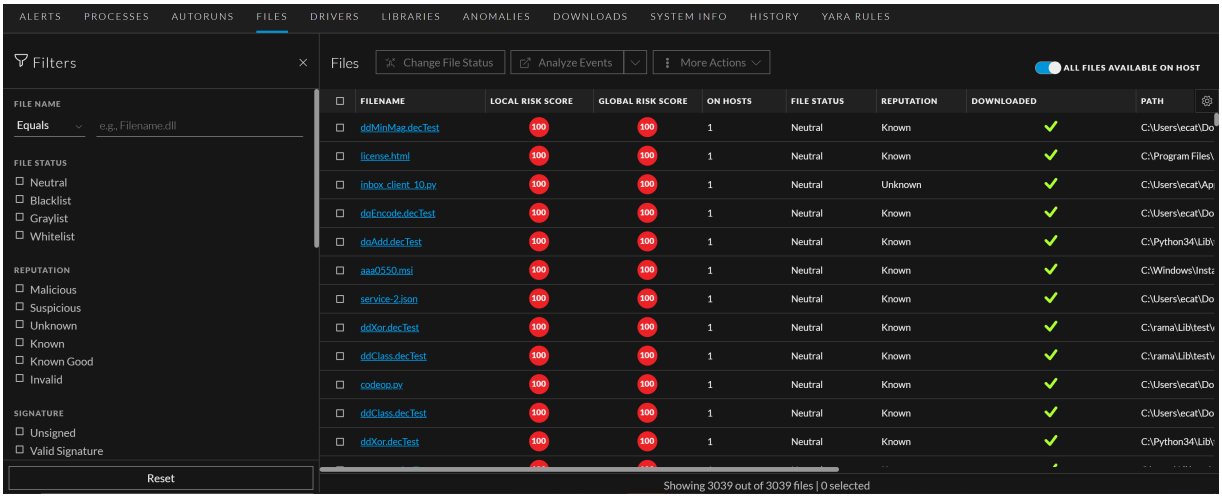
For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

Analyze Autoruns

In the Hosts details, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.



For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Note: The Endpoint Broker queries the Hosts present across multiple Endpoint Servers for each Autorun and displays the total count of the hosts for the respective Autoruns in the **On Hosts** column in the **Hosts** > **Autoruns** Broker view.
For Example:
If an Autorun is running on 2 different hosts present across multiple Endpoint Servers, the **On Hosts** count of the Autorun is displayed as 2 in the **Hosts** > **Autoruns** Broker view.

Analyze Files

To analyze the files, you can do either one of the following based on your requirement.

- In the **Hosts** view, select the **Files** tab.
  You can view the list of all files (reported as part of scan and tracking) on the host including the deleted files.

- To view the files reported as part of scan snapshot, you must disable **All Files Available On Host** toggle and select the scan time from the **Snapshot** drop-down list.

Example for analyze files, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts details, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts details, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze Anomalies

Note: This tab is available only for advanced agent.

In the Hosts details, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.
- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

Note: Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

Analyze System Information

In the Hosts details, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Analyze History

In the Host details, select the **History** tab. This tab lists the commands along with the respective status and additional details.

When you review the history, look for the command status and retrieval count to check if the agent retrieved the commands.

Below are some examples:

- A file download command is issued, but the file is deleted on the host. In this case status of the command is failed as the file is not downloaded.
- The retrieval count increases, but the command is not processed. This happens when an analyst requests a large number of files (For example, MFT, system dump, or process dump), and the connection breaks when the agent uploads these files.
- If the agent command is not retrieved, the agent is either offline or busy processing other commands (For example, uploading a system dump). In this case, the status of the command shows pending.

To view more details, click the **Hostname** link highlighted in blue. The Hosts details view is displayed. In the case of MFT, download file, system dump, and process dump command types, **Downloads** tab is displayed with details such as file name, type, status, size, downloaded time and SHA256 of the file, when you click on the **Hostname** link.

Export Host Details or Files to JSON File

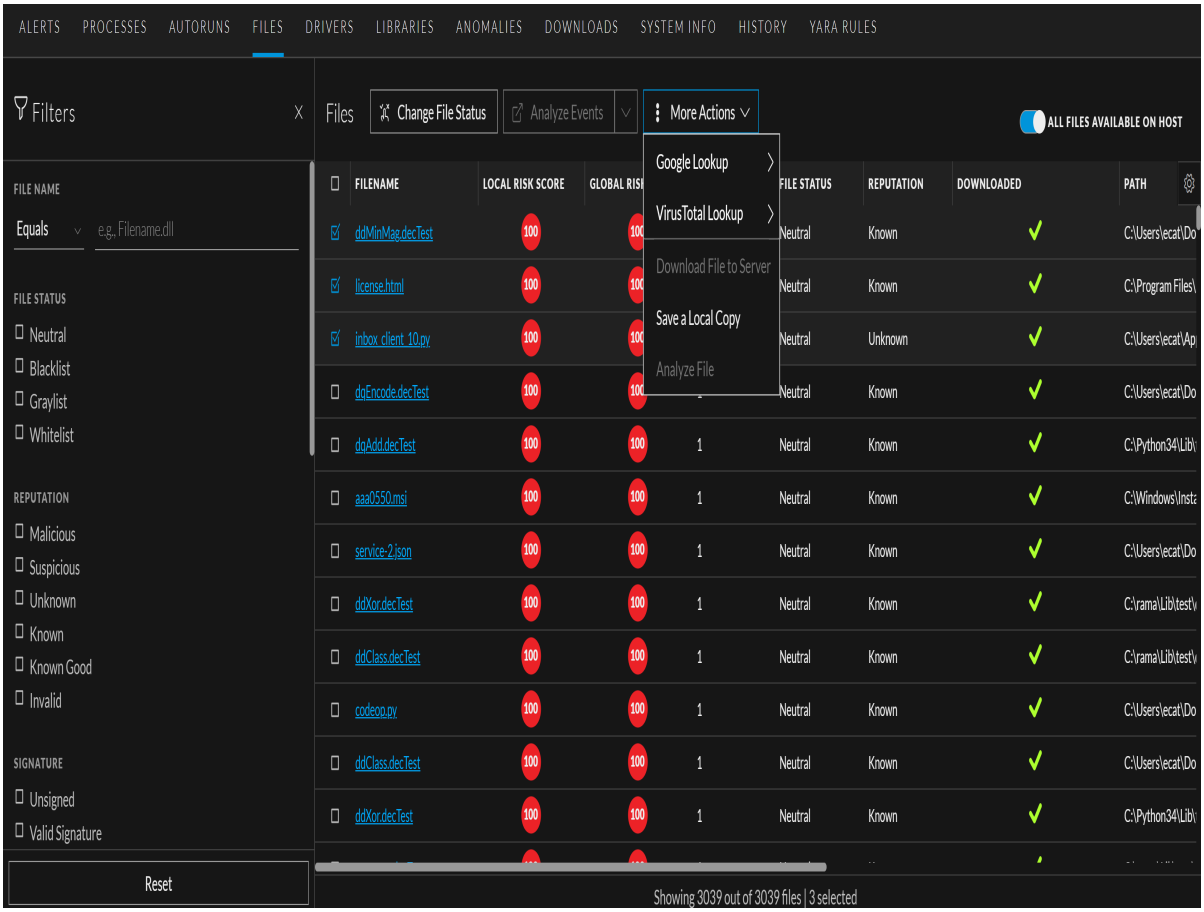
Note: Export Host details option is disabled if there is no snapshot time.

To export host details or files to JSON file:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. Click  (**More**) beside the hostname and do any of the following:
   - To export the scan data categories for the host, select **Export Host Details**. This exports files such as:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.
     - fileContext.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported during the host scan.

- machinedetails.json - This file consists of the machine details, including hardware, operating system, interfaces, and so on, along with the agent details like version, policy details.

Note: If Endpoint Broker is selected and a host is communicated with multiple Endpoint servers, during the host details export, all files and details of the host are exported from the Endpoint server where the selected snapshot is stored.



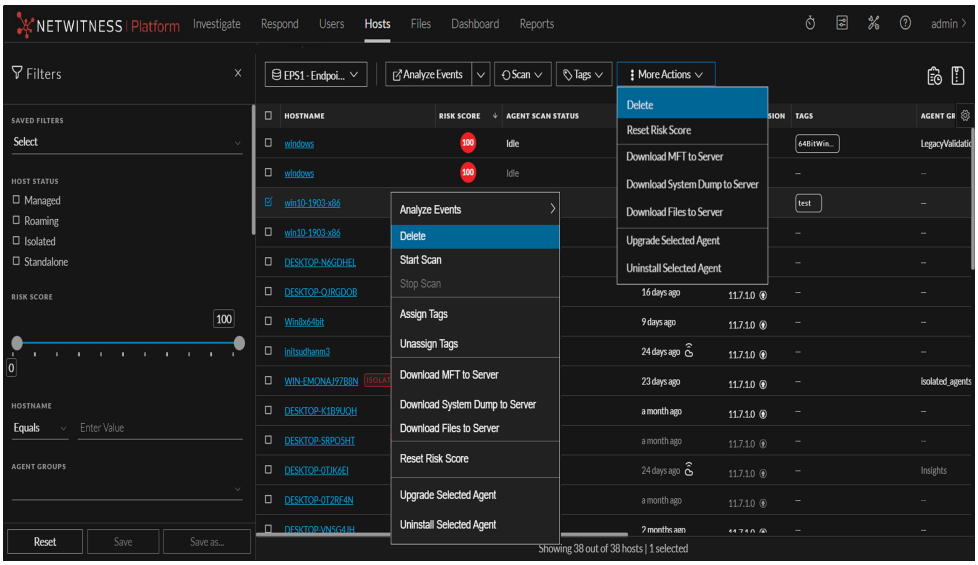
Note: allfiles.json file is exported irrespective of the selected snapshot.

- To export all the files available on the host, select **Export Files**. This exports:
  - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Hosts** > **Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More Actions** drop-down list in the toolbar, do the following:



- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

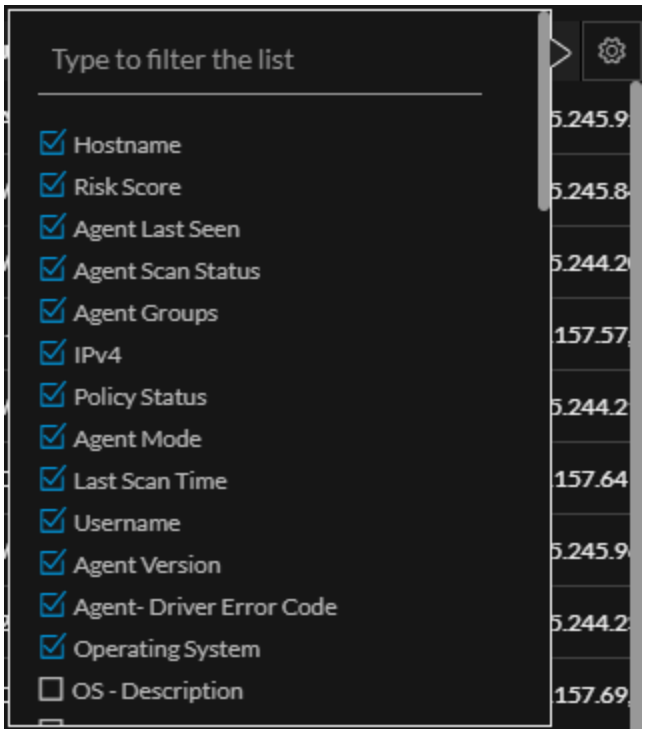
1. Go to **Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:

- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3 or later, if you want to delete the hosts with older versions:



1. Go to **Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

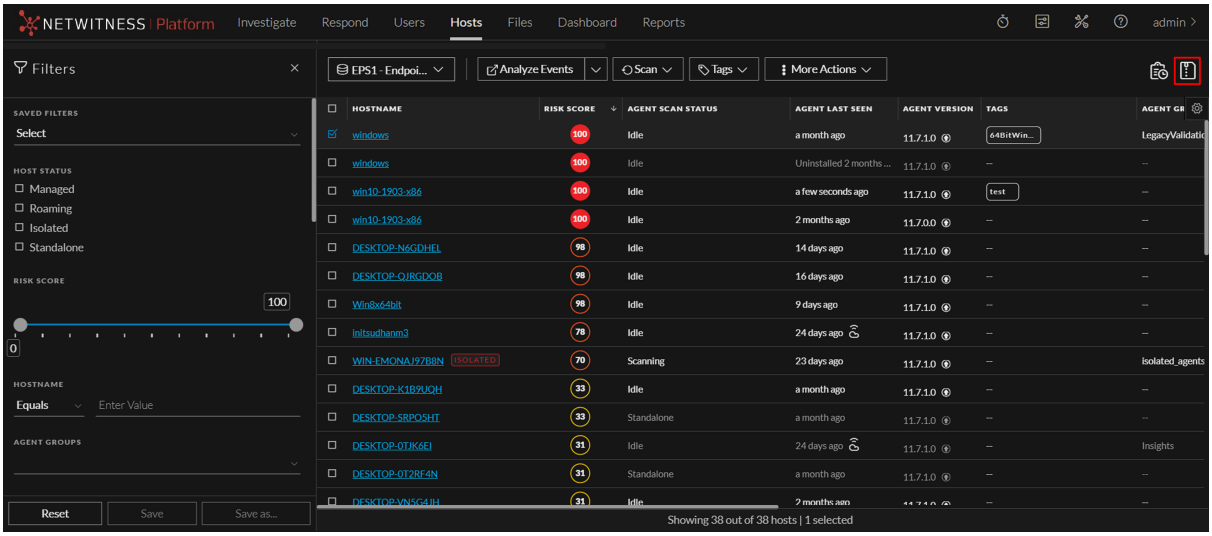
Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Scroll down or enter the keyword to search for the column in the displayed list.
4. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Hosts view.



Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **Hosts**.
2. Filter the hosts by selecting the required filter options.

3. Add columns by clicking in the right-hand corner.

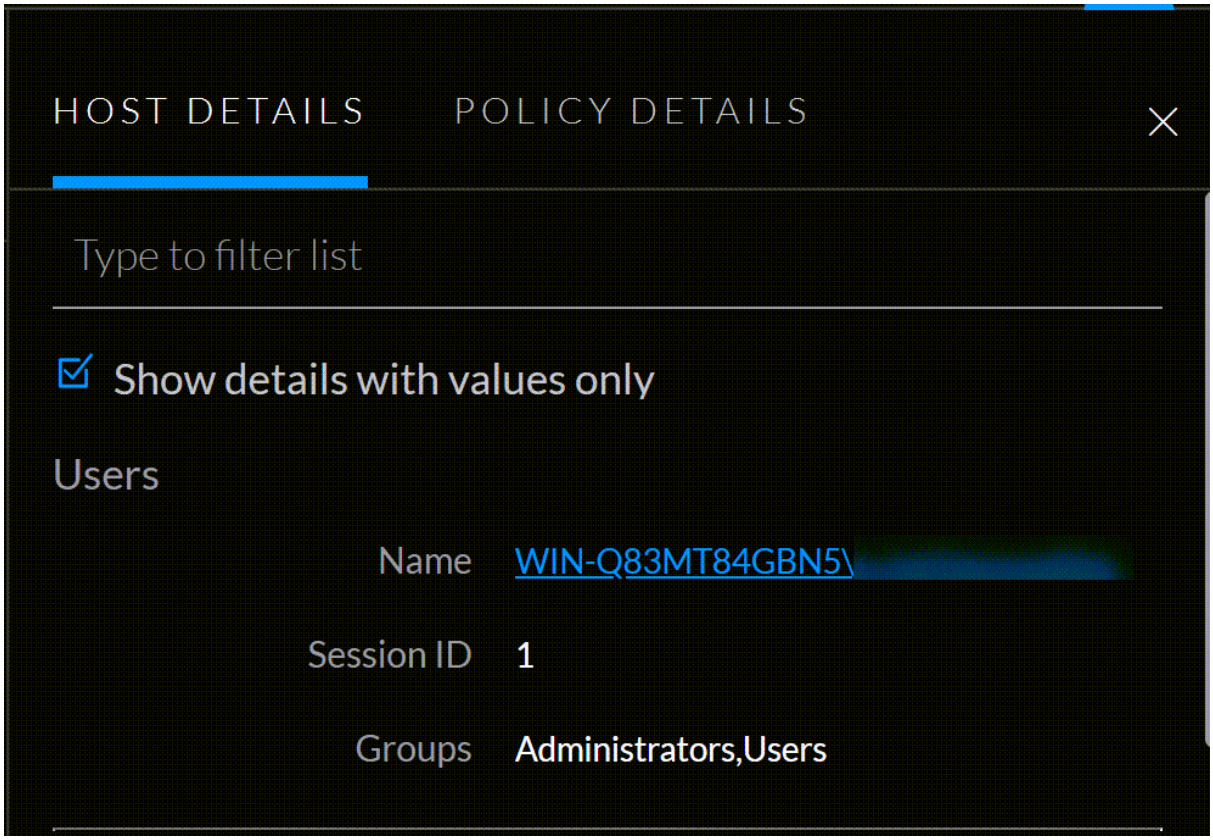
4. Click to export the host attributes to a csv file.

You can either save or open the csv file.

Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. On all the tabs within the Hosts view, the message Host is migrated to <Server-name> is displayed. You view the host details by clicking the <Server-name>. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

Note: Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.



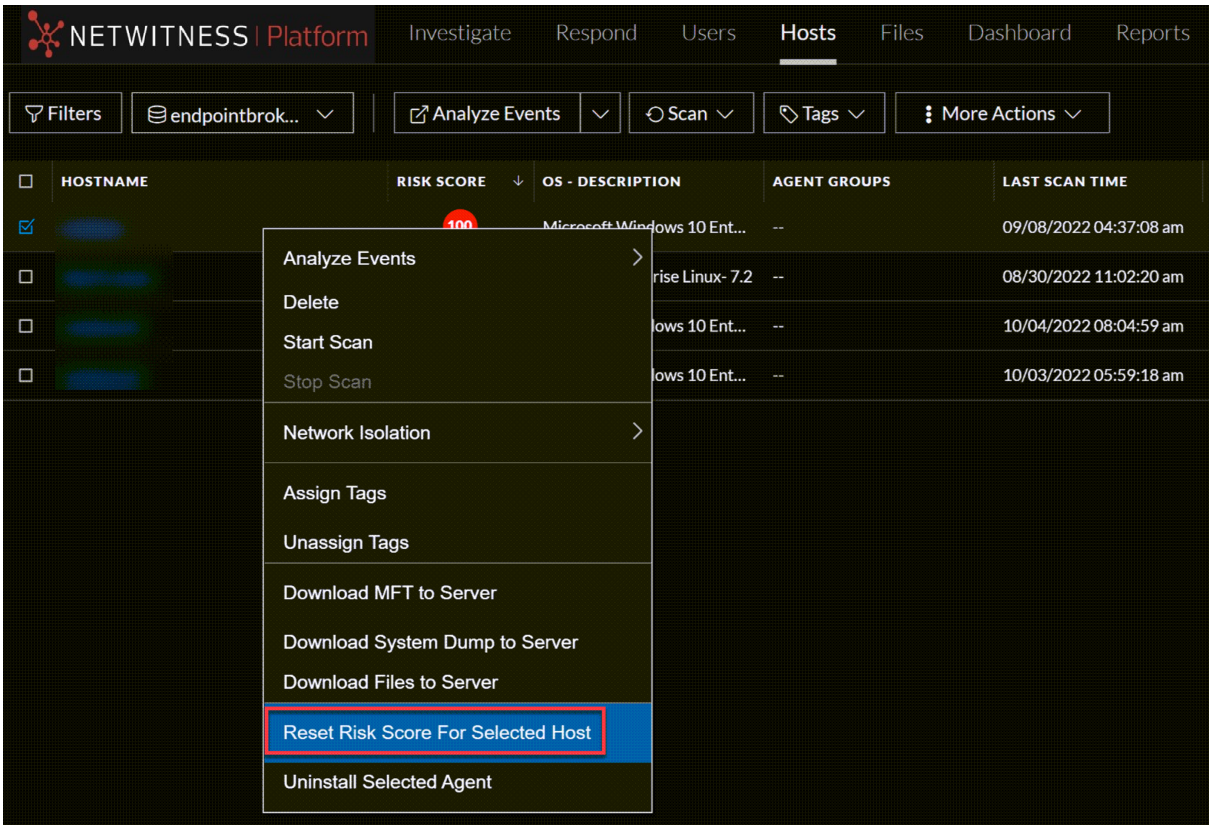
Note: To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the **Users** category, click the name.

This opens the **Entities** tab for investigation in a new tab.



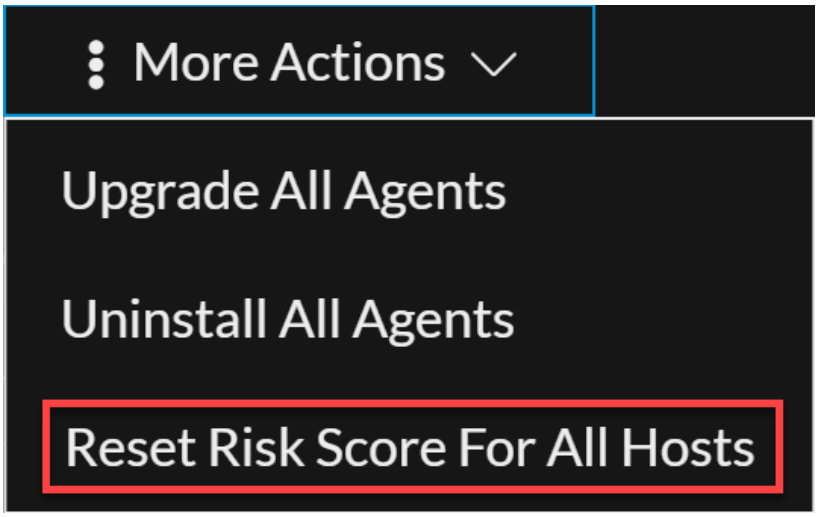
Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

To reset the risk score of the selected host:

1. Go to **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score For Selected Host** from the context menu.
- Click **More Actions** > **Reset Risk Score For Selected Host** in the toolbar.

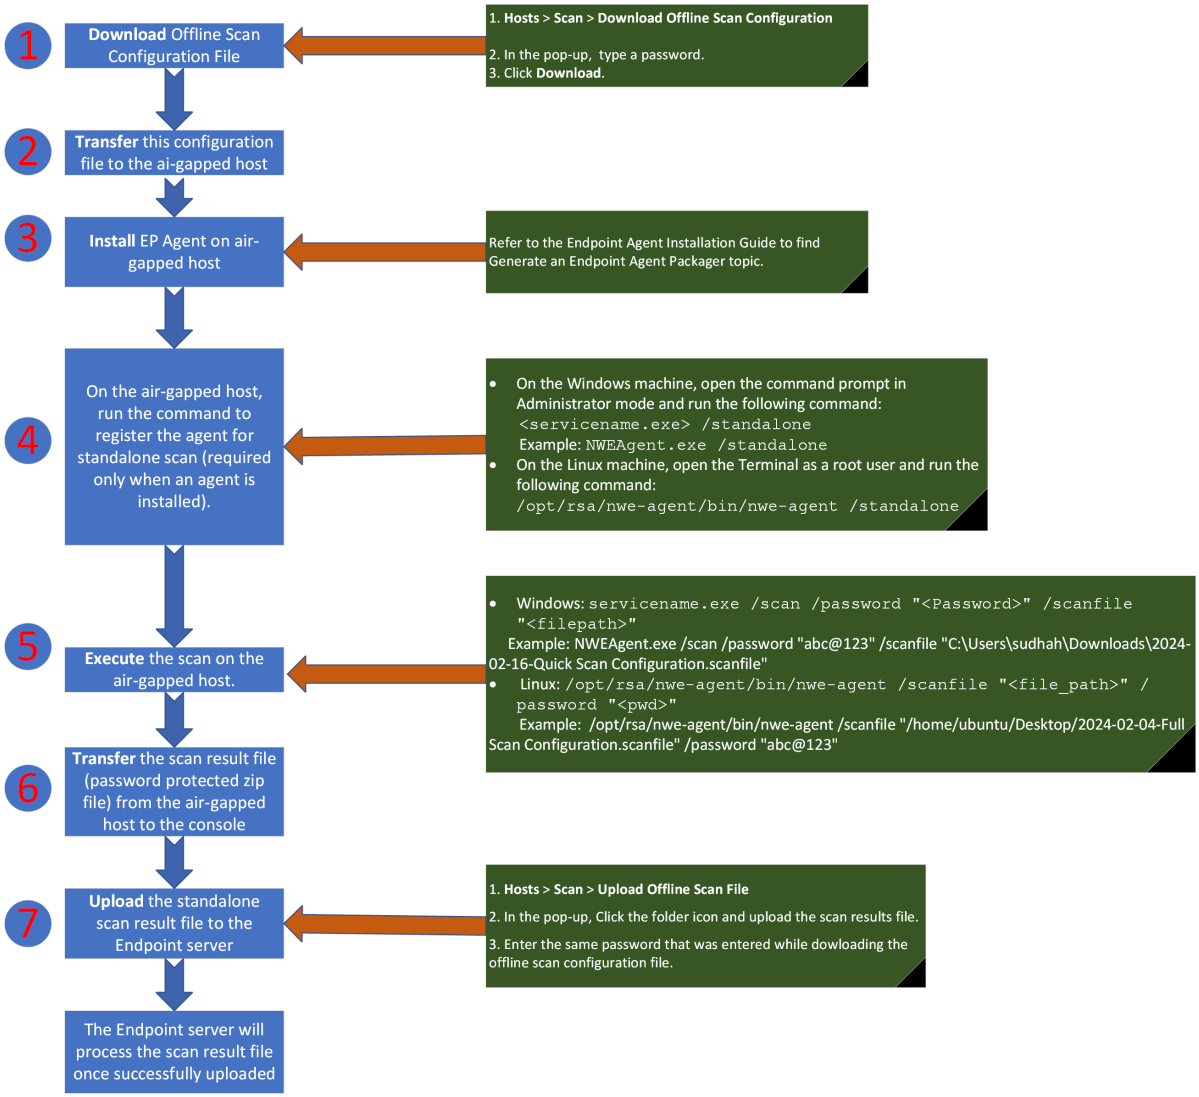
All the alerts associated with the score are deleted.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

To reset the risk score of all the available hosts simultaneously:

1. Go to **Hosts**.
2. Click **More Actions** > **Reset Risk Score For All Hosts** in the toolbar.

All the alerts associated with the score are deleted.

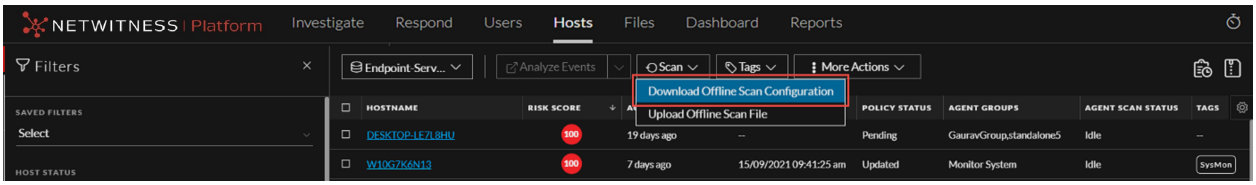


Standalone Scan on Air-gapped Windows and Linux Hosts

The Standalone scan feature allows administrators to run scans on the air-gapped Windows and Linux hosts that are disconnected from the network. Administrators can download the scan command once from UI and execute it on multiple hosts. For the best utilization of resources, NetWitness recommends running standalone scan every two weeks. Policies do not apply on air-gapped hosts, and features such as downloading MFT to the server, upgrading agents through UI, downloading a file to the server are not available for standalone agents.

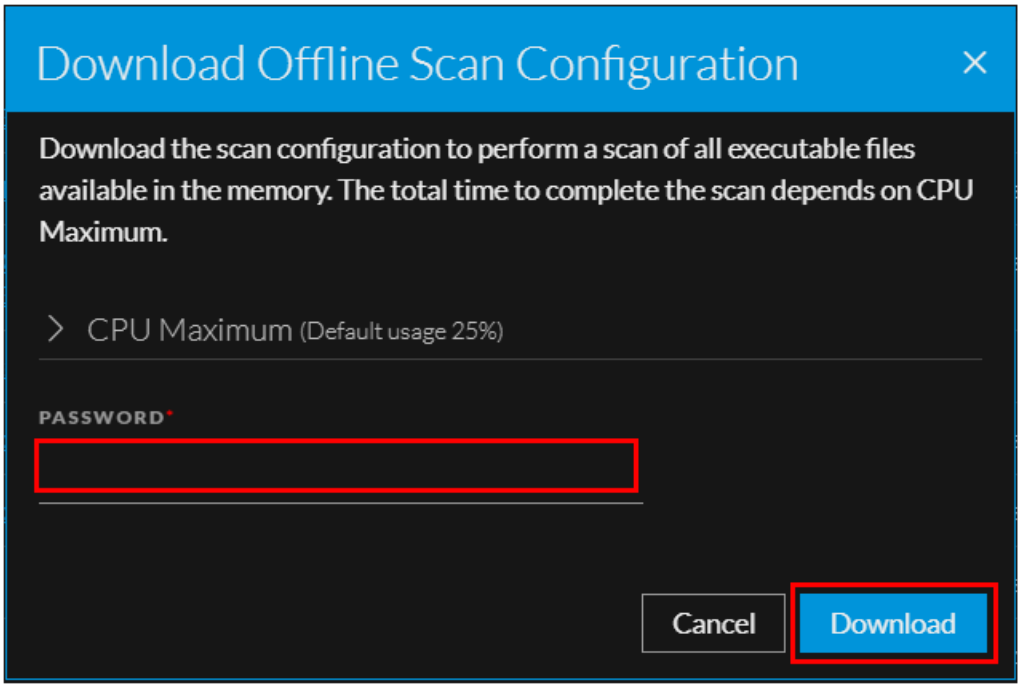
The scan process involves two files:

- **Offline Scan Configuration** - Contains the configuration information needed to run the scan.
- **Scan Results File** - This contains the results of the Scan, which you can upload using the **Scan > Upload Offline Scan File** option on the **Hosts** view. This file will be imported and processed by NetWitness.



Standalone scan workflow:

Note: Both Download Offline Scan Configuration and Upload Offline Scan File options are available only on the Endpoint server view. These options can't be accessed from Broker view.



Generate the scan configuration file

1. Click **Scan > Download Offline Scan Configuration** on the Hosts screen.

On the Download Offline Scan Configuration pop-up,

2. (Optional) **Select CPU Maximum**.
3. Enter a Password. (not more than 31 characters long)
4. Click **Download**.

5. Transfer the Offline Scan Configuration file to the air-gapped host.

Install Endpoint Agent and Register for Standalone Scan

1. Install the Endpoint Agent on the air-gapped host. Refer to *Endpoint Agent Installation Guide* for more information.
2. Register the agent for standalone scan (required only when an agent is installed).
   - If you are using a Windows machine, open command prompt in administrator mode and execute the following command:

     `ServiceName.exe /standalone`

     Example: `NWEAgent.exe /standalone`
   - If you are using a Linux machine, open the terminal as a root user and execute the following

command:

```
/opt/rsa/nwe-agent/bin/nwe-agent /standalone
```

Start a Standalone scan on Windows

1. Open the command prompt in Administrator mode, on the air-gapped host.
2. Execute the scan using the following command (syntax):

```
ServiceName.exe /scan /password ”<password>” /scanfile "<filepath>”
```

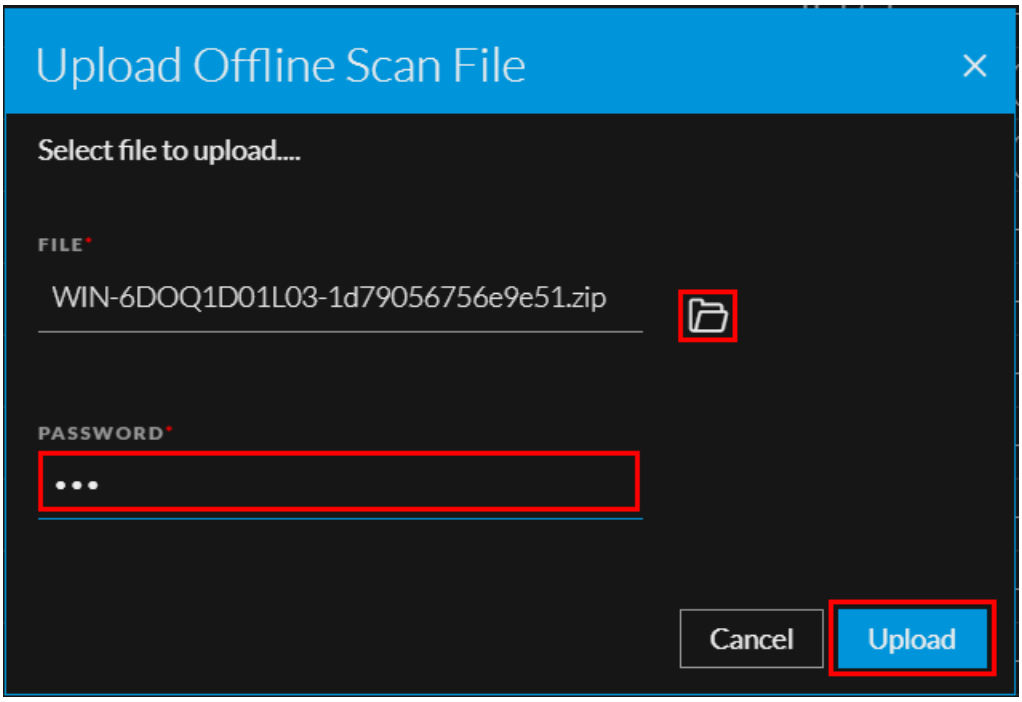
Example: `NWEAgent.exe /scan /password "Abc123$" /scanfile "C:\Users\johndoe\Downloads\2021-12-06-Full Scan Configuration.scanfile"`

- `<password>` is the password entered while generating the Offline Scan Configuration File.
- `<filepath>` is name of the scan configuration file with full path.

3. Wait until the scan is completed.
4. Transfer the scan result file (password protected .zip file) to upload to the UI.

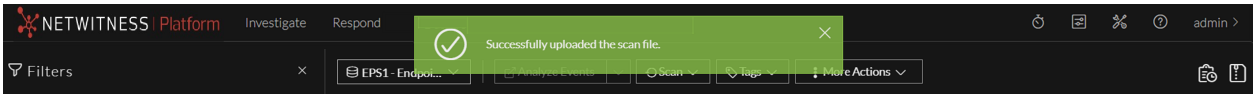
Start a Standalone scan on Linux

1. Open the terminal as a root user, on the air-gapped host.
2. Execute the scan using the following command (syntax):



```
/opt/rsa/nwe-agent/bin/nwe-agent /scanfile "<file_path>" /password "<pwd>"
```

Example: `/opt/rsa/nwe-agent/bin/nwe-agent /scanfile "/home/ubuntu/Desktop/2024-02-04-Full Scan Configuration.scanfile" /password "abc@123"`



3. Wait until the scan is completed.
4. Transfer the scan result file (password protected .zip file) to upload to the UI.

Upload the Standalone scan result file

1. Click **Scan > Upload Offline Scan File** on the Hosts screen.

2. Click  and upload the scan result file.
3. Enter the same password that was entered while downloading the offline scan configuration file.
4. The Endpoint server will process the scan result file once successfully uploaded.

Note: Standalone agents can only be upgraded manually using the Endpoint agent packager. Refer to *Generate an Endpoint Agent Packager* on *Endpoint Agent Installation Guide* for more information.

Investigating a Process

Note: The information in this topic applies to NetWitness Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, risk score, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

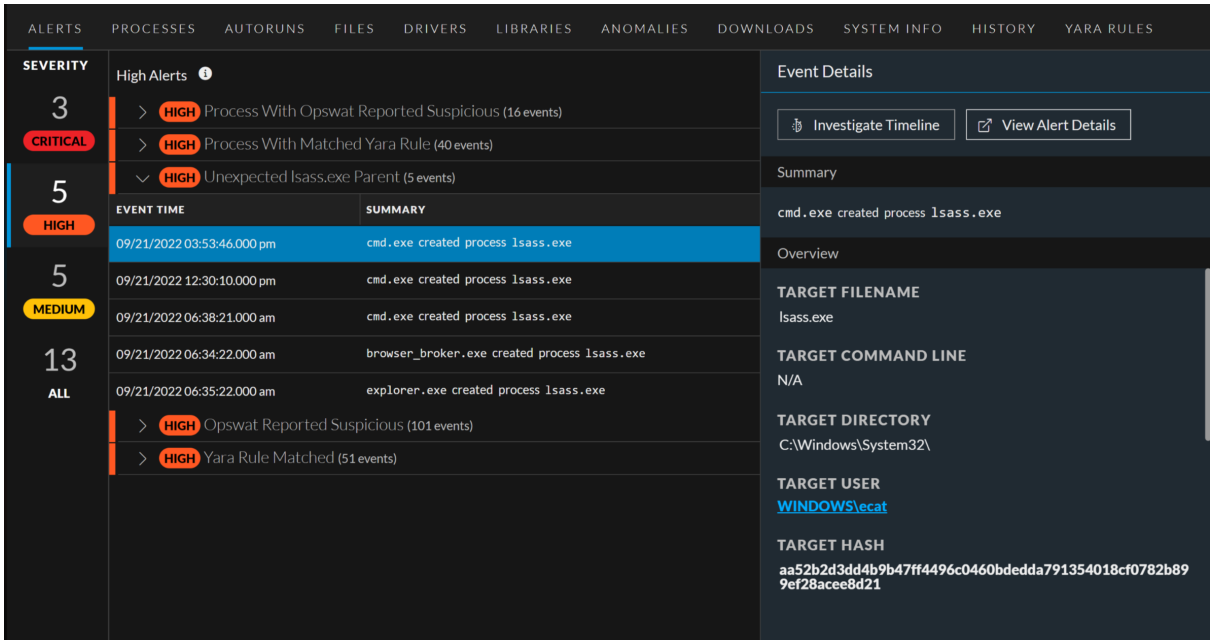
Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:
  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.

  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

Analyze a Process

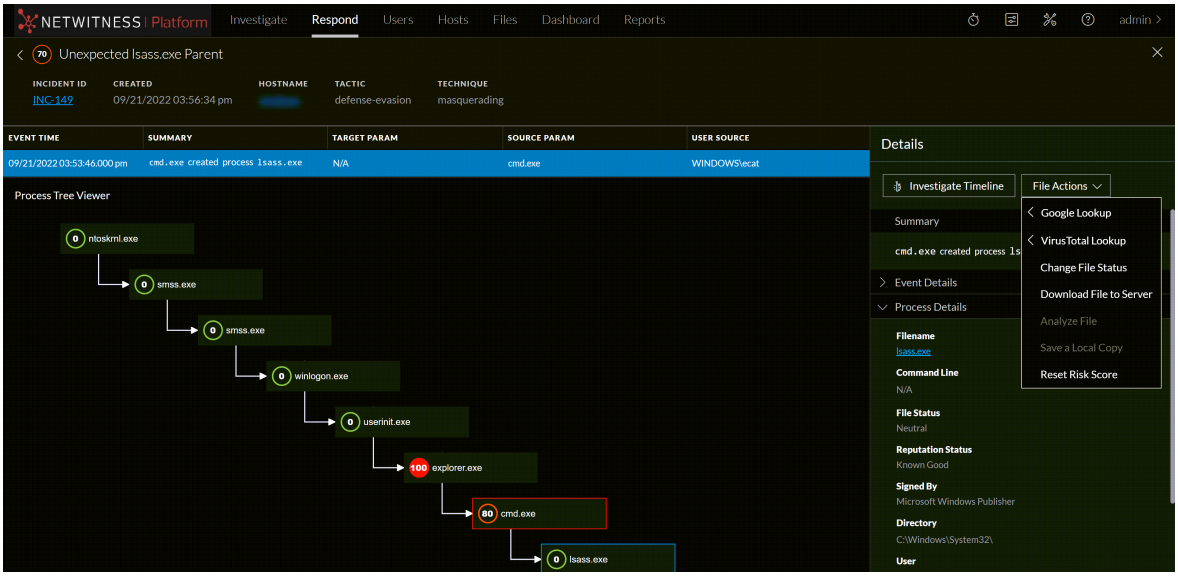


Based on the Alert severity, you can analyze the processes using two different options:

- **View Alert Details**: This option allows you to analyze the processes associated with **Critical** and **High** Alerts.
- **Analyze Process Tree**: This option allows you to analyze the processes associated with **Medium** Alerts.

To analyze the process associated with Critical and High Alerts:

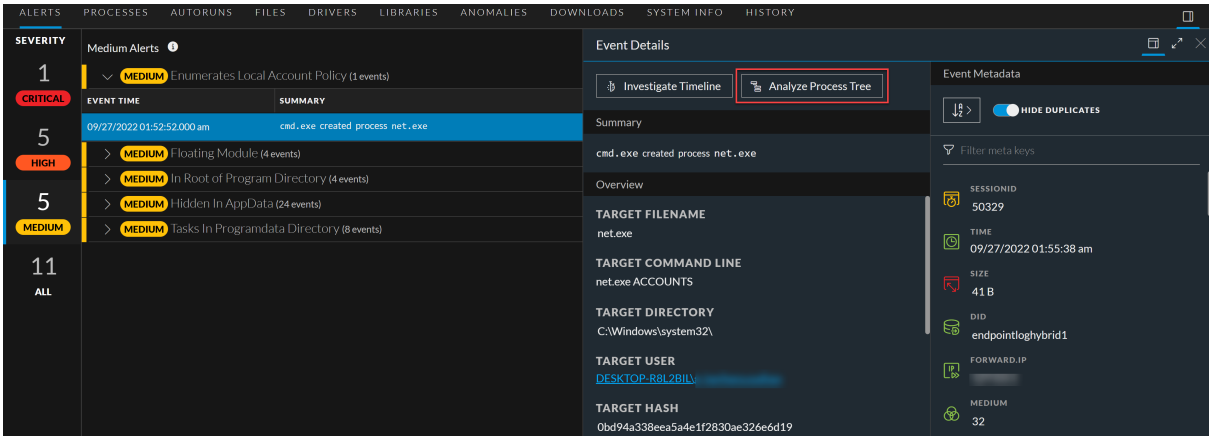
1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Critical** or **High** alert on the Host Details view. The **Event Details** panel appears.



3. Click **View Alert Details** to analyze the process activities of a file associated with the **Critical** or **High** Alerts.

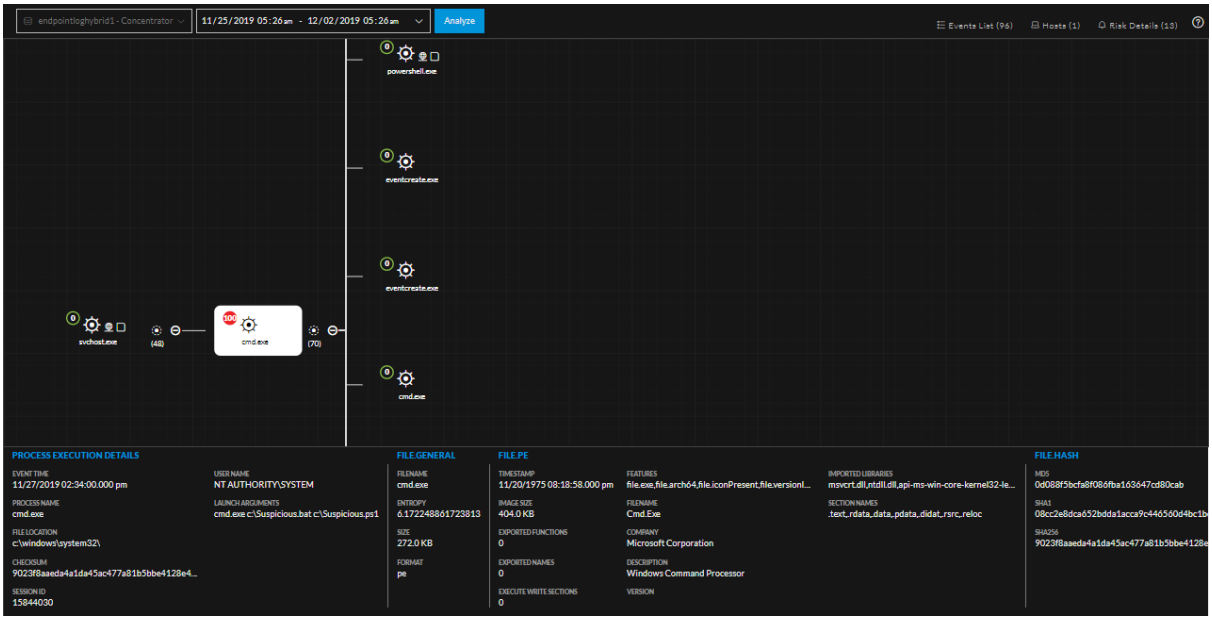
The **Process Tree Viewer** is displayed in the **Respond** service.

4. Select the process in the **Process Tree Viewer** and click **File Actions** in the **Details** panel to perform the following actions:
   - **Google Lookup**
   - **VirusTotal Lookup**
   - **Change File Status**
   - **Download File to Server**
   - **Analyze File**
   - **Save a Local Copy**



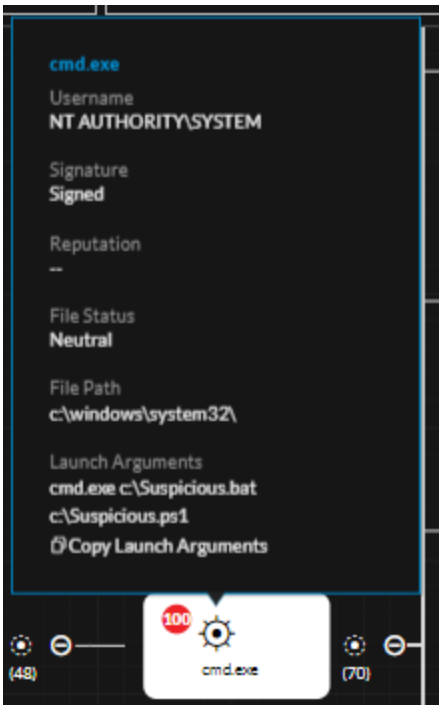
- **Reset Risk Score**

To analyze the process associated with Medium Alerts:



1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Medium** alert on the Host Details view. The **Event Details** panel appears.
3. To analyze the process activities of a file associated with the **Medium** Alerts, do one of the following:
   - In the **Event Details** panel, click **Analyze Process Tree**.
   - Select the **Processes** tab and do one of the following:
     - Right-click a process and select **Analyze Process** from the context menu.
     - Click **Analyze Process** in the toolbar.

   In the following example, the file `cmd.exe` has created process `net.exe`.

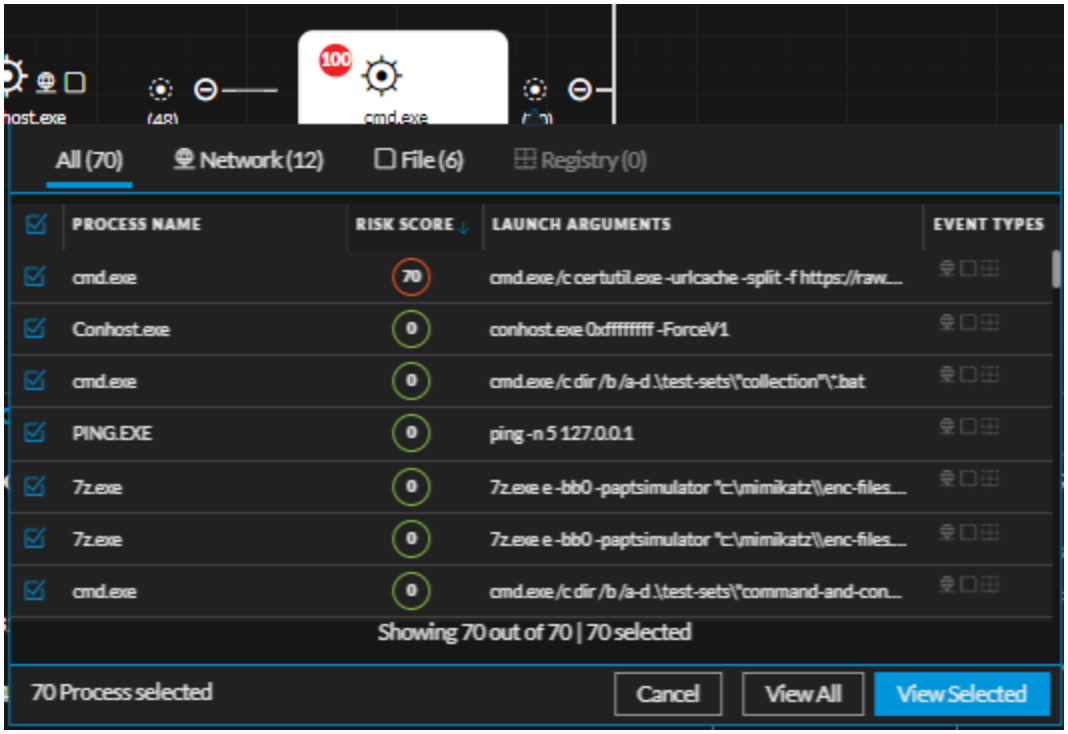


Clicking **Analyze Process** displays the process visualization. For each node, the process name, risk score, and type of activity the selected process has performed (network, file, or registry) are displayed. Optionally, you can change the time range to view data.

You can view the properties, such as process execution details, file properties of the selected process in the bottom of the view.

Note: No result is displayed in the process visualization view if there is no data for last seven days or if there is no `createprocess` event.

4. On the right side of the process visualization view:
   - Click **Events List** to view the associated events. You can also filter events based on the events category. For more information on filtering, see Analyze Events for a Process.
   - Click **Hosts** to view the hosts on which this file is present and the associated risk score. For more information, Analyze Hosts with File Activity.
   - Click **Risk Details** to view the list of distinct alerts, such as Critical, High, Medium, and All. For more information, see Analyze Hosts Using the Risk Score.
5. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

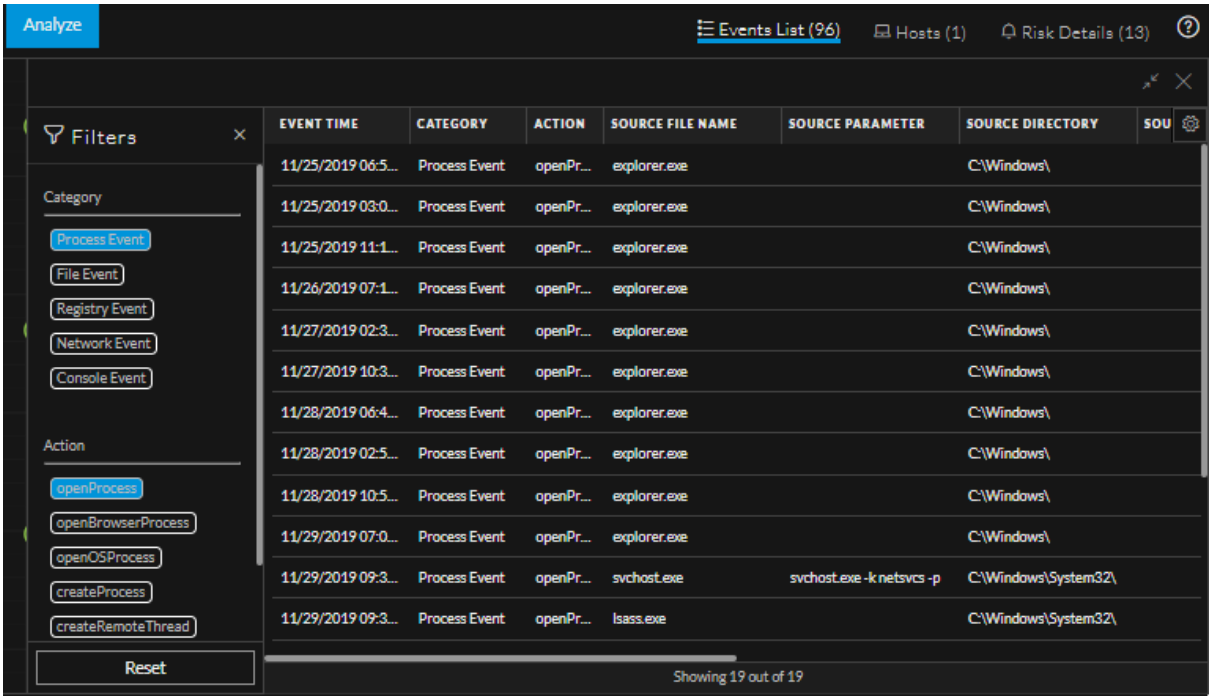


6. Click  to view the child processes. The Process selection dialog is displayed with the child processes associated with the process based on the risk score. You can filter the result on the event type by clicking icons on the top panel. When no matching event types are available, these filter options are disabled.

   Depending on the type of event, the icons are highlights in the Event Types column.

   a. Click **View All** to view all child processes or select the required processes and click **View selected**. The associated events and properties are displayed in the right panel.

b. Click  to change the process selection and click  to collapse the view.



Analyze Events for a Process

To analyze events for the selected process:

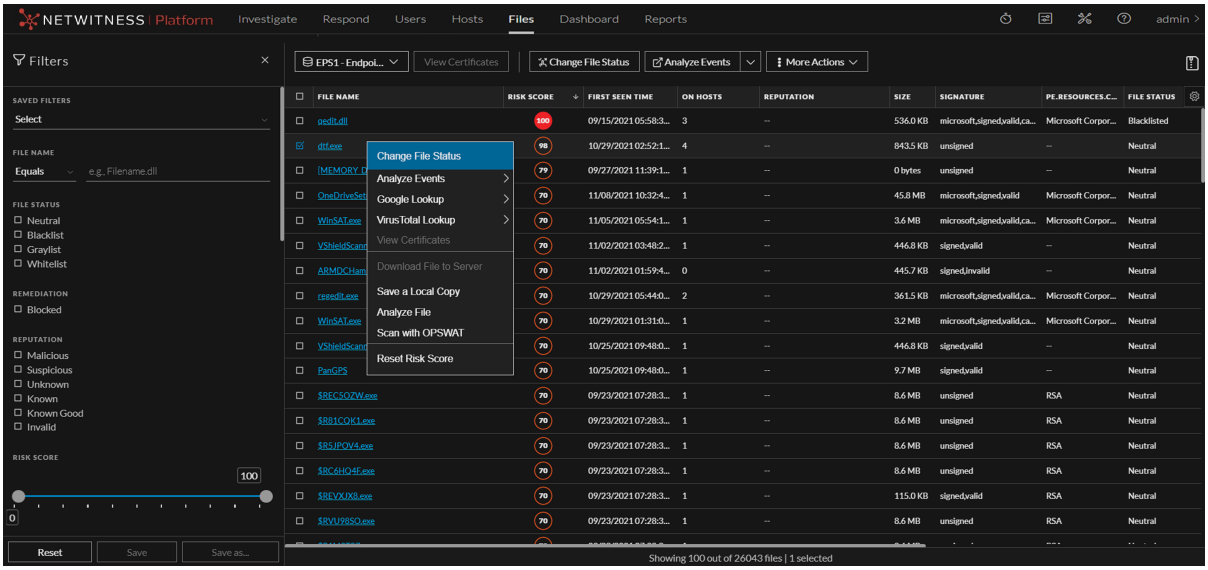
1. Perform steps 1 to 3 in To analyze the process associated with Medium Alerts:.
2. In the process visualization, click the **Events** tab.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

For example, to view only process events, select the **Process Event** category, and filter on action.

The result displays the sequence of activities involving this process for the selected filters.

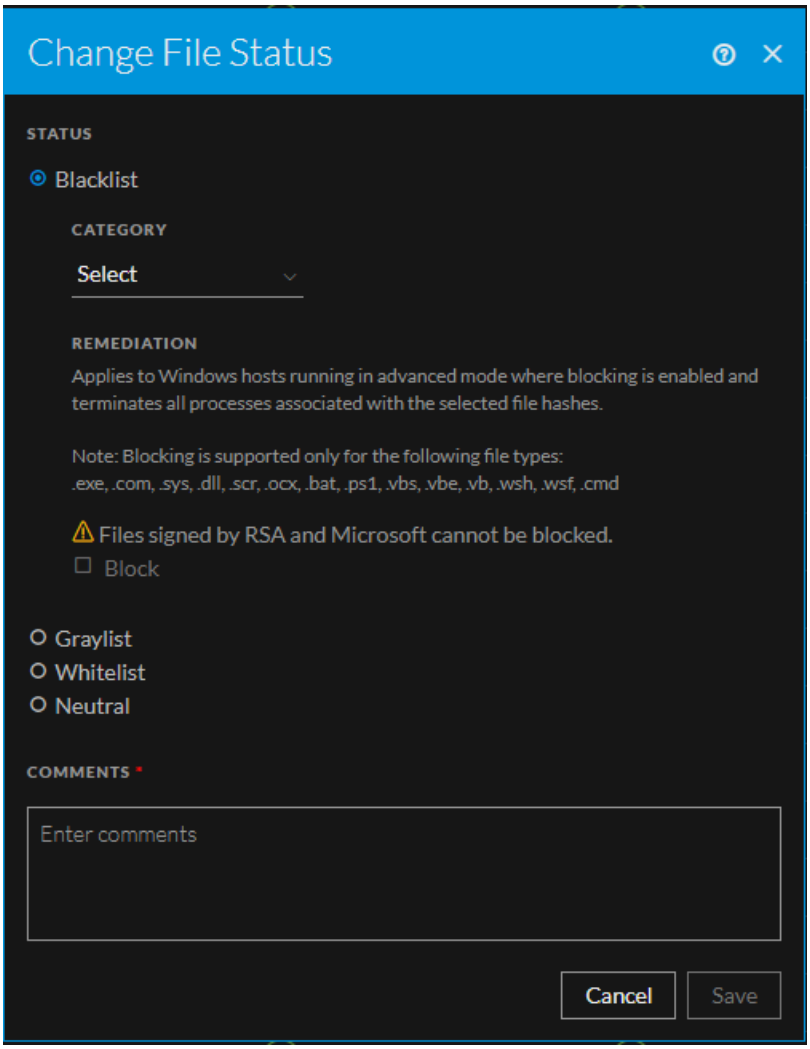
Note: For the console events, the context for local and remote are available only if the data is sent from 11.4 or later agents.

Note: At any given time, if the number of process events created from a single source VPID in Linux exceeds the count of **100**, only the first **100** events are displayed in the Process Visualization > **Events** view for a time interval of **8** hours. Only after the time interval of **8** hours, the new set of events created from the same source VPID (maximum **100** process events) will be displayed along with the existing set of events.



For Example: At **12PM** IST, if **1000** process events are created from a single source VPID, only the first **100** events are displayed in the Process Visualization > **Events** view until **8PM** IST. After **8PM** IST on the same day, the new set of **100** events created after **8PM** IST from the same source VPID will be displayed along with the existing set of events.

Changing File Status or Remediate



Note: By default, the blocking option is disabled in the policy. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **Hosts** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.

Note: You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

Caution: Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

Note: Blocking is supported only for Windows hosts that are running in advanced mode. All PE files along with the following file extensions can be blocked.
.exe, *.com*, *.sys*, *.dll*, *.scr*, *.ocx*, *.bat*, *.ps1*, *.vbs*, *.vbe*, *.vb*, *.wsh*, *.wsf*, *.cmd*
You cannot block the following:.
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.
To delete a blocked file, users can log in to the host and execute the delete command using the elevated command prompt.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

Import File Hashes using the Block Hash tool

The Block Hash tool allows you to import a set of file hashes which can be set to block state and change the file bias status (whitelist, blacklist, and graylist). The tool allows you to block the imported file hashes (suspicious, invalid, and malicious) and prevent them from opening or executing on the hosts. You can block up to a maximum of **50,000** file hashes using this tool.

Note: For more information on changing the file status or blocking the file, see Changing File Status or Remediate.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- Make sure the number of hashes entered in the JSON file is less than the number of the available limit of hashes that can be blocked (the maximum limit is **50,000**).
For example: If 100 file hashes are already blocked as part of NetWitness deployment, you can only block 49,900 more file hashes using this tool.

JSON File Format

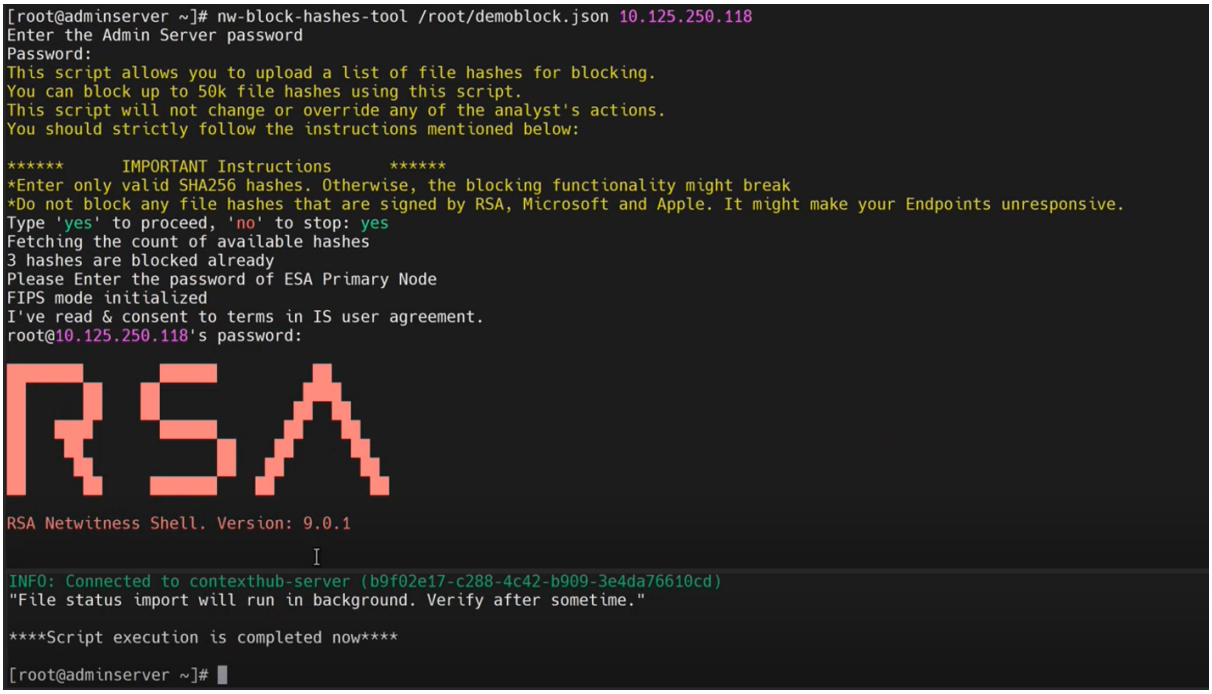
The example below describes the JSON file format for blocking and blacklisting the file hashes.

Sample demoblock.JSON:

```
[{
"checksums":
["1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2804","67fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb561","78vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman61n"],
"fileStatus": "Blacklist",
"comment”: "File blocking set through new tool",
"remediationAction": "Block"
}]
```

The example below describes the JSON file format only for blacklisting the file hashes.

Sample demoblock.JSON:



```
[{
"checksums":
["2b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2800","97fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb500","38vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman68c"],
"fileStatus": "Blacklist",
"comment": "File status change set through new tool",
}]
```

To block the file hashes using the Block Hash tool:

1. SSH to node 0 and copy the JSON file (containing the file hashes to be blocked) stored in it.
2. Run the tool.

   ```
   nw-block-hashes-tool <absolute path of json residing on node 0> <ESA node
   IP/hostname>
   ```

   Note: Enter the JSON file path in `<absolute path of json residing on node 0>` and enter the ESA node IP in `<ESA node IP/hostname>`.
   For Example: `nw-block-hashes-tool /root/demoblock.json 10.125.250.118`.

3. Enter the Admin Server password.
4. Follow the instructions displayed on the screen. Enter any one of the following options when prompted.

- **yes**: Enter **yes** to proceed with the execution of the script.
- **no**: Enter **no** to stop the execution of the script.

> **Note:** At this stage, the tool validates the number of incoming file hashes through the JSON file and the number of existing file hashes already blocked in the deployment. If the total of the file hashes (incoming through JSON file and existing as blocked in the deployment) exceeds the maximum limit of **50,000**, the tool stops the execution, and it will not proceed further.

Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```
4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually or automatically download the file to the server.

Note: Saving or analyzing downloaded file works the same way irrespective of whether the file is downloaded manually or automatically.

Note: Downloaded files are stored in the Endpoint Server which may fill up the disk space. To utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<files>/`. If you want to change the location, make sure that you have **endpoint-server.configuration.manage** permissions and do the following:
1. In the Explore view, go to **endpoint/download**,
2. In the base-path, provide the location of the directory.

Caution: By default, the status **File Download Disk Usage** stats in the **Health and Wellness** view shows unhealthy if the disk usage reaches 60% and the file download stops automatically when the disk usage is 70%. You can customize the warning or fatal thresholds in the  **> Services > Endpoint Server > view > Explore > rsa.endpoint.file-download-disk-thresholds.warning-percent** and **rsa.endpoint.file-download-disk-thresholds.fatal-percent** parameters respectively.

For the downloaded file, you can:

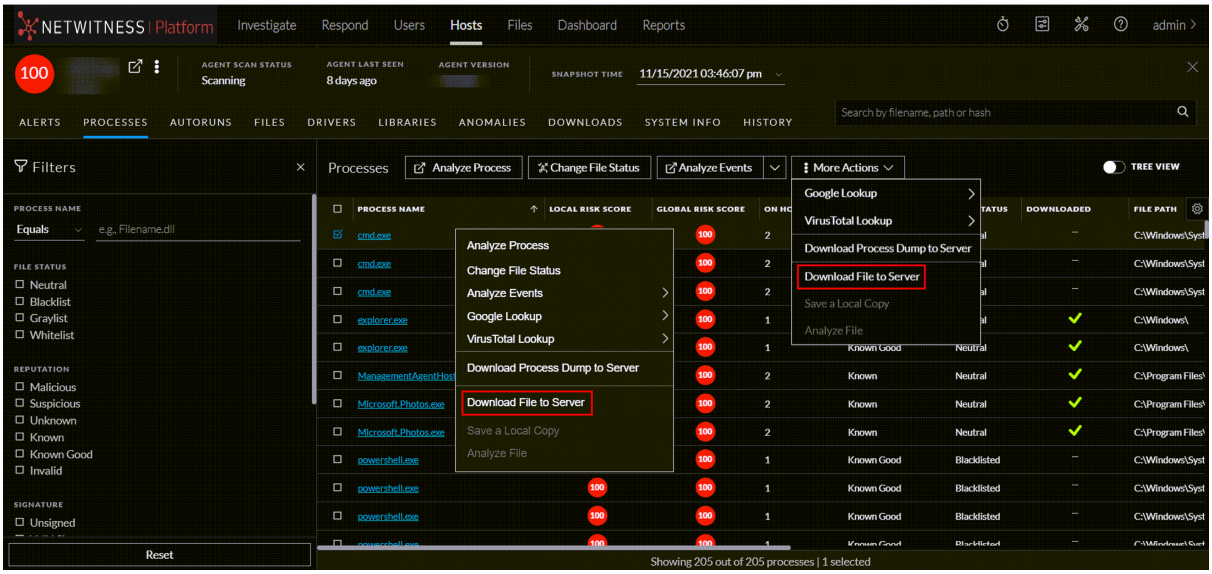
- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

Download Files to Server

Downloading file to server is not supported for memory DLL and floating code.

Note: Downloading files may take significant time. Additional requests to the agent during download are queued and processed when the download is complete.

Automatic File Download

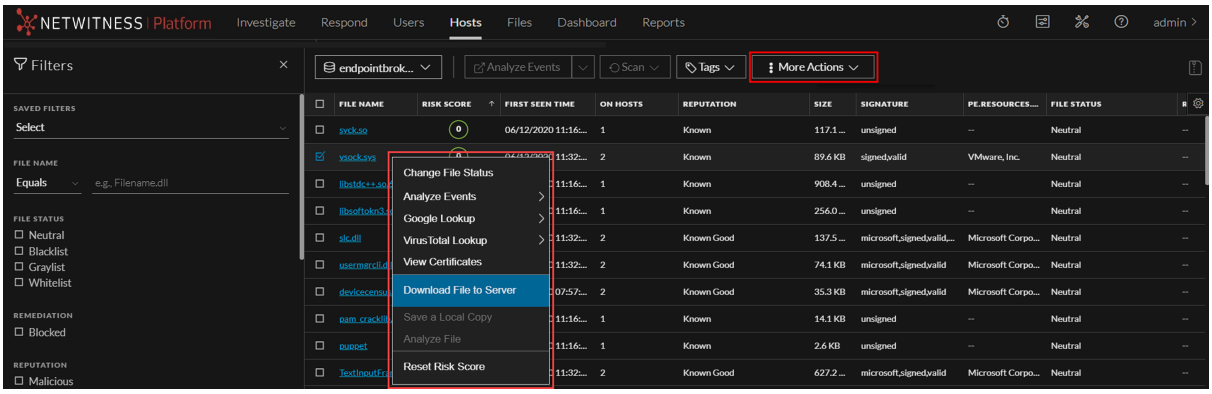


By default, the files that are unsigned and size lesser than or equal to 1 MB are downloaded automatically to the NetWitness Endpoint server. And, only single copy of each file is downloaded automatically. You can limit the volume of files to be downloaded in the  **> Endpoint Sources > Policies** tab, so the files matching certain criteria are only downloaded automatically. For more information on automatic file download settings, see "Create an EDR Policy" section in the *NetWitness Endpoint Configuration Guide*.

The status of the download is displayed in the **Files** tab > **Downloaded** column.

Manual File Download

To manually download files to the server from the Hosts view:



1. Go to **Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

To download files to the server from the Files view:

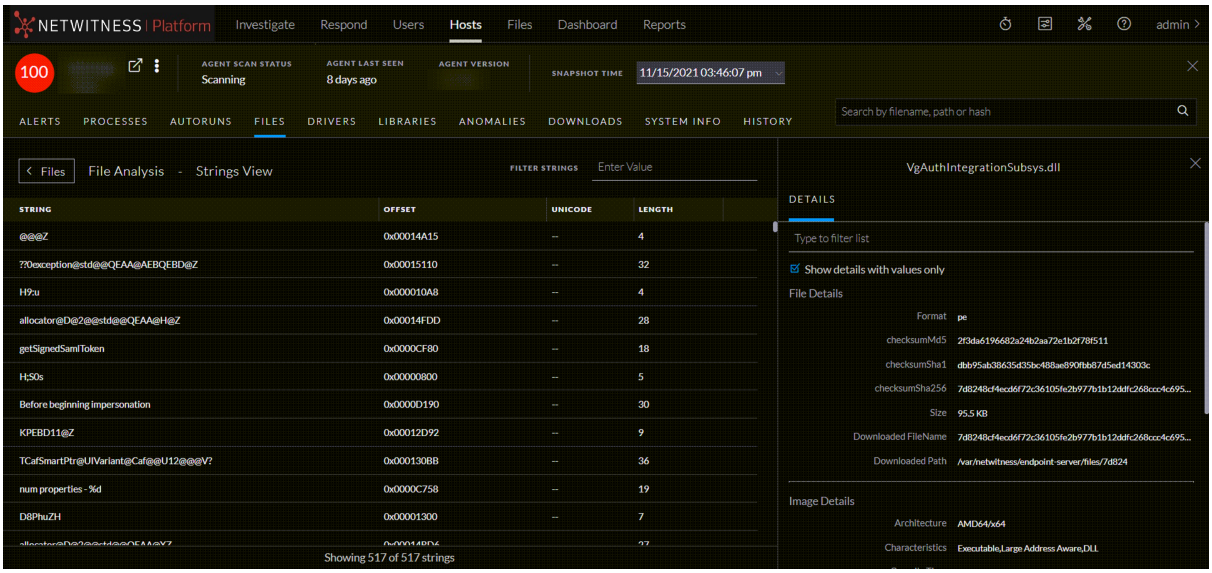
1. Go to **Files**.
2. Select the file and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

Save Downloaded Files

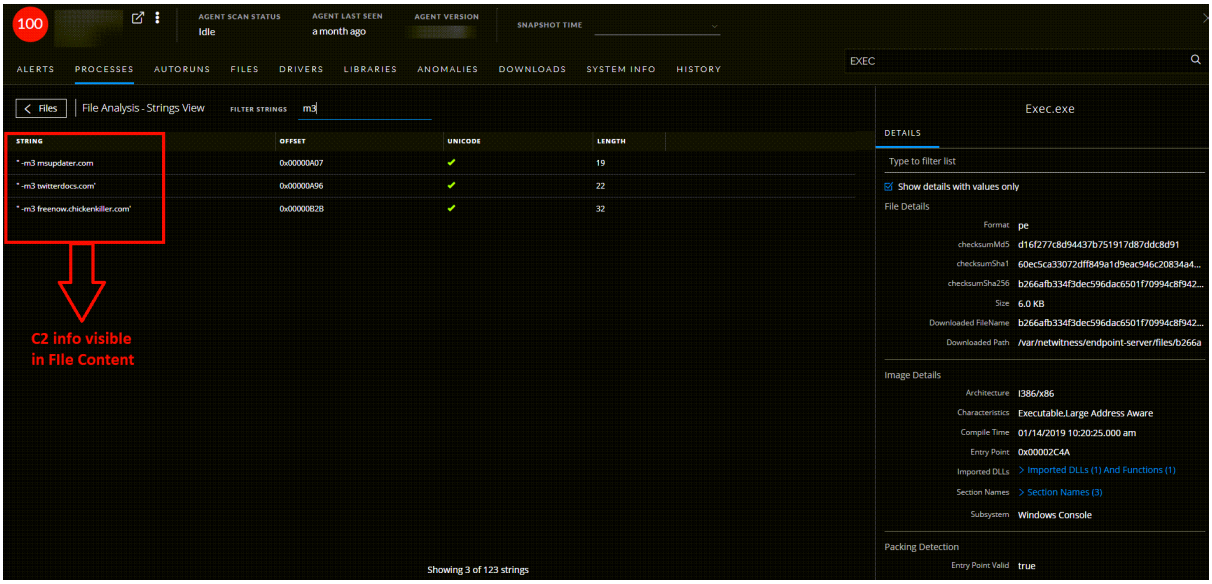
You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.



To save a file:

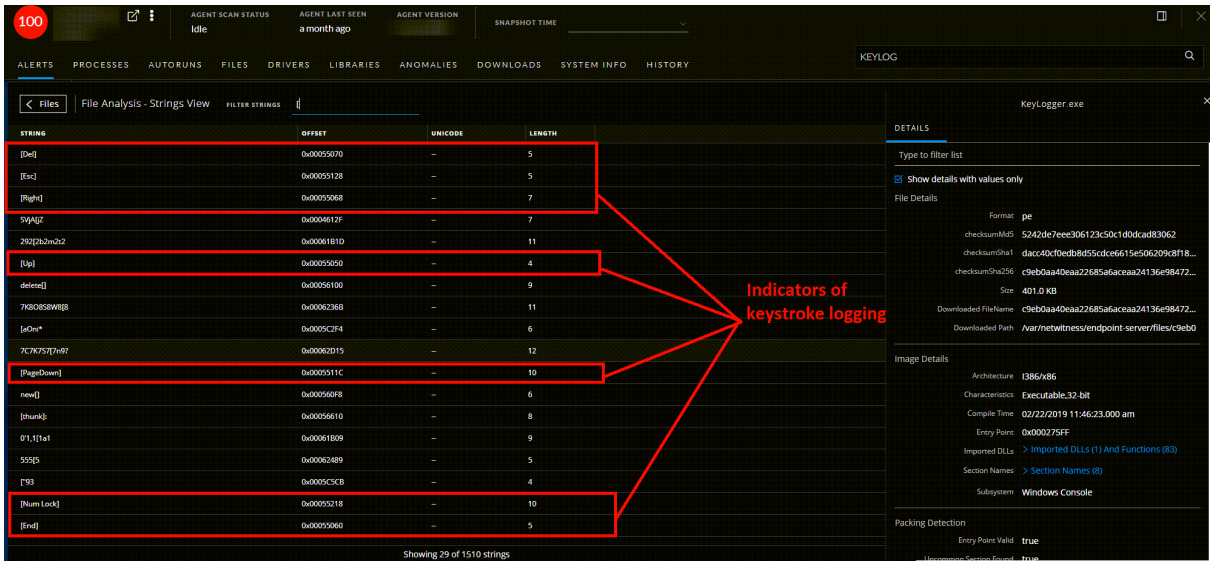
1. Go to **Hosts** or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

Analyze Downloaded Files



You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.



3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.

If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.

Performing Host Forensics

Note: The information in this topic applies to NetWitness Version 11.4 and later.

You can perform the following forensic investigation on a host:

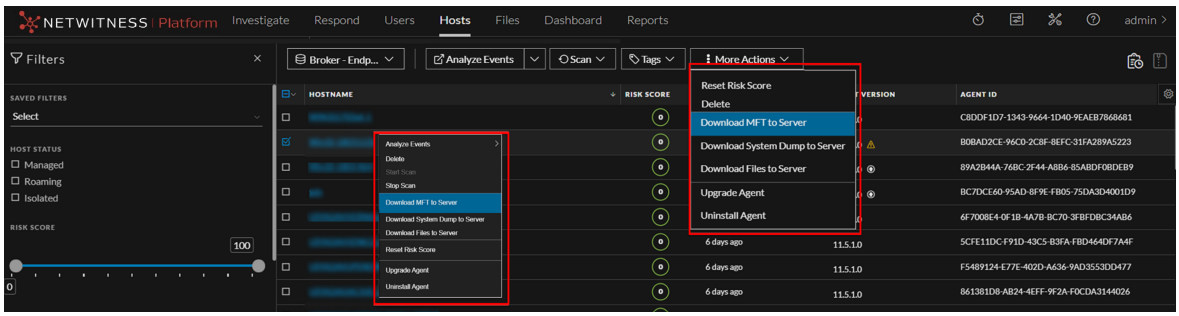
- Master File Table (MFT)
- System Dump
- Process Dump

Note: This is applicable only for Windows agent (in Advanced mode) with NetWitness Platform version 11.4. Downloading system dump files may take significant time. Additional requests to the agent during system dump download are queued and processed when the download is complete. MFT, system dump, and process dump downloads are not supported for agents communicating through Relay server.

Note: MFT, system dump, and process dump are stored in the Endpoint Server which may fill up the disk space. For large deployments, to utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<file type>/`, where `<file type>` is MFT, system dump, or process dump. If you want to change the location, make sure that you have endpoint-server.configuration.manage permissions and do the following:
1. In the Explore view, go to **endpoint/download**.
2. In the base-path, provide the location of the directory.

Download Master File Table

Master File Table contains metadata of every file on the host. It keeps track of information, such as filename, size, timestamps, permissions, and location of the file on the host. It consists of two sets of timestamps - Standard Information ($SI) and File Name ($FN). Each set has the following timestamps - creation, access, update, and modification.

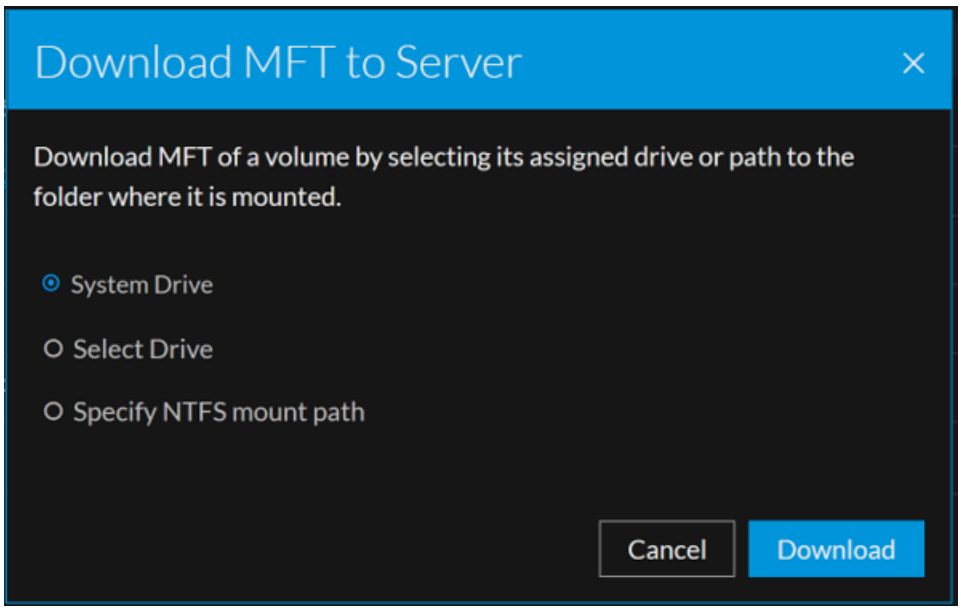


Time stomping is a technique that modifies the timestamps for a file (creation, access, update, and modification time) to mimic files that are in the same folder, making it difficult to identify suspicious files on a host. To perform forensic investigation of a suspicious file, you can download and analyze the MFT, and focus on files that are time stomped. For more information, see Analyze Downloaded MFT.

During MFT analysis, you can also search for suspicious filenames, and also files that were created before or after a known malicious event. You can also download files from the MFT viewer for further analysis.

Download MFT to Server

To download MFT to the server from the Hosts view:



1. Go to **Hosts** and do one the following:
   - Select one or more hosts and select **Download MFT to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

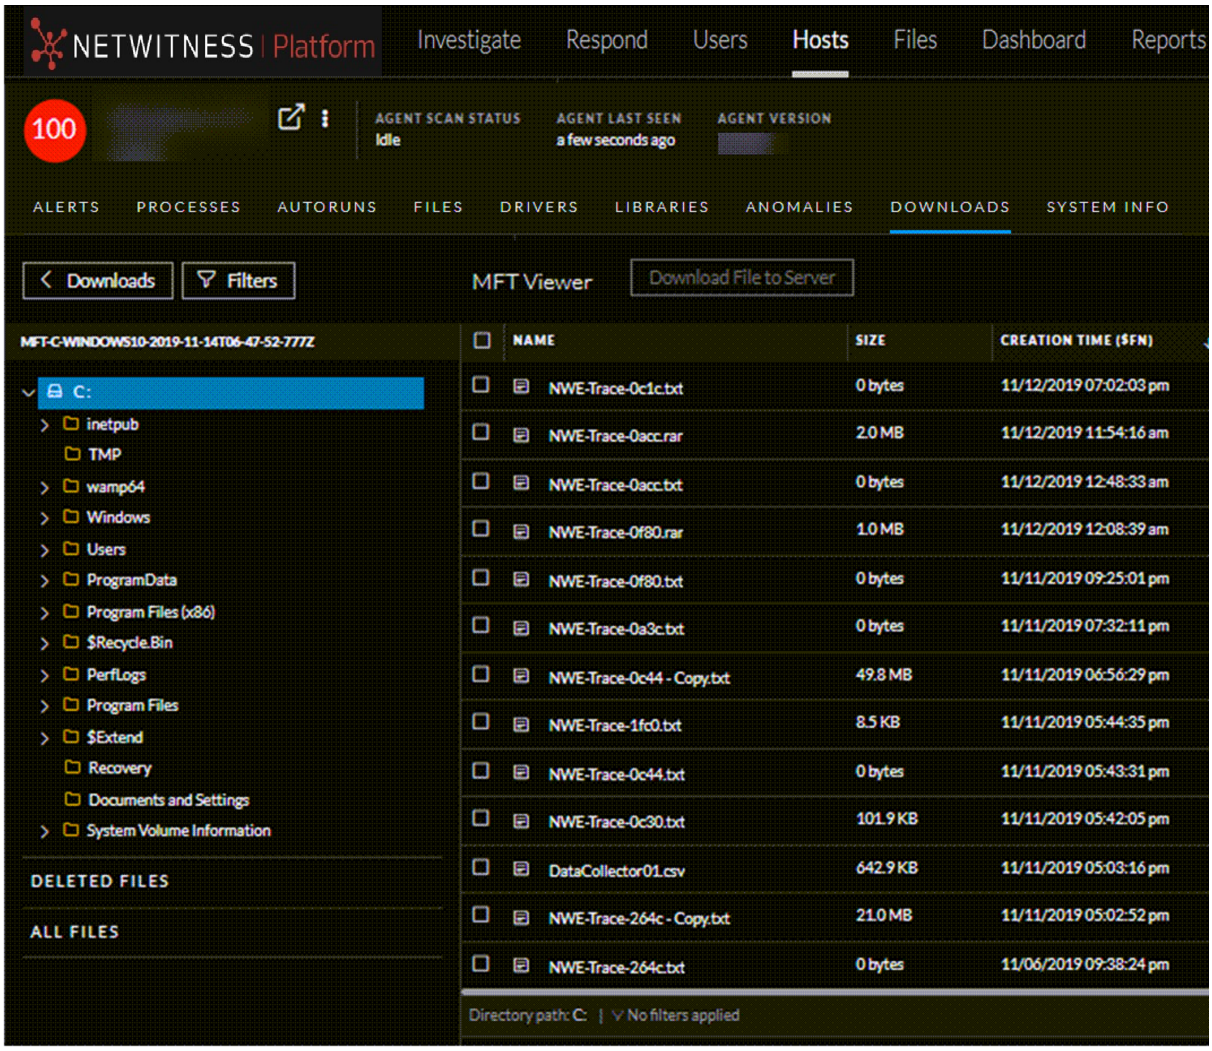
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download MFT to Server**.

2. In the **Download MFT to Server** dialog, select one of the following:
   - **System Drive** - to download MFT to the system drive.
   - **Select Drive** - to download MFT on assigned drive.
     You can select any drive from the **Drive** drop-down list. By default the selected drive is C.
   - **Specify NTFS mount path** - to download MFT on the path to the folder where it is mounted

   Click **Download**.

3. View details of the downloaded MFT in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

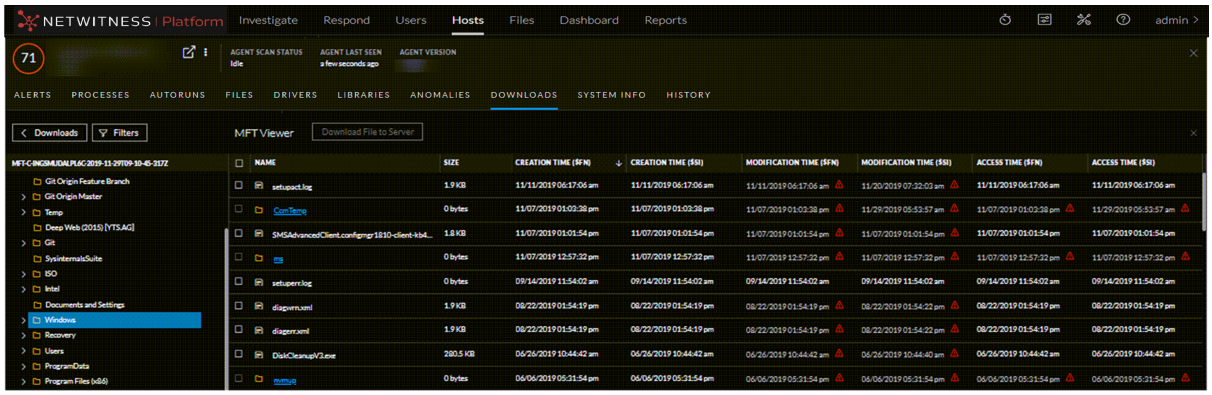
Analyze Downloaded MFT



You can use the MFT viewer to begin analysis where you can search for files based on file name, time stamps, and identify files that are timestomped.

View MFT

To view the content of the downloaded MFT:

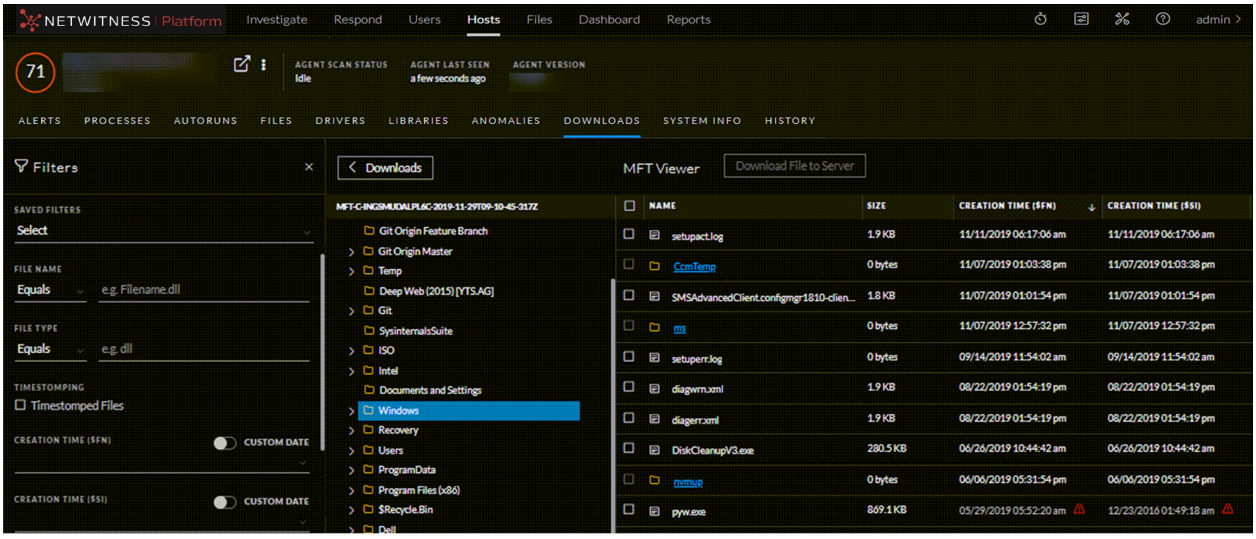


1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Click the file name. The MFT viewer is displayed.

   All available files are displayed in a tree view similar to the Windows Explorer in the All Files folder. The Deleted Files folder contains a sequential list of all deleted files.

4. Click ▶ to view the folder structure. Click the row to view the folder content.

   The details of the MFT is displayed in the table. By default, the table is sorted on the creation time ($FN). If the $SI and $FN timestamps are different, the columns are highlighted in red (⚠) indicating that it is time stomped.



5. Select one or more files and click **Download File to Server** on the toolbar to download files to the server.

> **Note:** Downloading a folder is not supported and hence the option is grayed out for folders.

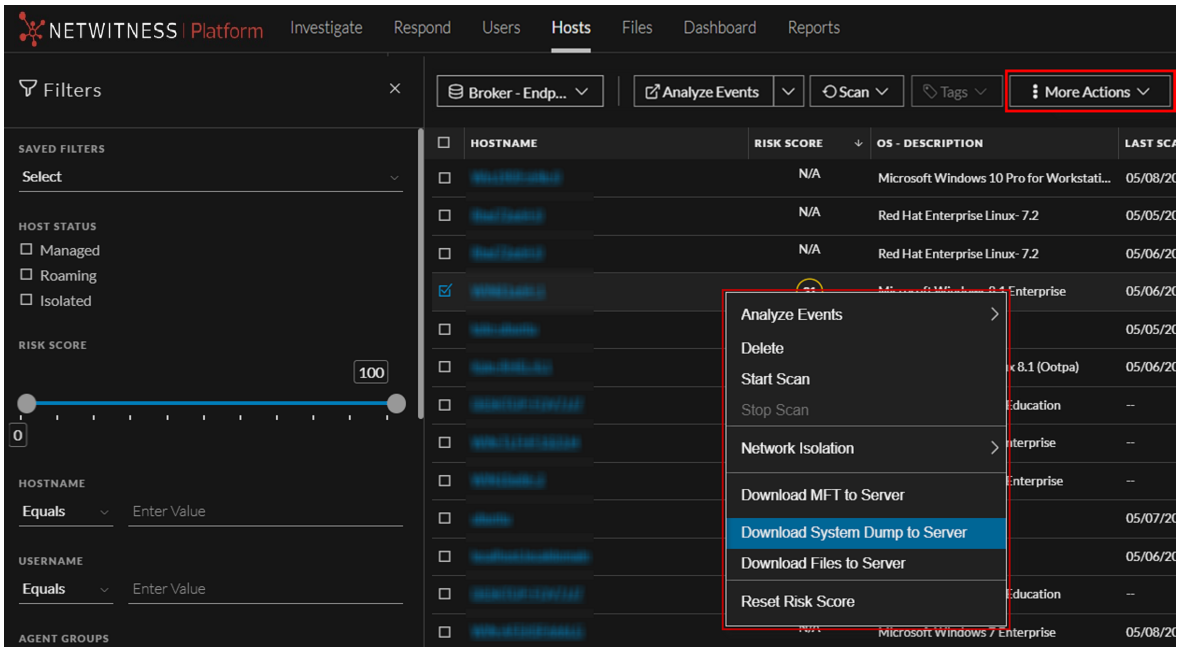
Filter MFT

You can filter files on file name, creation time ($FN), creation time ($SI), access time ($FN), access time ($SI), update time ($FN), update time ($SI), modified time ($FN), and modified time ($SI).

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

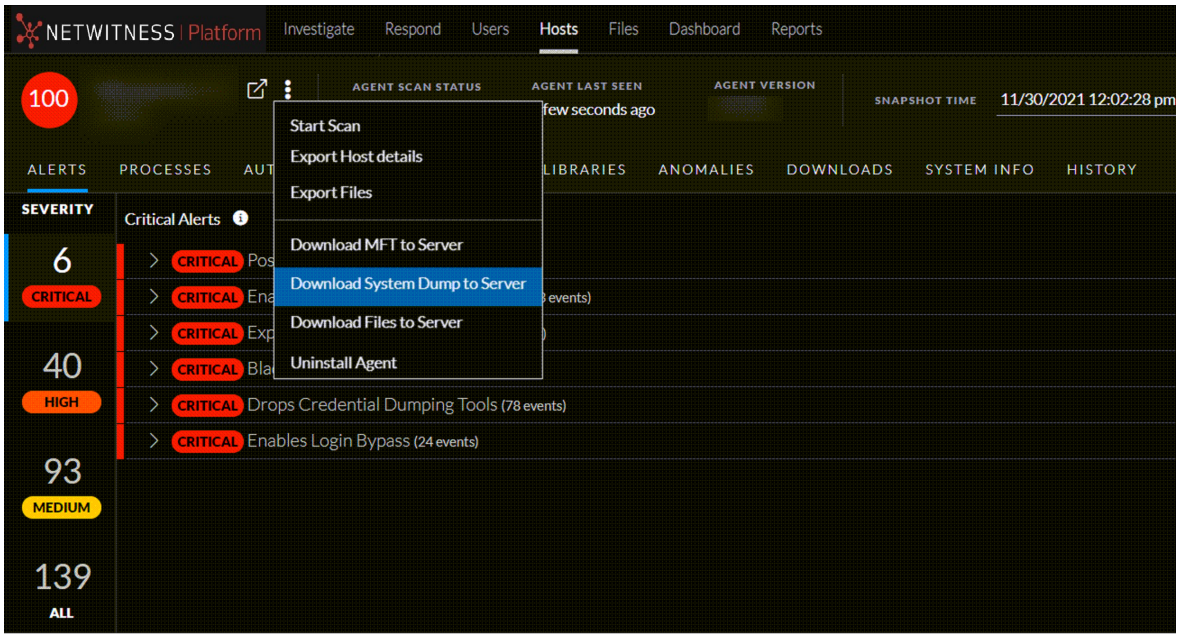
> **Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

To filter, save, and delete MFT, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.



System and Process Memory Dump

To perform forensic investigation during an incident response, you can request a memory dump of a host or a process running on the host. You can analyze these dumps using third-party tools, such as Volatility, Rekall.



Download System Dump to Server

To download system dump to the server from the Hosts view:

1. Go to **Hosts** and do one the following:
   - Select a host and select **Download System Dump to Server** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details and select **Download System Dump to Server** from the **More** option besides the hostname.

2. View the details of the downloaded system dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

Remote Shell

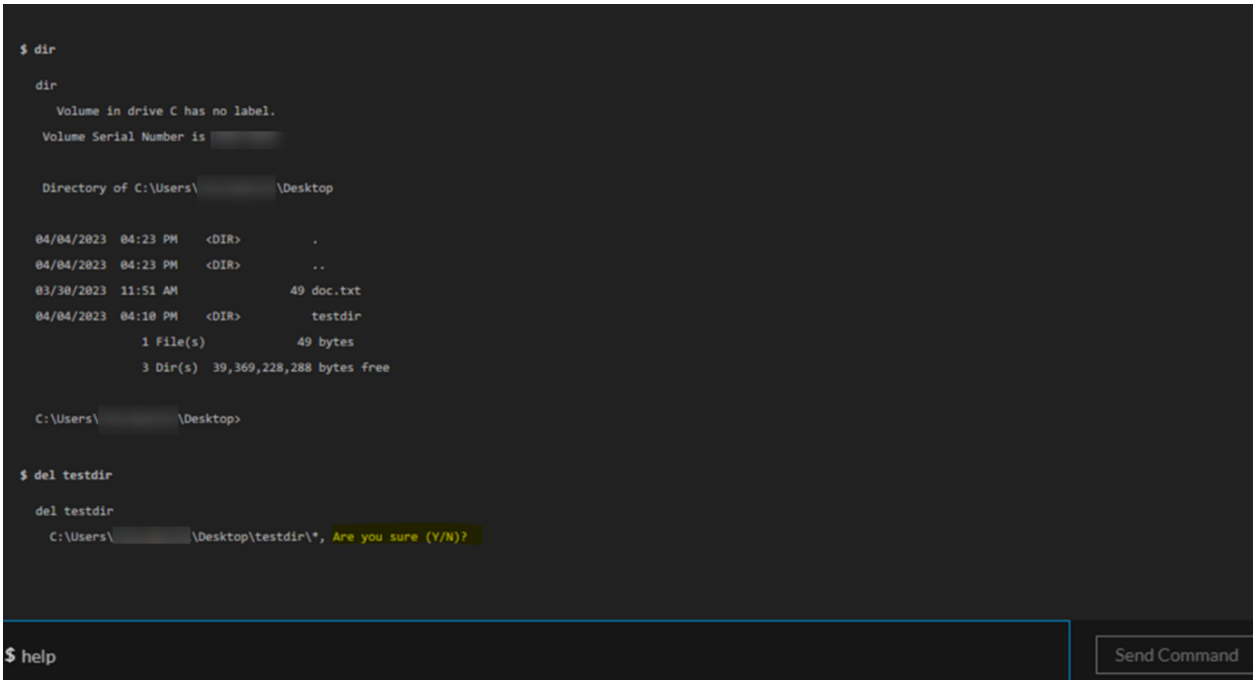
From version 12.3 or later, **NetWitness Remote Shell** feature (**Hosts** > Select the hostname > click  **(More)** beside the hostname > **Remote Shell**) allows you to access the agents installed on your Windows machine remotely and execute a list of commands to perform certain actions such as deleting the files, changing the directories, terminating specific processes, and executing the processes on the remote host.

Warning:
- Use **NetWitness Remote Shell** feature with utmost caution to avoid the potential for negative impact on the system. NetWitness Platform is not responsible for any damages, loss of data, or other consequences that may arise after using **NetWitness Remote Shell** feature.

- If you are an administrator, NetWitness recommends you to add roles and assign the role permissions only for the selected users in the **Security** > **Roles** view to avoid any damages to the system.

Note:
- **NetWitness Remote Shell** feature can be used only if Windows Advanced mode Agents are installed on the machine. The agent version must be 12.3 or higher to access the **NetWitness Remote Shell** feature.

- **NetWitness Remote Shell** feature supports connection with the agents that communicate through the relay servers (RAR). To access the **NetWitness Remote Shell** feature for the agent that communicates through the relay servers (RAR), you must download the latest relay packager from the Endpoint Server (EPS) and install it on the existing relay server.
For more information, see https://community.netwitness.com/t5/netwitness-platform-online/optional-installing-and-configuring-relay-server/ta-p/669551.



List of Supported Commands

The following table provides information about the list of supported commands displayed in the **NetWitness Remote Shell** console.

Supported Commands	Description
help	View the list of available commands
cd	Change the current working directory
del	Delete a file
rmdir	Delete a folder
dir	List the contents of a directory
mkdir	Create a new directory
tasklist	List all the active processes on the computer
taskkill	Terminate a process
call	Execute a process on the remote computer

Supported Commands	Description
reg	View or modify Windows registry settings

Note:
- You must use only the silent commands to perform the required actions.
- You must end the session and re-connect if you run any command that requires user inputs. Refer the following figure.

Example Scenarios

Example 1: If you want to delete a specific file that exists in different subfolders, you must run the following command.

```
del /s /q <full_file_path>
```

Here,

- **del** refers to delete.

- **/s** refers to the deletion of the file from all the subfolders.

- **/q** refers to quiet or silent mode execution.

- **<full_file_path>** refers to the location where the file exists.

Example 2: If you want to terminate a specific process running on your Windows machine, you must run the following commands.

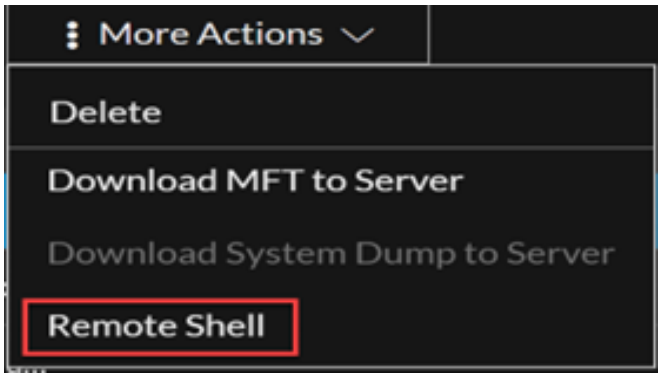
```
taskkill /f /im <process-name>
taskkill /f /pid <process-id>
```

Here,

- **taskkill** refers to terminate.

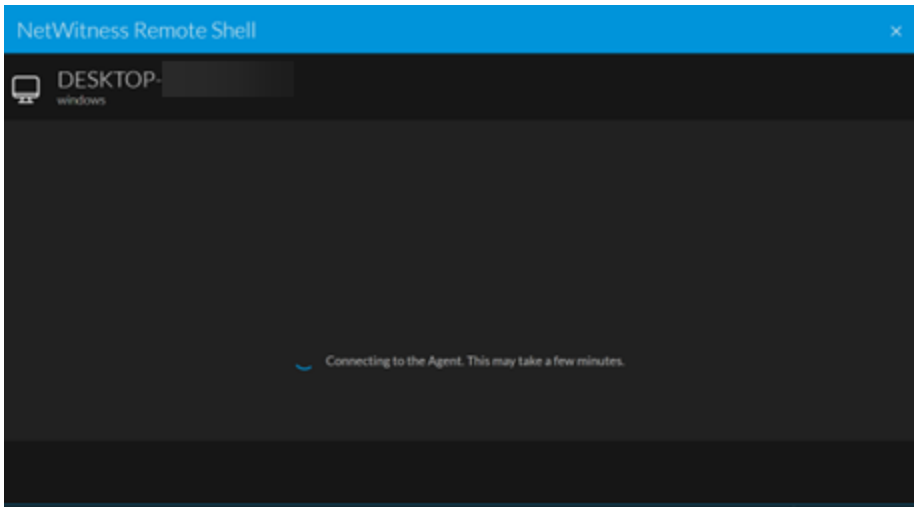
- **/f** refers to force shutdown.
- **/im** refers to image name.
- **<process-name>** refers to the specific process.
- **<process-id>** refers to the specific process ID.
- **/pid** refers to process ID.

Example 3: If you want to delete a specific registry, you must run the following command.



```
reg delete /f <keyname> [/v ]
```

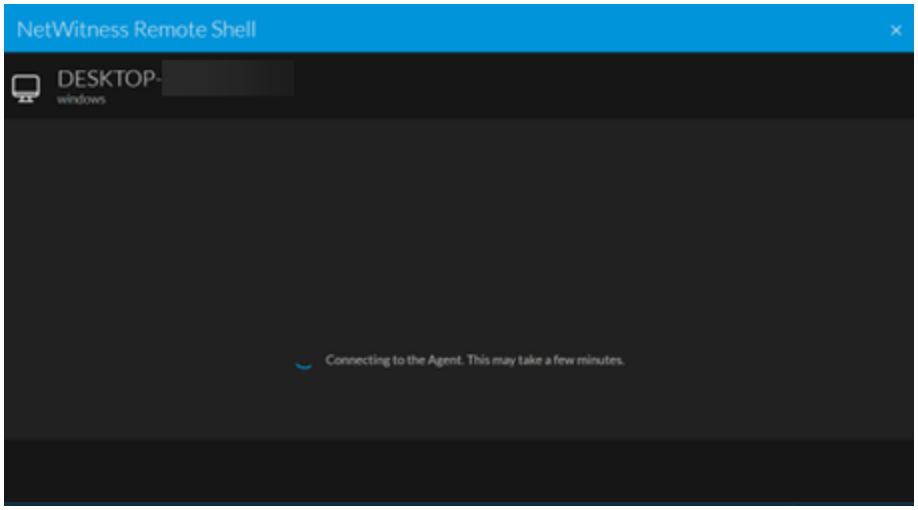
Here,



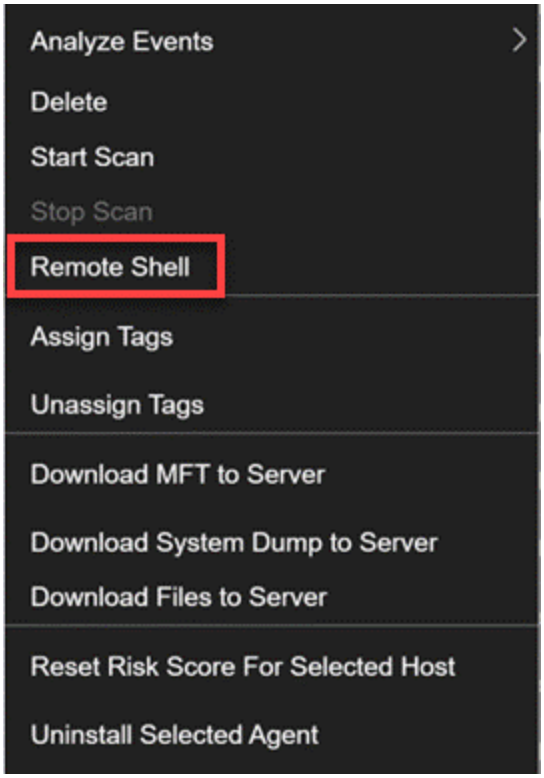
- **reg delete** refers to deleting a registry key.
- **/f** refers to deleting the existing registry subkey or entry without asking for the confirmation.
- **<keyname>** refers to the registry key name.
- **[/v]** refers to deleting a specific entry under the subkey.

To execute commands using NetWitness Remote Shell:

1. Go to **Hosts**. Do one of the following.
   - Click a row in the **Hosts** list view and go to **More Actions** > **Remote Shell**.

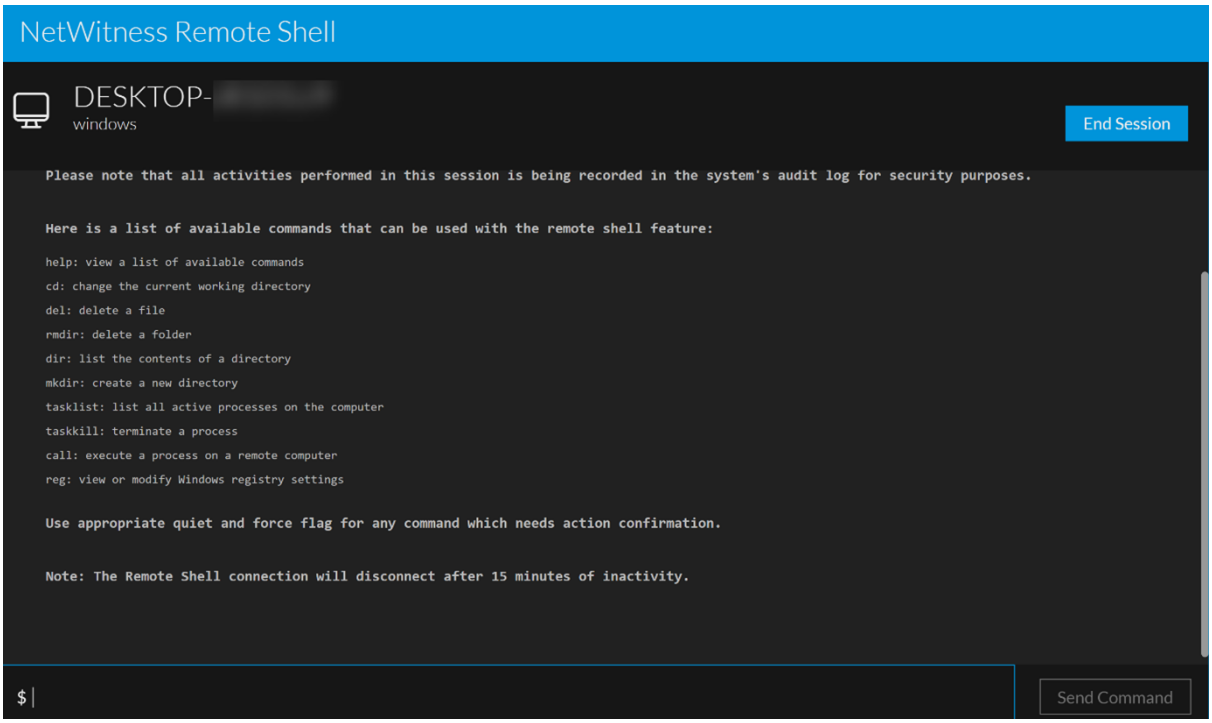


The **NetWitness Remote Shell** window is displayed.



- Click the Hostname and click (More) beside the hostname in the Host Details view to select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.



- Right-click a row in the **Hosts** list view and select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.

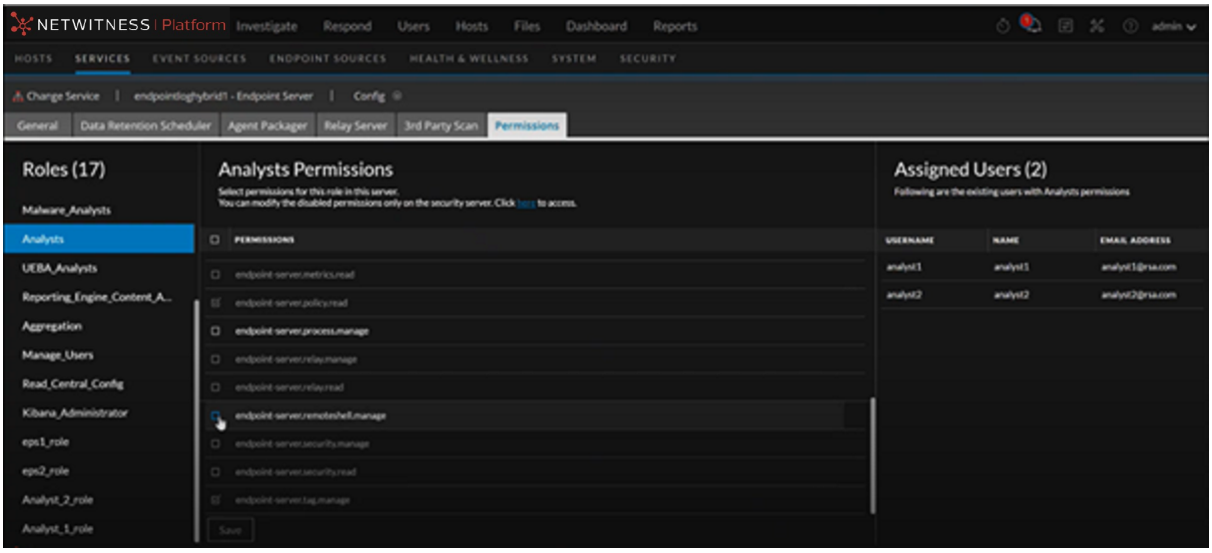
2. Enter the commands once the Agent is connected.

3. Click **Send Command** or press the **Enter** key.
4. Click **End Session** in the **NetWitness Remote Shell** window once the required action is performed.

   The confirmation window is displayed.
5. Click **End Session** to close the **NetWitness Remote Shell** window.

RBAC Permissions for Remote Shell

Users with Analysts and other roles must have the **endpoint-server.remoteshell.manage** permission to view and access **the NetWitness Remote Shell** feature. Administrators can assign the **endpoint-server.remoteshell.manage** role permission to a specific user or to a specific role. The existing roles must be duplicated in the **Security** > **Roles** view and the new users must be assigned to the duplicated roles to assign the **endpoint-server.remoteshell.manage** role permission only to the specific new users.



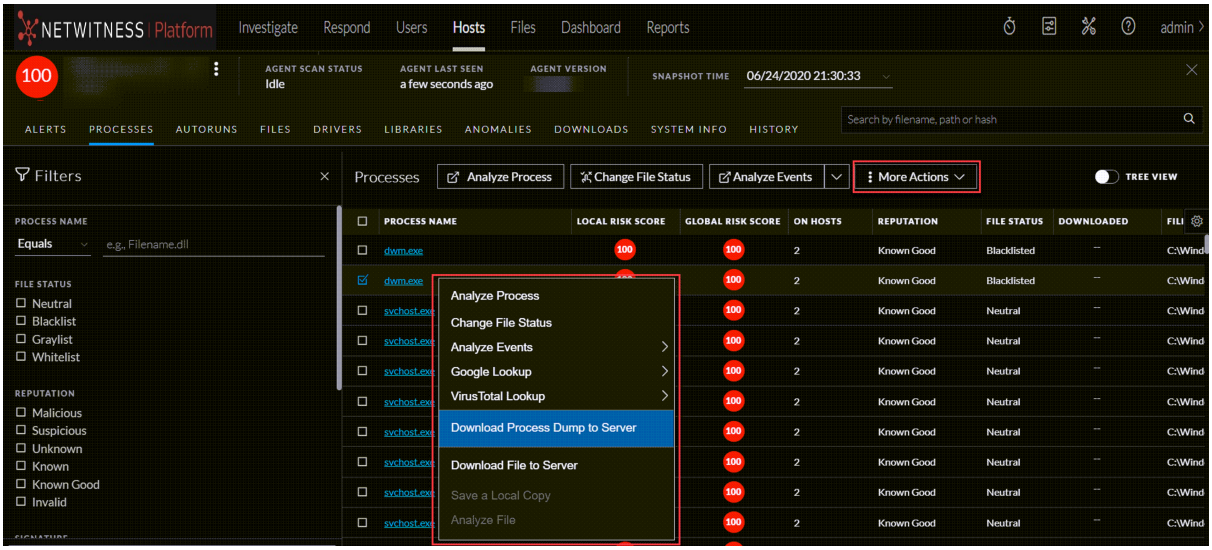
You must go to **(Admin)** > **Services** > select the Endpoint Server Service > **View** > **Config** > **Permissions** view to assign the **endpoint-server.remoteshell.manage** permission to the specific users. For more information on duplicating a role, adding a role and assigning permissions, and editing the role permissions, see **System Security and User Management Guide for 12.3**.

Administrators can configure the RBAC Permission at Endpoint Server level. You can allow the users assigned to a specific role to view and access the **NetWitness Remote Shell** feature on any specific Endpoint Server. When you allow the user to view and access the **NetWitness Remote Shell** feature only on a specific Endpoint Server such as EPS1, the user cannot view or access the **NetWitness Remote Shell** feature on any other Endpoint Servers such as EPS2 and EPS3. If the user has the access to the **NetWitness Remote Shell** feature on one of the Endpoint Servers such as EPS1, the user can view the **NetWitness Remote Shell** feature enabled in the **Endpoint Broker Server** view for all the agents. In this case, the user can access the feature and connect with the remote agent from the **Broker** view, if the selected remote agent is present only in EPS 1 and not in any other Endpoint Servers such as EPS2 and EPS3. If the user attempts to connect with the remote agent which is present only in EPS2, the **NetWitness Remote Shell** console screen keeps loading. This happens since the user can access the feature only on EPS1 and not on EPS 2.

Note: If you configure the **endpoint-server.remoteshell.manage** permission at the role level in the **Security** > **Roles** view, the users assigned to the role can access the **NetWitness Remote Shell** feature on any Endpoint Servers such as EPS 1, EPS 2, and EPS 3.
For more information on Configuring the RBAC permissions at the role level, see **(Optional) Add a Role and Assign Permissions** section in the **System Security and User Management Guide for 12.3**.

To configure Remote Shell RBAC permission to the specific users at the endpoint server level:

1. Go to  (Admin) > **Services**.
2. In the **Services** view, select the required Endpoint Server service.
3. Click  and select **View** > **Config**.
4. Go to **Permissions** tab.
5. Select the role you duplicated in the **Security** > **Roles** view from the **Roles** panel on the left.
6. Select the permission **endpoint-server.remoteshell.manage** from the **Permissions** section.



7. Click **Save**.

For more information on configuring the permissions at the Endpoint Server level, see Manage Role Permissions at Endpoint Server Level.

Download Process Dump to Server

To download process dump to the server:

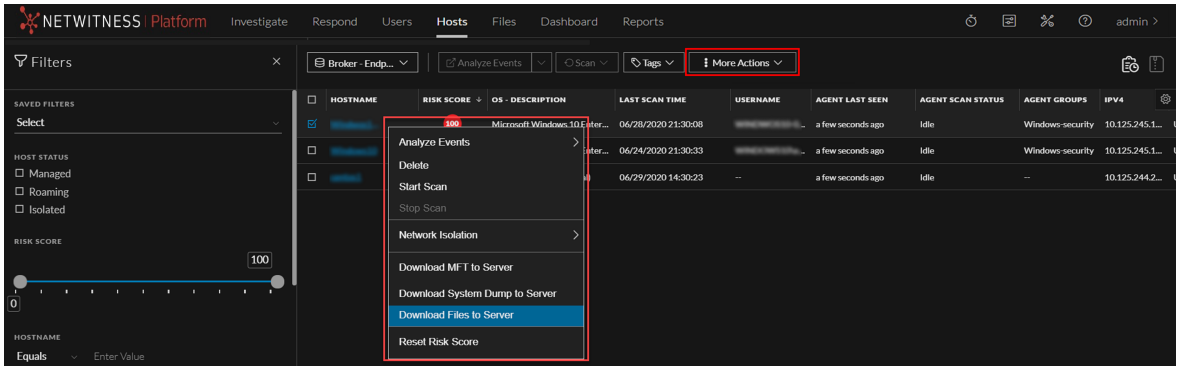
1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. In the Processes, Libraries, or Anomalies tab, select **Download Process Dump to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

4. View the details of the download process dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

To filter, save, and delete system dump or process dump, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

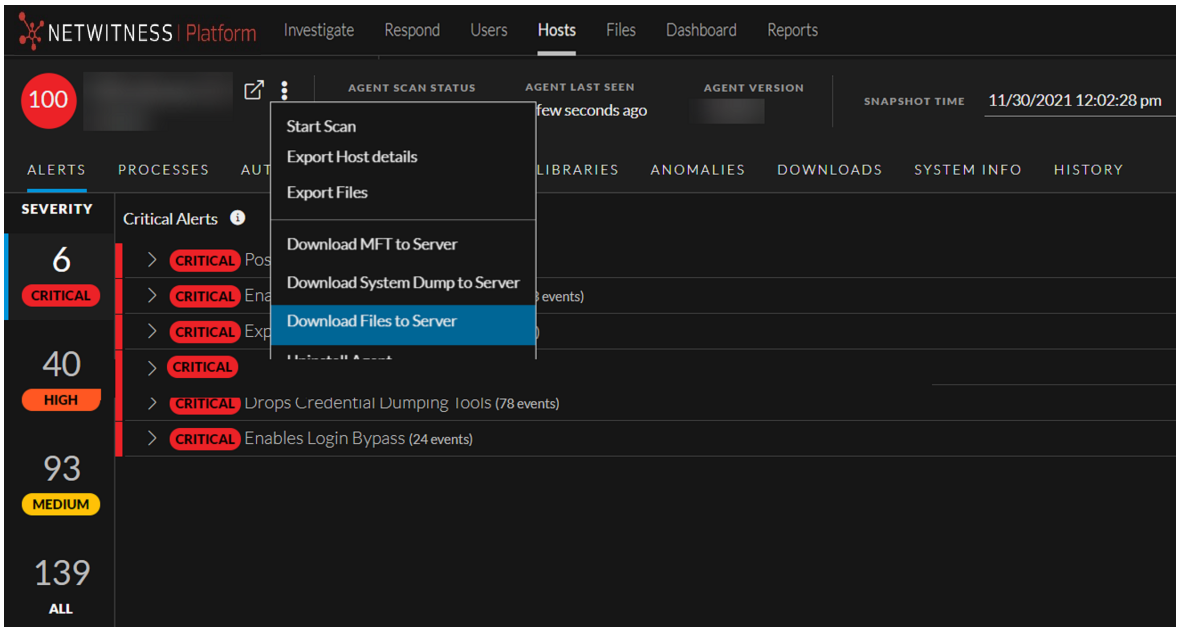
The following are some errors you might encounter during system and process dump download:

Issue	Explanation
Parameter is incorrect.	The process for which the dump is requested might be running with a different process ID.
Element not found	The process for which the dump is requested is no longer active.
java.io.IOException:Unable to unwrap data, invalid status [CLOSED]	Connection to the agent is interrupted.
java.net.SocketTimeoutException	The network is slow or the system is down.
One or more arguments are not correct	Agent might be in the Insight mode or driver is not running.



Download Files Using Full Path or Wildcard

You can manually download files that help in investigations by either providing full path of the file or using wildcard.



Note: This is applicable only for agents in Advanced mode with NetWitness Platform version 11.5 and later.

To download files to the server:

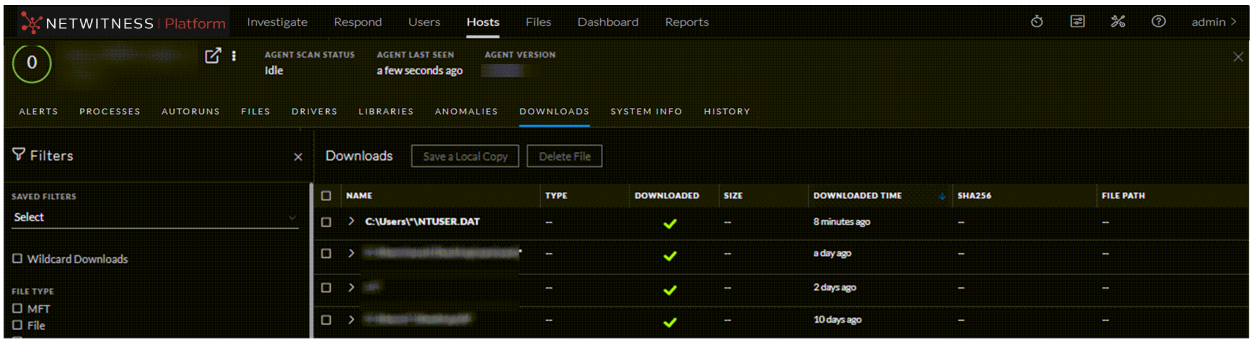
1. Go to **Hosts** and do one of the following:
   - Select one or more hosts from the same operating system, and select **Download Files to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar. You can download files from only top 100 selected hosts at a time.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download Files to Server**.

2. In the **Download Files to Server** dialog, enter the full path where the files may be present or search using wildcard. For wild card search, you can use a maximum of two `*`, one at a folder level and the other at a file level.

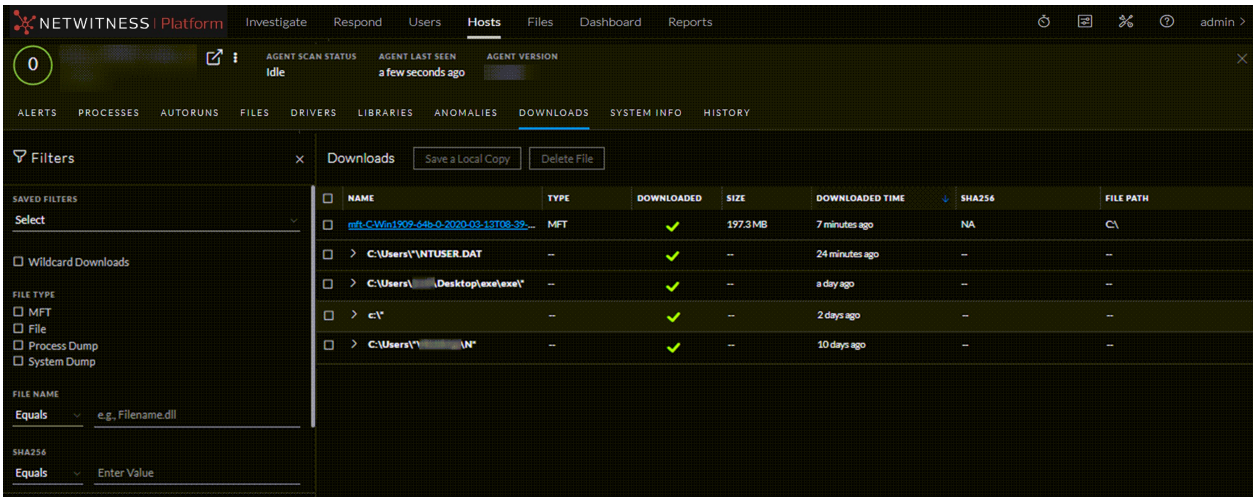
   For example, to retrieve the registry hive, you can enter the full path, `C:\Windows\System32\config\SYSTEM`.

   If you want to retrieve user settings and configuration preferences for all users, download all files using the wildcard `C:\Users\*\NTUSER.DAT`.



3. For wildcard search, enter the number of files to download and size of the file. By default, the number of files is set to 10 and file size is set to 100 MB. For example, if the maximum number of files is set to 10 and file size is set to 10 MB, first 10 files within 10 MB are downloaded.

   Note: You can set a limit to the Maximum Number of Files field on the explore page of the Endpoint server (> **[Endpoint server] > explore > endpoint/command > max-file-count**). By default, the limit is set to 100, and you can change it to any value between 100 - 1000 in each Endpoint server. In broker view, if the Endpoint servers have different max-file-count, the lesser value will be taken as the limit.

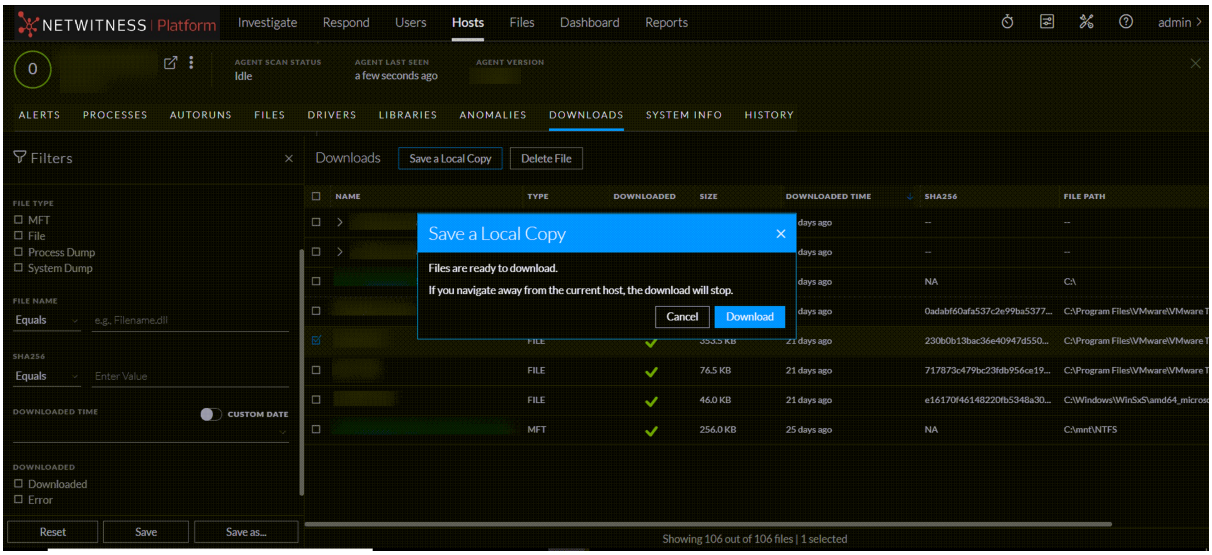


4. Click **Download**.

All files downloaded as a part of wildcard search are grouped together based on the search criteria. For example, all files downloaded using `C:\Users\*\NTUSER.DAT` are grouped, and you can click to expand and view all files under this group. You can sort the groups on the downloaded time and view the status of the download in the **Downloaded** column.

Filter Downloaded Files

You can filter the downloaded files on wildcard downloads, file type, file name, SHA256 (for files), and downloaded time. In the Downloaded Time field, you can also filter by custom date.



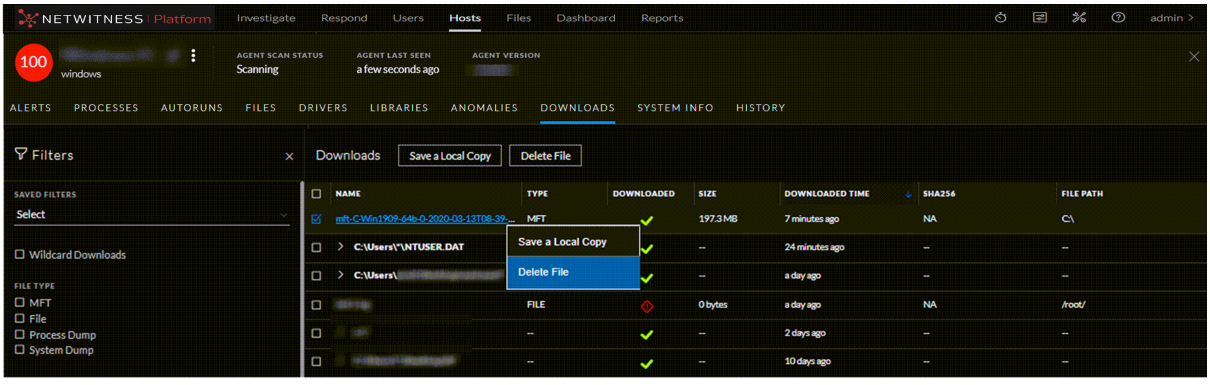
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Save Downloaded File

You can retrieve the downloaded file and save it to your local file system for further analysis. To save the file:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click the file you want to save and select **Save a Local Copy** from the context menu or from the toolbar.



4. In the **Save a Local Copy** dialog, click **Download**.

Note: For wildcard downloads, select a file from the group that are downloaded successfully to save a local copy. You cannot save multiple files in the group at a time or save files with errors.

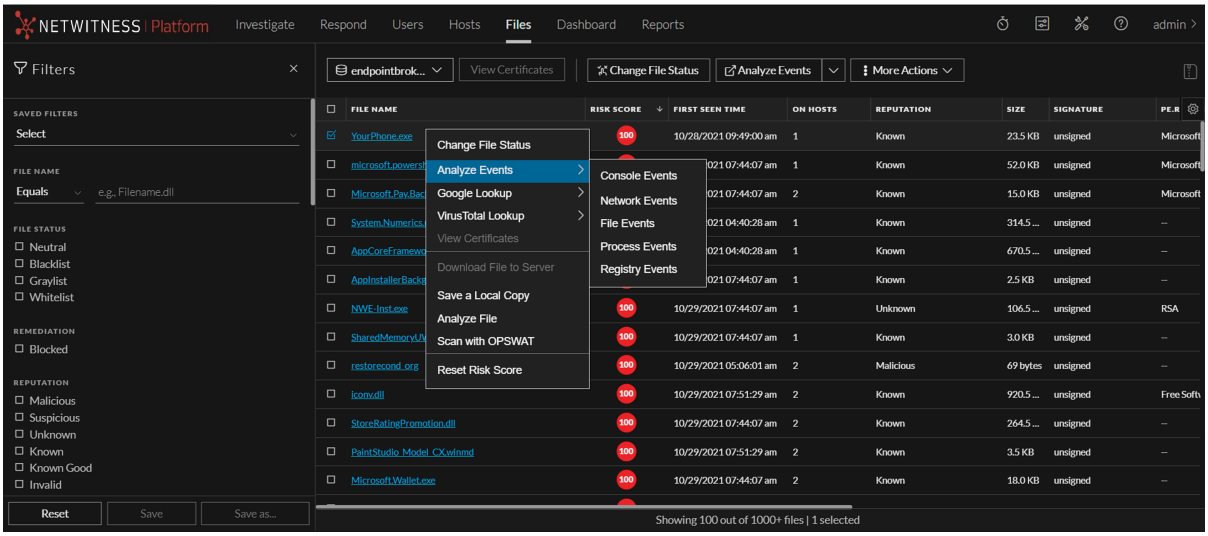
Delete Downloaded Files

If you want to delete the downloaded file from the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click one or more files you want to delete, and select **Delete File** from the context menu or from the toolbar.

Note: For wildcard downloads, you can select the group to delete all files that are downloaded.

Analyzing Events



If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

Note: By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

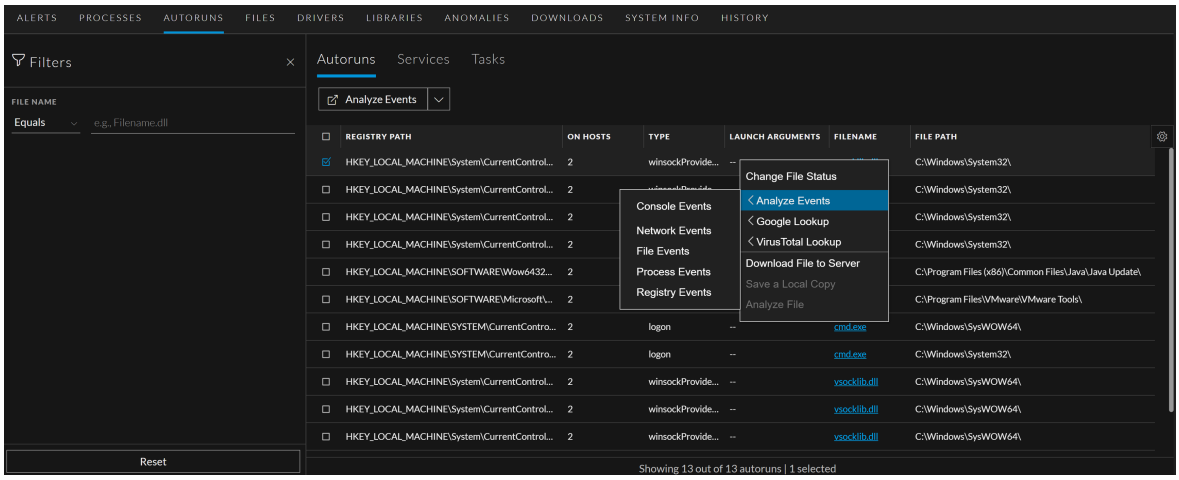
Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.

This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Note: If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.



Analyze Events from Hosts View

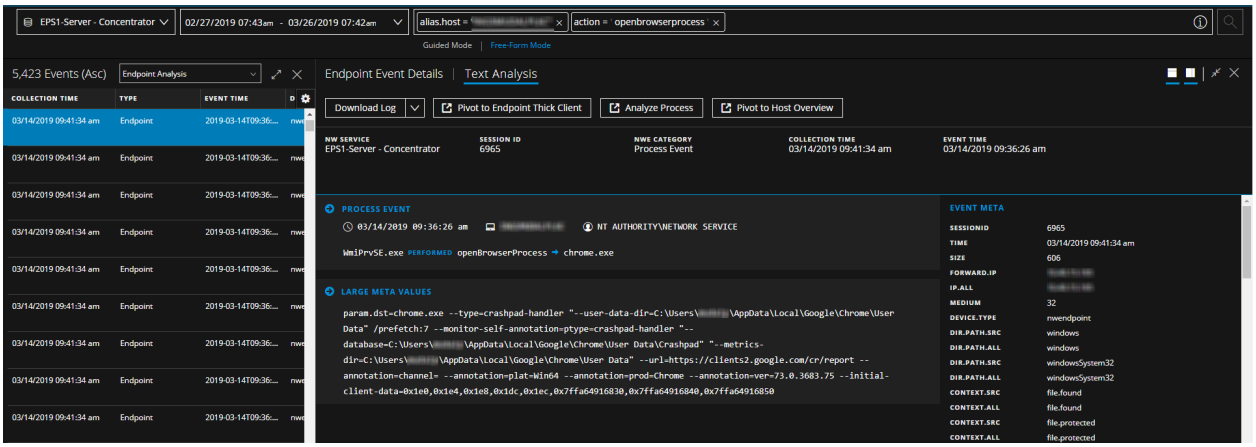
To investigate a particular host, IP address (IPV4), or username:

1. Go to **Hosts**.
2. Do one of the following:

- Right-click a host, select **Analyze Events** from the right-click context menu or in the toolbar, and select a specific event type (such as network events, file events) that you want to view.
- Select the hostname to open the host details. Right-click a file or in the toolbar, select **Analyze Events**, and select a specific event type that you want to view.

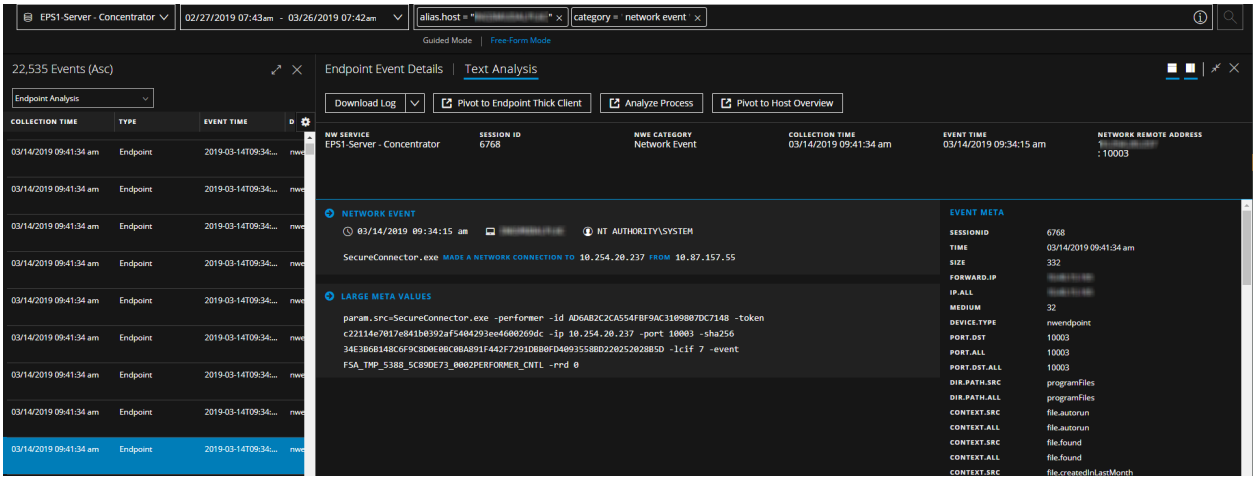
  The following figure is an example of the **Autoruns** tab.

  This opens the Navigate view with data related to the file.



For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Text Analysis for an Endpoint Event

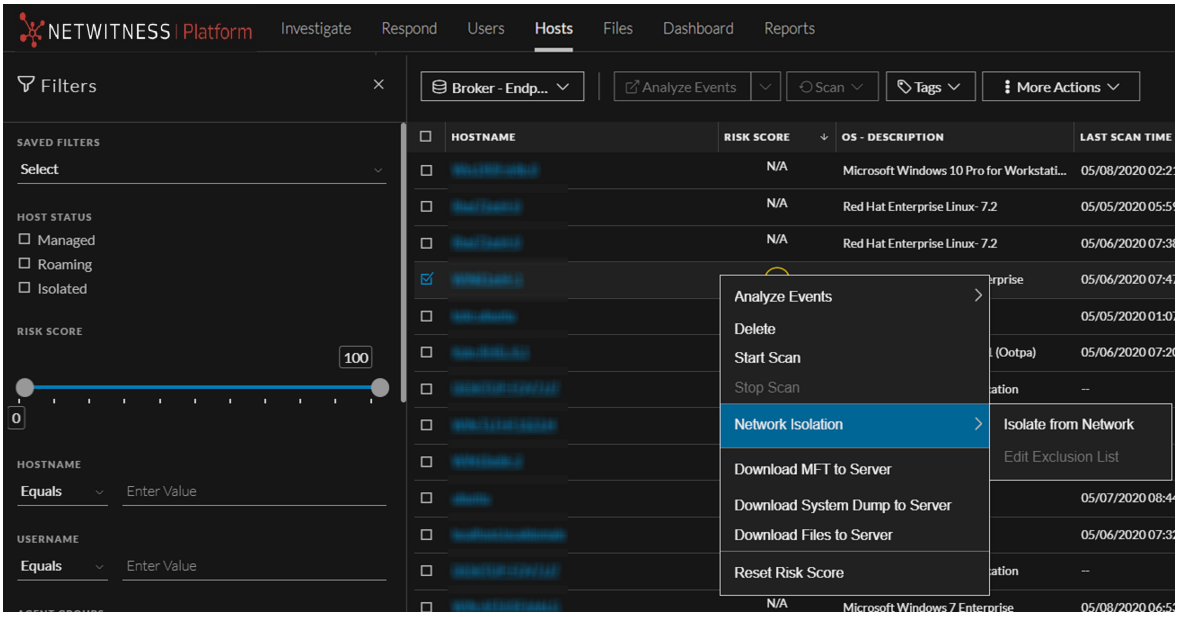


You can view all Endpoint events in their original text format in the Events view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event. (Version 11.5 and Later) The event header includes host name, process, and user name details in addition to other event details if the selected Endpoint event contains these metadata.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

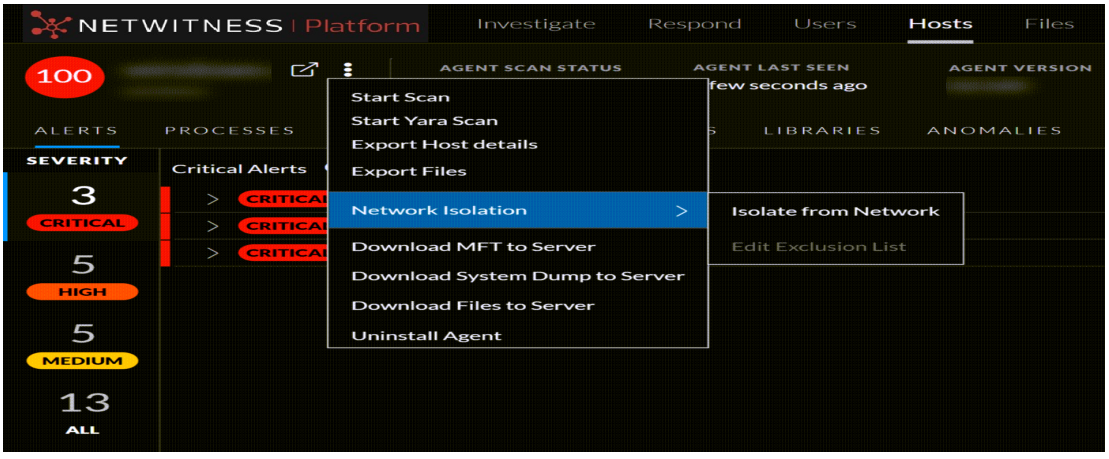
Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.

Below is an example of the Network event:



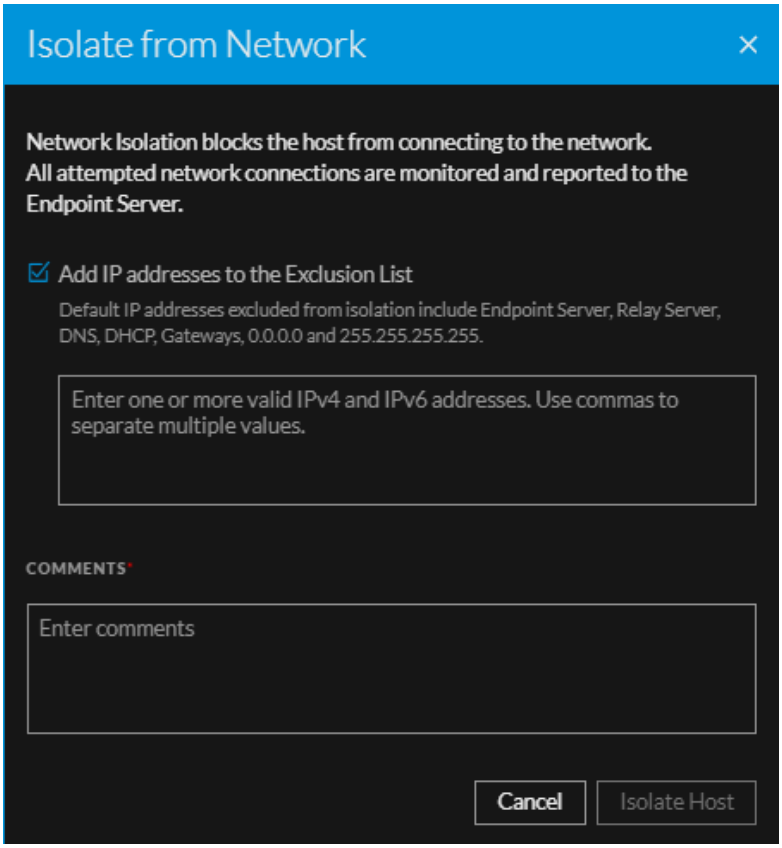
For more information on Events view, see the *NetWitness Investigate User Guide*.

Isolating Hosts from Network



Note: By default, the network isolation option is disabled in the policy, and you cannot view options mentioned in this section. To enable network isolation, in the policy configuration, select **Enabled** in the **Network Isolation** option under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

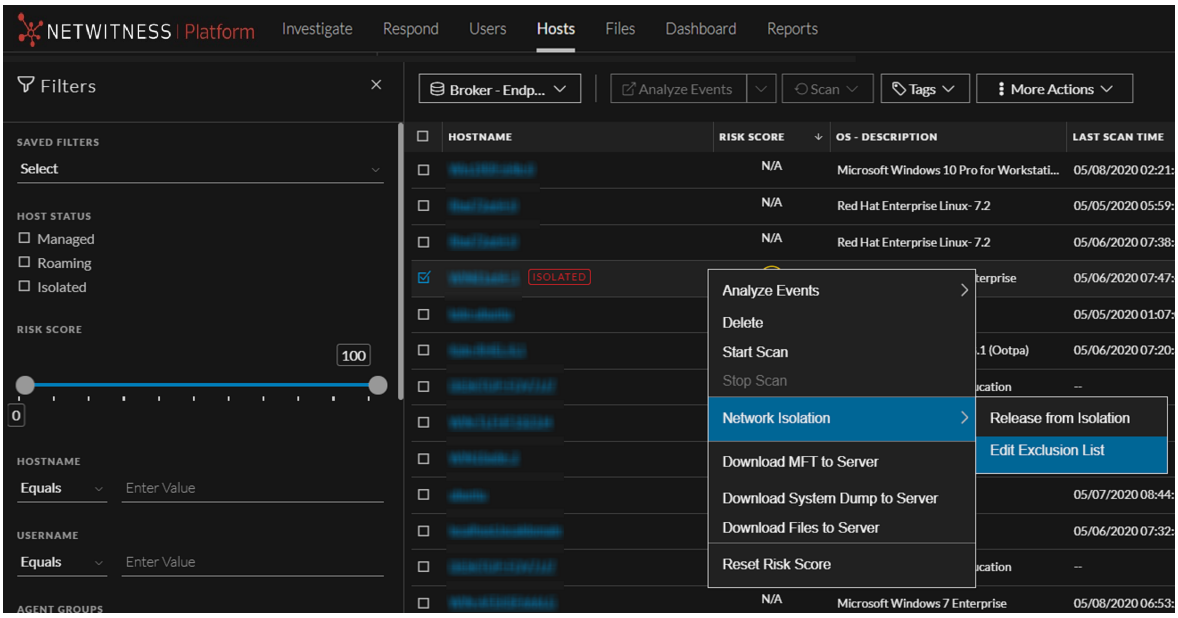
To isolate a host from the network:



1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Isolate from Network** from the right-click context menu, or from the **More** drop-down list in the toolbar.

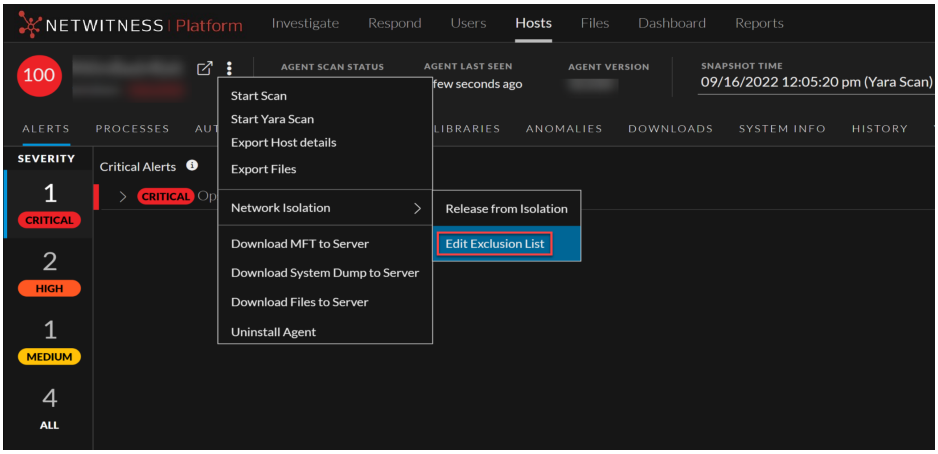
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Isolate from Network**.

2. In the Isolate from Network dialog, by default, a set of IP addresses are excluded from isolation. For more information, see Network Isolation. To add IP addresses to the list, select the **Add your IPs to Exclusion List** checkbox. You can enter up to 100 IP addresses separated by comma.



3. Enter comments.
4. Click **Isolate Host**.

Note: When a host is isolated, the connection to the following IP addresses are allowed:
- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

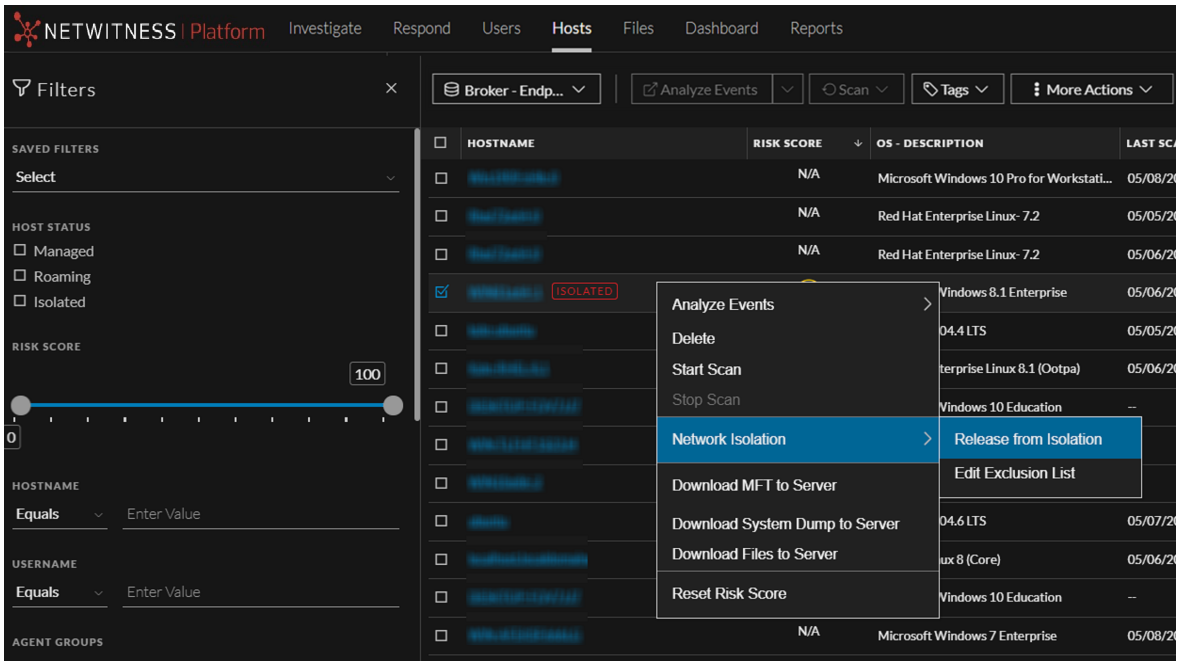


Edit Exclusion List

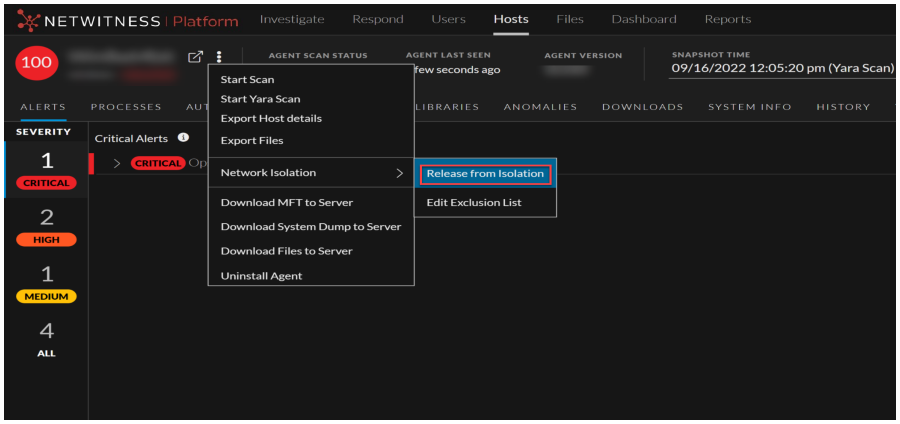
To edit the exclusion list:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Edit Exclusion List** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Edit Exclusion List**.



2. Add or modify the IP addresses in the list.
3. Enter comments and click **Save**.



Release Isolated Hosts

Releasing the isolated host restores the network connection and removes IP addresses added to the Exclusion list. To release the host from isolation:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Release from Isolation** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Release from Isolation**.

2. Enter comments and click **Release Host**.

High Availability (Endpoint Recovery)

The High Availability or Endpoint recovery configuration feature in the **Admin Server - Source Server Explore** view (**Admin** > **Services** > select the Source Server > **View** > **Explore** > **endpoint/recovery**) allows administrators to map the service ID of an Endpoint server with the recovery Endpoint service ID as part of recovery configuration.

Note: Map the service IDs of multiple Endpoint servers in the form of comma separated Key Value pairs. You must enter ':' in between the Key Value pairs. The Key refers to the service ID of the unavailable Endpoint server and the Value refers to the service ID of the recovery Endpoint server. For Example: <Unresponsive EPS ServiceId-1>: <Recovery EPS ServiceId-2>, < Unresponsive EPS ServiceId-3>: < Recovery EPS ServiceId-4>

To configure the Endpoint Recovery

1. Go to **Admin** > **Services**.

   The **Services** view is displayed.

2. Select the Source Server. Go to **View** > **Explore**.

   The **Explore** view is displayed.

3. Click **endpoint/recovery**.

4. Enter the service IDs of the Endpoint servers in **failover-service-id-mapping** field.

Endpoint Recovery Use Case Example

The following use case provides an example of an Endpoint administrator using the High Availability feature in the NetWitness Platform to configure the Endpoint recovery.

Use Case: Endpoint Server EPS 1 turns unresponsive

Administrator Steven finds that an Endpoint server EPS 1 in the environment is not responding from a long time and the communication between the agents and the Endpoint server EPS 1 is failing. Steven navigates to the **Admin Server - Source Server Explore** view and selects **endpoint/recovery** configuration. As part of the Endpoint recovery configuration, Steven maps the service ID of EPS1 with the service ID of an active Endpoint server EPS 2.

Pre-requisites for Endpoint Recovery Configuration

Make sure the following pre-requisites are met before you perform Endpoint Recovery Configuration.

- Before you install the recovery Endpoint server EPS 2 and perform Endpoint recovery configuration, make sure you copy the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files from EPS 1 (unresponsive Endpoint server) to EPS 2 (recovery Endpoint server). If the certificate files in EPS 1 and EPS 2 do not match, the agent fails to communicate with EPS 2 in case of EPS 1 failure.

IMPORTANT: Once you install EPS 1 on your machine, backup the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files. If you fail to do so and the EPS 1 fails due to some disaster, you cannot copy the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files in EPS 1 to EPS 2.

For more information on how to backup and copy the certificate files, see **Configuring Multiple Endpoint Log Hybrids** section in **Install NetWitness Platform Virtual Host in Virtual Environment** topic in the *Virtual Host Installation Guide for 12.3.1*.

- When you replace an unresponsive relay server configured on an Endpoint server with the new relay server, make sure you re-use the same Fully Qualified Domain Name (FQDN) or IP address of the unresponsive relay as part of the relay recovery configuration.
- You must enter the Forwarder address of the recovery Endpoint server in **Endpoint Sources** > **Policies** view immediately after mapping the service IDs of the Endpoint servers in the **Admin Server - Source Server Explore** view. During the failure of an Endpoint server EPS 1, if the IP address of the recovery Endpoint server EPS 2 changes, and you do not provide the Forwarder address of the recovery Endpoint in **Endpoint Sources** > **Policies** view, the agent fails to communicate with the recovery Endpoint server EPS 2.
- The HTTPS ports of the Primary Endpoint server and the recovery Endpoint server must match during the Endpoint recovery configuration.

DNS Recovery Configuration

Note: The agent cannot establish communication through RAR mode as part of DNS Recovery. If Endpoint server is not directly reachable, the DNS recovery fails.

When all the Endpoint servers in the deployment are unresponsive, the agent searches for the recovery Endpoint server through the DNS entry. You must configure the new recovery Endpoint server in the deployment and include it in the DNS record to allow the agent to communicate with the newly added recovery Endpoint server.

To add the recovery Endpoint server to the DNS entry

1. Enter the following in DNS server.
   - **Domain Name**: Enter the domain name of the recovery Endpoint server in the form of **<service ID>.nwrecovery.local**.

     For example: Domain Name must be entered in the form of 5bdv7ado-69a0-41f2- 8574-d3ffc78b9.nwrecovery.local.

     Here, **<service ID>** is the service ID of the unresponsive Endpoint server which is variable and **nwrecovery.local** is a static element in all the domain names.
   - IP Address: Enter the IP address of the recovery Endpoint server as the IP address for the domain name.
2. Perform Endpoint recovery configuration in **Admin Server - Source Server Explore** view. For more information, see To configure the Endpoint Recovery.

   The agent establishes communication with the newly added recovery Endpoint server.

NetWitness Endpoint with Third-Party Antivirus Products

If you want the NetWitness Endpoint agent to coexist with any of the security products, make sure to whitelist the agent. For more information, see the respective third-party product documentation.

Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

General Issues

Issue	Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying.
Solution	The Endpoint Broker aggregates data from all Endpoint Servers, which responds within 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following: 1. Go to  **(Admin) > Endpoint Broker** service. 2. Click  > **View** > **Explore**. 3. Click **endpoint/broker** node. 4. In the **query-timeout** field increase the value, for example, 30 seconds.

Issue	The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues: • UDP • HTTPS • Firewall

Solution	• To verify the UDP or HTTPS connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testnet`
	For example, `NWEAgent.exe /testnet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Issue	The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues: • UDP • TCP • TLS

Solution	• Firewall

	• To verify the UDP, TCP, and TLS connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testlognet`
	For example, `NWEAgent.exe /testlognet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Multi-server Issue

Issue	Agent is not communicating with the Endpoint Server after migration.
Solution	Check the Nginx logs of the Endpoint Server to which the agent has migrated, and if the agent is communicating with error code 403, that means the certificate of the first Endpoint Server and second Endpoint Server are different. This is because during the installation of second Endpoint Server, the certificate of first Endpoint Server is not copied to the second Endpoint Server. Reinstall the second Endpoint Server by copying the certificate of first Endpoint Server, and reinstall the agent. For more information, see the *Physical Host Installation Guide*.

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under  **(Admin) > Services** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	Hosts view shows 'No Results Found.' error in the following scenario: • Host A belongs to Endpoint server A and does not exist in Endpoint server B. • Endpoint server B is selected in Hosts view. • In a new window/tab, open the Host details page (of Host A) • Navigate to Hosts view using **[*Host Name*] > Actions > Pivot to Investigate**

	> Hosts/Files `Endpoint server B is selected by default, and the page shows 'No results found.' error.`
Explanation	This is expected behavior. The Endpoint server that is selected first is considered to be current /active throughout the session.
Workaround	Ensure the correct Endpoint server is selected, and `Pivot to Investigate > Hosts/Files` will behave normally.

Issue	For MFT download: 1. The request fails with file not found error for drives/mount paths created on the machine after agent is installed. 2. Incorrect MFT is downloaded for the provided NTFS mount path.
Solution	Make sure that the agent version is 11.6 or later.

Files View Issues

Issue	Unable to analyze events from **Hosts** and **Files** view.
Explanation	Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue: **Note:** To get the investigate-service-id: 1) Go to **(Admin) > Services > Concentrator** service. 2) Click > **View** > **Explore** tab. 3) Expand the **sys/stats** node list. 4) In the UUID filed, copy the value. 1. Go to **(Admin) > Services > Endpoint Server** service. 2. Click > **View** > **Explore** tab. 3. In the **endpoint/investigate** field, specify the **investigate-service-id**.

Policy Issue

Issue	Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required.
Explanation	**Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied.

	Permission Required - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Issue	Policy Status shows error.
Explanation	Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details.

Driver Issue

Issue	While loading the driver on the host, an error is encountered.
Explanation	Check the driver error code in the **Agent-Driver Error Code** column under **Hosts** view. Contact your system administrator with the error code.

Download Issue

Issue	Downloads (Files, MFT, System/Process dumps, etc.) fail at times.
Explanation	Downloads fail when there is not sufficient disk space on the Endpoint Server.
Workaround	Clean up some disk space and try downloading again. We recommend you keep sufficient disk space before initiating any download.

File Reputation Service Issue

Issue	When you configure RSA Live for the first time and the File Reputation service is not connected.
Solution	You must manually enable the File Reputation service. To enable the File Reputation service: 1. Go to  **(Admin) > System > Live Services**. 2. In the **Additional Live Services** section, select the enable File Reputation check box. 3. Click **Apply**.

Risk Scoring for Hosts or Files Issue

Issue	NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files.

Solution	Check the backlog of alerts for risk scoring. 1. SSH to the ESA Primary appliance. 2. Execute the following command: `mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or":[{state:"STAGED"},{state :"WORKING"}]}).count()' --quiet` The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts. 3. To disable risk scoring: a. Go to **(Admin) > Services > Respond** service. b. Click > **View** > **Explore**. c. Expand the **respond/scheduled/jobs** node list. d. In the **risk-scoring-enabled** field, set the value to **false**. 4. To disable Endpoint ESA alerts: a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium. i. Go to **(Configure) > ESA Rules**. The Configure view is displayed with the Rules tab open. ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete. A confirmation dialog is displayed. iii. Click **Yes**. b. To disable only Medium severity NetWitness Endpoint ESA alerts: i. Go to **(Admin) > ESA Correlation** service (on which Endpoint deployment is added). ii. Click > **View** > **Explore**. iii. Expand the **correction/alert** node list. iv. In the **transient-enabled** field, set the value to **false**.

Endpoint Broker/Server Issue

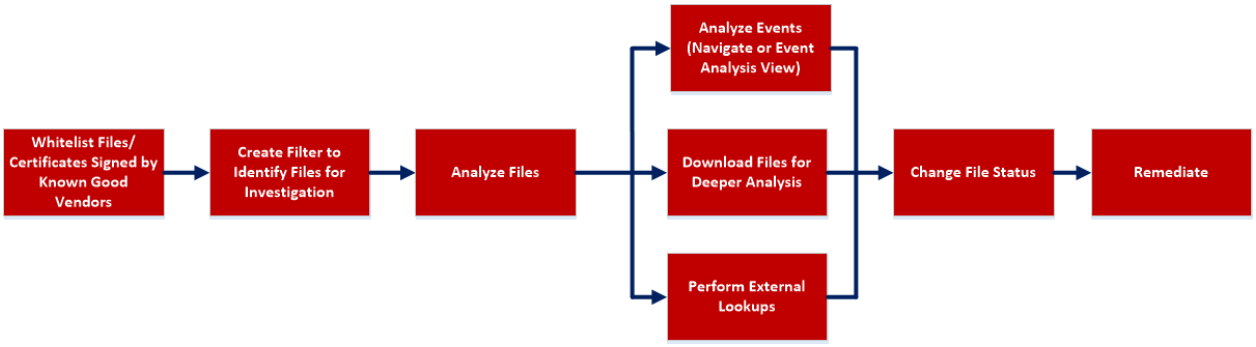
Issue	User have access to one Endpoint server and unable to access the other.
Explanation	Reach out to the administrator and check if you have access to that endpoint servers. Request for access if required.

Issue	In the Endpoint Server Broker view, the user can scan hosts that belong to a particular Endpoint server but cannot scan hosts that belong to another Endpoint server.
Explanation	User may not have access to that endpoint server. Check with the Administrator to see if the user has access.

NetWitness Endpoint Reference Materials

This section is intended to help you understand the purpose and application of NetWitness **Investigate** > **Hosts** view and **Files** view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - Downloads Tab
- Hosts View - System Information Tab
- Hosts View - Agent History Tab
- Hosts View - YARA Rules Tab



Files View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

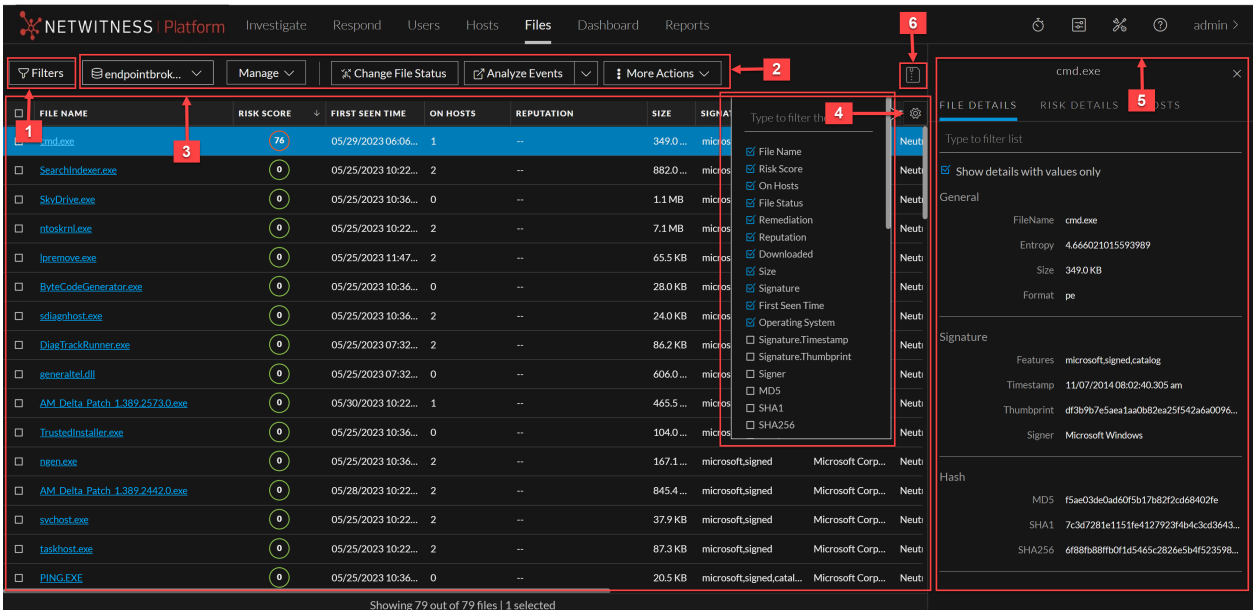
The Files view provides a holistic view of all files in your deployment. To access this view, go to **Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	whitelist files and certificates signed by known good vendors*	Analyze Certificates
Threat Hunter	create filter to identify files for investigation*	Filter Files
Threat Hunter	analyze files*	Investigating Files
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate



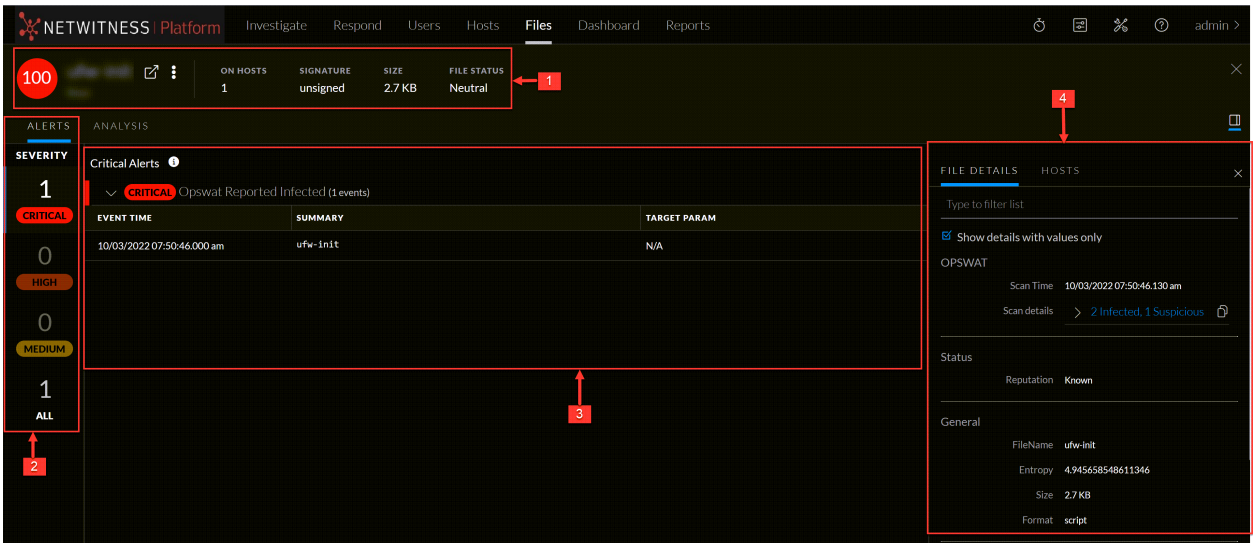
*You can perform this task in the current view

Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts
- Analyzing Downloaded Files
- Analyzing Events
- Analyze Certificates
- Manage Blocked File Hashes
- Changing File Status or Remediate

Quick Look

Below is an example of the Files view:

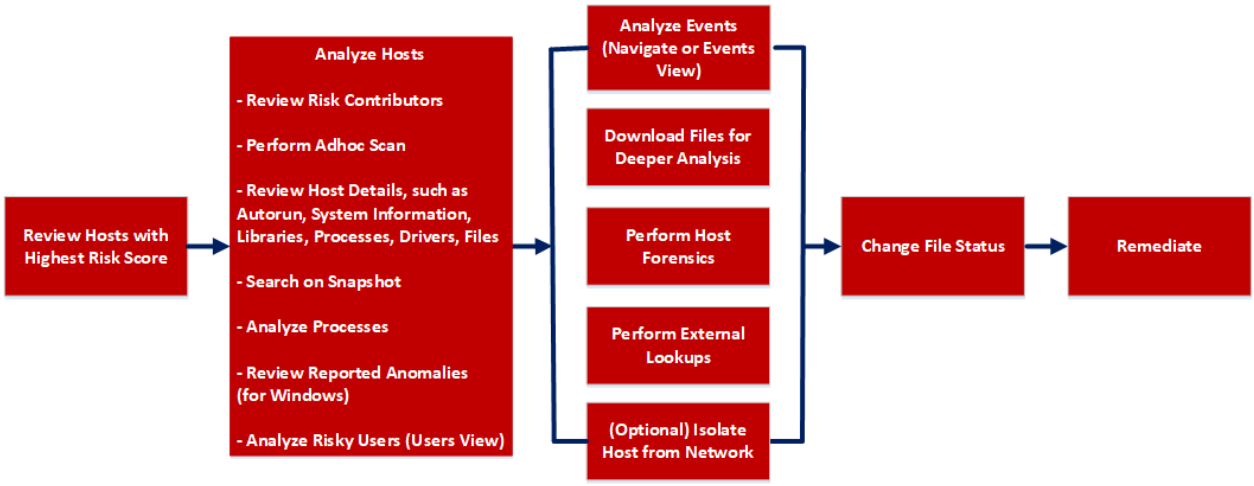


1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

2	**Actions in the toolbar:** **Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts. **Manage** - You can select any of the following drop-down options in the Manage drop-down list. • **Certificates** - Allows you to view a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates. • **Blocked File Hashes** - Allows you to add or import new file hashes and manage the existing blocked file hashes. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Reset risk score. **Note:** You can perform the above actions from the right-click context menu.
3	**Sort Columns.** Lets you sort on column titles.
4	**Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.
5	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Risk details** - Displays the distinct alerts associated with the risk score. **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. For more information, see Analyze Hosts with File Activity.
6	**Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files.

File Details View

To access this view, go to **Files**, and select a file. Below is an example of the File Details view:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to perform external lookups. **On Hosts** - Indicates the number of hosts on which a file exist. **Signature** - Provides signatory information. **Size** - Size of the file. **File Status** - Status of the file. For example, `Neutral`.
2	**Alerts Severity** tab - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert. **Analysis** tab - Provides detailed information about a downloaded file. For more information, see Analyzing Downloaded Files.
3	Displays events for an alert and metadata associated with a specific event.
4	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Hosts** - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

Hosts View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

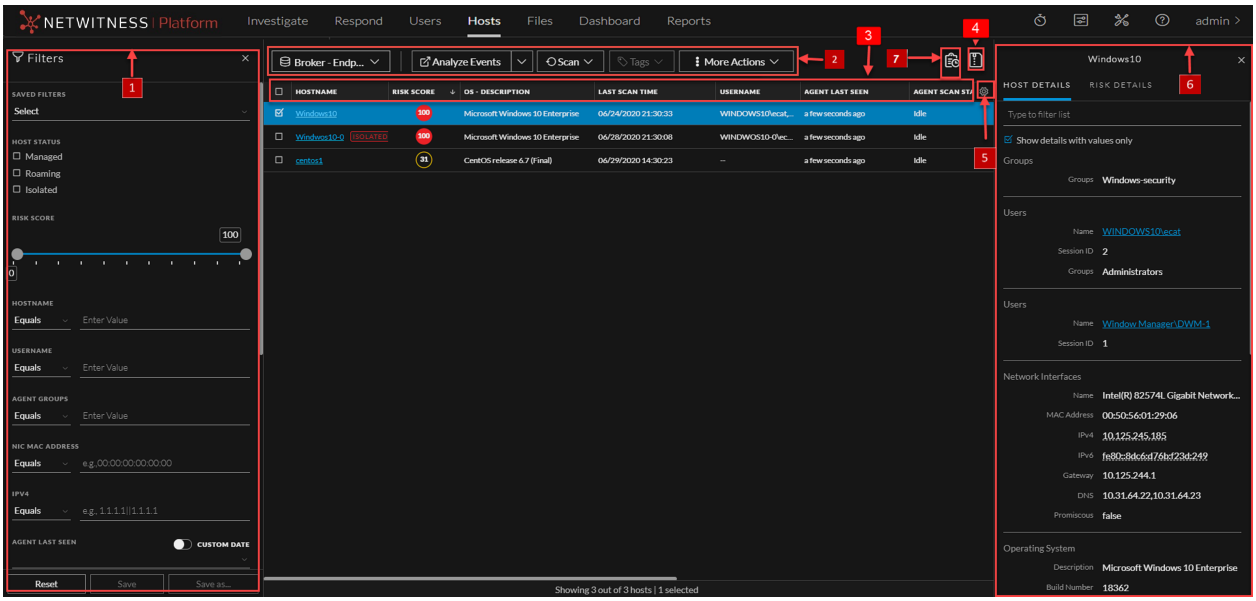
The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **Hosts**. By default, hosts are sorted based on the risk score.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details*	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes*	Investigating a Process
Threat Hunter	review reported anomalies*	Analyze Anomalies

User Role	I want to ...	Show me how
Threat Hunter	analyze risky users*	Analyzing Risky Users
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate
Threat Hunter	filter files*	Filter Host Details
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT*, system dump*, or process dump	Performing Host Forensics



*You can perform this task in the current view.

Quick Look

Below is an example of the Hosts view:

1 **Filter Hosts**.You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

Start Scan - Starts a scan for the selected hosts.

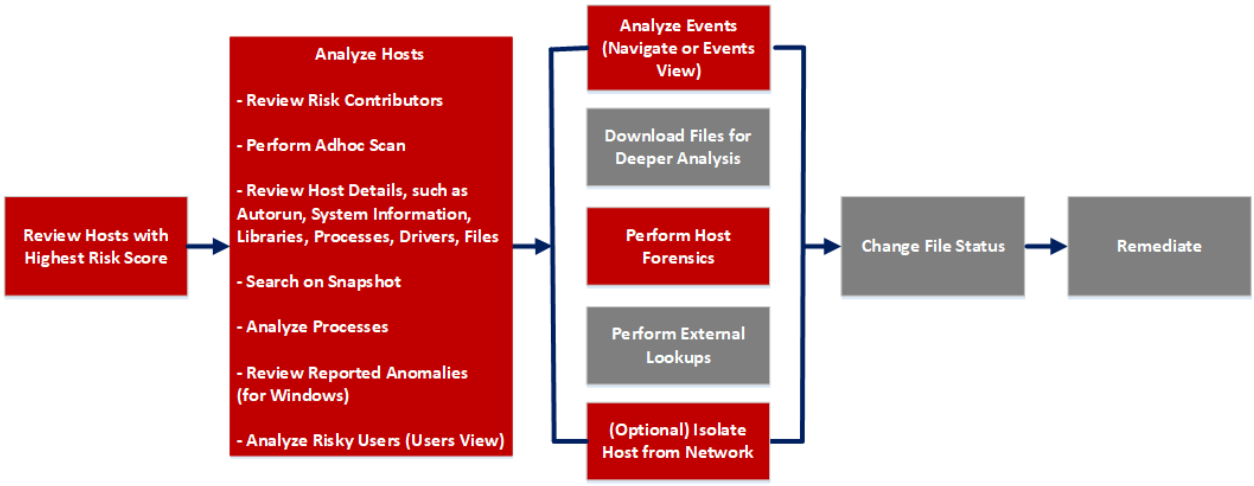
Stop Scan - Stops a scan for the selected hosts.

More Actions - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on column titles.



4	**Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.
5	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.
6	**Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs: **Host details** - Displays the host information such as Network Interfaces, operating system, hardware and others. **Risk details** - Displays the distinct alerts associated with the risk score.
7	**View Agent History** - Displays the list of commands issued to the agent. For more information, see View Agent History.

Hosts View - Details Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **Hosts** view, and select a host.

Workflow

What do you want to do?

- Isolating Hosts from Network

Quick Look

Below is an example of the Details tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.

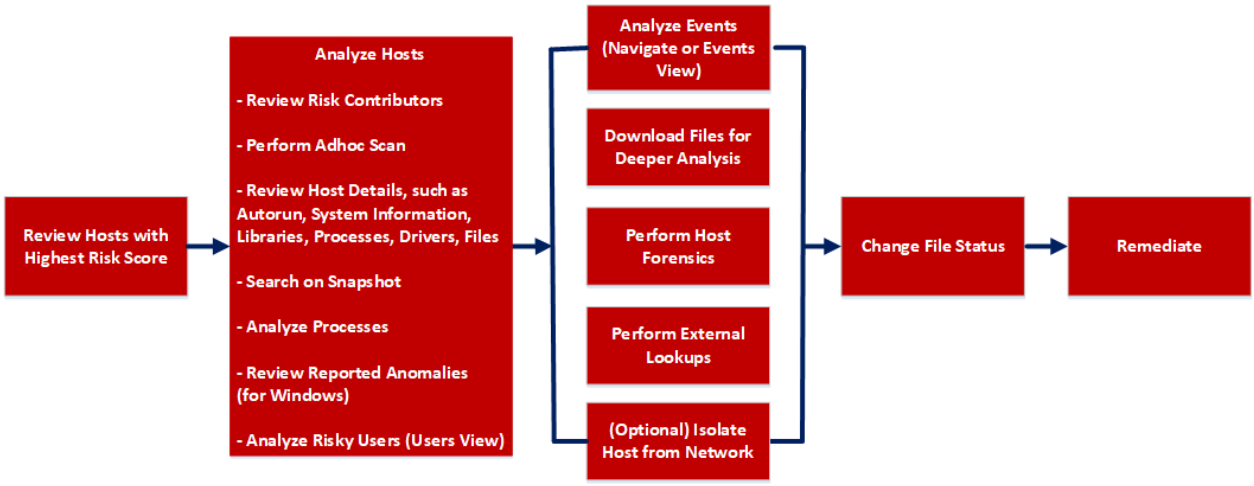
2	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**Show/Hide Right Panel** - Displays host and policy details panel.
4	**Host Details Panel** - Displays all properties of the selected host. It is grouped as follows: **Groups** - Groups on which the host is added on. **User** - Information related to the user. **Network Interfaces** - Network adapter information, such as Mac Address, Gateway. **Operating System** - Operating system version and build information. **Agent** - Agent-related information, such as agent ID, driver error code, install time, and agent mode. **Hardware** - Information related to the architecture. **Locale** - Time zone and language that is local to the host.

5 **Policy Details Panel** - Displays the following:

- Policy Status -
  - Updated - Host has the latest policy.
  - Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
  - Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
  - Error - Problem applying the latest policy along with the error description.
- Blocked Hashes Status -
  - Updated - Host has the latest blocked hashes.
  - Pending - Hashes are blocked but the latest hashes are not updated on the host. When the host communicates with the Endpoint server next time, the latest hashes are applied if there are no errors.
- Evaluated Time - Time when the Endpoint server evaluated the policy.
- Relay Server. Displays the Relay Server details.
  - Server - Host name or IP address of the Relay Server.
  - Port - Port number.
  - HTTP Beacon Interval - HTTP beacon interval value in minutes.
- Complete resolved policy settings. For more information, see "Managing Policies" in the *NetWitness Endpoint Configuration Guide*.

Note: The values that are not set in the policy are not displayed.

6 **Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.



7 Displays events for an alert and metadata associated with a specific event. For more information, see Analyze Hosts Using the Risk Score.

Hosts View - Process Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

Workflow

- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

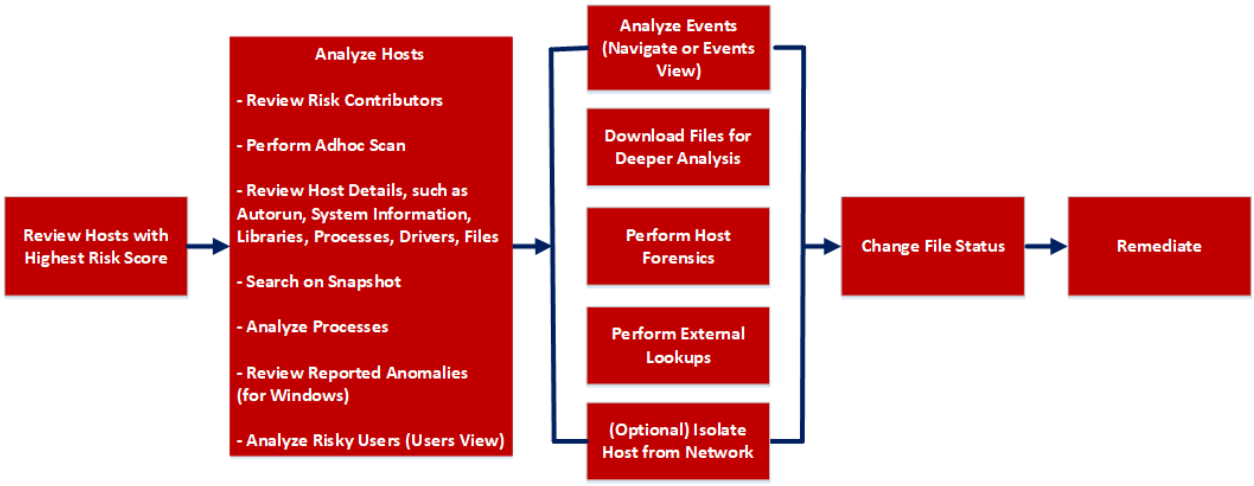
Snapshot Time - Lists scanned time stamps. To view the scan history, you select the snapshot time from the drop-down menu.

2	**Actions in the toolbar:** **Analyze Process** - Lets you perform process analysis to investigate a particular process behavior, and understand the entire process event chain, process parent-child relationships, and all associated events. For more information, see Investigating a Process. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Download process dump to server. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Toggle.** Lets you toggle between List view and Tree view.
5	**Process panel** - Displays process information, such as process name, local risk score, global risk score, On Hosts, reputation status, file status, and others.
6	**Show/Hide Right Panel** - Displays the following properties of a process in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Process** - Details of the process, such as image size and PID. **Image** - Image details loaded by the process. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
7	**Filter Files**. You can filter processes by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:

Field	Description
Process Name	Name of the process. For example, `server.exe`.
PID	ID of the process. For example, `492`.
Path	Path of the file associated with the process on the disk. For example, `C:\Windows\System32`.
Launch Arguments	Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`.



- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

Hosts View - Autoruns Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**All Files Available on Host** - Lists all files (reported as part of scan and tracking) on the host. By default, **All Files Available on Host** toggle is enabled for Windows and Mac.
5	**Details Panel** - Displays information, such as filename, local risk score, global risk score, on hosts, reputation status, file status, package details and others.
6	**Show/Hide Right Panel** - Displays the following properties in the right panel: • Details - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. • Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • Hosts - Displays the top 100 hosts based on the risk score on which the file is present.
7	Clicking a filename lets you navigate to the Files view for further analysis.
8	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. **Note:** In the **Deleted** column, a trash icon appears next to the deleted file. The **Deleted** column is not displayed if you disable **All Files Available On Host**. For more information, see Filter Host Details.
9	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Drivers Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Drivers tab lists the drivers running on the hosts at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Drivers** tab.

Workflow

What do you want to do?

Quick Look

Below is an example of the Drivers tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

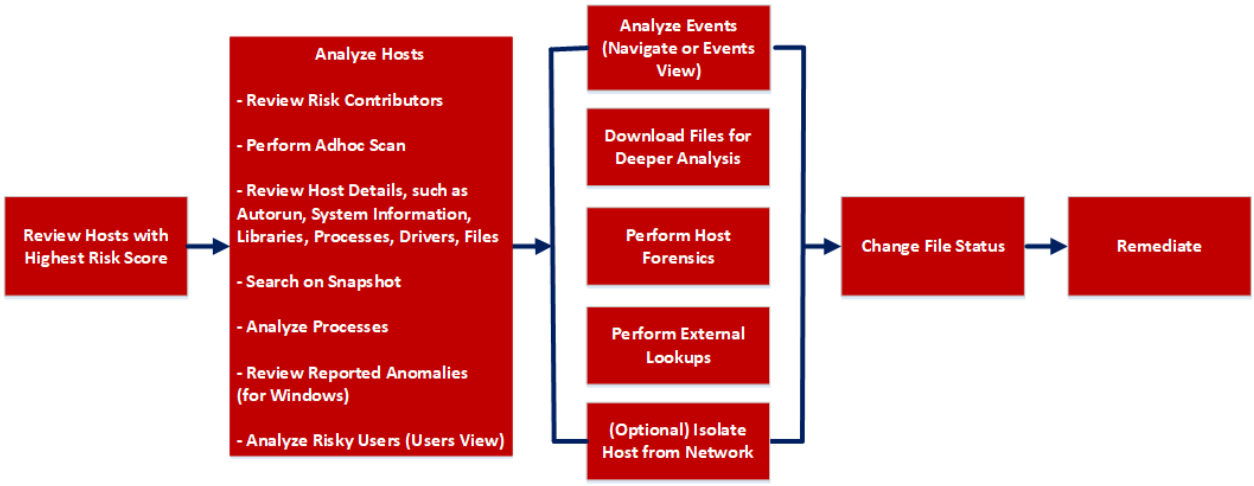
Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.



2	**Actions in the toolbar:** **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Details Panel** - Displays information, such as filename, local risk score, global risk score, on hosts, reputation status, file status, and others.
5	**Show/Hide Right Panel** - Displays the following properties in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Image** - Loaded image. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
6	Clicking a filename lets you navigate to the Files view for further analysis.
7	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Libraries Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Libraries tab lists the libraries loaded at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Libraries** tab.

Image Hooks

Image hooks found in executable image are displayed in the following columns.

Columns	Description
Type	Type of the hook . Possible values are - inline, iat, eat, or exception Handler.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Hooked Process	Process in which hooks are placed.
Hooked Filename	Name of the file that was modified by the hook.
Hooked Symbol	Symbol in which the hook is performed.

Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

Category	Description
Type	Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt.
Driver name	Name of the driver which placed the hooks.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.

Category	Description
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Object Function	Name of the object function hooked into.
Hooked File Name	Name of the file that was modified by the hook.

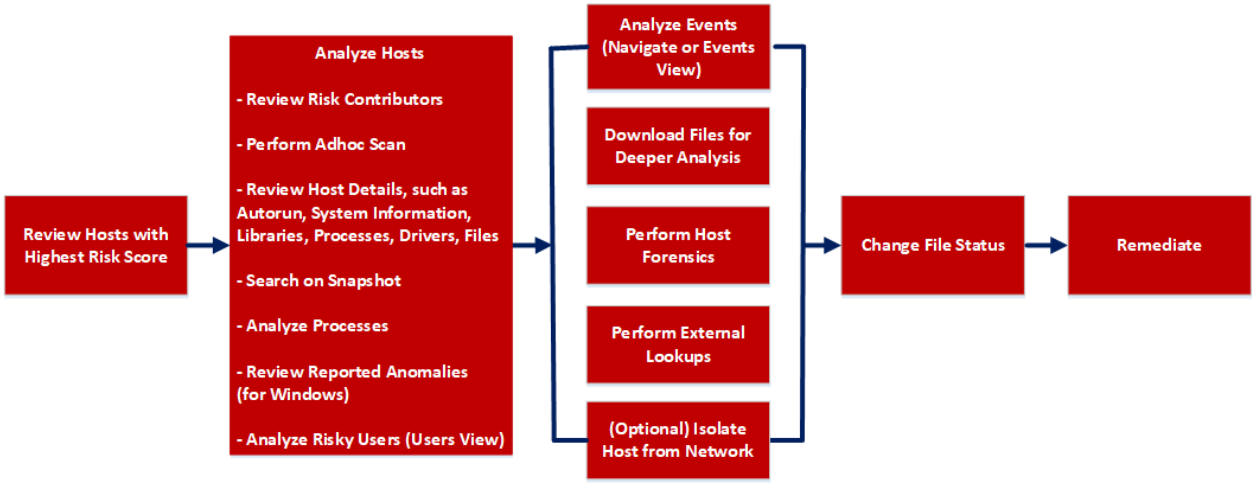
Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

Category	Description
Start Address	Start Address - Start address of the thread.
DLL Name	Name of the DLL.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Process	File name and PID of the process in which thread is running.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Signature	Provides signatory information.
Thread ID	ID of the running thread.
Thread Environment Block	Address of the thread environment block.

Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.



Category	Description
Hive	Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`.
Reason	Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch.
Registry Path	Registry path that is affected. The value is separated by a @ character.
Raw Type	Value type found in the low-level parsing.
Raw Data	Value data extracted from the low-level parsing.
API Type	Value type from the Win32 registry API.
API Data	Value data from the Win32 registry API.

Hosts View - Downloads Tab

Note: The information in this topic applies to NetWitness Version 11.4 and later.

The Downloads tab provides information about all downloads (MFT, files, system dump, and process dump) performed on the host. To access this tab, select a host from the **Hosts** view and click the **Downloads** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how

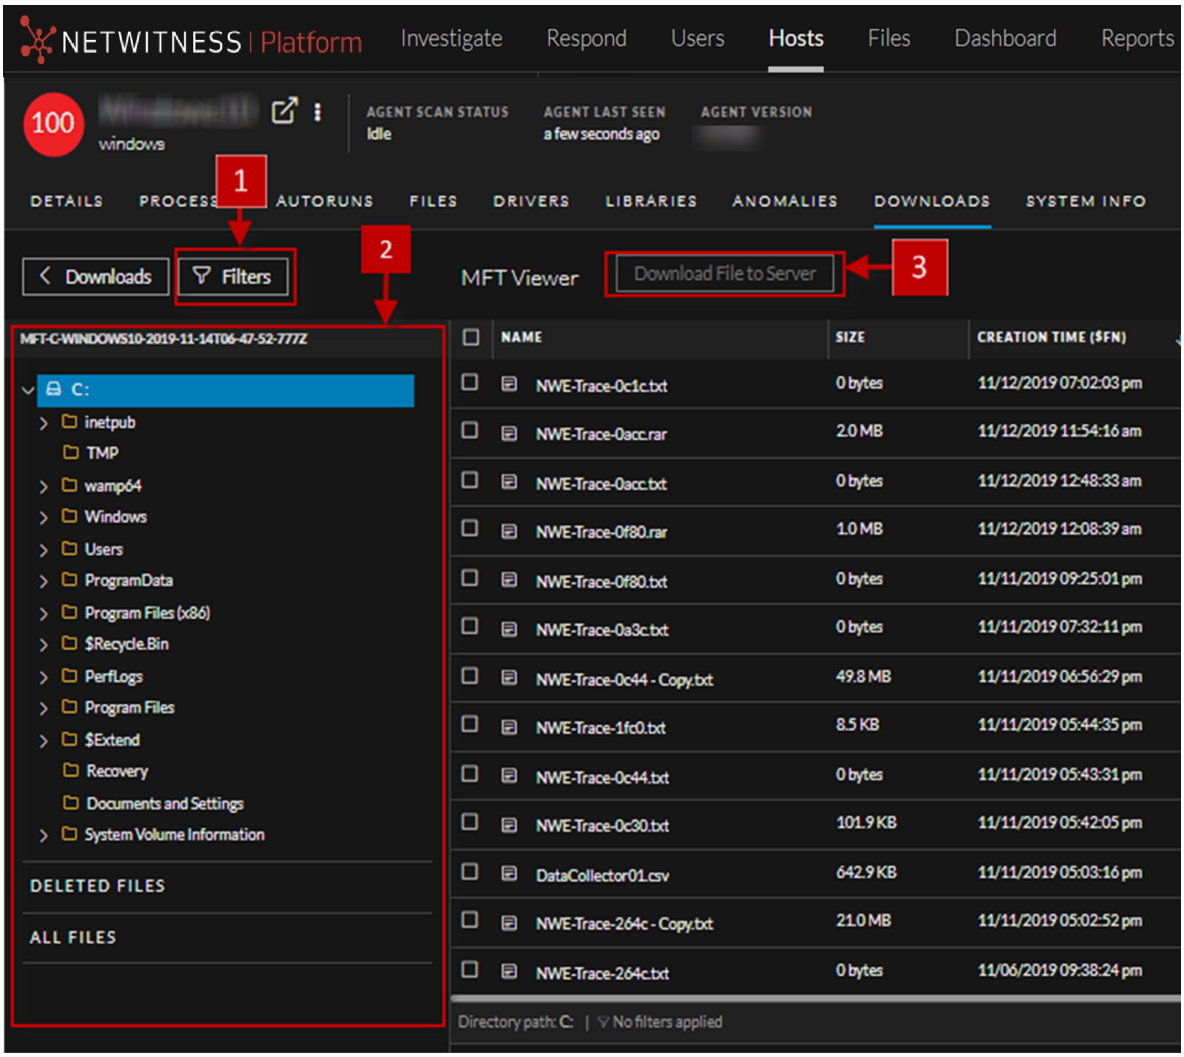
Quick Look

Below is an example of the Downloads tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download files to the server. For more information, see Download Files Using Full Path or Wildcard. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.
2	**Filter Files**. You can filter downloaded files by selecting the options in the Filters panel and create filters. For more information, see Performing Host Forensics.
3	**Actions in the toolbar:** **Save a Local Copy** - Lets you retrieve the downloaded MFT and save it to your local file system for further analysis. **Delete File** - Deletes the downloaded MFT from the server. For more information, see Performing Host Forensics.
4	**View MFT Details**. Click the filename to view the MFT details. For more information, see MFT Viewer.

The table displays the following information:



Column	Description
File Name	Name of the file that is downloaded. For example, `VGAuthService.exe`.
Type	Type of file downloaded - MFT, file, memory dump.

Column	Description
Downloaded	Status of the download:  - Download successful  - Processing the downloaded file  - Errors including download failed  - Errors downloading one or more files in the group.
Size	Size of the downloaded file.
Downloaded Time	Time when the MFT was downloaded.
SHA256	SHA256 of the file. **Note:** This is applicable only for files.

MFT Viewer

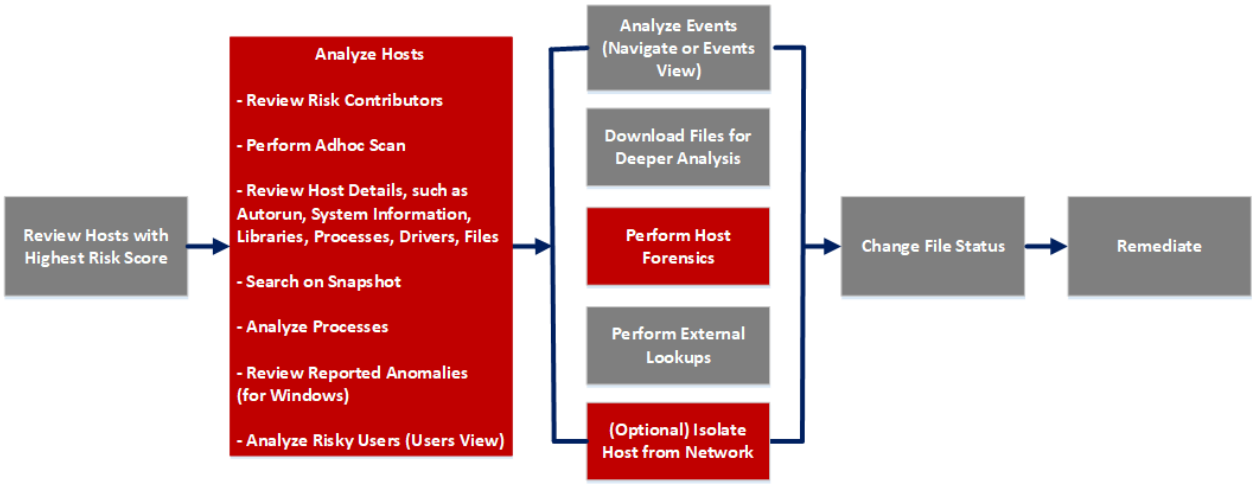
You can analyze the downloaded MFT using the MFT Viewer. For more information, see Analyze Downloaded MFT.

Below is an example of the MFT Viewer:

1. **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter MFT.
2. **Folder Details**. Lets you view the content of the MFT.
3. **Download File to Server**. Downloads files to the server.

The table displays the following information:

Column	Description
Name	Name of the file. For example, `dtf.exe`.
Size	Size of the file.
Creation Time ($FN)	File Name ($FN) creation time.
Creation Time ($SI)	Standard Information ($SI) creation time.



Column	Description
Modification time ($FN)	$FN modified time.
Modification time ($SI)	$SI modified time.
Access time ($FN)	$FN access time.
Access time ($SI)	$SI access time.
Update time ($FN)	$FN updated time.
Update time ($SI)	$SI updated time.
Full Path	Path of the file.
Allocated Size	File size on the disk.
Archive	Indicates if a file is archived.
Compressed	Indicates if a file is compressed.
Encrypted	Indicates if a file is encrypted.
Hidden	Indicates if a file is hidden.
Directory	Indicates if it is a directory.
Extension	Type of the file. For example, exe, pdf, txt.

Hosts View - System Information Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The System Information tab lists the agent system information. To access this tab, select a host from the **Hosts** view and click the **System Information** tab.

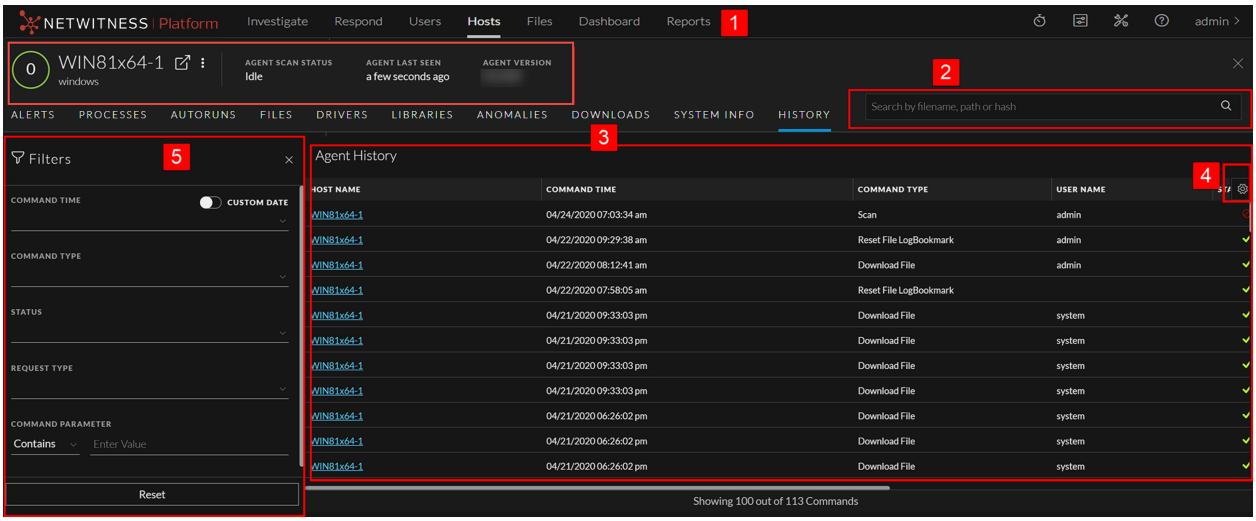
For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.
2	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**System Information Panel** - See System Information Panel.

System Information Panel

The System Information panel displays the following tabs:

Tabs	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.



Tabs	Description
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Security Configuration	Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.
Installed Applications	Displays the information about the various applications installed on a Windows machine.

Hosts View - Agent History Tab

The Agent History tab lists the commands along with the respective status and additional details.

Quick Look

Below is an example of the Agent History tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

2 **Search files on host**. Lets you search the files on the host (file name, file path, and SHA-256 checksum).

3 **Details Panel**- Displays information, such as:

- **Command Time** - Command issued time.
- **Command Type** - Type of the command (Identity, scan, stop scan, download file, MFT, process dump, system dump, start isolation, update isolation exclusion list, stop isolation, reset file logbookmark, and download multiple files, agent upgrade, and uninstall agent) issued.
- **User Name** - User who issued the command. For example, Analyst, System.
- **Status** - Status (success, pending, expired, failed, or cancelled) of the command issued.

Note: If the command's status is expired, it means that the agent is unable to process the command even after five retries.

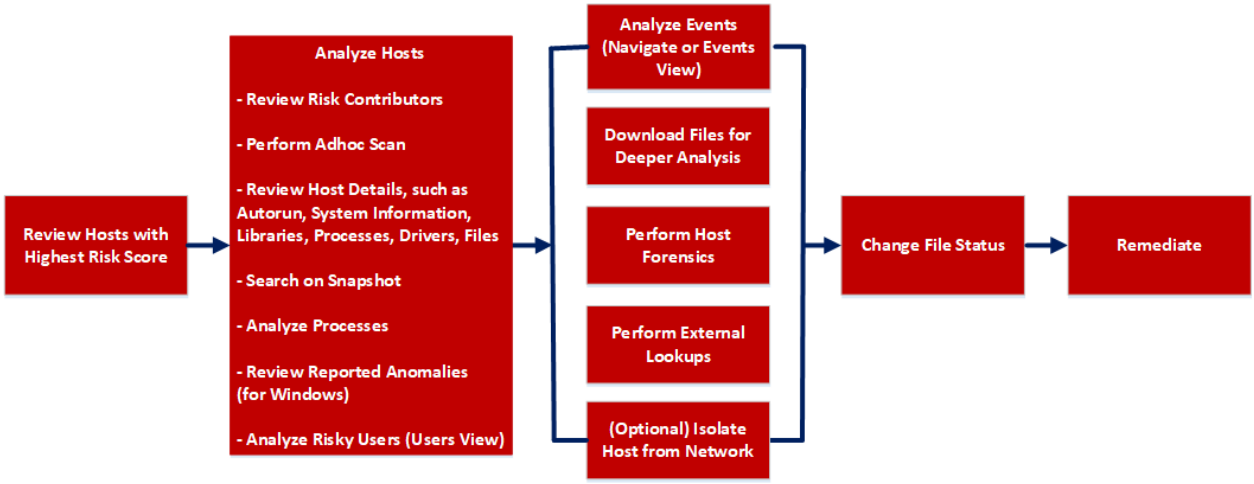
- **Command Parameter** - Parameters associated with the command. For example, Command parameter for command type Download File is `path = C:\Windows\System32\ | filename = cmd.exe | hash = 6f88fb88ffb0f1d5465c2826e5b4f523598b1b8378377c8378ffebc171bad18b`

Note: Command types such as identity, scan, stop scan, stop isolation, system dump do not contain any associated command parameters.

- **Processed Time** - Time at which the command is completed, pending, expired, failed, or cancelled.
- **Last Retrieval time** - Last time when the command is issued to the agent.
- **Total Retrieval** - The number of times the command is issued to the agent.

Note: After you upgrade to NetWitness version 11.5, the commands executed in the previous versions are displayed automatically. The fields such as last retrieval time, total retrieval, and user do not contain any values. For system generated commands, the user field value shows as system.

4 **Filter Files**. You can filter commands by selecting the options in the Filters panel. For more information, see Filter Host Details.



5 **Settings Menu.** You can set History view preferences by selecting columns from the Settings menu.

Hosts View - YARA Rules Tab

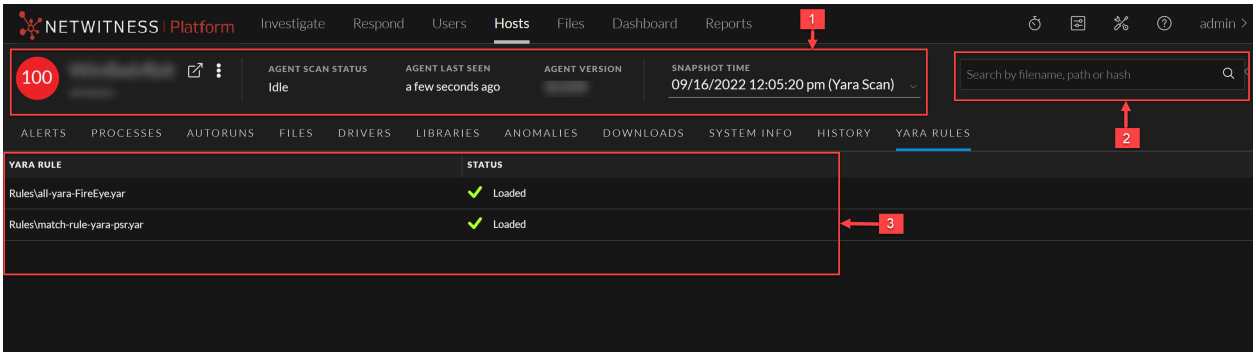
Note: The information in this topic applies to NetWitness Version 12.0 and later.

The **YARA Rules** tab lists the various YARA rules used for the scan and their status. To access this tab, select a host from the **Hosts** view and click the **YARA Rules** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes	Investigating a Process
Threat Hunter	review reported anomalies	Analyze Anomalies
Threat Hunter	analyze risky users	Analyzing Risky Users
Threat Hunter	analyze events	Analyzing Events
Threat Hunter	download files for deeper analysis	Analyzing Downloaded Files
Threat Hunter	perform external lookups	Launch an External Lookup for a File
Threat Hunter	change file status or remediate	Changing File Status or Remediate
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT, system dump, or process dump*	Performing Host Forensics



*You can perform this task in the current view.

Quick Look

Below is an example of the **YARA Rules** tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `12.0.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.
2	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**YARA Rules Panel** - Displays the following tabs: • **YARA Rule**: This tab lists all the YARA rules used for the scan. • **Status**: This tab displays the status of the YARA rules. For Example: If the YARA rule is successfully loaded, the status is displayed as **Loaded**. For more information on YARA Scans, see *Analyze Files Using YARA* section in Investigating Files topic.

Getting Started with ESA

This topic covers quick start topics for NetWitness Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules is highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user has five failed login attempts within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

Note: ESA sends alerts to NetWitness Respond for processing and the alerts are eventually stored in a database. If your rule creates too many alerts, it can slow down another part of the system.

When writing and deploying rules, you should be aware that rule memory usage and alert generation consume system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events**. The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Validate your ESA rules within the Rule Builder or Advanced EPL Rule Builder before you deploy them**. To prevent errors in your rules and confirm that they generate the expected alerts, you can test the rule logic with JSON data within the rule builders. This capability is available in NetWitness Platform version 11.5 and later. For more information, see Validate an ESA Rule and Validate an Advanced EPL Rule .
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded.
- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.

- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Add Memory Thresholds to ESA rules that use memory**. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the rule goes over the allotted memory threshold, it gets disabled individually and an error is displayed for that rule on the  **(Configure) > ESA Rules > Services** tab. This capability is available in NetWitness Platform version 11.5 and later.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

For more best practice information for writing ESA rules, see ESA Rule Writing Best Practices.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Working with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and

effective detection of events.

- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory usage for your ESA in the Health and Wellness tab. For more information, see "View Detailed Statistics in Health and Wellness" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Working with Trial Rules.
- **Set up thresholds in Health & Wellness to alert you if memory usage is too high**. There are metrics in NetWitness Health & Wellness that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see View Memory Metrics for Rules.
- **Monitor memory metrics for each rule in Health & Wellness**. For each rule, you can view the estimated memory usage in Health & Wellness. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see View Memory Metrics for Rules.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Correlation Services

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA Correlation service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA Correlation service machine may be down. To bring up ESA Services: Go to **(Admin) > Services**, select your ESA service, and then select **> Start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable.	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Go to **(Admin) > Services**, select your ESA service and then select **> Edit**. In the Edit Service dialog, click **Test Connection**. If the connection fails, you likely have a configuration error. Attempt to fix your configuration error and try again.
Suddenly, an ESA Correlation service is completely unresponsive and appears to have crashed. The ESA Correlation Log file shows a Too Many Open Files error.	Connectivity issues	The most likely cause for this error is a connectivity issue between the ESA Correlation service and a data source used in an ESA rule deployment, such as a Concentrator or Decoder. 1. Restart the ESA Correlation service. 2. Go to **(Admin) > Services**, select your ESA service and then select **> Restart**. 3. Check the connectivity from ESA to the data source. Look for connection errors in the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`. For example: `Error: com.rsa.netwitness.streams.RecordStreamException: admin@<ip address>:56005:: com.rsa.netwitness.streams.RecordStreamException: connect::com.rsa.asoc.transport.nw.session.NextgenException: Failed to connect to <ip address>:56005` If there are network connectivity issues, fix the issues and then restart the ESA Correlation service again to see if it fixes the problem. If you have a data source with intermittent connectivity, you should remove it from the ESA rule deployment.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to  **(Configure) > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.
		If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.
		Then, search for a message similar to the following:
		`"Property named '<meta_name>' is not valid in any stream"`
		For example, you might see:
		`Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`
		If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot ESA Rules

Problem	Possible Causes	Solutions
I have an ESA rule that is not getting deployed and is not creating alerts.	A meta key that the rule uses is a string array type, but it shows as a string type on ESA.	Check to see if any string array meta keys that the rule uses are configured as string array types on ESA. Go to  **(Configure) > ESA Rules > Settings** tab (Meta Key References). • If it shows `string[]`, it is configured as a string array type on ESA. This is fine. • If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. In the ESA Correlation service Explore view, go to `correlation/stream`. Add string array meta keys to the **multi-valued** list to allow them to be used as an array in ESA rules. Go back to the Meta Key References and click the refresh icon (). Verify that the meta keys with a string array type show a value of `.string[]`. For additional details, see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *ESA Configuration Guide*.
I set up notifications for a rule, but we are not receiving them. The `correlation-server.log` file does not show any errors. Why?	Correlation-server successfully sent the notification messages to integration-server, but when integration-server tried to send the notifications to their destination, it failed.	When troubleshooting notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). For an example, see Integration-Server SMTP Notification Error Example. **Note:** For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification.

Problem	Possible Causes	Solutions
I created a rule with an enrichment, added an SMTP notification, and deployed my rule. We are not receiving SMTP notifications. Why?	You do not have a template that met the criteria to parse the events.	Check the ESA Correlation service log files to see if the SMTP notification failed: `/var/log/netwitness/correlation-server/correlation-server.log`. For more details on the notification error, check the Integration-Server log file on the NetWitness Server (also known as Node 0, Admin server, or NWServer): `/var/log/netwitness/integration-server/integration-server.log`. If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. See SMTP Notification Error Example below for a notification error example. For information on creating a custom ESA template, see "Define a Template for ESA Alert Notifications" in the *System Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the Offered Rate statistic on the  **(Configure) > ESA Rules > Services** tab. Select the ESA service and then look at the statistics on the tab for the Deployment. If the Offered Rate is zero, then the ESA service is not receiving data from Concentrators. Check the ESA Correlation log files for connectivity issues: `/var/log/netwitness/correlation-server/correlation-server.log`. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in  **(Configure) > ESA Rules > Settings** tab (Meta Key References).

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	There may be a problem with the rule.	**If a specific rule is not firing**, go to **(Configure) > ESA Rules > Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.
After a recent upgrade, I am not seeing alerts and I am seeing disabled rules.	There may be a problem with the ESA rule deployment.	Deploy the ESA rule deployments again. Create a Deployment steps in the Live Services Management Guide provides more information on deploying rules using the ESA Correlation service. If this does not resolve the issue, check the ESA Correlation log files for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
After an update or upgrade to 11.3.0.2 or later, if I try to make an adjustment to some rules, I get an error when trying to save them.	The Ignore Case option may be selected for a meta key that does not contain alphabetic values, such as IP address.	In NetWitness Platform 11.3.0.2 and later, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text values. Adding Ignore Case on meta keys which do not contain alphabetic values causes additional processing to occur for no added benefit. In the ESA Rule Builder - Build a Statement dialog, check to see if you have any meta keys that do not contain alphabetic characters, for example, ip_src and ip_dst. If you do, clear the **Ignore Case** checkbox for those meta keys and try to save the rule again.

Problem	Possible Causes	Solutions
After an upgrade to 11.3.0.2 or later, I see a warning message in the ESA Correlation service log file showing a difference between the multi-valued and default-multi-valued parameter meta key values. Why?	You do not have the required meta keys on ESA Correlation that the Endpoint, UEBA, and Live content rules need to work.	If you want to use the latest Endpoint, UEBA, and Live content rules, add the necessary meta keys to the `multi-valued` and `single-valued` parameter fields. For detailed information and instructions, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.
Meta keys marked as sensitive for data privacy are still included in notifications and alerts for some rules.	In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view. 1. Add the ESA generated `event_source_id` meta key to the `index-concentrator-custom.xml` file. 2. Add the `event_source_id` meta key to the SELECT statement within any ESA rule that does not select every piece of metadata from the session. 3. After the Concentrator changes take effect, redeploy the ESA rule deployment that contains the ESA rule. To do this, see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id. For NetWitness 11.4 and later, to resolve the data privacy issue, see How to Remove Sensitive Meta Keys Globally from All Alerts.

Problem	Possible Causes	Solutions
The **Pivot to Investigate > Navigate** link does not work in a context tooltip accessed from Respond.	In ESA rules that do not select every piece of meta from the session (that is, using `select *`), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	For NetWitness 11.3 and later (including 11.4), see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id.
I added a data source filter to the data sources in my ESA rule deployment. It was working fine and then all of a sudden, I stopped receiving alerts.	If there are any adjustments to an application rule on the Decoders that are mapped to the data sources used in your data source filter, the filter does not work for that rule since the application rule used in the filter no longer exists.	The optional data source filter is available in NetWitness 11.5 and later. If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.
I added a data source filter to the data sources in my ESA rule deployment and I see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file.	You are filtering out a large portion of the traffic and less sessions match the aggregation criteria.	In the Explore view node list for an ESA Correlation service, select **correlation > stream**. Decrease the `max-sessions` parameter from 10,000 to a lower session count and restart the ESA Correlation service. For step-by-step instructions, see .
I created a rule using a Context Hub list and it was working properly, but suddenly, the rule stopped firing and ESA is not processing any rules.	If a Context Hub list that is used by ESA Correlation is renamed or deleted, ESA will not be able to access the list and may halt processing for all rules.	Do not rename or delete a Context Hub list that is used in a deployed ESA rule. ESA Correlation will also not be able to access a Context Hub list if you delete it and then add it again with the same name while the rule is deployed. If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

SMTP Notification Error Example

The following SMTP notification error example is an excerpt from a `correlation-server.log` file, which shows an error message for sending notifications with unsupported templates. In this example, there is a rule that is configured with the GeoIP enrichment, which has a hash table as one of its fields (the GeoIPLookup meta). Because the default SMTP template is only designed to deal with metas that are either singular values or arrays that contain only singular values, such as `"ip.src":"1.1.1.1"` and `"action":["fw:inbound-network-traffic"]`, sending the email notification fails due to the array containing a hash table.

```
FTL stack trace ("~" means nesting-related):

- Failed at: ${value!""} [in template "smtp.ftl" in macro "value_of" at line
1, column 152]

- Reached through: @value_of metadata[key] [in template "smtp.ftl" at line 85,
column 141]

----

...

For "${...}" content: Expected a string or something automatically convertible
to string (number, date or boolean), or "template output" , but this has
evaluated to an extended_hash (LinkedHashMap wrapped into
f.t.DefaultMapAdapter):

==> value!"" [in template "smtp.ftl" at line 1, column 154]
```

Integration-Server SMTP Notification Error Example

The following SMTP notification error example is an excerpt from an `integration-server.log` file, which shows a failure when the Integration-server attempts to send an email notification to the email notification server. In this case, you should check the email notification server configuration in the Global Notifications settings (**(Admin) > System > Global Notifications > Servers** tab).

```
2019-10-09 18:53:42,015 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
Notification|SMTP dispatch failed (Reason: Sending the email to the following
server failed : email.server.com:25)

2019-10-09 18:53:42,100 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
SystemOperation|Failed to forward ResolvedNotification
{server=5c45c867e4b03b89a49b78ba, destination=5c45c854e4b03b89a49b78b9,
content-length=30681}

java.lang.IllegalArgumentException: org.apache.commons.mail.EmailException:
Sending the email to the following server failed : email.server.com:25
```

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" procedure in the *ESA Configuration Guide* should fix the issue.

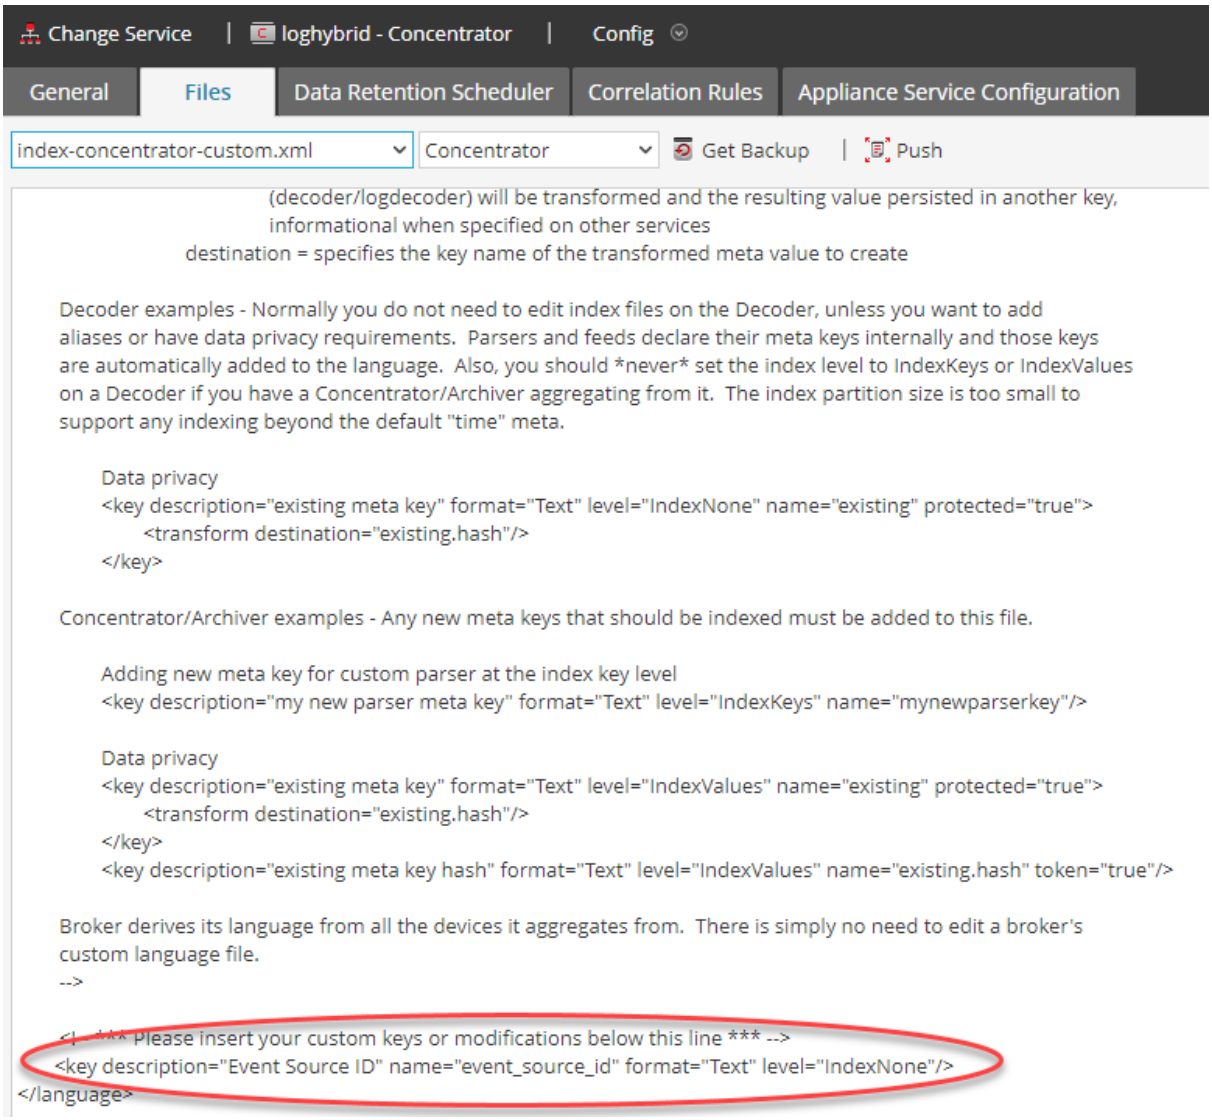
Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,
checksum_src, client_all, content, context, context_all, context_dst,
context_src, dir_path, dir_path_dst, dir_path_src, directory,
directory_all, directory_dst, directory_src, email_dst, email_src,
feed_category, feed_desc, feed_name, file_cat, file_cat_dst, file_cat_
src, filename_dst, filename_src, filter, function, host_all, host_dst,
host_orig, host_src, host_state, ip_orig, ipv6_orig, OS, param, param_
dst, param_src, registry_key, registry_value, risk, risk_info, risk_
suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id



In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.

The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy, instead, see How to Remove Sensitive Meta Keys Globally from All Alerts. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view.

Note: Do not use any Esper keyword as custom meta keys since this causes an error while creating an ESA Rule. For Esper keywords, see Reserved keywords.

1. Update the **`index-concentrator-custom.xml`** file to include the ESA generated **`event_source_id`** meta key. If you do not add the meta key, ESA cannot recognize it and the rule will fail to deploy.
   The following figure shows the file configured for the custom meta key "**`Event Source ID`**" with index settings of "**`IndexNone`**" with a format of "**`Text`**".

   <key description="Event Source ID" name="event_source_id" format="Text" level="IndexNone"/>

To save and deploy the new setting on the NetWitness host, select the **Apply** button. To force the change, restart the Concentrator service or you can wait until the next polling interval for the change to be recognized.

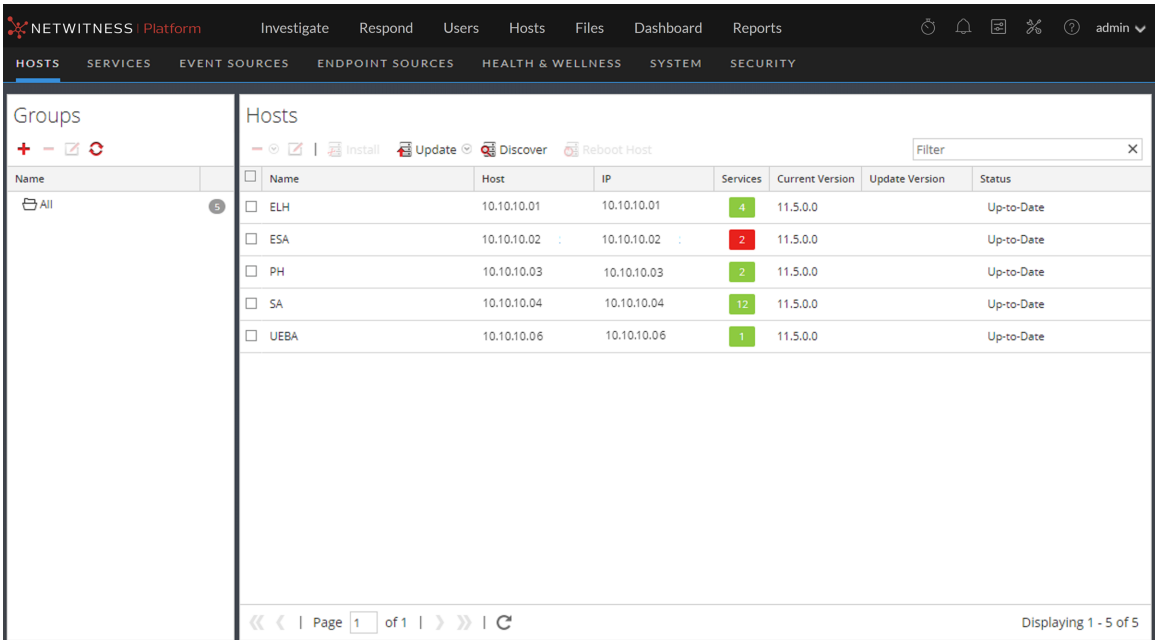
The XML file can also be deployed to other NetWitness hosts by clicking the **Push** button and selecting the destination NetWitness host. Only deploy the XML file to a NetWitness host that runs that service (that is, other Concentrators).

2. Update any ESA rule that selects only certain meta from the session to include the ESA generated **`event_source_id`** meta key. Add the **`event_source_id`** meta key to the **`SELECT`** statement. See the following example rule.

Example Rule with event_source_id

```
@RSAAlert
SELECT user_dst, reference_id, hostname, event_source_id FROM
Event(
```

```
device_class='Windows Hosts',
reference_id IN ('4624' , '4625'),
user_dst IS NOT NULL,
user_dst NOT LIKE '%$',
user_dst NOT IN ('ANONYMOUS LOGON','SYSTEM')
)
.win:time_batch(10 Minutes)
GROUP BY user_dst
HAVING COUNT(distinct hostname) >= 15;
```



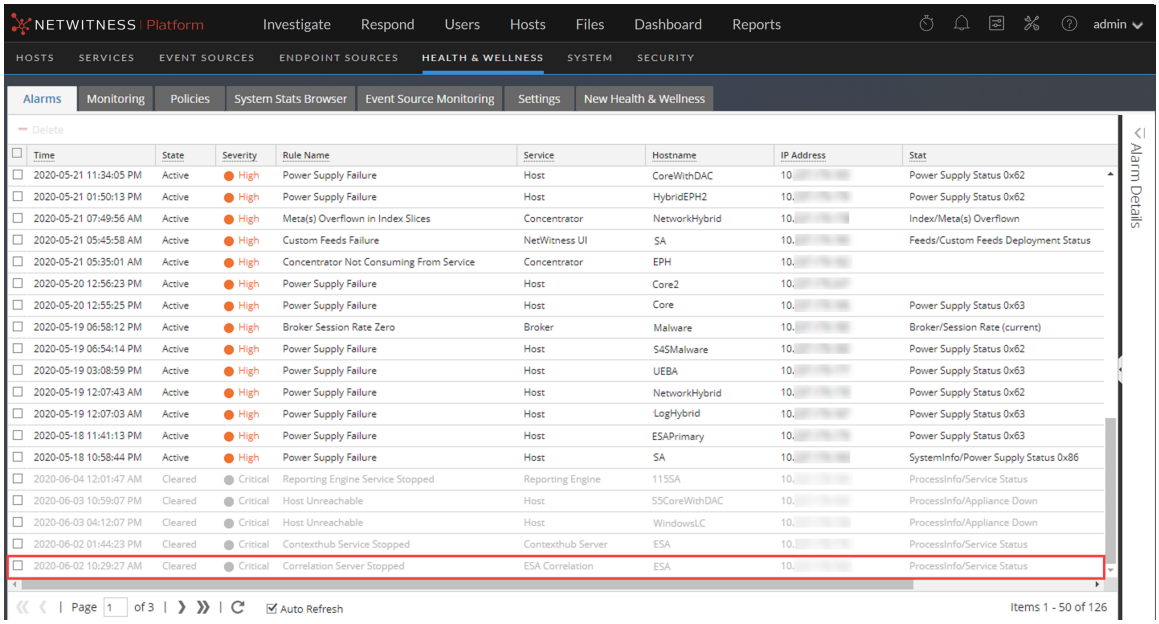
3. After the Concentrator changes takes effect, redeploy the ESA rule deployment that contains the ESA rule.

For additional information, see How ESA Handles Sensitive Data. For information on the stragegy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

Steps to Troubleshoot Memory Issues with an ESA Service Offline

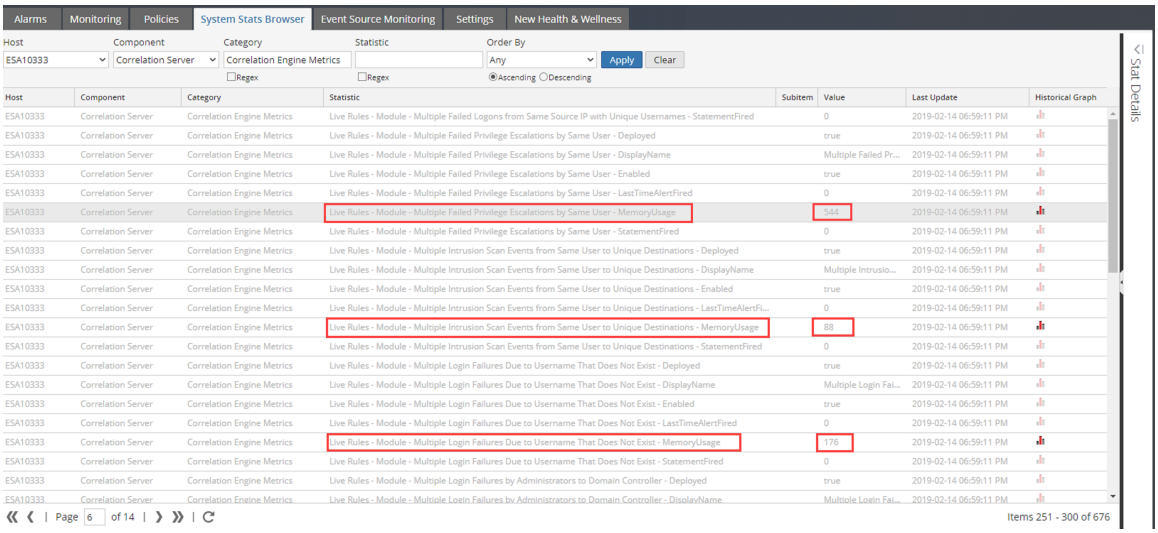
Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to  **(Admin) > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and you may see an error message.



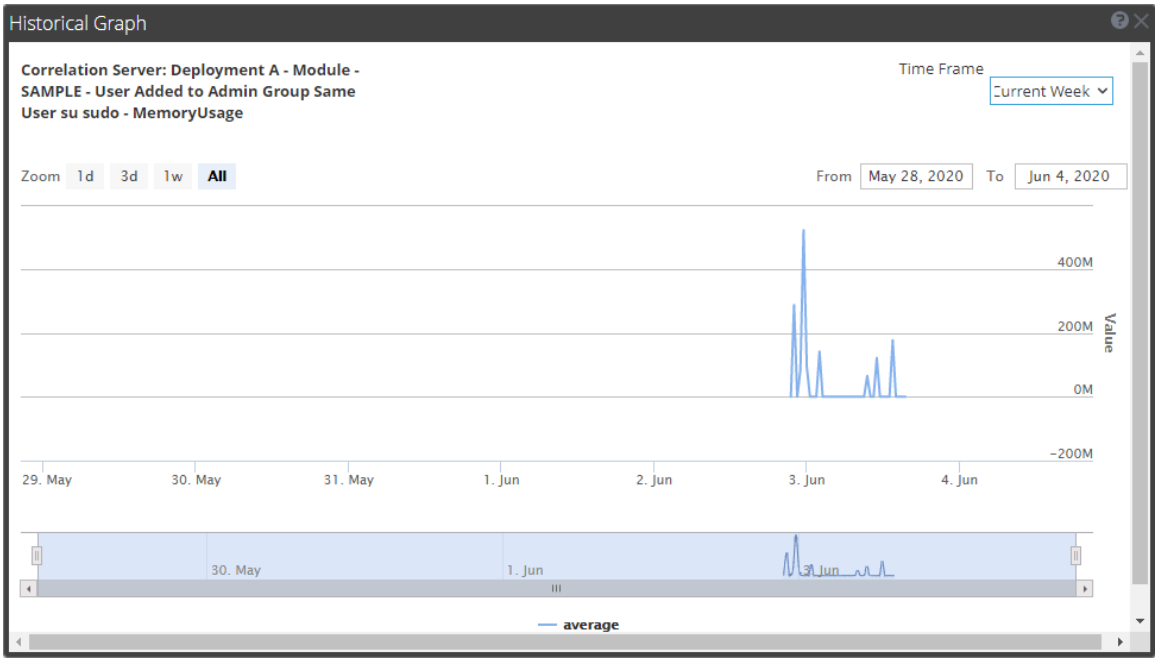
If your host is down, contact your NetWitness Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness



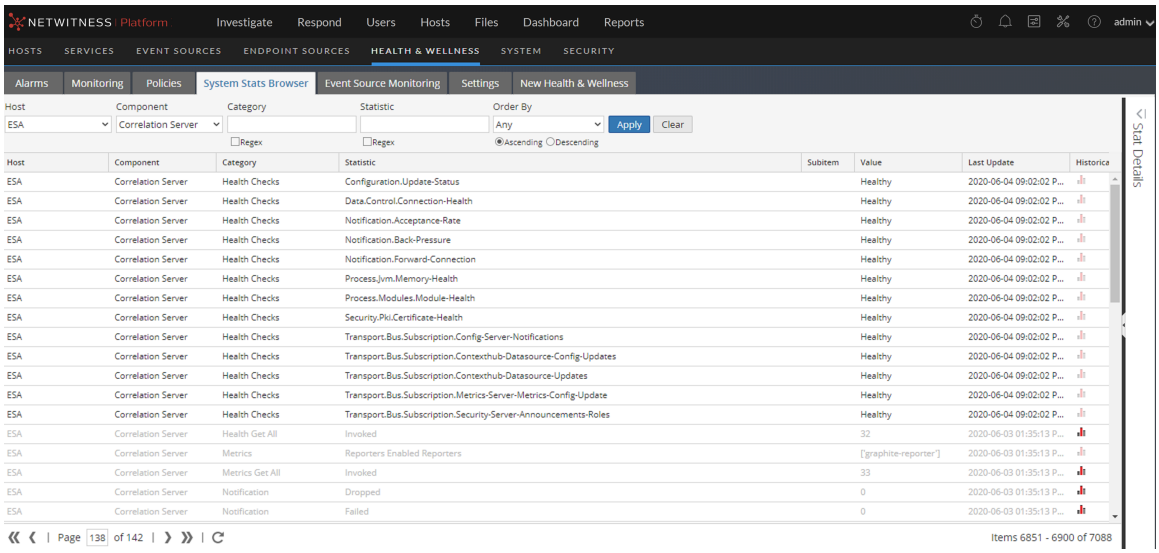
If your ESA service is down, you can go to Health & Wellness and view the **last known metrics** to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail. In NetWitness 11.5 and later, see also View Health Statistics and Trends for ESA Correlation in New Health & Wellness.

1. Go to **(Admin) > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms for ESA Correlation:
   - Correlation Server in Critical State
   - Correlation Server in Unhealthy State
   - Correlation Server Stopped



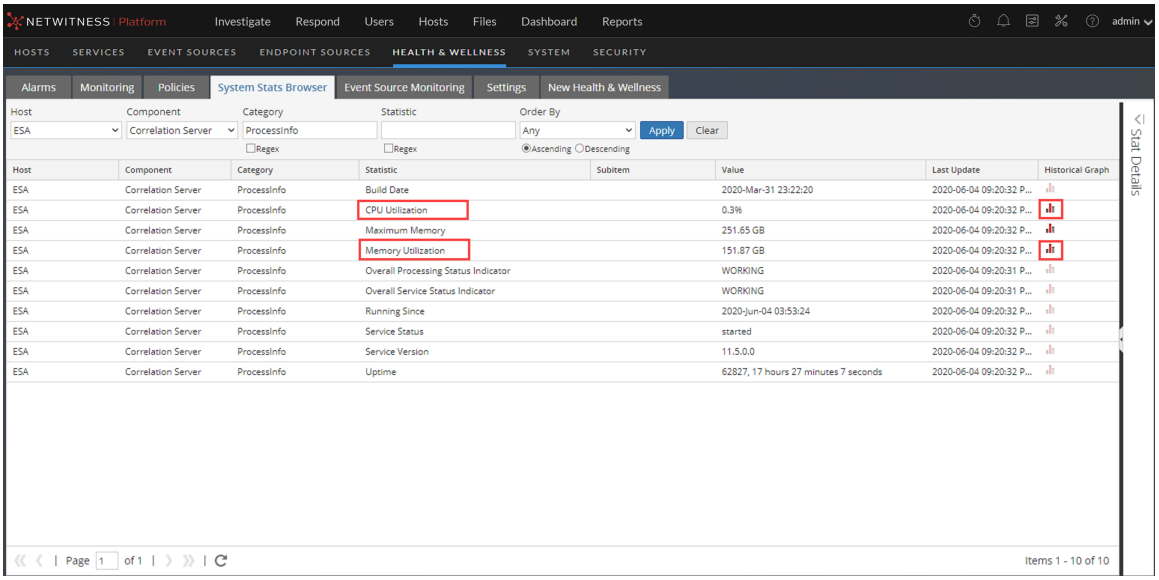
2. Go to **(Admin) > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following and click **Apply**:

Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics



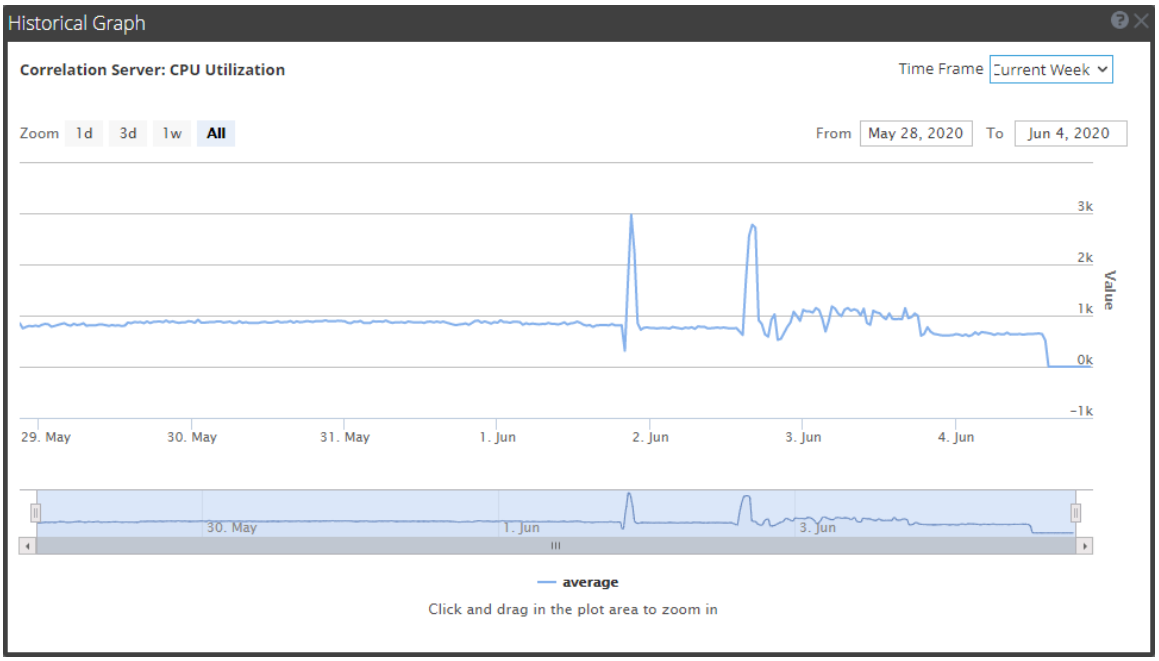
The name of the rule is in the **Statistic** column and the memory usage in bytes is in the **Value** column.

3. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.



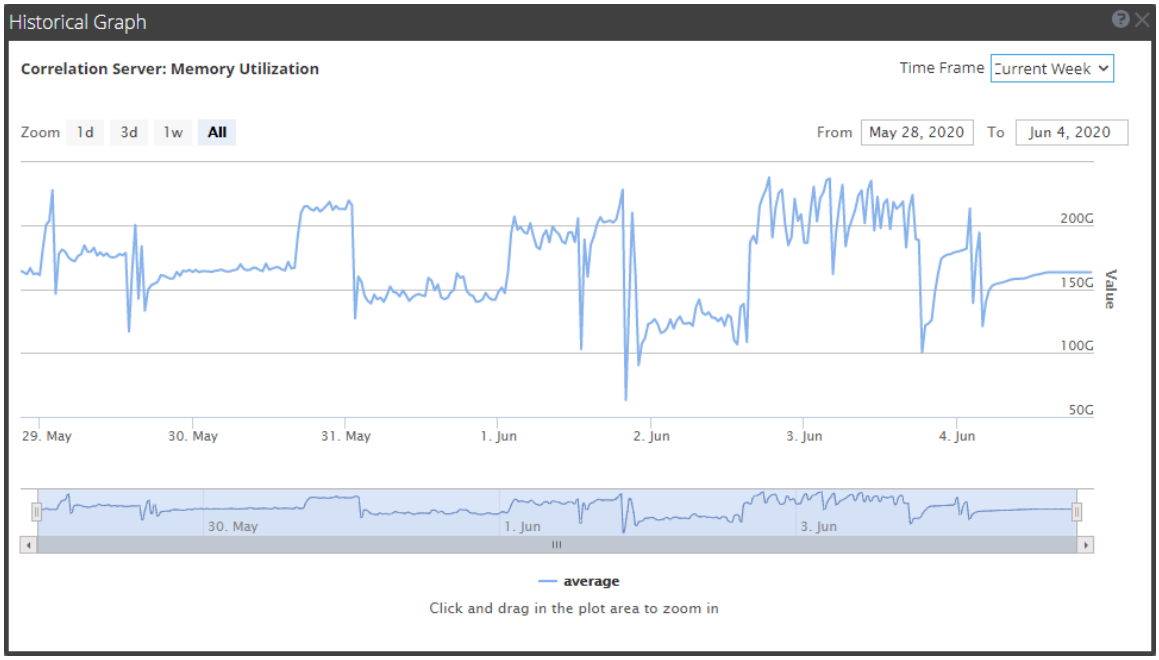
4. In the **System Stats Browser**, you can also see details of your ESA Correlation service performance.

Select your host, and use the following filters to view the following statistics:



Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	49.74%
<your host>	Host	SystemInfo	Memory Utilization	72.87%
<your host>	Host	SystemInfo	Used Memory	183.14 GB
<your host>	Host	SystemInfo	Total Memory	251.65 GB
<your host>	Host	SystemInfo	Uptime	289546, 3 days 8 hours 25 minutes 46 seconds
<your host>	Correlation Server	Process jvm	Memory Total Max	163 GB
<your host>	Correlation Server	Process jvm	Memory Total Used	13.50 GB
<your host>	Correlation Server	ProcessInfo	CPU Utilization	0.3%
<your host>	Correlation Server	ProcessInfo	Maximum Memory	251.65 GB
<your host>	Correlation Server	ProcessInfo	Memory Utilization	151.87 GB

The following figure shows the location of the ESA Correlation service CPU and Memory Utilization statistics.



5. Click  to view a historical view of CPU and memory utilization.

   The following figure shows the historical graph of **CPU utilization**.

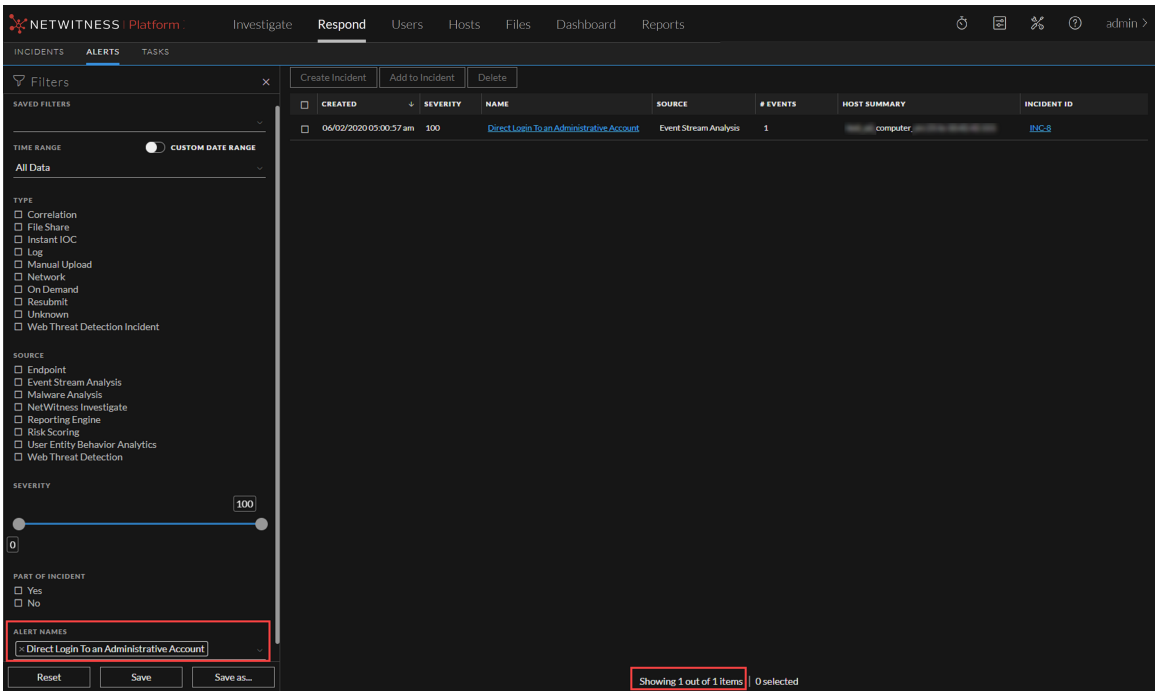
The following figure shows the historical graph of **Memory Utilization**.

If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. Go to **(Admin) > Services**, select your ESA service, and then select **> Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

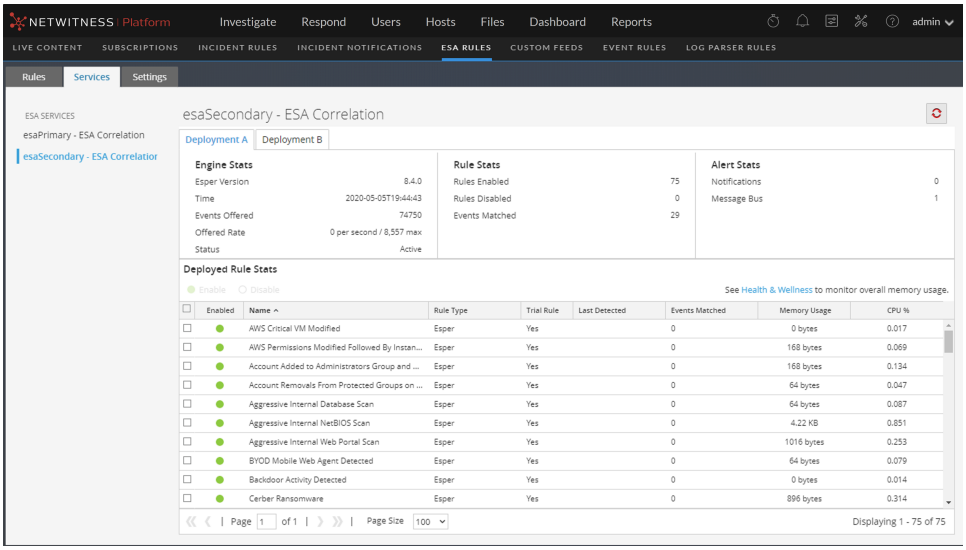


If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries



Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **Respond > Alerts**. In the **Filters** panel on the left, in the **Alert Names** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.

To clear your filter, click **Reset**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. This is a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column for the deployment. If a high number of events were matched for a given rule, you can investigate the rule further to see if you can make it more efficient.

Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **(Configure) > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **(Configure) > ESA Rules > Rules tab > Rule Library**.
2. For each rule that you repair, do the following:
   a. Select the rule to edit and then select **> Edit**.
   b. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
   c. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Working with Trial Rules.

Deploy Rules

To deploy rules, see topic Create a Deployment in the *Live Services Management Guide*.

Verify that the Rules are Enabled

After you deploy the ESA rules, they should automatically show as enabled. If not, you can enable the rules.

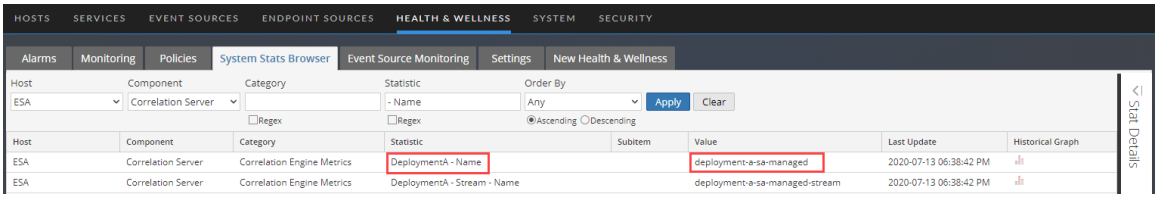
1. Go to **(Configure) > ESA Rules > Services** tab, and select the ESA service in the options panel.
2. On the deployment tab for the deployment that contains the rules, in the Deployed Rule Stats section, look at the status of the rules in the Enable column. Enabled rules show a green circle. If the rules show a white circle, you can enable the rules.
3. To enable rules, select the rules you want to enable and select **Enable** above the table.

(Optional) Check the ESA Correlation Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

ESA Rule Troubleshooting with Nw-Shell

Note: This procedure applies to NetWitness Platform 11.3 and later versions.



The ESA Correlation service replaces the Event Stream Analysis service in NetWitness version 11.3 and later. As a result of this change, some settings are no longer available in the user interface. In addition to the standard troubleshooting methods available, you can use the **nw-shell** utility to perform advanced troubleshooting of the ESA Correlation service and rules. For detailed information on the nw-shell utility, see the *NetWitness Shell User Guide*.

- Find Your Engine Name for Nw-Shell
- Connect to an ESA Correlation Server
- View the Contents of a Named Window
- See the Method Input and Output

Find Your Engine Name for Nw-Shell

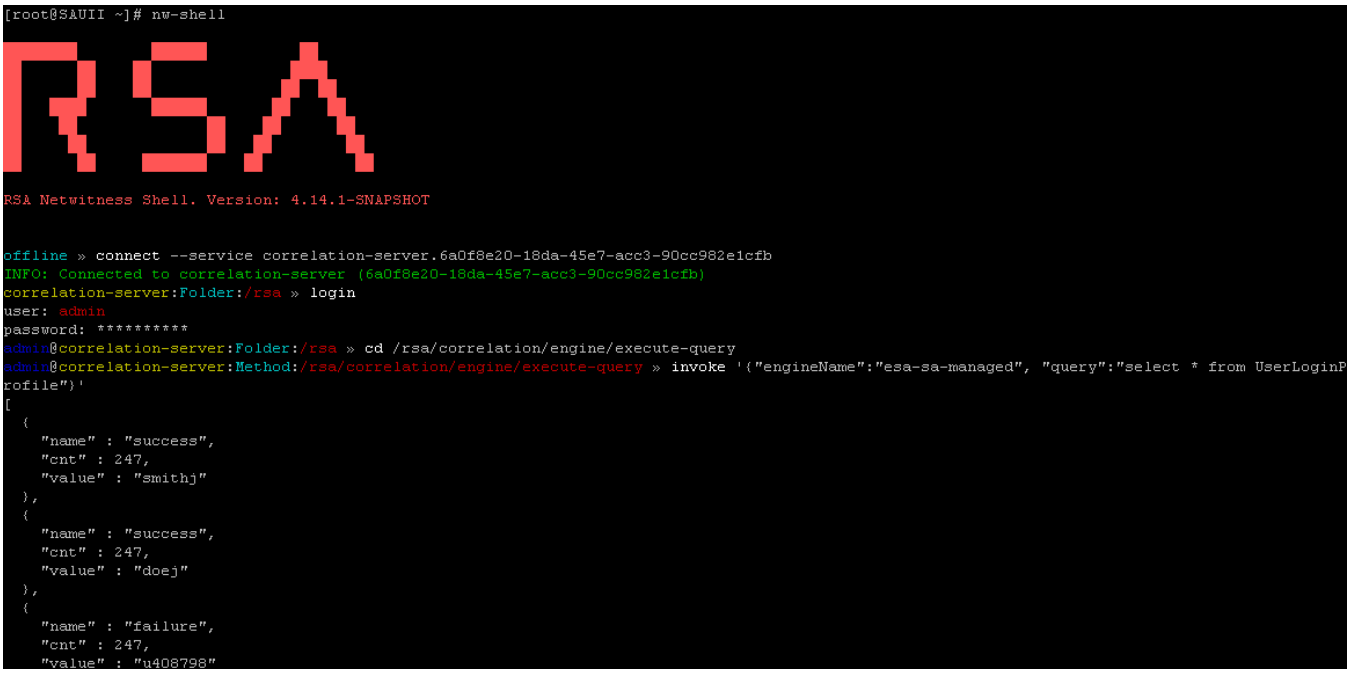
Follow these steps to find your engine name using your ESA rule deployment name. Your engine name is required for ESA Nw-Shell troubleshooting. Locate the names of each deployment that you plan to troubleshoot.

1. In the NetWitness UI, go to **(Admin) > Health & Wellness > System Stats Browser**.
2. In the System Stats Browser, use the following filters and then click **Apply**.
   a. **Host**: Select your ESA host.
   b. **Component**: Select **Correlation Server**.
   c. **Statistic**: Type **- Name** (put a space between the dash and name).
3. In the **Statistic** column, locate your deployment followed by **- Name**. The name in the **Value** field is `YOUR ENGINE NAME`.

In the above example, the deployment name is DeploymentA and the engine name is `deployment-a-sa-managed`.

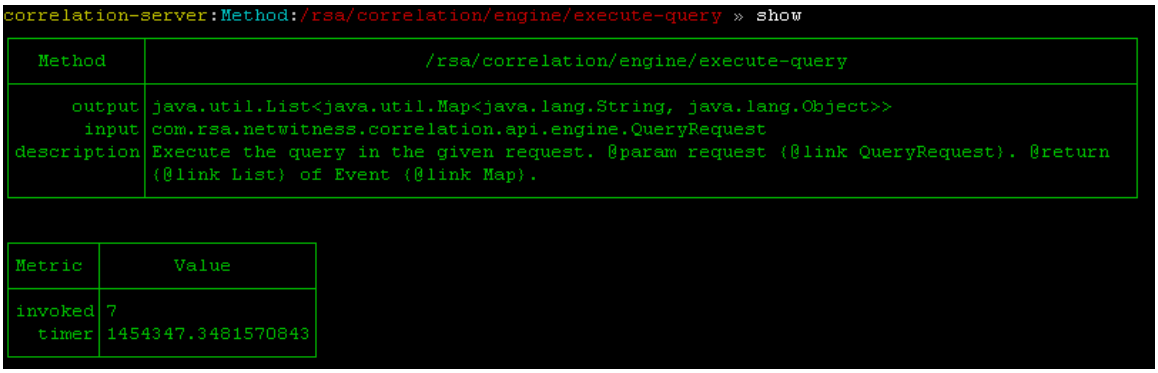
Connect to an ESA Correlation Server

1. Log in to nw-shell:
   a. Connect via SSH to the NW server (head unit).
   b. After logging in and getting the command prompt, type `nw-shell`.
2. Connect to ESA:
   a. Go to your ESA physical host and type the command:
   `cat /etc/netwitness/correlation-server/service-id`
   b. Go back to the NW server and nw-shell and connect to the correlation server:
   `connect --service correlation-server.ID`
3. Log in to ESA with the admin user credentials.
   a. Type `login`.
   b. Enter the username and password of the admin user.



View the Contents of a Named Window

Use the execute-query method to view the contents of a named window.



1. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/engine/execute-query`
2. Type `invoke '{"engineName":"<YOUR ENGINE NAME>", "query":"<YOUR QUERY>"}`
   - Where `<YOUR ENGINE NAME>` = the engine name that you located in Find Your Engine Name for Nw-Shell.
   - Where `<YOUR QUERY>` = the select statement into the named window.

Example: `invoke '{"engineName":"esa-sa-managed", "query":"select * from UserLoginProfile"}'`

See the Method Input and Output

Type `show` at the command line to see the input and output expected. All method invocation must be prefaced by `invoke`.

Obtain Correlation Server Metrics for ESA Rule Deployment Troubleshooting Using Nw-Shell

Note: This procedure is available in NetWitness Platform version 11.4.1 and later.

You can use Nw-Shell to view ESA Correlation Server metrics for each of your ESA rule deployments. These metrics show the number of sessions behind for the deployment data sources as well as the memory usage for the rules in the deployment.

1. Find the engine name to use for Nw-Shell. See Find Your Engine Name for Nw-Shell.
2. Connect to an ESA Correlation Server. See Connect to an ESA Correlation Server.
3. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/service/stats/get-condensed-metrics`
4. Type `invoke '<YOUR ENGINE NAME>'`
   Where `<YOUR ENGINE NAME>` is the engine name that you located in Find Your Engine Name for Nw-Shell.

Here is an example of the metrics output that you can obtain for your ESA rule deployment:

```
{
  "engineName" : "esa",
  "eventsOffered" : 1650,
  "maxEventsRate" : 2.337019271237945,

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for an ESA Correlation service and its associated ESA rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing ESA to slow down or stop. To see approximately how much memory a rule is using, you can view estimated memory usage for each rule in the Health & Wellness System Stats browser (you need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you need to complete the following steps to use memory metrics to troubleshoot memory usage for rules:

1. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see ESA Permissions.
2. View the memory statistics in Health & Wellness.
3. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
4. Use the memory metrics data to modify rules to be more efficient, if necessary.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

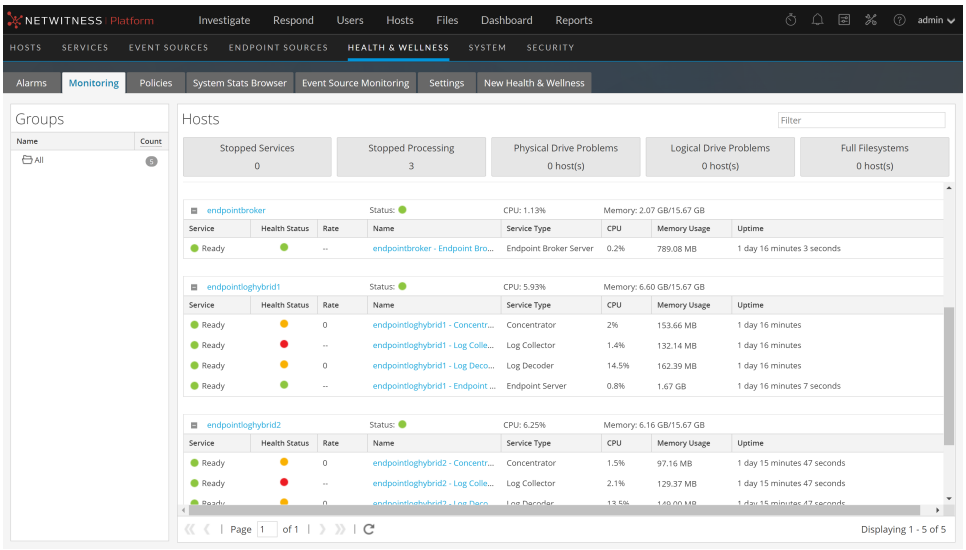
Prerequisites

The following are requirements for using memory metrics:

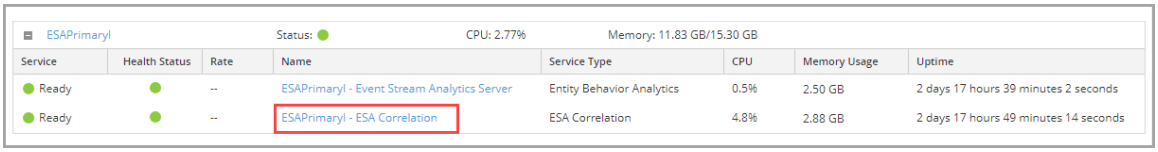
- You must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Note: Memory Metrics is always on for the ESA Correlation service; you do not have to enable it.

View Health Statistics and Trends for ESA Correlation in New Health & Wellness

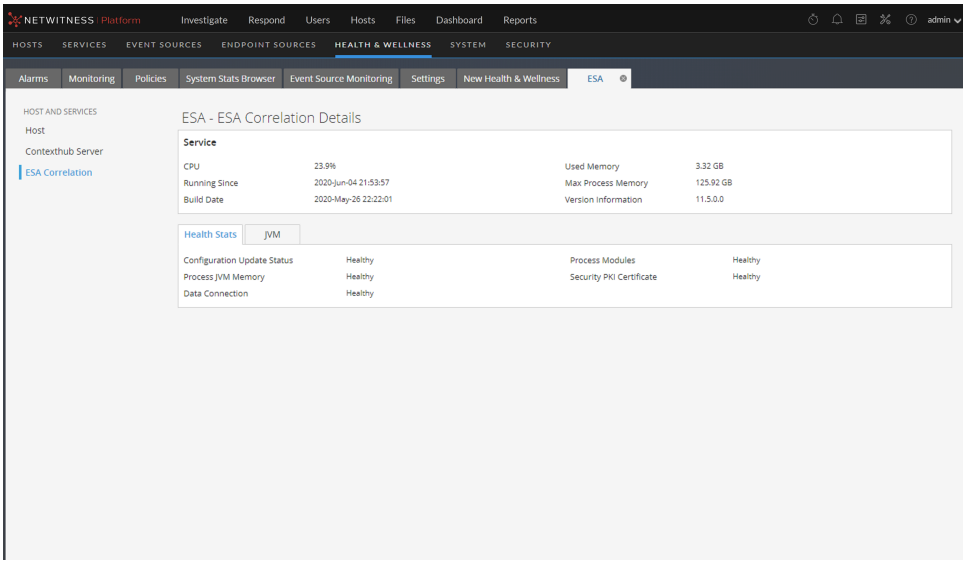


In NetWitness version 11.5 and later, New Health & Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

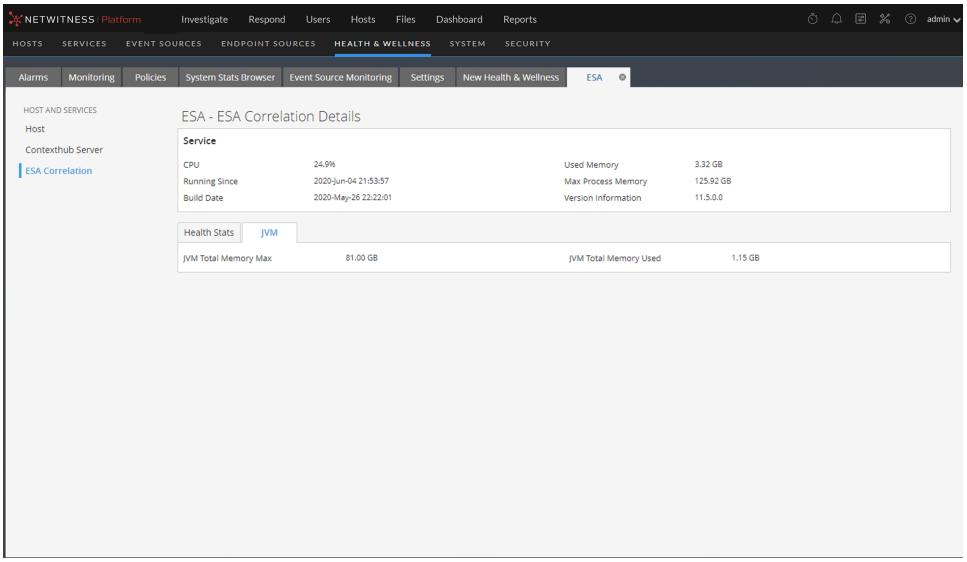


For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the *System Maintenance Guide*.

View Memory Metrics for an ESA Correlation Service in Health & Wellness



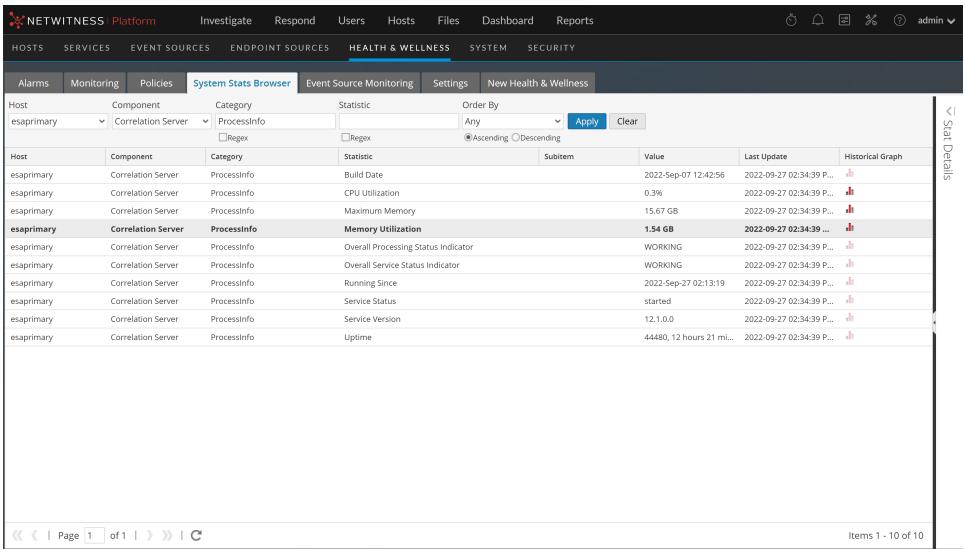
1. Go to **(Admin) > Health & Wellness > Monitoring** tab.



2. Locate your host and click the link in the **Name** field for your ESA Correlation service, for example, ESA- ESA Correlation.

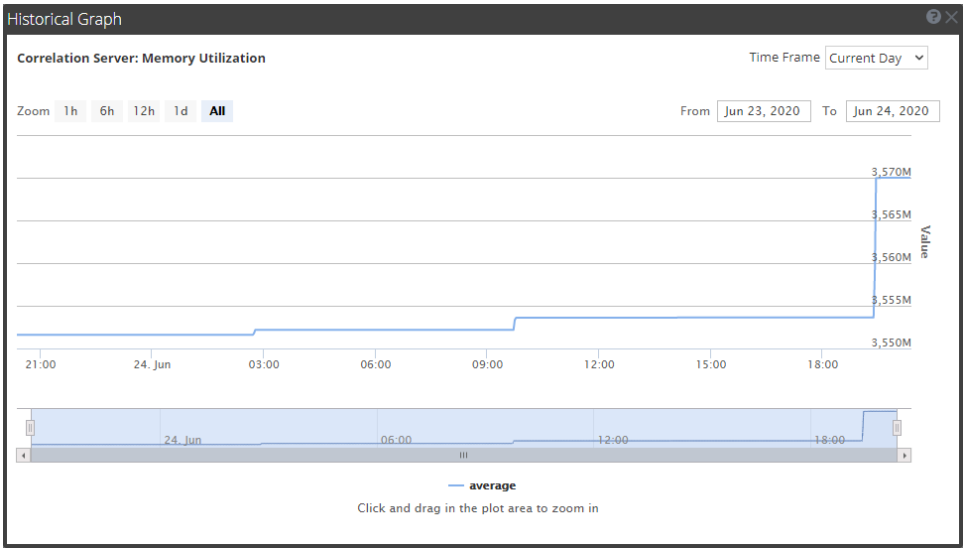
3. On the tab for your ESA host, click the **Health Stats** tab.
   You can view the health status of the ESA Correlation service.

4. Click the **JVM** tab.
   You can view the JVM total memory used by the selected ESA Correlation service.



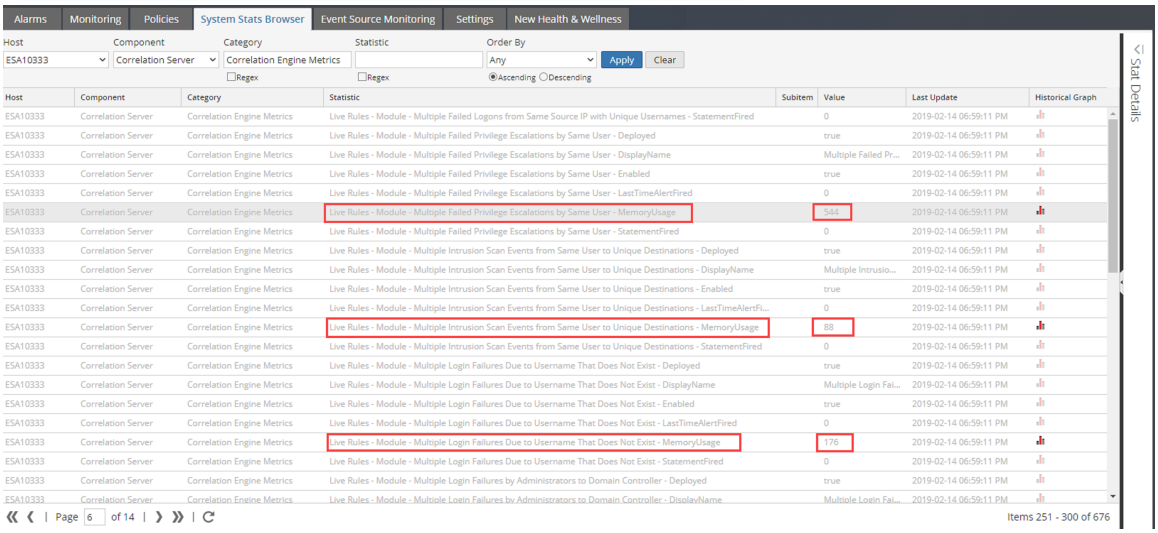
Note: You can also view memory metrics for the ESA Correlation service in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

View Memory Metrics for an ESA Correlation Service and its ESA Rules



1. Go to  **(Admin) > Health & Wellness > System Stats Browser**.
2. To view memory metrics for an ESA Correlation service, in the **Host** field, select your ESA host. Select **Correlation Server** for **Component**, enter **ProcessInfo** for **Category**, and then click **Apply**.

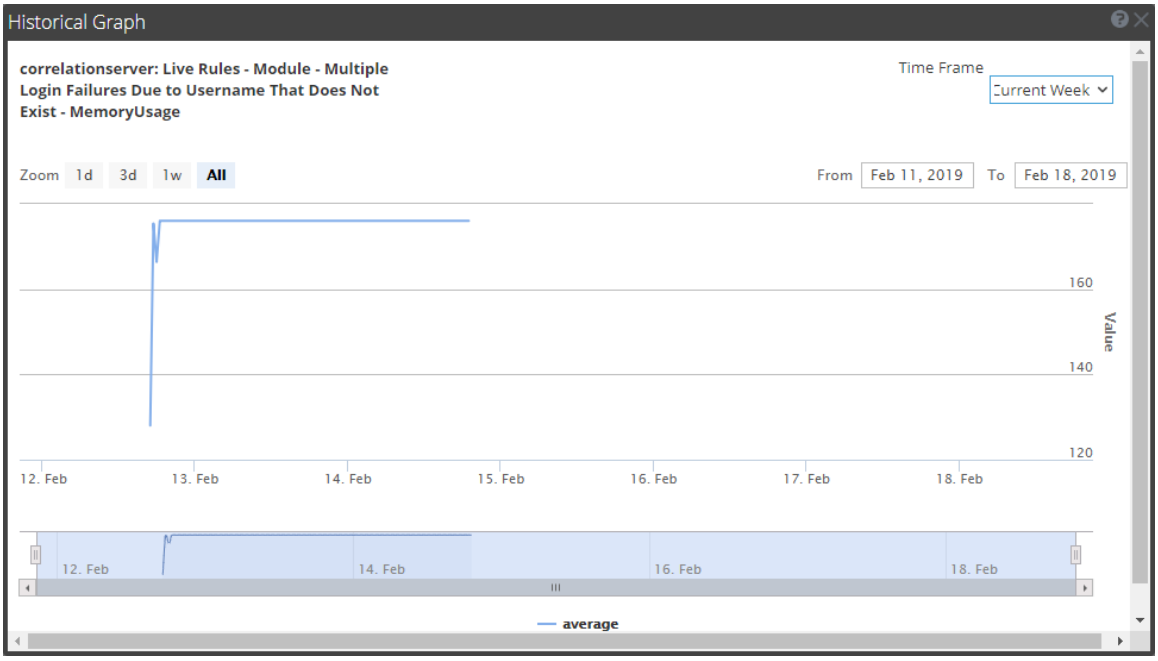
Host	Component	Category
<your host>	Correlation Server	ProcessInfo



The **Memory Utilization** statistic shows the total memory in use by the ESA Correlation service.

3. To view the historical memory usage for the ESA Correlation service, click the **Historical Graph** icon.

4. To view the memory metrics for individual rules, in the **Category** field, enter **Correlation Engine Metrics** and click **Apply**.



Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics

The name of the rule is in the **Statistic** column appended with **MemoryUsage** and the memory usage in bytes is in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 2/10/19 at 12 p.m., but Health & Wellness polls at 2/10/19 at 12:10 p.m., the **Last Update** field will display a timestamp of 2/10/19 12:10 p.m.

5. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

How ESA Handles Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA does not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule
- How to remove sensitive meta keys from global alerts

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

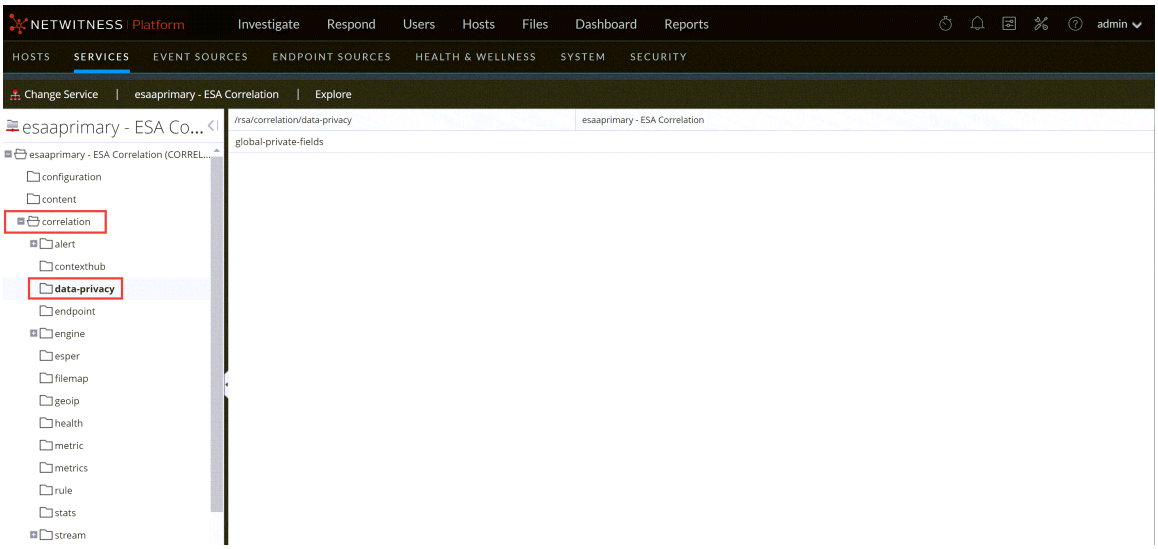
Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.



Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

How to Remove Sensitive Meta Keys Globally from All Alerts

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

1. Go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.

The changes are effective immediately.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

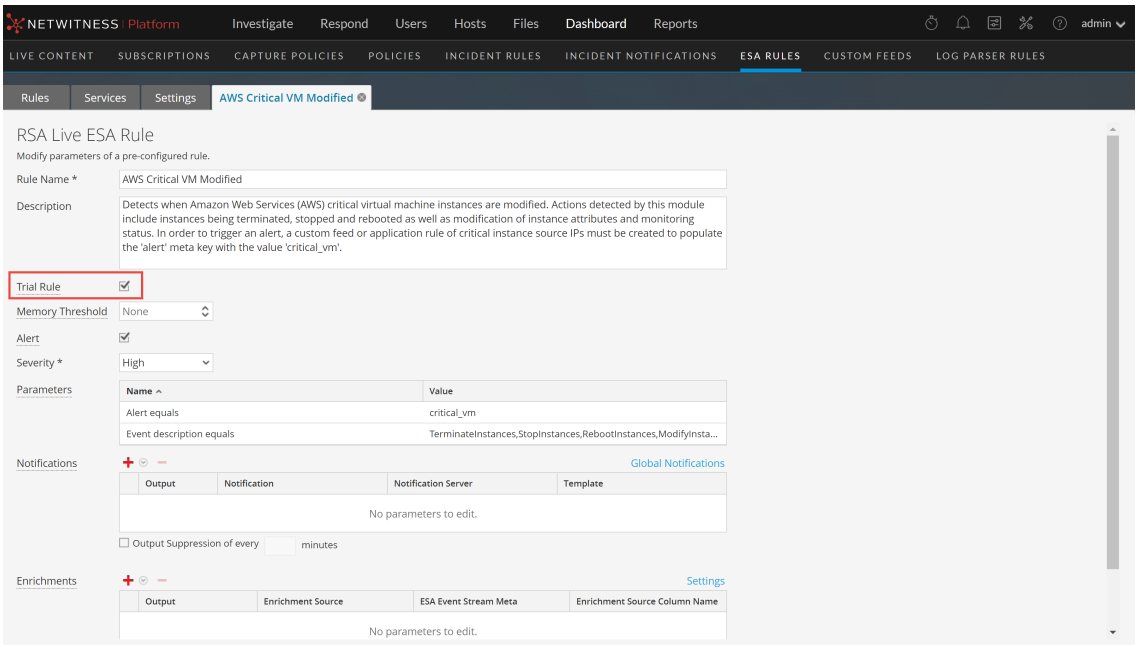
ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
RSA Live ESA	RSA Live has a catalog of ESA rules that are available to modify to run in your network.	RSA Live ESA rules are available to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.
Endpoint Rule Bundle	An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. The rules in this bundle only apply to NetWitness Endpoint.	If you have NetWitness Endpoint, you can configure risk scoring to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Sample Rules

Sample Rule Builder rules come with NetWitness and appear in the Rule Library. Use sample rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.



Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. These rules appear in the Rule Library with the sample rules. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold set by the administrator. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

The following figure shows the Trial Rule setting in the Rule Builder.

ESA Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness role. User access is restricted based on roles and permissions assigned to roles.

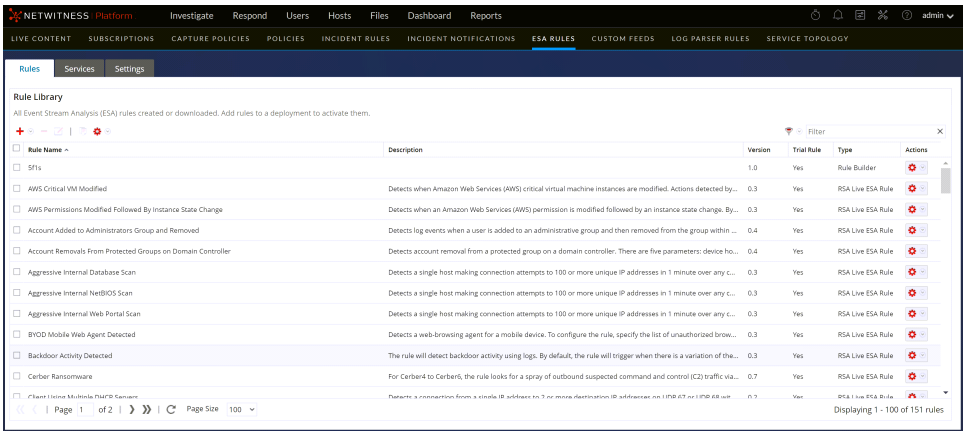
- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library

- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.



Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes
View Alerts	Yes		Yes	Yes		Yes
Manage Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

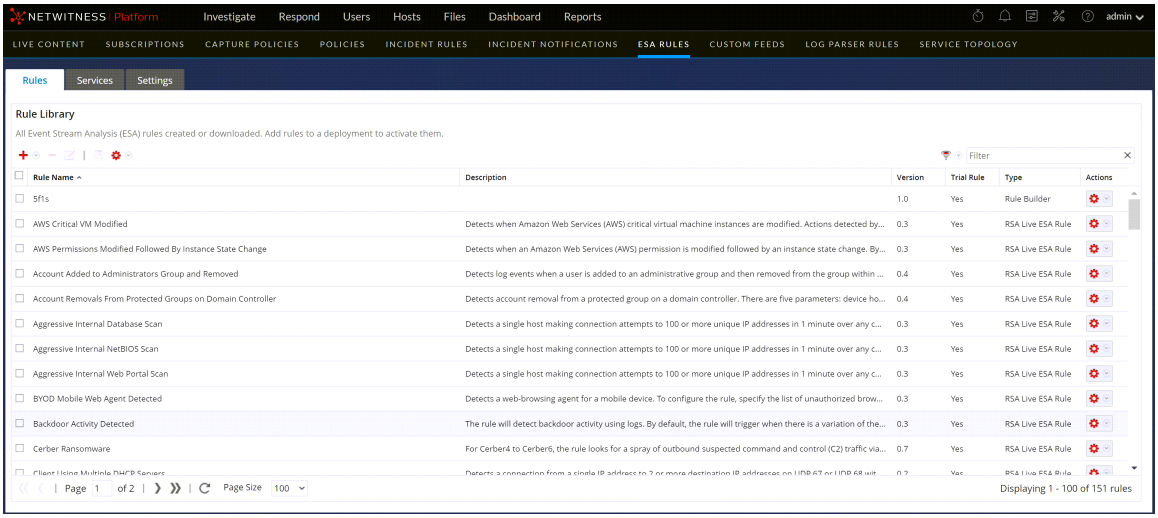
Practice with Sample Rules

NetWitness comes with sample rules so analysts can become familiar with how rules look before they create their own rules. Use the sample rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Sample rules are installed in the Rule Library, which contains every rule you download or create. The following figure shows sample rules in the Rule Library.

These are the available sample rules:

- SAMPLE - Blacklist - From inside countries that are not the US, Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - P2P Software as Detected by an Intrusion Detection Device

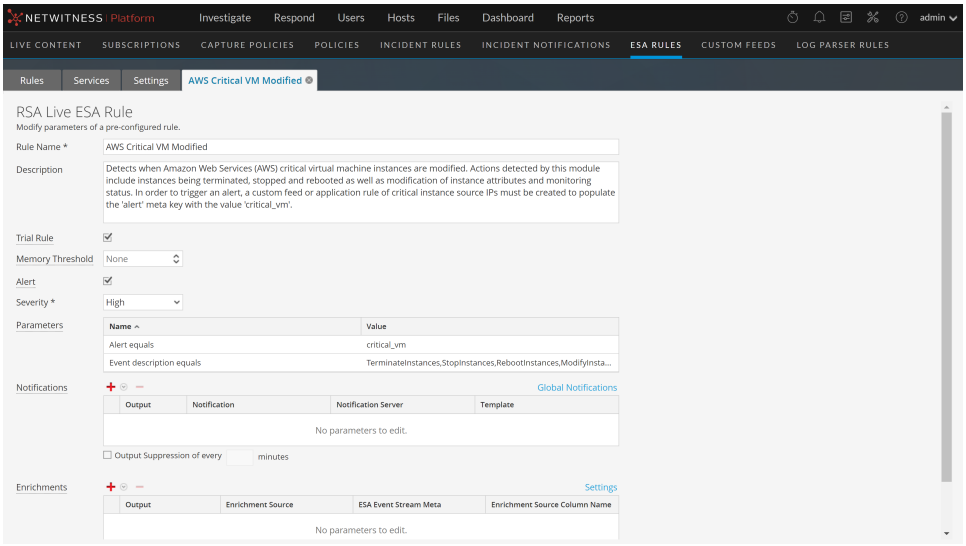


- SAMPLE - User Added to Admin Group Same User su Sudo
- SAMPLE - Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness from the rules you download and create.

Rule Library

The Rule Library shows the following information for a rule:



- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, downloaded from RSA Live, or Endpoint Rule Bundle.

Practice with Sample Rules

1. Go to **(Configure) > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library**, double-click a sample rule or select a sample rule and click . The rule is opened in Rule Builder.

3. To practice with a sample rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy sample rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with sample rules, you will be able to download, create, and deploy your own rules.

Working with Trial Rules

The ESA Correlation service is capable of processing large volumes of disparate event data from Concentrators. However, when working with ESA Correlation rules, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that rules do not use excessive memory, you can enable them as trial rules. You should disable the trial rule setting only after testing the new rule in your environment during times of both normal and peak network traffic.

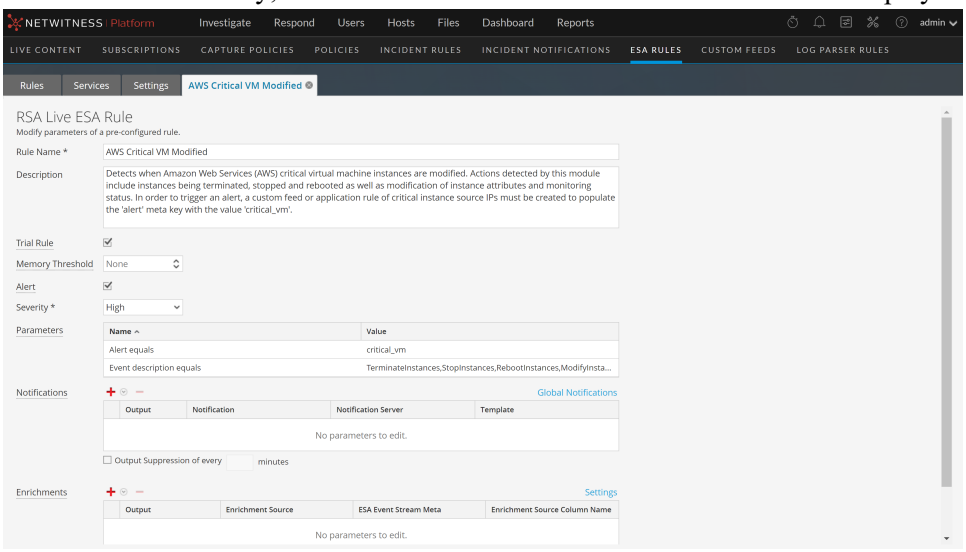
You can set a global threshold of the percentage of memory that trial rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically. To configure the memory threshold, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules that you import are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to deploy the rule with an added safeguard.

Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

Deploy Rules as Trial Rules



This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

In NetWitness 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment.

For example, if you change the status of a trial rule to disabled ((Configure) > ESA Rules > Services tab) and redeploy the ESA rule deployment ((Configure) > **ESA Rules** > **Rules** tab), the trial rule remains disabled.

1. Go to **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.

3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.
   - The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   - The configuration parameter, `fatal-percentage`, has a default value of 90.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **(Configure) > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Working with Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

Working with Live ESA Rules

This topic explains working with configurable ESA rules from the NetWitness Live Content Management System so you can customize them to meet your needs. Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "ESA Rules" at the following link: https://community.netwitness.com/t5/netwitness-platform-threat/rules/ta-p/677884

This is an example of how each Live ESA rule is described on Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

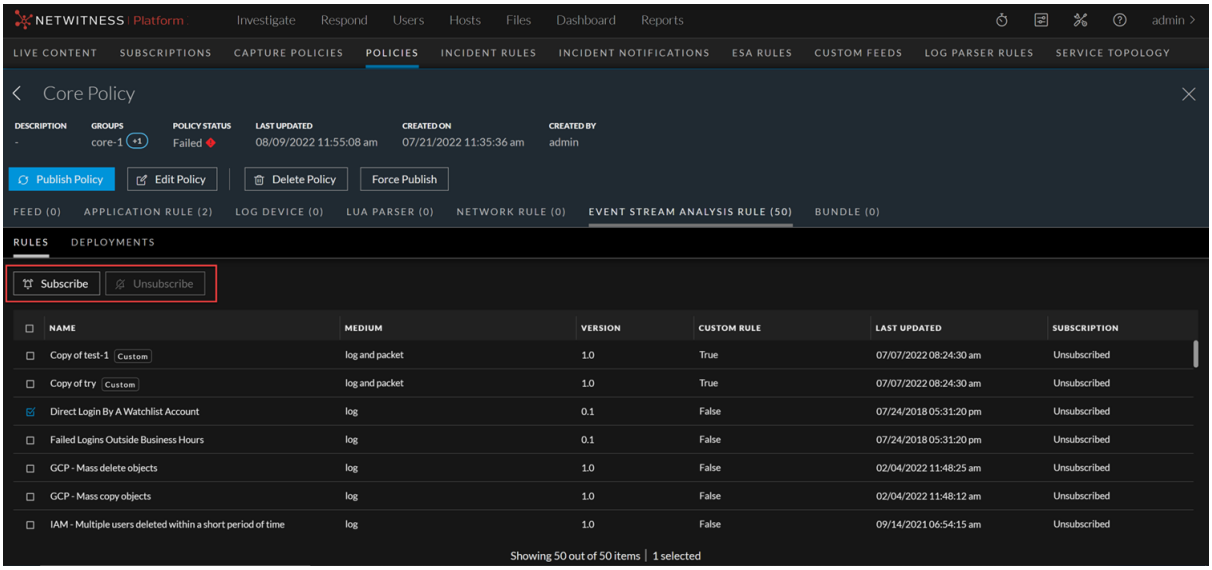
Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the example rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

Prerequisites

These are the prerequisites for working with configurable Live ESA rules;

- Have permission to manage rules.
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness. See the *Live Services Management Guide* for details.
- Update your meta keys. See "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*

Subscribe and Unsubscribe Live ESA Rules



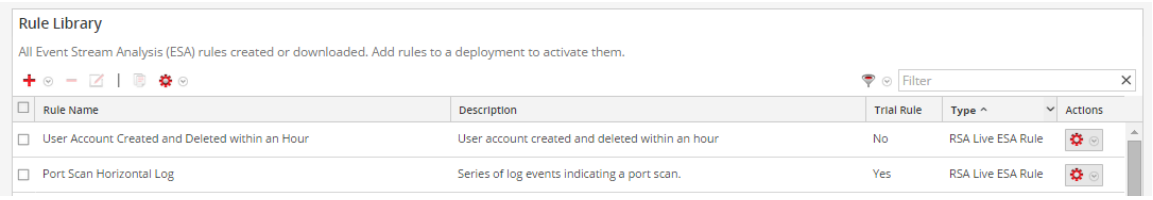
You can subscribe and unsubscribe live ESA rules from the **Configure** > **Policies** page.

To Subscribe the Live ESA rules

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Rules**.
5. Click one or more Live ESA rules and click **Subscribe**.



Note: ESA Rules cannot be manually deployed via Live Services. By default, all the ESA rules from Live are available in the ESA Rule library, if live is configured.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule
- Type
- Actions

The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Configure Parameters for an RSA Live ESA Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, double-click an RSA Live ESA Rule or select the rule and click .
   The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. NetWitness recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Alert (This option applies to 11.3 and later.) Select Alert to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
   - Severity
   - Notifications
   - Enrichments
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

5. Click **Save**.

Add a Rule Builder Rule

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

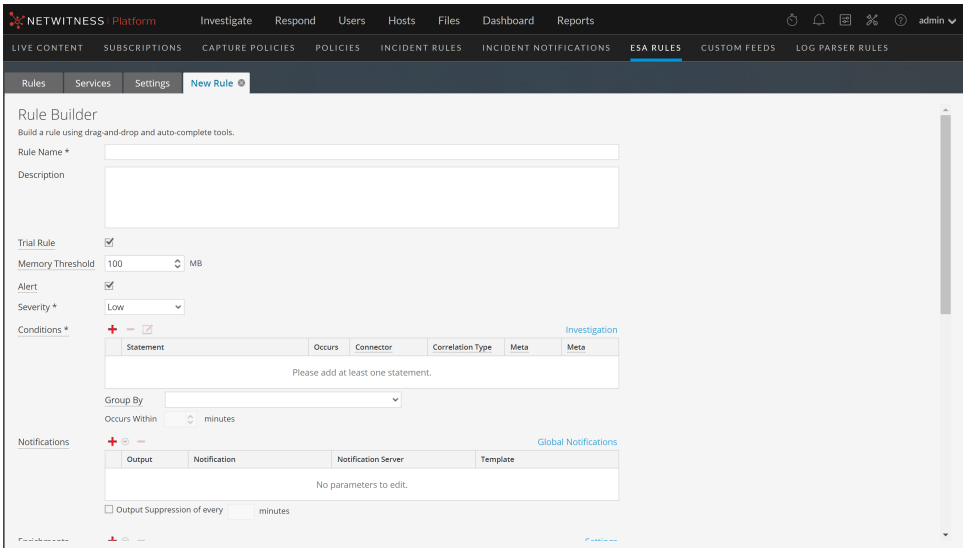
There are two methods to design a rule in ESA:

- **Rule Builder** is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- **Advanced EPL** allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you should use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.



Prerequisites

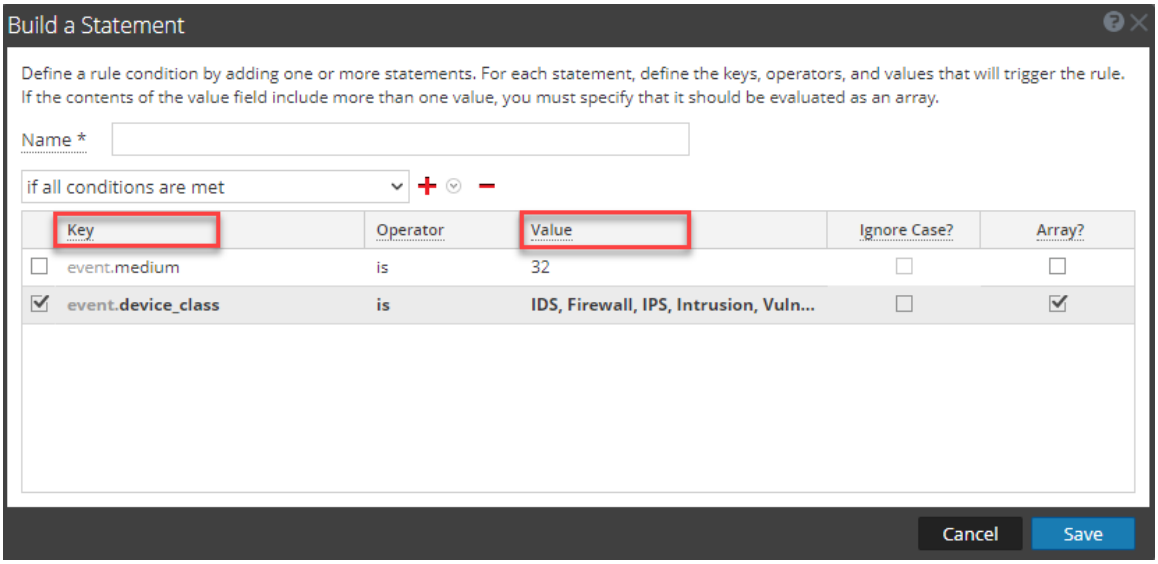
You must have permission to manage rules. See ESA Permissions.

Name and Describe a Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.

2. In the **Rule Library**, select  **> Rule Builder**.
   The New Rule tab is displayed.

3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.
6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the  (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
8. For **Severity**, classify the rule as Low, Medium, High or Critical.



Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

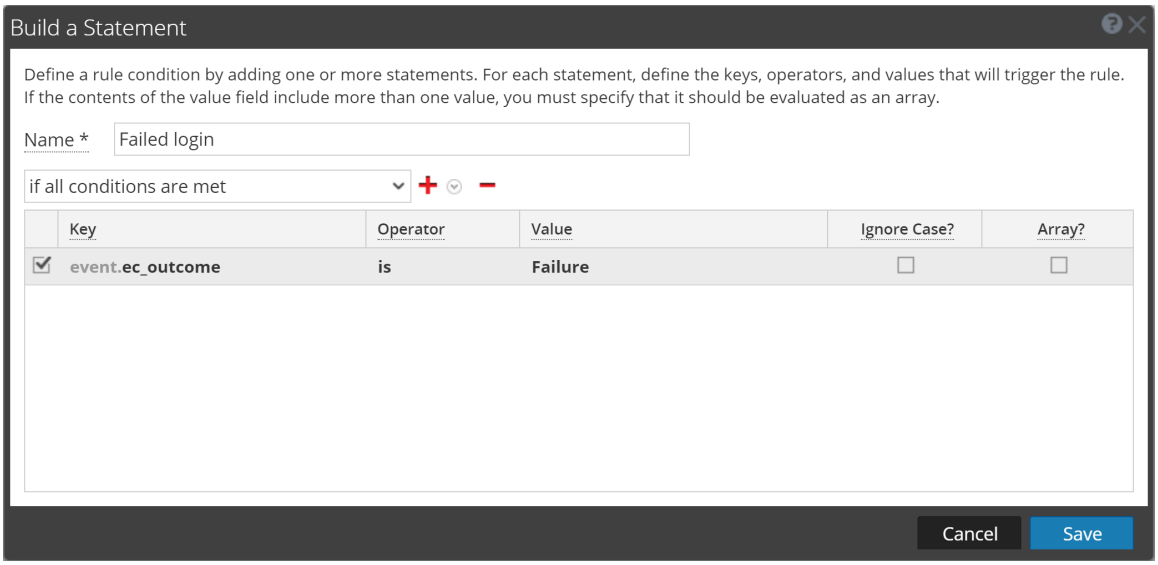
Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites

To build a rule statement, you must know the meta key and the meta value.

For a complete list of meta keys, go to **(Configure) > ESA Rules > Settings > Meta Key References**.

Meta entities are not currently supported, such as:



```
fullname.all
eth.all
ip.all
ipv6.all
port.src.all
port.dst.all
dir.path.all
org.all
geoip.all
port.all
```

```
domain.all
email.all
filename.all
directory.all
checksum.all
param.all
context.all
attack.all
analysis.all
compromise.all
inv.all
outcome.all
ec.all
user.all
host.all
client.all
```

Caution: If you add meta entities to your rule, they cannot get data from the data sources, so they do not trigger alerts.

Build a Rule Statement

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library**, click  **> Rule Builder** or edit an existing Rule Builder rule.
   The Rule Builder view is displayed.
3. In the **Conditions** section, click .
   The Build Statement dialog is displayed.

4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The operator that you use depends on the metadata type.
   The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), is one of (For array type meta), is not one of (For array type meta), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN." (For best rule performance, only use the **Ignore Case** option when necessary.)
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.
   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.
7. To use another meta key in the statement, click , select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click  and select **Add Whitelist Condition**.

9. To add a blacklist, click  and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

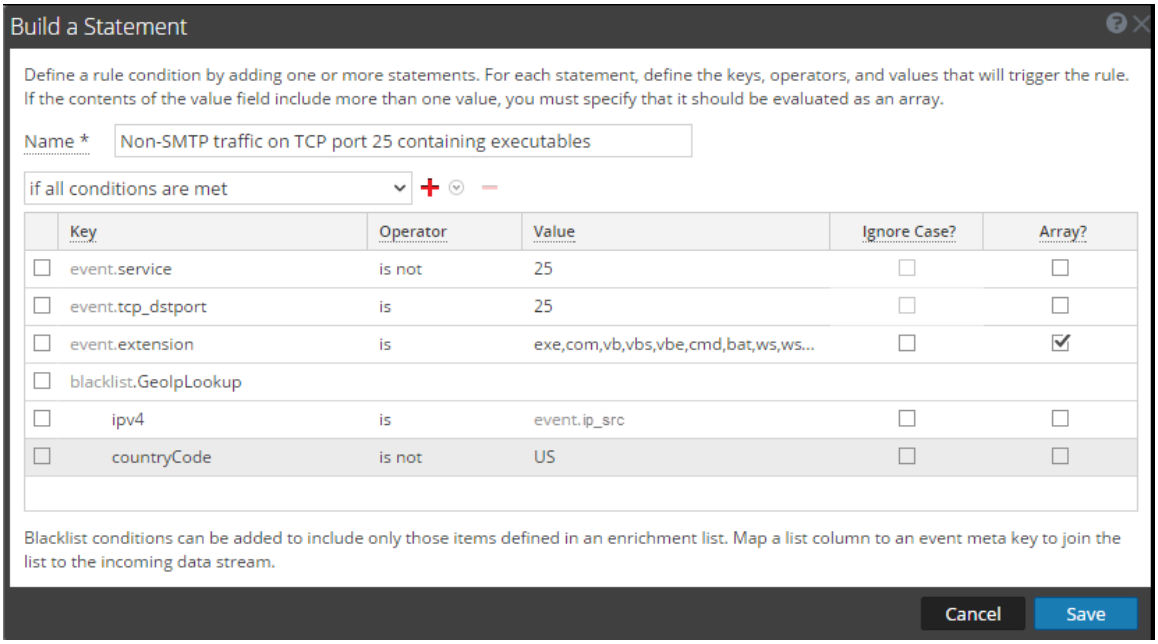
To Add a Whitelist

You use a whitelist to ensure that specified entities are excluded from triggering the rule. Whitelists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click  and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Note: An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.

To Add a Blacklist

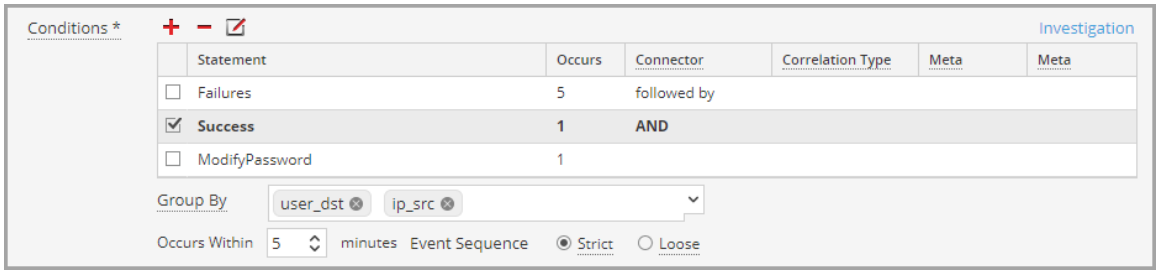


You use a blacklist to ensure that specified entities trigger the rule. Blacklists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click  and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a blacklist.
3. For the subcondition:
   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

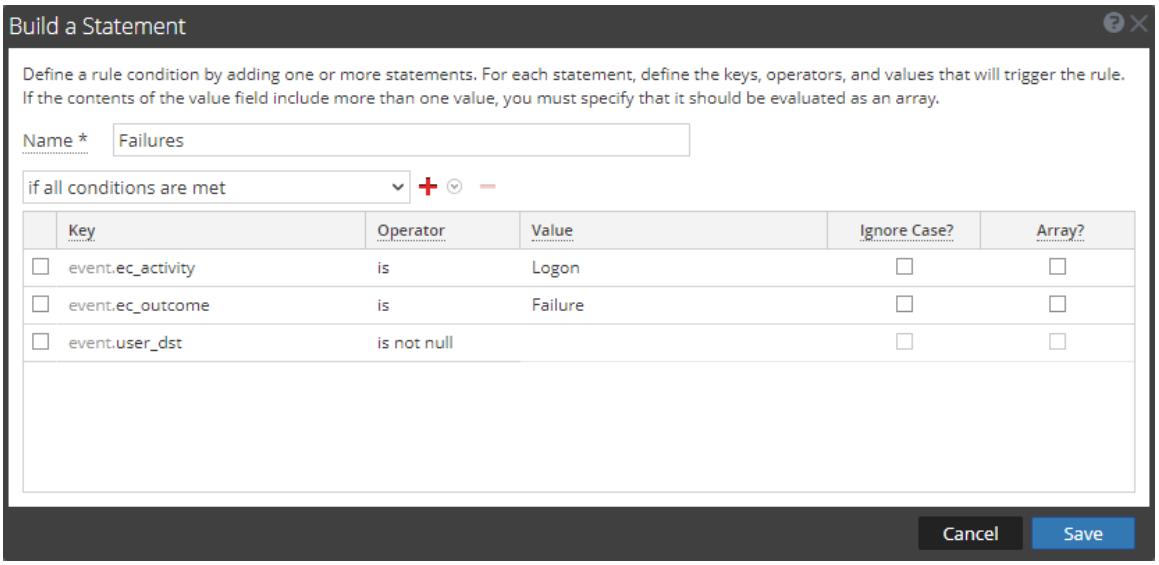
Example: Blacklist



The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.

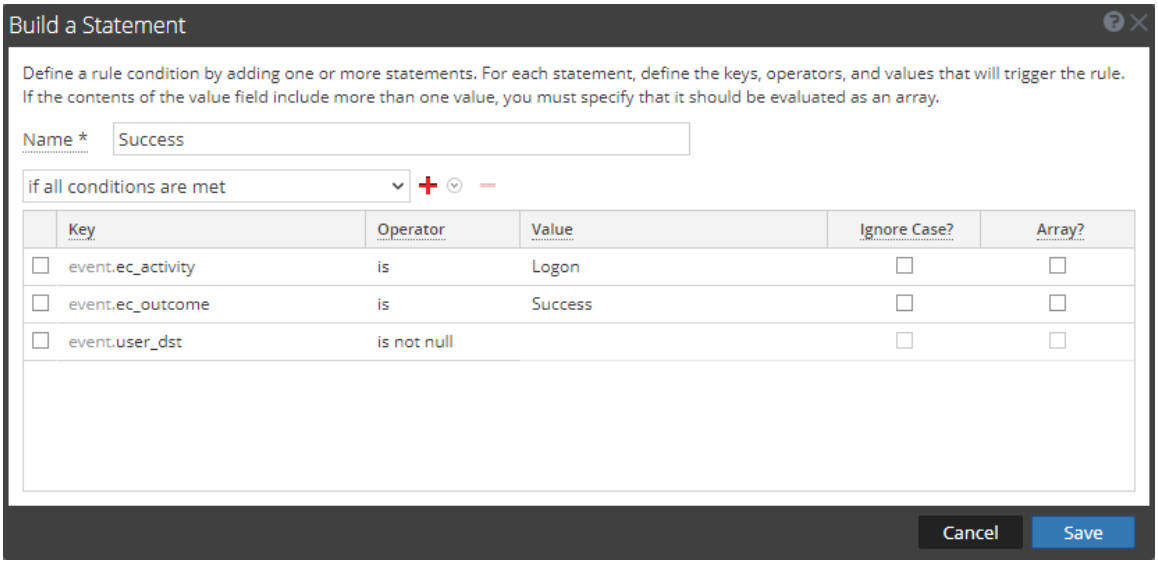
Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Strict Pattern Matching and Using the *Is Not Null* Operator



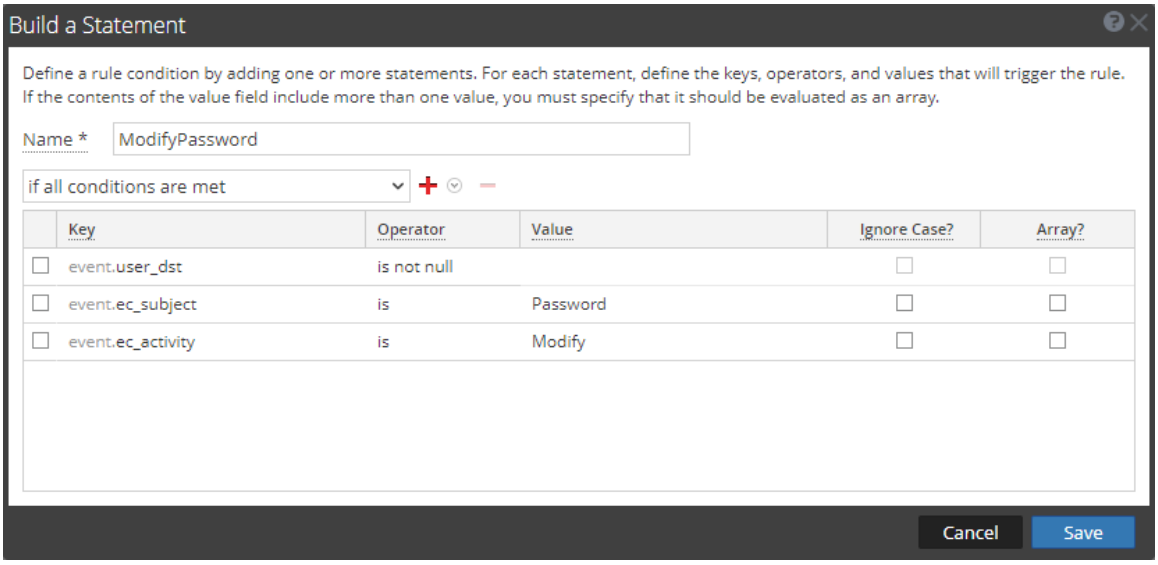
The following example uses the ability to exclude null values and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:

Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.
GroupBy: user_dst, ip_src	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and ip_src. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by ip_src ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specified with no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.



Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:

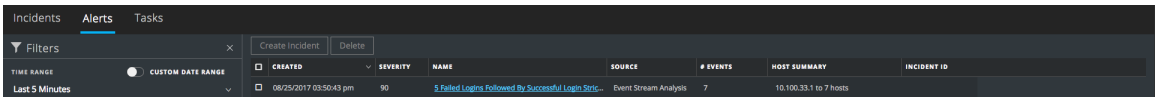


Rule Statement	Description
ec-activity is Logon	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. For best rule performance, only use the **Ignore Case** option when necessary.
ec_outcome is Failure	Identifies activity outcome logged as "failure."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

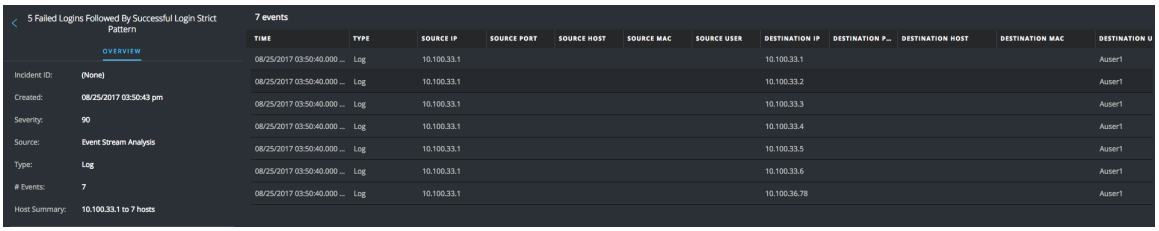
The following statement makes up the Success condition:

Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

The following statement makes up the ModifyPassword condition:

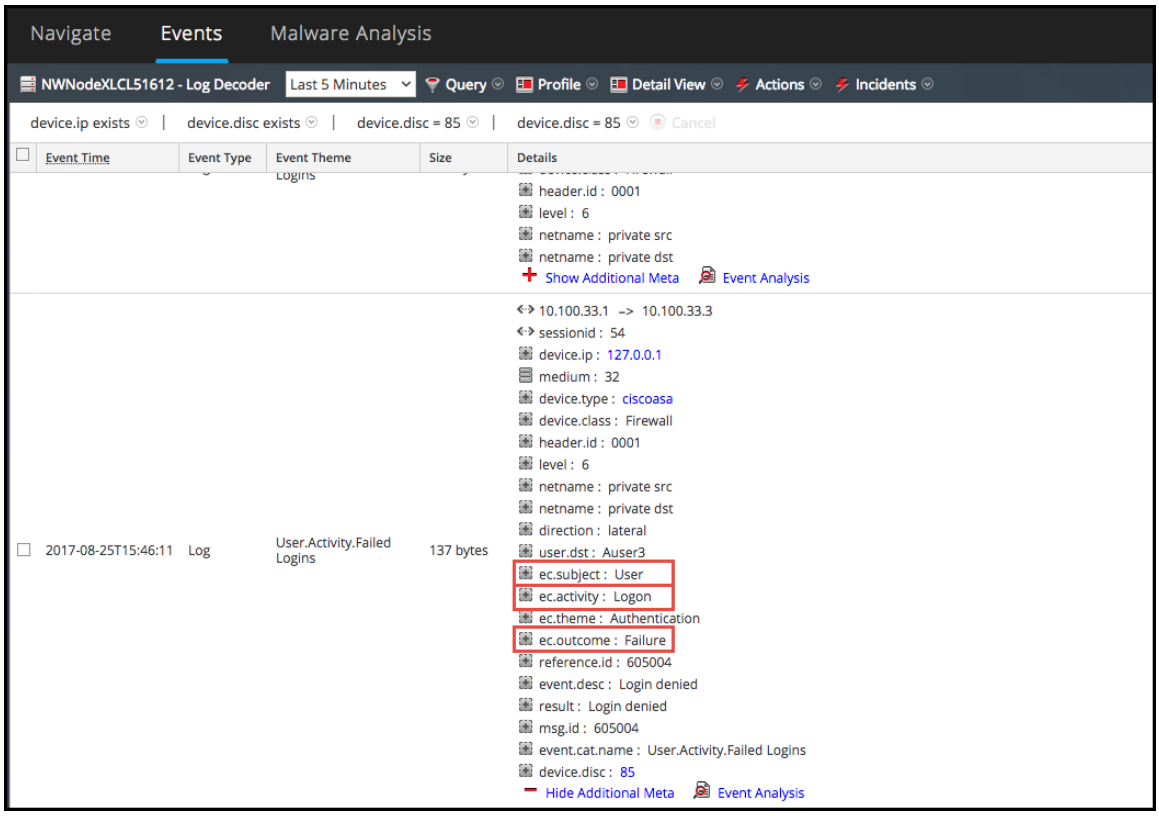


Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.



Example Results

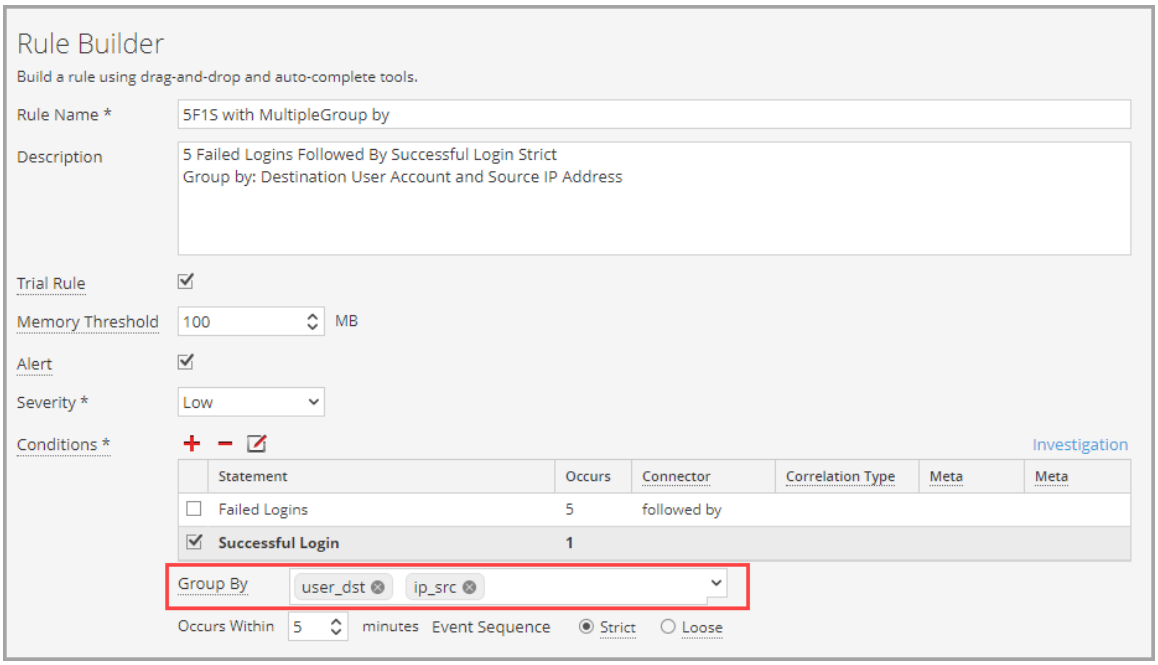
When the alert fires for the above example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.



The following figure shows the alert in the Respond Alerts List view.

The next figure shows the events in the alert in the Respond Alert Details view.

Drilling down into the Investigation view by clicking on the source for one of the events, you can see the case for each of the string values.

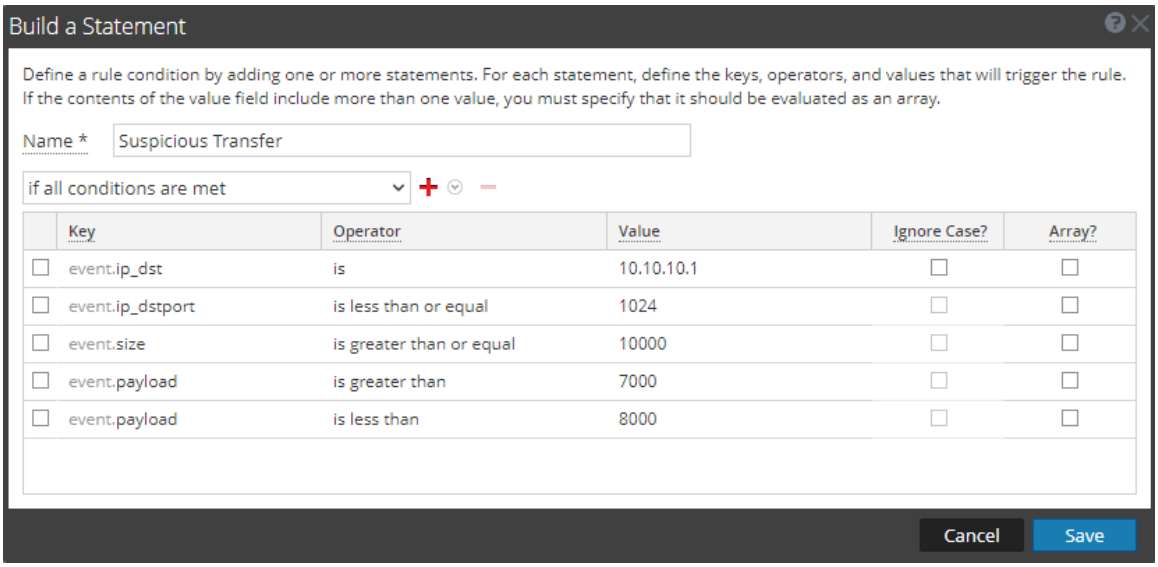


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

The following example shows a rule grouped by user_dst and ip_src.

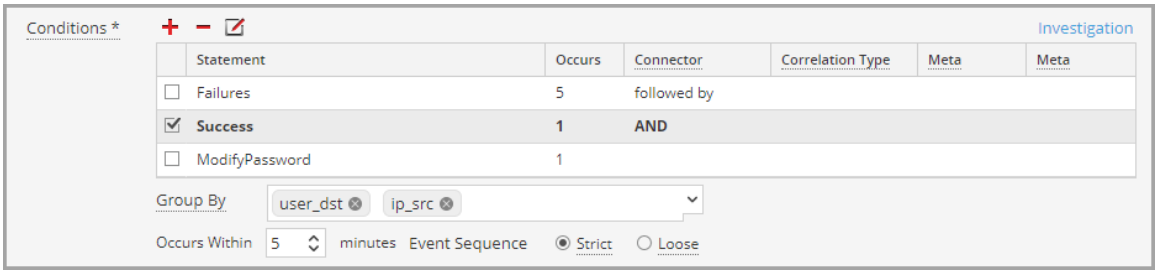


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and ip_src	Groups the rule results by user_dst (user destination account) and ip_src (IP address of the machine that the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.

This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

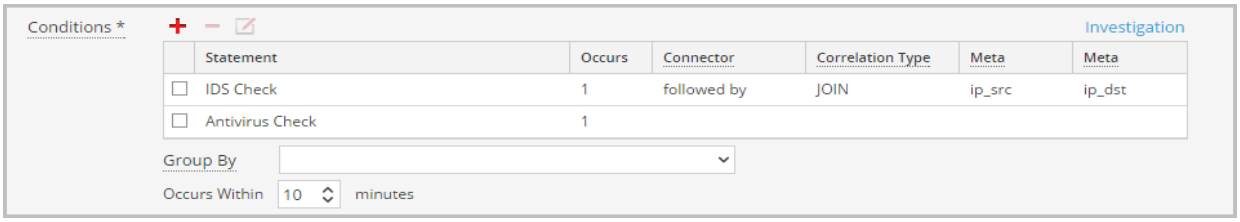
E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (ip_src) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by

- AND
- OR



4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between.

   For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events.
   For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log in to an account multiple times. To do this, you might group by user_dst and ip_src.

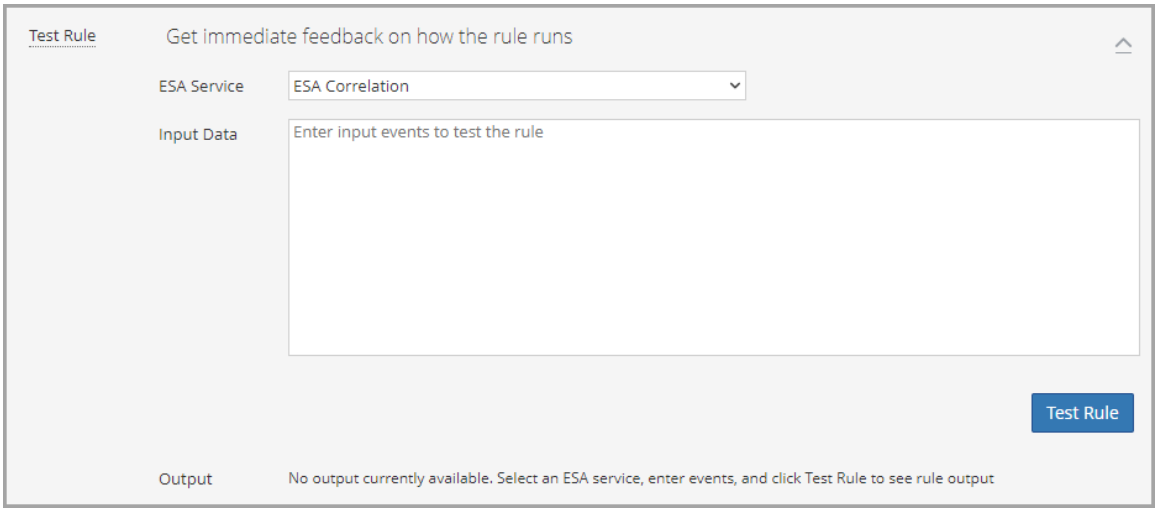
Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.

This is the criteria for the rule:

A. An IDS alert occurs.



B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Validate an ESA Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.
2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.

   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.

c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].

d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

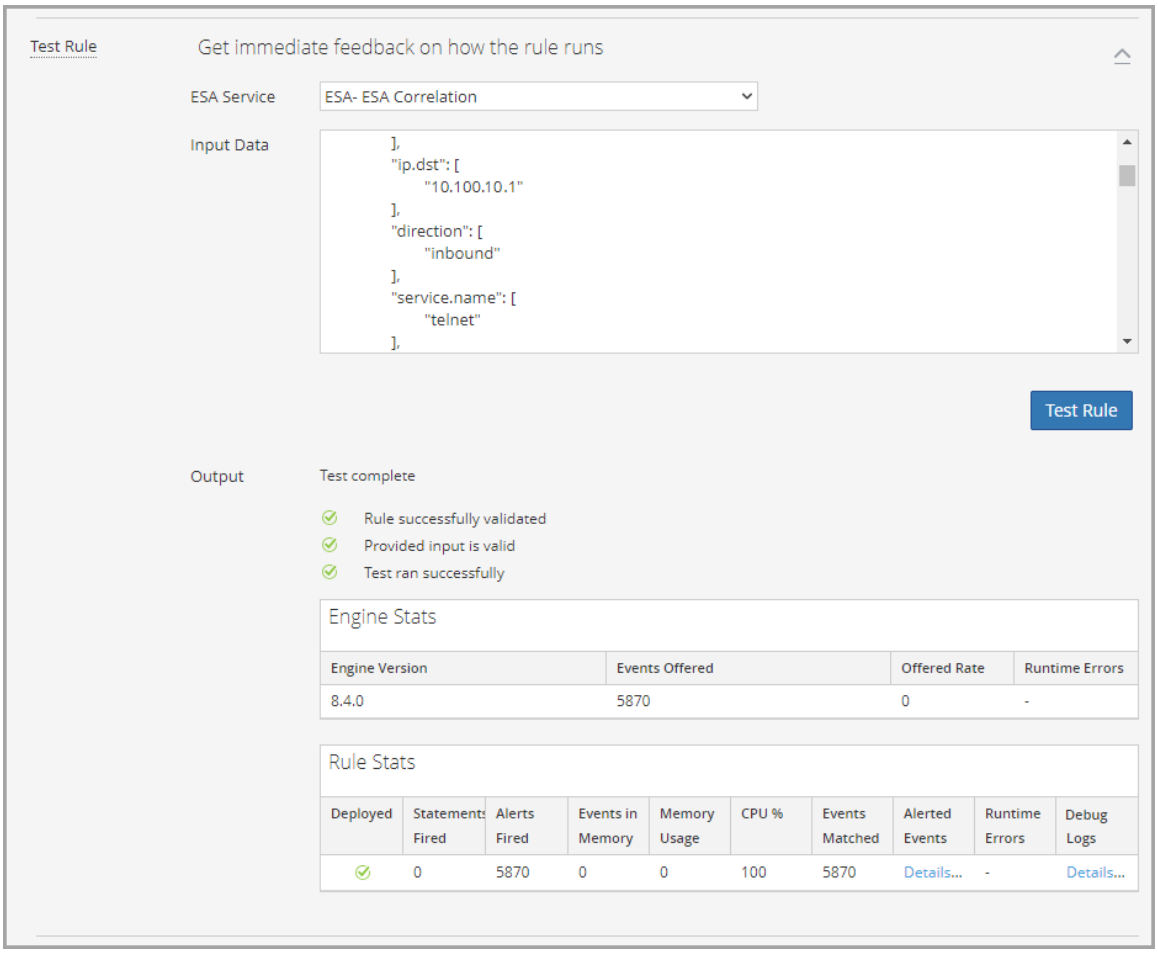
e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

To download the events from the Investigate > Events view:

a. In the main menu, go to **Investigate > Events** in a new tab.

b. In the Events view, enter a query for the ESA rule test.



c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.

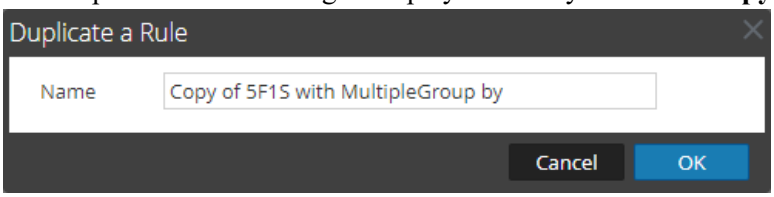
Field	Description
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

Edit, Duplicate or Delete a Rule



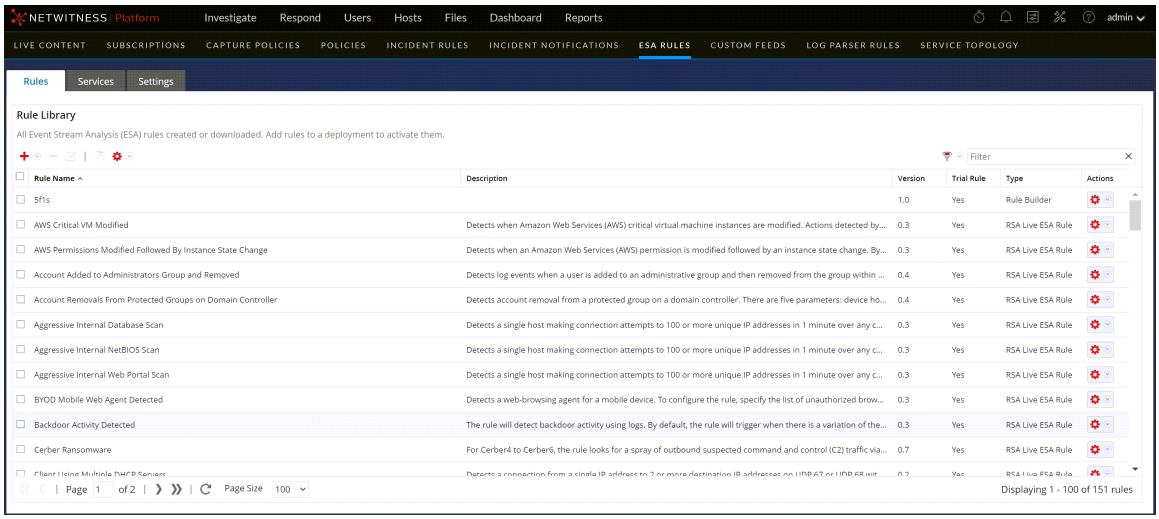
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Edit a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.



3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **(Configure) > ESA Rules > Rules**.
   The Rules tab is displayed.

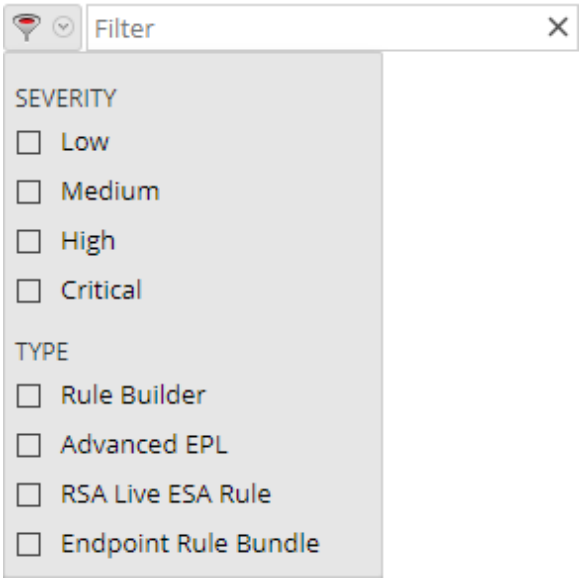
2. In the Rule Library, select one or more rules and click .

   A warning dialog is displayed.

3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules

This topic shows analysts how to specify the type of rules that display in the Rule Library.



Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Filter Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.

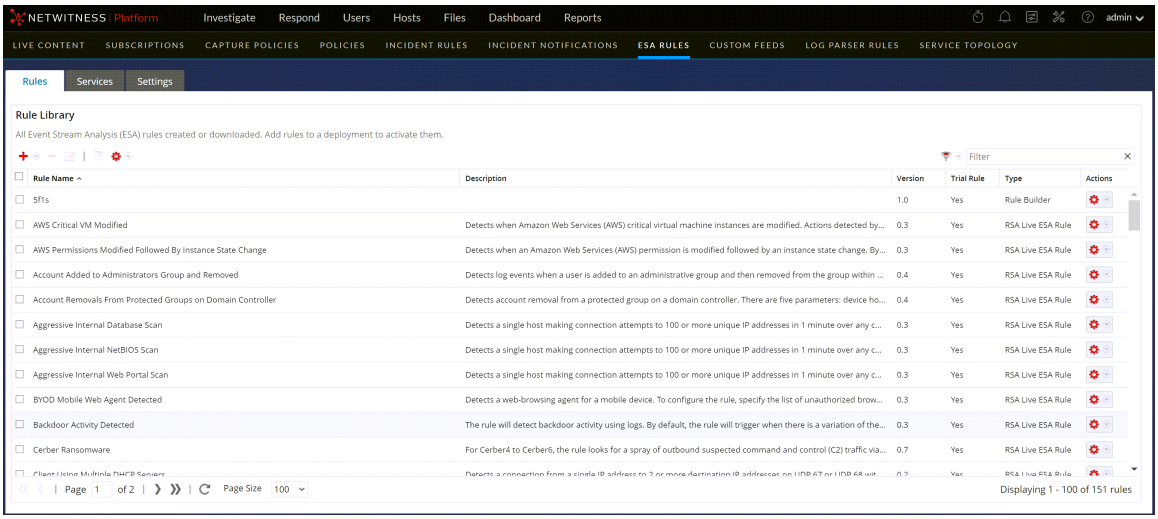
2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.

The selected rule types appear in the list.

Search for Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules



The topic provides instructions to import ESA rules from a NetWitness instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

Import ESA Rules

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rules Library** toolbar, select > **Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export ESA Rules

1. Select an ESA rule or multiple rules and select > **Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

To configure a notification, you configure these components:

- **Notification Server**: The notification server is the source of the notifications. After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- **Notifications**: These are the outputs (destinations) of the notifications, which can be email, script, and Syslog. When you design a rule, you can specify the notification for an alert.
- **Templates**: The message format of an alert notification is defined in a template.

If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. For more information, see Troubleshoot ESA Rules. For information on creating a custom template, see see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *System Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide.*

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email Notifications

ESA Correlation can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide.*
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.

- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Add Notification Method to a Rule

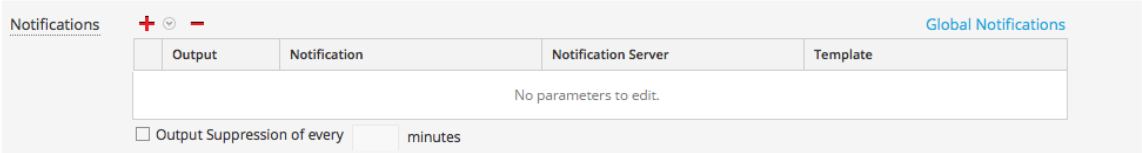
This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

Prerequisites

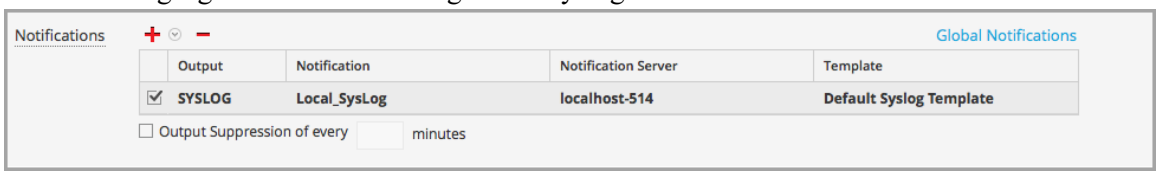


- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:

  Go to **(Admin) > System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide.*

Add a Notification Method to a Rule

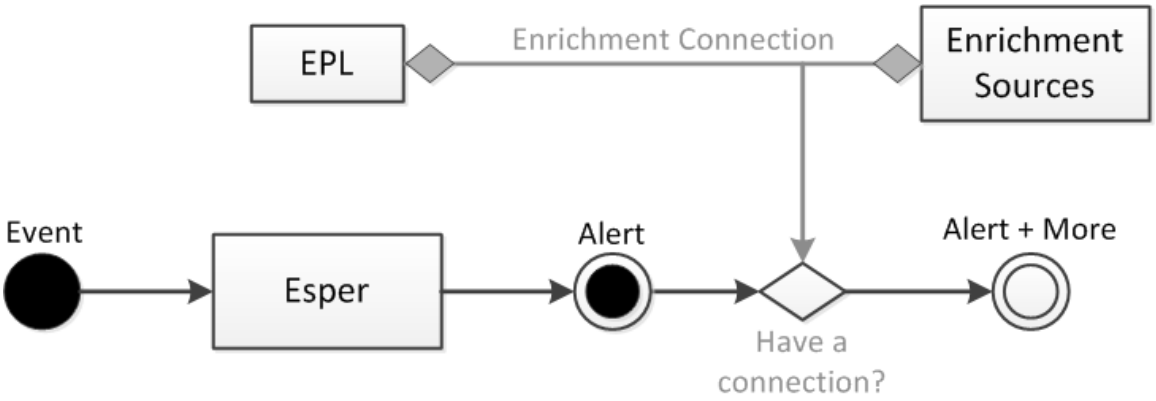


1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, click to add a new rule or select an existing rule and click .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.

3. Click and select the **Output** for the alert:

- Email
- SNMP (This option is not supported in NetWitness 11.3 and later.)
- Syslog
- Script

4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.



7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.

Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- MaxMindGeoIP Database

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Example Rule with Enrichments

The following example rule illustrates how ESA enrichments can enhance alerts.

```
@RSAAlert @Name("simple") SELECT * FROM Event(ec_theme='Login Failure')
```

This rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_ theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert without an enrichment with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
          {
               "username": "jhalpert",
               "host_dst": "www.facebook.com",
               "ip_dst": "31.1x.x9.1x8",
               "sessionid": 2,
               "ec_theme": "Login Failure",
               "esa_time": 1406148964130,
               "ip_src": "23.xx.23x.16"
          }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same deployment, with the same event stream, can generate the alert shown below.

```
{"events": [
     {
          "username": "jhalpert",
          "host_dst": "www.facebook.com",
          "GeoIpLookup": [
          {
               "city": "Cambridge",
               "longitude": -71,
               "countryCode": "US",
               "areaCode": 617,
               "metroCode": 506,
               "region": "MA",
               "dmaCode": 506,
               "ipv4Obj": "/23.xx.23x.16",
               "countryName": "United States",
               "postalCode": "02142",
               "ipv4": "23.xx.23x.16",
               "latitude": 42,
               "organization": "Verizon Business"
          }
     ],
     "orgchart": [
          {
               "supervisor": "mscott",
               "name": "James Halpert",
               "extension": 3692,
               "location": "Scranton",
```

```
            "department": "Sales",
            "id": "jhalpert"
        }
    ],
    "ip_dst": "31.1x.x9.1x8",
    "sessionid": 2,
    "LoginRegister": [
        {
            "username": "dshrute",
            "ip_src": "23.xx.23x.16"
        }
    ],
    "ec_theme": "Login Failure",
    "esa_time": 1406155218912,
    "ip_src": "23.xx.23x.16"
    }
]}
```

The system pulls contextual data to make the alert more meaningful.

To include the name of the supervisor and the name of the user with the last successful login in the ESA notification, this example includes the following template expressions: `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee in the alert and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- Context Hub List (Preferred)
- In-Memory Table (Ad hoc only)
- GeoIP

Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness. You can only use the In-Memory Table with ESA. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources.

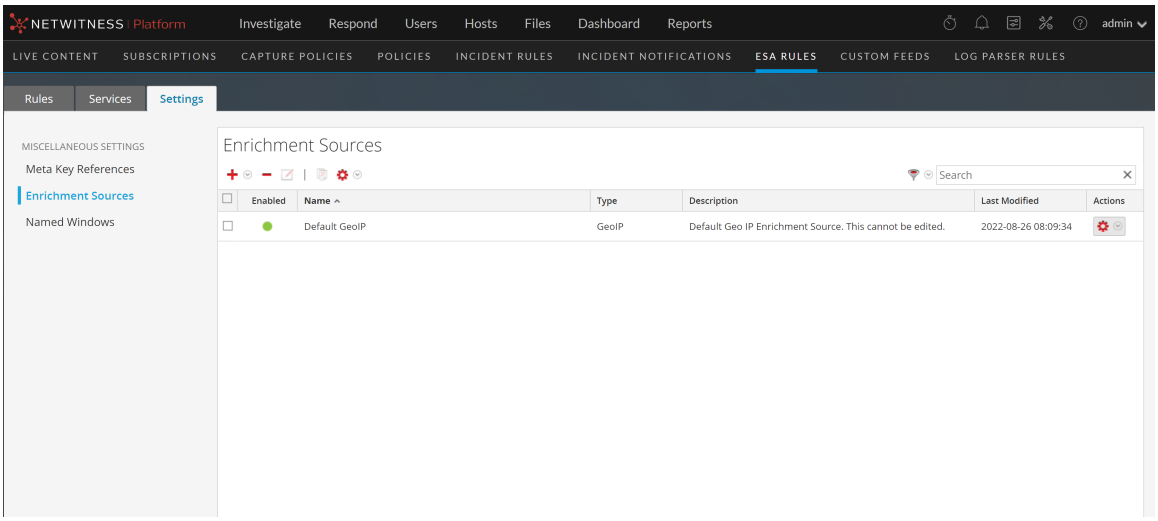
Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Configure a Context Hub List as an Enrichment Source

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

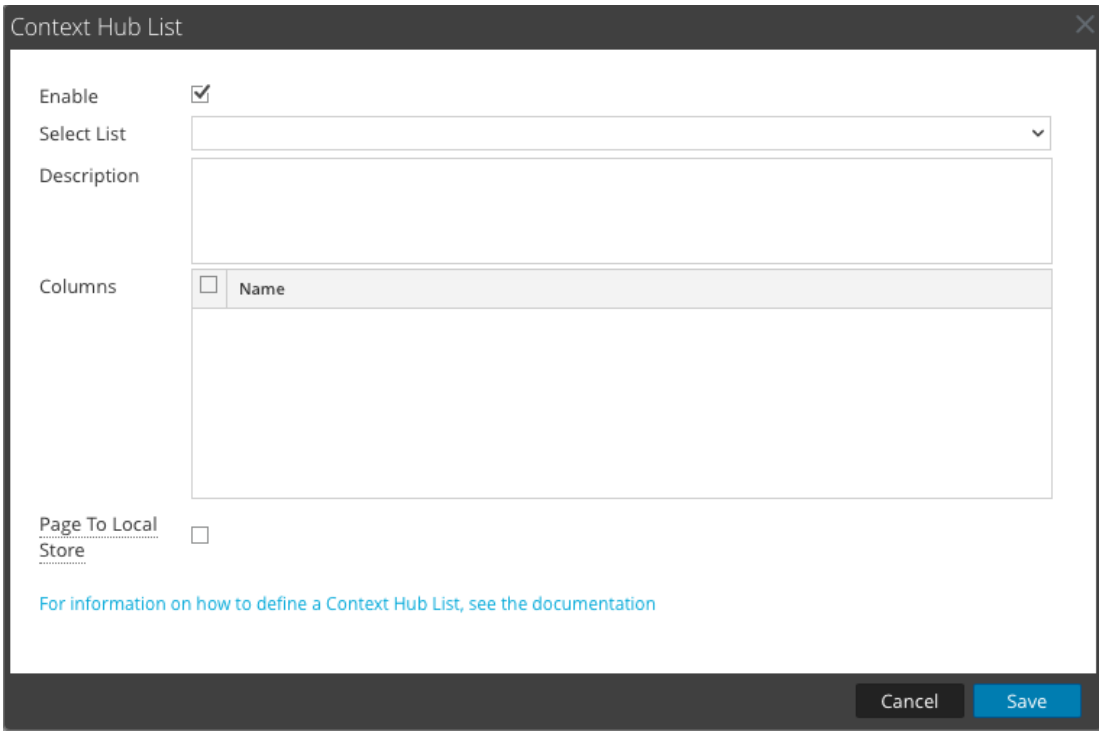
Prerequisites

Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *NetWitness Context Hub Configuration Guide*.



Caution: When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

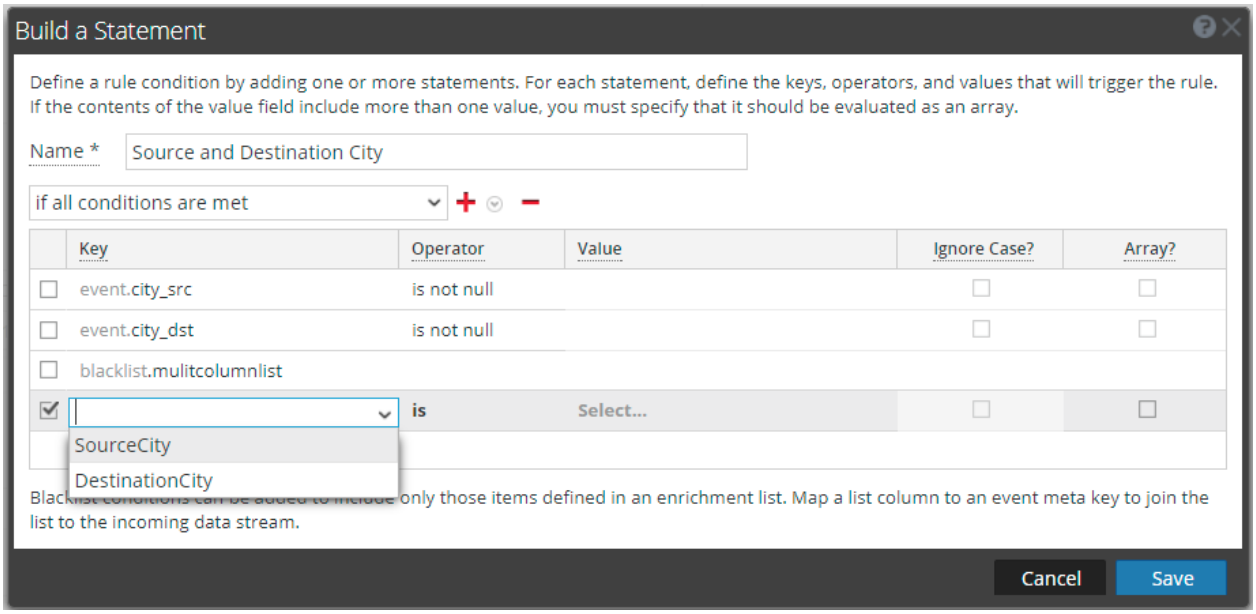
IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.



Configure a Context Hub List as an Enrichment Source

1. Go to  **(Configure) > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



3. From the  drop-down menu, select **Context Hub**.

4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.
6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.
7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.

8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

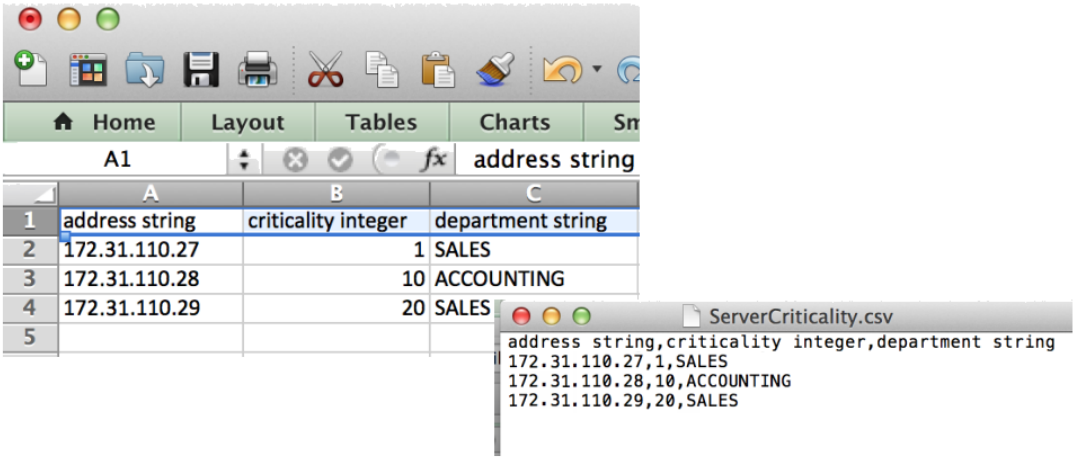
The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.

For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

Configure an In-Memory Table as an Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.



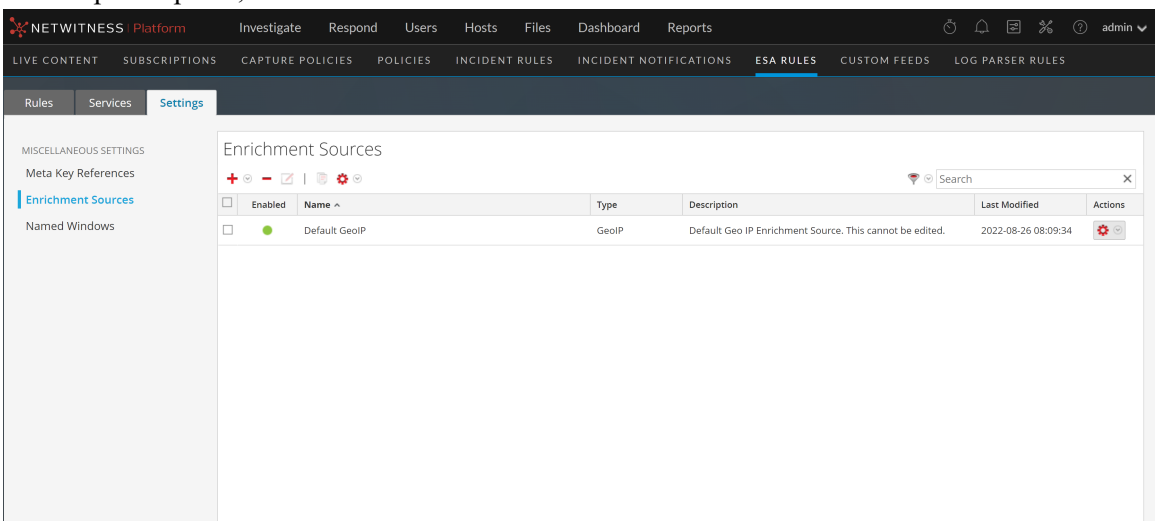
For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

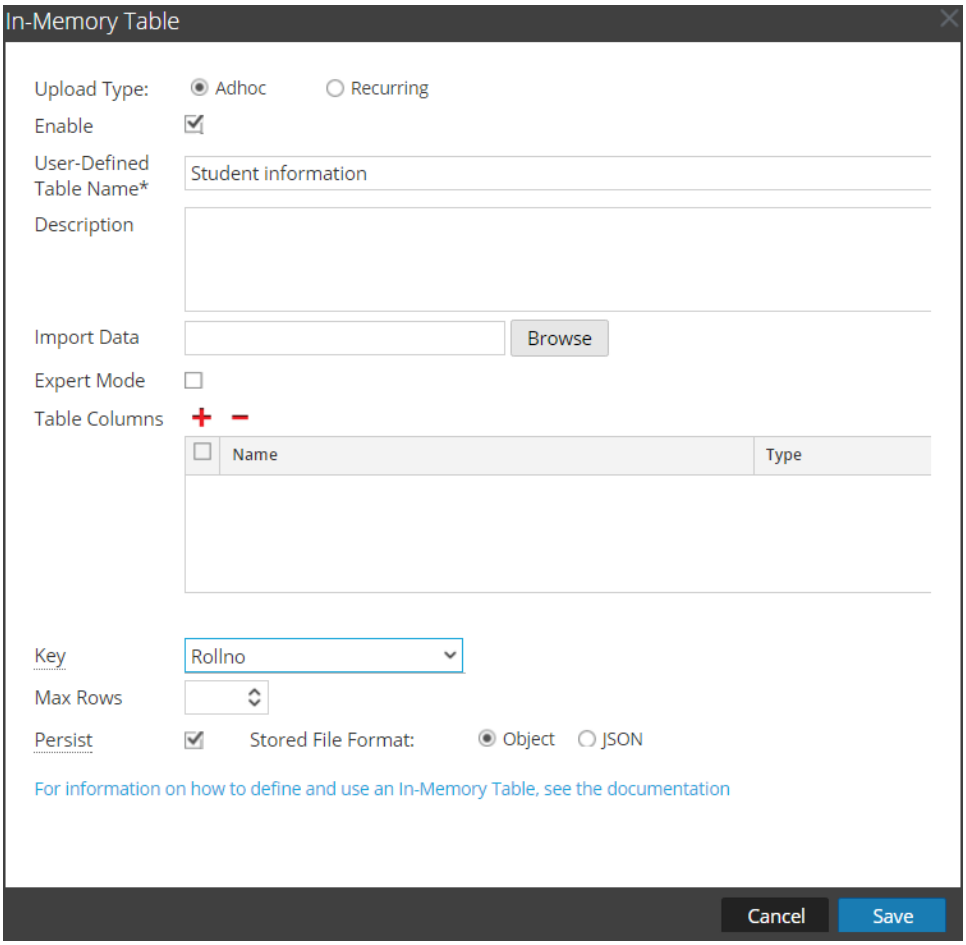
Prerequisites

- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

The following shows a valid .CSV file represented as a .CSV and as a table.



Configure an Ad hoc In-Memory Table



Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.

4. In the **Enrichment Sources** section, click  > **In-Memory Table**.

5. Describe the in-memory table:
   a. Select **Ad hoc**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   Note: Do not use any Esper keyword as **User-Defined Table Name** since this causes an error while using this enrichment in the ESA Rule. For Esper keywords, see Reserved keywords.

   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
   When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
    By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to a rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:

Next, the alert is enriched with the User_list in-memory table:

Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring In-Memory Table

Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

It is preferable to use Context Hub List enrichment sources for ESA rules instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness Platform. You can only use the In-Memory Table with ESA.

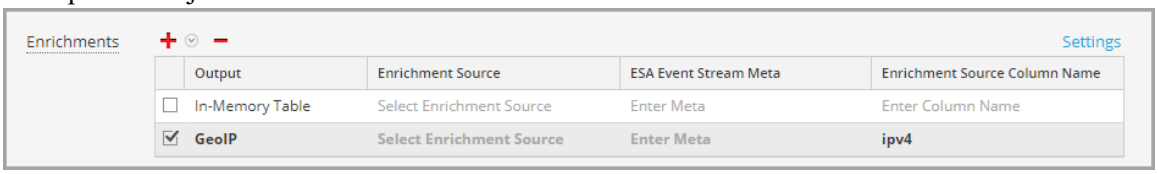
Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Note: This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure a Context Hub List as an Enrichment Source.



To add an enrichment to a rule:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - GeoIP

   Note: If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

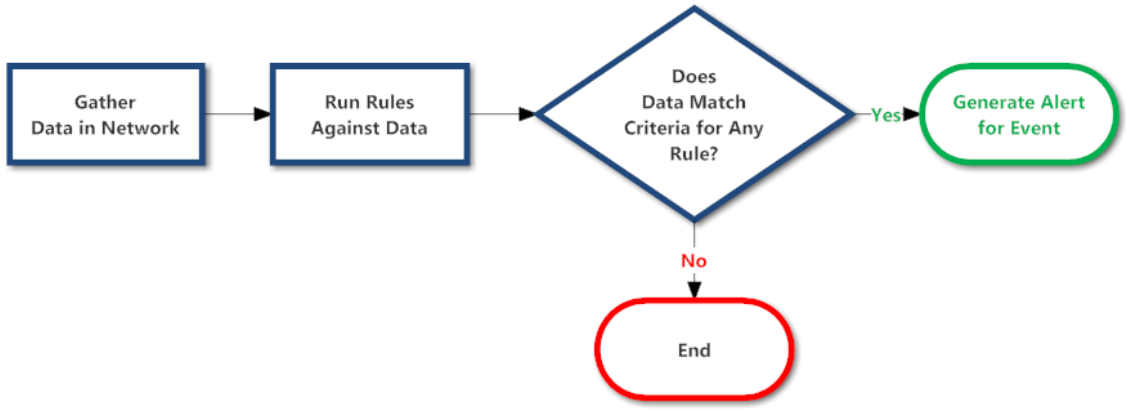
   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This adds an @Audit('stream') annotation to the rule. This is useful when debugging the Esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This section explains how an ESA Rule Deployment works and how to set up a deployment to run a group of ESA rules. Administrator, SOC Manager, or Data Privacy Officer role permissions are required for all procedures in this section.

To create an ESA rule deployment, you need to perform the steps described in Managing ESA Rules, Data Sources and Deployments



How an ESA Rule Deployment Works

An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:

In addition, you may want to perform other steps on your deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to the deployment. For descriptions of these procedures, Managing ESA Rules, Data Sources and Deployments.

Managing ESA Rules, Data Sources and Deployments

From 12.1 and later versions, the ESA deployments are managed by policies and groups on the **(Configure)** > **Policies** page.

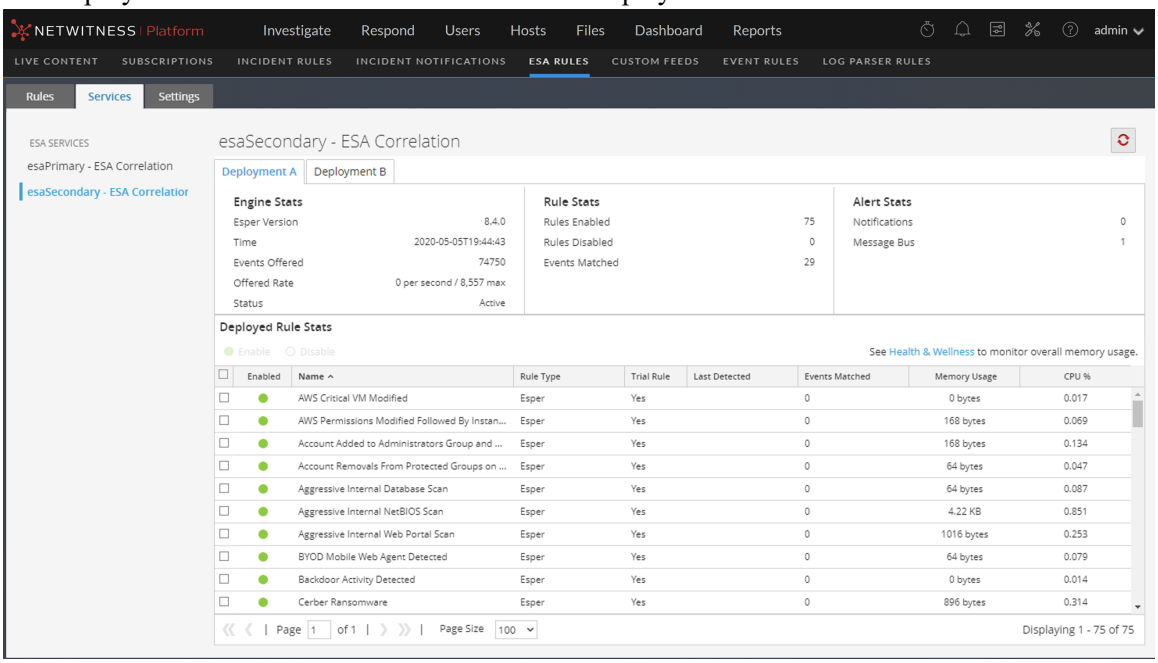
If you want to create any new ESA rules, add new data sources or perform any new ESA deployments, see the following sections in the Live Services Management guide:

- To view, add, edit, or delete data sources, see section "Manage ESA Datasources".
- To add, edit or delete an ESA rule, see the following topics, "Create an ESA Rule", "Edit, Duplicate or Delete a Rule", and "Delete an ESA Rule".
- To view, create, edit, remove, deploy or stop a deployment, see section "Manage Deployments".

View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts



View Stats for an ESA Service

This topic describes how to view the deployment statistics (stats) for an ESA Correlation service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot an ESA rule deployment.

Caution: When you modify and re-deploy an ESA rule deployment, all of the stats are removed from that deployment. The generated alerts are not removed from NetWitness Respond.

View ESA Stats

1. Go to **(Configure) > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.

3. (This option applies to NetWitness version 11.3 and later.) In the Deployment view under the ESA Correlation service name, select the tab of the deployment you would like to view. For example,

select the Deployment A tab to view the stats for deployment A. Select the Deployment B tab to view the status for deployment B.

4. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.
   - **Engine Stats**
   - **Rule Stats**
   - **Alert Stats**
5. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - The type of rule
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
   - The amount of memory used by the rule
   - The percentage of the deployment CPU used by the rule (available in NetWitness version 11.5 and later)
6. To monitor overall memory usage and health of your ESA Correlation service, click **Health & Wellness**.

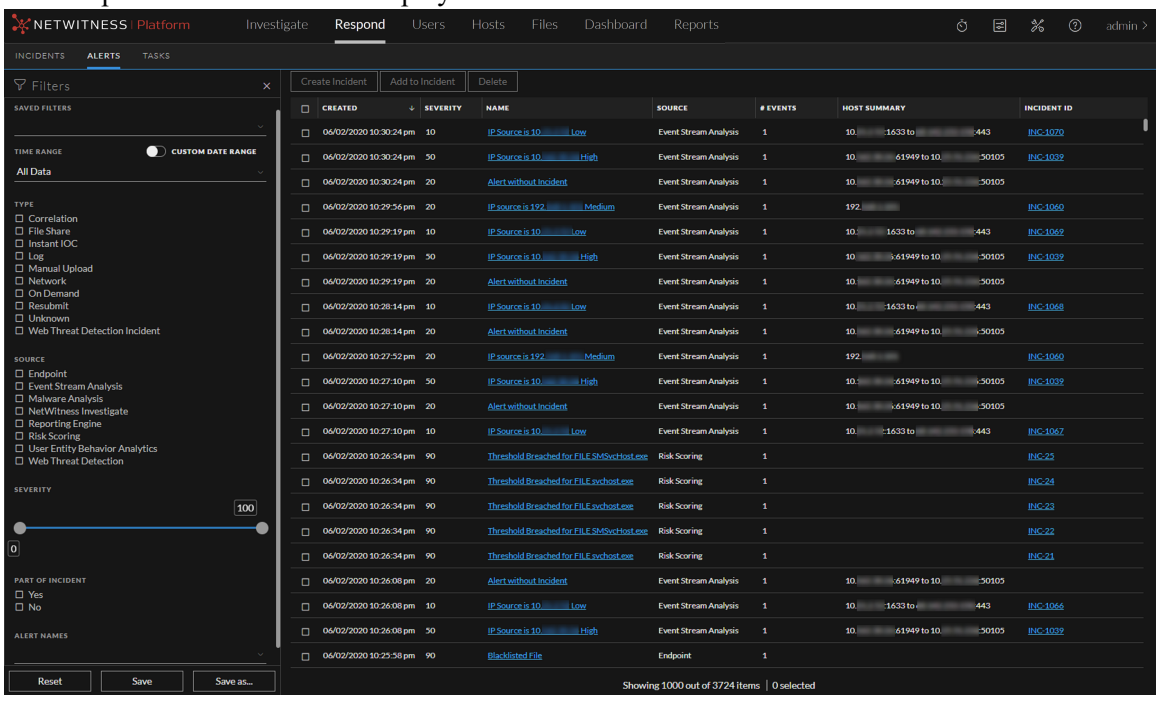
Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

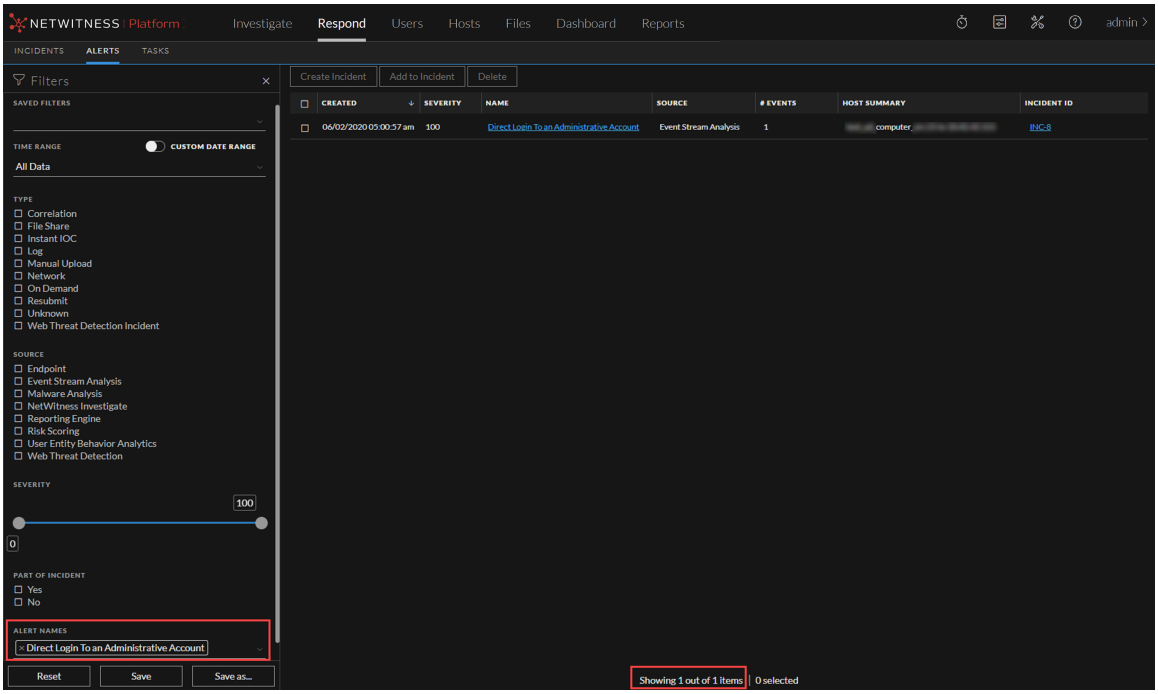
1. Click in the upper right corner to refresh the information.
2. View the updated information.



View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range from the following sources:

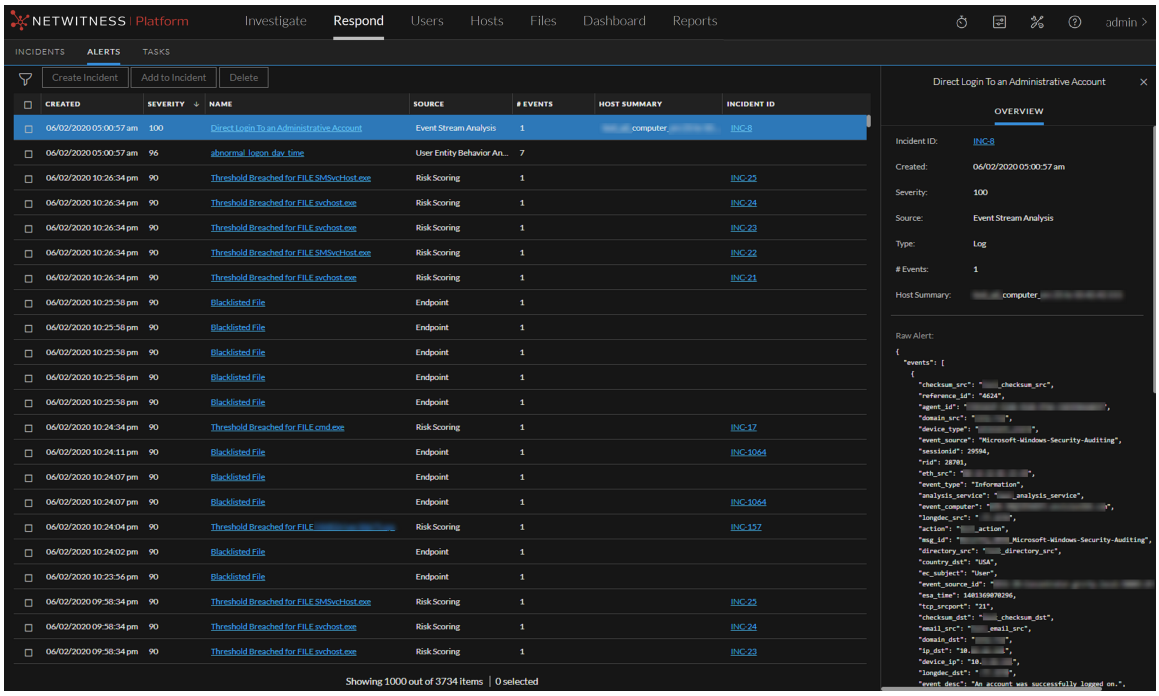
1. Detect AI
2. Endpoint
3. Event Stream Analysis
4. Malware Analysis
5. NetWitness Investigate
6. Reporting Engine
7. Risk Scoring
8. User Entity Behavior Analysis
9. Web Threat Detection



Perform the following steps to use the functionalities provided in the Respond view.

1. Go to **Respond > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness alerts.

2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the Alert Names section, you can select an alert for an ESA rule, such as



Direct Login to an Administrative Account, and leave the Time Frame set to Last Hour.
The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.

The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.

For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

Add an Advanced EPL Rule

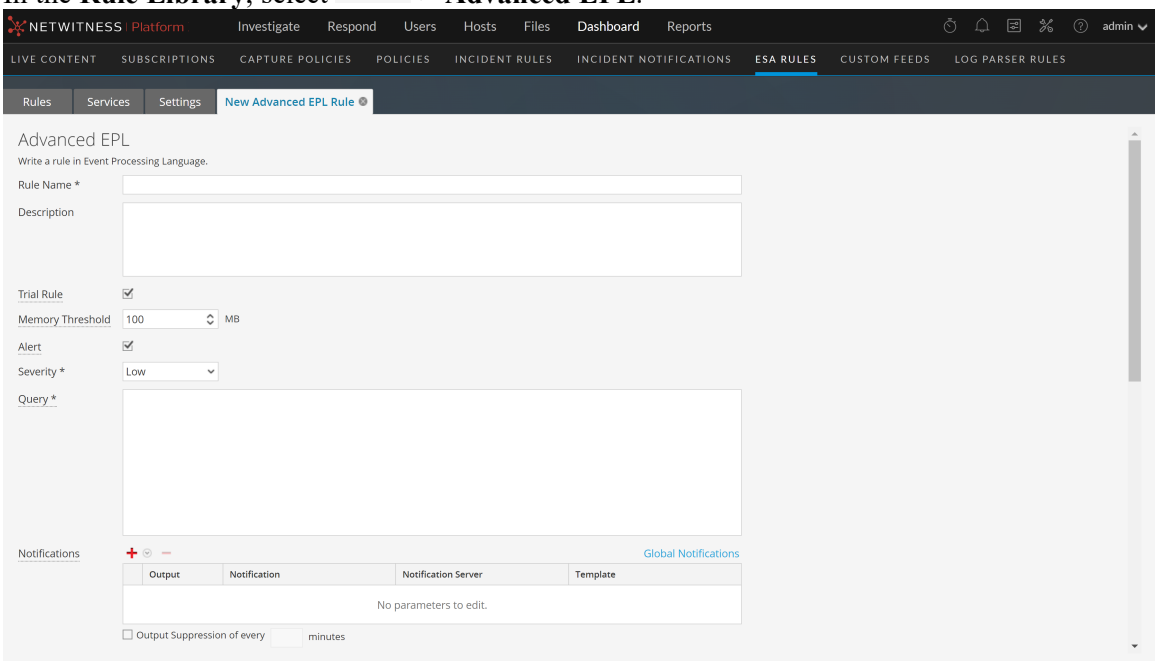
This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.



Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Add an Advanced EPL Rule

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library**, select **> Advanced EPL**.

3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.

6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.

7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.

8. For **Severity**, classify the rule as Low, Medium, High or Critical.

9. To define rule criteria, write a **Query** in EPL.

   Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

   Supported meta entities:

S. No	Supported Meta Entities	Description
1	fullname_all	
2	eth_all	
3	ip_all	Combines all the IPv4 meta keys.
4	ipv6_all	Combines all the IPv6 meta keys.
5	port_src_all	
6	port_dst_all	
7	dir_path_all	
8	org_all	
9	geoip_all	
10	port_all	
11	domain_all	
12	email_all	
13	filename_all	
14	directory_all	
15	checksum_all	
16	param_all	
17	context_all	
18	attack_all	
19	analysis_all	
20	compromise_all	
21	inv_all	
22	outcome_all	
23	ec_all	
24	user_all	
25	host_all	

26	client_all

10. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

    ```
    @Name("RIG {ip_src} {alias_host} {ec_activity}")
    ```

    where,

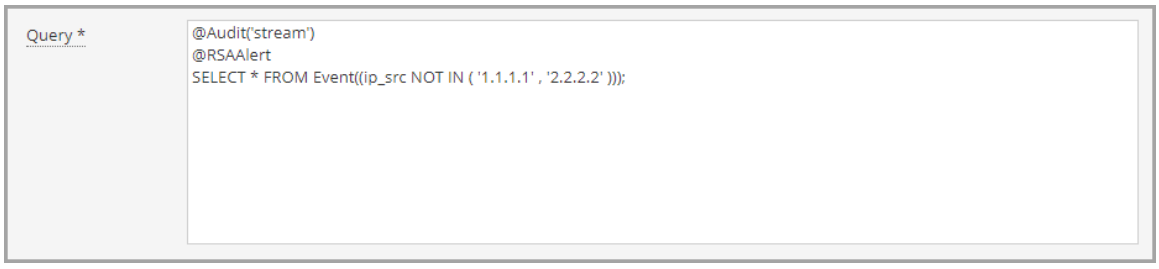
    - RIG is the static part of the statement name
    - {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

    Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

    If a rule should generate an alert, include this ESA annotation in the syntax:

    ```
    @RSAAlert
    ```

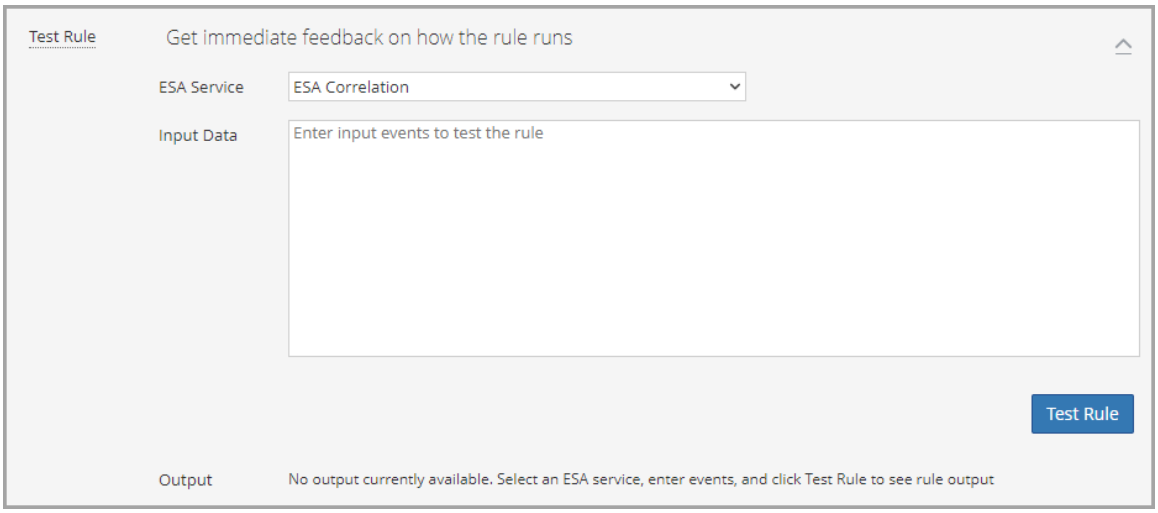
    For more information on ESA Annotations, see ESA Annotations.



Validate an Advanced EPL Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

If you want to view all of the debug information, include an `@Audit('stream')` annotation to your rule query and view the Debug Log in the test output. To enable auditing you require to add `@Audit` to the rule and set the logging level for the Esper audit package to INFO. This can be done by creating `correlation-server.yml` file under `/etc/netwitness/correlation-server` with this content and restarting the correlation-server service with systemctl restart rsa-nw-correlation-server:



```
logging:
   level:
     com.espertech.esper.audit: INFO
```

The following basic example query contains the `@Audit('stream')` annotation and queries for events that do not have a source IP of 1.1.1.1 or 2.2.2.2.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.

2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.
   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.
   c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].
   d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.
   e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.
   f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

   To download the events from the Investigate > Events view:

   a. In the main menu, go to **Investigate > Events** in a new tab.
   b. In the Events view, enter a query for the ESA rule test.
   c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

Note: If you are testing any Rule that has meta key defined as type 'short', the Test Rule will not generate alert for the event.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service

Field	Description
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Advanced ESA rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can make a strict pattern match for better performance.

Strict Pattern Match Example

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
     (medium IN ( 1 ) AND
     filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' , 'windows
executable' ))
     ).win:time(5 Minutes)
MATCH_RECOGNIZE (
     MEASURES E1 as e1_data , E2 as e2_data
     PATTERN (E1 E2)
     DEFINE
          E1 as (E1.filetype IN ('pdf')),
          E2 as (E2.filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' ,
'windows executable' ))
```

```
);
```

Caution: Care should be taken to only add the case-insensitive *toLowerCase()* function on meta keys as needed. The *toLowerCase()* function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function.

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: In NetWitness version 11.5, ESA Correlation supports Esper version 8.4.0. In version 11.4, ESA Correlation supports Esper version 8.2.0 and in version 11.3, ESA Correlation supports Esper version 7.1.0.

ESA Annotations

This topic describes annotations that NetWitness provides to use in advanced EPL rules.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

@RSAContext Annotation (11.5 and later)

The @RSAContext annotation can be used in advanced rules to dynamically add or remove data from a Context Hub list after the rule fires. For example, you can create a rule that automatically adds an IP address to a blacklist and removes it from a whitelist.

You can update a single-column or a multi-column Context Hub list. The @RSAContext annotation also performs error handling when the Context Hub list cannot be reached.

Prerequisites

Before deploying a rule using the @RSAContext annotation, the list must exist in Context Hub. For information on creating a Context Hub list, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

Single-Column Context Hub Lists

The @RSAContext annotation uses the following format for a single column Context Hub list:

```
@RSAContext (list="<single_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"LIST=<meta_key>"})
```

The @RSA Context parameters for a **single-column** Context Hub List are described in the following table.

Parameter	Description
`list`	Where `<single_column_list>` is the name of the single-column Context Hub list (whitelist or blacklist).
`action`	You can add an entry to or remove an entry from the list: • `DELETE_ENTRY` - Removes an entry from the list. • `ADD_ENTRY` - Adds an entry to the list. You can only have one action per `@RSAContext` entry.

Parameter	Description
onError	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
fields	Maps a meta key value to the column in the Context Hub list. Single-column lists always show LIST= in capital letters.

The first example deletes a source IP address from an IP whitelist. However, if the list is not available, the source IP address is not removed from the list and processing is continued.

```
@RSAContext (list="ip_whitelist", action=DELETE_ENTRY, onError = IGNORE_ERROR_
AND_CONTINUE, fields={"LIST=ip_src"})
```

The second example adds a source IP address to an IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="ip_blacklist", action=ADD_ENTRY, onError = STOP_ALL_RULE_
PROCESSING_AND_WAIT, fields={"LIST=ip_src"})
```

Multi-Column Context Hub Lists

The @RSAContext annotation uses the following format for a multi-column Context Hub list:

```
@RSAContext (list="<multi_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"<column1>=<meta_key1 or constant value1>",<column2>=<meta_key2 or
constant value2>",<column n>=<meta_key n or constant value n>",})
```

The @RSA Context parameters for a **multi-column** Context Hub List are described in the following table.

Parameter	Description
list	Where <multi_column_list> is the name of the multi-column Context Hub list.
action	You can add an entry to or remove an entry from the list: • DELETE_ENTRY - Removes an entry from the list. • ADD_ENTRY - Adds an entry to the list. You can only have one action per @RSAContext entry.
onError	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
fields	Maps a meta key values or constant values to the columns in the Context Hub list. Multi-column lists show the names of each column in the fields parameter.*

The first example deletes a user and the associated source and destination IP addresses from a multi-column IP whitelist. However, if the list is not available, the specified fields are not removed from the list and processing is continued.

```
@RSAContext (list="MultColumn_whitelist", action=DELETE_ENTRY, onError =
IGNORE_ERROR_AND_CONTINUE, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

The second example adds a user and the associated source and destination IP addresses to a multi-column IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="MultColumn_blacklist", action=ADD_ENTRY, onError = STOP_
ALL_RULE_PROCESSING_AND_WAIT, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

Automatic Context Hub List Updates

When using the @RSAContext annotation in your rules, string array meta keys (shown as `string[]` in the Meta Key References on the ESA Rules > Settings tab) are inserted and removed as separate lines in the Context Hub list. This enables lookups in the Investigate and Respond views.

Single Column Context Hub List Update Example

A single column Context Hub list has one column with the string array meta key `alias_host`. If the rule using that list fires and `alias_host` has three values (Google, Yahoo, and Dell), ESA Correlation adds three rows to the Context Hub list:

Google
Yahoo
Dell

Multi-Column Context Hub List Update Example

A multi-column Context Hub list has three columns. If the rule using that list fires and the meta keys have the following values:

- `username` (string array) with values Aimee and Chris
- `ip_dst` (string) with value 10.10.10.10
- `alias_host` (string array) with values Dell, Google, and Yahoo

ESA Correlation adds six rows to the Context Hub list:

Aimee, 10.10.10.10, Dell
Aimee, 10.10.10.10, Google
Aimee, 10.10.10.10, Yahoo
Chris, 10.10.10.10, Dell
Chris, 10.10.10.10, Google
Chris, 10.10.10.10, Yahoo

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

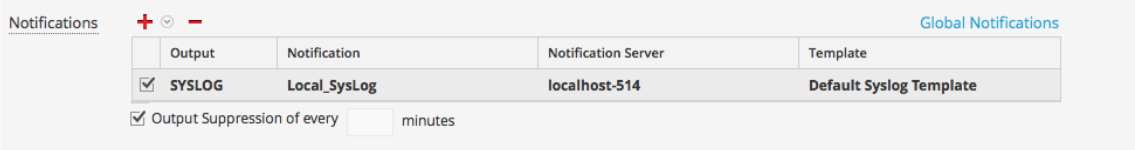
The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.



However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.

2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is undeployed and redeployed. The systems take a snapshot just before the ESA rule deployment is undeployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the deployment is redeployed. This ensures that the contents of the window are not lost if the deployment state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a deployment (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

Caution: (This caution applies only to NetWitness Platform versions 11.3.x, 11.4.x, and 11.5.0.0.) To avoid data being overwritten, if you have a rule with a named window, do not disable and re-enable it. Instead, undeploy and redeploy the ESA rule deployment that contains the rule.

IMPORTANT: The @RSAPersist annotation suggests avoiding the use of 'Event' as a data type when keeping all windows, as 'Event' is already declared as the schema. Please refer to examples of valid and invalid syntax scenarios.

Invalid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datas#keepall(evt Event);`
4.
5. `Insert into datas SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 Event);`

4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Valid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datatest#keepall(evt String);`
4. `Insert into datatest SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 java.util.Collection);`
4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Note: When using rules with named windows and enrichment windows, it is essential to ensure no differing or missing column types in the window definition. It is also advisable to avoid using keywords like 'Event' and 'Schema' as column names in the window definition. Additionally, if a rule attempts to define the same window twice, it is expected that runtime exceptions will occur.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

Note: Dynamic-name-enabled option allows you to disable dynamic alert name generation.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

@Audit Annotation

Add the `@Audit('stream')` annotation to your ESA rules to print alerts to the ESA logs for troubleshooting. This is useful when debugging the Esper rules. The @Audit('stream') annotation provides debug information for the next statement in the rule. For example:

```
@Audit('stream')
@RSAAlert
SELECT * FROM Event((ip_src NOT IN ( '1.1.1.1' , '2.2.2.2' )));
```

In the above example, `@RSAAlert` is only necessary if the statement needs to send an alert to the Respond view.

In NetWitness Platform 11.5 and later, you can test rules in the rule builders. If you add the `@Audit ('stream')` annotation to an advanced EPL rule, you can view the Debug Log in the test output. For more information, see Validate an Advanced EPL Rule .

Example Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Example #1:

Create a user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateAndDelete Useraccount1
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`  AND ec_outcome='Success'`
	`  AND user_src is NOT NULL`
	`  AND ec_activity IN ('Create', 'Delete')`
	`  ).win:time(300 seconds)`
	`match_recognize (partition by user_src`
	`   measures C as c, D as d`
	`   pattern (C D)`
	`  define`
	`   C as C.ec_activity='Create' ,`
	`   D as D.ec_activity='Delete');`

Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete') • Partition by creates buckets. In this case, Esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define the pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case. • The ‘loose’ pattern match of (C+ D) will result in decreased performance. Unless you need to include all C events within the generated alert, keep the strict pattern match of (C D). See the Esper documentation for more details.

EPL #2:

Rule Name	CreateAndDeleteUseraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`
	`->`
	`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_src)`
	`) )where timer:within(300 Sec) ];`

Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bounds and preferably small intervals. • If you do not need every first event to start a new thread and match with the subsequent second event, then add suppression syntax of @SuppressOverlappingMatches after the pattern keyword. See the Esper documentation for more details.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`and ec_activity in ('Create','Logon','Delete')`
	`and ec_theme in ('UserGroup', 'Authentication')`
	`and ec_outcome='Success'`
	`).win:time(300 seconds)`
	`match_recognize (measures C as c, L as l, D as d`
	`pattern (C L D)`
	`define`
	`C as C.ec_activity = 'Create',`

	L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src, D as D.ec_activity = 'Delete' AND D.user_src = C.user_src);
Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between. • Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	@Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long); @Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null); @Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null); @Name('Pattern') @RSAAlert(oneInSeconds=0, identifiers={"user"}) select * from FilteredEvents match_recognize (partition by user measures C as c, L as l, D as d pattern (C L+D) define C as C.ecactivity= 'Create', L as L.ecactivity= 'Logon', D as D.ecactivity='Delete');

EPL #5: Using Every @RSAAlert(identifiers={"user_src"})

Rule Name	CreateUserLoginandDeleteUser

Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	`SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern [every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event(ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];`

Example #3:

Excessive login failures from same sourceIP.

EPL #6: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time_batch(300 seconds) GROUP BY`
	`ip_src HAVING COUNT(*) = 10;`

Note	• Uses time _batch: Looks at events in batches(tumbling window). Every event matching the filter criteria will be kept for the specified time window. • "GROUP BY" clause aggregates events within the data window by ip_src and HAVING clause instructs a count of 10 events with the same ip_src must occur within the time window. • One of the issues with tumbling windows is that events occurring towards the end of the batch might not lead to an alert. In the below sequence of events at t=301 even though 10 login failures occurred for the same login in the last 300 secs, there will be no alert because the batch of events was dropped at t=300.

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3

	720 6 0 3 850 3 0 3 900 1 1 3 ends and 4 begins • Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows. • Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, Esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10. • Time and count can be modified as needed.

EPL #7: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time(300 seconds) GROUP BY ip_src HAVING COUNT(*) = 10;`

Note	• This is a sliding window and hence after an alert is fired for a set of events they can be used for another alert as well until time has passed. • If 10 events were involved in causing the alert only the last event will appear. • Events are not removed from the time window. You could use output rate limiting. See the Esper documentation for more details.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using time_batch

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event (`
	`ec_activity='Logon'`
	`AND ec_outcome='Failure'`

	AND ip_src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL) .win:time_batch(300 seconds) group by ip_src,ip_dst having count(distinct user_dst) >= 5;
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are at least 5 different users try to login from same ip.src and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using timer:interval

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))];
Note	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using timer and Lockout

Rule Name	FailedloginswoLockout
Rule	There are multiple failed logins that are not followed by Lockout event by the same

Description	user.

Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)`
	`AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))`
	`where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout')) ];`

Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.

Rule Code	`SELECT * FROM pattern[`
	`e1=Event(matchLike(alias_host, "10.0.0.%")) AND`
	`e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))`
	`where timer:within(5 Minutes)];`

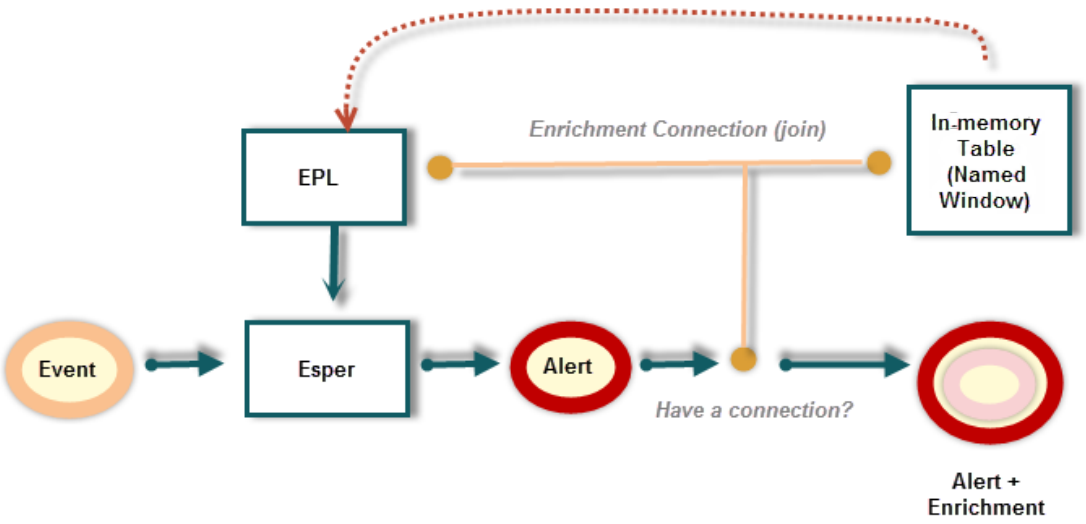
Note:
1. "**.**" in meta keys should be replaced with ("_").
2. All patterns should be time bound.
3. Use appropriate tags in front of statements, for example:

```
@RSAPersist:
@RSAAlert:
```

For additional details you can refer to:

- EPL Documentation: http://www.espertech.com/esper/esper-documentation/
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Configure an In-Memory Table Using an EPL Query



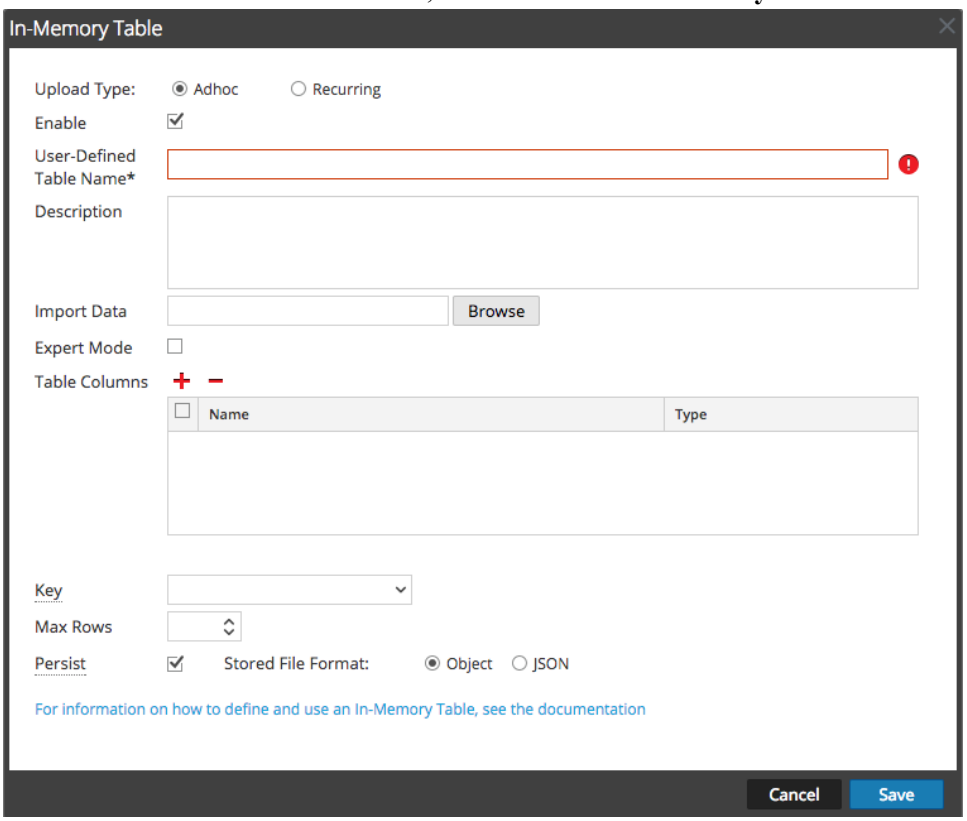
Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

When you use an In-Memory Table configuration in expert mode, you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting states from the event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



Prerequisites

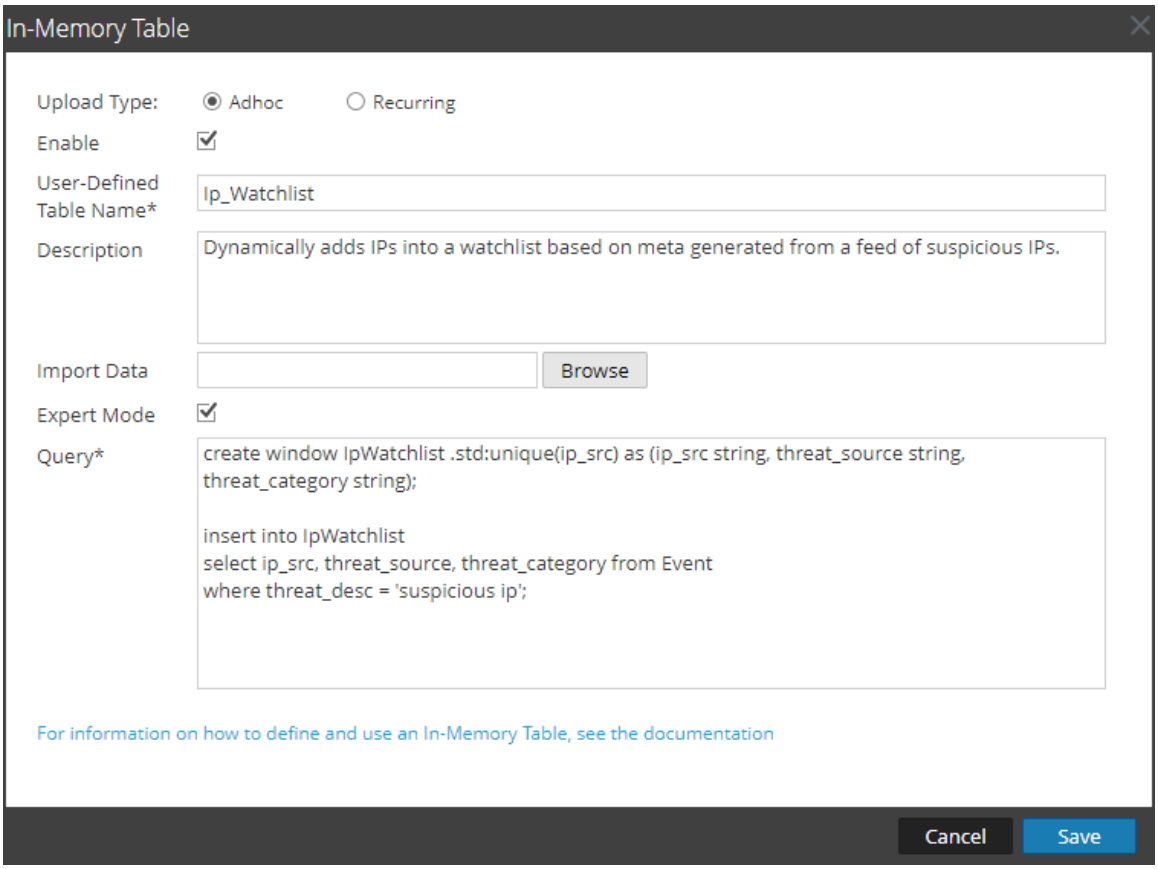
- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Procedure

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click > **In-Memory Table**.

5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.



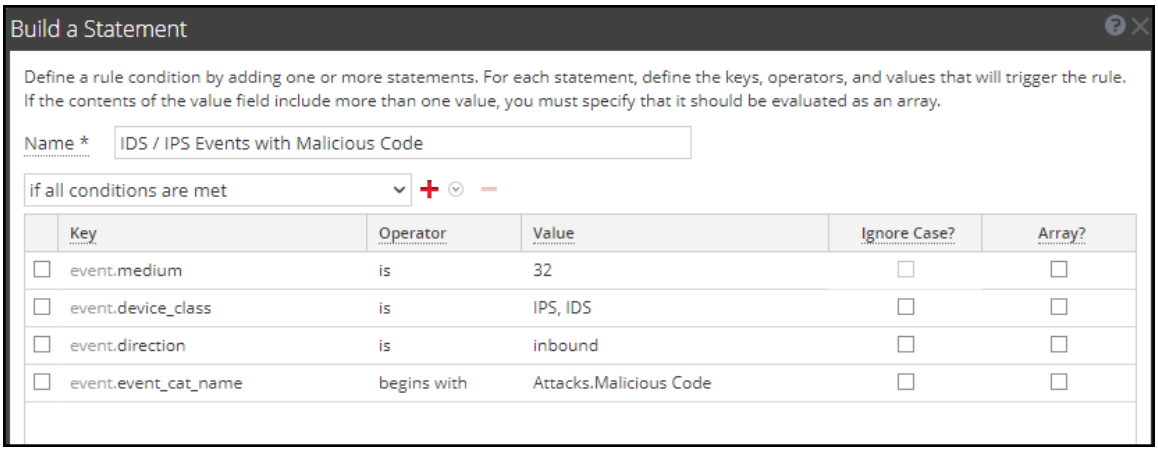
Example

For example, you want to know when an IPS or IDS is giving five or more inbound events with an event identified with malicious code. Additionally, you would like to know when the source IP of those events has been identified as suspicious by other sources. This information helps to more quickly triage the event and determine whether the alert is a true positive.

Step 1: Create the Enrichment

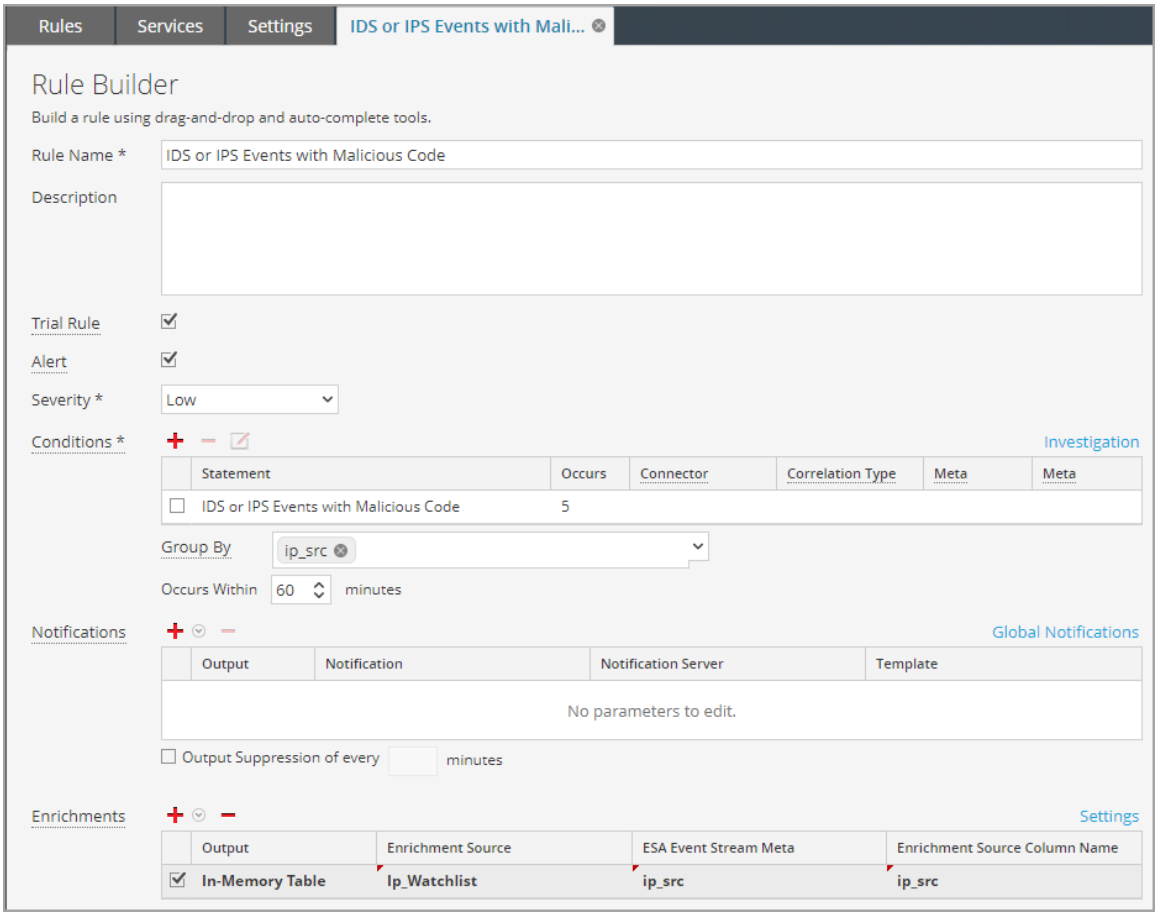
In this example, this enrichment is a watchlist of IPs that have been identified as suspicious by third party sources or by internal staff. The meta of `threat_desc equal to 'suspicious ip'` is generated when a match to a feed occurs. This meta can be matched and output based on a log, packet, or endpoint event.

The enrichment should look like the following:



Parameters	Description
Upload Type	Adhoc
IP_Watchlist	IP_Watchlist
Description	Dynamically populated whitelist based on a feed of IPs that are considered suspicious.
Expert Mode	Selected

Query	`create window IpWatchlist .std:unique(ip_src) as (ip_src string, threat_source string, threat_category string);`
	`insert into IpWatchlist`
	`select ip_src, threat_source, threat_category from Event`
	`where threat_desc = 'suspicious ip';`



Step 2: Create Your Rule

First, you need to create your ESA Correlation rule. This example rule looks for inbound IPS or IDS log events with the `event_cat_name` beginning with `Attacks.Malicious Code`. If five or more events for the same `ip_src` occur within 60 minutes, then an alert will be triggered. If an `ip_src` from the Enrichment equals the `ip_src` from the alert, then that alert will be enriched with additional meta. In this case, the analyst would see the values for `threat_source` and `threat_category` in the raw alert. `Threat_category` would indicate the type of malware and `threat_source` would indicate the entity that has reported the ip as suspicious. The analyst could use this information to do additional research or escalate to the next tier for creation of a possible incident.

Rule Statement

Rule Logic with Enrichment Added

ESA Alert References

In Event Stream Analysis (ESA), you configure and deploy ESA rules to get alerted about potential network threats.

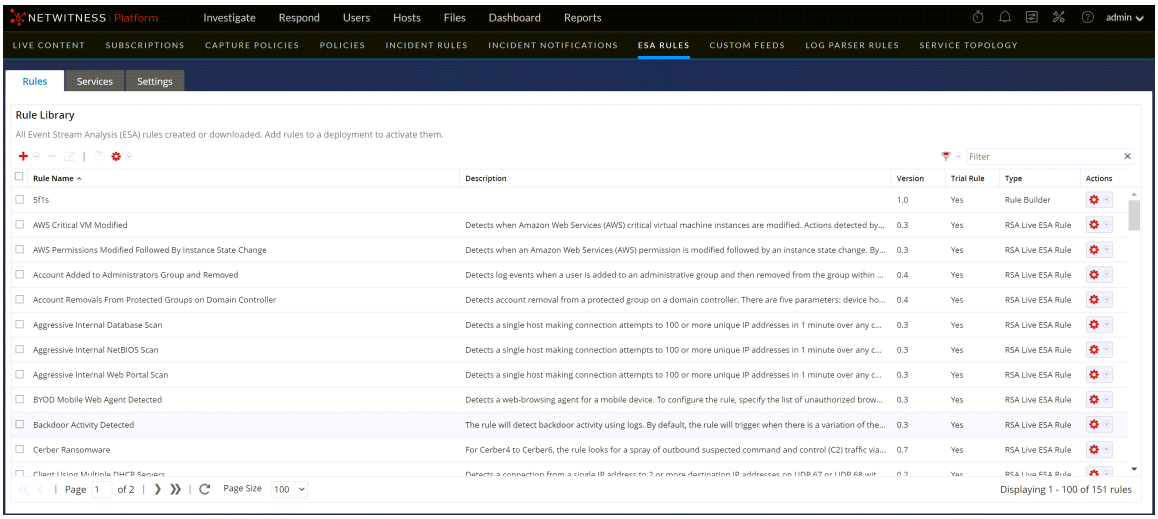
These topics explain the user interface for ESA Correlation rules.

- Rules Tab
- Rule Library Panel
- Rule Builder Tab
- Build a Statement Dialog
- Advanced EPL Rule Tab
- Rule Syntax Dialog
- Services Tab
- Settings Tab

Rules Tab

The Rules tab enables you to view and configure ESA rules.

What do you want to do?



Role	I want to ...	Show me how
Content Expert	View types of rules	ESA Rule Types
Content Expert	Deploy Trial Rules	Working with Trial Rules
Content Expert	Create a rule	Add Rules to the Rule Library

Related Topics

Getting Started with ESA

Quick Look

The Rules tab is displayed when you go to **(Configure) > ESA Rules**.
The following figure shows the Rules tab.

The Rules tab is divided into two sections:

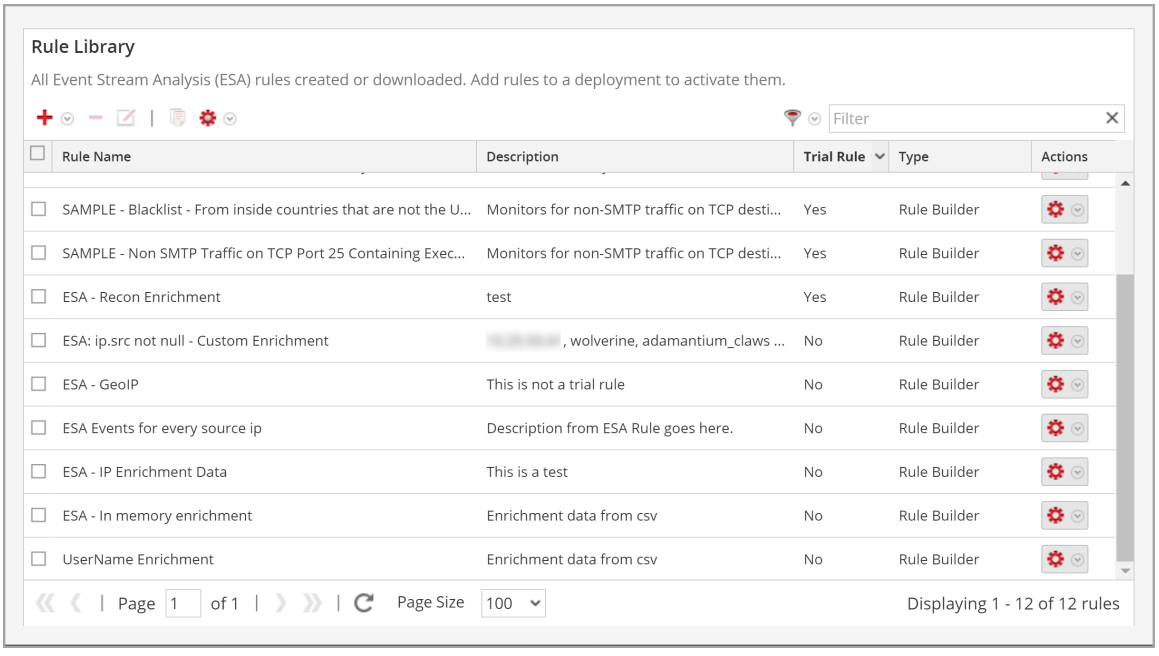
- Rules Tab Options Panel
- Rule Library Panel

Rule Library Panel

The Rule Library panel allows you to manage rules.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Add an ESA rule.	Add a Rule Builder Rule
Content Expert	Edit, duplicate, or delete an ESA rule.	Edit, Duplicate or Delete a Rule
Content Expert	Import or export ESA rules.	Import or Export Rules
Content Expert	Filter the ESA rules list.	Filter or Search for Rules



Related Topics

- Add an Advanced EPL Rule

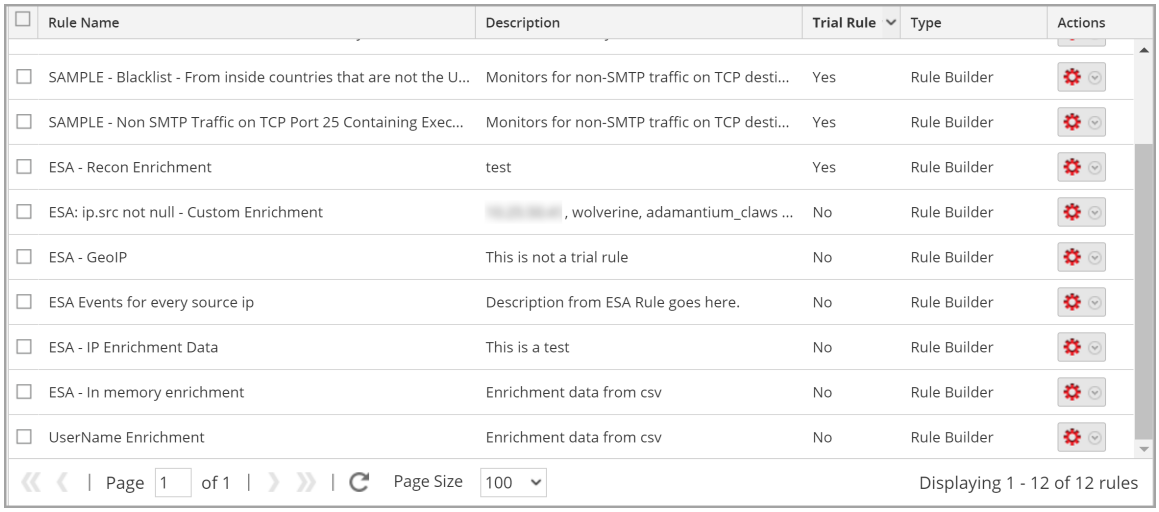
Quick Look

To access this view, go to **(Configure) > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.

The Rule Library panel includes the following components:

- Rule Library toolbar
- Rule Library list

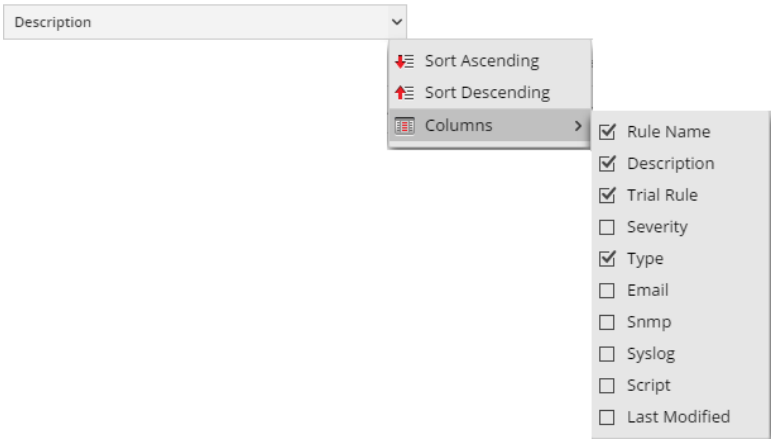


Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.



The Rule Library list shows all of the ESA rules. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule. For more information, see ESA Rule Types.
Actions ( )	Menu to delete, edit, duplicate, or export the selected rule.
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.

Column	Description
SNMP	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default. (ESA SNMP notifications are not supported in NetWitness version 11.3 and later.)
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.

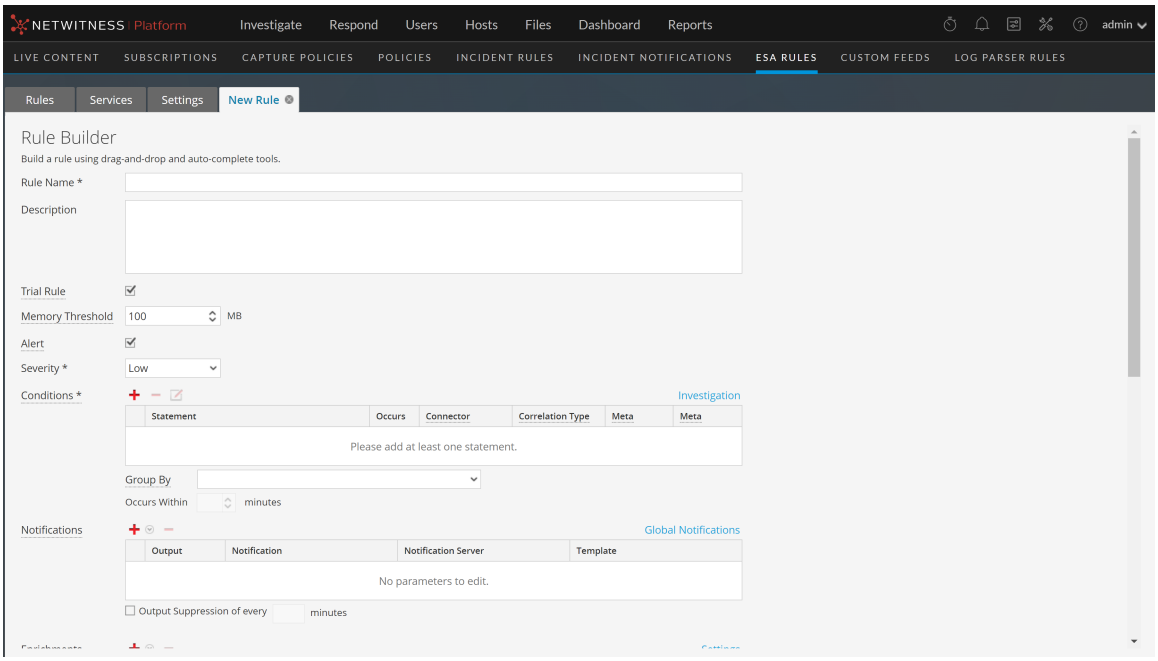
Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

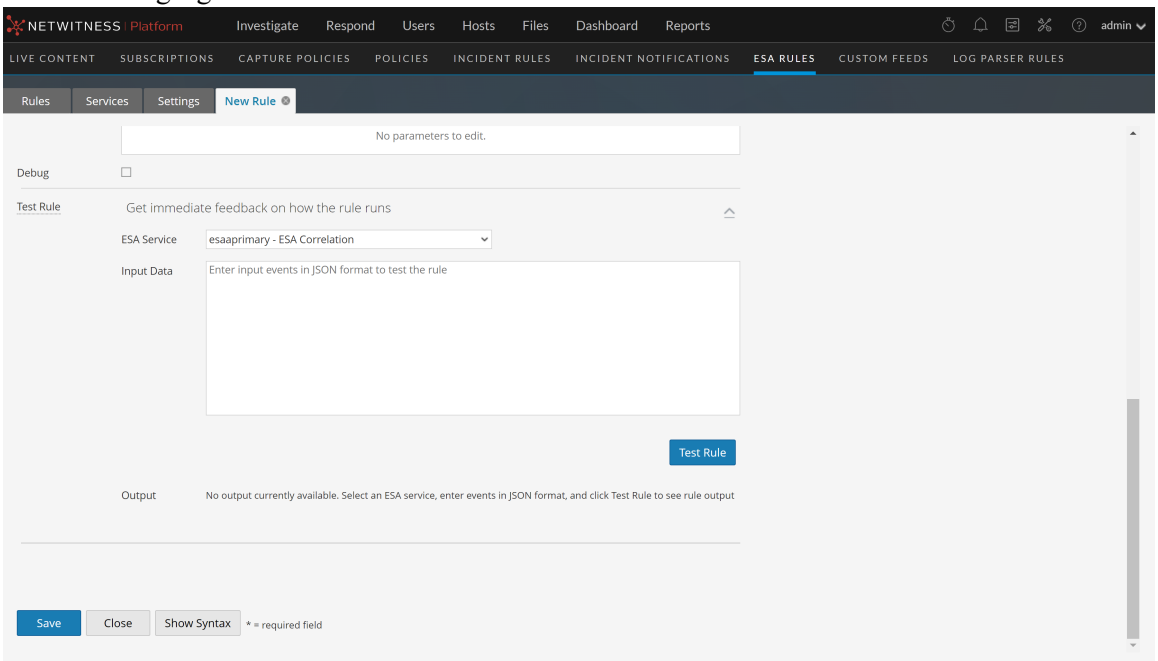
Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder RuleStep 1. Name and Describe the Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement
Content Expert	Test the ESA rule logic.	Validate an ESA Rule

Related Topics



- Add an Advanced EPL Rule

Quick Look



To access the Rule Builder tab:

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   The Rule Builder tab is displayed.

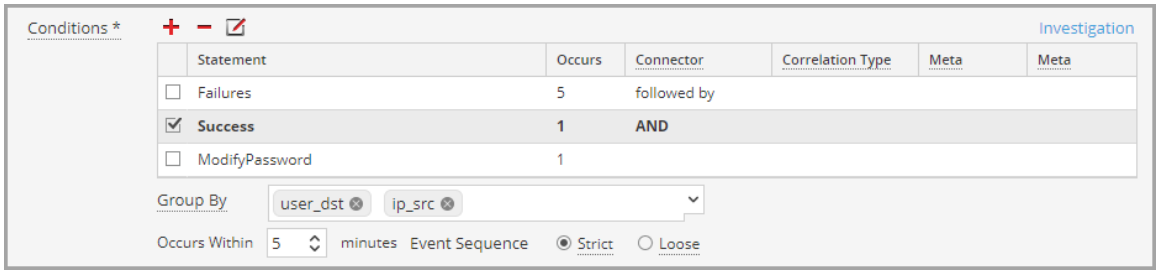
The following figure shows the Rule Builder tab.

The following figure shows the Rule Builder tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Rule Builder tab.

Field	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.

Field	Description
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.



The Rule Builder includes the following components:

- Conditions Section
- Notifications Section
- Enrichments Section
- Debug Option
- Test Rule Section

Conditions Section

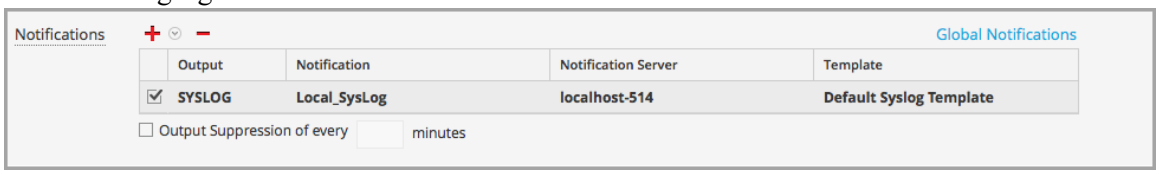
In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.

The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
	Edit selected statement.

Parameter	Description
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.



Parameter	Description
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

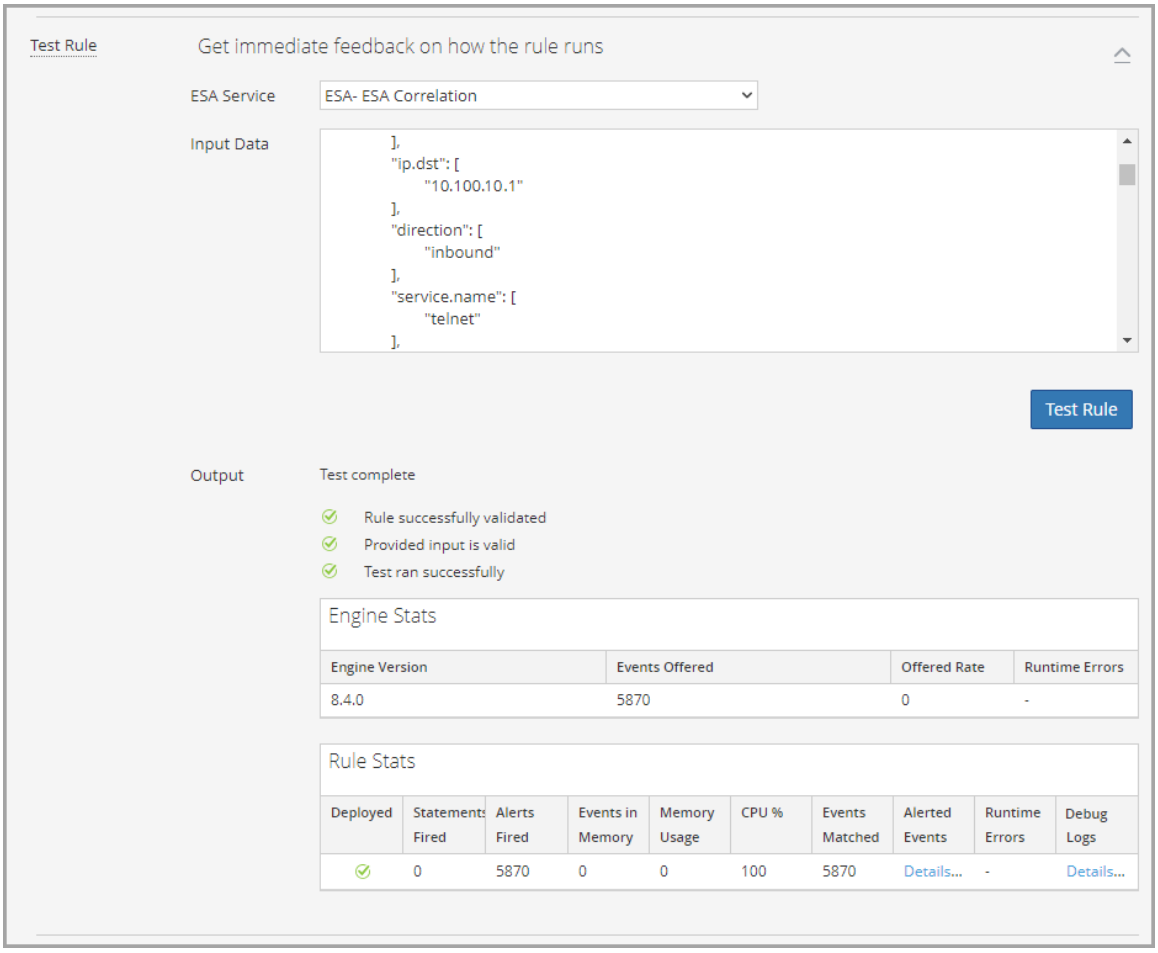
Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.



Debug Option

Select the Debug option to print alerts to the ESA logs for troubleshooting. This adds an @Audit ('stream') annotation to the rule. This is useful when debugging the Esper rules.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

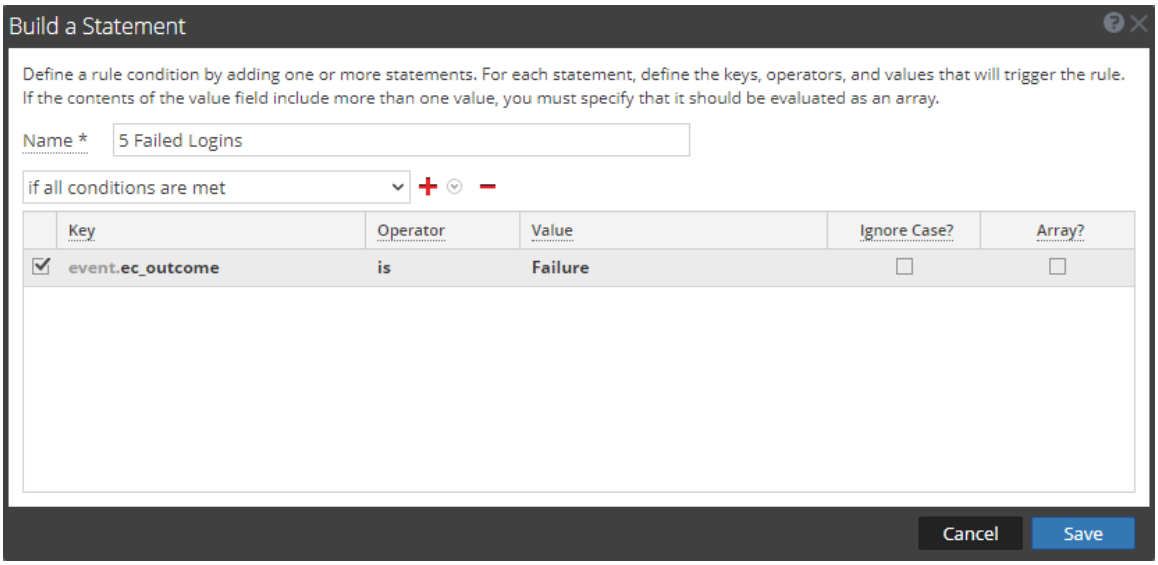
Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement



Related Topics

- Add a Rule Builder Rule

Quick Look

To access the Build a Statement dialog:

1. Go to  **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   A New Rule tab is displayed..
3. In the **Conditions** section, click .
   The Build a Statement dialog is displayed.

The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.

Parameter	Description
Operator	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • is one of (For array type meta) • is not one of (For array type meta) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.

Operator	Required Value	Usage	Example	Meaning
is	Array string value	The meta key is equal to one of the elements of the *value* field.	***user_dst*** is John, Doe, Smith.	***user_dst*** is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
is one of	Array string value	The meta key is one of the array string values in the *value* field.	***alias_host*** is one of Facebook, UTube, Instagram.	***alias_host*** is one of the array string values *Facebook, UTube, Instagram*.
is not one of	Array string value	The meta key is not one of the array string values in the *value* field.	***alias_host*** is not one of Facebook, UTube, Instagram.	***alias_host*** is not one of the array string values *Facebook, UTube, Instagram*.

Operator	Required Value	Usage	Example	Meaning
contains	String	The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italics*** are Meta that may not exist in all customer environments.

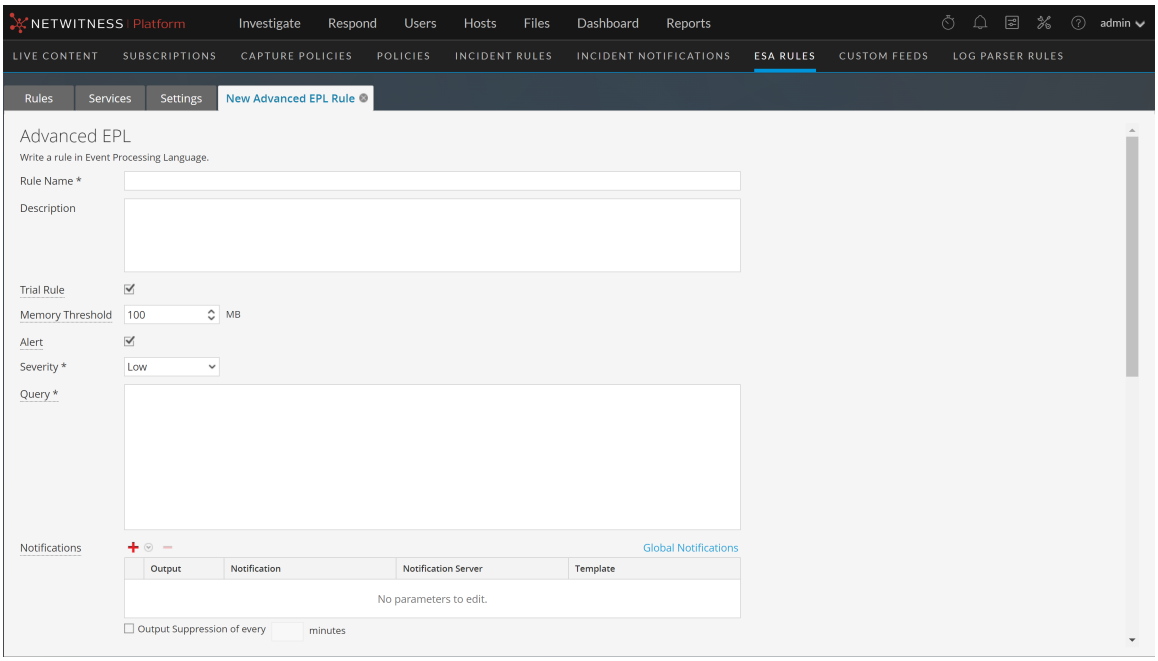
Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

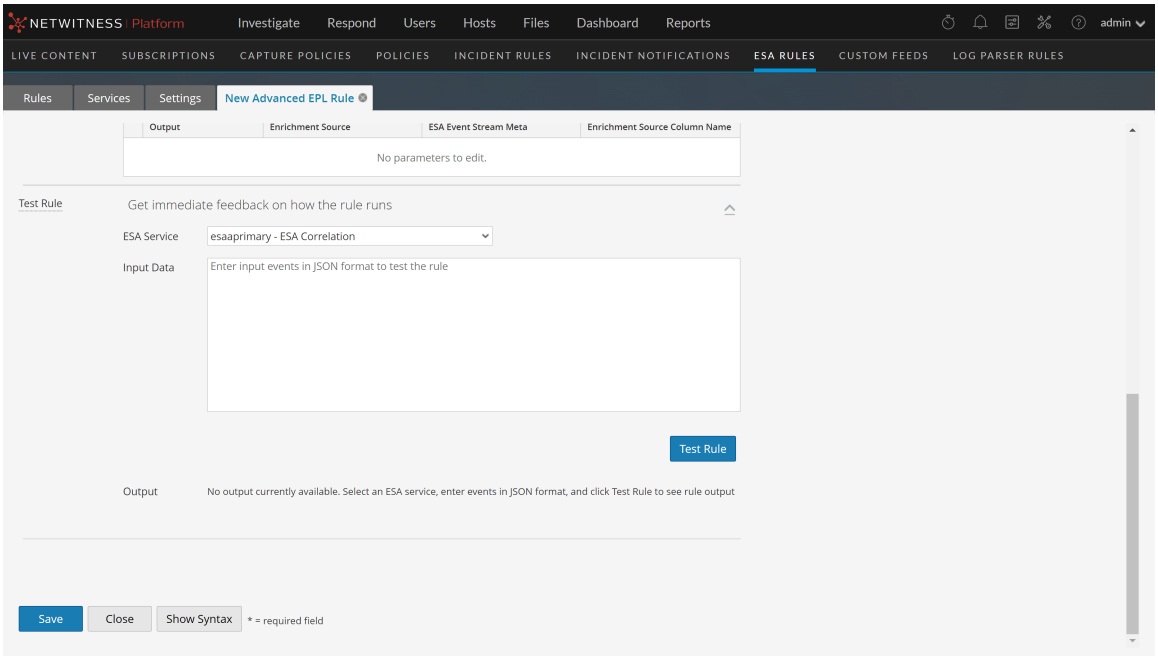
Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	Test the Advanced EPL rule logic.	Validate an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Example Advanced EPL Rules
Content Expert	See best practices for writing Advanced EPL Rules.	ESA Rule Writing Best Practices

Related Topics



- Add a Rule Builder Rule
- Enrichment Sources

Quick Look



To access the Advanced EPL Rule tab:

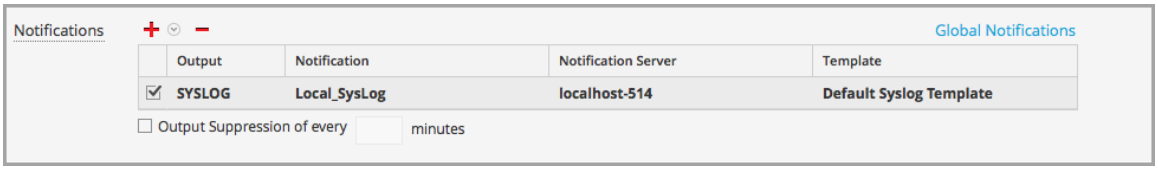
1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open by default.
2. In the **Rule Library** toolbar, select **> Advanced EPL**.
   The Advanced EPL Rule tab is displayed.

The following figure shows the Advanced EPL Rule tab.

The following figure shows the Advanced EPL Rule tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Advanced EPL Rule tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.



Parameters	Description
Trial Rule	Deployment mode to see if the rule runs efficiently.
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and Later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

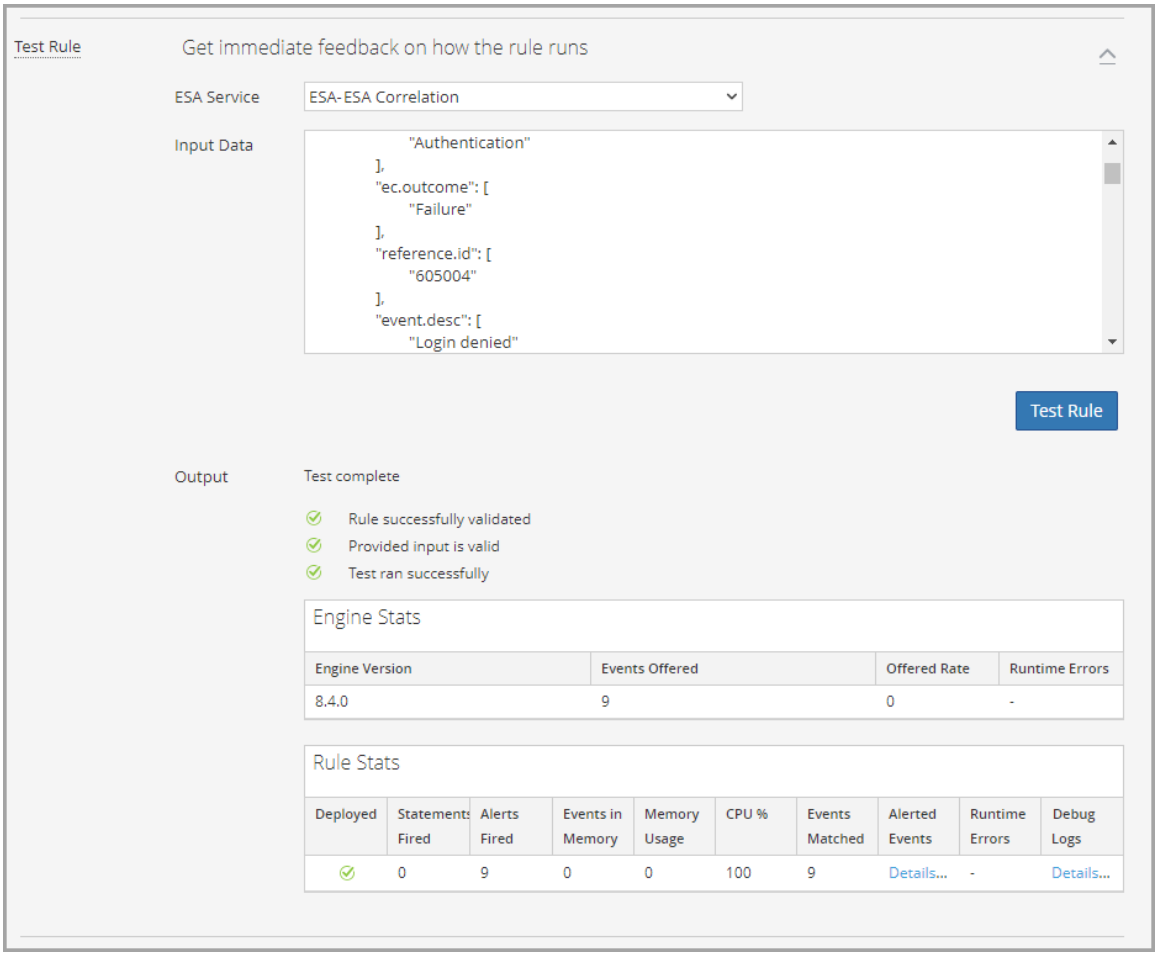
Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.

Parameter	Description
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.



Parameter	Description
	To add an enrichment.
	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. You can download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications. If you want to view all of the debug information for the test, include an `@Audit('stream')` annotation to your rule query.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

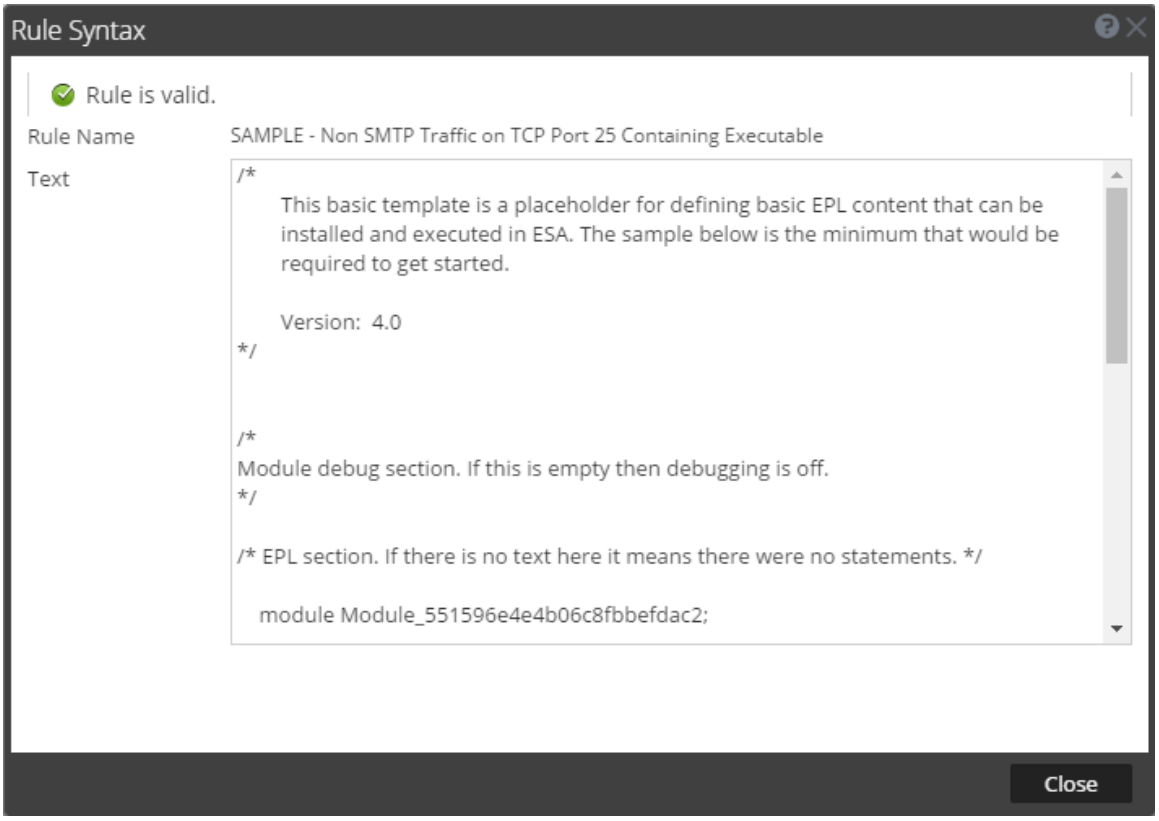
The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Rule Syntax Dialog



This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select **> Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.

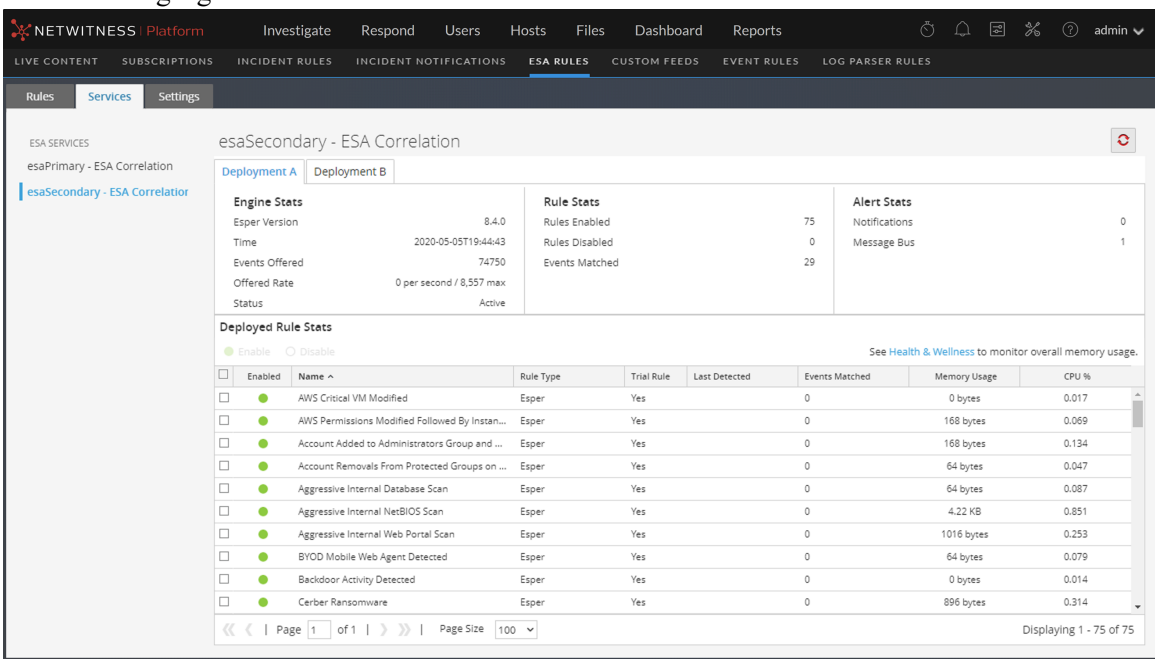
The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **(Configure) > ESA Rules > Services** tab. The Services tab shows the status of the deployments on each ESA service.

What do you want to do?



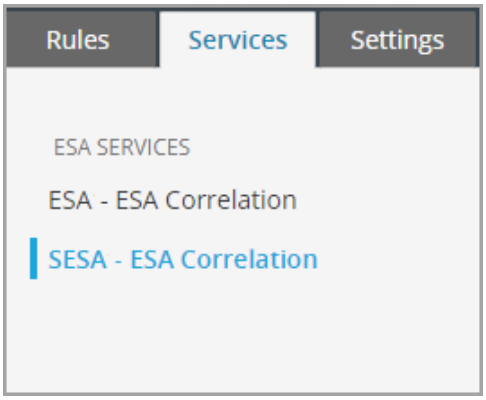
Role	I want to ...	Show me how
Content Expert	Troubleshoot Services Tab.	Troubleshoot ESA
Content Expert	View deployment Stats for an ESA Service.	View Stats for an ESA Service

Related Topics

- View a Summary of Alerts

Quick Look

The following figure shows the Services tab:



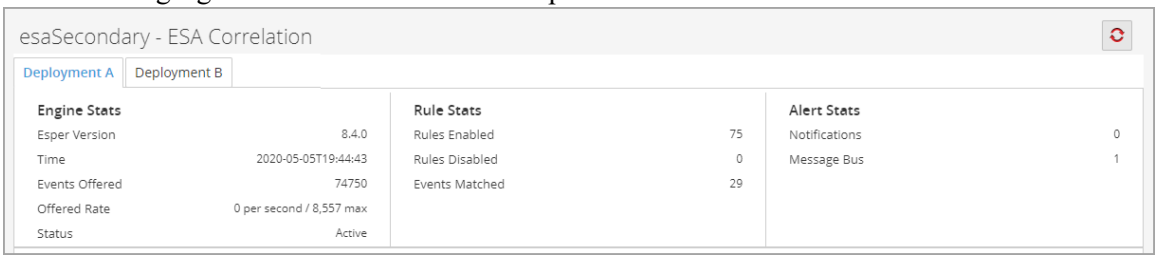
(This option is available in NetWitness version 11.3 and later.) If an ESA Correlation service has multiple deployments, under the service name, you will see a tab for each deployment. In the above example, there are two deployment tabs, Deployment A and Deployment B. Each tab displays information specific to that deployment.

The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness.



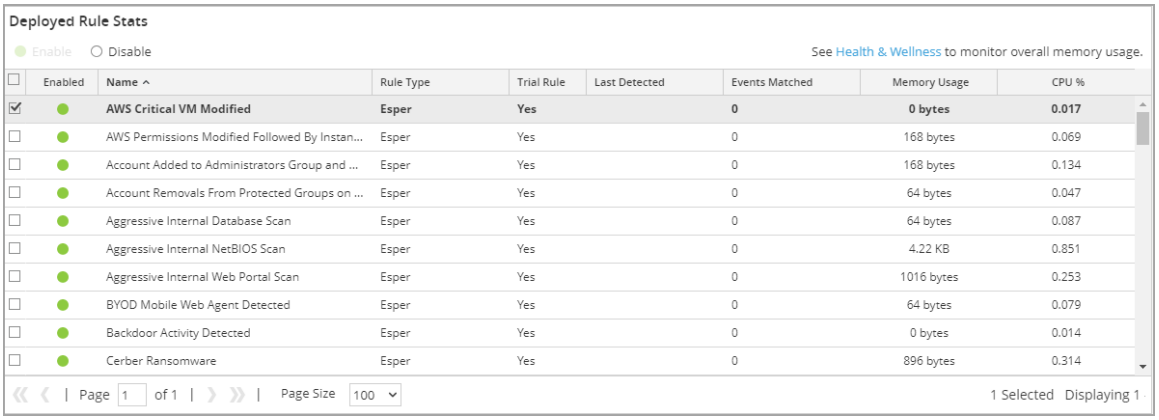
General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

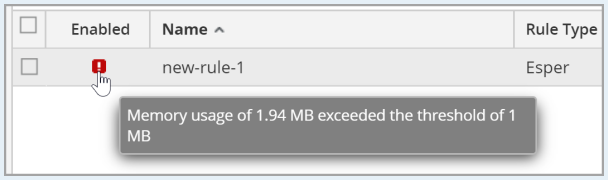
- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



The following table lists and describes the parameters in each section.

Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events processed by the ESA service since the last service start
	Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.
	Status	Shows the status of the deployment. A status of **Active** means that the deployment is active. A status of **Inactive** means that there was probably an error starting the deployment. Check the error log file for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
Rule Stats	Rules Enabled	Number of rules enabled
	Rules Disabled	Number of rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Message Bus	The total number of alerts sent to Respond for the deployment



Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.

The table lists the various parameters in the view and their description.

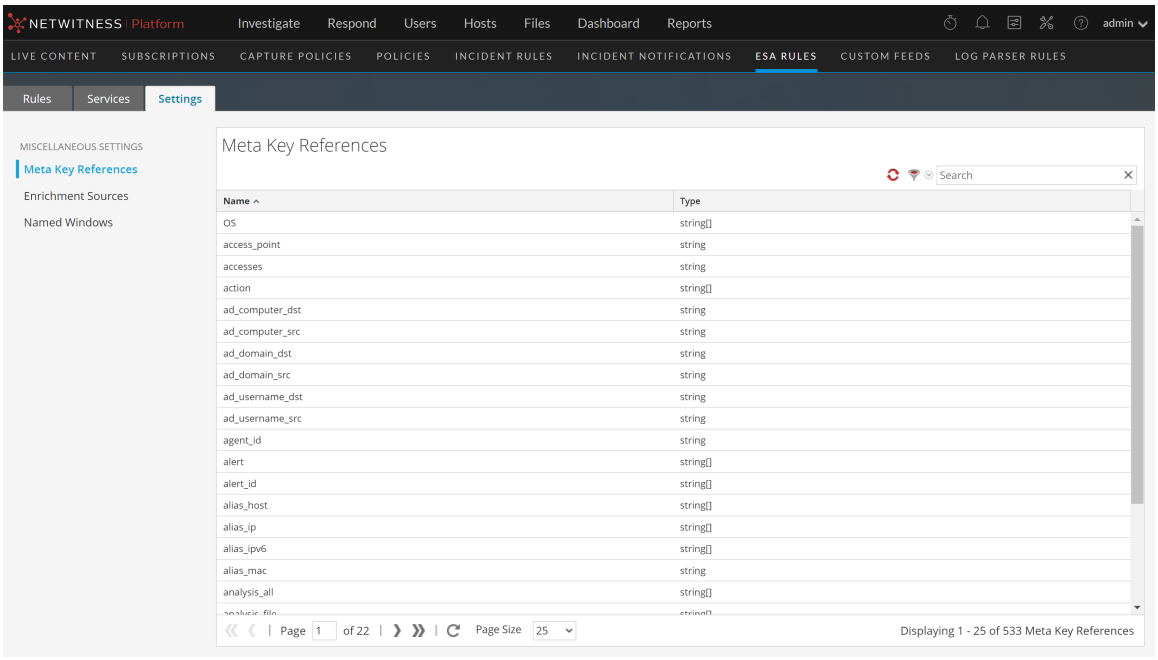
Parameters	Description
Enable	Enables a rule that was disabled.
Disable	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Enabled	Indicates whether the rule is enabled or disabled. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled. If a disabled rule has an error message, it shows in the Enabled field. Hover over the icon to view the error message tooltip. The following example shows that the rule was disabled because it exceeded the configured memory threshold for that rule. 
Name	Name of the ESA rule.
Rule Type	(This field applies to version 11.3 and later.) **Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. (This field is available in version 11.5 and later.) **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

Settings Tab

This topic describes the components of the **(Configure) > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- MetaKey References
- Viewing the List of Meta Entities
- Enabling Meta Entity in the ESA Correlation Server
- Building Rules with Custom Meta Entities
- Configure a data enrichment source
- View Named Windows

What do you want to do?



Role	I want to ...	Show me how
Content Expert	Configure an in-memory table as an enrichment source. (Recurring In-Memory Tables are no longer supported in version 11.3 and later.)	Configure an In-Memory Table as an Enrichment Source
Content Expert	Configure a Context Hub list as an enrichment source.	Configure a Context Hub List as an Enrichment Source

Related Topics

- Add a Data Enrichment Source
- Rule Builder Tab

Quick Look

The following figure shows the Meta Key References section in the Settings tab.

Meta Key References

The Meta Key References section lists each Meta key used by the ESA Correlation server and the type of value the key requires.

Meta key entities are configured to be a part of Event Schema. After you upgrade from NetWitness® Platform 11.5, or previous releases to NetWitness® Platform 11.6, you can enable the string [] meta keys entities. You can create rules and configure alerts based on the meta key entities that you select. You can also add meta entities to create rules. The meta entities retrieves data from the data sources to trigger alerts.

Note: Only the meta keys comprising of string [] are supported.

Viewing the List of Meta Entities

Perform the following steps to view the list of meta entities that are available in the system:

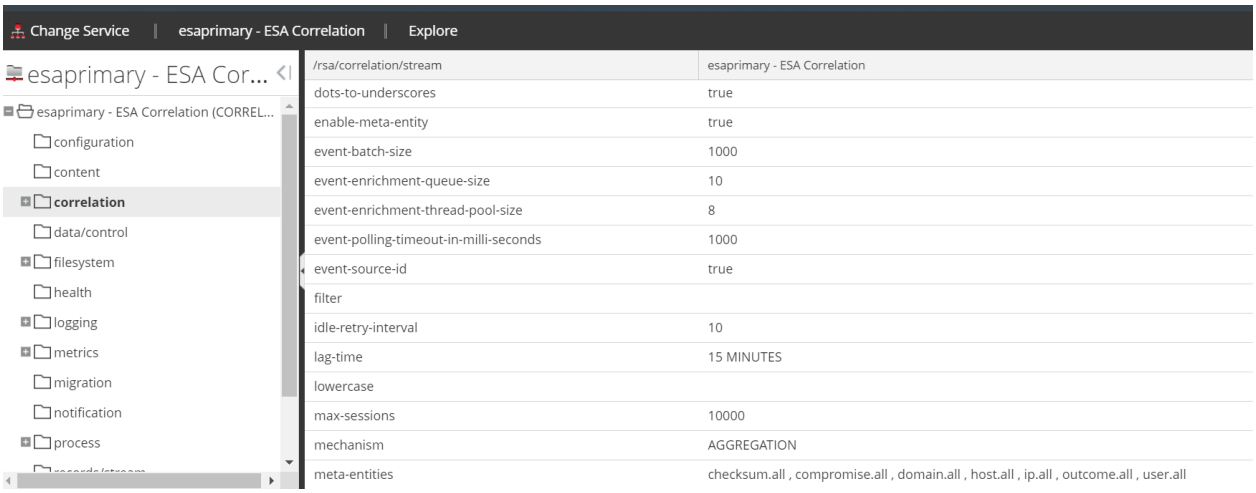
1. Go to (Configure) > **ESA RULES** > **Settings** > **Meta Key References**.

The Meta Key References page displays all the meta keys that are enabled.

2. Enter the name of the meta key in the Search text box to view specific meta entities.

Enabling Meta Entity in the ESA Correlation Server

After an upgrade to NetWitness 11.6 or later, you need to enable the meta entities in the ESA Correlation server to create rules and configure alerts based on the meta key entities.



To enable meta entities in the ESA Correlation server:

1. Click (Admin) **Admin** > **Services**.

2. In the Services view, select the ESA Correlation service.

3. Click the settings icon and go to **View** > **Explore**.

The ESA Correlation Configuration page lists all the services.

4. Click **enable-meta-entity** and set it to **true**.

Note: By default, **enable-meta-entity** is set to **false**. Ensure that you enable only the specific meta entitiy using which you want to build a rule. Enabling multiple meta entities affects the system performance.

5. Add custom meta entities by appending or editing the meta-entities field values under explore view.

In the Explore view node list for the ESA Correlation service, select **Correlation** > **Stream**.All the stream settings are listed. You can add custom meta entities to the list as per the requirement. Once you enable custom meta entities, you can view them under Meta Key References. Once you enable the custom meta key entities, the rules will start evaluating the meta key entities and start to evaluate and trigger alerts as per the configured conditions. For more information, see Viewing the List of Meta Entities

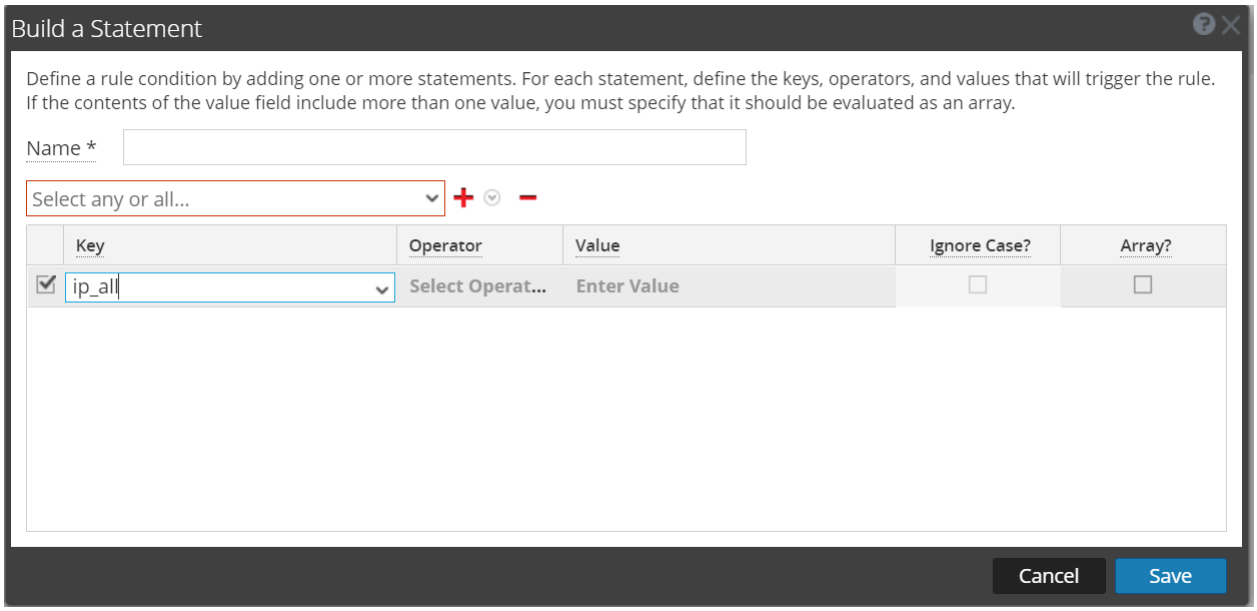
The following meta entities are listed in the ESA Correlation Configuration page:

- checksum.all
- compromise.all
- domain.all
- host.all
- ip.all
- outcome.all
- user.all

Meta Entity Usage Example

ip_all, and *host_all* are some of the examples of meta entities.

For example, the *ip_all* meta entity can be used to check for any malicious IPs. It combines all the IPv4 meta keys (*ip_src*,*alias_ip*, *ip_dst*, and *forward_ip*) and creates a string array to retrieve information and trigger alerts.



Note: You can add and enable custom meta entities (string arrays) to the list.

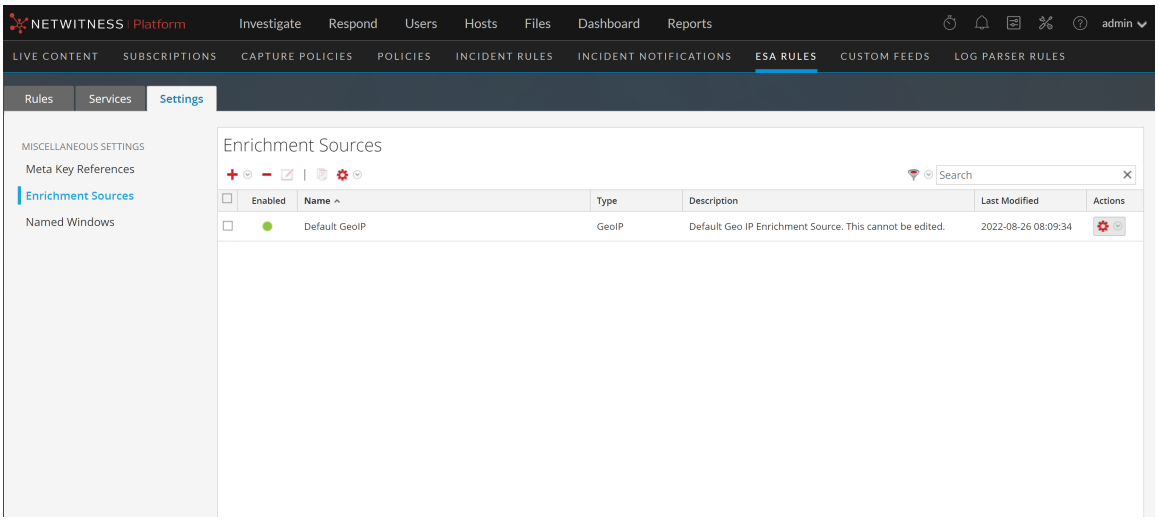
Building Rules with Custom Meta Entities

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

The following graphic shows an example of a Rule Builder statement using meta entities.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites



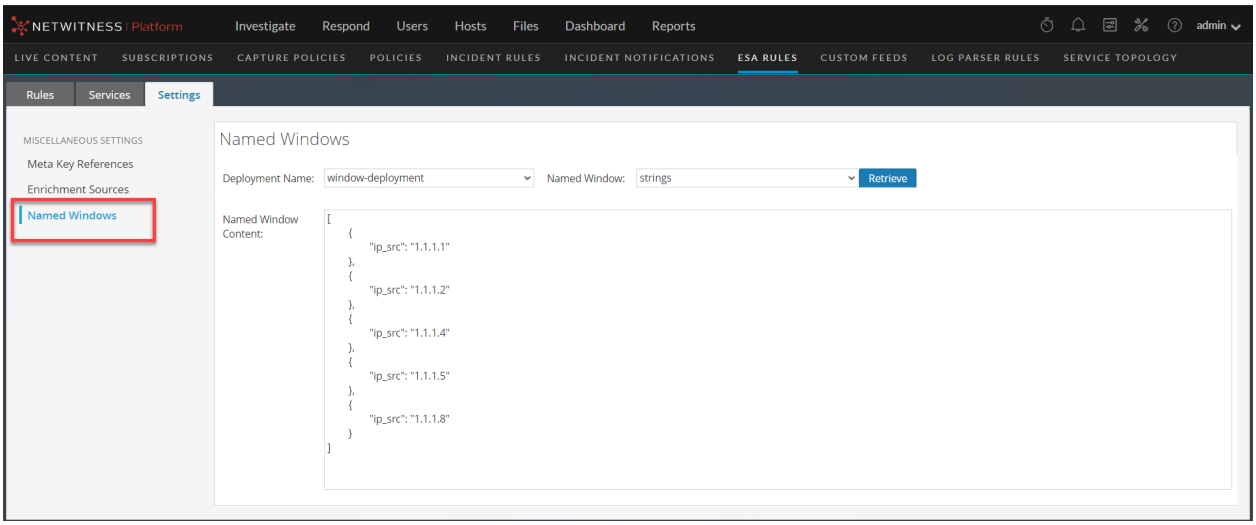
To build a rule statement, you must know the meta key and the meta value. For a complete list of meta keys, go to (Configure) > **ESA Rules** > **Settings** > **Meta Key References**.For more information about building rules with meta entities, see Rule Builder Tab.

Enrichment Sources

In the Enrichment Sources section, you can use the following external data sources:

- GeoIP
- In-Memory Table (Add hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)
- Context Hub

The following figure shows the Enrichment Sources section in the Settings tab.



View Named Windows

The ESA Esper processing model is continuous, helps in storing the data from the consumed sessions in the form of named windows based on the deployed ESA rule.

From 12.0 and later, you can view the contents of the windows of a particular named window using the named window settings tab.

The following figure shows the Named Windows section in the Settings tab.

Perform the following steps to view the list of named windows that are available in the system:

1. Go to **Configure** > **ESA RULES** > **Settings** > **Named Windows**.
2. Select a deployment name from the **Deployment Name** drop-down list.
3. Select a named window from the **Named Window** drop-down list.
4. Click **Retrieve**.

Event Stream Analysis Overview

NetWitness Event Stream Analysis (ESA) provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators.

ESA's advanced Event Processing Language allows you to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps perform powerful incident detection and alerting.

The following diagram shows the high-level data workflow:

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Upgrade Considerations for ESA Analytics

The Event Stream Analytics Server (ESA Analytics) service is not supported or available in NetWitness version 11.5 and later. The Whois Lookup Configuration and ESA Analytics Mapping panels are no longer in the user interface [(Admin) > **System**].

Note: Event Stream Analysis (ESA) is not end of life. ESA Correlation rules and the ESA Correlation service are supported. ESA Analytics, which is used for Automated Threat Detection, is different from ESA Correlation Rules and is EOL. In its place, you can use ESA Correlation as is offers more functional capabilities and better performance.

Configure ESA Correlation Rules

This topic provides high-level tasks to configure NetWitness Event Stream Analysis (ESA) Correlation Rules using the ESA Correlation service.

IMPORTANT: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see "Manage ESA Datasources" in Live Services Management Guide.

In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

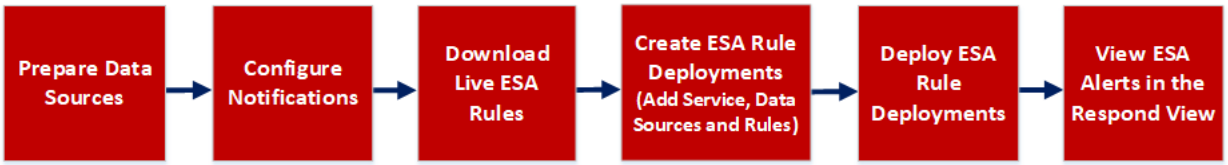
Caution: The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

IMPORTANT: If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see “Create a Deployment” topic in Live Services Management Guide.

Endpoint Risk Scoring Rules Bundle



An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see Deploy Endpoint Risk Scoring Rules on ESA. To configure NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: You must keep the ESA rules with windows (enrichments, named windows) and Endpoint Risk Scoring Rule Bundle rules in separate deployments as the window contents of the window rules will be removed when Endpoint Risk Scoring Rule Bundle is added to the same deployment. This issue will not occur when Endpoint Risk Scoring Rule Bundle is added to the deployment which involves non - window Event Stream Analysis Rule.

ESA Correlation Rules Configuration Workflow

The following diagram shows the high-level workflow for configuring ESA Correlation Rules with the ESA Correlation service.

ESA Rule Deployments are groups of ESA Rules processed by an ESA service to create alerts. In NetWitness 11.3 and later, the ESA Correlation service processes the ESA rules and creates alerts.

Before you can configure ESA Correlation Rules, install and configure the data sources (Concentrators) to use for the ESA rules. For example, you may have a Concentrator with HTTP packet data and another with Windows Log data. Next, configure the global notification methods that content experts can use for the ESA rules. For example, they may want to send an email notification when a rule creates an alert.

The NetWitness Live Content Management System (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. RSA Live contains an extensive library of ESA rules to detect threats that you can use to save time. Download the rules for the events that you want to detect in your network to the ESA Rule Library and adjust them as needed for your network environment.

After you prepare your data sources and download Live ESA rules, you can create one or more ESA rule deployments. An ESA rule deployment contains an ESA service, one or more data sources, and a set of ESA rules. For example, you can create an ESA rule deployment that contains an ESA Correlation service, a Concentrator with HTTP packet data, and a set of ESA rules for HTTP packet data. When you are ready to have the ESA service run the rule set, you deploy the ESA rule deployment, which places the rules on ESA.

After you deploy an ESA rule deployment, verify that you can view the ESA alerts in the Respond view (**Respond** > **Alerts**).

Prerequisites

Make sure that you:

- Install the ESA Correlation service in your network environment.
- Install and configure one or more Concentrators in your network environment.
- Download or ensure that you have access to the Alerting with Correlation Rules User Guide for version 11.3 or later. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Procedure

The following table shows the high level tasks required to configure ESA Correlation Rules.

Tasks	Reference
1. Prepare data sources, such as Concentrators, to use for your ESA Correlation Rules.	Refer to Broker and Concentrator Configuration Guide.
2. Configure notifications for the ESA Correlation service.	Refer to Notification Methods.
3. Working with Event Stream Analysis rules using Live. Configure the Live ESA Rule parameters for your environment.	Refer to Working with RSA ESA Live Rules.
4. Create ESA rule deployments*: Choose ESA Rules and the appropriate ESA service to use in the ESA rule deployment.	Refer to **Create a Deployment** topic in Live Services Management Guide.
5. Deploy ESA rule deployments.*	Refer to **Create a Deployment** topic in Live Services Management Guide.
6. View ESA alerts in the Respond view.	Refer to the NetWitness Respond User Guide.

*ESA rule deployments are groups of ESA Rules that are processed by an ESA service, such as the ESA Correlation service in NetWitness version 11.3 and later.

For additional optional advanced ESA Correlation Rules configuration procedures, see Additional ESA Correlation Rules Procedures.

For more information on alerting with ESA Correlation rules best practices, creating rules, working with trial rules, adding data enrichment sources, viewing statistics for an ESA service, and troubleshooting, see the Alerting with ESA Correlation Rules User Guide.

ESA Correlation Health and Wellness Monitoring

In NetWitness version 11.5 and later, New Health and Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the System Maintenance Guide.

Upgrade Considerations for ESA Hosts

Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Trial Rule Status Changes

In NetWitness Platform 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment. For example, if you change the status of a trial rule to disabled [(Configure) > **ESA Rules** > **Services** tab] and redeploy the ESA rule deployment [(Configure) > **ESA Rules** > **Rules** tab], the trial rule remains disabled. Previously, ESA trial rules could change status after an upgrade or when they were redeployed.

Upgrade Considerations for ESA Rule Deployments for version 12.1 and later

Before upgrading to the 12.1 version, NetWitness recommends that all the ESA deployments maintain an error-free state and remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to the 12.1 version.

Note: Make sure that you plan the upgrade process so that correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding correlation servers are upgraded. This action will not affect the events and alerts processing by correlation servers.

IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

After upgrading to the 12.1 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the correlation server to the 12.1 version. Verify if all the ESA deployments are in a healthy state. For more information, see **View a Deployment** topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content.. For more information, see "Merge Policy with ESA Content" topic in the *Live Services Management Guide*.

To support Endpoint and UEBA content as well as changes to ESA rules from Live, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service. Some single-value meta keys are also required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Additional ESA Correlation Rules Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of ESA Correlation Rules.

Use this section when you are looking for instructions to perform a specific task after the initial setup of ESA.

- Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys
- Configure Advanced Settings for an ESA Correlation Service
  - Enable or Disable Sending ESA Rule Alerts to the Respond View
  - Enable ESA Correlation Service Debugging for All Rules
  - Configure Maximum Events per Alert for All Rules
  - Adjust Maximum Sessions for the ESA Data Source Filter
  - Configure Meta Keys as Arrays in ESA Correlation Rule Values
  - Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy
- Configure Character Case for Advanced ESA Rules
- Deploy Endpoint Risk Scoring Rules on ESA
- Change Memory Threshold for ESA Rules
- Start, Stop, or Restart ESA Service
- View Audit Logs and Verify ESA Component Versions

Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions.

To support Endpoint, UEBA, and RSA Live content, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service for 11.3 and later. Additional string meta keys are required within the ESA Correlation service for 11.3.0.2 and later.

If the meta keys used for your ESA rules are different from the required default multi-value meta keys, your ESA rules continue to work, but you should update your ESA rules to use the required meta keys as soon as possible to ensure that your rules continue to deploy properly.

Note: On a new installation of ESA on 11.3.0.2 and later, no ESA rule adjustments are necessary.

The ESA Correlation service has the following multi-valued (string array) and single-valued (string) parameters:

- **`multi-valued`** - Shows the string array meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later, it shows the existing string array meta keys before the upgrade. (This parameter is equivalent to the Event Stream Analysis service ArrayFieldNames parameter in NetWitness Platform versions 11.2 and earlier.)
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string array meta keys for the latest version.
- **`single-valued`** - Shows the string meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later from versions prior to 11.3, this parameter value is empty.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string meta keys for the latest version.
- **`default-multi-valued`** - Shows the required string array meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.
- **`default-single-valued`** - Shows the required string meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.

Note: If you have the same value in the `single-valued` and `multi-valued` parameter fields, the `single-valued` meta key value takes precedence over the `multi-valued` meta key value.

To use the latest Endpoint, UEBA, and Live content rules, you must update the **`multi-valued`** parameter on the ESA Correlation service to include all of the meta keys in the **`default-multi-valued`** field. You must also update the **`single-valued`** parameter field to include all of the meta keys in the **`default-single-valued`** field. To do this, follow the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure.

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

Note: If you are using multiple ESA Correlation services, the `multi-valued` and `single-valued` parameters should be the same on each ESA Correlation service.

In NetWitness Platform 11.3.0.2 and later, ESA automatically adjusts the operator in the rule statement when there is a change from string to string array, but you still may need to make manual adjustments to adjust for the string array changes.

To change the string type meta keys to string array type meta keys manually, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```

If you used any meta keys in the ESA rule notification templates from the Required String Array or String Meta Keys list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.

Note: Advanced EPL rules may get disabled and are not automatically updated so they must be fixed manually.

For additional troubleshooting information, see “Troubleshoot ESA” in the *Alerting with ESA Correlation Rules User Guide*.

Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules

To use the latest Endpoint, UEBA, and Live content rules, you must update the **multi-valued** parameter field on the ESA Correlation service to include all of the meta keys in the **default-multi-valued** field. You must also update the **single-valued** parameter field to include all of the meta keys in the **default-single-valued** field.

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

Note: If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing this procedure should fix the issue. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.

1. After an upgrade to 11.3.0.2 or later, go to  **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select  **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.

3. Compare the **multi-valued** parameter meta keys with the required **default-multi-valued** meta keys. Copy and paste the missing string array meta keys from the **default-multi-valued** parameter to the **multi-valued** parameter. (You may want to copy only a couple meta keys at one time to reduce the number of reported errors).
4. Copy and paste the string meta keys from the **default-single-valued** parameter to the **single-valued** parameter.
5. If you have multiple ESA Correlation services, make the same meta key changes on each ESA Correlation service.
6. Apply the changes on the ESA Correlation services:
   a. Go to  **(Configure) > ESA Rules** and click the **Settings** tab.
   b. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ().
7. If you are using any of the **default-multi-valued** or **default-single-valued** meta keys in your ESA Advanced rules, update the rule syntax. See also Adjust Custom ESA Rule Builder and ESA Advanced Rules.
8. If you used any meta keys in the ESA rule notification templates from the **default-multi-valued** parameter list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.
9. Deploy your ESA rule deployments.
10. Check your rules for error messages in the ESA Rules section of the ESA rule Deployment or check the ESA Correlation error logs for errors.
    - (This option is available in NetWitness verson 11.3.0.2 and later.) To access the error messages in the ESA rule deployment, go to  **(Configure) > ESA Rules > Rules** tab, select a deployment in the options panel on the left, and go to the **ESA Rules** section. If the ESA rule status shows "Disabled" or shows the  icon in the Status column, you need to determine the issue to fix the rule. If a disabled rule has an error message, it shows  in the Status field. You can hover over the rule to view the error message tooltip without going to the error log.
    - To access the ESA Correlation service logs, you can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

Adjust Custom ESA Rule Builder and ESA Advanced Rules

Update your ESA Rule Builder and ESA Advanced rules to work with the string and string array meta keys listed in the `default-multi-valued` and `default-single valued` parameter fields for the ESA Correlation service. You can add additional meta keys to the `multi-valued` and `single-valued` parameters.

For example, if you use ec.outcome as a single-valued meta key in your ESA rule as shown below:

```
@RSAAlert
SELECT * FROM Event((ec_outcome IN ( 'Success' )))
.win:time_length_batch(2 Minutes, 2)
```

```
HAVING COUNT(*) >= 2;
```

If you add ec.outcome to the **multi-valued** parameter field, you need to update your rule as shown below:

```
@RSAAlert
SELECT * FROM Event(( 'Success' = ANY( ec_outcome ) ))
.win:time_length_batch(2 Minutes, 2)
HAVING COUNT(*) >= 2;
```

For more information, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,
checksum_src, client_all, content, context, context_all, context_dst,
context_src, dir_path, dir_path_dst, dir_path_src, directory,
directory_all, directory_dst, directory_src, email_dst, email_src,
feed_category, feed_desc, feed_name, file_cat, file_cat_dst, file_cat_
src, filename_dst, filename_src, filter, function, host_all, host_dst,
host_orig, host_src, host_state, ip_orig, ipv6_orig, OS, param, param_
dst, param_src, registry_key, registry_value, risk, risk_info, risk_
suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

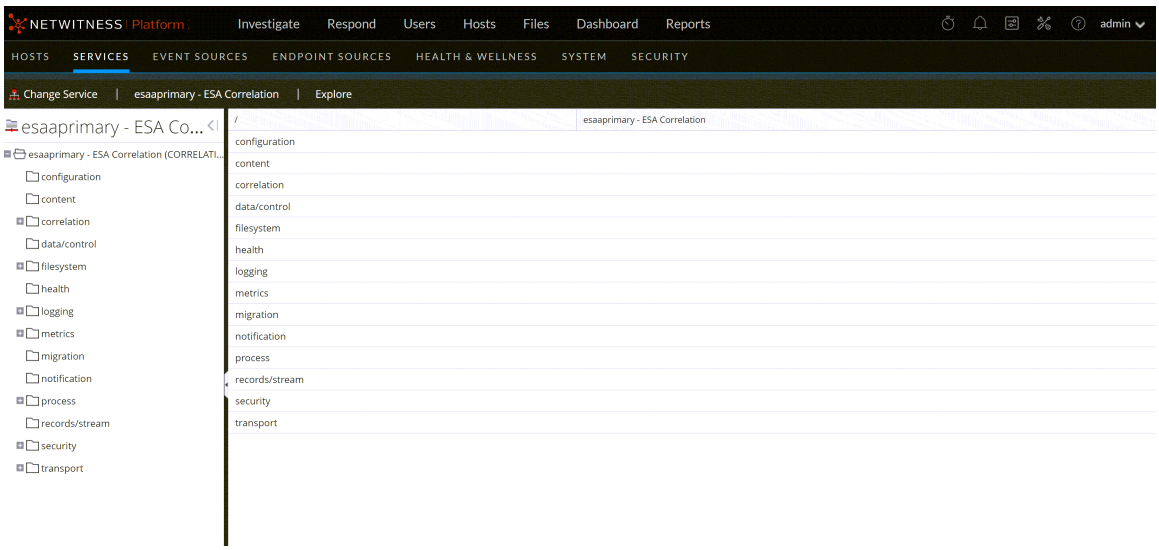
Note: If you are upgrading from version below 11.4.x.x, make sure that meta keys on new ESA hosts are updated to match upgraded ESA Hosts in the Same NetWitness Platform Network.

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.6, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to  **(Admin) > Services**, and in the Services view, select the ESA Correlation service and then select  **> View > Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to  **(Configure) > ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ().
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Configure Advanced Settings for an ESA Correlation Service



These procedures are optional and they apply only to ESA Correlation Rules.

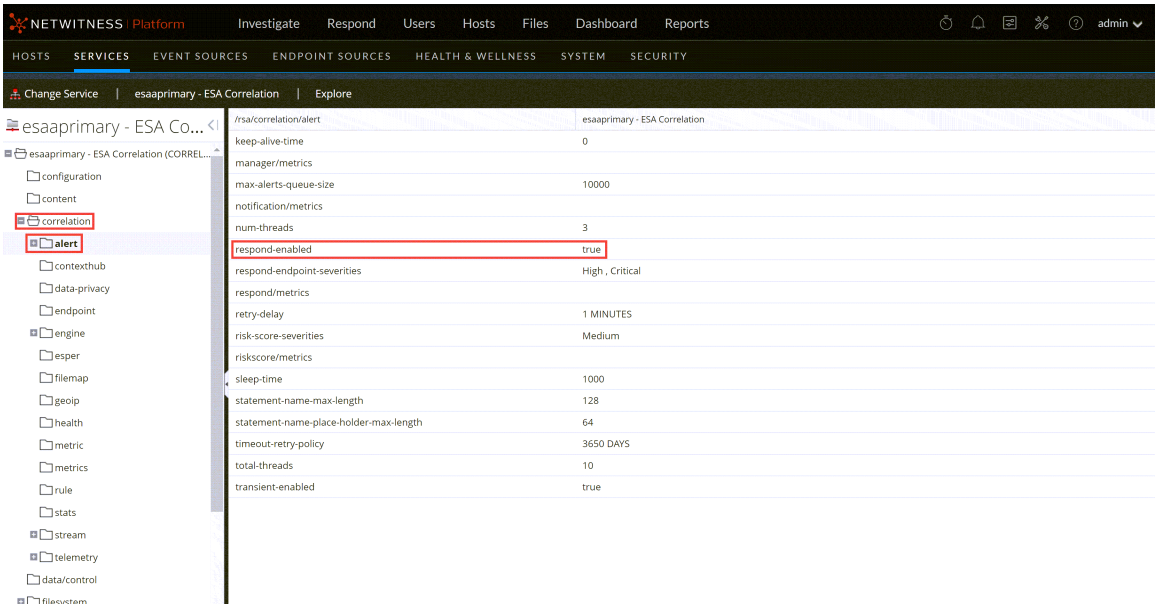
In the Explore view for an ESA Correlation service, you can manage sending ESA rule alerts to the Respond view, turn on debugging for all rules, configure the events to preserve for rules with multiple events, and configure meta keys as string array values on ESA.

- Enable or Disable Sending ESA Rule Alerts to the Respond View
- Enable ESA Correlation Service Debugging for All Rules
- Configure Maximum Events per Alert for All Rules
- Adjust Maximum Sessions for the ESA Data Source Filter
- Configure Meta Keys as Arrays in ESA Correlation Rule Values
- Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

Access Advanced Settings for an ESA Correlation Service

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. In Services view, select an ESA Correlation service and then select  **> View > Explore**.
   The Explore view is displayed.

Enable or Disable Sending ESA Rule Alerts to the Respond View



ESA gathers data, runs ESA Correlation rules against the data, captures events that meet rule criteria, and creates alerts for those captured events. You can view those alerts in the Respond view.

Before an ESA Correlation rule alert can go to the Respond view, both of the following settings must be enabled:

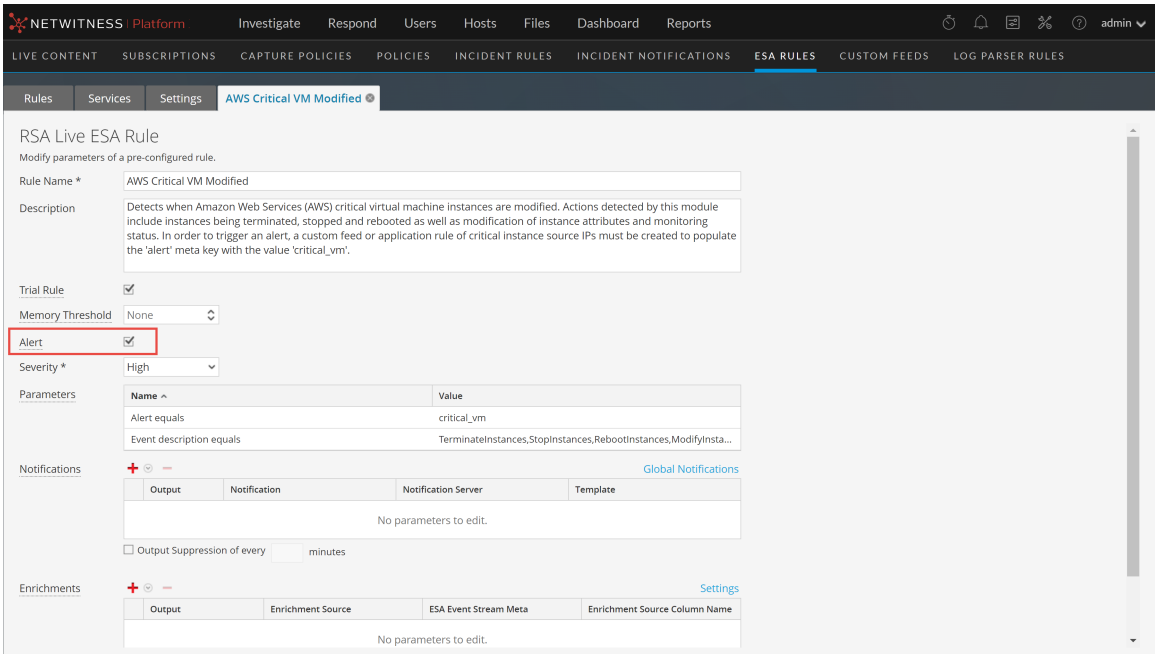
1. For all rules, the ESA Correlation service must have the `respond-enabled` parameter set to **true**. (The default is true.)
2. For an individual rule, the ESA Correlation rule must have the **Alert** option selected in the rule builder for that rule.

To enable or disable alert forwarding to the Respond view for ALL ESA Correlation rules:

1. In the Explore view node list for an ESA Correlation service, select **correlation > alert**.

2. To allow all ESA Correlation Rule alerts to go to the Respond view, set `respond-enabled` to **true**. Alerts for ESA rules that have the **Alert** option selected are visible in the Respond view.
3. To stop all ESA Correlation Rule alerts from going to the Respond view, set `respond-enabled` to **false**.
   ESA Correlation Rules do not go to the Respond view, even if you select the **Alert** option in the rule.

   The changes take effect immediately.



Note: The `respond-enabled` parameter is equivalent to the **Forward Alerts On Message Bus** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

To send or not send alerts to the Respond view for a single ESA Correlation rule:

Content experts managing the ESA Correlation rules can decide whether to send alerts to the Respond view for each rule.

1. Go to  **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.

   - To turn on Respond alerts for a rule, select the **Alert** checkbox.
   - To turn off Respond alerts for a rule, clear the **Alert** checkbox.

3. Click **Save**.

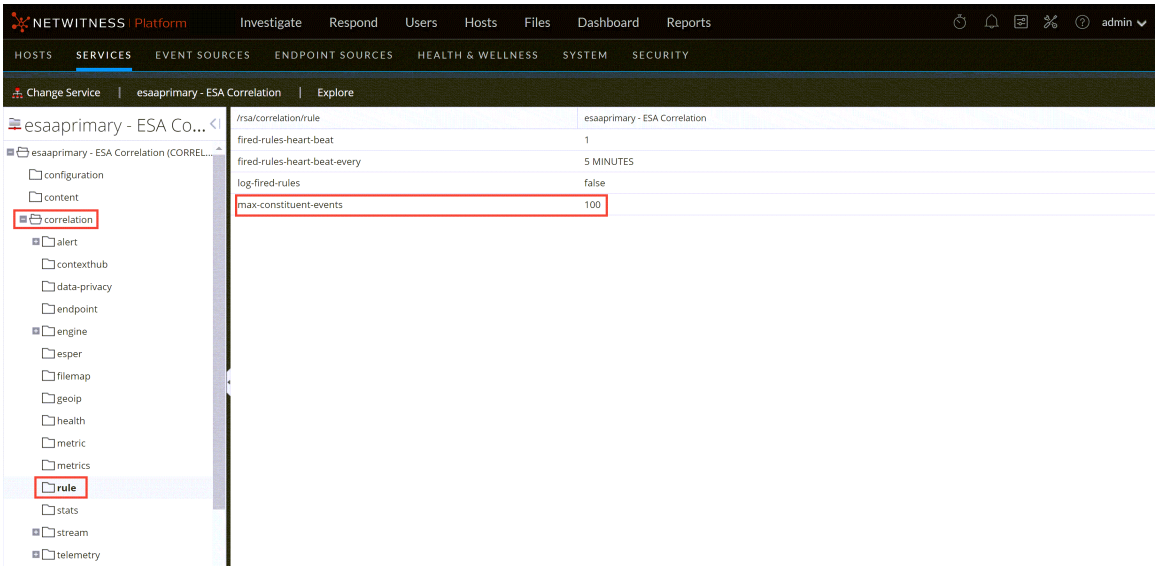
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Enable ESA Correlation Service Debugging for All Rules

You can turn on debugging for all ESA rules to see if rules are creating (firing) alerts and data is being processed properly by the ESA Correlation service. This can also be helpful when writing or fixing global notification templates, such as syslog or email. You can see the actual content of an alert before sending the notification.

When you disable ESA Correlation service debugging for all rules, you can still turn on debugging for an individual rule at any time.

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.



2. Set `log-fired-rules` to **true** to print alerts to the /var/log/netwitness/correlation-server/correlation-server.log for troubleshooting. This is the same as the Debug option in the rule builders for individual ESA rules except that this option enables debugging for all rules.
3. When you are ready to turn off debugging for all ESA rules, set `log-fired-rules` to **false**. The changes take effect immediately.

Note: The `log-fired-rules` parameter is equivalent to the **Debug Rules?** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Configure Maximum Events per Alert for All Rules

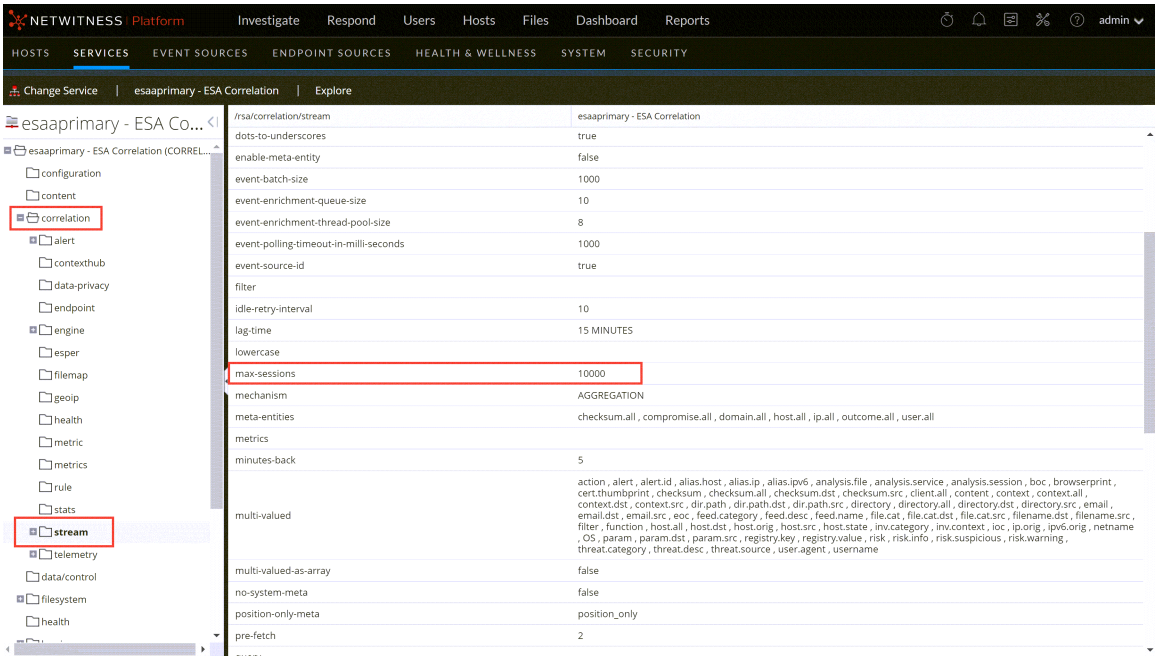
1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.

2. For rules that contain multiple events, in `max-constituent-events`, enter how many of the associated events to preserve. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is **100**.
   The changes take effect immediately.

Note: The `max-constituent-events` parameter is equivalent to the **Max Constituent Events** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Adjust Maximum Sessions for the ESA Data Source Filter

Note: This procedure applies only to NetWitness Platform version 11.5 and later.



In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

Caution: The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

When filtering out a large portion of the traffic, you may see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. (You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`). Lower the `max-sessions` parameter until you no longer see the error in the log. The more you filter out the traffic, the lower you should set the `max-sessions` parameter.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.

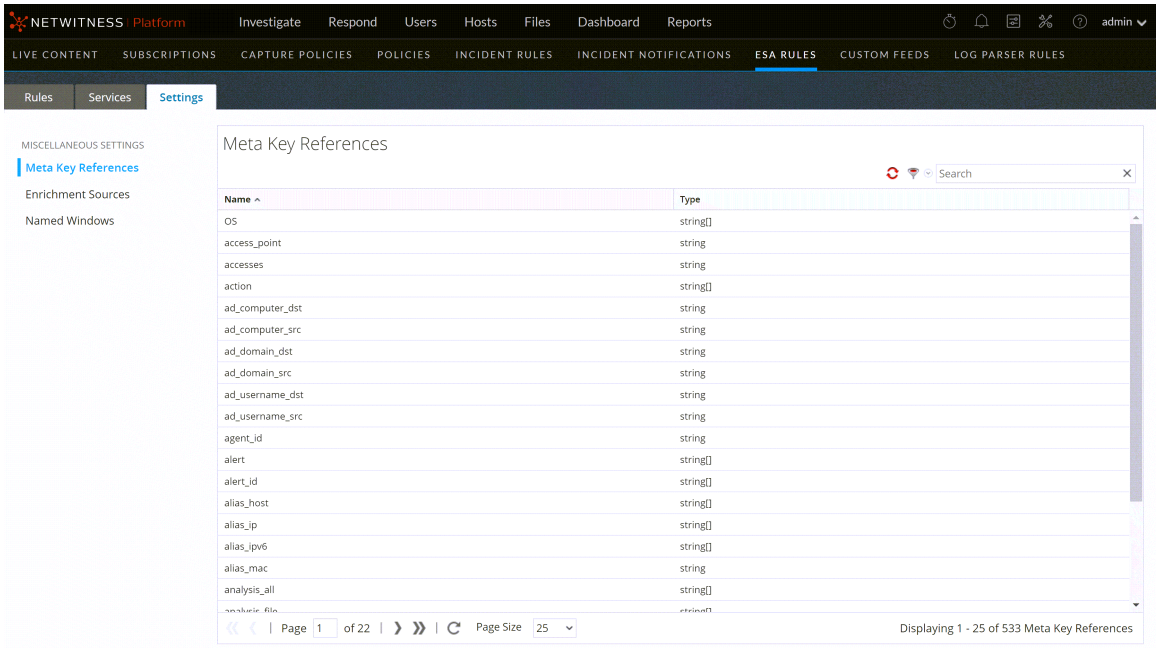
2. In `max-sessions`, lower the value until you no longer see the error in the ESA Correlation log file. The default value is **10000**.

3. Restart the ESA Correlation service. Go to **(Admin) > Services**, select the ESA Correlation service, and then select **> Restart**.

IMPORTANT: If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see “(Optional) Add a Data Source Filter” in the *Alerting with ESA Correlation Rules User Guide*.

Configure Meta Keys as Arrays in ESA Correlation Rule Values



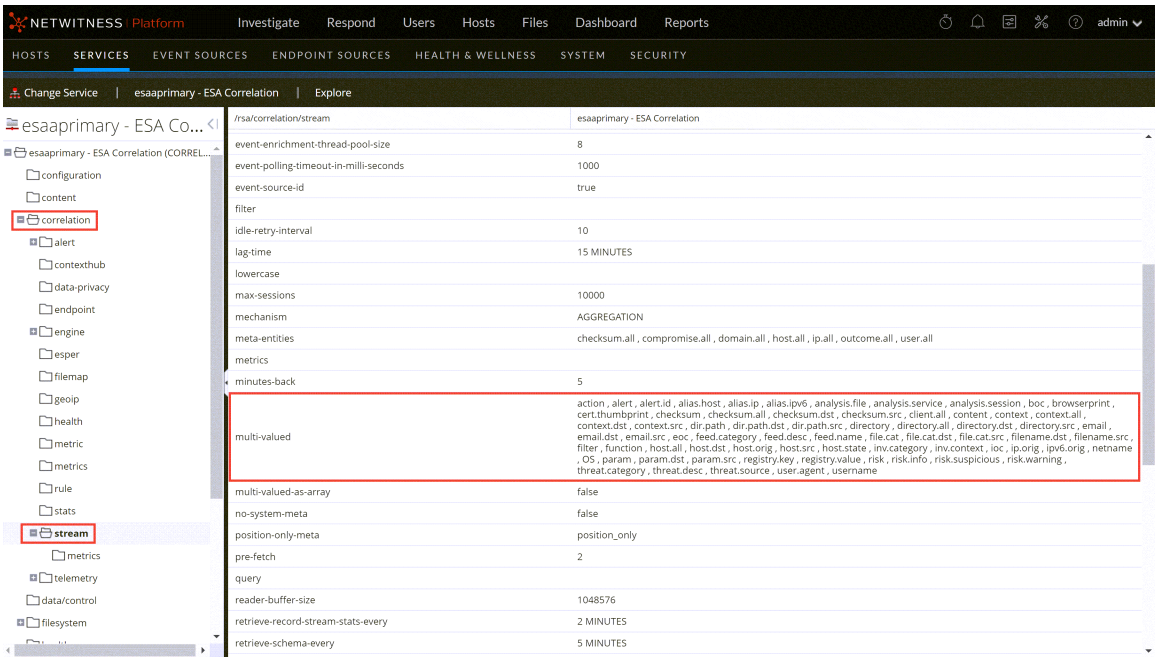
A common reason for an ESA rule to generate an error during deployment is because a meta key in the rule is a string array type, but it shows as a string type on ESA. To prevent or fix this issue, do the following:

- Determine if a Meta Key is a String Array Type on ESA
- Add the String Array Type Meta Key to ESA
- Verify that the String Array Type Meta Key is Configured Correctly on ESA

Caution: Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Determine if a Meta Key is a String Array Type on ESA

1. Go to **(Configure) > ESA Rules** and click the **Settings** tab.



2. In the Meta Key References, for each meta key that is a string array type, locate the meta key in the Name field and then check the value.
   - If it shows `string[]`, it is configured as a string array type on ESA. This is fine.
   - If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. Go to Add the String Array Type Meta Key to ESA.

Caution: Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Add the String Array Type Meta Key to ESA

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. If you add a meta key to the `multi-valued` parameter field that you use in other ESA rules, ensure that those rules are using the string array syntax.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.
2. Add string array meta keys to the **`multi-valued`** list to allow them to be used as an array in ESA rules.

3. Verify the configuration on ESA. Go to Verify that the String Array Type Meta Key is Configured Correctly on ESA.

Note: The `multi-valued` parameter is equivalent to the `arrayFieldNames` parameter in the Event Stream Analysis service in NetWitness version 11.2 and earlier.

Verify that the String Array Type Meta Key is Configured Correctly on ESA

1. Go back to **(Configure) > ESA Rules** and click the **Settings** tab.
2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).
3. Verify that the meta keys with a string array type show a value of `string[]`.

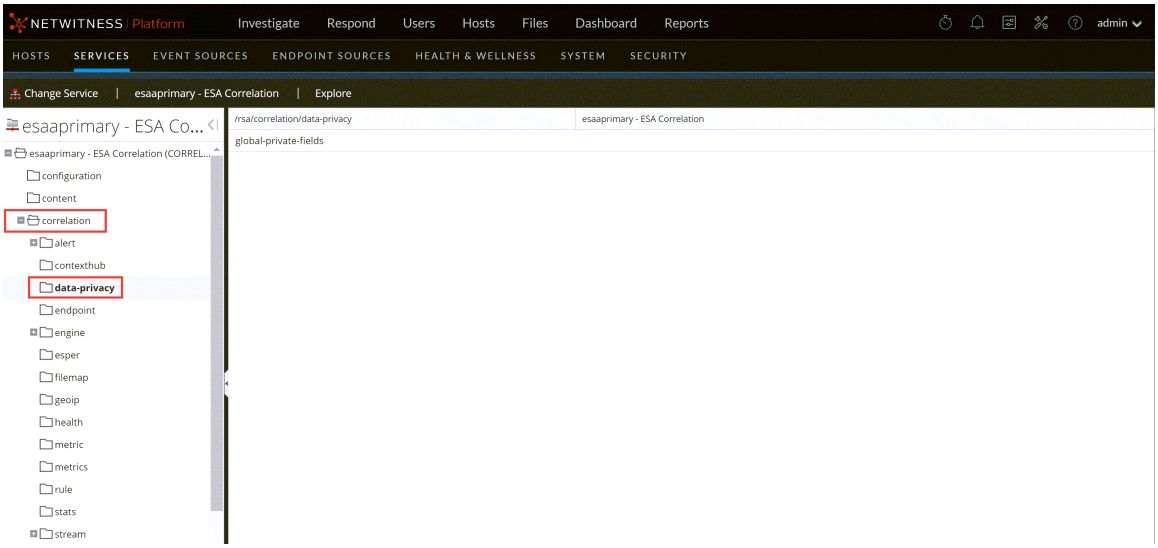
Required String Array Meta Keys on the ESA Correlation Service

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```



Note: Check the `default-multi-valued` and `default-single-valued` parameters on your ESA Correlation service for the latest required fields. For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

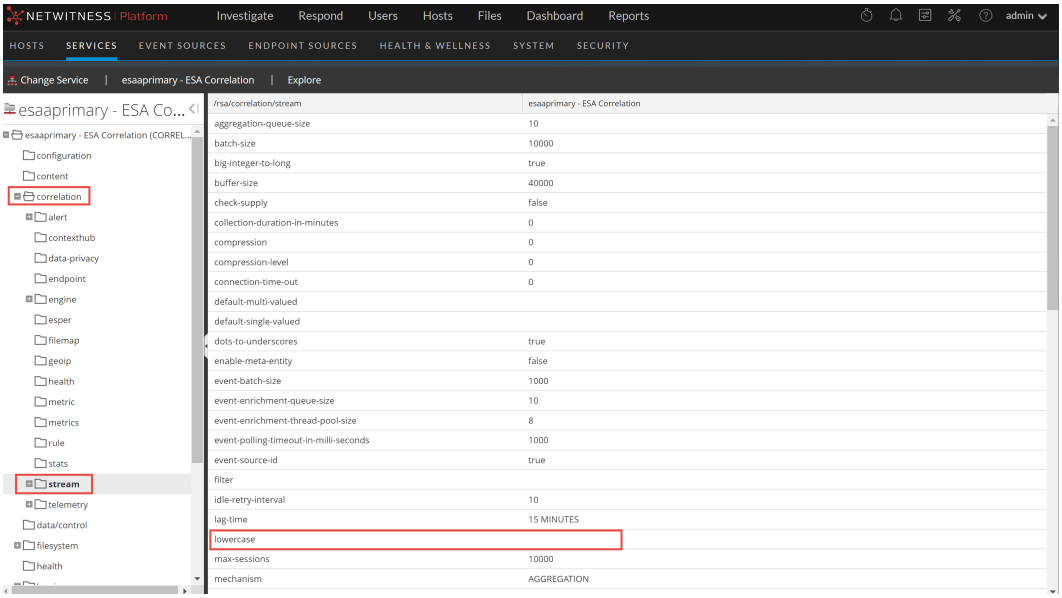
1. Go to  **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select  **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.

The changes are effective immediately.

For more information, see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules Configuration Guide*. For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

Configure Character Case for Advanced ESA Rules

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions, however, it is not supported in version 11.3.1.0.



Advanced Event Processing Language (EPL) rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta keys may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can use the `toLowerCase`() function. However, care should be taken to only add the case-insensitive `toLowerCase()` function on string and string array meta keys as needed. The `toLowerCase()` function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function. For more information, see "Event Process Language (EPL)" in the *Alerting with ESA Correlation Rules User Guide*.

You can optimize your rule performance by identifying the meta keys used most often in your environment. Instead of using the `toLowerCase()` function with the original meta key, replace the meta key throughout the rule with `<meta.key>_lower`. You can also use the special case-insensitive meta keys in your Rule Builder rules.
For example, you can configure ESA Correlation to use `filename_lower` (which is case insensitive) instead of using the original `filename` meta key. In your rule, replace `filename` with `filename_lower`.

To configure special case-insensitive meta keys to use in your ESA rules:

1. Go to  **(Configure) > ESA Rules > Rules** tab. In your ESA rule deployments, identify any ESA rules using the `toLowerCase()` function more than ten times for a particular string or string array meta key. Keep track of these ESA rules and meta keys.
2. Go to  **(Admin) > Services**, select an ESA Correlation service, and then select  **> View > Explore**.

3. In the Explore view node list, select **correlation > stream**.
   Notice that there is a **`lowercase`** parameter with empty values.

4. Update the **`lowercase`** parameter with the string or string array meta keys identified in step 1 using a comma separated list, for example: `protocol,alias.host,action,alert`

> **Note:** String and string array are the only data types supported for the ESA Correlation service **`lowercase`** parameter.
>
> Use NWDB format (decimal), NOT Esper format (underscore). Do not press **Enter** to commit or it will put in a return. Instead, click another parameter.

5. After you add all of the meta keys, validate the meta keys on ESA.

   a. Go to **(Configure) > ESA Rules > Settings tab > Meta Key References** and click the Meta Re-Sync (Refresh) icon ( ).

   b. Search for **`_lower`** or **`<meta key>_lower`**, for example: `protocol_lower`.

   - The meta keys with a string array type should show a value of `string[]`.
   - The meta keys with a string type should show a value of `string` (without the brackets).

6. Update all of your ESA rules that use `.toLowerCase` meta keys and replace them with `<meta key>_lower` (Example: filename_lower IN ('svchost.exe'))
7. Deploy the ESA rule deployment again.

> **Note:** If you remove a meta key from the `lowercase` parameter list and re-sync the meta key references, you also need to update the rules that use the corresponding lowercase meta key (`<meta.key>_lower`).

Deploy Endpoint Risk Scoring Rules on ESA

Endpoint Risk Scoring Rules only apply to NetWitness Endpoint.

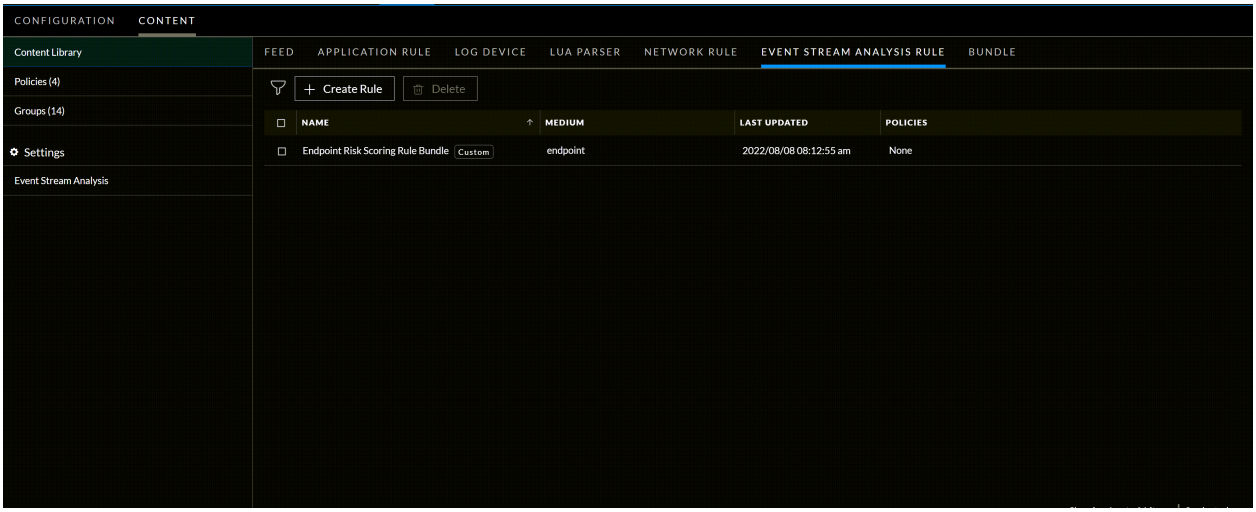
The ESA Correlation service processes and deploys endpoint risk scoring rules. These rules generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on Risk Scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. An *Endpoint Risk Scoring Rules Bundle* comes with NetWitness along with the sample ESA rules. The Endpoint Risk Scoring Bundle contains approximately 400 rules. You add this rule bundle to an ESA Rule Deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) during ESA Rule Deployment.

For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. For more information about ESA rule deployments, see "Deploy Rules to Run on ESA" in the *Alerting with ESA Correlation Rules User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Important Considerations when Deploying the Endpoint Risk Scoring Rules Bundle

- If you add the Endpoint Risk Scoring Bundle to an ESA rule deployment, the deployment should have data sources with endpoint data.
- An ESA rule deployment can have only one ESA Correlation service. You can, however, use the same ESA Correlation service in multiple deployments.
- If you have two ESA Correlation services with the same endpoint data sources, deploy the Endpoint Risk Scoring Rules Bundle on only one of them.



Deploy the Endpoint Risk Scoring Rules Bundle on ESA

Caution: Before you deploy the Endpoint risk scoring rules, update your meta keys. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

When you deploy the Endpoint Risk Scoring Rules Bundle in an ESA rule deployment, the ESA Correlation service gathers endpoint data in your network and runs endpoint risk scoring rules against the data. The goal is to capture events that match rule criteria, then generate alerts for the captured events.

The following procedure shows how to create an ESA rule deployment with the Endpoint Risk Scoring Rules Bundle and deploy it. If you already have an ESA rule deployment with endpoint data sources, you can add the Endpoint Risk Scoring Rules Bundle to the existing deployment.

The following figure shows the Endpoint Risk Scoring Bundle available in (Configure) > **Policies** > **Content Library** > **Event Stream Analysis Rule** page.

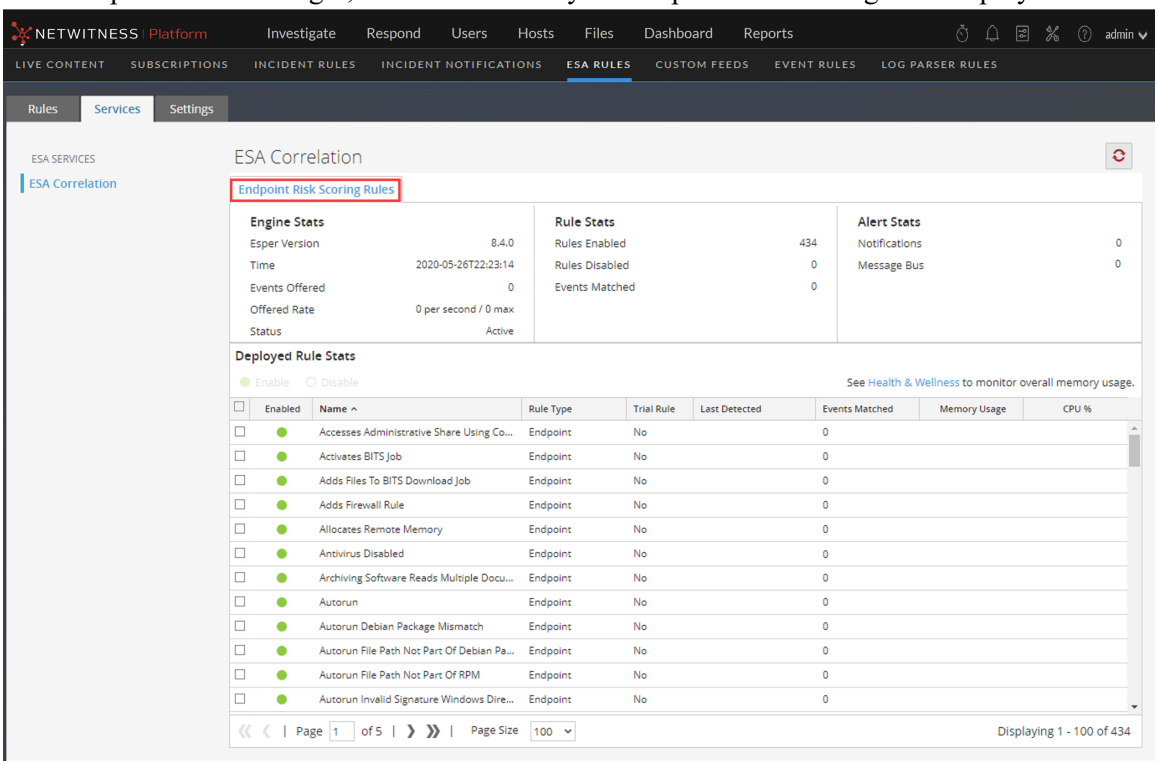
To create and deploy an ESA rule deployment with the Endpoint Risk Scoring Bundle

1. Go to **(Configure)** > **Policies**.
2. Add the endpoint data sources, for more information, see Add an ESA Datasource.
3. Create a deployment with Endpoint Risk Scoring Bundle. For more information, see Create a Deployment.

   You can now view information and statistics on the **(Configure) > ESA Rules > Services** tab. See View the Status of the Endpoint Risk Scoring Rules Deployment.

Change the Endpoint Risk Scoring Rule Bundle in a Deployment

You cannot edit or duplicate the Endpoint Risk Scoring Rules Bundle. After the bundle is deployed, you can enable and disable individual rules within the bundle. See Disable or Enable Individual Endpoint Risk Scoring Rules.

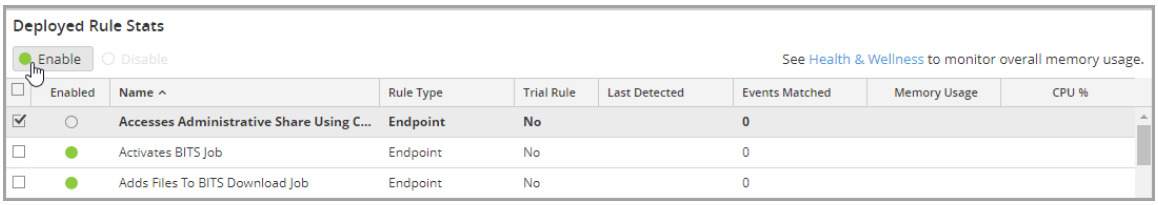


When you make changes to the ESA Rule Deployment containing the Endpoint Risk Scoring Rules Bundle, such as changing the endpoint data sources or changing compression levels, you must redeploy it for the changes to take effect. To redeploy, click the **Deploy Now** button for that deployment.

Caution: Deleting an ESA Rule Deployment with an Endpoint Risk Scoring Rule Bundle stops the Risk Scoring alerts that are used in risk scoring calculations to identify suspicious files and hosts.

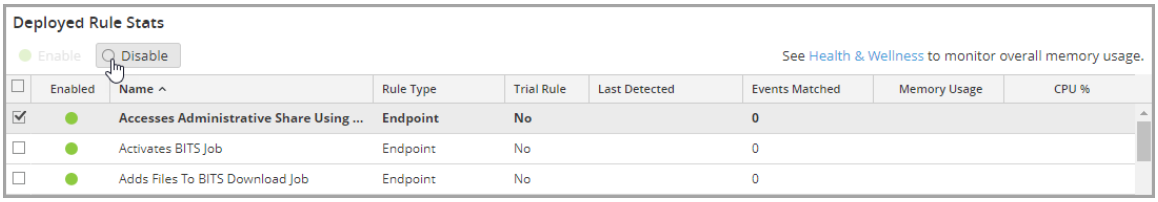
For more information about changing ESA rule deployments, see "Additional ESA Rule Deployment Procedures" in the *Alerting with ESA Correlation Rules User Guide*.

View the Status of the Endpoint Risk Scoring Rules Deployment



1. Go to the ESA Rules Services tab (**(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.

3. In the **Engine Stats**, **Rules Stats** and **Alert Status** sections, look at the statistics related to the deployment, such as Rules Enabled, Rules Disabled, and Events Matched, which show the total numbers for the deployment.
4. In the **Deployed Rules Stats** section, look at the following details for each Endpoint Risk Scoring Rule:
   - **Enable**: Indicates the enabled status. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled.
   - **Name**: Shows the name of the rule.
   - **Rule Type**: Endpoint indicates a rule from the Endpoint Risk Scoring Bundle and Esper indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
   - **Last Detected**: Shows the last time an alert was triggered for the rule.
   - **Events Matched**: Shows the total number of events that matched the rule.



Disable or Enable Individual Endpoint Risk Scoring Rules

1. Go to the ESA Rules Services tab (**(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.
3. In the **Deployed Rules Stats** section, do one of the following:
   - To enable rules, select the rules that you want to enable in the rules list and click the **Enable** button above the list.

   The selected rules are enabled and a message shows that the rules enabled successfully.

   - To disable rules, select the rules that you want to disable in the rules list and click the **Disable** button above the list.

   The selected rules are disabled and a message shows that the rules disabled successfully.

Change Memory Threshold for ESA Rules

The following procedures pertain to setting memory thresholds for ESA rules to prevent them from using excessive memory.

Change Memory Threshold for All Trial Rules

This procedure is optional and applies only to ESA Correlation Rules.

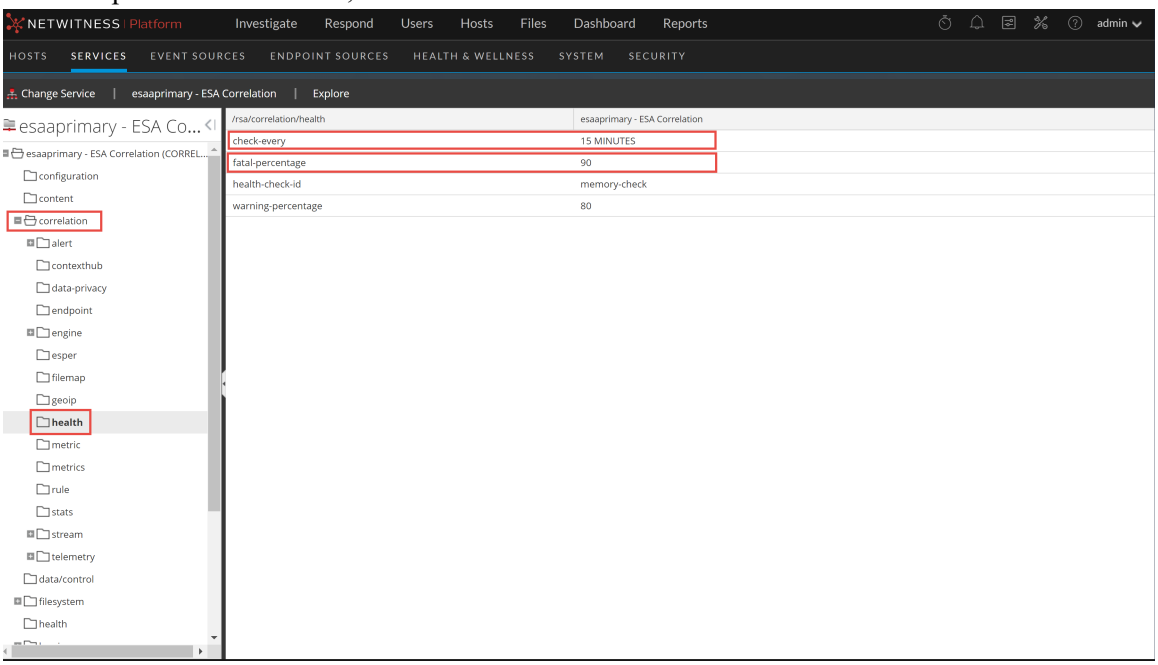
Administrators can increase or decrease the memory threshold for trial rules. Threshold refers to the ESA memory usage, which includes ESA base memory, trial rules, and non-trial rules. When the threshold is exceeded, all deployed trial rules on an ESA service are disabled.

You use trial rules to see if a rule runs efficiently and does not use excessive memory, which can impact performance or force the service to shut down.

By default, the memory threshold is 90, which is the percentage of Java Virtual Memory (JVM).

- The memory threshold is per ESA, not per rule.
- When the memory threshold is exceeded, all trial rules running on the ESA are automatically disabled.
- The ESA configuration has the following parameters for trial rules:
  - `fatal-percentage`: If memory rises above this percentage, ESA disables trial rules. For example, if fatal-percentage is set to 90, when memory rises above 90 percent, ESA disables trial rules.
  - `check-every`: This parameter determines how often ESA checks the fatal-percentage to disable trial rules.

For more information, see "Work with Trial Rules" in the *Alerting with ESA Correlation Rules User Guide*.



Prerequisites

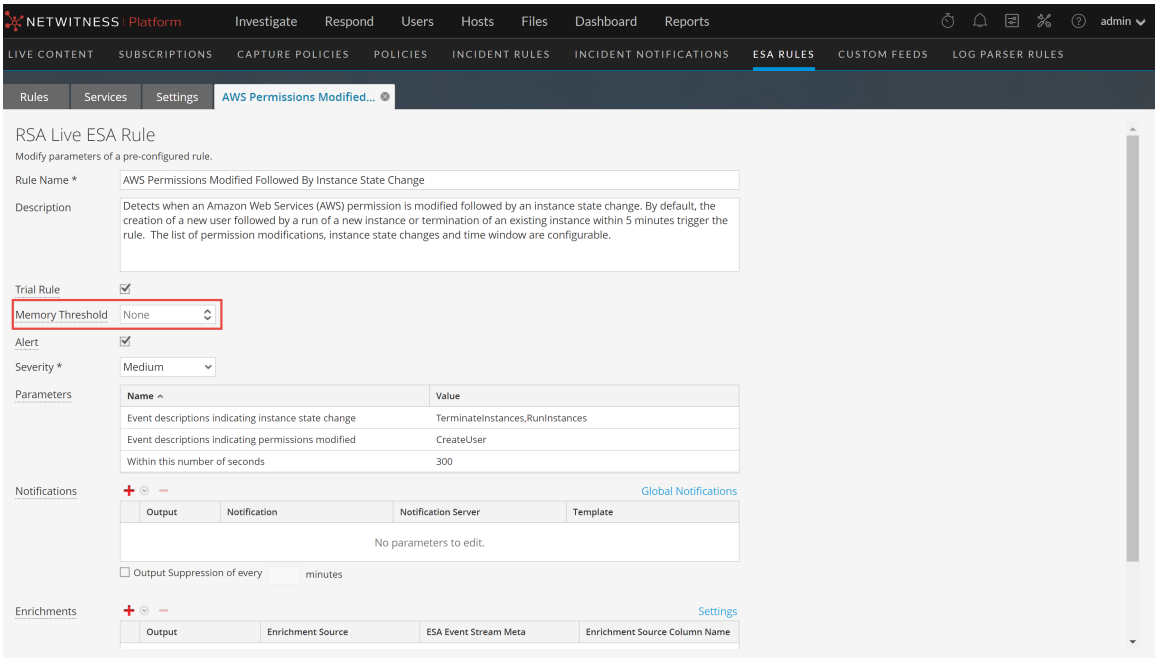
A role with administrative privileges must be assigned to you.

To change memory threshold for trial rules:

1. Log on to NetWitness as admin.
2. Go to  **(Admin) > Services**.
3. Select the ESA Correlation service and then select  **> View > Explore**.

4. In the Explore view node list, select **correlation > health**.

5. In the right panel, in `fatal-percentage`, type a percentage of JVM that trial rules on the ESA cannot exceed.
   The new memory threshold takes effect immediately.
6. If necessary, you can also adjust the `check-every` parameter, which determines how often ESA checks the fatal-percentage to disable trial rules. By default, ESA checks the fatal-percentage every 15 minutes.



Change Memory Threshold for Individual Trial Rules and Non-Trial Rules

Note: This option is available in NetWitness Platform version 11.5 and later.

In addition to setting a memory threshold for all trial rules, you can set a memory threshold individually for both trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set. You should configure a memory threshold for rules that use memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab.

1. Go to **(Configure) > ESA Rules >Rules** tab.
2. In the **Rule Library**, select the rule you want to configure and click .
   The rule details are displayed.

3. In the **Memory Threshold** field, add the maximum memory usage allowed for this rule in MB. **100 MB** is the default for new rules.

4. Click **Save**.
5. When you are finished changing the memory thresholds for individual rules in an ESA rule deployment, redeploy the deployment.
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Start, Stop, or Restart ESA Service

This topic provides instructions to start, stop, or restart the ESA Correlation service from the NetWitness user interface and from the command line. These procedures apply to ESA Correlation Rules.

Start the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Start**.

Stop the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Stop**.

Restart the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Restart**.

Start the ESA Service from the Command Line

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl start rsa-nw-correlation-server
   ```

Stop the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl stop rsa-nw-correlation-server
   ```

Restart the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   `systemctl restart rsa-nw-correlation-server`

View Audit Logs and Verify ESA Component Versions

This topic provides details about audit logging and instructions to verify the versions of the ESA components installed. These procedures apply to ESA Correlation Rules.

View Audit Logs for Rules

Audit logging allows you to view details about rules that are created and changed in NetWitness. There are local audit logs in each of the services in NetWitness. When Global Audit Logging is configured, NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system.

For details on how to access your local audit logs, see "Local Audit Log Locations" in the *System Configuration Guide*. To set up Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

The following Syslog global audit log examples show create, update, remove rule, and delete deployment actions for the ESA Correlation service (correlation-server).

```

Each log contains the following parameters:

- **Time stamp**: Time the rule was modified. Example: `09-17-2018 08:54:21`
- **System Info**: Information about the system where the action was performed, such as IP address. Example: `10.0.0.0`
- **deviceVersion**: Version of your ESA service. Example: `11.3.0.0`
- **deviceService**: Example: `correlation-server`
- **action**: Examples: `create`, `update`, `remove`
- **Parameters**: Placeholder for the following keys:
  - **Epl Module Identifier (moduleIds)**: unique identifier for the rules. Example: `5b9fce314a5b1f5951babc2a, 5b9fce314a5b1f5951babc2b`
  - **enabled**: Shows if the rule is enabled or not. Example: `enabled=true`
  - **respondEnabled**: Shows if alerts from this rule can go to the Respond view. Example: `respondEnabled=true`
  - **trial**: Displays if the rule is configured as a trial rule or not. Example: `trial=false`
  - **EplStatements**: Displays the rule syntax. Example:

    ```
    eplStatements=[module GHmoduleId15;@Name('GHmoduleName15') @Description
    ('GHmoduleDesc15') @RSAAlert(oneInSeconds=0, identifiers=

    {"user_dst"}

    ) SELECT * FROM Event(ec_outcome in ('Success', 'Failure') AND ec_
    activity='Logon').win:time(5 min) match_recognize (measures F as f_array,
    S as s pattern (F F F F F+ S+) define F as F.ec_outcome= 'Failure', S as
    S.ec_outcome= 'Success');]
    ```

  - **identity**: Example: `admin`

ESA Audit Logs on NW Server (11.5 and Later)

In NetWitness Platform 11.5 and later, in addition to the audit logs available on ESA Correlation-server, new audit logs on the NW Server (SA_SERVER) show when users add, modify, filter, delete, export, and import ESA rules in the Rule Library. The NW Server audit logs also show when users add, modify, and deploy ESA rule deployments. Modifications to an ESA rule deployment include adding, deleting, or updating a rule in a deployment as well as adding a data source or an ESA Correlation service to a deployment.

Verify ESA Correlation Version

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   rpm -qa | grep rsa-nw-correlation-server
   ```
   The ESA Correlation server version is displayed.

NetWitness Event Sources

Event sources are network sources that send information about events to the NetWitness. They can be physical devices, such as laptops, network switches or firewall, and virtual or cloud-based applications, such as VMware. For example:

- An Apache HTTP Server
- Amazon Web Services CloudTrail
- A Barracuda Web Application Firewall
- A connection to Dropbox
- An Oracle Database
- A VMware vCenter Server

You first configure all of your event sources so that they can communicate with the NetWitness. NetWitness provides configuration guides for many common event sources, using a variety of collection methods (such as Syslog or file collection). After you have your event sources configured, use the information in this guide to manage them going forward.

Event Source Management

The Event Sources module in NetWitness provides an easy way to manage event sources and configure alerting policies for your event sources.

Workflow

This workflow shows the overall process for managing event sources, and configure monitoring for them. It also shows where configuring alarms and alerts settings are located in the process.

Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

Automatic Mapping

Introduced in NetWitness version 11.1, the system maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. The User Interface (UI) indicates that an address has been auto-mapped in the Discovery workflow.

Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to  **(Admin) > Event Sources**.
2. Click any of the following:
   - The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
   - The **Manage** tab. Use this tab to add, edit, and delete event source groups and view details for your existing event source groups.
   - The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.

- The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
- The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

How Alarms and Notifications Work

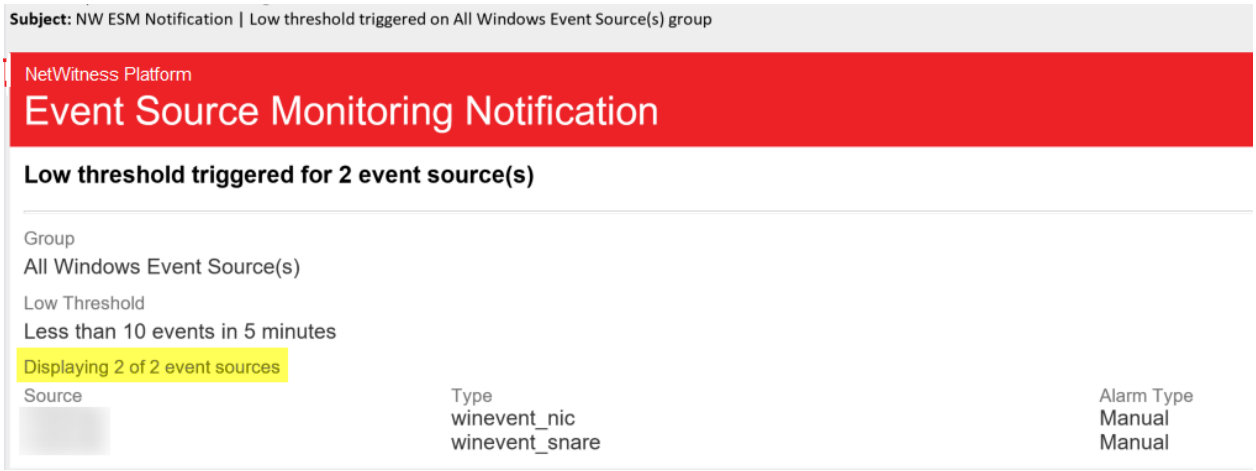
The Event Source module in NetWitness displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

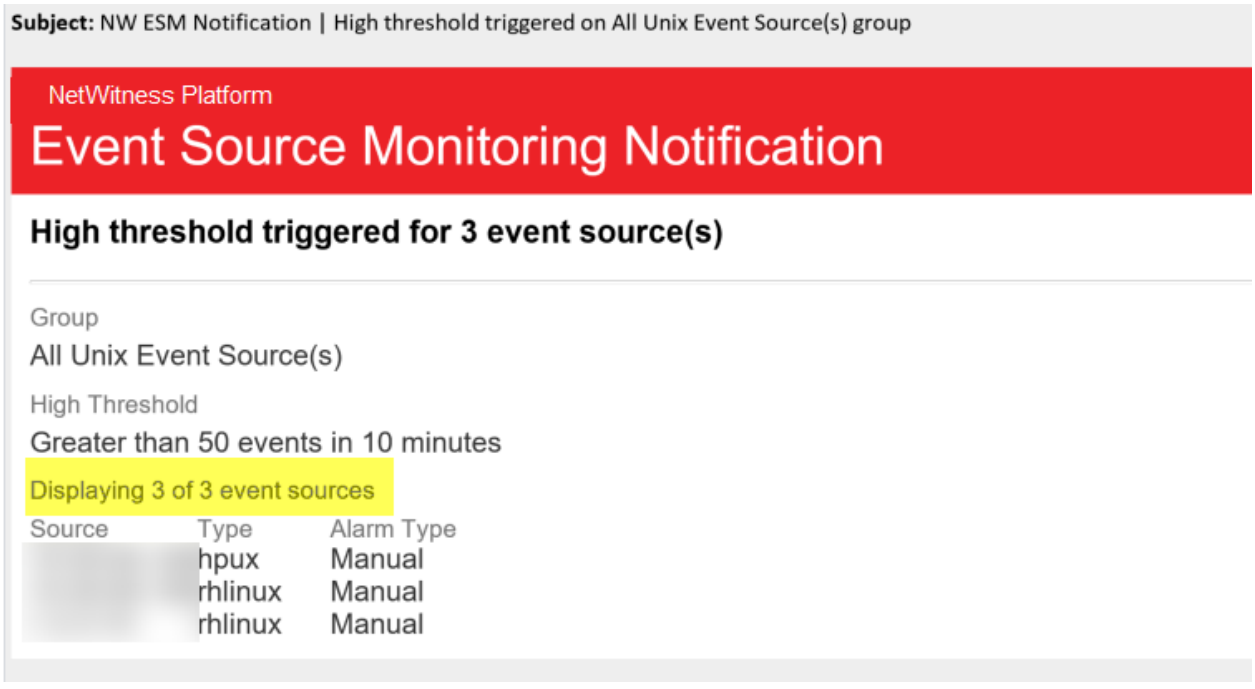
Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: The system sends an alert whenever an event source exceeds the thresholds in the policy for the associated groups.
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:



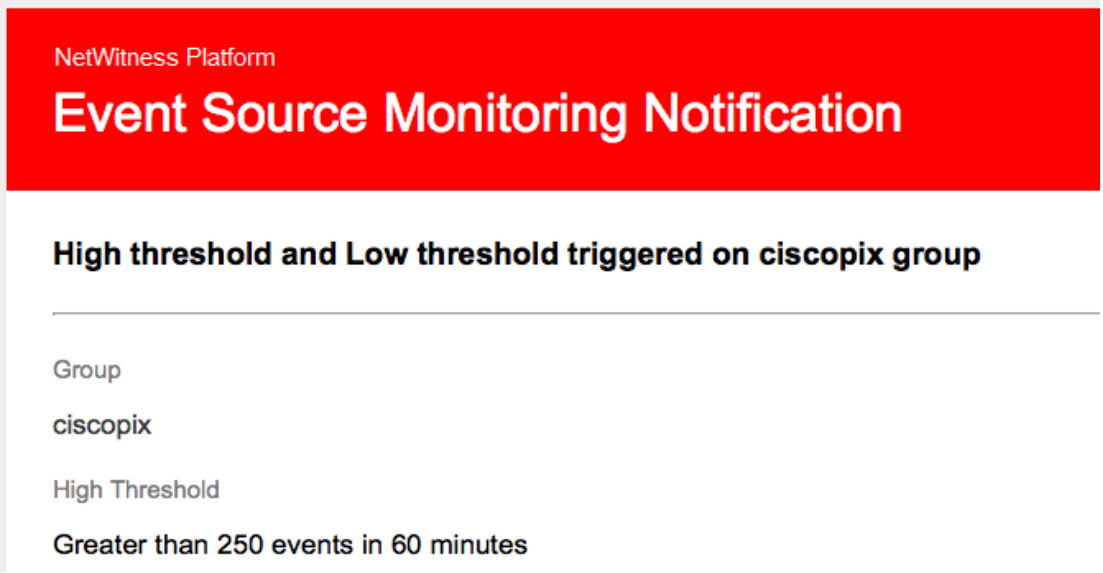
- To receive manual notifications (through email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:
  - Baseline alerting must be on. This is turned on by default.
  - You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
  - The event source that triggers the alarm must be in a group that has a policy enabled.
- If you have automatic alerting turned on, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list the event source that double alarmed twice; one listing indicating it was an automatic alarm.



Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.



The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.

High and Low Thresholds Both Triggered

Occasionally, both the high and low alarms are triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:

In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

Note: Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.

- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Common Scenarios for Monitoring Policies

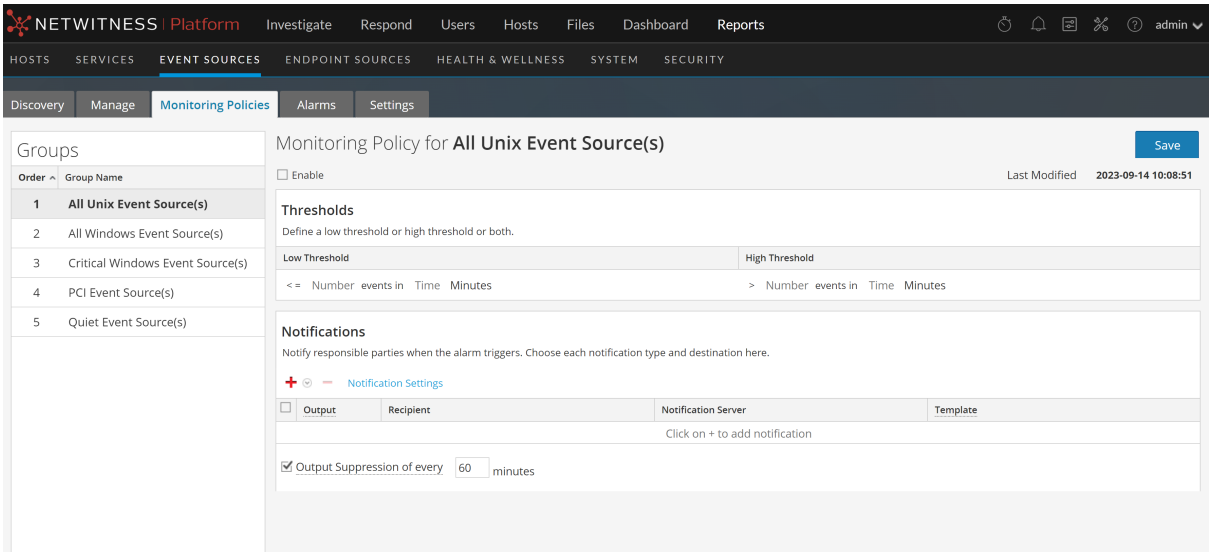
Typically, organizations monitor their event sources in "buckets" based on how critical the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

Note: If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)



Ordering the Groups

Note: To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices
3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any

thresholds—you can use automatic alerting to generate alarms for the event sources in this group.

In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

Managing Event Source Groups

Definitions

When dealing with event source groups in NetWitness, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

Default Groups

NetWitness has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

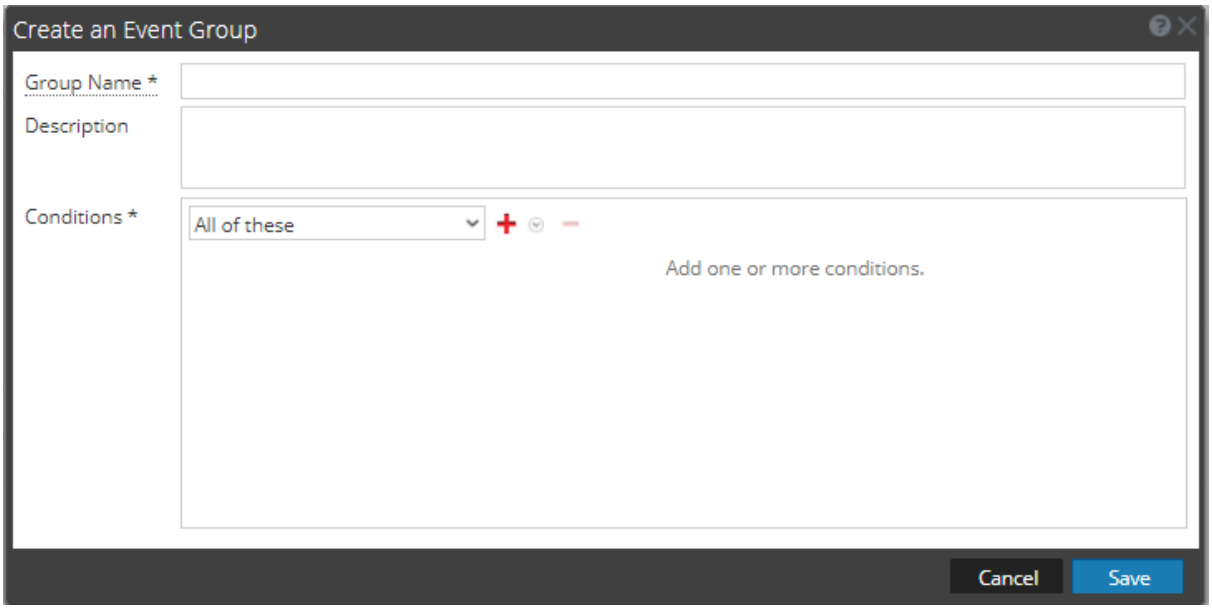
Note: You cannot edit or delete the **All** event source group.

Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

NetWitness provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:



- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

Procedure

To create an Event Source group:

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, click  .

   The Create an Event Group dialog is displayed.

3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

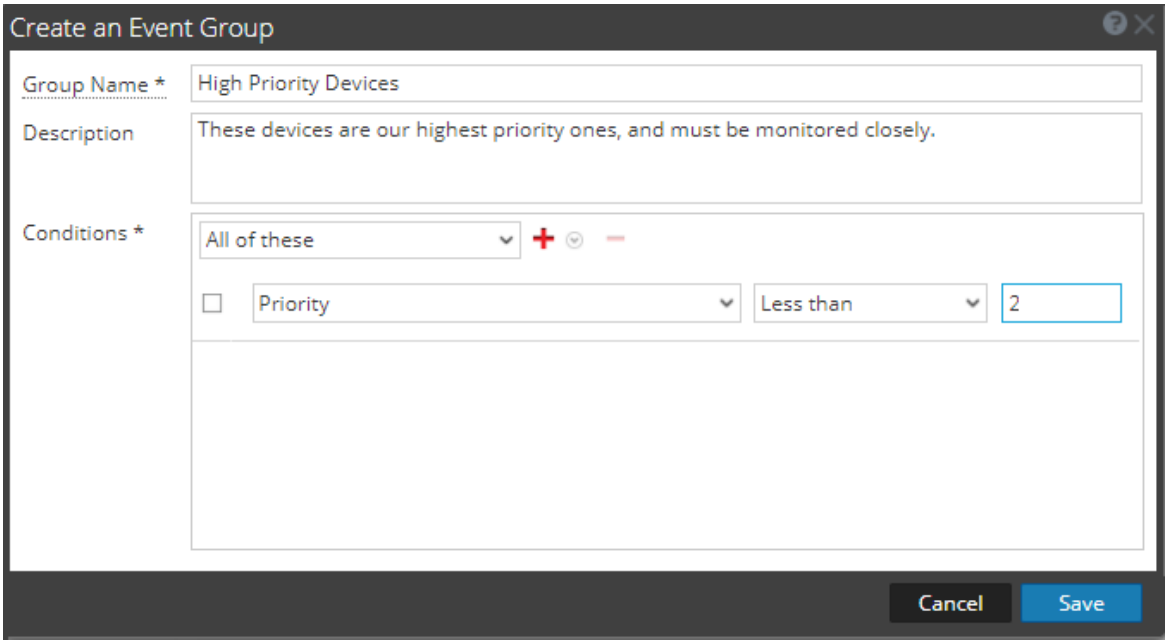
   The new group is listed in the **Manage** panel.

Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.



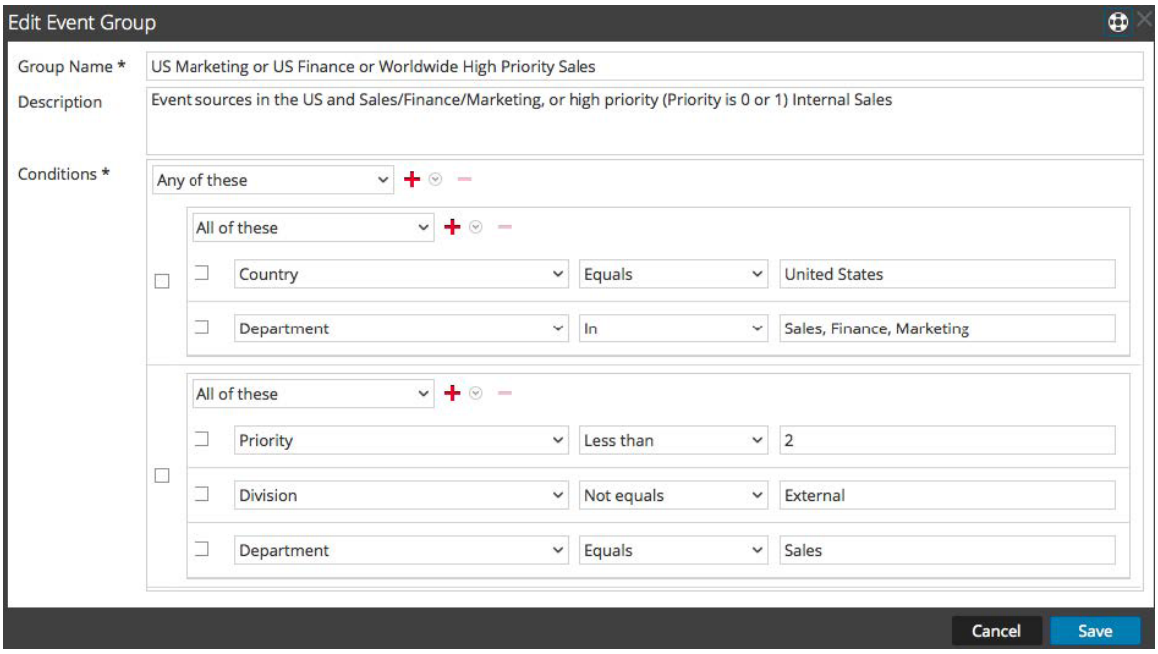
1. Go to **(Admin) > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.
4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.

a. Select an Attribute: **Priority**.

b. Select an Operator: **Less than**.

c. Enter a value: **2**.

The following figure displays the updated Edit Event Group dialog.



7. Click **Save**.

Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.

Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Parameters

The following table describes the fields on the Create/Edit an Event Group form.

Field	Description
Group Name	This field is required, and appears throughout the NetWitness UI as the identifier for the group.
Description	An optional description to help describe the purpose or details for the group.
Tools 	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group. • **Remove (−)**: removes the selected rule or group of rules from the list. When you add a new group, that has the effect of creating nested levels of conditions.
Conditions	Described below, in the **Rule Criteria** table.
Cancel / Save	**Cancel** and **Save** options are available in the form.

Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

Rule Constructor	Details
Grouping	You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules: • **All of these**: logically equivalent to AND • **Any of these**: logically equivalent to OR • **None of these**: logically equivalent to NOT If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected.
Attribute	This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on.

Rule Constructor	Details

Operator	Choose from the following options:
	• **Equals**: matches the provided value
	• **Not equals**: returns event sources whose specified attribute not equal to the provided value
	• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:
	`Where IP in 10.25.50.146, 10.25.50.248`
	This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.
	• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.
	• **Like**: matches items that begin with the provided string. For example:
	`Where Event Source Type Like Apache`
	This condition returns event sources whose Event Source Type begins with `Apache`.
	• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.
	• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.
	• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value.

Value	Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format.

Acknowledging and Mapping Event Sources

In NetWitness version 11.1, NetWitness introduced Automatic Mapping. The system automatically maps incoming events to a type based on previous logs received from that address, reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

To acknowledge event sources:

1. Go to  **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click **Toggle Acknowledge**.

Note the following:

- After Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.
- The **Toggle Acknowledge** button behaves as follows:
  - If the Acknowledged state for all of the selected event sources is the same, all values are toggled. That is, if you select only event sources with **Yes** in Acknowledged column, the value changes to **No** for all of them. Similarly if they all have **No** in the Acknowledged column, the value changes to **Yes** for all selected event sources.
  - If you select a multiple event sources, and the value for some is **Yes** and for other it is **No**, when you click **Toggle Acknowledge**, all of the values are set to **Yes** for the selected event sources.

Note: Acknowledged Event Sources are not displayed by default.

Manually Map Event Source Types

When discovered event source types are not completely accurate, you can manually map the parsers to obtain additional information.

To map one or more event sources:

1. Go to  **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click 

.

   The Manage Parser Mappings dialog box is displayed.

Note: For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

4. Add or remove parser mappings, and change the priority order, based on the needs of your organization. For more details, see Manage Parser Mappings .

Note: Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

Viewing Logs from Pre-11.0 Log Decoder

NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available. For more details, see Viewing Logs from Pre-11.0 Log Decoder.

Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness.

Similarly, you may need to change some of the conditions that are used to populate the group.

Note: You cannot edit the event source group name. After you create a group, that name exists as long as the group itself exists.

Edit an Event Source Group

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   The Edit Event Group dialog is displayed.
4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

Delete an Event Source Group

Note the following:

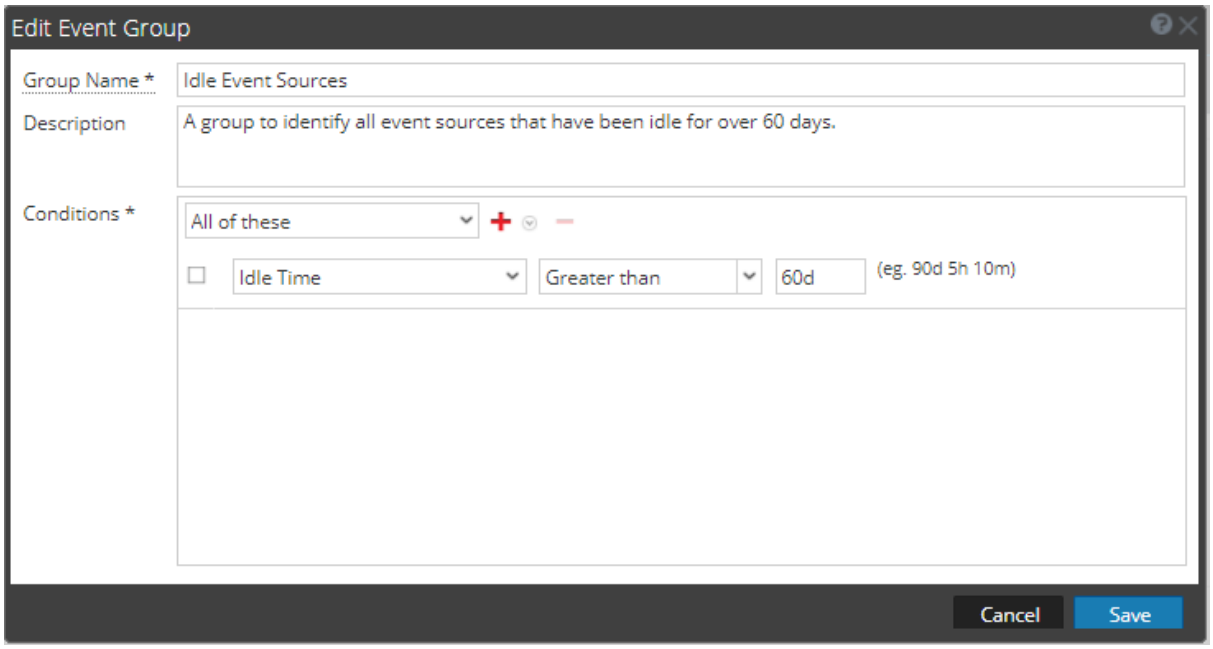
- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.
- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   A confirmation dialog is displayed.
4. Click **Yes** to delete the group.

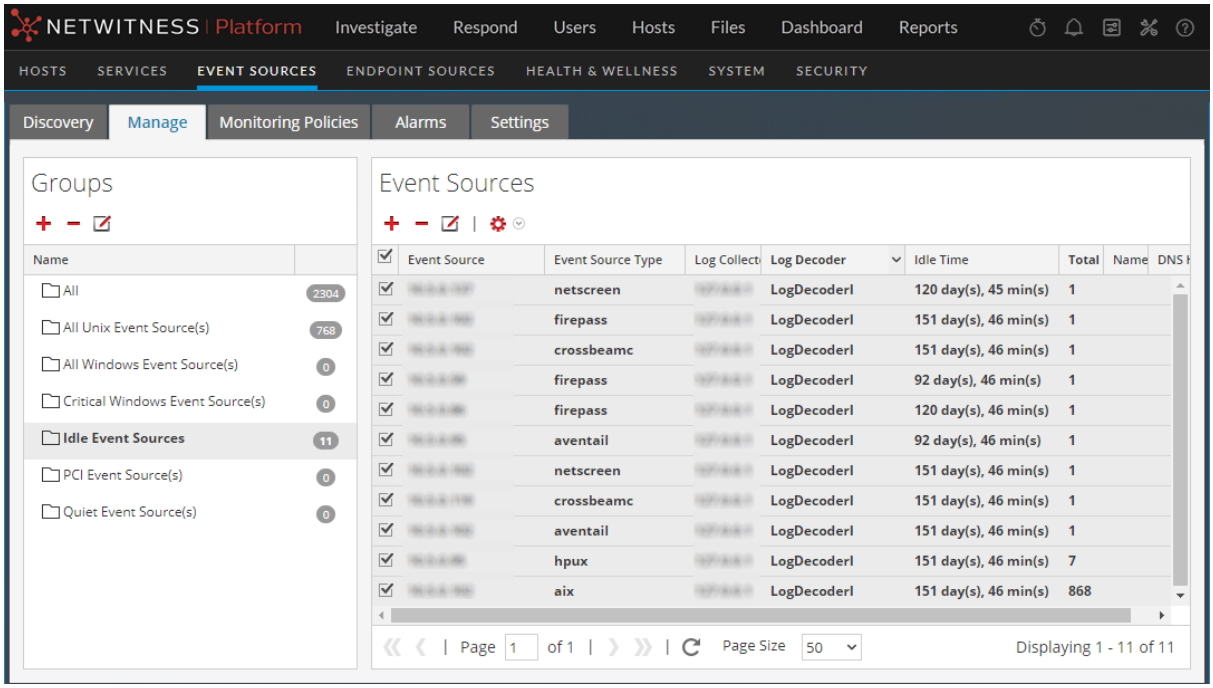
Removing Idle Event Sources



Periodically, you may want to update your set of event sources, and remove ones that are no longer being used. You can use the **Idle Time** parameter to do this.

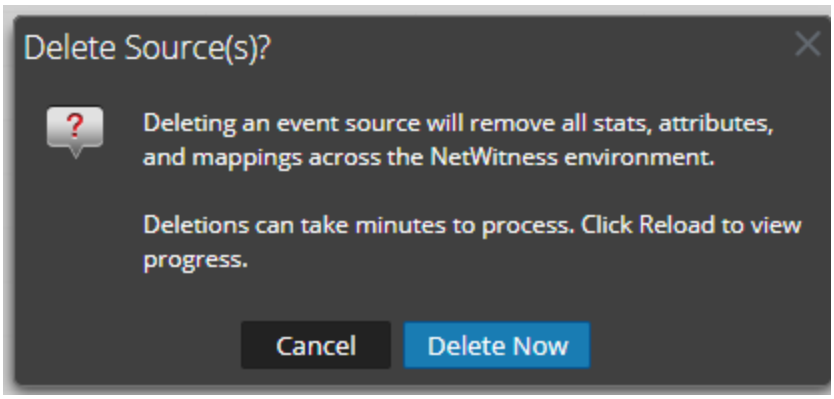
Note: The information in this topic applies to NetWitness Version 11.2 and later.

To remove idle event sources:



1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, click  .

   The Create an Event Group dialog is displayed.
3. Fill in the name and description as you like, and add a condition that uses the **Idle Time** parameter, as shown here:

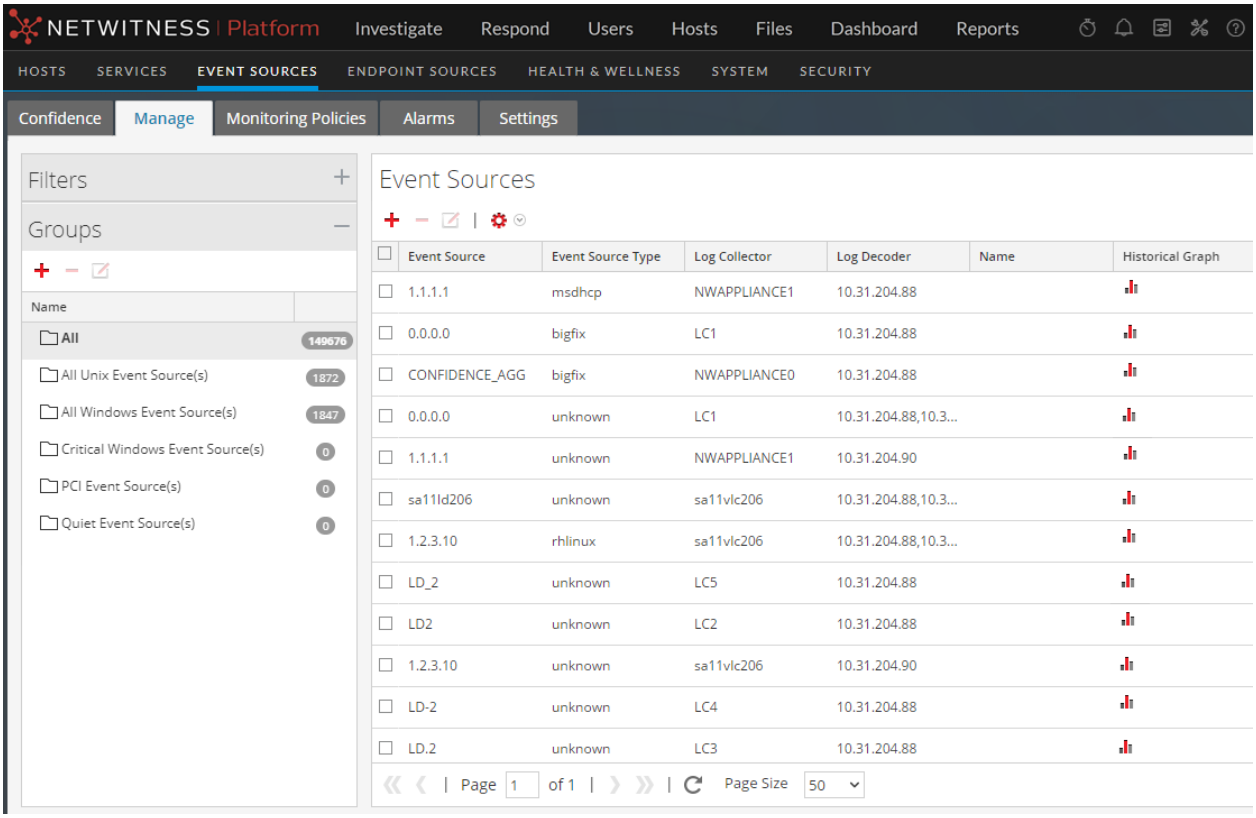


In this example, we have set the condition to identify event sources that have been idle for at least 60 days.

4. Save the new group, then select it in the Groups panel.
5. Select some or all event sources in the group. The following screen shows all event sources from this group selected.

6. In the Event Sources panel, click − to delete the selected, idle event sources.

   A confirmation message appears:



7. Click Delete Now to confirm your intention to delete the selected event sources.

If, in the future, an event source that has been removed sends logs, a new event source will be created.

Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:

Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. After you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, NetWitness uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

Create an Event Source

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click  to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

Note: The Discovery Score is listed as **Unavailable** for manually-added event sources. The score remains as **Unavailable** until the event source begins sending information to the NetWitness

Update Attributes for an Event Source

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click  to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
5. Enter or change the values for any attributes, except for certain attributes that cannot be altered after you have entered them.
6. Click **Save**

Bulk Editing Event Source Attributes

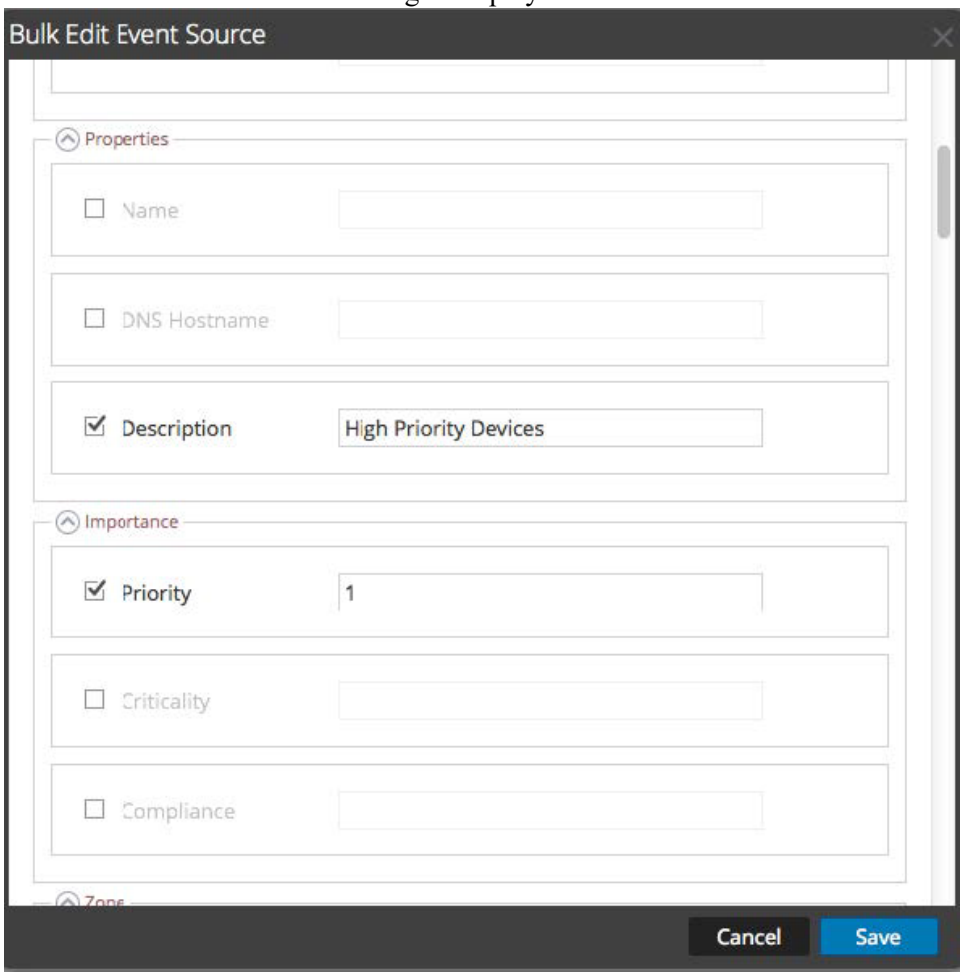
You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

Note: You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

Note: Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.



To bulk edit attributes for Event Sources:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

Note: To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.

5. Select the **Edit** icon from the menu bar.

   The Bulk Edit Event Source dialog is displayed.

6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

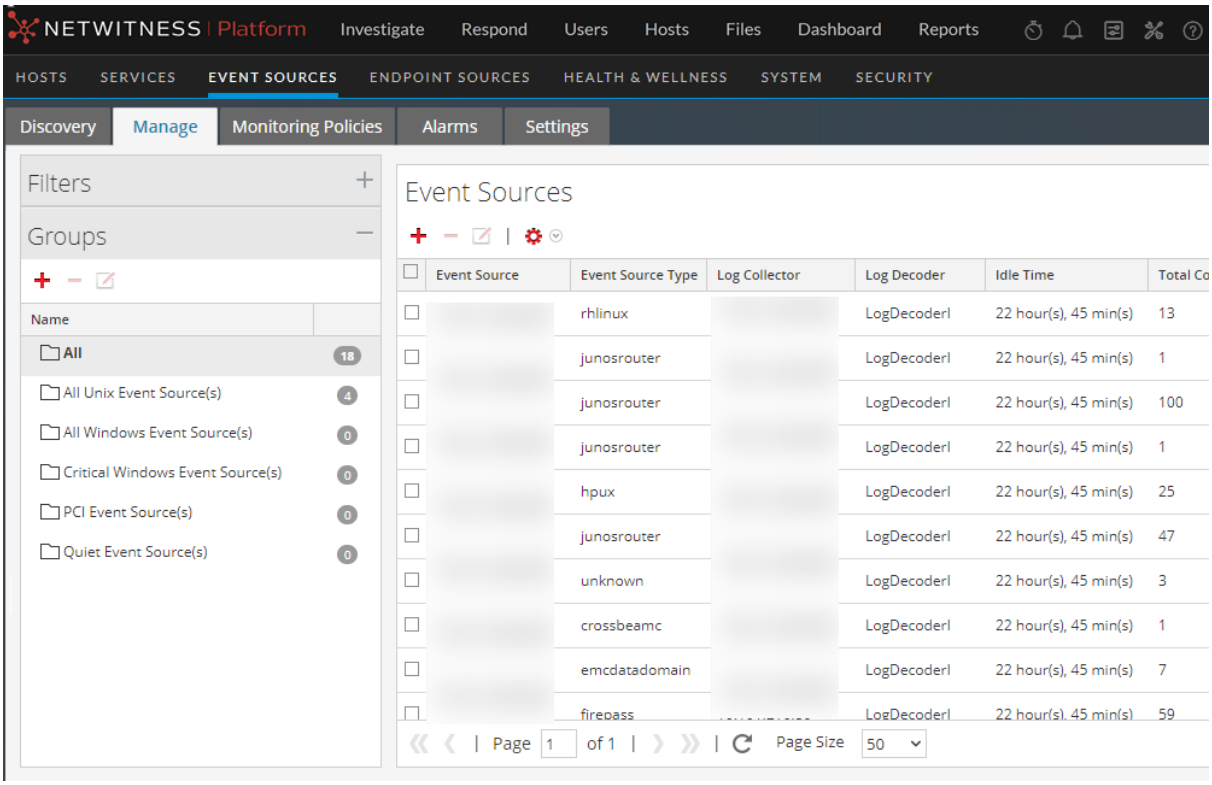
Note: The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness), the original value in NetWitness will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

NetWitness treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness, the attributes for that event source are ignored. That is, NetWitness does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness (that is, it is **not** cleared).

Note: There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.



The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

Import Event Source Attributes

To import Event Source attributes from a file:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

3. From the Import/Export menu in the toolbar ( ), select **Import** (Import).
   The Import Event Sources dialog is displayed.

4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness is blank. Thus, no existing values will be overwritten.
   - **Do not clear values**: Does not clear attribute values in NetWitness for items in the import file that

are blank.

- **Add Unknown Sources**: Adds new event sources based on items in the import file.

Note: You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

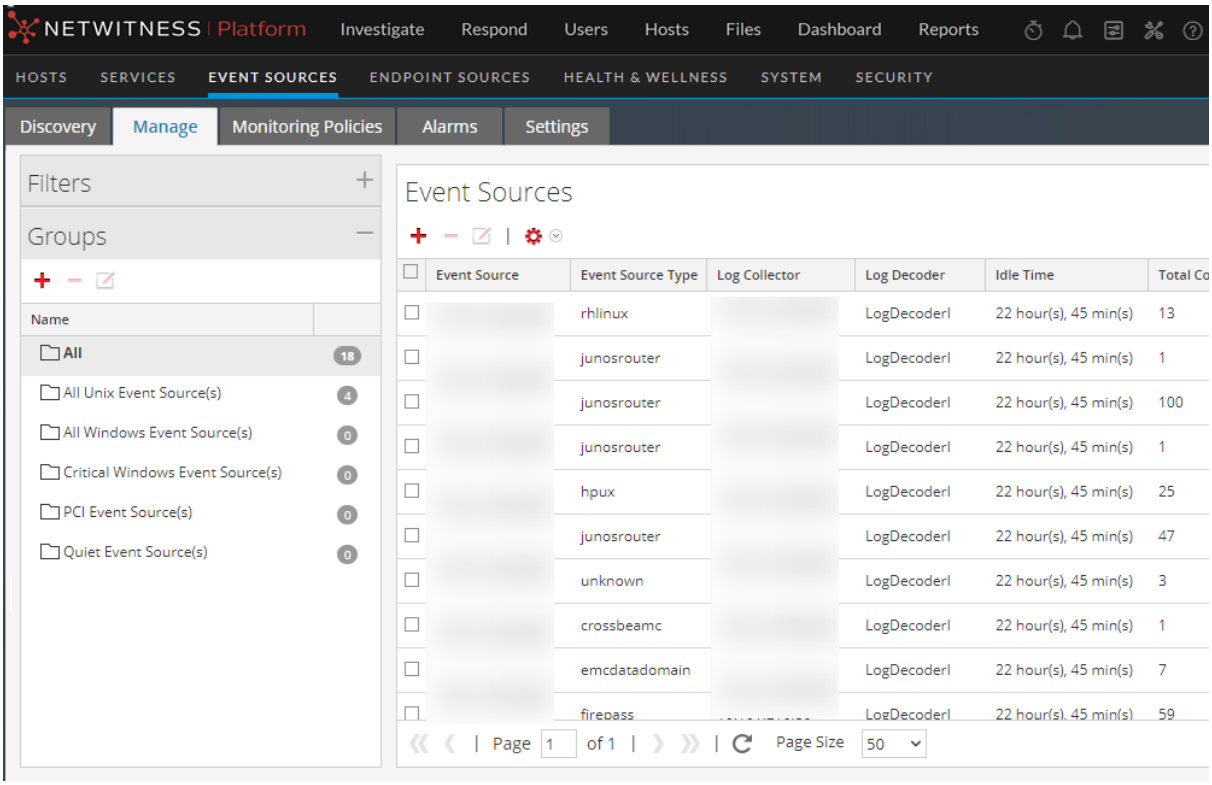
Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

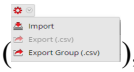
If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

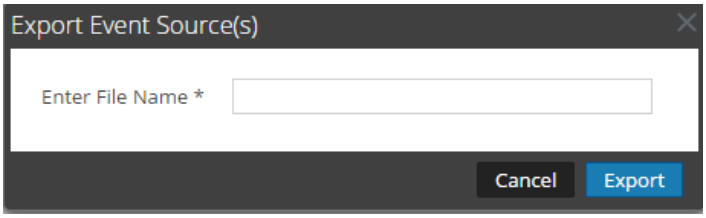


Note the following:



- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

To export your Event Sources:



1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

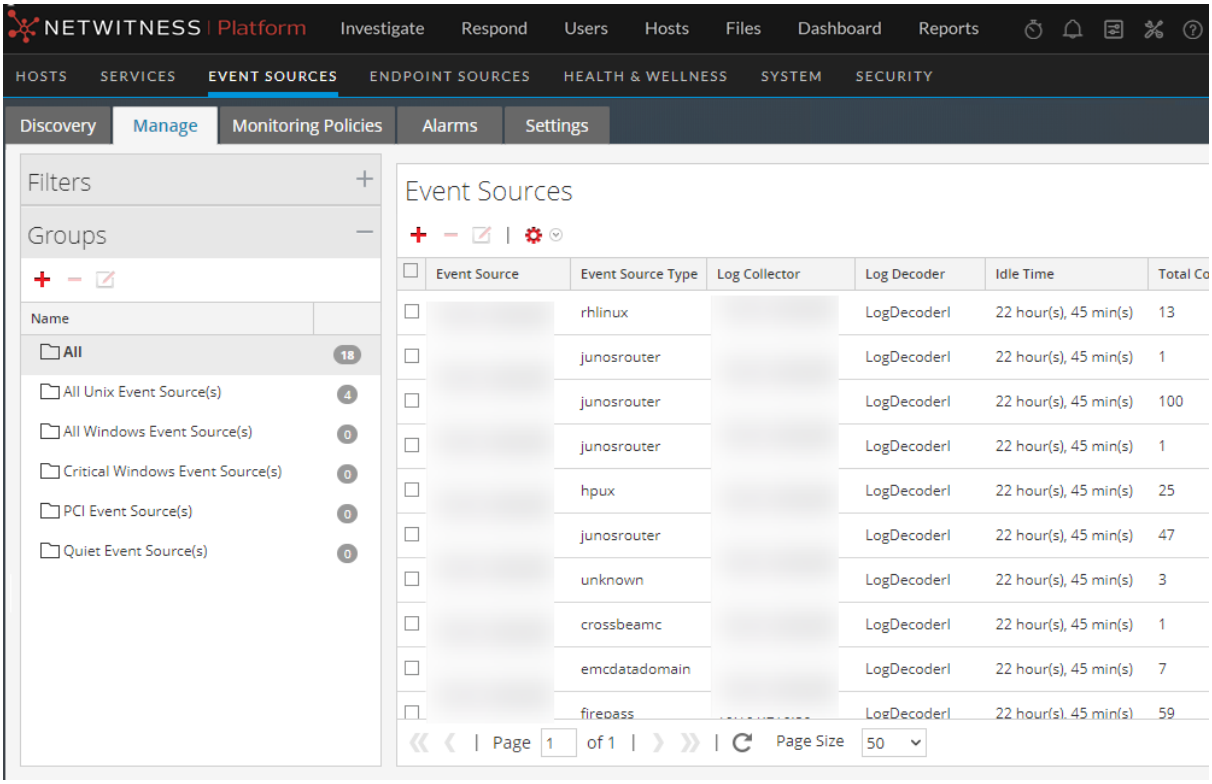
3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.

6. Enter a file name and click **Export**.

The event source attributes are saved to the file name you specified, in a CSV format.

Sorting Event Sources



The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

Note: The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)

To sort your event sources:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

3. To sort a column, click  in the column header.

   The Sort Options drop-down menu is displayed.
4. Select the sort order that you want.

Monitoring Policies

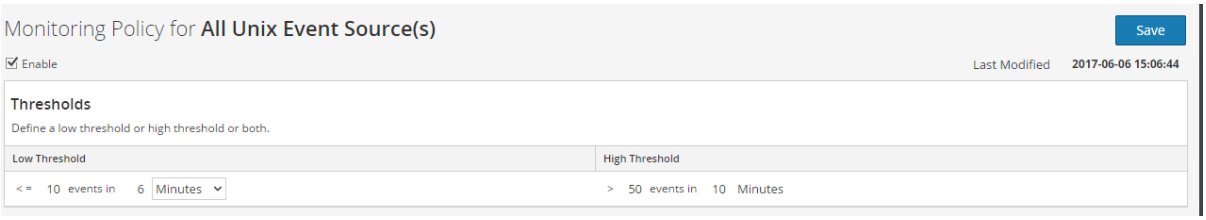
Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

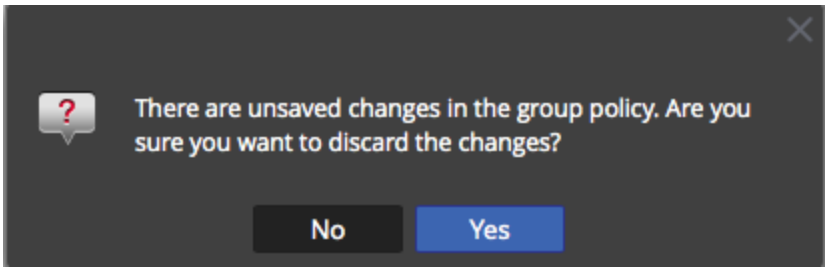
Note: In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.



Configuring Event Source Group Alerts

Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

Create an Alert Policy for an Event Source Group

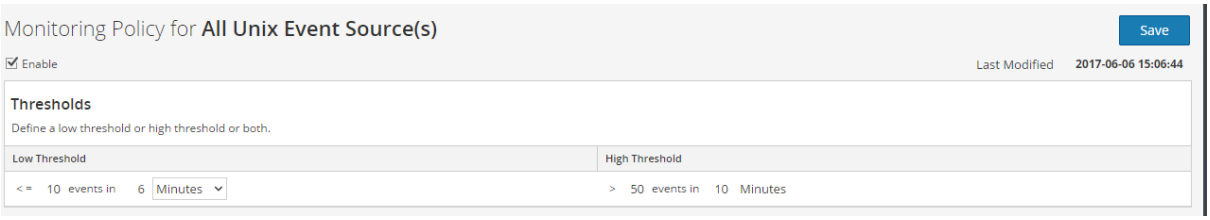


1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.

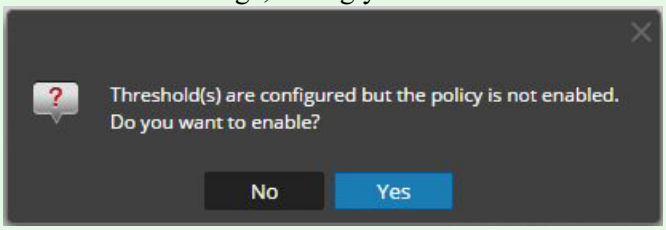
5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

Note: If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:



Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.



If you configure longer policy duration for low threshold policy, it may result in increased memory (SMS Heap) usage. In order to avoid increased memory usage (For more information, see 'Troubleshooting Health & Wellness' in the *System Maintenance Guide*), make sure you optimize the policy filter to match the required Event Sources and also NetWitness recommends having a policy duration of < 3 days if 30 low threshold policies match 20K Event Sources. If there are < 10 low threshold policies, you can have < 7 days policy duration with each policy matching unique Event Sources.

1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.

4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.
5. Select **Enable** to enable alarms when thresholds are not met.

Note: If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd

For example, suppose you enter 10 and 30 for the values for the low threshold: `10 events in 30 minutes`, and 20 and 30 for the values for the high threshold: `20 events in 30 minutes`. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

After you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

Note: After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Add Notifications for an event source group

To add notifications for an event source group:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

   Note: You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click , and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

   Note: Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

   Note: If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.

Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

Note: Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for

this event source group, even if thresholds are not met or exceeded.

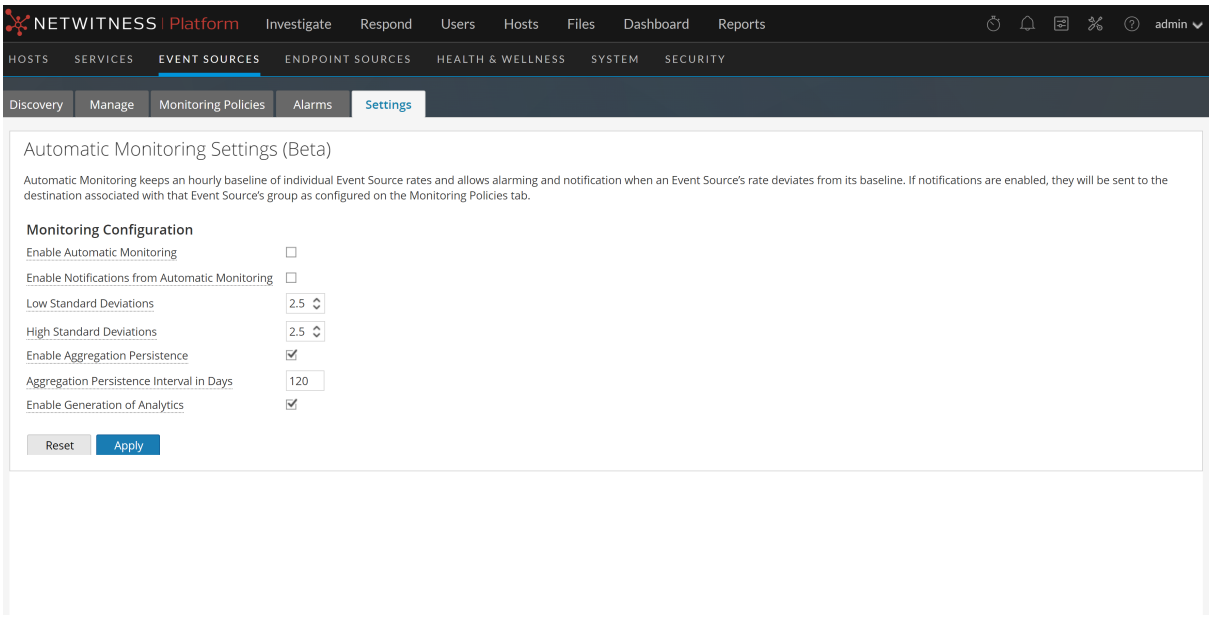
5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

Configuring Automatic Alerting

Note: Automatic alerting, and it settings, are currently in Beta testing.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:



- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Configure Automatic Alerting

To configure automatic alerting:

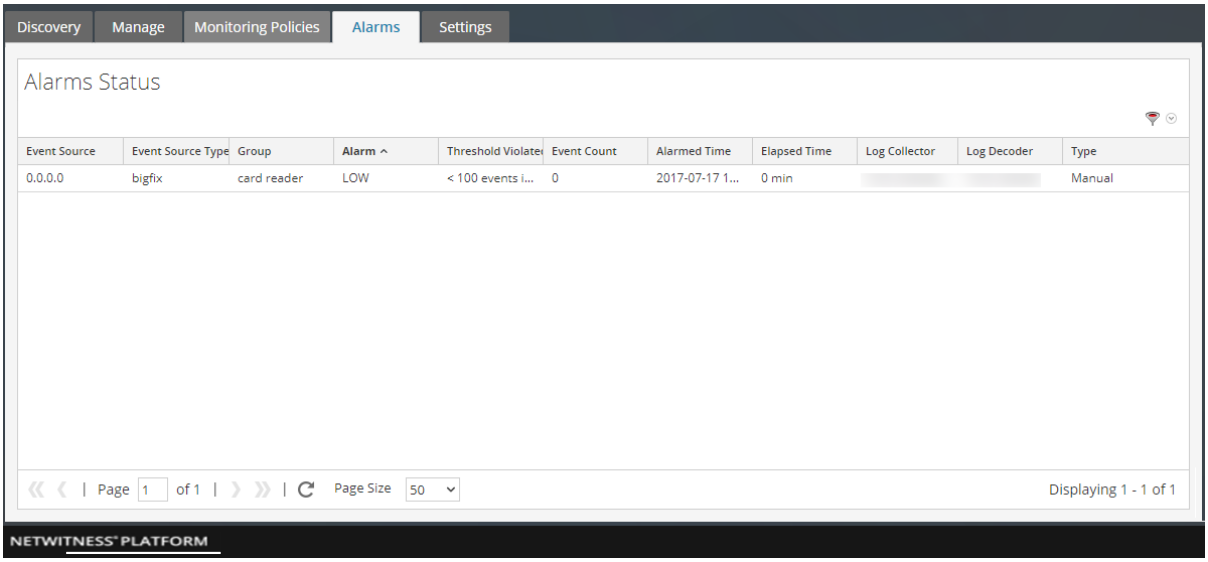
1. Go to  **(Admin) > Event Sources**.
2. Select the **Settings** tab.

   The Settings tab is displayed.

3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.5** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.5** (95% confidence).

   Note: You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation.
6. Click **Save** to close the dialog and save your settings.

Viewing Event Source Alarms



This topic describes how to view alarms for your event source groups. After you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to  **(Admin) > Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the  icon.

   This is an example when you mouse over the Alarm column.

5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

Note: You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area: 

Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

Event Source Management References

The following topics contain reference information for Event Source Management:

- Discovery Tab
- Manage Tab
- Manage Event Source Tab
- Event Sources View
- Create/Edit Group Form
- Details View
- Historical Graph for System Stats
- Manage Parser Mappings
- Alarms Tab
- Monitoring Policies Tab
- Settings Tab

Discovery Tab

To access the Discovery tab, go to NetWitness  (Admin) > **Event Sources**. The Discovery tab is displayed.

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

Note: The following features apply to NetWitness version 11.1 and later:
- Acknowledging multiple event sources
- Filtering by event source type
- (for 11.2 and later) Mapping filter options include None, Auto, and Manual
- Mapping multiple event sources
- Searching for event sources on the Event Source Discovery page

NetWitness, version 11.2 and later, automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. A value of **Auto** in the **Mapping Type** column indicates that an address has been auto-mapped.

Workflow

This workflow shows the overall process for configuring event sources.

What do you want to do?

Role	I want to...	Documentation
Administrator	Acknowledge and map event sources.*	Acknowledging and Mapping Event Sources

Manage Parser Mappings

Details View

Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.

1 Displays the Filters and Event Sources panels with the Discovery tab open.

2 Displays the Event Source Filter field with a drop-down menu that offers the following options:

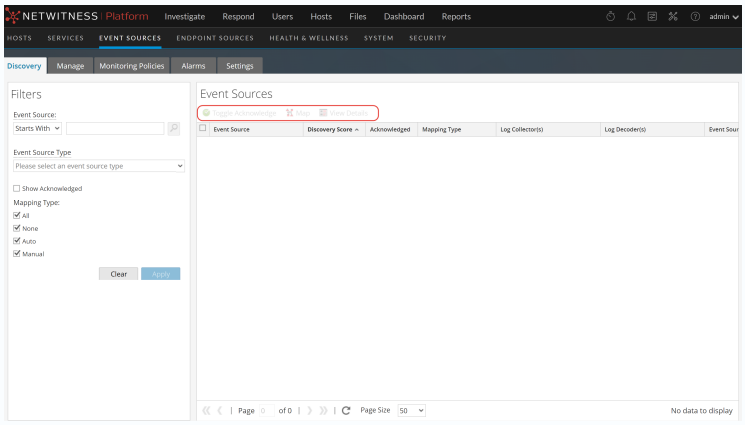
- Enter the full or partial address (IP, IPv6 or Hostname) of the source(s) you want to review. You can also enter multiple entries that are separated by commas.
  For example, **10.10.10.10,10.10.10.11,host1.company.com**
- **Exact:** Returns sources that completely match the search term.
  For example, **10.10.10.10** only returns **10.10.10.10**, not **10.10.10.101**.
- **Starts With:** Returns sources that start with the search term.
  For example,**10.10.10.** returns the whole **10.10.10.x subnet**.
- **Contains:** Returns sources that start with the search term.
  For example, **exch** returns all terms such as **us-exch-1.company.com**, or **lab21** returns all **hostx.lab21.company.com** terms.
- **Ends With:** Returns sources that end with the search term.
  For example, **lab21.company.com** returns all hosts.

Note: When specifying the search string, you can use **. - :** (period, dash, colon).

3 The Event Source Type drop-down menu filters for addresses containing all of the selected event source types.

4
- Select the **Show Acknowledged** checkbox to display acknowledged Event Sources.
- Mapping filter options can include just one of the mapping types listed in the Filter Panel, or multiple Mapping Types can be selected.

Note: If no mapping filter options are selected, the default is to display **All**, **None**, **Manual**, and **Auto** mapping types.



5
- The **Apply** button uses all criteria that is set in all filters.
- The **Clear** button clears all filters from the panel.

6 Toggles the event sources between acknowledged and not acknowledged states.

7 Maps the selected event sources.
8 View Details button to view details of the selected Event Source.
9 Displays the addresses of the selected Event Sources.
10 Displays the discovery scores of the selected Event Sources.
11 Displays whether or not the selected Event Sources have been acknowledged.
12 Displays the selected Event Source Mapping type as Auto, Manual, or None. Any changes to the mapping are only displayed here.
13 Displays the host names of the Log Collectors where the Event Sources are located.
14 Displays the host names of the Log Decoders where the Event sources are located.
15 Displays the discovered Event Source Types and their associated discovery scores.

Toolbar and Features

The Discovery tab contains the following features:

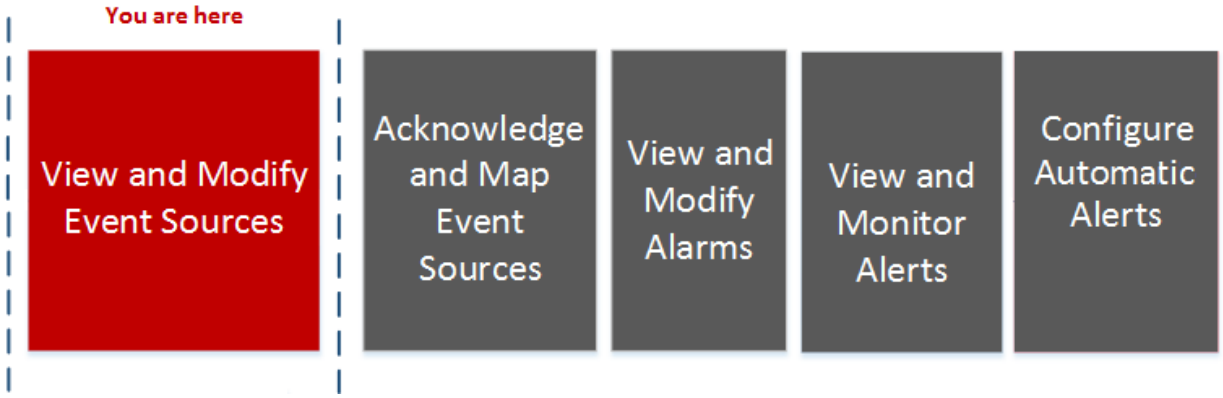
Field	Description
Tools   	The following items are available on the toolbar: • **Toggle Acknowledge**: Toggles the acknowledged state for the selected Event Source between **Yes** and **No**. • **Map**: Opens the Manage Parser Mappings dialog box, where you can map an event source to the correct log parser. • **View Details**: Provides details on the selected Event Source, as well as logs that have been received for this event source. For example: 
Event Source	The IP, IPv6, or Hostname of the Event Source.
Discovery Score	Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident).
Acknowledged	Selections are either **Yes** (you have acknowledged the Event Source) or **No** (you have not acknowledged the Event Source).

Field	Description
Mapping Type	Selections are **Manual** (you mapped the Event Source), **Auto** (the system automatically mapped the Event Source), or **None** (you have not mapped the Event Source). Auto mapping is content aware. When a log message is parsed to a high confidence header or message that has been tagged, an auto mapping will be set for that address and type. This auto-mapping is valid for 24 hours and will be renewed every time a log message matches a tagged header of a message. Log messages are first parsed against auto-mapped parsers, and only fall back to discovery if there is no match amongst the mapped parsers. Log messages that fall back to discovery can match the tagged headers or messages from other event sources: this results in multiple types being mapped. For example, an address could eventually be mapped to Windows, MS SQL, and Apache, and these parsers are evaluated first. If an event source is decommissioned, and its IP re-purposed, the 24-hour timer ages out the mappings for the decommissioned types. **Note:** This features applies to NetWitness version 11.2 and later.
Log Collector(s)	Log Collectors that have received logs from this Event Source address.
Log Decoder(s)	Log Decoders that have received logs from this Event Source address.
Event Source Type(s)	The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

Field	Description
Sort Ascending	Sort the column by discovery score in ascending order.
Sort Descending	Sort the column by discovery score in descending order.
Columns	Used to hide or show one or more columns.



Manage Tab

The Manage tab organizes event sources into groups, and displays attributes for each event source.

To access this tab, go to (Admin) > **Event Sources** > **Manage**.

Workflow

This workflow shows the overall process for configuring event sources.

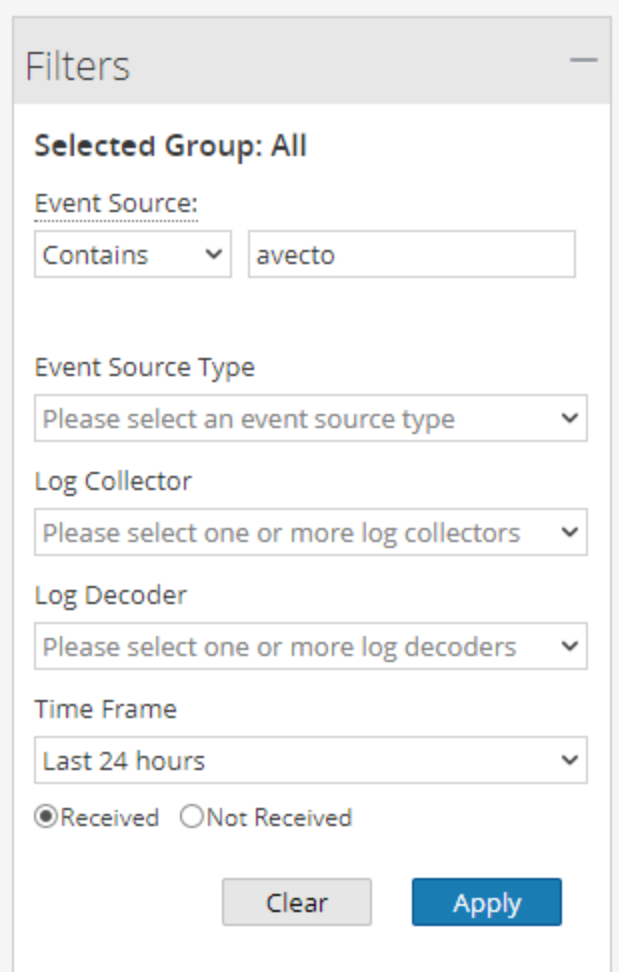
Creating Event Source Groups

Creating an Event Source and Editing Attributes

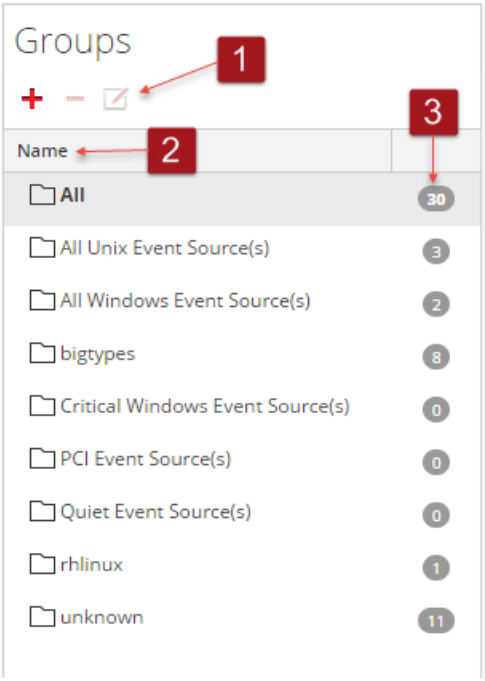


Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.

Filter Panel

The Filter Panel provides options for filtering the set of event sources shown in the grid view. This is an example of the Filter Panel:

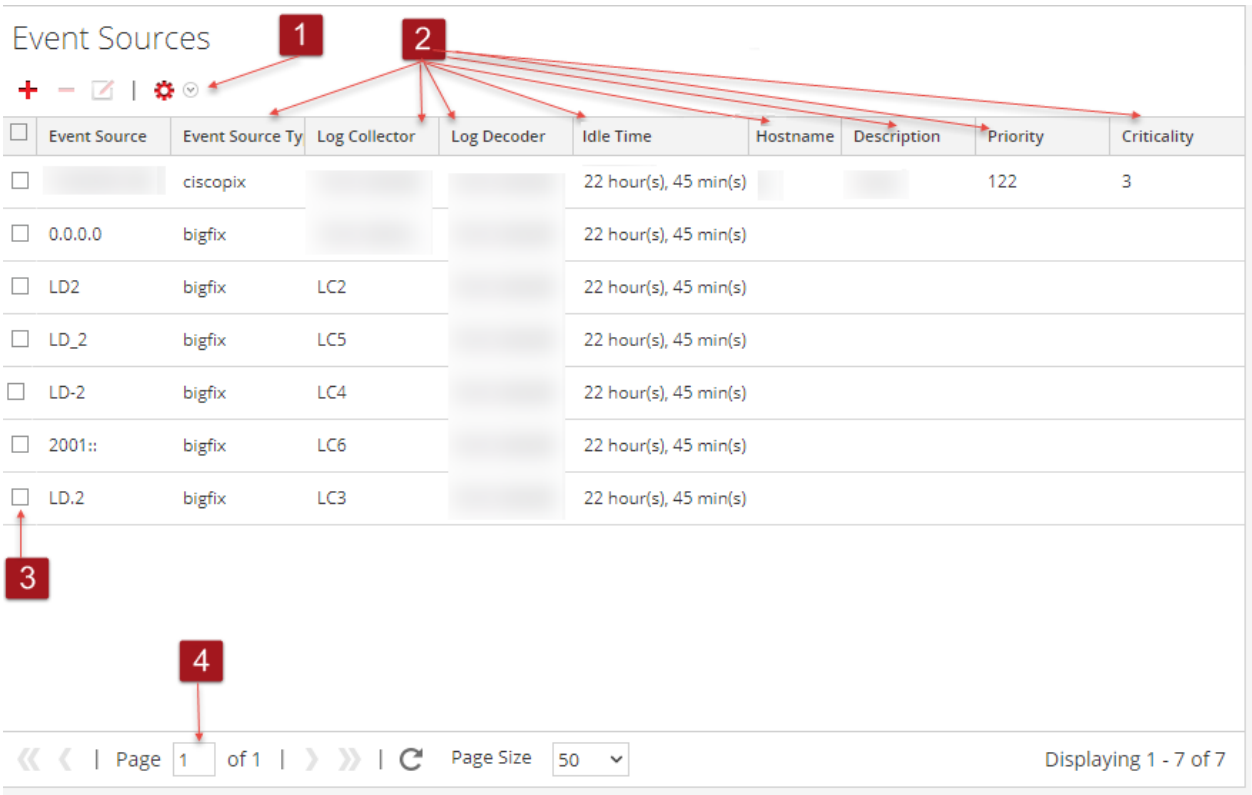


This panel provides the following options:

- You can filter on the event source name, using **Contains**, **Exact**, **Starts With**, or **Ends With**. Select one of these choices, then enter the corresponding string to match against.
- Select one or more Event Source Types to filter based on this value.
- To view event sources that send data to a particular Log Collector, select a Log Collector from the drop-down list.
- To view event sources that send data a particular Log Decoder, select a Log Decoder from the drop-down list.
- Select the time frame for when the events were collected. You can choose a value from 5 minutes to the previous 90 days, or all data that has been collected.
- Use the **Received** and **Not Received** radio buttons to filter the query results to contain only event sources that logs have been received from within the selected time, or query results to contain only event sources that logs have not been received from within the selected time.

After you complete the set of filters, click **Apply** to view the query results in the Event Sources grid.

Groups Panel



The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.

1	Displays the standard NetWitness icons for adding, removing, or editing groups.
2	Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group. For example, if you create a group that consists of Windows event sources for the Sales organization, you could name the group **Windows Sales Sources**. **Note:** The event source group name is not editable. After you create a group, that name exists as long as the group itself.
3	The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group. **Note:** The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count.

Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.

1	The toolbar contains the following tools:
	• **Add**: manually add an event source
	• **Remove**: remove an event source
	• **Edit**: Update attributes for an existing event source
	• **Import / Export** menu: Displays a menu with the following options:
	  • **Import**: Import event sources from a Content Management Database (CMDB), spreadsheet, or other tool.
	  • **Export**: Export selected event sources and their attributes in CSV format.
	  • **Export Group**: Export the entire group that is currently selected.

2	Columnar display of attributes. You can choose which attributes to display.
3	Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing.

4	Navigation Tools: At the bottom of the screen, there are items that help in navigating your group: • **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group. • **<<**, **<**, **>** and **>>**: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page. • **Page Size**: use this selector to choose your page size. • **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group.

Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

Historical Graph for System Stats

Note: The information in this topic applies to NetWitness Version 11.4.1 and later.

Historical system statistics are available for each event source.

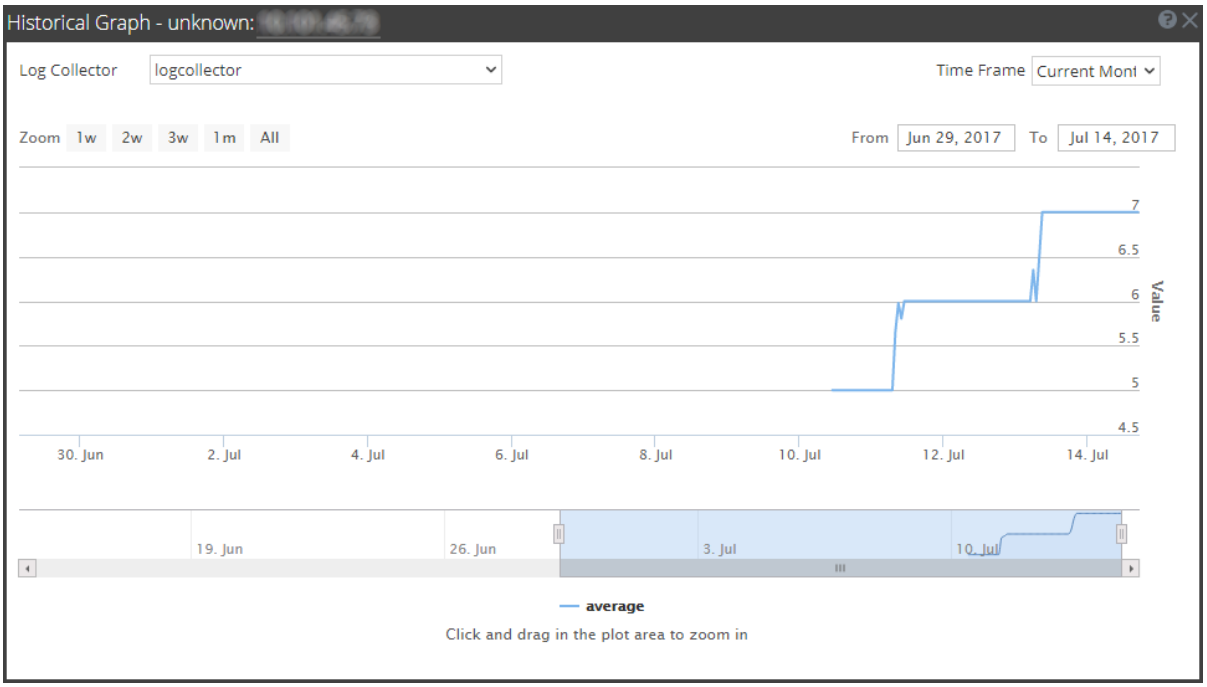
To access the Historical Graph for the System Stats:

1. Go to  **(Admin) > Event Sources**.
   The Event Sources view is displayed.
2. Click the **Manage** tab.
   The Event Sources Manage tab is displayed.
3. In the **Historical Graph** column, select the view chart icon () for any listed event source.
   The Historical graph for the selected event source is displayed. The figure displays event source

activity.

Parameters

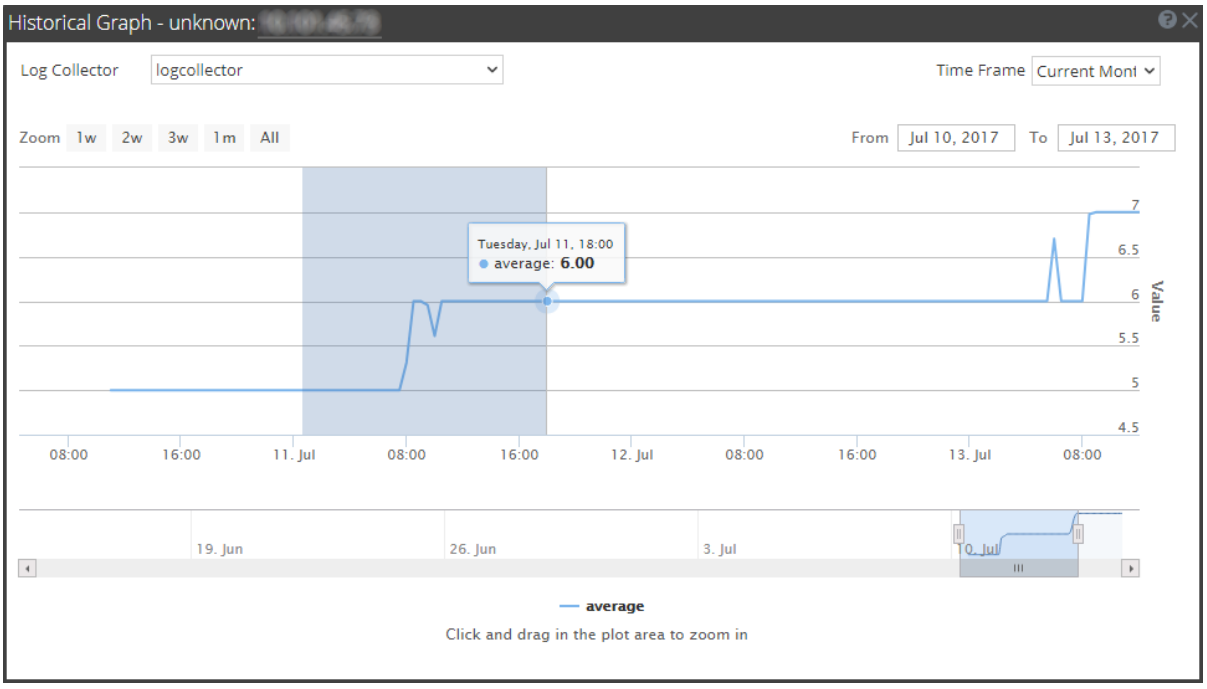
You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.



Parameter	Description
Log Collector	Select the Log Collector for which you want to view historical data. In some cases, the historical data for an event source may be spread across multiple Log Collectors.
Time Frame	Select the time frame for which you want to view the historical data. The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**.
From <date> To <date>	Select the date range for which you want to view the historical data.

You can zoom in for a detailed view of the data in the Historical graph.

Examples of Zooming In



You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6 hour frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6 hour window.

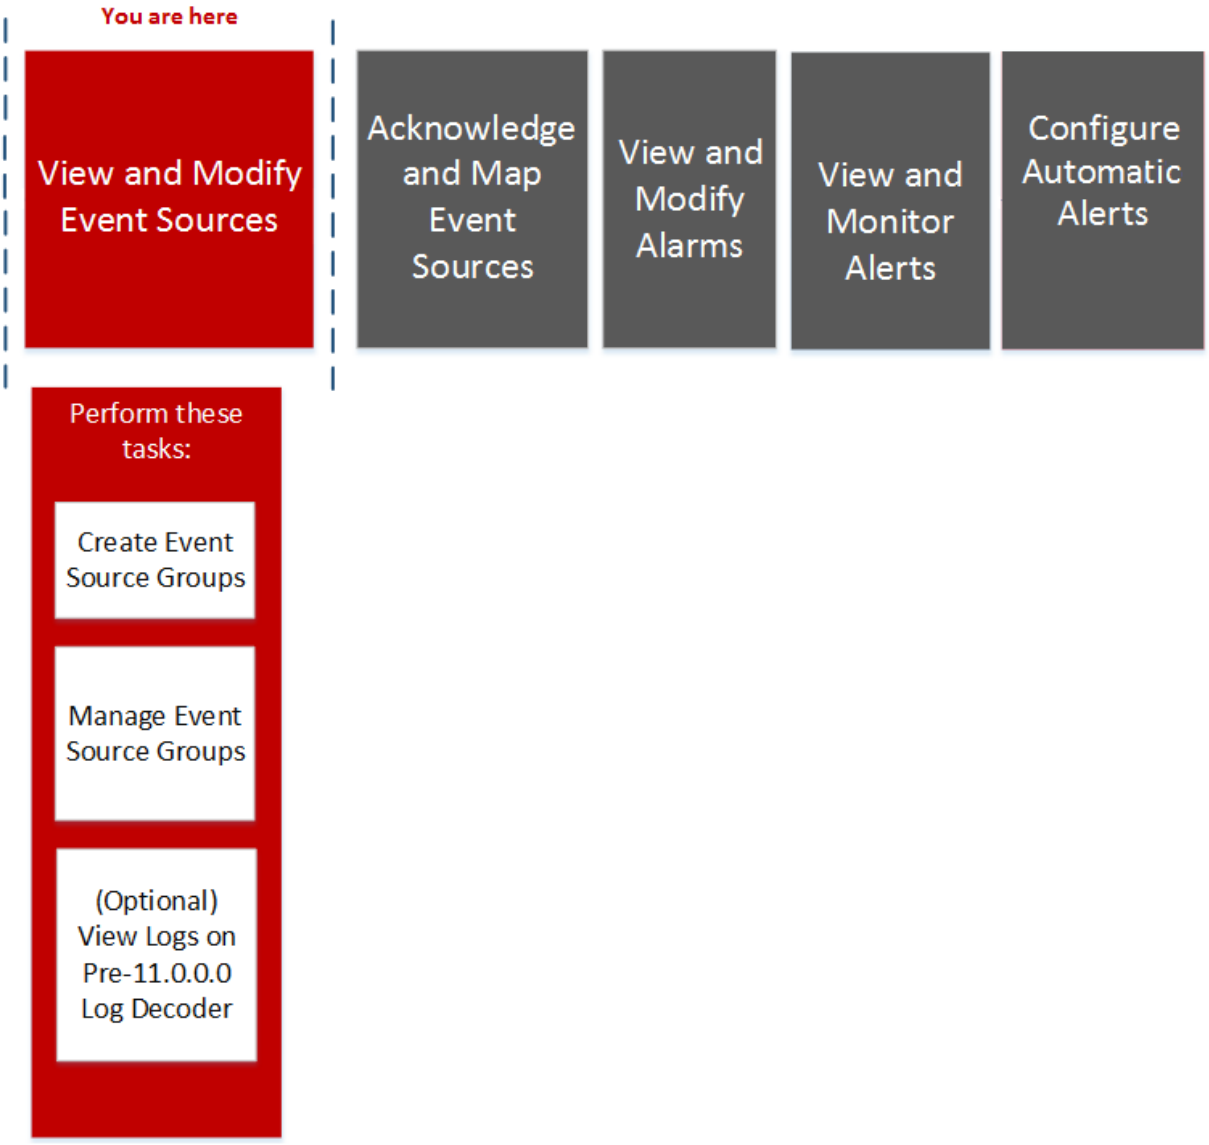
Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.

You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.

Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.



- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

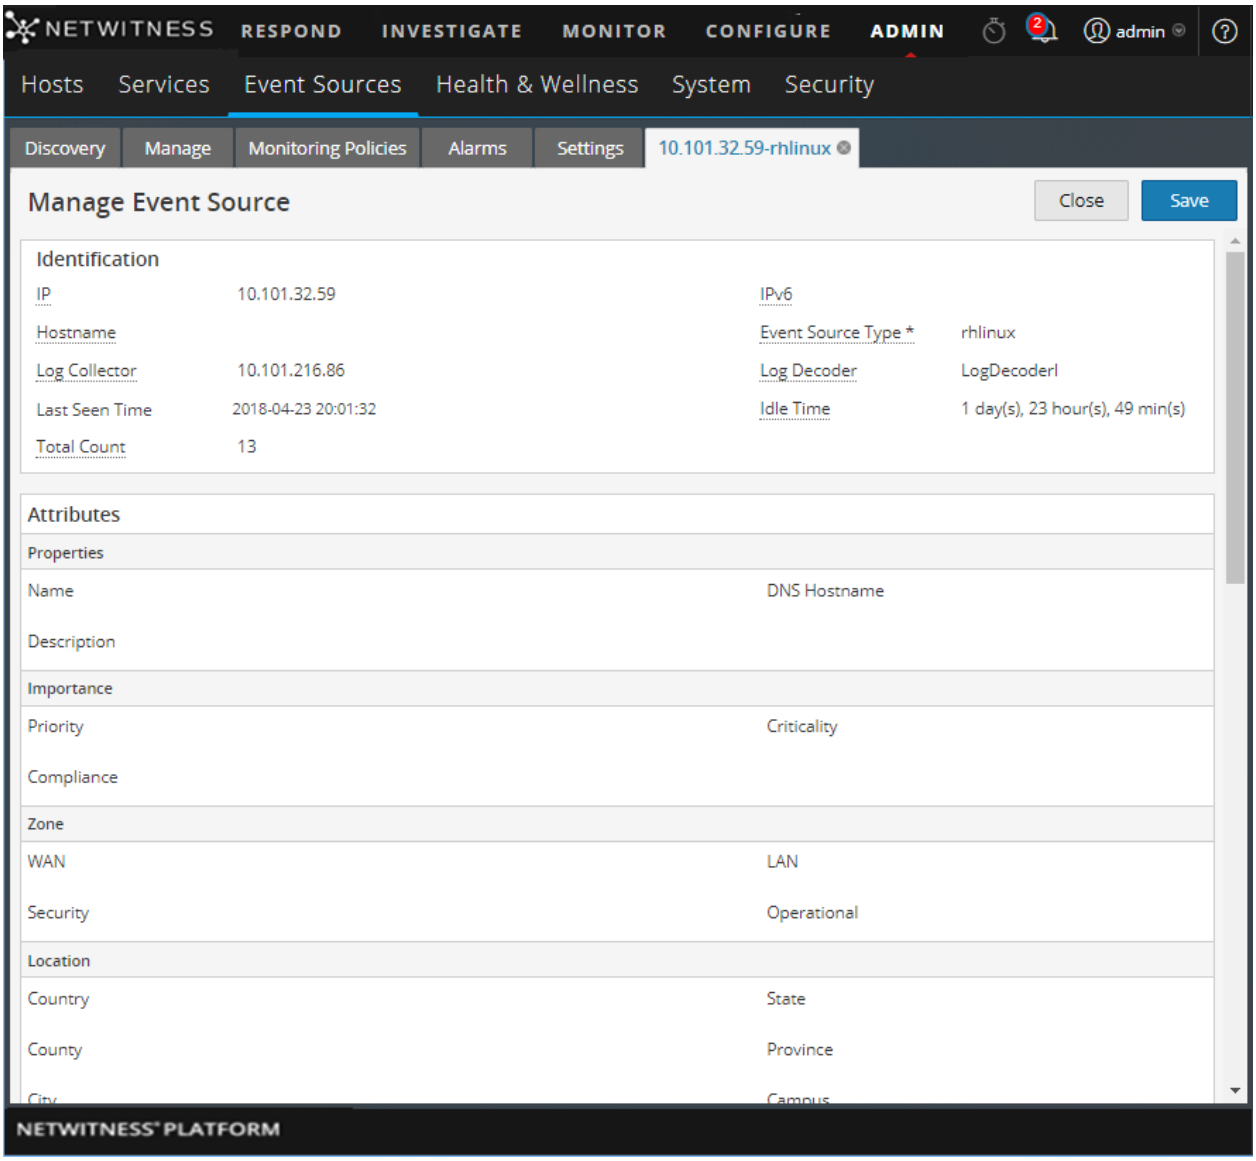
1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.

What do you want to do?

Role	I want to...	Documentation
Administrator	Create an event source group that contains all the high priority event sources.	Creating Event Source Groups
Administrator	Edit event source attributes.	Creating an Event Source and Editing Attributes



Related Topics

Creating Event Source Groups

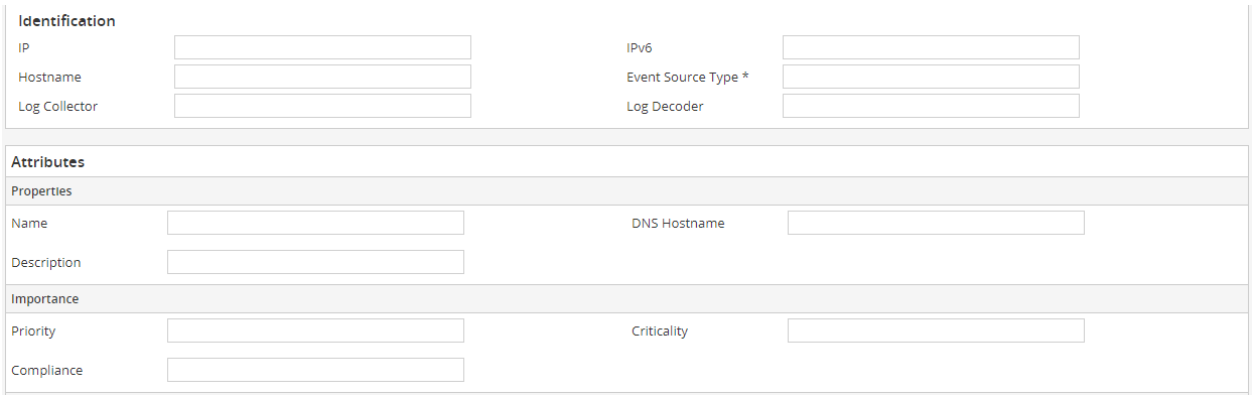
Creating an Event Source and Editing Attributes

Quick Look

This is an example of the Event Source tab:

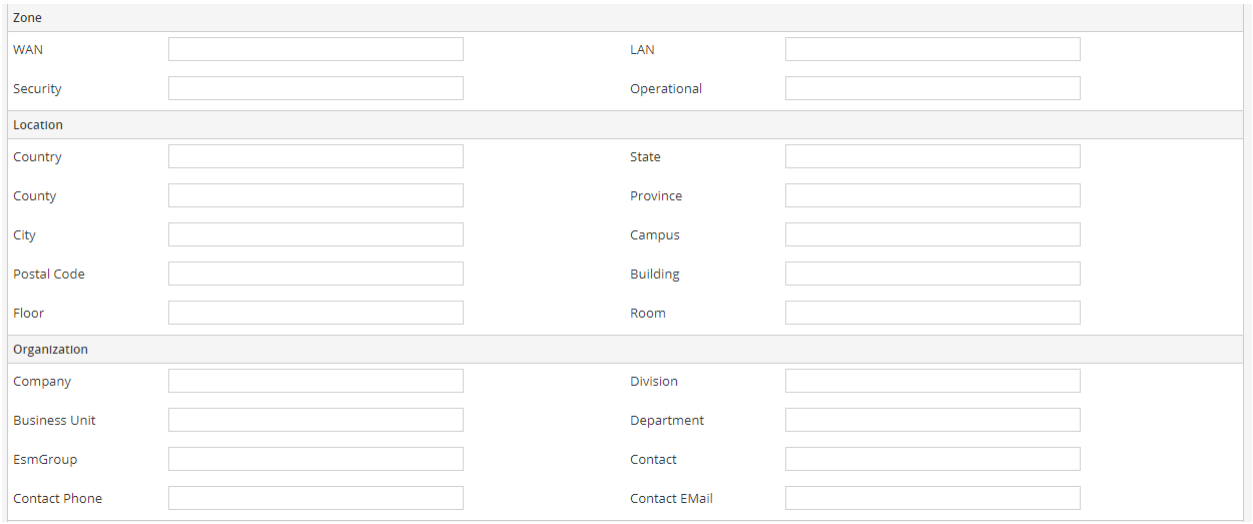
This table describes event source attribute categories.

Attribute Section	Description
Identification	These attributes are the main attributes that collectively identify an event source. You can only change these attributes when you are specifying the details for a new event source. For an existing event source, the attributes in this section are auto-populated, and cannot be changed while on this screen. Attributes available for a new event source: • IP • IPv6 • Hostname • Event Source Type • Log Collector • Log Decoder The following attributes are displayed when viewing the details for an existing event source: • Last Seen Time: this is the last time there was communication between NetWitness and the event source • Idle Time: this is the amount of time elapsed since the **Last Seen Time**. This time can be useful if you want to filter event sources that have been inactive for a certain duration. • Total Count: total count of all event sources for this **Event Source Type**.
Properties	These attributes provide the name and description. • Name • DNS Hostname • Description
Importance	These attributes can be used for grouping by priority. • Priority • Criticality • Compliance



Attribute Section	Description
Zone	These attributes can be used for grouping by zone. • WAN (Wide Area Network) • LAN (Local Area Network) • Security • Operational
Location	These attributes can be used to group by the physical or geographical location. • Country • State • County • Province • City • Campus • Postal Code • Building • Floor • Room
Organization	These attributes can be used to group by organization, and also to provide contact information. • Company • Division • Business Unit • Department • Group • Contact • Contact Phone • Contact Email
Owner	These attributes specify those responsible for the event source. • Manager • Primary Administrator • Backup Administrator

Attribute Section	Description
Physical	These attributes specify the physical properties for the event source. • Vendor • Serial Number • Asset Tag • Voltage • UPS Protected • Rack Height • Depth • BTU Output • Color
Function	These attributes can be used to group by function. • Primary Role • Sub Role 1 • Sub Role 2
System Information	These attributes specify system information. • Domain Name • System Name • Identifier • System Description
Custom	This section provides eight custom attributes, for any other attributes that your organization might need.

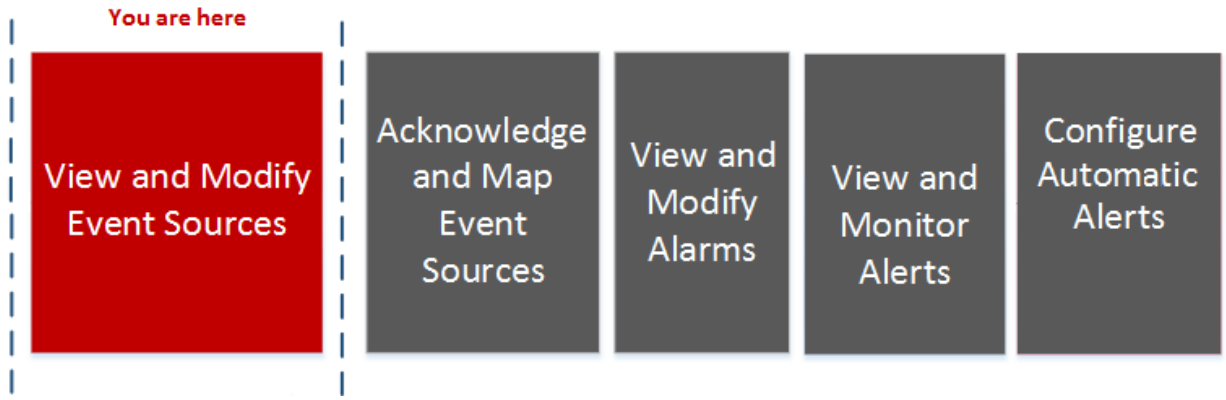


Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.

This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



Event Sources View

The Event Source Attributes panel has the following tabs.

To access this panel, go to **(Admin) > Event Sources**.

Related Topics

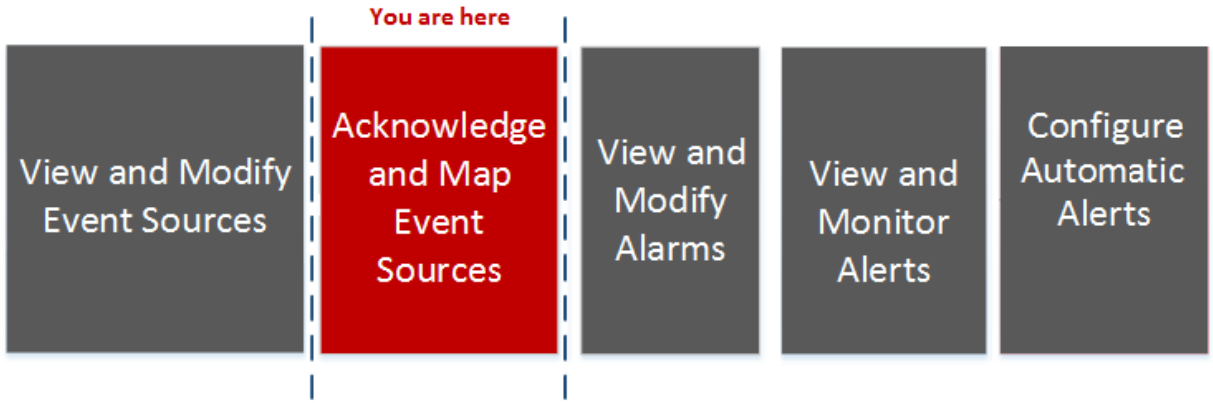
Viewing Logs from Pre-11.0 Log Decoder

Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

Note: Device logs are only available for 11.0.0.0 and above Log Decoders.



1	Displays the address of the selected Event Source.
2	Displays the potential type of the selected Event Source.
3	Displays the selected Event Source Mapping Type as Auto-Mapped, Manually Mapped, or None. Any changes to the Event Source Mapping are only displayed here.
4	Displays the discovery score for the selected Event Source type from least confident (0) to most confident (100).
5	Displays timestamps for the last few logs that have been parsed to the selected Event Source Type.
6	Displays the address of the Log Decoder that is parsing event sources.
7	Displays the discovery score of the corresponding log.
8	Displays logs for the selected Event Source type.
9	Allows you to acknowledge that all the discovered Event Source types are correct.
10	Allows you to set the appropriate parsers for selected Event Source addresses.
11	Displays the Event Source Management attributes for the selected Event Source Type.

Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

Workflow

This workflow shows the overall process for configuring event sources.

Related Topics

Viewing Logs from Pre-11.0 Log Decoder

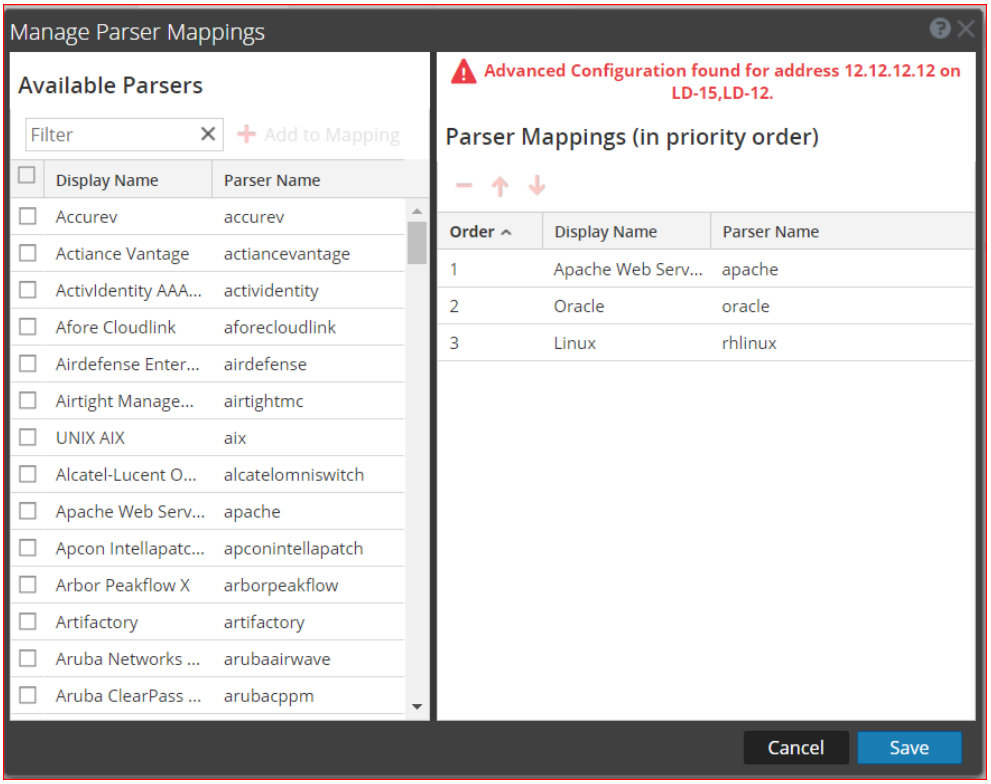
Quick Look

Note: For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

1	Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered. To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel. You need to select parsers before the **Add toMapping** button is enabled. Add the selected parser by clicking the **Add to Mapping** button in the right panel. You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key.
2	Displays the names of the selected parsers that you want to map.
3	Displays the order of the selected parser mappings. You can delete parser mappings by selecting the minus sign ( ). Press the **Ctrl** key to select multiple mappings to perform group operations on them.

4 Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner on the **Details** tab is updated to reflect the status. If mapped, the text displayed is **Mapped**.
Click **Cancel** to return to the **Details** tab.

Best Practices



When mapping multiple device types from the same event source, assign the highest priority to the strictest log parser. Conversely, a log parser with generic headers should be lowest in priority. The CEF log parser is an example of a strict log parser.

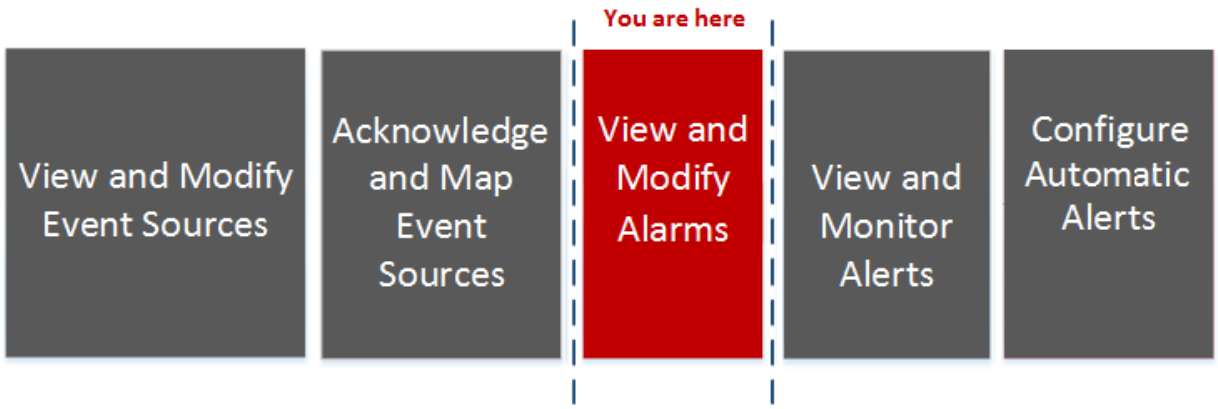
Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

Note: If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.

Alarms Tab



From the Alarms tab you can view details of the alarms that have been generated.

The Alarms tab has one panel that displays Alarm status.

To access this tab, go to (Admin) > **Event Sources** > **Alarms**.

Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.

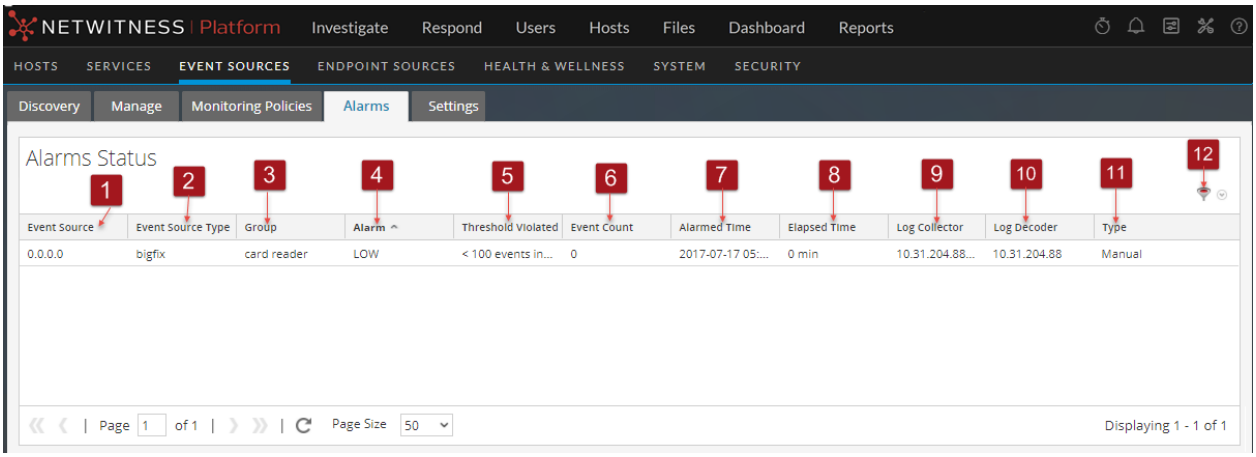
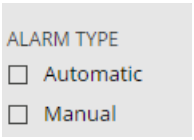
Administrator	Troubleshoot event source management.	ESM Troubleshooting & Appendix



*You can perform this task here.



Related Topics

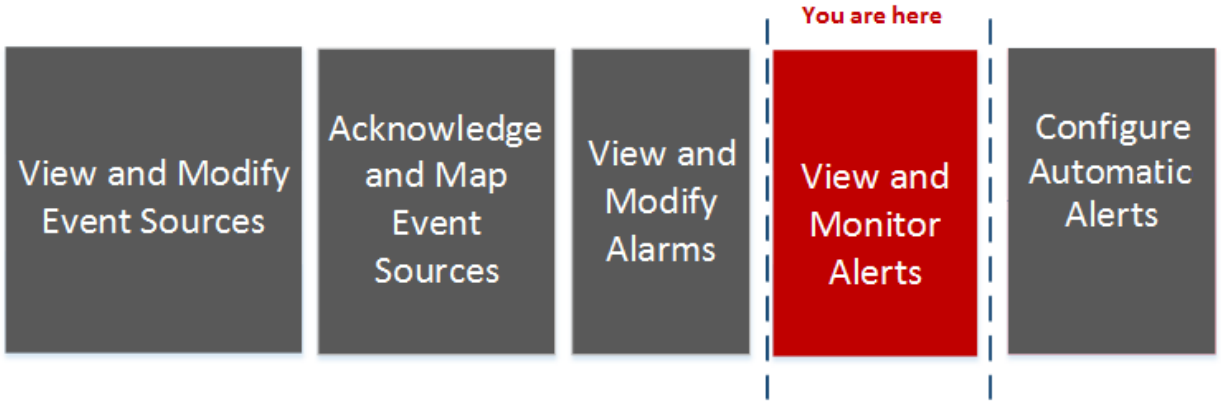
Configuring Automatic Alerting

Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. After the event source returns to a normal state, the corresponding alarm disappears from the list.

1	Displays the IP, IPv6, or Hostname of the event source that is alarmed.
2	Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux).
3	Displays the event source group that contains the event source for which the alarm has been triggered.
4	Displays the type of threshold that was triggered: **High** or **Low**
5	Displays the conditions of the threshold that was triggered. For example: `5,000,000 events in 5 minutes`
6	Displays the number of events in the threshold time period causing the alarm.
7	Displays the initial time the event source went into an alarmed state. **Note:** When you first access this view, the data is sorted by this column (most recent alarm first).
8	Displays the elapsed time since the event source entered an alarmed state.
9	Displays the Log Collector last collecting from this event source.
10	Displays the Log Decoder last receiving from this event source.
11	Displays the alarm type. Alarm type is either **Manual** or **Automatic**: • **Manual**: these are alarms that violate the configured threshold policy. • **Automatic**: these are alarms that deviate from the baseline for the alarmed event source.
12	Select the **Filter** icon to display the **Filter** menu:  Select either **Automatic** or **Manual**: • If you select **Automatic**, only the alerts that are based on baselines are displayed. • If you select **Manual**, only the alarms for which you have set thresholds are displayed.

Note: You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.



Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to (Admin) > **Event Sources** > **Monitoring Policies**.

Workflow

This workflow shows the overall process for configuring event sources.

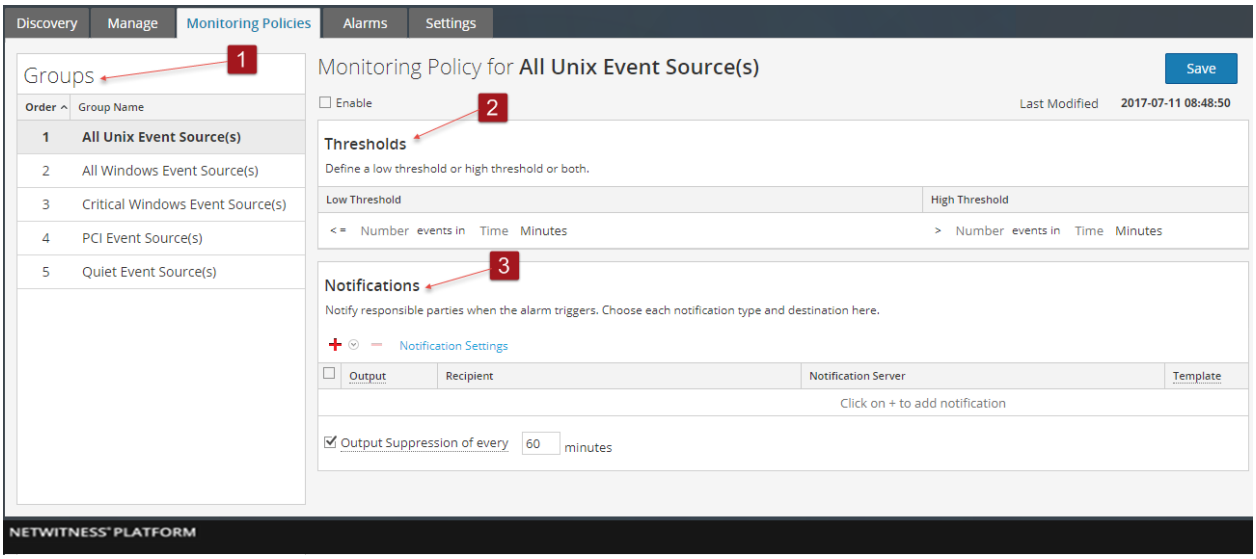
Related Topics

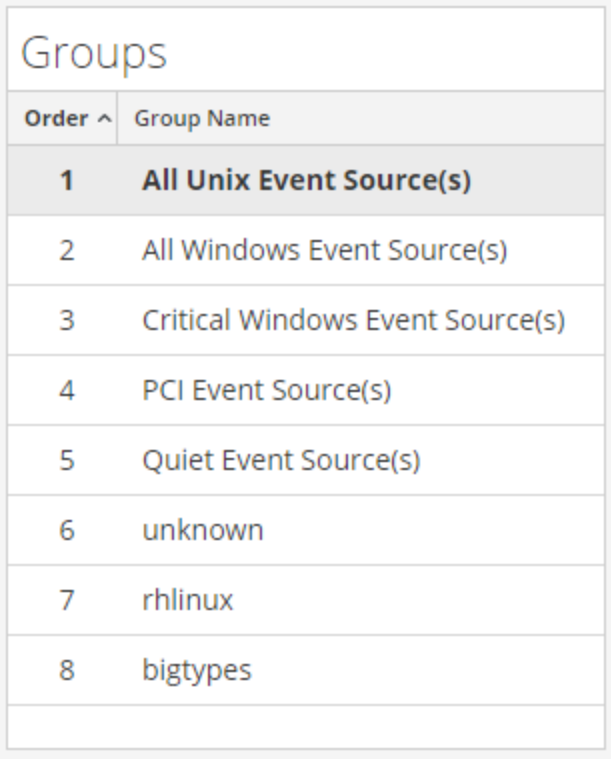
Setting Up Notifications



Disabling Notifications

Quick Look

The **Monitoring Policies** tab consists of three panels:



- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.

1 Displays the Groups panel.
2 Displays the Thresholds panel.
3 Displays the Notifications panel.

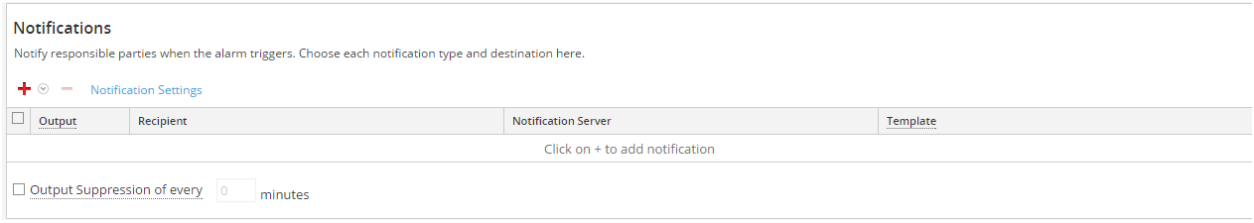
Event Groups Panel

The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

Thresholds Panel

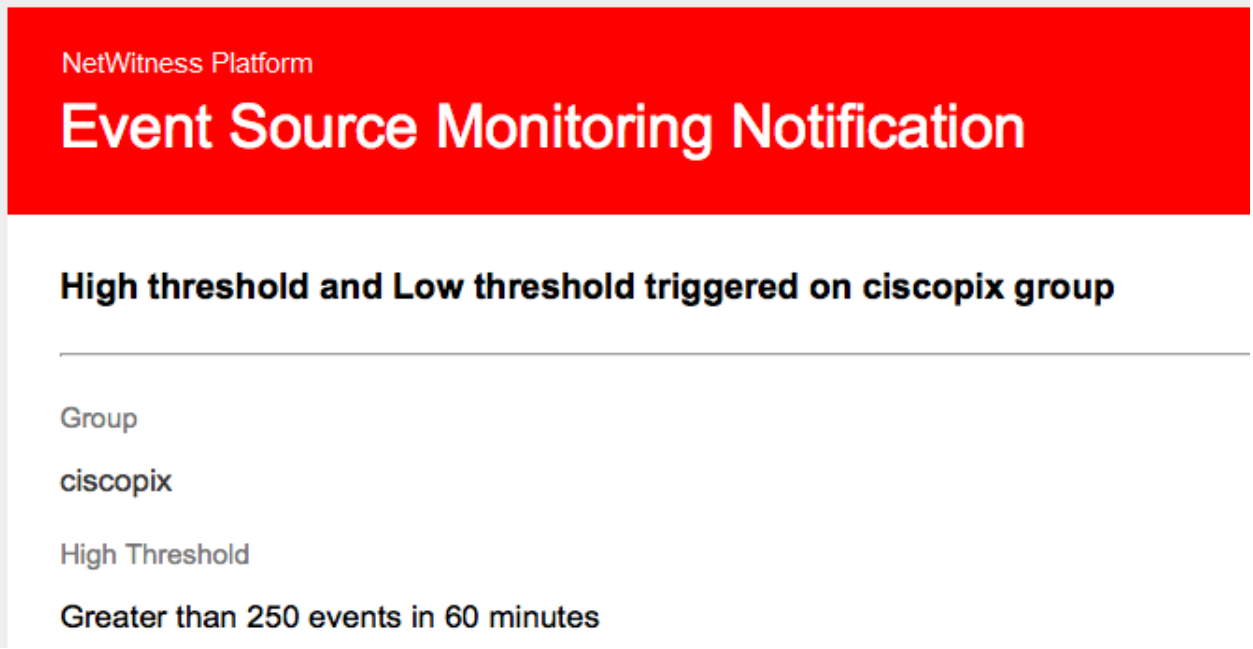
This is an example of the Thresholds panel for an event source group.



The Thresholds Panel contains the following features.

Feature	Description
Enable	The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring. **Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy. If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications. See below for more details on the look of notifications.
Low number of events Low number of minutes or hours	This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent.
High number of events High number of minutes or hours	Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent.
Last Modified date and time	This field indicates the last time and date that the thresholds were changed.
Save	Saves the changes you have made to the thresholds.

Notifications Panel



This is an example of the Notifications panel for an event source group.

The following table describes the fields on the Notifications panel

Field	Description
Tools + -	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification • **Remove (-)**: removes the selected row from the list.
Notification Settings	Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness.
Type	Displays the type of the notification that you have chosen. The available options are as follows: • Email • SNMP • Syslog
Notification	See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details.
Notification Server	See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details
Template	For Event Source Management, NetWitness provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization: • **Email template**: sends notifications to the specified email addresses. • **SNMP template**: sends notifications to the specified SNMP server • **Syslog** template: sends notifications to the specified Syslog server. See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details.
Output Suppression	Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time.

The following are sample notifications, based on the supplied Templates.

- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```
11-11-2015 11:57:33 Local7.Debug 127.0.0.1 community=public,
enterprise=1.3.6.1.4.1.36807.1.20.1, uptime=104313, agent_
ip=10.251.37.92, version=Ver2, 1.3.6.1.4.1.36807.1.20.1="NetWitness
Event Source Monitoring Notification:

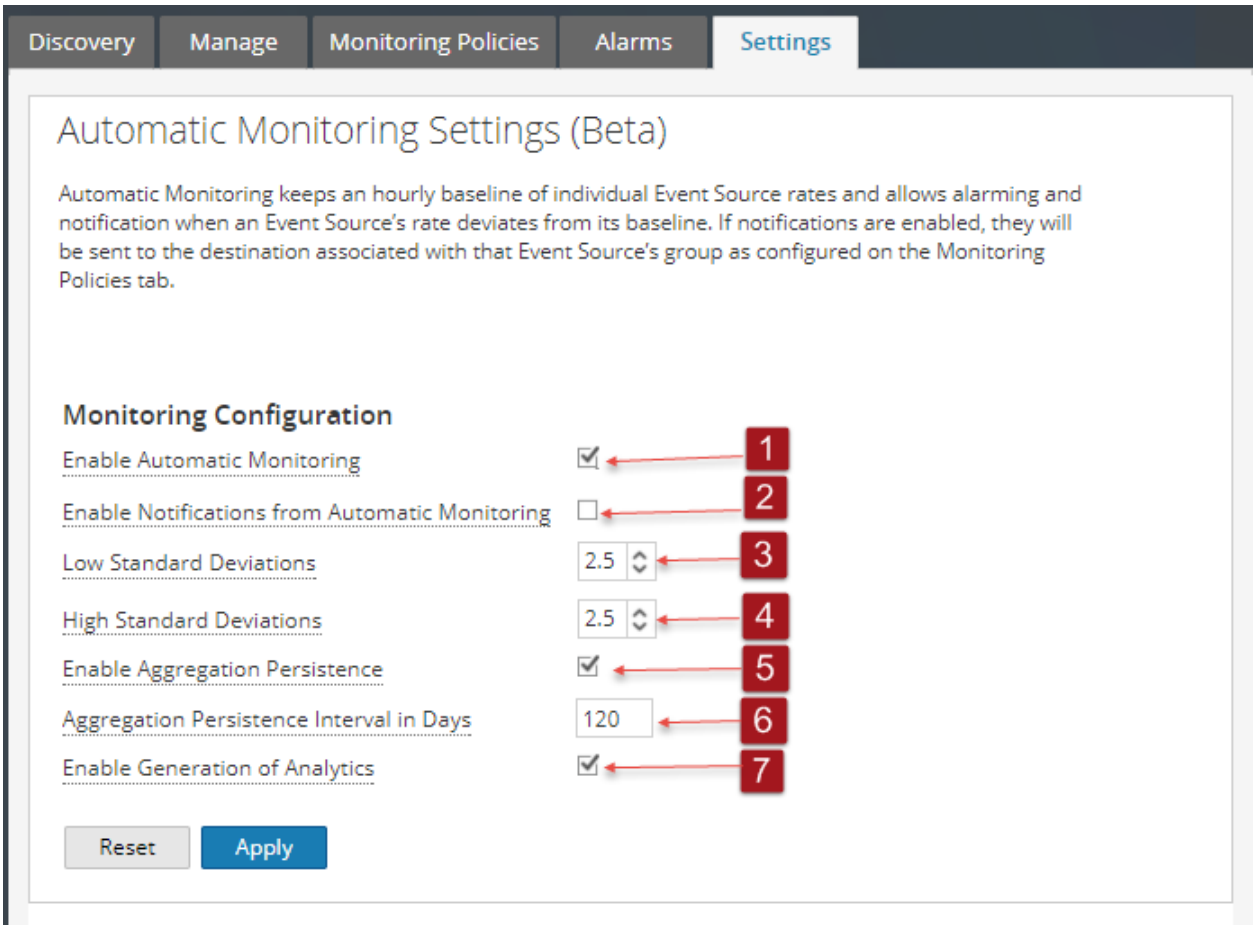
Automatic Alerting

Disabling Notifications

Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

About Automatic Alerting



You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Note: Automatic alerting, and it settings, are currently in Beta testing.

1	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
2	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
3	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
4	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
5	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
6	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
7	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source.

Note, however, the event source address and type is anonymized, so only your event rate information is revealed.

Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

8 The **Reset** option discards any unsaved changes for all settings on the page.

9 Click **Apply** to save any changes you made to the values on the page.

Features

The Settings tab contains the following features.

Feature	Description
Enable Automatic Monitoring	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
Enable Notifications From Automatic Monitoring	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
Low Standard Deviations	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
High Standard Deviations	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
Enable Aggregation Persistence	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
Aggregation Persistence Interval in Days	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source

Feature	Description
Enable Generation of Analytics	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality
Reset	This option discards any unsaved changes for all settings on the page.
Apply	Click **Apply** to save any changes you made to the values on the page.

ESM Troubleshooting & Appendix

Troubleshooting Topics:

- Alarms and Notifications Issues
- Duplicate Log Messages
- Troubleshooting Feeds
- Import File Issues
- Negative Policy Numbering

Appendix: Viewing Logs from Pre-11.0 Log Decoder

Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Settings** tab ((Admin) > Event Sources > Settings), and is selected by default. However, at some point someone may have cleared this option.

Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs.

Much of the preliminary configuration for Notifications is done from **(Admin) > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to  (Admin) **> Event Sources > Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely because it
exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.
   b. Click **decoder(*)** to view the properties for the decoder.
   c. In the Properties drop-down menu, select **reset**, then click **Send**.
4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.
5. Start the collectd service:
   ```
   service collectd start
   ```

Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness.

After the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

After the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

10.5 Log Decoders

Are your NetWitness Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

```
/opt/rsa/sms/esmfeed.zip
```

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

```
http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain
```

This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4 count=338
lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-Feb-04
22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304 source=5.6.7.8
count=1301 lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-
Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages:
`/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed:
Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have
al-least on group with at least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip
archive "/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not
be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On Log Decoders add **debug "true"** flag in in **/etc/collectd.d/logdecoder-esm.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

   ```
   tail –f /var/log/messages | grep collectd
   ```

   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

   ```
   Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
   error getting ESM data for field "groups" from logstat device=checkpointfw1
   forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
   NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting
   ESM data for field "forwarder" from logstat device=apachetomcat
   source=10.31.204.240. Reason: <reason>
   ```

ESMAggregator

1. On NetWitness, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

   ```
   # ESMAggregator module collectd.conf configuration file
   #
   # Copyright (c) 2014 RSA The Security Divsion of EMC
   #
   <Plugin generic_cpp>
   PluginModulePath "/usr/lib64/collectd"
   <Module "ESMAggregator">
           verbose 1
           interval "60"
           cache_save_interval "600"
           persistence_dir "/var/lib/netwitness/collectd"
   </Module>
   </Plugin>
   ```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run “tail –f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[1]

logdecoders = 767354a8-5e84-4317-bc6a-52e4f4d8bfff
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[4]
utcLastUpdate = 1425174470
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: Dispatching
RRD stat NWAPPLIANCE15788/esma_rrd-cacheflowelff/esm_counter-3.3.3.3 with a
value of 1752 for NWAPPLIANCE15788/cacheflowelff/esm_counter-3.3.3.3
aggregated from 1 log
```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

To change the feed generator job interval:

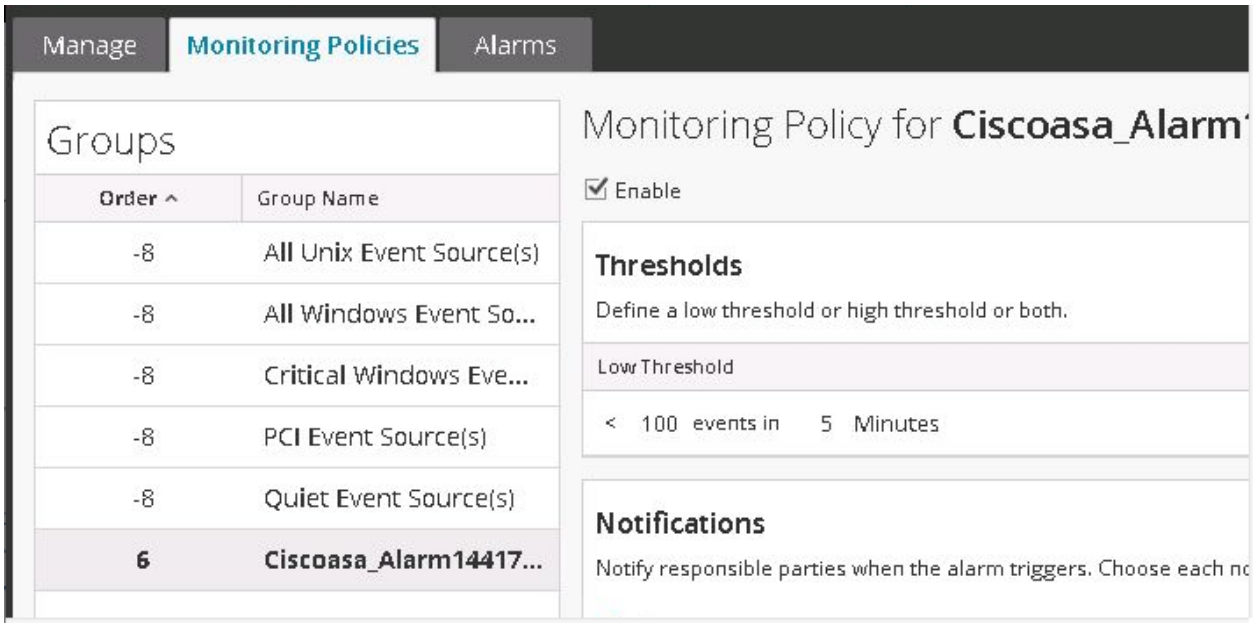
1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:



- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

Details

The following screen shows an example of the situation where the numbers of group policies become negative.

If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

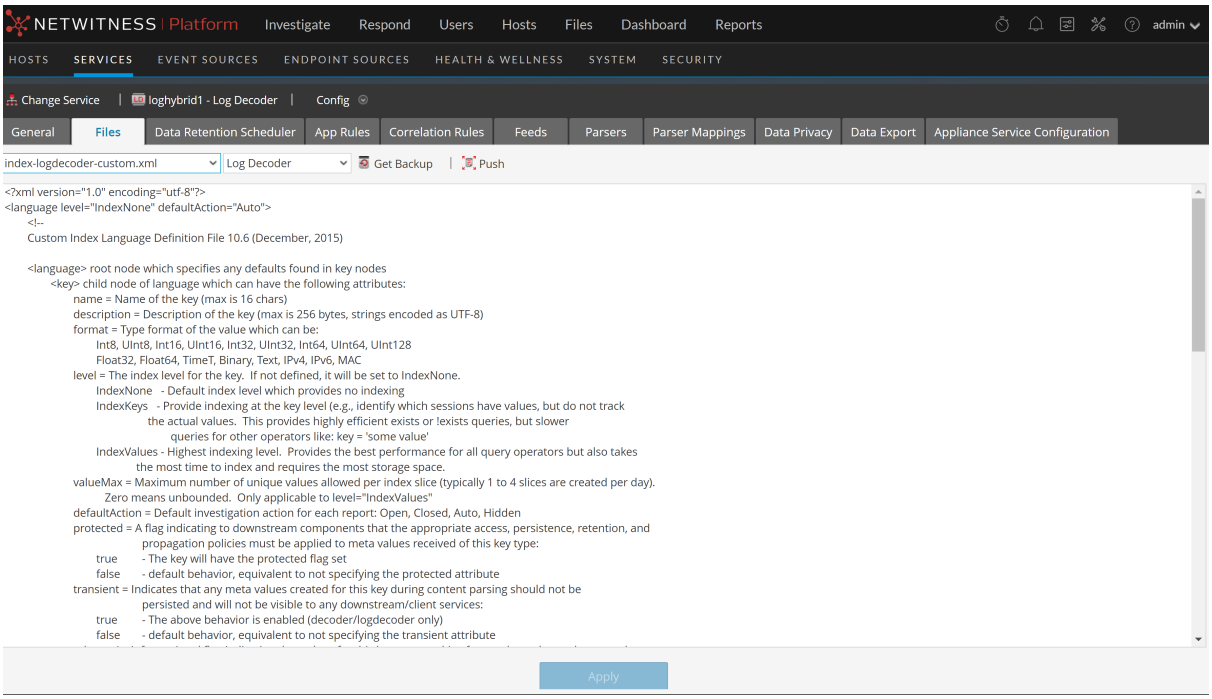
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`

   b. Click **decoder(*)** to view the properties for the decoder.

   c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Viewing Logs from Pre-11.0 Log Decoder



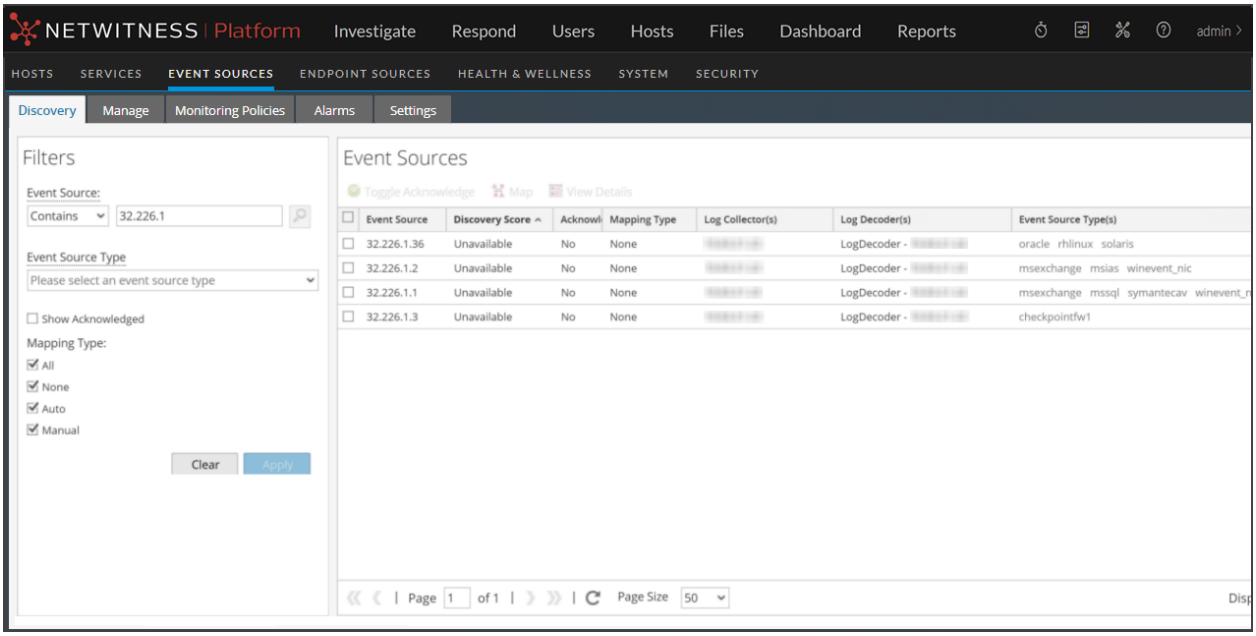
NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to  **(Admin) > Services >** select a Log Decoder, then select  **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

   ```
   <key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device Host" level="IndexValues" name="device.host" format="Text"
   valueMax="100000" defaultAction="Open"/>
   ```

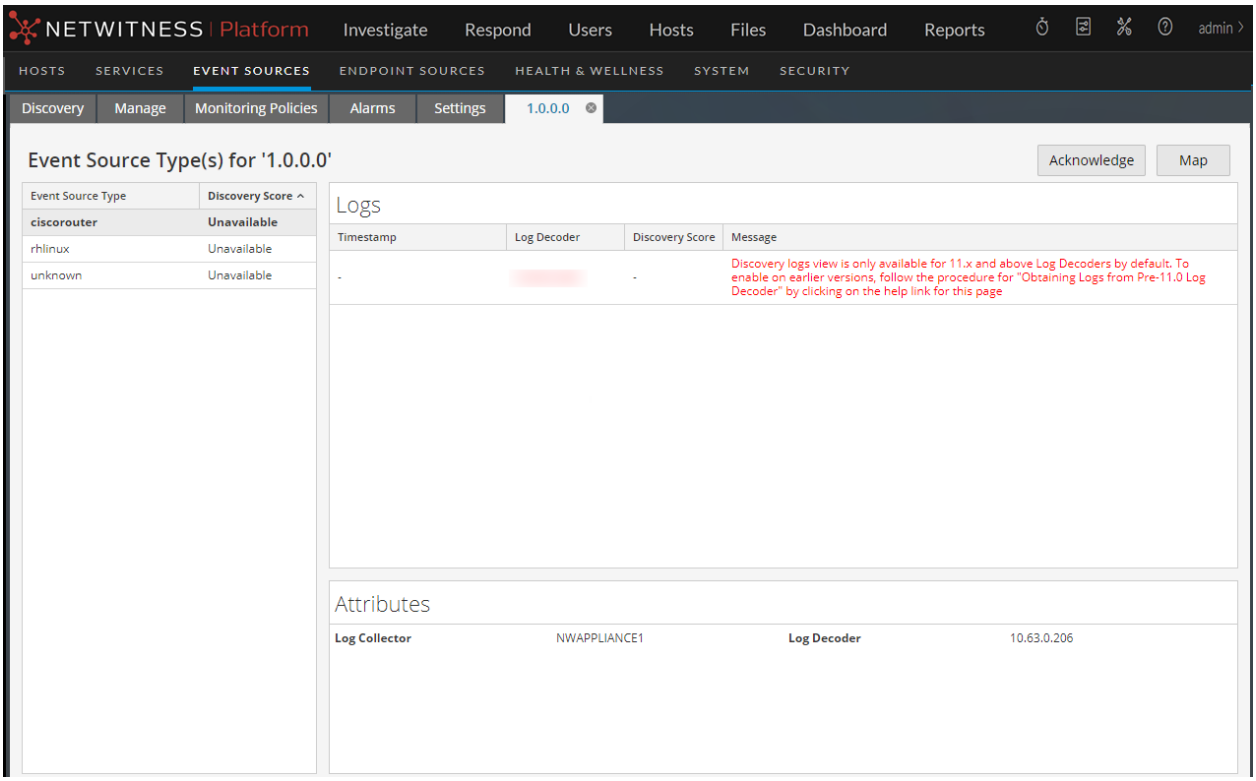
4. Click **Apply**.



5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.



Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.

Note: Device logs are only available for 11.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0 Log Decoder.

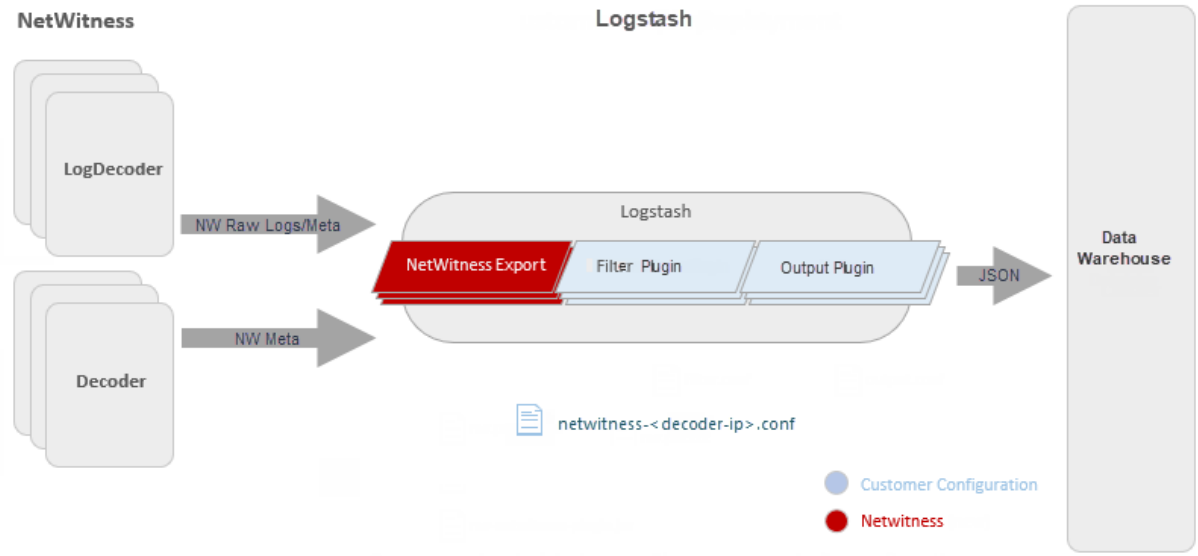
Overview

The NetWitness Export Connector is an input plugin for Logstash, used to export NetWitness Platform events and routes the data where you want, all in continuous, streaming fashion. Giving you the flexibility to unlock a variety of downstream use cases.



This plugin is installed on Logstash and integrates with NetWitness Decoders and Log Decoders. This plugin aggregates meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object, which can easily integrate with numerous consumers such as Kafka, AWS S3, TCP, Elastic and others.

Install NetWitness Export Connector on the Logstash service. To activate the connector, restart the Logstash service.

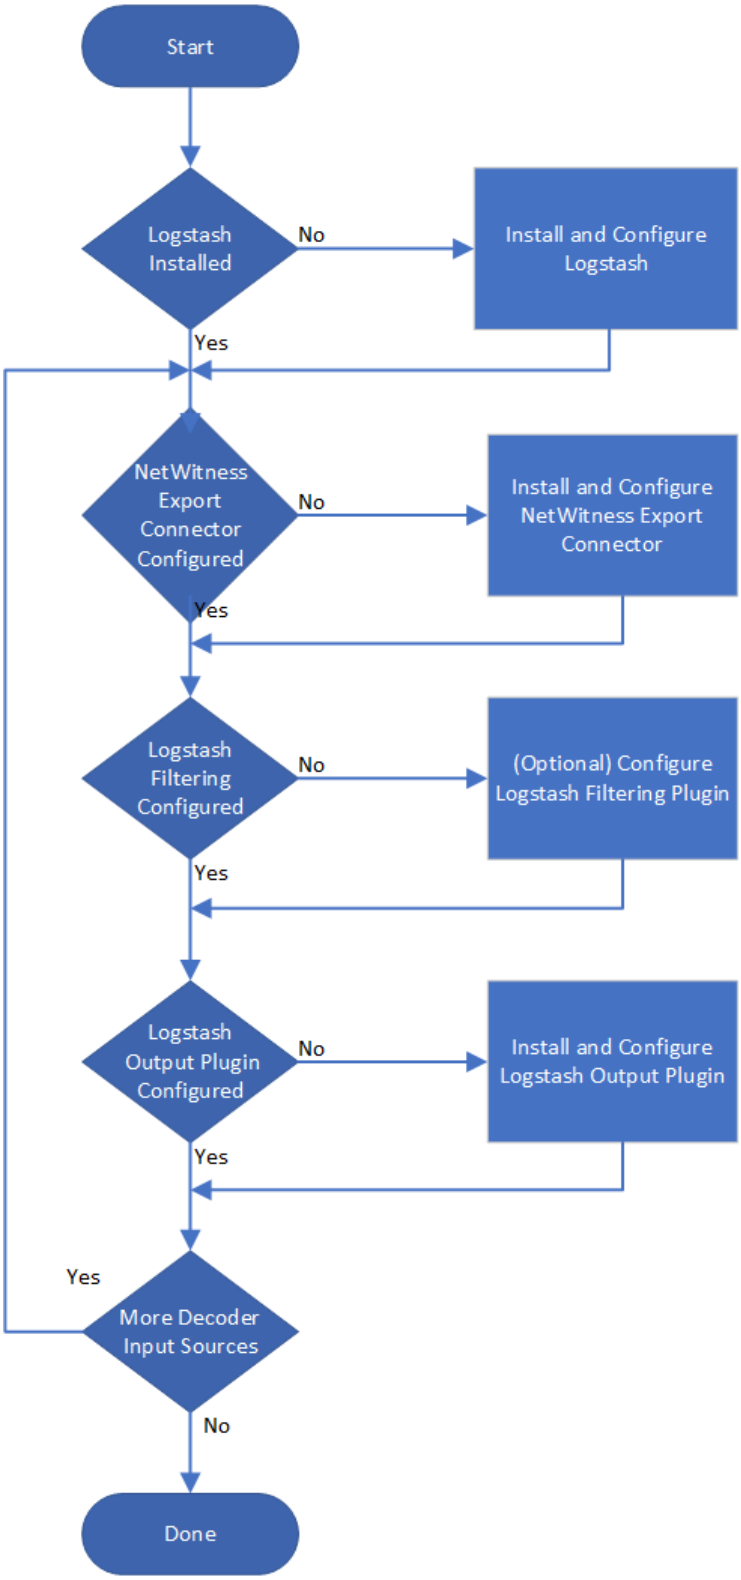
Note: From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see "Configure Logstash Event Sources in NetWitness" in the *Log Collection Configuration Guide*.

Work Flow of NetWitness Export Connector

Following diagram shows how NetWitness Export Connector works.

There are of three plugins available that helps with export.

- Input plugin
- Filter plugin (optional)
- Output plugin



1. The Input plugin collects the events from the event sources. You must install the NetWitness Export Connector to collect events from Decoder or Log Decoder. The NetWitness Export Connector uses NetWitness API that collects the following data and forwards it as Logstash messages.
   - Meta data and raw log data from the Decoder
   - Meta data from Log Decoder

The data is then forwarded to the Filter plugin.

2. (Optional) The Filter plugin adds, removes, or modifies the received data and forwards it to the Output plugin. You can use the standard Logstash filter plugins to add, remove, or modify the data.
3. The Output plugin sends the processed event data to the data warehouse destinations. You can use the standard Logstash output plugins to send the data.

Configuration Process

The following flowchart describes the steps to configure NetWitness Export Connector.

VM Sizing Recommendations

It is recommended to install the Logstash and the NetWitness Export Connector in an independent VM (Virtual Machine) deployment. Following are the requirements for different variations of EPS (Events Per Second).

Total VM Memory: Set an additional 4GB memory for the JVM (Java Virtual Machine) memory mentioned in the following table for the respective EPS. For Example, for 5K EPS, the JVM memory required is 4GB, the total VM memory must be set to 8 GB.

JVM Memory: The Xms and Xmx for the Logstash service must be set to the same value as shown in the table. You can update the JVM settings for Logstash in the `/etc/logstash/jvm.options` file. For more information, see JVM Settings documentation.

For more info, https://www.elastic.co/guide/en/logstash/7.x/jvm-settings.html

vCPUs: The vCPUs values that are shown is required only for NetWitness Export Connector to be functional for respective EPS. It is recommended to add extra 4 CPUs for other OS (Operating System) services. The recommended vCPU specifications for all the EPS listed in the following tables are: Intel Xeon CPU @2.6 Ghz.

Note: The above recommendations is valid only if the VM instance is completely dedicated for Logstash deployment.
The resources consumption is dependent on cumulative EPS irrespective of number of sources. For Example, if you have three Decoders of 5000 EPS each, the cumulative EPS is 15000 as a result we can use the sizing option of 15000 EPS instead of 5000 EPS 3 times.

Log Decoder

- Metadata over SSL (~50 meta keys)

EPS	vCPUs	JVM Memory
5000	4	4 GB
10000	4	4 GB
15000	8	8 GB
20000	8	8 GB
25000	14	12 GB
30000	14	12 GB
60000	16	32 GB

- Metadata over SSL (~140 meta keys)

EPS	vCPUs	JVM Memory
5000	8	4 GB
10000	11	4 GB
15000	14	8 GB
20000	17	12 GB
25000	19	16 GB
30000	19	16 GB

- Meta data and raw logs over SSL (~50 meta keys)

EPS	vCPUs	JVM Memory
5000	4	4 GB
10000	8	4 GB
15000	10	8 GB
20000	12	12 GB
25000	15	24 GB
30000	18	24 GB
60000	23	48 GB

- Meta data and raw logs over SSL (~140 meta keys)

EPS	vCPUs	JVM Memory
5000	8	4 GB
10000	10	8 GB
15000	17	10 GB
20000	19	16 GB
25000	20	32 GB
30000	20	32 GB

Network Decoder

- Meta data over SSL

EPS	vCPUs	JVM Memory
500 Mbps	4	2 GB
1 Gbps	4	2 GB
1.5 Gbps	8	4 GB
2 Gbps	8	4 GB
3.4 Gbps	12	8 GB
6 Gbps (10G Decoder)	12	24 GB
8 Gbps	15	32 GB
9.4 Gbps	15	48 GB

Install Logstash

IMPORTANT: Ensure that you follow all the security-related best practices and guidelines outlined in the Logstash documentation to avoid any potential security risks.

The NetWitness Export Connector is an input plugin for Logstash. Hence, installation of Logstash is important for NetWitness Export Connector to work. For more information, see the Overview section.

You can install the open source version of Logstash (OSS) or the paid version (Elastic). The supported version is Logstash 7.6.2.

Information on released versions of Logstash is available at Logstash Reference.

Note: It is recommended to install the Logstash service in CentOS operating system for better results.

Do the following steps to Install the Logstash.

1. Install the service: Installing Logstash
2. After installation, set Logstash to run as a service: Running Logstash
3. Enable Logstash to start when the system boots up: https://www.unix.com/man-page/centos/1/systemctl/

If you are using CentOS, make a note of the following:

- Logstash logs are stored in `/var/log/logstash/logstash-plain.log`
- If you install Logstash using rpm install, make sure it installs as logstash user and folders get created with the same user and **not** the root user.

Troubleshooting

For Generic Troubleshooting Instructions for Logstash, see Logstash Troubleshooting.

Install NetWitness Export Connector

Note: From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see "Configure Logstash Event Sources in NetWitness" in the *Log Collection Configuration Guide*.

Do the following steps to install NetWitness Export Connector .

1. Download the offline installer from NetWitness Link in the following location: NetWitness Export Connector Installer.
2. Copy the downloaded NetWitness ZIP archive to the system where Logstash runs.
3. Open a command prompt and run the following command to change directory to Logstash home.
   `cd /usr/share/logstash`
4. Check the status of the Logstash service by running the following command.
   `systemctl status logstash`
5. Stop the Logstash service by running the following command.
   `systemctl stop logstash`
6. Install the NetWitness Export Connector by running the following command.
   `bin/logstash-plugin install file:///<path-to-file>/netwitness-export-connector-x.x.x.zip`
7. Make sure that all the required configuration files (`netwitness-<decoder-ip>-input.conf`) are available in the following folder.
   `/etc/logstash/conf.d/`
8. Start the Logstash service by running the following command.
   `systemctl start logstash`

Configure NetWitness Export Connector

Note: Make sure you open the firewall of the Decoder or Log Decoder to establish connection with the Logstash. For more information, see "Network Architecture and Ports" in *Deployment Guide forNetWitness*.

You must configure the Logstash configuration file to process the NetWitness events. Create a Logstash configuration file and add the NetWitness Export Connector plugin parameter settings for event processing. Save the file as `netwitness-<decoder-ip>-input.conf`. After adding the NetWitness Export Connector plugin parameter settings, place the configuration file in `/etc/logstash/conf.d/` location.

A Logstash configuration file can have three separate sections for each type of plugin that you want to add to the event processing pipeline. The first section is for Input plugin (NetWitness Export Connector), the second section is for Filter plugin (optional) and the third section is for Output plugin.

To configure the NetWitness Export Connector plugin, add the parameter settings in the first section the Logstash configuration file.

For multiple pipelines configuration, see Multiple Pipelines Configuration documentation.

The configuration of each NetWitness Export Connector plugin must consist of the plugin name followed by a block of parameter settings for that plugin. If the NetWitness Export Connector has multiple plugins with block of parameters, they are applied in the order of their appearance.

The following is an example of NetWitness Export Connector with one plugin instance with block of parameter settings which fetches data from a single decoder .

```
input {
 netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
}
```

The following is an example of NetWitness Export Connector with two plugin instances with block of parameter settings which fetches data from two different decoders. Each plugin in the configuration is applied in the order as shown.

```
input {
 netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
}
```

Note: When configuring the Logstash, you may need to specify sensitive settings such as passwords. You can use the Logstash keystore to securely store secret values instead of file system permissions for using it in configuration settings. For more information, see Logstash keystore Documentation.

Following are the parameters accepted by NetWitness Export Connector.

Parameter	Description	Parameter Type	Default Value
host	IP address or hostname of the Decoder or Log Decoder (mandatory)	String	N/A
username	Username used to access the Decoder or Log Decoder (mandatory)	String	N/A
password	Password of the user (mandatory)	String	N/A
decoder_type	Accepts only 'decoder' or 'logdecoder' (mandatory)	String	N/A
ssl_enable	Enable SSL connection between the Decoders and the NetWitness Export Connector. For more information, see Configure SSL	Boolean	false
ssl_certificate_path	Path of the CA certificate that is used for SSL and Trusted Connections		/etc/pki/nw/trust/truststore.pem
ssl_certificate_password	Password of the certificate in use. Mandatory if SSL is enabled	String	N/A
ssl_client_certificate_path	Client's SSL certificate		/etc/pki/nw/node/node-cert.pem
ssl_version	Version of the SSL connection	String	TLSv1.2
plugin_metrics_enable	Enables metrics reporting to Elastic (New Health and Wellness), for more information see Health and Wellness	Boolean	false
elastic_host	IP address or hostname of the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
elastic_port	Port number of the Elastic host	String	9200

Parameter	Description	Parameter Type	Default Value
elastic_username	The username that is used to access the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
elastic_password	The password that is used to access the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
meta_include	Aggregates only the meta keys that are added in this parameter setting. Accepts comma separated values (csv) format	String	nil
meta_exclude	Excludes the meta keys that are added in this parameter setting from aggregation. Accepts comma separated values (csv) format	String	nil
start_session	Session from which the aggregation starts. Setting the value to 0 starts the aggregation from `last.session.id` in the Decoder	Number	0
export_log	Includes the raw log with the meta in the session (applicable only for Log Decoder aggregation)	Boolean	false
aggregate_ sessions	Number of sessions ingested in a batch from the Decoders	Number	1000
aggregation_ interval	Time interval (in milliseconds) between two event cycles	Number	1000
prefetch_count	Controls the number of batches to be pulled into the buffer that is available for the plugin to collect	Number	2

Parameter	Description	Parameter Type	Default Value
compression	The number of bytes in each message before message is compressed. Setting the value to '0' does not allow compression. Ranges between 0 to 131071	Number	0
compression_ level	The level of compression. Ranges between 0 to 9 where 1 is fastest and 9 has the better compression. A value of 0 selects the best balance between speed and compression	Number	6
buffer_size	Controls the number of records that the stream in the buffer before it is ingested	Number	40000
position_ tracking_path	Path where the last consumed session id is stored. Default storage location is `/var/lib/logstash`. For more information, see Position tracking and start session	String	`/var/lib/logstash`
custom_meta_ config_path	Path to the custom multivalued meta configuration file. For more information, see Configuring Custom Multi-valued Meta	String	nil
Query	Takes any NetWitness Platform query as Input **Note:** Only Indexed meta key must be the part of the query. For example, select `* where device.type = 'rhlinux'`	String	Select *

Position tracking and start session

Position tracking or bookmarking is used to track the sessions that are aggregated by logstash and sent to the consumer. Position tracking initiates automatically and updates the tracking file every 60 seconds in the path mentioned in `position_tracking_path` parameter in the configuration file. The file consists of two parts `[sessionid,timestamp]`. Default location is `/var/lib/logstash`, if it is not mentioned in the configuration file.

The `start_session` parameter accepts a number (long: primitive datatype) and indicates which is the first `sessionid` the plugin should request from its corresponding source. if the `start_session` parameter is not mentioned in the configuration file or if the value is mentioned as 0, the first session requested by the plugin will be the `last.session.id + 1`, `last_session_id` as in the decoder's REST API `/database/stats/last.seesion.id`.

if the position tracking file exists for a source and `start_session` is not configured or the `start_session` is set as value 0, the plugin with initiate aggregation from the `sessionid` indicated in the position tracking file.

if the position tracking file exists for a source and the `start_session` is set as non-zero value, the `start_session` value will take precedence over the position tracking file. The plugin will request from the session mentioned in the `start_session` parameter onwards.

Configure SSL

Note: When configuring the Logstash, you may need to specify sensitive settings such as passwords. You can use the Logstash keystore to securely store secret values instead of file system permissions for using it in configuration settings. For more information, see Logstash keystore Documentation.

To support trusted connections, the Decoder or Log Decoder has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

To establish trusted connection for the Decoder or Log Decoder with Logstash, add the following parameters in the Logstash Configuration file (`netwitness-<decoder-ip>-input.conf`) to enable the SSL mode.

Parameters	Settings	Parameter Type	Default Value
ssl_enable	Set the value to 'true' to enable SSL	Boolean	false
ssl_certificate_path	Enter the path of the Logstash keystore file. The keystore file must be in `.p12` format	String	N/A
ssl_certificate_password	Enter the password of the keystore	String	N/A

Certificate and Keystore

The NetWitness Export Connector must have a valid CA (Certificate Authority) certificate and a server certificate to establish a trusted connection with Decoders or Log Decoders.

Create a CA certificate

To create a CA certificate, do the following steps.

1. SSH to NW Logstash host.
2. Change the directory to /root by running the following command.
   `cd /root`
3. Create a private key of 2048 bits by running the following command.
   `openssl genrsa -out CA-key.pem 2048`
4. Create a CA certificate by running the following command.
   `openssl req -new -key CA-key.pem -x509 -days 1000 -out CA-cert.pem`

Create Certificate Signing Request (CSR) and Keystore

Do the following steps provided in this procedure to create a CSR for server and Keystore for the NetWitness Export Connector. You must submit the CSR to the Certificate Authority (CA) server to obtain a server certificate. Once the server certificate is created, do the following steps to package the private key and the signed certificate that must be uploaded to the Logstash keystore.

To create a CSR, do the following steps.

Note: You can skip till step 6 if you have PEM already available.

1. SSH to NW Logstash host.
2. Change the directory to /root by running the following command.
   `cd /root`
3. Create a private key of 2048 bits by running the following command.
   `openssl genrsa -out server-key.pem 2048`
4. Create a CSR by running the following command.
   `openssl req -new -key server-key.pem -out signingReq.csr`
5. Submit the CSR to the CA and get a signed server certificate by running the following command.
   `openssl x509 -req -days 1000 -in signingReq.csr -CA CA-cert.pem -CAkey CA-key.pem -CAcreateserial -out server-cert.pem`
6. Create a Keystore for the NetWitness Export Connector by running the following command.
   `- openssl pkcs12 -export -in server-cert.pem -inkey server-key.pem -certfile CA-cert.pem -out logstash-input-netwitness.p12`
7. Copy the `/etc/pki/nw/trust/truststore.pem` from the Decoder or Log Decoder to the Logstash host by running the following command.
   `scp /etc/pki/nw/trust/truststore.pem <logstash ssh username>@<logstash destination directory path>`
8. Import `truststore.pem` from the Decoder or Log Decoder to the Logstash keystore (`logstash-input-netwitness.p12`) by running the following command.

```
keytool -importcert -keystore logstash-input-netwitness.p12 -trustcacerts -
alias nw-inter -file truststore.pem -storetype PKCS12
```

Note: `truststore.pem` is same for all Decoders, if the Logstash is aggregating from same NetWitness setup. If the Logstash is aggregating from two different NetWitness setups, you must copy the `truststore.pem` for each Decoders.

9. Copy `logstash-input-netwitness.p12` file to the `/etc/logstash` directory by running the following command.
   ```
   cp logstash-input-netwitness.p12 /etc/logstash
   ```
10. Change the owner of `logstash-input-netwitness.p12` as Logstash by running the following command.
    ```
    chown logstash:logstash /etc/logstash/logstash-input-netwitness.p12
    ```

Note: You must use the same keystore "`logstash-input-netwitness.p12`" for all NetWitness hosts that is integrated with Logstash.

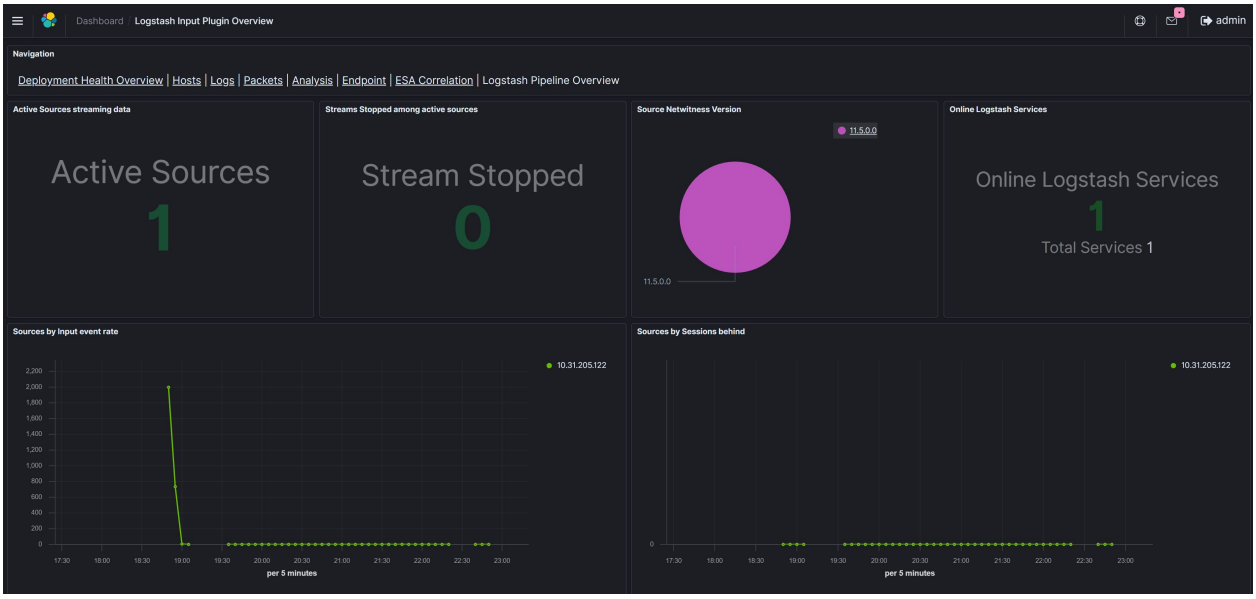
11. Connect to the Decoders to add the `server-cert.pem` to `trustpeer` and `caupload` APIs by running the following commands. You can also use to REST API port to connect.
    ```
    curl -X POST -d server-cert.pem http://<logdecoder or decoder
    IP>:<logdecoder or decoder REST port>/sys/trustpeer
    curl -X POST -d server-cert.pem http:// <logdecoder or decoder
    IP>:<logdecoder or decoder REST port>/sys/caupload
    ```

Note: If you are not able to use the REST API, follow the below steps to copy the certificates to `/sys peerCert` and `/sys caCert` APIs using NetWitness CLI .
1. SSH to Admin Server.
2. Type "help" for a list of commands or "man" for a list of manual pages.
3. Run the following command.
```
login localhost:50002 <username> <password>
```
3. Run the following commands.
```
send /sys peerCert op=add --file-data=/root/server-cert.pem
send /sys caCert op=add --file-data=/root/server-cert.pem
```

12. Restart the Logstash service running the following command.
    ```
    systemctl restart logstash
    ```

Note: If you are using an untrusted certificate, copy the `truststore.pem` file from the Decoder or Log Decoder and import it to `<JAVA_HOME>/lib/security/cacerts` for the Logstash service to trust the CA certificate of Decoder or Log Decoder. For example: `keytool -importcert -file </path/to/file/>truststore.pem -keystore /usr/java/jdk-X.Y.Z/lib/security/cacerts -alias nw-core-cert -storepass <password>`

Health and Wellness



Note: This feature is available only from NetWitness version 11.5 and later. For more information, see "Monitor New Health and Wellness" in *System Maintenance Guide forNetWitness*.

You can monitor the operational state of the Logstash service and details of sources configured in the New Health & Wellness tab available in NetWitness user interface. The New Health & Wellness is built on Elastic and Kibana. The metrics from the Logstash instance is sent to the Elastic service and visualized using Kibana. The tab displays the Logstash service status and the NetWitness Export Connector sources in a dashboard view. The New Health & Wellness service is referred as Elastic host in this document.

The Logstash service sends metrics for every 30 seconds. These metrics are used to view the operational status of the Logstash service and the NetWitness Export Connector. There are two types of metrics that are available for monitoring the Logstash status.

- Plugin metrics - For monitoring the NetWitness Export Connector status.
- Host metrics - For monitoring Logstash service instance (appliance or Virtual Machine) health status such as IO stats, CPU, memory usage and others.

By default, the plugin metrics are available in Logstash. To collect the host metrics, you must install Metricbeat, a third party software used for collecting the host metrics. It is recommended to enable both the plugin metrics and host metrics to view all the dashlets in the dashboard.

Download and Install Dashboard.

You need to download and deploy the dashboards from live to view the Logstash service and the NetWitness Export Connector stats in Kibana. Do the following steps.

1. Log in to NetWitness Platform UI.
2. Click  **(Configure) > LIVE CONTENT**.
3. In the **Search Criteria** panel, select the **Resource Types** as:
   - Health and Wellness Dashboards
   - Health and Wellness Monitors
4. Click **Search**.
5. In the **Matching Resources** view, select the **Logstash Input Plugin Overview** dashboard to deploy.
6. In the **Matching Resources** toolbar, click .
7. In the **Deployment Wizard > Resources** tab, click **Next**.
8. In the **Services** tab, select the Metrics Server service.
9. Click **Next**.
10. Click **Deploy**.
    The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.
11. Click **Close**.

For more information, see Advanced Configuration section in "Monitor New Heath and Wellness" topic in the *System Maintenance Guide forNetWitness*.

Create a User in New Health & Wellness (Kibana)

You must create user account in New Health & Wellness in NetWitness (Kibana), to send Logstash metrics to New Health & Wellness in NetWitness (Kibana). This user account is used in configuring the Logtstash plugin metrics and host metrics.

To create a user account in Kibana, do the following steps.

Note: This is applicable only for hosts or services that are not managed by NetWitness.

1. Go to  **(Admin) > HEALTH & WELLNESS > New Health & Wellness**.
   New Heath & Wellness panel view is displayed.
2. Click **Pivot to Dashboard**.
   Kibana Dashboard view is displayed in a new tab.
3. Click the Security icon  on the left.
   Kibana Security view is displayed.
4. In the Authentication Backends section, click **Internal User Database** and click the  icon to create new user.
5. Enter the username and the password in the respective columns.
6. In the Backend Roles section, click  and add `nwservice-role`, and then click **Submit**.
   Username is displayed in the Internal Database section.
7. Click the  icon to go back to Kibana Security view.
8. In the Permissions and Roles section, click **Role Mappings** and click **nwservice-role** to add the user name.
9. Click  and add newly created username, and then click **Submit**.

Enable the Logstash Plugin Metrics

To enable the Logstash plugin metrics, add the following parameters in the Logstash Configuration file (`netwitness-<decoder-ip>-input.conf`).

Parameter	Setting	Parameter Type	Default Value
plugin_metrics_ enable	Set the value to 'true' to enable the plugin metrics	Boolean	false

Parameter	Setting	Parameter Type	Default Value
elastic_host	Enter the IP address or hostname of the Elastic host or IP address of the New Health & Wellness service	String	N/A
elastic_port	Enter the port number of the Elastic host	String	9200
elastic_username	Enter the username that is used to access the Elastic host (user account created in Kibana, see Create a User in New Health & Wellness (Kibana))	String	N/A
elastic_password	Enter the password that is used to access the Elastic host	String	N/A

Enable the Logstash Host Metrics

Note: This is applicable only for hosts or services that are not orchestrated by NetWitness.

To enable the Logstash host metrics, follow the below steps.

1. Download Metricbeat software. For more information refer to Metricbeat.
   `curl -L -O https://artifacts.elastic.co/downloads/beats/metricbeat/metricbeat-oss-7.8.0-x86_64.rpm`
2. Install Metricbeat on the Logstash service by running the following command.
   `sudo rpm -ivh metricbeat-oss-7.8.0-x86_64.rpm`
3. Disable the default collection of Logstash monitoring metrics in the configuration file `logstash.yml` by changing `xpack.monitoring.enabled` parameter to `false`.
   `xpack.monitoring.enabled: false`

Note: Generally, the `x.pack.monitoring.enabled` parameter is commented. Remove the (#) character to activate it.

4. Enable the `logstash-xpack` module in Metricbeat to collect host status by running the following command.
   `metricbeat modules enable logstash-xpack`
5. In `/etc/metricbeat/modules.d/system.yml` file, add the following lines at the last and save it.

```
# Processors to parse process names of Netwitness Logstash Service.
- module: system
  period: 1m
  metricsets:
    - process
  processors:
    - add_fields:
        fields: {process.given.name: "logstash-service"} # Adding process
name to a new field
        when.contains:
          system.process.cmdline: "logstash-core.jar" # Condition on which
process name will be updated
```

Note: Use proper indentation while adding the lines. Refer an existing module in the `system.yml` file. If indentation is incorrect, the service may fail to start.

6. Configure the monitoring data to send metrics to Metricbeat. Follow the below steps.
   a. Update the `/etc/metricbeat/metricbeat.yml`file.
      - Replace the content in 'Elasticsearch output' section in `metricbeat.yml` with the following lines.

```
output.elasticsearch:
  # Array of hosts to connect to.
  hosts: ["<ELASTIC_HOST>:9200"]
  index: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"

  # Protocol - either `http` (default) or `https`.
  protocol: "https"
  ilm:
    enabled: false
    check_exists: false
  # Authentication credentials - either API key or username/password.
  username: "<ElASTIC_USERNAME>"
  password: "<ElASTIC_PASSWORD>"
  ssl.verification_mode: none

setup.ilm.enabled: false
setup.template:
   enabled: false # Disabled so that metricbeat auto-creates the
template everyday based on incoming metrics.
   name: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"
   pattern: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"
```

   b. Update the `ELASTIC_HOST`, `ELASTIC_USERNAME` and `ELASTIC_PASSWORD` details in `metricbeat.yml` file.

7. Start the Metricbeat service by running the following command.

```
sudo service metricbeat start
```

For more information visit the official documentation of Metricbeat.

Configuring Custom Multi-valued Meta

Default multi-valued meta keys are `action, alias.host, alias.ip, alias.ipv6, email` and `username`, if the custom multi-valued path parameter is not set in Logstash configuration file (`netwitness-<decoder-ip>-input.conf`), then only default values are considered for multi-valued meta. Custom valued meta can be setup in generic (applicable for all the Netwitness Platform host where the json file is referenced) or specific to the Netwitness Platform host and can have custom multi-valued meta for multiple host in single json file. Both the `custom_multi_valued_meta_generic field` and `custom_multi_valued_meta_specific field` can be used in single file or at-least one 1 field must be set.

Note: Provide absolute path to the json file in the configuration (`netwitness-<decoder-ip>-input.conf`) and make sure Logstash user has access to this file. Meta name should be the same as the Netwitness Platform default name format. Do not use underscore format of the meta key.

For example, below shown is the json file which has both generic and specific field set in `custom_meta.json`

```
{
  "custom_multi_valued_meta_generic": [
    "meta.1,meta.2,meta.3"
  ],
  "custom_multi_valued_meta_specific": {
    "0.0.0.0": [
      "meta.4,meta.5,meta.6"
  ],
  "1.1.1.1": [
    "meta.4,meta.5,meta.7"
  ]
 }
}
```

In above example, the meta keys `meta.1, meta.2 and meta.3` are applied to all the NetWitness Platform host in the configuration file that has custom_meta_config path is set. The meta keys `meta.1, meta.2, meta.3, meta.4, meta.5, meta.6` are set as custom multi-valued meta for hosts `0.0.0.0` and the meta keys `meta.1, meta.2, meta.3, meta.4, meta.5, meta.7` are set as custom multi-valued meta keys for the host `1.1.1.1` along with default mutli-valued meta.

Configure Logstash Filter Plugin (optional)

You can configure the Logstash Filter plugin to add, remove, or modify the specific input events from the Log Decoder or Decoder. To configure the Filter plugin, add the Filter plugin parameter settings in the second section of the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`). This plugin modifies the events based on the parameter settings. You can use the existing standard Logstash filter plugins for adding the parameter settings to the configuration file. For more information on existing Logstash standard filter plugins, see Filter Plugin Documentation.

The configuration of the plugin must consist of the plugin name followed by a block of parameter settings for that plugin. The following is an example of Logstash mutate filter plugin configuration parameters that remove specific meta keys.

```
filter
 {
 mutate {
 remove_field => ["ip_dst", "ip_addr"]
 }
}
```

Configure Logstash Output Plugin

You must configure the Logstash Output plugin to send the input events to a data warehouse destination. To configure the Output plugin, in the third section of the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`), add the Output plugin parameter settings. You can use the existing Logstash standard output plugins for adding the parameter settings to the configuration file. For more information on existing Logstash standard output plugins, see Output Plugin Documentation.

The configuration of the plugin must consist of the plugin name followed by a block of parameter settings for that plugin. The following is an example of Logstash Output plugin configuration parameters.

```
output
{
 kafka {
 codec => json
 topic_id => "logstash"
 }
}
```

Performance tuning for Kafka and Kafka Output Plugin

Following are the output plugin parameters for Kafka and Kafka Broker.

Kafka Output Plugin:
Following parameters require change in value for each parameters to add additional throughput in the deployment.
`batch_size, buffer_memory, compression_type, send_buffer_bytes`
For more information, see Kafka output plugin documentation.

Kafka Broker:
Following parameters require change in value for each parameters to add additional throughput in the deployment.
`num.network.threads, num.io.threads, socket.receive.buffer.bytes, socket.request.max.bytes, message.max.bytes, replica.fetch.max.bytes`
For more information, see Kafka Broker Performance documentation.

Known Issues

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Position tracking is not updated properly when query is used to filter the sessions. **Problem:** Last `session.id` aggregated is not updated to the latest aggregated ID but is updated only to the last filtered session retrieved. For Example, If a decoder has 1000 sessions, and only first 800 sessions match the filter, the `last.session.id` in the position tracking shows 800 even though all 1000 sessions are processed. This does not cause any data loss but if the Logstash service is restarted, aggregation will begin from 801 `session.id`, processing the 200 sessions again. **Workaround:** None	netwitness-export-connector-1.0.0		ASOC-101795

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Consumer does not consume all the events after the Logstash service is restarted. **Problem:** While running at a high EPS or if there is a large session behind, the NetWitness Export Connector aggregates the sessions of the decoders. The Logstash pipeline sends to the output plugin which in turn sends it out to the consumer. At this point, if a Logstash service is stopped or restarted, the Logstash pipeline ensures the data is sent out of the output plugin to the consumer, however all the sessions are not consumed by the consumer. This leads to data loss on the consumer end even though Logstash has sent out all the data. **Workaround:** Update the `start_session` parameter in the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`) by referring to the latest received `session.id` on Kafka or any other consumer used.	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-102440
NetWitness Export Connector	**Title:** Position tracking not saved for some Decoder sources after sometime in a multiple sources configuration. **Problem:** When aggregating data from multiple sources in a single Logstash instance, after a period of time, the position tracking thread fails for some or all of the sources gradually and stops tracking the position (bookmarking) for those sources. **Workaround:** None	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-102411

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Unable to start session aggregation from `first.session.id` of Decoder when it is not 1. **Problem:** If the Decoder has the `first.session.id` other than 1, which means the Decoder has data that has rolled over, the NetWitness Export Connector's `start_session` parameter will not start aggregation from that value, instead it would begin from the `last.session.id`. **Workaround:** Add 1 to the value to the `start_session` parameter and the aggregation would start as expected dropping the first session only. For example, if `first.session.id` on a Decoder is '1105000' add 1 to it and set the value of the `start_session` parameter as '1105001'.	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-101951

Entitlement Capability Implementation

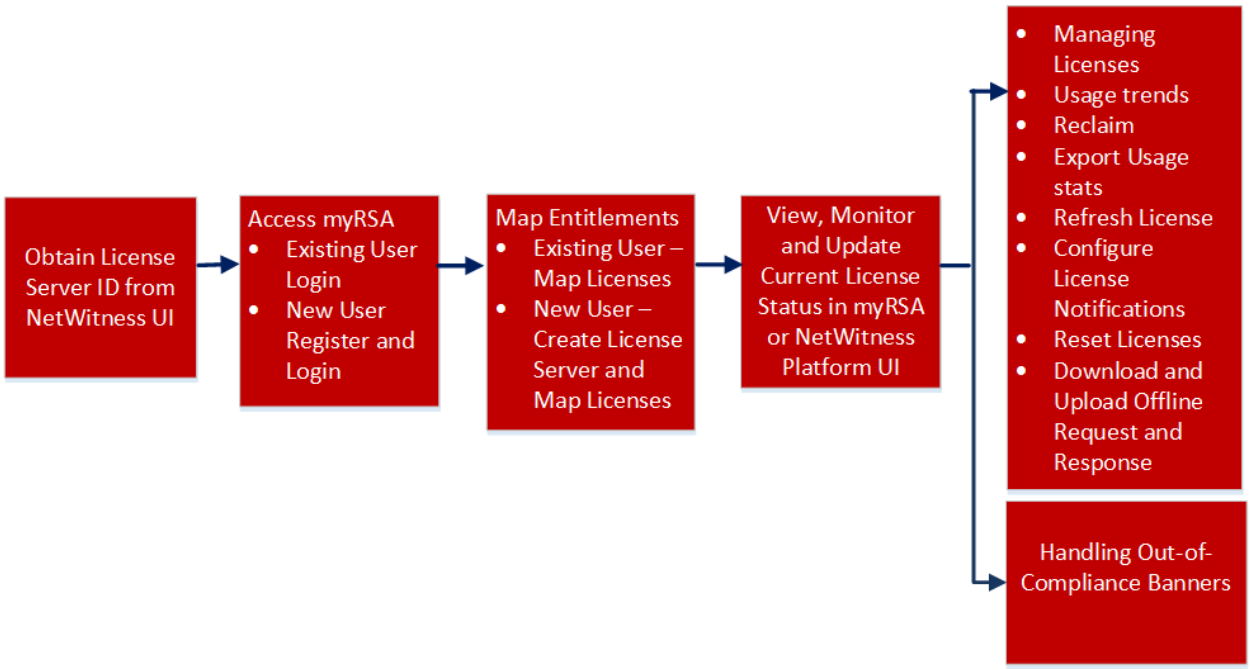
This topic describes how licensing of appliances and services is implemented in NetWitness. The entitlement capability leverages myRSA (https://my.rsa.com/) as the mechanism for entitlement delivery.

Key	Description
1	**Entitlements Created and Available to Customer.** After a customer order is processed, the entitlements (licenses) become available in myRSA. The entitlements are tied to an individual account.
2	**Register NetWitness Server on myRSA and Map Entitlements to the Local License Server (LLS).** • Customers log on to myRSA and view the entitlements to which they have access within their account. • Customers map entitlements to their Local License Server using the License Server ID (displayed in the NetWitness (Admin) **> System > Info** panel). The License Server ID is used only for mapping entitlements to a Local License Server and does not pertain to appliance activation.

Key	Description
3	**Synchronize the Server and Download Mapped Entitlements.** There are two methods for customers to synchronize with FlexNet Operations-On Demand (FNO-OD) and download the mapped entitlements to their LLS. • **Sites with Internet connectivity.** If the LLS has Internet connectivity, the LLS attempts to synchronize with FNO-OD every 24 hours over HTTP (TCP-80). Customers with Internet connectivity can also perform on-demand synchronization, using the **Refresh** option in the  (Admin) **> System > Licensing** panel on the NetWitness Server. For more information, see Register the Server (Online Registration). After the synchronization, endpoint entitlements that were mapped to the Local License Server on the NetWitness Platform appliance are synchronized on hourly basis by port 443. • **Sites in closed environments.** Customers can synchronize the mapped entitlements by downloading a capability request and importing it on the NetWitness Server. For more information, see Register the Server (Offline Capability Request). After the synchronization, entitlements that were mapped to the Local License Server on the NetWitness appliance are synchronized, but the entitlements have not been used in any way. For example, if you have purchased 10 Decoders and 10 Concentrators, 10 of 10 Decoder entitlements and 10 of 10 Concentrator entitlements would be available on the NetWitness Server.

Note: FNO-OD is the license server in the cloud on myRSA. The URL is rsasecurity.subscribenet.com. The customer's firewall must allow communications between this URL on port 80 (whatever it resolves to when using lookup or whois) and the NetWitness IP address.

NetWitness Platform Licensing Overview



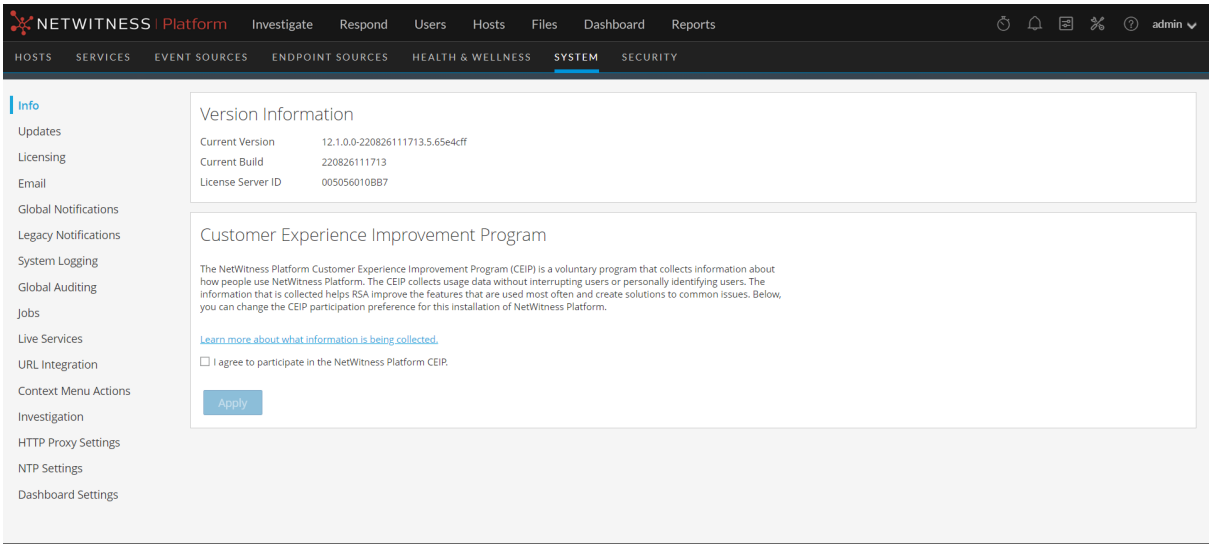
After you have purchased the licenses and have received all the relevant email communications, perform the steps required to map entitlements in NetWitness. You must perform each step in the proper sequence.

This document is divided into three parts:

- How to obtain license information from myRSA and view in the NetWitness Platform UI
- Understanding License Types and its functionality
- Troubleshooting or maintenance information

Workflow

The following workflow illustrates the end-to-end licensing process after you have the NetWitness product installed .



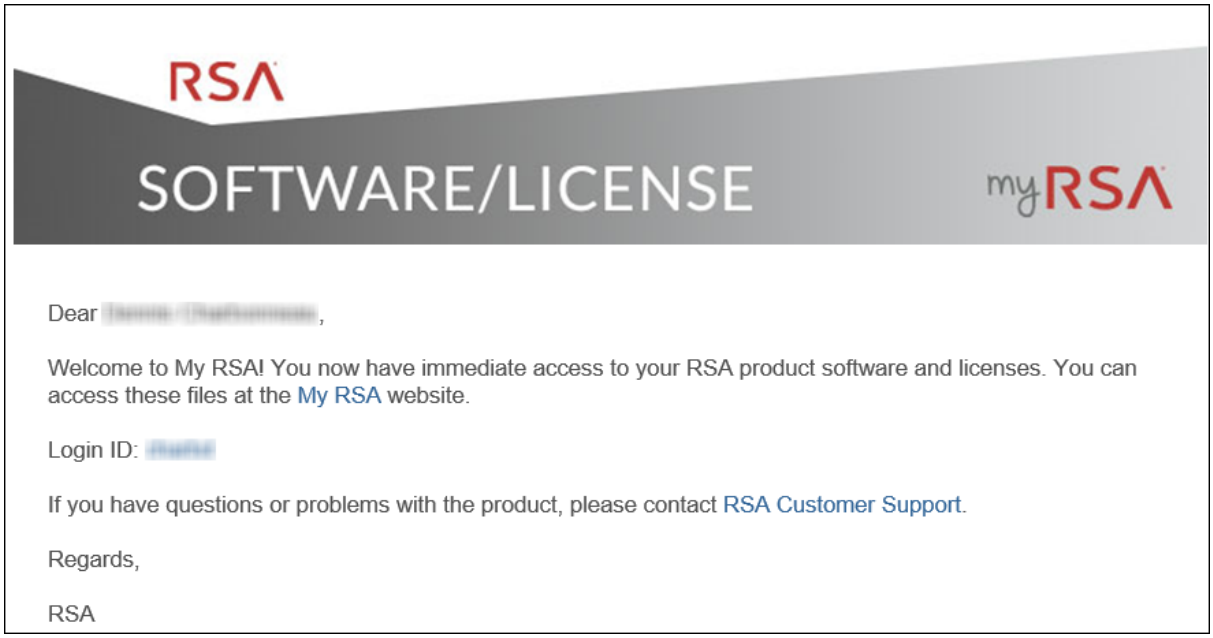
Obtain License Server ID from NetWitness Platform User Interface

Before you begin the licensing process, you must make sure that you obtain the License Server ID displayed in the NetWitness User Interface which is generated on the successful installation of the product.

To obtain the license service ID:

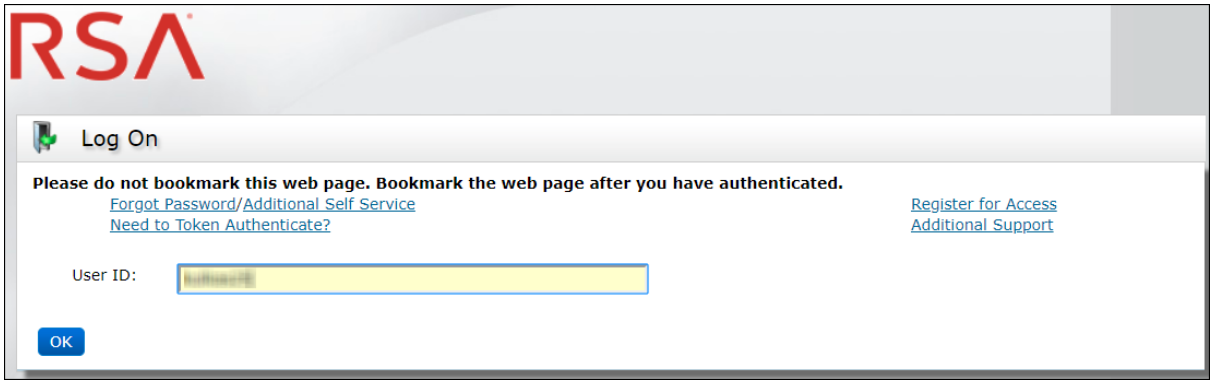
1. Log in to the NetWitness user interface.
2. Go to  **(Admin) > System**.

   The Admin System view opens to display the Version Information in the **Info** panel.



3. Under **Version Information**, locate the **License Server ID** and make a note.
   Log in to **myRSA** and enter the License Server ID to view your entitled license information. For more information, see Access myRSA.

Access myRSA



You will receive an order confirmation e-mail. Refer to your myRSA email for login information. If you are a new myRSA user, you also receive an e-mail containing instructions on how to create a new account. Your myRSA Welcome e-mail message contains system log in instructions to myRSA. This document provide you instructions on how to map your product licenses on the myRSA website.

1. The new users instruction e-mail contains a **Click Here** link. This link opens an Enrollment Portal, where the -Based Authentication (RBA) method must be configured for the account.
2. After the RBA method is enabled, a Confirmation e-mail message containing the User ID (which is your e-mail address), along with a temporary password is sent. After the first login, you are prompted to change the password. Once the password is changed, you are logged into myRSA.

Note: If you have a pre-existing account for the RSA Link or RSA Online websites, you receive only one e-mail on how to use your existing login credentials. You must log into myRSA with your existing User ID, password, and RSA method.

3. When you navigate to https://my.rsa.com/, the **RSA Secure Logon** screen is displayed.

4. Enter your User ID and click **OK**, which displays the **Password** field. When you enter the password, you are logged into myRSA.

   Your contact e-mail address is used to authenticate your User ID. If the Customer Authentication process is successful, the myRSA Software/License page displays a list of all the following products available which are associated to your site location:

   - RSA Products
   - Serial Numbers
   - Purchase Orders
   - Sales Orders

   Note: You may be prompted to verify your identity through your RBA method, if multiple log in failures occur in a row, or if you have not logged into myRSA within the past several months.

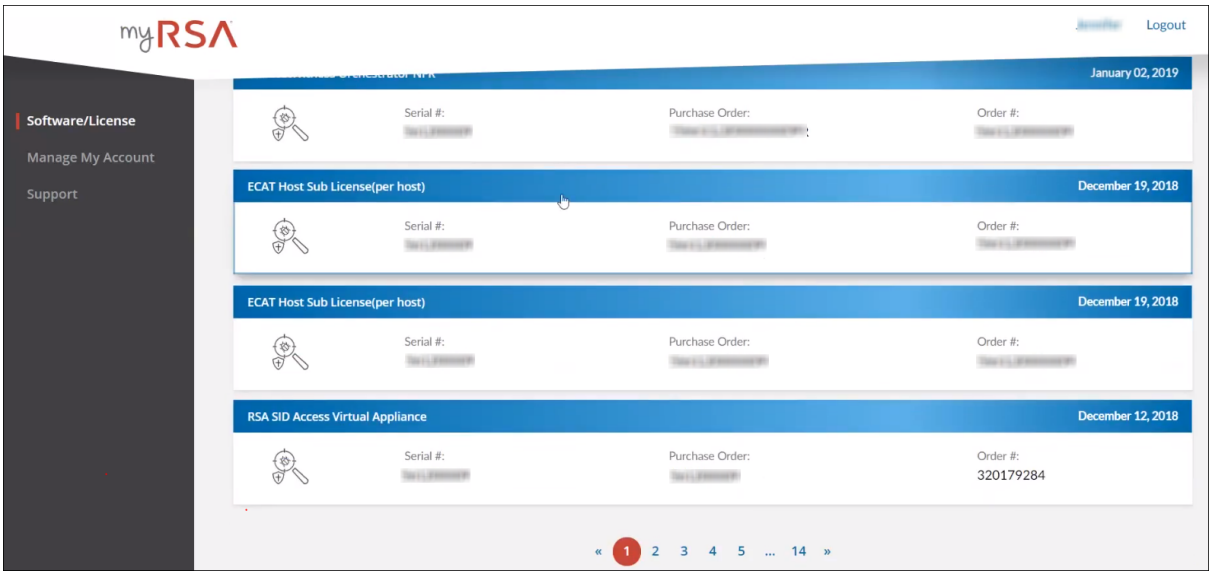
5. In the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

   The **Order Detail** screen is displayed.

License for NetWitness Endpoint 4.4.0.x Agents

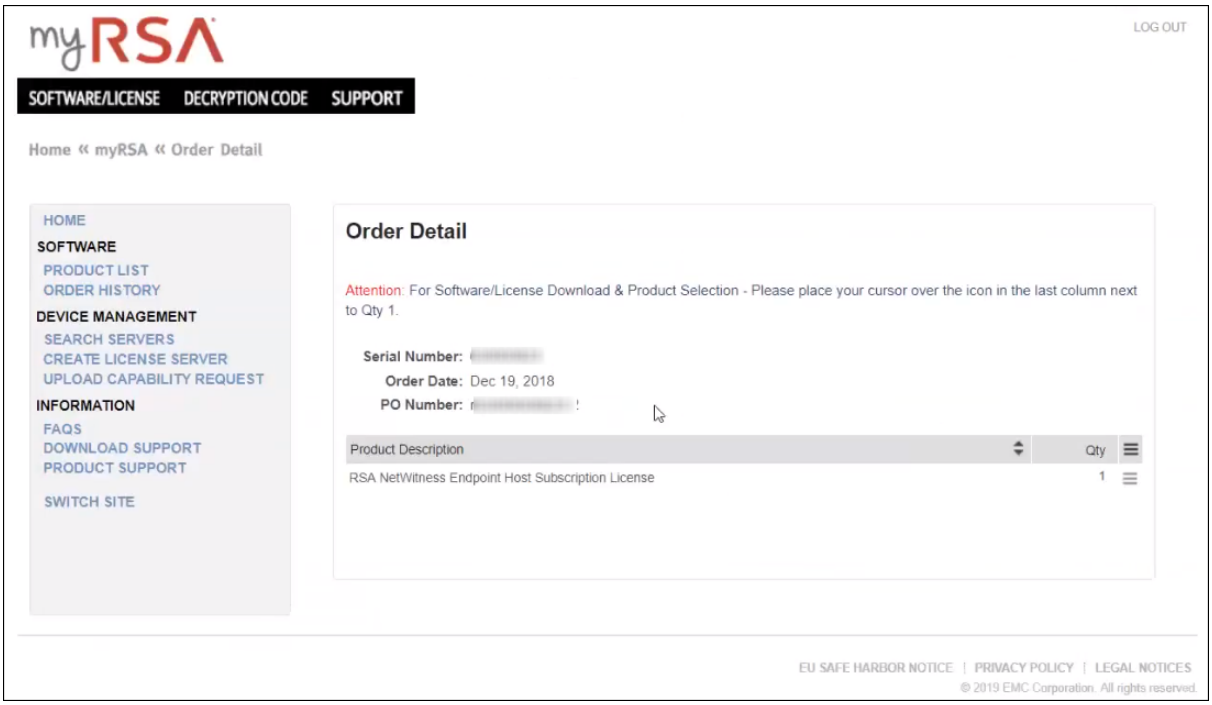
If you are an existing NetWitness Endpoint 4.4.0.x customer, who also has NetWitness Server, Log Hybrid and an ESA box, you receive licenses for NetWitness Endpoint 4.4 and 11.6 agents. You receive the following RSA Order Fulfillment Confirmation email which contains the license details for NetWitness Endpoint 4.4.0.x and NetWitness 11.6.

Note: If you are a new NetWitness 11.6 customer, the RSA Order Fulfillment Confirmation email contains the license details for the current 11.6 version only.



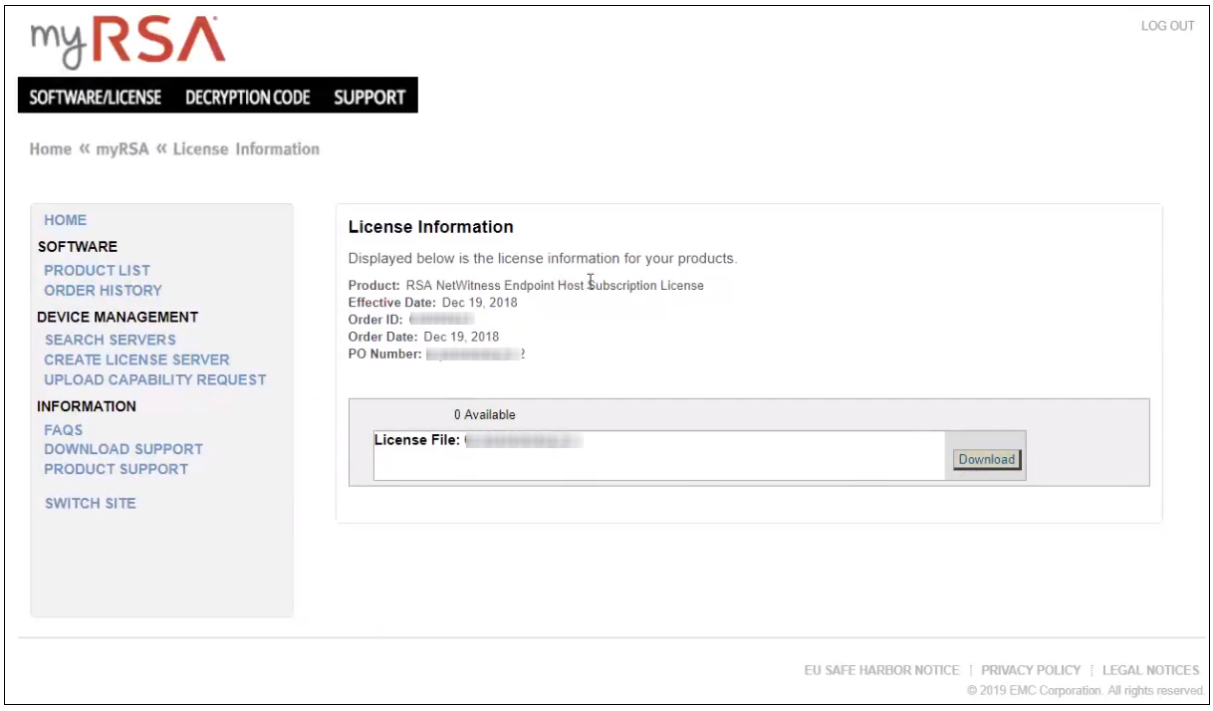
Part Number	Part Description	Quantity	Fulfillment Date
ECAT-SUB-T4	Tier4 RNWE Subsc p/Host 1001-2500 1Mo	1	February 7, 2019
	# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500		
	Serial/License Number: [redacted]		
RSA-0015012	ECAT Host Sub License(per host)	1	February 7, 2019
	# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500		
	Serial/License Number: [redacted]		

In the above screenshot, the part number with **RSA-0015012** indicates that it is aNetWitness Endpoint 4.4 license and the part number with **ECAT-SUB-T4** indicates that it is a NetWitness 11.6 license. You will get NetWitness 11.6 license and if you have NetWitness Endpoint 4.4 license, myRSA will upgrade the number of host for both licenses.



To download an Endpoint (ECAT) 4.4.x license, perform the following steps:

1. After you log in to myRSA, an ECAT Subscription Licenses option is displayed.



2. Click on ECAT Host Sub License (per host).

   The Order Detail page is displayed.

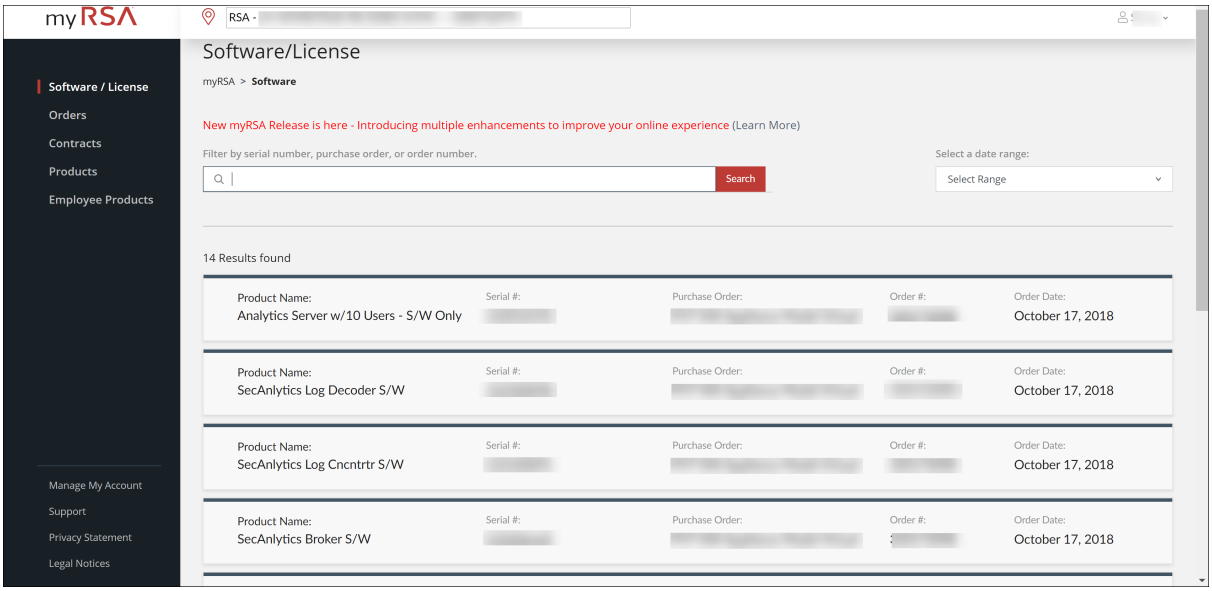
3. Click on **Product Description**.

   The License information page is displayed.

4. Click **Download** to download NetWitness Endpoint 4.4.0.x license.

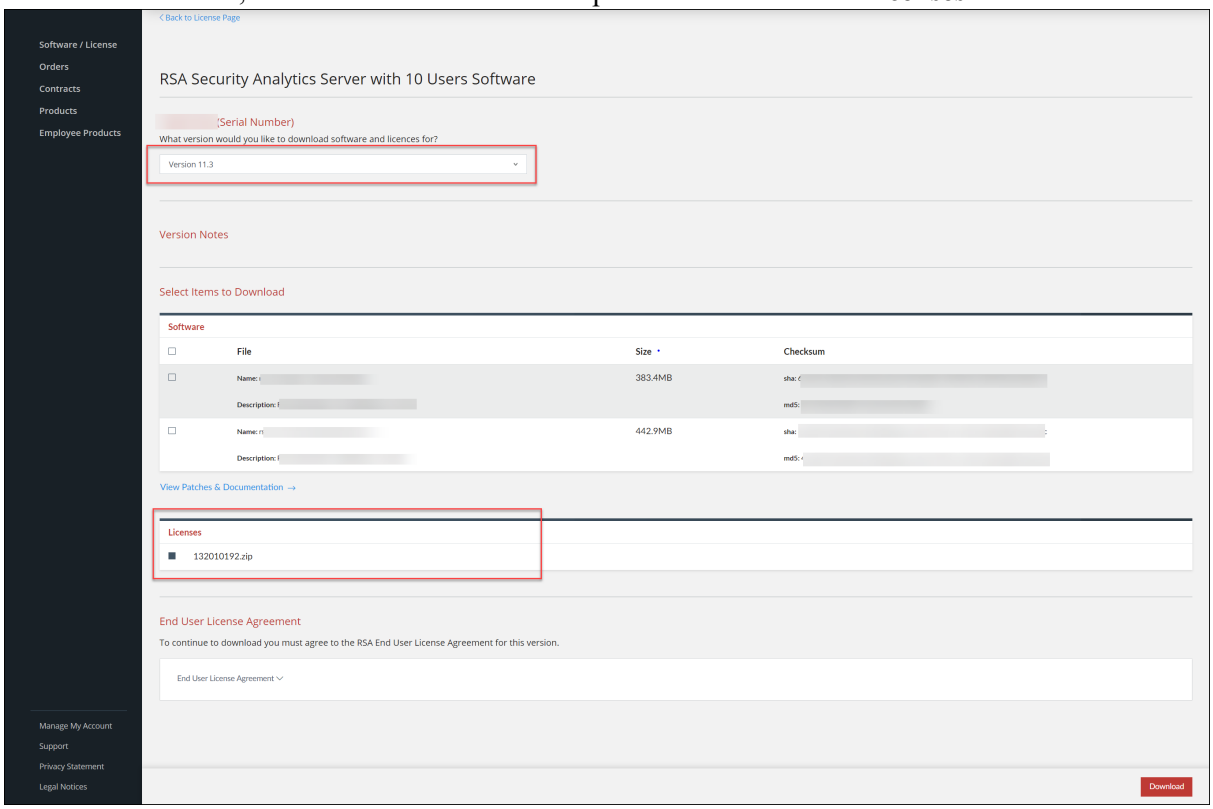
If you have an existing NetWitness Endpoint 4.4.0.x and do not have NetWitness Platform, then you must register to the license server. For more information. see Register the Server (Online Registration).

If you have an existing NetWitness Endpoint 4.4.0.x customer, and also NetWitness, then you can use the same license in NetWitness.



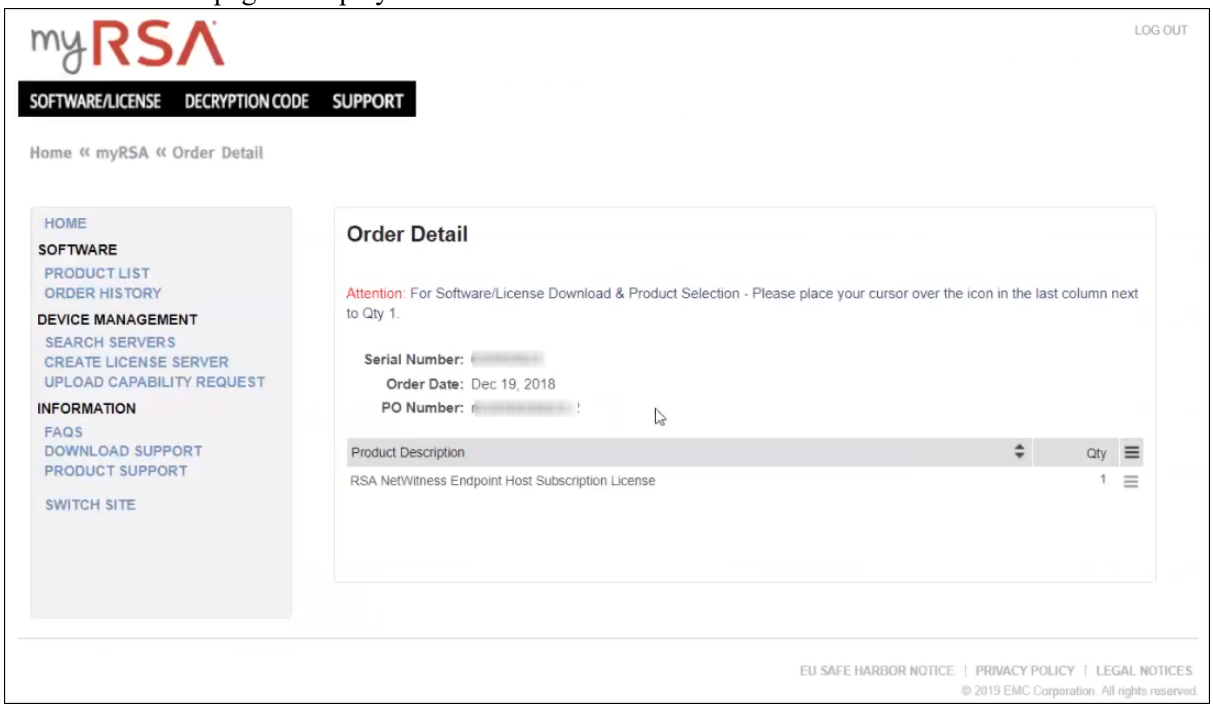
If you are new to NetWitness 11.6 , and have NetWitness Endpoint, then you can view the license only for the current version in NetWitness.

Register the Server (Online Registration)

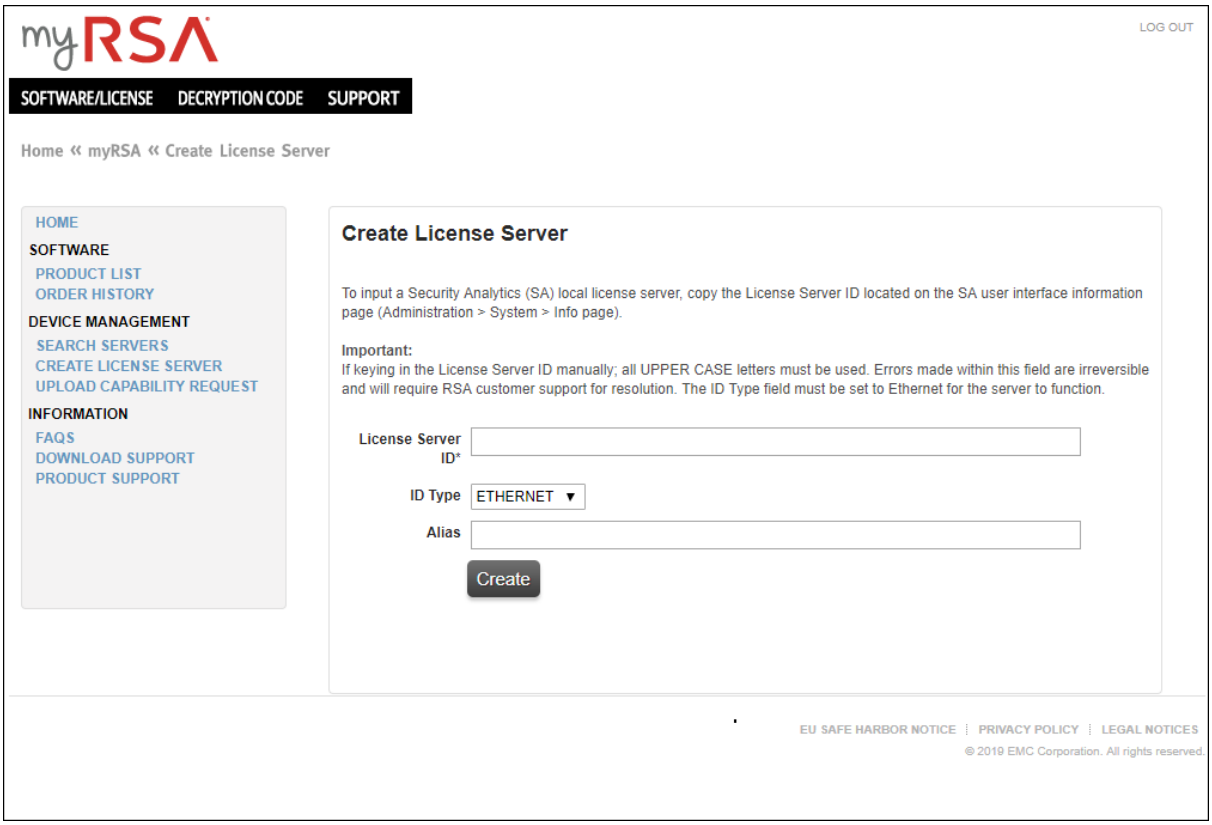


In the NetWitness entitlement process, you need to register the NetWitness Server and map the entitlements to the Local License Server (LLS). There are two methods of synchronizing NetWitness with myRSA: online and offline.

Note: By default NetWitness is configured to synchronize with myRSA at regular intervals hence manual synchronization is not required.

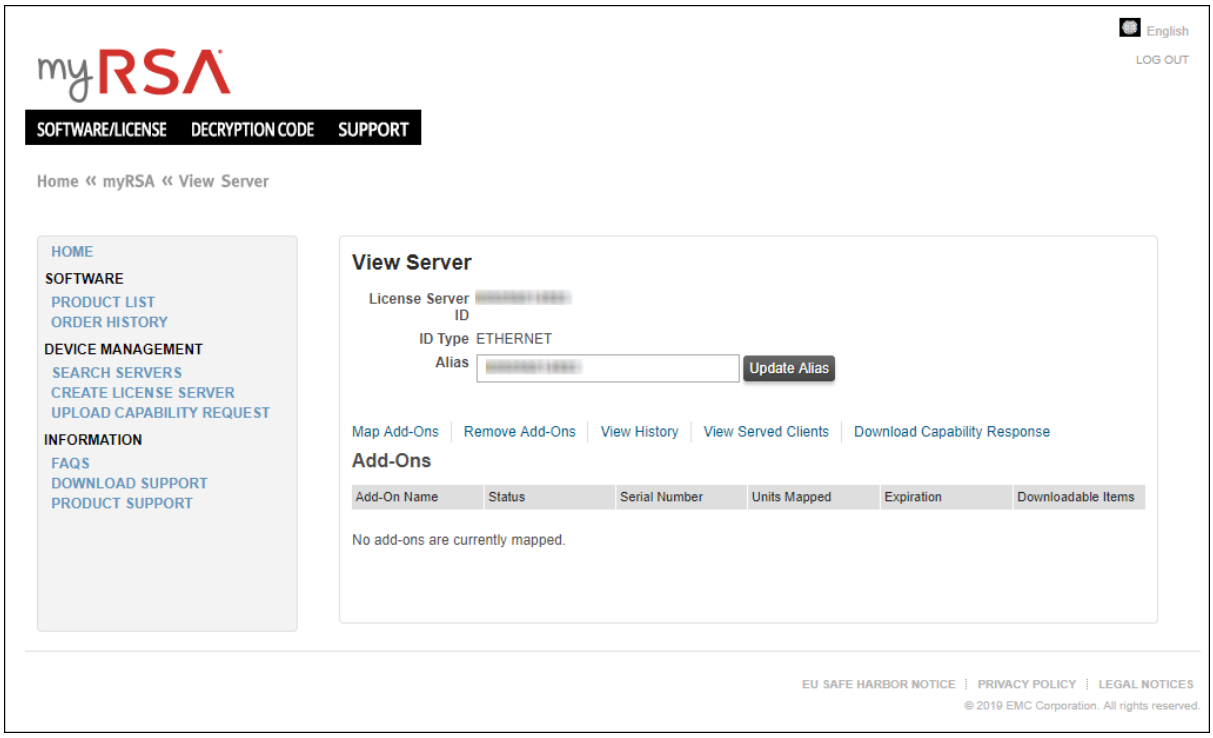


1. On the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

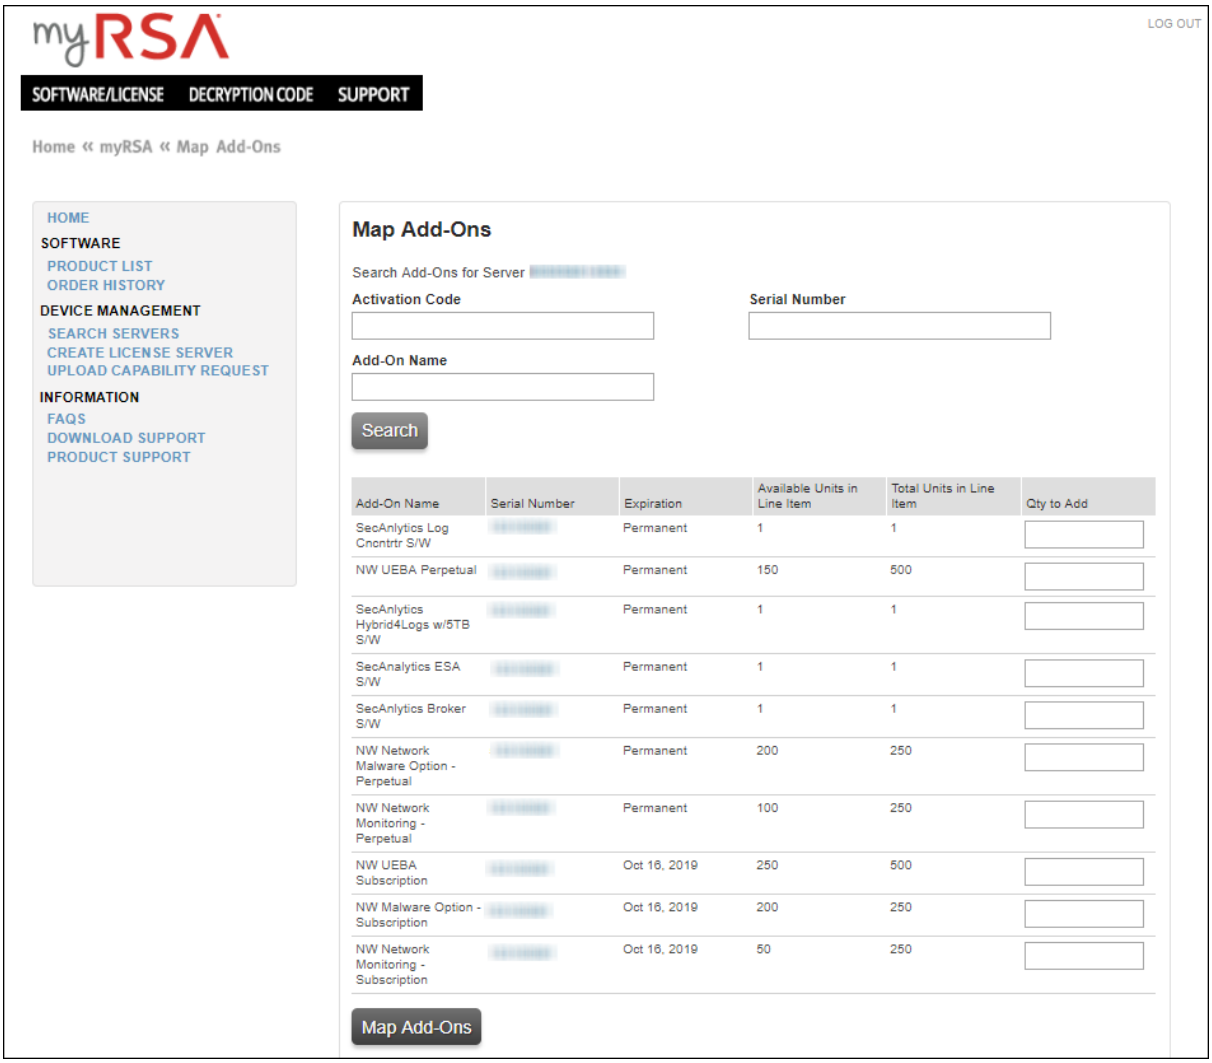


2. Click on a line item, select a version from the drop-down and select the **Licenses** checkbox.

3. Click **Download**.
The Order Detail page is displayed.



4. Click **Create License Server**.



5. Complete the following fields:
   - Copy or enter (in uppercase letters) the License Server ID in the License Server ID field.
   - In the **ID Type** drop-down, select **ETHERNET** (the default value).
   - In the **Type** drop-down, select **Ethernet** (the default value).
   - (Optional) In the **Alias** field, type an alias to your Appliance ID.
6. Click **Create**.

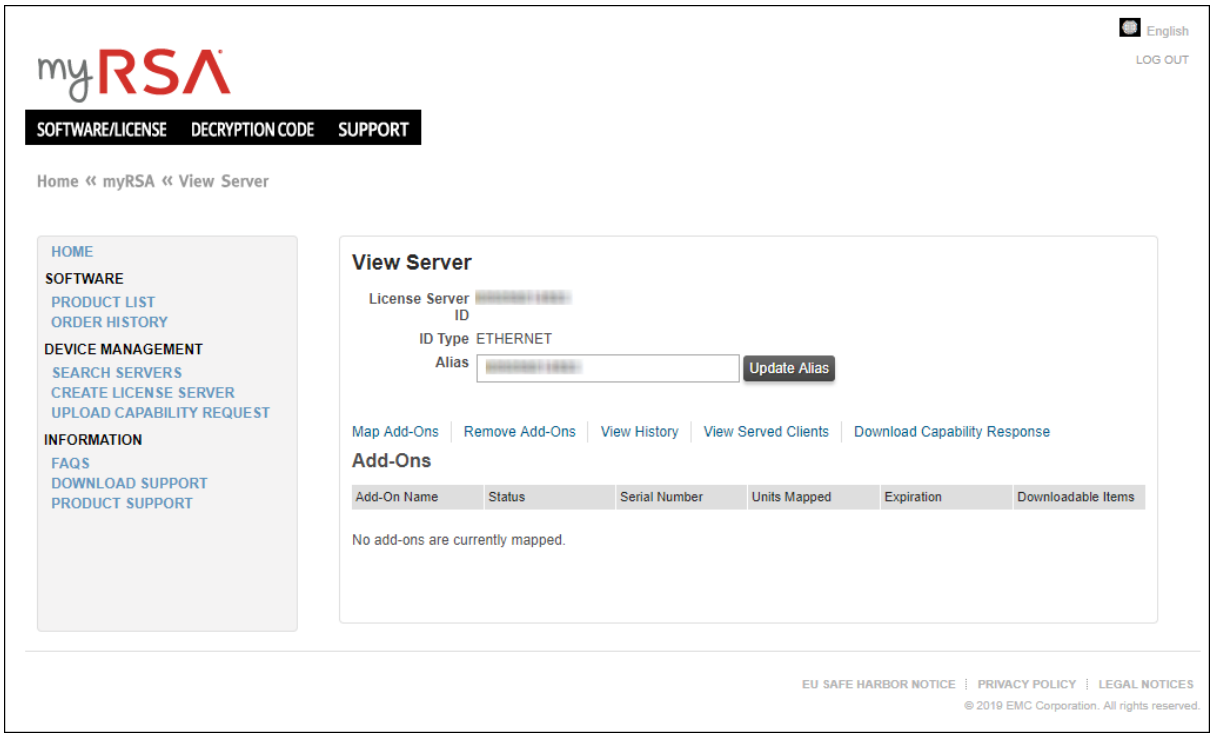
   The View Server page is displayed.

7. Click Map Add-Ons.

   The Map Add-Ons page is displayed.

8. After you have registered the license server and viewed the license details, you must map the entitlements. For more information, see Map Entitlements .

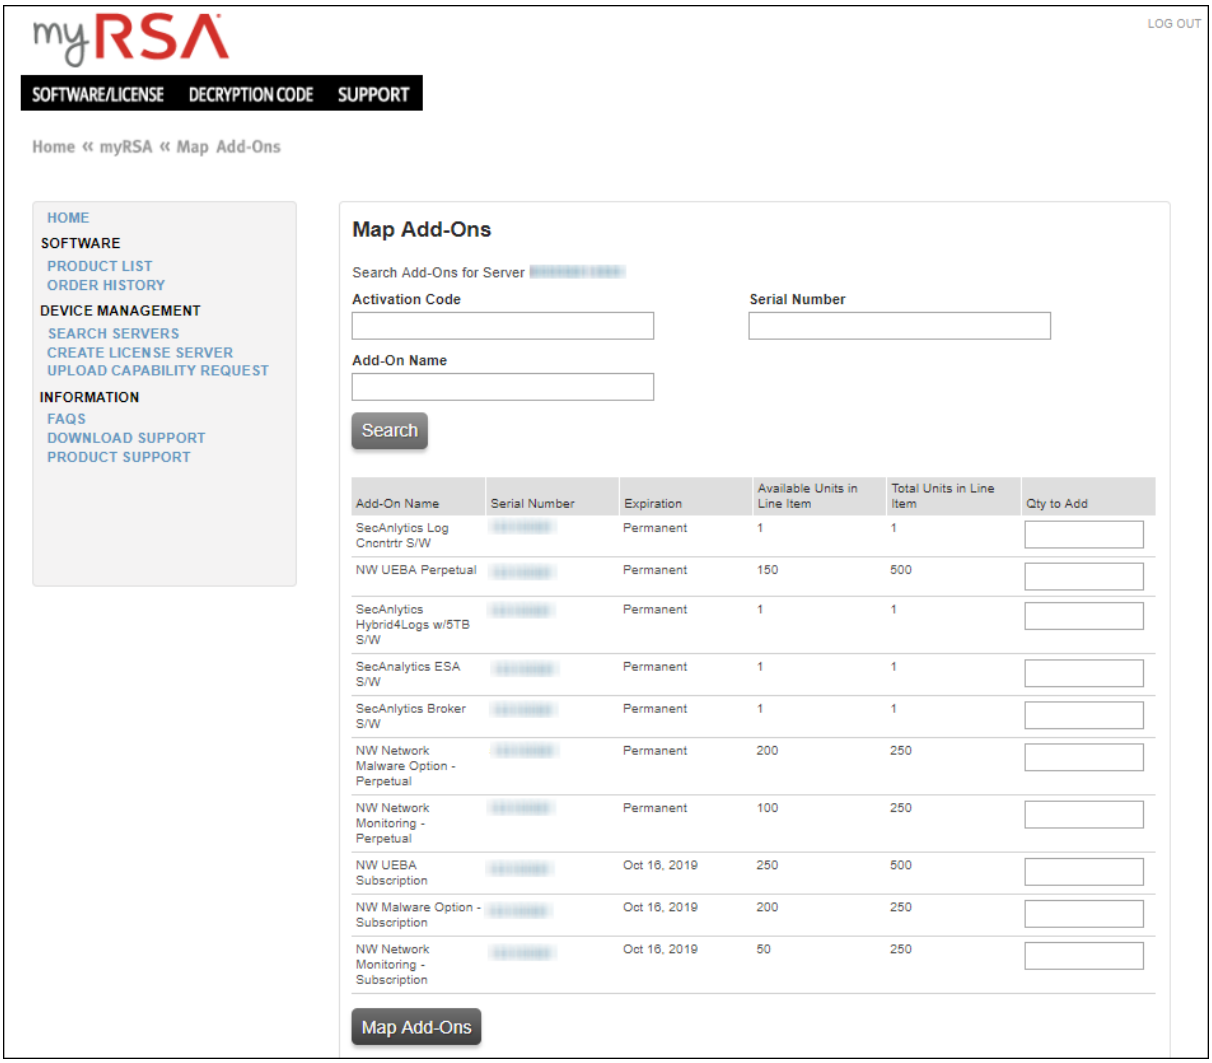
Note: By default NetWitness host is configured to synchronize with myRSA at regular intervals and also a designated nameserver (DNS). No action is required.



Note: In a multiple NetWitness deployment where the services are connected to both primary and secondary NetWitness hosts and the services are licensed only with the primary NetWitness, a license expiry message is shown for the same services on the secondary NetWitness. You can ignore the message and continue using the product.

Map Entitlements

Mapping entitlements involves choosing the quantity of available entitlements to pull to the NetWitness Server during synchronization.



To map appliance entitlements to the server:

1. Log in to myRSA.
2. Click on the **SEARCH SERVERS** and then click on the License Server ID to view the entitled Server Details.

3. Click **Map Add-Onss**.

   The Map Add-Ons page is displayed.

The Add-On table lists all entitlements that are available for your account. The table has a row for each NetWitness product entitlement, with the following information:

- **Add-On Name**: The name of the entitlement; for example, SMC Concentrator or SMC Decoder.
- **Serial Number**: The serial number associated with a product.
- **Expiration**: For licenses that are not permanent, the expiration information is displayed. The value in this field is a specific date (for example, Oct 6, 2019) or a time range (for example, 90 days). If the value is a time range, the expiration period begins when the add-on is mapped to a server.
- **Available Units in Line Item**: The quantity of entitlements currently available for that license. This quantity is the difference between the Total Units and the entitlements that have been mapped to a NetWitness Server for licensing.
- **Total Units in Line Item**: The total quantity of entitlements tied to a specific license.
- **Quantity to Add**: The number of entitlements for a specific license.

4. To designate the quantity of entitlements to map to the NetWitness Server from a license, type a quantity in the **Units to Configure** column.
5. Click **Map Add-Ons**.

   The View Server page displays a message indicating that the entitlements were successfully mapped to the NetWitness Server.

   Entitlements are now dedicated and set aside from an accounts pool. The message **License Not Generated** is displayed in the **Status** column for each entitlement. The entitlements are not yet full attached to the license server ID until the **Download Capability Response** link is clicked. Once done, a bin file is downloaded and on a page refresh the **Status** column will change to **License Generated**. At this point the license is fully attached to the license server ID and ready for use by NetWitness. The bin file that was downloaded can be manually applied to the NetWitness UI or the user can wait until the License Server checks in to pull the newly applied license to the NetWitness UI. If manually applying the bin file, it will expire within 48 hours of being created. If it expires before applying, simply click the **Download Capability Response** link for a new file.
6. (Optional) If you want to add more entitlements, use the **Map Add-Ons** option.
7. (Optional) If you want to remove entitlements, use the **Remove Add-Ons** option.

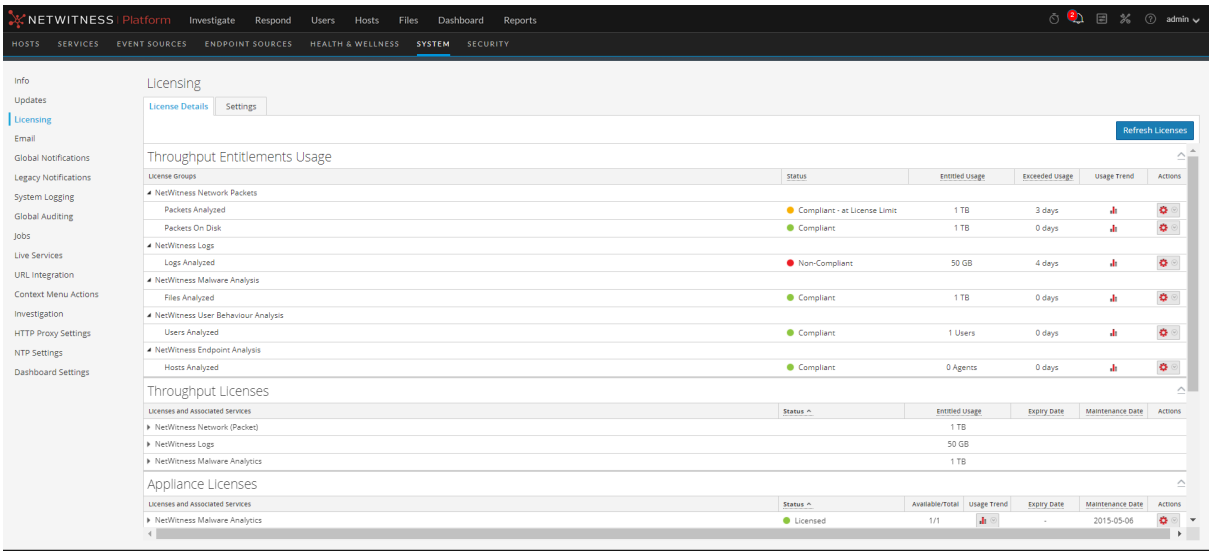
Now you can synchronize and pull down the mapped entitlements to the NetWitness Server

View Current Licenses

After you have completed the license process, you can view the current licensing status in the NetWitness UI.

Each NetWitness Server is a license server providing capabilities to entitle services connected to it. To make entitlements available for licensing services, the entitlements must be mapped to the Local License Server (LLS) on the NetWitness Server.

Note: If licensing a hybrid system, which has a Concentrator and Decoder on the same appliance, each component must be licensed separately.



View and Manage Licenses

In NetWitness, you can view and manage available licenses.

To view the licenses that are available on this instance of NetWitness:

1. Go to  **(Admin) > System.**
2. In the options panel, select **Licensing**.

   The **License Details** tab is displayed.

Each license is listed in the grid by license type. Information includes the status of the license indicated using color-coded circles and the related information.

Register the Server (Offline Capability Request)

NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS. This topic provides instructions for offline synchronization of the Local License Server (LLS) with the online repository. For more information on the functional description of the LLS, see Entitlement Capability Implementation.

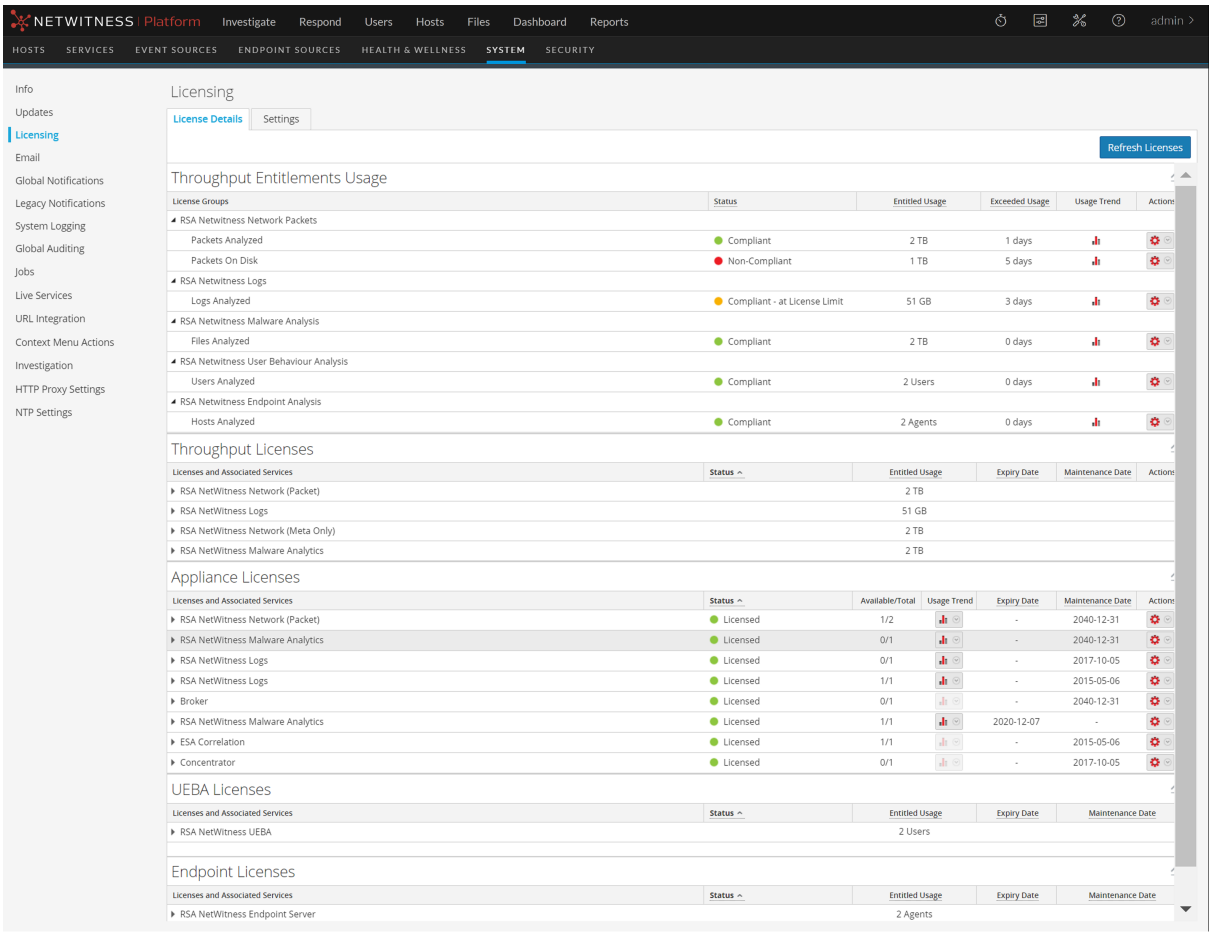
If you are unable to register the NetWitness Server online, you can download an offline capability request in NetWitness and upload that binary request to the myRSA Portal. If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA.

Prerequisites

Before implementing the NetWitness Platform entitlements capability offline, ensure the following

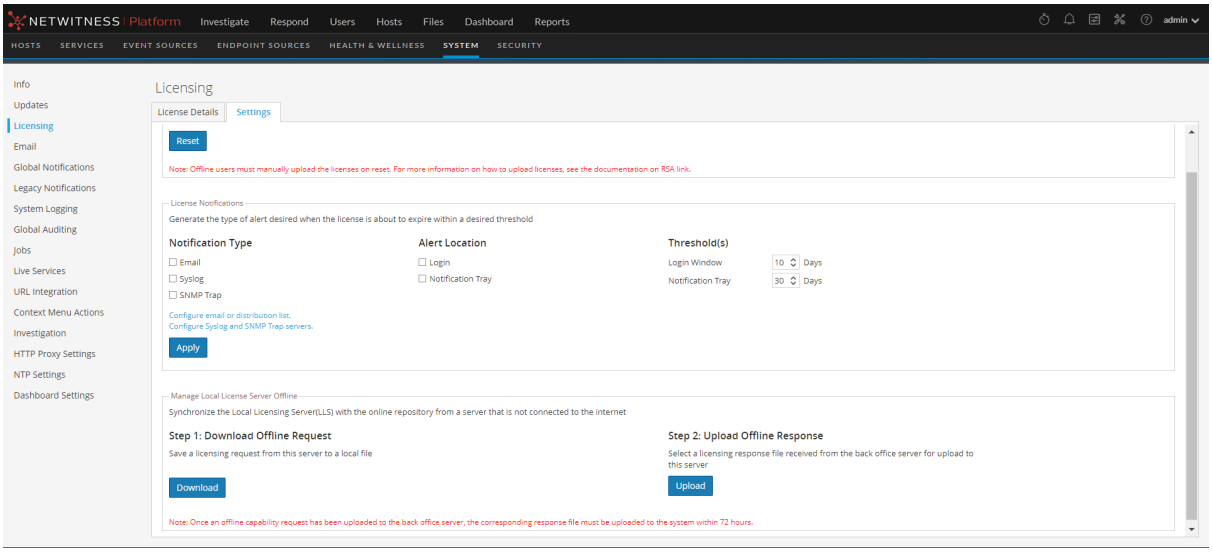
- The NetWitness Server is registered to myRSA (https://my.rsa.com/) and entitlements are mapped. Internet access is not required for offline synchronization.
- An Offline Capability Request has been downloaded from the NetWitness UI to be uploaded to myRSA.
- An Offline Response has been uploaded to NetWitness that was received from myRSA within 24 hours.

Here is a workflow that describes how to use the offline capability to acquire the licenses from myRSA and view them.



Download an Offline Request for Submission to myRSA

To register the server using an offline capability request:

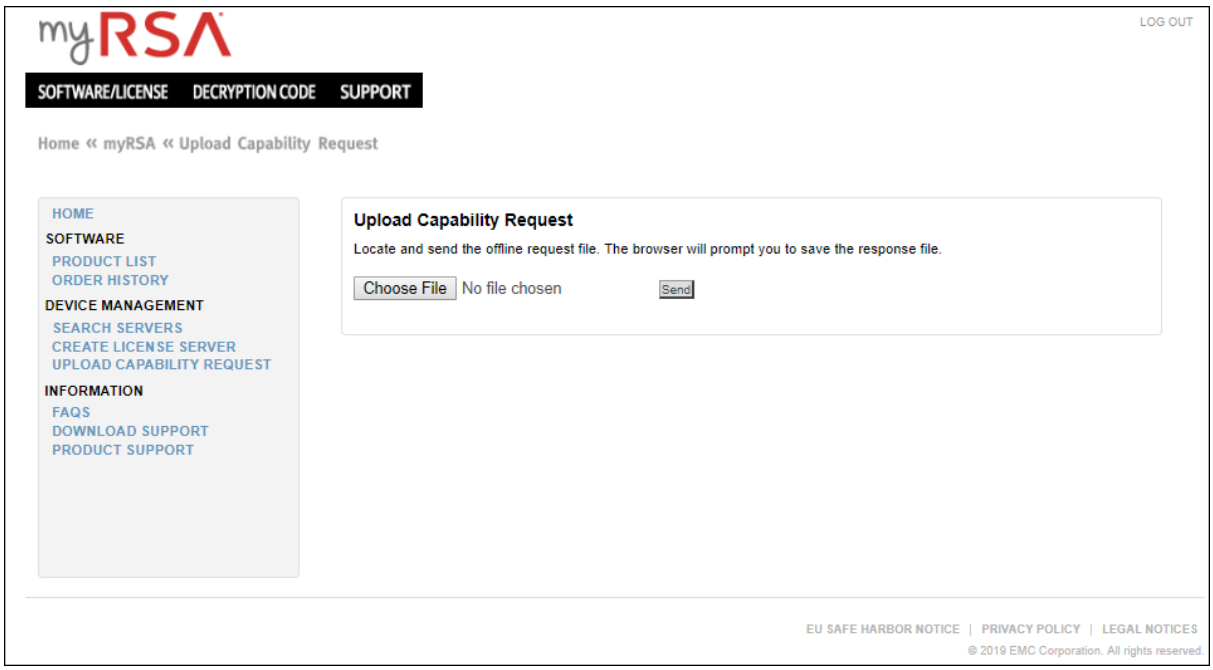


1. Go to  **(Admin) > System**.
2. Click **Licensing**.

   The License Details page is displayed.

3. Select the **Settings** tab.

   The Settings page is displayed.



4. In the **Step 1. Download Offline Request** panel, click **Download**.
   A file called **OfflineCapabilityRequest.bin** is downloaded to the local system.

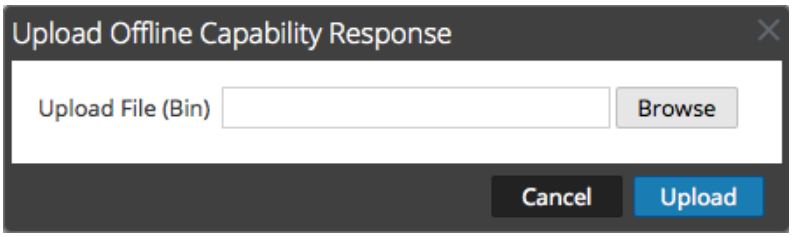
5. Login to the myRSA Portal at https://my.rsa.com/ with your user credentials.
6. Click on a service which needs to be licensed.

   Under **Device Management**, click **Upload Capability Request**.

   The **Upload Capability Request** dialog is displayed.

7. Click **Choose File** and browse the local file system to find the file downloaded from the NetWitness Server. Select **OfflineCapabilityRequest.bin**.

   The filename is displayed next to the **Choose File** button.



8. Click **Send**.
   The license data in a .bin file format is downloaded. The .bin file contains the data you entered as well as information about any entitlements that have been added to the NetWitness Server. If the server has just been added, there are no entries under **Add-Ons**. The server is registered and you can now map entitlements as described in the following sections.
9. After you download the .bin file from myRSA, login to NetWitness UI to upload the .bin file on the Settings page. For more information, see Upload an Offline Capability Response to NetWitness Platform.

Upload an Offline Capability Response to NetWitness Platform

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA. To upload an offline capability response (**response.bin**) file saved to the local file system from myRSA:

1. Follow the steps 1 to 3 mentioned in the Download a Capability Request for Submission to myRSA procedure.
2. Login to the NetWitness user interface.
3. Go to **(Admin) > System** > **Licensing** > **Settings** tab.
4. In the **Upload Offline Response** section, click **Upload Response**.

   A dialog to upload the file is displayed.

5. Browse and select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.

   The entitlements are uploaded to NetWitness and the licenses added to the grid in the **Licensing Details** tab. They are available for licensing appliances.

   After you have uploaded the entitlements, you can verify the synchronization by performing any one of the following:

   - To view results in NetWitness, go to **(Admin) > System**>**Licensing** > **Licensing Details** tab. The individual product entitlements that have been pulled down to NetWitness are displayed in the **Available/Total** column.
   - Within the myRSA interface, you can see the status for entitlements changed to **In Sync**.

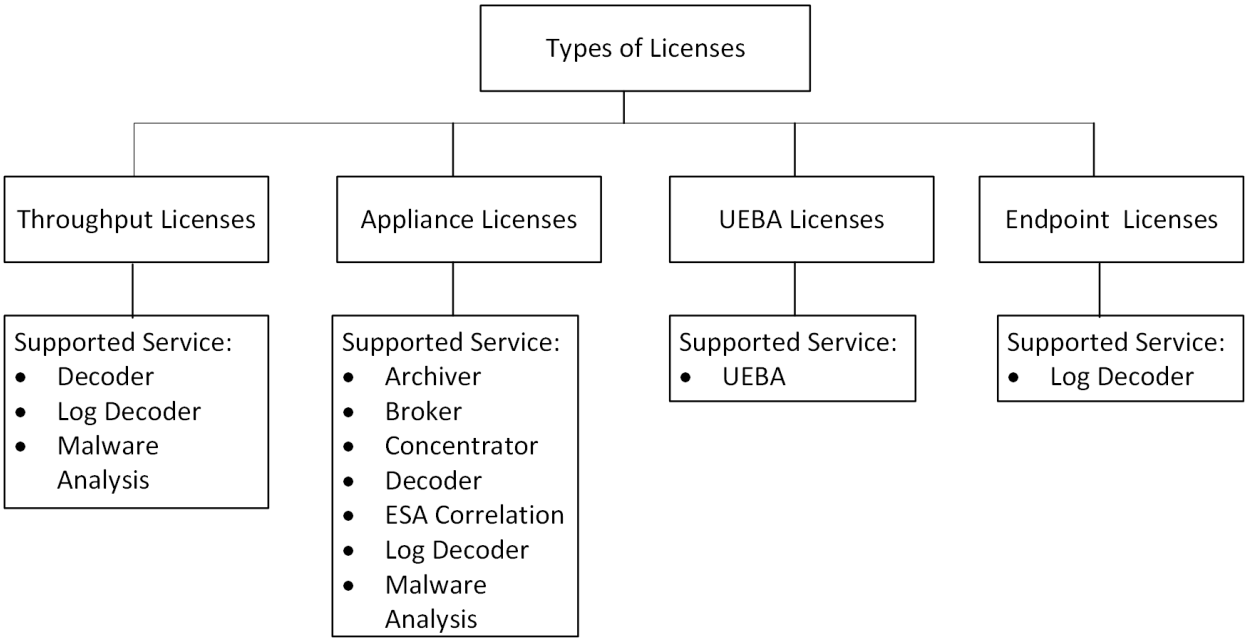
Refresh Licenses

When a new license is added, to map the view with the new license, click **Refresh Licenses.**

Refreshing your licenses performs the following behind-the-scenes tasks:

- Restarts the LLS server to ensure the latest licenses are pulled down from the central Flexera server.
- Associates any unlicensed service with a valid license (if available).
- Replaces expired or Out-of-the-Box license with valid licenses (if available).

License Types



After you have installed the NetWitness software and the required services, you need to acquire the relevant licenses for the each of the services or a group of services based on your requirements. NetWitnessentitlement uses a trust-based licensing model. Appliances continue to function as usual even when the license is out-of-compliance.

Choosing a License Type

The type of license you choose is based on your network requirements. The following types of licenses are available in NetWitness:

- Throughput License
- Appliance License
- UEBA (User and Entity Behavior Analytics)
- Endpoint License

Here is a chart, followed by a description of each license type available for the NetWitness Platform products and services.

Throughput Licenses

Throughput license are based on the amount of data used per day for logs (SIEM), or network (packets) or malware.

The throughput per day is measured in Gigabytes per day for logs, and in Terabytes per day for packets. The total amount of throughput is selected based on the total amount of throughput per day that is being licensed across your entire enterprise deployment of NetWitness Platform. This license is measured as follows:

Service	Unit of Measurement	Increments	License Duration
Network Decoder	Terabytes (TB) per day	1 TB	Subscription or perpetual
Log Decoder	Gigabytes (GB) per day	50 GB	Subscription or perpetual
Malware	Terabytes (TB) per day of Files Analyzed by Malware Analysis	1 TB	Subscription or perpetual

Note: In version 11.5 and later, NetWitness Platform introduced Network Meta-Only license in addition to the Network Full Packet license.

Network Full Packet License captures, analyzes, and stores packet payloads and metadata and allows users to retain the packet payload for analysis or for session reconstruction. Network Full Packet License measures the bytes analyzed and the bytes written to the disk for Network Packets.

Network Meta-Only License captures and analyzes packet payloads and discards the packet payload data after analysis. Using this license, NetWitness Platform can be deployed in an environment where full packet capture is not required. This helps to optimally manage the storage space, and easily detect threats without the need to retain the full payload of the sessions. Network Meta-Only License measures the bytes analyzed for Network Packets and can be used with or without the Network Full Packet License.

When customers have both - Network Meta-Only License and Network Full Packet Licenses, the entitlement is aggregated and measured against the bytes analyzed for Network Packets. However, the entitlement for bytes written to disk for Network Packets will continue to be measured against the Network Full Packet Licenses. The following table is an example of how the license is used and analyzed.

Available Licenses	Network Full Packet License	Network Meta-Only License	Network Packet Bytes Analyzed	Network Packet Bytes Written to Disk
10TB of Network Full Packet	10TB	0TB	10TB	10TB
10TB of Network Meta-Only	0TB	10TB	10TB	0TB
10TB of Network Full Packet 5TB of Network Meta-Only	10TB	5TB	15TB	10TB
5TB of Network Full Packet 10TB of Network Meta-Only	5TB	10TB	15TB	5TB

For more information on the status of your license, usage and out of compliance licenses, see About Out-of-Compliance Banners.

Appliance Licenses

NetWitness Platform supports the Appliance license, which is applicable to all hosts that require a license. Other services do not require a license. Appliance licenses are measured as follows:

- Services are licensed automatically if you have a valid appliance based license for a specific service to be licensed.
- Appliance licenses can be purchased as a perpetual license that does not expire and will have a maintenance contract. If you purchase a subscription license, then it will expire if you do not renew the contract.

User and Entity Behavior Analytics Licenses

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). UEBA monitors the number of active users from the previous day and sends it to the licensing server. The entitlement is measured for logs and endpoint events for the number of active users and is checked against a user id. If a threshold is identified in a calendar month an appropriate banner is displayed. For more information on banners, see About Out-of-Compliance Banners.

Note: There is no change in the license for multiple UEBA servers, as the license is based on the number of users monitored by UEBA.

Endpoint Licenses

Endpoint license are entitled based on the number of active agents deployed.

There are two types of agents:

- **Advanced Agents**: The license for these agents is based on the number of advanced agents in your deployment. A 90-days trail license period is provided. After the 90-days trial period, a zero MB and zero Agent license is applied to the Log Decoder service and Endpoint service in the NetWitness Endpoint Log Hybrid. Once an Endpoint license is applied any Archivers, Brokers, Concentrators, and ESA are automatically licensed as a result. An usage exceeded banner is displayed when the license goes out-of-compliance in the following scenarios:

  a. If the number of active agents exceeds the number of licensed agents

  b. If the Endpoint Subscription is about to expire in near future or has already expired.

  For example, if you have purchased a license for 50,000 agents and if the number of agents exceeds more than 50,000, the banner is displayed.

  Or, if you have purchased a license for 50k agents but have mapped the entitlements for only 10k agents on myRSA, an out-of-compliance banner is displayed when your usage exceeds these 10k active agents.

- **Insights Agents** - There is no license required for these agents if they are used to collect only endpoint data.
- **Log Collection with Endpoint Agents** - All Endpoint agents (Advanced or Insights) can forward Windows Log data only to a licensed Log Decoder (or Hybrid). Windows Logs sent to a licensed Log Decoder (or Hybrid) will count against either the applied Throughput or Appliance license. Logs may be retained in the NetWitness Endpoint Log Hybrid as long as a Log (SIEM) Throughput license with available capacity is available. In either case, a license for Logs is required, irrespective of the Insights or Advanced agent.

NetWitness Endpoint **4.4.0.x License**

If you have a **NetWitness Endpoint** 4.4.0.x license, you can use the same amount of license on NetWitness 11.6. For example, if you have purchased a 50,000 license for NetWitness Endpoint 4.4.0.x, you will get a 50,000 license on NetWitness Endpoint 4.4.0.x as well as on NetWitness 11.6. For more information on how to get a license for **NetWitness Endpoint 4.4.0.x**, see License for NetWitness Endpoint 4.4.0.x Agents.

Out-of-the-Box Trial License

NetWitness Platform comes with an OOTB 90-days trial license.

For Endpoint metered license, you will be provided with 0MB Log Decoder license. The 0MB license from the Log Decoder will be utilized after the 90-days trial period is complete. If you are still within the 90-days trial period and if you have an Endpoint Metered license, then the Log Decoder uses the remaining trial license. The Log Decoder will apply the 0MB license only after the trial license completed.

Configure License Support For Multiple NetWitness Servers

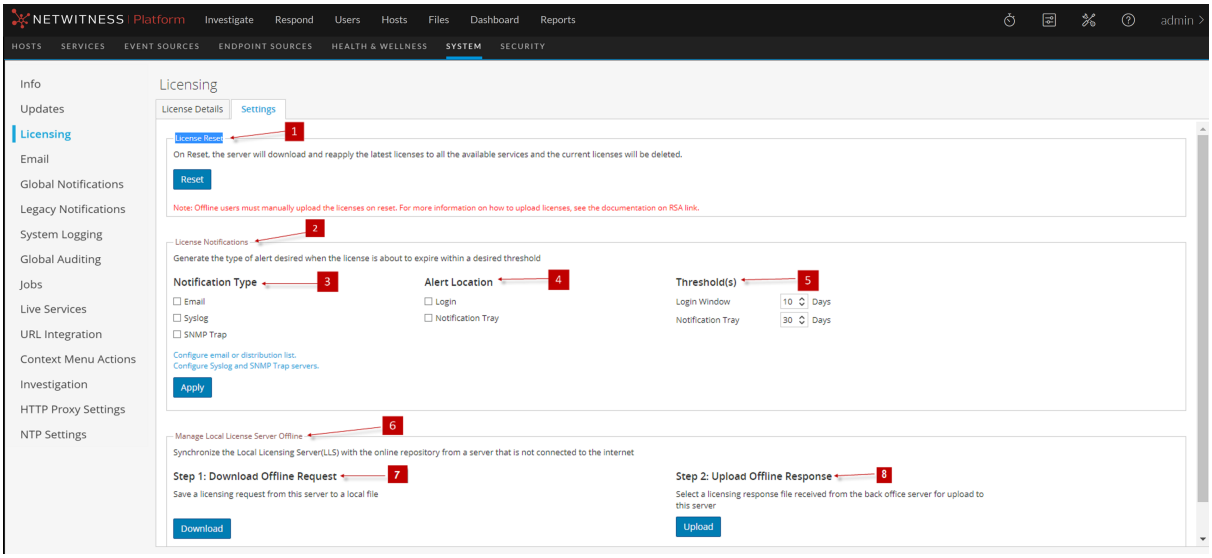
If you have multiple NetWitness servers deployed in your environment, and require license support, you must configure multiple Mac addresses.

To configure online:

1. Log in to the NetWitness Server console.
2. Navigate to /opt/netwitness/flexnetls.
3. Edit the local-configuration.yaml file and add the mac address of the back up or secondary host.
   For example, `backup-hostid: 685B3596A5F3` or `backup-hostid: "685B3596A5F3:785B3596A5F3"`.
4. Restart `systemctl restart flexnetls-RSALM`.
5. Obtain the instance details from `wget http://localhost:3333/api/1.0/instances` and set the `"failOverRole"` to `MAIN` to verify the failover.
   For example, `"failOverRole" : "MAIN"`.

To configure offline:

1. Perform the step 1 to step 6 from the online procedure .
2. Download the capability request from NetWitness UI.
3. Upload the request to FNO (myRSA).
4. Upload the response from FNO (myRSA) to the NetWitness UI.



Configure License Notifications

This topic provides instructions for configuring notification settings for the Local License Server (LLS). If you wish to receive alerts about the approaching license expiration date, you can configure NetWitness to send notifications. You can receive notification by email, syslog and SNMP. You can also view the notification during system log on and in the Notification Tray. You can also specify the number of days before expiration as a threshold for notification.

Note: In the Analyst UI, the license notifications will not be displayed in the notification tray or login window when the license goes out of compliance or when the license expires. This is displayed only on the Admin UI.

To configure the notification:

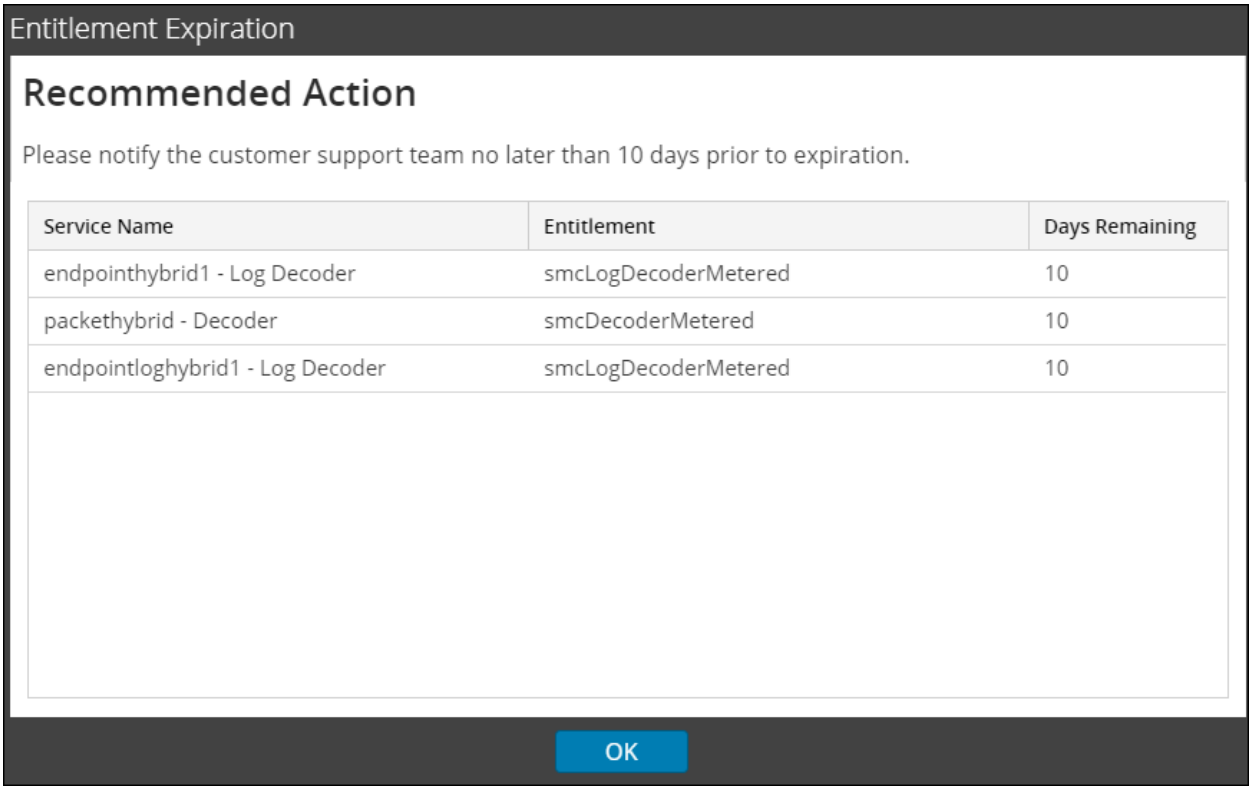
1. Go to  **(Admin) > System**.
2. Select **Licensing**.
3. Select the **Settings** tab.

4. Select each of the methods for NetWitness to use when sending a notification about the license status.
   a. To receive a notification at log on, select **Login** and specify the number of days before the license expires that you want to receive notification in the **Login Window Threshold** field.
   b. To receive a notification in the Notifications tray, select **Notification Tray** and specify the number of days before the license expires that you want to receive notification in the **Notification Tray Threshold** field.
   c. To receive an Email notification to a configured distribution list, select **Email** and select **Configure email or distribution list**. The Email panel is displayed in a separate tab, and you can

configure notifications in the Email Server Settings section. Refer to the *System Configuration Guide* for further details.

d. To receive syslog notifications, select **Syslog** and click **Configure Syslog and SNMP Trap servers**. The System Auditing panel opens in another tab and you can configure the system settings.

e. To receive notifications through SNMP Trap, select **SNMP Trap** and select **Configure Syslog and SNMP Trap servers.** The System Auditing panel opens in another tab and you can configure the SNMP auditing settings.



5. Click **Apply Notifications**.
   The settings are saved and go into effect immediately.

About Out-of-Compliance Banners

Banners let you know the status of your license and usage compliance.

Note: To help customers transition seamlessly to Throughput license for their network (packet) usage, NetWitness Platform provides a 45 days grace period. So, on upgrading to 11.6, you will not see the Out-of-Compliance notification or banner for 45 days from the day of upgrade for any network license usage. If you upgrade from 11.5.1 or later to 11.6, the available balance of the unused grace period will be applicable after the upgrade. For example
• If the grace period of 20 of the 45 days is used post upgrade to 11.5.1 or later then customers upgrading to 11.6 will get the remaining 25 days of the grace period.
• If the grace period of 45 days is used post upgrade to 11.5.1 or later the customers upgrading to 11.6 will not have any grace period left.

When a license for a specific service is about to expire, an **Entitlement Expiration** message is displayed with the list of services about to expire.

After you log on, either a red or yellow banner may be displayed, based on the license issue:

- A red banner is displayed if your license has expired, or exceeded the allotted usage, or if the license has internal errors.

Note: A red banner cannot be dismissed and the license issue must be resolved.

- A yellow banner is displayed if the license is approaching expiration or the license is nearing the allotted usage. The banner can be dismissed by clicking the **Reject** button.

Here is an of example of how the license usage is calculated and a way that you can resolve the license issues:

- Contracted daily usage can be exceeded three times in a calendar month. The fourth spike puts the system in an out-of-compliance state. If you are able to keep your usage within compliance for seven consecutive days until the end of calendar month, the Out-of-Compliance Red banner disappears.
- For example, if the fourth spike occurs on November 23, 2019, the Grace Period ends on December 31, 2019 and the Out-of-Compliance Red banner disappears.
- The breach period starts immediately after Grace Period ends. However, if your deployment is in a breach state, you can bring the state back to normal by keeping the usage in a compliant state for seven consecutive days.

Note: Even when the Red banner is displayed, there is no loss of functionality, all NetWitness appliances continue to work with full functionality. All other functionality is included in the license (ESA, storage, and so on).

Troubleshoot Licensing

This topic provides information about possible issues that NetWitness users may encounter when setting up licensing in NetWitness. You can look up explanations of issues and their solutions. NetWitness notifies users of issues using the popup notifications and the system log as described in the "Troubleshoot NetWitness" topic in the *System Maintenance Guide*.

Out-of-Compliance Banners

Problem	Possible Causes	Solutions
Yellow and Red Out-of-Compliance Banners	• A service is not licensed. • A license has expired, or is due to expire within the next two weeks. • Usage exceeds entitled limit. • Usage is approaching entitled limit.	• Contact Customer Support to buy or renew your license. • Reduce usage or • Adjust contracted usage amount

Common Log and Configuration Files

When troubleshooting licensing, the following files contain information that may help to diagnose the problem. Specific conditions for searching the files are described in the troubleshooting tables.

On the NetWitness Server, run `wget` for the following files after you ssh onto the NetWitness Server:

- `http://localhost:3333/api/1.0/features`
- `http://localhost:3333/api/1.0/instances`
- `http://localhost:3333//api/1.0/hostids`
- `http://localhost:3333/api/1.0/capability_request`

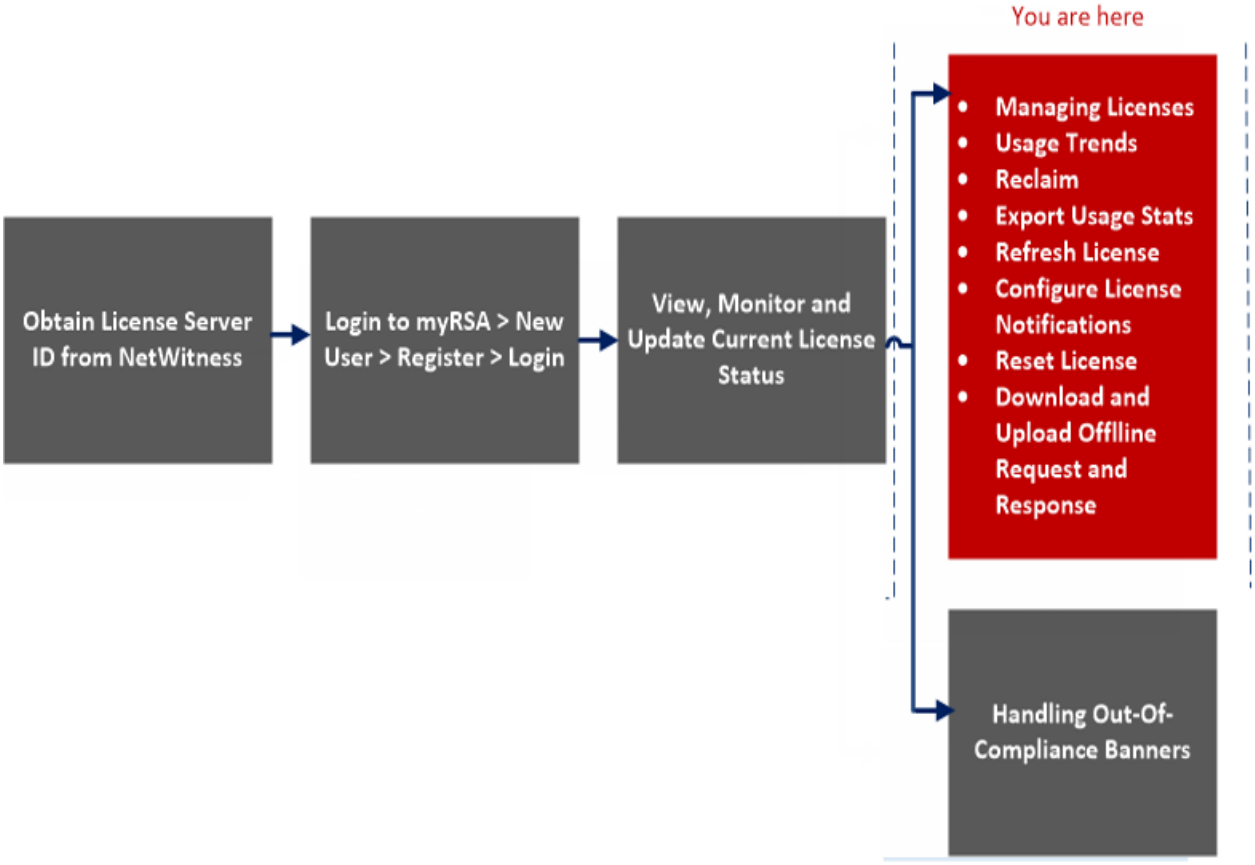
NetWitness Server Problems

This table lists possible problems with the NetWitness Server errors that can affect entitlements.

Problem	Possible Causes	Solutions
Some features have been mapped in the central Flexera server, but the NetWitness Server does not display them.	Ensure that the NetWitness Server is connected to the Internet.	To resolve the error execute a License Refresh as follows: 1. GSo to **(Admin) > Services > Licensing.** 2. In the License Details tab, click **Refresh Licenses**. **Note:** If the NetWitness Server is not connected to the Internet, try to synchronize offline. For more information, see Register the Server (Offline Capability Request)
NetWitness Platform Licensing page not showing any license information although there are services available.	Ensure that you have the required entitlements pulled down from the Central Flexera server.	To resolve the error execute a License Refresh as follows: 1. Go to **(Admin) > Services > Licensing**. 2. In the License Details tab, click **Refresh Licenses**.

Wrong License Mapping Issue

Problem	Possible Causes	Solution
Decoder license not available due to core appliances being removed from the NetWitness Server without releasing the license. Several core appliance licenses were not available for use.	Various possible causes.	Reset the license on NetWitness Server.



Problem	Possible Causes	Solution
Archiver DACs are not mapped to the license server with all other appliances' licenses.	Various possible causes.	1. Enter **1** in Quantity field to add for each license. 2. Select **Map Add-ons** at the bottom of the screen. 3. Click **Download Capability Request** and upload license to the Offline Capability Request in the User Interface under the **License** tab.
Two new appliances were installed: one Log Hybrid and one Log Archiver. Able to license the Log Hybrid, but the following error occurred when attempting to license the Archiver: "There is an issue with registering your product, please contact NetWitness Customer Support." Also, one of the Concentrators showed as a Trial license, and a separate Log Decoder showed as a Trial license when they should be licensed.	The new entitlements are not mapped to the license server.	Map add-ons to myRSA and upload the `.bin` file into the NetWitness User Interface.

License Details

This topic introduces the features of the System Licensing panel. NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS.

Workflow

This workflow shows the end-to-end licensing process.

Related Topics

- Settings
- View and Export Usage Stats

Note: On initial start up, the usage shown in the Licensing page displays zero usage for the initial one hour.

Quick Look

The following table describes the features of the License Details tab.

1 **Refresh Licenses**:Refreshes and maps the new licenses.

2 Displays the following details of the Throughput license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the entitled usage for aggregate as well as individual services .
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services.
- **Expiry Date** - Displays the expiry date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Reassigns an extensively used Throughput license to another unused Throughput license. This is applicable only for Throughput and Appliance license.

3 Displays the following details of the Appliance license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Available/Total** - Displays the number of available license and the total number of licenses.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Move the license from Appliance to Throughput license.
  - **Reclaim**: This option gets activated when any appliance service is down. When you click **Reclaim** the license becomes available in the pool of the specific license service. This is applicable only for Appliance license.

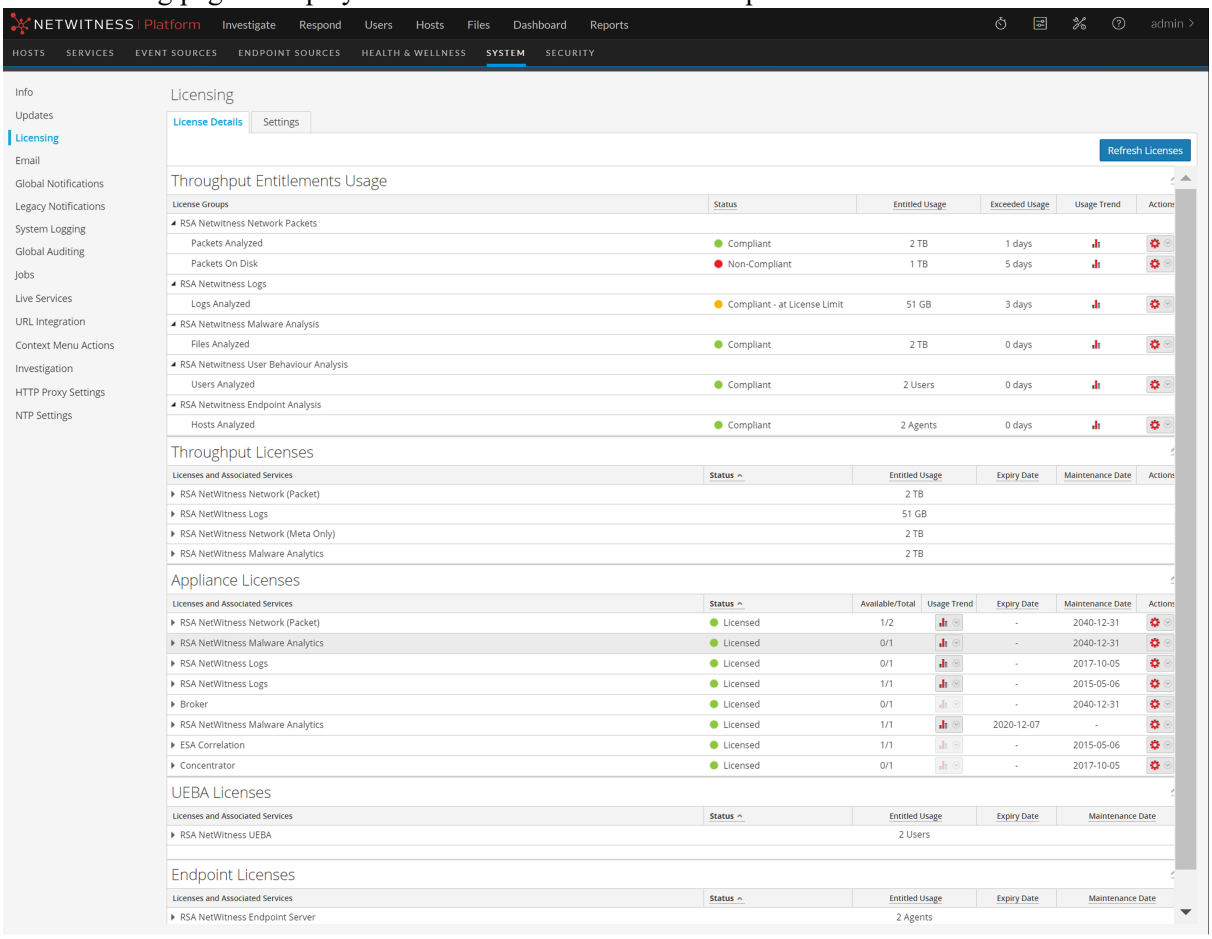
4 Displays the following details of UEBA license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near

Usage Limit, and Within Usage limit.

- **Entitled Usage** - Displays the number of entitled users.
- **Actual Usage** - Displays the daily active users.
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**

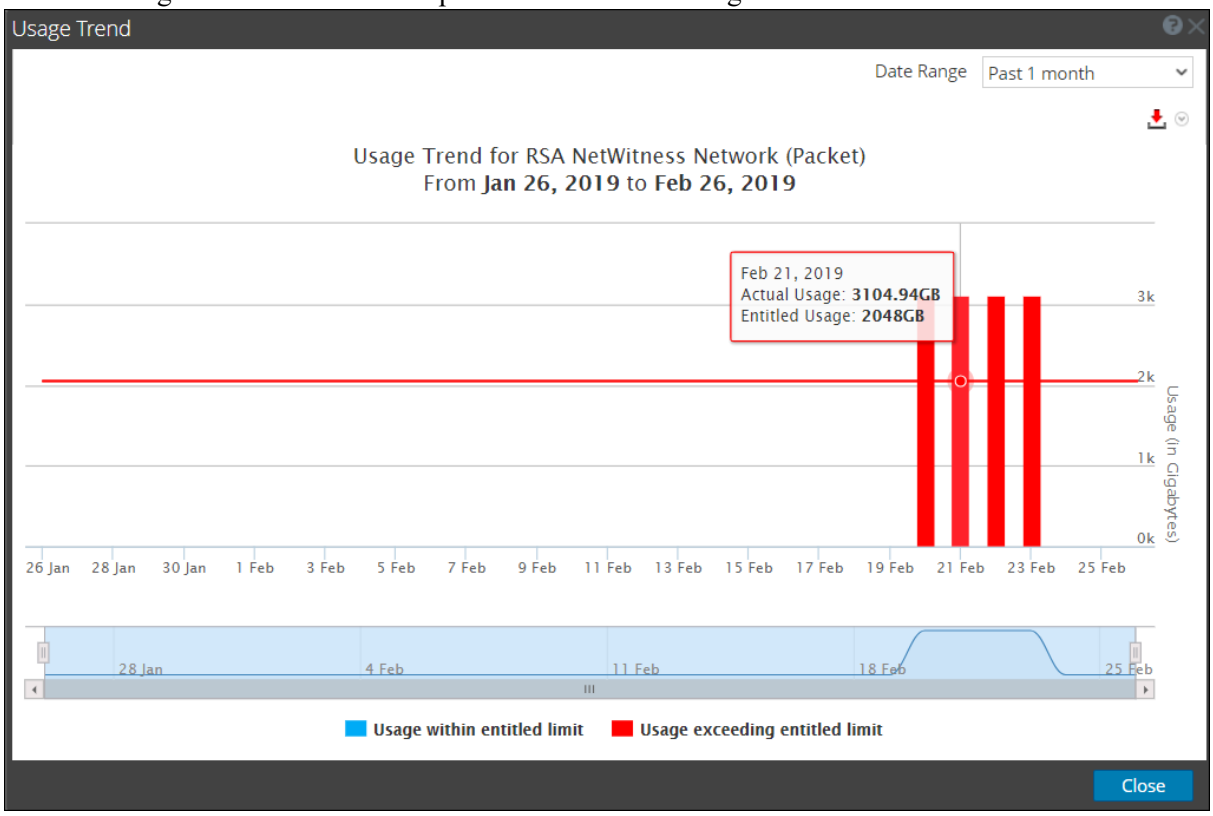
5 Displays the following details of Endpoint license or licenses.



- **License and Associated Service** - Displays the license and the services assigned to it. For example, Endpoint Hybrid or Endpoint Log Hybrid.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the users of the entitled agents .
- **Actual Usage** - Displays the number of daily active agents .
- **Exceeded Usage** - Displays the number of days on which the actual number of agents exceeded the entitled threshold.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time.
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**

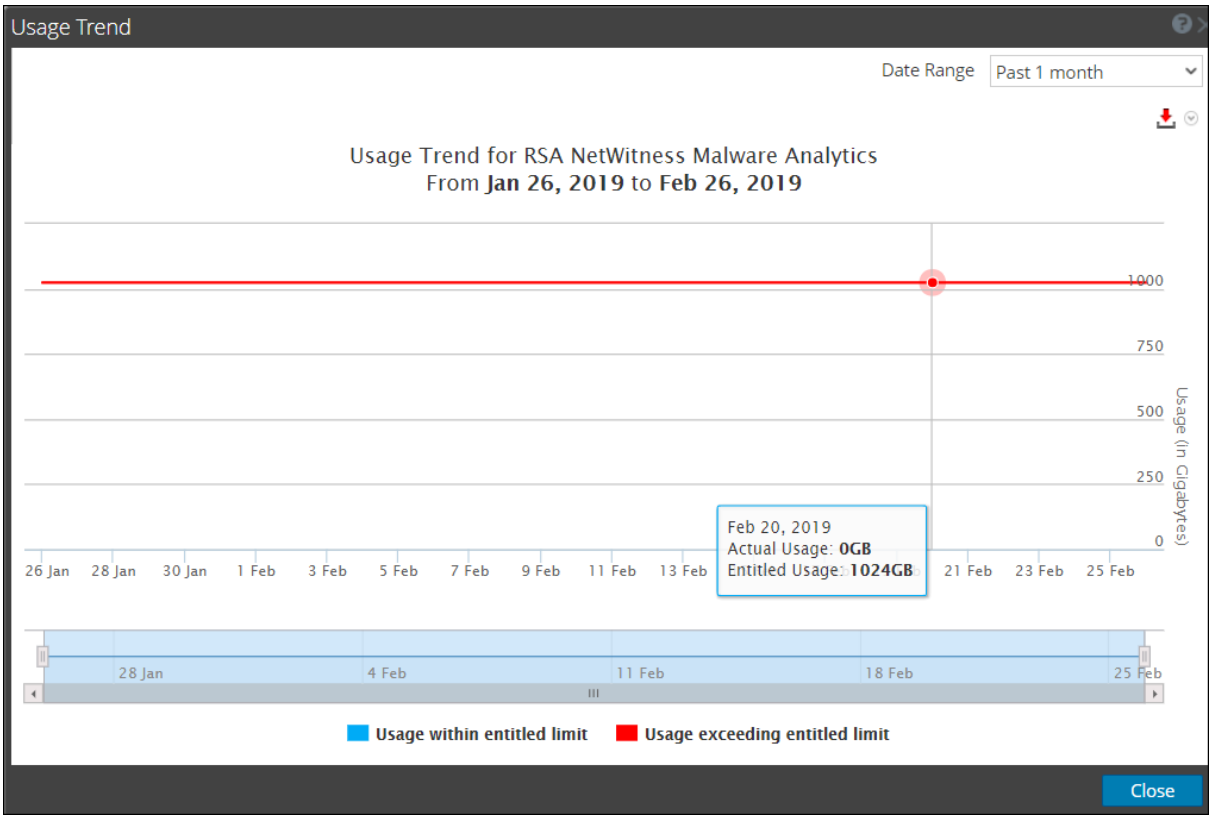
Usage Trends

You can view the usage trend for aggregate licenses as well as individual licenses. The data is displayed for each day. When you click the usage trend icon, it opens a new window and displays the usage data as a chart. The user can use this data to analyze the license usage in the deployment.

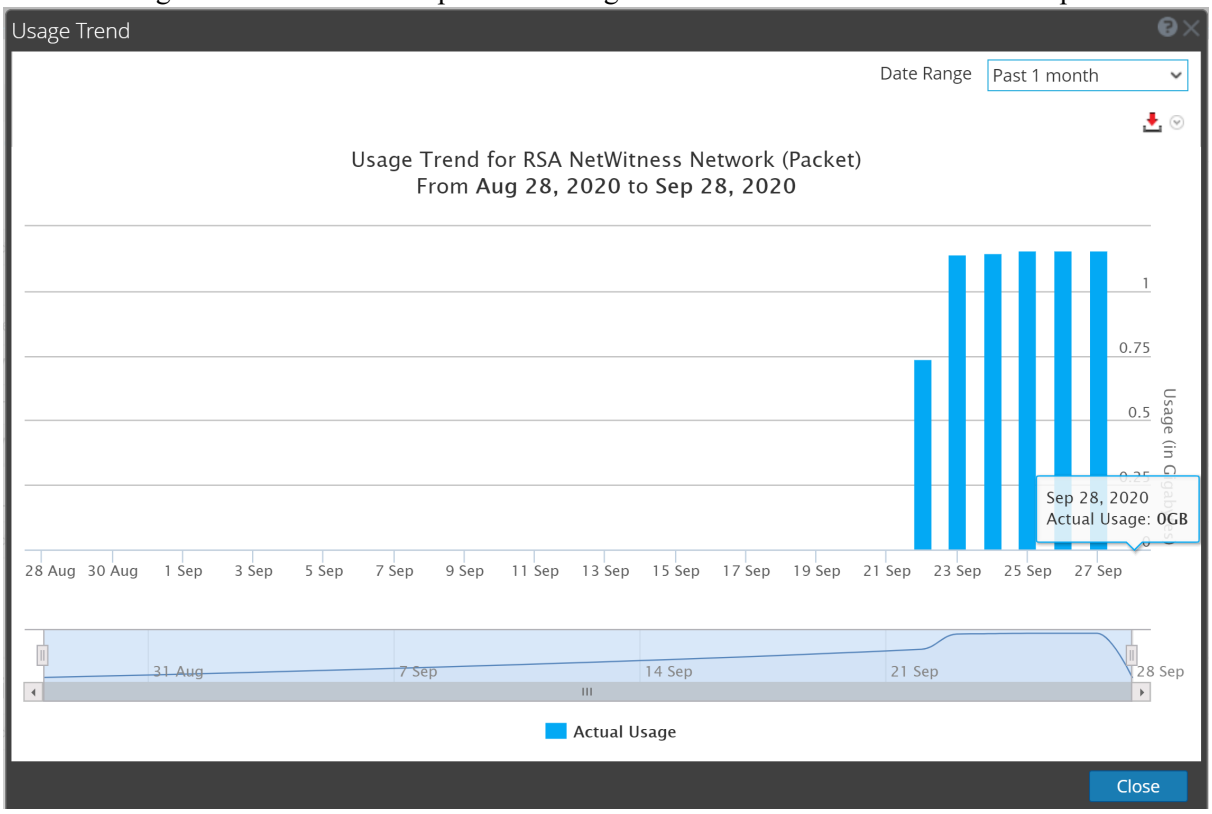


To access this view:

1. Go  (Admin) > **System** and select **Licensing**.
   The Licensing page is displayed with the License Details tab opens.



2. Select a service or license and click the  icon under the Usage Trend column.
   The Usage Trend window is displayed.



The following screenshot is an example of the Exceeded Usage Trend.

The following screenshot is an example of Within Limits Exceeded Usage Trend.

Usage Trend

Usage within entitled limit
Usage exceeding entitled limit
Close

The following screenshot is an example of the Usage Trend chart for a license with multiple services.

The threshold limit is indicated as a horizontal red-dotted line across the chart. When actual data usage exceeds the entitled daily usage, those days are indicated by red colored bars.
The chart can be generated to collect data for 1 month, 3 months, 6 months, 12 months or custom date range.

These charts can be exported in CSV, and PDF formats by clicking the icon.

Note: The maximum range for which trend can be viewed is 12 months. The pan-zoom bar at the bottom of the chart can be used to narrow the chart to a smaller time range for better visibility in that range.

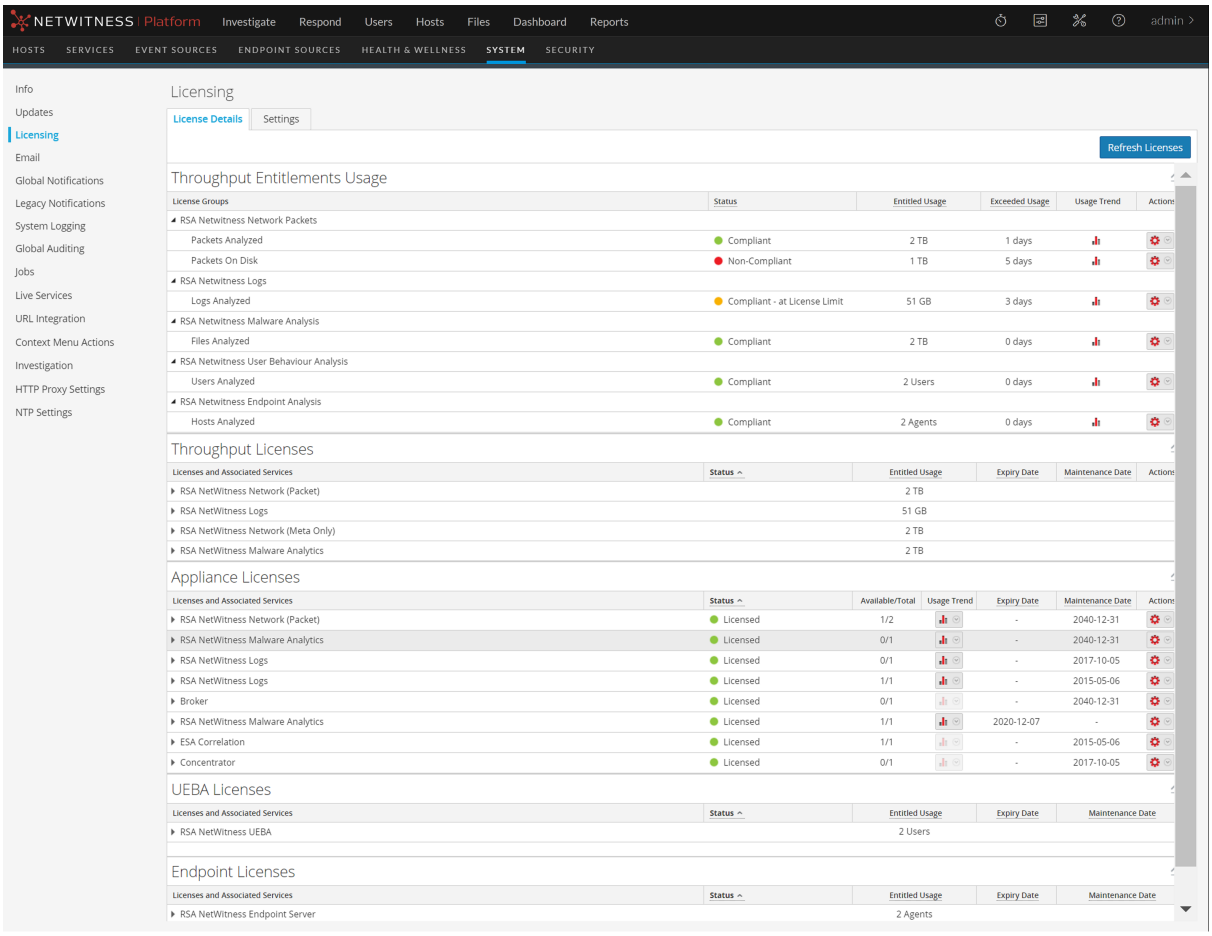
If the entitled limit exceeds the usage limit then an appropriate out-of-compliance banner is displayed. For more information, see About Out-of-Compliance Banners.

Reassign Service Licenses

You can move service between licenses only if a similar service license is available.

You can move the services between the following licenses.

- Throughput License to Throughput License
- Throughput License to Appliance License
- Appliance License to Throughput License
- Appliance License to Appliance License

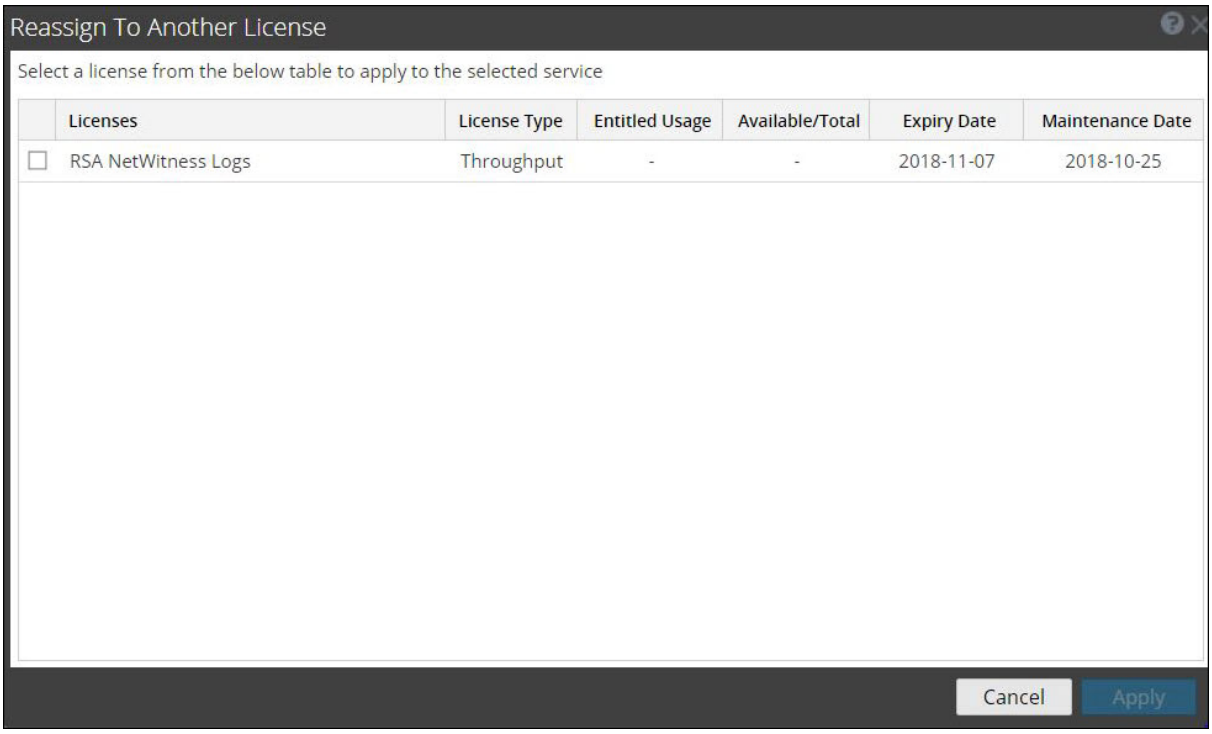


Note: If you want to change the licenses by moving between throughput and appliance, you can do this by selecting the license under the actions of each license. Trail licenses cannot be moved.

You can move the licenses for following reasons:

1. If the subscription based license has expired
2. If there are any unused available license for any service
3. If you want to reduce the usage of the service

To access this view:



1. Go  **(Admin) > System** and select **Licensing**.
   The License Details tab is displayed.

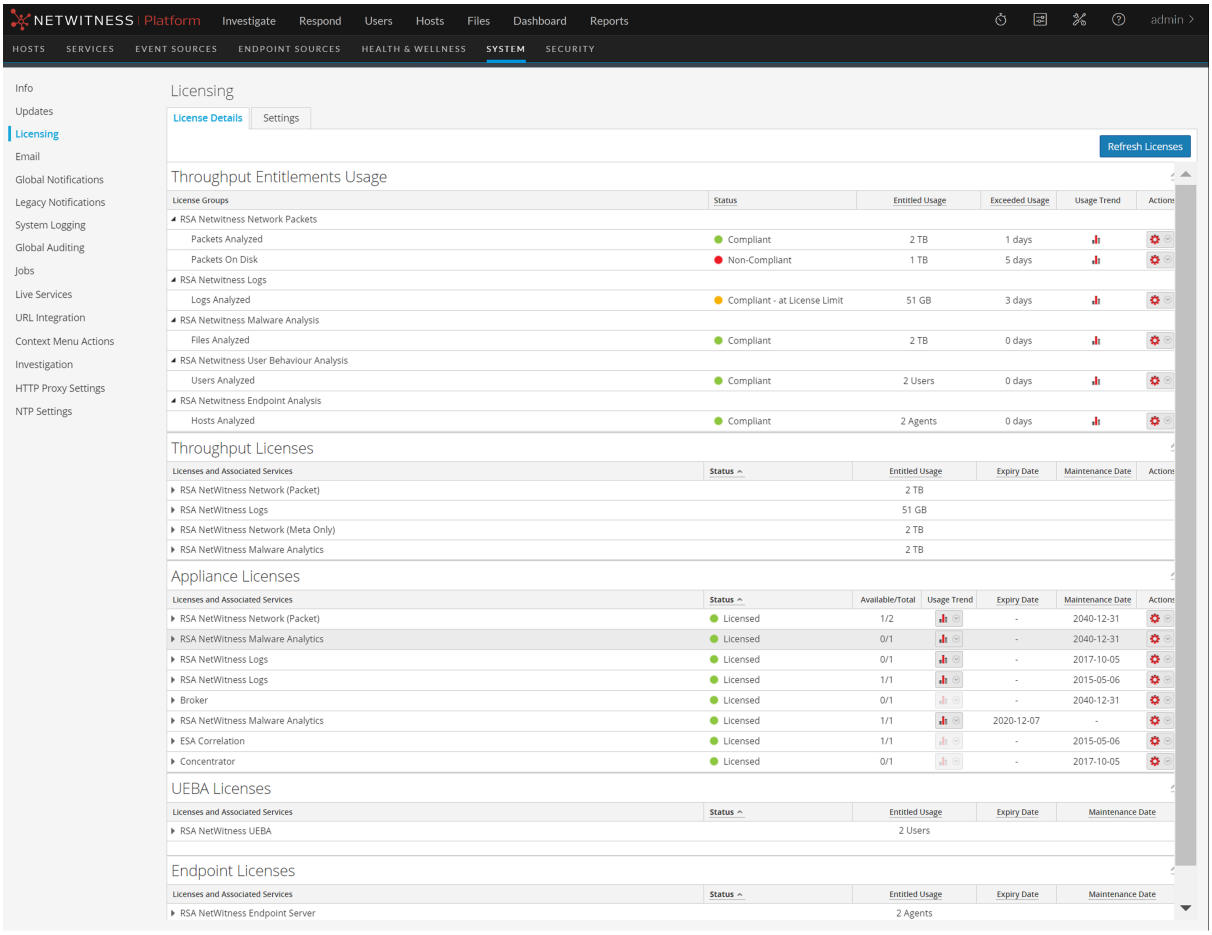
2. Select a service of which you want to move the license.

3. Click , and select the **Reassign to Another License** option.

   The Reassign To Another License dialog is displayed with a list of the available licenses that can be moved.

4. Select a license to be applied for the selected service.
5. Click **Apply**.

Note: The above procedure can be used to move both Throughput Licenses and Appliance Licenses. However, the UEBA and Endpoint licenses cannot be moved.



View and Export Usage Stats

NetWitness provides the ability for Administrators to view usage statistics of device types that are eligible for a Throughput , Appliance Licenses such as Log Decoder, Decoder, Malware, UEBA, and Endpoint Server licenses. An hourly usage statistics is captured for all supported services connected to the NetWitness Server and are made available in CSV, and PDF formats. Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

To access Export Usage Stats:

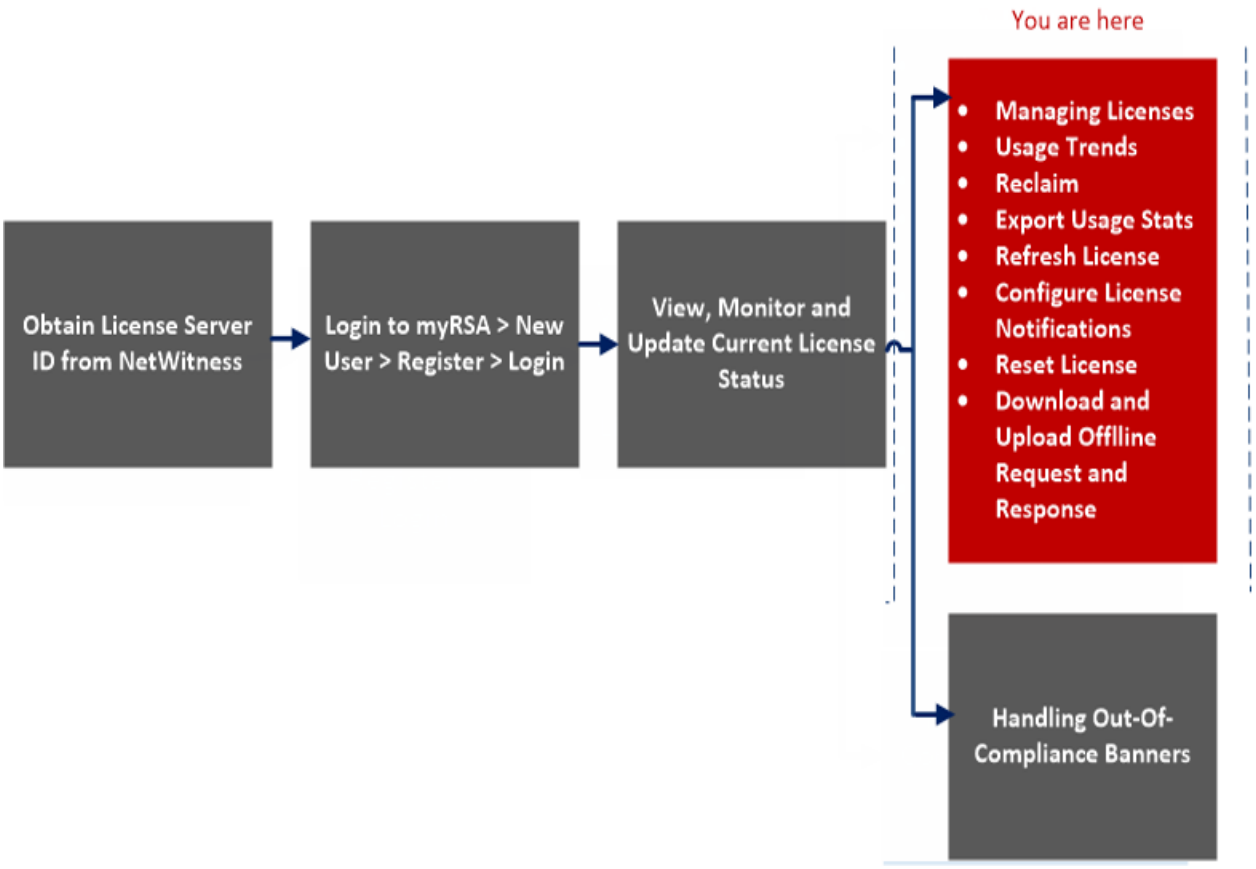
1. Go  **(Admin) > System** and select **Licensing**.

   The License Details tab is displayed.

2. Select a service for which you want to export usage stats.

3. Click  , and select the **Export Usage Stats** option.

   The **Export Usage Stats** dialog is displayed.



4. Select a **Preset Range**, **Date Range** (in case of custom range), **Format** and **Aggregation Type** to generate the report.
5. Click **Export** to export the report or click **Cancel** to return to the **License Details** tab.

Settings

This topic describes the notification settings for the NetWitness in the **Licensing panel** > **Settings** tab.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how...

Obtain License Server ID from NetWitness Platform User Interface

Configure License Notifications

Quick Look

From the **Settings** tab you can:

- Configure licensing notifications.
- Download an Offline Capability Request in NetWitness for submission to DLC.
- Within 72 hours, upload to NetWitness an Offline Response that was received from DLC.

The following table describes the **Settings** tab features.

1	Displays the **License Reset** panel which applies the default license settings.
2	Displays the **Licensing Notifications** panel.
3	Displays the **Notification Type**. There are three types of notifications: • **Email:** Checkbox to receive a notification of approaching license expiration in an email message. The email is sent to the configured email or distribution list. • **Syslog:** Checkbox to receive a notification of approaching license expiration in an syslog message. The syslog is generated in accordance with the settings in the Syslog Auditing Settings. • **SNMP Trap:** Checkbox to receive a notification of approaching license expiration in an SNMP trap. The trap is generated in accordance with the settings in the SNMP Auditing

	Settings.
4	Displays the type of **Alert Notification**. • **Login:** Select this checkbox to receive a notification of your approaching license expiration when you log on to NetWitness. The **Login Window Threshold** field specifies the number of days before the license expires to display the notification at log on. • **Notification Tray:** Select this checkbox to receive a notification of approaching license expiration in the Notifications tray.
5	Displays the **Threshold** field, which specifies the number of days before the license expires to send a notification to the Notifications tray.
6	Displays the **Manage Local License Server Offline** panel.
7	Displays the **Download Offline Request** button. This button enables you to download a request from the NetWitness Platform LLS into a local file for processing by a back-office server. The downloaded bin file should be uploaded to DLC to generate the offline response.
8	Displays the **Upload Offline Request** button. This button enables you to browse for an offline response that you received from the back-office server, and uploads the selected response to NetWitness. The file must be uploaded within 72 hours after receiving the file.

Out-of-Compliance Reference

This topic describes the workflow when your license is out of compliance.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Register NetWitness Server	Obtain License Server ID from NetWitness Platform User Interface
Administrator	Synchronize NetWitness Server	Register the Server (Online Registration)
Administrator	Install product licenses from DLC.	Access myRSA
Administrator	Monitor and update current licenses.	View Current Licenses
Administrator	Configure licensing notifications.	Configure License Notifications
Administrator	*View Out-of-Compliance banners.	About Out-of-Compliance Banners

*You can perform this task here.

Note: When throughput devices are under trial period, warning messages will not be displayed unless usage is observed on the corresponding device.

Out-of-Compliance State

The following sample banner is displayed when a license expires:

If your license has internal errors, the following banner is displayed:

In addition to a red banner being displayed during system log on, an Out of Compliance Acknowledgment dialog is also displayed. Click **Accept** to continue using your NetWitness product.

Licenses may become out-of-compliance due to reasons provided in the following table:

Red Banner Message	Possible Causes	Solutions
One or more services is not licensed.	Trial license period has expired. There are pre-11.0.0.0 services in the deployment that are not licensed.	Contact Sales team to procure a NetWitness license. Upgrade the services to NetWitness version 11.0.0.0 or later.
One or more licenses is expired.	Log ingestion usage has been observed after the date of renewal. The license is not valid anymore for the corresponding usage.	Contact Sales team to renew or resolve the license.
You have exceeded license usage limits.	If the allotted daily usage is exceeded on four or more occasions, the Grace Period begins. The Grace Period begins on the day of the fourth occurrence and ends at the end of the following calendar month. Seven continuous days of standard usage will end the Grace Period. If the daily allotted usage is still being exceeded at the end of the Grace Period, the 30-day Breach Period begins. Seven continuous days of standard usage will end the Breach Period.	Contact Sales to extend or increase your allotted usage by purchasing a NetWitness license.

Red Banner Message	Possible Causes	Solutions
Your Trial license has internal errors.	An internal licensing issue was reported during your Out-of-the-Box Trial period.	Contact Technical Support to resolve this issue.

Note: If a license has not been installed within 90 days, you must contact Sales to purchase a NetWitness license.

License Approaching Out-of-Compliance

When your license is approaching expiration, or it is nearing its allotted usage, a yellow banner with a brief description is displayed. A yellow banner is displayed 14 days before your license is due to expire. You will also see a yellow banner if you are approaching your allotted license usage. You can get rid of the yellow banner by clicking the **Dismiss** button.

The following sample banner is displayed in the NetWitness screen if your license is approaching its allotted usage:

The following table explains the messages that are displayed when you see a yellow banner.

Yellow Banner Message	Possible Causes	Solutions
You are nearing license usage limits.	One or more Throughput licenses has exceeded your allotted usage for three times during the current calendar month. The fourth time that you exceed your allotted usage during the current month will push the deployment into an Out-of-Compliance state.	Contact NetWitness Sales if your allotted usage spikes four times within a calendar month.
One or more licenses is expiring.	One or more licenses is due to expire within 14 days. Or Log ingestion usage has been observed. The license is not valid anymore for the corresponding usage.	Contact NetWitness Sales to purchase a new license.

License Usage Calculations for Decoder and Log Decoder Services

This topic provides information about license usage calculations for Decoder and Log Decoder Services.

- Decoder and Log Decoder generate stats called **Capture Bytes Processed** which is used for license usage calculations.
- Decoders also generate stats known as **Packet Write Bytes** in addition to **Capture Bytes Processed**.
- Every hour, the system compares the current reading with the previous hour's usage.
  - If the current reading is greater than or equal to the previous hour's usage, calculate the per-hour usage as the difference: **currentHourUsage = currentReading - previousHourUsage**.
  - If the current value is less than the previous hour's usage, it indicates a Decoder restart. In this case, set **currentHourUsage = currentReading**.
- At the end of the day, combine the usages of each individual hour for that day.
- The same calculation is carried out for each licensed Decoder in the environment.
- The combined usage of **Capture Bytes Processed** per day of all Log Decoders is shown under **Logs Analyzed**.
- The combined usage of **Capture Bytes Processed** per day of all decoders is shown under **Packets Analyzed**.
- The combined usage of **Packet Write Bytes** per day of all decoders is shown under **Packets on disk**.

Note:
- All the calculations are done based on UTC time.
- The daily usages shown on the UI is also based on UTC, irrespective of the timezone set in the user profile.

Live Services Management

NetWitness Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

NetWitness Live

Live is the component of NetWitness that manages communication and synchronization between NetWitness services and a library of Live content available to NetWitness customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Live Content Management System to NetWitness services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

Note: Any customer with valid maintenance can access NetWitness Live.

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

NetWitness Feedback and Data Sharing

Live Feedback is intended to help improve NetWitness. Once you set up and configure a Live account, usage data is shared with RSA.

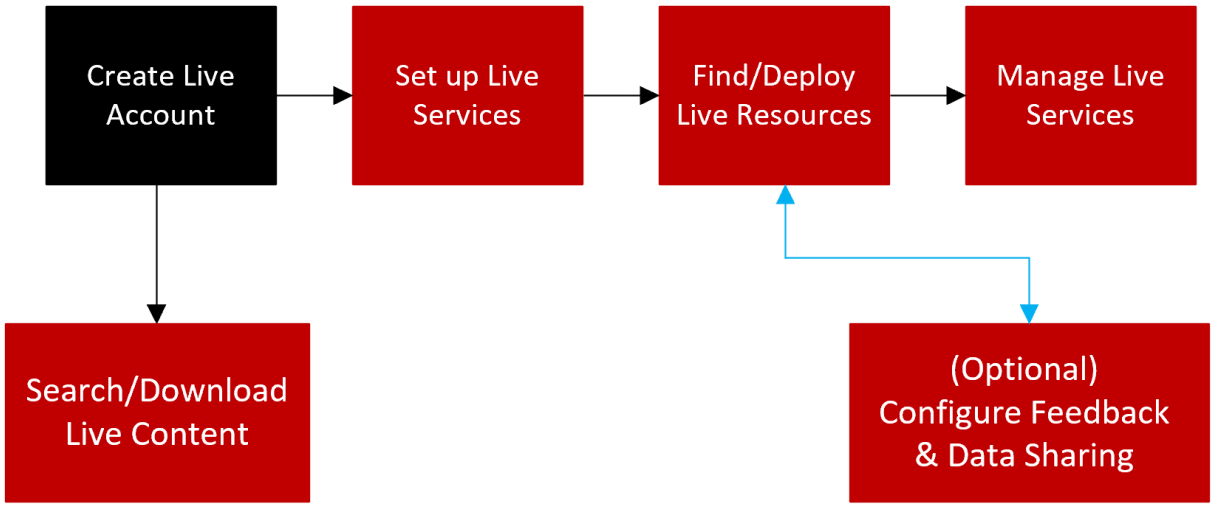
For more details, see NetWitness Feedback and Data Sharing.

For Debian Linux and NetWitness Endpoint Users

If you are upgrading to NetWitness 11.5 or later, and you are using NetWitness Endpoint and also have any Debian Linux endpoint systems, NetWitness recommends that you go to Live and download the following application rules:

- autorun debian package mismatch
- autorun file path not part of debian package
- debian package hash mismatch in important system directory
- debian package hash mismatch
- file path not part of debian package in important system directory
- file path not part of debian package

Deploy Content



This section explains the different ways available to deploy content:

- Deploy Content using Live Content UI
- Centrally Deploy Content using Policy UI

Create Live Account

Note: The NetWitness Live Registration Portal now has a new user interface and supports email verification.

You must create a Live account using the NetWitness Live Registration Portal (https://live.netwitness.com/registration/) on the Live server. Live Account is required to access all Live services including CMS. The CMS Library provides access to all NetWitness content in one place where you can view, search, deploy, and subscribe to NetWitness content.

Make sure the following are available to set up a NetWitness Live account:

- Active internet connection to access the portal.
- A valid and registered NetWitness License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **(Admin) > System > Info** panel.

Note: If the License Server is not set up, contact NetWitness Customer Support.

To create a Live Account:

1. Access the NetWitness Live Registration Portal using the URL: https://live.netwitness.com/

   The NetWitness Live log in page is displayed.

2. Click **Sign Up For Live**.

   The End User License Agreement page is displayed.

   Read the Terms and Conditions carefully and click **Accept**.

3. In the **Sign Up for NetWitness Live Account** page, enter all the fields:
   - The **First Name** and **Last Name** of the user.
   - The **Company** for which the Live Account is being created.
   - The **Email address** you enter will be used to receive the verification code for your new Live account and other notifications related to the Live account.
   - The **License ID** can be viewed on  **(Admin) > System > Info** panel.

- The **Username** and **Password** for the Live Account.

4. Click **Create Account**.
   You will be directed to **Confirm Sign up** page.
5. Enter the **Confirmation Code** sent to your registered email address.
   Click **Confirm**.
   You can see the confirmation message for your NetWitness Live Account registration.

   Note: You cannot create more than one Live account for the same License ID. For additional license, contact NetWitness Customer Support.
6. Once the account is created, enter your credentials and click **Sign In** to access the NetWitness Live.
7. After you sign in, you can perform the following:
   - Search and Download Content from NetWitness Live
   - Share Telemetry Data to NetWitness

Reset the Password for Your NetWitness Live Account

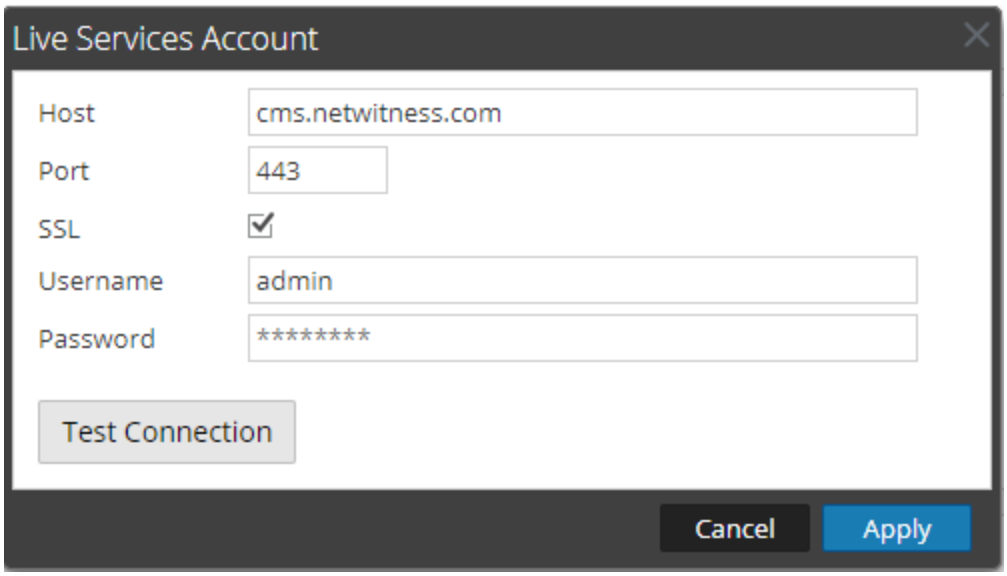
If you want to reset the password for your NetWitness Live Account, do the following:

1. Access the NetWitness Live Registration Portal using the URL:

   https://live.netwitness.com/

   The NetWitness Live log in page is displayed.

2. On the Sign Up page, click **Forgot Password?**.
3. Enter your **Username** and click **Send Code**.
   A verification code will be sent to your registered email address.
4. Enter the **Verification Code** and **New Password** on the Reset Password page and click **Submit**.



Set Up Live Services on NetWitness Platform

To set up Live on NetWitness Platform, you configure the connection and synchronization between the CMS server and NetWitness. The user interface for this setup is the **(Admin) > System > Live Services** Configuration panel.

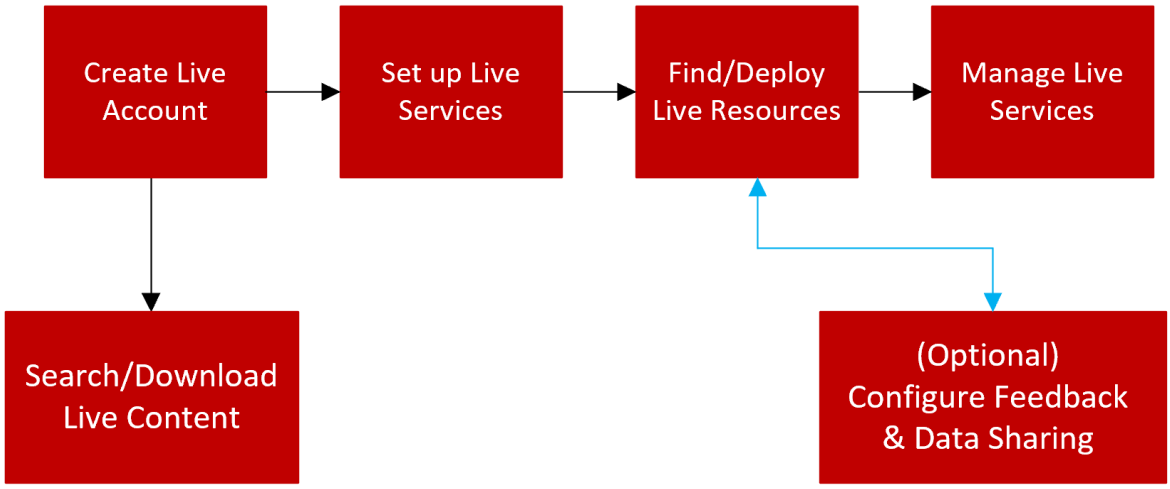
To configure the connection to the CMS Server:

1. Navigate to **(Admin) > System > Live Services**.
2. Click Sign In and enter your credentials in the Live Services Account dialog box.

3. Click Test Connection to make sure your connection is working.

4. If the test is successful, click **Apply**. If not, contact NetWitness Customer Support for help connecting to the Live server.
5. Configure the timing for synchronization of NetWitness Platform with updates from NetWitness Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

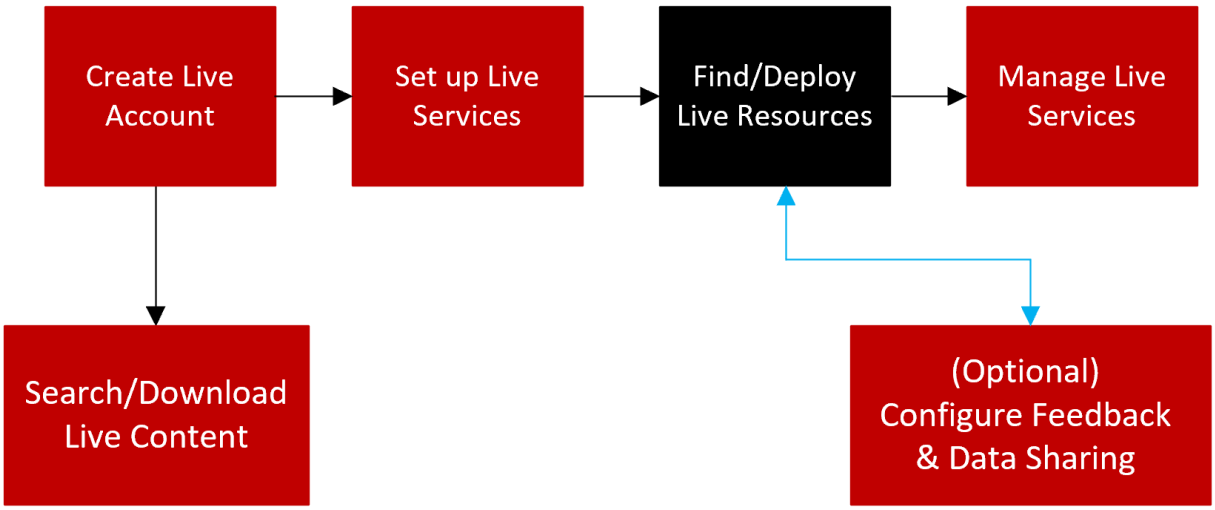


Deploy Content using Live Content UI

This topic explains the process of deploying the content using Live Content UI.

- Live Services Required Procedures
- Additional Procedures
- References
- Troubleshooting Live Services

Live Services Required Procedures

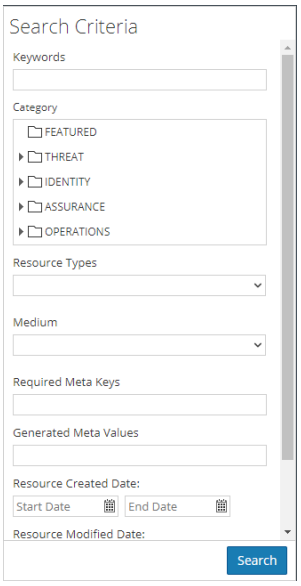


The following workflow describes the basic setup into four steps, which you perform individually.

Configuration Step	Description
Create Live Account	Create a Live Account on the NetWitness Live Registration portal URL: https://live.netwitness.com/registration/.
Set Up Live Services on NetWitness Platform	Set Up Live Services on NetWitness Platform by configuring a connection with the CMS server.
Find and Deploy Live Resources	Search and browse for resources in the Live Search view, and then, deploy the selected resources.
Manage Live Resources	Procedures for administrators to search for, subscribe to, and deploy resources from Live.
Search and Download Content from NetWitness Live	Search and browse for content in the NetWitness Live, and then, download the selected content.
NetWitness Feedback and Data Sharing	Describes the feedback and data sharing features provided in NetWitness, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community.

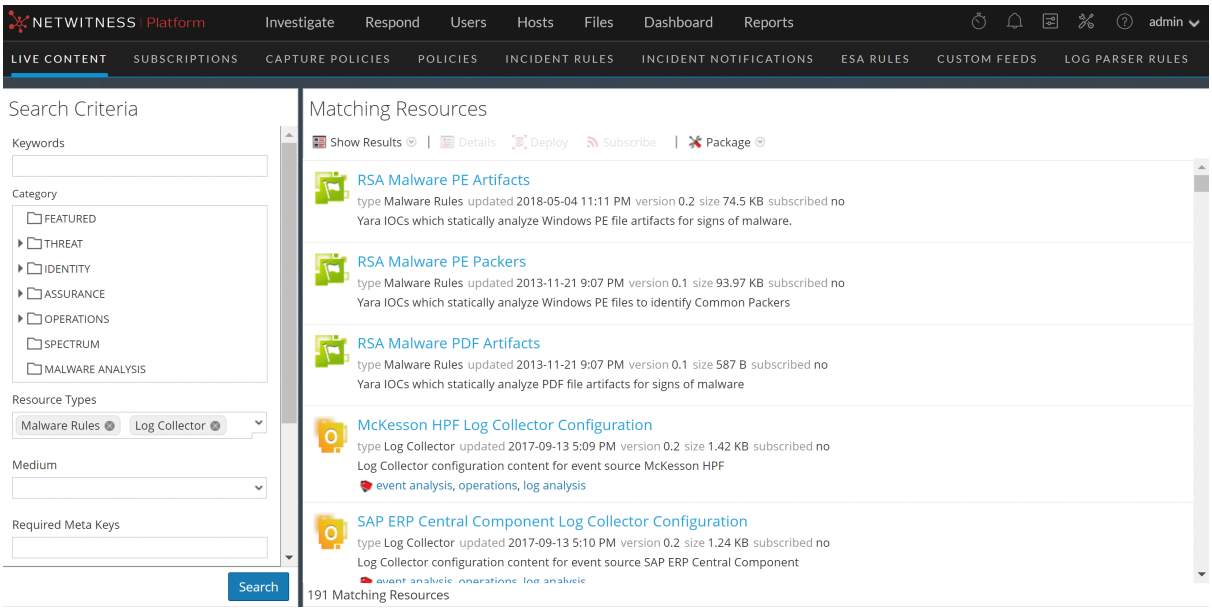
Find and Deploy Live Resources

Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



Find Resources in Live

IMPORTANT: ESA Rules cannot be deployed manually via Live Services. By default, all the ESA rules are available in the ESA Rule library if Live Service is configured.



To find resources:

1. Navigate to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.

3. Click **Search**.

   The Matching Resources panel displays detailed results.

4. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

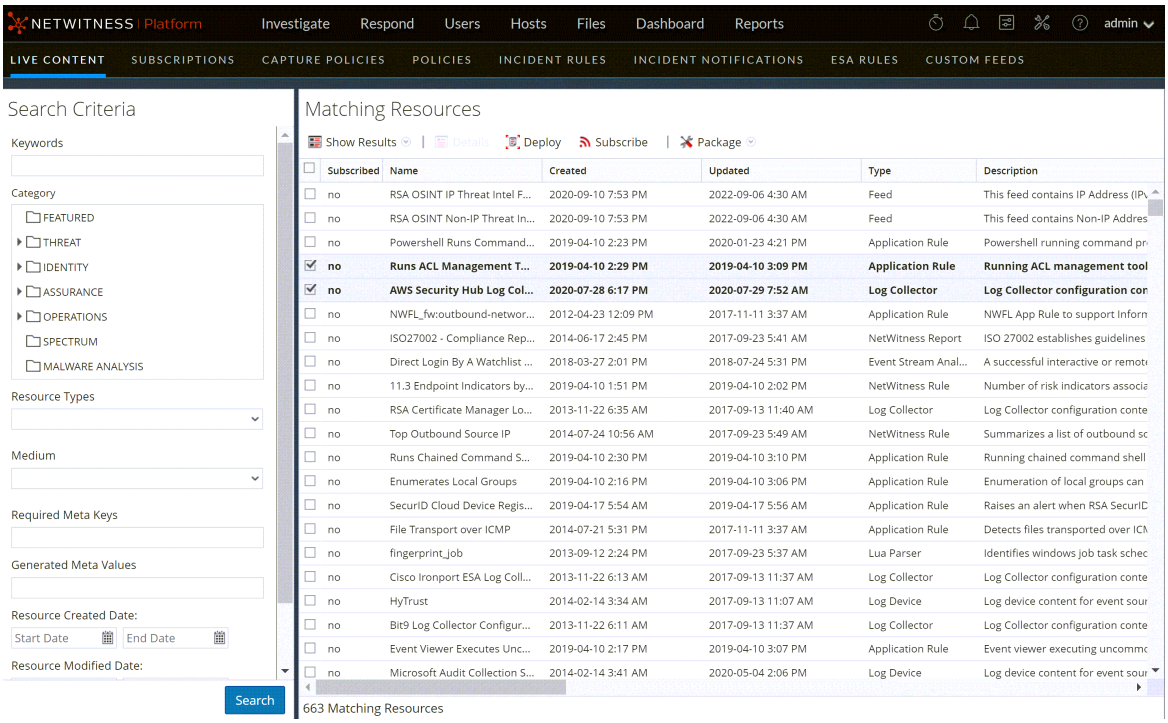
Deploy Resources in Live

In NetWitness, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Live, you can deploy resources manually to a service or a service group without subscribing to the resources. To deploy resources, select one or more from the list.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.
- If you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

Caution: For NetWitness 11.3, there is a new Content bundle for Endpoint, which contains approximately 400 application rules. Do not deploy this bundle (or the Endpoint application rules) onto any Log Decoder that is running an earlier version of NetWitness. The rules are only useful for 11.3 and newer, and would have major performance implications if deployed on Log Decoders that cannot process them.

To deploy resources manually:



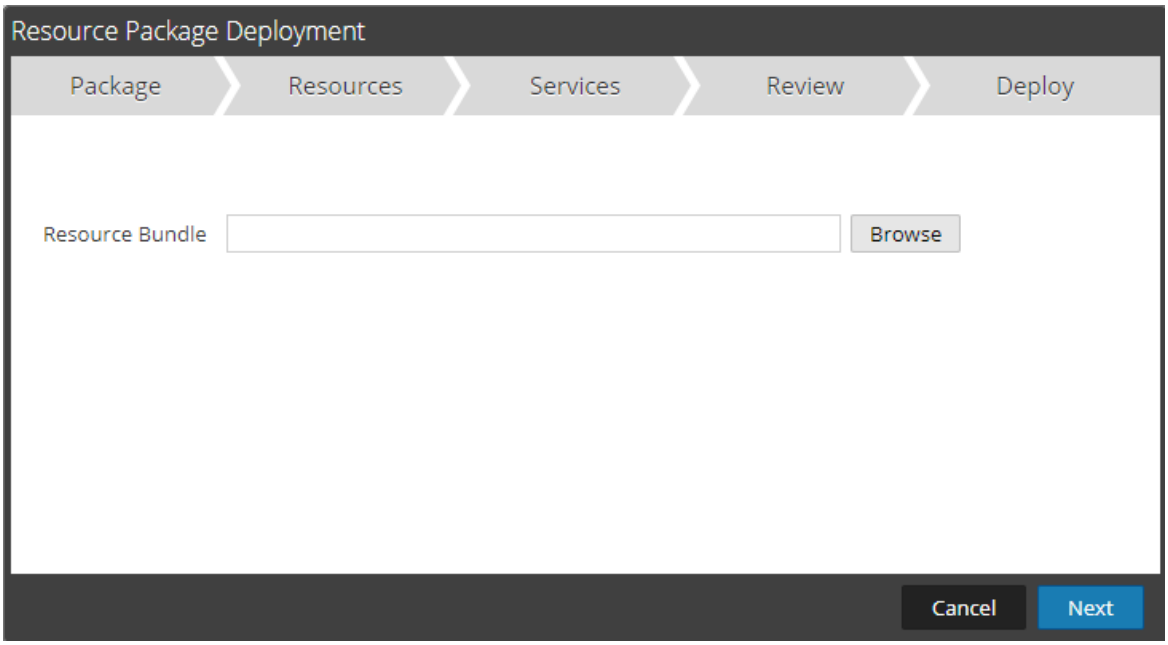
1. Go to  **(Configure) > Live Content**.
2. Select a group of resources, or a previously created resource package.

   To select a resource or group of resources:

   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

   b. In the **Matching Resources** panel, select **Show Results > Grid**.

   c. Select the checkbox to the left of the resources that you want to deploy.



d. In the Matching Resources toolbar, click Deploy.

3. To select a resource package to deploy:

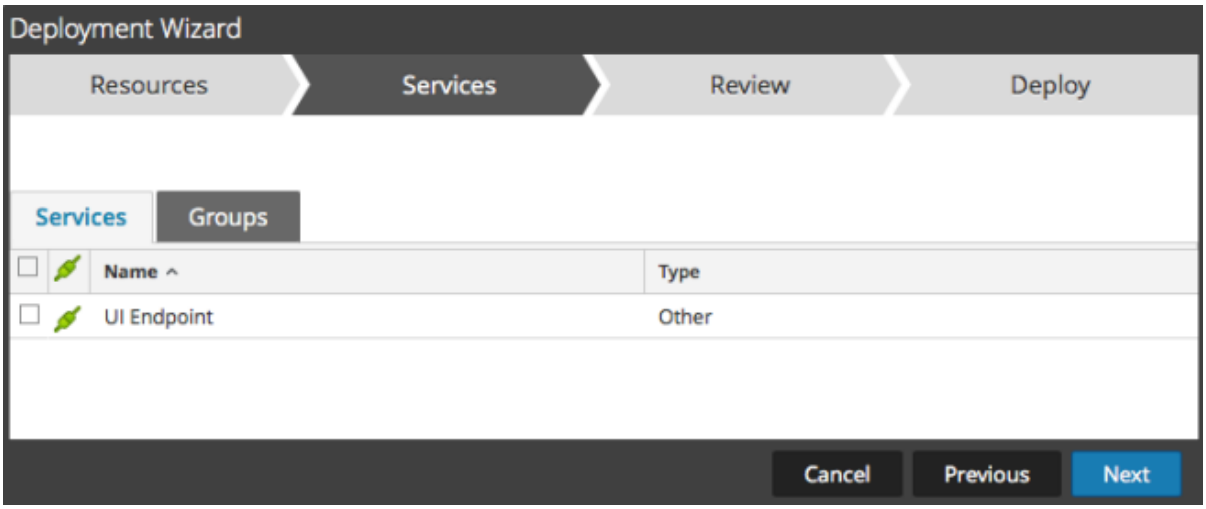
   a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** .

   The Package page of the Resource Package Deployment wizard is displayed.

b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

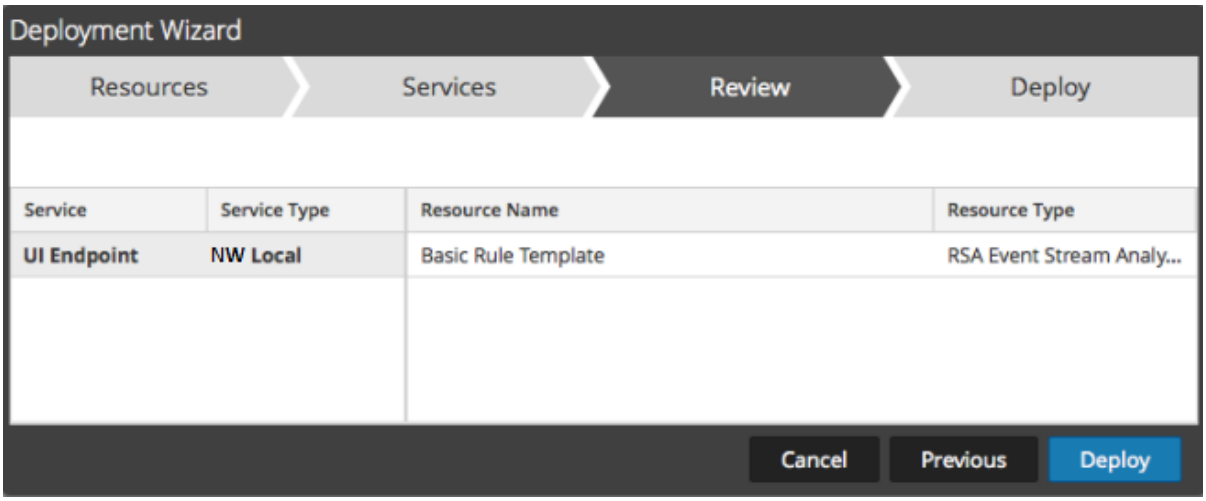
At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.



4. Click **Next**.

The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.



5. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

- Use the **Services** tab to select individual services, list of services, and service groups that are configured in the **(Admin) > Services** view.
- Use the **Groups** tab to select groups of services.

6. Click **Next**.

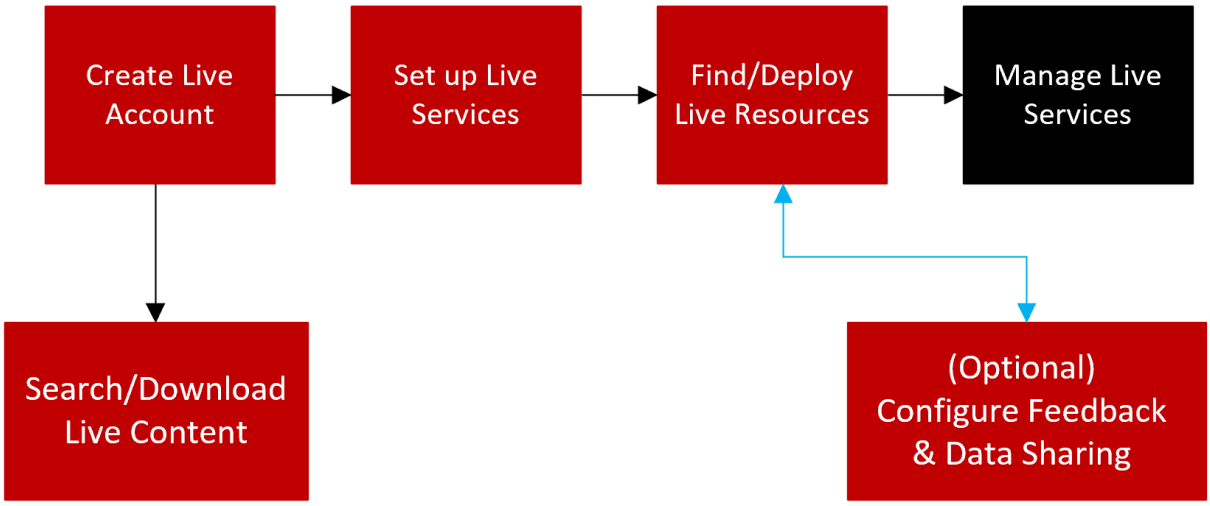
   The **Review** page is displayed.

   Make sure that you have selected correct resources and the services on which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you can click to review the errors and re-attempt the deployment.



8. Click **Close**.

Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services. For more information, see the *Decoder and Log Decoder Configuration Guide*.

Manage Live Resources

With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the the **(Admin) > Services** view.

There are several workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources
- Deploy a resource bundle
- Remove deployments of resources
- Download resources
- Set up data feeds

Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **(Admin) > System > Live Services panel**.

By adding subscribed resources to the deployments list, you configure NetWitness to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

To manage subscriptions and deployment:

1. In the **(Admin) > System > Live Services** panel, specify an interval at which NetWitness checks for updates to subscribed resources in Live and specify the email addresses of people to receive an email listing subscribed resources that have been updated.
2. In the **(Configure) > Live Content** search view, search for and subscribe to Live resources.
3. In the **(Configure) > Subscriptions > Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **(Configure) > Subscriptions > Deployments** tab, click to deploy the resources listed in the Deployments tab immediately.
5. In the **(Configure) > Subscriptions > Deployments** tab, select deployed resources from a Group, and remove them from services.
6. In the **(Configure) > Subscriptions** tab, unsubscribe from resources.

Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

To remove deployed resources:

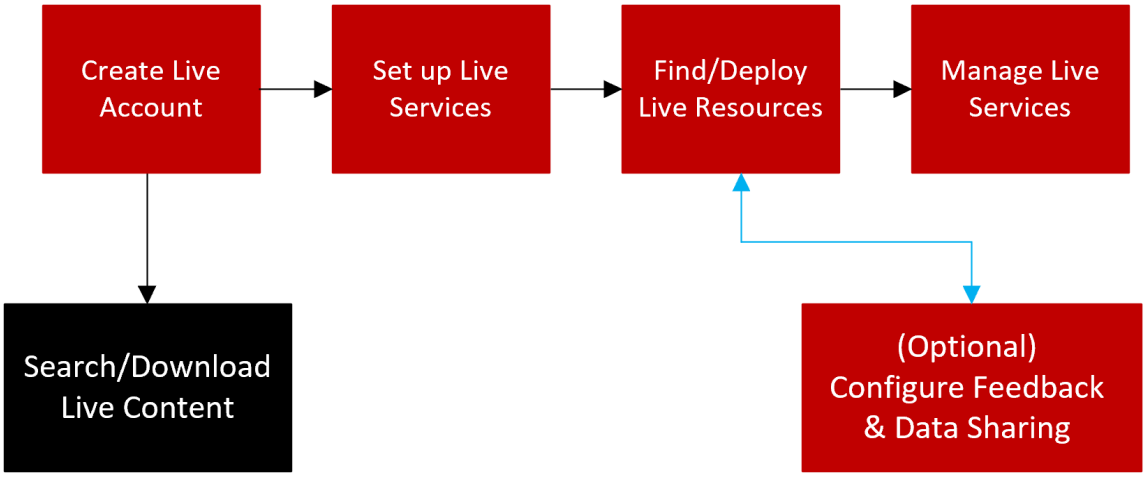
1. Go to the Live Resource View
2. Unsubscribe from a resource, and remove it from deployed services.

Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness accepts packages in **.nwp** files or **.zip** files.

Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.



Set Up Data Feeds

In the **Live** > **Feeds** view, you can set up and maintain Custom and Identify feeds.

Search and Download Content from NetWitness Live

Administrators can search for live content using the Search Content panel in the NetWitness Live, which is similar to browsing the live CMS content in the (Configure) > Live Content page on the NetWitness Platform.

Note: If Admin server is not connected to the Live Services, you can use the NetWitness Live to search and download the required content.

Prerequisites

- Ensure that you have created the Live account. For more information, see Create Live Account.

Quick Search for Content

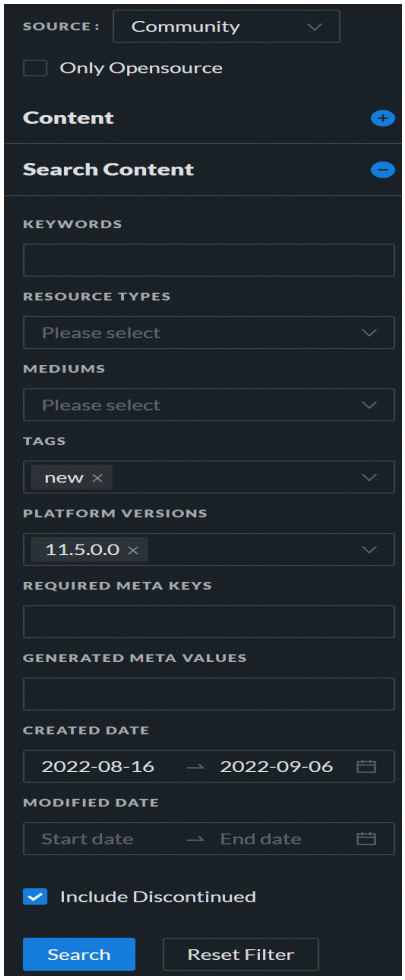
You can now select and view the content based on the Sources available in the NetWitness Live. You can select either NetWitness or Community from the Source drop-down list.

- **NetWitness**: Displays all the content provided by NetWitness.
- **Community**: Displays the content collected and retrieved from third party and open source communities.

  Note: The **Only Opensource** option will appear under the Search Content panel only when the community is selected as the source. You can use this option to select and search open-source related content.

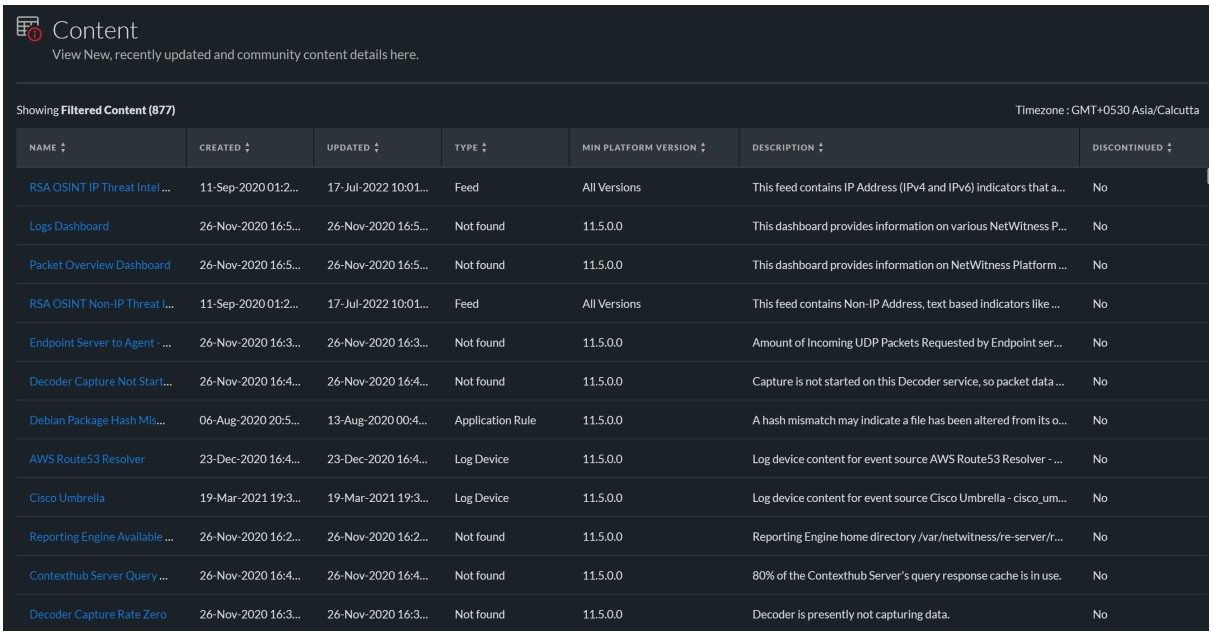
You can also quickly select and view the available content types under Content section.

Clicking expands the **Content** section and displays the following options:



- **New**: Displays the content which is created in the last 21 days.
- **Recently Updated**: Displays the content which is created or updated in the last 21 days.

Advanced Search for Content



You can search for the specific content in the Search Content view. For more information, see Live Search Content View.

To search the content:

1. Click to expand the **Search Content** section.
2. In the **Search Content**, specify the search criteria. Enter any or all of these: keyword, type of resource, medium, tag, platform versions, meta keys, meta values, date when content was created, date when content was modified, and (optional) discontinued content.

3. Click **Search**.
   The matching results are displayed on the right panel.

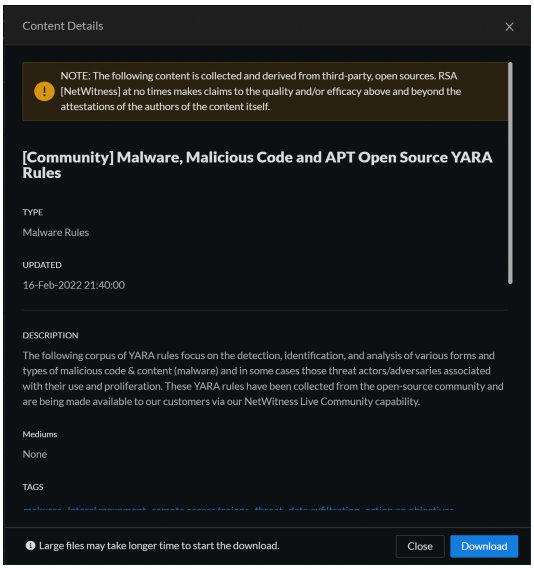
You can sort the content using the name, created, updated, type, or any of the column.

Note: Clicking **Reset Filter** removes the existing filters applied from the **Search Content**, and displays all the available content on the right panel.

Download Content



You can download the content from the results displayed in the right panel by performing the following steps:

Note:
- You cannot download a discontinued content.
- NetWitness provides no assurance related to the quality and accuracy of the content provided by the third parties and open source communities.

To download the content:

1. Click the name of the content that you want to download.

   The **Content Details** dialog is displayed.

2. Click **Download**.

   The content file is downloaded.

Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to NetWitness
- Packaging Resources
- Manage Custom Feeds
  - Creating a Custom Feed
  - Create a STIX Custom Feed
  - Creating and Managing an Identity Feed
  - Editing a Feed
  - Removing a Feed
- Miscellaneous Live Services Procedures

Export Data to NetWitness

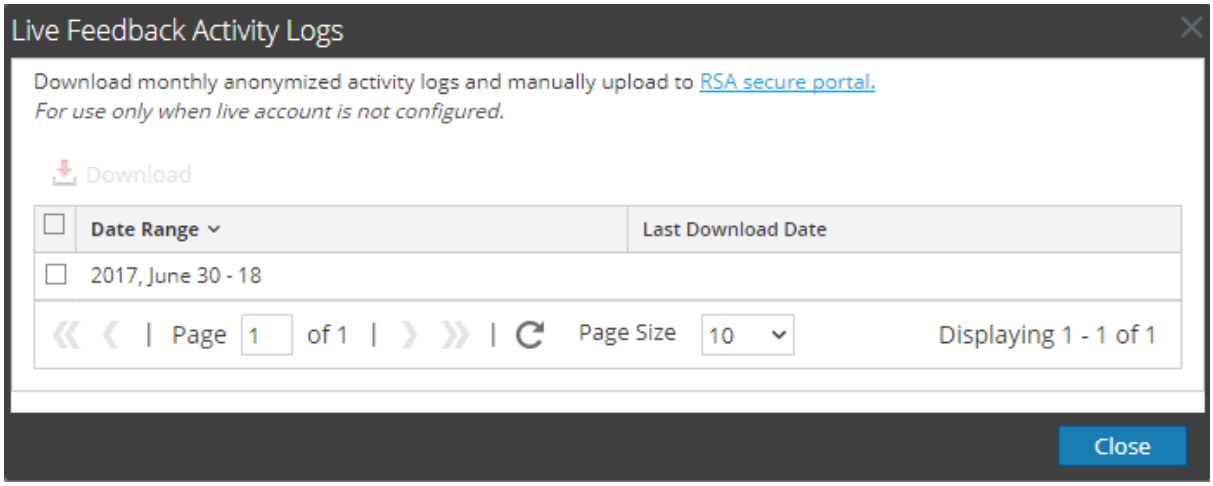
A NetWitness administrator can export the metrics in NetWitness for Live Feedback.

About Live Feedback

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

If the Live Account is not configured, you can manually upload the usage data to NetWitness. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

You must first download the Live Feedback historical data, and then upload it to share with NetWitness.



Download Live Feedback Historical Data

To download the Live Feedback historical data:

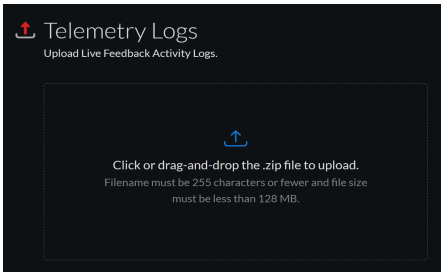
1. Go to  **(Admin) > System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status**and Download **Live Feedback Activity Log**.
3. Click **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.

4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the Live Feedback data is downloaded into a ZIP archive, consisting of individual JSON files for each month.



Share Telemetry Data to NetWitness

After you download the Live Feedback data, you can then upload it using the following procedure.

Note:
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data through NetWitness Live portal. For more information, Create Live Account.

To share the data to NetWitness

1. Log in to the NetWitness Live using your Live account credentials.
2. Click  on the left panel.
   The **Telemetry Logs** dialog is displayed.

Note:
- You can upload only .zip files.
- Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.

Packaging Resources

The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on a more secure network.

Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness instance, deploy the resource package. For more information, see Resource Package Deployment Wizard.

Prerequisites to Create a Resource Package

A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness and the ability to search for resources in the User Interface.

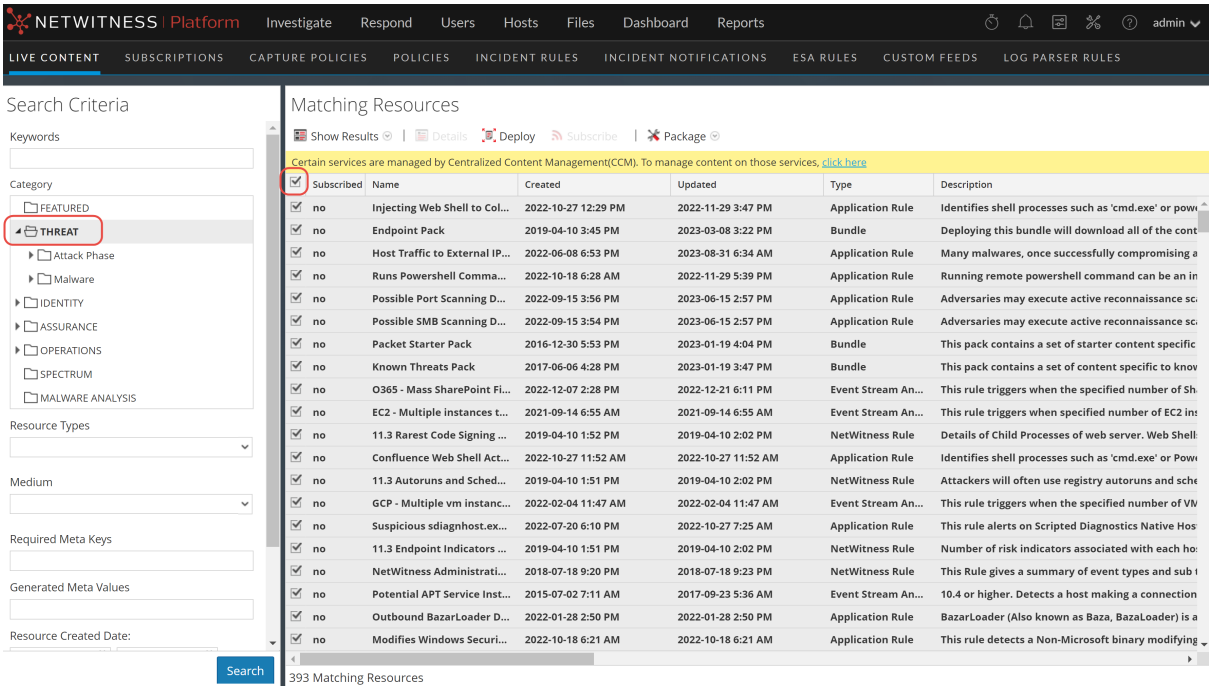
Creating a Resource Package

The following procedure describes how to create a resource package, as a ZIP archive and save it to your local file system.

To create a resource package:

1. Go to  **(Configure) > Live Content** from the NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.
3. Select some or all the resources that are listed in the Matches Resources pane.
4. Select 

> **Create**.



NetWitness creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

Creating Threat Package

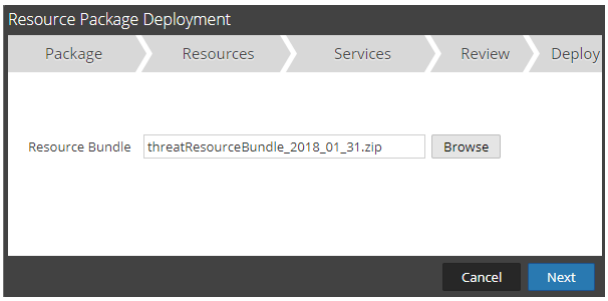
The following procedure describes how to create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Go to  **(Configure) > Live Content**.
2. From the **Category** section, select **Threat**.

3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.

4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.



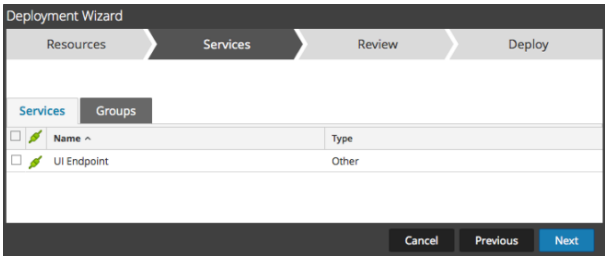
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

Deploying a Threat Package

This procedure assumes that you saved a package named **threatResourceBundle_2018_01_31.zip**, as described in the previous section. It describes how to deploy a saved resource package

1. Go to **(Configure) > Live Content**.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click **Browse** and navigate to the **threatResourceBundle_2018_01_31.zip** file that were created earlier.



4. Click **Next**.

   The **Resources** page displays details for the resources in the package.

5. Click **Next**.

   The **Services** page displays two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

6. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

7. Click **Next**.

   The **Review** page is displayed.

   Note: Make sure that you have selected correct resources and the services to which you want to deploy them.

8. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or **Previous** to either cancel the deployment or go back to the previous screen.

Manage Custom Feeds

The custom feed capability is implemented using the Custom Feed Wizard in NetWitness, allowing you to quickly populate Decoders with custom and identity feeds.

Custom Feed Creation

You can use the **Live > Custom Feeds > Setup Feed > Configure a Custom Feed** wizard to create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and edit the NetWitness feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

Sample Feed Definition File

```
<?xml version="1.0" encoding="utf-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
    <FlatFileFeed name="Dynamic DNS Domain Feed"
        path="dynamic_dns.csv"
        separator=","
        comment="#"
        version="1">

        <MetaCallback
            name="alias.host"
            valuetype="Text"
            apptype="0"
            truncdomain="true"/>

        <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
```

```
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
        </LanguageKeys>

        <Fields>
            <Field index="1" type="index" key="alias.host" />
            <Field index="4" type="value" key="threat.desc" />
            <Field index="2" type="value" key="threat.source" />
            <Field index="3" type="value" key="threat.category" />
        </Fields>

    </FlatFileFeed>
</FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Parameter	Feed Definition File Equivalent
	Define Feed tab
Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically.
Name	Enter a custom feed name in the feed data file that corresponds to the `flatfeedfile name` attribute in the feed definition file; for example, `Dynamic DNS Test Feed`.
File/ Browse	Enter a name of the feed data file that corresponds to the `flatfeedfile path` attribute in the feed definition file; for example, `dynamic_dns.csv`.
(STIX, Recurring) **Trust All Certificate**	Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked).
(STIX, Recurring) **Certificate/Browse**	For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.
	Define Feed tab - Advanced Options
XML Feed File	Enter a name of the feed definition file, for example, `dynamic_dns.xml`.
Separator	The separator character used to separate attributes in the feed data file. It corresponds to the **`flatfeedfile separator`** in the feed definition file; for example, a comma.

NetWitness Parameter	Feed Definition File Equivalent
Comment	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file; for example, #.
Remove STIX data older than	The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum.
Select Services tab	Select the services to which you want to send the data feed.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Ignore Case**	If this option checked, the feed will ignore the case.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.

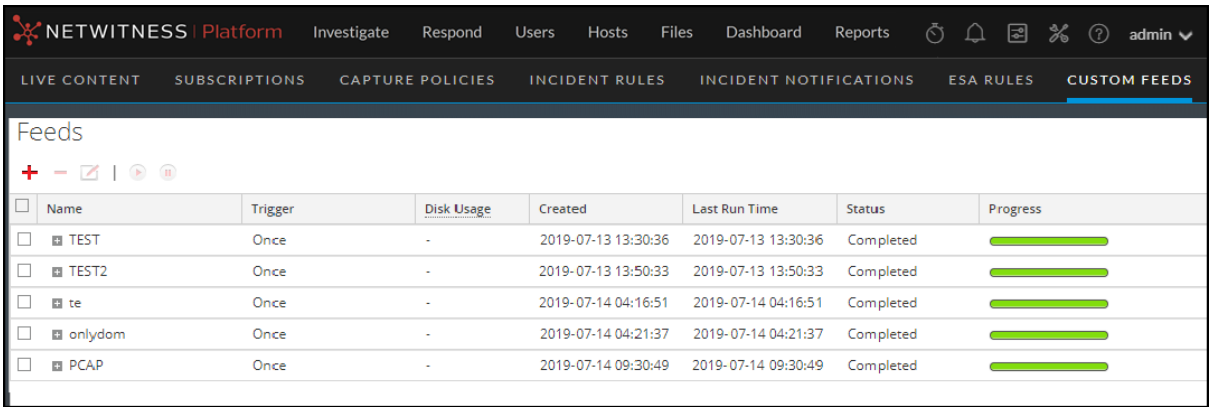
NetWitness Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected.
(DEFINE VALUES) **Key**	The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute.

Creating a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in NetWitness. For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

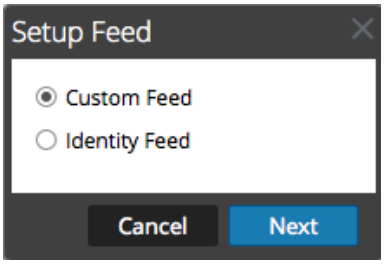
After completing this procedure, you will have created a custom feed.



The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

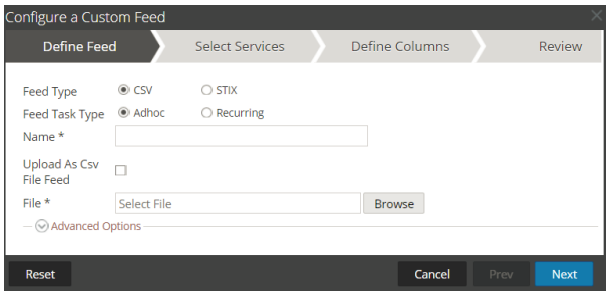
Note: Any feeds that are created in 11.2 release or prior will be automatically pushed to Context Hub as Lists. The lists can be looked up in the context lookup panel of the Respond and Investigate pages. If Context Hub is not configured or the service is down, then the feeds will be pushed to Context Hub the next time the server is available.

To create a custom feed:



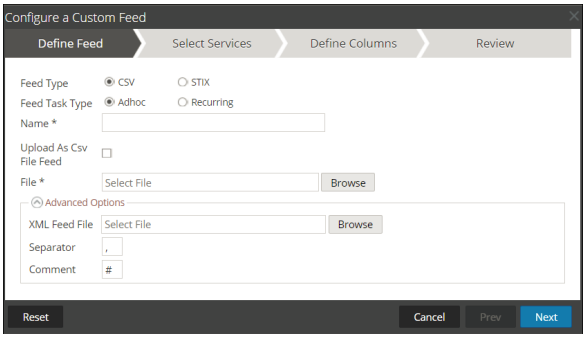
1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



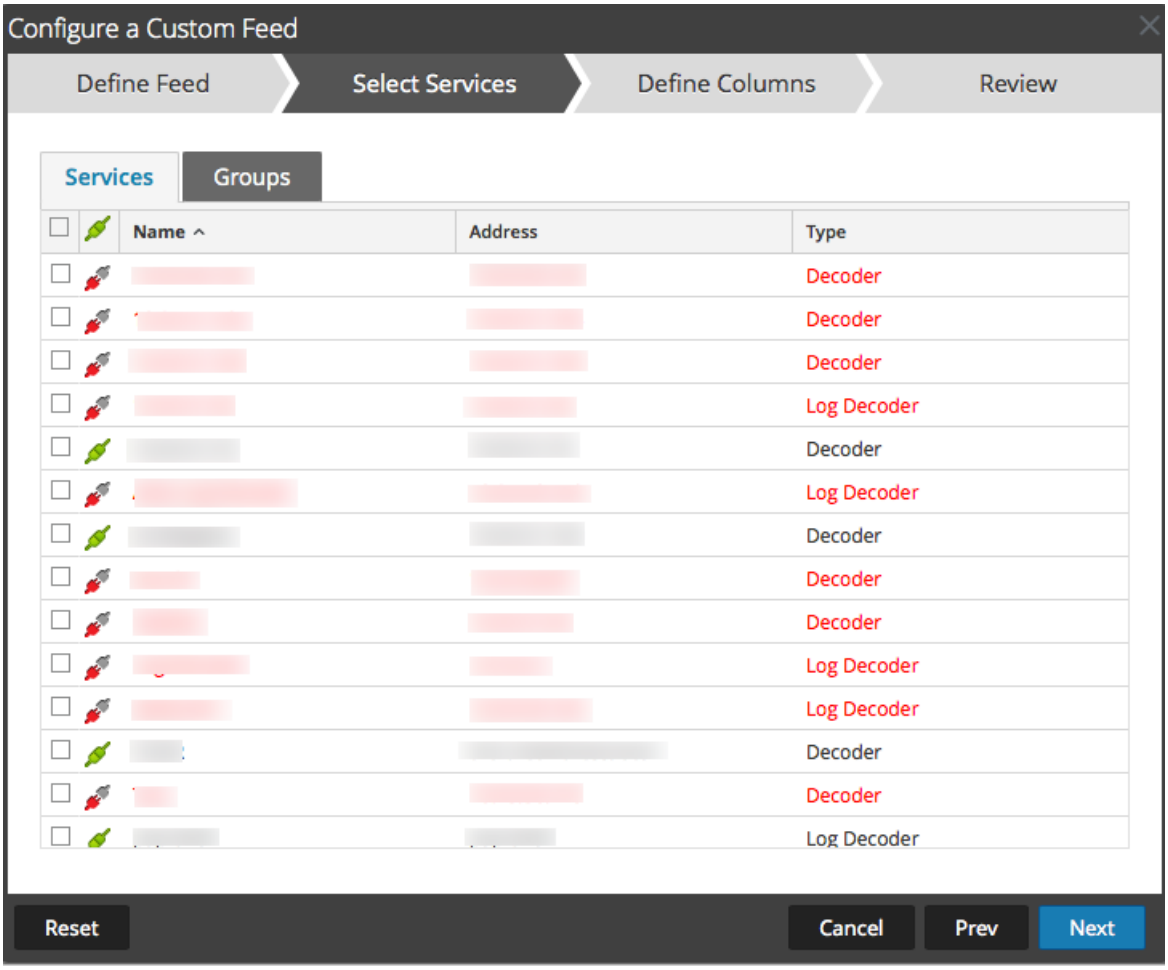
2. In the toolbar, click .

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

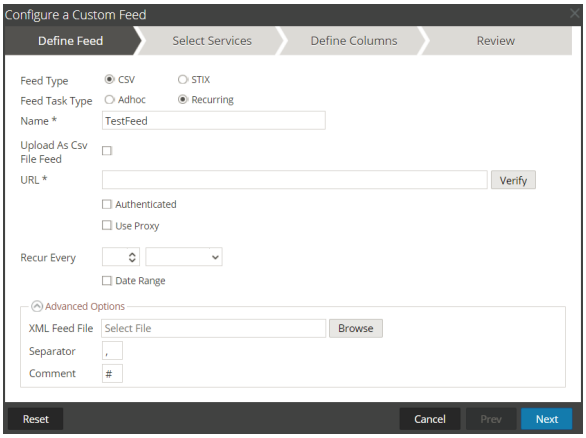
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



4. To define a feed based on a `.csv` formatted feed data file, select **CSV** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**.
   b. Select the checkbox **Upload As CSV File Feed**, if required.
   c. Select a .csv content **File** from the local file system, and click **Next**.
   d. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:

   e. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.
   f. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the



Define Columns tab is not needed.

6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

   The Define Feed dialog includes the fields for a recurring feed.

b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

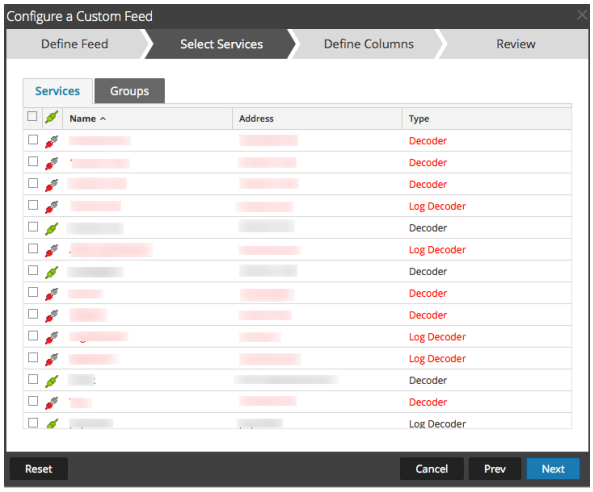
   NetWitness provides your user name and password for authentication to the URL.

d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.
   NOTE:
   If you are using an HTTPS based feed server, ensure that you import and install the certificates. For more information, see Import Certificates for HTTPS Service

e. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - Specify recurrence every week, and select the days of the week.

f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



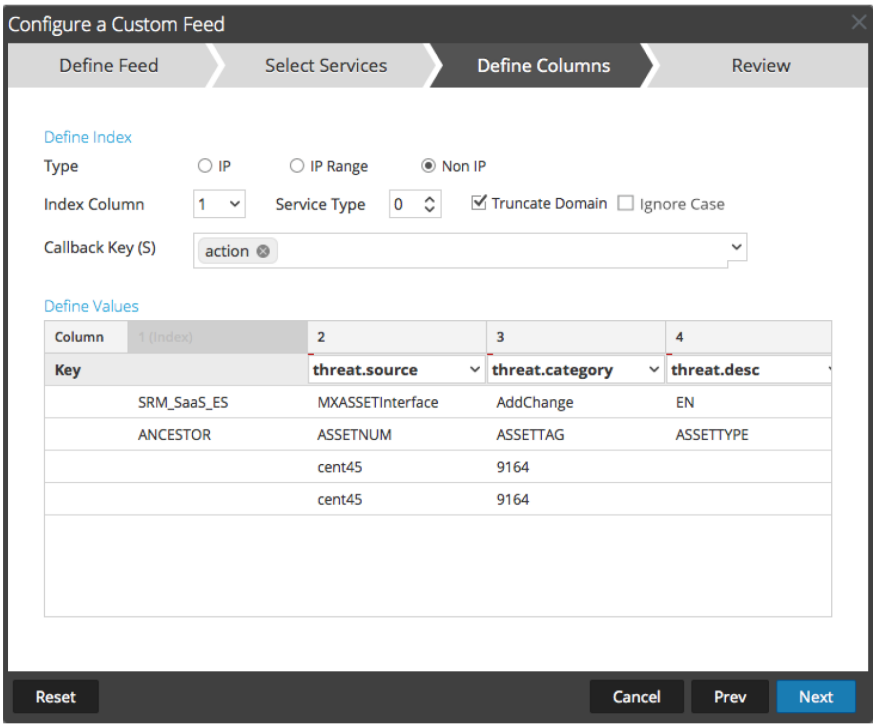
7. (Conditional) If you want to define a feed based on an XML feed file:

   - Type the feed **Name**, select **Advanced Options**.

     The Advanced Options fields are displayed.

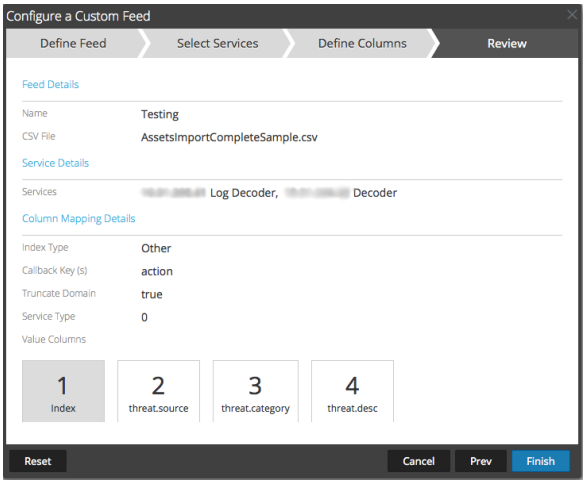
   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services dialog is displayed.



8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** and **Ignore Case** option.



d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

Note: When a custom feed gets converted into a context hub list, you must map at least one meta key with one or more meta types by mapping a column header with a meta. However, you can add or edit the entity mapping of a list by clicking ⚙ in the Lists tab. For more information, see the *Context Hub Configuration Guide*.

e. Click **Next**.

The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: When you create a feed, and if there is no entity mapping done such as in case of custom meta, then those columns in the List will not have entity mappings in Context Hub. You have to manually map the entities from the List page.

Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

1. SSH to the NW node and copy the CA certificate located in the following directory: */etc/pki/ca-trust/source/*
2. Execute the following command to update the certificates:
   `update-ca-trust`

3. Execute the following command to add the certificate to the java keystore:
   ```
   keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head
   ```
4. Restart the service on the NW node.

Note: Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in NetWitness.

Note: NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://oasis-open.github.io/cti-documentation/.

Caution: If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.0, you must re-configure the STIX recurring feed.

In NetWitness Platform, STIX feeds are supported. STIX content (with version 11.x) can be uploaded in an ".xml" format. The constructs such as Indicator Title and Description, Observable Title and Description, and Indicator Sightings information are parsed from STIX and pushed to the decoders or log decoders that are selected during feed configuration. Information such as IP addresses, File hashes, Domain names, URIs, and Email addresses are extracted from the STIX observable to be included in the feed.

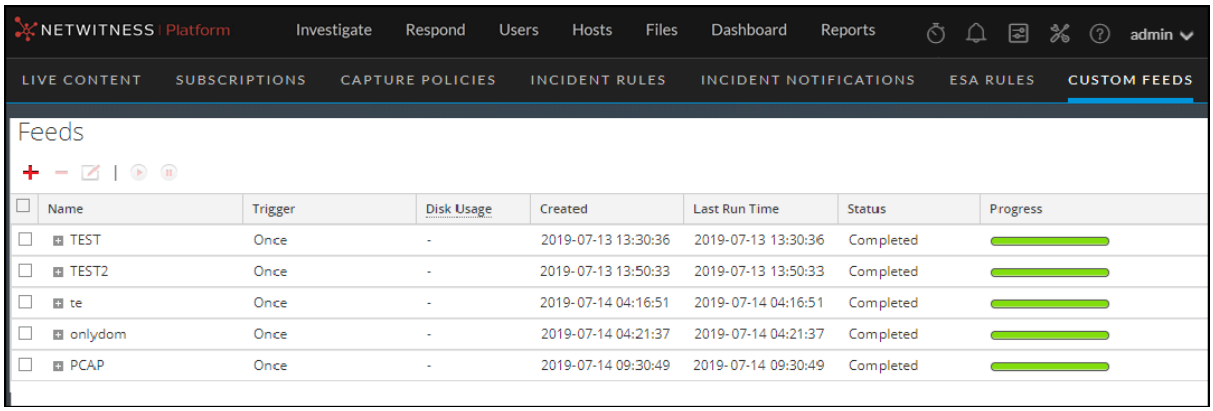
Make sure the following criteria are met before you upload the STIX file:

1. Only STIX Observables with property values in the "Equals" operator
2. The uploaded STIX xml file must have only one STIX_Package

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

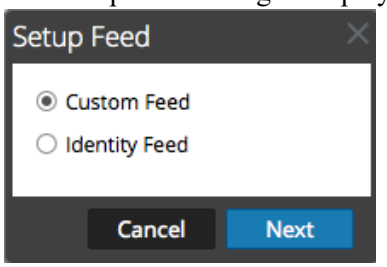
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.



The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

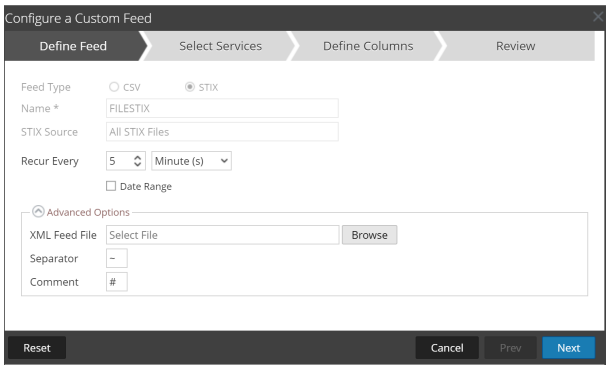
In NetWitness Platform, STIX (.xml) feed of type Indicators or Observable which contains the properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator is only supported. The STIX constructs that are parsed are Indicator Title and Description, Observable Title and description and Indicator Sightings information. The STIX (.xml) with a single STIX_Package is only supported."

To create a STIX custom feed:



1. Go to  **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, click .

   The Setup Feed dialog is displayed.

3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   Note: NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.

5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.
   a. **XML Feed file**: Browse and select an XML feed file from the local file system.
   b. **Separator**: Choose a separator (default is comma).
   c. **Comment**: Specify the comment characters used in the feed data file (default is #).
6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

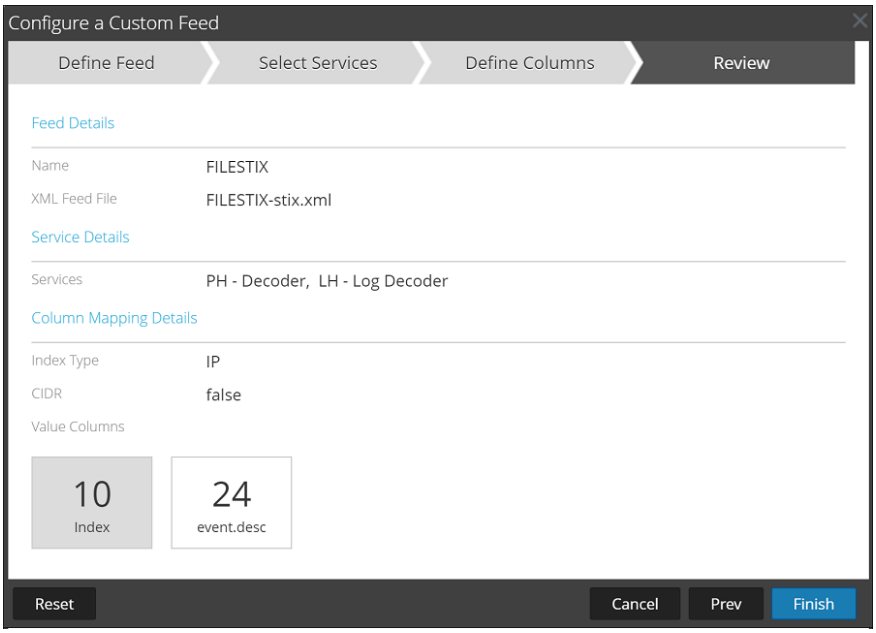
      - If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
      - If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:

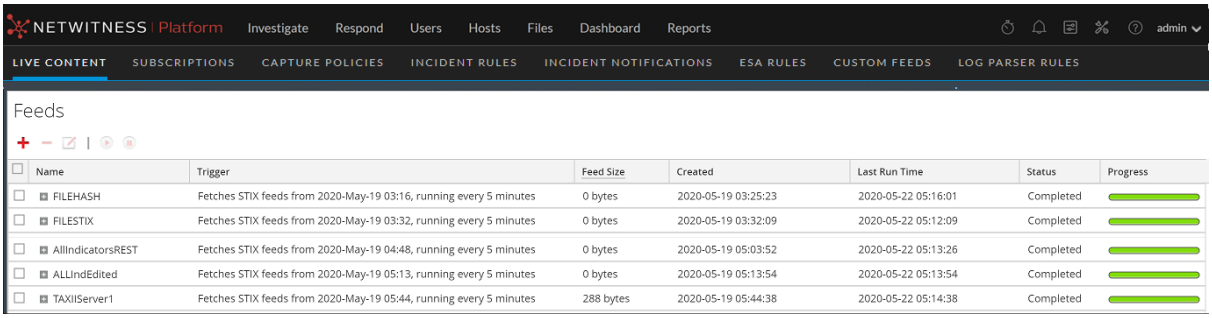
a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.

b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.

c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.



d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low and the status displays as unhealthy due to low memory. For more information on how to troubleshoot the `OutOfMemoryError` on the Context Hub Server, see "Troubleshooting" in the *Live Services Management Guide*.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

You can use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

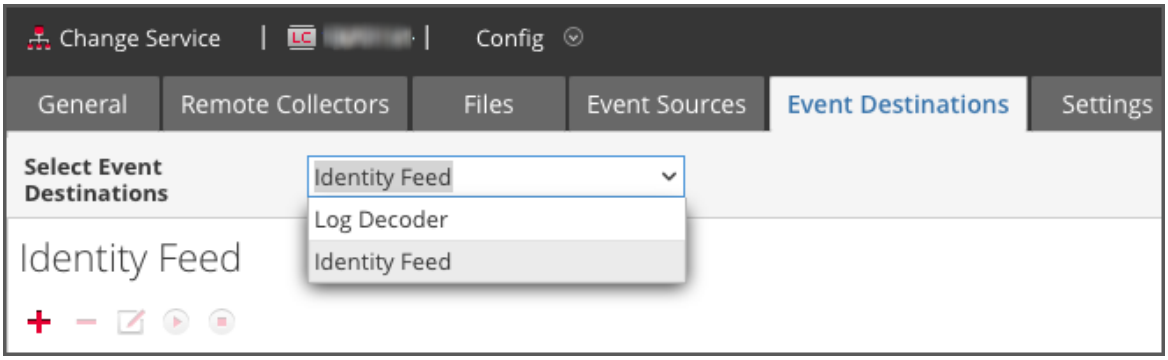
The following example shows the content of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

CSV File Content

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

XML File Content

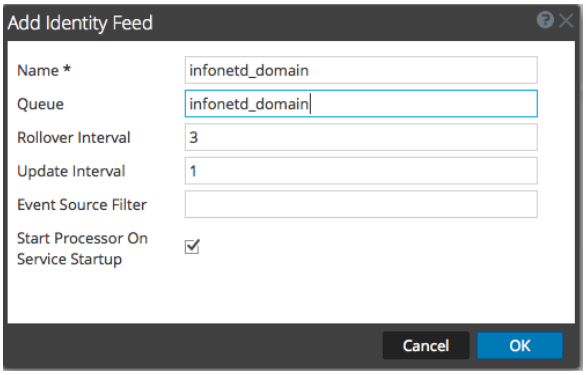
```
<?xml version="1.0" encoding="UTF-8"?><FDF
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
<MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">
<Meta name="ip.dst"/>
</MetaCallback>
<LanguageKeys>
<LanguageKey name="alert" valuetype="Text" />
</LanguageKeys>
<Fields>
<Field index="1" type="index" range="cidr"/>
<Field index="2" type="value" key="alert" />
</Fields>
</FlatFileFeed>
</FDF>
```



Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Creating and Managing an Identity Feed

You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.



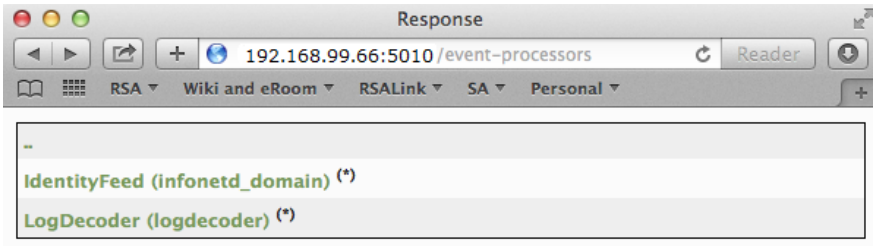
To create an identity feed:

1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.

   The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

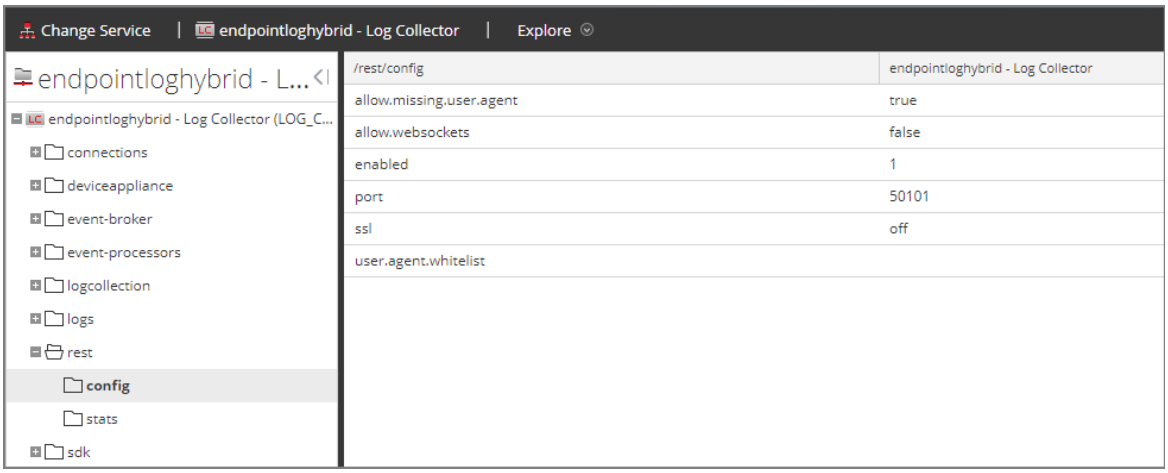


b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

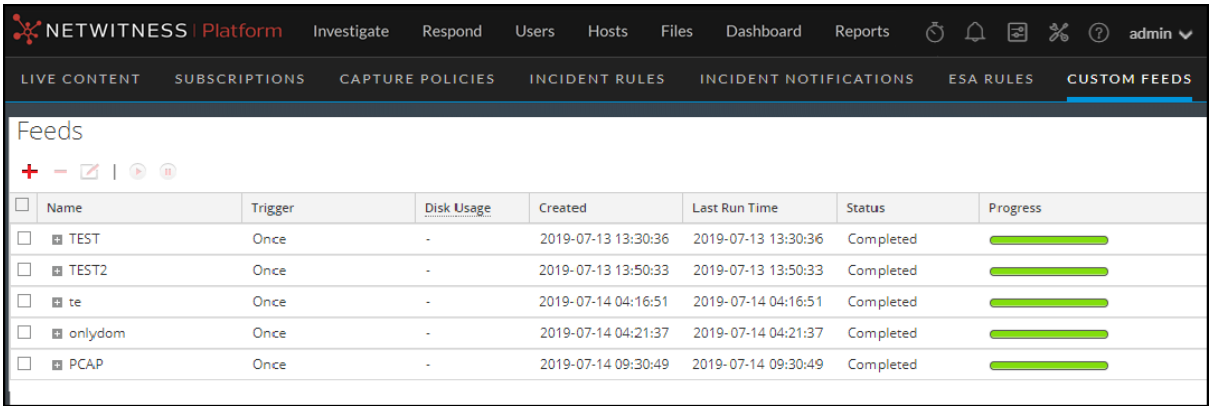


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to  **(Admin) > Services > <*Log Collector being setup*>**  **> View > Explore**.

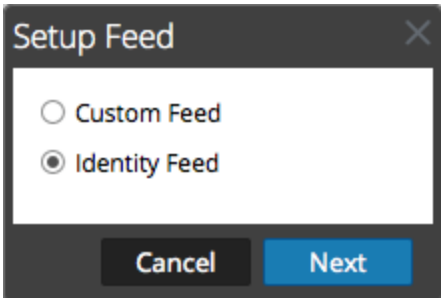
e. In the left pane, expand **rest > config**.



For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

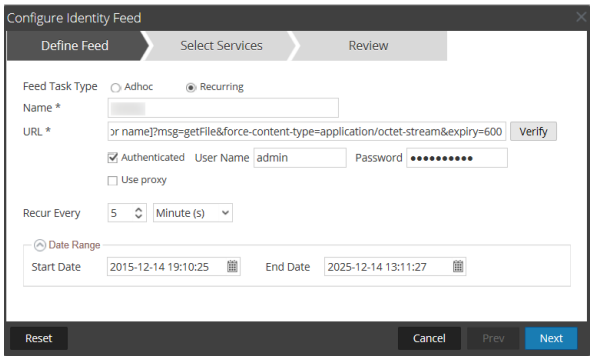


3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.

4. In the toolbar, click .

The Setup Feed dialog is displayed.



5. Make sure **Identity Feed** is selected and click **Next**.

The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.

Note: NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*

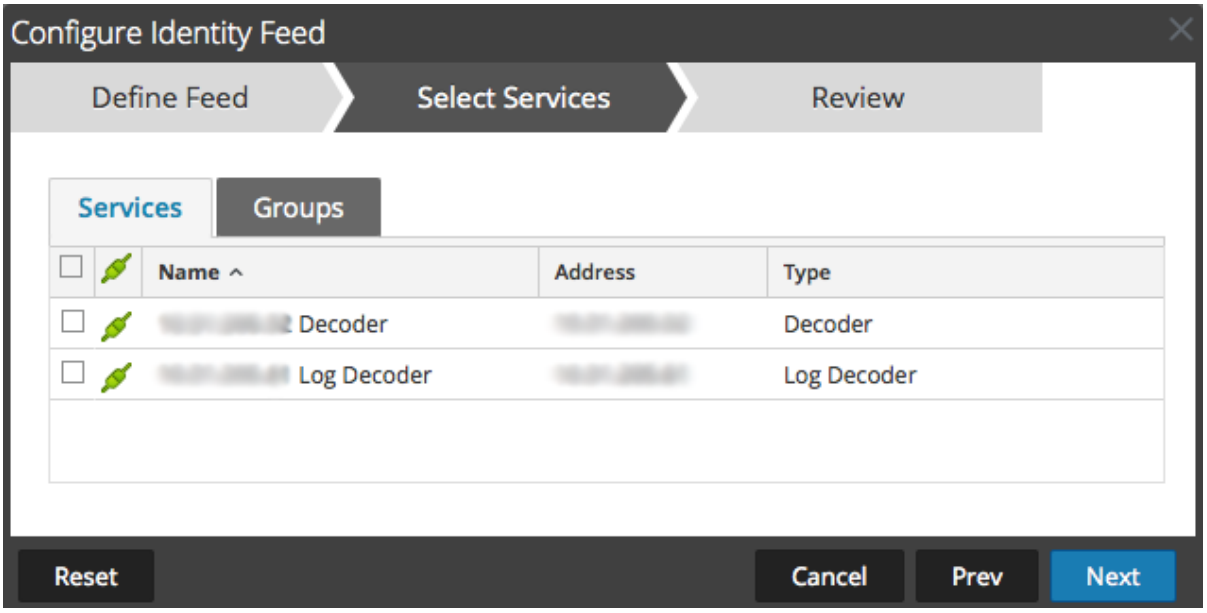
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to  **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

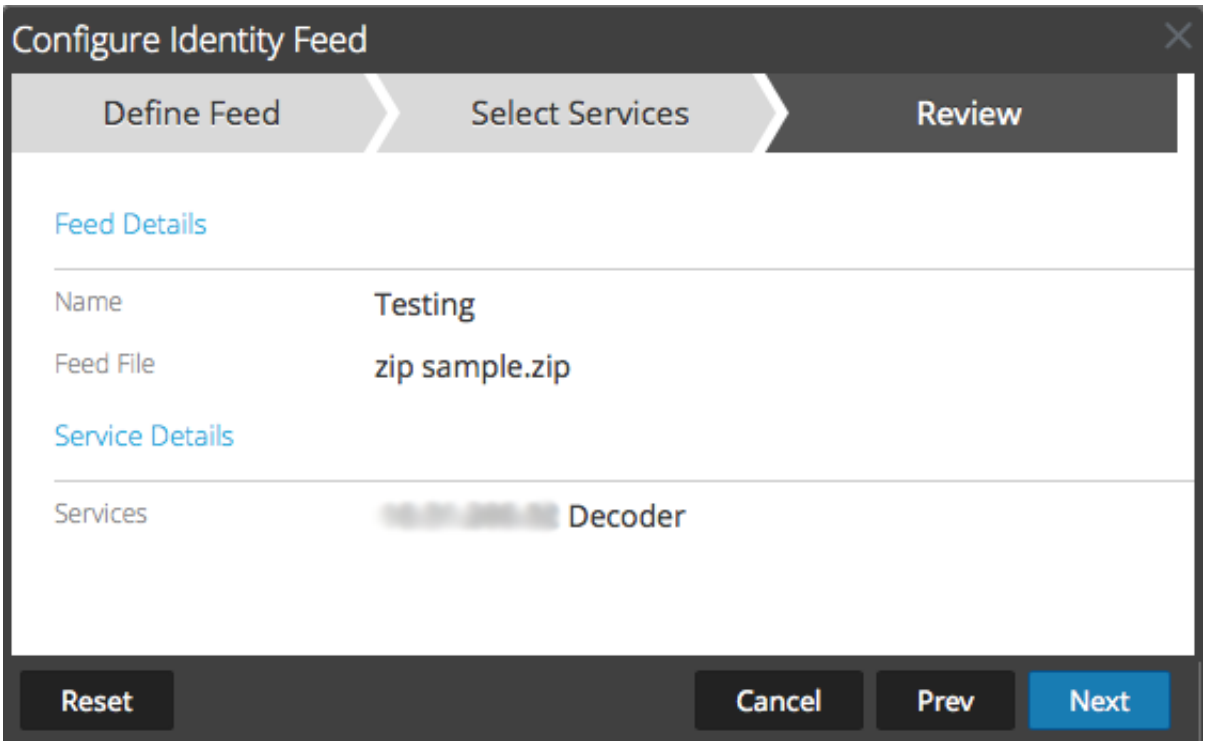
9. To define the recurrence interval, do one of the following:



- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.



11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.

13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

    The Review dialog is displayed.

Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

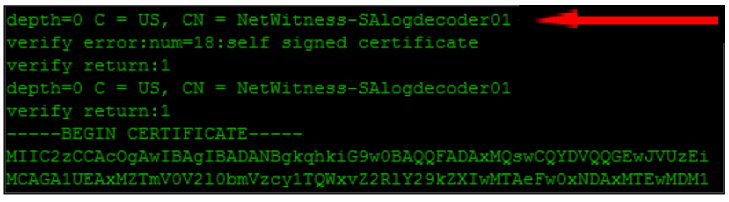
3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.



1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

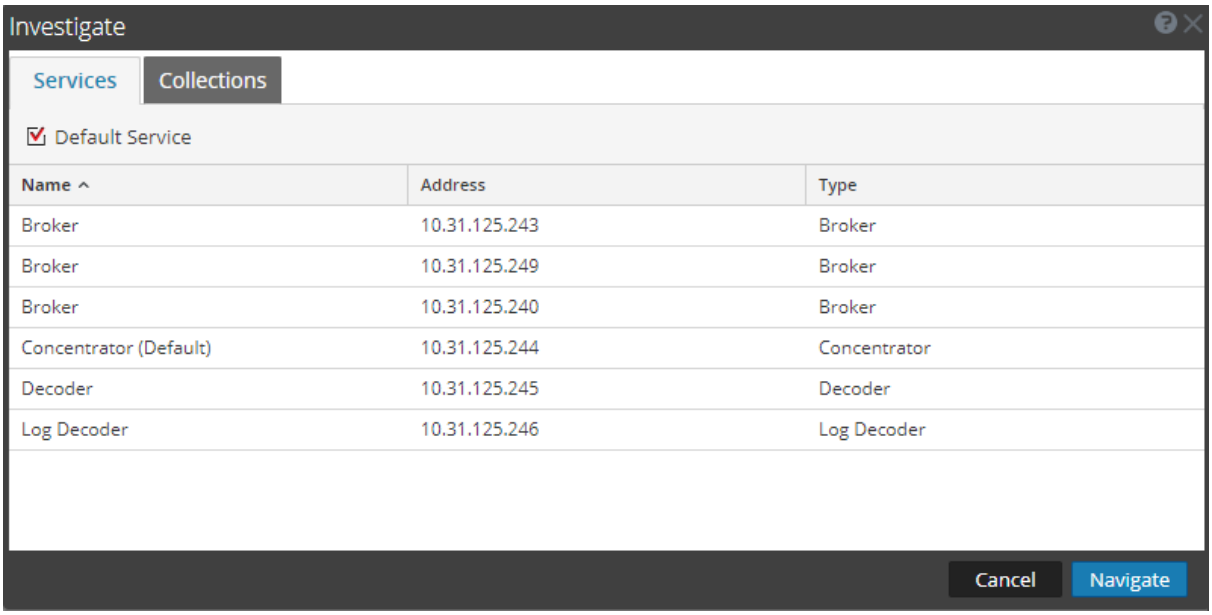
4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

Investigating an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

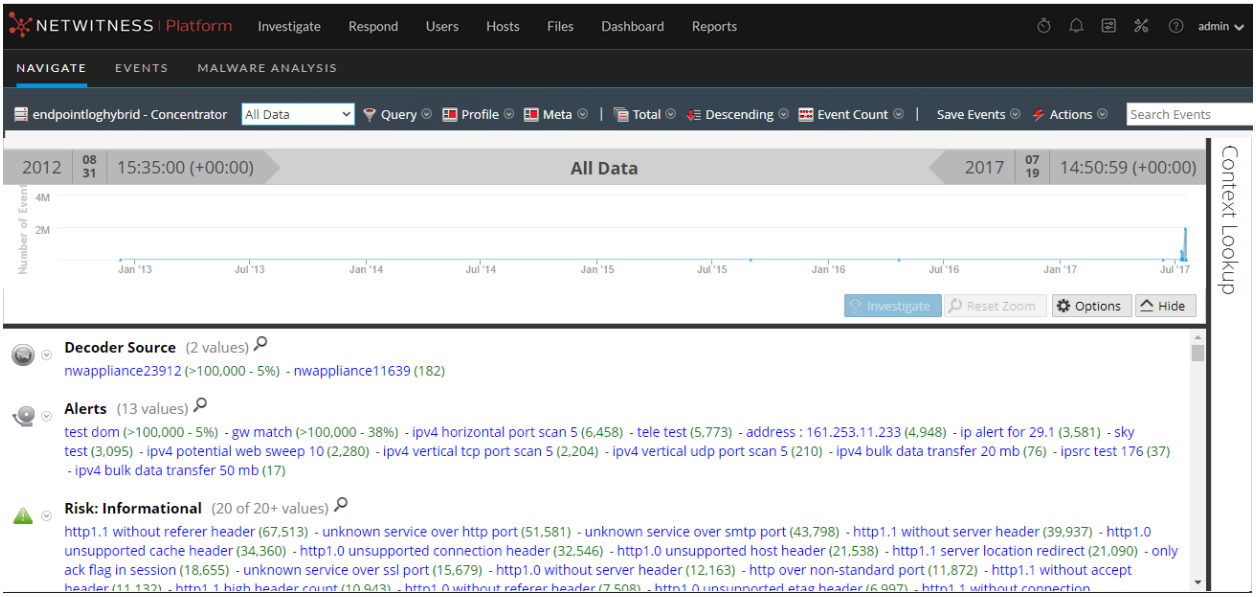
In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller or non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.



Note: An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

To investigate a configured identity feed:



1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.

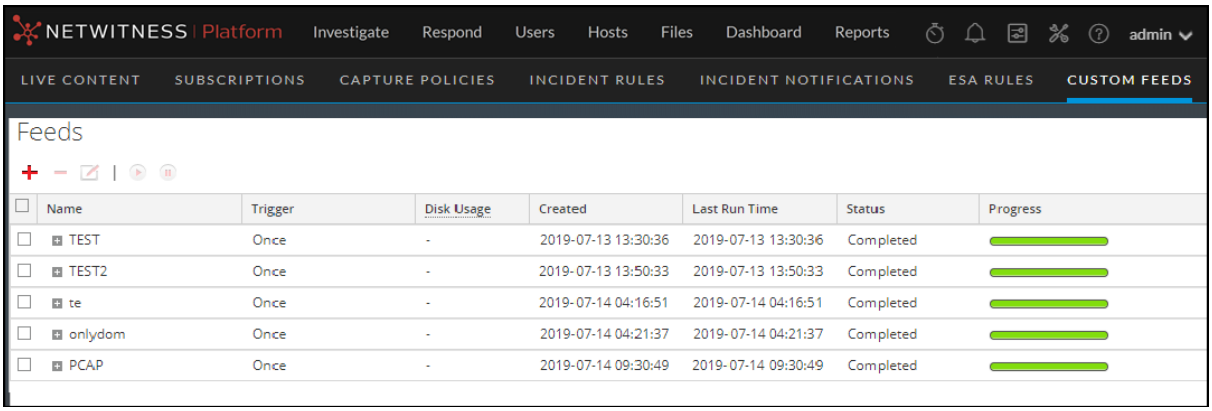
2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys:

The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

Editing a Feed

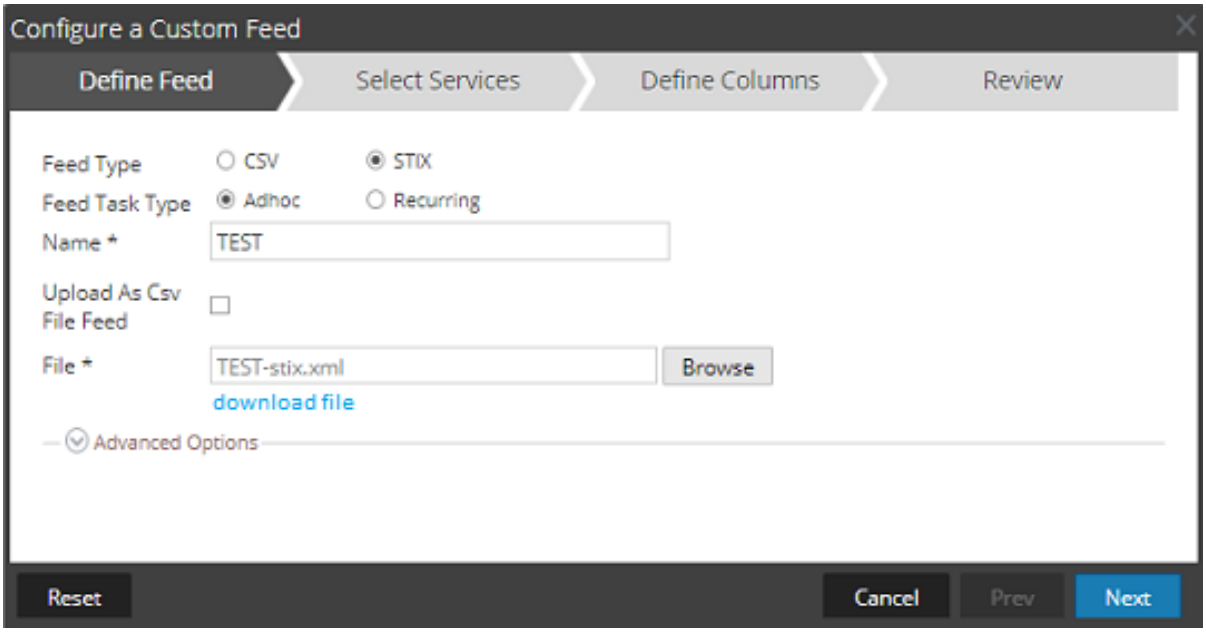
This topic provides instructions for editing a custom feed using the Custom Feed Wizard.



After you edit a feed:

- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) has been downloaded and edited.
- The feed has been recreated with the updated file and new feed specifications.

To edit an existing feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.

2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.

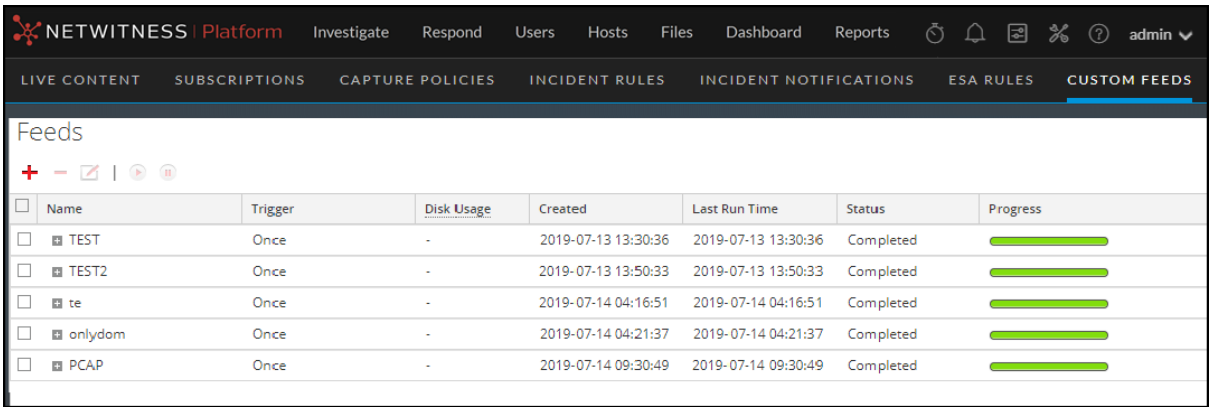
3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous dialog (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

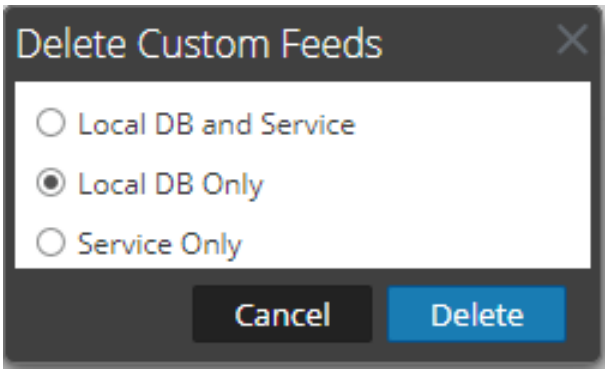
The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.



Removing a Feed

This topic provides instructions for removing a feed. You might want to remove a feed when some or all of the information in the feed is no longer useful for your organization.

To remove a feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.

2. In the toolbar, select a feed and click .

   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

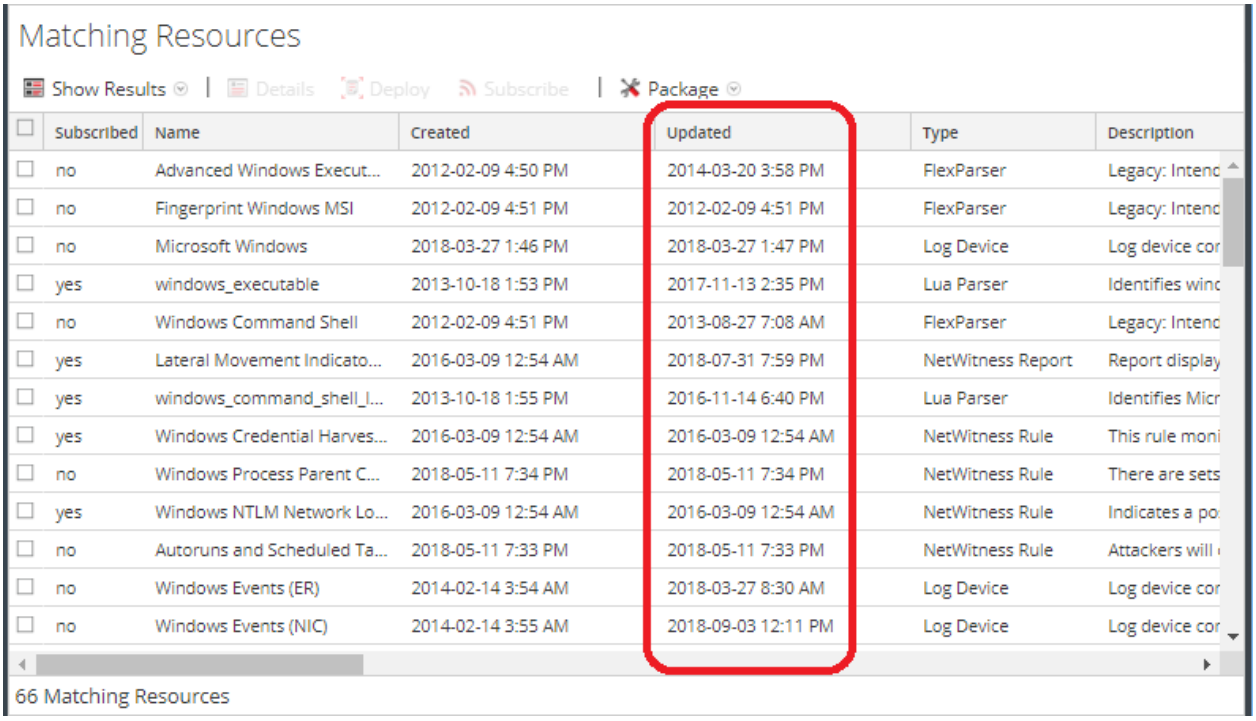
   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer seen on the NetWitness user interface.
   - If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
   - If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again

3. Select which feed you want to delete and click **Delete**.

   A warning dialog is displayed.

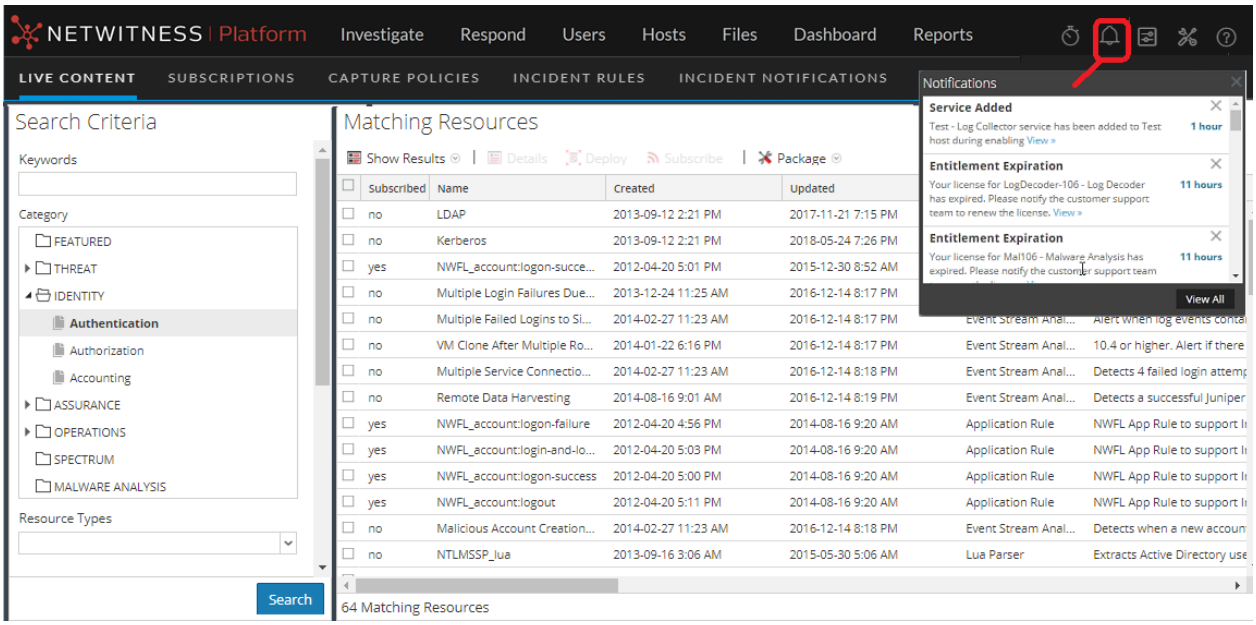
4. Click **yes** to confirm that you want to delete the feed from the selected areas.

Subscribing to Live Resources



This section describes subscriptions in Live.

Threats and the corporate landscape change over time. NetWitness periodically reviews existing content to determine whether it needs to be updated based upon current campaigns, or has become irrelevant due to changes in technology or attack techniques and tools.



You can discover new content by using the What's New dashlet within the Default Dashboard, or by searching through NetWitness Live by data range since last deployed. Be sure to subscribe to any content for which you want to receive update notifications.

Subscription Updates

When you view resources in the Matching Resources panel of the Live Content view, there is a column named **Updated**:

This value is also displayed when you select the detailed view for a resource. Every time a resource changes, its **Updated** value changes to match the specific update. If you are subscribed to a resource, and it gets updated, your system is automatically updated with the latest version, and you receive a notification. You can view your notifications by clicking the Notification icon, , from anywhere in the NetWitness UI.

You can also get email notifications when subscribed resources are updated. System Administrators can add email addresses in the **(Admin) > SYSTEM > Live Services** view. For more information, see the "Live Services Configuration Panel" topic in the *System Configuration Guide*.

Adding Subscribed Resources for Deployment to Services

1. Go to **(Configure) > Subscriptions > Deployments**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click .
   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.
   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.
6. You can click the Synchronize icon, , to immediately synchronize your changes.

Deleting a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Live.

To delete a subscription:

1. Go to **(Configure) > Subscriptions**.
2. In the **Subscriptions** tab, select the subscriptions you want to delete.
3. Click , then choose **Delete** to delete your selected resources or **Delete All** delete all subscriptions.

   A dialog asks for confirmation that you want to delete the subscription.
4. To confirm removal, click **Yes**.

   Your selected subscriptions are deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

Removing Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization.

You can remove subscriptions from the Live (Configure) > Subscriptions > Deployments panel, but any that have actually been deployed to services remain deployed until someone removes them.

To remove resources from the Deployments tab Subscriptions panel:

1. Go to **(Configure) > Subscriptions > Deployments**
2. In the **Groups** panel, select a group.

   Subscribed resources, if any, are listed in the Subscriptions panel.
3. In the Subscriptions panel, click .

   A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

Subscribe and Unsubscribe to a Resource

When you subscribe to resources, you will receive notification when new versions of the resources are available.

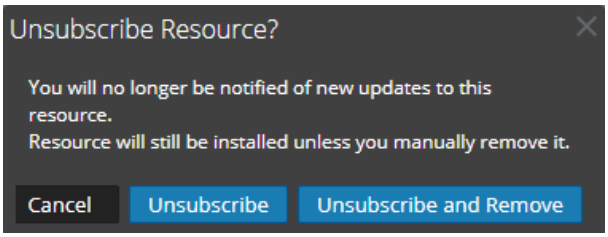
To subscribe to a resource:

1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click Subscribe.

   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

   The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.



To unsubscribe from a resource:

1. Open a detailed view of a resource in one of the following ways:
   - Perform a search, **(Configure) > Live Content** > enter search criteria, then select the resource in the Matching Resources panel, then click Details.
   - View subscriptions, **(Configure) > Subscriptions**, select the resource from the Subscriptions list, then click Details.

2. With the detailed view of a resource displayed. click Unsubscribe.

   A confirmation dialog is displayed.

3. Do one of the following:
   - To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
   - To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
   - To close the dialog without unsubscribing, click **Cancel**.

   The selected action is applied.

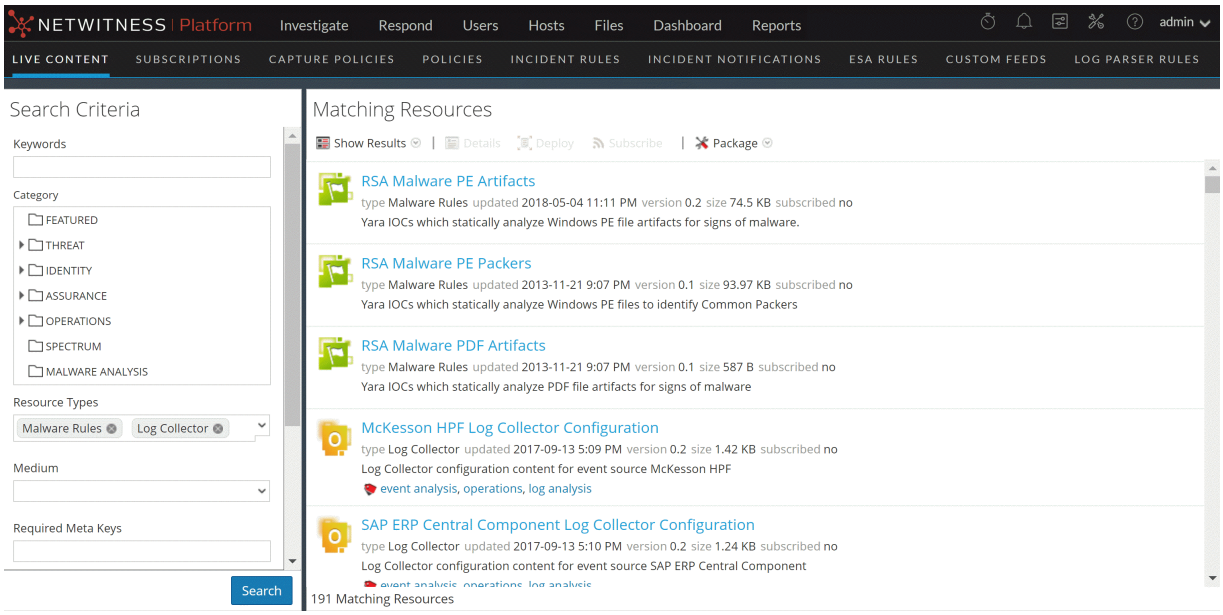
Viewing Subscribed Resources Selected to Deploy on Services

In the  **(Configure) > Subscriptions > Deployments** tab you can view subscribed resources that have been selected for deployment on services.

To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group. The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

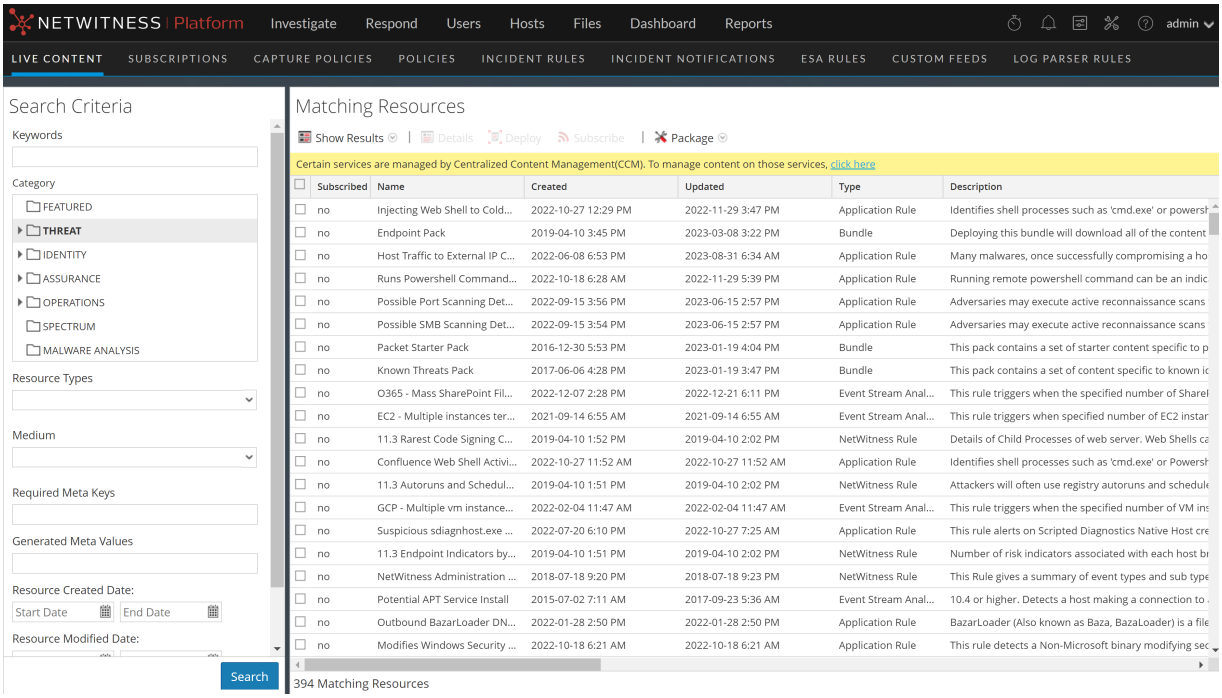
Miscellaneous Live Services Procedures



This section describes several other procedures.

Displaying Resource Details in Live Resource View

After you select a resource (in the Live Resource View), you can view its detailed information.



To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the results in **Show Results** > **Detailed view**, click the resource type icon or the resource name.

- If you are viewing the results in **Show Results** > **Grid view**, double-click a resource or select a

resource and click **Details**.

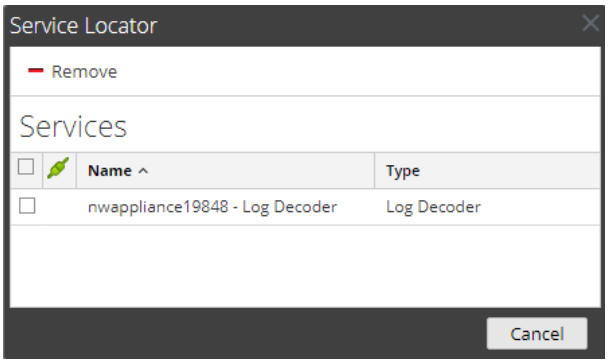
Downloading a Resource

You can download a single resource from the Live Resource View.

To download a resource:

1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource you want to download.
3. Select a single resource, then click Details.
4. Click Download.

The resource is saved as a ZIP archive to your local Downloads folder.



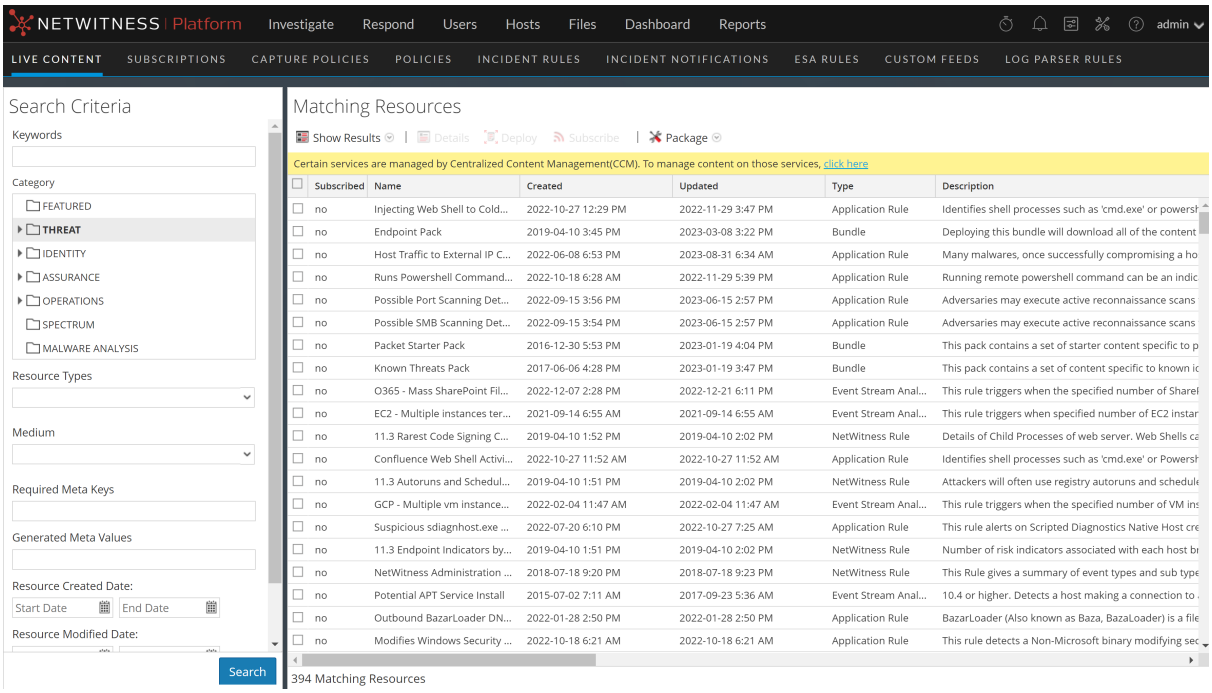
Locating and Removing a Deployed Resource from Services

You can locate and remove a deployed resource from services from the Live Resource View.

To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click Service Locator.

   The Service Locator dialog is displayed.



2. Select one or more services in the **Services** list.
3. Click −.

   The resource is removed from the selected services.

Showing Results as a List or in Detail

1. Select **Show Results > Grid** to change to grid results when viewing detailed results.

2. Select **Show Results > Detailed** to change to detailed results when viewing grid results.

Viewing Resource Details

You can display detailed information about a subscribed resource in the Resource View.

To view details:

1. In the **Subscriptions** tab, select a single subscription.
2. Click Details .

   The details of the resource are displayed in the Resource View.

References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in NetWitness. These topics are presented in alphabetical order.

Live Configure View

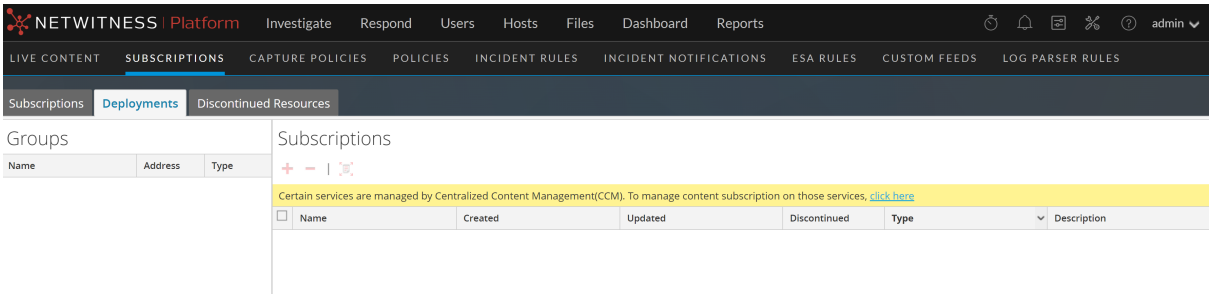
In the Live Configure view, NetWitness provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Live, please read Live Services Management.

To access this view, navigate to  **(Configure) > Subscriptions**. The view has three tabs: Deployments Tab, Subscriptions Tab, and Discontinued Resources Tab.

Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.
- Removing resources that are selected for deployment on services in a service group.



The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness synchronizes with NetWitness Live. The synchronization schedule is configured in the Live Configuration panel. Additionally, you can synchronize immediately in the **(Configure) > Subscriptions > Deployments** tab.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **(Configure) > Subscriptions**.
   The **Subscriptions** tab is displayed.
2. Click the **Deployments** tab.

The Deployments tab has two panels: **Groups** and **Subscriptions**.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

Feature	Description
Name	Displays the service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays the IP address of each service in the group.
Type	Displays the type of service.

Subscriptions Panel

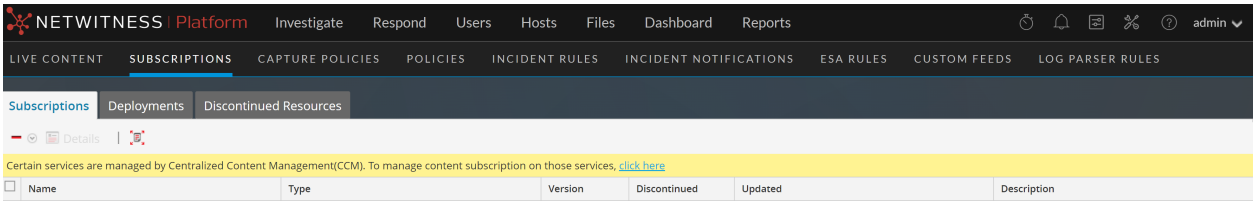
The following table describes the features in the Subscriptions panel.

Feature	Description
	Click  to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment.
	Click to delete the selected subscriptions from the deployment list for service group.
	Click  to synchronize your resources to the latest versions available on Live.
Name	Displays name of the resource.
Created	Displays date and time that the resource was created.
Updated	Displays date and time that the resource was last updated.
Type	Displays type of resource.
Description	Displays description of the resource.

Subscriptions Tab

Subscriptions are NetWitness Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from NetWitness Live. The choices made in the Live Configuration panel determine the synchronization frequency and also whether you receive update notifications through email. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness is subscribed is listed in this tab.



In the Subscriptions tab, you can:

- View all resources to which this NetWitness instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

Note: Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **(Configure) > Subscriptions**. The Subscriptions tab is displayed.

The **Subscriptions** tab has a toolbar and a grid.

Toolbar

This table describes the options available in the toolbar.

Feature	Description
	Deletes the selected subscriptions.
	Displays the details of a single subscribed resource in the Resource View.
	Check the Live Server for the latest discontinued resources.

Grid

Column	Description
☑	Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing.
Name	Displays name of the subscribed resource.
Type	Displays type of subscribed resource.
Version	Displays version of the subscribed resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - Resource is discontinued. **No** - Resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time when the subscribed resource was last updated.
Description	Displays description of the subscribed resource.

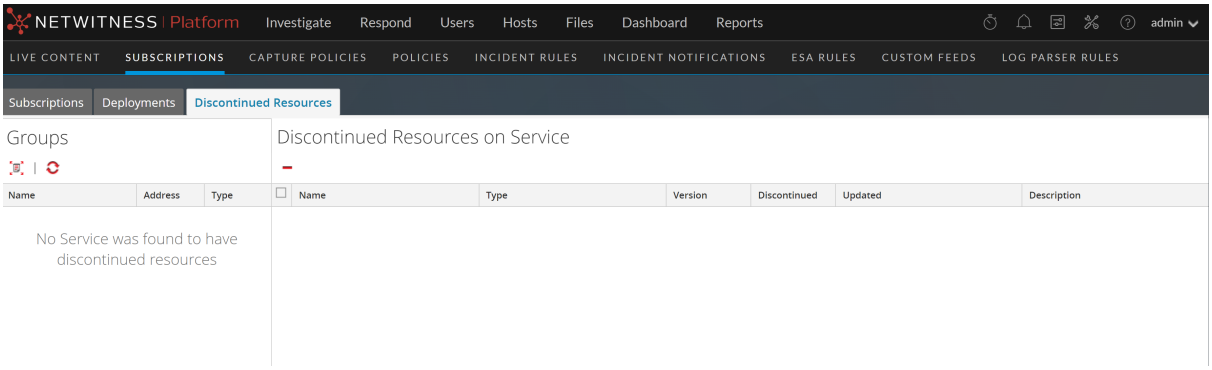
Discontinued Resources Tab

The Discontinued Resources tab provides a user interface in the Live Configure view:

- Scan the services for the discontinued resources.
- Remove the discontinued resources from any service or service group.

Note: Discontinued content still appears. With discontinued content there just won't be any updates, and users won't see these items when they search in Live, unless they check the **Include Discontinued Resources** box while searching.

In the RSA Content space on NetWitness Community, you can view the complete, up-to-date list of discontinued resources (Discontinued Content). For each resource, there is a description of why it was discontinued. Use these details to determine whether or not to remove a discontinued resource from your installation. .



The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to  **(Configure) > Subscriptions**.

   The **Subscriptions** tab is displayed.
2. Click the **Discontinued Resources** tab.

   The Discontinued Resources tab is displayed.

The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployed on the selected service or service group.

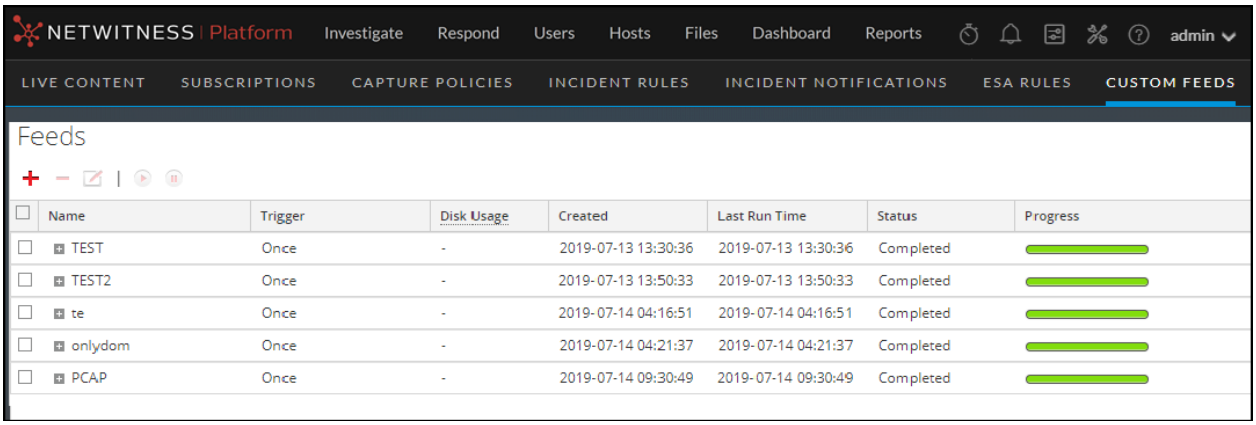
Feature	Description
	Click the button to scan the services for a discontinued resource.

Feature	Description
	Displays the current status of the discontinued resources on a service. **Note:** The status of a service may change while the services are being scanned.
Name	Displays service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays IP address of each service in the group.
Type	Displays type of service.

Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

Feature	Description
	Click the button to delete the selected resources from the service or service group.
Name	This is the name of the resource.
Type	This is the type of resource.
Version	Version of the discontinued resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - The resource is discontinued. **No** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time that the resource was last updated.
Description	Displays description of the resource.

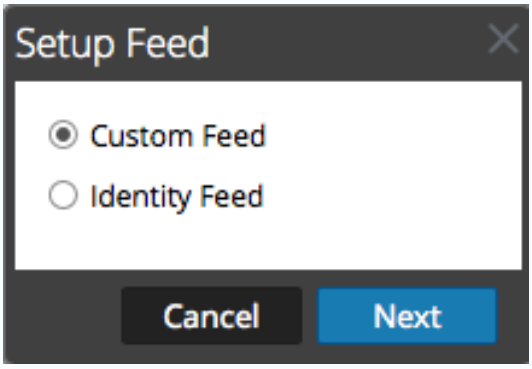


Live Feeds View

Use the Live Feeds View to:

- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.



To access this view, navigate to **(Configure) > Custom Feeds**.
This is an example of the Feeds view.

The **Feeds** tab has a toolbar and a grid.

Toolbar

This table describes the options in the toolbar.

Feature	Description
	Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.  • Custom Feed opens the **Configure a Custom Feed** wizard. • Identity Feed opens the **Configure Identity Feeds** wizard.
	Deletes the feed that you selected.
	Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Editing a Feed.
	Start or resume data feed.
	Stop or pause data feed.

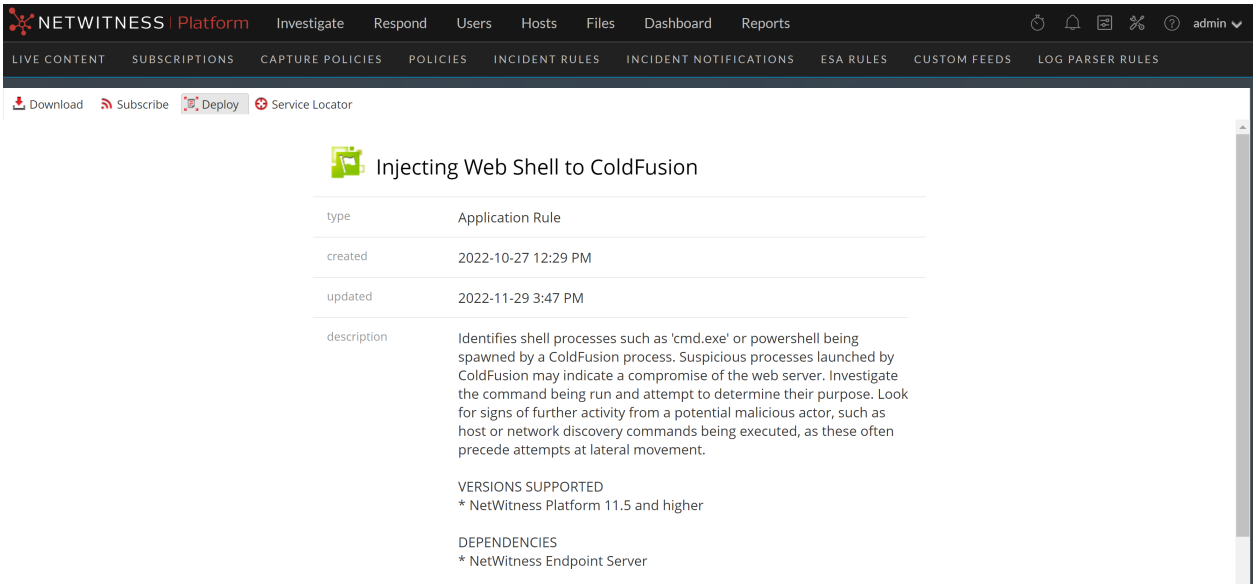
Feeds Grid

This table describes the columns in the grid.

Column	Description
	Selects a feed.
Name	Name of the feed. **Note:** You can now use special characters to define the name of the custom feed.
Trigger	Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created.
Created	Displays date and time when the feed was created.
Disk Usage	Displays the MongoDB storage size used by the TAXII feed.
Last Run Time	Displays date and time when the feed was last run.
Status	The status of the feed.
Progress	Progress bar.

Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has the following options:



- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

The required permission to access this view is View Live Resource Details.

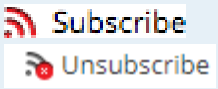
To access this view, do one of the following:

1. Go to **(Configure) > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.
3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

This is an example of the Resource view.

The Live Resource View has a detailed view of a single resource and a toolbar.

Resource Details



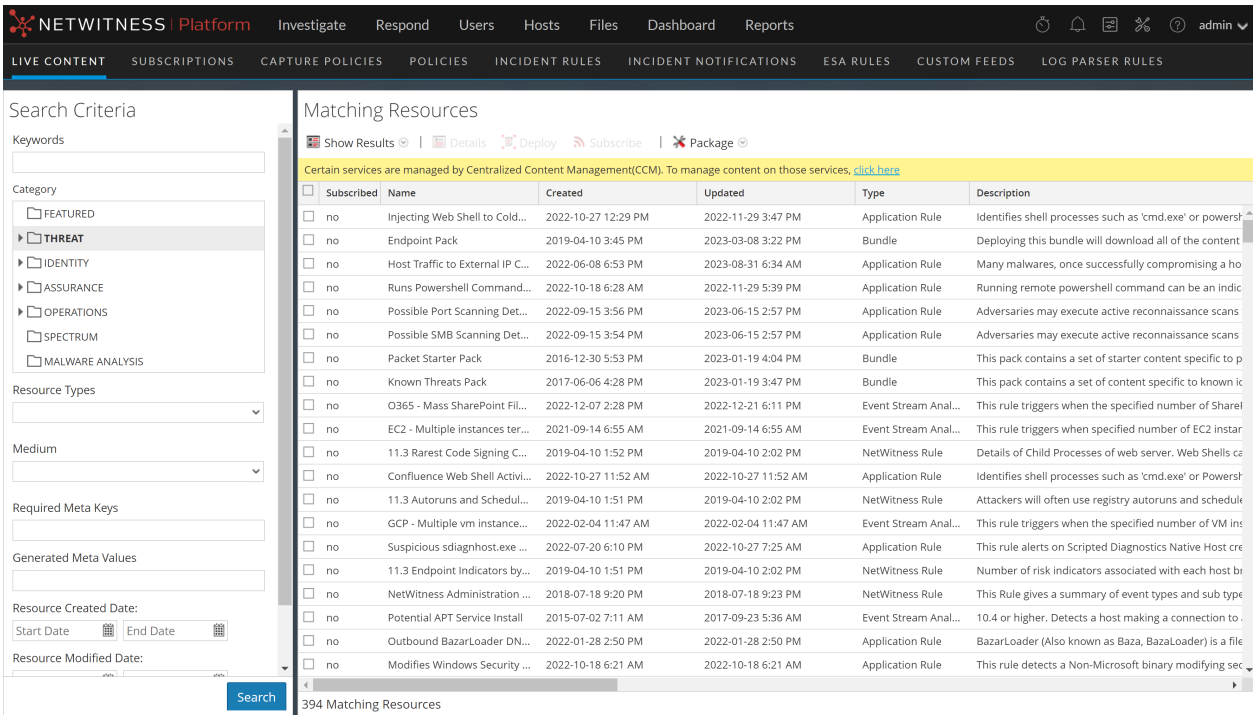
The following table describes the elements in the Resource Details section.

Feature	Description
Resource Type Icon	A graphic representation of the resource type, for example .

Feature	Description
Name	The name of the resource, for example, **fingerprint_office_lua**.
Type	The type of resource, for example, **RSA Lua Parser**.
Created	The date the resource was created, for example, **2013-09-15 02:16 PM**.
Updated	The date the resource was last updated, for example, **2013-09-15 02:16 PM**
Description	The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**.
Version in production	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **9.079 KB**.
Required Resources	A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked.
Tagged as 	The tags that apply to the resource. In the example, the tags are **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag.
Required Meta Keys	The meta keys  that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key.
Generates Meta Values	The meta values  that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value.
Permissions	The permissions required for the resource.

Resource View Toolbar

This table describes the Live Resource view toolbar options.

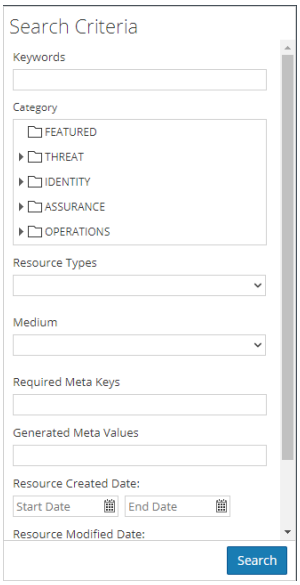


Feature	Icon	Description
Download		This option downloads the resource currently displayed in the Resource View.
Subscribe or Unsubscribe		This option subscribes to or unsubscribes from the resource currently displayed in the Resource View. • Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**. • Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed.
Deploy		This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog.

Feature	Icon	Description
Service Locator		This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services.

Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.



This is an example of the Search view.

The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

Search Criteria Panel

This is an example of the Search Criteria panel.

The following table provides descriptions of the Search Criteria panel features.

Feature	Description
Keyword(s)	Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.
Category	The categories mirror the hierarchical Investigation Model that NetWitness uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more information, see the Investigation Model topic in the NetWitness Content space on NetWitness Community.

Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Advanced Analytics (Warehouse) • Application Rule • Bundle • Correlation Rule • Event Stream Analysis Rule • Feed • FlexParser • Investigation Column Group • Investigation Meta Group • Investigation Profile • Log Collector • Log Device • Lua Parser • Malware Rules • NetWitness List • NetWitness Report • NetWitness Rule • (Version 11.5 and later) Health and Wellness Dashboards • (Version 11.5 and later) Health and Wellness Monitors **Note:** Some rules that have been deployed to an earlier version of NetWitness may not deploy or execute on NetWitness 11.x. For more information, see the Troubleshooting Live Services.
Medium	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • **endpoint**: for NetWitness 11.3 and later): applied to content that uses meta derived from endpoint agent and endpoint server data • **log**: applied to content that uses meta derived from log data • **packet**: applied to content that uses meta derived from network packets • **log and packet**: applied to content that correlates meta derived across log and packet data

Feature	Description
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field.
Required Meta Key(s)	Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field.
Generated Meta Value(s)	Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field.
Research Created Date	Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Research Modified Date	Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly.
Cancel	Click **Cancel** to cancel the search in progress.
Include Discontinued Resources	Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic.

Matching Resources Panel

The Matching Resources panel displays search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

Feature	Description
Resource Type Icon	A graphic representation of the resource type. For example .
Name	The name of the resource, for example, **Group Management**. **Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued.
Type	The type of the resource, for example, **Rule**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Version	The version of the resource, for example, **0.1**.

Feature	Description
Size	The size of the resource, for example, **153 B**.
Subscribed	Subscription status: • **yes**: This NetWitness instance is subscribed to this content resource. • **no**: This NetWitness instance has not subscribed to this content resource.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Tags	The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example,  .
Meta Keys	The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example,  .
Resource Meta Values	The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example,  .

Grid Results

In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness instance is subscribed to this content resource. • **no**: This NetWitness instance has not subscribed to this content resource.
Name	The name of the resource, for example, **Group Management**. **Note:** The resource name is displayed in red color if it is discontinued.
Created	The date when the resource was created, for example, **2015-08-12 3:11 PM**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Type	The type of the resource, for example, **Rule**.
Discontinued	The status of the discontinued resources: • **yes**: The resource that matches the search criteria is discontinued • **no**: The resource is not discontinued • **--**: The Live Server is not checked for the discontinued resources
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Toolbar	

Feature	Description
	This menu offers two ways to view search results: **Detailed** and **Grid**.
	This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view.
	This option applies to one or more selected resources.
	This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated.

	This menu offers two packaging functions for the selected resources:
	• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:
	  • open the file, or
	  • save the file for subsequent deployment.
	• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it.

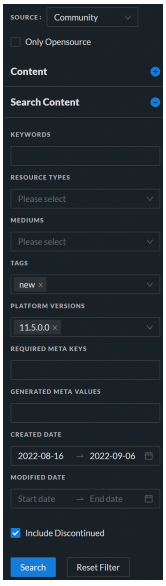
- For more information on Deployment (), see Find and Deploy Live Resources.
- For more information on Deploying a Package (), see the Resource Package Deployment Wizard,.

Live Search Content View

The Live Search Content view provides the ability to search the configured Live CMS for content. Once matching content are found, you can view the details, and download the content.

This is an example of the Search Content view.



The Live Search Content view has a panel for selecting the source and specifying search content. The matching content are displayed on the right panel.

The following table provides descriptions of the Live Search Content panel features.

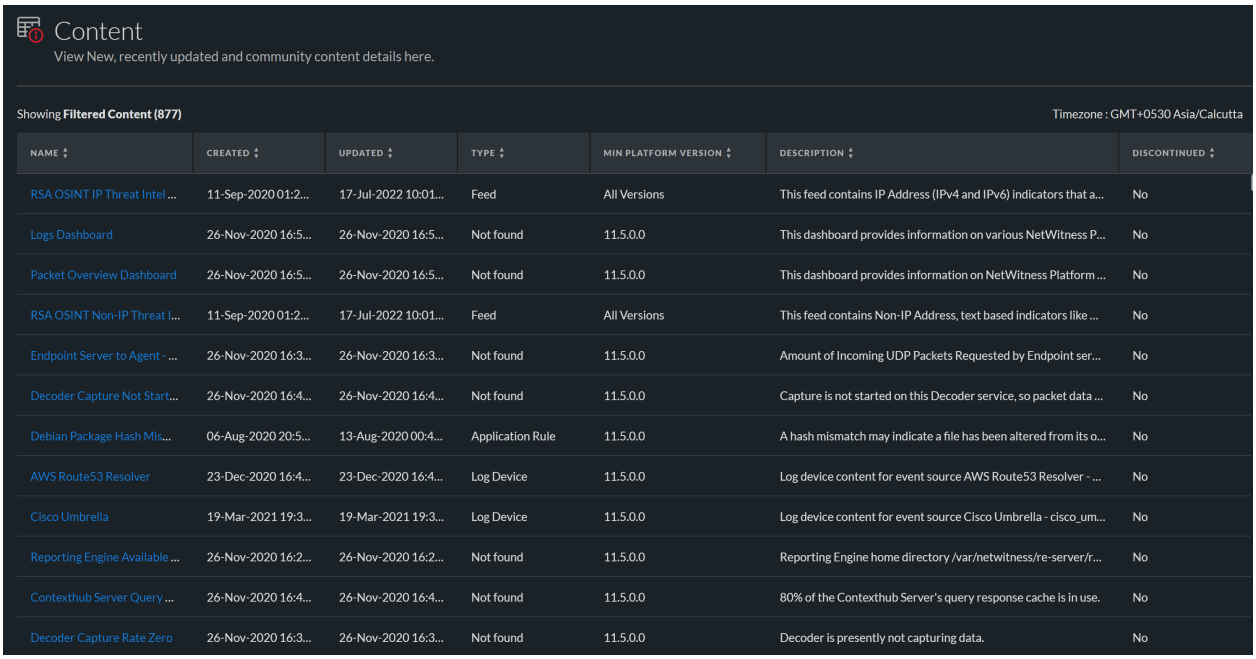
Feature	Description
NetWitness	Select NetWitness from the Source drop-down menu to search for the content that is provided by NetWitness Platform Live.
Community	Select Community from the Source drop-down menu to search for the content collected and retrieved from third party and open source communities.
Only Opensource	Select the Only Opensource checkbox to retrieve the content from the open-source communities. **Note:** When the community is selected as the source, the Only Opensource option will be displayed under the Search Content Panel to select and search for open source-related content.
New	Select New to retrieve the content which is created in the last 21 days.
Recently Updated	Select Recently Updated to retrieve the content which is updated in the last 21 days.

Search Content Panel

This is an example of the Search Content panel.

The following table provides descriptions of the Search Content panel features.

Feature	Description
Keywords	Enter a keyword or keywords to browse for content that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.



Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Application Rule • Feed • Log Device • Correlation Rule • NetWitness Rule • NetWitness Report • Lua Parser • Log Collector • NetWitness List • Malware Rules • Event Stream Analysis Rule • Advanced Analytics (Warehouse) • Bundle • Health and Wellness Dashboards • Health and Wellness Monitors • Investigate Profile • Investigate Column Group • Investigate Meta Group
Mediums	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • endpoint: for 11.3 and higher): applied to content that uses meta derived from endpoint agent and endpoint server data • log: applied to content that uses meta derived from log data • packet: applied to content that uses meta derived from network packets • log and packet: applied to content that correlates meta derived across log and packet data.
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse content for a Log Decoder, select the **netwitness for logs** tag.

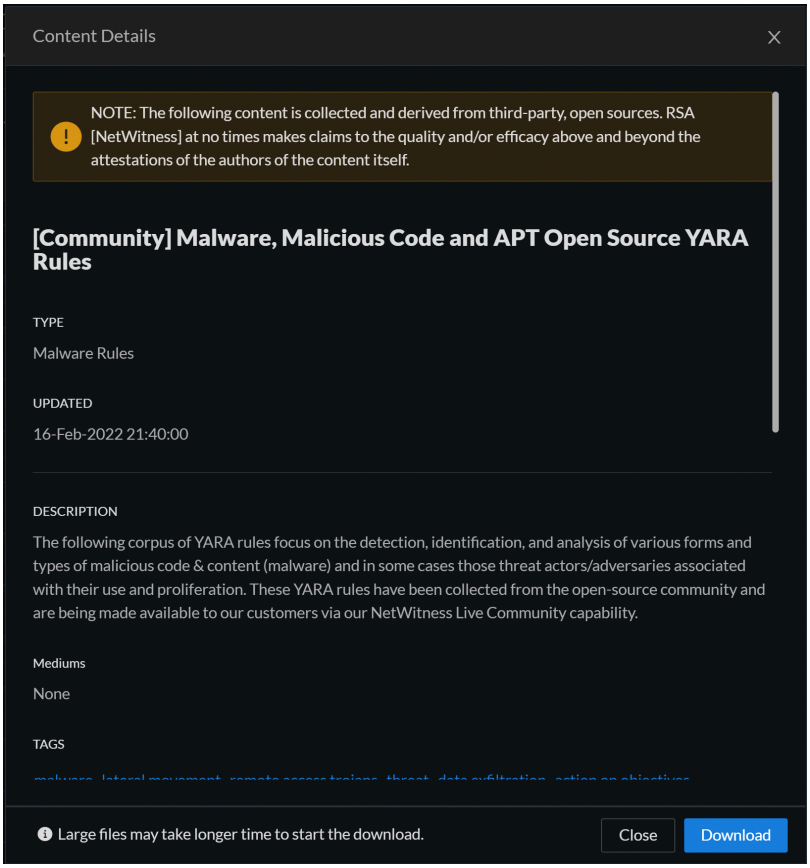
Feature	Description
Platform Versions	Select one or more platform versions from the drop-down list to search for content based on the versions. For example, **11.5**.
Required Meta Keys	Enter a specific meta key. For example, **threat.source**.
Generated Meta Values	Enter a generated meta value. For example, **rsa-firstwatch**.
Created Date	Specify a date range during which content were created. For example, to browse content that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar.
Modified Date	Specify a date range during which content were modified. For example, to browse content that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching content more quickly.
Reset Filter	Click **Reset Filter** to reset the existing search results and displays all the content on the right panel.
Include Discontinued	Check **Include Discontinued** to include the discontinued content in the search result. For an up-to-date list of content that have been discontinued, see the Discontinued Content topic.

Search Results Panel

The Search Results panel displays search results based on the selections made in the Search Content panel.

This is an example of the Search Results panel.

The following table describes the elements in the search results panel.



Feature	Description
Name	The name of the content. For example, **Log Parser Pack**.
Created	The date when the content was created. For example, **04-Aug-2017 15:19:06**.
Updated	The date when the content was last updated. For example, **29-Sep-2020 20:27:14**.
Type	The type of the content. For example, **Bundle**.
Min Platform Version	Platform version that the content supports. For example, 11.5 and higher. **Note:** Min Platform Version is not applicable for Community content.
Description	The description of the content. For example, **Contains all parser files and log collection files**.
Discontinued	The status of the discontinued content: • **Yes**: The content that matches the search criteria is discontinued • **No**: The content is not discontinued

Content Details Panel

In the Search Results panel, you can select any content titles to view the details in the pop-up window and download the content.

Note: NetWitness provides no assurance related to the quality and accuracy of the content provided by the third parties and open source communities.

This is an example of the Content Details panel.

The following table describes the elements in the Content Details section.

Feature	Description
Name	The name of the content. For example, **Log Parser Pack**.
Type	The type of the content. For example, **Bundle**.
Created	The date when the content was created. For example, **04-Aug-2017 15:19:06**.
Updated	The date when the content was last updated. For example, **29-Sep-2020 20:27:14**.
Description	The description of the content. For example, **Contains all parser files and log collection files**.
Version on Production	The version of the content. For example, **0.5**.
Size	The size of the content. For example, **14.96 KB**.
Required Resources	A list of resources on which this resource depends. For example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked in the pop-up window.

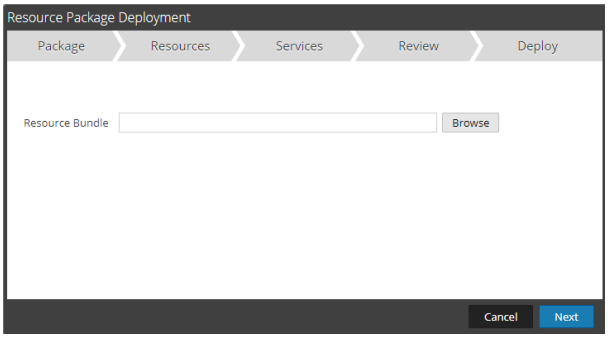
Feature	Description
Tags	The tags that apply to the content. For example, **threat**. Clicking a tag opens the Live Search Content view with the search narrowed to match content with that tag.
Required Meta Keys	The meta keys that apply to the content. For example, **Threat Category**. Clicking a meta key opens the Live Search Content view with the search narrowed to match content with that meta key.
Generated Meta Values	The meta values that the content generates. For example, **rsa-firstwatch**. Clicking a meta value opens the Live Search Content view with the search narrowed to match content with that meta value.
Discontinued	The status of the discontinued content: • **Yes**: The content that matches the search criteria is discontinued • **No**: The content is not discontinued

Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness.

If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.



Note: Use NetWitness Live to create resource bundles; this is a different application that is not part of NetWitness. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Package File.

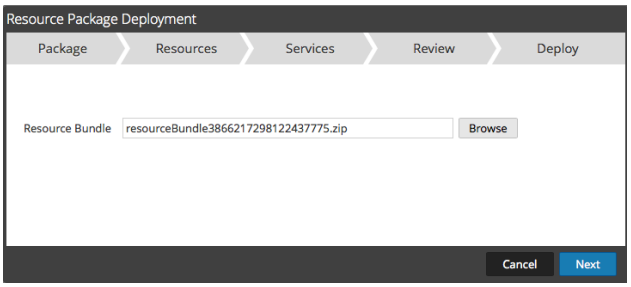
The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. Go to **(Configure) > Live Content**.
2. In the **Live Search - Matching Resources** toolbar, select Package > **Deploy**.

   The Resource Package Deployment wizard is displayed.

Features



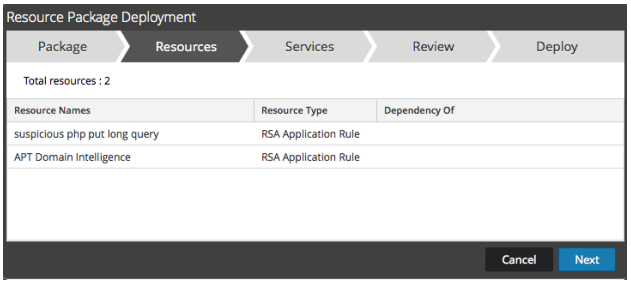
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**.
Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness returns to the Live Resources View.

Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



The following table describes the elements in the Package tab.

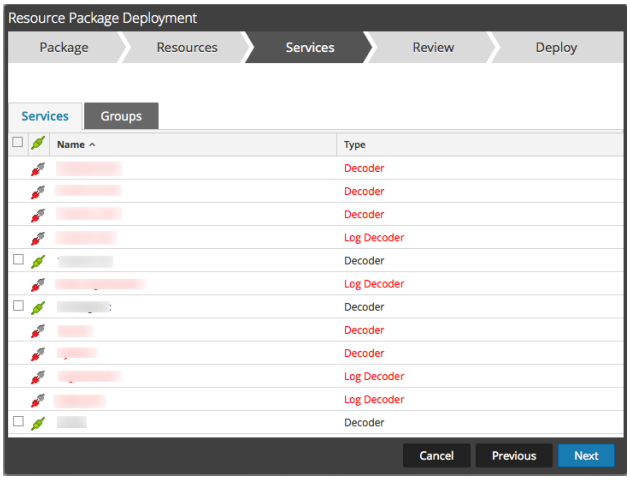
Column	Description
Resource Bundle	The input field to specify a resource bundle. You can type a path in this field or search using the Browse button.
	Command Buttons
Browse	This button opens a File Upload dialog in which you can browse the local file system and select a bundle.
Cancel	Cancels the deployment and closes the wizard.
Next	Displays the next tab of the wizard.

Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.

The following table describes elements in the Resources tab.



Column	Description
Resource Name	Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**)
Dependency Of	Displays Resources on which the selected resource depends (for example, **AIM lua**).

Services Tab

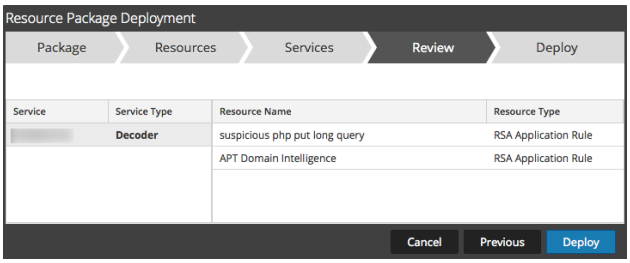
You select the services on which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the **(Admin)** > **Services** view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups on which you want to deploy the resources in the bundle.

This is an example of the Services tab.

The following table describes the elements in the Services tab.

Column	Description
	Services
	Selects services on which you want to deploy the content. You can select any combination of services and service groups.
Name	Displays the services in your environment on which you can deploy the content.
Host	Displays the name of the resource host.
Type	Displays the type of NetWitness service.
	Groups
	Selects service groups (if you have service groups defined in your environment).
Name	Displays the names of the service groups.



Review Tab

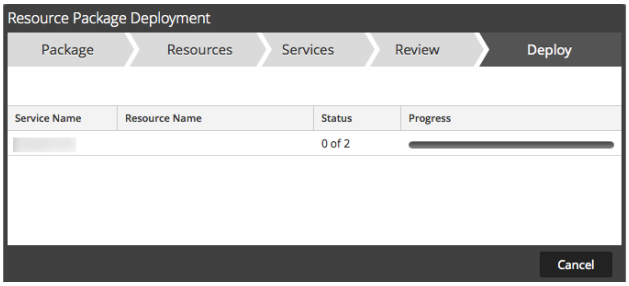
Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.

The following table describes the elements in the Review tab.



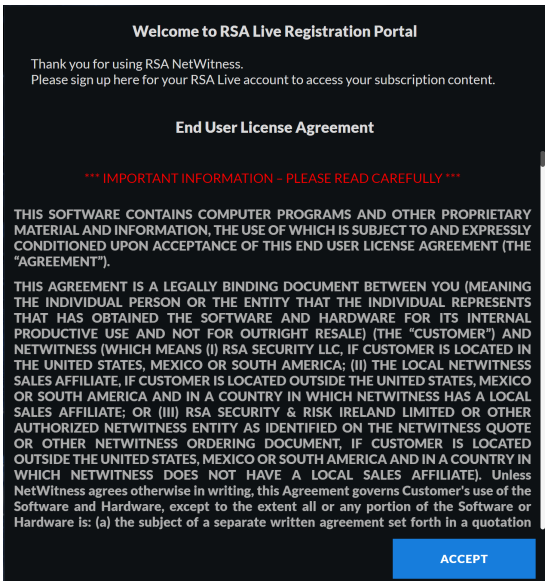
Column	Description
	Service Information
Service	Displays the services in your environment on which you can deploy the content.
Service Type	Displays the type of each NetWitness service (type of host or service).
	Resource Information
Resource Name	Displays the name of the resources you have selected (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**).
Deploy	Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard).

Deploy Tab

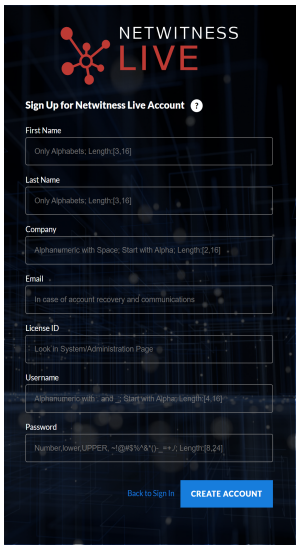
This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.



The following table describes the elements in the Deploy tab.



Feature	Description
Service Name	Name of the services to which resources are deployed.
Resource Name	Name of the resources.

Feature	Description
Status	Status of the manual deployment.
Progress	Progress of the manual deployment in a progress bar. When complete, the bar turns solid green.
Command Buttons	
Close	Closes the wizard.
Errors	Only displays if NetWitness encountered any errors. Click to display the errors.
Retry	Only displays if NetWitness encountered any errors. Click this button to try to deploy the resources again using the wizard.

NetWitness Live Registration Portal

The NetWitness Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in NetWitness Live library. To access the portal, go to the following URL: https://live.netwitness.com/registration/.

Click **Sign Up For Live**. The License Agreement page is displayed, once you agree to the Terms and Conditions, click **Accept**: the fields for setting up an account are displayed. These include Contact Information, and License ID.

The following table lists the contact information section fields and its descriptions:

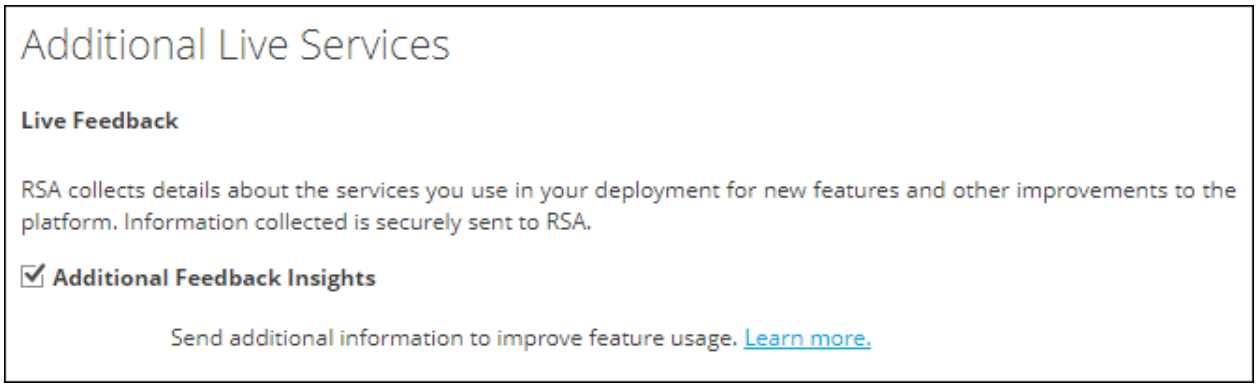
Parameter	Description
First Name	Your first name.
Last Name	Your last name.
Company	The name of your company.
Email	The email address where you want to receive notifications related to the Live account.

Parameter	Description
License ID	This is the License ID on the  (Admin) **> System > Info** page. **Caution:** The license ID on the NetWitness must be valid and must be registered on the Flexera Server. If not, contact NetWitness Customer Support.
Username	The username used to sign in to NetWitness Live account. The username must contain a minimum of four characters and a maximum of 16 characters.
Password	The password for the NetWitness Live account. The password must contain minimum of eight characters and the maximum length is 24, with at least one uppercase, one lowercase, one number, and one special character.

NetWitness Feedback and Data Sharing

The Live Feedback Activity Log enables you to download the usage data required for Live Feedback. After you download the Live Feedback data, you can then upload it to share with NetWitness.

The settings for these features are available in **(Admin) > System > Live Services** view, in the Additional Live Services section.



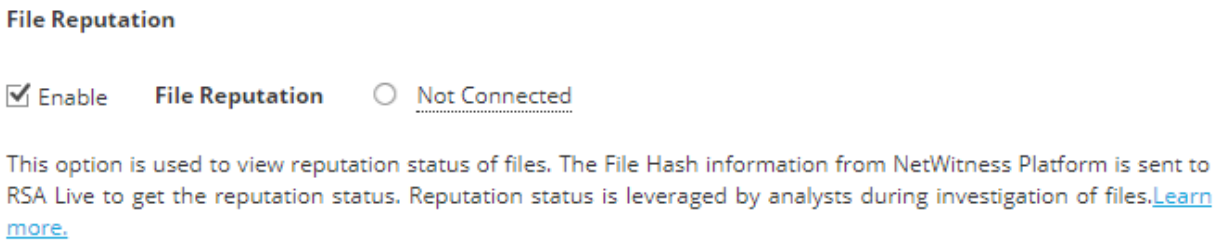
Additional Live Services

Participation in the Additional Live Services is configured in the **(Admin) > System > Live Services** view.

Live Feedback

Note: For NetWitness 11.4.1 and later, this section in the UI has been removed. As of 11.4.1, NetWitness has created the Customer Experience Improvement Program. For details, see "Configure the Customer Experience Improvement Program" in the *NetWitness System Configuration Guide*.

Live Feedback is intended to help improve NetWitness.



Once you set up and configure a Live account, usage data is automatically shared with NetWitness and is protected in accordance with the applicable license agreement. All such data shall be anonymized and shall not have any Personally Identifiable Information.

Before data is sent to NetWitness, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to NetWitness.

For more information, see the "Live Feedback Overview" topic in the *System Configuration Guide*.

File Reputation

File Reputation service provides instant access to the latest signatures using the RSA Live feed so data is more relevant, with fewer false positives. With this service, users always have reliable data about the reputation of files in their NetWitness Endpoint system. In addition to the whitelisting service, it provides blacklisting information as well.

File Reputation
Enable
File Reputation
Not Connected
This option is used to view reputation status of files. The File Hash information from NetWitness Platform is sent to RSA Live to get the reputation status. Reputation status is leveraged by analysts during investigation of files.Learn more.

Troubleshooting Live Services

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness.

Some Rules Are Invalid for Version 11.x

The rules "NetWitness Incident Management - Alert Details" and "NetWitness Incident Management - Incident Summary" are not valid for NetWitness version 11.x. Do not deploy these rules to an 11.x system.

Note: Rules are updated frequently, and the documentation for them is available in the Content space on NetWitness Community. For the latest information on Rules, see RSA NetWitness Rules.

OutOfMemoryError on Context Hub Server

You may encounter an OutOfMemoryError on Context Hub server, and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following steps:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

   Note: If the issue still persists, you must execute step 3.

3. To decrease the number of parallel threads available for processing STIX:

   a. Go to  **(Admin) > Services > Context Hub service > View > Explore**.

   b. In the tree panel, navigate to **enrichment/stix/ config**.

   c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.

   d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.

   e. Restart the Context Hub server.

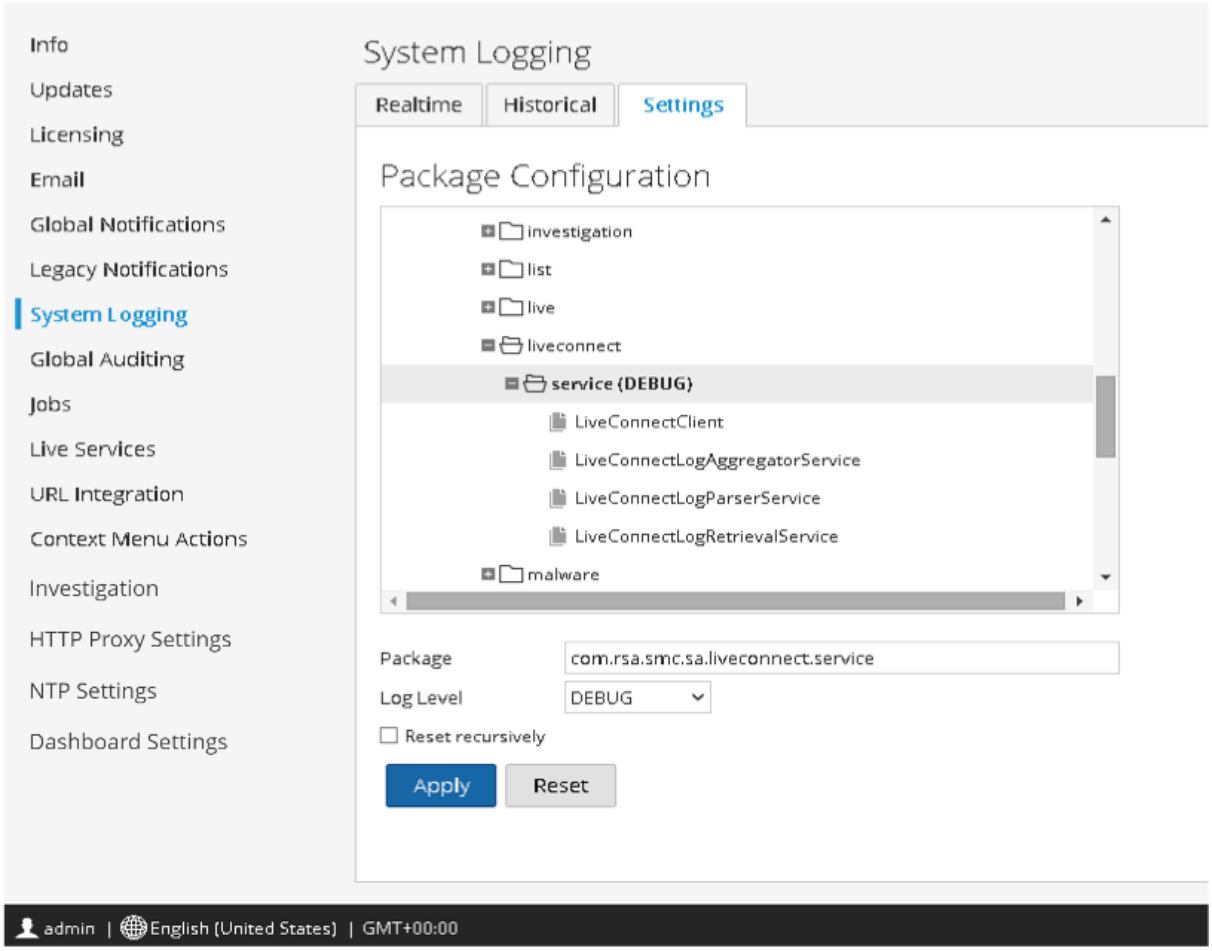
Troubleshooting Live Connect Threat Data Sharing

This section discusses troubleshooting Live Connect Threat Data Sharing.

Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you must construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss



The following is an example of the URL used to retrieve query logs:

```
https://<server>/admin/liveconnect/force_aggregation?startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true
```

System Logging: Debug

To access debug information:

1. Go to  **(Admin) > System > System Logging**.
2. Select the **Settings** tab.
3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.

Introduction to Endpoint Agent Installation

Note: The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, physical or virtual, where a supported operating system is installed. An Endpoint Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. (Optional) Configuring the Relay Server

Note: You must set up the default relay server before generating the Agent packager. Whenever the Relay server configuration is modified, agent policy is updated automatically. For more information on configuring the relay server, see *Endpoint Configuration Guide*.

2. Generating an agent packager
3. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and tracking events from these hosts. It monitors key behaviors related to process, file, registry, console, and network, and forwards them as events to the Endpoint Server over HTTPs.

Note: The Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information, see the *NetWitness Endpoint Configuration Guide*.

Supported Operating Systems

Note: From version 12.0 and higher, NetWitness Endpoint agents run on ARM devices running on Windows 10 and 11.

Windows	Linux *(The agent software runs only on x86_64 architecture)*	macOS
Windows 11 (up to version 22H2)	CentOS 7.x and 8.x	macOS Sonoma (14) **Note:** For more information on how to enable Process Events tracking on macOS 14, see Enable Process Events Tracking on macOS 14.
Windows 10 Kiosk Mode (64-bit)	Red Hat Enterprise Linux 7.x, 8.x, and 9.x	macOS Ventura (13)
Windows 10 (32 and 64-bit) (up to version 22H2)	SUSE Linux Enterprise Server 12 SP1, 12 SP3, 12 SP4, 12 SP5, 15 SP1, and 15 SP4	macOS Monterey (12)
Windows 8.1 (32 and 64-bit)	Ubuntu 16.04 LTS, 18.04 LTS, and 20.04 LTS	macOS Big Sur (11)
Windows 8 (32 and 64-bit)	Oracle Linux 8.8	macOS Catalina (10.15)
Windows 7 (32 and 64-bit)	Alma Linux 9.0	macOS Mojave (10.14)
Windows Server 2022 Windows Server 2022 Core		macOS High Sierra (10.13)
Windows Server 2019 Windows Server 2019 Core		macOS Sierra (10.12)
Windows Server 2016		OS X El Capitan (10.11)
Windows Server 2012 R2		OS X Yosemite (10.10)
Windows Server 2012		OS X Mavericks (10.9)
Windows Server 2008 R2 (32 and 64-bit)		

Hardware Requirements

The minimum requirements for installing, uninstalling, and upgrading the agent comply with the specific operating system requirements.

Enable Process Events Tracking on macOS 14

You can track Process events on macOS 14 after enabling audit control in your machine.

To enable Process events tracking on macOS 14

Note: The steps 1 and 4 are applicable to you only if the agent is installed and running on your machine. If the agent is not installed on your machine, skip the steps 1 and 4 and perform only the steps 2, 3, and 5.

1. Stop NetWitness agent by running the following command.

   ```
   sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

2. Copy the audit service template config file to create a new config by running the following command.

   ```
   sudo cp /etc/security/audit_control.example /etc/security/audit_control
   ```

3. Enable auditd service by running the following command.

   ```
   sudo launchctl enable system/com.apple.auditd
   ```

4. Enable NetWitness agent by running the following command.

   ```
   sudo launchctl load /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

5. Reboot the system.

Disable Process Events Tracking on macOS 14

You can disable Process events tracking in your macOS 14 by disabling the already enabled audit control.

To disable Process events tracking on macOS 14

1. Stop NetWitness agent by running the following command.

   ```
   sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

2. Disable auditd service by running the following command.

   ```
   sudo launchctl disable system/com.apple.auditd
   ```

3. Remove the audit service config file by running the following command.

   ```
   sudo rm /etc/security/audit_control
   ```

4. Enable NetWitness agent by running the following command.

   ```
   sudo launchctl load /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

5. Reboot the system.

Installation Flowchart

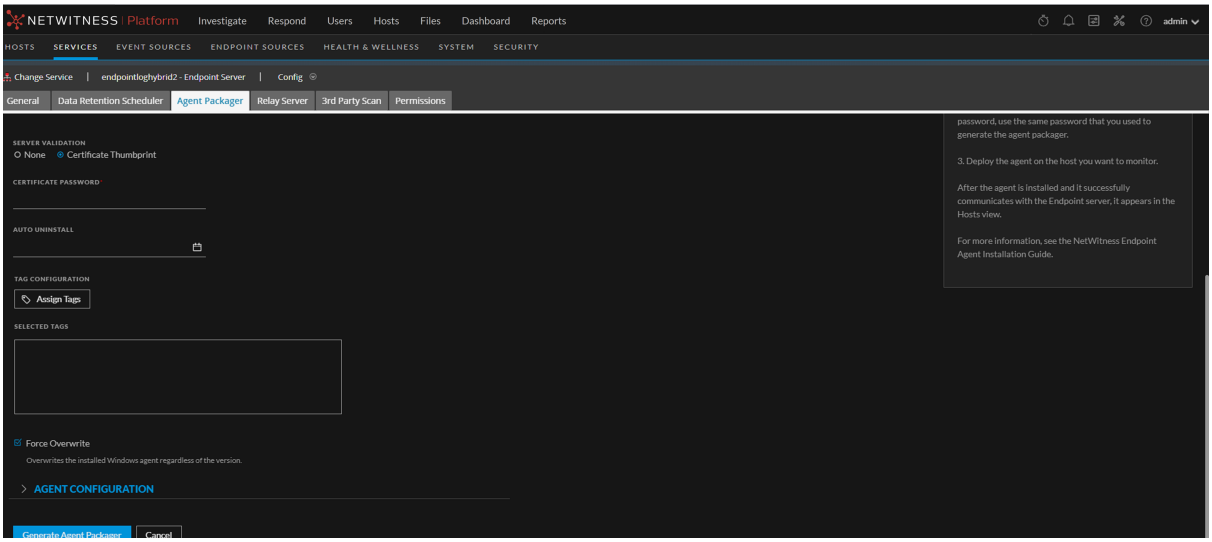
The following flowchart illustrates the Endpoint agent installation process:

Prerequisites

- Install NetWitness. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Install NetWitness Endpoint Log Hybrid. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Deploy ESA Rules from the Endpoint Rule Bundle. For more information, see *ESA Configuration Guide*.
- Configure Endpoint Metadata forwarding. For more information, see *NetWitness Endpoint Configuration Guide*.
- Review the default policies and create groups to manage your agents. For more information, see *NetWitness Endpoint Configuration Guide*.
- Configure your RSA Live account and make sure the File Reputation service is enabled. For more information, see *Live Services Management Guide*.
- To migrate an existing NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.5 and later, see https://community.netwitness.com/t5/netwitness-platform-online/migrating-netwitness-endpoint-4-4-0-x-to-netwitness-platform/ta-p/669090 to import the NetWitness Endpoint 4.4.0.x configurations (file status, certificate status and blocked hashes).

Note: If you are upgrading, make sure that you deploy the latest Endpoint application rules from RSA Live. For more information, see *Live Services Management Guide*.

Generate an Endpoint Agent Packager



To generate an agent packager to collect endpoint data from hosts:

1. Log in to NetWitness.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Login screen.

2. Click  **(Admin) > Services**.

3. Select the **Endpoint Server** service and click  **> View > Config > Agent Packager** tab.
   The Agent Packager tab is displayed.

4. Enter the values in the following fields:

Field	Description
Endpoint Server	Displays all the available Endpoint servers in the deployed.
Endpoint Server Forwarder (Optional)	The optional Endpoint Server Forwarder allows you to enter an alternative Fully Qualified Domain Name (FQDN) or IP address on which the sever can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server. If specified forwarder is not available, agent will eventually fall back to the packaged address.
HTTPS Port	Port number. For example, 443.
Server Validation	Determines how the agent validates the Endpoint Server certificate: • None – The agent will not validate the server certificate. • Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate.
Certificate Password	Password used to download the packager. The same password is used while generating the agent installer. **Note:** The password must be minimum seven characters long and a combination of uppercase and lowercase letters, numbers, and special characters. For example, **Admin@123**.
Auto Uninstall	Date and time the agent automatically uninstalls. You can leave it blank if not required.
Tag Configuration	When you click **Assign Tags** under Tag Configuration, you can do any of the following: • Create new tags and assign them to the hosts. • Select already existing tags and assign them to the hosts. For more information, see Investigate Hosts.
Force Overwrite	Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once. If you enable this option, make sure that you provide the same service name and driver service name as the previously installed agent, while creating a new agent. **Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>` After you move an agent from one deployment to another, using Force Overwrite to change the agent incurs an 8-hour delay in communication between the agent and its Endpoint Server on the new deployment. To eliminate the delay, uninstall the agent from the old deployment, and reinstall the agent on the new deployment.

Field	Description
Agent Configuration	
Note: The following Service and Driver fields are applicable only for Windows.	
Service	
Service Name	Name of the agent service. For example, NWEAgent.
Display Name	Display name of the agent service. For example, NWE Agent.
Description	Description of the agent service. For example, NetWitness Endpoint.
Driver	
Driver Service Name	Name of the driver service. For example, NWEDriver.
Driver Display Name	Display name of the driver service. For example, NWE Driver.
Driver Description	Description of the driver service. For example, NetWitness Endpoint Driver.
Generate Agent	Generates an agent packager.

5. Click **Generate Agent**.

   This downloads an agent packager (**AgentPackager.zip**) on the host where you are accessing the NetWitness user interface.

Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

Note: Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file as administrator by right-clicking the file and selecting **Run as administrator**.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - NWE000032.msi (for Windows 32-bit)
   - NWE000064.msi (for Windows 64-bit)
   - NWE00Aa64.msi (for ARM based Windows 64-bit)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.x86_64.rpm (for RPM based Linux 64-bit)
   - nwe-agent.x86_64.deb (for Debian based Linux 64-bit)

   Note: The MSI files should not be renamed.

Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

Note: By default, the agent is installed in the Insights mode. Depending on the policy assigned, the agent can operate in Insights or Advanced mode. Make sure you review the policy before deploying the agent. For more information, see *NetWitness Endpoint Configuration Guide*.

Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager on the host machine.

- Using Services.msc

  Open `Services.msc` in run and look for the service name that you configured while generating the agent packager on the host machine.

Deploying Agent (Linux)

To deploy the agent on the hosts you want to monitor:

RPM based Linux

Run the **nwe-agent.x86_64.rpm** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
rpm -iv <installer file name>.rpm
```

For example, using the default installer file name, you can enter the following command:

`rpm -iv nwe-agent.x86_64.rpm` (for x86_64 architecture)

Note: To upgrade RPM based Linux agents, run **rpm -Uvh nwe-agent.x86_64.rpm**.

Debian based Linux

Run the **nwe-agent.x86_64.deb** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
dpkg -i <installer file name>.deb
```

For example, using the default installer file name, you can enter the following command:

`dpkg -i nwe-agent.x86_64.deb` (for x86_64 architecture)

(Enter the administrator password when prompted.)

Note: To upgrade Debian based Linux agents, run **dpkg -i nwe-agent.x86_64.deb**.

Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

Deploying Agent (Mac)

To deploy the agent, run the `nwe-agent.pkg` file on the hosts you want to monitor. On macOS version Catalina (10.15) and higher, you need to move the `nwe-agent.pkg` file to a folder with sufficient access privileges (e.g., `/tmp`) and install the agent from there.

Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.
- Using Command Line

  Run the following command to get the PID

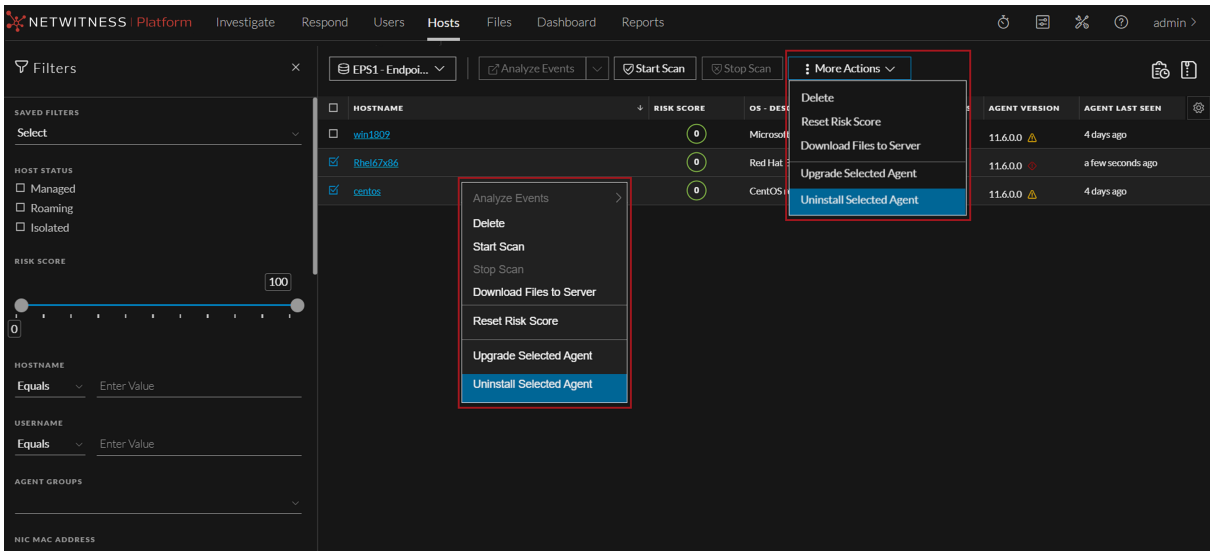
  ```
  pgrep NWEAgent
  ```
- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/NWEAgent.log | grep NWEAgent | grep Version
  ```

Uninstall Agents

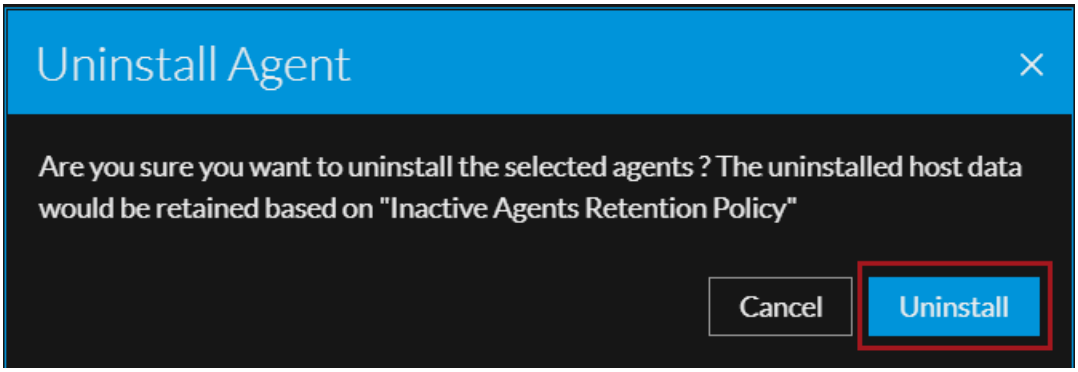
You can use one of the following methods to uninstall Endpoint agents. Select a method based on your current Endpoint agent version.

- Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)
- Uninstalling Agent Manually



Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)

Note: To uninstall an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

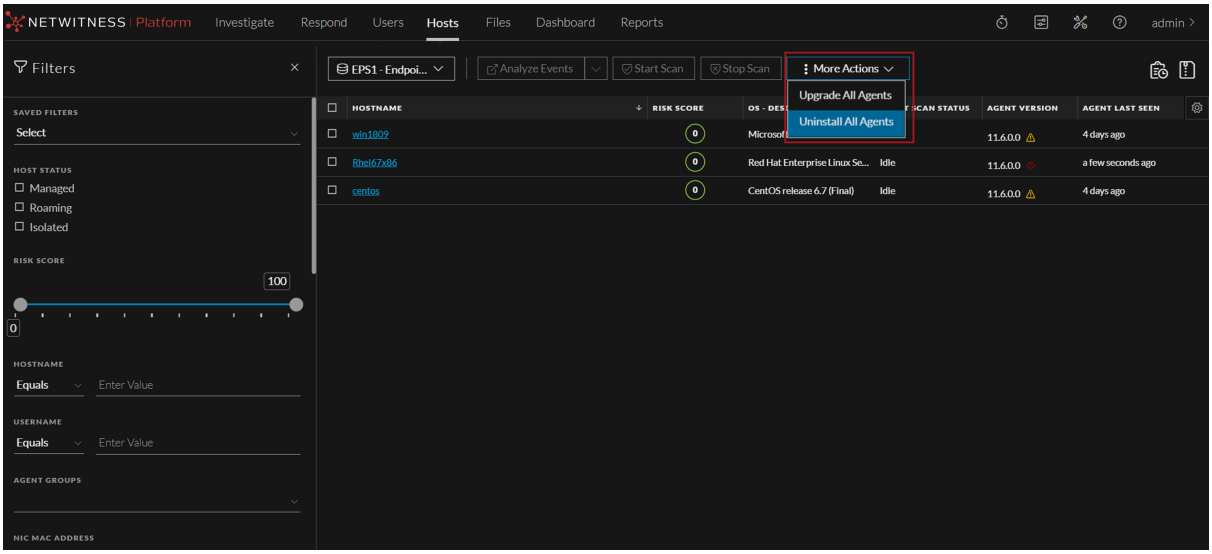


You can uninstall agent using UI by going to **Hosts** and performing one of the following options.

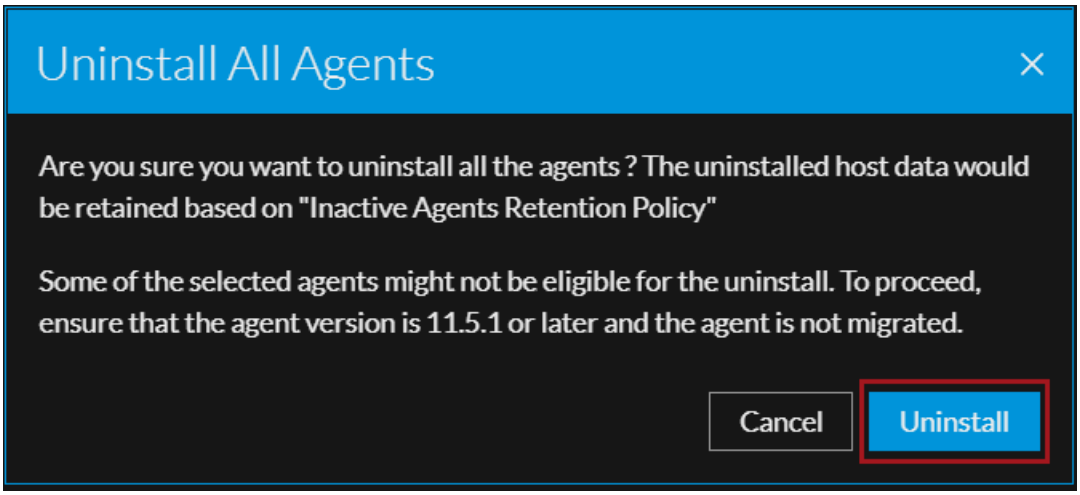
Uninstall one or more agents from Hosts view

1. Select one or more hosts from which you want to uninstall the agents.
2. Selected **More Actions > Uninstall Selected Agent** from the toolbar.

3. In the **Uninstall Agent** dialog, click **Uninstall.**



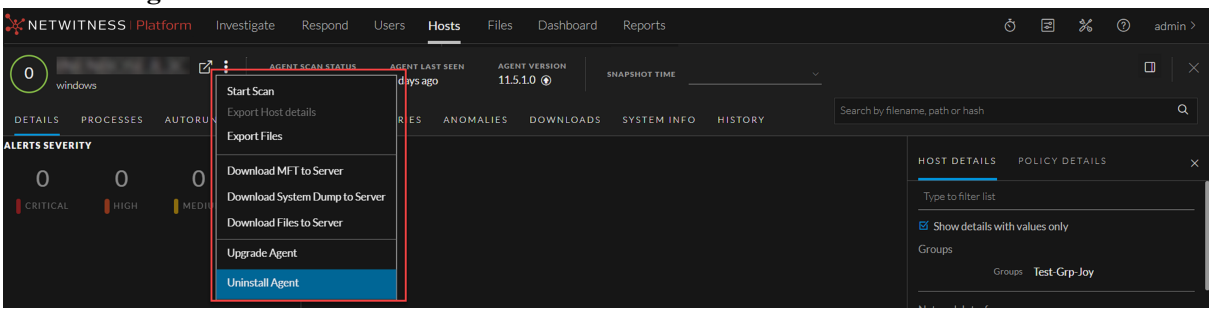
Uninstall all the agents from Hosts view



Note: Uninstall All Agents via UI is also supported for Broker service.

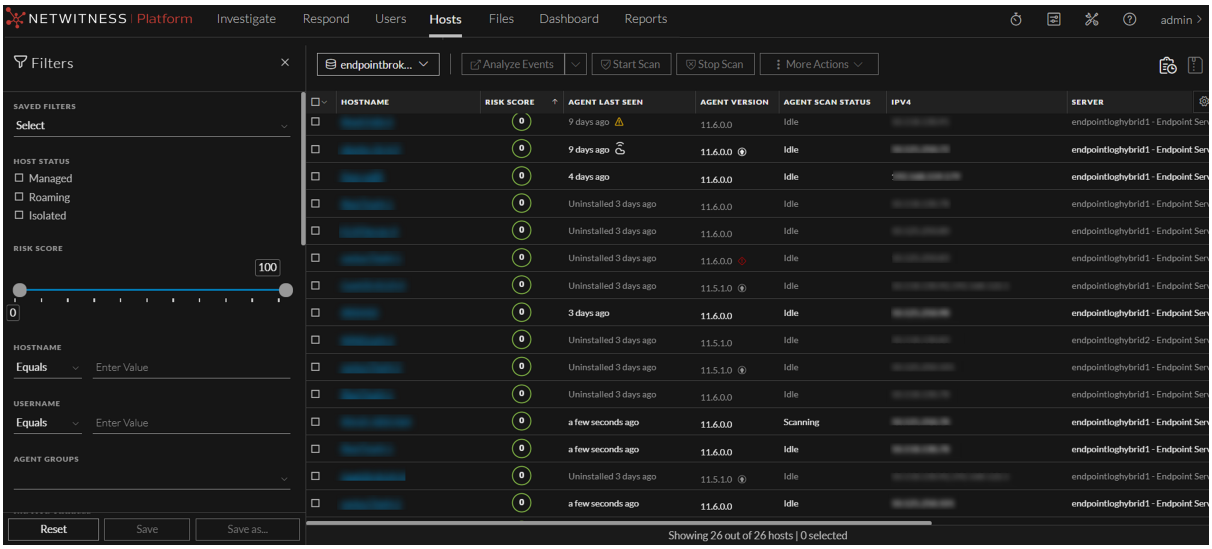
1. Select **More Actions > Uninstall All Agents** from the toolbar.

Note: For the uninstall all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. If you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



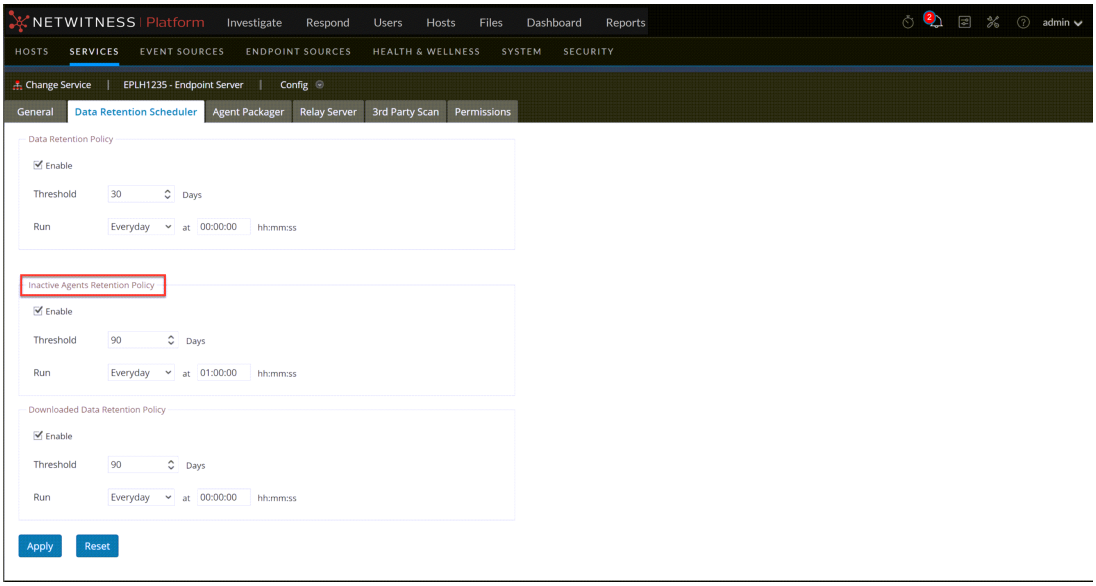
2. In the **Uninstall All Agents** dialog, click **Uninstall.**

Note: Uninstall All Agents process will require more time to complete depending upon the number of agents selected based on the filters applied.



Uninstall an agent from Host details view

1. Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Uninstall Agent**.



2. In the **Uninstall Agent** dialog, click **Uninstall.**

3. After the agent is uninstalled, **Agent Last Seen** is updated and the host is grayed out in the **Hosts** view.

Note: Once an agent is uninstalled, only **Delete** and **Analyze Events** actions can be performed on it.

IMPORTANT: If you are uninstalling agent using UI, the uninstalled host data would be retained based on **Inactive Agents Retention Policy.**

Uninstalling Agent Manually

Uninstalling Windows Agent

Run the following command as administrator:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

Uninstalling Linux Agent

For RPM based Linux, run the following command as root:

```
rpm –ev nwe-agent
```

For Debian based Linux, run the following command as root:

```
dpkg -r nwe-agent
```

Uninstalling Mac Agent

Run the following commands:

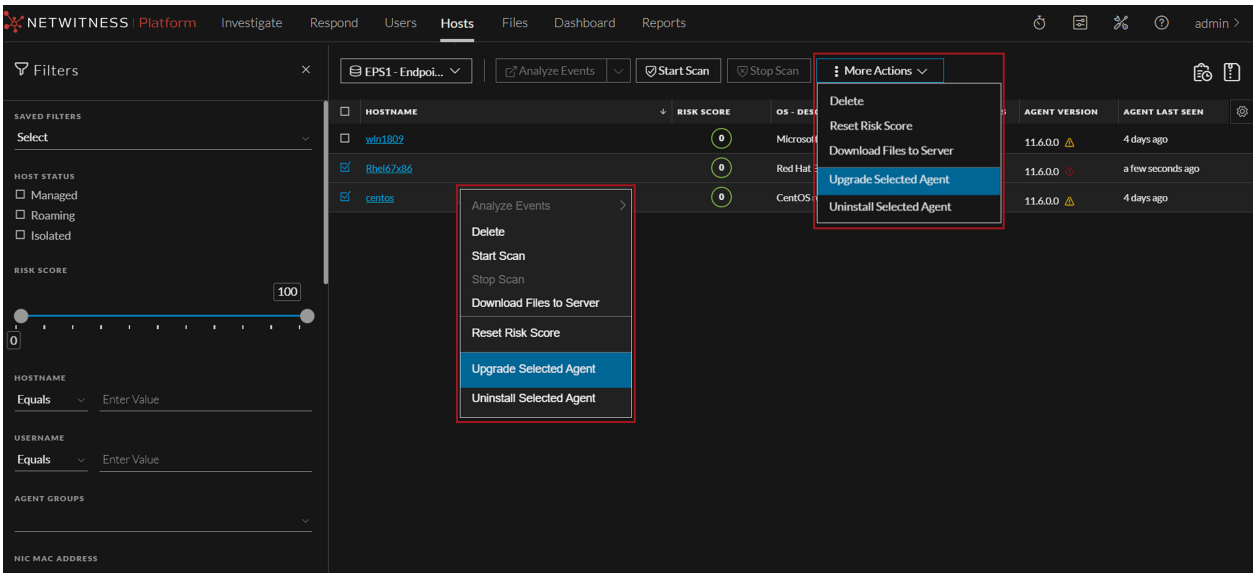
1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil --forget com.rsa.pkg.nwe`

Upgrade Agents

You can use one of the following methods to upgrade Endpoint agents. Select a method based on your current Endpoint agent version. If you have upgraded the endpoint server recently, you must restart it to see **Upgrade Selected Agent** and **Upgrade All Agents** options on the UI.

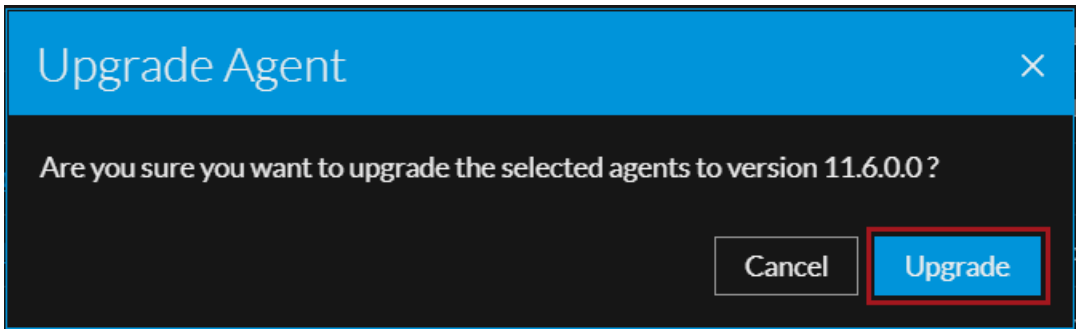
- Upgrading 11.5.1 or Later Agents Versions Using UI
- Upgrading 11.3.x or Later Agents Versions

Upgrading 11.5.1 or Later Agents Versions Using UI



Note: To upgrade agent from UI, ensure the service user account has both `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage` permissions. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

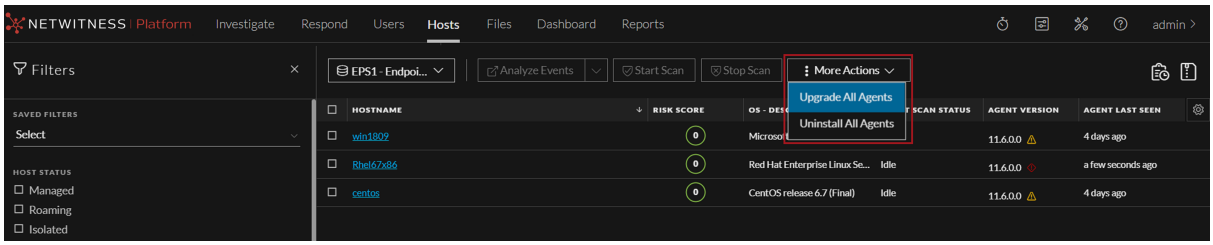
From 11.6, you can upgrade the Endpoint agents using the UI. Agent version must be 11.5.1 or later to upgrade using the UI.



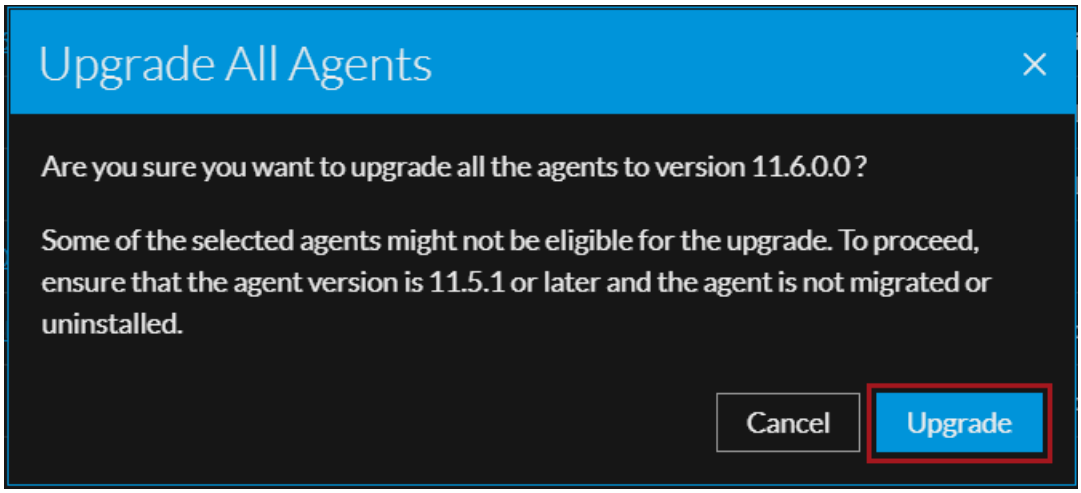
You can upgrade agents using UI by going to **Hosts** and performing one of the following options.

Upgrade one or more agents from Hosts view

1. Select one or more hosts and select **More Actions > Upgrade Selected Agent**



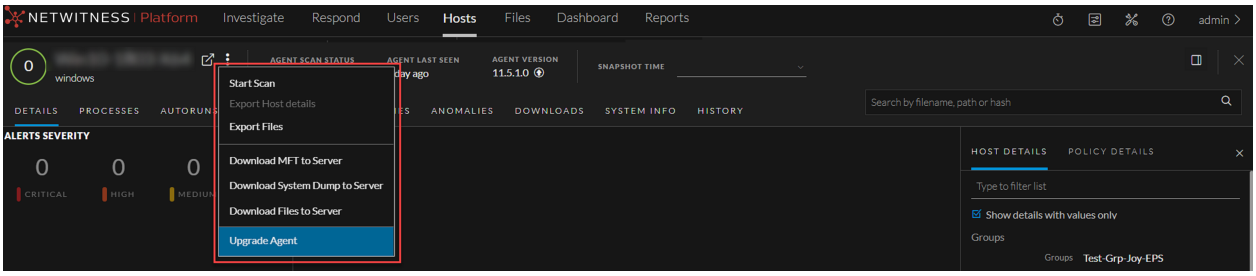
2. In the **Upgrade Agent** dialog, click **Upgrade**.



Upgrade all agents from Hosts view

1. Select **More Actions > Upgrade All Agents** from the toolbar, to perform bulk agent upgrade.

Note: For the upgrade all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. When you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



2. In the **Upgrade All Agents** dialog, click **Upgrade**.

Note: Upgrade All Agents process will require more time to complete, depending upon the number of agents selected based on the filters applied.

Upgrade an agent from Hosts details page

Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Upgrade Agent**.

1. In the **Upgrade Agent** dialog, click **Upgrade**.

Note: To upgrade an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

The following upgrade status icons are displayed in the **Agent Version** column.

Icons	Upgrade Status	Description
	Upgrade Available	An agent upgrade is available.
	Agent Upgrade Pending	The agent has not yet received the upgrade command.
	In Progress	The agent is being upgraded.
	Failed	Agent upgrade failed. View details in the agent history page.
No Icon	No Upgrade Available	No upgrade available for the agent. Refer to agent eligibility.

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands.
     The Agent History view is displayed.
   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands.
       The History view is displayed.

For more information on Agent History, see the "Investigating Hosts" topic in the *NetWitness Endpoint User Guide*.

Upgrading 11.3.x or Later Agents Versions

You can upgrade the 11.3.x and later versions of Endpoint agent to 11.6 or later.

Note: In a multi-server Endpoint deployment, during an agent upgrade, make sure that the correct Endpoint server is mentioned in the respective agent policy. In case the agent uses the default policy, ensure to use the agent packager downloaded from the respective Endpoint server to which it is communicating. Using Agent packager from different Endpoint server for agent upgrade will result in migrating the agents to another Endpoint server.

Note: For a subsequent installation or upgrade, use the same service and driver service name.

To upgrade from 11.3.x and later, download the 11.6 agent packager, deploy and verify agents. For more information, see Generate an Endpoint Agent Packager and Deploy and Verify Endpoint Agents.

Upgrade from 4.4.0.9 and 4.4.1.x is supported only for version 11.3. For more information, see *NetWitness Endpoint 4.4.1.x to NetWitness Platform 11.3 Migration Guide*.

To upgrade an agent from 4.4.0.x to 11.6, uninstall the agent and perform a fresh installation.

Recommendations for Installing Agents in Virtual Desktop Infrastructure (VDI) Environment

Agent ID is generated based on various parameters, such as security identifier (SID) and SMBIOS Universal Unique Identifier (UUID). A SMBIOS UUID is a 128-bit number used to uniquely identify a host.

Note: While cloning the VDI image where an agent is already installed, the agent ID automatically changes for Windows and Mac agents if `uuid.action = keep` is not set in the .vmx file. For more information, see Configure a Virtual Machine to change the UUID.
For Linux agents, the agent ID does not change automatically on VDI clone.

When you clone a VDI image:

- If you do not change the agent ID for each VDI clone, make sure that the SMBIOS UUID remains the same.
- If you change the agent ID for each VDI clone, make sure that the SMBIOS UUID is also changed.

To avoid duplication of agent IDs, make sure that the SMBIOS UUID changes on the following VDIs:

- Citrix XenServer
- VMWare Workstation
- VMware vCloud Director

  For more information, see VMware Knowledge Base.
- vCenter hosted ESXi Server

To get the SMBIOS UUID on a Windows virtual host, execute the following command:

```
wmic csproduct get UUID
```

Troubleshooting

This section provides information about possible issues when using the NetWitness Endpoint.

Packager Issue

Issue	Failed to generate the agent installers.
Explanation	Some encryption software may create additional files that fails to generate the agent installers.
Resolution	Copy the packager to a machine that does not have antivirus or encryption software and then generate the agent installers.

Issue	Failed to generate agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` fails to generate MAC agent installer (`nwe-agent.pkg`) with the error message "Failed to generate table of content for package" or "Failed to create config file C:\AgentPackager (4)\agents\mac\Plugins\NWEInstallerPlugin.bundle\Contents\Resources\config.cfg".
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**.

Issue	Agent packager generates temporary agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` generates MAC agent installer as `nwe-agent_tmp.pkg` instead of `nwe-agent.pkg`.
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**. The MAC agent package `nwe-agent.pkg` will be generated as expected

Agent Upgrade via UI Issues

Issue	Agent upgrade not available.
Explanation	1. The agent version might not be supported for upgrade from UI. Agent version has to be 11.5.1 or later for upgrade via UI. 2. Logged in user may not have appropriate permission for upgrade from UI. 3. Agent version is up-to date.
Resolution	1. Use the manual upgrade method for upgrading the version.

	2. Use admin user which have following permissions, endpoint-server.agentupdate.manage and endpoint-server.ca.manage. 3. No upgrade required. Agent version is already up-to date and no further upgrade is available.

Issue	Agent upgrade is in Pending state.
Explanation	The hosts for which the command is shown in pending could be in offline or inactive state.
Resolution	Ensure Hosts/agents are communicating with Endpoint server directly or via Relay server for it to receive the upgrade command from server. Verify "Agent Last seen" time in Host listing page.

Issue	Agent upgrade failed.
Explanation	1. Agent upgrade fail with any of the following reasons: • Service Name or Driver name mismatch • Checksum mismatch • Installer size mismatch 2. Agent installer could not be created.
Resolution	1. Retry upgrading the agent. If it continues to fail, use the manual upgrade method. 2. Check the permissions for the user initiated the upgrade command. User can be viewed in **Host** > **Agent History** page. User should have following permissions, `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage`.

Issue	Linux agent upgrade fails with an error, sudo not found.
Resolution	Make sure that the sudo package is installed on the agent machine.

Agent Uninstall via UI Issues

Issue	Agent uninstalled failed.
Explanation	Agent uninstall fails due to several unknown reasons.
Resolution	1. Retry uninstalling the agent. 2. Use the manual uninstall method. For more information, see Uninstalling Agent Manually.

Events Tracking Issues

Issue	Process events cannot be tracked on macOS 14 agent machine.
Explanation	The audit() framework used to track process events is deprecated in macOS 11 and disabled by default in macOS 14. As a result, the process events cannot be tracked on macOS 14 agent machine.
Resolution	For workaround, see **Enable Process Events Tracking on macOS 14** section in Introduction to Endpoint Agent Installation.

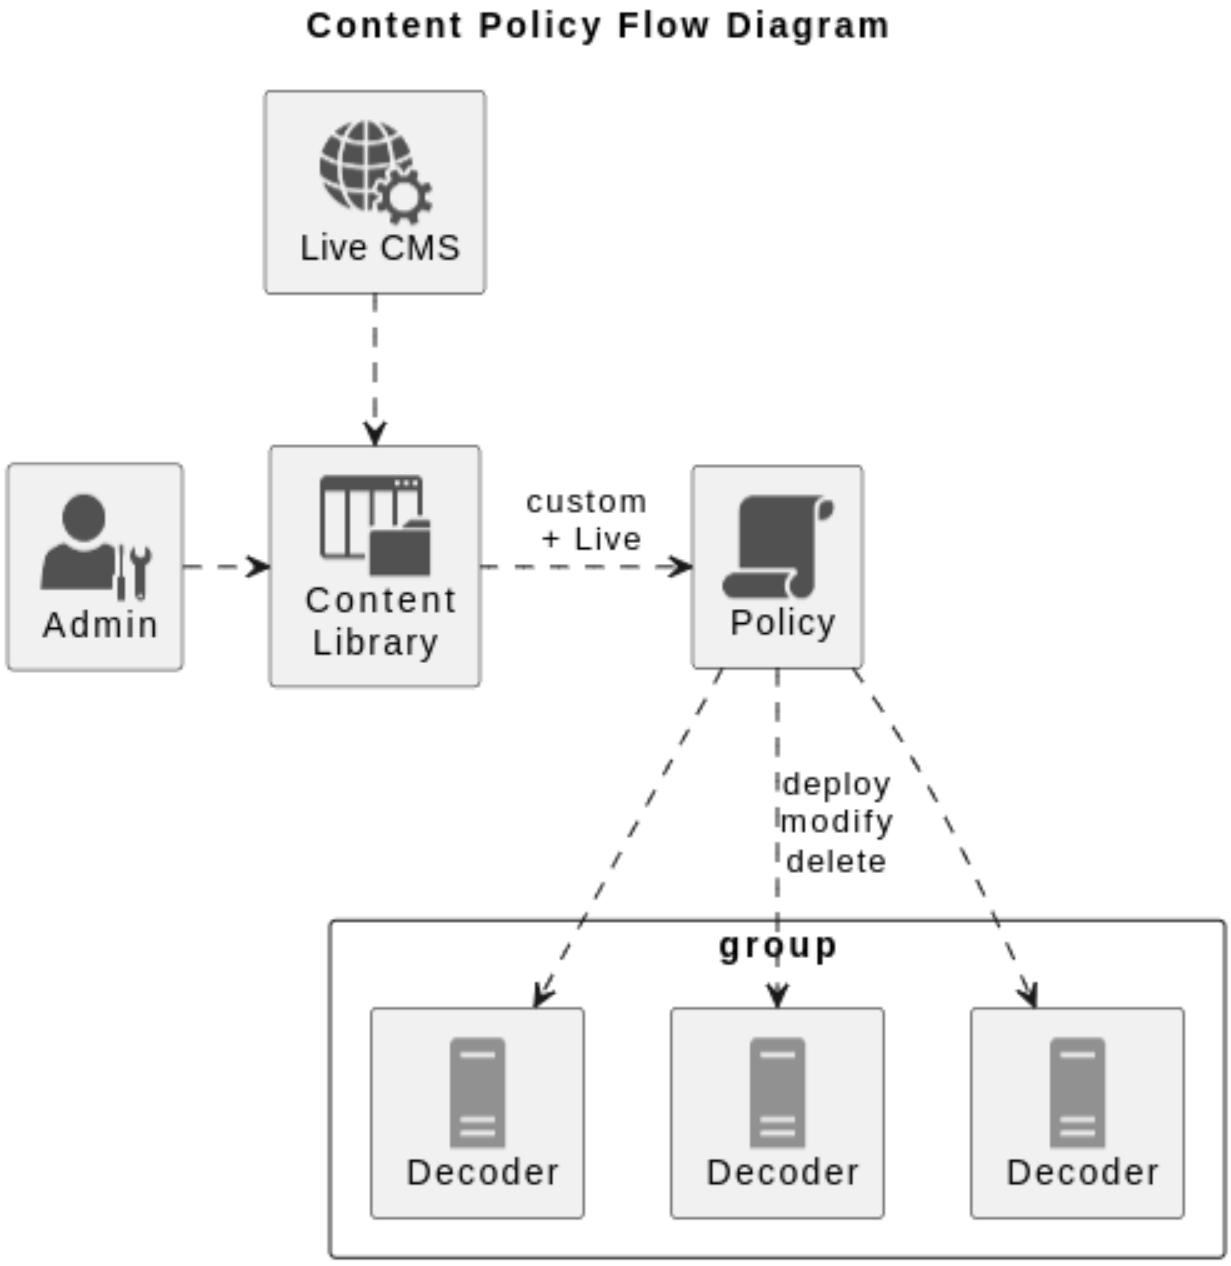
About Policy-based Centralized Content Management (CCM)

Legacy content management involves deploying and managing content in multiple places in the UI.

- **Live Content UI**: Located under the Configuration interface, this allows a “push” deployment of Live content to one or more services, but does not provide any management of content once it is deployed
- **Service Config UI**: Located under **Admin > Services > View Config**, this UI enables you to view, edit or delete content on individual services.



Policy-based Centralized Content Management (CCM) is a unified approach to find, deploy, and manage content through the entire life cycle based on policies that can be assigned to groups of devices. It is a single location to view, modify and manage the content deployed across all services in the environment.

This approach consists of three elements:

- Groups: A collection of NetWitness services (such as Decoders, Log Decoders, and Correlation Servers etc.) to assign and manage content.
- Content Policies: A container of content and subscription settings used to assign and manage content within a Group.
- Content Library: A local repository of content which resides on the Admin Server and is used to assign content to policies. This includes both Live and Custom content.

The Content Library contains Live content (synchronized with the Live CMS) and any custom content you create or import. To deploy, remove or manage content on your services, content is assigned from the Content Library to a Content Policy. Once that content policy is assigned to a group and Published, the content changes are put into effect on the services within the group.

Workflow

Benefits

Benefits of Policy-based Centralized Content Management:

- Add or remove content without repeating the process on each service.
- Add content from RSA Live or add your custom content into a single content repository. You can add content from this repository to a policy.
- Add a new service to an existing group to automatically deploy all necessary content.
- One-click management of subscriptions and automatic updates
- Provides highly responsive and updated UI for browsing RSA Live content that can help you with the following:
  - View Live content along with your content policies and click  to add content from Live.
  - Seamlessly view Live content along with your custom content.
- Create and upload content to the Content Library easily by:
  - Importing log parsers as a zip file instead of converting to ".envision" format.
  - Cloning existing Application Rules and Network Rules.
- Switch services between legacy Content Management UI and the new Centralized Content Management via Groups and Policies using the "toggle" feature. This can prevent content being mistakenly added or modified outside of a Policy, causing an out-of-sync issue.
- Create, modify and publish policies and manage custom content in the Content Library even without an internet connection.
- Find content, policies or groups of interest easily by using the **Filtering** capability of the UI.
- Receives meta key and operator suggestions while creating Application Rule and Network Rule conditions. This eases the creation of error-free rules.
- Manage ESA content and handle multiple deployments seamlessly using Policy.
- Seamlessly view ESA Live content along with your own custom content.
- Add and manage ESA Correlation servers as part of groups.
- Manage all the data sources for the ESA Correlation servers from the **Settings** > **Event Stream Analysis** > **Data Sources** page seamlessly.

IMPORTANT: It is recommended not to use the Centralized Content Management and Service Config page or Live Content page simultaneously for managing the content. Using the Service Config UI to add or modify content can cause the content to become out-of-sync with the Content Policy.

Note: If Policy-based Centralized Content Management is enabled for a service, then the Policy-based Centralized Content Management enabled services will be disabled in Live content UI and user will not be able to manage content of these services from Service Config page as Service Config page becomes read only and no actions except 'export' can be performed from Service Config page.

Enable or Disable CCM for All or Individual Decoder Services

You can choose to use CCM to manage content for selected services or for all services.

When CCM is Enabled:

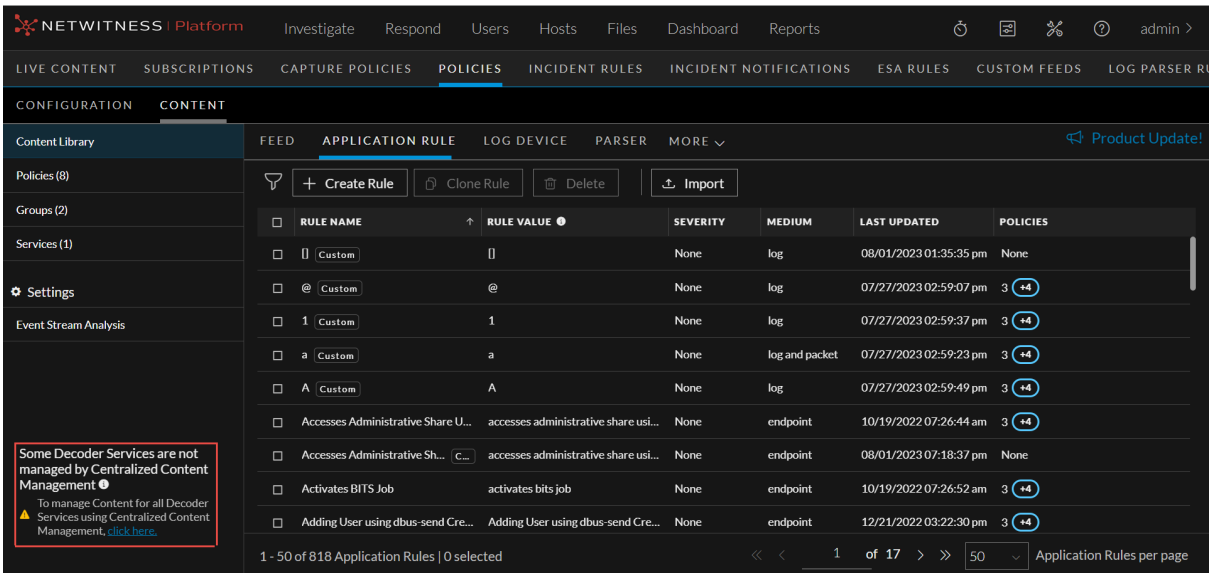
- The service config page is read-only. Only **Export** button is enabled in service config page to export content.
- Content cannot be deployed to CCM enabled services through the Live Content UI.
- Content for all CCM enabled services can be managed through the Content Policies and the Content Library.
- Content subscription from CCM overrides content subscription from **(CONFIGURE) > Subscriptions** page.

When CCM is Disabled:

- Content can be deployed from Live Content UI.
- The content of the service can be managed from service config page. Any changes made through the Service Config page does not reflect in the content policy.
- The service is disabled in the Policy or Group page of CCM and the policy status changes to **Partial**. The policy can be published with a disabled service. However, the policy state always remains **Partial**. Publishing a policy will affect only the services that are enabled for CCM.

  Note: When a service, which is part of a group, is added back to CCM, the policy status changes to "Unpublished".

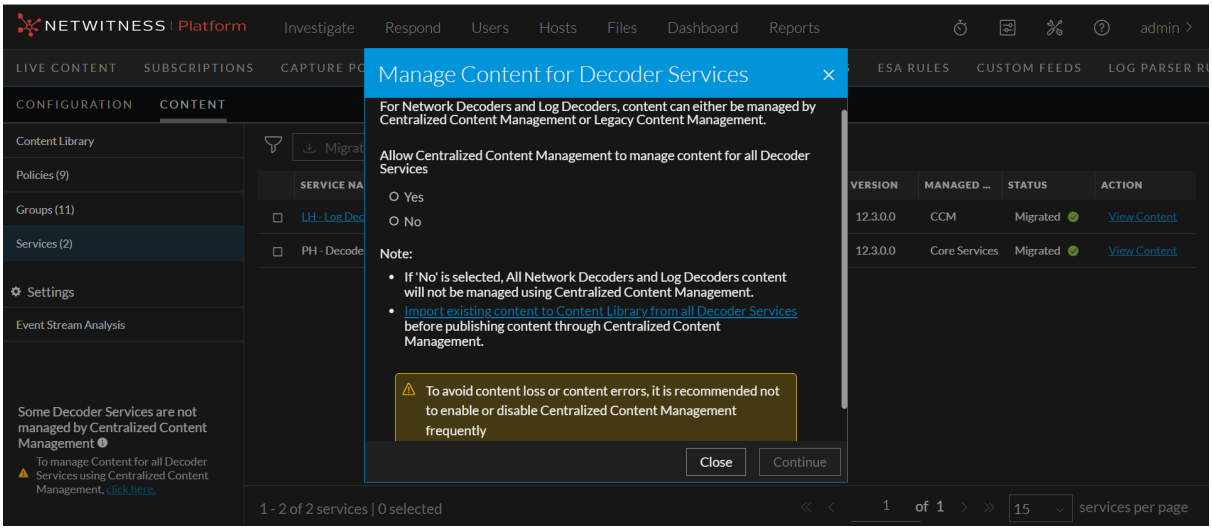
Enable or Disable CCM for All Decoder Services



From 12.2 version onwards, a CCM toggle is introduced to enable or disable CCM for all 12.0+ Decoder Services. The toggle is available on the UI.

To enable or disable CCM for all Decoder Services on the UI

Scenario 1: Some Decoder Services are Managed by CCM



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.

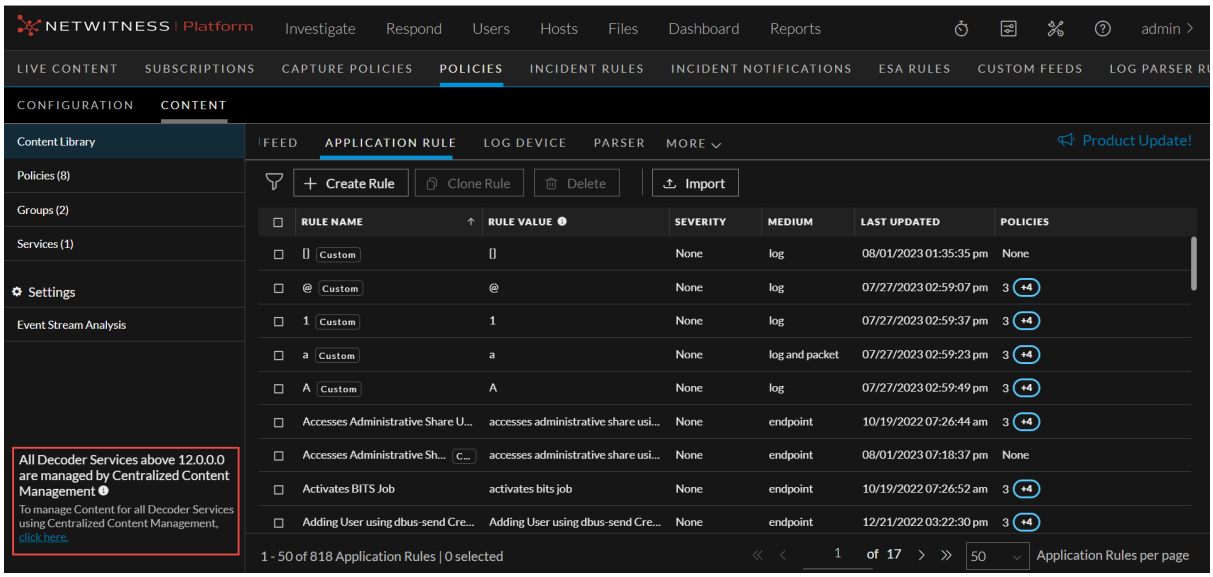
   The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

4. If the NetWitness platform consists of only few Decoders managed by CCM, then the message "Some Decoder Services are managed by Centralized Content Management" is diplayed. In such a case, you can choose to either manage all the Decoder Services by CCM or not to manage any Decoder Services by CCM by clicking **click here**.

   The **Manage Content for Decoder Services** pop-up window is displayed.

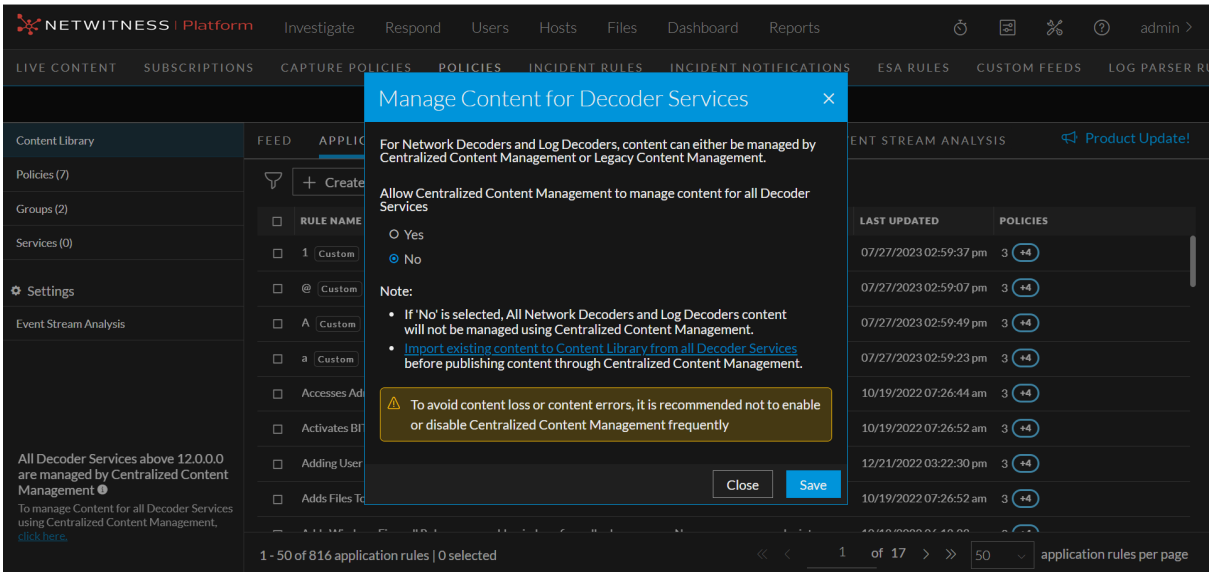
5. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services. Click **No** to disable CCM for all Decoder Services.

   Note: Read the notes on the pop-up window before clicking on **Continue**.



6. Click **Continue**. The **Manage Content for Decoder Services - Review and Confirm** screen is displayed.

7. Click **Confirm** to review and confirm the services which will be enabled or disabled based on the selected option. Else, click **Back** to go back to the previous screen.
8. The success message is displayed on the screen.

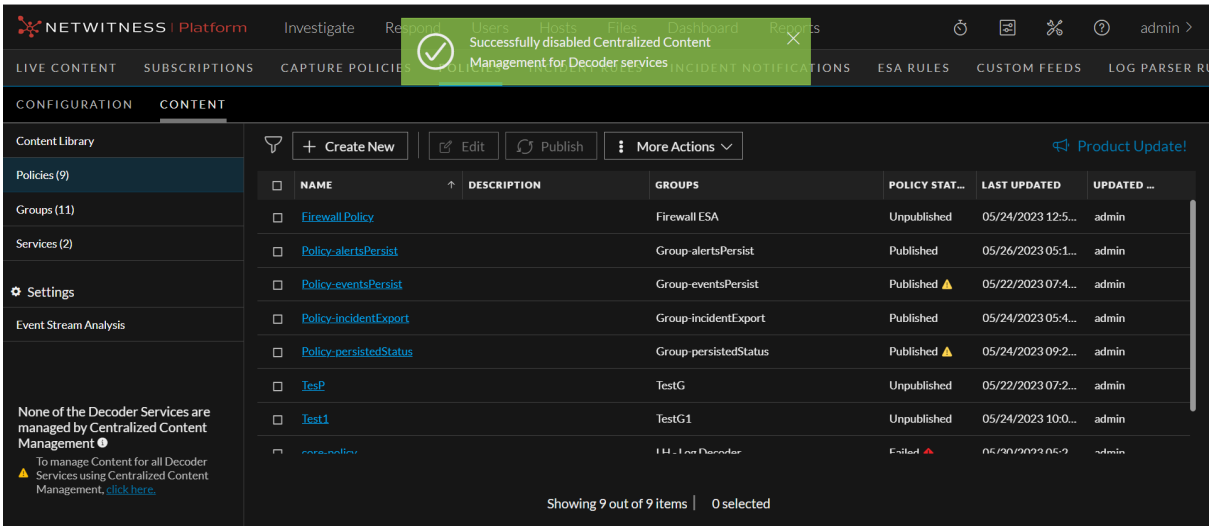


Scenario 2: All Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

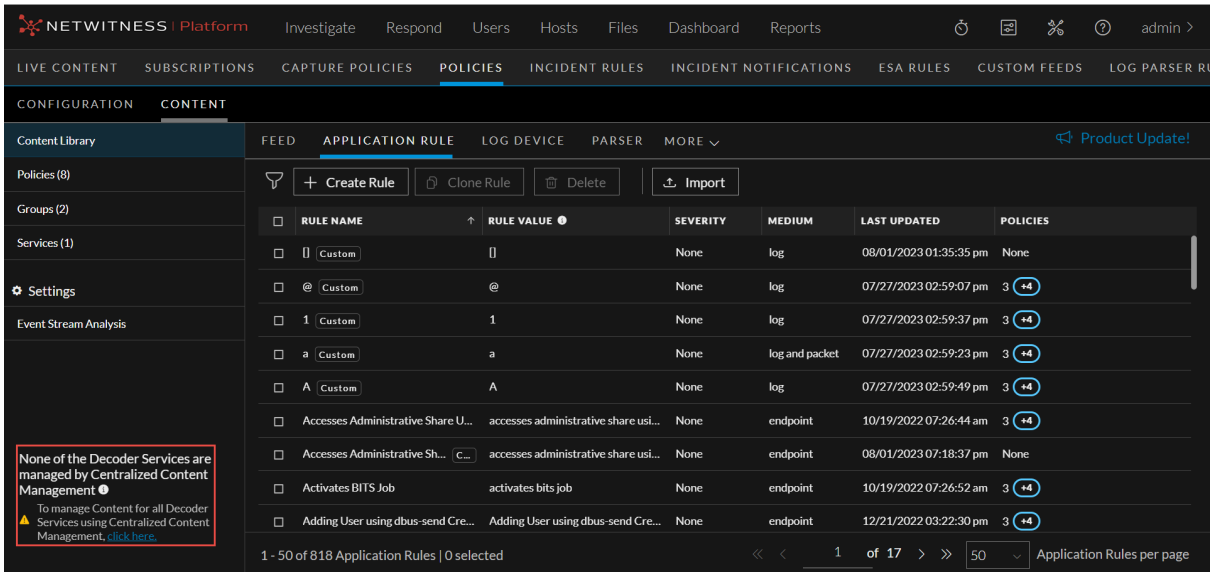
5. 5. If the NetWitness platform consists of all Decoders managed by CCM, then the message "All Decoder Services above 12.0.0.0 are managed by Centralized Content Management" is displayed. In such a case, you can choose to not manage any Decoder Services by CCM by clicking **click here**.

6. The **Manage Content for Decoder Services** pop-up window is displayed.



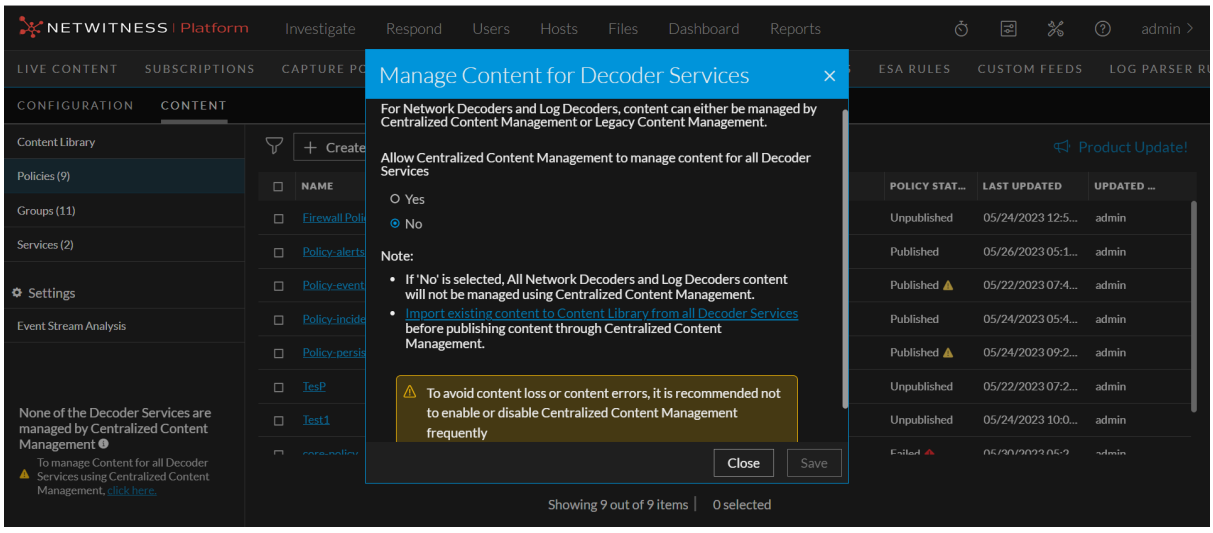
7. On the **Manage Content for Decoder Services** pop-up window, click **No** for **Allow Centralized Content Management to manage content for all Decoder Services** to disable CCM for all Decoder Services.

> **Note:**
> - The **Yes** option is selected by default.
> - Read the notes on the pop-up window before clicking on **Save**.



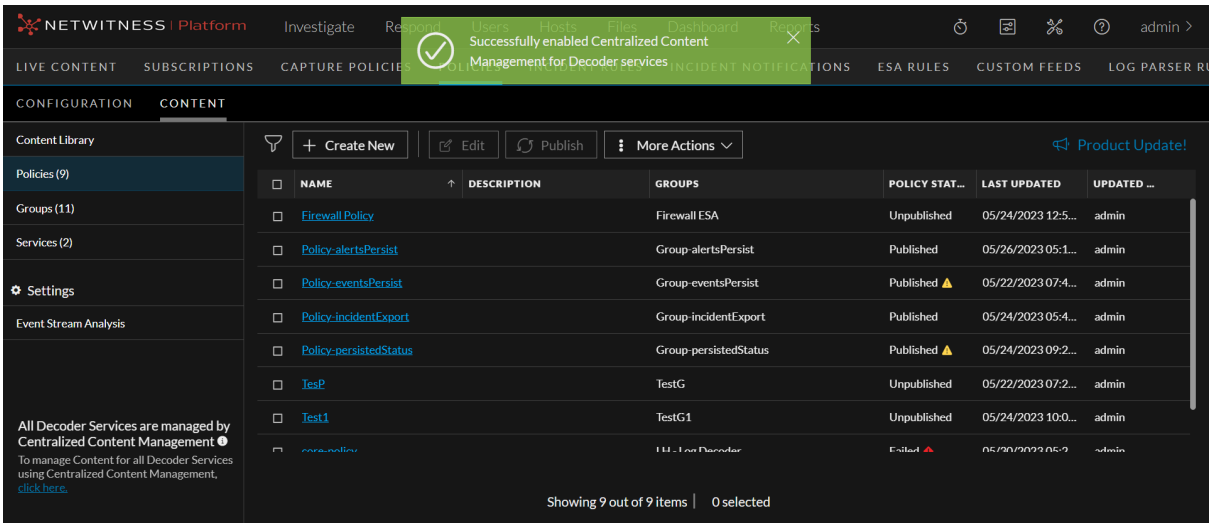
8. Click **Save**. The success message is displayed on the screen.

> **Note:** The **Save** option is enabled only when you select **No**.



Scenario 3: None of the Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.



5. If the NetWitness platform does not consist of any Decoders managed by CCM, then the message "None of the Decoder Services are managed by Centralized Content Management" is displayed. In such a case, you can choose to manage all Decoder Services by CCM by clicking **click here**.
6. The **Manage Content for Decoder Services** pop-up window is displayed.

7. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services.

Note:
- The **No** option is selected by default.
- Read the notes on the pop-up window before clicking on **Save**.

8. Click **Save**. The success message is displayed on the screen.
9. **Note:** The **Save** option is enabled only when you select **Yes**.

Enable or Disable CCM for Individual Decoder Services

To enable or disable CCM for individual Decoder services, see Enable or Disable CCM for Individual Decoder Services *topic under* Manage Services.

Manage Content Library

This section contains:

- Migrate Content from Core Services to Content Library
- Import Content to Content Library
- Create an Application Rule
- Clone Application Rule
- Edit Application Rule
- Delete Application Rule
- View Application Rule Details
- Create a Network Rule
- Edit Network Rule
- Delete Network Rule
- View Network Rule Details
- Create an ESA Rule
- Edit an ESA Rule
- Delete an ESA Rule
- Filter Content Rules

Migrate Content from Core Services to Content Library

The customers who want to use Centralized Content Management, and if their content is already deployed, a migration process is required.

The following types of content can be migrated from Core Services:

- Application Rule
- Network Rule
- Log Device
- Live Feeds
- LUA Parser

Note:
- When the user upgrades a Decoder or Log Decoder from 11.x, 12.0 or 12.1 version to 12.1.1 or later version, a back up of all the content is created automatically. Backup file will be available on Core Services' host under the following path:
For Log Decoder - `/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar`
For Network Decoder - `/var/netwitness/decoder/decoder_backupcontent_ccm.tar`
- When migrating content from two Decoders that have two different types of Custom or Live Base Parser associated with same Custom or Live Base Parser, both the Custom Parsers are added to Content Library. Th association inside the Policy will be with the most recently migrated Custom Parser.
- Within a migrated Policy, a Custom Parser will have only one Custom or Live Base Parser associated with it.
- Migrated content version will be in the Policy, if as part of migration, the Policy is auto created. If you remove this content, you cannot add the old version of the content back.

For steps on how to migrate content from Core Services to Content Library, see Migrate Content from Service under Manage Services.

Import Content to Content Library

Before the custom content can be used in policies, it must be imported to the Content Library.

To export Application Rules or Network Rules from Legacy UI

1. Go to  **(Admin) > Services**.
2. Go to Config view of the service where application rule or network rule is deployed.
3. Click either the **Application Rule** or the **Network Rule** tab.

   Note: The **Network Rule** tab is only available for **Network Decoder** services.
4. Select the content to migrate.
5. Click **Export** to export the selected content or click **All** to export all the content.

   The following table lists the supported file types and file extensions for Application Rules and Network Rules:

Content	Supported File Types	Supported File Extensions
Application Rules	**.NWR**	NA
Network Rules	**.NWR**	NA

To export Feeds, LUA Parsers, or Log Devices

The content file locations are as given below:

- Feeds content file location: /etc/netwitness/ng/feeds
- Lua Parsers content file location: /etc/netwitness/ng/parsers
- Log Devices content file location: /etc/netwitness/ng/envision/etc/devices

You can upload the files which are copied locally from these locations and import these files to Content Library.

The following table lists the supported file types and file extensions for Log Devices, LUA Parsers and Feeds:

Content	Supported File Types	Supported File Extensions
Feeds	**.zip**	**.feed** and **.token**
Log Devices	**.envision**, **.zip**, **.xml** **Note:** - The zip file should have a root folder. The root folder should contain the 'N' folders for 'N' number of content. The 'N' folder names should be the content names. The 'N' folders, will contain the respective xml files. - You can upload a maximum of 10 xml files at once. - You can upload base parsers as well as custom parser at once. - If you are importing a file which has both base and custom content, the base and custom content files are separated after importing them. - - The custom log parser naming convention should be '<base>msg-custom.xml'. - The base content name in Content Library will be the display name mentioned in the xml file. - The custom content name in Content Library will be the 'displayname-custom'. - While importing extension of a Base Parser, when multiple flavours of a Base Parser are present in Content Library, the extension is associated to the first Base Parser that is found.	NA
LUA Parsers	**.zip**	**.luax**, **.lua** and **.flextoken**

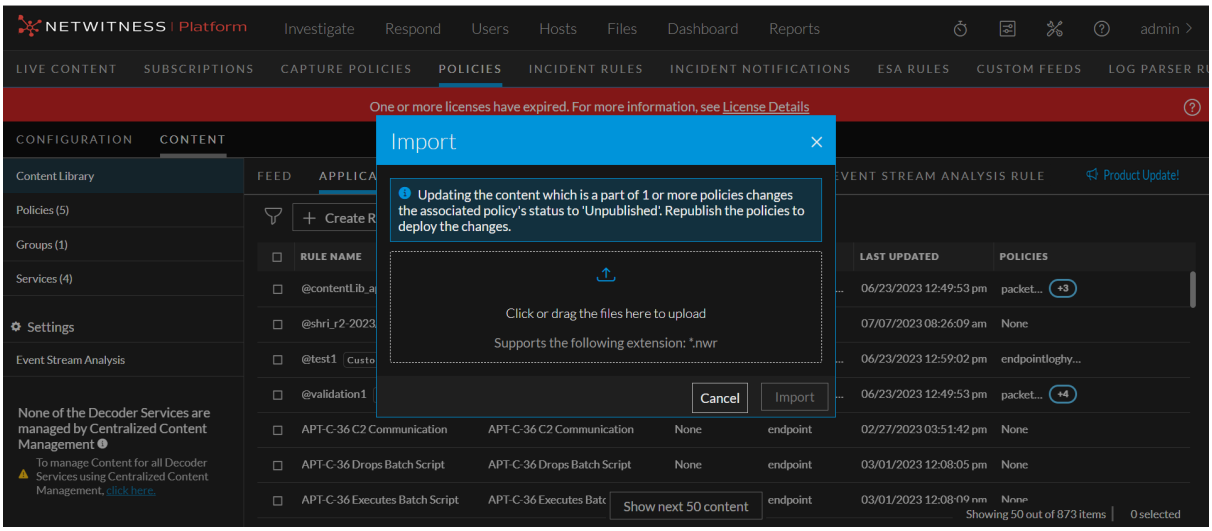
Note: Any imported content will be treated as custom content. If imported content has the same name as existing Live content, then it must be renamed upon import. Custom content with the same name can be overwritten.

To create .envision files

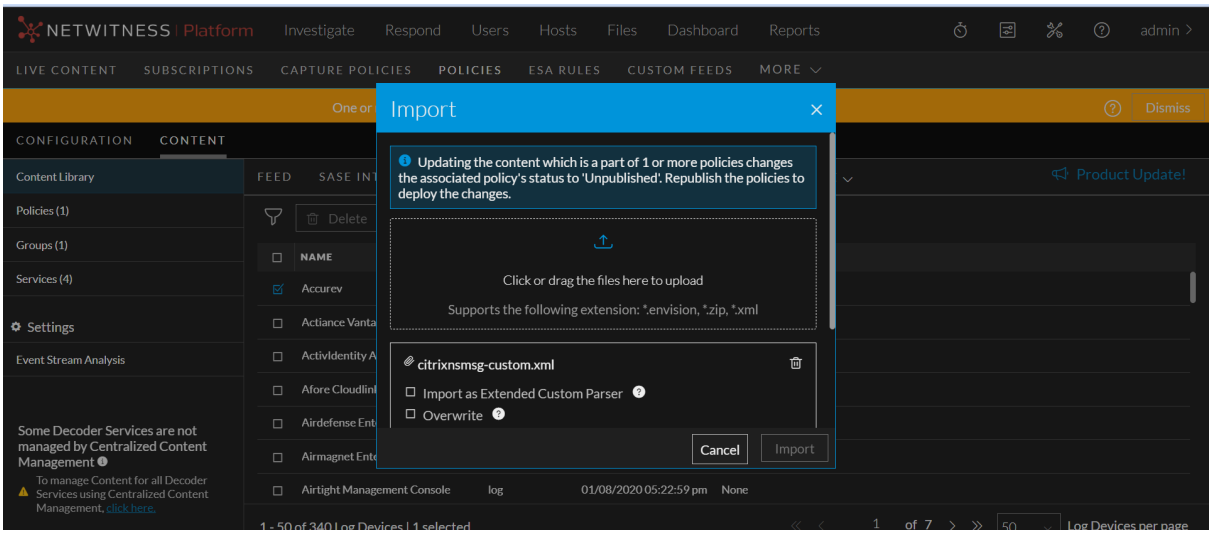
1. Keep all the Log Devices in a root folder in your local drive. For example, "logDevices".
2. From the command prompt, run the python script specified in the NetWitness Community portal with input argument as the path of the above folder.

   Note: The command to run the python script is "python3 pythonscriptname.py inputArg".
3. Once you run the script, a new zip named "nw_content_logDevices.zip" is created. This zip file will contain all the envision files.

IMPORTANT: All actions except 'Export' are disabled for Application Rules, Network Rules, Feeds, LUA Parsers and Log Devices from Service Config page for all core services if the service is managed by Policy-based Centralized Content Management.



To import content to Content Library



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Depending upon the type of content to be imported, click the following tabs:
   - **Application Rule**
   - **Network Rule**
   - **Parser**
   - **Feeds**
   - **Log Devices**

Note: The name of the application rule or network rule to be imported should not be same as existing rule name.

5. In the respective content panel, click **Import**.

6. In the **Import** panel, click or drag the file to upload.
7. While importing a Log Device parser, if you want to import a standalone XML as an extended parser, select **Import as Extended Custom Parser**. If this option is not selected, then the XML will be imported as a standalone parser.
8. Click **Overwrite** to overwrite content. This is applicable only in case of overriding an already imported content.

   Note: You cannot overwrite the content if the content name is same as the rule name of the existing content of the same type from live server. However, you can overwrite the content if the content name is same as the custom content rule name.

9. Select the medium types.
10. Click **Import** to complete the import process.

Create an Application Rule

This topic describes the steps to create an application rule. When you create a custom application rule, NetWitness allows you to tag MITRE ATT&CK Tactics and Techniques and for each rule.

IMPORTANT: Both MITRE ATT&CK® and ATT&CK® are registered trademarks of the MITRE Corporation. © 2024 The MITRE Corporation. This work is reproduced and distributed with the permission of The MITRE Corporation.

To create a new Application Rule

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. In the application rule panel, click **+ Create Rule** to add an application rule.
5. In the **CreateNew Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule. The options are listed below:
     - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
     - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
     - **Transient**: This option prevents the created alert metadata from being written to the disk.

- **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
  - Low
  - Medium
  - High
  - Critical

Note: Severity is selected by default as Low.

- **MITRE ATT&CK TACTICS**: Lets you select MITRE ATT&CK TACTICS from the list.

Note: Ensure that you apply at least one MITRE ATT&CK TACTIC for the rule.

- **MITRE ATT&CK TECHNIQUES**: Lets you select MITRE ATT&CK TECHNIQUES from the list.
- **DESCRIPTION**: Provide a description for the rule.

- Click **Save** to save the new application rule.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Clone Application Rule

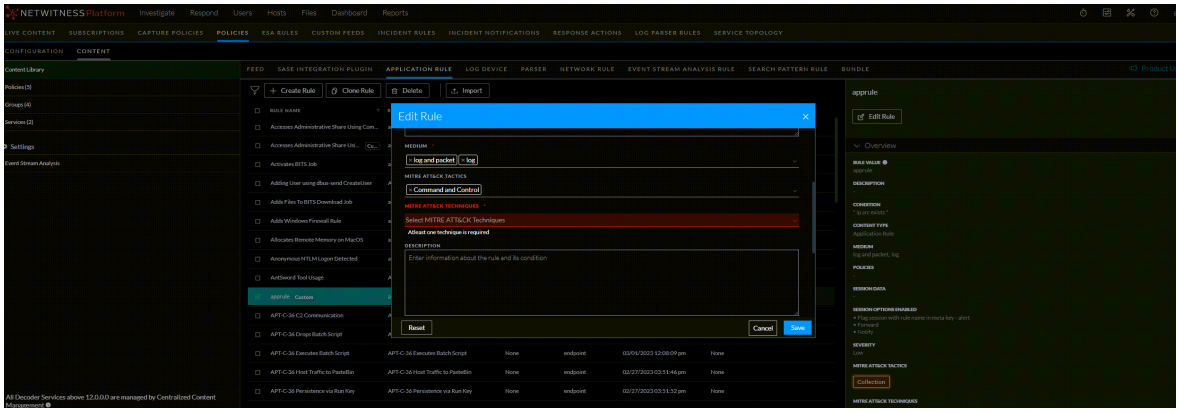
This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. In the left panel, click **Content Library**.
4. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
5. Click **Clone Rule**.
6. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

     Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.
   - Enter the condition for the rule.
   - Select the medium to be applied for the rule.
   - Select the MITRE ATT&CK TACTICS for the rule.
   - Select the MITRE ATT&CK TECHNIQUES for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Select a meta value from the Flag session with rule name in meta key drop-down menu. This is a mandatory field.
   - Click **Clone** to clone the rule.
   - Click **Cancel** to cancel the operation.



Edit Application Rule

When you edit the application rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.
- If the custom rule assigned to a policy is edited, then the customer must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that application rule is same as an existing rule, an error message is displayed.
- Let’s you to tag MITRE ATT&CK Tactics for each rule.
- Let’s you select the MITRE ATT&CK Techniques for the rule.

To edit an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to edit.
5. Click **Edit Rule** to edit the application rule.
6. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators ("=", "Not Equal To", "Contains", "Exists" and so on).
       - The entered condition will be enclosed in a 'Pill'. When you enter multiple conditions, the conditions are automatically joined by an 'AND' operator. On clicking the 'AND' operator, you can toggle between 'AND' and 'OR' operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Select the MITRE ATT&CK TACTICS for the rule. The MITRE ATT&CK Tactics are listed. You can select an appropriate MITRE ATT&CK Tactic.

   - Select the MITRE ATT&CK TECHNIQUES for the rule. The MITRE ATT&CK Techniques are listed. You can select an appropriate MITRE ATT&CK Technique.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.

- Select the session options to be applied for the rule.The options are listed below:
  - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
  - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
  - **Transient**: This option prevents the created alert metadata from being written to the disk.
  - **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
    - Low
    - Medium
    - High
    - Critical

  Note: Severity is selected by default as Low.
- Click **Save** to save the application rule details.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Delete Application Rule

When you delete the application rule, follow these guidelines:

- You can delete only the custom application rules.
- You cannot delete the application rule if it is associated to a policy. You should first disassociate the application rule from the policy and then delete it.

To delete an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to delete.
5. Click **Delete** to permanently delete the selected application rule.

View Application Rule Details

This topic describes the steps to view the application rule details.

To view Application Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The list of application rules is displayed.
4. Click a row to view details about the selected application rule in the right panel.
   The various details of the application rule are displayed.

Create a Network Rule

This topic describes the steps to create a network rule.

To create a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. In the network rule panel, click **+ Create Rule** to add a network rule.
6. In the **New Create Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.

- Click **Cancel** to cancel the operation.
- Click **Reset** to reset the data.
- Click **Save** to save the new network rule.

Clone Network Rule

This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
6. Click **Clone Rule**.
7. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

     Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.
   - Enter the condition for the rule.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Clone** to clone the rule.
   - Click **Cancel** to cancel the operation.

Edit Network Rule

When you edit the network rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.

- If the custom rule assigned to a policy is edited, then you must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that network rule is same as an existing rule, an error message is displayed.

To edit a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. Select the network rule to edit.
6. Click **Edit Rule** to edit the network rule.
7. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Cancel** to cancel the operation.
   - Click **Reset** to reset the data.
   - Click **Save** to save the new network rule.

Delete Network Rule

When you delete the network rule, follow these guidelines:

- You can delete only the custom network rules.
- You cannot delete the network rule if it is associated to a policy. You should first disassociate the network rule from the policy and then delete it.

To delete a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. Select a network rule to delete.
6. Click **Delete** to permanently delete the selected network rule.

View Network Rule Details

This topic describes the steps to view the network rule details.

To view Network Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. The list of network rules is displayed.
6. Click a row to view details about the selected network rule in the right panel.
   The various details of the network rule are displayed.

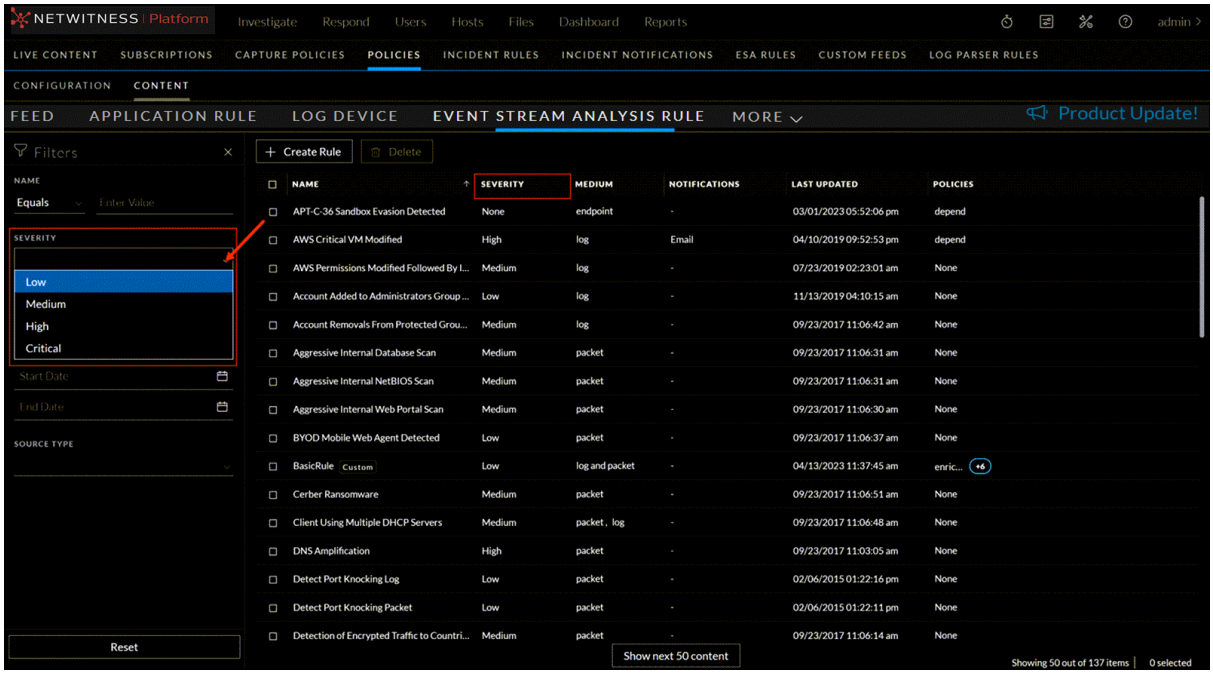
Create an ESA Rule

This topic describes the steps to create an ESA rule.

To create an ESA Rule

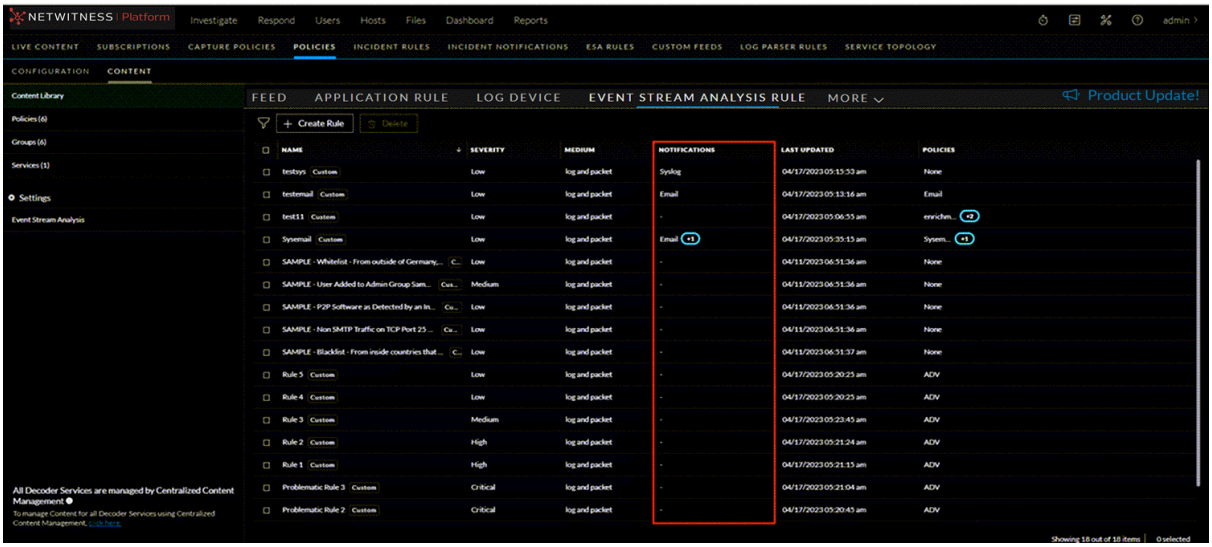
1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, click **+ Create Rule** to add an ESA rule.

You can select the **Advanced EPL** option or **Rule Builder** option from the dropdown as per your requirement. It navigates to **ESA Rules** > **Rules** view.



See the section Add a Rule Builder Rule for more information on creating rules in Rule Builder.

See the section Add an Advanced EPL for more information on creating Advanced EPL.



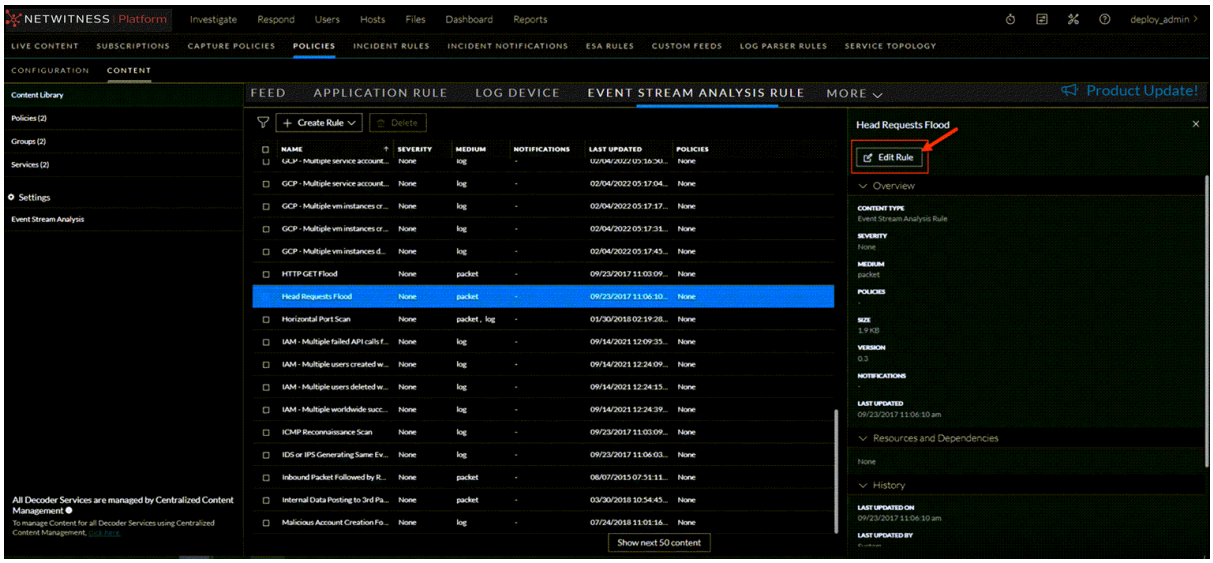
Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

From 12.3 and later, **Severity** and **Notifications** list views are added to the **Event Stream Analysis Rule** section.

The Severity list consists of None, Low, Medium, High, and Critical. You can also view rules filtering these options except for None. For more information on filtering these options, see Filter Content Rules.

Rules with syslog and email notifications can be viewed on the **Notifications** list of the **Event Stream Analysis Rule** section.

Edit an ESA Rule



This topic provides instructions to edit an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

To edit an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

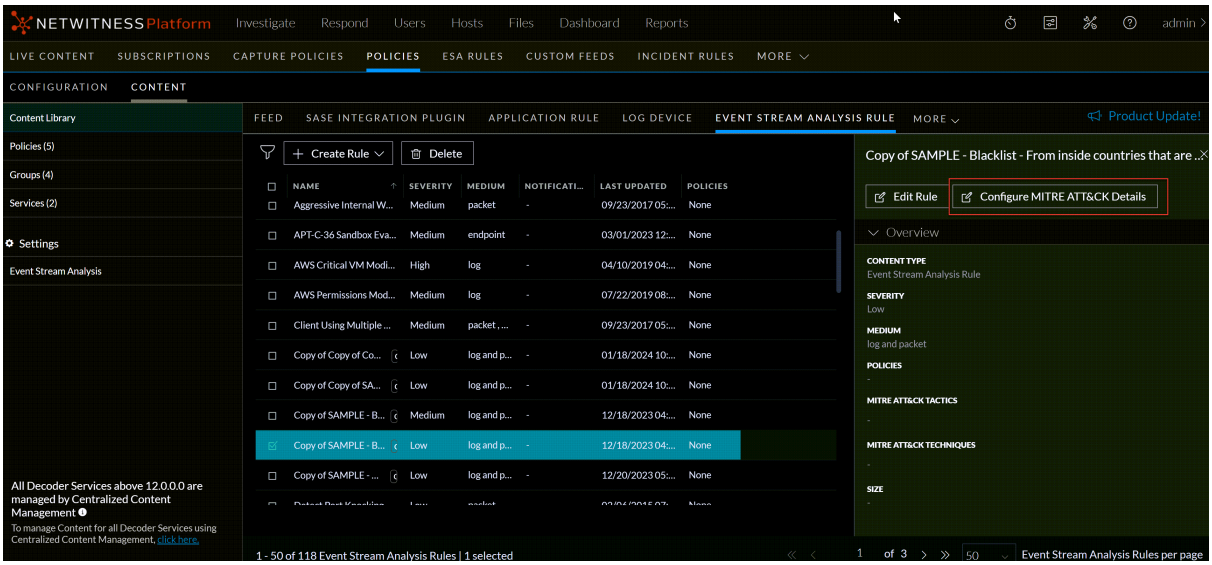
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, select the rule that needs to be edited.

   The overview panel opens, showing the Edit Rule tab on top.
6. Click the **Edit Rule** tab.

It navigates to **ESA Rules** > **Rules** view.

For more information on editing an ESA rule, see Edit, Duplicate or Delete a Rule.

Configure MITRE ATT&CK Details for an ESA Rule



You can tag MITRE ATT&CK Tactics and Techniques for an ESA rule. MITRE framework provides insight into tactics, techniques, or sub-techniques used by advanced attackers or advanced persistent threats (APTs). When you tag an ESA rule with MITRE ATT&CK Tactics and Techniques, analysts can easily identify incidents, alerts, and events that are associated with MITRE techniques and tactics.

To configure MITRE ATT&CK details for an ESA Rule

1. Go to **(CONFIGURE)** > **Policies**.
2. In the **policies** panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, select the rule that needs to be edited.

   The overview panel opens, showing the Edit Rule tab on top.
6. Click the **Configure MITRE ATT&CK Details** option.

7. In the **Configure MITRE ATT&CK Details** window, select the **MITRE ATT&CK Tactics**. You can apply multiple MITRE Tactics for an ESA rule.
8. Select the **MITRE ATT&CK Techniques**. You can apply multiple MITRE Techniques for an ESA rule.

   For more information on MITRE ATT&CK framework, see About MITRE ATT&CK Tactics and Techniques .

Delete an ESA Rule

You can delete one or more ESA rules. Once the ESA rule is deleted, the ESA rule will be removed from the available list.

To delete an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.

   The available ESA rules are displayed.

   Note: Only Custom ESA rules that are not assigned to a policy will be available for deletion.
5. Select one or more custom ESA rules and click **Delete**.

   A confirmation pop-up is displayed.
6. Click **Delete**.

About MITRE ATT&CK Tactics and Techniques

NetWitness allows you to tag an application rule with MITRE ATT&CK Tactics and Techniques. MITRE framework provides insight into tactics, techniques, or sub-techniques used by advanced attackers or advanced persistent threats (APTs). NetWitness uses the MITRE ATT&CK framework to detect and analyze different types of threats.

When you tag an application rule with MITRE ATT&CK Tactics and Techniques, analysts can look into the various techniques and tactics associated with the Incidents, alerts, and events.

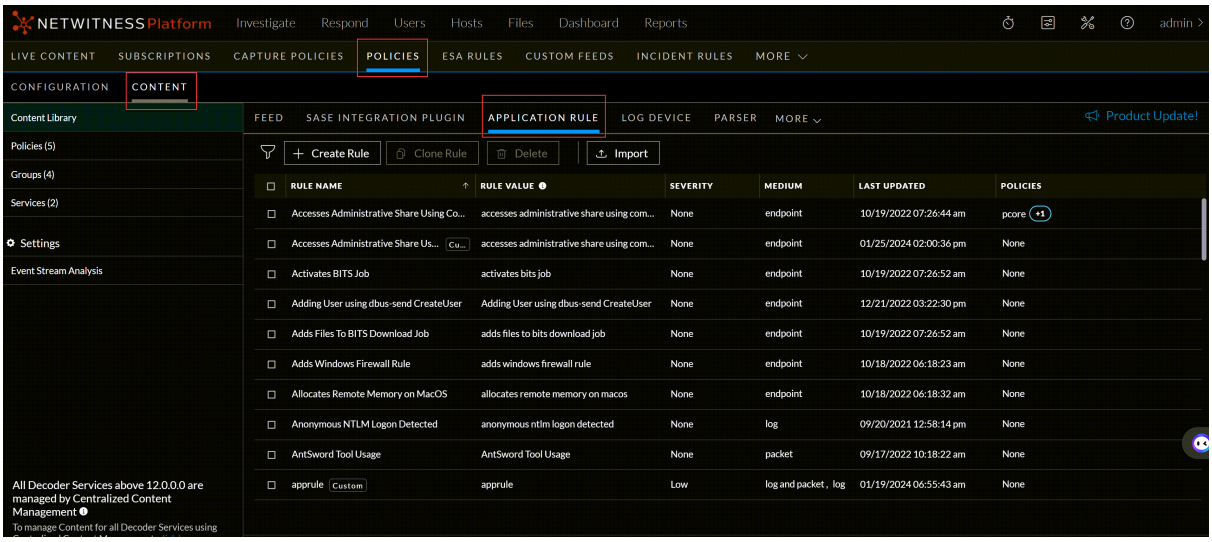
You do not have to search the MITRE pages to understand techniques or tactics and learn about their implications. You can view all the MITRE details in the **ATT&CK Explorer**. The additional details about MITRE ATT&CK Tactics and Techniques help you to understand how an attack or event is detected in their NetWitness system and then make informed decisions.

NetWitness Platform enables analysts to conduct further analysis with levels of granularity in techniques.

The MITRE ATT&CK framework is a curated knowledge base and model for cyber adversary behavior. It reflects the various phases of an adversary's attack lifecycle and the platforms they are known to target.

For more information on the MITRE ATT&CK framework, go tohttps://attack.mitre.org/resources/faq/

For more information, see “Use MITRE ATT&CK Framework” chapter in the NetWitness Respond User Guide for 12.4 .



View MITRE ATT&CK Tactics and Techniques in Application and ESA rules

NetWitness allows you to tag application rules and ESA rules with MITRE ATT&CK Tactics and Techniques. When you tag MITRE ATT&CK Tactics and Techniques, you can view the details of the tactics and techniques used by advanced attackers or advanced persistent threats (APTs). You do not have to search the MITRE pages to understand techniques or tactics and learn about their implications. You can view all the MITRE details in the ATT&CK explorer. The additional details about MITRE ATT&CK Tactics and Techniques help you to understand how an attack or event is detected in their NetWitness system and then make informed decisions.

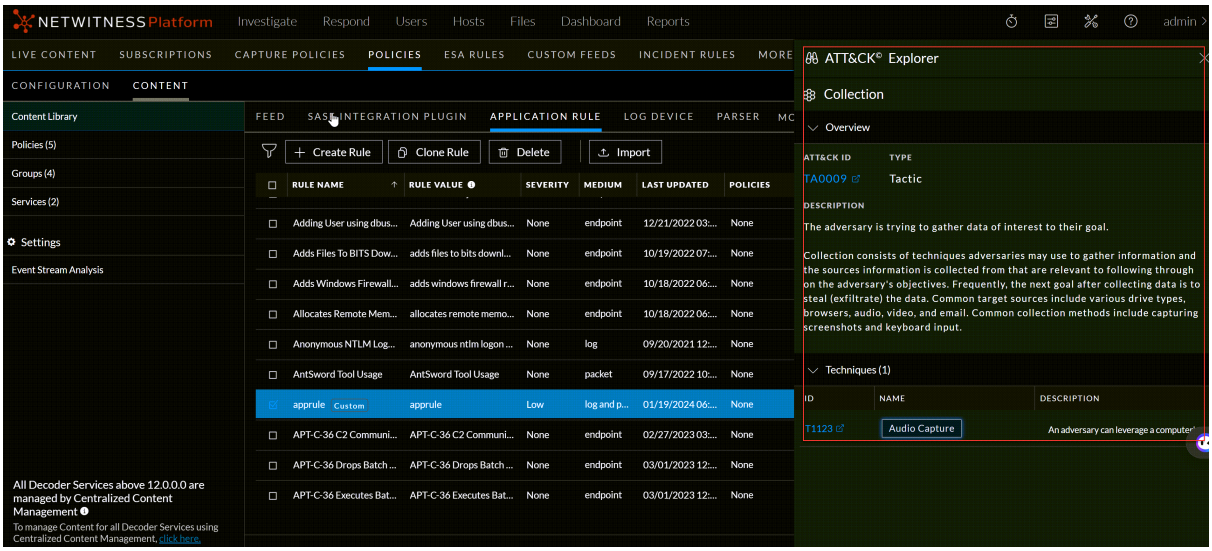
To view MITRE ATT&CK Tactics and Techniques in application and ESA rules

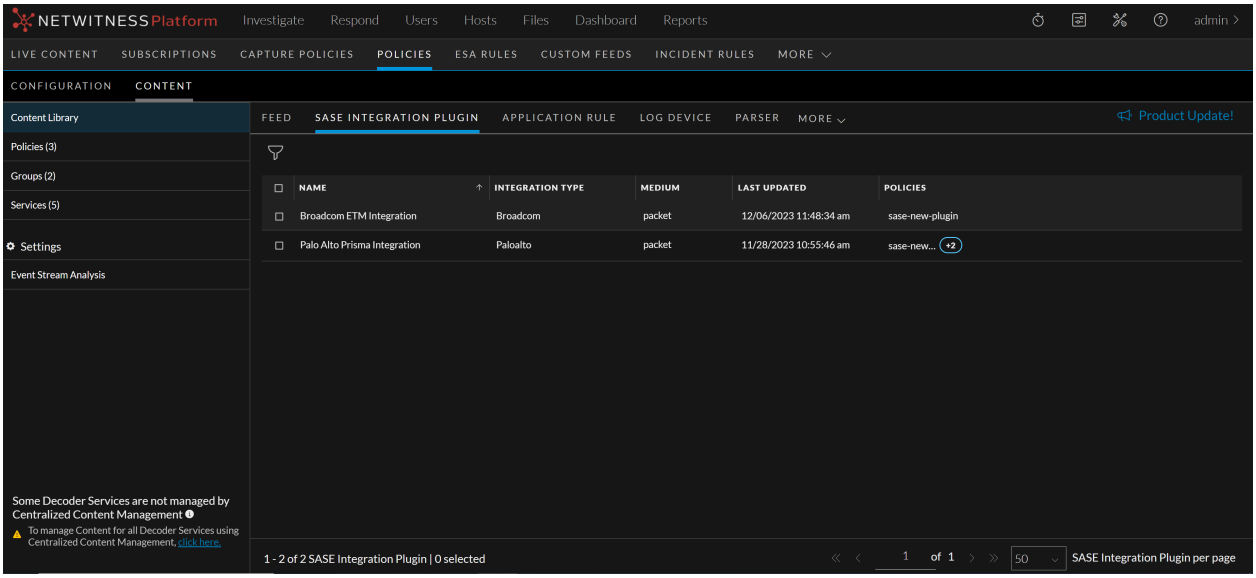


1. Go to **(CONFIGURE)** > **Policies**.
2. In the **Policies** panel, click **Content** tab.
3. Click **APPLICATION RULE**. The Application Rules are listed.

4. Click a rule that you want to view the MITRE ATT&CK Tactics and Techniques. The rule panel appears on the left side.

5. In the left panel, scroll down and view the MITRE ATT&CK TACTICS and TECHNIQUES categories.
6. Click a MITRE ATT&CK TACTICS or TECHNIQUES. The ATT&CK Explorer panel appears with details on tactics and techniques.

You can view the following details:



Fields	Description
MITRE ATT&CK Tactics	Displays the type of tactics associated with the Incident. For example, **Credential Access**. The tactic **Credential Access** tries to steal account names and passwords. For more information, see https://attack.mitre.org/tactics/enterprise/.
ATT&CK ID	Displays the ATT&CK ID associated with the Tactics. You can click the ATT&CK ID and go to the MITRE page and view the details. Analysts can benefit by visiting the MITRE page directly to get additional details about the Tactics. For example: **TA0006**. The Tactics ID **TA0006** is associated with the Tactic **Credential Access**.
TYPE	Displays the Technique associated with the Tactics.
TACTIC	Displays the Tactics that you tagged. You can tag multiple Tactics with a rule.
DESCRIPTION	Displays the detailed information about the Tactic associated with the particular incident.
Techniques	Displays the ID, Name, and the Description of the various Techniques and Sub – Techniques associated with the Tactics. **Note:** Techniques are how the adversary tries to achieve a tactical goal by performing an action. Sub – Techniques describe the adversarial behavior at a lower level than a technique. For more information, see • https://attack.mitre.org/resources/faq/#faq-0-0-header. • https://attack.mitre.org/techniques/enterprise/.

Fields	Description
Mitigations	Displays the ID, Name, and Description of the Mitigations used to prevent a technique or sub-technique from successfully executing. For example, The Mitigation name Account Use Policies associated with the ID M1036 helps configure features related to account use, like login attempt lockouts and specific login times. For more information, see https://attack.mitre.org/mitigations/enterprise/.
Procedure Examples	Displays the ID, Name, and Description of the procedures that the adversary uses for techniques or sub-techniques. For example, Lazarus Group with the ID G0032 is a North Korean state-sponsored cyber threat group that was responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. For more information, see https://attack.mitre.org/resources/faq/#faq-0-2-header and https://attack.mitre.org/groups/G0032/.

For more information, see “Use MITRE ATT&CK Framework” chapter in the NetWitness Respond User Guide for 12.4 .

Introduction to the SASE Integration Plugin

From NetWitness Platform 12.4 version or later, NetWitness introduces the **SASE Integration Plugin** from the **Configure** > **Policies** > **Content Library** page. These plugins can be deployed on the services (Decoders) through a policy configuration, enabling them to capture all the network traffic from various SASE vendors and process the data efficiently, leading to increased network visibility. NetWitness uses the processed data to detect anomalies and displays them to analysts for further investigation and threat-hunting purposes.

The following are the supported SASE Integration Plugins:

- **Palo Alto Prisma Integration**
- **Broadcom ETM Integration**

You must create a policy with the **SASE Integration Plugin** type and associate the policy with the group having a Decoder service, and then publish the policy. Additionally, you must set up the **SASE Integration Plugin** details in the **Configuration** tab for a particular SASE Vendor inside the **Policy Details** view and save the configuration.

For more information on configuring **Palo Alto Prisma Integration**, see *Palo Alto Prisma SASE Configuration Guide*.

For more information on configuring **Broadcom ETM Integration**, see *Broadcom ETM SASE Configuration Guide*.

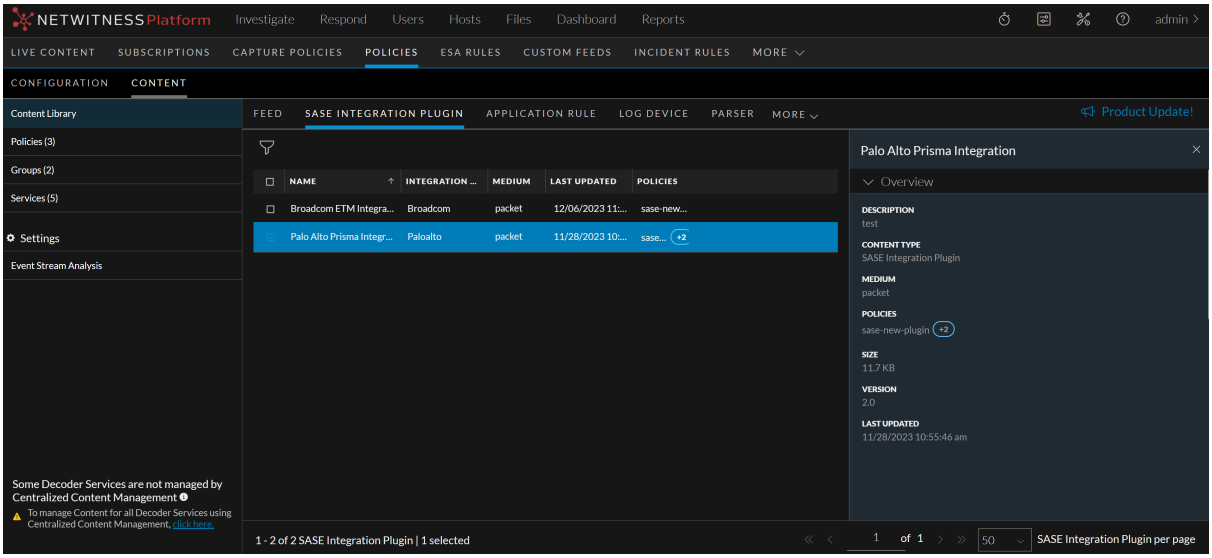
IMPORTANT: Ensure that you always publish the policy after adding the **SASE Integration Plugin** to deploy the plugin to the Decoder service.

Note:
• When you are adding the **SASE Integration Plugin** type, always enable the subscription by clicking the subscribed toggle. Once the content is subscribed, the updates are pushed automatically.
• You can also view the SASE Integration Plugin inside a **Policy Details** page and perform operations like **Filter**, **Enable**, **Disable**, **Subscribe**, and **Unsubscribe** those plugin types. For more information, see Manage Policies.

For more information on adding the **SASE Integration Plugin** content to a policy, see Create and Publish Policies.

For more information on groups, see Manage Groups.

View SASE Integration Plugin Details



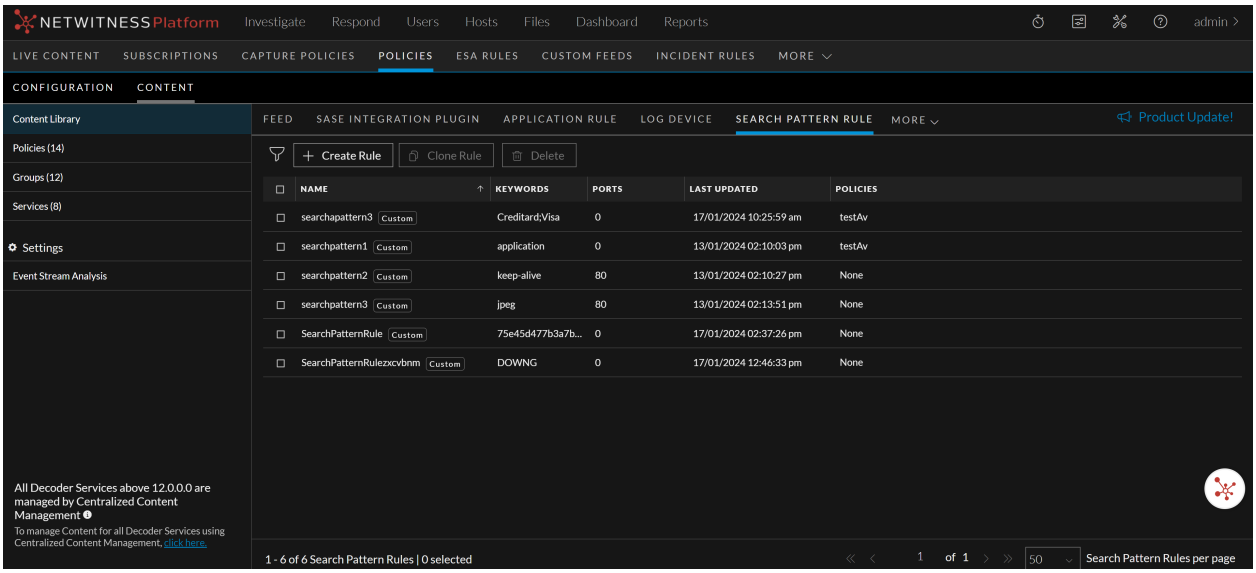
This topic describes the steps to view the SASE Integration Plugin details.

To view the SASE Integration Plugin details

1. Go to  **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **SASE Integration Plugin**

   The list of SASE Integration Plugins is displayed.
5. Click a row to view details about the selected **SASE Integration Plugin** in the right panel.

The various details of the SASE Integration Plugin are displayed.

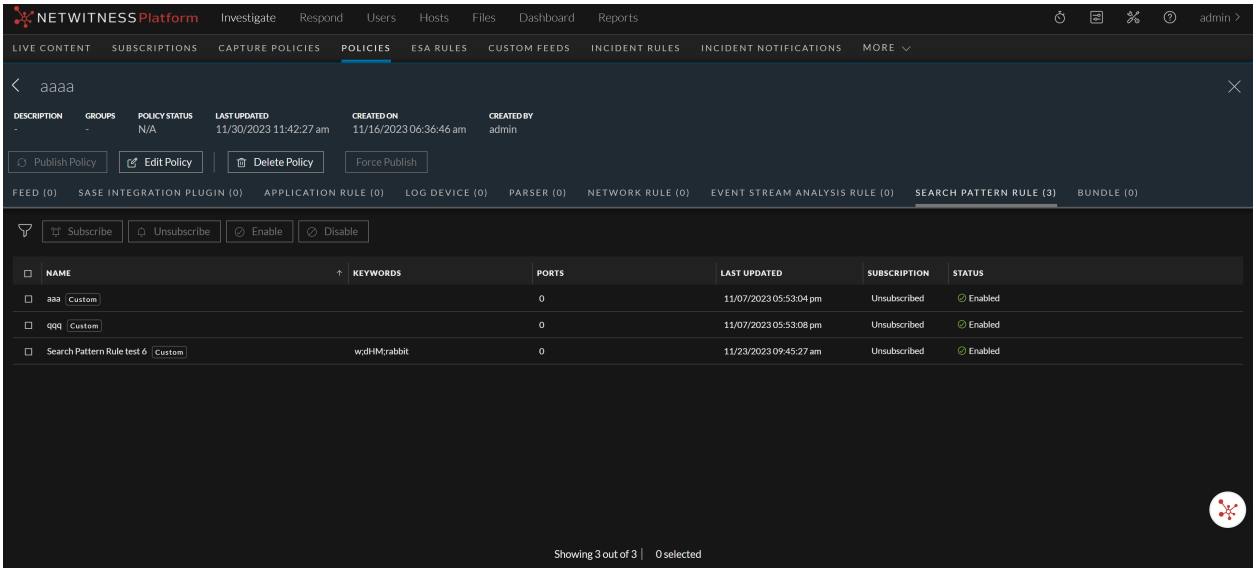


Manage Search Pattern Rule

From NetWitness Platform version 12.4 or later, administrators and analysts can create search pattern rules from the **Configure** > **Policies** > **Content Library** page to find sensitive data on their networks. These rules use keywords to identify patterns and they are matched based on an exact keyword string. Once a pattern is applied to a matched policy with services (Decoders), it searches for that pattern in the network traffic. Upon successful detection of a match, two important metadata will be generated (**found** and **match**).

- **found**: If a match (a keyword) is identified in a stream, the name of the search pattern rule will be added as the found metadata.
- **match**: If a keyword is detected as a match, the specific keyword that is identified will be added as a match meta.

Analysts can use this metadata to investigate further and determine if the sensitive data is being used maliciously. Additionally, analysts can gain real-time visibility into their network traffic, proactively monitoring it for potential threats.



Here is an example of search pattern that can be used to find sensitive data in networks:

Keywords: Keywords are words or phrases that are often associated with sensitive data. For example, the keyword **credit card** could be used to find network traffic that contains credit card numbers.

For example, in an environment, if you have four Decoders with CCM enabled and published to the policy. However, only three of these decoders have the search parser enabled, while one decoder doesn't have it enabled. As a result, only the three decoders with enabled search parser will generate **found** and **match** meta keys.

In addition, administrators can perform other operations on the search pattern rule, such as editing, cloning, deleting, and filtering a rule.

Note: You can also view the search pattern rules inside a **Policy Details** view and allows you to enable or disable those rules. For more information, see Manage Policies.

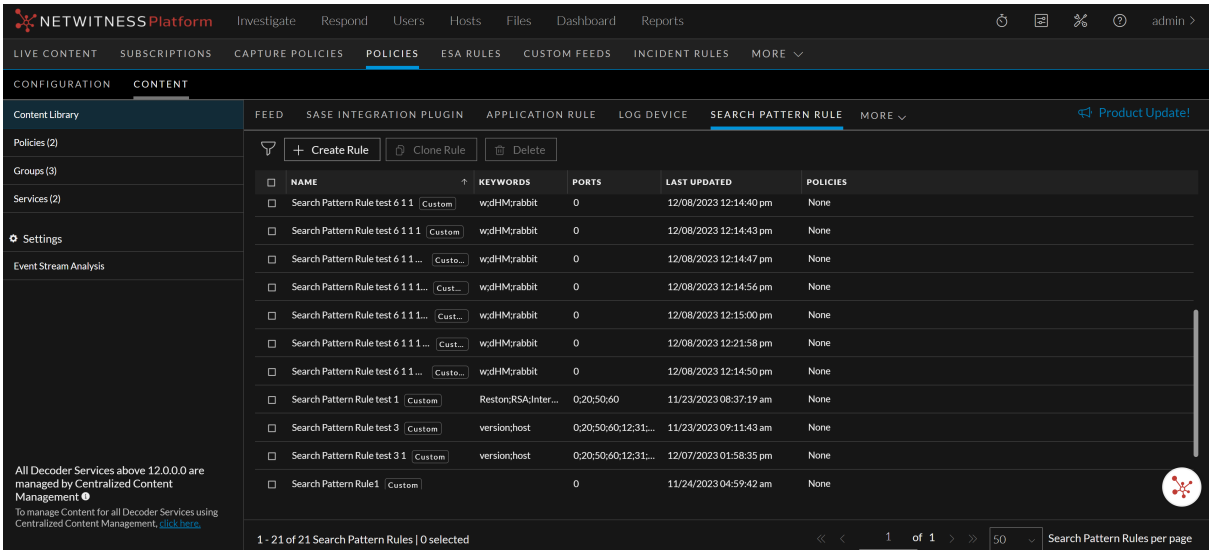
You must create a policy with the **Search Pattern Rule** type and associate the policy with the group having a Decoder service, and then publish the policy.

For more information on adding the search pattern rule content to a policy, see Create and Publish Policies.

For more information on groups, see Manage Groups.

You can perform following operations for Search Pattern Rule:

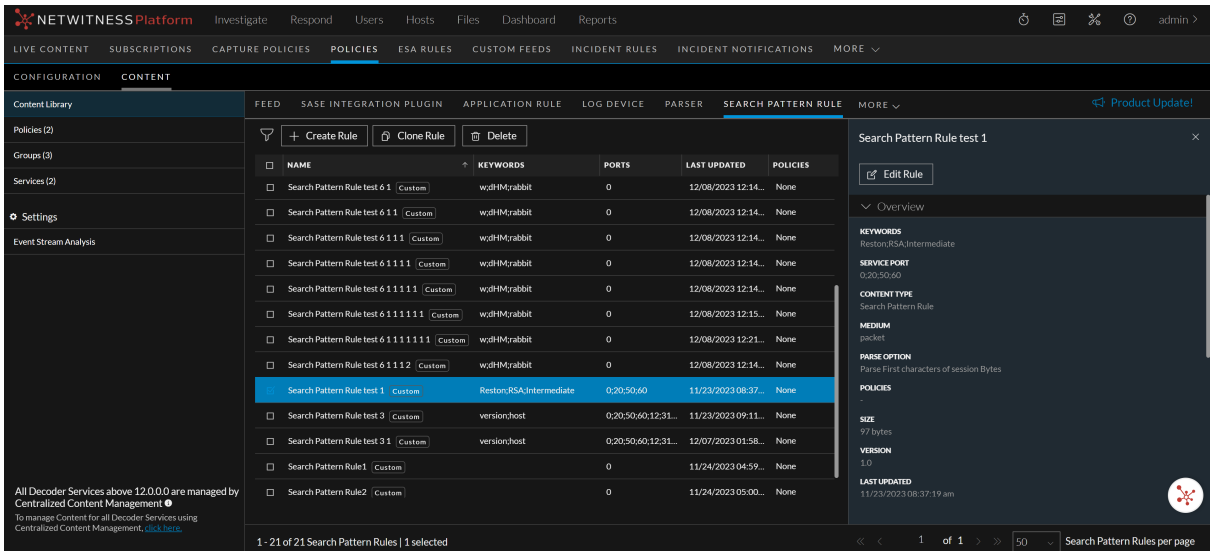
- View Search Pattern Rule Details
- Create a Search Pattern Rule
- Edit a Search Pattern Rule
- Clone a Search Pattern Rule
- Delete a Search Pattern Rule
- Filter Search Pattern Rules
- Filter Search Pattern Rules from Policy Details View



View Search Pattern Rule Details

This topic describes the steps to view the search pattern rule details.

To view the Search Pattern Rule details



1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.

5. Click a row to view details about the selected search pattern rule in the right panel.

   The various details of the search pattern rule are displayed.

Create a Search Pattern Rule

This topic describes the steps to create the search pattern rules.

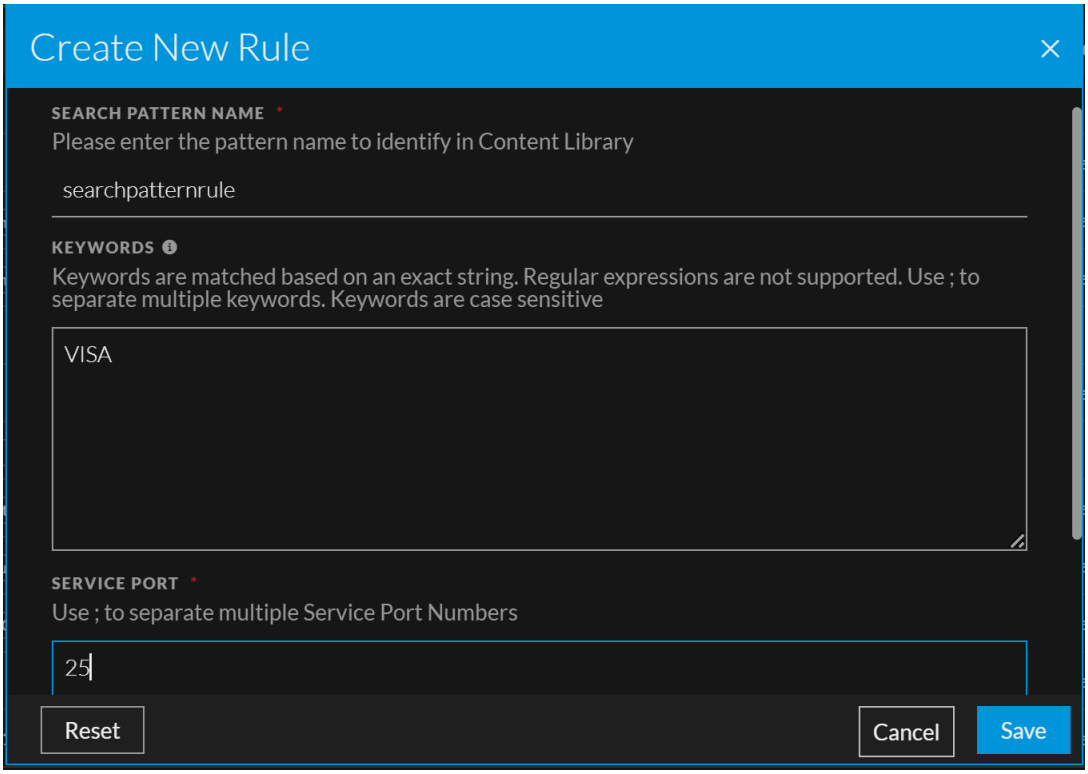
Prerequisites

- By default, only administrators are allowed to create search patterns. To enable access for analysts, they must contact their administrators.
- To generate the meta keys **found** and **match**, you need to enable the **Search Parser** (found and match), which is disabled by default. To do this, navigate to **(Admin)**> **Services** > select **Decoder** service > > **Config** > **General** > under **Parser Configuration** section, enable the **SearchParser**.

Note: Creating a generic search pattern rule will cause performance issues.

Note: An administrator must enable **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the search pattern rules. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

To create a Search Pattern Rule



1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.

5. Click + **Create Rule**.

   The Create New Rule dialog is displayed.

6. Enter the pattern name to identify them. The name must be unique and can contain a maximum of 256 characters. Use only letters, and numbers.

   Note: Search Pattern names cannot contain spaces.

7. Enter one or more keywords in the **Keywords** text box. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

   Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

   Note: Non-ASCII characters (for example, é, €, ★ , etc.) are not supported. Enter only ASCII characters when creating a search pattern.

8. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**.

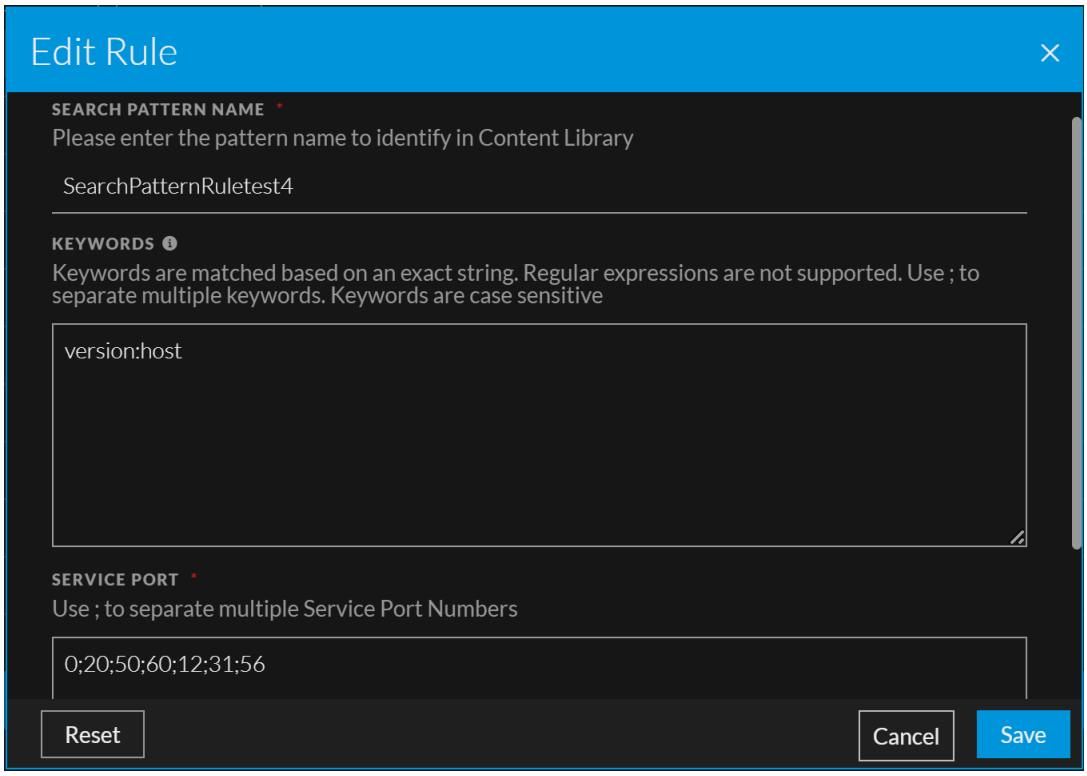
   Note: The port numbers must be between **1** and **65535**.

9. Click **Save** to create the search pattern rule.

10. Click **Reset** to reset the fields.

Edit a Search Pattern Rule

When you edit the search pattern rule, follow these guidelines:



- The search pattern rule name cannot be edited if the rule is assigned to a policy.
- If the rule assigned to a policy is edited, then the administrator must republish the policy for the changes to take effect in the service.
- While editing the rule name, if the name of that search pattern rule is the same as an existing rule, an error message is displayed.

To edit a Search Pattern Rule

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Click a row of the search pattern rule to be modified.
6. Click **Edit Rule** to modify the search pattern rule.

   The Edit Rule dialog is displayed.

7. In the **Edit Rule** panel, do the following:

a. Enter a unique rule name. The name must be unique and can contain a maximum of 256 characters. Use only letters, and numbers.

> **Note:** Search Pattern names cannot contain spaces. If the name of that search pattern rule is the same as an existing rule, an error message is displayed.

b. Enter one or more keywords in the **Keywords** field. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

   Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

c. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**,

> **Note:** The port numbers must be between **1** and **65535**.

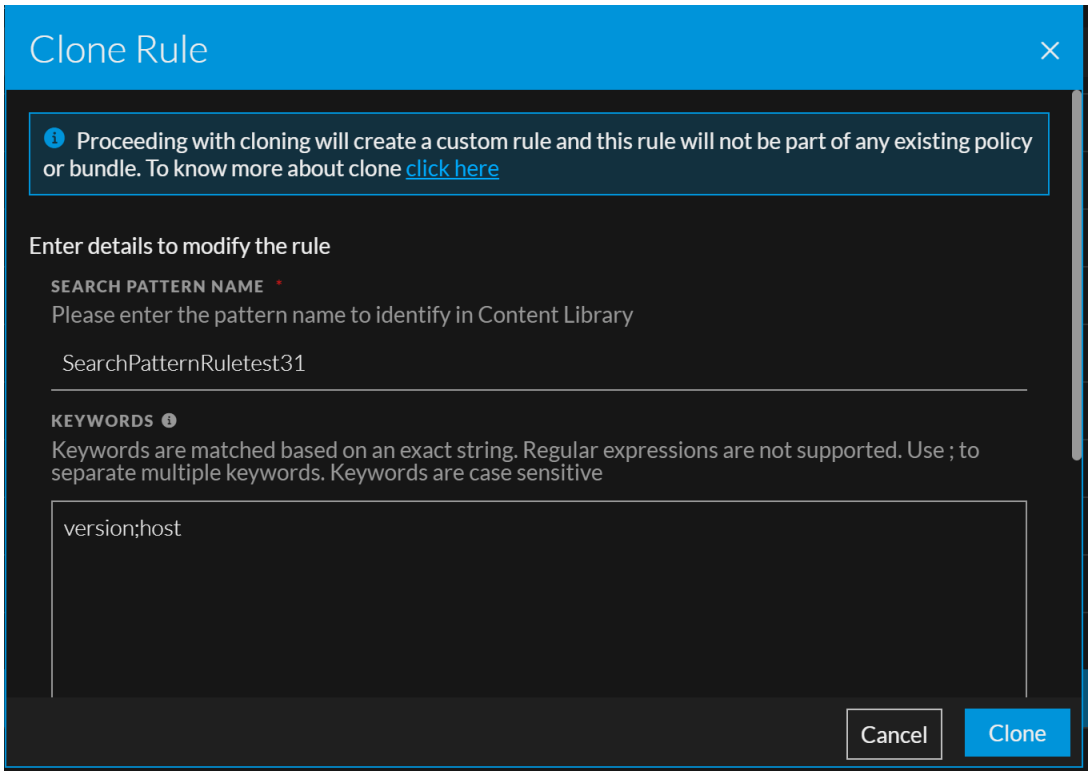
d. Click **Save** to save the search pattern rule details.

e. Click **Reset** to reset the fields.

f. Click **Cancel** to cancel the operation.

Clone a Search Pattern Rule

This topic describes the steps to clone a Search Pattern rule.



> **Note:**
> • Cloning will create a search pattern rule and will not be associated with any existing policy.
> • You can clone existing search pattern rules to generate new ones with different rule names but with the same parameters.
> • You can clone only one search pattern rule at a time.

To Clone a Search Pattern Rule

1. Go  **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Select a search pattern rule and click **Clone Rule**.

   The Clone Rule dialog is displayed.

6. In the **Clone Rule** panel, do the following:
   a. Enter a unique name for the search pattern rule clone. The name can contain a maximum of 256 characters. Use only letters, and numbers.

      Note: Rule names are always appended with a number. For example, if the rule has the name **SearchPatternRuletest3**, its name will be changed to **SearchPatternRuletest31** after the cloning.

   b. Enter one or more keywords in the **Keywords** text box. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

      Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

   c. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**,

      Note: The port numbers must be between **1** and **65535**.

   d. Click **Clone** to clone the search pattern rule details.

   e. Click **Cancel** to cancel the operation.

Delete a Search Pattern Rule

When you delete the search pattern rule, follow these guidelines:

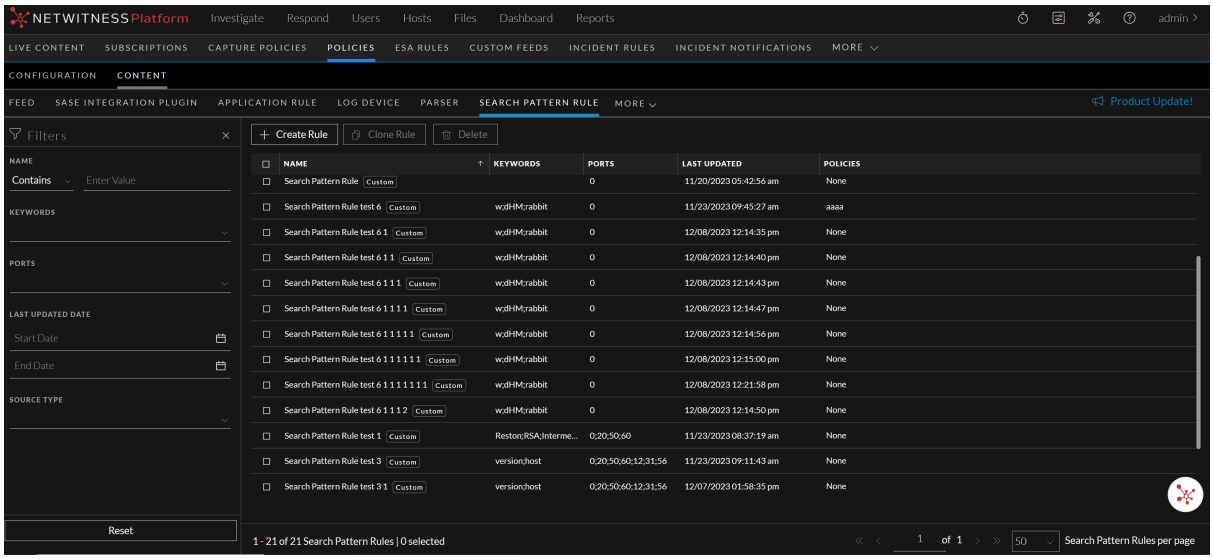
- You cannot delete the search pattern rule if it is associated with a policy. You should first disassociate the search pattern rule from the policy and then delete it.
- If you select a search pattern rule that is associated with a policy and another that is not associated with a policy, the delete button will be disabled.

To delete a Search Pattern Rule

1. Go **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Select one or more search pattern rules and click **Delete**.

   A confirmation pop-up is displayed.
6. Click **Delete** to permanently delete the selected search pattern rules.



Filter Search Pattern Rules

The Filters panel allows you to filter the list of search pattern rules under the content library based on the name, keywords, ports, last updated date, and source type.

To filter the search pattern rules

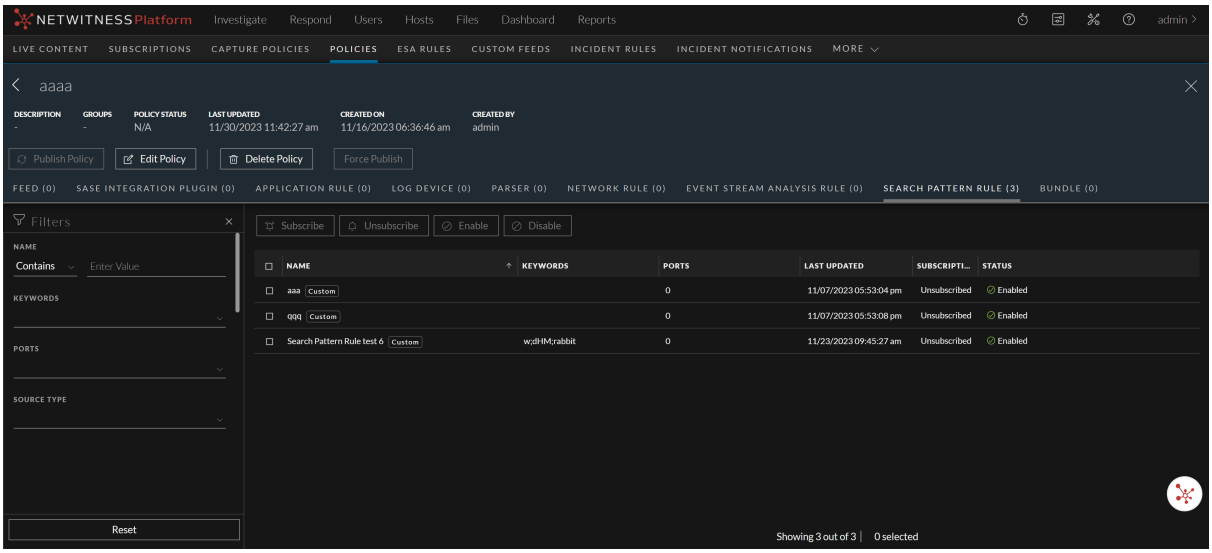
1. Go **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. By default, the filters panel is hidden. Click the (Filters) icon in the toolbar to expand the filters panel.

6. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the search pattern rule. Type one character, and a list of search pattern rules that contain that character is displayed, as you continue to type, the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular rule will be displayed.
7. To search by keywords, select one or more keywords that are listed in the **Keywords** drop-down list. The filter is an AND operator when searching for multiple keywords, such as **Visa** and **MasterCard**. In this case, the filter results will display all matches that contain both Visa and MasterCard.
8. To search by ports, select one or more port numbers that are listed in the **Ports** drop-down list. The filter is an AND operator when searching for multiple port numbers, such as **25** and **34**. In this case, the filter results will display all matches that contain both 25 and 34.
9. To filter by date range, under the **Last Update Date**, select the start date and end date from the date fields.

   For example, to filter search pattern rules that were updated between May 1 and May 31, you select May 1 as the start date and May 31 as the end date. You must enter dates in mm/dd/yyyy format, or you can click and pick dates from a calendar.
10. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
    - **Custom**
    - **Live**
11. To hide, click the icon at the top-right of the panel.

    The search pattern rules are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.



Filter Search Pattern Rules from Policy Details View

The Filters panel allows you to filter the list of displayed search pattern rules in the policy details view based on the name, keywords, ports, source type, enabled/disabled status, subscription status, resource-created date, and last updated date.

To filter the search pattern rules

1. Go (**CONFIGURE**) > **Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Do one of the following:
   - Click a policy name.
   - Click a row to view details about the selected policy and click **View Details**.

   The policy details view is displayed.
5. Click the **Search Pattern Rule** tab.
6. By default, the filters panel is hidden. Click the (Filters) icon in the toolbar to expand the filters panel.

7. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the search pattern rule. Type one character, and a list of search pattern rules that contain that character is displayed, as you continue to type, the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular rule will be displayed.
8. To search by keywords, select one or more keywords that are listed in the **Keywords** drop-down list. The filter is an AND operator when searching for multiple keywords, such as **Visa** and **MasterCard**. In this case, the filter results will display all matches that contain both Visa and MasterCard.

9. To search by ports, select one or more port numbers that are listed in the **Ports** drop-down list. The filter is an AND operator when searching for multiple port numbers, such as **25** and **34**. In this case, the filter results will display all matches that contain both 25 and 34.
10. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
    - **Custom**
    - **Live**
11. To filter by enabled/disabled status, select one or more statuses from the **Enabled/Disabled Status** drop-down list. The options are listed below:
    - **Enabled**
    - **Disabled**
12. To filter by subscription status, select one or more statuses from the **Subscription** drop-down list. The options are listed below:
    - **Subscribed**
    - **Unsubscribed**
13. To filter by a resource created date range, under the **Resource Created Date**, select the start date and end date from the date fields.

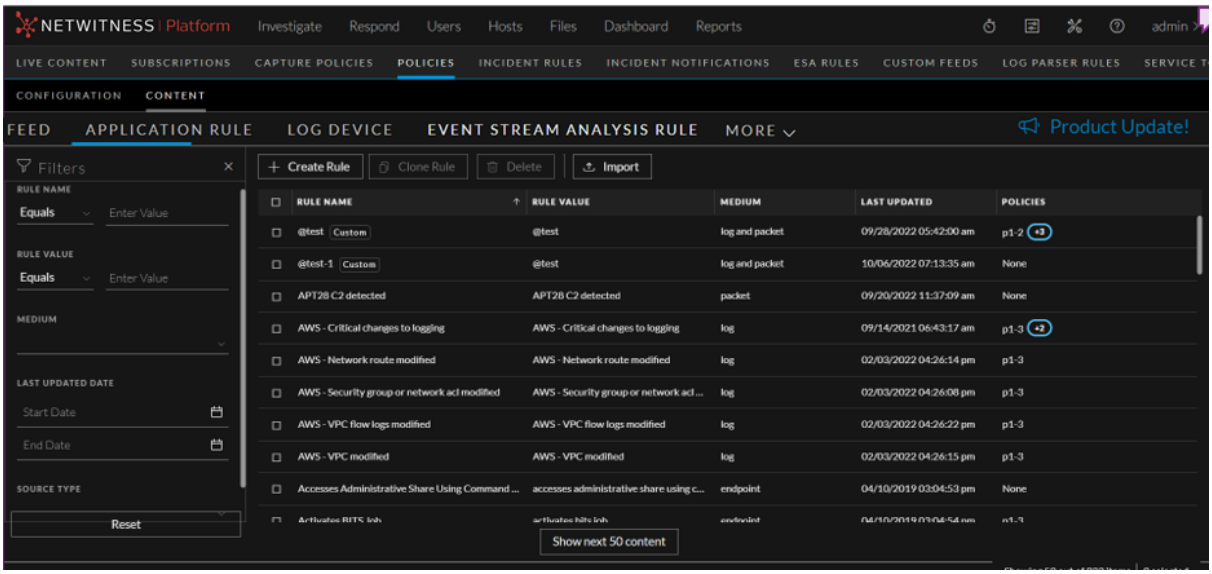
    For example, to filter contents that were created between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
14. To filter by date range, under the **Last Update Date**, select the start date and end date from the date fields.

    For example, to filter search pattern rules that were updated between May 1 and May 31, you select May 1 as the start date and May 31 as the end date. You must enter dates in mm/dd/yyyy format, or you can click and pick dates from a calendar.
15. To hide, click the  icon at the top-right of the panel.

    The search pattern rules are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

Filter Content Rules

The Filters panel allows you to filter the list of displayed contents under the content library based on the name, medium, date range, and source type.



This applies to the following content rule types:

- Feed
- Application Rule

- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- Bundle

To filter the content rules

1. Go to (CONFIGURE) > **Policies**.
2. In the policies panel, click **Content**.
3. Click **Content Library**.
4. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.

5. To search by rule name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the rule. Type one character and a list of rules that contain that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.
6. To filter by rule value:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the rule value. Type one character and a list of rules that contain the rule value with that character is displayed, as you continue to type the list is filtered to match.

- Set the filter option to **Equals** operator from the drop-down list and enter the full rule value. The particular content type will be displayed.

7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

   For example, to filter policies that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
9. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
10. To hide, click the  icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

Manage Groups

This section contains:

- Create a Group
- View a Group
- Delete a Group
- Edit a Group
- Filter Groups

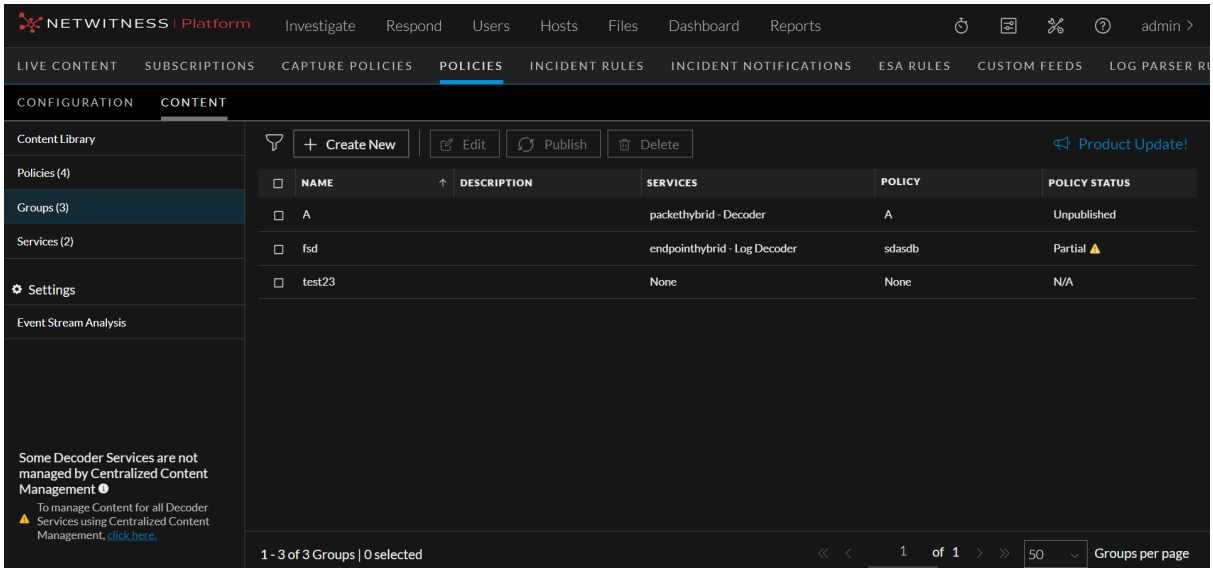
Create a Group

You can create a group with one or more services and assign one policy to it. Groups may be created without any assigned policy; however, a policy must be assigned to a group and Published in order for any content changes to take effect.

To create a Group

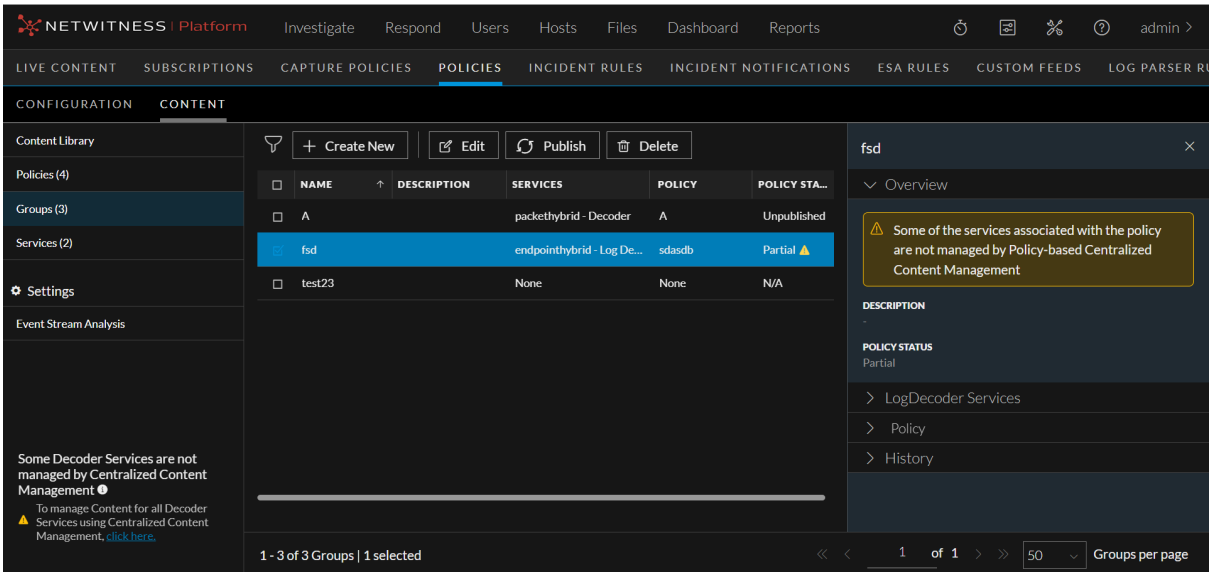
1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**.
4. In the tool bar, click **+ Create New**.
5. In the **New Group** panel, do the following:
   - Enter the name of the group.
   - Enter the description for the group.
6. Click **Next**.
7. In the **Define Group**, click + to assign services to the group.

   Note:
   - A service is disabled if it is assigned to another group.
   - A service is disabled if it is not managed by Policy-based Centralized Content Management.
   - ESA Services are not disabled when assigned to a group, as the ESA services can be assigned to more than one group.
8. Click **Next**.
9. In the **Assign Policies**, click + to assign policies to a group. You can assign only one policy to any particular group.



10. Do any one of the following:
    - Click **Save and Publish** to save and publish the settings.
    - Click **Save and Close** to save the settings.

View a Group



This topic describes the steps to view the properties of Group.

To view the properties of the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed. By default, 50 groups are displayed per page. To go to the next page, click . To go to the last page, click .

4. Click a row to view details about the selected group in the right panel.

Caution:

- An icon is displayed in the Groups View indicating policy status unpublished, if any services are part of the selected group and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon is displayed in the Groups View, indicating that the policy status failed for multiple reasons. Please see the groups overview section in the UI to find the failure reason and the workaround.

Delete a Group

You can delete one or more groups. Once the group is deleted, all services will be removed from the group and all the policy content will be deleted from the services.

To delete a Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed.
4. Select one or more Groups and click **Delete**.

   The Delete Groups dialog is displayed.
5. To delete the deployed content from the services upon deleting the group, select the option **Delete deployed content from the services on group removal**. For ESA service, the content will be deleted upon deleting the group.
6. Click **Delete** to permanently delete the selected group.

   The confirmation message is displayed.

Note:
- For a group with multiple services, even if we fail to delete a particular service under the group, the other services will get deleted. The service which is not deleted will be in **Failed** state.
- The group status changes to **Failed** if group deletion fails for any particular reason.

Edit a Group

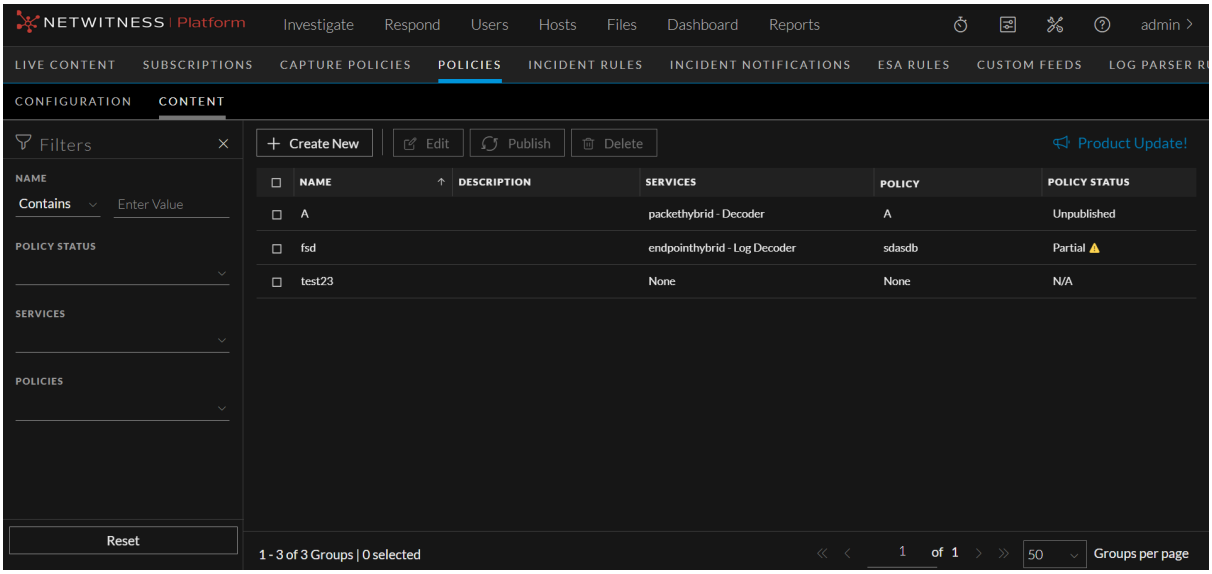
You can edit the properties of the group at any point in time. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description, then the status remains published (if it is already published).

To edit the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Group**. The available groups are displayed.
4. Select a group to edit and click **Edit**.
5. Make the required changes in the group.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     Note:
     - While removing a service from the group, you can opt to either delete the content of the service and remove the service or just remove the service from the group. While removing a service that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
     - While removing the group from the policy, the ESA content will be deleted by default.
   - The policy will be listed under the Unpublished category.
   - Click **Save and Close** to save the settings and return to the Policies view.

Filter Groups



The Filters Panel for content group allows you to filter the list of displayed groups, based on the group name, policy status, services and policies.

To filter the Groups

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**. The available groups are displayed.

4. To filter the groups, click . The filter panel is displayed.

5. On the filter panel, do the following:

   a. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed.

   b. Select the **Policy Status** from the drop-down list. The various drop-down values are:

      i. **Published**: Groups that are published to use.

      ii. **Unpublished**: Groups that are saved but not published.

      iii. **Failed**: Groups that are failed to publish.

iv. **N/A**: Groups for which publication status is not applicable.

v. **Partial**: Groups that are partially published.

c. Select the **Services** from the drop-down list.

d. Select the **Policies** from the drop-down list.

e. To reset the fields, click **Reset**.

Manage Policies

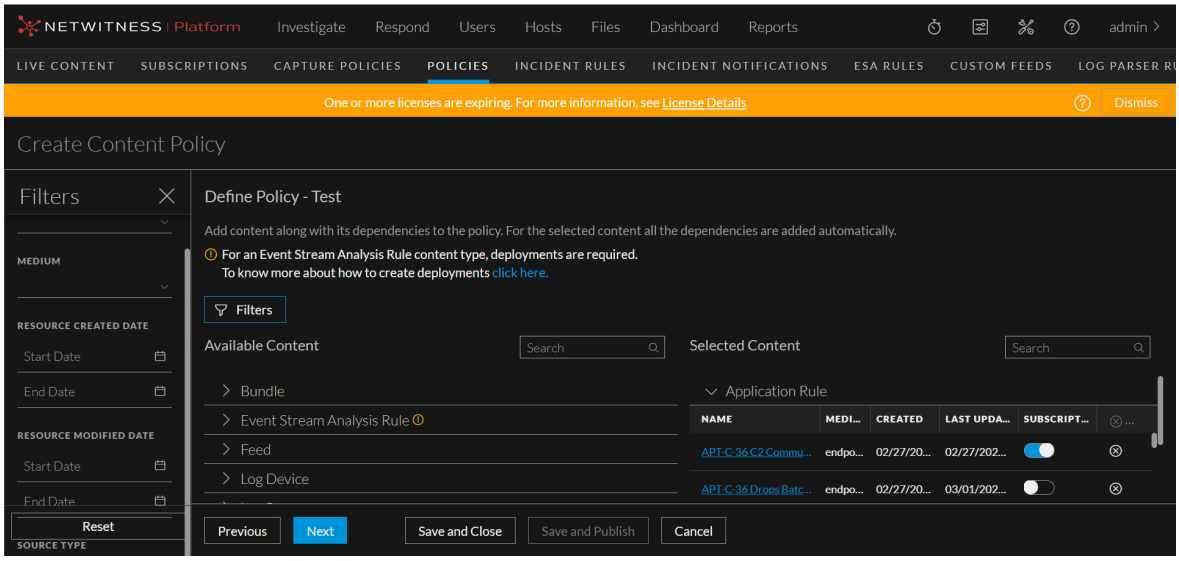
This section contains:

- Create and Publish Policies
- Clone a Policy
- Delete a Policy
- Edit a Policy
- View a Policy
- Enable Content for a Policy
- Disable Content for a Policy
- Subscribe Content for a Policy
- Unsubscribe Content for a Policy
- Filter Policies
- Filter Policy Content Details
- Merge Policy with ESA Content

Create and Publish Policies

You can create a policy and assign it to one or more groups.

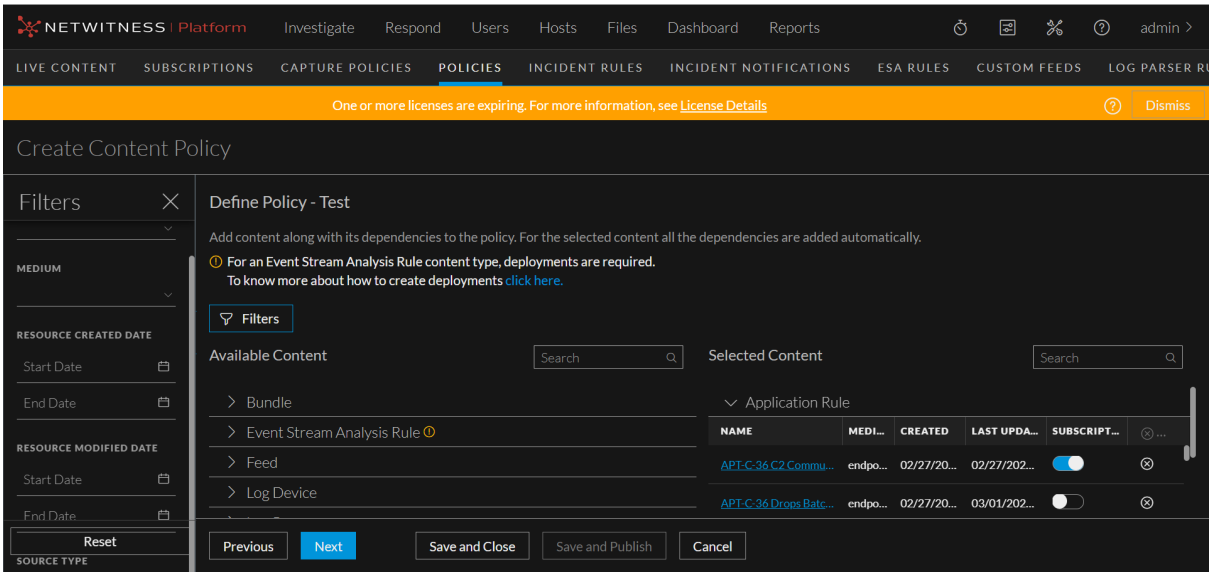
To create a Policy



1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**.

   The available policies are displayed.
4. Click **+ Create New** to add a new policy.
5. In the **New Policy** panel, do the following:
   - Enter a unique policy name.
   - Enter a description for the policy.
6. Click **Next**.
7. In the **Available Content**, select the content type and click + to add the content to the policy. To add all content based on the resource type, click . After you add the content, you can enable subscription (if required) by clicking subscribed toggle. Once the content is subscribed the updates are pushed automatically. To conveniently search the available content, type the initial content text in

the **Search** box available under the **Available Content** .To conveniently search the selected content, type the initial content text in the **Search** box available under the **Selected Content** .

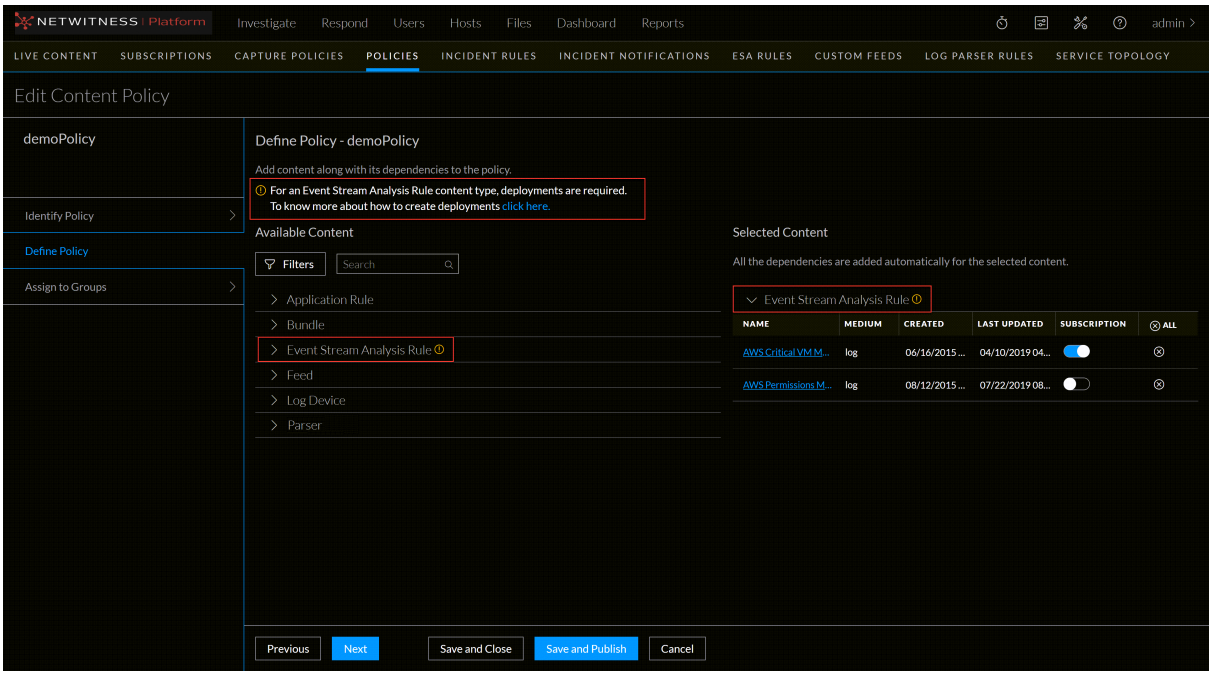


8. To filter both available and selected content, do the following:

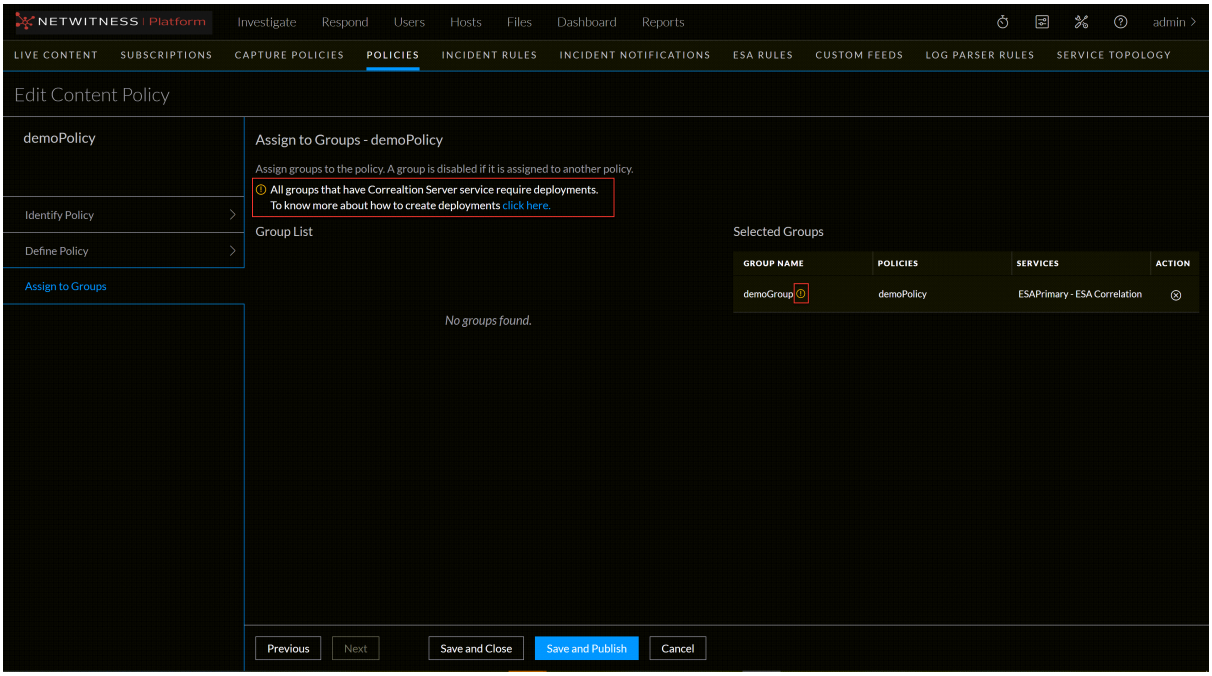
   - Click the  icon. The filter panel window is displayed.

   - Select the **Resource Types** from the available drop-down values.
   - Select the **Medium** from the available drop-down values.
   - Select the **Resource Created Date** and **Resource Modified Date**.
   - To reset the fields, click **Reset**.

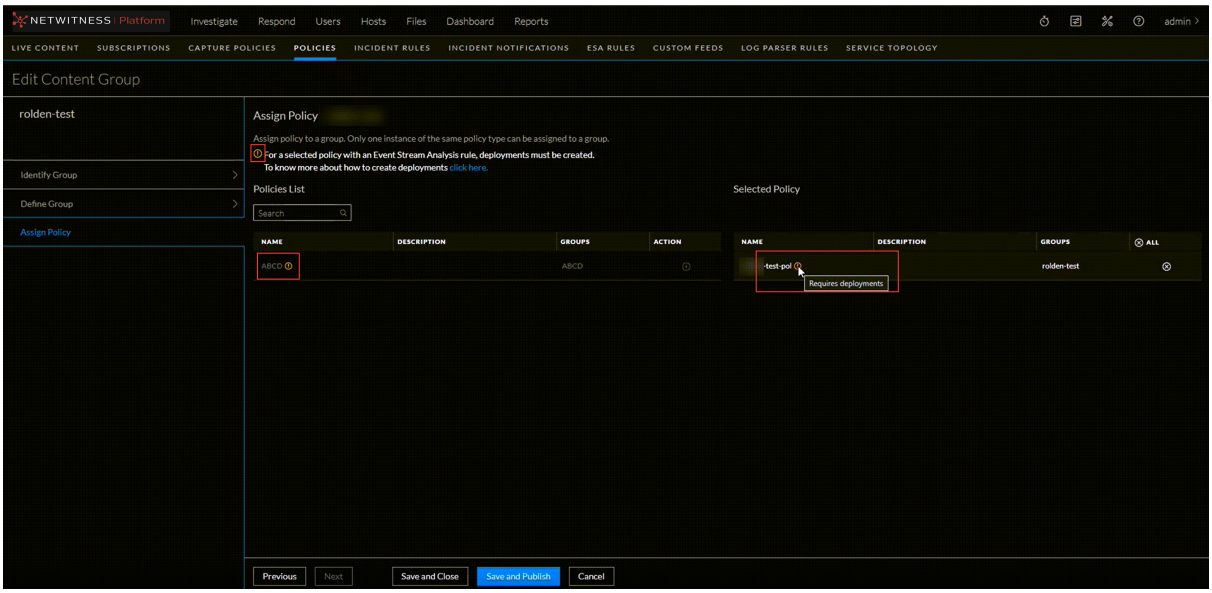
Note: Subscription is not allowed for custom content.



9. **Note:**
- All the dependencies are added automatically for the selected content. You can click on the content name highlighted in blue and look for details such as content description, content type, resources and dependencies and so on. You can also add and subscribe the resource from the details view.

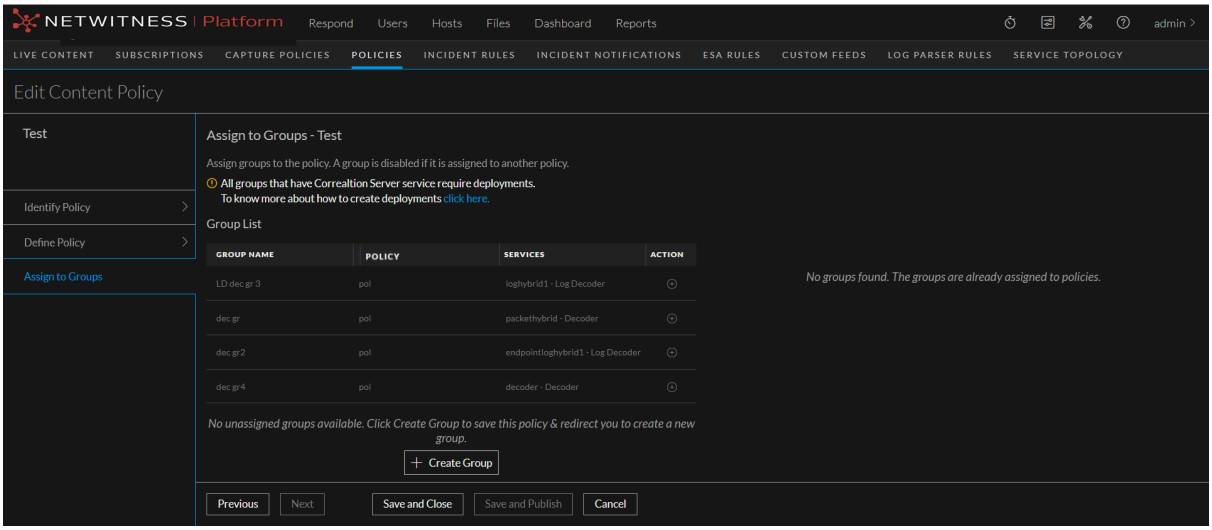


A caution icon is displayed to create a deployment on three scenarios.



- To implement the **Event Stream Analysis Rule** content type, you must have a deployment.

- All groups that have correlation server service must have a deployment.



- For any selected policy with an ESA rule, deployment are must be created.

To create and manage deployments, refer to Manage Deployments feature.

10. In the Group List, click + to assign groups to the policy.

Note: A group is disabled if another policy of the same type is already assigned to this group.

11. If there are no unassigned groups available, click 

to save the policy and redirect you to **Create New Group** screen. For more information on creating a new group, see Create a Group feature.

12. Click **Save and Publish** to save and publish the settings.

Note: You can also publish a policy from **Policy Details** screen. For more information on publishing a policy from **Policy Details** screen, refer View a Policy feature.

13. Click **Cancel** to cancel the publish content dialog.

14. Click **Save and Close** to save the settings.

IMPORTANT:
- From 12.3 version onwards, contents of services are not wiped out while publishing the first policy.
- The endpoint risk scoring requires certain application rules. Refer Endpoint Risk Scoring Rules to view the list of these application rules.

Clone a Policy

When you clone a policy, all the content from the old policy is copied to the new policy. The cloned policy can be assigned to a new group. You can clone only one policy at a time.

To clone a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

   The policy is cloned successfully.

Delete a Policy

Deleting a policy removes all content from the associated group.

To delete a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select one or more policies and in the More actions drop-down list in the tool bar, click **Delete**.

   The **Delete Policies** dialog is displayed.
5. To delete the deployed content from the group's services upon deleting the policy, select the option **Delete deployed content from the group's services on policy removal**. For ESA service, the content will be deleted upon deleting the policy.
6. Click **Delete** to permanently delete the selected policy.

   Deletion will take immediate effect and the policy will no longer be available in any group.

Note:
- While deleting a policy that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
- The services associated with this policy still require a restart if the restart is pending.
- You can also delete a policy from **Policy Details** screen. For more information on deleting a policy from **Policy Details** screen, refer View a Policy feature.
- The policy status changes to **Failed** if policy deletion fails for any particular reason.

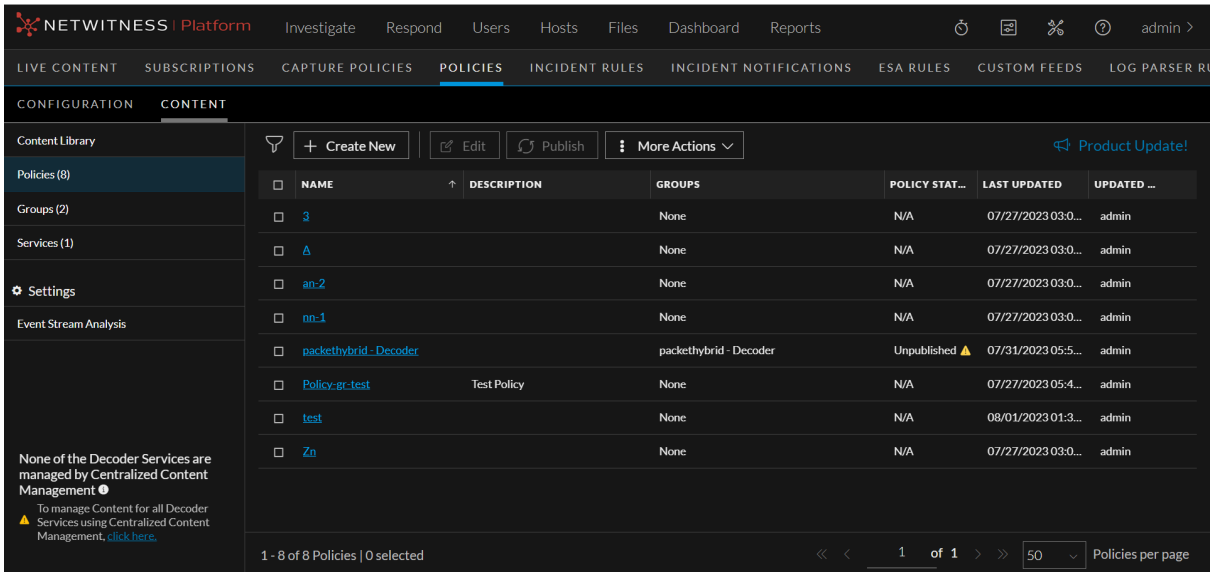
Edit a Policy

You can edit the content and settings of the policies. Once the policy is edited, the changes in the policy are reflected upon saving the policy. The changes are applied to the service once published. After saving and before publishing, the publication status of the changed policy is set to **Unpublished** if any settings are changed.

To edit a Policy

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to edit and click **Edit**.
5. Make the required changes in policy.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy. The policy will be listed under the Unpublished category.

     Note:
     - While removing a service from the group, you can opt to either delete the content of the service and remove the service or just remove the service from the group. While removing a service that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
     - While removing the group from the policy, the ESA content will be deleted by default.
   - Click **Save and Close** to save the settings and return to the Policies view.

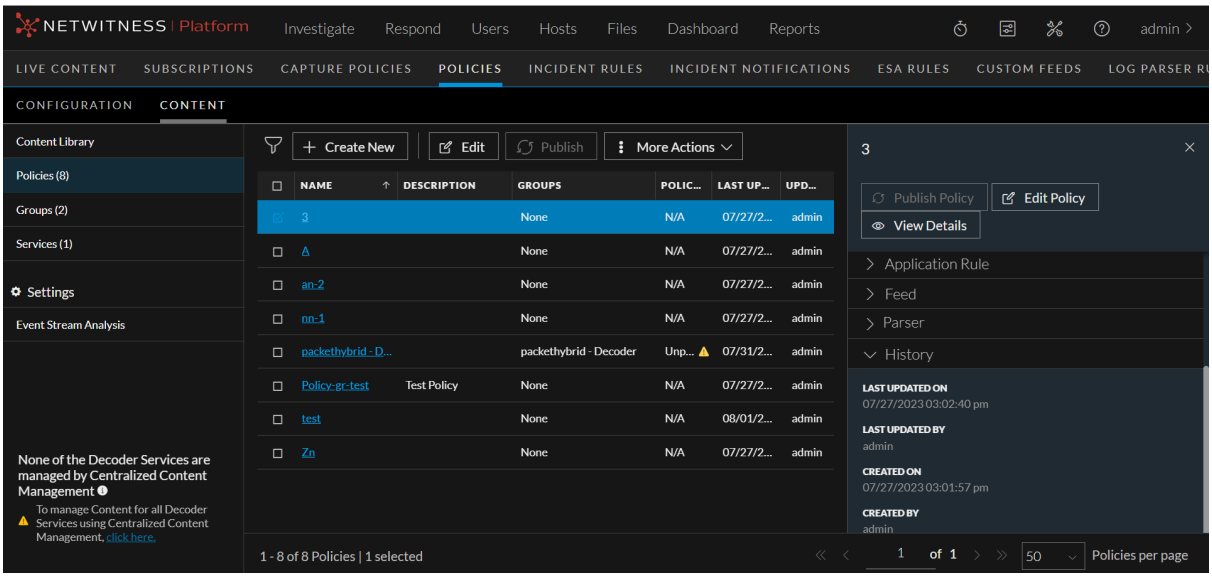


Note: You can also edit a policy from **Policy Details** screen. For more information on editing a policy from **Policy Details** screen, see View a Policy feature.

View a Policy

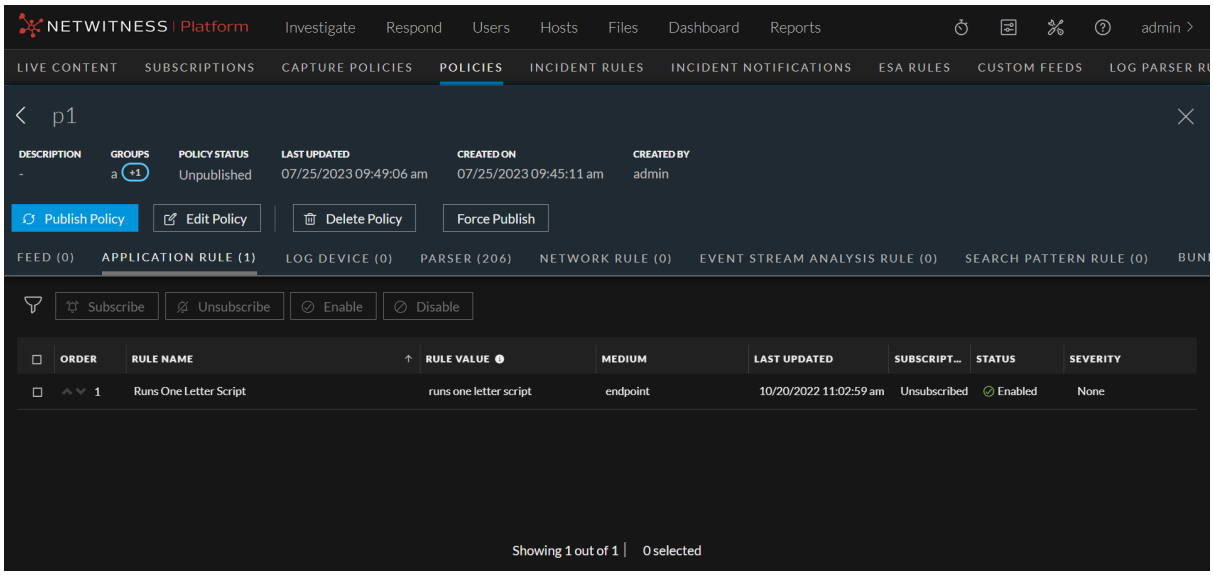
This topic describes the steps to view the properties of a Policy.

To view properties of the selected Policy



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed. By default, 50 policies are displayed per page. To go to the next page, click . To go to the last page, click .

Caution:



- An icon is displayed in the Policy View indicating policy status unpublished, if any services are part of the selected policy and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon is displayed in the Policy View, indicating that the policy status failed for multiple reasons. Please see the policy overview section in the UI to find the failure reason and the workaround.

4. From the policy listing page, you can perform the following actions:
   - Select a policy and click **Edit** to edit the policy. For more information on editing a policy, seeEdit a Policy feature.
   - Select the policy and click **Publish** to publish the policy if the policy is unpublished.
   - Select the policy and click **More Actions > Assign to Groups** to assign policy to available group.
   - Select the policy and click **More Actions > Clone** to clone the policy. For more information on cloning a policy, seeEdit a PolicyClone a Policy feature.
   - Select the policy and click **More Actions > Delete** to delete the policy. For more information on deleting a policy, see Delete a Policy feature.
   - Select the policy and click **More Actions > Force Publish** to force publish the policy. This action allows you republish all the content irrespective of the policy status.
5. Click a row to view details about the selected policy on the side panel.

6. To change the order of application rule assigned to the policy, do the following:
   1. To move the application rule or network down the order, click in the **Order** column.
   2. To move the application rule up the order, click in the **Order** column.
   3. You can also manually enter the order number in the **Order** column.
7. To change the order of network rule assigned to the policy, do the following:
   1. Click **Network Rules** tab.
   2. To move the network rule or network down the order, click in the **Order** column.
   3. To move the network rule up the order, click in the **Order** column.
   4. You can also manually enter the order number in the **Order** column.

   IMPORTANT: It is recommended not to order application rules or network rules deployed on the service from Service Config page if the service is part of Centralized Content Management.
8. Click the policy to view the details on the policy in a new page.

9. From the policy details page, you can perform the following actions:
   - To edit the policy, click **Edit Policy**. For more information on editing a policy, see Edit a Policy feature.
   - To delete the policy, click **Delete Policy**. For more information on deleting a policy, see Delete a Policy feature.
   - To publish the policy, click **Publish Policy**. For more information on creating and publishing a policy, see Create and Publish Policies feature.
   - To force publish a policy, click **Force Publish**. This action allows you republish all the content irrespective of the policy status.
   - To filter the content, click . For more information on filtering policy content details, see Filter Policy Content Details feature.
   - To enable or disable subscription, click **Subscribe** or **Unsubscribe** respectively.

     Note:
     - Subscription is not allowed for custom content.
     - The **Subscribe** and **Unsubscribe** button is disabled if any one of the content selected is custom.

Enable Content for a Policy

This topic describes the steps to enable the content for a Policy.

To enable content

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.

4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **SASE Integration Plugin**, **Search Pattern Rule** or **LUA Parser** panel, click the row to select the content to be enabled. You can either select all content or select any specific content to be enabled.
6. Click **Enable**.

If a Custom Log Device has a Base Parser as its dependency, then:

- The enable or disable status of the Custom Log Device will be same as that of the enable or disable status of Base Parser.
- You will not be able to enable or disable the Custom Parser.

Disable Content for a Policy

This topic describes the steps to disable the content for a Policy.

To disable content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **SASE Integration Plugin**, **Search Pattern Rule** or **LUA Parser** panel, click the row to select the content to be disabled. You can either select all content or select any specific content to be disabled.
6. Click **Disable**.

If a Custom Log Device has a Base Parser as its dependency, then:

- The enable or disable status of the Custom Log Device will be same as that of the enable or disable status of Base Parser.
- You will not be able to enable or disable the Custom Parser.

Subscribe Content for a Policy

This topic describes the steps to subscribe content for a Policy.

To subscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.

5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule**, **SASE Integration Plugin** or **Bundles** panel, click the row to select the content to be subscribed. You can either select all content or select any specific content to be subscribed.
6. Click **Subscribe**.

Unsubscribe Content for a Policy

This topic describes the steps to unsubscribe the content for a Policy.

To unsubscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule, SASE Integration Plugin** or **Bundles** panel, click the row to select the content to be unsubscribed. You can either select all content or select any specific content to be unsubscribed.
6. Click **Unsubscribe**.

Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Decoder**
- **Log Decoder**
- **Concentrator**

Additionally, you can filter based on publication status or service status:

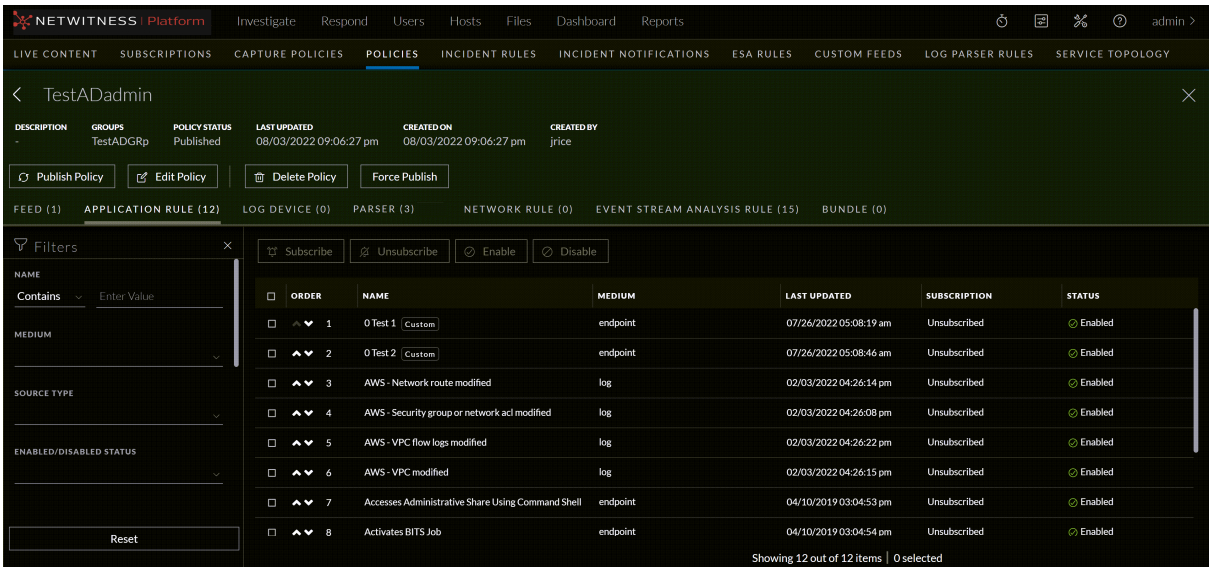
- **Published**: Policies that are published to use.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

The **Filters** panel can be hidden or displayed:

- To display if hidden, click the icon in the toolbar.
- To hide, click the icon at the top-right of the panel.

Filter Policy Content Details

The Filters panel allows you to filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date.



This applies to the following content types:

- Feed
- Application Rule
- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- Bundle

To filter policy content details

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Do one of the following:
   - Click a policy name.
   - Click a row to view details about the selected policy and click **View Details**.

   The policy details view is displayed.

5. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.
6. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules. Type one character and a list of content rules that contain that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.
7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
9. To filter by enabled/disabled status, select one or more statuses from the **Enabled/Disabled Status** drop-down list. The options are listed below:
   - **Enabled**
   - **Disabled**

   Note: Enabled/Disabled Status filtering is not applicable to Event Stream Analysis Rule content.

10. To filter by subscription status, select one or more statuses from the **Subscription** drop-down list. The options are listed below:
    - **Subscribed**
    - **Unsubscribed**
11. To filter by severity of the content, under the **Severity** field, select the drop-down values as either **Low**, **Medium**, **High** or **Critical**.

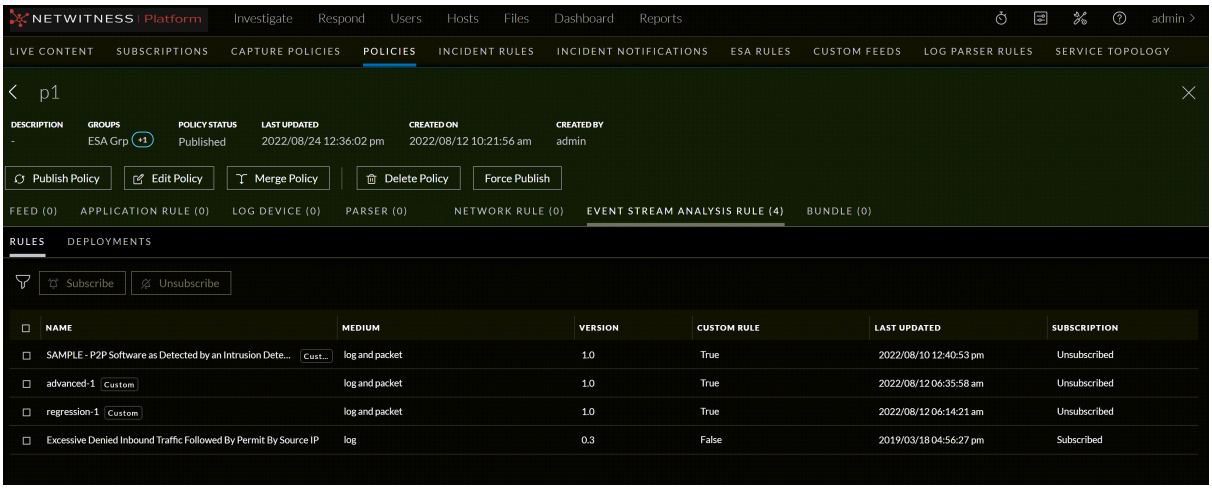
    Note: This field is applicable only for the content type 'Application Rule'.
12. To filter by a resource created date range, under the **Resource Created Date**, select the start date and end date from the date fields.

    For example, to filter contents that were created between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
13. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

    For example, to filter contents that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
14. To hide, click the icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

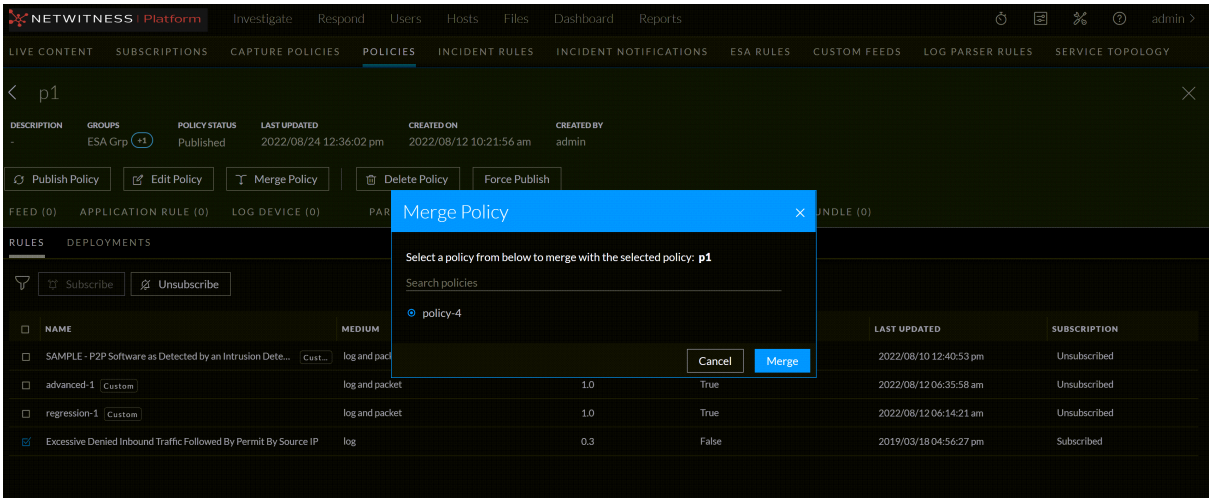
Merge Policy with ESA Content



From the 12.1 version, the ESA content is managed through the **(CONFIGURE)** > **Policies** page. After you upgrade to the 12.1 version, all the existing ESA deployments will be migrated to the policies and groups view. The **Merge Policy** button will be available only for the policy having ESA content and can only be merged with a policy with no ESA content.

Note: On merging a policy with another policy, the original policy gets deleted, and the other policy gets updated with the original policy content.

To merge Policy with an ESA Content



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Select a policy having ESA content to merge with another policy.

   The selected policy with ESA content view is displayed.

4. Click **Merge Policy**.

   The Merge Policy dialog is displayed.

5. Select a policy from the list or search for the name and Click **Merge**.

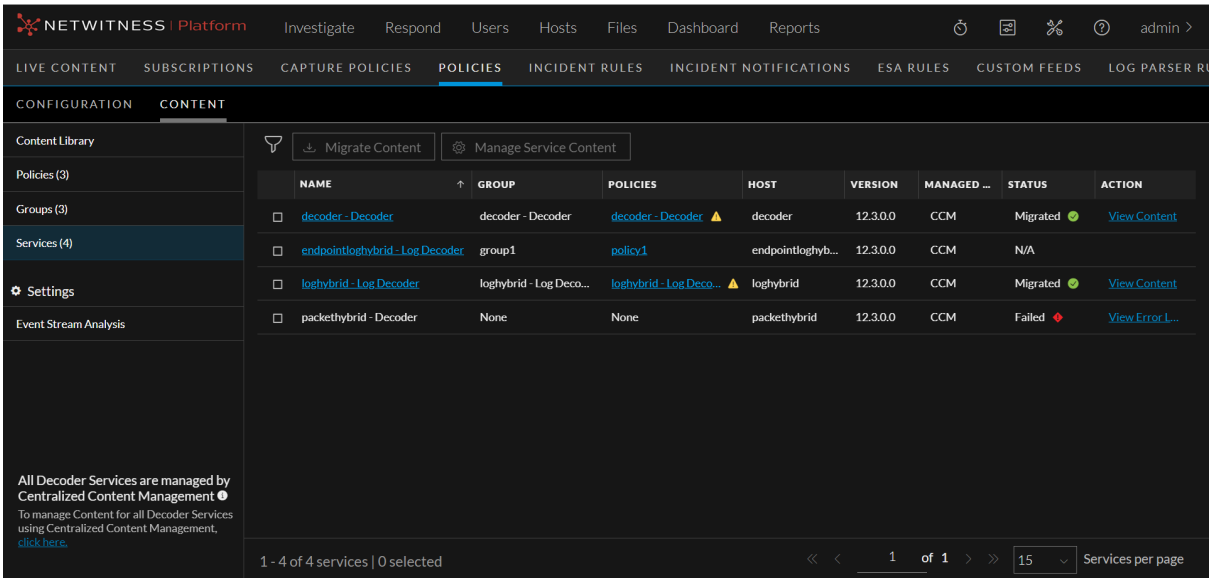
   A confirmation pop-up is displayed.

6. Click **Confirm**.

Manage Services

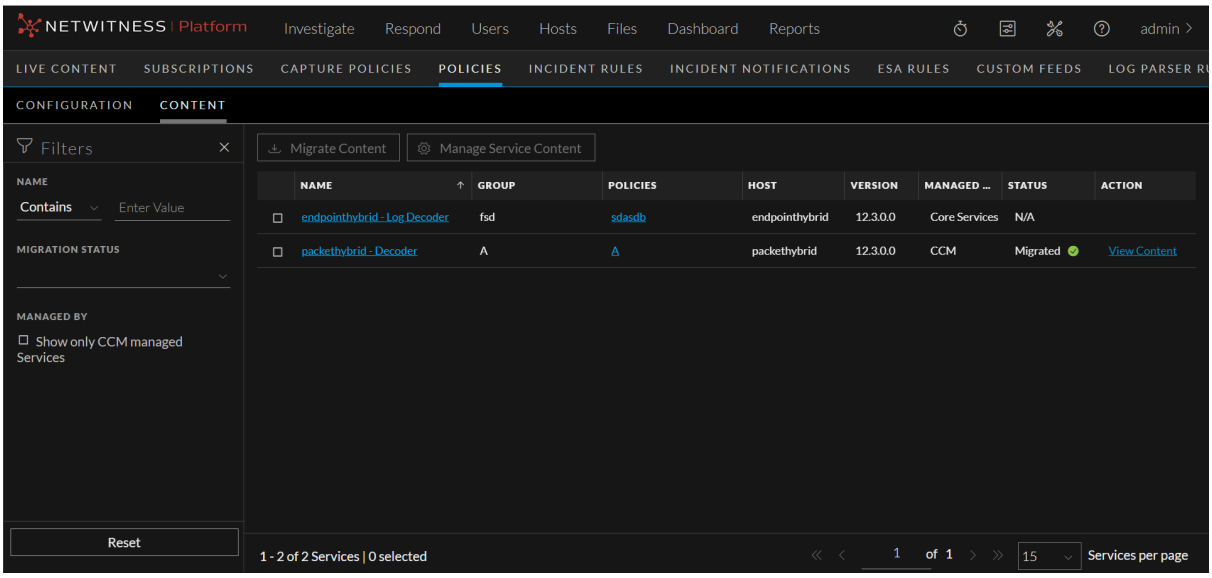
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

This sections contains:



- Migrate Content from Service
- View a Service
- Enable or Disable CCM for Individual Decoder Services

View a Service



This topic describes the steps to view the details of a service.

To view details of the selected Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Services**. The list of services are displayed. By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

4. To filter the services, click . The **Filters** panel is displayed.

5. On the **Filters** panel, do the following:

   i. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.

   ii. Select the **Migration Status** drop-down value.

   iii. Select **Show only CCM Managed Services** check-box under the **Managed By** field to display only the CCM managed services.

   iv. To reset the fields, click **Reset**.

6. Click the service to view the details of the service. The different details of the service are displayed. These details include the contents which will be deployed to the services from CCM policies.

7. To filter the content based on various parameters, click .
8. Click the content to view the details of the content on the right side panel. The complete content details such as **Overview**, **Resources and Dependencies**, and **History** are displayed.

9. To view the details of the policy for the migrated service, click the policy name present under the **Policies** column in the **Service List** page.

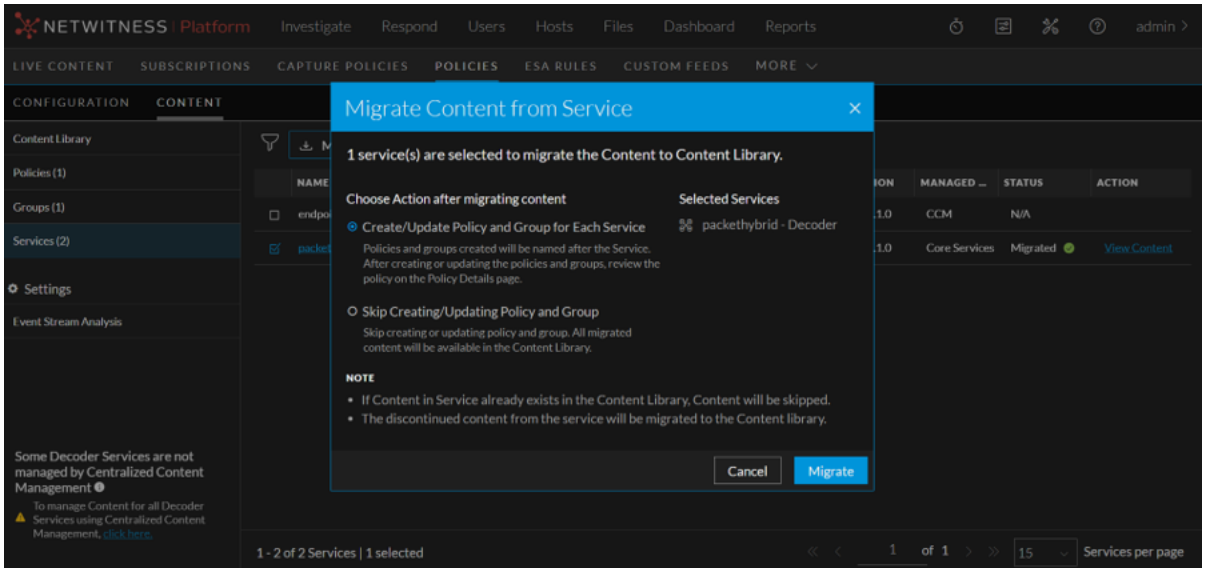
   For more details on the policy details, see View a Policy feature.

10. To view the details of the migrated content for the service, click the **View Content** hyperlink present under the **Action** column in the **Service List** page.
11. To view the details of the logs for failed migration, click the **View Error Log** hyperlink present under the **Action** column in the **Service List** page.

For more details on the migrating content from service, viewing migrated content and viewing error logs, see Migrate Content from Service feature.

Migrate Content from Service

This option allows you to migrate the contents of 12.3 and above version services.



To migrate Content from Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Services**. The list of services are displayed.
4. Select the services from which you want to migrate the content.

   Note: By default, you can select up to 5 services for migration. This also includes the services which are under migration. However, you can modify this number from **Admin -> Source Server -> Explore -> Central/Content -> Migration**.

5. Click **Migrate Content**.

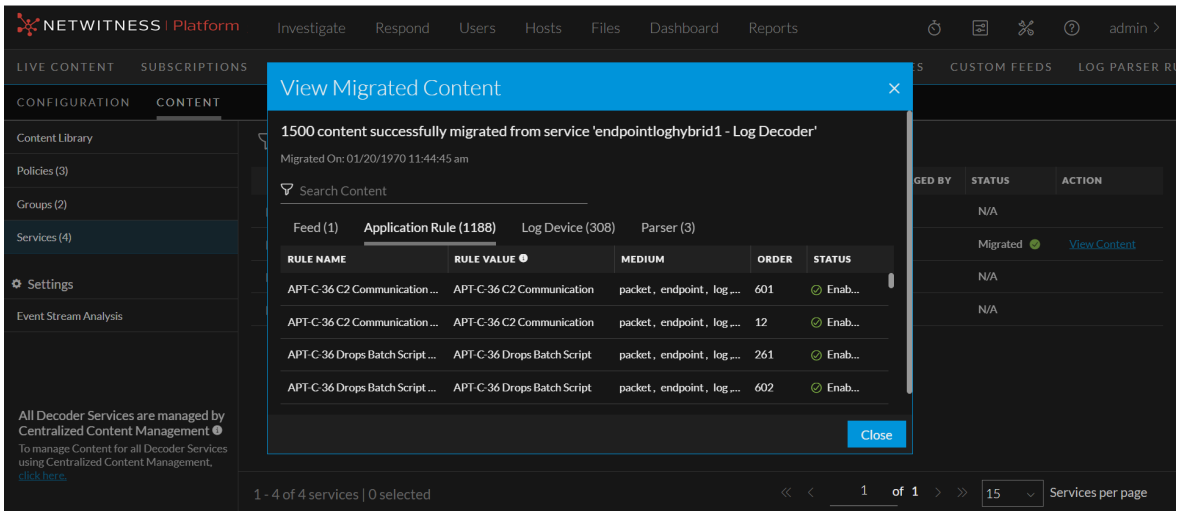
   The **Migrate Content from Service** pop-up window is displayed.

6. On the **Migrate Content from Service** pop-up window, choose action and click **Migrate**.
   - If you select **Create/Update Policy and Group for Each Service**, policy and group will be created or updated for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective listing pages. The policy and group which is created or updated for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled until the policy is reviewed. The policy can be published only after reviewing it either from **Policy Details** page or **Edit Policy** Page. When the policy or group gets updated with the

new content, the order of the new content will be given priority.

- If you select **Skip Creating/Updating a Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

Note:
- If the service is assigned to a group which is not attached to any policy, then the **Create/Update Policy and Group for Each Service** is disabled.
- When migrating content from two Decoders that have two different types of Custom or Live Base Parser associated with same Custom or Live Base Parser, both the Custom Parsers are added to Content Library. The association inside the Policy will be with the most recently migrated Custom Parser.
- Within a migrated Policy, a Custom Parser will have only one Custom or Live Base Parser associated with it.
- Migrated content version will be in the Policy, if as part of migration, the Policy is auto created. If you remove this content, you cannot add the old version of the content back.



Note: If a service migration fails to update a policy:
- You can edit the existing policy and add only the required content.
- Remove the service that is part of a group and remigrate the content. This will only create a policy if the content number is less than 8000.

7. The migration initiation message is displayed on the screen. The **Status** column displays the following values based on the status of migration:
   - Queued
   - Initializing
   - Analyzing Content
   - Migrating Content
   - Migrated
   - Failed

Note:
- The service can also be remigrated if it is already migrated and assigned to groups and policies.
- During parallel migration, if the selected services are updating common policies or using policies that are already being updated, you will receive a warning message on the screen. In such a scenario, it is recommended to update the policies through migration one service at a time to ensure that the last migrated service influences the policy in terms of order and version.

8. To view the migrated content details, do the following:
   - Click the **View Content** hyperlink present under the **Action** column. The hyperlink is available only after the migration process is complete.

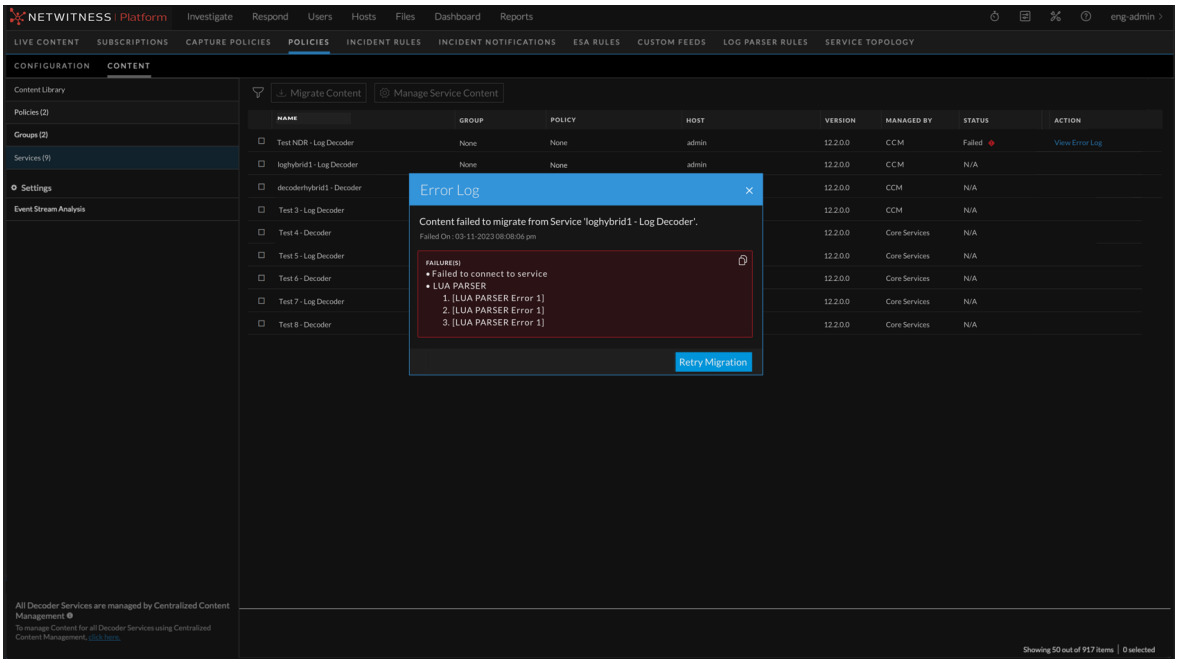
     The **View Migrated Content** pop-up window is displayed with the different tabs such as **Feed**, **Application Rule**, **Network Rule**, **Log Device** and **LUA Parser**.

Note:
- **Network Rules** tab is not applicable for Log Decoders.
- **Log Device** tab is not applicable for Decoders.

IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

- Click  to search the migrated content based on various parameters.

  Note:
  - For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
  - For Feeds, Log Device and LUA Parser, the search is based on the **Name**.



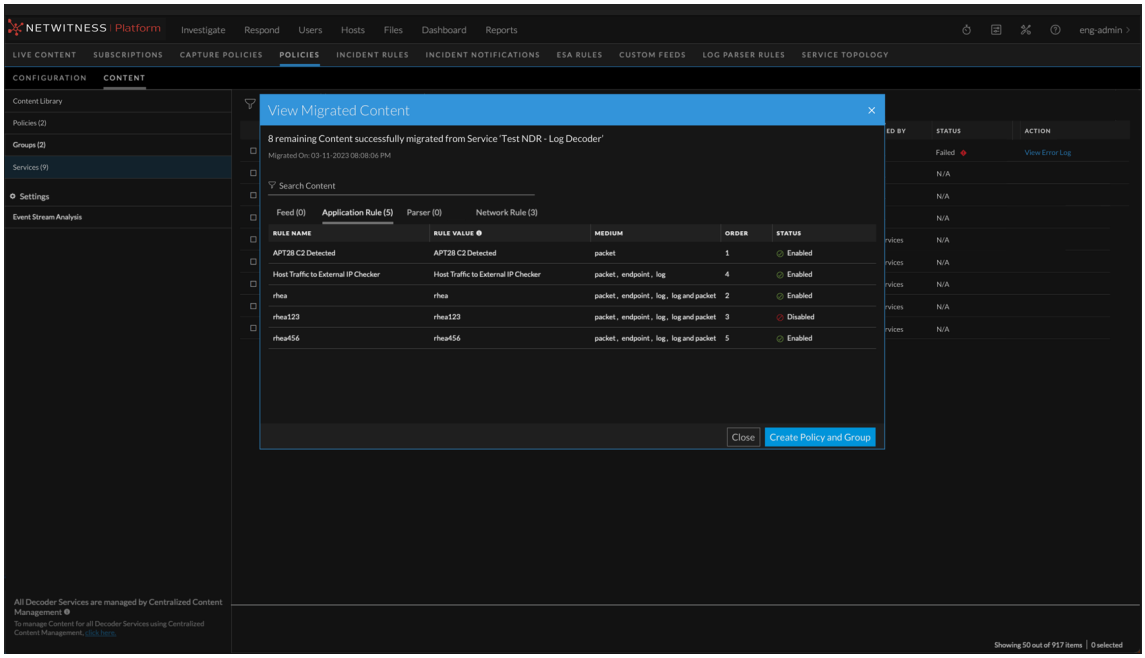
- Click each tab to view the content details. The **Application Rule** and **Network Rule** tabs will have details such as **Rule Name**, **Rule Value**, **Medium**, **Order** and **Status**. The **Log Device**, **Feeds** and **LUA Parser** tabs will have details such as **Name**, **Medium** and **Status**.

9. To view the error log details in case of failed migration, do the following:

   - Click the **View Error Log** hyperlink present under the **Action** column. The hyperlink is available only if the migration process has failed due to some reason.

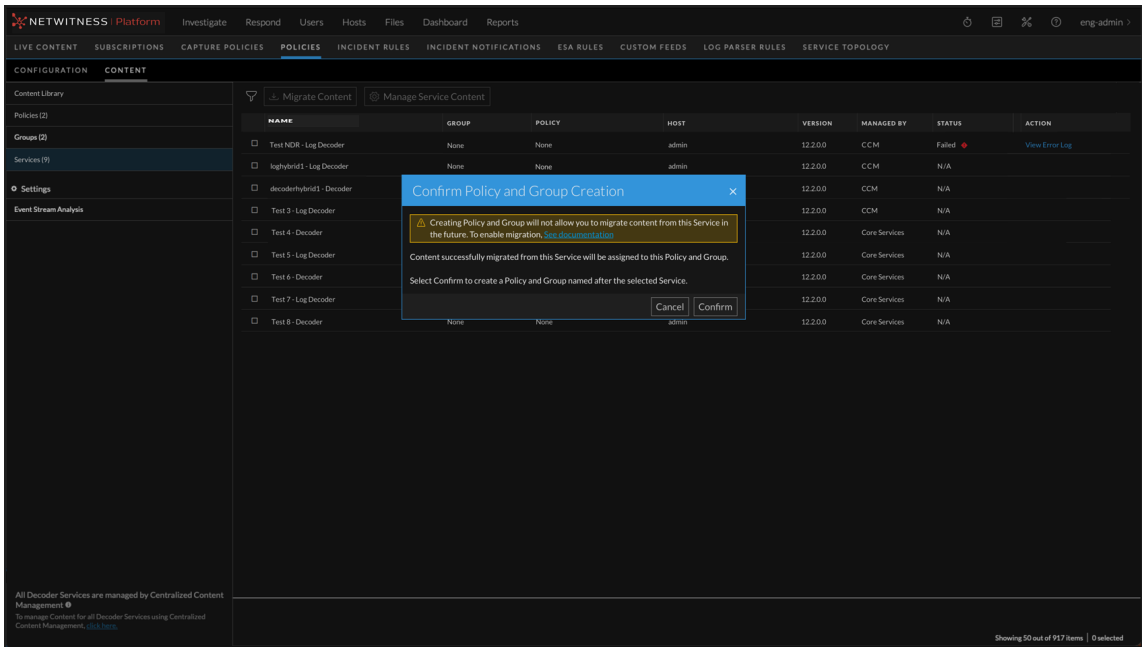
     The **Error Log** pop-up window is displayed with the details of error.

     The following screen is displayed if no content is migrated to Content Library.



Note: You should manually migrate the content in case of failed automated migration.

The following screen is displayed if some content is migrated is Content Library.



- To copy the error logs, click .
- To retry migration, click **Retry Migration**.
- In case of partial migration, to view the content that have been migrated successfully, do the following:

- Click **View Migrated Content**. The **View Migrated Content** pop-up window is displayed with the details of migrated content.

- To create policy and group for the service which is partially migrated, click **Create Policy and Group**.

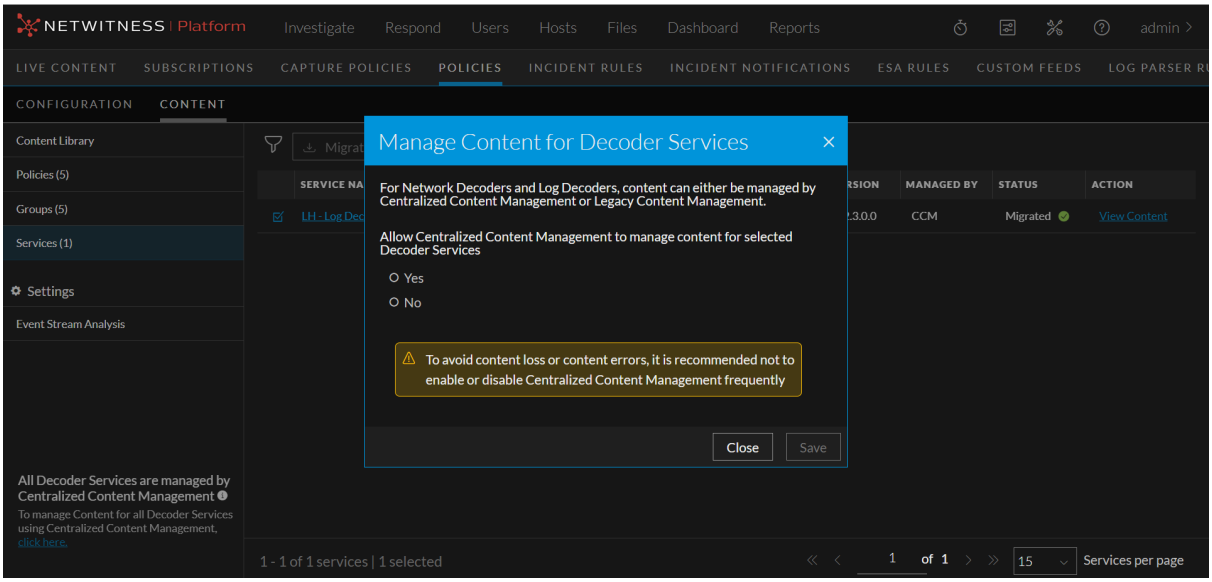
  The **Confirm Policy and Group Creation** pop-up window is displayed.

Best Practice Recommendation: Before creating policy and group for partially migrated service, it is recommended to retry migration.

- To confirm creation of policy and group, click **Confirm**. The policy and group will be listed under the **Policy Listing** and **Group Listing** pages.
- To go back to the **Service List** page, click **Cancel**.
- If you do not want to create policy and group for partially migrated service, click **Close in View Migrated Content** pop-up window.

10. To cancel the migration, click **Cancel** in the **Migrate Content from Service** pop-up window.

Note: Migrated Live contents will be categorized as Custom contents, if:
- You have modified the Live content manually before migrating it.
- The migrated Live content is an older version of the content.



Enable or Disable CCM for Individual Decoder Services

This topic describes the steps to enable or disable CCM for individual Decoder Services.

To enable or disable CCM for individual Decoder Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Services**. The list of services are displayed.
4. Select the service(s) for which you want to enable or disable CCM and click **Manage Service Content**.

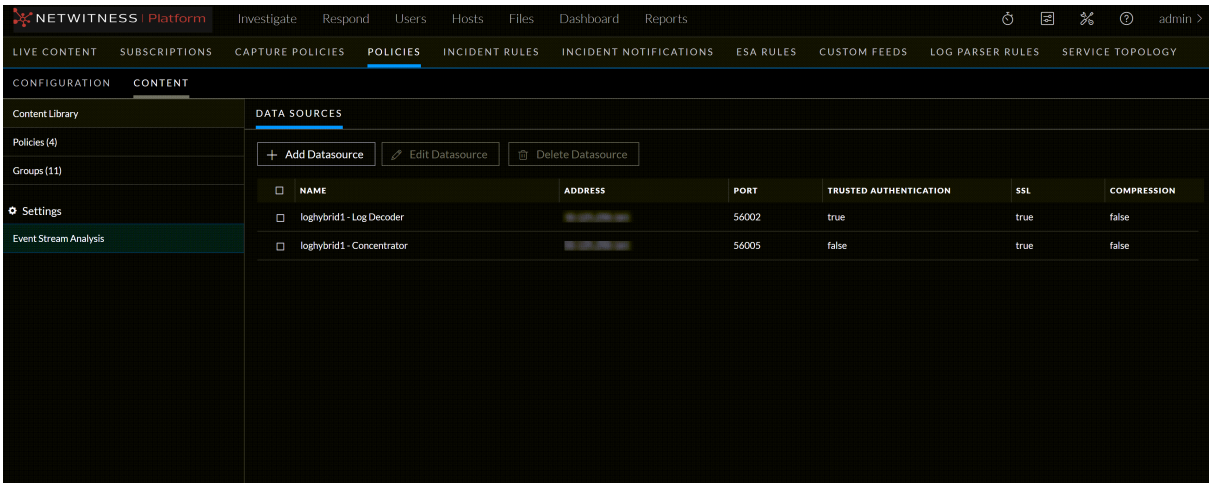
   The **Manage Content for Decoder Services** pop-up window is displayed.

5. In the pop-up window, select **Yes** for **Allow Centralized Content Management to Manage Content for Selected Decoder Services** to enable CCM for the selected service. Select **No** to disable CCM for the selected service.
6. Click **Save** to save the changes.

Manage ESA Datasources

This section contains:

- View an ESA Datasource
- Add an ESA Datasource
- Edit an ESA Datasource
- Delete an ESA Datasource



View an ESA Datasource

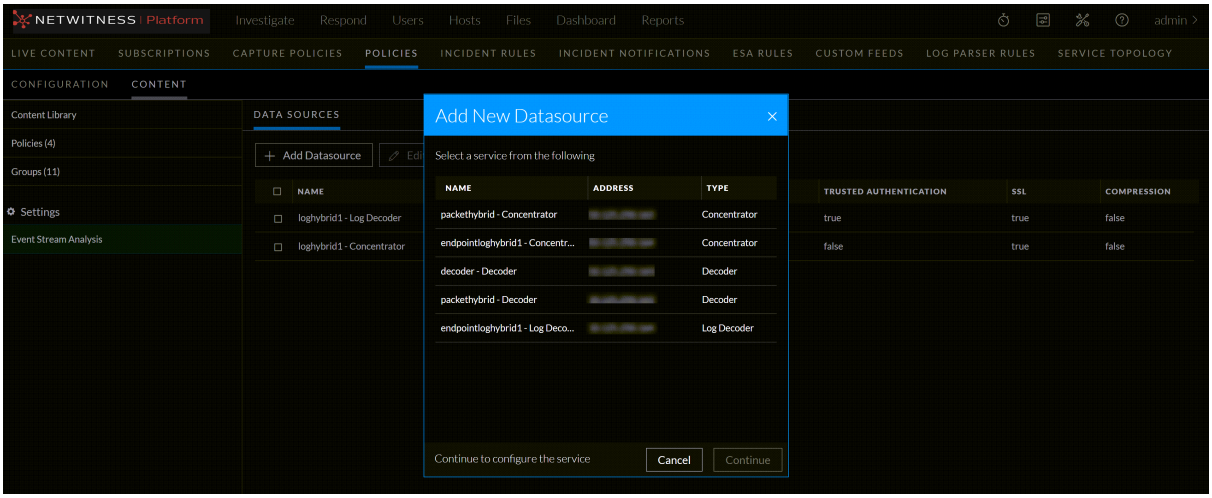
This topic describes the steps to view the ESA datsources available.

To view an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.

   The available datasources are displayed.

Add an ESA Datasource



You can add one or more ESA data sources, such as Concentrators, to use for your selected ESA Service. This enables you to specify different data sources for each deployment.

To add an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Click + **Add Datasource**.

   The Add New Datasource dialog is displayed.

Note: You can add a Log Decoder as a data source for ESA. But, it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

5. Select a service and click **Continue**.

Note: You can add only one service at a time.

6. Do one of the following:
   - Select the **Trusted Authentication** checkbox.
   - Enter your credentials (username and password) for the datasource.

Note:
- If you select **Trusted Authentication** instead of username and password. This option will enable the use of SSL by default. However, you can still configure the compression settings.
- If you choose to enter your username and password. You can configure both SSL and compression settings.

7. To enable the SSL settings, select the **SSL** checkbox. You can set your desired port number.

IMPORTANT: Ensure that you turn on SSL only if necessary, in order to avoid performance impact on the SSL protocol.

8. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

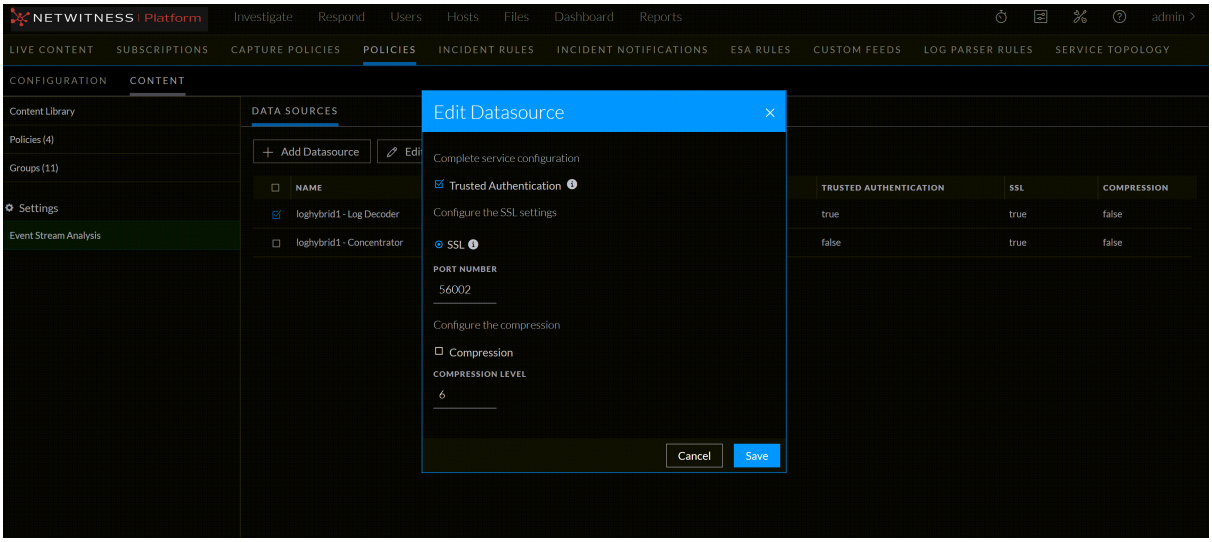
   - Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
   - Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
   - Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

   Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules.

9. Click **Test Configuration** to make sure that it can communicate with the ESA service.
10. Click **Save**.

    After you configure your data sources and they appear in the Available Configured Data Sources dialog, you can use them for your deployment.



Edit an ESA Datasource

You can edit the properties of the datasource at any point in time. You can edit the user credentials, SSL, port, and compression value of the datasource. When a data source password changes, it is important to change the password on the data source so that ESA can continue to communicate with the data source.

To edit an ESA Datasource

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Edit Datasource**.

The Edit Datasource dialog is displayed.

5. Make the required changes in the datasource.
6. Click **Save**.

Delete an ESA Datasource

You can delete one or more ESA datasources. Once the datasource is deleted, the service will be removed from the available configured list.

To delete an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Delete Datasource**.

   A confirmation pop-up is displayed.
5. Click **Delete Datasource**.

Manage Deployments

The ESA deployment consists of a policy with ESA rules, ESA services, and data sources. The ESA service scans your network for suspicious activity whenever you deploy policies. An ESA rule detects a different event every time, such as when a user account is created and deleted within 24 hours.

In addition, you can perform other steps on your deployment, such as changing a data source, editing or deleting a rule from the deployment through policy, renaming or deleting the deployment, or showing updates to the deployment, see Additional ESA Correlation Rules Procedures

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

For more information about groups, see Groups

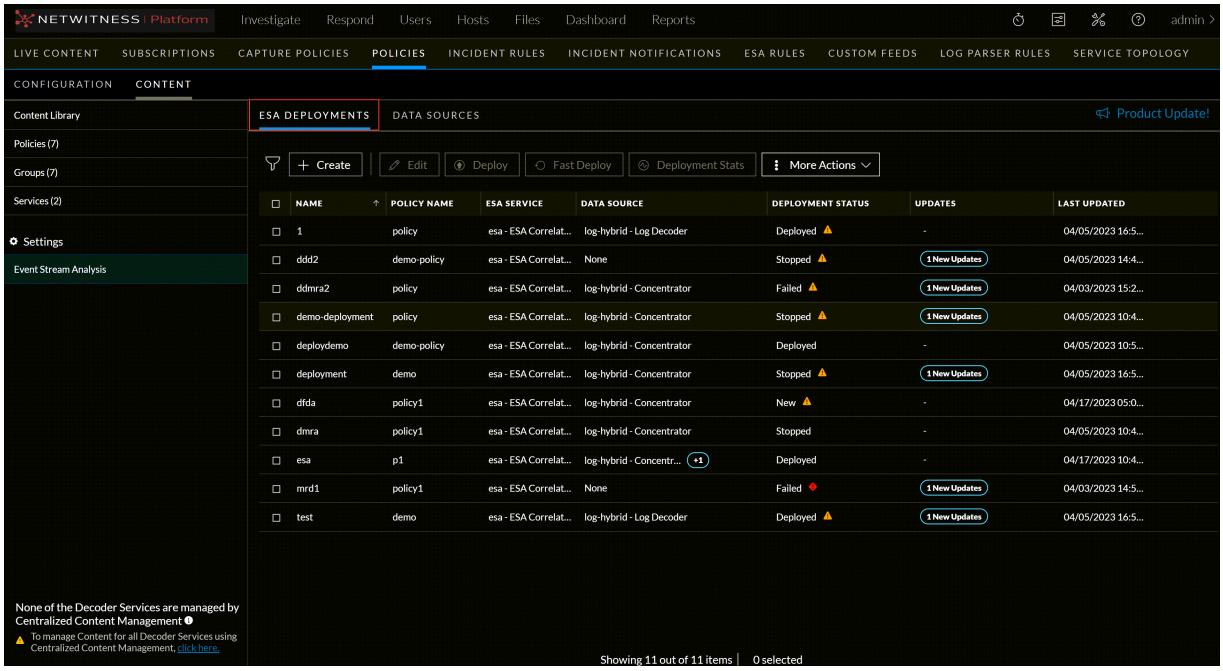
Note: With the unified ESA Deployments tab, you can manage deployments from a single view across all policies within Policy-based Centralized Content Management (CCM).

You can do the following:

- View a Deployment
- Create a Deployment
- Edit a Deployment
- Start a Deployment
- Fast Deployment
- Deployment Stats
- Remove a Deployment
- Stop a Deployment
- Migrate ESA Deployments to Policies and Groups

View a Deployment

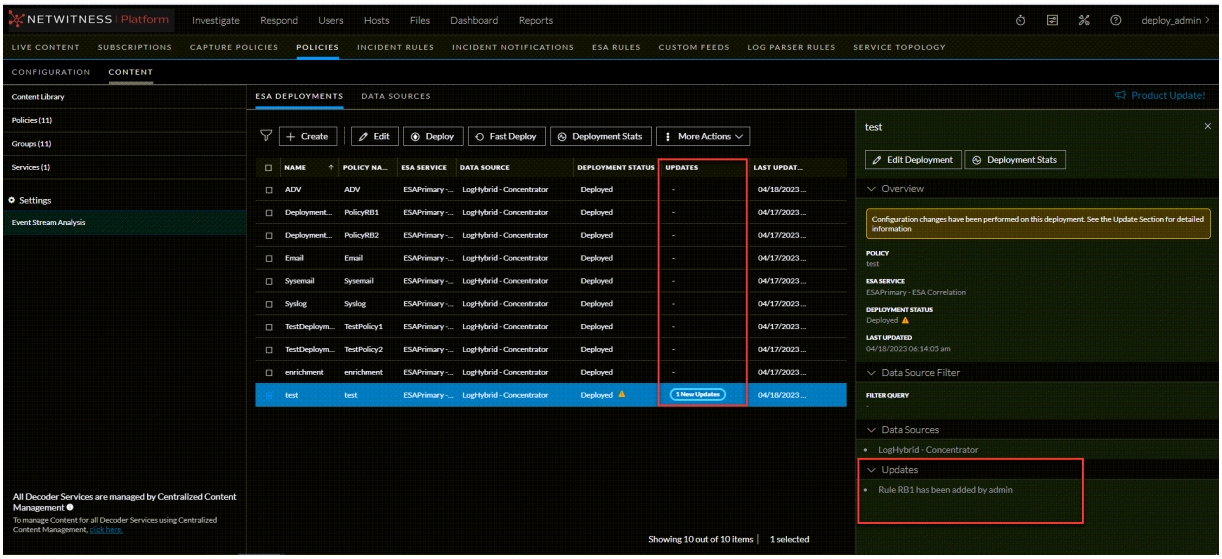
In the ESA deployment view, you can view a list of all the deployments associated with the policies and the actions you can perform with them. It helps you manage and set-up deployments within CCM to create, edit, deploy, remove, and stop deployments. NetWitness Platform provides two methods to manage deployments.



You can view deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create, edit, remove, and pause deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create, edit, remove and pause a deployment.

To view all deployments using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

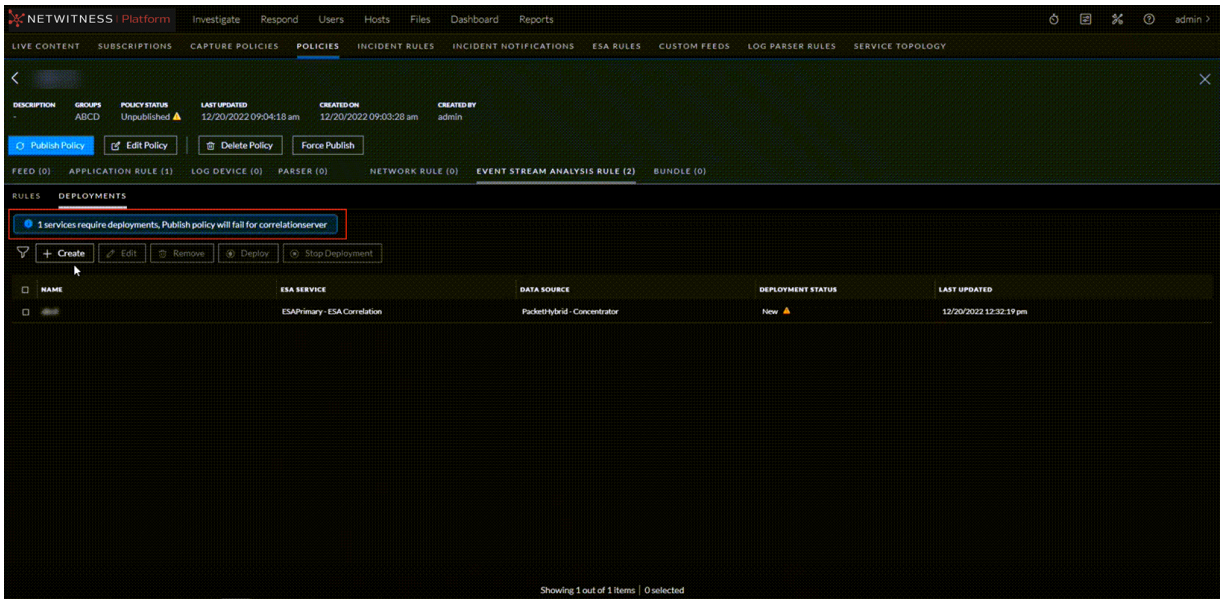
Note: Any changes made, like add / edit / delete to **rules**, **notifications**, and **enrichments** on the **ESA Rules** page for deployments, are displayed in the **Updates** section of the **ESA Deployments** view.

IMPORTANT: Any changes required for rule configurations must be made on the **ESA Rules** page only.

To view a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.

The available policies are displayed.



3. Click a Policy.

The selected policy view is displayed, and the Application Rule is default selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

The available deployments for the selected policy are displayed.

Caution: An icon is displayed in the deployments view indicating services require deployments, publish policy will fail for correlation servers. You may need to create deployments for such services if required.

Create a Deployment

When you create a deployment, you need to select a policy, ESA service, and data sources. An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

For more information on data sources, see Data Source

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

You can create deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create a deployment.

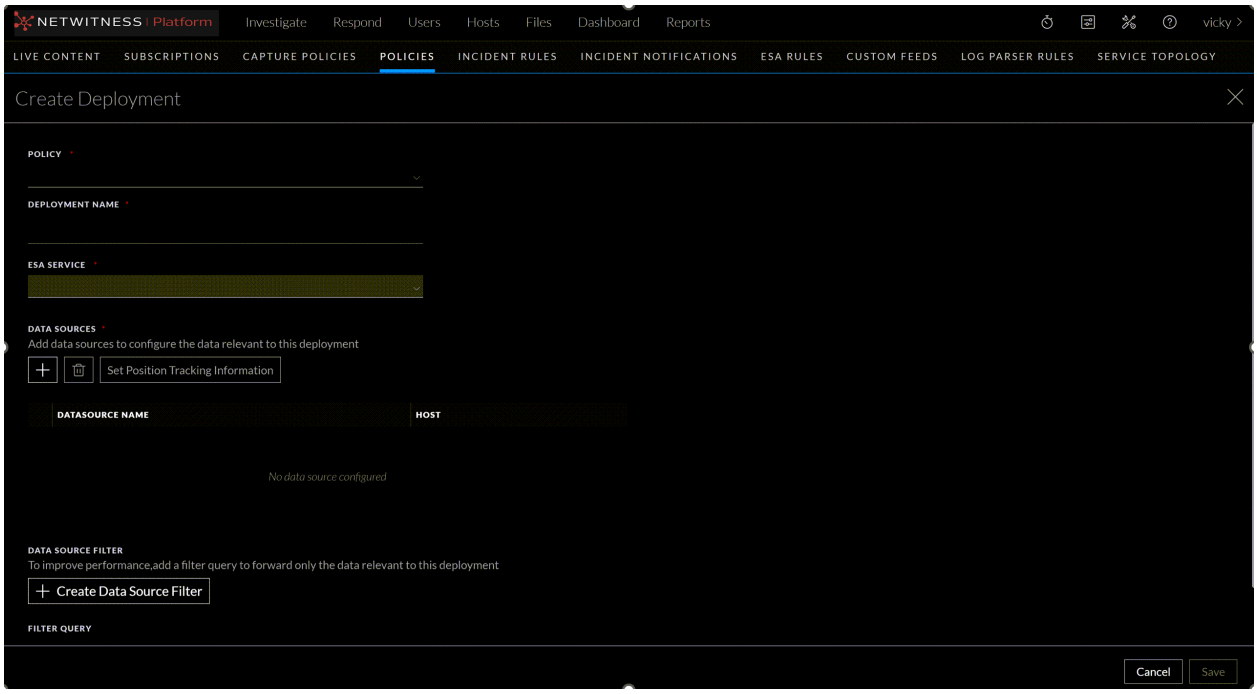
Prerequisites

- The group is assigned to a policy
- The Correlation server service is available in the groups assigned.

- A minimum of one ESA rule is added to the policy.
- ESA data source must be configured.

  For more information about groups, see Groups

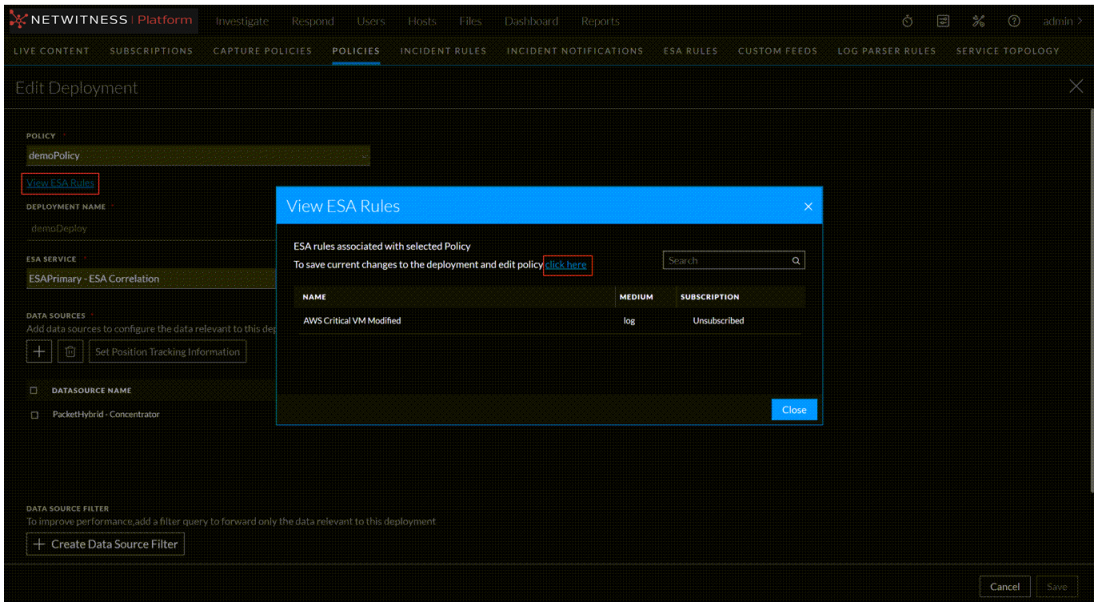
To create a deployment using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Click + **Create**

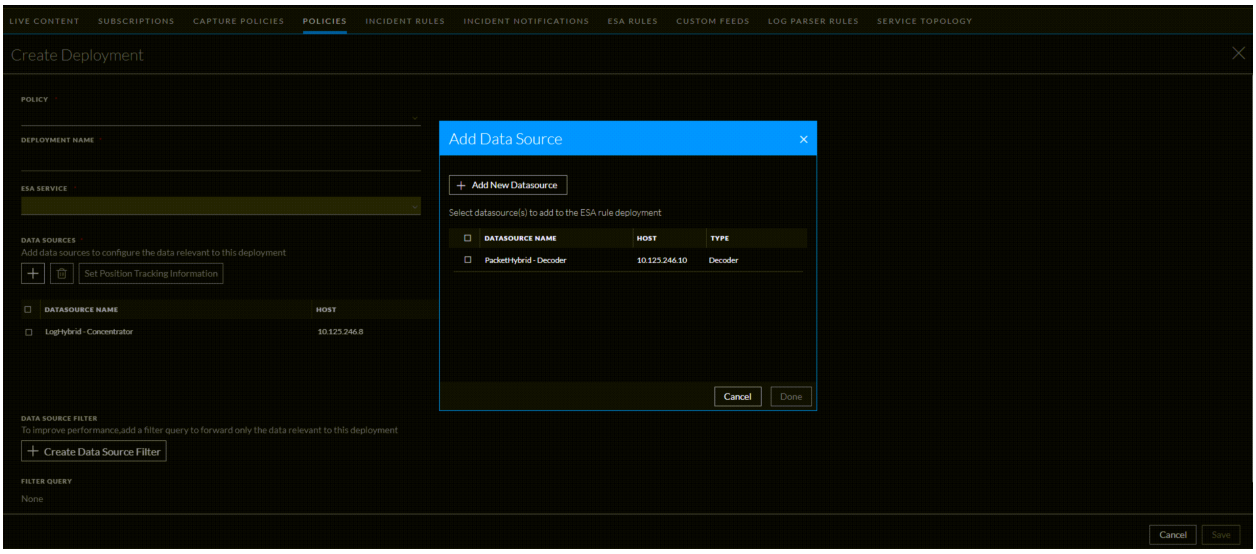


The Create Deployment dialog is displayed.

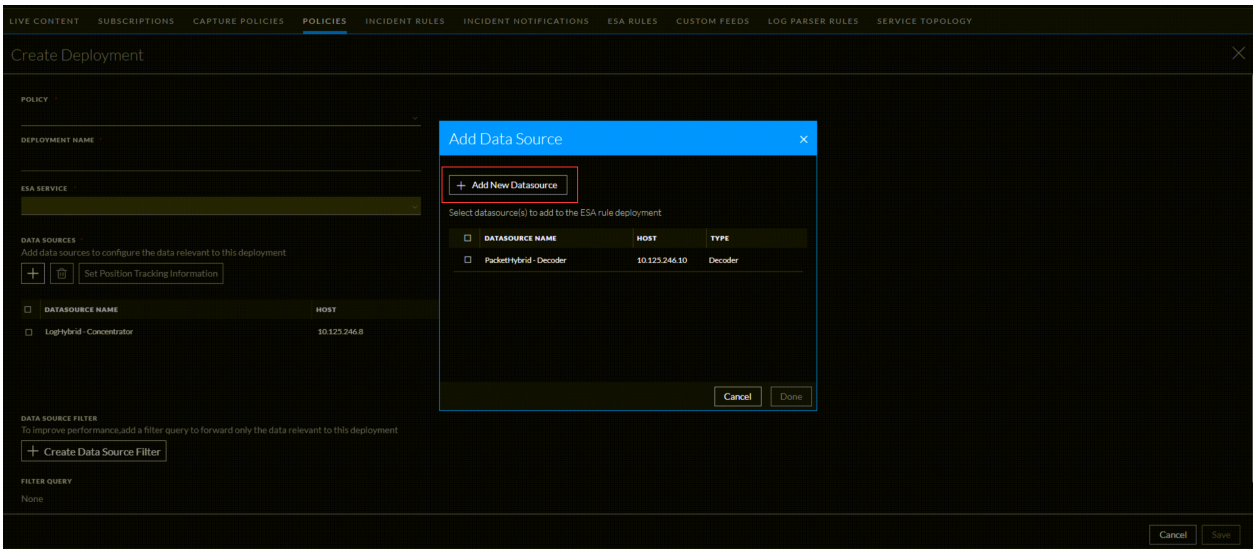
4. Select an eligible policy from the policy list.

Note: All the policies that meet the criteria mentioned above are listed in the policy drop-down. It is required to select a policy to proceed further.

If required, you can click on View ESA Rules to search for rules associated with selected policy.



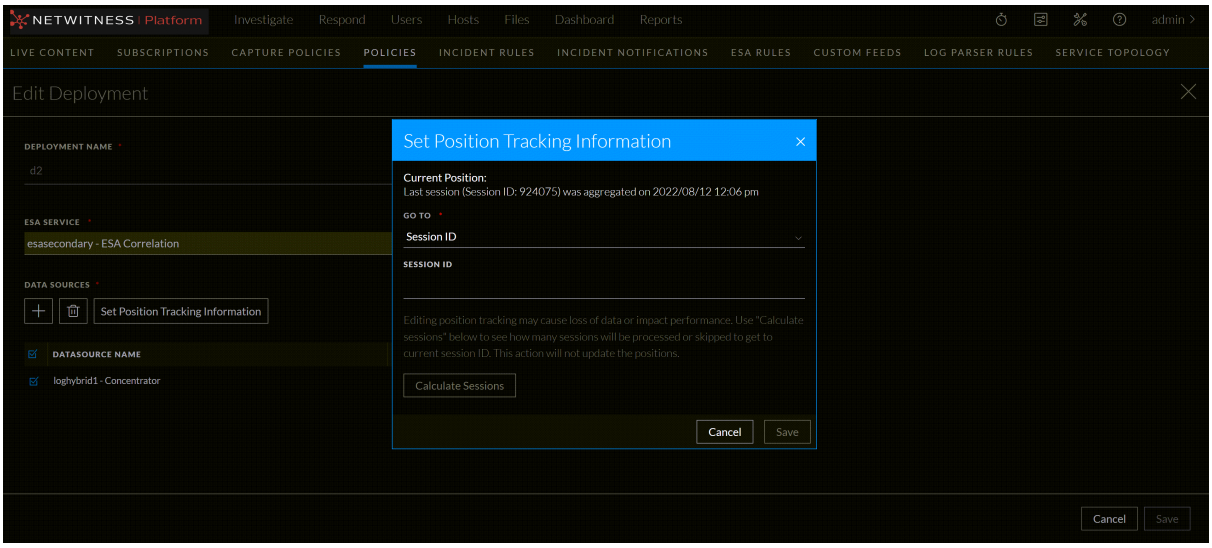
5. Enter a name for the deployment.
6. Select a service from the **ESA Service** drop-down list.



Note: Once the deployment is saved, the selected policy, name and ESA service cannot be modified.

7. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.



If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Select one or more data sources and click Done.
9. To delete the data source, select the data source and click .
10. (Optional) Select the required data source and click **Set Position Tracking Information** to process specific or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

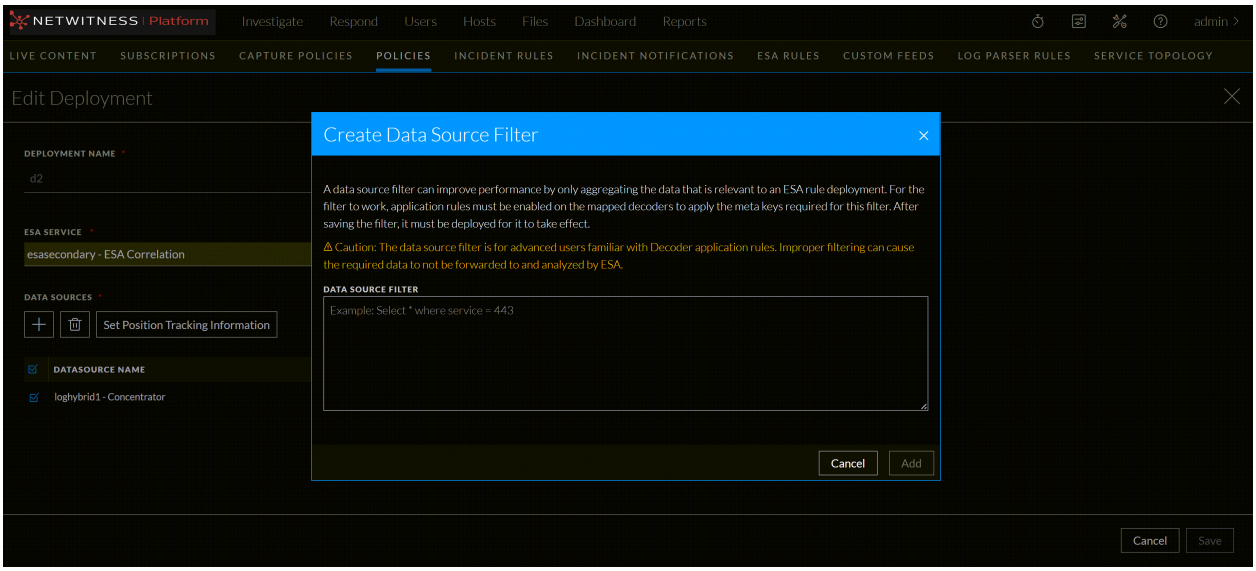
      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed to the existing position of the data source, if any.



c. To save the edited position tracking data source, click **Save**.

   For more information on Position Tracking Information, see Position Tracking Information.

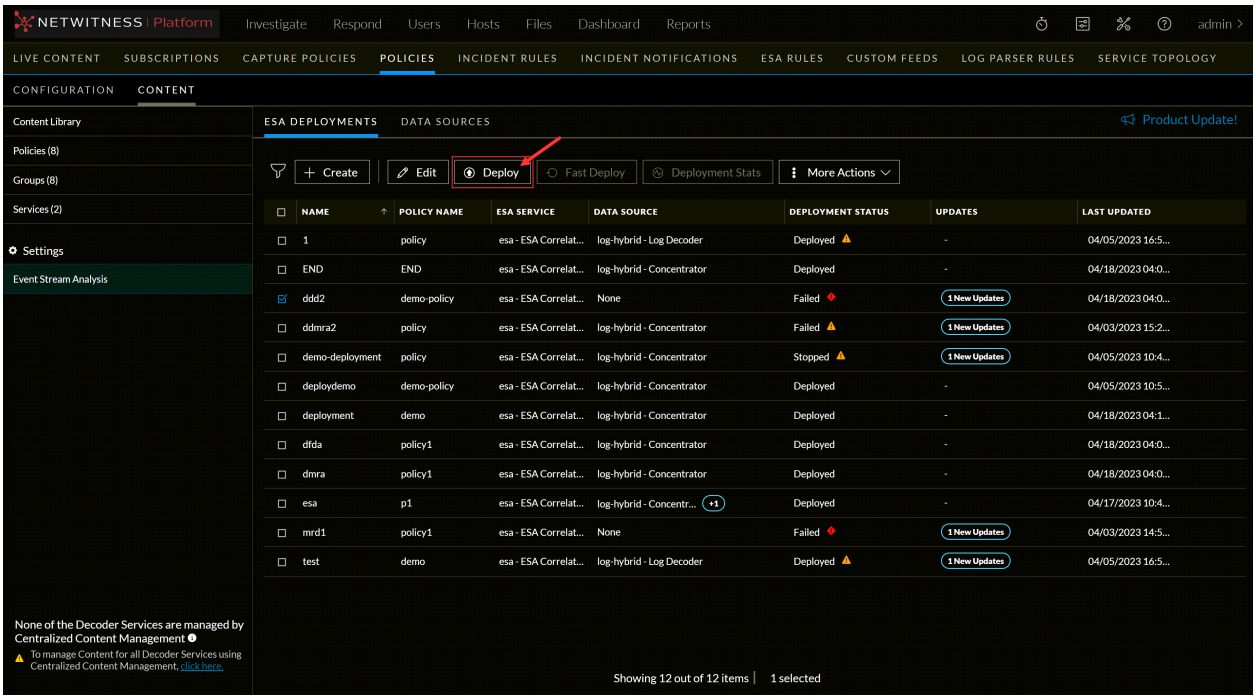
11. (Optional) To filter out specific session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data not to be forwarded to and analyzed by ESA.

The **Create Data Source Filter** dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443



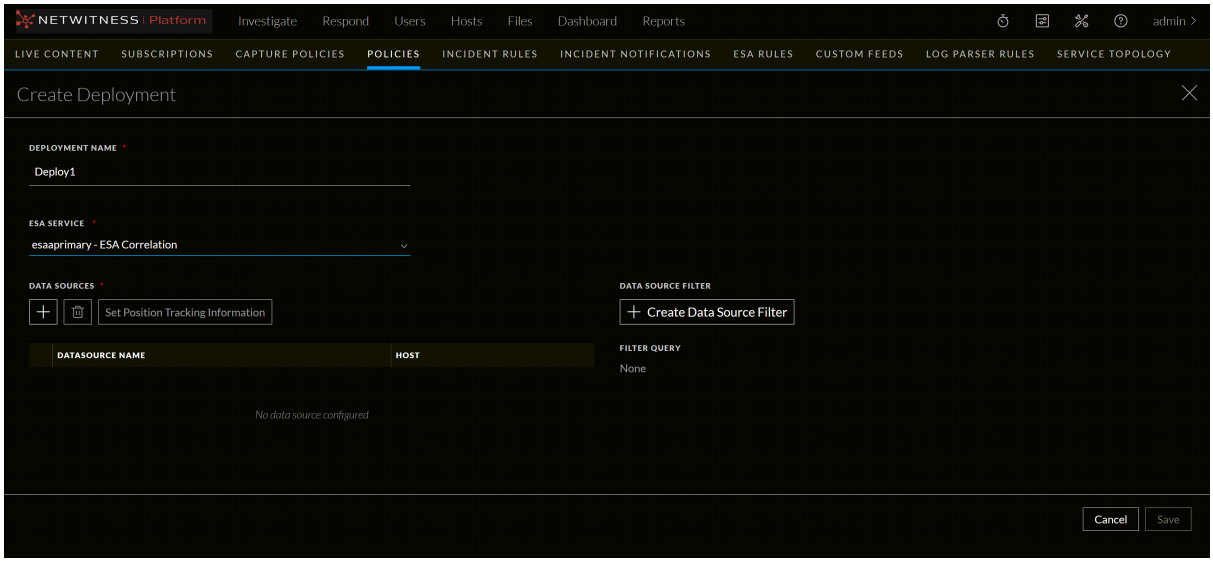
Based on the query processed, it will filter out only HTTPS logs-related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter**, and **Save** to remove it permanently.

12. To save the deployment, click **Save**.

13. Select the created deployment and click **Deploy**.



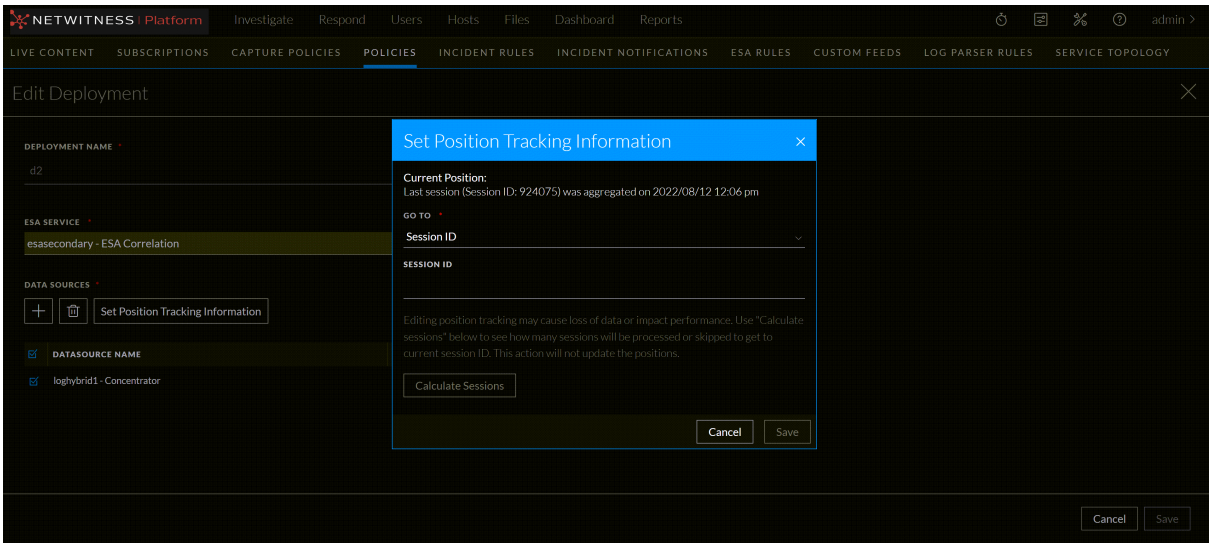
To create a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Click + **Create Deployment**.

   The Create Deployment dialog is displayed.



6. Enter a name for the deployment.

   Note: The policy is preselected as the user creates the deployment from the policy details view.
7. Select a service from the **ESA Service** drop-down list.
8. Under **Data Sources**, click + to add a data source.

   The Add Data Source dialog is displayed.
9. Select one or more data sources and click **Done**.

   IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.
10. To delete the data source, select the data source and click .
11. (Optional) the required data source and click **Set Position Tracking Information** to reprocess specific sessions or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

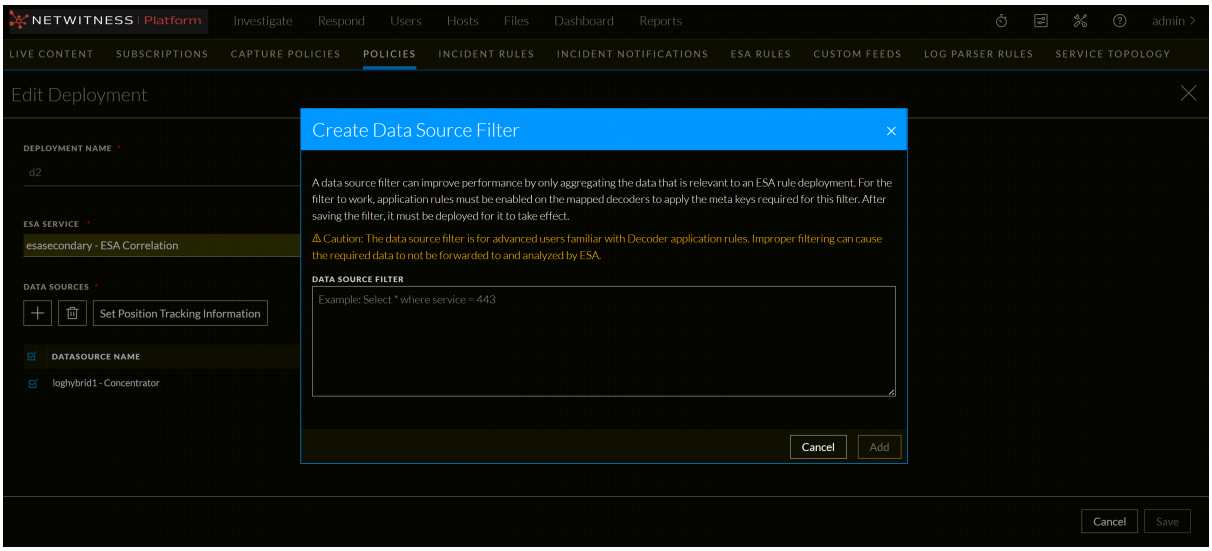
   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed with respect to the existing position of the data source, if any.

c. To save the edited position tracking data source, click **Save**.



d. The tracking position information will be deployed to the ESA Correlation service, only when the deployment is successfully completed.

   For more information on Position Tracking Information, see Position Tracking Information.

12. (Optional) To filter out certain session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

> **Caution:** The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

The Create Data Source Filter dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443

Based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter** and click **Save** to remove it permanently.

13. To save deployment, click **Save**.

14. Select the created deployment and click **Deploy**.

Edit a Deployment

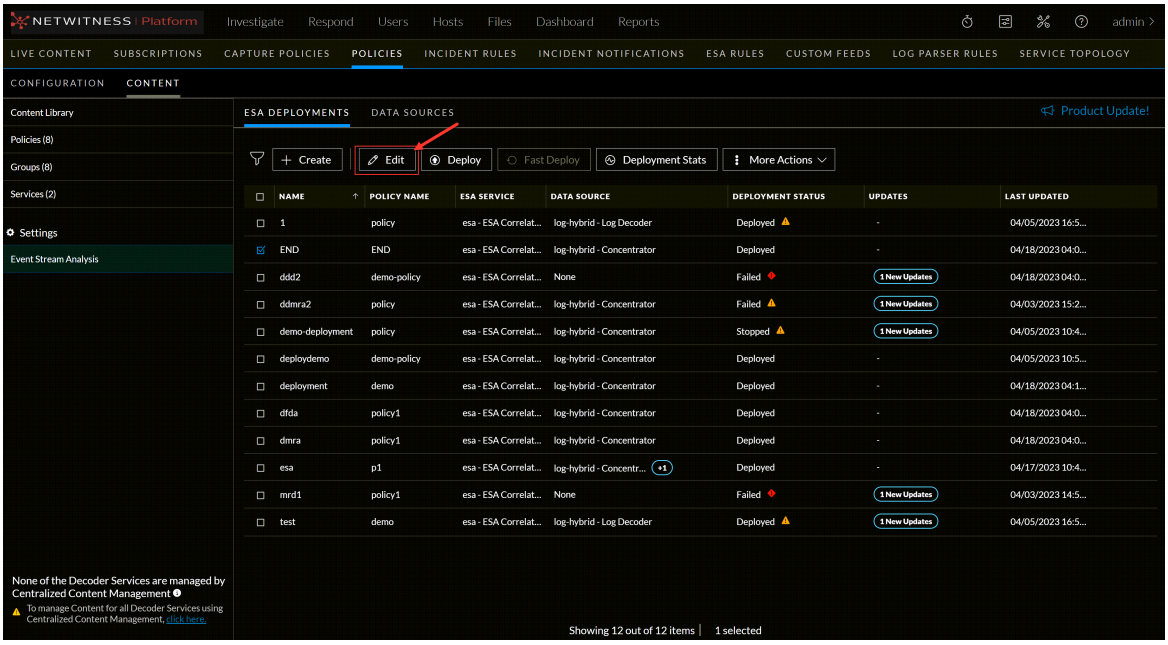
You can edit a deployment to change the data source, create a data source filter, and view ESA rules that are associated with this deployment. A data source filter can improve performance by only aggregating the data that is relevant to an ESA rule deployment. For the filter to work, application rules must be enabled on the mapped decoders to apply the meta keys required for this filter. After saving the filter, it must be deployed for it to take effect.

However, you cannot change the deployment name, or ESA service that are associated with the deployment.

You can edit deployments in the following ways:

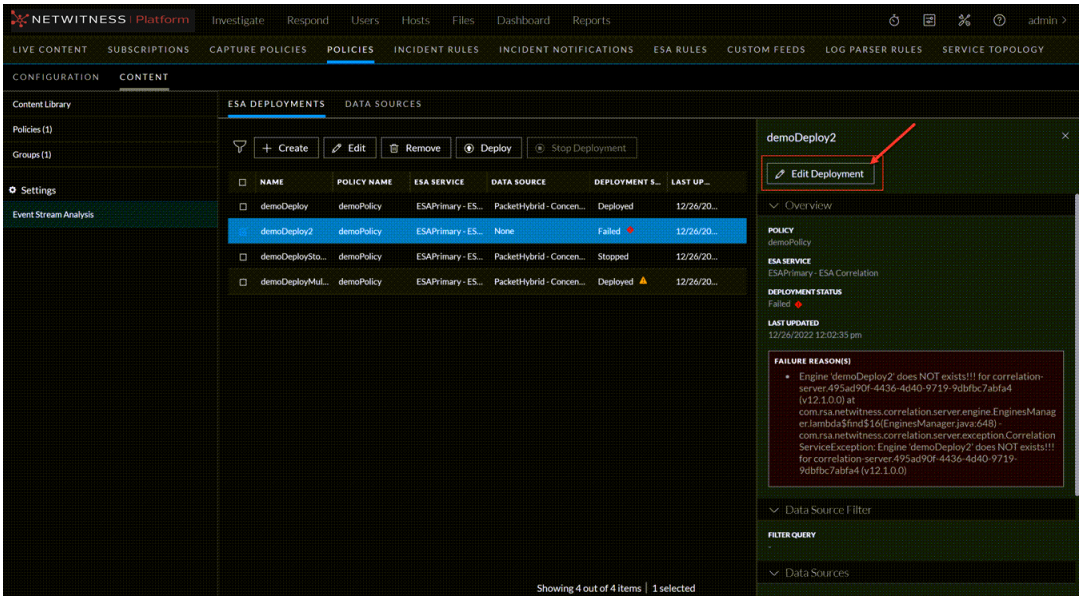
- Using the ESA Deployments tab. The **ESA Deployments** tab provides a consolidated view of all the available deployments within CCM. You can edit deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and edit a deployment.

To edit a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.

2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.



The available deployments are displayed.

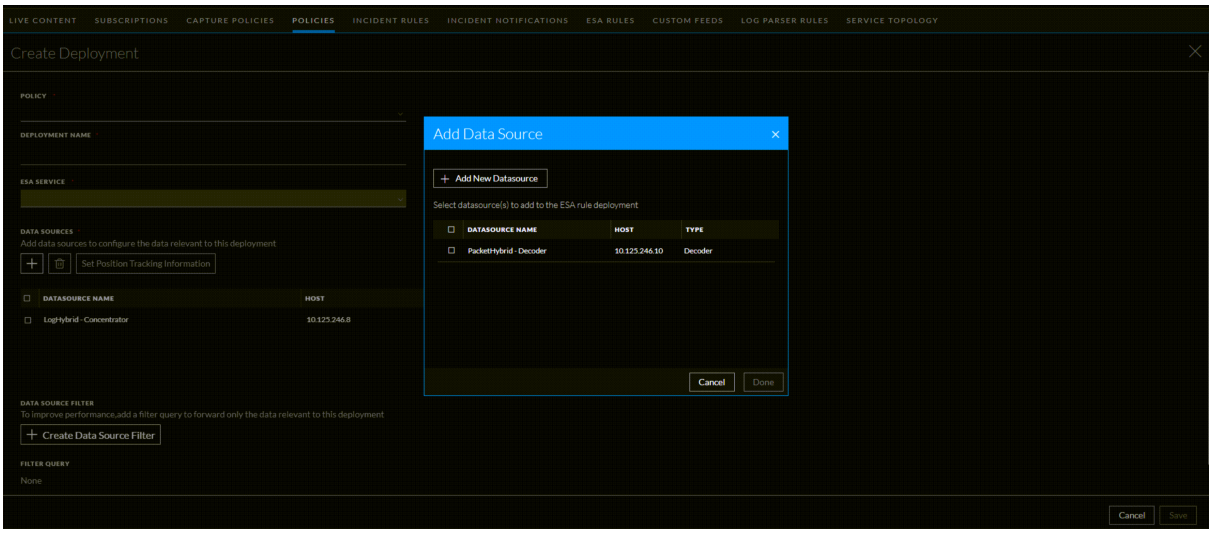
3. Select a deployment and click **Edit** or **Edit Deployment**.

   a. When you select the checkbox and click **Edit**.

   b. When you select or click a row of the deployment, a right panel is displayed to click **Edit Deployment**.

The **Edit Deployment** dialog is displayed.

4. (Optional) you can click on **View ESA Rules** to search for rules associated with selected policy. To save current changes to the deployment and modify the policy, select **click here** and navigate to the **Edit Content Policy** page.



5. Make the required changes in the deployment.

   Policy, deployment name, and ESA service are pre-populated and cannot be modified.

6. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.

7. If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Click **Save**.
9. Select the deployment and click **Deploy**.

To edit a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select a deployment to edit and click **Edit Deployment**.

   The **Edit Deployment** dialog is displayed.

6. Make the required changes in the deployment.
7. Click **Save**.
8. Select the deployment and click **Deploy**.

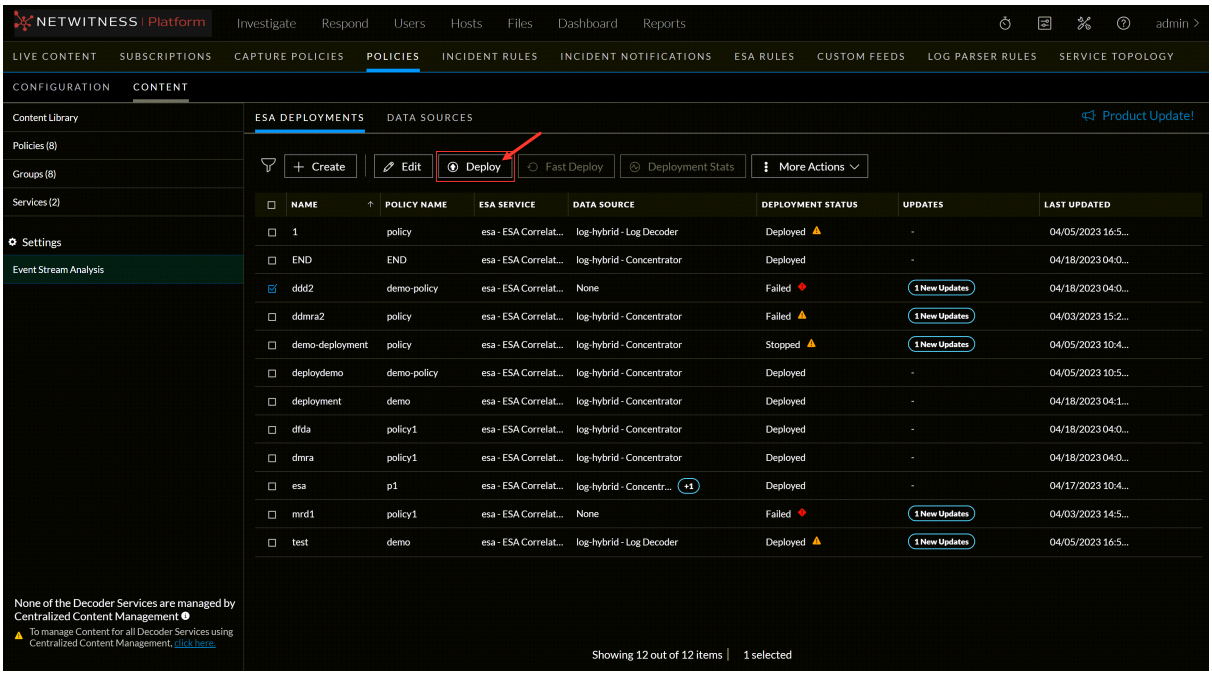
> **Note:** You can deploy the changes either by performing a **Deploy** action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Start a Deployment

The deployment includes ESA services with policy and associated ESA rules. When you initiate deployment, the correlation services start processing sessions from the configured data sources for matching events for the selected ESA rules in the policy.

For more information about ESA services and rules, see Alerting with ESA Correlation Rules

You can start deployments in the following ways:



- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can initiate deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and initiate a deployment.

To initiate a deployment, with the ESA Deployments tab

1. Go to (CONFIGURE) > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment and click **Deploy**.

To start a deployment with selected policy

1. Go to (CONFIGURE) > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

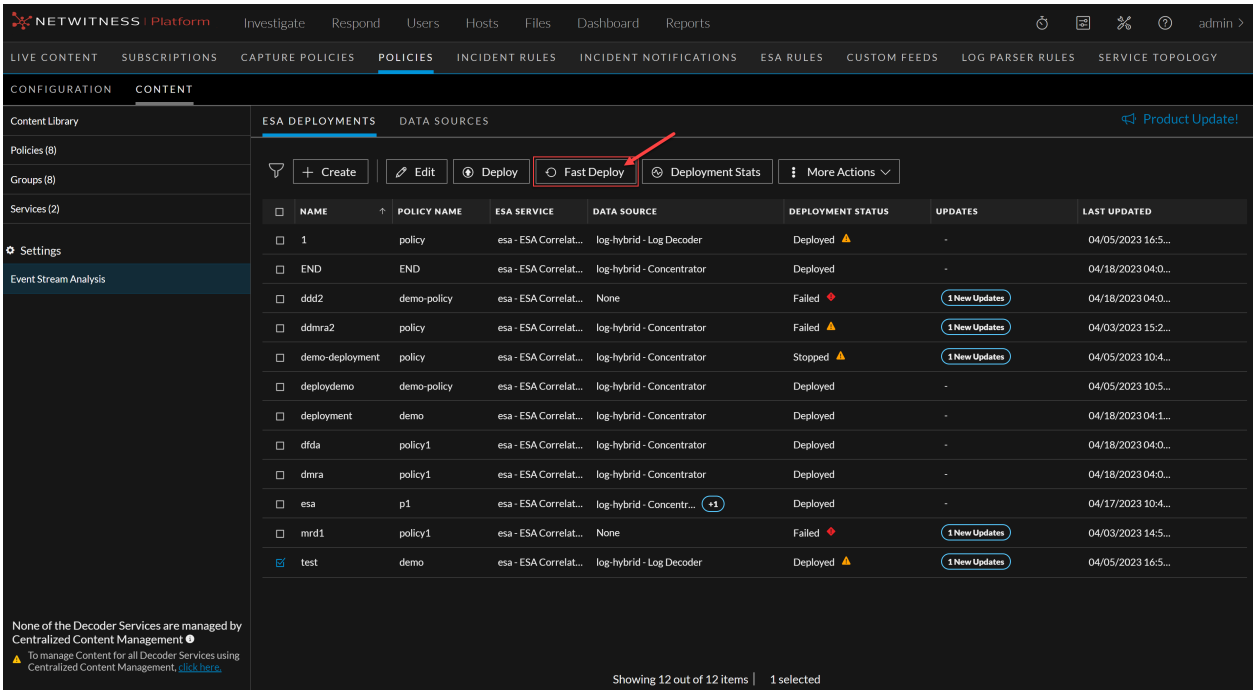
   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment to deploy and click **Deploy**.

> **Note:** You can deploy the changes either by performing a Deploy action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Fast Deployment

The **Fast Deploy** option is a feature that allows a user to quickly load the latest rule that runs entirely on the Esper Engine without redeploying the entire engine.



To do fast deployment

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

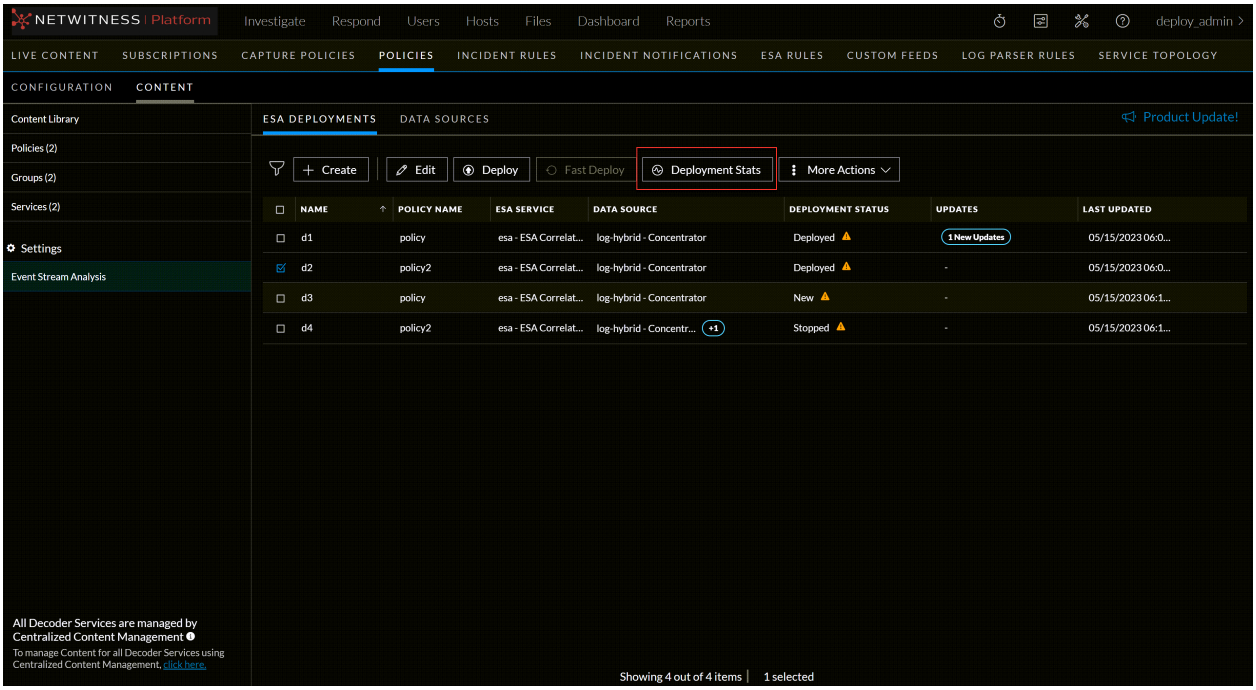
You can use the **Fast Deploy** option when there has been a change to an ESA rule, i.e., a rule has been added, modified, or deleted. If any other changes have been made, such as adding a data source, then the **Fast Deploy** option will not be available.

3. Select the deployments that are updated and need to be deployed.
4. Click **Fast Deploy**.

Deployment Stats

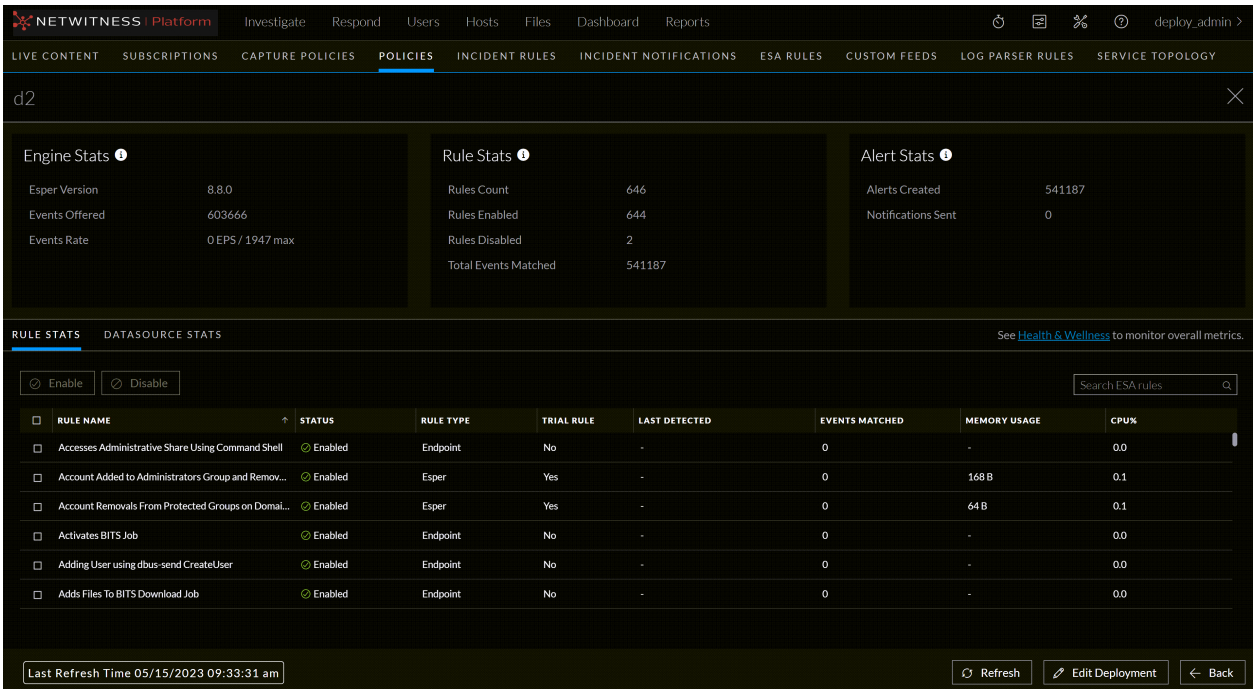
When an ESA deployment is deployed, you can view details about how the deployment is performing, such as statistics on the engine, rule, and alert. You can also view information on which rules are enabled or disabled and change their status.

This topic describes how to view an ESA Correlation service's deployment statistics (stats). This procedure is useful when determining a rule's effectiveness or troubleshooting an ESA rule deployment.



Caution: When you modify and re-deploy an ESA rule deployment, all the stats are removed from that deployment. The generated alerts are not removed from NetWitness.

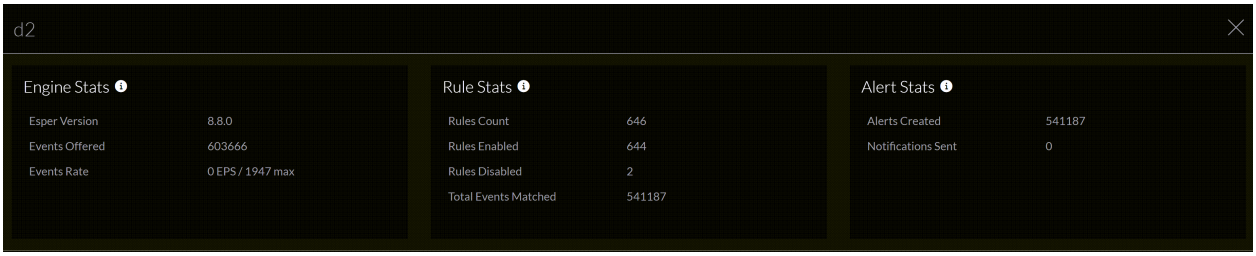
To view a Deployment Stats



1. Go to (CONFIGURE) > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment you want to see the stats.
4. Click on the **Deployment Stats** tab.



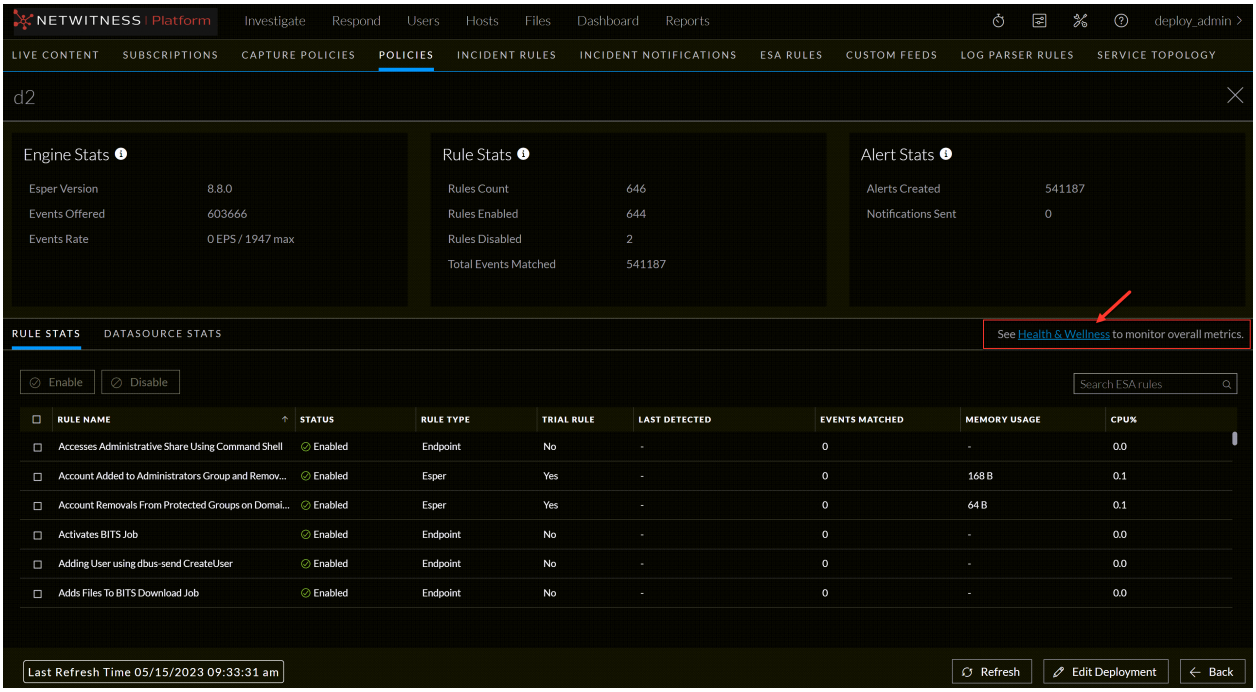
The deployment stats for the selected service are displayed.

Review the following sections of selected Deployment Stats. For a complete description of each statistic in each section, see the Deployment Stats Information.

- **Engine Stats**
- **Rule Stats**
- **Alert Stats**

The following figure shows the Deployment Stats panel.

5. Review the list of details about the rules deployed on the ESA.



- If the rule is enabled or disabled
- Rule name
- Rule type
- Rule trial mode
- Last detected
- Events matched
- Rule memory usage

- Deployment CPU percentage used by the rule.

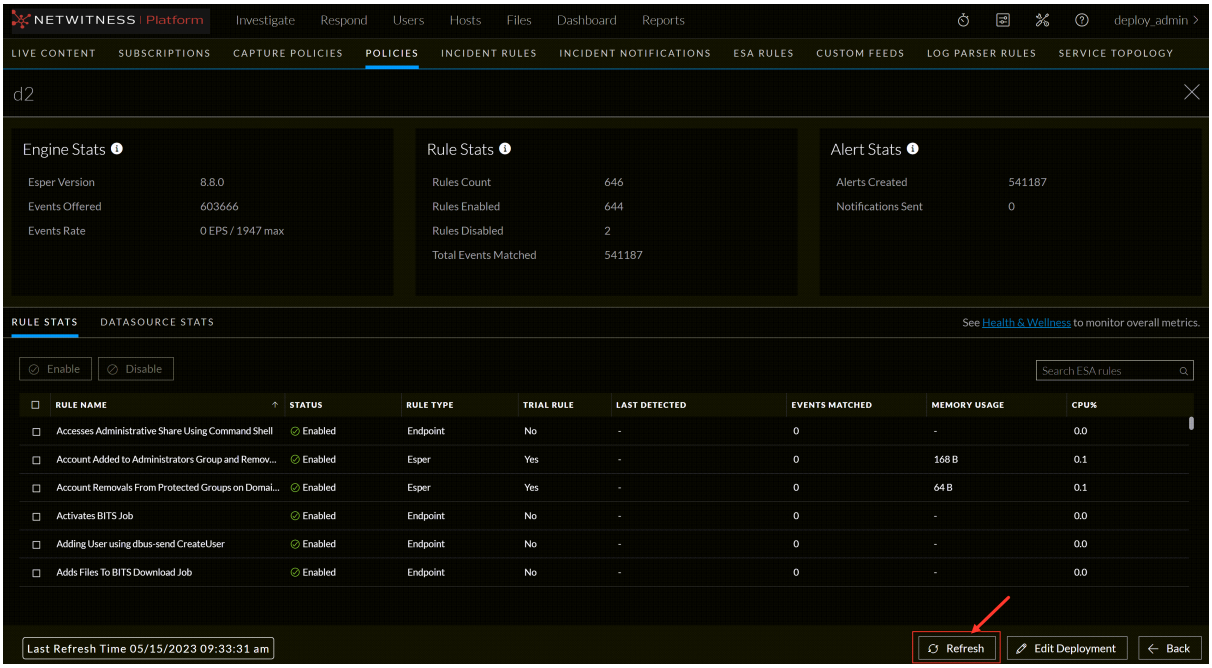
  For a complete description of each column in each section, see Deployment Stats Information.

Check Health and Wellness

To monitor your ESA Correlation service's overall memory usage and health, click **Health & Wellness**.

To Enable or Disable Rules

1. Select a rule from the **Rule Stats** panel grid.
2. Click **Enable** to enable the rule or click **Disable** to disable the rule.



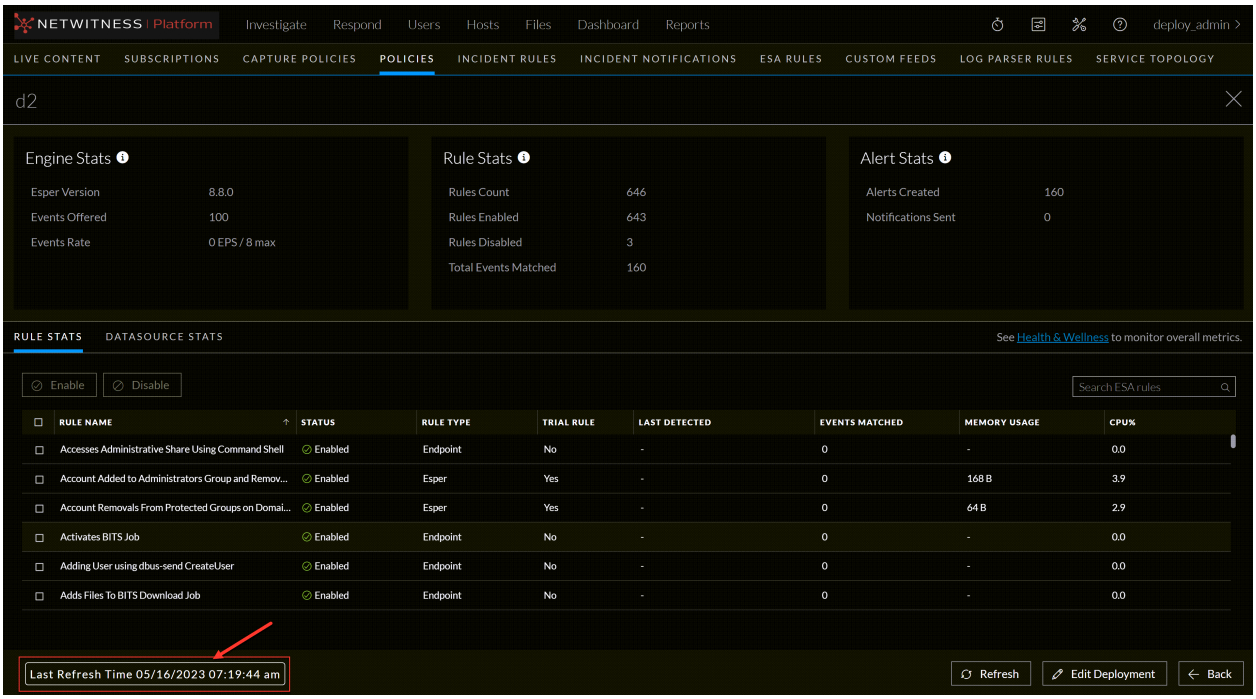
To Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule.

1. Click the **Refresh** tab in the bottom right corner to refresh the information.

   The Services tab is refreshed to show the changes which take effect immediately.

2. View the updated information.

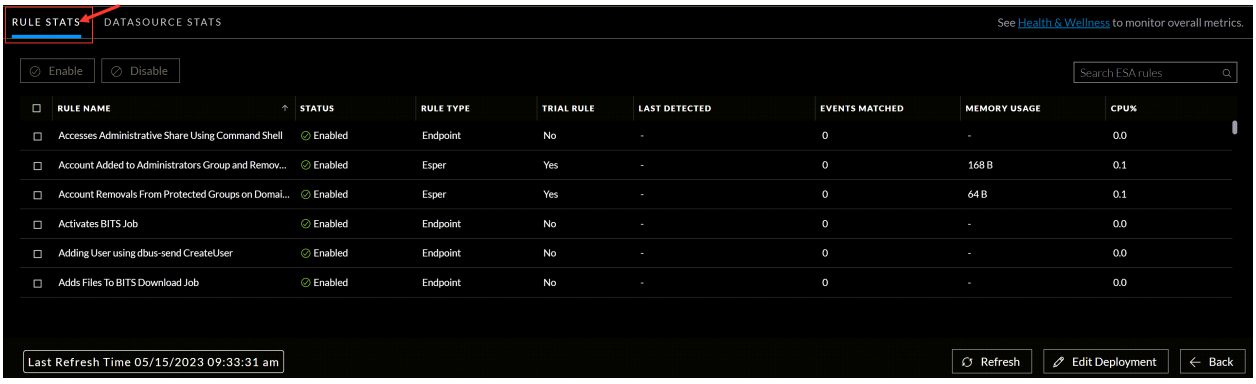


Edit the Deployment

To edit the deployment, Click the **Edit Deployment** tab in the bottom right corner of the page.

Last Refresh Time

This information indicates the last time when the deployment stats page was refreshed.

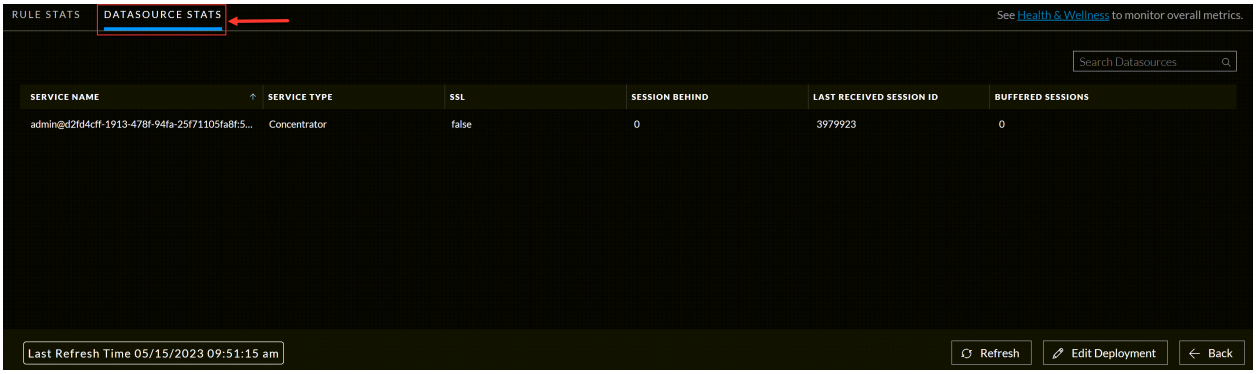


Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Events Offered	Number of events processed by the ESA service since the last service started.
	Events Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.

Sections	Parameter	Description
Rule Stats	Rules Enabled	The number of rules enabled.
	Rules Disabled	The number of rules disabled.
	Rules Count	The number of rules inside a deployment.
	Total Events Matched	Total number of events matched to all rules on the ESA service.
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Alerts Created	The total number of alerts sent to Respond for the deployment.

The Rule Stats panel details:

The Rules Stats provides details on the rules that are deployed on the ESA service. The following figure shows the **Rule Stats** panel.



The table below lists the various parameters in the Rules Stats view and their description.

Parameters	Description
	Enables a rule that was disabled.
	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Status	Indicates whether the rule is enabled or disabled. A green circle icon  indicates that the rule is enabled. A white circle icon  indicates that the rule is disabled. **Note:** If a rule has an error on deployment, it shows up as **'Failed'**. Hover over the Failed icon to view the error message in the tooltip.
Rule Name	Name of the ESA rule.

Parameters	Description
Rule Type	**Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.

Parameters	Description
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

The Data Source Stats panel details:

Parameters	Description
Service Name	Identity of the service.
Service Type	Type of the service.

Parameters	Description
SSL	Data Source connected to ESA deployment over an SSL connection using SSL port (For example, for the concentrator, it is 56005).
Session Behind	Difference between the last latest session id on the concentrator and the currently processed session id on ESA.
Last Received Session ID	The latest session id received by the deployment from the data source.
Buffered Sessions	Number of sessions in the ESA buffer to be consumed by the Esper engine.

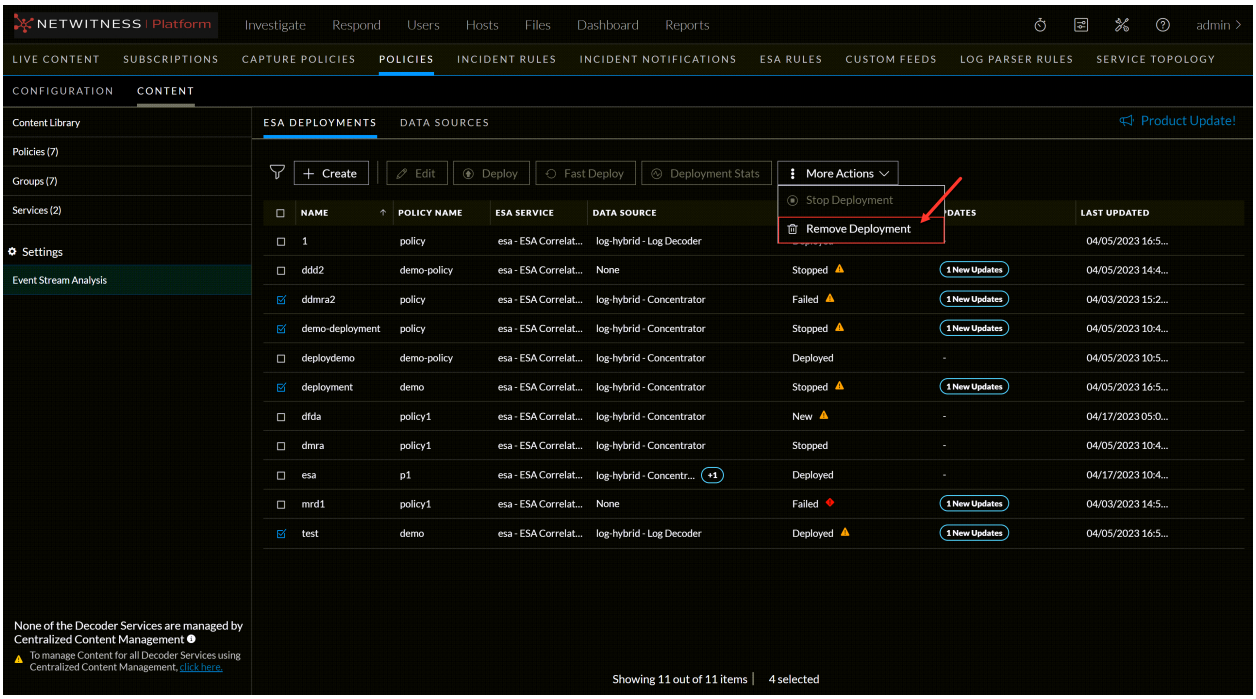
Remove a Deployment

You can delete one or more deployments when those deployments are not required. Once the deployment is deleted, all the configurations associated with the deployment will be permanently deleted from the correlation server. The alert process will be stopped for the deleted deployment.

You can remove deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can remove deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and remove a deployment.

To remove a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select the deployment that needs to be removed and click **Remove**.

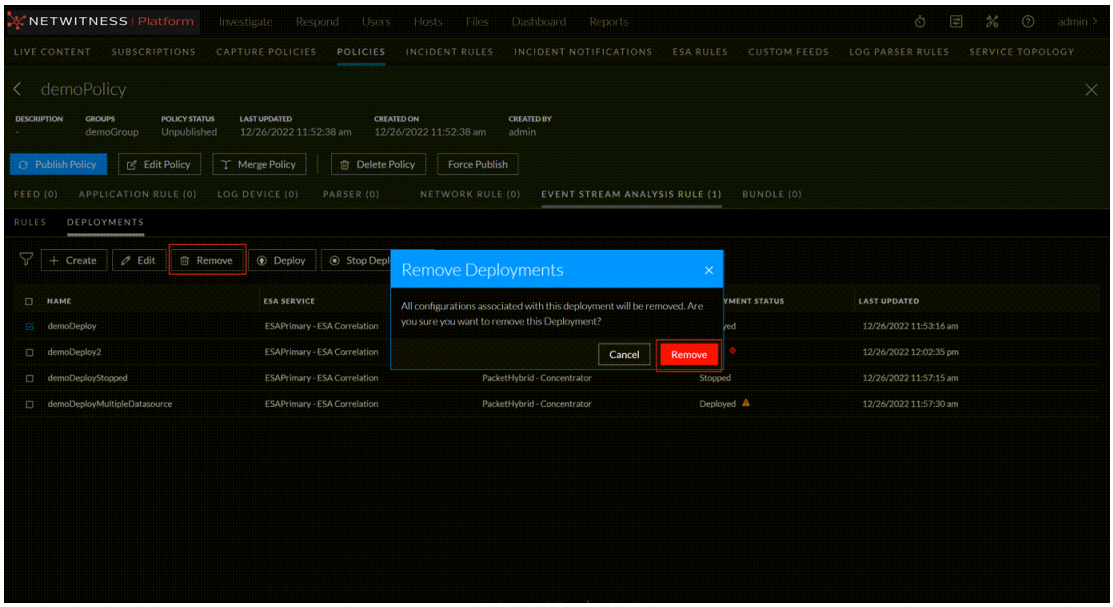
   A confirmation pop-up is displayed to confirm.

4. Click **Remove**.

To remove a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.



4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select the deployment that needs to be removed and click **Remove Deployment**.

   A confirmation pop-up is displayed to confirm if you want to remove it.

6. Click **Remove**.

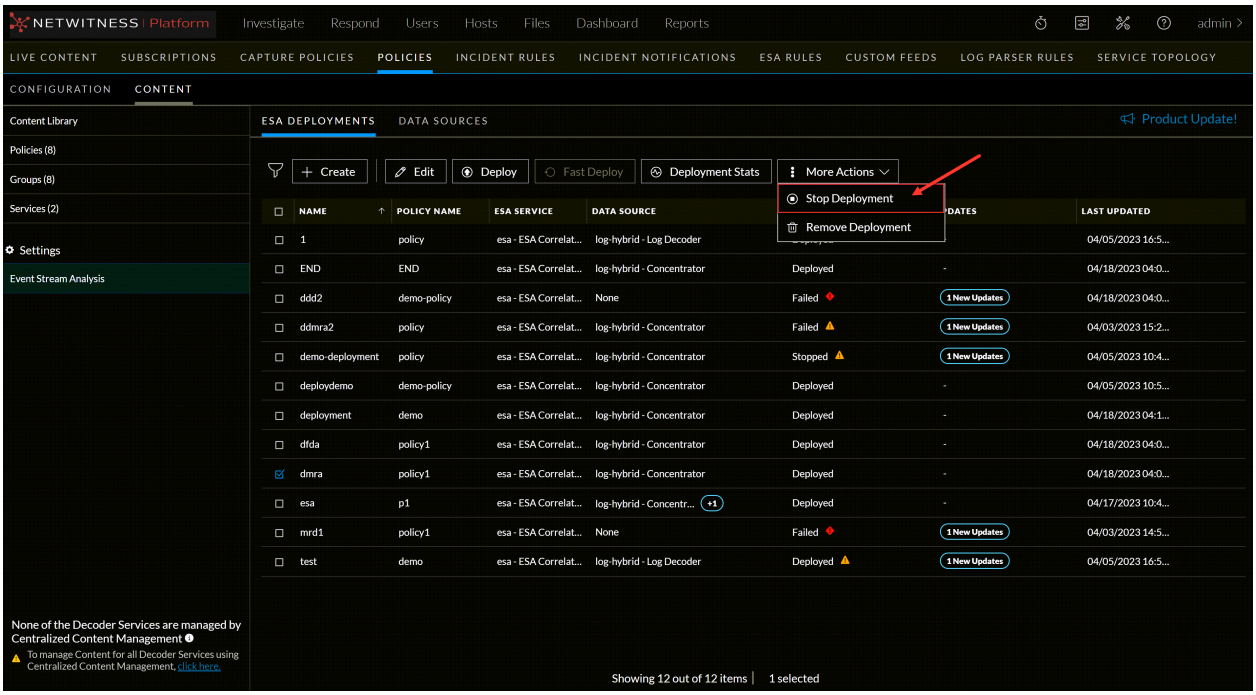
Note: It is required to have at least one deployment associated with the correlation service present in the group associated with the policy.

Stop a Deployment

You can stop a deployment to temporarily pause an ESA deployment. This will stop processing the event stream analysis alerts corresponding to the deployed policy.

To delete a deployment completely, see Remove a Deployment

To initiate a deployment again, see Start a Deployment



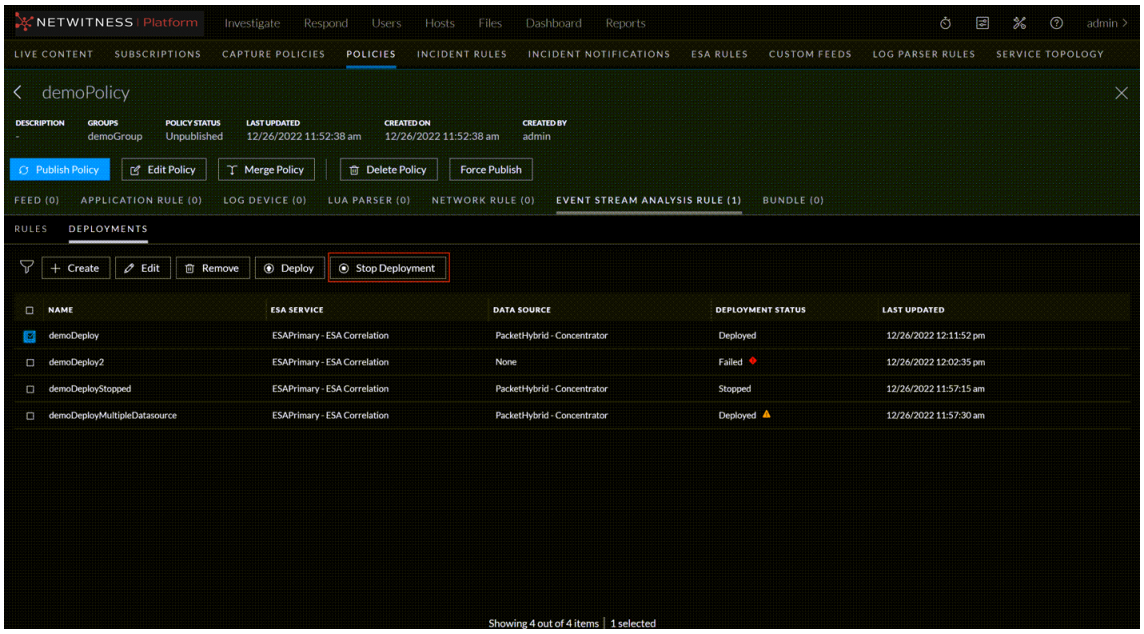
You can stop deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can stop deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and stop a deployment.

To stop a deployment from the ESA Deployments tab

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

   The available deployments are displayed.
3. Select the deployment that must be stopped temporarily and click **Stop Deployment**.



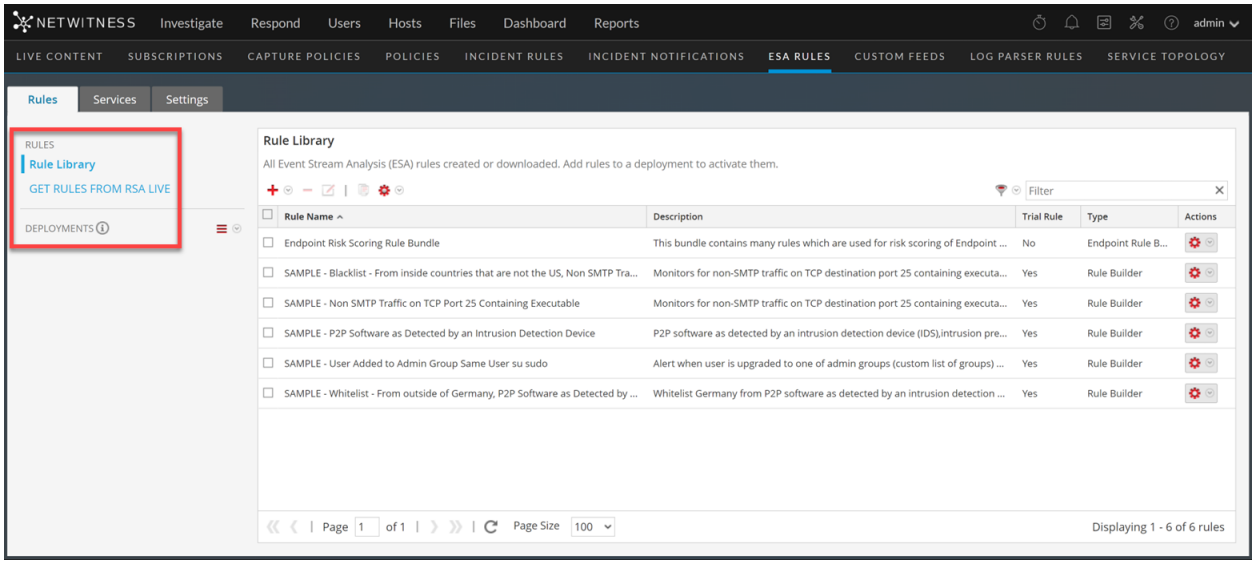
To stop a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment that needs to be stopped temporally and click **Stop Deployment**.

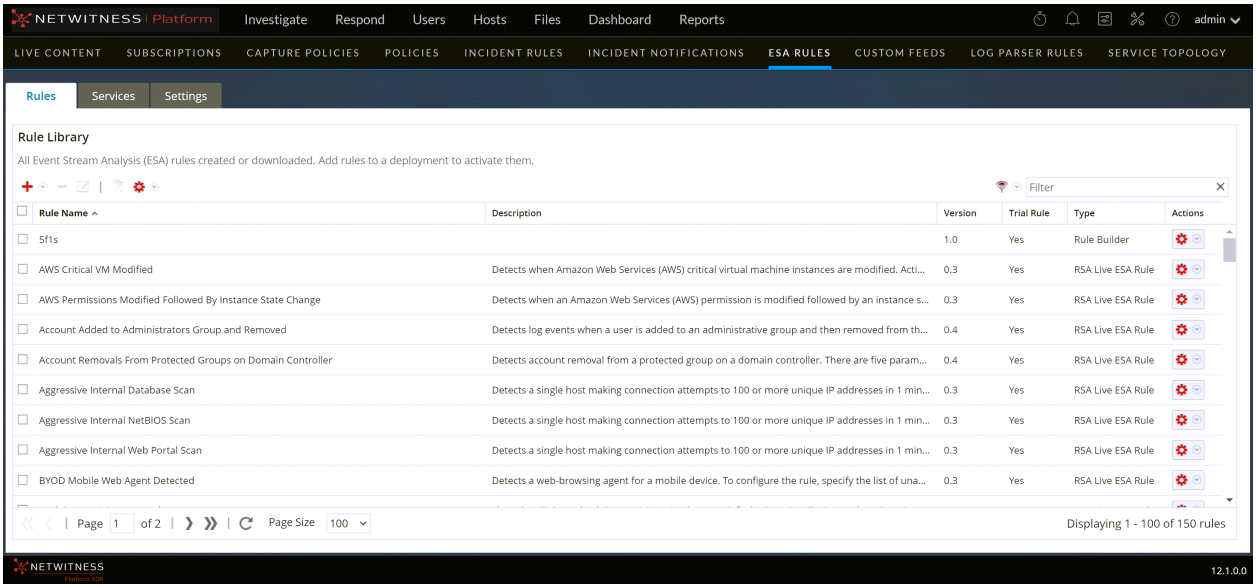
Note: Publishing the policy will not deploy the stopped deployments.



Migrate ESA Deployments to Policies and Groups

From version 12.1 and later, on successful upgrade of the Admin Server, the ESA deployments are managed by the policies and groups page. The deployments are not available on **(CONFIGURE)** > **ESA Rules** page.

12.0 and Earlier version



ESA Rules page in the 12.0 version.

12.1 version

Updated ESA Rules page in 12.1 version, where only rule libraries are available.

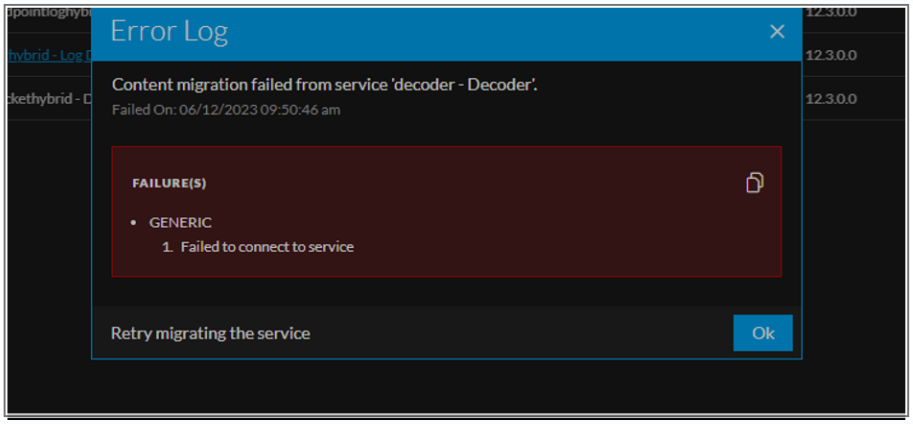
Note: The ESA deployments, after upgrading the Admin Server to 12.1 are not available to view or modify until the Correlation servers are also upgraded to the 12.1 version. However, the events are consumed, and ESA alerts are processed by the Correlation server.

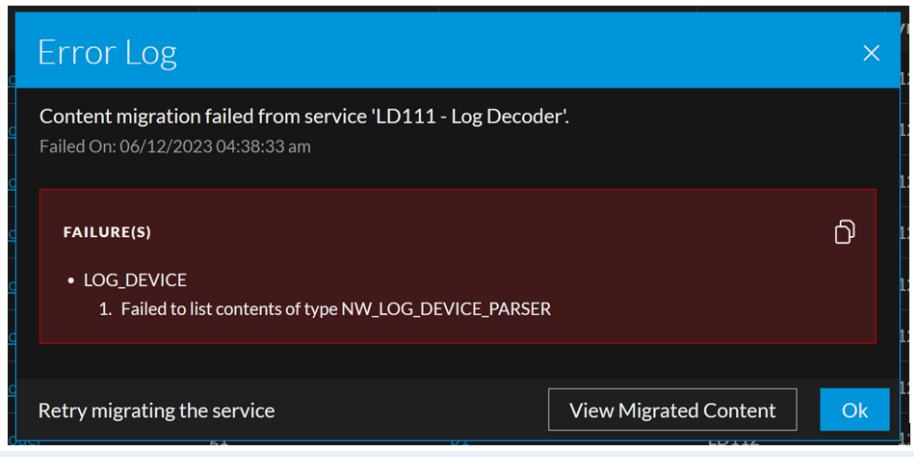
All the deployments are automatically migrated to policies and groups:

- Each deployment is converted into a policy and a group.
- Once the ESA Correlation server is upgraded to the 12.1 version, you can access these deployments as groups and policies.

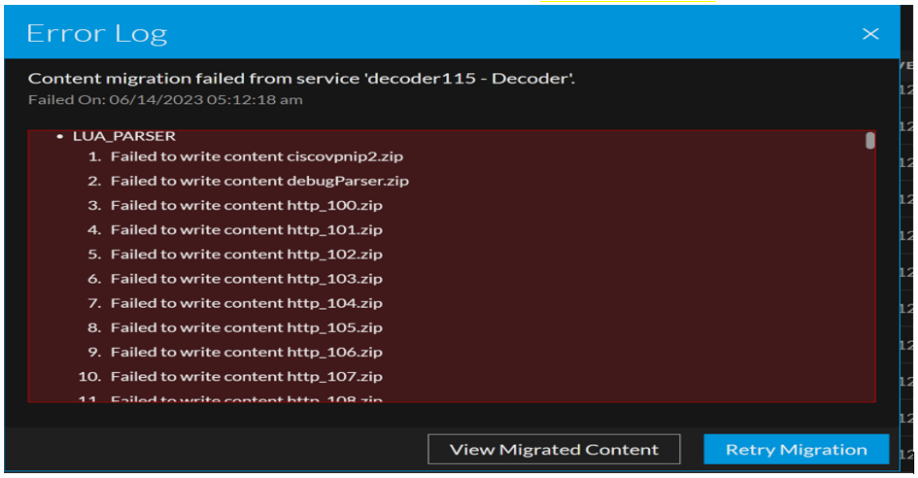
IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

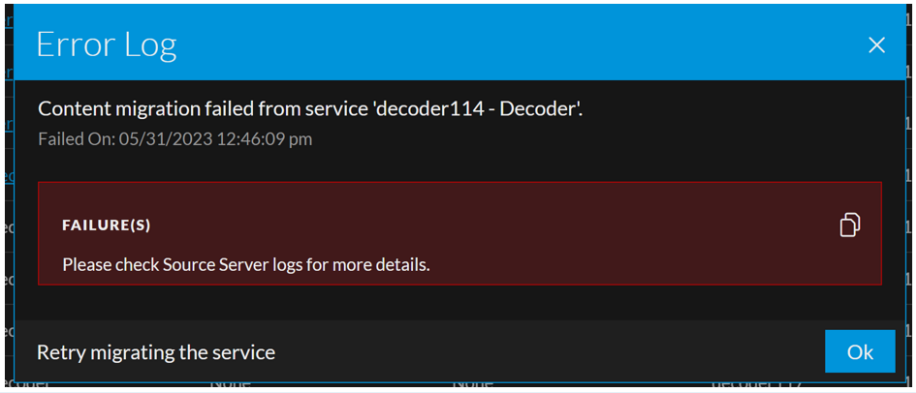
The following table provides the information on different deployment states for Policy and Groups:



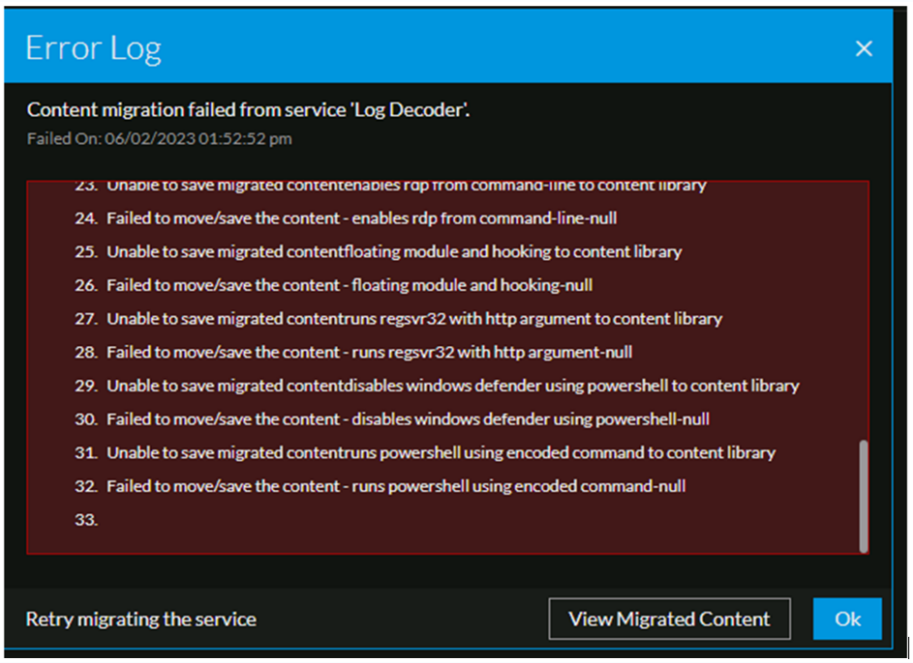


SlNo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No





Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rule are added.



Note: NetWitness recommends that all the deployments maintain an error-free state and also remove any unnecessary or unused ESA deployments.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when using Centralized Content Management (CCM) in NetWitness. You can look up explanations of issues and their solutions.

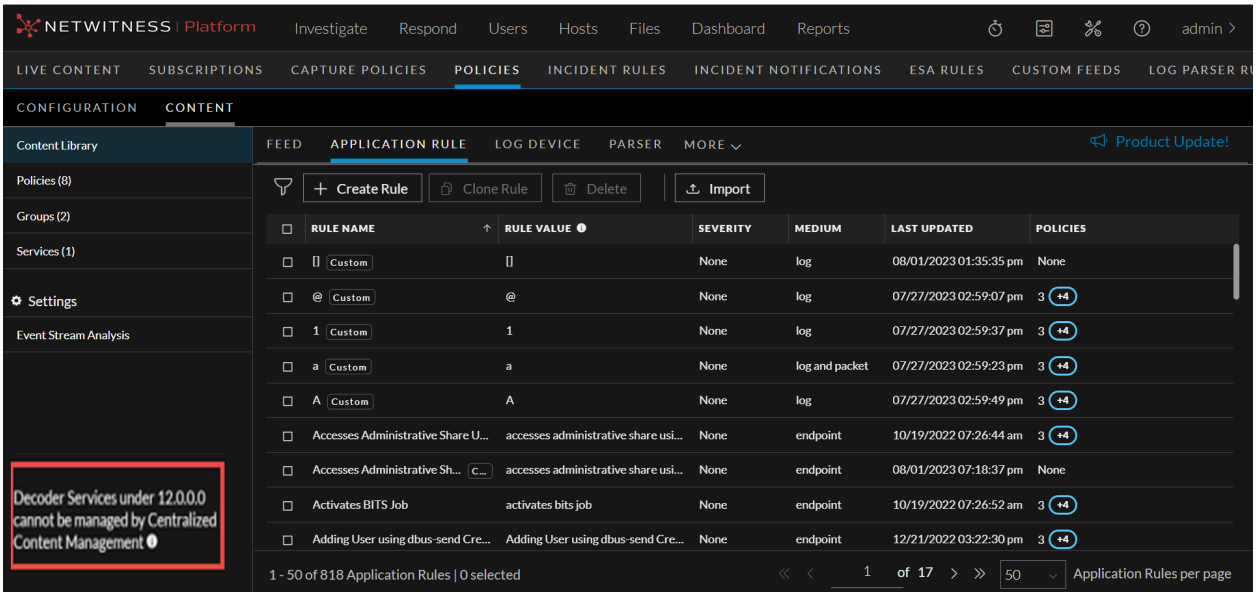
Problem	Solution
Failed to connect to service	Generally this error occurs when service is offline. If the service status is offline, then restart service and retry migration. If the service status is online, then retry migration. 
Failed to list content of type LOG_DEVICE_ PARSER	This is a temporary failure. Retrying migration resolves this issue. 

Problem	Solution
Failed to write content	This is a temporary failure. Retrying migration resolves this issue. 
Please check source server logs for more details.	This error occurs when source server goes offline during migration. Hence, restart source server and retry migration. 

Problem	Solution
Failed to move/save the content	This error may occur for various reasons and needs more investigation. Hence, please raise a CE ticket and share mongo dump and source server log with ticket. 

References

This section is a collection of references, which describe the user interface and more detailed information about how Policy-based Centralized Content Management works in NetWitness. The topics are presented in alphabetical order.



- Content Library Tab
- Data Sources Tab

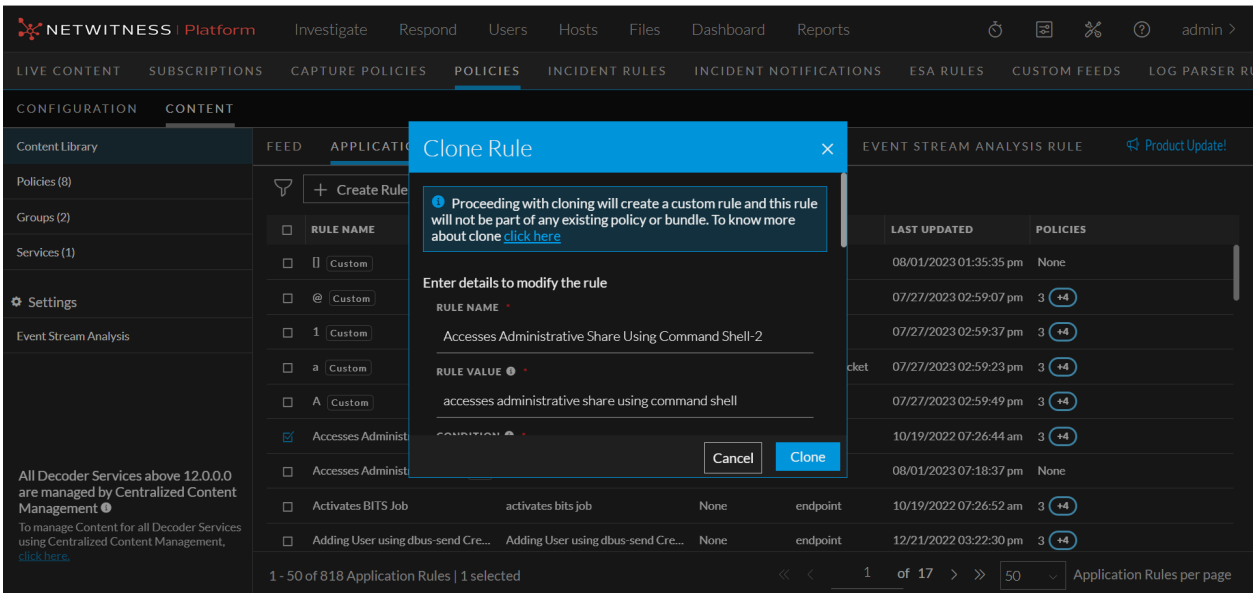
The following table describes the Content Library tab.

1	By default, 50 contents are displayed per page. To go to the next page, click ›. To go to the last page, click ».
2	Toolbar • Create Rule - Lets you create a rule. • Clone Rule - Lets you clone an application rule or network rule. For more information, see Clone Application Rule or Clone Network Rule. • Delete - Lets you delete an application rule or network rule. For more information, see Delete Application Rule or Delete Network Rule. • Import - Lets you import an application rule or network rule. For more information, see Import Content to Content Library.
3	Rule List Pane • Rule Name - Name of the rule. • Rule Value - The rule value. • Medium - Medium through which the rule is created. • Last Updated - Displays the time when the rule is updated. • Policies - Policies to which the rule is applied. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the ↑ icon to sort by the selected column.

Create New Rule dialog:

Below is an example of the Create New Rule dialog:



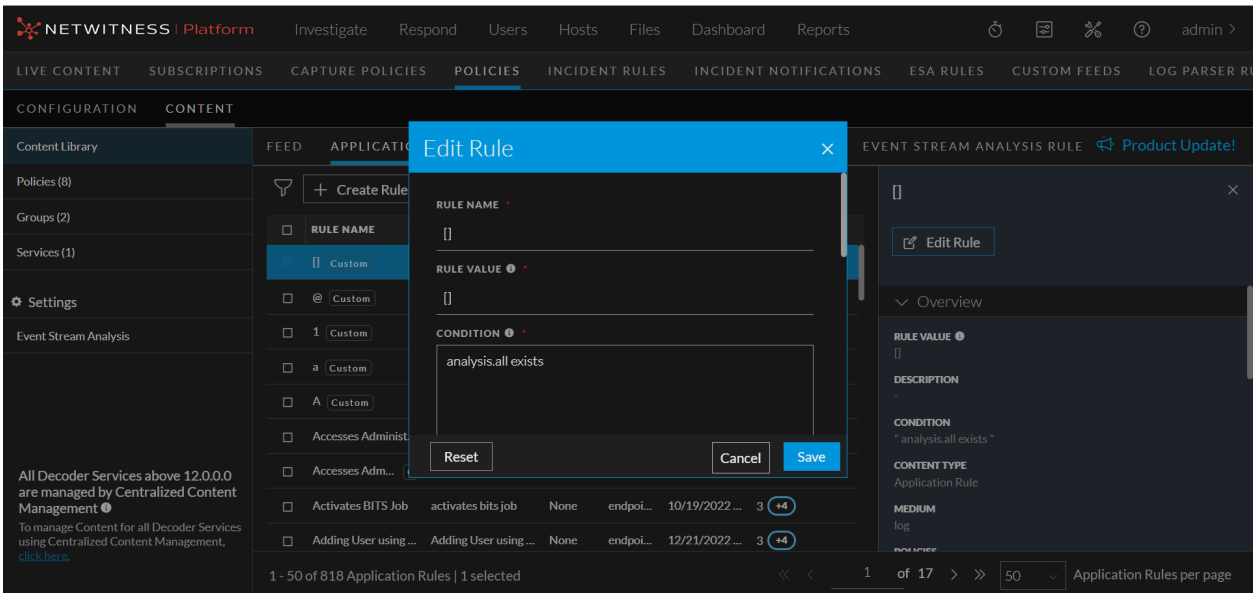
The table describes the information and options in the Create New Rule dialog:

Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4

Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Create New Rule dialog.
Cancel	Cancels the operations.

Clone Rule dialog:

Below is an example of the Clone Rule dialog.



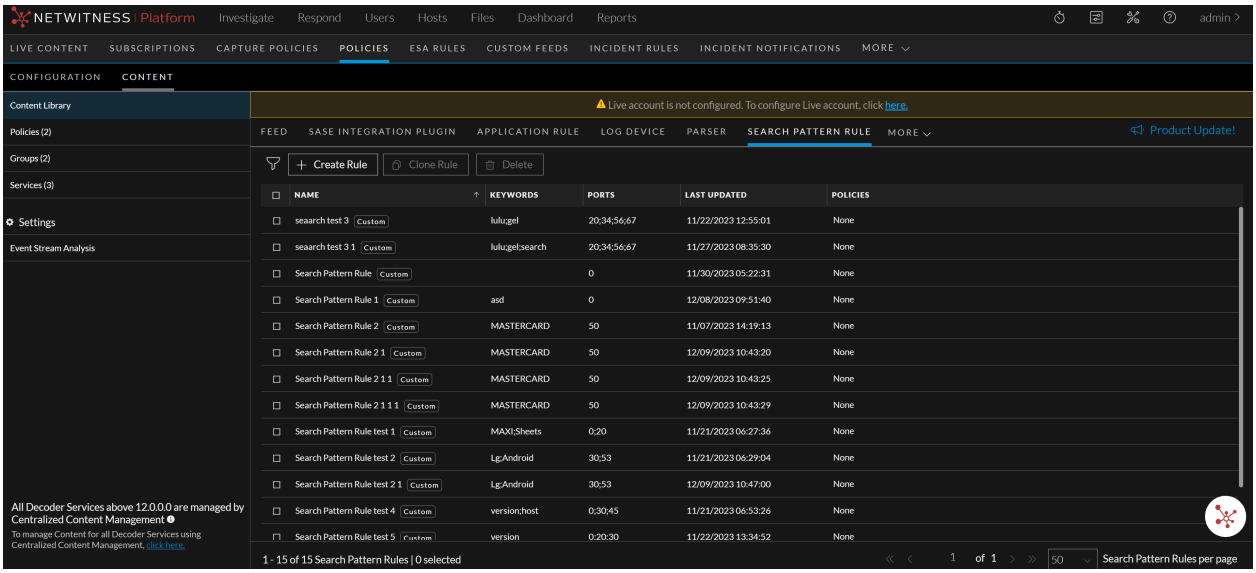
The table describes the information and options in the Clone Rule dialog:

Field	Description
Rule Name	Name of the cloned rule. The name should be unique.
Rule Value	The rule value written to the alert meta.

Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Clone	Clones the rule and closes the Cone Rule dialog.
Cancel	Cancels the operation.

Edit Rule dialog:

Below is an example of the Edit Rule dialog:



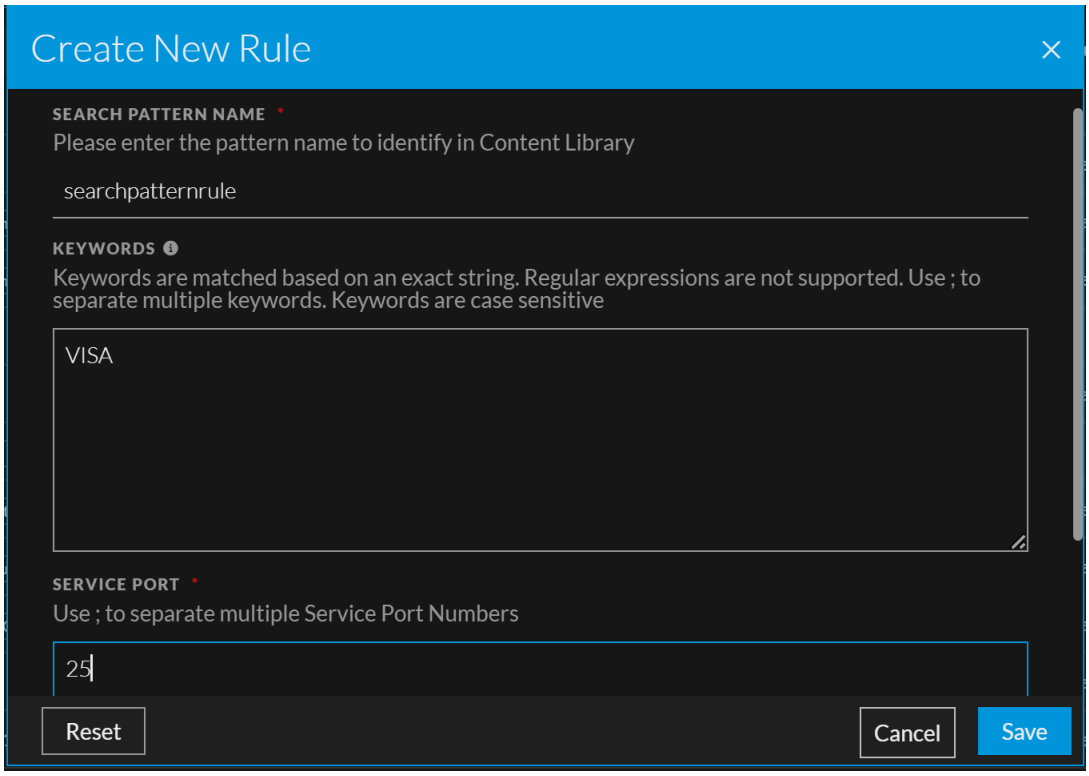
The table describes the information and options in the Edit Rule dialog:

Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4

Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Edit Rule dialog.
Reset	Reset the fields.
Cancel	Cancels the operation.

Search Pattern Rule tab

Following is an example of the **Content** > **Content Library** > **More** > **Search Pattern Rule** tab:



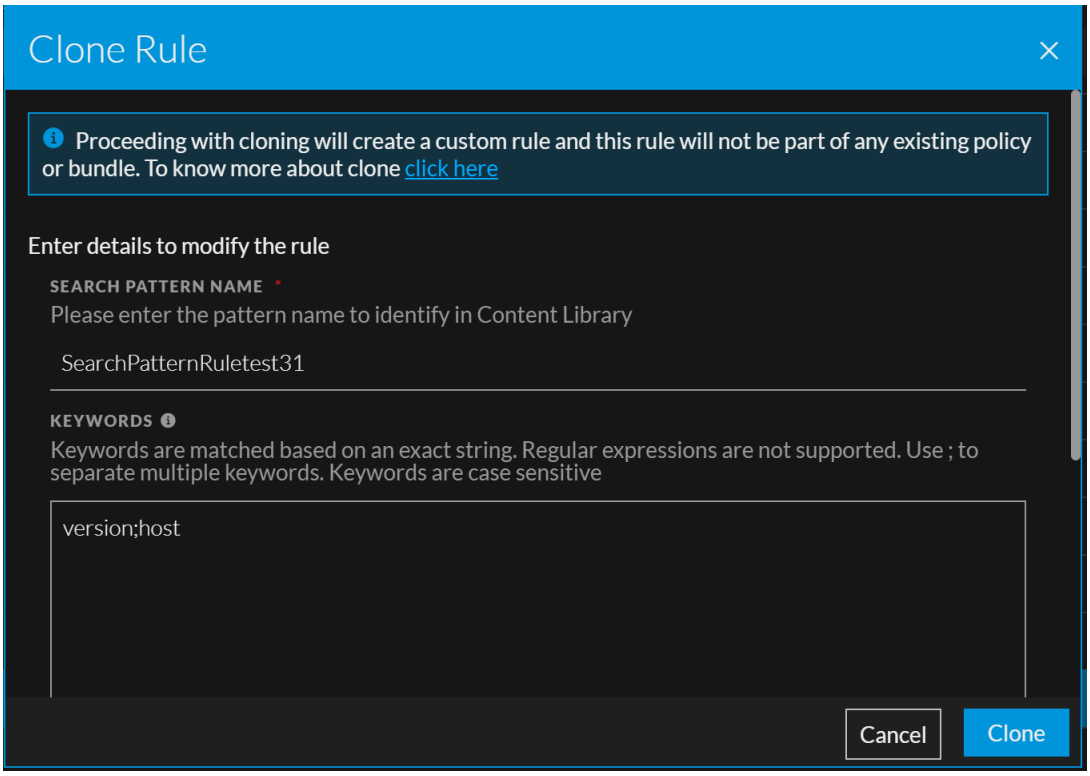
1 Toolbar

- **Create Rule** - Allows you to create a search pattern rule.
- **Clone Rule** - Allows you to clone a search pattern rule. For more information, see Manage Search Pattern Rule
- **Delete** - Allows you to delete a search pattern rule. For more information, see Manage Search Pattern Rule

2	Rule List Pane • **Name** - Name of the search pattern rule. • **Keywords** - Displays the keywords associated for each search pattern rule. • **Ports** - Displays the ports associated for each search pattern rule. • **Last Updated** - Displays the time when the rule is updated. • **Policies** - Policies to which the rule is applied. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the  icon to sort by the selected column.

Create New Rule dialog for Search Pattern Rule:

Below is an example of the Create New Rule dialog for Search Pattern Rule:

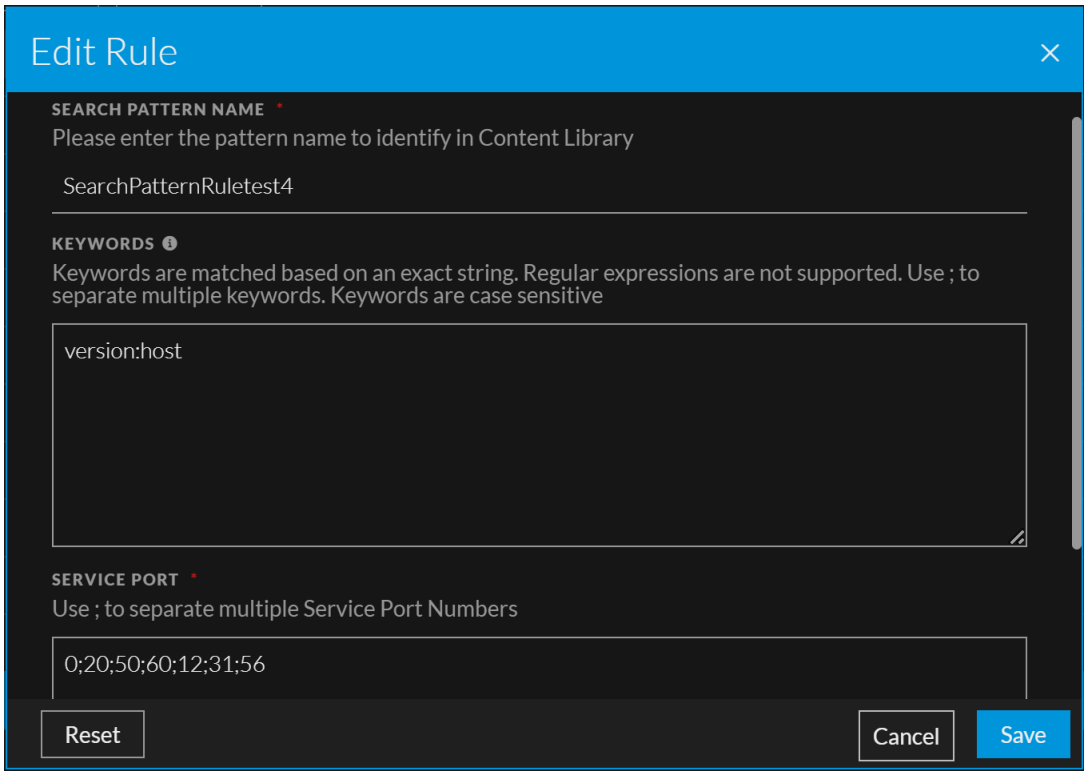


Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.

Field	Description
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and 65535.
Save	Saves the settings and closes the Create New Rule dialog.
Cancel	Cancels the operations.
Reset	Reset the fields.

Clone Rule dialog for Search Pattern Rule:

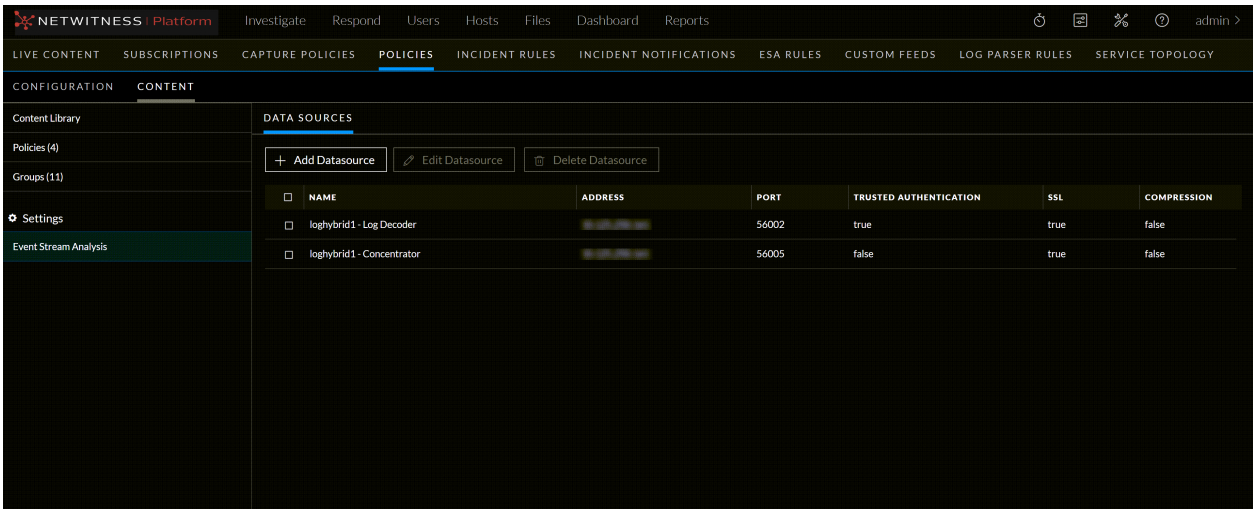
Below is an example of the Clone Rule dialog.



Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and **65535**.

Field	Description
Clone	Clones the rule and closes the Cone Rule dialog.
Cancel	Cancels the operations.

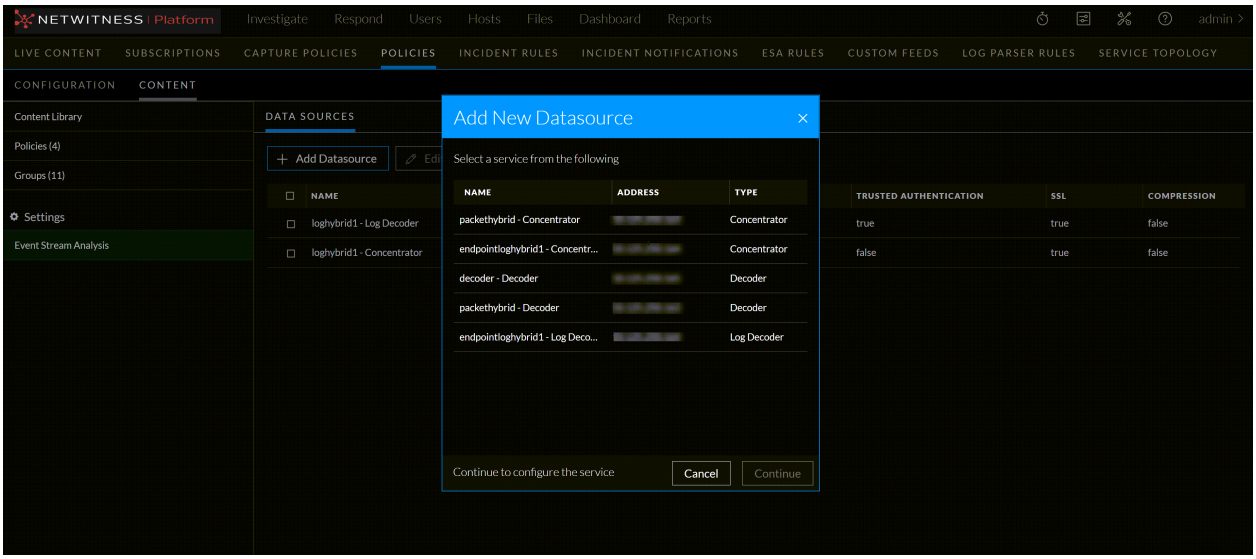
Edit Rule dialog for Search Pattern Rule:



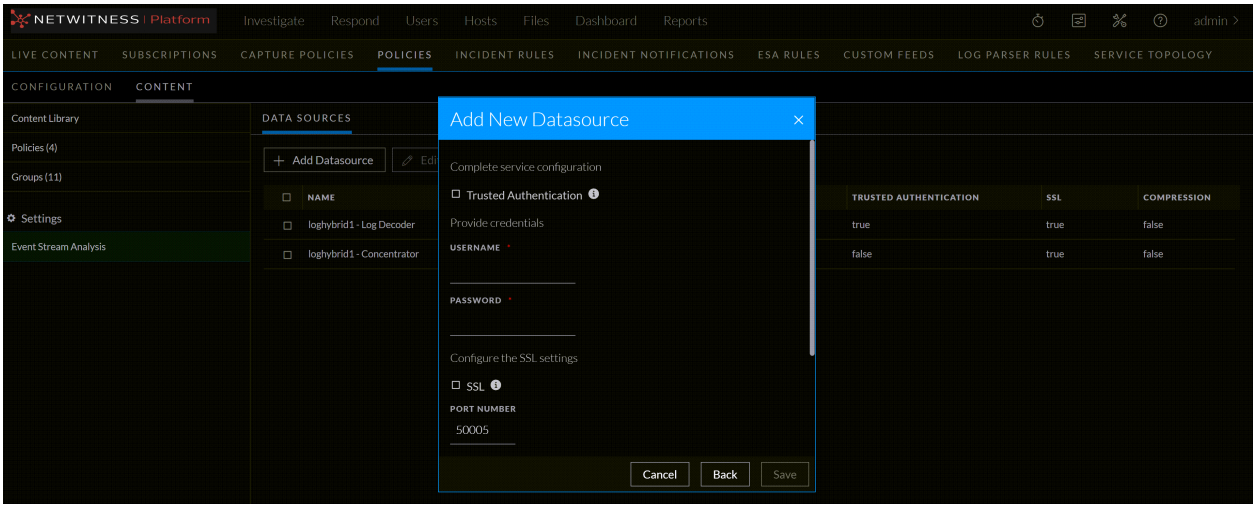
Below is an example of the Edit Rule dialog.

Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and **65535**.
Save	Saves the settings and closes the Edit Rule dialog.
Cancel	Cancels the operations.
Reset	Reset the fields.

Data Sources Tab



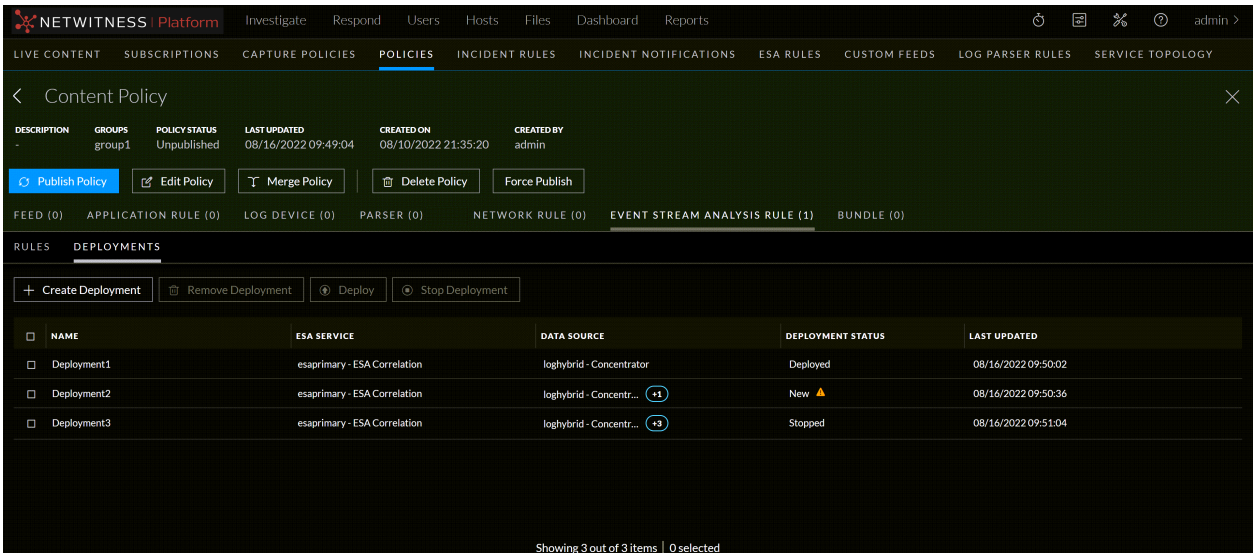
Below is an example of the **Content** > **Settings** > **Event Stream Analysis** > **Data Sources** tab:



The following table describes the Data Sources tab.

1	Toolbar • Add Datasource- Lets you to add a new Datasource. For more information, see Add an ESA Datasource. • Edit - Datasource - Lets you edit the Datasource. For more information, see Edit an ESA Datasource. • Delete Datasource - Deletes the selected Datasource.
2	Data Sources List Pane • Name - Shows the name of the data sources used by the selected ESA service. Data sources can be Concentrators or Decoders. • Address - IP address of the datasource where the ESA service is installed. • Port - Shows the port number used for authentication. • Trusted Authentication - Indicates that it uses Trusted Authentication for communication with ESA Service. • SSL - Indicates that it uses SSL for Authentication. • Compression - Enables you to adjust the Compression Level on different datasources for ESA.

Below is an example of the **Add New Datasource** dialog:



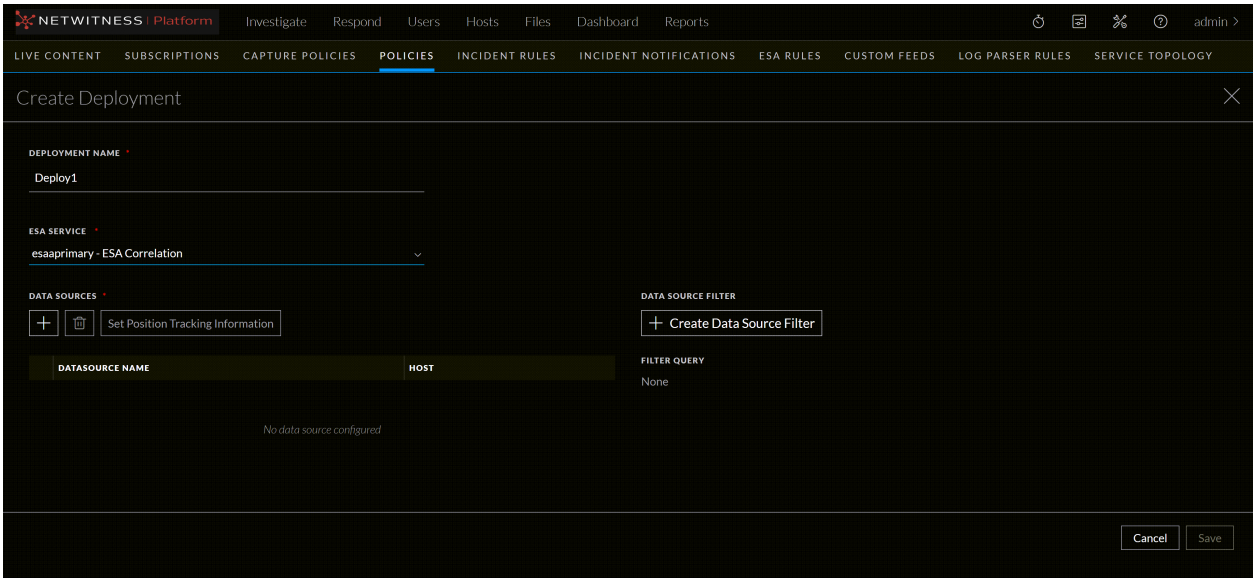
The table describes the information and options in the **Add New Datasource** dialog.

Field	Description
Trusted Authentication	This option will enable the use of SSL by default for authentication.
Username	The username used to sign in to your account for authenticating the datasource.
Password	The password for authenticating the datasource.
SSL	This will enable the use of SSL for authentication.
Port Number	This will enable the use of the port number for authentication.
Compression	This option enables you to adjust the Compression Level on different datasources for ESA.
Compression Level	Enables you to set different compression level. Compression Level: **0**, **1**, and **9**. For more information, see Add an ESA Datasource.

Field	Description
Test Configuration	Validates the provided configuration.
Save	Saves the settings and closes the Add New Datasource dialog.
Cancel	Cancels the operations.

Deployments Tab

Below is an example of the **Content** > **Policies** > select a policy > **Event Stream Analysis Rule** > **Deployments** tab:



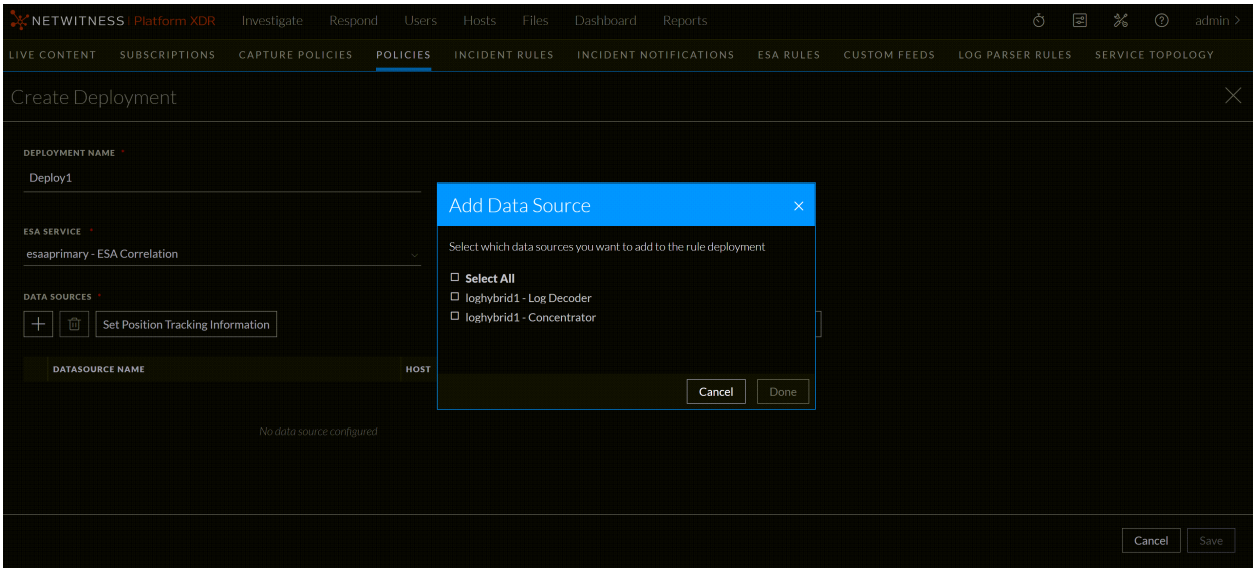
The following table describes the Deployments tab.

1	Toolbar • Create Deployment - Lets you to Add a new Deployment. For more information, see Create a Deployment. • Remove Deployment - Lets you to remove the Deployment.For more information, see Remove a Deployment. • Deploy - Lets you to deploy the Deployment. • Stop Deployment - Lets you to stop the selected Deployment.

2	Deployment List Pane • Name - Name of the content. • ESA Service - Displays the ESA service selected. • Data Source - Displays the Datasource added for ESA deployment. • Deployment Status - Status of the deployment. The values are: Deploying, Deployed, New, Stopping, Stopped, and Failed. • Last Updated - Displays the time when the deployment is updated.

Create Deployment dialog:

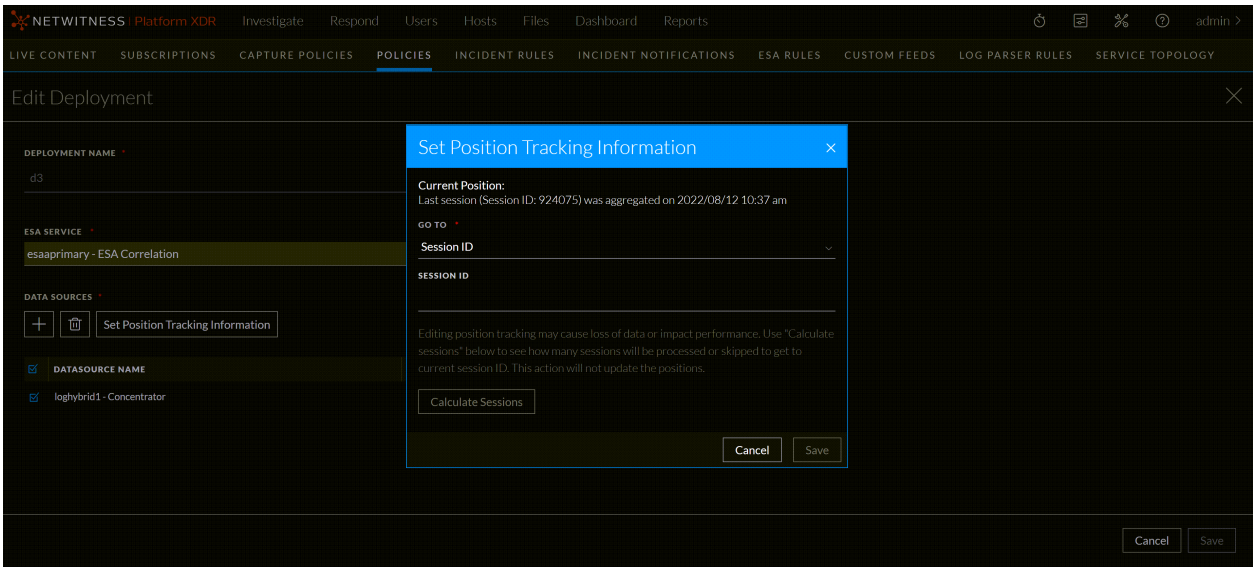
Below is an example of the Create Deployment dialog:



The table describes the information and options in the **Create Deployment** dialog.

Field	Description
Deployment Name	Name of the deployment. The name must be unique.
ESA Service	Displays the list of ESA services from the drop-down list. • esaprimary – ESA Correlation • esasecondary – ESA Correlation
	Adds a Datasource from the available list. At least one Datasource is required to set the position tracking information for ESA.
	Deletes the datasource that you are currently editing.

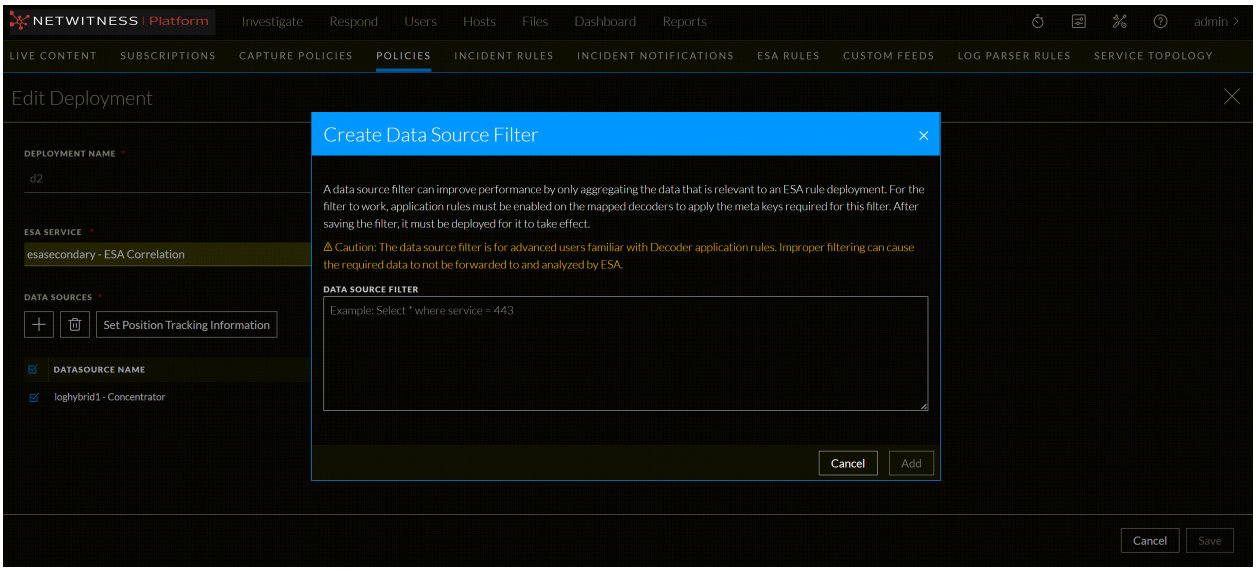
Field	Description
Set Position Tracking Information	Adds a position tracking information on different datasources for ESA. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the time/date when the events were processed. For more information, see Position Tracking Information.
Create Data Source Filter	Enables you to create the datasource filter to get the required results.
Save	Saves the settings and closes the Create Deployment dialog.
Cancel	Cancels the operations.



Below is an example of **Add Data Source** Dialog.

The table describes the information and options in the **Add Data Source** dialog.

Field	Description
Select Datasource / Select All	Allows you to select one or more datasources.
Done	Adds the datasource and closes the Add Data Source dialog.
Cancel	Cancels the operations.

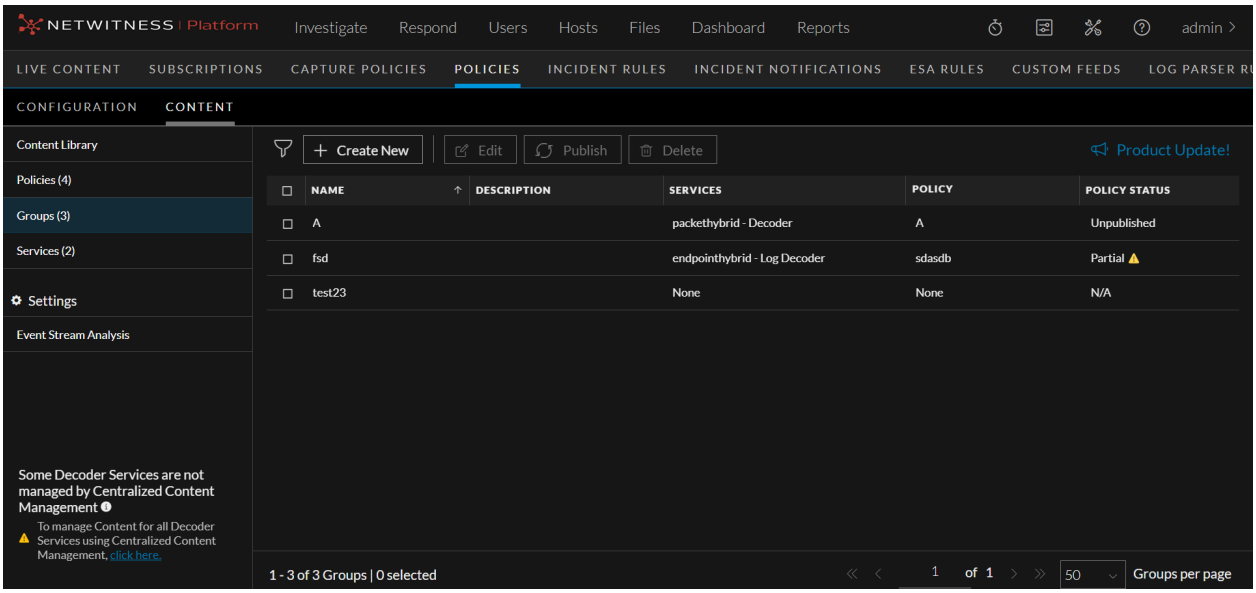


Below is an example of **Set Position Tracking Information** dialog.

The table describes the information and options in the **Set Position Tracking Information** dialog.

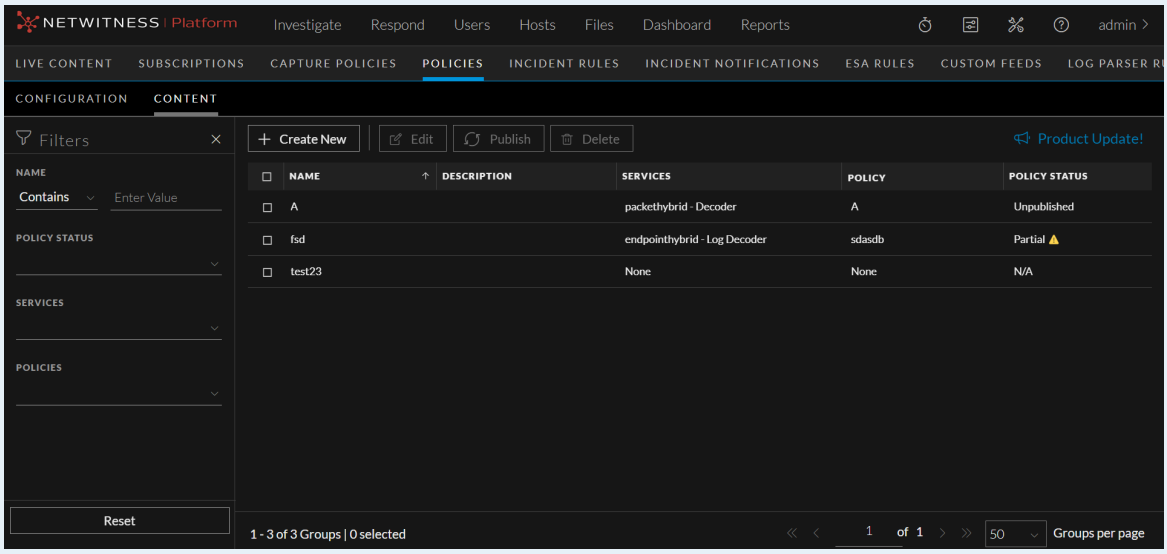
Field	Description
Go To	This option will enable the use of Session ID and data and time for ESA Correlation Service for the events.
Session ID	The ESA Correlation service starts processing the events from the session ID that you entered.
Date and Time	The ESA Correlation service starts processing the events from the date and time that you entered.
Calculate Sessions	This will calculate the number of sessions that will be processed with respect to the existing position of the data source.
Save	Saves the settings and closes the Set Position Tracking Information dialog.
Cancel	Cancels the operations.

Below is an example of **Create Data Source Filter** Dialog



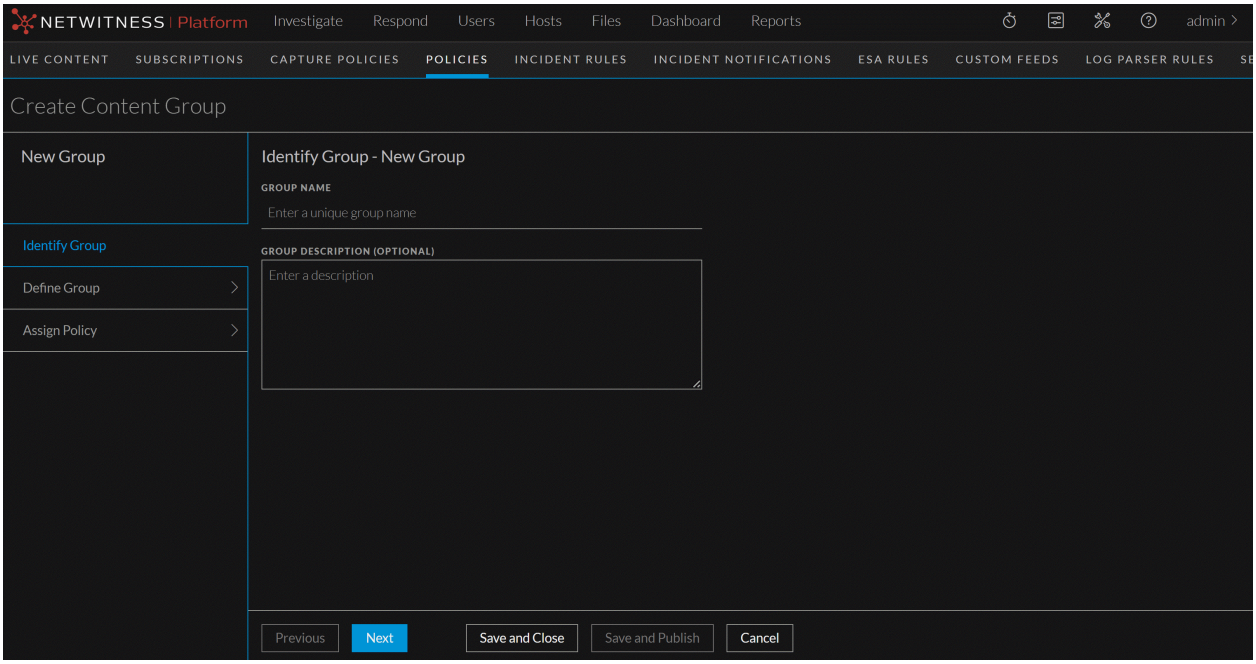
The table describes the information and options in the **Create Data Source Filter** dialog.

Field	Description
Data Source Filter	Enables you to enter the data source filter. For example, you can type **Select *where service = 443** to filter based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.
Add	Adds the configurations and closes the Create Data Source Filter dialog.
Cancel	Cancels the operations.



Groups Tab

Below is an example of the Content > Groups tab:

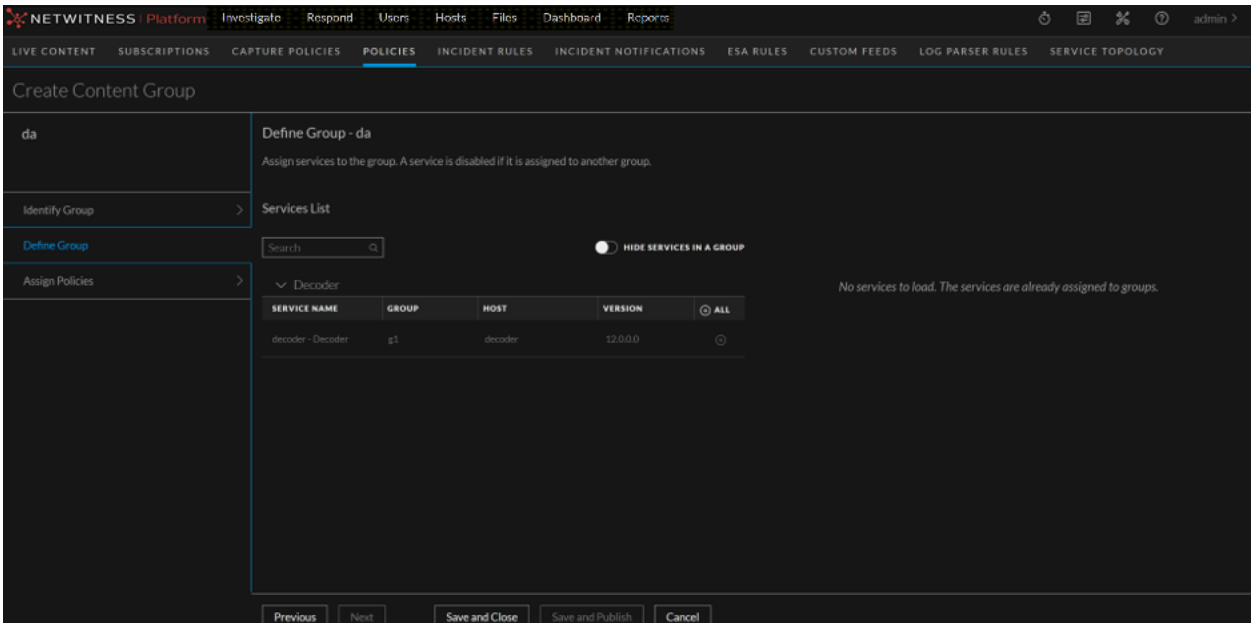


The following table describes the Groups tab.

1	By default, 50 groups are displayed per page. To go to the next page, click ›. To go to the last page, click ».

2	- Filter the groups based on various parameters.  Filter Panel: • Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed. • Policy Status - Select the **Policy Status** from the drop-down list. The various drop-down values are: ◦ **Published**: Groups that are published to use. ◦ **Unpublished**: Groups that are saved but not published. ◦ **Failed**: Groups that are failed to publish. ◦ **N/A**: Groups for which publication status is not applicable. ◦ **Partial**: Groups that are partially published. • Services - The service type to which the group is attached. • Policies – The policies to which the group is attached.
3	Toolbar • Create New - Lets you create a new group. For more information, see Create a group. • Edit - Lets you edit the group. For more information, see Managing Groups. • Publish - Publishes selected groups. • Delete - Deletes the selected group.

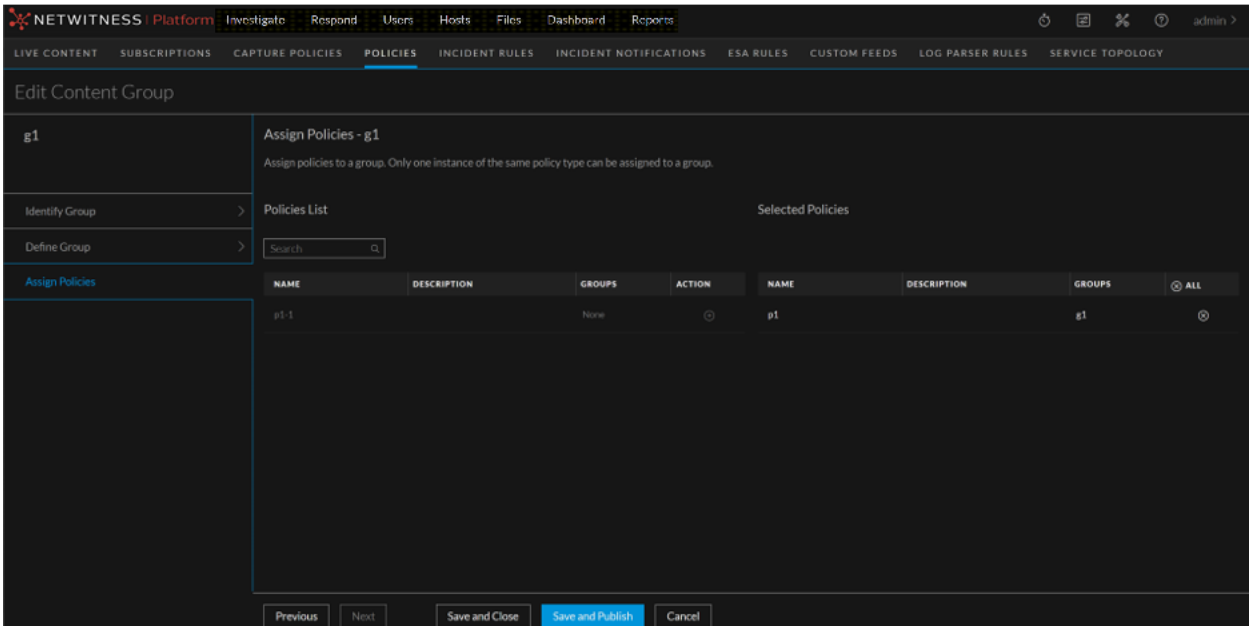
4	Group List Pane • Name - Name of the group. • Description - Description of the group. • Services - Displays the service to the which the group is applied. • Policies - Displays the policy to which the group is applied. • Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A. You can also sort on any column. If you mouse over a column header, a sort icon is displayed:  . Click  to sort by the selected column.
5	Groups Details Panel Displays the properties of the selected group.



Below is an example of the Create group dialog:

The table describes the information and options in the Create Group dialog:

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description (Optional)	Description of the group. Description should not exceed 8000 characters.
Save and Close	Saves the settings and closes the Create Group dialog.

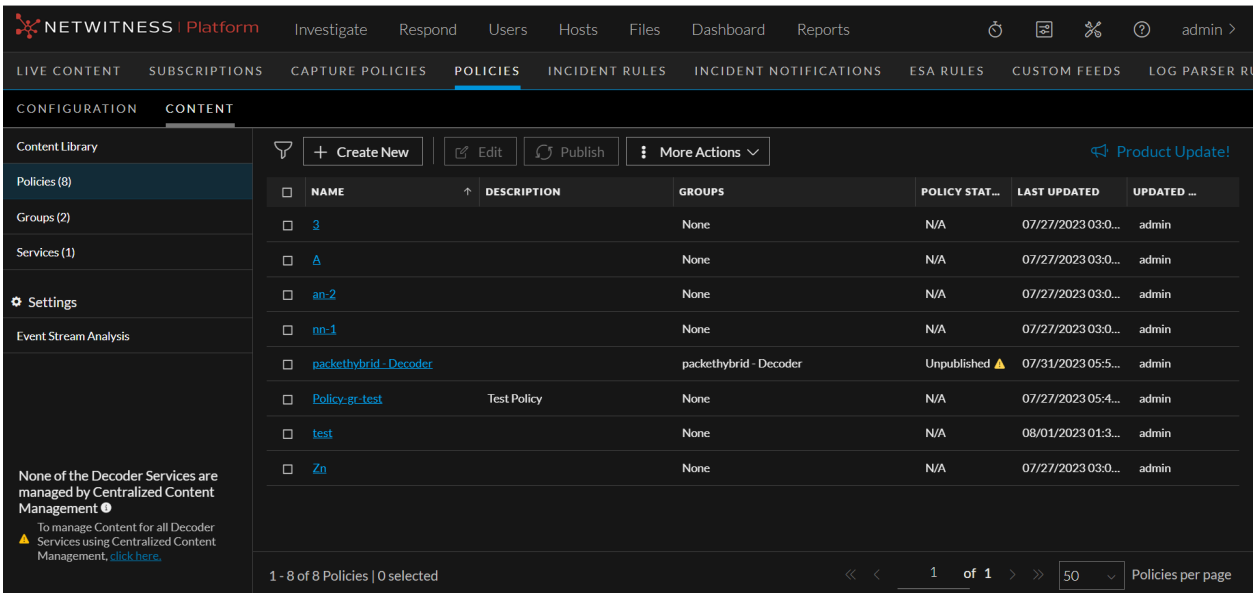


Below is an example of the define group dialog:

The table describes the information and options in the Define Group dialog:

Field	Description
Services List	Displays the list of services. The following describes services list: Service name – Name of the service. • Group - Name of the group. • Host - Host name of the service. • Version - Service version. • All - Lets you to add services to the group. You can either click to add all services or click ⊙ to add specific service.
Hide Services in a Group	Displays the services that is not assigned to any group. By default, this option is disabled.
Selected Services	Displays the list of selected services for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

Below is an example of Assign policy dialog:



The following table describes assign policy dialog:

Field	Description
Policies List	Displays the list of policies associated with the group. The following describes policies list: • Name - Name of the policy. • Description - Description of the policy. • Groups - Groups associated with the policy. • Action - Click to add policies to the group.
Selected Policies	Displays the list of selected policies for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

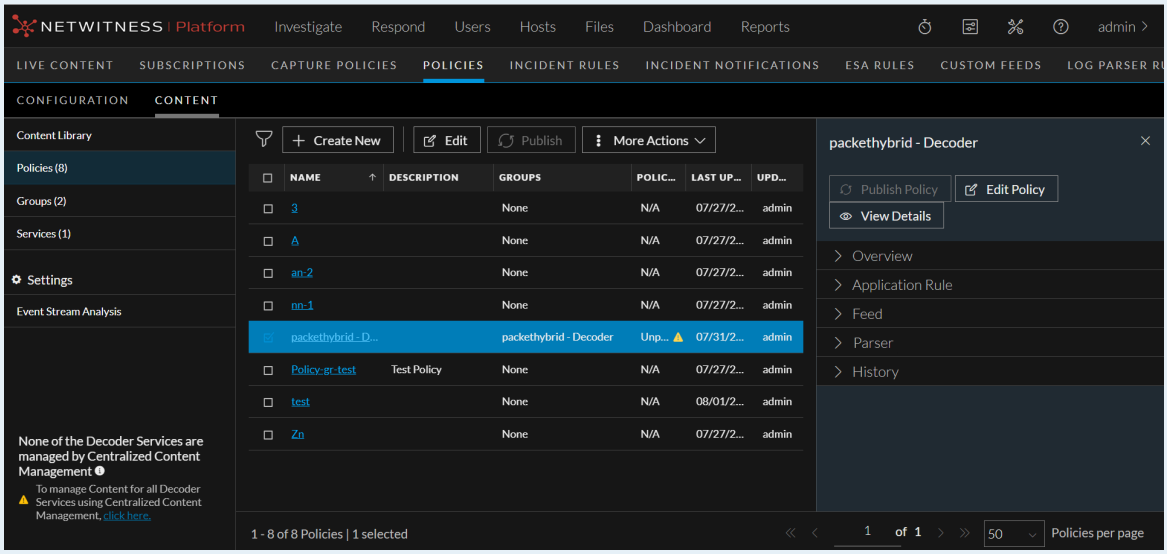
Policies Tab

The **(CONFIGURE) > Policies** view contains two tabs: **Configuration** and **Content**.
Below is an example of the **Content > Policies** tab:

The following table describes the Policies tab.

1	By default, 50 policies are displayed per page. To go to the next page, click ›. To go to the last page, click ».

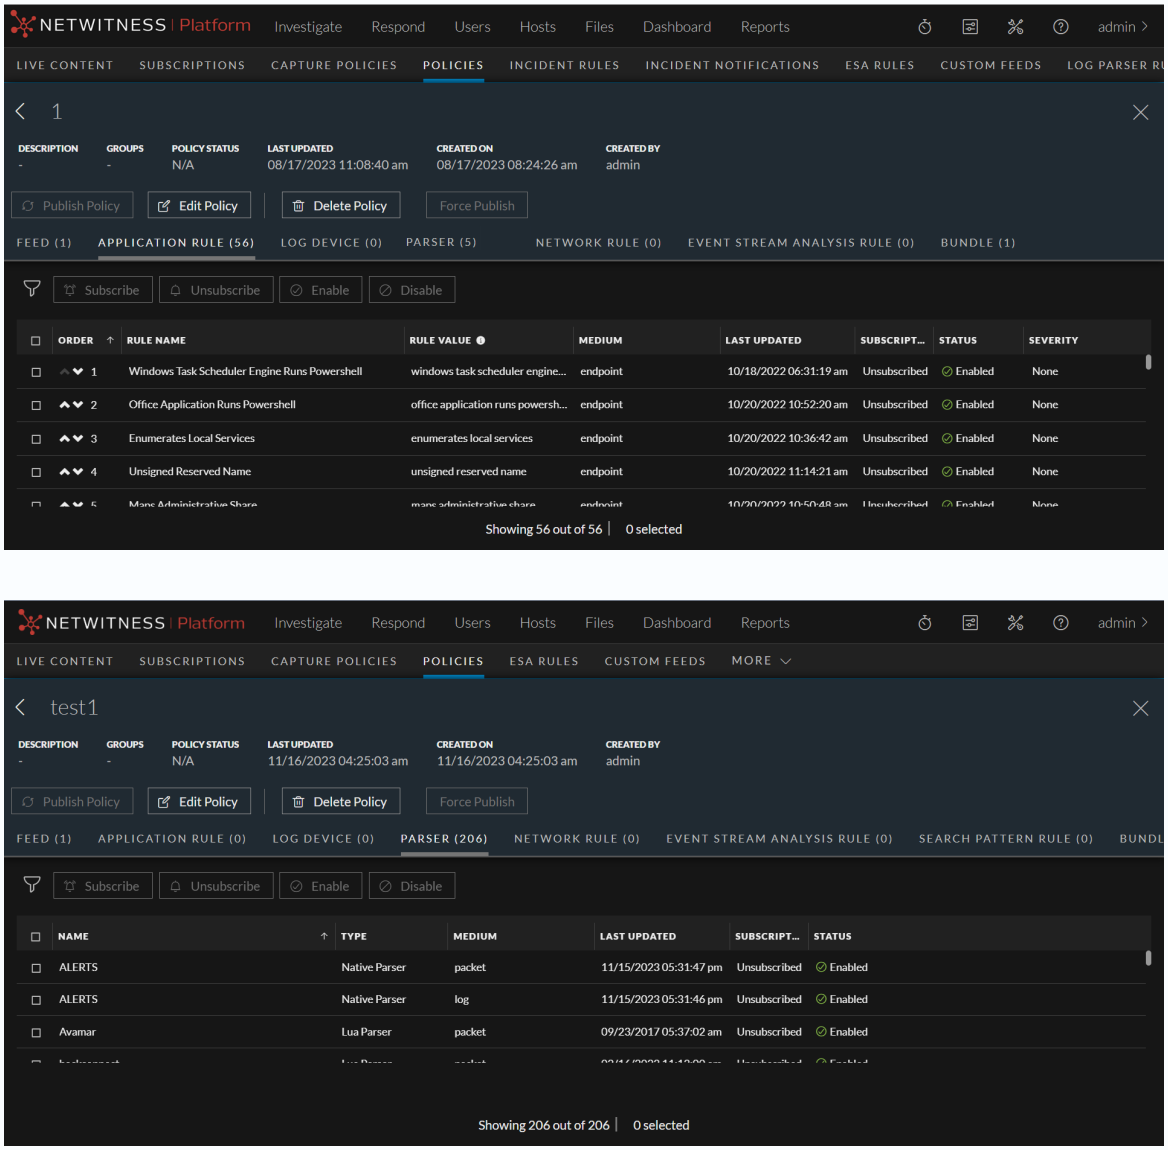
2 Toolbar:



- Create New - Lets you create a new policy. For more information, see Create a policy.
- Edit - Lets you edit the policy. For more information, see Edit a Policy.
- Publish - Publishes selected policy or policies.
- More Actions:
  - Assign to Group --Lets you assign policy to a group.
  - Clone - Lets you clone a policy.
  - Revert to - Lets you view the previous policy versions and revert policy to any previous version.

    Note:
    - The current version of the policy is disabled.
    - This option is disabled either if no policy is selected or multiple policies are selected.
  -  - Lets you name a policy version when you revert the policy.
  - Delete - Deletes the selected group or groups permanently.
  - Force Publish - Lets you republish all the content irrespective of the policy status. This option allows you to re-push all content or configurations to all services in the group. Some of the scenarios where you might want to force publish the policy are:
    - There was a service that was down or did not successfully receive content when it was first pushed out.
    - Some content may have been modified or removed locally on a service (outside of CCM control) and you want to re-apply the content from the policy.

3 Policy List Pane:



- Name - Name of the policy.
- Description - Description of the policy.
- Groups - Lists the group to which this policy is applied.
- Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A.
- Last Updated - Displays the time when the policy is updated.
- Updated By - The user who updated the policy. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the  icon to sort by the selected column.

4 Policy List - Side Pane:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- View Details - Lets you view the complete policy details.
- Expand the sections **Overview**, **Application Rule**, **Bundle**, **Feed**, **Lua Parse**r and **History** to view the details of the policy.
- The table contains details such as **Policy Version**, **Version Name** and **Published By**.

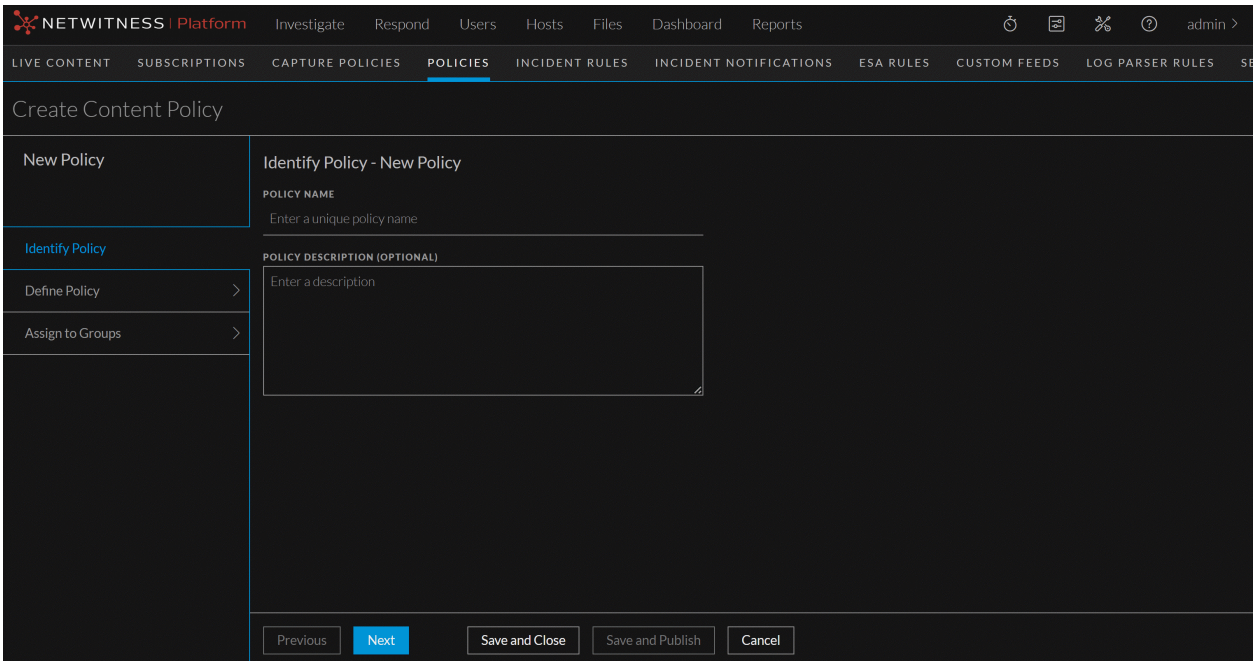
5 Policy Details Panel:

Displays the properties of the selected policy.

Toolbar:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- Delete Policy - Deletes the selected policy or policies permanently.
- Force Publish - Lets you republish all the content irrespective of the policy status.

Policy Details Pane:

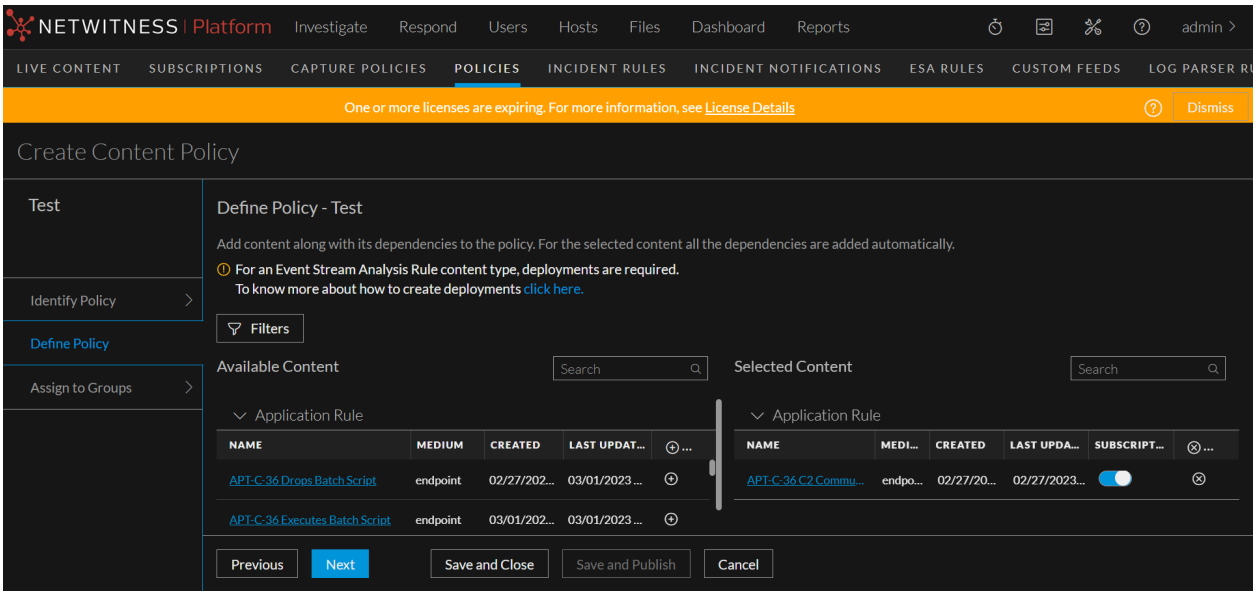


- Order - Order of the content. Click  to sort and display the content in the ascending order.

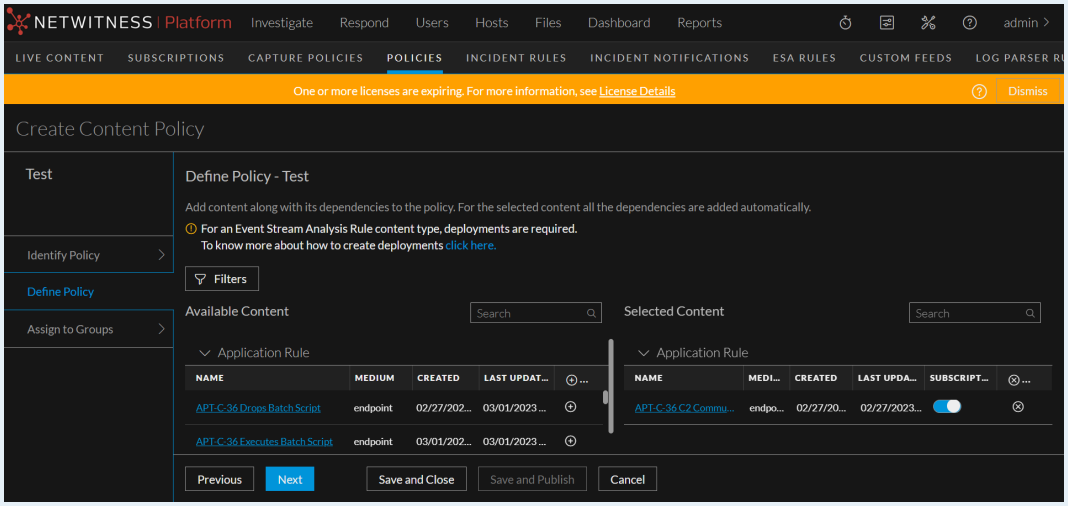
Click  to sort and display the content in descending order. This field is applicable only for **Application Rule** and **Network Rule** tabs.

- Rule Name - Name of the rule. The rule name will be unique. This field is applicable only for **Application Rule** and **Network Rule** tabs.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value. This field is applicable only for **Application Rule** and **Network Rule** tabs.
- Name - The content name. This field is applicable only for **Feed**, **Log Device** and **Parser** tabs.
- Type - The type of parser. For example, **Lua Parser** or **Native Parser**. This field is applicable only for **Parser** tab.
- Medium - Meta data source medium.
- Severity - The severity of content. For example, **Low**, **Medium**, **High** or **Critical**. This field is applicable only for **Application Rule** and **Event Stream Analysis Rule** tabs.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.
-  - Filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date. Following are the fields available in the filter panel:
  - Name - If you set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules, a list of content rules that contain that character is displayed, as you continue to type the list is filtered to match. If you set the filter option to **Equals** operator from the drop-down list and enter the full name, the particular content type will be displayed.
  - Medium - Select one or more mediums from the drop-down list. The available options are 'endpoint', 'log', 'log and packet' and 'packet'.
  - Source Type - Select one or more sources from the drop-down list. The available options are 'Custom' and 'Live'.
  - Enabled/Disabled Status - Select one or more statuses from the drop-down list. The available options are 'Enabled' and 'Disabled'. This field is not applicable for Event Stream Analysis Rule content type.
  - Subscription - Select one or more statuses from the drop-down list. The available options are 'Subscribed' and 'Unsubscribed'.
  - Severity - Select the severity from the drop-down list. The available options are 'Low', 'Medium', 'High' and 'Critical'. This field is applicable only for Application Rule and ESA content type.
  - Resource Created Date - Select the resource created date range.
  - Last Update Date - Select the last update date range.
- Subscribe - Lets you subscribe for the content if it is unsubscribed.

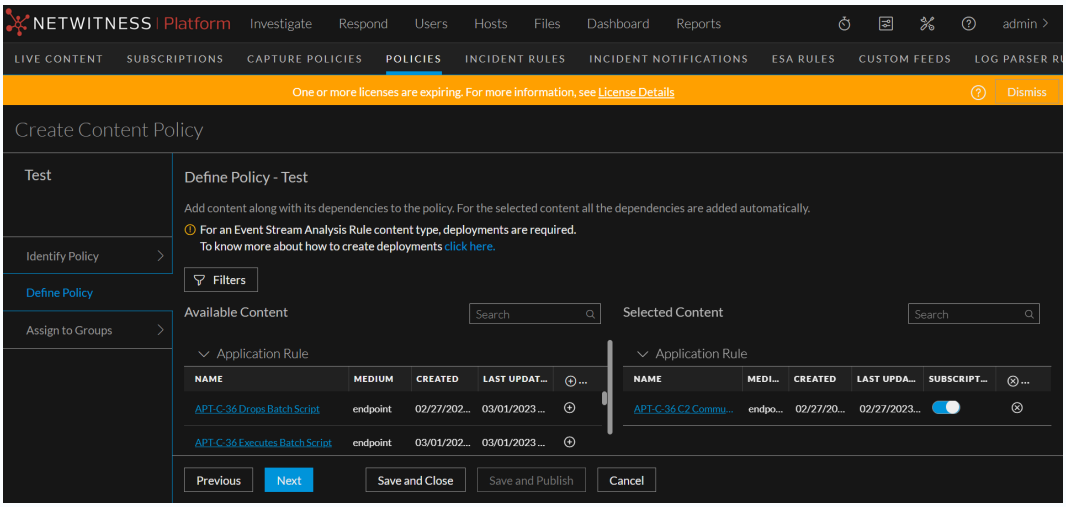
- Unsubscribe - Lets you unsubscribe for the content if it is subscribed.
- Enable - Lets you enable the content for the policy.
- Disable - Lets you disable the content from the policy.
-  - Move the content down the order.
-  - Move the content up the order.



Below is an example of the Create Content Policy dialog.

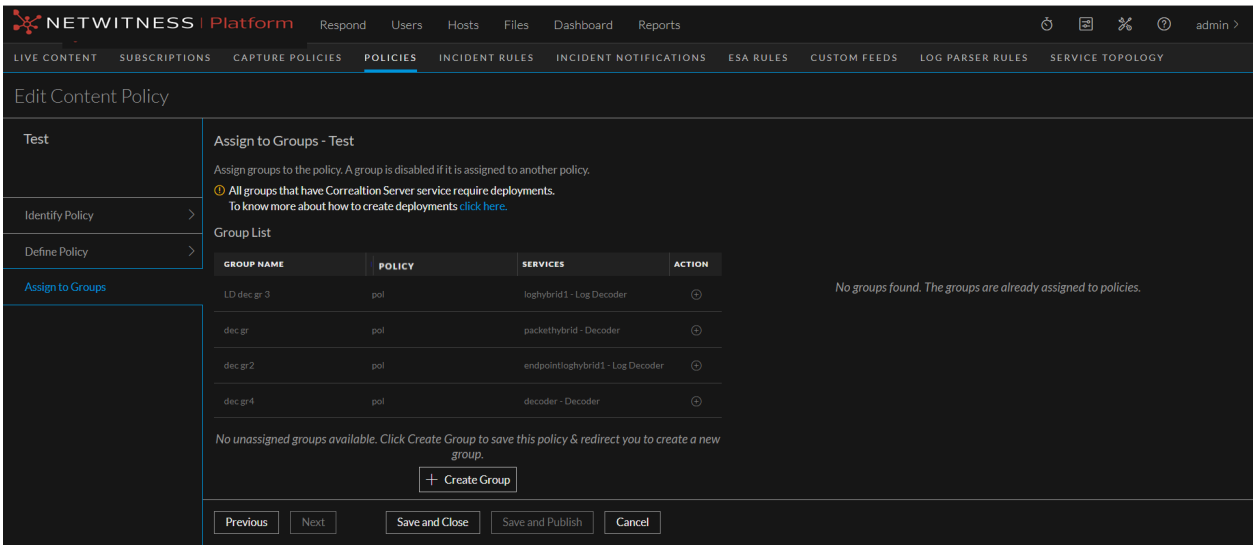


The table describes the information and options in the Create Policy dialog:



Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description (Optional)	Description of the policy. Description should not exceed 8000 characters.

Define Policy Settings:

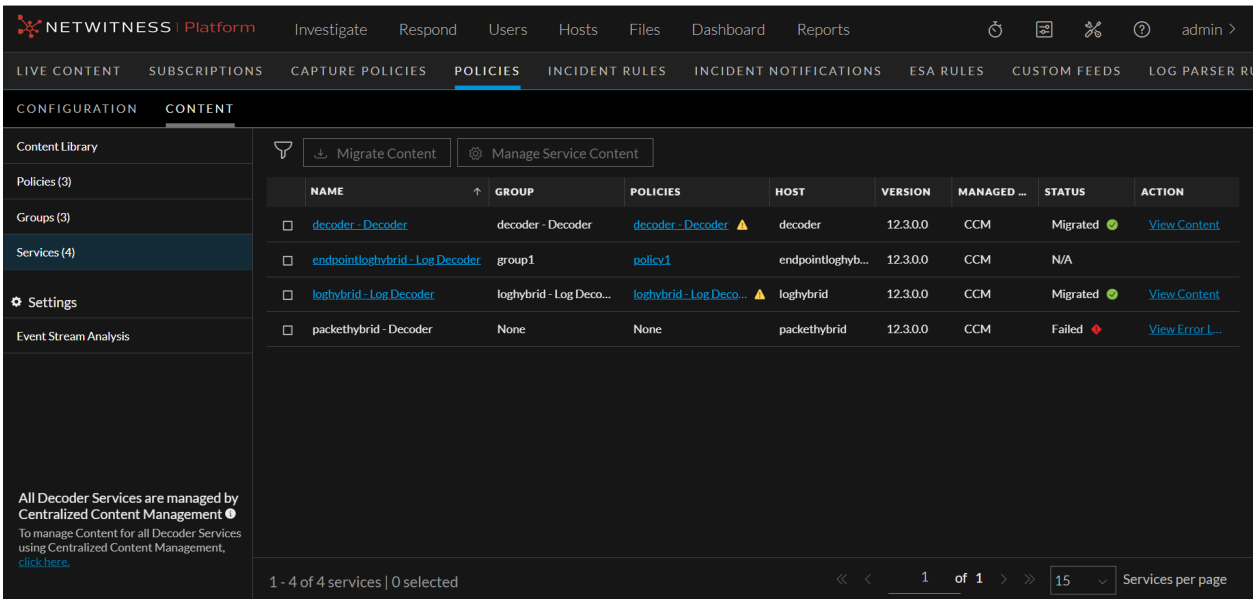


Field	Description

Available Content	Displays the available content resources in your deployment. Click  expand the resource type.
	The following describes resource type:
	• Name - Name of the resource.
	• Medium - Meta data source medium. Available values for medium are as follows:
	  • **Endpoint**: applied to content that uses meta derived from endpoint agent and endpoint server data
	  • **Log**: applied to content that uses meta derived from log data
	  • **Packet**: applied to content that uses meta derived from network packets
	  • **Log and packet**: applied to content that correlates meta derived across log and packet data
	• Created - Displays the time when the resource is created
	• Last Updated - Displays the time when the resource is updated last.
	• Action- Click + to add the resource and its dependencies to your deployment.
	•  - Click to add all content based on the resource type.
	•  - Filter the available content based on the following parameters:
	  ◦ **Resource Types** - The resource or the content type.
	  ◦ **Medium** - Meta data source medium. Available values for medium are as follows:
	  ◦ **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data
	  ◦ **Log**: Applied to content that uses meta derived from log data
	  ◦ **Packet**: Applied to content that uses meta derived from network packets
	  ◦ **Log and packet**: Applied to content that correlates meta derived across log and packet data

	◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the available content.
Selected Content	Lists the selected resource. Additionally, you can subscribe the content. Once the content is subscribed, the content resources are updated automatically in case of any changes.  •  - Filter the selected content based on the following parameters: ◦ **Resource Types** - The resource or the content type. ◦ **Medium** - Meta data source medium. Available values for medium are as follows: ◦ **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data ◦ **Log**: Applied to content that uses meta derived from log data ◦ **Packet**: Applied to content that uses meta derived from network packets ◦ **Log and packet**: Applied to content that correlates meta derived across log and packet data ◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the selected content.

Assign to Group:



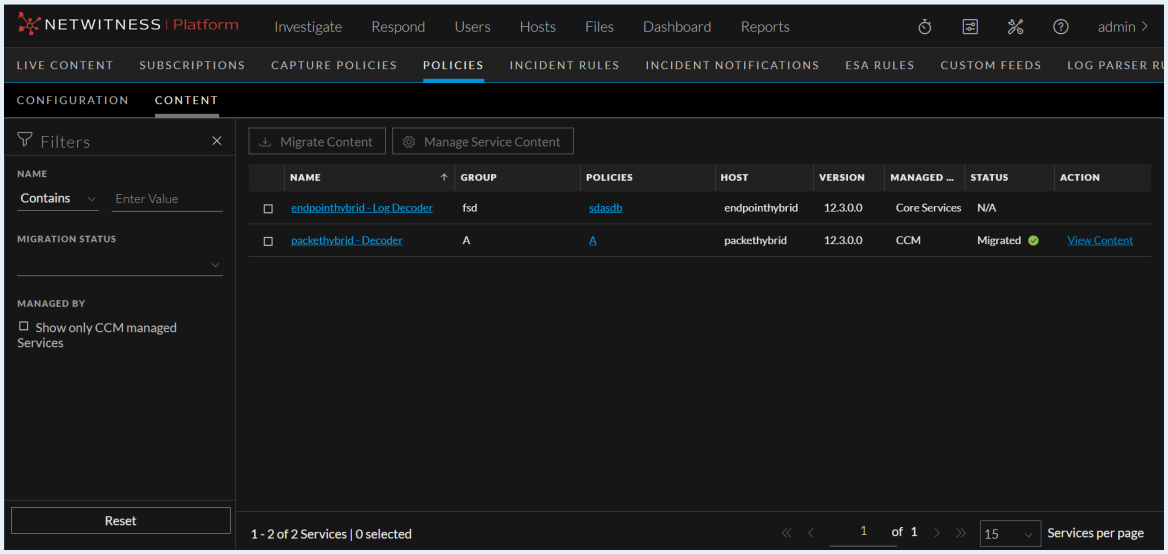
Group List	Displays the list of groups associated with the policy. A group is disabled if it is already assigned to another policy. • Group Name • Policies • Services • Action
	Click to create new group.
Selected Group	Lists the selected groups. Click  to add groups.
Save and Close	Saves the settings and closes the Create Policy dialog.
Save and Publish	Saves and publishes the created policy. **Note:** This option is disabled if: - Policy settings are not customized. - Policy is not assigned to groups.

Services Tab

The  **(CONFIGURE)** > **Policies** view contains two tabs: **Configuration** and **Content**.

The **CONTENT** tab has **Content Library**, **Policies**, **Groups** and **Services** on the left panel.

Below is an example of the Content > Services tab:

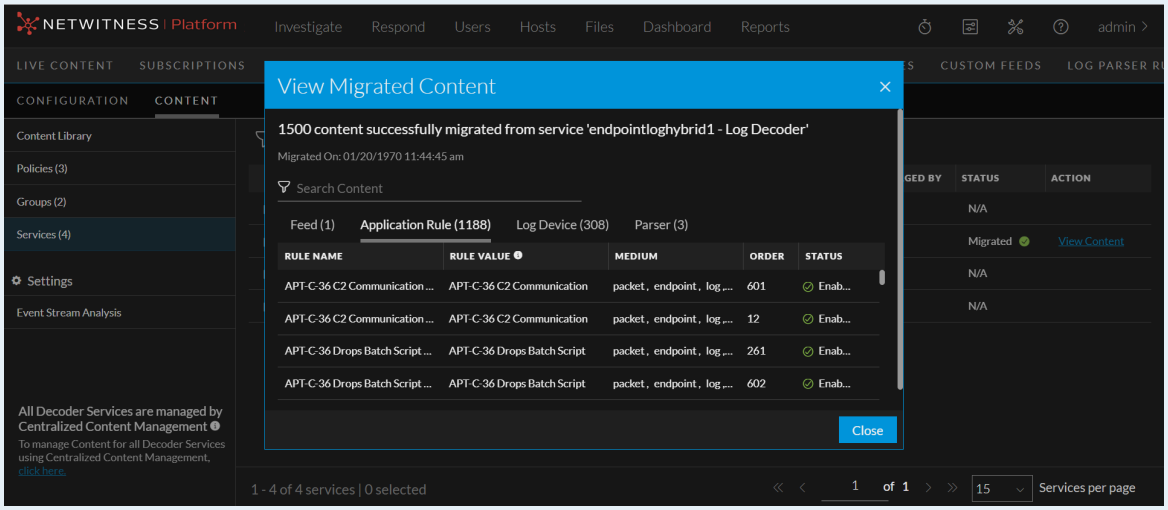


By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

1 Toolbar

- Migrate Content - Lets you migrate content from service. For more information, see Migrate Content from Service.
- Manage Service Content - Lets you enable or disable CCM for individual service(s). For more information, see Enable or Disable CCM for Individual Decoder Services.

2  - Filter services based on various parameters.



Filter Panel:

- Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.
- Migration Status - The **Migration Status** drop-down value. The drop-down values are 'Migrated', 'Migrating', 'Failed' and 'NA'.
- Managed By - Select the **Show only CCM Managed Services** to display only the CCM managed services.
- Reset - Reset the fields.

3 Services List Pane:

- Name - Name of the service.
- Group - The group to which service belongs.
- Policies - The policy to which the service is assigned. Click the policy name to view the details of the policy.
- Host - The service host name .
- Version - The service version number.
- Managed By - Indicates if the service is managed by CCM or Core Services.
- Status - Displays the migration status of the service. The column displays the following values based on the status of migration:
  - Queued
  - Initializing
  - Analyzing Content
  - Migrating Content
  - Migrated
  - Failed
- Action - Displays the action on the migrated content. The following actions are available:
  - View Content - If the **Status** is 'Migrated'.
  - View Error Log - If the **Status** is 'Failed'.

4 View Content - Click the hyperlink under the **Action** column to view the migrated content details in the **View Migrated Content** Pop-up window.

Available Tabs in the **View Migrated Content** Pop-up Window:

- Feed
- Application Rule
- Network Rule
- Log Device
- LUA Parser

Note:
- **Network Rules** tab is not applicable or Log Decoders.
- **Log Device** tab is not applicable for Decoders.

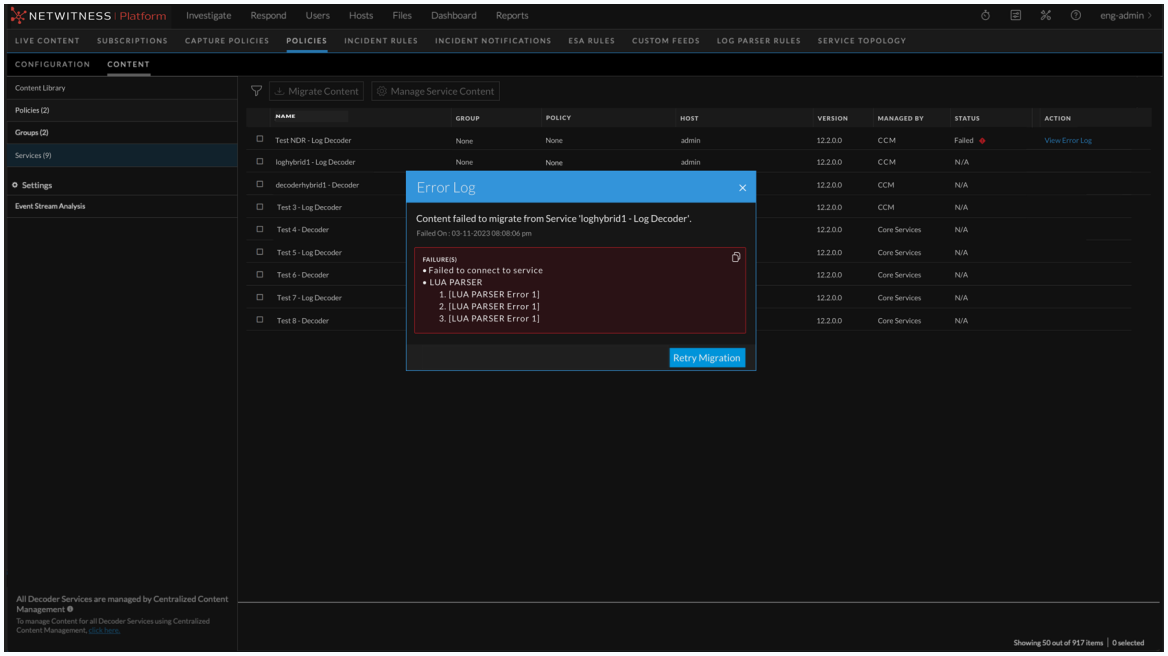
IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

 - Search the migrated content based on various parameters.

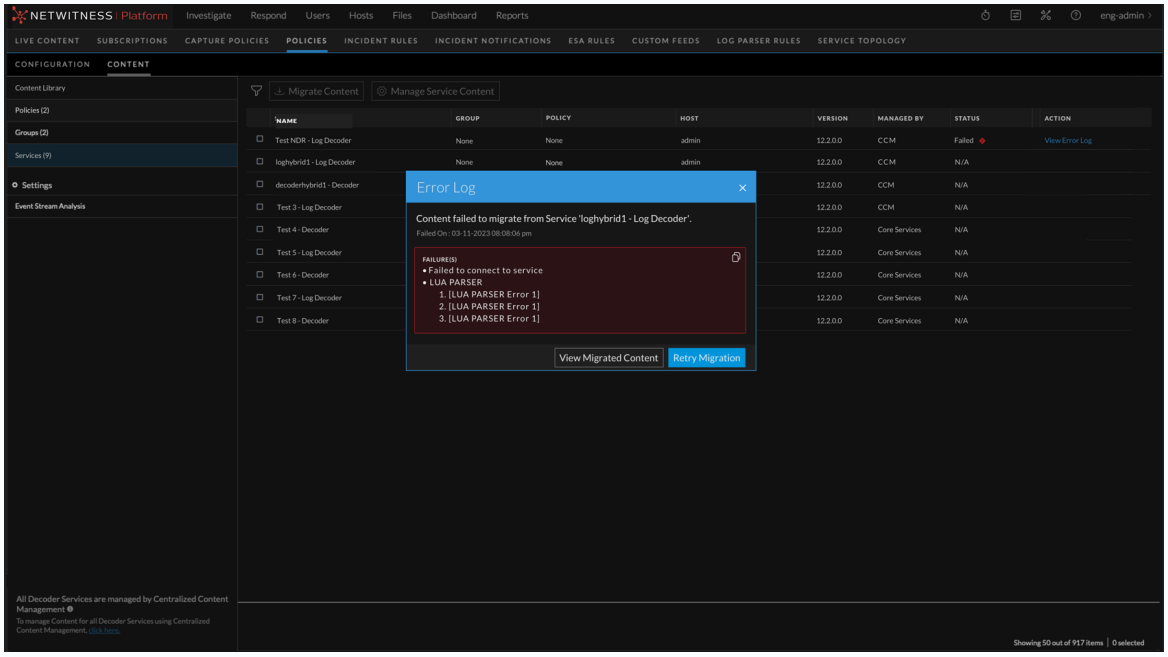
Note:
- For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
- For Feeds, Log Device and LUA Parser, the search is based on the **Name**.

Content Details for Feeds, Log Device and LUA Parser:

- Name - The content name.
- Medium - Meta data source medium.
- Status - The status of resource. For example, Enabled or Disabled.



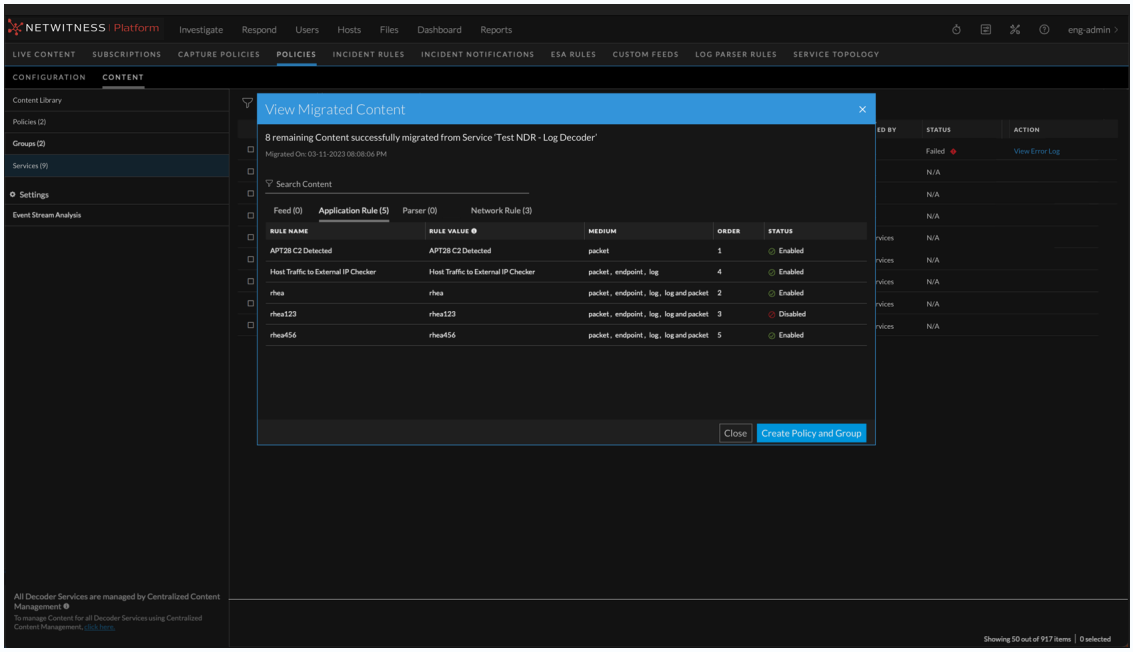
Content Details for Application Rule and Network Rule:



- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Order - The order of rule.
- Status - The status of resource. The status of resource. For example, Enabled or Disabled.

Available button in the **View Migrated Content** Pop-up Window:

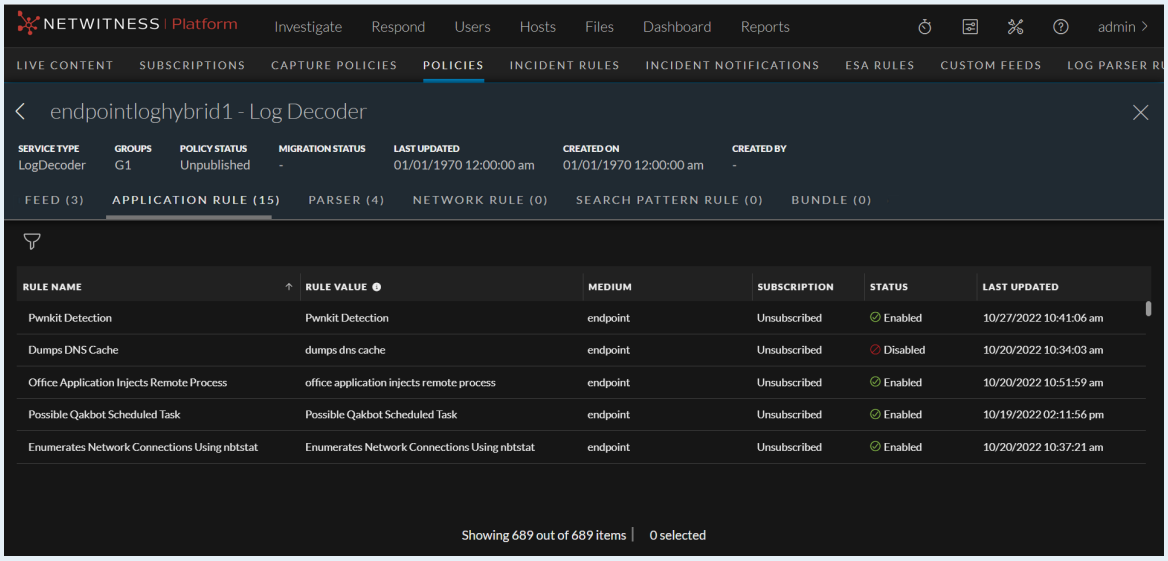
- Close - Close the pop-up window and return to **Service List** page.



5 View Error Log - Click the hyperlink under the **Action** column to view the log details in case the migration is failed.

Available buttons and Icons in the **Error Log** Pop-up Window:

-  - Copy the error logs.
- View Migrated Content - Click to View the content that have been migrated successfully. This button is present only in case of partial migration.



Available buttons and Icons in the **View Migrated Content** Pop-up Window:

- Close - Closes the pop-up window.
- Create Policy and Group - Creates policy and group for the partially migrated service.

- Retry migration - Retry migration.

6 Service Details Panel:

Displays the properties of the selected service.

Toolbar:

- Service Type - The type of service. For example, LogDecoder.
- Groups - The groups associated with the service.
- Policy Status -Indicates if the policy associated with the service is published or unpublished.
- Migration Status - The migration status of the service content.
- Last Updated - The date and time stamp on which the service was last updated.
- Created On - The date and time stamp on which the service was created.
- Created By - The user ID of the user who has created the service.

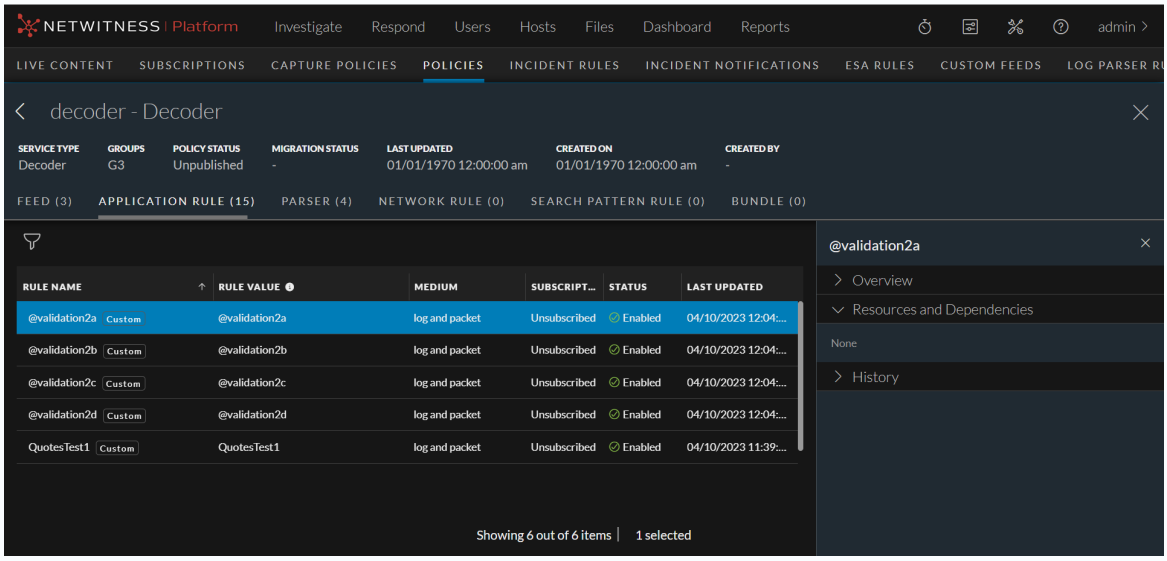
Available Content Tabs:

- Feed
- Application Rule
- Log Device. This tab is not applicable for service type 'Packet Decoder'.
- LUA Parser
- Network Rule. This tab is not applicable for service type 'LogDecoder'.
- Bundle

Service Details Pane for Feeds, Log Device, LUA Parser and Bundle:

- Name - The content name.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.

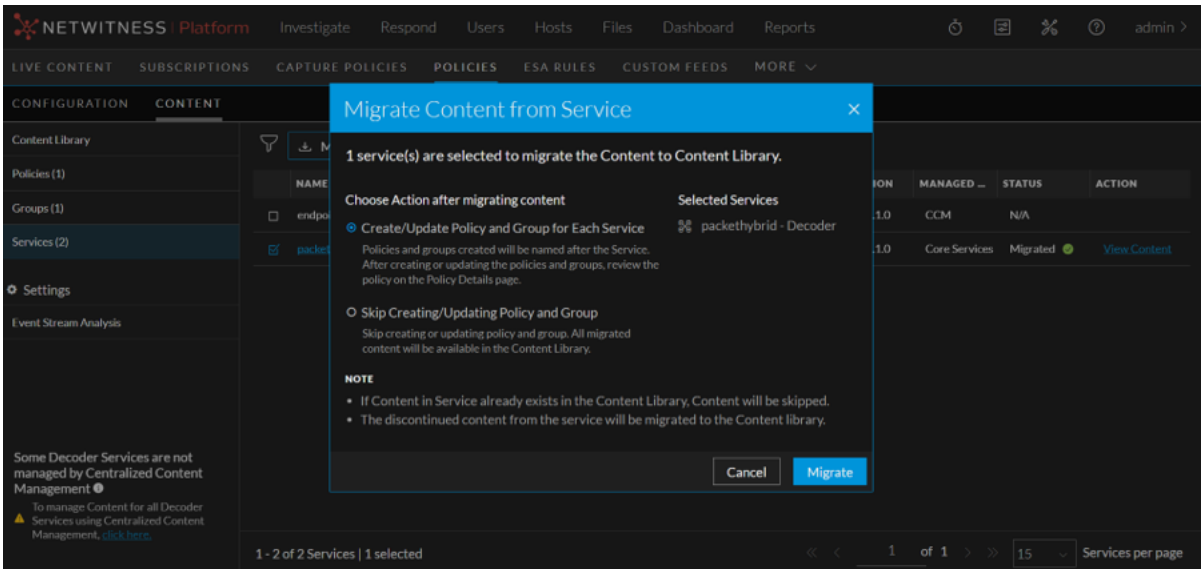
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.



Service Details Pane for Application Rule and Network Rule:

- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.

 - Filter the content based on various parameters.



7 Service Details Right Panel:

Displays the complete content details such as **Overview**, **Resources and Dependencies** and **History**.

Migrate Content from Service dialog:

Below is an example of the Migrate Content from Service dialog:

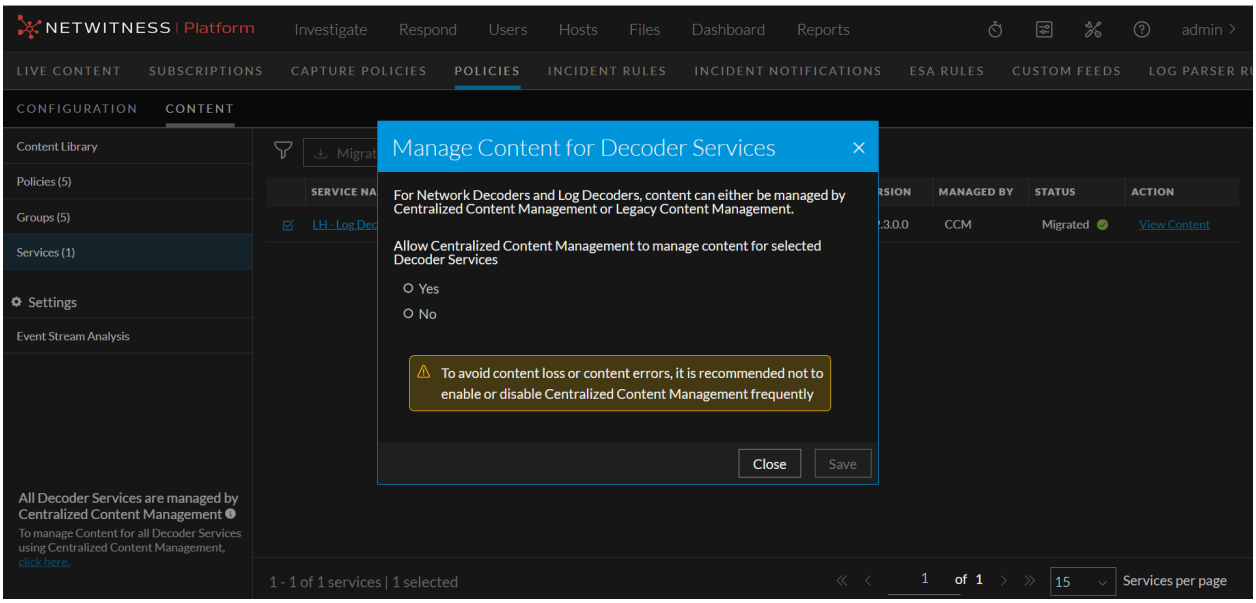
Note:
- If you select **Create/Update Policy and Group for Each Service**, policy and group will be the created or updated for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective pages.
- The policy and group which is created or updated for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled. The policy can be published only after reviewing it either from **Policy Details** page or **Edit Policy** Page. When the policy or group gets updated with the new content, the order of the new content will be given priority.
- If you select **Skip Creating/Updating Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

For more details on publishing a policy, refer Create and Publish Policies feature.

For more details on editing a policy, refer Edit a Policy feature.

For more details on policy details, refer View a Policy feature.

For more details on editing a group, refer Edit a Group feature.



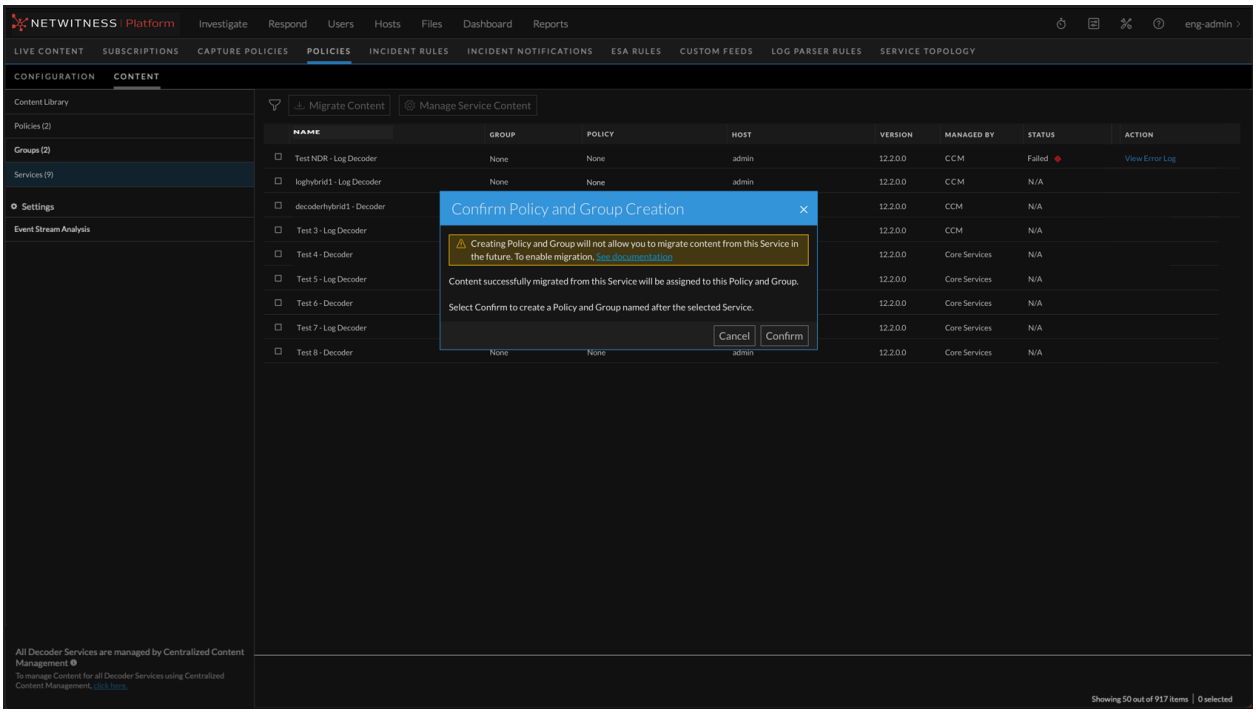
For more details on group details, refer View a Group feature.

The table describes the information and options in the Migrate Content from Service dialog:

Field	Description
Migrate	Initiate the migration of content for the selected service.
Cancel	Cancels the operation.

Manage Content for Decoder Services dialog:

Below is an example of the Manage Content for Decoder Services dialog:



The table describes the information and options in the Manage Content for Decoder Services dialog:

Field	Description
Allow Centralized Content Management to Manage Content for Selected Decoder Services	Select **Yes** to enable CCM for selected service(s). Select **No** to disable CCM for selected service(s).
Save	Save the changes.
Close	Close the **Manage Content for Decoder Services** pop-up window.

Confirm Policy and Group Creation dialog:

Below is an example of the Confirm Policy and Group Creation dialog:

The table describes the information and options in the Confirm Policy and Group Creation dialog dialog:

Field	Description
Cancel	Close the pop-up window and cancel the policy and group creation for the partially migrated service.
Confirm	Creates the policy and group for the partially migrated service. The policy and group will be listed under the Policy Listing and Group Listing pages.

Appendix A: Endpoint Risk Scoring Rules

Endpoint risk scoring requires the following content:

- "accesses administrative share using command shell"
- "activates bits job"
- "adds files to bits download job"
- "adds firewall rule"
- "allocates remote memory"
- "antivirus disabled"
- "archiving software reads multiple documents"
- "autorun debian package mismatch"
- "autorun file path not part of debian package"
- "autorun file path not part of rpm"
- "autorun key contains non-printable characters"
- "autorun"
- "autorun rpm mismatch"
- "autorun unsigned active setup"
- "autorun unsigned appinit_dlls"
- "autorun unsigned bho"
- "autorun unsigned bootexecute registry startup method"
- "autorun unsigned explorer registry startup method"
- "autorun unsigned hidden"
- "autorun unsigned hidden only executable in directory"
- "autorun unsigned ie toolbar"
- "autorun unsigned in appdatalocal directory"
- "autorun unsigned in appdataroaming directory"
- "autorun unsigned in programdata directory"
- "autorun unsigned in temp directory"
- "autorun unsigned logontype registry startup method"

- "autorun unsigned lsa provider"
- "autorun unsigned servicedll"
- "autorun unsigned winlogon helper dll"
- "autorun unsigned winsock lsp"
- "bad certificate warning disabled"
- "blacklisted file"
- "browser runs command prompt"
- "browser runs mshta"
- "browser runs powershell"
- "builds script incrementally"
- "clears application event log"
- "clears event logs using powershell"
- "clears security event log"
- "clears setup event log"
- "clears system event log"
- "combines binaries using command prompt"
- "command line usage of archiving software"
- "command line writes script files"
- "command prompt obfuscation"
- "command prompt obfuscation using value extraction"
- "command shell runs rundll32"
- "completes bits download job"
- "configures image hijacking"
- "configures port redirection"
- "copies binary over administrative share"
- "created in last month"
- "creates browser extension"
- "creates domain user account"
- "creates executable in startup directory"

Position Tracking Information

The ESA Correlation service continuously streams data from the data sources like decoders (log and network), and concentrators. ESA retrieves events from the data sources, and applies rules to generate alerts to detect malicious activities. When you deploy a data source, ESA starts processing information from the latest available session, by default. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the date and time when the events were processed.

Set Position Tracking Information enables you to:

- Visualize the number of sessions that a particular ESA data source has already analyzed, review the number of sessions ESA would process after you edit the position tracking, and plan your work.
- Set the tracking position information based on:
  - Session ID
  - Date and Time (Collection Time)
- Set position tracking for multiple data sources before you deploy them.
- Calculate the number of sessions that the ESA Correlation Service is scheduled to process for a particular data source to either process, reprocess, or skip sessions with respect to the current position of the data source.

Note: The Position tracking feature with the Date and Time option works based on the profile time settings in the NetWitness Platform UI. This time-zone based time from the UI is converted to UTC, and is sent to the core, to retrieve the corresponding session ID for that time stamp.
Example: If the UI follows IST, the UI converts it to UTC and sends it to the core. The session ID is fetched for the specific UTC time stamp, and set to position tracking at deployment.

Use Case Scenario

This section provides information about how you can use position tracking information in a real-world scenario.

Case 1: If you have deployed a data source with a total of 400 sessions that ESA has already processed, and if you want to start processing the events from the beginning, perform the following steps to reprocess the sessions.

Edit the position Tracking Information

1. Select the deployment and click **Edit Deployment**.
2. Select the datasource and click **Set Position Tracking Information**.

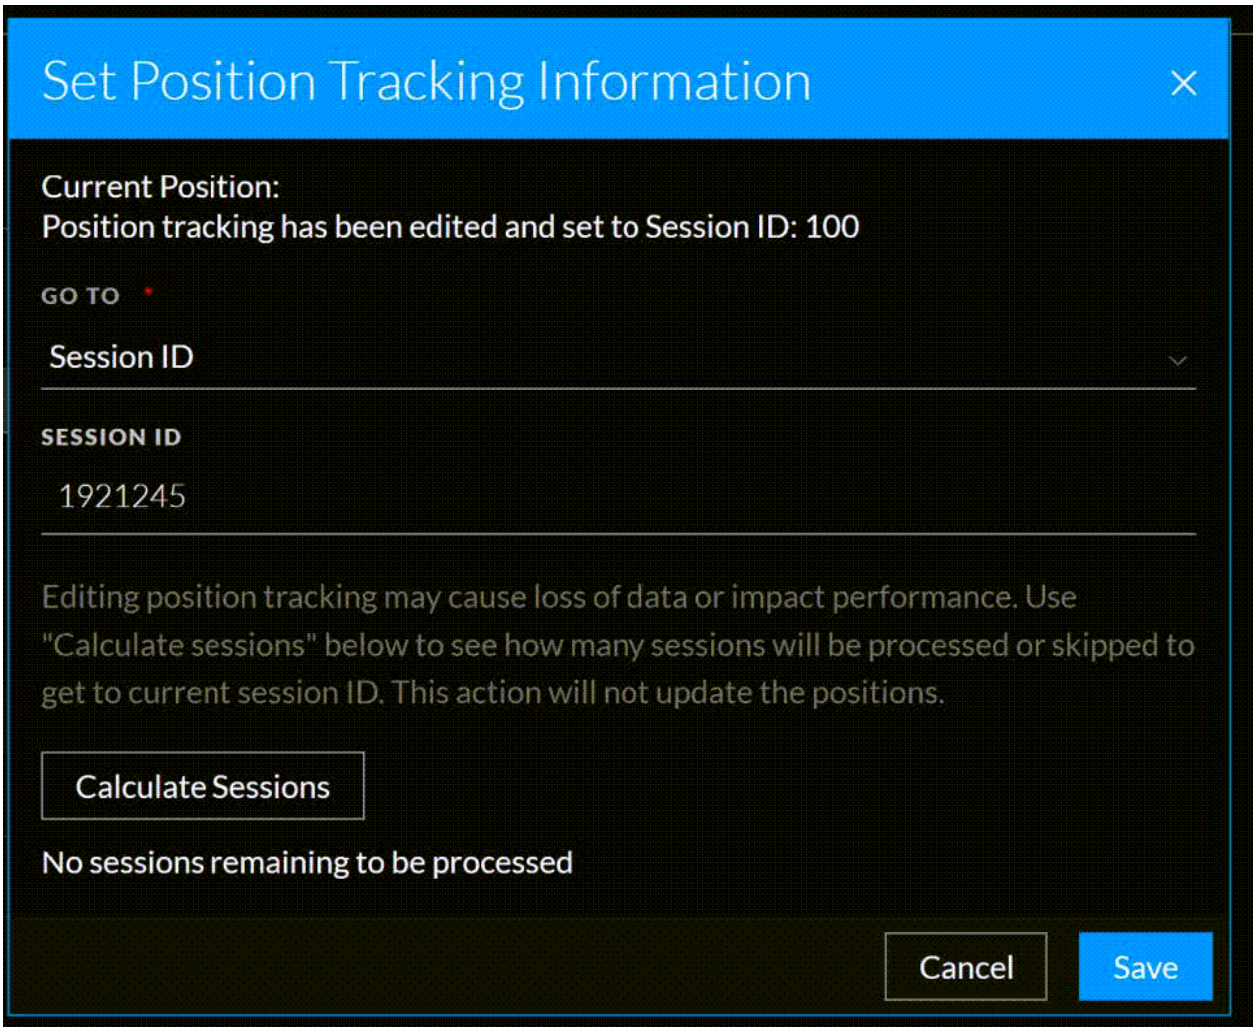
   The Set Position Tracking Information dialog is displayed.
3. In the **Go To** drop-down menu, select the **Session ID** and enter the session number as 1 in the **Session ID** text field.

You can also set the position tracking information based on date and time and the sessions will be calculated using data and time.

4. Click **Calculate Sessions**.
5. Click **Save** twice.
6. Select the Deployment and click **Deploy**.

   All the 400 sessions will be reprocessed.

   The following image shows the use case scenario.



Case 2: If you have deployed a data source with a total of 700 sessions available and the current position of the data source is at 100 and if you set the sessions ID to 250. In this case, 150 sessions will be skipped. You can also set the sessions based on the date and time.

The following image shows the use case scenario.

Case 3: If you have deployed a data source that has a total of 1921237 sessions available and if you set the session ID higher than the available sessions for the data source. In this case, no remaining sessions will be processed. You can also set the sessions based on date and time.

The following image shows the use case scenario.

Note: Editing the tracking information is optional. If you add a new data source to an existing ESA deployment, and you do not edit the tracking information, ESA follows the default behavior to process events.

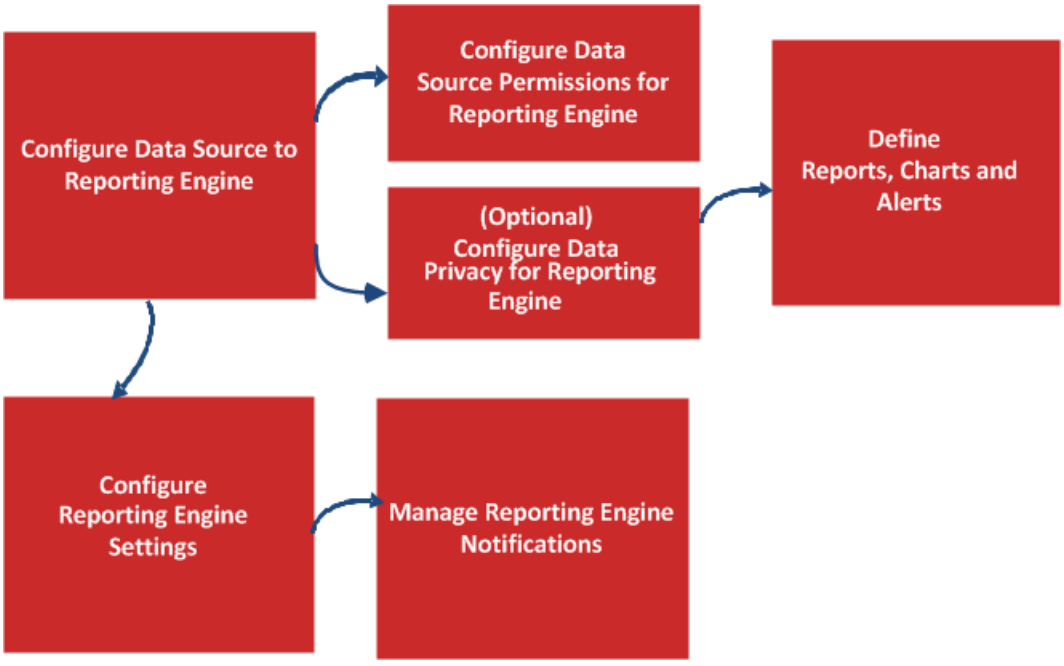
How Reporting Engine Works

NetWitness Reporting Engine is a service on the NetWitness Admin Server. It facilitates the data extraction from different data sources to generate reports for compliance and analysis. Reporting Engine stores the definitions of the charts, rules, reports and alerts that are used to generate reports, charts and alerts.

Reporting Engine configuration includes configuring the data sources, definitions of outputs or notifications and parameters to improve the performance of data extraction and report, chart, and alert generation.



When you install the NetWitness, Reporting Engine is automatically installed as a service. This enables the Reports, Charts, and Alerts to be maintained in the NetWitness and be available to view, download reports as PDF or CSV format, download charts as PDF and be added as dashlets.

For the Reporting Engine to run reports and alerts based on the data drawn from a data source, you must associate a data source, or multiple data sources to a Reporting Engine. There are three types of data sources:

- NWDB - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection. Reporting Engine supports the generation of reports, alerts, and charts.
- Warehouse - The Warehouse data sources are Horton Works and MapR which collects information from the Warehouse Connector and generates reports and alerts. This data source generates Reports only.
- Respond - Respond is used to generate reports on alerts and incidents. This data source generates Reports only.

Workflow

The following workflow shows an overview of the Reporting Engine configuration which enables the user to generate Reports, Charts, and Alerts.

Configure the Reporting Engine

On installation of the NetWitness Server, the Reporting Engine service is automatically available and some parameters are pre-populated with default values to achieve optimal results.

Make sure that the data sources are deployed and configured in the NetWitness. For more information, see "Add Service or Edit Service Dialog" topic in the *Host and Service Configuration Guide*.

You can perform the following tasks:

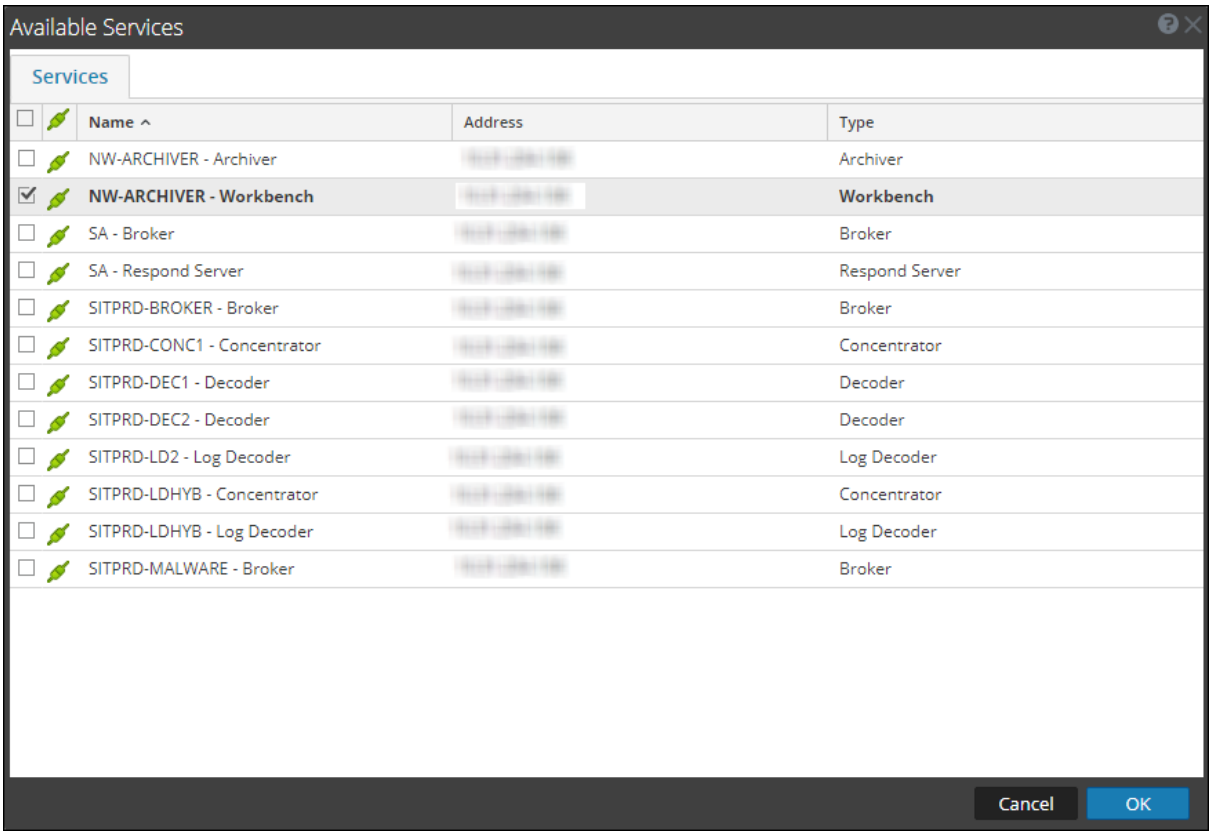
- Check Live for the latest data source content and deploy it on a regular basis. (For more information, see "Manage Live Resources" topic in the in *Live Services Management Guide*).
- (Optional) Add Additional Space for Large Reports.

Configure the Data Sources

You must configure NWDB, Warehouse, and Respond to generate Reports, Charts, and Alerts. Optionally, you can also configure Archiver, Collection, and Workbench data sources.

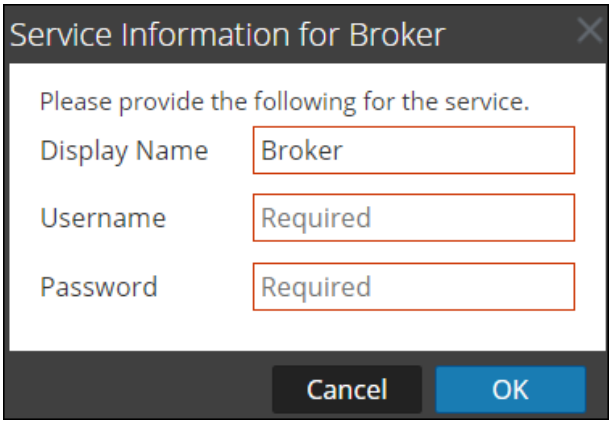
IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

Note: To execute Reports and Charts on an Analyst UI, make sure the admin adds the data sources to each Reporting Engine instance from the admin node using the relevant procedure described in this topic.



Configure a NWDB Data Source

To add a NWDB data source:



1. Go to  **(Admin) > Services**.
2. In the **Services**, select **Reporting Engine** service.
3. Click  > **View** > **Config**

   The Services Config View of Reporting Engine is displayed.
4. On the **Sources** tab, click  > **Available Services**.

   The **Available Services** dialog is displayed.

5. Select a NWDB service you want to add and click **OK**.
6. In the Service Information for Broker dialog, enter the service information for the service and click **OK**. In this example, we are adding a Broker service.

7. The service is displayed in the Sources tab when it is successfully added.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

Configure a Warehouse Data Source

You can add the warehouse data source to Reporting Engine, so that you can extract the data from the required services, store them in MapR or Horton works and generate Reports and Alerts. The procedure to configure Warehouse as a data source differs. To extract data from a Warehouse data source, you must configure it using the following procedure.

Note: Warehouse Connector is still supported, as it is reporting against a warehouse in NetWitness 11.x.

Prerequisite

Make sure you:

- Add a Warehouse Data Source to Reporting Engine.
- Set Warehouse Data Source as the Default Source.
- HIVE server is in running state on all the Warehouse nodes. Use the following command to check the status of the HIVE server:

  ```
  status hive2 (MapR deployments)
  service hive-server2 status (Horton Works deployments)
  ```

- Warehouse Connector is configured to write data to the warehouse deployments.
- If Kerberos authentication is enabled for HiveServer2, make sure that the keytab file is copied to the `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/` directory in the Reporting Engine Host.

  Note: The `rsasoc` user should have read permissions for the keytab file. For more information, see Configure Data Source Permissions.

  Also, make sure that you update the keytab file location in the **Kerberos Keytab File** parameter in the Reporting Engine Service Config View. For more information, see Reporting Engine General Tab.

To add Warehouse data source for MapR:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click  > **View** > **Config**.

   The **Service Config** view is displayed with the **General** tab open.
4. Click the **Sources** tab.
5. In the **Sources** tab, click  and select **New Service**.

   The New Service dialog is displayed.

6. In the **Source Type** drop-down menu, select **WAREHOUSE**.
7. In the **Warehouse Source** drop-down menu, select the warehouse data source.
8. In the **Name** field, enter the host name of the Warehouse data source.
9. In the **HDFS Path** field, enter the HDFS root path to which the Warehouse Connector writes the data.

   For example:

   If `/saw` is the local mount point for HDFS that you have configured while mounting NFS on the device. And if you have installed the Warehouse Connector service to write to SAW. For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

   If you have created a directory named `Ionsaw01` under `/saw` and provided the corresponding Local Mount Path as `/saw/Ionsaw01`, then the corresponding HDFS root path would be `/Ionsaw01`.

   The `/saw` mount point implies to `/`as the root path for HDFS. The Warehouse Connector writes the data `/Ionsaw01` in HDFS. If there is no data available in this path, the following error is displayed:

   `"No data available. Check HDFS path"`

   Make sure that `/lonsaw01/rsasoc/v1/sessions/meta` contains avro files of the meta data before performing test connection.
10. Select the **Advanced** checkbox to use the advanced settings, and fill in the **Database URL** with the complete JDBC URL to connect to the HiveServer2.

    For example:

If kerberos is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;principal=<Kerberos serverprincipal>
```

If SSL is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;ssl=true;sslTrustStore=<trust_store_
path>;trustStorePassword=<trust_store_password>
```

For more information on HIVE server clients, see https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients.

11. If not using the advanced settings, enter the values for the **Host** and **Port**.
    - In the **Host** field, enter the IP address of the host on which HiveServer2 is hosted.

      Note: You can use the virtual IP address of MapR only if HiveServer2 is running on all the nodes in the cluster.

    - In the **Port** field, enter the HiveServer2 port of the Warehouse data source. By default, the port number is **10000**.
12. In the **Username** and **Password** field, enter the JDBC credentials used to access HiveServer2.

    Note: You can also use LDAP mode of authentication using Active Directory. For instructions to enable LDAP authentication mode, see Enable LDAP Authentication.
13. Enable Kerberos authentication: see Enable Kerberos Authentication.
14. If you want set the added Warehouse data source as default source for the Reporting Engine, select the added Warehouse data source and click Set default.

To add Warehouse data source for Horton Works (HDP):

Note: Make sure you download the `hive-jdbc-1.2.1-with-full-dependencies.jar`. This jar contains the driver file of HIVE 1.2.1 which connects to Reporting Engine for Hive 1.2.1 Hiveserver2.

1. SSH to the NetWitness server.
2. In the `/opt/rsa/soc/reporting-engine/plugins/` folder, take a backup of the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
3. Remove the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
4. In the /opt/rsa/soc/reporting-engine/plugins folder, copy the following jar using WinSCP:

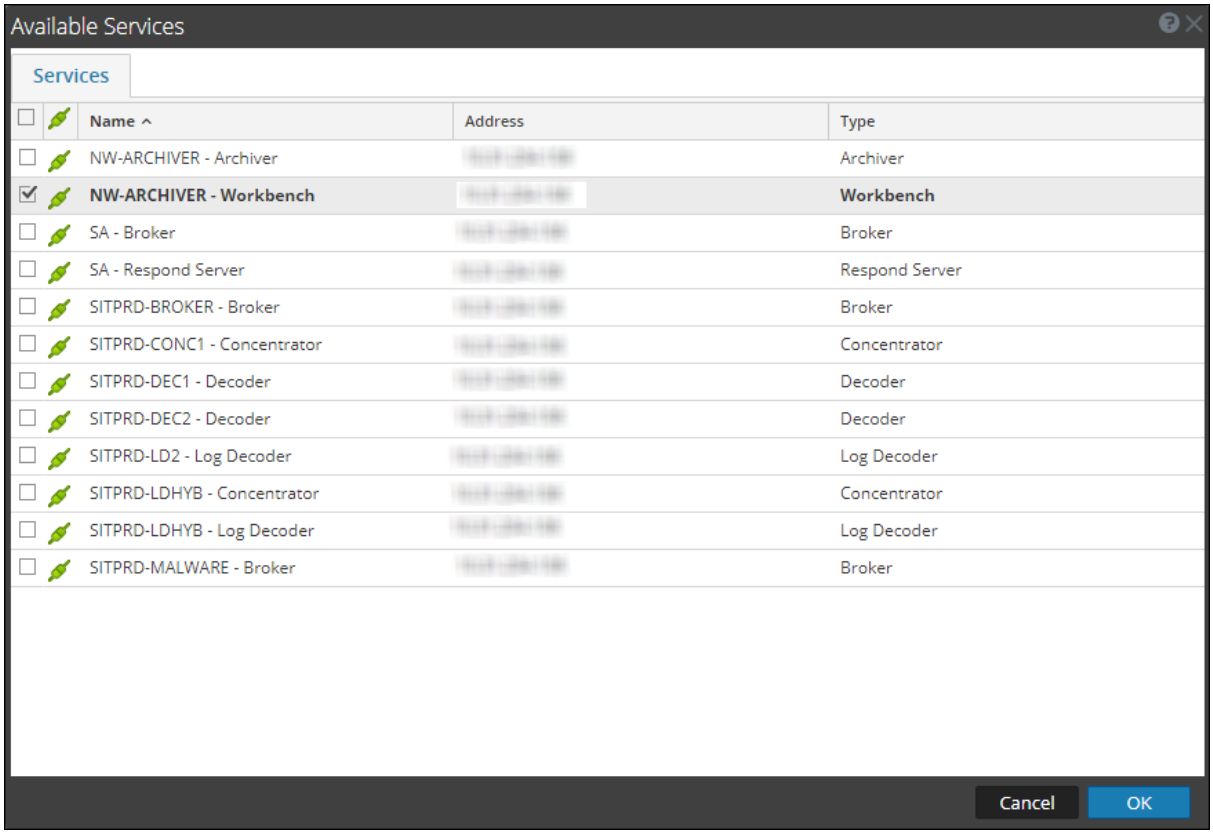
   `hive-jdbc-1.2.1-with-full-dependencies.jar`
5. Restart the Reporting Engine service.
6. Log in to NetWitness UI.
7. Select the **Reporting Engine** service and select > **View** > **Explore**.
8. In the **hiveConfig**, set **EnableSmallSplitBasedSchemaLiteralCreation** parameter to **true**.

Enable Kerberos Authentication

1. Select **Kerberos Authentication** checkbox, if the Warehouse is Kerberos enabled HIVE server.

2. Fill in the fields as follows:

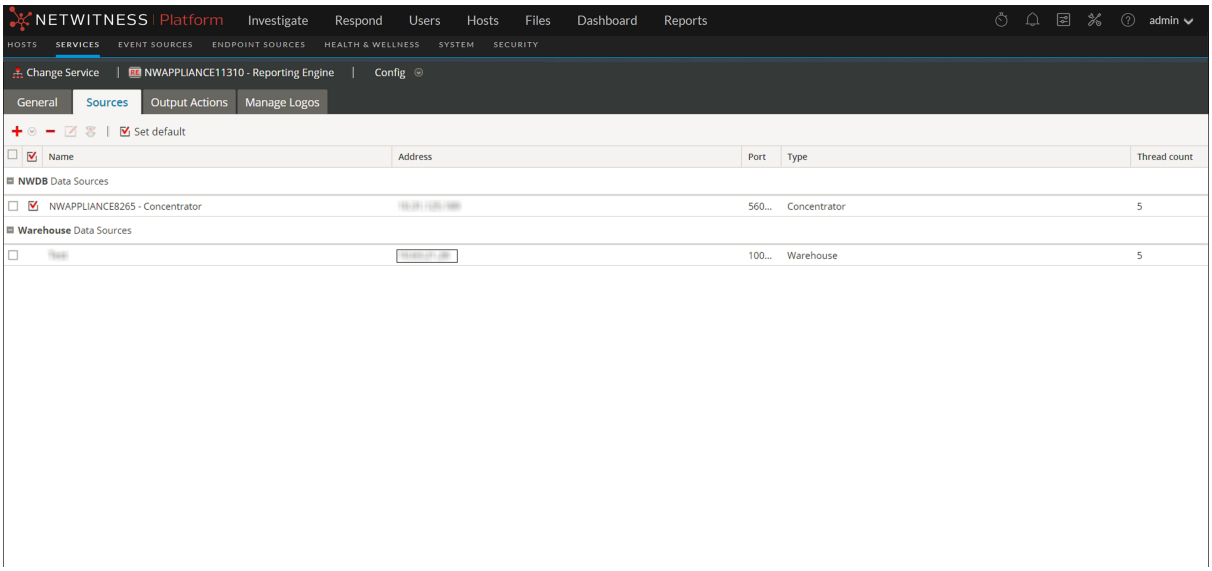
Field	Description
Server Principal	Enter the Principal used by the HIVE server to authenticate with the Kerberos Key Distribution Center (KDC) Server.
User Principal	Enter the Principal that HIVE JDBC client uses to authenticate with the KDC server for connecting the HIVE server. For example, gpadmin@EXAMPLE.COM.



Field	Description
Kerberos Keytab File	View the Kerberos keytab file location configured in the HIVE Configuration panel on the Reporting Engine General Tab. **Note:** Reporting Engine supports only the data sources configured with the same Kerberos credentials, like, User Principal and key tab file.

3. Click **Test Connection** to test the connection with the values entered.
4. Click **Save**.

   The added Warehouse data source is displayed in the Reporting Engine Sources tab.



5. Click  > **Available Services**.

   The Available Services dialog box is displayed.

6. In the Available Services dialog box, select the service that you want to add as data source to the Reporting Engine and click **OK**.

   NetWitness adds this as a data source available to reports and alerts against this Reporting Engine.

Note: This step is relevant only for an Untrusted model.

Set a Data Source as the Default Source

To set a data source to be the default source when you create reports and alerts:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select  > **View**> **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The **Services Config View** is displayed with the Reporting Engine Sources tab open.
5. Select the source that you want to be the default source (for example, Broker).
6. Click the  checkbox.

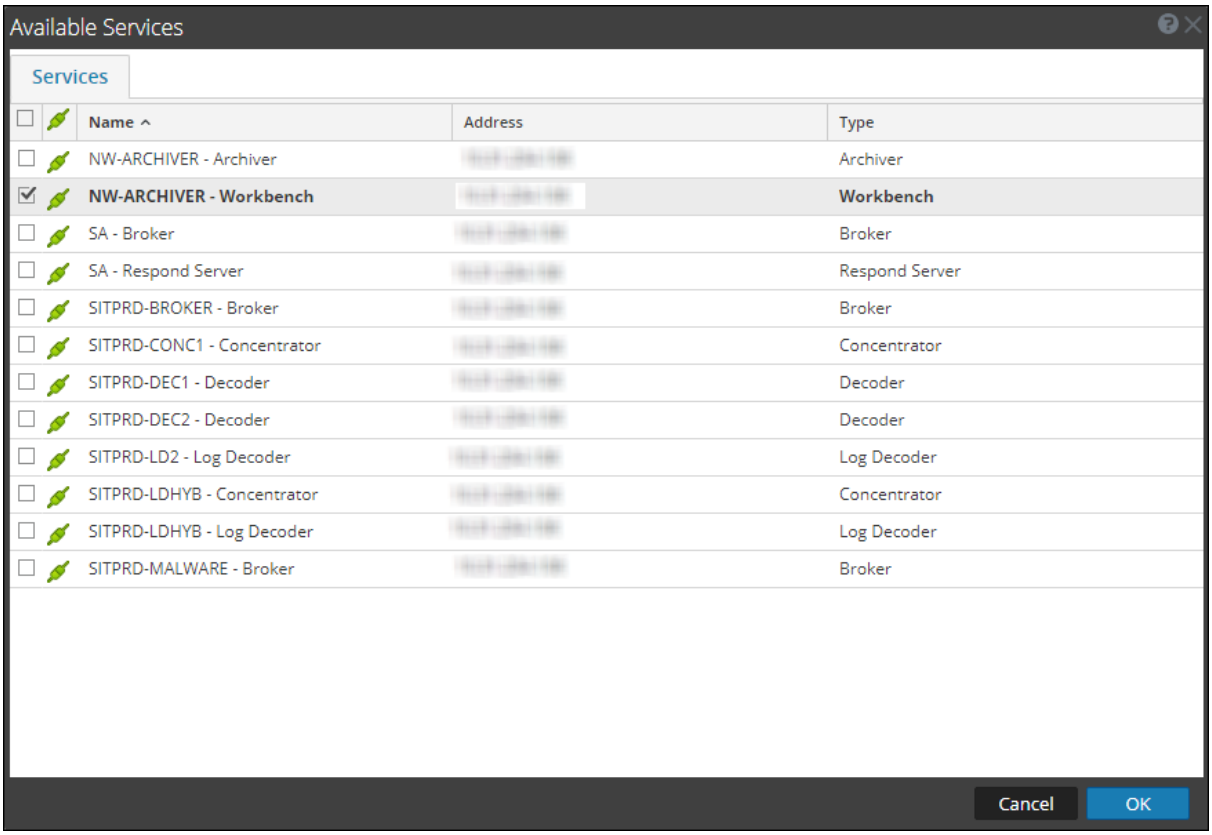
   NetWitness defaults to this data source when you create reports and alerts against this Reporting Engine.

(Optional) Add Workbench as Data Source

You must configure Workbench,to be able to use data from Workbench data source to generate Reports and Alerts. The following instructions describe how to add Workbench service as a data source to Reporting Engine to generate report for the data collected by Workbench.

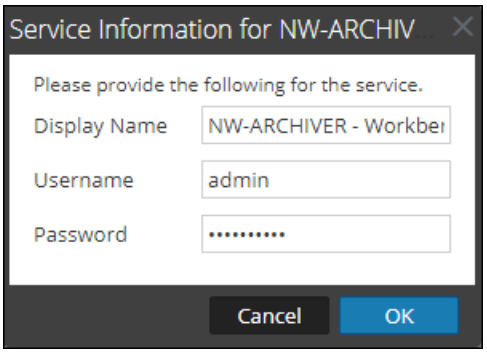
Prerequisites

Make sure you have:



1. Added Workbench as a service to your NetWitness deployment. For more information, see the *Archiver Configuration Guide*.
2. Added a Collection on the Workbench service.

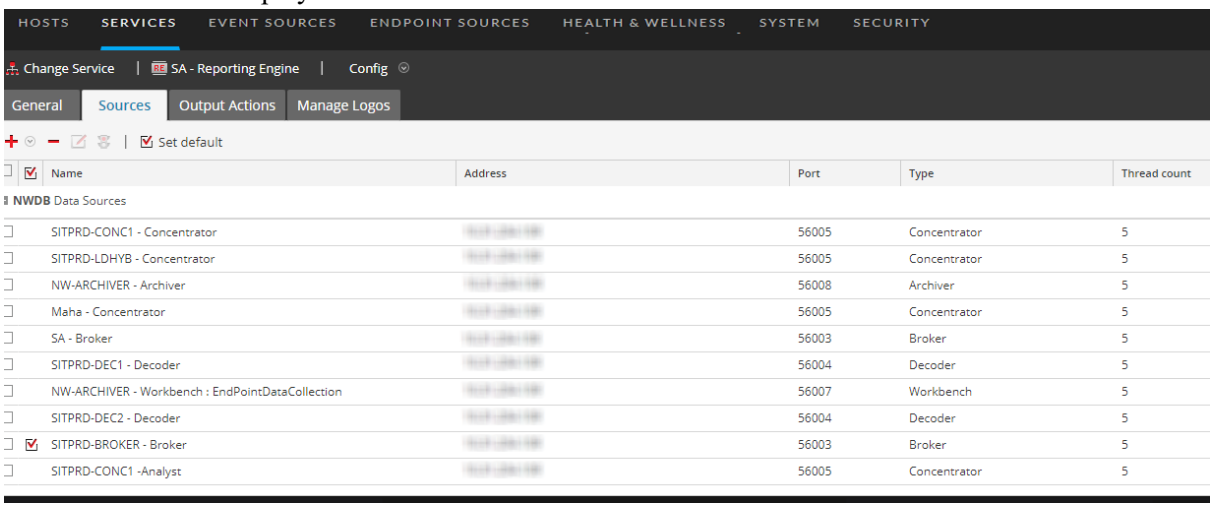
To add Workbench as a data source to Reporting Engine:



1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select  > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.

   The Available Services dialog is displayed:



6. Select the Workbench service and click **OK**.
   A list of collections are displayed.
7. Enter the service information, and click **OK**

8. Select a collection from the dropdown.

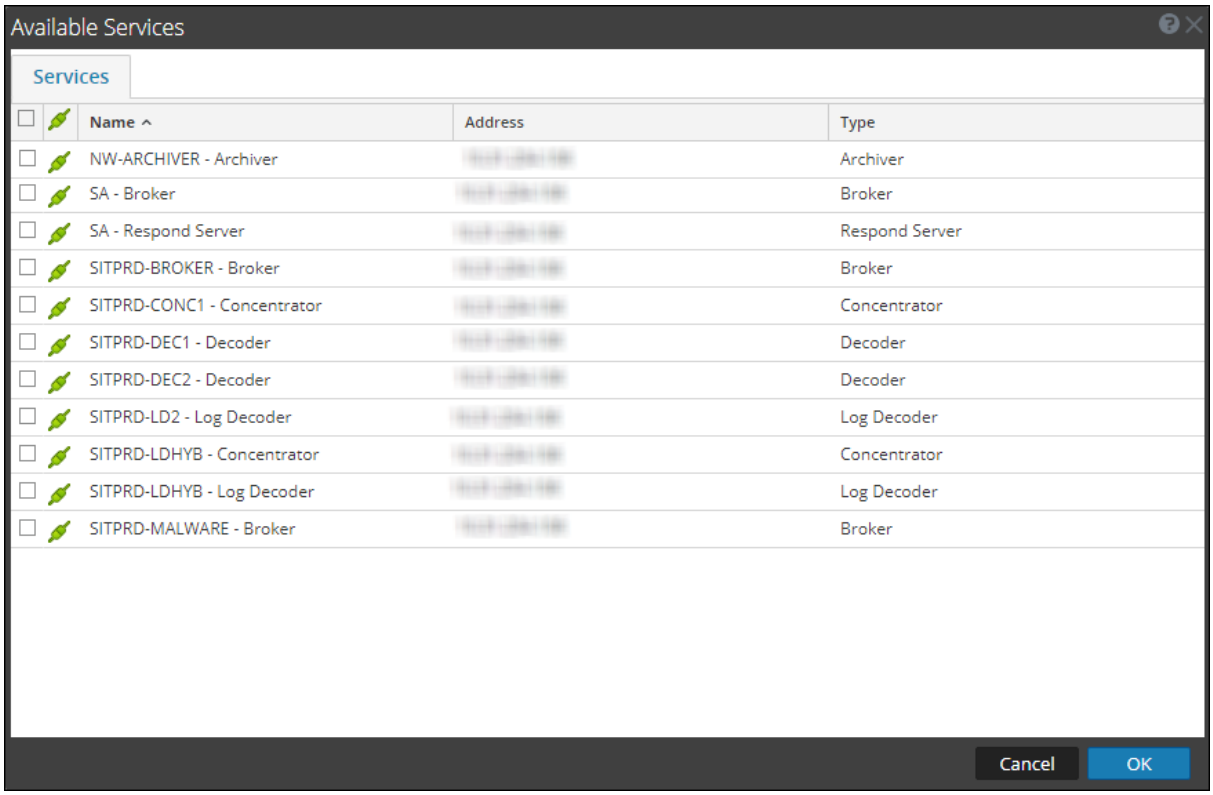
9. The data source is displayed in the Sources tab.

The workbench service is now added as a data source to the Reporting Engine.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

(Optional) Add Archiver as Data Source

You must configure Archiver, to be able to use data from Archiver data source to generate Reports and Alerts:



Prerequisites

Make sure that you have:

1. Installed the NetWitness Archiver host in your network environment. For more information, see the *Hosts and Services Getting Started Guide*.
2. Installed and configured Log Decoder in your network environment. For more information, see "Add Log Decoder as a Data Source to Archiver" in the *Archiver Configuration Guide*.
3. Reporting Engine service is available in your NetWitness deployment.
4. Added Archiver service to your NetWitness deployment. For more information, see "Add the Archiver Service" in the *Archiver Configuration Guide*.
5. Applied license to the Archiver service.

To add Archiver Data Source to Reporting Engine:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click  > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.
   The Available Services dialog is displayed.

6. Select the Archiver service and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the Username and Password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the Aggregate Services pane.

(Optional) Integrate Endpoint Information Into Reports

You can use the Endpoint data by using the following instructions to add the Endpoint information into Reports. The *Endpoint Integration Guide* provides an overview of Endpoint integration into NetWitness.

Prerequisites

Make sure that:

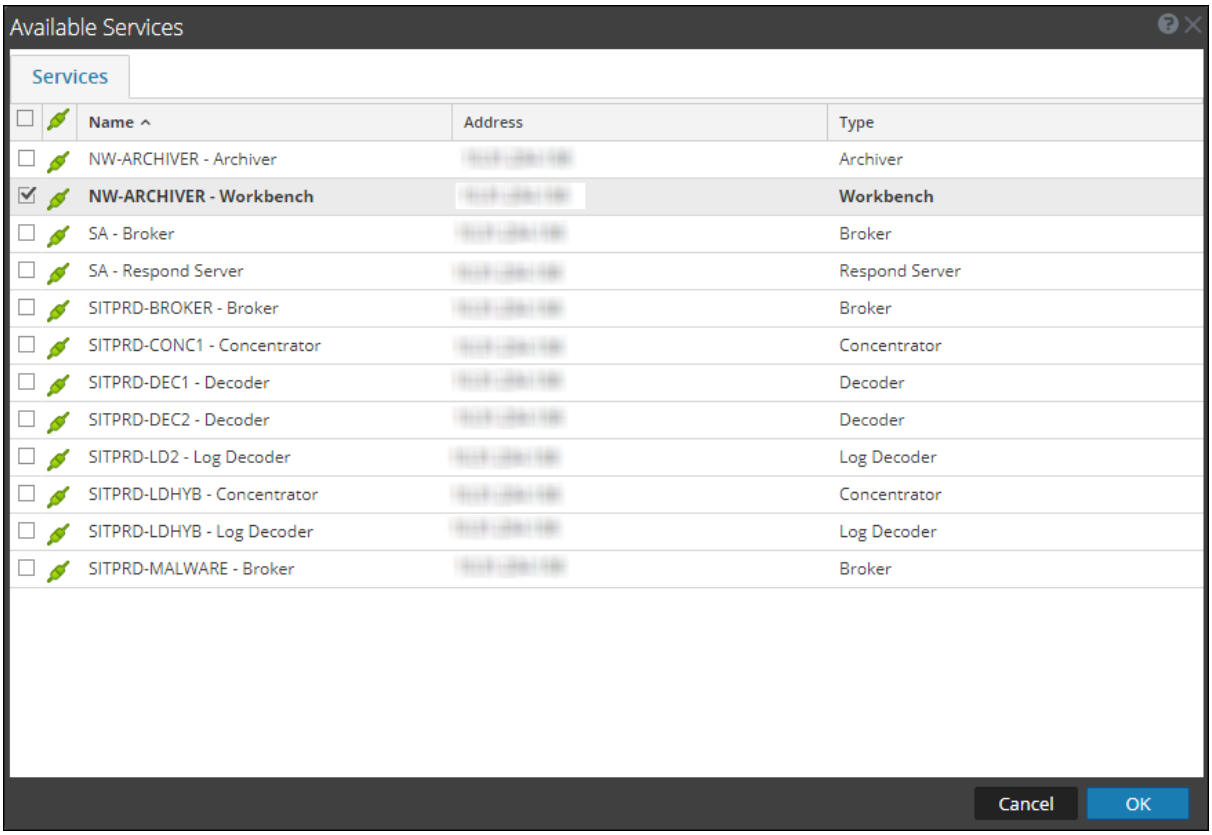
- You have configured the Endpoint alerts via syslog into a Log Decoder. For more information see, "Configure Endpoint Alerts Via Syslog into a Log Decoder" topic in *Endpoint Integration Guide*).

To integrate Endpoint information into Reports:

1. In **Reporting Engine**> **View**> **Config**> **Sources**.
2. Add the Concentrator that is consuming data from the Log Decoder as a data source.
   Endpoint meta is populated in Reporting Engine.
3. Run reports by selecting the appropriate meta.

(Optional) Add Collection as Data Source to Reporting Engine

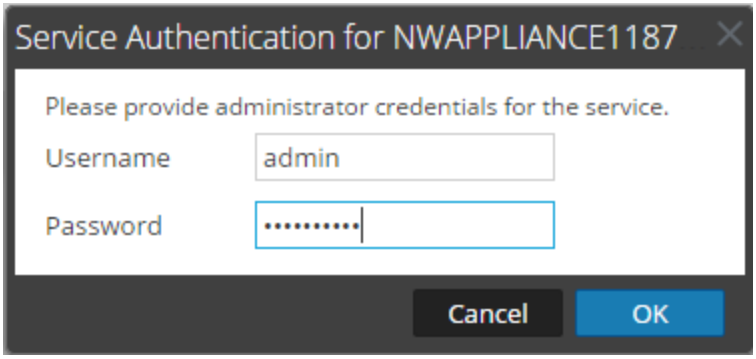
You must configure Collection, to be able to use data from Collection data source to generate Reports, Charts, and Alerts:



Prerequisites

Make sure that you have:

- Installed a Workbench service on a Reporting Engine host.
- Backed up data in a known location on your local host, if you are adding a collection using the data restored from the backed up data.



To associate a Collection as a data source with Reporting Engine:

1. Go to  **(Admin) > Services**.
2. In the **Services** list , select a **Reporting Engine** service.
3. Click  > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.
   The Available Services dialog is displayed.

6. Select the Workbench service and click **OK**.

   The Service Authentication dialog for the selected service is displayed.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the username and password for admin credentials for the service.
8. Click **OK**.

   The add collection dialog is displayed.

9. Select a collection from the drop-down list and click **OK**.

   The workbench service is now added as a data source to the Reporting Engine.

Configure Data Privacy for the Reporting Engine

You can configure the data privacy for all data sources of Reporting Engine using the Sources tab of the **Services** > **View** > **Config** view.

With the addition of the Data Privacy feature to NetWitness 11.0 and above, access to sensitive meta in NetWitness Core services can be restricted by configuring separate data sources for Data Privacy Officer (DPO) users and non-DPO users, and limiting access to those data sources by assigning appropriate permissions.

In the **Services** > **Config** view, you can add each Core service as two separate data sources: one with a service account having privileges equivalent to a DPO and the other with a service account having privileges equivalent to any other user. Then, to limit access to those data sources based on roles, you can assign read access or no access to those data sources for individual roles. To limit access to Warehouse data sources, you can do the same.or more information, see Configure Data Source Permissions.

Note: A user assigned to the `Data_Privacy_Officers` role (or an equivalent custom role), can create a report, chart and alert. Also, configure a report or alert output actions in the Reporting module. In an environment where data privacy features of NetWitness are enabled and one or more meta keys are configured as protected, these actions can result in the following:
- When an alert is created by a DPO user, any protected or sensitive meta involved in the alert is automatically available in Respond. This may inadvertently provide all the users of Respond module access to the sensitive meta values, regardless of their roles. One option to prevent this is to disable publishing into Respond from Reporting.
- When an Output Action is configured by a DPO user, either sensitive meta values, reports with sensitive meta values or both, may become available to target users or destinations of that Output Action, regardless of the role assigned to the target user.

It is strongly recommended that DPO users completely avoid creating alerts or configuring output actions for a report or alert in the Reporting module. If they do such configuration, the above implications must be carefully considered.

NetWitness Core services (for example, Concentrator, Broker, or Archiver) support the ability to restrict meta data based on the configured user role. To make use of the data privacy feature for Reporting Engine, you can configure two separate service accounts against Core services. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. The access to restricted meta data for the two service accounts is configured as part of the data privacy plan on each Core service.

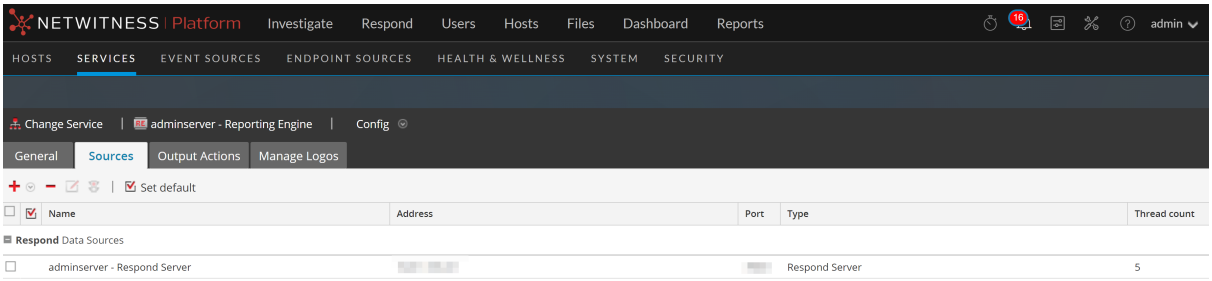
In Reporting Engine, you can add each Core service as two separate data sources (one being the regular data source and the other a privileged data source) using the two separate service accounts. You can configure Reporting Engine to allow only users with privileged roles to access the sensitive data source. Hence, Reporting Engine can connect to a NWDB Data source in two ways:

- Using a service account with DPO role.
- Using a service account without a DPO role.

Note: You can also add two or multiple data sources for the same Core service.

After adding two data sources with different service accounts for the same Core service, you can configure data source permissions to manage access to these data sources. For more information, see Configure Data Source Permissions.

Note: If the content is changed to utilize the transformed meta key, the hash value of the original meta is displayed in its place when viewing reports, charts and alerts.



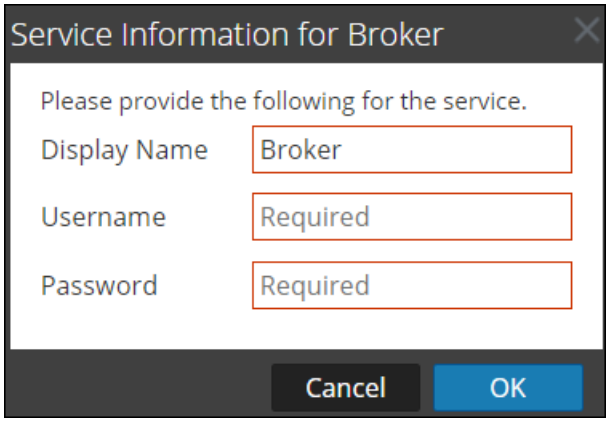
Add a NWDB Data Source with Different Service Accounts

To add a NWDB data source:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  **View** > **Config**.

   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Services Config View is displayed.

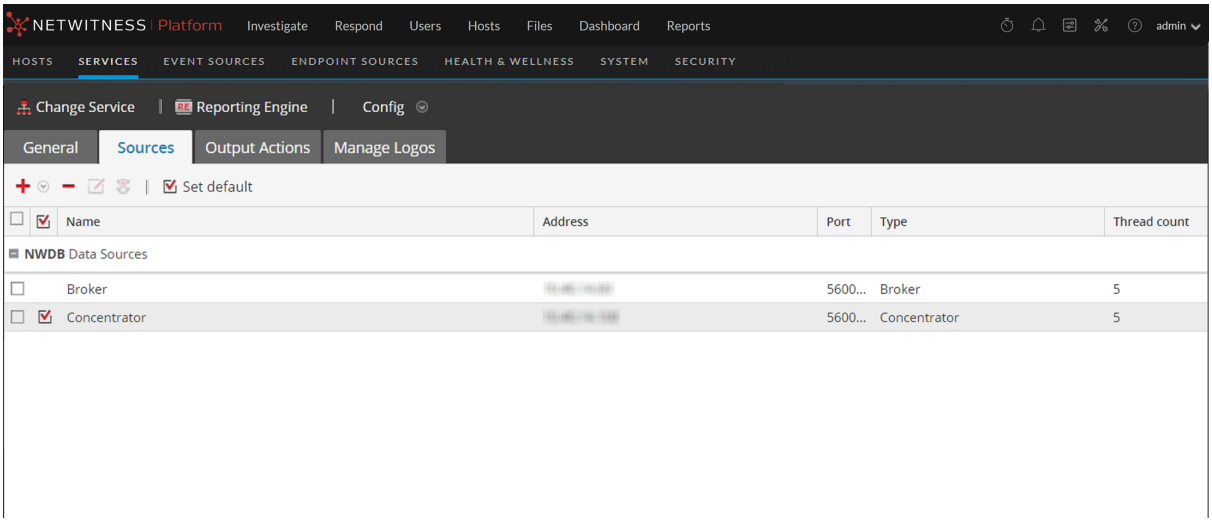


5. Click  and select Available Services.

   The Available Services dialog is displayed. All services are listed, including those that have already been added to the Reporting Engine.

6. Select the checkbox next to the service and click **OK**.

   The Service Information dialog for the selected service is displayed.



Note: NetWitness prompts you to provide a username and password for the selected service. To limit access to sensitive data, DPO users must use their credentials while adding the source instead of using the admin credentials. These credentials need to be applied to the host even if using trusted connections between the NetWitness server and NetWitness Core hosts.

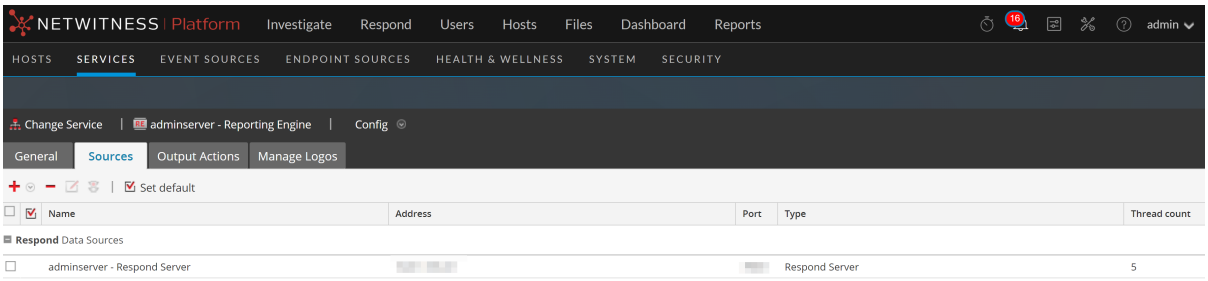
   Repeat the step for Non-DPO data source.

7. Enter the username and password for the required service account.
8. Click **OK**.

The required service is added as a data source to the Reporting Engine. Two data sources are added to Reporting Engine for the same Core device.

Configure Data Source Permissions

You can configure data source permissions for Reporting Engine using the **Sources** tab of the **Services** > **Config** view. This helps manage access control to the data sources by setting the data source permissions. Now, with the ability to add more than one data source for the same Core service, you can configure different permissions for each data source of the same Core service. For example, data privacy officers (DPO) can create a Warehouse source using their credentials, and that allows them to execute reports against the Warehouse while restricting everyone else from being able to use that source.



Note: In 11.x, the permissions for NWDB and Warehouse data sources are automatically set based on the permissions of the reporting objects. For example, if the role had the permissions set as **Read Only**/**Read & Write** for any reporting object in 10.5, then that role is automatically assigned read only permission for all the data sources that existed in 10.5. If no permission is set for the role, then the data source permission is automatically set to No Access.

To configure permissions to data sources:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Service Config View displays the Sources tab.

5. Select the data source for which you want to configure permissions by selecting the checkbox.
6. Click .

   The Data Source Permissions dialog is displayed.

7. Modify the access permission for different users based on the type of service account of the data source. The permission can be either **Read Only** or **No Access**.
8. Click **Save**.

   The required permissions are configured for the data source. For more information, see the *Reporting Guide*.

Configure Reporting Engine Settings

After you configure the Reporting Engine and required data sources based on your requirements, you can modify some of the configurations to customize your Reports, Charts, and Alerts.

To configure the settings:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed with the General tab highlighted. For more information on Reporting Engine General tab, see Reporting Engine General Tab.
4. Edit the Reporting Engine service settings and click **Apply**.

   The service settings are configured on Reporting Engine.

Enable LDAP Authentication

To enable LDAP mode of authentication using Active Directory for HiveServer2 for Warehouse data source, follow these steps.

1. Log on to the Analytics Warehouse appliance as root user.
2. Navigate to `/opt/mapr/hive/hive-0.11/conf.new/` directory. Type the following command and press ENTER:

   ```
   cd /opt/mapr/hive/hive-0.11/conf.new/
   ```
3. Edit the file `hive-site.xml`. Type the following command and press ENTER:

   ```
   vi hive-site.xml
   ```
4. Add the following properties under `<Configuration>` tag:

   ```
   <property> <name>hive.server2.authentication</name> <value>LDAP</value>
   </property> <property> <name>hive.server2.authentication.ldap.url</name>
   <value>LDAP_URL</value> </property>
   ```

   Where `LDAP_URL` is the URL of the LDAP Server.
5. Restart HiveServer2.

Add Additional Space for Large Reports

To add additional disk space to the Reporting Engine for large reports, follow the below steps. If large compliance reports have to be generated for Warehouse, the Reporting Engine disk space might get consumed quicker than expected. In such cases, you can mount any external storage such as SAN or NAS for storing reports.

The directories that tend to fill up disk space are `resultstore` and `formattedReports` under the Reporting Engine home directory. It is recommended to move only these two directories to SAN or NAS and replace the original locations with soft links pointing to the new locations. It is also recommended to leave the remaining directories in the local disk itself for reliable and high I/O performance.

Note: The following steps assume that the Reporting Engine home directory is located at `/var/netwitness/re-server/rsa/soc/reporting-engine/` and the external storage is mounted under `/externalStorage/`. Also, the 'rsasoc' user must have read-write access to the specified external storage path.

To move disk space for the Reporting Engine to external storage:

1. Stop Reporting Engine service as a root user.

   ```
   service rsasoc_re stop
   ```

2. Switch to `rsasoc` user.

   ```
   su rsasoc
   ```

3. Change to RE home directory.

   ```
   cd /var/netwitness/re-server/rsa/soc/reporting-engine/
   ```

4. Move the resultstore directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv resultstore /externalStorage
   ```

5. Move the formatted Reports directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv formattedReports /externalStorage
   ```

6. Create a soft link for resultstore. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/resultstore /var/netwitness/re-
   server/rsa/soc/reporting-engine/resultstore
   ```

7. Create a softlink for formattedReports. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/formattedReports /var/netwitness/re-
   server/rsa/soc/reporting-engine/formattedReports
   ```

8. Exit the `rsasoc` user.

   ```
   exit
   ```

9. Start Reporting Engine service as a root user.

   ```
   service rsasoc_re start
   ```

   Note: If the external storage is offline, you cannot perform the following tasks:
   1) Execute Reports or Reporting Alerts
   2) View existing Reports or Reporting Alerts
   However, you can create new Reporting objects such as Reports and Charts, and access Charts and Live Dashboard created for charts. Therefore, you must ensure that the external storage is reliable and has the required space.

   Additionally, if you want to store reports beyond 100 days, change the retention configuration appropriately for the service that you are using as a data source.

Accessing Reporting Engine Log Files

You can access the Reporting Engine log files which are stored in the following logs directory `/var/netwitness/re-server/rsa/soc/reporting-engine/logs/`

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`)

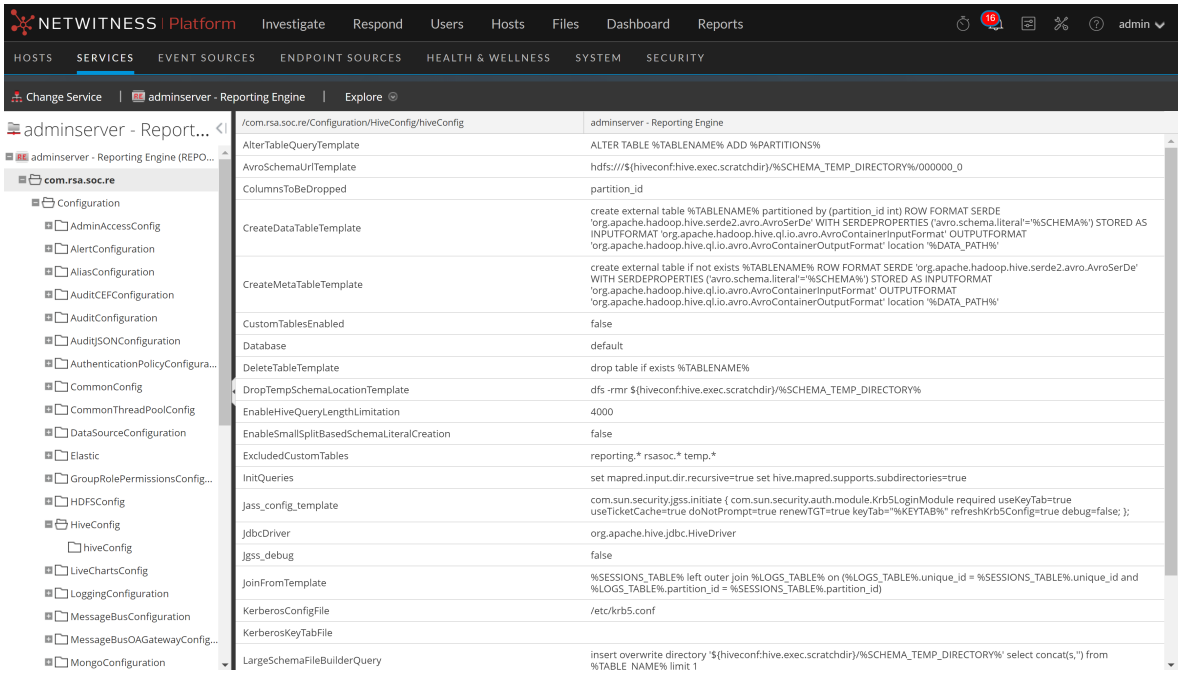
The Reporting Engine rarely writes command line error messages to the `rsasoc/nohup.out` file.

The Reporting Engine appends the log messages and output written by systemd system and the commands used to start the reporting-engine to the directory `/var/log/messages`.
A `/var/log/messages` log file is a system log file so only the root user can read it.

Configure Task Scheduler for a Reporting Engine

You can configure queues and pools in the Reporting Engine to schedule NWDB or Warehouse reports. For more information on Task Schedulers, see "Task Scheduler for Warehouse Reporting" in the *Reporting Guide*

Prerequisites



Make sure that you have identified the following:

- Scheduler type and pools or queues you want to use. You can configure only one scheduler for the Reporting Engine. By default the Fair Scheduler is configured.
- Names of the queues or pools, and the resources given to each queue and pool.
- NetWitness does not support multiple queues or pools per cluster. Netwitness recommends that you either provide unique names to queues or pools in all the clusters or use the same queue or pool names in both the clusters. If cluster size is large, there may be more than 3 pools or queues.
- If you are using an unsupported scheduler, the Reporting Engine does not set any property for the jobs that it launches.
- If the name of the pool or queue does not exist in the cluster, then Capacity Scheduler uses the default queue for the report. The Fair Scheduler may not execute the rule or creates a new pool with the lowest share. This is based on the value specified for the Fair Scheduler property `mapred.fairscheduler.allow.undeclared.pools`.
- If you do not specify a pool or queue, the job launched by the test rule is in the `mapr` pool or the default queue. It recommends that you configure a pool mapr with low (around 1/10 of total capacity) share with `maxRunningJobs = 2` so that these rules do not disrupt running reports. Make sure that you do not specify this pool name for any reports.

Specify the Pools and Queues

To specify the pools and queues:

1. Go to **(Admin) > Services**.
2. Select **Reporting Engine** and click > **View** > **Explore**.
3. Select **com.rsa.soc.re** > **Configuration** > **HiveConfig** > **hiveconfig** > **WarehouseResourcePoolNames**.
4. In the **WarehouseResourcePoolNames** field, enter the pool or queue names separated by spaces. For example, to configure four pools or queues with the names pool1, pool2, wrong and default, enter the names separated by a space.

Define Reports, Charts and Alerts

After you configure the Reporting Engine and the required data source based on your requirement, you can generate your Reports, Charts, and Alerts.

Define Reports

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a Rule
- Test a Rule
- Schedule Reports
- Add an Alert
- Add a Chart
- Test a Chart

For more information, see the above topics in the *NetWitness Reporting Guide*.

Define Charts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a chart and Chart Groups
- Test a Chart
- Investigate Charts
- Manage Charts

For more information, see the above topics in the *NetWitness Reporting Guide*.

Define Alerts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Alerting module:

- Configure Alerts
- Generate Alerts
- Add an Alert
- View an Alert

- View and Alert
- View Alerts Schedule
- Investigate an Alert

For more information, see the above topics in the *NetWitness Reporting Guide*.

Configure Reporting Engine General Settings

After you add and configure the Reporting Engine service, the system settings are defined with default values to achieve optimal results. However, you can modify and customize the Reporting Engine notifications based on your requirement by navigating to the **General** tab in the **Services** > **Config** view for a Reporting Engine.

Access the General Tab

You need to open the General tab to configure the general parameters for Reporting Engine.

To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services list, select a **Reporting Engine** service.
3. Click **View** > **Config**.
4. Select the **General** tab.
5. Click **Apply** after you edit the parameters.

After you navigate to the General tab, you can modify the following parameters.

- System Configuration
- Logging Configuration
- Warehouse Kerberos Configuration

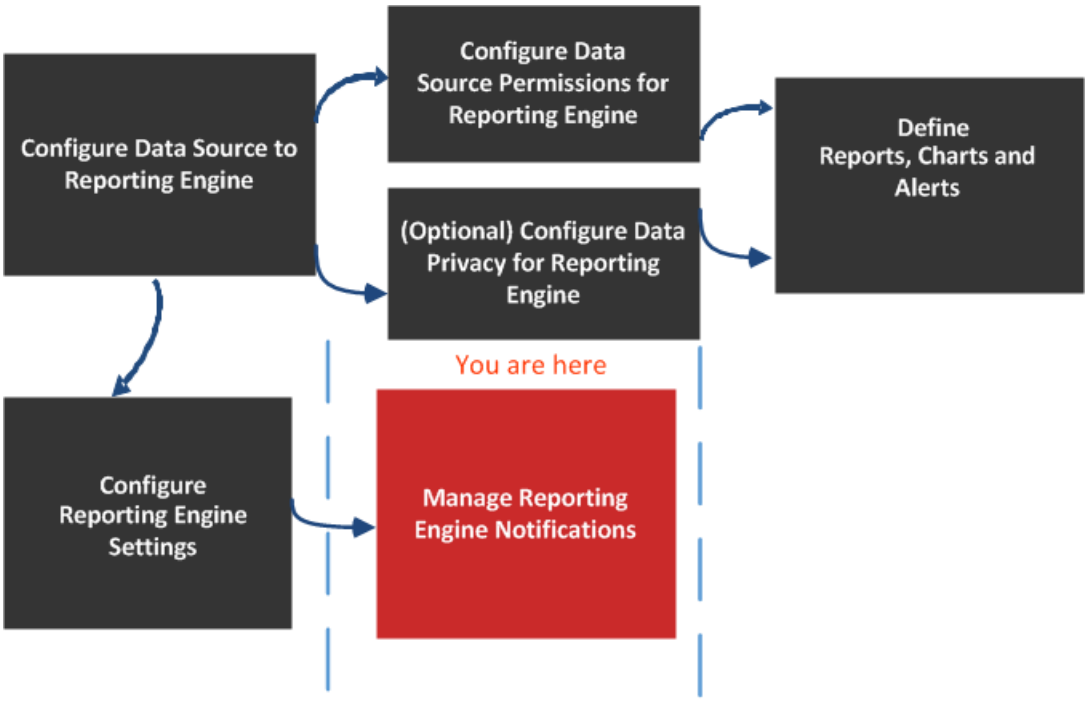
For more information see, General tab for details on the configuration parameters.

Troubleshooting Reporting Engine Configuration

Problem	Solution
When the NetWitness Server IP address is changes, the Reporting Engine datasource configuration does not get updated with the new IP	You must manually configure the new IP. Perform the following manual steps to configure the new IP address: 1. Login in NetWitness Platform. 2. Go to  **(Admin) > Services** > **Reporting Engine** > **View** > **Config**. 3. Click the **Output Actions** tab. 4. Add the new IP address in the **Hostname** field. 5. Click **Apply**. 6. Click the **Sources** tab and add the data sources again.

References

You can customize and make optimum use of the service by modifying the Reporting Engine settings in the **Services** > **Config** view, which has parameters that specifically pertain to the Reporting Engine.



See the following sections for details:

- Reporting Engine General Tab
- Reporting Engine Sources Tab
- Reporting Engine Output Actions Tab
- Reporting Engine Manage Logos Tab

Reporting Engine General Tab

The General tab for the Reporting Engine service controls several settings that can tune the performance of a service and specify the user credentials for the service. Navigate to Services > View > Config > Reporting Engine > General. These settings are used for the Reporting Engine service exclusively.

The required permission to access this view is Manage Services.

What do you want to do?

Role	I want to ...	Refer to...
Administrator	Configure Data Source to Reporting Engine	Configure the Data Sources

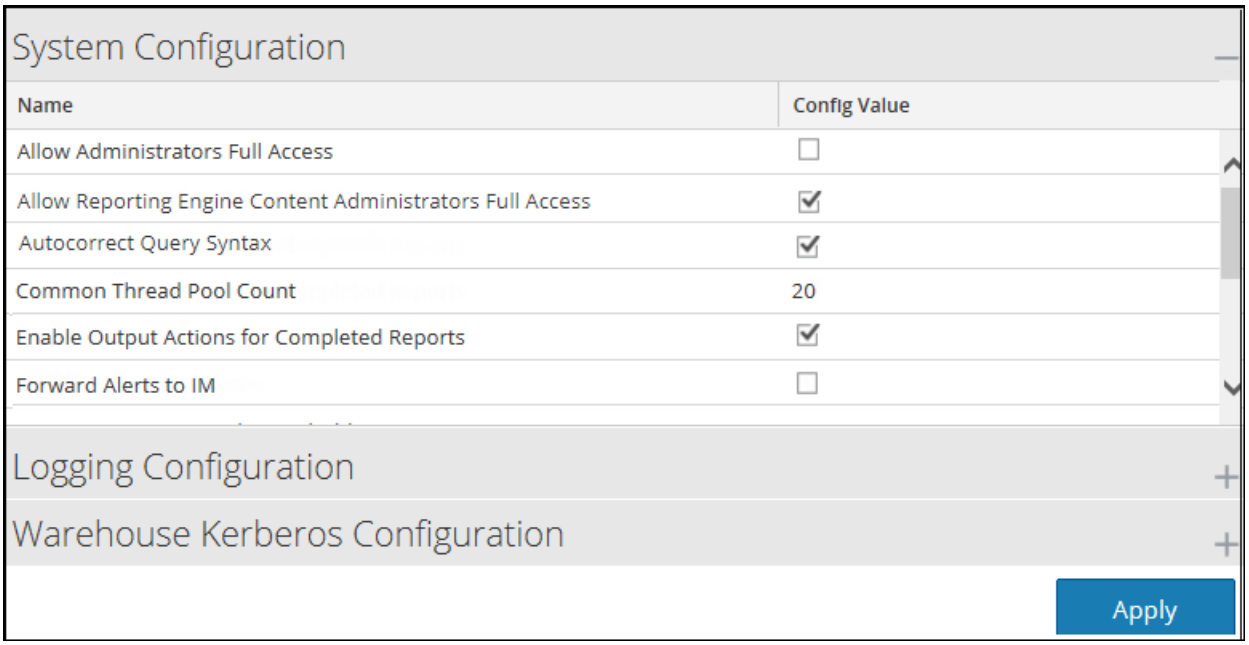
Related Topics

- How Reporting Engine Works

Quick Look

Here is example of the General tab where service configurations are displayed.



1. Displays all the available configurable tabs.
2. Displays the available configuration parameters for the system.
3. Displays the name of the parameter.
4. Displays the set values for each parameter.
5. Applies the changes.

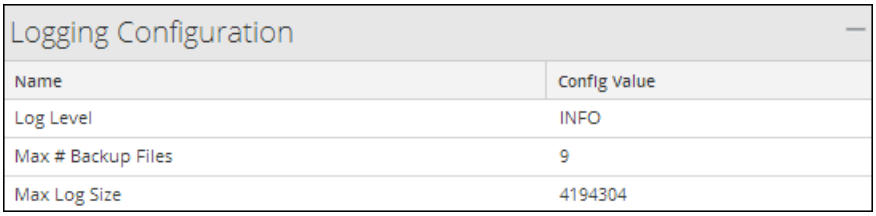
System Configuration

The System Configuration panel parameters for the Reporting Engine manage service configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. The default values are designed to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following figure displays the fields that can be configured in the System Configuration panel:

The following table describes the System Configuration panel features.

Name	Config Value
Allow Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users (non-admin). By default, this is not enabled. **Note:** If you enable the checkbox and then disable it, the access on all Reporting Engine objects that were enabled by selecting the checkbox will not be accessible. But, if you have defined the access on specific objects via Permissions window (**Reports > Manage > RE Object >**  **> Permissions**), enabling/disabling this checkbox will not have impact on these objects.
Allow Reporting Engine Content Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users. By default, this is enabled. If disabled, you cannot access the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users.
Common thread pool count	The number of thread pools assigned for executing common tasks on the Reporting Engine. A valid value is an integer (**20** default).
Enable Output Actions for Completed Reports	Select the checkbox to process the output actions only for reports with all rule executions successful. By default, this is enabled. If disabled, the output actions are processed for all scenarios (completed, partial, failure).
Forward Alerts to Respond	Select the checkbox to forward all the alerts to Respond. By default, this is not enabled.



Name	Config Value
Max# of Concurrent Alerts	The maximum number of alerts that can be run simultaneously. This has a direct impact on the NetWitness service against which the alerts are run, as each alert consumes a query thread on the NetWitness service. A valid value is an integer (**10** default).
Max # of Concurrent Charts	The maximum number of charts that can be run simultaneously. A valid value is an integer (**10** default).
Max # of Concurrent LookupAndAdd Queries	The maximum number of parallel LookupAndAdd Queries that can be run per NWDB rule. A valid value is an integer (**2** default). When you increase this value, for better performance, you must ensure the NWDB data source is configured to handle the parallel queries.
Max # Concurrent List Value Reports	The maximum number of list value reports per schedule that can be generated in parallel. A valid value is an integer (**1** default).
Max # List Value Reports	The maximum number of list value reports generated, irrespective of the number of values in the list. A valid value is an integer (**10000** default).
Max rows stored per Rule (Billions)	The maximum number of rows that a rule can fetch when queried. A valid value is an integer (**100** default).
Maximum disk space threshold	The maximum disk space threshold allotted (in GB) to execute reports, alerts and charts. The initial value is configured based on the available system space.
Minimum disk space threshold	The minimum disk space threshold allotted (in percentage) required to execute reports, charts, and alerts. By default, this is value is set to 5. **Note:** If the minimum threshold is reached, then the execution of reports, charts and alerts will stop even if the service is running.
NWDB Info Queries Time Out	The info queries time out in seconds for NWDB server. A valid value is an integer (**1800** default).
NWDB Maximum aggregate Rows	The maximum number of rows that is returned when an aggregation is used in the NWDB rule. A valid value is an integer (**1000** default).
NWDB Query Time out	The time out in seconds for NWDB server to time out the rule execution, if it cannot process the result in configured time. A valid value is an integer (**259200000** default).
Process output actions for successful reports only	Select this checkbox to process output actions only for reports whose all rule executions are successful. When you de-select this checkbox, output action will be triggered for partial, completed, and failed reports. **Note:** This is applicable for all output actions except for dynamic list output actions.

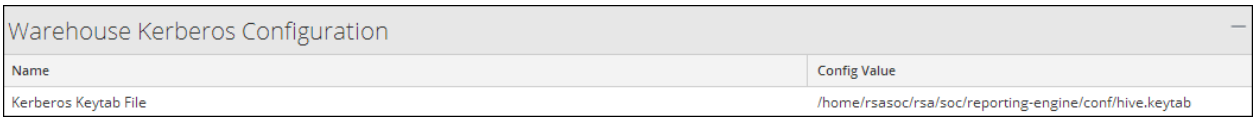
Name	Config Value
Retain Alert history for # days	The maximum number of days to retain the alert history and alert status. A valid value is an integer (**100** default).
Retain Chart history for # days	The maximum number of days to retain the chart history and chart status. A valid value is an integer (**30** default).
Retain Report history for # days	The maximum number of days the system retains report history and report status. A valid value is an integer (**100** default).
Schedule Thread pool count	The number of thread pools assigned for scheduled tasks (for example, clearing history) on the Reporting Engine. A valid value is an integer (**5** default).

Logging Configuration

The Logging Configuration panel parameters of the Reporting Engine manages the logging configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance of the Reporting Engine.

The following figure displays the fields that can be configured in the Logging Configuration panel.

The following table describes the Logging Configuration panel features.



Name	Config Value
Log Level	The logging level that determines the scope of information included in log files. Possible values are: • `ERROR` • `WARN` • `INFO (default)` • `DEBUG` • `ALL`
Maximum # Backup Files	The maximum number of backup log files the system retains. A valid value is an integer (**9** default).
Max Log Size	The maximum size (in bytes) of the primary log file. A valid value is an integer (**4194304** default).

For more information on Reporting Engine logging, see Accessing Reporting Engine Log Files.

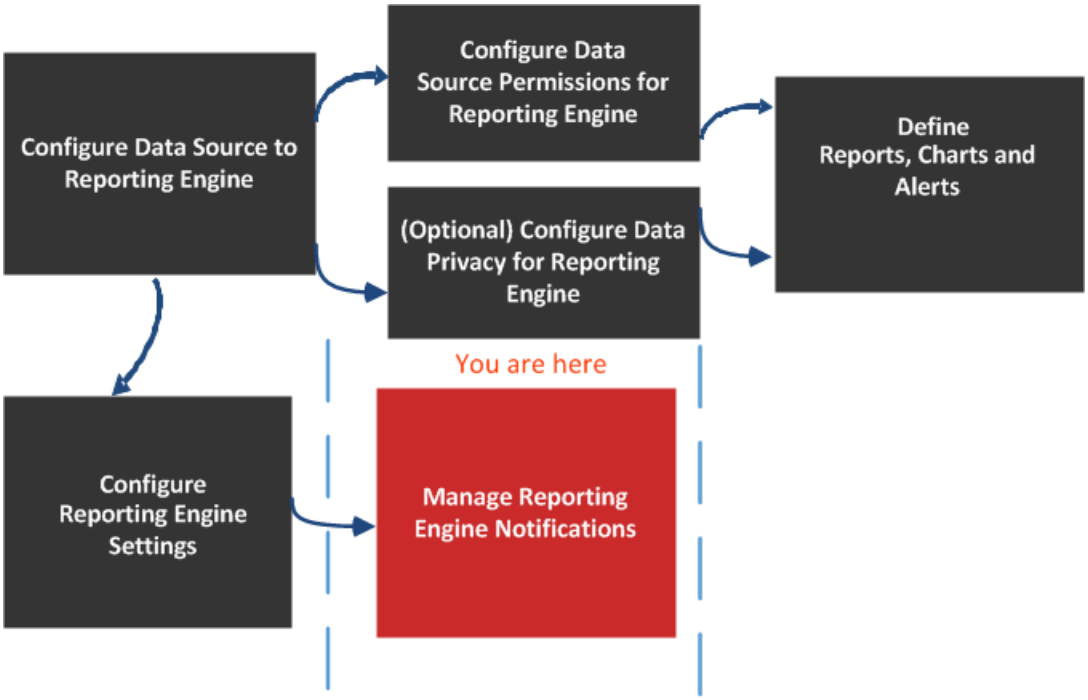
Warehouse Kerberos Configuration

The Warehouse Kerberos Configuration panel provides a way to specify the Kerberos Keytab file on this Reporting Engine.

The following figure displays the field that can be configured in the Warehouse Kerberos Configuration panel:

The following table describes the Kerberos Configuration panel features:

Name	Config Value
Kerberos Keytab File	The Kerberos keytab file location. For example: `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/hive.keytab`



The default Kerberos configuration file is located at, `/etc/kbr5.conf` in the Reporting Engine. You can modify the configuration file to provide details for Kerberos realms and other parameters related to Kerberos.

Added the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the `/etc/hosts` file in the host on which the Warehouse Connector service is installed.

Reporting Engine Sources Tab

The services configuration parameters are available in the Sources tab of the Services Config view for the Reporting Engine. The Sources tab for the Reporting Engine service in the Services Config view controls that data sources associated with a Reporting Engine. The Source tab consists of a single panel with a toolbar and a grid that lists the data sources associated with the Reporting Engine.

Workflow

Related Topics

- How Reporting Engine Works

Quick Look

Here is example of the Sources tab where the available services are displayed.

1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the selected service .
3 Displays the field parameters for the selected service.

The data sources available to the Reporting Engine for which you are defining reports, charts and defining alerts are:

- **NWDB Data Sources** - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection.

  Note: When a data privacy plan has been implemented to limit access to sensitive data on a data source, you must configure different service accounts in Reporting Engine for privileged and non-privileged users. To configure different service accounts for data privacy, you can add more than one NWDB data source. This procedure is available under Configure Reporting Engine Settings.

  IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

- **Warehouse Data Sources** - The Warehouse data sources are Horton Works and MapR.

- **Respond Data Sources** - Respond is used to generate reports on alerts and incidents. The Respond data sources are Reporting Engine, ESA, Malware, EndPoint, and Web Threat Detection. Respond is used to store the alerts and incidents reports.

If you set a source as the default data source, NetWitness uses that source when you create reports and alerts unless you choose to override it with one of the other sources listed in this tab.

Note: You can manage access control to NWDB and Warehouse Data Sources. For more information, see Configure Reporting Engine Settings.

Features

You can perform the following actions on the Sources tab:

Icon	Actions
	This option adds new services as data sources for Reporting Engine. Add existing services (Archiver, Workbench, and Collection) as data sources for Reporting Engine. For details, see the corresponding topic: • (Optional) Add Archiver as Data Source • (Optional) Add Collection as Data Source to Reporting Engine • (Optional) Add Workbench as Data Source
	This option removes data sources from a Reporting Engine.
	This option configures the Data Source Permissions. This is enabled only for NWDB and Warehouse Data Sources. For more information, see Configure Data Source Permissions.
	This option sets the default data sources for a Reporting Engine. This is the source to which NetWitness defaults in the **Data source** field of the following views: • Rule Definition view. • Create or Modify Alert view.

The NetWitness data sources are listed under the different categories as follows:

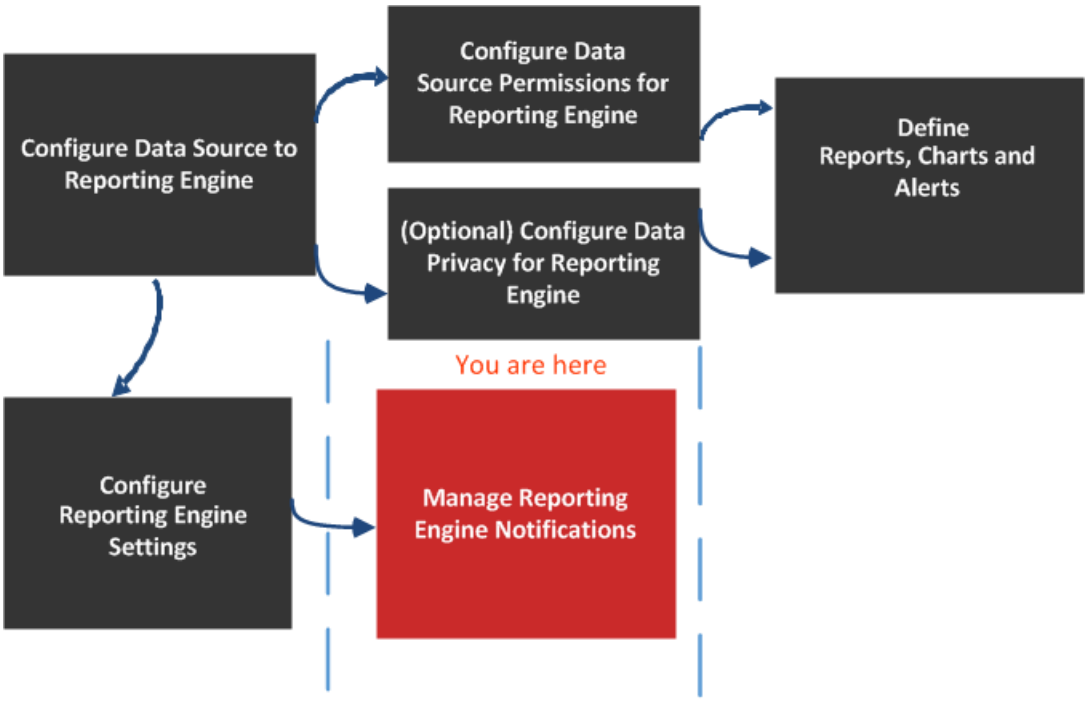
- NWDB Data Sources category displays the NetWitness data sources.
- Warehouse Data Sources category displays the Warehouse data sources.

Column	Description
	Clicking the check box selects the data source. After you select it, you can use toolbar to remove the source or set the source as the default.
Name	Displays the name of the data source.
Address	Displays the IP Address of the data source.
Port	Displays the port of the data source.

Column	Description
Type	Displays the service type of the data source.
Thread Count	Displays the thread pool size used for executing rules on the data source.

Reporting Engine Output Actions Tab

You can configure output actions for a Reporting Engine to determine the format you want the data to be presented to you based on your requirements. The service configuration parameters are available in the Output Actions tab of the Services Config view configured for a report or an alert execution. This tab consists of the following panels:



- NetWitness Configuration
- Simple Mail Transfer Protocol (SMTP)
- Simple Network Management Protocol (SNMP)
- Syslog
- Simple File Transfer Protocol (SFTP)
- Uniform Resource Locator (URL)
- Network Share

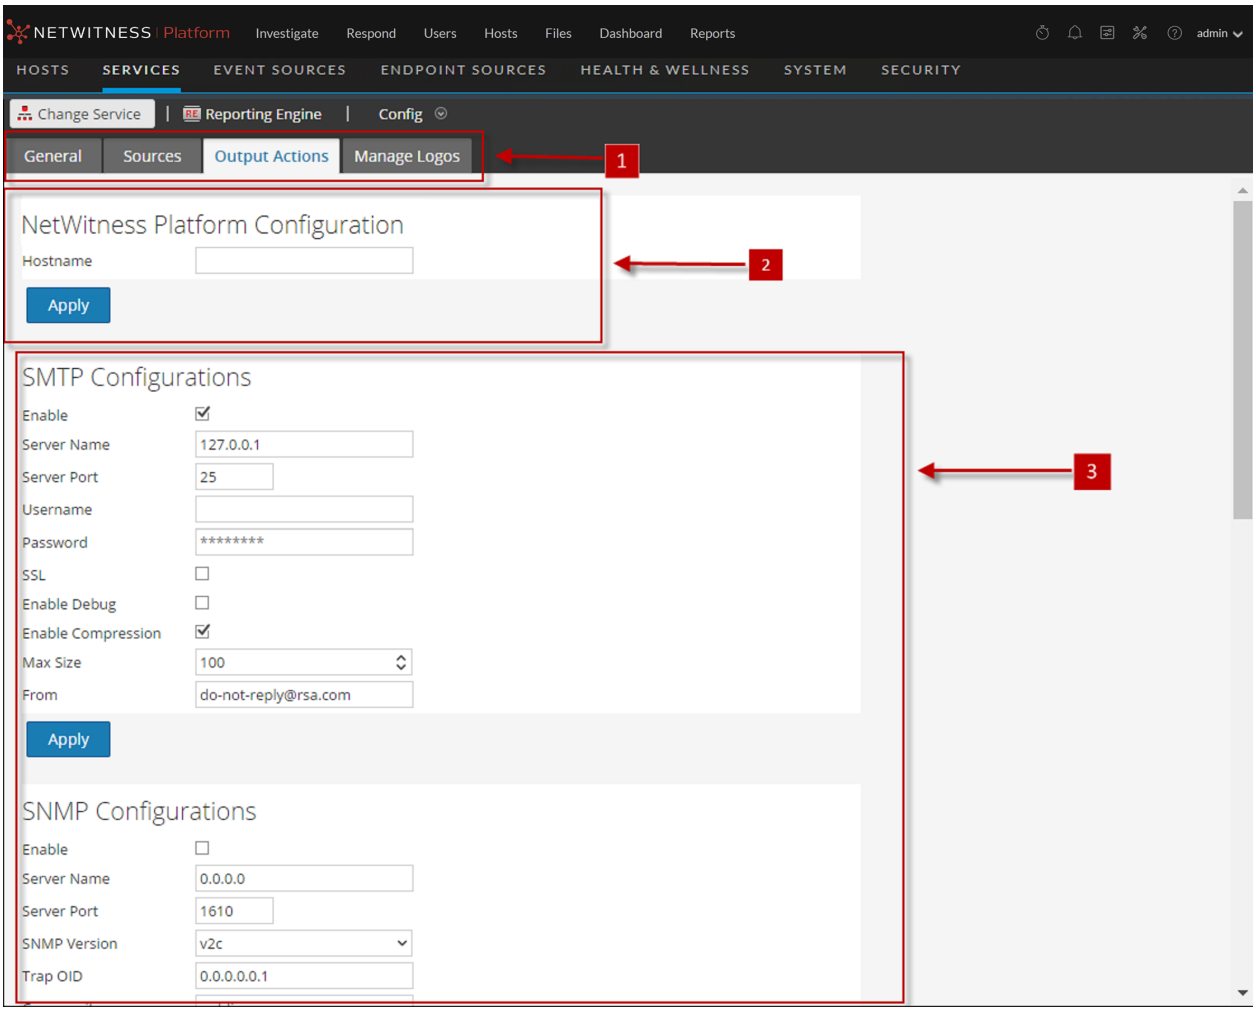
For instance, Syslog output action is used specifically for Reporting Engine Alerts, whereas, SFTP, URL, and Network Share output action is used specifically for Reporting Engine Reports.

You can configure the required permission to access this view in Manage Services.

You must ensure that the Reporting Engine is up and running and the data source from which you want to generate a report is configured in the NetWitness.

Workflow

What do you want to do?



Role	I want to...	Refer to...

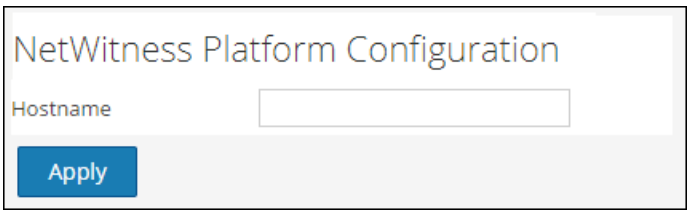
Related Topics

- How Reporting Engine Works

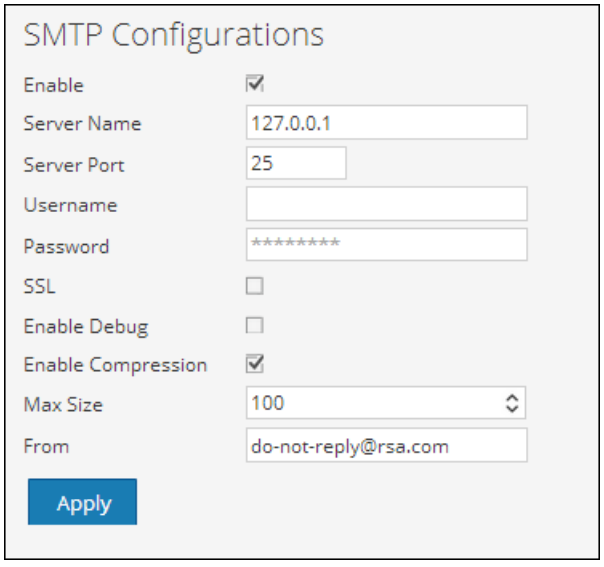


Quick Look

1	Displays all the available configurable tabs.
2	Displays the NetWitness configuration host.
3	Displays all the types of output action that can be configured.

NetWitness Configuration

The following figure shows the NetWitness Configuration on the Output Actions Tab.



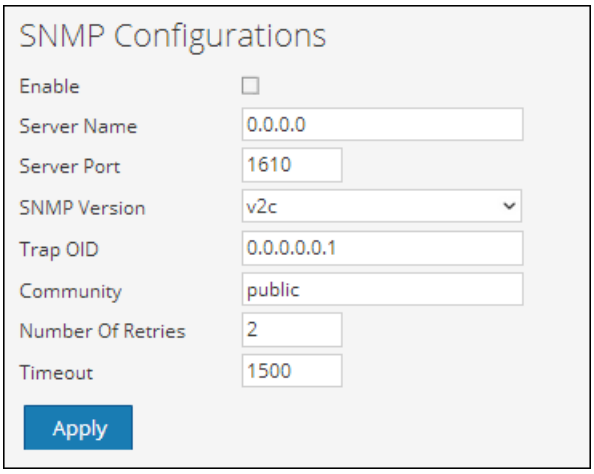
The following parameters identify the NetWitness host that is associated with the Reporting Engine.

Name	Config Value
Host Name	IP Address or Hostname of the NetWitness server. You must specify this parameter for all kind of deployments so that you can refer to this address to create investigation links to NetWitness from Reports, Alerts, and so on. The NetWitness uses this parameter to correctly generate: • SMTP Output Action • SNMP Output Action • Syslog Output Action • SFTP Output Action • URL Output Action • Network Share Output Action • Hyperlinks for meta values in Report PDFs
Apply	Update the configuration.

SMTP

After an execution is completed, an email notification is sent to the user based on the SMTP configuration.

The following figure shows the SMTP Configuration on the Output Actions Tab.



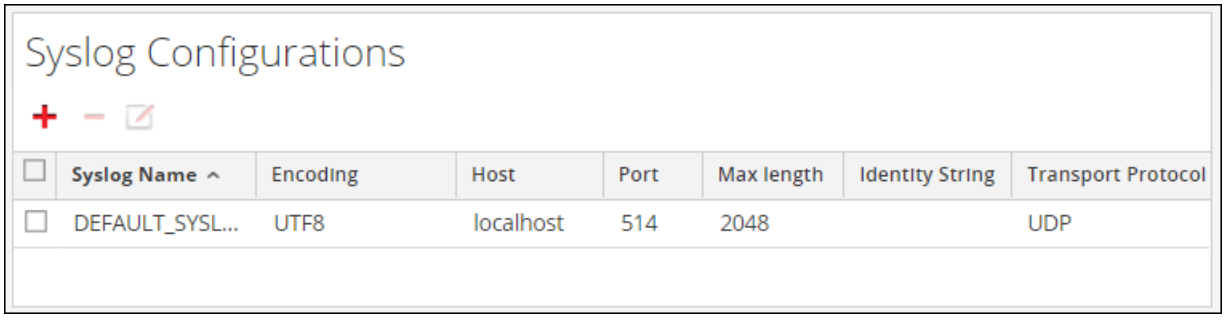
The following parameters manage SMTP (email) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SMTP as an output action for both alert and report from this Reporting Engine. By default, this value is enabled.
Server Name	Specify the hostname or IP Address of the server on which the target SMTP server runs. Default value is 0.0.0.0.
Server Port	Specify the SMTP server port number. Default value is 25.
Username	Specify the username of your SMTP account. Default value is blank. Password Specify
Password	Specify the password of your SMTP account.
SSL	Check this box to use Secure Socket Layer (SSL) to communicate with the SMTP server. Default value is do not use SSL.
Enable Debug	Check this box to enable debugging. Default value is do not enable debug.
Enable Compression	Check this box to enable compression. Default value is enable compression. If this value is enabled, the output files will have `.zip` extension.
Max Size	Specify the maximum size of attachments that can be sent. Default value is 100.
From	Specify the email address from which Security Analytics sends all messages. Default value is `do-not-reply@rsa.com`.
Apply	Update the configuration.

SNMP

After an execution is completed, a trap notification is sent to the user based on the SNMP configuration.

The following figure shows the SNMP Configuration on the Output Actions Tab.



The following parameters manage SNMP (messages to network-attached services) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SNMP output action as an output for alert messages from this Reporting Engine. Default value is Disable.
Server Name	Specify the hostname or IP Address of the server on which the target SNMP server runs. Default value is **0.0.0.0**.
Server Port	Specify the port number of the server on which the target SNMP server listens for faults and exceptions. Default value is **1610**.
SNMP Version	Specify the version number of the SNMP protocol NetWitness uses to send SNMP traps.
Trap OID	Specify the object identification number that identifies the type of trap to send. Default value is **0.0.0.0.0.1**.
Community	Specify the SNMP group to which NetWitness belongs. The default value is **public**.
Number Of Retries	Specify the maximum number of times NetWitness tries to resend the alert message through SNMP. Default value is **2**.
Timeout	Specify the number of seconds after which NetWitness times out (stops trying to send SNMP alerts). Default value is **1500**.
Apply	Update the configuration.

Syslog

After an execution is completed, all notifications are sent via Syslog messages to a particular host based on the Syslog configuration. Multiple Syslog servers can be configured on the Syslog Configuration panel.

The following figure displays the Syslog Configuration on the Output Actions Tab.

The following parameters manage syslog output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

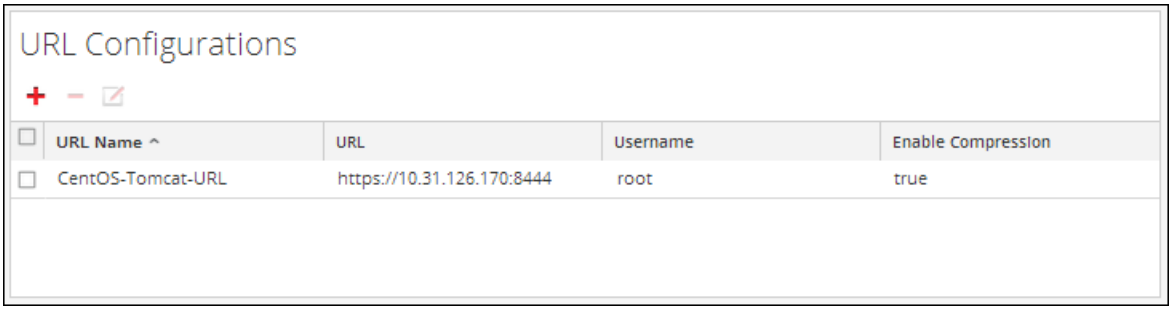
Name	Config Value
Syslog Name	The name of the Syslog configuration. **Note:** You cannot create a Syslog configuration with a name that already exists in the Reporting Engine Syslog configuration list.
Encoding	Specify the internationalization encoding for Syslog messages. Default value is **UTF8**.
Server Name	Specify the hostname or IP Address of the server on which the target Syslog process runs. Default value is blank.
Server Port	Specify the port number of the server on which the target Syslog server listens for faults and exceptions. Default value is **514**.
Max Length	Specify the maximum size (in bytes) of each Syslog alert message. Default value is **2048**. If **UDP** is the transport type and the Syslog message size is greater than 1024 bytes, you must configure a Syslog server that supports message sizes greater than 1024 bytes.
Identity String	Specify the string NetWitness inserts as a prefix in all Syslog alert messages. Default value is blank.
Include Local Hostname	Check this box to include the local hostname in all Syslog alert messages. Default value is do not include local hostname.
Truncate Message	Check this box to truncate all Syslog alert messages. Default value is do not truncate Syslog messages.
Use Identity	Check this box to use the IDENT protocol. Default value is does not use this protocol.
Include Local Timestamp	Check this box to include the local timestamp in all Syslog alert messages. Default value is do not include local timestamp.
Transport Protocol	Specify the transport type for Syslog message delivery. There are three parts to the Syslog transport type: UDP, TCP, and SECURE_TCP. Default value is **UDP**.
Syslog Message Delimiter	Specify the delimiter for the Syslog message. There are three delimiters: CR, LF, and CRLF. By default the value is **CR**. **Note:** This field populates when you select TCP or SECURE_TCP as the transport protocol.
Trust Store Password	Specify the password for the Trust store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.
Key Store Password	Specify the password for the Key store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.

Name	Config Value
Apply	Save the configuration.

SFTP

After an execution is completed, you can send or transfer files to a remote location based on the SFTP configuration.

The following figure displays the SFTP Configuration on the Output Actions Tab.



The following parameters manage SFTP (file transfer to a local drive) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
SFTP Name	The name of the SFTP configuration. **Note:** You cannot create an SFTP configuration with a name that already exists in the Reporting Engine SFTP configuration list.
Host	The IP Address or Hostname of the Reporting Engine server associated with the file transfer.
Port	If you want to use a different port than the default port, enter a port number. Default value is **22**.
Username	Specify the username for the SFTP configuration.
Password	Specify the password for the SFTP configuration.
Custom Folder	Select an SFTP location where you want to transfer the file to. You can use the pre-defined Windows or Linux directory structure in the custom folder path. For example, **/root/Downloaded_Files**. **Note:** If the directory does not exist, RE will create the directory in the custom folder path and copy files to this directory.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

URL

After an execution is completed, the output files are published to a URL based on the URL configuration.

The following figure shows the URL Configuration on the Output Actions Tab.

The following parameters manage URL (file transfer to a URL) output action configuration for a Reporting Engine service. When you add an Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the Config Values of these parameters according to the requirements of your enterprise.

Name	Config Value
URL Name	The name of the URL configuration. **Note:** You cannot create a URL configuration with a name that already exists in the Reporting Engine URL configuration list.
URL	The URL address associated with the file transfer.
Username	Specify the username for the URL configuration.
Password	Specify the password for the URL configuration.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

After the URL is configured, the files will be copied under the "URL_OUTPUT_ACTION" directory and the following parameters are sent to the server along with the compressed file.

Name	Config Value
filename	The name of the file.
filesize	The file size in bytes.
filetype	The file type associated with the file.
filechecksum	The number computed from a file that can be used to confirm that this is the one you expect and has been downloaded and stored properly.
hashingalgorithm	The hashing algorithm used to calculate the file checksum.

Name	Config Value
reportname	The name of the downloaded report.
executionid	The execution id associated with the report execution.
reportexecutionstarttime	The start time the report was executed.
status	The report creation status.
status description	The status description.

Network Share

After an execution is completed, you can transfer the output files to a mounted path or shared location based on the Network Share configuration.

The following figure shows the Network Share Configuration on the Output Actions Tab.

The following parameters manage Network Share (file transfer to a shared location on the network) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

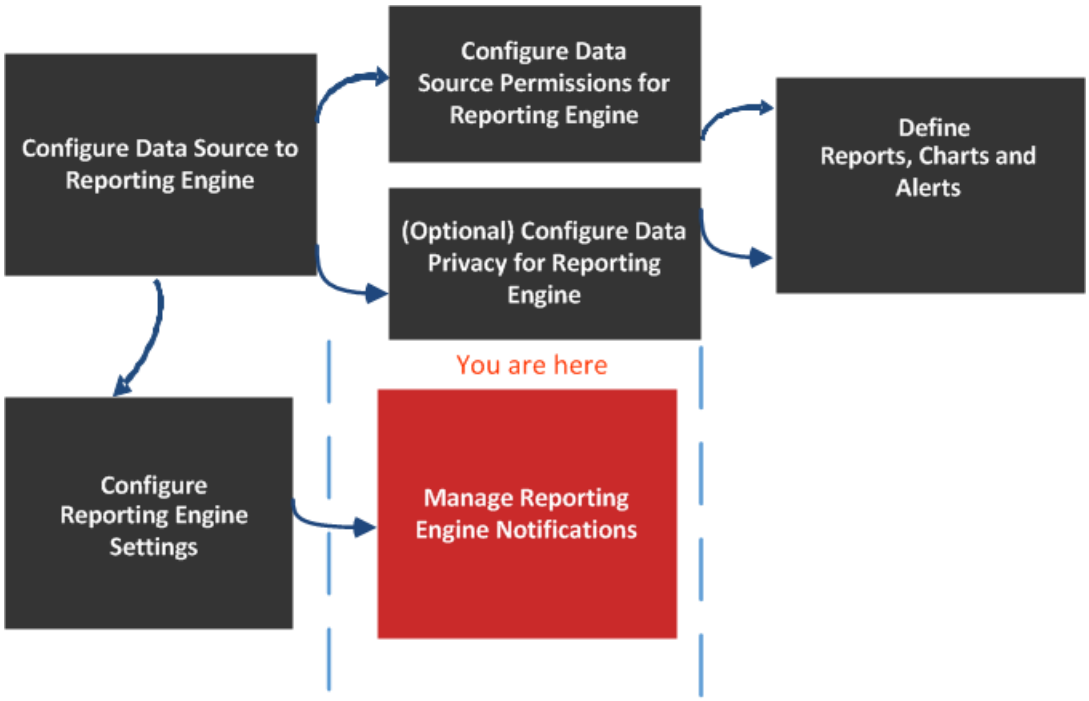
Name	Config Value
Network Share Name	The name of the Network Share. **Note:** You cannot create a Network Share configuration with a name that already exists in the Reporting Engine Network Share configuration list.
Mounted Path	The path (location) associated with the file transfer. You can use the pre-defined Linux directory structure in the mounted path. For example, **/mnt/win**. **Note:** The 'rsasoc' user must have read-write access to the specified Network Share mounted path.
	Click to view how the mounted path is created. This pop-up notifies that you must manually create the mounted path.

Name	Config Value
Destination Directory	Name of the directory where the transferred file is stored in the shared location.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

The following table lists the common operations you can perform in the Syslog, SFTP, URL and Network Share sections.

Operation	Description
	Create a Syslog, SFTP, URL and Network Share configuration.
	Delete a Syslog, SFTP, URL and Network Share configuration.
	Edit a Syslog, SFTP, URL and Network Share configuration.

Reporting Engine Manage Logos Tab



The Manage Logos option available in the **Services Config View** > **Manage Logos** tab, helps you to manage the logos associated with the Reporting Engine. The Manage Logos tab consists of a single panel with a toolbar and a grid that lists the logos.

You can upload the logos that you want to use in your report. After you upload the logo, you can set any logo as a default logo which will be automatically used in all the scheduled reports. You can choose to override the default logo with any other logo listed in this tab when you schedule a report. For more information, see "Select a Logo Dialog" topic in the *Reporting Guide*.

The supported image formats are:

- .jpg
- .png
- .gif

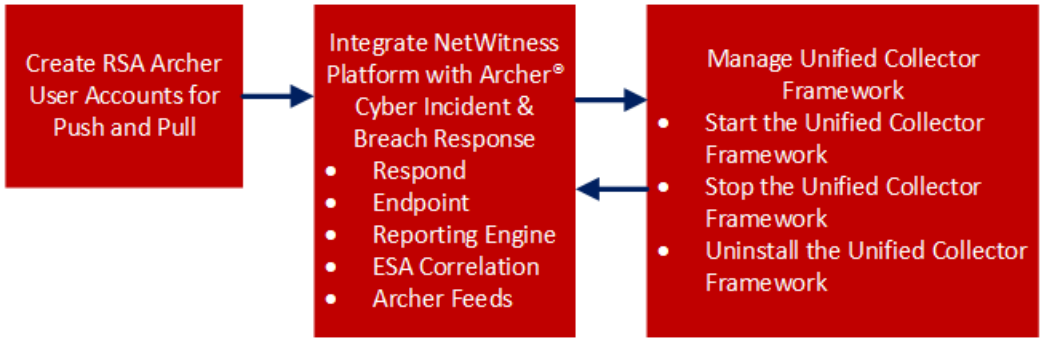
Archer Integration

Administrators can integrate NetWitness with Archer Cyber Incident & Breach Response to send alerts and incidents from NetWitness to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

Note: When you upgrade from Security Analytics 10.6.5 to NetWitness 11.x, the Archer Cyber Incident & Breach Response integration is no valid, and must be re-configured.

The following table list the NetWitness 11.x integration options with Archer Cyber Incident & Breach Response Version 1.3.1.2.

Archer Cyber Incident & Breach Response Version	NetWitness 11.x Integration	Reference
1.3.1.2	ESA Correlation	See "Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Reporting Engine (RE)	See "Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Respond	See "Configure Respond for Integration with Archer Cyber Incident & Breach Response 1.3.1.2" section.
1.3.1.2	Archer Feeds	See "Archer Feeds" section.



Configure NetWitness to Work With Archer

The Archer Cyber Incident & Breach Response solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on Archer Cyber Incident & Breach Response capabilities, see Archer documentation on the Archer Community or on the Archer Exchange Community.

This version of Archer determines how NetWitness will be integrated. For supported Archer platforms, see the *SecOps Installation Guide*.

Archer Cyber Incident & Breach Response1.3.1.2 integrates with NetWitness using the UCF (Unified Collector Framework), which comprises of NetWitness Respond integration service and Archer Cyber Incident & Breach Response Watchdog service.

This figure represents the flow of NetWitness 11.x integration with Archer Cyber Incident & Breach Response 1.3.1.2.

Create Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the Archer GRC Platform.

You require two Archer user accounts to avoid conflicts while sending and receiving data from NetWitness.

To create a user account for push and pull:

1. On the Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the Unified Collector Framework (UCF) uses this account to push data into Archer GRC. For example, UCF User, Push.

   Note: When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from Archer GRC. For example, UCF User, Pull.

3. (Optional) Enter a user name for the new user account.

   Note: If you do not specify a user name, the Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** panel, in the **Email** field, enter an email address to associate with the new user account.

5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

   Note: The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

   Note: Make a note of the user name and password for the new user account that you created. You need to enter these credentials when you set up the UCF to communicate with the Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

   Note: If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account, and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** panel, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select **SOC: Solution Administrator and EM: Read Only**.
   d. Click **OK**.
10. Click **Apply** and click **Save**.
11. If the machine language and regional settings of your Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the **Locale** field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your Archer GRC Platform, open **Internet Information Services (IIS) Manager**.
    c. Expand your Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.
    d. Restart your Archer GRC site.
12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from Archer GRC.

Integrate NetWitness Platform With Archer Cyber Incident & Breach Response

You have to configure the system integration settings to manage incident workflow in Archer Cyber Incident & Breach Response.

For information on how to configure system integration settings, see the "Manage Incidents in Archer Cyber Incident & Breach Response" in the *NetWitness Respond Configuration Guide*.

Unified Collector Framework

NetWitness integrates with Archer Cyber Incident & Breach Response 1.3.1.2 using the UCF. The UCF integrates with all supported SIEM tools and the Archer Cyber Incident & Breach Response solution. After you configure the system integration settings, all incidents are managed in Archer Cyber Incident & Breach Response instead of NetWitness Respond. Incidents created before the integration will not be managed in Archer Cyber Incident & Breach Response.

Note:
• You must configure the same option in both NetWitness and the Unified Collector Framework.
• Integration of the NetWitness Respond module with Reporting Engine or ESA Correlation can result in duplicate events, alerts, and incidents created in Archer Cyber Incident & Breach Response.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Reporting Engine, HP ArcSight, and NetWitness Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness servers connected to the same UCF.

Prerequisites

- Install the Archer Cyber Incident & Breach Response package on Archer. See Archer documentation Archer Community or on the Content Tab at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.
- Install Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure you have NetWitness 11.1 as it is compatible with Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure that Respond is configured inNetWitness.

The UCF allows you to integrate your Archer Cyber Incident & Breach Response system with the following:

- NetWitness Respond
- NetWitness Reporting Engine
- NetWitness ESA Correlation.
- Archer Feeds

Configure Respond for Integration with Archer Cyber Incident & Breach Response

Step 1: Select the Mode for NetWitness Respond

1. Go to  **(Admin) > Services**, select the **Respond Server** service, and select  > **View** > **Explore**.

2. Navigate to `respond/integration/export`.
3. Set the `archer-sec-ops-integration-enabled` field to **true**.
4. Restart the Respond service by running the following command:
   `systemctl restart rsa-nw-respond-server`

Step 2: Configure NetWitness Respond to Forward Alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in the SecOps Middleware box.
2. Copy both `keystore.crt.pem` and `rootcastore.crt.pem` from the certs folder (to the import folder of NetWitess server):
   ```
   cp rootcastore.crt.pem /etc/pki/nw/trust/import
   cp keystore.crt.pem /etc/pki/nw/trust/import
   ```

   Note: Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.

3. SSH to NW-server box
   a. Run the update-admin-node command:
      `orchestration-cli-client --update-admin-node`
   b. Restart the RabbitMQ service:
      `systemctl restart rabbitmq-server`
   c. Restart the SMS service:
      `systemctl restart rsa-sms.service`

      Note: This step is mandatory to avoid receiving the "message bus down" error message which indicates that the EventSourceMessagePublisher has failed to reconnect to RabbitMQ on restart. This can cause some features such as deleting event sources to function improperly.

   d. Create user archer and set permissions for the virtual host '`/rsa/system`'
      ```
      rabbitmqctl add_user archer archer
      rabbitmqctl clear_password archer
      rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"
      ```

Step 3: Forward Alerts to the NetWitness Respond

- To forward NetWitness ESA Correlation alerts to the NetWitness Respond:
  a. Go to  **(Admin) > Services > ESA** service.
  b. Select an **ESA Correlation** service and select  **> View > Explore**.
  c. Navigate to the Correlation option in the left panel and select the Alert option.
  d. Edit the respond-enabled option to TRUE.
  e. Restart the Correlation server.

- To forward NetWitness Reporting Engine alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Reporting Engine** service.
  b. Select the **Reporting Engine** service, and then select **> View > Config**.
  c. Click the **General** tab.
  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.
- To forward NetWitness Malware Analysis alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Malware Analysis** service
  b. Select the **Malware Analysis** service, and select > **View** > **Config**.
  c. Click the **Auditing** tab.
  d. In the **Respond Alerting** panel, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

Step 4: Forward Endpoint Alerts to the NetWitness Respond

You can forward Endpoint alerts to the Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus, see "Configure NetWitness Endpoint Alerts via Message Bus" in the *NetWitness Endpoint Integration Guide*.

Step 5: Aggregate Alerts into Incidents

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond View" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Go to **(Configure) > Incident Rules**.
2. To enable the rules provided out-of- the-box:
   a. Double-click the rule.
   b. Select **Enabled**.
   c. Click **Save**.
   d. Repeat steps a-c for each rule.
3. To add a new rule:
   a. Click **Create Rule**.
   b. Select **Enabled**.
   c. Enter the values in the following fields:

- Rule Name
- Action
- Match Conditions
- Grouping Options
- Incident Options
- Priority
- Notifications

4. Click **Save**.

Configure Endpoints in Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your NetWitness and Archer GRC systems.

Note: Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

Note:
• If Non SecOps mode is selected, incidents are managed in NetWitness Respond instead of Archer Cyber Incident & Breach Response.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Make sure the certificate subject name for your Archer GRC server matches the hostname.

Procedure

1. On the UCF system, open the Connection Manager, as follows:
   a. Open a command prompt.
   b. Change directories to `<install_dir>\SA IM integration service\data-collector`.
   c. Enter `runConnectionManager.bat`.
2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to Archer Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      Note: Enable SSL to add the Archer endpoints.

   b. For the endpoint name, enter **push**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to push data into your Archer GRC system.

f. Enter the password for the user account you created to push data into your Archer GRC system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **False**.

4. Add an endpoint for pulling data from Archer Cyber Incident & Breach Response, as follows:

a. Enter the number for Archer.

> **Note:** SSL must be enabled to add the Archer endpoints.

b. For the endpoint name, enter **pull**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to pull data from your Archer GRC system.

f. Enter the password for the user account you created to pull data from your Archer system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **True**.

5. Add an endpoint for NetWitness:

- For Respond

a. Enter the number for NetWitness IM.

b. Enter a name for the endpoint.

c. Enter the SA Host IP address.

d. For SA Messaging Port, enter **5671**.

e. Enter the target queue for remediation tasks. Selecting All processes both the Archer Integration (GRC) and IT Helpdesk (Operations).

f. When prompted to automatically add certificates to the SA trust store, enter **No**.
The certificates are added manually in previous steps.

> **Note:** If the auto upload of certificates is preferred, then user account credentials cannot be guest/guest. Instead, deploy_admin credentials can be used.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select Manage incident workflow exclusively in Archer Cyber Incident & Breach Response from the drop-down.

> **Note:** Make sure you select the second option as the first option is not supported in NetWitness Platform 11.x release.

- For Reporting Engine and ESA Correlation
  a. To use third-party integrations, add the Syslog Server Endpoint, as follows:
     i. Enter the number for Syslog Server Endpoint.
     ii. Enter the following:
     - User defined name
     - SSL Configured TCP port number

       Note: Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.
     - TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

       Note: Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.
     - UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

       Note: Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

     By default, the Syslog server runs in the above three modes, unless it is disabled by entering **0**.
  b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response

To configure Syslog Output Action for the Reporting Engine:

1. Go to  **(Admin) > Services**.
2. Select the **Reporting Engine** service, and click  **View** > **Config**.
3. Click the **Output Actions** tab.
4. In the **NetWitness Platform Configuration** panel, in the **Host Name** field, enter the host name or IP address of the Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:

a. In the **Server Name** field, enter the host name of the UCF.

b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.

c. In the **Protocol** field, select the transport protocol.

> **Note:** Configure SSL if you select Secure TCP.

6. Click **Save**.

To configure NetWitness Reporting Engine SSL for Secure Syslog Server:

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-0.b14.el7_4.x86_64/jre/lib/security`.
2. Run the following command:

```
keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
```

> **Note:** Do not copy and paste the above command. Type the command to avoid errors.

3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Go to  **(Admin) > Services**.
   - Select  **> View > Explore** of the **Reporting Engine** service .
   - Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
   - Expand **SSLContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.
4. Restart the Reporting Engine service by running the following command:
   `service rsasoc_re restart`

To configure rules in NetWitness Platform:

1. Go to **Reports > Manage**.
   The Manage tab is displayed.
2. In the **Rules > Groups** panel, click **+**.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click **+**.
   1. In the **Rule Type** field, select **NetWitness Platform DB**.
5. Enter a name for the rule.
6. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

> **Note:** Add the Syslog configuration with the Syslog name set above.

7. Click **Save**.

Note: To see the same number of alerts in the Reporting Engine and Archer GRC, make sure that you have selected **Once** for execute in both the Syslog and Record tabs.

To add Alert Templates for the Reporting Engine in NetWitness Platform:

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Go to **Reports > Manage > Alerts**.
2. Select the **Template** tab and click +.

Note: After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

3. In the **Name** field, enter a name for the alert template.
4. In the **Message** field, enter the alert message.
5. Click **Create**.
6. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Platform:

In NetWitness Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Go to **Reports > Manage > Alerts**.
2. Click +, select **Enable**, then Select the rule you created.
3. Select **Push to Decoders**.

   Note: If you do not enter a value in this field, the link in the Archer Security Alerts application to NetWitness does not work.

4. From the Data Sources list, select your data source.
5. In the **Notification** section, select **Syslog**.
6. Click + and complete the Syslog configuration fields.
7. In the **Body Template** field, select the template that you want to use for this Syslog alert.
8. Click **Save**.

Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response

To configure ESA Correlation Syslog Notification Settings in NetWitness:

1. Go to  **(Admin) > System > Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an ESA Correlation Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

   Field Description:

   - Name - Specify the custom name.
   - Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
   - Port - Specify the port number on which you want the UCF to listen.
   - Facility - Specify the Syslog facility.
   - Protocol - Select the protocol.
7. Click **Save**.

To configure NetWitness Platform ESA Correlation SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Copy the `keystore.cert.pem` from UCF machine to NetWitness server.
2. Run the following command:

   ```
   security-cli-client --add-trusts --service integration-server --superuser-id admin --superuser-pwd netwitness --chain-file <path to keystore.cert.pem file>
   ```
3. Restart the integration server by running the following command:

   ```
   service rsa-nw-integration-server restart
   ```

To Add ESA Correlation Alert Templates

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates\SecOps_SA_ESA_templates.txt`

1. Select  **(Admin) > System > Global Notifications**.
2. Click the **Templates** tab and click .
3. In the **Template Type** field, select ESA Correlation.
4. In the **Name** field, enter the name for the template.
5. 6. (Optional) In the **Description** field, enter a brief description for the template.

6. 7. In the **Template** field, enter the alert message.
7. 8. Click **Save**.
8. 9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create ESA Correlation Rules

1. Click  **(Configure) > ESA Rules**.
2. In the **Rule Library**, click ✚.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** panel:
   a. Click ✚ to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for the statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all the statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and click **Close**.
11. In the Deployments section, click .
12. Click ✚ and enter a deployment name.
13. Click ✚ for ESA Correlation services section.
14. Select the ESA Correlation Service.
15. In the Data Source section, click ✚ and select a data source.
16. Click **Save**.
17. In the **ESA Correlation Rules** section, click ✚ to select the ESA Correlation Rule that you created.
18. Click **Save**.
19. Click **Deploy Now**.

Archer Feeds

By default, only the IP address and Criticality Rating fields in the Archer Devices application are fed into NetWitness by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.

Note: If you want to feed Business Unit and Facility information from your Archer GRC Platform into Live, you must also add keys for these fields in the index-concentrator-custom.xml file.

Update the Concentrator and Decoder Services

The SA IM Integration Service in Archer Cyber Incident & Breach Response manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of NetWitness retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on the captured network traffic and the feed definition. To enable the Concentrator to detect a new metadata created by the Decoders, make sure to edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml` files.

1. Select  **(Admin) > Services**.
2. Select the **Concentrator** and select  > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select the `index-concentrator-custom.xml` file. Do one of the following:
   - If content already exists in the file, add a key for the new metadata element:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     Note: Do not copy and paste above command . Type the command to avoid errors.
   - If the file is blank, add the following content:

     ```
     <?xml version="1.0" encoding="utf-8"?>
     <language level="IndexNone" defaultAction="Auto">
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     </language>
     ```
5. Click **Apply**.
6. To add multiple devices:
   a. Click **Push**.
   b. Select the devices to which you want to push this file.
   c. Click **OK**.

7. Repeat steps 1 to 6 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.
8. Restart the Concentrator and Decoder services by running the following commands:
```
service nwdecoder restart
service nwconcentrator restart
```

Add the Archer Enterprise Management Endpoint in UCF

1. In the UCF connection manager, select the mode:
   a. Enter the number for Mode Selection.
   b. Select one of the following options:
      - Manage incident workflow in NetWitness.
      - Manage incident workflow exclusively in Archer Cyber Incident & Breach Response.
2. Add the Archer Enterprise Management Endpoint:
   a. Enter the number for Enterprise Management.
   b. Enter the values in the fields as described in the table below.

Field	Description
Endpoint Name	Optional endpoint name.
Web Server Port	Defaults to 9090. You can configure this to host the web server url by providing the URL with the port number as in the NetWitness live feed: http://hostname:port/archer/sa/feed.
Criticality	Criticality of the assets to be pulled from Archer GRC. If **false**, pull assets with any criticality. If **true**, pull assets with only high criticality. To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH.
Feed Directory	Directory where the assets CSV file from Archer GRC are saved. **Note:** The directory path provided must exist.
Web Server Username	Username for authenticating to the EM web server.
Web Server Password	Password for authenticating to the EM web server.

Field	Description
SSL Mode	Defaults to No. If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed` If you have not updated the host file, see "Update the NetWitness Host File" section. **Note:** NetWitness currently does not support Archer recurring feeds in SSL mode.

Update the NetWitness Platform Host File

1. Edit the host file on the NetWitness server at the following location: `vi /etc/hosts`.
2. Enter the following for the UCF host IP address:

   `<ucf-host-ip> <ucf-host-name>`
3. Restart NetWitness server by running the following command:

   `service jetty restart`
4. While configuring the NetWitness live feed, enter the host name for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   `http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.`
5. Verify that the connection works.

Create a Recurring Feed Task

For NetWitness to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

Note: For Archer Cyber Incident & Breach Response 1.2: For NetWitness to download feed files from the UCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to Archer Cyber Incident & Breach Response 1.3, with a few exceptions. See documentation on the Archer Exchange Community for details.

1. Select  **(Configure) > Custom Feeds**.
2. In the **Feeds** view, Click **+**.
3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

   where, *`http :ucf_hostname_or_ip:port`* is the address of the NetWitness Respond Integration Service system. For example: `http://<ucf-host-name>` .
7. Select **Authenticated**.

8. In the **User Name** and **Password** fields, enter the credentials of the user account you created in the Add the Archer Enterprise Management Endpoint in UCF procedure.
9. Define the recurrence interval for the feed.
10. In the **Date Range** panel, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, amke sure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details and click **Finish**.

Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the UCF for Archer Cyber Incident & Breach Response 11.3.1.2 Integration.

Start the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select **RSA Unified Collector Framework**.
3. Click **Start**.

Stop the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the Archer Cyber Incident & Breach Response WatchDog Service.

   Note: If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service.

3. Select **RSA Unified Collector Framework**.
4. Click **Stop**.

Note: If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

Uninstall the Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

Troubleshoot Archer Integration

This section provides resolutions to common problems that you may encounter while configuring Archer Cyber Incident & Breach Response 1.3.1.2 with NetWitness Respond.

Problem	After adding the endpoint for IM: NetWitness Respond the Certificate Authority truststore fails to set.
Solution	1. Make sure that the SSH credentials for the NetWitness host are valid. 2. If the credentials are correct, but the error still occurs, manually copy certificates.

Problem	Remediation Tasks being pushed to the operations queue through the UCF are not appearing in Archer Cyber Incident & Breach Response as Findings.
Solution	1. Open the Connection Manager using the command prompt: • `Change directories to <install_dir>\SA IM integration service\data-collector.` • `Type: runConnectionManager.bat` 1. Enter **2** to edit endpoint. 2. Enter **3** to NetWitness Respond. 3. Make sure the Target Queue is set to **All** or **Operations**.

Problem	In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between NetWitness and RSA Unified Collector Framework.
Solution	Verify that the SSL certificates are valid. **Note:** NetWitness Respond certificates are valid for two years. If your certificates are expired, regenerate and copy the expired certificates. **To regenerate and copy the certificates:** 1. In the Command Prompt, go to `<install_dir>\SA IM integration service\data-collector`. 2. Enter `runConnectionManager.bat` 3. Enter the number for Regenerate NetWitnessRespondIntegration Service Certificate. 4. In the NetWitness Respond endpoint, in Connection Manager, enter the number for Edit Endpoint. 5. Enter **Yes** to copy the certificates automatically to the NetWitness trust store. **Note:** If certificates fail to copy, manually copy the certificates.

Problem	NetWitness unable to forward incidents to UCF.

Solution	1. In the collector config (`C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\CONFIG\collector-config`), change the following:
	`im.virtualhost=/rsa/im/integration`
	to
	`im.virtualhost=/rsa/system`
	2. Restart UCF. For more information on restarting UCF, see Start the Unified Collector Framework.
	3. In the data collector (`C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\data-collector`), double click on the following file to run it.
	`runConnectionmanager.bat`

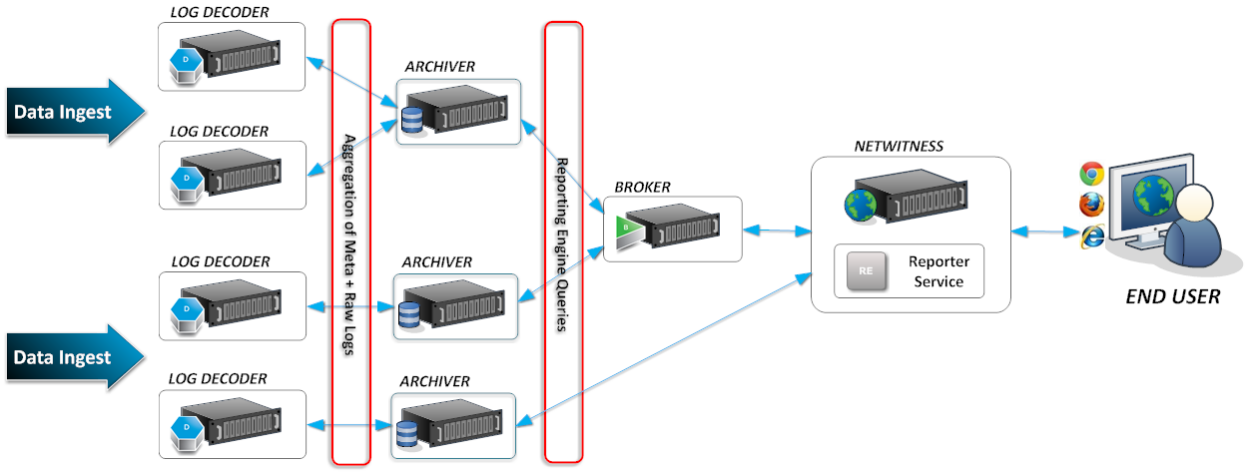
Archiver Overview



This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness network that implements the Archiver.

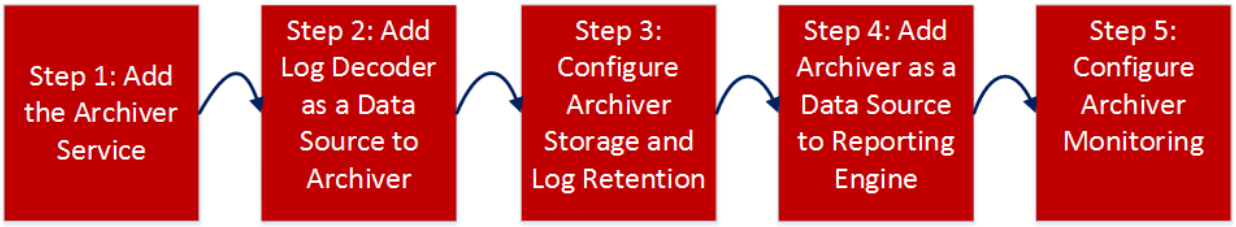
Configuring an Archiver

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

Prerequisites



Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

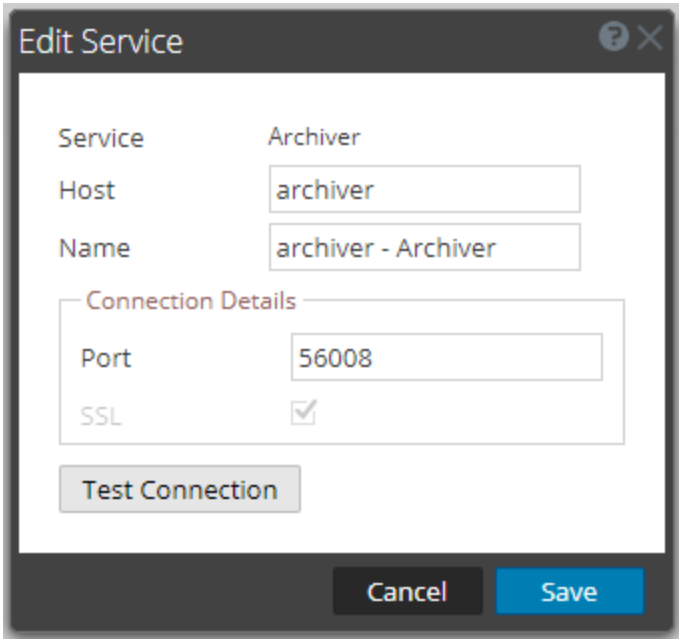
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

Configuration Step	Description
Edit the Archiver Service	Provides information on how to add an Archiver service to the Archiver host and apply a license to it.
Add Log Decoder as a Data Source to Archiver	Provides instructions on how to add a Log Decoder to an Archiver.

Configuration Step	Description
Configure Archiver Storage and Log Retention	Provides instructions on how to configure storage and log retention on an Archiver.
Add Archiver as a Data Source to Reporting Engine	Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver.
Configure Archiver Monitoring	Provides instructions on how to configure the alert mechanism related to Archiver storage.



Edit the Archiver Service

To add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See "Step 1: Add or Update Host" topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

Perform the following steps to edit the Archiver service:

1. Go to **(Admin) > Services**.
   The Services panel is displayed.

2. Select an Archiver service and click in the **Services** panel toolbar.
   The Edit Service dialog is displayed.

3. Provide the following details.

Field	Description
Host	Select a host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50008.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.

Field	Description
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.
Entitle Service	Select if you want to apply the entitlements currently configured to this service. For more information, see "Entitlement Capability Implementation" topic in the *Licensing Guide*.

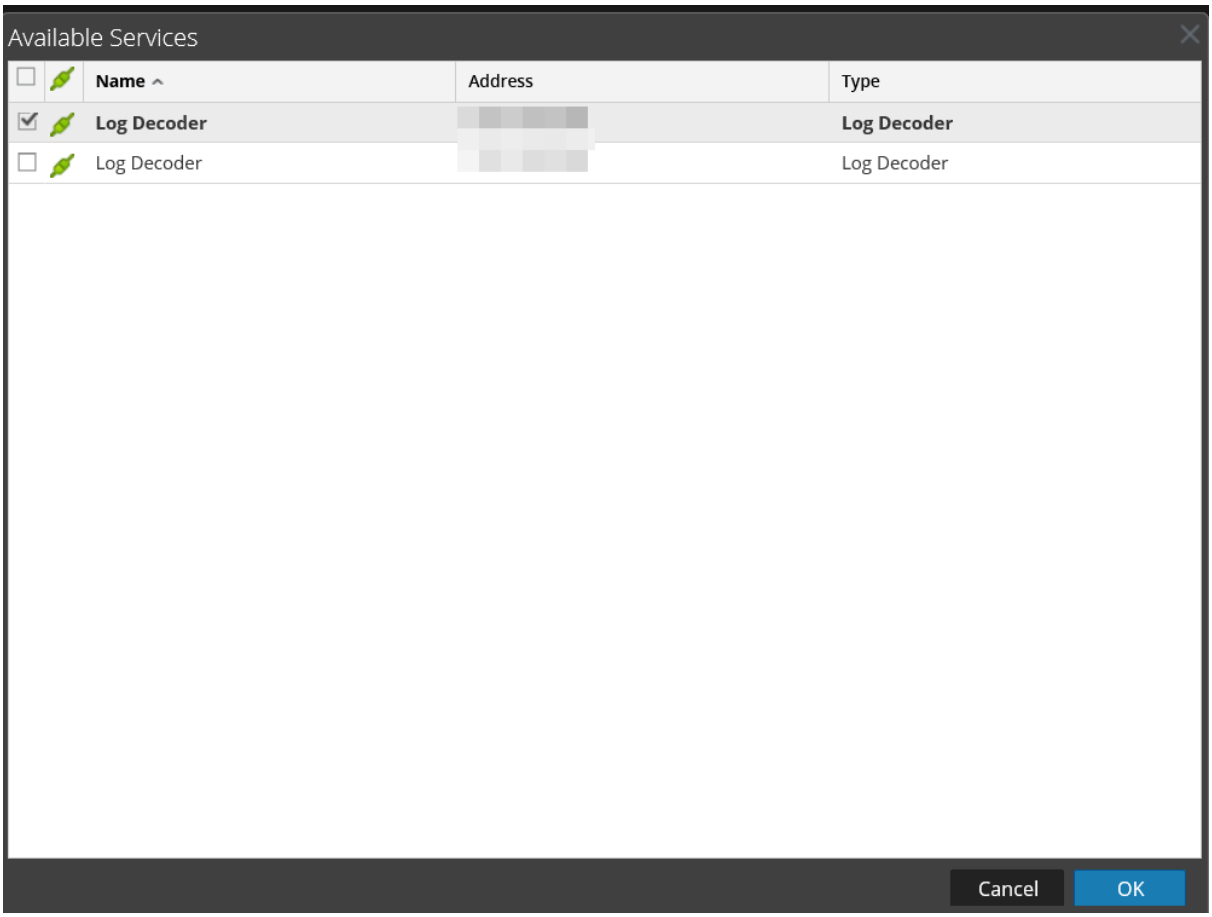
4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The edited service is now displayed in the services panel.

   Note: If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

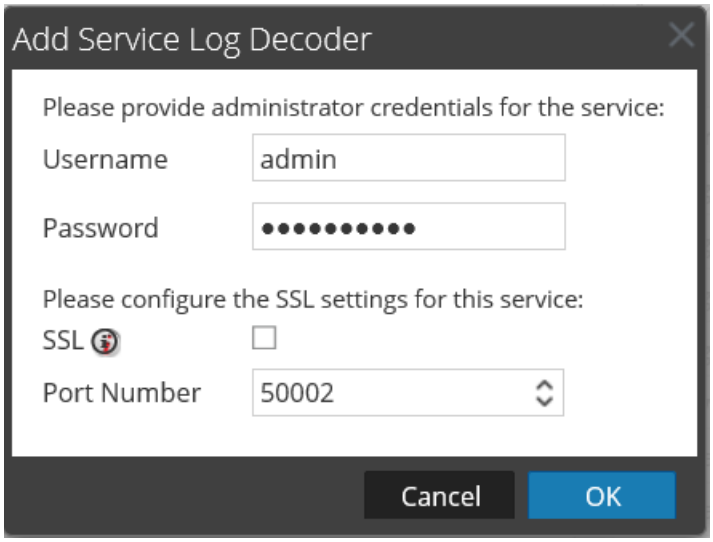
   Refer to the "Synchronize NetWitness Server**"** topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.



Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness and make sure the Archiver service shows as active and licensed.

Add Log Decoder as a Data Source to Archiver



To add a Log Decoder as a data source to an Archiver:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **General** tab, in the **Aggregate Services** panel, click .
   The Available Services dialog is displayed.

4. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.

5. If the Log Decoder is using the trust model, an Add Service dialog is displayed.

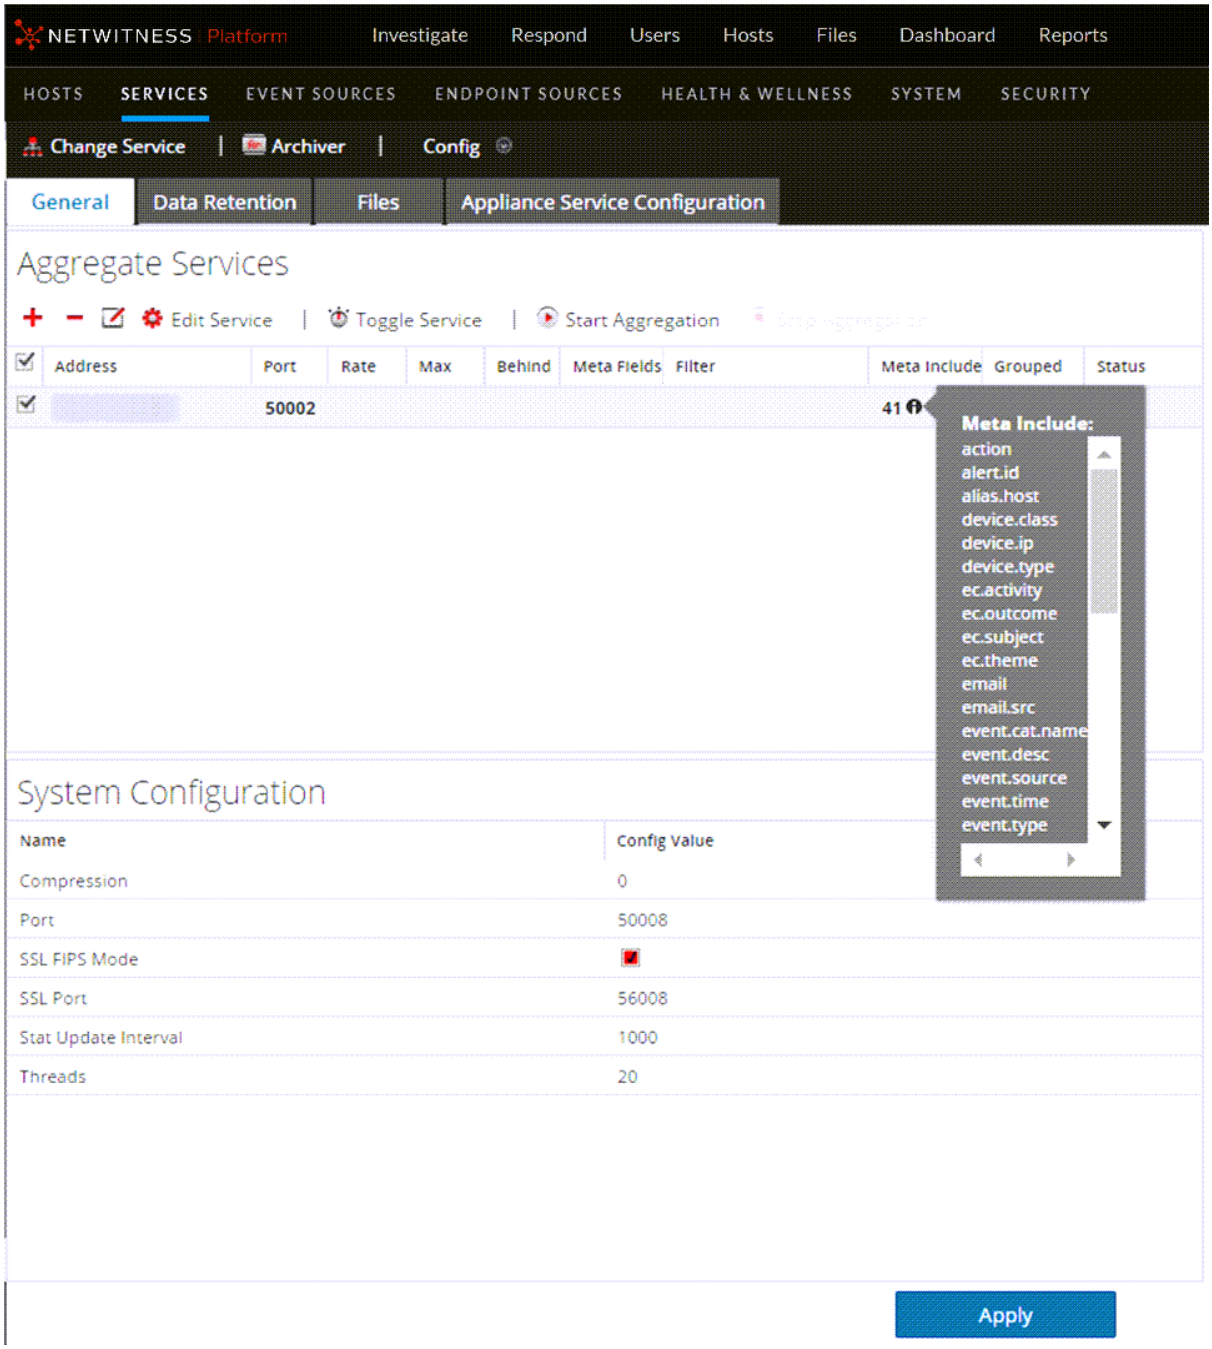
6. Type the username and password for the Log Decoder, and configure the SSL settings.
7. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

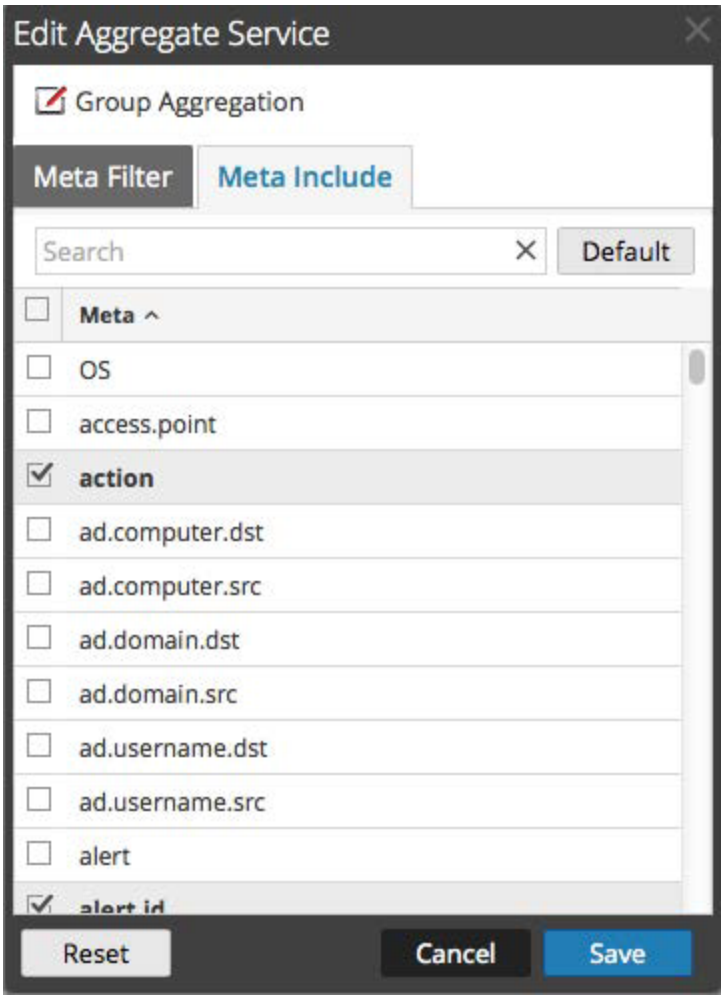
- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.



See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

(Optional) Configure Meta Filters for Aggregation



Follow this procedure to view and add additional meta items to the Archiver.

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click ⓘ in the **Meta Include** field.

2. To add additional meta items, select the Log Decoder service and click ✎.

3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

(Optional) Add Index Entries for Archiver Reporting

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)

- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

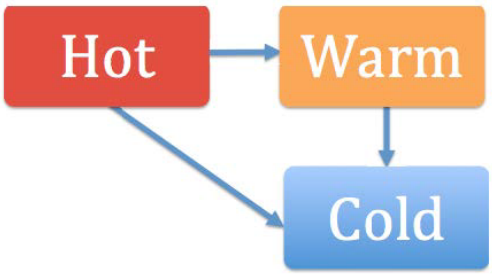
For information on customizing this list, see "Index Customization" in the *Core Database Tuning Guide*.

Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.



To do this, you must first define the total physical storage space for your collections. NetWitness enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage

When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

Procedure

Perform the following tasks in the order shown to configure storage and log retention.

Task	Reference
1. Configure total hot, warm, and cold storage.	Refer to Configure Hot, Warm, and Cold Storage.
2. Configure log retention storage collections.	Refer to Configure Log Storage Collections.
3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules.	Refer to Define Retention Rules.

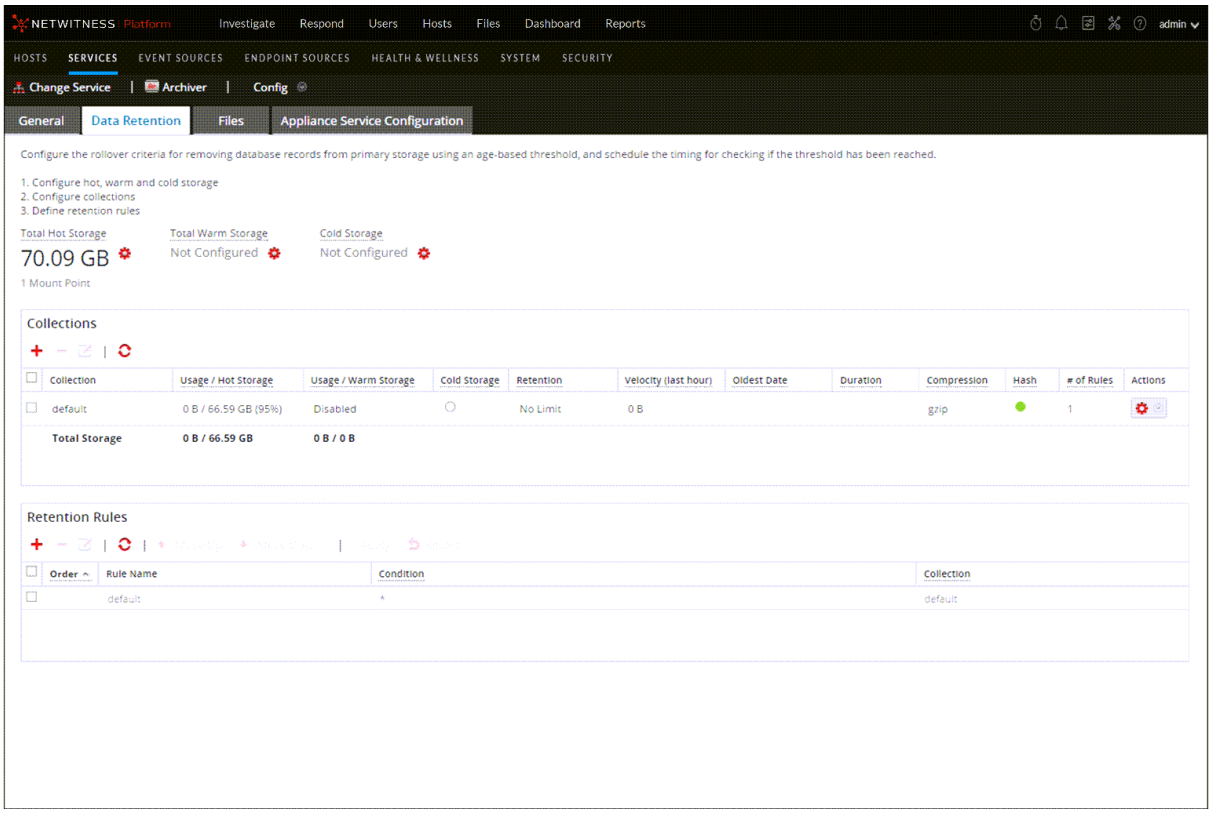
Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness does not manage cold storage.

Prerequisites

Ensure that you have:



1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

Procedures

Configure Total Hot Storage for an Archiver

1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Total Hot Storage** section, click  to configure total hot storage.

4. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

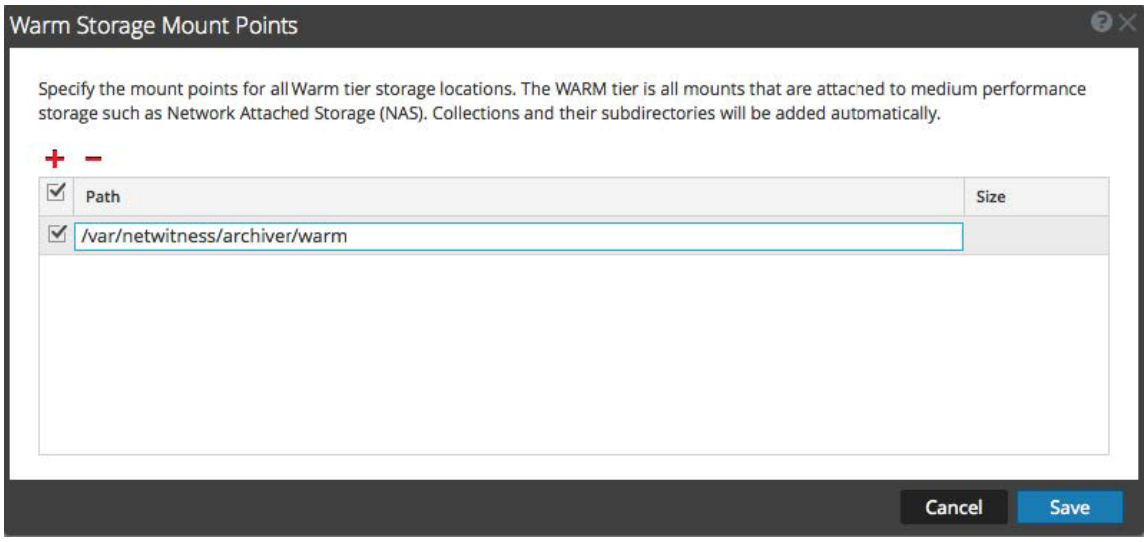
   To add a mount point, click + and type the path to the mount point.

5. Verify that your mount point paths are correct and click **Save**.

NetWitnesswill automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:

```
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index
```

For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:

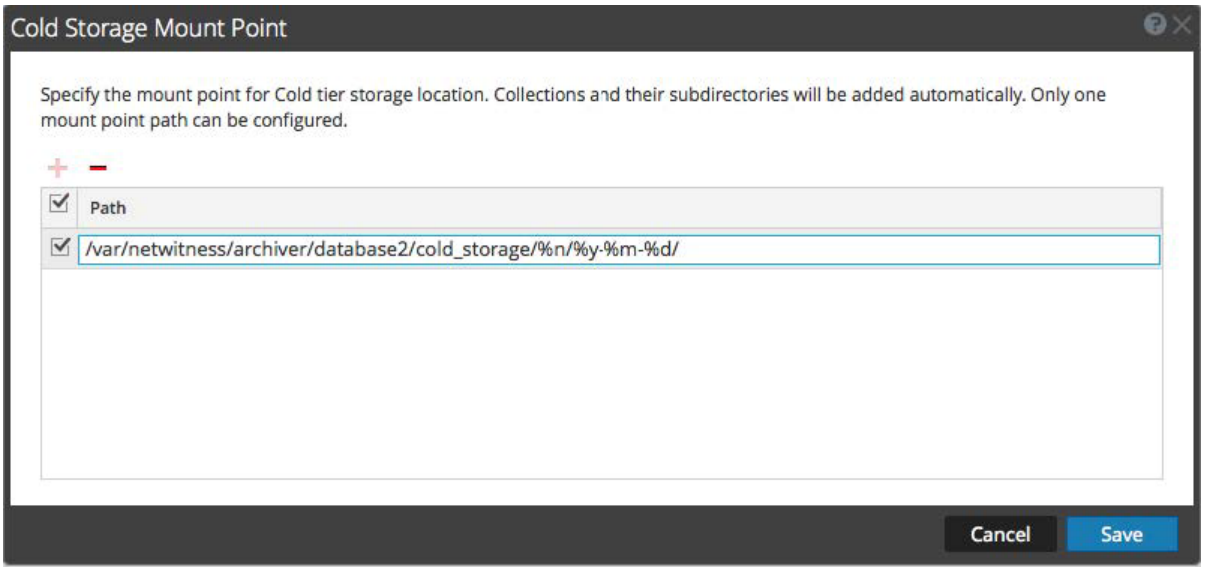


```
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index
```

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

Caution: After data has been saved to a mount point, it cannot be removed from the user interface.

Configure Total Warm Storage for an Archiver



(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).

Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

The following format specifiers are allowed in the path:

Format Specifier	Description
%n	collection name (required)
%y	year the data moved to cold storage
%m	month
%d	day
%h	hour
%##r	block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2.

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

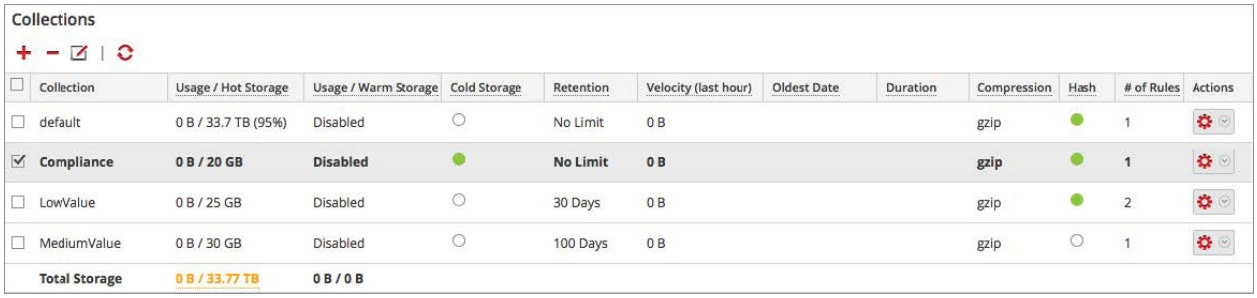
`/sa-cold-storage/%n/%y-%m-%d/`

NetWitness creates a directory each day with the following format:

/sa-cold-storage/compliance/2015-11-20/

Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.



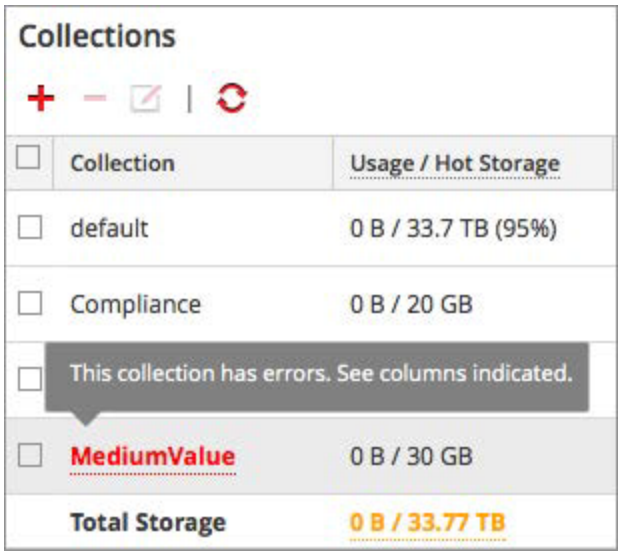
Feature	Description
+	Adds a mount point.
−	Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections.
☐	Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage.

Mount Point	Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC.
	Do not add collections or subdirectories to the mount points. NetWitness will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:
	`<storageLocation>/<CollectionName>/metadb`
	`<storageLocation>/<CollectionName>/packetdb`
	`<storageLocation>/<CollectionName>/sessiondb`
	`<storageLocation>/<CollectionName>/index`
	For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:
	`/var/netwitness/archiver/<CollectionName>/metadb`
	`/var/netwitness/archiver/<CollectionName>/packetdb`
	`/var/netwitness/archiver/<CollectionName>/sessiondb`
	`/var/netwitness/archiver/<CollectionName>/index`
	For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

Storage Size	Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference.

Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



Collections Features

The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

Feature	Description
	Opens the Collections dialog, in which you can add a storage collection.
	Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain.
	Opens the Collections dialog, in which you can edit the selected collection.
	Refreshes collection information.
	Selects a collection. For example, you can select a collection for editing or removal.
Collection	Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used. If a collection has errors, the collection name and the columns with errors appear in red text.
Usage / Hot Storage	Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold).
Usage / Warm Storage	Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage.
Cold Storage	Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled.
Retention	Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Velocity (last hour)	Shows the number of logs captured over the last hour.
Oldest Date	Shows the date and time of the last log capture.
Duration	Shows how may days ago that the last log was captured. For example: 20 days.
Compression	Shows the compression type used for the meta and raw data in the collection.
Hash	Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Feature	Description
# of Rules	Shows the number of rules applied to the collection. Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection. **Caution:** If a collection does not have a rule, no logs will ever go into that collection.
Actions	Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> **> Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules.
Total Storage	Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column.

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.

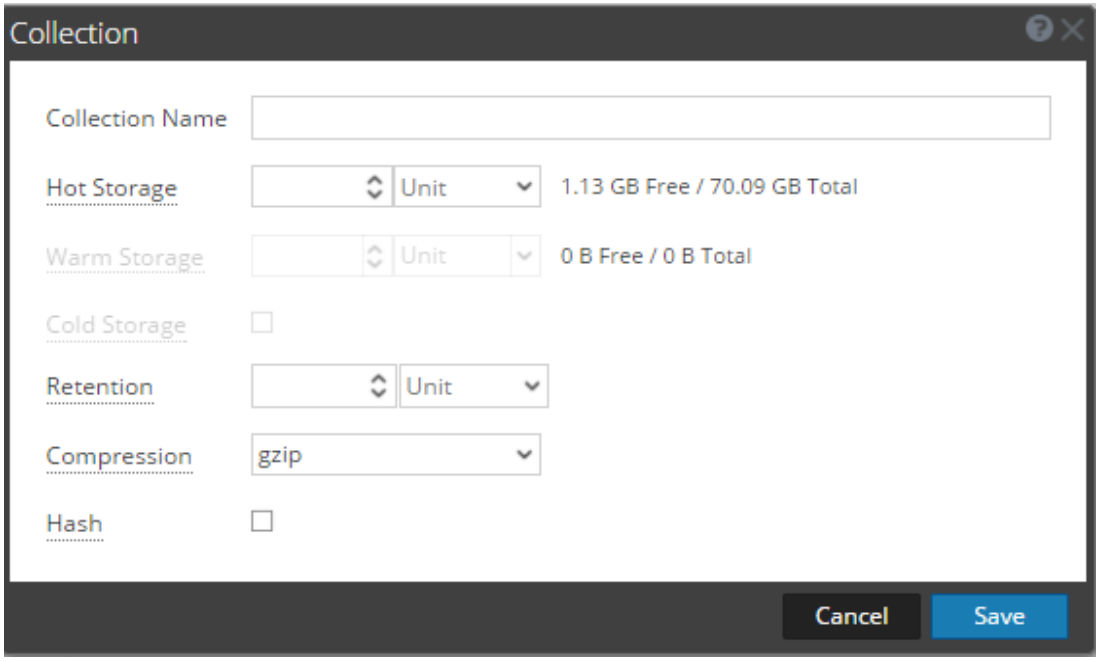
Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

Feature	Description
	Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection.
	Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule.
	Opens the Rule Definition dialog, in which you can edit the selected retention rule.
	Refreshes retention rule information.
Move Up	Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. You can also use drag and drop to reorder retention rules.
Move Down	Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.
Apply	Saves the rule order change.
Revert	Reverts the rule order change.
	Selects or shows a selected retention rule.
Order	Shows the order of a rule in the overall list of retention rules.
Rule Name	Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs.
Condition	Shows the conditions for the rule. These conditions specify the type of logs to include in the collection. Define Retention Rules presents the guidelines for all queries and rule conditions in Core services.
Collection	Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days)



Collection Dialog

On the (Admin) > **Services** > **Config** view > **Data Retention** tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

To access the Collection dialog:

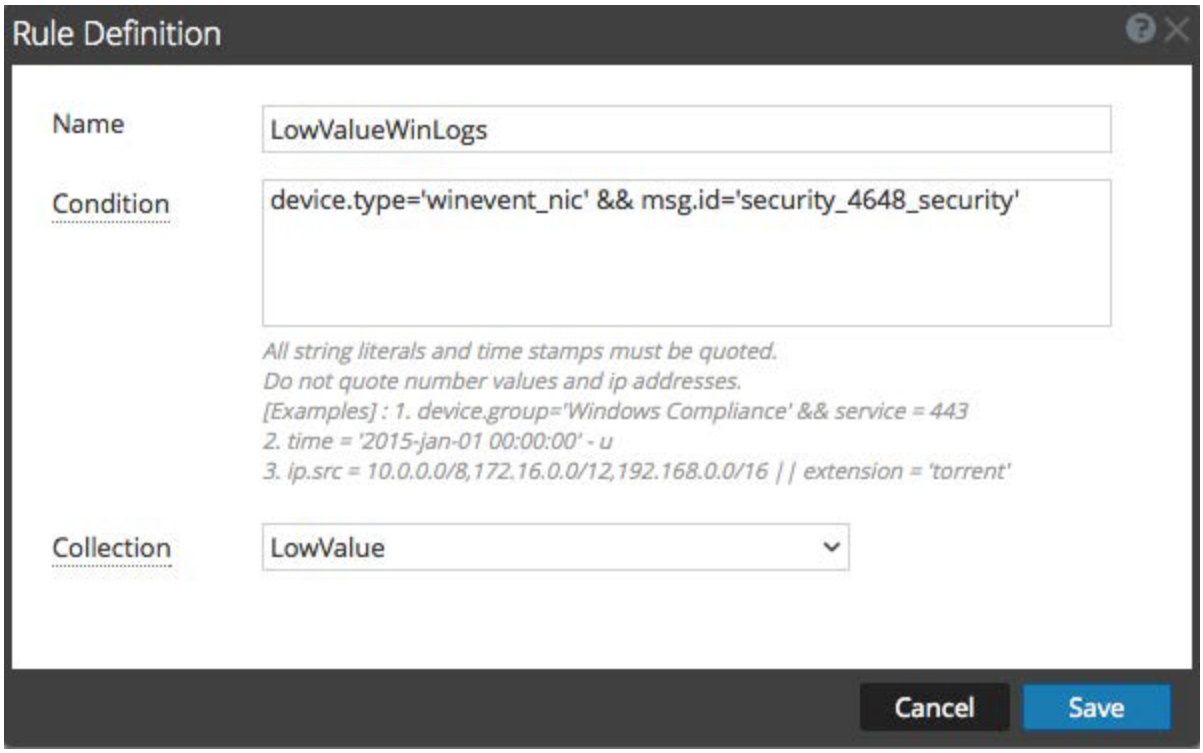
1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Collections** section, click to add or edit the rule.
   The Collection dialog is displayed.

The following table describes the fields in the Collection dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.



Rule Definition Dialog

In the  (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Retention Rule** section, click or .
   The Rule Definition dialog is displayed.

The following table describes fields in the Rule Definition dialog.

Field	Description
Name	Specify a unique name for your retention rule. For example: ComplianceDevices
Condition	Specify the conditions for the type of logs that you want to include in the collection. All sting literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.group='PCI Devices' || device.group='HIPPA Devices'`
Collection	Select the collection on which you want to apply this rule. For example: Compliance

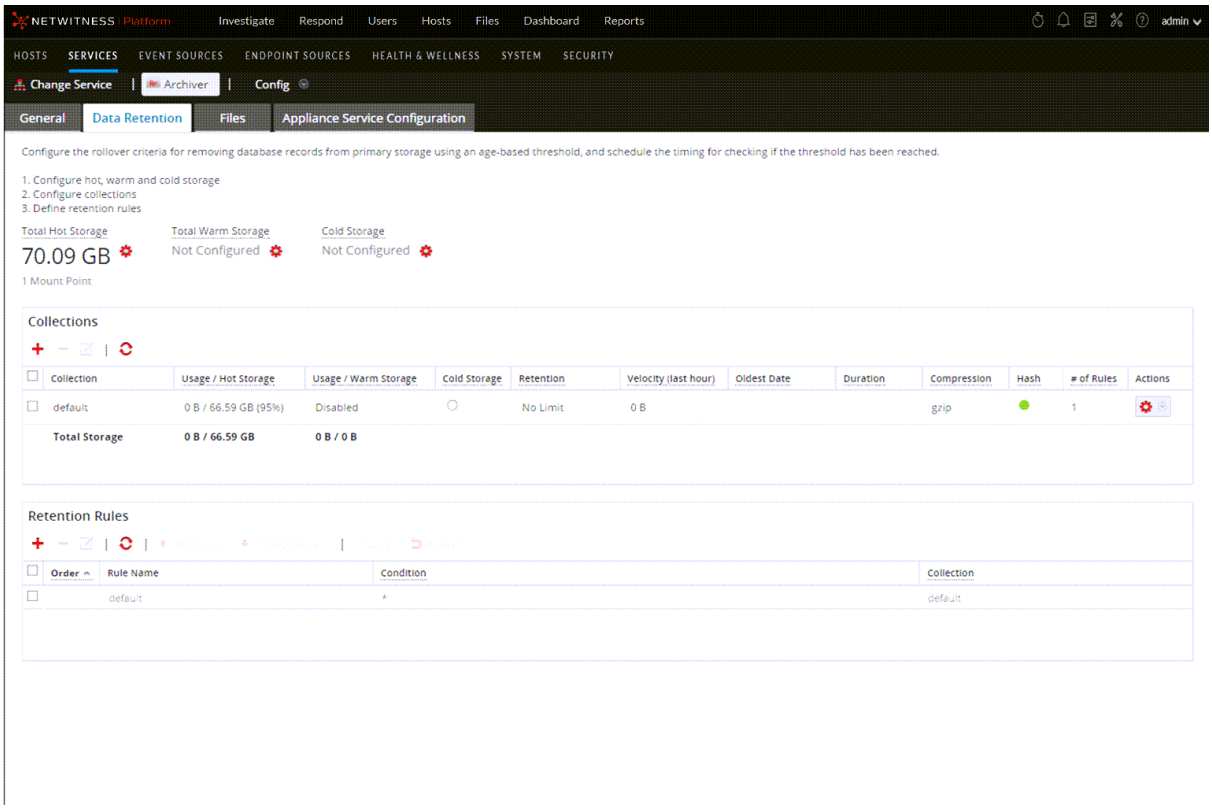
Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

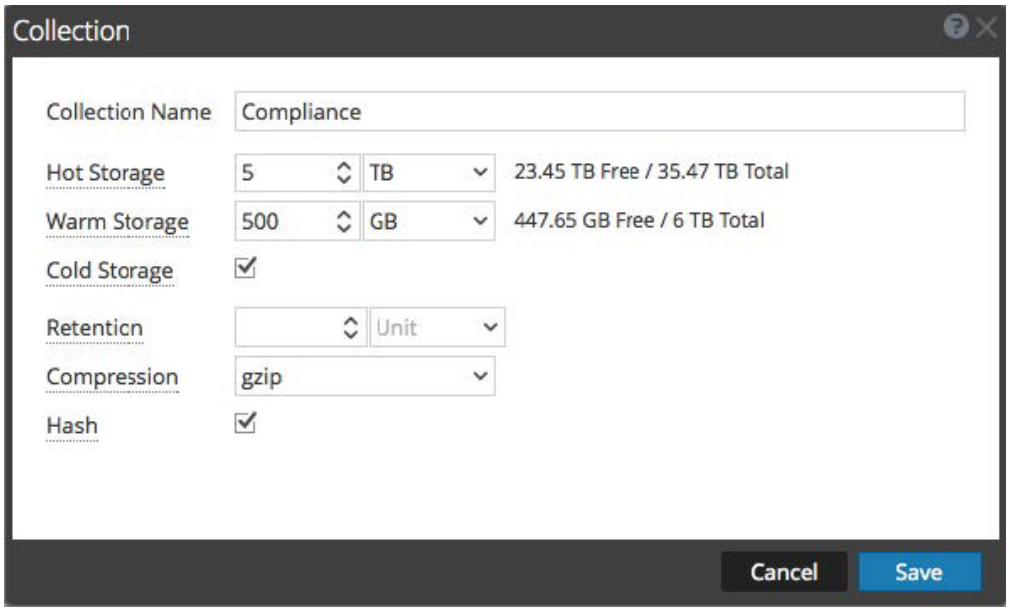
Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.



Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:



1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Collections** section, click  to add a collection.

   (If you decide to make changes to an existing collection, you can select the collection and click  to change the settings.)

The **Collection** dialog is displayed.

4. Configure the collection as described in the following table.

Field	Description
Collection Name	Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field.
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

5. Click **Save**.

   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.
   If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

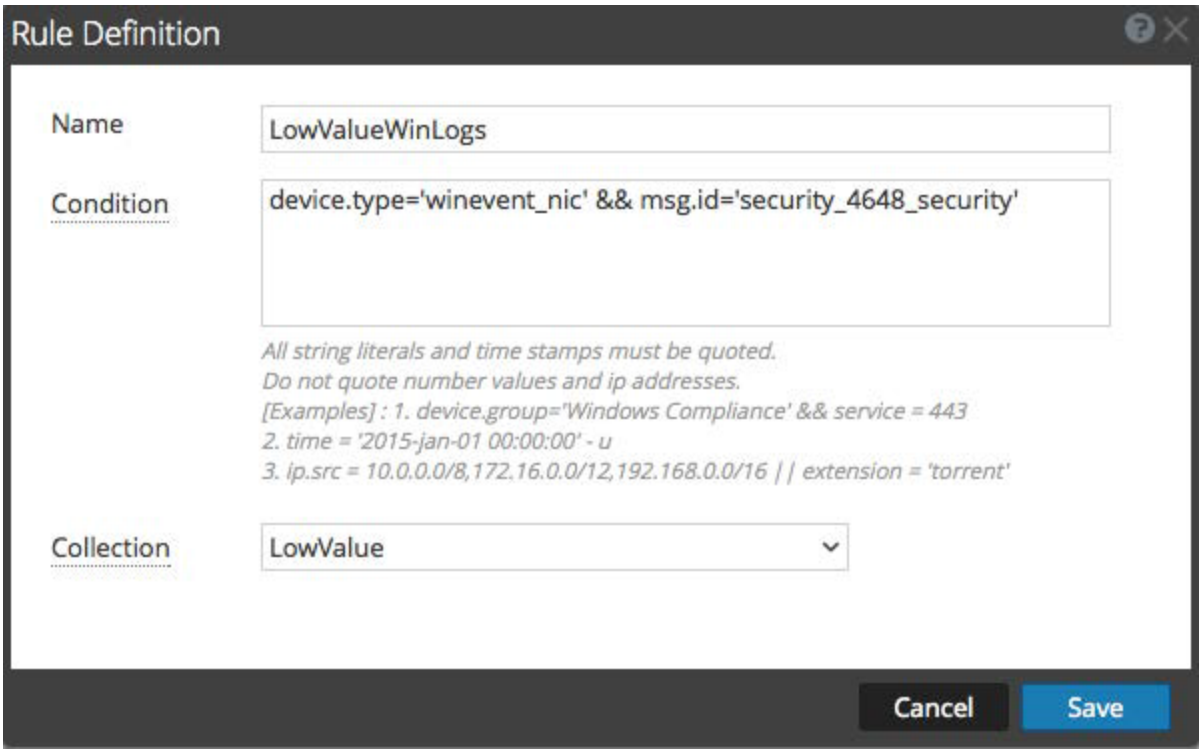
For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver ((Admin) > Services Config view).

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Prerequisites



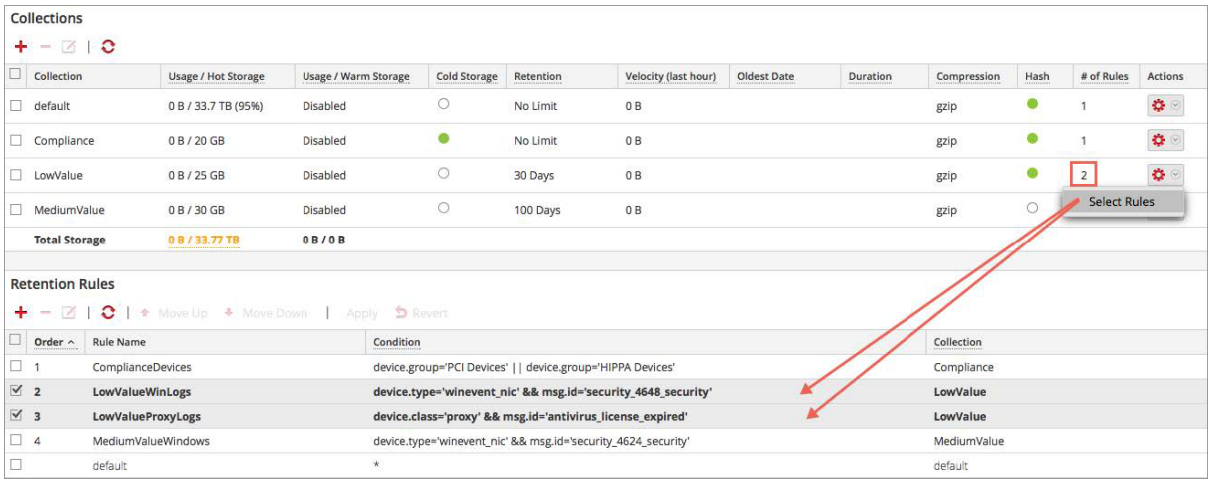
Before you configure your retention rules:

- Configure total hot, warm, and cold storage
- Configure log storage collections

Procedures

Define a Retention Rule for a Collection

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Retention Rules** section, click .
   The **Rule Definition** dialog is displayed.



4. Configure the fields in the Rule Definition dialog as described in the following table:

Field	Description
Rule Name	Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs
Condition	Specify the conditions for the type of logs that you want to include in the collection. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.type='winevent_nic' && msg.id='security_4648_security'`
Collection	Select the collection on which you want to apply this rule. For example: LowValue.

5. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click  **> Select Rules** in the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.

Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rules** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.

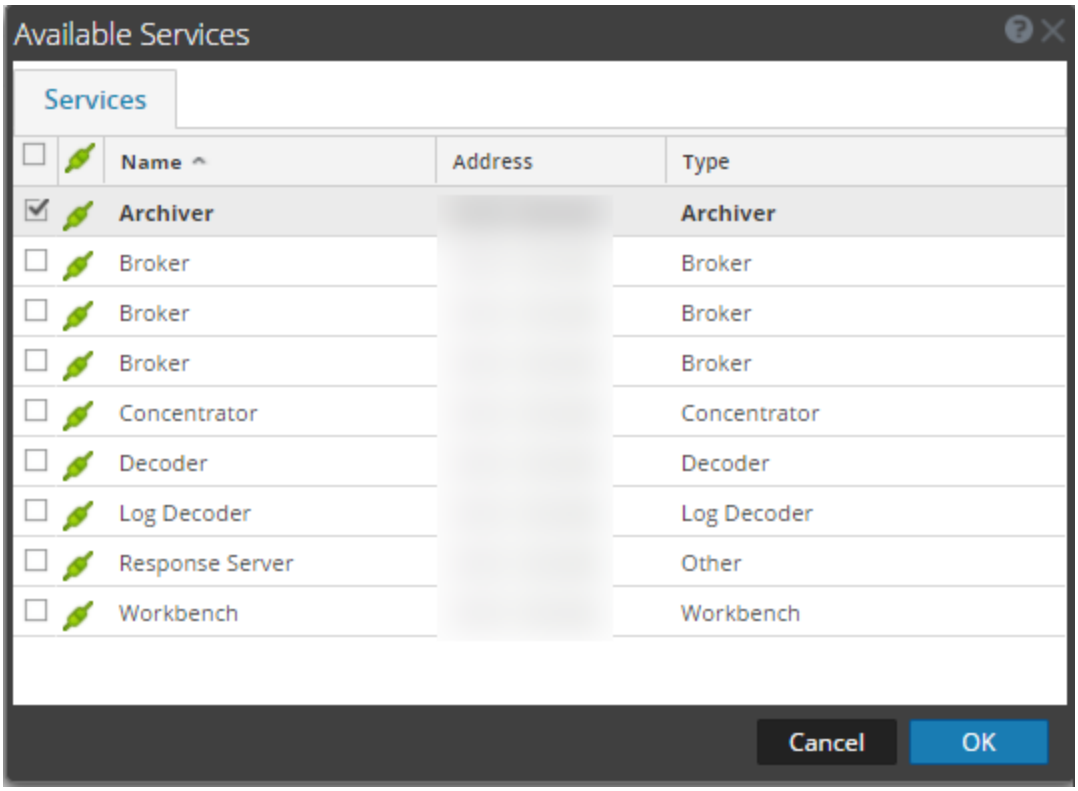
2. Click **Apply** to save the order of the retention rules.

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

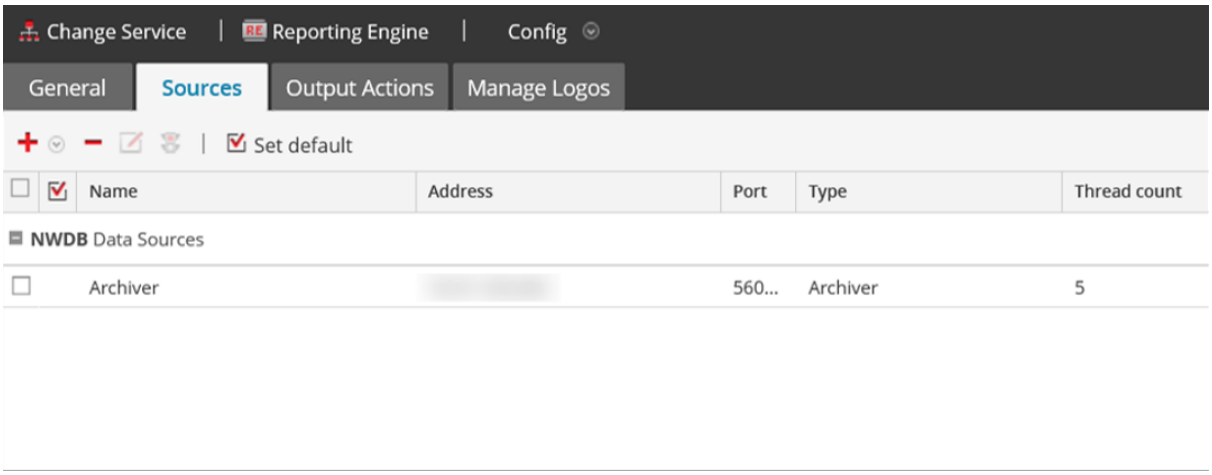
Prerequisites



Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

Procedure

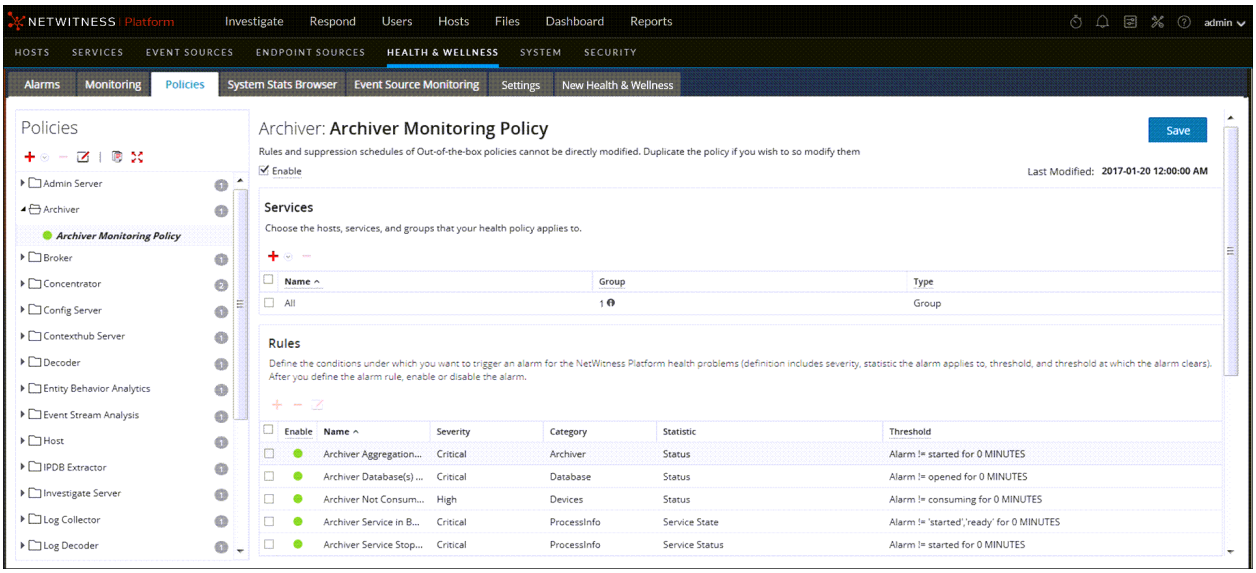


To associate an Archiver data source with Reporting Engine:

1. Go to  **(Admin)** > **Services**, click , and select **Reporting Engine**.
2. In the **Actions** column, select **View** > **Config**.
   The Services Config view of Reporting Engine is displayed with General tab open.
3. Select the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.

5. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**. The Service Information dialog is displayed.
6. Type the username and password for the Archiver.
7. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.



You can now create reports on the data collected by Archiver.

Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.

For detailed information, see "Manage Policies" in the *System Maintenance Guide.*

Additional Archiver Configuration

This topic is a collection of individual procedures, which an administrator may perform at any time and they are not required to complete the initial setup of the Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of an Archiver.

Configuring Data Backup and Restore

This topic provides information on the data backup and restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

Note: For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

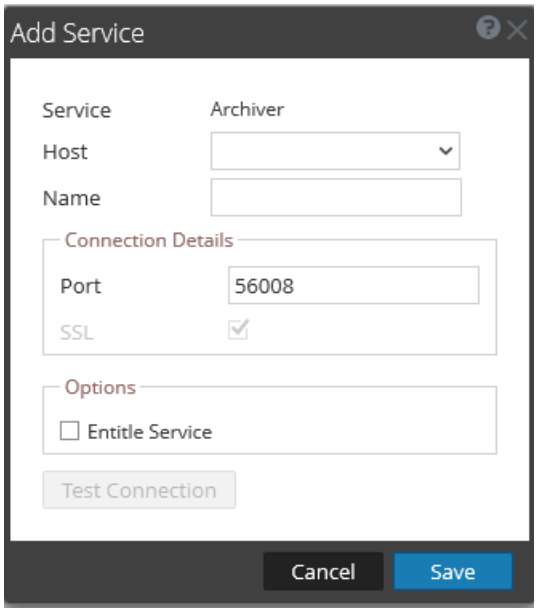
Action	Description
1. Restore your data to a location accessible by the Archiver.	Refer to Create Collection
2. Create a collection in Archiver that uses that location.	Refer to "Manage Collections" topic in the *Workbench Configuration Guide*.
3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service.	Refer to Add Archiver as a Data Source to Reporting Engine

Add Archiver Service

The NetWitness Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

Prerequisites

Make sure you have added an Archiver host and applied a license to it.



Procedure

Note: This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** panel, select **+>Archiver**.

   The Add Service dialog is displayed, as shown below.

3. Provide the following details.

Field	Description
Host	Select an Archiver host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50007.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.

4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the Services panel.

Note: If the test is unsuccessful, edit the service information and retry.

Create Collection

You can create a collection on an Archiver service using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

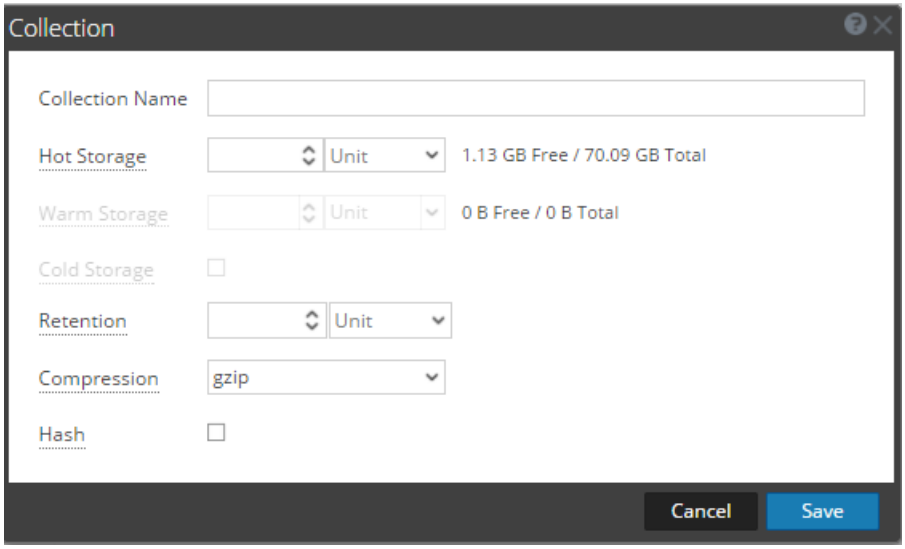
Prerequisites

Ensure that you have the following:

- Archiver service installed on an Archiver host.
- The Archiverservice has enough space to hold the collection.
- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.



Note: The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retentions** tab and click in the **Collections** panel to add a collection.

   The **Collection** dialog is displayed.

4. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.
5. Click **Save** to restore the collection.

   Note the following:
   - Target is the location where the collection is created.
   - If the source path provided to create the restoration collection does not exist, the following error message is displayed:

     "The source path does not exist '/xxx/xxx/'."

If there is insufficient storage to restore your collection, the following error is displayed:

"Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."

6. The Schedule Job dialog is displayed with the following message:

   "Restoring data into a new collection. Check the jobs page for progress."

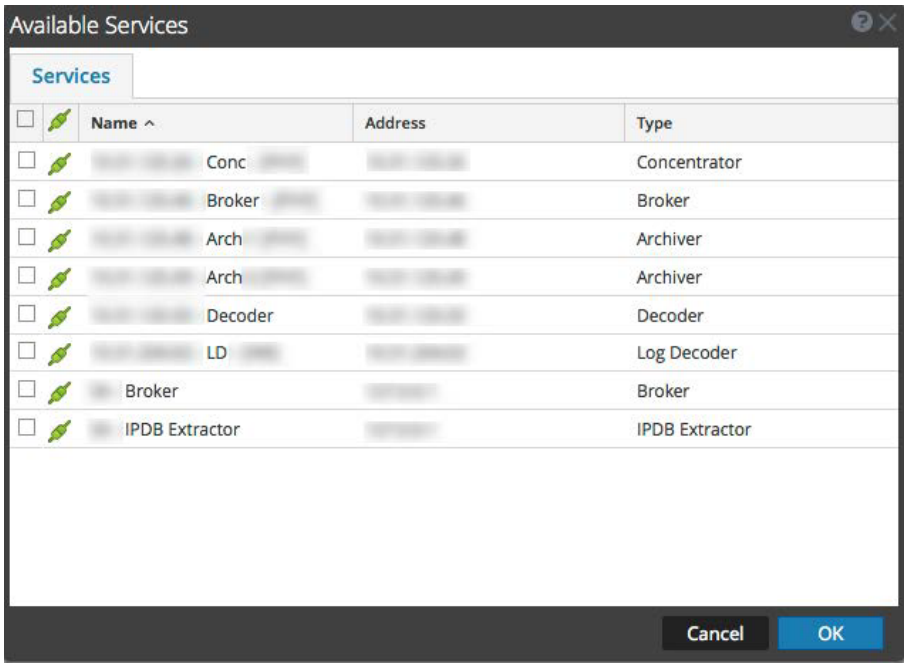
7. Click **Jobs**  icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

Note: When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

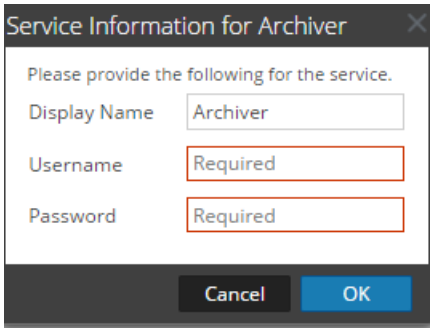
Prerequisites



Ensure that you have:

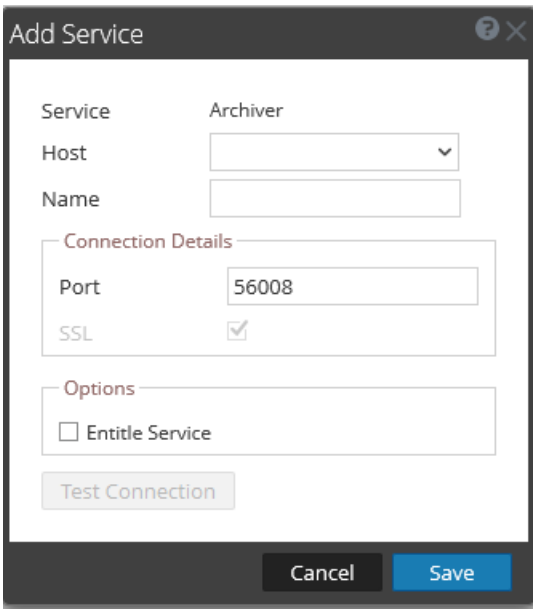
- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

Procedure



Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Go to  **(Admin) > Services**, click  , and select **Reporting Engine** service.
2. In the **Actions** column, click  **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.



5. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.

6. Type the username and password for admin credentials for the service.
7. Click **OK**.

   The Add Service dialog is displayed.

8. Select a host from the drop-down list and click **Save**.

   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

Note: This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to  **(Admin) > Services**.
2. Select an **Archiver** from the **Services** panel and select  **> View > Explore**.

   The Explorer view for the Archiver is displayed

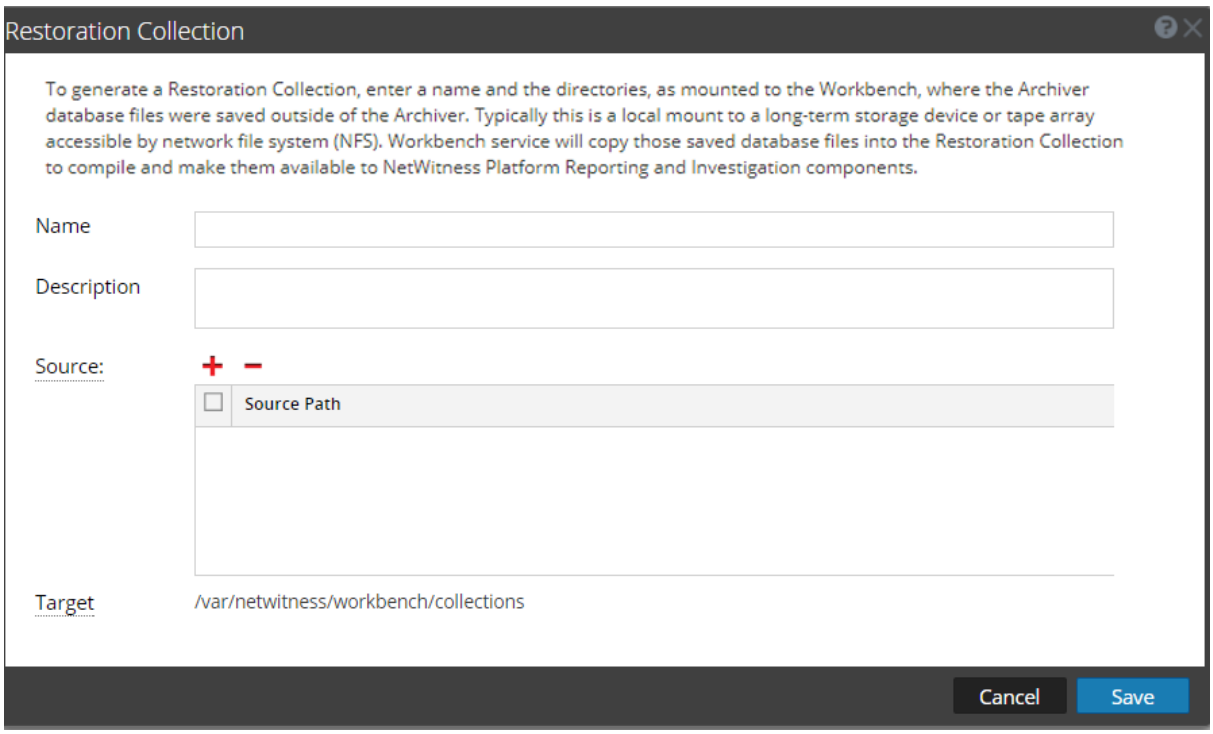
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for the selected query.

Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.



To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, then select **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.

   The Collections panel is displayed.
4. Click in the toolbar.

   The Restoration Collection dialog is displayed.

5. Provide the following information:
   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

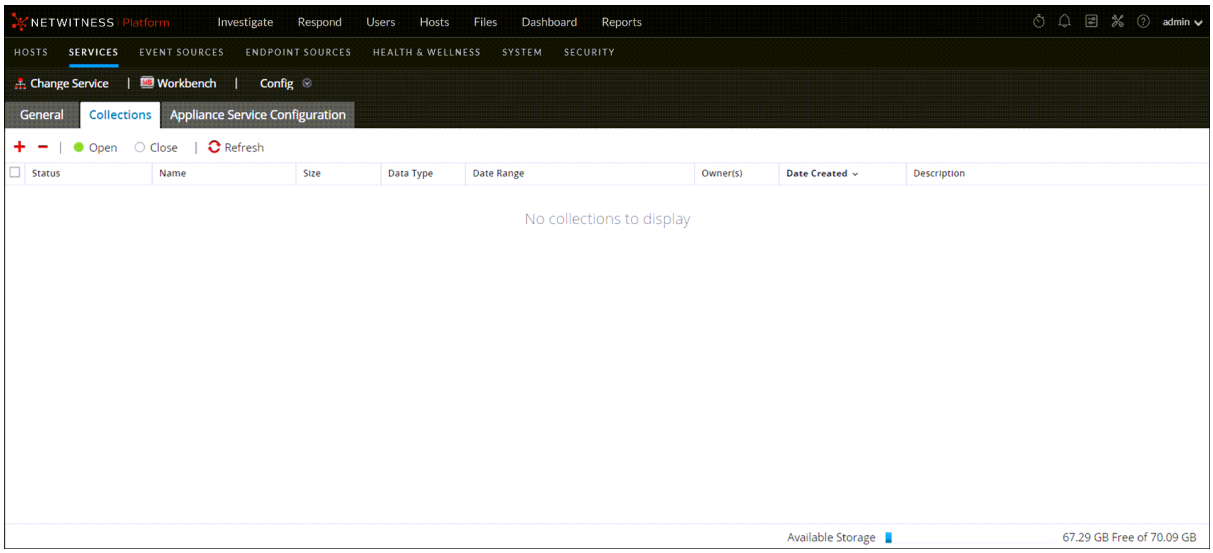
   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon  in the NetWitness toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

Delete a Collection



Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections panel is displayed.

4. In the Collections panel, select the collection that you want to delete.
5. Click − from the toolbar.

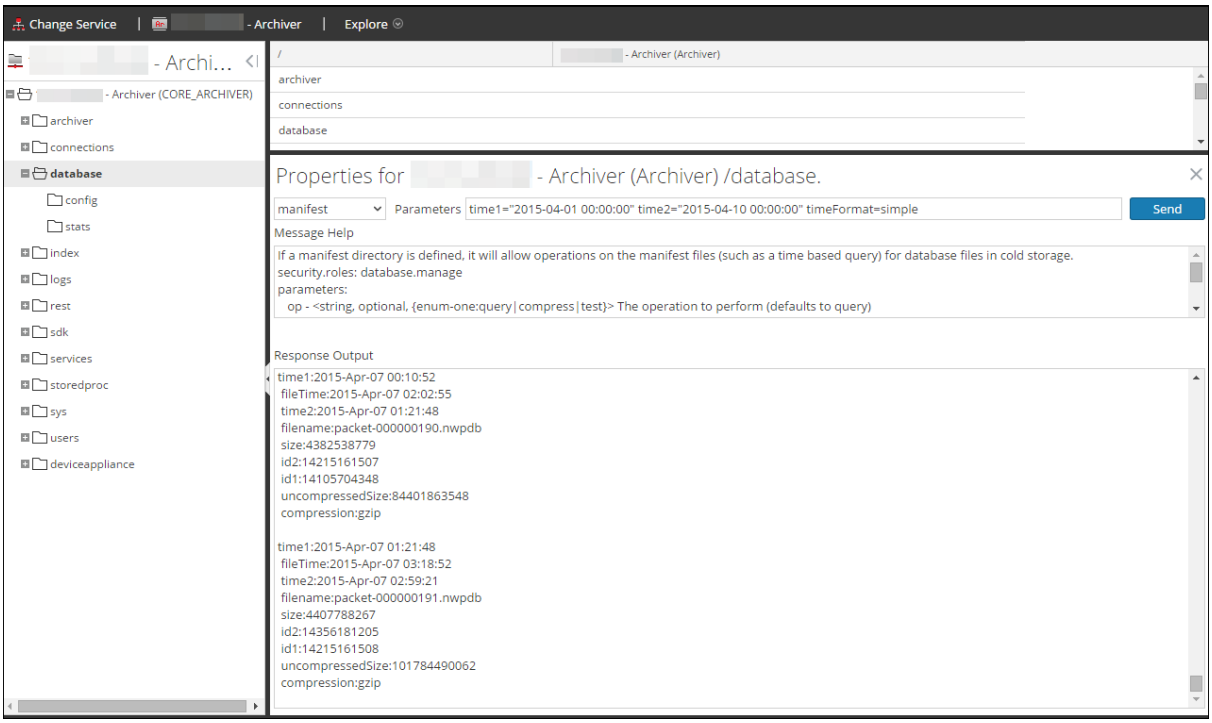
   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:



1. Go to **(Admin) > Services**, select the **Archiver**, and click **> View > Explore**.

   The Explorer view for Archiver is displayed.
2. Right-click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
3. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   Example Search:

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
   ```

4. Go to **(Admin) > Services**, select an **Archiver**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open
5. Select the **Collections** tab.
6. Create a restoration collection with the source path pointing to files listed in the manifest command output.
7. Save the collection.
   After successfully creating a collection, you can use this collection for reporting and investigation purposes.

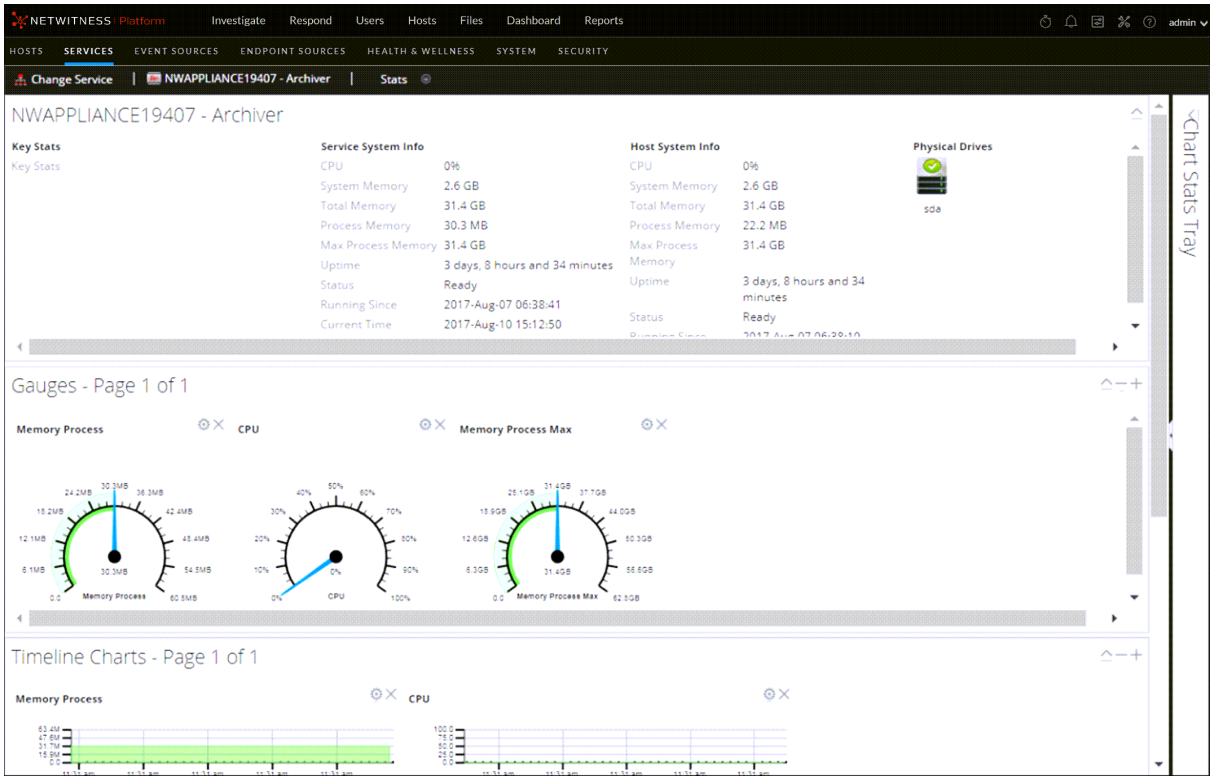
Investigate a Collection

To perform an investigation on an Archiver collection:

1. Go to **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

Note: For detailed information about using Investigate, see the *Investigate User Guide.*.



View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select an **Archiver**, then select **View > Stats**

   The Services Stats view is displayed.

Note: For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Archiver**, then select **> View > Logs**

The Services Logs panel is displayed.

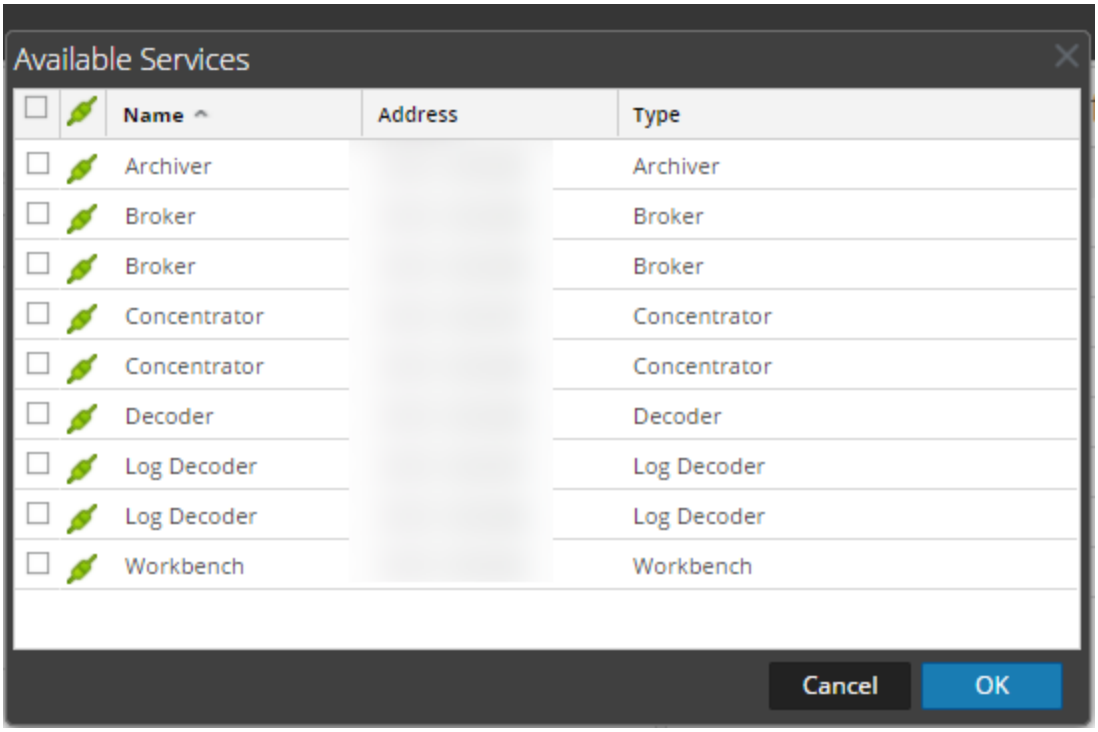
Note: For information about viewing and configuring audit logs, see "Configure Global Audit Logging" topic in the *System Configuration Guide.*

Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

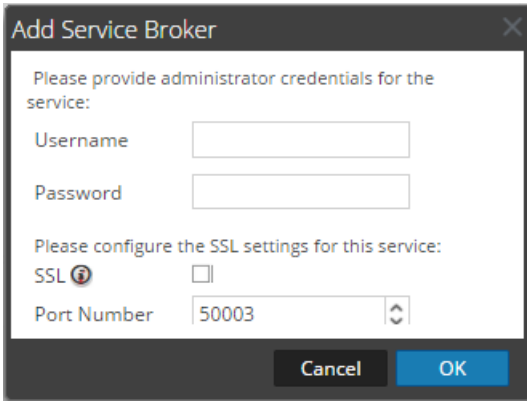
Prerequisites

Ensure that you have:



- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

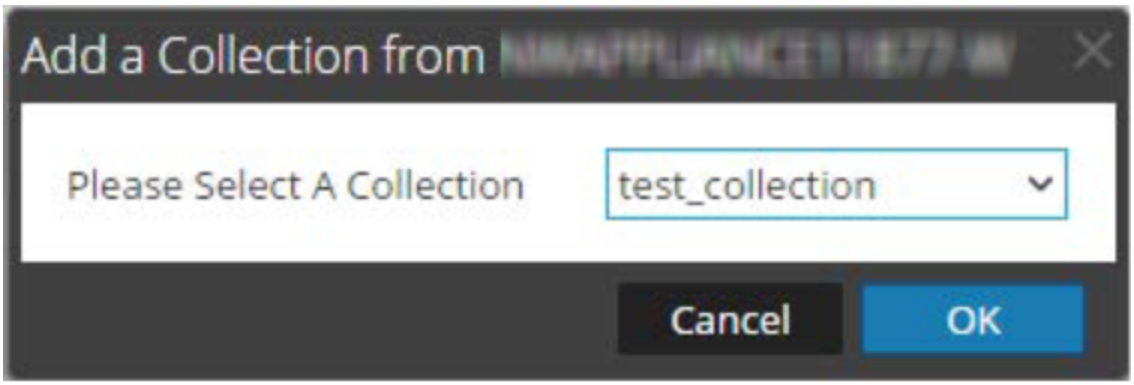
Procedure



To add an Archiver service as a data source on the Broker:

1. Go to  **(Admin) > Services** and select a **Broker** service.
2. In the **Actions** column, select  **> View > Config**.
   The Config view is displayed with the General tab open.
3. In the **Aggregate Services** section, click .

The Available Services dialog is displayed.



6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.

8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.

10. Select a collection from the drop-down list and click **OK**.

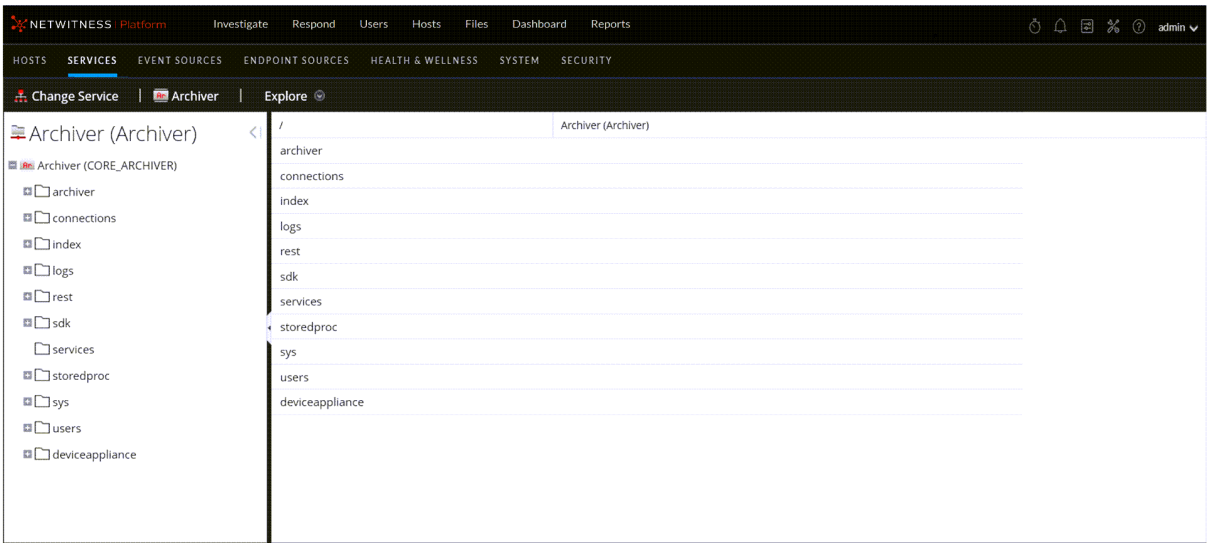
    The Archiver service is now added as a data source to the Broker.

Note: This procedure has to be performed for each collection.

Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

The following table lists the criteria that you can use to retrieve the hash files from the database.



Criteria	Description
sessions	You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information. **For example:** sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100. sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000
beginDate	You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS.
endDate	You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS **For example:** beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days.
directories	By default, the hash information files are stored with the database files they were created for. You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter. You can define the location as a filter and retrieve the hash information files for the configured location. **For example:** directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash

Procedure

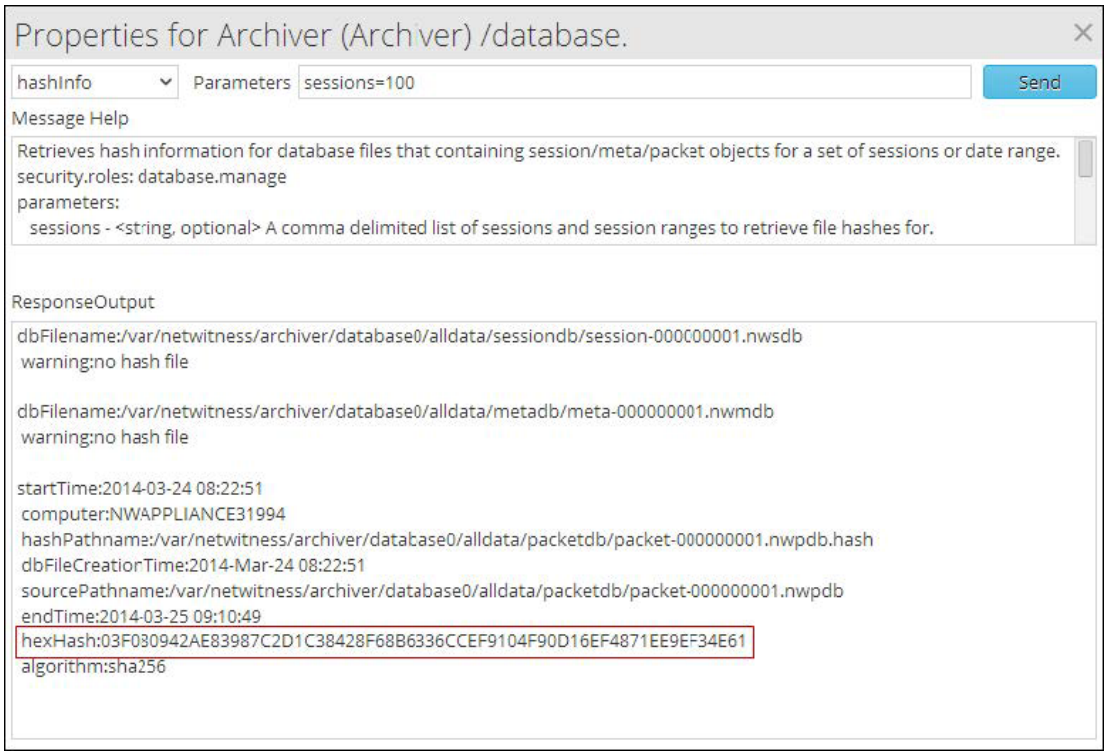
To retrieve hash information of the database files:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, select **View > Explore**.

   The Explore view of the Archiver service is displayed.

3. In the node tree, right-click on **archiver** and select **Properties**.

   The Properties dialog is displayed.



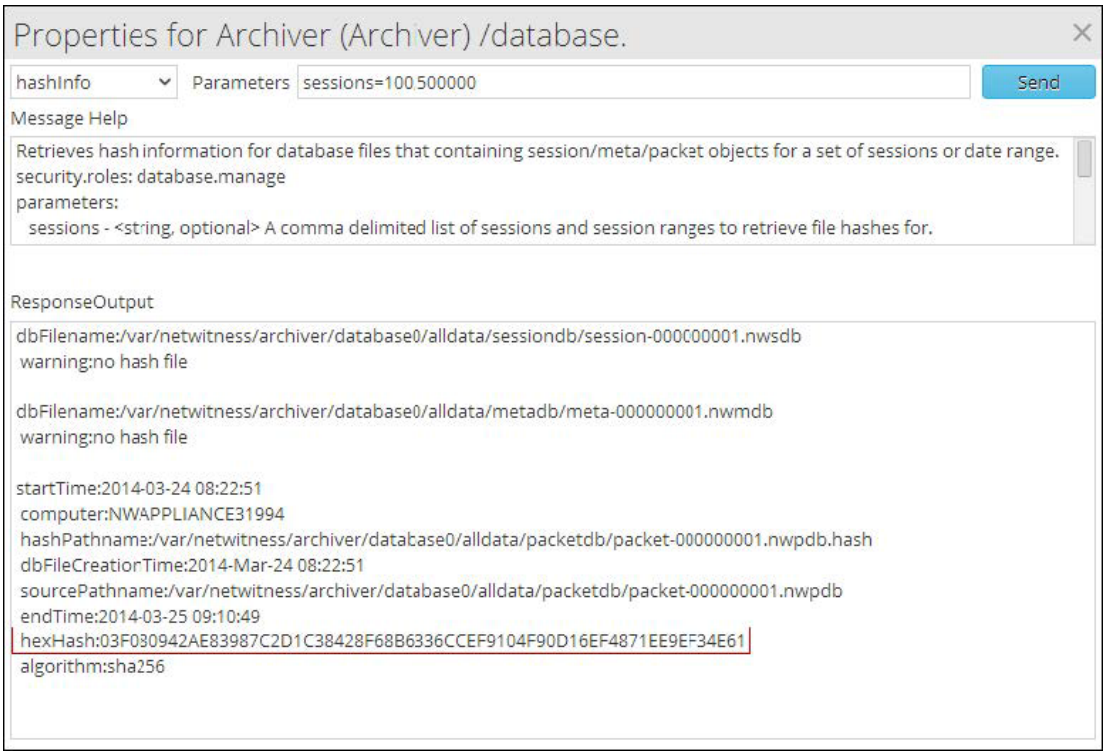
4. In the drop-down menu, select **hashInfo**.
5. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
6. Click **Send**.

   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

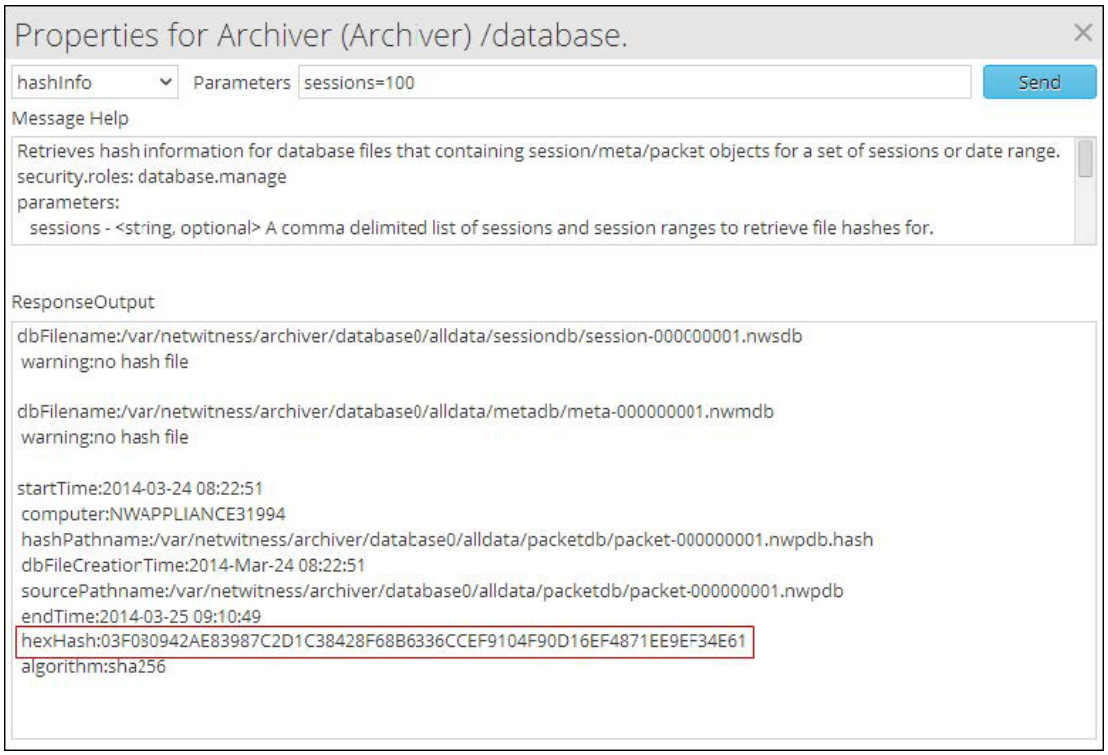
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000



Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

Archiver Collection Dialog

On the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoder as a source to the Archiver	Add Log Decoder as a Data Source to Archiver
Administrator	*Configure Archiver Storage and Log Retention	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to the Reporting Engine	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring	Configure Archiver Monitoring

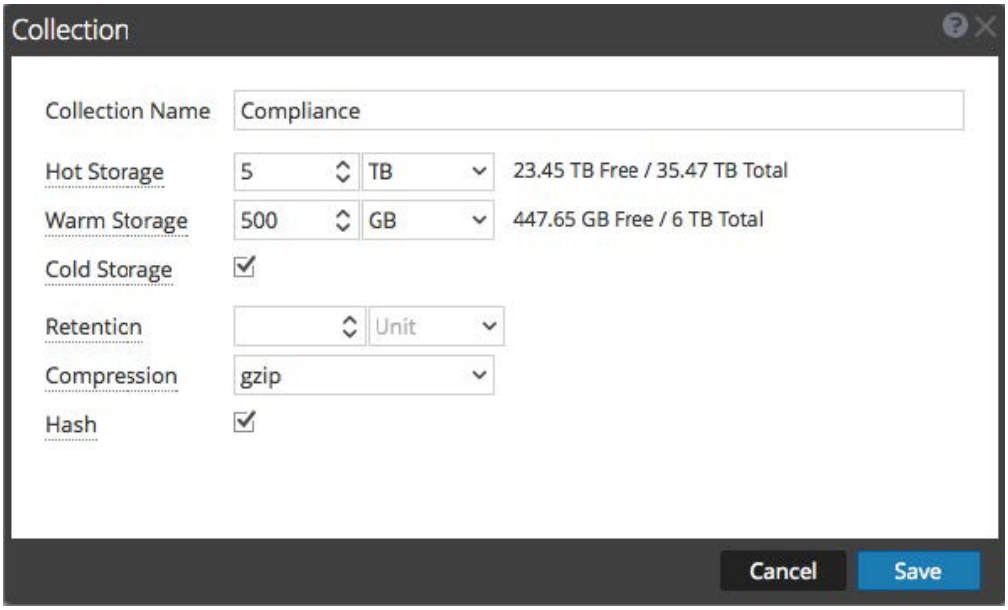
Related Topics



Configuring an Archiver

Quick Look

To access the Collection dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.

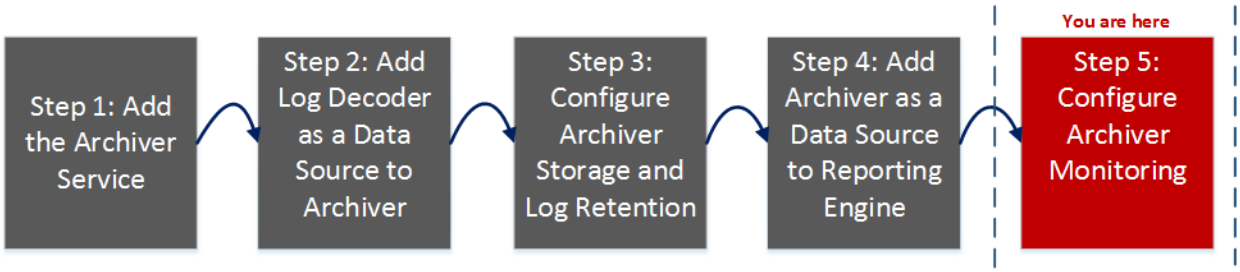
3. Click the **Data Retention tab**.
4. In the Collections section, click .
   The Collection dialog is displayed.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.

Field	Description
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved.



Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to **(Admin) > Services**, select an **Archiver** service, then select **View > Config**.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

Note: Archiver can aggregate from Log Decoder r and Archiver (Archiver-Archiver aggregation). Archiver can be aggregated by Archiver and Broker. A Broker can aggregate from either set of concentrators or set of Archivers

What do you want to do?

Related Topics

Configure Log Storage Collections

Quick Look

This is an example of the General tab.

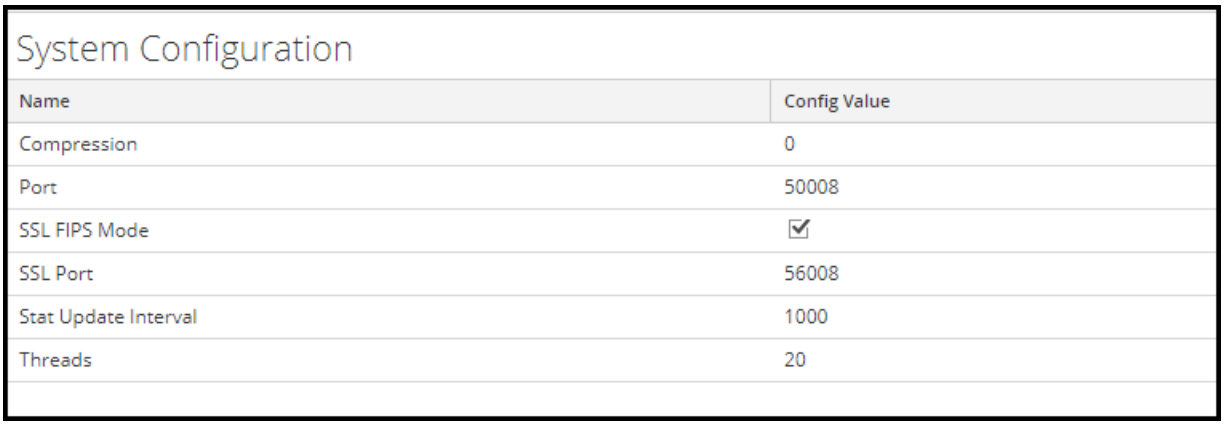
These are the three major sections in the General tab for Archivers:

1. Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
2. System Configuration section manages service configuration for a service.
3. Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process.

Aggregate Services Section

This is an example of the Aggregate Services section for a Concentrator. The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Archiver or a Log Decoder.
	Removes the selected aggregate service.
	Opens a dialog to edit **Meta Fields** and **Filter** values.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



The Aggregate Services section list has these columns.

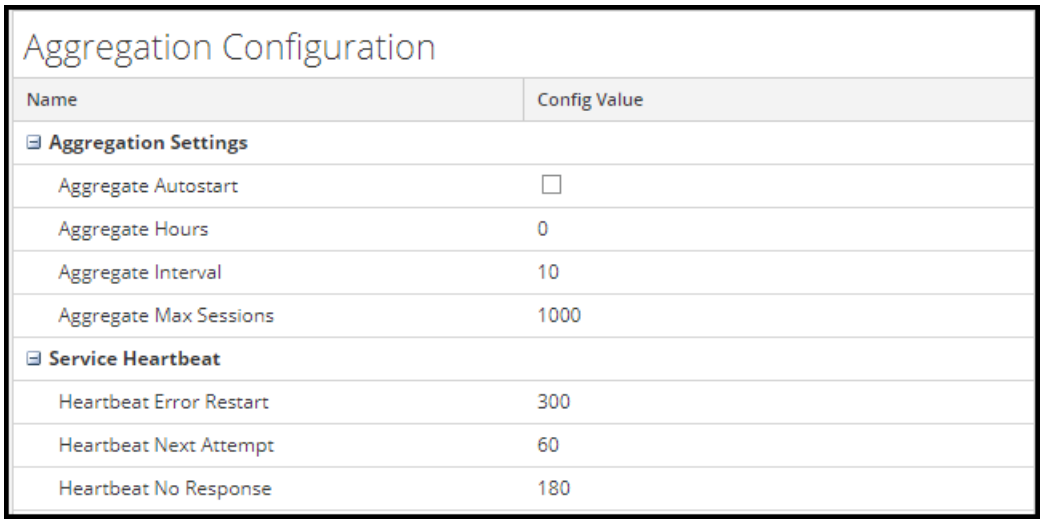
Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.

Column	Description
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

When a service is first added, default values are in effect. You can edit these values to tune performance.

The System Configuration section has these parameters.



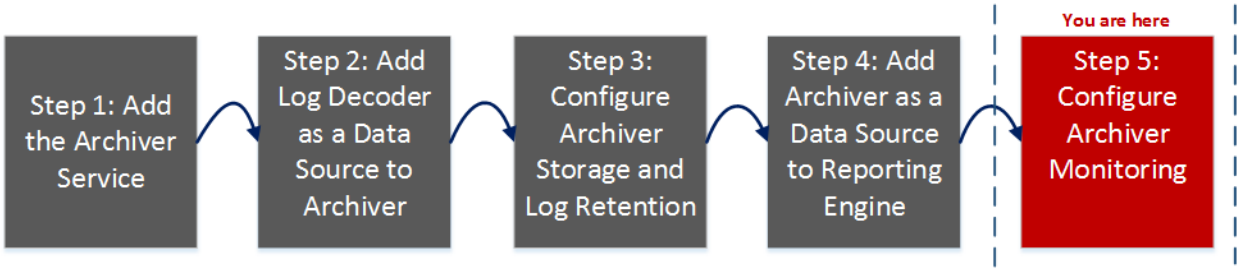
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.

Parameter	Description
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. Changes takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration Section provides configuration settings for aggregation. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not edit any of these settings without guidance from Customer Support.



Archiver Service Configuration

This topic lists and describes the available configuration settings for NetWitness Archivers.

Related Topics

Configuring an Archiver

Configure Hot, Warm, and Cold Storage

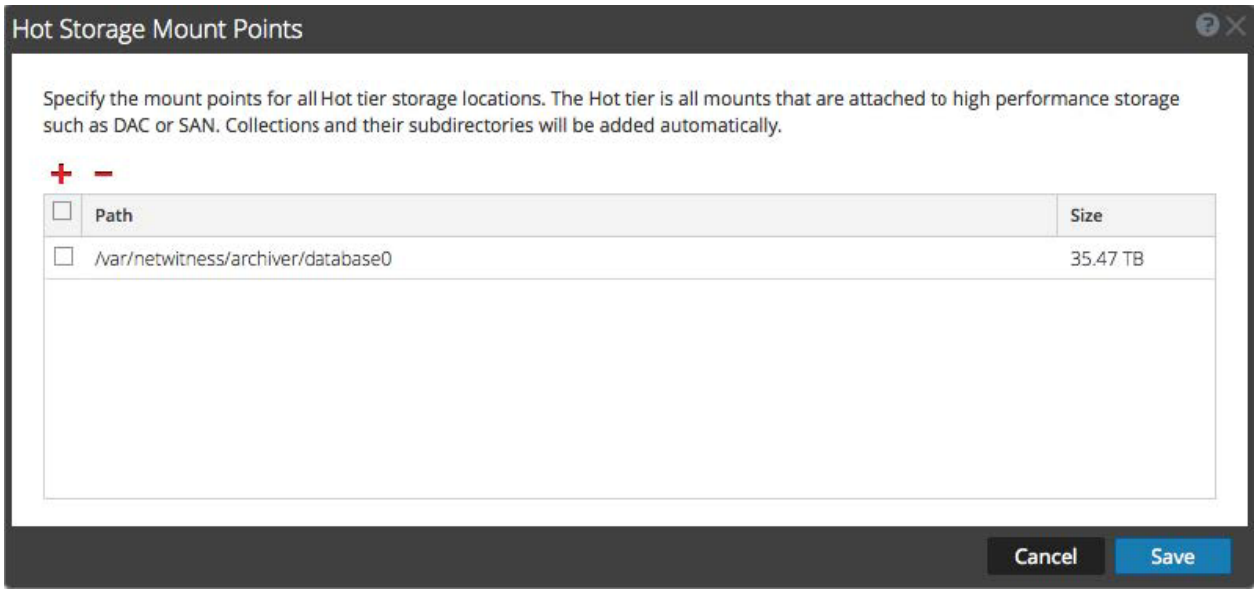
Quick Look

As an administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.

1	Displays the Collections panel with the Data Retention tab open.
2	Allows you to sort the collections in ascending or descending order.
3	Displays the allocated hot storage space for the collection, as well as the approximate current usage.
4	Displays the allocated warm storage space for the collection, as well as the approximate current usage.
5	Displays whether the collection uses cold storage for long-term backup.
6	Displays the time range used to determine when data is moved to cold storage or discarded.
7	Displays the amount of data written to the collection during the past hour.
8	Displays the date of the oldest data stored in the collection.
9	Displays the approximate age of the oldest data stored in the collection.
10	Displays the compression type used in collection storage.
11	Displays whether or not hashes are used when storing data in the collection.
12	Displays the number of retention rules that use this collection for storing data.
13	Displays the Actions drop-down menu.

14 Displays the Retention Rules panel.
15 Displays the order in which Retention Rules are evaluated in the execution chain.
16 Displays the name of the Retention Rule.
17 Data that satisfies this condition is stored in the corresponding collection.
18 Displays the collection used to store the data that satisfies this particular rule condition.

Total Hot, Warm, and Cold Storage

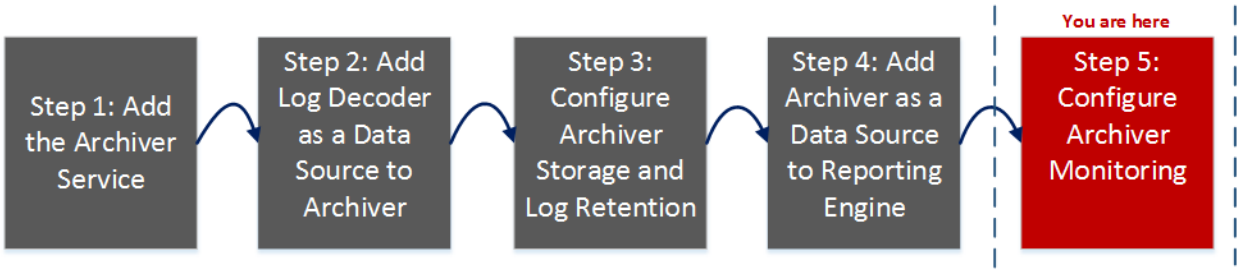


The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the icon near the respective section.



Services Config View - Archiver

The Services Config view ((Admin) > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

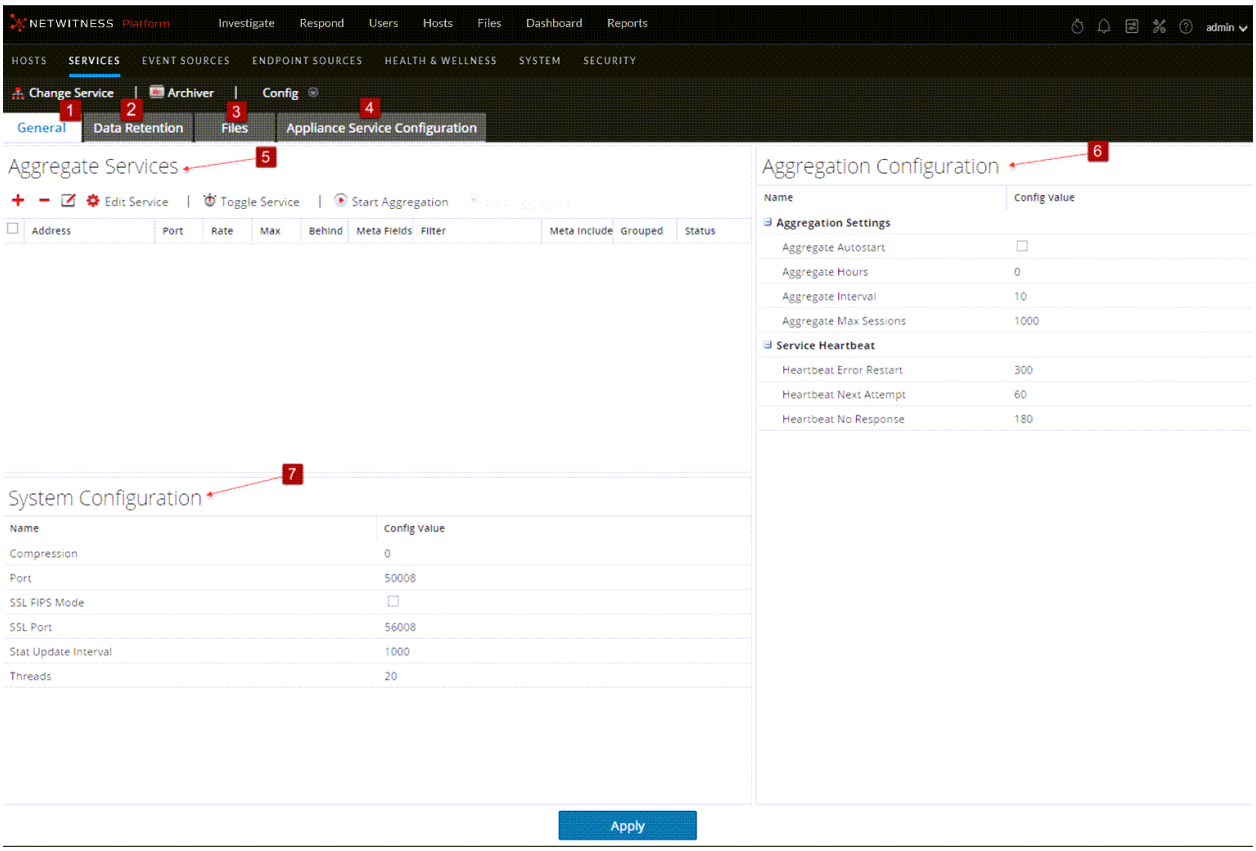
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine..	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring
Administrator	*Add a Log Decoder as an aggregate service.	Click in the Aggregate Services section.
Administrator	*Remove the selected aggregate service.	Click in the Aggregate Services section.

Role	I want to...	Show me how...
Administrator	*Edit Meta Fields and Filter values of the aggregate service.	Click  in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service.
Administrator	*Communicate with the Archiver.	Click  in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver.
Administrator	*Toggle the state of a service between offline and online.	Click  in the Aggregate Services section.
Administrator	*Aggregate data using the rules defined for the service.	Click  in the Aggregate Services section. Note that it is necessary to start aggregate service after aggregation has been stopped.
Administrator	*Stop aggregation on the Archiver.	Click  in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.



*You can perform this task in the current view.

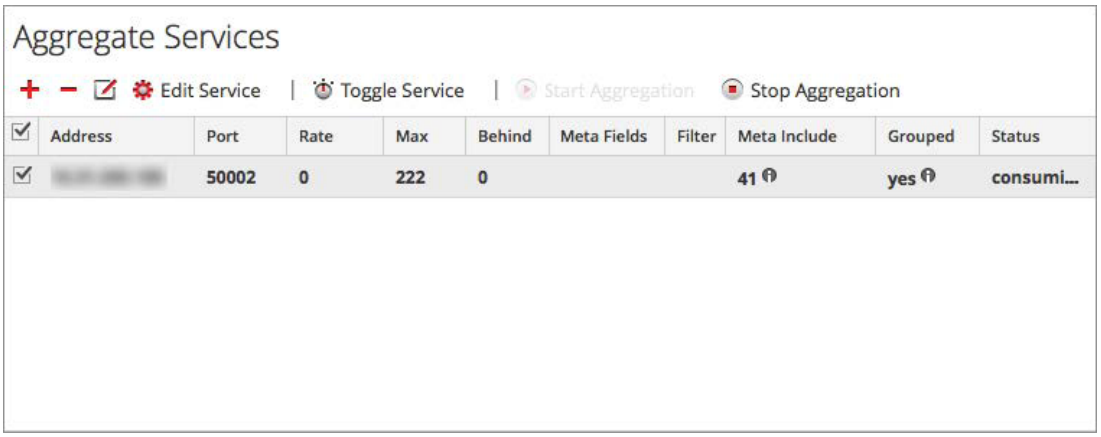
Related Topics

Configure Log Storage Collections

Quick Look

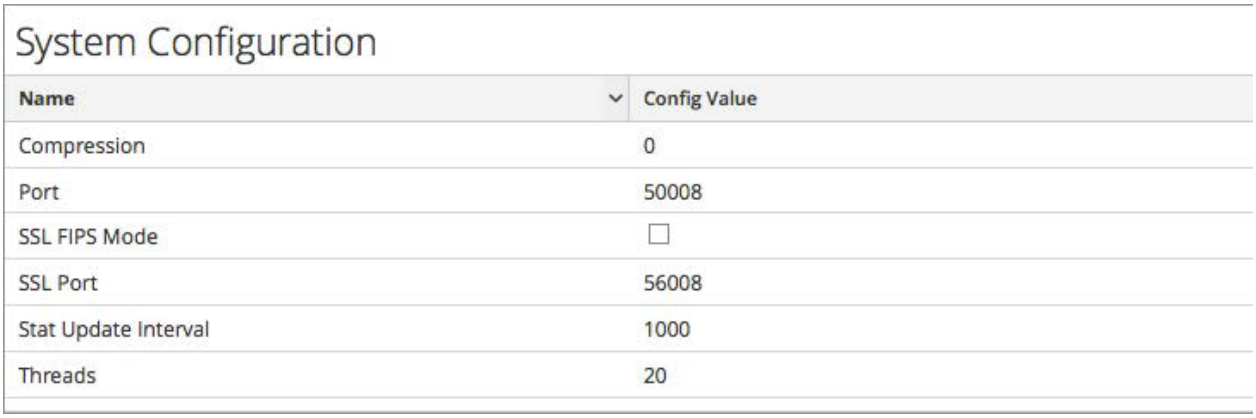
The Services Config view has four tabs and three panels.

1	General tab provides a way to manage basic Archiver service configuration.
2	Data Retention tab provides a way to view and edit collections and retention rules.
3	Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files
4	Appliance Service Configuration tab provides a way to configure an Archiver service.
5	Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
6	Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process.
7	System Configuration panel provides a way to manage service configuration for an Archiver service.



General

The General tab contains the following sections:

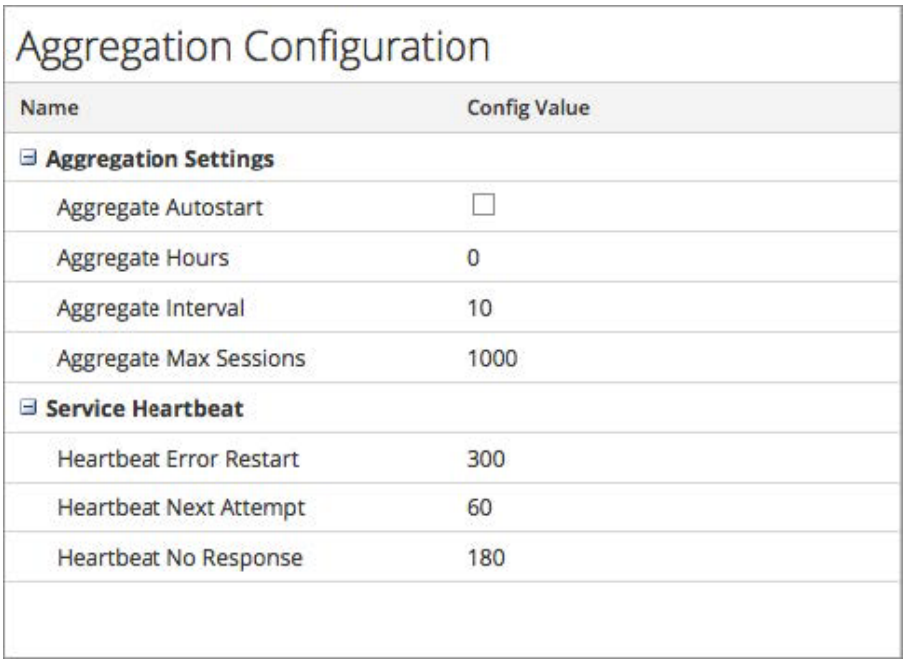


- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

System Configuration



When you add an Archiver service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

Task	Description
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.

Task	Description
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Aggregation Configuration

The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

Aggregation Settings

The Aggregations Settings section has the following parameters.

Parameter	Description
Aggregate Autostart	If enabled, data aggregation will automatically restart after a service restart.
Aggregate Hours	Determines the maximum number of hours a service is allowed to start aggregation.
Aggregate Interval	Determines the minimum number of milliseconds before another round of aggregation is requested.

Parameter	Description
Aggregate Max Sessions	Determines the number of sessions to aggregate on each round.

Service Heartbeat

The Service Heartbeat section has the following parameters.

Parameters	Description
Heartbeat Error Restart	Determines the number of seconds to wait after a service error before attempting a service reconnect.
Heartbeat Next Attempt	Determines the number of seconds to wait before attempting a service reconnect.
Heartbeat No Response	Determines the number of seconds to wait before taking unresponsive service to offline.

Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see "Files Tab" in the *Host and Services Getting Started Guide*.

AWS Installation Overview

Before you can deploy NetWitness in the Amazon Web Services (AWS) you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see the Storage Guide for NetWitness® Platform 12.4.
- Make sure that you have a NetWitness Throughput license.

When you are ready to begin deployment, you can purchase any of the following Third-Party solutions for packet capture in AWS. If you engage one of these third-parties, they will assign an account representative and a professional services engineer to you who will work closely with NetWitness Support.

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Azure, virtual, and hardware hosts. NetWitness recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow the best practices to use the system and the dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that the compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build a Concentrator directory for the index database on the Provisioned IOPS SSD.

AWS Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

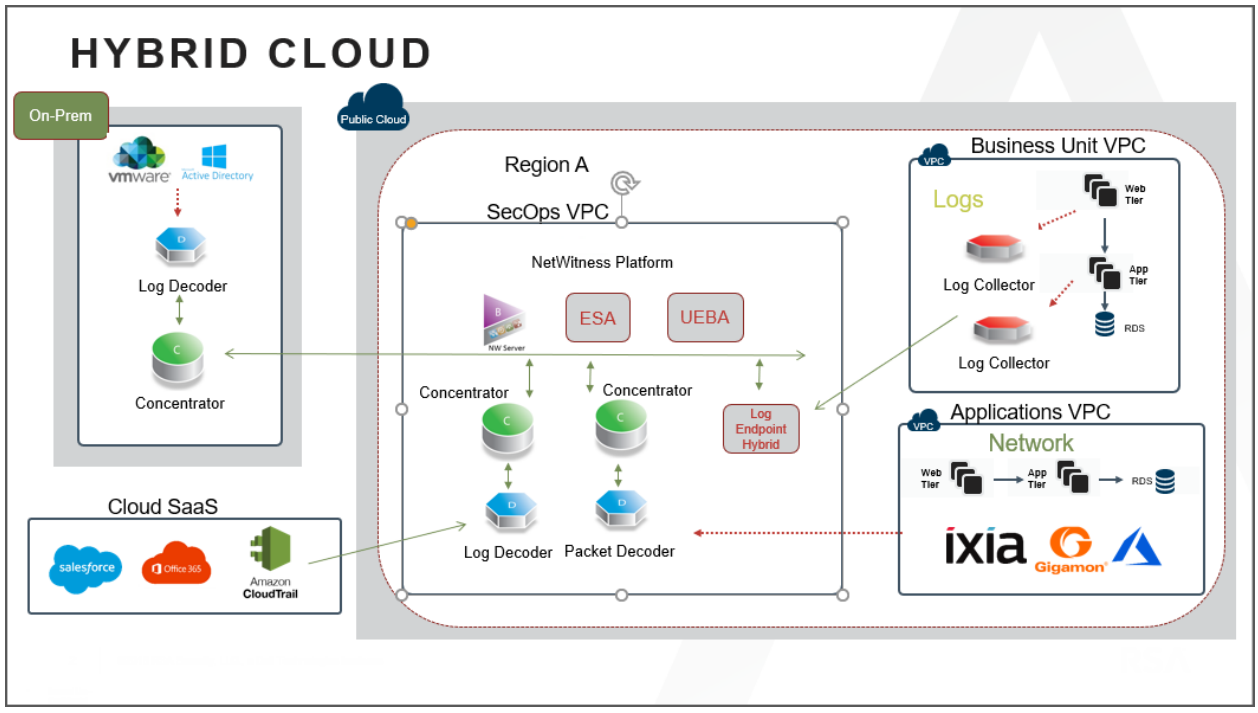
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Prerequisites

You need the following items before you begin the installation process:

- Ixia account (https://login.ixiacom.com/)
- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Decoder.

AWS Deployment

This topic contains the rules and high-level tasks that you must follow to deploy NetWitness components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness in AWS.

- If you reboot the Network Decoder instance, the tunnel is not retained. Create the tunnel on Network Decoder again and restart the Decoder service.
- It is recommended to use private IP addresses when you provision AWS NetWitness instances.

Note: If you assign a public IP to the NW Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

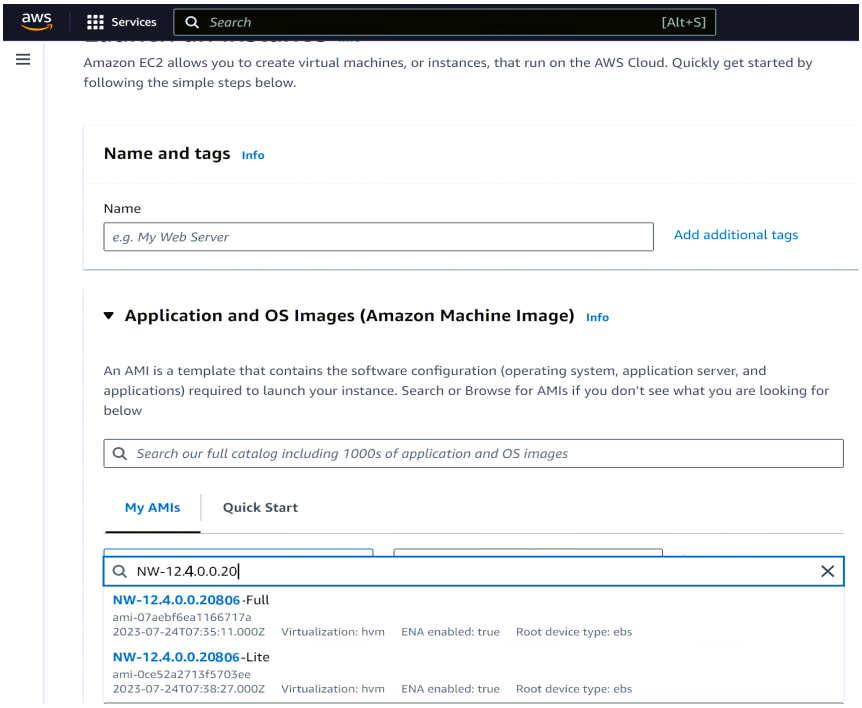
```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description	√
1	Establish AWS Environment	
2	Find NetWitness Platform AMIs	
3	Launch an Instance and Configure a Host	
4	Configure Hosts (Instances) in NetWitness Platform	
5	Configure Packet Capture	

Establish AWS Environment

1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.



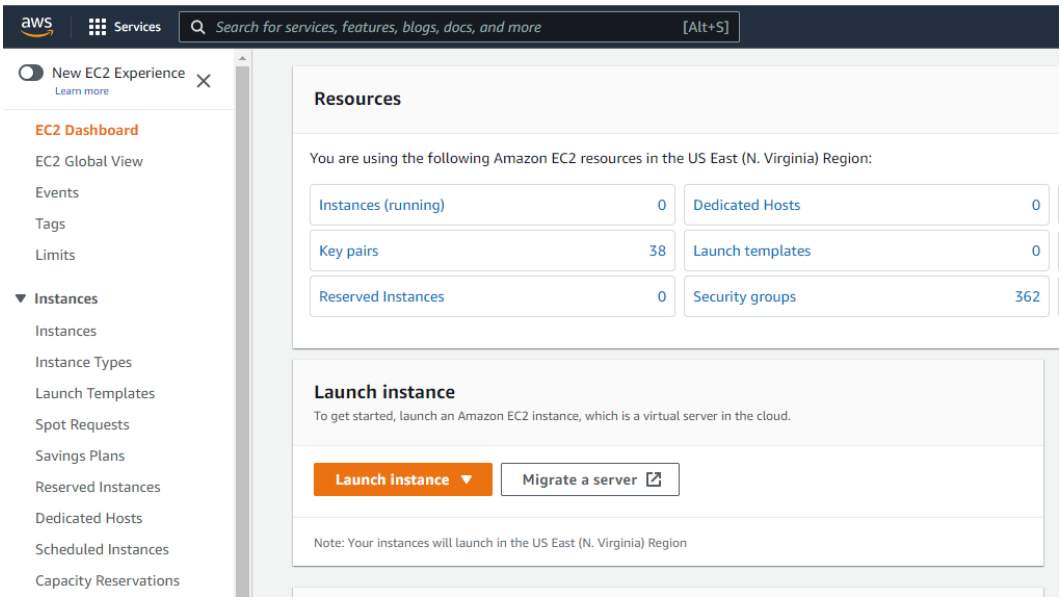
Find NetWitness Platform AMIs

You can search for NW- AMI files within the Public/Shared/Community repository, using the keyword "NW".

Note: NetWitness AMIs are available by default in the US East (N. Virginia) region (us-east-1). If you need AMIs for other regions, contact NetWitness Customer Support.

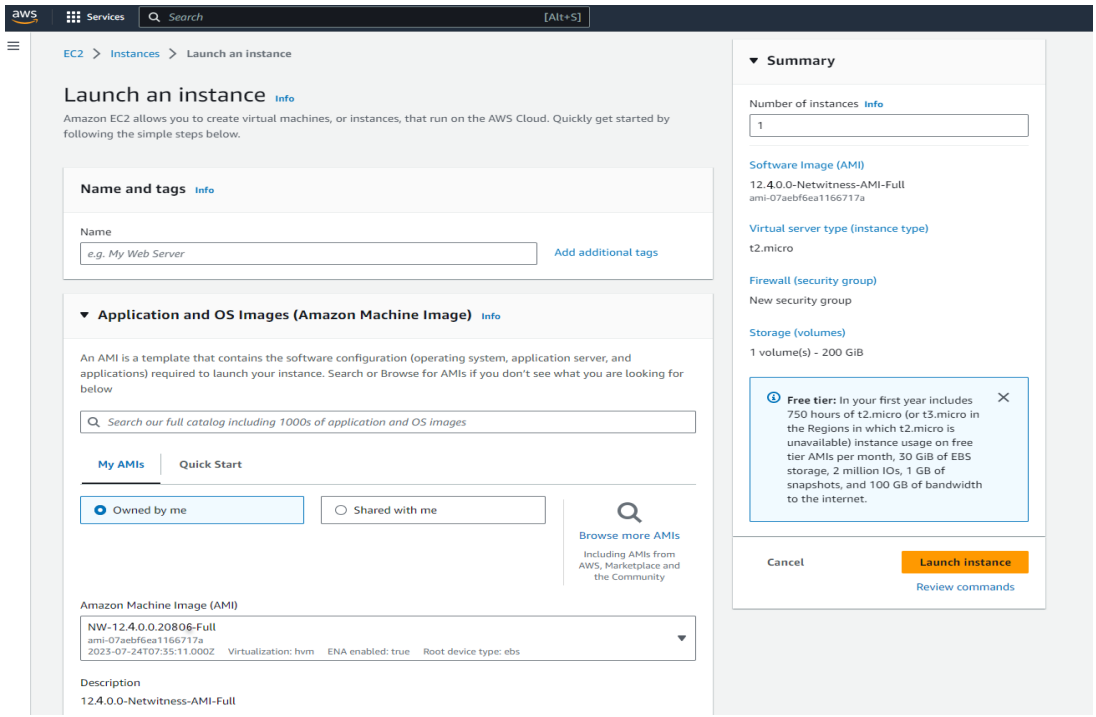
Note: For more information, see AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the new Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. Go to **EC2 Dashboard** and click **Launch Instance**.
   Launch an Instance page is displayed.
3. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
4. Search for **NW-12.4** from the **Amazon Machine Image (AMI)** drop-down menu to find the NetWitness AMIs.



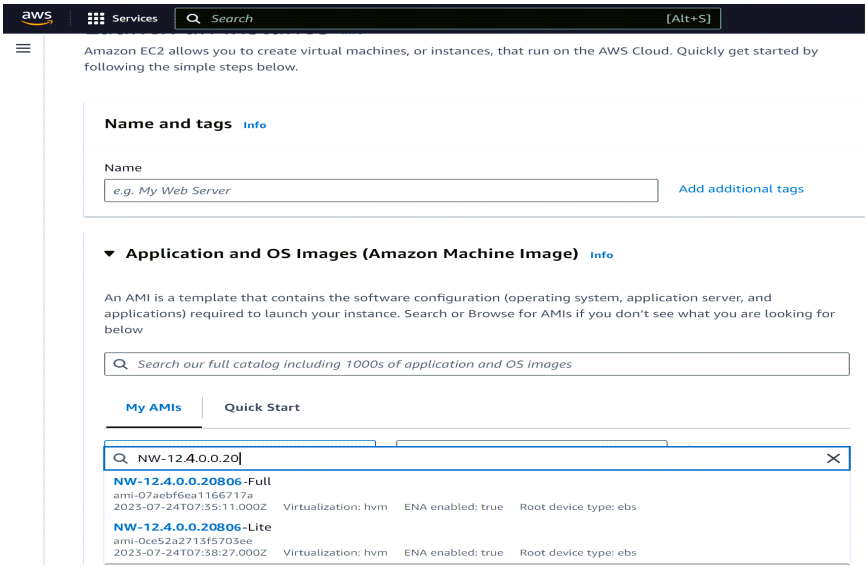
Note: Contact NetWitness Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to obtain access to the **NW-12.4.0.0.20806-Full**.

5. Go to Launch an Instance and Configure a Host.



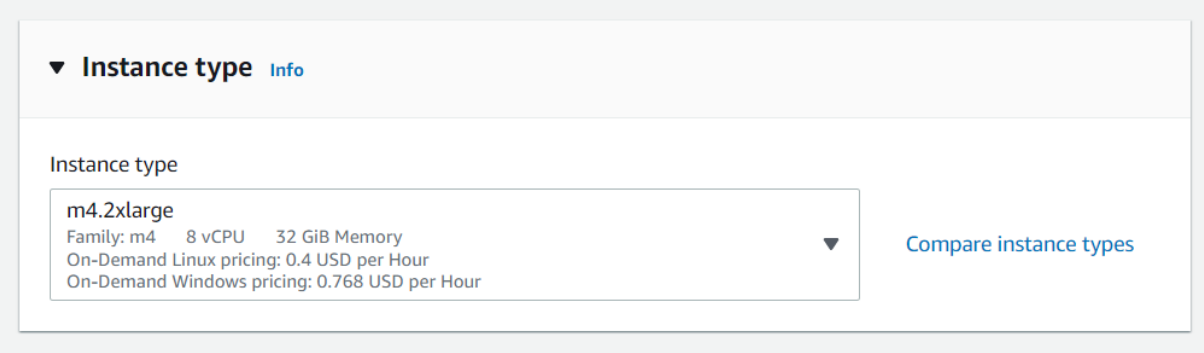
Launch an Instance and Configure a Host

Note: Fore more information, see AWS "Launch an instance using the new launch instance wizard" documentation (https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-launch-instance-wizard.html).

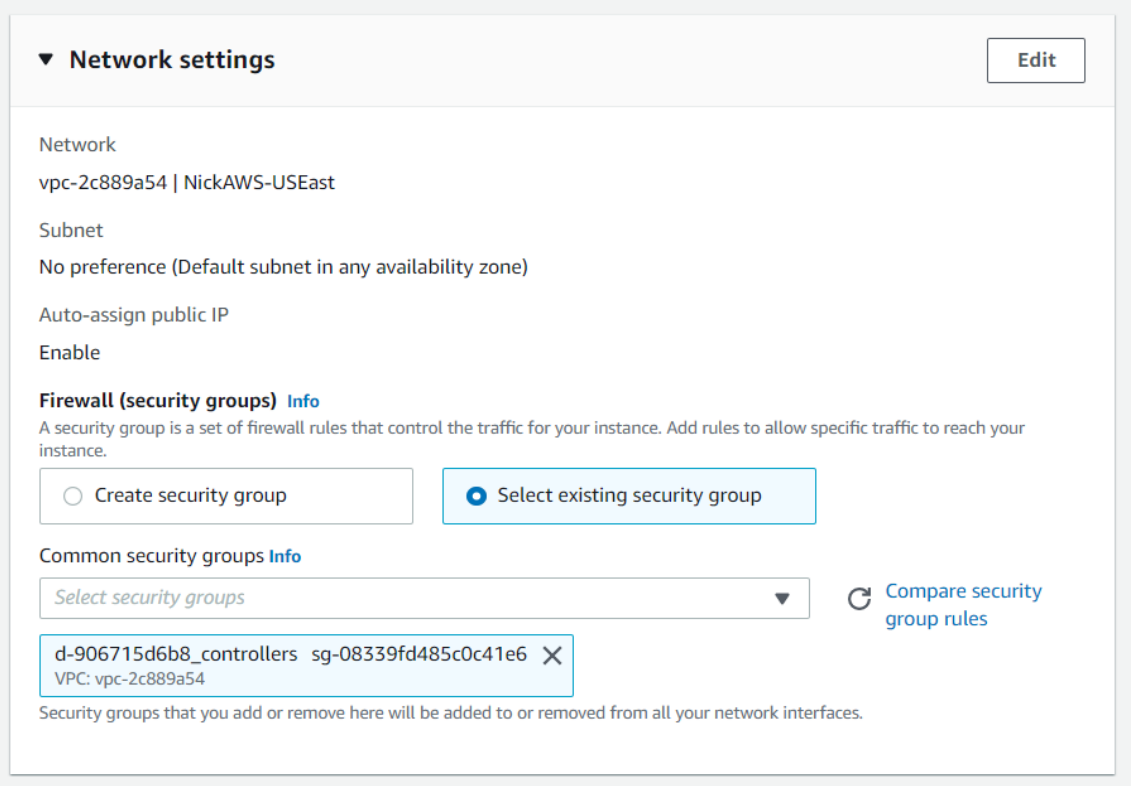


1. Log in to the Amazon EC2 console.
2. Go to **EC2 Dashboard** and click **Launch Instance**.

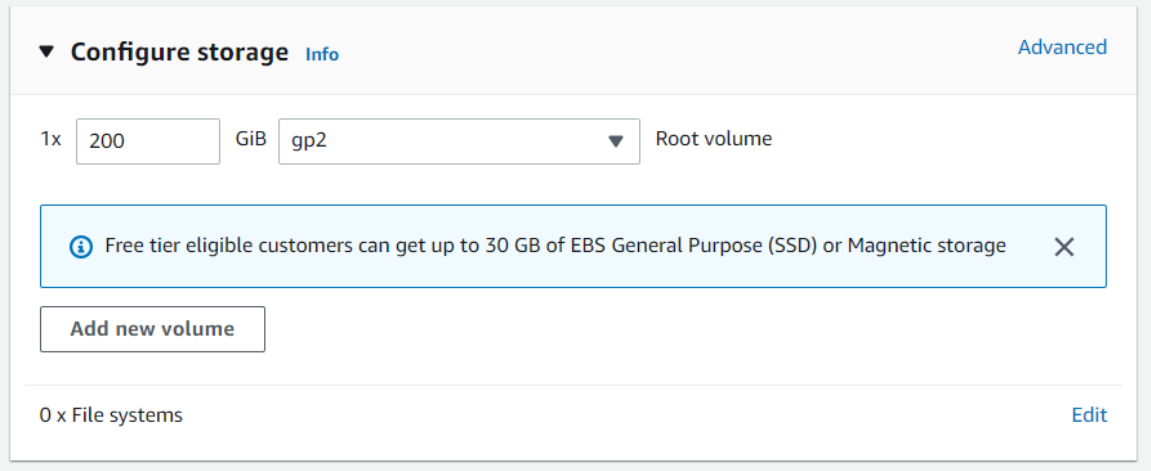
Launch an Instance page is displayed.



3. (Optional) Under **Name and tags**, enter a name for your instance.
4. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
5. Search for **NW-12** and select the **NW-12.4.0.0.20806-Full** image from the **Amazon Machine Image (AMI)** drop-down menu.

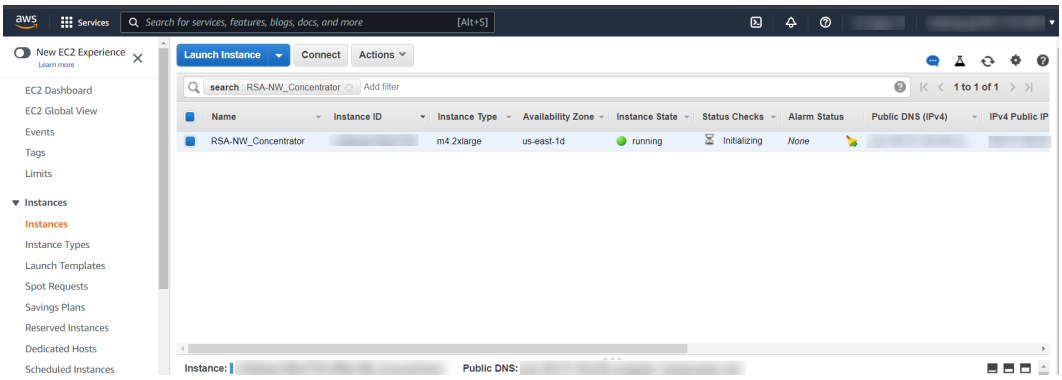


6. Under **Instance type**, Choose the RAM and CPUs by selecting the instance type.
   For more information, see Storage Guide for NetWitness® Platform 12.4 for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type

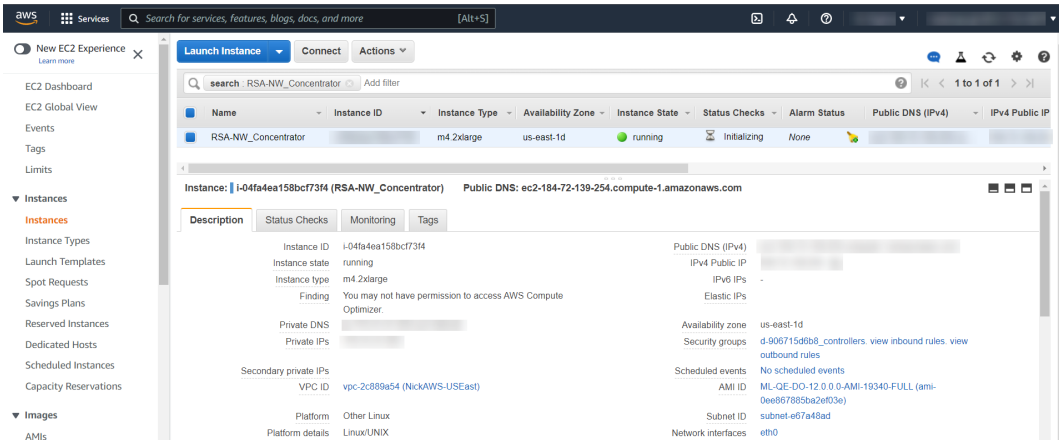


selected with **8** CPUs and **32** GB of RAM.

7. Under **Network settings**, select **Select existing security grop** option and select your security group from **Common security groups** drop-down menu.



8. Under **Configure Storage** specify the size and type of the volume.



For more information, see the Storage Guide for NetWitness® Platform 12.4 for guidelines on how to configure storage based on based on the requirements of the NetWitness component (that is, service) for which you are launching an instance.

9. Under **Summary**, you can specify the number of instances required and to review your instance configuration.
10. Click **Launch Instance**.
11. Click **Instances**.
12. Select **Instances** from the left navigation panel to review all instances that AWS is initializing (for example, the **RSA-NW_Concentrator**) .

The IP Address for the new **RSA-NW-Concentrator** host is ***sample-ip-address***.

13. SSH to the newly-created instance using the default NetWitness credentials.
14. Go to Configure Hosts (Instances) in NetWitness Platform.

Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.4*.

Installation Tasks

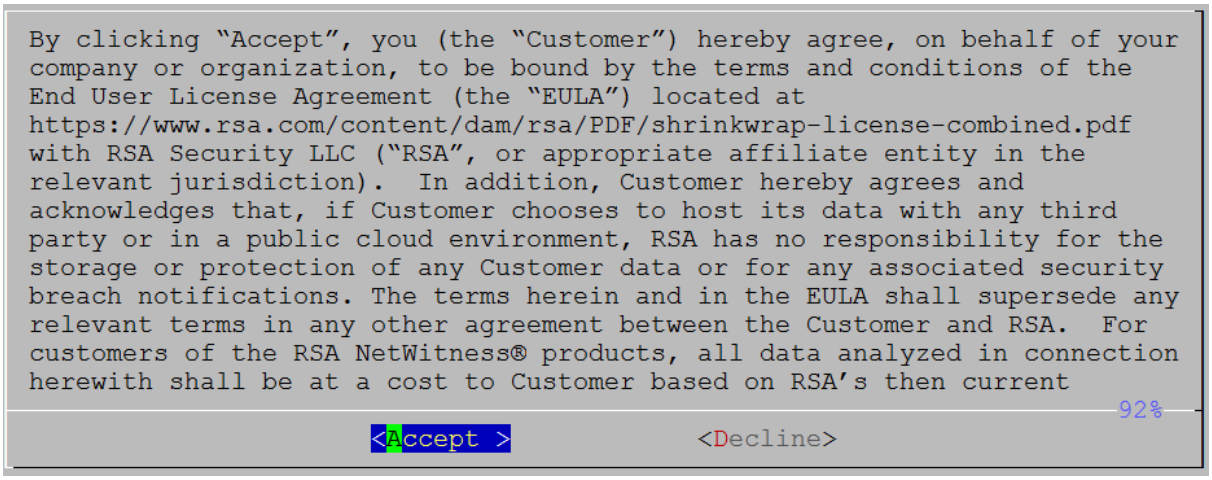
Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.4*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Task 1 - Install 12.4 on the NW Server Host and Component Hosts

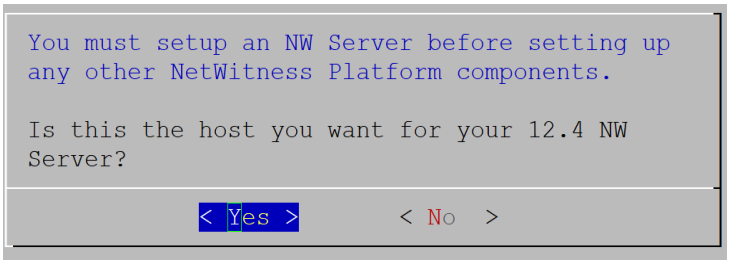
Complete the following steps to install 12.4 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

Note: You can perform this task for **NW-12.4.0.0.20806-Full** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

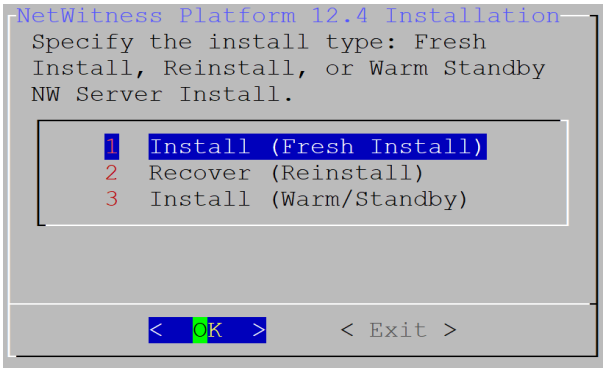
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

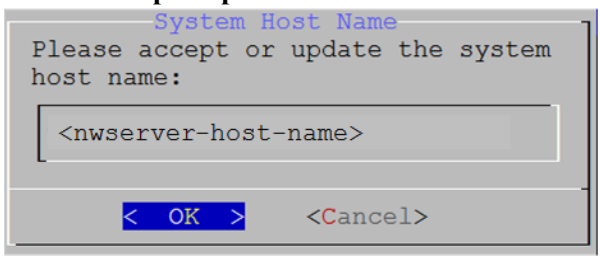
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

> **Note:** Use the following options to navigate the Setup prompts.
> 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
> 2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
> 3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
> If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.4 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.4 on the NW Server.
   Tab to **No** and press **Enter** to install 12.4 on other component hosts.



Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.4 Disaster Recovery.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

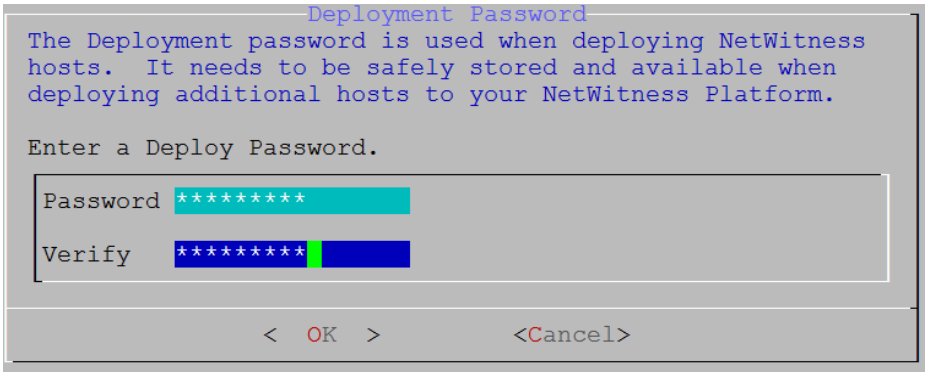
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

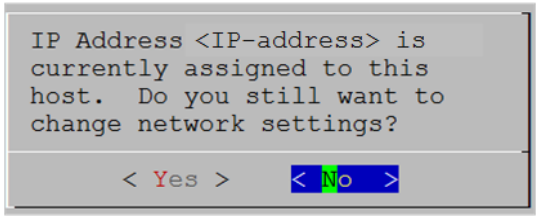


The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

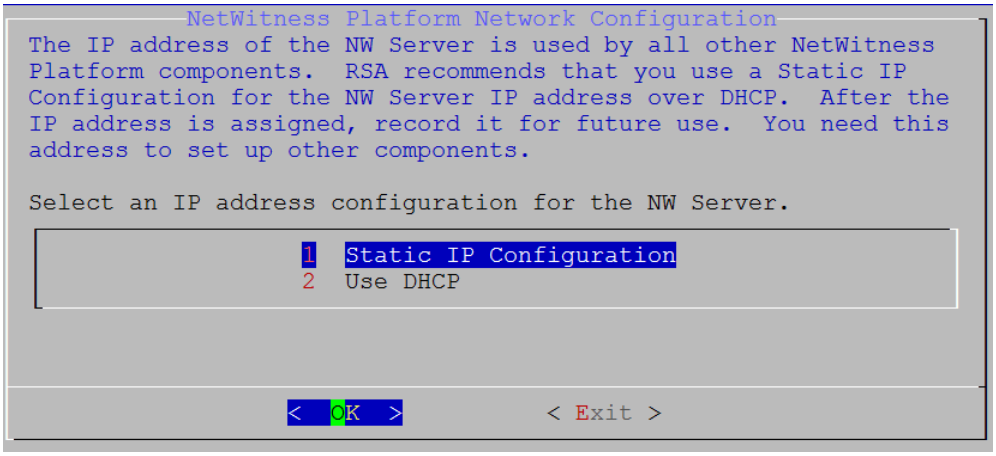
8. One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

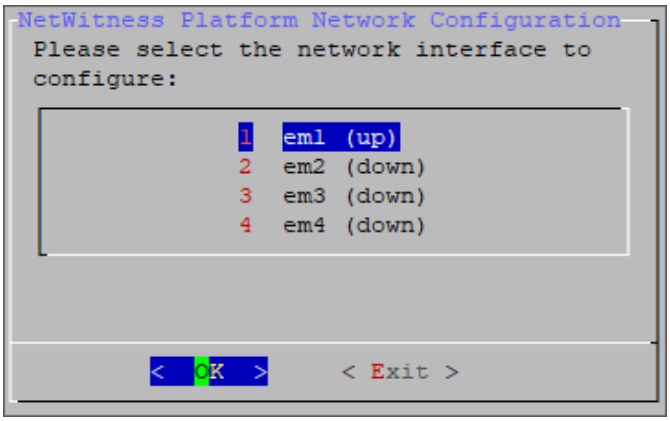
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and

press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

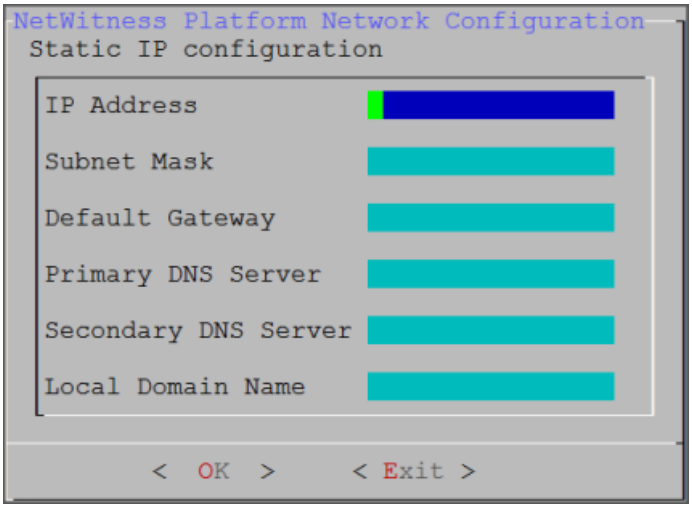


Note: If you connect directly from the host console, the following warning is not displayed.



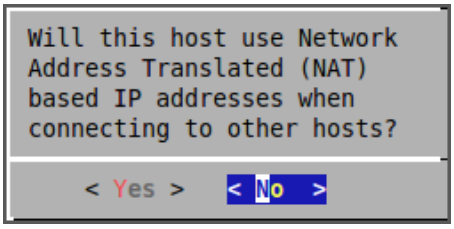
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
   The following **Static IP Configuration** prompt is displayed.

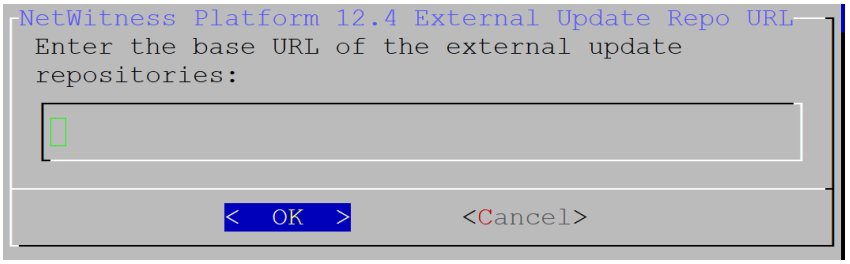
10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

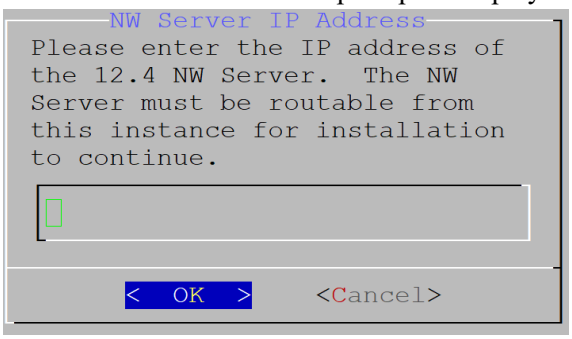
12. The **Update Repository** prompt is displayed.



For the NW Server:

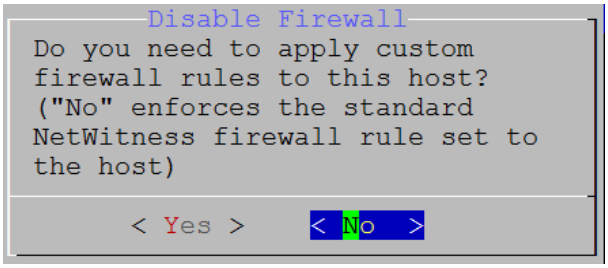
- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.4. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



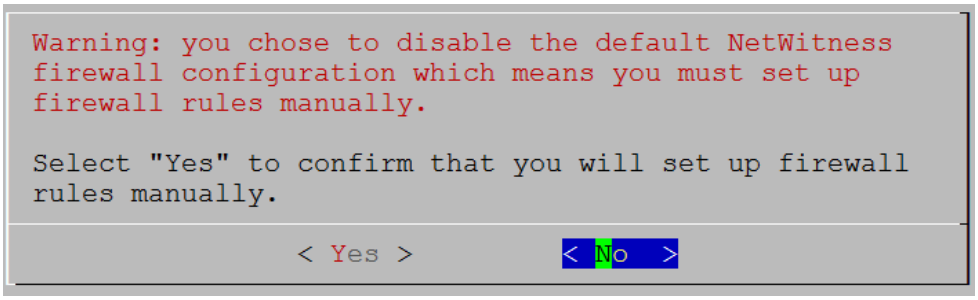
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

For component hosts:

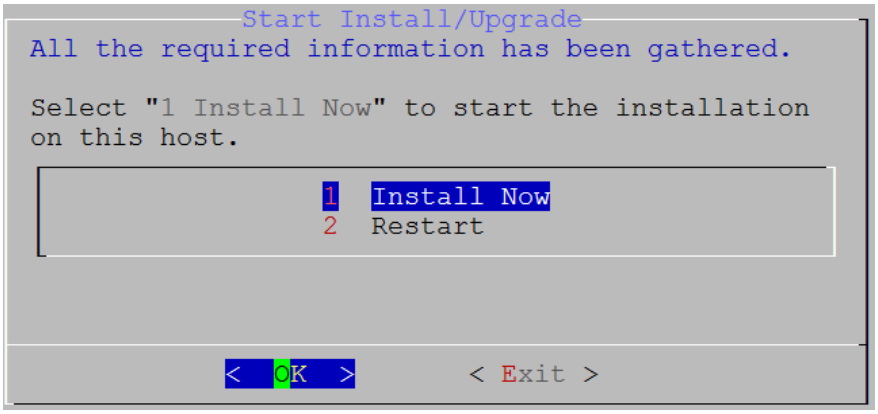


- Select the same repo that you selected when you installed the NW Server host and follow the steps above.

- The NW Server IP Address prompt is displayed.



Type the NW Server IP address. Tab to **OK** and press **Enter**.



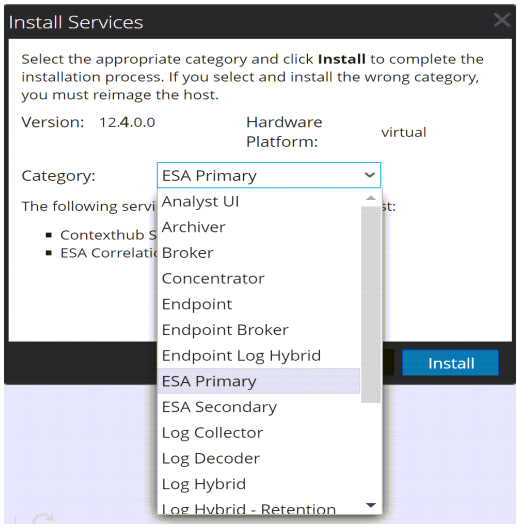
13. The Disable firewall prompt is displayed.

Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.4.
    When **Installation complete** is displayed, you have installed 12.4 on this host.

    Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled
 (skipped due to only_if)
    * file[/etc/yum.repos.d/CentOS-Base.repo] action delete (up to date)
    * ruby_block[yum-cache-reload-CentOS-Base] action nothing (skipped due to action :nothing)
     (up to date)
  * yum_repository[Remove CentOS-CR repository] action delete
    * execute[yum clean all CentOS-CR] action runERROR:root:code for hash md5 was not found.

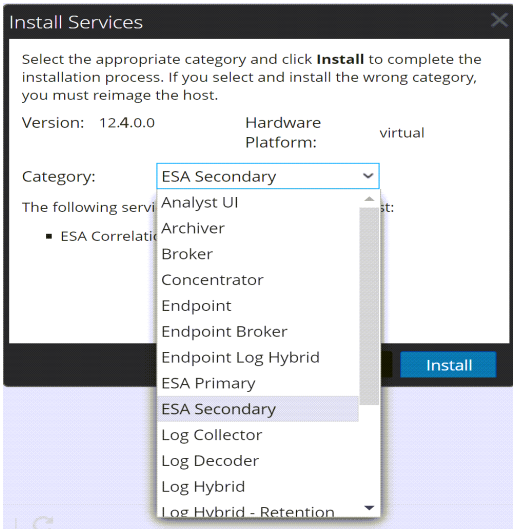
  File "/usr/lib64/python2.7/hashlib.py", line 129, in <module>
    globals()[__func_name] = __get_hash(__func_name)
  File "/usr/lib64/python2.7/hashlib.py", line 98, in __get_openssl_constructor
    f(usedforsecurity=False)
```

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.4 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

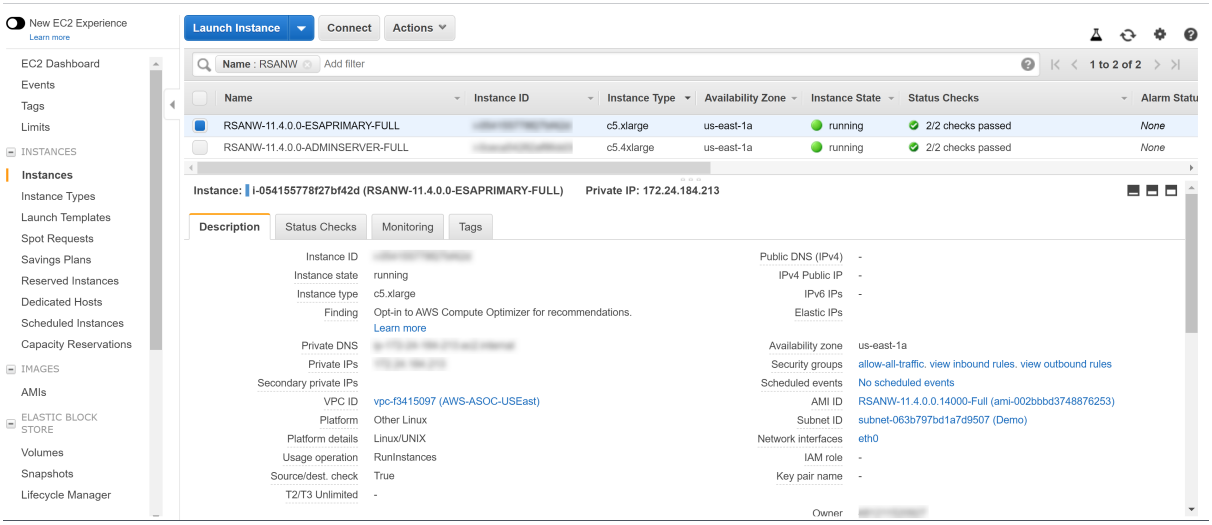
   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.4 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server



Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.4* for instructions on how to set up a Warm Standby NW Server.

(Optional) Boot NetWitness 11.4 EC2 Instance using c5 Instance Types

Following are the steps:

1. Deploy an EC2 instance using NW 11.4 Lite/Full AMI (RSANW-11.4.0.0.14000-Full, ami-002bbbd3748876253).
2. Select a non-nitro based instance type. For example, "_m4.large_" and boot the instance.
3. Install the package "_dracut-config-generic_" and rebuild the initramfs image.
4. For environment without internet connection, copy the provided RPM package to target 11.4 EC2 instance and install it.
5. Shutdown or stop the EC2 instance. Ensure that the instance shutdown behavior is set to "Stop" and not "_Terminate._".

6. Change the instance type of existing EC2 instance to nitro-based c5 types (For example, c5.4xlarge) and start the EC2 instance.
7. The EC2 instance boots successfully now, passing the system and instance status health checks.

Note: Once the instance is moved to c5 instance types and booted successfully, the system will remain fixed in c5 instance state and cannot be reverted back to m4 instance types.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Network Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP
- VPC Traffic Mirroring

Integrate Gigamon GigaVUE with the Network Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Network Decoder

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution, see "Gigamon® Visibility Platform for AWS Data Sheet"https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf.

For more information on the deployment details, see "Gigamon® Visibility Platform for AWS Getting Started Guide" https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf.

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Network Decoder Tunnel.

Task 2. Configure Tunnel on the Network Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255 key 0

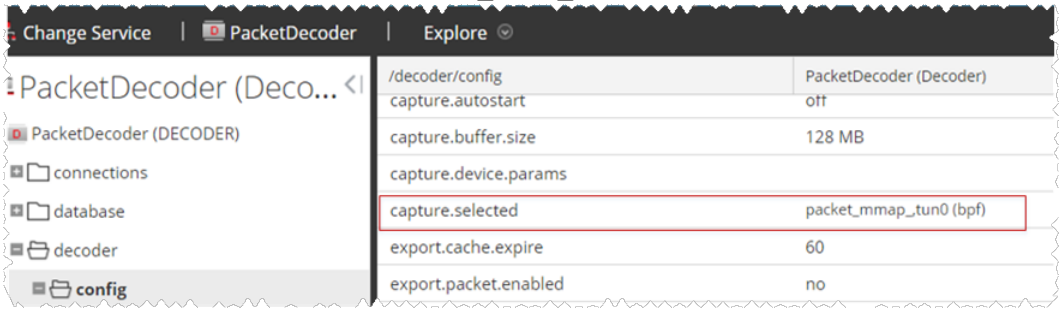
$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

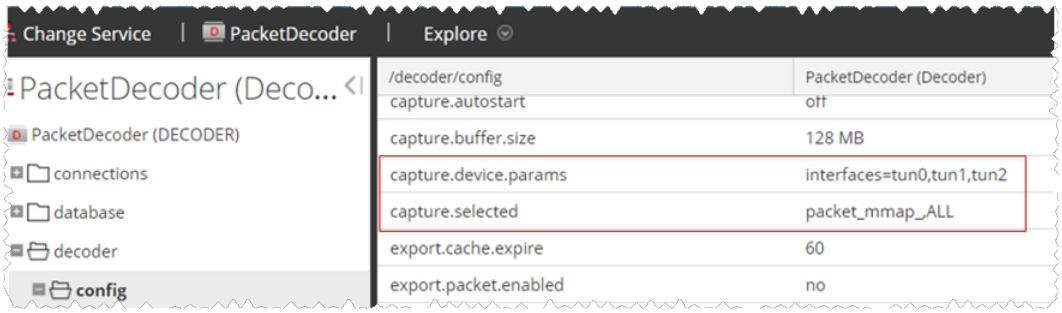
ip_tunnel 25216 1)



If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```



3. Create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
      `service ip6tables restart`

4. Set the interface in the Network Decoder.
   a. Log in NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service.
   b. Set the `capture.selected = packet_mmap_,tun0`.

5. (Conditional) - If you have multiple tunnels on the Network Decoder.
   a. Restart Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart decoder service.

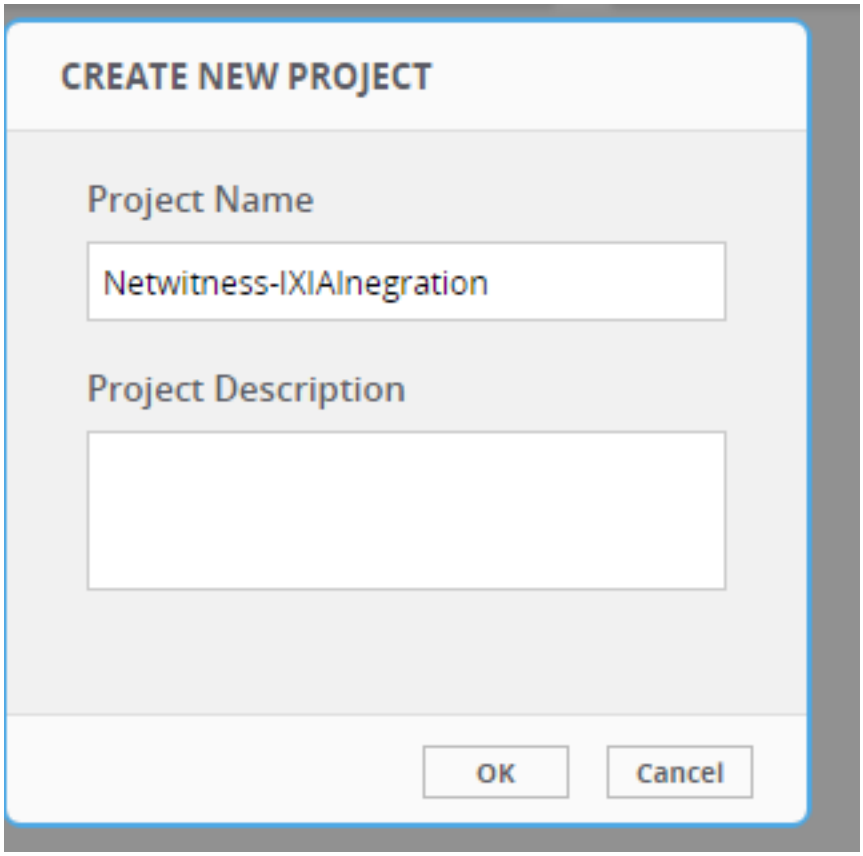
```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in Decoder.

Integrate Ixia with the Network Decoder

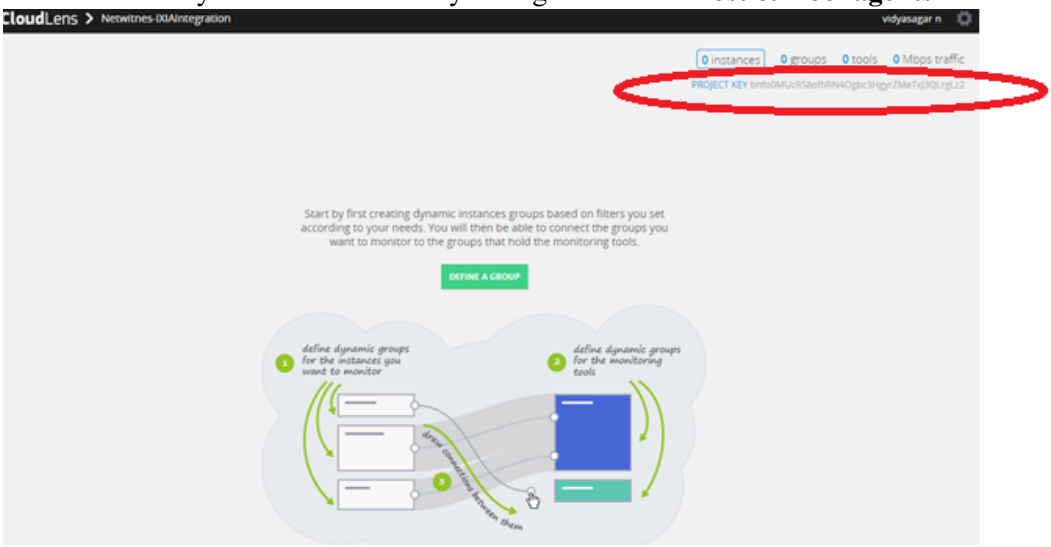
You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set Interface in Network Decoder



Task 1. Deploy Client Machines

- Deploy client machines onto which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (https://www.ixia.cloud/help/Default.htm) for specifications needed for supported client machines.
- For Client Machines (as well as Decoder machine) the following ports must be opened on AWS Security Group Inbound Rules; UDP 19993 from all, TCP 22 from Admin IP.



Task 2. Create CloudLens Project

Complete the following steps to create a new project and get your project key.

1. Get Cloudlens login credentials and access to a free trial.
   a. Create an Ixia login account at https://www.ixiacom.com/products/cloudlens-trial-a.
2. Go to the Cloudlens public site (https://www.ixia.cloud).
3. Click + (add) to create a new project with a name of your choosing (for example, **NetWitness-IxiaIntegration**).

4. Click on your newly created project and make note of your Project Key.
   You need the key later for the API key configured on the **Host & Tool agents**.

Task 3. Install Docker Container on Decoder

Complete the following steps to install the Docker container onto the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following commands to complete the install the Docker service on the Decoder.

```
#yum clean all
# yum -y install docker
```

3. Enter the following command string to start the Docker service.

```
# service docker start
```

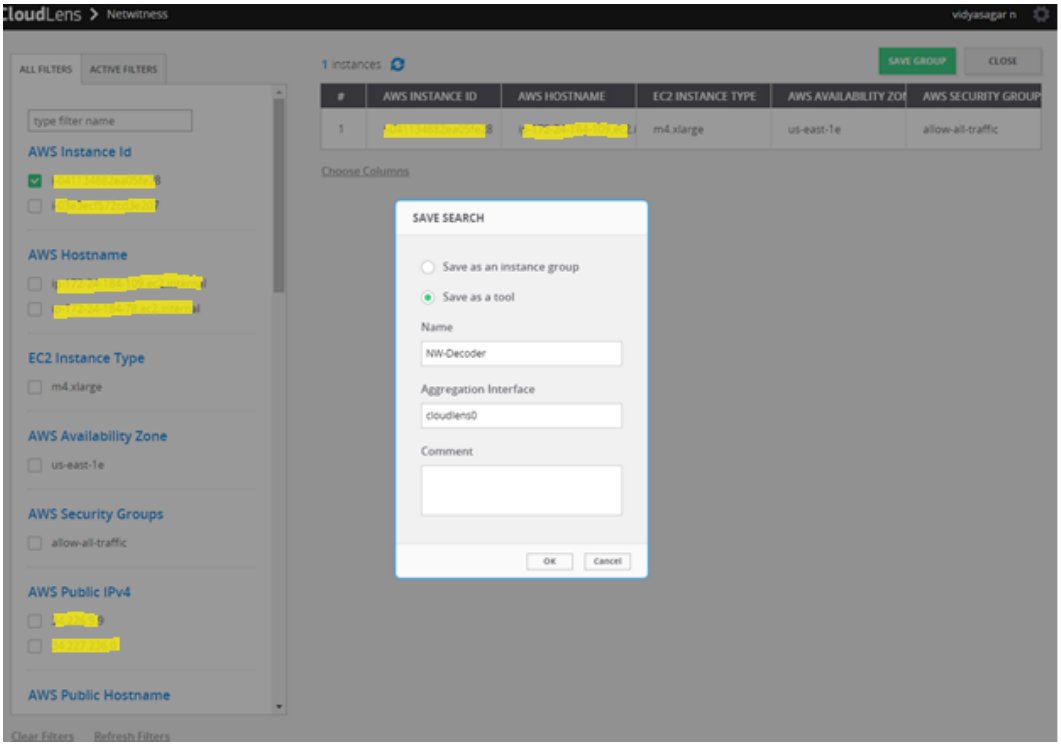
4. Enter the following commands to:
   - Access the Ixia repository and obtain the cloudlens-agent container.
   - Replace the **ProjectKeyFromIxiaProjectPortal** variable, which identifies your project key in Ixia portal, with the Project Key you created in Task 2. Create CloudLens Project.

```
sudo docker run \
--name cloudlens \
 -v /:/host \
-v /var/run/docker.sock:/var/run/docker.sock \
-d --restart=always \
--net=host \
--privileged \
ixiacom/cloudlens-agent:latest \
--server agent.ixia.cloud \
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

Task 4. Install Docker Container on Clients

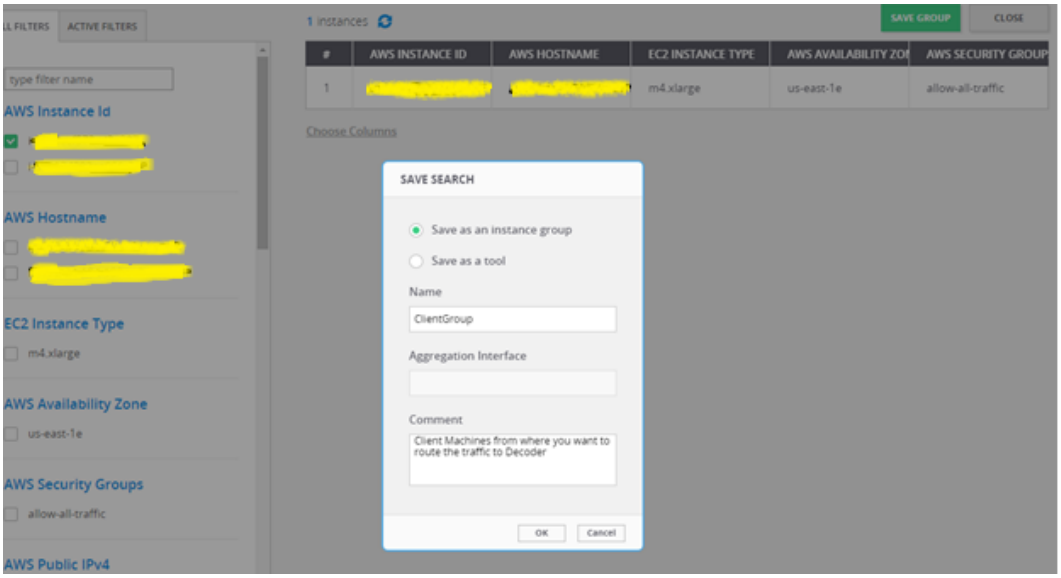
Complete the follow steps to Y install the Docker Container onto the client machines for which you want to route the traffic to the Network Decoder.

1. SSH to the AWS Client instance.
2. Enable root access to OS CLI (for example `sudo su -`).
3. Enter the following commands to install Docker.
   ```
   # yum -y install docker
   ```
   Caution: The above example of the installed docker engine is for CentOS7. The instructions may vary slightly for different Linux Distributions. For more information, see the Docker docs at https://docs.docker/install.
4. Enter the following commands to start the Docker service.
   ```
   # service docker start
   ```
5. Enter the following commands to:
   - Access the Ixia repository and obtain the **cloudlens-agent** container.
   - Replace the variable **ProjectKeyFromIxiaProjectPortal**, which identifies your project key in Ixia portal, with the Project Key you created in the previous section.
     ```
     sudo docker run \
     --name cloudlens \
      -v /:/host \
     -v /var/run/docker.sock:/var/run/docker.sock \
     -d --restart=always \
     --net=host \
     --privileged \
     ixiacom/cloudlens-agent:latest \
     --server agent.ixia.cloud \
     --accept_eula y \
     --apikey ProjectKeyFromIxiaProjectPortal \
     ```



Warning: If you cut and paste commands from a PDF, first paste them into a test editor such as Notepad to confirm the syntax before pasting into the OS CLI. Direct cut and paste between PDF and CLI can contain dashes or other special characters that should not be part of the commands.

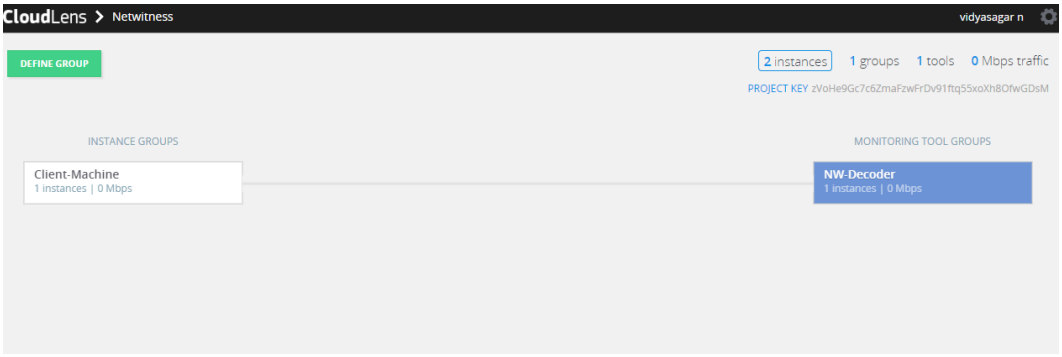
Task 5. Map the Network Decoder to Ixia Clients



Complete the following steps to map the Network Decoder to the client machines to route the traffic to the Network Decoder.

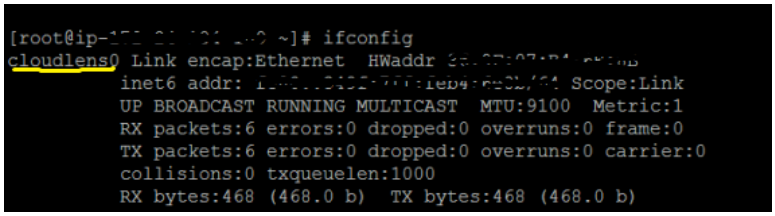
1. Go to the Cloudlens public site (https://www.ixia.cloud).
2. Double-click on your project to open it.
3. Click the **Define Group** button or the Instances count.
   You should see two instances listed, one for your decoder and the other for the client machines.
4. Filter for the decoder instance and click **Save Search**.
5. Choose **Save as a tool**.
6. Specify a name for the tool, and the **Aggregation Interface**.
   Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual

interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

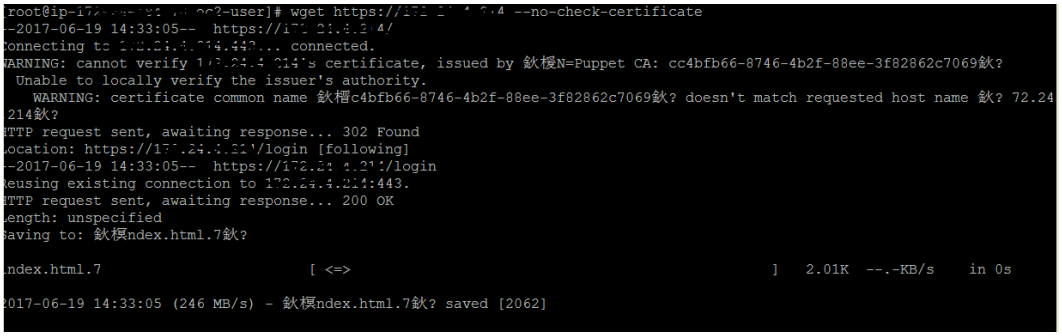


7. Filter the client host instance from the list, and click **Save Search**.

8. Navigate back to the top-level view of the project.
   Your client machine instance and Decoder instance are now displayed.



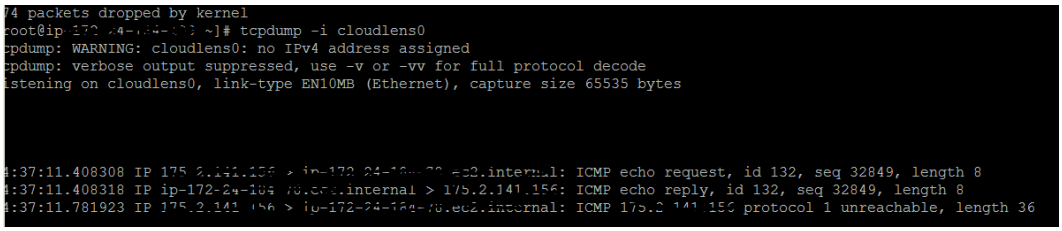
9. Drag a connection between the your client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

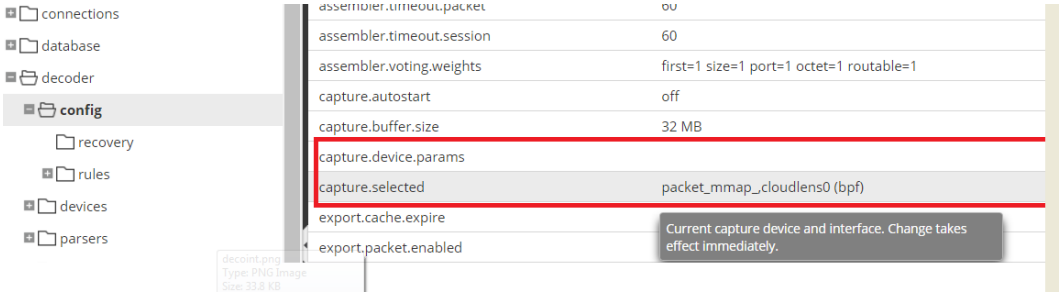
Complete the following steps to validate that packets are actually arriving at the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following command.
   `ifconfig`
   The new aggregation interface you created is displayed.



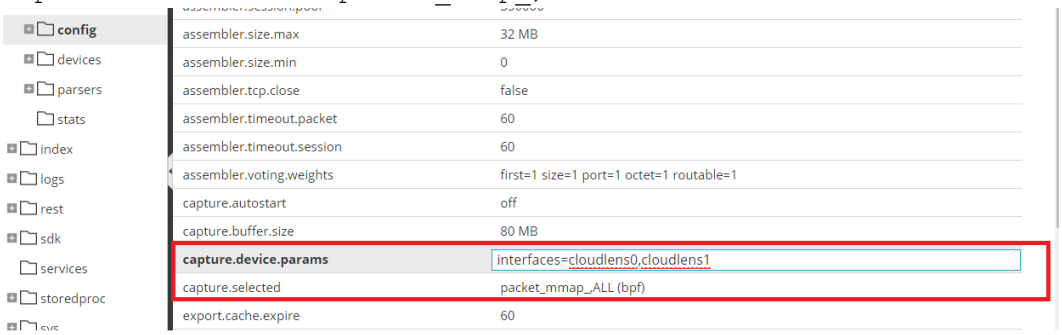
3. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

4. SSH to Network Decoder to go to your Network Decoder instance CLI.



5. Enter the following commands to look for suitable results in the tcpdump.
   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface to use for the Ixia integration.

1. SSH to the Network Decoder.
2. Enter the following commands to restart decoder service.
   `$ sudo restart nwdecoder`
   The Network Decoder is now set to capture network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.
6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. (Conditional) - If you have multiple capture interfaces on the Network Decoder, set the parameters with the following values.
   `capture.device.params --> interfaces=cloudlens0,cloudlens1`

```
capture.selected --> packet_mmap_,All
```

8. Restart the Decoder service after you set the **capture.selected** parameter.

Integrate f5® BIG-IP with the Network Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to NetWitness flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a

network interface. MAC address rewriting can be used to route packets to another subnet.

2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. NetWitness recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

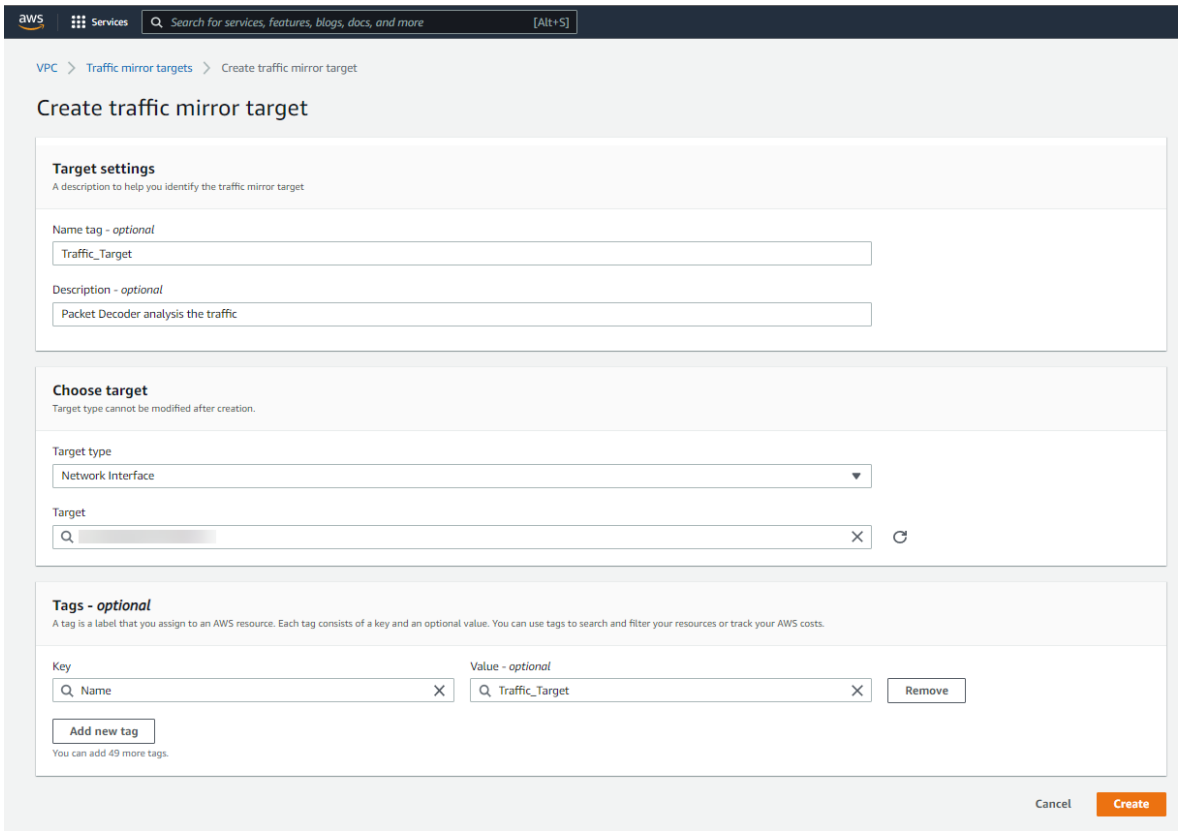
Integrate VPC Traffic Mirroring with the Network Decoder

VPC Traffic Mirroring allows users to capture and inspect network traffic to analyze packets without using any third-party packet forwarding agents. The solution provides insight and access to network traffic across VPC infrastructure. Users can copy network traffic at any ENI (Elastic Network Interfaces) in VPC, and send it to NetWitness to analyze, monitor, and troubleshoot performance issues.

You must complete the following tasks to integrate the Network Decoder with VPC Traffic Mirroring:

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination

Task 2. Configure a VPC Traffic Mirroring Filter



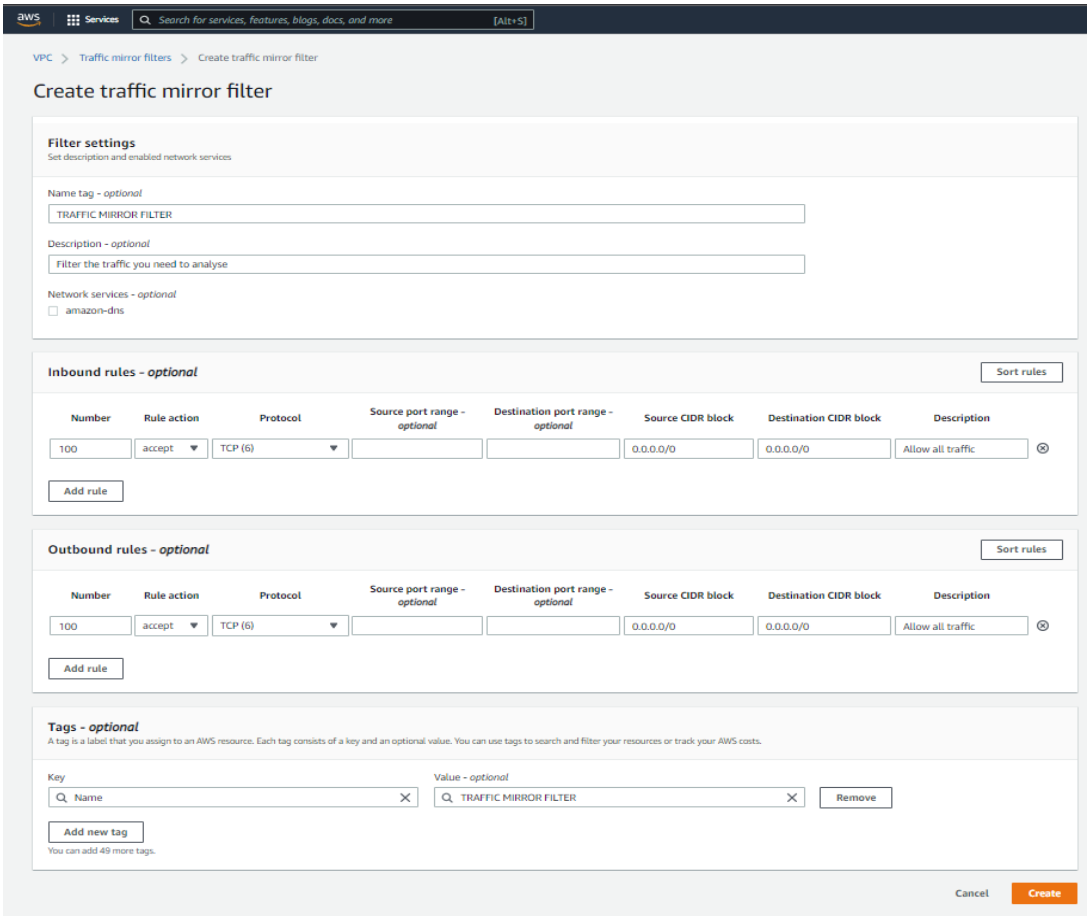
Task 3. Configure a VPC Traffic Mirroring Session

Task 4. Setup a new VXLAN interface on the Network Decoder

Task 5. Validate VPC Traffic Mirroring Packets Arriving at Network Decoder

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination.

1. Open the VPC service console view at https://console.aws.amazon.com/vpc/home.
2. In the navigation panel, select **Traffic mirror targets**.
3. Click **Create traffic mirror target**.



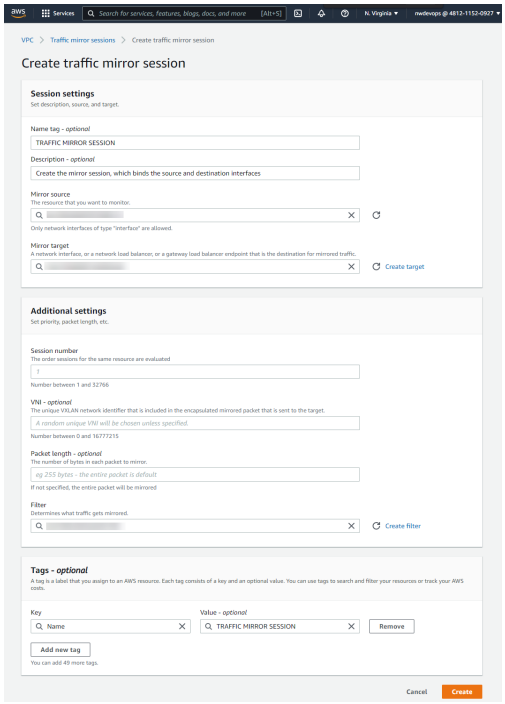
4. In the **Create traffic mirror target** dialog, provide all the required information and click **Create**.

Task 2. Configure a VPC Traffic Mirror Filter

Configure the VPC traffic mirror filter to send only the required packets to the Network Decoder. You can determine if the inbound or outbound traffic needs to be captured or not.

Note: Make sure the UDP port 4789 is open on the AWS instance of Network Decoder.

1. In the navigation panel, select **Traffic mirror filters**.
2. Click **Create traffic mirror filter**.



3. In the **Create traffic mirror filter** dialog, provide all the required information and click **Create**.

Task 3. Configure a VPC Traffic Mirror Session

You must configure a VPC Traffic Mirror Session to mirror the traffic by a communication channel between source ENI and destination ENI.

1. In the navigation panel, select **Traffic mirror sessions**.
2. Click **Create traffic mirror session**.

3. In the **Create traffic mirror session** dialog, provide all the required information and click **Create**.

Task 4. Set Up a new VXLAN Interface on the Network Decoder

To capture the UDP enabled traffic you must create an interface and tunnel it to Network Decoder by performing the following steps.

1. SSH to the Decoder.
2. Enter the following commands.

```
sudo ip link add tun0 type vxlan id <VXNLAN ID> local any dev <primary
interface ex: eth0> dstport 4789

sudo ip link set tun0 up

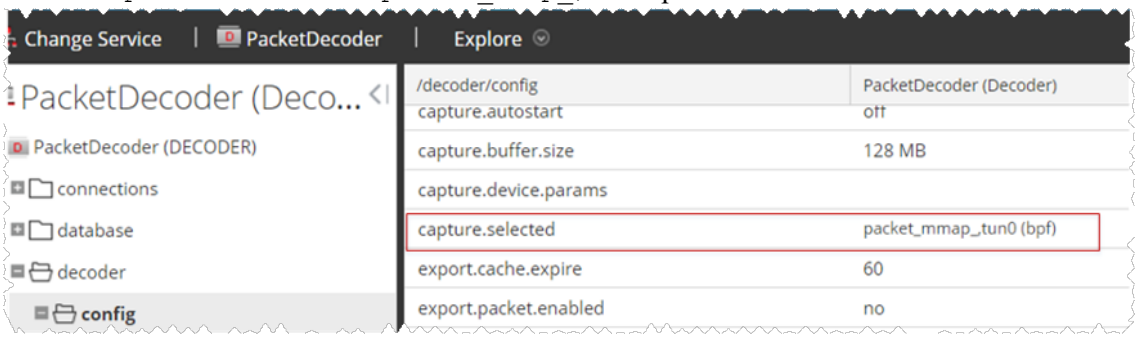
ifconfig
```

```
tun0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 8951
        inet6 fe80::bc58:afff:fe06:ec29  prefixlen 64  scopeid 0x20<link>
        ether be:58:af:06:ec:29  txqueuelen 1000  (Ethernet)
        RX packets 989  bytes 74140 (72.4 KiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 8 overruns 0  carrier 0  collisions 0
```

3. To create a firewall rule in the Network Decoder to allow traffic through the tunnel.

a. Open the IP tables file using the command `vi /etc/sysconfig/iptables`.

b. Append the line `-I INPUT -p udp -m udp --dport 4789 -j ACCEPT`.



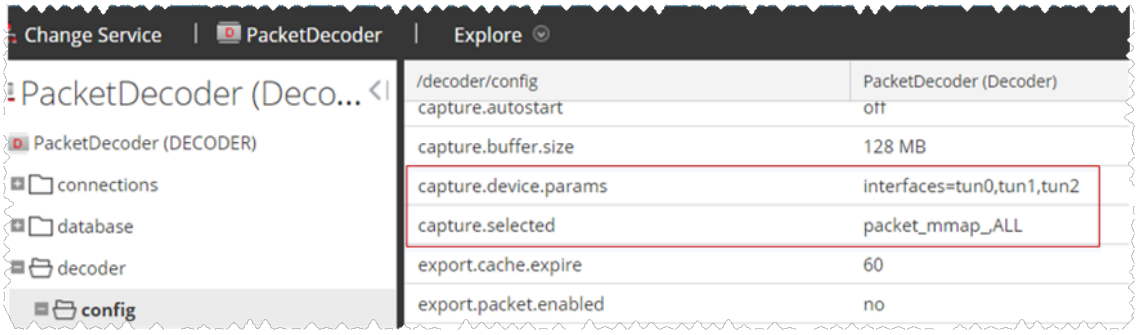
c. Restart IP tables by using the following commands.

```
service iptables restart
service iptables status
```

4. To set the interface in the Network Decoder.

   a. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service.

   b. Set the `capture.selected = packet_mmap_,tun0` parameter.



5. (Conditional) If you have multiple tunnels on the Network Decoder.

   a. Restart the Decoder service after you create the tunnel in Network Decoder.

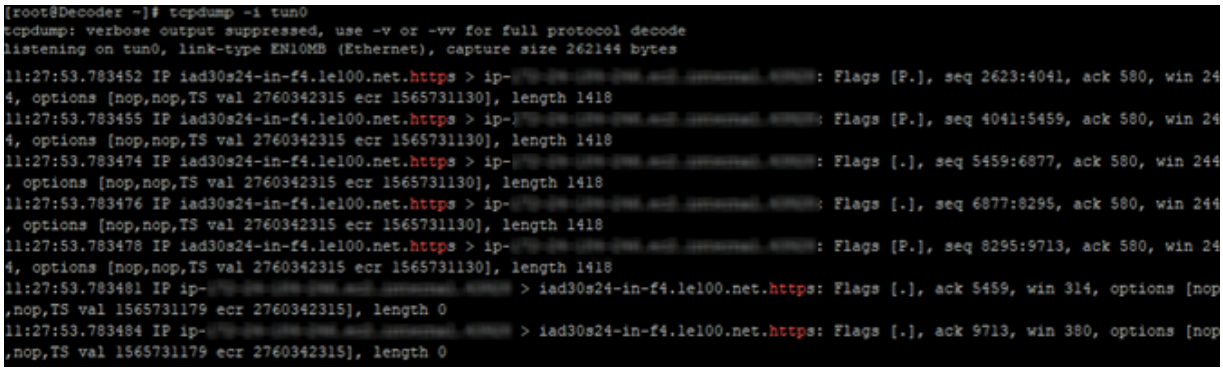
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart the Decoder service.

```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in the Network Decoder.



Task 5. Validate VPC Traffic Mirroring Packets Arriving at the Network Decoder

Perform the following steps to validate if the Network Decoder is receiving the network data (packets) successfully.

1. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

2. Enter the `tcpdump -i tun0` command to look for suitable results in the tcpdump.

3. The NetWitness reflects meta values as shown below.

Note: You can mirror traffic from an EC2 instance that is supported by the AWS Nitro system (A1, C5, C5d, C5n, I3en, M5, M5a, M5ad, M5d, p3dn.24xlarge, R5, R5a, R5ad, R5d, T3, T3a, and z1d).

Note: For more information, see "New – VPC Traffic Mirroring" documentation at https://aws.amazon.com/blogs/aws/new-vpc-traffic-mirroring/.

AWS Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 12.4.0.0 and adjusted as needed.

This topic contains the minimum AWS instance configuration settings recommended for the NetWitness virtual stack components.

- EC2 Instance:
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the NW component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Network Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond is receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Block Storage

  For more information on the required volumes and the storage allocations, see the Storage Guide for NetWitness® Platform 12.4.

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Getting Started with NetWitness Platform for AWS Marketplace

This document describes how to get started with Netwitness Platform 12.4 using AMI from AWS Marketplace and configure it.

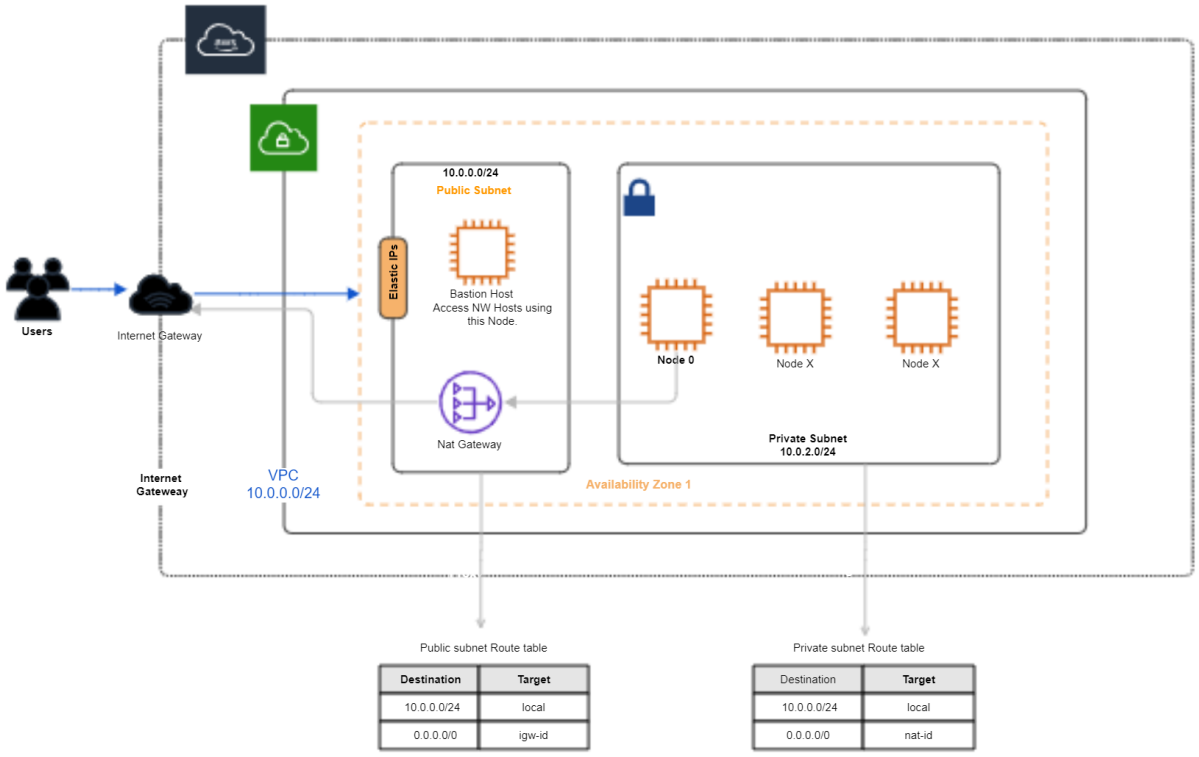
About NetWitness Platform for AWS Marketplace

NetWitness Platform delivers uncompromised threat detection, investigation, and response, across network, logs, and endpoint, whether deployed on-premises, in the cloud, or hybrid. The NetWitness Platform allows security analysts to prioritize, respond, reconstruct, survey, investigate and confirm information about threats in their environment and take the appropriate response, optimizing their security posture and protecting against the impacts of attacks.

Core platform modules include network detection and response (NDR), security information and event management (SIEM) and endpoint detection and response (EDR). Additional modules are available for UEBA, SOAR, and asset analytics to reduce the attack surface. NetWitness features market-leading SASE integrations (both packets and logs), and over 400 integrations with general-purpose and industry-specific security tools, with the ability to instantly parse new sources. NetWitness Platform is utilized continuously in the field by NetWitness Incident Response/Cyber Defense Services, where new detections and methods cycle back into product development.

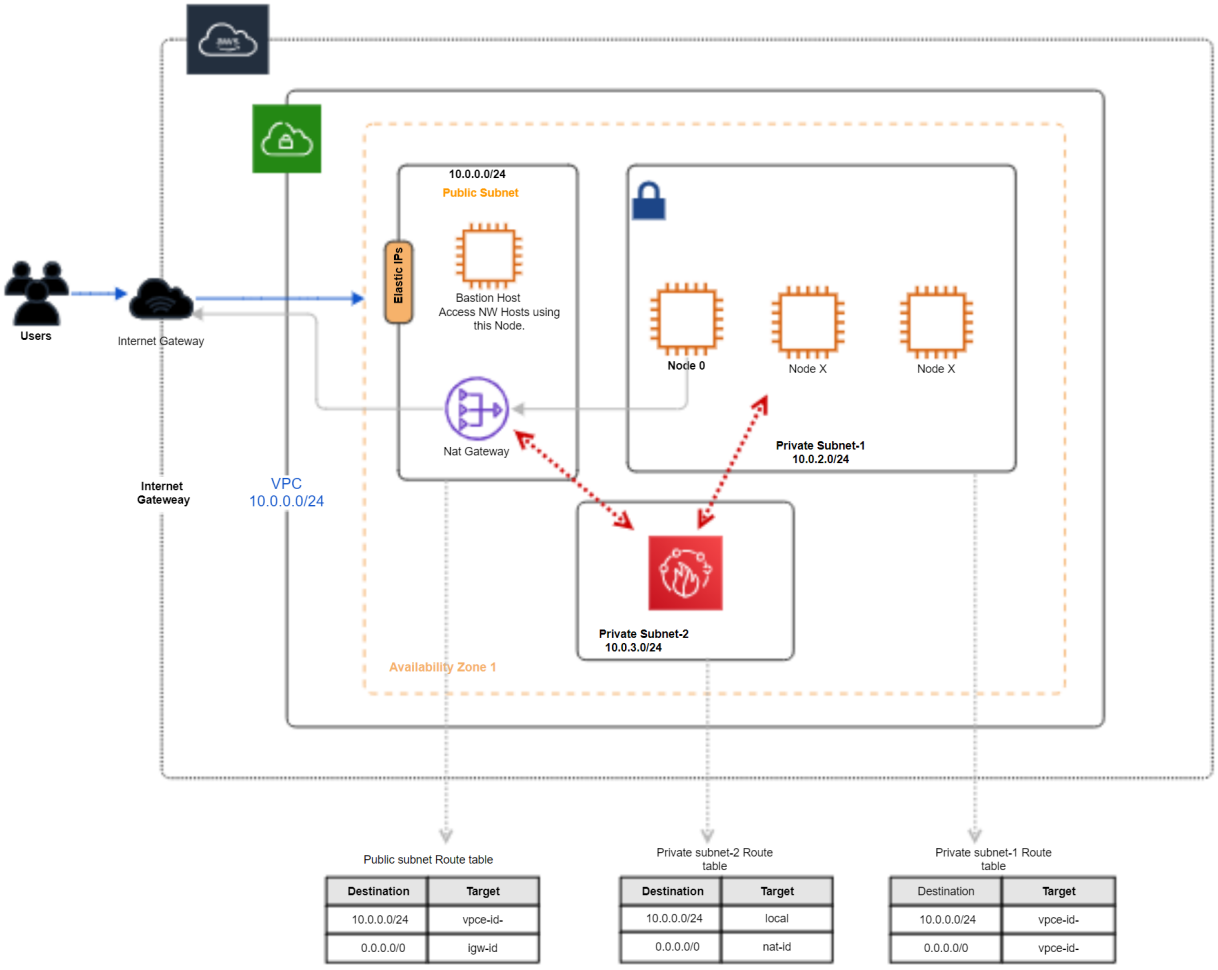
Prerequisites

Ensure the following before you begin the installation:



- Access to the AWS console with the appropriate permissions to set up the network and launch an EC2 instance.
- Subscribe to Netwitness 12.4 Product from Marketplace

Deploy NetWitness Platform from AWS Marketplace



Deployment Overview

The following diagrams show the recommended AWS network architectures for NetWitness deployment.

NetWitness Deployment without Internet Connectivity (Air-Gapped Environment)

NetWitness Deployment with Restricted Internet through Firewall Configuration

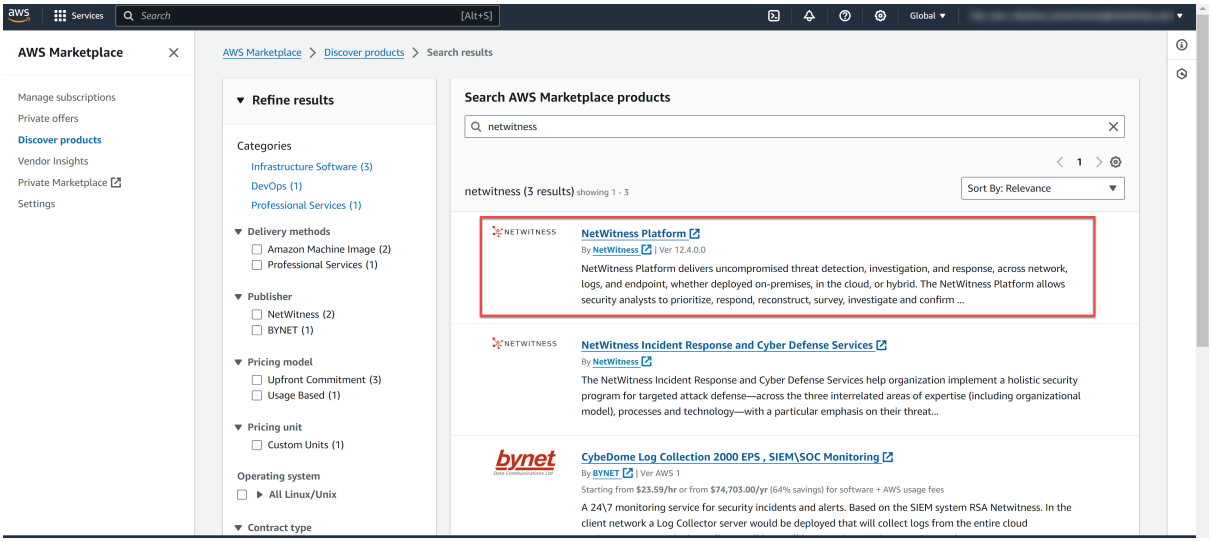
1. Set up the NetWitness platform on a dedicated VPC with VPC flow logs enabled to isolate any network issues is recommended. Create a VPC with one Public and Private subnet within the VPC. For more information, see Create a VPC.
2. Specify your own CIDR block for the subnets, which is a subset of the VPC CIDR block.
3. Create two subnets (public and private) and two route tables for NetWitness deployment without Internet connectivity (air-gapped environment).
   - **Set up Public Subnet**: Include the internet gateway in a custom route table. If a subnet is associated with this route table, its traffic will be routed to the internet, making it a public subnet.
   - **Set up a Private Subnet**: Create a custom route table. Keep the default route (same as main table route). The subnet associated to this route table will be the private subnet.

   Create two private subnets and three route tables for NetWitness deployment with restricted internet. Additionally, a route table is needed for an additional subnet.
4. Create an internet gateway and attach it to the public subnet to enable communication with the internet.

5. Create a NAT gateway in a public subnet and attach it to the private subnet's route table to allow instances in private subnets to access the Internet.
6. Create two separate security groups is recommended - one for the Bastion instance and another for the private instances as a security best practice.

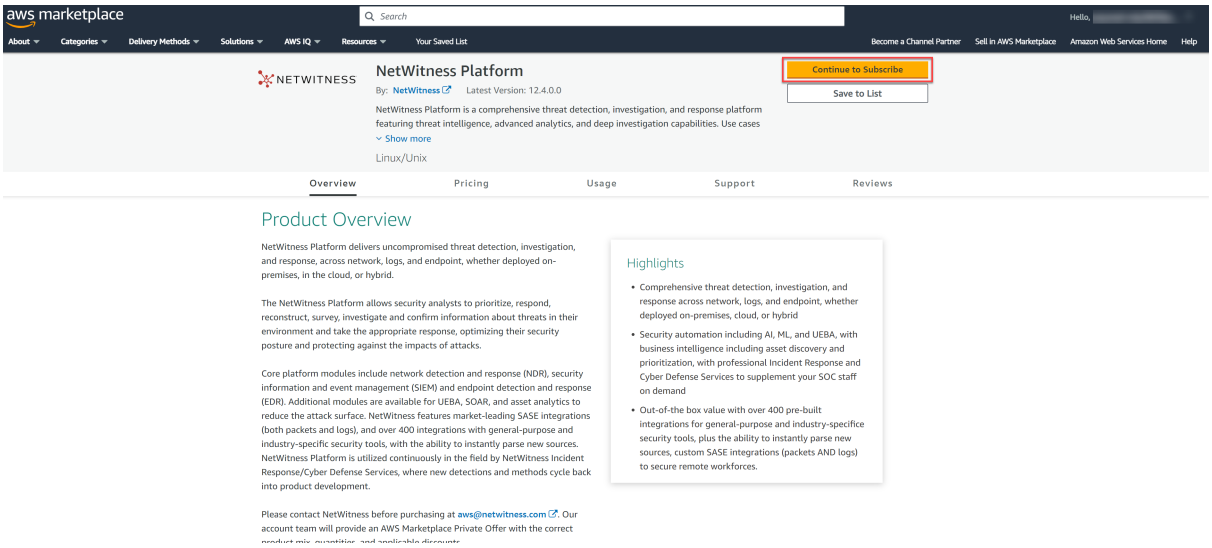
   IMPORTANT:
   - If the preferred approach is to set up NetWitness in an air-gapped environment where NW servers have no internet connectivity, a firewall is not required, and all outbound ports can be closed. As a result, the NW Admin server cannot access **CMS.netwitness.com** and must manage content offline. For more information, see the diagram **NetWitness Deployment without Internet Connectivity (Air-Gapped Environment)**.
   - To access the NetWitness repo package without a firewall configuration, you must open the outbound ports 80 and 443 in the private security group for the NetWitness instance. This will allow you to access the internet and download the NetWitness repo package. After downloading the package, ensure that you close all outbound ports.
   - If customers want to provide internet access to specific domains or URLs in private instances, they can limit outbound traffic by using a firewall. This can be done by whitelisting the URLs in the firewall group and opening ports 80 and 443 in the outbound rules of a private security group. For more information, see the diagram **NetWitness Deployment with Restricted Internet through Firewall Configuration**.
7. Launch the Bastion instance, use the security group created for the Bastion instance in the previous step 6; it's important to allocate an Elastic IP address to ensure communication with the Internet.
8. launch the Bastion instance, generate a key pair and keep it safe. This key pair will be required to SSH into Bastion instance for troubleshooting purposes.
9. Subscribe to NetWitness Product from the AWS Marketplace service. For more information, see Subscribe to AWS NetWitness Marketplace Product.
10. Launch a private NetWitness instance using the NetWitness AMI from AWS Marketplace, within a private subnet and use the security group created in step 6. For more information, see Deploy EC2 Instance from AWS Marketplace and Configure a Host.

Subscribe to AWS NetWitness Marketplace Product

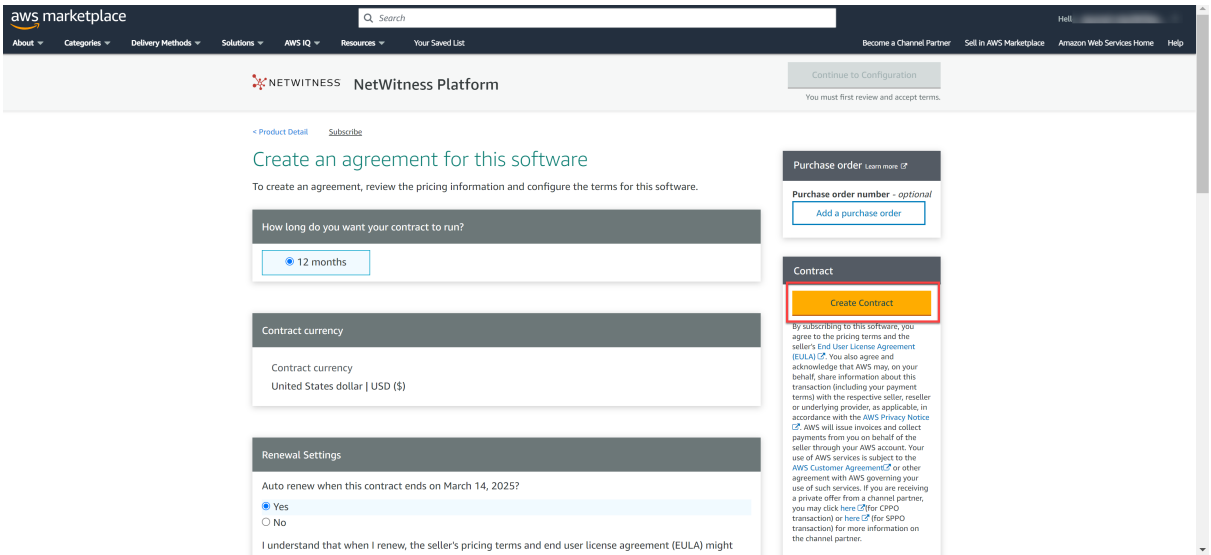


This topic describes the steps required to subscribe to NetWitness through the AWS Marketplace.

To subscribe to NetWitness through the AWS Marketplace

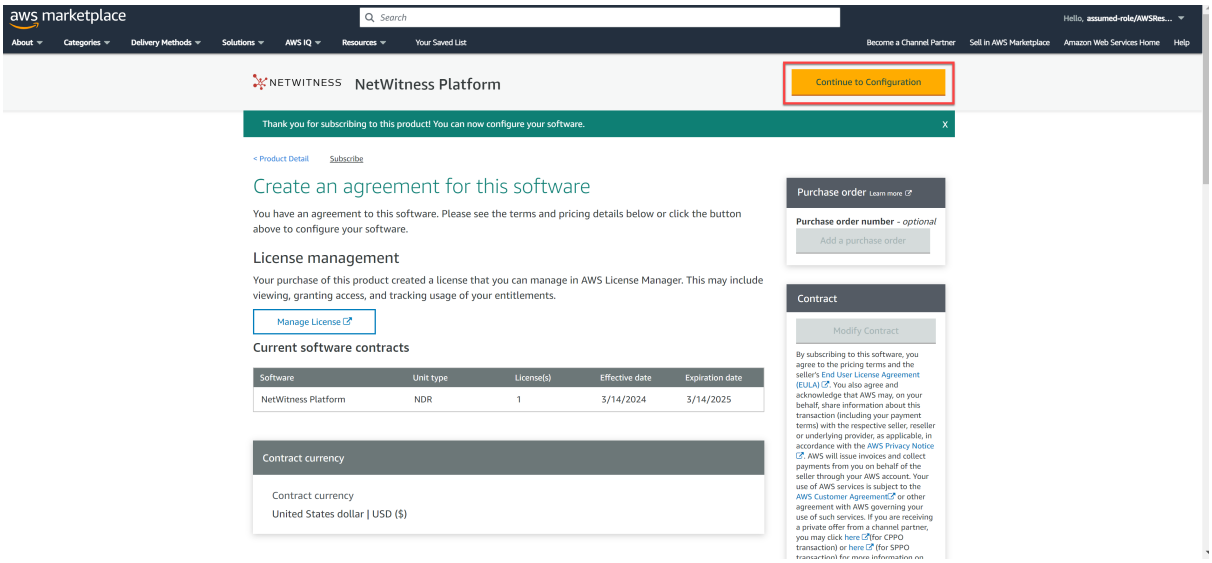


1. Log in to the AWS Management Console.
2. Navigate to **AWS Marketplace Subscriptions** AWS Service and click **Discover Products** in the left panel.

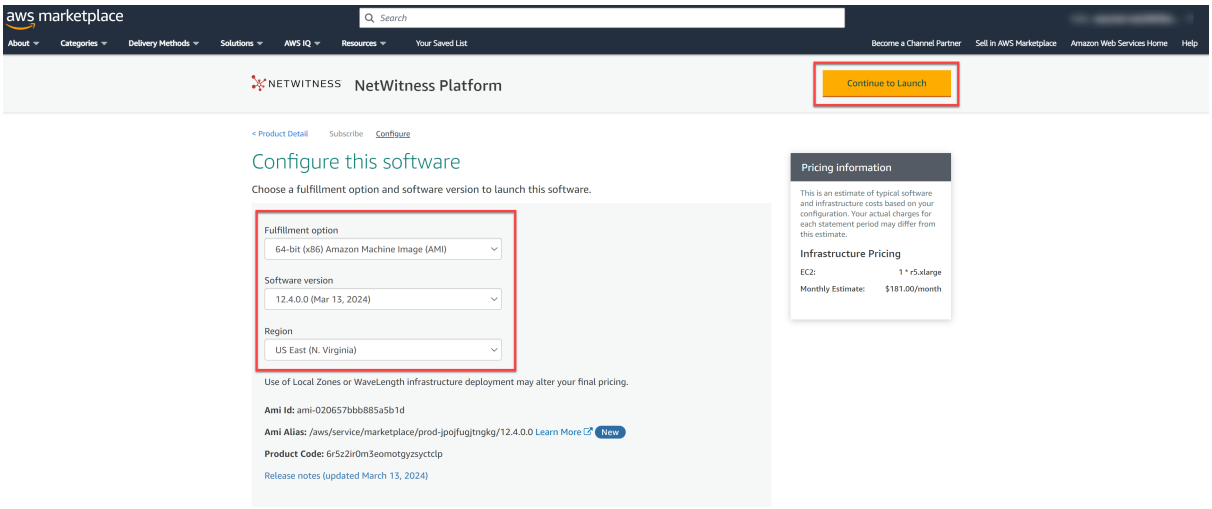


3. Search for **NetWitness** product and select **NetWitness Platform 12.4**.

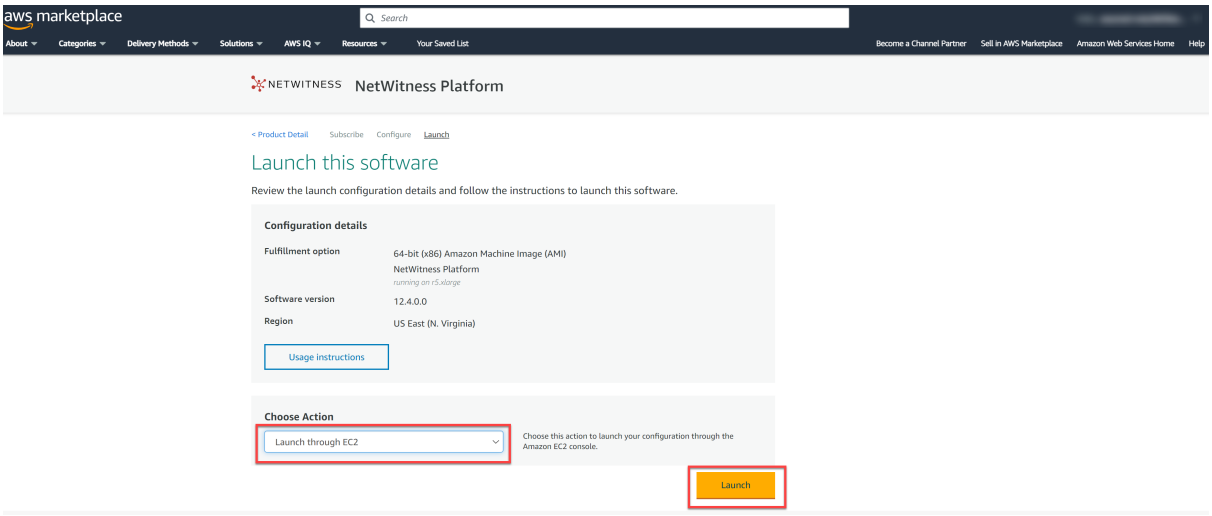
4. Click **Continue to Subscribe** in the upper right corner of the page.



5. Verify the terms and the pricing and click **Create Contract**.



A success message is displayed that you subscribed to the product.

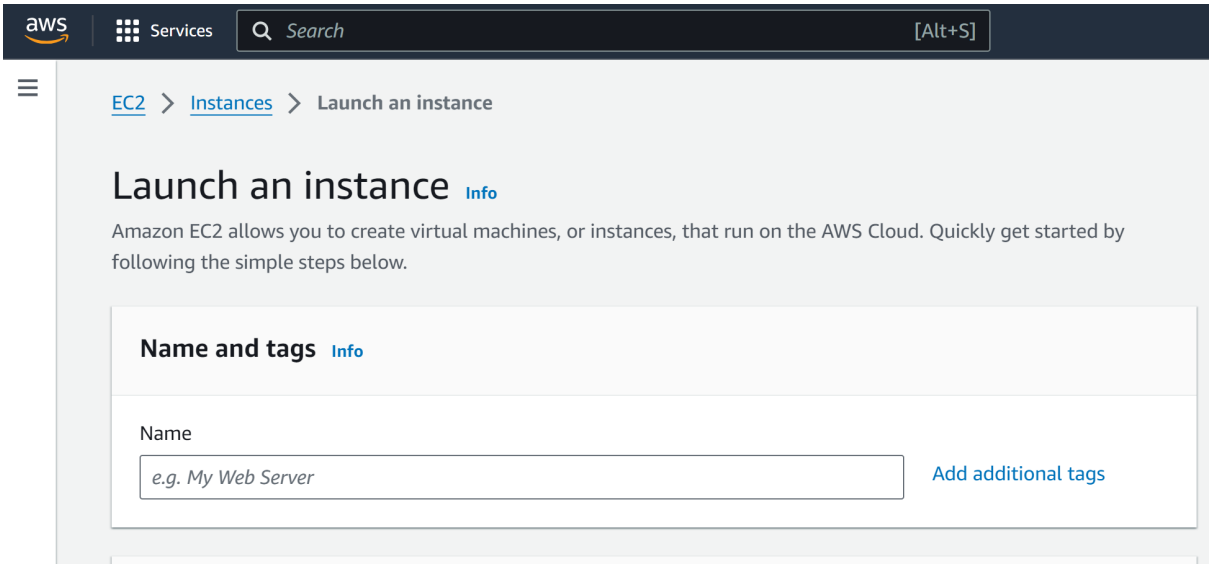


6. Click **Continue to Configuration**.

7. Under **Configure this Software** view, keep the default settings and click **Continue to Launch**.

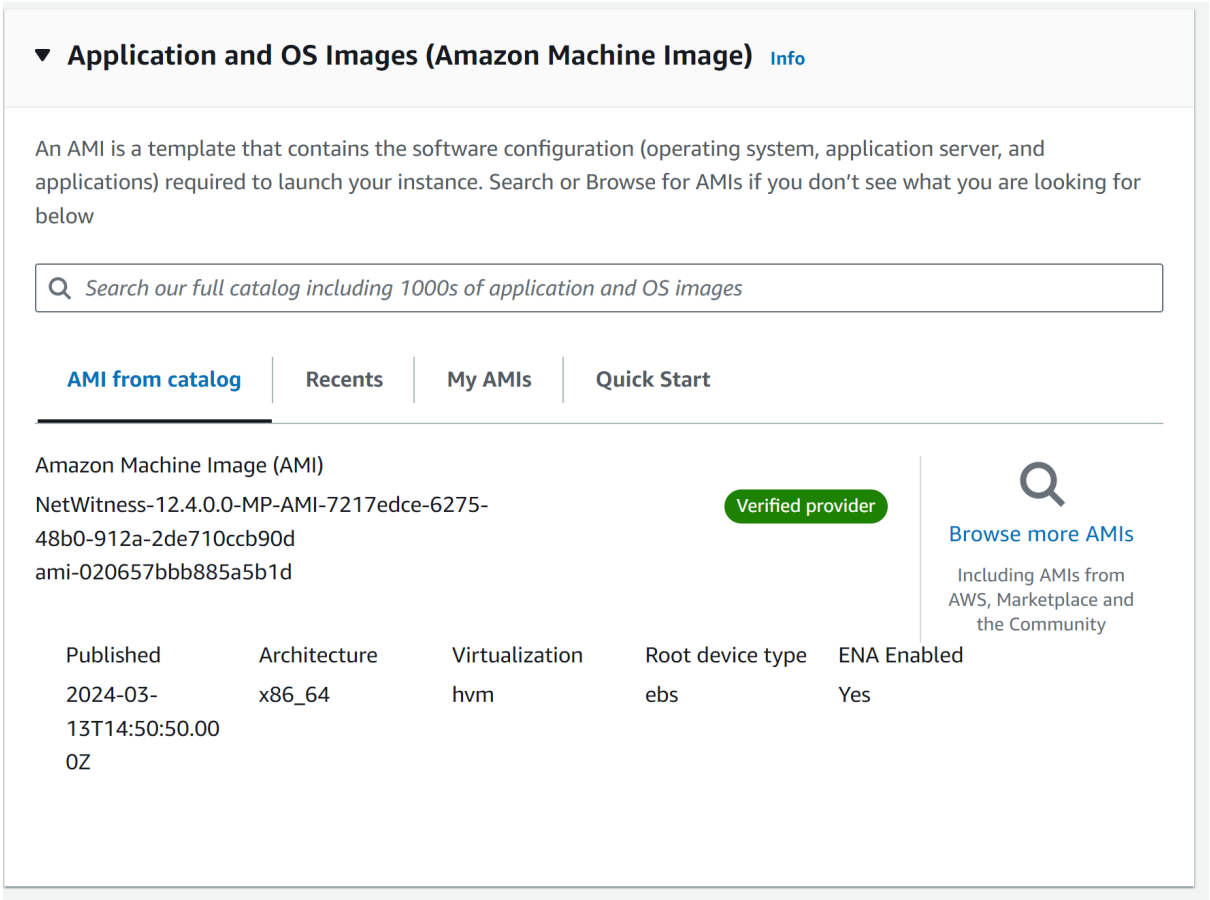
8. Select **Launch through EC2** from the **Choose Action** drop-down list and click **Launch**.

Next steps, **Launch** button redirects you to the **EC2** > **Instances** > **Launch an instance** setup view to configure and deploy the EC2 instance.



Deploy EC2 Instance from AWS Marketplace and Configure a Host

Configure the NetWitness Platform on an AWS instance by using the provided Amazon Machine Image (AMI).

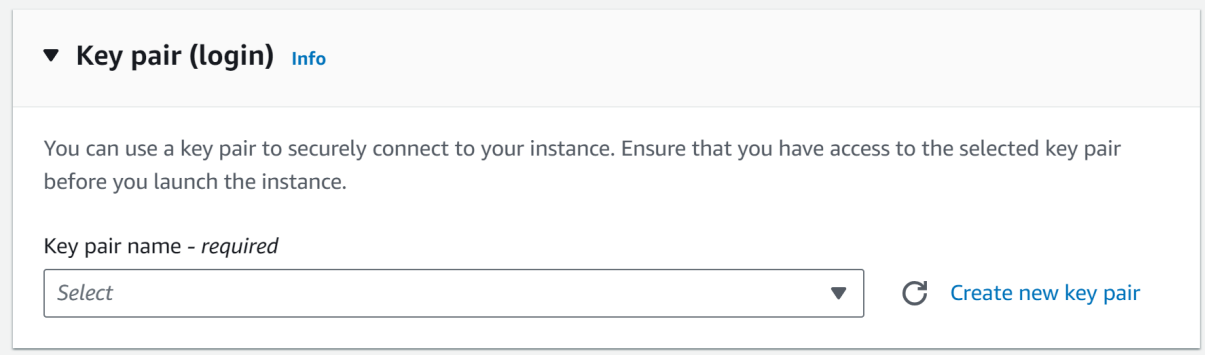


1. Enter the name under the **Name and tags** for your instance

   (Optional) To add other tags, click **Add additional tags**. Then, for each tag, click **Add tag** and enter the Key, Value, and Resource Types.

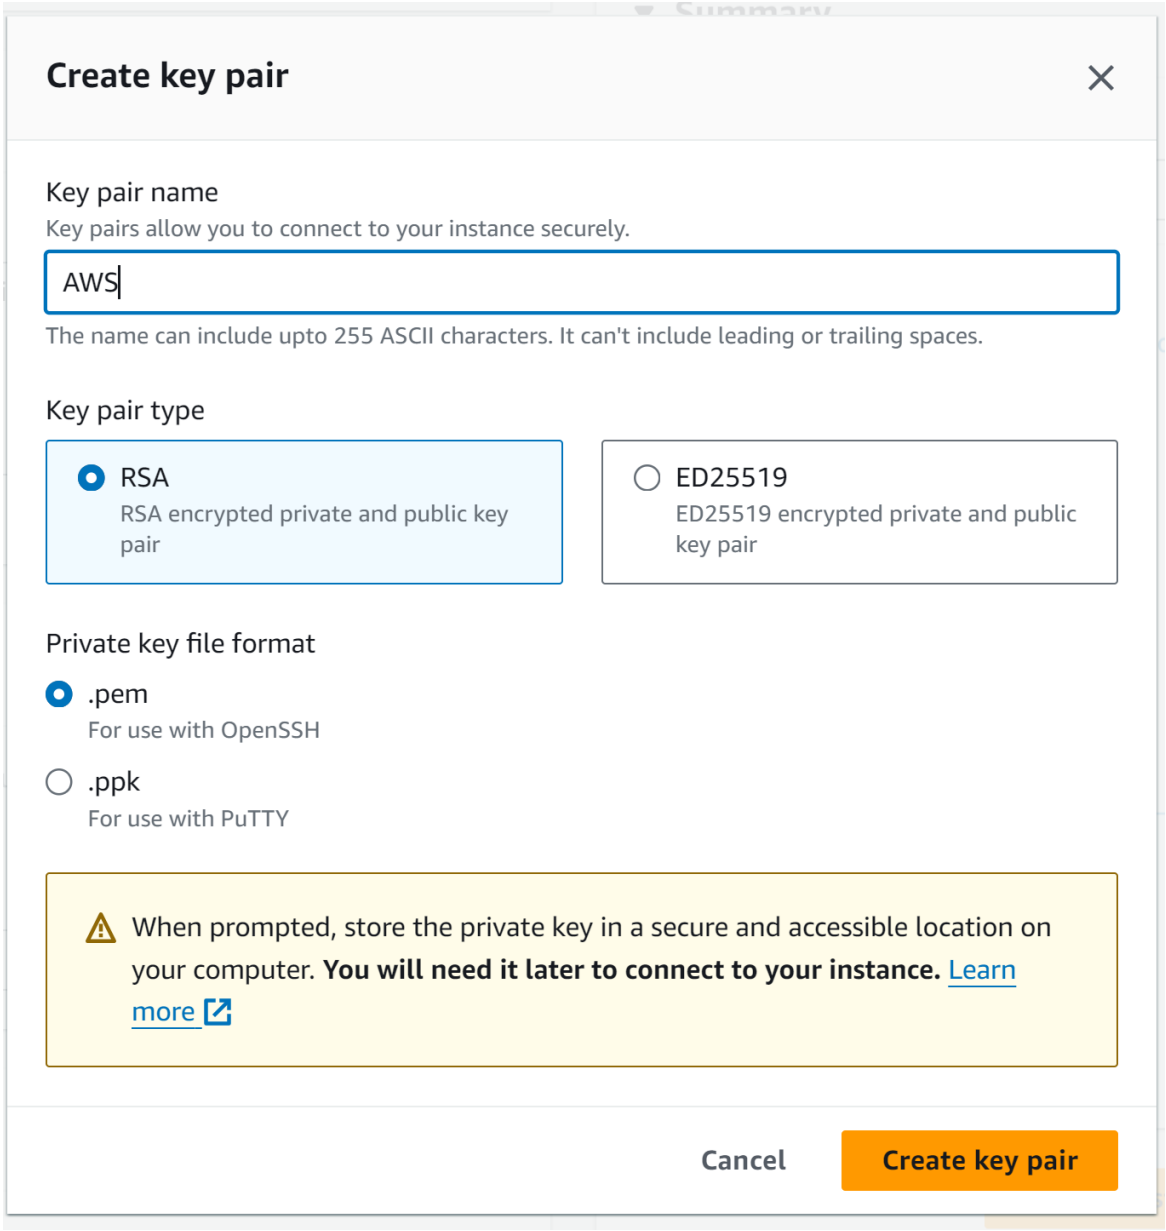
   Note: For Resource Types, add **Instances** and **Volume**.

2. Under **Application and OS Images (Amazon Machine Image)**, the AMI is pre-selected by default from the **AMI from catalog** section as you have subscribed.



3. Select an instance size from the **Instance** type drop-down list.

NetWitness recommends creating an **m7a.4xlarge** instance type with 16 CPUs and 64 GB of RAM for NW Server (node-0) and suggests choosing the appropriate instance type based on specific requirements. For further guidance on selecting the recommended instance type for each NW Service, please refer to the Storage Guide for NetWitness® Platform 12.4.



4. Under **Key pair (login)**, create or select the key pair for SSH authentication.

Note: If you are creating an instance for the first time, you need to generate a key pair. For subsequent instances, you can reuse the same key pair.

a. To create a new key pair, select **Create new key** pair.

   The Create key pair dialog is displayed.

b. In the **Key pair name** text box, type a name for the new key pair and keep other values as default.

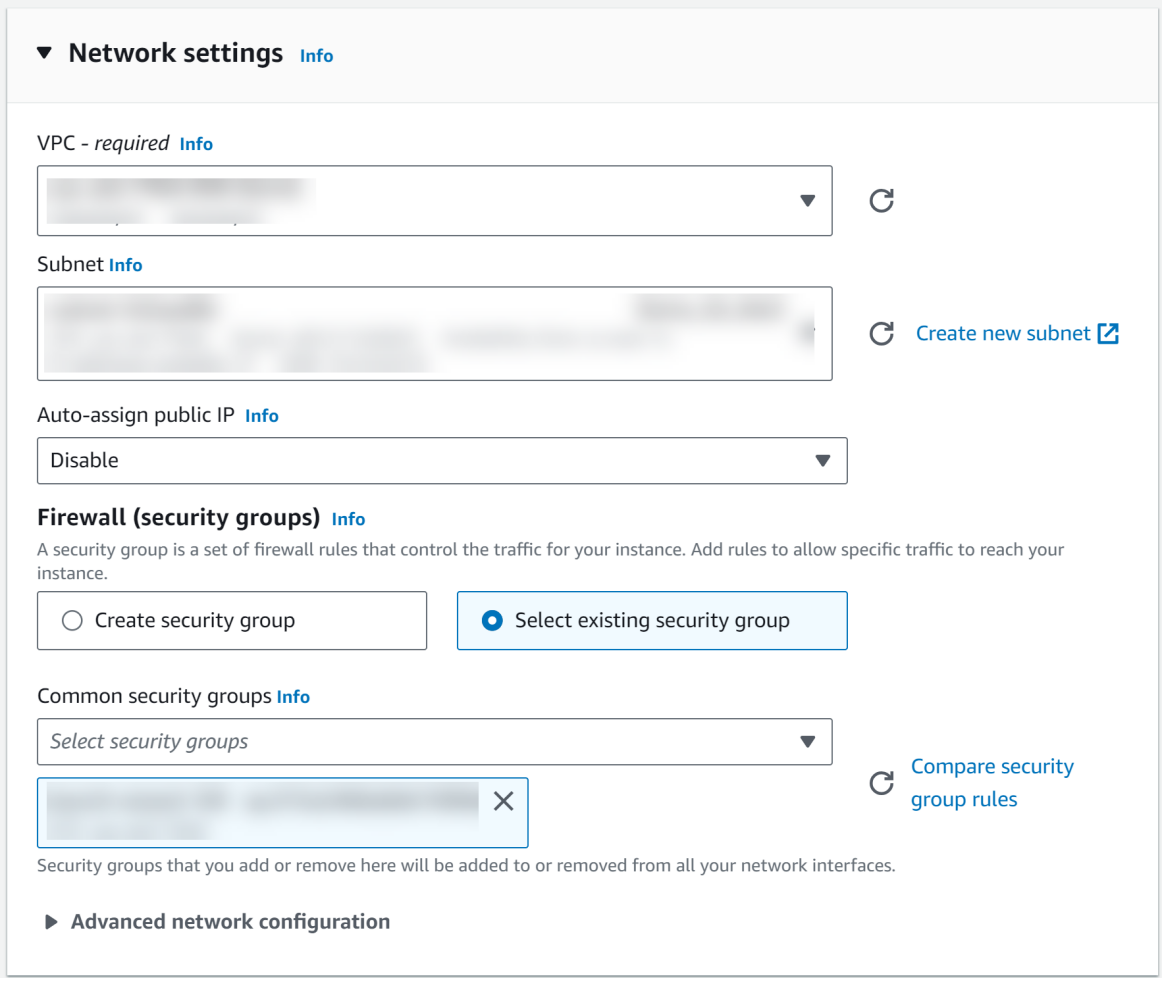
c. Click **Create key pair**.

The .PEM file that contains the private key is downloaded.

d. Save the private key to a location that is secure and accessible. You cannot download the private key file again.

Note: AWS EC2 instances are accessed with the help of key pairs and do not proceed without selecting a key pair.

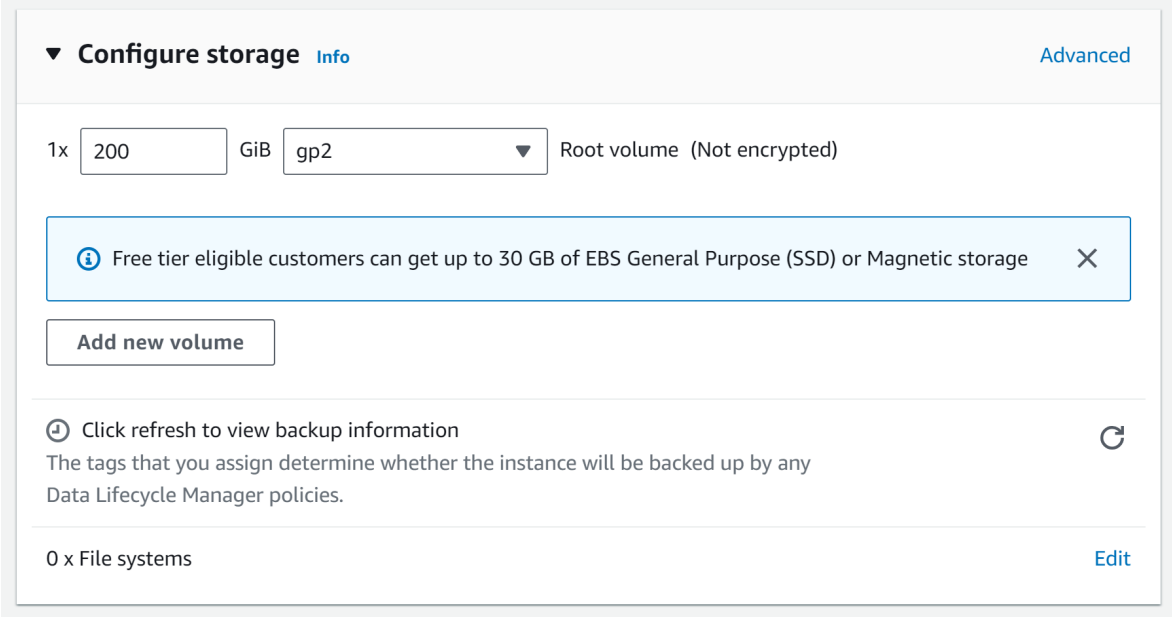
5. Under **Network Settings**, select a VPC, Subnet, and Security group.



To select or create, click **Edit** and configure the details:

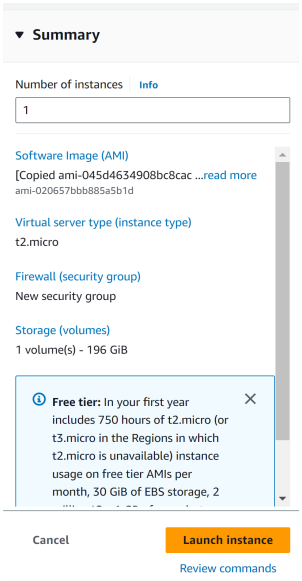
a. Select a virtual private cloud (VPC) from the **VPC** drop-down list.

b. Select a private subnet for your VPC from the **Subnet** drop-down list.



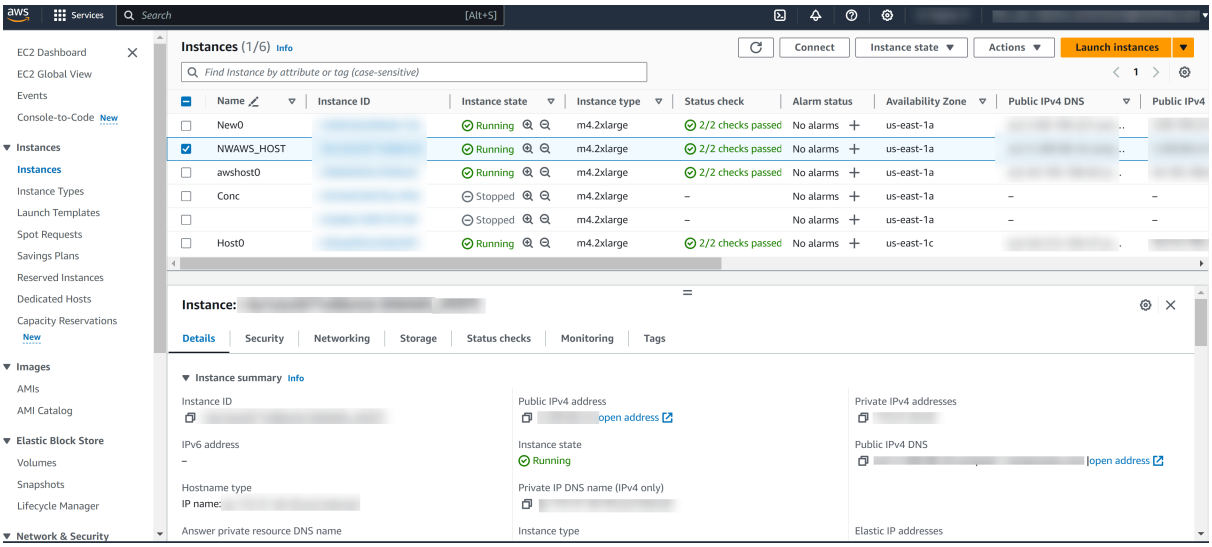
c. Select **Disable** from the **Auto-assign public IP** drop-down menu.

d. Under **Firewall (security groups)**, Choose the **Select existing security group** option and under **Common security groups** drop-down list, select an existing private instance security group that allows ports for the NetWitness, to create an allowlist of trusted IP addresses that can access your NetWitness deployment. In the security group you must add the inbound and outbound rules. For more information on the ports used by NetWitness components, see the topic Network Architecture and Ports topic in the *Deployment Guide for NetWitness Platform 12.4*.



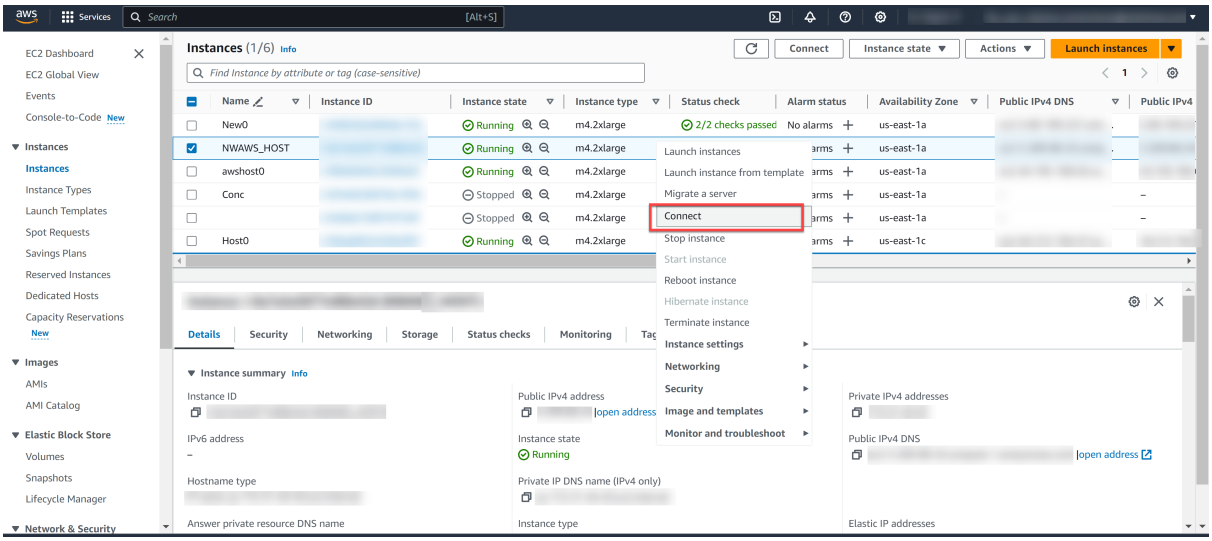
6. Under **Configure storage**, specify the size and type of the volume.

- (Optional) Click **Add new volume** if you need more storage and configure the details. For information about available disk options, see AWS Volume Types.



For more information, see the Storage Guide for NetWitness® Platform 12.4 for guidelines on how to configure storage based on based on the requirements of the NetWitness component (that is, service) for which you are launching an instance.

7. Under **Summary**, you can specify the number of instances required and review your instance configuration.
8. Click **Launch Instance**.



9. Wait a few minutes for the provisioning and initialization to finish.
10. Click **Connect to instance**, which navigates you to the instances tab where you can see all information about our instance.

Note: Wait at the Instances view until the **Instance State** shows **Running** and **Status checks** shows **2/2 checks passed**.

11. Select the instance, right-click, and click **Connect**.

IMPORTANT: You must contact NetWitness Customer Support to procure NetWitness repositories to continue orchestrating the software. Please provide the **NAT gateway IP address (not the Bastion host IP)** to whitelist, which allows access to the NetWitness repository package.

12. On your computer, open a terminal program, then navigate to the location where the .pem file is stored to open an SSH connection using the aws user account.

13. Enter the following command to connect to the Bastion instance:

    `ssh -i <.pem file> ec2-user@<Public IP>`

    For example: `ssh -i aws.pem ec2-user@150.0.0.0`

14. Enter the following command to connect to your private (NW server) instance from the Bastion instance:

    Note: Make sure to copy the downloaded .pem key of the private NetWitness instance to the Bastion instance to connect to the NetWitness private instance.

    ```
    ssh -i <.pem file> ec2-user@<Private IP>
    ```

    For example: `ssh -i aws.pem ec2-user@10.0.0.0`

15. Enter the following command to set the root privileges for the aws user:

    ```
    sudo su
    ```

16. Enter the following command to copy the NetWitness 12.4.0.0 package to this location:

    ```
    wget -m -nH --no-parent https://repo.netwitness.com/12.4.0.0/
    ```

    Caution: Do not proceed with the installation until the ports on your firewall are configured.

17. Install the NetWitness Platform. For more information, see **Installation Tasks** section under the topic Launch an Instance and Configure a Host.

    To configure the other Component hosts, for example, **Packet Decoder** Host, you must repeat the steps 1-11 to launch a new EC2 instance and perform the **Installation Tasks** procedure and then log in to the NetWitness Platform and follow the procedure **Install Component Services on Hosts** under the topic Launch an Instance and Configure a Host.

18. If you use the Enterprise network to access AWS resources such as EC2 instances, you can access the NetWitness Platform UI using the private IP address of the NetWitness instance (node-0). However, suppose you are not connected to an Enterprise network. In that case, you must set up port forwarding within your Bastion instance to access the NetWitness Platform UI from your local system using the public IP of the Bastion instance.

Getting Help with NetWitness Platform

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com/
LiveUI	https://live.netwitness.com

Feedback on Product Documentation

You can send an email to feedbacknwdocs@netwitness.com to provide feedback on NetWitness Platform documentation.

Azure Installation Overview

Azure instances have the same functionality as the NetWitness hardware and virtual hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

Before you can deploy NetWitness in Azure, you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness® Platform 12.4.
- Make sure that you have a NetWitness Throughput license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness hardware hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database and Decoder directory for Packet database on SSD Disks with high IOPS / write throughput.

Azure Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

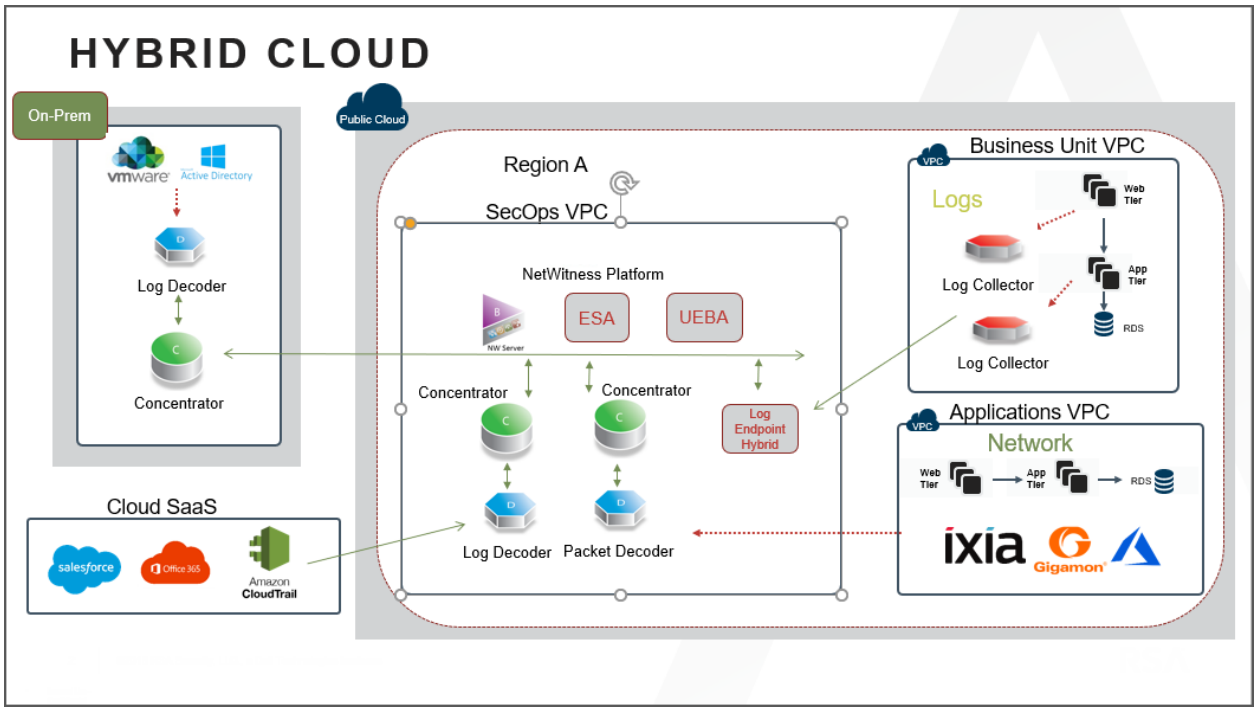
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Azure Configuration Recommendations

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5GBps were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - The Packet stream included a Network Decoder and Concentrator.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
    - The default partition size of Azure VM hosts for `/root` is 8GB and for `/var/netwitness` is 15GB. These partitions can be increased to a minimum of 40GB. For more information see, Updating Partition Size.
- VHD (Storage)
  For more information, see Storage Guide for NetWitness® Platform 12.4 on how to increase the number of volumes based on your storage requirements using the NetWitness Sizing & Scoping Calculator.

Azure Instance Recommendations

The following table shows the storage recommendations for NetWitness Azure VMs.

Azure Image Type	Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)
NW Server	Does not apply	16	112	Standard D14_v2
Log Decoder	15,000	32	128	Standard D32s_v3
Log Concentrator	15,000	16	112	Standard DS14_v2
Archiver	15,000	16	112	Standard D14_v2
Log Collector	15,000	8	32	Standard D8s_v3
UEBA*	Does not apply	16	112	Standard D14_v2

Note: *If your log collection volume is low, NetWitness recommends you to deploy UEBA only on a virtual host. If you have a moderate to high log collection volume, NetWitness recommends you to deploy UEBA on the physical host as described under "NetWitness UEBA Host Hardware Specifications" in the *Physical Host Installation Guide*.

Refer to the *Storage Guide for NetWitness Platform* for additional storage information.

Packet Stream Solutions

The following tables show Instance recommendations for Different EPS rates for Packet stream.

Note: NetWitness Decoder is supported with Gigamon Packet broker from version 11.7.x or higher on Azure Cloud environment.

Decoder - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Decoder	500	16	64	Standard D16ds_v4	Yes
Decoder	1000	16	64	Standard D16ds_v4	Yes
Decoder	1500	32	128	Standard D32ds_v4	Yes

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index, session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
500	packet	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index, session, meta	RAID5 of minimum 3 P20 Premium SSD Disks	170MB/s
1000	packet	RAID5 of minimum 3 P30 Premium SSD Disks	170MB/s
1500	index, session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s
1500	packet	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

Concentrator - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Packet Concentrator	500	16	64	Standard D16ds_v4	No
Packet Concentrator	1000	16	114	Standard DS14_v2	No
Packet Concentrator	1500	16	114	Standard DS14_v2	No

Note: For Packet Concentrator with **500**Mbps rate, if the query load on the environment is on the higher side (max concurrent queries > **5**), it is recommended to use **Standard DS14_v2** Instance.

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index	RAID5 of minimum 3 P30 Premium SSD Disks	10000
500	session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index	RAID5 of minimum 3 P40 Premium SSD Disks	12000
1000	session, meta	RAID5 of minimum 3 P20 Standard SSD Disks	170MB/s
1500	index	RAID5 of minimum 3 P40 Premium SSD Disks	15000
1500	session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

ESA and Context Hub

The following table shows Instance recommendations for Different EPS rates for ESA.

Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type	Accelerated Networking Enabled
15,000	16	112	Standard DS14_ v2	No
50,000	20	140	Standard DS15_ v2	Yes
100,000	32	256	Standard E32s_ v3	Yes

Updating Partition Size

You can increase the partition size to a minimum of 40GB each.

After adding additional required disk size to the Azure VM, you can extend the partition sizes using the following commands:

1. SSH to the VM, login as a root user and execute the following command to view the existing partitions along with the new partition added.
   `lsblk`
2. Check the name of the new partition. Eg: `sdc`

```
pvcreate /dev/sdc -y
vgextend netwitness_vg00 /dev/sdc -y
lvextend -L 40G /dev/netwitness_vg00/root -y
xfs_growfs /dev/netwitness_vg00/root
lvextend -L 40G /dev/netwitness_vg00/nwhome -y
xfs_growfs /dev/netwitness_vg00/nwhome
```

These commands are provided assuming that `sdc` is the new disk added and 40GB is the extended partition size for each of the partitions.

Azure Deployment

This topic contains the rules and high-level tasks you must perform to deploy NetWitness components in Azure.

Rules

You must adhere to the following rules:

It is recommended to use private IP addresses when you provision Azure NetWitness VMs.

Checklist

Step	Description	√
1.	Deploy NW Server Host	
2.	Deploy NW Component Hosts in Azure	
3.	Installation Tasks	

Storage Configurations

This topic contains the recommended Azure storage configurations.

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.4*.

Enabling Swap Partition in Azure Deployments

After completing the Azure deployment, you must enable the swap in your deployment.

To do this, perform the following steps:

1. Modify the default parameters at `/etc/waagent.conf` to

```
ResourceDisk.Format=y
ResourceDisk.Filesystem=ext4
ResourceDisk.MountPoint=/mnt/resource
ResourceDisk.EnableSwap=y
ResourceDisk.SwapSizeMB=4096
```

The following screenshot displays the default parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=n

# Size of the swapfile.
ResourceDisk.SwapSizeMB=0
```

The following screenshot displays the modified parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=y

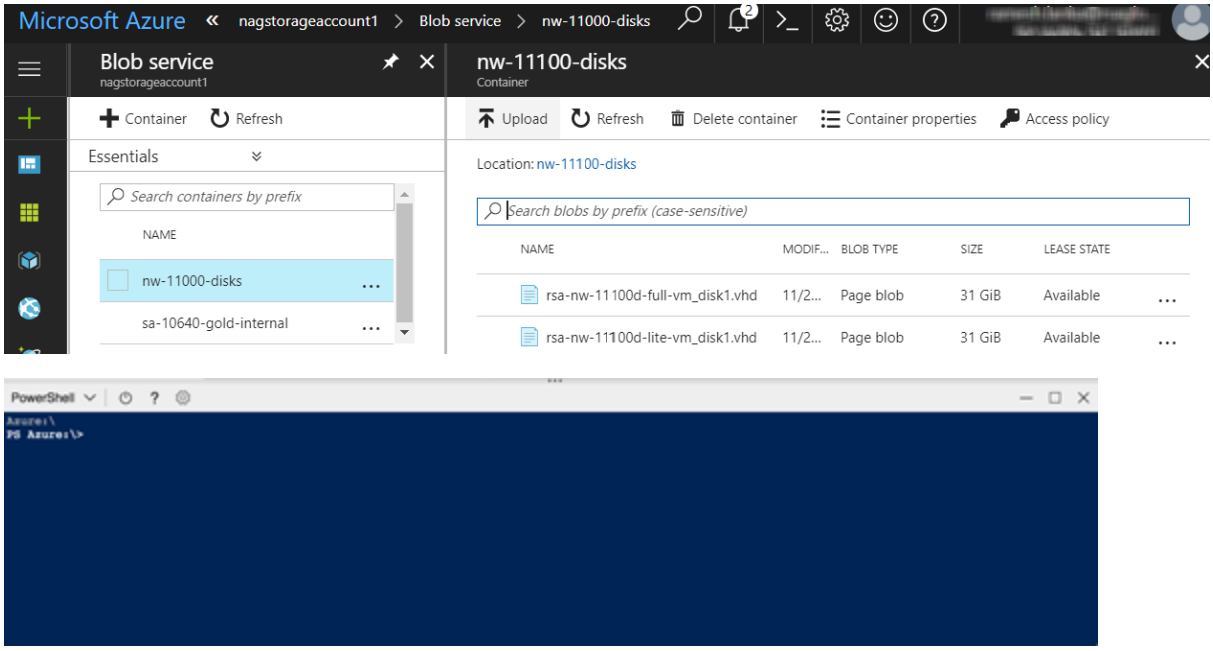
# Size of the swapfile.
ResourceDisk.SwapSizeMB=4096
```

Note: You can set the `ResourceDisk.SwapSizeMB` parameter based on your requirement.

2. Restart the `waagent.service` using the command: `systemctl restart waagent.service`

Note: To check the status of the swap use the command `swapon --show`.

Deploy NW Server Host



The following tasks must be performed to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

Note: It is not mandatory to deploy the NW Server in the Azure Cloud environment . For more information on how to deploy other components, see Azure Deployment Scenarios.

Task 1. - Upload NW Server VHDs

To upload NW Server VHDs to Azure.

1. Contact Customer Support (https://community.netwitness.com/t5/support/ct-p/support) to open a support case requesting the NW Server VHDs. A valid throughput license is required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.

You will need a storage account, blob service and container setup. This is where the VHD's are copied. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell on your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

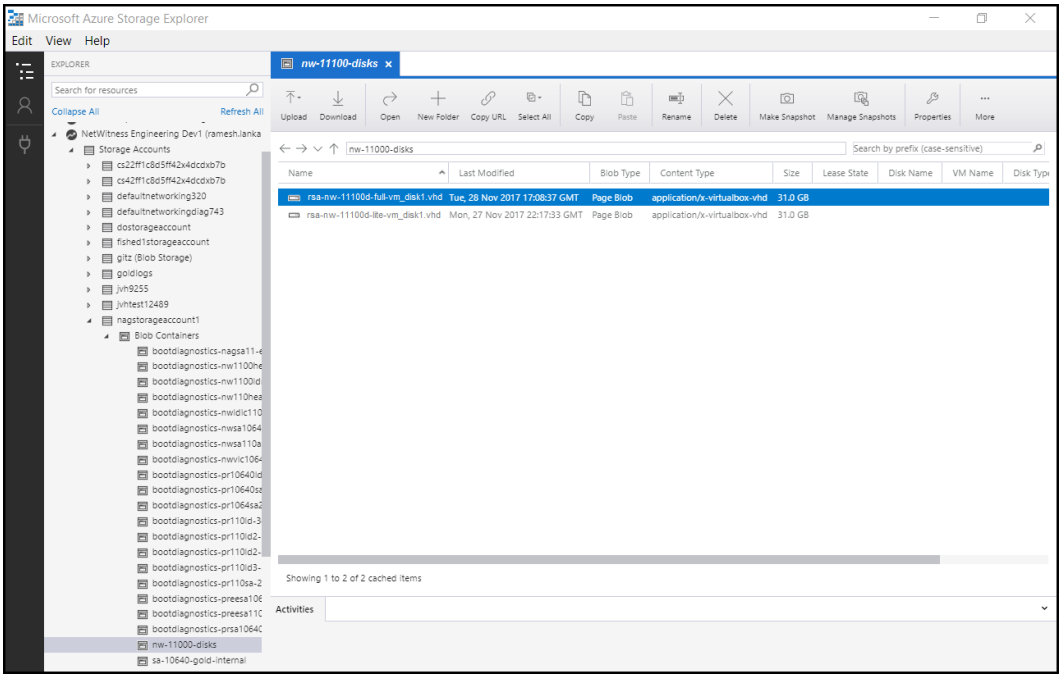
b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell on your workstation, log in to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

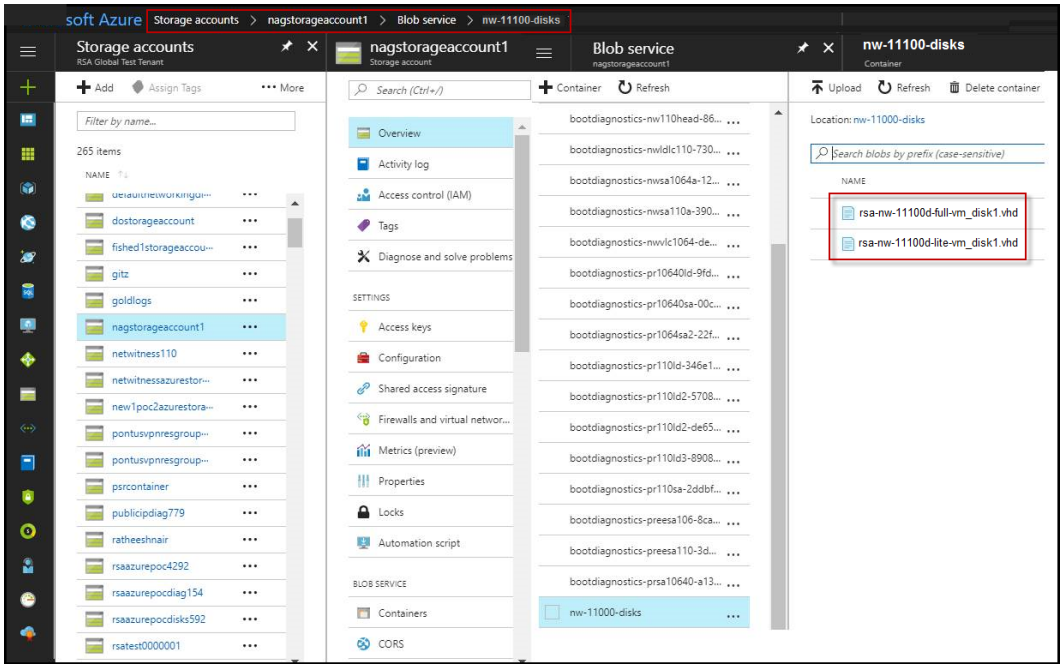
f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> -Name <storage-account-name>).Context`



g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. Obtain the Blob copy status by using the command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " -Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll must create an image and a VM.

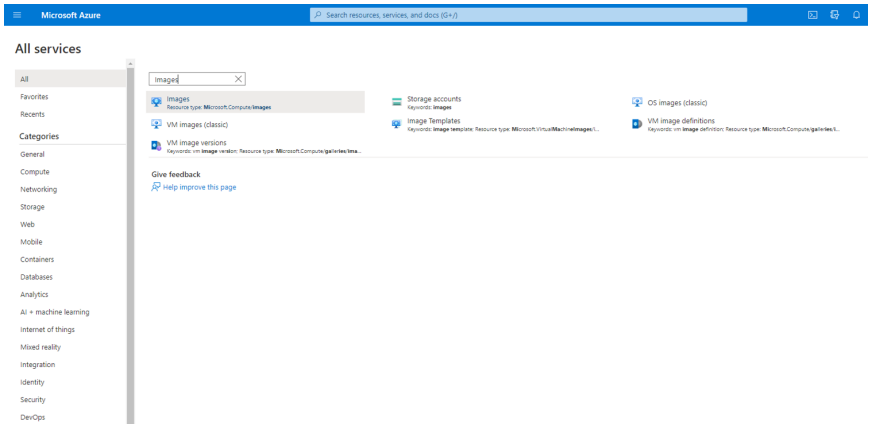


5. Verify if all the NW Server VHDs are uploaded into the Azure Cloud.

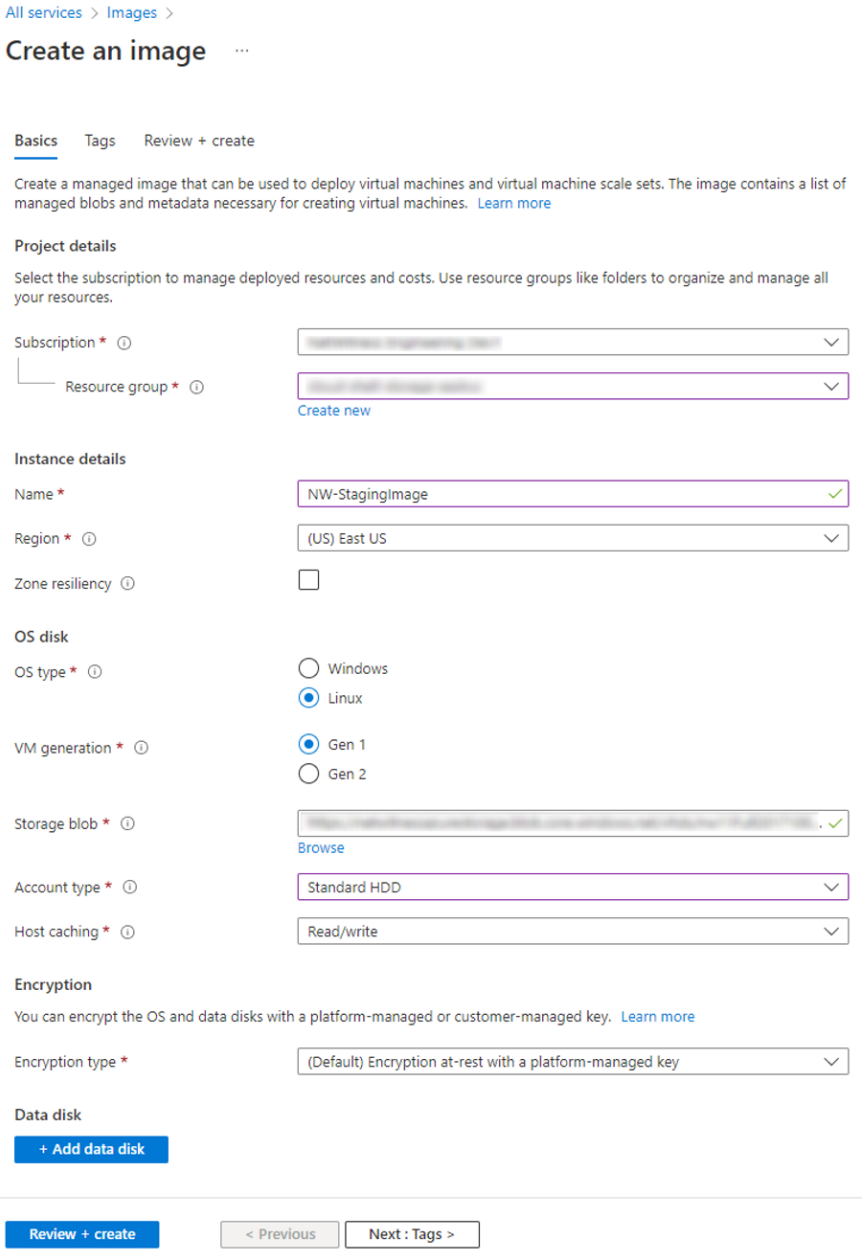
Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents of your storage.

a. Log in to the Azure portal (https://portal.azure.com).

b. From the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



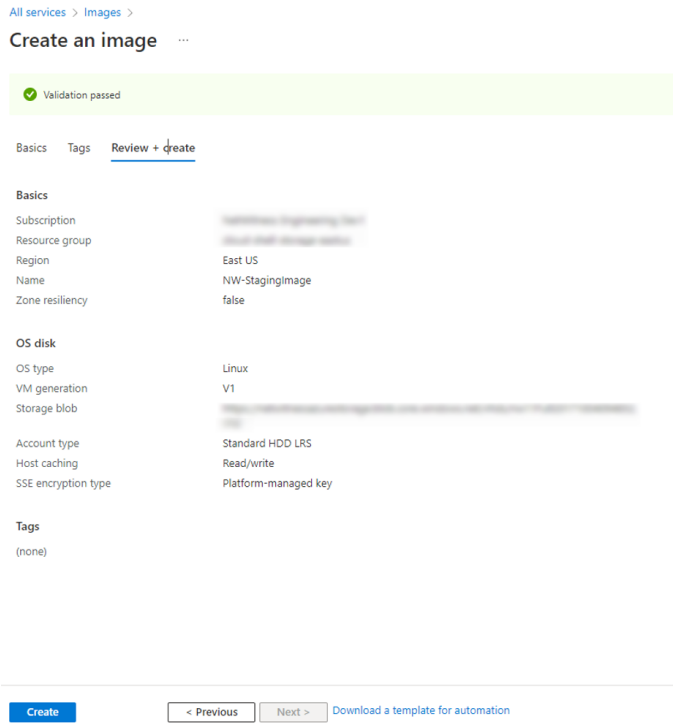
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**).



Task 2. - Create NW Server Image

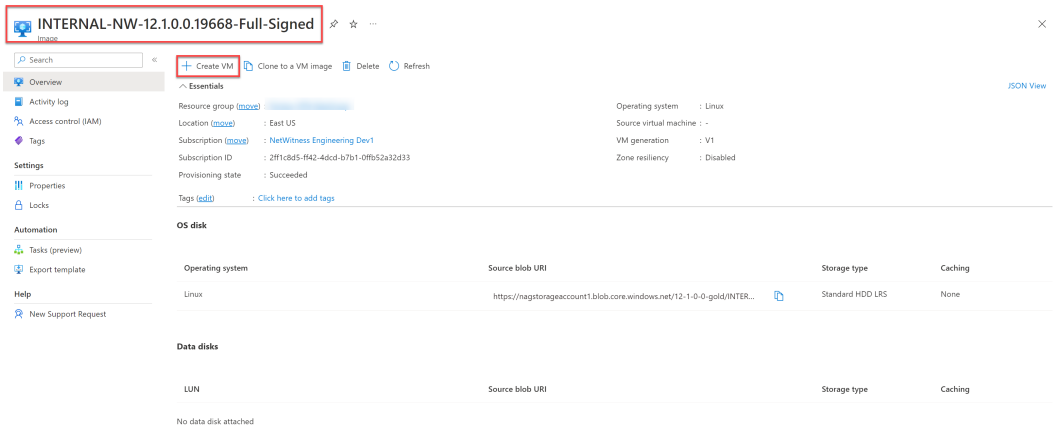
To create a NW Server image in Azure from upload VHDs, perform the following steps:

1. Log in to https://portal.azure.com.
2. From the left panel, click **All Services** and filter by Images.
3. Click **Images**.

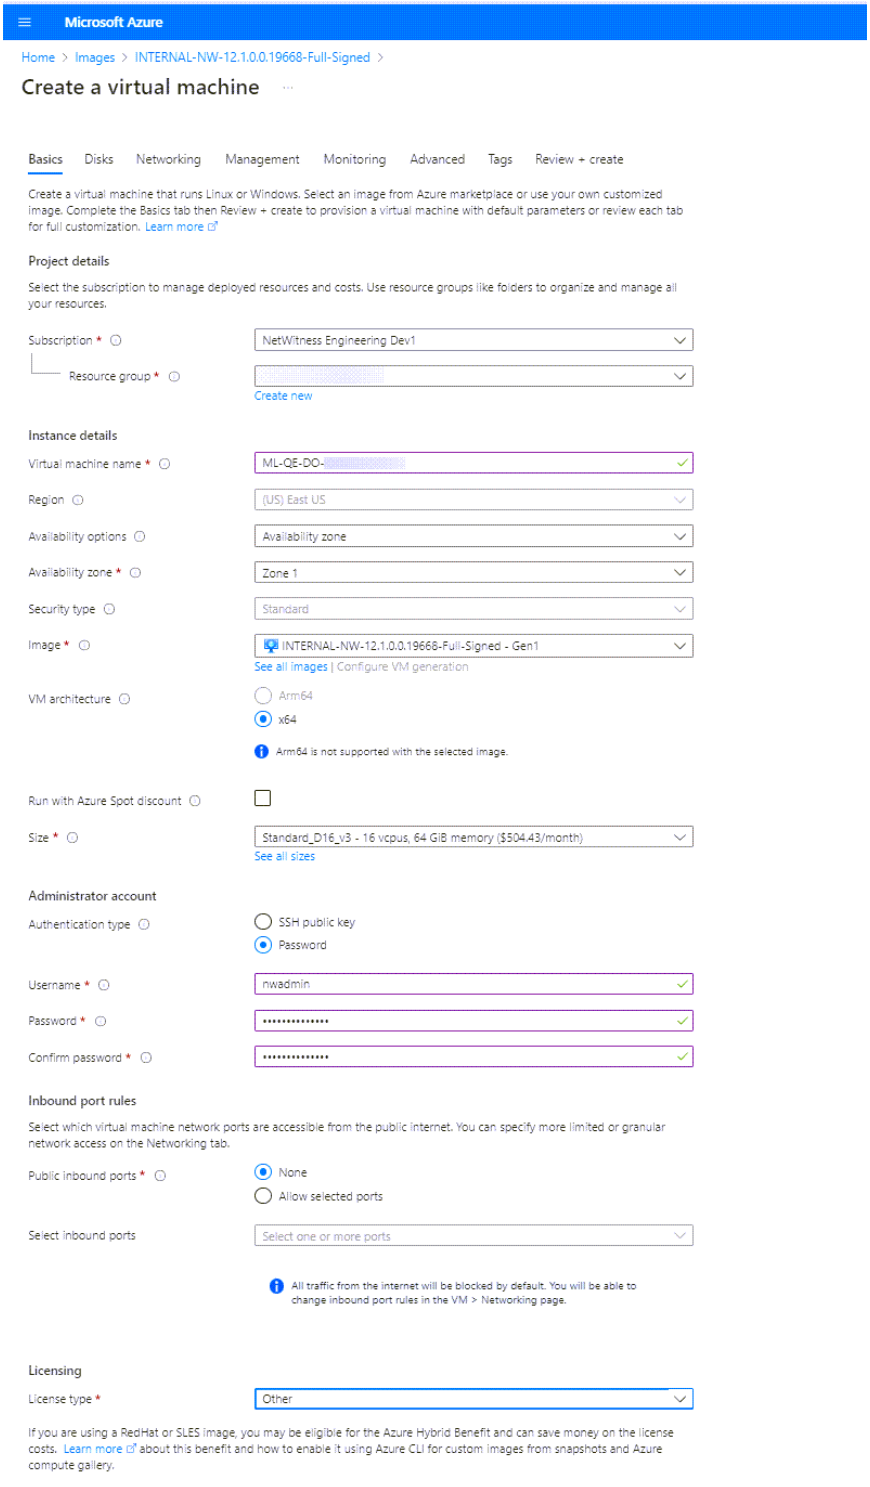


4. To create and configure the Image.
   a. Click **Create**.
   b. Enter an image **Name**, select the correct **Resource Group**, select a valid **Region**, and set the **OS Disk** to Linux.
   In the **Storage blob**, browse to the uploaded location of the VHDs .
   c. Make sure that **Standard (HDD)** is selected for **Account Type**.
   The following screen shot illustrates a completed **Create Image** view.

   d. Click **Next : Tags >** to add the tags for the Image (optional) and then Click **Review + create**.
   Azure does a validation check.



e. Click **Create** to create the image.
Check notifications on top right for the confirmation.

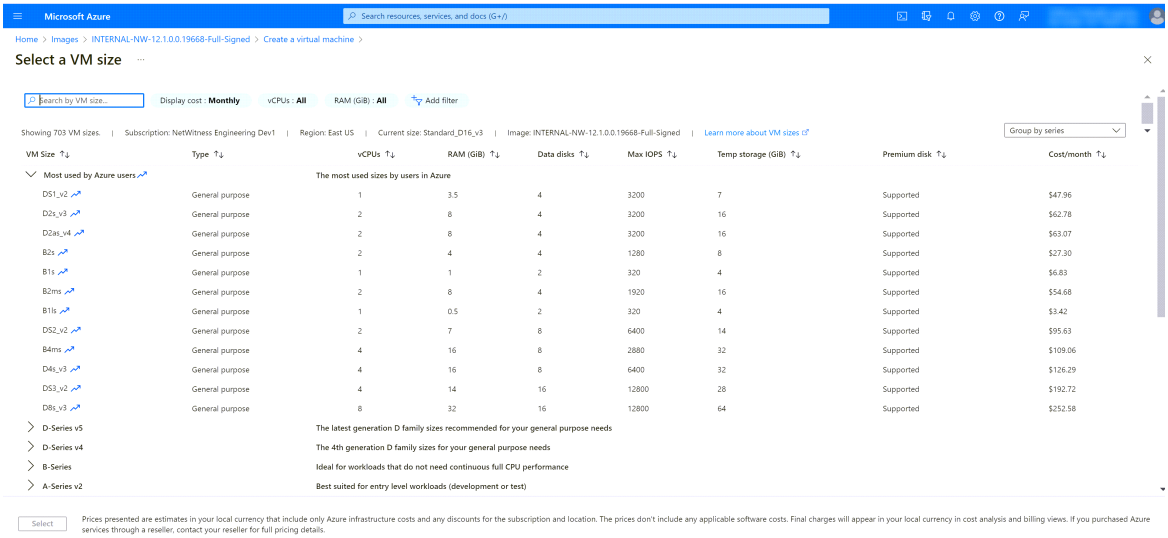


Task 3. Create Virtual Machine (VM)

To create a VM in Azure using the NW Server image:

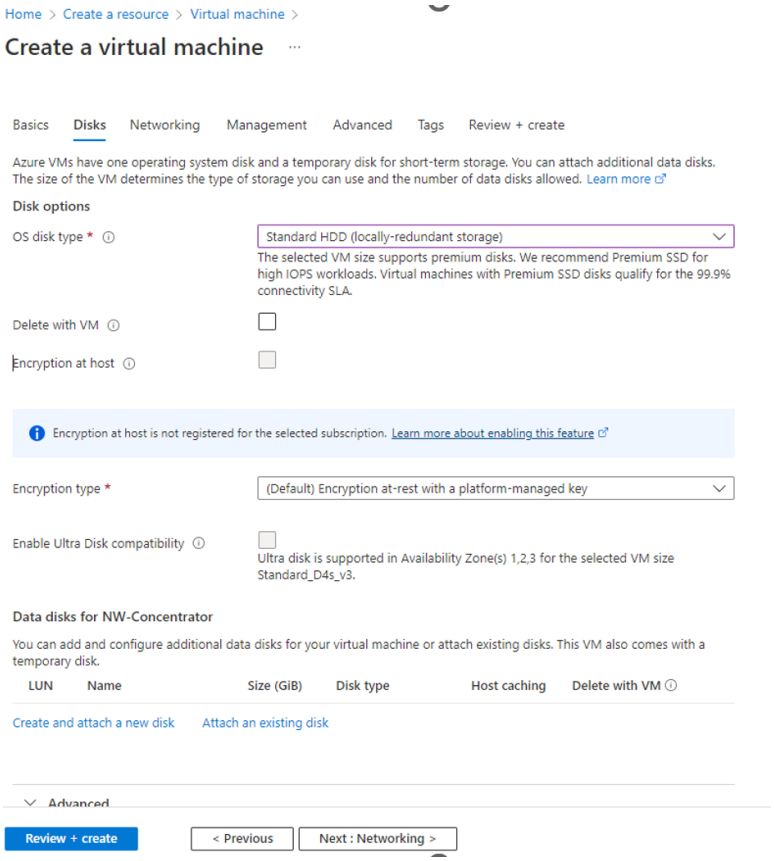
1. Go to **Images** and click **Create VM**.

The **Basics** tab is displayed.



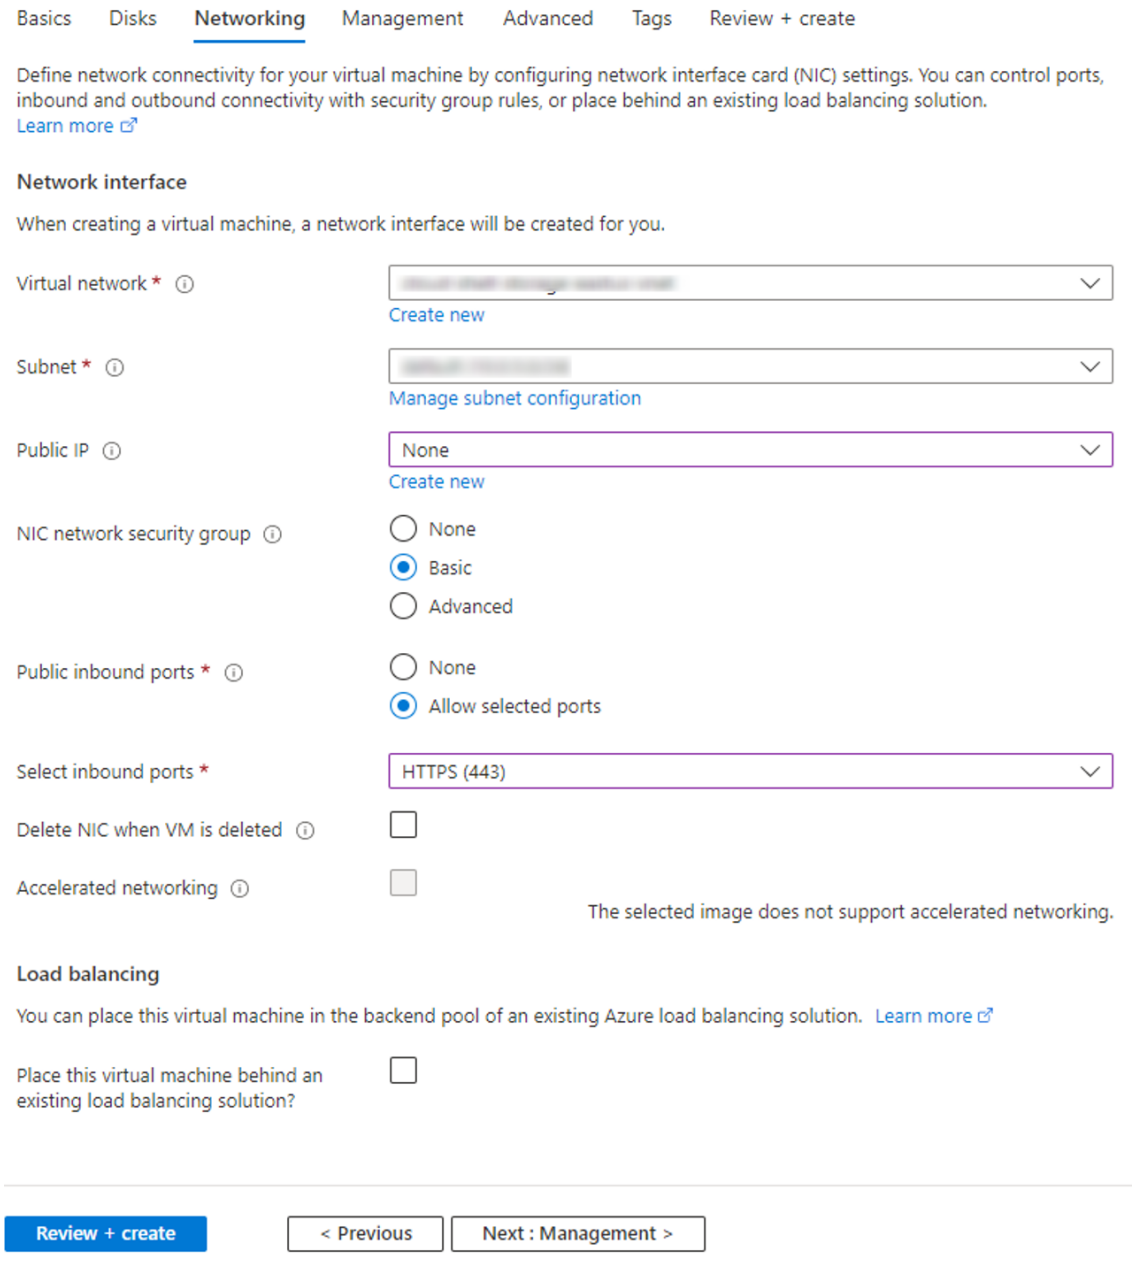
2. Enter the values in following fields.
   a. In the **Name** field, enter a user-defined name (for example, **ML-QE-DO**.

> **Caution:** The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).



> **Note:** Make sure the values selected in the **Subscription**, **Resource group**, and **Region** fields are correct.

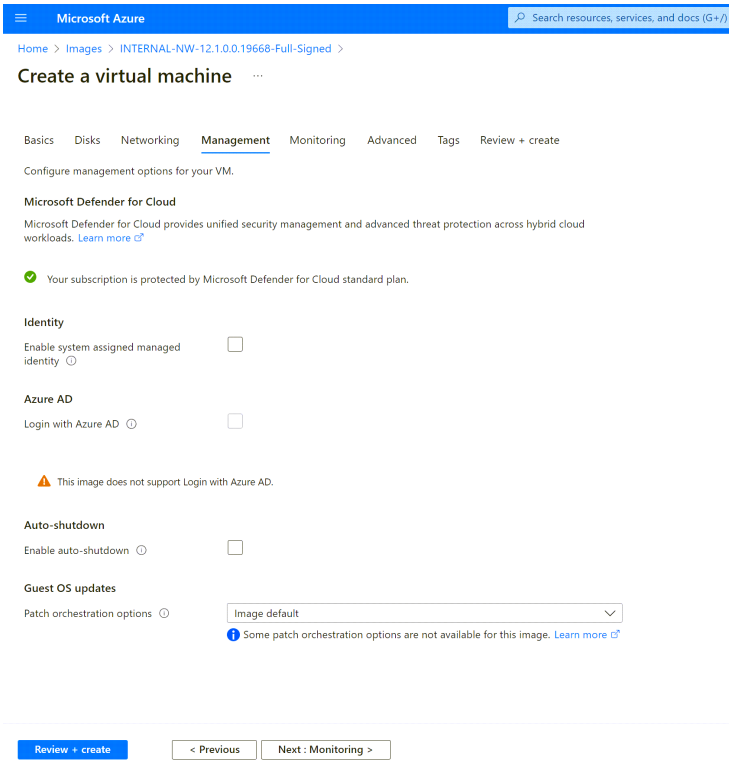
   b. Click **See all sizes** and select appropriate Size and Instance. The recommended instance for Concentrator is **Standard F8**.



> **Note:** The sizing is based upon the capacity requirements of your enterprise. For more information on NetWitness VM size recommendations based on log capture rates, see Azure Configuration Recommendations. The minimum size NetWitness recommends for the NW Server is **F8 Standard**.

   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Click **Next** : **Disks >**.
   The **Disks** tab is displayed.
3. In the OS Disk type, select **Standard HDD** from the drop-down list and click **Next : Networking >**.

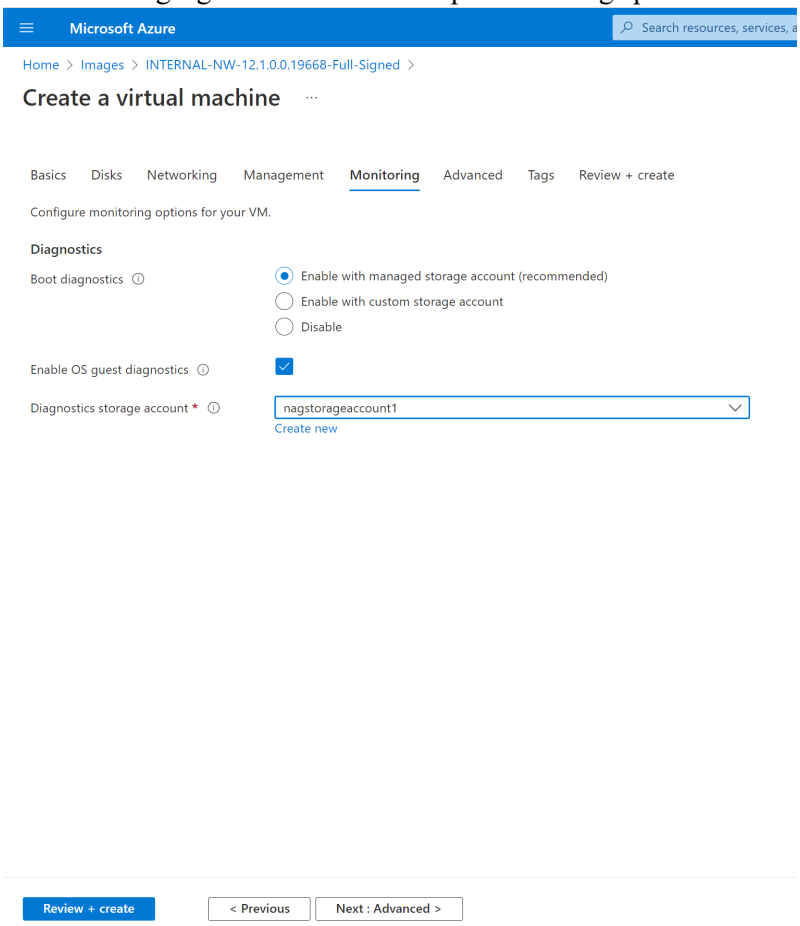
The **Networking** tab is displayed.



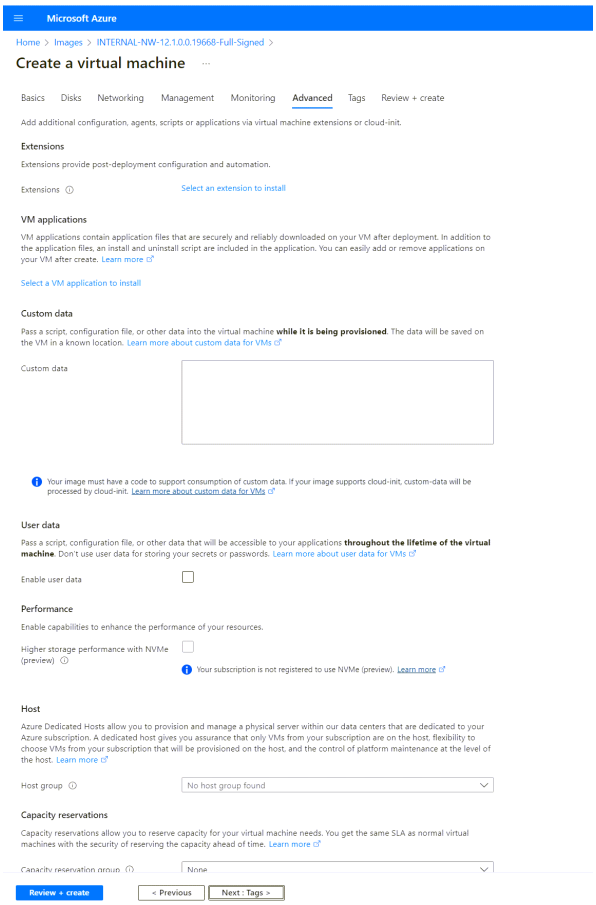
4. Click and define the fields.
   a. In the **Networking** tab, select:
      - A valid **Virtual network** and **Subnet**.

      - **None** for the **Public IP address**.
        NetWitness recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.

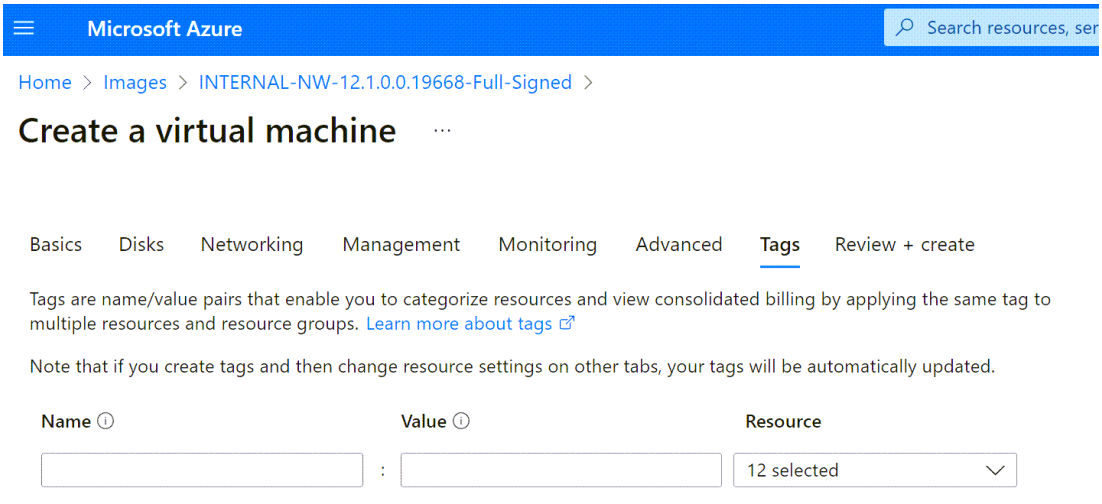
- A valid **Network security group**.
  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).



b. (Optional) In the **Management** tab, configure the details if required and click **Review + create**.



c. In the **Monitoring** tab, under Diagnostics, select:



- **On** for **Boot Diagnostics**
- **On** for **OS guest diagnostics**
- a valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.

Note: By default, the settings remain unchanged in the **Advanced** and **Tags** tab. Add any name and value pairs for tags based on requirement.

Microsoft Azure
Home > Images > INTERNAL-NW-12.1.0.0.19668-Full-Signed >
Create a virtual machine

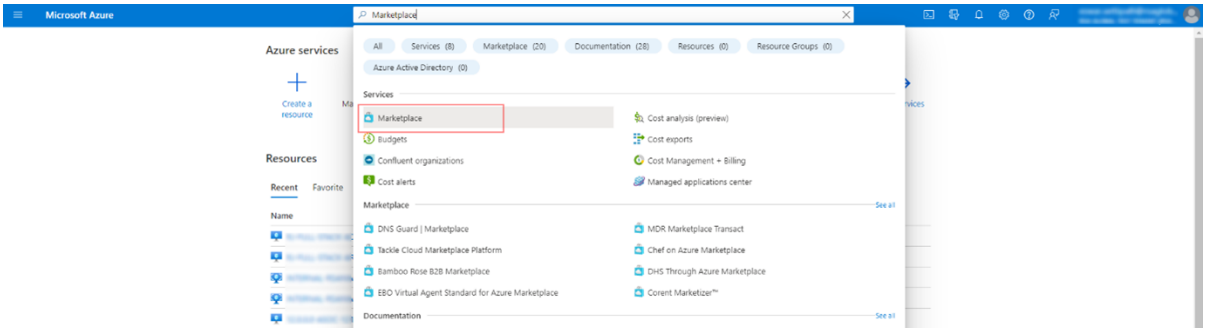
The NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Overview** on the Virtual Machine to view all the required details such as VM status and IP Address.

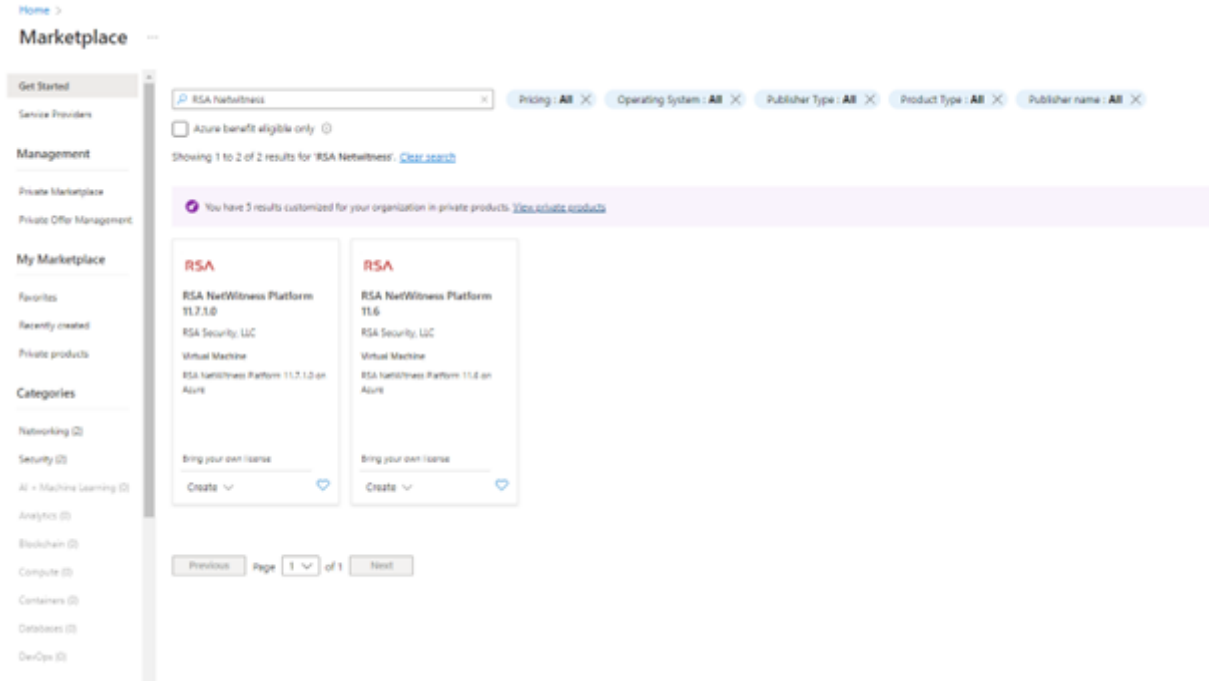
7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password.

```
[psradmin@12 ~]$ sudo passwd root
[sudo] password for psradmin:
Changing password for user root.
New password:
BAD PASSWORD: The password contains more than 4 characters of the same class consecutively
Retype new password:
passwd: all authentication tokens updated successfully.
```



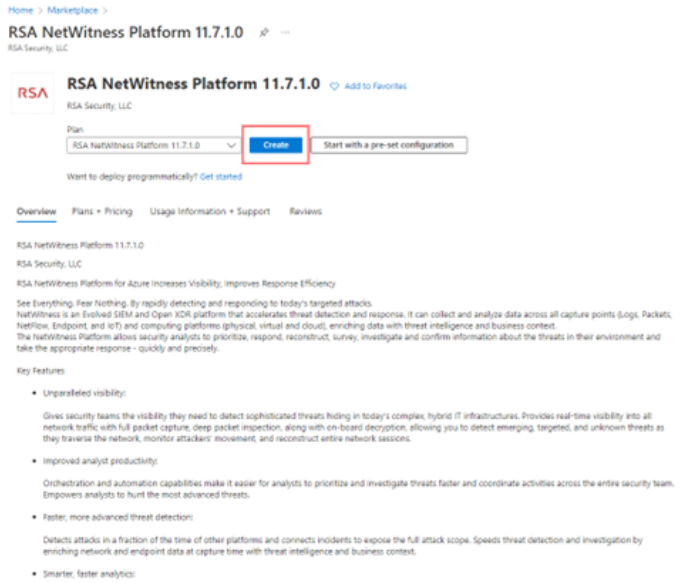
8. Close the current SSH session and open a new SSH session with **root** using the username and the password created in the previous step.

> **Note:** Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the NetWitness User Interface will not load.



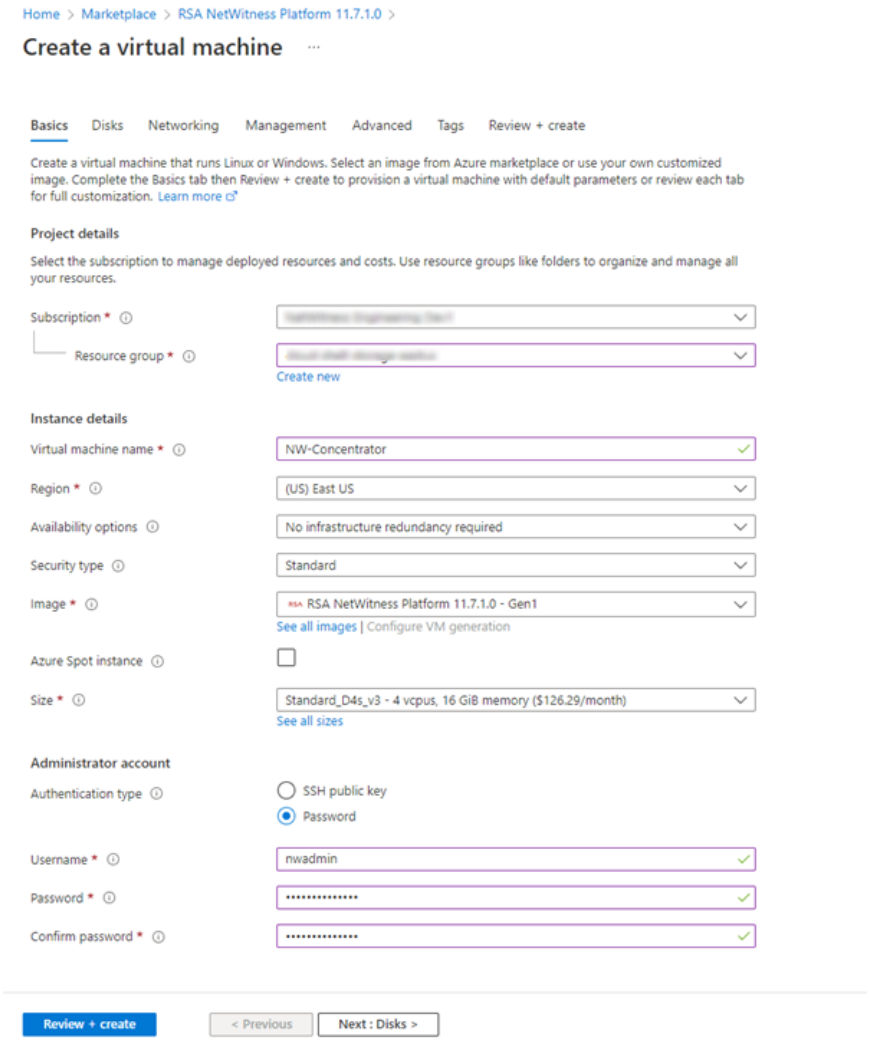
Deploy NW Component Hosts in Azure

You must perform the following tasks to configure a NW Component Host on a Virtual Machine (VMs) in the Azure Cloud environment.



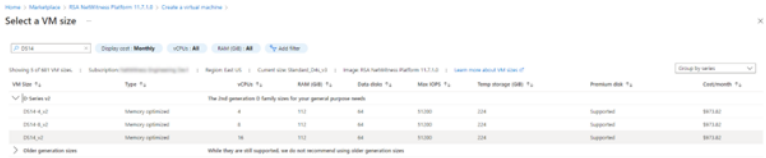
1. Search for Marketplace in Azure portal.

2. Search for **RSA NetWitness**.



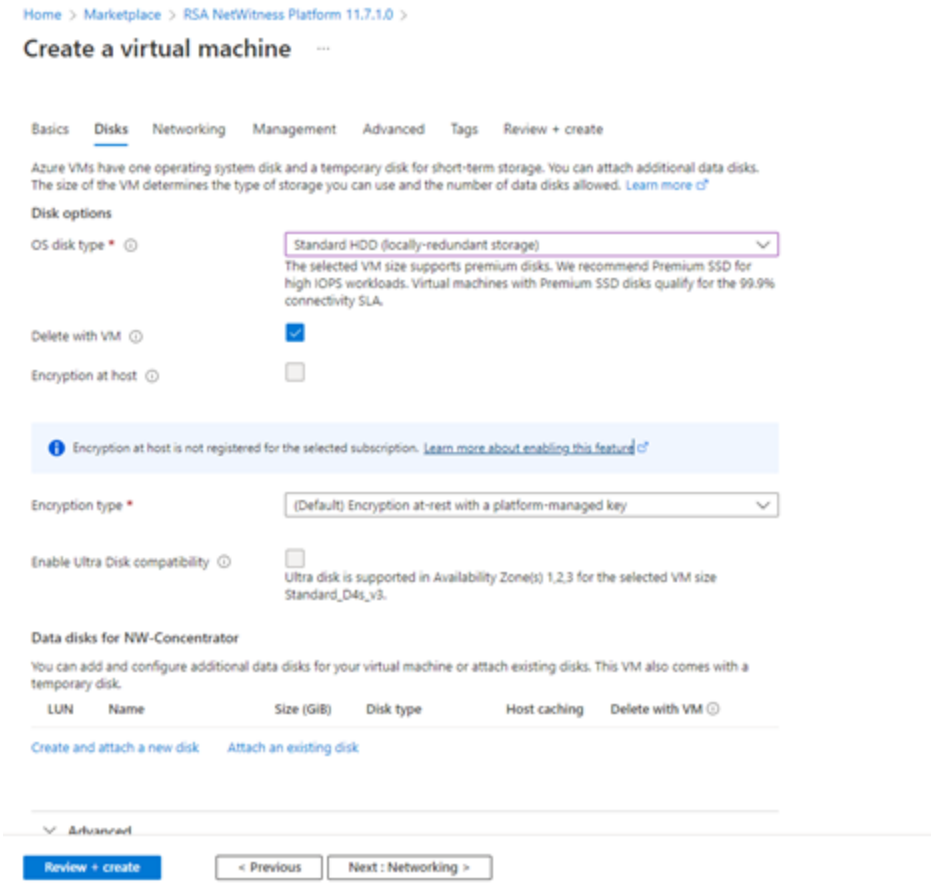
3. Select RSA NetWitness Platform 12.4.0.0 and click **Create**.

The **Create virtual machine** wizard opens and displays the **Basics** tab.



4. Enter the values in the following fields:
   a. Specify a VM **Name** (for example, **NW-Concentrator**).
   b. Select **Password** for **Authentication type**.
   c. Enter your credentials (**User name** and **Password**) and **Confirm Password**.
   d. Click **OK**.

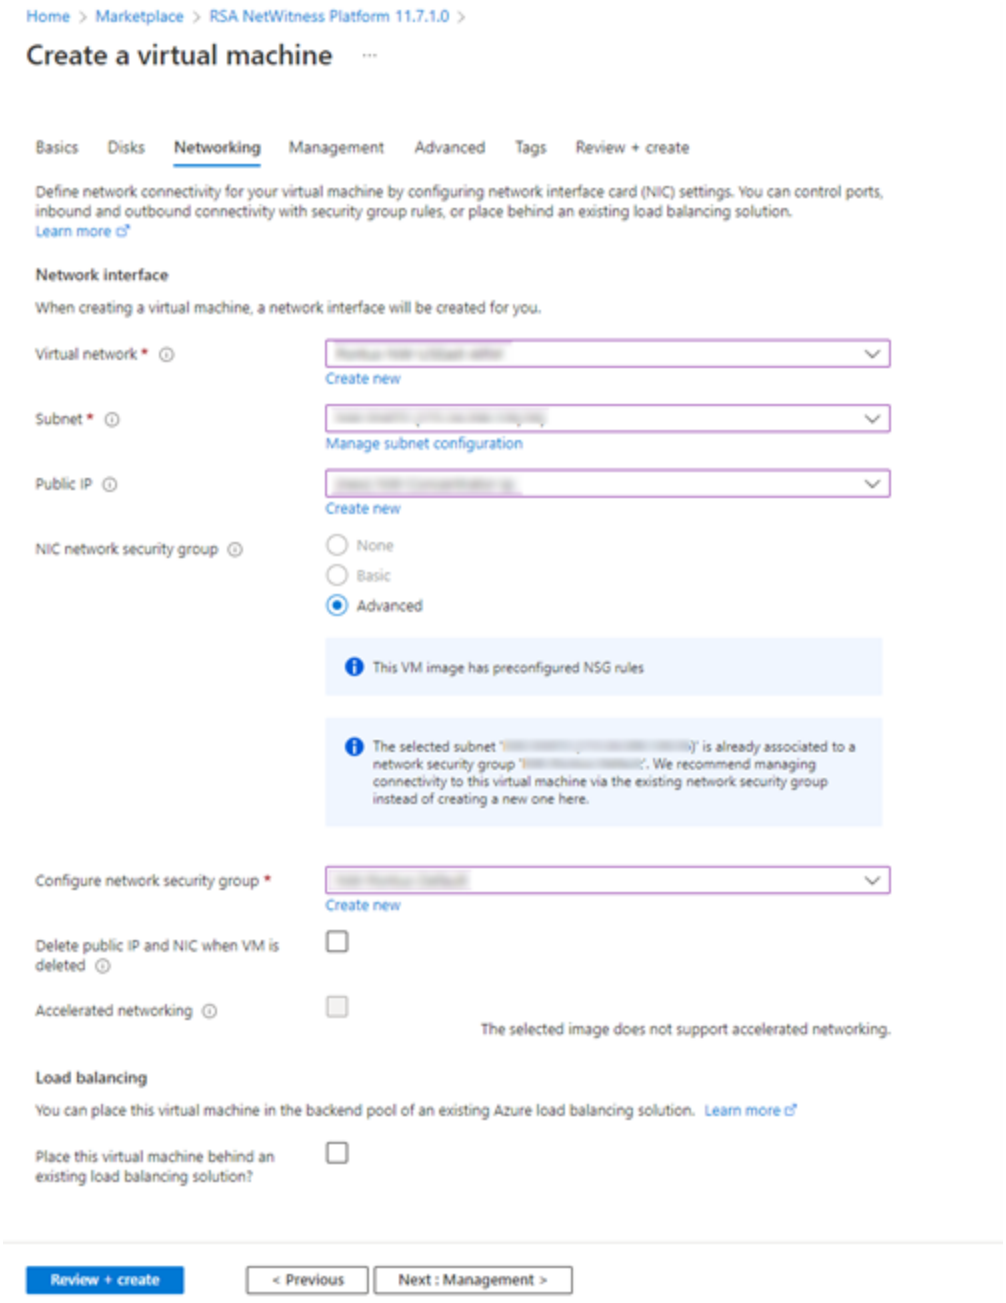
Azure validates the **Basic** specifications and the **2 Size** page is displayed.



5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   For more information on NetWitness recommendations of the VM sizes for each service, see Azure Configuration Recommendations.

   Azure validates the **Size** specifications. Click **Next : Disks >**.

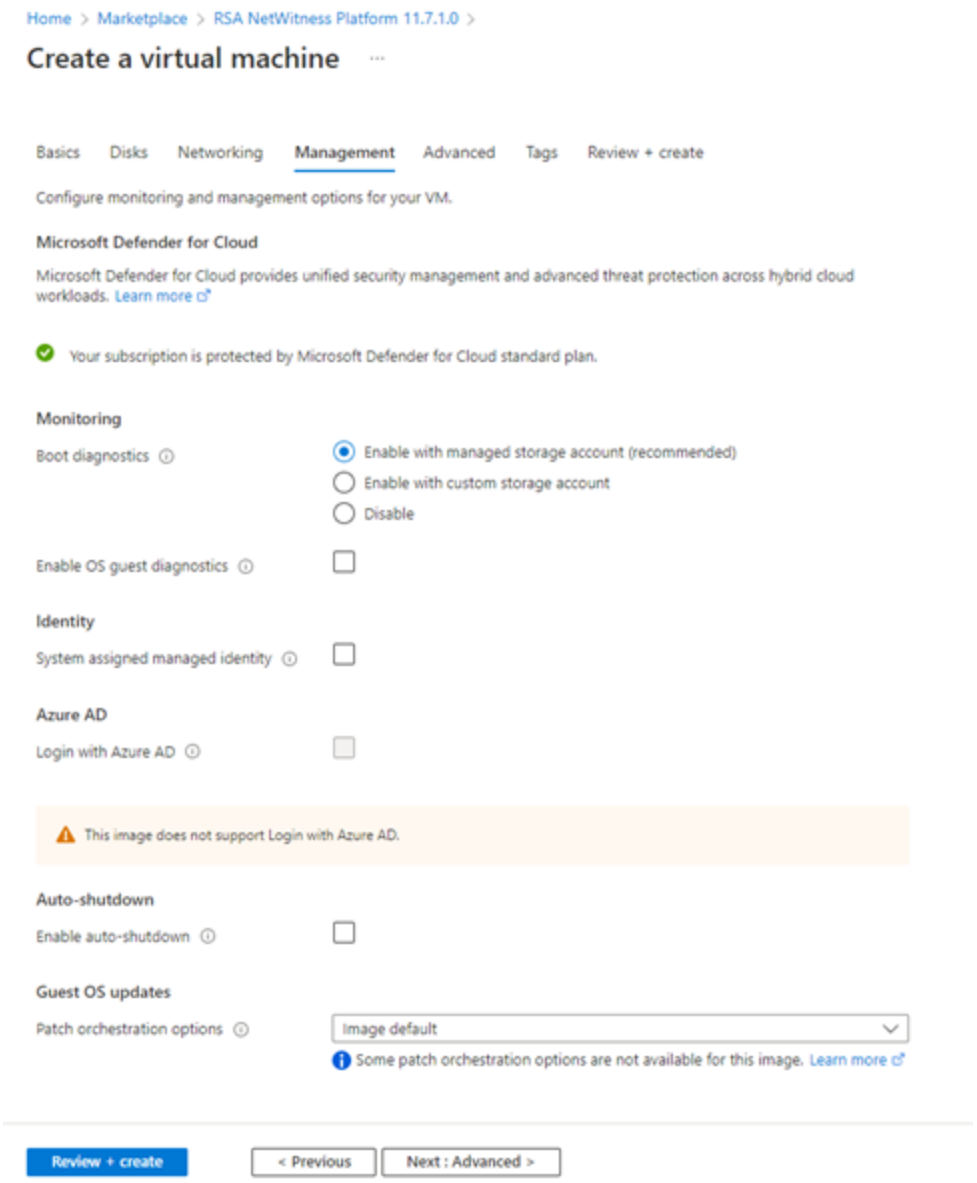


6. Under **Disks** tab, Select **SSD** for the **VM disk type** of the Concentrator or **HDD** for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).

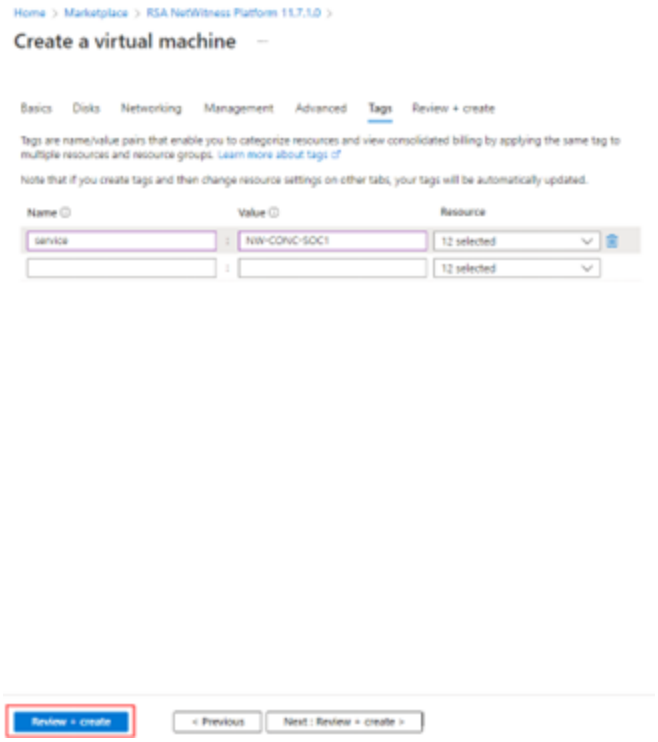
Click **Next : Networking >**.

7. In the **Networking** tab:
   a. Adjust **Virtual network**, **Subnet**, and **Public IP address** according to the requirements of your network.
   b. Enabling **Accelerated Networking** is recommended for Decoder hosts with higher line rates (> **800**Mbps).
   c. Specify a valid **Network Security group**.

> **Note:** For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to *Deployment: Network Architecture and Ports* (https://community.netwitness.com/t5/netwitness-platform-online/network-architecture-and-ports/ta-p/668996) for a comprehensive list of the ports you must set up for all NetWitness components.



d. After completing the configurations, click **Next : Management >**.



8. In the **Management** Tab:

   a. Enable Boot diagnostics and OS guest diagnostics.

   b. Configure Identity based on your requirements.

9. Click **Next : Advanced >** to enter **Advanced** settings tab. Make the required changes if any and click **Next : Tags >**.
10. In the **Tags** menu, add **Name**, **Value** pairs if any and click **Review + create**.

Azure validates the VM and displays the status check.

11. Click **Create** to deploy the NW-Concentrator VM in Azure.
12. Configure the host VM in NetWitness 12.4.0.0.
13. Repeat steps 1 through 12 inclusive for the rest of the core NetWitness component services.

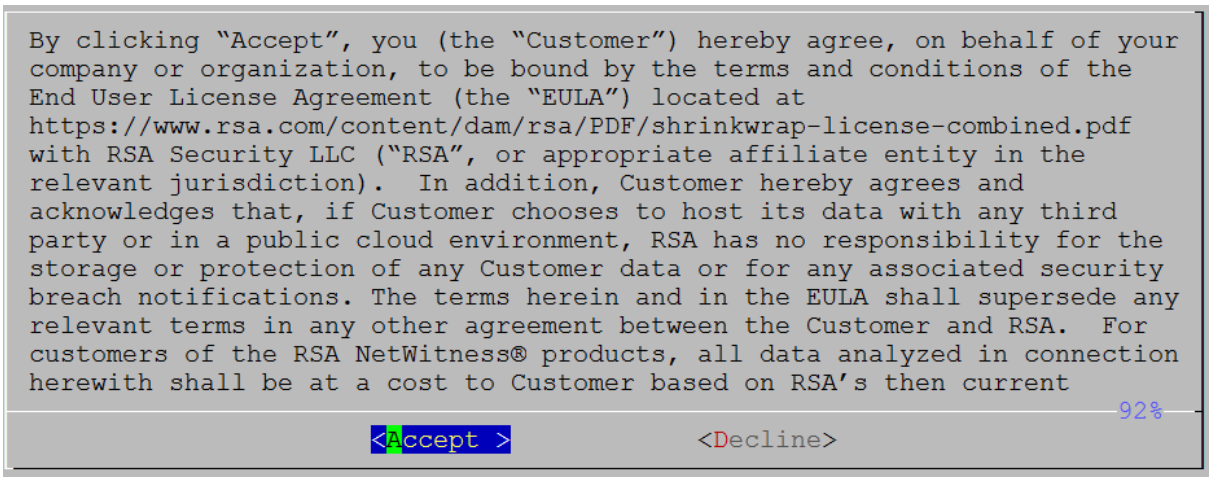
Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.4*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

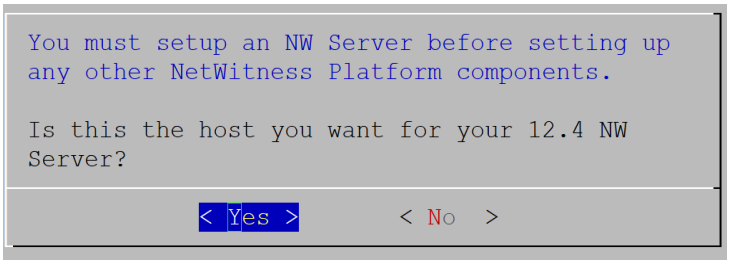
Install 12.4 on the NetWitness Server (NW Server) and Component Hosts

Note: You can perform this task for **INTERNAL-NW-12.4.0.0.20806-Full-Signed** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

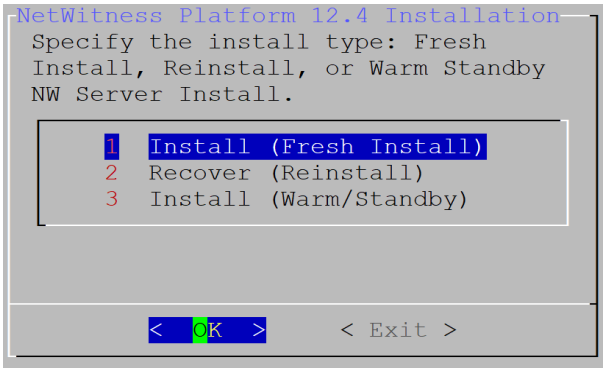
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.4 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.4 on the NW Server.
   Tab to **No** and press **Enter** to install 12.4 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.4 Disaster Recovery.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

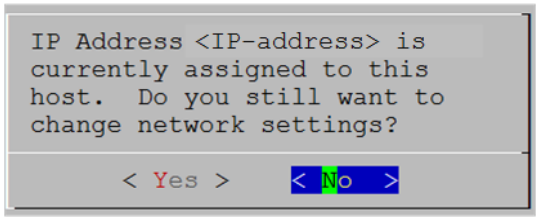
6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

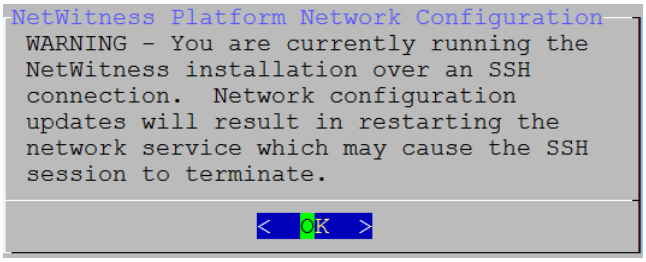
   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

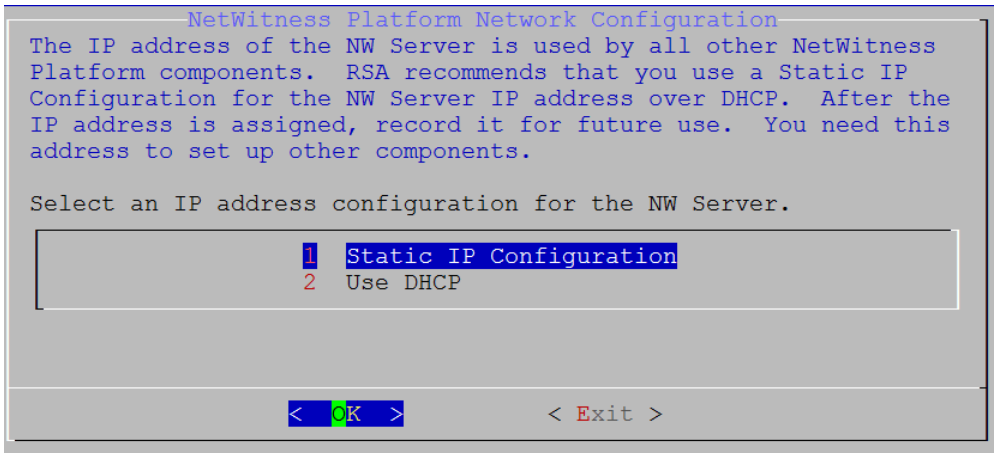
8. One of the following conditional prompts is displayed.



- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

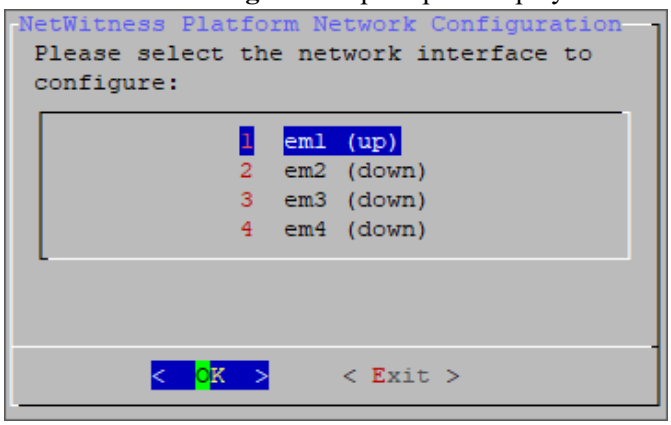
- If you are using an SSH connection, the following warning is displayed.



Note: If you connect directly from the host console, the following warning is not displayed.

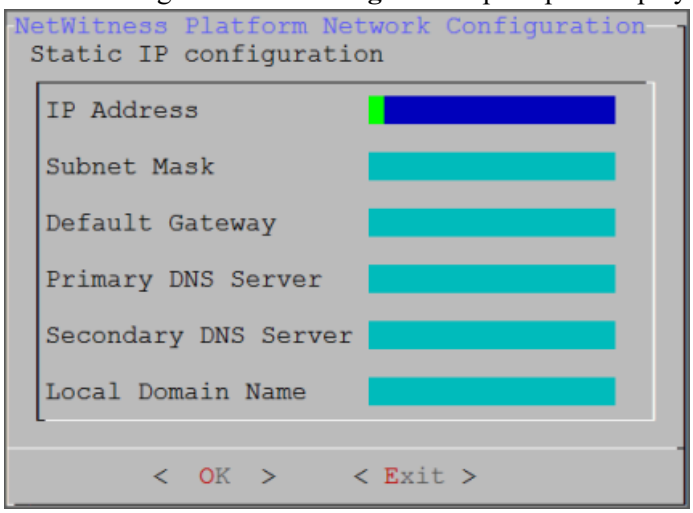
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.



If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.

9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

   The following **Static IP Configuration** prompt is displayed.

10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

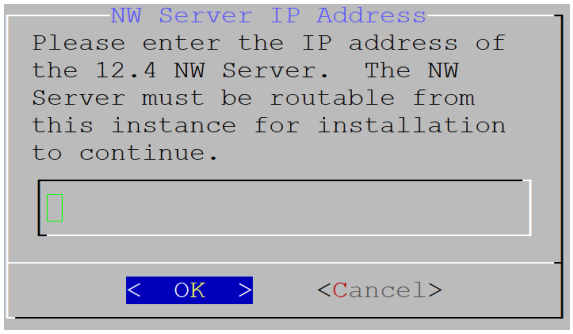
11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

12. The **Update Repository** prompt is displayed.

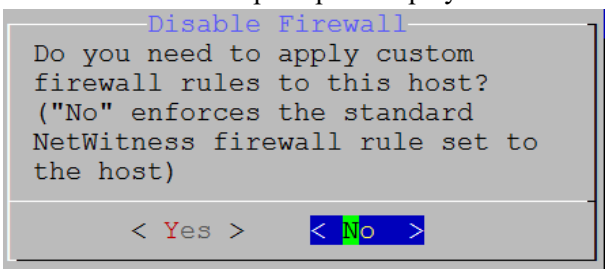
    For the NW Server:

    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.4. If the program cannot find the attached media, you receive the following prompt.



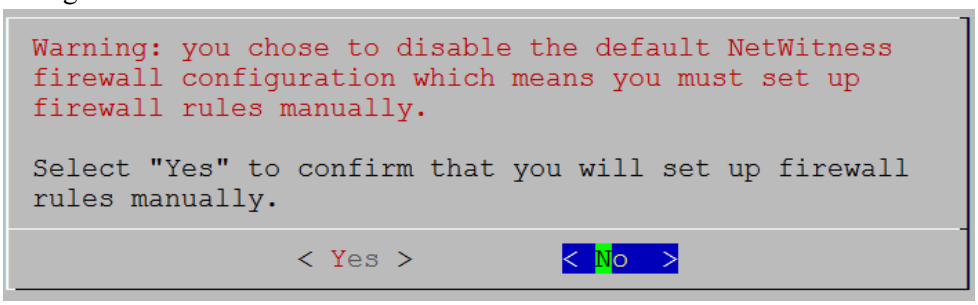
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.



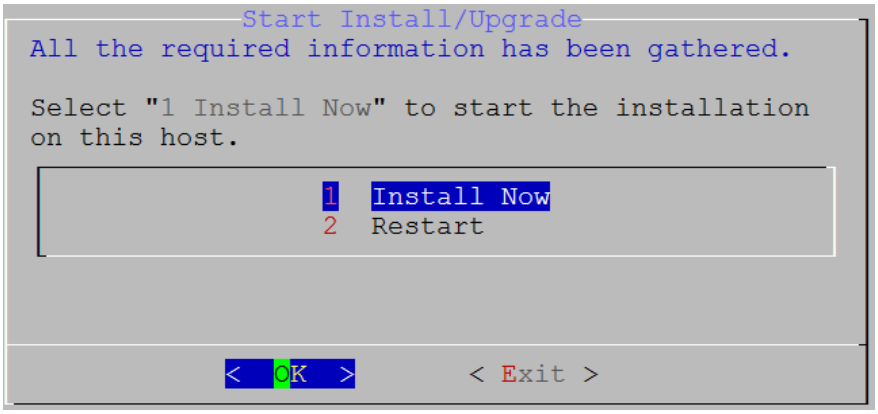
For component hosts:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



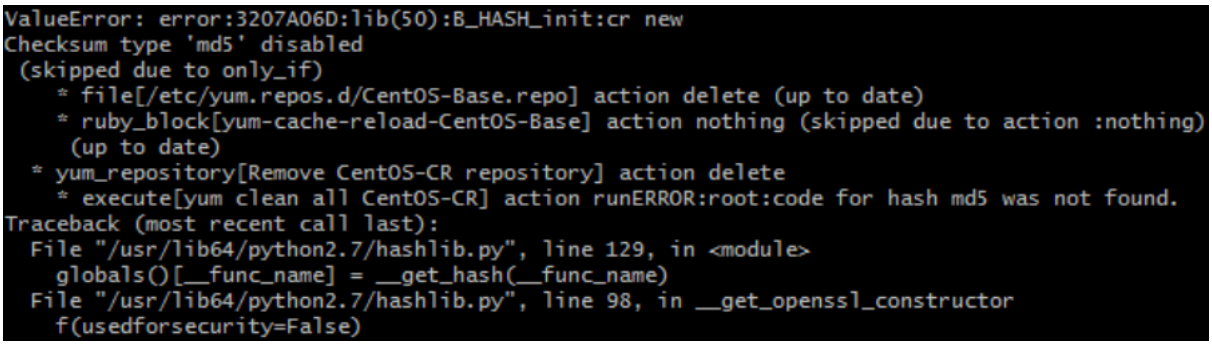
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

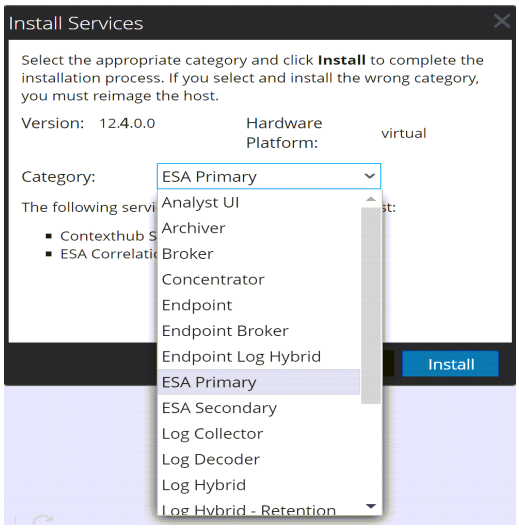
configuration.



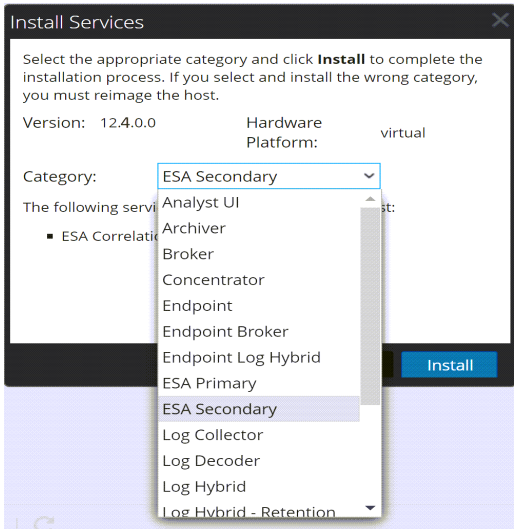
14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.4.
When **Installation complete** is displayed, you have installed 12.4 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.4 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

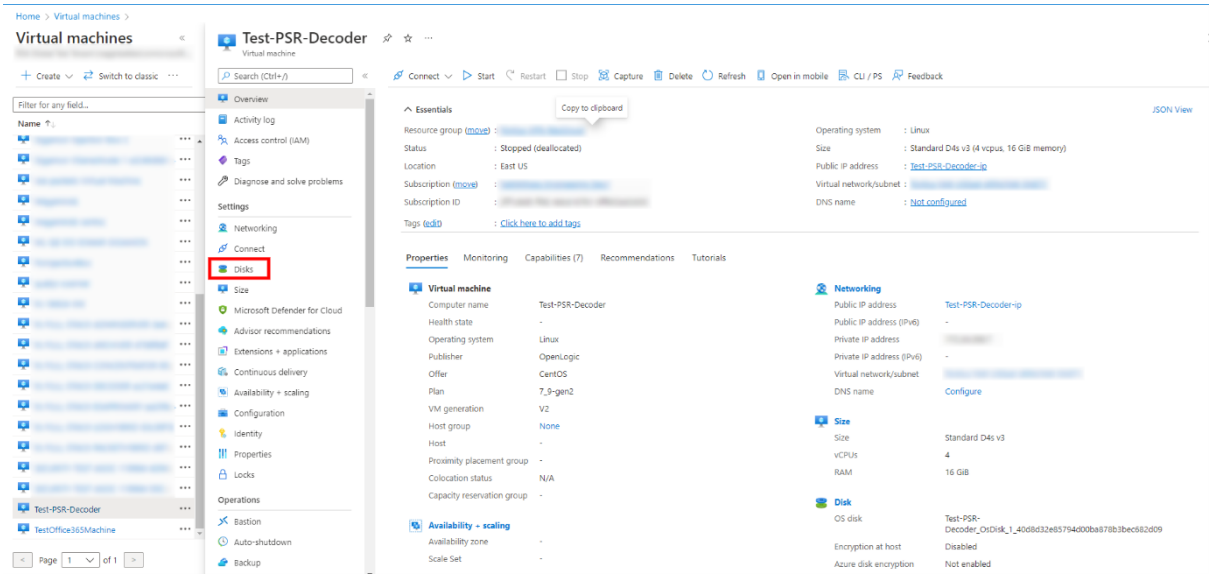
   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

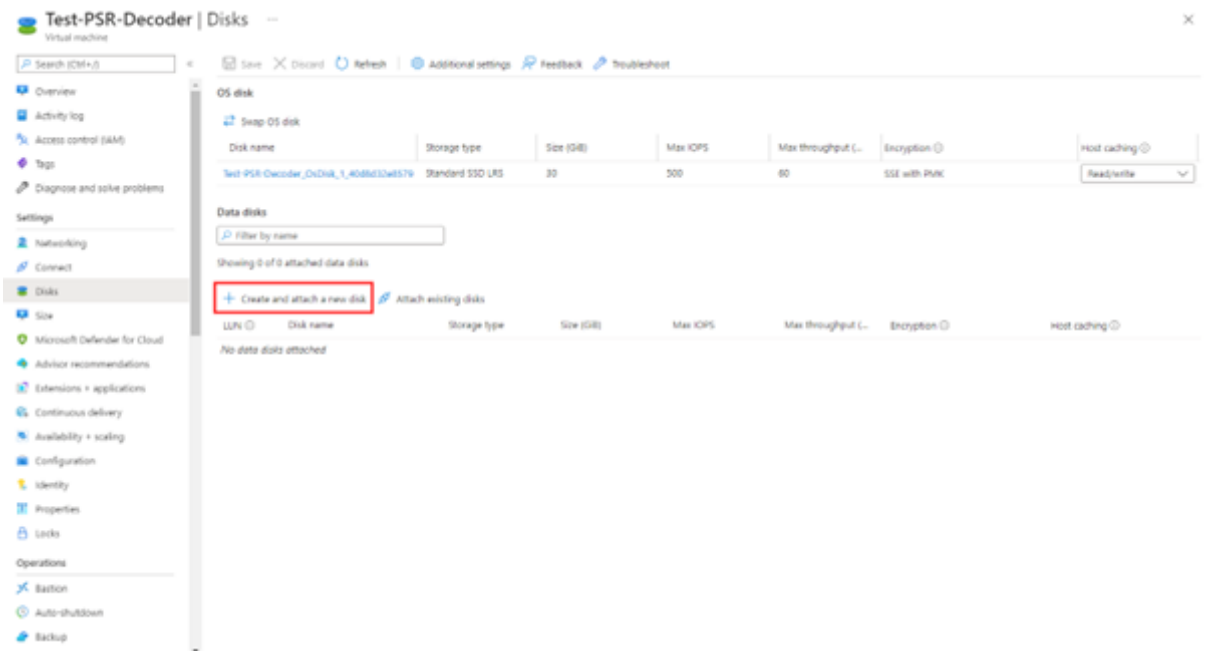
Complete licensing requirements for installed services. See the *NetWitness Platform 12.4 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.4* for instructions on how to set up a Warm Standby NW Server.

NetWitness Azure Storage Allocation Procedure

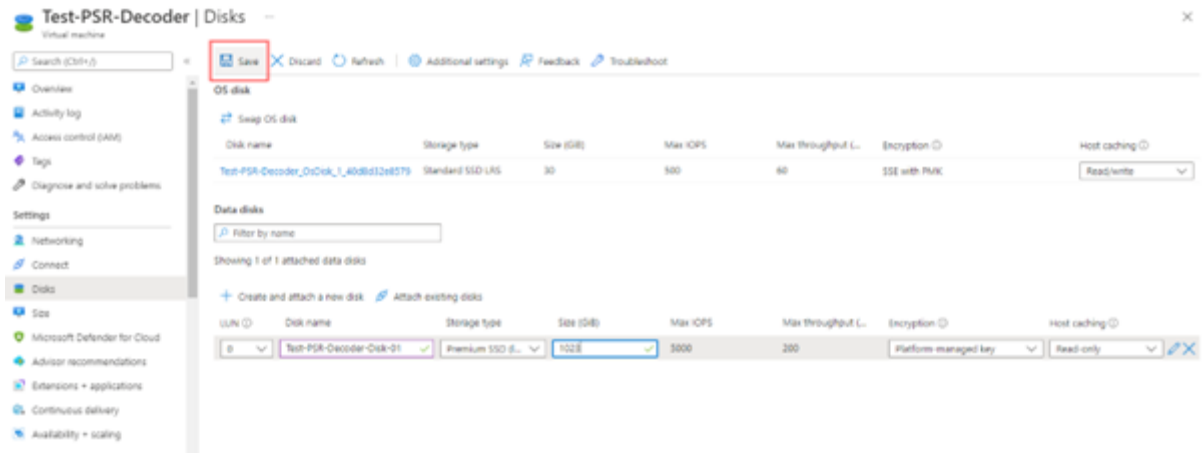


To allocate storage in NetWitness Platform 12.4.0.0, perform the following steps:

1. In Microsoft Azure portal (https://portal.azure.com/), go to **Virtual Machines**.
2. Click the required VM > **Disks**.

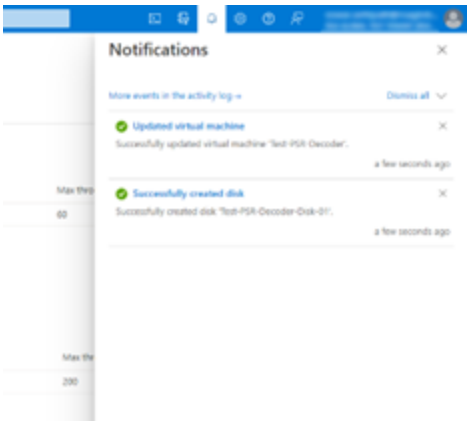
3. Click **Create and attach a new disk**.

> **Note:** You need to add the appropriate amount of disks / IOPS to meet the retention requirements. If you need to add more than a single disk, a RAID configuration is needed.



4. In the Disks view,
   a. Enter the Disk name.
   b. Select the storage type of disk.

Note: Premium SSD with high throughput / IOPS is recommended for Concentrator-IndexDB, Decoder-PacketDB.



c. Select appropriate disk tier and size based on IOPS / Required retention. For more information, refer Azure Managed Disks documentation (https://docs.microsoft.com/en-us/azure/virtual-machines/disks-types).

d. Enable **Read/write** caching.

5. Click **Save** to finish adding the disk.

6. Once the disk is saved, the success notification messages are displayed in the **Notifications** view.

RAID Creation

NetWitness recommends striping the disks to get better performance / IOPS with added disks for deployments that require high IOPS/ throughput (for example: a packet decoder with 1.5Gbps). **Mdadm** Utility is used to create a raid array.

Parameters related to Raid Array Creation

- `--create`: Name of the managed disk you want to create. Usually, the name begins with /dev/md0, /dev/md1, and /dev/md2.
- `--level`: Raid level for creating an array. It can be 0, 1, 5, 6, or 10.
- `--raid-devices`: Total count of the disks to be configured in an array along with device names separated by space.

  For Example: `--raid-devices`=5 /dev/sdc /dev/sdd /dev/sde /dev/sdf /dev/sdg

Steps to create a Raid Array

Follow the steps below after the required disks are added to the Host VM

1. Identify the name of the newly added disks. Run the command `lsblk`.

   For Example: **/dev/sde** and **/dev/sdf**

2. Select the set of disks as part of your RAID-5 configuration.

   For example: Select the disks **/dev/sde**, **/dev/sdf**, **/dev/sdg**, **/dev/sdh** as part of your PacketDB for Decoder.

3. Run the command `mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sde /dev/sdf /dev/sdg /dev/sdh`.

4. Check the status of the disks once the RAID configuration is created. Run the following command

   `mdadm--detail`

5. Run the command `vgcreate -s 32 decodersmall1 /dev/md0` to create a volume group **decodersmall1** which will span across the entire RAID configuration.

6. Run the command `lvcreate -L 4T -n packetdb decodersmall1` to create a logical volume **PacketDB** on **decodersmall1**.

7. Run the command `mkfs.xfs /dev/mapper/decodersmall1-packetdb` to format the newly created logical volume to an xfs partition required by the NetWitness services.

8. Make entries in the `/etc/fstab` configuration file to mount the logical volume (created) and retain the logical volumes even after a system reboot.

9. Run the command `mdadm --detail --scan > /etc/mdadm.conf` to create and store the information about the RAID configurations in the file. On system reboot, the RAID configuration is retained.

10. Run `reconfig api` on the core-service database node to update the database directory settings.

Example Scenario

The below commands describe the steps to configure a RAID-5 for PacketDB with 4 disks.

```
mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sdc /dev/sdd /dev/sde /dev/sdf

vgcreate -s 32 decoder /dev/md0

lvcreate -L 3.9T -n packetdb decoder

mkfs.xfs /dev/mapper/decoder-packetdb
```

```
echo "/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs
noatime,nosuid 1 2" >> /etc/fstab
mount -a
mdadm --detail --scan > /etc/mdadm.conf
```

Note: For more information regarding Azure Disks, see Azure managed disk types, Configure software RAID, Performance tiers for managed disks, and Change the performance of Azure managed disks using the Azure portal.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, Azure assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate one of the following third-party solutions with the Network Decoder to capture packets in the Azure cloud environment.

- Gigamon GigaVUE
- Ixia CloudLens

Integrate Gigamon GigaVUE with the Network Decoder

You can access Gigamon Visibility Platform through the Azure Marketplace on the Azure portal. It is activated by a BYOL license. A thirty-day free trial is also available. For more information on the Gigamon solution, see GigaVUE Cloud Suite for Azure.

For more information regarding GigaVUE Deployment, see https://docs.gigamon.com/doclib515/Content/GV-Cloud-Azure/preface-Azure.html?tocpath=GigaVUE%20Cloud%20Suites%7CAzure%7C_____0.

You will see the traffic incoming on NW Decoder Host once the **Monitoring Session** is deployed within the **Gigamon GigaVUE-FM** with Decoder receiver NIC as tunnel.

Integrate Ixia with the Network Decoder

Keysight Ixia CloudLens SaaS is a Network Visibility platform. For more information on the CloudLens solution, see https://www.keysight.com/in/en/products/network-visibility/cloud-visibility/cloudlens/cloudlens-saas.html.

You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines

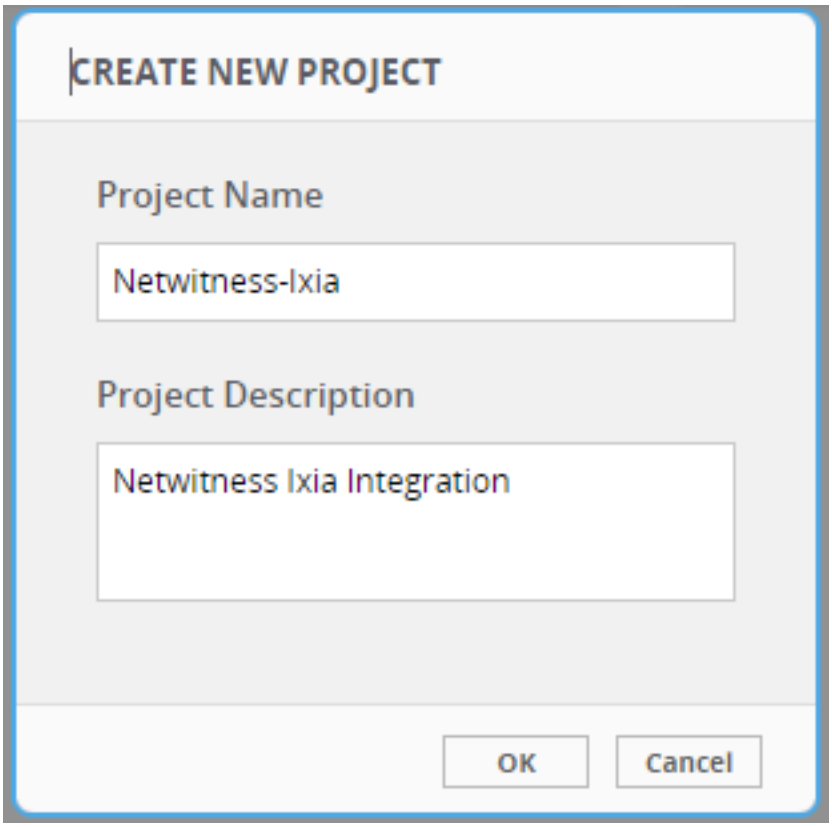
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set the Interface in the Network Decoder

Task 1. Deploy Client Machines

- Deploy client machines from which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (**https:<CloudLensManager_IP>/cloudlens/docs/Default.htm**) for specifications needed for supported client machines.

Note: <CloudLensManager_IP> is the respective CloudLens Manager instance.

Note: Modify the VM's network security group to allow incoming traffic on following ports:
- **TCP: 22 (SSH)**: Connection to the instance / VM.
- **IP Protocol: 47 (GRE)**: Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.
- **UDP Protocol: 19993 (Encrypted Tunnel)** – Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.



For more information, see https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg.

Task 2. Create CloudLens Project

1. Login to **Ixia Cloudlens Manager** and go to the **Configure** Page.
2. Click + (add) to create a new project.
3. In the **CREATE NEW PROJECT** view,
   - Enter the Project Name

     For Example: **Netwitness-Ixia**.
   - Enter the Project Description

     For Example: **Netwitness Ixia Integration**.

4. Click **OK**.
5. Click **SHOW PROJECT KEY** to get the API Key for the project.

   The key is required to configure the **Host and Tool agents**.

Task 3. Install Docker Container on Decoder

1. SSH to Network Decoder.
2. Setup the docker. For more information on how to setup the docker, see https://docs.docker.com/engine/install/centos/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command:

```
sudo docker pull <CloudLens_IP_here>/sensor
```

5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command:

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens -v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m --log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_verify no
```

Task 4. Install Docker Container on Clients

1. SSH to Azure VM with root privileges.
2. Setup the docker for the OS / Distributions. For more information, see https://docs.docker.com/engine/install/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

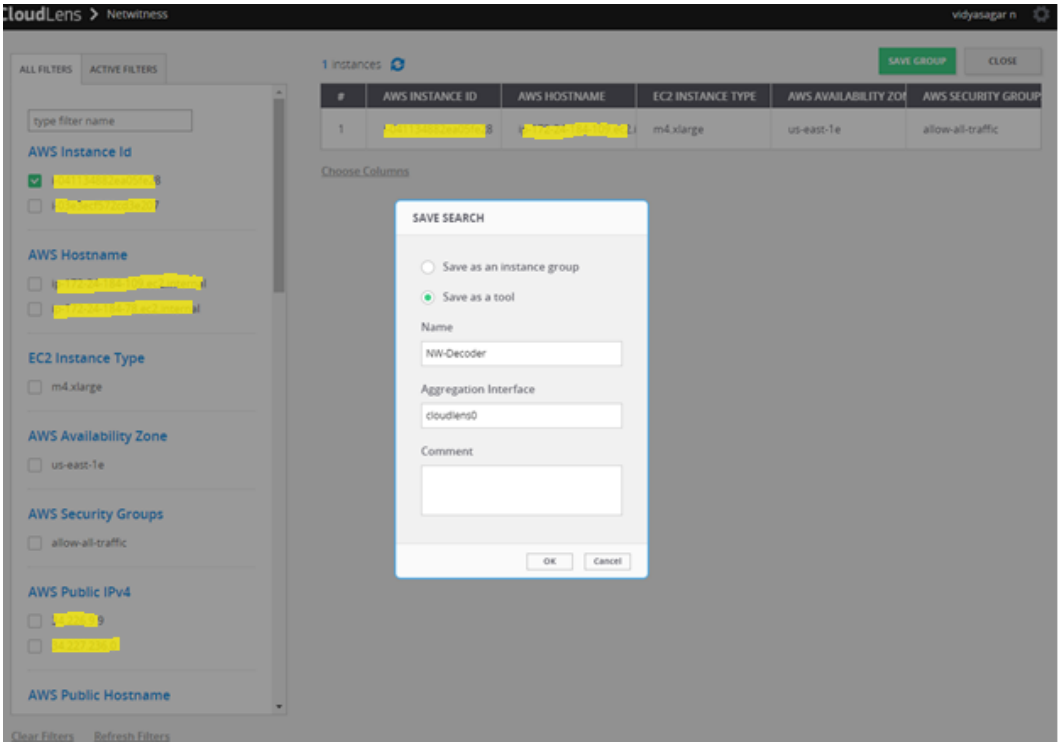
sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command.

```
sudo docker pull <CloudLens_IP_here>/sensor
```

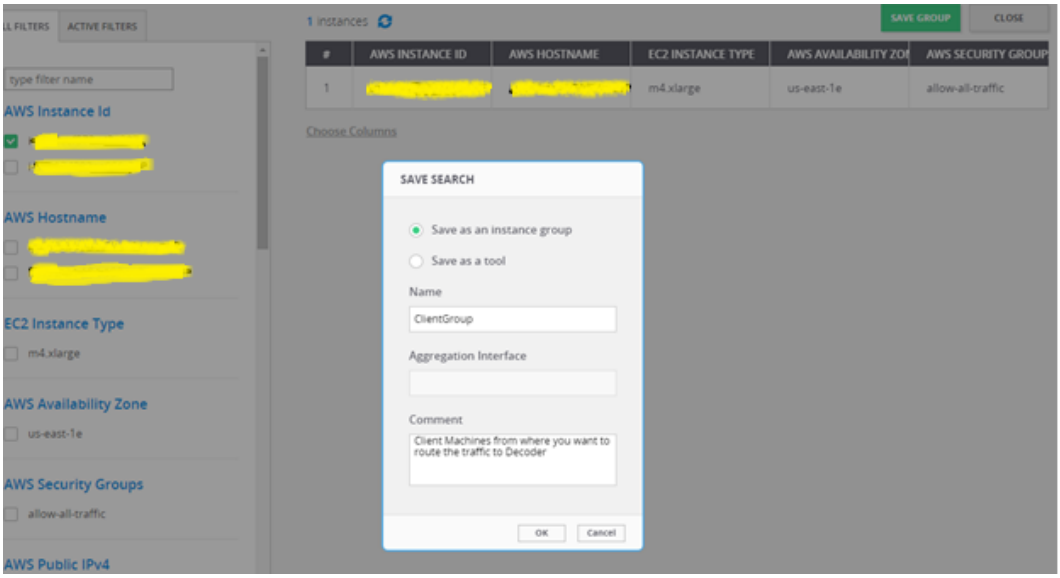
5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command.

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens
-v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_
MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name
cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m -
-log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_
key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_
verify no
```



Task 5. Map Network Decoder to Ixia Clients

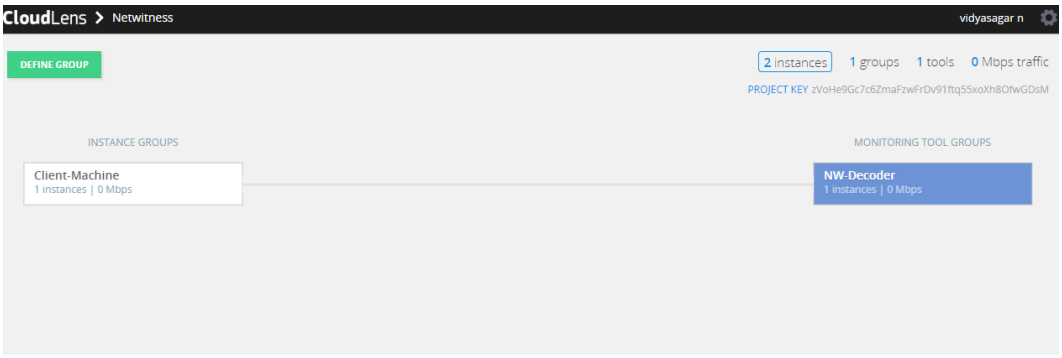
Map the Network Decoder to the client machines to route the traffic to the Network Decoder. Do the following:



1. Go to the **CloudLens Manager** UI.
2. Click on your project and open it.
3. Click **Define Group** or the Instances count.

   You should see two instances listed, one for your decoder and the other for the client machines.
4. Apply filter for the decoder instance and click **Save Search**.
5. Select **Save as a tool**.
6. Specify a name for the tool and the **Aggregation Interface**.

> **Note:** Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

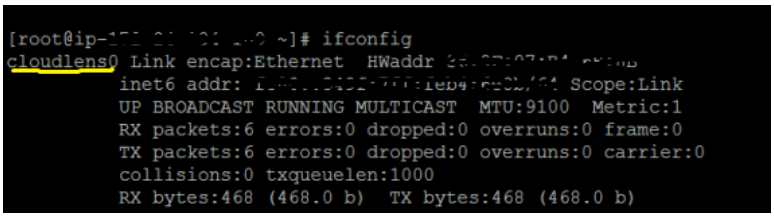


7. Apply filter for the client host instance from the list and click **Save Search**.

8. Navigate back to the top-level view of the project.

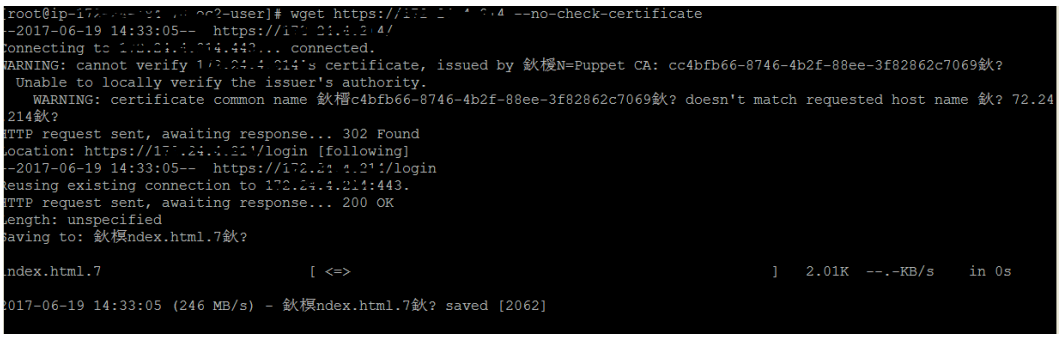
   Your client machine instance and Decoder instance are now displayed.

9. Drag a connection between the client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

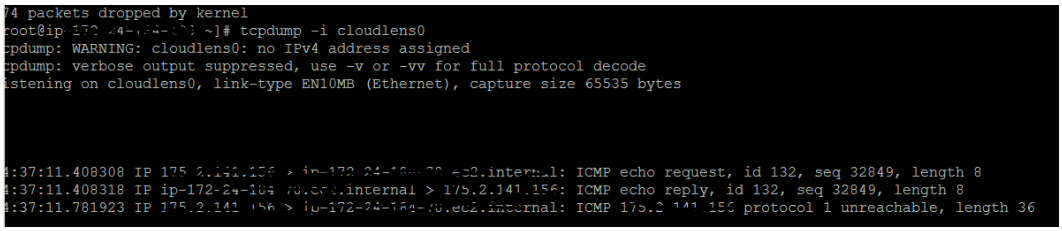
Complete the following steps to validate that the packets are actually arriving at the Network Decoder.



1. SSH to the Network Decoder.
2. Run the following command.

   ```
   ifconfig
   ```

   The new aggregation interface you created is displayed.

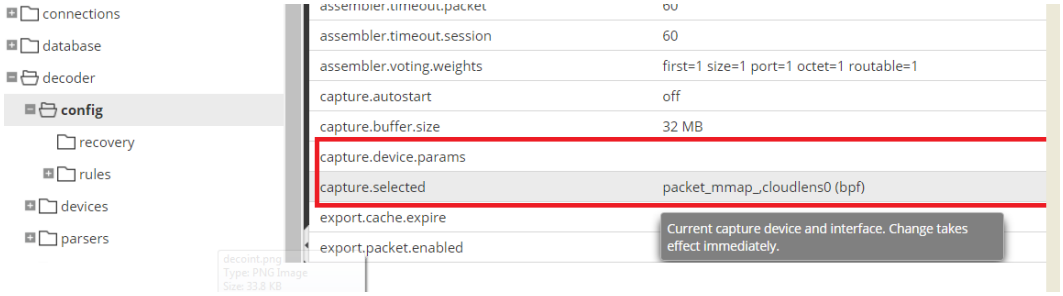


3. Generate traffic from the client OS instance CLI (for example: `wget http://www.google.com/`).

4. SSH to the Network Decoder and go to your Network Decoder instance CLI.
5. Run the following command to look for suitable results in the tcpdump.

   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface for the Ixia integration.

1. SSH to the Network Decoder.
2. Run the following command to restart the decoder service:

   `$ sudo restart nwdecoder`

   The Network Decoder is now set to capture the network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.

6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. Restart the Decoder service after you set the **capture.selected** parameter.

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Getting Started **4**

About NetWitness SASE 4

Prerequisites 5

Deploy Broadcom ETM Integration using CCM **6**

Task 1. Map Network Adapter in Decoder for Broadcom ETM Integration 6

Task 2. Create and Publish Policy for Broadcom ETM Integration 8

Task 3. Configure Broadcom ETM Integration from Policy Details View 12

Task 4. Verify Broadcom ETM Events Received at Decoder 15

Task 5. Verify Events Meta from Broadcom ETM in Investigate View 16

Getting Started

NetWitness SASE, combined with Broadcom (Private Preview Mode), provides unprecedented visibility into behavior and communication among devices and services in remote and distributed networks across on-premises, hybrid, and cloud deployments.

What NetWitness SASE does:

- **Streamline searches and investigations**: Log into a single user interface to perform index searches, pivot through metadata, and reconstruct network sessions to receive results quickly.
- **Leverage retained data**: Empower analysts to perform forensic examinations on a triggered detection and threat hunt for unknown threats against retained raw network communications.
- **Correlate disparate data sets**: Enrich the context of investigations by correlating data from the actual network traffic of remote users with other access by those same users for a complete end-to-end story of what transpired.
- **Minimize costs**: Optimize storage and reduce operating costs using new compression algorithms, selective retention, and the ability to split network decoder components to limit what must run in the cloud.

Note: In 12.4 release, NetWitness SASE integration with Symantec by Broadcom is in Private Preview Mode.

About NetWitness SASE

NetWitness supports SASE and critical hybrid use cases across on-premises and in the cloud by partnering with Broadcom on technical integrations. NetWitness SASE Integrations give organizations complete visibility into encrypted traffic, remote users, and cloud workloads. With NetWitness SASE integrations, customers can achieve SASE flexibility, inherent security advantages, and complete visibility into threat detection and response.

NetWitness SASE provides the following capabilities:

- **Flexible**, **secure**, **real-time traffic monitoring:** NetWitness SASE integrations capture all network traffic from remote users in near real-time, enabling immediate response to any potential threats. Regardless of the location of the data collected, the data is available in the detection engine, and analysts can easily find the anomalies. The customization opens available in NetWitness SASE reduce the risk of storing sensitive, personally identifiable information.
- **Get scalable**, **high-performance cloud security**: With NetWitness SASE integrations, enhance total visibility and threat detection capabilities across your enterprise using well-known on-premises mechanisms such as rules, parsers, feeds, and machine learning. Perform searches and investigations and swiftly receive results with a single user interface. The integration supports forensic examinations on triggered detections and facilitates threat hunting against retained network communications, empowering analysts to combat unknown threats effectively.

- **Eliminate blind spots**: NetWitness SASE integrations empower organizations to retain complete visibility into their cloud security stack, cost-effectively eliminating blind spots in their cloud traffic and maximizing the effectiveness of their security infrastructure investments. Organizations have the visibility and control they need over encrypted traffic to ensure compliance with their privacy, regulatory, and acceptable use policies, whether on-premises or in the cloud.
- **Unparalleled network visibility to strengthen SASE security:** The improved visibility provided by the integration allows organizations to close gaps in their zero trust security posture and enable better detection capabilities.

Prerequisites

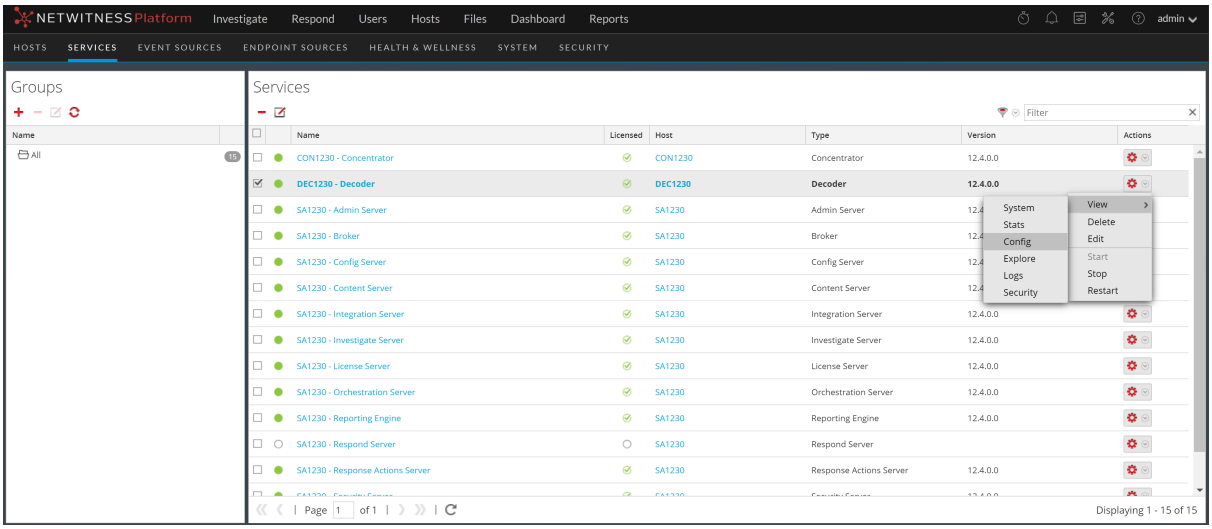
Before proceeding, it is important to make sure the following:

- The NetWitness Platform (Admin Server and Packet Decoder Host) is on version 12.4 or later.
- You are connected to Live Services under the  **(Admin)** > **System** > **Live Services** page.
- The Decoder services are managed by Centralized Content Management (CCM). If CCM does not manage it, you can enable CCM for the particular decoder service. For more information, see the topic Enable or Disable CCM for Individual Decoder Services.
- You must have the Request URL and Auth Token from Broadcom for configuration.

Deploy Broadcom ETM Integration using CCM

This topic describes how to deploy the Broadcom ETM Integration for users using the Policy based CCM.

You must perform the following tasks to deploy the Broadcom ETM Integration on NetWitness Platform.



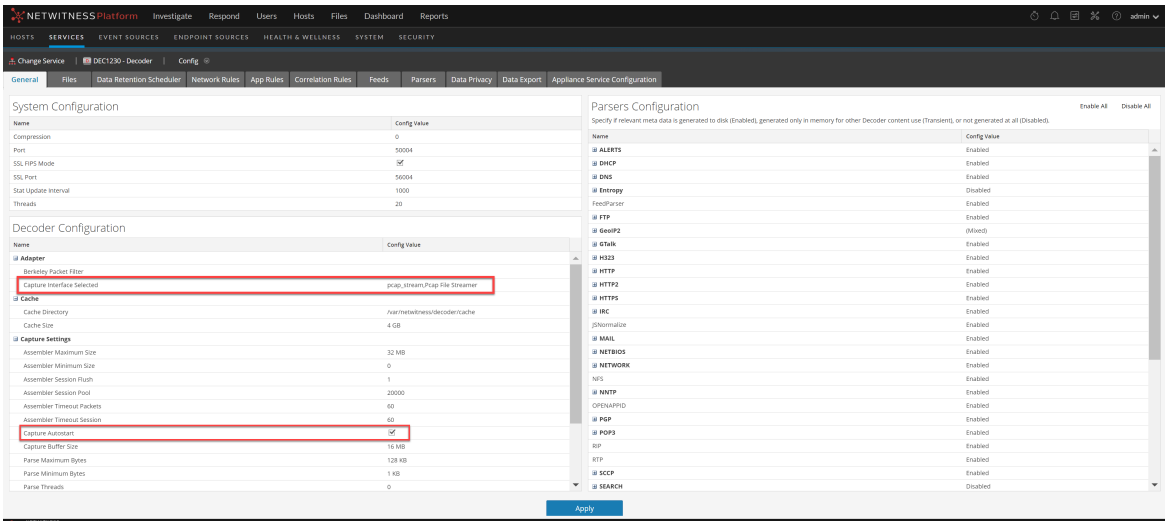
- Task 1. Map Network Adapter in Decoder for Broadcom ETM Integration
- Task 2. Create and Publish Policy for Broadcom ETM Integration
- Task 3. Configure Broadcom ETM Integration from Policy Details View
- Task 4. Verify Broadcom ETM Events Received at Decoder
- Task 5. Verify Events Meta from Broadcom ETM in Investigate View

Task 1. Map Network Adapter in Decoder for Broadcom ETM Integration

You must select a network adapter **(pcap_stream,Pcap File Streamer)** and enable **Capture Autostart** option through which the Decoder captures packets and processes the data.

To Map the Network Adapter in Decoder for Broadcom ETM Integration

1. Log in to the NetWitness Platform.
2. Go to **(Admin)** > **Services**.
3. Select the **Packet Decoder** service and click  > **View** > **Config**.

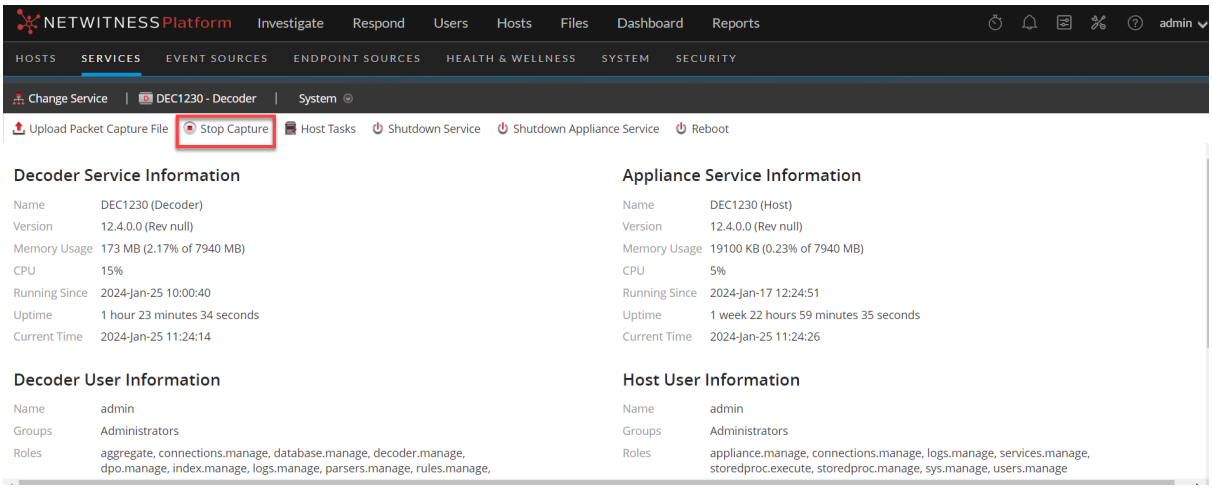


The Configure view for the Decoder service is displayed with the **General** tab open.

4. Under the **Decoder Configuration** section, do the following:

   a. Set the **Capture Interface Selected** to **pcap_stream,Pcap File Streamer** network adapter.

   b. Enable the **Capture Autostart** option.



5. Click **Apply** to save the changes.

6. To restart the Decoder service, go to the **Services** view, select the Decoder service, and click  > **Restart**.

7. A Confirmation dialog request is displayed. To restart the service, click **Yes**.

8. (Optional) Navigate to the System view of the Decoder service and check if the Decoder is capturing the data.

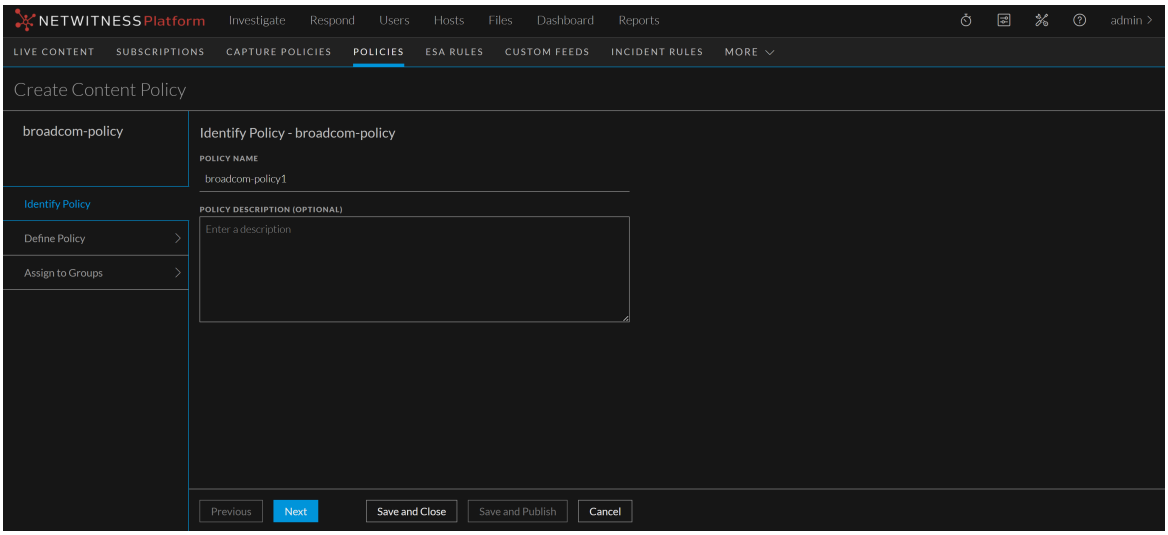
   This option ensures the decoder has already started capturing the packets.

Task 2. Create and Publish Policy for Broadcom ETM Integration

You must create a policy with Broadcom ETM Integration plugin type and assign it to one or more groups having a decoder service and publish the policy.

Prerequisites

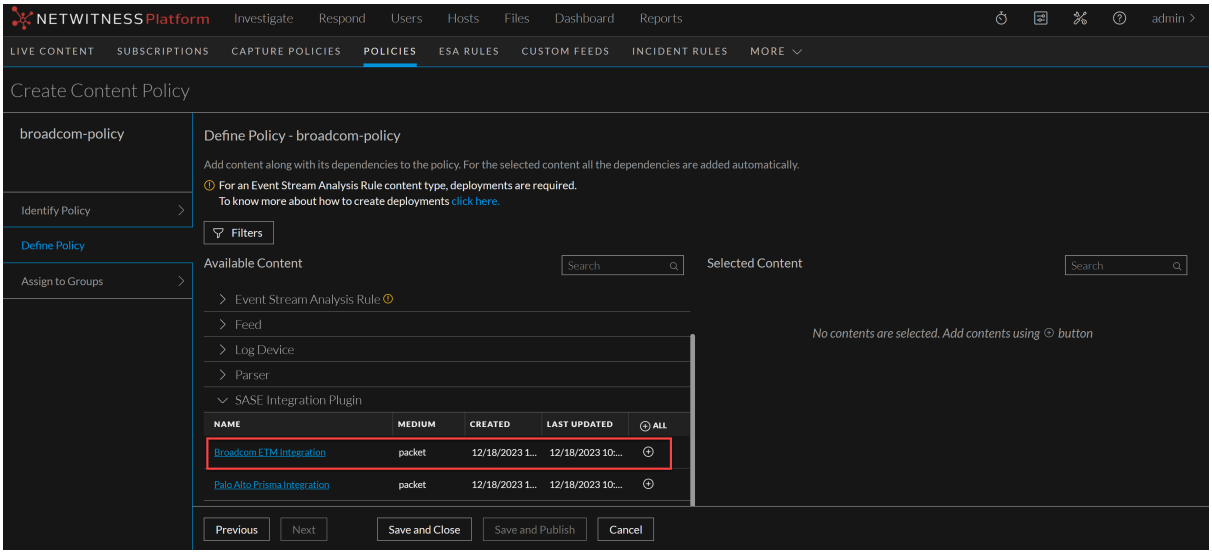
- Ensure that the **Broadcom ETM Integration** plugin is available at the SASE Integration Plugin tab.
- Ensure that the group with one or more decoder services is created.



Supported Hosts

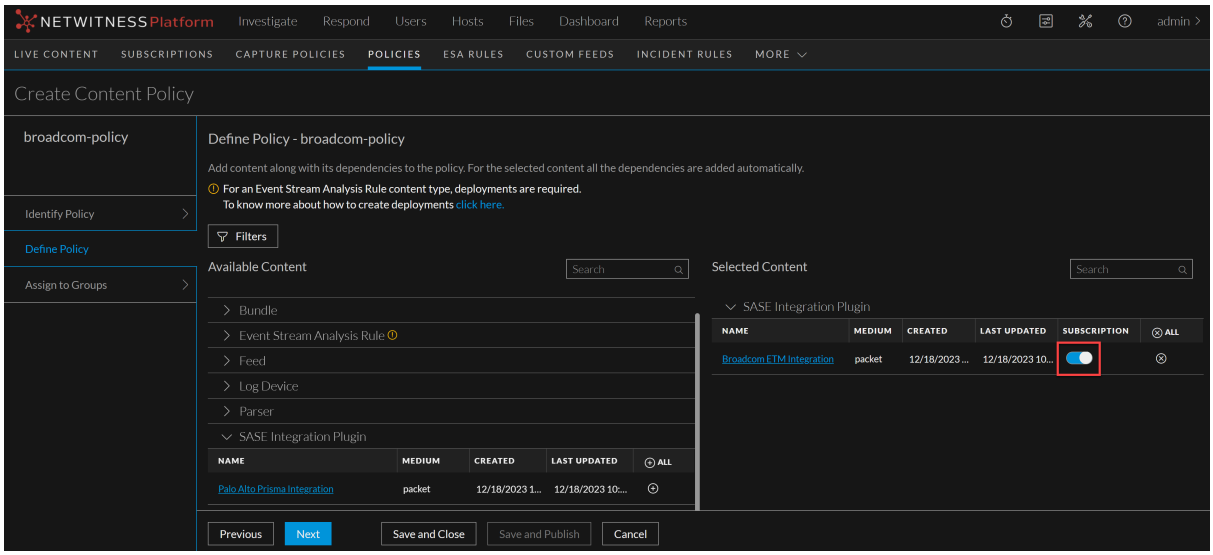
- Packet Decoder
- Packet Hybrid

To create and publish policy for Broadcom ETM Integration



1. Go to (Configure) > **Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**.

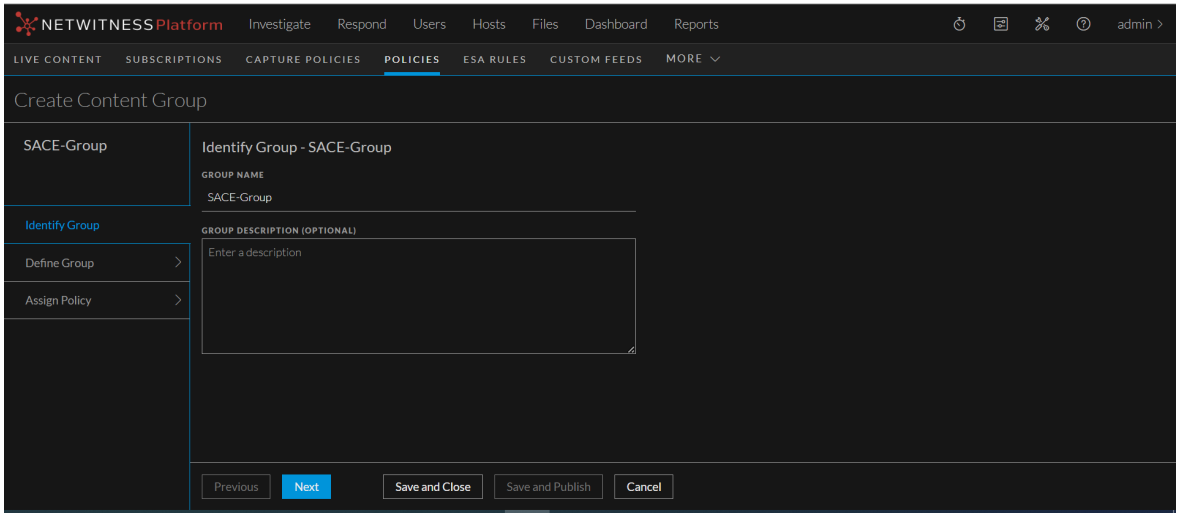
   The available policies are displayed.
4. Click + **Create New** to add a new policy.
5. In the **New Policy** panel, do the following:
   a. Enter a unique policy name.
   b. (Optional) Enter a description for the policy.



6. Click **Next**.

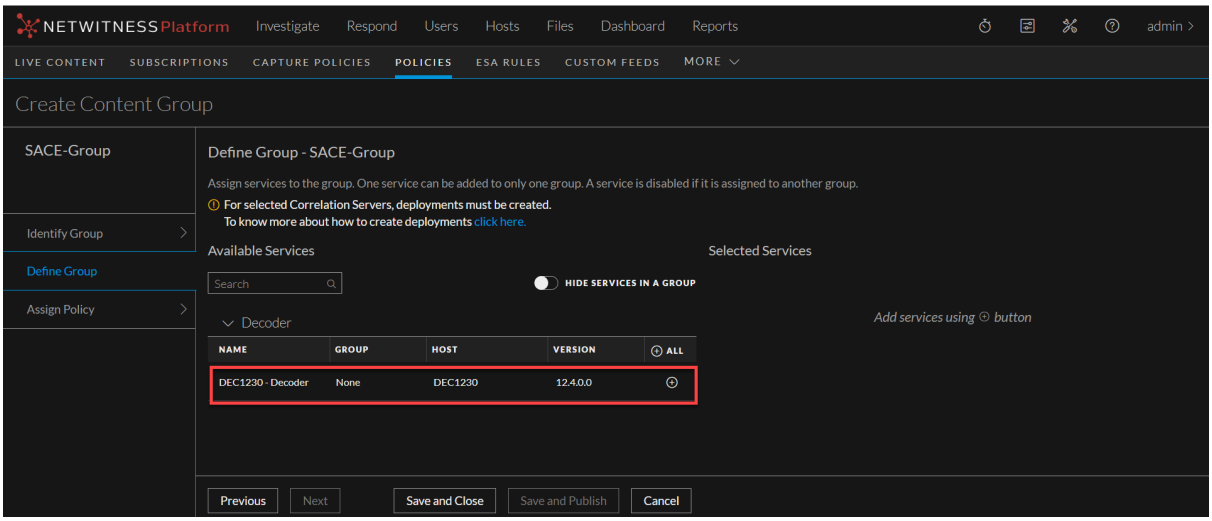
7. In the **Available Content**, select the plugin and click + to add the **Broadcom ETM Integration** plugin to the policy. To add all content based on the resource type, click ⊕ ALL.

8. Enable the subscription (if required) by clicking the subscribed toggle. Once the content is subscribed to, the updates are pushed automatically.



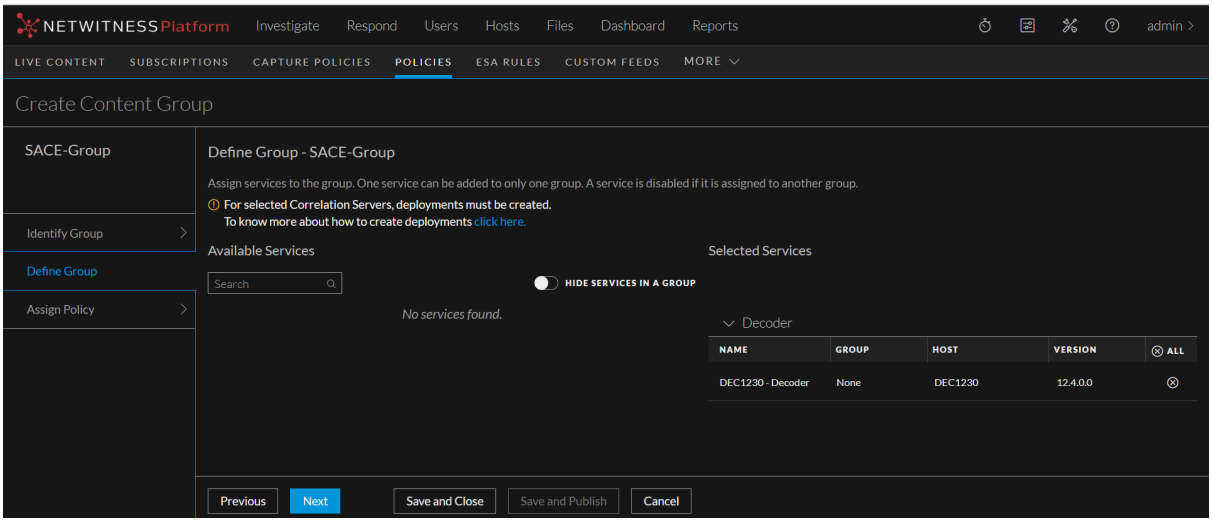
9. Click **Next**.

10. If there are no unassigned groups available, click 



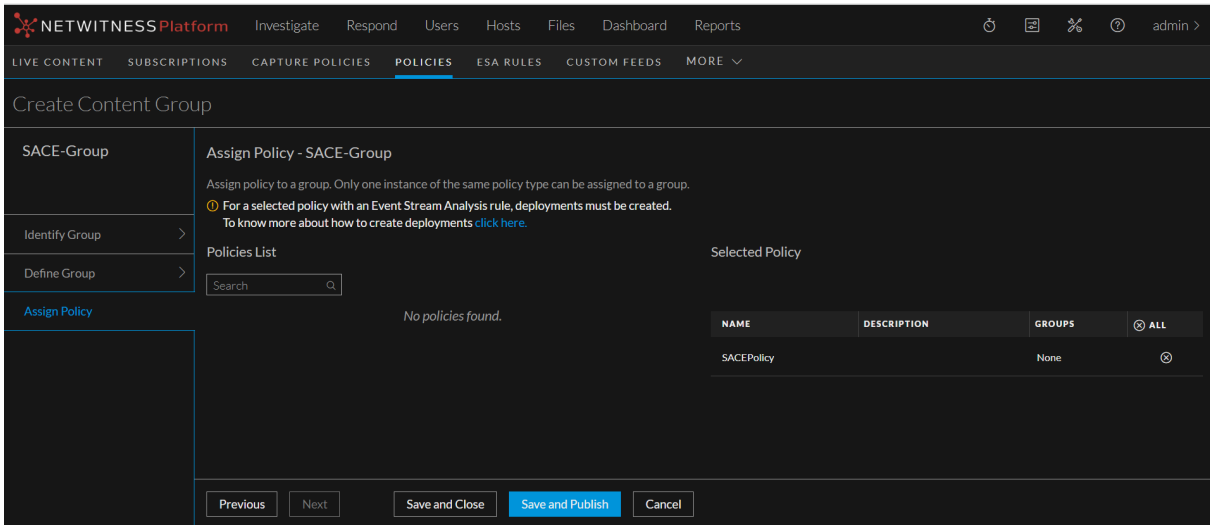
to save the policy and redirect you to the **Create New Group** screen.

11. In the New Group panel, do the following:
    - Enter the name of the group.
    - (Optional) Enter the description for the group.

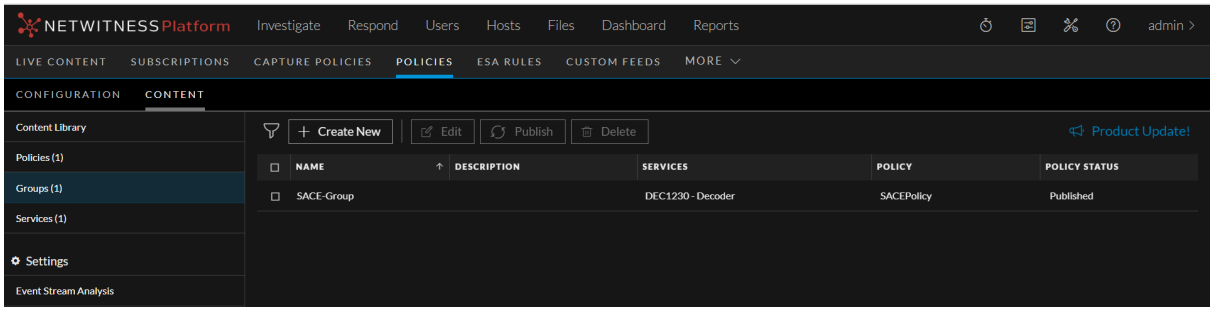


12. Click **Next**.

13. In the **Define Group**, click + to assign services to the group.



Note:
- A service is disabled if it is assigned to another group.
- A service is disabled if it is not managed by Policy-based Centralized Content Management.



14. Click **Next**.

15. In the Assign Policies, click + to assign policies to a group. You can assign only one policy to any particular group.

16. Click **Save and Publish** to save and publish the settings.

IMPORTANT: Ensure that you always publish the policy after adding the **Broadcom ETM Integration** plugin to deploy the plugin to the Decoder service.

Note: You can also publish a policy from the **Policy Details** screen. For more information on publishing a policy from the **Policy Details** screen, refer to the View a Policy topic.

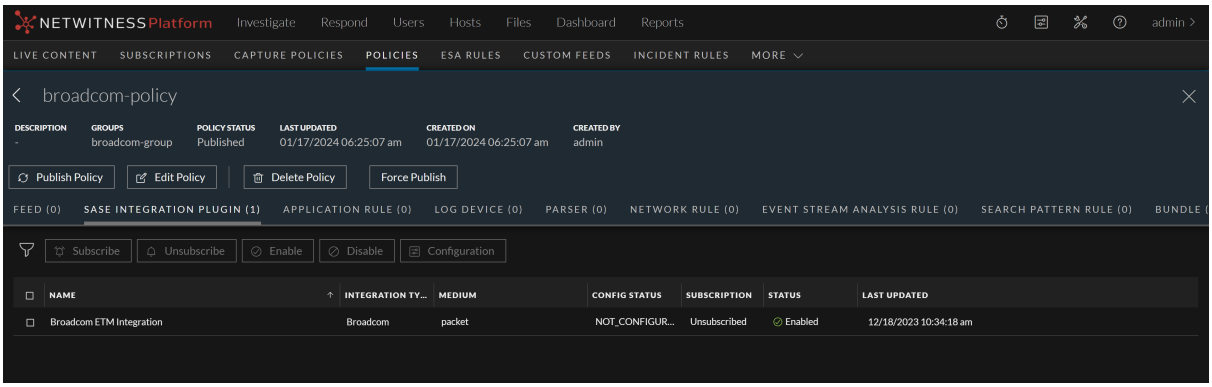
For more information on Policies, see Manage Policies.

For more information on Groups, see Manage Groups.

Next steps, go to the policy details view and perform the Broadcom ETM Integration settings. For more information, see Task 3. Configure Broadcom ETM Integration from Policy Details View

Task 3. Configure Broadcom ETM Integration from Policy Details View

Administrators can configure the Broadcom ETM Integration type to capture the network data from the decoder service within a policy, which sends the data to NetWitness. The data is then processed by NetWitness so that it can provide a comprehensive view of network traffic and malicious activity. Analysts can use this data to monitor network traffic, identify threats, and investigate any malicious behavior.

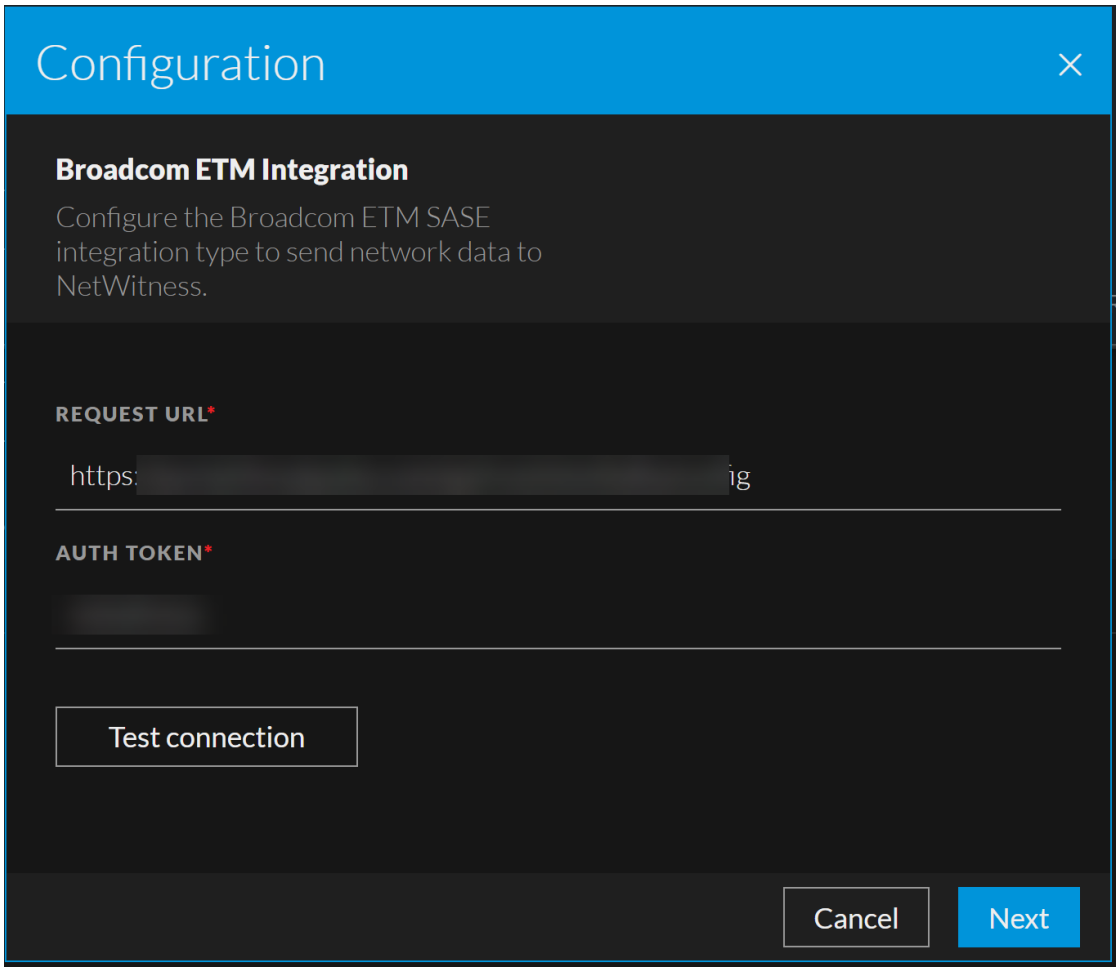


Prerequisites

Before you begin configuring the Broadcom ETM Integration, ensure that you have the following details:

- Ensure there is a policy created with the Broadcom ETM Integration plugin type, and the policy is associated with the group that has a Decoder service configured, and the policy is published.
- You must have the Request URL and Auth Token from Broadcom for configuration.

To Configure Broadcom ETM Integration

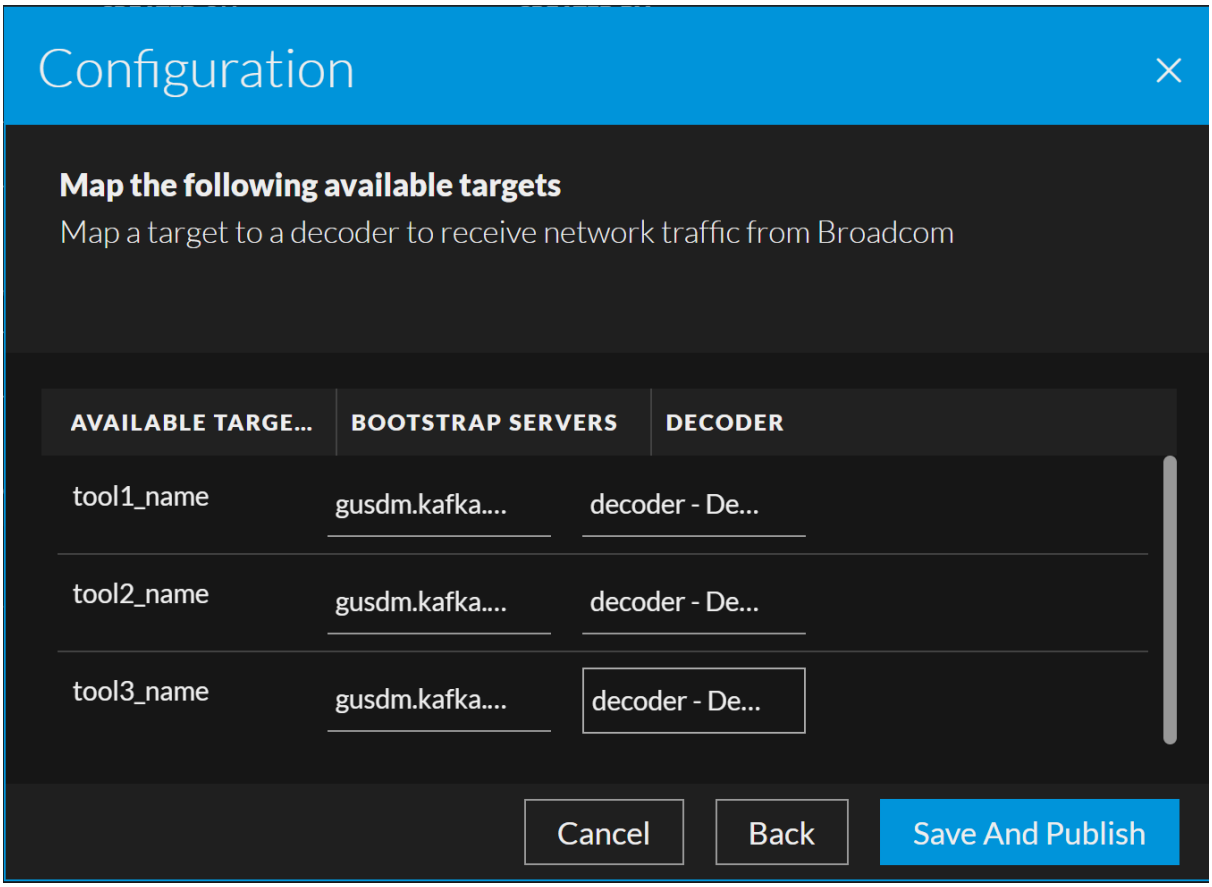


1. Go to **(Configure)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Do one of the following:
   a. Click the policy name containing the Broadcom ETM plugin type to view the policy details.
   b. Click a row to view details about the selected policy and click **View Details**.
5. Click the **SASE Integration Plugin** tab.

IMPORTANT: The **Configuration** button will be disabled when the policy status is **Unpublished**, **Failed**, or **N/A**. For more information, see Filter Policies.

6. Select the **Broadcom ETM Integration** type and click **Configuration**.

   The Configuration dialog is displayed.



7. Enter the request URL in the **Request URL** field.
8. Enter the auth token in the **Auth Token** field.

   Note:
   • Broadcom provides you with a unique request URL and Auth token for your account.
   • It is important to keep your auth (bearer) token and request url secure. Do not share it with other users or applications

9. Click **Test Connection** to determine if NetWitness connects to the Broadcom service and ensure the connection is successful.
10. Click **Next** to continue.

    The screen to configure the targets is displayed.

11. To configure the available targets, do the following:
    - Select the available bootstrap servers from the drop-down list.
    - Select a decoder service from the drop-down list to map it to the target.

    The Bootstrap server in a Kafka cluster consists of a Kafka host and a Kafka port. The decoder connects to the target (topic) using this Kafka host and Kafka port and fetches the data from the Kafka topic.

    Note:
    • A target (Kafka topic or tool name) can only have one decoder configured.
    • You can assign the target to an undefined value if no decoders are available.

12. (Optional) To return to the previous screen, click **Back**.
13. Review the target configuration details and click **Save And Publish**.

    To verify if the configuration was completed successfully, ensure that the **Config Status** column displays **Configured** for the Broadcom ETM Integration.

Task 4. Verify Broadcom ETM Events Received at Decoder

You can analyze the Broadcom ETM events that have been received by the Decoder and verify their accuracy.

To verify the Broadcom ETM Events Received at Decoder

1. Log in to the NetWitness Platform.
2. Go to **(Admin)** > **Services**.
3. Select the **Packet Decoder** service and click > **View** > **Stats**.
4. Under the **Key Stats** section, check the values for **Capture Rate**, **Max Capture Rate**, and **Total Captured packets** for the decoder service.

Task 5. Verify Events Meta from Broadcom ETM in Investigate View

To verify Broadcom ETM events, you must first aggregate the Decoder service into the Concentrator and then go to the **Investigate** > **Events** page to view the Broadcom ETM events.

- Add the Decoder Service in the Concentrator
- Verify from the Investigate > Events View

Add the Decoder Service in the Concentrator

1. Log in to the NetWitness Platform.
2. Go to **(Admin)** > **Services**.
3. In the **Services** list, select the **Concentrator** service.
4. Click > **View** > **Config**.

   The Services Config View of the Concentrator is displayed.
5. Select the **Sources** tab.
6. Click and select Available Services.

   The Available Services dialog is displayed.

7. Select the **Decoder** service and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

8. Enter the Username and Password for the service.
9. Click **OK**.
10. Click **Apply**.

Verify from the Investigate > Events View

1. Go to **Investigate** > **Events**.
2. Select the **Concentrator** Service from the **Services** selection drop-down list.
3. Click  to load the Broadcom ETM events in the Events table.

Broker and Concentrator Basics

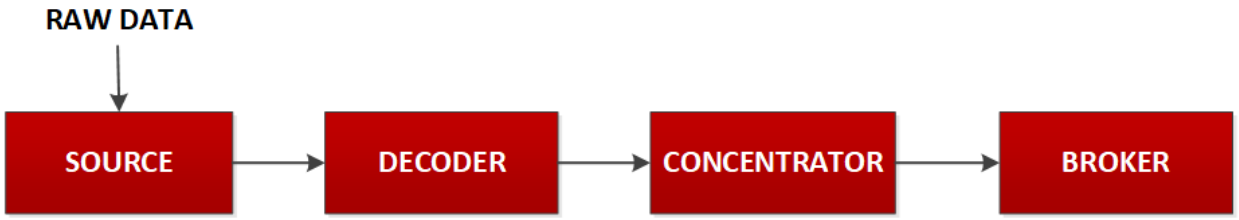
Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness user interface. Most of the configuration is performed in the Administration Services view (**(Admin) > Services**).

You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (**(Admin) > Services**).



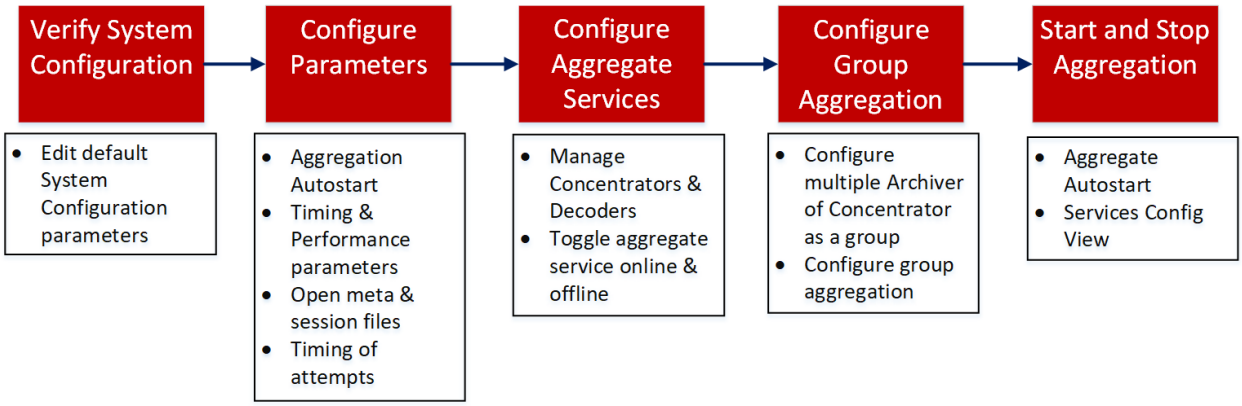
Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

Note: Go to the Master Table of Contents in NetWitness community portal to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

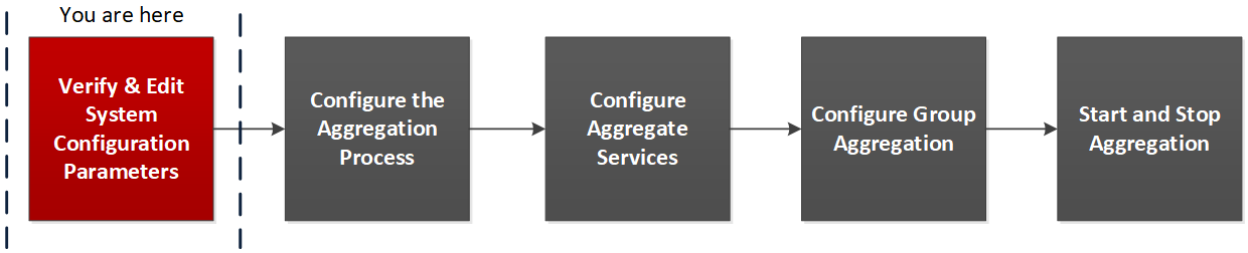


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



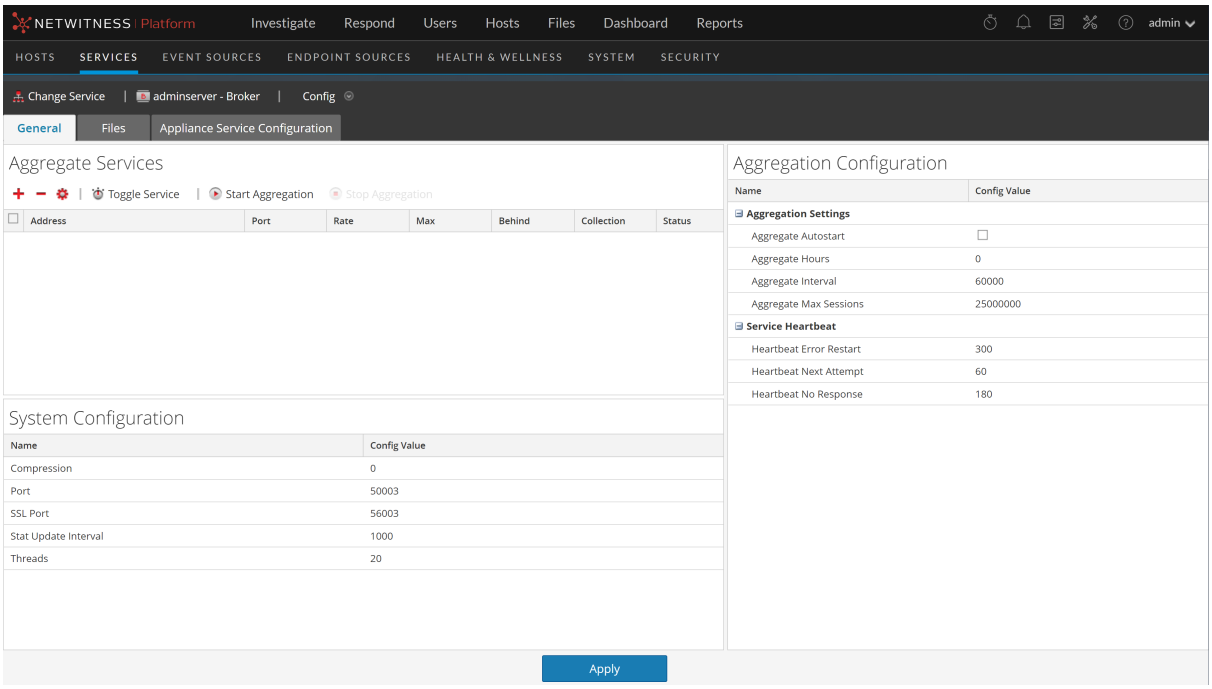
Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

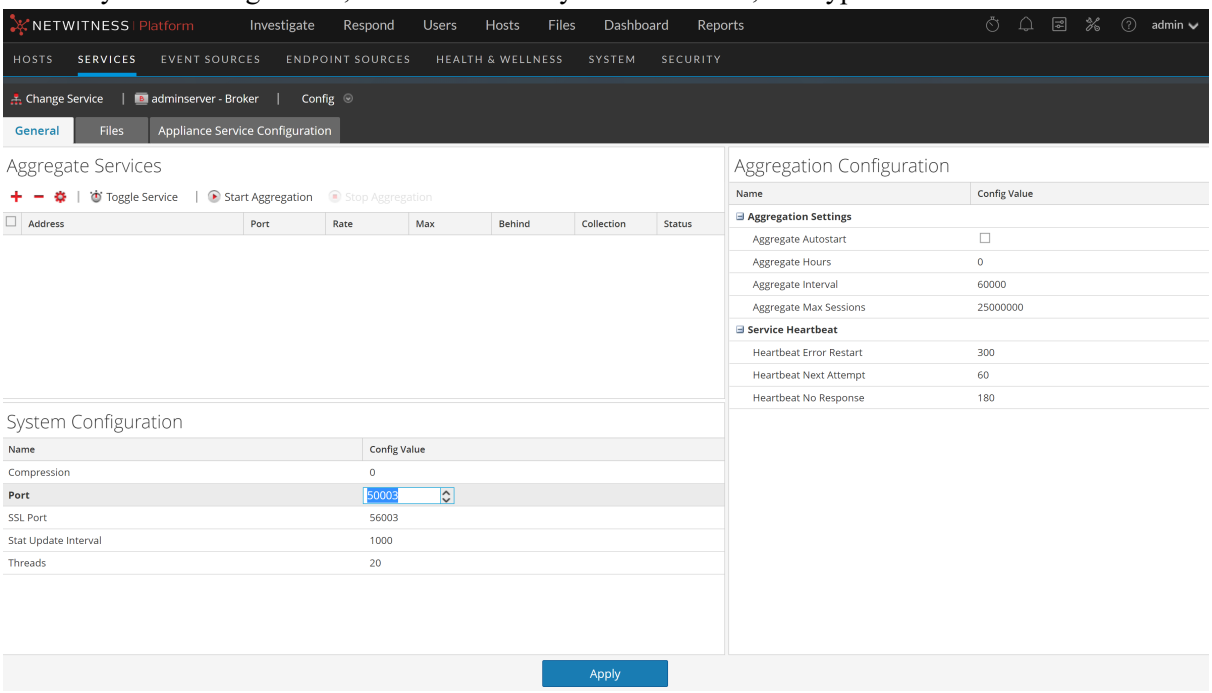
Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. You can edit these values to tune performance.



In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

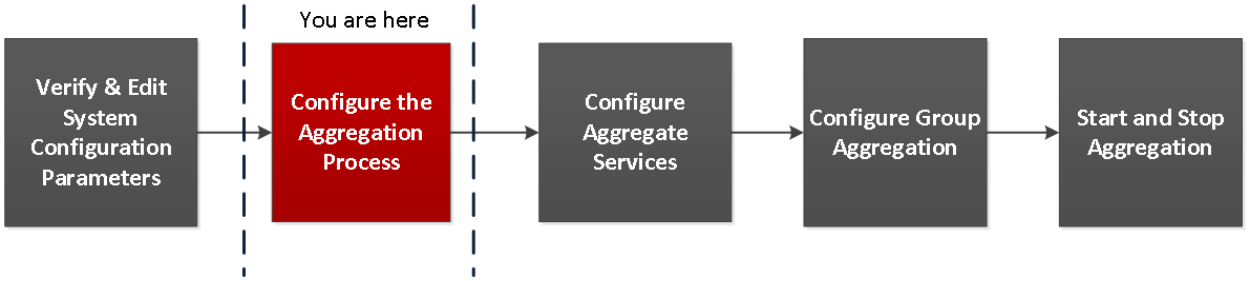


To edit system configuration parameters for a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

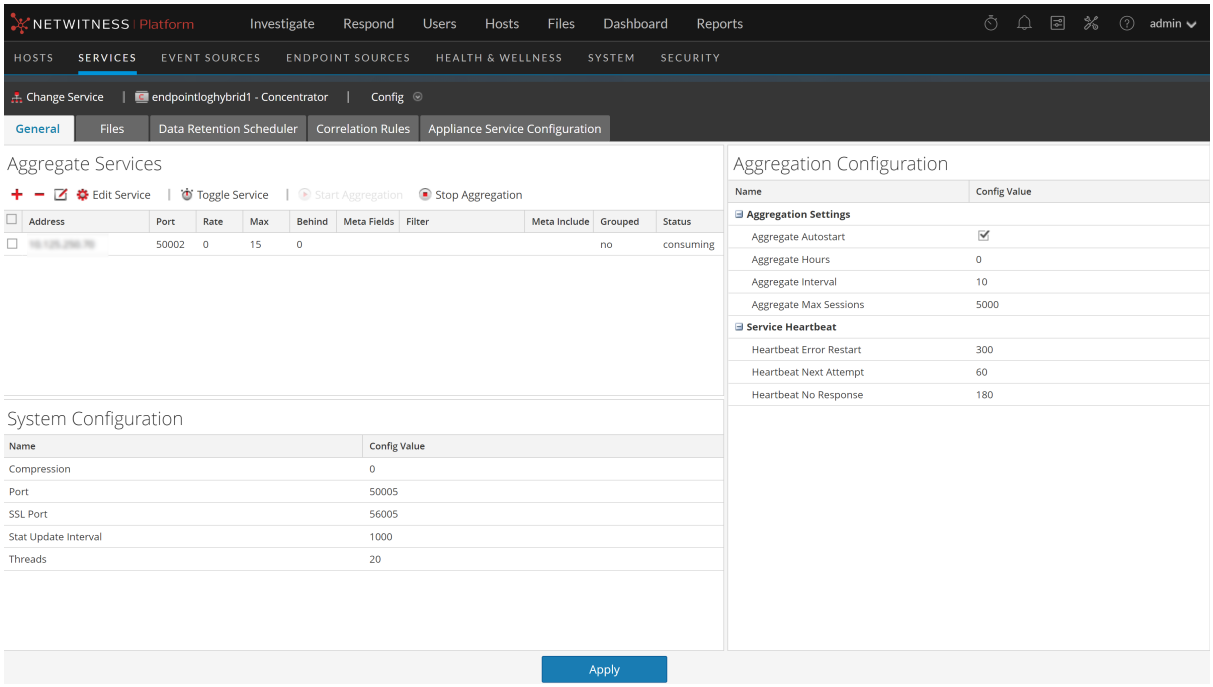
   The Services Config view for the selected service is displayed.

3. Under System Configuration, click a field that you want to edit, and type a new value.



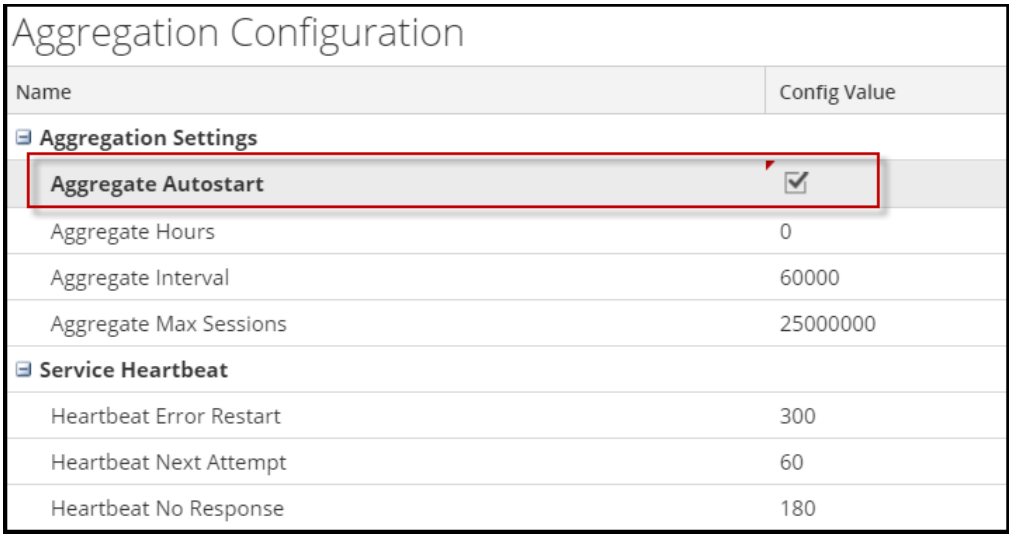
4. When finished editing, click **Apply**.

Step 2. Configure the Aggregation Process



Configuring the aggregation process for a Broker or Concentrator includes setting:

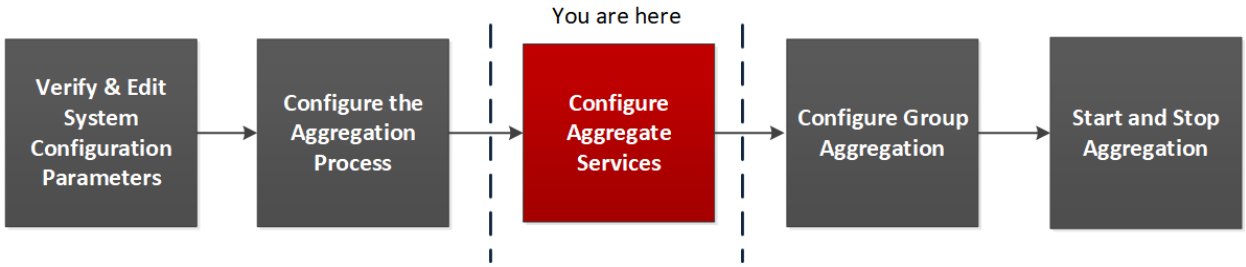
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



To configure the aggregation process on a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.

3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.

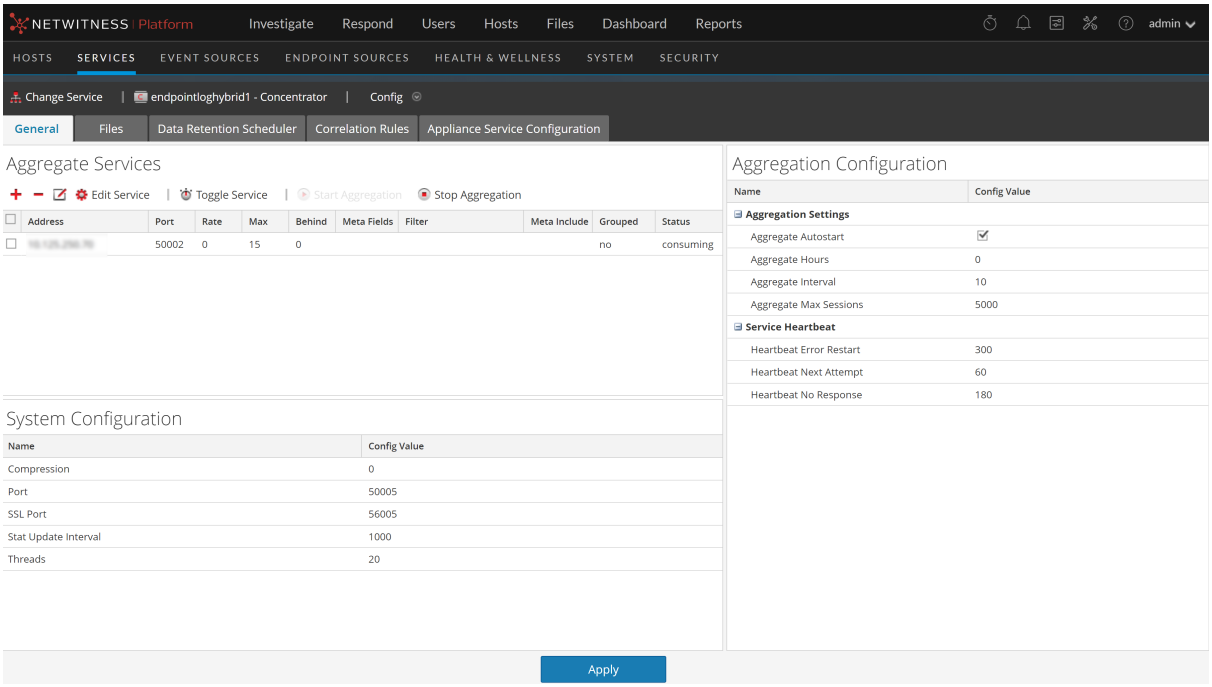


4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

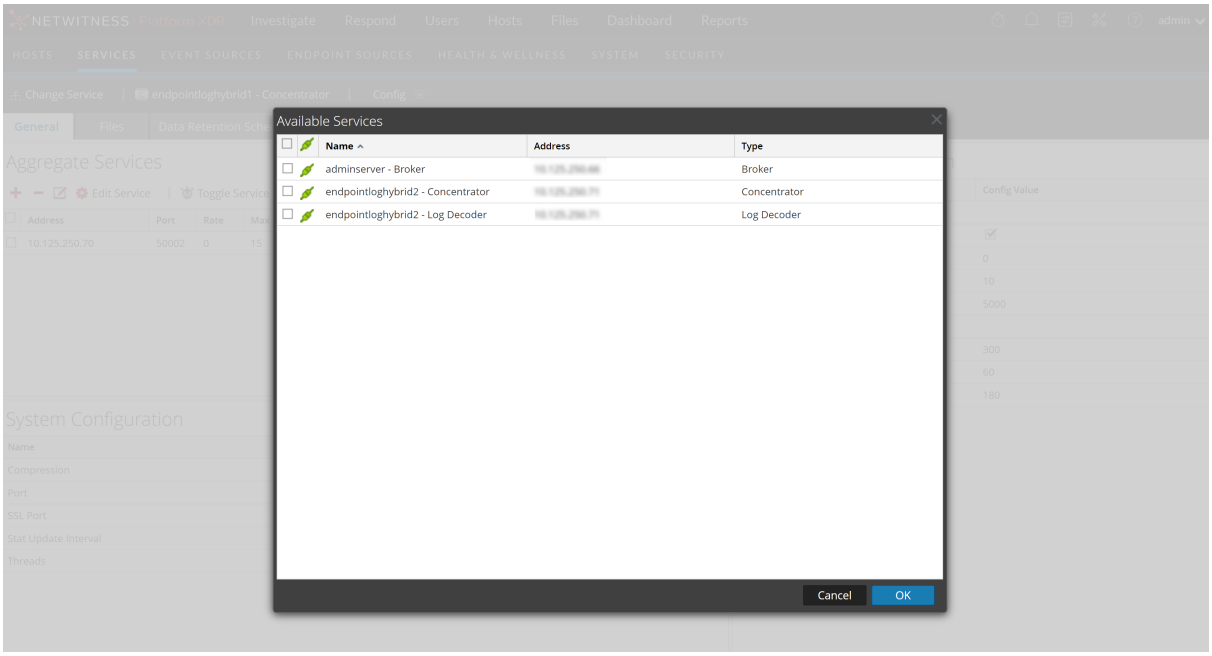
Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:



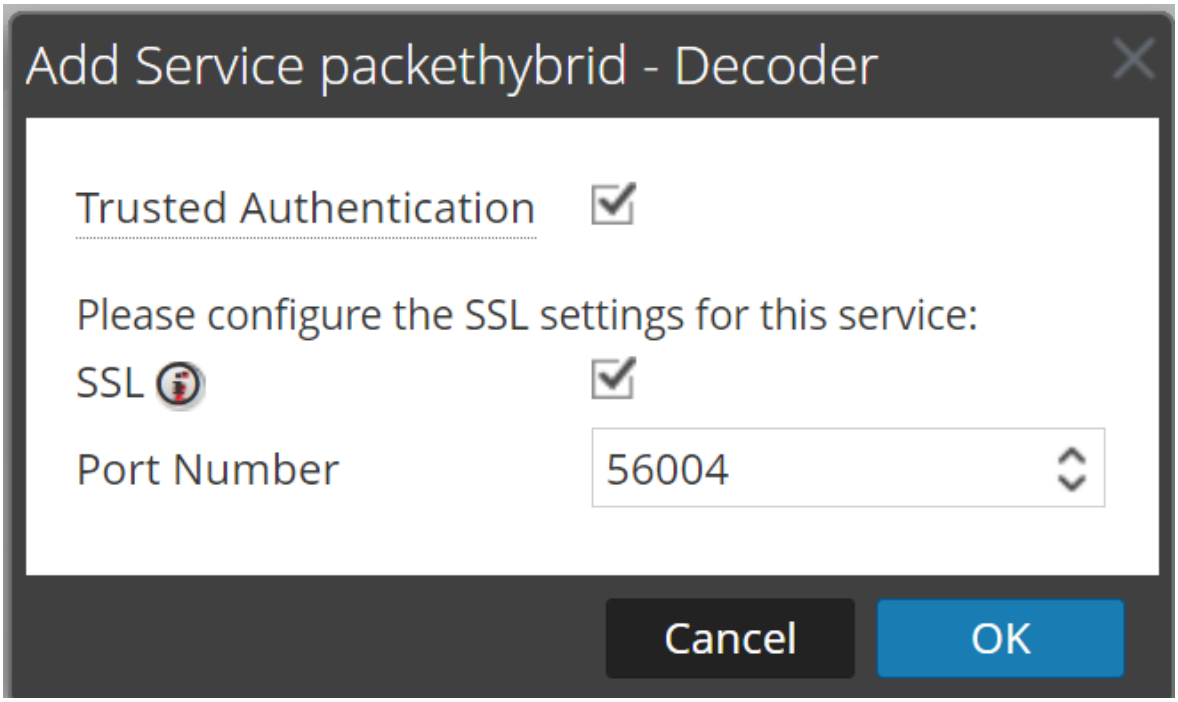
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



To configure aggregate services to a Broker or Concentrator:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  **> View > Config**.

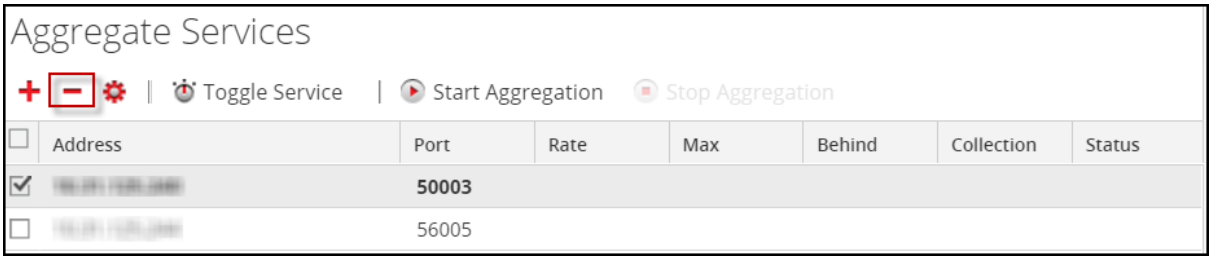
   The Services Config view for the selected service is displayed.



3. Click  in the **Aggregate Services** toolbar.
   The Available Services dialog is displayed.

4. Select one or more services to be added and click **OK**.
5. Use one of the following ways to add a service for aggregation:
   - Use Password-Based Authentication. Enter the Administrator username and password. Click **OK**.

- Select **Trusted Authentication**. Click **OK**.



The added services are listed in the Aggregate Services list.

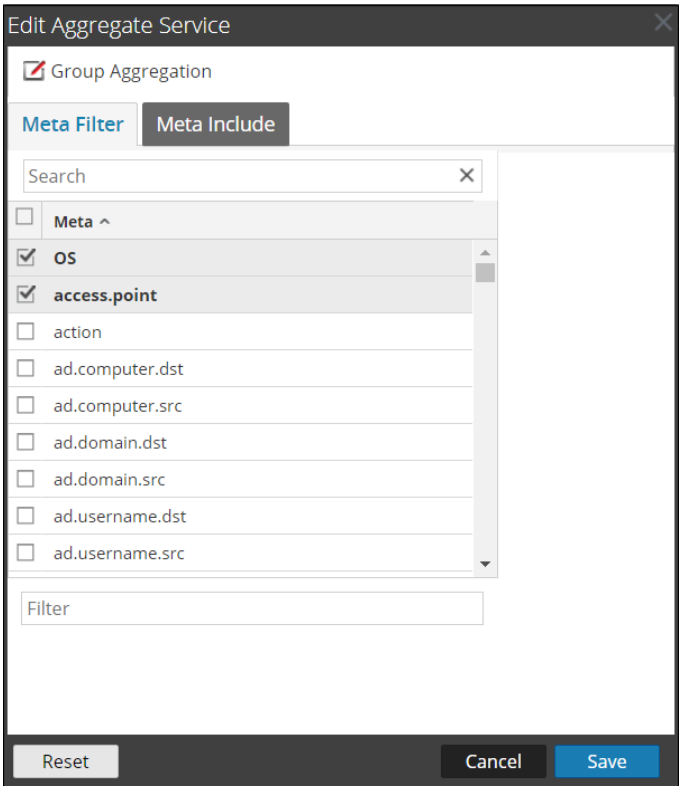
6. To save the changes, click **Apply**.

To remove aggregate services from a Broker or Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.

The service is removed from Aggregate Services list.



3. To save the change, click **Apply**.

To edit aggregate services on a Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness, you must add it to this instance of NetWitness in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.

5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click 

.

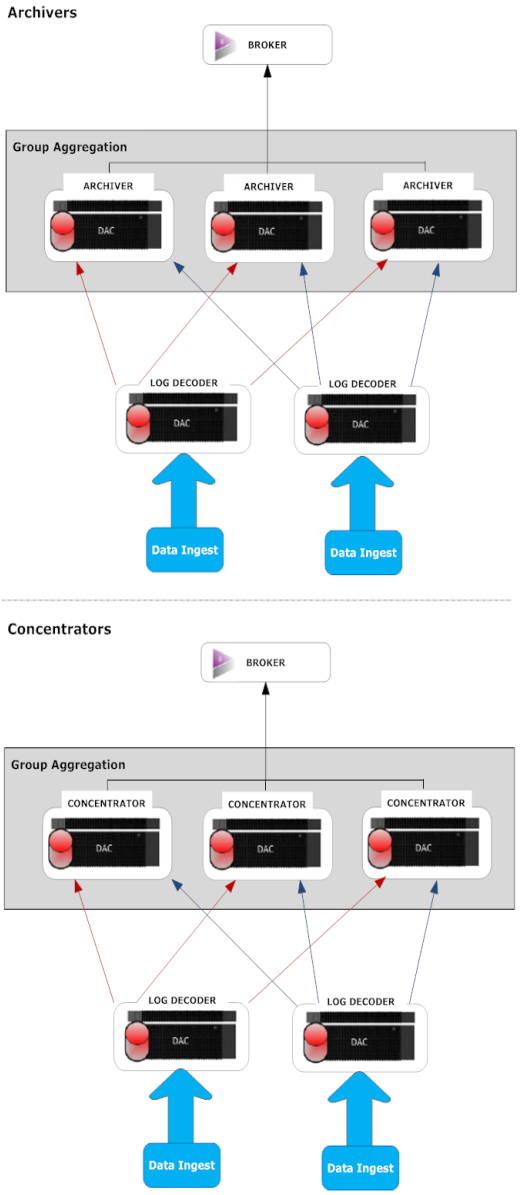
   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

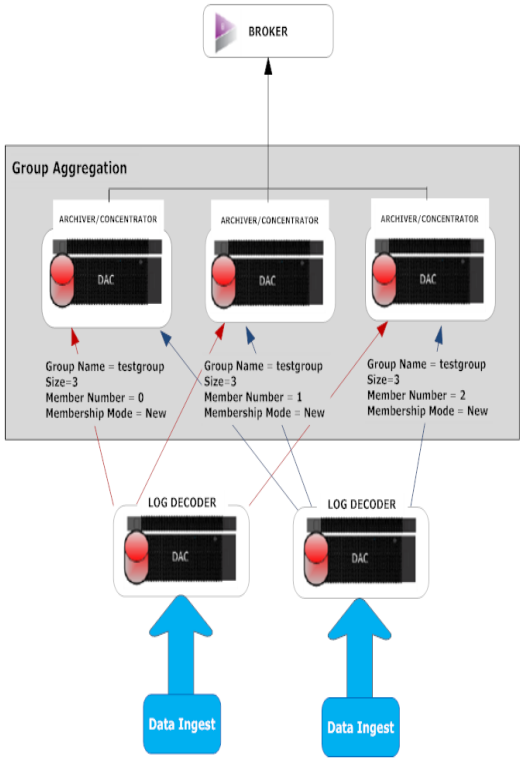
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



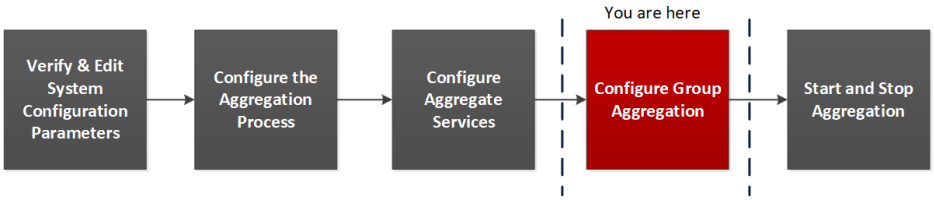
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

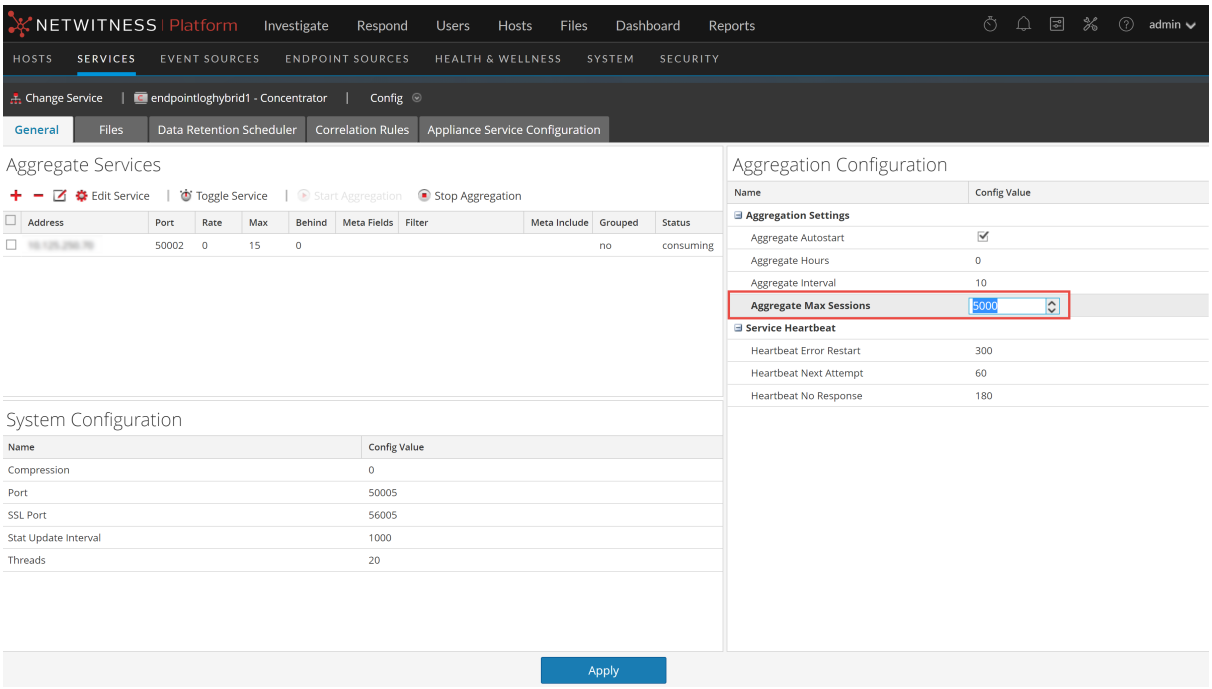
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

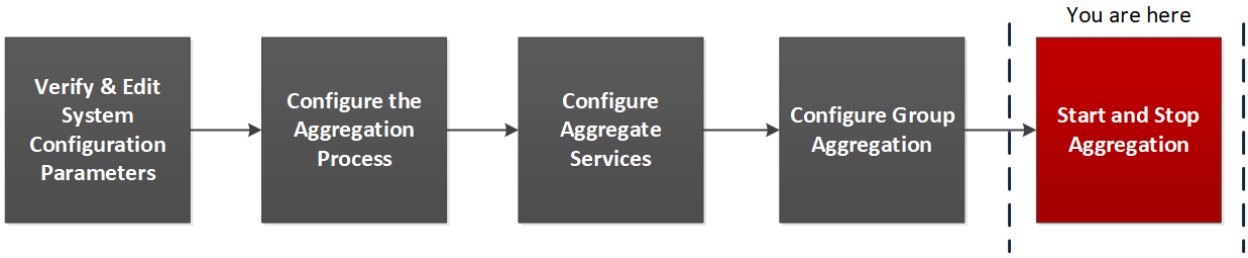
   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

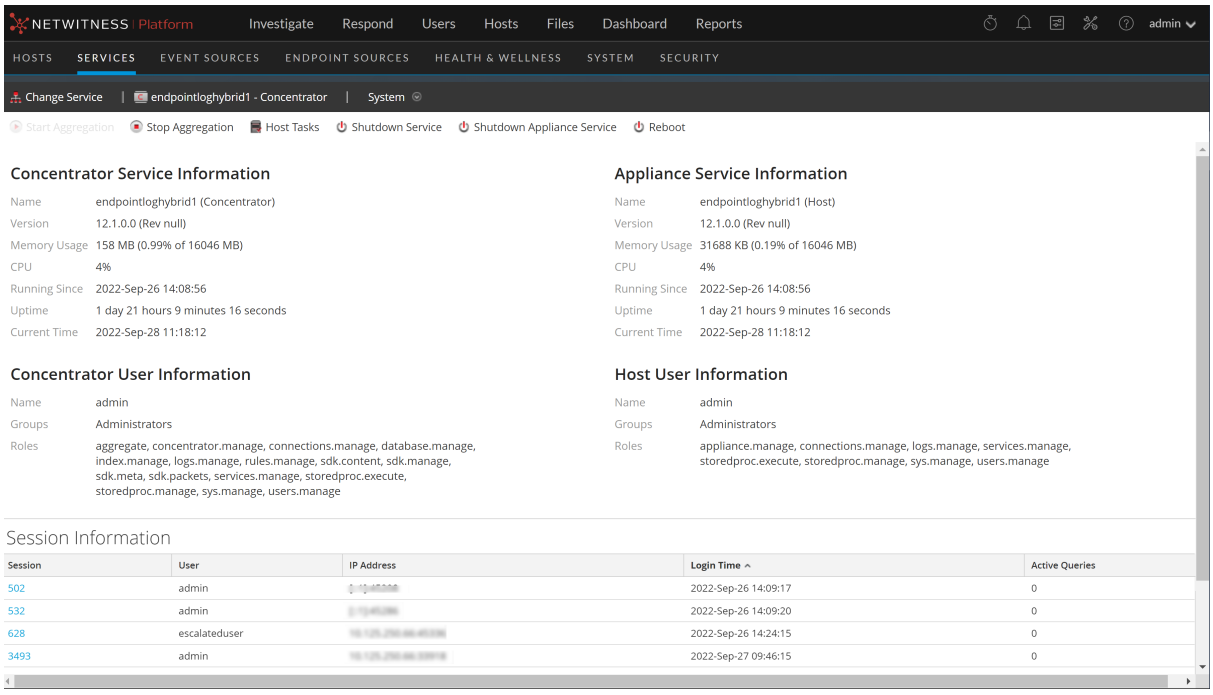
i. In the Service Config view, click **Apply**.



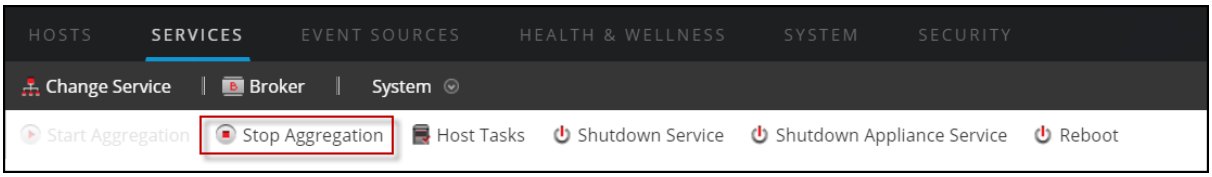
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Step 5. Start and Stop Aggregation



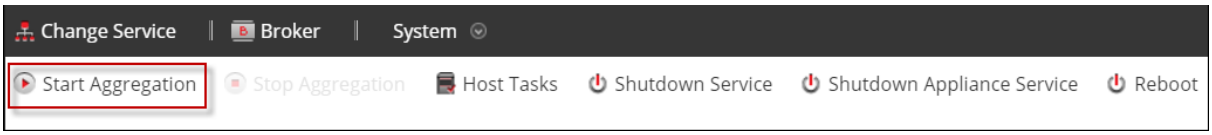
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



Note: The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate autostart is enabled, as well as the size of a round of aggregation and time between rounds.

To start and stop data aggregation in the services system view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

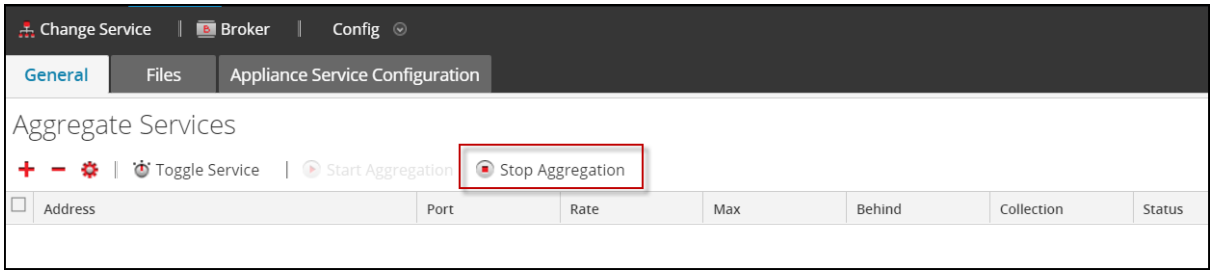
4. If you want the service to start aggregating data again, click **Start Aggregation**.

   You can now investigate the captured data in the Investigation module.

To start and stop aggregation in the services config view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click Start Aggregation in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click  in the **Aggregate Services** toolbar.

   When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

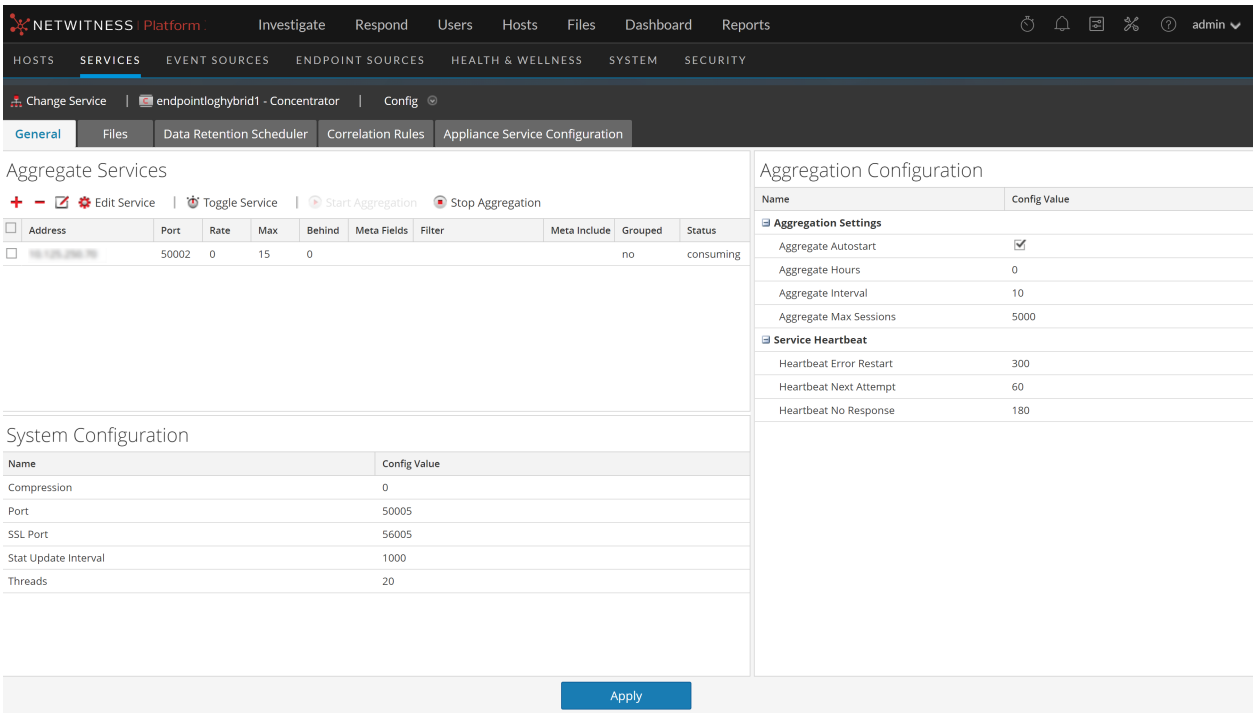
Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

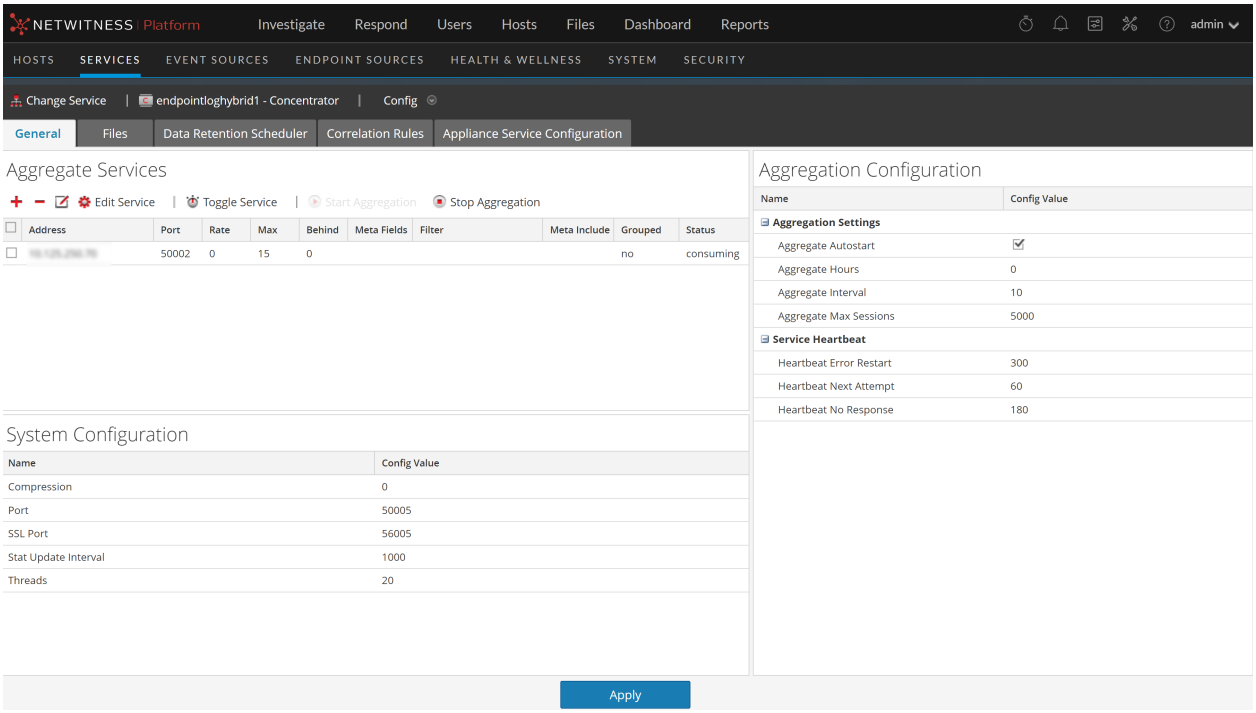
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?



Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

Related Topics

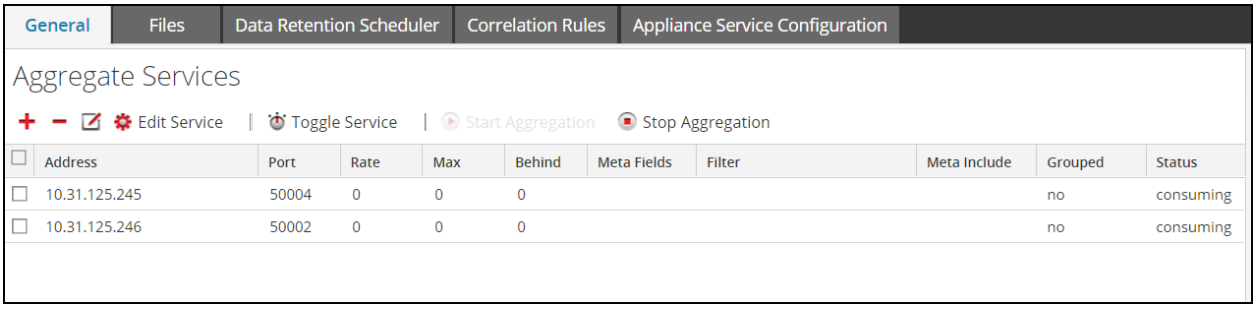


- Broker and Concentrator Basics
- Broker and Concentrator Configuration

General tab

This is an example of the General tab for a Concentrator.

This is an example of the General tab for a Broker.



These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration

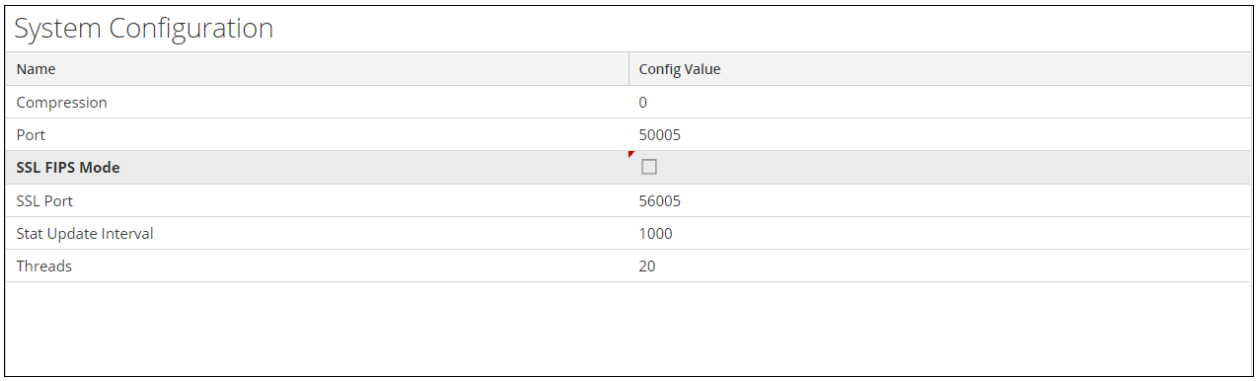
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.

The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



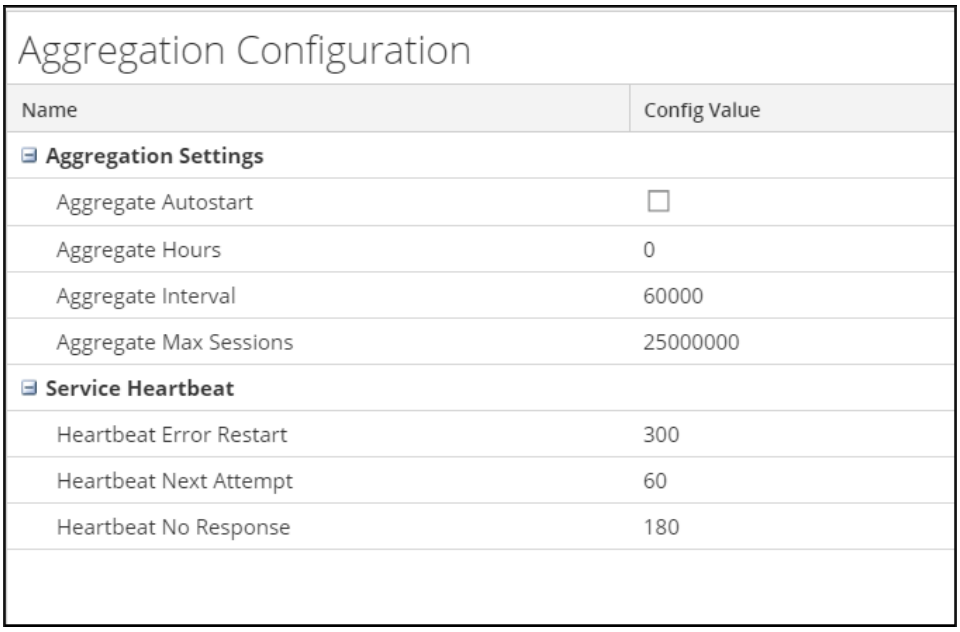
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.

Column	Description
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists`
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.

The following table describes the aggregation settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

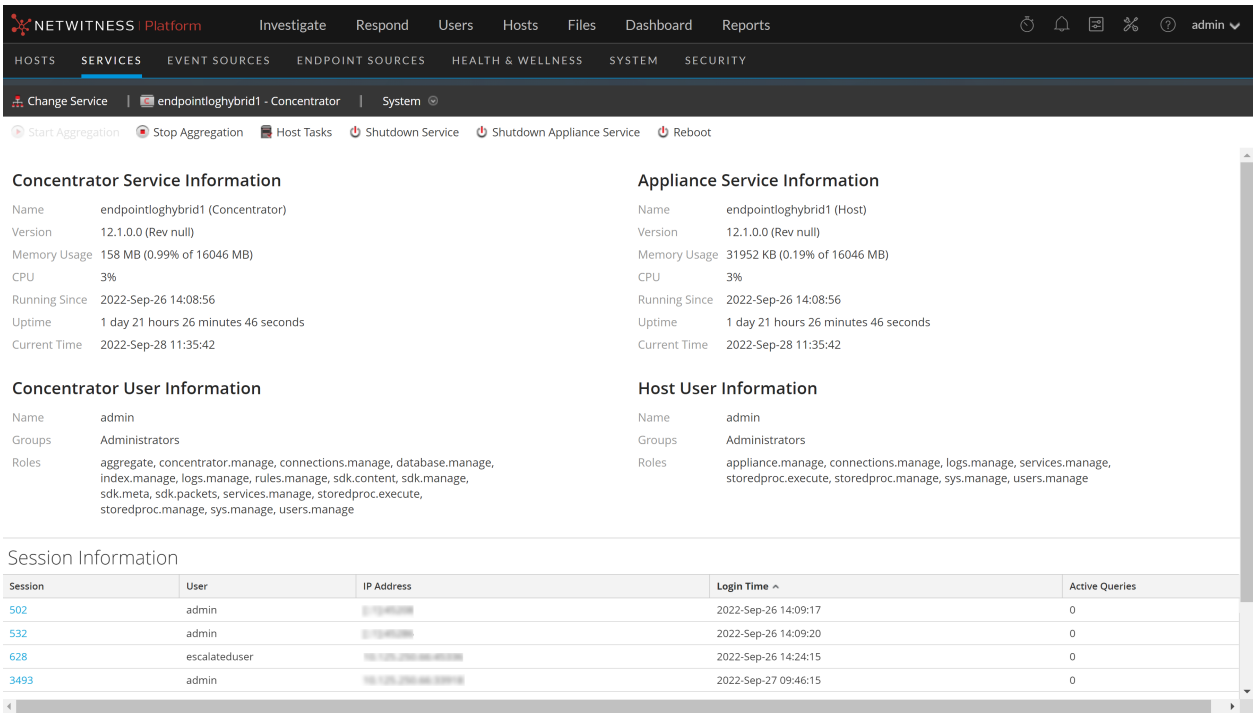
The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

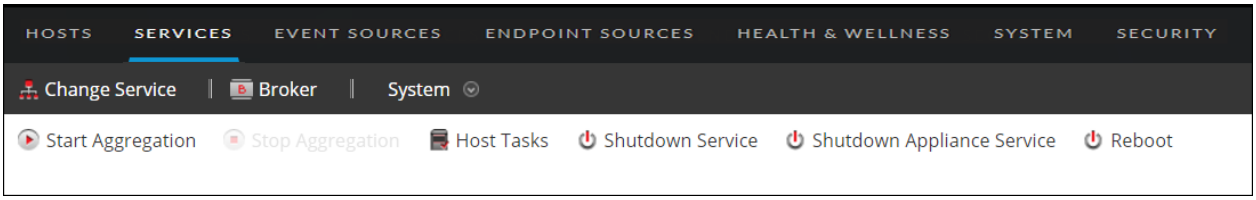
Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics



- Broker and Concentrator Basics
- Broker and Concentrator Configuration

Services System View



You can access this view by doing the following:

1. Go to  **(Admin)** > **Services.**
2. Select a Concentrator or Broker, and select  > **View** > **System**.

   The System view for the selected Concentrator or Broker is displayed.

The following figure is an example of the toolbar for a Broker or Concentrator.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

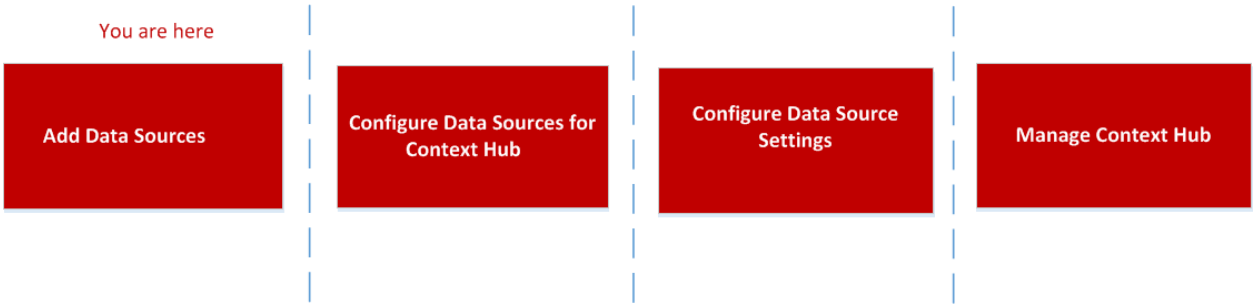
Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

NetWitness Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

File Reputation Server - Provides contextual information for reputation status of files.



STIX - Provides contextual information on IP address, email address, domain, filename, URL, and file hash from STIX sources.

REST API - Provides contextual information for any accessible web service with an exposed REST API.

Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **(Admin) > Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:

Context Hub service is pre-installed on primary ESA host, and automatically added to the NetWitness.

Note: You can have only one Context Hub service instance enabled in your NetWitness deployment. If there are multiple ESA service in NetWitness, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

Configure Lists as a Data Source

Lists as a Data Source use the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful lists such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab. Additionally, all feeds (except STIX feeds) that are created are converted to lists and displayed on the context lookup. If Context Hub is not configured or the service is down, then the feeds will be made available whenever Context Hub is up and running. For more information on creating feeds, see the *Live Services Management Guide*.

Note: When you create a feed, a list is automatically generated with the same name as the feed. If the list name already exists, then the name of the new list is suffixed with the number '2". For example if the existing feed name is test1.csv, then the new list will be named as test2.csv.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

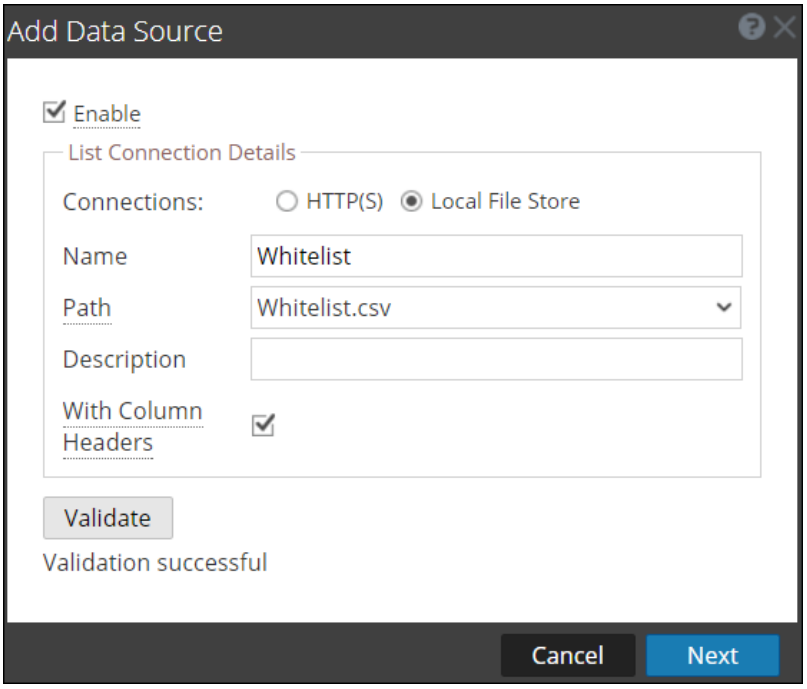
Note: You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in  **(Admin) > Services** view of NetWitness.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

Caution: If you are creating a Context Hub list for use as an enrichment source in ESA, the list name cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

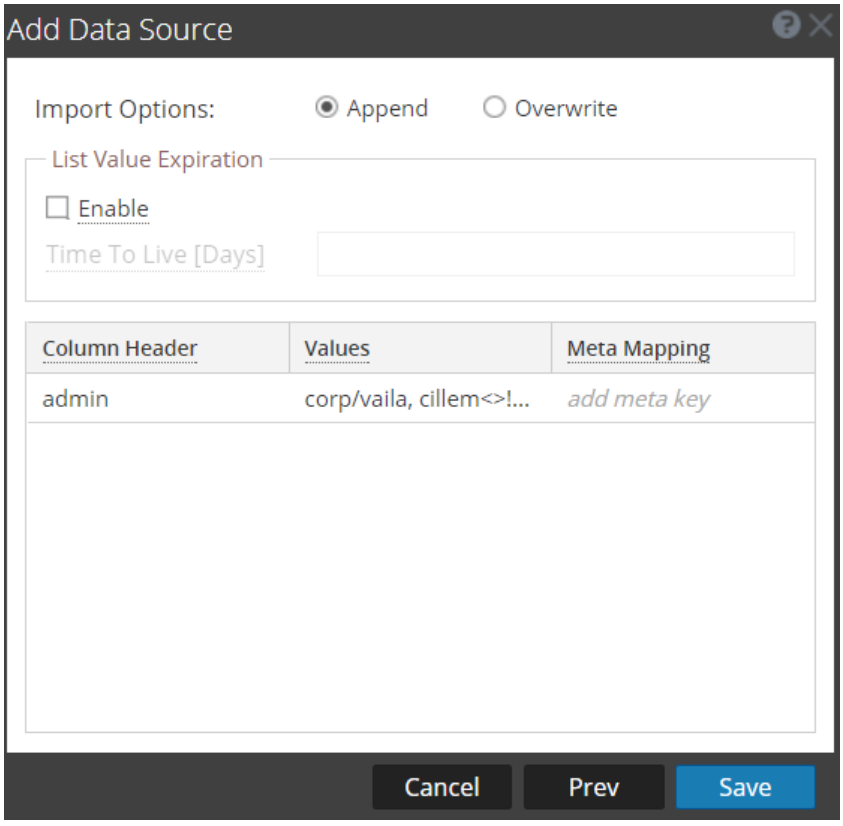


Add List data source using Local File Store

To add a List as a data source:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.



6. Select the **Local File Store** Connection Type.

7. Provide the following database connection details. Enter the following fields for Local File Store Connection Type:
   - **Name:** Provide a name for the list data source.
   - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
     A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
   - (Optional) **Description**: Add a description for the selected file.
   - **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.
8. Click **Validate**.

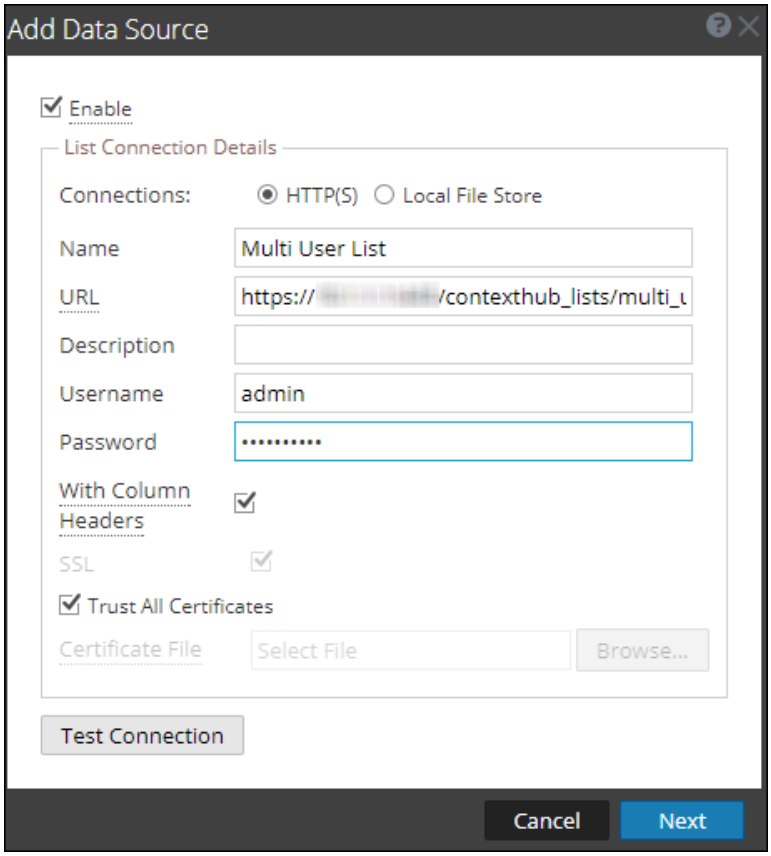
   If the validation fails, you cannot add the data source.
9. Click **Next**.

   The next dialog is displayed.

10. Select any one of the following options:
    - **Append** - Select this option to add the imported values to an existing list.
    - **Overwrite** - Select this option to replace the values in an existing list with the imported values.
11. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable**

checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.

12. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:
    - **Column Header**: Display headers of the CSV file which must be mapped to a meta type.
    - **Meta Mapping**: Maps a column header field to a meta type.
    - **Values**: Displays the first three values from the imported list.
13. Click **Save**.



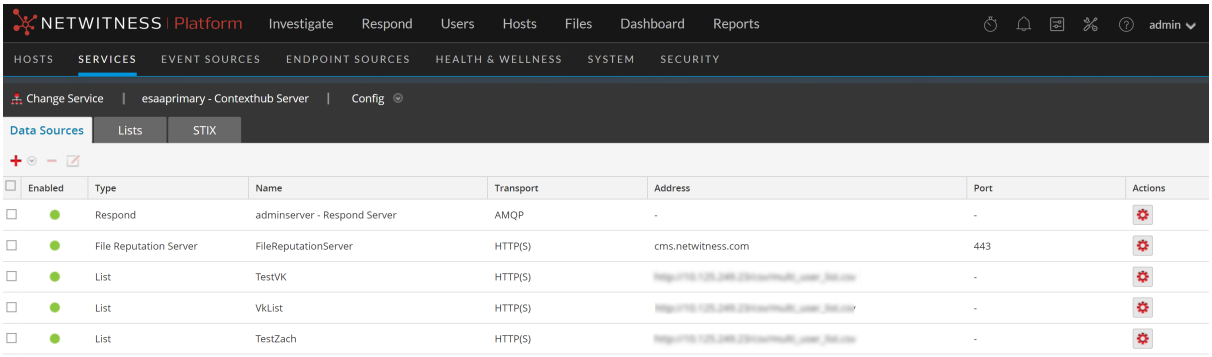
Add List data source using HTTP(S)

To add List as a data source:

1. Select  **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click  > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

6. Select the HTTP(S) Connection Type.



- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-address of the HTTP(S)server>:<Port on which the HTTP(S) server is hosted>/<Absolute path of CSV file>`. For example, `https://10.1.1.1:443/contexthub_lists/multi_user_list.csv`
  - (Optional) **Description**: Add a description for the selected file.
  - (Optional) **Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
  - (Optional) **Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
  - **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
  - **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.

- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP (S)server certificate for the connection to be successful.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save** to save the settings.

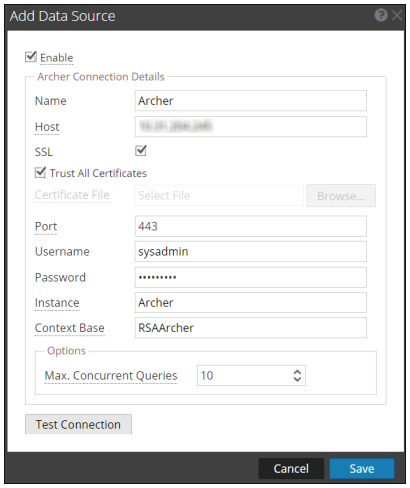
   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.

Next Steps

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub.
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and *NetWitness Investigate User Guide*.

Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.



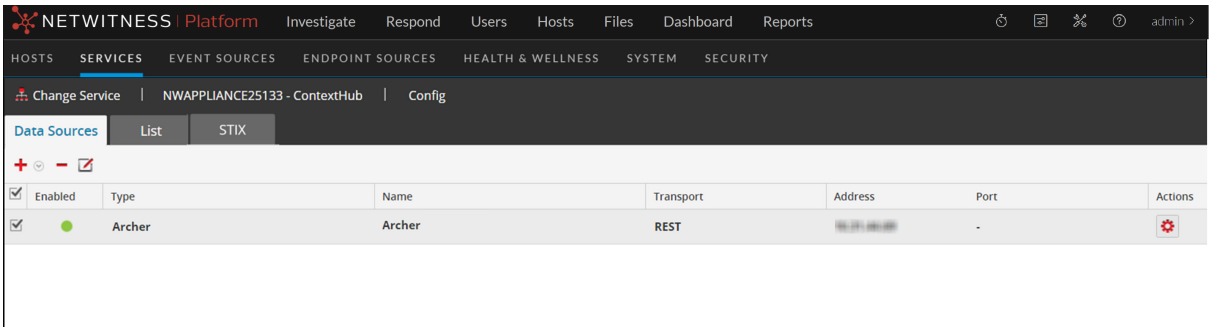
Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **Archer**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Archer server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, archer located at the Archer web address https://archer.company.com/**rsaarcher**/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.

   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *NetWitness Respond User Guide* and *Investigate User Guide*.

Configure Archer Data Source

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the Configure Archer dialog:

4. In the **Settings** tab. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.

5. Click **Cache Settings**. Configure the following fields.

Field	Description
Export Attributes Configuration	In **Settings**, **Export Attributes Configuration**, click **Export** to export the Archer Attributes Configuration. These are the attributes visible in Context Lookup while viewing Archer details for a IP, Host, or Mac. A JSON configuration file gets downloaded and the order of the attributes in sync with the listing in the context panel is maintained in the JSON file.
Import Attributes Configuration	If you want to update or edit the configuration settings, in **Settings**, **Import Attributes Configuration**, click **Browse**. Select the JSON file containing the configuration attributes. The attributes appear in the Context Lookup panel when a user views the context, in the order which they were imported. **Note:** You can backup the previous attributes before importing any changes made to existing attributes.
Data Prefetch Settings	In **Settings**, **Data Prefetch Settings** helps prefetch the data. Configure the **Schedule Recurrence** to provide data faster when you hover over the intended entity in Respond.
Schedule Recurrence	In the **Recur Every** field, enter a value or use the drop-down to configure the recurrence for prefetch. The default time duration can be selected from the drop-down list for configuring the duration of recurrence. Available values are minutes, hours, days, or weeks.

6. Click any one of the following options:

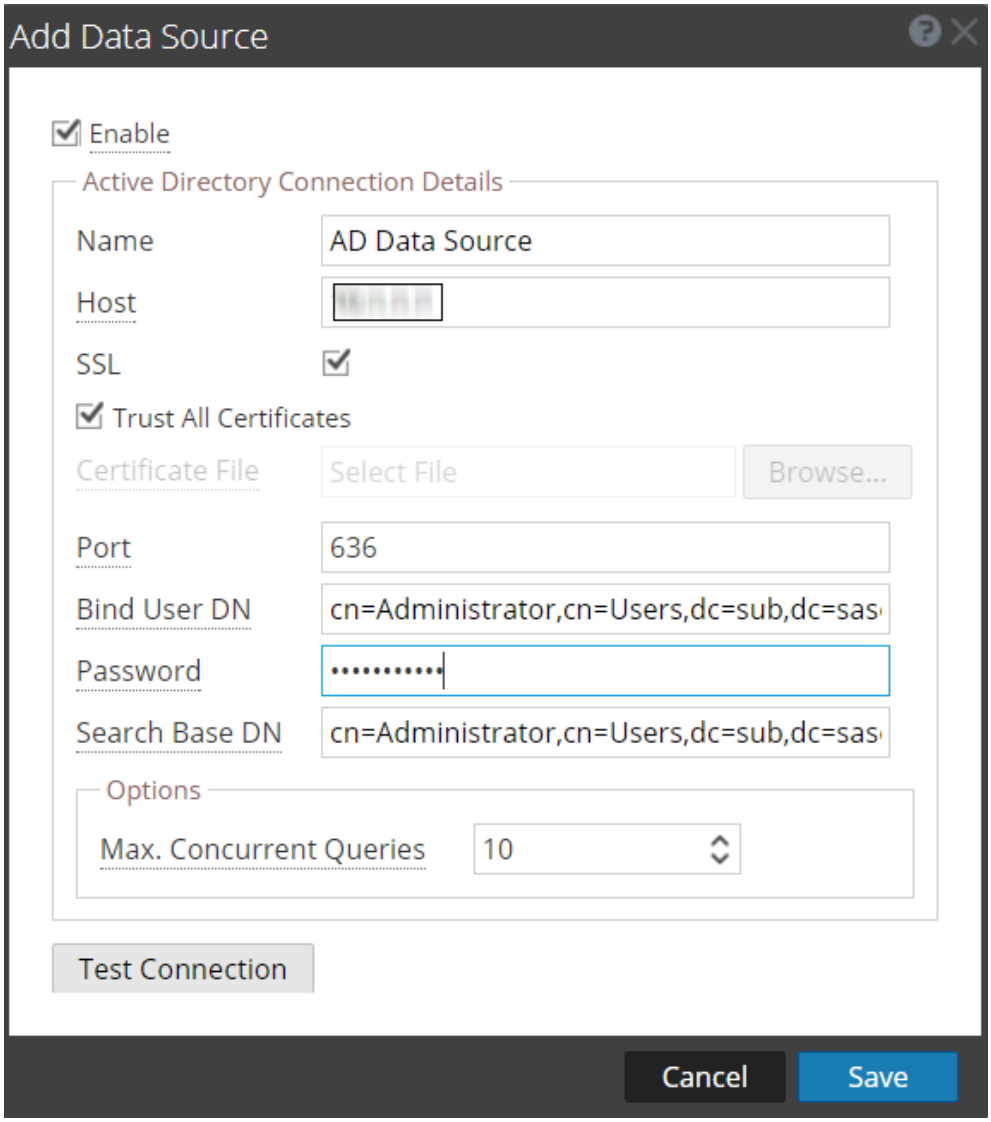
- **Cancel** - select this option to cancel the changes.
- **Save** - select this option to save the changes.
- **Save and Close** - select this option to save and close the dialog.

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

Prerequisites



Before you configure Active Directory data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click **> View> Config**.
   The Services Config View of Context Hub is displayed.

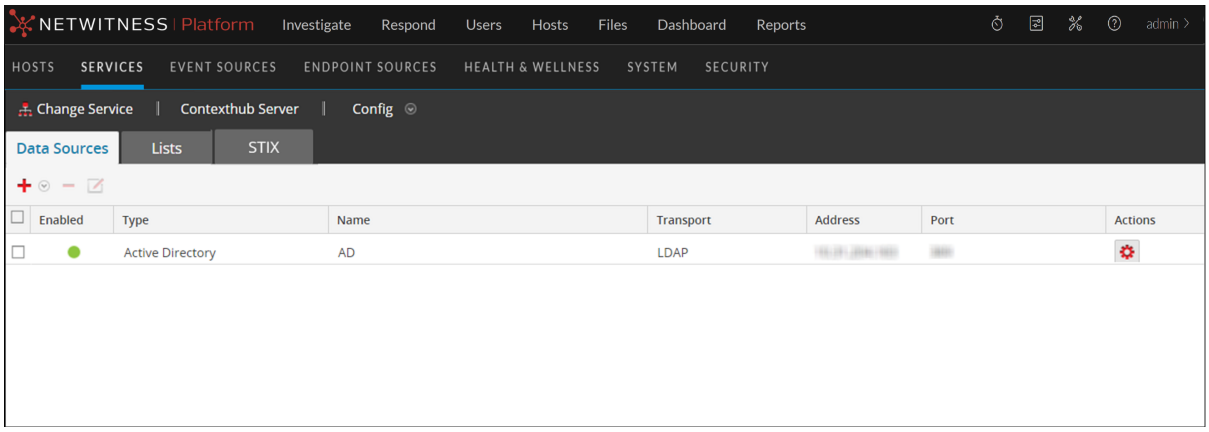
3. In the **Data Sources** tab, click + **> Active Directory**.
   The **Add Data Source** dialog is displayed.

You need to configure the Active Directory schema to replicate the following attributes to view the data in the Respond page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

4. Provide the following database connection details:



- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields.
  - **Name:** Enter a name for the AD data source.
  - **Host:** Enter the host name or IP address of the AD.
  - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
  - **Port:** The default port is 636 with SSL and 389 without SSL.
    If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).

    Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

    Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
  - **Password:** Enter password of the user DN used to bind with AD.
  - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
  - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is displayed

in the **Data Sources** tab.

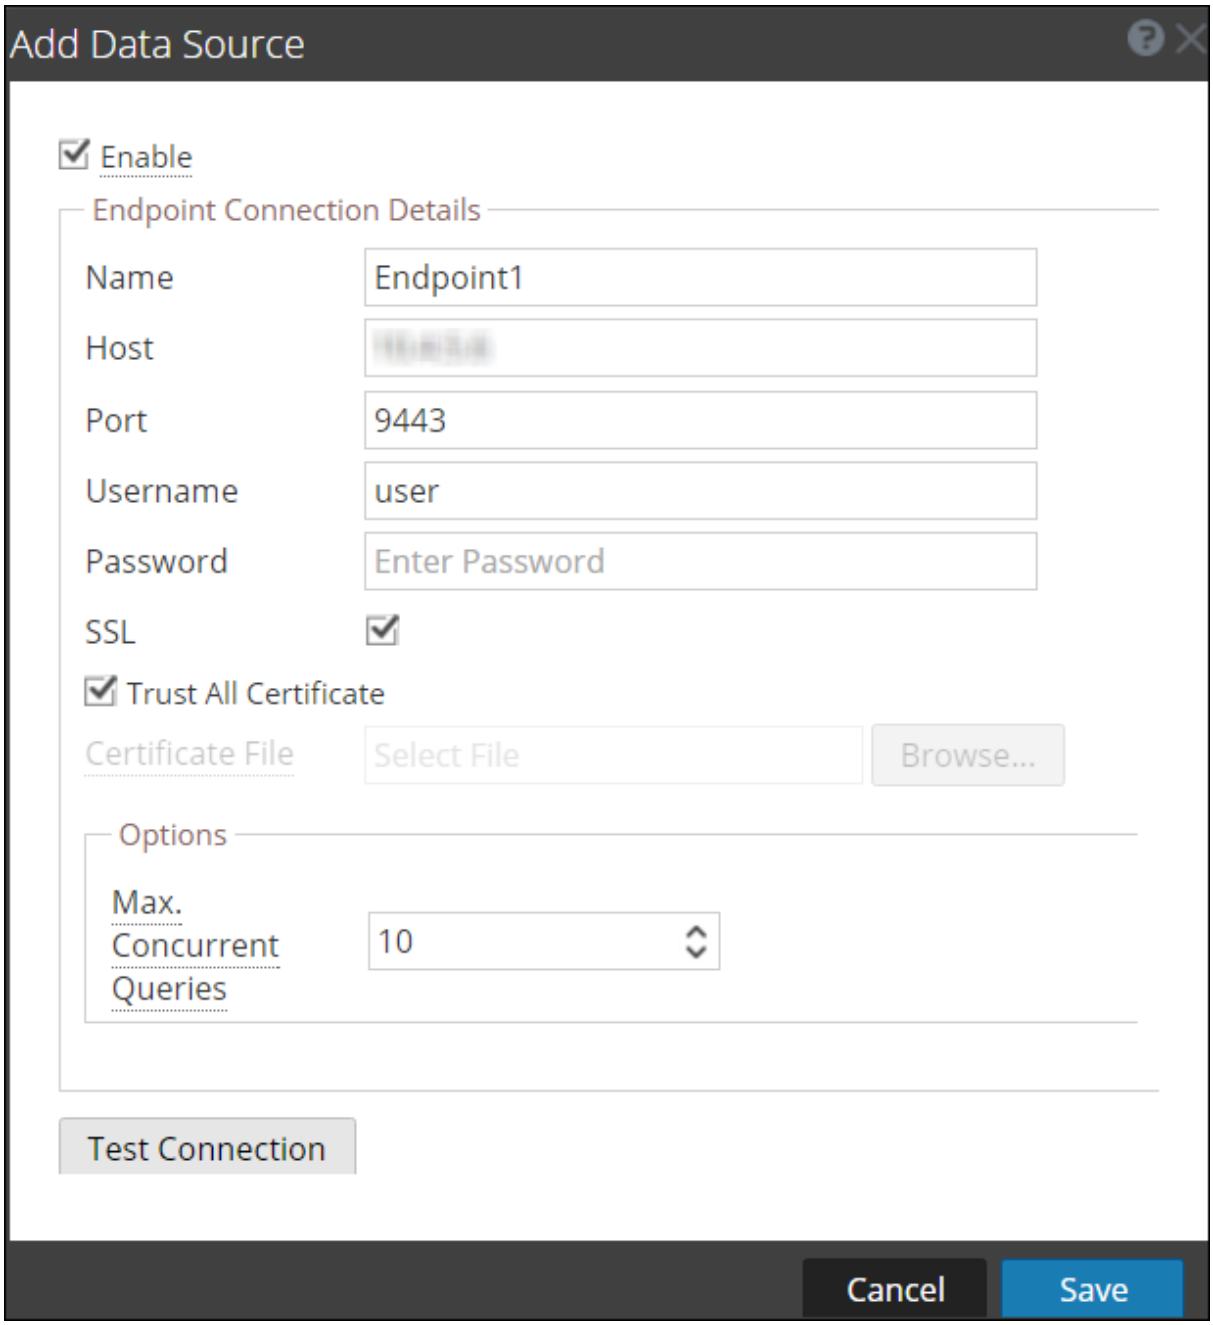
After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Configure NetWitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.



Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in  **(Admin) > Services**.view of NetWitness.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at NetWitness Community.

To add NetWitness Endpoint as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **Endpoint**.
   The **Add Data Source** dialog is displayed.

4. Provide the following information:

   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting** – This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

   Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

   - Enter the following fields:
     - **Name**: Enter a name for NetWitness Endpoint data source.
     - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
     - **Port**: The default port is 9443.
     - **SSL**: Select SSL if you want NetWitness to communicate with the host using SSL. This is enabled by default.
     - **Username**: Enter the NetWitness Endpoint API Server username.
     - **Password**: Enter the NetWitness Endpoint API Server password.
     - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
     - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.

6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

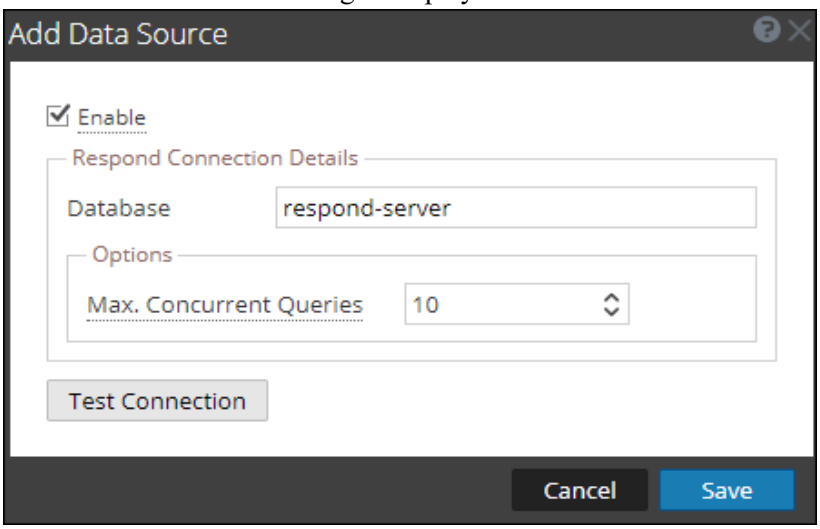
Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*

Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.



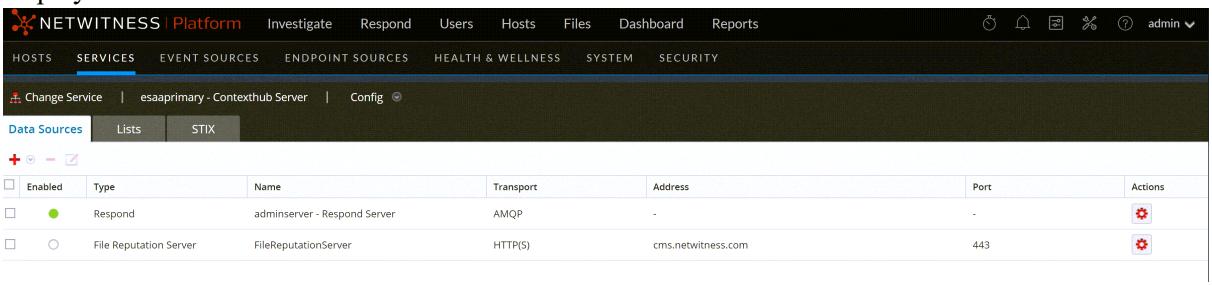
Prerequisites

Before you configure Respond data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **(Admin) Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **Respond**.
   The **Add Data Source** dialog is displayed.



The required fields to configure the Respond data source are automatically updated.

You can enable or disable Context Highlighting. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

> **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source is displayed in the **Data Sources** tab.

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure File Reputation Server as a Data Source

File Reputation Server provides analysts the opportunity to view reputation status of files. By default, File Reputation is enabled in Additional Live Services section.

If Context Hub service is configured, File Reputation Server is automatically added as data source for Context Hub.

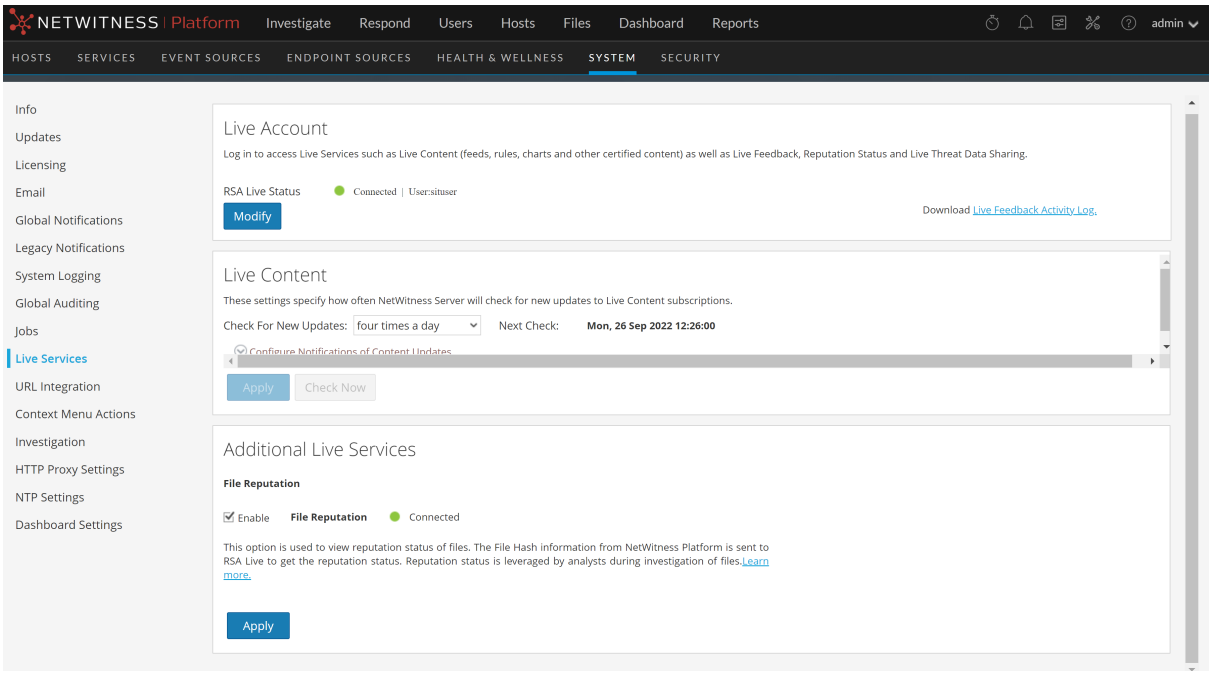
Prerequisites

Ensure the followings:

- Context Hub is enabled and the service is available in **(Admin)** > **Services** view of NetWitness.
- NetWitness Live Account is available.

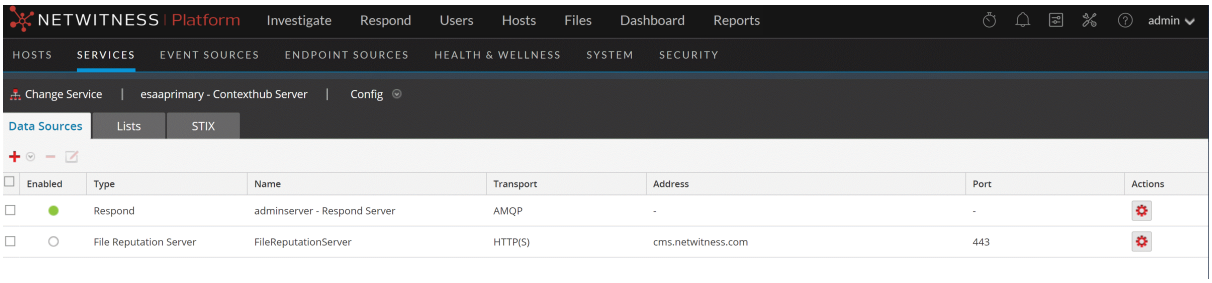
Note: To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **File Reputation** is enabled in **Additional Live Services** section. Before setting up File Reputation data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. File Reputation is automatically added as a data source for context hub.



For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.



Enable or Disable File Reputation Data Source

To enable or disable File Reputation data source for Context Hub:

1. Go to **(Admin) > System**.
2. In the left navigation pane, select **Live Services**.
3. In the **Additional Live Services** section, enable **File Reputation**.

4. Click **Apply**.
   File Reputation Server data source is enabled for Context Hub service.
5. To verify, go to the **Data Sources** tab and view the available sources.
   File Reputation source must be added to the list of available sources and the **Enabled** field must be a solid green circle ( ).

6. To disable File Reputation data source, disable **File Reputation** in Additional Live Services panel and click **Apply**.

   File Reputation data source is disabled for Context Hub service.

Edit File Reputation Server Data Source Settings

To edit File Reputation Server data source for Context Hub:

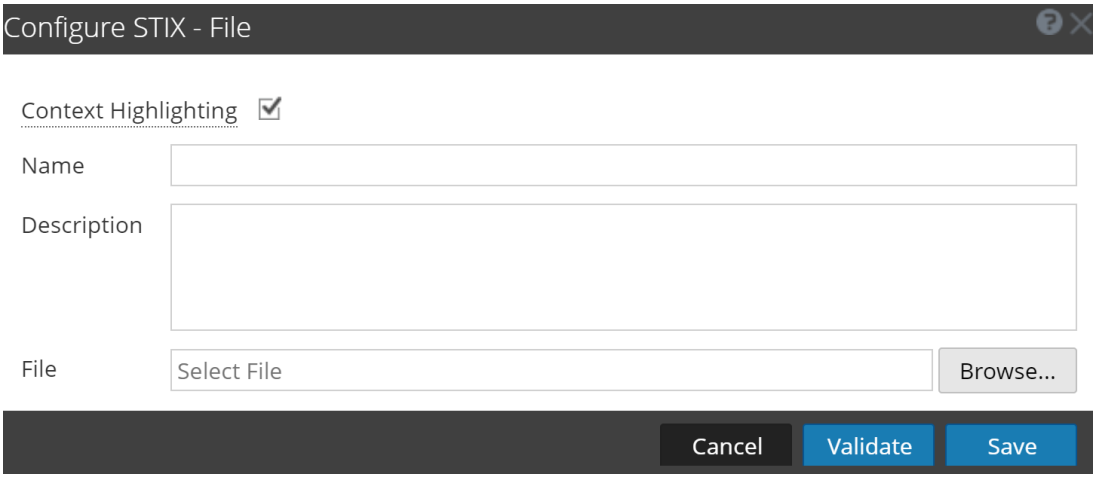
1. Select **(Admin) > Services**.
   The Services view is displayed.

2. In the **Services** panel, select the Context Hub service, and **> View > Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, select the File Reputation Server source and click .
   The **Edit Data Source** dialog is displayed.

4. Edit the required fields:

Field	Description
Context Highlighting	This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled. **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.
Max. Concurrent Queries	You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25.

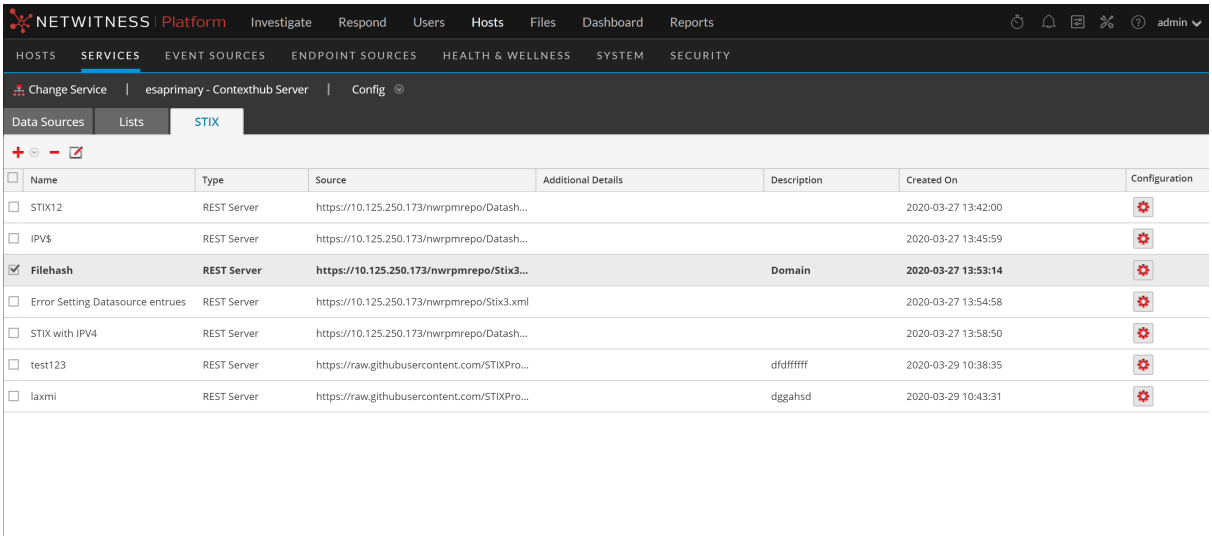
5. To edit the Proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.



Configure STIX as a Data Source

You can configure Structured Threat Information eXpression (STIX) as a data source for Context Hub and use the Context Hub service to fetch contextual threat intelligence information from a STIX source.

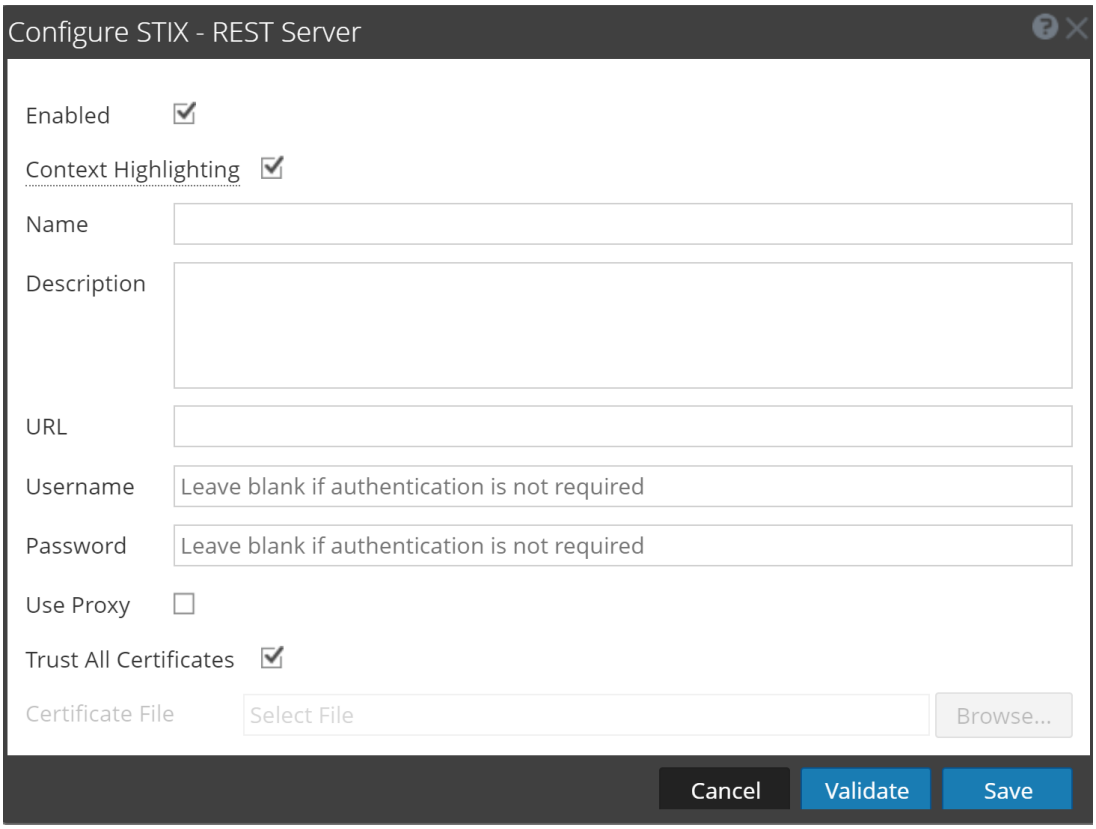
Configure STIX File



To add STIX as a data source for Context Hub:

1. Go to **(Admin) > Services** .
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **File** as data source.

4. Provide the following details:
   a. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   b. **Name**: Provide a name for the STIX file data source.
   c. **Description**: Provide description of the data source.
   d. **File**: Browse for the file you want to add as a data source.
5. Click **Validate** to verify the format of the file.



6. Click **Save** to configure the data source.
   The File is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.

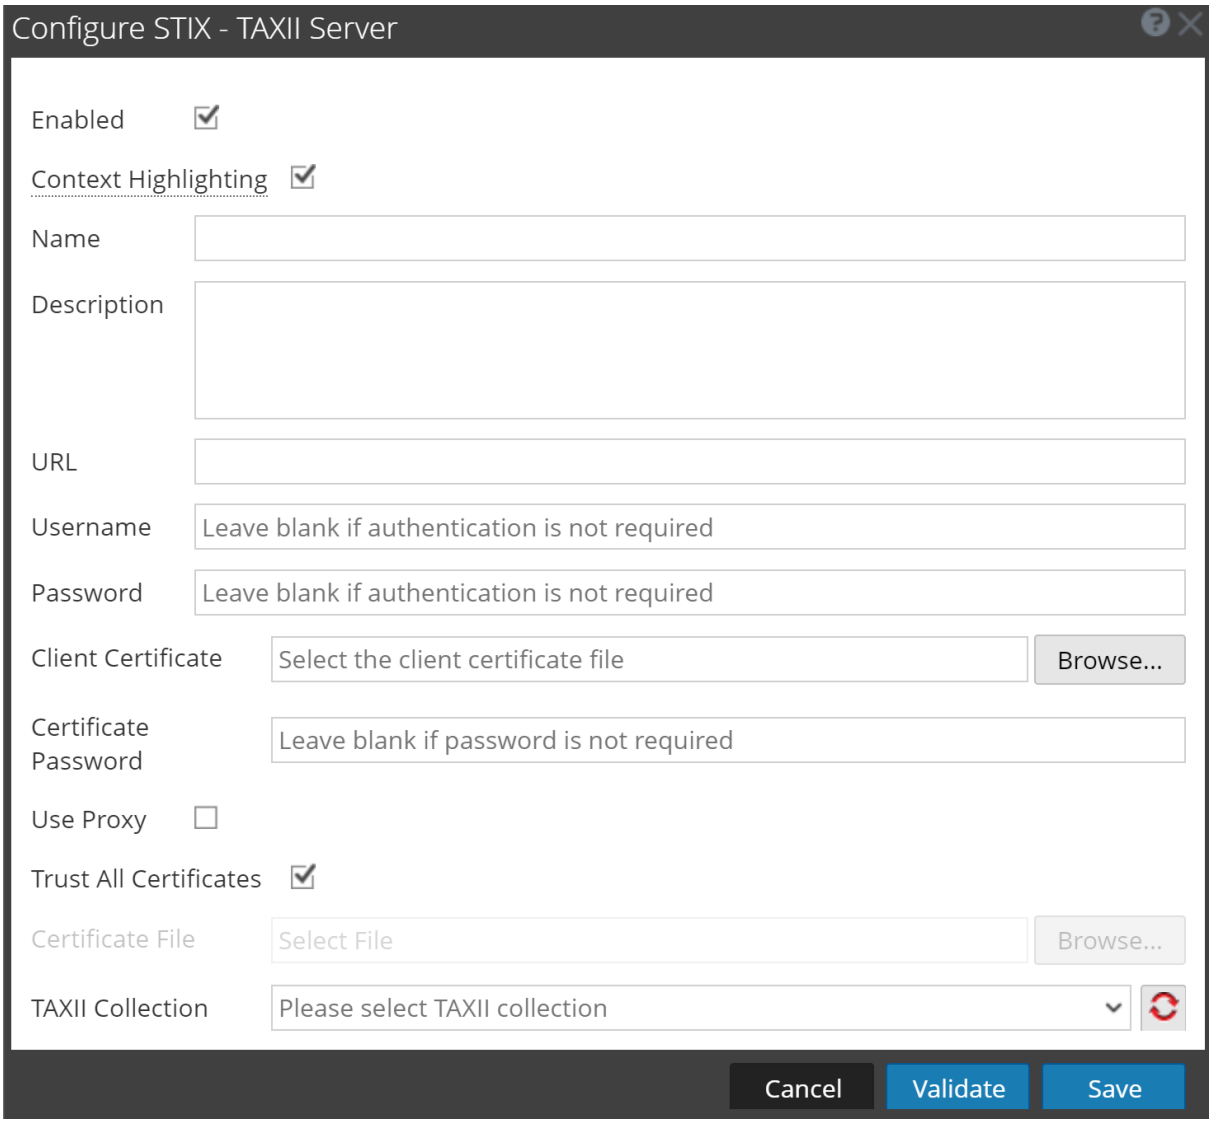
Configure REST Server

To add REST as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **REST Server** as data source.

4. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the REST Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the URL to the STIX file to be hosted on the server.
   f. (Optional) **Username**: Enter the username for the REST server.
   g. (Optional) **Password**: Enter the password for the REST server.
   h. **Use Proxy**: Select this checkbox to use proxy.
   i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate.
   j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.
5. Click **Validate** to verify the connection parameters to the REST Server.

6. Click **Save** to configure the data source.
   The REST Server is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.



After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Configure TAXII Server

To add TAXII Server as a data source for Context Hub:

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .

4. Select **TAXII Server** as data source.

5. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the TAXII Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the discovery URL to the TAXII Server.
   f. (Optional) **Username**: Enter the username for the TAXII server.
   g. (Optional) **Password**: Enter the password for the TAXII server.

h. (Optional) **Client Certificate**: Browse to upload a pkcs12 format client certificate available on your local system.

i. (Optional) **Certificate Password**: Enter the password to the certificate, if it is password-protected.

j. (Optional) **User Proxy**: Select this checkbox to use proxy.

k. (Optional) **Trust All Certificates**: Select this checkbox if yoenabu want to trust all certificates and do not have a custom certificate.

l. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

m. **TAXII Collection**: Select the TAXII Collection name from the drop-down to automatically download the collection.

6. (Optional) Click  to manually retrieve the list of collections available in the TAXII server , if the collections are not downloaded automatically.
7. Click **Validate** to verify the connection parameters to the TAXII Server.
8. Click **Save** to configure the data source.
   The TAXII Server is added as a data source and is displayed in the **STIX** tab.

After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure REST API as a Data Source

You can configure REST API as a data source for Context Hub which allows analysts to use the Context Hub during an investigation to fetch contextual information from any accessible web service with an exposed REST API. Use the procedures in this topic to add REST API as a data source for Context Hub service and configure the settings (if required) for REST API. The maximum number of REST APIs supported by default is ten.

Prerequisites

Before you configure REST API data source, ensure that:

• Context Hub service is available in  (Admin) > **Services** view of NetWitness Platform.

• Third-party REST API web server is reachable.

To add REST API as a data source for Context Hub:

1. Go to (**Admin**) > **Services**.
   The Services view is displayed.

2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config view is displayed.

3. In the **Data Sources** tab, click  > **REST API**.
   The Add Data Source dialog is displayed.

4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - Enter the following fields.
     a. **Name** - Enter a name for the REST API data source.
     b. **URL** - Specify the REST API URL with the query parameters.
     The following table lists some examples of URL and associated parameters:

URL	Parameters
https://www.virustotal.com/vtapi/v2/file/report?apikey=<API Key>&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, C5D0065B594A4775E26FA9875B21189F

URL	Parameters
https://www.virustotal.com/vtapi/v2/url/report?apikey= 1bfdf66f3b0f1875381830ec933f7151f5b48c1cbaa54ac625f2d5a74312e9a2&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, textspeier.de

c. **Description** – Enter the description of the REST API data source.

d. **User name**: Enter the username of the REST API if it needs to be authenticated.

e. **Password**: Enter the password of the RSET API if it needs to be authenticated.

f. **Response Type**: Select the REST API response type. Possible values are:

- HTML
- JSON

g. **Test Meta value**: Enter the meta value to test the REST API connection.

Note:
- The meta value you specify will be replaced with `$metavalue` in the URL mentioned in step 2 for test connection.
- During context lookup, the `$metavalue` variable is replaced with meta value in the REST API call.

h. **SSL** - Enables SSL communication to REST API. By default, this option is selected.

i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate. By default, this option is enabled.

j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

5. Click **Test Connection** to test the connection between Context Hub and the REST API data source.
6. Click **Next**.
7. In the **Response Preview** section, you can view the live response for the REST API configured, using the test meta value as a placeholder.
8. In the **Meta Mapping** section, select one or more meta type supported by the REST API to view context lookup (for meta values) in the Respond and Investigation views.
9. In the **Field Mapping** section, you can add friendly display name for the response field for which you want to perform context lookup. Do the following:

a. Click .

b. In the **Field** drop-down, enter the path for which you want to add a friendly name. As you type the path, the auto-suggest function looks for the matches in the JSON path returned in the response preview. You can also add the path that is not available in the response preview but available for other meta values.

c. **Value (from Preview)** field is filled automatically when you select the path.

d. In the **Display Name** field, enter the friendly name.

> **Note:** After configuration, only the fields that are mapped with friendly names are displayed during context lookup. If you do not map any fields, all fields in the JSON will be available during context lookup.

10. Click **Save** to configure the data source.

> **Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  (**ADMIN**) > **Services**> **View** > **Explore** view.

Edit REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the Data Sources tab, click  > **REST API**.
4. Edit the required fields.
5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. In the **Meta and Field Mapping** and **Cache settings**, edit the required fields.
7. Click **Save** to save the settings.

> **Note:** In 12.3 and later versions, field mapping and Data Preview are enabled for authenticated REST API without providing the username and password.

Delete REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the **Data Sources** tab, select the data source you want to delete.
4. Click .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to  **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

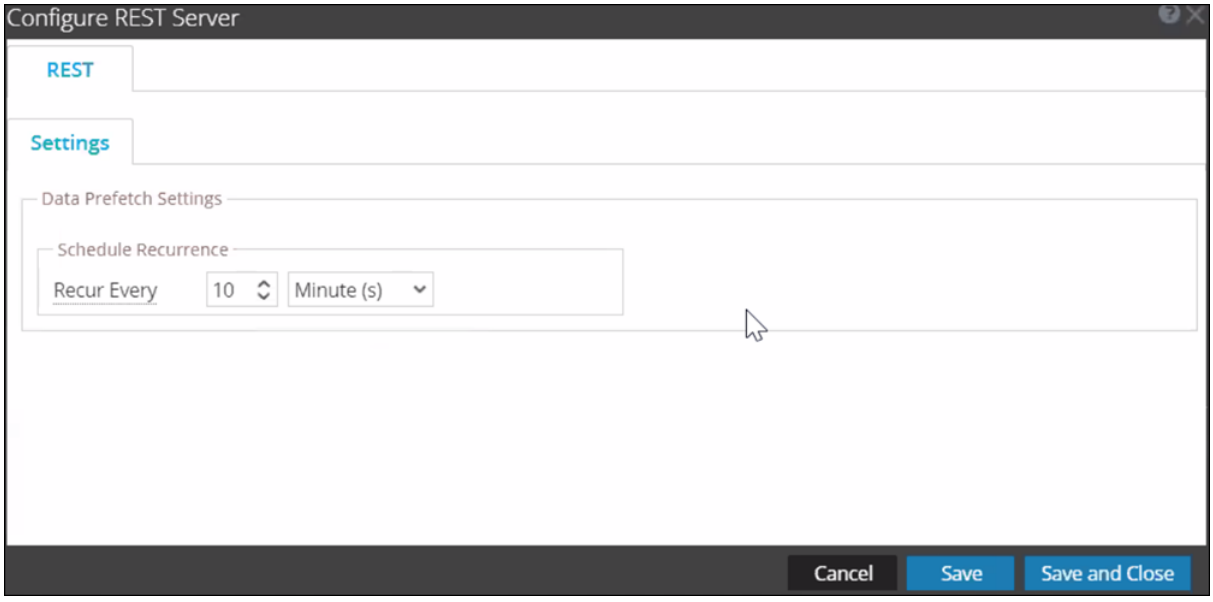
3. Select the data source for which you want to configure the settings and click  in the Actions column.

   The following screenshot is an example of the NetWitness Endpoint settings dialog:

The following screenshot is an example of the REST API settings dialog:

4. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.

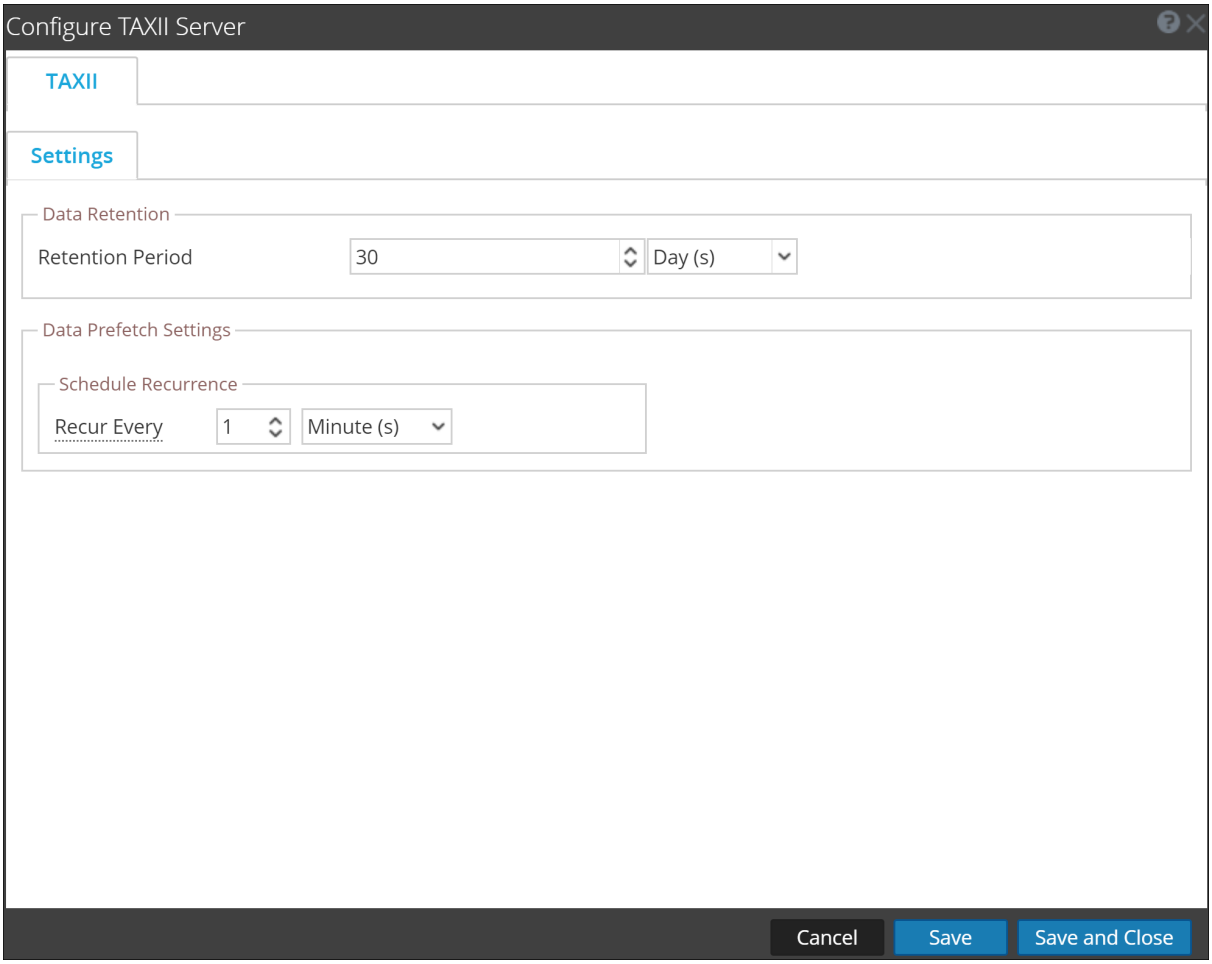


Field	Description
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.
List value Expiration	**Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained. **Time to Live (Days)**: Enter the number of days you want to the list values to be retained.
Meta Mapping	Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Context Hub Fields**: Column headers from CSV file you have added when creating a list.
Meta and Field Mapping	**Response Preview**: You can view the live response for the REST API configured, using the test meta value as a placeholder. **Copy**: Copies the response preview. **Meta Mapping**: Any REST API stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities selected. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Field Mapping**: Add friendly display name for the response field which is displayed during the context lookup.  - Add a field mapping. - Delete a field mapping. **Field**- Enter the path for which you want to add a friendly name. **Value (from Preview)**- The value is filled automatically based on the path. **Display Name**- Enter friendly name.
Minimum IIOC Score	The minimum IIOC score to be considered for fetching contextual information of NetWitness Endpoint modules.

Field	Description
Query Last (Days)	The duration (in days) for which the Context Data must be queried.
Limit	The maximum number of records to be displayed when Context Lookup is performed.
Recur Every	Configure recurring schedule to fetch and store contextual data for the required intervals.

5. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

To access and configure settings for STIX data sources



1. Go to **(Admin) > Services** and select Context Hub service.
2. Click > **View** > **Config** > **STIX** tab.
3. Select the data source for which you want to configure the settings and click in the Configurations column.
   a. For REST Server, the following fields are displayed.

Configure the following fields for REST Server.

Field	Description
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source.

b. For TAXII Server, the following fields are displayed.

Configure the following fields for TAXII Server.

Field	Description
Retention Period	Specify the number of days the content retrieved from the taxi data source must be retained before it is automatically deleted.
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source .

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

Data Source (Connection)	Response Supported Groups	Field Settings
List	List	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes]
Archer	Archer	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Export Attributes Configuration Export Attributes Data Prefetch Settings Schedule Recurrence
Active Directory	Users	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes]

Data Source (Connection)	Response Supported Groups	Field Settings
NetWitness Endpoint	IOC Machines Modules	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Minimum IIOC Score Context Panel Settings
Respond	Alerts Incidents	Context Panel Settings Data Prefetch Settings Query Last [Days Cache Settings Cache Enabled Cache Expiration (Minutes)
File Reputation Server	File Reputation Server	Cache Settings Cache Enabled Cache Expiration (Minutes)
TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. To map the metas, navigate to (Configure) > **System** > **Investigation** > **Context Lookup**.

Data Source (Connection)	Response Supported Groups	Field Settings
REST API	REST API	• Meta and Field Mapping • Meta Type • Field • Value (from Preview) • Display Name • Cache Settings • Cache Enabled • Cache Expiration (Minutes)

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Import or Export Lists for Context Hub

As an administrator you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

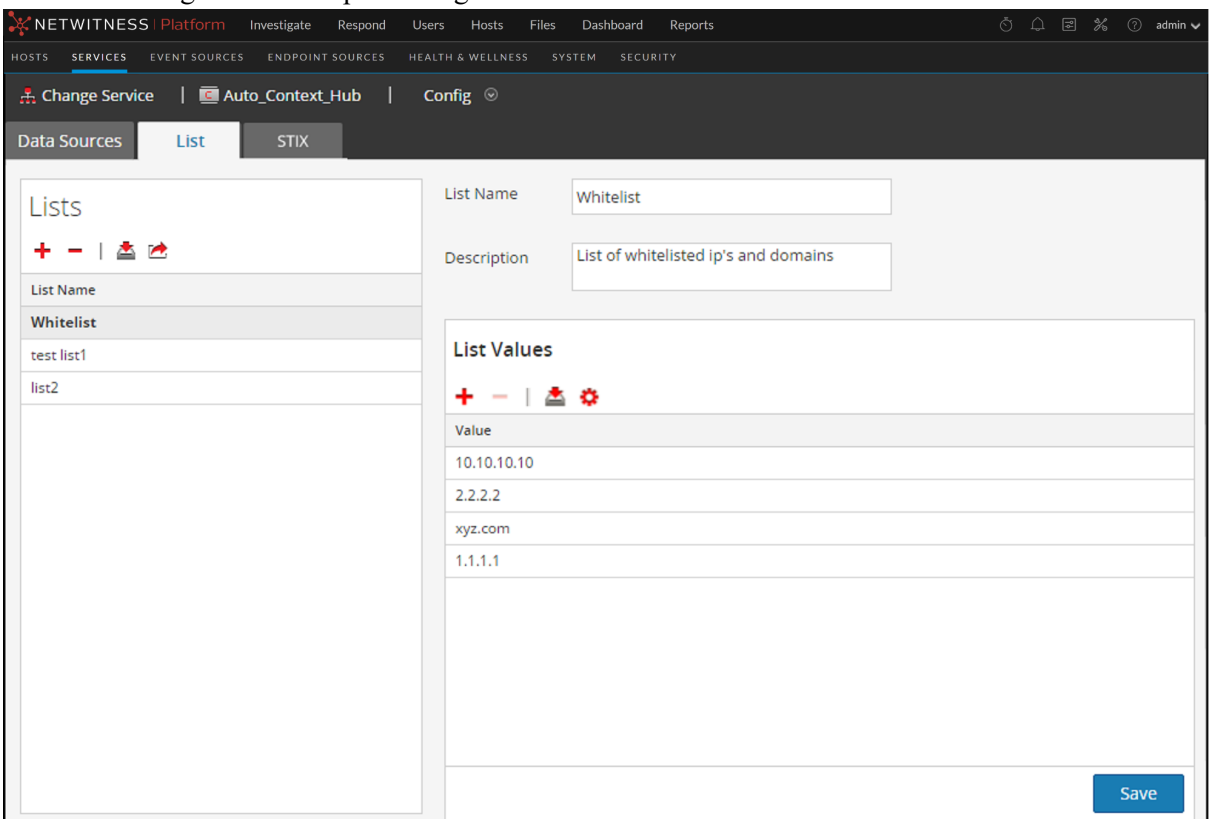
Prerequisites

Ensure that Context Hub is enabled and the service is available in  **(Admin) > Services** view of NetWitness.

Import a List

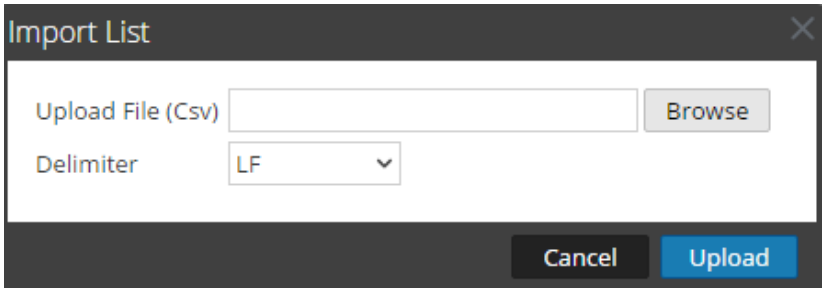
After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list



Note: You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file when the schedule recurs. In case of a custom feed list, if the feed is edited or deleted, the corresponding Context Hub list also gets edited or deleted.

Import Single-Column List



To import a list:

1. Select  **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list.

4. Click  on the **Lists** panel.
   The **Import List** dialog is displayed.

5. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).
6. Click **Upload** to upload the CSV file to Context Hub.

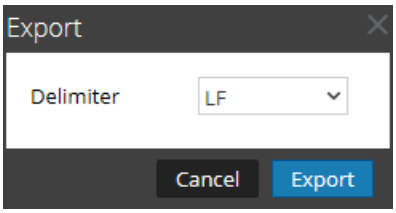
These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

Note: You cannot create a new multi column list by directly importing a CSV file. However, all the feeds that are converted into multi-colum lists will be displayed in the List tab. For information on how to import multi-column list, see Configure Lists as a Data Source

Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:



1. Go to  **(Admin) > Services**.
   The services view is displayed.
2. Service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click  on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

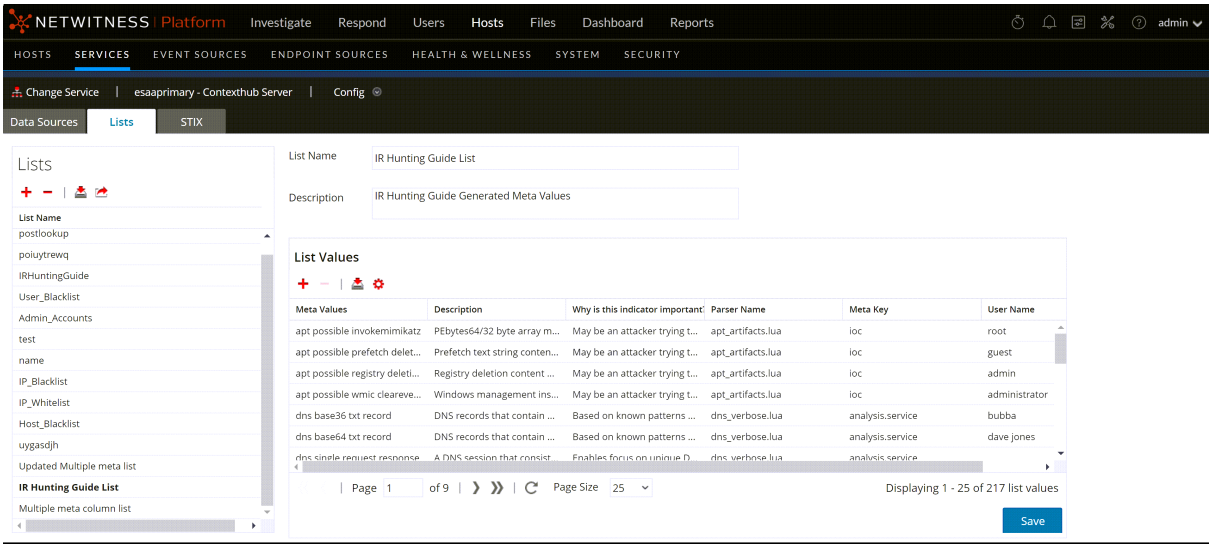
Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click  .
   The **Export** dialog is displayed.

2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

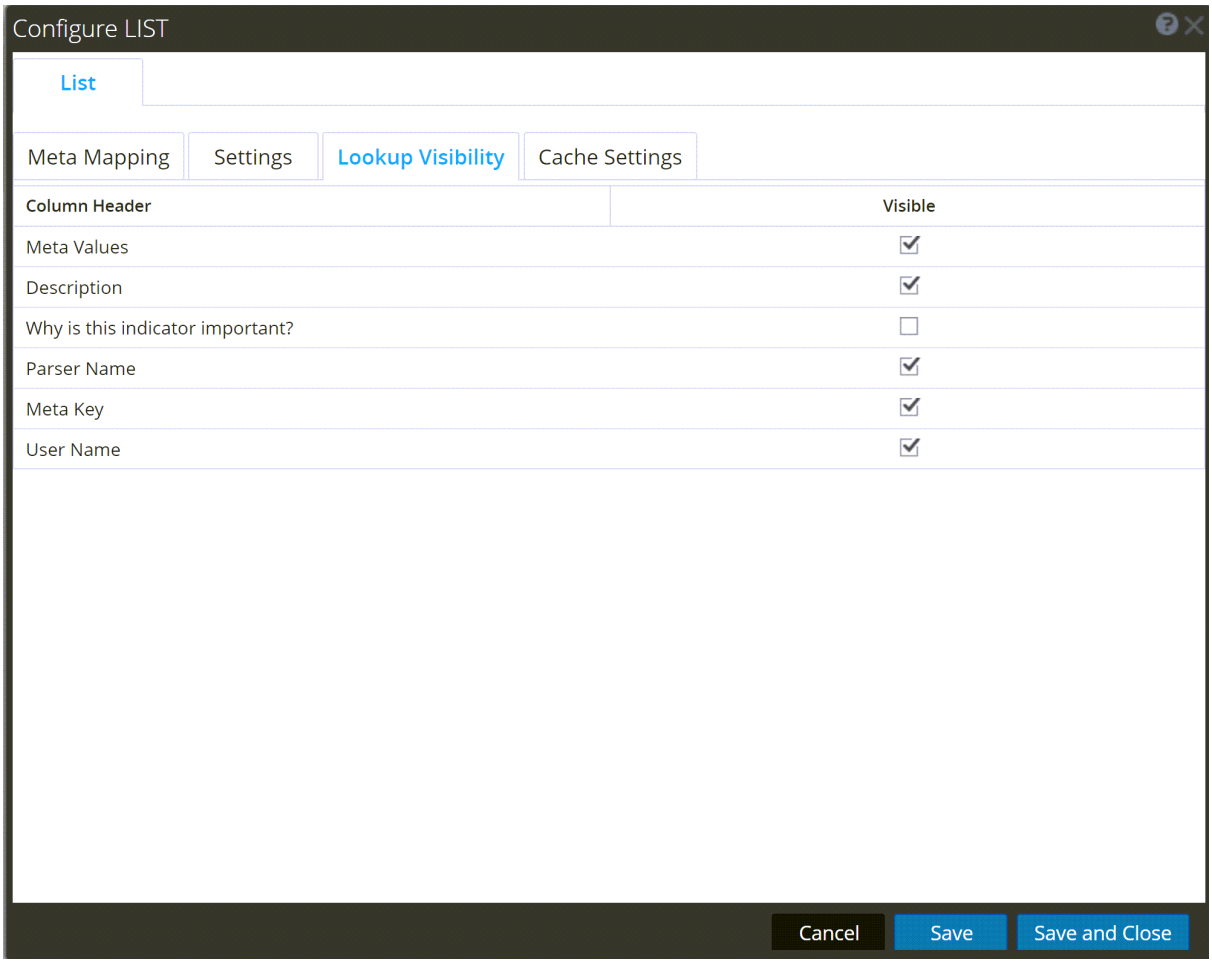
In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file to the local machine.



Note: When a custom feed is converted into a Context Hub list, you must map at least one meta key with one or more entity mapping for a column header with a meta. However, if you want to add or edit more entities you can do so by clicking ⚙.

Manage Meta values for Context Hub Lists

From NetWitness Platform 12.3 version or later, administrators can view and manage headers and values in the context Hub lists panel's newly added **List Details** tab. This enhancement helps administrators with more flexibility in enabling and disabling required meta values and helps analysts to have better visibility in the **Investigate** and **Respond** Context lookup Lists Panel for further analysis and investigation.



To view and manage context hub lists Meta keys

1. Go to  **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
   The below image is an example of multi-column lists.

4. In the Lists panel, select a list name for which you want to configure the settings and click on the  **Actions** column.
   The Configure List dialog is displayed.
5. Click the **List Details** tab.

   The available configured meta key for the lists is displayed.

6. By default, five meta keys will be enabled. You can deselect the required meta keys from the lists and select the required ones.

   Note:
   - The List Details tab must have at least one meta key enabled.
   - You can enable a maximum of only five meta keys in the Lists Details tab.

7. Click **Save**.

   You can now navigate to **Investigate** > **Events** or **Respond** view and click on the selected meta key or entity associated with the lists, the context look-up panel opens with the details of the selected meta keys on the Lists tab for further analysis. For more information, see topic Context Lookup Panel Lists Tab in the *NetWitness Investigate User Guide*.

Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with NetWitness meta keys.

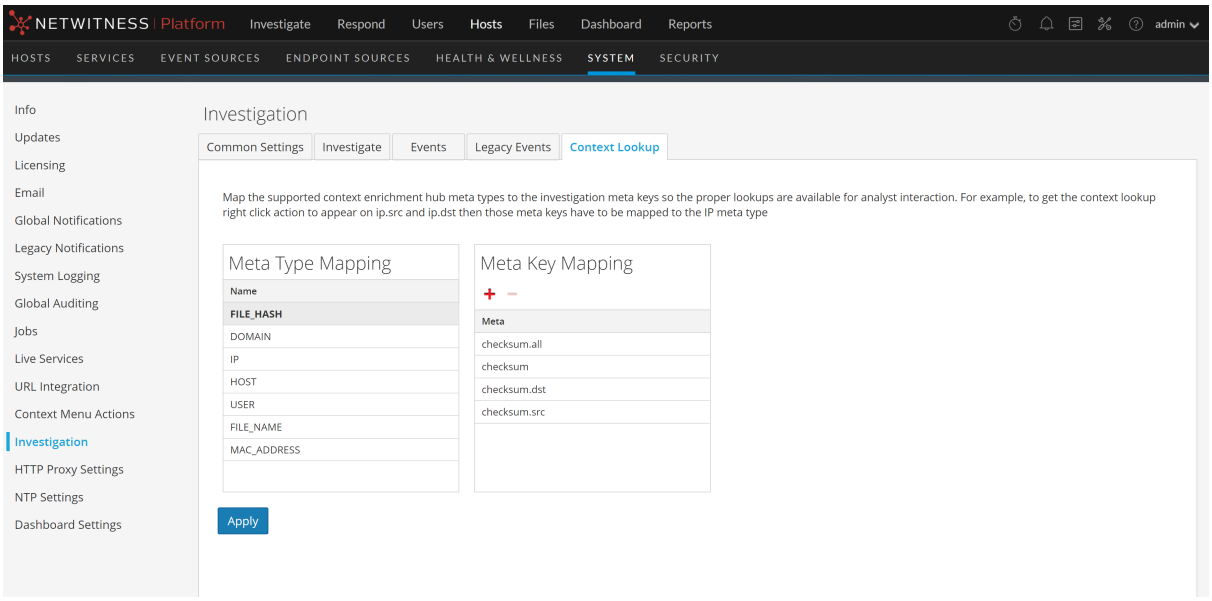
The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the Respond database.

In the  (Admin) **> System > Investigation** view, the Context Lookup tab enables the administrator to configure the NetWitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

Note: You cannot add a new Meta Type.

The default mapping is given below:



Meta Type Name	Meta Keys
IP	device.ip, ip.dst, ip.src, ip.addr, paddr, ip.all, alias.ip
USER	user.all, user.src, user.dst, username
DOMAIN	domain.src, domain.all, domain.dst
MAC_ADDRESS	eth.dst, eth.src, eth.all
FILE_NAME	filename, filename.all, filename.src, filename.dst, sourcefile
FILE_HASH	checksum.all, checksum, checksum.dst, checksum.src
HOST	device.host, alias.host, host.all

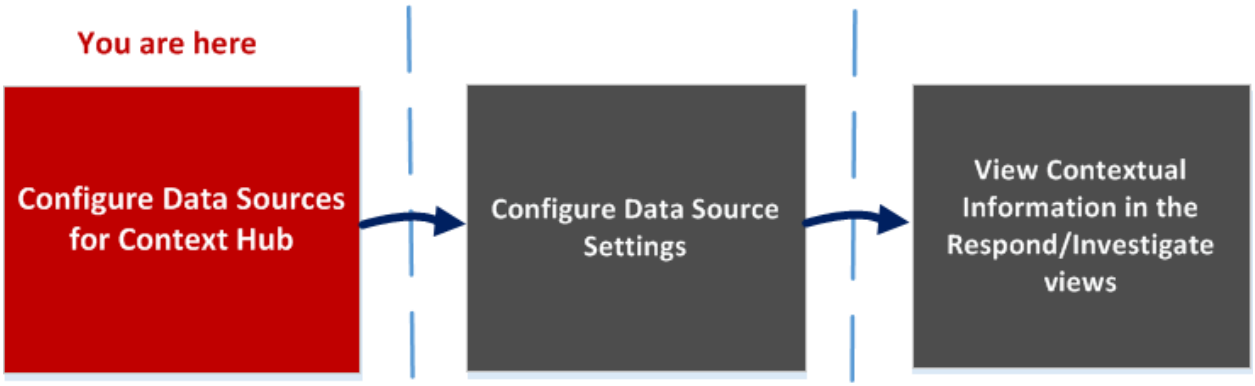
Procedure

To manage Investigation meta keys mapping:

1. Go to  **(Admin) > System**.
2. In the options panel, select **Investigation**.

   The Investigation Configuration panel is displayed.
3. Select the **Context Lookup** tab.

4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" form-at="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning Guide*. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.



In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

Workflow

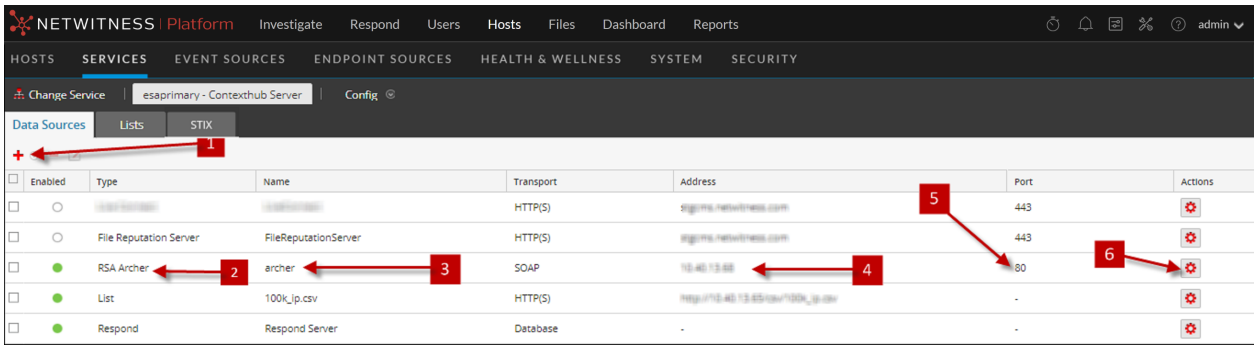
This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.

- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Sources for Context Hub*	Configure Lists as a Data Source Configure Archer as Data Source Configure Active Directory as a Data Source Configure NetWitness Endpoint as a Data Source Configure REST API as a Data Source Configure File Reputation Server as a Data Source Configure STIX as a Data Source
Administrator	Configure Hub Data Settings*	Configure Context Hub Data Source Settings

Role	I want to ...	Show me how
Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.
Analyst	Add, create and delete list from the Respond or Investigate View	See the *NetWitness Respond User Guide*. See the *Investigate User Guide*.
Analyst	Add or delete an entry from an existing list	See the *NetWitness Respond User Guide*.



*You can complete this task here (that is in the Context Hub Data Sources Tab.)

Related Topics

- Configure Lists as a Data Source

- Configure NetWitness Endpoint as a Data Source
- Configure Respond as a Data Source
- Configure REST API as a Data Source
- Configure File Reputation Server as a Data Source
- Configure STIX as a Data Source
- Configure REST API as a Data Source

Quick Look

The following example illustrates how to add a data source for Context Hub service.

1 Click + to display the **Add Data Source** dialog.
2 Displays the type of Data Source.
3 Name that identifies the Data Source.
4 The IP address or hostname of the data source.
5 The connection port for the data source.

6 Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.

7 Click **Test Connection** to verify that the host is connected to the Context Hub service.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Lists as a Data Source.
	Delete a data source. If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available.
	Opens the Edit Data Source dialog.
	Opens the Configure Settings dialog. You can view and edit the settings for the data sources. For description of each field in Configure Responses dialog, see Configure Context Hub Data Source Settings .

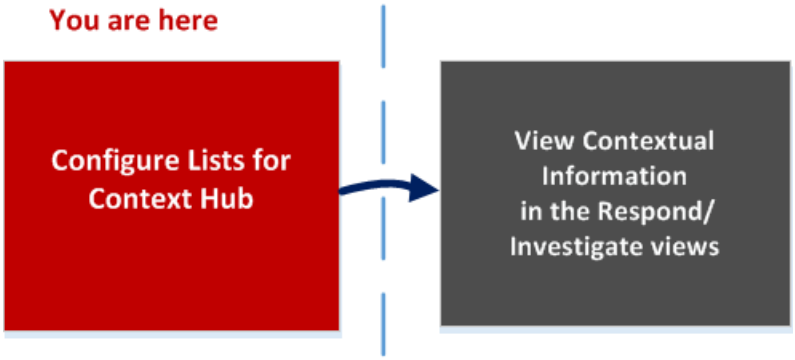
Data Source Configurations

The following table describes the listed configurations.

Feature	Description
Enabled	Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled (). An blank white circle indicates that data source is disabled.
Type	The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, REST API or File Reputation server.
Name	The unique name to identify the data source. For example, Respond.
Address	The IP address or hostname of the data source.
Port	The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on.

Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Lists** tab.



The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing external or custom feed CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

Note: You can also create lists and add list values from Respond and Investigation views. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.

Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure List Data Source for Context Hub*	Configure Lists as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

Role	I want to ...	Show me how
Administrator/ Analyst	"Manage Lists and List Values in Investigation	See the *Investigate User Guide*.
Administrator/ Analyst	Create a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Update a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Delete list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Import a list	Import or Export Lists for Context Hub
Administrator/ Analyst	Export list	Import or Export Lists for Context Hub

*You can complete this task here (that is in the Context Hub Lists Tab).

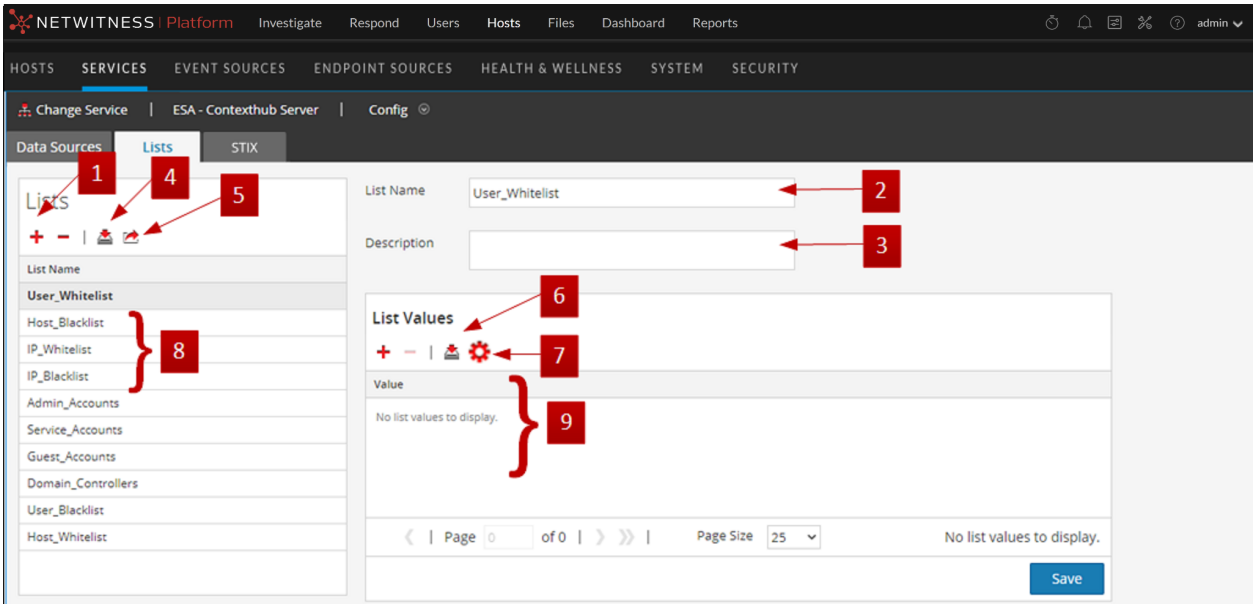
Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.



By default, 10 empty single-column lists are available in NetWitness11.1. These lists are empty and you need to add information to these lists. The out of the box 10 list names are used in ESA rules, for more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide*. For users upgrading from previous versions, they will be able to view these new lists in addition to their previously created lists. The lists available by default are:

- Admin_Accounts
- Guest_Accounts
- Service_Accounts
- User_Blacklist
- User_Whitelist
- Host_Whitelist

- Domain_Controllers
- IP_Blacklist
- IP_Whitelist
- Host_Blacklist

Note: If a list with the same name already exists prior to updating to or installing NetWitness12.4, then that list will be retained. Either rename that list before updating to 11.1 or update the contents in such a way that it can be used in ESA rules.

The lists are available in ESA rules tab in CONFIGURE > ESA Rules > Settings > Enrichment Sources. For more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide for Version 11.1*.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.

1	Click + to add a new list.
2	Name that identifies the list.
3	Description of the list.
4	Click to import list(s) to Context Hub.
5	Click to export a list to the local machine.
6	Click to import list values to selected list.
7	Click to add or edit entity mapping.

8	Displays the custom list(s) that are added to Context Hub.
9	Displays the list values that are added to the selected list.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Add a new list. For more information, see Configure Lists as a Data Source.
	Delete a list. If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information.
	Import lists to Context Hub. For more information, see Import or Export Lists for Context Hub.
	Export a list to the local machine. For more information, see Import or Export Lists for Context Hub.

Note: You can select multiple lists at a time. Do one of the following:
1. Select a list, press and hold Ctrl key, and click the lists to be selected.
2. Select a list, press and hold Shift Key, and use arrow keys to select other lists.

List View Options

The following table describes the Lists configurations.

Feature	Description
List Name	Unique name to identify the list.
Description	Description of the list.
Save	Saves the changes made to the list.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Context Hub STIX Tab

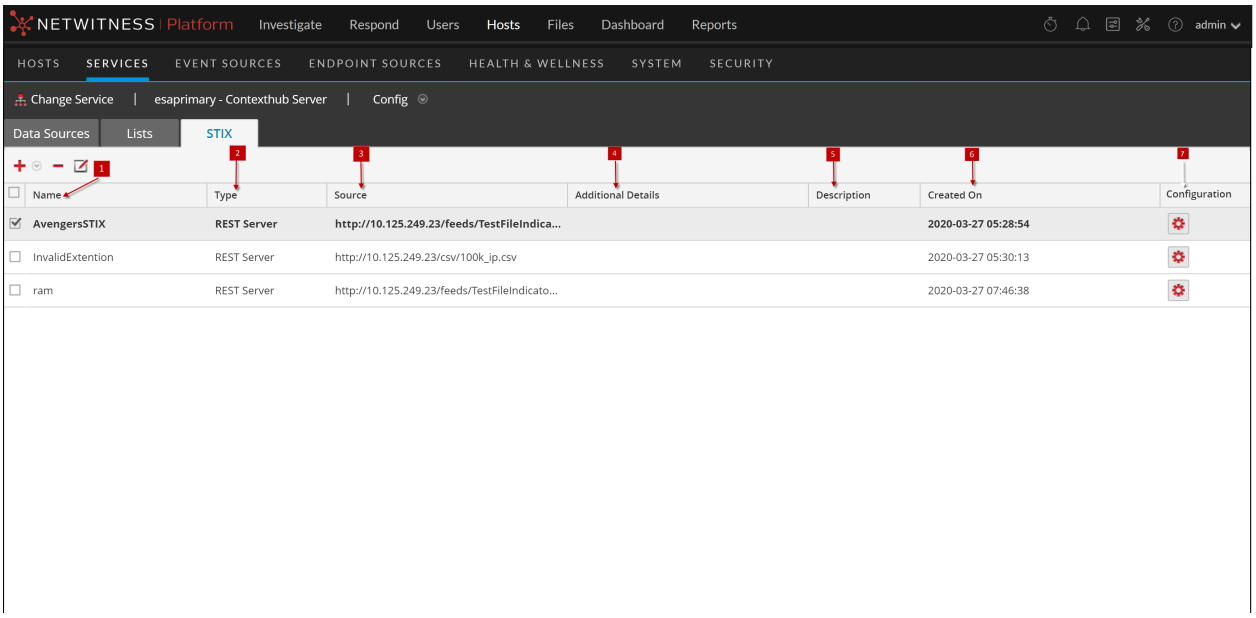
In the **STIX** tab, you can create and configure Structured Threat Information eXpression (STIX) data source for Context Hub. Navigate to  **(Admin) > Services**> Select Context Hub service > **View** > **Config** > **STIX** tab.

The STIX tab of the Context Hub service allows you to create one or more STIX, REST URLs, or TAXII data sources and edit them whenever required. When STIX is configured, Context Hub service automatically considers it as a data source.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure STIX Data Source for Context Hub*	Configure STIX as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

*You can complete this task here (that is in the Context Hub Lists Tab).



Related Topics

- Configure STIX as a Data Source

Quick Look

The following example illustrates how to add STIX to Context Hub service.

The STIX tab consists of add, delete and edit data sources options.

1	Name that identifies the added STIX source.
2	Type of data source - REST server, STIX or TAXII server.
3	The path of the source from which the STIX files are obtained.
4	Additional details related to the data source being added.
5	Description of the data source.
6	Date when the data source was created.
7	Click to edit the selected data source and configure advanced settings.

Toolbar

The following table describes the toolbar actions.

Feature	Description
+	Add a new data source such as File, REST Server, or TAXII Server. For more information, see Configure STIX as a Data Source .
−	Delete the selected data source.
✎	Edit the selected data source.

The following table describes the all the data source server configuration options.

Field	Description
Common Configuration Options	

Field	Description
Enabled	Select this checkbox to enable the configuration.
Name	Provide a name to the data source you want to add.
Description	Description of the data source.
Cancel	Click to revert the data source addition.
Validate	Click to verify the URL path to the Server.
Save	Click to save the configuration and add the required server as a data source.
REST Server Configuration Options	
URL	URL of the REST server.
Username (Optional)	Provide the username of the REST server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Click browse to navigate to the location of the certificate file.
TAXII Server Configuration Options	
URL	URL of the TAXII server.
Username (Optional)	Provide the username of TAXII server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Client Certificate	Browse to upload a pkcs12 format client certificate available on your local system.
Certificate Password	Enter the password to the certificate, if it is password-protected.
UserProxy	Select this checkbox to enable proxy.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Browse and select the certificate file.
TAXII Collections	Select the TAXII Collection name from the drop-down to automatically download the collection.
	Click to manually retrieve the list of available TAXII Servers, if the collections are not downloaded automatically.

Field	Description
STIX File Configuration Options	
File	Browse and select the STIX file.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when setting up their ContextHub service in NetWitness.

Problem	Solutions
Prefetch for list fails if the list is created in append mode.	**Details:** The following error message is displayed in logs indicating that, entries in list exceeds the max allowed. `Error setting data source entries com.rsa.asoc.contexthub.exception.ContextHubException: total.entries.exceed.max` Also, Health & Wellness sets the stat - `Contexthub.Datasource.Health.Data-Sources-Health` to `Unhealthy` and displays the names of the lists for which prefetch has failed. For example, number of entries in the list are 50001 and number of records in the CSV file are 50001 (user did not change the csv since last prefetch.). Upper limit on number of entries in list is 100,000. Now on prefetch, Context Hub will try to append 50001 entries to the list but since 50001 + 50001 > 100,000, prefetch fails. **Solutions:** You should add only those entries in the .csv file which they wish to append to the existing .csv file. If, you do not want to append any entries to the list then perform one of the options, as applicable: • If you created the list with headers: remove all rows from the csv except the header. • If you created list without headers: you should have 0 rows in csv.
The Respond service is not able to send incidents to Archer with third party signed certificates.	As a workaround, you need to run a command to add a PEM certificate to the Respond trust store Run the following command on the Respond host: `security-cli-client --add-trusts -s respond-server -x <pem_certfilename> -u <username> -k <password>` Where: • `<pem_certfilename>` is the name of the certificate file. • `<username>` and `<password>` are your NetWitness administrator credentials.
SSL handshake with Archer certificate fails while adding it as a data source.	Use an archer generated certificate with the Trust All Certificates option configured.

Problem	Solutions
Pivot to Investigate option on the Respond page does not navigate to the correct link.	When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the NetWitness Server, login to the NetWitness Server Host and enter the service jetty restart command.
When you import a list with missing quotes such as "172.16.0.0, the list is saved without any data to display.	This is because of the Apache bug (CSV-141), which does not parse CSV files with incorrect formats. To fix, import a list with correct quotes to avoid displaying an empty file. For example, “172.16.0.0”, “host.mycompany.com” and so on.
Increasing the limit settings for Alerts and Incidents leads to lookup error.	By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased, the looked-up meta for alerts and incidents may lead to lookup error. This happens due to an internal database restriction. Make sure to keep the limit for viewing number of Alerts and Incidents to 50 or less.
Multiple incident and alert tabs are displayed while editing advanced configuration of Respond datasource.	You must delete duplicate entries in the Context Hub MongoDB and restart the MongoDB Context Hub Server. Perform the following: 1. Log in to control MongoDB on Admin Server. 2. Go to contexthub-server > ds_meta collection. **Note:** Make a note of '_id' value of duplicate entries for the incident and alerts documents that you want to delete. 3. In the ds_meta collection, delete 1 Incident and 1 Alert document. Once the duplicate entries are deleted only 1 Incident and 1 Alert type document will be available in the ds_meta collection. 4. Log in to application MongoDB on ESA Primary. 5. Go to contexthub-server, locate and delete the below collections: • ds_entries*_*<id-of-incident-doc-deleted-in-step 3> • ds_entries*_*<id-of-alert-doc-deleted-in-step 3> 6. Under bookmark_store collection, locate and delete documents with id same as _id of Incident and Alert from ds_meta collection. 7. Restart Context Hub Server.

Data Privacy Overview

This topic introduces the concept and implementation considerations for a data privacy officer or administrator who is managing exposure of privacy-sensitive data in NetWitness. In addition, information about recommended use cases is included.

Note: A data privacy plan touches on most components of NetWitness. The person who configures data privacy needs to understand NetWitness network components, configuration of NetWitness hosts and services as described in the *Host and Services Getting Started Guide*, and the types of information that need to be protected.

Regulatory mandates in some locations, for example the European Union (EU), require that information systems have a means of protecting privacy-sensitive data. Any data that could directly or indirectly identify "Who did what when?" may be considered privacy-sensitive data. A few examples are user names, email addresses, and host names. NetWitness provides a range of controls that customers can leverage to protect privacy-sensitive data. These controls can be used in a variety of combinations to protect privacy-sensitive data, without significantly reducing analytical capability.

A user role for a Data Privacy Officer (DPO) supports the management of privacy-sensitive data. The DPO can configure NetWitness to limit exposure of metadata and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness include:

- Data Obfuscation
- Data Retention Enforcement
- Audit Logging

Data Obfuscation

NetWitness has configurable options for data obfuscation. Data privacy officers and administrators can specify which meta keys in their environment are privacy-sensitive and limit where the meta values and raw data for those keys are displayed in the NetWitness network. In place of the original values, NetWitness can provide obfuscated representations to enable investigation and analytics. In addition, DPOs and administrators can prevent persistence of privacy-sensitive meta values and raw logs or packets.

Three methods work together to implement data obfuscation:

- Obfuscation of meta values for privacy-sensitive meta keys with an optional salt. Meta keys configured as protected are represented by obfuscated values at the time of creation on a Decoder or Log Decoder; the obfuscated values are hashed and considered to be impossible to read. To implement, you must configure the Decoder and Log Decoder hash algorithm and salt, and configure privacy-sensitive language keys as protected on all Core services.
- Role-based access (RBAC) to the raw logs or packets and the privacy-sensitive meta values. The DPO can use roles with granular permission capabilities to restrict what an analyst versus a data privacy officer is able to view during configuration, analysis, and investigation. The *System Security and User Management Guide* provides in-depth coverage of the RBAC implementation in NetWitness. To implement, you must configure metadata and content visibility per role on individual Brokers, Concentrators, Decoders, Log Decoders, and Archivers.

- Preventing persistence of privacy-sensitive meta values and raw logs or packets. To implement, you must configure meta keys on parsers for individual Decoders and Log Decoders as transient.

Data Retention Enforcement

NetWitness can ensure that data is retained only as long as necessary or as specified. An administrator can configure data retention using age and time thresholds on a per-service basis. Schedulers running on each service automatically delete data meeting those thresholds. Once the data is deleted, it is no longer available through user interfaces, queries, or application programming interface (API) calls. Some of the NetWitness components also support purging of data through overwrites.

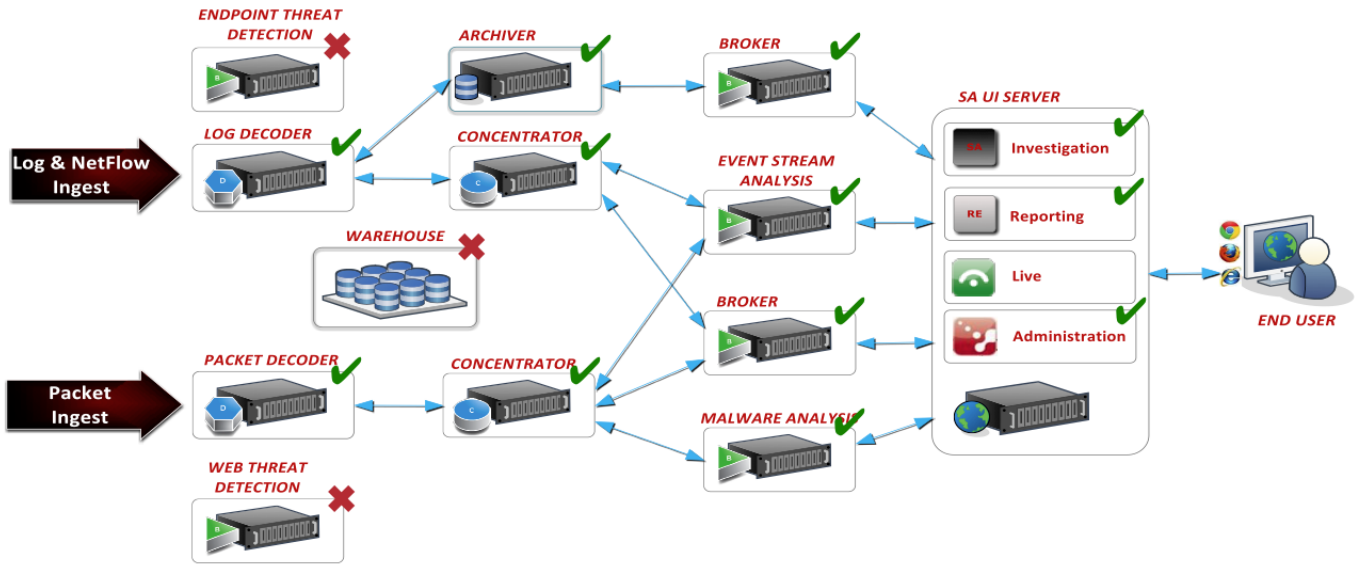
An administrator can manage data retention in several ways:

- Configure how long data persists in storage on the system.
- For Core services, strategically remove privacy-sensitive data that may have been written by configuring automatic removal of data of a specific age.
- Configure NetWitness so that original data is not sent or saved to the other components. If privacy-sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, and NetWitness Servers, data retention can be managed there as well. This configuration for Event Stream Analysis is managed in the Services Explorer view.

Note: If a situation arises where the DPO decides that already collected data is privacy-sensitive after the system is functional, the administrator can manually overwrite the data from databases or files where the data is saved.

Audit Logging

Administrators can leverage audit logs that NetWitness creates using the Global Audit Logging feature. The audit logging feature generates audit log entries about many activities, and the following are examples of log entries that are relevant to data privacy:



- Modifications to permissions and users assigned to roles.
- Failed and successful attempts to log on to NetWitness and log off.
- Data deletion.
- Data exports and downloads.
- Navigation by users to user interfaces and queries that users performed.
- Attempts (successful or not) to view or modify privacy-sensitive data, including an identification of the user who made the attempts.

All audit log entries are part of a standard audit trail for NetWitness. Administrators can configure NetWitness to forward audit logs to a designated destination, including third-party systems to provide additional filtering and reporting capabilities. For more information on Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Components Covered by the Data Privacy Feature

The figure below identifies the NetWitness components covered by the Version 11.x data privacy feature with a green check mark. Components marked with an X are not supported by data privacy functions. The *NetWitness Getting Started Guide* provides a functional description of NetWitness components.

Note: NetWitness data privacy features are not supported for Warehouse and protected metadata can make it to Warehouse through Warehouse Connector, unless explicitly configured to be filtered out using Warehouse Connector Meta Filters. If protected metadata makes it to Warehouse, users having direct access to Warehouse can query such data. Data privacy officers need to prevent that through administrative, technical, and procedural controls outside of NetWitness.

Data Privacy Feature Implementation by Component

The following table identifies which data privacy features are supported for each NetWitness component. For each component, a check mark indicates if the component supports data obfuscation, data retention enforcement, data overwriting, and audit logging.

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Ingestion				
Decoder	✓	✓	✓	✓
Log Decoder	✓	✓	✓	✓
Meta Aggregation				
Concentrator	✓	✓	✓	✓

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Broker	n/a	✓ (stored in DPO cache only)[1]		✓
Real-Time Analysis				
Investigate	✓	✓ (stored in DPO cache only)[2]		✓
Event Stream Analysis	✓			✓
Malware Analysis	✓	✓		✓
Respond	✓	✓		✓
Reporting				
Reporting Engine	✓	✓		✓
Long-Term Analytics				
Archiver	✓	✓	✓(uncompressed)[3]	✓
Warehouse				

Notes:
1 - Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker using the Scheduler in the Services Config view Files tab.
2 - Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
3 - The overwriting procedure described in Configure Data Retention applies to uncompressed data.

Component-Specific Configuration Guidelines

NetWitness components and modules that obtain access to privacy-sensitive metadata and their obfuscated counterparts are Investigate, Event Stream Analysis (ESA), Malware Analysis, Respond, and Reports. They get access to data based on the permissions defined for the role to which the user belongs. The Administrator or DPO configures each Decoder or Log Decoder to identify meta keys that are flagged for obfuscation.

These components have additional guidelines to ensure that they function as expected with a data privacy scheme:

- **Event Stream Analysis**. When ESA receives privacy-sensitive data from NetWitness core, ESA passes on only the obfuscated version of the data. ESA does not store or show protected data. There are some additional guidelines for configuring advanced EPL rules and enrichment sources as well as information on how to remove sensitive data globally from all alerts (see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules User Guide*).

- **Malware Analysis**. Malware Analysis references certain meta keys during scoring, including `alias.host`, `client`, and others. To ensure no loss of analytical functionality Malware Analysis should be configured as a trusted client; that is, configured to connect to the NetWitness Core infrastructure with an account equivalent to a user in DPO role. Otherwise, if meta keys referenced by Malware Analysis do get tagged for obfuscation and are not accessible to Malware Analysis, some of the Indicators of Compromise (IOCs) may be rendered ineffective.
- **Respond Server service.** The Respond Server service uses a data privacy mapping file to display obfuscated data in alerts.(see "Obfuscate Private Data" in the *NetWitness Respond User Guide*) and has a configurable data retention period for alerts (see "Set a Retention Period for Alerts and Incidents" in the *NetWitness Respond User Guide*).
- **Reports.** In Reporting Engine, each Core service is added as two separate data sources, using the two separate service accounts; one data source has a service account representing the Data Privacy Officer role and the other data source has a service account representing a non-Data Privacy Officer role. "Configure Data Privacy for Reporting Engine" in the *Reporting Engine Configuration Guide* provides procedures to configure data privacy for Reporting Engine.

Recommended Configurations

This topic describes the recommended data privacy implementation for NetWitness and several additional use cases for managing exposure of privacy-sensitive data in NetWitness. Administrators can set up the NetWitness hosts and services to meet data privacy requirements for their environment. This section provides recommended configurations for data privacy and data retention.

Recommended Data Privacy Configuration

The recommended configuration to obtain the best analytical value with data obfuscation enabled is to define privacy-sensitive metadata and keep both original and obfuscated (hash) values of privacy-sensitive data on disk for Decoders, Log Decoders, Concentrators, and Brokers.

The assumption is that only a handful of metadata (approximately 10 meta keys) will be classified as protected and a FIPS 140-compliant algorithm for hashing will be used along with a salt to make reverse engineering the original value difficult. The recommended solution is SHA-256 with a salt length of at least 16 characters and up to 60 characters.

Note: By default, hash values are stored in binary format for faster response times and because it requires less storage space in the database when compared to saving them in string format. The recommended storage method is text/string.

Brokers and Investigate may have original and obfuscated data in cache due to data privacy officers using Investigate to confirm the original value to which the obfuscated value maps during investigations. Downstream services can also limit the use of the original sensitive values to in-memory processing so that data does not persist on disk in those downstream systems; this holds true for ESA and Malware Analysis.

The recommended solution to delete data when ready is the built-in and automatic data retention enforcement, which deletes data at a certain threshold. You can use this method for the following components: Decoder, Log Decoder, Log Collector, Archiver, Malware Analysis, NetWitness Respond, and Reporting Engine. You can manually configure Event Stream Analysis to support similar automatic data retention enforcement.

To manage cache storage, the NetWitness Server clears cache related to investigations of events every 24 hours. The Broker can also be configured to execute a periodic removal of locally stored cache.

Options for Data Retention Configurations

NetWitness provides alternative controls that the administrator can apply to enforce stronger restrictions on privacy-sensitive data storage when data obfuscation is enabled.

Data Storage With Data Retention Options in Effect

The following table summarizes where data is stored in the default configuration with no data privacy as well as for each data retention alternative. A checkmark indicates that privacy-sensitive data is saved on the component; a blank indicates that no privacy-sensitive data is stored on the component.

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
Ingestion				
Decoder	✓	✓		
Log Decoder	✓	✓		
Meta Aggregation				
Concentrator	✓	✓		
Broker	✓ (Cache only)	✓ (Cache only)		
Real-Time Analysis				
Investigate	✓	✓ (Cache only)		
Event Stream Analysis	✓			
Malware Analysis	✓			
Respond	✓			
Reporting				
Reporting Engine	✓	✓ (Optional)		
Long-Term Analytics				
Archiver	✓ (Optional)	✓ (Optional)		
Warehouse	✓ (Optional)	✓ (Optional)		
Content				
Live	n/a	n/a	n/a	n/a
Fraud Analysis				
RSA Fraud and Risk Intelligence Suite	n/a	n/a	n/a	n/a

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
End Point Protection				
NetWitness Endpoint	n/a	n/a	n/a	n/a

Notes:
Cache Only means that sensitive data is in the Broker or NetWitness Server cache. Configure Data Retention provides details about automated and manual clearing of cache.
Optional means that sensitive data storage does occur, but can be limited by optional configurations. For example, to limit where sensitive data is stored, do not enable DPO access for Reporting and do not aggregate original protected data into the Archiver.

Option 1: No Original Data Saved to Disk, Only Hash Stored

Administrators can eliminate the persistence of sensitive data to disk and store only an obfuscated value if the risk of exposure is too great. In this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and must use obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, data obfuscation must be enabled with hash values configured. You can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save the original values for meta keys identified as sensitive, storing only the hash of original values along with other non-sensitive metadata related to the event.

A side effect of these options is some loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds).
- Event stream analysis (ESA) and Malware Analysis systems must rely only on the obfuscated meta values when doing their correlation and scoring respectively.
- Reporting Engine is limited to pulling reports using the non-sensitive and obfuscated values.

- The data privacy officer cannot view the original value, but can use the configured hash and salt to determine if an obfuscated value represents a specific known original value.

Option 2: No Original or Obfuscated Values Stored: Not Recommended

Administrators can eliminate the persistence of the original value to disk entirely if the risk of exposure is too great. As in Option 1, in this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and have no obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save not save the original values for meta keys identified as sensitive, storing only non-sensitive metadata related to the event.

A side effect of these options is significant loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds). See Configure Data Retention.
- All downstream components have no visibility in the original values, obfuscated or otherwise.
- The data privacy officer has no visibility into the original value obfuscated or otherwise.

Optional Data Overwriting Options

Several options for overwriting data are available, and you should thoroughly understand each one before implementing data overwriting.

Option 1: Limit Disk Space for Continuous Overwriting of Older Data

If the desired data retention period to store the data, and therefore the amount of storage required for that data, is known, the size of the underlying hardware or the partition can be limited to that size. By reducing the hard drive storage or the partition size, the amount of free space available that has to be filled before new data overwrites it would also be limited. The newly ingested data continually overwrites the older data. Either solution must be done at deployment time to be effective.

Side effects of this option are:

- The removal of some disks will limit the number of resources available to distribute the I/O, causing some degradation in performance.

- The smaller partition size may cause some degradation in performance, but would alleviate some of the performance impact of removing disks.

Option 2: Use Tiered Storage to Overwrite Data on a Scheduled Basis

If overwriting of data is required on a scheduled automatic basis, you can configure the Decoders and Concentrators to use tiered storage. The tiered storage configuration provides a mechanism for invoking a script after a database file has been removed from the application but prior to its removal from the file system. If necessary, instead of moving the file to the second tier, or cold storage, (the intended function in a tiered storage use case), the script can use a utility like the CentOS `shred` utility to overwrite the file. This tool is less effective when the database is stored in a journaling file system like XFS, in which the Core database resides, and on a RAID logical drive like the ones with which the Core hosts connect.

Most other NetWitness components do not have this option; their data is stored in a database that does not support the tiered storage mechanism. The only other component that could use this overwrite method is the Reporting Engine since it saves reports and alerts as individual files. However, the Reporting Engine charts are stored in a database so they would be immune to this technique.

Option 3: Purge Data Using String and Pattern Redaction Option

Data purging provides a mechanism to strategically overwrite a specific subset of data from the system in case any sensitive data has been persisted either on purpose or by accident. The NetWitness `wipe` utility allows for unique patterns to be written over the data in the meta and packet databases for Core services, which may contain RAW packets or logs for existing sessions, based on a session identifier. All Core components have the capability to overwrite a subset of data that has been found by executing a query string, including regex patterns. The session identifiers resulting from the query are fed into the NetWitness `wipe` utility.

Note: This option is not available if the data in the Core database has been compressed (as typically done in Archiver deployments).

In most NetWitness components the database in use does not provide a built-in redaction or secure deletion mechanism. The Malware Analysis component can overwrite the data object in the database with the value `private` instead of deleting it during the data retention management process, but this is not meant to be a secure deletion mechanism.

Caution: Using this method on a large number of sessions has two drawbacks: it can be time-consuming and impact performance.

See Purge Data Using String and Pattern Redaction Option for procedure.

Limitations to Data Overwriting

There are limitations to the overwriting techniques described as Option 2 and 3. To perform the overwrite of the data in the disk sectors, the above options for overwriting and the overwrite command line tool provided as an alternative method (`shred`, a function of CentOS) make assumptions about the disk layout. NetWitness hosts use SSD drives and RAID configurations for performance and reliability reasons, and these inhibit the functionality of the overwrite techniques. If overwrite techniques alter SSD drives and RAID configurations in an attempt to increase security, there will inevitably be an associated performance cost reflected in ingest rates, query speeds, and potentially other areas. The command line tools available for overwrite are recommended only for special use cases when it is necessary to redact specific data. The tools are not for use in a real-time continuous method because of the potential performance cost that will be incurred.

Quick Start Procedures

This section provides end-to-end instructions for preparing to configure data privacy features, then completing the configuration of the recommended data privacy solution.

- Prepare to Configure Data Privacy
- Configure the Recommended Data Privacy Solution

Prepare to Configure Data Privacy

This topic provides general guidelines for planning and configuring data privacy policies in the NetWitness network. Before beginning configuration, you must understand the data that needs to be protected on your network and develop a plan. You will need to:

1. Identify the meta keys that hold privacy-sensitive data and need to be protected. This decision is based on requirements specific to your site.
2. Decide which users need access to privacy-sensitive metadata and raw content. The first decision is whether to separate the DPO and administrator roles for your site by configuring a custom administrators system role on Decoder and Log Decoders and removing the `dpo.manage` permission. By default, administrators have all permissions including the ability to configure the salted hash transform used to obfuscate data; some sites may want to reserve this access for data privacy officers. "Service User Roles and Permissions" in the *Hosts and Services Getting Started Guide* has more details on exactly what permissions each role has and the purpose of the permissions.
3. Plan the configuration changes you need to make in your NetWitness deployment to support adequate data privacy.
4. Assess how your configuration may impact out-of-the-box and custom content. For example, by default content available through Live for Reporting Engine is not geared toward obfuscated meta values.

In a single deployment, certain data-privacy configurations in the Core services must be the same. The following table lists these settings and uses a checkmark to identify the services for which the configuration must be the same. In the heading, the following abbreviations are used: D = Decoder, LD = Log Decoder, A = Archiver, C = Concentrator, and B = Broker.

	Configuration must be the same for these services:				
Setting	**D**	**LD**	**A**	**C**	**B**
Hash algorithm and salt for privacy-sensitive data	✓	✓			
Language key data privacy attributes in the custom index file (includes configuring keys as protected)	✓	✓	✓	✓	✓
Transient meta keys (not persisted on disk) per service and parser	✓	✓			
Meta data and raw content visibility per system user group. (The meta keys must exist in the custom index file.)	✓	✓	✓	✓	✓
User who has the `Aggregation` service user role assigned is added.*	✓	✓	✓		

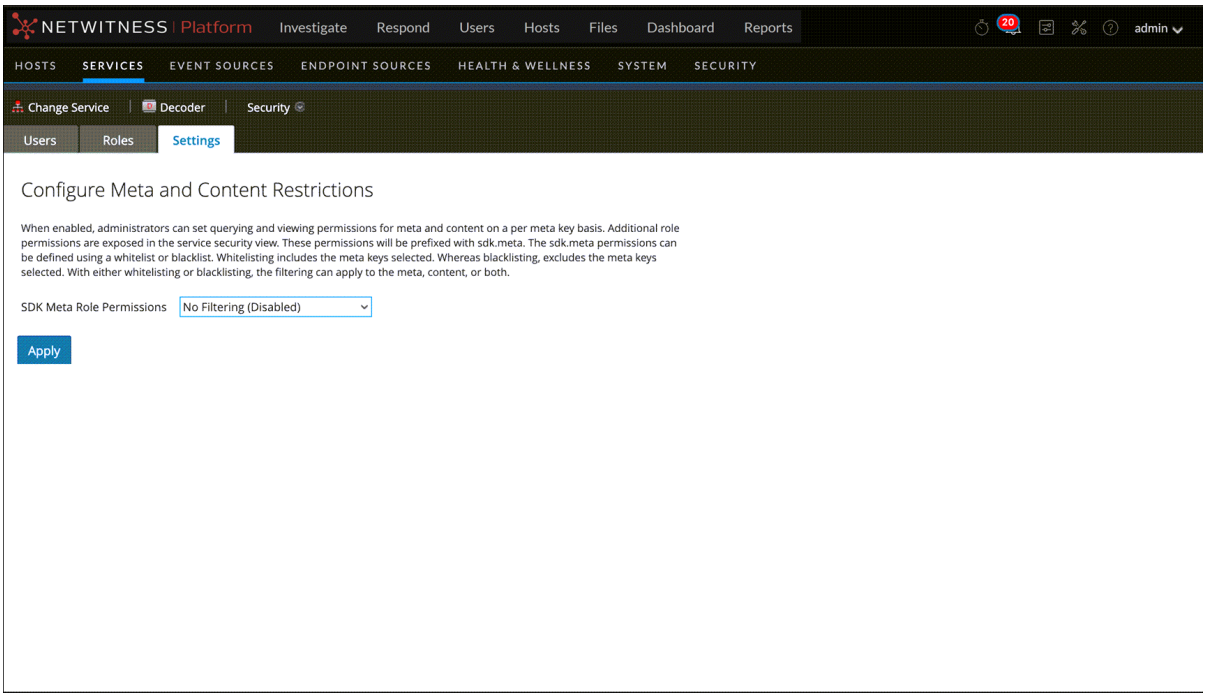
* When trying to access data on an aggregate service, the Log Collector or Broker requests authentication. When prompted to enter user name and password, you must authenticate as a user who is assigned the `Aggregation` service role. "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide* provides detailed information about this role. Follow the instructions in "Add, Replicate or Delete a Service User" in the *Hosts and Services Getting Started Guide* to create a user and assign the new user the Aggregation service user role.

Configure the Recommended Data Privacy Solution

This topic tells administrators and data privacy officers how to configure the recommended data privacy solution in a NetWitness network. These are the basic steps to follow to configure the NetWitness system to identify sensitive data and determine who can see the sensitive data. The recommended configuration generates obfuscated values of certain original meta keys and then persists both the original and obfuscated data so that it is available to users assigned privileged role access.

This configuration has several parts:

1. Create two users with different levels of permissions. One user (the data privacy officer) can view all metadata and another user (an analyst) is restricted from seeing certain metadata and content with associated metadata.
2. Set up two transforms using a salt and hash to create an obfuscated version of original `username` and `ip.src` meta keys.
3. Configure data retention on the Decoder and Concentrator services.

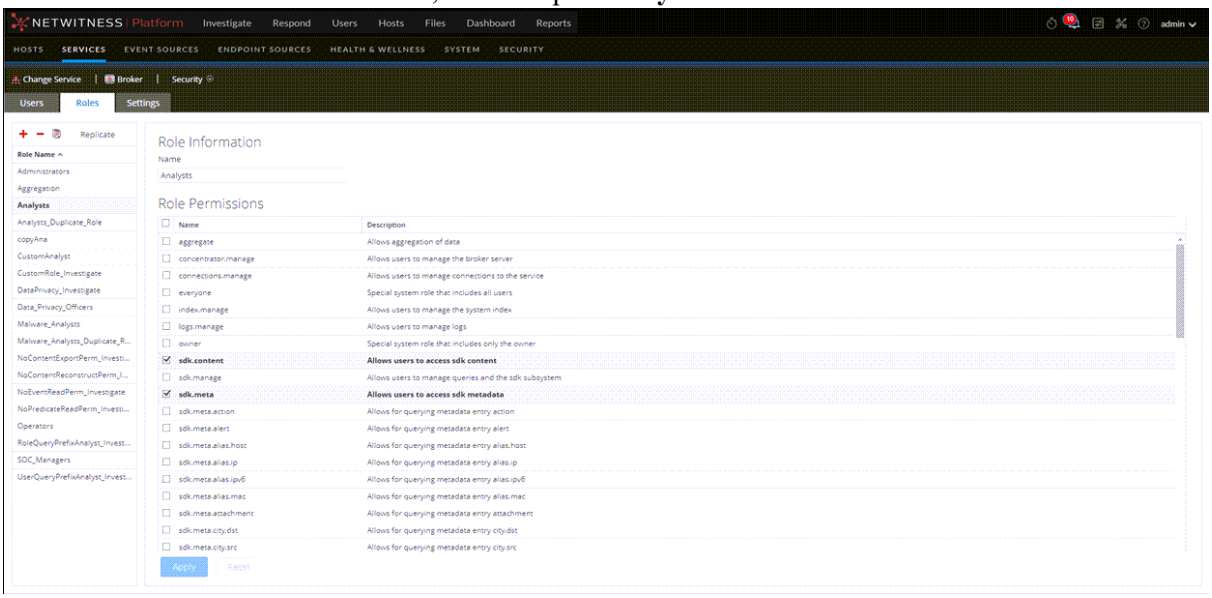


Note: The following conditions are required in order to complete this procedure:
-The Concentrator and Decoder must be added to the NetWitness Server using trusted connections.
-The NW Server version must be 11.x or later.
-The Core services must be 11.x or later.
-Aggregation must use Aggregators accounts on all Core services.

Configure Metadata and Content Restrictions on Brokers, Concentrators, and Decoders

Note: In version 11.6, if these 12 metas namely `'sessionid','nwe.callback_id', 'medium','session.split','ip.dst','ip.src','ipv6.src','ipv6.dst','tcp.dstport','tcp.srcport','udp.dstport', and 'udp.srcport'` are restricted then the group events option will be disabled.

To restrict the metadata and raw content that users can view, you must enable SDK system roles to allow more granular controls by configuring metadata and content restrictions on each service in the Services Security view.



1. Go to  **(Admin)** > **Services**, select a service and then select  **> View > Security**.
2. Click the **Settings** tab.

3. In the **SDK Meta Role Permissions** field, select **Blacklist meta and content**. Click **Apply**.

   This allows the administrator to blacklist individual meta keys so that only the data privacy officer can see the meta keys and content. New roles per meta key are added to the Roles tab.

4. Click the **Roles** tab and select a role, for example **Analysts**.

5. In the **Roles** tab,

   a. Select the meta keys that you do not want analysts to see, for example, select `sdk.meta.username` and `sdk.meta.ip.src`.
   This restricts the analyst from seeing the privacy-sensitive meta keys `username` and `ip.src` as well as any content for any session that contains that metadata within it.

b. Ensure that `sdk.packets` is selected.
   If it is de-selected, analysts lose the ability to bulk export raw packets and logs. In NetWitness Platform 11.0 and later, RBAC just works for packets. Sessions that are restricted are just skipped during pcap generation in Investigate. Sessions that are allowed have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.

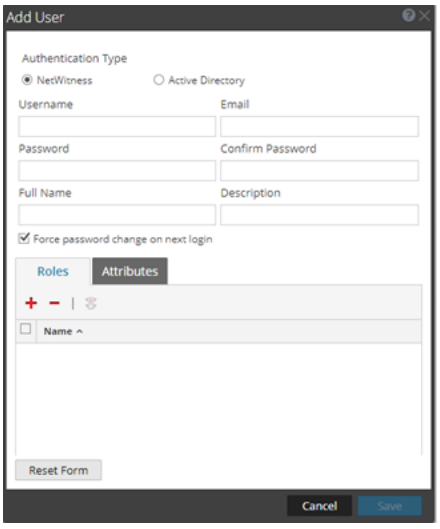
c. Click **Apply**.

6. In the Roles tab, ensure that the `Data_Privacy_Officers` role has no `sdk.meta.values` selected. Click **Apply**.

   A DPO can view any metadata and any session.

   In the Roles tab, ensure that the `Aggregation` role has the following permissions: select `aggregate`, `sdk.content`, `sdk.meta`, and `sdk.packets`.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server



You must add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:

   a. Go to **(Admin)** > **Security**, select the **Users** tab. In the **Users** tab toolbar, click .

   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

Username = <new user name for logon, for example, DPOadmin>
Email = <new user's email, for example, DPOadmin@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy1!@>
Full Name = <new user's full name, for example, DPO Administrator>

c. Click the Roles tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy2!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the Roles tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Configure Obfuscated Data on Decoders and Concentrators

This procedure creates the obfuscated values to provide to users who do not have access to the original values.

1. Configure a salt so that the obfuscated value becomes unique. Different companies may have analysts of the same first name and potentially the same login username, and using a salt limits the possibility of someone outside your organization determining your obfuscation mechanism. In this example, you use a simple salt and SHA-256, but the salt is configurable and the hash algorithm can be changed. For additional information, see Configure Data Obfuscation.

a. To define the salt and hash algorithm, go to  **(Admin) > Services**.

b. Select a Decoder in the **Admin Services** view and select  > **View > Config**.

c. Click the **Data Privacy** tab, and select hash algorithm (SHA-256). In the Salt field, type a hash, for example, **rsasecurity**, and click **Apply**.

2. Define the transforms, including the hash format, between the original meta key and obfuscated meta key on the Decoder. The default hash format is binary, but the recommended configuration calls for using the text/string format.

a. While still in the Services Config view, click the **Files** tab, and in the drop-down menu select **index-decoder-custom.xml.** (You can apply this same configuration to the Log Decoder in the `index-logdecoder-custom.xml` file.)

b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key name="username" description="Username" format="Text"
protected="true"><transform destination="username.hash"/></key>
<key name="username.hash" description="Username Hash"
format="Text"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
protected="true"><transform destination="ip.src.hash"/></key>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text"/>
</language>
```

c. To restart the Decoder service, go to **(Admin)** > **Services**, find the Decoder service you want to restart, and select > **Restart**.
The service should automatically restart.

3. Define the meta keys on the Concentrator in the `index-concentrator-custom.xml` file:

a. Go to **(Admin)** > **Services**, select a Concentrator in the **Admin Services** view, and select > **View > Config**.

b. Click the **Files** tab, and in the drop-down menu select **index-concentrator-custom.xml**

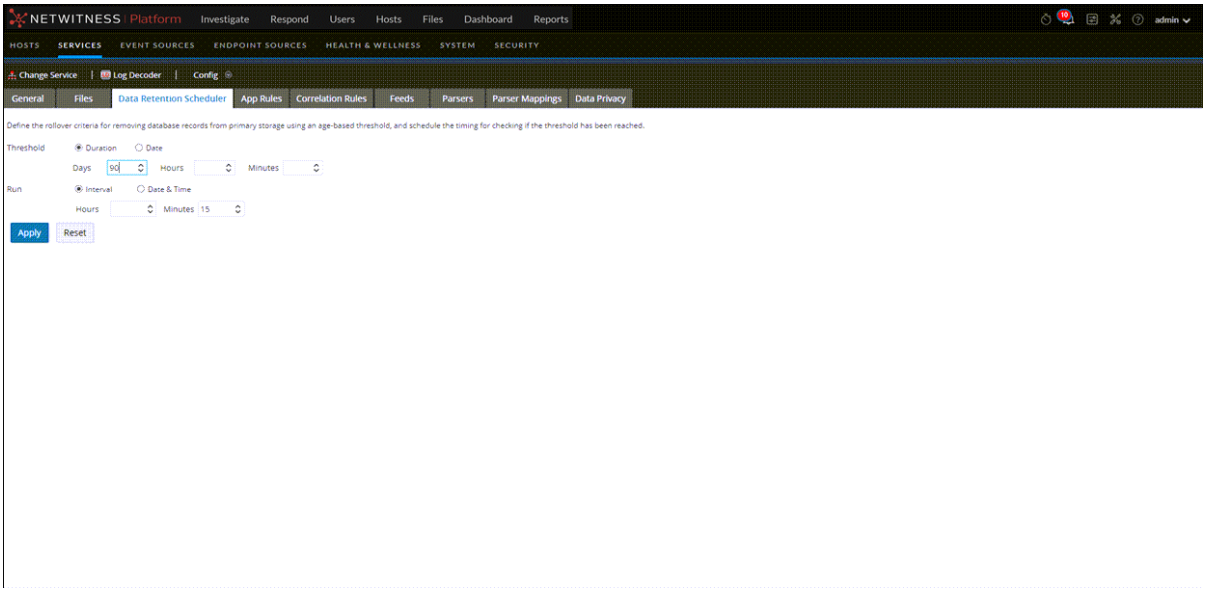
c. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexValues" defaultAction="Auto">
<key name="username" description="Username" format="Text"
level="IndexValues" protected="true"/>
<key name="username.hash" description="Username Hash"
format="Text" level="IndexValues" token="true"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
level="IndexValues" protected="true"/>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text" level="IndexValues" token="true"/>
</language>
```

d. To restart the Concentrator service, go to **(Admin)** > **Services**, find the concentrator service you want to restart, and select > **Restart**.
The service should automatically restart.

Configure Data Retention on Concentrators and Decoders

Data retention configuration ensures that the data residing in the NetWitness Core components is deleted after a certain time. Configuring data retention on Concentrators and Decoders is not required for all environments, but it may be necessary to be in compliance with applicable laws and regulations. It is important to evaluate an appropriate retention period for your environment. The Data Retention Scheduler settings that you set apply to ALL data on a Concentrator or Decoder.



In the following example, NetWitness is configured to execute a check every 15 minutes to determine if the duration threshold has been met. If the threshold is met, NetWitness deletes data older than 90 days in the relevant databases.

Caution: The 90 day retention period is just an example. Adjust your rollover criteria depending on the location of the data and the applicable laws. In a strict data privacy environment, such as in Europe where laws require that Personally Identifiable Information (PII) not be saved or removed frequently, you may need to adjust the time.

This procedure is optional. If you do not set a time retention limit, the system automatically deletes the oldest data when the hard drive space is full.

(Optional) For each Concentrator and Decoder:

1. Navigate to the **Services Config** view **> Data Retention Scheduler** tab.

2. Define the data retention period. For example, set the **Threshold** to **Duration**, and type **90** in the **Days** field.
3. Define how often the scheduler checks to see if the threshold has been met. For example, set the runtime to **Interval** and select **15** in the **Minutes** field.
4. To save the configuration, click **Apply**.

Validate Data Privacy Protection

At this point, users have been added with roles that have permissions around specific types of metadata. The next step is to make sure the restricted user (the analyst) cannot view what the unrestricted user (the DPO) can. Also you need to ensure that the data retention configuration is limiting how long data is kept on the systems.

1. View role-based obfuscation in action:
   a. Log on as the unrestricted user (DPOadmin) and make sure this user can see all the data including the protected sensitive data `username` and `ip.src` along with any session that contains that metadata.
   b. Log off and the back on as the DPO user.

c. For each Decoder and Log Decoder, import a PCAP or logfile into the Services System view. Go to  **(Admin)** > Services, click a service, and use the **Upload Packet Capture File** option to upload a PCAP file that contains `username` and `ip.src` metadata.

d. When the import is complete, go to **Investigate > Navigate**, select the Concentrator connected to the Decoder to which the data was just imported.

e. Scroll down to make sure the `username` and `ip.src` meta keys and corresponding values are visible.

f. Click one of the green numbers next to a `username` or `ip.src` value and verify that the session loads in the Events view.

g. Make a note of the session ID to check when logging on as the restricted user.

h. Log off and log on as the restricted user (NonprivAnalyst).

i. Repeat steps c through f to verify that the user cannot see any `username` or `ip.src` metadata or sessions with that metadata including the one previously mentioned.

j. To jump to a specific session in the **Navigate** view, in the **Actions** menu, select **Go to Event** and enter the session ID.

2. Validate that the data retained in the database falls within the retention time configured in the Data Retention Scheduler.

a. Log off and log on as the unrestricted user (DPOadmin).

b. On the Concentrator, navigate to the **Services > Explore** view.

c. In the node tree, select the **database** node and then **stats**.

d. Observe the `meta.oldest.file.time` value and verify that this is not older then the threshold put on the data retention scheduler.

e. Change the service to the Decoder and repeat steps b through d, check for `stats meta.oldest.file.time` and `packet.oldest.file.time`.

In-Depth Procedures

This topic is a collection of procedures that a Data Privacy Officer uses to implement a data privacy plan for the NetWitness network. These procedures are part of an overall configuration, and are performed as needed to implement the data privacy plan and manage the flow of information in the network.

- Configure Data Obfuscation
- Configure Data Retention
- Configure User Accounts for Use in Data Privacy

Configure Data Obfuscation

This topic provides the procedures for configuring data obfuscation in NetWitness. In a single deployment, all Core service configurations for a data privacy solution must be the same; be sure to use the same hash and salt across all Decoders and Log Decoders.

Note: In order for data obfuscation to work, user accounts need to be configured as described in Configure User Accounts for Use in Data Privacy.

Configure the Decoder Hash Algorithm and Salt

Value hashing accomplished as part of the data privacy solution occurs at the time of meta key creation on the Decoder and Log Decoder. Both services have default settings for use with all meta keys whose values are transformed without a specified hash algorithm type or salt value. The initial NetWitness values for defaults are: hash algorithm (SHA-256) and salt (none).

Note: The SHA-1 algorithm and it is not available.

If you want to change the default settings, you can edit them in the Services Config view > Data Privacy tab or in the following nodes in the NetWitness Services Explorer view:

- `/decoder/parsers/transforms/default.type`

  The algorithm to use for any keys with a transform defined that does not specify `type`. The supported algorithms are: `duplicate` and `sha-256`.

- `/decoder/parsers/transforms/default.salt`

  The salt value prepended to any value that is hashed (`sha-256`). This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. A salt of up to 60 characters can be used without any major impact. A salt of at least 16 characters is recommended.

To edit the default hash algorithm and salt

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Decoder or Log Decoder service, and select  **> View > Config > Data Privacy**.

3. In the **Configure Hash Algorithm and Salt** section, select a **Hash Algorithm** to use for any meta keys with a defined transform that does not specify type: `sha-256`. (A second algorithm, `duplicate`, is available for administrators to use in validating that expected hashing behavior is occurring in the network.)
4. (Optional) In the **Salt** field, enter a salt value to be prepended to any value that is hashed. This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. If a unique salt is required for each individual meta key, that needs to be configured in the index file as shown in example 3 below.
5. Click **Apply**.

   The new settings become effective immediately.

Configure Language Keys

The NetWitness Core Language has several language key attributes to facilitate data privacy. You can edit these attributes in the custom index file for each Decoder or Log Decoder. The custom index file (for example, `index-decoder-custom.xml`) is editable in the Services Configuration view > Files tab. After making changes in the index file, like the ones shown in the examples below, a service restart in a specific sequence is required.

Based on the data privacy requirements for your site, configure individual meta keys to be protected using the following `key` attributes:

- `protected`

  This attribute specifies that NetWitness should consider the values as protected and tightly control any release of the value. When propagating the protected attribute, NetWitness ensures that any downstream trusted system treats the values accordingly. Add this attribute to all services that create the protected values (that is, Decoder or Log Decoder) and any services that will provide trusted access (software development kit (SDK) query/values, aggregation) outside of Core services. The exception to this rule is that a Broker with no index file specified does not need to have the attribute added.

- `token`

  This attribute specifies that values for this key are stand-ins for another value and may not be visually interesting. The `token` attribute is informational, primarily for UI elements to display the value in a more useful or visually pleasing format.

- `transform`

  This child element of `key` indicates that any values for a given meta key should be transformed and the resulting value persisted in another meta key. The `transform` element is only required on Decoders and Log Decoders and is informational if specified on any other Core services. The `transform` element has the following attributes and children:

Name	Type	Description	Optional or Required
`destination`	attribute	Specifies the key name where the transformed value will be persisted.	required
`type`	attribute	The transform algorithm to apply. If not specified, the value of `/decoder/parsers/transforms/default.type` is used.	optional
`param`	child-element	A name/value pair, where each `param` element has a required attribute `name` and the child text is the value. The only supported `param` is used to specify a meta key-specific `salt` value. If not specified, the following value is used: `/decoder/parsers/transforms/default.salt`	optional

Example 1

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.hash` with the default algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.hash"/></key>
```

Example 2

On a Concentrator, mark `username` as protected and `username.hash` as token:

```
<?xml version="1.0" encoding="utf-8"?> <language level="IndexNone"
defaultAction="Auto">
<key description="Username" format="Text" level="IndexValues" name="username"
protected="true"/>
<key description="Username Hash" format="Binary" level="IndexValues"
name="username.hash"
token="true"/> </language>
```

Example 3

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.bin` with the specified algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.bin" type="sha-256">
param name="salt">0000</param> </transform></key>
```

Configure Metadata and Content Visibility Per User Role on Core Services

On individual Broker, Concentrator, Decoder, Log Decoder, and Archiver services being viewed in the Services Security view (**Admin) > Services > Security**), administrators can configure the visibility of metadata and content based on the user group or role assigned to a user. This is called the SDK meta roles capability, and it is enabled by default. Administrators who want to configure metadata and content visibility per user must not disable the `sdk.content` permission (in the Roles tab). If the `sdk.content` permission has been disabled in the Roles tab, packets and raw logs are not visible to `system.roles` node. The `system.roles` node handles the filtering using the method configured in the Settings tab.

With `sdk.content` capability enabled, the next step is to select the method of filtering metadata and content in the Settings tab. Selecting a blacklist or whitelist option makes additional permissions for specific meta keys available in the Roles tab. The result is that administrators can choose a user role, such as analyst, in the Roles tab and select specific meta keys (and content) to be blacklisted or whitelisted for that user group. The permissions apply to any user in the user group.

For the Events view to display events correctly, the `sdk.meta.medium` meta key must be enabled to display values in the Type column (one of the default columns in the Events list). In addition, any meta keys used in a Query Prefix under User Settings in the Users tab or a PreQuery configured for Investigate must be enabled (**Admin) > Security > Users** or **(Admin) > Security > Roles**). If the meta key is not enabled for the user group, the column will not be displayed in the Events list.

Note: In the Version 11.4 and later Events panel, events are listed even when the user does not have permission to view the event reconstruction. In addition, the download options may still be available when a user does not have permission to view the event reconstruction. In these cases the user is allowed to download the events, but the output is an empty file because restricted permissions are enforced during the download.

The following table lists the options for filtering in the Settings tab and the numeric values used to disable (0) and the types of filtering (1 through 6). There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

system.roles Node Value	Settings Tab Option	Event Metadata	Original Event
0	**No Filtering.** System roles that define permissions on a per meta key basis are disabled.	Visible	Visible
1	**Whitelist meta and content.** By default no meta keys and no packets are visible. Selecting individual SDK meta roles per user group allows users to see metadata and packets for that SDK meta role.	Not Visible-Select to Show	Not Visible-Select to Show
2	**Whitelist only meta.** By default packets are shown, but no metadata is visible. Selecting individual SDK meta roles per user group allows users to see metadata for that SDK meta role.	Not Visible-Select to Show	Visible
3	**Whitelist only content.** By default metadata is visible, but no packets are visible. Selecting individual SDK meta roles per user group allows users to see packets for that SDK meta role.	Visible	Not Visible-Select to Show
4	**Blacklist meta and content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata and packets for that SDK meta role.	Visible-Select to Hide	Visible-Select to Hide
5	**Blacklist only meta.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata for that SDK meta role.	Visible-Select to Hide	Visible
6	**Blacklist only content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing packets for that SDK meta role.	Visible	Visible-Select to Hide

Three factors determine what a user sees:

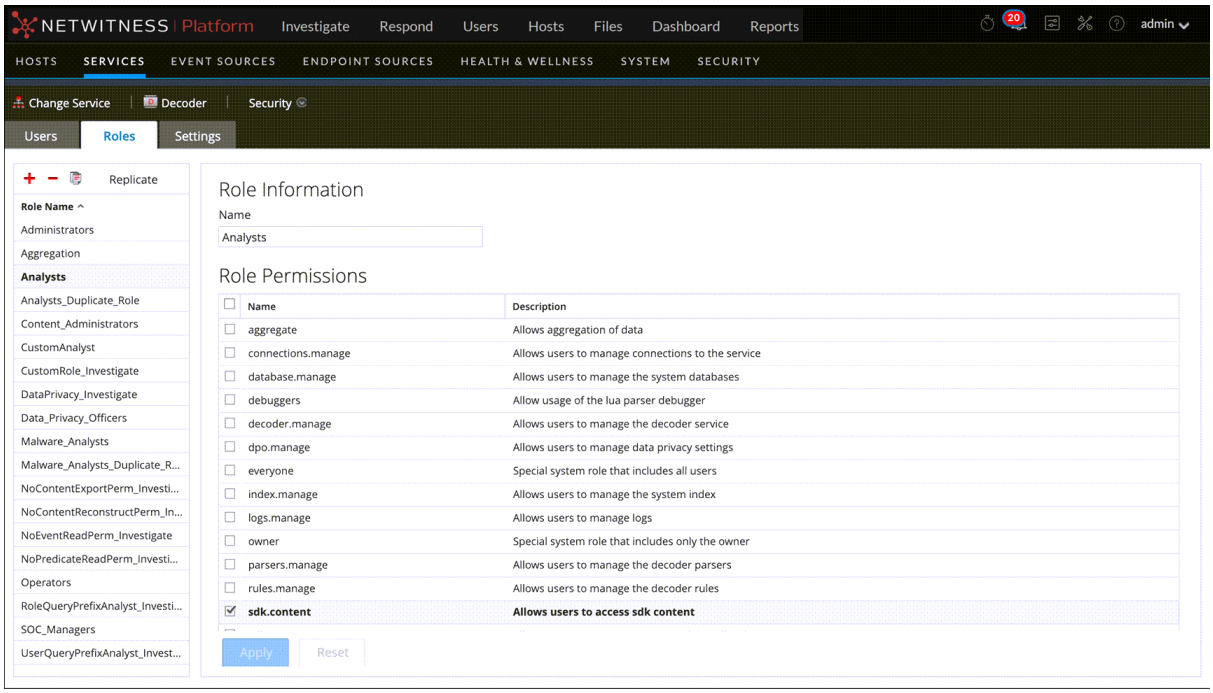
- The SDK meta role setting (blacklist or whitelist).
- The restricted meta keys configured for the group to which the user belongs.

- The meta keys in the session being analyzed. These include meta keys specified in a query prefix for a user at the service level, and for roles and users at the system level.

Caution: Be aware that with blacklisting, implicit trust is granted for all except the configured metadata. For a Decoder to have RBAC enabled and use implicit trust, it must only use a blacklist system setting; a whitelist setting will result in some issues with meta keys that are not explicitly enabled and therefore not visible. It is impossible to grant implicit trust under whitelist rules because the universe of meta keys cannot be known. If you want to use whitelisting, a workaround is to turn RBAC off for the Decoder and disable any user accounts from connecting directly to the Decoder if they should use RBAC.

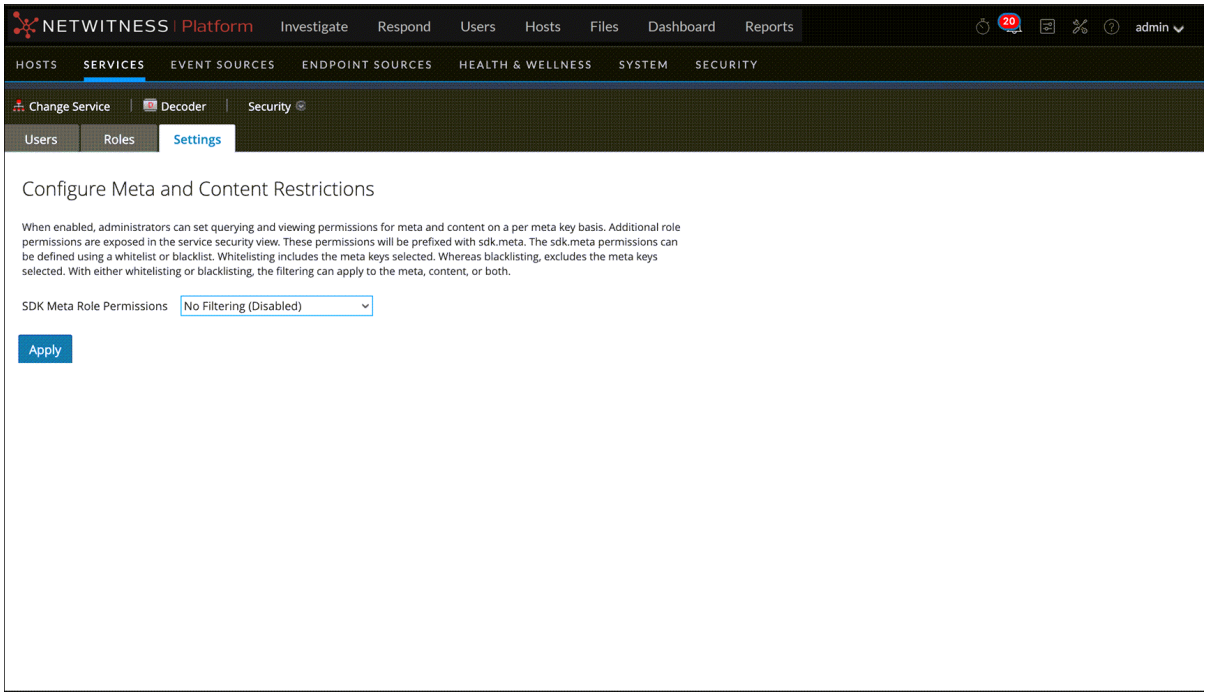
Here is an example of how the SDK meta role configuration meshes with a Group that has restricted meta keys.

Configuration:



- The SDK meta role setting is **Blacklist meta and content**. With this option implemented, all metadata and all content (packets and logs) are visible by default.
- The administrator has restricted meta keys configured for the Analysts group to prevent viewing of sensitive data (for example, `username`).
- The packets and logs for any session that includes the `username` meta key are not visible to an analyst.

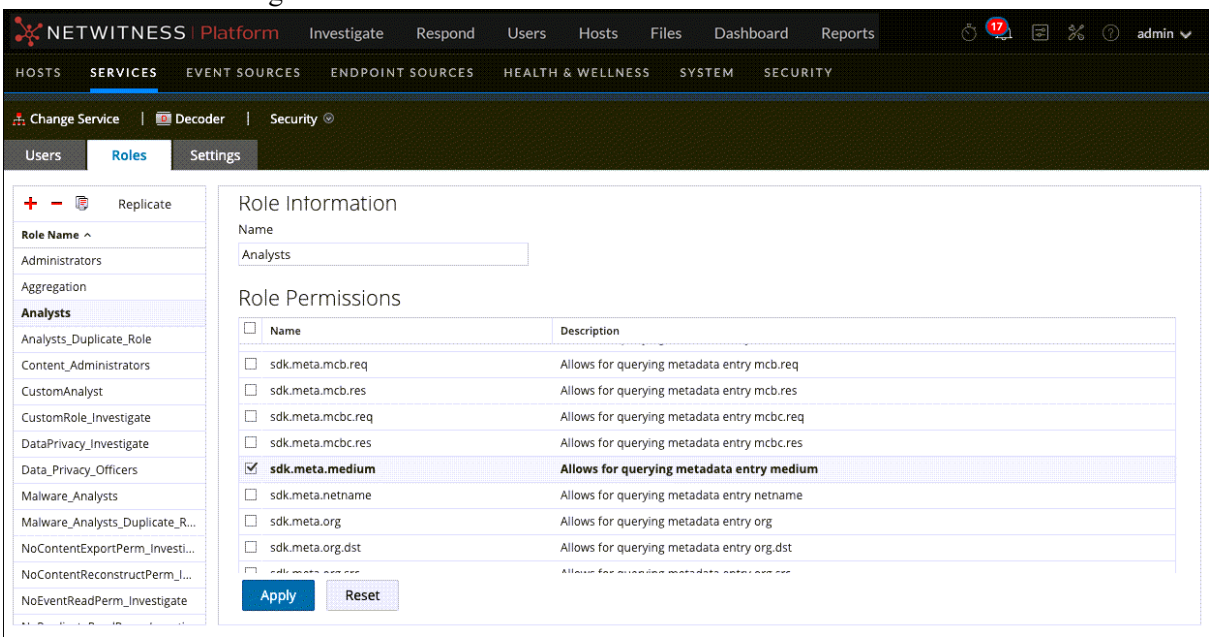
Result: Now a user who is a member of the Analyst Group investigates a session. Depending on the content of the session, the results are different:



- Session 1 includes the following meta keys: `ip`, `eth`, `host`, and `file` The session does not include `username` so all packets and logs in the session are displayed.
- Session 2 includes the following meta keys, `ip`, `time`, `size`, `file`, and `username`, Because the session includes `username` , no packets or logs from the session are displayed for the analyst.

To configure metadata and content restrictions for a Decoder or Log Decoder:

1. Go to  **(Admin)** > **Services**.
2. In the **Services** view, select a Broker, Concentrator, Decoder, Log Decoder, or Archiver service and select  **> View > Security**. Click the **Roles** tab, select a role, and verify that the `sdk.content` permission is enabled.



3. Click the **Settings** tab.

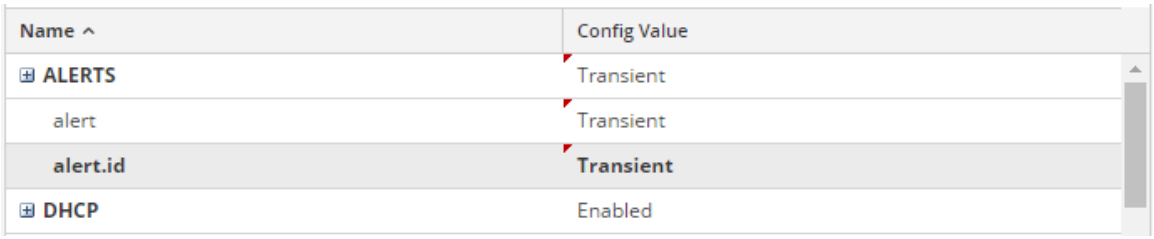
4. Select one of the filtering methods (blacklist or whitelist) and content types (meta and content, meta only, or content only), and click **Apply**.
5. Click the **Roles** tab and a role for which you want to allow content (whitelist) or block content (blacklist) as specified in the SDK Meta Role Permissions setting.

The Role Permissions for the selected role are displayed, and the SDK Meta Role Permissions are available for selection, for example, `sdk.meta.medium`. If you selected one of the whitelist options in the SDK Role Permissions setting, you must assign each SDK meta role to make the selected content visible to users assigned that SDK meta role. The `sdk.meta.medium` permission must be enabled in order for the Type column to be displayed in the Investigate > Events view. If you selected one of the blacklist options in the SDK Role Permissions setting, selected content will be hidden from users assigned that SDK meta role.

6. Select the SDK meta role permissions for users assigned this role. Click **Apply**.

The settings become effective immediately and apply to new packets and logs processed by the Decoder or Log Decoder.

Configure Meta Keys Not Written to Disk Per Parser on a Decoder



On a Decoder and Log Decoder, a Data Privacy Officer can configure individual meta keys that are not written to disk. To do so, the DPO specifies the meta keys as transient in the index and the parser configuration.

Note: The same capability was previously available on Log Decoders, and was configured when setting up parsers by modifying the table-map.xml file. Now it is integrated in the Services Config view.

To configure selected meta keys on individual parsers that will not written to disk:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder or Log Decoder service and select **> View > Config**.
3. In the **Parsers Configuration** section of the **General** tab, select a parser and then select **Transient** in the **Config Value** drop-down list. Access the list by clicking on the configuration value (Enabled, Disabled, or Transient).

The configuration change is marked by a red triangle.

4. Click **Apply**.

   The change is effective immediately. The parser configured as Transient will no longer store meta keys to disk.

Configure Data Retention

A NetWitness user with the role of Administrator can configure NetWitness to ensure that sensitive data has been removed after a specific retention period, regardless of system ingest rate. For instance, the policy might be to keep packets (both raw data and metadata) for no more than 24 hours, and to keep some logs (both raw data and metadata) for up to seven days. If sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, Event Stream Analysis, and NetWitness Servers, data retention can be managed there as well. The administrator needs to set up each service individually across all NetWitness components (except Event Stream Analysis) based on policy and data privacy laws.

Sensitive data may also be in cache.

- Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker by editing the `Scheduler` file in the Services Config view Files tab.
- Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
- If the Data Privacy Officer (DPO) exports data, that is the same as saving data on the NetWitness Server in the jobs queue. To clear this data, the administrator or DPO should clean up the jobs queue on a regular basis.

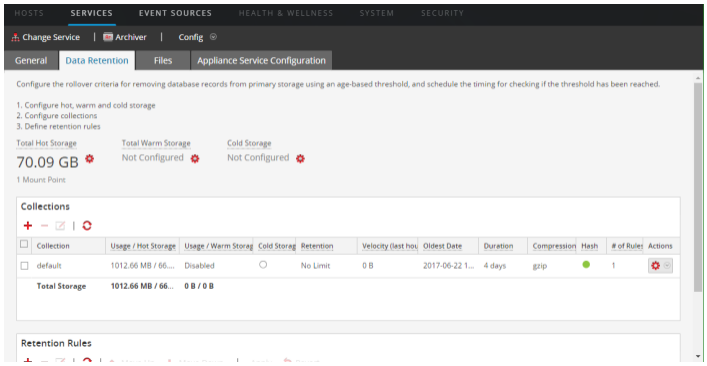
Data Retention

You can schedule a recurring job for Decoder, Log Decoder, and Concentrator services in NetWitness to check if data is ready to be removed. The Data Retention Scheduler provides a means to configure basic scheduling (see below), and advanced Scheduler settings are also available by editing the `Scheduler` file in the Services Config view Files tab or the node in the Explorer view.

The Archiver has flexible data storage and retention options. You can place different types of log data into individual collections and manage them separately. These collections enable you to specify how much of the total storage space to use and how many days to store the logs in the collection. You can also determine whether to delete the log data or to move it to offline cold storage after it reaches the maximum specified storage space for the collection.

For example, you can put sensitive information in a collection and configure a limitation on how long to keep it, such as 30 days. To delete the data after 30 days, you would not enable warm or cold storage for that collection.

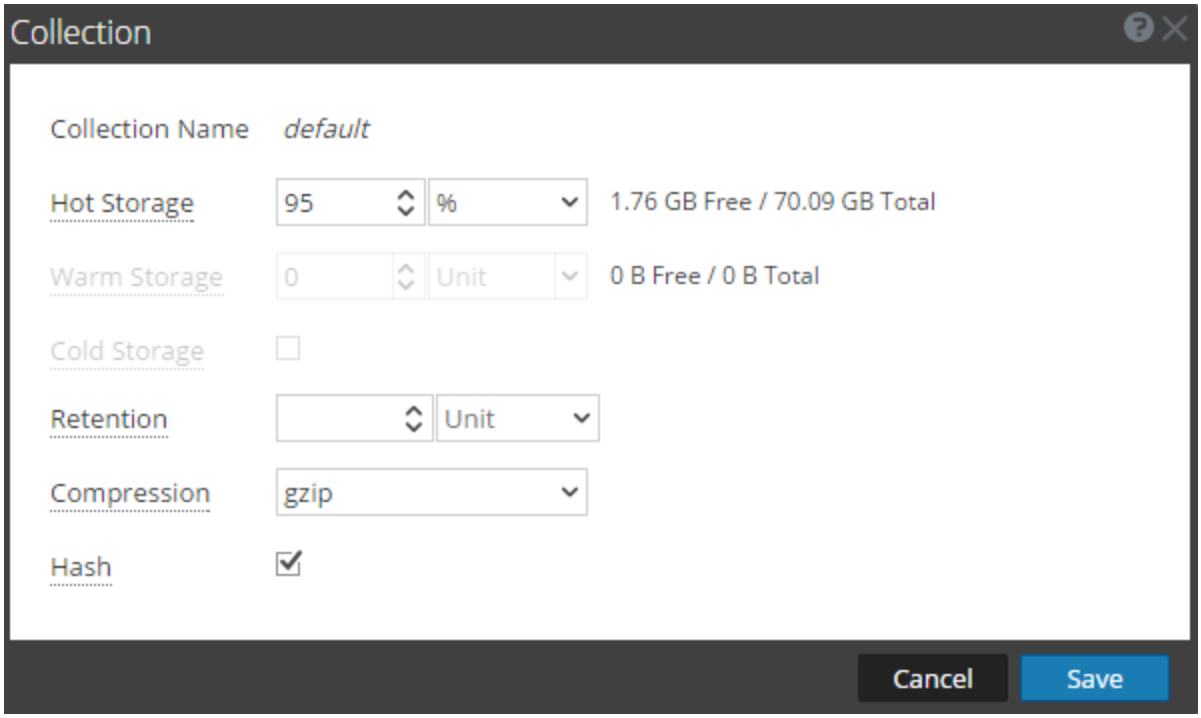
Deleting versus Retaining Log Data



Administrators can configure hot, warm, and cold tiered storage on an Archiver. Cold storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. You can choose whether to enable cold storage for each log storage collection. NetWitness does not manage cold storage.

Enable or Disable Cold Storage in a Log Storage Collection

When log data in a collection reaches its retention limits for hot and warm storage, you can delete it or move it to offline (cold) storage.



To enable or disable cold storage in a log retention storage collection on an Archiver:

1. Go to **(Admin)** > **Services**.
2. Select the Archiver service and select **> View > Config**.
3. Click the **Data Retention** tab.

4. In the **Collections** section of the Data Retention tab, select a collection and click .

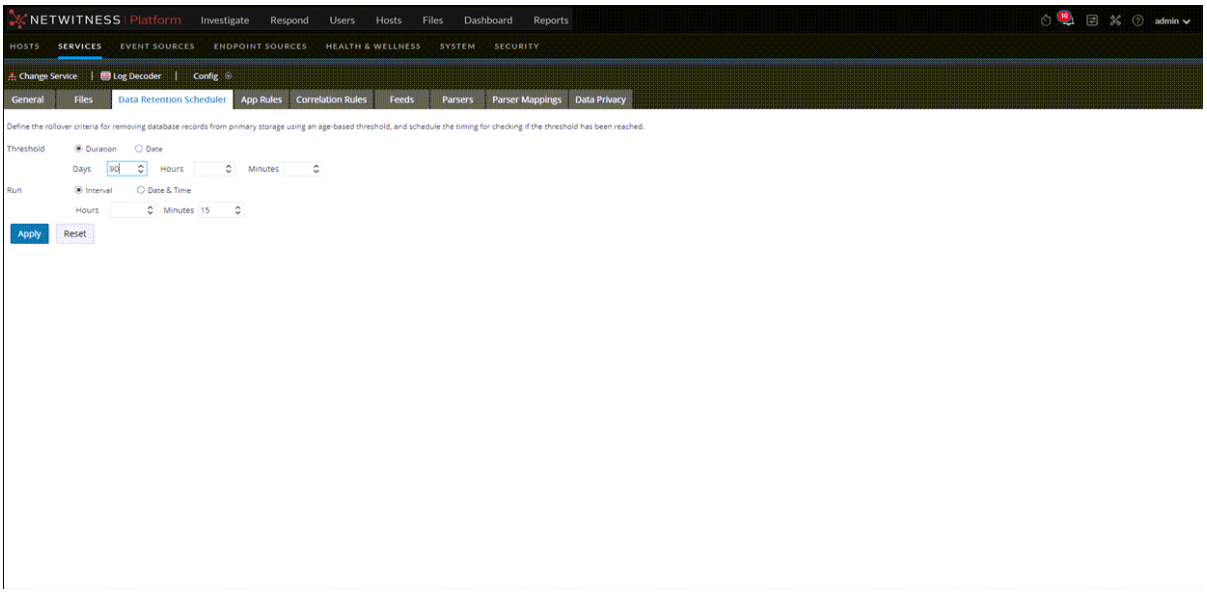
   The Collection dialog is displayed.

Note: If the maximum storage size of the collection does not allow full data retention for the retention period specified, NetWitness deletes the data or it goes to warm or cold storage if specified in the collection.

5. Enable or disable cold storage:
   - To delete log data when the collection reaches its specified retention limits, clear the **Cold Storage** checkbox.
   - To move log data to offline storage when the collection reaches its specified retention limits, select the **Cold Storage** checkbox.
6. Click **Save**.

Configure Log Retention and Storage on an Archiver

To configure log retention and storage on an Archiver, see "Configure Archiver Storage and Log Retention" in the *Archiver Configuration Guide*.



Schedule a Recurring Job to Check Data Retention Thresholds

The data retention scheduler configuration ensures that the data residing in the Decoder, Log Decoder, and Concentrator components is deleted after a certain time. For example, data retention on a Decoder might be configured to execute a check every 15 minutes to determine if the specified duration threshold has been met. If the threshold is met, NetWitness deletes data older then 4 hours in the relevant databases.

Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

For a Decoder, Log Decoder, or Concentrator:

1. Go to  **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder, Log Decoder, or Concentrator service and select  **> View > Config**.
3. Click the **Data Retention Scheduler** tab.

4. Set the threshold based on the duration of time the data has been stored or the date on which the data was stored. Do one of the following:

   a. To define the duration of time that data can be stored before removal, select **Duration**, and then specify the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.

   b. To define the removal of data based on the date of the timestamp, select **Date**, and then specify the monthly date and time in the Calendar and Time fields.

5. Do one of the following to configure the **schedule for checking rollover criteria**:

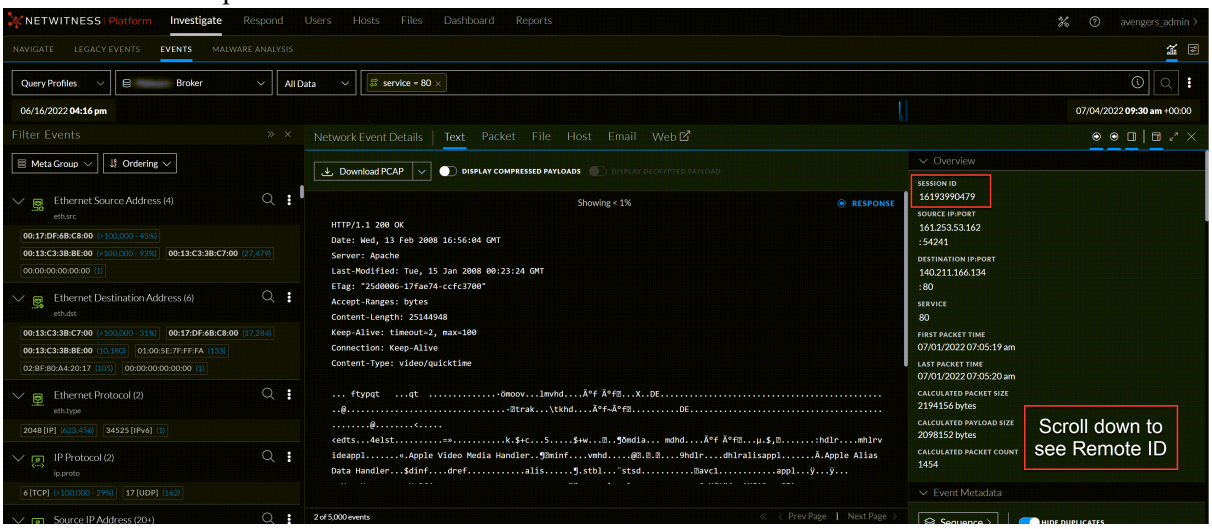
   a. If you want to set a regular interval at which the scheduled database check occurs, select **Interval** and specify the **Hours** and **Minutes** between the scheduled checks.

   b. If you want to set a regular date and time at which the scheduled database check occurs, select **Date and Time** and specify the system clock time in `hh:mm:ss` format for the rollover.

      - To specify the day, select **Every Day**, **Weekdays,** or **Weekends**. The Scheduler defaults to **Every Day**.
      - To specify a different set of days of the week, select **Custom** and click on each day on which the database check occurs.

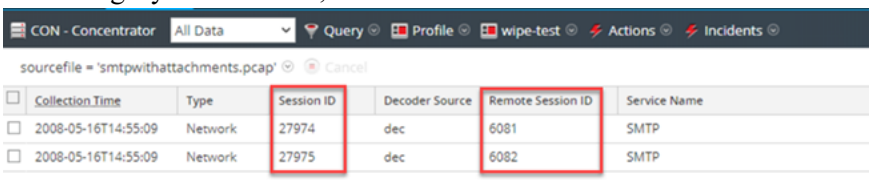
      Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

6. Click **Apply** to complete the configuration.



Purge Data Using String and Pattern Redaction Option

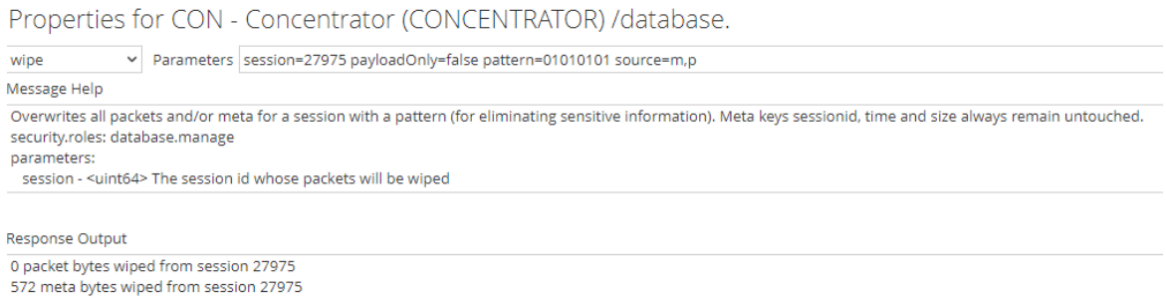
If you have data where you do not want it to be (for example, you have classified data in your unclassified Network Decoder), purging data using string and pattern redaction is the fastest way to wipe data. It is ideal for smaller amounts of data. This method requires that you identify the data to be purged by using a query in either the Investigate view, the REST API interface, or the NwConsole. Using the Investigate view requires additional steps to clear user interface cache on the admin server. This procedure includes the extra steps needed when you find the data to be purged using the Investigate view.



Note: If a large amount of data needs to be purged, it is best to start with the data on the storage component. Refer to Optional Data Overwriting Options for additional information.

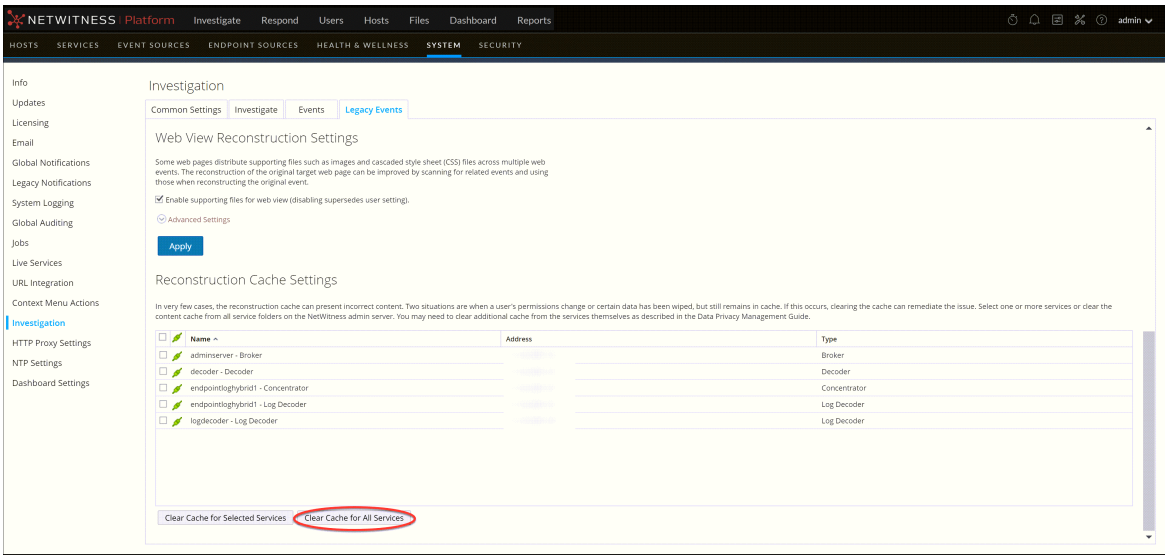
To purge the data:

1. Go to **Investigate** > **Events** or **Investigate** > **Legacy Events** and find the events that you want to purge. In the Events view you can see the session ID in the Overview panel. You need to scroll down in the Event Meta panel to see the remote ID.

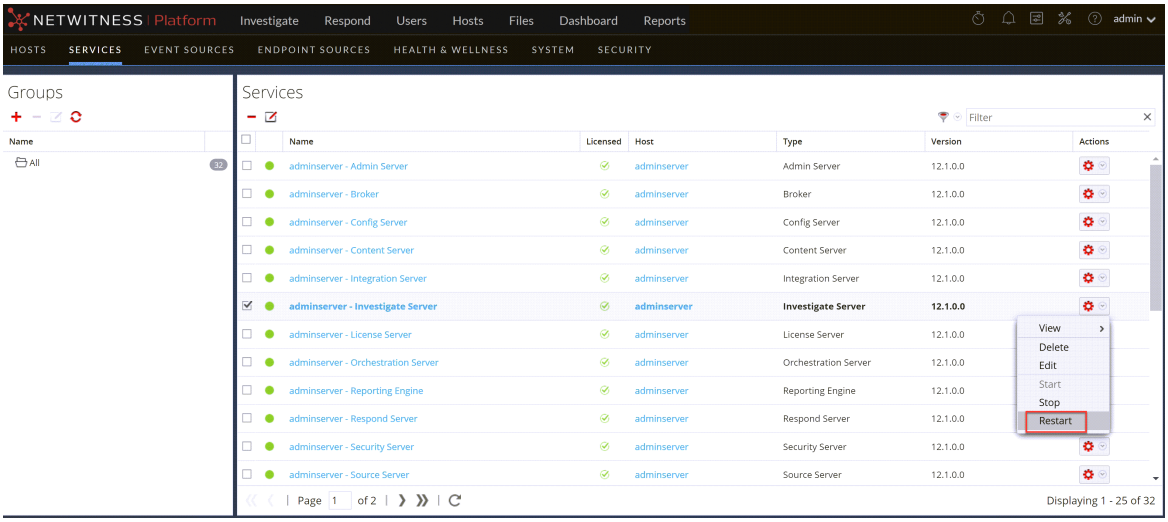


In the Legacy Events view, both IDs are visible in the Events list.

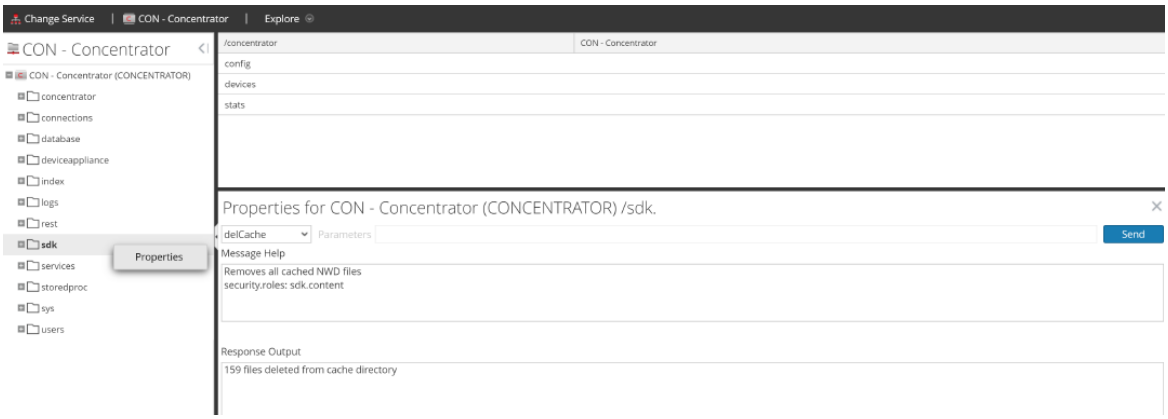
2. Make a note of the session ID and the remote ID of each event to be deleted. In the example above, the session IDs are 27974 and 27975. The remote IDs are 6081 and 6082.
3. Starting with the Concentrator, view the service using the REST API. Refer to the *RESTful API User Guide* for instructions. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
   In the REST API, enter the `wipe` command with the following parameters:



- **`session=<uint64>`**: The session ID whose packets will be wiped.
- **`payloadOnly=<bool, optional>`**: If `payloadOnly` is `true`, only the packet payload will be overwritten. The default value is `true`.
- **`pattern=<string, optional>`**: The pattern uses all zeros by default. If you use a string as your pattern, it will not overwrite any meta values that are not a string type. Therefore, it is best to keep the pattern as a numerical value.
- **`metaList=<string, optional>`**: Comma-separated list of metadata to wipe. The default (empty) is all metadata.
- **`source=<string, optional, {enum-any:m|p}>`**: The types of data to wipe: metadata, packets, or both. The default is packets only. The best option here is to wipe both metadata and packets `(m,p)`.



4. For each Network Decoder and Log Decoder in the path of the query, use the `wipe` command and the remote session IDs to overwrite the raw sessions on disk.



5. To ensure that the indexed meta values that were stored on the Concentrator index are removed, rebuild the index. This can take a long time but is necessary because the `wipe` command does not remove any data from the Concentrator index. Refer to the *Core Database Tuning Guide* for instructions.
6. (Optional) If the data was discovered using the Investigate view, additional steps are necessary:
   a. To clear the query path to prevent an analyst from bringing up an old copy of the session, go to: **(Admin)** > **System** > **Investigation** > **Legacy Events** and click **Clear Cache for All Services**.

b. To clear the cache for a reconstruction in the Events view, restart the Investigate service.

c. To clear the cache for the Concentrator and Network Decoder, go to  **(Admin)** > **Services** > **Concentrator** > right-click **sdk** > **Properties** and  **(Admin)** > **Services** > **Decoder** > right-click **sdk** > **Properties** and execute the `delCache` command. The figure below shows this path for the Concentrator.

An analyst attempting to view the same session in Investigate will see that the raw data is unavailable for viewing and the metadata has been overwritten.

Configure User Accounts for Use in Data Privacy

This topic provides the procedures for configuring user accounts that work with data obfuscation in NetWitness. In order for data obfuscation to work, accounts and permissions for several types of users must be configured.

- Customize the default Administrators system role in NetWitness to remove permissions that should be available only to the Data Privacy Officer.
- Add two new user accounts at the system level to depict a data privacy officer and a typical analyst.
- Add a user account at the service level with the aggregation role so that Decoders and Log Decoders can aggregate data to a Concentrator or Broker.
- On the Reporting Engine, configure two separate service accounts. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. This procedure is described in "Configure Data Source Permissions" in the *Reporting Engine Configuration Guide*.

Customize the Default Administrators User Role at the Service Level

To separate the data privacy officer and administrator functions on each Decoder and Log Decoder, you need to remove the `dpo.manage` permission from a clone of the Administrators role.

1. Go to  **(Admin)** > **Services**, select a Decoder or Log Decoder, then select  **> View > Security**.
2. In the **Services Security** view, click the **Roles** tab, select **Administrators** and click .
   In the **Enter Role Name** dialog, enter a new role name such as Non_DPO_Administrators and click **Save**.
3. Select the new role.

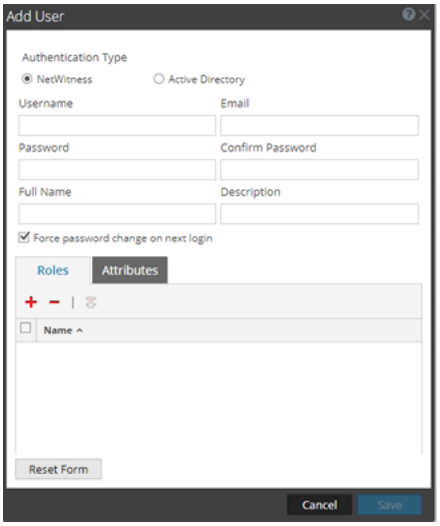
   The Role Information is displayed for editing.
4. Clear the box next to **dpo.manage** so that it is no longer checked and click **Apply**.

   The permission to manage data privacy configuration is removed for the new role.
5. In the **Users** tab, select each user who has the **Administrators** role, and change their role to the cloned role.
6. Validate that the users with the modified Administrators role can login as with admin privileges.
7. Validate that the users with the modified Administrators role cannot configure metadata and content restrictions in the Settings tab.

Add a User Account with the Aggregation User Role at the Service Level

To ensure that Decoders and Log Decoders can aggregate data to a Concentrator or Broker:

1. **Go to** **(Admin)** > **Services,** select a **Decoder** or **Log Decoder,** then select **> View > Security.**
2. In the **Users** tab, add a user with the `Aggregation` role and click **Apply**.



Note: "Aggregation Role" in the *Hosts and Services Getting Started Guide* provides details about the application of this user role.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You need to add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all places must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. **Go to** **(Admin)** > **Security,** select the **Users tab** and click **.**
   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. Click the **Roles** tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the  **(Admin)** > **Security** view, click the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the **Roles** tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Data Privacy References

The following reference materials are available for management of data privacy and data retention. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- See "Data Privacy Tab" in the *Decoder and Log Decoder Configuration Guide.*
- See "Data Retention Tab - Archiver" in the *Archiver Configuration Guide.*
- See "Data Retention Scheduler Tab"in the *Hosts and Services Getting Started Guide.*

NetWitness Core Database Introduction

This topic provides an overview of the NetWitness Platform Core database. The NetWitness Platform Core services contain a proprietary database developed specifically for use within the NetWitness Platform products. It bears little resemblance to traditional relational databases, and is not based on any off-the-shelf database technology. As such, many users find that there is a steep learning curve to understanding how the Core database works, and how to make best use of it. The purpose of this guide is to help NetWitness Platform users understand the database and use it to its fullest potential.

As a System Administrator, you can use this information to help plan your NetWitness Platform deployment, and to tune it for best performance. As an Analyst, you can use this guide to structure your analysis in ways that will return reports faster. As a Content Developer, you can use this guide to help write content that will be processed efficiently by the database system.

NetWitness Platform Products Covered by this Guide

This guide covers the capabilities of NetWitness Platform. The following NetWitness Platform components contain the Core database:

- Concentrator
- Archiver
- Decoder
- Log Decoder
- Workbench

Frequently Used Terms

Definitions for terms that are used throughout this document are presented here. The terms are listed in the order in which they enter the NetWitness Platform system:

- **Packet DB** : The packet database contains the raw captured data. On a Decoder, the packet database contains packets as captured from the network. Log Decoders use the packet database to store raw logs. The raw data stored in the packet database is accessible by a Packet ID, however, this ID is typically never visible to the end user.
- **Packet ID** : A number used to uniquely identify a packet or log in a packet database.
- **Meta DB** : The meta database contains items of information that are extracted by a Decoder or Log Decoder from the raw data stream. Parsers, rules, or feeds can generate meta items.
- **Meta ID** : A number used to uniquely identify a meta item in the meta database.
- **Meta Key** : A name used to classify the type of each meta item. Common meta keys include ip.src, time, or service.
- **Meta Value** : Each meta item contains a value. The value is what each parser, feed, or rule generates.

- **Session DB** : The session database contains information that ties the packet and meta items together into sessions.
- **Session** : On a packet Decoder, a session represents a single logical network stream. For example, a TCP/IP connection is one session. On a Log Decoder, each log event is one session. Each session contains the references to all the Packet IDs and Meta IDs that refer to the session.
- **Session ID** : A number used to uniquely identify sessions in the Session DB.
- **Index** : The index is a collection of files that provides a way to look up Session IDs using Meta Values.
- **Core Database** : This refers to the combination of the Packet, Meta, Session, and Index.

For syntax definitions, this document uses EBNF grammar definitions.

NetWitness Core Database History

NetWitness developed the Core database for use in packet capture systems. Early in the history of NetWitness, developers identified that existing database technologies would not be able to keep up with the high ingest rate inherent in full packet capture. Contemporary database technologies were not anywhere close to being able to keep up with capturing the number of sessions received every second, much less sorting every packet. Likewise, the volume of data meant that packet storage would need to be discarded and reused just as quickly as it was consumed. This was also a weakness of databases at the time. Thus, NetWitness created a database consisting of the packet, session, and meta databases.

In order to provide the analytical capabilities of NetWitness Investigator, a meta index was added to the NetWitness database. The index shared the same design goals as the original databases. It was designed to sustain a very high insert rate into a high number of very large indices.

The index has evolved considerably over the years. Early versions of the index were only capable of providing summary estimates about how many unique meta values were present in the meta database. Other versions have had great challenges in meeting acceptable query performance. For example, NetWitness 9.0 more frequently measured report times in minutes rather than seconds. The current version of the index is derived from the NetWitness 9.0 index, but has evolved considerably in order to meet performance expectations and to add new features.

Core Database Strengths and Weaknesses

Strengths:

- High sustained insert rates, without needing down time for bulk inserts.
- Decent query performance simultaneous with high insert rates.
- Automatic cleanup and rollover of old data with minimal fragmentation.
- Extremely high number of meta value indices: more than 100 enabled by default on a Concentrator.
- Ability to scale to Petabyte database sizes and Terabyte index sizes within a single node.

- Using meta key-value pairs, it is very flexible for storing arbitrary meta items within a session. Thus a session can be used to represent nearly any kind of data record.

Weaknesses:

- The query functionality is limited and low level.
- The packet, meta, and session DB schema is fixed, and all customization is done through custom meta keys and values.
- The database provides no transaction atomicity guarantees as you might expect to find in a SQL database.

Basic Database Configuration

This topic covers basic database configuration settings of NetWitness Core services. For information on how to configure the Core services by editing configuration files, see "Service Configuration Settings" in the *Host and Services Getting Started Guide* .

This document assumes that the reader has some familiarity with adjusting the configuration of a NetWitness Core service. To use this document, you should be familiar with one of the mechanisms for modifying the configuration tree of Core services. Examples of such mechanisms include the Explorer view of the Administration pages within the NetWitness Platform user interface, or the REST interface accessible on each service through a web browser.

Find Help within the Core Service

Each configuration item within a Core service has a built-in help description of what the item does. You can view this help information by hovering your mouse over the configuration item in the Explorer view. Each configuration item also indicates whether it can be changed without restarting or if a restart of the service is needed for the change to take effect.

Developers using the REST API can retrieve the help text for each configuration item by sending the `help` message to the configuration node path.

Packet, Meta, and Session Storage

Each of the packet, meta, and session databases are configured through the `/database/config` folder on each NetWitness Core service. Each database has a configurable parameter to specify where the Core service stores data. Packet, meta, and session databases follow a predictable pattern for all of their configuration entries. Configuration items for the packet database start with the prefix `packet` , meta database configuration starts with the prefix `meta` , and the session database configuration items start with the prefix `session` .

Index Storage

The index configuration is stored in the `/index/config` folder on each Core service.

Topics

- Tiered Database Storage
- Manifests

Tiered Database Storage

This topic describes tiered database storage and provides recommendations for Hot, Warm, and Cold tier storage.

Starting with version 10.4, the Archiver service has the capability to be configured to use tiered storage. The concept of tiered storage is to put the most recent data on a Hot tier, which is the fastest storage available on the Archiver.

All services use the Hot tier by default.

The next tier is known as Warm and is typically cheaper and slower storage, such as a network-attached storage (NAS). The Warm tier contains older data; how old depends upon how much storage is allocated on the Hot tier and the average ingest rate. When the Hot tier reaches max utilization, the natural progression is to move the oldest data from the Hot tier to the Warm tier. When configured correctly, this happens automatically and is invisible to the end user. Queries and data access happen automatically no matter what tier (Hot or Warm) the data resides on. However, there can be a performance impact when accessing data on the Warm tier as compared to the Hot tier, because access times on the Warm tier are typically slower.

In addition to Hot and Warm, there is also a Cold tier. The Cold tier is only used as a staging area for offline backup. NetWitness Core services do not access data on the Cold tier. NetWitness Core services move the oldest data to the Cold tier and consider it abandoned (the service no longer accesses the data). This data can then be backed up to long-term storage like tape for possible restoration months or even years later, depending on requirements. The backing up and subsequent removal of data on the Cold tier must be handled outside of NetWitness Core services via scripts or other processes.

If the Cold tier becomes full because external processes are not removing data in a timely manner, this causes the NetWitness Core service to eventually stop the ingestion of new data until the problem is corrected.

When moving data to the Cold tier, NetWitness recommends that the directory remain on the same mount point as where it is being moved from. Therefore, if the files are coming from the Warm tier, it is far better for performance reasons to set the Cold tier directory on the same file system. The reason for this is that the service attempts to simply move the file and directory to the Cold tier, which is a nearly instantaneous operation on the same file system. If the move fails, the fallback is to copy the data to the Cold tier, which takes more processing time and causes additional I/O contention on the tier from which it is being copied.

Archiver

The tiers of storage capabilities are used by the Archiver. You can configure Archiver to only use Hot storage (the default), Hot and Warm, or all three (Hot, Warm and Cold). All services must use Hot, you cannot configure a service to only use Warm. Data flows from Hot to Warm and finally to Cold. You can also skip Warm and go from Hot to Cold. If Cold (offline) storage is not configured, the oldest data is deleted on the last configured tier, which has been the standard operating procedure.

The typical Archiver deployment sets all the databases to unlimited size (packet.dir, meta.dir, session.dir, index.dir, and optionally the Warm tier variants), which means that the size specifier is left off or set to zero. This lets the databases and index grow unbounded. Instead of each database managing their own size and rolling out only when each individual database exceeds their configured size, Archiver rolls out everything together using the `/index sizeRoll` command. This enables the databases and index to roll out in unison. For more information on sizeRoll, see "Asynchronous Rollover" in Rollover .

Archiver is typically configured to place the index, session, meta, and packet (log) DB on the same volume, instead of multiple volumes like a Concentrator or Decoder. Although this can potentially cause more I/O contention when concurrent reads happen across multiple databases, it also maximizes overall retention. Because all databases are on the same volume, they are configured to roll out together, which minimizes orphaning of data. Decoder and Concentrator are configured for maximum I/O speed, but can suffer from estimates on the proper volume sizing.

For example, if the session DB is too large, it may have enough storage for six months of retention, whereas the meta DB and index only have retention for four months. Because the session, meta DB, and index are intricately tied together, the shortest retention period for all three define the overall retention period (in this case, four months). Retention of individual databases is mostly affected by factors beyond our control, such as traffic captured, meta generated (parsers, feeds, rules) and filtering. The databases are easily resized by a simple configuration change, but this usually also involves changes at the hardware and file system level to adjust partitions, which complicates dynamic resizing. Archiver avoids these problems by using a single volume for everything, with the trade-off of somewhat slower I/O speed.

Manifests

This topic describes manifest files and provides an example manifest for a meta DB file. It also describes manifest searching and provides an example manifest search.

Manifest files are created with every session, meta, and packet (log) DB file and index slice directory. A manifest file is a file that describes several key pieces of information about the data to which it refers. Manifest files are written as a JSON record. Manifest files travel with the data they represent from tier to tier. If the data they represent is deleted, the manifest file is also deleted, except in the following special case. If the service has `/database/config/manifest.dir` configured to a valid directory, at the point when the manifest data is deleted, a copy of the manifest file is placed into the directory pointed at by `manifest.dir` (the directory is created if it does not exist). This enables a NetWitness Platform feature called historical manifest searching.

The intention of this process is to keep historical manifest files for years, in one location for offline querying. As you might imagine from a service running for many years, this can potentially generate hundreds of thousands of files. This should not be a concern however, as the service automatically compresses files into a single archive in order to save space when they grow too numerous. Manifest files are very small and compress well.

Example manifest (`meta-000000023.nwmdb.manifest`) for a meta DB file:

```
{
    "filename" : "meta-000000023.nwmdb",
    "size" : 185153768,
    "fileTime" : 1403903940,
    "id1" : 150814110,
    "id2" : 159341086,
    "session1" : 4023382,
    "session2" : 4250442,
    "time1" : 1403903879,
    "time2" : 1404739851
}
```

```
filename  = The filename for the db file the manifest represents
size      = The size in bytes of the db file
fileTime  = The time the file was created
id1       = The starting id in the file (for this example, the starting meta
ID)
id2       = The last id in the file (for this example, the last meta ID)
session1  = The starting session ID of the first meta in the file
session2  = The last session ID of the last meta in the file
time1     = The POSIX time of the first "time" meta found in the file
time2     = The POSIX time of the last "time" meta found in the file
```

In this example manifest, the most important fields are `fileTime` , `time1` and `time2` . All three fields are written in POSIX time. `time1` and `time2` are the starting and stopping times of the meta recorded in the meta DB file `meta-000000023.nwmdb` . In particular, `fileTime` is always the time in which the file was created (not last modified). `time1` and `time2` are representative of the min and max range of the parsed data within the meta DB file. When doing historical searches by time, `time1` and `time2` are preferred over `fileTime` , when they are present. Manifest files for the other databases and index contain some different fields, but all have enough information to perform time based queries.

Search Historical Manifests

When manifests are collected in the directory pointed to by `manifest.dir` , it is assumed that the data they refer to was copied to the Cold tier and eventually backed up to offline storage. Because the historical manifests are still accessible by the service, this allows time-based queries to be performed on offline data, in order to determine what data needs to be restored for a given time range.

You can search manifests using the `/database manifest` command:

```
manifest: If a manifest directory is defined, it will allow operations on the
manifest files (such as a time based query) for database files in cold
storage.
security.roles: database.manage
parameters:
   op - <string, optional, {enum-one:query|compress}> The operation to perform
(defaults to query)
   time1 - <date-time, optional> The beginning time (UTC) for matching offline
database files
   time2 - <date-time, optional> The ending time (UTC) for matching offline
```

```
database files
   timeFormat - <string, optional, {enum-one:posix|simple}> Specify the time
format that is returned (posix, simple), default is posix
```

Example search:

```
/database manifest time1="2014-04-20 11:00:00" time2="2014-04-11
11:20:00" timeFormat=simple
```

The search returns all manifests that match the query:

```
[ filename=meta-000001691.nwmdb size=4843826176 fileTime="2014-Apr-20
11:06:34" id1=301555027452 id2=301733101896 session1=15352020201
session2=15361024200 time1="2014-Apr-20 11:05:34" time2="2014-Apr-20 11:16:34"
compression=gzip ]
[ filename=session-000001865.nwsdb size=268439552 fileTime="2014-Apr-20
11:06:35" id1=14674145801 id2=14682041000 metaId1=288217522208
metaId2=288370660984 packetId1=11733872441 packetId2=11741745303 ]
[ filename=session-000001866.nwsdb size=268439552 fileTime="2014-Apr-20
11:18:31" id1=14682041001 id2=14689936200 metaId1=288370660985
metaId2=288520616949 packetId1=11741745304 packetId2=11749618589 ]
```

The returned results can be used to correlate which files should be restored from backup for the given time range. For versions 10.4 and later, a service called Workbench can be used to take the restored files and provide a query interface over the restored data using one or more collections.

Setup of the Workbench service is beyond the scope of this document. For more information, see "Configure Data Backup and Restore" in the *Archiver Configuration Guide* .

Advanced Database Configuration

This topic explains the advanced configuration options of the NetWitness Core database.

The configuration options of the NetWitness Core database may change from one release to the next. However, many of the configuration items do not change frequently and are documented here. This is not an exhaustive list, since new features are added in every release, and they may require new configuration items. For the most up-to-date documentation, refer to the built-in help functionality of the NetWitness Core service.

- Scheduler
- Rollover
- Snort Rules and Configuration

Database Configuration Nodes

This topic describes database configuration nodes. The following database configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

packet.dir,meta.dir,session.dir

This is the primary configuration entry for each database (also known as the Hot tier). It controls where in the file system the respective databases are stored. This configuration entry understands a complex syntax for specifying many directories as storage locations.

Configuration syntax:

```
config-value = directory, { ";" , directory } ;
directory    = path, [ ( "=" | "==" ) , size ] ;
path         = ? linux filesystem path ? ;
size         = number size_unit ;
size_unit    = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
number       = ? decimal number ? ;
```

Example:

```
/var/lib/netwitness/decoder/packetdb=10
t;/var/lib/netwitness/decoder0/packetdb=20.5 t
```

The size values are optional. If set, they indicate the maximum total size of files stored there before databases roll over. If the size is not present, the database does not automatically roll over, but its size can be managed using other mechanisms.

The use of = or == is significant. The default behavior of the databases is to automatically create directories specified when the Core service starts. However, this behavior can be overridden by using the == syntax. If == is used, the service does not create any directories. If the directories do not exist when the service starts, the service does not successfully start processing. This gives the service resilience against file systems that are missing or unmounted when the host boots.

If you modify the size of a directory in use, the size takes effect immediately, as long as it is larger. If the size is smaller, it is ignored if it is more than 10 percent smaller than the existing size. This prevents an accidental mistype that causes a enormous loss of data. For example, if the packet database was configured for `12 TB` and someone mistyped it as `12 GB` , the database would end up deleting over 11 TBs of data in order to shrink it down to just 12 GB. Instead, the database ignores the `12 GB` setting and logs a warning, so that the error can be caught quickly. Of course, if the size specified is actually correct and more than a 10 percent difference from the existing size, the only recourse for it to take effect is to restart the service. When it starts back up, it assumes the size is correct and adjusts the database to the new size by rolling out the oldest data until the new size is reached. If you actually do want to adjust the size downward and by more than 10 percent without restarting the service, you need to modify the size multiple times, each time adjusting it by less than 10 percent. Watch the service logs to know when the database has adjusted to the new size, as it only adjusts the total database size when the latest file being written has been closed.

If new directories get added or deleted (semicolon separated), they do not take effect until the service restarts.

packet.dir.warm , meta.dir.warm , session.dir.warm

These settings are optional and are used for Warm tier storage on an Archiver. By default, they are blank and unused. If configured, they follow the same format and behavior as `packet.dir` , `meta.dir` , and `session.dir` (see _ `packet.dir` , `meta.dir` , and `session.dir` _ above). When configured, the oldest file on the Hot tier moves to the Warm tier when no available space remains in the Hot tier.

packet.dir.cold , meta.dir.cold , session.dir.cold

These settings are optional and are used to move files from either a Hot or Warm tier storage system to the Cold tier directory specified. Specifically, this setting is nothing more than a directory, there are no size specifiers. However, the defined path name has a few special format specifiers that you can use to name the directory with the date of the data in it.

```
%y   = The year of the data being moved to the cold tier
%m   = The month of the data being moved to the cold tier
```

```
%d   = The day of the data being moved to the cold tier
%h   = The hour of the data being moved to the cold tier
%##r = A block of time within a day. So %12r would create two blocks, 00 and
01\. 00 for all data in the AM, 01 for all PM data
```

Example setting:

```
packet.dir.cold = /var/lib/netwitness/archiver/database1/alldata/cold-
storage-%y-%m-%d-%8r
```

For the setting above, if a log database file was about to be moved to cold storage and it was created on `2014-03-02 15:00:00`, it would be moved to the following directory on the Cold tier:

```
/var/lib/netwitness/archiver/database1/alldata/cold-storage-2014-03-02-01
```

The last number `01` needs some explanation. The `%8r` specifier breaks the hours of the day into 24 / 8 = 3 parts. The first eight hours of the day would be block `00`, so 12 a.m. to 8 a.m. The next eight hours are from 8 a.m. to 4 p.m. and are assigned block `01`. Since the data being moved to cold storage was created at 3 p.m., it falls into block `01`. The `%r` format specifier is useful for backing up files with a granularity somewhere between a day `%d` and a single hour `%h`. The Cold storage directory is created on demand and is defined by the data being moved when the format specifiers are used.

The ability to add a date to the path of the data is just a convenience added for backup and restore. It is a way of tagging the data with a date in the path.

packet.file.size, meta.file.size, session.file.size

This controls the size of the files created with each database. It is normally not necessary to change these values as the default values typically work well. This setting takes effect immediately for subsequent files.

packet.files, meta.files, session.files

This setting controls the number of files held open by the database. You can increase this value to improve performance: however, the operating system has an overall limit on the number of files that service can keep open. If this limit is exceeded, an error is reported and the service does not function. This setting takes effect immediately.

In versions 10.6 and later, the default value for packet.files, meta.files, and session.files is `auto` and the service manages the number of open files based on this criteria:

1. Number of collections
2. Amount of system memory

When set to `auto` , the number is dynamic and you can view it in the logs when it changes. NetWitness recommends that you leave this value as `auto` and do not change it to a specific number.

packet.free.space.min , meta.free.space.min , session.free.space.min

This setting provides a safety limit on the minimum free space that exists on the paths specified by the packet.dir, meta.dir, and session.dir directories, respectively. This setting is used to prevent the service from running out of space in the event that other programs have filled up the space that should be dedicated to each of the databases. This setting takes effect immediately.

packet.index.fidelity , meta.index.fidelity

This setting controls how frequently packet ID locations and meta ID locations are indexed. This setting can be increased to reduce the amount of space needed by each packet or meta nwindex file, but increasing the setting reduces the speed at which individual packets or meta items can be located. This setting takes effect immediately.

The session database does not have a fidelity setting because it does not generate index files.

packet.integrity.flush , meta.integrity.flush , session.integrity.flush

This setting controls whether the database forces a sync operation on the file system when it is finished writing a file. The default value is `sync` , which means when a file is closed there will be a significant delay while the data writes to non-volatile storage. It may be necessary to set this to `normal` in order to achieve higher sustained write rates, especially on a Decoder. This setting takes effect on the next file created. Therefore, it is expected that at least one more sync will happen if the value was just changed to `normal` .

If packet drops are occurring and packet.integrity.flush is set to `sync` , set it to `normal` and monitor. Keep the session and meta flush settings on `sync` If packet drops are still problematic, then set all three to `normal` and monitor.

packet.write.block.size , meta.write.block.size , session.write.block.size

The block size represents how much data is allocated at a time within each database file. Larger block sizes can provide higher throughput and compression ratios, and can improve the rate at which items can be retrieved from the database sequentially. However, larger block sizes have a detrimental impact on random read speed for compressed packet and meta items. This setting takes effect immediately.

packet.compression , meta.compression

These parameters control whether the databases compress data. Compression reduces the amount of storage needed by each database, but it can have a major detrimental impact on the speed at which items are written to the database, and the speed at which items are retrieved from the database. Changes take effect immediately on the next file creation.

Note: The Packet db format `pcapng` cannot be compressed.

As of version 12.3, the valid values for this parameter are `gzip, zstd, bzip2, lzma` or `none`. `gzip` or `zstd` are the preferred algorithms when compression is used, because they provide a good balance between performance and space savings. Both `bzip2` and `lzma` can achieve better space savings, but the tradeoff in speed is substantial and likely should only be considered for low ingest speeds and when storage space is at a premium.

packet.compression.level , meta.compression.level

You can use these settings to further refine how the compression algorithms behave. They have no effect when compression is disabled. The valid values are between 0–9 (between 0-22 for `zstd`). The default value of zero means let the software pick the best setting for speed and compression. The values between 1 and 9 are used as a sliding scale between performance (1) and compression (9). The value of 9 (or 22 for `zstd`) typically gives you the best compression for a given algorithm, but the worst performance. Somewhere in the middle is usually the best setting, which is what zero picks.

hash.algorithm

This setting controls how the database files are hashed. The default value is `none` , so no hashing is performed. The valid values are `none` , `sha256` , `sha1` , or `md5` . Database files can be hashed to provide evidence that they have not been tampered with since they were closed. Hashing is time intensive and affects ingest performance when enabled. This change takes effect immediately.

hash.databases

This setting controls which databases are hashed. Valid values are `session` , `meta` , and `packet` and are comma separated when hashing multiple databases. This change takes effect immediately.

hash.dir

This setting is normally empty, which means the hash file is created in the same directory as the database file that was hashed. If this setting is defined, the hash file is written to the directory specified instead. This could be some form of write-once storage for resilience against hash tampering.

Hash files are small XML files containing the hex encoded hash along with metadata about the database file that was hashed.

Index Configuration Nodes

This topic describes index configuration nodes. The following index configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

index.dir

The `index.dir` setting controls where the files used by the index are stored. This setting supports the same syntax as the `packet.dir` , `meta.dir` , and `session.dir` settings.

index.dir.warm

The Warm tier storage for index slices. This setting supports the same syntax as `packet.dir.warm` , `meta.dir.warm` , and `ession.dir.warm` .

index.dir.cold

The Cold tier storage for index slices. This setting supports the same syntax as `packet.dir.cold` , `meta.dir.cold` , and `session.dir.cold` .

index.slices.open

This setting controls the number of index slices held open by the index. Index slices are opened automatically as needed by queries. When queries complete, the index engine may hold the slices open so that subsequent queries execute faster. The most recently created slices are the slices that will be held open, since they are mostly likely to be used by queries.

If queries against the index require the index to open slices, then they will execute slower than if the slices were already open. Therefore, this parameter should be tuned such that most queries executed against the index will work on open slices. However, each open index slice consumes some resources, such as file handles and memory. If there are too many index slices open, the overall performance of the service can suffer.

You should set this parameter so that the open index slices will cover most of the time ranges that most queries will need. For example, if most queries are over the past two weeks, and there are index slices created every 8 hours, then there are 14 days x 3 slices per day, or 42 slices created over the past two weeks. Thus, you could set index.slices.open to 42 so that only slices that are likely to be used are held open.

If this parameter is set to 0, then all slices are held open until the next index save. In this scenario, the only thing limiting the number of slices open in the process is the number of slices in the index.

page.compression

Deprecated. Versions of the NetWitness Core index between 9.8 and 10.2 supported two different index compression algorithms, and you can choose between them using this setting. As of 10.3, the only recommended value is the default of `huffhybrid` .

save.session.count

This setting controls how often the index is automatically saved when new sessions are inserted. If the value of save.session.count is greater than 0, any time more than `save.session.count` sessions are added to the index, the index automatically saves itself. If the `save.session.count` is set to 0, this feature is disabled and the index will not automatically save itself when new sessions are added to the index.

`save.session.count` can be used to implement an automatic save pattern that is based on the volume of data that enters the index. This is useful because it allows a lightly loaded system to generate save points less often.

For more information on the topic of index saves, see the section in this guide on Optimization Techniques .

reindex.enable

This setting controls the operation of the background reindexer .

SDK Configuration Nodes

This topic describes the SDK configuration nodes that affect the database. There are some additional configuration items in each Core service that affect the database, but do not actually affect how the database stores or retrieves data. These settings exist in the `/sdk/config` folder.

max.concurrent.queries

This setting controls how many query operations are allowed on the database simultaneously. Allowing more simultaneous query operations can improve overall responsiveness for more users, but if the query load of the Core service is very I/O bound, having a high max.concurrent.queries value can have a detrimental effect. The recommended value is near the number of cores on the system, including hyper threading. Thus, for an appliance with 16 cores, the value should be somewhere close to 32\. Subtract a few for aggregation threads and general system response threads. Subtract a few more if this is a hybrid system (for example, both a Decoder and Concentrator running on the same appliance). There is no magic number, but somewhere between 16 and 32 should work well.

max.pending.queries

This setting controls the backlog size for the query engine of the database. Larger values allow the database to queue more operations for execution. A queued query does not make progress on its execution, so it may be more useful to make the system produce errors when the queue is full, rather than allowing the queue to grow very large. However, on a system that is primarily performing batch operations such as reports, there may be no detrimental effect to having a large queue.

cache.window.minutes

This setting controls a feature of the query engine that is intended to improve query responsiveness when there are a large number of simultaneous users. For more information on cache window, see Optimization Techniques .

max.where.clause.cache

The where clause cache controls how much memory can be consumed by query operations that need to produce a large temporary data set to evaluate sorting or counting. If the where clause cache size is overflowed, the query still works, but it is much slower. If the where clause cache is too large, it is possible for queries to allocate so much memory that the service would be forced into swap or run out of memory. Thus, this value multiplied by the max.concurrent.queries should always be much less than the size of physical RAM. This setting understands sizes in the form of a number followed by a unit, for example `1.5 GB`.

max.unique.values

The maximum unique values limits how much memory can be consumed by the SDK Values function. SDK Values produces a sorted list of unique values. In order to produce accurate results, it may need to merge together large numbers of unique values from many slices. This merged set of values must be held in memory, so this parameter exists to put a limit on how much memory the merged value set can consume. The default value will limit memory usage to approximately 1/10th of total RAM.

query.level.1.minutes, query.level.2.minutes, query.level.3.minutes

These settings are available in 10.4 and earlier versions.

In versions 10.4 and earlier, the Core database supports three query priority levels. Each user is assigned to one of the priority levels. Therefore, there are up to three groups of users that can be defined for the purposes of performance tuning. These settings control how long each user level is allowed to execute the queries. For example, lower privileged users may have a lower value so that they are not able to use all the resources of the Core service with long-running queries.

query.timeout

This setting is available in 10.5 and later versions.

Query levels have been replaced in versions 10.5 and later with per user account query timeouts. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, there is a new config node under each account called `query.timeout`, which is the maximum amount of time in minutes that each query can run. Setting this value to zero means no query timeout will be enforced by the Core service.

max.where.clause.sessions

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. The value of 0 disables this limit.

The number of sessions needed to fully process a query is equal to the number of sessions that match the WHERE clause of the query, assuming that all terms in the where clause have a suitable index. If there are terms in the where clause that are not indexed, the database has to read more sessions and meta, and reaches this limit sooner.

max.query.groups

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on the number of unique groups collected in a single query. For example, if a query has a group by clause with multiple metas that have high unique value counts, the amount of memory needed for that query could easily outpace the amount of RAM available on the server. Thus, this limit exists to prevent out-of-memory conditions from happening.

Setting a value of 0 disables this limit.

packet.read.throttle

This is a decoder-only setting that affects the access to the packets database. When packet.read.throttle is set to a value greater than 0, the decoder attempts to throttle packet reads when it detects packet contention on the packet database. Higher numbers provide more throttling. Changes takes effect immediately.

cache.dir , cache.size

All NetWitness Platform Core services maintain a small file cache of raw content extracted from the device. These parameters control the location (cache.dir) and size (cache.size) of this cache.

pin.cache.dir , pin.cache.size

All NetWitness Platform Core services provide a separate file cache of raw content that is marked (or pinned) for long-term retention. These parameters control the location (pin.cache.dir) and size (pin.cache.size) of this cache. You can configure the maximum size of the pinned cache at `/sdk/config/pin.cache.size`. The default size is zero that prevents pinning of new sessions once storage decreases below 100 MB. If you configure it with a non-zero value, then it will reduce the cached files when the total size exceeds the configured size by deleting the oldest pinned sessions.

parallel.values

This setting is available in 10.5 and later versions.

This setting allows SDK-values operations to be executed in parallel. If this is set to 0, it will disable parallel execution. If it is set to a value greater than 0, it represents the number of threads created when each SDK-values operation is executed. The maximum value is the number of logical CPUs available when the process started.

Setting a higher value for parallel.values is useful when there are small numbers of simultaneous users, since it will allow for more complex Investigations to be executed more quickly. If there are many simultaneous users, it is better to use a low value here, since there will be many independent SDK-values operations executed simultaneously.

parallel.query

This setting is available in 10.5 and later versions.

This configuration is similar to the parallel.values setting in that the maximum value is the number of logical CPUs. Setting parallel.query to a specific value should take into account the number of simultaneous users to maximize CPU utilization without consistently exceeding available resources.

Setting a higher value for parallel.query is useful when there are small numbers of simultaneous users and queries, since it will allow more complex queries to be executed more quickly. If there are many simultaneous users and queries, it is better to use a low value, since there will be many independent SDK-query operations executed simultaneously.

Query operations are limited by the meta database read rate, so setting parallel.query to a value higher than 4 is unlikely to produce dramatically better results than the default value of 0\. The best number to use for parallel.query will depend on the type of storage attached. Experiment with different values of parallel.query to determine the best results for your storage system.

Per-User Configuration Nodes

This topic describes the per-user configuration nodes. There are settings that influence the actions users are allowed to perform on the database. These settings are stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the settings apply.

query.prefix

A query prefix applies a filter to every query operation that the user performs. This is implemented by taking the `query.prefix` values and appending it the the where clause of each query using the logical && (and) operator. For more information on Where Clauses, see Queries .

query.level

This setting is available in 10.4 and earlier versions.

The query.level setting assigns the query level that the users have for every query they perform. These influence whether their queries are limited by the query.level.1.minutes, query.level.2.minutes, or query.level.3.minutes.

query.timeout

This setting is available in 10.5 and later versions.

The query.timeout setting assigns the maximum amount of time in minutes that a user can run each query. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, this setting is stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the setting applies. When this value is set to zero, the Core service does not enforce the query timeout.

session.threshold

The session.threshold setting assigns a maximum session threshold for the user. If set, this threshold value is assigned to all values calls that the user performs. A detailed discussion of both the values call and thresholds is covered in this guide.

Scheduler

This topic provides a brief introduction to the scheduler and explains how to schedule commands. All NetWitness Core services come with a built-in scheduler found under `/sys/config/scheduler` . To use the scheduler, you add the command you want to run periodically using one of two messages:

`/sys/config/scheduler addInter` - Add a command to run at the specified interval (every N hours, minutes or seconds)

or

`/sys/config/scheduler addMil` - Add a command to run at the specified time of day or even specific days of the week

Example

For example, suppose that you have a use case to delete all packet data that is greater than seven days old. Since you cannot configure the packet.dir setting to rollout data based on a time interval, you need to schedule the `/database timeRoll` command to run every so often. For this example, create a timeRoll to run every 20 minutes:

```
addIter minutes=20 pathname=/database msg=timeRoll params="type=packet days=7"
```

This command adds a scheduled task (it is persisted between restarts of the service) to run every 20 minutes, on the `/database` node, and ages out all packet data older than seven days. The `params` parameter is used to pass all the parameters to the command specified (in this case `timeRoll`). Notice how it quotes all the embedded parameters (`type` and `days`) so they are not interpreted as parameters to be passed to the outer `addIter` command. If the parameters inside `params` need to use quotes, you must escape the inner quotes with a backslash. You can rewrite it with embedded quotes, which does not alter the command in any way:

```
addIter minutes="20" pathname="/database" msg="timeRoll"
params="type=\"packet\" days=\"7\""
```

This command works identically to the original, but demonstrates how to escape complicated parameter passing. Additional useful scheduler commands are:

`/sys/config/scheduler print` - Print all scheduled commands (you can also see them by doing an `ls` on the scheduler node).

`/sys/config/scheduler delSched` - Delete a scheduled command by passing in the identifier shown in the `print` (or `ls`) command.

This is a brief introduction to the scheduler. For more information on command parameters, send the `help` message to the scheduler node and pass in the command name via the `msg` parameter. For more information, see the "Services Explore View" topic in the *Host and Services Getting Started Guide* .

Rollover

This topic describes the two rollover mechanisms. The database operates as a first-in, first-out (FIFO) queue. New data is always appended to the database, and the oldest data is automatically removed as needed. Data that is in the middle of the database is immutable, meaning it cannot be modified.

There are two mechanisms to for rollover: synchronous and asynchronous.

Synchronous Rollover

Synchronous rollover refers to rollover settings that are applied in response to a write operation on the database. That means data is removed from the database in direct response to the need to write new data. Synchronous rollover is configured by setting size values on the configuration for `packet.dir` , `meta.dir` , `session.dir` , and `index.dir` .

Synchronous rollover on the packet, meta, and session databases can occur within any write operation. Synchronous rollover on the index occurs when the index is saved.

Asynchronous Rollover

Asynchronous rollover refers to database file removal that occurs when an explicit rollover command is issued to the database. Most commonly this type of rollover is scheduled to run periodically using the built-in scheduler of the Core service. The user can also explicitly request it.

The asynchronous rollover command is the `sizeRoll` message present on the `/index` and `/database` nodes of the configuration tree. The message on the `/database` node does size rollover on packet, meta, and session databases only, while the message on the `/index` node can do simultaneous rollover on both the index and the packet, meta, and session databases.

The `sizeRoll` command has the following parameter syntax:

```
size-roll-params    = {type-param, space}, (max-size-param | min-free-param |
max-percent-param), {max-size-warm-param, space}
type-param          = "type=", {type-flag} , { ",", type-flag } ;
type-flag           = "packet" | "meta" | "session" ;
max-size-param      = "maxSize=", number, {space}, unit ;
max-percent-param   = "maxPercent=", number, {space}, unit ;
min-free-param      = "minFree=", number, {space}, unit ;
max-size-warm-param = "maxSizeWarm=", number, {space}, unit ;
unit                = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
```

```
number              = ? decimal number ? ;
percentage          = ? number between 0 and 100 ? ;
```

The `type` parameter controls the databases to consider for removing the oldest data based on total size or space remaining. If type is not specified on the `/index` sizeRoll, only the index is considered for rollover operations.

The `maxSize` parameter sets a current maximum size of the database or index. If the database is larger than this size, oldest data is deleted first (or moved to the Warm or Cold tier, depending on the configuration) until total size is less than `maxSize` . The `sizeRoll` operation determines which data is oldest out of all the databases and the index based on session IDs. Sessions or index entries with lowest session IDs are deleted first, possibly including removing meta and packet databases that are orphaned by removing entries from the session database. The index data is rolled out if the sessions that it refers to are removed.

The `maxSizeWarm` parameter sets a current maximum size on the *Warm* tier, but otherwise behaves identically to the `maxSize` parameter. When data is rolled out on the Warm tier, it is moved to the Cold tier (if configured) or deleted.

The `maxPercent` parameter sets a maximum percentage of all the volumes of all databases passed in `type` parameter combined. When exceeded, oldest data is deleted first until total size is less than maxPercent of total volumes.

The `minFree` parameter sets a minimum allowed free space on the volumes before oldest data is deleted.

Each call to the sizeRoll operation provides a single pass through the database to delete files. When the operation completes, the current size utilization of the database will have met the criteria specified by the `maxSize` , `maxPercent` , or `minFree` parameters and the optional `maxSizeWarm` . Therefore, this operation can be scheduled periodically to ensure that the database can continue to operate uninterrupted.

Example

The following example shows a typical sizeRoll scheduler entry for an Archiver:

```
pathname=/index minutes=5 msg=sizeRoll params="type=meta,session,packet
maxSize=25TB maxSizeWarm=150TB"
```

This scheduler entry specifies that every five minutes the database ensures that the max size of the meta, session, packet, and index does not exceed 25 terabytes on the Hot tier and does not exceed 150 terabytes on the Warm tier.

Snort Rules and Configuration

Snort® rules and configuration are added to the parsers/snort directory for Investigator and Decoder. Decoder supports the payload detection capabilities of Snort rules. The rules files must have the extension `.rules` and the configuration files must have the extension `.conf` . The Decoder implementation of Snort rules is centered on using the content strings defined in a Snort rule as a token. Once a token is matched, the rule header and additional rule options can be evaluated. Currently, rules that do not define any content (via `content` or `uricontent` rule options) are not supported.

Configuration

The configuration files are loaded prior to loading rules.

Variable Definitions	Description
`ipvar`	The full language for defining IP Address variables is supported, including lists, CIDR, and negation.
`portvar`	The full language for defining IP Address variables is supported, including lists, ranges, and negation.
`var`	Not supported; use `ipvar` or `portvar` .

Action Definitions	Description
`ruletype`	The definition of additional `ruletype` s is supported. However, only rules that have a base rule type of **alert** are supported.

General Configuration	Description
`nopcre`	This configuration option disables all rules with **pcres**.

Meta key usage

Starting with the 11.3 release, an attempt has been made to align better the Snort parser's meta key usage with that of other parsers. As of the 11.3 release, the default mode operation continues to write to the legacy key set (consistent with previous releases). To use the aligned key set, set the `udm` option to `true` for the Snort parser in the `parser.options` configuration node. Refer to the **General options** section, below, for a description of how the two modes differ.

Rules

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however,there are rule options that are not supported by Decoder that are not fully parsed.

Snort rules are parsed and loaded when PCS is loaded (any import/capture in Investigator, initial capture start and parser reload in Decoder).

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. Decoder only utilizes rules with alert actions.
Protocols	Decoder supports the current Snort protocol keywords (`tcp` , `udp` , `icmp` , `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.
Direction Operator	The directional operator supports the from-to (`->`) and bidirectional (`<>`) values. The to-from (`<-`) value is invalid and will cause the rule to fail to load.

General options

Snort rule general options can result in different meta keys being written depending on whether the Snort parser is in legacy mode or not.

Aligned key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `sig.name` meta.
`sid`	If the rule matches, the `sig.id` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.

Option	Description
`priority`	If the rule matches and it has a `priority` option, it is used for the value of the `risk.num` meta.

Legacy key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `risk.info` , `risk.warning` , or `risk.suspicious` meta, depending on rule priority.
`sid`	If the rule matches, the `sid` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.
`priority`	If the rule matches and it has a `priority` option, it is used to determine the type of risk meta associated with the `msg` value.

Payload options

Decoder supports the following payload rule options:

Option	Description
`content`	The `content` option creates a token for Decoder to match. Only tokens of three or more bytes are accepted. It is also important to note that Decoder differs from Snort in that rules are evaluated across the payload of the reconstructed stream and not just a single packet. This can result in differences in rules matches between Snort and Decoder, especially when considering positional options.
`nocase`	Currently not supported. This option is ignored and case-sensitive matching is used.
`depth`	This option is applied to the distance of the token from the beginning of the stream. If the token position is greater than this value, it is not a match.
`offset`	This option is applied to the distance of the token from the beginning of the stream. If the token position is less than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is less than this value, it is not a match.
`within`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is greater than this value, it is not a match.

Option	Description
`http_uri`	Any token that hits is verified to fall within an `http_uri` as indicated by the HTTP parser. No URI normalization is applied.
`uricontent`	There is no URI normalization applied. Otherwise, this is equivalent to the content option with the `http_uri` modifier.
`pcre`	Currently, PCREs are only applied to URIs and must specify the U option.

Non-payload options

Option	Description
`flow`	Verifies that the rule is only applied to the client or server stream.
`to_client`	Limits the rule to only matching on a stream that Decoder has defined as Server.
`from_server`	Synonym for `to_client` .
`from_client`	Limits the rule to only matching on a stream that Decoder has defined as Client.
`flowbits`	Maintains state per session and are reset at the end of each session.
`set`	When the rule matches, the specified flowbit is set.
`unset`	When the rule matches, the specified flowbit is cleared.
`toggle`	When the rule matches, the specified flowbit is flipped.
`isset`	When the rule is evaluated, the specified flowbit state must be set for the rule to match.
`isnotset`	When the rule is evaluated, the specified flowbit state must not be set for the rule to match.
`noalert`	Prevents the rule from generating meta data if it matches.

Queries

This topic covers the database query syntax. There are three main mechanisms for performing queries in the database, the `query` , `values` , and `msearch` calls on the `/sdk` folder on each Core service.

The `query` call returns meta items from the meta database, possibly using the index for fast retrieval.

The `values` call returns groups of unique meta values sorted by some criteria. It is optimized to return a subset of the unique values sorted by an aggregate function such as count.

The `msearch` call takes text search terms as it's input, and returns matching sessions that match the search terms. It can search within indexes, meta, raw packets, or raw logs.

`query` Syntax

The `query` message has the following syntax:

```
query-params     = size-param, space, query-param, {space, start-meta-param},
{space, end-meta-param}, {space, search-param} ;
size-param       = "size=", ? integer between 0 and 1,677,721 ? ;
query-param      = "query=", query-string ;
start-meta-param = "id1=", metaid ;
end-meta-param   = "id2=", metaid ;
search-param     = "search=", search-string ;
metaid           = ? any meta ID from the meta database ? ;
```

The `id1` , `id2` , and `size` parameters form a paging mechanism for returning a large number of results from the database. Their usage mostly benefits developers who are writing applications directly against the NetWitness Core database. Normally, results are returned in the order of oldest to newest data (higher meta IDs are always more recent). In order to return results from most recent to oldest, reverse the IDs such that `id1` is larger than `id2` . This has a slight performance penalty, because the where clause must be completely evaluated before processing in reverse order can begin.

When size is left off or set to zero, the system streams back all results without paging. For the RESTful interface, this results in the full response to be returned with chunked-encoding. The native protocol returns the results over multiple messages.

The `query` parameter is a `query` command string with its own NetWitness-specific syntax:

```
query-string      = select-clause {, where-clause} {, group-by-clause {,
order-by-clause } } ;
select-clause     = "select ",  ( "*" | meta-or-aggregate {, meta-or-
aggregate} ) ;
```

```
where-clause      = " where ",  { where-criteria } ;
meta-or-entity    = (meta_key | entity) ;
meta-or-aggregate = meta-or-entity | aggregate_func, "(", meta-or-entity, ")"
;
aggregate_func    = "sum" | "count" | "min" | "max" | "avg" | "distinct" |
"first" | "last" | "len" | "avglen" | "countdistinct" ;
group-by-clause   = " group by ", meta-key-list
meta-key-list     = meta-or-entity {, meta-key-list}
order-by-clause   = " order by ", order-by-column
order-by-column   = meta-or-aggregate { "asc" | "desc" } {, order-by-column}
```

The `select` clause allows you to specify either `*` to return all the meta in all the sessions that match the where clause, or a set of meta field names and aggregate functions to select a subset of the meta with each session.

The `select` clause may contain entity names in the place of meta key names. If an entity name is in the select clause, meta items returned by the query will have their key name set to the entity name, rather than their actual meta key name stored in the session. Thus, the names of the meta items returned in the query will match the names of the metas in the select clause. For example, if there is an entity `ip` that consists of `ip.dst` and `ip.src` , then a query containing `select ip` will only return `ip` fields, with nothing to distiguish `ip.dst` meta items from `ip.src` meta items in the result set.

The `select` clause may contain renamed meta key names. Any fields appearing in the result set as a result of a renamed key in the `select` clause will be returned with the meta key name matching the name used in the `select` clause. For example, if the key `port_src` is used to rename `tcp.srcport` , then a query containing `select port_src` will only return `port_src` fields, even if the underlying meta had type `tcp.srcport` .

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. Doing so causes discrepancies in the results returned to Brokers. The reason for the discrepancies is that Concentrators cannot return only one of the key values of a renamed meta key pair and still preserve the correctness of the result set for the requested size. Hence, the Concentrator omits renamed meta key pair results to preserve the correctness of the result set, which causes the Broker to pull the result from the next Concentrator and advance the IDs that are returned.

Example: `select ip.proto,ipv6.proto` cannot be combined with `size=10` (a paging query) `size=10 flags=0 threshold=0 query="select time,ip.src,ip.dst, ip.proto,ipv6.proto,eth.type,size,payload,lifetime,client,did`

The aggregate functions have the following effect on the query result set.

Function	Result
`sum`	Add all meta values together; only works on numbers
`count`	The total number of meta fields that would have been returned

Function	Result
min	The minimum value seen
max	The maximum value seen
avg	The average value for the number
distinct	Returns a list of all unique values seen
countdistinct	Returns the number of unique values seen. countdistinct is equivalent to the number of metas that would have been returned by the distinct function.
first	Returns the first value seen
last	Returns the last value seen
len	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For example, the word "NetWitness" returns a length of 10. All IPv4 fields, like ip.src , return 4 bytes.
avglen	Returns a single value which is the average value returned from the len function. The result is always a float64 value.

where Clauses

The where clause is a filter specification that allows you to select sessions out of the collection by using the index.

Syntax:

```
where-criteria    = criteria-or-group, { space, logical-op, space, criteria-
or-group } ;
criteria-or-group = criteria | group ;
criteria          = (meta-key | entity), ( unary-op | binary-op meta-value-
ranges ) ;
group             = ["~"], "(" where-clause ")" ;
logical-op        = "&&" | "||" ;
unary-op          = "exists" | "!exists" ;
binary-op         = "=" | "!=" | "<" | ">" | ">=" | "<=" | "begins" |
"contains" | "ends" | "regex" ;
meta-value-ranges = meta-value-range, { ",", meta-value-range } ;
meta-value-range  = (meta-value | "l" ), [ "-", ( meta-value | "u" ) ] ;
```

```
meta-value          = number | quoted-value | ip-address | mac-address |
relative-time ;
number              = ? any numeric value ? | ( '"' text '"' )
quoted-value        = ( '"' text '"' ) | ( '"' date-time '"' ) ;
relative-time       = "rtp(" , time-boundary , "," ,  positive-integer , time-
unit, ")" ;
time-boundary       = "earliest" | "latest" | "now" ;
positive-integer    = ? any non-negative integral number ?
time-unit           = "s" | "m" | "h" ;
```

When specifying rule criteria, the `meta-value` part of the clause is expected to match the type of the meta specified by the `meta-key` . For example, if the key is `ip.src` the `meta-value` should be an IPv4 address. Entity names are allowed in any location where a meta-key name is required.

Queries using a `meta-key` name will match meta items corresponding both to the `meta-key` name as well as to the names of any "renames" specified for the key. See "Key Renaming" under the Index Customization topic for details on key renaming.

Query Operators

The following table describes the function of each operator.

Operator	Function
=	Match sessions containing the meta value exactly. If a range of values is specified, any of the values is considered a match.
!=	Matches all sessions that would not match the same clause as if it were written with the = operator.
<	For numeric values, matches sessions containing meta with the numeric value less than the right side. If the right side is a range, the first value in the range is considered. If multiple ranges are specified, the behavior is undefined. For text metas, a lexicographical comparison is performed.
<=	Same behavior as < , but sessions containing meta that equals the value exactly are also considered matches.
>	Similar to the < operator, but matches sessions where the numeric value is greater than the right side. If the right side is a range, the last value in the range is considered for the comparison.
>=	Same behavior as > , but sessions containing meta that equals the value exactly are also considered matches.
begins	Matches sessions that contain text meta value that starts with the same characters as the right side.

Operator	Function
`ends`	Matches sessions that contain text meta that ends with the same characters as the right side.
`contains`	Matches sessions that contain text meta that contains the substring given on the right side.
`regex`	Matches sessions that contain text meta that matches the regex given on the right side. The regex parsing is handled by boost::regex.
`exists`	Matches sessions that contain any meta value with the given meta key.
`!exists`	Matches sessions that do not contain any meta value with the given meta key.
`length`	Matches sessions that contain text meta values of a certain length. The expression on the right side must be a non-negative number.

Text Values

The system expects quoted text values. Unless it can be parsed as a time (see below), a quoted value is interpreted as text.

> It is also important to quote any text value that may contain – so that it is not interpreted as a range.

For text values, the backslash character \ is used as an escape value. This character is used when you need to search for a value containing quote characters. If you need to search for a backslash character, then the backslash itself must be escaped, as \\ . Note that if you are wrapping the query parameters within another language, such as the parameter fields of the REST interface, you may need to add additional escape levels as required by whatever API or interface you are using to interact with the core service.

IP Addresses

IP addresses can be expressed using standard text representations for IPv4 and IPv6 addresses. In addition, the query can use CIDR notation to express a range of addresses. If CIDR notation is used, it is expanded to the equivalent value range.

MAC Addresses

A MAC address can be specified using standard MAC address notation: `aa:bb:cc:dd:ee:ff`

Numeric Values

In a where clause, you can specify numeric search values. Numbers should not be surrounded by quotes.

Bucketed Numeric Indexes

Meta keys indexed with bucketing can be used like any other numeric search value. Under most situations such searches will return sessions that have a meta value that exactly matches the requested search criteria.

Special behavior is invoked for queries that select only `sessionid` , for example a query of the form `select sessionid where size = 2048` . Selecting `sessionid` explicitly bypasses all meta database read operations, and only returns index information. If selecting `sessionid` only, and if the numeric value specified is exactly equal to one of the bucket values, then the system will return all sessions that match somewhere in the bucket, rather than an exact match. For example, the search term `size = 2048` will match all sessions in the 2 KB bucket, which is the range from 2048 to 3171 bytes. However, if the search values does not match a bucket values, then the system will return only matches for the exact byte value. For example, the search term `size = 2049` will only match sessions with a size meta value exactly 2049. In this mode of operation, specifying a non-bucket value in a where clause is slower than searching within a bucket value. The 'where' clause parameter to the `values` API also invokes this optimization.

Using bucketed values in other forms of `query` does not invoke special behavior. The same is true for the `msearch` API. For those APIs, the use of a bucketed index in the where clause is evaluated accurately, without special meaning applied to bucket values. To search within an entire bucket using these APIs, specify the bucket range explicitly. For example `size=2048-3171` .

More information on how to tell if an index is bucketing is in the topic Index Customization .

Numeric Value Aliases

For numeric values, aliases specified in the index can be used in a query as a quoted string in place of where a literal numeric value would be used; e.g.,

```
select * where service = "NFS"
```

Numeric value aliases can be used anywhere a numeric literal might be used: as a single value, as the beginning or end of a range, or in a comma-delimited list of values (and/or ranges).

Refer to the topic Index Customization for details of how value aliases can be specified in the index.

Date and Time Expressions

In NetWitness Platform, dates are represented using Unix epoch time, which is the number of seconds since Jan 1, 1970 UTC. In queries, you can express the time as this number of seconds, or you can use the string representation. The string representation for the date and time is `"YYYY-mmm-DD HH:MM:SS"` . A three-letter abbreviation represents the month. You can also express the Month as a two-digit number, 01-12.

Time values must be quoted.

All times specified in queries are expected to be in UTC.

Relative Time Points

Relative time points allow a where clause to reference a value at some fixed offset relative to the earliest or latest time metas seen in the collection. It can also be used to reference a point in time relative the the current time.

A relative time point expression has the syntax `rtp(boundary, duration)` .

The boundary is either `earliest` , `latest` , or `now` .

The duration is an expression of hours, minutes, or seconds. For example, `24h` , `60m` , or `60s` . When the boundary is `earliest` , the duration represents the amount of time **after** the earliest time present in the collection. If the boundary is `latest` , the duration represents the amount of time **before** the earliest time present in the collection. If the boundary is `now` , the duration represents the amount **before** the current time.

When the boundary is `now` , the system clock of the Core service host is used to determine what time it is.

Boundary can be represented as 0 seconds if you wish to specify the relative time point with no duration offset. This is most useful in the case of the `now` boundary, since it is possible that the highest, latest, time observed in the collection may be much earlier than the current time.

Relative time points can only be used in SDK operations, where there is a collection from which to get the boundaries for earliest and latest time metas.

Relative time points only work on indexed meta types. The default indexed meta types are `time` and `event.time` .

Examples:

```
Last 90m of collection time:
time = rtp(latest, 90m) - u

First 2 days of event time:
event.time = l - rtp(earliest, 48h)

Events added in the last hour:
time = rtp(now, 60m) - rtp(now,0s)
```

Special Range Values

Ranges are normally expressed with the syntax * `smallest` * - * `largest` *, but there are some special placeholder values you can use in range expressions. You can use the letter `l` to represent the lower-bound of the all meta values as the start of the range, and `u` to represent the upper bound. The bounds are determined by looking at the smallest or largest meta value found in the index out of all the meta values that have already entered the index.

If you use the `l` or `u` tag, it should be unquoted.

For example, the expression `time = "2014-may-20 11:57:00" - u` would match all time from that 2014-may-20 11:57:00 to the most recent time found in the collection.

Notice that it is easy to confuse a range expression with a text string. Make sure that text values that contain − are quoted, and that hyphens within range expressions are not within quoted text.

`group by` Clause (since 10.5)

The query API has the ability to generate aggregate groups from the results of a query call. This is done using a `group by` clause on the query. When `group by` is specified, the result set for the query is subdivided into groups. Each group of results is uniquely identified by the meta values indicated in the group by clause.

For example, consider the query `select count(ip.dst)` . This query returns a count of all ip.dst metas in the database. However, if you add a `group by` clause, like this: `select count(ip.dst) group by ip.src` , the query returns a count of the ip.dst metas found for each unique ip.src.

As of version 10.5, you can utilize up to 6 meta fields in a `group by` clause.

The `group by` clause shares some of the same functionality as the `values` call, but it offers significantly more advanced groups at the expense of longer query times. Producing the results of a grouped query involves reading the meta from the meta database for all sessions that match the `where` clause, while a values call can produce its aggregates by reading the index only.

The contents of each group returned by the query are defined by the `select` clause. The `select` clause can contain any of the aggregate functions or meta fields selected. If multiple aggregates are selected, the result of the aggregate function is defined for each group. If nonaggregate fields are selected, the meta fields are returned in batches for each group.

The result set of a `group by` query is encoded with the following rules:

1. All meta items associated with a group are delivered with the same group number.
2. The first meta items returned to the group identify the group key. For example, if the `group by` clause specifies `group by ip.src` , then the first meta item of each group will be an `ip.src` .
3. The normal, nonaggregate meta items are returned after the `group key` , but they all will have the same group number as the group key metas.
4. The aggregate result meta fields for each group are returned next.
5. All fields within a group are returned together. Different group results will not be interleaved.

If one of the `group by` meta items is missing from one of the sessions matched by the `where` clause, that meta field is treated as a NULL for the purposes of that group. When the results for that group are returned, the NULL-valued parts of the group key will be omitted from the group's results, since the database has no concept of NULL.

The semantics of a `group by` query differ from a SQL-like database in terms of what meta fields are returned. SQL databases require you to select the `group by` columns explicitly in the `select` clause if you want them to be returned in the result set. The NetWitness Core database always implicitly returns the group columns first.

A query with a `group by` clause honors the result set `size` parameter if one is provided. However, due to the nature of the grouping, it puts an additional burden on the caller to page and reform groups if a fixed-size result set is requested. For this reason, you should not specify an explicit result size when making a `group by` call. By not specifying an explicit size, the entire result set will be delivered as partial results.

`group by` clauses allow results to be grouped by an entity definition.

The following table describes the database honors configuration parameters that limit I/O or memory impact of a group by query.

Parameter	Function
/sdk/config/max.query.groups	This is the limit on how many groups can be held in memory to calculate aggregates. This parameter allows you to limit the overall memory usage of the query.
/sdk/config/max.where.clause.sessions	This is the limit on how many sessions from the where clause can be processed in a query. This parameter allows you to set a limit on the number of sessions that have to be read from the meta and session databases to resolve a query.

order by Clause (since 10.5)

An order by clause can be added to a query that contains a group by clause. The order by clause causes the set of grouped results to be returned in sorted order.

An order by consists of a set of items to sort by in ascending or descending order. Sorting can be performed on any data field that will be returned in the result set. This includes meta specified by the select clause, aggregate function results specified by the select clause, or group by meta fields.

The order by clause can sort over many columns. There is no limit on the number of order by columns allowed in the query; but a practical limit exists in that each of the order by columns must refer to something returned by the select clause or group by clause. The multiple column sort is imposed lexicographically, meaning that if two groups have equal values for the first column, then they are sorted by the second columns. If they are equal in the second column, they are sorted by the third column, and so on for however many order by columns are provided. Groups that do not contain any of the metas referenced by the order by clause are sorted first in the result set in the case of an ascending sort, and last in the case of a descending sort.

The NetWitness Core database is unique in that the groups of results returned by a query may each have many values for a selection. For example, it is possible to select all meta items that match a meta type and organize them into groups, and it is possible to use the distinct() function to return groups of distinct meta values. If an order by clause references one of the fields in the group that has multiple values, the sorting order is applied as follows:

1. Within each group, the fields with multiple matching values are ordered by the ordering clause
2. All the groups are sorted by comparing the first occurrence of the ordered field found within each group

The order by clause is only available in queries that have a group by clause, since groups are required to organize the meta fields into distinct records. If you wish to sort an arbitrary query as if there were no grouping applied, use group by sessionid . This ensures that results are returned in groups of distinct sessions or events.

group by clauses are naturally returned in ascending group key order; but, an order by clause can be used to return groups in a different order.

If an order by column does not specify asc or desc , the default ordering is ascending.

Examples:

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
desc
select countdistinct(ip.dst),sum(size) GROUP BY ip.src ORDER BY sum(size)
desc, countdistinct(ip.dst)
select sum(size) GROUP BY ip.src, ip.dst ORDER BY ip.dst desc
select user.dst,time GROUP BY sessionid ORDER BY user.dst
select * GROUP BY sessionid ORDER BY time
```

`search` parameter

The `query` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` clause in the `query` parameter. This means that the `query` and `search` parameters work together. Use the `query` parameter to specify the `select` clause, the `group by` clause, or the `order by` clause. Any `where` clause criteria specified in the `query` parameter are combined with the search filter as if they were joined with an `AND` operation.

Searches through the `query` API are always done against indexed meta, in case-insensitive mode. It has the same behavior as specifying flags `si,sm,ci` to the `msearch` API.

`values` call

The index provides a low-level `values` function to access the unique meta values that have been stored in the index. This function allows developers to perform more advanced operations on groups of unique meta values.

The `values` call parameter syntax:

```
values-params          = field-name-param, space, where-param, space, size-
param, {space, flags-param} {space, start-meta-param}, {space, end-meta-
param}, {space, threshold-param}, {space, aggregate-func-param}, {space,
aggregate-field-param}, {space, min-param}, {space, max-param}, {space,
search-param} ;
field-name-param       = "fieldName=", (meta-key | entity) ;
where-param            = "where=", where-clause ;
```

```
size-param            = "size=", ? integer between 1 and 1,677,721 ? ;
start-meta-param      = ? same as query message ?
end-meta-param        = ? same as query message ?
flags-param           = "flags=", {values-flag, {"," values-flag} } ;
values-flag           = "sessions" | "size" | "packets" | "sort-total" |
"sort-value" | "order-ascending" | "order-descending" ;
threshold-flag        = "threshold=", ? non-negative integer ? ;
aggregate-func-param  = "aggregateFunction=", { aggregate-func-flag } ;
aggregate-func-flag   = "count" | "sum" ;
aggregate-field-param = "aggregateFieldName=", ( meta-key | entity ) ;
min-param             = "min=", meta-value ;
max-param             = "max=", meta-value ;
search-param          = "search=", search-string ;
```

The `values` call provides the function of returning a set of unique meta values for a given meta key. For each unique value, the `values` call can provide an aggregate total count. The function used to generate the total is controlled by the flags parameter.

Parameters

The following table describes the function of each parameter.

Parameter	Function
`fieldName`	This is the meta key name for which you retrieve unique values. For example, if `fieldName` is `ip.src` , this function returns the unique source IP values in the collection. Entities can be used for the field name, in which case the result is defined as the combined set of field values for all the referenced meta keys. If the `fieldName` refers to a key with rename references, the result is defined as the combined set of field values for the given meta key name plus all of the references' meta keys.
`where`	This is a `where` clause which filters the set of sessions for which the unique values are returned. For example, if the `fieldName` is `ip.src` , and the `where` clause is `ip.src = 192.168.0.0/16` , only values in the range of `192.168.0.0` to `192.168.255.255` are returned. For information on the `where` clause syntax, see *Where Clauses* .
`size`	The size of the set of unique values to return. This function is optimized to return a small subset of the possible unique values in the database.

Parameter	Function
id1 , id2	These optional parameters limit the scope of the search for unique values to a specific region of the meta database and the index. Setting the id1 and id2 parameters to a limited range of the meta database is very important to running searches quickly on large collections.
flags	Flags control how the values are sorted and totaled. Flags are described in the following Values Flags section.
threshold	Setting the threshold parameter allows the values call to short-cut collection of the total associated with each value once the threshold is reached. By providing a threshold, the caller can reduce the amount of index and meta items that must be retrieved from the database. If the threshold parameter is omitted or set to 0, this optimization is not used.
aggregateFunction	Optional parameter used to change the default behavior from counting sessions, packets, or size to counting or summing the numeric field defined by aggregateFieldName . Both parameters must be specified when either is defined. Pass either sum or count to specify which behavior to perform.
